Abstract: Although most of people have experienced shyness as a contextual emotion, shyness temperament is found in about 10-16% of the population. In this research, we focused on shyness temperament. Previous research suggested that there're close associations between shyness and cognitive bias (e.g., judgement bias and interpretation bias). However, these studies are basically carried out in the Western population or Chinese college students through cross-sectional investigations, and the research results may not be very stable or have strong quasi-causal relationships, and can not be generalized to the Chinese children. Therefore, the purpose of this study was to examine the stable and quasi-causal relationships between children's shyness and their biases in judging and interpreting social events through a longitudinal survey. The Children Shyness Questionnaire, the Possibility/Cost of Negative Social Events Questionnaire, and Ambiguous Social Situation Questionnaire were used to investigate 1112 fourth and fifth grade primary school students in Gushi County, Henan province. Data were collected every six months, and three-wave data were collected in total (T1, T2, T3). At T1, there were 485 students in the fourth grade, 627 students in the fifth grade, 681 boys (61.24%) and 431 girls (38.76%). The age of the participants was between 8 and 14 years old ($M = 10.29$, $SD = 0.87$). In this study, cross-lagged analysis was performed on the collected data. The results showed that: (1) Children's shyness, probability judgment and cost judgment of negative social events, and the threat interpretation of ambiguous social situations were all moderately stable in three times of measurements; (2) children's shyness significantly and positively predicted every subsequent probability judgment and cost judgment. While probability and cost judgment can only significantly and positively predict T3shyness, and the predictive effect is less

than the predictive effect of shyness on them. That is, children's shyness and judgment bias have a mutual predictive relationship, but shyness has a dominant role in predicting probability and cost judgment; (3) children's shyness significantly and positively predicted every subsequent threat interpretation, but threat interpretation had no significant predictive effect on shyness.

Keywords: Children, Shyness, Judgement Bias, Interpretation Bias, Cross-lagged analysis

农村学龄前儿童心理理论的发展特点：社会领域理论的视角

辛聪¹ 李丹阳² 刘国雄¹（通讯作者）

¹ 南京师范大学心理学院，南京，210097, Lewgx@163.com

² 年糕妈妈亲子研究院，杭州，310013

摘 要 社会领域理论（Social Domain Theory）主张儿童的社会认知包括道德、习俗和个人领域。道德领域有关公平和权利，具有强制性、普遍性、不可变性，如不能随便骂人。习俗领域对人际互动起调节作用，具有情境相对性和可变性，如不同社会制度下的风俗习惯。个人领域通常涉及个人的自我选择和自主性，较少受权威等因素的影响。心理理论（Theory of Mind, ToM）涉及个体对他人和自身心理状态的认知。对不同领域的社会理解以及心理理论的发展是个体社会性发展的重要组成部分，个体的行为不仅受其愿望、信念等基本心理状态的影响，同时也会受到其所处的道德、习俗或个人等领域的社会规则的调节和制约。有研究显示，农村学龄前儿童所处的生活环境对其心理理论的发展有一定的影响，但这些研究通常仅聚焦于个人领域，缺少跨领域的综合证据。本研究以 924 名 3-6 岁农村儿童为对象，采用故事-问题法，通过“规则意识”、“知道与否”和“错误信念”等任务考察了其在道德、习俗和个人领域内心理理论的发展特点。结果发现，在道德领域和习俗领域方面年龄的主效应显著， $F(3, 920) = 26.63, p < 0.001, \eta_p^2 = 0.08$ ， $F(3, 920) = 41.15, p < 0.001, \eta_p^2 = 0.12$ ，即 $\text{ToM}_6 \text{ 岁组} > \text{ToM}_5 \text{ 岁组} > \text{ToM}_4 \text{ 岁组} > \text{ToM}_3 \text{ 岁组}$ 。“知道与否”信念上也出现了年龄效应， $F(3, 920) = 84.39, p < 0.001, \eta_p^2 = 0.22$ ，即 $\text{ToM}_6 \text{ 岁组} > \text{ToM}_5 \text{ 岁组} > \text{ToM}_4 \text{ 岁组} > \text{ToM}_3 \text{ 岁组}$ 。直言错误信念和内容错误信念同样存在显著的年龄差异， $F(3, 920) = 46.11, p < 0.001, \eta_p^2 = 0.13$ ， $F(3, 920) = 38.54, p < 0.001, \eta_p^2 = 0.11$ ，二者均表现为 $\text{ToM}_6 \text{ 岁组} > \text{ToM}_5 \text{ 岁组} > \text{ToM}_4 \text{ 岁组}$ 和 $\text{ToM}_3 \text{ 岁组}$ ，但 3 岁组和 4 岁组的表现无显著差异。结果表明，农村地区学龄前儿童的心理理论发展水平随年龄不断增长，不同年龄间差异较大。值得注意的是，3 岁和 4 岁儿童在错误信念理解上差异较小，但在道德和习俗领域中心理理论差异较大，说明不同领域中心理理论的发展水平存有年龄差异，道德和习俗领域中心理理论发展水平趋于一致，但个人领域中心理理论在儿童早期分化较晚。

Features of the Development of Theory of Mind for Rural Preschool Children: A Perspective of Social Rules Domain Theory

XIN Cong¹, LI Danyang², LIU Guoxiong¹

¹School of Psychology, Nanjing Normal University, Nanjing, 210097

²NicoMama Research Center of Parent-Child Bonding, Hangzhou, 310013

Abstract: The social rules domain theory suggests that children's social cognition includes moral, conventional, and personal domains. The moral domain is related to fairness and rights, with mandatory, universal, immutable (e.g., Should not curse freely). The conventional domain regulates interpersonal interactions and is contextually relative and variable. The personal domain is usually concerned with individual self-choice and autonomy and is less influenced by factors such as authority. Theory of mind (ToM) involves the perception of the mental states of others and oneself. Social understanding of different domains and the development of the theory of mind are important components of an individual's social development, whose behavior is not only influenced by their basic psychological

states such as aspirations and beliefs but is also regulated and restricted by the social rules of the moral, conventional or personal domains in which they live. Some studies have shown that the living environment in which rural preschoolers live has an impact on the development of the theory of mind, but these studies usually focus only on the personal domain and lack comprehensive evidence across domains. Using a story-question method, the present study examined the developmental features of the theory of mind in the domains of morality, convention, and personal in 924 rural children aged 3-6 years. A significant main effect of age was found in the moral and conventional domains, $F(3, 920) = 26.63, p < 0.001, \eta_p^2 = 0.08$, $F(3, 920) = 41.15, p < 0.001, \eta_p^2 = 0.12$. Highest performance in the 6 years old group and worst performance in the 3 years old group ($\text{ToM}_{6\text{-year-old}} > \text{ToM}_{5\text{-year-old}} > \text{ToM}_{4\text{-year-old}} > \text{ToM}_{3\text{-year-old}}$). There was also an age effect on the understanding of knowing, $F(3, 920) = 84.39, p < 0.001, \eta_p^2 = 0.22$ ($\text{ToM}_{6\text{-year-old}} > \text{ToM}_{5\text{-year-old}} > \text{ToM}_{4\text{-year-old}} > \text{ToM}_{3\text{-year-old}}$). A significant main effect of age was also found when we analyzed straightforward false beliefs and content false beliefs, $F(3, 920) = 46.11, p < 0.001, \eta_p^2 = 0.13$, $F(3, 920) = 38.54, p < 0.001, \eta_p^2 = 0.11$, both of which performed better in the 6-year-old group than in the other groups, and the 5-year-old group performed better than the 4-year-old and 3-year-old groups, but there was no significant difference in performance between the 4 and 3-year-old groups. The results showed that the developmental level of theory of mind among preschool children in rural areas increased with age and varied considerably between ages. It was interesting to note that the differences between 3- and 4-year-old groups in their understanding of false beliefs were small, but the differences in theory of mind in the moral and conventional domains were large, suggesting that there were age differences in the level of development of the theory of mind in different social domains, with a convergence in the moral and conventional domains, but a late divergence in the theory of mind in the personal domain in early childhood.

3-4 岁儿童空间再定向中对局部角度信息的表征

冯淦桢¹ 胡清芬¹ (通讯作者)

¹ 北京师范大学发展心理研究院, 北京, 100875, qingfenhu@bnu.edu.cn

摘要 空间再定向是人类拥有的一项重要认知能力。研究者们普遍认同整体几何线索的使用在再定向中具有明显优势, 并有研究表明儿童只能建立起局部几何信息与目标位置的直接联系, 难以依赖局部几何线索进行再定向(综述可参见 Lee & Spelke, 2010)。但由于传统的再定向任务并没有分离任务空间中的整体与局部几何信息, 儿童在再定向过程中是否表征了局部几何信息一直存在争论。本研究采用新创的再定向-局部位置选择任务, 对任务空间的整体与局部几何信息进行分离, 考察儿童在空间再定向中对局部角度信息的表征。研究的有效被试为 20 名 3 岁儿童和 22 名 4 岁儿童。实验采用 2 (年龄) × 3 (任务类型) 混合实验设计, 其中任务类型为被试内变量, 所有被试需要完成三种任务: ①再定向任务: 儿童看到贴纸被藏在菱形空间中的某个角落, 随后通过闭眼旋转的方式完成失向, 再睁开眼睛找回贴纸; ②再定向-局部位置选择任务: 流程与再定向任务一致, 但在儿童失向过程中, 菱形空间被拆解成四个“八”型片段, 并重新摆放; ③局部位置再认任务: 流程与再定向任务一致, 但任务环境为再定向-局部位置选择任务中使用的“八”型片段阵列。结果发现, 儿童在再定向任务中的正确搜索比例(正确率, 0.81 ± 0.03)显著高于再定向-局部位置选择任务(0.61 ± 0.06)和局部位置再认任务(0.62 ± 0.04)。4 岁儿童正确搜索的比例(0.74 ± 0.04)总体上高于 3 岁儿童(0.63 ± 0.04), 但只有在再定向-局部位置选择任务中, 4 岁儿童的正确率显著地高于 3 岁儿童。将 3、4 岁儿童在各任务中的正确率与随机水平相比较, 结果发现: 3 岁儿童在再定向-局部位置选择任务中的表现与随机水平没有差异, 在局部位置选择任务中的正确率与随机水平具有边缘显著差异, 但在再定向任务中的表现显著高于随机水平; 4 岁儿童在三种任务条件下的正确率均高于随机水平。研究结果表明, 3、4 岁儿童具备表征空间中局部角度信息的能力, 但只有 4 岁儿童可以自发地在空间再定向过程中形成对空间局部角度信息的表征。

Three-and Four-year-old Children's Representation of Local Angle Information in Reorientation

Ganzhen Feng¹, Qingfen Hu¹

¹ Institute of Developmental Psychology, Beijing Normal University, Beijing,

qingfenhu@bnu.edu.cn

Abstract: Reorientation is an essential ability for humans. It is widely accepted that global geometric cues have priority for use in reorientation. And some studies suggest that, for young children, local geometric cues could only be used as direct cues (beacon) to signal a specific location but not used to specify the orientation (see Lee & Spelke, 2010, for a review). However, since the classic reorientation task mixes global and local geometric information, it is still debatable whether children represent local geometric information during reorientation. Adopting a new paradigm, in which global geometric information and local geometric information were not integrated, we investigated young children's representation of local angle information during reorientation. Participants included 20 3-year-old children and 22 4-year-old children. The experiment followed a 2 (Age)×3 (Task type) mixed factorial design. All participants were tested individually, and they completed three tasks. (a) A reorientation task. The child watched the experimenter hide a sticker in a predetermined corner in a rhombic enclosure and then was blindfolded and spun by the experimenter until disoriented. After disorientation, the child was asked to search for the sticker. (b) A reorientation-local recognition task. The procedure was identical to that of the reorientation task. But during disorientation, the rhombic enclosure was changed into a fragmented array consisted of four '∧' isolated corners. (c) A local recognition task. The procedure was also identical to that of the reorientation task. But the task was conducted in the fragmented array used in the reorientation-local recognition task. Results show that children's mean proportion of correct first search (accuracy) was significantly higher in the reorientation task (0.81 ± 0.03) than in the reorientation-local recognition task (0.61 ± 0.06) and in the local recognition task (0.62 ± 0.04). In general, 4-year-old children (0.74 ± 0.04) performed better than 3-year-old children (0.63 ± 0.04). However, 4-year-old children performed significantly better than 3-year-old children only in the reorientation-local recognition task. To further evaluate 3- and 4-year-old children's performance, their accuracies were compared with chance. Results revealed that 3-year-old children's accuracy in the reorientation-local recognition task did not differ from chance. Their accuracy in the local recognition task was marginally above chance and their accuracy in the reorientation task was significantly above chance. Four-year-old children's accuracies in all tasks were significantly above chance. Our results suggest that although both 3- and 4-year-old children were able to represent the location based on local angle information, only 4-year-old children spontaneously form a representation of local angle information during reorientation.

² 陕西省儿童青少年心理与行为健康研究中心, 西安, 710062, jingjing.zhao@snnu.edu.cn

摘要 视觉注意广度 (visual attention span, VAS) 是指在一次短暂的注视时间里可以被同时平行加工的视觉刺激数量。目前, 关于阅读障碍者是否存在视觉注意广度缺陷、视觉注意广度缺陷是否独立于语音缺陷、视觉注意广度缺陷是阅读障碍产生的原因还是结果等问题依旧存在很大争议。本研究对包含阅读障碍组和正常控制组的视觉注意广度相关文献进行了元分析, 共纳入 32 篇文章 (英文 30 篇, 中文 2 篇), 包含 56 项研究, 2299 名被试。总效应检验表明, 阅读障碍存在明显的视觉注意广度缺陷, 阅读障碍组的视觉注意广度较正常组差 ($g = -0.57$)。刺激类型 (言语刺激/非言语刺激)、对照组匹配类别 (年龄匹配/阅读能力匹配)、语言 (法语/汉语/英语/荷兰语/德语/其他语言) 对阅读障碍的视觉注意广度缺陷具有显著的调节作用, 被试年龄 (6-18 岁/18 岁及以上) 和任务类型 (整体报告/部分报告/N-Back) 不会对视觉注意广度的组间差异产生影响。

阅读障碍组的言语（字母、数字、汉字等）视觉注意广度显著差于正常组，而非言语（图形、颜色等）视觉注意广度与正常组没有显著差异（ $Q_b = 11.43, p = 0.0007$ ）。与年龄匹配的正常组进行比较，阅读障碍组的视觉注意广度明显更差，而与阅读匹配的正常组相比，阅读障碍组的视觉注意广度与正常组相似（ $Q_b = 9.46, p = 0.002$ ）。法语、荷兰语和汉语的阅读障碍表现出明显的视觉注意广度缺陷，而英语、德语、葡萄牙语和希腊语的阅读障碍没有表现出视觉注意广度缺陷（ $Q_b = 40.54, p < 0.0001$ ）。总的来说，本研究表明阅读障碍存在视觉注意广度缺陷，并且视觉注意广度缺陷不独立于语音缺陷，可能是阅读障碍语音缺陷导致的结果而非阅读障碍产生的原因。

Moderators of visual attention span deficits in developmental dyslexia: evidence from meta-analysis

Kelina Cha^{1,2}, Jiuqing Tang^{1,2}, Xue'er Ma^{1,2}, Yu'e Yao^{1,2}, Jingjing Zhao^{1,2}

1 School of Psychology, Shaanxi Normal University, 710062

2 Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an, China, 710062 corresponding author E-mail (jingjing.zhao@snnu.edu.cn, 029-85303395)

Abstract: Visual attention (VA) span is the number of distinct visual elements which can be processed in parallel in a multi-element array. At present, it is still in debate about whether visual attention span deficit exists in dyslexia, whether visual attention span deficit is independent of phonological deficit, and whether visual attention span deficit is the cause or result of dyslexia. A meta-analysis from studies about visual attention span in dyslexia group and control group was conducted, including 32 articles (30 in English and 2 in Chinese), 56 studies and 2299 subjects. Collectively, the visual attention span of dyslexic individuals presented a moderate pooled effect size ($g = -0.57$), which was significantly worse than typically developing individuals, indicating obvious visual attention span deficits in dyslexia. Stimulus type (verbal/ nonverbal stimulus), control group type (age matched/ reading matched) and language (French/ Chinese/ English/ Dutch/ German/ other languages) had significant moderating effects on visual attention span deficit of dyslexia. The age of subjects with dyslexia (6-18 years old/ 18 years old and above) and task type (global report/ partial report/ n-back) did not have influence on the group differences of visual attention span. The verbal (letters, numbers, Chinese characters, etc.) VAS of dyslexic individuals was significantly lower than that of typically developing individuals, while there was no significant difference in nonverbal (graphics, colors, etc.) VAS between dyslexic individuals and typically developing individuals ($Q_b = 11.43, p = 0.0007$); Compared with the age-matched control group, the visual attention span of the dyslexic individuals was significantly worse, while the visual attention span of the dyslexic individuals was similar to that of the reading-matched control group ($Q_b = 9.46, p = 0.002$); French, Dutch and Chinese dyslexia performed worse than the control group in the visual attention span task, while English, German, Portuguese or Greek dyslexia did not show visual attention span deficit ($Q_b = 40.54, p < 0.0001$). In general, this study suggests that individuals with dyslexia do exist visual attention span deficit, and visual attention span deficit is not independent of phonological deficit, which may be the result of phonological deficit rather than the cause of dyslexia.

威胁刺激的攻击性和可爱度对幼儿无意视盲的影响

牛益曼¹ 张慧¹（通讯作者） 李梦婷¹ 李夏¹

1 浙江师范大学杭州幼儿师范学院（特殊教育学院），杭州，310000, zhanghui1987@zjnu.cn

摘要 人们对情绪性刺激的注意加工存在着“负性偏向”和“正性偏向”这两种调节假说。威胁刺激是一类可以激发人们负性情绪的刺激，研究表明，当威胁刺激呈现出攻击的姿态时，它们更容易捕获人们的注意；也有一些证据表明，可爱的刺激物可以唤起人们的正性情绪，从而更可能被注意到。然而，对于幼儿群体，威

胁刺激常常以可爱的卡通形象出现,那么,威胁刺激的攻击性(负性情绪相关特质)和可爱度(正性情绪相关特质)如何影响幼儿的注意偏向?本研究将基于无意视盲的研究范式,采用2(攻击姿势:攻击姿势,非攻击姿势)×3(可爱程度:高,中,低)的二因素混合实验设计,考察了180名5-6岁幼儿($M_{age}=75.99$ 月, $SD_{age}=3.17$,男女各半)对不同形态的威胁刺激蛇的注意加工特征。结果显示:(1)可爱度的主效应显著,高可爱度的蛇比中性可爱度的蛇更容易被觉察到,但这种偏向只存在于女生;(2)攻击性主效应不显著,无论是男生还是女生,对呈现出攻击姿态的蛇的觉察率并没有显著高于非攻击姿态的蛇。与中性可爱度蛇相比,高可爱度的蛇和低可爱度的蛇更容易被发现,且非攻击性高可爱度蛇(正性情绪最高)比攻击性低可爱度蛇(负性情绪最高)更容易被发现。这意味着幼儿对情绪唤醒度高的威胁刺激更敏感,对正性情绪的敏感度要高于负性情绪,存在对情绪性刺激的“正性偏向”。

The effect of striking posture and cuteness of the threat-relevant stimuli on young children's inattention blindness

Niu Yiman¹, Zhang Hui¹, Li Mengting¹, Li Xia¹

Hangzhou College of Preschool Teacher Education of Zhejiang Normal University, Hangzhou, 310000

Abstract: There are two hypotheses for the attentional processing of emotional stimuli: "negative bias" and "positive bias". Threatening stimuli are a category of stimuli that can evoke negative emotions, and previous studies have found that threatening stimuli are more likely to capture attention when they are presented in a striking posture; there is also some evidence that cute stimuli can evoke positive emotions and are more likely to be noticed. However, for young children, threatening stimuli often appear as cute cartoon images, so how do the striking posture (negative emotion related) and cuteness (positive emotion related) of threatening stimuli affect young children's attentional bias? This study will use a two-factor mixed experimental design of 2 (striking posture: striking posture, non-striking posture) × 3 (cuteness: high, medium, low) to examine the attentional processing characteristics of young children to different forms of snakes by an inattention blindness paradigm. A total of 180 children aged 5-6 years ($M_{age}=75.99$ months, $SD_{age}=3.17$, 90 boys) were selected. The results showed that: (1) the main effect of cuteness was significant, and snakes with high cuteness were more likely to be detected than those with neutral cuteness, but this bias was only present in girls; (2) the main effect of striking posture was not significant, and both boys and girls didn't have significantly higher detect rates for snakes presenting an aggressive posture than for those in a non-aggressive posture. Snakes with high cuteness and low cuteness were more likely to be detected than those with neutral cuteness, and non-aggressive posture high cuteness snakes (highest positive emotions) were more likely to be detected than aggressive posture low cuteness snakes (highest negative emotions). This implies that people are more sensitive to threatening stimuli with higher emotional arousal and more sensitive to stimuli with high positive emotions, and that there is a "positive bias".

家庭读写环境在 3-6 岁儿童汉字阅读发展中的作用

李向飞^{1,2} 李甦^{1,2*}

1 中国科学院心理研究所, 北京, 100101

2 中国科学院大学心理学系, 北京, 100049

摘 要 家庭读写环境是影响儿童早期读写发展的重要因素。然而, 少有研究在较大年龄范围的学前儿童中探查家庭阅读环境对汉语阅读能力的作用。本研究的主要目的是检验家庭读写环境对 3-6 岁儿童汉字阅读能力的作用。此外, 根据前人研究, 我们也将儿童的读写兴趣这一影响读写发展的重要因素纳入到对儿童家庭读写环境的测查中。本研究从北京和上海的 4 所幼儿园中随机选取了 223 名儿童, 采用汉字识别任务测查儿

童的汉字阅读能力。同时,由儿童父母完成家庭读写环境问卷,以调查儿童的家庭读写环境特征。结果发现,不同年龄儿童的家庭读写环境存在显著差异,早期的家庭读写环境可能会随着儿童年龄的增长而发生变化。层次回归分析结果显示,家庭读写环境对早期汉字阅读能力的作用在不同年龄的儿童中表现出了不同的模式。具体来说,父母阅读教育以及儿童的文字兴趣对4岁儿童的汉字阅读能力均有独立贡献。家庭阅读资源能够独立解释6岁儿童汉字阅读能力中的变异。此外,父母阅读教育对6岁儿童的汉字阅读能力有着边缘显著的作用。本研究从早期汉语阅读发展的角度为家庭读写环境模型的理论提供了重要证据。研究结果同时也说明,在测查早期的家庭读写环境时,纳入儿童的读写兴趣这一因素是十分重要的。

The Varied Influence of the Home Literacy Environment on Chinese Preschoolers' Word Reading Skills

Xiangfei Li^{1,2}, Su Li^{1,2}

1 Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, China

Abstract: An early home literacy environment is essential to children's later literacy development. However, few studies have explored the influence of the home literacy environment on Chinese reading in preschoolers across a wide age range. The present study mainly investigated the home literacy environment's effect on Chinese word reading in 3- to 6-year-old children. Additionally, children's literacy interest, which is important for reading development and interacts with the home literacy environment, was also measured. Two hundred twenty-three children were recruited and completed a Chinese character recognition task, and their parents were asked to rate the children's home literacy environment. The results showed that the home literacy environment changed significantly with children's age, suggesting that the home literacy environment may change over time. Hierarchical regression analyses revealed that the home literacy environment's effect on Chinese word reading showed different patterns across age groups. Specifically, parent reading instruction and children's interest in print played unique roles in the Chinese word reading of 4-year-old children. Moreover, home reading resources independently contributed to 6-year-olds' word reading scores, with a marginally significant effect of parent reading instruction. The results provided important evidence for the home literacy model in early Chinese word reading development and highlighted the necessity of incorporating children's literacy interest into investigations of the early home literacy environment.

Keywords: home literacy environment, preschooler, Chinese word reading, children's literacy interest, early reading development

数字游戏化认知训练对神经发育性障碍儿童核心认知能力的影响： 一项元分析

任筱宇^{1,2} 吴倩冰² 崔楠² 赵婧² 毕鸿燕^{1,3} (通讯作者)

1 中国科学院行为科学重点实验室; 中国科学院心理研究所脑科学与学习困难研究中心, 北京, 100101

2 首都师范大学心理学院, 北京市“学习与认知”重点实验室, 北京, 100037

3 中国科学院大学心理系, 北京, 100049

摘要 神经发育性障碍是由大脑发育异常引起的早发性障碍, 在患有神经发育障碍的儿童中, 注意缺陷/多动障碍和特殊学习障碍(如, 发展性阅读障碍、发展性计算障碍)儿童会较多地接受认知训练。近年来, 数字游戏化认知训练被广泛应用于特殊儿童干预。然而, 关于数字游戏化认知训练对神经发育性障碍儿童认知

能力影响的相关研究结果仍存在争议。因此，有必要运用元分析方法对数字游戏化认知训练的有效性进行研究。本研究发现，在不区分神经发育性障碍的不同类型时，数字游戏化认知训练对神经发育性障碍儿童核心认知能力有显著的即时性效果，并且这种干预效果具有一定的保持性（干预结束3个月后）。然而，在区分神经发育性障碍的不同类型时，数字游戏化认知训练对注意缺陷/多动障碍儿童和阅读障碍儿童的认知能力有显著的干预效果，而对计算障碍儿童的干预效果仅边缘显著。同时，在注意缺陷/多动障碍儿童和阅读障碍儿童中，数字游戏化认知训练的远迁移效应显著。此外，本文还发现训练效果不仅受游戏化形式的影响，还受训练内容的影响。未来应针对不同类型神经发育性障碍儿童的核心缺陷设计数字游戏化认知训练，以有效地提高其认知技能，帮助其更好地应对学业挑战。

关键词 神经发育性障碍儿童，数字游戏化认知训练，元分析

Effectiveness of digital game-based trainings on core cognitive abilities in children with neurodevelopmental disorders: A meta-analysis

REN Xiaoyu^{1,2}, WU Qianbing², CUI Nan², ZHAO Jing², BI Hongyan^{1,3}

1 CAS Key Laboratory of Behavioral Science; Center for Brain Science and Learning Difficulties,
Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

2 Beijing Key Laboratory of Learning and Cognition, School of Psychology, Capital Normal
University, Beijing 100037, China

3 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract : Neurodevelopmental disorders (NDDs) are early onset disorders which result from abnormal brain development. In those suffering neurodevelopmental disorders, individuals with attention-deficit/hyperactivity disorder (ADHD) and specific learning disorders (SLD), such as developmental dyslexia and developmental dyscalculia are often treated with cognitive trainings. In recent years, digital game-based cognitive trainings have been used in training children with special needs. However, relevant results of previous literatures regarding the effects of digital game-based trainings on cognitive abilities in children with NDDs have still been controversial. So, it is crucial to use the meta-analysis method to provide a quantitative summary of the effectiveness of digital game-based trainings. Our study found the digital game-based trainings could efficiently increase overall performance on core cognitive domains of all the children with NDDs both immediately after training (post-test) and within a period less than 3 months (short-term follow-up test). However, when taking the different type of neurodevelopmental disorders into consideration, we found that digital game-based trainings were more efficient for children with ADHD and dyslexia than for children with dyscalculia. Meanwhile, the far-transfer effects of digital game-based trainings were found in children with ADHD and dyslexia. Moreover, we found that not only the game-features, but also the training content contributed to training effect. Digital game-based trainings more specially targeting on the critical deficits of children with different type of NDDs should be designed in the future to help them improve cognitive skills more efficiently, as well as better cope with academic challenges.

Keywords: Neurodevelopmental disorders, digital game-based cognitive trainings, the meta-analysis method

提取练习是最有效的记忆方法吗?基于 5-6 岁幼儿的研究

王雪珂 冯廷勇

西南大学心理学部, 重庆 400715

摘要 学习是记忆的基础，有效的学习方法可以让记忆更容易。尽管之前的研究已经发现，与集中学习和分散学习相比，需要测试的提取练习更能改善个体的长时记忆，但这种效果是否适用于幼儿尚不清楚。因此，本研究主要探讨了对幼儿记忆最有效的学习方法。50 名 5-6 岁幼儿分别通过集中学习、分散学习和提取练习学习了 24 个生僻词。在每一种学习方法中，分别测量短时间延迟 3 min 和长时间延迟 1 天或 5 天的词汇记忆

表现。结果表明,无论是短时记忆还是长时记忆,分散学习都优于提取练习和集中学习。此外,分散学习和提取练习显示出一种特殊的记忆现象——“记忆回涨”,即记忆随着时间的延迟而增加,而集中学习并没有出现这种现象。更重要的是,项目分析发现记忆的增加主要是通过记忆测试中增加词汇项目的唤起,几乎没有受到词汇遗忘的影响。综上所述,这些发现表明分散学习是幼儿教育环境中最有效的记忆方法。因此,如果要最大限度地提高孩子的记忆力,如何安排学习时间和计划是必须考虑的问题。

关键词 分散学习,提取练习,记忆回涨,时间延迟

Is the retrieval practice the most effective method to memorize? Not in young children aged 5 and 6 years

WANG Xueke, FENG Tingyong

Faculty of Psychology, Southwest University, Chongqing 400715, China

Abstract: Learning is fundamental to memory, and an effective learning method can make it easier to memorize with less effort. Although previous studies have found that retrieval practice that requiring test improves long-term memory more than massed learning and spaced learning, less clear is whether the effect generalizes to young children. In this study, we examined the most effective learning method for children's memory. Fifty children aged 5 and 6 years learned 24 unfamiliar words in massed learning, spaced learning, and retrieval practice respectively. And in each learning method, the recall test was used to measure the memory performance in a short-time delay of 3 min and a long-time delay of 1 day or 5 days. The results indicated that spaced learning performed better than retrieval practice and massed relearning regardless of short-term or long-term memory. Moreover, spaced learning and retrieval practice showed hypermnesia, a special memory phenomenon that an increase in memory with time delay, but massed relearning did not. More importantly, the item fate analyses found that the increase of memory was driven mainly by increasing the recovery of items during the recall test, and was barely affected by the forgetting of items. Together, these findings suggested that spaced learning was the most effective method to memorize in young children's educational settings. Thus, how to arrange learning time and plan should be taken into account if maximizing children's memory.

Key words: spaced learning, retrieval practice, hypermnesia, time delay

青少年在合作学习中的同伴互助行为研究

摘要 青少年在群体中的亲社会行为表现有助于促进良好的同伴关系构建,能够有效防止校园欺凌行为的发生(Padilla-Walker & Carlo, 2015)。本研究着眼于青少年在合作学习过程中展现的帮助、合作、关心、同情等亲社会行为,探究了青少年同伴互助行为的发生和发展机制。研究对象是河北省某县级中学的22名七年级学生(8名男生,14名女生),这些学生分别组成包含了7,7,8名学生的三个小组参与学生主导的合作推理讨论(Anderson et al, 1998),每个小组各进行了7次讨论。平均时长27.5分钟,共577.6分钟。本研究对21个小组讨论视频进行了同伴互助行为的编码,最终形成5110条编码,包含四个类别:行为支持(345条)、情感支持(633条)、认知支持(3505条)和讨论促进行为(如管理发言顺序;627条)。结果发现:(1)从第一次到第七次合作讨论青少年展现的同伴互助行为总体呈上升趋势,由7.33次每分钟上升至10.15次每分钟。其中,认知支持行为的上升趋势与总体保持一致,由3.81次每分钟上升至7.56次每分钟,增长了将近一倍。(2)不同性别学生之间的互助行为呈现出显著差别:在情感支持上,同性间的互助行为是异性间的

2.93 倍；在认知支持上，异性间的互助行为是同性间的 1.53 倍，其中女生间的认知支持行为（ $M=13.87$ ）明显低于其他类别（ $M=33.64$ ）。（3）互助行为在合作学习过程中随时间的变化趋势分析发现，讨论促进行为在讨论初期呈现较大比例（ $T1=23.35\%$ ），但是随着讨论的进行，讨论促进行为的比例逐渐减小（ $T5=8.79\%$ ），认知支持的比例逐渐增加（由 57.61% 上升至 75.21%），并在讨论后期保持稳定。研究结果表明随合作学习次数的增加，青少年能够更加自主地管理小组讨论，逐渐将合作的重点放在内容学习上，且随讨论的进行小组成员在认知任务上的投入越来越高，反映了自我调节学习能力的增强。同伴互助行为在性别上的差异表明小组结构中的性别平衡有利于认知支持行为的发生。本研究通过对即时性行为的视频编码揭示了青少年群体中的同伴互助行为模式，为探究合作学习过程中影响同伴关系变化的内在机制提供了新的方法和思路。

Abstract: Previous studies have confirmed that prosocial behaviors are associated with the creation of positive peer relationships among adolescents (Padilla-Walker & Carlo, 2015). This study focuses on adolescents' helping behaviors during collaborative discussions to investigate the emergence and development of prosocial behaviors. The study included 22 seventh graders (8 boys and 14 girls) in a rural middle school in north China. These students formed three groups to participate in seven Collaborative Reasoning (CR; Anderson et al, 1998) discussions, with each group having seven, seven, and eight students respectively. All the CR discussions were videotaped—the total discussion time was 577.6 minutes and each discussion was averagely 27.51 minutes. Four types of helping behaviors were coded in the 21 CR discussions and a total of 5,110 helping behaviors were identified: behavioral support behaviors (345), emotional support behaviors (633), cognitive support behaviors (3505), and discussion facilitating behaviors (627). The results showed that adolescents' total number of helping behaviors increased from the first discussion to the seventh discussion, with the lowest being 7.33 per minute and the highest being 10.15 per minute. In particular, the number of cognitive support behaviors increased from 3.81 per minute to 7.56 per minute, nearly doubled. Adolescents' helping behaviors differed among gender groups. Emotional support behaviors were more likely to occur in the “boy-to-boy” and “girl-to-girl” groups, while cognitive support behaviors were more likely to occur in the “girl-to-boy” and “boy-to-girl” groups and less likely to occur in the “girl-to-girl” group as compared to the other three types of relationships. Adolescents' helping behaviors were tracked over the course of each discussion. The result indicated that the percentage of discussion facilitating behaviors decreased as the discussion progressed (from 23.35% to 8.79%), while the percentage of cognitive support behaviors increased and remained high (from 57.61% to 75.21%) till the end of the discussion. These findings suggest that adolescents presented different types of helping behaviors during collaborative group work. In this process, students became more effective in discussion management and were able to devote more time to cognitively support their peers in the collaborative discussion. The differences in helping behaviors among gender groups implied that gender balance could facilitate the emergence of cognitive behaviors in collaborative groups. Overall, this study revealed the development pattern of adolescents' helping behaviors during collaborative discussions and its effect on students' self-regulated learning. The implication

is that adolescents' social development can be studied through moment-to-moment coding of social behaviors in authentic learning settings.

摘要 错误记忆指记得未学的内容或混淆记忆来源, 可分为内源和外源错误记忆。以往研究多关注儿童和老年记忆发展, 较少关注青少年。该研究考察了 92 名初中生、98 名高中生、90 名大学生的内源和外源错误记忆。内源记忆任务中, 学习 12 列词表 (每列含 8 个语义相关词, 如: 做梦、打盹、休息等), 随后自由回忆。真实回忆指写出已学词 (如: 做梦) 的总数, 内源错误回忆指写出不在词表中但语义相关词 (如: 睡觉) 的总数。外源记忆任务含以下三阶段。第一, 原始事件, 看到两个事件 (各含 50 张图片, 如某图: 手机放在裤子后兜)。第二, 事后信息, 读两个事件的文字陈述 (各含 50 句话)。每个年龄组的被试随机分半为实验组和控制组。实验组看到虚假信息 (其中 24 句与原事件不一致, 如: 手机放在裤子侧兜), 而控制组看到准确信息。第三, 再认测验, 所有被试需根据原始事件图片进行再认 (如题目: 在图片中看到手机放在裤子哪里? 选项: 后兜、侧兜、前兜)。真实再认指选择原图片信息 (如, 后兜) 的比率。对于实验组, 外源错误再认指选择虚假信息 (如, 侧兜) 的比率, 无关再认指选择无关信息 (如, 前兜) 的比率。对于控制组, 除准确信息之外的两个选项分别被记为两类无关再认 (如, 侧兜、前兜)。结果发现: 1) 内源记忆任务: 初中生的真实回忆低于高中生和大学生, 初高中学生的错误回忆低于大学生。与大学生相比, 中学生记忆的语义网络未发展成熟, 内源错误记忆较少。2) 外源记忆任务: 虚假信息效应显著, 实验组的外源错误再认高于无关再认, 实验组对错误信息项目的再认率高于控制组。初高中生比大学生更易受虚假信息影响, 在记忆中对信息源监控弱, 外源错误记忆较多。总之, 青春期内外源错误记忆的发展趋势具有差异, 随年龄增长, 内源错误记忆上升, 外源错误记忆下降。该结果支持记忆的激活监控理论, 错误记忆体现了记忆中语义网络激活和信息源监控失败。该研究对理解记忆发展规律和教育司法实践具有理论和应用价值。

Abstract: False memory refers to the memory distortion that were never experienced or people confuse the source of memory, including endogenous or exogenous false memories. Previous memory development studies have focused on children and older adults rather than adolescents. The current study examined the endogenous and exogenous false memories in 92 junior high school students, 98 senior high school students, and 90 college students. In the endogenous memory task, participants studied 12 lists of 8 semantically-related words (e.g., "Dream", "Nap", and "Rest"), and were asked to take a free recall task later. True recall refers to the total number of studied words that have been recalled (e.g., "Dream"). False recall refers to the total number of semantically-related unstudied words that have been recalled (e.g., "Sleep"). The exogenous memory task involves three stages. First, during the original event stage, participants saw two events (50 pictures for each event, e.g., "The man took away her phone and put it into his pants' back pocket"). Second, during the post-event information stage, participants were asked to read narrations of these two events (50 sentences for each event). Participants in each age group were randomly divided

into two groups (i.e., experimental group and control group). Participants in the experimental group read misinformation (24 sentences were inconsistent with original pictures, e.g., “The man took away her phone and put it into his pants’ side pocket”), whereas participants in the control group read accurate narrations. Third, during the recognition test stage, all participants were asked to take a memory task based on what they saw in the original pictures (e.g., “Which pocket of his pants did the man put the phone into?”, options: “Back pocket”, “Side pocket”, “Front pocket”). True recognition refers to the rate of choosing details presented in the picture (e.g., “Back pocket”). For the experimental group, misinformation false recognition refers to the rate of choosing misinformation presented in the narration (e.g., “Side pocket”), and foil recognition refers to the rate of choosing foil detail (e.g., “Front pocket”). For the control group, foil recognition refers to two foil choices (e.g., “Side pocket” and “Front pocket”), respectively. Results show that: 1) In the endogenous memory task, true recall in junior high school students was lower than those in senior high school students and in college students, while false recall in junior and senior high school students was lower than those in college students. Compared with college students, the semantic network of junior and senior high school students’ memory is immature, and thus they have fewer endogenous false memory. 2) In the exogenous memory task, the misinformation effect was significant. In the experimental group, misinformation false recognition was higher than foil recognition. For the choice rate of post-event misinformation items, the misinformation group was higher than the control group. Compared with college students, the junior and senior high school students were more susceptible to misinformation, and their source monitoring ability were weak, and thus they have more exogenous false memory. In short, there were different development trends in endogenous and exogenous false memories. From adolescence to young adulthood, endogenous false memory increases with age, but exogenous false memory decreases with age. These results support memory activation-monitoring theory. False memory reflects the activation of semantic network and failure of source monitoring. This study has theoretical values for understanding memory development, and practical values for educational and legal practice.

社会工作记忆训练提升个体的心理理论和观点采择能力

杨运梅^{1,2} 李晶^{1,2} (通讯作者)

1 中国科学院心理研究所, 中国科学院行为科学重点实验室, 北京 100101

2 中国科学院大学心理学系, 北京 100049, lij@psych.ac.cn

摘要 社会工作记忆是指在大脑中编码和存储社会信息的能力。社会工作记忆可以正向预测心理理论, 并且社会工作记忆训练不仅可以提高个体的社会工作记忆容量, 还能提高其观点采择能力。目前尚未有研究系统探查社会工作记忆训练对个体心理理论的提升效果。因此, 我们试图探究以下问题: (1) 社会工作记忆与心理理论、观点采择的关系; (2) 社会工作记忆训练能否提升个体的核心社会认知能力? 我们设置了社会工作记忆条件和认知工作记忆条件, 其中社会工作记忆条件分为3组, 分别以生物运动光点、工具性身体姿势和情绪性身体姿势为训练材料, 对照组以矩形方块为训练材料。84名18-22岁的大学生参加了为期4周的训练, 每周3次, 每次大约30分钟。每次训练15组, 每组有(20+n)个试次。结果显示, 生物运动和情绪性身体姿势条件下, 被试的社会工作记忆容量与情感心理理论呈显著的正相关, 并且两组的社会工作记忆容量与观点采择能力之间也有显著的正相关关系。经过训练后, 每组都提高了本身的工作记忆容量, 此外工具性身体姿势条件下生物运动工作记忆、认知工作记忆均有显著提高; 情绪性身体姿势条件下还提高了工具性身体姿势工作记忆容量。进一步分析远迁移效应发现, 训练后四组的心理理论和观点采择能力均有显著提升。这些结果说明, 社会工作记忆训练不仅可以提高成人的社会工作记忆量, 还可以提高未经训练的认知工作记忆, 而认知工作记忆训练后并没有迁移到社会工作记忆。与此同时, 四组训练后的核心社会认知能力均有显著提升, 但是组间差异并不明显。这一方面说明社会性和认知性的工作记忆训练都有可能促进个体的心理理论和观点采择能力的提升, 但另一方面也有可能是由于成人的心理理论和观点采择能力已经发展的较为成熟, 训练后的提升可能是重复测量或者是练习效应造成的。

Social working memory training improves theory of mind and perspective-taking

Yang Yunmei^{1,2}, Li Jing^{1,2}

1 CAS Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China;

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract: Social working memory(SWM) refers to the ability to encode and store social information in the brain. SWM can positively predict the theory of mind(ToM), and SWM training can not only improve the individual's SWM capacity, but also improve perspective-taking. So far, to our knowledge, no studies have systematically investigated the effect of SWM training on the enhancement of ToM. Therefore, we tried to explore the following questions: (1) The relationship between SWM, ToM and perspective-taking; (2) Can SWM training improve the individual's ToM and perspective-taking? There were two experimental conditions in our study: SWM training condition and cognitive working memory(CWM) training condition. The SWM training condition consisted with three groups. We used the point-light display of biological motion(BM), instrumental body posture and emotional body posture as the SWM training material, and used rectangular block as the CWM training material. Eighty-four college students, aged 18 to 22, were trained 3 times per week and 30 minutes each time. The whole training lasted 4 weeks. There were 15 blocks per training session, and each block had (20 + n) trials. The results showed that under the conditions of BM and emotional body posture, there was a significant positive correlation between SWM capacity and emotional ToM, and there was also a significant positive correlation between SWM capacity and perspective-taking ability in both groups. After the training, the WM capacity of each group increased. In addition, the BM-WM and CWM capacity were significantly improved in the instrumental body posture condition. Emotional body posture group also increased the capacity of instrumental body posture WM. Further analysis of the distal transfer effect found that the ToM and perspective-taking ability of the four groups were significantly improved after training. These findings indicate that SWM training can not only improve the SWM of adults, but also improve their untrained CWM. However, the effect of CWM training fail to transfer to SWM. At the same time, ToM and perspective-taking ability of the four groups improved significantly after training, but there was no significant difference among the groups. This finding shows that both social and cognitive working memory training may enhance the ToM and perspective-taking ability. It is worth noting that due to the mature development of the ToM and perspective-taking ability in adults, the improvement after training may be caused by repeated measurement or the effect of practice.

知觉显著性对儿童加工意外威胁刺激的影响：基于眼动的证据

张慧¹（通讯作者） 王芬^{1,2}

1 浙江师范大学，杭州幼儿师范学院（特殊教育学院），杭州, 310000

2 杭州市上城区东城幼儿园，杭州，310019, zhanghui1987@zjnu.cn

摘要 快速觉察威胁刺激对幼儿的生命安全起着重要的作用，已有研究认为，幼儿对预期的威胁刺激可能存在优先加工的注意偏向，但当威胁刺激在意外条件下呈现，幼儿对这类刺激的注意加工存在怎样的特点，刺激的知觉显著性如何影响加工过程？本研究采用经典的无意视盲范式，通过 2（刺激类型：威胁刺激、非威胁刺激）×2（知觉显著性：高、低）被试间完全随机设计，结合眼动技术，考察了 88 名幼儿（75.16±3.12 个月，男生 38 名）在不同知觉显著性条件下对威胁刺激蛇与非威胁刺激蜥蜴的注意加工特点。结果表明：（1）幼儿在两种知觉显著性条件下对意外的威胁刺激蛇与非威胁刺激蜥蜴的觉察率均不存在显著的差异；（2）对于意外威胁刺激蛇，知觉显著性对刺激的觉察率有重要影响，显著性越高，觉察率越高；知觉显著性对注视点个数与时长存在显著影响，高显著性蛇的注视点个数与注视时长显著多于低显著性蛇；（3）对于意外非威胁性刺激蜥蜴，知觉显著性对觉察率不存在显著影响；知觉显著性对注视点个数和注视时长不存在显著影响。

当前结果表明, 虽然幼儿对意外威胁刺激蛇不存在直接的注意偏向, 但知觉显著性与意外刺激的关系结果显示, 幼儿加工意外威胁刺激蛇与意外非威胁刺激蜥蜴的注意过程存在一定的差异, 刺激的颜色这种知觉显著性特征对加工意外威胁刺激蛇存在显著的影响, 但对意外非威胁刺激蜥蜴不存在显著影响。

The Effect of Perceptual Salience on Children's Perception of Unexpected Threat Stimuli: Evidence from Eye Movements

Hui Zhang¹, Fen Wang^{1, 2}

(¹Hangzhou College of Preschool Teacher Education, Zhejiang Normal University, Hangzhou, 310000)

(²Hangzhou Dongcheng Kindergarten, Hangzhou, 310019)

Corresponding author's E-mail: zhanghui1987@zjnu.cn

Abstract: Rapid detection of threat-relevant stimuli plays an important role in children's safety. Previous studies suggest that children may have an attentional bias to the expected threat-relevant stimuli, but when the threat-relevant stimuli are presented under unexpected conditions, do children also have stable attentional bias to these stimuli? Perceptual salience, as a factor that has an important influence on attention under unexpected conditions, how dose it affect children's perception of unexpected threat stimuli? We employed 88 young children (75.16 ± 3.12 months, 38 boys), who were randomly designed with 2 (type of stimulus: threatening stimulus, non-threatening stimulus) $\times$ 2 (perceptual salience: high perceptual significance and low perceptual significance) to explore the attention perception of threatening stimulus and non-threatening stimulus, snake and lizard in current study, under different perceptual significance. The results show that: 1) There was no significant difference on the perception rate of threatening and non-threatening stimulus in two perceptual significance conditions. 2) For the threatening stimulus snake, perceptual salience had an important impact on the perception rate of threat stimuli, the higher the significance, the higher the perception rate. Also, perceptual salience had an important influence on the number of gaze points and gaze duration for the threatening stimulus snake, the number of gaze points and gaze duration for the snake of high significance are significantly higher than those snake of low significance. 3) For the non-threatening stimulus lizard, perceptual salience had no significant influence on the perception rate, and also had no significant influence on the number of gaze points and gaze duration. As the current results show, although children don't have direct attentional bias towards unexpected threatening stimulus snake, the relationship between perceptual salience and unexpected stimuli shows that there is a certain difference in the attention process of threatening stimulus snake and non-threatening stimulus lizard under unexpected conditions. The color of the stimulus is a perceptually significant feature that has a significant effect on the processing of unexpected threatening stimulus snake, but has no significant effect on the unexpected non-threatening stimulus lizard.

摘 要 未来教育规划是个体对未来教育建构机会并实现教育计划的过程, 主要包括探索和投入两个方面。未来教育规划对于青少年当前的适应及顺利过渡到成年期具有重要意义。已有研究表明, 父母教育期望是青少年未来教育规划的重要相关因素, 而这些研究是基于横断数据的结果, 对于父母教育期望对青少年教育未来取向的长期纵向影响模式尚不清楚。同时, 父母教育期望对青少年未来规划影响的作用机制尚不清楚。基于此, 本研究以 605 名高中生为被试, 以青少年教育未来取向问卷、父母教育期望量表和学业成绩自评定量表为测量工具, 采用间隔一年的追踪研究设计, 探讨父母的教育期望对青少年教育期望的纵向影响, 并检验学业成绩对二者关系的调节作用。在控制了 T1 的性别、年龄、家庭社会经济地位等变量后, 结果发现: (1) T1 的父母教育期望能正向预测高中生 T2 的教育规划, T1 的学业成绩能正向预测 T2 的教育规划。即, 父母教育期望更高及学业成绩评定更高的高中生一年后有着更高的教育探索与教育投入行为; (2) T1 的学业成绩在 T2 的父母教育期望与教育规划中起调节作用。进一步的简单斜率检验结果表明, 学业成绩越高, 父母教育期望对教育规划的预测作用越强。这些结果表明, 在对青少年教育规划的干预工作中, 要重视父母教育期望及学生学业成绩的作用。

The Effect of Parental Educational Expectation on future education planning among Chinese adolescents: The Moderating Role of Academic Achievement

Song Ruijun¹, Yu Fengjie², Chen Liang¹, Zhang Wenxin¹

1 School of Psychology, Shandong Normal University, Jinan, 250014, zhangwenxin@sdsu.edu.cn

2 Shandong Youth University of Political Science, Jinan, 250103

Abstract: Future education planning refers to a process which individual constructs education plans and realizes these education plans, including exploration and commitment. Extant studies indicated that future education planning is vital to various aspects of adolescents' current and later adjustment. Cross-sectional research has documented that parental educational expectation play an important role in adolescents' future education planning. However, little is known about the longitudinal association between parental educational expectation and future education planning. Additionally, the mechanisms that potentially account for such relationship remain uncertain. The current study aimed to examine the longitudinal moderating role of academic achievement in the relationship between parental educational expectation and future education planning. All participants in the study were senior high school students from four middle schools in Shandong province. A number of 719 students participated in this study at T1 and the final sample completed in both two waves were 605. The mean age of valid participants was 16.01 years ($SD = 0.59$) at T1, with 54.5% boys. Participants filled out the Future Orientation Questionnaire, Parental Educational Expectation Questionnaire, and the Self-rated Academic Achievement Questionnaire. After controlling for gender, age, and SES at T1, the results indicated that (1) Parental educational expectation and academic achievement at T1 can positively predict senior high school students' future education planning at T2. Thus, students with high parental educational expectation or high academic achievement have more active educational exploration and commitment; (2) The relation between parental educational expectation and future education planning at T2 was moderated by academic

achievement at T1. Simple slope test further indicated that the specific link between parental educational expectation and future education planning was stronger for students with high academic achievement. The findings indicated that high level of parental educational expectation and academic achievement was of great importance for senior high school students' future education planning.

青少年早期升学过渡期内外化问题共发模式及其转变

柳霖¹ 张良¹ 马玉鑫¹ 苗新煜¹ 张文新¹ (通讯作者)

¹ 山东师范大学心理学院, 济南, 250014, zhangwenxin@sdu.edu.cn

摘要 内外化问题与儿童青少年日后适应发展密切相关, 探究内外化问题发展相关因素具有重要意义。鉴于内外化问题发展以及二者间的组合存在一定的个体差异和复杂性, 有必要以个体定向视角进行考察, 以期获得更全面、准确的结果。青少年早期升学过渡期在个体发展阶段中具有特殊性, 内外化问题发展可能表现出更为特别的变化。因此, 本研究聚焦于青少年早期升学过渡期, 采用潜剖面分析(LPA)和潜转变分析(LTA)考察内外化问题共发模式及其稳定性和变化性, 并采用逻辑回归考察各内外化问题共发模式的特点及内外化问题共发模式发展变化的影响因素。本研究以 2136 名小学 6 年级学生及其父亲或母亲为被试, 在初一年级时进行追踪测量。本研究的内外化问题、父母教养(父母温情、专制控制、监控)、家庭社会经济地位均由父母报告, 同伴地位(同伴拒绝、同伴接纳)采用同伴提名法测量。结果发现:(1) 升学过渡期内, 存在四种内外化问题共发模式亚组: 低问题组、低外化-中内化组、高外化-中内化组、中外化-高内化组。(2) 综合升学过渡期前后两个时间点, 父母温情是区分不同内外化问题共发模式最重要、关键的因素。(3) 在升学过渡前后, 各内外化问题共发模式具有中至高水平的稳定性、低至中水平的变化性。(4) 性别、升学过渡期前一时间点的父母温情和同伴拒绝、升学过渡期间父母专制控制变化量、父母温情变化量、同伴拒绝能够影响儿童青少年内外化问题共发模式的转变。本研究结果扩充了本领域的研究发现, 为内外化问题及其共发发展的预防和干预策略的研发提供了理论基础。

Co-occurrence Patterns of Internalizing and Externalizing Problems and their Transitions during the School Transition Period in Early Adolescence

LIU Lin, ZHANG Liang, MA Yuxin, MIAO Xinyu, ZHANG Wenxin

School of Psychology, Shandong Normal University, Jinan 250014

Abstract: It has significant importance to explore the relevant factors of the development of children and adolescent internalizing and externalizing problems, because the close link between these problems and future developmental outcomes. Given the individual differences and complexities in the development of internalizing and externalizing problems and the combination of the both, it is necessary to investigate from the individual-orientated perspective in order to obtain more comprehensive and accurate results. Due to the specificity of the school transition in early adolescence, the development of internalizing and externalizing problems may show special changes. Therefore, this study focusing on the school transition in early adolescence, used latent profile analysis and latent transition analysis to investigate the co-occurrence patterns of internalizing and externalizing problems and their stability and change respectively, and used logistic regression to investigate the characteristics of the co-occurrence patterns of internalizing and externalizing problems and the influencing factors of the changes of the co-occurrence patterns of internalizing and externalizing problems. In addition, this study also examined the relationships between gender and family socioeconomic status and the co-occurrence patterns of internalizing and externalizing problems and their changes. This study recruited 2,136 primary school sixth graders and their parents as participants, who were evaluated again one year later. In this study, internalizing and externalizing problems, parenting (warmth,

authoritarian control, monitoring/supervision) and family socioeconomic status (SES) were all reported by parents, while peer status (peer rejection, peer acceptance) were measured by peer nomination method. Findings were as follows: (1) During the transition into secondary school, there were four co-occurrence patterns of internalizing and externalizing problems: low problem class, low externalizing-medium internalizing class, high externalizing-medium internalizing class, and medium externalizing-high internalizing class. (2) On both time points, parental warmth was the most strong factor to distinguish different co-occurrence patterns of internalizing and externalizing problems. (3) During the transition into secondary school, the co-occurrence patterns of internalizing and externalizing problems had a medium to high level of the stability and a low to medium level of transitions. (4) Gender, parental warmth and peer rejection in the time point before the transition into secondary school, changes in parental authoritarian control, changes in parental warmth, and changes in peer rejection during transition into secondary school could influence the changes of the co-occurrence patterns of internalizing and externalizing problems. The results of this study extended the findings in this field and provided a theoretical basis for the research and development of prevention and intervention strategies for internalizing and externalizing problems and their co-development.

Keywords: school transition, co-occurrence patterns of internalizing and externalizing problems, latent transition analysis, parenting, peer status

小学儿童教师支持、数学态度和数学焦虑的纵向联系： 三年追踪研究

张傲雪¹, 王阳阳¹, 李红霞¹, 高佳¹, 司继伟¹ (通讯作者)

1 山东师范大学心理学院, 济南, 250358, E-mail: sijiwei1974@126.com

摘要 数学焦虑是儿童青少年常见的负性学业情绪之一, 它不仅与消极学业后果关联, 还会导致个体避免选择 STEM (科学、技术、工程、数学) 领域相关工作。为及早预防和减少数学焦虑, 有必要揭示儿童数学焦虑与其潜在的个体与环境影响因素间的动态作用机制。本研究使用感知到的数学教师支持、数学态度和儿童数学焦虑量表, 对 1802 名小学三、四年级儿童进行了为期三年的追踪研究, 通过构建交叉滞后模型, 以揭示儿童感知到的数学教师支持、数学态度和数学焦虑间的交互作用机制。主要研究发现为: (1) 在同一时间点, 儿童感知到的数学教师支持与数学态度呈显著正相关, 与数学焦虑显著负相关, 同时数学态度与数学焦虑呈显著负相关; (2) 数学态度和数学焦虑间存在稳定的双向纵向联系, T1 数学态度显著负向预测 T2 数学焦虑, 同时 T1 数学焦虑显著负向预测 T2 数学态度, 从 T2 到 T3 二者之间的关系呈相同模式; (3) 感知到数学教师支持与数学态度、数学教师支持与数学焦虑间的纵向关系是单向且稳定的, T1 数学教师支持不能预测 T2 数学态度和 T2 数学焦虑, 但 T1 数学态度对 T2 数学教师支持的正向预测和 T1 数学焦虑对 T2 数学教师支持的负向预测均显著, 从 T2 到 T3, 三者间的纵向关系呈相同模式。本研究首次从纵向角度初步揭示了数学教师支持、数学态度和小学儿童数学焦虑间的动态联系, 并强调了数学态度对数学焦虑变化的积极影响, 为后续旨在降低数学焦虑风险的干预实践提供了理论支撑。

1 School of Psychology, Shandong Normal University, Jinan, 250358

Abstract: Math anxiety is one of the most common negative academic emotions in children and adolescents. It is not only associated with negative academic consequences, but also leads individuals to avoid choosing STEM (Science, Technology, Engineering, Mathematics) related work. In order to prevent and reduce math anxiety as soon as possible, it is necessary to reveal the dynamic mechanism between children's math anxiety and its potential individual and

environmental factors. Using the Perceived Math Teacher Support, Attitudes toward Mathematics and Math Anxiety Scale for children, this study tracked 1802 students of grade 3 and 4 for three years, and constructed a cross-lag model to reveal the interaction mechanism among elementary school children's perceived mathematics teacher support, math attitude and math anxiety. The main findings are as follows: (1) Primary school children's perceived math teacher support is positively correlated with attitude toward mathematics, negatively correlated with math anxiety, and there was a significant negative correlation between attitude toward mathematics and math anxiety. (2) The longitudinal relationship between attitude toward mathematics and math anxiety is bidirectional and stable. T1 attitude toward mathematics significantly negatively predicts T2 math anxiety, while T1 math anxiety significantly negatively predicts T2 attitude toward mathematics; from T2 to T3, the relationship between the two shows the same pattern. (3) The longitudinal relationships among perceived math teacher support, attitude toward mathematics and math anxiety is unidirectional and stable. T1 perceived math teacher support can not predict T2 attitude toward mathematics and T2 math anxiety, but the positive prediction of T1 attitude toward mathematics on T2 perceived math teacher support and the negative prediction of T1 math anxiety on T2 perceived math teacher support were significant. From T2 to T3, the longitudinal relationships among the three showed the same pattern. This study reveals the dynamic relationships among perceived math teacher support, attitude toward mathematics and math anxiety from a longitudinal perspective for the first time, and emphasizes the positive impact of attitude toward mathematics on primary school children's math anxiety, which provides theoretical support for the subsequent intervention practice to reduce the risk of math anxiety.

Keywords: Primary school children, math anxiety, perceived math teacher support, attitude toward mathematics

小学儿童父母教育卷入、COMT 基因 rs4680 多态性与数学焦虑的关系

赵晓萌¹ 高佳¹ 张明亮^{1,2} 张傲雪¹ 司继伟¹ (通讯作者)

摘要 为探究 COMT 基因 rs4680 多态性与父亲/母亲教育卷入是否对儿童数学焦虑存在基因与环境交互影响, 使用小学生父母教育卷入行为问卷、儿童数学焦虑量表和 DNA 分型技术, 对山东省潍坊市某小学三到六年级的 594 名小学生及父母进行调查。综合运用传统回归分析和内部验证性分析, 结果表明: (1) 父亲教育卷入和母亲教育卷入的性别主效应显著, 父母对女生数学学习的参与程度明显高于男生; (2) 父亲教育卷入的年级主效应显著, 具体表现为父亲教育卷入在四至六年级上呈显著上升趋势; (3) 儿童数学焦虑的年级主效应显著, 除四、五年级的数学焦虑差异不显著外, 其他年级的数学焦虑两两差异均显著, 整体上呈现出随年级升高而不断降低的趋势; (4) 在父亲教育卷入模型中, 父亲教育卷入的主效应显著, rs4680 多态性对儿童数学焦虑的主效应以及两者交互效应不显著; (5) 在母亲教育卷入模型中, 母亲教育卷入的主效应显著, rs4680 多态性与母亲教育卷入的交互作用对儿童数学焦虑的预测作用显著; (6) 当母亲教育卷入较高时, GG 基因型儿童的数学焦虑水平显著低于 A 等位基因儿童; 当母亲教育卷入较低时, GG 基因型儿童的数学焦虑水平表现出高于 A 等位基因儿童的趋势, 但差异未达到显著性水平。本研究有助于从理论上清晰理解小学儿童数学焦虑变化的成因, 揭示数学焦虑的底层遗传机制, 亦能为实际教育教学提供方向, 便于指导父母和教师在与学生的互动中产生传递有效信息, 形成恰当有效的指导措施。

Abstract: To investigate whether the COMT rs4680 polymorphism and parental involvement have significant gene-environment interactions with children's math anxiety(MA), this study used primary school parental education involvement behavior questionnaire, children's math anxiety scale and DNA typing Technology, surveyed 594 elementary school students and their parents in the third to sixth grades of a primary school in Weifang City, Shandong Province. Combining traditional regression analysis and internal confirmatory analysis, the results show that:(1) The main gender effect of paternal involvement and maternal involvement is significant, and parental involvement in mathematics learning for girls is higher than that for boys; (2)The primary effect of paternal involvement in grades is significant, which is specifically manifested in a significant upward trend in father education involvement in grades four, five, and six; (3)The main effect of children's math anxiety in grades is significant. Except for the difference in math anxiety between fourth grade and fifth grade children, there is a significant difference between the math anxieties of other grades, showing a trend of decreasing with the increase of grade as a whole; (4)In the paternal involvement model, the main effect of paternal involvement is significant, and the main effect of rs4680 polymorphism on children's mathematical anxiety and the interaction between the two is not significant; (5)In the maternal involvement model, the main effect of maternal involvement is significant, and the interaction between the rs4680 polymorphism and maternal involvement has a significant predictive effect on children's mathematical anxiety; (6)When maternal involvement is involved, GG genotype children's math anxiety level is significantly lower than A allele children; when maternal involvement is low, GG genotype children's math anxiety level is higher than A allele children, But the difference did not reach a significant level. This research not only helps to clearly understand the causes of mathematics anxiety changes in elementary school children and to reveal the underlying genetic mechanism of mathematics anxiety in theory, but also can provide directions for practical education and teaching, thus guiding parents and teachers how to produce transmission from interaction with students. Effective information, grasp the potential influencing factors of children's math anxiety, and form appropriate and effective guidance measures.

小学儿童数学焦虑的潜在类别转变及其父母教育卷入效应： 三年纵向考察

郭凯玥 赵晓萌 李红霞 王阳阳 司继伟（通讯作者）

山东师范大学心理学院，济南，250358, sijiwei1974@126.com

摘要 数学焦虑指个体在解决与数学有关的问题时，出现的不安、紧张、畏惧等焦虑状态和负性情绪反应。当代发展心理学家 Lerner 提出的发展情境理论强调个体发展的异质性，Rubinsten 等人(2018)近期提出数学焦虑的生物-心理-社会动态发展模型进一步认为数学焦虑受到个体自身因素(如遗传倾向、神经生理倾向等)与环境因素(如父母教养方式、教师态度)相互作用，处于不断的发展变化之中。但前人数学焦虑研究罕见探索儿童数学焦虑的潜在类别及其随时间的转变情况。本研究采用潜在剖面分析(LPA)和潜在转变分析(LTA)考察小学阶段儿童数学焦虑的潜在类别及其随时间的发展转变情况，并采用逻辑回归考察父母教育卷入在小学儿童数学焦虑类别转变中的作用。以 1720 名三、四年级儿童为被试，对其数学焦虑和感知到的父母教育卷入进行三次追踪，每次间隔一年。将儿童的数学成绩、考试焦虑、年级、性别作为协变量控制。结果表明：(1)小学儿童数学焦虑存在低数学焦虑组、高数学评估焦虑组和高数学获得焦虑组三种异质性类别；(2)随时间的推移，高数学评估焦虑组儿童倾向于向低数学焦虑组转变，高数学获得焦虑组倾向于向高数学评估焦虑组转变，而低数学焦虑组稳定性较强；(3)父亲教育卷入($B = -0.45, SE = 0.15, p = 0.003, OR = 0.64$)和母亲教育卷入($B = -0.94, SE = 0.19, p < 0.001, OR = 0.39$)对儿童数学焦虑由低数学焦虑组向高数学评估焦虑组的转变具有负向预测作用；母亲教育卷入促使儿童数学焦虑由高数学评估焦虑组向高数学获得焦虑组转变($B = 0.52, SE = 0.21, p = 0.01, OR = 1.68$)，该预测效应主要体现在男生身上；父亲教育卷入促使儿童数学焦虑由高数学获得焦虑组向

低数学焦虑组转变($B = 0.66, SE = 0.27, p = 0.02, OR = 1.93$), 该预测效应主要体现在女生身上。本研究从纵向角度首次揭示父亲/母亲教育卷入对儿童数学焦虑类别转变的预测作用, 会因不同的数学焦虑类别而异。上述研究发现为从个体异质性角度看待儿童数学焦虑提供了重要参考。

Transition of Latent Classes of Children's Mathematics Anxiety in Primary School and the Distinctive Effects of Parental Educational Involvement: A Three-wave Longitudinal Study

Kaiyue Guo, Xiaomeng Zhao, Hongxia Li, Yangyang Wang, Jiwei Si

School of Psychology, Shandong Normal University, Jinan 250358

Abstract: Mathematics anxiety refers to the anxiety state, such as anxiety, tension and fear, and negative emotional response when individuals solve mathematics-related problems. Developmental Contextualism proposed by contemporary developmental psychologist Lerner emphasizes the heterogeneity of individual development. Further, the dynamic developmental bio-psycho-social model of mathematical anxiety holds that the interaction between individual factors and environmental factors makes the development of individuals' mathematics anxiety heterogeneity. As individual factors and environmental factors are constantly developing and changing, the developmental trajectories of mathematics anxiety are dynamic. However, there were few studies to examine the latent classes of mathematics anxiety and the development and transitions of it from a longitudinal perspective. Moreover, parental educational involvement as one of important environmental factors might predict the transitions of mathematics anxiety over time. Thus, person-centered approach, including Latent Profile Analysis (LPA) and Latent Transition Analysis (LTA) was used to solve these two problems in this study. 1720 students of grade three and grade four in county primary schools were selected as participants. *Children's Mathematics Anxiety Scale* compiled by Chiu and Henry (1990) and revised by Geng and Chen (2005) and *Questionnaire on Parental Involvement Behavior of Primary School Students* compiled by Wu, Han, Wei, and Luo (2013) were used to measure children's mathematics anxiety and their perceived parental educational involvement separately three times over three years. Children's mathematics achievement, test anxiety, grade and gender were taken as covariates. Some valuable results were obtained as follows. (1) There were three different subgroups of mathematics anxiety in primary school children, including low mathematics anxiety group, high mathematics evaluation anxiety group and high mathematics acquisition anxiety group; (2) As time went by high mathematics evaluation anxiety group tended to change to low mathematics anxiety group, high mathematics acquisition anxiety group tended to change to high mathematics evaluation anxiety group, and low mathematics anxiety group were relatively stability; (3) Father involvement ($B = -0.45, SE = 0.15, p = 0.003, OR = 0.64$) and mother involvement ($B = -0.94, SE = 0.19, p < 0.001, OR = 0.39$) had a negative predictive effect on the transition of children's mathematics anxiety from low math anxiety group to high math evaluation anxiety group. Mother involvement was able to promote the change of children's mathematics anxiety from high mathematics evaluation anxiety group to high mathematics acquisition anxiety group ($B = 0.52, SE = 0.21, p = 0.01, OR = 1.68$), which was mainly in boys. Positive father involvement could promote the change of children's mathematics anxiety from high mathematics acquisition anxiety group to low mathematics anxiety group ($B = 0.66, SE = 0.27, p = 0.02, OR = 1.93$), which was mainly in girls. The findings of this study distinguished the predictive effect of father/mother involvement on the transition of different mathematics anxiety subtypes from a longitudinal perspective. Our findings provide an important reference for viewing children's mathematics anxiety from the perspective of individual heterogeneity.

摘要 以往研究发现, 父母的教养投入对儿童心理及学习适应均有正向预测作用。新冠疫情期间的实证研究也发现, 规律的日常活动可以作为保护因素, 缓冲疫情给儿童带来的不良影响。新冠疫情所造成的学校停课, 使儿童经历了长达一学期的居家学习状态。在这期间, 母亲的教养投入存在哪些表现? 对儿童返校后的行为及心理适应结果会带来哪些影响? 围绕以上问题, 本研究采用追踪设计, 分别在疫情隔离期间(T1: 2020年4月)和一年后(T2: 2021年4月)收集母亲教养投入、学生心理与学习适应以及日常节律数据。研究被试为565名4-8年级学生($M_{age} = 12.77$, $SD_{age} = 1.47$)及其母亲($M_{age} = 39.82$, $SD_{age} = 4.59$)。其中, 母亲报告了疫情期间的教养投入, 以及疫情期间(T1)和返校后(T2)儿童的日常活动节律, 儿童报告了疫情期间(T1)和返校后(T2)的抑郁症状和考试成绩(T2)。结构方程模型结果表明: 1) 在控制了T1的儿童抑郁症状后, 疫情期间母亲的活动休闲投入、学习指导投入, 均可以正向预测疫情期(T1)儿童的日常活动, 并随后正向预测返校后(T2)儿童的日常活动, 进而正向预测儿童返校后(T2)的考试成绩, 负向预测T2的抑郁症状; 2) 疫情期间母亲的活动休闲投入和学习指导投入, 还通过疫情期(T1)儿童的日常活动, 直接正向预测了返校后(T2)儿童的考试成绩, 但这一中介路径在儿童抑郁症状中不显著。研究为了解新冠疫情期间母亲教养投入与儿童后续心理行为发展结果之间的关系提供了实证证据。

The Relationship Between Maternal Involvement in the COVID-19 and Children's Psychological and Academic Adjustment: The Mediation Role of Daily Routines

³ Changning Mental Health Center, Shanghai, China

Abstract: Previous studies suggested that more parental involvement was associated with better academic and psychological adjustment. Studies during the COVID-19 pandemic have also found that regular daily routines acted as a protective factor to buffer children from psychological maladjustment. Due to the closure of schools during the quarantine, children had been studying at home for up to a semester. The current study aims to explore the following questions: which aspect of parental involvement would show during the COVID-19 stay-at-home period? What would be the effects of parental involvement on children's academic and psychological adjustment after students returning to school? Data were collected from 565 students ($M_{age} = 12.77$, $SD_{age} = 1.47$) in grades 4-8 and their mother ($M_{age} = 39.82$, $SD_{age} = 4.59$) during the COVID-19 outbreak (T1: April 2020) and after returning to school (T2: April 2021). Children reported depressive symptoms (T1&T2) and academic achievement (T1). Mothers reported maternal involvement during the COVID-19 stay-at-home period and children's daily routines (T1&T2). The result of the structural equation model found that: 1) after controlling for T1 depressive symptoms of children, maternal involvement in both activity and study positively predicted T1 children's daily routines, which further positively predicted T2 children's daily routines, and then in turn positively predicted T2 children's academic achievement and negatively predicted T2 children's depressive symptoms. 3) Maternal involvement in both activity and study also directly predicted T2 children's academic achievement through T1 children's daily routines. However, this mediation

effect of daily routines was not found in the relationship between maternal involvement and children's depressive symptoms. This study provides empirical evidence to understand the relationship between maternal involvement during the COVID-19 and children's subsequent psychological and behavioral development outcomes.

儿童社交淡漠与抑郁感的发展轨迹： 基于平行潜变量增长模型

丁雪辰¹ 张雯¹ 徐刚敏² (通讯作者) 周楠³

¹ 上海师范大学心理学系, 上海, 200234

² 华东师范大学心理与认知科学学院, 上海, 200062, xugami@sina.com

³ 首都师范大学学前教育学院, 北京, 100048

摘要 社会退缩是指个体从社会交往活动中抽离而表现出独处的行为, 不同水平的社交回避和社交趋近动机的组合将其划分为多种亚型——害羞, 社交回避与社交淡漠, 其中较低的社交回避和较低的趋近动机构成了社交淡漠。已有研究表明, 社交淡漠显著正向预测儿童青少年的抑郁感水平。然而, 很少有研究关注抑郁感对儿童社交淡漠的发展产生的影响, 同时以往研究多是从横断研究的角度出发, 缺乏对两者之间发展轨迹关系的考察。本研究采用自我报告和同伴报告结合的方式, 对 609 名 3~4 年级儿童的社交淡漠和抑郁感水平进行为期 3 年共 3 次的追踪调查, 使用两种追踪数据分析方法探讨社交淡漠和抑郁感之间是否存在相互预测作用及发展轨迹是否存在共变关系。首先, 采用交叉滞后模型考察在控制变量自身稳定性后, 社交淡漠和抑郁感水平在三次测量里是否能够相互预测。研究结果表明: 第一年和第二年的抑郁感水平均能正向预测相应的后测社交淡漠水平; 而第一年和第二年的社交淡漠水平则无法预测相应的后测的抑郁感水平。其次, 采用平行潜变量增长模型探究儿童社交淡漠和抑郁感发展轨迹中起始水平和发展速度之间的关系。结果表明: 抑郁感的起始水平可以正向预测社交淡漠的发展速度, 具体表现为, 当儿童的抑郁感的起始水平较高 (均值之上一个标准差) 时, 社交淡漠上升速度未达显著水平; 而当儿童的抑郁感的起始水平较低 (均值以下一个标准差) 时, 社交淡漠发展速度显著下降。本研究的结果为从发展的视角理解中国儿童社交淡漠与抑郁感之间的动态相互关系提供了有价值的信息, 同时也为儿童社交问题的干预提供一定的指导。

Abstract: Social withdrawal denotes the process by which individuals remove themselves from opportunities for social interaction. Different underlying social-approach and social-avoidance motivations have been proposed to account for the various subtypes of socially withdrawn behaviors. Unsociability is conceptualized as resulting from both low social-approach and low social-avoidance motivations. In Chinese society, unsociability poses a risk to adolescents' psychological adjustment. Studies have shown that unsociable adolescents experience increased psychological adjustment difficulties, including low self-worth, and depressive symptoms and loneliness. However, little is known about the contributions of adjustment experiences to the development of unsociability. Moreover, these studies almost based on cross-sectional design, the dynamic relations between children's unsociability and depression

symptoms have not been tested. This study examined reciprocal contributions between unsociability and depression symptoms as well as their developmental patterns. Longitudinal data were collected once a year from Grade 3 to Grade 4 for 609 children from multiple sources. Results of cross lagged model showed (1) depression symptoms have positive effects on later unsociability, whereas unsociability doesn't have such effects. Parallel process latent growth modeling revealed that (2) initial level of depression symptoms positively associated with the development rate of unsociability. Furthermore, children with higher initial level of depression (1 SD above the mean) had a positive but nonsignificant growth in unsociability, and children with lower initial level of depression (1 SD below the mean) had a negative growth in unsociability. The present study would provide valuable information about the relations between unsociability and depression symptoms from a developmental perspective in a non-Western context.

Keywords: unsociability, depression, latent growth model, longitudinal study

亲子冲突、不良同伴交往与青少年网络游戏成瘾的关系： OXTR 基因 rs53576 多态性的调节作用

梁 俏¹ 喻承甫¹（通讯作者）

广州大学教育学院心理学系，广州，510006，yuchengfu@gzhu.edu.cn

摘 要 根据中国互联网络信息中心（CNNIC）颁布的《2020 年全国未成年人互联网使用情况研究报告》，我国未成年网民规模达到 1.83 亿，玩网络游戏的未成年网民比例高达 62.5%，在工作日和周末玩游戏日均超过 2 小时的未成年人分别为 13.2%和 23.8%。可见，我国拥有庞大的青少年网民规模，并且青少年网民的游戏使用率居高不下。尽管网络游戏已成为人们最流行的休闲娱乐方式，但对身心尚未成熟的青少年而言，过度沉迷于网络游戏很可能发展为网络游戏成瘾（Internet gaming disorder, IGD）。亲子关系是家庭环境系统的重要组成部分，并且亲子关系的发展具有重要的遗传基础。催产素受体基因（oxytocin receptor, OXTR）是亲子关系发展的重要候选基因。已有研究证实亲子冲突是青少年 IGD 的风险因素之一。然而，目前考察亲子冲突是如何影响男女青少年 IGD 的研究非常有限，也甚少研究揭示基因如何与环境交互作用于男女青少年 IGD。基于社会学习理论和基因×环境交互作用视角（G×E），本研究构建了一个有调节的中介模型来检验不良同伴关系是否在亲子冲突与男女青少年 IGD 的关系间起中介作用，以及该中介效应能否被 OXTR 基因 rs53576 多态性所调节。共 469 名青少年匿名参与问卷调查。研究结果发现：1）不良同伴关系在亲子冲突与青少年男生女生 IGD 的关系间起显著的中介作用；2）OXTR 基因 rs53576 多态性在“亲子冲突 → 不良同伴关系 → 女生 IGD”这一中介路径中起调节作用。具体而言，调节效应在 AA 基因型女生中显著，在 AG/GG 基因型女生中不显著，同时，这一调节效应在男生中均不显著。本次研究发现进一步揭示了青少年网络游戏成瘾的影响因素、发生过程和基因遗传机制，为日后干预方案的制定和治疗提供了更多实证依据。

关键词 亲子冲突，不良同伴关系，网络游戏成瘾，OXTR 基因 rs53576 多态性，青少年

Parent-adolescent conflict, deviant peer affiliation and adolescents internet gaming disorder: The moderating role of OXTR gene rs53576 polymorphism

Qiao Liang¹, Chengfu Yu¹

¹ Department of Psychology, School of Education, Guangzhou University, Guangzhou, 510006

Abstract: According to the report of 2020 the China research report on Internet use of minors by China Internet Network Information Center (CNNIC), the number of Chinese underage internet users reached 183 million. Besides, the rate of playing online game account for 62.5%, and the rate of using online game more than 2 hours on workday and weekend account for 13.2% and 23.8%, respectively. It was clear that China had a large number of adolescents internet users, and the utilization rate of game stay high. Internet games have become the most popular way of leisure and entertainment for people. However, for adolescents who physical and psychological development is immature, excessive addiction to internet games is likely to develop into internet gaming disorder (IGD). Parent-adolescent

relationship is an important part of family environment system. Moreover, parent-adolescent relationship has an important genetic basis. The oxytocin receptor (OXTR) is a candidate gene for the development of parent-adolescent relationship. Previous studies have indicated that parent-adolescent conflict was one of the risk factors for adolescent IGD. But there has been limited research examining how parent-adolescent conflict affects IGD in both male and female adolescents. Also, few studies have explored how genes interact with the environment to male and female adolescents with IGD. Based on Social Learning Theory and the perspective of Gene-Environment (G×E) interactions, this study constructs a moderated mediation model to test whether deviant peer affiliation play a mediating role of the association between parent-adolescent conflict and IGD in both male and female adolescents, and this mediating process whether moderated by OXTR gene rs53576 polymorphism. A sample of 469 adolescents anonymously responded to a set of questionnaires. Finally, the current study found that: 1) deviant peer affiliation significantly mediated the association between parent-adolescent conflict and IGD in both male and female adolescents; 2) OXTR gene rs53576 polymorphism could moderated the mediating path of “parent-adolescent conflict → deviant peer affiliation → female adolescent IGD”. Specifically, the moderating effect was significant for female adolescents with AA genotype, while nonsignificant for adolescents with AG and GG genotype. In addition, the moderating effect nonsignificant for male adolescents. The present study further revealed the impact factor, occurrence process and genetic mechanism of adolescent IGD, which provide more empirical evidence for the formulation and treatment of intervention programs in the future.

Keywords : parent-adolescent conflict, deviant peer affiliation, internet gaming disorder, OXTR gene rs53576 polymorphism, adolescent

同伴侵害对青少年抑郁症状的影响： 一般自我概念和友谊亲密性的纵向作用

杨盼盼¹ 符翊雯¹ 马艳歌¹ 赵斯曼² 李丹¹(通讯作者)

1 上海师范大学, 心理系, 上海 200030

摘 要 青少年抑郁是青少年时期的主要精神障碍之一, 探讨青少年抑郁的影响因素具有重要意义。在众多的因素中, 同伴受害对青少年的抑郁产生和发展具有广泛而深远的影响。为了探讨同伴侵害对青少年抑郁症状的长期影响作用及其作用机制, 本研究对 458 名 ($M_{\text{年龄}}=11.34$ 岁, $SD_{\text{年龄}}=0.58$ 岁, 213 名男生) 6 年级的学生进行为期三年的追踪调查。被试分别在六年级、七年级和八年级报告受到欺负、一般自我概念、抑郁症状和友谊亲密度等情况。在此基础上采用 *Mplus* 7.4 软件, 构建纵向的有调节的中介模型。主要数据结果表明: (1) 在控制了性别和抑郁症状的先前水平后, 一般自我概念(T2)在同伴侵害(T1)与青少年的抑郁症状(T3)中起到中介作用, 中介效应量为 0.07, 95%CI [0.03, 0.12]。 (2) 友谊亲密性(T1)在上述中介作用中起着调节作用, $\beta=0.11$, $p<.05$ 。具体来说, 只有当青少年感知的友谊亲密性(T1)水平较低时, 同伴侵害(T1)能通过通过一般自我概念(T2)显著预测其抑郁症状水平(T3), $\beta=0.05$, $p<.05$, 95%CI [0.02, 0.14]。本研究不仅验证了同伴侵害对青少年抑郁症状的长时影响, 更揭示了一般自我概念和友谊亲密性在其中的重要作用, 为预防同伴侵害对青少年心理健康发展的不利影响提供一定的指导和帮助。

How Peer Victimization Influences Chinese Adolescents' Depressive Symptoms: The Longitudinal Effects of General Self-Concept and Friendship Intimacy

Panpan Yang¹, Yiwen Fu¹, Yange Ma¹, Siman Zhao², Dan Li¹ (Corresponding author)

¹Department of Psychology, Shanghai Normal University, Shanghai, China ²Department of Psychology, University of Dayton, Dayton, OH, USA

Abstract: As a major mental disorder during the adolescent period, youth depression is considered a serious public health problem. Therefore, it is salient to investigate the influencing factor of youth depression. Peer victimization is of particular interest among numerous factors as it is associated with depression closely (for a review, Reijntjes et al., 2010). Hence, this study aims to test a conceptual model using a longitudinal design that adolescents' general self-concept mediates the association between peer victimization and depression symptoms and friendship intimacy moderates the relations between peer victimization and general self-concept. Participants were $N = 458$ ($M_{age} = 11.34$ years, $SD_{age} = 0.58$ year, 213 boys at Time 1) sixth-grade students recruited from two randomly selected public schools in Shanghai, People's Republic of China. Adolescents reported on peer victimization, general self-concept, friendship intimacy, and depressive symptoms when they were in sixth grade, seventh grade, and eighth grade respectively. The main results show that (1) After controlling gender and previous depressive symptoms levels, peer victimization at Time 1 could predict adolescents' depressive symptoms at Time 3 through general self-concept at Time 2, the mediating effect is 0.07, 95%CI [0.03, 0.12]. (2) Friendship intimacy at Time 1 played a moderating role in the indirect pathway from peer victimization at Time 1 to depressive symptoms at Time 3 through general self-concept at Time 2, $\beta = 0.11$, $p < .05$. To be specific, the mediating role of general self-concept was only significant among adolescents who had lower friendship intimacy levels, $\beta = 0.05$, $p < .05$, 95%CI [0.02, 0.14]. Figuring out the mechanism underlying how peer victimization influence adolescents' depression symptom could provide efficient guidance and help for the implementation of intervention plans.

Keywords: peer victimization, general self-concept, depressive symptoms, friendship intimacy, longitudinal moderated mediation model.

同伴关系、社交自我概念和抑郁症状之间的双向关联： 一项 5 年纵向研究

摘要 同伴关系与抑郁症状间存在双向关联, 但两者间存在的潜在作用机制尚不清晰。现有理论和研究表明, 同伴关系与社交自我概念及社交自我概念与抑郁症状间存在双向关联。但鲜有研究考察三者间动态单向或双向影响及三者间可能存在的间接影响。基于此, 本研究以 1952 名五年级儿童为被试 (平均年龄 11.31 ± 0.49 岁; 男生 1009 名), 进行每年一次, 持续时间五年的追踪调查, 考察同伴关系、社交自我概念与抑郁症状间的纵向关联及其性别差异、年龄差异。采用同伴提名法测量同伴拒绝, 自我报告法测量同伴侵害、社交自我概念和抑郁症状。交叉滞后模型结果发现: (1) 5 年级和 8 年级的同伴侵害能够预测随后一年的抑郁症状, 5~8 年级的抑郁症状均能够预测随后一年的同伴侵害, 未发现同伴拒绝与抑郁间联系; (2) 6 年级的社交自我概念能够预测 7 年级的同伴拒绝, 5、7、8 年级的社交自我概念能预测随后的同伴侵害, 未发现同伴关系对社交自我概念的预测; (3) 社交自我概念与抑郁症状间存在双向关联; (4) 抑郁能够通过社交自我概念影响同伴拒绝, 未发现同伴拒绝通过社交自我概念影响抑郁; (5) 抑郁能够通过社交自我概念影响同伴侵害, 未发现同伴侵害通过社交自我概念影响抑郁。模型未发现三者关系的性别差异和年龄差异。本研究发现了抑郁通过社交自我概念间接影响同伴关系, 为症状驱动假说提供了证据。

Abstract: There are reciprocal associations between peer relationships and depressive symptoms, but the potential mechanisms of these associations are still unclear. Existing theories and research indicated that peer relationships were bidirectional associated with social self-concept, social self-concept was bidirectional associated with depressive symptoms. However, there is a dearth of research investigating dynamic unidirectional or bidirectional effect and indirect effect among peer relationships, social self-concept, and depressive symptoms. Participants were 1,952 children (Mage = 11.3 ± 0.49 years; 1,099 boys) being followed from Grade 5 to Grade 9 annually. Peer rejection was measured by peer nomination, peer victimization, social self-concept, and depressive symptoms were measured by self-report. Results from cross-lagged model were as follows: (1) peer victimization at Grade 5 and Grade 8 predicted subsequent depressive symptoms, depressive symptoms from Grade 5 to Grade 8 predicted subsequent peer victimization, but no association was found between peer rejection and depressive symptoms; (2) social self-concept at Grade 6 predicted subsequent peer rejection, social self-concept at Grade 5, 7, and 8 predicted subsequent peer victimization, but peer relationships did not predict social self-concept was found; (3) social self-concept were bidirectional associated with depressive symptoms; (4) depressive symptoms had indirect effect through social self-concept on peer rejection, no indirect effect was found that peer rejection predicted depressive symptoms via social self-concept; (5) depressive symptoms predicted peer victimization via social self-concept, no indirect effect was found that peer victimization predicted depressive symptoms via social self-concept. The model found no gender or age differences among peer relationships, social self-concept, and depressive symptoms. This study found depressive symptoms predicted peer relationships via social self-concepts, these results provided evidence for the symptom-driven hypothesis.

儿童青少年同伴侵害与敌意归因的关系--一项交叉滞后分析

李雪琳 陈亮(通讯作者) 潘斌 张文新

1 山东师范大学心理学院, 济南, 250014

2 山东师范大学儿童青少年发展研究院, 济南, 250014, chen_liang1010@126.com

摘要 同伴侵害 (Peer Victimization) 是指个体遭受同伴攻击的经历。敌意归因 (Hostile Attribution Bias) 是指在模糊的激惹情境中个体对他人的意图做出敌意解释的倾向。敌意归因与同伴侵害间存在显著正向关联。然而, 目前尚缺乏考察二者间关系方向的纵向研究。遭受同伴侵害的经历可能会使个体建构不信任的图式, 这种不信任的图式会使儿童青少年在模糊的激惹情境中对同伴的意图做出敌意解释。敌意归因也可能预测同伴侵害, 具有敌意归因的儿童往往会表现出损害同伴群体功能的攻击或其它问题行为, 使得周围同伴可能会通过攻击的方式惩罚这些儿童, 故而遭受同伴侵害。此外, 同伴侵害和敌意归因间的关系还可能存在类型特异性。本研究以 1015 名 4、7 年级的儿童青少年 (平均年龄 13.33±1.55 岁, 男生 536 人, 四年级 505 人) 为研究对象, 进行间隔一年的短期追踪测量, 采用交叉滞后分析考察同伴侵害和敌意归因间的关系方向及其性别差异、学段差异。采用自我报告与同伴提名对同伴侵害进行测量, 采用自我报告对敌意归因进行测量。结果发现, 自我报告和同伴提名的同伴侵害均能显著预测下一个时间点的敌意归因, 但敌意归因不能显著预测随后的同伴侵害。同伴侵害与敌意归因之间的关系不存在类型特异性。同伴侵害与敌意归因之间的关系具有跨性别与学段的一致性。本研究结果提示我们, 同伴侵害是影响个体认知发展的重要风险因素, 它会使儿童青少年对世界及周围的环境抱有消极看法。故而干预研究者应对此高度重视, 否则可能会影响对儿童青少年

世界观、价值观的培养，长此以往导致个体反社会等不良行为的发生发展。同时，敌意归因并非是个体的遭受侵害的致因，因此将遭受侵害的原因仅归咎于儿童青少年自身的做法不值得提倡。

A Cross-Lagged Analysis of Associations between Peer Victimization and Hostile Attribution Bias

LI Xuelin, CHEN Liang, PAN Bin, ZHANG Wenxin

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan 250014

Abstract: Peer victimization refers to children's experience of being a target of aggressive behavior from peers. Hostile attribution bias (HAB) is a tendency to interpret the intent of others as hostile in ambiguous situations. Existing studies have shown that there is a positive correlation between peer victimization and HAB. However, because of the lack of longitudinal studies, it is unclear the relational direction of them. The experience of peer victimization may cause a change in schema, for example, one's beliefs about trust, which may lead to the attribution of hostility in ambiguous provocative situations. HAB may also predict peer victimization. Children with hostile attributions tend to show maladjusted behavior such as aggression. As a result, they may be less socially accepted and more likely to be the targets of peer victimization. Furthermore, the relationship between peer victimization and HAB may be type-specific. Participants included 1015 fourth and seventh grade students (mean age=13.33±1.55 years old at wave 1, 536 males, 505 fourth graders). This study used one-year short-term longitudinal design and cross-lagged modeling to examine the relational direction between HAB and peer victimization. Meanwhile, gender differences and grade difference in associations between peer victimization and HAB were also taken into account. Peer victimization was rated by self-report and peer nomination; HAB was measured by self-report. Findings were as follows: Both self-report and peer nomination of peer victimization at time 1 could predict subsequent HAB; but HAB couldn't predict subsequent peer victimization. There was no type-specific relationship between peer victimization and HAB. The relationship between peer victimization and HAB had no significant gender difference and no grade difference. The results of this study suggest that peer victimization is an important risk factor for cognitive development. It will make individuals hold a negative view of the world and the surrounding environment. If no attention and intervention is paid to this, it may even affect the world outlook and values of children and adolescents, and in the long run, individuals will have anti-social and other negative behaviors. At the same time, the HAB is not the antecedent of peer victimization, therefore, schools, teachers should pay attention to that it is not worth advocating to attribute the victimization to children and adolescents themselves.

2 华南师范大学政治与行政学院，广州，510631

摘要 孤独感、抑郁症状和社交焦虑是儿童和青少年最常见的内化问题，这些内化问题经常同时发生，这种同时发生预示着更低的心理社会功能（例如，自杀风险的增加）。自杀意念被认为是自杀行为的主要前兆。自杀的逃避理论认为，负面情绪（例如抑郁症状）与自杀意念有关。此外，自杀的人际理论认为，与不良人际关系相关的归属感受挫（例如，孤独和社交焦虑）会增加一个人的自杀风险。然而，关于青少年向青春期

过渡期间孤独感、抑郁症状和社会焦虑的共同发展轨迹，以及确定的轨迹如何与随时间变化的自杀意念相关，我们知之甚少。因此，本研究旨在确定(a)从童年中期到青春早期早期的孤独感、抑郁症状和社交焦虑的异质性共同发展轨迹，以及(b)所确定的不同轨迹与青少年随时间变化的自杀意念的关系。来自中国南方地区的643名小学生参加了六次重复测量。第一次测量时间的平均年龄为9.01岁，SD=0.75，男生占55.2%。结果表明，孤独感、抑郁症状和社交焦虑存在五种不同的联合发展轨迹：一致低组（孤独感、抑郁症状和社交焦虑最初是低水平，随后下降；占总体45.1%）、中等偏低，且以孤独感和抑郁症状为主组（孤独感、抑郁症状最初是中等水平，随后稳定；而社交焦虑最初是低水平，随后稳定；占总体15.7%）、中等，且以孤独感和抑郁症状为主组（孤独感和抑郁症状随时间推移先上升后下降，但仍保持在较高水平；而社交焦虑症状一直保持中等水平；占总体4.2%）、中等偏低，且以社交焦虑为主组（孤独感和抑郁症状最初是低水平，随后稳定或下降；而社交焦虑最初是中等水平，随后增加；占总体24.9%）、一致高组（孤独感、抑郁症状和社交焦虑最初是高水平，随后稳定或增加；占总体10.1%）。持续经历两到三种内化问题的青少年的自杀意念水平最高，持续经历一种主要内化问题的青少年的自杀意念水平是次高，持续经历三种低水平的内化问题的青少年的自杀意念最低。研究结果对于内化问题和自杀意念的预防和干预工作具有重要启示。

Co-Developmental Trajectories of Loneliness, Depressive symptoms, and Social Anxiety from Middle Childhood to Early Adolescence and Their Relationship with Suicidal Ideation

Abstract: Loneliness, depressive symptoms and social anxiety are among the most prevalent internalizing problems in children and adolescents. These internalizing problems often co-occur, and this co-occurrence indicates lower psychosocial functioning (e.g., an increased risk of suicide). Suicidal ideation is considered to be a major precursor of suicidal behaviors. The escape theory of suicide suggests that negative emotions (e.g., depressive symptoms) are related to suicidal ideation. Moreover, the interpersonal theory of suicide posits that thwarted belongingness associated with poor interpersonal relationships (e.g., loneliness and social anxiety) contributes to one's risk for suicide. Nevertheless, little is known about the co-developmental trajectories of loneliness, depressive symptoms, and social anxiety among youth during the transition into adolescence and how identified trajectories are associated with time-varying suicidal ideation. This study thus aimed to determine the (a) heterogeneous co-developmental trajectories of loneliness, depressive symptoms, and social anxiety from middle childhood to early adolescence, and (b) associations between the identified, distinct trajectories and youth's time-varying suicidal ideation. A total of 643 elementary school students from southern China completed six repeated measures. The average age of participants at the first wave was 9.01 years, SD = 0.75, and boys accounted for 55.2% of sample. Five distinct joint developmental trajectories of loneliness, depressive symptoms and social anxiety were found: the congruent-low group (loneliness, depressive symptoms, and social anxiety are initially low and subsequently decreasing, accounting for 45.1% of the total), the moderately low with predominant loneliness and depressive symptoms group (loneliness and depressive symptoms are initially moderate and subsequently stable, whereas social anxiety are initially low and subsequently stable, 15.7%), the moderate with predominant loneliness and depressive symptoms group (loneliness and depressive symptoms are initially increasing followed by a slight decrease, but still remained at a relatively high level, whereas social anxiety is initially moderate and subsequently stable, 4.2%), the moderately low with predominant social anxiety group (loneliness and depressive symptoms are initially low and subsequently stable or decreasing, whereas

social anxiety is initially moderate and subsequently increasing, 24.9%), the congruent-high group (loneliness, depressive symptoms, and social anxiety are initially high and subsequently stable or increasing, 10.1%). The highest suicidal ideation was observed among adolescents who persistently experienced two or three internalizing problems, followed by those who persistently experienced one predominant internalizing problem, and finally, adolescents who persistently experienced low levels of all three types of internalizing problems. These findings have important implications for the prevention and intervention of internalizing problems and suicidal ideation.

二孩家庭父母偏爱的特点及其与青少年问题行为的关系

罗芮¹ 赵云燕² 何然² 王耘¹ 陈福美² (通讯作者)

1 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875

2 北京师范大学中国基础教育质量监测协同创新中心, 北京, 100875, chenfumei@bnu.edu.cn

摘要 随着二孩家庭的逐渐增多, 父母偏爱日益受到社会各界的关注。父母偏爱是指父母教养或被认为教养某一个或某几个子女的方式更加积极(Brody et al., 1998), 是一种普遍存在的消极教养现象(Oliver & Pike, 2018)。本研究以 1655 名二孩家庭的青少年为研究对象, 其中男孩 751 名(占 45.4%)、女孩 904 名(占 54.6%), 大孩 1015 名(占 61.3%)、二孩 640 名(占 38.7%), 被试平均年龄为 13.18 岁($SD = 1.34$), 同胞年龄差为 7.05 ± 3.52 岁。研究采用同胞差异经历量表 (SIDE-C) 分别对父亲偏爱和母亲偏爱进行测量, 儿童抑郁量表(简版) (CDI-S) 以及攻击行为问卷 (AQ) 分别对青少年抑郁和攻击行为进行测量。结果发现: (1) 二孩家庭中, 父亲偏爱和母亲偏爱的整体水平均较低, 且二者没有显著差异; (2) 父、母偏爱均存在显著的群体差异, 具体表现为: 男孩报告父母更偏爱自己, 女孩报告父母更偏爱同胞; 大孩报告父亲偏爱自己, 母亲偏爱同胞, 二孩报告父亲偏爱同胞, 母亲偏爱自己; 高同胞年龄差组(10 岁以上, 占 14.1%) 青少年报告父母更偏爱自己, 中(6-10 岁, 占 53.4%)、低(0-5 岁, 占 31.6%) 同胞年龄差组青少年则均报告父母更偏爱同胞; (3) 在控制青少年性别、年龄、家庭 SES 之后, 父亲偏爱和母亲偏爱均对青少年问题行为有显著影响, 且与青少年问题行为的关系均为不规则 U 型曲线关系: 当父母偏爱同胞或中高程度偏爱自己时, 青少年问题行为水平均较高; 当父母较低程度偏爱自己时, 青少年问题行为水平最低。

The Characteristics of Parental Favoritism in Two-child Families and Its Relationship with Adolescents' Behavior Problems

Rui Luo¹, Yunyan Zhao², Ran He², Yun Wang¹, Fumei Chen²

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, China

2 Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, China

Abstract: With the implementation of the universal two-child policy, the number of two-child families in China has been increasing. At the same time, the problems of parental favoritism that followed has become increasingly serious. Parental favoritism is a common phenomenon in which parents treat, or are perceived to treat one or some of their children more positively than their other children (Brody et al., 1998). Data in this study were collected from 1655 adolescents from two-child families who were in grades 7 to grades 10. And the sample includes 751 boys and 904 girls, and 1015 older siblings and 640 younger siblings. The mean age of these participants was 13.18 years ($SD =$

1.34). The sibling age difference was 7.05 ± 3.52 years. Parent favoritism was measured by Sibling Inventory of Differential Experience-Chinese Version (Daniels & Plomin, 198; Ong & Tan, 2018). Aggressive behavior was measured using the Aggression Questionnaire (Bush & Perry 1992), and depression was measured using the Children's Depression Inventory-Short Version (Kovacs, 1992). The main findings are as follows: (1) There was no significant difference between paternal favoritism and maternal favoritism, and both paternal favoritism and maternal favoritism were in a lower level. (2) There were significant group differences in maternal and paternal favoritism. The specific manifestations were as follows: a) boys reported that parents favor themselves more, while girls reported that parents favor their siblings more; b) first-born children reported that father favors themselves more while mother favor their siblings more, in contrast, second-born children reported that father favor their siblings more and mother favor themselves more; c) adolescents in large-sibling-age-difference group reported that parents favor themselves more, and the adolescents in middle-sibling-age-difference group and small-sibling-age-difference group reported that parents favor their siblings more. (3) Both paternal favoritism and maternal favoritism had significant effects on adolescents' behavior problems, and their relationship with adolescents' behavior problems both were partial U-curvilinear. Parenting that both strongly favors and strongly disfavors the adolescents was associated with higher levels of behavior problems, compared with the more moderate range of parental favoritism.

同性恋者内化同性恋嫌恶与孤独感的关系： 一个有调节的中介模型

姜雯宁，丁雯，王利源，廖祥瑞，赵卫国（通讯作者）

山东师范大学心理学院，济南，250014，zhaoweiguo@sdu.edu.cn

摘 要 内化同性恋嫌恶是指同性恋者经历对外界偏见的内化过程后，所形成的对自身性取向的负性态度。作为在同性恋群体中广泛存在的一种典型心理特征，内化同性恋嫌恶是损害同性恋者心理健康的关键因素，其中孤独感是高内化同性恋嫌恶群体普遍存在的心理健康问题。社会生态视角强调从社会文化的角度去探究同性恋者心理健康作用机制。在中国“严父慈母”的传统教养观念下，父亲拒绝和母亲过度保护可能是同性恋群体面临的两种典型的家庭教养环境。母亲守门员效应认为母亲的教养态度与行为对父亲教养投入有重要的影响。基于此，本研究建立了有调节的中介模型，考察了父亲拒绝在内化同性恋嫌恶与同性恋者孤独感关系间的中介作用，以及该过程是否受母亲过度保护的调节。通过问卷调查法，使用内化同性恋嫌恶量表、孤独感量表和父母教养方式问卷简式中文修订版对 229 名同性恋者进行调查，结果发现：(1)在控制性别、年龄、父母婚姻状况和家庭社会经济地位后，内化同性恋嫌恶与孤独感呈显著正相关；(2)父亲拒绝在内化同性恋嫌恶与孤独感之间起部分中介作用；(3)母亲过度保护调节了父亲拒绝中介内化同性恋嫌恶与孤独感关系的前半段路径，即相对于低水平的母亲过度保护，高水平的母亲过度保护会加剧父亲拒绝教养。因此，同性恋群体内化同性恋嫌恶对孤独感的影响是有调节的中介效应。本研究在同性恋群体内化同性恋嫌恶与孤独感的关系中验证了母亲守门员效应，启示母亲应给予父亲更多参与子女教育的机会，避免因过度关爱导致“关门效应”出现，为同性恋群体营造支持性的家庭环境，从而帮助其健康成长提供了理论支撑。

Internalized Homophobia and Loneliness in Homosexuals: A Moderated Mediation Model

JIANG Wenning, DING Wen, WANG Liyuan, LIAO Xiangrui, ZHAO Weiguo

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract : Internalized homophobia refers to the negative attitude of homosexuals towards their own sexual orientation after the internalization of external prejudice. As a typical psychological feature widely existing in homosexuals, internalized homophobia is the key factor to damage the mental health of homosexuals, and loneliness

is a common mental health problem of highly internalized homophobia groups. From the perspective of social ecology, it is emphasized to explore the mechanism of mental health of homosexuals from the perspective of social culture. Under the traditional Chinese upbringing concept of "strict father and loving mother", the father's rejection and the mother's overprotection may be two typical family upbringing environments faced by homosexuals. The maternal gatekeeping effect suggests that maternal parenting attitude and behavior have an important influence on father's parenting investment. Based on this, this study established a moderated mediation model to examine the mediating role of father's rejection in the relationship between internalized homophobia and loneliness in homosexuals, and whether this process was moderated by mother's overprotection. A sample of 229 homosexuals completed measures of Internalized Homophobia Scale, Loneliness Scale and Simplified Chinese Revision of Parenting Style Questionnaire (s-EMBU-c). The results showed that: (1) after controlling for gender, age, parental marital status and family socioeconomic status, there was a significant positive correlation between internalized homophobia and loneliness; (2) father's rejection was a partial mediator between internalized homophobia and loneliness; (3) maternal overprotection moderated the first half of the pathway of paternal rejection mediating the relationship between internalized homophobia and loneliness, that is, compared with low-level mother's overprotection, high-level mother's overprotection would aggravate father's rejection. This study verified the maternal gatekeeping effect in the relationship between internalized homophobia and loneliness in the homosexuals, enlightened that the mother should give the father more opportunities to participate in children's education, avoid the "closed door effect" caused by excessive care, and provided theoretical support for the homosexuals to create a supportive family environment, so as to help them grow up healthily.

Keywords: homosexuals, internalized homophobia, loneliness, father's rejection, maternal overprotection

学业压力、自尊与青少年非自杀性自伤行为： 催产素受体基因 rs53576 多态性的调节作用

陈沛 喻承甫 聂衍刚（通讯作者）

广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn

摘要 非自杀性自伤（nonsuicidal self-injury, NSSI）是指在没有致命意图的情况下对身体组织做出故意的、直接的、不被社会接受的危害性行为，已成为当前全球性重大公共卫生问题。学业压力作为一种慢性压力源，是青少年非自杀性自伤的重要诱因，但是迄今对其内在作用机制尚不清楚。随着个体易感性研究深入到基因层面，越来越多的研究强调探究基因影响青少年非自杀性自伤的发展机制的重要性。最近研究表明，催产素受体（the oxytocin receptor gene, OXTR）基因 rs53576 多态性可能决定青少年受学业压力影响的程度。为进一步了解学业压力对青少年非自杀性自伤的影响机制以及遗传易感性，本研究选取广东省广州市和东莞市的两所普通中学的 469 名初中生作为研究对象（ $Mean_{age}=13.31$ 岁， $SD=0.47$ ）进行研究，考察自尊在学业压力与青少年非自杀性自伤的关系中的中介作用，以及催产素受体基因 rs53576 多态性在这一关系中的调节作用。研究结果显示：（1）自尊在学业压力与青少年非自杀性自伤的关系中起中介作用；（2）rs53576 多态性显著调节“学业压力→自尊→青少年非自杀性自伤”，具体表现为，AA 基因型青少年的学业压力能够显著降低自尊水平，进而增加 NSSI 的风险；而在 GG、GA 型青少年中，该中介路径不显著。本研究将有助于我们较为深刻地了解学业压力对青少年的非自杀性自伤的作用机制，为实际中的青少年非自杀性自伤干预方案研究提供了科学的指导意义。

Academic Stress and Adolescent Nonsuicidal Self-injury: A Moderated Mediation Model

Pei Chen, Chengfu Yu, Yangang Nie

Department of Psychology/Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou 510006

Abstract: Nonsuicidal self-injury (NSSI) is defined as repetitive, intentional, direct injury of one's body tissue without suicidal intent, that is not socially accepted. It has become a serious global public health problem. As a chronic pressure, academic stress is an important risk factor of adolescent NSSI. However, the mechanism underlying the relationship between academic stress and adolescent NSSI is still unclear. As the study of individual susceptibility has gone deep into the level of gene, there is increasing evidence for the importance of gene in understanding the etiology of adolescent NSSI. Recent research has suggested that the oxytocin receptor (OXTR) gene rs53576 polymorphism could determine the degree to which adolescents are influenced by academic stress. In order to have a deep understanding of the mechanism and genetic susceptibility between academic stress and adolescent NSSI, the current study surveyed 469 teenagers ($Mean_{age}=12.81$ years, $SD=0.47$) in Guangzhou, Dongguan city to verify the mediating role of self-esteem and the moderating role of OXTR gene rs53576 polymorphism in the relationship between academic stress and adolescent NSSI. The results showed that: (1) self-esteem played a mediating role in the relationship between academic stress and adolescent NSSI; (2) this mediating mechanism was moderated by the OXTR gene rs53576 polymorphism, for adolescents with AA genotypes, academic stress was related to lower levels of self-esteem, which increased adolescent NSSI. However, this mediation effect was not observed among adolescents with GG and AG genotype. The current study contributed us to have a deeper understanding of the role of academic stress on adolescent NSSI, and provided scientific guidance for the study of adolescent NSSI intervention programs in practice.

3 国民心理健康评估与促进协同创新中心, 天津, 300074, linlin@tjnu.edu.cn

摘 要 青少年时期是个体发展和成熟的关键时期, 经历着心理、生理等多方面的改变。已有研究表明在青少年这个特殊时期, 抑制控制的神经回路处于一个重要的发展阶段。冲动性是与抑制控制能力相关的一种人格特质, 其基本特征是对行为的负面后果敏感性较低、倾向于在充分加工信息前做出快速、无计划的反应、不考虑行为的长期后果。已有研究研究表明, 冲动性水平与青少年时期的多种问题行为密切相关, 但这些研究大多局限于局限于冲动性均值的比较, 而较少考虑到动态的发展变化。鉴于此, 本研究试图探究中国青少年冲动性的发展轨迹及其影响因素。研究以天津市某中学 210 名中学生为研究对象, 使用 Barratt 冲动性量表, 进行了间隔半年、为期一年半的三次追踪调查。首先构建无条件潜变量增长模型检验冲动性的变化趋势; 然后, 采用潜类别增长曲线分析确定冲动性发展变化的亚群组; 最后, 采用多元逻辑斯蒂回归的方法考察家庭环境亲密性、家庭环境矛盾性等因素对亚群组的影响。结果显示: (1) 各测量时间点的冲动性呈显著正相关; (2) 初中 1~2 年级青少年的冲动性水平随年龄不断增长, 总体呈现线性递增趋势; (3) 冲动性的发展变化存在 3 个起始水平及变化速度不同的亚群组, 分别为恒高组、恒低组和居中升高组; (4) 家庭环境亲密性对恒低组和居中升高组的预测作用显著; 教师支持对恒高组和居中升高组的预测作用显著; 教师支持对恒低组和居中升高组的预测作用显著。这些结果说明, 青少年冲动性的变化遵循不同的发展轨迹, 且家庭环境和学校环境是重要的影响因素, 因此应从以上两方面预防青少年与冲动性相关的问题行为的发生。

Abstract: Adolescence is a critical period of individual development, experiencing changes in psychology, physiology and other aspects. Previous studies have shown that the neural circuits of inhibition control are in an important stage of development in this special period of adolescence. Impulsivity is a multidimensional construct characterized by deficiencies in self-control or delayed gratification, often times resulting in rash and hasty behaviors. While there are arguably multiple ways to define the construct, the most common definition describes impulsivity as a trait characterized by the tendency to act on the spur of the moment and to neglect planning for the future. Although earlier research regarded impulsivity as stable traits across time, emerging findings from longitudinal and cross-sectional research are beginning to provide evidence of its dynamic nature. This study aimed to examine the trajectory of impulsivity in Chinese adolescents and its influencing factors. A longitudinal study was conducted with 210 Chinese adolescents. Their impulsivity were examined, and three waves of data were collected. The impulsivity at each point was significantly positively correlated. The impulsivity of junior high school adolescents showed a linear growth trend. There were three subgroups with different starting levels and varying rates of change, they are high group, low group and elevated group. Family environment intimacy had a significant predictive effect on the low group and elevated group. Teacher support had a significant effect on the prediction of high group and elevation group. Teacher support had a significant predictive effect on the low group and high group. These results indicate that impulsivity changes in adolescents follow different developmental trajectories and family environment and school environment are important influencing factors, so the occurrence of impulsive-related problem behaviors in adolescents should be prevented from the above two aspects.

Keywords: impulsivity, trajectory, subgroups, family environment, school environment

压力性生活事件、抑郁症状对青少年睡眠问题的影响： 情绪调节的保护作用

刘婷¹（通讯作者） 张卫²

1 华南师范大学心理学院，广州，510631, tingliu@m.scnu.edu.cn

2 华南师范大学心理学院，广州，510631

摘要 由于容易受到来自社会、学校、家庭和同伴的压力，青少年出现了许多健康问题，睡眠问题就是其中之一。近年来，青少年睡眠问题受到越来越多的关注，而压力性生活事件被发现是睡眠问题的一个风险因素。作为压力的量化概念，压力性生活事件涵盖了来自经济、工作、学习、社会关系、身体和精神疾病等领域的各种负性经历。然而，已有研究在解释压力性生活事件和青少年睡眠问题之间的作用机制方面，仍然存在很大的缺口。根据压力和疾病的阶段模型，基于大脑的压力评估可能通过情感和认知影响与健康有关的行为。因此，本研究提出，抑郁症状是压力性生活事件和青少年睡眠问题之间关系的中介因素。但是并非所有遭受压力性生活事件的大学生都会发展成抑郁症状，情绪调节是可以缓解这一路径的一个保护因素。本研究从中国广东省三所高校中招募了 356 名大学生（36.3%为男性，平均年龄=18.33 岁）匿名填写关于生活压力事件、抑郁症状、情绪调节和睡眠问题的量表。在控制了性别、年龄和社会经济地位之后，结构方程模型结

果显示, 抑郁症状部分中介了生活压力事件和睡眠问题之间的关系, 而情绪调节缓冲了压力性生活事件对抑郁症状的负面影响。也就是说, 抑郁症状是压力性生活事件与青少年睡眠问题关联的一种中介机制, 而情绪调节则影响这一机制。在了解了基本机制后, 我们建议促进情绪调节在预防和干预压力性生活事件和睡眠问题中的潜在作用。

Stressful life events, depressive symptoms and adolescent sleep problems: The protective effect of emotion regulation

Ting Liu, Wei Zhang

School of Psychology, South China Normal University, Guangzhou, 510631

Abstract: Vulnerable of stressors from society, school, family and peers, adolescents suffer from many health problems, and one of which is sleep problems. Adolescent sleep problems have received increasing attention in recent years, and stressful life events have been found to be a risk factor for sleep problems. As a quantitative construct for stress, stressful life events cover various adverse social environmental experiences coming from economic circumstances, work and academic fields, social relationships, physical and mental diseases, or other domains. However, there remains a large gap in examining factors that might explain or affect the association between stressful life events and adolescent sleep problems. According to the stage model of stress and disease, brain-based stress appraisals may affect health-relevant behaviors via affective responses and higher-level cognitions. Thus, the current study proposed depressive symptoms as the mediator of the association between stressful life events and adolescent sleep problems. Although stressful life events represent general risk factors for depression, not all university students who suffer from stressful life events will develop into depressive symptoms. Emotion regulation is one protective factor which could alleviate this path. A sample of 356 Chinese university students (36.3% males, mean age = 18.33 years, SD = 0.57) completed anonymous questionnaires regarding stressful life events, depressive symptoms, emotion regulation and sleep problem. Gender, age and socioeconomic status were included as covariates in the analyses. Structural equation models showed that depressive symptoms partially mediated the association between stressful life events and sleep problems. Meanwhile, emotion regulation buffered the negative effects of stressful life events on depressive symptoms. The findings suggest that depressive symptoms act as one mechanism by which stressful life events may be associated with adolescent sleep problems, and emotion regulation affects this mechanism. After understanding the underlying mechanism, we suggest a potential role of promoting emotion regulation in the prevention and intervention of stressful life events and sleep problems.

Keywords: stressful life events, sleep problems, depressive symptoms, emotion regulation

青少年情绪耗竭与自我同情的纵向关系

陈彦羽 张宝山 (通讯作者)

陕西师范大学, 西安, 710062, zhangbs@snnu.edu.cn

摘要 自我同情是指个体以宽容和理解的态度看待挫折和不幸, 始终保持着对自我的友善和关切, 对个体的身心健康有着重要的保护作用。然而, 对于青少年而言, 他们往往面临着繁重的学业压力, 易引发情绪耗竭, 这已经被证明是青少年学业倦怠的开端。近年来, 有研究者提出, 高水平的倦怠可能会导致个体自我同情水平的下降, 然而并没有研究关注情绪耗竭这个学业倦怠的核心成分和自我同情不同维度之间的关系, 更没有研究从纵向发展的角度对两者间的关系进行探讨。基于此, 本研究采用短期纵向设计, 通过潜变量增长模型检验了情绪耗竭和自我同情的三个维度 (自我宽容、普遍人性、正念) 在一个完整的学习周期内的具体发展轨迹, 以及情绪耗竭的发展对自我同情各维度发展的纵向影响。本研究从西安市 3 所中学共招募到 427 名初中生进行间隔 2 个月的 3 次追踪调查, 让他们分别在开学前、期中考试前和期末考试前报告他们的情绪耗竭和自我同情水平。结果发现, 从学期开始到学期结束, 青少年的情绪耗竭随着时间的推移呈线性增长,

而自我宽容和正念则随着时间的推移呈线性递减趋势。再者，情绪耗竭的初始水平能够负向预测自我宽容、正念的初始水平，情绪耗竭的发展速度能够显著负向预测自我宽容、正念的发展速度。最后，情绪耗竭的初始水平能够负向预测自我宽容的发展速度。综上，本研究得出结论，从学期开始到学期结束，青少年感知到的情绪耗竭水平显著提升，自我宽容、正念水平显著下降，并且高水平的情绪耗竭可能是青少年自我宽容水平下降的原因。这提示我们，通过减少青少年的情绪耗竭，能够提高他们的自我同情水平，并进一步促进他们的身心健康发展。

The Longitudinal Relationship between Emotional Exhaustion and Self-compassion in Adolescent Students

Yanyu Chen, Baoshan Zhang

School of Psychology, Shaanxi Normal University, Xi'an, China

Abstract: Self-compassion refers to being open and understanding attitude in the face of failures or misfortune, always keeping kindness and caring attitude toward oneself, which plays an important role in protecting individual physical and psychological health. However, adolescents tend to face the burden of academic stress, and thereby results in emotional exhaustion, which has been proved to be the initial stage of academic burnout. Some researchers recently argued that high levels of burnout may result in the reduction in individual self-compassion. However, there is no research focus on the relationships between emotional exhaustion, a core component of academic burnout, and sub-components of self-compassion, as well as investigating this topic from the longitudinal perspective. Therefore, the current study adopted a short-term longitudinal design, using latent growth curve models to explore the developmental trajectories of emotional exhaustion and self-compassion (i.e. self-kindness, common humanity, mindfulness) in a complete learning cycle, and the longitudinal relations between emotional exhaustion and sub-components of self-compassion. In the current study, 427 students were recruited from 3 junior high schools in Xi'an, China. Adolescent reported their emotional exhaustion and self-compassion three times with about 2-months intervals from the beginning to the end of the semester. Our results indicated that mean level of emotional exhaustion increase over time, mean level of self-kindness and mindfulness decreased over time. Additionally, the initial levels of emotional exhaustion negatively predicted the initial levels of self-kindness and mindfulness. Changes in emotional exhaustion significantly negatively predicted changes in self-kindness and mindfulness. Finally, initial levels of emotional exhaustion negatively predicted the changes in self-kindness. Overall, the current study indicated that emotional exhaustion adolescent perceived significantly increase, and self-kindness and mindfulness decrease over time from the beginning to the end of the semester. Furthermore, high levels of emotional exhaustion may lead to the reduction of self-kindness, which suggested that alleviating the levels of emotional exhaustion can increase their self-compassion, and further promote their physiological and psychological health development.

父母-青少年对家庭亲密性的感知差异及其对青少年问题行为的影响： 基于 RSA 模型的分析

赵云燕¹ 陈福美¹ 罗芮^{1,2} 罗玉晗^{1,2} (通讯作者)

1 北京师范大学中国基础教育质量监测协同创新中心, 北京, 100875,

2 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875

摘要 家庭亲密性指家庭成员彼此之间的情感联结, 与青少年发展紧密关联。然而, 父母与青少年对家庭环境的感知往往存在分歧, 而这种分歧不能只由测量误差解释, 更反映了亲子在认知与沟通等方面主观感知的真实情况, 因而能预测青少年的心理社会适应。但是目前关于家庭亲密性亲子感知差异的探究较少, 且结论不一致。同时, 以往亲子感知差异的研究常采用差分法来进行亲子感知差异与青少年发展结果之间的关联分析, 而差分法存在数据分析冗余等问题, 且难以对亲子感知差异的方向与程度进行深入细致的分析。为克服此问题, 近期研究者采用了二项式回归来充分纳入父母与青少年双方感知的信息, 并结合响应曲面分析 (Response Surface Analysis, RSA) 对亲子感知差异进行更为形象的呈现。基于此, 本研究结合二项式回归与响应曲面分析来探讨家庭亲密性的亲子感知差异与青少年问题行为的关系, 采用家庭功能量表中的家庭亲密性分量表、特质性攻击量表与孤独感量表 (分别作为外化问题和内外问题的指标), 对 1136 个家庭的父母和青少年 (年龄 12.59 ± 1.17 岁, 其中女生 612 名) 进行考察。结果表明: (1) 青少年与父母对家庭亲密性的感知存在差异, 父母感知到的家庭亲密性更高; (2) 亲子感知一致时, 家庭亲密性能显著预测青少年的问题行为, 家庭亲密性越高, 青少年的内、外化问题越少。 (3) 亲子感知不一致时, 家庭亲密性能显著预测青少年的问题行为, 且存在性别差异。对男生而言, 亲子感知不一致时, 仅自身感知的家庭亲密性与其内、外化问题负向关联; 对女生而言, 父母和自身感知的更高的家庭亲密性均对其外化问题具有保护作用, 但仅自身感知的家庭亲密性对其内化问题具有保护作用。本研究检验了中国文化下家庭亲密性的亲子感知差异, 并支持其与青少年心理发展存在紧密关联, 这不仅丰富了以往研究, 也为家庭过程模型的本土化提供实证依据, 并提示未来研究应综合考虑多名家庭成员的感知, 以便为良好家庭关系构建及家庭功能失调的干预提供更丰富的依据。

Parent-Adolescent Discrepancies in Family Intimacy and Adolescent Problem Behaviors: A Response Surface Analysis

Yunyan ZHAO¹, Fumei CHEN¹, Rui LUO^{1,2}, Yuhan LUO^{1,2}

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing 100875;

2 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing 100875

Abstract: During the stressful adolescent period, family intimacy is a particularly critical factor worth investigation, as it is closely tied to adolescent socio-emotional development. However, parents and adolescents tend to differ in their perception of family intimacy, which is solely accounted for by measurement error, but also parent-child communication and relationship quality. To strengthen cogency and validity cross studies, researchers tend to collect data from both parents and adolescents. However, informants often differ in their reports, which is traditionally regarded as measurement error. However, recent researches suggest that such informant discrepancy is meaningful in adolescent development. From this perspective, some studies have explored into informant discrepancies in family intimacy, yet the literature is insufficient and sometimes inconsistent. Moreover, researchers often adopted difference-score method with the absolute difference between informants' assessments, which is statistically

redundant, and does not consider the direction of difference. To overcome these issues, researchers recommend polynomial regression with a more-detailed analysis of informant discrepancies. Further, response surface analysis help visualize the relationship between parental report, adolescent report, and outcome variables, giving a vivid illustration on the linearity and direction of their relationship. Thus, this study examined the informant discrepancy between parents and adolescents, and explored the link between such discrepancy and adolescent problem behaviors. The current study aimed to examine the existence of informant (in)congruence in family intimacy under Chinese Culture, and further investigate its connection to adolescent problem behaviors, including both internalizing and externalizing problem behaviors. We recruited 1136 intact Chinese families with children attending elementary school or middle high school, with an average age of 12.59 years old ($SD = 1.17$) and including 612 girls, who answered a questionnaire including the family intimacy subscale of family functioning scale, trait aggression scale (as an index of externalizing problem behaviors), loneliness scale (as an index of internalizing problem behaviors), and demographic information. Then polynomial regression and response surface analysis were conducted to detect (in)congruence in reports of family intimacy between parents and adolescents, and its linkage with adolescent internalizing and externalizing problem behaviors. Besides, we analyzed boys and girls separately. The results of polynomial regression and response surface analysis indicated that: (1) parents and adolescence differed in their reports of family intimacy, and parents tended to have higher levels of family intimacy. (2) Parent-adolescent congruence in family intimacy were negatively linked to adolescent internalizing and externalizing problem behaviors, both for girls and boys. (3) Parent-adolescent incongruence in family intimacy were linked to adolescent externalizing problem behaviors, and the relations differed between adolescent girls and boys. With incongruence between adolescents and parents, adolescents' report was more strongly related with externalizing problem behaviors, especially for boys. Specifically, higher levels of family intimacy was associated with boys' less externalizing problems only when reported by boys (rather than parents), but with the reporter being parents or girls, higher family intimacy had a protective value. This study reveals the existence of parent-adolescent (in)congruence in family intimacy and its relationship with adolescent development in mainland Chinese families, implying the significance of adolescents' view and feelings in their development, sometimes even more than parents' perceptions. Thus, as researches on parent-child (in)congruence has profound meaning on adolescent clinical and developmental research, further investigation is called for.

Keywords: parent-adolescent discrepancies, family intimacy, internalizing problem, externalizing problem, response surface analysis

父母对子女父母情绪的回应方式和青少年自杀意念： 探究青少年内在情绪问题、认知重评和与父母关系质量的中介作用

丁如一¹（通讯作者） 吴妮妮² 倪士光¹

1 清华大学国际研究生院，深圳，518055, ding.ruyi@sz.tsinghua.edu.cn

2 广东第二师范学院，广州，510303

摘要 青春期是一个具有较高自杀意念风险的发展时期，而自杀意念是青少年未来自杀企图和自杀行为的重要预测指标。以往研究表明，青少年自杀与家庭环境因素有关，然而已有研究较少关注父母情绪教养与青少年自杀的关系。本研究聚焦父母情绪教养的重要维度——父母对子女负面情绪的回应（以下简称父母回应方式），通过问卷调查对父母回应方式和青少年自杀意念之间的关系以及父母回应方式对青少年自杀起作用的内在机制进行实证探究。本研究以中国青少年家庭为研究对象（ $N=4574$ ；父母：35.81%为男性， $M=44.07$ 岁；青少年：55.40%为男性， $M=16.28$ 岁）。在研究中，我们邀请父母对自身父母回应方式进行评估，并邀请青少年评估自身的内在情绪问题、认知重评和与父母的关系质量。本研究对6种类型的回应方式（即3种支持型和3种非支持型）与青少年自杀意念之间的关系，以及青少年内在心理特征（内在情绪问题、认知重评和与父母的关系质量）中介作用。结果表明，三种父母支持性的回应方式——情绪安慰、问题解决和鼓励情绪表达——负向预测青少年自杀意念；而两种非支持性的父母回应方式——惩罚回应、父母烦躁或不舒服——正向

预测青少年自杀意念。然而，非支持性父母回应方式—否认和忽视—与青少年的自杀意念之间不存在统计上显著相关。此外，本研究表明青少年的内在情绪问题和与父母关系质量在 PRCNE 和青少年的 SI 之间起到了完全中介的作用；然而父母回应方式通过青少年的认知重评间接影响青少年自杀意念的假设并没有得到证实。本研究强调父母回应方式在青少年自杀中作用，拓展了已有研究对青少年自杀意念的了解。研究结果同时强调与父母回应方式密切相关的青少年的内化问题和与父母的关系质量对于青少年自杀意念的重要性。

关键词 情绪教养，父母回应方式，负面情绪，青少年，自杀意念

Parental Response to Children's Negative Emotions and Suicidal Ideation in High-School Students: Investigating the Mediating Roles of Adolescents' Internalizing Problems, Cognitive Reappraisal, and Perceived Relationship Quality with Parents

Ruyi Ding¹, Nini Wu², Shiguang Ni¹

¹Tsinghua Shenzhen International Graduate School, Tsinghua University, Shenzhen, 518055,
ding.ruyi@sz.tsinghua.edu.cn

²Guangdong University of Education, Guangzhou, 510303

Abstract: Adolescence is a developmental period with a heightened risk for suicidal ideation (SI), which is a crucial indicator of adolescents' future suicide attempts and behaviors. The suicide literature has consistently implicated that many adolescents have SI due to reasons related to the family. Extant literature has paid limited attention to how parental emotion socialization (PES) relates to adolescents' SI. By focusing on parental reactions to children's negative emotions (PRNCE), which is a commonly targeted aspect of PES, this study evaluated to investigate whether PRCNE play a role in adolescents' SI and if yes through which processes that PRCNE works on SI. This research utilized data from a sample of Chinese adolescent families ($N=4574$; Parents: 35.81% was males, $M=44.07$ years old; Adolescents: 55.40% was males, $M=16.28$ years old), with parents giving their reports on PRCNE and adolescents self-evaluating their adjustment in internalizing problems, cognitive reappraisal, and perceived relationship quality with parents. We examined the relations between six types of PRCNE (i.e., three supportive ones and three non-supportive ones) and adolescents' SI, as well as analyzed the mediating roles of adolescents' adjustment. The results showed that supportive PRCNE including emotion-focused response, problem-focused response, and expression encouragement negatively predicted, while nonsupportive PRNCE containing punitive response and distress response positively predicted adolescents SI. However, no statistically significant association exists between the nonsupportive PRCNE of minimization and adolescents' SI. Moreover, adolescents' internalizing problems and perceived relationship quality with parents fully mediated the relations between PRCNE and adolescents' SI. Contrary to our hypothesis, the indirect effect of PRCNE on adolescents' SI through adolescents' cognitive reappraisal is not supported. The present research informs adolescents' SI by emphasizing the roles of PRCNE. The findings also highlight the importance of paying attention to adolescents' internalizing problems and perceived relationship quality with parents in relation to PRCNE with the aim of providing intervention for adolescents' SI.

父母过度保护与儿童焦虑：一个有调节的中介模型

赵京伟 陈晓旭 耿喆 徐夫真（通讯作者）

山东师范大学心理学院，济南，250014, xufuzhen@sdsu.edu.cn

摘要 焦虑是童年常见的心理健康问题。经历过高的、持续的焦虑的儿童容易出现学校适应不良、睡眠障碍和记忆力下降等问题，也会增加其在青春期或成年期罹患焦虑障碍、抑郁障碍和其他精神障碍的风险。以往研究表明，父母过度保护与儿童焦虑密切相关。从基本心理需要理论的视角来看，父母过度保护会阻碍

小学儿童自主需要和能力需要的满足，而需求挫折感可能是引发儿童焦虑的重要因素。当儿童心理自主性发展受阻时，可能会引起亲子冲突，从而间接引发儿童焦虑情绪。基于此，父母过度保护可能对儿童焦虑之间存在直接影响和间接影响。不同气质类型的儿童处于不利的家庭环境中时，可能会表现出不同的适应结果，气质中的努力控制成分可能在其中发挥着重要作用。先前研究发现中小学生的努力控制水平越高，其焦虑水平越低。而且高水平的努力控制可以缓冲父母消极教养行为以及消极亲子关系对小学儿童焦虑情绪的影响。基于此，父母过度保护与儿童焦虑的直接影响及其中介过程都可能受到儿童努力控制的调节。本研究采用班级整群抽样法，从山东省济南市七所普通小学选取 470 名小学儿童及其父母为被试，进行间隔一年的追踪调查。采用父母过度保护量表、亲子冲突量表、努力控制问卷和儿童焦虑量表考察父母过度保护与儿童焦虑的关系及亲子冲突的中介作用和儿童努力控制的调节作用。结果发现：（1）父亲/母亲过度保护均能显著正向预测自身与儿童的亲子冲突，父亲过度保护还可以显著正向预测母子冲突；（2）母子冲突在母亲过度保护与儿童焦虑之间起部分中介作用；母子冲突在父亲过度保护与儿童焦虑之间起完全中介作用；（3）中介模型的后半段路径受到儿童努力控制的调节，即高水平的努力控制缓冲了母子冲突对儿童焦虑的影响。

关键词 过度保护，亲子冲突，努力控制，儿童焦虑

Parental Overprotection and Children's Anxiety: A Moderated Mediating Model

Jingwei Zhao, Xiaoxu Chen, Zhe Geng, Fuzhen Xu (Corresponding Author)

School of Psychology, Shandong Normal University, Jinan, 250014, xufuzhen@sdsu.edu.cn

Abstract: Anxiety is a common mental health problem in childhood. Children who have experienced high and persistent anxiety are prone to problems such as school maladjustment, sleep disorder and memory decline, which also increases their risk of anxiety disorder, depression disorder, and other mental disorders. Previous studies have shown that there is a correlation between parental overprotection and child anxiety. From the perspective of the Basic Psychological Needs Theory, parental overprotection hinder the satisfaction of children's autonomy and competence need, and need frustration may be an important factor in inducing children's anxiety. When the development of children's psychological autonomy was hindered, parent-child conflict may be triggered, which indirectly triggers children's anxiety. Therefore, parental overprotection may have direct and indirect effects on children's anxiety. Children with different temperament types may show different adaptation results when they were in an unfavorable family environment, and the effort control component of temperament may play an important role in it. Previous studies have found that the higher the level of effort control of elementary and middle school students, the lower their anxiety level. A high level of effort control can buffer the influence of parents' negative parenting behavior and negative parent-child relationship on primary school children's anxiety. Therefore, the direct effects of parental overprotection and children's anxiety and their mediating processes may be moderated by children's effort control. A total of 470 primary school students and their parents from Jinan City were surveyed with cluster sampling, who were assessed again one year later. The present study was surveyed by using the Parental Overprotection Subscale of Parental Bonding Instrument, the Parent-Child Conflict Subscale of Child-Parent Relationship Scale, the Effortful Control Subscale of Early Adolescent Temperament Questionnaire and the Spence Children's Anxiety Scale. The present study investigated the association of parental overprotection and children's anxiety, exploring the mediating role of parent-child conflict and whether it was moderated by children's effortful control. The results indicated that: (1) Both paternal and maternal overprotection had significant positive predictive effect on father-child and mother-child conflict, separately; and paternal overprotection as well as had significant positive predictive effect on mother-child conflict. (2) Maternal overprotection predicted negatively children's anxiety through the partial mediating effect of mother-child conflict; paternal overprotection predicted negatively children's anxiety through the full mediating effect of mother-child conflict. (3) Children's effortful control moderated the second path of the mediation. Specifically, the high level of children's effortful control buffered the impact of mother-child conflict on children's anxiety.

粗暴养育与初中生非自杀性自伤行为的关系： 冲动性特质的中介作用和自我同情的调节作用

李佳霖¹ 肖晴¹ 张野¹（通讯作者） 刘致宏¹

¹ 沈阳师范大学教育科学学院，沈阳，110034, zhangye_psy@163.com

摘要 为探讨初中生粗暴养育、冲动性特质、自我同情和非自杀性自伤行为的关系，采用粗暴养育问卷、冲动性特质量表、自我同情问卷和青少年自我伤害问卷对辽宁省两所学校的 954 名初一至初三年级的学生进行调查。结果显示：（1）粗暴养育显著正向预测初中生非自杀性自伤行为，冲动性特质在两者间起中介作用；（2）粗暴养育对非自杀性自伤行为的直接效应受到自我同情的调节，直接效应对低自我同情的初中生更为显著；（3）自我同情调节冲动性特质对粗暴养育与初中生非自杀性自伤行为中介过程的后半段路径，在低自我同情下，粗暴养育对非自杀性自伤行为的影响更为显著。

关键词 粗暴养育，非自杀性自伤行为，冲动性特质，自我同情，初中生

The Relationship between Harsh Parenting and NSSI of Junior Middle School Students: The Mediating Role of Impulsivity and the Moderating Role of Self-compassion Abstract

Li Jialin, Xiao Qing, Zhang Ye, Liu Zhihong

School of Educational Sciences, Shenyang Normal University, Shenyang

Abstract: In order to explore the relationship between rough parenting, impulsive traits, self-compassion and NSSI behavior of junior middle school students, 954 junior middle school students from grade 1 to grade 3 in two schools in Liaoning Province were surveyed by Harsh Parenting Questionnaire, Impulsivity Personality Scale, Self-compassion Questionnaire and Adolescent Self-Injury Questionnaire. The results showed that: (1) Rough parenting significantly positively predicted junior middle school students' NSSI behavior, and impulsive traits played a mediating role between them; (2) The direct effect of rough parenting on NSSI behavior is regulated by self-compassion, and the direct effect is more significant for junior middle school students with low self-compassion; (3) Self-compassion regulates the second half of the mediating process between rough parenting and junior high school students' NSSI behavior. Under low self-compassion, rough parenting has a more significant impact on NSSI behavior.

Keywords: Rough parenting, NSSI, Impulsive, Self-compassion, Junior middle school students

家庭混乱与经济处境不利青少年共情的关系 ——皮质醇和消极反应性的作用

李虹颖 黄四林（通讯作者）

北京师范大学发展心理研究院，北京，100875, E-mail:hsilin@126.com

摘要 随着 2020 年绝对贫困的消除，我国的脱贫攻坚事业取得了辉煌的历史性成就。为摆脱贫困的代际传递，经济处境不利青少年的身心健康发展非常值得关注。以往研究关注经济处境不利青少年的学业成绩与心理健康等，鲜有研究对如共情、合作与决策等社会认知能力进行考察；经济处境不利群体的研究局限于成年人，本研究试图探讨家庭混乱与经济处境不利青少年共情的关系，以及皮质醇与消极反应性在二者关系中的作用。根据适应校准模型（ACM, adaptive calibration model），生理应激反应系统（尤其是 HPA 轴活动）和个体的敏感性共同协调生理或心理特征的发展(Ellis & Del Giudice, 2019)。作为 HPA 轴活动的典型标记物，较低的皮质醇反映出个体对慢性压力环境的适应(Condon, 2018; Miller, Chen, & Zhou, 2007)；而消极反应性反映出个体对消极压力源的敏感程度(Abramson, Paz & Knafo-Noam, 2019)，以往研究中大多关注它的负面作用，

并未对保护性作用进行探讨。本研究采用多数据来源法对河北省原贫困县共 2 所学校 460 名的 12-17 岁青少年进行调查。采集了儿童的尿液皮质醇、家长报告的儿童消极反应性与儿童报告的消极反应性以及共情与家庭混乱。结果显示：（1）家庭混乱对两种共情的预测作用不同，家庭混乱对认知共情有显著的负向预测作用，家庭混乱越高，认知共情越低，但对情感共情的预测作用不显著。（2）皮质醇在家庭混乱与情感共情之间的关系中具有调节作用，皮质醇水平较低的青少年，家庭混乱与情感共情高度正相关，而皮质醇水平较高的青少年，家庭混乱与情感共情的相关不显著，而家庭混乱对认知共情的关系未受到皮质醇水平的影响。（3）消极反应性在家庭混乱与认知共情之间的关系中具有调节作用，家庭混乱与青少年认知共情的关系随着消极反应性的增加而减弱，而家庭混乱与情感共情的关系未受到消极反应性的影响。综上所述，皮质醇与消极反应性均可以对经济处境不利青少年的共情起到保护性作用：较低的皮质醇水平显著降低了高家庭混乱对情感共情的消极影响；而较高的消极反应性显著降低了高家庭混乱对认知共情的消极影响。

关键词 经济处境不利，家庭混乱，共情，消极反应性，皮质醇

Relationship between family chaos and empathy in economically disadvantaged adolescents: the role of cortisol and negative reactivity

Li Hongying, Huang Silin

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875, China

Abstract: With the elimination of absolute poverty by 2020, China has made brilliant historic achievements in poverty alleviation. In order to escape the intergenerational transmission of poverty, the physical and mental health development of economically disadvantaged adolescents is still of great concern. Previous studies have focused on the academic performance and mental health of economically disadvantaged adolescents, while few studies have examined their social cognitive abilities, such as empathy, viewpoint selection, cooperation and decision-making. Studies on the social cognitive ability of economically disadvantaged adolescents are usually limited to adults. This study attempted to explore the effects of family disorder on empathy and the moderating role of cortisol and negative reactivity in this study. According to the Adaptive Calibration Model (ACM), physiological stress response system (especially HPA axis activity) and individual sensitivity coordinate the development of various physiological and psychological characteristics (Ellis & Del Giudice, 2019). On the one hand, cortisol is a typical marker of HPA axis activity, and low cortisol reflects the adaptation of individuals to chronic stress environment (Condon, 2018). On the other hand, negative reactivity is the temperament that reflects the sensitivity of an individual to negative stressors (Abramson et al., 2019; Miller et al., 2007). Previous studies often focused on its negative effects, but did not conduct exploration on its protective effect. This study adopts the multi-source method to investigate 460 adolescents aged 12-17 years from 2 schools in the former poverty-stricken counties of Hebei Province collecting urine cortisol, parent-reported negative child reactivity and adolescent-reported negative reactivity, empathy and family chaos. The results showed that: (1) Chaos had different effects on the two kinds of empathy. Chaos had a significant predictive effect on cognitive empathy negatively, that is, the higher the degree of family chaos, the lower the cognitive empathy, but the effect on emotional empathy was not significant. (2) The cortisol played a moderating role in the effect of chaos on emotional empathy. Among the adolescents of low cortisol levels, chaos has highly positive correlation with emotional empathy. On the contrary, among the high cortisol levels of adolescents, chaos has no significant correlation with emotional empathy. And impact on cognitive empathy is not affected. (3) Negative reactivity played a moderating role in the effect of chaos on cognitive empathy. The negative effect of chaos on adolescents' cognitive empathy decreased with the increase of negative reactivity, while the effect on emotional empathy was not affected. In conclusion, these results suggest that both cortisol and negative reactivity have protective effects on empathy in economically disadvantaged adolescents. Specifically, lower cortisol levels significantly reduce the negative effects of chaos on emotional empathy. However, higher negative reactivity can significantly reduce the negative impact of chaos on cognitive empathy.

亲子分离背景下的亲子亲合、交感神经系统活动与大学生抑郁的关系

赵景欣（通讯作者） 王蕾 敖成明

山东师范大学心理学院，济南，250014，jingxinzha@126.com

摘 要 作为个体生命早期最为严重的不良经历，父母外出务工带来的亲子分离会显著提高个体出现抑郁的风险，且这种影响持续终生。根据发展情境论，长期的亲子分离不仅直接影响个体抑郁，还会在一定程度上改变生物和环境因素与抑郁之间的关联。在这一背景下，揭示因长期亲子分离所致的影响个体抑郁发展的生物-环境作用机制就成为发展科学中的一个重要研究问题。然而，已有研究主要关注正在发生的亲子分离和消极环境对个体抑郁的影响，相对忽视了生命早期亲子分离经历的长期作用，并且对于积极环境因素和个体神经生物因素的关注也不足。作为个体对压力的生物敏感性指标，交感神经系统活动与家庭保护因素在早期经历亲子分离个体抑郁发展中的作用已成为该领域研究的前沿问题。本研究以 210 名大学生为被试，基于有亲子分离经历和无亲子分离经历大学生的比较，以亲子亲合为积极环境指标，以交感神经系统活动为神经生物指标，系统考察了亲子亲合与大学生抑郁的关系并检验了交感神经系统活动（以皮肤电导水平反应性为测量指标，SCLR）和亲子分离在其中的调节作用。结果发现：（1）亲子亲合负向预测大学生抑郁，亲子分离经历正向预测大学生抑郁。（2）交感神经系统活动对父子亲合与大学生抑郁关系的调节作用因亲子分离经历的不同而有所差异：在有亲子分离经历大学生中，父子亲合仅在大学生的 SCLR 较低时才能负向预测其抑郁；在无亲子分离经历大学生中，父子亲合仅在大学生的 SCLR 较高时才能负向预测其抑郁。（3）亲子分离时长能够调节父子亲合与大学生抑郁的关系：只有当亲子分离时间较短时，父子亲合才能负向预测大学生抑郁。这表明，生命早期的亲子分离经历不仅能够对个体的抑郁症状产生长期影响，还能在一定程度上改变生物和环境因素与个体抑郁之间的关联。

The Association Between Parent-Child Cohesion, Sympathetic Nervous System Activity and College Students' Depression Under the Background of Parent-Child Separation

Jingxin Zhao, Lei Wang, Chengming Ao

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract: Parent-child separation, a consequence of parents' rural-to-urban migration, is considered as the most serious adverse experience of early life adversity, which put the individuals at increased risk for suffering from depression. According to developmental contextualism, prolonged parent-child separation not only directly affects individual depression, but also changes the association between biological-environmental factors and depression. In this context, it has become an important research issue in development science to reveal the biological-environmental mechanisms of depression caused by parent-child separation. However, previous studies mainly focused on the effects of ongoing parent-child separation and negative environment on individual depression, relatively ignoring the long-term effects of parent-child separation experience in early life, and paid insufficient attention to positive environmental factors and individual neurobiological factors. As an indicator of biological sensitivity to stress, the role of sympathetic nervous system activity and family protective factors in the development of depression in individuals who experienced early parent-child separation has become a frontier problem. To address these research gaps, based on the comparison between college students with parent-child separation experience and college students without parent-child separation experience, this study used parent-child cohesion as an positive environmental indicator and sympathetic nervous system activity (measured by Skin Conductance Level Reactivity, SCLR) as a neurobiological indicator to systematically investigate the biological-environmental mechanisms of the difference effect of parent-child separation on the development of depression in college students. A total of 210 college students were recruited from two universities in Shandong Province, including 135 college students with parent-child separation experience and 75 college students without parent-child separation. The results showed that: (1)

Parent-child cohesion negatively predicted depression, while parent-child separation experience positively predicted depression. (2) The moderating effect of sympathetic nervous system activity on father-child cohesion and depression varied with parent-child separation experience: Among college students with parent-child separation experience, father-child cohesion could only negatively predict depression when SCLR was lower. Among college students without parent-child separation experience, father-child cohesion was only a negative predictor of depression when SCLR was higher. (3) The parent-child separation duration could moderate the association between father-child cohesion and depression: Only when the parent-child separation duration was shorter, father-child cohesion could negatively predict depression. These results indicated that early experience of parent-child separation not only had a long-term impact on the development of individual depressive symptoms, but also changed the association between biological-environmental factors and depression to a certain extent.

摘 要 当个体面临压力事件时, 往往会采取特定的应对方式来试图减轻自己的心理负担, 而应对方式是否选择得当决定了一个人在处理压力事件时的结果的优劣, 由此可见应对方式的重要性。在应对方式的众多潜在影响因素中, 父母教养方式的作用不容小觑, 本研究从积极心理学的角度出发, 采用父母教养方式评价量表、社会支持量表、一般自我效能感量表、简易应对方式量表对 3784 名青少年进行施测, 以探究父母积极教养方式与青少年应对方式之间的内部作用机制, 以期对育有子女的个体带来一定的启示。根据前人的理论基础, 本研究以社会支持的各子维度以及自我效能感作为中介, 构建并筛选了结构方程模型, 此外, 根据被试在简易应对方式量表上的实际作答情况, 采用潜在类别分析的方法将被试划分为不同类别, 并采用方差分析检验父母积极教养方式在不同类别的个体上有什么差异, 以探究在不同程度的父母积极教养方式下成长的个体是否会产生不同的模式来应对压力源。结果发现: (1) 父母积极教养方式与积极应对方式间存在显著正相关, 而与消极应对方式间不存在显著相关。(2) 社会支持和自我效能感在父母积极教养方式与积极应对方式的关系中起部分中介作用, 但社会支持中仅有主观支持正向预测自我效能感并进一步预测积极应对方式, 构成链式中介。(3) 潜在类别分析结果支持 4 类别模型, 4 种被试类别分别为两极型、保守型、积极型和不作为型。(4) 方差分析结果表明各类别间的父母积极教养方式得分差异显著。结论: 父母积极教养方式与消极应对方式的形成无关, 且与积极应对方式间的关系并非都是直接的, 父母积极教养方式可通过社会支持和自我效能感来间接作用于积极应对方式。此外, 社会支持中的客观支持和支持利用度并不能有效帮助个体提高自我效能感, 而主观支持却有助于个体自我效能感的提升, 从而促使个体采取更加积极的应对方式。在不同程度的父母积极教养方式下成长的个体会产生不同的应对模式。

Abstract: Individuals always adopt specific coping style to lighten their pressure when facing the stressful events, and the coping style they chose may lead to different consequence, which shows the importance of coping styles. Previous studies prove that many factors may influence individual's coping style, and parenting style is the most important one. In the current study, 3784 adolescents took Egna Minnen av Barndoms Uppförstran (EMBU), Social Support Scale (SSS), General Self-Efficacy Scale (GSES) and Simplified Coping Style Questionnaire (SCSQ) to explore the internal mechanism underlying positive parenting style and coping style, so as to bring some enlightenment to the individuals with children. According to previous theoretical basis of many studies, social support and self-efficacy were chosen as the mediating variables, and the Structural Equation Models were constructed. In addition, we processed Latent Class Analysis according to the participants' real response to divide participants into different categories, and One-way ANOVA was used to test the difference in the scores of the positive parenting style of different categories, to clarify whether individuals growing up under different levels of positive parenting style would generate different coping patterns to face the stressful things. It was found that: (1) There was a significant correlation between positive parenting style and positive coping style, while the correlation between positive parenting style and negative coping style was not significant. (2) Social support together with self-efficacy played a partial mediating role between positive parenting style and positive coping style, but in the social support, only the subjective support predicted self-efficacy positively, and self-efficacy predicted positive coping style further, form a multiple chained mediation. (3) LCA supported C4 model, 4 categories were "bipolar", "conservative", "positive", "inactive". (4) The results of One-way ANOVA showed that there were significant differences in the scores of positive parenting style among different categories. Conclusion: The positive parenting style had nothing to do with negative coping style, while positive parenting style could indirectly predict positive coping style through the mediation which composed of social support and self-efficacy. Furthermore, objective support and support utilization could not effectively help individuals improve their self-efficacy, while subjective support did, and prompted individuals to adopt more positive coping styles. Individuals growing up under different level of positive parenting style may generate different coping patterns.

摘要 人类亲社会行为及其种系演化和个体发生发展是一个重大的科学问题, 受到科学界的高度关注。过去十几年来, 众多研究从单基因×环境交互作用(G×E)的角度考察了遗传和环境对亲社会行为的影响及其作用机制。然而, 伴随着对单基因研究局限性的认识以及对“遗传率缺失”的探索, 越来越多的研究者强调采用多基因研究范式能够更全面和准确地描绘亲社会行为的个体差异及发生机制。催产素的社会显著性假说(social

salience hypothesis)以及来自 fMRI 的研究证据表明,催产素系统(oxytocinergic system)对社会线索的敏感性依赖于其与多巴胺系统(dopaminergic system)的交互作用。由此可推知,催产素系统基因、多巴胺系统基因与环境因素可能交互影响个体的亲社会行为。基于此,本研究立足于社会显著性假说,采用基因—基因—环境($G \times G \times E$)设计,以 1080 名青少年(初次测评时 $M_{age} = 13.32 \pm 0.48$ 岁,女生占 50.4%)为被试,进行为期 2 年的追踪调查。研究分别采用教师报告、母亲报告和 DNA 分型技术测评青少年亲社会行为、母亲积极教养行为和基因型,考察催产素受体(oxytocin-receptor, *OXTR*)基因、D2 型多巴胺受体(dopamine D2 receptor, *DRD2*)基因与母亲积极教养行为对青少年亲社会行为的影响及其作用机制。结果发现:(1)控制 T1 的亲社会行为、家庭社会经济地位和性别后,*OXTR* 基因、*DRD2* 基因和母亲积极教养对青少年亲社会行为的预测作用均不显著;(2) *OXTR* 基因、*DRD2* 基因及母亲积极教养间的两者交互效应均不显著;(3) *OXTR* 基因、*DRD2* 基因与母亲积极教养行为交互影响青少年亲社会行为。具体表现为,相比其他基因型组合,同时携带 *OXTR* 基因 AA 基因型与 *DRD2* 基因 G 等位基因的青少年更易从母亲积极教养行为中获益而表现出更多的亲社会行为。本研究为亲社会行为的多基因遗传基础提供了新的证据,并且为社会显著性假说提供了支持,促进了对亲社会行为个体差异和发生机制的理解。

Interaction Among Oxytocin Receptor (*OXTR*) Gene, Dopamine D2 Receptor (*DRD2*) Gene and Maternal Positive Parenting on Adolescent Prosocial Behavior: A Gene-Gene-Environment Study

LI Xi, CAO Yanmiao, LIN Xiaonan, TIAN Xiangjuan, QIN Xiaqing, CHI Xiaohui, ZHANG Wenxin
School of Psychology, Research Institute of Child and Adolescent Development, Shandong Normal University, Jinan 250014

Abstract: Prosocial behavior, that is, behavior intended to benefit others, has been linked to a variety of desirable traits, such as positive relationships, better academic performance, and psychosocial adjustment outcomes. The development of human prosocial behavior and its origin are important scientific issues, which are highly concerned by researchers. For decades, there was accumulating evidence for the importance of gene by environment interactions ($G \times E$) in understanding the origins and the mechanisms underlying prosocial behavior. However, the majority of studies have examined $G \times E$ using single loci in candidate genes, ignoring the polygenic nature of prosocial behavior. In addition, the social salience hypothesis and fMRI studies have suggested that the oxytocinergic system could regulate the salience of social cues through its interaction with the dopaminergic system. Therefore, it is possible that candidate genes involved in these two systems (i.e., oxytocin receptor gene, *OXTR* and dopamine D2 receptor gene, *DRD2*) may interact with each other in regulating the responsiveness to the environment, which in turn is related to prosocial behavior. Therefore, the present study aimed to examine the interaction among *OXTR* gene, *DRD2* gene, and maternal positive parenting on adolescents' prosocial behavior, by adopting the perspective of gene-gene-environment interactions ($G \times G \times E$). Participants were 1080 mother-offspring dyads (adolescents mean age 13.32 ± 0.48 years old at the first time point, 50.4% females) recruited from the community. Using a 2-year longitudinal design, mother-reported maternal parenting and teacher-reported prosocial behavior were collected at Time 1. At Time 2 (adolescents mean age 15.32 ± 0.48 years old, 50.4% females), saliva samples of adolescents were collected, and prosocial behaviors were also assessed by teachers. All measures showed good reliability. Genotyping in *OXTR* gene and *DRD2* gene were performed for each participant in real time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom). Hierarchical regression analyses were conducted to examine the main and interactive effects of *OXTR* gene, *DRD2* gene and maternal positive parenting on adolescents' prosocial behavior. The results showed that, after controlling for gender, age, and SES, there was a significant three-way interaction among *OXTR* gene, *DRD2* gene, and maternal positive parenting on prosocial behavior. Specifically, compared to other combined genotypes of *OXTR* and *DRD2*, adolescents carrying

both AA genotype of *OXTR* gene and G allele of *DRD2* gene were more sensitive to maternal positive parenting and exhibited more prosocial behavior. However, neither main effects nor two-way interactions among *OXTR* gene, *DRD2* gene, and maternal positive parenting were significant. These findings highlight the complex polygenic underpinnings of prosocial behavior and lend support for the gene-gene-environment interactions on the development of prosocial behavior.

Keywords: prosocial behavior, maternal positive parenting, *OXTR* gene, *DRD2* gene, gene-gene-environment interaction

亲子分离对青少年应激后 HPA 轴和 RSA 的影响： 来自留守儿童的证据

摘要 亲子分离是指缺乏监管能力的未成年人与父母双方或一方分开生活, 不能共同生活的行为。作为早期生活应激事件, 亲子分离会影响个体的正常发展。研究显示, 有亲子分离经历的成年人会出现更多的酗酒、更差的亲密关系和同伴关系以及更差的心理健康水平。尽管已有研究已经证实亲子分离对个体行为的影响, 但较少有研究关注亲子分离对个体生理的影响。HPA 轴和自主神经系统在应激过程中起主要反应的两个系统。本研究旨在探讨亲子分离对青少年应激时 HPA 轴和自主神经系统反应的影响。研究选取 118 名 12-16 岁的青少年(男: 63, 女 55), 包括亲子分离组 61 人(父母均外出半年以上)和无分离组 57 人(父母均为外出过)。所有被试进行特里尔应激测验(TSST), 并在应激测验开始前 15min, 0min 以及开始后的 10,20,35,50min 的 6 个时间点采集被试唾液并采用 ELISA 检测方法检测其中的皮质醇水平, 此外采用 Biopac 生理仪记录 TSST 前后被试的心率呼吸用于计算应激各阶段呼吸性窦性心率不齐(RSA)水平。结果显示: ①皮质醇的时间和亲子分离的主效应显著, 皮质醇在 TSST 前后呈现出了先增高后降低的应激反应, 且亲子分离组在应激后 10min, 20min, 35min 的皮质醇水平显著低于未分离组, 亲子分离组的皮质醇的反应性和调节性均显著低于未分离组; ②RSA 的时间主效应和交互作用显著, 但亲子分离的主效应不显著, 亲子分离组在演讲阶段的反应 RSA 显著高于未分离组。以上结果提示亲子分离对不同的应激反应系统产生了不同的影响。

Abstract: Parent-child separation means that a minor who lacks guardianship ability lives separately from both parents or one of them and they could not live together. As one of the early adverse life events, parent-child separation can have a certain influence on individual development. Previous studies showed that adults with parent-child separation experience more alcoholism, worse couples and peer relationships and poor mental health.

Although many studies have pointed out the impact of parent-child separation on individual behavior, there are few studies on the physiological effects. The hypothalamic-pituitary-adrenal (HPA) axis and autonomic nerves system are central two main stress response systems. In present study, we aimed to examine whether adolescents experienced the parent-child separation had a disrupted pattern of stress responses in comparison to those lived with their parents, using cortisol as markers of HPA axis and RSA as indicators reactivity to stress. Participants were 118 adolescents (61 left behind by two parents and 57 peers living with both parents; 63 male and 55 female) aged 12 to 16. All the female subjects in this study were required in the early follicle for saliva collection. Cortisol was measured through the collection of six saliva samples via passive drool. The first two samples were collected 0 and 15 min before the Trier Social Stress Test (TSST), a well-established, standardized stress paradigm. The third, fourth, fifth and sixth samples were collected 10, 20, 35 and 50 min after the beginning of the TSST. Saliva samples were analyzed in a single batch with a high sensitivity enzyme immune assay kit (Salimetrics State College, PA, Catalogue No.1-3102). All samples were assayed in duplicates. was used to record The heart rate and respiration were recorded by Biopac physiologic instrument before and after TSST for calculating the level of respiratory sinus arrhythmia (RSA) at various stages of stress. The results showed that the main effects of time and parent-child separation were significant. The TSST elicited a robust and significant increase in cortisol. The LBA had lower cortisol responses to the TSST at 10min,20min,35min after TSST. The cortisol reactivity and recovery were lower in LBA than N-LBA.② For RSA, the main effect of parent-child separation was not significant. But the Δ RSA of LBA was significantly higher than N-LBA during speech in TSST. These results suggest that parent-child separation has different effects on different stress response systems.

父母严厉管教与流动儿童焦虑的关系：父母温暖和性别的调节作用

刘莉¹ 翟培鑫¹ 赵金霞² 王美芳³ (通讯作者)

1 山东师范大学心理学院, 济南, 250014

摘要 虽然研究者对父母严厉管教和儿童焦虑之间的关系进行了一系列理论探讨和实证研究, 并获得了一些有价值的研究结论。然而, 关于二者间关系的具体作用机制的考察较为缺乏。一些理论观点指出, 父母严厉管教有其更广泛的发生背景, 这一背景因父母对儿童积极和消极情感水平的不同而不同。这一广泛的情感背景可能通过改变亲子关系的本质或儿童的社会化意愿进而影响了父母严厉管教的效应。基于此, 我们推测, 父母温暖作为父母严厉管教发生的一个重要情感背景, 可能会缓冲父母严厉管教这一压力事件对儿童焦虑的不利影响。本研究以 477 个中国流动家庭的儿童及其父母双亲为被试, 考察父母一方温暖是否更加有助于缓解其自身严厉管教对流动儿童焦虑的不良影响, 以及是否能够缓解父母另一方的严厉管教对流动儿童焦虑的影响, 从而深入揭示父母严厉管教影响流动儿童焦虑的情感机制。研究发现, 母亲心理攻击和体罚对男孩焦虑有显著正向预测作用, 而母亲心理攻击仅对女孩焦虑有正向预测作用。此外, 父亲温暖加剧了母亲心理攻击与男孩焦虑的关系, 母亲温暖加剧了父亲体罚与女孩焦虑的关系。研究结果为“健康环境悖论”提供了部分支持, 并在一定程度上揭示了父母严厉管教影响流动儿童焦虑的情感机制。

Abstract: Although parental harsh discipline has been found to be related to child anxiety, the mechanisms that link harsh discipline to child anxiety are not well characterized. Some theoretical points suggest that the broader emotional context may affect the effects of parental harsh discipline on child adjustment by changing the nature of parent-child relationships or children's socialization will. This study focused on one potential emotional context, parental warmth, that may moderate the associations between parental harsh discipline and migrant children's anxiety. Specifically, the present study investigated the relations between both paternal and maternal harsh discipline (psychological aggression and corporal punishment) and migrant children's anxiety and the moderating role of both parents' warmth and child gender in Chinese societies. Participants were 477 elementary school-age children and both their parents in Chinese migrant families. The results indicated that maternal but not paternal psychological aggression and corporal punishment significantly predicted boys' anxiety, and girls' anxiety was predicted by maternal but not paternal psychological aggression. Moreover, paternal warmth exacerbated the relations between maternal psychological aggression and boys' anxiety, while maternal warmth exacerbated the relations between paternal corporal punishment and girls' anxiety. The findings provide partial support for the "healthy context paradox" and highlight the importance of considering how the broader family emotional context may interact with parental harsh discipline to influence child adjustment.

摘要 近二十年来, 基于分子遗传学范式的研究考察了遗传因素对攻击行为的影响, 确定了攻击行为的系列风险基因及其基因—环境的交互作用机制。然而, 随着研究的深入, 基因型—行为表型的关联研究局限性日益凸显, 而内表型概念的提出与应用为探究基因型与行为表型间的关系提供了新的视角。尤其是, 研究显示基因并不直接编码攻击行为, 其功能的发挥通常需要通过影响相应的神经生化过程、气质等内表型, 且从基因型到行为表型的作用路径受到环境因素的调节。此外, 由于外显攻击和关系攻击在其预测因素、发展轨迹和适应结果方面均存在明显的差异, 区分不同形式的攻击行为考察“基因—内表型—行为”机制及环境因素的调节作用有助于更好地理解攻击行为的病因学机制。基于此, 本研究以“基因—内表型—行为”为理论框架, 以 1054 名汉族青少年 (初次测评时 $M_{age} = 13.32 \pm 0.48$ 岁, 女生占 50.1%) 为被试, 进行为期三年的追踪调查, 采用母亲报告测评积极教养行为, 青少年自我报告测评抑制控制, 同伴评定测评攻击行为, 考察抑制控制在 5-HTR2A 基因与攻击行为间的中介作用, 以及母亲积极教养行为对该中介机制的调节作用。结果发现: (1) 抑制控制在 5-HTR2A 基因与外显攻击间起中介作用, 携带 T 等位基因的个体具有较高的抑制控制能力, 进而表现出较少的外显攻击行为; 抑制控制在关系攻击模型中的中介作用不显著。(2) 母亲积极教养行为能够调节“5-HTR2A 基因—抑制控制—外显攻击”的前半路径, 表现为在高母亲积极教养行为环境中, 携带 T 等位基因的青少年的抑制控制能力显著高于 CC 基因型携带者, 进而降低了其外显攻击行为, 而在低母亲积极教养行为环境中, 这一中介效应不显著。研究结果从 5-羟色胺系统基因、抑制控制和家庭教养等方面扩展了对于

青少年攻击行为的发生机制及个体差异的科学认识，并为“基因—内表型—行为”这一理论框架提供了新的证据。

5-*HTR2A* Gene and Adolescent Aggression: The Mediating Role of Inhibitory Control and the Moderating Role of Maternal Positive Parenting

CHI Xiaohui, CAO Yanmiao, QIN Xiaqing, LI Xi, LIN Xiaonan, CHEN Guanghui,
ZHANG Wenxin

School of Psychology, Research Institute of Child and Adolescent Development,
Shandong Normal University, Jinan 250014

Abstract: For two decades, molecular genetic research on aggression has brought discoveries that advanced the etiology of aggression. However, it remains unclear how vulnerable genes operate to influence aggression. Researchers have sought to make more progress by exploring the "gene-endophenotypic-behavior" mechanism. Considering the abnormal functions of serotonin in risk of aggression, the 5-*HTR2A* gene rs6311 polymorphism have attracted much attention. In addition, theoretical considerations and new empirical evidence suggest that inhibitory control mediates the association between 5-*HTR2A* and aggressive behavior. Recent research also has suggested that parenting could determine the degree to which a child is influenced by 5-*HTR2A* gene. Therefore, the present study proposed a moderated mediation model to extend previous studies by integrating 5-*HTR2A*, inhibitory control, and maternal positive parenting in understanding the etiology of aggression. Besides, due to the differences between overt and relational aggressive behavior in developmental trajectories, antecedents, and consequences, differentiating between overt and relational aggression may help further clarify the processes by which 5-*HTR2A* gene eventuates in adolescent aggression. Participants were 1054 adolescents (50.1% females, $M_{age} = 13.32 \pm 0.48$ years at Time 1) from the longitudinal study of Chinese children and adolescents (LSCCA). Mother-reported parenting, adolescent-reported inhibitory control, and peer-rated aggressive behavior were collected at Time 1, Time 2, and Time 3 respectively. DNA was extracted from saliva and genotyping in 5-*HTR2A* genes were performed for each participant in real time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom). The moderated-mediation analyses were conducted using PROCESS macro for SPSS to examine the mediating role of inhibitory control and the moderating role of maternal parenting in the longitudinal associations between 5-*HTR2A* and aggression. The results showed that: (1) Inhibitory control mediated the relationship between 5-*HTR2A* gene and overt aggression, but the mediation model did not hold for relational aggression. Specifically, compared to CC genotype carriers, individuals with T alleles showed greater inhibitory control, and in turn is related to lower levels of aggressive behavior. (2) The mediation effects were moderated by maternal positive parenting. For adolescents raised in higher levels of positive parenting, T alleles carriers reported higher levels of inhibitory control, which reduced risk for aggression, but the mediation effects were not observed among adolescents experiencing lower levels of positive parenting. The results of this study extend the scientific understanding of the mechanism of adolescent aggression and individual differences from the aspects of serotonin system gene, inhibitory control and maternal parenting. These findings suggest that overt aggression and relational aggression are likely to involve in somewhat different psychosocial mechanisms and provide new evidence for the mechanism of "gene-endophenotypic-behavior".

农村留守家庭中家庭抗逆力与祖孙幸福感的二元关系： 关系质量的中介作用

胡琼（通讯作者） 周焱琳 张琼

浙江大学心理与行为科学系，杭州，huqiong19991119@163.com

摘要 抗逆力是指从压力中恢复的能力，它对于提升个体的幸福感具有重要的作用。家庭抗逆力作为一种重要的家庭资源，可以增强所有家庭成员的幸福感。留守家庭主要指父母均为农村进城务工人员，孙辈留在农村由祖辈照顾的家庭。在探讨留守家庭幸福感的研究中，研究者大多仅关注个体成员幸福感的影响因素。根据家庭系统理论，家庭成员是相互依存的，单独分析任何一个成员都不足以揭示整个家庭的适应过程。据此，本研究从家庭抗逆力和家庭系统理论出发，采用成对研究探讨留守家庭中祖辈、孙辈两代人所感知的家庭抗逆力、祖孙关系与主观幸福感的相互影响。130对留守祖辈和孙辈独立完成了一份编码相同的问卷，包括家庭抗逆力、祖孙关系质量以及主观幸福感量表。相关分析结果表明，祖辈和孙辈在家庭抗逆力、祖孙关系和主观幸福感得分显著相关，两者相互依存性强。主客体互倚模型分析表明，祖辈和孙辈感知的家庭抗逆力都与自身的幸福感有直接关联，并且心理韧性在其中起着显著的部分中介作用（主体效应）。此外，祖辈家庭抗逆力能通过影响其感知的关系质量进而影响儿童的主观幸福感；类似地，孙辈家庭抗逆力能通过影响其感知的关系质量进而影响祖辈的主观幸福感（客体效应）。该研究结果在理论上丰富了家庭韧性理论和祖孙关系研究，强调家庭抗逆力和祖孙关系质量在增强祖孙幸福感中的重要作用；同时也为促进留守家庭福祉提供了实践指导，即可以通过家庭层面的干预增强家庭抗逆力，进而改善留守祖孙的关系质量，最终促进留守家庭成员整体幸福感。

心理学元研究的理论和实践意义

张航 陈中永（通讯作者）

内蒙古师范大学心理学院，呼和浩特，010022，835957037@qq.com

摘要 元研究是对现有研究的研究。在心理学研究日益细分化和深入化的今天，研究报告和学术论文的数量指数增加，形成了海量的文献资料，对这些文献资料进行概括、总结的再研究就是心理学的元研究。心理学元研究以整体观、系统观、生态观、动态观等深刻的理论思维方法为核心，以文献法、统计分析法、比较法等元方法为具体手段，对已有研究、研究现状和研究预测进行的系统研究。心理学元研究可以是对某一专题下的同类研究进行概括总结；也可以是把不同专题的研究整合归纳为一个整体性知识；把历史研究成果与当代研究成果整合；把不同领域成果在高位整合；把不同学派观点按统一性整合等等。通过将心理学知识视为关于心理学的整体的、动态的认识成果，对现有的心理学知识进行验证性评价，进而对离散状态的知识进行加工整理，使心理学知识理论化、结构化和系统化。这对心理学从学说林立、分歧众多、表述各异的“前科学”状态走向理论明晰、系统结构化的“科学”状态具有重要的现实意义，对学科的良好发展具有理论引导意义。目前，心理学元研究需要聚焦于以下几个领域：身心关系；心理活动过程之间的关系；心理与环境的关系；心理学与相关学科的关系。

The Theoretical and Practical Significance of Meta-study of Psychology

Zhang Hang, Chen Zhongyong

School of Psychology, Inner Mongolia Normal University, Hohhot

Abstract: Meta-study is the study of existing research. Nowadays, with the increasing differentiation and deepening of psychological research, the number of research reports and academic papers has increased exponentially, forming a massive amount of literature materials. The restudy to summarize and summarize these literature materials is the meta-study of psychology. Psychological meta-study is a systematic study of existing research, research status and research prediction, with the core of profound theoretical thinking methods such as holistic view, system view, ecological view and dynamic view, and with the meta-methods such as literature method, statistical analysis method and comparative method as specific means. Psychological meta-study can be a summary of similar research under a particular topic; It can also be the integration of different topics into a comprehensive knowledge; Integrate historical research results with contemporary research results; Integrating achievements in different fields at a high level; Unifying different school of thought and so on. By taking psychological knowledge as a whole and dynamic cognitive result about psychology, the existing psychological knowledge is evaluated in a confirmative way, and then the discrete state knowledge is processed and sorted out, so that the psychological knowledge is theorized, structured and systematized. It is of great practical significance for psychology to move from the state of "pre-science" with many theories, many differences and different expressions to the state of "science" with clear theory and systematic structure, and it is of theoretical guiding significance for the sound development of the discipline. At present, psychological meta-study needs to focus on the following areas: mind-body relationship; The relationship between mental processes; The relationship between psychology and environment; The relationship between psychology and related disciplines.

Keywords: meta-study, metamethod, metatheory

中国心理学会史百年新论

阎书昌

河北师范大学心理学系, 石家庄, 050024, yanshuchang@126.com

摘 要 经过文献查找, 作者发现中华心理学会成立于 1921 年 8 月 5 日。中华心理学会成立之后, 创办了亚洲第一份专业期刊《心理》杂志, 在北京召开纪念会并留下合影, 也陆续召开了几次学术演讲会。作者经过搜寻, 从张耀翔的后人手中获取了《心理》杂志的封面扫描件, 并对该原件的历史经历进行了富有逻辑性的想象性复原。作者对 1931 年中华心理学会筹委会、1937 年 1 月中国心理学会进行了图像学考证, 对 1948 年心理学会复会活动进行了考证。待到 1949 年之后中国心理学会才再次经过筹备, 于 1955 年 8 月正式成立。此次中国心理学会从筹备到成立, 因为原始资料的匮乏而稀见于文献。在周先庚学术档案中发现了这批资料, 为解开这一时期的中国心理学内部的人员、事务的跌宕提供了可能。1966~1977 年间的中国心理学会历经学科撤销的悲剧, 1977 年 7、8 月, 中国科学院心理研究所恢复活动。1977 年 11 月, 中国心理学会再次恢复活动, 并走上正常发展的道路。1978 年 5 月中国心理学会开展学术活动, 在杭州召开了关于评论冯特心理学、发展心理学和教育心理学的专业会议。中国心理学会发展历程中影像史料也是历史的组成部分。作为学术共同体的中国心理学会, 随着中国政治的动荡而起起伏伏。自 1977 年以来, 中国心理学走上了健康而迅猛发展的道路, 已经成为也必将成为国际心理学舞台上不可或缺的力量。改革开放以来中国心理学会取得了组织机构增长, 成为国际心理学的重要组织力量, 学术出版力量不断增强的巨大成就。中国心理学会的发展历程中学科专业意识一直维系着学科的建设与发展的动力, 推动着学科专业期刊的发展。中国心理学会历经百年艰辛的发展历程, 终于走上了正轨, 随着新的百年即将开启, 中国心理学必作为具有中国文化基因的心理科学力量, 在国家建设的方方面面做出自己的贡献!

理想心理学的背景与方法论贡献：以第二代正念干预的实证研究为例

曾祥龙¹

1 北京师范大学心理学部，北京，100875，xzeng@bnu.edu.cn

摘要 随着积极心理学、第二代正念干预等领域的深入发展，越来越多的心理学研究尝试研究现实中几乎不存在的理想心理，诸如天人合一、平等慈等。在此过程中，心理学实证研究也面临一系列新的方法论挑战，比如如何测量被试未经验甚至不理解的心理状态，如何衡量干预效果或进行操作检验等。因此，一种旨在指导如何研究理想心理的“理想心理学”（idealistic psychology，又译“理念心理学”）便应运而生。它不仅在研究对象（理念）、研究任务（设计、实现、评估）等宏观层面有别于传统心理学，也在更具体的研究范式层面，批判和指导具体的心理学实证研究。基于一项第二代正念干预（正念积极心理）的干预研究，理想心理学指出该研究乃至整个第二代正念干预研究普遍存在的问题：教导理想心理甚至进行相关练习，却并不期待理想心理的实现；只测量幸福感、焦虑、抑郁等一般心理学变量，并以此作为干预有效性的指标，而无法直接测量所培养的理想心理状态，也无法论证干预中培养理想心理状态的价值。这一案例表明，理想心理学基于心理学实证研究的新趋势和新挑战，其思想主张已经对心理学实证研究起到了一定促进作用；但另一方面，目前理想心理学主要批判既有研究的范式，尚需以更多实证研究实践其所推崇的新范式。

The background and methodological contribution of Idealistic Psychology: An example of empirical study on Second-Generation Mindfulness-Based Interventions

Xianglong ZENG

Faculty of Psychology, Beijing Normal University, Beijing

Abstract: With the further development in domains like positive psychology and Second-Generation Mindfulness-Based Interventions, more and more psychological studies tried to study idealistic mentalities that almost do not exist in realm, such as oneness, equal loving-kindness. During this process, empirical psychological studies faced a series of new methodological challenges, such as how to measure mental states that participants did not experience or even did not understand, how to assess the effects of interventions or conduct manipulation check. Therefore, an “idealistic psychology” that aims to guide how to study idealistic mentalities had been raised accordingly. It differs from traditional psychology not only on macro and abstract levels such as objects (ideals) and tasks (to design, achieve, evaluate), but also on micro and detailed level of research paradigm, which criticize and guide specific empirical psychological studies. Based on an interventional study on Second-Generation Mindfulness-Based Intervention (Mindfulness-Based Positive Psychology), idealistic psychology pointed out the problem of this study and of Second-Generation Mindfulness-Based Interventions in general: it taught idealistic mentalities and even did relevant practices, but it did not expect the achieve of those idealistic mentalities; it only measured general psychological variables like well-being, anxiety and depression, and used them as indicators for effects of intervention, but did not directly measured the idealistic mentalities to be cultivated, and could not justify the value of the cultivation of idealistic mentalities in intervention. This case showed that, idealistic psychology is based on the new trends and new methodological challenges in empirical psychological studies, and its ideas had facilitated the empirical psychological studies. On the other hand, currently idealistic psychology mainly criticized the studies with existed paradigms, and it still needs to apply its new paradigms with more empirical studies.

人类共情的特质与情境变异性

孙亚斌^{1, 2, 3} 罗非^{1, 2} 王锦琰^{2, 2} (通讯作者)

1 中国科学院心理健康重点实验室 (中国科学院心理研究所), 北京 100101

2 中国科学院大学心理学系, 北京 100049, wangjy@psych.ac.cn

3 香港理工大学应用社会科学系, 香港

摘要 共情是当今社会心理学与情感神经科学领域备受关注的话题。通常认为, 共情和人们养育后代、道德发展以及帮助行为密切相关。虽然共情反应通常是自动产生的, 但是对于具体的个体和具体的情景, 这些反应又表现出明显的变异性。因此, 为了促进人们输出恰当的共情反应, 本文对共情变异性的类型进行了梳理, 并对其可能的演化根源和现实的作用机制进行了理论探讨。共情的变异性主要有两种: 其一为在个体间变化的特质变异性, 受复杂的生物-心理-社会因素的影响, 不同的个体具备不同的共情能力; 其二为在个体内变化的情境变异性, 表现为受共情的主体 (共情者)、客体 (共情对象) 和主客体关系, 以及社会文化和物理环境等因素的影响, 同一个体在不同的情景表现出不同的共情反应。从演化的角度而言, 共情的自动性产生于对他人处境产生快速情绪反应的演化适应压力, 并通过镜像神经元系统发挥作用。共情的特质变异性根源于母婴照料行为导致的性别差异, 是基因和环境交互作用的结果。另外, 共情意味着人们需要投入大量的认知资源 (以及其他资源), 因此人们不能随时随地对所有人产生同样的共情反应, 而必须有所区分, 这是共情情境变异性产生的根源。人们通过情境选择、注意分配和认知评价来实现对具体于共情反应的调节。

Dispositional and situational variations in human empathy

SUN Ya-Bin^{1, 2, 3}, LUO Fei^{1, 2}, WANG Jin-Yan^{1, 2}

1 CAS Key Laboratory of Mental Health, Institute of Psychology, Beijing 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

3 Department of Applied Social Sciences, Hong Kong Polytechnic University, Hong Kong, China

Abstract: Empathy is one of the topics of great interest in social psychology and affective neuroscience. It is commonly believed that empathy is closely related to parenting, moral development, and helping behaviors. Although empathic responses are usually automatic, they exhibit significant variability for specific individuals and situations. Therefore, in order to facilitate the output of appropriate empathic responses, this paper sorts out the types of empathic variations and theorizes on their possible evolutionary roots and realistic mechanisms. There are two main types of empathic variations: one is dispositional variation that varies among individuals, which is influenced by complex bio-psycho-social factors, and manifesting as different individuals have different empathic abilities; the other is situational variation that varies within individuals, which is influenced by the subject (empathizer), the object (target of empathy) and the subject-object relationship, as well as the socio-cultural and physical environment, and manifesting as the same individual shows different empathic responses in Different situations exhibit different empathic responses. From an evolutionary perspective, the automaticity of empathy arises from the evolutionary adaptive stress of generating rapid emotional responses to others' situations and acts through the mirror neuron system. Dispositional variation in empathy is rooted in sex differences resulting from maternal and infant caregiving behaviors and is the result of genetic and environmental interactions. In addition, empathy implies that people need to devote a large amount of cognitive resources (and other resources), so they cannot generate the same empathic response to all people at all times and must differentiate, which is the source of situational variation. Context selection, attention allocation, and cognitive appraisal are used to regulate empathic responses specifically.

经颅直流电刺激对不同通道言语工作记忆的影响

朱荣娟^{1,2} 游旭群^{1,2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知重点实验室, 西安, 710062, youxuqun@snnu.edu.cn

摘 要 言语工作记忆是对言语信息进行短暂的存储和操作, 它对高级的言语认知功能具有重要的影响。Baddeley 提出负责言语工作记忆加工的语音环路系统, 该系统包括语音存储和发音复述两个部分。言语信息进入语音环路加工的方式依赖于通道表征的形式: 视觉通道呈现的言语信息需要将视觉信息转换为语音信息才能进入到语音环路系统, 而听觉通道呈现的言语信息可以直接进入语音环路系统。脑成像研究发现在左侧后顶叶皮层观察到显著的言语工作记忆通道效应, 以及左侧额下回皮层对语音信息和听觉信息加工更敏感。后顶叶皮层和额下回皮层在工作记忆存储和操作过程中起着非常重要的作用。但是, 后顶叶皮层和额下回皮层与言语工作记忆通道效应之间的因果性联系缺乏系统研究。而经颅直流电刺激(tDCS)能够揭示特定脑区和认知功能之间的因果性联系, 且对提升工作记忆能力具有较高的潜能。因此, 本研究旨在通过刺激左侧后顶叶皮层和左侧额下回皮层, 观察视觉通道和听觉通道呈现的言语工作记忆提升效果。实验采取单盲的离线经颅直流电刺激的方式, 将被试随机分在阳极刺激组(后顶叶皮层刺激和额下回刺激)和伪刺激组, 接受 1.5mA 微弱电流刺激, 电刺激持续作用 20 分钟, 采集刺激前后视觉字母 3-back 和听觉字母 3-back 任务绩效。研究结果发现, 阳极 tDCS 作用于左侧后顶叶皮层能够提高视觉通道呈现的言语工作记忆表现, 而对听觉通道呈现的言语工作记忆提升效果不显著。阳极 tDCS 作用于左侧额下回皮层既能够提升视觉言语工作记忆, 还能提升听觉言语工作记忆。该研究表明, 左侧后顶叶皮层在言语工作记忆通道效应中起着重要的作用。左侧额下回皮层与不同通道言语工作记忆之间存在因果性联系。

The effect of transcranial direct current stimulation on different sensory modalities of verbal working memory

Rongjuan Zhu, Xuqun You

Key laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, School of Psychology, Shaanxi Normal University, Xi'an, 710062, China

Abstract : Verbal working memory (VWM) refers to temporary maintenance and manipulation of linguistic information in memory, allowing the brain to perform higher cognitive functions such as language comprehension. Baddeley proposed a framework for VWM, called the phonological loop, which was divided into two components known as the phonological store and articulatory rehearsal. The manner of verbal information entering the phonological loop relies on the modality of representation: visually presented verbal information must transfer visual stimuli into phonological information, whereas auditory information has a more direct route to phonological coding. Neuroimaging studies showed that significant modality effects in VWM were observed in the left posterior parietal cortex (PPC). The left inferior frontal gyrus (IFG) was more sensitive to auditory and phonological information. The PPC and IFG played an important role in maintenance and manipulation of VWM. However, it is unclear whether it exists the causal association between the PPC/IFG and different sensory modalities of verbal working memory. Therefore, the present study aimed to examine whether tDCS over the left PPC and IFG affect visual and auditory VWM updating performance using single blind design. Participants were randomly divided into three groups to

receive anodal (left PPC and left IFG) and sham tDCS, respectively. During the stimulation, a constant current of 1.5 mA was applied continuously for 20 minutes. Participants performed the visual letter 3-back task and auditory letter 3-back before and after tDCS. The results showed that stimulating the left PPC enhanced the response efficiency of visual VWM compared with sham condition, but not the auditory VWM. While anodal stimulation to the left IFG improved the response efficiency of both tasks. The present study revealed that the modality effect of VWM was observed in the left PPC. The left IFG have a causal role in different sensory modalities (visual vs. auditory) of VWM updating.

2 浙江大学心理与行为科学系, 杭州, 310007, zympsy@foxmail.com

摘要 汉字字形识别是一个高度专家化的过程, 已有研究者提出了合体汉字识别的相互作用模型、经成分识别模型、多层次交互激活模型、多层次格式塔双向加工模型等认知模型。这些模型大多将汉字字形识别分为特征、部件和整字几个层次。然而, 这些模型较少深入到笔画层次以下进行讨论, 没有充分解释笔画从整字视觉刺激中分离出来的过程。汉字是由笔画构成的, 笔画的相连交叉形成了线段节点。对这些节点的提取和分析, 可能是笔画加工的起点。如果笔画分离阶段以并行方式加工, 那么节点越多, 为笔画分割提供的信息就越多, 识别越容易; 反之, 如果笔画分离串行加工, 那么节点数越多, 加工复杂度越高, 识别越难。为了检验该假设, 本研究考察了节点数量对独体汉字识别的影响。实验采用独体字作为材料, 控制字频和笔画数, 以六档(从 10 毫秒到 60 毫秒, 每 10 毫秒为一档)呈现时间, 向被试快速呈现节点数多和节点数少的两组真字, 并以多节点和少节点的两组假字作为填充材料。被试观察刺激后, 判断看到的是真字还是假字。结果表明, 被试对多节点汉字有更高的辨别力, 真字组中被试对多节点组字具有更快的反应时和更高的正确率。综上所述, 本研究发现了独体字字形识别的节点数效应, 揭示了节点数量对于汉字识别具有重要影响, 表明视觉系统以并行加工方式按照线段节点分离笔画。该发现加深了对汉字字形识别早期视觉过程的认识, 有助于开发更为完整的汉字识别认知模型。

The nodes number effect in the recognition of single-element Chinese characters

Yiming Zhu¹², Yang Zhao¹², Jifan Zhou¹², Mowei Shen¹²

1 The National Key Lab of Human Factors, Hangzhou

2 Department of Psychology and Behavioral Science, Zhejiang University, Hangzhou

Abstract: Chinese character recognition is a highly expert process. Researchers have proposed several cognitive models for Chinese character recognition, such as recognition-by-component model, multilevel interactive activation model, model for grapheme recognition of complicated Chinese characters, and multi-level Gestalt interactive processing model. A consensus of most models is that Chinese character recognition involves three levels: features or strokes, parts and whole characters. However, these models seldom go deeper under the level of strokes, therefore how strokes were separated from other strokes remains unclear. Chinese characters are made up of strokes, which are connected and intersected to form line nodes. Theoretically, the extraction and analysis of these nodes is the first step for stroke separating. If the stroke separation is processed in parallel, then the more nodes a character has, the more information provided for the stroke segmentation, and therefore the character would be easier to recognize; on the contrary, if the strokes are separated in series, more nodes leads to higher processing complexity, thus the character would be harder to recognize. To test this hypothesis, the current study examined the effect of the number of nodes on

the recognition of Chinese characters. The experiment used single-element characters as the materials, character frequency and number of strokes were controlled. The characters were briefly presented (with duration of 6 levels: 10ms, 20ms, 30ms, 40ms, 50ms, or 60ms). Characters were chosen from two groups (high node-count and low node-count) of true characters, and two groups (high node-count and low node-count) of fake characters. After observing each character, the subjects judged whether it was a true character or a fake one. The results showed that the subjects have a higher discriminability for the characters with more nodes. Especially, for the true characters, subjects respond to high node-count characters faster and more accurate than low node-count character. In summary, this study found the nodes number effect in the recognition of single-element characters, showing that the recognition performance increased with the number of nodes a character has. This finding support the hypothesis that stroke separation were performed in parallel. This study deepens the understanding of the early visual process of Chinese character recognition, which could contribute to develop a complete cognitive model of Chinese character recognition.

双语产生中语言特异性控制与一般领域认知控制的适应性整合

吴俊杰^{1,2,3} 郭桃梅¹ (通讯作者)

1 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, guotm@bnu.edu.cn

2 天津师范大学心理学部, 天津, 300387

3 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

摘 要 一般领域认知控制与双语产生中的语言控制有着密切的关系, 双语者很大程度上依赖一般领域认知控制功能来控制两种相互冲突的语言。我们之前的研究表明, 双语者的背侧额叶脑网络和额叶-皮层下脑网络可能分别发挥着一般领域认知控制和语言特异性控制的功能。近些年的研究发现, 双语者的一般领域认知控制功能可以经过短期训练而得到提高, 进而影响到他们在语言控制任务中的行为和脑电反应。然而, 尚不清楚这一过程涉及一般领域认知控制与语言特异性控制脑网络的何种变化。本研究招募了两组同质被试, 让他们前后两次在功能性核磁共振扫描仪 (functional magnetic resonance imaging scanner) 下完成相同的语言切换任务, 在两次扫描间隔的 8 天时间里, 安排其中一组被试 (实验组) 每天接受非语言切换任务训练, 另一组被试 (控制组) 每天接受大致同等时长的颜色判断训练。本研究使用新兴的拓展统一结构方程模型 (extended unified structure equation model) 的方法进行验证性的脑网络分析, 结果发现实验组相比于控制组在额叶-皮层下网络上有更大幅度的连接强度减弱, 而在背侧额叶网络上的变化则没有显著差异。该结果表明双语者在一般领域认知控制能力提升的过程中还可能伴随着语言特异性控制与一般领域认知控制的适应性整合。本研究首次从脑网络的角度揭示了双语者语言控制机制可塑性变化。

*E-mail: guotm@bnu.edu.cn

Abstract: Domain-general cognitive control is closely related to language control in bilingual language production. To a large extent, bilinguals rely on domain-general cognitive control functions to juggle two conflicting languages.

Our previous research has shown that the dorsal-frontal network and the frontal-subcortical network may underpin domain-general cognitive control and language-specific control, respectively. Research in recent years has found that domain-general cognitive control of bilinguals can be improved after short-term training, which modulates their behavior and brain activity in language control tasks. However, it remains unclear what changes this process induced in the brain networks of domain-general cognitive control and language-specific control. In the present study, two groups of homogeneous subjects were recruited and asked to perform pre and post-tests of the same language switching task during functional magnetic resonance imaging (fMRI) scanning. For each day in the interval of pre and post-tests, one group (i.e., experimental group) received training of a non-verbal switching task, and the other (i.e., control group) was arranged to perform a color judgment task at a similar amount. We adopted an emerging extended unified structure equation model (euSEM) approach to conduct a confirmatory brain network analysis. Results showed a larger decrease of connection strength in the frontal-subcortical group for the experimental group rather than the control group and no significant greater change in the dorsal-frontal network for the experimental group relative to the control group. These results indicate that the improvement of domain-general cognitive control in bilinguals may induce an adaptive integration of language-specific control and domain-general cognitive control. This study first reveals the plasticity of the language control mechanism of bilinguals from the perspective of the brain network.

Keywords: bilingualism, language control, domain-general cognitive control, brain network, adaptive integration model

不同认知方式个体的反语认知加工

马越 苗沂林 李寿欣（通讯作者）

山东师范大学心理学院，济南，250358，shouxinli@sdsu.edu.cn

摘要 反语（Irony）是指使用与本意相反的话语来表达本意的一种非字面语言，反语加工的机制长期以来受到研究者的关注，在反语理解中存在的重要问题是，受话者何时以及如何整合语言信息和非语言信息来获得说话者的意图？作为个体差异重要维度的认知方式是影响非字面语言理解的重要非语言线索，已有研究发现，不同场认知方式个体在工作记忆、阅读理解等方面有显著差异，然而，尚未见文献从认知方式角度考察反语认知加工的机制。因此，在本研究中，通过施测“团体镶嵌图形测验”，筛选典型的场依存型和场独立型个体，探讨不同认知方式个体反语认知加工的差异及其认知神经机制。共设计2个实验，实验1，采用眼动技术，考察不同认知方式个体反语认知加工的时间进程。结果发现，场依存型个体在理解反语时比字面语用时更长且回视更多，而场独立型个体在加工反语和字面语时没有差异。实验2，采用声音材料和文本材料相结合的方式，使用ERP技术，分析反语和字面语加工过程中的N400和LPC（晚期正成分），进一步探讨不同认知方式个体反语认知加工的神经机制。结果发现，场依存型个体在加工反语时比字面语引发了更大的N400波幅，而场独立型个体在早期识别反语时未能发现反语加工代价；但与场依存型个体相比，场独立型个体在字面语和反语加工晚期都引发了更大的LPC波幅。上述结果表明，反语的理解过程受到认知方式这一个体差异变量的调节，且对反语认知加工的影响从早期阶段就开始起作用，一直持续到晚期语义整合阶段。本实验结果支持限制—满足模型。

The Effect of Cognitive Styles on Irony Processing

Yue Ma, Yilin Miao, Shouxin Li

School of Psychology, Shandong Normal University, Jinan, 250358

Abstract: As a kind of non-literal language, irony refers to the use of words contrary to the original meaning to express the original meaning. The mechanism of irony processing has long been the focus of researchers. The important question in the understanding of irony is when and how the recipient integrates verbal and non-verbal information to obtain the intended meaning of the speaker. As an important dimension of individual differences,

cognitive style is an important non-verbal cue that influences non-literal language comprehension. Previous studies have found that individuals with different cognitive styles have significant differences in working memory and reading comprehension, etc. However, no literature has examined the mechanism of irony cognitive processing from the perspective of cognitive style. Therefore, in this study, we screened typical field-dependent and field-independent individuals through the "group embedded figure test (EFT)", and explored the differences in the cognitive processing of irony among individuals with different cognitive styles and their cognitive neural mechanisms. This research includes two experiments: eye-movement technique was used to investigate the temporal process of ironic cognitive processing among individuals with different cognitive styles. The results show that the field dependent individuals understand irony longer and look back more frequently than the literal ones, while the field independent individuals have no difference in processing irony and literal ones. In Experiment 2, the neural mechanism of irony processing in individuals with different cognitive styles was further explored by analyzing N400 and LPC (late positive component) in the process of irony and literal language processing using the combination of sound and text materials and using ERP technology. The results showed that field dependent individuals had a larger N400 amplitude when processing irony than literal ones, while field independent individuals could not find the cost of irony processing in early recognition of irony; However, compared with the field dependent individuals, the field independent individuals caused more LPC amplitude in the late stage of literal and irony processing. The results show that the process of irony understanding is regulated by cognitive style, which is an individual variable, and the effect on irony cognitive processing starts from the early stage and continues to the late stage of semantic integration. The experimental results support the constrain-satisfaction framework.

汉字整合促进联结再认与项目再认

赵春宇¹ 谢苗苗¹ 郭春彦¹ (通讯作者)

¹ 首都师范大学心理学院, 北京市“学习与认知重点实验室”北京, 100048, guocy@cnu.edu.cn

摘要 根据双加工理论, 情景记忆的再认由两个基本的心理过程支持: 熟悉性和回想。先前的研究发现, 熟悉性和回想这两个过程都可以支持项目再认, 而联结再认只能由回想加工所支持。近年来, 许多研究发现一种特殊情况: 当进行联结的两个部分可以被整合为一个整体时, 熟悉性也可以支持联结再认(整合效应)。汉字作为一种象形文字, 将其偏旁部首整合为一个合体字的过程与传统的整合操纵有诸多不同之处。因此, 汉字整合过程中是否依然存在这种整合效应还有待研究。除此之外, 先前的研究一致表明整合对联结再认起促进作用, 但整合对项目再认的影响还存在争议。因此, 汉字整合对项目再认的影响也是本研究要探讨的问题。本研究使用学习再认范式和具有高时间分辨率的 ERP 技术来探讨汉字整合如何影响联结再认与项目再认影响以及背后的认知神经机制。学习阶段, 被试需要记住屏幕上出现的两个字以及它们之间的配对关系并判断这两个字合起来能否成为一个汉字。联结再认测验阶段, 被试需要判断屏幕上出现的字对是与学习阶段一样的还是重新组合的。项目再认测验阶段, 被试需要判断屏幕上出现的单个汉字在学习阶段是否在学习阶段学过。实验结果对汉字整合与非整合条件下联结再认与项目再认时的行为表现与 ERP 特征进行了比较。行为结果表明, 相比于非整合条件, 汉字整合条件下的联结再认和项目再认的 Pr 值(击中率 - 虚报率)都显著更高。ERP 结果表明, 联结再认时汉字整合条件下有显著的 FN400 效应和 LPC 效应, 而项目再认时只有显著的 LPC 效应; 非整合条件下联结再认和项目再认时都表现出显著 LPC 效应而没有 FN400 效应。本研究与前人的研究结果一致, 发现整合操作后存在基于熟悉性的联结再认, 表明汉字整合过程中也存在整合效应。此外, 汉字整合还可以提高项目再认成绩, 但此时只有回想的参与。这可能与汉字整合使得项目间建立起了更强的联系, 形成了更有效且稳定的联结有关。

Chinese character unitization increase associative recognition and item recognition

Chunyu Zhao¹, Miaomiao Xie¹, Chunyan Guo¹ (Correspondence)

¹ Beijing Key Laboratory of Learning and Cognition, School of Psychology, Capital Normal University, Beijing, China, 100048, guocy@cnu.edu.cn

Abstract: According to the dual-process models, the recognition of episodic memory can be supported by familiarity and recollection. Previous studies have revealed that both familiarity and recollection can support item recognition, but only recollection can support associative recognition. However, recently, some studies have found a type of special case that associative recognition can be supported by familiarity as long as the components in an association can be unitized (unitization effect). As a kind of pictograph, the process of uniting its parts into a compound character is different from the traditional unitization manipulation. Therefore, it is not clear whether the unitization effect still exists after Chinese character unitization. In addition, previous studies have consistently shown that unitization promotes associative recognition, but the impact on item recognition is still controversial. To clarify the two problems, our study used study-recognition paradigm and ERP technology with high time resolution to explore how Chinese character unitization affects associative recognition and item recognition, as well as the cognitive neural mechanism behind it. In the study phase, participants were instructed to remember both the single characters on the screen and their pairing relationship, and to discriminate whether the character pair could form a new compound character. In the associative recognition phase, participants were instructed to discriminate whether the word pairs on the screen are intact as those in the study phase or recombined. In the item recognition phase, participants were instructed to discriminate whether a single character was old or new compared with the study phase. As respect to data analysis, we compared the behavior performance and ERP components under the unitization conditions and non-unitization conditions during associative recognition and item recognition. The behavioral results showed that the Pr (hit - false alarm) of associative recognition and item recognition was higher under unitized condition than non-unitized condition. The ERP results showed that, (1) under the unitized condition, there were significant FN400 and LPC effects during associative recognition, while there was only significant LPC effect during item recognition, (2) under the non-unitized condition, there was only significant LPC effect during both associative recognition and item recognition, but there was no FN400 effect. This study indicates that the performance of associative recognition was significantly improved after Chinese character unitization. At the same time, there were not only recollection-based but also familiarity-based associative recognition. This is consistent with the previous researches, indicating that unitization effect also exists in the process of Chinese character unitization. In addition, the unitization of Chinese characters can also improve the performance of item recognition. At this time, only recollection was involved whether under unitized condition or non-unitized conditions. This may be related to the fact that Chinese character unitization makes stronger connections between items and forms a more effective and stable association.

任务转换和双语转换中情感代价的不对称性

邓郡¹ 林无忌¹ 高媛¹ 恩煜尧¹ 莫雷¹ (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631, molei@m.scnu.edu.cn

摘要 任务转换(task switching)是指在两项或多项不同任务间相互转换的过程。转换任务在反应时和正确率上的亏损被称为“转换代价(switch cost)”。转换代价受到任务难度的调节,即转向简单任务比转向困难任务消耗更多的认知资源,产生更大的转换代价。有研究发现,任务转换存在情感代价,即任务转换比任务重复诱发更消极的情感评估。情感代价的产生可能是由于认知资源的消耗导致,但是当前对于情感代价的认知机制尚不明确。因此本研究将采用任务/双语转换范式和情感诱导范式,探究任务难度的差异能否引发情感代价的不对称性。实验1采用任务转换范式和情感诱导范式,探讨任务转换中任务难度和转换类型是否在情感评估

上存在交互作用,表现出情感代价的不对称性。实验2以非熟练汉-英双语者为研究对象,采用双语转换范式和情感诱导范式,探讨双语转换过程是否存在情感不对称性。实验3在实验2基础上,以熟练汉-英双语者为研究对象,进一步探讨熟练程度是否会影响情感代价的不对称性。实验1的结果表明,与重复试次相比,困难任务的转换试次具有更消极的情感评估;而简单任务的转换试次情感评估无明显变化。说明困难任务的情感代价更大。实验2的结果表明,与重复试次相比,L2(英语)任务的转换试次情感评估更消极,而L1(汉语)任务的转换试次情感评估无明显变化。实验3的结果表明,高熟练双语者进行双语转换时不存在情感代价。综上所述,本研究证明任务转换和双语转换均存在情感代价的不对称性,表现为困难任务的情感代价更大,并且双语转换中的情感代价会随着双语者熟练度的提高而消失。说明情感代价是由于认知资源的消耗产生,情感代价随着认知资源消耗增加而增大,以揭示情感代价的认知机制。

The asymmetry of affect cost in task switching and language switching

Jun Deng¹, Wuji Lin¹, Yuan Gao¹, Yuyao En¹, Lei Mo¹(corresponding author)

1 School of Psychology, South China Normal University, Guangzhou, Guangdong, China

E-mail: molei@m.scnu.edu.cn

Abstract: Task switching refers to the process of switching between two or more different tasks. The loss in response time and accuracy of switching tasks is called "switch cost". The switching cost is adjusted by the difficulty of the task, that is, switching to easier tasks consumes more cognitive resources than switching to more difficult tasks, resulting in greater switching costs. Studies have found that task switching has an affective cost, that is, task switching induces more negative affective evaluation than task repetition. The affective cost may be caused by the consumption of cognitive resources, but the current cognitive mechanism for the affective cost is still unclear. Therefore, this study will adopt the task/bilingual switching paradigm and the affective priming procedure to explore whether the difference in task difficulty can cause the asymmetry of affective costs. Experiment 1 adopts the task switching paradigm and the affective priming procedure to explore whether the task difficulty and the switching type have an interactive effect on affective evaluation in the task switching, which shows the asymmetry of the affective cost. Experiment 2 selected non-proficient Chinese-English bilinguals as the research object, adopts the bilingual switching paradigm and the affective priming procedure to explore whether there is affective asymmetry in the bilingual switching process. Experiment 3 is based on Experiment 2, selecting proficient Chinese-English bilinguals as the research object, and further explores whether proficiency will regulate the asymmetry of affective cost. The results of Experiment 1 show that compared with repeated trials, the switch trials of difficult task have a more negative affective evaluation; while the switch trials of easy task have no significant change in affective evaluation. It indicates a greater affective cost of difficult task. The results of Experiment 2 show that compared with repeated trials, the affective evaluation becomes more negative when switching to the L2 (English) task, while has no significant change when switching to the L1 (Chinese) task. The results of Experiment 3 show that there is no affective cost when highly skilled bilinguals perform bilingual switching. In summary, this study proves that both task switching and bilingual switching have asymmetry in affective cost. The affective cost of difficult task is greater, and the affective cost of bilingual switching will disappear as the proficiency of bilinguals increases. It shows that the affective cost is caused by the consumption of cognitive resources, and the affective cost increases with the consumption of cognitive resources, which reveals the cognitive mechanism of the affective cost.

不同估计策略下注意负荷和时间结构对接触时间估计的影响

刘煜^{1,2} 游旭群^{1,2}(通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知重点实验室, 西安, 710062, youxuqun@snnu.edu.cn

摘要 估计接触时间(time-to-contact, TTC)指的是个体对运动物体到达特定位置时间的估计, 有助于个体对环境信息的处理。以往研究表明, 注意负荷、估计策略(速度策略和时间策略)、运动路径的时间结构(可见路径与被遮挡路径的比值)均会对估计 TTC 产生影响, 然而三者对 TTC 估计的共同作用效果尚未明确。因此, 本研究采用双任务范式, 通过两个实验探讨了不同估计策略下注意负荷对不同时间结构 TTC 估计的影响。实验 1 在可见-遮挡(visible-occluded, V-O)条件下进行, 即运动目标最初可见, 随后被遮挡, 该条件下个体偏好使用速度策略。采用 2(低负荷, 高负荷)× 3(时间结构为 0.5, 1, 1.5)的两因素被试内实验设计, 20 名在校大学生参与了该实验。因变量指标为 TTC 估计的均方根误差(Root-mean-squared error, RMSE)、相对偏差 BIAS 和变量误差(Variable error, VE)。实验 2 在遮挡-闪烁-遮挡(occluded-flashed-occlude, O-F-O)条件下进行, 即运动目标在最初出现和运动到路径中点时可见, 其他时间均不可见, 该条件下个体偏好使用时间策略。实验设计及因变量指标同实验 1, 20 名在校大学生参与了该实验。采用重复测量方差分析对数据进行分析。实验 1 结果表明, 对于 RMSE, 注意负荷主效应显著($p = 0.009$), 注意负荷与时间结构交互作用显著($p = 0.007$)。进一步简单效应分析发现, 时间结构为 0.5($p = 0.04$)和 1.5($p = 0.001$)时, 注意负荷对 TTC 估计影响差异显著, 时间结构为 1 时差异不显著($p = 0.29$)。对于 VE 和 BIAS 的分析发现, 被试估计 TTC 的准确性与其估计敏感性有关。实验 2 结果表明注意负荷、与时间结构的交互效应均不显著, $p > 0.38$ 。综合两个实验的数据分析发现, 估计策略、注意负荷和时间结构的交互作用显著($p = 0.012$)。高负荷下, 估计策略和时间结构的交互作用显著($p = 0.004$)。本研究表明当个体使用速度策略时, 注意负荷越高, TTC 估计越准确, 但同时会受到时间结构的影响; 当个体使用时间策略时, TTC 估计则主要受到任务的时间结构的影响。

The Influence of Attention Load and Temporal Structure on The Estimation of Time-to-Contact under Different Estimation Strategies

Liu Yu^{1,2}, You Xuqun^{1,2}(corresponding author)

1 Department of Psychology, Shaanxi Normal University, Xi'an, 710062

2 Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, Xi'an, 710062

Abstract: Estimated time-to-contact (TTC) refers to an individual's estimation of the time when a moving object arrives at a specific location, which is helpful for the individual to process environmental information. Previous studies have shown that attention load, estimation strategies (speed strategy and timing strategy), and the temporal structure of the motion path (the ratio of the visible path to the occluded path) will all have an impact on the estimated TTC, but the combined effect of the three on the TTC estimation Not yet clear. Therefore, this study adopts the dual-task paradigm and explores the influence of attention load on TTC estimation with different temporal structures through two experiments. Experiment 1 was carried out under the condition of visible-occluded (V-O), that is, the moving target is initially visible and then occluded. Under this condition, individuals prefer to use the speed strategy. A two-factor in-subject experimental design of 2 (low load, high load) × 3 (temporal structure 0.5, 1, 1.5) was adopted, and 20 college students participated in the experiment. The dependent variable indicators are the Root-mean-squared error (RMSE), relative deviation BIAS, and variable error (VE) estimated by TTC. Experiment 2 was carried out under the condition of occluded-flashed-occlude (OFO), that is, the moving target is visible when it initially appears and when it moves to the midpoint of the path, and it is not visible at other times. Under this

condition, the individual prefers to use the timing strategy. The experimental design and dependent variable indicators were the same as Experiment 1, and 20 college students participated in the experiment. Repeated measures analysis of variance was used to analyze the data. The results of Experiment 1 show that for RMSE, the main effect of attention load is significant ($p = 0.009$), and the interaction between attention load and temporal structure is significant ($p = 0.007$). Further simple effect analysis found that when the temporal structure is 0.5 ($p = 0.04$) and 1.5 ($p = 0.001$), the effect of attention load on TTC estimation is significantly different, and when the temporal structure is 1, the difference is not significant ($p = 0.29$). The analysis of VE and BIAS found that the accuracy of the participants' estimation of TTC is related to the sensitivity of their estimation. The results of experiment 2 show that the interaction effects of attention load and temporal structure are not significant, $p > 0.38$. Based on the data analysis of the two experiments, it is found that the interaction of estimation strategy, attention load, and temporal structure is significant ($p = 0.012$). Under high load, the interaction between estimation strategy and temporal structure is significant ($p = 0.004$). This study shows that when the individual uses the speed strategy, the higher the attention load, the more accurate the TTC estimation, but at the same time it will be affected by the temporal structure; when the individual uses the timing strategy, the TTC estimation is mainly affected by the task temporal structure.

化身虚拟老年人对主观年龄和认知功能的影响

王敏¹ 麻珂²

1 西南大学心理学部, 重庆, 400715

2 西南大学心理学部, 重庆, 400715, Psyke1@swu.edu.cn

摘要 不同于实际年龄, 主观年龄是一个人主观感觉自己多少岁, 它对个体的认知功能和健康有着重要的作用。前人的研究发现主观年龄很容易被操控, 比如老年人在经历了五分钟的记忆实验后, 他们主观年龄增大了。本研究利用虚拟技术, 尝试改变被试的主观年龄。通过佩戴虚拟现实头盔, 大学生被试在虚拟环境中可以看到镜子中自己的影像, 如果该影像是老年人, 并且他的动作和被试的动作一致, 则被试会对该虚拟化身产生身体拥有感, 以为“镜中人的老年人就是我”。实验一操纵了被试与虚拟人物之间动作一致性, 测量被试的主观年龄, 对老年人的内隐刻板印象, 以及记忆任务表现。实验结果发现, 相比较不一致, 在动作一致时, 被试的主观年龄显著增大, 对老年人的内隐刻板印象变好, 在记忆任务中, 被试的表现也显著降低。实验二在操控被试与虚拟人物之间动作一致性之前, 启动了被试对年龄的不同的印象。实验记录了被试的主观年龄, 内隐刻板印象和记忆任务表现。结果发现, 在给予被试积极的年龄印象启动之后, 相比于消极的启动, 被试的主观年龄虽然变大, 内隐刻板印象变好, 但是记忆认知任务成绩也会上升。结果表明, 虚拟老年化身能够影响被试的主观年龄认知, 对老年人的内隐刻板印象, 和记忆任务的表现, 而这种表现的改变是受到不同的启动条件的调制。

The Effect of Virtually Being old people on Subjective Age and Cognitive Function

Wang Min¹, Ma Ke²

Southwest University Faculty of Psychology, chongqing

Abstract: Different from chronological age, subjective age is individuals how old they feel or how old they view themselves. It plays an important role in an individual's cognitive function and health. Previous studies have found that subjective age can be rapid manipulated, such as when older people experience an increase in subjective age after a five-minute memory experiment. In this study, virtual technology was used to try to change the subjective age of the participants. By wearing a virtual reality helmet, college students can see their own body in the mirror in the virtual environment. If the virtual avatar is an old people and his or her actions are consistent with those of the participants,

the participants will have a sense of body ownership of the virtual avatar, thinking that "the old people in the mirror is me". Experiment 1 manipulated the action consistency between the participants and the virtual avatar, measured the participants' subjective age, implicit bias against old people, and memory task performance. The experimental results showed that, compared with inconsistency, when the actions were consistent, the subjective age of the participants increased significantly, the implicit bias against old people became better, and the performance of the participants in the memory task also decreased significantly. Experiment 2 activated participants' different impression of age before manipulating the consistency of movement between participants and virtual avatar. The participants' subjective age, implicit bias against old people and memory task performance were recorded. The results showed that, compared with the negative priming, the subjective age of the participants increased and the implicit stereotype improved after the positive priming, but the performance of the memory and cognitive tasks also increased. The results showed that the avatar of virtual old age could affect participants' subjective age cognition, implicit bias against old people, and performance of memory task, and the change of performance was modulated by different priming conditions.

目光注视对客体注意的影响及其时间进程

闫驰¹ 孔凤¹ 高云飞¹ 胡赛赛¹ 王勇慧¹ 赵晶晶¹ (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710062, zhaojingjing1987@snnu.edu.cn

摘要 目光注视在人类社交以及捕获和维持注意方面发挥重要作用。前人研究已经发现目光注视方向可以引导注意分配,然而睁眼或直视的面孔是一种包含社交信息的特殊客体。客体对注意分配的引导我们称之为客体注意,它是指个体对相同客体两个(或多个)特征的识别比对不同客体两个(或多个)特征的识别更快更准确。携带社交信息的眼光注视信号与客体是否以及如何交互引导注意仍需进一步研究。因此本研究采用双框线索范式,以具有不同注视方向(直视或回避)的客体作为刺激,通过操纵不同 SOA 来考察目光注视对客体注意的影响及其时间进程。实验一以面孔作为刺激,采用 2(线索位置: 直视 vs. 回避)×3(有效性: 有效 vs. 无效不同 vs. 无效相同)×3(SOA: 300 ms vs. 600 ms vs. 900 ms)被试内实验设计来探讨特殊的面孔客体如何与目光注视信息进行交互。结果表明 600 ms SOA 时,直视条件下的客体注意效应显著大于回避条件,进一步分析表明客体效应的差异来自于直视比回避条件下被试对无效相同客体位置上的目标反应更快,这说明与回避条件相比,直视更能捕获我们的注意,从而产生更大的客体注意效应。为了探究当面孔信息被削弱或消除时,目光注视效应是否能够扩展到其他客体中,实验二将面孔倒置,探讨当面孔信息被削弱时,目光注视对客体效应的影响是否还会发生;实验三和实验四分别使用不同注视方向的眼睛叠加矩形框或真实客体作为刺激,探讨当面孔信息被消除时,目光注视效应是否能够扩展到其他客体中。实验四的结果与实验一一致。实验二和实验三虽然也在 600 ms SOA 时发现了直视和回避目光客体效应的差异,但是差异来自于直视比回避在无效不同客体的目标反应更慢,表现出对直视目光的脱离困难,这说明直视更能维持我们的注意,从而产生更大的客体注意效应。上述结果说明了直视目光在 600 ms SOA 时更能捕获或维持我们的注意。

Different temporal dynamics of object-based attention with faces between direct and averted gaze

Chi Yan¹, Feng Kong¹, Yunfei Gao¹, Saisai Hu¹, Yonghui Wang¹, Jingjing Zhao¹

¹ School of Psychology, Shaanxi Normal University, Xi'an, 710062

Abstract: Eye contact plays an important role in social interaction and can capture and hold attention. Previous studies have shown that eye contact can guide attentional allocation. However, face with direct or averted gaze is a special object containing social information. The object's guidance for attentional allocation is called object-based attention, in which items in the cued object are processed preferentially than items in the uncued object. It is still unclear whether and how eye contact interacts with objects in guiding attentional allocation. Therefore, the aim of our

study was to investigate the impact of gaze on object-based attention and its temporal dynamics by using two-rectangle paradigm and objects with different gaze directions (direct or averted). In Experiment 1, we used face as stimulus and a 2 (cue location: direct-gaze face, averted-gaze face) $\times$ 3 (cue validity: valid, invalid same-object, invalid different-object) $\times$ 3 (SOA: 300, 600, 900) within-subjects factorial design to investigate whether and how eye contact interacted with face to guide attentional allocation. The results revealed a larger object-based effect when the cue appeared on the direct-gaze face compared to the averted-gaze face under 600 ms SOA. Further analysis showed that the difference of object-based effect derived from that participants reacted more quickly to the target in direct gaze than averted gaze under the invalid same-object condition, which indicated that direct gaze could capture attention and caused a larger object-based effect. In order to explore whether the gaze effect can be extended to other objects when face information is weakened or eliminated. Inverted faces were used in Experiment 2 to explore whether the results in Experiment 1 could be found when face information was weakened. In Experiments 3 and 4, rectangles or real objects overlaid with eyes were used to explore whether the gaze effect existed when face information was eliminated. The results of Experiment 4 were consistent with Experiment 1. Although the results of Experiment 2 and Experiment 3 also suggested that the difference of object-based effect with eye contact in 600 ms SOA, the difference was due to the slower response to target in direct gaze than averted gaze under invalid different-object condition, which indicated that it was more difficult to disengage attention from direct gaze, which led to a larger object-based effect. This result provides the first evidence that direct gaze can capture and maintain attention at 600 ms SOA.

摘要 感知社会地位在社交中起着重要作用。以往研究表明,个体通过社会经济地位(SES)和道德地位(MS)感知他人社会地位。个体会将注意优先投入到高 SES 目标者;印象形成中更关注目标者的负面道德信息。然而由于研究范式等的局限性,目前尚未有研究同时考察 SES 和 MS 对注意分配的影响,以及哪种地位占主导来引导注意选择仍不清楚。因此,本研究采用双框范式的变式,通过虚拟简历法操纵目标者的地位,探究上述问题。实验一采用 2 (线索位置:高 SES;低 SES) $\times$ 3 (线索有效性:有效;无效相同客体;无效不同客体) $\times$ 3 (SOA: 100 ms; 300 ms; 500 ms) 被试内实验设计,探究 SES 对选择性注意的影响及其时间进程。结果发现,高、低 SES 条件下的空间效应在不同 SOA 时均无显著差异;然而当 SOA 为 300 ms 时,高 SES 条件下的客体效应显著大于低 SES 条件。这表明 SES 不影响空间注意;但在 300 ms SOA 时影响客体注意且进一步分析表明高 SES 目标者既捕获注意又维持注意。实验二采用 2 (线索位置:高 MS;低 MS) $\times$ 3 (线索有效性:有效;无效相同客体;无效不同客体) $\times$ 3 (SOA: 100 ms; 300 ms; 500 ms) 被试内实验设计,探究 MS 对选择性注意的影响及其时间进程。结果发现,当 SOA 为 300 ms 时,高 MS 条件下的空间效应和客体效应均显著大于低 MS 条件。这表明 MS 在 300 ms SOA 时同时调节空间注意和客体注意,且高 MS 目标者既维持了个体的注意,又易化了其所在的空间位置。实验三在实验一、二的基础上操纵 SOA 为 300 ms,采用 4 (线索位置:高 SES;低 SES;高 MS;低 MS) $\times$ 3 (线索有效性:有效;无效相同客体;无效不同客体) 被试内实验设计,进一步探究 SES 和 MS 谁占主导地位。结果发现,空间效应在不同线索位置上差异不显著;但高 MS 条件下的客体效应显著大于高 SES、低 SES 和低 MS 条件,高 SES 条件下的客体效应显著大于低 SES 和低 MS 条件,低 SES 和低 MS 条件无显著差异。这表明个体在高 MS 的目标者上投注了更多的注意资源。上述实验揭示:SES 和 MS 对个体选择性注意的影响模式不同;MS 可能在社会地位对个体注意系统的影响中起主导作用。

² Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101

Abstract: Perceived social status is ubiquitous in guiding social interactions in numerous environments. The literature on status has revealed that socioeconomic status (SES) and moral status (MS) are two important dimensions of social status relevant to human. Previous study has found that high SES faces received more attention than low SES faces, people preferentially assigned more attention to negative morality information when forming an impression of a person. However, as a result of the limitation of paradigm, it's still unclear how and when SES and MS simultaneously shape selective attention, and the relative importance of this two status to the perceiver's attentional processing is still an open question. To explore these problems, the current study used a variant of two-rectangle paradigm and manipulated the targets' status with fictive CVs. Experiment 1, employing a 2 (cue position: high SES, low SES) $\times$ 3 (cue validity: valid, invalid same-object, invalid different-object) $\times$ 3 (SOA: 100 ms, 300 ms, 500 ms) within-subjects factorial design, explored the influence and time course of SES on selective attention. The results revealed no significant differences in space-based effect between high SES and low SES faces under different SOA conditions, but a greater object-based effect can be observed within high SES faces than low SES faces for 300 ms SOA condition. These results suggested that SES did not modulate space-based attention, but SES plays an important role in object-based attention for 300 ms SOA condition, high SES faces capture and maintain perceivers' attention. In Experiment 2, a 2 (cue position: high MS, low MS) $\times$ 3 (cue validity: valid, invalid same-object, invalid different-object) $\times$ 3 (SOA: 100 ms, 300 ms, 500 ms) within-subjects factorial design was carried out to explore the influence and time course of MS on selective attention. Interestingly, the results showed that a greater space-based effect and a greater object-based effect can be observed within high MS faces than low MS faces for 300 ms SOA condition. The results indicate that MS affect space-based attention as well as object-based attention for 300 ms SOA condition, high MS face only maintain the perceivers' attention and there is a facilitation of its spatial location. To further explore the relative importance of SES and MS, we used a 4 (cue position: high SES, low SES, high MS, low MS) $\times$ 3 (cue validity: valid, invalid same-object, invalid different-object) within-subjects factorial design. The results showed that the difference of space-based effect for different cue position was not significant, but a greater object-based effect for high MS faces than high SES, low SES and low MS face. Additionally, a greater object-based effect was observed for high SES than low SES and low MS faces, the difference of object-based effect between low SES and high SES faces was not significant. These results indicated that participants assigned more attention to high MS faces. Taken together, there are different impact patterns of SES and MS on attentional allocation, and MS may be relatively more important than SES for individuals' attentional processing.

摘要 驾驶员危险知觉能力是关系道路安全驾驶的重要因素, 面对日益复杂化的交通环境, 探寻提升驾驶员危险知觉能力的方法至关重要。大量研究表明, 驾驶员危险知觉能力与驾驶安全存在直接关联。目前, 英国、澳大利亚等国家已经出现基于电脑和触屏设备的标准化危险知觉测验 (HPT), 但我国尚未出现成熟范本。因此, 本研究采用测量和实验的方法, 考察现有危险知觉训练模式的效果、特点及其受主体情绪的影响。研究一参考 Wetton 等人 (2010) 编制 HPT 的过程和原则, 以实地拍摄行车视频为素材, 编制一套符合国内的《驾驶员危险知觉测验》, 为后续研究提供工具。测验包含 4 种场景 (道路危险源、车辆危险源、视觉盲区、特殊路况), 共 30 个项目, 反应方式为鼠标点按, 量化指标为命中率和时间偏移, 通过实证效度来评估

测验有效性。研究二采用 4（训练模式：专家评论训练、导航视角训练、预期训练、无训练） $\times$ 2（情绪启动：愤怒、平静）组间设计探究情绪对危险知觉可训练性的影响。因变量为被试命中率提升量（后测命中率-前测命中率）和时间偏移减少量（前测时间偏移-后测时间偏移）。结果表明：1）自编《危险知觉测验》具有一定有效性，能够将专家组和新手组区分开，可用于后续研究；2）适当训练干预可以提升驾驶员识别危险源的准确性和及时性；3）危险知觉训练效果会受到愤怒情绪的抑制；4）三种训练模式都能提升被试危险知觉能力，但训练效果会受到主体愤怒情绪影响。导航视角训练总体上效果最优，但容易受到主体愤怒情绪的抑制，而专家评论效果则具有较好的跨情绪一致性。研究为将来该领域的研究和实践提供较为可用的工具，并为将来驾驶员的培训和相关法律法规的制定提供理论依据和建议。

HPT test and the influence of emotion on the trainability of risk perception

HE Xiaoling, DENG Zhu

Nanjing Normal University, Nanjin, 210008

Abstract: Drivers' risk perception ability is an important factor related to road safety driving. Faced with increasingly complicated traffic environment, it is very important to explore ways to improve drivers' risk perception ability. A large number of studies have shown that there is a direct correlation between drivers' risk perception ability and driving safety. Currently, the United Kingdom, Australia and other countries have developed standardized risk perception tests (HPT) based on computers and touch screen devices, but China has not yet developed a mature model. Therefore, this study adopted the methods of measurement and experiment to investigate the effect and characteristics of the existing risk perception training model and the influence of emotion on the trainability of risk perception. In Study 1, referring to the process and principles of compiling HPT by wetton et al (2010), and taking field driving videos as materials, a set of domestic driver risk perception test was prepared to provide tools for follow-up research. The test includes 4 scenarios (road hazards, vehicle hazards, visual blind areas and special road conditions), a total of 30 items. The response method is mouse click, and the quantitative indicators are hit rate and time offset. The effectiveness of the test is evaluated through empirical validity. In study 2, 4 (training mode: expert review training, navigation perspective training, anticipation training, no training) $\times$ 2 (emotional activation: anger, calm) inter group design was used to explore the impact of emotion on the trainability of risk perception. The dependent variables are the increase of the subject's hit rate (post test hit rate - pretest hit rate) and the decrease in the time offset (pretest time offset - post test time offset). The results show that: 1) The self-compiled risk perception test has certain effectiveness, which can distinguish the expert group from the novice group, and can be used in the follow-up research; 2) Appropriate training intervention can improve the accuracy and timeliness of drivers' hazard identification; 3) The effect of risk perception training suppressed by anger; 4) All the three training modes can improve the risk perception ability of the subjects, but the training effect will be affected by the anger emotion of the subjects. Navigation view training had the best effect overall, but it was more easily suppressed by the anger of the subject, while expert review training had better cross-emotion consistency. The research will provide useful tools for future research and practice in this field, and provide theoretical basis and suggestions for driver training and relevant laws and regulations in the future.

发展性协调障碍儿童视空间信息前注意加工失匹配负波研究

陈书玲, 王恩国*

河南大学教育科学学院, 河南, 开封, 475000, enguowang@126.com

摘要 目的: 发展性协调障碍 (developmental coordination disorder, DCD) 是一种常见的神经发育障碍, 表现为智力发展正常, 但是精细和粗大运动技能发展受损。前注意加工是无需注意参与的, 对刺激的早期、自动化的加工, 失匹配负波 (mismatch negativity, MMN) 是研究前注意加工的客观指标。本研究旨在探究发展性协调障碍儿童和对照组儿童视空间信息的前注意加工功能特点。方法: 使用发展性协调障碍问卷家长版 (DCDQ) 和儿童运动协调能力成套评估工具 (M-ABC), 并结合教师评价, 筛选出 7-10 岁发展性协调障碍儿童 24 例, 同时选取对照组儿童 23 例。采用偏差刺激呈现频率为 20% 的非注意 oddball 范式, 应用美国 EGI 公司生产的 ERP 仪器, 采集并比较两组儿童的视觉失匹配负波。结果: 行为结果表明, 在注意主任务上, 两组儿童的反应时不存在差异; 然而, 障碍组儿童的准确率显著低于对照组 ($t = -2.431, p < 0.05$)。ERP 结果表明, 相比于障碍组儿童的视觉 MMN 波幅 $[(0.410 \pm 0.232)\mu V]$, 对照组儿童枕部 (O1、Oz、O2) 引起的波幅更负 $[(-0.306 \pm 0.237)\mu V, p = 0.036]$, 差异具有统计学意义 ($p < 0.05$)。结论: 发展性协调障碍儿童的视空间前注意加工能力较正常儿童差, 可能存在视觉感知障碍。意义: 通过 ERP 研究可以确定发展性协调障碍儿童是否在特定大脑区域存在功能异常, 是否存在注意加工问题, 深入探讨注意视空间信息加工脑机制, 为发展性协调障碍儿童的及时发现、矫正与治疗提供帮助, 提高其学习效率, 改善学业成绩。

Study on pre-attentive change detection index by visual mismatch negativity in children with Developmental Coordination Disorder

CHEN Shuling, WANG Enguo*

School of Education, Henan University, Kaifeng Henan, 475000, enguowang@126.com

Abstract: Objective: Developmental Coordination disorder (DCD) is a common neurodevelopmental disorder, characterized by normal intellectual development but impaired fine and gross motor skill development. Pre-attentive processing does not need attention, the early, automatic processing of stimuli, and the mismatch negativity (MMN) is an objective indicator of pre-attentive processing. The aim of this study was to investigate the pre-attentive processing of visuospatial information in children with and without developmental coordination disorder. Method: Motor coordination was measured using the Developmental Coordination Disorder Questionnaire (DCDQ) and Movement Assessment Battery for Children test (M-ABC), combined with teacher evaluation, 24 children aged 7-10 years with developmental coordination disorder were selected, and 23 children in the control group were selected. The visual mismatch negativity waves of the two groups of children were collected and compared with the ERP instrument produced by EGI company in the United States by using the non-attentional Oddball paradigm with the deviant frequency of 20%. Results: The behavioral results showed that there was no difference in the response time of the two groups of children on the attention main task. However, children in the disorder group were significantly less accurate than those in the control group ($t = -2.431, p < 0.05$). The ERP results showed that compared with the visual MMN amplitude of children in the disorder group $[(0.410 \pm 0.232)\mu V]$, the occipital amplitude of children in the control group (O1, Oz, O2) was more negative $[(-0.306 \pm 0.237)\mu V, p = 0.036]$, and the difference was statistically significant ($P < 0.05$). Conclusion: Children with developmental coordination disorder have poorer visuospatial attention processing ability than normal children, and may have visual perception impairment. Significance: Can determine whether the developmental coordination disorder children through ERP research in a specific area of the brain dysfunction, whether there is attention to the problem of processing. To further explore the brain mechanism of attentional visual spatial information processing in order to provide help for the timely detection, correction and treatment of children with developmental coordination disorder, and improve their learning efficiency and academic performance.

工作记忆中的信息移除机制

万晓伟¹ 王腾飞¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310000

摘要 信息繁杂的时代里, 我们的大脑每天都面对着大量需要处理的内容, 那么在这背后, 是什么样的工作记忆机制让我们避免陷入混乱局面, 保持高效工作的呢? 工作记忆是一个对信息进行暂时储存、加工的系统, 前人提出工作记忆中的无关信息会被主动地移除, 以便在容量有限地情况下, 更好地为目标服务。本研究旨在探究工作记忆任务中干扰项的加工方式, 并进一步验证工作记忆的信息移除是否存在。实验范式沿用 Ecker 等人 (2014) 使用的改良版工作记忆范式, 自变量为 CTI (线索和目标之间的时间间隔), 通过改变 3 方面实验设置 (记住替换词后是否按键、回忆时是否需要对应位置、是否加入特殊词), 对 93 名浙江大学学生开展 4 项实验, 并在此基础上增加意外回忆测试, 让被试在所有试次结束后, 自由回忆前面出现过的所有词语, 以探究干扰项的回忆效果。研究结果和移除假说不一致, 不论是否按键、是否按位置回忆, 被试并没有按照预想表现出在 CTI 长的条件下, 回忆出更少的干扰词, 且同样是干扰词, 被试对于特殊的动物词汇的记忆效果比其他的普通词汇更好, 并没有被一视同仁地主动从工作记忆中移除。这表明, 工作记忆中的信息移除机制可能并不存在, 但不可否认, 让工作记忆保持高效工作的机制一定存在, 未来研究可进一步探究不同范式下的机制差异。

The mechanism of removing information in working memory

Wan Xiaowei, Wang Tengfei

Department of psychology and behavioral sciences

Abstract: In the face of so much information, our brains have to deal with a lot of things every day. So what mechanisms of working memory help us avoid chaos and stay productive? Working memory is a system that temporarily stores and processes information. Predecessors have proposed that irrelevant information in working memory will be actively removed in order to better serve the target in the case of limited capacity. The purpose of this study is to explore the processing mode of interference items in working memory tasks and further verify whether the information removal of working memory exists. The experimental paradigm follows the improved working memory paradigm used by Ecker et al. (2014), and the independent variable is CTI (cue-target interval). By changing the experimental settings in three aspects (whether to press the key after remembering the replacement word, whether to need the corresponding position when recalling, and whether to add special words), four experiments were carried out on 93 students of Zhejiang University. On this basis, an unexpected recall test was added to let the subjects freely recall all the words in front of them after all trials, so as to explore the recall effect of distracters. The research results are inconsistent with the removal hypothesis. No matter whether the key is pressed or not, the subjects do not recall fewer distracters as expected under the condition of long CTI, and they are also interfering words. The subjects have better memory effect for special animal words than other ordinary words, and have not been removed from working memory without discrimination. This shows that the information removal mechanism in working memory may not exist, but it is undeniable that the mechanism to keep working memory working efficiently must exist. Future research can further explore the mechanism differences under different paradigms.

摘要 视觉工作记忆是一个短暂存储信息的记忆系统, 以往研究认为视觉工作记忆的容量是固定不变的。但最近有研究表明, 在记忆真实物体时, 随着编码时间的延长, 被试的记忆容量会增加 (Li et al., 2020)。也就是说, 视觉工作记忆的存储容量受到编码时间的影响。然而, 对于其依赖的神经机制并不清楚。因此, 本研究采用颅内电极记录技术 (StereoElectroEncephaloGraphy, SEEG) 来探究被试在不同编码时间下的神经活动。本研究采用 Li et al., 2020 中的实验范式, 让被试记忆六个真实物体, 呈现时间分别为 0.2s, 1s 和 2s, 随后相应地呈现空屏 2.8s, 2s 和 1s。之后, 会在其中一个物体的位置上呈现 0.5s 的追溯线索, 提示被试需要回忆哪个位置上的物体。测试阶段, 在之前提示位置呈现两个物体, 要求被试判断之前记忆过的物体出现在上面还是下面, 并给予反馈。本研究通过分析额叶、顶叶、枕叶、海马头和海马尾这几个区域的电极发现: 1) 在编码阶段, 额叶、顶叶、枕叶的 gamma 波段 (60-140 Hz) 存在持续性的激活, 并且激活时间与编码时间一致。2) 顶叶和枕叶的 gamma 波段强度在编码阶段对于正确试次要高于错误试次, 表明其与记忆有关。3) 利用表征相似分析 (Representational similarity analysis) 发现, 顶叶、枕叶、额叶的编码与回忆阶段的表征相似矩阵存在与编码时间的锁时效应, 且在正确和错误试次间表现不同。综上所述, 本研究认为不同编码时间下的记忆神经表征存在差异, 且这种差异主要存在于顶枕区域以及额叶区域, 且主要体现在 gamma 波段。

Abstract: Visual working memory (VWM) is the memory system that temporarily holds visual information. It is assumed that VWM has fixed memory capacity. Recent work with real-world objects, however, has challenged this view by providing evidence that the VWM capacity for real-world objects is not fixed but instead increases with prolonged encoding time (Li et al., 2020), indicating that VWM is influenced by the encoding time. However, little is known about its underlying neural mechanism. The current research was designed to investigate the brain activity for different encoding times by using the Stereo Electro Encephalo Graphy (SEEG). The present experimental paradigm was basically identical to Li et al., 2020, the participants were asked to remember six real-world objects that were presented for 0.2s, 1s and 2s, followed by a 2.8s, 2s, and 1s delay respectively. After the delay, a single item was cued and then was tested, following by a 2s feedback display. We analyzed the electrodes across the whole brain and found that 1) The gamma band (60-140 Hz) in the frontal, parietal, and occipital cortex was constitutively activated, and was locked to the encoding time. 2) The power in gamma band in the frontal and parietal cortex was larger for correct trials than incorrect trials, indicating that the activity in gamma band was related to memory. 3) Representational similarity analysis showed that the Representational similarity between the encoding and the retrieval period in the frontal, parietal, and occipital cortex was locked to the encoding time as well, and was larger for correct trials than incorrect trials. Overall, we argue that the neural representations of memory for different encoding times were different, and such difference mainly exist in the activity in gamma band from the frontal, parietal, and occipital brain regions.

自我调节学习中类别间与类别内的信息加工

韩林株¹ 谢伟烨¹ 陈剑平¹ 刘志雅² (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631

² 华南师范大学心理学院, 广州, 510631, zhiyalu@snu.edu.cn

摘要 类别学习下的自我调节学习是指个体在加工多个类别知识时自主选择学习策略的过程。当学习者在同个类别内进行连续加工时称为集中学习, 在不同类别间进行对比加工时称为交替学习。前人研究基于自然类别材料考察了类别间相似性对自我调节学习的影响, 结果发现: 类别间相似性低时, 学习者更多的选择集中学习; 类别间相似性高时, 则更多地选择交替学习, 并且取得更好的分类学习效果, 这表明类别相似性可预测自我调节学习下的学习行为。类别相似性不仅包括类别间相似性, 还包括类别内相似性, 学习者在寻找类别内的共性时也是有学习策略的。在以往研究中自我调节学习是已知呈现样例的数量, 该因素是否会影响个体的学习策略还有待探究。因此, 本研究共设计两个实验, 实验一探讨类别间相似性(高/低)与类别内相似性(高/低)对自我调节学习的影响, 实验二探讨影响类别转换的因素, 在实验一的基础上增加呈现样例数量的条件。本研究共 240 名大学生参加实验, 采用原型学习材料, 分为四个类别, 通过变异水平严格控制类别间与类别内相似性, 使用自我调节学习范式, 即学习阶段学习者可自由选择四类别中的一个类别进行学习, 学习结束后进入测试阶段。结果表明: 正确率方面, 实验一与实验二中类别间低相似条件的分类正确率显著高于类别间高相似条件, 类别内高相似条件的分类正确率显著高于类别内低相似条件。转换率作为衡量学习策略的指标, 是指学习阶段在不同类别间转换的比例。对转化率进行整体和阶段性方差分析, 发现当呈现样例数量时, 类别内高相似条件下的转换率显著高于类别内低相似条件, 且第一阶段的转化率显著高于其他三个阶段。本研究的结论: 类别间与类别内相似性共同预测自我调节学习的分类效果; 当告知学习者样例数量时, 学习者的学习策略会受到类别内信息而非类别间信息的影响, 同个类别内的样例越相似, 学习者更倾向于采用交替学习, 并且这种交替的倾向会随着学习进程而减弱, 进一步验证自我调节学习中的数据驱动效应。

Information Processing between and within Categories in Self-regulated Learning

Han Linzhu¹, Xie Weiye¹, Chen Jianping¹, Liu Zhiya²

Department of Psychology, South China Normal University, GuangZhou, 510631

Abstract: Self-regulated learning under category learning refers to the process in which individuals independently choose learning strategies when processing multi-category knowledge. When learners perform continuous processing in the same category, it is called concentrated learning, and when they perform contrast processing between different categories, it is called alternate learning. Previous studies investigated the impact of similarity between categories on self-regulated learning based on natural category materials. The results show that: when the similarity between categories is low, learners more choose concentrated learning; when the similarity between categories is high, more Choose alternate learning and achieve better classification learning results, which indicates that category similarity can predict learning behavior under self-regulated learning. Category similarity includes not only the similarity between categories, but also the similarity within categories. Learners also have learning strategies when looking for commonalities within categories. In previous studies, the number of examples presented in self-regulated learning is known, and whether this factor will affect individual learning strategies remains to be explored. Therefore, two experiments were designed in this study. Experiment 1 explores the impact of similarity between categories (high/low) and within-category similarity (high/low) on self-regulated learning. Experiment 2 explores the factors that affect category switching. On the basis of experiment 1, the conditions for presenting the number of samples were increased. In this study, a total of 240 college students participated in the experiments. We used prototype learning materials, divided into four categories, strictly controlled the similarity between and within categories through the level of variation, and used a self-regulated learning paradigm, namely learners in the learning phase can freely choose one of

the four categories for learning, and enter the testing phase after learning. The results showed that in Experiment 1 and Experiment 2, the classification accuracy of the low similarity condition between the categories is significantly higher than that of the high similarity condition between categories, and the classification accuracy of high similarity condition within the categories is significantly higher than that of low similarity condition within the categories. As an indicator of learning strategy, conversion rate refers to the ratio of conversion between different categories in the learning phase. The overall and staged variance analysis of the conversion rate found that when the number of samples is presented, the conversion rate under high similarity condition within the categories is significantly higher than that under low similarity condition within the categories, and the conversion rate in the first stage is significantly higher than the other three stages. The conclusions of this study are as follows: similarity between categories and within categories jointly predict the classification effect of self-regulated learning; When the learner is informed of the number of examples, the learner's learning strategy will be affected by the information within the categories rather than the information between the categories. The more similar the examples in the same category are, the learners are more inclined to adopt alternate learning, and this tendency to alternate will weaken with the learning process, further verifying the data-driven effect of self-regulated learning.

视觉工作记忆编码中的特征分离

李金睿, 王本驰 (通讯作者)

华南师范大学, 脑科学与康复医学研究院, 广州, 510631, wangbenchi.swift@gmail.com

摘要 视觉工作记忆是一个短暂存储视觉信息的在线记忆系统。早期研究认为视觉工作记忆的基本存储单元为客体, 即是以整体的形式进行加工和存储的。然而, 近来有证据表明视觉工作记忆中对于不同客体特征的存储是分离的, 且每个特征都有其独立的存储空间和存储容量。那么, 究竟是什么造成了多特征物体不同特征的不同存储容量? 对此, 我们假设不同维度的特征具有不同神经机制, 即在编码阶段的加工时间和深度上存在差异。为了证明这一假设, 我们通过脑电 (EEG) 技术和多变量模式分析 (MVPA) 方法对组成物体的不同特征进行解码以比较特征之间的编码时间和加工深度。本研究分为两个实验。在实验一中, 在视野中央给被试呈现一个带有颜色和方向的光栅刺激, 被试按要求记忆颜色或方向, 或同时记忆其颜色和方向。在实验二中, 给被试呈现一个不仅具有颜色和方向特征, 而且具有位置特征的光栅刺激, 即光栅刺激可能出现在注视点的左侧或右侧。但是位置信息与记忆任务无关, 被试只要记忆光栅刺激的颜色和方向即可。与此同时, 我们记录了被试在完成实验任务时的脑电数据。实验一的研究结果显示, 在记忆颜色或方向条件下, 对于颜色的解码信息要比方向的更早达到峰值; 而方向的解码信息比颜色的要维持更久。在同时记忆颜色和方向条件下, 我们发现了类似的结果, 表明同一物体的不同特征存在不同的编码方式。通过对时频转换的数据进行 MVPA 分析, 发现这种不同特征的编码差异主要反映在 α 波段 (8-12Hz) 上。此外, 实验二的结果重复验证了实验一, 并且发现位置作为无关特征时依旧会进行编码, 且与颜色和方向存在不同的编码形式。因此, 我们认为视觉工作记忆对于物体的编码是存在特征分离的。

The dissociated encoding of features in visual working memory

Jinrui Li, Benchu Wang

Institute for Brain Research and Rehabilitation, South China Normal University, Guangzhou, 51000, wangbenchi.swift@gmail.com

Abstract: Visual working memory (VWM) is an online memory system that temporarily stores visual information. Early research suggested that the object is the basic storage unit of VWM. However, recent evidence shows that the storage of different features from multi-features objects in VWM is dissociated, and each feature has independent storage space and capacity. So, what causes the different storage capacities for different features? We assume that the

processing of different features have different neural mechanisms. To test this hypothesis, we decoded different features using multivariate pattern analysis (MVPA) from the data recorded through electroencephalogram (EEG), and then compared the start of the encoding time and the strength of the encoding between features. In Experiment 1, we presented a grating including color and orientation information in the center of the display. The participants were asked to memorize the color or orientation, or to memorize both the color and orientation. In Experiment 2, the same grating appeared on the left or right side of the central fixation. Here the participants only needed to memorize the color and orientation of the grating, but ignored the location. Meantime, we recorded the EEG during the task. Experiment 1 showed that, when memorizing color or orientation, the color decoding accuracy reached plateau earlier than the orientation; and the activity of the orientation lasted longer than that of the color. When memorizing both color and orientation, we found similar results, indicating that people adopted different strategies to encode different features of the same object. From the time-frequency analysis, the current results were mainly reflected in the alpha band (8-12Hz). Experiment 2 mimicked the results showed in Experiment 1, and it showed that the encoding of location was different from that of the color and orientation. Thus, we argue that the encoding of different features in VWM is separate.

摘要 工作记忆在日常生活中被频繁使用, 服务于我们当前的认知任务。以往研究表明工作记忆是一种短暂存储信息的记忆系统; 并且, 工作记忆中的信息通过反复复述可以存储到长时记忆之中, 形成更为持久的记忆表征 (Ranganath et al., 2005)。然而, 对于工作记忆转化为长时记忆的时程效应及其神经机制, 我们却知之甚少。大量研究表明海马对长时记忆的维持和提取十分重要, 并且海马在工作记忆维持新项目的过程中扮演着重要角色。那么, 海马是否在工作记忆向长时记忆转化过程中起到一定的作用? 为了探究这一记忆转化过程的时程效应及其神经机制, 本研究拟采用颅内电极记录技术 (StereoElectroEncephalography, SEEG), 采集癫痫病人的颅内电极数据。本研究试图回答两个问题: 1) 工作记忆转化为长时记忆的时程效应; 2) 海马在工作记忆转为长时记忆的过程中起到何种作用。实验过程中, 被试需要记忆并回忆光栅刺激的方向并通过鼠标做出反应。实验一共包含 6 个区组, 每个区组包含 30 个试次, 且每个试次呈现的光栅刺激都具有相同的方向信息。实验根据光栅数量分为两个条件, 即负荷 1 和 2。通过分析行为数据, 以及事件相关电位和时频转换后的数据, 我们发现工作记忆的绩效和海马的电信号都会随着练习的增加而变化。主要表现为, 记忆编码后的海马激活会随着不同区组变化, 且在第四个区组达到最低; 同样 Gamma 频段 (60-140Hz) 的强度也会随着不同区组变化, 在第四个区组最弱。这表明工作记忆可能在第四个区组, 即 90~120 次的重复时, 开始转化为长时记忆, 伴随着海马激活程度的降低。

The time course and its neural mechanism when transferring working memory into long-term memory

Yunayuan Zhang, Bench Wang

Institute for Brain Research and Rehabilitation, South China Normal University, Guangzhou, 51000, wangbenchi.swift@gmail.com

Abstract: Working memory (WM) is frequently used in daily life to serve our current cognitive tasks. Previous studies have shown that WM is a memory system storing information temporarily. In addition, information stored in WM can be transferred into long-term memory (LTM) through repeated rehearsal, to form durable memory representations (Ranganath et al., 2005). However, little is known how the information from WM is transferred into

LTM, and how is its time course and its neural mechanism. Some studies have identified that the hippocampus plays a critical role in the maintenance and retrieval of LTM; moreover, the hippocampus significantly affects maintaining new items in WM. Therefore, does the hippocampus also provide support for the transferring from WM into LTM? In order to investigate the time course underlying such memory transfer and its neural mechanism, the present study adopted SEEG (StereoElectroEncephaloGraphy), and collected the data from epileptic patients. We attempted to answer two questions: 1) the time course for transferring information from WM into LTM; 2) what's the role of hippocampus during this transfer? During the experiment, the participants were required to remember and recall the orientation of the grating stimulus and then responded with the mouse. The experiment consisted of 6 blocks, each block containing 30 trials, and the stimuli presented in each trial had the same orientation. The experiment was divided into two conditions according to the number of gratings, namely load 1 and 2. We found that both the WM performance and the activity in the hippocampus changed after practice. Interestingly, the activity in hippocampus after the stimulus offset systematically changed between different blocks, and reached the lowest level in the fourth block. Similarly, the power of Gamma band (60-140Hz) also varied from block one to six, and was weakest in the fourth block as well. It suggests that the information from WM may already be transferred into LTM after 3 blocks, reflected by the decreased activity in hippocampus.

睡眠对知觉与动作序列内隐习得离线巩固效应的影响

凌晓丽¹ 李雪晴¹ 孙鹏² (通讯作者)

1 山东师范大学心理学院, 济南, 250358

2 山东财经大学大学生心理健康教育与研究中心, 济南, 250014, atinonfrom@126.com

摘 要 学习不仅可以发生在线阶段, 也可以发生在离线阶段。在离线阶段发生的学习被称为离线巩固, 即在最初获得知识之后, 即使没有额外的练习, 其记忆痕迹也会保持稳定或提高。既往研究发现睡眠对外显学习的离线巩固具有促进作用, 但其对内隐学习离线巩固的影响尚缺乏一致性的结论。此外, 既往关于内隐学习离线巩固的研究主要采用了经典的序列学习范式, 未对动作序列和知觉序列进行区分。有鉴于此, 本研究采用改版的序列反应时任务, 在完全分离知觉序列和动作序列的情况下, 通过三个实验, 使用不同长度与复杂程度的序列规则, 系统考察了睡眠对知觉序列和动作序列内隐学习离线巩固效应的影响。在实验过程中, 被试需完成学习与测验两个阶段的序列反应时任务。在该任务中, 屏幕上会呈现 6 个 (或 4 个) 周围色块和一个中间色块, 要求被试判断目标色块与周围哪个色块颜色一致并又快又准地进行按键反应。对于知觉序列组, 目标色块的颜色遵循某一固定序列, 但周围色块的颜色是随机分配的, 因此, 对应的手指按键序列也是随机的; 对于动作组, 手指按键顺序遵循某一规律, 但目标色块的颜色是随机的。实验之前被试并不知晓序列规则的存在。学习与测验阶段间隔 12 个小时。对于睡眠组, 晚上 7 点-9 点完成学习阶段的序列反应时任务, 第二天早上 7 点-9 点完成测验阶段的任务; 白天组, 则相反。结果发现, 对于动作序列, 序列复杂程度较低时, 无论是否经过睡眠都会发生离线巩固效应, 而对于较为复杂的动作序列规则, 只有经历睡眠才会引起离线巩固效应的发生; 对于知觉序列, 无论何种难易程度, 均未发生任何离线巩固效应。上述结果表明内隐序列知识基于睡眠的离线巩固会受到序列类型及序列复杂程度的调节。

The effect of sleep on the consolidation of perceptual and motor sequences in implicit learning

Xiaoli Ling¹, Xueqing Li¹, Peng Sun²

² Mental Health Education and Research Center, Shandong University of Finance and Economics, Jinan 250014, atinonfrom@126.com

Abstract: Learning occurs not only during the learning phase (online periods), but also during the offline interval subsequent to the learning phase (offline periods). The process during the offline periods is referred to as consolidation, which means stabilization or enhancement of a memory trace even without additional practice after the initial acquisition. Previous studies have demonstrated that sleep improves offline memory consolidation related to explicit learning. However, consistent conclusion has not been reached on the impact of sleep on the consolidation of implicit learning. This discord may be explained by the fact that the majority of studies examined the offline consolidation effect of implicit learning used the classical version of the serial reaction time (SRT) task, in which the different modalities (perceptual and motor) of sequence learning are confounded. The present study investigated the effect of sleep on the consolidation of implicit perceptual and motor sequence learning by three experiments using a modified version of Serial Reaction Time task, which allows independent manipulation of perceptual and motor sequences. In the criterion tasks, six (or four) colored squares were presented around the center of the screen, where the target square appeared simultaneously and the participants were asked to press the button corresponding to the square which shared the same color with the target. The tasks in three experiments differed concerning the sequence length and structural complexity. In each experiment, we introduced a 12-h (including or not including sleep) delay between the learning and the retest phase with AM-PM and PM-AM. Results showed that, sleep does not promote the offline consolidation of perceptual sequences, regardless of the degree of difficulty. For motor sequences, the sequence learning effect significantly increased following sleep but not after waking when the sequence length was long and structural complexity was high. However, sleep-related offline improvements were absent when the structural complexity was low. These results indicated that the offline consolidation of implicit sequence knowledge based on sleep is modulated by sequence type and sequence complexity.

奖赏与惩罚在运动适应中的作用

印丛

首都体育学院, 北京, 100191, yincong@cupes.edu.cn

摘要 运动学习指人通过练习, 在运动行为表现上有所提高的过程, 是近年来认知心理学研究的热点领域之一。其中, 运动适应研究人的运动系统如何根据自身或环境变化进行快速调整; 由于其简单普遍, 因此被视作理解运动学习的基石所在。尽管关于奖赏和惩罚的研究是推动很多学科发展的前沿力量, 但在运动适应领域尚无系统研究。一些研究发现, 奖赏和惩罚在运动适应中的作用不同: 奖赏促进记忆保留, 惩罚提高学习速率。然而, 我们尚不清楚奖赏和惩罚对一种学习的影响是否会迁移到随后相同性质的学习中去。而且在以往研究中, 被试仅单纯地接受奖赏或惩罚一种强化方式, 尚不清楚奖赏与惩罚相结合的方式对运动适应的学习和记忆有何影响。因此, 本研究采用视觉运动旋转的实验范式, 试图探究奖赏、惩罚以及奖罚结合的强化方式对运动适应中学习、记忆以及迁移的影响。实验分为 7 个阶段: 基线、初始旋转学习、初始后效测量、初始冲洗、相反方向旋转学习、再冲洗、第二次旋转学习、第二次后效测量。四组被试在第 2 阶段, 即初始旋转学习阶段得到的反馈不同: 控制组仅接受视觉反馈, 奖赏组额外接受正分反馈, 惩罚组额外接受负分反

馈，奖罚结合组既可能得到正分又可能得到负分反馈。正分、负分分别对应被试费的增加或减少。实验结果发现，在初始旋转学习阶段，奖罚结合组比奖赏组学得更快，这种趋势甚至保留到了后续相反方向旋转学习阶段。然而，在第二次旋转学习中，各组学习情况却没有显著差异。将前后两次后效测量进行比较，我们发现受相反方向旋转学习的干扰，控制组、惩罚组与奖罚结合组的记忆保留有所降低；而奖赏组却没有显著变化。这样的结果表明，与单纯的奖励相比，采用奖罚结合的方式可以提高运动适应的学习速率；这种提高甚至可以迁移到相反参数的学习中去。单纯的奖赏可以促进记忆保留。这暗示了奖赏和惩罚在运动适应中作用的神经机制很有可能是不同的。

The effect of reward and punishment in motor adaptation

Yin Cong

Capital university of physical education and sports, Beijing, 100191, yincong@cupes.edu.cn

Abstract: Motor learning refers to improvement in the performance of motor behavior through practice, which is gaining increasing popularity in the field of cognitive psychology in recent years. As it is easily controlled in laboratory and universally experienced in our daily life, motor adaptation, investigating how human make quick adjustments in the face of altered conditions, has served as a cornerstone in understanding motor learning. Although reward and punishment-based learning has been at the forefront of advances in many disciplines, it has not been systematically studied in the field of motor adaptation. Some researchers have found that reward and punishment have dissociable effects on motor adaptation: reward increases retention of motor memory while punishment speeds up learning. However, it is not clear whether the effect of reward and punishment on one learning could transfer to the following learning. Besides, as participants receive only pure reward or punishment in previous research, it is not clear the effect of combination of reward and punishment on motor adaptation. Here, we used visuomotor rotation paradigm to explore different effects of reward, punishment and the combination of reward and punishment on learning, memory and transfer of motor adaptation. The experiment had 8 phases: baseline, initial rotation learning, initial aftereffect, initial washout, counter-rotation learning, second washout, second rotation learning, second aftereffect. We recruited four groups of participants and they differed in the feedback they received during the second phase, i.e. initial rotation learning. *Control* group received only visual feedback. Besides visual feedback, *Reward* group received positive score, *Punish* group received negative score while *RP combination* group could receive both positive and negative score according to their performance. Participants were informed that positive and negative score signify the increase and decrease of their participation fee. We found that during the initial rotation learning phase, *RP combination* group learned faster than *Reward* group. This tendency remained till following counter-rotation learning phase. However, no significant differences were detected during the second rotation learning phase. When comparing two aftereffect phases, we found the memory retention of *Control*, *Punish* and *RP combination* group decreased as the interference of the counter-rotation learning. However, the memory retention of *Reward* group remained the same. The results show that compared to pure reward, the combination of reward and punishment could enhance the learning rate of motor adaptation. Furthermore, the enhancement could be even transferred to the following learning with opposite parameter. However, only pure reward could promote memory retention. The results suggest that different neural circuit may underlie reward and punishment in motor adaptation.

真实且可控：基于虚拟现实的实验心理学平台

缪明诚¹ 蒯曙光^{1,2} (通讯作者)

1 华东师范大学心理与认知科学学院, 脑科学与教育创新研究院, 上海市心理健康与危机干预重点实验室认知神经科学研究所, 上海, 200062, sgkuai@psy.ecnu.edu.cn

摘要 对场景环境的控制是心理学实验的重要环节。通过计算机软件构建实验刺激并呈现在平面显示器上进行实验已经被普遍应用于实验心理学研究。然而在真实的世界中, 人们处于与三维复杂社会环境的交互中。传统的刺激呈现方式难以还原人类在三维世界中的真实反应, 我们需要一个能最大程度复刻真实环境, 并可以量化控制的呈现技术。随着影像处理和动画技术的发展, 虚拟现实因其沉浸式的体验展示出了其在社会场景研究中的巨大潜力。为了便于更多的研究者们使用这项技术, 我们在一个广泛使用的三维动画引擎 Unity3D 的基础上开发了一个实验工具包。在这个工具包中, 我们提供了 1) 包括城市街口、运动场馆在内的诸多常见社会场景, 和覆盖各年龄段、性别和体型的影视级别高精度人物模型库, 以使得研究者能够自由地搭建一个高度还原真实的虚拟实验空间; 2) 人物动画库, 包含常用的肢体动作和面部表情, 例如打招呼和惊讶, 使得复杂的社会行为能够得到良好地控制; 3) 与市面常用虚拟现实头盔和控制器的交互模块; 4) 以及一个简化实验设计和数据记录的类库, 并配备大量虚拟现实实验程序的样例, 以减少编写虚拟现实实验的时间成本。总结而言, 我们的工具包降低了研究者使用虚拟现实作为研究工具的技术门槛, 使得研究者能够轻松地创建一个真实且可控的实验环境。

A virtual reality tool for psychophysics research

Ming-Cheng Miao, Shu-Guang Kuai

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, the Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

Abstract: Stimulus manipulation and presentation is an essential part of psychological experiments. Using computer software to generate stimuli and present them on computer screens has been commonly used in experimental psychology research. However, in a real three-dimensional world, humans interact with the complex social world, which is difficult to be reproduced on a 2D computer screen. Therefore, it is necessary to build an experimental tool to reproduce the 3D environment in a psychological experiment. The development of virtual reality has demonstrated its great potential for generating close-to-real social scenes and providing an immersive experience. To facilitate the use of this technology, we have developed an experimental toolbox based on Unity3D, a widely used 3D animation engine. In this toolbox, we provide 1) a library of frequently used social scenes, including urban streets, gym, etc., and a film-level 3D human model database which is consist of models of different ages and genders, enabling researchers to easily build a highly realistic virtual experiment space; 2) a library of human animations containing body movements and facial expressions such as waving hand and being surprised, helping generate and present complex social behaviors in a virtual scene; 3) a user-friendly plugin to connect with most commonly used virtual reality head-mounted displays and controllers; 4) and a class library for factorial design as well as response recording with a number of demos and code examples. In summary, our toolbox lowers the technical barrier for researchers in the various research fields to use virtual reality as a research tool, simplifying the process of creating a realistic and controllable experimental environment.

面孔线索和身体线索对极端情绪识别的分离影响：来自眼动的证据

王光亚 肖瑞琪 王艳梅* (通讯作者)

华东师范大学心理与认知科学学院, 上海, 200062, ymwang@psy.ecnu.edu.cn

摘要 极端情绪是指在生活中经历的极端高强度的情绪体验。以往研究主要关注中等强度情绪的表情识别, 较少关注身体姿势线索对情绪识别的影响。本研究采用行为学实验和眼动技术相结合, 采用 4 个实验, 以运动员不同强度输、赢的面部表情和身体姿势图片作为实验材料, 探究不同情绪强度 (极端 vs 中等) 下, 身体姿势对情绪识别的影响及其机制。实验 1 和实验 2 为行为学实验, 采用 2 (呈现部位: 面孔 vs 身体) × 2 (强度: 极端 vs 中等) × 2 (愉悦度: 输 vs 赢) 的被试内设计, 分别要求被试对单独呈现的面孔或身体的愉悦度 (实验 1) 和唤起度 (实验 2) 进行判断, 结果进一步验证了前人的研究, 即被试仅能通过身体姿势判断极端强度情绪的愉悦度 (输 vs 赢), 但极端强度情绪下, 面孔线索和身体姿势线索均可提供情绪唤起度的信息。实验 3 和实验 4 结合眼动技术, 实验 3 采用 2 (整体情绪强度: 极端 vs 中等) × 2 (面孔愉悦度: 输 vs 赢) × 2 (身体愉悦度: 输 vs 赢) 的被试内设计, 要求被试判断面孔与身体组合图片的愉悦度。发现被试通过身体姿势的愉悦度来判断整体情绪的愉悦度。眼动结果表明, 整体情绪强度为极端强度时, 对身体的平均注视时间更长, 该结果为通过身体线索来判断极端强度情绪的效价提供了生理学证据。而且当身体姿势为输时, 对眼睛的注视时间显著长于对嘴巴的注视时间, 为赢时则没有显著差异, 这一结果说明对身体姿势注视的增加, 改变了对于面部的注视模式。实验 4 采用 2 (整体情绪愉悦度: 输 vs 赢) × 2 (面孔强度: 极端 vs 中等) × 2 (身体强度: 极端 vs 中等) 的被试内设计, 要求被试判断面孔与身体组合图片的唤起度。结果表明, 极端强度面孔条件下的整体唤起度评分显著高于中等强度面孔条件。眼动结果表明, 在对唤起度判断的过程中, 不存在对极端强度情绪身体姿势的注视偏好。综上, 本研究结果从行为学和眼动模式两个层面进一步说明了对极端强度情绪的效价识别主要依靠身体线索。但是对极端强度情绪的唤起度识别还是主要依靠面孔线索。

The differential role of face cues and body gestures in peak emotion recognition: evidence from eye movement

Guangya Wang, Ruiqi Xiao, Yanmei Wang*

(School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062)

Abstract: Peak emotion refers to the apex of a highly intense emotional experience accompanied by the immediate peak expressions in response to real-life situations. Previous studies mainly focused on the recognition of normal facial expression, but less on the influence of body gestures on emotion recognition. In this study, across four experiments, we have explored the difference in emotion recognition from body and face cues between peak intensity emotion and moderate intensity emotion using behavioral measures and eye movement technique. Facial expression and body posture pictures of athletes with different intensity emotion (peak vs. moderate) were adopted as experimental materials. Experiment 1 and Experiment 2 were behavioral experiments, using a 2 (presentation part: face vs. body) × 2 (emotion intensity: peak intensity vs. moderate intensity) × 2 (valence: lose vs. win) within-subjects design. The participants were required to judge the valence (experiment 1) or arousal (experiment 2) of the face expression or body gesture presented separately. The results found that participants could judge the valence (loss vs. win) of peak emotion only from body gestures correctly, and face cues failure to provide the valence information for peak emotion recognition. However, participants could judge the arousal of peak emotion from face cues and body gestures. These results further confirmed the findings of the previous studies. Experiments 3 and 4 explored the difference of eye movement pattern in emotion recognition from face cues and body gestures between peak intensity and moderate intensity. Experiment 3 used a 2 (global intensity: peak intensity vs. moderate intensity) × 2 (facial valence: lose vs. win) × 2 (body valence: lose vs. win) within-subjects design, the participants were asked to judge the valence of the composite face-body pictures. The results showed that body gestures played a more

important role in providing valence information of peak emotion recognition than face cues. Moreover, according with behavioral results, eye movement data showed that the average percentages of fixation times for the body gestures were higher in peak intensity condition than in moderate intensity condition, providing physiological evidence for judging the valence information of peak emotion from body cues. For peak intensity emotion recognition, when the body valence was loss, the fixation times for eyes were significantly longer than the fixation times for mouth; however, when the body valence was win, there was no significant difference. These results showed that the increase of body posture fixation changed the fixation pattern of face. Experiment 4 used a 2 (global valence: lose vs win) $\times$ 2 (facial intensity: peak intensity vs medium intensity) $\times$ 2 (body intensity: peak intensity vs medium intensity) within-subjects design, the participants were asked to judge the arousal of composite face-body pictures. The results showed that face cues played the main role in providing arousal information regardless of peak intensity or moderate intensity. There was no significant difference of eye movement pattern between face cues and body gestures for arousal judgement of peak emotion. In summary, the present study combined behavioral measures with eye movement technique, providing both behavioral and physiological evidences for the important role of body gestures in peak emotion recognition. These results demonstrated that the valence judgement of peak emotions mainly depends on body cues, while the arousal judgement of peak emotions mainly depends on face cues.

Keywords: peak emotion, body gesture cues, face cues, emotion recognition, eye movement pattern

小容量集合面孔吸引力的平均表征

王丹¹ 田欣然¹ 刘春晓¹ 李嘉欣¹ 陈文锋^{1*}

¹ 中国人民大学心理学系, 北京 100872, wchen@ruc.edu.cn

摘要 以往研究发现集合的吸引力评分要显著高于集合成员的评分的平均值, 即集合吸引力高评现象。研究者提出整合集合成员合成平均面孔是集合吸引力高评的原因。但这种高评现象多出现于较大的集合中, 而在小容量集合中则不容易出现高评现象。这存在两种可能: 一是小集合面孔没有形成平均面孔, 二是小集合面孔中个体表征突显, 虽然形成了平均面孔但受到了个体表征的干扰。为了阐明其原因, 本研究采用吸引力评价任务并操纵集合加工时间, 通过两个实验来阐明小容量集合面孔的平均表征机制。在吸引力评价任务中, 要求被试对集合刺激的吸引力、集合合成的平均面孔以及集合中的每一张个体面孔进行评分。每个实验中都包含两种类型的集合: 一种是所有的集合成员都是原始面孔, 没有平均面孔; 另一种方法是将一张由集合中其他原始面孔合成而来的平均面孔也包含在集合中。研究结果发现, 小容量集合中也能够形成平均表征, 平均表征是通过形成平均刺激的表征来产生的, 且吸引力不出现高评现象是由于平均刺激受到了干扰。当认知资源不足时, 个体的精确表征不再凸显, 平均面孔受到干扰减小, 高评现象重新出现。

关键词 平均表征、面孔吸引力、平均面孔、小容量集合

Average representation of face attractiveness in small group size

Wang Dan, Tian Xinran, Liu Chunxiao, Li Jiaxin, Chen Wenfeng

Department of Psychology, Renmin University of China, Beijing 100872, China

Abstract: Previous studies found that group attractiveness scores higher than average value of group members' characteristic values, that is group attractiveness effect. The researchers suggest that an average face morphed by integrating members is responsible for group attractiveness effect. However, the group attractiveness effect mostly appears in the large group but rarely in the small group. There are two possibilities: 1) the average face is not morphed in small group, 2) although an average face was morphed in small group, it is disturbed by salient individual face representations. The present study used the scoring paradigm and manipulated processing time to clarify the mechanism of average representation of face attractiveness in small group size through two experiments. In the scoring paradigm, participants were asked to rate the attractiveness of group stimuli, the average face created from the group, and each face of the group in isolated manner. There were two kinds of groups in each experiment: one is that all group members are original faces, without the average face; The other is an average face morphed from other

original faces was included in the group. The results show that small group can generate average representation by morphing an average face; Group attractiveness effect didn't appear in small group because the average face was disturbed; The lack of cognitive resources results in the weakened salient individual face representations in small group so that the average face is less likely to be disturbed and the group attractiveness effect could reappear.

自身运动方向感知偏向于光流中静止的物体

孙琪（通讯作者） 李乾楷 李新宇

浙江师范大学心理学系，金华，321004, sunqihku@qq.com

摘要 先前研究证明观察者可以使用光流对我们自身运动方向进行准确的感知，且光流中独立运动的物体会对自身运动方向感知产生影响。然而，光流中静止的物体是否对自身运动方向感知产生影响并不清楚。换言之，观察者把光流中静止的物体看作是光流的一部分，还是作为一个额外的信息并使用该信息对自身运动方向进行感知并不明确。为回答上述问题，我们设计了4个实验。在实验1中，光流刺激模拟观察者在由200个点组成的地面上平移。在2/3试次中，一个柱子放置在光流地面上，且在刺激一半呈现时间时，柱子在自身运动方向左侧或右侧4°或8°的位置。在每个试次中，光流刺激持续500ms，其自身运动方向从步长为4°的[-28°, 28°]区间中随机选择。0°为屏幕中心。被试通过移动鼠标控制的探针来报告他们感知的方向。结果表明，与光流刺激中无柱子时的感知方向相比，当光流刺激中的柱子位于自身运动方向右侧时，感知方向明显偏右；反之亦然。结果说明光流中的静止物体会影响自身运动方向感知。实验2通过保持柱子在屏幕上的高度不变让柱子的运动轨迹不符合光流规律。实验3在实验2的基础上，柱子由四条线和四个点组成。该方法明显降低了柱子的凸显性，同时让观察者无法将柱子视为点高密度的区域。结果与实验1相同，说明观察者没有将静止物体作为光流的一部分。实验4呈现三类刺激：纯光流（无柱子）、纯柱子以及同时包含柱子和光流的刺激。此外，光流中点的数量也从20、100和500中随机选择。结果表明，当光流中不含柱子时，方向误差-感知方向减真实方向之间-随着点数量的增加而减小；相比之下，当柱子添加到光流中时，点数量对误差的影响就消失了。该结果表明，当静止物体处于光流中时，光流只需含有少数几个点就可以让观察者准确地感知自身运动的方向。综上所述，本研究首次发现观察者并没有将光流中的静止物体作为光流的一部分，而是将静止物体作为单独的信息对自身运动方向进行判断。同时，静止物体可以减少航向感知对光流强度的依赖。

Static object in optic flow biases the heading perception

Qi Sun*, Qiankai Li¹, Xinyu Li¹

Department of Psychology, Zhejiang Normal University, Jinhua, 321004

Abstract: Previous studies have demonstrated that observers can use optic flow to accurately perceive their instantaneous self-motion direction (i.e., heading), and the extra object or biological motion in the optic flow can affect the heading perception. However, there was no study to investigate whether the individual static object in the world affects the heading perception. Or in other words, when the display of optic flow contains an extra static object, observers take the object as a part of optic flow or as extra information that affects our heading perception. We, therefore, conducted four experiments to examine the effects of the static object in the optic flow on heading perception. In Experiment 1, the display (80°×80°) simulated observers translating (4 m/s) on a dot-ground consisting of 200 dots. Some displays contained an extra pole (height: 1 m) that was placed on the dot-ground and left or right to the heading direction by 4° or 8° at half of the display presentation time. On 500-ms each trial, heading direction was randomly chosen from -28° to 28° with respect to the display center (0°) in steps of 4°. 0° was not included. Participants reported their perceived heading by moving a mouse-controlled probe. The results showed that compared with the display without the pole, the perceived heading was more rightward biased as the pole was right to the actual heading; vice versa, suggesting that static object in optic flow affects heading perception. In Experiments 2, we kept the height of the pole on the screen constant to remove the deformation of the pole so that the motion trajectories of

the edge of the pole were not consistent with the rule of optic flow; in Experiment 3, we constructed a pole with four dots connected by four lines. The new pole reduced the luminance of the pole and prevented observers from taking the pole as an area with huge dots. The result patterns were the same as Experiment 1, suggesting that the observers do not take the static object as a part of optic flow. Experiment 4 showed participants pure optic flow (i.e., the pole was not presented), pure pole, and the display containing both pole and dots. Additionally, the dot number of optic flow was varied (e.g., 20, 100, and 500 dots). The results showed that the heading error – the difference between perceived heading and actual heading – decreased with the increase of dot number as the display did not contain a pole; by contrast, when a pole was added to the dot-ground, the effects of dot number disappeared. The results suggest that when a static object is in the optic flow, optic flow with few dots is enough to be used to perceive heading accurately. To sum up, the current study first revealed that observers do not take the static object as a part of optic flow and bias their heading perception towards the static object in the optic flow. The static object can reduce the reliance of heading perception on the intensity of optic flow.

摘要 在绝大多数基于光流的自身运动方向感知研究中, 呈现的自身运动方向是均匀分布的, 且刺激分布的中心与身体正前方重合。因而, 当自身运动方向分布不再是均匀分布时, 或刺激分布的中心与身体正前方分离时, 自身运动方向的感知是否发生改变并明确。为回答该问题, 我们设计了 5 个实验。实验 1 和 2 中, 光流刺激模拟被试在一个 3D 点阵空间中平移。每次试验, 光流刺激呈现 500ms, 其自身运动的方向从步长为 6°的[-33°, 33°]的区间中随机选择。0°为身体正前方。被试通过移动鼠标控制的探针来报告感知的方向。其中, 自身运动方向可能是均匀分布, 即不同方向呈现的试次数相同; 也可能是 U 形 (实验 1) 或 V 形 (实验 2) 分布, 即试次数随着方向值得增大而增加。结果发现, 与均匀分布相比, U 形和 V 形分布下的自身运动方向更加被低估。实验 3 中, 光流刺激可能是均匀分布, 也可能是右偏分布。在右偏分布中, 身体正前方右侧的自身运动方向试次数明显多于身体正前方左侧的自身运动方向试次数, 且分布的中心位于身体正前方的右侧。结果发现, 右侧自身运动方向在右偏分布中明显比在均匀分布中被低估; 但左侧自身运动方向在右偏分布中低估程度比均匀分布中小。甚至当 50% 的点被随机点取代时, 该结果也被重复出来 (实验 4)。实验 5 中, 两个分布均为均匀分布。但其中的一个分布中自身运动方向关于身体正前方对称; 在另一个分布中自身运动方向均在身体正前方的右侧, 因而分布中心位于身体正前方的右侧。结果发现, 两个分布中, 右侧自身运动方向的报告值差异不显著。综上所述, 本研究发现观察者可以习得自身运动方向的分布, 并用该分布来调整自身运动方向的感知。该研究表明视觉系统中可能存在着一个对自身运动方向的全局表征, 该表征与身体正前方和新习得的自身运动方向分布交互影响我们自身运动方向的判断。同时, 该研究也说明基于光流的自身运动方向感知与 anti-Bayesian 解释一致, 而非 Bayesian 解释。

Effects of heading distribution on heading perception from optic flow

Qi Sun¹, Jing-Yi Wang¹, Rui-Fang Yan¹, Xin-Yu Li^{1*}

¹ Department of Psychology, Zhejiang Normal University, Jinhua, 321004

Abstract: Previous studies have revealed that the perception of self-motion direction (i.e., heading) from optic flow was biased toward the straight-ahead direction. However, in most of these studies, the headings were uniformly distributed; and the distribution center coincided with the straight-ahead direction, resulting in the effects of the heading distribution on heading perception remained unclear. Specifically, did the perceived heading change if the headings were not uniformly distributed or the distribution center was biased from straight ahead? We conducted four experiments to answer the question. In Experiments 1 and 2, the display (80°×80°) simulated observers translating in

a 3D dot-cloud consisting of 175 dots. On each 500-ms trial, the heading direction was randomly selected from -33° to 33° relative to the straight-ahead direction (0°) with steps of 6° . Participants moved a mouse-controlled probe to indicate their perceived heading on two heading distributions: (1) uniform distribution in which the trial numbers of all headings were the same; (2) U-shape (Experiment 1) or V-shape (Experiment 2) distribution in which the trial number increased with the increase of heading. The distribution centers coincided with the straight-ahead direction in these distributions. The results showed that compared with the uniform distribution, the headings were more underestimated in U-shape and V-shape distributions, suggesting that observers can learn the heading distribution and use it to modulate heading perception from optic flow. Experiment 3 contained a right-heavied distribution and a uniform distribution. In the right-heavied distribution, the trial numbers of headings right to the straight-ahead direction were more than that of headings left to the straight-ahead direction; and the distribution center was right to the straight-ahead direction. The results showed that the mean perceived heading was left to the straight-ahead direction and biased away from the distribution center in the right-heavied distribution. The heading underestimation was more increased for the right-side headings in the right-heavied distribution than the uniform distribution, but the underestimation of the left-side headings was decreased in the right-heavied distribution. The results were reproduced when 50% of the dots were replaced with random noise dots (Experiment 4). The results again suggest that observers can learn the heading distribution and use it to modulate the heading perception. In Experiment 5, two uniform distributions were presented. However, in one uniform distribution, the headings were symmetric about the straight-ahead direction (0°), so the distribution center coincided with the straight-ahead direction. In another uniform distribution, the headings were all right to the display center in one uniform distribution, so the distribution center was right to the straight-ahead. The results showed that the perceived headings of the right-side headings were not significantly different between the two uniform distributions, suggesting that heading perception from optic flow was not biased toward the distribution center. To summarize, the current study revealed that observers could learn the recent distribution of headings, and the heading distribution had effects on the heading perception. Specifically, the perceived heading was more biased towards the straight-ahead direction as the headings took more proportion in the heading distribution. However, the bias decreased as the heading took little proportion in the heading perception. The study implies that our visual system contains a global representation of headings that interacts with our recent experienced heading distribution and the straight-ahead direction to affect our heading perception. The study might suggest the heading perception is consistent with an anti-Bayesian account rather than a Bayesian account.

摘要 很多研究探究了物理空间内的预测运动任务, 例如碰撞时间估计任务 (time to collisions tasks), 拦截任务 (interceptive tasks), 相对到达时间任务 (relative arrival time tasks) 等。从不同的维度探究该任务有利于研究者更加清楚的了解其心理加工机制。本研究使用数字预测任务范式探究数字距离和节奏对该任务的影响。数字预测范式是指被试判断一个数字按照恒定的变化速率何时能增加或减少到某一目标数字。本研究设计 3 个行为实验: 实验一探究在没有节奏信息情况下数字距离对数字预测运动的影响, 结果发现被试在数字距离大的条件下绩效显著高于数字距离小的条件。实验二探究在有节奏信息条件下数字距离对数字预测任务的影响, 结果发现当存在节奏信息时被试在数字距离大的条件下绩效也显著高于数字距离条件小的条件。另外, 本研究对比了实验一和实验二的结果, 发现存在节奏信息能显著提高被试的数字预测任务的结果。实

验三探究了在不规则节奏信息（即随机呈现起始数字和转换数字之间的数字）条件下数字距离对数字预测任务的影响，结果显示当随机呈现数字信息时被试在数字距离小的条件下任务绩效显著低于数字距离大的条件。此外，本研究对比了实验一和实验三的结果，发现在小数字距离条件下，被试在无节奏信息和不规则节奏信息条件下的差异不显著；在大数字距离条件下，被试在无节奏信息条件下的任务绩效显著高于在不规则节奏信息条件下的绩效。因此本研究得出，节奏信息可以提高数字估计的任务绩效；而不规则的节奏信息能够破坏个体利用数字距离线索进行时间估计，进而降低其任务绩效。

2 Shaanxi Provincial Key Lab of Behavior and Cognitive Neuroscience, Xi'an 710062

Abstract: Lots of research focused on prediction motion (PM) in physical space, such as time to collision tasks, interceptive tasks or relative arrival time tasks. Exploring PM tasks from different dimensions is helpful for researchers to better understand its cognitive mechanism. This research explored the impact of number distance and rhythm on number PM task. Number PM task is that people judge when a number increase or reduce to a target number in a constant change rate. We designed three experiments: in Experiment 1, we explored the role of number distance in number PM task without rhythm cues. The results indicated that participants performed better in big number distance condition than in small number distance. We tested the impact of number distance and regular rhythm cue on number PM task in Experiment 2. The results showed that participants also performed better in big number distance condition than in small number distance. In addition, we compared the results of Experiment 1 and Experiment 2, which demonstrated that the performance was always better when there were regular rhythm cues. We tested the influence of number distance on number PM task in the irregular rhythm cues condition. The results showed that the performance was better in big number distance condition relative to small number condition. Furthermore, we compared the results of Experiment 1 and Experiment 3, which indicated that, in small number distance condition, the difference of performance was not significant between no rhythm cue and irregular cue. Participants performed better in no rhythm cue condition relative irregular rhythm cue condition when the number distance was big. Therefore, we conclude that the rhythm information can improve the performance of number distance. However, the irregular rhythm information can degrade the role of number distance, and further reduces the performance of number PM task.

Keywords: Number prediction, Number distance, Rhythm

长时训练减少声音诱发闪光错觉的反应

黄杰¹, 鲁柯¹, 王爱君¹, 张明¹

¹苏州大学心理学系，心理与行为科学研究中心，苏州，215123, psyzm@suda.edu.cn

摘要 声音诱发闪光错觉(sound-induced flash illusion, SiFI)是一种以听觉信息为主导加工的多感觉整合现象，表现为当视觉闪光伴随不相等数量的听觉声音在 100 ms 内相继或同时呈现时，个体会错觉性地知觉到视觉闪光的个数与听觉声音的数量相等（即产生裂变错觉或融合错觉）。虽然以往的研究表明，SiFI 效应产生的原因之一是个体知觉敏感性较低，但尚未有研究关注长时训练造成的知觉敏感性变化对 SiFI 的影响。本研究采用经典的 SiFI 范式与反馈训练相结合，考察 7 天的长时训练对 SiFI 的错觉量与反应时的影响。研究要求训练组被试完成为期 9 天的行为任务，其中第 1 天与第 9 天分别为前后测，中间 7 天为训练阶段，被试在训练阶段完成的 SiFI 任务给予正确与否的反馈。同时，研究要求控制组被试只需要在第 1 天与第 9 天分别进行一次前测与后测。实验结果发现：(1)与控制组相比，训练组的裂变错觉与融合错觉的错觉量显著减小，反应也

更快，且训练对于裂变错觉的影响要大于融合错觉；(2) SiFI 的错觉量在训练过程中存在“高原现象”，即当反馈训练进行到第 5 天时，被试的训练效果达到稳定。研究表明，基于长时程的训练可以显著提高个体的知觉敏感性，进而减小 SiFI 的错觉量。本研究补充了 SiFI 领域的知觉训练研究，并进一步提供证据表明 SiFI 可以作为一个测量工具去提高多感觉整合的效率。

Long-term Training Reduces the Responses to the Sound-induced Flash Illusion

Jie Huang¹, Ke Lu¹, Aijun Wang¹, Ming Zhang¹

¹Department of Psychology, Soochow University, Research Center for Psychology and Behavioral Sciences, Suzhou, 215123, psyzm@suda.edu.cn

Abstract: Sound-induced flash illusion (SiFI) is an auditory-dominated multisensory integration phenomenon in which visual flashes presented with an unequal number of auditory beeps are illusorily perceived as equal in number to the auditory beeps. Although the SiFI has been documented to correlate with perceptual sensitivity, to date there is no consensus as to how it corresponds to sensitivity with long-term training. The present study adopted the classic SiFI paradigm with feedback training to investigate the effect of a week of long-term training on the SiFI effect. By asking the participants in the training group to complete a 9-day behavioral task, in which the first day and the ninth day were the pretest and posttest respectively, and the middle seven days were the feedback training stage. The participants were given feedback (e.g., correct or wrong) on the SiFI in the training stage. Both the training group and control group completed a pretest and a posttest before and after the perceptual training; however, only the training group was required to complete seven-day behavioral training. The results showed that: (1) long-term training could reduce the response of fission and fusion illusions by improving perceptual sensitivity, and the improvement of training effect on fission illusion was greater than fusion illusion; (2) there was a “plateau effect” that emerged during the training stage, which tended to stabilize by the fifth day. These findings demonstrated that the SiFI effect could be modified with long-term training by ameliorating perceptual sensitivity, especially in terms of the fission illusion. Therefore, the present study supplements perceptual training in SiFI domains and provides evidence that the SiFI could be used as an assessment intervention to improve the efficiency of multisensory integration.

额区 Theta 波对认知疲劳的调控作用

李明珠 麦子峰 宁倩 马宁*

华南师范大学心理学院，睡眠研究中心，广州，510631, maning@m.scnu.edu.cn

摘要 认知疲劳是指随着执行任务时间的延长，个体的认知表现，如注意、记忆等持续下降的现象。前额 theta 波（4-8 Hz）是衡量认知疲劳最为稳定的脑电频段之一，但在认知疲劳的不同阶段中，theta 能量与行为表现之间的关系目前尚不明确。本研究拟通过 1 小时的精神运动警觉性任务（PVT）诱发认知疲劳，并将 1 小时的任务划分为三个相等的时间段（T1：0-20min，T2：20-40min，T3：40-60min）以探索认知疲劳随着执行任务时间延长的发展进程，以及在认知疲劳的不同阶段中，脑电功能与行为表现之间的关联是否存在差异。结果表明，随着任务时间的延长，个体在 PVT 任务中的表现持续下降，T3 阶段反应时显著长于 T2 阶段，T2 阶段反应时显著长于 T1 阶段。时频分析的结果表明，刺激呈现后 200-450ms 之间，额区（Fz，Fp1，Fp2）和双侧顶枕区（左侧：PO7，PO3，O1；右侧：PO8，PO4，O2）的 theta 波能量随着任务时间的延长下降。前额 theta 波活动反映了个体的认知努力的水平，theta 波能量下降，反映出个体的认知努力减少。然而，单试次回归分析的结果仅发现额区的 theta 波与行为表现之间的关系随着任务时间的延长发生改变，额区 theta 波对反应时的回归系数在任务初始阶段（T1：0-20min）显著高于任务后期阶段（T3：40-60min），即随着任务时间的延长，额区 theta 波能量对个体行为表现的影响下降，这可能表明随着认知疲劳程度的增加，个体认知努

力减少,对行为的调控能力下降。综合上述结果,本研究发现,认知疲劳的程度随着任务时间的延长而加剧,并且在认知疲劳程度加剧的过程中,额区的 theta 波能量降低,且与行为表现之间的关联程度下降,从而表明额区 theta 波能量在执行长时间的认知任务过程中,对认知行为表现具有重要的调控意义。

关键词 theta 波, 认知疲劳, 额区调控

The regulation role of frontal theta on cognitive fatigue

Li Mingzhu, Mai Zifeng, Ning Qian, Ma Ning *

School of Psychology, Center for Sleep Research, South China Normal University, Guangzhou,

510631, maning@m.scnu.edu.cn

Abstract: Cognitive fatigue can be defined as cognitive function decline induced by prolonged task performance. The frontal theta activity (4-8 Hz) is one of the most stable EEG frequency bands to measure cognitive fatigue. However, the relationship between theta activity and behavioral performance in different stages of cognitive fatigue remains unclear. We examined the developmental course of cognitive fatigue using a prolonged psychomotor vigilance task. In this study, we segmented the 1-hour task into three 20 min time block (T1:0-20min, T2:20-40min, T3:40-60min) to explore the correlation between theta activity and behavioral performance during different stages of cognitive fatigue. The results showed that with the prolong of the task, the performance in the PVT task continued to decline. The response time during phase T3 was significantly longer than that during T2, and the response time during T2 was significantly longer than that during T1. Time-frequency analysis found that after stimulus presentation, the frontal area (Fz, Fp1, Fp2) and bilateral occipital area (Left: PO7, PO3, O1; Right: PO8, PO4, O2), the theta activity decreases over time. The frontal theta activity reflects the level of cognitive effort, and the theta activity decline reflects the decrease of cognitive effort over time. However, the results of single-trial regression analysis found that only frontal theta change was related to the behavior change during the prolonged task. The regression coefficient of theta wave in the frontal region was significantly higher during the first time block(T1:0-20min) than the third time block (T3:0-20min). The influence of frontal theta activity behavioral performance decreased over the task time, which may indicate that with cognitive fatigue increasing, participants reduced the cognitive effort to regulate the behavior performance. To sum up, the present study found that cognitive fatigue increased over the task time, and the frontal theta activity decreased. Meanwhile, the correlation between frontal theta activity and behavioral performance decreased over time. The current findings indicated that frontal theta activity played an important role in regulated cognitive performance during the prolonged cognitive task.

Keywords: Theta activity, Cognitive fatigue, Frontal region regulation

分类决策过程中跨通道信息整合的动态过程

李建花^{1,3} 华林^{2,3} 邓玮^{1,3}, E-mail: wdeng@um.edu.mo

² 澳门大学健康学院, 澳门

³ 澳门大学认知与脑科学研究中心, 澳门

摘要 为了优化行为表现,大脑会整合来自不同感官的信息。先前研究表明,多感官环境会促进或干扰分类表现,跨通道信息整合可能有重要影响但其机制尚不清楚。目前,知觉决策领域备受重视的两个理论是信息整合发生在早期信息编码阶段或晚期决策选择阶段,本研究借助脑电设备(EEG)、线性判别分析(LDA)及前馈模型探究跨通道信息整合的时间动态机制。39名被试佩戴128导脑电设备分别完成无干扰、视觉干扰、听觉干扰的视觉分类任务和听觉分类任务。行为表现显示:(1)视觉和听觉无关信息会对视觉分类有显著的促进作用;(2)视觉无关信息会促进,而听觉无关信息会干扰听觉分类表现。脑电数据显示:(1)视觉分类过程中,对听觉无关信息的整合发生在早期信息编码阶段,而视觉无关信息整合发生在晚期决策选择阶段,这可能与通道属性有关;(2)听觉分类时无关信息的通道效应没有体现在神经活动上。综合来看,这些结果证实了视觉和听觉无关信息会对视觉和听觉分类任务产生不同的影响,会分别体现在神经活动和行为表现层

面。这些结果也强调了跨通道信息整合可能发生在早期信息编码阶段，也可能发生在晚期决策选择阶段，揭示了分类决策过程中跨通道信息整合的动态过程。

The Dynamic Process of Multisensory Integration in the Categorization Decision Making

Jianhua Li^{1,3}, Lin Hua^{2,3}, Wei Deng^{1,3}

1 Department of Psychology, University of Macau, Macau SAR, China

2 Faculty of Health Sciences, University of Macau, Macau SAR, China

3 Centre for Cognitive and Brain Sciences, University of Macau, Macau SAR, China

Abstract: To optimize behavioral performance, our brain combines information from different senses. Previous research showed that categorization behavioral responses could be either facilitated or interfered with by the multisensory context. However, how the brain integrates multisensory task-relevant or -irrelevant information during categorization is still unclear. A developing view is that the impact on either the early information encoding, or the post-sensory processing efficacy could be plausible. Here, a Task (Visual Categorization vs. Auditory Categorization) × Distractor Modality (visual vs. auditory) within-subject design was conducted with electroencephalogram (EEG), in which participants were required to finish both tasks under baseline, visual distractor, and auditory distractor context. With higher accuracy or faster response defined as facilitation effect and lower accuracy and slower response defined as interference effect, compared with baseline condition, the behavioral results showed that (1) distractors have a significant facilitation effect on visual categorization; (2) the effect of the distractor on auditory categorization is modulated by its modality, that is visual distractors could facilitate performance, while auditory distractors could interfere with it. To explain the effect on the behavior, the multivariate pattern analysis of EEG data showed that it is primarily the early-sensory, EEG component amplitudes of visual categorization representation are amplified by the auditory distractor, whereas it is the late-decision impacted by the visual distractor. Overall, these findings suggested that visual and auditory task-irrelevant information has different effects in both Visual and Auditory Categorization Task, reflecting on the neural and behavioral level respectively. Information integration could occur both during sensory encoding and decision formulation, revealing a dynamic interplay between multisensory integration and categorization decision making.

例外存在时呈现顺序对基于规则和信息整合类别学习的影响

谢伟烨¹ 陈剑平¹ 王宇情¹ 刘志雅² (通讯作者)

1 华南师范大学心理学院，广州，510631

2 华南师范大学心理学院，广州，510631, zhiyaliu@scnu.edu.cn

摘要 以往研究发现，交错呈现不同类别刺激（交错呈现）比连续呈现相同类别刺激（集中呈现）更有利于类别学习，因为交错呈现增强了不同类别刺激间的区别对比。Noh 等人（2016）在类别学习双系统框架下，采用四类别学习任务探索呈现顺序对基于规则和信息整合类别学习的影响，结果发现集中呈现有利于基于规则的类别学习，交错呈现有利于信息整合的类别学习。因为在交错呈现条件下，学习者需同时生成四个类别的检验规则，对工作记忆产生负担，不利于基于规则的类别学习。相反，交错呈现鼓励学习者放弃基于规则的次优策略，快速转换到信息整合的程序性系统，因此有利于信息整合的类别学习。现实生活中，人们并不能根据某个或多个特征组合完美地区分一些类别，总会存在一些例外。为了更贴合实际，本研究在 Noh 等人（2016）的实验基础上，修改了相应的类别结构，增加了一些例外刺激，使被试根据两个维度进行分类的最大正确率为 95%，并且增加基线条件（随机呈现），进一步考察在例外情境下呈现顺序对基于规则和信息整合类别学习的影响。对测试阶段的正确率进行 3（呈现方式：交错、集中、随机）× 2（类别结构：基于规则、

信息整合)的完全随机方差分析。结果发现:在基于规则条件下,集中呈现的分类正确率显著低于交错呈现和随机呈现的分类正确率,但交错呈现和随机呈现的分类正确率没有显著差异。在信息整合条件下,集中呈现、交错呈现和随机呈现的分类正确率没有显著差异。上述结果表明,在例外情境下,集中呈现不利于基于规则的类别学习,而呈现顺序不会影响信息整合的类别学习。本研究认为,在基于规则的任务中,例外的存在干扰学习者在集中呈现条件下为每个类别形成的相应规则,损害程度大于交错呈现条件下增加工作记忆负担造成的损害。在信息整合的任务中,虽然交错呈现条件鼓励学习者快速放弃基于规则的次优策略,但例外的存在干扰学习者形成刺激—反应联结,因此没有出现交错呈现优势。本研究也进一步验证了类别学习双系统理论。

关键词 类别学习,例外,交错呈现,集中呈现,类别学习双系统理论

The Effect of Presentation Order on Rule-based and Information Integration Category Learning in the Presence of Exceptions

Xie Weiye¹, Chen Jianping¹, Wang Yuqing¹, Liu zhiya²

Department of Psychology, South China Normal University, GuangZhou, 510631

Abstract: Previous studies have found that interleaved presentation of different categories of stimuli is more conducive to category learning than blocked presentation of the same category of stimuli, this is because the interleaved presentation enhances the contrast between different categories. Noh et al. (2016) used a four-category learning task to explore the impact of presentation order on category learning based on rules and information integration under the framework of category learning dual systems, and found that blocked presentation is beneficial to rule-based category learning, and interleaved presentation is beneficial to information integrated category learning. Under the condition of interleaved presentation, learners need to generate test rules of four categories at the same time, which will burden working memory and is not conducive to rule-based category learning. On the contrary, interleaved presentation encourages learners to abandon rule-based strategies which are sub-optimal and quickly switch to a procedural system of information integration, thus facilitating category learning of information integration. In real life, people cannot perfectly distinguish certain categories based on one or more combination of characteristics, and there will always be some exceptions. In order to be more realistic, this study modified the corresponding category structure on the basis of the experiment of Noh et al. (2016), and added some exceptional stimuli, so that the maximum accuracy rate of the subjects' classification according to the two dimensions was 95%. We also added baseline condition (random presentation) to further examine the impact of presentation order on rule-based and information integration category learning in the presence of exceptions. Perform a completely random variance analysis of 3 (presentation mode: interleaved, blocked, random) x 2 (category structure: rule-based, information integration) for the correct rate of the test phase. The results found that: under rule-based condition, the classification accuracy rate of blocked presentation was significantly lower than that of interleaved presentation and random presentation, but there was no significant difference between the classification accuracy rates of interleaved presentation and random presentation. Under the condition of information integration, there was no significant difference in the classification accuracy of blocked presentation, interleaved presentation and random presentation. The above results show that in exceptional situation, blocked presentation is not conducive to rule-based category learning, and the presentation order does not affect category learning of information integration. This study believes that in rule-based task, the existence of exceptions interferes with the corresponding rules formed by learners for each category under the condition of blocked presentation, and the damage is greater than the damage caused by increasing the burden of working memory under the condition of interleaved presentation. In the task of information integration, although the interleaved presentation condition encourages learners to quickly abandon the rule-based sub-optimal strategy, exceptions interfere with the learner's formation of stimulus-response connections, so there is no advantage of interleaved presentation. This research also further validates the dual system theory of category learning.

The Coaching Leadership Effect on Team Effectiveness: Multi-level Mediating Effect Model

Li Yingwu, Ren Zhengzheng

(Department of Psychology, Renmin University of China, Beijing, 100872)

Abstract: Based on the Input-Mediator-Output-Input (IMOI) theory, this study proposed a cross-level mediated model that discussed the influence of coaching leadership on team effectiveness. Through online anonymous surveys, this study collected data from more than 419 employees in 77 software development teams across the country, and constructed our MSEM with coaching leadership behaviors. Team learning, and team effectiveness at Level 1, and member satisfaction and self-efficacy at Level 2. The main results showed that: (1) Coaching leadership behavior had a significant positive impact on team performance ($r = 0.310, p < 0.05$) and member satisfaction ($r = 0.48, p < 0.001$); and it also had a positive influence on team learning ($r = 0.842, p < 0.001$) and member self-efficacy ($r = 0.299, p < 0.01$); (2) Team learning has a significant positive impact on team performance ($r = 0.401, p < 0.05$) and member satisfaction ($r = 0.48, p < 0.001$), and it plays a mediating role between coaching leadership and team performance ($r = 0.337, p < 0.05$, LLCI = 0.033, ULCI = 0.658), as well as member satisfaction ($r = 0.40, p < 0.001$, LLCI = 0.228, ULCI = 0.593); (3) Self-efficacy has significant positive effect on member satisfaction ($r = 0.41, p < 0.001$), and it plays a mediating role between coaching leadership and member satisfaction ($r = 0.12, p < 0.01$, LLCI = 0.053, ULCI = 0.198). The results of this study help to understand the multi-level organizational theoretical model of coaching leadership on team performance and can effectively guide change and team management practices.

Keywords: Coaching leadership; self-efficacy; team effectiveness; multi-level organizational theory

摘要 在全球范围内，工作场所的伤害和事故一直是严重的问题，安全生产不容乐观。面对安全生产的严峻形式，如何降低生产事故的发生、提高员工的安全绩效是理论界和实践界共同关注的焦点之一。而领导作为工作中的重要角色，对员工的工作态度与行为有着极为重要的影响。因此，本研究从领导的角度出发，探究领导特质情感呈现通过影响员工工作投入对员工安全绩效的作用机制。新近提出的领导特质情感呈现这个构念（即，领导与下属互动过程中引起员工相似情感感受的倾向，包括积极情感呈现与消极情感呈现两个维度），会从个体和团队两个过程影响下属的工作投入。其中，领导积极情感呈现一方面能够引发员工个体的积极情感，进而扩展个体的注意、认知和行动的范围，使员工产生更高水平的工作投入；另一方面，在团队中，领导积极情感呈现引发的相似的积极情感会自下而上地聚合形成情感氛围，在这种积极情感氛围下，下属会更加认同团队的工作目标并产生高水平的工作投入。然而，领导消极情感呈现所引发的员工消极情感与团队消极情感氛围则会对下属的工作投入产生阻碍作用。同时，工作投入作为一种积极的工作状态，当工作投入较高时，员工会迅速有效地进入工作状态，并在生产活动中更加关注自身的安全，因此更容易表现出安全遵守和安全参与行为。本研究采用问卷调查法，收集了来自核电企业的67个团队的467名一线员工与其直接领导（67名）的数据。其中，领导特质情感呈现和工作投入来自员工评价，安全遵守和安全参与来自领导评价。运用多层中介模型对数据进行统计分析，结果显示，工作投入中介了领导积极和消极特质情感呈现对员工安全遵守与安全参与的影响，支持了研究假设。本研究有如下两方面贡献：（1）本研究首次将领导特质情感呈现这一概念引入安全领域，同时为解释员工安全绩效的作用机制提供了全新的视角；（2）在管理实践中，企业在选用、考察和培训中关注领导情感呈现这一特质，也有助于提升员工的工作投入与安全绩效。

关键词 领导特质情感呈现，工作投入，安全遵守，安全参与

The influence of leader trait affective presence on employee safety performance: the mediating role of work engagement

Yiyi Chen^{1,2}, Feng Li^{1,2}

1 CAS Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract: Injuries and accidents in the workplace have always been a serious issue worldwide. Facing the severe form of occupational safety, how to reduce the occurrence of accidents and improve the safety performance has been one of the key issues in academia and business. In addition, leadership as an important role in work also has an extremely important influence on employees' attitudes and behaviors. This research explores the mechanism of leader trait affective presence on employees' safety performance through the mediating role of work engagement. Leader trait affective presence—the tendency of leaders to make their interaction employees feel similarly positive or negative, will influence followers' work engagement through both individual and group affective processes. Leader positive affective presence can elicit followers' positive affect during the interactions which helps employees develop themselves further, broaden thought-action repertoires and produce higher levels of work engagement on the one hand. On the other hand, employees tend to identify with team goals more strongly and better engage at work under the positive affective climate in groups which are engendered attributed to the elicitation of the similar positive feelings among team members. However, employees' negative affect and the group negative affective climate caused by leader negative affective presence will hinder work engagement. When the work engagement is high, employees will efficiently immerse in the tasks and pay more attention to their own safety behaviors in production activities. So, it is easier to show safety compliance and safety participation. In this study, we investigated 467 employees and their

direct supervisors (67) from 67 groups in a nuclear power company. Leader trait affective presence and work engagement were evaluated by employees. Safety compliance and safety participation were evaluated by their supervisors. Multilevel Mediation model was conducted to test the hypotheses. Results show that the effect of leader positive and negative affective presence on employees' safety performance is mediated by work engagement, which supports hypotheses of our study. There are mainly two contributions in this study: (1) The introduction of leader affective presence extends the existing theories in the field of occupational safety, which provides a new perspective to explain the effect of leaders' traits on employees' safety performance; (2) In practical term, companies could pay more attention to leader affective presence during selection or inspection, which also helps to improve employees' work engagement and safety performance.

摘要 尽管有学者开始关注领导正直对员工沉默行为的影响, 但领导正直与领导能力如何交互影响不同类型的员工沉默的问题, 尚未有研究予以解答。同时, “德才兼备”的领导类型, 虽然在实践中受到推崇, 但是其管理效果却缺乏学术支持。为解决这些问题, 基于信任研究模型(Burke et al., 2007), 本文探索了领导行为正直与领导能力感知对于默许型、防御型及亲社会型沉默的交互效应, 并揭示了领导信任的中介作用。基于之前的研究, 我们提出了一个被中介的调节模型, 认为领导的行为正直与能力感知将交互影响员工对领导的信任, 进而差异化地影响员工的沉默行为。具体来说, 我们预测对领导的信任将会积极影响员工的亲社会沉默, 而消极影响默许和防御型沉默。研究使用一个跨三时间点的研究设计, 收集了来自 87 个领导团队的 285 名员工的相关数据。分析结果表明, 在领导具有高能力的情况下, 领导正直与领导信任具有更正向的关系, 且领导正直能显著负向预测防御型沉默, 正向预测亲社会型沉默, 但无法显著预测默许型沉默; 数据支持了被中介的调节模型。本研究有助于我们理解领导正直积极效应的边界条件, 探索了领导正直与领导能力对于领导信任的影响, 以及对领导信任与不同类型员工沉默行为之间的关系。本研究的结果丰富了领导正直、信任与员工沉默的相关文献, 有力地支撑了“德才兼备”这一领导观念的学术价值, 具有较高的实践指导意义。

How Leader Integrity and Competence Interact to Influence Employee Trust and Different Silences

Jinyun Duan¹, Linhan Yu², Lixiaoyun Shi¹, Xiaotian Wang¹

1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

2 Department of Psychology and Behavioral Science, ZheJiang University, Hangzhou, 310058

Abstract: Although scholars began to focus on the influence of leader integrity on employee silence, how perceived leader integrity and competence interact to influence employees' different types of silences remained unanswered. Drawing from trust framework (Burke et al., 2007), this paper investigated the joint effects of leader behavioral integrity and competence on employee acquiescent, defensive and prosocial silence, as well as the mediating effect of trust in leader. A time-lagged data from 285 employees and 87 direct leaders was used to test our model. Results suggested that at higher level of leader competence, leader integrity was more positively related with trust in leader, which in turn related to defensive silence negatively, prosocial silence positively, and acquiescent silence non-significantly; The mediated-moderation models were also tested. This research enhances our understanding of how leader traits influencing trust in leader, as well as its nuanced relationships with employees' different silences.

善意性别偏见的代际传递及其对女性领导力涌现的影响

高茵¹ 董航² (通讯作者) 徐建平²

1 北京师范大学心理学部, 北京北京市西城区新街口外大街 19 号, 100875

2 北京师范大学心理学部, 北京北京市西城区新街口外大街 19 号, 100875 202028061195@mail.bnu.edu.cn

摘要 随着女权运动的兴起, 性别偏见议题受到了越来越多的关注。善意性别偏见指一类主观情感上爱护女性但是将她们限制在传统性别角色上的态度, 因持有者的主观好意而难以被识别为偏见。已有研究发现, 善意性别偏见暗中维护了男女不平等的现状, 对女性的身心健康和个体发展具有负面影响。本研究的目的是探究男女平权思想日益盛行的背景下, 善意性别偏见态度在亲子间的传播路径, 存在形式, 以及其对女性领导力涌现的影响。本研究分为三个子研究, 考察了女性父母的善意性别偏见态度、女性的善意性别偏见态度、善意性别偏见环境和女性的领导力涌现之间的关系。研究一采用问卷调查法, 调查了来自北京、上海、安徽、山西等省市的 165 名女性和她们的至少一方家长, 测量他们各自持有的善意性别偏见、女性的领导力涌现。结果发现, 家长对善意性别偏见态度的认可程度正向预测了其女儿对善意性别偏见的认可程度, 但无法预测女性的领导力涌现。研究二采用半结构化访谈法, 对 10 个有女儿的家庭和 4 名成年女性分别进行深度访谈, 访谈文稿采用 NVivo 进行编码, 形成编码表。发现家庭生活中对女儿的善意性别偏见主要存在于行事作为、生活照顾、婚恋态度、学业期望和工作生活期望这几个主题中。研究三结合前人研究并采用研究二收集到的访谈文本和编码结果制作善意性别偏见研究材料, 将来自全国各地 60 所高校的 166 名参与者随机分为实验组和控制组。实验组和控制组分别阅读包含或不包含善意性别偏见的描述材料, 之后共同组成团队完成任务。任务完成后, 请小组成员评价其他成员的领导力涌现。结果发现, 善意性别偏见环境对女性的领导力涌现具有显著的负面影响。整合研究结论认为, 在父母与女儿的相处过程中, 无意中表现出的善意性别偏见会阻碍女性的领导力涌现。本研究对女性领导力的培养和发展提供了有效建议, 对于改善社会性别偏见问题, 拓展女性人才的发展空间具有重要价值。

Abstract: With the rise of feminism, more and more attention has been paid to the issue of gender bias. Benevolent gender bias refers to an attitude that emotionally cherishes women but restricts them to traditional gender roles, and is difficult to identify as bias because of the goodwill of the holder. Studies have found that benevolent gender bias secretly maintains the status quo of gender inequality, and has a negative impact on women's physical and mental health and individual development. The purpose of this study is to explore the transmission path and existence form of benevolent gender bias attitudes between parents and children, as well as its influence on the emergence of female leadership in the context of the increasing prevalence of gender equality. This study is divided into three sub-studies to examine the relationship between benevolent gender bias attitudes of female parents, benevolent gender bias attitudes of women, benevolent gender bias environment and female leadership emergence. In Study 1, 165 female participants and their parents from Beijing, Shanghai, Anhui, Shanxi and other provinces and cities were investigated by questionnaire. Their benevolent sexism, women's leadership emergence were measured. The results showed that parents' recognition of the benevolent sexism positively predicted their daughters' benevolent sexism, but they could

not predict women's leadership emergence. In Study 2, 10 families and 4 women were interviewed in-depth by semi-structured interview method. The interview manuscripts were coded by NVivo to form a coding table. It is found that the benevolent sexism towards daughters at home mainly exists in the following themes: daughter's behavior, parenting, marriage attitude, academic expectation and life expectation. In Study 3, 166 participants from 60 universities across the country were randomly divided into experimental group and control group. The experimental group and control group was asked to read the description materials with and without benevolent sexism respectively. Then the experimental group and the control group formed a team solve a task. After the task is completed, ask the team members to evaluate the leadership emergence of other members. The results show that the benevolent sexism environment has a significant negative impact on the emergence of women's leadership. The conclusion of the study is that unintentional benevolent sexism will hinder the emergence of women's leadership. This study provides suggestions for the development of women's leadership, which is of great value to improve gender equality and the development of female talents.

摘 要 全世界每年发生近 3.74 亿起非致命性工伤和疾病, 导致许多员工长期缺勤。根据中华人民共和国应急管理部最新发布的全国生产行业安全事故统计, 2020 年全国生产行业安全事故 3.8 万余起, 死亡人数为 2.74 万余人, 重特重大事故 16 起, 死亡人数 262 人。安全事故的发生给国家和企业都带来了巨大的损失, 也给相关家庭带来了巨大的痛苦, 安全生产形势复杂严峻。已有研究发现了安全行为与安全事故和伤害之间存在普遍的联系。因此, 本研究基于内隐追随理论, 使用仁慈型领导量表、下属默契量表、安全氛围量表和安全行为量表, 整群抽取国内某大型企业的 639 名员工作为被试来收集数据, 使用 SPSS21.0 及 Mplus8.0 对数据进行分析, 探讨仁慈型领导与员工安全行为的关系, 以及下属默契的中介作用和安全氛围在其中起到的有调节的中介作用。结果发现: (1)仁慈型领导能够正向影响员工的安全行为; (2)下属默契在仁慈型领导与员工安全行为间起中介作用; (3)安全氛围正向调节下属默契的中介作用, 高水平的安全氛围能够有效增强仁慈型领导通过下属默契对安全行为的影响。本研究深入探究了与员工安全行为相关的因素及它们间的关系, 明确了领导者对员工安全行为的重要影响、下属默契在仁慈型领导与安全行为间的积极作用以及培养良好的安全氛围的重要性, 为提升员工安全行为水平、降低安全事故发生率提供了科学依据, 为达到提升安全绩效的目的提供了科学路径。

The Effect of Benevolent Leadership on Safety Behavior: A Moderated Mediation Model

Zhenzhen Sun¹, Yuchen Sun¹, Yunxia Xu¹, Dawei Wang^{1,2}

¹ School of psychology, Shandong Normal University, 250358

² EAP center of Shandong Normal University, Jinan Shandong, 250358, wdw112@163.com

Abstract: Nearly 374 million non-fatal injuries and diseases occur every year in the world, resulting in the long-term absence of many employees. According to the latest statistics of safety accidents in the national production industry released by the Ministry of emergency management of the People's Republic of China, in 2020, there were more than 38,000 safety accidents in production industries nationwide, leading to more than 27,400 deaths, and 16 major accidents, with 262 deaths. The occurrence of safety accidents has brought great losses to the country and enterprises, and also brought great pain to the families concerned. The situation of safety production is complicated and severe.

Studies have found a general association between safety behaviors and accidents and injuries. Thus, based on the implicit followership theory, this study used the benevolent leadership scale, subordinates' moqi scale, safety climate scale and safety behavior scale to explore the relationship between benevolent leadership and employees' safety behavior, as well as the mediating role of subordinates' moqi and the moderating role of safety climate. There were 639 valid questionnaires, and the data were analyzed using SPSS 21.0 and M-plus 8.0. The results showed that : (1) High benevolent leadership is associated with high subordinates' moqi; (2) Subordinates' moqi mediated the relationship between benevolent leadership and employee safety behavior; (3) Safety climate positively moderates the mediating effect of subordinates' moqi, high level of safety climate can effectively enhance the influence of benevolent leadership on safety behavior through subordinates' moqi. This study explores the factors related to employee safety behavior and their relationship. The results demonstrate the important influence of leaders on employee safety behaviors, the positive role of subordinates' moqi between benevolent leadership and safety behaviors, and the importance of cultivating a good safety climate. This finding provides a scientific basis for improving the level of safety behavior of employees and reducing the incidence of safety accidents, and also provides a scientific path for improving safety performance.

Keywords: benevolent leadership, safety behavior, subordinates' moqi, safety climate

因为是我而接纳我：内在和外在肯定对员工解决职场人际冲突的影响

邓棉琳 李秀君 王峰 石文典（通讯作者）

上海师范大学心理系，上海，200234，swd_nx@163.com

摘 要 外界对于个人的肯定和接纳可分为内在肯定和外在外肯定两种形式，内在肯定是对一个人相对稳定的内在品质的肯定，而外在肯定是对个人外在行为表现或结果的肯定。研究发现，这两种肯定对于亲密关系的影响存在差异，来自伴侣的内在肯定（vs. 外在肯定）更能增进个体对亲密关系的信任和承诺，表现出更多的亲关系意愿和行为（Gordon & Chen, 2010）。这是由于内在肯定比外在肯定更能降低个体的自我防御性，进而促进亲人际关系行为。然而，以往研究仅局限于个体人际关系，忽略了组织情境。本研究聚焦于组织情境下，首次探究了两类肯定对员工解决职场人际冲突的影响。研究一考察内在和外在外肯定是否影响员工对假想职场人际冲突的宽恕意愿。238 名企业员工被随机分配到内在肯定和外在外肯定组：内在肯定组回忆一段组织对自己的内在肯定（如，因为自己人品好而受到接纳），外在肯定组回忆一段组织对自己的外在肯定（如，因工作业绩好而受到嘉奖）；接着让被试阅读八段职场人际冲突情境的描述，想象自己是情境中的受害者并指出对每段情境的宽恕意愿。研究二考察内在和外在外肯定是否影响员工对真实职场人际冲突的解决意愿。390 名被试首先回忆一段在近六个月中，自己与他人之间发生的工作冲突事件；随后完成内在肯定或外在肯定的启动（同研究一）；之后所有被试针对先前冲突事件的回忆，进行调解、宽容以及报复意愿的评分。研究一、研究二均表明，内在肯定比外在肯定能导致员工有更多的缓和职场人际冲突的意愿。研究三进一步考察外在肯定是否也能促进员工较为友善地解决职场人际冲突。463 名被试参与了这项研究，除在启动肯定类型（内在/外在肯定）时新增了控制组，其余研究过程与研究二基本相同。结果表明，与控制组相比，外在肯定也能增进员工缓和职场人际冲突的意愿，但其效果不如内在肯定。本研究首次在组织情境下考察内外在肯定的影响，丰富了这一主题的研究内容，拓展了自我肯定理论的解释范围，并为如何缓解职场人际冲突提供了实践参考。

关键词 自我肯定，内在肯定，外在肯定，亲关系行为，职场人际冲突

Accepting me for me: The effects of intrinsic vs. extrinsic affirmations on employees' responses to workplace offenses

Mianlin Deng, Xiujun Li, Feng Wang, Wendian Shi*

Department of Psychology, Shanghai Normal University, Shanghai, China

Abstract: Affirmation of one's self-worth can be divided into two types --- intrinsic affirmation and extrinsic affirmation. Intrinsic affirmation refers to an individual is unconditionally accepted and understood for his own intrinsic attributes. Extrinsic affirmation refers to an individual is accepted by his meeting external standard or achieving some goals. Past research has showed that intrinsic relative to extrinsic affirmation may have more relationship benefits. A study on romantic relationship demonstrated that intrinsic (vs. extrinsic) affirmation enhances relationship quality and promotes pro-relationship behaviors. This is because intrinsic affirmation lessens defensiveness more than extrinsic affirmation, which is thus helpful for building healthy relationships. However, the effects of intrinsic vs. extrinsic affirmations have not been examined in organizations. Three experiments of the present research were conducted to investigate the effects of intrinsic vs. extrinsic affirmations on responses to workplace interpersonal offenses. Experiment 1 examined the effects of intrinsic vs. extrinsic affirmations on willingness to forgive hypothetical workplace offenses. 238 employees were randomly assigned to intrinsic or extrinsic affirmation condition. They recalled and described a past event in which they were affirmed in the workplace for their inner qualities (intrinsic affirmation condition) or external performance (extrinsic affirmation condition). Then, eight hypothetical scenarios of workplace offenses were presented. Participants indicated their willingness to forgive the offenders of the scenarios. Experiment 2 examined the effects of intrinsic vs. extrinsic affirmations on multiple response intentions (willingness to forgive, reconcile, and revenge) toward real workplace offenses. 390 participants first recalled and described an unforgettable experience in which they were offended by a colleague over the last six months. Then, they completed the writing task of affirmation manipulation (the same as Experiment 1). Afterwards, their current response intentions toward the workplace offense that they had just recalled were measured. Experiments 1 and 2 showed that intrinsic relative to extrinsic affirmation from work promoted more positive response intentions (including increased willingness to forgive and reconcile and reduced inclinations toward revenge) toward colleagues who had offended them hypothetically or in real situations. Furthermore, to examine whether extrinsic affirmation can also promote pro-relationship responses to workplace offenses, Experiment 3 added a control condition (baseline level) and its remaining procedure was identical to that of Experiment 2. 463 participants took part in Experiment 3. The results showed that although extrinsic affirmation was less effective than intrinsic affirmation, it (vs. control condition) still triggered greater pro-relationship intentions. The present research was the first to examine the effects of intrinsic vs. extrinsic effect in organizations, which enriches the literature on affirmations of self-worth and extends the explanation scope of the self-affirmation theory. In addition, the current research has some practical implications. It provides a brief, impactful intervention that can ameliorate negative defenses (resentment and seeking revenge) and thus boost positive, cooperative reactions (forgiveness and reconciliation) to workplace offenses.

Keywords: self-affirmation, intrinsic affirmation, extrinsic affirmation, pro-relationship behavior, workplace interpersonal offense

敬业度在角色压力与反生产行为间的作用——感戴的调节

苏逸¹ 周雪² 钟建安¹ (通讯作者)

1 浙江大学心理与行为科学系, 杭州, 310028, jiananzhong@zju.edu.cn

2 中华联合财产保险股份有限公司浙江分公司, 杭州, 310005

摘要 角色压力 (role stress) 是工作场域下由于角色模糊、角色冲突和角色超载而造成的压力体验, 常常会导致一些负向的组织行为结果。其中, 角色压力与反生产行为 (counterproductive work behavior, CWB) 之

间的关系在前人的文献中已被广泛地探讨,也有文献研究了角色压力-反生产行为的中介变量,如负性情绪、组织支持感等,但鲜有将敬业度作为中介来考虑其作用机制的。敬业度(engagement)是员工在工作中表现出来的高度投入和积极主动的身心状态,但越来越多的管理实践揭示了员工敬业度有持续下降的趋势,因此对敬业度的考量具有现实意义。依据资源保存理论,首先构建了如下假设:角色压力会造成心理资源的耗竭,而这会引发敬业度的下降,并进一步导致反生产行为的增加。文章通过实证数据证实了该假设,发现角色压力与反生产行为具有显著的正向关系,敬业度与反生产行为具有显著的负向关系,敬业度在角色压力和反生产行为的关系中发挥了部分中介作用。其次,依据拓宽-建构理论,感戴(gratitude)作为一种积极情绪,可以补偿由于角色压力带来的资源损耗,建构个体损失的心理和社会资源,即感戴会负向调节敬业度与反生产行为之间的消极关系,具体而言,员工的感戴水平越高,即使敬业度由于角色压力而下降,他们也不会产生更多的反生产行为。由于工作场域下的感戴测量并未得到普遍的认可,所以在前人研究的基础上编制了员工感戴量表,经检验,符合心理测量学的标准,并谨慎地用于后续模型中对感戴这一变量的测量。文章在前人研究的基础上,首先,编制了员工感戴量表,经过访谈、专家研讨、题项形成与筛选、初测、再测、项目分析、信效度检验等,初步认定该量表可以作为工作场域下对员工感戴水平的一种测量方式。其次,借助自编量表和相关成熟量表,验证了本研究提出的有调节的中介模型,即员工感戴水平负向调节了员工敬业度在角色压力和反生产行为之间的中介作用。最后,探讨了理论贡献、实践意义、不足之处和未来展望。

关键词 角色压力,反生产行为,敬业度,感戴

The role of engagement between role stress and counterproductive work behavior——The moderating effect of gratitude

SU Yi¹, ZHOU Xue², ZHONG Jianan¹

1 Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou 310028, China

2 China United Property Insurance Co., Ltd. Zhejiang Branch, Hangzhou 310005, China

Abstract: Role stress is a pressure experience caused by role ambiguity, role conflict and role overload in the workplace, which often results in negative organizational behaviors. Among them, the relationship between role stress and counterproductive work behavior (CWB) has been widely discussed in previous literatures, some studies further investigated the mediating variables in the role stress-counterproductive work behavior process, such as negative emotions, perceived organizational support, etc. However, when it comes to underlying mechanism, few have taken engagement as a potential mediator. Engagement refers to the highly engaged and active physical and mental state of employees in their work. Yet, an increasing number of management practices have revealed a tendency of continuous decline of employee engagement. Therefore, investigation of engagement has practical significance. Based on the conservation of resource theory, the following hypothesis are proposed firstly: role stress causes the exhaustion of psychological resources, which will lead to the decline of engagement, and further increases counterproductive work behavior. This paper confirms the hypothesis through empirical evidence and finds that role stress is positively related to counterproductive work behavior, while engagement is negatively related to counterproductive work behavior. Engagement plays a partial mediating role in the relationship between role stress and counterproductive work behavior. Secondly, according to the broaden-and-build theory, gratitude, as a positive emotion, can compensate for the resource exhaustion caused by role pressure and build the psychological and social resources simultaneously. Furthermore, gratitude negatively moderates the negative relationship between engagement and counterproductive work behavior. Specifically, the higher the employee's level of gratitude is, the weaker the negative relationship between engagement and counterproductive work behavior will be. Since the measurement of employee's gratitude in the workplace has not been universally recognized, we developed a scale to measure employee's gratitude. The scale has been tested to meet the standards of psychometrics, and has been carefully used to measure the level of gratitude in subsequent models. On the basis of previous studies, we first developed a scale of employee's gratitude. After interviews, expert discussion, item generation and reduction, initial test, retest, item

analysis, reliability and validity test, etc., it was preliminarily concluded that this scale could be used to measure employee's gratitude in the workplace. Secondly, the moderated mediation model proposed in this study that employee's gratitude negatively moderated the mediating effect of employee's engagement between role stress and counterproductive work behavior was confirmed by using self-developed scales and related maturity scales. Finally, the theoretical contributions, practical implications, limitations and direction for future research are discussed.

用幸福感染员工——以领导行为和解释风格为中介的研究

曹璐¹ 张陈怿旻¹ 马剑虹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310028, jhma@zju.edu.cn

摘要 积极组织心理学强调从积极的角度研究组织行为的运行规律。本研究聚焦于领导的幸福感是如何传递给员工的, 分析了幸福的领导在解释风格和领导行为上的特征, 及其对员工心理资本和幸福感的影 响过程。本研究包含 3 个子研究, 研究一以 360 名高校管理人员为调查对象, 测量了他们的幸福感、解释风格、领导行为, 结果显示: 领导的解释风格在领导幸福感与领导行为中起到了部分中介作用。研究二以 811 名高校员工为调查对象, 测量其感知到的领导行为、心理资本、幸福感, 结果显示: 员工心理资本在员工感知的领导行为与员工幸福感之间起到了部分中介作用。研究三分别调查了高校管理人员及其下属, 收集领导-员工配对数据 106 份。结果显示: 解释风格、领导行为、心理资本在领导幸福感与员工幸福感之间起到了链式中介作用。有两条路径得到了验证, 路径一: 领导幸福感—领导解释风格—领导行为—员工心理资本—员工幸福感; 路径二: 领导幸福感—领导行为—员工心理资本—员工幸福感。同时, 加入中介变量后, 领导幸福感对于员工幸福感的直接作用效应不显著。结果表明, 领导幸福感对员工幸福感有正向影响, 但并非直接传递给员工, 而是通过解释风格、领导行为、员工心理资本的间接作用来影响员工幸福感的。

关键词 领导幸福感, 员工幸福感, 解释风格, 领导行为, 心理资本

How to Transmit Well-being from Leader to Members: Mediation of Leader Behavior and Explanatory Style

Cao Lu, Zhang Chenyiyang, Ma Jianhong(corresponding author)

Department of Psychology and Behavioral Science, Zhejiang University, Hangzhou, 310028

Abstract: Positive organizational psychology focuses on the organizational benefits of employee well-being. Following this perspective, the current study is designed to explore the influence of happy leaders on subordinates' social capital and subjective well-being by examining mediation process of leader behaviors and explanation styles. The whole research included 3 studies. In study 1, 360 managers who worked in university were investigated to measure their well-being, explanatory style and leader behavior. The results showed that the explanatory style of leaders played a partial mediating role in the well-being and leader behavior of leaders. In Study 2, 811 employees who worked in university were investigated to measure their perceived leader behavior, psychological capital and well-being. The results showed that psychological capital played a partial mediating role between employees' perceived leader behavior and employees' well-being. Study 3 investigated managers and their subordinates who worked in university, and collected 106 pairs of leader-employee matching data. The results showed that explanatory style, leader behavior and psychological capital played a chain mediating role between leaders' well-being and employees' well-being. Two paths have been verified: Leaders' well-being - Leaders' explanatory style - Leader Behavior - employees' psychological capital - employees' well-being (Path 1); Leaders' well-being - Leader Behavior - employees' psychological capital - employees' well-being (Path 2). At the same time, the direct effect of leaders' well-being on employees' well-being is not significant after adding mediating variables. In sum, this study showed that leadership well-being has a positive impact on employee well-being, but it is not directly transferred to employees, but through the indirect effect of explanatory style, leader behavior and employee psychological capital.

Keywords: Leadership well-being, Employee well-being, Explanatory style, Leader behavior, Psychological capital

生涯发展何以可持续？员工职业生涯的潜在转变分析

摘要 随着组织和社会经济环境日趋复杂化，个体在职业发展过程中所面临的不确定性与挑战性不断增加。在不确定环境中，员工追求什么样的生涯成功模式能够让自己变得健康、快乐、且有生产力，实现可持续职业生涯？这对于员工个体层面和组织层面的职业生涯管理都十分重要。在职业生涯研究领域，可持续职业生涯（sustainable career）是一个兴起的热点议题，但相关的实证研究却凤毛麟角。本研究结合可持续职业生涯的理论框架和人-环境匹配理论，探索员工职业生涯可持续性（指标包括健康、主观职业成功和绩效）的潜在剖面类型，重点探讨人-职匹配程度与职业生涯可持续性的潜在剖面变化之间的关系。研究采用纵向研究设计，收集了间隔6个月的两轮次员工问卷调查的匹配数据（ $n = 529$ ）；数据分析采用潜在剖面分析（latent profile analysis）和潜在转变分析（latent transition analysis）的方法。研究结果发现：（1）员工职业生涯可持续性存在4种类型的潜在剖面：高可持续性、健康导向、绩效导向和低可持续性，这4种潜在剖面在两轮员工数据的分析中得到重复验证；（2）人-职匹配程度高的员工更有可能经历职业生涯可持续性的积极转变，与之相反，人-职匹配程度低的员工则更有可能经历职业生涯可持续性的消极转变。本研究丰富了可持续职业生涯的实证研究，并从人-职匹配视角深化了对职业生涯动态演变与可持续性转变的理解，具有理论方面的贡献性。同时，本研究为组织的人力资源管理与员工的职业生涯管理提供了有益的决策参考。

Whose career is becoming more sustainable?

A latent transition analysis

Zhongda Wu, Chang-qin Lu

School of Psychological and Cognitive Sciences, Peking University

Abstract: Under the increasingly complex organizational and socio-economic environment, individuals are facing more and more uncertainty and challenges in their career development. In such a context, what kind of sustainable career mode should employees pursue to sustain their career with more health, happiness, and productivity? This is an important question no matter for the organizations' human resource management or employees' career management. In the field of vocational behavior, however, the extant research lacks empirical investigations on career sustainability. Integrating the theoretical framework of Sustainable Career and Person-environment Fit theory, the current study uses two-wave questionnaire data ($n = 529$) with an interval of 6 months to empirically identify the classes of employees' career sustainability through Latent Profile Analysis (LPA; using employees' self-reported data of health, subjective career success, and performance as the indicators), and further examine the predicting effect of person-job fit on the transitions (or stability) of employees' career sustainability classes, adopting Latent Transition Analysis (LTA). LPAs for each wave of data consistently resulted in four latent profile classes of employee career sustainability: *highly sustainable*, *health-oriented*, *performance-oriented*, and *unsustainable*. Moreover, an LTA model indicated that employees with higher person-job fit were more likely to go through positive transitions in career sustainability; on the contrary, employees with lower person-job fit were more likely to go through negative transitions in career sustainability. This study enriches the empirical research on employees' sustainable career and further deepens the understanding of career dynamics and sustainability transitions from the perspective of person-job fit. Also, this study provides practical implications for organizations' human resource management and employees' career management.

Keywords: sustainable career, person-job fit, latent transition analysis, latent profile analysis, career success

紧缺人才的胜任特征智能评估研究

时勘 宋旭东 李秉哲 王译锋 覃馨慧

温州大学温州模式发展研究院, 教育学院, 温州, 325035, shik@psych.ac.cn

摘要 为充分发掘我国紧缺人才优势, 改进现有人才选拔、评估和培训方法, 需要利用人工智能匹配的新技术, 为科技前沿领域聚集一批想创新、敢创新、能创新的高层次人才队伍。本研究为了解决紧缺型人才的瓶颈问题。首先, 基于大数据的人-职智能匹配, 通过基于 O*NET 的职业工作分析和基于心理测试的特征分析, 建立基于大数据聚合的智能匹配系统, 将大范围各地区紧缺专业的职业要求与求职人员的心理特征相匹配, 获得各类人群的基本归类后, 再进行结构化面试等新型甄选方法, 以提高人员选拔的速度和精度。此外, 基于地理位置的 LBS (Location Based Services) 为用户提供与位置相关的各类信息服务。其次, 从紧缺科技人员和关键管理岗位领导者入手, 通过关键行为事件访谈获得录音, 并对录音进行文本的转录, 通过计算机半自动化编码, 对非结构性数据进行索引、搜寻等数据挖掘, 形成核心胜任特征模型, 以此来作为对外招聘、培训和绩效评估的依据。目前, 科研团队已经在关键行为事件访谈、多模态信息的处理技术方面有所进展, 并开发出基于核心胜任特征的网络测试与培训系统, 包括共性胜任特征和科研、工程、管理领域下的特异性胜任特征, 并使用 SGP 成长评估模型对培训的效果进行衡量。在培训方式上, 也将采用认知技能培训、安全心智培训、团体沙盘游戏、合作型团队培训和情境模拟评价的新型培训获得验证, 通过可视化平台展示其动态过程, 供选人用人和绩效评估中使用。目前, 针对紧缺人才核心胜任特征的智能评估模式初步已初步取得了一定成效。

Research on intelligence Evaluation of Competency of Talents in short supply

Shi Kan, Song Xudong, Li Bingzhe, Wang Yifeng, Qin Xinhui

Educational School, Academy of Wenzhou Model Development ,

Wenzhou University, Wenzhou 325035

Abstract: In order to fully explore the advantages of talents in short supply in China and improve the existing methods of talent selection, evaluation and training, it is necessary to gather a group of high-level talents who want to, are willing to and can innovate in the frontier fields of science and technology by using the new technology matched by artificial intelligence. This study aims to solve the bottleneck problem of talents in short supply. First of all, based on large data - intelligent matching, through the analysis of the vocational work based on the O * NET and based on the characteristics of the psychological test analysis, establish intelligent matching system based on the data aggregation, will be a shortage of a wide range of regional professional career requirements match with the psychological characteristics of people, for all kinds of people, after the basic classification of Then structured interview and other new selection methods, in order to improve the speed and accuracy of personnel selection. In addition, LBS (Location Based Services) provides users with various information Services related to Location. Secondly, from a shortage of technical personnel and key management job leader, through key behavioral event interview recordings, and the transcription of the recording for text, semi-automatic coding by computer, the unstructured data indexing, searching, such as data mining, the formation of the core competence characteristics model, in order to as the basis of external recruitment, training and performance evaluation. At present, the research team has been in key behavioral event interview, multimodal information processing technology, and developed the network testing and training system based on the core competence characteristics, including general competence characteristics and scientific research, engineering, management, under the specific competencies, and use the SGP

growth model to measure the effect of training. In terms of training methods, new types of training such as cognitive skills training, safe mind training, group sandtable game, cooperative team training and situational simulation evaluation will also be adopted to be verified, and the dynamic process will be displayed through a visual platform for use in selection and employment and performance evaluation. At present, the intelligent evaluation mode aiming at the core competency of talents in short supply has preliminarily achieved some results.

天生的和平使者？大五人格特质与人际冲突调解的关系

张晓蕾¹（通讯作者） Katalien Bollen² Martin Euwema²

¹ 清华大学心理学系，北京，100084, xiaoleizhang@tsinghua.edu.cn

² KU Leuven, Leuven, 3000, Belgium

摘要 本研究旨在探讨人格与人际冲突调解（Interpersonal peacemaking）之间的关系。冲突调解是团队成员中的一种自愿行为，它是指员工站在中立、公正的角度自愿帮助发生冲突的同事，以帮助同事找到友好的冲突解决方案。冲突调解在组织研究中被定义为一种组织公民行为。根据近期的研究，人际冲突调解可被分为五个成分来研究，它们分别是：冲突调解的总体行为（peacemaking in general）、问题解决导向的调解（settlement oriented peacemaking）、情感导向的调解（emotion oriented peacemaking）、幽默型调解（humorous peacemaking），以及调解的多重偏向性（multi-partiality of peacemaking）。本研究旨在探究大五人格特质与人际冲突调解的五个成分之间的关系。503 名来自世界各地的参与者填写了一项问卷调查，用于评估他们的人格特质和在工作场合中的冲突调解行为。我们采用 AMOS 22.0 进行了数据分析。与预期假设一致，开放性、外向性和宜人性格特质与冲突调解的大多数成分呈正相关，而尽责性和神经质仅与幽默型调解以及调解的多重偏向性呈负相关。冲突调解是团队中的一种重要行为，但尚未得到充分研究，促进冲突调解有助于提高团队效率。本文是探索人格特质与人际冲突调解行为之间关系的首批研究，对组织的人力资源管理具有一定的启示意义。

关键词 组织公民行为，人格，冲突调解，冲突管理，第三方行为

Natural-born Peacemakers?

Big Five Personality Traits and Interpersonal Peacemaking

Xiaolei Zhang^{1*}, Katalien Bollen², Martin Euwema²

¹Tsinghua University, Beijing, 100084, China ²KU Leuven, Leuven, 3000, Belgium

*Corresponding Author, E-mail: xiaoleizhang@tsinghua.edu.cn

Abstract: This study aims to investigate the relation between personality and interpersonal peacemaking. Peacemaking is considered as voluntary behavior of team members to help conflicting colleagues in an impartial way, to find an amicable solution. Peacemaking in organizational studies is identified as an organizational citizenship behavior. According to recent research, peacemaking can be studied from the perspective of five different components: peacemaking in general, settlement oriented peacemaking, emotion oriented peacemaking, humorous peacemaking, and multi-partiality. We test the relation between the Big Five personality dimensions and five different components of interpersonal peacemaking. Five hundred and three participants from different backgrounds filled out a survey assessing their personality and peacemaking behavior at work. To test our hypotheses, we conducted Structural Equation Modeling in AMOS 22.0. In line with expectations, Openness, Extraversion, and Agreeableness related positively to most peacemaking components, while Conscientiousness and Neuroticism related negatively to the use of humor, and peacemakers' multi-partiality. Peacemaking is an important, however understudied, behavior in teams. The promotion of peacemaking contributes to team effectiveness. This is one of the first studies exploring the

relationship between personality (Big Five) and different aspects of interpersonal peacemaking. The implications for human resource management in organizations are discussed.

摘要 工作场所求助行为指员工向工作中的同事寻求情感性或工具性帮助, 以解决工作中或工作之外的一些问题。员工求助行为有利于个体和团队绩效、员工幸福感以及组织的可持续发展, 且工作场所中的人际互助行为大部分是由求助者寻求帮助引发的。但工作场所求助行为却很少被研究。依恋理论是理解人际关系的核心心理学理论, 从依恋的视角理解员工求助行为具有合理性。依恋理论已在发展心理学和社会心理学中被广泛应用, 但在组织行为学中却很少被关注。因此本研究基于依恋理论探讨员工依恋风格对其工作场所情感性求助和工具性求助行为的影响及作用机制。Chan (2013) 回顾了求助相关文献, 提出了求助模型, 他发现该模型只关注求助认知相关的前因变量, 而没有关注求助情感相关的前因变量, 并认为情感对求助行为的影响可能是未来有潜力的研究方向。依恋理论主要研究依恋的认知-情感过程, 认为依恋风格会影响个体的认知和情感。因此本研究基于依恋理论认为员工依恋风格会通过工作相关的积极情感和消极情感影响员工情感性求助和工具性求助行为。本研究采用人际关系经验量表(ERS)、工作相关情感量表和应对量表中的情感性求助和工具性求助行为两个维度对 278 名在职员工分三阶段进行问卷测试, 采用结构方程模型对数据进行多重中介效应分析。数据分析结果表明模型拟合良好, $\chi^2(217) = 462.868, RMSEA = 0.064, CFI = 0.934, TLI = 0.921, SRMR = 0.081$ 。员工对同事的依恋回避和依恋焦虑均会通过积极工作情感负向影响情感性求助和工具性求助行为。员工对同事的依恋焦虑会通过消极工作情感正向影响情感性求助行为。理论上, 本研究促进了依恋理论在职场中的应用, 丰富了员工依恋风格、求助行为的相关研究。实践上, 本研究对于从工作相关的情感出发对员工的求助行为进行干预具有一定的指导意义。

The Effects of Employee Attachment Style on Workplace Help-Seeking Behavior:

The Mediating Roles of Positive Job Affect and Negative Job Affect

Du Jianghong^{1,2}, Gan Shanjing^{3,4}, Meng Hui⁵, Li Yongxin⁶, Wang Zhenyuan²

1 School of Education, Suzhou University of Science and Technology, Suzhou, China

4 VU School of Management, Beijing, China

5 School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

6 Institute of Psychology and Behavior, Henan University, Kaifeng, China

Abstract: Help-seeking behavior in the workplace refers to employees seeking emotional or instrumental help from colleagues to solve problems at work or outside of work. Employee help-seeking behavior is beneficial to individual

and team performance, employee happiness, and sustainable development of the organization. Besides, most of the helping based interactions are initiated by someone seeking help. However, help-seeking behavior in the workplace has rarely been studied. Attachment theory is a core psychological theory to understand interpersonal relationship. Therefore, it is reasonable to understand employees' help-seeking behavior from the perspective of attachment. Attachment theory has been widely used in developmental psychology and social psychology, but little attention has been paid to in research of organizational behavior. Therefore, based on attachment theory, this study explores the effects of employee attachment style on emotional help-seeking and instrumental help-seeking behaviors in the workplace and the underlying mechanism. Chan (2013) reviewed the literature related to help-seeking and proposed a help-seeking model. He found that this model only focused on the cognitive-related antecedent variables of help-seeking, but did not pay attention to the affect-related antecedent variables of help-seeking. He believed that the impact of affect on help-seeking behavior might be a potential research direction in the future. Attachment theory is centrally concerned with the cognitive-affective processes of attachment and suggests that attachment style can influence individuals' cognition and affect. Therefore, based on attachment theory, this study hypothesizes that employees' attachment style can affect employees' emotional and instrumental help-seeking behaviors through positive and negative job affect. In this study, Experience of Relationships Scale (ERS), Job Affect Scale, and the two dimensions of emotional help-seeking and instrumental help-seeking behaviors in Coping Scale were used to measure 278 employees in three waves. Structural equation model was used to analyze the multiple mediating effects. The results show that the model fits the data well, with $\chi^2(217) = 462.868$, $RMSEA = .064$, $CFI = 0.934$, $TLI = 0.921$, $SRMR = 0.081$. Both employees' attachment avoidance and attachment anxiety to colleagues can negatively influence their emotional and instrumental help-seeking behaviors through positive job affect and negative job affect. Employees' attachment anxiety to colleagues can positively affect their emotional seeking behavior through negative job affect. Theoretically, this study promotes the application of attachment theory in the workplace, and enriches the literature on employee attachment style and help-seeking behavior. Practically, this study has a certain guiding significance for the intervention of employees' help-seeking behavior from the perspective of job affect.

Keywords: Employee Attachment Style, Emotional Help-seeking, Instrumental Help-seeking, Positive Job Affect, Negative Job Affect

绩效压力情境下的员工安全生产行为：作用机制的探讨

王梦圆 郭淑慧 李楠 陆昌勤（通讯作者）

北京大学心理与认知科学学院，北京，100871，lucq@pku.edu.cn

摘 要 生产效益和生产安全是影响加工制造型企业竞争力的两大重要因素。而在现实中，企业为追求高生产效益，往往会制定高的生产绩效目标，这势必导致一线生产员工体验到较大的绩效压力。工作场所的压力已被证实是影响员工安全生产的一个主要因素。但到目前为止，绩效压力的研究仅仅关注其对员工的绩效、不道德行为等方面的作用后果，却鲜有研究探讨其与员工安全生产行为之间关系。因此，本研究旨在探究绩效压力与安全生产行为(包括安全遵守行为和安全参与行为)之间的关系，重点探讨绩效压力对安全生产行为作用的内在作用机制和边界条件。本研究包括2个子研究。研究1在国内一家加工制造型企业中进行调研，共获得了279名一线生产员工两轮次的自我报告匹配数据。研究2在国内另一家加工制造型企业中进行调研，分别收集员工自我报告数据，以及上司对员工安全生产行为的评价数据，共获得了287名一线生产员工三轮次的员工-上司匹配数据。研究1的结果表明：绩效压力对员工安全生产行为的抑制作用是通过情绪耗竭产生的，即高的绩效压力会导致员工的情绪耗竭水平上升，进而会导致其安全生产行为的减少。研究2再次验证了研究1的研究结果，并发现了员工的工作自我效能感对上述中介作用的调节作用，即对于工作自我效能感较高的员工来说，情绪耗竭的中介作用不成立，而对于工作自我效能感较低的员工来说，绩效压力会通过加剧员工情绪耗竭，进而降低其在工作中的安全生产行为。本研究发现丰富了绩效压力以及安全生产行为的研究，同时也为企业的安全生产管理提供了一定的实践启示：企业管理者应结合实际，科学合理地制定绩效目

标, 并给予安全生产更多的重视, 同时, 企业应更多地关注员工的心理健康状况, 并可以考虑对员工进行一定的工作技能培训以提升员工的自我效能感水平。

关键词 绩效压力, 安全生产行为, 情绪耗竭, 工作自我效能感

How Performance Pressure Impacts Frontline Workers' Safety Behaviors in the Workplace? An Investigation of Underlying Mechanism

Mengyuan Wang, Shuhui Guo, Nan Li, Chang-qin Lu

School of Psychological and Cognitive Sciences, Peking University, Beijing, PRC

Abstract: The production and safety in the workplace are two key factors which matter the competitiveness of manufacturing industry. Nevertheless, compared with safety issue, the production might be paid more attention and be more visible in practice. Employers usually set high performance benchmarks and scrutinize employees' performance in a high-stakes manner. Employees in the manufacturing industry are thus facing performance pressure at work. Performance pressures was found to significantly affect employees' job performance and unethical behaviors. Unfortunately, less is known regarding how performance pressure might influence workplace safety. Drawing upon the Job Demands-Resources model, the current research develops and examines an integrative model of frontline workers' safety behaviors (i.e., safety compliance and safety participation) under performance pressure. To examine our hypothesized conceptual model, we conducted two field studies. Study 1 collected two-wave data from 279 frontline workers in a Chinese manufacturing company and Study 2 collected three-wave multisource data from 287 frontline workers in another Chinese manufacturing company. Mediation analyses and moderated mediation analyses with a bootstrapping technique were then conducted to examine the hypothesized model. The results demonstrate that performance pressure increased emotional exhaustion, which in turn led to fewer safety behaviors (i.e., safety compliance and safety participation). However, these indirect effects differed among employees. The indirect effects of performance pressure on safety behaviors through emotional exhaustion was significant and negative among employees with low job self-efficacy, but not significant among employees with high job self-efficacy. To sum, this research demonstrates that performance pressure, a prominent job demand at work, could damage workplace safety behaviors through a health-impairment process, while employee's job self-efficacy, an important personal resource, could buffer these detrimental effects. Our findings might enrich the literature of performance pressure and safety to some extent. Meanwhile, these findings also suggest that employers should take cautions when they are setting performance benchmarks for employees. Interventions to protect frontline workers' psychological well-being and trainings on job skills to promote frontline workers' job self-efficacy are needed.

Keywords: performance pressure, safety behaviors, emotional exhaustion, job self-efficacy

促销折扣不确定性对网购中跨期选择的影响

殷超楠 钟建安

浙江大学心理与行为科学系, 杭州, 310028, 21939027@zju.edu.cn

摘要 当消费者面临一个即将开始的促销活动, 他们往往需要做出一个跨期选择, 即决定现在购买还是等待促销。近来在网络促销中还出现了前期隐藏折扣价格的方式, 这进一步增加了跨期选择的不确定性。本研究旨在探讨这种促销折扣不确定性对跨期选择的影响, 并基于期望效用和信息缺口理论探究感知功能价值和好奇心的中介作用。实验 1 模拟了网络促销情境, 测量了被试在确定和不确定折扣下的跨期选择以及感知功能价值和好奇心。结果表明: 相比于 2% 低折扣, 消费者在不确定折扣下的好奇心更强, 从而更有可能等待促

销；而相比于 35%高折扣，不确定性导致感知功能价值下降，因此对跨期选项的偏好降低。相比于 15%折扣，不确定折扣下的好奇心更强、感知功能价值更低，由于好奇心和感知功能价值起到相反的作用，导致两种条件间的跨期选择差异不显著。在实验 2 中，我们将产品属性（享乐/实用）作为调节因素，并记录了购买决策的反应时。结果表明，购买享乐产品时不确定折扣的积极效用更强；不确定折扣下的反应时显著长于确定折扣。这意味着，尽管不确定性在一定程度上能增加吸引力，但也需要考虑它可能会消耗更多的认知资源（更长的反应时）。总体而言，我们的研究发现不确定性促销是通过好奇心和感知功能价值的双重中介作用对跨期选择产生影响的。这项研究不仅扩充了有关不确定性促销的研究，也为未来的研究提供了一个新的视角。

关键词 跨期选择，促销折扣不确定性，感知功能价值，好奇心

The Influence of Uncertainty of Promotion Discount on Intertemporal Choice in Online Shopping

Chaonan Yin, Jianan Zhong

The Department of Psychology and Behavioral Science, Zhejiang University, 148 Tianmushan Road, Hangzhou, Zhejiang, China

Abstract: When consumers are faced with an upcoming promotion, they have to make an intertemporal choice, that is, decide whether to buy now or wait for the discount. Recently there has even been a way of giving an undisclosed discount prior to the promotion, which increased the uncertainty of intertemporal choice. This research aims to discuss the effect of the uncertainty of the promotion discounts on intertemporal choice, and explore the moderating effects of perceived functional value and curiosity. Study 1 simulated a context of online marketing, we measured the intertemporal choices of participants and their curiosity and perceived functional value under determined or uncertain discounts. The results showed that, compared to 2% discount, consumers were more likely to wait for the promotion under the uncertain discount, which was driven by their curiosity; compared to 35% discount, uncertain discount led to lower perceived functional value, thus lowering the preference for intertemporal options. The curiosity and perceived functional value played the opposite roles, therefore there was no significant decision difference between uncertain discount and 15% discount. In study2, we manipulated product attributes (hedonic / utility) as moderators and recorded the response time of the purchase decision. We found that the positive effect of uncertain discount was stronger when purchasing hedonic products, and the response time under uncertain discount was significantly longer than determined discounts. That is, although uncertainty can increase attraction to some extent, the longer response time it takes which means consuming more cognitive resources also need to be considered. In general, we discovered the dual psychological mechanism of the impact of uncertain promotion on intertemporal choice, which was mediated by perceived functional value and curiosity. This research not only enriches the literature about uncertain promotion, but also provides a new perspective for future research.

Keywords: intertemporal choice, uncertain promotion, perceived functional value, curiosity

未来时间洞察力对飞行驾驶安全行为的影响： 风险知觉与职业使命感的双重路径

潘盈朵^{1、2} 李晨麟^{1、2} 游旭群^{1、2}（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西省行为与认知重点实验室，西安，710062, youxun@snnu.edu.cn

摘 要 飞行事故人为特征的日益凸显使得飞行人因失误与现代航线安全成为航空领域持续关注的议题。在探索威胁因素及其影响机制的同时，不应忽视积极个人特质对飞行驾驶安全的保护作用。未来时间洞察力（Future Time/Temporal Perspective, FTP）在未来的认知、体验与行为上体现的人格特质，通过个人对长远目标的一般倾向与从长计议对个体的重要价值加以表征，反映了时间管理、预期推理、理想追求等方面的个体差异。根据飞行情境中的风险不确定性与飞行任务的跨期决策特征，结合未来时间洞察力的状态监控、未来

规划等核心要素,已有研究证实未来时间洞察力是风险驾驶行为的晴雨表,能够良好预测驾驶员的安全绩效。为进一步探析未来时间洞察力对飞行安全的促进路径,研究基于调节聚焦理论,结合中国本土民航组织情境,对 237 名中国航线飞行员进行自陈量表数据取样,检验未来时间洞察力对安全飞行绩效的影响以及作用机制。结果显示:(1)未来时间洞察力对飞行员安全驾驶行为具有显著的正向影响,高未来时间洞察力个体的飞行安全水平显著高于低未来时间洞察力个体;(2)风险知觉(Risk Perception)与职业使命感(Calling)在未来时间洞察力对飞行员驾驶安全行为(Safety Operation Behaviors among Airline Pilots)的积极影响中发挥了部分中介作用:未来时间洞察力既可以通过提升飞行员的风险知觉水平这一自我预防(self-prevention)路径,也能够通过加深飞行员的职业使命感这一自我提升(self-enhancement)路径保障飞行任务的安全执行。研究结论不仅结合了传统人格研究取向和社会认知研究取向,揭示了未来时间洞察力对飞行驾驶安全行为的维护机制,丰富了既有飞行人因失误预防研究体系,同时也为航空安全文化建设、飞行员心理选拔、机组安全管理等实务内容提供了一定的启示与建议。

关键词 未来时间洞察力, 飞行驾驶安全行为, 风险知觉, 职业使命感, 调节聚焦理论

The Impact of Future Time Perspective on Safety Operation Behaviors among Pilots: Dual Path of Risk Perception and Calling

Pan Yingduo^{1,2}, Li Chenlin^{1,2}, You Xuqun^{1,2}(corresponding author)

1 Department of Psychology, Shaanxi Normal University, Xi' an, 710062

2 Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, Xi' an, 710062

Abstract: The increasingly prominent human characteristics of flight accidents have made pilot errors and modern airline safety cause continuous concern in the aviation field. While exploring the threat factors and their influencing mechanisms, the protective effect of positive personal characteristics on safety operation behaviors should not be ignored. The personality traits, reflected by future time perspective(FTP) in future cognition, experience and behavior, characterize the important value of individuals through their general tendency towards long-term goals and thinking, reflecting individual differences in time management, expected reasoning, and ideal pursuit. According to the risk uncertainty in the flight situation and the intertemporal decision-making characteristics of the flight mission, combined with the core elements such as state monitoring and future planning of FTP, studies have confirmed that FTP is a barometer of risk driving behavior, which can predict the safe performance of pilots. To further explore the path of FTP to flight safety, based on the regulatory focus theory and the situation of civil aviation organization, the study sampled self-reported scale data from 237 Chinese pilots to examine the impact and the mechanism of FTP on safe flight performance. The results showed that: (1) FTP has a direct and positive effect on safety operation behaviors, in which the safety operation behaviors of high-FTP pilots were higher than low-FTP counterparts. (2) Risk perception and calling partially mediated the relationship between the relationship between FTP and safety operation behaviors: FTP can promote the safe execution of flight missions by improving the pilots risk perception level and strengthening pilots calling. The research combines the traditional personality research orientation and the social cognition orientation, reveals the maintenance mechanism of FTP to the safety operation behavior among pilots, enriches the existing prevention research system of human errors. Also it provides certain enlightenment and suggestions for the construction of aviation safety, pilots psychological selection, and crew safety management.

Keywords: Future Time Perspective, Safety Operation Behaviors among Airline Pilots, Risk Perception, Calling, Regulatory Focus Theory

摘要 随着智能手机的普及, 行人步行时使用手机现象普遍, 因手机分心导致交通事故时有发生。研究探讨不同类型手机分心对步行的影响, 并进一步分析其影响的脑机制。研究包括三个实验, 首先采用行为实验, 选择大学生志愿者 30 人探讨手机通话、发信息、听音乐三种分心条件对行人行为的影响; 之后运用功能性近红外脑成像技术 (fNIRS), 分别考察不同认知负荷难度的分心任务 ($N=35$) 及不同通道类型分心任务 ($N=40$) 影响行人行为 (包括对交通信号灯和汽车鸣笛的反应) 的脑机制。数据结果发现: (1) 当步行时使用手机通话和发信息时, 被试对交通信号灯的反应均显著慢于无分心条件和听音乐时的反应 ($p<0.05$); 手机通话分心条件下, 被试对汽车鸣笛的反应显著慢于无分心和听音乐条件下的反应 ($p<0.05$); (2) 当步行时手机通话和发信息, 行人的步行速度显著慢于步行时听音乐和无分心的情况 ($p<0.001$); (3) 被试认为步行时手机通话和发信息要比无分心 ($p<0.001$) 和听音乐 ($p<0.01$) 付出更多的心理努力, 且认为步行时手机通话和发信息的任务难度更高 ($p<0.001$); (4) 高难度分心任务下, 被试对步行任务的反应时显著长于低难度分心任务 ($p<0.01$), 且在背外侧前额叶皮层、额极皮层、视觉联合皮层的脑区激活程度更高 ($p<0.05$), 表现出认知负荷对步行成绩的影响; 同时, (5) 视觉分心任务下, 被试对交通信号灯的反应时明显长于对汽车鸣笛的反应时 ($p<0.001$), 且在背外侧前额叶皮层、额极皮层、视觉联合皮层等脑区对交通信号灯反应的激活程度显著高于对汽车鸣笛反应的激活 ($p<0.05$); 听觉分心时, 被试对汽车鸣笛的反应时显著长于对交通信号灯的反应时 ($p<0.01$), 且在缘上回、颞上回等脑区对汽车鸣笛反应的激活程度显著高于对交通信号灯反应的激活 ($p<0.05$), 表现出同一通道资源竞争现象。由此我们得出结论, (1) 步行时手机通话与发信息均显著影响行人行为, 表现为行走速度变慢, 对外界信息反应延迟。(2) 手机影响步行安全既受到分心认知负荷大小的影响, 也与同一通道内资源竞争的限制。

Abstract: With the popularity of smart phones, it is common for pedestrians to use mobile phones while walking, and traffic accidents often occur due to walking distraction. This study investigated the influence of different types of mobile phone distraction on pedestrian response and further analyzed the brain mechanism of the effect. The study consists of three experiments. First, 30 college students were selected to conduct a simulated pedestrian task to investigate the influence of three types of smart phone using, talking, texting and listening to music on pedestrian response. Then, using functional near-infrared spectroscopy (fNIRS) technique investigated the brain mechanisms of different cognitive load distraction task ($N=35$) and distractions of different sensory channels task ($N=40$) affecting pedestrian responses. The results showed that (1) Participants responded to the traffic lights much longer when they talking and texting in the mobile phone than listened to music or had no distraction while walking. Participants responded to the car horns much longer when they talking in the mobile phone than when they listened to music or had no distraction while walking. (2) Walking speed of participants who talked on mobile phones and sent messages while walking is significantly slower than those who listened to music and were not distracted. (3) Participants reported talking and texting in the mobile phone while walking needed more mental effort than without distraction

and listening to music, and talking and texting in the mobile phone while walking was rated as more difficult. (4) Under the condition of high cognitive load distraction task, participants responded to the pedestrian task much longer than that of distraction task with low cognitive load ($p < 0.01$), and the brain areas of dorsolateral prefrontal cortex, frontal cortex and visual association cortex were more activated under the high cognitive load condition, showing the influence of cognitive load on pedestrian response. (5) Participants tended to react to the traffic lights much slower than the car horns when they distracted by visual stimulus, and in the dorsolateral prefrontal cortex, frontal cortex and visual association cortex, the activation degree of the brain regions responding to traffic lights was significantly higher than that in car horns. When the auditory distraction occurs, the participants' response to the car horns was much slower than the traffic lights. The activation degree of superior marginal gyrus and superior temporal gyrus in response to car horns was significantly higher than that of traffic lights, which showed resource competition in the same sensory channel. Therefore, we draw the conclusions that (1) Mobile phone conversation and sending messages while walking significantly affect pedestrian behavior, which is manifested as slow walking speed and delayed response to external information. (2) Both cognitive load and resource competition between pedestrian task and smart phone using type in the same sensory channel would effect pedestrian safety.

Keywords: mobile phone distraction, pedestrian safety, fNIRS, cognitive load, resource competition

孤独对物质性消费偏好的作用：一个有调节的中介模型

熊青云 高寒松 钟建安（通讯作者）

浙江大学心理与行为科学系，杭州，310028, jiananzhong@zju.edu.cn

摘要 与表示客观上社会关系较少的孤立相区别，孤独指个体理想社交情况和现实社交情况之间的落差及其带来的负面情绪结果。孤独会对消费者的人际交往产生影响，促使消费者建立新的社会关系来满足自身的归属需要，这一倾向也体现在消费中，相比具有人际交往失败风险的体验性消费，高孤独水平的消费者更倾向于通过物质性消费来与物品建立联结，补偿未满足的归属需要。因此，归属需要在孤独对物质性消费偏好的影响中起中介作用。不同调节定向的个体对理想现实差距的需求理解不同，从而产生不同强度的归属需要，因此，调节定向可以调节孤独对归属需要的影响，进而调节归属需要的中介作用。我们开展了四个研究来验证这一模型：研究一通过问卷法收集了 154 份有效数据，用量表测量了被试的孤独、孤立及消费偏好，发现控制孤立的影响后，孤独能够显著正向预测物质性消费偏好；研究二共收集了 230 份有效问卷，将被试随机分为物质性消费和体验性消费两组，通过测量他们愿意为对应消费类型付出的购买努力来反映他们的消费偏好，发现孤独能够显著增强被试的物质性消费偏好；研究三采用单因素被试间设计，将 192 名被试随机分为孤独组和控制组，通过问题的频率程度影响被试的选择来对孤独进行操纵，并测量了被试的归属需要，逐步回归法的结果发现归属需要在孤独对物质性消费偏好的影响中起中介作用；研究四引入调节定向作为调节变量，共收集 267 份有效问卷，结果表明有调节的中介模型成立，调节定向作为调节变量作用于自变量孤独和中介变量归属需要之间。本研究基于补偿消费理论和调节定向理论，丰富了消费心理学领域中孤独的研究，拓展了调节定向对消费行为影响的研究，为企业应该如何针对孤独人群的偏好来开发相关产品提供了一定参考。

The Effect of Loneliness on Material Consumption Preference: A Moderated Mediation Model

Xiong Qingyun¹, Gao Hansong¹, Zhong Jianan¹

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028,
jiananzhong@zju.edu.cn

Abstract: In contrast to isolation, which indicates less objective social ties, loneliness refers to the gap between an individual's ideal social situation and his actual social situation and the negative emotional consequences it brings.

Loneliness will have an impact on the interpersonal communication of consumers, prompting consumers to establish a new social relationship to meet their own belonging need. This tendency is also reflected in the consumption. Compared with experiential consumption, which has the risk of interpersonal communication failure, consumers with high loneliness are more inclined to establish connection with goods through material consumption and compensate for unsatisfied belonging need. Therefore, belonging need plays a mediating role in the effect of loneliness on materialistic consumption preference. Individuals with different regulatory orientations have different understandings of the need produced from the gap between ideal and reality, thus producing different intensity of belonging need. Therefore, regulatory orientation can moderate the effect of loneliness on belonging need, and then moderate the mediating effect of belonging need. We conducted four studies to verify this model. In the first study, we collected 154 questionnaires and measured loneliness, isolation and consumption preferences. After controlling for the effect of isolation, loneliness significantly positively predicted material consumption preferences. In the second study, a total of 230 questionnaires were collected. The participants were randomly divided into two groups: material consumption group and experiential consumption group, and their consumption preferences were reflected by the amount of effort they were willing to pay for corresponding consumption types. It was found that loneliness significantly enhanced the material consumption preference of the participants. In the study3, we used single factor between-subjects design. 192 subjects were randomly divided into loneliness group and control group. We manipulated loneliness by changing the degree of frequency in the questions to affect the choice of subjects, and then measured belonging needs. The result of stepwise regression showed that belonging need played a mediating role in the effect of loneliness on material consumption preference. In study 4, a total of 267 valid questionnaires were collected with regulatory orientation as a moderating variable. The results showed that regulatory orientation acted on the relationship between independent variable loneliness and mediating variable belonging need. Based on the theory of compensatory consumption and the theory of regulatory orientation, this study enriches the research on loneliness in the field of consumer psychology, expands the research on the influence of regulatory orientation on consumer behavior, and provides some reference for enterprises to develop related products according to the preferences of lonely people.

Keywords: loneliness, compensatory consumption theory, belonging need, experiential and material consumption

PPAR γ 介导小胶质细胞极化表型参与应激致 ob/ob 小鼠 抑郁障碍易感性

王威, 秦夏青, 姜志君, 李浩男, 朱泽萌, 刘德祥, 潘芳 (通讯作者)

山东大学基础医学院医学心理与伦理学系, 济南, 250012, panfang@sdu.edu.cn

摘要 背景: 肥胖导致机体呈慢性低度炎症状态, 这与肥胖个体的抑郁易感性有关, 但机制不清。有研究提示, 小胶质细胞过度激活是应激致抑郁症状和中枢炎症的主要原因。小胶质细胞激活通常分为经典激活 (M1) 和替代激活 (M2)。M1 型小胶质细胞可通过分泌促炎细胞因子, 如肿瘤坏死因子- α (TNF- α)、白介素 (IL)-1 β 和 IL-6, 引起中枢神经系统的功能障碍。M2 型, 即神经保护型, 可释放 IL-4、IL-10 和转化生长因子- β (TGF- β) 等抗炎细胞因子, 对抗炎症诱导的中枢神经系统损伤。过氧化物酶体增殖物激活受体 γ (PPAR γ) 是一种核转录因子, 可调节小胶质细胞极化表型和中枢炎症。本研究探讨 PPAR γ 在应激致肥胖小鼠抑郁障碍易感性中的作用。方法: 采用慢性不可预知性温和应激 (CUMS) 构建野生型 (wt) 小鼠和瘦素基因缺陷 (ob/ob) 小鼠抑郁模型, 采用糖水偏好实验、旷场实验、悬尾实验和 Morris 水迷宫实验检测小鼠抑郁样行为及学习记忆水平。同时检测前额叶皮质和海马区小胶质细胞激活状态、细胞因子、NF- κ B 表达和 PPAR γ 表达。结果: CUMS

导致 wt 和 ob/ob 小鼠抑郁样行为和空间记忆受损, 前额叶皮质和海马区促炎细胞因子升高、抗炎细胞因子降低, 小胶质细胞 M1/M2 比值增大, NF- κ B 过度表达以及 PPAR γ 表达下调。与 wt 小鼠比较, ob/ob 小鼠表现出更严重的行为障碍和更高水平的促炎细胞因子、M1/M2 比值、NF- κ B 激活以及更低水平的抗炎细胞因子和 PPAR γ 表达。PPAR γ 激动剂吡格列酮可减轻 wt 和 ob/ob 小鼠的抑郁样行为, 并逆转促炎和抗炎细胞因子的失衡。结论: 慢性应激导致肥胖小鼠更严重的抑郁样行为和神经炎症以及更低水平的 PPAR γ , 这表明 PPAR γ 介导小胶质细胞极化表型与应激致肥胖小鼠抑郁障碍易感性有关。

PPAR γ -mediated Alteration of Microglial Activation Phenotypes is Involved in Susceptibility to Depressive Disorder Induced by Stress in ob/ob Mice

Wang Wei, Qin Xiaqing, Jiang Zhijun, Li Haonan, Zhu Zemeng, Liu Dexiang, Pan Fang Department of Medical Psychology and Ethics, School of Basic Medical Science, Shandong University, Jinan, 250012, E-mail: panfang@sdu.edu.cn

Abstract Background: Obesity is a chronic low-grade inflammation state of the body which is associated with the susceptibility to depression in obesity, however, the underlying mechanisms have not yet been fully elucidated. Studies have suggested that excessive activation of microglia is proposed to be the main cause of stress-induced depressive symptoms and central inflammation. Microglial activation is usually categorized into classical (M1) and alternative (M2). M1 microglia could cause dysfunction of central nervous system (CNS) by secreting pro-inflammatory cytokines, such as tumor necrosis factor- α (TNF- α), interleukin (IL) -1 β and IL-6. M2 phenotype, the neuroprotective microglial phenotype, releases anti-inflammatory cytokines including IL-4, IL-10 and transforming growth factor- β (TGF- β) against inflammation-induced damage in the CNS. Further, peroxisome proliferator-activated receptor gamma (PPAR γ) is a nuclear transcription factor which regulates microglial polarization and inflammation. Our study aimed to investigate the role of PPAR γ in susceptibility to depressive disorder induced by stress in obese mice. Methods: Chronic unpredictable mild stress (CUMS) was performed to build wild-type (wt) mice and leptin-deficient (ob/ob) mice depression model. Depression-like behaviors and memory levels were evaluated by sucrose preference test, open field test, tail suspension test and Morris water maze test. Additionally, the activated microglial state, cytokines, NF- κ B expression, as well as PPAR γ expression in the prefrontal cortex and hippocampus were examined. Results: CUMS induced depression-like behaviors and spatial memory impairment, elevated pro-inflammatory cytokines, decreased anti-inflammatory cytokines, increased M1/M2 ratios of microglia, NF- κ B overexpression and down-regulation of PPAR γ expression in the prefrontal cortex and hippocampus in both wt and ob/ob mice. However, ob/ob mice exhibited severer behavioral disorders and higher levels of pro-inflammatory cytokines, M1/M2 ratios, NF- κ B activation, as well as lower levels of anti-inflammatory cytokine and PPAR γ expression compared to wt mice. Conclusions: Stressed obese mice displayed serious depression-like behaviors, higher levels of neuroinflammation and more downregulated expression of PPAR γ , which suggested that PPAR γ -mediated alteration of microglial activation phenotypes is related to the susceptibility to depressive disorder induced by stress in obese mice.

胃肠道肿瘤患者失眠与心理困扰的关系： 应对方式与年龄的调节作用

吕高荣¹ 赵迪¹ 厉萍¹ (通讯作者)

¹ 山东大学护理与康复学院, 济南, 250012, pingli12@sdu.edu.cn

摘要 目的: 了解胃肠道肿瘤患者的心理困扰状况, 分析失眠与心理困扰的关系, 并探讨应对方式和年龄在二者关系中的调节作用。方法: 选取山东省某两所三级甲等医院胃肠外科的 352 名胃肠道肿瘤患者, 采用失眠质量指数 (ISI), 简易应对方式问卷 (SCSQ) 及 Kessler10 量表(K10)对患者进行评估; 运用 Pearson 相关分析及多元线性分层回归分析年龄、应对方式、失眠及心理困扰的关系, 并通过 Process 宏插件进行有调节的调节效应分析。结果: 胃肠道肿瘤患者的年龄范围为 26-87 岁, 平均为 58.32 (12.05) 岁, 心理困扰的平均得分为 21.29 (4.54) 分, 失眠与心理困扰正相关 ($r=0.510, P<0.001$), 与积极应对正相关 ($r=-0.225, P<0.001$), 与消极应对不相关 ($r=0.062, P>0.05$)。有调节的调节分析显示, 积极应对, 年龄和失眠的三元交互显著 ($\beta=0.104, P<0.05$); 消极应对, 年龄和失眠的三元交互显著 ($\beta=0.171, P<0.01$)。Johnson-Neyman 技术的结果显示积极应对只在 34 岁及以下患者的失眠与心理困扰的关系中起负向调节作用; 消极应对在 51 岁及以下患者的失眠与心理困扰的关系中起负向调节作用, 在 68 岁及以上患者中起正向调节作用。结论: 胃肠道肿瘤患者的心理健康状况较差, 失眠和心理困扰密切相关。年龄能够调节应对方式在失眠和心理困扰间的调节作用。具体来说, 在中青年人人群中, 积极应对或消极应对的水平越高, 失眠与心理困扰的关系越弱; 在老年人中, 消极应对水平越高, 失眠与心理困扰的关系更强, 而积极应对的水平不影响失眠与心理困扰的关系。

Relationship between insomnia and psychological distress among gastrointestinal cancer patients: The moderating effects of coping style and age

Gaorong Lv¹, Di Zhao¹, Ping Li¹ (corresponding author)

¹School of Nursing and rehabilitation, Shandong University, Jinan, 250012, pingli12@sdu.edu.cn

Abstract: Objective: This study investigated the psychological distress of patients with gastrointestinal cancer, analyzed the relationship between insomnia and psychological distress, and explored the moderating effects of coping style and age in the relationship between insomnia and psychological distress. Methods: A total of 352 patients with gastrointestinal cancer were recruited to participate in this study from two tertiary hospitals of Shandong, China. They were assessed using the Insomnia Index (ISI), Simplified Coping Style Questionnaire (SCSQ) and Kessler10 scale (K10). Pearson correlation analysis and multiple linear regression were used to analyze the relationships between age, coping style, insomnia and psychological distress, and the Process macro was used to test the moderating effect. Results: The range of age among patients with gastrointestinal cancer was 26-87 years old, with a mean age of 58.32 (12.05) years old. The mean score of K10 was 21.29 (4.54). Insomnia was positively correlated with psychological distress ($r=0.510, P<0.001$), positively correlated with positive coping ($r=-0.225, P<0.001$), and not correlated with negative coping ($r=0.062, P>0.05$). The ternary interaction between positive coping, age and insomnia was significant ($\beta=0.104, P<0.05$), and the ternary interaction between negative coping, age and insomnia also was significant ($\beta=0.171, P<0.01$). The results of Johnson-Neyman technology showed that positive coping had a negative moderating effect on the relationship between insomnia and psychological distress in patients aged 34 and younger. Negative coping had a negative moderating effect in patients 51 years and younger and a positive moderating effect in patients 68 years and older. Conclusion: The psychological distress of gastrointestinal cancer patients is high and insomnia and psychological distress are closely related. Age can moderate the moderating effect of coping style on the relationship between insomnia and distress. Specifically, in middle-aged and the young patients, the higher positive coping or negative coping indicates a weaker relationship between insomnia and psychological

distress. In older people, the higher negative coping means a stronger association between insomnia and psychological distress.

不同人工智能模型在公立医院医生工作绩效预测中的应用

郭伯堂¹ 李佳芮¹ 杨艳杰¹ (通讯作者)

哈尔滨医科大学心理科学与健康管理中心, 哈尔滨, 150078

摘要 背景 中国取得抗击新冠肺炎疫情胜利, 公立医院承担了最紧急、最危险、最艰苦的医疗救治工作, 发挥了主力军作用。提升医生个人工作绩效, 推动公立医院高质量发展, 为更好提供优质高效医疗卫生服务、防范化解重大疫情和突发公共卫生风险、建设健康中国提供有力支撑。目的 该研究旨在建立一种机器学习预测模型, 可用于医院管理者预测医生个人工作绩效, 针对性干预促进医院高质量发展。方法 2020年5月-10月对哈尔滨市八所公立三甲医院医生1600名进行问卷调查, 收集人口学特征和其他变量数据进行数据分析。在此基础上, 我们开发了一个医生工作绩效的预测模型。利用SMOTE方法增加小种群样本的数据, 每个数据根据大约9:1的比率随机分配到训练和测试集中。利用召回率、精度、F1分数、AUC下的面积确定了极端梯度提升树(XGBOOST)、支持向量机(SVC)和随机森林模型(RF)模型。结果 研究共纳入1509名被试, 其中240例(15.90%)为低工作绩效个体。重要度排序发现睡眠质量、婚姻状况、子女个数、开放性人格、感情承诺、成就动机、道德性人格、利他性人格、持续承诺等是医生工作绩效的重要预测特征。极端梯度提升树(XGBOOST)模型比其他模型具有更高的预测性能(AUC: 0.966, 精度: 0.983, 召回率: 0.952, 特异性: 0.923)。结论: 本研究建立的极端梯度提升树(XGBOOST)模型可准确识别低工作绩效的医生个体, 为医院管理者提供更个性化的干预建议, 有助于提升组织绩效, 推动医院高质量发展。

The Performance of Different Artificial Intelligence Models in Predicting job performance among physicians of public hospital

Botang GUO¹, Jiarui LI¹, Yanjie YANG¹

Psychological science and health management center, Harbin Medical University, Harbin, Heilongjiang 150078, China

Abstract: Background China had won the novel coronavirus pneumonia epidemic situation, and the public hospital had undertaken the most urgent, the most dangerous and the most difficult medical treatment work, and had played the main force role. We should pay attention to improving the personal performance of physicians, promote the high-quality development of public hospitals, and provide strong support for better providing high-quality and efficient medical and health services, preventing and resolving major epidemic and public health risks, and building a healthy China. Objective The purpose of this study was to establish a machine learning prediction model, which can be used for hospital managers to predict physicians' personal job performance and targeted intervention to promote the high-quality development of the hospital. Methods From May to October 2020, a questionnaire survey was conducted among physicians in eight public hospitals in Harbin. Demographic characteristics and other variable data were collected for data analysis. On this basis, we developed a prediction model of physicians' job performance. Synthetic Minority Oversampling Technology (SMOTE) was utilized to increase data for small population samples. Each datum was randomly assigned based on a ratio of about 9:1 into the training and test sets. XGBClassifier (XGB), Support Vector Machine(SVM) and Random Forest (RF) models were determined using recall, accuracy, F1 score and area under the receiver operating characteristic curve (AUC). Results: A total of 1509 subjects were included in the study, of which 240 cases were local performance individuals. In order of importance, we found that sleep quality, marital status, number of children, openness personality, emotional commitment, achievement motivation, conscientiousness personality, agreeableness personality, continuous commitment are important predictive

characteristics of physicians' job performance. The AUC of the XGB (0.971), SVC (0.901), and RF (0.955) models were found. The largest AUC among the three models was seen in the XGB model. XGB model has higher prediction performance than other models (AUC: 0.966; precision: 0.983; recall: 0.952; specificity: 0.923) Conclusion The XGB model established in this study can accurately identify individual doctors with low work performance, provide more personalized intervention suggestions for hospital managers, help to improve organizational performance and promote high-quality development of the hospital.

利福昔明通过影响肠道菌群改善 CUMS 大鼠抑郁样行为

朱泽萌¹, 李浩男¹, 王威¹, 姜志君¹, 潘芳¹, 刘德祥² (通讯作者)

¹ 山东大学基础医学院医学心理与伦理学系, 济南, 250012

² 山东大学基础医学院医学心理与伦理学系, 济南, 250012, liudexiang@sdu.edu.cn

摘要 目的: 探讨利福昔明对慢性不可预知温和应激 (CUMS) 抑郁模型大鼠的抗抑郁作用, 为治疗抑郁症提供理论依据。方法: 56 只 SPF 级雄性 Wistar 大鼠, 适应性喂养一周后, 随机分为对照组 (C)、慢性应激组 (U)、慢性应激+利福昔明组 (U+R) 和利福昔明组 (R)。采用 5 周慢性不可预知温和应激建立大鼠抑郁模型, 同时采用利福昔明灌胃作为干预手段。造模结束后, 采用蔗糖偏好实验, 旷场实验, 高架十字迷宫实验和 Morris 水迷宫实验检测抑郁样行为和学习记忆的改变。使用无菌 EP 管收集大鼠粪便样本, 提取分离肠道菌群 RNA, 然后采用 PCR 扩增 16SrRNA 的 V3-V4 区域后, 应用高通量测序分析大鼠肠道微生态组成, 考察各组大鼠肠道菌群丰度和多样性等的变化情况。以免疫组织化学、酶联免疫吸附实验、蛋白免疫印迹等方式检测前额叶皮质和海马中的 5-HT、色氨酸、IDO1、TPH2 和炎症细胞因子 (IL-6、TNF- α) 水平。结果: 慢性不可预知温和应激导致大鼠在行为学测试中表现出明显的抑郁、焦虑样行为和学习记忆功能损害。慢性应激降低前额叶皮质和海马中 5-HT 和 TPH 2 的水平, 增加促炎细胞因子、色氨酸和 IDO 1 的水平, 并导致肠道微生态发生紊乱。经利福昔明干预后, 可改善 CUMS 大鼠抑郁样行为, 且 5-HT、色氨酸、IDO1、TPH2 和炎症细胞因子的表达趋于正常, 肠道微生态趋于正常。结论: 利福昔明通过影响肠道菌群进而影响色氨酸代谢中 5-HT 的生成和降低神经炎症改善 CUMS 大鼠抑郁样行为。

Rifaximin improves depression-like behavior of CUMS rats by affecting the intestinal flora

Zemeng Zhu, Haonan Li, Wei Wang, Zhijun Jiang, Fang Pan, Dexiang Liu*

Department of Medical Psychology and Ethics, School of Basic Medical Sciences, Shandong University, Jinan, Shandong, 250012

Abstract: Objective: To explore the antidepressant effects of rifaximin in depression animal model established with chronic unpredictable mild stress-induced (CUMS). Methods: fifty-six 21-day-old male Wistar rats after 7 days of acclimatization were randomly divided into four groups namely the control group (C), chronic unpredictable mild stress (CUMS) group (U), CUMS+Rifaximin group (U+R) and Rifaximin group (R). The rats in U and U+R group were received 5-week CUMS. Meanwhile, rifaximin was used as an intervention method. After molding, sucrose preference test, open field test, elevated plus maze test and Morris water maze test were used to detect alterations in depressive-like behaviours and memory impairment. Fecal samples were collected using the sterile EP tubes. The V3-V4 region of the 16SrRNA gene of the intestinal flora was amplified by PCR, after the RNA of intestinal flora were extracted and separated. High-throughput sequencing technic was applied to analyze composition of intestinal microflora and the changes of composition and diversity of intestinal flora in rats in each group. The expression levels of 5-HT, tryptophan, IDO1, TPH2 and inflammatory cytokines (IL-6, TNF- α) in the prefrontal cortex and hippocampus were measured by immunohistochemistry, enzyme-linked immunosorbent assay and western blotting.

Results: CUMS induced depressive and anxiety-like behaviors and memory impairment. CUMD induced increased levels of tryptophan and IDO 1 and proinflammatory cytokines in the prefrontal cortex and hippocampus, decreased levels of 5-HT and TPH 2, and disturbed the intestinal microecology. Rifaximin could relive depressive behaviors, the expressions of 5-HT, tryptophan, IDO1, TPH2 and inflammatory cytokines, and normalize the intestinal microecology. Conclusion: Rifaximin can affect the production of 5-HT in tryptophan metabolism and cytokines by affecting intestinal flora and then improve depressed behavior.

Keywords: Rifaximin, intestinal flora, depression, 5-HT, neuroinflammation

患者感知的医方共情对医患关系的影响：患者对医方信任的中介作用

吴清¹ 金哲宇² 王沛¹ (通讯作者)

¹ 华东师范大学教育学部, 上海, 200062, E-mail: wangpei1970@163.com

² 上海师范大学教育学院, 上海, 200234

摘要 目的: 相互信任的医患关系对照护质量有重要影响。研究已经证实患者感知的医方共情和患者对医方信任对医患关系的影响。然而, 这些变量间的关系及潜在影响机制尚不明晰。因此, 本研究旨在探索患者感知的医方共情、患者对医方的信任及医患关系间的关系, 探究患者对医方信任可能的中介作用。方法: 研究采用中文版医方共情量表、维克森林医师信任量表和医患关系量表(患者版)对来自中国东部、中部和西部地区的 3289 名患者(有效回收率 68.6%)进行大样本调查。采用相关分析、Bootstrap 中介效应检验法等进行数据分析。结果: 患者感知的医方共情、患者对医方的总体信任、仁爱信任和技术信任、医患关系间均呈现正相关($r=0.49-0.75$, P 均 <0.01)。患者感知的医方共情、患者对医方的总体信任、仁爱信任和技术信任直接预测患者对医患关系的评价。患者感知的医方共情对患者对医方的总体信任、仁爱信任、技术信任有直接预测作用。中介效应分析显示, 患者对医方的总体信任在患者感知的医方共情和医患关系中起中介作用($b=0.18$, 95% CI=[0.15, 0.21])。具体而言, 患者对医方仁爱信任在患者感知的共情和医患关系间的中介作用显著($b=0.24$, 95% CI=[0.20, 0.28]), 患者对医方技术信任的中介作用不显著($b=0.01$, 95% CI=[-0.02, 0.02])。结论: 患者感知的医方共情可以直接影响或者通过患者对医方的仁爱信任间接影响医患关系, 说明患者对医方仁爱的关注以及医方共情在医患信任重建中的重要作用。

Abstract: objective: a trustful physician-patient relationship is an essential component of high-quality care. the influence of physician's empathy and patient trust on physician-patient relationship has gained empirical support. however, relationship among these variables and underlying influencing mechanism remain unclear. this study aims to explore the relationship among physician's empathy, patient trust and physician-patient relationship, and mediation role of patient trust. methods: a cross-sectional survey was conducted. a total of 3289 patients (response rate 68.6%) recruited from eastern, central and western china completed questionnaire. physician's empathy, patient trust and physician-patient relationship were measured by chinese version of consultation and relational empathy scale, wake forest physician trust scale and patient-doctor relationship questionnaire, respectively. bootstrapped mediation

analysis was performed. results: all correlations were significantly positive across physician's empathy, patient all trust, patient trust in physician's benevolence and competence, and physician-patient relationship ($r=0.49-0.75$, all with $p<0.01$). patients' evaluation of physician-patient relationship was directly predicted by their perception of physician's empathy, patient overall trust, patient trust in physician's benevolence ($b=0.67$, $p<0.001$) and competence ($b=0.05$, $p=0.026$). patients' perception of physician's empathy could directly predict patient overall trust, and patient trust in physician's benevolence and competence. mediation analysis showed that the indirect effect of physician's empathy on physician-patient relationship through patient overall trust was significant ($b=0.18$, 95% $ci=[0.15, 0.21]$). specifically, the mediation effect of patient trust in physician's benevolence was significant ($b=0.24$, 95% $ci=[0.20, 0.28]$) and the mediation effect of patient trust in physician's competence was not significant($b=0.01$, 95% $ci=[-0.02, 0.02]$). conclusions: patients' perception of physician's empathy influences their evaluation of physician-patient relationship directly and indirectly via patient trust in physician's benevolence. the findings underline patients' attention to physician's benevolence and the significance of physician's empathy in rebuilding trust and harmonious relationship between physician and patient.

Keywords: physicians' empathy, patient trust in physician, patient trust in physician's benevolence, patient trust in physician's competency, physician-patient relationship

疫情爆发期间民众医患信任的恢复：一项潜转化分析

陈一笛¹ 马金金¹ 朱焕雅¹ 甘怡群¹ (通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871, ygan@pku.edu.cn

摘要 目的: 近年来, 中国的医患矛盾已经侵蚀了公众对医生的信任, 中国的医患信任随着杀医伤医案件的爆发跌至谷底。但是, 自 2020 年 1 月以来, 与 COVID-19 大流行的斗争可能改变了公众对医护人员的看法。我们的研究探究了公众信任在疫情爆发后是否发生变化, 如果发生了是如何变化的, 以及封城、隔离的政策和社会支持如何促进公众对医生的恢复。方法: 采用具有全国代表性的纵向样本, 于 2020 年 2 月至 3 月在中国大陆 29 个省进行了基于人口的纵向研究。基线样本 ($N=3233$) 是在中国 COVID-19 传播最快的期间获得的 (2020 年 2 月 1 日至 9 日)。研究随访 ($N=1380$) 在疫情恢复期进行 (2020 年 3 月 17 日至 24 日)。排除 30 名地理位置发生改变的个体, 共得到 1350 名参与者在这两个时间点匹配的数据。使用 M-plus 7.0 的极大似然估计法估计了两个时间点民众对医生信任的潜剖面模型, 和一个潜在转化模型探究社会支持、风险感知对医患信任变化的影响。结果: 民众对医生的信任在疫情爆发期间有显著的改善。通过两个时间点的潜剖面模型发现, 两个 class 的潜剖面模型拟合最好, 参与者被分为中度信任组 (T1 时潜剖面类别概率为 21%, T2 时有 45% 转变为高信任组) 或高信任组 (T2 有 88% 保持在高信任组)。在有隔离经历的人群中 [$B = 0.52$, $p = 0.041$, 95% $CI (0.02-1.03)$, $OR = 1.68$], 以及在社会支持较高的人群中 [$B = 0.60$, $p = 0.001$, 95% $CI = (0.29-1.02)$, $OR = 1.83$] 观察到了从中度信任组到高信任组的转化。社会支持调节了向高信任潜剖面的转变。结论: 我国 COVID-19 疫情爆发和隔离经历与患者对医生信任度的提高有关。在突发公共卫生事件中, 公众对医疗服务提供者的信任可以恢复, 应利用社会支持和风险管理策略进一步促进维持医患信任。

The effects of the COVID-19 epidemic outbreak on public trust in physicians in China: A latent transition analysis

Yidi Chen¹, Jinjin Ma¹, Huanya Zhu¹, Yiqun Gan¹(corresponding author)

¹ School of Psychological and Cognitive Sciences, Peking University, 100871, ygan@pku.edu.cn

Abstract: Background For over a decade, conflicts between physicians and patients in China have eroded public trust in physicians (PTP). The recent battle with the COVID-19 epidemic ongoing since January 2020 may have changed public perceptions. Our study investigated whether and how PTP changed since the outbreak and how lockdown experience and social support contributed to restoration of PTP. Methods A Population based, longitudinal study were

conducted in 29 provinces in mainland China with nationally representative longitudinal data from February to March, 2020. The baseline sample ($N = 3,233$) was obtained during the most rapid progression of COVID-19 in China (February 1 to 9). Study follow-up ($N=1,380$) took place during the recovery period (March 17 to 24). A total of 1,350 participants were matched between the two time points (30 participants were removed due to change of location). Two latent profile models and a latent transition model were estimated using robust maximum likelihood estimation (MLR) by M-plus 7.0. Results PTP significantly improved during the outbreak. Participants were classified into either a moderate trust (21% at T1; 45% transition into high group at T2) or a high trust (88% maintained at T2) in physicians' latent profile. A latent transition from the moderate trust to the high trust group was observed between baseline and follow-up in locked-down regions [$B = 0.52, p = 0.041, 95\% CI (0.02-1.03), OR = 1.68$] and among those with higher social support [$B = 0.60, p = 0.001, 95\% CI = (0.29-1.02), OR = 1.83$]. Social support moderated the transition to the high trust latent profile. Conclusion The COVID-19 epidemic outbreak and lockdown experience in China was associated with increased patient physician trust. The public trust can be restored in health care providers during a public health emergency and social support and risk management strategies should be utilized to further promote to maintain PTP.

无法忍受不确定性成分与广泛性焦虑症状间关系的网络分析

任垒 冯廷炜 毋琳 刘旭峰（通讯作者）

空军军医大学军事医学心理学系，西安，710032，lxf_fmumu@163.com

摘要 无法忍受不确定性（Intolerance of uncertainty, IU）被认为是广泛性焦虑（Generalized anxiety disorder, GAD）发展和维持的重要危险因素。目前研究大多使用自我报告量表总分来探究 IU 与 GAD（或担忧）之间的关系。然而，IU 是由不同的认知、情感和行为成分所组成的构念；GAD 是由认知、情感和躯体症状的组成的异质性综合症。本研究旨在探索 IU 不同成分与 GAD 不同症状之间的关系模式以及 IU 的哪些成分是 GAD 的核心危险因素，从而为相关预防和干预提供一定的参考。以陕西省某大学 624 名大学生为研究对象。采用无法忍受不确定性量表（IUS-12）测量 IU 各成分；采用广泛性焦虑量表（GAD-7）测量 GAD 各症状。使用软件 R 进行正则化偏相关网络的统计分析和可视化，特别关注网络中各个变量的预期影响（Expected influence）和桥预期影响（bridge expected influence）。结果表明，IU 社团内存在 4 条最强关联的边，如“无法预料的事情让我烦躁不安”和“我会因为无法得到所有需要的信息而感到沮丧”（正则化偏相关系数为 0.39）。GAD 社团内存在 2 条最强关联的边，如“由于不安而无法静坐”和“感到似乎将有可怕的事情发生而害怕”（正则化偏相关系数为 0.30）。在网络中，GAD 症状“对各种各样的事情担忧过多”和 IU 成分“我会因为无法得到所有需要的信息而感到沮丧”具有最高的预期影响。在 IU 社团中，“我会因为无法得到所有需要的信息而感到沮丧”具有最高的桥预期影响。在 GAD 社团中，“对各种各样的事情担忧过多”和“不能够停止或控制担忧”症状的桥预期影响最高。节点预期影响和桥预期影响的相关稳定性系数分别为 0.75 和 0.44。本研究揭示了 IU 不同成分与 GAD 不同症状之间的潜在关联路径以及 IU 的哪些成分是 GAD 的核心危险因素。这些结果为相关的预防和干预提供了潜在的靶点，如针对“它使我无法获得我需要的所有信息”可能比针对 IU 其他成分能更有效地减少 GAD 症状的严重程度。

The relations between different components of intolerance of uncertainty and symptoms of generalized anxiety disorder: a network analysis

REN Lei, FENG Tingwei, WU Lin, LIU Xufeng

Department of Military Medical Psychology, Air Force Medical University, Xi'an, 710032,

lxf_fmму@163.com

Abstract: Intolerance of uncertainty (IU) is considered as an important risk factor in the development and maintenance of generalized anxiety disorder (GAD). Yet, researches have investigated the relations between IU and GAD (or worry) using total scores on self-report measures. However, IU is a complex construct, consisting of beliefs, emotions, and behaviors. GAD is a heterogeneous syndrome characterized by different cognitive, affective, and physical symptoms. The purpose of this study is to explore the relations between different components of IU and symptoms of GAD, and which components of IU are the core risk factors of GAD, so as to provide some reference for related prevention and intervention. We recruited 624 college students from one university in Shaanxi Province. Components of IU were measured by 12-item Intolerance of Uncertainty Scale (IUS-12) and symptoms of GAD were measured by Generalized Anxiety Disorder 7-Item Questionnaire (GAD-7). Software R is used for statistical analysis and visualization of regularized partial correlation network. Specifically, we focused on the expected influence and bridge expected influence of each variable. The results showed that four strongest edges were between components of IU, like “Unforeseen events upset me greatly” and “It frustrates me not having all the information I need” (regularized partial correlation = 0.39). Two strongest edges were between symptoms of GAD, like “Being so restless that it is hard to sit still” and “Feeling afraid as if something awful might happen” (regularized partial correlation = 0.30). Symptom “Worrying too much about different things” and component “It frustrates me not having all the information I need” had the highest expected influences in the present network. In the community of IU, component “It frustrates me not having all the information I need” had the highest bridge expected influence. And in the community of GAD, symptoms “Worrying too much about different things” and “Not being able to stop or control worrying” had the highest bridge expected influence. The correlation stability coefficients of node expected influence and node bridge expected influence are 0.75 and 0.44, respectively. This study reveals potential pathways between different components of IU and various symptoms of GAD and which components of IU are the core risk factors of GAD. These results may provide some references for related prevention and intervention, such as targeting component “It frustrates me not having all the information I need” may be more effective at reducing symptoms of GAD than targeting other components of IU.

基于多元模式分类的大脑血氧信号复杂性分析 在多动性抽动症儿童诊断中的应用

辛潇洋¹² Xiaoqing Gao¹ (通讯作者)

1 浙江大学心理科学研究中心, 杭州, 310012

2 浙江大学心理与行为科学系, 杭州, 310012

通讯作者 Email: xiaoqinggao@zju.edu.cn

摘要 多动性抽动症是一种多发于儿童或青少年时期的神经障碍性疾病, 由于缺乏可靠的量化生理诊断指标, 当前多动性抽动症的诊断仍大多依赖对于症状的定性描述, 因此, 一种能够准确辨别多动性抽动症的生物标志物对于病患的及时诊断与干预有着重要的意义。大脑血氧信号复杂性作为一种反映环境适应能力的生理指标, 可用于区分包括注意缺陷多动障碍(ADHD)和强迫性神经官能症(OCD)这两种常见的抽动症并发症在内的多种神经性障碍。本研究的首要目的便是在此基础上探究血氧信号复杂性能否应用于多动性抽动症儿童的诊断中。此外, 考虑到当前的复杂性分析主要大多为单变量分析方法的局限性, 本研究的第二个目的是探究基于多元模式的复杂性分析方法的优点。本研究使用静息态功能磁共振成像(fMRI)技术采集了 25 名男性抽动症患儿和 25 名年龄、性别以及教育程度匹配的健康儿童对照的大脑静息态血氧水平依赖(BOLD)信号, 采用多尺度熵计算其大脑血氧信号复杂性。分别采用传统的单变量模式分析方法(独立样本 t 检验)和包含非线性支持向量机(SVM)分类算法的多元模式分析方法对组间复杂性差异进行分析。在此基础上, 采用相关分析探究不同分析方法获得的复杂性指标与患儿的症状严重程度(耶鲁综合抽动严重程度量表得分)的关系。结果显示: 1) 在左侧小脑、额上回、额内侧回, 患儿的血氧信号复杂性显著低于健康对照; 2) 在左侧壳核、右侧尾核、丘脑、双侧小脑以及多处皮质处, 多元模式分析能够以最高 94% 的准确性显著区分患儿和健康儿童的复杂性模式; 3) 由多元模式分析推导出的非线性复杂性指标在左侧小脑与右侧运动辅助区与患儿的症状严重程度呈现显著正相关。研究支持了抽动症的基底核-小脑-丘脑-皮质环路的病理学模型, 证明了多元模式分析方法在症状区分以及描述复杂性症状严重程度之间关系的优点, 说明了当结合多元模式分析方法后, 大脑血氧信号复杂性能够作为一种有效的抽动症诊断潜在生物标志物。

Abstract: Tourette syndrome (TS) is a kind mental disorder which often occurs in childhood or adolescence. Due to the lack of reliable diagnostic biomarkers and it's the varied presentations or the interferences of other comorbidities of TS, TS diagnosis is still mainly dependent on the qualitative descriptions, therefore a proper biomarker is crucial for the early diagnosis and intervention of this syndrome. The complexity of brain blood-oxygen signal is a fundamental feature of dynamic biological systems reflecting the ability to adapt and function in an ever-changing environment. Results from a number of researches have shown that the complexity of brain blood-oxygen signal can

successfully identify the abnormal brain regions related to the pathophysiology of certain neuropsychiatric disorders, including attention deficit hyperactivity disorder (ADHD) and obsessive compulsive disorder (OCD), which are two common comorbid disorders of TS. Hence the first goal of our study is to further explore whether it can be used for the TS discrimination. Besides, considering the limitation of the widely used univariate analysis in the complexity analysis, the second goal of our study is to explore the potential advantages of applying multivariate analysis in the complexity analysis. The resting state brain blood-oxygen-level-dependent (BOLD) signals of 25 male children with TS and 25 age-gender-education degree matched healthy controls (HCs) were obtained using the resting state functional magnetic resonance imaging (fMRI) technique. Multiscale entropy was selected as the complexity measure of BOLD signals. Both traditional univariate analysis (independent sample *t* test) and multivariate searchlight analysis with non-linear SVM classification method were used to explore the group differences in the complexity of resting state BOLD signals between 25 TS boys and 25 HCs. Correlation analysis between TS severity in TS patients (YGTSS scores) and different complexity indices derived from different analysis method was further conducted. The results showed: 1) significant complexity reduction exhibited in TS patients in the left cerebellum, left superior frontal gyrus and left medial frontal gyrus; 2) significant classification accuracies for the complexity pattern were found in the left putamen, right caudate, right thalamus, bilateral cerebellum and several regions of the cortex; 3) significant correlations between YGTSS scores were only found with the non-linear complexity index derived from the multivariate searchlight analysis with non-linear classification methods in the left cerebellum and right supplementary motor area. Our study supports the model of basal ganglia-cerebellar-thalamo-cortical for the pathophysiology of tics and demonstrates the advantages of multivariate analysis in the TS discrimination and the description of the associations between TS severity and complexity. Taken together, these results suggested that combined with multivariate searchlight classification, complexity is of potential clinical utility as a biomarker for TS diagnosis.

知觉负载对注意增强前脉冲抑制的影响

陈梁杰, 刘雷, 葛钟书, 杨晓东, 李量 (通讯作者)

北京大学心理与认知科学学院, 北京 100080, liangli@pku.edu.cn

摘要 突发地, 强听觉刺激(脉冲刺激)能够引发个体的惊吓反射, 当事先一段时间内出现一个弱刺激(前脉冲刺激), 个体的惊吓反射会被显著的抑制。这一现象被称为前脉冲抑制(prepulse inhibition, PPI)。以往研究发现 PPI 受个体注意水平的调节, 即注意前脉冲刺激时 PPI 会大于非注意条件下的 PPI。然而, 现有研究多对前脉冲刺激的特征或空间位置来操控注意水平高低, 缺少通过知觉负载操控注意水平来检测 PPI 变化。本研究采用视觉知觉负载任务, 屏幕上呈现 4 种颜色和 4 种形状的随机组合色块, 低负载任务要求被试判断是否出现特定颜色或形状的色块, 高负载任务要求被试判断特定颜色和形状组合的色块是否存在。在视觉任务中同步出现前脉冲刺激和脉冲刺激, 为了控制被试对前脉冲刺激的注意水平, 在每段任务中会持续播放宽带背景噪声, 并采用双耳时间差操控前脉冲刺激和背景噪声的相对知觉空间位置。当背景噪声与前脉冲刺激的知觉空间位置相同时, 称之为知觉空间重合(perceptual spatial co-location, PSC), 听者对前脉冲刺激的觉察较难。当背景噪声与前脉冲刺激的知觉空间位置不同时, 称之为知觉空间分离(perceptual spatial separation, PSS), 听者对前脉冲刺激的觉察较易。实验测量高低负载水平下被试在不同知觉空间条件下的听觉 PPI 水平。结果发现高负载条件下被试对目标刺激判别的反应时会显著高于低负载条件下的反应时, 但正确率没有显著差异, 这说明知觉负载任务的操控是有效的。对 PPI 进行两因素(2 负载水平 * 2 知觉空间位置)重复测量方差分析, 结果发现知觉负载主效应显著, 即低负载水平下的 PPI 显著高于高负载水平下 PPI, 而知觉控制位置主效应不显著。两因素的交互作用显著, 简单效应分析表明仅当低负载水平下知觉空间分离的 PPI 大于知觉空间重合下的 PPI, 高负载条件下二者没有显著差异。上述结果说明 PPI 的注意调节受跨通道知觉负载的影响, 高负载视觉任务会占用被试的注意资源进而降低对前脉冲刺激的加工, 表现出更低水平的 PPI。此研究通过知觉负载操控进一步验证 PPI 能够被个体注意水平所调节。

关键词 前脉冲抑制, 知觉负载, 注意调节, 知觉空间位置

The effect of perceptual load on attentional enhancement of prepulse inhibition

Liangjie Chen, Lei Liu, Zhongshu Ge, Xiaodong Yang, Liang Li (corresponding author)
School of Psychological and Cognitive Sciences, Peking University, Beijing 100080, China
E-mail: liangli@pku.edu.cn

Abstract: A sudden and intense aural stimulus (pulse) can trigger the individual's startling response, which is significantly inhibited when a weak stimulus (prepulse) is presented before a period of time. This phenomenon is known as prepulse inhibition (PPI). Previous studies have found that PPI is modulated by the attention of prepulse. In other words, PPI in the attended condition is larger than PPI in the unattended condition. However, most of the studies control the level of attention to detect PPI changes by the feature or spatial location of the prepulse, not by manipulating perceptual load. In this study, a visual perception load task was used, in which 4 colors and 4 shapes were combined and presented randomly on the screen. The low-load task required the subjects to judge whether a certain color or shape appeared, while the high-load task required the subjects to judge whether a certain color or shape combination existed. To controlling attention on prepulse, the background noise was continued to play in each trial, and the interaural time difference was used to control the relative perceptual spatial position of the prepulse and the background noise. When the perceptual spatial position of background noise and the prepulse are the same, which is called perceptual spatial co-location (PSC), the listener is difficult to detect the prepulse. When the perceptual spatial position of the background noise is different from that of the prepulse, it is called perceptual spatial separation (PSS). The listener can detect the prepulse more easily. PPI was measured under different perceptual spatial positions under high/low load conditions. The results showed that the PPI under high load condition was significantly higher than that under low load condition, but there was no significant difference in the accuracy, which indicated that the control of perceptual load task was effective. Two ways repeated measurement ANOVA (2 load level * 2 perceived spatial position) was performed on PPI. The results showed that the main effect of perceptual load was significant, that is, the PPI under low load level was significantly higher than that under high load level, while the main effect of perceived control position was not significant. The interaction between the two factors was significant. Simple effect analysis showed that PPI of PSS was larger than PPI of PSC only under low load condition, but there was no significant difference under high load condition. These results suggested that the attentional modulation of PPI was affected by cross-model perceptual load, and the high-load visual task would occupy the attention resources and reducing the processing of prepulse, showing a lower level of PPI. This study further verified that PPI could be modulated by attention through perceptual load task.

人类听皮层中的空间关系表征——颅内电生理证据

罗路¹ 徐娜² 王茜³

1 北京体育大学心理学院, 北京, 100084, luolu@bsu.edu.cn

2 首都医科大学北京天坛医院神经内科, 北京, 100070

3 北京大学心理与认知科学学院, 北京, 100871, wangqianpsy@pku.edu.cn

摘要 声源空间位置是声信号的基本属性, 也是人类听觉系统的加工目标之一。当环境中同时存在多个声信号时, 声源之间的空间关系便成为理解整个复杂听觉场景的重要线索。但是, 听皮层如何表征空间关系目前尚不明确。本研究通过高时空分辨率的颅内电生理记录技术, 在 22 例癫痫患者中初步探讨了听觉脑区对声源空间关系的表征机制。我们使用头相关传递函数分别处理男声与女声的音节/da/, 构建出不同空间关系的听觉刺激, 并由此筛出 295 个具有显著听觉反应的电极触点, 主要分布在颞横回 (n = 39)、颞上回 (n = 127)

与后岛叶皮层 ($n = 80$)。针对每一个电极触点,我们提取颅内脑电信号中与本地神经元活动密切相关的高频伽马 (high gamma, 60 – 150 Hz) 成分,并计算不同空间关系条件之间的神经表征差异矩阵 (representational difference matrix, RDM),观察可见几种反复出现的 RDM 模式。进一步对所有电极的 RDM 进行无监督聚类分析,得出了 5 种典型模式,分别反映 3 类不同的空间表征偏好,包括 (1) 单侧空间偏好,即当两个声音均位于左侧或右侧空间时电极反应最特殊; (2) 特定声源身份-空间组合偏好,即神经反应选择性地偏好“同侧男声对侧女声”或“同侧女声对侧男声”; (3) 相对空间关系偏好,即电极对声源空间重合和空间分离的反应存在差异。三种空间表征偏好在皮层中的分布也存在差异,其中对单侧空间具有选择性的电极最多 (48%),符合前人研究描述的听皮层特点;表征声源身份-空间组合 (38%) 与相对空间关系 (14%) 的电极相对较少,后者相对于前者多集中在颞叶靠后的位置,提示后侧颞叶对空间关系加工的特殊贡献。有趣的是,统计各个脑区中各类空间偏好的占比后发现,有 18% 的初级听皮层电极表现出了对相对空间关系的表征,该占比与前人动物电生理研究中发现的表征相对空间关系的神经元占比接近。该结果表明,人类听皮层中存在复杂多样的听觉空间表征机制,这可能是支撑人类优秀空间听觉能力的神经基础。

1 School of Psychology, Beijing Sport University, 100084, luolu@bsu.edu.cn

2 Department of Neurology, Beijing Tiantan Hospital, Capital Medical University, Beijing, China, 100070

3 School of Psychological and Cognitive Sciences, Peking University, Beijing, China, 100871, wangqianpsy@pku.edu.cn

Abstract: The location of the sound source is a fundamental feature of auditory signals and one of the primary computational goals of the human auditory system. When multiple sound streams exist, the relative spatial location of sound sources provides essential information for us to understand the complex auditory scene. However, how the auditory cortex encodes this spatial relationship remains an open question. Using intracranial electroencephalogram (iEEG) with high spatial and temporal resolutions, we probed the neural representation of auditory space in auditory cortices from 22 subjects with epilepsy. For sound stimuli, we used the head-related transfer function to construct auditory scenes that contained different spatial relationships between a male and a female-speaking syllable /da/. We collected 295 electrode contacts with significant auditory responses. These electrodes covered auditory areas, including Heschl's gyrus ($n = 39$), superior temporal gyrus ($n = 127$), and posterior insula ($n = 80$). We extracted the high gamma (60 – 150 Hz) component of the iEEG signals closely related to local neural processing and calculated the representational difference matrix (RDM) for each contact. We observed repeated patterns of RDM across contacts and further extracted these patterns using unsupervised clustering analysis. The clustering algorithm revealed five RDM patterns that likely represented three different spatial preferences. The first one showed a preference towards hemifields, with contacts exhibited special responses to conditions where both sounds localized in the left or right hemifield. The second one showed a preference toward specific identity-localization combinations, with contacts exhibited special responses to “left male/right female” or “left female/right male” conditions. The third showed a preference toward relative spatial relationships, with contacts exhibited differential responses to spatial co-localization and separation. The three types of representation had different anatomical distributions. Most contacts (48%) showed a preference towards hemifields, consistent with previous findings that most cortical neurons have broad spatial tuning to contralateral space. Meanwhile, relatively fewer contacts showed a preference towards identity-location combinations (38%) and relative spatial relationships (14%), with the latter had a more posterior distribution, suggesting a special role for posterior temporal areas in the processing of relative sound location. Interestingly, by examining the ratios within each auditory area, we found that 18% of contacts in the primary auditory

cortex displayed representation of relative sound location, which was close to the proportion revealed by previous single-unit recordings in animals. These results revealed a functional heterogeneity of spatial processing in the human auditory cortex, which could serve as the neural substrate of our outstanding performance in spatial hearing.

阳虚质个体对应激情境的情绪和 HRV 反应

张小聪

南京中医药大学心理学系, 南京, 210023, zhangxiaocong@njucm.edu.cn

摘要 中医理论认为, 体质是个体在先天禀赋和后天获得的基础上形成的形态结构、生理功能和心理状态方面相对稳定的特质。当体质平衡遭到破坏, 个体就会对某些致病因素具有易感性。阳虚体质个体容易罹患抑郁、焦虑等心理问题。本研究采用《中医体质量表》、《抑郁自评量表》、《焦虑自评量表》筛选没有抑郁、焦虑症状的 26 名阳虚质和 31 名平和质大学生为被试, 运用特里尔社会应激任务(Trier Social Stress Test, TSST)创设应激情境, 以主观情绪体验、心率变异性等指标考察阳虚质个体的应激反应模式, 为分析阳虚质个体对心理问题的易感性提供依据。整个实验包括 5 个阶段: 静息期、应激任务期(准备期、演讲期、心算期)和恢复期。对正性情绪、负性情绪、应激感知得分进行 2(组别:阳虚质、平和质)×5(实验阶段:静息期、准备期、演讲期、心算期、恢复期)的重复测量方差分析。结果表明, 组别×实验阶段交互作用显著, 阳虚质比平和质个体在应激任务中感受到更多的负性情绪($F=11.45, P=0.001$)和压力体验($F=7.37, P=0.001$)。对 HRV 指标进行 2(组别:阳虚质、平和质)×5(实验阶段:静息期、准备期、演讲期、心算期、恢复期)的重复测量方差分析。结果表明, LF/HF 指标的组别×实验阶段交互作用显著($F=5.54, P=0.01$), 阳虚质个体在演讲期、心算期的 LF/HF 比值显著高于对照组。本研究结果表明, 阳虚质个体从应激情境中体验到更多负性情绪, 且交感神经系统功能亢进, 是导致其对心理问题易感性的重要原因。

Emotional and HRV Responses of Yang-deficiency Individuals to Acute Stress

Zhang Xiao-cong

Department of Psychology, Nanjing University of Chinese Medicine, Nanjing, 210023

Abstract: According to the theory of traditional Chinese medicine, constitution is the relatively stable trait in terms of morphological structure, physiological function and psychological state formed on the basis of innate endowment and acquired. When the physical balance was destroyed, individuals would be susceptible to some pathogenic factors. Individuals with Yang deficiency constitution were prone to depression, anxiety and other psychological problems. In this study, 26 Yang-deficiency and 31 balanced constitution college students without depression and anxiety symptoms were selected by Constitution of Chinese Medicine Questionnaire, Self-Rating Depression Scale and Self-Rating Anxiety Scale. Trier Social Stress Test was used to create stress environment, heart rate variability (HRV) and other indicators were used to investigate the stress response of Yang-deficiency individuals. The whole experiment includes five stages: resting period, stress task period (preparation period, speech period, mental arithmetic period) and recovery period. The 2(groups: Yang-deficiency, balanced constitution) × 5(experimental stages: resting period, preparation period, speech period, mental arithmetic period, recovery period) repeated measurement ANOVA was used to analyze the scores of positive emotion, negative emotion, stress perception and HRV. The results showed that the interaction effects were significant for negative emotions and stress experience. Yang-deficiency individuals felt more negative emotions ($F = 11.45, P = 0.001$) and stress experience ($F = 7.37, P = 0.001$) during the stress task. The interaction effect was also significant for LF / HF ratio ($F = 5.54, P = 0.01$), values of Yang-deficiency individuals were significantly higher in the speech stage and mental arithmetic stage.

Yang-deficiency individuals experienced more negative emotions to stress, and their sympathetic nervous system were overactivated, which lead the susceptibility to psychological problems.

Keywords: TCM Constitution, Yang-deficiency, stress, psychological problems

右侧额顶区联合 theta 交流电刺激对空间能力的影响

张大为^{1,2}（通讯作者），Alexandros Moraidis², Torkel Klingberg²

2 瑞典卡罗琳斯卡医学院神经科学系，斯德哥尔摩，17177

摘要 右侧额顶区 theta 脑波的功能连接，是空间工作记忆（Visual-spatial working memory, vsWM）的重要电生理基础。近来研究将经颅交流电刺激（Transcranial alternating current stimulation, tACS）应用于 vsWM 的电生理研究中，一方面该技术有助于建立 vsWM 与该功能连接的因果关系，另一方面该技术为增强个体 vsWM 提供了新思路。已有研究报告右侧额顶区 theta 的 tACS 刺激对 vsWM 的影响，但存在以下未知。1，vsWM 与诸多空间能力相关（如心理旋转，mental rotation，MR），尚且未知观察到的效应是 vsWM 特异性的改变还是空间能力广泛性的改变。2，现有研究未使用高空间精度的交流电刺激，右侧额顶区的刺激同时也会对其他脑区造成影响，因此无法得知实验结果是否完全由右侧额顶区的变化引起。3，从刺激方案的频率属性来讲，理论上有两种方案，即减慢 theta 方案（Slow）和强化个体固有 theta 方案（Tune），尚未有研究比较这两种方案。基于此，本研究招募 20 名成人被试，采用被试内实验设计，每人完成 3 种在线 tACS 条件，即 Slow 条件、Tune 条件、及 Sham 条件。tACS 由 2 组 2×1 电极阵诱发，放置于右侧的额叶及顶叶。在 Slow 中，刺激频率被设定为 4 赫兹且额顶同相位。不同于 Slow，Tune 中使用的频率取决于个体在前测 vsWM 中，theta 频段的额顶功能连接特征。而 Sham，仅在实验开始前后 90 秒内出现 6 赫兹刺激。在每种条件下，被试需要先后完成三个任务：vsWM、MR、数学运算，记录正确率及反应时。在刺激前后，记录每名被试的静息脑电，预处理后使用 phase-locking value 的方法计算额顶区功能连接。相比 Sham，Tune 显著提升了 vsWM ($F(1, 19) = 5.103, p < 0.05, \eta_p^2 = 0.212$) 及 MR ($F(1, 19) = 5.332, p < 0.05, \eta_p^2 = 0.219$) 的成绩，而没有显著改变数学能力。相比之下，Slow 并未显著改变三类任务表现。静息脑电的结果类似，Tune 显著提升了右侧 ($F(1, 19) = 8.045, p < 0.05, \eta_p^2 = 0.297$) 和中侧 ($F(1, 19) = 8.725, p < 0.001, \eta_p^2 = 0.315$) 额顶区的功能连接，而 Slow 没有诱发出显著差异。综上，本研究支持了右侧额顶交流电刺激对 vsWM 的影响。而这种提升可能是基于空间能力的广泛提升，从而支持了 vsWM 与 MR 的共同通路假说。但这种效果仅在刺激频率为个体特有 theta 频率时才可诱发。在此基础上，本研究也为优化 Slow 方案提供了方向。

The effect of right fronto-parietal theta tACS on spatial abilities

Da-Wei Zhang^{1,2} (Corresponding author), Alexandros Moraidis², Torkel Klingberg²

1 Department of Psychology, Yangzhou University, Yangzhou, 225009, dwzhang@yzu.edu.cn

2 Department of Neuroscience, Karolinska Institutet, Stockholm, 17177

Abstract: The right fronto-parietal theta connectivity is an important electrophysiological underlying of visual-spatial working memory(vsWM). Recent studies highlight the use of transcranial alternating current stimulation(tACS) in vsWM research given its potentials in offering casual explanations and a new approach to enhancing vsWM performance. Indeed, research already showed the effects of theta tACS on vsWM; however, existing evidence has the following limitations. Firstly, vsWM is broadly correlated with various spatial abilities (e.g. mental rotation, MR). It is unknown if the observed effect is specific on vsWM or the common spatial ability. Secondly, given that the observed effect was not derived from high-definition tACS, the alleged “right fronto-parietal tACS” in previous studies may also stimulate other brain regions. Thus, it is not clear if the observed effect is entirely attributed to the change of the right fronto-parietal connectivity”. Thirdly, concerning the temporal setting of tACS, there are two approaches to intervening vsWM – slowing down theta oscillations (Slow) and strengthening the individual-specific theta oscillation (Tune). However, the two protocols have not been compared. Hence, the current study recruited 20

adults and adopted a within-subject design. Each participant completed 3 online tACS conditions – Slow, Tune, and Sham. tACS protocols were deployed with 2 sets of 2 by 1 electrodes on right fronto-parietal regions. In Slow, the frequency of tACS was set to 4 Hz, and the fronto-parietal stimulation was in phase. Tune was similar to Slow but the setting that the frequency of Tune depended on the theta connectivity feature demonstrated in a vsWM task before tACS. In contrast, Sham involved the stimulation of 6 Hz only in the first and last 90 seconds. In each condition, participants were guided to complete 3 tasks: vsWM, MR, and arithmetics. Accuracy and response time were recorded. Besides, resting-state electroencephalography (rs-EEG) was recorded immediately before and after each stimulation. After preprocessing, the phase-locking value was calculated to measure fronto-parietal connectivity. Compared to Sham, Tune significantly improved vsWM ($F(1, 19) = 5.103, p < 0.05, \eta_p^2 = 0.212$) and MR ($F(1, 19) = 5.332, p < 0.05, \eta_p^2 = 0.219$) but not arithmetics. Slow did not show any improvements. Similarly, Tune significantly improved right ($F(1, 19) = 8.045, p < 0.05, \eta_p^2 = 0.297$) and middle ($F(1, 19) = 8.725, p < 0.001, \eta_p^2 = 0.315$) fronto-parietal connectivity and Slow did not show such effects. In sum, this study supports the effect of right fronto-parietal tACS on vsWM. However, the effect is not vsWM specific – it may derive from the change on the common spatial ability, which further supports the common mechanism of vsWM and MR. It should be noted that the effect was only elicited by individual-specific frequency, which provides directions for optimizing the Slow protocol.

注意焦点可以预防运动领域的自我损耗吗？

李丹阳¹ 张力为¹（通讯作者）

¹ 北京体育大学心理学院，北京，100084, liweizhang@hotmail.com

摘要 运动员大赛最佳竞技表现的核心是良好的自我控制(张力为, 2013)。自我控制的力量模型提出，自控资源是一种有限的共用资源，一旦使用就会损耗，出现自控能力暂时下降的现象，即产生“自我损耗”(Baumeister et al., 1998; Englert & Bertrams, 2013)。在竞技领域的激烈比赛中，由于运动员必须时刻做到高度自控，因此，如何预防运动员的自我损耗是当前面临的严峻挑战(张力为, 张连成, 2013)。注意焦点干预为预防自我损耗提供了研究思路，该领域研究表明，相比于内部焦点(即个体对自己身体动作的关注，如高尔夫挥杆时的手臂摆动)，外部焦点(即个体对动作产生效果的关注，如高尔夫挥杆时的球杆摆动)可以促进动作执行的自动化，进而可以减少资源消耗，并提升运动表现(Wulf, 2013)。基于上述观点，研究拟采用“双任务”范式考查注意焦点能否预防自我损耗，即在个体完成自我损耗的诱发任务时，实施注意焦点干预，以期减少个体在这一任务上的资源消耗，使其在后续自我损耗的探测任务上具有更充足的资源，从而具有更好的自控表现。实验招募了 34 名运动等级为二级及以上的大学生运动员，采用单因素 3 水平组间实验设计。首先，完成 Operation 手眼协调动作自控任务(Alquist et al., 2020)，在完成该任务时随机接受不同的注意焦点干预：控制组(12 名)为“请又快又好地完成任务”；内部焦点组(10 名)为“务必关注你的手，请又快又好地完成任务”；外部焦点组(12 名)为“务必关注小镊子，请又快又好地完成任务”。然后，完成神经激活逆反应运动自控任务(李丹阳, 张力为, 2020)。结果表明，相比于控制组和内部焦点，外部焦点干预减少了个体在 Operation 任务上的资源消耗，使其在完成神经激活逆反应任务时具有更充足的资源，自我控制表现更好，具体为在该任务的反应时和正确率上表现更佳。研究提示，在运动领域的自我控制任务中，注意焦点可以作为一种经济、有效的干预

手段, 通过促进个体动作执行的自动化, 进而减少自控资源消耗, 从而预防个体在上一任务上的自我损耗, 最终改善其在后续任务上的自我控制表现。

Can Attentional Focus Help to Prevent Ego Depletion in Sports?

Danyang Li, Liwei Zhang

School of Psychology, Beijing Sport University, Beijing 100084

Abstract: The core of athletes' best competitive performance is good self-control (Zhang, 2013). How to improve athletes' self-control ability is an urgent concern of the practitioners of competitive sports. The strength model of self-control proposes that all acts of self-control are dependent on a global energy resource. The capacity of this resource is considered to be limited and can temporarily become depleted after an exertion of self-control (a state referred to as *ego depletion*), meaning that there is less capacity available for subsequent acts of self-control for a certain amount of time afterward, which leads to poorer self-control in secondary tasks in the meantime (Baumeister et al., 1998; Englert & Bertrams, 2013). As athletes must achieve a high degree of self-control at all times in fierce competitive sports, thus how to prevent athletes' ego depletion is a severe challenge currently facing (Zhang & Zhang, 2013). Among the different procedures, the attentional focus is a promising one. Empirical evidence has amassed for the benefits of adopting an external focus on the intended movement effect (e.g., focus on the pendulum-like motion of the golf club) relative to an internal focus on body movements (e.g., focus on the swing of your arms). These findings indicate that an external focus promotes automaticity in movement control, with the consequence that reduced information processing demands and enhanced the effectiveness and efficiency of motor performance (Wulf, 2013). Following the line of arguments, the present study aimed to examine whether the intervention of attentional focus might prevent the effects of ego depletion by applying the dual-task paradigm: attentional focus circumvents the need for self-control in the first task used to induce ego depletion, which makes the individual reserve more sufficient resources to cope the subsequent self-control tasks. Given that, the individual will have better self-control performance in the secondary task. Thirty-four collegiate athletes were randomly assigned to one of the following three groups, which differed only in the way that the Operation task, an attentionally demanding perceptual-motor task requiring hand-eye coordination (Alquist et al., 2020). Participants completed the Operation task in different attentional focuses: control (i.e., please complete the task fast and well; $n = 12$), internal focus (i.e., focus on your hand, please complete the task fast and well; $n = 10$), and external focus (i.e., focus on the tweezer-like device, please complete the task fast and well; $n = 12$). Immediately after completion of the first task, participants were asked to complete the second task, the "nerve activation inverse reaction" task, which requires the individual to inhibit the habitual response in a sport task (Li & Zhang, 2020). Results showed that external focus removed the drain on the self-control resource usually imposed by the Operation task and made individuals possess sufficient resources to perform more quickly and accurately on the subsequent "nerve activation inverse reaction" self-control task, compared with control and internal focus. The present study demonstrates that a brief intervention of attentional focus promotes the automatization of movement execution, reduces the resource demand, so that prevents the effects of ego depletion, and improves self-control performance.

Keywords: attentional focus, movement automatization, ego depletion, self-control

压力对运动任务中定向注意的影响

艾丽欣 张力为 (通讯作者)

北京体育大学心理学院, 北京, 100084, liweizhang@hotmail.com

摘要 注意控制理论认为注意对压力下的运动表现起着非常重要的作用, 但缺少直接证据支持注意是压力与运动表现间的中介变量。定向注意包括早期和晚期两个阶段, 运动领域常见的时间压力和奖惩压力主要影响早期的注意定向阶段还是晚期的注意脱离阶段尚需考查。研究一通过两个实验分别检验时间压力和奖惩压

力对飞镖任务中定向注意的影响,参与者为非飞镖或射击项目运动员。实验1共64名参与者,采用两因素混合设计探讨时间压力对定向注意的影响,结果显示:无论时间压力高低,相对于任务目标,干扰目标引发的注意定向更多,未支持注意控制理论;实验2共40名参与者,采用单因素组内设计,探讨奖惩压力对定向注意的影响,结果显示:无论在何种奖惩压力下,相对于任务目标,干扰目标引发的注意定向更少;只有在奖赏压力下,干扰目标引发的注意脱离更加困难,部分支持了注意控制理论。研究二包含实验3和实验4,分别邀请112和66名非飞镖或射击项目运动员,使用虚拟现实下的射击任务,对研究一的结果进行重复性检验。结果显示:20项因变量指标中,在差异检验的方向上有14项指标的结果得到重复,重复率为70%。对两个研究的结果进行迷你元分析,结果发现:时间压力和奖惩压力对定向注意的影响都体现在注意脱离阶段。具体来说,相较于低时间压力,高时间压力导致对干扰目标的注意脱离更加困难,效果量处于中等水平;对任务目标的注意脱离更快,效果量较大。相较于惩罚压力,奖赏压力能够导致干扰目标引发的注意脱离更慢;奖赏在与惩罚的竞争中占据优势,且效果量较大。综上所述,本研究得出以下结论:高时间压力抑制目标导向的注意系统,激活刺激驱动的注意系统,主要表现在晚期注意脱离阶段,使对任务目标的注意脱离更快,对干扰目标的注意脱离更慢。奖惩压力激活刺激驱动的注意系统,主要表现在晚期注意脱离阶段,使干扰目标引发的注意脱离更加困难,且奖赏目标在与惩罚目标的竞争中占有优势。

Effect of Stress on Orientation of Attention in Sports

Lixin Ai, Liwei Zhang

School of Psychology, Beijing Sport University, Beijing, China

Abstract: Attention often concerned with pressure and performance as a third variable. The causal relationship between these variables, however, is not entirely clear. Whether the negative pressure effect occurs at the early stage of attentional engagement or at the late stage of attentional disengagement needs further explore. We sought to examine the completion cycle between reward and punishment, and how they were moderated the flow from top-down to bottom-up. For study 1, two experiments were organized via a dart-throw task to investigate the effects of time pressure and reward-punishment pressure upon orientation of attention. In experiment 1, a between-within subject design was used to investigate the impact of time pressure on orientation of attention. The findings revealed that the distractors displayed an advantage of attention disengagement over the task target independent of the time constraint. In experiment 2, a two-factor within-subject design was selected to examine the effect of reward-punishment pressure on orientation attention. The findings exposed that the distractors cause more attentional engagement and the length of the distractors under the reward condition was longer. Study 2 was performed using virtual reality to repeat the results of study 1. The outcomes discovered that 14 of the 20 outcomes were replicated in the same direction. The probability of replicated test results was 70%. A mini meta-analysis was done on the results of the two studies. Results showed that the effects of time pressure and reward-punishment pressure on orientation of attention were reflected in the attention disengagement stage. In detail, compared with low time pressure, high time pressure led to more difficult attention disengagement from distractors, the effect size was at a medium level. Compared with punishment pressure, reward pressure can cause attention disengagement from distractors more slowly. Reward has the advantage in the competition with punishment, and the effect size was large. In summary: Time pressure inhibited top-down attention system and activated the bottom-up attention system mainly in the attentional disengagement stage. In detail, the attentional disengagement from targets went faster and the attentional disengagement from distractors went slower. Reward-punishment pressure activated the bottom-up attention system mainly in the attentional disengagement stage. In detail, the attention disengagement from distractors went more difficult and reward targets had an advantage in the competition between punishment targets.

Keywords: Time Pressure, Reward-Punishment Pressure, Orientation of Attention, Mini Meta-analysis

网球运动员运动记忆的表征更新机制

冯琰¹（通讯作者） 倪倩玉²

沈阳体育学院 运动人体科学学院，沈阳，110102，fy241919@qq.com

摘要 目的：众所周知，运动专家具有超强的运动记忆能力，探讨运动员超强运动记忆背后的表征更新机制，可以丰富运动记忆相关的理论与实践内容。方法：采用专家——新手范式，选取 24 名体育学院网球运动员（依据运动水平将其分为专家组和新手组）为实验对象，采用 N-back 实验范式，结合网球比赛图片设置运动实验情境，运用美国 Neuroscan 脑电记录系统对不同水平网球运动员在不同记忆负荷下的运动记忆表征更新的行为和脑神经活动特点进行比较。结果：行为结果显示：在高记忆负荷下，不同水平网球运动员准确率的组别主效应显著（ $F_{(1, 22)}=15.857$ ， $P<0.05$ ， $\eta^2=0.419$ ），专家组的准确率高于新手组；在同等记忆负荷下，不同水平网球运动员反应时的组别主效应显著（ $F_{(1, 22)}=5.303$ ， $P<0.05$ ， $\eta^2=0.194$ ），专家组的反应时短于新手组；ERPs 结果显示：在高记忆负荷下，不同水平网球运动员在特定脑区所诱发的 P3 和 PSW 峰波幅组别主效应显著，专家组波幅明显高于新手组。在同等记忆负荷下，不同水平网球运动员诱发的 P3 和 PSW 峰潜伏期组别主效应显著，新手组潜伏期明显晚于专家组。结论：高水平网球运动员在将新刺激与长时记忆中的动作技能套路相组化过程中，提取长时记忆中已有的相应动作模式较迅速，其可能的神经机制为大脑皮层特定脑区诱发产生的 P3 和 PSW 潜伏期较早；随着任务难度的增加，高水平网球运动员的运动记忆表征更新程度明显增加，用于运动记忆表征更新的心理运算资源更多，其可能的神经机制为大脑皮层特定脑区诱发产生 P3 的脑神经活动水平较高。

Study on the Mechanism of Representation Updating of Tennis Athletes' Motor Memory

Feng Yan¹ (Corresponding author), Ni Qianyu²

Shenyang Sport University, Academy of Sports and Human Sciences, shenyang, 110102

Abstract: Objective: As we know, the athletes possess great motor memory. In this study, we explored the representation updating mechanism of tennis players' great motor memory, in order to enrich the theories and practice of motor memory. Methods: Using the expert novice paradigm, 24 tennis players (divided into expert group and novice group according to their sports level) were selected as the experimental objects. The n-back experimental paradigm was used to set the exercise experimental situation combined with the pictures of tennis matches. The representation of motor memory of tennis players of different levels under different memory loads was updated by using the neuroscan EEG recording system. Behavior and brain nerve activity were compared. Results: The results show that: under the high memory load, the main effect of different levels of tennis players' accuracy rate is significant ($F_{(1, 22)} = 15.857$, $P < 0.05$, $\eta^2 = 0.419$), and the accuracy rate of expert group is higher than that of novice group; under the same memory load, the main effect of different levels of tennis players' response is significant, ($F_{(1, 22)} = 5.303$, $P < 0.05$, $\eta^2 = 0.194$), and that of expert group is significant. The results of ERPs showed that: under high memory load, the main effect of P3 and PSW peak amplitude induced by different levels of tennis players in specific brain regions was significant, and the amplitude of expert group was significantly higher than that of novice group. Under the same memory load, the main effect of P3 and PSW peak latencies induced by different levels of tennis players is significant, and the latency of novice group is significantly later than that of expert group. Conclusion: In the process of organizing the new stimulus with the action skill routine in long-term memory, the high-level tennis players can extract the corresponding action patterns from the long-term memory more quickly. The possible neural mechanism is that the latency of P3 and PSW induced by specific brain regions of cerebral cortex is earlier; With the increase of task difficulty, high-level tennis players' motor memory representation updating degree increased significantly, and more psychological computing resources were used for motor memory representation updating. The possible neural mechanism was that the brain nerve activity of P3 induced by specific brain regions of cerebral cortex was higher.

Key words: tennis player, motor memory, memory load, event-related potential

专项注意训练对羽毛球初学者知觉预测影响及神经机制研究

腾戈思¹（通讯作者） 赵洪朋²

1 沈阳体育学院运动人体科学学院, 沈阳, 110000, 449101041@qq.com

2 沈阳体育学院, 沈阳, 邮编, 110000

摘要 目的: 专项注意训练是通过对注意训练研究范式加以改良, 契合某种运动专项的注意特点, 从而提高从事该运动专项运动员认知能力的训练方式。注意偏向是注意过程中的一种成分, 表现为对特定目标认知加工能力的提升及抑制无关刺激, 研究表明个体的注意偏向特征可以通过训练加以强化和改变。知觉预测是个体利用部分信息或先行信息预测未知事件的一种高级的认知加工过程, 是运动过程中影响运动行为进行及完成的一项重要能力。本研究对羽毛球初学者进行以注意偏向为基础的专项注意训练干预, 验证专项注意训练对羽毛球初学者知觉预测影响, 探索专项注意训练影响知觉预测的神经机制。方法: 以沈阳体育学院羽毛球选修课学生作为实验被试, 共 30 名, 男 18 名, 女 12 名, 分为实验组和对照组。进行实验前测, 通过羽毛球视频及图片材料使其预判赛场信息, 测试其知觉预测反应时与准确率, 同时采取测试过程中的 ERP 数据。对实验组进行为期 4 周的专项注意训练, 训练范式为采取改良的点探测任务范式, 对照组不进行任何干预。训练周期结束后, 对两组被试进行实验后测, 再次测试其知觉预测的行为及神经机制特征。通过对比实验前后测的数据, 判断专项注意训练对个体知觉预测的影响及神经机制。结果: 行为方面: 前测两组被试知觉预测任务反应时及正确率无显著性差异, 后测实验组知觉预测任务反应时及正确率显著优于对照组; 实验组后测知觉预测任务反应时及正确率均显著优于前测, 对照组前后测无显著性差异。] ERP 方面: 前测两组被试 ERP 数据无显著性差异, 后测实验组 P1、N2 及 P3 波幅及潜伏期显著小于对照组; 实验组后测 N2 及 P3 波幅与潜伏期显著小于前测, 对照组前后测 ERP 数据无显著性差异。结论: 1) 专项注意训练可以提高个体对专项刺激物的认知加工程度, 从而使其知觉预测过程判断时间更短, 正确率更高。2) 知觉预测过程受到前额叶及顶叶的多重调控; 专项注意训练提高个体相关脑区活动水平, 表现为消耗更少的资源, 在预测目标时更容易。

Research on the Influence of Special Attention Training on Perception Prediction of Badminton Beginners and Its Neural Mechanism

Gesi Teng, Hongpeng Zhao

Shenyang Sports University, Shenyang, 110000

Abstract: Purpose: Special attention training is improving the research paradigm of attention training to fit the attentional characteristics of a sport, finally improve the cognitive ability of athletes engaged in this sport. Attentional bias is a component in the attention process, performed by the improvement of cognitive processing ability for specific targets and suppression of irrelevant stimuli. Research shows that the characteristics of human attention bias can be strengthened and changed through training. Perceptual prediction is an advanced cognitive processing process in which people use partial information to predict unknown events. It is an important ability for people to complete sports training. In this study, the badminton beginners were trained with attentional bias, verify the influence of special attention training on the perception prediction of badminton beginners, explore the neural mechanism of special attention training affecting perception prediction. Method: Take 30 badminton beginners as experimental subjects, 18 males and 12 females, divided into experimental group and control group. Pre-test using the perceptual prediction task to test the response time and correct rate of the two groups, at the same time take the ERP data during the test. Conduct special attention training for the experimental group for 4 weeks, the training paradigm is to adopt an improved point detection task paradigm, no intervention in the control group. After the training period is over, post-test the two groups. Test the behavior and neural mechanism characteristics of its perceptual prediction. By comparing the data measured before and after the experiment, judge the influence of special attention training on individual perception prediction and the neural mechanism. Result: In terms of behavior, there is no significant

difference in the response time and accuracy of the two groups of perception prediction tasks in the pre-test, in the post-test experimental group's perceptual prediction task response time and accuracy rate were significantly better than those of the control group. The post-test perception of the experimental group predicts the task response time and accuracy rate significantly better than the pre-test, no significant difference measured in the control group. In terms of ERP, there is no significant difference in the ERP data of the two groups in the previous test, the amplitude and latency of P1, N2, and P3 of the experimental group after the test were significantly smaller than those of the control group. The amplitude and latency of the post-test N2 and P3 of the experimental group were significantly smaller than those of the pre-test, no change in the control group. Conclusion: 1) Special attention training can improve the individual's cognitive processing degree of the special target stimulus, so that the judgment time of the perceptual prediction process is shorter and the accuracy rate is higher. 2) The process of perception prediction is regulated by multiple frontal and parietal lobes; Special attention training improves the activity level of the individual's relevant brain regions, which is manifested as consuming less resources and making it easier to predict goals.

1 School of Psychology, Beijing Sport University, Beijing, 100084, btzy1973@126.com.

2 Institutes of Psychological Sciences, Hangzhou Normal University, Hangzhou, 311121,
lijie.psy@hznu.edu.cn.

Abstract : Objects: Perceptual cognitive expertise refers to the ability of performers to identify and process (environmental) information for integration with existing knowledge to facilitate the selection of appropriate responses under time pressure. Soccer referees are required to make a large number of decisions quickly and there is a great demand for perceptual cognitive expertise in soccer referees. Existing studies and reviews lack an overview of the perceptual cognitive expertise of referees, so this paper provides a systematic review of the factors influencing the perceptual cognitive processes, perceptual cognitive skills and training of soccer referees. Method: Using the systematic review method, the four databases "EBSCO", "Web of Science", "ScienceDirect", "China National Knowledge Infrastructure" and related references were searched for the keywords "soccer/football referee" + "perceptual cognition/ perception/perceptual cognitive", 594 articles were further screened and 40 pieces of literature were included in the analysis. Results: (1) Factors affecting perceptual cognitive processes can be divided into internal and external factors. The results of internal factors suggest that the number of years of refereeing and the number of hours of training per week can have an impact on perceptual cognitive processes. Researches on external factors have shown that: the distance and angle of the referee from the player alter his depth perception and visual perception; referees' on-field running speed can have an impact; and slow-motion replay of match video will improve the referee's sensitivity to fouls. (2) Perceptual cognitive skills consist mainly of recognition and recall capacity, anticipation and decision-making. Increased expertise and training can improve recognition and recall capacity; causal perception affects the referee's anticipation; the flash lag effect is a major cause of offside decision errors, and expertise and perceptual cognitive training can counter its adverse consequences. (3) At present, video simulation training and computer animation training are the two main training methods for perceptual cognition, which improve the correct rate of referee recognition and decision making. In recent years, blurred environments and virtual reality have also been used as training methods to improve the perceptual cognition of soccer referees. Prospects: (1) Researchers have focused more on the subject of assistant referees and less on head referees, and subsequent research on head referees could be added. (2) Perceptual cognitive skills lack its own domain-specific research paradigm, and existing researches have mostly used generic measuring methods. In the future, research paradigms with domain characteristics can be developed. (3) The field of perceptual cognitive skills is still controversial, such as the mechanism of causal perception on anticipation, and needs to be further investigated with a larger scale of participants and different research paradigms. (4) Perceptual cognitive training tools are still in their infancy, and subsequent research can provide a deeper exploration of training methods and the neural mechanisms affected by training.

羽毛球大学生运动员运动决策优势特征及神经机制研究

熊强¹ 冯琰² (通讯作者)

1 闽南师范大学, 漳州, 363000

2 沈阳体育学院运动人体科学学院, 沈阳, 110102, fy241919@qq.com

摘 要 羽毛球是一项动作精细、技战术灵活多变、开放性的竞技项目, 具有球速快、出手动作一致性高等特点。羽毛球运动员要在极短的时间内对来球作出迅速、准确的反应和决策, 必须具备高效率的运动决策能力。Singer (1980) 将运动决策分为预期过程和动作选择过程。因此, 本研究以运动认知加工过程为主线, 对

不同羽毛球水平大学生在运动决策的动作选择反应阶段的行为、眼动和脑神经活动特点进行研究, 比较不同水平羽毛球大学生运动员之间存在的加工差异的基础上, 揭示较高水平的羽毛球大学生运动员的动作选择反应优势的行为、认知特征及其可能的神经机制, 为今后羽毛球教学和训练的科学化提供理论依据。本研究采用专家—新手的研究范式, 运用眼动记录法和事件相关电位(ERP)记录法相结合技术, 对不同羽毛球水平大学生判断回击球类型的行为、眼动和脑神经活动进行同步记录。实验对象为24名体育院校羽毛球运动员, 根据运动水平的不同, 将其分为专家组和经验组。专家组为羽毛球院队队员12名, 平均年龄 24.8 ± 2.3 岁, 平均训练年限 6.8 ± 1.7 年, 运动等级为二级; 经验组为羽毛球专修大学生12名, 平均年龄 20.2 ± 1.1 岁, 平均训练年限 1 ± 0.3 年, 无运动等级但具备一定的羽毛球基础。研究采用 2 (运动水平) $\times 2$ (信息量)的混合实验设计。自变量运动水平为组间变量, 包括专家组和经验组两个水平; 自变量信息量为组内变量, 包括两个不同时间点的信息量, 分别为对方球员击球后四帧(160ms)--低信息量, 对方球员击球后七帧(280ms)--高信息量。因变量为行为指标(反应时, 准确率), 眼动指标(注视点呈现时间、注视数目、眼跳距离)和脑电指标(ERPs的峰潜伏期、峰波幅和平均波幅)。结论: 1、羽毛球大学生运动员在判断后场回击球类型的动作选择反应阶段, 具有准确性高的行为优势, 羽毛球专修大学生呈现的快速反应则是以“牺牲”准确率为代价的。2、羽毛球大学生运动员在判断回击球类型的动作选择反应阶段, 相同时间遮蔽条件下, 羽毛球大学生运动员具有准确率高, 搜索信息速度快的优势; 其可能的神经机制为大脑皮层相应脑区N1激活程度高、时间晚, P2脑神经活动水平低, P3激活程度低; 诱发产生的PSW兴奋性水平高; 说明专家组运动员的动用的心理资源少, 注意集中程度高。

Study on the Characteristics and Neural Mechanism of Sports Decision-making Advantage of Badminton College Athletes

1 Minnan Normal University, Zhangzhou, 363000

2 Shenyang Sport University, College of sports and Human Sciences, Shenyang, 110102,
fy241919@qq.com

Abstract: Badminton is a competitive event with fine movements, flexible techniques and tactics and openness. It has the characteristics of fast ball speed and high consistency of hand movements. Badminton players must have high-efficiency sports decision-making ability if they want to make rapid and accurate response and decision-making to the incoming ball in a very short time. Singer (1980) divided motion decision-making into expectation process and action selection process. Therefore, taking the process of sports cognitive processing as the main line, this study studies the characteristics of behavior, eye movement and brain nerve activity of college students with different levels of badminton in the action selection response stage of sports decision-making, and compares the processing differences between College Badminton Athletes with different levels. This paper reveals the behavioral, cognitive characteristics and possible neural mechanism of action choice response advantage of high-level badminton college athletes, so as to provide a theoretical basis for the scientific badminton teaching and training in the future. Using the expert novice research paradigm and the combination of eye movement recording method and event-related potential (ERP) recording method, this study synchronously recorded the behavior, eye movement and brain nerve activities of college students with different badminton levels in judging the type of return stroke. The subjects were 24 badminton players in physical education colleges. According to their sports level, they were divided into expert group and experience group. The expert group consists of 12 badminton team members, with an average age of 24.8 ± 2.3 years, an average training period of 6.8 ± 1.7 years and a sports grade of grade II; The experience group consists of 12 badminton majors, with an average age of 20.2 ± 1.1 years, an average training period of 1 ± 0.3 years, no sports level, but with a certain badminton foundation. The study adopts a mixed experimental design of 2 (exercise level) $\times 2$ (amount of information). The independent variable movement level is an inter group variable, including expert group and experience group; The independent variable information quantity is an intra group variable, including the information quantity at two different time points, which are four frames (160ms) - low information quantity after the

opponent's player hits the ball, and seven frames (280ms) - high information quantity after the opponent's player hits the ball. The dependent variables were behavioral indicators (reaction time, accuracy), eye movement indicators (fixation time, fixation number, saccade distance) and EEG indicators (peak latency, peak amplitude and average amplitude of ERPs). Conclusion: 1. Badminton college athletes have the advantage of high accuracy in the action selection reaction stage of judging the type of backcourt return stroke. The rapid response of badminton college students is at the expense of "sacrificing" accuracy. 2. Badminton college athletes have the advantages of high accuracy and fast search information under the same time shielding condition; The possible neural mechanism is that the activation degree of N1 in the corresponding brain area of cerebral cortex is high and the time is late, the activity level of P2 brain nerve is low and the activation degree of P3 is low; Induced PSW had a high level of excitability; It shows that the athletes of the expert group use less psychological resources and pay high attention to concentration.

摘要 目的：研究累积生态风险对大学生运动拖延的影响，探究锻炼自我效能感的中介作用和主观锻炼体验的调节效应。方法：课题组以分层整群抽样的方式从江西共青大学城五所高校选取 903 名大学生为被试对象，通过问卷调查法获取累积生态风险、锻炼自我效能感、主观锻炼体验和运动拖延的相关数据。结果：大学生累积生态风险、锻炼自我效能感、主观锻炼体验与运动拖延得分在性别上存在显著差异。其中，男生锻炼自我效能感和主观锻炼体验得分显著高于女生，而女生累积生态风险与运动拖延得分相对较高。相关分析结果显示，大学生累积生态风险与锻炼自我效能感、主观锻炼体验之间存在显著负相关；累积生态风险与运动拖延之间存在显著正相关。本文在控制大学生性别、年级的情况下，将累积生态风险、锻炼自我效能感、主观锻炼体验、运动拖延进行中心化处理。中介效应表明，大学生累积生态风险、锻炼效能感和运动拖延构建的结构方程模型适配度很高且各路径系数显著，在“累积生态风险→锻炼自我效能感→运动拖延”路径中，间接效应 Bootstrap95%置信区间为[-0.154,-0.048]；直接效应置信区间是[-0.335,-0.118]，两种效应都不包括 0，表明锻炼自我效能感在累积生态风险影响运动拖延的路径中有中介效应。调节效应显示，累积生态风险与主观锻炼体验的交互作用对锻炼自我效能感和运动拖延影响的 R²变化量显著。结论：锻炼自我效能感在累积生态风险影响运动拖延的路径中存在中介效应。主观锻炼体验调节了累积生态风险到大学生运动拖延的路径和中介效应的前半段路径。

Abstract: Objective: To study the effect of cumulative ecological risk on college students' exercise delay, and to explore the mediating effect of exercise self-efficacy and the moderating effect of subjective exercise experience. Method: The research group selected 903 college students from five universities in Jiangxi Gongqing University Town in a stratified cluster sampling method to obtain cumulative ecological risks, exercise self-efficacy, subjective exercise experience, and exercise procrastination through questionnaire surveys. related data. Results: There are significant differences in the gender of college students' accumulated ecological risk, exercise self-efficacy, subjective exercise experience and sports procrastination scores. Among them, boys' exercise self-efficacy, and subjective exercise experience scores were significantly higher than girls' scores, while girls' cumulative ecological risk, exercise procrastination was relatively high. Correlation analysis results show that there is a significant negative correlation between accumulated ecological risk and exercise self-efficacy and subjective exercise experience among college students; there is a significant positive correlation between accumulated ecological risk and exercise procrastination. Under the condition of controlling the gender and grade of college students, this paper will centralize the treatment of accumulated ecological risk, exercise self-efficacy, subjective exercise experience, and exercise delay. The mediating effect shows that the structural equation model constructed by college students' cumulative ecological risk, exercise efficacy, and exercise procrastination has a high degree of adaptability and significant path coefficients. In the path of "cumulative ecological risk→exercise, self-efficacy→exercise procrastination", there is an indirect effect Bootstrap 95% confidence interval is [-0.154, -0.048]; the direct effect confidence interval is [-0.335, -0.118], both effects do not include 0, indicating that exercise self-efficacy is in the path of cumulative ecological risk affecting sports procrastination Mediation effect. The moderating effect shows that the interaction of cumulative ecological risk and subjective exercise experience has a significant change in R^2 that affects exercise self-efficacy and exercise procrastination. Conclusion: Exercise self-efficacy has a mediating effect in the path of cumulative ecological risk affecting exercise procrastination. Subjective exercise experience regulates the path from accumulated ecological risk to the delay of college students' exercise and the first half of the path of mediation effect.

累积生态风险对大学生运动拖延的影响： 自我控制的中介效应和锻炼氛围的调节效应

董亚琦^{1,2} 陈伟琴² 杜年宙¹ 彭益秀¹ 方梅¹

1. 共青城市中学，江西九江，332020

2. 江西师范大学体育学院，江西南昌，330022, 1052583225@qq.com

摘要 目的：大学生运动拖延与个体所处的生态背景密切相关，受家庭、学校、同伴和个体风险等累积因素的影响。本文旨在研究累积生态风险对大学生运动拖延的影响，验证自我控制的中介作用与锻炼氛围的调节效应，以期为高校体育课程改革，助力大学生形成健康生活方式提供理论参考。方法：本文采用文献资料法、逻辑分析法和数理统计法研究以分层整群随机抽样的方式从江西共青大学城五所高校选取 903 名大学生为被试对象，采用累积生态风险量表、自我控制量表、锻炼氛围量表和运动拖延量表收集相关数据。结果：大学生累积生态风险、自我控制、锻炼氛围与运动拖延得分在性别上存在显著差异。其中，男生自我控制和

锻炼氛围得分显著高于女生，而女生累积生态风险和运动拖延得分相对较高。大学生累积生态风险对运动拖延有正向预测作用 ($R^2=0.379$, $F=183.120$, $\beta=0.612$, $P=0.000$)；也可以显著负向预测自我控制水平 ($R^2=0.117$, $F=39.807$, $\beta=-0.342$, $P=0.000$)；当大学生累积生态风险和自我控制同时进入回归方程后预测运动拖延，路径系数具有统计学意义 ($R^2=0.456$, $F=136.616$, $\beta=-0.066$, $P=0.026$)，自我控制介入回归模型之后，大学生累积生态风险对运动拖延的解释力明显提高，而路径系数明显降低 ($\beta=0.598$)，说明自我控制在大学生累积生态风险和运动拖延之间起部分中介效应。调节效应显示，累积生态风险与锻炼氛围的交互作用对大学生自我控制影响的 R^2 变化量显著 ($P=0.014$)，说明锻炼氛围调节了累积生态风险与大学生自我控制的路径。结论：自我控制是累积生态风险因素影响运动拖延的一个中介变量，锻炼氛围调节了累积生态风险因素到大学生自我控制的路径。

The influence of accumulated ecological risk on the procrastination of college students: the mediating effect of self-control and the moderating effect of exercise atmosphere

Yaqi Dong^{1,2}, Weiqin Chen², Nianzhou Du¹, Yixiu Peng¹, Mei Fang¹

1. Gongqing City Middle School; Jiujiang, Jiangxi 332020

2. School of Physical Education, Jiangxi Normal University, Nanchang 330022

Abstract: Purpose: University student movement procrastination is closely related to the individual's ecological background, and is affected by cumulative factors such as family, school, peers and individual risks. This article aims to study the impact of cumulative ecological risks on college students' sports delays, verify the mediating effect of self-control and the regulating effect of exercise atmosphere, in order to provide theoretical references for the reform of college physical education curriculum and help college students to form a healthy lifestyle. Method: This article uses the method of literature data, logical analysis and mathematical statistics to select 903 college students from five universities in the Gongqing University Town of Jiangxi Province in a stratified cluster random sampling method, and adopts the cumulative ecological risk scale, self The control scale, exercise atmosphere scale and exercise procrastination scale collect relevant data. Results: There are significant differences in the gender of college students' accumulated ecological risk, self-control, exercise atmosphere and sports procrastination scores. Among them, boys' self-control and exercise atmosphere scores were significantly higher than girls' scores, while girls' cumulative ecological risk, sports procrastination was relatively high. The cumulative ecological risk of college students has a positive predictive effect on sports procrastination ($R^2=0.379$, $F=183.120$, $\beta=0.612$, $P=0.000$); it can also significantly negatively predict the level of self-control ($R^2=0.117$, $F=39.807$, $\beta=-0.342$, $P=0.000$); when college students' cumulative ecological risk and self-control enter the regression equation at the same time, they predict movement delay, and the path coefficient is statistically significant ($R^2=0.456$, $F=136.616$, $\beta=-0.066$, $P=0.026$) After self-control is involved in the regression model, the explanatory power of college students' cumulative ecological risk to exercise procrastination is significantly improved, while the path coefficient is significantly increased ($\beta=0.598$), indicating that self-control has a partial mediating effect between college students' cumulative ecological risk and exercise procrastination. The moderating effect shows that the interaction between cumulative ecological risk and exercise atmosphere has a significant change in R^2 ($P=0.014$), which indicates that the exercise atmosphere regulates the path of cumulative ecological risk and college students' self-control. Conclusion: Self-control is an intermediary variable of cumulative ecological risk factors affecting sports procrastination, and the exercise atmosphere regulates the path from cumulative ecological risk factors to college students' self-control.

预期到现实的转变：安慰剂效应提升锻炼的情感反应

仇悦¹ 毛志雄¹（通讯作者） 员东婷¹

¹ 北京体育大学心理学院，北京，100084

摘要 研究背景：锻炼的情感反应在个体变异性上受预期强度和方向的调节，如个体相信锻炼能/不能带来情感效益。鉴于此，研究者会尽量排除预期对锻炼实际效果带来的混淆效应，即安慰剂效应。但从促进锻炼效益最大化的角度考量，合理利用安慰剂提升情感效益确是另一种明智选择。如利用心理因素，采用言语指导的预期操纵范式向个体传达“锻炼非常有效”的信息，以此种效能信息作为安慰剂。然而关于安慰剂的干预内容，以往研究一般采用结果预期(锻炼会增加活力感)，自我效能感预期(你有出色的运动能力)或物品效能预期(佩戴磁手环能增加运动效益)的干预内容。但目前研究中未同时对比这三种预期内容何者更优。研究目的：探讨不同安慰剂干预类型对运动中(主观报告)以及心率变异性(客观指标)的影响，旨在探讨何种安慰剂干预类型效果最佳。研究方法：在一次急性 30min 有氧跑步前，三组安慰剂干预组分别观看相应的预期启动材料，控制组观看中性材料。在运动前，运动期间每隔 5min，运动后对情感反应进行测量。研究结果：在运动后情感反应上，结果预期组和自我效能感预期组比控制组感受到更多愉悦感；结果预期组比自我效能感预期组和控制组感受到更高的活力感；结果预期组紧张感低于控制组。对比编码分析(contrast-coded analysis)，将安慰剂组(结果预期组、自我效能感预期组、物品效能组)和控制组分别编码为(-1, -1, -1, +3)，结果表明 3 组安慰剂干预组在运动后愉悦感和活力感上高于控制组。然而在运动中愉悦感和运动后心率变异性上，安慰剂干预组和控制组无差异。研究结论：安慰剂效应因预期干预的具体内容而异，结果预期组对运动后情感反应的提升作用较稳健。这可能是因为结果预期的本质更能增加因果透明性，进而帮助个体建立锻炼与结果收益间的连接，进而增加个人控制感，带来放大的安慰剂效应。此外，相比客观指标，安慰剂效应对主观报告指标更为敏感。

关键词 预期；安慰剂效应；锻炼的情感反应

Expectation to Reality:

The add-on Placebo Effect Augment Affective Response to Exercise

QIU Yue, MAO Zhixiong, YUN Dongting

Beijing Sport University, Beijing, 100084, China

Abstract: Background: Numerous studies have extensively investigated the positive effects of acute and long-term exercise on affective response. The specific direction and magnitude of these responses can vary from individual to individual, depending on the expectation of the exercise. For example, individuals believe that exercise can/cannot bring emotional benefits. So, researchers try to rule out the confounding effect on the actual effect of exercise, known as the placebo effect. However, it is a wise choice for researchers to correctly use the placebo effect to produce additional exercise benefits. Research on the “add-on placebo effect” has focused on experimentally manipulating expectations and on adopting a paradigm of verbal instructions to convey a positive message (e.g., the exercise you will perform often results in a good mood). However, as for the specific placebo intervention, previous studies generally used outcome expectation (exercise will increase the sense of vitality), self-efficacy expectation (you have excellent athletic ability) or product utility expectation (wearing a magnetic bracelet can increase the exercise benefit). However, most studies did not simultaneously compare the three expected content which is better. The current study has investigated the effects of different types of placebo intervention on affective responses (subjective reports) and heart rate variability (objective indicators) during and after exercise, and to determine which type of placebo intervention has the best effect. Method: Before an acute 30-minute running, the three placebo groups were shown the corresponding expectation priming material, while the control group was shown the neutral material. Affective responses were measured before exercise, every 5 minutes during exercise, and after exercise. Results: Outcome expectation group and the self-efficacy expectation group felt more enjoyment than the control group. Outcome expectation group felt higher vigor than the self-efficacy expectation group and the control group. The outcome

expectation group had less tension than the control group. In contrast coding analysis, the three-placebo group and control group were coded as -1, -1, -1, +3, respectively. The results showed that the placebo intervention group had higher enjoyment and vigor after exercise than the control group. However, there was no difference in enjoyment during exercise and heart rate variability after exercise. Conclusions: The placebo effect varied with the specific content of the placebo intervention, and the outcome expected group on the improvement of affective response after exercise was more robust. This may be because the nature of outcome expectation increases causal transparency, which in turn helps individuals establish a connection between exercise and outcome benefits, and increases the individual's sense of control and amplifying the placebo effect. In addition, compared to objective indicators. The placebo effect was more sensitive to subjective reporting measures.

Keywords: placebo effect; expectation: affective response to exercise

不同信息表征方式对慢性病风险感知及锻炼意向的影响

张成岳¹ 朱昭红² (通讯作者)

1 西安体育学院研究生院, 西安, 710068

2 西安体育学院运动与健康科学学院, 西安, 710068, 1432909389@qq.com

摘要 身体活动不足导致慢性病高发, 适度锻炼可有效降低慢性病发病率, 但我国居民身体活动水平偏低, 因此有必要采取措施提升人们的身体活动水平。研究表明风险感知可提升锻炼意向, 而信息表征会影响风险感知, 信息表征是信息在现实中的呈现方式, 如图片、文字、表格、语音等不同表征方式。表征方式不同, 风险感知亦存在差异。以往研究表明, 图形和表格呈现的信息能引发人们更强烈的风险感知和行为改变意向。通过改变信息呈现方式影响人们的风险感知及行为已经在多个领域取得成果, 如疫苗接种、戒烟、戒酒等, 然而还未发现关于信息表征对慢性病风险感知及锻炼意向的研究。本研究以 180 名大学生为被试, 采用单因素被试间实验设计, 向被试分发内容完全相同、表征方式不同(图形、文字、表格)的实验材料(实验材料改编自 2017 年国家体育总局颁布的《全民健身指南》), 旨在探讨不同信息表征方式(图形、文字、表格)对慢性病风险感知及锻炼意向的影响。结果发现, (1) 不同信息表征方式对慢性病风险感知的影响存在显著差异($F=5.12, p<0.01, \eta_p^2=0.06$), 相比于图形表征, 表格和文字表征的健康信息能引发人们更强烈的慢性病风险感知, 但表格和文字之间的差异不显著; (2) 不同信息表征方式对锻炼意向的影响没有显著差异; (3) 风险感知对锻炼意向有预测作用($R^2=0.03, p<0.05$)。本研究首次在锻炼行为领域进行了信息表征的研究, 发现不同信息表征会影响人们对慢性病的风险感知, 表格和文字表征的效果更好, 这不仅拓展了信息表征的研究领域, 还为政府机构进行宣传教育提供依据。

Effect of different information representation methods on chronic disease risk perception and exercise intention

Zhang Chengyue¹, Zhu Zhaohong²

Xi'an Physical Education University, 1 Graduate School, 2 School of Exercise and Health Sciences, Xi'an 710068, China

Abstract: Lack of physical activity leads to high incidence of chronic diseases. Moderate exercise can effectively reduce the incidence rate of chronic diseases, but the living level of our residents is low. Therefore, it is necessary to take measures to improve people's physical activity level. Research shows that risk perception can improve exercise intention, and information representation can affect risk perception. Information representation is the format of information, such as pictures, words, tables, voice and other different representation methods. There are differences in risk perception with different representations. Previous studies have shown that information presented by graphs and tables can trigger people's stronger risk perception and behavior change intention. The effect of information representation on people's risk perception and behavior has been achieved in many fields, such as vaccination,

smoking cessation, alcohol abstinence and so on. However, there is no research on the effect of information representation on risk perception and exercise behavior. In this study, 180 college students were selected as subjects, and a single factor inter subject experiment design was adopted. The experimental material with the same content and different representation methods (graphics, text, tables) were distributed to the subjects. The purpose of this study was to explore the effect of different information representation methods (graphics, text, tables) on the risk perception of chronic diseases and exercise intention. The results showed that: (1) there were significant differences in the effects of different information representation methods on the risk perception of chronic diseases ($F = 5.12$, $p < 0.01$, $\eta_p^2 = 0.06$), Compared with graphic representation, the health information represented by table and text can induce people's stronger perception of chronic disease risk, but the difference between table and text is not significant. (2) There was no significant difference in the effect of different information representation on exercise intention. (3) Risk perception had a predictive effect on exercise intention ($R^2 = 0.03$, $p < 0.05$). This study is the first time to study the information representation in the field of exercise behavior. It is found that different information representations will affect people's risk perception of chronic diseases, and the effect of form and text representation is better. This not only expands the research field of information representation, but also provides the basis for government agencies to carry out publicity.

Keywords: information representation, risk perception, exercise behavior

基于自我决定理论的成年人锻炼动机潜剖面分析

郭璐 毛志雄（通讯作者）

北京体育大学心理学院，北京，100084

摘要 本研究基于自我决定理论，探索成年人锻炼的动机剖面，以及动机剖面与锻炼阶段及锻炼行为的关系。方法：采用横断调查设计，共 618 名参与者完成了线上调查(男 250 人，女 366 人，缺失 2 人)，平均年龄为 49.38 ± 7.16 岁。通过《锻炼行为调节问卷—BREQ3》和《锻炼变化阶段量表》测量了参与者的锻炼动机(无动机、外部调节、内摄调节、认同调节、整合调节及内部动机)和锻炼阶段(前意向、意向、准备、行动及保持阶段)，采用《戈丁休闲时间身体活动问卷(LTPA)》测量了行动及保持阶段参与者的中到大强度身体活动量。数据处理采用潜剖面图分析(latent profile analysis, LPA)探索成年人锻炼的动机剖面；采用卡方独立性检验探索动机剖面与锻炼阶段的关系，采用贝叶斯单因素方差分析检验在行动和保持阶段，不同动机剖面人群中到大强度身体活动量的差异。结果：1) 识别出由不同动机组合形成的 4 个成年人锻炼动机剖面，分别为：低控制高自主，中等控制及自主，无动机，及高控制高自主动机剖面；2) 动机剖面与锻炼阶段相关显著($\chi^2(12) = 145.40$, $sig. < .001$)，在低控制高自主和高控制高自主人群中，锻炼保持阶段的比例最高(分别为 65.82%和 65.43%)；在中等控制及自主人群中，50.9%的个体处于行动或保持阶段；而 35.5%的无动机人群处于前意向阶段。3) 在行动和保持阶段，不同动机剖面人群的中到大强度身体活动量存在差异($BF_{10} = 1722.24$)，低控制高自主和高控制高自主动机剖面的中到大强度身体活动量高于中等控制及自主和无动机剖面。结论：1) 不同类型的动机构成了 4 种成年人锻炼的动机模式；2) 自主动机有利于锻炼坚持及更多的锻炼行为；3) 在自主动机高时，控制动机未对锻炼坚持和锻炼行为产生负面影响。

关键词 锻炼动机剖面，自主动机，控制动机，锻炼阶段，锻炼行为

Latent Profile Analysis of Adults' Exercise Motivation Based on Self-Determination Theory

Guo Lu, Mao Zhi-Xiong

School of Psychology, Beijing Sport University, Beijing 100084

Abstract: Objectives: This research aimed to identify motivational profiles for exercise, using Self-Determination Theory as theoretical framework among a sample of adults of China; and to explore the relationships between motivational profiles and exercise stage and moderate to vigorous PA behavior. Method: A cross sectional survey was

used. 618 Chinese adults (age = 49.38 ± 7.16 years, ages 39–70; $n_{\text{male}} = 250$, $n_{\text{female}} = 366$, 2 missed) completed the online multidimensional measure of motivation for exercise by the *Behavioural Regulation in Exercise Questionnaire* (BREQ3). The stage of exercise was measured by one item scale named *Stages of Change Questionnaire*. *Godin Leisure Time Physical Activity Questionnaire* was filled by participants in action and maintenance stages to measure their moderate to vigorous physical activity behavior. Latent profile analysis was conducted by R Language to identify motivational profiles for exercise. Chi-square test of independence and Bayesian ANOVA were used to test relationships between motivational profiles and stages of exercise and MVPA respectively. Results: 1) A solution with four motivational profiles was favored by results. Profile 1 combined strong autonomous motivations and weak controlled motivations and amotivation; profile 2 combined all motivations on average; profile 3 was characterized by both low autonomous and controlled motivations except average amotivation; and the last profile combined both high controlled and autonomous motivations. 2) There was significant relationship between motivational profiles and stages of exercise ($\chi^2(12) = 145.40$, $\text{sig.} < .001$). Among profile 1 and 4 groups, the proportion of the maintenance stage were the highest (65.82% and 65.43%, respectively); among adults in profile 2, 50.9% of individuals were in the action or maintenance stages; and 35.5% amotivated adults were in the precontemplation stage. 3) The Bayesian Factor was 1722.24 supporting the credible differences of MVPA across different motivational profiles. Adults in profiles 1 and 4 had more MVPA than adults in profiles 2 and 3. Conclusions: 1) Adults' motivations for exercise can be described in 4 profiles which are made up of multiple and simultaneous types of motivation. 2) More autonomous motivation profiles may be central to long term exercise engagement. 3) Controlled motivation may not have negative influence on exercise engagement when people have high autonomous motivations.

Keywords: exercise motivational profiles, autonomous motivation, controlled motivation, exercise stage, exercise behavior

大学生身体活动意向与行为的关系：有调节的中介模型

朱良昊¹ 杨嘉² 韩斌¹（通讯作者）

1 中南民族大学体育学院，武汉，430074, zlhzhupipi@163.com

2 湖南大学体育学院，长沙，410079

摘要 目的：以计划行为理论（TPB）为基础框架，构建一个有调节的中介模型，重点考察行动计划的中介和调节作用及习惯强度的调节作用。方法：以 634 名在校大学生为被试，采用问卷调查法完成对《TPB 量表》、《身体活动等级量表 PARS-3》、《行动计划量表》和《自我报告习惯指数 SRHI》的测量，运用结构方程模型（SEM）进行假设模型检验。结果：（1）行动计划和习惯强度的纳入，将 TPB 模型对身体活动的解释力从 31.2%提升至 49.3%。（2）多群组分析显示，预测模型具有跨性别和跨低、中、高身体活动水平的测量不变性。（3）主观规范、感知行为控制与习惯强度对行为意向的直接正向预测作用具有统计学意义（ $P < 0.01$ ），其中感知行为控制的预测效应值最大；行动计划与习惯强度对身体活动的直接预测作用具有统计学意义（ $P < 0.01$ ），其中习惯强度的预测效应值最大。（4）行为意向对身体活动的直接预测作用受行动计划、习惯强度的调节；行动计划在行为意向与身体活动间起部分中介作用，且中介过程的后半路径受习惯强度的调节。结论：将行动计划、习惯强度作为弥合身体活动意向与行为间鸿沟的“第三变量”，有助于解释和预测意向-行为转化的复杂作用机制，可作为大学生身体活动行为干预的理论依据。建议：学校和社会通过完善体育场地设施，开放更多的公共体育资源，来削弱大学生进行身体活动所面临的阻碍；学校体育教师和社会体育从业者主动引导大学生制定符合自身情况的身体活动计划，推动他们从“有意向”到“有行动”的落实；家庭和学校应继续加强终身体育观念的灌输，培养大学生形成定期参与身体活动的生活习惯。

The relationship between physical activity intention and behavior of college students: a moderated mediation model

ZHU Liang-hao¹, YANG Jia², HAN Bin¹

1 School of P. E., South-central University for Nationalities, Wuhan 430074, Hubei China

2 School of P. E., Hunan University, Changsha 410079, Hunan China

Abstract: Objective: Based on the theory of planned behavior (TPB), a moderated mediation model is constructed, focusing on the mediation and moderation effect of action planning and the moderation effect of habit strength. Methods: Taking 634 college students as Participants, using questionnaire survey method to complete the measurement of "TPB Scale", "Physical Activity Rating Scale, PARS-3", "Action Planning Scale" and "the Self-Report Habit Index, SRHI", Hypothesis model testing is carried out by structural equation modeling (SEM). Results: (1) The inclusion of action planning and habit strength increased the explanatory power of the TPB model for physical activity from 31.2% to 49.3%. (2) Multi-group analysis shows that the prediction model is invariant to the measurement of transgender and across low, medium, and high levels of physical activity. (3) The direct positive predictive effect of subjective norms, perceived behavior control and habit strength on behavior intention is statistically significant ($P < 0.01$), among which the predictive effect of perceived behavior control is the largest; action planning and habit strength have direct effects on physical activity The predictive effect is statistically significant ($P < 0.01$), and the predictive effect of habit strength is the largest. (4) The direct predictive effect of behavioral intention on physical activity is moderated by action planning and habit strength; action planning plays a part of mediating role between behavioral intention and physical activity, and the latter half of the mediation process is moderated by habit strength. Conclusion: Taking action planning and habit strength as the "third variable" to bridge the gap between physical activity intention and behavior can help explain and predict the complex mechanism of intention-behavior transformation, and can be used as a theoretical basis for college students' physical activity behavior intervention. Suggestion: Schools and society improve sports facilities and open more public sports resources to weaken the obstacles faced by college students in physical activity; school physical education teachers and social sports practitioners actively guide college students to develop physical activity plans that suit their own conditions and promote them From "intentional" to "action" implementation; families and schools should continue to strengthen the instillation of the concept of lifelong sports, and cultivate college students to form a lifestyle habit of regularly participating in physical activities.

腹式呼吸对压力下注意控制的影响

龚然¹ 陈慧娟¹ 张力为² (通讯作者)

1 北京体育大学心理学院, 北京, 100084

2 北京体育大学心理学院, 北京, 100084, liweizhang@hotmail.com

摘要 注意控制是指关注目标本身, 忽略无关信息干扰的能力。竞技比赛中, 如何在压力下做好注意控制, 对每个项目的运动员都很重要。注意控制理论 (attentional control theory) 认为, 压力损害注意控制, 但并没有指出如何降低其不利影响。通过自主放松发展而来的腹式呼吸 (diaphragmatic breathing) 为解决该问题提供了思路。本研究借助具有沉浸感、交互性效果的虚拟现实 (Virtual Reality, VR) 技术构建结合运动情境的通用性压力情境, 通过腹式呼吸方法, 探索改善注意控制的手段, 以提高运动员在紧张焦灼、复杂多变竞技比赛中的适应能力。为探究短期、长期腹式呼吸对压力下注意控制的改善作用, 实验 1 邀请 168 名大学生参加一项 2 × 2 的组间设计实验, 自变量为通过 VR 技术诱发的压力情境 (低、高) 和呼吸练习 (腹式呼吸、正常呼

吸), 因变量为 Stroop 干扰效应以及心率变异性的变化。结果发现, 短期腹式呼吸练习可改善注意控制 ($F(4, 121) = 2.58, p = .040, \eta_p^2 = .08$); 但没有发现高压情境下呼吸练习具有更为明显的改善效果 ($F(4, 121) = .26, p = .906$)。实验 2 邀请 70 名大学生参加一项 2×3 的混合设计实验, 组间自变量为呼吸训练 (腹式呼吸、控制), 组内自变量为测量时间 (前测、中测、后测), 因变量为 Stroop 干扰效应以及心率变异性的变化。研究参与者随机分入腹式呼吸组和控制组, 前者共进行 8 周、每周 2 次、每次 20 分钟的腹式呼吸训练, 后者则不进行任何干预训练。结果发现, 与实验 1 相比, 长期呼吸训练改善注意控制的效果更大 ($F(4, 55) = 27.90, p < .001, \eta_p^2 = .67$); 腹式呼吸组的中测和后测表现均优于前测 ($F(8, 51) = 4.31, p = .001, \eta_p^2 = .40$), 这说明长期腹式呼吸训练提高注意控制的效果更为明显与稳定。本研究提示, 一次性腹式呼吸练习即可改善注意控制表现, 且这种促进作用在低压、高压情境下均适用; 长期腹式呼吸训练的干预效果优于短期腹式呼吸练习, 腹式呼吸对注意控制的改善作用具有一定的可重复性。因此, 腹式呼吸可作为调整运动员训练与比赛身心状态、放松恢复的备选手段。

关键词 腹式呼吸, 注意控制, 压力, 虚拟现实

The effect of diaphragmatic breathing on attentional control under pressure

Ran GONG¹, Huijuan CHEN¹, Liwei ZHANG²

1 Department of psychology of Beijing Sport University, Beijing, 100084

2 Department of psychology of Beijing Sport University, Beijing, liweizhang@hotmail.com

Abstract: Attentional control refers to the ability to overcome current difficulties through efforts, focus on relevant information all the time, and avoid distracting interference of irrelevant information. In competitive competition, it is very important for events and athletes to control attention under pressure. Attentional control theory (ACT) proposes that pressure may damage attentional control performance, however, it doesn't point out how to reduce the effects. The diaphragmatic breathing provides a way to improve the performance of attentional control under pressure. This study uses virtual reality (VR) technology, which characterized by immersion and interaction effects, to construct a general pressure situation combined with sports scenes. Meanwhile, the way of diaphragmatic breathing can find a simple and easy way to improve the performance under pressure, and improve the adaptability of athletes in complex and changeable competitions. Experiment 1 aimed to examine the effect of short-term diaphragmatic breathing practice on attentional control under pressure. We invited 168 participants to join in a 2×2 between-group experiment design. Independent variable consisted of pressure situation (low, high) and breathing practice (diaphragmatic breathing, normal breathing). Dependent variable consisted of Stroop interference effect and the changes of HRV physiological indexes. The experiment used VR to induce pressure situation and completed Stroop task at the same time. The results showed that breathing practice could improve attentional control performance ($F(4, 121) = 2.58, p = .040, \eta_p^2 = .08$). However, no significant improvement was found in the high pressure situation ($F(4, 121) = .26, p = .906$). Experiment 2 aimed to examine the effect of long-term diaphragmatic breathing training on attentional control under high pressure. We invited 70 participants to join in a 2×3 mixed-group experiment design. Independent variable consisted of breathing training (diaphragmatic breathing, control) and measure time (pre-test, middle-test, post-test). Dependent variable consisted of Stroop interference effect and the changes of HRV physiological indexes. Participants were randomly assigned to diaphragmatic breathing group and control group. The diaphragmatic breathing group received breathing training for 8 weeks, twice a week and 20 minutes each time, while the control group did not receive any intervention. The results showed that compared with the breathing practice in experiment 1, the effect size of breathing training on attentional control was greater ($F(4, 55) = 27.90, p < .001, \eta_p^2 = .67$). This result suggested that the effect of improving attentional control by long-term diaphragmatic breathing training was more obvious and stable. All in all, diaphragmatic breathing can improve the performance of attentional control whether in low pressure situation or high pressure situation. The intervention effect of long-term diaphragmatic

breathing training is better than short-term diaphragmatic breathing practice with repeatability. Maybe diaphragmatic breathing can be used as an alternative way to adjust athletes' daily physical and mental states.

疫情下精英运动员备战奥运的心理训练个案分析

许娜¹ 王英春¹ 孙明宇¹ 迟立忠¹ (通讯作者)

¹ 北京体育大学心理学院, 北京, 100084, Chilizhong3804@163.com

摘要 疫情下, 训练环境受限、后期比赛不确定等挑战影响运动员的身心健康 (Schinke, et al., 2020), 为做好抗疫情、保备战工作, 心理团队以中国运动员心理建设系统理论为依据, 制订了三重目标: 1) 减少疫情下的心理应激; 2) 提高自我控制能力; 3) 提升文化素养和精神境界。研究采用多重基线水平的 ABA 单被试实验设计, 对 16 名备战奥运精英运动员进行为期 5 个月“术道兼修”心理干预, “术”是指通过心理技能学习与训练能够在短期内收到效果, 例如: 讲座、心理咨询、团体辅导等; “道”的提升则需要依靠个人人格的不断完善与心理素养的持续积淀来实现, 是一个通过学习与体悟获得心理能力不断发展的长期过程, 例如: 演讲比赛、感谢信和读书会。使用心境状态问卷、心理疲劳、状态自信心和选拔赛射箭成绩, 对被试的心理水平和运动表现水平进行测量。采用视觉化检验 (visual analysis) 和效果量 NAP (Nonoverlap of All Pairs) 对实验数据进行分析。干预结束后 1 个月请 4 位教练员和 16 名运动员回答《实践评估问卷》以进行社会效度评价。随着干预进行, 16 名运动员的运动表现水平均有所提高, 社会效度评价支持了干预效果。结果显示, 术道兼修的心理训练具有良好的心理干预效果, 可帮助射箭运动员提高运动表现水平。

Sport psychology services to high performance athletes during COVID-19

XU Na, WANG Yingchun, SUN Mingyu, CHI Lizhong

School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: During COVID-19, challenges such as restricted training environment and uncertainty games affect athletes' physical and mental health (Schinke, et al., 2020). In order to Olympic Games, the psychological team uses Chinese athletes' psychological system theory, three goals have been formulated: 1) reduce psychological stress during COVID-19; 2) improve self-control; 3) improve cultural literacy and spiritual realm. The study adopted a single-participant ABA experimental design with multiple baseline levels. 16 athletes preparing for the Olympics were subjected to a 4-month the combination of skill orientation and spirit orientation psychological intervention. "Shu" refers to the ability to learn and train psychological skills in a short time, such as: lectures, psychological counseling, group counseling, etc; "Dao" needs to improve personal personality and the psychological literacy, such as: speech contest, thank you letter and book reading. Use the state of mind questionnaire, mental fatigue questionnaire, state confidence questionnaire and archery rings to measure the mental level and athletic performance. Visual analysis and NAP (Nonoverlap of All Pairs) were used to analyze the experimental data. One month after the intervention, 4 coaches and 16 athletes were asked to answer the "Practice Evaluation Questionnaire" for social validity evaluation. As the intervention progressed, the sports performance of the 16 athletes improved, and the evaluation of social validity supported the intervention effect. The results show that psychological training has a good psychological intervention effect and can help archery athletes to improve their athletic performance.

自我谈话对飞镖投掷表现的影响机制：基于脑电与运动学特征的分析

洪晓彬^{1,2} 赵孟炎³

1 武汉体育学院 心理学系, 武汉, 430079,

2 武汉体育学院 运动训练监控湖北省重点实验室, 武汉, 430079

3 武汉体育学院 研究生院, 武汉, 430079

摘要 对于精细运动技能而言, 运动员动作执行前几秒钟的认知状态, 能够对运动员的行为表现产生重要影响。因此, 如何调整该段时间个体的认知状态是运动心理学家关注的热点。体育运动领域研究发现, 有效的认知干预策略能调整运动员在该段时间的状态。自我谈话就是其中常见的方式之一。尽管以往研究发现, 自我谈话能对运动员的行为表现产生积极影响, 但这些研究大多是从结果表现的角度出发, 鲜有研究探究自我谈话的作用过程。为此, 本研究从行为学、运动学和脑电活动变化三个角度探讨自我谈话的内在作用机制, 从而为丰富体育运动领域自我谈话相关研究。本研究采用有偿招募方式, 选取 15 名男性大学生飞镖新手和 15 名男性大学生飞镖专家为实验被试。实验设计为 2×2 两因素混合设计, 旨在探讨指导型自我谈话和激励型自我谈话对不同运动专长的个体的飞镖投掷表现的作用机制。其中, 组间变量为被试类型(飞镖专家与新手), 组内变量为自我谈话类型(指导型与激励型自我谈话)。为减少实验误差, 组内变量使用平衡设计, 即每组被试分为均等的两部分, 一部分先使用指导型, 再使用激励型, 另一部分先使用激励型, 再使用指导型。研究结果发现, 在行为学表现上, 对于飞镖新手来说, 指导型自我谈话效果更好; 而对于飞镖专家来说, 激励型自我谈话效果更佳。在运动学表现上, 无论是飞镖新手还是飞镖专家, 指导型自我谈话都降低了个体的运动协调表现。此外, 从整体表现来看, 两种自我谈话方式都能影响飞镖专家的运动协调能力。在脑电活动变化上, 使用自我谈话对飞镖专家的运动控制能力更为有效, 而对飞镖新手的视空间协调能力效果更佳, 但对两者的言语认知思维的影响并没有太大差异。此外, 研究还发现, 激励型自我谈话能有效提高飞镖新手的脑功能连接性, 而指导型自我谈话能有效促进飞镖专家的脑功能连接性。

A study on the mechanism of self talk effect on throwing performance of different dart players: based on the analysis of EEG and kinematic characteristics

HONG Xiaobin^{1,2}, ZHAO Mengyan³

1 Department of Psychology, Wuhan Sports University, Wuhan, 430079

2 Hubei Exercise Training and Monitoring Key Lab, Wuhan Sports University, Wuhan, 430079

3 Graduate School, Wuhan Sports University, Wuhan, 430079

Abstract: For fine sports, the cognitive state of athletes in the first few seconds before the execution of their actions can have an important impact on their behavior. Therefore, how to adjust the cognitive state of individuals in this period of time is the focus of sports psychologists. Research in the field of sports found that effective cognitive intervention strategies can adjust the state of athletes in this period of time. Self talk is one of the common ways. Although previous studies have found that self-talk can have a positive impact on the performance of athletes, most of these studies are from the perspective of result performance, and few studies explore the process of self-talk. Therefore, this study explores the internal mechanism of self talk from three perspectives of behavior, kinematics and EEG activity changes, so as to enrich the research on self talk in the field of sports. In this study, 15 novice male college students and 15 male college students' dart experts were selected as the research objects, and a 2x2 mixed experimental design was used to explore the mechanism of guided self-talk and incentive self-talk on dart throwing performance of individuals with different sports expertise. The results show that, in terms of behavioral performance, the guided self-talk is better for novice darts, and the incentive self-talk is better for dart experts. In terms of kinematic performance, both novice darts and expert darts, guided self-talk reduces the individual's motor coordination performance. In addition, from the overall performance point of view, the two self talk ways can affect

the movement coordination ability of dart experts. In the change of EEG activity, the use of self talk is more effective for dart experts' motor control ability, and better for dart novices' visual spatial coordination ability, but there is not much difference in the impact on their speech cognitive thinking. In addition, the study also found that motivational self talk can effectively improve the brain function connectivity of dart novices, while instructional self talk can effectively promote the brain function connectivity of dart experts.

正念减压训练对钢架雪车运动员正念、抑郁、焦虑、睡眠质量和注意集中的干预效果

徐守森（通讯作者） 李佳新 张力为

1 首都体育学院，北京，shousenxu@126.com

2 首都体育学院研究生部，北京

3 北京体育大学心理学院，北京

摘要 目的：考察正念减压对中国钢架雪车队运动员正念、抑郁、焦虑、睡眠质量和注意集中的干预效果。方法：对国家钢架雪车集训队 21 名运动员进行正念减压干预。采用正念五因素问卷（FFMQ）、抑郁自评量表（SDS）、状态特质焦虑量表（TSAI）、匹兹堡睡眠质量指数（PSQI）于干预开始前、干预 4 周后、干预 8 周/干预结束后以及干预结束 4 周后进行施测，评估 MBSR 对运动员正念水平、抑郁、焦虑和睡眠质量的影响。采用数字划消实验于干预开始前和干预结束后施测，评估 MBSR 对运动员注意集中水平的影响。结果：（1）正念减压可以提高钢架雪车运动员的正念水平，但是干预效果具有滞后效应，干预结束四周后才能观察到。短期的干预效果主要表现在有觉察行动子量表上，干预开始四周之后就有效果，干预结束四周之后依然具有长期后效。（2）正念减压训练显著降低了钢架雪车运动员的抑郁水平，干预开始四周之后就有效果，干预结束四周之后依然具有长期后效。（3）正念减压训练显著降低了钢架雪车运动员的特质焦虑水平，显著降低了钢架雪车运动员的状态焦虑水平，干预结束四周之后依然具有长期后效。（4）正念减压训练显著提高了钢架雪车运动员的睡眠质量，干预开始四周之后就有效果，干预结束之后效果明显，干预结束四周之后依然具有长期后效。（5）正念减压训练显著提高了钢架雪车运动员的注意集中水平。结论：正念减压训练可以有效提高钢架雪车运动员的正念水平，降低其抑郁和焦虑程度，提升其睡眠质量，提高其注意集中水平；作为一种有效的心理干预手段，在后续心理服务过程中可以继续使用正念减压训练。

Intervention Effects of MBSR on Mindfulness, Depression, Anxiety, Sleep Quality, and Concentration of Skeleton Athletes

Abstract: Objective: To investigate the intervention effects of Mindfulness Based Stress Reduction (MBSR) on mindfulness level, depression, anxiety, sleep quality, and attention concentration level of Chinese skeleton athletes. Methods: Total 21 athletes from Chinese skeleton team were trained once a week for 8 weeks. Five Facet Mindfulness Questionnaire (FFMQ), Self-Rating Depression Scale (SDS), State-Trait Anxiety Inventory (TSAI), and Pittsburgh Sleep Quality Index (PSQI) were measured four times at baseline (pre-test, T1), 4 weeks after the intervention start (middle test, T2), 8 weeks after the intervention start (post-test, T3), and 4 weeks after the end of the intervention (tracing test, T4), to evaluate the intervention effects of MBSR on mindfulness level, depression, anxiety, and sleep quality of skeleton athletes respectively. The Cancellation tasks was tested at baseline (pre-test, T1) and 8 weeks after the intervention (post-test, T3) to assess the effect of the MBSR on attention concentration level of skeleton athletes. Results: 1) MBSR can promote the mindfulness level of skeleton athletes, but this kind of hysteresis effect could be found after the end of intervention. 2) MBSR can significantly reduce the depression of skeleton athletes, and this kind of intervention effect could also be found after four weeks of the intervention. 3) MBSR can significantly decrease the anxiety of skeleton athletes, including trait anxiety and state anxiety, and this kind of

intervention effect could also be found after four weeks of the intervention. 4) MBSR can improve the sleep quality of skeleton athletes, and the intervention effect could be found four weeks after the start, and there is a long term effect four weeks after the end of training. 5) MBSR has a significant intervention effect on concentration of skeleton athletes. Conclusion: MBSR training could improve the mindfulness level, decrease the depression & anxiety level, increase the sleep quality, enhance the attentional concentration of skeleton athletes. As an effective psychological skills training, MBSR can continued to be used in the future on skeleton athletes.

Key Words: Mindfulness-Based Stress Reduction; skeleton; Depression & Anxiety; Sleep Quality; Concentration

正念干预对高校运动员心理健康及睡眠质量的影响

陈子灵¹ 周越¹ (通讯作者)

¹ 北京体育大学运动人体科学学院, 北京, 100084, bsu0218@163.com

摘 要 目的: 运动员群体的心理疾病患病率较高, 尤其在团体项目中(如篮球、排球等)。大学生的心理健康状况如今也令人堪忧, 而高校运动员作为大学生的一个特殊群体, 学业压力还会与紧张的比赛和训练周期联系在一起, 同时要扮演好这双重的角色, 必然使得背负在他们身上的担子更加沉重。此外, 他们往往会额外牺牲睡眠时间来完成各方面的任务, 从而面临较大的睡眠障碍风险。因此, 本研究将正念干预应用于高校运动员中, 旨在探讨其对心理健康以及睡眠质量的改善效果。方法: 北京体育大学校队男子排球运动员 14 人(4 名健将, 10 名一级)和女子篮球运动员 6 名(均二级), 实验组和对照组各 10 名。每晚 9 点集中进行共 20 分钟的正念冥想和正念呼吸练习, 课程为两位冥想大师 Jack Kornfield 和 Tara Brach 开发的《每日正念》中文版, 为期 4 周。采用症状自评量表(SCL-90)、匹兹堡睡眠质量(PSQI)问卷、五因素正念量表(FFMQ)和正性-负性情绪量表(PANAS)以及 sleeptek 空气垫式睡眠监测仪进行测量。结果: (1) 本研究中 SCL-90 中敌对、焦虑因子以及 PANAS 中负性情绪得分与 PSQI 得分均存在极显著正相关($r=0.74$ 、 0.75 和 0.74 , $P<0.01$), 抑郁、偏执因子与 PSQI 得分均存在显著正相关($r=0.61$ 和 0.68 , $P<0.05$)。 (2) 实验组干预前后, 睡眠效率显著提高、入睡时间显著缩短($t=-4.20$ 和 2.66 , $P<0.05$), 睡眠时长增加, 大多数能达到建议的 8 个小时(7.95 ± 1.10 小时), 深睡占比增加, 但均无显著差异($P>0.05$); SCL-90 中各因子分及总分在干预后均有所下降, 其中抑郁、偏执因子分显著下降($t=2.81$ 和 3.15 , $P<0.05$); FFMQ 得分在干预后有显著增加($t=-5.09$, $P<0.05$); 对照组干预前后各问卷、量表和生理指标均无显著差异($P>0.05$)。 (3) 实验组较对照组干预后测睡眠效率和睡眠时长显著增加、R 期显著减少($t=2.36$ 、 $t=2.78$ 和 $t=2.70$, $P<0.05$); 后测量表和问卷结果两组之间均无显著差异($P>0.05$)。结论: (1) 4 周的干预可以显著提高高校运动员的正念水平; (2) 心理因素是影响睡眠质量的关键, 正念干预可以促进高校运动员的心理健康, 改善睡眠质量。

Effects of Mindfulness Intervention on Mental Health and Sleep Quality of College Athletes

CHEN Ziling¹, ZHOU Yue¹ (Corresponding author)

¹ School of Kinesiology and Human Science, Beijing Sport University, Beijing 100084, China.

Corresponding author: bsu0218@163.com

Abstract: Objective: The prevalence of mental illness among athletes is high, especially in team sports (such as basketball, volleyball, etc.). Nowadays, the mental health of college students is also worrying, and college athletes, as a special group of college students, the academic pressure will be associated with the intense competition and training cycle, at the same time to play this double role, will inevitably make the burden on them more heavy. In addition, they tend to sacrifice extra sleep to complete various tasks, which puts them at greater risk for sleep disorders. Therefore, this study applied mindfulness intervention to college athletes to explore its effect on improving mental health and sleep quality. Methods: There were 14 men's volleyball players and 6 women's basketball players in the school team of Beijing Sport University. There were 10 in the experimental group and 10 in the control group. A

four-week, 20-minute concentration of mindfulness meditation and mindful breathing exercises at 9pm every night. The Chinese version of Daily Mindfulness, developed by two meditation gurus, Jack Kornfield and Tara Brach. The symptom Self-rating Scale (SCL-90), The Pittsburgh Sleep Quality (PSQI) Questionnaire, the Five-factor Mindfulness Scale (FFMQ), the Positive-negative Emotion Scale (PANAS) and the Sleeptek Air cushion sleep monitor were used for measurement. Results: (1) In this study, hostility and anxiety factors in SCL-90 and negative emotion scores in PANAS were significantly positively correlated with PSQI score ($R = 0.74, 0.75$ and $0.74, P < 0.01$), and depression and paranoia factors were significantly positively correlated with PSQI score ($R = 0.61$ and $0.68, P < 0.05$). (2) In the experimental group before and after intervention, the sleep efficiency was significantly improved, the time to fall asleep was significantly shortened ($t = -4.20$ and $2.66, P < 0.05$), the sleep duration was increased, most of them could reach the recommended 8 hours (7.95 ± 1.10 hours), and the proportion of deep sleep was increased, but there were no significant differences ($P > 0.05$); The scores of all factors and total scores in SCL-90 were decreased after intervention, and the scores of depression and paranoia were significantly decreased ($t = 2.81$ and $3.15, P < 0.05$). FFMQ score was significantly increased after intervention ($t = -5.09, P < 0.05$); There were no significant differences in the questionnaire, scale and physiological indexes before and after intervention in the control group ($P > 0.05$). (3) Compared with the control group, the sleep efficiency and sleep duration of the experimental group were significantly increased after intervention, while the R period was significantly decreased ($t = 2.36, T = 2.78$ and $T = 2.70, P < 0.05$). There were no significant differences between the two groups ($P > 0.05$). Conclusions: (1) 4-week intervention can significantly improve the level of mindfulness of college athletes; (2) Psychological factors are the key factors affecting sleep quality, and mindfulness intervention can promote mental health and improve sleep quality of college athletes.

摘要 本研究将精英运动员操作性地界定为曾在全国大型比赛获得前3名、亚洲比赛前6名、奥运会和世界级比赛前8名的运动员(刘洁洁, 2019)。研究的目的是通过访谈发生急性严重损伤后仍能重返赛场，取得优异成绩的精英运动员，探讨运动员伤后合理应对的心理策略。采用半结构式访谈的质化研究方法，基于解释性现象学分析(Interpretative Phenomenological Analysis, IPA)对研究对象高同质性和对访谈文本深入分析的要求以及资料饱和原则，以面对面或者腾讯会议的形式访谈了11名有急性严重损伤史且有备战奥运会经历的国家队运动员，其中10名运动员皆在伤后重返赛场并取得了优异成绩。采用Colaizzi (1978)的现象学分析方法进行资料分析。深度访谈发现，运动员在发生急性损伤后会绝望，沮丧，沉浸在受伤中，但部分精英运动员仍能重返赛场并取得优异成绩，得益于以下3点。**第一，用合理化心态看待受伤。**“竞技体育谁不受伤呢？”这种想法可以减轻运动员伤后的心理痛苦。**第二，设定明确的目标。**来自教练或领导的肯定可以帮助运动员消除内心的不确定性，如“你只管好好养伤，伤好后一定让你比奥运会”。这会帮助运动员明确自己的目标，“康复就是为了参加奥运会。”“你要知道你自己想要什么，然后尽可能得去争取。”正是这样的目标感给了运动员坚持康复的动力。**第三，关注并做好康复过程中的每个当下。**运动员要经历难以忍受的疼痛，日复一日做同样的动作，甚至每天的训练都达不到自己的期望。但很多运动员认为，“别想太多，做好当下该做的，做好自己该做的。要坚持，可能有一段时间，每一天都看不到自己有哪些进步，但是过几个月之后，再回头看确实是不一样的。”

关键词 精英运动员，急性损伤，严重损伤，应对，心理策略

How should elite athletes deal with acute severe injuries?

YUN Dongting, ZHANG Liwei

Beijing Sport University, Beijing, 100084, China

Abstract : In this study, elite athletes are operationally defined as those who have won the top 3 in national competitions, the top 6 in Asian competitions, the top 8 in the Olympic Games and world-class competitions (Liu Jiejie, 2019). The purpose of this study is to interview elite athletes who can return to the field after acute serious injury and achieve excellent results, and to explore the psychological strategies of athletes to deal with them reasonably after injury. Using qualitative research methods and semi-structured interviews, the high homogeneity of the subjects and in-depth analysis of interview texts required by Interpretive Phenomenological Analysis are the basic principles of the study. Eleven national team athletes with a history of acute serious injuries and preparation for the Olympic Games were interviewed in the form of face-to-face or Tencent meetings, and 10 of them returned to the field after injury and achieved excellent results. The phenomenological analysis method of Colaizzi (1978) was used to analyze the data. In-depth interviews found that athletes will be desperate, depressed and immersed in injuries after acute injuries, but some elite athletes can still return to the field and achieve excellent results, thanks to the following three points. First, treat injuries with a rational mindset. "Who is not injured in competitive sports?" This kind of thinking can alleviate the psychological pain of athletes after injury. Second, set clear goals. Affirmation from coaches or leaders can help athletes eliminate their inner uncertainty, such as "you just take good care of the injury, and you will certainly participate in the Olympic Games after the injury is healed." This will help athletes define their goals: "recovery is to participate in the Olympic Games. you need to know what you want, and then you have to go for it as much as you can." It is this sense of goal that gives athletes the motivation to continue to recover. Third, pay attention to and do well every moment in the process of rehabilitation. Athletes have to experience unbearable pain, do the same movements day after day, and even their daily training falls short of their expectations. But many athletes think, "Don't think too much, do what you have to do right now, do what you have to do. To persevere, there may be a time when you can't see any progress every day, but after a few months, it's really different to look back."

Keywords: Elite athletes, acute injury, severe injury, coping, psychological strategy

排球专项大学生运动竞赛情绪感染与竞赛状态焦虑的关系 及其链式中介效应研究

张晓月¹ 杨阿丽² (通讯作者) 王兴¹

1 沈阳体育学院研究生部, 沈阳 110102

2 沈阳体育学院运动人体科学学院, 沈阳, 110102, E-mail: yalabc135@163.com

摘 要 在排球运动竞赛中, 情绪感染现象非常普遍。所谓情绪感染, 它是人与人之间感官情绪信息自动化、无意识地传递的过程, 情绪信息接受者与情绪信息发出者产生趋于一致的情绪现象。本研究着重探讨排球专项大学生运动竞赛情绪感染的基本特征及其与竞赛状态焦虑之间的关系, 揭示正念、运动竞赛情绪调节自我效能感在其中的作用机制, 以期为促进排球专项大学生赛场表现、降低消极情绪感染影响、提高对竞赛状态焦虑的预测与解释以及相关干预工作提供实证依据。研究主要采用访谈法、问卷法, 在编制《排球专项大学生运动竞赛情绪感染问卷》的基础上, 采用整群抽样, 对北京体育大学、沈阳体育学院、吉林体育学院、哈尔滨体育学院 511 名排球专项大学生进行调查。结果表明, 编制的《排球专项大学生运动竞赛情绪感染问卷》由 23 个项目组成, 包括 5 个维度, 即: 积极、悲伤、焦虑、挫折、愤怒。问卷信效度良好, 达到心理测量学标准; 排球专项大学生总体情绪感染程度较高, 在运动竞赛中更多受积极、焦虑、挫折情绪感染的影响, 在性别上无显著差异。二级及以上运动等级和训练年限为 1-6 年的排球专项大学生感受到的焦虑情绪感染更多,

其中 1-3 年最大；积极情绪感染通过正念、情绪调节自我效能感对竞赛状态焦虑和状态自信心影响的链式中介模型成立。消极情绪感染通过正念、情绪调节自我效能感对竞赛状态焦虑影响的链式中介模型成立，而对状态自信心的链式中介模型不成立。消极情绪感染对状态焦虑的直接影响更大，积极情绪感染对状态自信心的直接影响更大。因此，排球专项大学生情绪感染程度较高，要重视对排球专项大学生情绪感染的调节和辅导。在干预研究中应注重对排球专项大学生的情绪感染、正念、情绪调节自我效能感的干预，积极探索正念、情绪调节自我效能感的干预训练方法，提高正念和情绪调节自我效能感水平，消除消极情绪感染，促进运动表现。

Research on the Relationship between Competition Emotional Contagion and Competition State Anxiety of College Volleyball Students and its Chain Mediating Effect

ZHANG Xiaoyue, YANG Ali, WANG Xing

Shenyang sport university, No.36 jinqiansong east road, sujiatun district, Shenyang

Abstract: In volleyball competitions, emotional contagion is very common. Emotional contagion is a process of automatic, unconscious transfer of sensory-emotional information between people, where the receiver of the emotional information and the sender of the emotional information produce a convergent emotional phenomenon. This study focuses on the basic characteristics of volleyball college students' sports competition emotional contagion and its relationship with competition state anxiety, reveals mindfulness, sports competition emotion regulation self-efficacy in the mechanism, to promote volleyball college students playground performance, reduce the influence of negative emotional contagion, improve the prediction and interpretation of competition state anxiety and related intervention work to provide empirical basis. Research mainly adopts interview method, questionnaire method, On the basis of compiling the questionnaire of College Students' Emotional contagion in Volleyball Competition, 511 volleyball special college students from Beijing Sports University, Shenyang Institute of physical education, Jilin Institute of physical education and Harbin Institute of physical education were investigated by cluster sampling. Research result: The questionnaire of College Students' Emotional contagion in Volleyball Competition consists of 23 items, including 5 dimensions, namely: positivity, sadness, anxiety, frustration, and anger. The questionnaire has good reliability and validity and meets the psychometric standards. Volleyball college students' overall emotional contagion is high, in the sports competition is more affected by positive, anxiety, frustration emotional contagion, no significant difference in gender. In terms of anxiety contagion, Level 2 and above and training for 1-6 years of volleyball students feel more, of which 1-3 years is the largest. Positive emotional contagion was established through the chain mediating model of mindfulness and emotion regulation self-efficacy on competition state anxiety and state confidence. The chain mediating model of negative emotion contagion on competition state anxiety through mindfulness and emotion regulation self-efficacy is established, but the chain mediating model of state self-confidence is not established. Negative emotional contagion has a greater direct effect on state anxiety and positive emotional contagion has a greater direct effect on state self-confidence. Therefore, volleyball college students have a high degree of emotional contagion, we should pay attention to the regulation and counseling of volleyball college students' emotional contagion. The intervention study should focus on the intervention of emotion contagion, mindfulness, and emotion regulation self-efficacy of volleyball college students, and the intervention training methods of mindfulness and emotion regulation self-efficacy should be actively explored, to improve the level of mindfulness and emotion regulation self-efficacy, eliminate negative emotional contagion and promote sports performance.

情绪对大学生网球初学者击球稳定性的影响： 自我谈话的调节作用

杨阿丽¹ 丁其玉² 皮悦慈²

1 沈阳体育学院体育社会科学研究中心，沈阳，110102，通讯作者 E-mail: yalabc135@163.com

2 沈阳体育学院研究生部，沈阳，110102

摘 要 情绪和自我谈话是影响动作表现的重要因素，本研究基于合理情绪疗法理论，在深度挖掘大学生网球初学者自我谈话特征的基础上，通过 3 个递进式研究揭示大学生网球初学者情绪、自我谈话、击球稳定性三者之间的关系，以期体育教师、网球初学者提供情绪调节的建议，为促进网球教学质量和运动表现提供实证依据和指导。研究结果表明：（1）运用观察法和访谈法对 20 名大学生网球初学者自我谈话内容进行描述研究，发现大学生网球初学者较多使用消极自我谈话。其原因是练习者击球效果达不到理想时多进行负面思维。（2）采用单因素被试内实验设计，探究不同情绪状态（正性、中性、负性）对大学生网球初学者动作表现的影响，20 名大学生网球初学者参与研究。发现不同情绪状态下（正性、中性、负性）大学生网球初学者正反手击球稳定性不同，较正性情绪和中性情绪状态，负性情绪状态下大学生网球初学者正反手击球稳定性较差，且差异性显著。正性情绪与中性情绪状态下个体动作表现差异性不显著。（3）令参与者处于负性情绪状态下，采用单因素被试间实验设计，探究即时自我谈话（指导型、动机型）对负性情绪的调节作用，45 名大学生网球初学者参与研究。发现即时指导型自我谈话能调节负性情绪对大学生网球初学者正反手击球稳定性的消极影响。即时动机型自我谈话与对照组差异性不显著。（4）采用单因素被试间实验设计，探究长期指导型自我谈话和长期动机型自我谈话对大学生网球初学者正反手击球稳定性的影响。对 117 名大学生网球初学者干预九周，发现自我谈话（指导型、动机型）可以促进大学生网球初学者正反手击球的稳定性，且指导型自我谈话的效果优于动机型自我谈话，长期动机型自我谈话对负性情绪具有调节作用。

The Influence of Emotion on the Hitting Stability of College Tennis Beginner: The Moderating Effect of Self-talk

Yang A Li, Ding Qi Yu, Pi Yue CI

Shenyang sport university, No. 36 jinqiansong east road, sujiatun district, Shenyang

Abstract: Emotion and self talk are important factors that affect action performance. Based on the theory of rational emotional therapy, this study explored the characteristics of self talk of college tennis beginners, and revealed the relationship among emotion, self talk and hitting stability of college tennis beginners through three progressive studies. In order to provide suggestions for physical education teachers and tennis beginners to regulate their emotions, to promote the quality of tennis teaching and sports performance to provide empirical basis and guidance. The results show that: (1) Using observation and interview methods to describe the content of self talk of 20 college tennis beginners, it is found that college tennis beginners use more negative self talk. The reason is that practitioners often think negatively when their batting effect is not ideal. (2) In this study, a single factor experiment was designed to explore the influence of different emotional states (positive, neutral, negative) on the action performance of college tennis beginners. It is found that the stability of forehand and backhand of college tennis beginners under different emotional states (positive, neutral, negative) is different, compared with positive emotion and neutral emotional state, the stability of forehand and backhand stroke of college tennis beginners in negative emotional state is poor, and the difference is significant. There was no significant difference between positive emotion and neutral emotion. (3) Put the participants in a negative mood., a single factor experimental design was used to explore the moderating effect of instant self talk (guided self-talk and motivational self-talk) on negative emotions., 45 college tennis beginners participated in the study. It is found that immediate guided self talk can regulate the negative influence of negative emotions on the stability of forehand and backhand stroke of college tennis beginners. There was no significant difference between instant motivational self-talk and control group. (4) Using the single factor experimental design,

this paper explores the influence of long-term guided self-talk and long-term motivational self-talk on the stability of forehand and backhand stroke of college tennis beginners. After nine weeks of intervention on 117 college tennis beginners, it was found that self talk (guided self talk, motivational self talk) can promote the stability of forehand and backhand stroke of college tennis beginners, and the effect of guided self talk is better than that of motivational self talk. Long term motivational self talk can regulate negative emotions.

运动员情绪调节与竞技表现的关系

王欢 姜媛（通讯作者）

北京体育大学心理学院，北京，100084, jiangyuan97@sina.cn

摘要 情绪调节指个体运用策略来发起、维持、调整或表达情绪的能力。情绪调节能力对运动员在竞技大赛中取得最佳运动成绩至关重要。因此，本文的目的是从情绪调节的理论、测量评估方法、以及对运动员情绪调节能力的干预三个角度来探讨情绪调节与运动成绩之间的关系。本文采用系统综述的方法，从中国知网，万方，Web of Science 和 EBSCO 等数据库进行文献检索。从 145 篇文献中确定了符合纳入标准的 30 篇文献，包括 2 篇综述，20 篇实证研究和 8 篇干预研究。介绍了解释情绪调节与竞技表现关系的 5 个理论的核心要点和实证研究，包括情绪调节过程模型、认知动机关系理论、情绪调节工具模型、多行动计划模型和团队运动员情绪调节的多级模型，并探讨 5 大理论的异同及运动员情绪调节在研究中的重要性。还介绍了通过量表、行为检测法和生理检测法对情绪调节的外显调节和内隐调节进行评估的方法；最后归纳了通过心理训练提高情绪调节能力的三类方法。结论：情绪调节与运动成绩的高低存在密切联系，这种关系受情绪、认知方式和环境等多种因素的影响，且在团体运动中，运动员的情绪调节还会受到队友的影响。情绪调节策略及其有效性的自信程度，在情绪调节与运动成绩的关系中起重要作用。内隐情绪调节是一种有价值的情绪调节方式，能有效抑制运动员的负面情绪和行为，但该方面的研究在运动领域相对匮乏。可有效提高运动员情绪调节能力的训练方法可概括为传统心理训练方法、生物反馈训练和正念训练三类，与传统方法相比，生物反馈训练和正念训练更能帮助运动员更好地感知和调节情绪，进行对运动表现产生更多积极影响。因此，生物反馈训练和正念训练可作为运动员日常的心理监测和心理训练手段。未来还需要进一步探究情绪调节与运动成绩的关系，以及加强对体育运动中内隐情绪及调节方式的探究，为后续从外显和内隐两个层面进行个人化的情绪调节干预提供依据和方法。

The Relationship between Emotional Regulation and Athletic Performance of Athletes

WANG Huan, JIANG Yuan(corresponding author)

School of Psychology, Beijing Sport University, Beijing 100084, jiangyuan97@sina.cn

Abstract: Emotional regulation is the ability of individuals to use strategies to initiate, maintain, adjust or express emotion. Emotional regulation is very important for athletes to get the best performance in competition. Therefore, the purpose of this systematic review is to explore the relationship between emotional regulation and sport performance from three perspectives that the theory of emotional regulation, measurement and intervention. The paper uses the method of systematic review. The following databases were searched from CNKI, Wanfang data, Web of Science and EBSCO. Results: 30 articles meeting our inclusionary criteria were identified from 145 articles, including 2 reviews, 20 empirical studies and 8 intervention studies. This review introduced the core points and empirical studies of five significant theories to explain the relationship between emotion regulation and competitive performance, which includes Emotional regulation process model, cognitive motivational relational theory(CMRT), instrumental model of emotion regulation, the multiaction plan model(MAP) and Multilevel Model of Emotion Regulation of Athletes in Teams(MERAT), and discussed similarities and differences of the five theories and the

importance of emotional regulation of athletes. Then introduced a method to evaluate explicit regulation and implicit regulation of emotion regulation by scale, behavioral test and physiological test. Conclusion: emotional regulation is closely related to sport performance, which is affected by emotion, cognitive style, environment and other factors, in team sports, athletes' emotional regulation is also influenced by their teammates. Emotional regulation strategies and confidence in their effectiveness play an important role in the relationship between emotional regulation and performance. Implicit emotion regulation is a valuable way of emotion regulation, which can effectively inhibit the negative emotion and behavior of athletes, but the research on this aspect is relatively scarce in the field of sports. The intervention method that can effectively improve athletes' emotional regulation ability can be summarized into three categories: traditional psychological training method, biofeedback training and mindfulness training. Compared with traditional methods, biofeedback training and mindfulness training can help athletes better perceive and regulate emotions and have more positive effects on sports performance. Therefore, biofeedback training and mindfulness training can be used as daily psychological monitoring and psychological training means for athletes. In the future, it is necessary to further explore the relationship between emotional regulation and sports performance, and strengthen the exploration of implicit emotions and regulation methods in sports, so as to provide basis and methods for subsequent individualized emotional regulation intervention from both explicit and implicit levels.

龙舟运动员情绪调节策略对运动决策影响

左琳 姜媛（通讯作者）

北京体育大学心理学院，北京，100084, jiangyuan97@sina.cn

摘要 本研究为探讨情绪调节策略在不同比赛情境和比赛阶段中对龙舟运动员决策正确率和速度的影响，采用实验法，以某大学龙舟队 32 名男运动员为研究对象，年龄在 18 岁到 22 岁，采用 2（情绪调节策略：认知重评策略，表达抑制策略）×3（比赛情境：船头领先，船头持平，船头落后）×3（比赛阶段：启航，途中，冲刺）的混合实验设计，自变量是情绪调节策略、比赛情境、比赛阶段，因变量是运动员的运动决策。研究结果发现：1.运动员运动决策的正确率在领先的时候高于落后和持平的时候。2.运动员运动决策的正确率在冲刺阶段高于启航与途中阶段；运动员运动决策的速度在途中和冲刺阶段快于启航阶段。3.采取认知重评策略的运动员运动决策速度快于采取表达抑制策略的运动员运动决策速度。4.采取表达抑制策略的运动员运动决策速度在途中阶段快于冲刺和启航阶段；在途中阶段，运动员运动决策的正确率在领先的时候高于落后和持平的时候；在冲刺阶段，运动员运动决策的速度在领先的时候快于持平和落后的时候。结论：龙舟运动员的运动决策正确率在冲刺阶段领先的时候最高；龙舟运动员的运动决策速度在途中阶段最快；无论是何种比赛情境和比赛阶段，采取认知重评策略的龙舟运动员运动决策速度均快于采取表达抑制策略的龙舟运动员运动决策速度。

Influence of emotion regulation strategies on sports decisions of dragon boat athletes

Zuo Lin, Jiang Yuan(Corresponding Author)

School of Psychology, Beijing Sport University, Beijing, 100084, jiangyuan97@sina.cn

Abstract: In order to explore the influence of emotion regulation strategy on the correct rate and speed of decision-making of dragon boat athletes in different competition situations and stages, the experimental method was used to study 32 male athletes of a university dragon boat team, aged 18 to 22, using 2(emotion regulation strategy: cognitive reappraisal strategy, expression inhibition strategy)×3(competition situation: bow leading, bow flat, backward)×3(race stage: sailing, on the way, sprint)×3(race stage: mood regulation strategy, race situation, race stage, race stage) The dependent variable is the athlete's motion decision. The results show that :1. The accuracy of athletes'

sports decision-making is higher than that of backward and flat. 2. the correct rate of athletes' sports decision is higher in the sprint stage than in the sailing stage and the speed of athletes' sports decision is faster in the en route and sprint stage than in the sailing stage. Athletes who 3. adopt cognitive re-evaluation strategy are faster than athletes who adopt expression inhibition strategy. Athletes who 4. adopt the expression suppression strategy are faster in the en route stage than in the sprint and sailing stage; in the en route stage, the correct rate of the athlete's sports decision is higher than that of the backward and flat when leading; in the sprint stage, the speed of the athlete's sports decision is faster than the flat and backward when leading. Conclusion: The correct rate of motion decision of dragon boat athletes is the highest when the sprint stage is leading, the speed of motion decision of dragon boat athletes is the fastest on the way stage, and the speed of motion decision of dragon boat athletes adopting cognitive re-evaluation strategy is faster than that of dragon boat athletes adopting expression suppression strategy.

情绪、情绪调节策略与目标定向对运动员行为抑制的影响

张诗艺¹ 姜媛² (通讯作者)

1 北京体育大学, 北京, 100084

2 北京体育大学心理学系, 北京, 100084, jiangyuan97@sina.cn

摘要 情绪对行为抑制的影响是运动心理学研究的重要内容。行为抑制是个体能够快速抑制先前形成的优势反应, 重新调整判断做出新的正确反应的能力。运动员在比赛场上时常需要行为抑制帮助转化因误判而产生的错误应对动作。赛场上不同情绪会影响运动员的注意、决策以及行为, 因此探讨不同情绪调节策略对于不同情绪的调节效果, 有利于运动员在运动场上迅速调整状态, 发挥应有竞技水平。目标定向理论假定人在定义成就和判断感知能力方面采用不同的方式, 个体在处理成就任务的时候, 依据自己对自身能力的评价, 其目标类型性质也会发生变化。探讨三者对于运动员行为抑制的影响有利于丰富心理学领域相关研究同时丰富运动训练学相关理论, 对提高运动员的运动表现和运动成绩有重要意义。本研究采用问卷法与实验法, 以同场对抗类项目运动员 105 名为研究对象, 采用 2 (情绪: 积极、消极) × 2 (情绪调节策略: 认知重评、表达抑制) × 2 (目标定向: 任务定向、自我定向) 三因素被试间设计, 结果: (1) 情绪主效应显著, 消极情绪状态下运动员行为抑制正确率更高; 情绪调节策略主效应边缘显著, 使用表达抑制策略运动员行为抑制稍好于认知重评策略; 目标定向主效应显著, 任务定向运动员的行为抑制好于自我定向运动员。(2) 情绪、情绪调节策略与目标定向间两两交互效应均不显著。(3) 情绪、情绪调节策略与目标定向共同影响运动员行为抑制, 消极情绪状态下使用认知重评策略的自我定向运动员在行为抑制任务中成绩最好。结论: 运动员行为抑制受到情绪、情绪调节策略与目标定向的共同影响。消极情绪状态下, 任务定向运动员采取表达抑制策略能够有效调节情绪对于行为抑制的影响; 自我定向运动员采取认知重评策略能够有效调节情绪对行为抑制的影响。

The Impact of Emotion, Emotional Regulation Strategies and Goal Orientation on Behavioral Inhibition of Athletes

Zhang Shiyi¹, Jiang Yuan² (Corresponding author)

1 Beijing Sport University, Beijing, 100084

2 Psychology College Beijing Sport University, Beijing, 100084, E-mail jiangyuan97@sina.cn

Abstract: The influence of emotion on behavior inhibition is an important content of sports psychology research. Behavioral inhibition is the ability of an individual to quickly suppress previously formed dominant responses and to readjust judgments and make new correct responses. Athletes often need behavior suppression to help transform the wrong response actions caused by misjudgment. Different emotions on the field will affect athletes' attention, decision-making and behavior. Therefore, exploring the effects of different emotional regulation strategies on

different emotions is conducive to athletes' rapid adjustment of status on the field and their due competitive level. The theory of goal orientation assumes that people adopt different ways in defining achievement and judging perception ability. When an individual handles achievement tasks, according to his own evaluation of his own ability, the type and nature of his goals will also change. To explore the influence of the three factors on athletes' behavior inhibition is beneficial to enrich the relevant researches in the field of psychology and enrich the relevant theories of sports training, which is of great significance to improve athletes' athletic performance and performance. This research adopts the questionnaire method and experimental method, with 105 athletes competing against class project named the research object, using 2 (emotions: positive and negative) $\times$ 2 (emotion regulation strategies: cognitive reappraisal and expression suppression) $\times$ 2 (goal orientation, task orientation and ego orientation) three factors between subjects design. Results: (1) the main effect significant, negative mood state of athletes behavior inhibition of higher accuracy; The edge of main effect of emotion regulation strategy was significant, and the behavioral inhibition of athletes using expression inhibition strategy was slightly better than that of cognitive reappraisal strategy. The main effect of target orientation is significant and task-oriented athletes' behavior inhibition is better than that of self-oriented athletes. (2) The pairwise interaction effect between emotion, emotion regulation strategy and target orientation is not significant. (3) Emotion, emotion regulation strategy and target orientation influence athletes' behavioral inhibition together. Self-oriented athletes who use cognitive reevaluation strategy in negative emotional state have the best performance in the behavioral inhibition task. Conclusion: The inhibition of athletes' behavior is influenced by emotion, emotion regulation strategy and target orientation. Under negative emotional state, task-oriented athletes can effectively regulate the influence of emotion on behavior inhibition by adopting expression inhibition strategy; Self-directed athletes adopting cognitive reappraisal strategy can effectively regulate the influence of emotion on behavioral inhibition.

情绪对不同威胁敏感性运动员注意控制的影响

关雅婧 姜媛（通讯作者）

北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘要 目的：探究威胁敏感性高低的运动员在不同情绪状态下注意控制功能中注意转换和注意集中的差异。方法：使用《威胁敏感性量表》选取威胁敏感性高和低的运动员，采用项目鉴别指数法把被试根据量表总分的高低次序排列，前 27% 为高威胁敏感性运动员，后 27% 为低威胁敏感性运动员。采用视频诱发情绪，经 5 点评分快乐情绪视频 3.9 分，愤怒情绪视频 3.5 分，均满足要求，视频时长各 4 分钟。任务转换范式要求在不断变化的环境中个体根据特定需要稳定保持或灵活转换目标，根据重复任务反应时可以判断注意集中功能，转换任务反应时可以衡量注意转换的水平高低。筛除情绪诱发效果差的被试 9 名后，有效参与者共 79 名。研究参与者包含高威胁敏感性运动员 40 人，低威胁敏感性运动员 39 人，女生 36 人，男生 43 人，平均年龄 20.73 ± 2.17 岁，所有参与者视力或矫正视力正常。实验采用 2（威胁敏感性：高、低） $\times$ 2（情绪状态：快乐、愤怒）被试间设计，因变量是重复任务和转换任务的反应时。结果：以威胁敏感性和情绪作为组间自变量，以重复任务和转换任务反应时为因变量进行两因素方差分析可知，不同威胁敏感性运动员在重复任务中差异显著， $F(1,78) = 4.36$ ， $p < .05$ ，高威胁敏感性运动员的重复任务反应时（ 851.36 ± 272.24 ）长于低威胁敏感性（ 831.68 ± 295.84 ）。情绪在转换任务上主效应显著， $F(1,78) = 7.40$ ， $p < .01$ ，快乐情绪状态下运动员的转换任务反应时（ 896.39 ± 287.24 ）长于愤怒情绪状态下的情况（ 870.45 ± 287.50 ）。威胁敏感性和情绪的交互作用不显著，但描述统计结果显示，高威胁敏感性运动员在快乐时重复任务反应时（ 858.18 ± 265.63 ）长于愤怒时（ 844.86 ± 278.38 ），而低威胁敏感性运动员在快乐情绪中重复任务反应时（ 828.60 ± 295.66 ）比愤怒状态下（ 834.99 ± 296.18 ）短。结论：低威胁敏感性运动员更能保持注意集中，愤怒情绪状态下运动员非常警觉，在注意转换功能上表现较好，情绪对不同威胁敏感性运动员注意控制的影响有待深入讨论，进一步研究其作用机制。

The Impact of Emotion on Attention Control of Athletes with Threat Sensitivity

Guan Yajing, Jiang Yuan(corresponding author)

School of Psychology, Beijing Sport University, Beijing, 100084, jiangyuan97@sina.cn

Abstract: Purpose: To explore the difference of attention conversion and attention concentration in attention control functions of athletes with high or low threat sensitivity under different emotional states. Method: Use the "Threat Sensitivity Scale" to select athletes with high and low threat sensitivity, and use the item discrimination index method to rank the subjects according to the total score of the scale. The top 27% are high threat sensitive athletes, and the last 27% are athletes with low threat sensitivity. Video is used to induce emotions. After 5-point scoring, the happy emotion video is 3.9 points, and the angry emotion video is 3.5 points, both of which meet the requirements, and the video duration is 4 minutes each. The task switching paradigm requires individuals to stably maintain or flexibly switch goals according to specific needs in a constantly changing environment. According to the response of repeated tasks, the attention concentration function can be judged, and the level of attention conversion can be measured when the response of switching tasks is changed. After screening out 9 subjects with poor emotional inducing effects, there were 79 effective participants. The study participants included 40 high-threat-sensitive athletes, and 39 low-threat-sensitive athletes, 36 girls, and 43 boys, with an average age of 20.73 ± 2.17 years old. All participants had normal or corrected vision. The experiment adopts a design of 2 (threat sensitivity: high, low) $\times$ 2 (emotional state: happy, angry) between subjects, and the dependent variable is the response time of repetitive tasks and switching tasks. Results: Taking threat sensitivity and emotion as the inter-group independent variables, and using the repetitive task and switching task response time as the dependent variable, a two-factor analysis of variance showed that athletes with different threat sensitivity have significant differences in repetitive tasks, $F(1,78) = 4.36, p < .05$, the repetitive task response time (851.36 ± 272.24) of high threat sensitivity athletes is longer than that of low threat sensitivity (831.68 ± 295.84). Emotion has a significant main effect on the switching task, $F(1,78) = 7.40, p < .01$, the response time of the athlete in the happy emotional state (896.39 ± 287.24) is longer than the situation in the angry emotional state (870.45 ± 287.50). The interaction between threat sensitivity and emotion is not significant, but the descriptive statistics show that the high-threat-sensitive athletes have longer repetitive tasks when they are happy (858.18 ± 265.63) than when they are angry (844.86 ± 278.38), while low-threat-sensitive athletes' response time of repeated tasks in the happy mood (828.60 ± 295.66) is shorter than that in the anger state (834.99 ± 296.18). Conclusion: Athletes with low threat sensitivity are more able to maintain attention concentration. Athletes are very alert in the state of anger and perform better in the attention conversion function. The influence of emotions on the attention control of athletes with different threat sensitivity needs to be discussed in depth, and its mechanism of action should be further studied.

运动对抑郁干预的元分析

董亚琦 胡济光 胡君 童美玲 卢志鹏 洪亮

共青城市中学, 江西九江, 332020, 3079359109@qq.com

摘要 目的: 本文通过分析运动对抑郁症干预的相关文献, 为临床运动处方治疗抑郁提供理论支持, 力求通过科学规律的身体锻炼来改善人们抑郁水平。方法: 以“体育参与”、“运动”、“体育锻炼”、“抑郁”为中文关键词, 以“physical participation” OR “exercise” OR “sports” AND “depression”为英文检索词, 在中国知网、万方数据库、PubMed 数据库、SCI 科学引文索引 WOS 数据库精确检索相关文献, 时间跨度为建库以来到 2020

年 12 月底。采用 Review Manager5.3 软件进行发表偏倚检验、异质性检验、绘制森林图，并对数据进行亚组分析和敏感性分析。结果：（1）本文纳入 14 篇文献共 1312 名调查对象，其中实验组 716 名，对照组 596 名，运用 Cochrane 工具对所纳入的文献进行质量学评价，纳入文章质量处于中等水平以上。（2）亚组分析结果：运动能很好地缓解大学生（ $P<0.00001$ ）和中学生（ $P<0.00001$ ）的抑郁水平。运动跑台、太极拳、健美操、健身气功、普拉提、网球对抑郁均有显著的干预效果。中等强度运动（ $P<0.00001$ ）对抑郁症的缓解有显著的效应。结论：中等及以上强度的运动均能改善学生的抑郁水平，中等强度的有氧运动对抑郁症干预效果最佳。运动可以刺激神经递质、去甲肾上腺素、多巴胺和内啡肽的分泌，从而有效降低抑郁水平。针对抑郁症群体的具体情况，合理调整运动参数，形成个性化的健身运动处方，通过体育锻炼转移抑郁人群的注意力，拓展人际渠道，合理调控情绪，实现抑郁症的精准干预。

Meta-analysis of the intervention of sports on depression

Yaqi Dong, Jiguang Hu, Jun Hu, Meiling Tong, Zhipeng Lu, Liang Hong

Gongqing City Middle School; Jiujiang, Jiangxi 332020

Abstract: Objective: This article analyzes the relevant literature on the intervention of exercise on depression, provides theoretical support for clinical exercise prescription to treat depression, and strives to improve people's depression level through scientific and regular physical exercise. Method: Use "sports participation", "sports", "exercise", "depression" as Chinese keywords, and "physical participation" OR "exercise" OR "sports" AND "depression" as English search terms, which are known in China Net, Wanfang database, PubMed database, SCI scientific citation index WOS database accurately retrieve relevant documents, the time span is from the establishment of the database to the end of December 2020. The Review Manager5.3 software was used for publication bias test, heterogeneity test, forest map drawing, and subgroup analysis and sensitivity analysis of the data. Results: (1) A total of 1312 survey subjects were included in 14 articles, of which 716 were in the experimental group and 516 were in the control group. Cochrane tools conducted a qualitative evaluation of the included articles, and the quality was above the medium level. (2) Subgroup analysis results: exercise can well alleviate the depression levels of college students ($P<0.00001$) and middle school students ($P<0.00001$). Sports treadmills, Tai Chi, aerobics, Health Qigong, Pilates, and tennis all have significant intervention effects on depression. Moderate-intensity exercise ($P<0.00001$) has a significant effect on the relief of depression. Conclusion: Moderate-intensity aerobic exercise has a significant effect on depression intervention. Exercise stimulates the secretion of neurotransmitters, norepinephrine, dopamine and endorphins, thereby effectively reducing the level of depression. According to the specific situation of the depression group, reasonably adjust the exercise parameters, form a personalized fitness exercise prescription, divert the attention of the depressed group through physical exercise, expand interpersonal channels, Reasonable control of emotions, and achieve precise intervention for depression.

Keywords: exercise, depression, intervention, meta-analysis

体育锻炼对大学生心理健康水平的影响：心理弹性的中介作用

李蕊¹ 姜媛²

1 北京体育大学，北京，100084

2 北京体育大学心理学院，北京，100084, jiangyuan97@sina.cn

摘要 为明确体育锻炼对心理健康的作用机制，本研究构建了一个中介模型，重点考察了心理弹性在二者关系中的中介作用。以 500 名大学生为调查对象，使用抑郁自评问卷（SDS）测量的抑郁情绪作为心理健康水平的消极情绪指标，以 PANAS 中积极情绪指作为心理健康水平的积极维度评价指标，体育活动等级量表考察体育锻炼强度，Conner-Davidson 心理弹性量表（中文版）测量心理弹性。结果显示：（1）锻炼水平与心理弹性（ $r=.250, p<.0.01$ ）、积极情绪（ $r=.198, p<.0.01$ ）显著正相关，与抑郁（ $r=-.198, p<.0.01$ ）显著负相关；心理弹性与积极情绪（ $r=.337, p<.0.01$ ）、显著正相关，与抑郁（ $r=-.576, p<.0.01$ ）显著负相关。

(2) 中介效应检验发现: 在控制了性别、年级和学科类型之后, 体育锻炼对积极情绪有显著的正向预测作用, 心理弹性在体育锻炼与积极情绪的关系中起部分中介作用, 该直接效应为.115, 心理弹性的中介效应为.097, 分别占总效应 (.212) 的 54.25%和 45.75%。在控制了性别、年级和学科类型之后, 体育锻炼对抑郁有显著的负向预测作用, 心理弹性在体育锻炼和抑郁的关系中起完全中介作用, 该直接效应为-.055, 心理弹性的中介效应为-.098, 分别占总效应 (-.153) 的 35.95%和 64.05%。研究结果不仅有利于全面理解体育锻炼对心理健康积极和消极两个维度的影响, 而且可以引导大学生积极参加体育活动, 使其成为改善大学生心理健康水平的有效方法。

Effects of Physical Exercise On Mental Health of College Students: Mediating Effect of Resilience

Li Rui, Jiang Yuan

Beijing Sports University, Beijing

Abstract: In order to give an interpretation for the relationship and complex mechanisms between physical exercise and mental health, the present study conducted a model of mediation, focusing on the mediation role of resilience in the relationship between the two. In this study, 500 college students were participated by using Self-rating Depression Scale (SDS) as a negative emotional indicator of mental health, The Positive and Negative Affect Scale (PANAS) was used to evaluate the level of positive emotion, physical activity rating scale was used to evaluate the intensity of physical exercise, Conner-Davidson Resilience Scale (Chinese version) was used to measure resilience. The results showed that: (1) physical exercise was positively correlated with resilience ($r=.250, p<.0.01$) and positive emotion ($r=.198, p<.0.01$), negatively correlated with depression ($r=-.198, p<.0.01$); resilience was positively correlated with positive emotion ($r=.337, p<.0.01$), and negatively correlated with depression ($r=-.576, p<.0.01$). (2) After controlling for gender, grade and subject type, physical activity has a positive direct effect on positive emotion; resilience plays a part of mediating role in the relationship between physical exercise and positive emotion. The direct effect is .115, the mediating effect of resilience is .097, accounting for 54.25% and 45.75% of the total effect (.212) respectively. After controlling for gender, grade and subject type, physical activity has a negative effect on depression; resilience plays a completely of mediating role in the relationship between physical exercise and depression. The direct effect is -.055, the mediating effect of resilience is-.098, accounting for 35.95% and 64.05% of the total effect (-.153) respectively. The research results are not only helpful to understand the influence of physical exercise on the positive and negative dimensions of mental health, but also can guide college students to take an active part in physical activities, it is an effective method to improve the mental health level of college students.

Keywords: physical activity, mental health, resilience

短时有氧运动影响执行功能的安慰剂效应

王俞卜 高峰 郭璐 (通讯作者)

北京体育大学心理学院, 北京, 100084, guol@bsu.edu.cn

摘要 目的: 实验一探讨了习惯性预期的安慰剂效应(placebo effect)及反安慰剂效应(nocebo effect); 实验二首先探讨了诱发预期的安慰剂效应及反安慰剂效应, 然后探讨了习惯性预期在诱发预期产生安慰剂效应及反安慰剂效应关系间的调节作用。方法: 本研究在 30min 中等强度有氧运动干预前后测量执行功能。实验一: 选用大学生 171 人($M_{age} = 19.61 \pm 2.138$ 岁), 其中男生 75 人, 女生 96 人。采用 3 (习惯性预期: 积极、中性、消极) $\times$ 2 (时间: 前测、后测) 的混合实验设计, 因变量为 Go/No Go 任务的 d 值和 Go 反应时(抑制功能), 2-back 任务的正确率和反应时(刷新功能), More odd shifting 任务(转换功能)的混合正确率和转换成本。实验二: 来自研究一中的参与者 150 人($M_{age} = 19.53 \pm 1.903$ 岁), 其中男生 69 人, 女生 81 人。采用 3 (诱发预期: 积极、中性、消极) $\times$ 3 (习惯性预期: 积极、中性、消极) $\times$ 2 (时间: 前测、后测) 的混合实验设计, 因变量同实验一。

结果：重复测量方差分析结果显示：实验一：习惯性预期与时间对 d 值的交互作用显著 $[F(2, 148) = 5.058, p = .008, \eta_p^2 = .064]$ ，简单效应分析发现，积极组后测 d 值显著大于前测 $[p = .003, 95\%CI = 0.099-0.490]$ ，表明积极的习惯性预期对运动改善抑制功能产生安慰剂效应。转换成本的习惯性预期与时间的交互作用显著 $[F(2, 141) = 4.214, p = .017, \eta_p^2 = .056]$ ，简单效应分析发现，消极组后测转换成本显著大于前测 $[p = .014, 95\%CI = 9.968-85.341]$ ，表明消极的习惯性预期对运动改善转换功能产生反安慰剂效应。实验二：d 值的诱发预期与时间的交互作用显著 $[F(2, 126) = 5.769, p = .004, \eta_p^2 = .084]$ ，简单效应分析发现，积极组后测 d 值显著大于前测 $[p = .040, 95\%CI = 0.013-0.541]$ ，消极组后测 d 值显著小于前测 $[p = .008, 95\%CI = -0.595-0.092]$ ，表明积极的诱发预期对运动改善抑制功能产生安慰剂效应，消极的诱发预期对运动改善抑制功能产生反安慰剂效应。结论：运动对抑制功能和转换功能的效益受习惯性预期影响，运动对抑制功能的效益受诱发预期影响，积极预期增强认知效益，消极预期削减认知效益。

Placebo Effect of Short-term Aerobic Exercise on Executive Function

Yu-Bu Wang, Feng Gao, Lu Guo

Beijing Sport University, School of Psychology, Beijing, 100084

Abstract: Objective: In Experiment 1, we investigated the placebo effect and the nocebo effect of habitual expectation. In Experiment 2, we first investigated the placebo effect and nocebo effect of induced expectation, and then investigated the moderating effect of habitual expectations on the relationship between placebo effect and nocebo effect of induced expectation. Methods: In this study, executive function was measured before and after a 30 min moderate-intensity aerobic exercise intervention. Experiment 1: 171 college students ($M_{age} = 19.61 \pm 2.138$ years) were selected, including 75 males and 96 females. A mixed experimental design of 3 (habitual expectation: positive, neutral, negative) $\times$ 2 (time: pre-test, post-test) was adopted, and the dependent variables were the d value and Go response of Go/No Go task, the accuracy of 2-back task and the response time, and the mixed accuracy and switching cost of More odd shifting task. Experiment 2: 150 participants from study 1 ($M_{age} = 19.53 \pm 1.903$ years), including 69 males and 81 females. A mixed experimental design of 3 (induced expectation: positive, neutral, negative) $\times$ 3 (habitual expectation: positive, neutral, negative) $\times$ 2 (time: pre-test and post-test) was adopted, and the dependent variable was the same as Experiment 1. Results: Experiment 1: d value: The interaction between the habitual expectation and time was significant $[F(2, 148) = 5.058, p = .008, \eta_p^2 = .064]$. Simple effect analysis showed that the post-test' s d value of the active group was significantly higher than that of the pre-test' s d value $[p = .003, 95\%CI = 0.099-0.490]$. The results showed that positive habitual expectations had a placebo effect on the inhibitory function of exercise improvement. Switching cost: The interaction between the habitual expectation and time was significant $[F(2, 141) = 4.214, p = .017, \eta_p^2 = .056]$. Simple effect analysis showed that the post-test' s switching cost in the negative group was significantly higher than that in the pre-test' s switching cost $[p = .014, 95\%CI = 9.968-85.341]$. These results suggest that negative habitual expectations have a nocebo effect on the conversion function of exercise improvement. Experiment 2: d value: The interaction between induced expectation and time was significant $[F(2, 126) = 5.769, p = .004, \eta_p^2 = .084]$. Simple effect analysis showed that the post-test' s d value of the active group was significantly higher than that of the pre-test' s d value $[p = .040, 95\%CI = 0.013-0.541]$. The post-test' s d value of the negative group was significantly lower than that of the pre-test' s d value $[p = .008, 95\%CI = -0.595-0.092]$, indicating that the positive inductive expectation had a placebo effect on the inhibitory function of exercise improvement, while the negative inductive expectation had a nocebo effect on the inhibitory function of exercise improvement. This study did not find a moderating effect of habitual expectations. Conclusion: The benefits of exercise on inhibitory function and conversion function are affected by habitual expectation, and the benefits of exercise on inhibitory function are affected by induced expectation. Positive expectation enhances cognitive benefit, while negative expectation decreases cognitive benefit. Placebo expectation may be an important psychological factor

affecting the executive function of exercise improvement, which should be paid more attention to in subsequent studies.

单次 HIIE 运动时长与注意策略对久坐少动大学生情感反应的影响

侯俊如¹ 郭璐² (通讯作者)

1 北京体育大学运动心理学院, 北京, 100084

2 北京体育大学运动心理学院, 北京, 100084, guolu2000@163.com

摘要 目的: 本研究旨在探究不同运动时长的高强度间歇运动与不同注意策略对久坐少动大学生运动情感反应的影响, 以尝试找到能够改善久坐少动者情感反应的最佳运动方法。方法: 研究选取低身体活动水平大学生 100 名, 锻炼强度偏好低且容忍度低, 锻炼阶段处于准备期或意向期。采用二因素组间实验设计, 自变量 1 为 1:1HIIE 的运动时长 (30s、45s、60s), 自变量 2 为注意策略 (分离型、联结型), 因变量为情感效价和运动后愉悦感, 其中情感效价在运动过程中的 20%、40%、60%、80%、100% 进行重复测量, 探究不同运动时长及注意策略对 HIIE 情感反应的影响。结果: (1) 对于运动期情感效价, 注意策略与测量时间点交互作用显著, 在分离型注意策略中, 运动期 20% 时的情感效价显著高于其他四个测量时间点。而联结型注意策略所产生的情感效价在各时间点上没有显著差异; 运动时长和注意策略交互作用显著, 在 60sHIIE 中, 分离型注意策略得分显著高于联结型注意策略。(2) 对运动期恢复期情感效价的差值, FS 测量时间点主效应显著, 20% 的 FS 差值显著低于其他四个时间点, 运动结束时的 FS 显著高于其他四个时间点。即随着 HIIE 的进行, 运动期与恢复期所产生的 FS 差值逐渐增大, 在运动结束时达到最大。(3) 对运动后愉悦感而言, 运动时长与注意策略的交互作用显著, 在 30sHIIE 中, 联结型注意策略所产生的运动后愉悦感显著高于分离型注意策略。在 60sHIIE 中, 分离型注意策略所产生的运动后愉悦感显著高于联结型注意策略。结合描述统计结果可以发现, 30s-联结型和 60s-分离型这两组被试的 PACES 得分也最高。结论: (1) 在运动休息比为 1:1 的 HIIE 运动中, 恢复期能够使得运动期下降的情感效价得到恢复, 从而始终保持在较为积极的状态。(2) 在不同运动时长的 HIIE 中选择适当的注意策略可以提高运动情感反应。在 30sHIIE 中使用联结型注意策略会产生更高的运动后愉悦感, 在 60sHIIE 中使用分离型注意策略会产生更好的运动中情感效价及运动后愉悦感。

Effects of single HIIE duration and attention strategies on emotional responses and subsequent exercise of sedentary people

Hou Junru¹, Guo Lu²

1 Department of Psychology, Beijing Sports University, Beijing, 100084

2 Department of Psychology, Beijing Sports University, Beijing, 100084, guolu2000@163.com

Abstract: Objective: The purpose of this study was to explore the influence of different duration of high-intensity interval exercise and different attention strategies on the emotional response of sedentary and sedentary college students to exercise, so as to try to find the best exercise method to improve the emotional response of sedentary college students. Methods: The study selected 100 college students with low physical activity level, with low exercise intensity preference and low tolerance, and the exercise stage was in the preparation period or intention period. Two-factor group experiment design was adopted. One of the independent variables was 1:1HIIE exercise duration (30s, 45s, 60s), another was attention strategy (separated type, linked type), and dependent variable was affective valence and post-exercise pleasure to explore the effects of different exercise duration and attention strategies on HIIE's emotional response. The affective valence was repeatedly measured in 20%, 40%, 60%, 80%, and 100% of the exercise process. Results : (1) For the affective valence of exercise period, the interaction between attention strategy and measurement time point was significant. In the separate attention strategy, the affective valence of 20% of exercise period was significantly higher than that of the other four measurement time points. The affective valence of

associative attention strategy had no significant difference at each time point. The interaction between exercise duration and attention strategy was significant. In the 60sHIIE, the score of detached attention strategy was significantly higher than that of connected attention strategy. (2) For the difference of affective valence in the recovery period of exercise, the main effect of FS at the measured time point was significant, the difference of FS at 20% was significantly lower than the other four time points, and the difference of FS at the end of exercise was significantly higher than the other four time points. That is, with the progress of HIIE, the FS difference between the exercise period and the recovery period gradually increases and reaches the maximum at the end of the exercise. (3) For the post-exercise pleasure, the interaction between exercise duration and attention strategy is significant. In 30sHIIE, the post-exercise pleasure generated by the associative attention strategy is significantly higher than that generated by the separate attention strategy. In the 60sHIIE group, the dissociative attention strategy produced significantly higher post-exercise pleasure than the associative attention strategy. Combined with the descriptive statistical results, it can be found that 30s-connected and 60s-separated groups also had the highest scores of PACES. Conclusion : (1) In HIIE exercise with exercise rest ratio of 1:1, the recovery period can restore the affective valence decreased during the exercise period, so as to maintain a more active state. (2) Choosing appropriate attention strategies in HIIE with different exercise duration can improve the emotional response to exercise. In the group of 30sHIIE, the associative attentional strategy produced higher post-exercise pleasure, while in the group of 60sHIIE, the separate attentional strategy produced better affective valence and post-exercise pleasure.

单次高强度间歇运动训练与认知训练相结合 对普通大学生多目标追踪表现的影响

岳倩¹ 李杰² (通讯作者) 张禹¹ (通讯作者)

1. 北京体育大学心理学院, 北京, 100084, btzy1973@126.com

2. 杭州师范大学心理科学研究院, 杭州, 311121, lijie.psy@hznu.edu.cn

摘要 目的: 目前增强多目标追踪表现的研究多为单独的认知训练或者单独的运动锻炼对多目标追踪表现的影响, 为此本研究旨在探讨高强度间歇运动训练与认知训练相结合对普通大学生多目标追踪表现的影响。

方法: 高强度间歇运动(High-Intensity Interval Training, HIIT)以 TABATA 运动形式进行, 共两组, 每组八个动作, 每个动作运动形式为先 20s 运动, 后 10s 休息。一组 4min, 中间休息 1min, 约 9min。运动过程中被试的心率为最大心率的 85%。认知训练的形式为自适应多目标追踪(Multiple Object Tracking, MOT)训练, 即当被试在某次追踪时的反应正确, 下一次追踪任务中客体的运动速度将上调 30%; 而当被试反应错误时, 客体的运动速度会下调 20%, 小球的初始速度为 68cm/s, 共 30 个 trail。实验采用 2(测试时间: 前测、后测)×4(组别: MOT 组、HIIT 组、MOT+HIIT 组、对照组)的混合设计, 组间变量为组别, 其中 MOT 组 22 人、HIIT 组 22 人、MOT+HIIT 组 21 人、对照组 21 人, 组内变量为测试时间, 因变量为被试在自适应 MOT 任务中追踪目标客体时能够达到的客体运动速度值, 分别为极值(被试所有正确追踪任务中客体运动速度的最大值, 代表被试的最大追踪能力), 平均阈值(被试所有正确追踪和错误追踪转折点处所对应的客体运动速度值的中点, 代表被试的平均追踪能力), 最后四次阈值(被试追踪过程中最后四次转折点处的客体运动速度的平均值, 代表被试的稳定追踪能力)。结果: 以组别和时间自变量, 前后测成绩为因变量做重复测量方差分析, 结果显示: (1) 最后四次阈值的测试时间主效应显著($F(1,82)=17.629, p=0.000, \eta_p^2=0.177$), 组别主效应不显著, 组别和时间交互作用显著($F(3,82)=3.977, p=0.011, \eta_p^2=0.127$), 进一步的简单效应分析表明, MOT 组、MOT+HIIT 组的后测成绩均好于前测($p=0.003, p=0.000$)。 (2) 极值和平均阈值的测试时间主效应显著($F(1,82)=13.843, p=0.000, \eta_p^2=0.144$) ($F(1,82)=31.919, p=0.000, \eta_p^2=0.280$), 组别主效应以及组别与时间的交互作用不显著。结论: (1) 单次急性认知训练和高强度间歇运动训练与认知训练相结合这两种训练方法均提高了被试的稳定追踪能力。 (2) 单次高强度间歇运动没有改善被试的多目标追踪表现。

The Effect of the Combination of Acute High-Intensity Interval Training and Cognitive Training on the Performance of Multiple Object Tracking of College Students

Qian YUE¹, Jie LI², Yu ZHANG¹

1. College of Psychology, Beijing Sport University, Beijing 100084

2. Institutes of Psychological Sciences, Hangzhou Normal University, Hangzhou 311121

Abstract: Purpose: At present, most of the researches to enhance the performance of multiple object tracking are about the effects of separate cognitive training or separate exercise on the performance of multiple object tracking. Therefore, this study aimed to explore the effect of the combination of acute high-intensity interval training and cognitive training on the performance of multiple object tracking of college students. Methods: High-Intensity Interval Training (HIIT) was performed in the form of TABATA. There were two sets of eight movements in each group. Each movement consisted of 20s exercise followed by 10s rest. One set was 4min, and the rest was 1min, the whole process lasted 9 minutes. The heart rate of the subjects during the exercise was 85% of their maximum heart rate. The form of cognitive training was adaptive Multiple Object Tracking (MOT), and there were 30 trails in total. Adaptive training adopted the adaptive program to control the movement speed of the object. The initial speed of the ball was 68cm/s. When the participant reacted correctly, the movement speed of the object in the next trial would be increased by 30%. When the response was wrong, the object's speed of motion would be reduced by 20%. A mixed design of 2(time: pre-test, post-test) $\times$ 4(group: MOT, HIIT, MOT+HIIT, control group) was adopted. The inter-group variables were group (MOT=22, HIIT=22, MOT+HIIT=21, control group=21), the intra-group variable was time, and the dependent variable was the object velocity value that the subject can achieve when tracking the target object in the adaptive MOT task, which were respectively the extreme value (the maximum movement speed of the object in all correct tracking tasks represented the maximum tracking ability of the subject), the average threshold value (the midpoint of the object velocity values corresponding to all correct tracking and false tracking turning points of the subject represented the average tracking ability of the subject), The last four threshold (the average of the object's speed at the last four turning points in the course of tracking represented the stable tracking ability of the subject). Results: Using group and time as independent variables and pre - and post-test scores as dependent variables, the results of repeated measures ANOVA showed that (1) the main effect of time was significant in the last four thresholds($F(1,82)=17.629, p=0.000, \eta_p^2=0.177$), while the main effect of group was not significant. The interaction between group and time was significant($F(3,82)=3.977, p=0.011, \eta_p^2=0.127$). Further simple effect analysis showed that the scores of MOT group and MOT+HIIT group were better than those of pretest ($p=0.003, p=0.000$). (2) The main effect of test time for extreme value and average threshold was significant($F(1,82)=13.843, p=0.000, \eta_p^2=0.144$) ($F(1,82)=31.919, p=0.000, \eta_p^2=0.280$). The main effect of group and the interaction between group and time were not significant. Conclusions: (1) Both acute cognitive training and the combination of high-intensity interval exercise training and cognitive training improved the subjects' stable tracking ability. (2) Acute high-intensity interval exercise did not improve participants' performance in multiple object tracking.

新冠疫情下居民体育活动和焦虑的特点与关系：有调节的中介模型

付敬伟 张国礼（通讯作者）

北京体育大学心理学院，北京，100084, guoli_zhang@126.com

摘要 2020年伊始，突如其来的新冠疫情席卷全球，对人类各个领域造成了强烈冲击，居民出现群体焦虑，如何制定有效措施促进居民身心健康、社会和谐稳定成为重要问题，探究新冠疫情期间居民体育活动现状、焦虑程度，以及体育活动、积极心理资本、焦虑之间的关系具有重要理论意义和实践价值。目的：考察新冠疫情下居民体育活动、焦虑的特点与关系，分析居民焦虑的缓解效应及作用机制。方法：采用体育活动等级

量表(PARS-3), 积极心理资本问卷(PPQ), 焦虑自评量表(SAS)在全国各地进行网络在线调查, 最终收集 425 份有效数据。结果: 新冠疫情下, 居民体育活动量明显偏少, 居民焦虑程度显著高于普通情境下的常模($t = 15.40$, $p < .001$), 且相对于高体育活动量, 低体育活动量居民的焦虑程度显著更高($t = 2.64$, $p < .01$), 积极心理资本显著更低($t = -3.87$, $p < .001$); 男性在焦虑上的得分显著高于女性($t = 2.81$, $p < .01$), 但在积极心理资本上无性别差异; 体育活动正向预测积极心理资本 ($\beta = .20$, $p < .001$), 积极心理资本负向预测焦虑 ($\beta = -.32$, $p < .001$), 积极心理资本中介了体育活动和焦虑的关系, 亲友互动 (家人互动、朋友互动) 调节了体育活动和积极心理资本之间的关系。结论: 此结果表明居民可以通过体育活动增加积极心理资本缓解焦虑情绪, 且在亲友互动等社会支持不足的情况下居民则更需要通过体育活动等方式来增加积极心理资本, 以缓解焦虑。

Characteristics and Relationship between Residents' Physical Activity and Anxiety under the COVID-19 Epidemic in China: A Moderated Mediation Model

Fu Jingwei, Zhang Guoli

School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: At the beginning of 2020, the sudden outbreak of the COVID-19 swept the world, causing a strong impact on all fields of human beings. The residents have group anxiety. How to formulate effective measures to promote residents' physical and mental health and social harmony and stability has become an important issue. Current status of residents' sports activities, the degree of anxiety, as well as the relationship between physical activity, positive psychological capital, and anxiety have important theoretical significance and practical value. *Objective:* To investigate the characteristics and relationships of residents' physical activity and anxiety under the COVID-19, and analyze the alleviating effect and mechanism of residents' anxiety. *Methods:* Using the Physical Activity Rating Scale (PARS-3), the Positive Psychological Capital Questionnaire (PPQ), and the Self-rating Anxiety Scale (SAS) to conduct online surveys across the country, and finally collect 425 valid data. *Results:* Under the COVID-19, the residents' physical activity was significantly less, and the residents' anxiety was significantly higher than the norm in ordinary situations ($t = 15.40$, $p < .001$), and compared with the high physical activity, The degree of the low physical activity residents' anxiety is significantly higher ($t = 2.64$, $p < .01$), and the positive psychological capital is significantly lower ($t = -3.87$, $p < .001$); males score significantly higher on anxiety than females ($t = 2.81$, $p < .01$), but there is no gender difference in positive psychological capital; physical activity positively predicts positive psychological capital ($\beta = .20$, $p < .001$), and positive psychological capital negatively predicts anxiety ($\beta = -.32$, $p < .001$), positive psychological capital mediates the relationship between physical activity and anxiety, and family-friend interaction (family interaction, friend interaction) mediates the relationship between physical activity and positive psychological capital. *Conclusion:* This result shows that residents can increase their positive psychological capital through physical activities to relieve anxiety, and in the case of insufficient social support such as the interaction of relatives and friends, residents need to increase their positive psychological capital through physical activities to relieve anxiety.

修复不公正的意义：角色、权威修复行为影响法学生司法体系认同感

彭寒羽¹ 马皓²（通讯作者）

¹ 中国政法大学社会学院，北京，100088

² 中国政法大学社会学院，北京，100088，chinafzxl@163.com

摘要 不公正时常发生，且难以避免，如何修复不公正、如何评估和提高修复效果是法律心理学需要关注的社会情景。目前相关的国内实证研究几乎为零，国外的研究也大多集中于组织不公正领域，司法不公正鲜有涉猎。不公正事件发生后的权威机构行为在一定程度上能够使修复不公正事件，使不公正恢复至公正状态，提高受害者或旁观者对权威机构的信任，进而提高公民的司法体系认同感。本研究设计了一个2（角色：受害者、旁观者）*3（权威行为：惩罚行为、赔偿行为、无作为行为）的被试间实验，用以研究权威行为对法学生司法体系认同感的影响。通过对207名中国政法大学的法学生进行实验，结果发现角色、权威行为均会影响法学生的司法体系认同感，具体表现为角色的主效应显著， $F(2, 116)=5.52$ ， $p=0.005$ ， $\eta_p^2=0.09$ ；权威行为的主效应边缘显著， $F(4, 350)=2.25$ ， $p=0.063$ ， $\eta_p^2=0.03$ ；但两者的交互作用不显著；同时组织信任在这一路径中起到了一定中介作用，具体表现为行为满意度能够直接显著正向预测认同感中的成员归属， $B=0.16$ ， $SE=0.06$ ， $\beta=0.21$ ， $t=2.76$ ， $p=0.006$ ；也能够通过组织信任的完全中介作用显著正向预测认同感中的身份认同，组织信任的中介作用为 $B=0.43$ ， $SE=0.13$ ， $\beta=0.27$ ， $t=3.38$ ， $p=0.001$ 。本研究虽存在着实验变量定义困难等问题，但对于修复行为在不公正事件发生后的作用机制起到了一定探索作用，同时为法律心理学的其他研究提供了新思路。

关键词 权威修复行为，不公正，司法体系认同感，组织信任

The Influence of Authority Behavior on Group Identity in Unfair Situation: The Mediating Role of Organizational Trust

Hanyu Peng, Ai Ma

China University of Political Science and Law, School of Sociology, Beijing

Abstract: Authoritative behavior after injustice scenarios can restore injustice to a just state to some extent, increasing the trust of victims or bystanders in authoritative institutions, and then improving their group identity. This research designed a 2 (role: victim, bystander) * 3 (authoritative behavior: punishment behavior, compensation behavior, inaction behavior) between subjects to study the influence of authority behavior on the group identity of law students. Through experiments on 207 law students, it was found that roles and authoritative behaviors affect group identity through different ways; at the same time, organizational trust plays a mediate role. Although this study has problems such as poor experimental manipulation of compensation behavior, it still explores the way to study authoritative behavior in the field of bystanders.

Keywords: actions, group recognition, law student, trust

面部表情欺骗数据库的构建与分析

杨钞操 申寻兵（通讯作者） 牛草园 王俣

江西中医药大学，南昌，330004

摘要 检测欺骗对于个人生活、社会稳定及国家安全至关重要。检测欺骗的关键在于检测欺骗的线索。基于测谎仪、EEG、fMRI、热成像、认知线索及行为线索等方法无法有效地检测欺骗。通过机器学习检测欺骗的言语线索和非言语线索有较高的准确率(高于 54%)。而基于机器学习检测欺骗需要大量的欺骗样本进行建模。因此，构建具有心理学特征的欺骗数据库对于欺骗检测研究有着极为重要的意义。面部表情隐含着较为丰富的潜在欺骗线索（如瞳孔、微表情），且通过表情检测欺骗有较好应用前景。产生欺骗模型的条件有两种：一是自然条件、二是实验室条件。由于欺骗无法被实验人员控制产生。因此，如何在自然条件下或实验室条件下诱发产生高生态效度的欺骗数据模型成为了研究者们热切关注的难题。因此，本研究在两种条件下分别构建了面部表情欺骗数据库，并进行了分析研究。实验一在实验室条件下采用了 38 个情绪诱发视频，基于情绪泄露理论，通过“诱发—抑制”范式采集了 25 名大学生被试（Mean age=19.6, SD=2.25）在自然情绪表达（诚实）和抑制情绪表达（欺骗）下的面部表情线索，并通过一台高清摄像机捕捉记录。得到了 920 个视频，其中诚实 462 个，欺骗 458 个。使用了机器学习软件 OpenFace2.0 对视频进行处理并输出面部表情的 AU (Action Unit)强度及相关距离指标。并通过 Python 对这些指标进行计算整合，使用 SPSS 对诚实和欺骗的数据进行配对样本 t 检验。实验二在自然条件下以“狼人杀”欺骗游戏的范式，通过两台摄像机分别采集了 59 名大学生和 29 名戒毒人员（Mean age=28.24, SD=9.45）的面部表情线索。通过视频剪辑软件剪辑出 750 个视频，其中诚实 474 个，欺骗 276 个，处理分析同实验一。结果显示，在实验室条件下，诚实和欺骗的一些指标存在着显著差异，而自然条件下的指标均无显著性差异。由于本研究仅采用了配对样本 T 检验进行分析，后续研究可用机器学习的方式进行分析处理或许能有更好的结果说明。

关键词 面部表情，欺骗线索，欺骗检测，数据库、机器学习

Construction and Analysis of Facial Expression Deception Database

Chaocao Yang, Xunbing Shen*, Caoyuan Niu, Yu Wang

College of Humanities, Jiangxi University of Chinese Medicine, Nanchang 330004, China

Abstract: Detecting deception proves crucial for individual lives, social stability, and national security. And the critical of detecting deception seems to detect deception cues. Researchers explored numerous deception cues, such as Polygraph, EEG, fMRI, thermal imaging techniques, cognitive cues, behavioral cues. In general, those detection method looks invalidated. Thus, researchers derived high accuracy rates (higher than 54%) by machine learning, which can detect verbal and nonverbal cues which seems difficulty to be perceived by naked eye. However, this method requires a sea of deception samples for building the model. Therefore, constructing a deception database with psychological features proves crucial for machine learning to detect deception. Since facial expressions contain plentiful potential deception cues, which might exist a good application prospect. Consequently, we constructed a facial expression deception database under laboratory and natural conditions. A comparative study of deception databases in both conditions was conducted. In the 1st experiment, 38 emotion-evoking videos were used to eliciting facial expression cues under laboratory conditions. We recruited 25 graduates (Mean age= 19.6, SD = 2.25) and employed 19 videos to elicit natural emotion (truthful) and utilized the other videos to elicit fake emotion (deceptive). 920 videos were edited by software Adobe Premiere, including 462 truthful and 458 deceptive. The machine learning software OpenFace 2.0 was employed to process the videos and output facial expression metrics. Python was utilized to compute the metrics and Paired-Samples T test was employed to analysis metrics. In 2nd experiment, the facial expressions of 59 college students and 29 drug addicts (Mean age=28.24, SD = 9.45) were captured by two high-speed cameras under natural conditions, which named "werewolf" deception game. We edited 750 videos by video editing software Adobe Premiere, including 474 honest and 276 deceptive. The analysis appeared the same as 1st experiment. The results showed that there were significant differences between some indicators of honesty and deception in laboratory conditions, while there were no significant differences in natural conditions. Since this study

only used the paired sample T-test for testing, machine learning may be employed for computing and processing in subsequent studies to obtain better results.

Risk-Need-Responsivity 理论模型对戒毒人员适用性的评价

徐晓锋

中央司法警官学院, 保定, 0710501, 1003778942@qq.com

摘要 加拿大学者 Andrews 等 1990 年提出 Risk-Need-Responsivity (简称 RNR) 理论, RNR 理论包括危险原则、需求原则、反应原则。Andrews 和 Bonta(2010) 把八个中心危险和需求因素分成“大四”危险因素和“中四”危险因素。该理论在罪犯矫治领域影响很大, 但该理论的应用量表在戒毒领域效度结论不一。研究发现: RNR 理论对吸毒犯矫治效果预测总体适用性不高。作 RNR 理论的应用, 第三代风险评估 LSI-R 量表对成年吸毒犯具有较高的预测效度; YLS/CMI 量表测量青少年吸毒犯, 物质滥用子量表对再犯预测效度较低, 同伴关系和态度子量表对再犯预测效度较高。第四代风险评估 LS/CMI 量表是 LSI-R 量表的发展, 以该量表为因变量的研究发现吸毒犯和其他罪犯在总分、犯罪历史子量表、酒精/毒品问题子量表三项指标上有显著的差异。依据 RNR 理论, 犯因性需要因素对农村地区农民毒品使用和犯罪之间联系的预测效度较高, 反社会人格模式和亲犯罪态度量表对后续严重吸毒行为预测效度较高。综合 RNR 理论在戒毒领域应用效度的研究, 可以认为 RNR 理论在戒毒领域并不完全像罪犯以罪犯为研究对象一样完全适用, 在戒毒矫治领域以 RNR 理论为指导, 在以吸毒犯作为研究对象时, RNR 理论及毒品子量表条目需要进行修订, 尤其是增加毒品子量表的条目, 并需要以戒毒人员为对象进行验证。

关键词 RNR 理论, 戒毒人员, 适用性, 评价

Evaluation of the applicability of risk-needy-responsivity theory model to drug addicts

Xu XiaoFeng

Central Institute for correctional Police, Baoding, 0710501, China

Abstract: Canadian scholar Andrews et al proposed Risk-Need-Responsivity (hereinafter referred to as RNR) theory in 1990. RNR theory includes danger principle, demand principle and response principle. Andrews and Bonta(2010) divide the eight central risk and need factors into "senior" risk factors and "middle fourth" risk factors. The theory has great influence in the field of correction of criminals, but the validity of the application scales of the theory in the field of drug rehabilitation is different. It is found that the overall applicability of RNR theory to predicting the correction effect of drug offenders is not high. With the application of RNR theory, the third generation risk assessment scale LSI-R has a high predictive validity for adult drug offenders. YLS/CMI scale was used to measure juvenile drug offenders. Substance abuse subscale had a lower predictive validity for recidivism, while peer relationship and attitude subscale had a higher predictive validity for recidivism. The LS/CMI scale of the fourth generation of risk assessment is the development of the LSI-R scale. Using this scale as the dependent variable, it is found that there are significant differences between drug offenders and other offenders in the three indicators of total score, criminal history sub-scale and alcohol/drug problem sub-scale. According to the RNR theory, the factors of criminal need have a high predictive validity for the relationship between drug use and crime among rural farmers, and the antisocial personality model and pro-criminal attitude scale have a high predictive validity for the subsequent serious drug use. Comprehensive RNR theory applied in the field of drug research, the reliability and validity of can think RNR theory in the field of drug is not like a criminal to criminals as completely as the research object, in the field of drug treatments in RNR theory as the instruction, in the drug addicts as the research object, the theory of RNR and drug inventory items need to be revised, especially to increase drug inventory items, And it needs to be verified with drug addicts as the object.

遭遇同伴侵害的大学生更沉迷于社交媒体： 错失恐惧的中介与学校归属感的调节效应

汪梦圻¹ 王林欣¹ 黎彦余¹ 窦凯¹ (通讯作者)

¹ 广州大学教育学院心理学系&青少年心理与行为研究中心, 广州, 510006, psydk@gzhu.edu.cn

摘要 同伴侵害是造成大学生问题性社交媒体使用的重要风险因素, 但同伴侵害如何及何时会影响大学生问题性社交媒体使用仍缺乏足够的证据。基于补偿性网络使用理论、自我决定理论、生态系统理论和压力-缓冲模型等综合理论的观点, 错失恐惧可能会中介同伴侵害对问题性社交媒体使用的影响, 而学校归属感会缓冲这一效应。为检验这一假设, 本研究采用纵向追踪设计(共 3 个时间点, 间隔 3 个月)对广州市 569 名大学生(男生 242 名)的同伴侵害(T1)、错失恐惧(T2)、学校归属感(T1)和问题性社交媒体使用(T1/T2/T3)进行测量, 并运用结构方程模型进行检验。结果发现: (1) 在控制人口学变量后, 同伴侵害可显著正向预测大学生问题性社交媒体使用($B=0.268$, $95\%CI=[0.116, 0.438]$); (2) 同伴侵害还会通过错失新颖信息($B=0.237$, $95\%CI=[0.124, 0.343]$)和错失社交机会($B=0.219$, $95\%CI=[0.109, 0.328]$)这两条路径间接影响大学生问题性社交媒体使用; (3) 学校归属感显著调节错失社交机会在同伴侵害与大学生问题性社交媒体使用间的中介效应, 即相比于高学校归属感($B=-0.128$, $95\%CI=[-0.324, 0.046]$), 同伴侵害通过错失社交机会间接增强大学生问题性社交媒体使用在低学校归属感条件下更显著($B=-0.184$, $95\%CI=[-0.355, -0.005]$)。由此推测, 错失社交机会的恐惧是同伴侵害加剧大学生问题性社交媒体使用的重要机制, 且低学校归属感在其中发挥“推波助澜”的作用。该结果有助于扩展大学生问题性社交媒体使用的多系统环境风险因素的研究, 为开展大学生社交网络成瘾的干预和预防工作提供了科学参考。

The association between peer victimization and problematic social media use among Chinese adolescent: Testing A moderated mediation model

Meng-Li Wang¹, Lin-Xin Wang¹, Yan-Yu Li¹, Kai Dou¹

¹ Department of Psychology, School of Education, Guangzhou University, Guangzhou, 510006

Abstract: Peer victimization is an important risk factor for problematic social media use among college students, but there is still insufficient evidence on how and when peer victimization affects problematic social media use. Based on compensatory internet use theory, self-determination theory, ecological system theory and the stress-buffering model, fear of missing out may mediate the effect of peer victimization on problematic social media use, while psychological sense of school membership may buffer this mediating effect. In order to examine the effects, 569 college students (242 boys) in Guangzhou were investigated for T1 peer victimization, T2 fear of missing out, T3 psychological sense of school membership, and T1/T2/T3 problematic social media use, using three-wave longitudinal data with time interval of three months. After controlling a range of demographic variables, the structural equation model showed that: (1) peer victimization can significantly and positively predict problematic social media use among college students($B=0.268$, $95\%CI=[0.116, 0.438]$); (2) peer victimization also indirectly affects problematic social media use in college students through fear of missing new information ($B=0.237$, $95\%CI=[0.124, 0.343]$) and fear of

missing social opportunity($B=0.219$, $95\%CI = [0.109, 0.328]$); (3) psychological sense of school membership significantly moderates the mediating effect of fear of missing social opportunity between peer victimization and problematic social media use among college students. Compared with higher psychological sense of school membership ($B=-0.128$, $95\%CI = [-0.324, 0.046]$), the indirect effect of peer victimization enhances problematic social media use among college students through fear of missing social opportunity is more significant under lower psychological sense of school membership($B=-0.184$, $95\%CI = [-0.355, -0.005]$). Therefore, it is speculated that the fear of missing social opportunity is an important mechanism of peer victimization exacerbating problematic social media use among college students, and the lower psychological sense of school membership plays a moderating role in this process. The results are helpful to expand the research on multi-system environmental risk factors of problematic social media use among college students, and provide a scientific reference for the intervention and prevention of social network addiction among college students.

Keywords: peer victimization, problematic social media use among college students, fear of missing out, psychological sense of school membership

大学生生涯同一性的理论与测量工具： 基于学职融合的自我同一性发展视角

刘彦¹² 钟建军¹ (通讯作者) 李祥凤¹ 曲静¹ 白杨¹

1 内蒙古师范大学心理学院, 呼和浩特, 010022

2 南昌职业大学教育科学研究所, 南昌, 330500

摘要 埃里克森的心理社会发展理论中,“自我同一性”的形成与发展作为青少年阶段自我发展过程中最核心的任务,玛西亚在此基础上做出了同一性的操作化,将同一性形成的方式划分成探索和承诺。然而,对于大学阶段的学生在生涯发展过程中所凸显的动力意向、学职过渡的独特性,本研究从互依我和独立我两个视角出发,结合大学生生涯自我同一性中关心的具体问题,构建了大学生生涯自我同一性探索、承诺、意向三维测量模型并编制了相关测量工具。研究借助层面理论进行概念性定义,通过方便取样前后进行了预测、修订和正式施测,最后产生了52题、6点记分的《大学生生涯自我同一性量表》,测量了生涯自我同一性的六个维度,包含四种同一性形成路径和两种动力结构。研究通过SPSS、Lisrel、Mplus统计软件对量表的信效度和结构模型进行检验,结果显示:六个维度的Cronbach's α 系数在0.868~0.932之间,间隔两周的重测信度达到0.683~0.754,组合信度、聚敛效度和区分效度均达到可接受水平。量表的模型结构良好($\chi^2/df=3.141$, CFI=0.98, NFI=0.97, NNFI=0.98, RMSEA=0.053),且该模型结构在中国汉族和蒙古族被试中具有文化等值性。此外,研究还进行了概化理论分析,发现各维度条目数在3~7题时,已可以达到较好的信度标准,这为日后进一步发展简化版量表和编制复本问卷奠定了基础。综上,本研究所研制的《大学生生涯自我同一性量表》,涵盖了大学生自我同一性发展在生涯领域中的四种路径和两大动力结构,条目数适中,具有良好的心理测量学指标。

Theory and Measurement tools of College Students' Career Identity: Based on the Academic-Vocational Integration Perspective by Development of Ego-Identity

LIU Yan¹², ZHONG Jianjun¹(corresponding author), LI Xiang-feng¹, QU Jing¹, BAI Yang¹

1 College of Psychology, Inner Mongolia Normal University, Hohhot, 010022

2 Institute of Educational Science, Nanchang Vocation University, Nanchang, 330500

Abstract: In Erickson's theory of psychosocial development, the formation and development of "ego-identity" is the most core task in the process of self-development in the adolescent stage. Basis on it, Marcia made the operation of identity and divided the way of identity formation process into exploration and commitment. However, for college

students in the process of career development highlights the dynamic interest, the uniqueness of transition from school to work transition, from two perspectives of interdependent and independent I, combined with the specific concern of self-identity of college students career, constructs the university students to explore career self-identity, commitment, and intention three-dimensional measurement model and relevant measurement tools are developed. Theory research with the aid of level to the conceptual definition, through convenience sampling is forecasted, revision and formal measured before and after, generated 52item, 6 points score of the college students' Career-Professional Identity Scale, measuring the six dimensions of career ego-identity, contains four kinds of identity formation path and two kinds of dynamic structure. The reliability and validity of the scale and its structural model were tested by SPSS, Lisrel and Mplus statistical software. The results showed that Cronbach's coefficient of the six dimensions was between 0.868 and 0.932, and the reliability of the re-test after two weeks reached 0.683 to 0.754. The combined reliability, convergent validity and discriminant validity all reached acceptable levels. The model structure of the scale is good ($\chi^2/df=3.141$, CFI=0.98, NFI=0.97, NNFI=0.98, RMSEA=0.053), and the model structure has cultural equivalence between Chinese Han and Mongolian subjects. In addition, the theoretical analysis of generalization is also carried out, and it is found that the reliability standard can be better when the number of items in each dimension is 3~7, which lays a foundation for the further development of the simplified scale and the preparation of the duplicate questionnaire in the future. In sum, the College students' Career-Professional Identity Scale developed in this study covers four paths and two major dynamic structures of the development of college students' self-identity in the career field, with a moderate number of items and qualified psychometrics indicators.

基于 MBTI 人格类型的职业指导策略——来自技工院校的调查研究

王桂玲¹ 周华¹ 彭聪² (通讯作者)

¹ 临沂市技师学院, 山东临沂, 276000

² 临沂市技师学院电气工程系, 山东临沂, 276000, 1348828615@qq.com

摘要 本研究基于 MBTI 人格类型理论, 旨在揭示与分析技工类院校学生的人格类型特征, 提出符合技工类院校学生人格类型特征的职业指导策略, 以期提高技工类院校学生就业的人职匹配度, 和学生的就业满意度。研究方法采用调查法, 使用 MBTI-M 人格类型量表, 随机选取 1734 名技工院校学生进行施测。结果显示: 1) 教导型人格 (ENFJ) 为技工院校学生数量最多的人格类型; 2) 与普通高中生样本相比, 技工院校学生的人格特征在决策方式维度上, 和生活方式维度上, 具有显著差异。技工院校学生在决策方式上更倾向情感而非思考, 而在生活方式上更倾向判断而非感知; 3) 技工院校中的不同专业, 具有不同的“优势”职业性格类型, 即该类型学生在某专业的学业表现较好。本研究从以下方面提出职业指导建议: 1) 技工院校学生中数量最多的教导型人格, 在谆谆善诱引导他人方面具有特长, 提示应多注重发掘学生这方面的优势; 2) 与普通高中不同, 技工院校教育具有明确的专业性, 建议在选择专业之前, 进行人格类型测试, 依照各专业“优势”职业性格类型, 在学生选择专业时给出建议; 3) 技工院校的职业指导应贯穿学习始终, 立足专业特点与性别差异, 以及同专业内学生不同的人格类型, 合理引导学生利用自身的优势空间, 开展差异化职业指导。结论: 技工院校学生的职业指导策略, 需同时考虑学生的人格类型和专业特点, 因“材”择业, 实现最佳的人职匹配。

Career guidance Strategies based on MBTI Personality Type -- A Survey From A Technician Institute

Gui-Ling WANG¹, Hua ZHOU¹, Cong PENG²

1 Linyi Technician Institute, Linyi, Shandong, 276000

2 Department of Electrical Engineering, Linyi Technician Institute, Linyi, Shandong, 276000,
1348828615@qq.com

Abstract: Based on MBTI personality type theory, this study aims to reveal and analyze the personality types of students from technician institutes and propose career guidance strategies in line with the characteristics on personality types, expecting to obtain a person-vocation fit and improve students' job satisfaction. Research methods: 1734 technical college students were randomly selected to carry out the survey by completing MBTI-M personality Type scale. The results show that: 1) Persuasive personality (ENFJ) is the personality type with the largest number of students in technician institutes; 2) Compared with the sample of high school students, the personality characteristics of technician institute students are significantly different in dimensions on decision-making mode and life style. Technician institute students tend to be emotional rather than ruminative while making decisions, also, judgmental rather than perceptive on lifestyle. 3) There are "advantageous" occupational personality for technician institutes students who are in different majors have which means students with some characters tend to have better academic performance in a certain major. Here are some career guidance suggestions: 1) Persuasive personality, which is the personality type with the largest number of students in technician institutes, informs us that more attention should be paid to exploring the advantages of students from this aspect. 2) Different from high schools, technician institute education is more focused on vocational education. It is suggested to conduct this personality type test before choosing a major. In this way, students can get advice according to the "advantage" occupational personality type of each major. 3) Career guidance in technician institutes should be in focus throughout the study. Students deserve to be encouraged to make full use of their advantages and be carried out differentiated vocational guidance based on professional characteristics, gender differences, as well as different personality types of students within the same major. Conclusion: Personality types and characters of different subjects should be considered to get a full understanding of vocational guidance strategy for technician institutes students, finally, to obtain a person-vocation fit.

大学生的资质过高感及其对适应的作用机制

潘润生¹ 李智¹ 石慧敏¹ 吴晓杰¹ 杨舒其¹ 孙宇¹ 王鹏¹ (通讯作者)

1 山东师范大学心理学院, 济南, 250358, pengsdnu@163.com

摘要 高考升学作为影响个体生涯发展的关键事件之一, 受到考生、家长和教师的广泛重视。特别是在集体主义文化背景下, 高考的成败被赋予了更加广泛的社会意义。在给予成功者巨大荣誉、光环与关注度的同时, 我们对那些失意者的心理状态, 以及他们升入大学后的生涯发展却所知甚少。尽管高考被认为是最公平的考试之一, 但仍不可避免地受到一些随机因素和结构性因素的影响, 导致并不是每一个考生都能进入与自认为与自己能力相匹配的大学。人力资源领域内的相关研究表明, 若个体认为自身具备的资质超出所处环境的要求, 即体验到资质过高感, 将对个体的心理健康和工作态度产生负面影响, 并可能影响个体的工作绩效。因此本文在结合以往理论与研究的基础上, 将资质过高感这一概念引入到大学生群体中, 开发了大学生资质过高感的测量工具, 并使用纵向研究设计对大学生的资质过高感与入学适应水平之间的关系和作用机制进行了实证研究, 为高校相关工作者提供了一些帮助感到资质过大大学生的建议。在山东三所普通高校前后招募了近 1800 名大学生参与访谈和问卷调查, 前后共进行了 4 轮施测, 并使用 SPSS26.0, Mplus7.0 和 Process3.5 插件对问卷数据进行分析后, 得出了以下结论: (1) 本研究中编制的大学生资质过高感问卷具有较好的信度;

验证性因素分析的结果表明问卷具有较好的结构效度,该问卷适合作为后续研究工具使用。(2)大学生的资质过高感正向预测其入学一个月后的学习动机,心理资本在二者间起调节作用。(3)大学生的资质过高感负向预测其入学一个月后的生活满意度。(4)大学生的资质过高感与入学适应间存在遮掩效应,具体表现为资质过高感通过学习动机路径间接正向预测入学两个月后的适应水平,同时通过生活满意度路径负向预测入学两个月后的适应水平。(5)心理资本调节资质过高感通过学习动机路径对入学适应的影响,该路径的积极作用对心理资本较高的个体较强,对心理资本较低的个体较弱。

College Students' Perceived Overqualification and its Effect Mechanism on Adaptation

PAN Runsheng¹, WANG Peng¹

¹ School of Psychology, Shandong Normal University, Jinan 250358

Abstract: College entrance examination, as one of the key events affecting individuals' career development, draws widely attention from students, parents and teachers. What's more important, in the context of Chinese collectivism culture, the success or failure of the examination has been given a broader social significance. While we bestow great kudos, glory and attentions on those who succeed, we know little about those who failed. Although the college entrance examination is considered to be one of the fairest exams, it is inevitably influenced by some random and structural factors, resulting in not every examinee being able to enter a university that matches his or her abilities. Studies in the field of human resources have shown that if an individual believes that his or her qualifications exceed the requirements of the environment, that is, if he or she experiences a feeling of overqualification, it will have a negative impact on the individual's mental health and work attitude, and may affect the individual's work performance. As a result, on the basis of previous theory and research, this paper introduced the concept of perceived overqualification into the group of college students, developed a college student perceived overqualification measurement tools, and conducted a longitudinal study to reveal the relationship and mechanism between college students' perceived overqualification and adaptation after enrollment. Our work provided some practical suggestions for helping college students with perceived overqualification. We recruited nearly 1800 college students from three ordinal universities in Shandong province for the purpose of interview and questionnaire survey. As a result, 4 rounds of measurements were conducted and data was analyzed with SPSS26.0, Mplus7.0 and Process3.5. Conclusions were drawn as follows: (1) The college student perceived overqualification questionnaire developed in this study has good reliability; results of confirmative factor analysis indicated this questionnaire has good validity, which proved this questionnaire to be an effective measurement tools in future study. (2) College students' perceived overqualification can positively predict their learning motivation one month after enrollment, and psychological capital plays a moderating role in the relationship between them. (3) College students' perceived overqualification can negatively predict their life satisfaction one month after enrollment. (4) There is a masked effect between the perceived overqualification and the adaptation of college students, which is shown as the perceived overqualification indirectly positively predicts adaptation two months after enrollment through the mediation of learning motivation, and negatively predicts adaptation two months after enrollment through the mediation of life satisfaction. (5) The influence of overqualification on adaptation through learning motivation path is stronger for individuals with higher psychological capital, but weaker for individuals with lower psychological capital.

大学生主动性人格、领悟社会支持与建言意愿的关系研究

刘美¹ 范宁²（通讯作者） 林顺利¹

¹ 河北大学社会学系，保定，071000

² 河北大学心理学系，保定，071000，ningfan@hbu.edu.cn

摘要 新课程改革强调以人为本，健全学生人格，注重学生的健康发展。确立学生主体地位，与新课程改革密切相关。大学生的主体地位应不仅仅体现在课堂中积极参与，还应该体现在对班级建设或教师授课方式提出建议，这样更能体现大学生的主人翁意识。大学生与教师的关系既区别于基础教育阶段的师生关系，又区别于工作状态下的员工与领导的关系，在课堂的教学中，如果出现有损学习效率的事情，大学生如果有建言意愿，能够促进大学课堂的教学，在有限的时间得到更多的知识，能够与教师共同成长。本研究旨在研究大学生群体中的建言意愿，并探讨个体内部的主动性人格和外部的领悟社会支持两方面与大学生建言意愿的关系。采用主动性人格量表、领悟社会支持量表和建言意愿量表对 407 名大学生进行问卷调查。结果显示，主动性人格、社会支持对建言意愿有显著预测作用。在分维度中，朋友支持在变革性与抑制性建言间起部分中介作用；家庭支持在变革性与促进性建言间起部分中介作用；其他支持在变革性与促进性建言间起部分中介作用。而且，发现一些人口学变量（性别、是否为学生干部、学业水平）也在影响着建言意愿。此外，编制了半结构访谈提纲，对 15 名大学生进行访谈，使用 Nvivo 软件进行质化分析，结果显示，绝大多数被试均与访谈人员就建言相关内容进行阐述，描述了自己的相关经历，表明了自己对于人格、社会支持与建言意愿之间关系的看法，对问卷的结果进行了补充，更加深入地了解到了不同性别、不同年级、不同性格的大学生选择建言的原因以及建言之前考虑的因素。本研究一方面可以扩充建言的研究领域，有助于促进大学生的建言意愿，产生更多的建言行为，为高校教学管理的质量提升提供实证参考。另一方面，还可以推进有关建言意愿心理机制的理论研究，丰富相关的管理心理学理论。

Research on the Relationship between Proactive Personality, Perceived social support and Willingness of Voice of College Students

Liu mei

Sociology Department, Hebei University Baoding City, Hebei Province

Abstract: The new curriculum reform emphasizes people - oriented, improve the students' personality, pay attention to the healthy development of students. It is closely related to the new curriculum reform to establish the student's subject status. The subject status of college students should not only be reflected in the active participation in the classroom, but also should be reflected in the class construction or teachers teaching methods of suggestions, which can better reflect the sense of ownership of college students. The relationship between college students and teachers is different from the teacher-student relationship in the basic education stage, and different from the relationship between staff and leaders in the working state. In classroom teaching, if there is something harmful to learning efficiency, college students with willingness of voice will be able to promote classroom teaching, get more knowledge in the limited time, and grow up together with teachers. The purpose of this study is to study the willingness of voice among college students and to explore its relationship with proactive personality(individual internal) and perceived social support(individual external). The proactive personality questionnaire, PSSS and willingness of voice scale were used to survey 407 college students. The results show that proactive personality and social support play a significant role in predicting the willingness of voice. In the sub-dimension, friends support plays a part of mediation role between transformative and prohibitive voice; Family support plays a part intermediary role between transformative and promotive voice advice; Other support plays a mediation role between transformative and promotive voice. In addition, it is found that some demographic variables (gender, student leader or not, academic level) also affect voice behavior willingness. In addition, a semi-structured interview outline was compiled and 15 college students were interviewed, used Nvivo software for qualitative analysis, the result shows

that the vast majority of participants were linked to related contents in the interviewers will advice, describes their relevant experience, shows his for the personality, the relationship between social support and advice intention, the results of the questionnaire are supplemented to further understand the reasons why college students of different genders, grades and personalities choose voice behavior and the factors considered before voice behavior. On the one hand, this study can expand the research field of voice behavior, help promote the voice behavior intention of college students, produce more voice behavior, and provide empirical reference for the improvement of teaching management quality in colleges and universities. On the other hand, it can also promote the theoretical research on the psychological mechanism of voice behavior intention and enrich the relevant theories of management psychology.

父母教养投入对初中生未来取向的影响： 个人成长主动性、职业决策自我效能感的链式中介作用

岳云帆¹ 何宁¹ (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710062, hening@snnu.edu.cn

摘要 目的: 未来取向指个体在思想和行为上对未来的偏好与规划。青少年期是个体思考人生发展方向、确定职业发展目标的关键期, 合理的未来规划有助于青少年顺利实现从儿童期向成人期的过渡与转变。生态系统理论提出, 家庭环境对个体发展具有深远影响。然而, 已有研究多立足于从家庭环境因素解释个体已有心理, 较少探讨其对未来指向行为的功能及其机制。因此, 从家庭环境因素理解青少年未来取向的发展具有重要意义。与此同时, 未来取向意指个体主动思考和应对发展任务与挑战, 而自我效能感是个人成长主动性的重要预测变量。高自我效能感个体能积极应对困难与挫折, 并迅速汲取经验以获得个人成长。由此, 本研究旨在探讨父母教养投入对青少年未来取向的影响, 以及职业决策自我效能感、个人成长主动性在其中的作用机制。方法: 通过方便取样的方法, 采用父母教养投入问卷、未来取向问卷、个人成长主动性量表、职业决策自我效能感量表对 358 名初中生进行问卷调查。结果: (1) 父母教养投入、个人成长主动性、职业决策自我效能感与未来取向呈显著正相关; (2) 父母教养投入、个人成长主动性、职业决策自我效能感均显著正向预测未来取向; (3) 个人成长主动性、职业决策自我效能感在父母教养投入对未来取向的影响中存在多重中介与链式中介作用。结论: (1) 充分的父母教养投入能使青少年体会到来自家庭的有力支持, 有助于增强其积极思考未来的职业决策效能体验与主动迎接成长的信心, 从而表现出更高水平的未来取向特征; (2) 在青少年生涯规划教育过程中, 不仅应发挥家庭的重要功能, 也要从学校角度进一步挖掘青少年未来职业规划教育的有效途径, 提升其主动成长的信心与能力。

The Impact of Parental Involvement on Future Orientation: The Chain Mediating Role of Personal Growth Initiative and Career Decision-making Self-efficacy

Yunfan Yue¹, Ning He¹ (Corresponding author)

School of Psychology, Shaanxi Normal University, Xi'an

Abstract: Purpose: Future orientation refers to the individual's preference and planning for the future in thought and behavior. Adolescence is a critical period for individuals to think about the direction of their life and determine their career development goals. Reasonable future plans help young people to smoothly realize the transition and transformation from childhood to adulthood. Ecosystem theory proposes that the family environment has a profound impact on individual development. However, the existing studies are mostly based on explaining the individual's

existing psychology from family environment factors, and seldom discuss its function and mechanism for future-oriented behavior. Therefore, it is of great significance to understand the development of adolescents' future orientation from family environment factors. At the same time, future orientation means that individuals actively think about and respond to development tasks and challenges, and self-efficacy is an important predictor of personal growth initiative. Individuals with high self-efficacy can actively deal with difficulties and setbacks, and learn from experience quickly to gain personal growth. Therefore, this study aims to explore the influence of parental upbringing investment on adolescents' future orientation, as well as the mechanism of self-efficacy in career decision-making and personal growth initiative. Method: Through convenient sampling methods, a questionnaire survey was conducted among 358 junior high school students by using parental involvement questionnaire, future orientation questionnaire, personal growth initiative questionnaire, and career decision self-efficacy scale. Results:(1)Parental involvement, personal growth initiative, career decision-making self-efficacy and future orientation are significantly positively correlated;(2)Parental involvement, personal growth initiative, and career decision-making self-efficacy all significantly positively predict future orientation;(3)Personal growth initiative and career decision-making self-efficacy have multiple intermediary and chain intermediary roles in the influence of parental upbringing investment on future orientation. Conclusions:(1)Sufficient parental upbringing investment can enable young people to experience strong support from their families, help them to actively think about the future of career decision-making efficiency experience and proactively welcome growth confidence, thus showing a higher level of future orientation characteristics;(2)In the process of youth career planning education, not only should the important function of the family be brought into play, but also effective ways of future career planning education for young people should be further explored from the school point of view, so as to enhance their confidence and ability to actively grow.

儿童青少年消极同伴关系与执行功能的联系：冗思的中介作用

孙慧^{1,2} 张露露^{1,2} 纪林芹^{1,2} (通讯作者)

1 山东师范大学心理学院, 济南, 250014

2 山东师范大学儿童青少年发展研究院, 济南, 250014, sdjlq@126.com

摘 要 执行功能包含一系列高级认知能力, 在儿童青少年期持续发展, 与个体良好的适应结果相联系。根据 Baumeister 的自我调节模型, 消极同伴关系会损害个体的归属需要, 对痛苦经历的抑制和调节过程会消耗心理资源, 从而限制执行功能的发展。已有研究揭示了消极同伴关系与执行功能的关系, 但鲜有研究考察消极同伴关系和执行功能二者关系的具体机制。消极的社会经历会产生反射性的痛苦反应, 考虑到情绪及思维方式对儿童青少年发展的重要作用, 我们将冗思纳入同伴侵害与执行功能的关系中, 考察冗思的中介作用。即消极同伴关系可能会导致冗思, 损耗个体心理资源, 进而限制执行功能的发展。本研究以童年中期、童年晚期和青少年早期 3 个年龄阶段 (分别为 3、5、7 年级) 的 549 名儿童青少年为被试, 进行时隔半年的追踪, 使用同伴提名法测量同伴拒绝, 使用自我报告法测量同伴侵害、抑郁冗思和愤怒冗思, 使用父母报告法测量执行功能。结果发现: (1) 潜变量交叉滞后模型分析结果显示同伴拒绝、同伴侵害负向预测执行功能, 执行功能负向预测同伴拒绝, 但不能预测同伴侵害, 表明同伴拒绝与执行功能间存在双向预测关系。(2) 中介效应分析结果显示, 愤怒冗思在同伴侵害对执行功能的影响中发挥中介作用, 抑郁冗思在同伴侵害对执行功能的影响中未发挥中介作用。两类冗思在同伴拒绝对执行功能影响中的中介作用不显著。(3) 多组比较结果显示, 消极同伴关系与执行功能的联系以及冗思在其中的作用均不存在显著的性别差异和发展阶段差异。结果表明, 同伴拒绝、同伴侵害经历会限制执行功能的发展, 较差的执行功能会进一步增加同伴拒绝的可能性。同伴侵害会导致儿童青少年产生更多的愤怒冗思, 进而影响执行功能。本研究的发现有助于了解消极同伴关系对调控机能的影响及其内在机制, 加强对消极同伴关系经历的关注有助于儿童青少年的认知调控能力的健康发展。

Associations between Negative Peer Relations and Executive Function in Childhood and Adolescence: The Mediating Role of Rumination

SUN Hui^{1,2}, ZAHNG Lulu^{1,2}, JI Linqin^{1,2}

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan 250014

Abstract: Executive functions (EFs) refer to a family of advanced cognitive functions, which develop throughout childhood and adolescence, are associated with better developmental outcomes. According to Baumeister's self-regulation model, negative peer relations impair need to belong, and the process of inhibiting and regulating painful experiences will consume psychological resources, thus limiting the development of executive function. Previous studies revealed the association between negative peer relationship and EFs, however, few studies have investigated the mechanism of this relationship. Considering the important role of emotion and mindset on the development of children and adolescents, we take rumination into account, investigate the mediating role of rumination between peer victimization and EFs. That is, negative peer relations influence rumination, then consume psychological resources, which impair the development of EFs. In this study, 549 children and adolescents from 3 grades (grade 3, grade 5, grade 7) were tracked for 6 months. Peer rejection were measured by peer nomination. Peer victimization, depressive rumination and anger rumination were measured by self-report. Executive function was measured by parent-report. The results showed that: (1) Cross-lagged analysis showed that peer rejection and victimization negatively predicted executive function. There was a bidirectional associations of peer rejection and executive function. Executive function couldn't predict peer victimization. (2) Mediation effect analysis showed that anger rumination played a mediating role in the effect of peer victimization on executive function, but depressive rumination not. Neither depressive rumination nor anger rumination play a mediating role in the effect of peer rejection on executive function. (3) Multi-group models indicated no sex differences and no development stage differences was found in the relationships between negative peer relations, rumination and executive function. This study revealed peer rejection and victimization will limit the development of executive function, and poor executive function will further increase the possibility of peer rejection. Peer victimization will lead to more anger rumination among children and adolescents, and then influence the executive function. The results highlighted that it's essential to pay more attention to the negative peer relations, so as to prompt their development of cognitive regulation.

Keywords: Peer rejection, Peer victimization, Executive function, Anger rumination, Depressive rumination

小学生学校幸福感的发展轨迹：预测因素及与问题行为的关系

摘要 学校幸福感作为积极心理学在学校领域的重要研究内容, 是反映学生学校适应的重要指标。学生的学校幸福感不仅对其当前的整体幸福感与身心健康起着重要影响, 还关系到学生未来的身心健康及其个体生涯发展。尽管学校幸福感对小学生的影响是长远且深厚的, 但是小学生学校幸福感的发展模式及其与预测因素、后果的关系尚不清楚。因此, 本研究的目的是探究小学生学校幸福感的三个组成成分(学校满意度、在校积极情感、在校消极情感)的协同发展轨迹及其与预测因素、后果的关系。本研究采用问卷调查法, 选取2756名4-5年级的小学生($M_{\text{age}} = 9.91 \text{ years}$, $SD = 0.72$, 47%是女生)为被试进行了四波段的追踪调查, 每次

测量间隔 6 个月。采用平行过程潜类别增长模型分析识别出小学生学校幸福感的三种成分的四种协同发展轨迹类型：（1）繁荣组（48.6%），（2）共同中稳定组（29.2%），（3）共同高稳定组（13.3%），（4）问题组（8.9%）。多元回归分析结果显示：同伴侵害、教师虐待是小学生学校幸福感不良发展的风险因素；成绩是小学生学校幸福感积极发展的保护因素。问题组和繁荣组的学生分别报告了最多的内外化问题和最少的内外化问题。研究结果强调了亚组差异对了解学校幸福感发展的重要性，以及普遍筛查、动态监测和针对特定亚组的独特特征的干预的必要性。

2 School of politics and administration, South China Normal University, Guangzhou, 510631

Abstract: As an important research content of positive psychology in school field, subjective well-being in school is an important index reflecting students' school adaptation. Students' subjective well-being in school not only plays an important role in their current global well-being, physical and mental health, but also relates to their subsequent physical and mental health and individual career development. Although the impact of subjective well-being in school among elementary school students is long-term and profound, its developmental patterns and predictors and outcomes during this period are unclear. Thus, this study aimed to identify multiple co-developmental trajectories of the three components (i.e., school satisfaction, positive affect in school and negative affect in school) of subjective well-being (SWB) in school and their relations to predictors and outcomes among Chinese elementary school students. A total of 2756 students (Mage = 9.91 years, SD = 0.72; 47% girls) completed a packet of measures on four occasions at 6-month intervals. Parallel process latent class growth analyses identified four co-developmental groups (i.e., flourishing, congruently moderate-stable, congruently high-stable, and troubled). Multivariate logistic regression analyses revealed that peer victimization, maltreatment by teachers served as risk factors for the adverse co-development groups; whereas academic achievement served as protective factor for the favorable co-development groups. Students in the troubled group and flourishing group reported the most and fewest internalizing and externalizing problems, respectively. The findings highlighted the importance of subgroup differences in understanding the progression of SWB in school and the need for universal screening, dynamic monitoring, and interventions tailored to the unique characteristics of the subgroups.

童年创伤对青少年网络成瘾的影响：自我隐瞒的中介机制

杨玲¹ 汪志君¹ 曹华¹（通讯作者） 周蓉¹

1 西北师范大学心理学院，兰州，730070，caohua360083915@163.com

摘要 青少年网络成瘾一直受到研究者的高度关注。研究表明，童年创伤与青少年网络成瘾的关系密切。但是，童年创伤与青少年网络成瘾的研究较少。因此，预防青少年网络成瘾促进其心理健康发展，积极探索童年创伤与青少年网络成瘾的内在机制尤为重要。Schimmenti 发现童年创伤可能导致个体有更低地自我暴露，促使其产生自我隐瞒的动机。为了逃避这些负性情绪或者隐瞒带来的压力从而选择不合理的行为方式，使用网络来逃避。本研究以青少年为被试，探讨自我隐瞒在童年创伤与青少年网络成瘾的中介作用，以期找到改善网络成瘾的有效方法。因此本研究假设自我隐瞒在童年创伤与青少年网络成瘾间起中介作用。为了探讨自

我隐瞒在童年创伤与青少年网络成瘾间的中介作用。采用儿童期虐待问卷(childhood trauma questionnaire,CTQ)、自我隐瞒量表(self-concealment scale,SCS)、青少年病理性互联网使用量表(adolescent pathological internet use scale,APIUS)对 565 名中学学生进行调查,获得有效问卷 532 份。研究表明:(1)童年创伤与青少年网络成瘾呈显著正相关,自我隐瞒与童年创伤和青少年网络成瘾呈显著正相关;(2)自我隐瞒的中介作用的模型拟合良好, $(\chi^2=203.703, df=49, \chi^2/df=4.157, GFI=0.938, AGFI=0.902, NFI=0.939, IFI=0.953, TLI=0.936, CFI=0.952, RMSEA=0.077, SRMR=0.048)$,童年创伤能够正向预测自我隐瞒水平($\beta=0.27, p<0.001$),童年创伤能正向预测青少年网络成瘾($\beta=0.36, p<0.001$),童年创伤通过自我隐瞒对青少年网络成瘾的中介作用为 0.116,童年虐待对调整抑郁的总效应为 0.428,效果量 27.10%。由此说明,童年创伤不仅直接影响青少年网络成瘾水平,还会通过自我隐瞒对青少年网络成瘾产生影响。这启示我们,家长、学校和社会要对青少年进行适当关怀和支持,使青少年敞开心扉,降低自我隐瞒的可能性,有效减少其孤独感和消极情绪,减少青少年病理性互联网的使用。

The Influence of Childhood Trauma on Adolescents' Internet Addiction Disorder: Mediating Mechanism of Self-concealment

Yang Ling¹, Wang Zhijun¹, Cao Hua¹(corresponding author), Zhou Rong¹

¹ school of Psychology, Northwest Normal University, Lanzhou, 730070,

caohua360083915@163.com

Abstract: Teenagers' Internet addiction has been paid great attention by researchers. Studies have shown that childhood trauma is closely related to adolescents' Internet addiction. However, there are few studies on childhood trauma and adolescent Internet addiction. Therefore, it is essential to prevent teenagers' Internet addiction, promote their mental health development, and actively explore the internal mechanism of childhood trauma and teenagers' Internet addiction. Schimmenti found that childhood trauma may lead to lower self-exposure, which leads to the motivation of self-concealment. To escape these negative emotions or hide the pressure and choose unreasonable behavior, use the network to escape. Taking adolescents as subjects, this study explores the mediating role of self-concealment in childhood trauma and adolescents' Internet addiction to find an effective way to improve Internet addiction. Therefore, this study assumes that self-concealment plays an intermediary role between childhood trauma and adolescent Internet addiction. To explore the mediating role of self-concealment between childhood trauma and adolescent Internet addiction. A total of 565 middle school students were investigated with the Child Abuse Questionnaire (CTQ), Self-Concealment Scale (SCS), and Adolescent Pathological Internet Use Scale (APIUS), and 532 valid questionnaires were obtained. The results show that: (1) there is a significant positive correlation between childhood trauma and adolescent internet addiction, and there is a significant positive correlation between self-concealment and childhood trauma and adolescent internet addiction; (2) The model of the mediating effect of self-concealment fits well ($\chi^2=203.703, df=49, \chi^2/df=4.157, GFI=0.938, AGFI=0.902, NFI=0.939, IFI=0.953, TLI=0.936, CFI=0.952, RMSEA=0.077, SRMR=0.048$) Childhood trauma can positively predict the level of self-concealment ($\beta=0.27, p<0.001$), and positively predict adolescents' Internet addiction ($\beta=0.36, p<0.001$). Furthermore, the mediating effect of childhood trauma on adolescents' Internet addiction through self-concealment is 0.116. The total effect of childhood abuse on adjusting depression is 0.428, with an adequate amount of 27.10%. Therefore, childhood trauma directly affects teenagers' Internet addiction and influences teenagers' Internet addiction through self-concealment. This enlightens us that parents, schools, and society should give proper care and support to teenagers to open their hearts, reduce the possibility of self-concealment, effectively reduce their loneliness and negative emotions, and reduce the use of pathological Internet by teenagers.

初中生课外活动参与对认知能力的影响 ——基于全国 10083 名初中生的分析

周笛 潘彦谷 (通讯作者) 邹可 骆俊兴

西南财经大学社会发展研究院, 成都, 61130, panyg@swufe.edu.cn

摘要 认知能力发展是青少年心理发展的重要内容, 课外活动参与在提升青少年认知能力上发挥了重要作用, 但国内鲜见基于全国样本数据的相关实证研究。本研究选取 2014—2015 学年“中国教育追踪调查”(CEPS) 10083 名初中生的数据, 采用多水平模型的分析方法, 探讨不同类型课外活动参与对初中生认知能力的影响, 并进一步分析影响程度的性别差异和家庭经济地位差异。结果发现: 第一, 课外写老师布置的作业时间、课外体育锻炼时间对初中生认知能力具有显著的正向影响。而平时参加课外补习时间、上兴趣班时间、看电视时间、上网玩游戏时间对学生的认知能力具有显著的负向影响。第二, 性别和家庭经济地位调节课外活动参与对认知能力的影响。具体表现为, 课外写老师布置作业的时间对男生认知能力的正向影响大于女生, 而平时参加校外辅导班时间对女生认知能力的负向影响大于男生; 平时上兴趣班时间对富裕家庭学生认知能力的负向影响更大, 看电视和体育锻炼分别对困难家庭学生认知能力的负向影响和正向影响更大。研究发现对青少年课外时间的合理安排, 家庭培养策略的参考以及学校、社会相关教育管理实践具有一定的指导意义。

关键词 课外活动, 认知能力, 性别, 家庭经济地位

Effects of Extracurricular Activity Participation on Cognitive Ability among Junior Middle School Students

ZHOU Di, PANG Yangu, ZOU Ke, LUO Junxing

Research Institute of social development, Southwest University of Finance and Economics, Chengdu

Abstract: Cognitive ability development is a crucial part of adolescents' psychological development, and participation in extracurricular activities plays an important role in improving adolescents' cognitive ability. However, there is little in-depth empirical research based on national samples. Based on the data of 10083 junior high school students in China Education Panel Survey (CEPS) from 2014 to 2015, this study used the multi-level model analysis method to explore the impact of different types of extracurricular activities on the cognitive ability of junior high school students, and further analyzed the moderating role of gender and family economic status. The results showed that: (1) The extracurricular time spent on homework assigned by the teacher and physical exercise had significant positive impacts on the cognitive ability of junior high school students. The time spent on extracurricular tutoring, interest classes, watching TV, and playing games online had significant negative impacts on students' cognitive ability; (2) Gender and family economic status moderated the association between extracurricular activities and cognitive ability among junior high school students. Specifically, the homework time assigned by the teacher had a greater positive impact on boys' cognitive ability, while the time spent on extracurricular tutoring on weekdays had a greater negative impact on girls' cognitive ability. Besides, the time spent on interest classes on weekdays had a greater negative impact on the cognitive abilities of students from wealthy families, and the time spent on watching TV and physical exercise had greater negative and positive impacts on the cognitive abilities of students from difficult families. These findings have certain guiding significance for the reasonable arrangement of adolescents' extracurricular time, the reference of family training strategies and the educational management practices of schools and society.

摘要 新冠肺炎疫情背景下, 居家隔离使青少年的人际交往模式发生骤变, 其线下主要交往对象从同伴转为父母等主要照料者。复学后, 青少年表现出的亲社会行为能够帮助个体快速建立同龄人社交, 完成群体适

应,进而适应紧张的学习生活和校园生活,有效预防心理危机事件的发生。本研究探究了青少年疫情期间的生活状态对其复学后群体适应的影响。本研究对上海的一所私立中学的490名初中生进行了问卷调查,平均年龄13.78岁($SD = 1.26$),男女性各半;使用亲子关系量表(NRI),生活质量量表(QOL),正负性情绪量表(PANAS),短版中学生亲社会行为量表进行测量,探讨了以母子关系、父子关系分别为自变量,以生活质量为调节变量,以正负情绪为中介变量,以亲社会行为为因变量的2个有调节的中介模型。结果表明:(1)疫情居家期间,优质的亲子关系能正向预测中学生的正性情绪(母子关系: $B = 0.338, t = 7.424, p < .01$;父子关系: $B = 0.324, t = 7.201, p < .01$)、负向预测中学生的负性情绪(母子关系: $B = -0.345, t = -9.716, p < .01$;父子关系: $B = -0.309, t = -8.705, p < .01$),进而促进中学生复学后的亲社会行为表现,正负情绪存在显著中介作用;(2)生活质量显著调节了亲子关系对正负情绪的影响,感知到的生活质量越高,优质的母子关系对中学生正性情绪的正向预测越强($B = 0.009, t = 2.165, p < .05$)、对中学生负性情绪的负向预测作用越弱($B = 0.010, t = 3.453, p < .01$),优质的父子关系对中学生负性情绪的负向预测作用越弱($B = 0.007, t = 2.425, p < .05$);(3)母子关系与父子关系对中学生复学后亲社会行为表现的影响模式存在差异:仅父子关系对亲社会行为的直接预测作用显著(母子关系: $B = 1.055, t = 1.783, p > .05$;父子关系: $B = 1.548, t = 2.728, p < .01$);生活质量仅对父子关系对正性情绪的预测作用没有调节($B = 0.005, t = 1.203, p > .05$)。本研究进一步提出了一个更为完整的亲子关系对青少年亲社会行为的作用机制模型,补充了前人研究中的不足,这一成果对于培养、促进青少年的同伴适应,社会适应能力的发展有一定的贡献。

Impact of adolescents' living conditions during the epidemic on group adaptation after school resumption

Ruilin Wang¹, Jianhang He¹, Xiaoru Li¹

Department of Psychology, Fudan University, Shanghai, China, 200433, Email:

lixiaoru@fudan.edu.cn

Abstract: In the context of COVID-19, home isolation caused an abrupt change in the interpersonal interaction pattern of adolescents, and their main offline interaction objects shifted from peers to parents and other primary caregivers. After returning to school, pro-social behaviors that adolescents exhibit can help them quickly establish peer socialization, complete group adaptation, and then adapt to stressful academic and campus life, effectively preventing psychological crisis events. This study explored the impact of adolescents' living conditions during the epidemic on their group adaptation after returning to school. Questionnaires were administered to 490 middle school students, with a mean age of 13.78 years ($SD = 1.26$), in a private middle school in Shanghai, and the gender ratio was 1:1. The Network of Relationships Inventories (NRI), Quality of Life Scales (QOL), Positive and Negative Affect Scales (PANAS), and short version of Scale of Middle School Students' Prosocial Behaviors were used to explore the effects of mother-child relationship and father-child relationship as independent variables, respectively, quality of life as moderating variable, positive and negative emotions as mediating variables, and pro-social behavior as dependent variable in 2 moderated mediation models. The results showed that: (1) During the epidemic staying at home, high-quality parent-child relationship could positively predict the positive emotions of middle school students (mother-child relationship: $B = 0.338, t = 7.424, p < .01$; father-child relationship: $B = 0.324, t = 7.201, p < .01$) and negatively predict the negative emotions of middle school students (mother-child relationship: $B = -0.345, t = -9.716, p < .01$; father-child relationship: $B = -0.309, t = -8.705, p < .01$), thereby promoting the performance of pro-social behaviors of middle school students after returning to school, with a significant mediating effect of positive and negative emotions; (2) Quality of life significantly moderated the effect of parent-child relationship on positive and negative emotions. The higher the perceived quality of life, the stronger the positive prediction of high-quality mother-child relationships on middle school students' positive emotions ($B = 0.009, t = 2.165, p < .05$), the weaker the negative predictive effect on middle school students' negative emotions ($B = 0.010, t = 3.453, p < .01$), and the weaker the negative predictive effect of high-quality father-child relationships on middle school students' negative

emotions ($B = 0.007, t = 2.425, p < .05$); (3) There were differences in the patterns of influence of mother-child relationship and father-child relationship on middle school students' performance of pro-social behaviors after returning to school: only the direct predictive effect of father-child relationship on pro-social behavior was significant (mother-child relationship: $B = 1.055, t = 1.783, p > .05$; father-child relationship: $B = 1.548, t = 2.728, p < .01$); quality of life only did not moderate the predictive effect of father-child relationship on positive emotions ($B = 0.005, t = 1.203, p > .05$). This study further proposed a more complete model of the mechanism of the role of parent-child relationship on adolescents' pro-social behavior, which complements the deficiencies in previous studies, and these results have contributed to the cultivation and promotion of peer adaptation of young people and the development of social adaptability.

专家和新手教师在师生联合搭建任务中的差异：一项超扫描研究

肖威龙, 范丽婷, 李新伟, 孙炳海, 李伟建*

浙江师范大学教师教育学院心理学系, 浙江金华, 321004, xlxh@zjnu.cn

摘要 师生互动不仅是保证教学目的达成的重要形式,也是促进学生社会性、行为和认知发展的重要途径。以往的互动研究多从学生视角切入展开探讨,对教师因素产生的影响与效用的关注不足。同时,已有研究表明专家教师在教学知识的结构性、教学计划的关联性和教学监控的有效性等教学行为上显著优于新手教师。那么,专家教师在与学生合作互动中的行为表现(如合作效率)上是否同样显著优于新手教师?此外,互动脑假说指出个体的大脑神经结构受到人际互动过程中获得的经验与技能的影响。那么,脑际神经同步能否识别专家/新手教师在师生合作互动中的差异?基于上述两个研究问题,本研究采用近红外超扫描技术,通过2(教师类型:专家 vs. 新手)×2(任务类型:合作 vs. 独立)的混合设计,考察了专家-新手教师与学生互动的行为差异与脑际神经机制。行为结果显示:合作条件下,专家教师-学生组的完成率显著高于新手教师-学生组。视频编码结果显示,专家教师-学生组的合作性显著高于新手教师-学生组;专家教师的任务主导性显著高于新手教师。fNIRS结果显示:在合作搭建条件下,专家教师-学生组在右侧背外侧前额叶脑区出现了显著的脑际神经同步,并且观测到的脑际神经同步比新手教师-学生组更强。同时,在合作搭建下,格兰杰因果分析同样未发现两类教师与学生之间存在脑际神经活动方向的主导角色。此外,专家教师-学生组在合作过程中的脑际神经同步与师生合作搭建的完成率、合作性存在边缘显著的正相关;与专家教师的心理理论能力、观点采择能力存在显著正相关。上述结果表明,专家教师-学生组的合作互动的行为表现显著优于新手教师-学生组,脑际神经同步能够识别更优的师生合作互动。本研究从行为与脑际神经机制的视角揭示了专家和新手教师与学生合作互动的行为和脑际神经活动的差异以及教师的心智化能力对师生合作互动的潜在影响。

The differences between experts and novice teachers when collaborate with students: a fNIRS hyperscanning study

Weilong Xiao, Liting Fan, Xinwei Li, Binghai Sun, Weijian Li

College of Teacher Education, Zhejiang Normal University, Jinhua, Zhejiang, China

Abstract: Teacher-student interaction is not only an important way to ensure the achievement of teaching purposes, but also an important way to promote students' social, behavioral and cognitive development. In the previous studies, interactive research mostly started from the perspective of students and started to explore, and the focus on the impact and effectiveness of teacher factors was insufficient. At the same time, existing research has shown that expert

teachers are significantly better than novice teachers in teaching behavior, such as the structure of teaching knowledge, the relevance of teaching plans and the effectiveness of teaching monitoring. Then, are expert teachers also significantly better than novice teachers in the performance of cooperation with students (such as cooperation efficiency)? In addition, the interactive brain hypothesis indicates that the individual's brain neural structure is affected by the experience and skills gained during interpersonal interaction. Then, can inter-brain neural synchronization recognize the differences between expert/novice teachers in teacher-student cooperation? Based on these two research questions, this study combined near-infrared super-scan technology and a mixed design of 2 (teacher type: expert vs. novice) x 2 (task type: cooperation vs. independent), the expert-novice teacher and student were investigated Interactive behavioral differences and interbrain neural mechanisms. The behavior results showed that under the cooperation conditions, the completion rate of the expert teacher-student group is significantly higher than that of the novice teacher-student group. The video coding results showed that the cooperation of the expert teacher-student group was significantly higher than that of the novice teacher-student group; the task dominance of the expert teacher was significantly higher than that of the novice teacher. The fNIRS results showed that under the conditions of cooperative construction, the expert teacher-student group showed significant inter-brain neural synchronization in the right dorsolateral prefrontal brain area, and the observed inter-brain neural synchronization was stronger than the novice teacher-student group. At the same time, under the cooperation condition, Granger Causal Analysis not found dominant role in the direction of brain activity between the two types of teachers and students. In addition, the brain-synchronization of the expert teacher-student group in the cooperation process was marginally positively correlated with the completion rate and cooperation of the teacher-student team; there was a positive correlation with the expert teacher's theory of mind ability and perspective taking ability. The results indicate that the expert teacher-student group's cooperative interaction performance is better than the novice teacher-student group, and the inter-brain neural synchronization can identify better teacher-student cooperation interaction. This study reveals the differences in the behaviors and inter-brain neural activities of experts and novice teachers and students in the cooperative interaction and the potential impact of teachers' mental ability on the cooperative interaction between teachers and students from the perspective of behavior and inter-brain neural mechanisms.

情绪共情与教师情绪衰竭的关系：有调节的中介模型

丁雯 姜雯宁 廖祥瑞 李清天 赵卫国（通讯作者）

山东师范大学心理学院，济南，250358，zhaoweiguo@sdsu.edu.cn

摘 要 教学是一种情感上的努力，调查研究显示中小学教师群体普遍存在情绪衰竭现象。共情与情绪衰竭之间的关系已经得到了研究者的关注，但是并未得到一致性的结果。有研究指出共情作为一种积极心理特质，通常会对个体身心健康产生积极影响；截然相反的结果显示共情具有负面效应，对他人共情会消耗情绪及情绪调节资源，进而加剧自身情绪衰竭。这可能与共情的两种成分——认知共情和情绪共情所发挥的作用不同有关，情绪共情是共情负面效应的主要来源。因此，十分有必要进一步厘清情绪共情与教师情绪衰竭之间的关系。然而，目前缺乏足够的实证研究对二者之间的内部作用机制进行探讨。情绪劳动等同情绪调控模型(emotional labor as emotion regulation model, ELERM)和最近的实证研究均指出，情绪共情能够通过情绪劳动策略对教师的情绪衰竭产生影响，且情绪共情与环境工作因素（挑战性-阻碍性压力源）的相互作用会促使教师选择不同的情绪劳动策略，从而影响情绪衰竭。鉴于此，本研究尝试从教师自身视角出发，着重考察情绪共情对教师情绪衰竭产生的负面效应，并进一步探讨表层扮演（通过隐藏或伪装真实情感以表现出组织要求的情绪情感）、深层扮演（通过改变认知诱因以激发组织要求的情绪情感）和自然感受情绪的表达这三种情绪劳动策略在二者关系中的中介作用以及挑战性-阻碍性压力源的调节作用。以 932 名中小学教师作为研究对象进行问卷调查。结果发现：(1) 情绪共情与中小学教师情绪衰竭呈正相关，证实了情绪共情的负面效应；(2) 表层扮演和自然感受情绪的表达的中介作用显著，情绪共情既能够通过增加表层扮演策略的使用频率进而

加剧教师的情绪衰竭,也能通过增加自然感受情绪的表达策略的使用频率进而缓解教师的情绪衰竭;(3) 表层扮演的中介作用受到挑战性压力源和阻碍性压力源的调节。具体而言,在低挑战性压力源或高阻碍性压力源下,表层扮演的中介作用增强。本研究为教师共情的负面效应提供了证据,并且对教师专业化实践及心理健康教育培训具有重要启示。

Associations Between Affective Empathy and Teachers' Emotional Exhaustion: A Moderated Mediation Model

DING Wen, JIANG Wenning, LIAO Xiangrui, LI Qingtian, ZHAO Weiguo

School of Psychology, Shandong Normal University, Jinan, 250358, zhaoweiguo@sdsu.edu.cn

Abstract: Teaching is a kind of emotional efforts, and some surveys have shown that emotional exhaustion is common among primary and secondary school teachers. The relationship between empathy and teachers' emotional exhaustion has attracted the attention of many researchers, but no consistent results have been obtained. Some studies have pointed that empathy as a positive impact on individuals' physical and mental health; the opposite results showed that empathy has a negative effect. To be specific, empathy with others may consume one's own emotions and emotional regulation resources, thereby exacerbating their own emotional exhaustion. We speculated this may be related to the different roles played by the two components of empathy—cognitive empathy and affective empathy, and affective empathy is the main source of the negative effects of empathy. Both emotional labor as emotion regulation model(ELERM) and the recently empirical studies have found that the interaction between affective empathy and work factors in the environment (i.e. challenge and hindrance stressors) may prompt teachers choose different emotional labor strategies, and thus have an impact on teachers' emotional exhaustion. Therefore, it is necessary to further clarify the relationship between affective empathy and teachers' emotional exhaustion. However, there is currently a lack of sufficient empirical research to explore the internal mechanism of action between them. Given this, from the perspective of teachers themselves, the current study focused on the negative effect of affective empathy on teachers' emotional exhaustion, and further to explore the mediating and moderating roles of surface acting (by hiding or faking true emotions to display appropriate emotions at work), deep acting (by changing the cognitive inducement to stimulate the appropriate emotions at work), authentic emotional display and challenge and hindrance stressors. A total of 932 primary and secondary school teachers completed measures of emotional exhaustion, empathy, emotional labor strategies and challenge and hindrance stressors. The results were as follows: (1) Affective empathy was positively related to teachers' emotional exhaustion; (2) Both surface acting and authentic emotional display partially mediated the relationship between affective empathy and emotional exhaustion, that is affective empathy can aggravate emotional exhaustion by increasing surface acting, and can also alleviate the emotional exhaustion by enhancing authentic emotional display; (3) The mediating role of surface acting between affective empathy and emotional exhaustion was moderated by challenge and hindrance stressors. Especially, the mediating effect is stronger at high hindrance stressors or at low challenge stressors. This study provides an evidence for the negative effect of affective empathy and provides important enlightenment for teachers' professional practice and mental health education and training.

陈述性记忆预期错误在不同强度恐惧记忆提取消退中的应用及其性别差异

石佩¹ 董媛媛¹ 柳旻淼¹ 倪晓冰¹ 陈文俊¹ 杨子凡¹ 郑希付¹ (通讯作者)

华南师范大学心理学院, 广州, 510631, zhengxf@scnu.edu.cn

摘要 现有的条件性恐惧记忆提取消退范式这一非侵入性干预操作中, 预期错误被证明是诱发记忆去稳定的必要条件, 但是现有的预期错误的产生方式缺乏主观差异及可视化的考量, 有研究发现陈述性记忆和非陈述性记忆拥有相同的脑区激活, 两种类型记忆并非独立, 从而基于陈述性学习和非陈述性学习相互作用的观点, 陈述性记忆的预期错误的诱发方式可以自动化地引发恐惧记忆的进入再巩固, 而陈述性记忆量化的研究已经趋于成熟, 因此本研究使用陈述性记忆的预期错误的操作方式引发恐惧记忆的预期错误, 探索其在恐惧记忆的再巩固过程中的有效性, 主要从不同强度恐惧记忆以及性别差异两方面进行分析。结果发现: (1) 对比较弱恐惧记忆的预期错误组和无预期错误组发现, 预期错误的效果在消退阶段便已经有所展现, 无预期错误组未完全消退, 而预期错误组完成消退并且未出现自发恢复及重建现象; (2) 对于较强恐惧记忆有预期错误组的数据结果显示, 其消退效果显著, 未出现自发恢复, 但存在重建现象; (3) 对于有预期错误操作的两组性别分析发现, 强恐有 PE 性别差异不显著, 均未出现自发恢复, 但是弱恐有 PE 女生组在习得和消退阶段表现出一定的易习得难消退效果, 这一研究结果与前人研究结果一致。结果表明可以通过陈述性记忆的预期错误的产生方式开启恐惧记忆再巩固过程, 有效抑制恐惧记忆的自发恢复和重建, 并且可以进一步通过人为可视化操作预期错误的大小来消除恐惧记忆, 并且该操作方式对于男女组均有效果, 也为后续恐惧记忆预期错误量化的研究提供思路的参考, 在较强恐惧记忆的重建方面的应用还需要进行进一步探究。

The application and sex difference of declarative memory prediction error on the retrieval-extinction of different intensity of fear memory

ShiPei, DongYuanyuan, LiuMinmiao, NiXiaobing, ChenWenjun, YangZifan, RongMuxin,
ZhengXifu

School of Psychology, South China Normal University, Guangzhou, 510631, China

Abstract: Prediction Error (PE) has been demonstrated as a necessary condition to induce destabilization on conditioned fear extinction in retrieval-extinction paradigm which is a non-invasive intervention operation. But the existing way of prediction error produced lacks subjectivity and visualization on fear memory. Brain structures typically associated with nondeclarative learning are increasingly implicated in declarative memory, they have an interaction. Thus, the way of declarative memory prediction error induced triggers the fear memory undergo reconsolidation, and declarative memory quantitative research has been mature. Therefore, this study using declarative memory prediction error operation cause fear memory errors, to explore its effectiveness in the process of reconsolidation of fear memory, mainly analyze from two aspects of different intensity of fear memory and gender difference. The results showed that : (1) for the prediction error group and the no prediction error group (no PE group) in weak fear memory groups, the effect of prediction error play a great role in extinction stage. No PE group don't extinction, while the PE group extinction successfully without spontaneous recovery and reinstatement. (2) In the enhanced memory condition, PE can improve the extinction and spontaneous recovery, but participants will be feared when they faced US again. (3) The gender difference analysis of the two groups with PE operation found that the gender difference of the strong fear PE was not significant, and there was no spontaneous recovery, but the weak fear PE female group showed a certain effect of easy to learn in the stages of acquisition and difficult to fade in the stages of extinction, which was consistent with the results of previous studies. The results showed that the reconsolidation process of fear memory could be initiated by the prediction error in declarative memory, and the spontaneous recovery and reinstatement of fear memory could be effectively suppressed. In the future, fear memory can be further eliminated by manually visualizing the size of prediction errors, and this operation method is effective for both male

and female groups. It provides a reference for subsequent research on quantification of prediction errors of fear memory. Further exploration is needed for its application in the reconstruction of strong fear memory.

家庭中的好表现可预测工作中的高投入吗？

——基于中小学教师工作-家庭关系视角的探索

陈亚萍 佟月华（通讯作者） 魏淑华

济南大学教育与心理科学学院，济南，250022，sep_tongyh@ujn.edu.cn

摘 要 目的：从工作-家庭关系的视角，考察中小学教师的家庭角色绩效与工作投入的关系。方法：采用整群抽样法，调查 700 名已婚中小学教师，其中有小学教师 289 名（41.3%），中学教师 411 名（58.7%）；男教师 234 名（33.4%），女教师 466 名（66.6%）。采用纵向问卷调查法，第一时间段采用《家庭角色绩效量表》和《工作-家庭支持问卷》调查被试的家庭角色绩效和家庭支持状况，在时隔一年后的第二时间段，采用《工作-家庭增益量表》、《工作-家庭冲突量表》和《U-trecht 工作投入量表》调查被试的家庭对工作的增益、家庭对工作的冲突和工作投入状况。运用 AMOS 对研究工具进行验证性因素分析，运用 SPSS 进行主要变量的描述性统计和相关分析，采用 Bootstrap 法，考察中小学教师的家庭角色绩效与工作投入的关系，并探讨家庭支持、家庭对工作的增益和家庭对工作冲突在其中的中介作用。结果：（1）家庭角色绩效、家庭支持、家庭对工作的增益和工作投入之间呈显著正相关，家庭对工作的冲突与各变量均呈显著负相关；（2）家庭角色绩效可显著预测工作投入，总效应量为 0.23。（3）家庭支持、家庭对工作的增益和家庭对工作的冲突在家庭角色绩效影响工作投入的过程中起中介作用，其中介效应量分别为 0.06、0.02 和 0.11；（4）“家庭支持→家庭对工作的增益”在家庭角色绩效影响工作投入的过程中起链式中介作用，效应量为 0.04。结论：中小学教师的家庭角色绩效不仅能直接影响工作投入，还通过家庭支持、家庭对工作的增益和家庭对工作的冲突间接作用于工作投入。

Does Good Performance at Home Predict High Engagement at Work? ——An Exploration Based on The Perspective of Work-family Relationship of Primary and Secondary School Teachers

CHEN Yaping, TONG Yuehua, WEI Shuhua

School of Education and Psychology, University of Jinan, Jinan 250022

Abstract: Objective: From the perspective of work-family relationship, this paper examines the relationship between family role performance and work involvement of primary and secondary school teachers. Methods: Using cluster sampling method, seven hundreds married primary and secondary school teachers were investigated, including 289 (41.3%) primary school teachers and 411 (58.7%) secondary school teachers. There were 234 male teachers (33.4%) and 466 female teachers (66.6%). Family role performance and family support were measured at time point 1, and family-to-work enrichment, family-to-work conflict, work involvement were measured at time point 2. AMOS was used for confirmatory factor analysis, SPSS was used for descriptive statistics and correlation analysis of major variables. Bootstrap method was used to investigate the relationship between family role performance and work involvement, and to explore the mediating roles of family support, family-to-work enrichment and family-to-work conflict. Results: 1) Family role performance, family support, family-to-work enrichment and work involvement were significantly positively correlated, and family-to-work conflict was significantly negatively correlated with all the other variables; 2) Family role performance can significantly predict work engagement, with a total effect size of 0.23. 3) Family support, family-to-work enrichment and family-to-work conflict played a mediating role in the process of family role performance affecting work engagement, with mediating effect sizes of 0.06, 0.02 and 0.11, respectively; 4) “family support → family-to-work enrichment” played a chain mediating role in the process of family role

performance affecting work engagement, the effect size was 0.04. Conclusion: The family role performance of primary and secondary school teachers not only directly affects work engagement, but also indirectly affects work engagement through family support, family-to-work enrichment and family-to-work conflict.

Keywords: family role performance, work engagement, family support, family-to-work enrichment, family-to-work conflict

Abstract: Objective: Construct a high school student's career planning ability structure through scientific methods, compile a high school student's career planning ability assessment questionnaire, investigate the status of high school students' career planning ability level, and provide support for the development of the school's career planning education. Methods: The design consists of three parts. First of all, based on the summary of the existing research, 101 experts are invited. Through semi-structured interviews and expert suggestions, a preliminary dimension of high school students' career planning ability structure is initially constructed. After preparing the questionnaire items, a

total of 27 high school students and graduate students in psychology were invited to revise the questionnaire items to form the initial questionnaire. Then, after testing 592 high school students, the questionnaire was subjected to project analysis and multiple exploratory factor analysis to form a formal questionnaire. The test was conducted on 1782 high school students, and the reliability and validity of the questionnaire were tested using confirmatory factor analysis. Finally, a formal questionnaire was used to survey the career planning ability of 1921 high school students. Results: (1) High school students' career planning ability is a multi-dimensional structure, including career preparation ability, self-awareness ability, information acquisition ability, career decision-making ability, career management ability. (2) The "High School Students Career Ability Questionnaire" contains 5 dimensions, 40 items, using Likert's 5-point scoring, the internal consistency coefficient of the total questionnaire is 0.95, the internal consistency coefficients of all 5 dimensions are greater than 0.8, and the reliability is extremely high. good. (3) Confirmatory factor analysis shows that $\chi^2/df=2.254$, $RMSEA=0.035$, $GFI=0.930$; $NFI=0.929$, $IFI=0.959$; $PGFI=0.629$, $PNFI=0.725$. The fit index is ideal, the internal structure of the scale is good, it meets the psychometric standards, and can be used to measure the career planning ability of high school students. (4) High school students' career planning ability is at a medium level (3.346 ± 0.588) and needs improvement. (5) High school students' career planning abilities differ significantly in gender($t=2.484$, $p < 0.05$), grade($F=15.984$, $p < 0.001$), and family location($t=5.955$, $p < 0.001$). The career planning ability of boys is better than that of girls; the career planning ability of the first grade is higher, and the career planning ability of the third grade is lower; students from urban areas have higher career planning skills than non-urban students.

Keywords: senior high school students, capacity structure, career planning skills, questionnaire development

摘要 近年来, 游戏化被广泛地应用在健康服务、教育培训、物流、市场营销等活动, 以及社交网络等应用程序中, 但以往研究主要聚焦于游戏化元素的自身特点, 忽略了用户对这些元素的感知与体验。为填补这一空白, 本研究旨在通过 4 个研究开发与验证游戏化体验量表。研究一通过开放式问卷收集用户对游戏化元素的体验与感知, 以探索游戏化体验的内在结构。研究二编制了初始项目并通过主成分分析探索其因子结构。研究三通过验证性因子分析对量表的信度和效度进行了评估。研究四对量表进行了简化并验证了量表的测量不变性。研究表明, 游戏化体验量表(Gamification Experience Scale, GXS)由 33 个项目组成, 共有 6 个可重复验证的因子, 包含社交互动、乐趣、沉浸感、社会比较、成就感与特权, 累计方差贡献率为 80.952%。Cronbach's α 的范围在 0.884 至 0.977, McDonald's ω 在 0.934 至 0.974, 表明信度良好。所有项目载荷均大于 0.7, 6 个维度的 AVE 值均大于 0.6, CR 值均大于 0.9, 表明聚合效度良好。Fornell-Larcker 标准与 HTMT 被用来检验区分效度, 6 个维度的 AVE 平方根均大于它们与其他维度的相关系数且 HTMT 值均小于 0.85, 表明区分效度良好。6 个维度与契合度、持续使用意愿、口碑以及 App 评分均呈现不同程度的显著正相关, 验证了量表的校标关联效度。本研究的发现强调了以用户为中心的游戏化体验的重要性, 为未来有关游戏化体验的研究提供了重要的理论基础和评估游戏化体验的可靠测量工具。此外, 本研究为在线服务的管理者与设计师在理解游戏化体验方面提供了新的见解与测量手段。

Development and Validation of the Gamification Experience Scale (GXS)

Yang Cai and Wendian Shi

Department of Psychology, School of Education, Shanghai Normal University, Shanghai, 200234

Abstract: In recent years, gamification has widely been applied to health services, education, training, logistics, and marketing, as well as in applications such as social networks. However, previous studies mainly focus on gamification elements, ignoring users' perception and experience of these elements. In order to fill this gap, this research aims to develop and validate the Gamification Experience Scale (GXS) through four studies. Study 1 collected user experiences and perceptions of using gamification elements through an open-ended questionnaire to explore the psychological structure of gameful experiences. Study 2 developed the initial item pool and explored the factor structure through principal component analysis. Study 3 evaluated the reliability and validity of the scale through confirmatory factor analysis. Study 4 optimized the length of the scale and validated its measurement invariance. The results show that the GXS consists of 33 items with six replicable factors, including social interaction, enjoyment, immersion, social comparison, accomplishment, and privilege. The six extracted factors explained 80.952% of the total variance. Cronbach's α ranged between 0.884 to 0.977, and McDonald's ω ranged between 0.934 to 0.974, demonstrating confident reliability. All of the indicator loadings were greater than 0.7, the AVE values of the six dimensions were greater than 0.6, and the CR values were greater than 0.9, supporting convergent validity. The Fornell-Larcker criterion and HTMT were used to test discriminant validity. The square roots of AVE of the six dimensions were all greater than their correlation coefficients with other dimensions, and the HTMT values were all less than 0.85, reflecting discriminant validity. The six dimensions were positively correlated with engagement, continued use intention, word-of-mouth, and application rating to varying degrees, which validated the criterion-related validity. Our findings highlight the importance of user-centered gameful experience and provide an important theoretical foundation for future research on gameful experience and a reliable measurement tool for evaluating gameful experience. Additionally, this research provides new insights for online service stakeholders in understanding gameful experience.

摘要 社会风险感知是指全社会范围内, 人们对各种客观风险的主观感受和认识。社会风险感知不仅会影响个体的身心健康, 而且会影响社会心态, 不利于社会健康稳定发展。新时代民众面临新风险, 同时民众关心的社会风险也有所变化。现有研究对凸显当前时代特点的网络安全风险和民生领域具体风险的重点关注有待加强。为探究适合我国新时代背景下民众社会风险感知的结构维度, 通过访谈、专家评定并对相关研究进行文献分析, 确定了网络安全、房价压力、养老问题、社会人际、区域差距、政务公开、教育培养、医疗卫生、生态环境和就业保障共 10 个维度, 编写了与之对应的 49 个项目。对 200 名来自全国不同地区、不同年龄段、不同行业的民众进行初测, 进行探索性因素分析, 形成 46 个项目组成的正式量表。并采用该量表对 456 名民众进行调查, 回收数据并分析其信效度。经过数据分析和处理, 最终量表包含 10 个维度 30 道题目, 量表的内部一致性信度为 0.91, 各维度 Cronbach's α 在 0.74-0.85 之间, 累计方差解释率为 69.92%。验证性因素分析表明模型拟合良好, RMSEA=0.04, GFI=0.92, IFI=0.96, TLI=0.96, CFI=0.96。各维度之间的相关系数为 0.18-0.50 之间, 且各维度与量表总分的相关均显著。综上, 社会风险感知量表具有良好的信度和效度, 符合心理测量学标准要求, 适用于对中国民众社会风险感知的评估。

Abstract: Social risk perception refers to people's subjective feelings and understanding of various objective risks in the whole society. Social risk perception will not only affect the physical and mental health of individuals, but also affect the social mentality, which is not conducive to the healthy and stable development of society. In the new era, people are faced with new risks, and the social risks that people care about have also changed. The focus of existing studies on cyber security risks and specific risks in the field of people's livelihood that highlight the characteristics of the current era needs to be strengthened. To explore suitable for China's new era under the background of public social structure dimension of risk perception, through interviews, expert assessment and the related research literature analysis, determines the network security, housing stress, pension problems, social interpersonal, regional disparity, open government, education, culture, health, ecological environment and job security, a total of 10 dimensions, Forty-nine corresponding projects have been written. An exploratory factor analysis was conducted on 200 people from different regions, different ages and different industries to form a formal scale consisting of 46 items. The scale was used to investigate 456 people, and the data were collected and its reliability and validity were analyzed. After data analysis and processing, the final scale contains 30 items in 10 dimensions. The internal consistency reliability of the scale is 0.91, Cronbach's α in each dimension is between 0.74 and 0.85, and the cumulative variance interpretation rate is 69.92%. Confirmatory factor analysis showed that the model fit well, RMSEA=0.04, GFI=0.92, IFI=0.96, TLI=0.96, CFI=0.96. The correlation coefficients of each dimension ranged from 0.18 to 0.50, and the correlation between each dimension and the total score of the scale was significant. In conclusion, the social risk perception scale has good reliability and validity, meets the requirements of psychometrics standards, and is suitable for the assessment of Chinese people's social risk perception.

中学生问题解决能力量表的编制

董佳瑞¹ 刘蓝蔚² 方平¹ (通讯作者)

1 首都师范大学心理学院, 北京, 100048, pfang2007@126.com

2 北京市日坛中学实验学校, 北京, 100084

摘要 随着现代素质教育的不断推进和深入, 教育者逐渐强调学生问题解决能力这一高阶思维的重要性。问题解决能力不仅是贯穿学生的学习生涯, 也是我国学生发展核心素养的十八重点之一, 更是 21 世纪学生的必备能力之一。但是回顾以往有关问题解决能力的研究, 不难发现问题解决能力的理论虽然丰富但却缺少有效的测量工具。中学阶段是学生抽象逻辑思维发展的关键时期, 因此对中学生问题解决能力的有效测量不仅对他们的学业起着引导作用, 更有利于他们的发展。所以本研究立足于我国中学生的学习与发展现状, 综合已有研究, 编制了中学生问题解决能力量表, 为更好的测评中学生问题解决能力提供有效的帮助。本研究首先通过对已有研究文献的梳理和总结, 在理论层面上将中学生问题解决能力构念为问题探究、框架构建、计划制定、计划实施、结果反馈这五个维度, 共编制了 36 道题目。首先研究一对名中学生进行施测, 回收数据进行项目分析和探索性因素分析, 最终形成了包含 5 个维度, 共 20 道题目的正式量表, 累计解释变异量为 76.41%; 研究二采用正式量表对 356 名中学生进行施测, 回收数据用于验证性因素分析, 结果表明: 总量表的 Cronbach's α 为 0.82, $\chi^2/df=2.12$, RMSEA = 0.048, IFI=0.978, TLI=0.974, CFI=0.978。数据分析的结果表明

本量表具有良好的信效度,符合心理测量学的标准和要求,可应用于对中学生问题解决能力的调查研究中,在实践层面丰富了问题解决能力的研究。

Compilation of Problem-Solving Ability Scale for Middle School Students

DONG Jiarui ¹, LIU Lanwei ², FANG Ping ¹ (Corresponding author)

¹ Collage of Psychology, Capital Normal University, Beijing, 100048, China

² Beijing Ritan Middle School Experimental School, Beijing, 100084, China

Abstract: With the continuous advancement and deepening of modern quality education, educators gradually emphasize the importance of high-level thinking of students' problem-solving ability. The problem-solving ability not only runs through the students' study career, but also one of the eighteen key points of the core literacy development of our students, and it is also one of the necessary abilities of the 21st century students. But looking back on the previous researches on problem-solving ability, it is not difficult to find that the theory of problem-solving ability is rich but lack of effective measuring tools. The middle school stage is a critical period for the development of abstract logical thinking ability. The effective measurement of the problem-solving ability of middle school students not only guides their academic work, but also benefits their development. Therefore, based on the current situation of middle school students' learning and development in China, this study compiled the scale of middle school students' problem-solving ability to provide effective help for better assessment of middle school students' problem-solving ability. This research first through to the existing literature combing and the summary, in the theoretical level constructs the middle school student problem-solving ability the question inquiry, the frame construction, the plan formulation, the plan implementation, the result feedback these five dimensions, a total of 36 questions were prepared. Firstly, a pair of middle school students were tested, and the data were collected for item analysis and exploratory factor analysis. Finally, a formal scale containing 5 dimensions and a total of 20 items was formed, with a cumulative interpretation variance of 76.41%. In the second study, 356 middle school students were measured using a formal scale, and the data were recovered for confirmatory factor analysis. Cronbach's $\alpha=0.82$, $\chi^2/df=2.12$, RMSEA =0.048, IFI=0.978, TLI=0.974, CFI=0.978. The results of data analysis show that this scale has good reliability and validity and conforms to the standards and requirements of psychometrics. It can be applied to the investigation and research on the problem solving ability of middle school students, which enriches the research on problem solving ability at the practical level.

摘要 目的: 美术能力倾向测验对美术人才的识别和选拔具有重要意义,我国社会发展对美术能力倾向测验提出了现实需求,需要我们关注美术能力倾向测验的开发与应用。因此,本研究对美术能力测验开发的历史进行回顾,对已有美术能力倾向测验进行分类并予以介绍,分析测验的不足,并提出研究的发展方向,以期对进一步开发适用于我国国情的美术能力倾向测验提供一定的启示。**资料来源:** 本文采用文献检索法,回顾了1913年以来主要以国外研究为主的,国、内外对美术能力方面的测量研究。**资料选择:** 由两名研究员独立审查资料,从中国知网、谷歌学术、Cog Prints 等多个专业论文搜索网站对如“审美知觉”、“美术测验”、“美术能力”、“美术能力测量”等关键词进行检索。**资料提取:** 两名研究员对主要的30个美术能力倾向测验进行资料整理、归纳分类。**结论:** 现有测验可分为从审美能力测量和艺术创作能力测量两种角度开发的测

验,其中审美能力测量的测验又可以分为审美判断测验和判断后选择判断理由的测验。但以往研究存在缺乏对审美知觉能力维度的实证研究、没有区分“主观美”和“客观美”,以及缺乏对各类型美术能力倾向测验效度的比较研究的问题。未来可进一步加深对审美知觉能力维度的实证研究,开发多类型美术能力判断测验并比较其效度,开发适用于小学甚至学龄前儿童的美术能力倾向测验,以及开发适合我国国情的美术能力倾向测验。

Aesthetic Measurement: Review and Prospect of Art Aptitude Test

LI Xuan^{1,2}; DONG Shenghong^{1,2}

School of Psychology, Jiangxi Normal University, Nanchang 330022

Jiangxi Key Laboratory of Psychology and Cognitive Science, Nanchang 33002

Abstract: Purpose: Art aptitude test is of great significance to the identification and selection of artistic talents, the social development of our country has put forward the realistic demand for the art aptitude test, which requires to pay attention to the development and application of the art aptitude test. Hence, in order provide some enlightenment for the further development of art aptitude test applicable to China's national conditions, this study reviews the history of art aptitude test development, classifies and introduces the existing art aptitude test, analyzes the deficiencies of the test, and puts forward the development direction of the study. **Data identification:** Using the method of literature review, this paper reviews the domestic and foreign research on the measurement of art ability since 1913, which mainly focuses on foreign research. **Study selection:** Two observers independent searched keywords such as "aesthetic perception", "art test", "art ability" and "measurement on art ability" from CNKI, Google Scholar, Cog Prints, and other professional paper retrieval websites. **Data extraction:** Two observers collated and classified the data of 30 mainly art aptitude tests. **Conclusion:** The existing tests can be sorted out into two aspects: the measurement of aesthetic ability and artistic creation ability. However, there are some problems in previous studies, such as lack of empirical research on the dimensions of aesthetic perception ability, the distinction between "subjective beauty" and "objective beauty", and comparative study on the validity of various art aptitude test. Future empirical research on the dimension of aesthetic perception ability can be more further, developing multiple types of art ability judgment tests and comparing their validity, developing art aptitude tests suitable for primary school or even preschool children, for China's national conditions as well.

多维度儿童智力诊断量表全国参考性常模制定研究

刘晓陵¹ 董淑颖¹ 赖新蓁¹ 金瑜²

¹ 华东师范大学心理与认知科学学院, 上海, 200062

² 华东师范大学特殊教育学系, 上海 200062, yjin@spe.ecnu.edu.cn

摘要 1978年以来,本土化智力测验的研发取得了积极成果,但亦存在几个待突破的情况:针对学龄前和小学儿童的智力测验少;多数智力测验在区别轻、中、重度智力落后程度上的功力不足;不少测验未制定全国常模。为此,金瑜等在深入考察中外多个经典智力测验的基础上,2006年编制了多维度儿童智力诊断量表(简称 MIDSC)。该测验作为个别智力测验,旨在诊断 4-11 岁儿童的智力状况,为智力落后儿童的鉴定和区分提供客观信息。MIDSC 是基于心理测量学取向的智力测验,同时汲取当代认知心理取向和多维取向的智力理论,采用层级模型理论架构,最高层为 G 因素,第二层为言语因子、操作因子和工作记忆,最底层为 11 种狭窄能力,由此衍生出全量表、三个分量表和 11 个分测验(含 1 个补充充分测验)。此后 MIDSC 历经 10 余年的使用、检验和修订,臻于成熟。本研究主要目的是制定全国参考性常模,再次检验测验的心理测量学特征。首先标准化取样。根据国家行政区划划分,采用兼顾东西南北和大中小城市原则,确定了六个取样地区、组建协作组、进行主试培训。依据人口普查结果、按照人口统计学变量分配各地区、各年龄组被试人数,抽样和施测,最终常模样本组包含 800 名被试。从中随机选取了 61 名被试进行重测,141 名被试接受《中小学

生团体儿童智力筛选测验》，30名4至6岁半的儿童接受了《韦氏学龄前儿童智力测验（WPPSI）》测试；抽取了51名智力落后儿童接受MIDSC测试。其次建立常模。采用连续常模法拟合技术，4-10岁各年龄组内细分为三个小组，制定各年龄组常模，分测验采用均数为13、标准差为4的标准分，分量表和全量表采用100为均数、15为标准差的离差智商；经检验，智商分数符合正态分布。最后检验心理测量学特征。结果发现：三个分量表和全量表分半信度达0.96-0.99；10个正式分测验中，6个分半信度高于0.90，仅1个略低于0.8；全量表重测信度为0.82。验证性因素分析发现层次结构模型拟合性优良（ $CMIN/DF=4.426$ ； $CFI=0.99$ ； $RMSEA=0.065$ ）；校标效度研究得到效度系数分别为0.73,0.62,0.73和0.58；差异检验发现智力落后组在所有分测验和量表得分上均显著低于正常组，效应量达1.72-3.68。结论：MIDSC的心理测量学特征符合要求，能够诊断4-11岁儿童智力、鉴别和区分智力落后儿童，可以推广使用。

关键词 多维度儿童智力诊断量表，常模，信度，效度

A study on the Establishment of National Reference Norm of Multi-dimensional Intelligence Diagnostic Scale for Children

Xiaoling liu¹, Shuying Dong¹, Xinzhen Lai¹, Yu jin²

1the School of Psychology and Cognitive Science, ECNU, 200062

2the Department of Special Education, ECNU, 200062

Abstract: Since 1978, the research and development of native intelligence test has achieved positive results, but there are still some problems to be broken through: the intelligence test for preschool and primary school children is less; Most intelligence tests have insufficient ability in distinguishing between the degree of light, medium and severe mental retardation; Many tests have not developed national norm. So, Jin Yu and others have compiled a Multi-dimensional Intelligence Diagnosis Scale for Children(MIDSC) in 2006 based on the in-depth investigation of many classic intelligence tests at home and abroad. As a personal intelligence test, the test aims to diagnose the intelligence status of 4-11 year olds and provide objective information for the identification and differentiation of children with intellectual disabilities. MIDSC is an intelligence test based on psychometrics orientation, and draws on the intelligence theory of contemporary cognitive psychological orientation and multi-dimensional orientation. It adopts the hierarchical model theory structure, with the highest level being g factor, the second layer is speech factor, operation factor and working memory, and the lowest level is 11 narrow abilities, thus the full scale is derived three subscales and 11 subtests (including 1 supplementary test). After more than 10 years of use, inspection and revision, MIDSC has been mature. The main purpose of this study is to develop national reference norm and to test the psychometric characteristics of the test again. First, standardize the sampling. According to the division of national administrative regions, six sampling areas, cooperative groups and main trial training were determined by taking into account the location and the size of cities. According to the census results, the number of subjects in different regions and age groups was distributed according to demographic variables. The sample and test were conducted. The final normal shape group consisted of 800 subjects. 61 subjects were randomly selected for retest, 141 subjects were tested with the Screening Test for Group Children of Primary and Secondary Students", and 30 children aged 4 to 6 and a half were tested with the Wechsler Preschool and Primary Scale of Intelligence (WPPSI); 51 children with mental retardation were selected for MIDSC test. Secondly, the norm is established. The continuous norm fitting technique was used, and each 4-10-year-old group was divided into three groups, and the norm of each age group was established. The standard scores of mean number 13 and standard deviation 4 were used in the subtest. The deviation IQ of 100 mean and 15 was used as the standard deviation in the subscale and the total scale; The IQ scores were tested to be in accordance with the normal distribution. Finally, the characteristics of psychometrics were tested. The results showed that the half-split reliability of the three subscales and the total scale was 0.96-0.99; 6 of the 10 formal subtest had a half-split reliability higher than 0.90, only one was slightly lower than 0.8; The retest reliability coefficient of the total scale was 0.82. The results of confirmatory factor analysis showed that the model fit of hierarchical structure was good ($CMIN/df=4.426$); $CFI=0.99$; $RMSEA=0.065$); The coefficients of criterion-related

validity were 0.73,0.62,0.73 and 0.58, respectively; The difference test showed that all the scores of mental retardation group were significantly lower than those in the normal group, and the effects were 1.72-3.68. Conclusion: the psychometric characteristics of MIDSC are in line with the requirements, and can be used widely in the diagnosis of intelligence, distinguishing and distinguishing children with mental retardation between 4-11 years old.

Keywords: MIDSC, norm, reliability, validity

MUPP-2PL 在迫选式性格测验中的应用研究

刘娟¹ (通讯作者) 韩婷¹ 李云川¹ 杨婷¹

¹ 北京智鼎优源管理咨询有限公司, 北京, 100101, liuj@zhiding.com.cn

摘 要 迫选式问卷能很好地避免传统李克特问卷所带来的各种反应偏差问题(如作答趋中性、社会赞许效应、装好作假等), 因此它被很多人才测评开发者所青睐。但迫选式问卷基于传统计分形式产生的数据为自模式数据, 这种数据形态违背了一些测验质量分析(如信度分析、因子分析等)的前提假设, 从而导致迫选式测评的测验科学性无法得到相关测量学指标的支持。近年来, 为了从迫选题目中获得非自模式的数据和更准确地估计潜在特质值, 研究者提出了多种适用于迫选题目的 IRT 模型: Brown (2010) 基于瑟斯顿比较判断法提出的瑟斯顿 IRT 模型, Stark (2005) 基于配对迫选题型开发的 MUPP 框架, 基于此框架, 当题目符合展开反应模式并使用 GGUM 为概率函数时, 则为 MUPP-GGUM 模型 (Stark et al. 2005), 当题目符合优势反应模式并使用 2PL 为概率函数时, 则为 MUPP-2PL 模型 (Morillo et al. 2016)。本研究将基于 MUPP-2PL 模型, 采用极大似然参数估计方法对维度分数 (theta) 进行估计, 旨在探讨在多种模拟条件下维度分真值、估计值和自模分数之间的关系, 以及在何种情境下, 可以最大化发挥 IRT 计分的优势, 获得更精确的维度分估计值。研究中数据模拟所使用的题目信息来自 MAP 职业性格测验, 它是智鼎在线公司基于人格特质理论开发的测验产品, 共测量了 24 个性格维度, 由数个迫选题块组成, 每个题块由来自不同性格维度的三个描述条目(即题目)组成。研究考虑了每个维度所测量的题目数, 各维度内题目的难度参数、区分度参数的变异性, 单维 block 的占比和真值分布等条件。研究评价标准包括维度分数估计偏差 (bias) 及绝对偏差 (absbias), 维度分数估计值与真值的相关 (corr)。结果发现: (1) 每个维度所测量的题目数是影响 theta 估计稳定性的重要因素; (2) 维度内题目的难度参数标准差高于 0.3 时对 theta 的估计更为准确; (3) 对极端 theta 的估计误差较大。本研究立足于成熟的人格测验产品 MAP, 在研究过程中借鉴了其多年来积累的开发经验, 研究结果对高维人格类迫选测验的开发和 MUPP-2PL 模型在其中的应用具有一定的指导价值。

A Research on the Application of the MUPP-2PL in the Forced-Choice Personality Test

Liu Juan, Han Ting, Li Yunchuan, Yang Ting

Beijing Insight Online Management Consulting Co., Ltd, 100101

Abstract: Forced-choice questionnaires (FCQs) are preferred by many talent assessment developers because they avoid the response biases associated with traditional Likert-type questionnaires (e.g., response neutrality, social desirability, faking, etc.). However, the ipsative data generated by FCQs are based on traditional scoring methods, and violate some assumptions of test quality analysis (e.g., reliability analysis, factor analysis, etc.), and thus the scientific validity of FCQs cannot be supported by relevant measurement indicators. In recent years, in order to overcome the problems of ipsative data and to estimate potential trait values more accurately, researchers have proposed several IRT models applicable to FCQs: the Thurston IRT model proposed by Brown (2010) based on Thurston's comparative judgment rule, and the MUPP framework developed by Stark (2005) based on multidimensional pairwise preference

items. Based on the MUPP framework, when the item conforms to the unfolding response pattern and uses generalized graded unfolding model (GGUM) as the probability function, it is the MUPP-GGUM model, and when the item conforms to the dominant response pattern and uses two-parameter logistic model (2PL) as a probability function, it is the MUPP-2PL model (Morillo et al. 2016). In this study, the dimensional score (θ) will be estimated using a maximum likelihood parameter estimation method based on the MUPP-2PL model, in order to explore the relationship between the true value of the dimensional score, the estimated value and the ipsative score under a variety of simulation conditions, as well as the context in which the advantages of IRT scoring can be maximized to obtain a more accurate estimate of the dimensional score. The data simulations are based on the item information of the MAP Occupational Personality test, a personality test developed by Insight Online Company based on Personality Trait Theory, which measures 24 personality dimensions and consists of several forced-choice question blocks, with each block consisting of three description items from different personality dimensions. The study considered the number of items measured for each dimension, the variability of the discrimination parameter and the difficulty parameter of the items within each dimension, the proportion of unidimensional blocks, and the distribution of truth values. The study evaluation criteria included bias and absolute bias of the dimensional score estimates, and correlation of the dimensional score estimates with the truth value. It was found that (1) the number of items measured per dimension was an important factor affecting the stability of θ estimates; (2) θ was estimated more accurately when the standard deviation of the difficulty parameter of the items within the dimension was higher than 0.3; and (3) The estimation error of more extreme (very low or high) scores are higher on average than those of medium scores. This study is based on MAP, a well-established personality test, and draws on its many years of development experience. The results of this study are valuable for the development of high-dimensional personality tests and the application of the MUPP-2PL model to these tests.

摘要 高科技作弊作为团体作弊的一种形式, 具有大规模、有组织、答案可以跨考场传播等特点。本研究借鉴高维变量筛选的思想, 提出一种结合传统作弊甄别指标优势与高科技作弊特点的算法。首先计算两两考生间的答案抄袭指标 ω 或 g_2 , 按此从大到小将考生排序, 从嫌疑度最大的考生开始寻找可能的嫌疑作弊团体, 依次判别考生是否属于此团体, 最后通过作弊团体的判别标准, 选出真正的作弊团体。在算法中有 3 个比较重要的超参数: Tr 通过对切割点的判断来判断筛选出的组是否是作弊组, Ta 通过对组内答案抄袭指标的判断来判断筛选出的组是否是作弊组, M 用于决定何时结束对考生中作弊组的筛选, 停止算法。分别进行两个模拟研究, 均进行了 100 次模拟研究。研究一用于研究算法中的超参数 (Tr 、 Ta 、 M) 对不同场景的作弊甄别结果的影响, 模拟 5000 名考生的作答, 设置 50 名作弊考生, 3 种抄袭比例 (40%, 60% 和 80%) 和 3 种抄袭源能力 (能力百分等级为 70%, 80% 和 90%)。研究二研究使用 ω 和 g_2 两种指标的传统算法与新算法的结果。模拟 25000 名考生的作答, 设置单组作弊与多组作弊的情境, 设置 3 种作弊考生人数 (50、100、200 名), 3 种抄袭比例 (40%, 60% 和 80%) 和 3 种抄袭源能力 (能力百分等级为 70%, 80% 和 90%), 同时为传统算法设置了严格与宽松的 α 水平。研究一的结果表明在甄别难度最大即抄袭率为 40% 时, Tr 的取值影响较大, 当标准宽松时, 检出率高的同时误判率较高, 对 Ta 取值严格, M 取值大一些可以在控制误判率的同时保证良好的检出率。研究二中, 单组作弊情境下, 使用两种指标的新算法的检出率保持在 90% 以上, 误判率接近为 0, 当 α 水平宽松时, 传统算法可以得到与新算法接近的误判率但检出率远低于新算法, 当 α 水平严格时, 传统算法可以得到与新算法接近的检出率但误判率远高于新算法。多组作弊情境下, 新算法的

检出率保持在 97%以上，最大的误判率为 4.21‰，传统算法无法在保证高检出率的同时实现低误判率。新算法的结果明显优于传统算法。

An Algorithm to Detect High-tech Cheating

Yongze Xu¹, Xinyi Wang², Fang Luo² (Corresponding author)

¹ TCL Multimedia, Hong Kong, 999077

² Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: The complex nature of high-tech cheating has brought new challenges to cheating screening. In this paper, we propose a new algorithm that is conceived of as a combination of the advantages of traditional cheating indexes and the related information of cheating groups for high-tech cheating. We calculate the aberrant similarity index ω and g_2 between two test takers and then find all possible suspect groups starting from the largest aberrant similarity, establish criteria for candidates to join the group and determine if they are members of that cheating group, finally determine whether it is a "real" cheating group by setting the discriminating criterion for the establishment of the groups. There are 3 important hyperparameters in the algorithm. Tr is a threshold to standardize whether a cut point is significant to cut out a group. Ta is a threshold to view the indicators within a group whether big enough to be doubted. M gives the condition of convergence, when cheat group is not found during forward screening M times in a row, we stop the iteration. Two simulation studies are conducted to evaluate the performance of the new approach under different conditions and each simulation is repeated 100 times. Study 1 is aimed to investigate the effect of the hyperparameters (Tr , Ta , M) in the algorithm on the screening results. The total sample size is 5000 and the number of cheaters in Study 1 was set to 50. Three levels of gunner's ability (70%, 80%, and 90%,) and three levels of plagiarism ratio (40%, 60%, and 80%) are considered in Study 1. Based on Study 1, the purpose of Study 2 is to compare the results of the traditional algorithm and our new algorithm using the two indexes of ω and g_2 under the determination of better performing hyperparameter values. The total sample size is 25000 and single-group cheating and multiple-group cheating conditions are set. Three levels of cheaters (50, 100, and 200), three levels of gunner's ability (70%, 80%, and 90%,) and three levels of plagiarism ratio (40%, 60%, and 80%) are considered in Study 2. Also, we set strict and loose alpha levels for the traditional method. The results of Study 1 show that when the plagiarism rate is 40%, the value of Tr has a greater impact. When the value of Tr is large, that is, when the standard is loose, the detection rate is high and the Type I error rate is high. A larger value for Ta and a larger value for M can control the Type I error rate and ensure a good detection rate. In Study 2, the detection rates of the new algorithm using both indexes in the single-group cheating conditions remain above 90% and the Type I error rates are close to zero. When the alpha level is loose, the traditional algorithm could obtain the Type I error rates close to that of the new algorithm but the detection rates are much lower, and when the alpha level is strict, the traditional algorithm could obtain the detection rates close to that of the new algorithm but the Type I error rates are much higher. Under multiple cheating conditions, the detection rates of the new algorithm remain above 97%, and the max Type I error rate is 4.21‰. The traditional algorithm cannot achieve a low Type I error rate while ensuring a high detection rate. The result of the new algorithm is significantly better than those of the traditional algorithm. Simulation results show that the new algorithm yields a high detection rate, as well as low Type I error, under different simulated conditions.

摘要 创造力测量是创造力研究的基础。一直以来, 以发散思维测验和顿悟类测验为主流的传统创造力测验存在诸多弊端。首先, 传统测验过于强调创造力标准化定义中的“新颖性”, 忽略“适宜性”, 导致许多新奇而怪异的作答被误判为高创造性; 第二, 将发散性思维等同于创造性思维, 缺乏对聚合性思维的考察; 第三, 评价指标单一, 人工评分费力费时; 第四, 传统测验任务较为简单抽象, 脱离真实问题情境, 生态效度低下。针对以上问题, 本研究旨在开发游戏形式的创造力测验任务, 收集被试在交互中的过程性数据, 实现对多种创造思维能力的评估。创造力游戏测验以“证据中心的设计”为指导框架, 围绕“史前人类生活”构建问题情境, 引导被试展开想象, 通过组合卡片故事的方式“合成”创造性解决方案。游戏分为三个关卡, 共设计超 600 种动画反馈, 被试每一步的卡片组合都会触发预设反馈, 以此保证被试有较大的问题探索空间, 同时限制其交互行动范围, 减小测量误差。本研究共招募 515 名大一学生被试, 同时完成发散性图形与文字测验、中文远距离联想测验、顿悟性问题测验、威廉斯创造倾向量表等效标测验。研究一提取了过程性行为指标, 并系统检验了测验的难度、区分度、信效度。结果表明, 测验具有良好的心理测量学属性。其中, “创造性方案总数”指标与顿悟测验分数的相关最高 ($r = 0.30, p < .001$); “卡片组合方案总数”指标与发散图形测验中“灵活性”分数的相关最高 ($r = 0.29, p < .001$)。研究二以操作步骤和顿悟测验分数为节点构建贝叶斯网络, 进一步探讨个体的顿悟水平对游戏关键作答的影响, 为结构效度提供证据。创造力游戏测验的作答体验得到被试非常高的评价, 体现游戏测验的优势和前景。

Development of a Game-Based Assessment to Measure Creativity

Yuzhuo Yuan¹, Fang Luo¹

1 Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, 100875, China

1 Faculty of psychology, Beijing Normal University, Beijing, 100875, China (luof@bnu.edu.cn)

Abstract: Creativity measurements are the foundation of creativity research. Divergent thinking tests and insight problems as major instruments for measuring people's creativity have been long questioned by scholars in the field. Firstly, the standardized definition of creativity indicates two predominant attributes of creative products, novelty and appropriateness. However, the novelty was overemphasized which resulted in some novel, but odd, bizarre answers were considered as creative. Secondly, some researchers considered the creative thinking process as only involving divergent thinking, ignoring the function of convergent thinking. Thirdly, behavioral indicators of the test were scarce, at the same time, subjective scoring methods were strenuous and time-consuming. The purpose of the current study aims to develop a game-based assessment to measure multiple creativity thinking skills, with the guidance of evidence-centered design, a foundational assessment design framework. The game was designed to guide participants to imagine under the problem situation of “prehistoric human life”, and to explore creative solutions by combining different story cards. There're three levels in the game, with more than 600 kinds of pre-designed animation as the feedbacks after each trial, which ensures a large problem-solving space for the participants, while limiting the number of game interactions and reducing measurement errors. To validate the assessment, we collected data from 515 first-year university students who played the game and completed several external creativity measures (i.e., Figural and verbal creative thinking tests, insight problems, Chinese remote association test, Williams creativity assessment packets). The results of study 1 showed that the game has sound psychometrical properties. The creativity estimates (i.e., “the number of solutions”, “the number of card combinations”) derived from the game significantly correlated with the external measures, with the correlation coefficient were 0.30 and 0.29, respectively. In study 2, a Bayesian network was conducted including each step and insight scores as nodes, which further examined the relationship

between the insight skills and participants' in-game actions. Finally, the game received very high evaluation from participants, showing the attractions of game-based assessment.

摘要 毒品成瘾问题对社会治安和国家稳定是一个不小的威胁因素。因此, 加深对吸毒者心理因素的特点和加工方式的了解, 针对吸毒群体开展有效的心理治疗, 对提高吸毒者心理特质及今后的戒毒工作具有重要意义。前人研究中常使用回归分析探索变量间的关系, 同时使用此方法对结果变量进行预测和筛选。在采用回归模型分析数据的心理学研究中, 最小二乘法是最常用的模型系数估计方法, 但这种传统方法存在以下两点不足: 其一是多重共线性, 即在回归模型中多个预测变量之间存在相关关系, 这使得估计得到的回归系数易于受到样本数据的影响, 从而导致估计结果的稳定性较差; 其二是过度拟合, 这使得所得模型只适用于当前样本, 缺乏概化能力。而机器学习方法可以弥补传统方法的这些不足之处。机器学习方法中的 Ridge 回归、Lasso 回归和弹性网络算法, 对高度相关变量的回归系数施加惩罚, 从而解决了传统统计的限制性共线性假设。Ridge 回归将不重要的预测变量系数缩小为零。Lasso 回归和弹性网络回归算法可以将系数精确地缩小到零, 从而对更简单的模型进行子集选择。目前很少有研究使用该方法, 故本研究在前人研究的基础上使用机器学习中这三种方法, 以期识别出影响毒品成瘾的关键心理风险因素, 为戒毒与禁毒相关研究与实践提供更多理论和工具上的参考。本研究使用自编量表对正常人群和从天津市某戒毒所抽取的吸毒者进行施测, 共 677 名被试, 其中吸毒者 317 名, 正常人 360 名。之后使用 Ridge 回归、Lasso 回归和弹性网络算法随机抽取 70% (n=474) 的有效数据集作为训练样本集, 剩余 30% (n=203) 作为测试样本集。结果发现, 所使用的不同机器学习统计算法的结果非常相似。在所建立的模型中, 相对于其他变量, 责任心表现出了最大的相对重要性, 其 Ridge 回归、lasso 回归和弹性网络算法的重要性系数分别为 0.036、0.040、0.040, 其次是易分心和社会偏见, 其 Ridge 回归、lasso 回归和弹性网络算法的重要性系数分别为 0.026、0.023、0.026 和 0.025、0.022、0.024。

Abstract: Drug addiction is a serious threat to public order and national stability. Therefore, it is of great significance to deepen the understanding of the characteristics and processing mode of drug addicts' psychological factors and carry out effective psychological treatment for drug addicts. Regression analysis is often used in previous studies to explore the relationship between variables, at the same time using this method to predict and screen the outcome variables. The least square method is the most commonly used method to estimate model coefficients in psychological research using regression models to analyze data. However, this traditional method has the following two shortcomings: One is multiple collinearity, that is, there exists correlation among multiple predictors in the regression model, which makes the estimated regression coefficients easily influenced by the sample data, thus

making the estimated result less stable. The second is overfitting, which makes the model fit only for the current sample and lack generalization ability. Machine learning methods can make up for these shortcomings of traditional methods. Ridge regression, Lasso regression and elastic network algorithms in machine learning methods solve the restrictive collinear assumption of traditional statistics by imposing penalties on the regression coefficients of highly correlated variables. Ridge regression reduces the coefficient of an unimportant predictor variable to zero. Lasso regression and elastic network regression algorithms can reduce coefficients to zero precisely for subset selection of simpler models. At present, few studies have used this method, so this study uses these three methods in machine learning on the basis of previous studies. In order to identify the key psychological risk factors affecting drug addiction, and provide more theoretical and instrumental reference for the related research and practice of drug rehabilitation and drug control. A total of 677 subjects, including 317 drug addicts and 360 normal subjects, were tested with self-made scale. Then 70% ($n = 474$) of the valid datasets were randomly selected as training sample sets using Ridge regression, Lasso regression and elastic network algorithms, Remaining 30% ($n = 203$) as a test sample set. It is found that the results of different machine learning statistical algorithms used are very similar. Accountability showed the greatest relative importance relative to other variables in the established model, The importance coefficients of the Ridge regression, lasso regression and elastic network algorithms are 0.036, 0.040, and 0.040 respectively, followed by distraction and social bias, The importance coefficients of Ridge regression, lasso regression and elastic network algorithm are 0.026, 0.023, 0.026 and 0.025, 0.022 and 0.024 respectively.

摘要 自2019年底新冠疫情爆发以来,人们的生活、学习、工作等方面都受到了巨大的影响。对于学生而言,长时间的隔离、授课方式的转变、师生交流方式的变化等问题为学生的学习活动带来了诸多不便。已有研究针对中小学生对大学生群体受疫情影响的情况开展调查,但少有针对研究生群体的研究。因此,本研究针对研究生群体,旨在探究疫情期间研究生学习活动所受到的影响。本研究采用自编研究生学习活动受疫情影响问卷、焦虑自评量表、自评抑郁量表和社会回避及苦恼量表进行调查,向全国各省市高校的研究生发放问卷,共回收有效问卷2818份。采用潜在类别分析方法对疫情期间研究生学习活动所受影响进行分类,并进行了有关的后续分析,探讨人口学变量对分类的影响,及各潜在类别研究生心理健康状况的差异。分析结果发现,研究生学习活动受疫情影响的类型可以分为4个类别,即总体受影响较小组(34.83%)、总体受影响较大组(31.97%)、课程活动受影响较大组(19.40%)和社交活动受影响较大组(13.79%)。进一步采用多分类logistic回归分析探讨人口学变量对分类的影响。结果表明,年级是影响分类的重要预测因子。与总体受影响较小组相比,总体受影响较大组和社交活动受影响较大组中硕士二年级和硕士三年级的研究生所占比例均较大;在课程活动受影响较大组中,硕士二年级研究生所占比例大于硕士一年级和硕士三年级的研究生。采用方差分析探究各潜在类别研究生心理健康状况的差异,结果显示,总体受影响较大组在焦虑、抑郁和社交焦虑上的得分均显著高于其他三组,其次是课程活动受影响较大组和社交活动受影响较大组,总体受影响较小组在这三个量表上的得分均最低。本研究结果表明,疫情使各年级研究生的学习活动均受到了不同程度的影响,当前疫情常态化背景下应关注研究生的心理健康问题。

Effects of COVID-19 Pandemic on Chinese Graduate Students' Learning Activities: A Latent Class Analysis

Jinqing Wang¹, Minqiang Zhang¹(corresponding author), Zhengyan Liang¹, Yuanlin Xia¹, Derong Kang¹, Qing Zeng¹

1 School of Psychology, South China Normal University, Guangzhou

Abstract: Ever since the outbreak of COVID-19 at the end of 2019, people's lives, studies, work, and other aspects have been tremendously affected. For students, long-term home isolation, the transformation in teaching methods, and changes in teacher-student communicative modes have caused a lot of inconvenience to their learning activities. Studies concerning the impact of the COVID-19 pandemic on primary, secondary, and college school students have been conducted by researchers, but few studies have targeted graduate students. Therefore, the current study is aimed at graduate students, intending to explore the extent to which their learning activities have been affected due to the pandemic. A self-compiled questionnaire with relation to the impact of the pandemic on graduate students' learning activities, self-rated anxiety scales (SAS), self-rated depression scales (SDS), and social avoidance and distress scales (SAD) were used to conduct investigations in the present study. Questionnaires were distributed to graduate students in universities across the country, and a total of 2818 valid questionnaires were collected. Latent class analysis was performed to classify the effects of the pandemic on graduate students' learning activities. Related follow-up analysis was carried out to explore the effects of demographic variables on classification and the differences in the mental health status of graduate students in various latent classes. The results showed that four latent classes were identified, namely the overall less affected group (34.83%), the overall more affected group (31.97%), course activities are more affected group (19.40%) and social activities are more affected group (13.79%). Multinomial logistic regression analysis was further conducted to explore the influence of demographic variables on the classification. The results indicated that grade is a significant predictor of the latent classes. Compared with the overall less affected group, the proportions of postgraduates in the second and third year of master's degree in the overall more affected group as well as social activities are more affected group are both larger. In course activities are more affected group, second-year grad students accounted for higher proportion in comparison to first-year and third-year grad students. The analysis of variance was used to explore the differences in the mental health of postgraduates in each latent class. Results showed that the scores of anxiety, depression, and social anxiety of the more affected group were significantly higher than those of the other three groups, followed by the course activities are more affected group and social activities are more affected group, and the overall less affected group had the lowest scores on these three scales. The results of this study suggest that the learning activities of graduate students in all grades are affected to varying degrees owing to the current crisis. Under the current backdrop of the new normal, attention should be paid to the mental health of graduate students.

Keywords: COVID-19 pandemic, graduate student, learning activity, latent class analysis

疫情期间研究生的心理健康现状及其影响因素 ——基于 2829 名中国研究生的调查数据

康德荣¹ 张敏强¹ (通讯作者) 梁正妍¹ 夏园林¹ 李嘉¹ 梁警丹¹

¹ 华南师范大学心理学院, 广州, 510631, 2640726401@qq.com

摘要 自 2019 年 12 月以来, 新冠肺炎疫情开始在中国以及世界蔓延, 不但对群众的生命安全产生威胁, 也在带来了心理层面的巨大压力。校园教学人员聚集度高, 涉及人数众多。出于疫情防控的目的, 各校均采取了封校隔离、远程授课等一系列举措。已有研究对学生群体在疫情期间的心理健康状况开展了调查, 但目前缺少针对研究生群体的疫情期间心理健康状况的研究。本研究通过线上问卷的形式, 采用焦虑自评量表和抑郁自评量表对来自中国不同地区的 2829 名硕士研究生样本进行调查, 通过方差分析探讨研究生人口学特征与焦虑及抑郁症状之间的关系, 结果显示: 受访者中重度抑郁占 1.3%, 中度抑郁占 14.4%, 轻度抑郁占 21.8%; 重度焦虑占 1.4%, 中度焦虑占 4.34%, 轻度焦虑占 14.4%。单因素方差分析发现, 不同性别、年级、学校毕业要求、与导师交流方式及与同学的交流方式的受访者在焦虑和抑郁水平上存在显著差异。两因素方差分析发现, 与导师的交流方式和与同学的交流方式之间存在显著的交互作用。简单效应检验发现, 与导师间接交流的情况下, 与同学间接交流和与同学直接交流的研究生的焦虑与抑郁得分不存在显著差异; 与导师直接交流的情况下, 与同学间接交流的研究生焦虑与抑郁水平显著高于与同学直接交流的研究生。研究结果启示,

应对疫情期间研究生心理健康状况进行监测，尤其在研究生无法与导师或同学进行直接交流的情况下，重点关注其焦虑与抑郁状况。

The status and influencing factors of mental health among graduate students during the COVID-19 epidemic:

Based on the analysis of survey of 2829 graduate students in China

Derong Kang¹, Minqiang Zhang¹(corresponding author), Zhengyan liang¹, Yuanlin Xia¹, Jia Li¹,
Jingdan Liang¹

¹ School of Psychology, South China Normal University, Guangzhou

Abstract: A covid-19 epidemic has been spreading in China and other parts of the world since December 2019. The epidemic has not only threaten the people's lives, but also brought psychological pressure. There are highly crowded massive people in teaching activities. For the prevention and control of the epidemic, schools adopted isolation, online education and other measures. Previous scholarship had assessed student's mental health issues during epidemics. However, there is no research to explore the influencing factor to mental health of graduate students during epidemics. In this study, 2829 graduate students from different regions of China were recruited to complete the network questionnaires, the contents of the questionnaire included demographic data, Self-Rating Anxiety Scale (SAS) and Self-Rating Depression Scale (SDS). Results indicated that 1.3% of the respondents were experiencing severe depression, 14.4% moderate depression, and 21.8% mild depression; that 1.4% of the respondents were experiencing severe anxiety, 4.34% moderate anxiety, and 14.5% mild anxiety. One-way ANOVA analyses found that gender, grade, graduation requirements, communication means with advisors and communication means with peers influenced the anxiety and depression of respondents. Two-way ANOVA analyses found communication means with advisor and communication means with peers have significant interactive effects on respondents' anxiety and depression. Simple effect analyses found if communication means with advisors is indirect means, there was no difference in anxiety and depression between respondents who communicated with peers directly and who communicated with peers indirectly; if communication means with advisors is direct means, there are higher anxiety and depression in respondents who communicated with peers indirectly than who communicated with peers directly. The results of this study suggest that the mental health of graduate students should be monitored during epidemics. Their anxiety and depression should be paid more attention, especially when students could not communicate with advisor and peers directly.

信息假设的贝叶斯因子评估

顾昕¹

¹ 华东师范大学教育心理学系, 上海, 200062, xgu@dep.ecnu.edu.cn

摘要 目前, 零假设显著性检验(null hypothesis significant testing, NHST)是心理学研究者主要的统计推断工具。然而在过去十多年中 NHST 的局限性被广泛讨论。比如, 零假设很少能代表研究者的理论期望; p 值无法衡量数据支持假设的程度; 基于 p 值小于 0.05 的推断可能导致不可信的研究结论和发表偏差。本研究呈现 NHST 的替代方法, 即使用贝叶斯因子(Bayes factor, BF)进行假设评估。贝叶斯因子反映数据支持假设的相对程度, 例如, $BF_{12}=10$ 表示数据支持假设 1 的证据是假设 2 的 10 倍。此外, 贝叶斯因子可转化为后验模型概率, 用于同时比较多个研究假设。除了检验传统零假设与备择假设外, 贝叶斯因子还可用于评估代表研究者理论期望的信息假设。信息假设的一个简单例子是 $m_1 > m_2 > m_3$, 其中 m 表示各组均值。贝叶斯检验的关键

是先验分布的选取与贝叶斯因子的计算。在先验信息缺失或研究者不愿引入先验信息以得到完全客观的统计推断结论时,本研究提出适用于一般统计模型的客观先验选取方法,利用部分样本数据信息设定合理先验。随后,基于该先验设定方法推导贝叶斯因子的表达式。零假设与备择假设的贝叶斯因子可简化为后验密度与先验密度在零假设处的比值,而信息假设的贝叶斯因子则可表示为后验概率与先验概率在信息假设限制下的比值。此后,利用MCMC算法估计先验与后验密度或概率,进而计算贝叶斯因子。为了便于心理学研究者使用该方法,本研究在CRAN平台上开发R软件包**bain**,同时在可视化统计数据分析软件JASP中嵌入**bain**模块。目前已可用于贝叶斯t检验、回归系数检验、方差分析、协方差分析、逻辑回归、重复测量、以及简单结构方程模型的参数检验等。

Evaluating informative hypotheses using the Bayes factor

Xin Gu

Department of Educational Psychology, East China Normal University, Shanghai

Abstract: Psychological researchers are well-acquainted with null hypothesis significance testing (NHST). It is, arguably, their main inferential tool. In the last decade the limitations of NHST have extensively been discussed. To name three: the null-hypothesis only rarely represents the expectations that researchers have; the p-value cannot measure the support from the data for the hypotheses; and, evaluation of the p-value versus the benchmark “.05” leads to undesirable phenomena like questionable research practices and publication bias. This study will first introduce an alternative for NHST, that is, hypothesis evaluation using the Bayes factor. The Bayes factor reflects the degree to which the data support the hypotheses. For example, if $BF_{12}=10$ this implies that the evidence from the data to support hypothesis 1 is 10 times larger than to support hypothesis 2. In addition, Bayes factors can be translated into posterior model probabilities, which can be used to compare multiple hypotheses simultaneously. Besides testing the traditional null hypothesis against the alternative hypothesis, the Bayes factor can also be used to evaluate the informative hypothesis that represents researchers’ theoretical expectations. A simple example of an informative hypothesis is $m_1 > m_2 > m_3$, where m denotes the mean of each group. The key procedure of Bayesian tests includes the prior specification and the Bayes factor computation. When the prior information is not available or researchers are unwilling to involve the prior information to obtain completely objective statistical inference, this study proposes an objective prior specification approach that can be applied to general statistical models. This approach uses a part of sample data to set a proper prior. Based on such prior setting, the Bayes factor is derived. The Bayes factor of the null hypothesis and the alternative hypothesis can be simplified as the ratio of posterior and prior densities at null hypothesis, while the Bayes factor of the information hypothesis can be expressed as the ratio of posterior and prior probabilities under the constraints of the information hypothesis. Thereafter, the MCMC algorithm is used to estimate the prior and posterior densities or probabilities, and then to compute the Bayes factor. In order to facilitate the use of the proposed method for psychological researchers, An R software package Bain has been developed on CRAN, and been exported to the visual statistical data analysis software JASP. At present, the proposed approach accompanied by the software can be used for Bayesian t tests, regression coefficient tests, analysis of variance, analysis of covariance, logistic regression, repeated measurement, and parameter tests in simple structural equation models.

潜在回归线性 Logistic 测验模型的测验等值研究

黄菲菲¹ 张敏强¹ (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631, zhangmq1117@qq.com

摘要 测验等值在国外已广泛应用于大型考试、题库建设、计算机化自适应等方面, 相较之下, 由于我国对测验等值的研究开展较晚, 因此在这方面的研究则显得较少。现如今, 我国许多重要的考试均尚未实现等

值,例如高考、英语四六级考试等。尽快实现测验等值是国内许多大型考试所共同面临的重要任务。然而,随着互联网的广泛应用,即使是集优点于一身的非等组锚测验设计都常面临锚题曝光的问题。因此,有必要通过理论和实证研究探索如何在无锚人、无锚题的情况下,寻找可实现测验分数等值的新方法。

本研究在解释性项目反应模型的框架下,通过一个模拟研究和一个实证研究对潜在回归线性 Logistic 测验模型在测验等值的应用方面进行深入研究,研究结果发现:(1)潜在回归线性 Logistic 测验模型在测验等值过程中能有效估计考生能力参数和题目区分度参数。其中,对考生能力参数的估计几乎接近真值。但是,在估计题目难度参数时出现明显的偏差。(2)潜在回归线性 Logistic 测验模型的测验等值精确度受到考生样本量、题目数量和参数预测变量个数不同程度的影响。在题目数量方面,当题目数量在 20 道或者 40 道时,潜在回归线性 Logistic 测验模型的参数估计表现较为稳定。在考生样本量方面,潜在回归线性 Logistic 测验模型在考生能力参数和题目区分度参数的估计误差随着样本量的增大而减小。在预测变量个数方面,当题目参数预测变量个数越多,潜在回归线性 Logistic 测验模型在估计题目难度参数时表现越差。(3)和传统等值设计下的测验等值结果相比,潜在回归线性 Logistic 测验模型在测试实践中能够很好地估计考生能力参数和题目区分度参数。但是,在题目难度参数的估计出现了明显的偏差。同时,因为样本量较少和预测变量选择有限的问题,潜在回归线性 Logistic 测验模型在实证研究中出现了无法收敛的情况。

Research on the Test Equating of Latent Regression Linear Logistic Test Model

Feifei Huang, Minqiang Zhang

School of Psychology, South China Normal University, No.55, West of Zhongshan Avenue, Tianhe District, Guangzhou City

Abstract: Test equating has been widely used in large-scale examinations, item bank construction, computerized adaptive test, etc. abroad. Compared with foreign countries, domestic research in this area is progressing slowly. Nowadays, many important examinations in our country have not conducted the test equating, such as the college entrance examination and the CET-4 or CET 6. It is an important task for many large-scale examinations in China to conduct the test equating as soon as possible. However, with the rapid development of the Internet, the design of the non-equivalent groups with anchor test often faces the problem of the exposure to anchors. Therefore, it is necessary to use theoretical and empirical research to explore how to find new methods that can achieve the test equating without common person and anchor items. This study conducted a simulation study and an empirical study to investigate the application of the the latent regression linear Logistic test model under the framework of Explanatory item response models. The results showed that: (1) The latent regression linear Logistic test model can effectively estimate the person ability parameter and the item discrimination parameter in the process of test equating. Besides, the estimation of the person ability parameter is really accurate. However, the model showed significant deviations when estimating the item difficulty parameter. (2) The accuracy of the test equating of the latent regression linear Logistic test model was affected by the sample size, length test and the numbers of predictors. When the length of test was at 20 and 40, the latent regression linear Logistic test model had a stable performance of the parameter estimation. Besides, the estimation error of the latent regression linear Logistic test model in the person ability parameter and the item discrimination parameter decreased as the sample size increased. Furthermore, the latent regression linear Logistic test model had the worst performance on estimating the item difficulty parameter as the numbers of the predictors increased. (3) Compared with results of the traditional design of test equating, the latent regression linear Logistic test model can well estimate the person ability parameter and the item discrimination parameter in the practice of test equating. However, there is a significant deviation in the estimation of the item difficulty parameter of the latent regression linear Logistic test model. At the same time, the latent regression linear Logistic test model has the problem of convergence in the empirical research because of the small sample size and limited choice of predictors.

同时兼顾能力与属性掌握模式的 Higher-order CD-CAT 选题策略研究

席崇钦¹ 涂冬波¹ 蔡艳¹(通讯作者)

¹ 江西师范大学心理学院, 南昌, 330022, cy1979123@aliyun.com

摘要 在心理与教育测量领域, 一个能同时提供终结性评价和形成性评价的测验是非常有实际应用价值的, 其中终结性评价(由能力表示)便于了解被试的潜在特质在群体中的相对位置, 而形成性评价(由属性掌握模式或知识状态表示)不但有助于心理症状的诊断与干预, 也有助于学习或教学策略的改进。为了同时高效地获取被试的终结性评价和形成性评价, 研究者们开发出了兼顾能力和属性掌握模式的双目标 CD-CAT, 其中基于高阶认知诊断模型的 higher-order CD-CAT, 因其理论解释更合理, 题库建设成本更低而逐渐受到关注。然而, 当前 Higher-order CD-CAT 的选题只能采用单目标 CD-CAT 中的传统选题策略, 即只对属性掌握模式自适应, 这可能导致能力的估计精度不高。鉴于此, 本文试图开发一种适用于 Higher-order CD-CAT 的新选题策略, 思路如下: 在高阶认知诊断模型框架下, 被试的项目作答由其属性掌握模式决定, 而属性掌握模式归属于更高阶的能力, 由此可认为被试的项目作答是由能力和属性掌握模式联合决定的。本文基于 PWKL 方法的选题思路, 结合了能力和属性掌握模式的联合后验概率, 从而开发出适用于 Higher-order CD-CAT 的、兼顾能力和属性掌握模式的 HO-PWKL 选题策略。Monte Carlo 实验表明: 在不同条件下, HO-PWKL 的测量精度和题库安全性均高于传统策略。同时, 在短测验、以及多属性的测验中, HO-PWKL 在测量精度上的优势更为明显, 这些优势并不受认知诊断模型的影响, 说明新策略比较稳定可靠。另一方面, 虽然 HO-PWKL 的选题用时比 KL、HKL 和 PWKL 更多, 但即使在测量属性比较多的测验中, 新策略选择每个项目的平均用时依旧非常少, 这符合 CAT 的速度要求。综合而言, 本研究开发的 HO-PWKL 选题策略基本可行, 可以满足在 higher-order CD-CAT 中同时兼顾能力和属性掌握模式信息的选题要求, 弥补了传统的选题策略仅对属性掌握模式自适应的不足。

Item selection method considering both the ability and cognitive profile in higher-order CD-CAT

Chongqin Xi¹, Dongbo Tu¹, Yan Cai¹

¹ School of Psychology, Jiangxi Normal University, Nanchang, China

Abstract: A test that can provide the summative information to ranking examinees in order and provide formative information for remediation may be very valuable in psychology and education setting. Although the existing dual-objective CD-CAT can meet this purpose, this CAT system just a compromise because each item is calibrated by two models which underlying constructs are dramatically different. Therefore, the higher-order CD-CAT which employs higher-order CDMs was proposed. Moreover, the development of the item bank of this CAT system would be easier than that in the traditional dual-objective CD-CAT. However, current item selection methods used in the higher-order CD-CAT select items adaptively according to only the attribute profile, which might lead to low precision with respect to ability. In light of this, a new item selection method that simultaneously considers both the ability and attribute profile information was proposed for the higher-order CD-CAT in this study. Under the frameworks of the higher order CDMs, ability governs the attribute profiles, and the item responses are modeled by the attribute profiles; hence, it is reasonable to hold that the item responses are affected by a combination of the ability and attribute profile of the examinees. This study incorporated the combination into the PWKL method and finally proposed the HO-PWKL method, which can simultaneously consider the information of both the ability and attribute profile. The results from the simulation study indicated that the proposed method always outperformed the traditional methods in terms of the measurement accuracy and item usage rate, and these advantages would be more evident in the short test or more attributes were measured. Furthermore, the above advantages did not be affected by

the model used, which demonstrated that the newly proposed method is precise and stable. With respect to the implementation time of each method, the new method slower than the KL, HKL and PWKL method in that it is more complicated, especially when more attributes were measured. However, the average item administration time of the HO-PWKL method is less than 125 milliseconds even though 8 attributes were measured, which meets the calculation speed requirement of CAT. To summarize, under the higher-order CD-CAT, the new method proposed in this study always outperformed the existing methods in terms of measurement accuracy and item pool usage, which would promote further study and practical application of the higher-order CD-CAT.

一种高效的 CD-CAT 在线标定新方法：基于熵的信息增益与 EM 视角

谭青蓉¹ 汪大勋¹ 罗芬¹ 蔡艳¹ 涂冬波¹ (通讯作者)

¹江西师范大学心理学院, 南昌, 330022, tudongbo@aliyun.com

摘要 认知诊断计算机自适应测验(Cognitive Diagnostic Computerized Adaptive Testing, CD-CAT)是认知诊断(Cognitive Diagnostic, CD)与计算机自适应测验(Computerized Adaptive Testing, CAT)相结合的产物, 在为被试提供详细诊断信息的同时可提高测验的准确性及效率, 是目前的研究热点。CD-CAT 使用的前提是已构建好的题库, 但题库的建设和维护却是一个极具挑战性的任务。在线标定是题库维护的有效方式之一, 截至目前 CD-CAT 中仅有较少方法能同时标定新题的 Q 矩阵和项目参数。此外, 已有在线标定方法的新题标定效率均较低, 有待于进一步提高。因此, 在 CD-CAT 情境下开发提升新题标定精度和标定效率的方法是极为必要的。受 Chen 等人(2015)提出的 SIE (Single-Item Estimation)方法和特征选择方法中信息增益(Information Gain, IG)准则的启发, 本研究提出了基于熵的信息增益的在线标定方法(Information Gain of Entropy-based Online Calibration Method, IGEOCM)。IGEOCM 以序列方式来标定新题的 Q 矩阵和项目参数, 具体如下: 首先, 基于被试属性掌握模式和被试在新题上的作答, 构建熵的信息增益指标并最大化该指标来标定新题 q 向量; 其次, 基于被试属性掌握模式后验分布, 被试在新题上的作答及上一步所估计的新题 q 向量, 使用 EM 算法标定新题项目参数。对于所有新题重复以上两步以获得所有待标定新题的 Q 矩阵和项目参数。随后, 为验证 IGEOCM 在不同标定样本、属性掌握模式、新题作答个数以及选题策略下的性能, 展开了两项 Monte Carlo 实验研究, 并将其与已有 SIE、SIE-R-BIC 和 RMSEA-N 方法比较。结果表明: (1) IGEOCM 方法在所有条件下均具有较好的标定精度和标定效率, 且略优于 SIE, SIE-R-BIC 和 RMSEA-N 方法。(2) 各方法的项目标定精度随样本量的增加而提升。(3) 相对高阶分布和多元正态分布, IGEOCM, SIE, SIE-R-BIC 和 RMSEA-N 方法在均匀分布下性能更佳。(4) 被试新题作答个数对各在线标定方法标定精度和标定效率的影响较小。(5) CD-CAT 选题策略影响 SIE 和 IGEOCM 方法的项目标定精度。在高阶分布和多元正态分布下, SIE 方法和 IGEOCM 在选题策略为 MPWKL 和 GDI 时具有更高的 Q 矩阵标定精度。总体而言, 尽管所提 IGEOCM 方法在标定精度和标定效率方面均颇具竞争力且略优于传统方法, 但对 CD-CAT 中在线标定方法的研究仍需进一步深化和拓展。

A High-efficiency and New Online Calibration Method in CD-CAT Based on Information Gain of Entropy and EM algorithm

Qingrong Tan¹, Daxun Wang¹, Fen Luo¹, Yan Cai¹, Dongbo Tu¹ (corresponding author)

¹School of Psychology, Jiangxi normal university, Nanchang, 330022, tudongbo@aliyun.com

Abstract: Cognitive diagnostic computerized testing (CD-CAT) includes the advantages of both cognitive diagnosis (CD) and computerized adaptive testing (CAT), which can offer detailed diagnosis feedback for each examinee by applying less test items and time. It has been a promising field. Item bank is a prerequisite for the implementation of CD-CAT, however, its maintenance is a very challenging task. One of the effective ways to maintain the item bank is online calibration. Till now, there are only a few online calibration methods in the CD-CAT context that can calibrate

Q-matrix and item parameters simultaneously. Moreover, the computational efficiency of these methods needs to be further improved. Therefore, it is crucial to find more online calibration methods that jointly calibrate the Q-matrix and item parameters. Inspired by SIE (Single-Item Estimation) method proposed by Chen et al. (2015) and information gain feature selection criteria in feature selection, an information gain of entropy-based online calibration method (IGEOCM) was proposed in this study. The proposed method can jointly calibrate Q-matrix and item parameter in a sequentially manner. The detailed process of the new items was described as follows: First, for the new item j , the q-vector can be calibrated by maximizing the information gain of entropy-based on the attribute patterns of examinees and the examinees' responses to item j . Second, the item parameters of the new item j are estimated by the EM algorithm based on the posterior distribution of examinees' attribute pattern, the examinees' responses to item j and the q-vector estimated in the first step. Repeating the first step and second step for all other new items to obtain their estimated Q-matrix and estimated item parameters one-by-one. Two simulation studies were conducted to examine whether the IGEOCM could accurately and efficiently calibrate the Q-matrix and item parameters of the new items under different calibration sample size (40, 80, 120, 160 and 200), different attribute pattern distribution (uniform distribution, higher order distribution and multivariate normal distribution) and different number of new items answered by examinee (4, 6 and 8), and different item selection algorithm (posterior-weighted Kullback-Leibler, PWKL; the modified PWKL, MPWKL; the generalized deterministic inputs, noisy "and" gate model discrimination index, GDI; shannon entropy, SHE). Furthermore, the performance of the proposed methods was compared with the SIE, SIE-R-BIC and RMSEA-N methods. The results indicated that (1) the IGEOCM worked well in terms of the calibration accuracy and estimation efficiency under all conditions, and outperformed the SIE, SIE-R-BIC and RMSEA-N methods overall. (2) The accuracy of the item calibration increases as the sample size increases for all calibration methods under all conditions. (3) the SIE, SIE-R-BIC, RMSEA-N and IGEOCM performed better under the uniform distribution and higher order distribution than under the multivariate normal distribution. (4) The number of new items answered by the examinee had a negligible impact on the calibration accuracy and computation efficiency of the SIE, SIE-R-BIC, RMSEA-N and IGEOCM. (5) The item selection algorithm in CD-CAT affects the Q-matrix calibration accuracy of the SIE and IGEOCM methods. Under the higher order distribution and multivariate normal distribution, the SIE method and IGEOCM have higher Q-matrix calibration accuracy when the item selection algorithms are MPWKL and GDI. On the whole, although the proposed IGEOCM is competitive and outperform the conventional method irrespective of in the calibration precision or computational efficiency, the studies on the online calibration method in CD-CAT still need to be further deepened and expanded.

非参数诊断方法在纵向认知诊断测评中的应用

刘耀辉¹ 陈琦鹏¹ 徐慧颖¹ 詹沛达¹ (通讯作者)

¹ 浙江师范大学教师教育学院心理学系, 金华 321004

摘要 纵向测评的发展有利于教育者更好把握学生的学习和发展轨迹。相对于构建参数模型的方法, 采用非参数诊断方法因其计算简便, 受限条件少等优势已被用于横断认知诊断测评中。为了探究非参数方法在纵向认知诊断测评中的应用, 研究(1)在汉明距离方法应用的基础上, 加入了约束条件, 提出了约束汉明距离的非参数诊断方法。同时尝试将“参数+非参数”的方法应用于纵向的认知诊断测评中。(2)采用 Zhan, Jiao, Liao 和 Li(2019)提出的纵向高阶认知诊断模型为数据生成模型, 基于模拟研究对比了汉明距离, 约束汉明距离, “参数+非参数”三种方法和纵向参数模型的诊断方法在不同条件下(学生数量 $N=100, 300$; 属性个数 $K=3, 5$; 题目数量=30, 50; 纵向测评的时间点 $T=2, 3, 5$)的学生属性模式判准率(Pattern correct classification rate, PCCR)和纵向的属性模式判准率(Longitudinal pattern correct classification rate, LPCCR)。模拟研究结果表明: 与参数模型结果相比, 汉明距离、约束下的汉明距离和“参数+非参数”三种方法均具有较好的 PCCR 与 LPCCR。测评时间点的增加, 题目数量的增多都能提高以上三种含有非参数诊断方法的 PCCR, 但随着属性数量的增

加, PCCR 呈下降趋势。LPCCR 随着时间点的增加、属性数量的增多呈现下降的趋势, 但含有非参数的诊断方法所属性数量变化带来的影响较大。在属性个数为 5 时, 非参数诊断方法的表现略差于参数模型下的 LPCCR。上述三种包含非参数的诊断方法, 在不同样本下表现一致, 即不受样本容量的影响。非参数诊断方法可在要求不低于一定判准率的基础上应用于纵向认知诊断测评中, 为现有纵向认知诊断方法提供一个参考。

Application of Non-parametric Diagnostic Methods in Longitudinal Cognitive Diagnostic Assessment

Yaohui Liu¹, Qipeng Chen¹, Huiying Xu¹, Peida Zhan¹

¹Department of Psychology, College of Teacher Education, Zhejiang Normal University, Jinhua, 321004, China

Abstract: The development of longitudinal evaluation is beneficial to educators to better grasp the learning and development track of students. Compared with the method of constructing parametric model, the non-parametric cognitive diagnostic method has the advantages of simple calculation, less time consuming and less limited conditions to complete the classification of students and it has been used in cognitive diagnosis. To explore the application of non-parametric methods in longitudinal cognitive diagnostic assessment, we did the following study.

In the first part, we put forward a new constrained Hamming distance based on the previous study of Hamming distance, and tried to combine the parametric and non-parametric methods as a half-parametric method to apply to the longitudinal cognitive diagnosis. In part two, we compared the performance of different methods (parametric, half-parametric, Hamming distance, constrained Hamming distance) under different conditions in a simulation study. The simulation study focused on four factors which include (a) the sample sizes at two levels of 100 and 300; (b) the number of attributes at two levels of 3 and 5; (c) the number of items at two levels of 30 and 50; (d) the number of occasions at three levels of two, three and five. Based on the data generated by a longitudinal higher-order diagnostic classification model proposed by Zhan, Jiao et al., (2019). The results show that the half-parametric, Hamming distance and constrained Hamming distance all have good pattern correct classification rate (PCCR) and longitudinal PCCR. The PCCR of them can be increased with the increase of the occasions and the number of items, but with the increase of the number of attributes, PCCR shows a downward trend. Longitudinal PCCR showed a decreasing trend with the increase of occasions and the number of attributes, but the non-parametric methods (Hamming distance, constrained Hamming distance) and half-parametric methods were greatly affected by the change of the number of attributes. When the number of attributes is 5, the longitudinal PCCR of them is slightly worse than that in parametric model. These methods are consistent in different samples except parametric method, that is, they are not affected by sample size.

摘要 学习进阶是指学生对某个主题日益复杂的思考或理解方式的描述 (NRC, 2007)。值得注意的是, 学习进阶不仅可以从认知的角度描述学生的学习过程, 而且可以架构学习研究和课堂教学实践的桥梁 (Salinas, 2009)。它的建立是一个从建立假设性学习进阶到验证假设的迭代过程。目前, 已有一些关于学习进阶的验

证方法,其中具有代表性的有 Rasch 模型和规则空间模型(RSM)的方法。由于前者主要用于测量学生能力,因此不能为学生提供细粒度的属性分析。虽然后者可以在认知诊断框架下测量细粒度的属性,但 RSM 有时无法获得正确的属性层级关系。针对上述两种方法的不足,本研究提出了一种新的基于认知诊断的学习进阶验证方法,即能够基于数据验证属性层级关系的层级诊断分类模型(HDCM)的方法。然后,以分数的加减运算为例,深入探讨了新方法在数学学习进阶中的应用。首先,基于专家评定法析取分数运算属性及其层级关系;随后,参考 Klein 等人(1981)的水平划分建构假设性的小学生分数运算学习进阶,用以描述分数运算发展过程;最后,收集 817 名五年级学生在 56 题的分数运算测验上的数据,采用层级诊断分类模型(HDCM)对数据进行分析并修正学习进阶假设。本研究的主要发现如下:(1)小学生分数运算包括 5 个属性:基本运算(A1)、约分(A2)、通分(A3)、带分数拆分(A4)和借位(A5);(2)确立的分数运算学习进阶包括 4 个水平:处于进阶水平 1 的学生只能掌握简单的同分母分数加减运算,水平 2 的学生能进行需要约分的同分母分数加减运算,水平 3 的学生能进行异分母分数加减运算及简单的带分数加减运算,水平 4 的学生能进行复杂的带分数加减运算。综合来看,本研究建构的小学生分数运算学习进阶确立了完整的小学生分数运算结构、刻画了分数运算发展的进程,不仅突破已有基于 Rasch 模型或 RSM 等学习进阶验证方法的局限,而且探索了基于带属性层级的参数化认知诊断模型的学习进阶的教学实践价值,对数学教育研究者、心理测量研究者以及一线教师具有借鉴意义。

Development of a New Learning Progression Verification Method Based On the Hierarchical Diagnostic Classification Model: taking Fractional Operations as an Example

Lu Yuan¹, Yanlou Liu², Ping Chen¹ (corresponding author), Tao Xin¹ (corresponding author)

¹ Collaborative Innovation Centre of Assessment toward Basic Education Quality, Beijing Normal University, Beijing

² China Academy of Big Data for Education, Qufu Normal University, Qufu

Abstract: Learning progressions referred to descriptions of increasingly sophisticated ways of thinking about or understanding a topic (NRC, 2007). It is worth pointing out that learning progression can not only describe the learning process of a student from a cognitive perspective but also bridge learning research and classroom teaching practice (Salinas, 2009). Its establishment is an iterative process from the establishment of hypothetical learning progression to the verification of hypotheses. Up to now, some validating methods about learning progressions have been proposed and the representative ones include the method of Rasch model (Rasch, 1960, 1966a, 1966b) and the method of rule space model (RSM; Tatsuoaka, 1983, 1995, 1996). Because the former method is mainly used to measure students' abilities, it cannot provide fine-grained attribute analysis for students. Although the latter method can measure fine-grained attributes via the cognitive diagnosis framework, RSM sometimes fails to obtain the correct attribute hierarchical relationship. To overcome the shortcomings of the above two methods, this paper puts forward a new cognitive diagnosis-based verification method, i.e., the method of hierarchical diagnostic classification model (HDCM) which can verify the hierarchical relationship of attributes based on data. Then, the application of the new method in learning progressions of mathematics is thoroughly explored by taking the addition and subtraction of fractions as an example. First, the attributes of fractional operations and their hierarchical relationships were extracted using an expert assessment method. Following the level division of Klein et al. (1981), a hypothesized learning progression was constructed to describe the development of fractional operations. Next, the HDCM was used to analyze the test data on a 56-item fractional operation test collected from 817 fifth-grade students, followed by the revision of the learning progression hypothesis. Results showed that (1) the fractional operations involved five attributes: basic operation (A1), reduction of a fraction (A2), changing fractions to a common denominator (A3), split with mix number (A4), and borrowing (A5); (2) the constructed learning progression featured four levels: students at

level 1 were only able to master simple addition and subtraction of fractions with the same denominator, students at level 2 could perform the addition and subtraction of fractions with the same denominator requiring reduction, students at level 3 were capable of performing addition and subtraction operations with different denominator fractions, as well as simple addition and subtraction operations with mixed numbers, and students at level 4 could perform complex addition and subtraction operations with mixed numbers. In conclusion, the constructed learning progression of fractional operations establishes a complete structure of fractional operations and characterizes the development of fractional operations. It not only breaks through the limitations of the existing methods of learning progression based on Rasch Model and rule space model, etc., but also explores the teaching practice value of learning progression based on the parameterized cognitive diagnosis model with attribute hierarchies, which can be a useful reference for mathematics education researchers, psychometric researchers and front-line teachers.

问题解决测验过程数据的序列反应模型的建构及应用

韩雨婷¹ 刘红云² (通讯作者)

1 北京师范大学心理学部, 北京, 100875

2 北京师范大学心理学部, 北京, 100875, hylu@bnu.edu.cn

摘要 基于计算机的交互式问题解决测验可以在仿真任务情境下实时记录学生的反应过程, 并保存为过程数据。过程数据蕴含了关于学生认知与思维活动的丰富信息, 对这些信息进行挖掘与分析有利于对学生潜在能力进行更加准确的估计。然而, 过程数据形式新颖、结构复杂, 如何充分合理地利用过程数据评估学生的潜在能力是一个兼具理论和实践意义的新议题。本研究围绕这一议题, 提出了一种可以全面利用学生在问题解决测验中的反应过程信息, 估计其潜在能力和题目状态转移参数的序列反应模型。本研究首先提出了将学生的整个反应过程表征为问题状态序列的信息提取方法, 然后结合随机过程思想, 提出了可以对整个问题状态序列进行分析的序列反应模型 (SRM) 及其参数估计方法。然后使用一个 Monte Carlo 模拟研究探讨了样本量、序列长度和先验信息对于 SRM 参数估计返真性的影响, 并使用该模型分析了国际学生评估项目 (PISA) 2012 年计算化问题解决测验 Tickets 任务的过程数据。模拟研究结果表明, 新方法具有良好的心理测量学性能, 先验信息的有无对于 SRM 参数估计返真性的影响较小; 样本量越大, 状态转移参数估计的返真性越好; 序列长度越长, 潜在能力估计的返真性越好。实证研究结果表明, 用 SRM 分析实际数据获得的能力估计值与专家评分标准相一致, 可以正向预测学生在问题解决测验上的整体能力; 并且由于 SRM 利用了学生完整的反应序列, 因此对于能力水平的区分相较于结果变量更加合理与细致, 还可以获得任务中每种行为特征 (状态转移) 的相对难易程度。本研究提出的序列反应模型在充分利用过程性信息的同时兼具可解释性, 为更合理、准确地估计学生能力提供了方法支持。同时, SRM 的分析结果可为基于计算机的交互式问题解决测验的编制, 以及如何提高测验的信度提供有用的参考, 为实证研究提供了理论基础和方法学指导。总之, 本研究推动了过程数据建模方法的发展, 为基于动态过程的心理与教育测评提供了更深入和细化的分析方法。

Sequential Response Model and Its Application for Analyzing Process Data of Problem-Solving Test

Han Yuting¹, Liu Hongyun² (corresponding author)

1 School of Psychology, Beijing Normal University, Beijing, 100875

2 School of Psychology, Beijing Normal University, Beijing, 100875, hylu@bnu.edu.cn

Abstract: The computer-based interactive problem-solving test can record students' response processes in real time under virtual reality scenario, and save them as process data. Process data contains rich information about students' cognitive and thinking activities. Making full use of these information can lead to more accurate estimation of students' latent abilities. However, the form of process data is novel and its structure is complex. How to rationally

and fully utilize process data to evaluate students' latent abilities more accurately and comprehensively is a new issue with both theoretical and practical significance. Aiming at this problem, this study proposed a sequential response model (SRM), which can make full use of students' complete response sequences in problem-solving test to estimate their latent abilities and state transition parameters. In this study, we first proposed an information extraction method which characterized the whole reprocess process as a sequence of problem states. To analyze the whole problem state sequence, combined with the idea of stochastic process, SRM and its parameter estimation method were proposed. Then, a Monte Carlo simulation study was used to explore the influence of sample size, sequence length and prior information on the accuracy of parameter recovery in SRM. And the proposed model was further used to analyze the process data of the Ticket task in the Programme for International Student Assessment (PISA) 2012 problem solving test. Simulation results showed that the new methods had good psychometric performance. The setting of prior information has little influence on the accuracy of parameter estimation; and the increase of sample size and response sequence can improve the parameter estimation accuracy. The empirical data analysis results showed that the ability estimates obtained from SRM were consistent with the scoring rules made by experts, and can significantly predicted students' overall performance in the problem-solving test. In addition, compared with the result variable, SRM was more reasonable and detailed in distinguishing students' capabilities, and can also obtain the relative difficulty of each state transition in the task, for it utilizing the complete response sequences. The proposed SRM can make full use of the process information and be interpretable at the same time, which provides method support for estimating students' abilities in a more rational and accurate way. In the meantime, the fruitful results of SRM can provide useful reference for the development of computer-based interactive problem-solving test and the improvement of test reliability, which provides methodological guidance for empirical research. In summary, this study promotes the development of process data modeling method, and provides a more in-depth and detailed analysis method for psychological and educational assessment based on dynamic process.

摘 要 随着互联网的发展, 无监督在线测验凭借其测验效率高、测验成本低等优势, 成为当下较为常见的测验实施方式之一。但对于无监督在线测验过程中产生的潜在误差, 现有的理论体系还无法给出清晰完整的解释。因此, 有关的心理测量学问题亟需研究。研究使用自行开发的手机无监督在线测验平台, 探究了无监督在线测验的无监督性与测验设备的跨屏显示对测验结果的影响因素。研究一以北京师范大学 218 名在校生为研究对象, 比较了有人监督与无人监督两种情境下的作答情况, 同时邀请受测者填写尽责性问卷以及报告他们对测验的重视程度。研究二重点讨论了题目跨屏显示对受测者作答的影响, 以 477 名 18 至 35 周岁的互联网用户为研究对象。受测者被随机分配到题目跨屏幕组或非跨屏幕显示组, 两组题目内容一致, 只在显示界面上有所差异。测试完成后, 邀请受测者报告他们在测验时感到的焦虑与愤怒两种负面情绪。研究发现, 监考角色的缺失将引发大量的非严肃性作答行为。而受测者是否决定认真作答与他们对于测验的重视程度有关。使用作答时间比率、标准化分数以及电话回访结果等信息, 可以更加科学地确定非严肃性作答筛选标准范围。对于跨屏显示的题目和没有跨屏显示的题目, 两种测试界面不存在测试等价性。跨屏显示组的受测者报告了更高的愤怒与焦虑水平。研究结合实际, 重点探究了实际测验使用中可能遇到的问题以及对于测验结果产生的影响, 丰富了无监督在线测验设备理论的实证研究基础。研究进一步丰富了基于时间作答比率来筛选非严肃性作答受测者的方法。结论认为, 未受控制的低利害性无监督在线测验会出现大量非严肃作答行为, 题目跨屏显示不利于考生进行作答。该结论可用于测试实施方在无监督在线测试开发、实施、结果分析中提供参考与借鉴, 具有一定的应用价值。

Research and Control of Influencing factors of Unproctored Internet-based Ability Test Results

Haoyu Li¹, Jianping Xu², Yuzhi Wang²

Beijing Normal University, 19 Xijiekouwai Dajie, Xicheng District, Beijing, China, 100875,
202021061084@mail.bnu.edu.cn

Abstract: Relying on the development of Internet, unproctored Internet-based test, with the advantages of high efficiency and low cost, has become one of the most common ways of test implementation. However, it still lacks comprehensive theoretical system to identify the potential errors in the process of unproctored Internet-based test. The psychological measurement problems related needs to be improved. This study, applying self-developed unproctored Internet-based test platform on mobile phone, explores the influence on test results of two factors including proctored and unproctored situation and display interface. Study 1: Concerning supervision situation, 218 students in Beijing Normal University are divided into two groups to carry out the research, one of which is under the supervision of experimenters and another without the supervision of experimenters. Meanwhile, volunteers are required to fill in conscientiousness questionnaires and report their attention degree of the test. The study further enriches the method of selecting non-serious responses respondents, based on time response ratio. Study 2: As for the display interface factor, 477 Internet users aged between 18 and 35 are selected as study objects and randomly assigned to cross or non-cross screen display groups with unified question. Two groups have the same research question but different display interfaces. Then volunteers are invited to report their anxiety and anger degree in the process of test. The study found that the lack of supervision will lead to a large number of non-serious responses. Whether the volunteers decide to answer seriously or not depends on the importance they attach to the test. Relying on the information of response time ratio, standardized score and telephone follow-up results, the scope of screening criteria for non-serious responses can be determined more scientifically. As for display interface, the two test interfaces show no measurement invariance. Compared with the group without cross screen display, subjects in the cross-screen display group show higher level of anger and anxiety. Combined with practice, the study focuses on the exploration of possible problems in practical test implementation and the influence on test results, providing empirical research data for unproctored Internet-based test devices and theory. It shows that uncontrolled unproctored Internet-based test will appear non-serious answer behavior, the items which across the screen display will not be conducive to the candidates to answer. The conclusion, of great application value, can offer reference for the development, implementation and result analysis of unproctored Internet-based test.

Keywords: Unproctored Internet-based test, Non-serious responses, Psychological measurement analysis

谁掌握着计算机化分类测验的最终话语权？ ——三大类终止规则

任赫 黄颖诗 陈平（通讯作者）

北京师范大学中国基础教育质量监测协同创新中心，北京，100875，pchen@bnu.edu.cn

摘要 作为一种特殊的计算机化自适应测验，计算机化分类测验（Computerized Classification Testing, CCT）能够自适应地将被试划分到两个或多个不同的类别，已被广泛应用于合格性测验及临床心理学或医学诊断中。作为 CCT 的重要组成部分，终止规则决定测验何时停止以及将被试最终划分到何种类别，因此直接影响测验效率及分类准确率。根据终止规则所基于的理论基础，已有终止规则可以划分为三大类：似然比规则、贝叶斯决策理论规则及置信区间规则。具体地说，它们的核心思路分别是：（1）通过事先设定不同类别被试的能力的上下界，构造假设检验以及似然比统计量；（2）通过作答反应获得被试能力的后验分布，并由此计算损失函数值；（3）通过判断被试能力估计值的置信区间是否高于/低于分界分数，从而完成对被试的分类。同

时,在构造具体的终止规则时,还要考虑不同测验情境(主要包括划分的类别数以及测验的维度数)的特点。总体而言,似然比规则基于似然比检验,具有较好的理论性质,相关研究也较多。但是,该方法在多维、多分类等复杂测验情境下的拓展难度较大。贝叶斯决策理论规则通过后验概率与损失函数,完成对被试的分类判断。损失函数的多样性使得该方法的形式非常灵活,也使得该方法很容易就可以被应用于不同的测验情境中。但是,形式的灵活会不可避免地导致使用者在损失函数的选择上产生疑问,也可能会在实际应用中产生由于损失函数选取不恰当而导致的误差。置信区间方法直接将分界分数与能力估计值的置信区间进行比较,是三种方法中最简单直接的一类方法。但是,这种方法的稳健性较差,测验效率也相对较低。未来研究可以继续开发贝叶斯规则、考虑多维多类别情境或者结合反应时和机器学习算法。针对 CCT 测验的不同应用场景的实际需求,三类终止规则在合格性测验上均有应用潜力,而贝叶斯规则在临床医学问卷中更为适用。

Who Has the Final Say in Computerized Classification Test: Three Types of Termination Rules

Ren He, Huang Yingshi, Chen Ping (Corresponding Author)

Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, 100875, pchen@bnu.edu.cn

Abstract: As a subset of computerized adaptive testing, computerized classification testing (CCT) aims to classify participants into two or more different categories adaptively and has been widely used in eligibility testing and clinical psychology or medical diagnosis. As a crucial part of CCT, the termination rule determines when the test is to be stopped and what category the participants are ultimately classified into, which directly affects the efficiency and accuracy of the test. According to the theory on which the termination rules are based, the existing termination rules can be divided into three types: likelihood ratio rules, Bayesian decision theory rules, and ability confidence intervals rules (ACI). Specifically, their core ideas are: (1) by pre-setting the upper and lower bound of different categories, constructing hypothesis tests and calculating likelihood ratio statistics; (2) obtaining the posterior distribution of the participant's ability by responses, and calculating the loss function value; (3) determining if the confidence interval of the participant's ability estimate includes, above, or below the cut-point, the classification of the participant is decided. At the same time, in different test situations (mainly including the number of categories and the number of items' dimensions), CCT termination rules have various specific forms. In general, the likelihood ratio rule is based on the likelihood ratio test, which has good theoretical properties, and there are many related studies. However, this method is more difficult to be extended to complex test situations such as multi-dimension and multi-category. The Bayesian decision theory rules complete the classification decision by calculating posterior probability and loss function. The diversity of the loss function makes the method very flexible and makes it easy to be applied to different test situations. However, the flexibility of the form may inevitably cause users to have questions about the choice of the loss function and may also cause an extra error due to improper loss function in practice. The ACI method directly compares the cut-off score with the ability confidence interval, so it is the simplest and most direct rule among the three methods. However, this method has poor robustness and relatively low efficiency. Future research can continue to develop Bayesian rules, consider multi-dimensional and multi-category situations, or combine response time and machine learning algorithms to construct new termination rules. In view of the actual needs of different practical situations of the CCT test, all of the three rules have application potential in the eligibility test, and the Bayesian rule is more applicable in clinical medical questionnaires.

Keywords: computerized classification testing, termination rule, likelihood ratio, Bayesian decision theory

阶段适应与融入反应时的计算机化分类测验选题策略

黄颖诗 任赫 陈平（通讯作者）

北京师范大学中国基础教育质量监测协同创新中心，北京，100875，pchen@bnu.edu.cn

摘要 计算机化分类测验（Computerized Classification Testing, CCT）的目的在于将考生划分到不同类别。如何选择题目以构建满足各方面需求的试卷一直是 CCT 的研究热点。题目曝光控制是首要面临的问题，现有基于分界分数的选题策略固定选择在分界分数处具有高信息量的题目，导致题库中大量题目浪费而高信息量题目曝光率极高。测验时间控制是亟待解决的第二个问题，目前不同考生完成测验的时间往往差异较大，且部分考生可能超时。因此本研究：（1）提出阶段适应的 CCT 选题策略（SAI），即根据当前决策需求匹配相应信息量的题目；（2）优化融入反应时的 CCT 选题策略（M-GMFCT），并结合阶段适应思想提出 timed-SAI 策略。研究一采用模拟方法考察 SAI 能否“按需分配”题目，并比较它与传统方法在题目均衡使用和分类准确性方面的表现。因此，从区间 $[-3.5, 3.5]$ 以 0.25 为步长生成 29 个考生能力点，并考虑两种测验长度（10 和 20 题）。题库大小为 500 题，分界分数取 0，权重参数取 1。每种条件重复 100 次，评价指标为：选择优先指数、题目曝光率与正确分类百分比（PCC）。结果表明：（1）能力距分界分数越近，SAI 越倾向于选择高信息量题目，反之则推荐低信息量题目；（2）传统方法中高信息量题目的曝光率接近 1，而 SAI 中大部分题目的曝光率低于 0.2；（3）在大多数情况下，SAI 的 PCC 都高于传统方法。研究二考察 M-GMFCT 与 timed-SAI 能否减小测验时长的均值与方差。为贴合实际，从 $N(0, 1)$ 中随机抽取 1000 名考生的能力。采用层次模型对作答和反应时联合建模，并设置考生能力与速度的相关 $\rho_{\theta\tau} = 0.59$ 、题目难度与时间强度的相关 $\rho_{b\beta} = 0.65$ 。敏感参数取 0.5，其余条件同研究一。每种条件重复 100 次，评价指标为：测验长度为 10 时每名考生的测验时间和 PCC 以及测验长度为 10、15 和 20 题时的题目曝光 χ^2 统计量。结果表明：（1）timed-SAI 的测验时长均值与方差最小，M-GMFCT 次之，传统方法最大；（2）M-GMFCT 与传统方法的 PCC 无显著差异；（3）timed-SAI 的 χ^2 在所有题目水平下均最低。未来研究可拓广至多维多分类测验情景、考虑条件依赖的反应时模型、分析不同类型反应时对决策判断的帮助。

Stage Adaptive and Timed Item Selection Methods for Computerized Classification Test

Huang Yingshi, Ren He, Chen Ping (Corresponding Author)

Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, 100875, pchen@bnu.edu.cn

Abstract: Computerized classification test is designed to divide examinees into different proficiency categories. A corollary problem is how to select items for the test to satisfy all stakeholders. One of the challenges faced by test developers is item exposure control. As CCT trends to select items with high information at the cut scores to make decisions reliable, the top informative items are under high exposure rate while the less informative ones with little chance to be used. Another issue that is pertinent for CCT is time control. It is crucial to reduce the differences between examinees' test-taking time and the number of examinees who exceed the time limitation. The objects of this study are to (1) propose the stage adaptive item selection method (SAI) for CCT, i.e., matching the current need for decision making with the rank of item information; (2) optimize the GMFIT method to CCT (M-GMFCT) and combine with the idea of stage adaptive method to introduce the timed-SAI method. Study 1 investigated the nature of the SAI and the performance in item usage as well as classification accuracy compared with the traditional method. Specifically, 29 levels of examinees' ability (from -3.5 to 3.5 by 0.25) and two levels of test length (10 and 20 items) were simulated. The item bank contained 500 items and the cut score was set at 0. The weighting parameter was set at 1. Each condition was repeated 100 times and the selected priority index, item exposure rate, and percentage of correct classifications (PCC) were computed. Results show that: (1) the new method picks the informative items when the current ability estimate are close to the cut score and recommends the less informative items otherwise; (2) the item

exposure rates of high-quality items under the traditional method are close to 1 while most of the items have lower exposure rate with the SAI method; (3) the PCCs of the SAI method, for the most part, are higher than the traditional method. Study 2 determined whether the M-GMFCT and the timed-SAI can shrink the mean and variance of the test-taking time. 1000 examinees were generated from $N(0, 1)$. The hierarchical model was used to model the response and response time. And the correlation between ability and speed was 0.59. The correlation between item difficulty and time density was 0.65. The sensitivity parameter was 0.5. The remaining conditions were the same as in study 1. Each condition was repeated 100 times and the test time and PCC were computed under length 10 when the χ^2 statistic was calculated under three levels of length (10, 15, and 20 items). Results show that: (1) the timed-SAI method holds the smallest mean and variance of test time and the M-GMFCT takes second place while the traditional one has the longest and most fluctuant test time; (2) the PCCs of the M-GMFCT and the traditional method are similar; (3) the χ^2 statistics of the timed-SAI method are at the lowest level among the others under all test lengths. Future directions may seek to further progress in extending the stage adaptive and timed item selection methods in the multidimensional and polytomous scenario and using the conditional dependent model to be more in line with the practical need and make full use of the information provided by response time.

一种基于句向量的中文短文本主观题自动评分方法

宫皓明 康春花 曾平飞 (通讯作者)

浙江师范大学, 浙江省智能教育技术与应用重点实验室, 浙江 金华, 321004, zpf@zjnu.cn

摘要 主观题自动评分技术在语言学习与语言测试领域诊断及信度方面具有重要的应用前景。英文主观题自动评分技术以统计分析技术为主, 而中文由于其语言的复杂性难以使用统计分析技术进行主观题的自动评分。随着自然语言处理技术的飞速发展, 中文主观题的自动评分技术正在蓬勃发展。文本较短的主观题称为短文本类的主观题, 例如概述题、简答题等, 短文本类的主观题有标准答案, 自动评分应先处理考生文字答案, 然后比较处理后文本与标准答案的相似度, 以此进行评分。在文本主题挖掘方法中, 主题模型是一种广泛应用于短文本的挖掘方法。主题模型将文本根据不同主题分类成若干集合, 使得被分类在同一集合内的所有文本共享同一主题。由于短文本主观题文本数据较少, 可能存在数据稀疏问题, 且如果不能联系上下文进行判断各种语境下的多义词, 中文的语义会造成不同程度的缺失, 影响文本语义挖掘的效果。因此本文提出 Doc-BTM 模型, 使用句向量模型解决上下文语义缺失问题。同时通过句向量模型引入主题模型, 将文本通过句向量模型进行训练后, 在句向量模型的基础上结合使用词对主题模型(biterm topic model, BTM), 通过词对主题模型缓解短文本数据稀疏的问题。本文使用复旦中文语料库进行主题建模, 将本文提出的 Doc-BTM 模型与词向量模型、词对主题模型进行聚类效果的比较。选取 K-Means 聚类算法验证模型的有效性。选用 F-measure 对处理后的短文本聚类效果进行性能评价, 将准确率、召回率、F1 作为评价指标。实验结果表明 Doc-BTM 模型的准确率、召回率、F1 相比传统基础模型有了进一步的提升。

An Automatic Scoring Method Based on Sentence Vectors for Subjective Questions of Chinese Short Texts

Haoming Gong, Chunhua Kang, Pingfei Zeng

Key Laboratory of Intelligent Education Technology and Application of Zhejiang Province, Zhejiang Normal University, Jinhua Zhejiang, 321004

Abstract: The automatic scoring technology of subjective questions has important application prospects in the field of language learning and language testing in terms of diagnostic information and reliability. The automatic scoring technology for English subjective questions is mainly based on statistical analysis technology, while it is difficult for Chinese to use statistical analysis technology for automatic scoring of subjective questions due to its language

complexity. With the rapid development of natural language processing technology, the automatic scoring technology of Chinese subjective questions is developing rapidly. Subjective questions with short text are called short text subjective questions, such as summary questions, short answer questions, etc. Short text subjective questions have standard answers. Automatic scoring technology should first process the students' text answers, and then compare the similarity between the processed text and the standard answers for scoring. Among text topic mining methods, topic model is a widely used short text mining method. The topic model classifies texts into several collections according to different topics, so that all texts classified in the same collection share the same topic. Since there is less text data for short text subjective questions, data sparseness may exist. And if it is not possible to judge polysemous words in various contexts in relation to the context, the semantics of Chinese will cause varying degrees of deficiency, which will affect the effect of text semantic mining. Therefore, we propose the Doc-BTM model and use the sentence vector model to solve the problem of contextual semantic lack. Then the topic model is introduced through the sentence vector model, after the text is trained through the sentence vector model, the biterm topic model (BTM) is combined with the sentence vector model to alleviate the problem of sparse short text data through the BTM. We use the Fudan Chinese Corpus for topic modeling, and compare the clustering effect of the Doc-BTM model proposed in this paper with the word vector model and the BTM. We choose K-Means clustering algorithm to verify the effectiveness of the model. F-measure is used to evaluate the performance of the short text clustering effect after processing, and the accuracy rate, recall rate, and F1 are used as evaluation indicators. The experimental results show that the accuracy, recall, and F1 of the Doc-BTM model have been further improved compared with the traditional basic model.

Keywords: topic model, sentence vector model, short text subjective questions, automatic scoring technology

决策者及互动同伴的社会价值取向对合作行为的影响及其机制

孙倩 马俊树 周俊 刘永芳 (通讯作者)

华东师范大学心理与认知科学学院, 上海, 200062, yfliu@psy.ecnu.edu.cn

摘要 合作行为普遍存在于人类社会, 对人类社会的发展尤为重要。一般而言, 它受决策者的社会价值取向的影响, 亲社会决策者比亲自我决策者有着更高的合作水平。与此同时, 合作行为的产生也会受到互动同伴社会价值取向的影响, 相较于与亲自我者互动时, 决策者与亲社会者互动时会表现出更多的合作行为。那么, 决策者社会价值取向对合作行为的影响是否会因互动同伴社会价值取向的不同而不同? 可能的中介机制为何? 目前鲜有研究进行探讨。为此, 本研究设计了 2 个实验, 采用“三重对策矩阵”筛选亲社会决策者与亲自我决策者, 考察两种社会价值取向的决策者在与亲社会、亲自我及社会价值取向未知的同伴进行公共物品游戏时的合作行为 (实验 1) 及其作用机制 (实验 2)。实验 1 结果显示, 互动同伴的社会价值取向调节了决策者社会价值取向与合作行为之间的关系: 互动同伴为亲社会者及未知社会价值取向者时, 亲社会被试的合作行为显著多于亲自我被试的合作行为; 互动同伴为亲自我者时, 亲社会与亲自我被试的合作行为不存在显著差异。实验 2 重复了实验 1 的结果, 并进一步发现: 当互动同伴为亲社会者及未知社会价值取向者时, 决策者的社会价值取向完全通过对互动同伴的合作预期影响其合作行为; 当互动同伴为亲自我者时, 合作预期在决策者社会价值取向与合作行为关系间的中介作用不复存在。这些结果弥补了现有研究的不足, 有利于更好地理解社会价值取向与合作行为的关系。

Effects of Social Value Orientation of The Decision-maker and The Confederate on Cooperative Behavior and The Potential Mechanism

Qian Sun, Junshu Ma, Jun Zhou, Yongfang Liu (Correspondence)

School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062,
yfliu@psy.ecnu.edu.cn

Abstract: Cooperative behavior generally exists in human society, and it plays a vital role in the development of society. Generally, cooperative behavior is affected by the decision-maker's social value orientation, and Pro-Social decision-makers cooperate more than Pro-Self decision-makers. At the same time, cooperative behavior is affected by the confederate's social value orientation, and decision-makers cooperate more with Pro-Socials but not with Pro-Selfs during social interaction. So far, whether the effect of the decision-maker's social value orientation on cooperative behavior would be moderated by the confederate's social value orientation and its potential mechanism remains unknown. To address this issue, we designed two experiments. In Experiment 1, we selected Pro-Social and Pro-Self participants using "triple matrix game" firstly, and then measured these participants' cooperative behavior when they played Public Goods Game with a Pro-Social confederate, a Pro-Self confederate, and a confederate whose social value orientation was unknown. In Experiment 2, we further investigated the cognitive mechanism in the relationship between social value orientation and cooperative behavior. Results of Experiment 1 showed that the confederate's social value orientation moderated the association between decision-maker's social value orientation and cooperative behavior. Specifically, Pro-Social participants cooperated more than Pro-Self participants when they interacted with a Pro-Social confederate or a confederate with unknown social value orientation but not a Pro-Self confederate. The results of Experiment 2 replicated the result of Experiment 1, and further found that cooperative expectation for the confederate plays a mediating role in the relationships between participants' social value orientation and cooperative behavior when they interacted with a Pro-Social confederate or a confederate with unknown social value orientation but not a Pro-Self confederate. These results make up the deficiency of the existing research and shed light on better understanding the relationship between social value orientation and cooperative behavior.

Keywords: cooperative behavior, social value orientation, decision-makers, confederates, cooperative expectation

社会决策中的信息回避：利己还是利他？

刘定国¹ 孙坚磊¹ 艾攀¹ 向博¹ 杜静¹ 郑洪霞¹ 戴艳²（通讯作者）

¹ 四川师范大学心理学院，成都，610068

² 四川师范大学心理学院，四川成都，610068，daiyanch@163.com

摘要 目的 （1）探究大学生在不同模糊情境（模糊自己收益或模糊对方收益）中，不同的信息取向（信息回避或信息获取）对其进行利己或利他选择的影响。（2）探究大学生社会选择倾向及信息回避的心理机制。（3）探究影响信息回避和社会决策选择的背景因素。方法 本实验分为两个部分。在实验一中，通过有偿招募的方式得到非心理学、经济学类专业大学生被试 200 名，其中男性 62 名，女性 138 名。采用改编的独裁者博弈范式，首先向被试呈现模糊对方收益的分配方案，并询问被试是否愿意知晓对方名下的具体数值。被试作出信息取向选择后，无论选择信息回避与否，都将被试随机分配到利己分配方案（自己 10、对方 5）或利他分配方案（自己 10、对方 15），每种方案下 100 人，被试在对应的分配方案作出决策。最后，完成道德认同量表和无法忍受不确定性量表。在实验二中，通过有偿招募的方式得到非心理学、经济学类专业大学生被试 200 名，其中男性 78 名，女性 122 名。同样采用改编的独裁者博弈范式，向被试呈现模糊自己收益的分配方案后，其余程序与实验一相同。结论 （1）人们在决策中，会选择信息回避行为，信息回避影响被试在社会决策中的选择。（2）在不同情境下，被试选择信息回避的目的可能是为了个人利益而“更好地利己”，也可能是为了抵抗利己的诱惑而“更好地利他”，具有情景的差异性。（3）在本研究中，被试是否选择信息回避，

和被试的不确定性容忍度没有任何关系。道德认同是影响社会决策（实验1）和信息回避行为（实验2）的一个可能的背景因素。

Abstract: Objective (1) to explore the influence of different information orientation (information avoidance & Information Acquisition) on self-interest or altruistic choice of college students in different fuzzy situations. (2) To explore the psychological mechanism of College Students' social choice tendency and information avoidance. (3) Explore the background factors that influence information avoidance and social decision-making. Methods the experiment was divided into two parts. In Experiment 1, 200 non psychology and economics college students were recruited, including 62 males and 138 females. Using the changed dictator game paradigm, the participants were first presented with a fuzzy distribution scheme of each other's income and asked whether they would like to know the specific value of each other's name. After the subjects made the choice of information orientation, whether they chose information avoidance or not, they were randomly assigned to egoistic allocation scheme (self 10, opposite party 5) or altruistic allocation scheme (self 10, opposite party 15). Under each scheme, 100 participants made decisions in the corresponding allocation scheme. Finally, the scale of moral identity and the scale of intolerable uncertainty were completed. In the second experiment, 200 non psychology and economics majors were recruited, including 78 males and 122 females. In the same way, the adapted dictator game paradigm was used to present the participants with a fuzzy distribution scheme of their own benefits, and the rest procedures were the same as those in Experiment 1. Conclusion (1) people will choose information avoidance behavior in decision-making, and information avoidance affects subjects' choice in social decision-making. (2) In different situations, the purpose of information avoidance may be "better self-interest" for the sake of personal interests, or "better altruism" to resist the temptation of self-interest. (3) In this study, whether the subjects choose information avoidance or not has no relationship with the uncertainty tolerance of the subjects. Moral identity is a possible background factor affecting social decision-making (Experiment 1) and information avoidance behavior (Experiment 2).

鱼和熊掌不可兼得：3~5 岁幼儿道德决策与自我利益的抉择

张雪 刘一沛 赵晨辰 刘文（通讯作者）

辽宁师范大学心理学院，大连，116029, wenliu703@126.com

摘要 本研究考察 3~5 岁幼儿道德决策的发展特点及自我利益在其中的作用，探究 3~5 岁幼儿在正义与利益之间的抉择，幼儿是否会牺牲个人利益来拒绝坏人，以及这种行为发展的年龄特点。本研究采用现场行为情境实验对幼儿进行测试，设置对照组和实验组，实验组先观看角色扮演视频，再观看物品选择视频，幼儿需要在好人给出的较少资源和坏人给出的较多资源间做出选择，同时设置了资源的不同比例；对照组仅观看物品选择视频，幼儿只需要在不同比例下做出资源数量的选择即可。结果显示：在对照组，幼儿确实会选择更多的物品，120 人中有 105 人，二项式检验结果显示，两种选择的差异是显著的($p < 0.001$)，各年龄组分别进行二项式检验，各年龄组均存在显著差异($p < 0.001$)。各年龄组幼儿在不同比例下的选择结果，不存在显著的年龄差异和比例上的差异 (Fisher's exact, $p = 0.892$)。在实验组，幼儿在两种选择结果上，120 人中有 69 人选择了坏人给的更多资源，二项式检验结果显示，两种选择的差异是不显著的 $p = 0.120$ ，各年龄组分别进行二项

式检验,除了3岁组中差异显著,其他年龄组差异均不显著,分析各年龄组幼儿在不同比例下的选择结果,随着年龄的发展幼儿选择更多资源的频数在两种比例下都在逐渐下降,但年龄差异不显著(Fisher's exact, $p=0.670$)。研究结论:3~5岁幼儿在不同情境下的行为决策存在显著差异,对坏人的拒绝行为存在显著的年龄差异,自我利益的比例不同,幼儿对坏人的拒绝行为存在显著的影响。当两种选择对自身利益差异不大的情况下,幼儿会做出更多的拒绝行为,即牺牲自我利益来拒绝反社会行为者,但当选择比例增大时,出于自我自利的作用,幼儿会更多的接受反社会行为者给出的资源。即幼儿已经具有对反社会行为者的厌恶,但在实际决策中,自我利益是其决策影响的一个重要因素。

Not both Fish and Bear's Paw: the Choice of Moral Decision and Self-interest of 3-5-year-old Children

Xue Zhang, Yipei Liu, Chenchen Zhao, Wen Liu, (Corresponding Author)

School of Psychology, Liaoning Normal University, Dalian 116029, wenliu703@126.com

Abstract: This study examines the developmental characteristics of 3-5-year-old children's moral decision-making and the role of self-interest in it. To explore the choice between justice and interest of 3-5-year-old children, whether they will sacrifice their personal interests to reject bad people, and the age characteristics of this behavior development. In this study, children were tested by scene behavior situation experiment. The control group and the experimental group were set up. The experimental group watched the role-playing video first, and then watched the item selection video. The children need to choose between the less resources given by the good people and the more resources given by the bad people. At the same time, the different proportion of resources was set. The control group only watched the item selection video, and the children only needed to make the choice of the number of resources under different proportions. The results showed that: in the control group, children did choose more items, 105 out of 120 children. The results of binomial test showed that the difference between the two choices was significant ($P < 0.001$), and there were significant differences in each age group ($P < 0.001$). There is no significant difference in age and proportion among different age groups (Fisher's exact, $p=0.892$). In the experimental group, 69 out of 120 children chose more resources given by bad people. The binomial test results showed that the difference between the two choices was not significant, $P=0.120$. The binomial test was conducted for each age group. Except for the 3-year-old group, the difference was not significant in other age groups. The results of the selection of children in different age groups were analyzed with the development of age, the frequency of children choosing more resources is gradually decreasing in both proportions, but there is no significant difference in age (Fisher's exact, $p=0.670$). Conclusion: there are significant differences in behavior decision-making of 3-5-year-old children in different situations, there are significant age differences in the refusal behavior of bad people, the proportion of self-interest is different, and children's refusal behavior to bad people has a significant impact. When there is little difference between the two choices for their own interests, children will make more refusal behaviors, that is, they will refuse antisocial actors at the expense of self-interest. However, when the proportion of choices increases, children will accept more resources given by antisocial actors for the role of self-interest. That is to say, children already have aversion to antisocial actors, but in actual decision-making, self-interest is an important factor affecting their decision-making.

社交目标取向对消费决策风格的影响：中国与印尼的跨文化探究

魏馨怡¹ 陈学芳¹ 马剑虹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310028, jhma@zju.edu.cn

摘要 人们可能对那些激发他们在社交环境中行为的社交能力有不同的目标取向, 研究发现不同的社交目标取向预示着不同的行为反应。消费者社会化模型认为一些前因变量会通过社会化角色(如父母、同伴、媒

体等)影响社会化的过程,进而影响消费者社会化的结果。消费决策风格是消费者在作出决策时所表现出的稳定购物决策态度、习惯、倾向等心理特征。从消费者社会化的角度看,社交目标取向可作为社会化过程中形成的一种行动意图来影响消费决策风格,然而目前对社交目标取向和消费决策风格之间关系的研究还较少。此外,研究发现不同宗教信仰会影响个体的消费决策风格和目标取向,而中国与印尼在宗教信仰的人数比例上有较大差异。因此,为了探索社交目标取向与消费决策风格的关系,以及在中国、印尼两种文化间的差异,本研究使用社交目标取向量表(SAGOS)及消费者决策风格量表(CSI)测量两国共237名大学生(中国:132,印尼:105)的社交目标取向与消费决策风格,通过路径分析探究两变量之间的关系。结果表明所使用的量表在两个文化环境中的信度良好。中国被试中仅2.3%有宗教信仰;印尼被试均有宗教信仰。在两国文化中,实用主义消费风格仅受发展目标取向影响显著,社交取向消费风格受到发展目标取向和趋近目标取向的共同影响,不可取的消费风格仅受回避目标取向的影响。对比两国数据,在消费风格上,中国不可取的消费风格维度得分显著大于印尼。在社交目标取向中,中国发展目标取向维度和趋近目标取向维度得分显著大于印尼。对比两个变量的关系,中国文化中,社交取向的消费风格受趋近目标取向的影响(效应量为0.347)大于印尼文化中这一影响(效应量为0.185)。结果表明:不同的社交目标取向可以预测不同的消费决策风格,同时该效果具有跨文化的一致性,但在影响程度上存在一定差异。中国大学生较印尼大学生在消费风格上更容易冲动和困扰,同时更重视提高社交技巧和关系质量,更倾向于获得积极的社交评价和声望。

The Influence of Social Goal-Orientation on Consumer Decision-Making Style: A Cross-Cultural Exploration of China and Indonesia

Wei Xinyi¹, Chen Xuefang¹, Ma Jianhong¹

Department of Psychology and Behavioral Science, Zhejiang University, Hangzhou, 310028, Email: jhma@zju.edu.cn

Abstract: People may have different goal orientations toward social competence that motivate their behavior in social settings. Research has found that different social goal orientations indicate different behavioral responses. The consumer socialization model postulated that some antecedent variables affected socialization processes via socialization agents (such as parents, peers, media, etc.). Then these socialization processes, in turn, affected consumer socialization outcomes. Consumer decision-making styles referred to the psychological characteristics of stable shopping decision-making attitudes, habits, and tendencies shown by consumers when making decisions. From the perspective of consumer socialization, social goal orientation could be used as an action intention formed in the socialization processes to influence consumer decision-making styles. However, there are few researches on the relationship between social goal orientation and consumer decision-making styles. In addition, some research found that different religious beliefs affected the individual's consumer decision-making styles and goal orientation, and the proportion of religious beliefs in China and Indonesia was quite different. Therefore, in order to explore the relationship between social goal orientation and consumer decision-making styles, as well as the differences between the two cultures of China and Indonesia, this study used the Social Goal Orientation Survey (SAGOS) and Consumer Style Inventory (CSI) to measure the social goal orientation and consumer decision-making styles of 237 students (China: 132, Indonesia: 105). We explored the relationship between the two variables through path analysis. The results showed that the scales we used had good reliability in the two culture. Only 2.3% of Chinese participants had religious beliefs; while Indonesian participants all had religious beliefs. In both cultures, utilitarian consumer styles were only significantly influenced by social developing goals, social/conspicuous consumer styles were influenced by social developing goals and social demonstration-approach goals, and the undesirable consumer styles were only affected by social demonstration-avoidance goals. Comparing the data of the two countries, in terms of consumer decision-making styles, Chinese undesirable consumer styles dimension score was significantly higher than that of Indonesia. In the social goal-orientation, the scores of Chinese social developing goal orientation dimension and social demonstration-approach goal dimension were significantly higher than those of Indonesia. Comparing the

relationship between the two variables, in Chinese culture, the influence of social demonstration-approach goal on social/conspicuous consumer decision-making styles was greater (with the effect size of 0.347) than in Indonesian culture (with the effect size of 0.185). The results indicate that different social goal-orientations could predict different consumer decision-making styles, and the effect has cross-cultural consistency, with only a certain difference in the degree of this predictive effect. Chinese students are more likely to be impulsive and confused in their consumer decision-making styles than Indonesian students, and they pay more attention to improve social skills and relationship quality and are more inclined to gain positive social evaluation and prestige.

社会比较和自我肯定策略对正性负性情绪的影响

李萌^{1,2} 游旭群^{1,2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知重点实验室, 西安, 710062, youxuqun@snnu.edu.cn

摘要 个体天然的具有社会属性, 不可避免的会进行社会比较, 从而获得自我概念的完整性。心理资源理论认为, 一定时间内个体的心理资源是有限的, 如前项任务消耗了资源, 那么可用于后项任务的资源便会减少。积极正性的情绪作为一种重要的心理资源, 是个体从事各类活动的关键影响因素。因此探究社会比较对正性负性情绪的影响意义重大。个体进行社会比较的结果, 受到个体如何看待社会比较信息, 以及个体如何认知自己与比较对象的关系。其中, 向上社会比较就是个体和一个比自己更好的对象进行比较, 向下社会比较就是个体和一个比自己更差的对象进行比较; 个体认为自己与比较对象的关系是相似还是相反。自我肯定理论认为, 当个体面临潜在威胁时, 通过肯定个体与威胁领域无关的重要价值, 达到自我整体性, 进而拥有更多的心理资源。自我肯定策略可以帮助个体缓解在社会比较中产生的威胁效应。但特质肯定和价值肯定策略的有效性, 还没有稳定的结果, 有待进一步探索。实验采用双因素被试间设计, 探究社会比较方向(向上比较组、向下比较组、控制组)和自我肯定策略(特质肯定、价值肯定、控制组)的使用, 对正性负性情绪的影响。被试被随机要求与模拟智力测验成绩排名前10%或者与排名最后10%的人相比, 然后测量其正性负性情绪。结果发现, 自我肯定策略对正性、负性情绪的影响, 表现出显著性差异; 社会比较方向和自我肯定策略, 在正性情绪上表现出交互作用显著。社会比较方向和自我肯定策略的使用对正性负性情绪的影响, 表现出显著的性别差异。结果表明自我肯定策略的使用, 可以有效地应对社会比较后产生的负性情绪, 帮助个体平复情绪波动。在日常生活中应该重视自我肯定策略的使用和推广。

The influence of social comparison and self-affirmation strategies on positive and negative emotions

Meng Li, Xuqun You*

School of Psychology, Shaanxi Normal University, Xi'an, China

Shaanxi Provincial Key Laboratory of behavior and cognition, Xi'an, China

Abstract: Individuals with natural social attributes inevitably carry out social comparison, so as to obtain the integrity of self-concept. According to the theory of psychological resources, the individual's psychological resources are limited in a certain period of time. If the former task consumes resources, the resources available for the latter task will be reduced. Positive emotion, as an important psychological resource, is the key factor for individuals to engage in various activities. Therefore, it is of great significance to explore the impact of social comparison on positive and negative emotions. The result of social comparison depends on how the individual views the information of social comparison, for example, he tends to compare with better objects or worse objects than himself; And whether the individual's cognition of the social comparison object is similar or opposite. The theory of self-affirmation holds that when an individual is faced with potential threats, he can achieve the integrity of self-concept and have more

psychological resources by affirming his important value which has nothing to do with the threat field. Self-affirmation strategies can help individuals alleviate the threat effect in social comparison. However, the effectiveness of the two strategies is not stable. Therefore, further study is needed. The experiment is a between-groups design, which have two factors. This study explored the influence of social comparison direction (upward comparison group, downward comparison group, control group) and self-affirmation strategy (trait affirmation, value affirmation, control group) on positive and negative emotions. The subjects were randomly asked to compare with the top 10% or the bottom 10% of the simulated intelligence test scores, and then measured their positive and negative emotions. The results showed that there were significant differences in the effects of self-affirmation strategies on positive and negative emotions; Social comparison direction and self-affirmation strategy showed significant interaction in positive emotion. There are significant gender differences in the effects of social comparison direction and self-affirmation strategy on positive and negative emotions. The results show that the use of self-affirmation strategy can effectively deal with the negative emotions generated by social comparison, and help individuals to calm the emotional fluctuations. In daily life, we should pay attention to the use and promotion of self-affirmation strategy.

结伴购物与冲动消费的关系：同伴类型与自我控制的作用

郑泽卿¹ 刘麒¹ 方平¹ 姜媛² (通讯作者)

1 首都师范大学心理学院, 北京, 100048, pfang2007@126.com

2 北京体育大学心理学院, 北京, 100084

摘 要 在当前消费环境下, 结伴购物已成为线下购物的主要形式, 而同伴在购物过程中并非是某人出现在购物场景中, 而是通过影响消费者情绪、提供意见、情感支持、减少风险感知等方式, 改变消费者的消费行为。冲动消费是个体在无准备无计划的情况下, 受到外界促发而产生的消费行为。冲动消费受到营销刺激、个体因素以及情境因素共同影响, 因而关注结伴购物、明确同伴的参与下对购物者冲动消费意愿的影响是十分重要的。本研究选取 150 名大学生作为研究对象, 通过 3 个实验探究了购物情境、自我控制能力、同伴类型及购物者性别对冲动消费意愿的影响。结果表明: (1) 个体冲动消费意愿在不同购物情境中存在显著差异。与独自购物相比, 结伴购物情境下, 被试的冲动消费意愿显著更高。(2) 冲动消费意愿在不同自我控制能力个体间存在显著差异; 在购物情境与冲动消费意愿间调节作用显著, 自我控制能力调节了购物情境和冲动消费意愿的关系。结伴购物情境下, 低控组个体的冲动消费意愿显著高于高控组。(3) 结伴购物情境下, 个体冲动消费意愿在同伴类型的不同水平上存在显著差异, 同伴类型中的辈分关系及同伴性别交互作用显著。当陪同者为朋辈时, 购物者冲动消费意愿更高; 陪同者为男性, 购物者冲动消费意愿更高; 相对于男性长辈, 男性朋辈陪同下, 个体冲动消费意愿更高; 女性陪同者的辈分关系在个体冲动消费意愿上没有显著差异。(4) 被试性别在同伴类型与个体冲动消费意愿的关系上存在显著的调节作用, 与男性长辈相比, 个体性别在男性同辈水平上调节作用显著, 在女性朋辈及女性长辈水平上不显著。

The Relationship Between Group Shopping and Impulsive Consumption: The Role of Peer-type and Self-control

ZHENG Zeqing¹, LIU Qi¹, FANG Ping¹, JIANG Yuan² (Corresponding Author)

1 School of Psychology, Capital Normal University, Beijing 100048, China

2 College of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: In the current consumption environment, shopping in partnership has become the main form of offline shopping. However, in the process of shopping, peers do not appear in the shopping scene but change consumers' consumption behavior by influencing consumers' emotions, providing opinions, emotional support, and reducing risk perception. Impulse consumption is a kind of consumption behavior that is promoted by the outside world without preparation and plan. Impulsive consumption is influenced by marketing stimulation, individual factors, and situational factors. Therefore, it is very important to pay attention to the influence of partner shopping and peer participation on consumers' impulse consumption intention. In this study, 150 college students were selected as the research object, and three experiments were conducted to explore the influence of shopping situation, self-control ability, peer type and shopper's gender on impulse consumption intention. The results show that: (1) there are significant differences in individual impulse consumption intention in different shopping situations. Compared with shopping alone, the impulsive consumption intention of the participants in group shopping was significantly higher. (2) There are significant differences between individuals with different self-control ability in impulse consumption intention; there is a significant moderating effect between shopping situation and impulse consumption intention, and self-control ability regulates the relationship between shopping situation and impulse consumption intention. In the context of group shopping, the impulse consumption intention of low control group was significantly higher than that of high control group. (3) In the context of group shopping, there are significant differences in individual impulse consumption intention at different levels of peer types, and there is significant interaction between generation relationship and peer gender in peer type. When the accompanying person is a peer, the shopper's impulse consumption intention is higher; when the accompanying person is a male, the shopper's impulse consumption intention is higher; compared with the male elder, the individual impulse consumption intention is higher when accompanied by male peer; there is no significant difference in the generation relationship of female escort on individual impulse consumption intention. (4) Compared with male elders, individual gender has a significant moderating effect on the relationship between peer type and individual impulse consumption intention. Compared with male elders, individual gender has a significant moderating effect on a male peer level, but not on female peer and female elder level.

理性的社会惰性

王郁琿 李玉刚 栾胜华（通讯作者）

中国科学院心理研究所，北京，100101，luansh@psych.ac.cn

摘要 社会惰性（social loafing）是指个体在群体中工作不如单独一个人工作时努力的倾向。社会惰性广泛存在，并被大多数社会心理学家认为是一种“社会疾病”。但果真如此吗？在群体任务中适当降低个人付出是否是种理性行为？本研究利用信号检测论作为分析工具，对群体任务中的个人表现进行建模，通过计算机模拟研究个体在同时进行群体任务与个人任务时的注意分配策略，定义在个人任务上注意分配过高的策略为社会惰性策略（简称惰性策略），反之为非惰性策略，称选择惰性策略的人有惰性倾向。与前人的研究结果不同，模拟结果表明，群体越大，个人的惰性策略需视其他任务参数而定，两者之间不存在一个简单的线性关系（即群体越大，社会惰性越强）。最佳的注意分配策略由个人能力、群体大小、其他人的惰性策略，以及任务回报等多方面因素决定。具体表现为：（1）群体中只有一名成员有惰性倾向时，无论其他成员能力比该成员强还是弱，选择惰性策略皆可使该成员个人收益达到最高；（2）群体中除一名成员外的其他成员有惰性

倾向时, 该成员应选择惰性策略使个人收益达到最高; (3) 群体中所有成员有同样的惰性倾向时, 当群体中各成员能力较弱时, 所有成员都选择非惰性策略可使个人收益达到最高, 其他情况下所有成员都选择惰性策略可使个人收益达到最高。本研究针对群体大小 (3 和 9 人) 及群体内其他成员的惰性策略 (其他人没有惰性倾向和所有成员具有同样的惰性倾向) 进行了试验研究。结果表明, 被试的惰性策略会随他人所采用的策略而变化; 而且, 随着群体变大, 被试会调整自身的惰性策略, 并不是一味的增强惰性倾向。这些变化的趋势与模拟结果一致, 是追求利益最大化的个体应该表现出的趋势。本研究的结果表明: 社会惰性是人们对所处复杂任务环境的适应性反应, 适度的惰性可以是理性的。

The Rationality of Social Loafing

Yuhui Wang, Yugang Li, Shenghua Luan

Institute of Psychology, CAS, Beijing, luansh@psych.ac.cn

Abstract: Social loafing is a phenomenon in which a person exerts less effort when the person works in groups than when working alone. Social loafing exists widely and is considered by most social psychologists as a "social disease". But is this really the case? Can some degree of loafing be a rational act? To find out, we used signal detection theory to model individual behavior in a dual-task context, in which a person is asked to engage in two decision-making tasks simultaneously, one individual and the other group. Social loafing is defined as allocating too much attention (usually more than 50%) to the individual task. Different from previous findings, our simulation results show that group size and loafing tendency are not always linearly related (i.e. the larger the group, the more the loafing). The optimal amount of loafing depends on group members' abilities, members' loafing tendencies, group size, and task payoffs. Specifically, 1) when only one member can loaf, the person should loaf to maximize total payoff; 2) when other members of the group are loafing, the remaining person should also loaf; and 3) when all members of the group loaf to the same extent, if their abilities are relatively low, the rational choice is not to loaf; otherwise, loaf. After the simulations, we conducted an experiment to examine participants' loafing tendencies in tasks distinguished by two factors: group size (3 or 9) and the loafing tendencies of other, computer-simulated members (not loafing or loafing to the same extent as the participant). The results showed that participants loafed to different extents in response to the loafing tendencies of others, and with the increase of group size, participants adjusted their loafing strategies flexibly and did not always increase their loafing tendencies. The observed pattern of loafing behaviors is consistent with our simulation results, suggesting that participants could adjust their loafing strategies in the same directions as a payoff-maximizing, rational person would do. In sum, our study shows that social loafing is our mind's adaptive response to complex task environments and that some degree of loafing is a rational strategy in many task environments.

贫富差距下的躁动

——社会阶层和经济不平等如何影响人们的财富和地位追求

王喆辰¹² Jolanda Jetten² Niklas Steffens²

1 复旦大学社会发展与公共政策学院, 上海, 200433, wangzc@fudan.edu.cn

2 澳大利亚昆士兰大学心理学院, 布里斯班, qld4072

摘要 社会阶层影响了人们的感知、目标和价值观, 而经济不平等影响了人们的态度和行为。基于社会身份认同理论, 本文开展的一系列前期研究显示, 当一个人的社会阶层越高, 其对于财富和地位的追求渴望也越大。基于新物质主义理论和地位焦虑理论, 本文进一步探索了经济不平等是如何影响人们的财富和地位追求。研究 1 和 2 采用了“虚拟社会”实验范式, 直接操纵被试感知到的经济不平等水平, 并测量了被试对于财富和地位的追求渴望。结果显示, 相比处在“经济平等”组的被试, 处在“经济不平等”组的被试报告了更高财

富和地位渴望。研究 3 使用跨文化样本, 通过多层线性回归模型分析, 发现社会层面的经济不平等水平(通过“基尼系数”测量)与个体层面的财富和地位追求渴望(通过人们对于“追求更多财富和地位”这一价值观的认同程度测量)呈现显著正相关。此外, 本文还发现社会阶层对于“经济不平等—财富和地位追求”的关联具有调节作用。具体而言, 较低社会阶层人士, 其追求更多财富和地位的渴望, 受到经济不平等程度的影响更大。总体而言, 这些研究结果揭示了经济不平等在追求动机层面的社会心理影响。本文进而探讨了这种影响的后果, 如贫富差距与物质主义和拜金主义的关系、贫富差距加剧了社会躁动不安、影响社会和谐稳定等, 并为如何缓解这些社会躁动、鼓励良性社会竞争提供了思路和建议。

Restless in an unequal world: How social class and economic inequality affect people's desire for wealth and status

Zhechen Wang^{1,2}, Jolanda Jetten², Niklas Steffens²

1 School of Social Development and Public Policy, Fudan University, Shanghai, China, 200433, wangzc@fudan.edu.cn

2 School of Psychology, The University of Queensland, Brisbane, Australia, qld4072

Abstract: Social class influences people's goals, values, and perceptions, while economic inequality affects people's attitudes and behaviors. Building on the social identity theorizing, the present research has found in a set of preliminary studies that higher social class is associated with a greater desire for wealth and status. Building on the neo-material and the status anxiety perspectives, the present research has further investigated whether and how economic inequality might influence people's attitude towards wealth and status. Using experimental designs, Studies 1 and 2 has shown that people in the high inequality condition reported a greater desire to have more wealth and status than those in the low inequality condition. In a large-scale cross-cultural sample, Study 3 has shown that economic inequality at the societal level is associated with a greater desire for both wealth and status as well. Moreover, further analyses have shown that the effect of inequality on desire varies as a function of social class. Particularly, the “greater inequality—heightened desire” relationship was stronger among lower- than upper-class individuals. In summary, these findings reveal the socio-psychological consequences of economic inequality. The present research further discusses the impacts of the relationship on materialism, social restlessness, and social stability, and offers insights into alleviating social restlessness and encouraging healthy social competition.

Keywords: Social class, Economic inequality, Desire for wealth, Desire for status

面孔吸引力对赠礼行为意愿及其礼物价格估计的影响机制

李晓静¹ 刘雯萱¹ 梁敏莹¹ 张维¹ (通讯作者)

华南师范大学心理学院, 广州, 510631, psycheungwai@163.com

摘要 面孔吸引力对个体的社会活动有着深远的影响。目前已有研究发现面孔吸引力对于社会经济和人际交往等方面有着明显的美貌溢价效应。作为一种常见的社会活动, 赠送行为反映着人际关系的互动过程, 然而, 面孔吸引力如何对赠送行为及其选择产生影响仍缺乏相关实证研究。本研究通过 2 个实验分别从收礼者和送礼者的角度, 基于情景模拟实验向被试呈现高低吸引力和不同性别的面孔, 以研究面孔吸引力和面孔性别如何影响赠送行为。实验 1 探讨被试作为赠送行为的收礼者时送礼者的面孔吸引力和性别对礼物估价的影响, 结果发现, 当送礼者为高面孔吸引力时, 作为收礼者的被试对礼物估价明显更高。同时, 被试在面对高吸引力面孔时更偏好女性面孔并对其赠送的礼物有更高的估价; 但这种效应在低面孔吸引力送礼者上消失。实验 2 在首次礼物赠予情境下, 探讨被试作为送礼者时, 收礼者的面孔吸引力和性别对赠送不同价位礼物意愿的影响。结果发现, 当被试作为送礼者时, 同样表现出收礼者的面孔吸引力和性别的交互效应, 即对高吸引力女性面孔赠送高/中/低价格礼物的意愿都明显高于低吸引力面孔。进一步对不同性别和吸引力的面孔的社会距离进行评定, 结果发现收礼者的面孔吸引力能够通过社会距离间接影响送礼者赠送高/中/低价格礼物的意

愿。收礼者面孔吸引力越高,则送礼者感知到与其的社会距离越小,赠送礼物的意愿就越高。本研究从送礼者和收礼者的主体角度初步探讨影响赠送行为的相关因素,进一步证实了送礼行为中的美貌溢价效应。

The psychological mechanism of facial attractiveness on willingness of gift behavior and gift price estimation

Li Xiaojing, Liu Wenxuan, Liang Mingyong, Zhang Wei

School of psychology, South China Normal University, No. 55, Zhongshan Avenue West, Tianhe District, Guangzhou, China

Abstract: Facial attractiveness has a profound effect on individual social activities. At present, previous studies have found that facial attraction has an obvious beauty premium effect on social economy and interpersonal communication. As a common social activity, gift-giving behavior reflects the interactive process of interpersonal relationship. However, there is still a lack of relevant empirical research on how facial attraction affects gift-giving behavior and its choice. The present study adopted two scenario simulation experiments which from the perspective of the recipient and the giver, respectively, and further discuss how facial attractiveness and face gender affect the gift-giving behavior. Experiment 1 explored the influence of the facial attractiveness and facial gender of the giver on the gift evaluation when the participants were the recipients. The results showed that when the giver had high facial attractiveness, the participants had significantly higher gift evaluation. At the same time, when facing high attractive faces, participants prefer female faces and have a higher evaluation of their gifts. But this effect was absent in gift givers with low facial attractiveness. In Experiment 2, under the first gift giving situation, the effects of the recipient's facial attractiveness and facial gender on the willingness to give gifts at different prices were discussed. The results show that the participants' willingness of giving high, medium, and low price gifts to high attractive female faces was significantly higher than that of low attractive faces. Furthermore, we also found the facial attractiveness of the recipient can indirectly affect the willingness of the giver to give high, medium and low price gifts, which showed a significant mediation effect of "facial attractiveness" → "perceived social distance" → "the willingness of gift-giving". That is, the more attractive the recipient's face was, the less social distance the giver perceived, and the more willing the giver was to give gifts at high, medium and low prices. Our present study preliminarily discusses the relevant factors affecting gift giving behavior from the perspective of the giver and recipient, and provided further evidence to the beauty premium effect in gift giving behavior.

Keywords: Facial attractiveness, Gender, Gift-giving willingness, Social distance, Gift price estimation

道德阈限模型具有跨文化一致性:来自中国集体主义文化的证据

肖威龙¹, 李蕊¹, 孙炳海¹

1 浙江师范大学教师教育学院, 浙江金华, 321004

摘要 研究背景: 人们选择行动, 使他们能够保持自己的道德自我关注。但是, 道德行为到底是如何转化为道德自我关注的呢? 西方学者基于已有研究提出了道德阈限模型(Moral Threshold Model)用于解释道德行为到底是如何转化为道德自我关注并基于 WEIRD 样本(西方-受教育-工业化-富裕-个人主义文化的样本)验证了该模型的解释效力(Zlatev, Kupor, Laurin & Miller, 2020)。然而, 道德阈值模型是否具有跨文化适用于的普遍性尚不得而知? 方法和材料: 基于上述问题, 本研究开展了两个单因素被试间实验, 共计招募了 1804 名中国被试来检验道德阈限模型的两个核心假设。实验采用风险情境背景下的金钱投资任务对两个核心假设进行跨文化的检验。研究结果: (1) 当受益人是需要帮助的人而不是自己时, 人们对小的有保证的积极结果

表现出更强的偏好，而不是大的不确定的结果；（2）人们在为慈善机构做决策时，相对于只为自己做决策时，对最大潜在利益的大小不那么敏感。研究结论：本研究为中国集体主义文化中的道德阈限模型提供了支持证据。研究结果表明道德阈限模型具有跨文化一致性，能够用于解释道德行为到底是如何转化为道德自我关注的内在心理机制。

关键词 道德自我，道德阈限模型，集体主义文化

Moral Threshold Model is Universal: The evidence from China's collectivist culture

Weilong Xiao¹, Rui Li¹, Binghai Sun¹

1. College of Teacher Education, Zhejiang Normal University, Jinhua, 321004, Zhejiang, China

Abstract: Background: People select actions that allow them to maintain their moral self-regard. The moral threshold model was put forward to explain how moral actions translate into moral self-regard by scholars with the WEIRD sample (Zlatev, Kuper, Laurin, & Miller, 2020). However, whether the moral threshold model applies as a human universal is still unknown? Materials and methods: In two studies, a total of 1804 participants under China's collectivist culture were recruited to test the two main hypotheses of the moral threshold model. The test context was set as a hypothetical monetary investment task. Results: The results showed a stronger preference for smaller guaranteed positive outcomes over larger uncertain ones when the beneficiary was a prosocial cause than when it was. Moreover, people's decisions were less sensitive to the maximum potential benefit when making decisions for a charity than when making decisions exclusively for themselves. Conclusion: The current study provided evidence for the moral threshold model among China's collectivist culture, which indicated that the moral threshold model could be applying as a human universal.

Keywords: moral self-regard, moral threshold model, morality, collectivist culture

摘要 幸福一直是积极心理学研究的热点，大众观点常认为道德者更幸福。关于幸福的研究有两种主要的理论观点：享乐论和实现论。道德身份虽然在概念和实证上均与实现论幸福密切联系，但也存在关于道德身份和享乐论幸福（主观幸福感）联系的证据。现有研究的局限在于对道德身份与两种幸福感的联系关注不够，并缺少对道德身份促进幸福机制的探讨。本研究提出，在成人初期，实现论的幸福感反映了实现论身份的功能完善，道德身份可能通过实现者身份的功能的完善促进主观幸福感。道德身份的内化（有）和符号化维度（做）均可通过该机制促进主观幸福感。研究收集了成人初期416名在校大学生的调查数据，被调查者完成了道德身份中心性问卷，主观幸福感和实现论幸福感的测量。结果证实了研究的假设：实现论幸福在道德身份和主观幸福感之间起着完全中介的作用。道德身份的“有”和“做”两方面均通过实现论身份的中介促进主观幸福感。研究讨论了道德身份与两种幸福观点的关系，虽然幸福的研究认为享乐论幸福和实现论幸福是两种并行的观点，但在身份发展的特定时期，道德身份的对幸福感促进的作用主要体现在实现身份的功能完善上，某种程度上主观幸福感是实现论身份所带来的间接收益。道德身份作为实现论身份的一个重要方面，对于幸福的发展和促进起重要作用。

How is “Having” and “Doing” of Moral Identity Linked to Subjective Well-being? The Mediating Role of Eudaimonia Identity in Emerging Adults

Peng Cui¹, Yufan Shen², Jianhong Ma¹

1 Department of Psychology and Behavioral Sciences, Zhejiang University

2 School of Education Science, Zhoukou Normal University

Abstract: Moral identity can be useful in improving human well-being, but researches payed little attention to the relationship between moral identity and two different well-being perspective: hedonia and eudaimonia. Current study proposed that eudaimonia identity can be a critical mechanism that function as mediation between moral identity and subjective well-being in emerging adults. Two subdimensions of moral identity: internalization and symbolization, usually be thought as the “having” and “doing” side of the moral self, both can promote subjective well-being from the proposed mediation mechanism. We examined 416 emerging adult participants, who completed the Self-importance of Moral Identity, the Satisfaction with Life Scale, Scale of Positive and Negative Experience, and the Questionnaire for Eudaimonic Well-being. The result from the investigate data confirmed our hypothesis. The eudaimonia identity played as complete mediation between moral identity and subjective well-being. Two subdimensions of moral identity, internalization and symbolization, both promoted subjective well-being from the mediation mechanism of eudaimonia identity function. We discussed this finding’s implication with moral identity, eudaimonia and hedonia research.

Keywords: Moral identity, Subjective well-being, Eudaimonia well-being, emerging adults, mediation effect

同情增加第三方惩罚：对以往研究的两个补充

范丽婷¹ 陈钊君¹ 肖威龙¹ 孙炳海¹（通讯作者） 李伟健¹

1 浙江师范大学教师教育学院，金华，321004，浙江，中国，jky18@zjnu.cn

摘要 第三方惩罚(Third-Party Punishment, TPP)一般是指个体作为旁观者观察到违反社会规范的行为，愿意牺牲自我利益来惩罚违规者。以往大量研究表明，在不公平的情境且无法直接帮助受害者的情况下，个体的同情会增加第三方惩罚。本研究主要对情境中不公平的程度进行分类，在不同程度的不公平情境中研究同情对第三方惩罚的影响。此外，有研究者提出随着不公平程度的增加，惩罚成本也将随之增加。因此，我们认为在特定的不公平情境下，惩罚成本可能会影响同情与第三方惩罚之间的关系。研究1采用2（同情：高同情、低同情）*3（不公平程度：低不公平、中等不公平、高度不公平）的被试间实验设计。发现只有在中等程度不公平的情境下，高同情组的第三方惩罚显著高于低同情组。此外，道德愤怒在同情增加第三方惩罚的过程中起到了调节作用。研究2基于高度不公平情境，采用2（同情：高同情、低同情）*3（惩罚成本：低惩罚成本、中等惩罚成本、高惩罚成本）的被试间实验设计。数据分析发现，在低、中程度的惩罚成本中，同情通过道德愤怒增加第三方惩罚。结果表明，同情只能在中等程度不公平的情境下，增加第三方惩罚；与此同时随着不公平情境的增加，个体的第三方惩罚行为不会随之增加的一个重要因素是惩罚成本。

关键词 同情，第三方惩罚，不公平情境，惩罚成本，道德愤怒

Compassion magnifies third-party punishment: Two additions to previous research

Liting Fan¹, Yijun Chen¹, Weilong Xiao¹, Binghai Sun¹, Weijiang Li¹

¹College of Teacher Education, Zhejiang Normal University, Jinhua, 321004, Zhejiang, China Email: jky18@zjnu.cn

Abstract: Third-party punishment (TPP) generally refers to the behavior that individuals punish violators at the expense of self-interest when the violation of social norms has nothing to do with their own interests. Previous studies

have provided overwhelming evidence that compassion magnifies third-party punishment in an unjust situation where the individual cannot directly help the victim. With the present contribution, we predominantly focus on classifying the levels of unjust situations to further examine how compassion influences third-party punishment at different levels of unjust situations. Besides, as the degree of injustice increases, the punishment cost will also increase. We consider the punishment cost may influence the relationship between compassion and third-party punishment in a specific unjust situation. The study 1 adopted an inter-subject design of 2 (compassion: high compassion vs. low compassion)*3 (degree of unjust: low unjust vs. medium unjust vs. high unjust), and found that the degree of third-party punishment in the high compassion group was significantly higher than in the low compassion group which only occurred in the medium level of unjust situations. And moral rage plays a mediating role during the magnificent of third-party punishment by compassion. The study 2 adopted an inter-subject design of 2 (compassion: high compassion vs. low compassion)*3 (penalty cost: low penalty cost vs. medium penalty cost vs. high penalty cost) in a highly unfair situation, and observed that compassion increased third-party punishment through moral rage only in the condition of low and medium punishment cost. Our results showed that compassion increased third-party punishment through moral rage only in the medium unjust situation; And in the high unjust situation, punishment cost is an important factor which resulted in that compassion does not increase third party punishment.

Keywords: compassion, third-party punishment, unjust situation, punishment cost, moral rage

洗尽铅华归本真——身体清洁对道德行为及意图的影响

周启钧 陈浩 庄锦英（通讯作者）

华东师范大学心理与认知科学学院，上海，200062, jy Zhuang@psy.ecnu.edu.cn

摘要 清洁与道德之间存在着紧密的隐喻联系，研究者们认为，身体清洁会使个体将自身视为更加纯洁的存在，由此影响个体的道德行为及判断，但研究结论并不统一。本研究假设，身体清洁的具身体验激活了清洁与道德间的隐喻联结，进而易化了个体对道德事件的加工，并且这种易化的方向是促进道德行为与意图的更真实表达。具体而言，实验 1a 首先将道德表现区分为意图与行为两个维度，通过问卷测量被试的作弊行为及未来道德意图。结果发现：相较于控制组，身体清洁（洗澡）显著影响了被试的道德行为及意图之间的关系，即那些拥有更多作弊行为的被试报告了更高的不道德意图，表现出道德一致性效应。实验 1b 采用相同的测量方式，调换了行为与意图的测量顺序，先测量意图后测量行为，结果与实验 1a 相一致，即相较于控制组，身体清洁显著影响了被试的道德行为与意图之间的关系，但是，方向相反：即那些报告了更低的不道德意图的被试进行了更多的作弊行为，表现出道德许可效应。这些效应在控制组均不存在。上述结果提示，身体清洁易化了个体对自身道德行为与意图之间联系的加工。实验 2 人为操纵被试的道德表现，强制要求被试将自己描述为一个道德或不道德的人，探究清洁操纵是否会影响不同道德自我启动对不道德意图的作用，结果发现：控制组中，不道德启动相较于道德启动表达了更不道德的意图，而身体清洁组中则不存在这种差异，表明，身体清洁组被试的道德意图更不容易受到实验者外部强加的道德启动的影响。基于以上结果，我们认为，身体清洁可以易化个体对道德事件信息的加工，使个体能够更好地利用自身真实经验做出判断，并排除外在因素的影响。

Wash away the dirt to see the real thing: The effect of physical cleansing on moral behavior and intention

ZHOU Qijun, CHEN Hao, ZHUANG Jinying

School of Psychology and Cognition, East China Normal University, Shanghai, 200062,

jy Zhuang@psy.ecnu.edu.cn

Abstract: There is a strong metaphorical link between cleanliness and morality. Researchers have suggested that physical cleansing causes individuals to perceive themselves as purer beings, which in turn influences their moral

behavior and judgments, but their findings are inconsistent. In this study, we hypothesized that the embodied experience of physical cleanliness activates the metaphorical connection between cleanliness and morality, thus facilitating individuals' processing of moral events in the direction of promoting more authentic expressions of moral actions and intentions. To be specific, in experiment 1A, moral performance was divided into two dimensions: intention and action, and participants' cheating behavior and future moral intention were measured through a questionnaire. Results: Compared to the control group, physical cleansing (bathing) significantly affected the relationship between moral behavior and intention, i.e., participants who cheated more reported higher unethical intentions, showing the moral consistency effect. In experiment 1B, the same measurement method was used and we change the measurement order of behavior and intention. The intention was measured first and then the behavior was measured. The results were consistent with experiment 1A, that is, compared with the control group, physical cleanliness significantly affected the relationship between the moral behavior and intention of the subjects, but in the opposite direction: Those who reported lower unethical intentions engaged in more cheating, showing the moral licensing effect. None of these effects existed in the control group. These results suggest that physical cleanliness facilitates individuals' processing of the relationship between moral behavior and intention. In experiment 2, participants were forced to describe themselves as moral or immoral to manipulate their moral performance. In the control group, the unethical priming expressed more unethical intentions than the moral priming, but this difference was not found in the clean group, suggesting that the moral intentions of the clean group were less susceptible to the externally imposed moral priming of the experimenter. Based on the above results, we believe that physical cleanliness can facilitate individuals' processing of moral event information, enabling individuals to make better use of their own real experience to make judgments and eliminating the influence of external factors.

低权力感增加道德规范敏感性：来自 fNIRS 的证据

周雨豪 柳郑捷 蔺姝玮 张凤 孙炳海（通讯作者）

浙江师范大学教师教育学院，金华，321004，jky18@zjnu.cn

摘要 传统的道德困境判断使得人们不得不在“功利论和道义论”之间做选择，这忽视了个体的第三种选择“不行动偏好”（偏好论）。而 CNI 参数可以区分出个体的道德困境判断是由功利论倾向(C 参数)、道义论倾向(N 参数)还是不行动偏好(I 参数)所引起的。Gawronski 和 Brannon(2020)等人的研究发现相较于提高权力感，降低个体的权力感仅促使被试产生更高的道德规范敏感性(N 参数)。但这一研究未能厘清不同权力感水平对个体道德规范敏感性的影响是由于高权力感降低了道德规范敏感性，还是低权力感增加了道德规范敏感性。为进一步探究高低权力感道德规范敏感性的差异来源，这一研究首先增设控制组探究高低权力感对道德困境判断的影响。其次，权力感对道德困境判断的影响缺乏认知神经层面的研究。因此，这一研究采用近红外(fNIRS)设备测量不同权力感状态下的个体在进行道德困境判断时的大脑血氧变化情况以提供相应神经指标。最后，本研究认为控制感和秩序需求在权力感与规范敏感性之间起到链式中介作用，支持补偿控制理论。这一研究通过三个实验表明：与高权力感个体相比，低权力感增强了个体的道德规范敏感性(N 参数)且伴随腹内侧前额叶(vmPFC)的显著激活。低权力感通过降低控制感，进而增加秩序需求，最终增加道德规范敏感性(N 参数)，为补偿性控制理论提供了实证依据。

Low Sense of Power Increases the Sensitivity to Moral Norms: Evidence from fNIRS

Zhou Yuhao, Liu Zhengjie, Lin Shuwei, Zhang Feng, Sun Binghai

College of Teacher Education, Zhejiang Normal University, Jinhua, 321004

Abstract: The traditional view is that individuals' judgments of moral dilemmas are "either utilitarian or deontological". However, CNI parameters can further distinguish whether moral dilemma judgement is caused by utilitarian tendencies (C parameter), deontological tendency (N parameter), or inaction preference (I parameter). Gawronski and Brannon (2020) investigated the influence of sense of power on moral dilemma judgment based on CNI and found that reducing individual sense of power can promote subjects to have higher sensitivity to moral norms (N parameter) than increasing sense of power. But this finding does not say whether a high sense of power reduces sensitivity to moral norms or whether low sense of power increases it. In order to further clarify the sources of differences in sensitivity to moral norms of high and low sense of power, a control group was first added to explore the influence of high and low sense of power on moral dilemma judgment. Secondly, a large number of researchers have devoted themselves to exploring the neural mechanism of moral dilemma judgment, but the study of moral dilemma judgment by sense of power still remains at the behavioral level. Therefore, this study used near-infrared (fNIRS) equipment to measure the changes of cerebral blood oxygen in individuals with different sense of power when making moral dilemma judgment, so as to provide neural indicators for the influence of sense of power on moral dilemma judgment. Based on the compensation control theory, this study finally explored the internal psychological mechanism of the influence of the sense of power on the moral dilemma judgment. In this study, we concluded that: Low sense of power enhanced individuals' sensitivity to moral norms (N parameter), accompanied by significant activation of vmPFC. And low sense of power increases the need for structure by reducing the sense of control, and ultimately increases the sensitivity to moral norms (N parameter), providing an empirical basis for compensatory control theory.

第三方惩罚的情绪动机：群体偏差和情绪调节的作用

郭睿¹ 蔡琪玥¹ 王国龙² 伍珍（通讯作者）¹

摘要 作为旁观者去付出代价惩罚不公平的第三方惩罚行为，是维护社会规范的重要的利他行为，然而很多研究都发现第三方惩罚中存在群体偏差，且其内在机制并不明晰。本研究采用三个实验，探讨了第三方惩罚及其群体偏差的情绪动机以及个体情绪调节发挥的作用。在报名时首先测量被试的情绪调节策略（偏向表达抑制还是认知重评），然后让被试参与线上互动游戏。被试作为第三方旁观者，看到分配者和接受者之间的分配结果（公平或者不公平）后，报告当下的多种情绪，然后自主决定付出一定代价去惩罚分配者（付出1个单位可以惩罚分配者3个单位）。实验1（ $n=43$ ）中不提示任何群体信息以提供基线，结果发现看到不公平分配引起的更多惩罚是由愤怒情绪中介的；而越倾向于采用表达抑制策略的个体（下称表达抑制者），这种中介效应越小。实验2（ $n=44$ ）进一步增加了群体信息，在游戏之初，分配者、接受者、被试选择加入不同的群体，然后进行与实验1相同的任务；结果发现，只有在分配者为内群，接受者为外群这种组合时，高表达抑制者这种不公-愤怒-惩罚的效应才更小。在实验2的基础上，实验3操控了被试的视角，分别强调“分配者做出这样的分配”（ $n=39$ ）和“接受者收到这样的分配”（ $n=40$ ）。结果发现，在强调“分配者做出这样的分配”时，高表达抑制者对内群做出不公分配的愤怒和惩罚（相对外群做出不公）更少，对外群接受不公分

配的愤怒和惩罚（相对内群接受不公）更少。当强调“接受者接受这样的分配”时，不管情绪调节策略如何，人们都只在接受者为内群（而不是外群）时，对不公产生更高愤怒和惩罚。此外，特质测量结果还发现表达抑制和“共享他人积极情绪”的积极共情能力负相关。从实验1到实验3的结果说明，第三方惩罚及其群体偏差的情绪动机主要是愤怒；此外，情绪调节会影响这一过程，相对于认知重评，表达抑制策略使用者不公平厌恶更小；特别是内群分配者对外群接受者做出分配时，高表达抑制者能够容忍不公。当强调“接受者”时，不管何种情绪调节策略都产生了区别对待；在强调“分配者”时，只有高表达抑制者存在这种区别对待。结合与共情的相关，表达抑制者的“区别对待”可能与表达抑制与对外群接受者更差的共情有关。总之，本研究深入探讨了第三方惩罚及其群体偏差的情绪机制，有利于理解人类维护公平规范和群体秩序的本质。

The emotional motivation underlying group bias in Third-Party Punishment and the role of emotion regulation

Rui Guo¹, Qiyue Cai¹, Guolong Wang², Zhen Wu (corresponding author)¹

Department of Psychology, Tsinghua University, Beijing, 100084, zhen-wu@mail.tsinghua.edu.cn

School of Information Technology and Management, University of International Business and Economics, 100105

Abstract: Third-party Punishment (TPP) that dispenses costly punishment for unfairness as bystanders is a type of altruistic behavior to maintain the social norm. However, while a growing number of studies revealed group bias in TPP, its underlying mechanisms remain unclear. In the current study, we conducted three experiments to examine the role of emotion as well as emotional regulation strategies in explaining TPP, in particular group bias in punishment. We assessed participants' emotional regulation strategies (habitually using suppressive expression or cognitive reappraisal) during recruitment, and then participants engaged in an online interactive game. As a third-party bystander, after witnessing the distribution (fair or unfair) between the allocator and the recipient, participants were asked to report their emotion and decided the amount of money to deduct as punishing the allocator (i.e., each unit they spent led to three-unit reduction in gains of the allocator). In Experiment 1 ($n = 43$), we provided no group information (as a baseline) and found that witnessing unfair distribution resulted in more punishment, which was mediated by heightened feelings of anger. Notably, this mediating effect was smaller among suppressors – individuals who were more likely to habitually adopt suppressive expression (vs. cognitive reappraisal) strategies. In Experiment 2 ($n = 44$), we provided group information. At the beginning of the game, the allocator, the recipient, and the participant (bystander) chose to join different groups and then performed the same task as in Experiment 1. Our results demonstrated that only under the “ingroup allocator and outgroup recipient” condition, there existed a weaker mediational path from unfairness to punishment via feelings of anger among suppressors. In an effort to build upon Experiment 2, Experiment 3 manipulated the angle from participants. Specifically, we presented participants with two conditions: “the allocator makes such a distribution” ($n = 39$) and “the recipient receives such a distribution” ($n = 40$). The findings were intriguing. On the one hand, when the *allocator* was emphasized, suppressors displayed less feelings of anger and less punishment when the ingroup (vs. outgroup) allocator distributed unequally and when the outgroup (vs. ingroup) recipient received unfair distributions. On the other hand, when the *recipient* was emphasized, regardless of the use of emotional regulation strategies, participants only reported more feelings of anger and more punishment towards injustice when the recipient was an ingroup (rather than outgroup) member. In addition, we also found an inverse association between suppressive expression and positive empathy (i.e., the ability to “share others' positive feelings and events”). These above results indicated that feelings of anger served as an emotional motivation for TPP and its group bias. Interestingly, emotional regulation moderated this process. Compared with cognitive reappraisal users, suppressive expression users had less inequity aversion, especially when there was a combination of the ingroup allocator and the outgroup recipient. When the *recipient* was emphasized, no matter which emotion regulation strategies were used, participants discriminately dealt with injustice towards ingroup and outgroup victims.

When the *allocator* was emphasized, only suppressors showed discrimination. Specifically, such "injustice discrimination" of suppressors may be related to their poorer empathy towards outgroup recipients. In conclusion, this study explored in depth the emotional mechanism of third-party punishment and its group bias, which contributed to understanding the nature of maintaining fair norms and group order.

摘 要 警示语, 如“NO smoking”、“请勿喧哗”, 广泛出现在日常生活中, 指的是提醒和警告他人注意安全、遵循规则的告示或建议。本研究考察语言和自我相关性对警示语有效性的影响。在有效性的衡量上, 根据警示语的多阶段认知加工模型, 选取警觉度、愉悦度和遵从度作为指标。实验 1 招募了 30 名大学生被试, 以文字模态的警示语为实验材料, 采用 2(语言: 中文/英文)×2(自我相关性: 高/低)的两因素被试内实验设计, 以被试对警示语愉悦度、警觉度和遵从度的评分为因变量。在实验过程中, 首先屏幕中央呈现注视点“+”500ms, 随后随机呈现中、英文警示语 2000ms, 被试依次完成对警示语警觉度、愉悦度和遵从度的 7 点评分。运用拉丁方设计将 30 名被试分为三组, 以平衡三项评分之间的呈现顺序。结果发现, 对高自我相关性的警示语来说, 双语者对中文或英文表达的警示语的有效性加工没有差异, 而对低自我相关性的警示语来说, 中文表达警示语的有效性加工加工优于英文表达。实验 2 招募了 30 名大学生被试, 以图文模态的警示语为实验材料, 采用 2(语言: 中文/英文)×2(自我相关性: 高/低)的两因素被试内实验设计, 因变量为被试对警示语警觉度、愉悦度和遵从度的评分。实验程序同实验 1。结果显示, 无论自我相关性的高低, 中、英表达警示语的有效性加工没有明显区别。以上结果表明: (1)自我相关性影响语言对文字模态警示语有效性的认知加工; (2)图文模态警示语的有效性加工优于文字模态警示语。

Abstract: Warnings, such as “No smoking” and “Don’t make noise”, are widely used in daily life. They refer to notice or suggestion that remind and warn others to pay attention to safety and follow the rules. This study examines the impact of language and self-relevance on the effectiveness of warnings. For the measurement of effectiveness, alertness, pleasure and compliance were selected as indicators based on a multi-stage cognitive processing model of warnings. In Experiment 1, 30 college students were recruited, and text modal warnings were used as stimuli in a 2×2 within-subjects design, with language (Chinese, English) and self-relevance (high, low) as the independent variables, and participants’ scores of alertness, pleasure and compliance with warnings as the dependent variables. During the experiment, a gaze point “+” was first displayed in the centre of the screen for 500 ms, followed by a random presentation of the warnings in English or Chinese for 2000 ms. Participants completed a 7-point scale on the alertness, pleasure and compliance of the warnings in turn. A Latin square design was used to divide the 30

participants into three groups to balance the order of presentation between three ratings. It was found that for warnings with high self-relevance, there was no difference in the effectiveness of warnings in Chinese or English, while for warnings with low self-relevance, the effectiveness of warnings in Chinese were better than those in English. Experiment 2 recruited 30 college students. Image-text modal warnings were used as stimuli in a 2 (language: Chinese, English) × 2 (self-relevance: high, low) within-subjects design, and participants' scores of alertness, pleasure, and compliance with warnings as the dependent variables. The experimental procedure was the same as Experiment 1. The results indicated that regardless of the level of self-relevance, there was no significant difference in the effectiveness of warnings in Chinese or English. The results of the above two experiments indicated that self-relevance influences the cognitive processing of language on the effectiveness of text modal warnings, and the effectiveness of image-text modal warnings is better than that of text modal warnings.

同性竞争情景下面孔吸引力组合对择偶复制的影响

卢雅婷^{1,2} 王颖^{1,3} 李瑛^{1,2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

摘要 择偶复制 (mate choice copying) 是指在择偶过程中, 个体受到其它同性别个体对目标对象评价、判断影响, 做出相同或相似择偶决策的行为。择偶复制可以减少择偶过程中的不确定性, 节约成本, 提高辨别异性的能力, 从而辅助个体做出更加准确的配偶选择。本研究通过两个实验探讨在同性竞争情景下面孔吸引力组合对择偶复制现象的影响。实验一采用 4 (榜样人物和靶目标的吸引力组合: 高高组/低低组/高低组/低高组) × 2 (榜样人物对靶目标的态度: 感兴趣/不感兴趣) 被试内实验设计, 采用择偶复制研究的经典范式, 考察被试在榜样人物的不同态度下对靶目标的交往意愿变化。实验二采用 2 (同性竞争情景: 同性竞争情景/非同性竞争情景) × 4 (榜样人物和靶目标的吸引力组合: 高高组/低低组/高低组/低高组) × 2 (性别: 男性/女性) 混合实验设计, 在实验一的基础上探讨同性竞争情景对择偶复制的影响。结果表明: (1) 无论何种吸引力组合情况下, 榜样人物对靶目标为感兴趣态度时, 被试对靶目标的交往意愿均增加, 即证明择偶复制现象。(2) 无论榜样人物对靶目标是否感兴趣, 只有当二者同为高吸引力水平时, 对于靶目标两次评价分数变化的性别差异显著, 男性对于靶目标的交往意愿下降更多。(3) 当靶目标和榜样人物均为高吸引力水平 (即高高组) 及榜样人物为高吸引力、靶目标为低吸引力 (即高低组) 时, 被试在感兴趣态度下的评分变化显著大于不感兴趣态度下, 即在榜样人物为感兴趣态度下被试与靶目标的交往意愿显著增加。(4) 增加同性竞争情景后, 无论何种吸引力组合, 男女对靶目标的交往意愿评价均下降, 即同性竞争情景降低了择偶复制现象的出现。尤其在榜样人物和靶目标同为高吸引力水平时, 女性交往意愿下降最为显著。(5) 同性竞争情景下, 对榜样人物的认知评价也发生了变化。无论何种吸引力组合, 被试对榜样人物的评价都更加消极, 且吸引力越高, 对其评价就越负面。研究结果对理解择偶复制这一复杂的人类行为提供了实验性证据。

3 Xi'an Aerospace City No.1 High School, Xi'an, 710199

Abstract: Mate choice copying refers to the behavior in which individuals will be affected by the evaluation and judgment of other same-sex individuals on the target object and make the same or similar mate choice decisions

during the mate selection process. Mate choice copying can reduce the uncertainty in the process of mate selection, save costs, and improve the ability to distinguish between the opposite sex, so as to help individuals make more accurate mate selection. In this study, two experiments were conducted to explore the effect of attractiveness combination on mate choice copying under the intrasexual competition. In Experiment 1, a 4(the attractiveness combination of the model and the target: high-high group/low-low group/high-low group/low-high group) $\times$ 2(the attitude of the model to the target: interested/not interested) within-subjects design and the classic paradigm of mate choice copying was used to investigate the change of the participants' dating intention to the target under the different attitudes of the model. Based on Experiment 1, experiment 2 explored the effect of intrasexual competition on mate selection by conducting a 2(intrasexual competition situation: intrasexual competition situation/non-intrasexual competition situation) $\times$ 4(the attractiveness combination of the model and the target: high-high group/low-low group/high-low group/low-high group) $\times$ 2(gender: male/female) mixed design. The results showed that: (1) No matter what kind of attractiveness combination, when the model was interested in the target, the participants' willingness to date with the target increases, which proved the phenomenon of mate choice copying. (2) No matter whether the model was interested in the target or not, only when both of them are at high attraction level, the gender difference of the two evaluation scores for dating with the target was significant, and men's willingness to date with the target decreased more. (3) When the target and model were both of high attractiveness level (high-high group), and the model was of high attractiveness, while the target was of low attractiveness (high-low group), the score change of the participants under the attitude of interest was significantly greater than that under the attitude of not interest, that is, the willingness of the participants to date with the target was significantly increased under the attitude of model being of interest. (4) After adding the variable of intrasexual competition situation, no matter what kind of attractiveness combination, both men and women's willingness to date with the target decreased, that is, the intrasexual competition situation reduced the occurrence of mate choice copying phenomenon. Especially under the condition of high attractiveness of the model and the target, the decline of women's willingness to date was more significant. (5) In the context of intrasexual competition, the cognitive evaluation of the models also changed. No matter what kind of attraction combination, the participants' evaluation of model characters was more negative, and the higher the attraction of model, the more negative the evaluation. The results provided experimental evidence for understanding the complex human behavior of mate choice copying.

摘 要 面孔情绪在人们的生活与社交中起着重要的作用，而情绪性别刻板印象会影响个体的面孔情绪信息加工。情绪性别刻板印象是指人们对男性和女性这两类特定社会群体在体验和表现具体情绪程度上所持有的固有观念或者既定的认知模式，这种与情绪有关的性别刻板印象已经被很多研究所证实。另有研究表明性别图式类型与性别刻板印象有密切关联，主要表现为性别图式类型对性别刻板印象起调节作用。相比于非性别图式化，性别图式化个体更易受到性别刻板印象的影响。但以往研究多通过外显指标探讨面孔情绪，而面孔情绪的性别刻板印象研究则很少。本研究采用情感错误归因程序（AMP）的变式，从内隐层面考察性别图式对面孔情绪性别刻板印象的影响。实验选取湖北省某大学在读本科生 287 名，发放《大学生性别角色问卷》（CSRI-50），回收有效问卷 214 份。通过男性分量表和女性分量表得分分别计算出中位数，并对被试进行性别图式分类，最终符合条件的 80 名同学参加正式实验。其中性别图式化个体 30 人，非性别图式化个体 50 人；男生 31 人，女生 49 人；平均年龄 20.35 ± 1.19 岁。实验采用 2(面孔性别：男、女) $\times$ 2(面孔情绪：高兴、生气) $\times$ 2(性别图式类型：性别图式化、非性别图式化)的混合实验设计。结果表明面孔情绪主效应显著，面孔情绪与面孔性别的交互效应显著。本研究表明中国大学生存有明显的面孔情绪性别刻板印象，面孔性别会影响个体的面孔情绪知觉。相较于女性高兴面孔，个体对男性高兴面孔的评价更积极。相较于女性生气面孔，对男性生

气面孔的评价更消极。此外,在面孔性别对个体面孔情绪识别的影响中,性别图式并不起作用。性别图式化个体与非性别图式化个体在对面孔情绪的知觉上没有差异。

关键词 面孔情绪, 性别刻板印象, 性别图式

Gender stereotype of facial emotion: the effect of gender schema

Pu Yue, Zhang Ruiqing, Wu Peng

Department of Psychology, Hubei University, Wuhan, 430062, reavenwp@hubei.edu.cn

Abstract: Facial emotion plays an important role in people's life and social interaction, and gender emotional stereotypes can affect individuals' information processing of facial expression. Gender stereotypes of emotion refer to people's inherent concepts or established cognitive models on the experience and performance of specific emotions in two specific social groups, male and female. The existence of this emotion-related gender stereotypes has been confirmed by many studies. And studies have shown that gender schema types are closely related to gender stereotypes, which is mainly manifested in the moderating effect of gender schema types on gender stereotype-related behaviors, gender schematic individuals are more likely to be affected by gender stereotypes than non-gender-schematic individuals. However, previous studies mostly explored facial emotions through explicit indicators, while there were few studies on gender stereotypes of facial emotions. This study investigated whether gender facial emotional stereotypes of college students are influenced by gender schema types at the implicit level, using a variant of Affect Misattribution Procedure. A total of 287 undergraduate students in a comprehensive university in Hubei Province were selected. The CSRI-50 was issued and 214 valid questionnaires were collected. The medians were calculated by the scores of male subscale and female subscale respectively, and the subjects were classified by gender schema. Finally, 80 students participated in the formal experiment. There were 30 gender-schematized individuals and 50 non-gender-schematized individuals, and there were 31 boys and 49 girls with an average age of 20.35 ± 1.19 years. The experiment used 2 (facial gender: male, female) $\times 2$ (facial emotion: happy, angry) $\times 2$ (gender schema: gender-schematic, non-gender-schematic) mixed experimental design. The results show that the main effect of facial emotion is significant, and the interaction between facial emotion and facial gender is significant. This study shows that Chinese college students have obvious gender stereotypes of facial emotion, and facial gender affects individuals' perception of facial emotion. Happy faces were rated more positively on men than on women. And anger faces were rated more negatively on men than on women. In addition, gender schema does not play a moderated role in the influence of face gender on individuals' face emotion recognition. There is no difference between gender-schematic and non-gender-schematic individuals in the perception of facial emotion.

Keywords: facial emotion, gender stereotype, gender schema

努力因素对内群体偏好的影响

梁婧涵 朱芷怡 张博雅 张茗睿 马伟军 (通讯作者)

华东师范大学心理与认知科学学院, 上海, 200062, wjma@psy.ecnu.edu.cn

摘要 近年来,自我归类理论(一个探讨群体过程与偏好的认知性理论)强调群体的形成常具有情境依赖性。结合实际,为加入群体付出越多努力的人往往对内群成员偏好更高,提示努力相关因素可能成为影响群际偏好的情境因素;但其影响机制还有待研究。为此,本研究基于自我归类理论对参照框架的强调,通过4个实验探索了有/无参照框架时努力因素对群际偏好的影响。实验1a、1b操纵被试加入群体所需的努力程度,分别通过公共物品范式(以合作任务中向公共账户投入的代币数占个人总数的比例代表其合作偏好)与归因范式(以被试对模糊故事情境中内群体的辩护程度代表其归因偏袒程度)衡量内群偏好,结果均发现无参照框架时努力程度越高内群体偏好越强。该结果可由努力的合理化模型解释,即高认知需求任务使个体认知失调,个体通过美化结果(增加对内群体偏好)合理化自身努力。实验2和3引入参照框架,通过虚拟指导语操纵努力相关变量,结合公共物品范式测量内群体偏好。实验2在操纵个体及其决策对象的努力程度后发现,努力程度相似的被试合作偏好显著更高;该结果可用社会比较理论解释,即个体在社会比较中为维护自身的正

确性会更重视与他人的相似,因此会对努力相似的个体产生偏好。实验3操纵被试及其决策对象的努力经历性质、努力结果后发现,结果优势时,被试多与经历性质相似者合作,结果劣势则多与结果相似者合作;即任务结果影响群际偏好形成时的关注焦点;该结果可结合社会比较理论与认知失调理论进行解释,即总体上个体通过与他人的相似性确认内群概念,但努力结果劣势可能导致认知失调,进而影响个体在群体形成过程中关注过程或结果的相似性。综上,努力投入程度影响内群体偏好的形成,且有/无参照框架下影响机制不同。本研究结果首次系统探索了努力对群体形成与群际偏好的影响,为心理内群体的促成提供了实践指导。

关键词 努力程度,努力经历,努力结果,内群体偏好

Effort Input Affects the Ingroup Bias

Jinghan Liang, Zhiyi Zhu, Boya Zhang, Mingrui Zhang, Weijun Ma

School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062,

wjma@psy.ecnu.edu.cn

Abstract: Ingroup bias is not often formed by actual ingroup or outgroup concepts. The self-classification theory, namely a cognitive theory which explores the process of group formation and preferences, emphasizes the situational dependence of group concepts, which provides a new perspective for understanding the formation of ingroup in the psychological sense. Combined with reality, the more efforts the individual puts in to join a group, the more sense of identity and higher preference of ingroup members are showed, which suggests the possible impact of efforts and related factors for the ingroup bias. However, which specific factors are included and how they affect ingroup bias have not yet been studied. Therefore, based on the theory of self-classification, and combining the theory of cognitive dissonance and the theory of social comparison, we explored the influence of efforts and the relevant factors through four behavioral experiments. Study 1a and 1b manipulated the degree of participants' efforts prior to entering a group, and measured ingroup bias by public goods paradigm (in this paradigm, the level of favoritism shown in collaboration is represented by the ratio of how many tokens the participant gives to the public account to the number of tokens he/she takes into the personal account) and attribution paradigm (in this paradigm, the favoritism is represented by the level of defense for one side in an ambiguous story) respectively. The results show that when there's no reference frame, the more efforts the participants make, the higher ingroup bias they show, which can be interpreted by rationalization model of effort in cognitive dissonance theory. That is to say, cognitively demanding tasks disturb one's cognition and so the individual justifies his/her efforts by embellishing results (by the means of increasing favoritism towards ingroups). To further explore the influence of social comparison frame, study 2 manipulated the degree of participants' efforts prior to entering a group, as well as the degree of efforts of both ingroup members and outgroup members, and measured ingroup bias by public goods paradigm. The results show that when there is a reference frame, if the effort level between the participant and his/her partner is similar, the ingroup bias shown will become higher. Social comparison theory can provide a potential explanation for it, that in order to maintain self-righteousness, an individual will pay more attention to the similarity with others in social comparison, resulting in the favoritism towards whoever has alike experience of efforts. Moreover, study 3 manipulated the result of participants', ingroup members', and outgroup members' efforts, as well as the experience of making efforts, on the condition that the levels of participants' efforts were alike. Afterwards, ingroup bias was measured by public goods paradigm. The results show that when there is a reference frame, the outcome of efforts can moderate the effect of efforts. Specifically, when the individual is at disadvantage with a bad result of efforts, he/she will show stronger ingroup bias in favor of partners with similar results of efforts, and when the individual was at disadvantage with a bad result of efforts, stronger ingroup bias is shown by partners with similar experience of efforts. It can be explained by combining social comparison theory and cognitive dissonance theory, which says an individual confirms the concept of ingroup by the similarity with others, but the disadvantage of outcomes of his/her efforts may lead to cognitive dissonance, having an impact on individuals' focus of processes and results when

forming groups. In conclusion, this research is the first to systematically point out the influence of efforts on forming groups and intergroup bias, which provides practical guidance on how to accelerate the formation of ingroup.

互动方式和群体身份对幸灾乐祸的影响

陈钊君 范丽婷 肖威龙 黄彤茵 孙炳海（通讯作者）李伟健

浙江师范大学教师教育学院，金华，321004，浙江，中国，jky18@zjnu.cn

摘要 幸灾乐祸是指个体对他人遭遇的不幸事件而产生愉快情绪反应的现象。当个体对他人产生幸灾乐祸时，就有可能主动置他人于不幸中，对有竞争关系的他人或群体更有可能采取攻击行为。以往研究发现，群体间竞争关系增加了个体对外群体的幸灾乐祸，然而群体间的合作关系对幸灾乐祸的影响并未进一步探讨。并且以往研究大多基于现实生活中的群体身份探讨幸灾乐祸，个体对群体固有的刻板印象等因素未能加以控制。因此，本研究将被试随机分配到新的群体，创建平等中立的群体身份。本研究通过2个实验来探讨不同互动方式和群体身份对幸灾乐祸的影响以及背后的心理过程。研究1采用3（互动方式：竞争 vs. 合作 vs. 控制组）×2（群体身份：外群体成员 vs. 内群体成员）两因素混合实验设计。结果表明，群体身份的主效应显著，个体对外群体成员的幸灾乐祸程度显著高于内群体成员；互动方式和群体身份的交互作用显著。简单效应分析表明，在群体竞争互动中，个体对外群体成员的幸灾乐祸程度显著高于内群体成员群体。研究1的结果尚不能说明个体对内外群体成员幸灾乐祸程度的差异是由于个体增加了对外群体的幸灾乐祸所致还是由于减少了对内群体的幸灾乐祸所致。并且厌恶是探讨人际幸灾乐祸最普遍的预测因素，不同的群体身份容易使个体产生群体间偏见，包括厌恶等情绪，因此本研究引入了厌恶这一心理变量。研究2采用单因素被试内实验设计，自变量为群体身份（外群体成员 vs. 内群体成员 vs. 控制组）。结果表明，在群体竞争互动中，个体对不同群体身份成员的幸灾乐祸存在显著性差异。个体对外群体成员的幸灾乐祸程度显著高于控制组，个体对内群体成员和控制组的幸灾乐祸程度无显著差异。采用Bootstrap法进行中介分析发现，厌恶在群体关系与幸灾乐祸之间起部分中介作用。综上，研究表明（1）竞争的互动方式会增加个体对外群体的幸灾乐祸程度。（2）群体竞争互动中，引发了个体对外群体的厌恶，从而增加了个体对外群体成员的幸灾乐祸程度。

关键词 幸灾乐祸，群体互动，社会认同，厌恶

The influence of different interaction and group memberships on schadenfreude

Yijun Chen, Liting Fan, Weilong Xiao, Tongyin Huang, Weijian Li, Binghai Sun,

College of Teacher Education, Zhejiang Normal University, Jinhua, 321004, Zhejiang, China

Abstract: Schadenfreude is a common psychological phenomenon, which refers to the phenomenon that individuals have a happy emotional response to the unfortunate events encountered by others. When individuals feel happy about others' unfortunate, they may take the initiative to put others in their unfortunates, while others or groups with competitive relationships may take aggressive actions. The cultural differences and historical background among groups will affect the individual's schadenfreude over the group. Most previous studies discussed the group's schadenfreude over the actual group. Therefore, in this study, subjects were randomly assigned to new groups to create equal and neutral group identities. With the present contribution, we conducted two experiments to explore the effect of internal and external group identity on schadenfreude under the relationship of cooperation, competition and independence. The study 1 is to adopt a two-factor mixed experimental design of 3 (interaction mode: competition vs. cooperation vs. control group) ×2 (group identification: external group members vs. internal group members). The results of Study 1 showed that the main effect of internal and external groups is significant, the main effect of interaction mode is not significant. The interaction between interaction mode and group identification is significant, Simple effect analysis shows that there is a significant difference in the degree of individual gloating over the members of internal and external groups under the condition of competition among groups. The results of Study 1

could not explain whether the difference in the degree of schadenfreude towards the internal and external group members was caused by the increase of schadenfreude towards the external group or the decrease of schadenfreude towards the internal group. In addition, aversion is the most common predictor of interpersonal schadenfreude, and different group identities are easy to cause individuals to have inter-group bias, including aversion and other emotions, so this study introduced aversion as a psychological variable. In study 2, a single-factor in-subject experimental design was adopted, and the independent variable was group identification (out-group members vs. in-group members vs. control group). The results showed that there were significant differences in the schadenfreude of different group identification members. Under the condition of group competition, the degree of individual's schadenfreude with foreign group members was significantly higher than that of control group. There is no significant difference in the schadenfreude between the internal group members and the control group. Using Bootstrap method, we found that aversion partially mediated the relationship between group relationship and schadenfreude. Based on the above research results, this study draws the following conclusions: (1) Competitive interaction will increase the degree of schadenfreude of the individual outside the group. (2) In the group competition situation, it causes the individual's aversion to the outside group, thus increasing the degree of Schadenfreude of the outside group members.

政治参与和地方政府信任的关系：一个有调节的中介模型

曹柠梦 乐国安(通讯作者) 缪润润 杨传玉 柳郑捷

浙江师范大学教师教育学院, 金华 321004, NingMengC2017@163.com

摘 要 “民惟邦本，本固邦宁”，公众对政府的认同、信任与支持在政府维系政治稳定、开展高效社会治理等方面具有重要意义。由此，提高公众政府信任成为政府工作的重要任务之一。以往研究发现，我国公众对政府信任存在“差序格局”，即公众对中央政府的信任高于对地方政府的信任。而差序格局的存在或弱化地方治理、阻碍国家整体治理效益提升。地方政府作为与公众直接接触、交往与沟通的政府机构，探讨地方政府信任提升机制具有重要的现实意义。协同治理理论指出，政府、社会组织、公众等多方主体应通过协同合作共同治理社会公共事务，实现公共利益最大化。公众作为主体之一，在地方政府的社会治理过程逐渐发挥出重要作用。政治参与作为公众向政府表达自身需求的渠道之一，在此过程中，公众获得政府相关信息和知识，增加对政府的认识，更好理解政府等，从而提升了公众对政府的信任水平。众多研究指出，公众积极的政治参与能够提升公众对政府的信任水平。政府宣传教育是一种政府管理手段，旨在运用思想政治工作或激励方式，以提高公众政治认识、实现组织目标等。本研究拟在考察公众政治参与和地方政府信任关系的基础上，重点探索政府宣传教育在提升公众地方政府信任以及在公众政治参与和地方政府信任关系间的作用。结合实际政府宣传教育活动，本研究提取了政府宣传教育活动的频率和宣传教育有用性评价作为两个主要的考察变量。对 2071 名被试进行问卷调查并分析。结果发现：（1）政治参与显著正向预测地方政府信任；（2）活动有用性评价在政治参与和地方政府信任间起部分中介作用；（3）宣传教育频率负向调节政治参与和有用性的关系以及有用性的中介效应，表现出边际递减效应。上述结果表明，多渠道提升公众政治参与意识，合理把握政府宣传教育频率是促进地方政府信任提高的可选策略。

关键词 政治参与 地方政府信任 政府宣传教育 有调节的中介 边际递减效应

The Relationship between Political Participation and Local Government Trust: A Moderated Mediation Model

Cao Ningmeng, Yue Guoan, Miao Runrun, Yang chuanyu, Liu zhengjie

College of Teacher Education, Zhejiang Normal University, Jinhua, 321004

Abstract: “The people are the foundation of the state, and the state is solid.” The public’s recognition, trust, and support for the government is of great significance in maintaining political stability and carrying out efficient social governance. Therefore, improving public government trust has become one of the important tasks of government work. Previous studies have found that the public trust in the government in China has a “differential pattern”, that is, the public trust in the central government is higher than the trust in the local government. However, the existence of a differential pattern may weaken local governance and hinder the improvement of the overall governance efficiency of the country. As a government agency that directly contacts, communicates with the public, local governments have important practical significance to explore the mechanisms for enhancing trust in local governments. The collaborative governance theory points out that the government, social organizations, the public, and other multi-parties should jointly govern social public affairs through collaborative cooperation, to maximize public interests. Political participation is the peak for the public to express their needs to the government. In this process, the public obtains government-related information and knowledge, increases their understanding of the government, and the government, thereby enhancing the public’s level of trust in the government. Studies showed that the public actively participates in raising the level of trust in the government. Government publicity and education is a government management method that aims to use ideological and political work or incentive methods to improve public political awareness and achieve organizational goals. Based on examining the relationship between public political participation and local government trust, this study focuses on exploring the role of government publicity and education in enhancing public local government trust and the relationship between public political participation and local government trust. Combined with the actual government publicity and education activities, this study extracted the frequency of government publicity and education activities and the public’s evaluation of the usefulness of publicity and education as two main variables. A total of 2071 participants were investigated and analyzed in the present study. The results indicated that: (1) political participation significantly and positively predicted local government trust. (2) The relationship between political participation and local government trust was mediated by activity usefulness. (3) The frequency of publicity and education negatively moderated the relationship between political participation and activity usefulness and the mediating effect of activity usefulness, showing a diminishing marginal effect. These findings indicated that multi-methods to enhance the awareness of political participation and reasonably grasping the frequency of government publicity and education were optional strategies for promoting trust in local governments.

Keywords: political participation, local government trust, government publicity and education, a moderated mediation model, diminishing marginal effect

公正世界信念与组织中的亲社会行为：心理资本的作用

陈碧璐¹ 陶一秀¹ 马剑虹¹（通讯作者）

¹ 浙江大学心理与行为科学系，杭州，310028, jhma@zju.edu.cn

摘要 公正世界信念理论认为人们有一种基本需要，即相信自身所处世界是公正的，在公正世界里，人们得其所应得，所得即应得。这种信念可为个体提供控制感与安全感，带来一系列诸如维持个体心理健康、促进长期目标投入等适应性、亲社会结果，但其中的作用机制及这类适应性、亲社会结果的情境特异性仍有待探究。在作用机制方面，本研究认为，公正世界信念所提供的控制感与安全感是个体重要的心理力量来源，可促进个体更为广泛的心理资源的构建，使其拥有更高水平的心理资本，从而鼓励个体对于各类事件的积极应对。在情境特异性方面，以往研究一般关注公正世界信念对个体的适应性影响及个人与一般公正世界信念

的二维构念与亲社会行为之间的关系，少有研究将公正世界信念引入组织管理领域，在组织情境中探讨其对员工亲社会行为的影响。本研究基于公正世界信念的二维建构与积极心理资本理论，采用问卷调查与情境短文评价方法，探讨在组织情境中，个人公正世界信念与一般公正世界信念对员工亲社会行为的影响及心理资本在其中的作用，以拓展对公正世界信念在组织情境中作用的认识。结果显示，在特定的组织不公情境中，员工的个人公正世界信念与一般公正世界信念均对其亲社会行为存在正向影响，但作用机制有所不同：个人公正世界信念主要通过员工的心理资本促进其亲社会行为；一般公正世界信念在心理资本这一作用路径之外，也存在情绪路径，通过愤怒、同情等消极道德情绪驱动员工做出亲社会行为。在更为广泛的组织情境中，个人公正世界信念与一般公正世界信念则均可通过心理资本对组织中的亲社会行为产生积极作用。研究结果表明，公正世界信念的适应性、亲社会功能不仅局限于个人公正世界信念，一般公正世界信念，至少在组织情境中，也可促进亲社会行为。而心理资本则是公正世界信念发挥其积极功能、产生适应性、亲社会结果的重要机制。

关键词 公正世界信念，心理资本，组织中的亲社会行为

Belief in a Just World and Prosocial Behaviors in Organization: The Role of Psychological Capital

Bilu Chen¹, Yixiu Tao¹, Jianhong Ma¹

¹ Department of Psychology and Behavioral Science, Zhejiang University, HangZhou, 310028

Abstract: Theory of belief in a just world(BJW) holds that people have a basic need to believe that the world they live in is just, where people get what they deserve. Such belief can provide individuals with a sense of control and security, leading to a range of adaptive and prosocial outcomes such as maintaining one's psychological well-being and promoting one's commitment for long-term goal, while the explanatory mechanisms and the contextual specificity of these adaptive and prosocial outcomes remain to be explored. In terms of explanatory mechanisms, this study proposes that the sense of control and security provided by BJW are important sources of psychological power for individuals, contributing to the construction of a wider range of psychological resources and a higher level of psychological capital (PsyCap), which encourages individuals to respond positively to various events. In terms of contextual specificity, previous researches have generally focused on the adaptive functions of BJW for individuals and the relationship between two-dimensional construct of BJW and prosocial behaviors, few studies have introduced BJW to organizational management and explored its effects on employees' prosocial behaviors in organization. Based on the two-dimensional construct of BJW and positive psychological capital theory, this study used questionnaires and situation vignettes to explore the effects of personal belief in a just world (PBJW) and general belief in a just world(GBJW) on employees' prosocial behaviors in organization and the role of PsyCap, aiming at expanding the understanding of the effects of BJW in organizational contexts. The results showed that in specific organizational injustice contexts, employees' PBJW and GBJW both positively affected their prosocial behaviors, though with different mediators: PsyCap mediated the effects of PBJW as well as GBJW on prosocial behaviors, while GBJW also drove employees' prosocial behaviors via negative moral emotions such as anger and sympathy. In broader organizational contexts, both PBJW and GBJW had positive effects on prosocial behaviors with PsyCap as the mediator. The findings suggest that the adaptive and prosocial functions of BJW are not exclusive to PBJW. GBJW, also serves much important functions to promote prosocial behaviors, at least in organizational contexts. And PsyCap is an important explanatory mechanism through which BJW serves its positive functions and produce adaptive, prosocial outcomes.

3 陕西师范大学心理学院, 西安, 710061

摘要 生态文化对信任这一复杂的社会心理过程有着重要影响, 近年来愈发受到研究者的重视。以往研究大多从国家间跨文化比较的视角探究生态文化对信任的影响, 近年来逐渐有研究者尝试从国家内的地域差异对信任问题进行探索。然而目前还少有研究对中国内部南北方不同生态文化下的信任差异进行探讨, 其内在心理机制也尚未明确。研究采用信任博弈范式, 在国家间研究基础上探讨了中国内部南北地域生态文化差异对人类信任行为的影响及其内在心理机制。实验1采用2×2的混合设计, 考察了在地区来源和社会距离的共同影响下南北方个体的信任差异。结果显示: (1) 北方人具有更强的内群体偏好, 对内群体成员具有更高的信任水平; (2) 中国内部信任存在地区效应, 信任双方的地区来源对信任产生影响。北方人更加信任同地区人, 南方人不存在地区信任偏好; (3) 社会距离能够缓和信任的地区效应; (4) 互惠预期是信任地区效应的内在心理机制。实验2引入互惠预期变量, 采用2×2×2的混合设计, 用于检验中国内部信任地区效应是否受到互惠预期的影响。结果显示: (1) 互惠预期是信任地区效应的内在心理机制, 验证了实验1的结果; (2) 互惠预期仅在近社会距离条件下产生影响, 在远社会距离条件下不起作用。研究发现了中国内部信任存在地区效应, 并验证了互惠预期是其内在心理机制, 为中国南北方信任的相关研究提供了更加全面、辩证的研究视角, 同时也拓展了社会距离和互惠预期的相关研究。

3 School of Psychology, Shaanxi Normal University, Xi'an 710062, China

Abstract: Ecological culture has an important impact on trust which is a complex psychosocial process, and scholars pay more and more attention to it in recent years. Previous studies have mostly used the way of cross-cultural comparison among countries to explore the influence of ecological culture on trust. In recent years, some researchers have gradually tried to explore the problem from regional differences within the county. However, researches on the difference of trust between the north and the south of China under different ecological cultures are almost blank, and its underlying mechanism is also unclear. Based on the inter-country research, this study used the paradigm of Trust Game to explore the influence of ecological and cultural differences between the north and the south of China on trust behavior and its underlying mechanism. In Experiment 1, the mixed design of 2×2 was adopted to investigate the differences of trust between individuals from the north and the south of China under the influence of regional sources and social distance. The results of Experiment 1 show that: (1) Northerners have stronger internal group preferences and higher level of trust in in-group members; (2) China's internal trust has regional effect, and the regional sources of both sides of trust have influence on trust. Northerners trust people from the same region more, southerners do not have regional trust preference; (3) Social distance is able to mitigate trust region effect; (4) Reciprocity expectation is the underlying mechanism of trust region effect. Introducing the variable of reciprocity expectation, Experiment 2 adopted the mixed design of 2×2×2 to examine whether the region effect of China's internal trust is affected by reciprocity expectation. The results of Experiment 2 show that: (1) Reciprocity expectation is the underlying mechanism of trust region effect, which verifies the results of Experiment 1; (2) Reciprocity expectation has an effect

only in acquaintances, but not in strangers. This study finds the trust regional effect existing between the north and the south of China and verifies its underlying mechanism, which provides a more comprehensive and dialectical perspective for the research on China's internal trust, and meanwhile expands the research on social distance and reciprocity expectation.

社交网络捐赠利他者更利他的边界机制：基于信任视角

郭晓荣¹（通讯作者） 梁晓燕¹ 刘晓飞¹ 赵桐¹

¹ 山西大学教育科学学院，太原，030006，gxrr@foxmail.com

摘要 信任问题已逐渐成为互联网公益事业发展的桎梏。本研究在信任整合模型和精细加工可能性模型的指导下，通过拟生态化实验考察个体特质因素（个人公正世界信念）、状态因素（自我损耗）对社交网络捐赠决策的影响，并重点关注转发者特性的信源信任（网络人际信任）以及受助者特性的内容信任（责任归因）在其中的调节作用。研究采用问卷调查法和实验法相结合的方式进行。研究1结果显示，在个人公正世界信念和自我损耗影响个体捐赠决策的过程中，网络人际信任的调节作用显著。面对熟人参照时（高网络人际信任条件下），低个人公正世界信念者处于高自我损耗状态时，社交网络捐赠意愿显著提高。研究2结果显示，在个人公正世界信念和自我损耗影响个体捐赠决策的过程中，责任归因的调节作用显著。在责任外归因条件下，高个人公正世界信念者处于低自我损耗状态时，社交网络捐赠意愿显著提高；在责任内归因条件下，低个人公正世界信念者处于高自我损耗状态时，社交网络捐赠意愿显著降低。研究结果表明，在社交网络捐赠情境中，网络人际信任和责任归因是影响个体捐赠决策的边界条件，在特定的情况下发挥作用。由此可见，公益组织在募捐时应关注这些外部因素，取其所长，避其所短，更好地利用社交网络的优势推动公益事业的发展。

How to make the altruist more altruistic in Social Network fundraising? Perspective of trust

Guo Xiaorong, Liang Xiaoyan, Liu Xiaofei, Zhao Tong
School of Educational Science, Shanxi University

Abstract: The problem of trust has gradually become the shackle of the development of Internet public welfare. In order to cultivate citizen's charitable consciousness and promote the development of Internet public welfare, under the guidance of Integrative Model of Trust and Elaboration Likelihood Model, this study focused on the influence of individual attributes (idiosyncratic factor and state factor: personal belief in a just world and ego-depletion) on their fundraising decision-making process, and revealed the moderating effect of source trust from sender (online interpersonal trust) and content trust from recipient (attribution of responsibility). The study was conducted by the method of questionnaire survey and experiment. Study 1 explored the moderating role of online interpersonal trust in the process of individual attributes influencing fundraising decision-making. The results showed that online interpersonal trust plays a significant role in the process of personal just world belief and self-depletion affecting individual fundraising decision-making. Under the condition of High self-depletion, the low-individual just-world believers' willingness to donate increased significantly after strengthening interpersonal trust. Study 2 explored the moderating role of attribution of responsibility in the process of individual attributes influencing fundraising decision-making. The results showed that responsibility attribution plays a significant role in the process of personal just world belief and self-depletion influencing individual fundraising decision. Under the condition of out-of-duty attribution, the high individual just world believers under the condition of low ego-depletion increased significantly their willingness to donate; Under the condition of in-of-duty attribution, the low individual just world believers under the condition of high ego-depletion significantly reduced their willingness to donate. According to the above

research results, in the social network fundraising situation, interpersonal trust and responsibility attribution are the boundary conditions that affect individual fundraising decision-making, and play a role in specific circumstances. Therefore, the public welfare organizations should pay attention to these external factors, take advantage of their strengths, avoid their weaknesses, and better use the advantages of social networks to promote the development of public welfare undertakings.

人们对智能机器亲社会谎言的接受度及其作用机制

郑艳蝶 刘快 吴明证（通讯作者）

浙江大学心理与行为科学系，杭州，310000，psywu@zju.edu.cn

摘 要 谎言通常被认为是不道德的，但亲社会谎言是一种特殊的谎言类型，其善意的目的会改变人们对这种“不道德行为”的评价。人们认可他人的亲社会谎言，但人们是否接受智能机器在两难情境中的亲社会谎言决策？本研究基于道德基础理论，通过四项研究探讨了人们对智能机器亲社会谎言决策的接受度及其作用机制。按照道德基础理论，谎言违背了公平这一道德基础，由此将亲社会谎言具体化为公平—关怀基础冲突、公平—自由基础冲突、公平—洁净基础冲突、公平—忠诚基础冲突和公平—权威基础冲突的两难情境。通过探索人们对智能机器在这五种冲突情境中对亲社会谎言决策的接受度在道德基础间和道德基础内的差异，以全面地揭示人们是否接受智能机器的亲社会谎言决策。研究一探讨了智能机器亲社会谎言决策接受度的道德基础间差异，具体探讨了人们对智能机器亲社会谎言决策的接受程度、道德评价、信任程度和购买意愿。研究发现，人们接受智能机器在公平—关怀基础冲突、公平—自由基础冲突、公平—洁净基础冲突的两难情境中的亲社会谎言决策，且相比于诚实决策人们倾向于接受智能机器的亲社会谎言决策；人们不接受智能机器在公平—忠诚基础冲突和公平—权威基础冲突的两难情境中的亲社会谎言决策，且相比于亲社会谎言决策人们倾向于接受智能机器的诚实决策。研究二探讨了智能机器亲社会谎言决策接受度的道德基础内差异。聚焦于关怀/伤害基础，探讨了三种伤害类型的关怀—公平基础冲突情境中人们对智能机器亲社会谎言的接受度。研究发现，在涉及三种伤害类型的关怀—公平基础冲突两难情境中人们接受智能机器的亲社会谎言决策，且相比于诚实决策人们倾向于接受智能机器的亲社会谎言决策。研究三聚焦于关怀基础，探讨人们对智能机器亲社会谎言决策的接受度的心理机制。研究发现，对智能机器的心智感知、感知仁慈、拟人化影响着人们对智能机器亲社会谎言决策的接受度，并且在智能机器亲社会谎言决策和对智能机器的接受度中发挥着链式中介作用。

People's Acceptance of Prosocial Lies of Autonomous Machines and the Underlying Mechanism

Yandie Zheng, Kuai Liu, Mingzheng Wu*

Zhejiang University, Hangzhou

Abstract: In daily life, people tell prosocial lies for the benefit of others to avoid interpersonal conflicts and maintain positive relations with them. Lying is normally considered immoral, but prosocial lying is a special type of lying, whose benign purpose changes people's evaluation of such "immoral behavior". Research has found that people have higher moral evaluation and trust for those who make prosocial lies. Autonomous machines will inevitably face moral dilemmas when they function, thus, it is meaningful to know do people allow autonomous machines to tell prosocial lies? Based on moral foundation theory, the current paper explores people's acceptance of prosocial lying decision-making of autonomous machines through four studies. According to moral foundation theory, lying violates the moral foundation-fairness, so we specify prosocial lying in the fairness-care conflict dilemma, fairness-liberty conflict dilemma, fairness-purity conflict dilemma, fairness-loyalty conflict dilemma, and fairness-authority conflict

dilemma. By revealing inter-and intra-moral foundation differences in people's acceptance of prosocial lies of autonomous machines, the current paper reveals a comprehensive and systematic picture of whether people accept autonomous machines to tell prosocial lies. Study 1 explore the inter-moral-foundation acceptance differences of prosocial lying decision-making of autonomous machines. Study1 discusses acceptability, moral evaluation, trust level, and purchase intention. The results of study 1 indicate that in dilemmas when fairness conflicts with care, liberty, sanctity, people permit autonomous machines to tell prosocial lies, and prosocial lying decision-making is preferred than honest decision-making; in dilemmas when fairness conflicts with loyalty, authority, people don't allow autonomous machines to make prosocial lies, and honest decision-making is preferred than prosocial lying decision-making. Study 2 explores the intra-moral-foundation acceptance differences of prosocial lying decision-making of autonomous machines. Focusing on the care/harm foundation, we design three types of fairness-care conflict dilemmas based on the previous harm classification: emotional harm to people, physical harm to people, and harm to animals. Study 2 finds that in all the fairness-care dilemmas, people permit autonomous machines to tell prosocial lies, and prosocial lying decision-making is preferred over honest decision-making. Study 3 focuses on the care/harm foundation to investigate the underlying mechanisms between prosocial lying decision-making of autonomous machines and people's acceptance. The results show that mind perception, perceived benevolence, and anthropomorphization of autonomous machines affect people's acceptance and three factors play a chained mediating role between prosocial lying decision-making of autonomous machines and people's acceptance. In summary, the current paper indicates that in dilemmas when fairness conflicts with care, liberty, sanctity, people allow autonomous machines to tell prosocial lies; in dilemmas when fairness conflicts with loyalty, authority, people don't allow autonomous machines to tell prosocial lies and people's acceptance of prosocial lying decision-making of autonomous machines are statistically unchanged regardless type of harm in fairness-care conflict dilemmas. It suggests that people's acceptance of prosocial lying decision-making of autonomous machines vary among moral foundations and are consistent within a moral foundation. Besides, mind perception, perceived benevolence, and anthropomorphization of autonomous machines jointly is the mechanism of people's acceptance of prosocial lying decision-making of autonomous machines.

线上接触对群际关系的影响：基于加工流畅性的视角

简佩玲 张洁 关荐（通讯作者）

宁夏大学教育学院，银川，750021, guanjian@nxu.edu.cn

摘要 群际关系是社会心理学研究的重要领域，良好的群际关系对促进社会和谐具有重要意义。群际接触是现实生活中改善群际关系的有效策略。随着互联网的发展与普及，阅读网络媒介中发布的新闻评论这种新的线上接触方式也逐渐受到学者的关注。此外，阅读网络评论时的加工流畅性会影响网络用户对外群体成员的态度和评价，对网络情景中群际关系具有重要作用。因此，本文从加工流畅性的视角出发，通过模拟虚拟的外群体，以大学生为被试，采用投资博弈范式及自行编写网络媒介的新闻报道及评论，探讨网络情景中阅读网络评论这种线上接触方式对群际关系（包括群际信任、接触意愿和社会距离）的影响。实验1采用3（线上接触：直接、扩展、控制组）×2（知觉流畅性：高、低）的被试间设计，考察线上接触和知觉流畅性对群际关系的影响及接触意愿和社会距离的中介作用。实验2同样采用3（线上接触：直接、扩展、控制组）×2（语义流畅性：高、低）的被试间设计，考察线上接触和语义流畅性对群际关系影响及接触意愿和社会距离的中介作用。结果表明：（1）线上接触可以改善网络情景中的群际关系。线上接触条件下的个体表现出了更强的接触意愿，更小的社会距离以及更高的群际信任；（2）加工流畅性是改善网络情景中群际关系的可行性路径。无论是知觉流畅性还是语义流畅性，高流畅条件下的被试表现出了更强的接触意愿，更小的社会距离以及更高的群际信任；（3）与现实情景的研究结果一致，接触意愿和社会距离在线上接触与群际信任之间起中介作用。

关键词 线上接触，加工流畅性，群际关系

The impact of online contact on intergroup relations: a processing fluency-based perspective

Jian Peiling, Zhang Jie, Guan Jian

School of Education, Ningxia University, Yinchuan, 750021, guanjian@nxu.edu.cn

Abstract: Intergroup relations are an important area of research in social psychology, and good intergroup relations are important in promoting social harmony. Intergroup contact is an effective strategy for improving intergroup relations in real life. With the development and popularity of the Internet, the new online contact method that reading news commentaries published in the online media has also gradually received the attention of scholars. Moreover, the processing fluency when reading online comments affects the attitudes and evaluations of outgroup members by online users, and plays an important role in intergroup relations in online scenarios. Therefore, from the perspective of processing fluency, this paper explores the impact of online contact that reading reviews in an online situations on intergroup relations (including intergroup trust, willingness to engage and social distance) by simulating virtual out-groups, using an investment game paradigm and self-written news reports and reviews from the online medium, with university students as subjects. Experiment 1 used a 3 (online contact: direct, extended, control group) $\times$ 2 (perceptual fluency: high vs. low) between-subjects design to examine the effect of online contact and perceptual fluency on intergroup relations and the mediating effects of willingness to engage and social distance. Experiment 2 also used a 3 (online contact: direct, extended, control group) $\times$ 2 (semantic fluency: high vs. low) between-subjects design to examine the role of online contact and semantic fluency in the effect of online contact on intergroup relations and the mediating effects of willingness to engage and social distance. Results indicated that : (1) online contact improves intergroup relations in online situations. Individuals in the online contact condition showed greater willingness to engage, less social distance and higher intergroup trust; (2) processing fluency is a viable route to improving intergroup relations in online situations. In both perceptual and semantic fluency, subjects in the high fluency condition showed greater willingness to engage, less social distance and higher intergroup trust; (3) consistent with the findings in the real-life scenario, willingness to engage and social distance mediated the relationship between online contact and intergroup trust.

工作伦理调节心理契约破裂感知对组织公民行为的影响

赵珺¹ 高艳艳¹ 马剑虹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310012, jhma@zju.edu.cn

摘 要 员工组织关系是当前组织行为和管理心理的重要课题, 它不仅包括雇佣合同中议定的员工和组织双方的角色, 也包括存在于心目中双方责任、义务的期望——前者是文本形式的契约, 后者则是心理契约。员工会对组织是否遵循心理契约内容进行评价, 当察觉组织未能实现契约规定时, 会产生一定的心理契约破坏感。这种心理契约破裂知觉 (Perceived Psychological Contract Breach) 会带来员工在工作动机与态度方面的改变, 影响工作行为与绩效, 最终影响组织绩效和组织战略目标的实现。工作伦理 (Work Ethics) 描述了员工对于受雇企业和具体工作的态度, 是一种员工对自身行为的内在约束机制。本研究认为员工的工作伦理可能在心理契约破裂感知影响组织公民行为之间产生“防火墙”效果。根据 Forsyth 的伦理思想理论, 我们将工作伦理分为主观主义 (Subjectivists)、绝对主义 (Absolutists)、例外主义 (Exceptionists) 和情境主义 (Situationists) 四类。本研究将心理契约破裂五项全局量表 (Robin 和 Morrison, 2000)、心理契约量表 (Rousseau, 2001)、工作伦理多项量表 (Miller 等, 2002) 和组织公民行为量表 (Katz, 1964) 整合, 在互联网企业进行调查, 收集有效问卷 412 份。结果分析发现员工的心理契约破裂感知和组织公民行为呈显著负相关。其中持交易型

(Transactional) 心理契约的员工对心理契约破裂更敏感, 组织公民行为更容易受心理契约破裂的负性影响。而关系型心理契约的员工对心理契约破裂的容忍度较高, 组织公民行为受心理契约破裂的影响也较小。结合四种工作伦理发现, 当员工感知心理契约破裂, 某些类型的工作伦理对组织公民行为的下降有“防火墙”效应。其中绝对主义和例外主义工作伦理持有者在感知心理契约破裂时组织公民行为呈现显著负相关 ($\beta_{\text{Absolutists}} = -0.224, p_{\text{Absolutists}} = 0.044$; $\beta_{\text{Exceptionists}} = -0.269, p_{\text{Exceptionists}} = 0.01$), 其余两种类型无显著效应。由于绝对主义和例外主义都是低相对主义的工作伦理类型, 可见相对主义工作伦理是在心理契约破裂时影响组织公民行为的关键。本研究结合了工作伦理理论, 探讨心理契约、心理契约破裂对组织公民行为的影响, 为解决企业发展中人力资源和管理方面遇到的困难提供了新的工具。

The Effects of Work Ethics on Organizational Citizenship Behavior Under Perceived Psychological Contract Breach

Jun Zhao, Yanyan Gao, Jianhong Ma

Zhejiang University, Department of Psychology and Behavioral Sciences, Hangzhou, 310012

Abstract: The relationship between employees and organizations is one of the primary focuses in areas such as Organizational Behavioral Sciences and Managerial Psychology. Not only does it include duties and roles specified on text-based agreements, but it also involves expectations of bilateral obligations and responsibilities. The former refers to written contracts, while the later describes psychological contracts. Employees tend to evaluate whether organizations have met these psychological commitments; when not fully achieved, senses of psychological contract breach will arise. Perceived psychological contract breach can bring changes in employees' attitudes and motivations, affecting work-related behaviors and performances. Such consequences, accumulated, will impact organizational performances and strategic objectives. Work ethics describes employees' attitudes toward their employer organizations and specific tasks assigned in their working routines. It is considered an inherent mechanism of employees' self-discipline. In this study we believe that work ethics serves as a buffer between perceived psychological contract breach and organizational citizenship behavior. According to Forsyth's ethical ideologies (1984), we hereby categorize work ethics holders into Subjectivists, Absolutists, Exceptionists and Situationists. We combined Five-item Global Scale to Measure Perceptions of Contract Breach (Robin & Morrison, 200), Psychological Contract Inventory (Rousseau, 2001), The Multidimensional Work Ethic Profile (Miller, Woehr, & Hudspeth, 2002) as well as Organizational Citizenship Behavior Items (Katz, 1964). A total of 412 effective questionnaires were collected from an internet company. Analysis revealed that perceived psychological contract breach was negatively related to organizational citizenship behavior. Employees with transactional psychological contracts were more sensitive to perceived psychological contract breaches, that their organizational citizenship behaviors were more susceptible to the negative effects of breached psychological contracts; relational psychological contract holders, on the other hand, were steadier on their organizational citizenship behavior levels. Results also revealed the buffering effects of work ethics. Absolutists and Exceptionists experienced significant negative impacts on their organizational citizenship behaviors when facing perceived psychological contract breaches ($\beta_{\text{Absolutists}} = -0.224, p_{\text{Absolutists}} = 0.044$; $\beta_{\text{Exceptionists}} = -0.269, p_{\text{Exceptionists}} = 0.01$). Subjectivists and Situationists, on the other hand, showed no significant effects. Since both Absolutists and Exceptionists share the characteristics of low relativism in work ethics, we can conclude that relativism serves a major role in the relationship between perceived psychological contract breach and organizational citizenship behavior. With theories of work ethics, this study examined the effects of psychological contract, perceived psychological contract breach on organizational citizenship behavior, bringing potential novel insights into problem-solving in human resource and management.

利他性惩罚有利于惩罚者获取权力：一个演化的视角

陈思静（通讯作者） 汪昊

浙江科技学院经济与管理学院，杭州，310023

浙江科技学院，杭州，310023, chensijing@zju.edu.cn

摘要 利他惩罚是维持基因无关个体之间广泛合作的重要机制，但它也提出了一个长期存在的进化之谜：既然利他惩罚降低了惩罚者的适应度，那么利他惩罚者是如何在进化中得到选择的？一种解释是利他的惩罚为惩罚者带来了积极的声誉。本研究通过引入声誉的二维结构，从权力的角度进一步探讨利他惩罚如何通过正面声誉提高惩罚者的适应度。三个实验表明：利他性惩罚有利于惩罚者获取权力。实验1是120名本科生参与的被试内设计。被试随机分成30组，每组4人，进行5轮公共物品博弈。在每一轮之后，被试可以惩罚选择保留代币的成员。然后，实验者向被试展示三名成员的惩罚次数。被试用7点李克特量表评估他们的热情和能力，并在他们之间分配权力点。实验2是240名本科生参与的2（温暖：低/高） $\times$ 2（能力：低/高）被试间设计。旨在用实验室操作声誉的两个维度来进一步检验其与权力之间的因果关系。实验3是3（惩罚：无/低/高） $\times$ 2（组间竞争：无/有）混合设计，考察了组间竞争对惩罚与权力关系的影响。实验1的结果表明，利他惩罚有利于惩罚者权力的获得，能力评价在上述关系中起中介作用，而温暖评价的中介作用不显著。实验2对实验1中的中介变量（热情和胜任力）进行操作，验证了上述变量与因变量权力获得之间的因果关系。实验3表明，组间竞争进一步增强了参与者将权力分配给利他惩罚者的倾向。总之，本研究通过考察影响惩罚与权力获得关系的调节变量和中介机制，在一定程度上解释了利他惩罚影响惩罚者权力获得的机制：利他惩罚提高了人们对惩罚者声誉的评价，这种积极的评价最终转化为惩罚者的权力获得；而群体间的竞争加剧了上述现象的发生趋势。上述结果为理解利他性惩罚的演化机制提供了一种权力视角，并为理解人类社会中群体领袖的最初涌现这一问题提供了新的理论思路。

关键词 利他性惩罚，权力，声誉，群体间竞争

Altruistic Punishment Favors the Power Attainment for Punishers: An Evolutionary Perspective

Abstract: The existing literature suggests that altruistic punishment is an important mechanism maintaining extensive cooperation among genetically unrelated individuals, but it also raises a long-standing evolutionary riddle: since altruistic punishment reduces the fitness of punishers, how are altruistic punishers selected in evolution? One explanation is that altruistic punishment brings a positive reputation for punishers. By introducing the two-dimensional structure of reputation, this study further explores how altruistic punishment can improve punishers' fitness through positive reputation from a power perspective. Experiment 1 was a within-participants design involving 120 undergraduates. Participants randomly formed 30 groups of 4 to play 5 rounds of public goods games. After each round, participants could punish defectors who chose to keep the tokens. Then, the experimenter presented to participants the number of punishments made by the three members. Participants evaluated their warmth and competence on a 7-point Likert scale, and allocated the power points among them. Experiment 2 was a 2 (warmth: low/high) $\times$ 2 (competence: low/high) between-participants design involving 240 undergraduates. Participants read a piece of material describing performance of a particular individual in terms of warmth and competence, and then participants chose an integer from 0 to 10 to represent the number of power points that they were willing to allocate to that individual. Experiment 3 was a 3 (punishment: no/low/high) $\times$ 2 (between-group competition: without/with) mixed design, where punishment was within-participants variable and between-group competition was between-participants variable. Participants played 5 rounds of public goods games in group of 4, and allocated power points among the members according to the number of punishments. The results of Experiment 1 showed that altruistic punishment was conducive to punishers' power attainment, and the competence evaluation mediated the above relationship, while the mediating effect of warmth evaluation was not significant. Experiment 2 manipulated the mediating variables (warmth and competence) in Experiment 1 and confirmed the causal relationship between the

above variables and the dependent variable, power attainment. Experiment 3 showed that between-group competition further strengthened the participants' tendency to allocate power to altruistic punishers. In conclusion, by examining the moderating variables and mediating mechanisms that affect the relationship between punishment and power attainment, this study explains to a certain extent the mechanism by which altruistic punishment affects punishers' power attainment: altruistic punishment improves people's evaluation of punishers in terms of competence; this kind of positive evaluation finally translates into punishers' power attainment; and the between-group competition strengthens the tendency of the occurrence of the above phenomenon. These findings shed some light on the understanding of the evolutionary mechanism of altruistic punishment.

社会比较对攻击性的影响：一个有调节的中介模型

韩磊（通讯作者） 李维姿 展艳茹 桑墨涵 韩婷 高峰强

山东师范大学心理学院，济南，250014, hanlei-0333@163.com

摘要 社会比较是一种普遍存在的社会现象，人们在日常生活中习惯于通过与他人进行比较来了解和判断自己的在群体中的地位与能力，从而对自己做出评价和定位。然而，过度或者不良的社会比较不仅会导致个体产生诸多问题行为，还会使个体表现出更高的攻击性。因此，研究社会比较对攻击性的影响具有重要的现实意义。此外，已有研究发现，相对剥夺感、愤怒和隐性自恋人格是影响攻击性的重要因素，但是目前尚未有研究将他们与社会比较纳入同一框架之中进行考察。因此，本研究旨在探讨相对剥夺感和愤怒在社会比较对攻击性影响中的中介机制以及隐性自恋人格可能的调节作用。采用社会比较倾向量表、相对剥夺感量表、愤怒量表、攻击问卷以及隐性自恋人格问卷，对山东省某高校 726 名大学生（平均年龄 18.23 岁，标准差为 0.71）进行调查。结果表明：（1）社会比较能够显著正向预测攻击性。（2）相对剥夺感和愤怒在社会比较与攻击性之间起中介作用，具体而言，社会比较通过三条路径影响攻击性：一是相对剥夺感的单独中介作用；二是愤怒的单独中介作用；三是相对剥夺感和愤怒的链式中介作用。（3）隐性自恋人格调节了社会比较与攻击性之间的关系，具体作用于“社会比较→相对剥夺感→攻击性”这条中介路径上，即高隐性自恋人格可以增强社会比较与相对剥夺感以及相对剥夺感与攻击性之间的关系。本研究不仅揭示了社会比较对攻击性的影响及其作用机制，也为干预和减少个体的攻击性提供了一定的依据和启示。

The Effect of Social Comparison on Aggression: A Moderated Mediation Model

Lei Han, Weizi Li, Yanru Zhan, Mohan Sang, Ting Han, Fengqiang Gao

School of Psychology in ShanDong Normal University, Jinan, 250014

Abstract: Social comparison is a universal social phenomenon. In daily life, people are used to understanding and judging their status and ability in the group by comparing with others, so as to evaluate and position themselves. However, excessive or bad social comparison will not only lead to many problem behaviors, but also lead to higher aggression. Therefore, it is of great practical significance to study the effect of social comparison on aggression. In addition, existing studies have found that relative deprivation, anger and covert narcissistic personality are important factors affecting aggression, but there is no study to integrate them and social comparison into the same framework to consider the mechanism. Therefore, the present study aimed to investigate the mediating mechanisms of relative deprivation and anger on the effect of social comparison on aggression and the possible moderating effect of covert narcissistic personality. A total of 726 college students ($M_{age} = 18.23$ years, $SD = 0.71$) from a university in Shandong Province participated in the current study and completed multiple questionnaires, namely, the Social Comparison Orientation Scale, Relative Deprivation Scale, Anger Scale, Aggression Questionnaire and Covert Narcissistic Personality Questionnaire. The results showed that: (1) Social comparison can significantly positively predict

aggression. (2) Relative deprivation and anger played a mediating role between social comparison and aggression. In particular, social comparison influenced aggression indirectly through three paths: one was the mediating role of relative deprivation; the second was the mediating role of anger; the third was the chain mediating role of both relative deprivation and anger. (3) The relationship between social comparison and aggression can be moderated by covert narcissistic personality, and specifically acted on the mediating path of “social comparison→relative deprivation→aggression”. That is, high covert narcissistic personality can enhance the relationship between social comparison and relative deprivation and between relative deprivation and aggression. This study not only contributes to reveal the effect of social comparison on aggression and its mechanism, but also provides some basis and enlightenment for intervention and reduction of individual aggression.

Keywords: social comparison, aggression, relative deprivation, anger, covert narcissistic personality

偏好重塑：积极人际互动促进直觉亲社会行为

石荣¹ 刘昌²

¹ 山东大学医学心理学系，济南，250000, shirong2013@163.com

² 南京师范大学心理学院，南京，210000, liuchang@njnu.edu.cn

摘要 亲社会属性是人类生活的一个重要特征，但对于人们是否能够形成亲社会行为的一般直觉向，仍存在争论。亲社会性反思模型(the reflective model of prosociality)认为，人类生来就是具有非道德和纯粹利己主义倾向的生物，从事亲社会行为需要对这种利己主义本能进行反思控制。而亲社会性直觉模型(the intuitive model of prosociality)却提出了相反的假设，认为在许多情况下，亲社会行为不需要主动控制自私冲动，它本身就可以以直觉的(或冲动的)方式出现。亲社会性自动化的行为特征，奖赏寻求相关的神经特征，以及儿童亲社会性的早期发展都为亲社会性直觉模型提供了支持性证据。为了协调这两种不同的理论观点和证据，社会启发式假设(social heuristic hypothesis, SHH)对影响直觉亲社会行为的因素进行了预测。行为决策是由那些在过去经历过的情况下取得成功的行为经验所塑造的(Chudek & Henrich, 2011; Kiyonari, Tanida, & Yamagishi, 2000)。个体的直觉反应容易受过去经验的影响，将在日常互动中有利的行为内化为一种启发式，在一些情境中成为引导个体行为的关键。在日常生活中，人们总是参与公共或私人互动。在互动过程中既存在积极互利的情况，也存在着糟糕失望的情况。我们对他人的行为受以往他人行为和我们自身互动经验的影响。在这些理论和研究的基础上，我们通过3项实验来探究互动经历对直觉亲社会选择的影响。我们分别通过在线互动、回忆和助人报道的方式直接或间接地诱发参与者的互动经验。总体而言，研究发现：(1)互动经历会影响个体后续的帮助选择：积极互动经历增加了个体的帮助选择。(2)这一效应是存在于依赖启发式的直觉加工条件下，在深思熟虑加工中几乎消失。(3)帮助行为的改变在一定程度上可以由人性感知来解释。这在一定程度上说明，亲社会行为偏好能够通过互动经验在相对较短的时间尺度内被重塑。

A remodeling of preferences:

Positive interactions promote intuitive pro-social behavior

Rong Shi¹, Chang Liu²

¹ Department of Medical Psychology, Shandong University, Jinan, China

² School of Psychology, Nanjing Normal University, Nanjing, China

Abstract: Prosocial behavior is a central feature of human life and there is an ongoing debate whether individuals have, therefore, developed a general intuitive tendency to act prosocially or not. The reflective model of prosociality holds that humans are born as creatures with non-moral and purely egoistic tendencies, and prosocial behavior requires exerting reflective control over this egoistic instinct. However, in contrast to the reflective model, Zaki and Mitchell (2013) have proposed an intuitive model of prosociality, which suggests that prosocial behavior often arises from intuitive, hot, or system 1 preferences, representing an impulse of its own. The intuitive model of prosociality is

supported by at least three markers: behavioral signs of automaticity, neural signatures of reward seeking, and early development. The idea that prosociality can be intuitive in no way implies that it always is and there are some conflicting evidences. The social heuristics hypothesis (SHH) has therefore been proposed as a theoretical framework to addressing conflicting evidences. The SHH posits that associations between processing mode and prosocial behavior are complex and multifaceted, prone to shifting according to individual variability and the contexts in which it occurs. In the current study, we explored the impact of helping experience on intuitive prosocial behavior and the potential mediating factors from a perspective of preferences remodeling. In three experiments, we induced participants' helping experiences directly or indirectly through online interaction, recall, and news reports about helping. Consistent with our predictions, positive helping interactions could promote helping choice. This effect existed in the intuitive processing that relies on heuristics and virtually disappear in deliberative processing. Moreover, we also present evidence that our treatment effects could be explained by the change in views of humanity. Taken together, our findings suggest that the power of previous experience for shaping our behavior in a virtual help settings.

Keywords: intuitive prosociality, social heuristics hypothesis, prosocial behavior, remodeling of preferences

女性周期性的激素变化与亲社会行为

王弘毅¹（通讯作者） 李建花² 陈岚¹ 何黎胜³

1 华东师范大学心理与认知科学学院，上海，200062，通讯作者 E-mail: hywang@psy.ecnu.edu.cn

摘要 利他和亲社会是社会心理学和行为科学的研究热点。亲社会行为在人类合作、竞争和社会共同进化中发挥着至关重要的作用。近期研究表明，施加外源性激素所导致的激素水平的变化能影响人们的亲社会倾向。此外有研究表明，即使是自然范围内的激素的波动也可能影响亲社会行为。以往研究探究了月经周期的激素变化对亲社会性的影响，但研究结果不一致。Anderl 等人（2015 年）使用被试间设计，并通过被试的口头报告的生理周期信息估计女性的生理周期阶段，发现处于卵泡期的女性比处于黄体期的女性具有更高的亲社会倾向；但 Sternstrom 等人(2018)使用类似的方法，却发现卵泡期的女性比黄体期的女性更不亲社会。以往研究结果的不一致很可能是由于研究方法的局限性所致。基于此，本研究直接测量女性被试的唾液类固醇激素水平，并采用被试内的实验设计，探究了女性周期性变化的激素水平（雌二醇、孕酮和睾酮）与其亲社会性之间的关系。亲社会水平通过三个行为任务（慈善捐赠任务、社会价值取向任务和社会折扣任务）和一份自陈报告的问卷（亲社会倾向测量）来测量。被试连续五周、每周来实验室一次参与实验。每次测试，被试都提供唾液样本以供测量其激素水平。此外，被试还完成亲社会测量任务。实验程序和分析方法都在实验实施之前在 OSF 平台进行了预注册。多层线性回归的结果表明，女性亲社会性水平不受雌二醇、孕酮、睾酮、和雌二醇和孕酮之比水平的调节。这一结果说明，女性的亲社会水平不受到生理周期的激素变化而改变。这一结果也强调了探究激素水平和社会行为关系的研究中，使用被试内设计的重要性。

Do Women's Natural Hormonal Fluctuations Modulate Prosociality?

A Within-subject Analysis

Hongyi Wang¹, Jianhua Li², Lan Chen¹, Lisheng H³

1 East China Normal University, Shanghai

2 University of Macau, Macau

3 SILC Business School, Shanghai University, Shanghai

Abstract: The study of altruistic and prosocial behavior is at the core of modern social and behavioral sciences. It plays a vital role in human cooperation, competition, coordination and societal coevolution. Recent advances show

that exogenously administered hormone levels moderate prosocial propensities. It's been argued that even the natural hormonal fluctuations may affect prosocial propensities although debates remain. Previous studies have attempted to examine the effects of menstrual cycle on prosociality, but have obtained ambiguous results. Using between-subject designs and self-reported menstrual histories, Anderl and colleagues (2015) found that women in the follicular phase were more prosocially orientated than those in the luteal phase but Sternstrom et al. (2018) found that women in the follicular phase were less prosocial than those in the luteal phase. This somewhat conflicting evidence regarding the menstrual cycle effects on prosociality may be due to methodological limitations. Our study directly tests this conjecture using a within-subject design in which women's hormone levels and prosocial tendencies were repeatedly measured across the menstrual cycle. In this study, we investigated the relationships between women's natural salivary steroid hormone levels (estradiol, progesterone, and testosterone) and their prosociality in a variety of contexts, as measured by three behavioral tasks (Charitable Donation, Social Value Orientation, and Social Discounting tasks) and one self-reported questionnaire (the Prosocial Tendencies Measure). Participants completed five weekly laboratory tests to obtain within-subject hormonal fluctuation data and prosociality measurements. In a preregistered analysis, we found little evidence supporting the hypotheses that women's prosociality tracked natural changes in salivary estradiol, progesterone, estradiol-to-progesterone ratio, or testosterone. Our results demonstrate the importance of performing within-subject analyses when examining the relationships between hormonal levels and social behavior.

Keywords: menstrual cycle, prosociality, estradiol, progesterone, testosterone

从“生存”到“发展”：助人分配中的效率-公平权衡

王天鸿¹ 王逸璐¹ 申劭婧¹ 谢晓非¹ (通讯作者)

¹ 北京大学心理与认知科学学院, 行为和心理健康北京市重点实验室, 北京, 100871, xiaofei@pku.edu.cn

摘要 当同时面对多个潜在受助对象时, 助人者通常需要考虑如何在多个受助者之间分配有限的资源。该决策过程往往涉及对于公平和效率的权衡。本研究关注潜在受助者的处境如何影响助人决策中的分配偏好。对比受助者的处境(在接受帮助的领域所拥有的资源多寡)与该领域所需资源的基准线, 可以区分“生存”和“发展”两种情境。在“生存”情境中, 受助者的处境尚未达到该领域的基准线; 而在“发展”情境中, 受助者的处境达到了基准线但仍不充分。本研究提出, 相比于“发展”情境, 在“生存”情境下, 助人者更偏好能使所有潜在受助者获得等量资源的“公平”方案, 而非使得资源总量最大化的“效率”方案。此外, 本研究还探讨了目标完成度、叙述框架两个调节变量的作用。本研究通过4个实验检验假设。实验1采用“爱心家教为学生补习功课”情境, 发现在“生存”情境中, 助人者更偏好公平方案; 而在“发展”情境中, 助人者更偏好效率方案。实验2探究帮助目标完成度的调节作用, 通过2(受助者处境: 生存/发展)×2(目标完成度: 全部/部分完成)混合设计, 采用“为贫困山区儿童运食物”情境, 发现当效率方案可以一次性满足全部帮助目标时, 无论在何种条件下, 帮助者都更偏好效率方案。实验3探究叙述框架的调节作用, 采用2(受助者处境: 生存/发展)×2(叙述框架: 获益/损失)的被试间设计, 采用情境同实验2, 发现当使用损失框架叙述问题时, 两种条件下人们都更偏好公平方案。实验4采用“新冠疫情期间为果农运出水果”的新情境, 再次检验了主效应。同时, 实验3、4都尝试对可能的中介因素进行探究。本研究揭示, 潜在受助者的处境会影响助人决策中的分配偏好: 相比于在帮助现状在基线以上的人们进一步改善生活、实现“发展”时, 助人者在帮助现状处于基线以下的受助者跨越基线、保证“生存”时, 更偏好公平方案而非效率方案。这一发现对现有的助人决策、分配决策相关研究进行补充, 同时有助于促进对效率和公平的深入理解。

From surviving to thriving: How helping allocation preferences shift

Wang Tianhong, Wang Yilu, Shen Shaojing, Xie Xiaofei School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University

Abstract: When having multiple recipients who need help at the same time, helpers often need to consider ways to allocate limited resources among multiple recipients. Such decision-making processes often involve a trade-off between equity and efficiency. The current study focuses on how the situation of potential recipients affects helping allocation preferences. By comparing the recipient's situation (the amount of resources available in the area needing help) to a bottom line of resources needed in that area, a distinction can be identified between people in "surviving" and "thriving" situations. For people who are "surviving", their situation has not yet reached the bottom line of the area, while people the "thriving" scenario are ones who have reached the bottom line but is still insufficient. The current study suggests that helpers prefer "equity" in "surviving" scenarios, where all potential recipients receive an equal amount of resources. When facing "thriving" situations, helpers prefer "efficiency", where the total amount of resources is maximized. In addition, we explored the role of two moderating variables, goal completion and narrative framing. Four experiments were conducted to test the hypotheses. Experiment 1 used a "student tutoring" scenario and found that compared to the "thriving" scenario, the helpers preferred the equity option rather than the efficiency option in the "surviving" scenario. Experiment 2 explored the moderating effect of goal completion using a scenario where food needed to be transported for poor children in the mountain. A mixed design of 2 (recipient's situation: surviving/ thriving) $\times$ 2 (goal completion: all/partial completion) was used. The helper preferred the efficiency solution regardless of the condition. With the same scenario, Experiment 3 explored the moderating effect of narrative frame using a 2 (recipient's situation: surviving/ thriving) $\times$ 2 (frame: gain/loss) between-subjects design. Results have found greater preferred towards the equity option for both conditions when the problem was described with a loss frame. The main effect was tested again in Experiment 4 with a scenario of "helping farmers to transport fruits during a COVID19 epidemic". Meanwhile, both Experiments 3 and 4 attempted to explore possible mediating factors. The current study reveals that the situation of potential recipients affects distributional preferences when making helping decisions: compared to facing multiple recipients who are in "thriving" situations, the helpers preferred the equity option rather than the efficiency option when facing multiple recipients who are "surviving" below the bottom line. Our finding has implications for existing helping decisions. At the same time, it serves as complements for existing research on helping decisions and distributional decisions and contributes to a deeper understanding of efficiency and equity.

抽象/具体的死亡提醒以及年龄如何影响死亡认知及态度： 基于死亡提醒操作回答的文本分析

法卉（通讯作者）¹ 棉村英一郎¹ 三浦麻子¹

¹ 大阪大学，日本，565-0871, houkei_423@yahoo.co.jp

摘要 根据恐惧管理理论，死亡提醒操作会触发人们对于自己必死命运的本能恐惧（存在论恐惧），从而引发其对于自身文化世界观或是内群体的防御反应。但最近存在很多对于死亡提醒操作效果再现性的质疑。本研究首次尝试通过进行文本分析来验证传统的死亡提醒操作——即对抽象死亡进行想象——的合理性。其次，本研究也探讨了年龄对于死亡认知及态度的影响。本研究在日本收集了 204 名年轻人（年龄 19.16 ± 1.54 岁），以及 180 名老年人（年龄 72.29 ± 4.79 岁）在死亡提醒操作（抽象/具体）中的回答并加以分析。抽象死亡提醒操作要求被试认真想象并写下自己死亡时的想法和心情。而具体死亡提醒操作则要求被试认真想象并写

下自己死于事故时的想法和心情。分析结果显示,人们被唤起死亡意识后的思考主要包括以下五个方面的内容:存在论恐惧(死亡的不可避免性及预测不能性)、情感表出、生命反思、临终状态,以及身后事。抽象/具体的死亡提醒操作使被试的死亡思考产生不同侧重。对抽象死亡进行思考的被试——无论是年轻或是老年人——对于存在论恐惧,即死亡的客观性质有更多言及。除此之外,相比老年人,年轻人会更多言及对于生命的思考,表述出今后的人生目标。而对具体死亡进行思考的被试则有更多情感表出,会更为详细的表述自己面对死亡时的心情。面对死亡,年轻人表达最多的是悲伤、恐惧等负性情绪。而老年人则更多的表达出一种“不喜不悲”的中性情绪。同时,相较抽象死亡条件,被试对于自己身后事(遗产分配等)的言及也有显著增加。根据以上结果可以得出:1)抽象的死亡提醒操作最能唤起被试的存在论恐惧,而具体的死亡提醒操作则会使被试聚焦于死亡的其他侧面。这一发现证实了传统死亡提醒操作的合理性;2)虽然客观上老年人距离死亡更近,但他们与年轻人一样能够对抽象死亡进行思考。这说明老年人依然能够与死亡保持心理上的距离。同时,他们对于死亡也抱有更为豁达、不消极的态度。这一发现也为“如何实现健康老化”提供启示。

How Abstract / Specific Mortality Manipulation and Age May Affect Concern and Attitudes Toward Death: A Content Analysis of the Answer from Mortality Salience Manipulation

Hui Fa, Eiichiro Watamura, Asako Miura

Osaka University, Japan

Abstract: According to terror management theory, mortality salience (MS) manipulation triggers people's instinctive fear of death (existential terror), thereby eliciting defensive reactions to others who have a different cultural worldview or that belong to out-groups. However, there have been many doubts about the reproducibility of the effect of mortality salience recently. The present study is the first attempt to verify the rationality of traditional MS manipulation—individuals' exposure to an abstract mortality manipulation without providing any specific information of death—through context analysis. Furthermore, we also explored the effect of age on death concerns and attitudes. The present study was conducted in Japan. We collected and analyzed the text data from two-hundred and four young people ($M_{age} = 19.16$, $SD = 1.54$) and one-hundred and eighty older people ($M_{age} = 72.29$, $SD = 4.79$), who accepted either abstract or specific MS manipulation. In the abstract MS manipulation, participants were asked to imagine their own death and write down their emotions and feelings towards it. Whereas in the specific MS manipulation, participants were asked to imagine their own death caused by an accident. According to the results, the text contents can be categorized into the following five aspects: Existential Terror (the inevitability and unpredictability of death), Emotion Expression, Life Reflection, Dying State, and After Death. We found that participants tend to focus on different aspects of death after different MS manipulation. Participants who were exposed to an abstract MS manipulation—whether young or old—mentioned Existential Terror, namely, the objective nature of death more often. Compared to older participants, young participants showed greater concern for Life Reflection, emphasizing how they would like to live their life. On the other hand, in specific MS manipulation, participants focused more on Emotion Expression—how they feel in the face of death. For young participants, the most frequently used words were “*terrify*” or “*sad*”, which revealed a negative attitude towards death. In comparison, older participants were more capable of feeling neutral about death (e.g. “*I don't feel anything special towards death.*”). Additionally, there were a significant number of participants that spoke more about After Death—for example, how to deal with the inheritance. We can draw the conclusion from the present study that existential fear was more frequently aroused by abstract MS manipulation, while specific MS manipulation would draw participants' attention to other aspects of death. These findings provide evidence for the rationality of traditional MS manipulation. Furthermore, although older people are objectively closer to death, their reaction towards abstract MS manipulation was similar to young peoples' reactions, indicating that older people are still able to maintain psychological distance from death. Meanwhile, they are more

open-minded and maintain non-negative attitudes towards death. These findings may also provide a better understanding of the process of healthy aging.

社会信息对他人疼痛评估的影响

张兰兰¹, Tor D. Wager², Leonie Koban^{3*}

² Department of Psychological and Brain Sciences, Dartmouth College

³ Paris Brain Institute

摘要 准确知觉他人的疼痛至关重要,尤其在医疗保健情境下,这可能关乎疼痛治疗或管理的程度和策略。然而,评估他人的主观感受天然地存在障碍,且这一过程极易受到其他因素的影响。本研究通过两个实验考察对他人疼痛的评估(实验一:实验室数据, $N = 50$; 实验二:网络数据, $N = 207$)和疼痛管理推荐(实验二)是否受到社会信息的影响。实验一中被试观看受伤的手或脚的图片并评估受伤者的疼痛程度。这些图片分为高、中、低三种疼痛水平且平衡匹配了较低($Social_{Low}$)或较高($Social_{High}$)的社会评价信息(10位虚构被试的疼痛评分)。实验二中被试观看慢性肩痛病人转动患肢时的疼痛面部表情视频剪辑并评估病人的疼痛程度和给与疼痛管理推荐(止痛药或心理治疗)。与实验一相同,视频刺激材料也平衡匹配了较低($Social_{Low}$)或较高($Social_{High}$)的社会评价信息。研究结果显示:(1)实验一中被试的疼痛评分显著受到刺激图片疼痛水平的驱动,即刺激图片的疼痛水平越高被试所给出的疼痛评分越高, $t(49) = 16.27, p < 0.001$ 。更重要的是, $Social_{High}$ 实验条件下的疼痛评估显著高于 $Social_{Low}$ 下的疼痛评估, $t(49) = 8.83, p < 0.001$ 。(2)实验二验证了实验一中揭示的社会信息效应, $t(206) = 7.54, p < 0.001$ 。然而,与实验预期不同的是,我们未能发现社会信息对疼痛管理推荐的影响,即 $Social_{High}$ 和 $Social_{Low}$ 实验条件下被试推荐给病人的止痛药剂量, $t(206) = 0.35, p = 0.73$ 和心理治疗疗程, $t(206) = 1.41, p = 0.16$, 均无显著差异;此外,对止痛药或心理治疗的推荐偏好也无显著差异,对于止痛药偏好 $t(206) = -1.59, p = 0.11$, 对于心理治疗偏好 $t(206) = 1.59, p = 0.11$ 。相关分析发现被试的特质性移情水平越高所表现出的社会信息效应越强, $r(207) = 0.25, p = 0.04$ (实验一), $r(207) = 0.11, p = 0.056$ (实验二)。本研究显示人们对他人的疼痛评估总体来说是客观理性的,但是极易受到社会信息的影响。

Social information influences estimation of vicarious pain

Lanlan Zhang¹, Tor D. Wager², Leonie Koban^{3*}

¹ School of Leisure Sport and Management, Guangzhou Sport University

² Department of Psychological and Brain Sciences, Dartmouth College

³ Paris Brain Institute

Abstract: Accurately perceiving pain in others is important, especially in medical and healthcare settings, in which different levels of perceived pain might lead to different treatments or pain management strategies. However, judging the pain of others is inherently difficult and may be influenced by various social and cultural factors. Here, we examined whether vicarious pain estimation (experiment 1, lab data, $N=50$, and experiment 2, online data, $N=207$) and pain management recommendations (experiment 2) are influenced by the opinion of others (social information). In experiment 1, perceivers viewed pictures depicting injured hands or feet in high, medium and low intensities, preceded by nonpredictive social information (pain ratings from 10 fictitious perceivers), indicating low ($Social_{Low}$) or high ($Social_{High}$) vicarious pain estimation of others. In experiment 2, perceivers viewed facial video clips of real patients suffering from chronic shoulder pain and estimated patients' pain intensity and gave their pain management recommendations regarding pain medicine and psychotherapy. We found that (1) in experiment 1, perceivers' pain estimation was highly driven by normative vicarious pain intensity levels, $t(49) = 16.27, p < 0.001$. More importantly, pain estimation during $Social_{High}$ trials was statistically higher than that during $Social_{Low}$ trials, $t(49) = 8.83, p <$

0.001; and (2) experiment 2 replicated the social influence effect in pain estimation observed in Experiment 1, $t(206) = 7.54$, $p < 0.001$. However, we failed to reveal such effect in pain management recommendations, for dose of pain medicine, $t(206) = 0.35$, $p = 0.73$; for session of psychotherapy, $t(206) = 1.41$, $p = 0.16$; paired t-test of Social_{HIGH} and Social_{LOW} trials revealed no preference for psychotherapy: $t(206) = 1.59$, $p = 0.11$ or pain medicine $t(206) = -1.59$, $p = 0.11$. Correlation analysis revealed that perceivers with more empathy showed larger social influence, $r(207) = 0.25$, $p = 0.04$ for experiment 1 and $r(207) = 0.11$, $p = 0.056$ for experiment 2. Our findings revealed that people's pain estimation was basically reasonable, but could be biased by such little social influence.

Emily.Bower2@va.gov

摘要 背景：孤独感是老年人普遍存在的心理问题，也是其他心理问题，如抑郁，焦虑，自杀等的重要原因。广场舞是一项在中国广泛开展的以老年人为主的健身运动，有效地增加了老年人的社会参与，是改善老年人孤独感的潜在干预措施。这篇综述旨在研究广场舞与孤独感以及其他心理健康因素之间的关系。

方法：本文采用范围综述的方法，系统检索了 Scopus 英文数据库和 CNKI 中文数据库，研究广场舞与孤独或社会联系，身心健康或认知功能之间的关系同行评审的期刊文章和博硕士论文被纳入研究。结果：检索获得文献 763 篇，其中 117 篇符合纳入标准。仅 6 篇文献评估了孤独或社交关联，且均为横断研究。广场舞与较少的孤独感，更好的社交关系和更多的社交参与有关。65 篇文献评估了心理健康状况，其中 23 篇为随机对照实验，研究结果包括减轻心理症状，增加积极情绪和幸福感。9 篇文献探究了认知功能，其中 6 篇为随机对照实验，研究发现参与广场舞可以改善老年人认知功能。85 篇文献关注躯体健康，其中 37 篇为随机对照实验，研究结果包括改善身体形态，身体机能和身体素质等，降低血压血脂，改善心肺和肾功能等。结论：广场舞是减少中国老年人孤独感的一种可行的干预措施。目前已发表的研究广场舞和孤独感或社交关联的研究均发表与近几年，且均为横断研究，未来关于广场舞如何减少老年人孤独感仍有较多研究空间。目前关于广场舞研究的文献仍大多集中于躯体健康，心理方面研究的因素较少，基本关注于精神病症状、积极情绪和幸福感，广场舞带来的积极影响和作用机制有待进一步探讨。

Does Square Dance Improve Loneliness and Mental Health of Older Adults? A Scoping Review

Yuxing Jiang^{1,2}, Yeates Conwell², Emily S. Bower²

¹Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310007

²Department of Psychiatry, University of Rochester Medical Center, Rochester, NY, USA, 14642

Abstracts: Backgrounds: Loneliness is a common psychological problem among the elderly, and it is also an important cause of other psychological problems, such as depression, anxiety, and suicide. Square dance, a widespread exercise among the elderly in China, successfully increase social engagement of the elderly, and could be an effective intervention to reduce loneliness among older Chinese adults. This review aims to examine the relationship between square dance and loneliness, and related health outcomes. Methods: The databases Scopus and CNKI were systematically searched with the instruction of scoping review. Peer-reviewed journal articles and thesis publications examining the relationships between square dance in China and loneliness or social connection, physical health, mental health, or cognition were included. Results: 763 publications were retrieved, 117 of which met the inclusion criteria. Only 6 articles evaluated loneliness or social connection, and they were all cross-sectional studies.

Square dance was associated with less loneliness, better social relationships, and more social engagement. 65 publications evaluated mental health, 23 of which were randomized controlled trial. The findings included alleviating psychological symptoms, increasing positive emotions and well-being. Nine articles explored cognitive function, and six of them were randomized controlled trial. The study found that participation in square dance can improve the cognitive function of the elderly. 85 articles focused on physical health, 37 of which were randomized controlled trial. The research results included improving body size indexes, physiological function tests, and physical strength and agility indicators, lowering blood pressure and blood lipids, and improving heart, lung and kidney functions. Conclusion: Square dance is a feasible intervention to reduce the loneliness of Chinese elderly. The published studies on square dance and loneliness or social connections have been published in recent years, and they are all cross-sectional studies. There is still more directions for research on how square dance can reduce the loneliness of the elderly in the future. At present, the literature on square dance research is still mostly focused on physical health, and there are few psychological factors. The main focus is on psychotic symptoms, positive emotions and well-being. The positive influence and mechanism of square dance need to be further explored.

Keywords: older adults, loneliness, square dance, mental health

自我损耗效应存在的新证据

党君华¹ (通讯作者)

¹ 瑞典乌普萨拉大学神经科学系, 乌普萨拉, 75236, dangjunhua@gmail.com

摘要 自我损耗效应指的是, 相对于完成一项不需要耗费努力的中性任务, 完成一项需要耗费努力的自控任务之后, 人们在随后的自控任务上会表现得更差。该效应从 1998 年提出以后获得了极大的关注, 有成百上千项研究曾探讨过这一效应, 参与的研究者多达数千人。但是, 最近几年, 这一效应的可重复性遭到了极大的挑战。Carter 等人(2015)在其元分析中指出, 自我损耗效应存在严重的发表偏差, 使用统计方法纠正发表偏差以后, 自我损耗效应基本等于零。随后 Hagger 等人 (2016) 发起了多实验室重复研究, 结果真的没有发现显著自我损耗效应。随后, Dang 等人(2021)又组织了另外一项多实验室重复, 结果发现了显著自我损耗效应, 但是效应很弱, 只有 $d=0.10$ 。从前人的这些研究中, 我们发现, 效应比较小的原因主要是实验操纵太弱, 也即在大多数自我损耗研究中, 第一个损耗任务都只有 5 到 10 分钟, 起不到损耗的作用。因此, 本研究中, 我们首先设计了一个范式, 也即使用反向眼跳作为第一个损耗任务, 持续半小时左右, 第二个任务使用了 Go/Nogo 任务。我们首先在中国的学生群体中进行了检测, 发现了很强的自我损耗效应。随后, 我们使用多实验室重复法, 在 11 个实验室中进行重复, 结果也发现了较强的自我损耗效应 ($d=0.30$)。随后, 我们又通过网络平台上招募被试重复这一范式, 同样也发现了相应大小的效应。本研究证明, 只要实验操纵足够强, 就可以产生稳定的自我损耗效应, 从而为解决这一重复危机提供了重要证据。

New Evidence for the Existence of Ego Depletion

Junhua Dang

Department of Neuroscience, Uppsala University

Abstract: The ego depletion effect refers to the phenomenon that compared with completing a neutral task that does not require effort exertion, completing a self-control task demanding effort exertion impairs subsequent self-control performance. This effect has attracted so much attention that hundreds of studies involving thousands of researchers have tested this effect. However, the replicability of ego depletion has been challenged recently. In a meta-analysis, Carter et al. (2015) found substantial publication bias in ego depletion literature. The effect size of ego depletion turned to be zero after correcting for publication bias. Hagger et al. (2016) organized a multi-lab replication that also found a null effect. Although another multi-lab replication found a significant effect (Dang et al., 2021), the effect size was small ($d=0.10$). We argue that the small effect size is due to the weak manipulation used in previous studies. In the current research, we designed a new paradigm, with an antisaccade task lasting 30 minutes as the depleting task

and a Go/No go task as the outcome measure. We tested it in a sample of Chinese students, which found a strong effect. Then we organized a multi-lab replication consisting of 11 labs and found a small to medium effect size ($d = 0.30$). Finally, we tested the paradigm with an online sample and also found a comparable effect size. Therefore, our results demonstrate that the ego depletion effect does exist as long as the manipulation is strong effect, which provides important evidence for the replicability crisis of ego depletion.

身体负重感对绿色自然景观审美偏好的影响及其机制

刘雯萱¹ 李晓静¹ 梁敏莹¹ 刘思哲¹ 张维¹ (通讯作者)

华南师范大学心理学院, 广州, 510631, psyeungwai@163.com

摘要 进化美学认为审美具有一定的进化意义, 那些具有显著进化含义的事物更容易被体验为美。同时, 审美体验还建立在身体感觉的基础上, 特定的、相匹配的身体感觉与动作能提高人们的审美体验。因此, 对于人们心理机能能有好处且隐含着进化效价的自然景观环境而言, 人们对其的审美偏好是否会随着不同程度的身体感觉而发生变化仍是一个值得探究的问题。本研究通过 4 个实验, 基于外显和内隐判断任务来研究不同类型自然景观环境(绿色与非绿色自然景观)的外显审美偏好和内隐审美注意偏向是否会随着不同程度的身体负重感觉(身体负重与无身体负重)而发生变化以及其中的心理机制。结果发现, 相比非绿色自然景观, 处于身体负重状态下的被试在外显审美评级任务(实验 1)中对绿色自然景观有着更高的审美评价; 同时也表现出了对绿色自然景观的明显审美注意偏向(实验 2 和实验 3), 但这种基于外显审美和内隐注意偏向的效应在无身体负重条件下则没有出现。此外, 实验 4 通过内隐联想测试(IAT)也发现, 当被试处于身体负重状态时, 相较于非绿色自然景观, 他们更容易将高轻松感词汇与绿色自然景观联系起来。上述结果表明, 身体负重感可以影响人们对绿色自然景观的审美偏好, 这可能是因为绿色自然景观在身体负重条件下与轻松感有更强的隐性关联, 有助于减轻人们的身体负重感, 从而提高他们对绿色自然景观的偏好。

The influence of physical burden on the aesthetic preference for green natural environment

Liu Wenxuan, Li Xiaojing, Liang Mingying, Liu Sizhe, Zhang Wei

School of psychology, South China Normal University, Guangzhou, China

Abstract: The perception of beauty is known to be associated with the bodily sensations and evolutionary implications. However, whether the aesthetic preference for natural landscape environments with different evolutionary benefits changes on the basis of different degrees of bodily sensations is still an open issue. The present study used four experiments to investigate whether the sensation of a physical burden is capable of changing the explicit aesthetic appraisal and implicit aesthetic attentional bias for natural landscape. In addition, we further investigated whether green natural landscapes are implicitly associated with a sense of relaxation, and provide a preliminary explanation of this preference for green natural landscapes. The results showed that participants wearing a heavy backpack gave green natural landscapes higher aesthetic scores in the explicit aesthetic rating task (Experiment 1). Similarly, a clear aesthetic attentional bias toward the green natural landscape was found in the physical backpack condition, but not in the no-backpack condition (Experiment 2 and Experiment 3). Furthermore, the implicit association test (IAT) in Experiment 4 revealed that a green natural landscape was more readily associated with a high level of relaxation when the participants wore a backpack. The results indicated that the bodily sensation of a physical burden modulates the aesthetic preference for natural environments when they consist of green plants, which are associated with a high level of relaxation and have significant evolutionary implications.

一笑而过还是感同身受：幽默与共情的相互抑制关系

李龙骄¹ 熊心妍¹ 张晓萌¹

¹ 北京师范大学心理学部, 北京, 100875

摘要 良性进犯理论认为幽默来源于被评价为良性的进犯, 由于对他人所受进犯的共情可能使该进犯难以被评价为良性, 因此提出假设 1: 面对他人所受进犯时, 共情对于幽默感知存在抑制作用。共情反应常伴随着共情代价, 但由于它具有社会赞许性因而避免共情的动机难以被公然表达, 而相信人们应该以非严肃的幽默态度来应对进犯这一信念可以使避免共情的动机得到表达, 因此提出假设 2: 幽默应对信念对共情存在抑制作用。通过四个研究考察了幽默子成分与共情之间相互抑制的关系。研究 1 采用相关法: 研究 1a 通过问卷测量了 135 名中国大学生的幽默感和特质共情, 结果表明应对型幽默和特质共情存在显著负相关; 研究 1b 通过 prolific 平台对 194 名英美被试采用更为全面的幽默感和特质共情量表施策, 同时开发“幽默应对信念量表”并检验信效度, 结果再次支持了幽默感中应对相关成分与共情的显著负相关, 幽默应对信念量表信效度良好且得分与特质共情表现出效应量最大的负相关。研究 2 通过实验法检验幽默成分与共情的相互抑制关系: 研究 2a ($N = 140$) 在操纵情境共情后测量被试对视频材料的幽默评分, 结果发现情境共情启动会显著地降低被试的幽默感知; 研究 2b ($N = 176$) 在操纵幽默应对信念后要求被试报告对一段视频中角色的共情反应强度, 结果表明幽默应对信念的启动会显著地降低被试的共情反应。综上, 研究结果表明无论是作为稳定特质还是情境反应, 幽默与共情都存在相互抑制的关系, 其中起到关键作用的子成分为幽默应对信念。本研究基于良性进犯理论和有关共情代价的相关研究, 开拓性地提出了幽默与共情之间的相互抑制, 关注到两种优势特质之间的辩证制衡, 同时也启发高特质共情的个体可以在社交时选择更加灵活的策略, 通过使用自己舒适的幽默类型以获得更加融洽的社交体验。

关键词 幽默, 共情, 幽默应对信念

Laugh it off or put yourself in others' shoes:

The mutual inhibition between humor and empathy

Li Longjiao¹, Xiong Xinyan¹, Zhang Xiaomeng¹

¹ Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: Benign Violation Theory holds that humor arises from violations that are evaluated as benign, and because empathy towards the violation makes it more difficult to evaluate it as benign, H1 was proposed: empathy has an inhibitory effect on humor perception in the face of violation on others. On the other hand, empathic response is often accompanied by personal costs while it is socially desirable, making the motivation to avoid empathy inappropriate to express overtly. H2 suggests the belief that responding to violations with a non-serious humorous attitude is right and helpful allows the motivation to avoid empathy to be expressed, thus such belief, named as Coping Humor Belief, would have a suppressive effect on empathy. The mutual inhibition between humor and empathy was examined through four studies. Study 1 took the correlational approach: Study 1a measured the sense of humor and trait empathy in 135 Chinese university students through established scales, the results showed a significant negative correlation between coping humor and trait empathy; Study 1b administered more comprehensive scales to 194 British and American subjects, developing and validating the Coping Humor Scale at the same time. The results again supported the negative correlation between the coping-related component of humor and empathy, and the good reliability and validity of the Humor Coping Beliefs Scale, which showed the largest negative effect size correlation with trait empathy. Study 2 experimentally examined the mutual inhibitory relationship between humor components and empathy: Study 2a ($N = 140$) measured subjects' humor ratings on a video material after manipulating situational empathy and found that situational empathy priming significantly reduced subjects' perceptions of humor; Study 2b ($N = 176$) asked subjects to report their empathic responses to a character in a video after manipulating their coping humor belief, the results showed that the initiation of coping humor belief significantly reduced subjects' empathic responses. Taken together, the findings suggest that humor and empathy are mutually inhibitory, both as stable traits

and as situational responses, with humor coping beliefs as a key subcomponent. Based on the Benign Violation Theory and literatures about empathy cost, this study pioneered the idea of mutual inhibition between humor and empathy, focusing on the dialectical checks and balances between the two virtues. Practically speaking, the results inspires individuals with high trait empathy to use humor more flexibly when socializing to get a more congenial social experience, as humor is considerably appreciated in social settings.

Keywords: humor, empathy, coping humor belief

正念影响强迫症的心理机制探究

魏艳萍¹ 李书航¹ 唐文新² 陈树林¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310007, chenshulin@zju.edu.cn

² 浙江大学医学院附属精神卫生中心/杭州市第七人民医院, 杭州, 310007

摘要 引言: 正念被认为是干预强迫症的一种可能方法, 但是已有的研究发现正念对于强迫症患者的干预效果并不是完全一致的, 例如有研究发现正念中的不反应、不判断和有觉知地行动与强迫症水平成负相关, 而观察与描述成正相关或者无显著关系(Carpenter, Conroy, Gomez, Curren, & Hofmann, 2019), 也有研究发现只有不行动能够预测干预效果(Hawley et al., 2017)。因此本研究将探究正念影响强迫症的心理机制, 考察正念各维度对强迫症状水平的影响, 并探究不恰如其分的体验在正念与强迫症水平之间的中介作用。方法: 在大学以及精神专科医院中调查了 559 名被试 (男性 184 名), 平均年龄为 22.17 岁 ($SD=3.74$ 岁)。采用强迫症状分类量表修订版 (OCI-R)、正念五因素量表 (FFMQ) 以及不恰如其分的体验问卷中文版 (NJRE-C) 进行评估, 并收集人口学信息。采用相关分析、单因素方差分析以及结构方程模型进行统计推断。结果: 相关分析结果表明正念五因素中, 观察 ($r=.308, p<.001$) 与不行动 ($r=.122, p=.004$) 和强迫症水平成正相关, 描述 ($r=-.198, p<.001$)、不判断 ($r=-.465, p<.001$) 与有觉知地行动 ($r=-.461, p<.001$) 与之成负相关。将正念五个维度、NJRE、以及强迫症水平纳入模型进行路径分析, 模型拟合良好 ($\chi^2=10.458, df=4, RMSEA=0.054, CFI=0.991, TLI=0.960, SRMR=0.011$)。结果表明 NJRE 完全中介觉察、描述、不判断与强迫水平, 部分中介 (35%) 有觉知地行动与强迫水平。讨论: 本研究发现正念的五个因素对强迫症水平的影响方向是不同的。路径分析结果发现观察、描述与不判断均完全通过改变 NJRE 水平影响强迫症水平, 而有觉知地行动对于强迫症水平有直接作用, 且不行动的主效应不成立。研究结果进一步探究了正念、NJRE 与强迫症水平的作用机制, 并且表明正念干预对于强迫症的影响不是完全有益的, 应当谨慎采用正念干预强迫症。

The Psychological Mechanism of Mindfulness in Obsessive-Compulsive Disorder

Yanping Wei¹, Shuhang Li¹, Wenxin Tang², Shulin Chen¹ (corresponding author)

School of Medicine, Hangzhou, China

Abstract: Introduction: Mindfulness is considered as a possible intervention for obsessive compulsive disorder (OCD). However, previous studies found that the effects of mindfulness-based interventions were not completely

beneficial for patients. For example, one study found the facets of mindfulness like non-reactivity, non-judging and acting with awareness were negatively correlated with the severity of obsessive-compulsive disorder, while observing and describing were positively or not significantly correlated (Carpenter, Conroy, Gomez, Curren, & Hofmann, 2019). Another study found that the effect of intervention was only predicted by the level of nonreactivity (Hawley et al., 2017). Therefore, this study wanted to explore the psychological mechanism of mindfulness in OCD, to examine the relationships of five dimensions of mindfulness on the severity of OCD symptoms, and to explore the mediating effect of not just right experience (NJRE) on mindfulness and OCD. Methods: 559 subjects from universities or psychiatric hospitals (184 males) were surveyed. The average age was 22.17 years ($SD=3.74$ years). Four scales including the revised version of Obsessive-Compulsive Inventory scale (OCI-R), the Five-Factor Mindfulness Questionnaire (FFMQ), the Chinese version of Not Just Right Experience (NJRE-C), and geographic information scale were used. Correlation analyses, ANOVA, and structural equation modeling (SEM) were undertaken. Results: The results of correlation analysis showed that among mindfulness facets, Observing ($r=0.308$, $p < .001$) and Nonreactivity ($r = .122$, $p = .004$) demonstrated positive correlations, while Describing ($r = -.198$, $p < .001$), Non-judging ($r = -.465$, $p < .001$), and Acting with awareness ($r = -.461$, $p < .001$) showed negative correlations. The model of SEM consisted of five facets of mindfulness, NJRE and the severity of OCD fitted well ($\chi^2 = 10.458$, $df = 4$, $RMSEA = 0.054$, $CFI = 0.991$, $TLI = 0.960$, $SRMR = 0.011$). Results indicated that NJRE completely mediated Awareness, Describing, Non-judging and OCD, and partly mediated (35%) Acting with awareness and OCD. Discussion: The study found different effects of mindfulness facets on OCD. The results of SEM showed NJRE completely mediated Observing, Describing, Non-judging and OCD, partly mediated Acting with awareness and OCD. These findings showed the relationships of mindfulness, NJRE and OCD and indicates that it should be cautious on the application of mindfulness intervention for OCD patients considering different effects of five facets on OCD.

第二代正念干预的本土化与价值澄清：基于正念积极心理的实证研究

曾祥龙

北京师范大学心理学部，北京，100875，xzeng@bnu.edu.cn

摘 要 第二代正念干预是近年正念干预发展的最新趋势。相比于第一代正念干预，第二代正念干预的特点之一是强调外显的伦理培养。然而，第二代正念干预所传递的某些伦理与价值观念，包括第一代正念干预即有内隐传递的价值观念，比如正念冥想和慈悲冥想所隐含的效果论、享乐主义的价值观念等，并不必然正确或具有文化普适性。因此，在推广和应用正念干预时，有必要进行价值澄清，以保证干预的世俗性和适用性，并尊重参与者的价值观和选择权。本研究评估了名为“正念积极心理”的本土第二代正念干预。该六周干预的练习包括正念冥想和慈悲冥想，并整合了积极心理学、中国哲学等内容；其设置符合第二代正念干预的一般特点，并在干预的后期，通过对照不同哲学思想等方式，尽力澄清之前练习所承载的价值观念。基于 138 名被试的随机控制干预研究表明，该干预有效改善了幸福感、人际态度等心理变量，且参与者普遍认可了干预对潜在价值判断的价值澄清工作。正念积极心理不仅提供了适合中国应用的第二代正念干预，也突显了正念干预中普遍存在、尚需解决的价值澄清问题，推动正念干预作为世俗心理干预的进一步发展。本次实证研究也探讨了正念干预中价值澄清的标准（何种程度上的澄清是必要的）及其评估（参与者的评估是否是有效指标）等问题。

The localization and value clarification of the Second-Generation Mindfulness-Based Interventions: Empirical study on Mindfulness-Based Positive Psychology

Xianglong ZENG

Faculty of Psychology, Beijing Normal University, Beijing

Abstract: Second-Generation Mindfulness-Based Interventions (SG-MBI) is the new development of Mindfulness-Based Interventions (MBI). Compared to the First-Generation Mindfulness-Based Interventions (FG-MBI), one characteristic of SG-MBI is to cultivate ethics explicitly. However, some ethics and values delivered in SG-MBI, including values implicitly delivered in FG-MBI, such as consequentialism and hedonism delivered underlying mindfulness meditation and four immeasurables meditations, were not necessarily right or universally accepted across cultures. Therefore, it is necessary to make value clarification when spread and apply MBI, in order to secure the secularity and feasibility, and respect the values and right of choices. The current research evaluated an indigenous SG-MBI called “Mindfulness-Based Positive Psychology” (MBPP). This six-week training practice mindfulness meditation and four immeasurables meditations, and integrate positive psychology, Chinese philosophy. Its setting met the general characteristics of SG-MBI, and in its later sessions, tried to clarify the values underlying earlier practices by contrasting different schools of philosophy and such. A randomized controlled trial with 138 participants showed that, this training not only improved psychological variables like well-being and interpersonal relationship, and participants endorsed the work of value clarification. MBPP not only provided the SG-MBI that is suitable for application in China, and also highlighted the issue of value clarification that is widely-existed and to be solved in MBI, thus facilitate the further development of MBI as secular interventions. This empirical study also discussed the issues like standard of value clarification in MBI (the extent of necessary value clarification) and its assessment (whether participants’ evaluation is valid index).

逆境的力量：负性生活事件经历的应激接种作用以及积极重评在其中的调节作用

朱珊珊¹ 甘怡群¹（通讯作者）

1 北京大学心理与认知科学学院，北京，100871, ygan@pku.edu.cn

摘要 目的：以往的应激心理学研究多聚焦于应激的负面效应，将压力事件和逆境经历视为心理健康的危险预测因子之一。然而，最近的研究认为适度的压力经历有助于个体之后的压力应对并提升心理健康，这种效应被称为应激接种。本研究旨在探究生活事件暴露史与心理健康之间的关系，以及负性生活经历是否存在应激接种作用。方法：在间隔两个月的两个时间点收集了纵向数据。在时间点1收集了生活事件暴露史以及积极重评分数；在时间点2收集了压力感知分数，共匹配得到448份有效数据。其中，生活事件暴露史的数据收集需要被试对67个常见生活事件逐一填写，内容包括：发生时间、持续时间、影响程度。对于被试经历过的生活事件，用“影响程度*持续时间”作为该事件的分数。根据被试对事件正负性质的评价，将所有事件的得分划分为负性事件总分和正性事件总分。结果：负性事件总分与压力感知分数呈U型曲线关系，即中等程度的负性事件暴露史能够预测最低的当前压力感知水平——负性事件总分*负性事件总分（二次项）对压力感知的回归显著， $\beta=0.510$, $p=0.004$ ；负性事件总分（一次项）对压力感知的效应为 $\beta=-0.141$, $p=0.418$ 。而正性事件分数与压力感知呈线性关系， $\beta=-0.34$, $p<0.001$ 。本研究进一步探索了积极重评在上述二次曲线关系中的调节作用：负性事件总分*负性事件总分（二次项）和积极重评的交互作用显著， $\beta=0.129$, $p=0.023$ ；负性事件总分（一次项）和积极重评的交互作用不显著， $\beta=0.004$, $p=0.931$ 。进一步地将积极重评以 $M\pm SD$ 划分为高中低三组后进行分组回归，发现只有在积极重评高分组中，才呈现出负性事件总分与压力感知的二次关系，二次项的效应为 $\beta=1.456$, $p=0.001$ ，一次项的效应为 $\beta=-1.089$, $p=0.009$ ，而在中分组和低分组中均

未能验证二次曲线关系。结论：负性生活事件与当前压力感知水平存在 U 型曲线关系，具有中等程度负性生活事件暴露史的个体在当前感知到的压力水平最低，而积极重评在其中起到了调节作用。

关键词 应激接种 生活事件暴露史 负性生活事件 二次曲线模型 积极重评

The strength of adversity: the stress inoculation effect of negative life event experience and the moderating effect of positive reappraisal

Shanshan Zhu¹, Yiqun Gan¹(corresponding author)

¹ School of Psychological and Cognitive Sciences, Peking University, 100871, ygan@pku.edu.cn

Abstract: Previous studies on stress psychology focused on the negative effects of stress, and regarded stress events and adversity experiences as one of the risk predictors of mental health. However, recent studies have begun to pay attention to the positive effects of stress. It is believed that stress experience helps individuals cope with stress and improve their mental health. This effect is called stress inoculation. The present study aims to explore the relationship between life event exposure and mental health, and whether negative life experiences have the stress inoculation effect. Method: longitudinal data were collected at two time points which are two months apart. At time point 1, life event exposure and positive reappraisal were collected; at time point 2, perceived stress scores were collected, and a total of 448 valid data were matched. The data collection of life event exposure requires subjects to fill in 67 common life events one by one, including: time of occurrence, duration, and degree of impact. For the life events experienced by the subjects, we use "degree of influence * duration" as the score of the event, and according to the subjects' evaluation of the positive and negative nature of the event, divide the scores of all events into negative life event scores and positive life event scores. Results: Negative life event scores and perceived stress scores showed a U-shaped curve relationship, that is, the lowest current stress perception level can be predicted by the moderate negative events exposure—Negative life event scores * Negative life event scores (quadratic term) has a significant effect on stress perception, $\beta=0.510$, $p=0.004$; the effect of negative life events (linear term) on stress perception is $\beta=-0.141$, $p=0.418$. Positive life event scores have a linear relationship with stress perception, $\beta=-0.34$, $p<0.001$. This study further explored the moderating effect of positive reappraisal in the above-mentioned curve relationship: negative life events * negative life events (quadratic terms) and positive reappraisal have significant interaction effects, $\beta=0.129$, $p=0.023$; The interaction between negative life events and positive reappraisal was not significant, $\beta=0.004$, $p=0.931$. Furthermore, the positive reappraisal was divided into three groups of high, middle and low according to M and SD, and then the regressions of each group are carried out. It is found that only in the high group, the quadratic relationship between negative life event exposure and stress perception is presented, and the effect of the quadratic term is $\beta=1.456$, $p=0.001$, the effect of the linear term is $\beta=-1.089$, $p=0.009$. The quadratic relationship cannot be verified in the middle and low groups. Conclusion: There is a U-shaped relationship between negative life events exposure and current stress perception. Individuals who had experienced moderate negative life events have the lowest perceived stress level, and positive reappraisal plays a moderating role in it.

Keywords: stress inoculation, life event exposure, negative life event, quadratic curve model, positive reappraisal

正念减压课程的作用及起效机制：正念、自我悲悯和自我冷漠

李燕娟¹ 邹颖敏¹ 张晴雪¹ 刘兴华¹(通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871, Xinghua_liu@pku.edu.cn

摘要 背景：以往许多研究发现正念减压课程（Mindfulness-based Stress Reduction; MBSR）能提升正念和自我悲悯，降低觉知压力，且正念和自我悲悯都是重要的起效机制。然而，大多数研究仅使用 Neff 开发的自我悲悯量表总分，忽略了该量表拟合更好的两因子结构（自我悲悯和自我冷漠），且探究机制时仅考虑中介变量（即正念和自我悲悯）的前后测差值，未考察中介变量与结果变量的时间先后顺序。本研究将考虑自我悲悯量表的两个子维度，加入中测，以检验 MBSR 能否通过干预中的正念和自我悲悯/冷漠预测干预后的觉知

压力。方法：本研究为随机对照研究，招募 68 名高压人群（觉知压力量表得分 ≥ 26 分），随机分到 MBSR 组或等待控制组。MBSR 组被试获得持续八周（每周 2.5 小时）的正念课程，加一日正念日（6 小时），等待控制组在等待期间不接受任何干预，在后测结束后获得 2 日正念课程（共 12 小时）。两组被试在干预前（T0）、中（第四周结束后，T1）、后（T2）测量五因素正念量表、觉知压力量表和自我怜悯量表。结果：2（组别） $\times$ 3（测量时间）重复测量方差分析发现对于正念、觉知压力和自我冷漠，时间 $\times$ 组别交互作用显著；对于自我怜悯，时间 $\times$ 组别交互作用不显著。事后比较结果表明，相比于等待控制组，MBSR 组的正念水平在 T1 和 T2 显著提高，觉知压力和自我冷漠水平在 T2 显著降低。中介效应分析结果表明，仅 T1 正念水平在干预对 T2 觉知压力和 T2 自我冷漠的作用中起到部分中介作用。讨论：本研究重复验证了 MBSR 能通过提升高压人群的正念水平降低其觉知压力。此外，本研究将自我怜悯量表的两个子维度进行区分后，发现在 MBSR 能显著降低干预后的自我冷漠，且是部分通过提升干预前期的正念水平实现的，但并未发现 MBSR 对于自我怜悯的效果，也未发现其是正念起效的机制。这提示我们能将 MBSR 用于降低高压人群的压力水平和自我冷漠，而未来若需要提升个体的自我怜悯水平，可能还需要在干预中增加相应练习（如慈心禅）的剂量。

关键词 正念减压课程，觉知压力，自我冷漠，自我怜悯，特质正念

The Effects and mechanisms of Mindfulness-based Stress Reduction Program: Mindfulness, Self-Compassion and Self-coldness

LI Yan-juan, ZOU Yin-min, ZHANG Qin-xue, LIU Xing-hua

School of Psychological and Cognitive Sciences, Peking, 100871

Abstract: Background: Previous studies have found that mindfulness-based Stress Reduction program (MBSR) helps improve mindfulness and self-compassion, while reduce stress. Besides, mindfulness and self-compassion are potential mechanisms of change in MBSR. However, most studies only used the total score of the Self-Compassion Scale (SCS) developed by Neff, ignoring the validated two-factor structure (self-compassion and self-coldness) of the scale, and only used pre-post change score of self-compassion and mindfulness as the mediating variables, without examining the temporal sequence of mediators and outcome variables. In the current study, two dimensions of the SCS were analyzed separately, and mid-tests were added to test whether MBSR could predict post-intervention perceived stress through mindfulness and self-compassion/coldness. Methods: Sixty-eight high-stress (Perceived Stress Scale score ≥ 26) participants were recruited and randomly assigned to MBSR group or waiting-list control (WL) group. MBSR group received 8-week sessions (2.5-h per week) and a one-day (6-h) retreat, while the WL group received no intervention during the waiting period and received a 2-day (6-h per day) of mindfulness training after post-test. The Five-factor Mindfulness Scale, Perceived Stress Scale and Self-compassion Scale were measured before (T0), during (at the end of week 4, T1) and after (T2) the intervention. Results: Results of 2 (group) $\times$ 3 (measurement time) repeated-measure ANOVA found that the time $\times$ group interaction was significant for mindfulness, perceived stress and self-coldness, while the time $\times$ group interaction was not significant for self-compassion. The results of post-hoc comparison showed that compared with the WL group, mindfulness in the MBSR group were significantly increased at T1 and T2, and perceived stress and self-coldness were significantly decreased at T2. The mediating effect analysis showed that only mindfulness at T1 partially mediated the effects of the intervention on T2 perceived stress and T2 self-coldness. Discussion: The current study has repeatedly verified that MBSR can reduce perceived stress by improving mindfulness skills. In addition, after distinguishing the two dimensions of the SCS, the current study found that MBSR could significantly reduce self-coldness after intervention, which was partly achieved by improving mindfulness at the early stage of intervention. However, no effect of MBSR on self-compassion was found, nor was it found to be the mechanism of the effect of MBSR. These findings suggest that MBSR can be used to reduce the stress and self-coldness in people with high stress. However, to improve self-compassion, it may be necessary to increase the dose of corresponding exercises (such as Loving-kindness meditation) in the MBSR program.

Keywords: mindfulness-based stress reduction, perceived stress, self-coldness, self-compassion, mindfulness

针对情绪困扰的 49 天在线自助正念干预的有效性

招颖诗¹ 李燕娟² 刘兴华¹(通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871, Xinghua_liu@pku.edu.cn

摘要 背景: 线上正念近几年被广泛关注, 不少研究已证明线上正念干预对改善心理健康的效果, 然而, 研究中的线上正念大多缺乏系统结构化的干预框架, 且目前仍未有直接针对情绪困扰或者障碍的正念干预。本研究将主要探讨结合正念减压课程 (Mindfulness-based Stress Reduction; MBSR) 与针对情绪障碍的跨诊断治疗统一方案 (Unified Protocol for Transdiagnostic Treatment of Emotional Disorders, UP) 的缓解情绪困扰的正念干预 (Mindfulness Intervention for Emotional Distress, MIED) 对于改善心理健康的效果。**方法:** 本研究为单组研究, 通过公益渠道分 9 批次招募 4312 名情绪困扰人群 (K10>21 分) 和 1361 名心理工作者, 被试在完成报名问卷和前测问卷将获得持续 49 天的线上自助正念课程, 课程内容包括每日的练习音频、阅读材料和作业。所有被试在干预前 (T0)、干预期间每周 (T1-6) 和干预后 (T7) 测量五因素正念量表简版、觉知压力量表、Kessler 情绪困扰量表、阿森斯失眠量表、总体焦虑水平及其干扰程度量表和总体抑郁水平及其干扰程度量表, 从第 2 批次开始新增平静心境问卷。**结果:** 混合线性模型结果发现随着课程时间增加, 被试的压力、情绪困扰、焦虑显著降低 (大效应量); 正念及其维度和平静心境显著增加 (中效应量), 抑郁和失眠显著改善 (中效应量)。亚组分析结果发现, 和没有完成 50% 课程的学员相比, 完成至少 50% 课程的学员的在正念水平上有更大的效应量, 在其他的变量上没有相似发现。**讨论:** 本研究初步证明了缓解情绪困扰的正念干预对于改善情绪困扰以及其他心理健康问题的有效性, 但症状的缓解源于课程时间还是课程干预内容, 仍需进行随机对照实验, 进一步确认干预带来的效果。

Effectiveness of a 49-day self-help online mindfulness Intervention for emotional distress

Yingshi ZHAO, Yanjuan LI, Xinghua LIU

School of Psychological and Cognitive Sciences, Peking, 100871

Abstract: Background: Online mindfulness has attracted widespread attention in recent years and many studies proved its effect on mental health. However, most of the online mindfulness studies lacked a systematic and structured intervention framework and there is no mindfulness intervention for emotional distress so far. In the current study, we focused on the effect of Mindfulness Intervention for Emotional Distress (MIED) on improving mental health, which combined Mindfulness-based Stress Reduction(MBSR) and the Unified Protocol for Transdiagnostic Treatment of Emotional Disorders. **Method:** Our study was a single-group study. 4,312 people with emotional distress (K10>21) and 1,361 psychological workers were recruited online. After completing the registration questionnaire and the pre-test questionnaire, the participants received an online self-help mindfulness course lasting 49 days, including daily practice audio, reading materials and assignments. *Five-Facet Mindfulness Questionnaire—Short Form, Chinese Perceived Stress Scale, Kessler Psychological Distress Scale, the Overall Anxiety Severity and Impairment Scale, the Overall Depression Severity and Impairment Scale, Athens Insomnia Scale and Inner Peace State Scale* were measured before the intervention (T0), every week (T1-6) during intervention and after the intervention (T7). **Results:** Results of mixed linear model showed that with the increase of course time, stress, emotional distress and anxiety of participants decreased significantly with large effect size. Mindfulness and peace of mind increased significantly with medium effect size. Depression and insomnia also improved significantly with medium effect size. Subgroup analysis found that participants who completed at least 50% of the intervention had a larger effect size on levels of mindfulness than participants who did not complete 50% of the intervention. Similar findings were not found for other variables. **Discussion:** This study preliminarily proved the effectiveness of MIED to alleviate emotional distress and other mental health problems. However, to find out whether the relief of symptoms is due to practice time or the intervention content, a randomized controlled trial is needed.

新冠肺炎疫情下创伤后应激症状独特的纵向关系： 一项交叉滞后网络分析

蒋宛月¹² 于丽霞¹² 赵春晓¹² 任志洪¹² (通讯作者)

1 青少年网络心理与行为教育部重点实验室暨人的发展与心理健康湖北省重点实验室, 武汉, 430079

2 华中师范大学, 心理学院, 湖北武汉, 430079, 任志洪, ren@ccnu.edu.cn

摘要 背景: 新型冠状病毒肺炎疫情被认为是一种新型集体创伤, 为了解在这一特定背景下创伤后应激症状的产生和维持, 并为维护心理健康提供建议。本研究对创伤后应激症状, 以及症状和焦虑、抑郁、自杀意念, 生活质量, 社会支持之间的时间关系进行探索。方法: 通过 DSM-5 的创伤后应激障碍检查表对被试的创伤后应激症状进行两次测量, 时间间隔为六个月。基于两次测量都提供了完整数据的 81 名被试, 使用最新开发的交叉滞后网络模型构建症状, 以及包含焦虑、抑郁、自杀意念、生活质量、社会支持五个协变量的网络, 并评估症状的预测能力和被预测程度。结果: 结果表明对未来创伤后应激症状预测作用最大的是不计后果或自我毁灭行为, 其次是难以集中注意力和睡眠障碍; 被预测程度最大的症状是责备自己或他人, 其次是负性信念、闯入性的创伤记忆、与创伤相关的噩梦和创伤事件线索引起的生理反应。协变量对创伤后应激症状的发展影响较小。结论: 在新冠肺炎这一新型创伤的背景下, 不计后果或自我毁灭行为是创伤后应激症状的核心。将不计后果或自我毁灭行为作为核心的干预目标可能最为有效, 对该行为的干预可能会限制其他症状未来的发展, 从而加速康复。另外, 交叉滞后网络结果所呈现的症状之间预测和被预测的关系为理解症状发展的因果机制提供了启示。

2 School of Psychology, Central China Normal University, Wuhan 430079, China, Zhihong Ren, E-mail address: ren@ccnu.edu.cn

Abstract: Background: The Coronavirus disease 2019 (COVID-19) outbreak has been suggested as a collective trauma, which presents a continuing crisis. The current study was aimed to know the arise and maintenance of posttraumatic stress symptoms and give specified suggestions to people under the shadow of COVID-19. This study explored the temporal relationship between PTSD symptoms, , anxiety, depression, suicidal ideation, quality of life, and social support. Method: Posttraumatic stress symptoms were measured twice, six months apart, using the DSM-5 Posttraumatic Stress Disorder Checklist. Based on 81 healthy participants who provided complete data from both measurements, the newly developed cross-lagged panel network model was used to construct symptoms and networks with covariates (i.e., anxiety, depression, suicidal ideation, quality of life and social support), and the predictive power and degree of symptoms were evaluated. Results: The cross-lagged network analysis revealed self-destructive/reckless behavior was the most significant predictor of future posttraumatic stress symptoms, followed by difficulty concentrating and sleep disturbance. The most predicted symptom was blame of self or others,

followed by negative belief, intrusive thoughts, nightmares, and physiological cue reactivity. Covariates had little effect on the development of posttraumatic stress symptoms. Conclusion: Self-destructive/reckless behavior was the most central symptom in the network of posttraumatic stress symptoms related to the COVID-19 pandemic, which as an important target of interfere may have great benefits. In addition, the results of the cross-lagged panel network provide insights for understanding the causal mechanism of symptom development.

Key words: COVID-19, posttraumatic stress symptoms, network analysis, cross-lagged

摘要 幸福感分为享乐主义取向的主观幸福感和实现论的心理幸福感。而生命意义包括意义感和意义寻求两个维度。研究发现生命意义能够预测幸福感。本研究试图探讨在新冠疫情期间，抗疫医护人员和普通民众在生命意义和主观幸福感以及心理幸福感的关系方面的差异。本研究在新冠肺炎疫情爆发期间（2020年3月至4月）施测，被试为山西赴武汉的一线抗疫医护人员（405名），简称医护组，和非武汉地区的普通民众（343名），简称民众组两组。使用生命意义量表(MLQ-search)、生活满意度量表(Satisfaction with Life Scale)、正性负性情绪量表问卷(PANAS)和心理幸福感量表(Psychological Well-being Scale)调查发现，医护组在生命意义、主观幸福感和心理幸福感的得分都显著高于民众组。两组的生命意义感与生活满意度和积极情感呈显著正相关，与消极情感呈显著负相关。且相关系数其医护组显著高于民众组。生命意义的意义寻求维度与生活满意度和积极情感呈显著正相关，与消极情感呈负相关但不显著。且相关系数医护组显著高于民众组。生命意义的意义感维度和心理幸福感，意义寻求维度和心理幸福感均成显著正相关，相关系数也是医护组显著大于民众组。综上，山西赴武汉的抗疫医护人员生命意义和幸福感得分显著高于非武汉地区的普通民众，而其生命意义与幸福感的相关系数等也显著高于后者，结果提示可能是较高的生命意义帮助医护人员应对灾难性应激事件，并提升幸福感。

摘要 目的 探讨积极心理自助练习对医学生焦虑抑郁、主观幸福感及学习投入情况的影响，为改善医学生心理健康状况、促进学习投入提供有效指导。方法 选取某医科院校162名医学生作为研究对象，进行为期4周的积极心理自助练习，分别在自助练习前（T1）、练习1个月后（T2）、练习3个月后（T3）采用焦虑量表（GAD-7）、抑郁量表（PHQ-9）、总体主观幸福量表（GWB）及学习投入量表（UWES）测量其焦虑、抑郁、主观幸福感及学习投入情况。结果 重复测量结果显示：学生在经过1个月积极心理自助练习后，焦虑、抑郁、主观幸福感及学习投入情况在时间主效应上存在显著性差异（ $P < 0.05$ ），且呈现一定的变化趋势。其中在不同时间段焦虑情绪平均值分别为（ $T1=3.70 \pm 3.05$ ； $T2=2.49 \pm 2.71$ ； $T3=3.49 \pm 3.66$ ， $T1 > T3 > T2$ ，其中 $T1$ 与 $T3$ 不存在显著性差异，其他均有显著性差异），抑郁情绪平均得分为（ $T1=5.79 \pm 3.46$ ； $T2=4.03 \pm 3.10$ ； $T3=5.14 \pm 3.80$ ， $T1 > T3 > T2$ ，各时段均存在显著性差异），结果显示，在干预后第一个月焦虑抑郁情绪得分显著下降，3个月之后又开始升高，但仍低于练习之前。主观幸福感总分平均得分为（ $T1=78.48 \pm 10.19$ ； $T2=86.15 \pm 9.90$ ； $T3=82.01 \pm 10.74$ ， $T2 > T3 > T1$ ，且各时段之间均存在显著性差异），学习投入总分平均得分为（ $T1=72.87 \pm 13.96$ ； $T2=80.59 \pm 16.27$ ； $T3=76.42 \pm 15.13$ ， $T2 > T3 > T1$ ，且各时段之间均存在显著性差异），说明自助练习后第一个月主观幸福感、学习投入得分显著提高，练习后3个月较练习一个月后有所下降，但仍高于自

助练习之前得分。结论 积极心理自助练习能够有效降低医学生焦虑抑郁情绪水平,改善学习投入情况,提高主观幸福感,促进身心健康。

Abstract: Objective To evaluate the effects of positive psychological self-help exercise on anxiety, depression, subjective well-being and learning engagement for medical students, so as to provide effective guidance for improving mental health status and promoting learning engagement. Method 162 students from a medical college received positive psychological self-help exercise for 4 weeks, and were measured by Generalized Anxiety Disorder-7 scale (GAD-7), Patient Health Questionnaire-9 scale (PHQ-9), General Well-Being scale (GWB) and Utrecht Work Engagement Scale (UWES). The anxiety, depression, and subjective well-being and learning engagement were measured before intervention (T1), 1 month after intervention (T2) and 3 months after intervention (T3), respectively. Result The repeated measurement results showed that after 1 month of positive psychological self-help exercise ($P < 0.05$), there were significant differences in the main effect of time on anxiety, depression, subjective well-being and learning engagement with a certain trend. The average score of anxiety in different time periods was ($T1=3.70\pm3.05$; $T2 = 2.49 \pm 2.71$ mm; $T3=3.49\pm3.66$, $T1>T3>T2$, among which $T1$ and $T3$ had no significant difference, while the others had significant difference), and the average score of depression was ($T1=5.79\pm3.46$; $T2 = 4.03 \pm 3.10$ mm; $T3=5.14\pm3.80$, $T1>T3>T2$, all with significant differences). The results showed that anxiety and depression scores decreased significantly in the first month after the intervention, and began to increase again after 3 months, but still lower than before the exercise. The average score of the total subjective well-being score was ($T1=78.48\pm10.19$; $T2 = 86.15 \pm 9.90$ mm; $T3=82.01\pm10.74$, $T2>T3>T1$, and there were significant differences among different periods). The average score of total learning input was ($T1=72.87\pm13.96$; $T2 = 80.59 \pm 16.27$ mm; $T3=76.42\pm15.13$, $T2>T3>T1$, and there were significant differences among all time periods), indicating that subjective well-being and learning input scores were significantly improved in the first month after self-help exercise, and decreased at the third month after exercise compared with the first month, but still higher than the scores before self-help exercise. Conclusion Positive psychological self-help exercise can effectively lower the anxiety and depression level for medical students, improve learning engagement、 subjective well-being, and promote physical and mental health.

摘 要 目的: 新冠肺炎疫情爆发对人们的心理健康造成了一定影响。在居家隔离期间, 家长与儿童有更长的相处时间。家长的精神健康可能会影响儿童的 HPA 轴功能。方法: 本研究在 2020 对 119 位儿童及其家长进行了施测, 家长的抑郁和焦虑在 2020 年 5 月施测, 儿童的唾液皮质醇于 9 月份收集, 而儿童的创伤后应

激症状在 11 月份收集。结果：通过潜在剖面分析，本研究发现五种潜在模式，即：未受影响组、皮质醇调节失效组、受其他压力源影响组、皮质醇调节有效组、以及未受父母影响组。在未受影响组中，父母低焦虑抑郁，儿童低皮质醇，低 PTSS；在皮质醇调节失效组中，父母焦虑抑郁高，儿童皮质醇水平低，PTSS 高；在被其他压力源影响组中，父母焦虑抑郁低，而儿童的皮质醇水平和 PTSS 都高；在皮质醇调节有效组中，父母焦虑抑郁低，儿童皮质醇水平高，同时 PTSS 低；在未受父母影响组中，父母焦虑抑郁水平高，儿童皮质醇水平中等，儿童 PTSS 水平低。在疫情期间，未受影响组比其他组有显著更少的行为问题，学习问题，思想障碍，以及强迫性活动。在疫情后（2020 年 11 月），皮质醇调节失效组和被其他压力源影响组比其他三组有更多的学习问题。讨论：本研究发现，在疫情期间，父母的心理健康情况和儿童应对压力的反应存在不同的潜在类型。父母的心理健康和儿童的心理健康息息相关。

Abstract: This study utilized a latent profile analysis approach to examine the relationship between parent-child stress response profile with salivary cortisol levels and children's conduct problems in 119 primary school students in Hubei province during and after the outbreak of COVID-19 in China. Parent's mental health may have an important influence on children's hypothalamic-pituitary-adrenal (HPA) functioning. Parents' depression and anxiety score were measured during the outbreak of COVID-19 in Hubei in May 2020, saliva cortisol samples were collected in September 2020, and child PTSS were measure in November 2020. A latent profile analysis was conducted to identify profiles of parents' anxiety, depression, children's salivary cortisol level, and children's posttraumatic stress symptoms (PTSS) among a group of 119 primary school students at Hubei province and their parents. The result revealed five family stress response profiles: unaffected, cortisol adjustment not functioning, influenced by other stress, cortisol adjustment functioning, unaffected by parents. During the pandemic, in May, children in the unaffected group had least significantly less conduct problems, learning problems, mind obstacles, and impulsive activities than students in other groups. After the pandemic, in November, children in the cortisol adjustment not functioning group and the influenced by other stress group had significantly more leaning problems than other groups. This study revealed that parents' mental health may have significant influence on children's mental health and behavior. Interventions targeting at parents' mental health may have benefits for children as well.

疫情期间儿童创伤后应激症状和抑郁的发展轨迹：基于比较的视角

赵轶¹ 孙迅¹ 岳金明¹ 安媛媛¹（通讯作者）

¹ 南京师范大学心理学院，南京，210023，anran220@163.com

摘要 背景：2020 年初疫情期间，居家隔离所带来的创伤后应激症状（Posttraumatic stress disorder symptoms, PTSS）和抑郁情绪可能对儿童的身心发展带来负面影响。家庭抗逆力（Family resilience）从家庭整体应对危机的能力出发，可以帮助儿童缓解这两种危机下常见的心理反应。本研究基于比较的视角考察了疫情流行初期儿童 PTSS 和抑郁轨迹，以探讨疫情期间两类负性情绪动态发展的规律性和差异性，并探究儿童感知到的家庭抗逆力对该群体 PTSS 和抑郁发展亚类型的预测作用。方法：选取江苏省四所中小学的 883 名学生（男生

452 人, 女生 431 人, 平均年龄 11.41 ± 2.27 岁), 使用自编人口学量表、创伤后应激障碍检查量表 (PCL-5)、流调中心儿童抑郁量表 (CES-DC) 和儿童家庭抗逆力量表 (FRAS-CR) 于 2020 年 2 月底、3 月中、3 月底进行三个时间点的追踪测评, 并采用潜变量混合增长模型和多元逻辑回归模型进行数据分析。结果: 疫情爆发初期 (2020 年 2 月至 3 月), 儿童 PTSS 的发展轨迹存在 2 个亚类型, 分别是持续稳定组 (71.1%) 和先高后低组 (28.9%); 抑郁的发展轨迹也存在持续稳定组 (83.0%) 和先高后低组 (17.0%) 2 个亚类型。此外, 虽然家庭抗逆力总分并不能预测儿童的 PTSS 和抑郁轨迹, 但其分维度 (保持积极态度) 得分更低的儿童更有可能属于 PTSS 的先高后低组, 且预测效应显著 ($p < 0.05$)。结论: (1) 儿童 PTSS 和抑郁情绪的发展轨迹皆具有群体异质性, 并且存在相似的发展亚类型, 均可以分为持续稳定组和先高后低组两种; (2) 儿童在疫情爆发初期出现 PTSS 的概率高于抑郁情绪; (3) 家庭抗逆力对儿童 PTSS 的发展轨迹存在显著预测效应。本研究对探讨 PTSS 和抑郁的相关关系具有一定的理论价值, 并对分类识别和支持危机中儿童缓解创伤后应激症状和抑郁情绪有着一定的临床价值。

Developmental Trajectories of posttraumatic stress disorder symptoms and depression among children during COVID-19:

A comparative view

Yi Zhao¹, Xun Sun¹, Jinming Yue¹, Yuanyuan An¹

¹ School of Psychology, Nanjing Normal University, No.1 Wenyuan Street, Nanjing, China

Abstract: Background: During the early 2020 pandemic, posttraumatic stress disorder symptoms (PTSS) and depression among children caused by home quarantine were likely to negatively impact their physical and mental development. Family resilience, based on the ability of family to cope with crises as a whole, can help children alleviate these two prevalent psychological reactions under crises. Based on a comparative perspective, this study examines the trajectories of PTSS and depression in children at the early days of pandemic, in order to explore the regularity and differences of the dynamic development of two categories of negative emotions. and explores the predictive effect of children's perceived family resilience on PTSS or depression sub-types of development. Methods: A total of 883 students (452 boys, 431 girls, average age 11.41 ± 2.27 years) were selected in four primary and secondary schools in Nanjing. They were assessed with a self-designed demographic scales, the PTSD Checklist for DSM-5 (PCL-5), the Center for Epidemiologic Studies Depression Scale for Children (CES-DC) and the shortened Chinese version of the Family Resilience Assessment Scale (FRAS-CR) in late February, mid-March, and late March, 2020, respectively. Latent mixture growth model (LGMM) and a multi-logistic regression model were used for data analysis. Results: There were two PTSS trajectories in children, namely, the continuous stable group (71.1%) and the moderate decreasing group (28.9%). There were also two depression trajectories in children: the continuous stable group (83.0%) and the moderate decreasing group (17.0%). The total family resilience score did not predict children's PTSS and depression trajectories, but children with lower scores in the sub-dimension (maintaining a positive outlook) were more likely to be in the moderate decreasing PTSS group, and the predictive effect was significant ($p < 0.05$). Conclusion: (1) Displaying group heterogeneity, the developmental trajectories of PTSS and depression had similar sub-types: the continuous stable group and the moderate decreasing group. (2) Children had a higher probability of developing PTSS than depression early in the pandemic. (3) Family resilience can significantly predict the trajectories of children's PTSS. This study had a certain theoretical value for exploring the correlation between PTSS and depression, and the current findings also had a number of clinical implications for identifying and supporting the alleviation of PTSS and depression among children in crises.

失独父母创伤后应激障碍的症状网络结构

布威佐热姆·艾力^{1,2} 陈雅茹^{1,2} 刘正奎^{1,2} (通讯作者)

1 中国科学院心理研究所, 北京, 100101

2 中国科学院大学心理系, 北京, 101408, liuzk@psych.ac.cn

摘要 对于独生子女的父母来说, 他们唯一的孩子去世是一种伤害性极强的创伤事件, 这种白发人送黑发人的悲痛通常会导致创伤后应激障碍 (posttraumatic stress disorder, PTSD)。以往的研究常关注失去独生子女的父母 (中国的研究中通常称作失独父母) PTSD 总分, 少有研究从症状视角关注失独父母的 PTSD。本研究旨在探究失独父母创伤后应激障碍的症状网络结构从而了解失独父母 PTSD 发生机制。本研究采用横断面的问卷调查方式, 从 2016 年 11 月至 2017 年 7 月共调查了中国 10 个城市的 385 名失独父母。被试的纳入标准是至少在 1 年前失去了独生子女, 且目前没有养育其他小孩, 女性参与者必须年满 49 岁, 这意味着她们已经过了生育年龄。采用 DSM-5 创伤后应激障碍量表 (PTSD checklist for DSM-5, PCL-5) 测量 PTSD 症状。采用 R 语言 qgraph 和 bootnet 代码包对数据进行网络分析。症状网络分析结果显示: (1) 兴趣减退 (diminished interest)、过度惊吓 (exaggerated startle)、易怒/愤怒 (irritability/anger) 和噩梦 (nightmares) 是失独父母 PTSD 症状网络的高中心性症状。(2) 以下 3 对症状之间的连接最强, 分别是: 反复出现的想法 (recurrent thoughts and nightmares) 和噩梦 (nightmares)、易怒/愤怒 (irritability/anger) 和鲁莽/自我毁灭行为 (reckless/self-destructive behavior) 之间, 以及过度紧张 (hypervigilance) 和过度惊吓 (exaggerated startle)。本研究在一定程度上表示了失独父母 PTSD 的高中心性症状和症状之间的关系, 并且具有高中心性和强度连接性的症状可以成为失独父母心理辅导中的干预靶点。总之, 本研究拓宽了学界对失独父母 PTSD 症状的认识, 并为失独父母的心理辅导工作提供一定的启示。

Abstract: Background: The death of a child is a highly traumatic event and often leads to mental health problems, including posttraumatic stress disorder (PTSD). Previous studies focused on overall PTSD after the loss of an only child; however, little attention has been paid to PTSD at the symptom level. This study aims to identify the network structure of PTSD symptoms in bereaved parents who have lost their only child, known as Shidu parents in Chinese society. Methods: A cross-sectional study enrolled 385 bereaved individuals who had lost an only child across 10 cities in China from November 2016 to July 2017. PTSD symptoms were measured by the PTSD Checklist for DSM-5 (PCL-5). Network analysis was implemented by using the R packages qgraph and bootnet. Results: The PTSD network revealed that diminished interest, exaggerated startle, irritability/anger, and nightmares were the most central symptoms. The strongest connections emerged between the symptoms of recurrent thoughts and nightmares, irritability/anger and reckless/self-destructive behavior, and hypervigilance and exaggerated startle. Conclusions: The current study provides further clarity regarding how PTSD symptoms relate to each other in bereaved parents who have lost an only child. Symptoms with high centrality and connectedness may be viable targets for intervention in bereaved parents.

中国中老年夫妻抑郁症状的纵向网络分析：个体与二元网络

张金凤¹ 屈笛扬² 黄嘉笙³ (通讯作者)

1 重庆大学公共管理学院, 重庆, 400044

2 香港城市大学社会与行为科学系, 香港

3 中山大学心理学系, 广州, 510006, huangjsh39@mail.sysu.edu.cn

摘要 抑郁症状在老年群体中普遍发生, 具有性别差异, 且在夫妻间存在较强的互依性。本研究试图通过纵向网络分析探讨中老年群体的抑郁症状间交互模式的性别差异以及个体症状如何在夫妻间相互影响。本研究的样本来源于中国健康与养老追踪调查(CHARLS)在 2011 和 2013 的两个中老年人队列追踪数据, 最终纳入分析的有效样本为 2578 对夫妻(平均年龄 55.55 岁, SD = 8.55)。该调查使用《流行病学研究中心抑郁量表-10》测量抑郁症状, 包括 10 个症状条目。本研究使用交叉滞后面板网络模型(cross-lagged panel network models)分别对丈夫个体、妻子个体以及夫妻二元的抑郁症状网络进行估计。个体网络分析结果显示, 丈夫和妻子的个体抑郁症状网络形态存在差异。在丈夫个体网络中, 作为反向症状的“愉快”相比其他症状具有更强的点出影响力(out-expected-influence), 即对网络中的其他抑郁症状有更强预测作用; 而“做事费劲”及反向症状“希望”和“愉快”则具有更高的点入影响力(in-expected-influence), 即更容易受到网络中其他抑郁症状的影响。在妻子个体网络中, “害怕”及反向症状“希望”和“愉快”具有较强的点出影响力, 且“希望”和“愉快”的点入影响力也比其他抑郁症状更强。二元网络分析结果可视化地展示了同时纳入丈夫和妻子进行分析, 抑郁症状在夫妻二元系统中呈现的整体网络特征。其中, 妻子的“害怕”症状有较高的桥接影响力(bridge expected-influence)以及桥接强度(bridge strength), 表示其在整体样本中对丈夫抑郁症状的预测作用以及双向联系程度都较强。但其后的 bootstrap 分析显示样本中夫妻二元症状网络的桥接影响力指标并不稳定, 提示二元抑郁症状网络中可能存在较多夫妻间的双向预测作用, 且预测强度和方向可能在样本中具有较大的差异性。本研究在具有全国代表性的中老年夫妻样本中估计了抑郁症状的个体与夫妻二元网络, 揭示了抑郁症状网络的性别差异以及症状在夫妻之间的交互模式。本研究结果强调了无论在个体还是夫妻层面, 抑郁症状之间都存在较强的相互预测关系, 并提示未来研究需要关注症状相互关系的异质性。

A Longitudinal Network Analysis of Depressive Symptoms in Chinese Late Middle-Aged and Older Couples: Individual and Dyadic Networks

Jinfeng Zhang¹, Diyang Qu², Jiasheng Huang³ (corresponding author)

1 Chong Qing University, School of Public Policy and Administration, Chongqing

2 City University of Hong Kong, Department of Social and Behavioural Sciences, Hong Kong

3 Sun Yat-Sen University, Guangzhou, huangjsh39@mail.sysu.edu.cn

Abstract: Depression, a serious mental health problem with high prevalence in the Chinese elderly population, has gender differences and strong interdependence within couples. Applying longitudinal network analysis in a large sample of Chinese late middle-aged and older couples, this study aimed to investigate the intra-individual interaction pattern of depressive symptoms and its gender differences, as well as the inter-individual interaction pattern of symptoms within the couple. Data were obtained from the 2011 and 2013 cohorts of China Health and Retirement Longitudinal Study (CHARLS), a longitudinal survey of late middle-aged and older adults. The final sample included in the analysis was 2578 couples (mean age = 55.55, SD = 8.55). The survey used "Epidemiology Research Center Depression Scale-10" to measure the depressive symptoms. We computed two individual networks separately in husbands and wives and a dyadic network using cross-lagged panel network models. Noticeably, husbands' and wives'

depressive symptoms showed different network structures. Specifically, in husbands' symptoms network, *Happiness* was highest in out-expected-influence (out-EI), indicating its relatively higher predictiveness to other symptoms within the network. *Hope*, *Happiness*, and *Felt everything was an effort* were higher in in-EI, which suggested that they were more susceptible to other depressive symptoms. Whereas, in wives' symptoms network, symptoms of *Fear*, *Hope*, and *Happiness* exhibited higher out-EI. Meanwhile, *Hope* and *Happiness* also were higher in in-EI. The dyadic network visualized how the partners' symptoms cohered and interacted within the couple. Specifically, wives' symptoms of *Fear* had higher bridge EI and bridge strength. It indicated that wives' *Fear* has a strong predictive effect on and strong mutual connections with husbands' depressive symptoms. However, the bridge EI estimates were unstable under bootstrapping conditions, suggesting that there might be more bi-directional predictive effects within couples in the dyadic depressive symptom network and that the intensity and direction of the effects might have great heterogeneity among the samples. This study demonstrates the networks of depressive symptoms at both individual and dyadic level in a nationally representative sample of Chinese late middle-aged and older couples. The results of this study highlight a strong mutual predictive relationship between depressive symptoms at both individual and couple levels and suggest that future research should focus on the heterogeneity of the relationship between symptoms.

Keywords: Longitudinal network analysis, Dyadic perspective, Chinese late middle-aged and older couples, Depressive symptoms

干预中自我怜悯与心理症状动态变化过程的网路分析

黄嘉笙¹ 王雨吟¹ (通讯作者)

1 中山大学心理学系, 广州, 510006, wangyuy2@mail.sysu.edu.cn

摘要 许多证据表明自我怜悯干预对心理症状具有明显改善作用,但其具体的起效机制仍未得到充分探讨。本研究试图从网络视角切入、分析干预过程中自我怜悯各成分和心理症状之间相互影响的动态过程,在网络层面揭示自我怜悯干预的起效机制。本研究基于自我怜悯压力管理在线个体干预(SCSM-OI) 2021 年度上半年参与者的干预期每日追踪数据进行分析,数据包括参与者每日报告一次的自我怜悯六成分(自我友善、自我批判、普遍人性、孤独感、正念和过度沉溺)以及抑郁、焦虑和应激症状。共有 57 名被试在 28 天的干预期间完成了不少于 21 次的每日测量,被纳入为有效样本。研究使用多层向量自回归模型(mlVAR)估计干预过程中自我怜悯成分与心理症状之间的同时网络(个体在同一时间点内的网络关系)和时序网络(交叉滞后的预测性网络关系)。结果显示,自我怜悯成分与不同心理症状的动态变化过程存在差异。例如,在自我怜悯-抑郁的时序网络中,只有普遍人性能显著预测后一天的“忧郁”症状,而自我怜悯与焦虑及应激的时序网络则较之更为密集,且存在自我怜悯成分与症状之间的双向预测关系。在自我怜悯-焦虑的时序网络中,自我批判具有较高的桥接影响力(bridge EI),即在自我怜悯的各成分中自我批判对焦虑症状的预测力更强;在自我怜悯-应激的时序网络中则是自我友善的桥接影响力更高。自我怜悯成分与心理症状的同时网络与时序网络也存在差异。例如,过度沉溺在同时网络中与抑郁症状的桥接联系较强,但在时序网络中则不然。而自我批判虽然在时序网络中对焦虑症状的桥接影响力较高,在同时网络中与焦虑症状的联系却较弱。自我友善与应激症状中的“失控感”在时序网络中具有正向的双向预测关系,但在同时网络中却呈现显著的负相关。本研究结果表明干预过程中自我怜悯成分对抑郁、焦虑与应激症状分别具有独特的动态影响过程。其中时序与同时网络的差异性也提示着未来研究应使用更密集的报告周期澄清自我怜悯各成分与心理症状变化的具体因果机制。

The Network Dynamics of Self-Compassion and Psychological Symptoms during Intervention

Jiasheng Huang¹, Yuyin Wang¹

¹ Department of Psychology, Sun Yat-sen University, Guangzhou

Abstract: Self-compassion (SC) interventions showed promising effects on psychological symptoms, but the mechanisms of SC interventions have not been adequately explored. Adopting a network perspective, this study aimed to investigate the dynamics of SC components and psychological symptoms during an intervention. We used the daily report data of participants of the Self-Compassion Based Stress Management-Online Individual (SCSM-OI) on the first half of 2021, which consisted of six components of SC (self-kindness, self-judgement, common humanity, isolation, mindfulness, and over-identification) as well as symptoms of depression, anxiety, and stress. The valid sample included 57 participants who completed at least 21 times of daily reports during the 28-day intervention. This study used multilevel vector autoregressive model (mlVAR) to estimate the contemporaneous and the temporal networks of SC components and psychological symptoms during SCSM-OI. Results showed that the network dynamics differed across categories of symptoms. For example, in the SC-depression temporal network, only common humanity significantly predicted the symptom of Felt depressed on the next day, but the SC-anxiety and the SC-stress temporal networks were denser, demonstrating mutual predictive effects between SC components and symptoms. Self-judgement was high in bridge expected influence (bridge EI) in the SC-anxiety temporal network while Self-kindness had a higher bridge EI in the SC-stress temporal network. The contemporaneous and the temporal networks of SC and symptoms also differed. For example, Over-identification showed strongest a bridge connection with depressive symptoms in the contemporaneous network but not in the temporal network. Self-judgement had a strong bridge EI with anxiety symptoms in the temporal network but not in the contemporaneous network. Self-kindness showed positive and mutual predictive effects with Loss of control in the temporal network, but a significant negative association in the contemporaneous network. Our findings reveal the unique dynamics of SC and different kinds of psychological symptoms. The differences between the temporal and contemporaneous networks encourage future studies using more intensive measurement intervals to clarify the causal dynamics of SC components and psychological symptoms.

摘要 自杀三阶段理论是自杀意念-行为框架下的一个新生理论, 强调心理痛苦、绝望、联结感、自杀能力以及自杀意念在自杀行为形成中的作用。但目前直接验证自杀三阶段理论的实证研究多采用以变量为中心的方法, 其研究结论主要基于样本的平均水平得出, 忽视了个体间的差异, 无法准确地揭示自杀意念及行为产生的机制。因此, 本研究在“以人中心”的研究视角下, 采用问卷法对太原、济南、聊城、重庆的 1947 名中国大学生 (M 年龄 = 20.06, SD = 1.37; n 男性 = 960) 进行调查, 再进一步检验自杀三阶段理论的合理性。具体而言, 本研究以心理痛苦、绝望、联结感、自杀能力和自杀意念作为指标, 利用潜在剖面分析 LPA 来识别大学生自杀风险的不同亚群体。研究结果表明, 大学生自杀风险亚类别可以分为: 无自杀意念组 (73.45%), 低自杀意念组 (16.01%), 高自杀意念组 (7.70%) 和自杀行为风险组 (2.80%) 四类, 各亚类别间的异质性主要体现在自杀尝试水平上。无自杀意念组中的个体感受到的心理痛苦和绝望水平最低; 低自杀意念组中的个体虽然感受到了心理痛苦和绝望, 但两者的水平并未超过联结感; 高自杀意念组中的个体感受到的心理痛苦和绝望水平超过了联结感, 但自杀能力水平相对较低; 自杀行为风险组中的个体不仅心理痛苦和绝望水平超过了联结感, 而且自杀意念和自杀能力水平最高。此外, 自杀行为风险组的个体自杀尝试水平显著高于

其他三类亚群体。研究结果不仅支持了自杀三阶段理论的合理性，而且提示我们针对不同自杀风险人群构建多重预防机制和干预方案。

Examining Suicide Risk Through the Lens of the Three-Step Theory: A Latent Profile Analysis in Chinese University Students

Yuan Zhou¹, Jiedi Liu¹, Hongxia Fan¹

¹ School of Educational Science, Shanxi University, No. 92 Wucheng Road, Taiyuan 030006, China

Abstract: The Three-Step Theory (3ST) of suicide is a new theory rooted in the ideation-to-action framework, which emphasizes the role of pain, hopelessness, connectedness, suicide capacity and suicide ideations in the formation of suicide behaviors. However, previous empirical studies that directly verify the 3ST all used variable-centered approaches, which conclusions are mainly based on the average level of the sample, ignoring the differences between individuals, and could not accurately reveal the mechanism of suicide ideations and behaviors. Therefore, under the research perspective of "person-centered", the current study used questionnaire method to investigate 1947 Chinese university students in Taiyuan, Jinan, Liaocheng and Chongqing (Mage = 20.06 years, SD = 1.37; n male = 960) to further examine the rationality of the 3ST. Specifically, this study used psychache, hopelessness, connectedness, suicide ideation and suicide capacity as indicators, and used potential profile analysis (LPA) to identify distinct suicide risk profiles. The results showed four different suicide risk profiles: non-suicide ideation subgroup (73.45%), low suicide ideation subgroup (16.01%), high suicide ideation subgroup (7.70%) and suicide behavior risk subgroup (2.80%). The heterogeneity between subgroups is mainly reflected in the level of suicide attempts. The individuals in the non-suicide ideation subgroup felt the lowest level of psychache and hopelessness. The participants in the low suicide ideation subgroup felt psychache and hopelessness that did not exceed the connectedness. Only psychache and hopelessness felt by the individuals in the high suicide ideation subgroup exceed the level of connectedness, but suicide capacity was relatively low. Participants' psychache and hopelessness in the suicide behavior risk subgroup exceed connectedness and have the highest level of suicide ideations and suicide capacity. In addition, participants in the suicide behavior risk subgroup had significantly higher levels of suicide attempts than the other three subgroups. The results support the rationality of the 3ST and suggest that it is critical to construct multiple prevention mechanisms and targeted intervention programs for different suicide risk groups.

负性认知偏向对创伤后应激障碍的联合作用及纵向预测

赵子仪 任志洪（通讯作者）

青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，
武汉，430079，ren@mail.ccnu.edu.cn

摘要 创伤后应激障碍（PTSD）是一种以直接或间接方式接触一个或多个实际的或被威胁的死亡、严重创伤或性暴力事件之后所发展出的心理障碍。根据 PTSD 的认知模型，对负性刺激的认知偏向（注意偏向、评估偏向和记忆偏向）是 PTSD 产生、维持和发展的重要机制，既有较多关注单一认知偏向对 PTSD 的预测作用，而忽略了认知偏向之间的复杂关系及其对 PTSD 症状发展可能存在的联合作用。基于此，本研究采用横断和追踪研究设计，以 60 具有 PTSD 症状的大学生（Mage = 20.17, SDage = 2.11）为被试，使用混乱句子范式和 Eye-Link 眼动追踪方法探究负性信息加工模式（注意偏向、评估偏向、记忆偏向）对 PTSD 症状的联合作用模式及纵向预测效果。研究结果显示：（1）对负性刺激的注意选择/注意维持偏向可通过作用于负性评估偏向进而影响负性记忆偏向，负性注意选择偏向和评估偏向均可显著正向预测 PTSD 症状；（2）与弱环节预测模式相比，累加预测模式对 PTSD 症状的纵向预测效果更佳，即 PTSD 的症状发展并不取决于负性偏向

最严重的单一认知加工阶段，而取决于具有负性偏向的认知加工阶段的整体数量和水平。本研究结果为联合认知偏向假说提供了新的实证研究支持，未来可尝试对 PTSD 个体的负性认知模式进行整体干预。

The predictive effect of combined cognitive biases on Posttraumatic stress disorder symptoms

Ziyi Zhao, Zhihong Ren

Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Key Laboratory of Human Development and Mental Health of Hubei Province, School of Psychology, Central China Normal University, Wuhan; China

Abstract: Posttraumatic stress disorder (PTSD) is a psychological disorder which develops after the exposure to actual or threatened death, serious injury, or sexual violence in direct or indirect ways. Cognitive models of PTSD postulate that negative information processing biases of attention, appraisal and memory play key roles in the onset and maintenance of PTSD. The previous studies have revealed the predictive effect of a single negative cognitive bias on the level of PTSD. However, both theoretical and empirical studies in recent years have shown that the effects of negative cognitive bias on PTSD are not independent of each other. On the contrary, they affect the symptom level and longitudinal development of PTSD in a combined manner. In view of above, the present study was to explore the predictive effects of combined cognitive biases (attentional bias, appraisal bias, and memory bias) and the integrative models (additive model vs. weakest link model) on PTSD symptoms. Sixty college students ($M_{age} = 20.17$, $SD_{age} = 2.11$) with PTSD symptoms completed a computerized version of the scrambled sentences test while their eye movements were recorded. Posttraumatic Stress Disorder Checklist-5 was administrated to measure participants' PTSD symptom. Results showed that (1) negative attentional selection bias and maintenance bias could significantly positively predict negative appraisal bias, and negative appraisal bias could significantly positively predict negative memory bias. In addition, negative attentional selection bias and appraisal bias could significantly positively predict the level of PTSD symptoms. (2) The additive model, instead of the weak link model, could significantly predicted the level of PTSD. That was to say, the development of PTSD symptoms does not depend on the dominantly cognitive process toward negative material, but on the overall number and level of negative bias cognitive process. The results of this study provide new empirical support for the combined cognitive biases hypothesis, and also suggest that clinical interventions for PTSD should consider the combined negative cognitive biases, rather than a specific stage of cognitive processing.

心理咨询中的责任归因与会谈质量的关系： 两个归因维度和来自咨询师与当事人的不同视角

赖丽足¹ 任志洪²

1 华中师范大学心理学院，武汉，430079

2 华中师范大学心理学院，武汉，430079, ren@ccnu.edu.cn

摘要 问题解决的责任归因和问题发生的责任归因是心理咨询中两个重要的归因维度，但已有研究对责任归因与咨询效果的关系研究不一致，且只关注当事人视角。本研究首先考察咨询师和当事人评价的问题发生和问题解决责任归因对各自评价的会谈质量以及当事人自评的症状改善之间的影响，其次关注会谈过程中，咨询师和当事人责任归因一致性对会谈质量和当事人症状改善的影响。在一所高校心理咨询中心进行数据收

集,共招募 91 名当事人,44 名咨询师参与研究。每次会谈结束后邀请咨询师和当事人分别填写对当事人问题发生和问题解决的责任归因,以及会谈过程质量评价。纳入分析的共 411 次会谈,采用主客体互倚模型结合多水平模型探究问题发生和问题解决责任归因对会谈质量在被试内水平和被试间水平上的主体效应和客体效应。结果显示,当事人对问题发生和责任归因在被试间既存在主体效应,也存在客体效应,即越将问题发生责任归结为自身的当事人越能预测自评的会谈质量,也能预测咨询师评的会谈质量,该效应在被试内不存在。咨询师和当事人对问题解决的责任归因在被试内和被试间水平都存在主体效应,并只在被试内水平上存在客体效应,问题解决责任归因到当事人越高的咨询师或者当事人,都越能预测自身评价的会谈质量但不能预测对方评价的会谈质量,且随着会谈进程变化,问题解决责任归因越高,自评或者对方评价的会谈质量也越高。进一步采用多项式结合响应面分析考察咨询师和当事人的责任归因一致性对会谈质量的影响。结果显示,以当事人评价的会谈质量为结果变量时,问题发生责任越不一致,当事人评价的会谈质量越差;一致高问题解决责任归因下的会谈质量比一致低问题解决责任归因下的会谈质量好,且问题解决责任归因越不一致,当事人评价的会谈质量越差。以咨询师评价的会谈质量为结果变量时,问题发生责任归因一致性对结果没有影响,但是问题解决责任归因下,一致高问题解决责任归因的会谈质量高于一致低问题解决责任归因,随着随着问题责任归因增加,咨询师评价的会谈质量先升后降。本研究从责任归因的不同维度和不同评价者深入考察了责任归因和会谈质量的关系,为进一步实践和应用提供启示,心理咨询中需要更加关注问题解决的责任归因。

The relationship between responsibility attribution and session quality: Two dimensions and two-person perspectives

Lai Lizu, Ren Zhihong

Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education;
School of Psychology, Central China Normal University; Key Laboratory of Human Development
and Mental Health of Hubei Province, Wuhan 430079, China

Abstract: The attribution of responsibility for blame and solution are two important attribution dimensions in psychotherapy, but existing studies are inconsistent with the relationship between responsibility attribution and session outcome. The present study aimed to examine the impact of blame and solution attribution evaluated by the therapists and the clients on session quality. Besides, the present study aim to focuses on the relationship between responsibility attribution congruence and session quality. Data collection was conducted in a psychological counseling center in a university, and 91 clients and 44 counselors were recruited to participate in the research. After each session, the therapist and the client were invited to fill in responsibility attribution questionnaire, as well as the session quality evaluation. A total of 411 sessions were included in the analysis, and the actor and partner effect model combined with the multi-level model was used to explore the actor and partner effects of blame and solution attribution responsibility on the session quality at the between and within dyads level. The results shows that the client rated blame attribution responsibility has both a actor effect and a partner effect between dyads. That is, clients who blame themselves more for their problems has higher client-rated or therapist- rated session quality compared the clients who blame themselves less. Actor and partner effect of client-rated blame attribution not exist within dyads. There are actor effects of client rated or therapist rated solution attribution between and within dyads and partner effects only exists within dyads. Polynomials combined with response surface analysis was conducted to investigate the impact of the attribution congruence of clients and therapists on session quality. The results show that when the therapist rated session quality was used as the outcome, the more inconsistent the blame responsibility, the worse the session quality. And the session quality under consistent high solution attribution is higher than that under inconsistent solution attribution. When the client rated session quality was used as the outcome, the congruence of blame attribution has no effect on the result, but under the solution attribution, the session quality with the consistent high solution attribution is higher than that under the consistent low solution attribution. As the solution attribution,

the client-rated session quality first rises and then declines. This study thoroughly investigated the relationship between responsibility attribution and session quality from different dimensions of responsibility attribution and different evaluators, and provided enlightenment for further practice and application. It is necessary to pay more attention to the problem-solving responsibility attribution in psychotherapy.

双重干预网络游戏障碍的鲁莽冲动和奖赏敏感冲动的效果研究

郑阳¹ 贺金波¹ (通讯作者) 仇雨亭¹

¹ 华中师范大学心理学院, 青少年网络心理与行为教育部重点实验室, 武汉, 430079

摘要 随着网络游戏障碍 (Internet Gaming Disorder, IGD) 被 ICD-11 正式列为一种行为成瘾障碍, IGD 的相关干预研究显得愈发重要。冲动性既是 IGD 的核心症状, 也是其关键心理机制, 因此对 IGD 的冲动性予以干预具有理论和实践的双重价值。但既往的相关干预往往只关注冲动性的单一维度, 且取得的效果也不一致。根据 Dawe 等的冲动二因素模型, 奖赏敏感冲动 (Reward Sensitivity/Reward Drive) 使成瘾者更容易趋近成瘾奖赏, 鲁莽冲动 (Rash Impulsiveness) 使成瘾者无法抑制成瘾行为。本研究以冲动二因素模型为理论基础, 通过《网络游戏成瘾量表》(马庆国, 戴坤懿, 2011) 招募了四组 IGD 被试, 通过比较四组被试在干预前后的不同维度冲动性得分, 探究单一的鲁莽冲动或奖赏敏感冲动干预与综合干预方案是否存在不同效果。前测中使用信号停止任务 (Stop Signal Task, SST) 测量被试的鲁莽冲动, SRC 任务 (Stimulus-Response Compatibility, SRC) 测量被试的奖赏敏感冲动。接着进行行为训练, 对前三组被试分别采用 Go/No-go 训练干预鲁莽冲动、SRC 训练干预奖赏敏感冲动、Go/No-go 和 SRC 综合训练双重干预鲁莽和奖赏敏感冲动, 第四组被试为控制组, 不进行任何训练。训练每天进行 1 次, 持续 15 天, 之后进行 IGD 分数、SST 和 SRC 的后测, 并在后测结束的 30 天后对所有被试进行线上问卷的追踪测量。结果发现: ①与训练前测相比, Go/No-go 训练组被试在后测中的鲁莽冲动水平显著降低, SRC 训练组被试在后测中的奖赏敏感冲动水平显著降低, 而综合训练组被试在后测中的两种冲动水平均显著降低 (图 A、B); ②与训练前测相比, 三组干预被试中, 只有综合训练组被试在追踪测量中的 IGD 分数显著降低 (图 C), 且综合训练组被试的冲动性改变量对 IGD 分数改变量的解释力显著高于单一 Go/No-go 和 SRC 训练组。结果表明, Go/No-go 和 SRC 范式的两种行为训练能够分别有效改善 IGD 的鲁莽冲动和奖赏敏感冲动, 但两种行为训练结合的干预效果优于单一训练。

A Study of the Effects of a Dual Intervention for Rash Impulsiveness and Reward Sensitivity in Internet Gaming Disorder

Yang Zheng, Jinbo He, Yuting Qiu

School of Psychology, Central China Normal University, Key Laboratory of Adolescent Cyberpsychology and Behavior of Ministry of Education, Wuhan, 430079

Abstract: With Internet Gaming Disorder (IGD) officially listed as a behavioral addiction disorder by ICD-11, research on IGD-related interventions has become increasingly important. Impulsivity is both a core symptom and a key psychological mechanism in IGD, and therefore interventions for impulsivity in IGD have both theoretical and practical value. However, previous related interventions have tended to focus on a single dimension of impulsivity and have achieved inconsistent results. According to Dawe et al.'s two-factor model of impulsivity, reward sensitivity/reward drive makes addicts more likely to gravitate toward addictive rewards, and rash impulsiveness prevents addicts from suppressing addictive behaviors. Using the two-factor model of impulsivity as a theoretical basis, four groups of IGD subjects were recruited by the Online Game Addiction Scale (Ma & Dai, 2011) to investigate whether there were different effects of a single rash impulsiveness or reward sensitivity intervention versus a combined intervention program by comparing the impulsivity scores of the four groups on different

dimensions before and after the intervention. The Stop Signal Task (SST) was used in the pretest to measure subjects' rush impulsiveness and the Stimulus-Response Compatibility task (SRC) to measure subjects' reward sensitivity. The first three groups of subjects were trained with Go/No-go training focused on rush impulsiveness, SRC training focused on reward sensitivity, and combined Go/No-go and SRC training focused on both rush impulsiveness and reward sensitivity, and the fourth group of subjects was the control group without any training. Training was conducted once a day for 15 days, followed by post-testing of IGD scores, SST and SRC, and follow-up measurements of the online questionnaire were administered to all subjects 30 days after the post-test. The results found that (1) subjects in the Go/No-go training group only had significantly lower levels of rush impulsiveness, subjects in the SRC training group only had significantly lower levels of reward sensitivity, and subjects in the combined training group had significantly lower levels of both impulsivity (Figure A and B); (2) among the three intervention groups, only the subjects in the combined training group had significantly lower IGD scores in the follow-up measure (Figure C), and the explanatory power of the impulsivity change for the change in IGD scores was significantly higher in the combined training group than in the single Go/No-go and SRC training groups. The results showed that the two behavioral trainings of Go/No-go and SRC were effective in improving rush impulsiveness and reward sensitivity in IGD, respectively, but the intervention effect of the combined behavioral trainings was better than that of the single training.

精神疾病康复期患者社会融入过程中相对剥夺感产生的原因： 基于解释现象学分析的质性研究

李常旭 黄长生

康林心理医院，长春，130117, lcx4664@163.com

摘要 处于精神疾病康复期患者的社会融入不仅能够反映社会对该类人群的接纳程度，同时也证明患者自身处于一个相对良性的康复进程。然而，多数精神疾病康复期患者的社会融入过程并不理想，甚至会出现由于社会融入失败而导致的精神疾病复发的情况。在社会融入过程中，精神疾病康复期患者会因为与其他正常群体进行比较时产生落差感，进而体验到愤怒和不满等负性情绪。这种主观的认知和情绪体验过程被称为相对剥夺感（relative deprivation, RD）。精神疾病康复期患者的相对剥夺感是影响其社会融入以及后续治疗的心理因素之一。既往研究多数倾向以正常人群为研究对象，对其相对剥夺感以及相关变量进行研究，以精神疾病康复期患者为研究人群的相对剥夺感研究相对较少。本研究通过两名临床精神科主治医师以及内科主任医师会诊筛选，最终选取 26 名处于精神分裂症康复期且之前或当前体验到相对剥夺感的患者为研究群体。在对既往文献进行梳理后拟定半结构化访谈提纲，对患者进行人均不少于 45 分钟的访谈。经过对谈话内容的整理以及信效度校验，采用解释现象学分析法（interpretative phenomenological analysis, IPA）对患者的相对剥夺感的成因进行分析，结果表明：所选取样本中有 23 名处于康复期的精神分裂症患者均有一定程度的相对剥夺感，并且，相对剥夺感围绕以下五点原因生成：1.自我污名与公众污名的消极影响。2.社会支持系统数量与质量的差异性。3.对过去经历的对比。4.当下行动能力的降低与不足。5.对持续治疗的消极情绪。本研究还发现，相对剥夺感会影响患者在院期间的康复以及出院后的用药情况，进而导致其复发率增加。并且部分康复期患者为回避相对剥夺感而对住院治疗产生依赖。本研究为医疗结构对精神疾病患者的康复阶段提供一定的心理支持建议，提升患者的自我价值感，增加患者在康复过程中的社会功能，改善患者社会认知与自我认知。

The Reason of Relative Deprivation with Mental patients during Convalescence in Social Integration : a Qualitative Research based on Interpretive Phenomenological Analysis

Changxu Li, Changsheng Huang

KangLin mental health hospital, ChangChun, JiLin

Abstract: The social integration of patients in the convalescent period of mental illness can not only reflect the degree of social acceptance of this group of people, but also prove that the patients themselves are in a relatively benign convalescent process. However, the social integration process of most patients in the convalescent period of mental illness is not ideal, and even the relapse of mental illness may occur due to the failure of social integration. In the process of social integration, patients in the convalescent period of mental illness will experience negative emotions such as anger and dissatisfaction because of the feeling of falling apart from other normal groups. This subjective process of cognitive and emotional experience is known as relative deprivation (RD). It is one of the psychological factors that affect the social integration and convalescence of patients. Previous studies tend to take normal population as the research object and study their relative deprivation and related variables, while there are relatively few studies on the relative deprivation of mental illness convalescent patients as the research population. In this study, two attending clinical psychiatrists and chief physicians were consulted and screened, and 26 patients who were in the recovery stage of schizophrenia and had experienced relative deprivation before or currently were selected as the study group. The semi-structured interview outline was drawn up after reviewing the previous literature, and the patients were interviewed for no less than 45 minutes per person. After sorting out the conversation contents and checking the reliability and validity, interpretative phenomenological analysis (IPA) is adopted to analyze the causes of the relative deprivation of patients. The results showed that 23 schizophrenic patients in the recovery period in the selected samples had a certain degree of relative deprivation, and the relative deprivation was generated around the following five reasons: 1. Negative effects of self-stigma and public stigma. 2. Differences in the quantity and quality of social support systems. 3. Comparison of past experience. 4. The reduction and deficiency of current action ability. 5. Negative feelings about continuing treatment. The study also found that a sense of relative deprivation affected patients' recovery during hospital stay and their medication status after discharge, leading to an increased recurrence rate. In addition, some convalescent patients rely on hospitalization in order to avoid relative deprivation. This study provides some psychological support suggestions for the medical structure in the rehabilitation stage of patients with mental illness, so as to improve the sense of self-worth of patients, increase the social function of patients in the process of convalescence, and improve the social cognition and self-cognition of patients.

Keywords: relative deprivation, interpretative phenomenological analysis, convalescent period of mental illness, schizophrenia, Social Integration

抑郁的核心特征：过高的应激感受性和失调的期待性快感体验

杨文辉（通讯作者）¹ 周媛¹

¹ 湖南师范大学心理学系，长沙，410081，yangwh110

摘要 背景：抑郁-应激-快感缺失启发模型假设：快感缺失源于过强的应激反应所致的大脑奖励系统功能失调。心理学上，应激感受性影响奖赏体验，从而导致抑郁的作用机制尚不清楚。本研究在该模型理论基础上，以抑郁发作缓解个体为研究对象，与抑郁症状和无抑郁症状的健康个体比较，探讨应激感受性、期待和消费性快感和抑郁的关系，回答：(1)过高的应激感受性和过低的快感体验是否为抑郁的核心特征？(2)应激感受性对奖赏期待和抑郁情绪调控作用的损害是否是抑郁发作的特征？ 方法：经两阶段抑郁障碍病例筛选后的抑郁障碍完全缓解（n=54）、有抑郁症状但追踪观察1年从未有过抑郁发作（n=69）和无抑郁症状的个体（n=320）完成时间性愉快体验量表、应激感受量表、心境与焦虑问卷和贝克抑郁量表第2版（BDI-II）。根据应激感受性得分将三组被试分为高低分组，比较组间组内快感体验、BDI-II得分差异；再进一步检验三组应激感受性对

期待和消费性快感与抑郁的调节作用及差异。结果：(1)三组期待性快感得分差异显著 ($F=15.22, P<.001$)，抑郁障碍完全缓解组依次低于 (36.71 ± 8.15) 抑郁症状组 (39.91 ± 9.28)，无症状组 (43.93 ± 7.54)；抑郁障碍完全缓解组的应激感受性得分 (30.35 ± 3.77) 依次高于其他两组 (27.87 ± 4.96) (25.34 ± 5.58) ($F=15.59, P<.001$)；(2)抑郁障碍完全缓解组的应激感受性高低分组间的期待和消费性快感得分无差异 ($t_s = 0.55-0.56, d_s = 0.15-0.16$)，BDI-II得分差异显著 ($d_s=0.62$)，抑郁症状组组间无任何显著差异 ($t_s < 1.15$)，无症状组组间在快感体验和 BDI-II 得分上均有差异 ($t_s = 2.22-9.65, d_s = 0.25-1.03$)；(3)控制焦虑因子后，应激感受性的增加与较低的快感体验水平有关 ($\beta=-0.18, t(320)=-2.75, P<.001$)；(4)抑郁症状组和无症状组中，应激感受性能调节期待性快感与抑郁 ($B=-0.59, SE=0.14, P=.00$) ($B=-0.18, SE=-0.05, P=.011$)，高应激下，期待性快感才能显著预测抑郁，而抑郁障碍缓解组中不存在调节作用。三组应激感受性均不能调节消费性快感与抑郁。结论：过高的应激感受性和过低的不受调控的期待性快感体验可能是抑郁的核心特征，也可能是区分抑郁发作的重要标志。

关键词 快感体验,期待性,消费性,应激感受性,抑郁

Core characteristics of depression: excessive stress perception and dysfunctional anticipation hedonia

Yang Wenhui¹ (corresponding author), Zhou Yuan¹

¹ Department of psychology, Hunan Normal University, Changsha, 410081, yangwh110

Abstract: Background: Depression-stress-anhedonia inspired models hypothesize that anhedonia results from brain reward system dysfunction from too strong stress responses. Psychologically, stress perception affects the reward experience, and the mechanism of action leading to depression is unknown. Based on the theory of this model and individuals with depression disorder completely relieved, this study compared with the healthy individuals of depression and without depression, and discussed the relationship between stress perception, anticipatory and consumer pleasure and depression, answering: (1) Is too high stress perception and too low hedonia the core characteristics of depression? (2) Is stress sensory damage to reward anticipatorys and depression regulation characteristic of depressive episodes? Methods: Complete remission of depression disorder ($n=54$), individuals with depression symptoms ($n=69$) and no depression symptoms ($n=320$), the temporal experience of pleasure scale, the perceived stress scale, mood and anxiety questionnaire and Beck self rating depression scale. The three subjects were divided into high groups, compare the differences between hedonia and BDI-II scores, and further test the anticipatory and difference of hedonia and depression. Results: (1) The three groups of expected pleasure scores differ significantly ($F=15.22, P<.001$) successively depression disorder completely relieved below (36.71 ± 8.15) depressive group (39.91 ± 9.28), no depression symptoms (43.93 ± 7.54); stress sensory scores (30.35 ± 3.77) successively higher than the other two groups (27.87 ± 4.96) (25.34 ± 5.58) ($F=15.59, P<.001$); (2) There was no difference between anticipatory and consumption pleasure scores in groups with depression ($t_s = 0.55-0.56, d_s = 0.15-0.16$), The BDI-II scores differ significantly ($d_s=0.62$), No significant differences between depressive groups ($t_s < 1.15$), Anticipatory hedonia and BDI-II scores differ among no depression symptoms groups ($t_s = 2.22-9.65, d_s = 0.25-1.03$); (3) After controlling the anxiety factors, Increased stress perception is associated with lower levels of hedonia ($\beta = -0.18, t(320)=-2.75, P<.001$); (4) Anticipatory hedonia and depression in the depressive and no depression symptoms groups ($B= -0.59, SE=0.14, P=.00$) ($B=-0.18, SE=-0.05, P=.011$), under high stress, anticipation pleasure significantly predicts depression, with no regulatory effects in the depression disorder relief groups. All three groups of stress perception can not regulate consumer pleasure and depression. Conclusion: Excessive stress perception and too low unregulated anticipatory hedonia may be the core characteristic of depression or an important sign of depression differentiation.

湖南师范大学心理学系, 长沙, 410081

摘要 目的: (1)检验学龄期儿童情感障碍与分裂症访谈问卷(K-SADS-PL)筛查我国青少年(10-24岁)抑郁障碍的信度和效度。(2)检查该问卷跨年龄段(即10-18岁青少年和19-24岁早期成人)的效度和信度。方法:(1)样本选取与筛查:分3次从5所中学和1所大学中选取17,132名10-24岁青少年,完成贝克抑郁量表第2版的问卷调查,筛查出有抑郁症状($n=910$)和无抑郁症状($n=425$)样本共1,355人[10-18岁青少年($n=835$,61.2%),19-24岁早期成人($n=517$,38.8%)],完成K-SADS-PL诊断访谈及汉密尔顿抑郁量表(HAMD),根据美国精神障碍诊断手册第四版(DSM-IV)的抑郁障碍诊断标准进行评估和诊断。(2)比较抑郁障碍当前发作青少年($n=103$)和早期成人($n=34$)抑郁症状分布比例和得分差异。(3)采用平行分析分别检测青少年($n=853$)和早期成人($n=517$)样本中的因子个数,再分别进行探索性结构方程模型(ESEM)分析,验证因子结构,比较模型的拟合程度最优。(4)选取部分访谈被试($n=139$)完成贝克抑郁量表(BDI-II)、特质焦虑量表(STAI)、冗思反应量表(RRS)、自杀意念量表(SIQ)评估汇聚效度。(5)评估K-SADS在抑郁障碍样本($n=171$, $n=58$)中的内部一致性信度、评分者一致性信度和重测信度($n=139$)。结果: (1)青少年在精神运动性迟滞、内疚、思维/注意力减退的比例和得分均高于早期成人;早期成人在食欲、睡眠过多的比例高于青少年。疲乏得分青少年高于早期成人。(2)平行分析揭示青少年和成人早期样本均为单因子结构,青少年样本数据与1因子模型的拟合指标($CFI=0.988$, $TLI=0.986$, $RMSEA=0.086$)可在可接受范围,各条目的因子负荷在0.73-0.93之间;早期成人数据1因子拟合指标 $CFI=0.995$, $TLI=0.995$, $RMSEA=0.057$,各条目的因子负荷在0.85-0.97之间。(3)K-SADS-PL抑郁评分总分与HAMD总分($N=1352$)高相关($r=0.73$, $P<0.01$),与RRS量表、SIQ量表($n=139$)中等正相关($r=0.31$ 、 0.38 , $P<0.01$),与STAI量表、BDI-II量表($n=139$)总分均呈低正相关($r=0.17$ 、 0.28 , $P<0.01$)。(4)抑郁障碍青少年($n=171$)早期成人($n=58$)样本的Cronbach α 系数分别为0.71和0.76,青少年中各条目间的相关系数分别在-0.11-0.65(早期成人:-0.16-0.63),各条目与总分的相关系数在0.22-0.53之间(早期成人:0.15-0.49)。评分者一致性kappa系数在0.88-1.00之间;间隔半年和一年后访谈的重测相关系数为0.21和0.24($ps<0.01$)。结论:K-SADS-PL在我国青少年中为单因子结构,具有良好的汇聚效度、内部一致性信度和评分者信度,可作为有效筛查我国青少年抑郁障碍的标准化工具。

Affective Disorders and Schizophrenia for School-Age Children-Present and Lifetime version in Chinese Adolescents

YANG Wen-Hui, LI fang et al

Department of Psychology, Human Normal University, Changsha 410081, china

Abstract: Objective: (1)To examine validity and reliability of The Schedule for Affective Disorders and Schizophrenia for School-Age Children-Present and Lifetime version (K-SADS-PL) interview in Chinese adolescents (10-24 years old). (2) To examine validity and reliability of K-SADS-PL in transitions from adolescence to early adulthood (adolescence :10-18 years, Young Adult :19-24 years) Methods: (1) Samples selection and K-SADS-PL assessed for depression: From 2013 to 2019, A representative sample of 17,132 adolescents aged from 10 to 24 years at intake was assessed for depression by BDI-II-C firstly. A total of 1,355 adolescents with depressive symptoms ($n=910$) and no depressive symptoms ($n=425$) were screened [Including adolescents aged 10-18 ($n=835$, 61.2%) and early adults aged 19-24 ($n=517$, 38.8%)]. Then The 1,355 subjects were interviewed for MDD utilizing the Schedule for Affective Disorders and Schizophrenia for School-Age Children-Present and Lifetime version (K-SADS-PL) and the the diagnosis of MDD was made based on the criteria of DSM-IV. (2) To compare the distribution of depressive symptoms and score differences between adolescents with current onset of depressive disorder ($n=103$) and early adults ($n=34$). (3) To compare the structure validity between adolescents ($n=853$) and young adult ($n=517$), Using Parallel analysis examines the factor structure, and compare the structure which is fitted

the data well. (4) Convergent validity(N=1352,n=139): Selecting some participants (n=141) complete the Hamilton Depression Inventory (HAMD), Beck Depression Inventory (BDI-II), Trait Anxiety Inventory (STAI), Redundancy Response Inventory (RRS), suicidal ideation The scale (SIQ) assesses the convergent validity of K-SADS. Then assess the K-SADS-PL of Convergent validity.(5) Reliability: To examine internal reliability (Cronbach α coefficient) and inter-rater reliability (kappa coefficient) as well as retest reliability (n=139) of K-SADS-PL in Chinese adolescents and young adult. Results: (1) Differences in how depression presents in adolescents and young adults: We found that Psychomotor retardation, Tired, thinking ability or loss of concentration symptoms were more common in adolescents MDD than adult MDD. Appetite changes, Hypersomnia symptoms were more common in adult with MDD. (2) Structure validity: Parallel analysis indicated that the single-factor structure of K-SADS-PL fitted the data well in adolescent and young adult, with CFI=0.988, TLI=0.986, RMSEA=0.086, and the factor loadings of items from 0.78 to 0.93 by EFA in adolescence; with CFI=0.995, TLI=0.995, RMSEA=0.057, and the factor loadings of items from 0.78 to 0.93 by EFA in young adult.(3) Convergent validity: The scores of K-SADS-P was imaginatively correlated with the scores of HAMD($r=0.73, P<0.01$), and appositely correlated with the scores of the dimension of concerning between self and experiences of RRS and SIQ($r=0.31, 0.48, P<0.01$), as well as the scores of BDI-II and STAI($r=0.28, 0.17, P<0.01$). (4) Reliability: The Cronbach alpha coefficient of the K-SADS-PL scores with adolescence and young adult was 0.71, 0.74. With adolescence the intercorrelations of 17 items ranged from -0.11 to 0.65 respectively, and item-total correlations ranged from 0.22 to 0.53, respectively($P<0.05$). With young adult the intercorrelations of 17 items ranged from -0.16 to 0.63 respectively, and item-total correlations ranged from 0.15 to 0.49, (respectively $P<0.05$). The test-retest coefficient was 0.21 and 0.24 respectively($P<0.01$). The inter-rater reliability of kappa coefficient ranged from 0.88 to 1.00. Conclusion: The Schedule for Affective Disorders and Schizophrenia for School-Age Children-Present and Lifetime Version is a single-factor structure. And it showed good reliability and validity in adolescents and suitable for epidemiological study.

长期潜水环境暴露对海军职业潜水员基本认知能力的累积影响

赵后雨¹ 辛文韬¹ 王义普¹ 沈兴华²

¹ 海军军医大学海军特色医学中心, 上海, 200433

² 海军军医大学海军特色医学中心, 上海, 200433, xhshensmmuhyx@163.com

摘 要 目的 海军职业潜水员是执行水下施工和救援打捞的技术人员, 潜水环境是最危险最特殊的作业环境之一。完整的认知能力是海军职业潜水员执行潜水作业的必备条件, 但是潜水环境暴露也可能会对其认知能力产生影响。本研究旨在探索长期潜水环境暴露对海军职业潜水员基本认知能力的累积影响, 以及这种影响在潜水员工龄上的分布特点。方法 采用中科院心理研究所开发的基本认知能力测量系统对某部 170 名海军职业潜水员和 155 名非潜水员的加工速度、工作记忆、空间认知、情景记忆和言语能力五项基本认知能力进行测试, 数据采用 SPSS26.0 软件, 应用 t 检验、协方差分析、双因素方差分析等方法进行统计分析。结果 海军职业潜水员的基本认知能力总平均分显著低于非潜水员 ($F=6.915, p=0.009$)。总体来看, 潜水员的五项基本认知能力得分均值均低于非潜水员, 但是只有工作记忆 ($F=14.334, p<0.001$) 和言语能力 ($F=5.861, p=0.016$) 达到显著水平。将研究对象按照工龄分为工龄 1~5 年组、6~10 年组和 >10 年组, 对各项基本认知能力进行工龄分组和实验分组的双因素方差分析。结果显示, 在工龄 1~5 年分组, 潜水员的加工速度 ($p<0.05$)、工作记忆 ($p<0.001$)、情景记忆 ($p<0.01$)、空间认知 ($p<0.05$) 和言语能力 ($p<0.05$) 低于非潜水员; 在工

龄 6~10 年分组, 潜水员的言语能力 ($p<0.05$) 低于非潜水员, 其余各项能力无组间差异; 在工龄>10 年分组, 潜水员的言语能力 ($p<0.05$) 低于非潜水员, 情景记忆 ($p<0.01$) 高于非潜水员, 其余各项能力无组间差异。结论 海军职业潜水员的基本认知能力会受到长期潜水环境暴露的影响, 不同的能力受影响程度不一样, 潜水时长不同的个体受影响程度也不一样。潜龄 1~5 年的海军职业潜水员的加工速度、工作记忆、情景记忆和空间认知能力受长期潜水环境暴露的不利影响显著, 这种影响随着潜龄的延长而逐渐减弱。而长期潜水环境暴露对海军职业潜水员言语能力的不利影响则贯穿其整个职业生涯。

Cumulative Effect of Long-term Diving Environmental Exposure on Primary Cognitive Functions of Navy Professional Divers

ZHAO Hou-yu, XIN Wen-tao, WANG Yi-pu, SHEN Xing-hua

Navy Characteristic Medical Center, Naval Medical University, Shanghai 200433 China

Abstract: Objective Navy professional divers are the technicians who carry out underwater construction and rescue, and the diving environment is one of the most dangerous and special working environments. Complete cognitive ability is necessary for navy professional divers to perform diving operations, while environmental exposure may also affect their cognitive ability. This study aimed to explore the cumulative effect of long-term diving environmental exposure on primary cognitive functions of navy professional divers, and the distribution characteristics of this effect on the length of diving. Methods The primary cognitive functions including processing speed, working memory, spatial cognition, episodic memory and speech ability of 170 navy professional divers and 155 non-divers were tested by a computer system developed by the Institute of psychology, Chinese Academy of Sciences. The data were collected and analysed by SPSS 26.0 software using methods including t-test, Covariance and two-way ANOVA. Results The total average score of primary cognitive functions of divers was significantly lower than that of non-divers ($F = 6.915, p = 0.009$). Overall, the average scores of five primary cognitive functions of divers were all lower than those of non-divers, but only working memory ($F = 14.334, p < 0.001$) and speech ability ($F = 5.861, p = 0.016$) reached significant level. According to the length of service, the subjects were divided into 3 groups: 1-5 years group, 6-10 years group and > 10 years group. The primary cognitive functions were analyzed by two-way ANOVA. The results showed that in 1-5 years group, the processing speed ($p < 0.05$), working memory ($p < 0.001$), episodic memory ($p < 0.01$), working memory ($p < 0.01$) and cognitive ability ($p < 0.05$) of divers were significantly lower than those of non-divers; in the group of 6-10 years of service, the speech ability of divers was lower than that of non-divers ($p < 0.05$); in the group of more than 10 years of service, the speech ability of divers ($p < 0.05$) was lower than that of non-divers, and the episodic memory ($p < 0.01$) was higher than that of non-divers. Conclusion The primary cognitive functions of navy professional divers are affected by long-term diving environmental exposure. The effect of long-term diving environmental exposure on navy professional divers varies among different functions and different length of diving. The processing speed, working memory, episodic memory and spatial cognitive ability of navy professional divers serving 1 to 5 years were significantly affected by long-term diving environmental exposure, and the effect gradually weakened with the extension of diving years. While the adverse effects of long-term diving environment exposure on the verbal ability of navy professional divers run through their whole career.

军队文职人员挑战性压力对工作旺盛感的影响： 被调节的中介效应

田艳辉 王争印 杜柯柯 白胜军

国防科技大学信息通信学院，陕西西安，710106，tianyanhui05@163.com

摘要 目的：探讨军队文职人员挑战性压力与工作旺盛感的关系及情感体验的中介效应和职业韧性的调节效应。方法：采用挑战性压力量表、情感指数量表、工作旺盛感量表和职业韧性量表对 450 名军队文职人员进行调查，回收有效问卷 426 份。结果：军队文职人员挑战性压力与工作旺盛感显著负相关（ $r=-0.31, P<0.01$ ）、与情感体验显著正相关（ $r=0.27, P<0.01$ ），情感体验与工作旺盛感显著负相关（ $r=-0.41, P<0.01$ ），职业韧性与情感指数显著负相关（ $r=-0.27, P<0.01$ ）、与工作旺盛感显著正相关（ $r=0.61, P<0.01$ ）；层次回归分析的结果表明，控制人口学变量的影响后，挑战性压力对工作旺盛感具有显著的负向影响（ $\beta=-0.30, P<0.001$ ），情感体验在该过程中起部分中介作用（ $\beta_1=-0.26, P<0.001$ ； $\beta_2=-0.36, P<0.001$ ），职业韧性对情感体验的中介作用起调节作用。具体来说，高职业韧性下，情感体验的中介作用较弱，中介效应值为-0.03，95%置信区间为[-0.06, 0.01]，低职业韧性情况下，情感体验的中介效应较强，大小为-0.07，95%置信区间为[-0.11, -0.03]。结论：提高军队文职人员的工作旺盛感可以从降低其面临的挑战性压力、提高积极情感体验等方面入手，尤其要加强对低职业韧性群体的教育和引导。

Challenge Stressor and Thriving at Work of Military Civilian: A moderated mediation model

TIAN Yanhui, WANG Zhengyin, DU Ke-ke, BAI Shengjun

College of Information and Communication, National University of Defense Technology,
Shaanxi Xi'an 710106, China

Abstract: Objective: To explore the relationship between the challenging stressor and thriving at work and the mediating effect of emotional experience, the moderating effect of career resilience in this process of military civilian. Methods: A total of 450 military civilian were selected and required to complete challenge stressor scale, index of general affect scale, thriving at work scale and career resilience scale, finally, 426 valid questionnaires were collected. Results: There was a significant negative correlation between challenge stressor and thriving at work ($r=-0.31, P<0.01$), and positive correlation between Emotional experience ($r=0.27, P<0.01$), and there was a significant negative correlation between emotional experience and thriving at work ($r=-0.41, P<0.01$). Finally, there was a significant negative correlation between career resilience and emotional experience ($r=-0.27, P<0.01$), and thriving at work ($r=0.61, P<0.01$). Hierarchical regression analysis shows that challenging stressor had a significant negative effect on thriving at work of military civilian ($\beta=-0.30, P<0.001$), the emotional experience played a part mediating role in this process ($\beta_1=-0.26, P<0.001$; $\beta_2=-0.36, P<0.001$), and the career resilience mediates the mediating effect through emotional experience. Specifically, the mediating effect of emotional experience was weak in the case of high career resilience, the value of mediation is -0.03, 95% CI is [-0.06, 0.01], and strong in the case of low career resilience, the value of mediation is -0.07, 95% CI is [-0.11, -0.03]. Conclusion: Reducing the challenge stressor and improving the positive experience both were effective methods to improve the level of thriving at work of military civilian, and we should especially focus the group with low career resilience.

Keywords: challenge stressor, emotional experience, thriving at work, career resilience, military civilian

军校学员生命意义感对主观幸福感的影响：正念的中介作用

田艳辉

国防科技大学信息通信学院，陕西西安，710106，tianyanhui05@163.com

摘要 主观幸福感一直是积极心理学研究的重要内容，是衡量个体心理健康的重要指标，也是近些年来学界的研究热点。军校学员受特殊环境和严格管理的影响，其心理健康状况理应得到更多的关注。本研究采用生命意义感量表、正念量表和主观幸福感量表分别对 410 名军校学员进行调查，共回收有效问卷 376 份。相关分析结果显示，生命意义感与正念 ($r=0.148, P<0.01$) 和主观幸福感 ($r=0.291, P<0.001$) 显著正相关，正念与主观幸福感间的相关也达到显著性水平 ($r=0.213, P<0.001$)。采用层次回归分析的方法对正念在生命意义感和主观幸福感间的中介作用进行检验，结果显示，在对性别、年龄、家庭所在地等人口学变量进行控制后，生命意义感能够显著正向影响主观幸福感 ($\beta=0.271, P<0.001$)、显著正向影响正念 ($\beta=0.113, P<0.05$)，正念对主观幸福感的影响也达到显著性水平 ($\beta=0.166, P<0.001$)。采用 Hayes 编写的 PROCESS3.3 程序对中介效应的大小进行检验，设置 Bootstrap=5000，结果显示，正念的中介效应值为 0.072，置信区间为 [0.01, 0.16]，生命意义感对主观幸福感的直接效应值为 0.70，置信区间为 [0.44, 0.97]，由此证明，正念在生命意义感影响军校学员主观幸福感的过程中起部分中介作用。最后，本文基于研究结论对军校学员的教育和管理提出了一些建议。

关键词 生命意义感，正念，主观幸福感，军校学员

The influence of the meaning in life on subjective Well-being of military Cadets: the Mediating effect of mindfulness

TIAN Yanhui

College of Information and Communication, National University of Defense Technology,
Shaanxi Xi'an 710106, China

Abstract: Subjective well-being has always been important content in the study of positive psychology, it is an important indicator to measure the degree of individual mental health, and is also a research hotspot in the academic field in recent years. Due to the special environment and strict management, more attention should be paid to the mental health of cadets. In our research, 410 cadets were investigated by the Meaning in Life Scale, the mindfulness scale and the subjective well-being scale, and a total of 376 valid questionnaires were collected. The correlation analysis results showed that the meaning in life was positively correlated with mindfulness ($r=0.148, P<0.01$) and subjective well-being ($r=0.291, P<0.001$), and the correlation between mindfulness and subjective well-being also was significant ($r=0.213, P<0.001$). Hierarchical regression was adopted to examine the mediation effect of mindfulness between meaning in life and subjective well-being, the results showed that meaning in life could positive influence subjective well-being ($\beta=0.271, P<0.001$) and mindfulness ($\beta=0.113, P<0.05$) significantly, and the mindfulness also had a positive influence on subjective well-being ($\beta=0.166, P<0.001$) after controlling the demographic variables such as gender, age and home location. PROCESS3.3 written by Hayes was used to verify the size of mediating effect and Bootstrap=5000. The results showed that the mediating effect value of mindfulness was 0.072, the confidence interval was [0.01, 0.16], the direct effect value between meaning in life and subjective well-being was 0.70, and the confidence interval was [0.44, 0.97], thus it could prove that mindfulness played a partial mediating role between meaning in life and subjective well-being of military cadets. Finally, in this paper, we put forward some suggestions on the education and management of military cadets based on the research.

Keywords: meaning in life, mindfulness, subjective well-being, military cadets

“和平方舟”号医院船医务人员远航期间健康相关生活质量的队列研究

刘旭¹ 韩英男² 唐碧茵¹ 胡超群¹ 张鹭鹭³ (通讯作者)

1 海军军医大学卫生勤务学系, 上海, 200433

2 海军军医大学政治工作处, 上海, 200433

3 海军军医大学卫生勤务学系, 上海, 200433, zllrmit@163.com

摘要 背景 “和平方舟”号医院船自2010年起,9次执行“和谐使命”海外人道主义医疗援助任务,到访43个国家和地区,为23万多人次提供医疗服务。在和谐使命-2017中,医院船从中国舟山,到访吉布提、塞拉利昂、加蓬、刚果、安哥拉、莫桑比克、坦桑尼亚和东帝汶8个国家,用时155天。执行此次任务的医务人员大多来自原海军总医院和海军军医大学的附属医院。大量文献研究已证实,长远航对船员身心健康有显著影响。对于平时在军队医院工作,临时抽组上医院船的医务人员来说,这155天的远航生活对他们的身心健康提出挑战。本研究旨在调查执行和谐使命-2017任务前后医务人员的生活质量及变化情况,并探讨其影响因素,以为后续任务的人力抽组提供参考建议。方法 通过健康相关生活质量SF-12量表来评价医务人员健康状况。SF-12的条目共计12条,通过生理健康总分(PCS)和心理健康总分(MCS)评估调查对象的总体生理和心理健康水平。问卷还包括年龄、性别、专业等基本信息和个人信心状态、社会与家庭支持等方面的问题。对船上所有医务人员采用队列研究设计,随访医疗队员在航行前(出发时)和航行5个月后的健康状况。资料分析采用描述性统计,两组比较采用t检验、Wilcoxon秩和检验,三组比较采用Kruskal-wallish检验,影响因素分析采用逐步线性回归分析。结果 共有91名医疗队员参加此次队列研究,占有医疗队员人数的82.73%。医疗队员在航行前的PCS和MCS均高于常模,而在经过5个月航行后,PCS和MCS均明显下降。回归分析结果显示,女性船员的PCS下降更为明显。航行前对执行任务缺乏信心的队员PCS下降更为明显;另外,医疗管理人员的PCS下降比医生、护士更为明显。在心理健康得分方面,年龄(年长)和缺乏家庭支持是导致长远航过程中MCS下降的危险因素。结论 航行前,医疗队员的健康状况无论是生理或心理都处在较好水平,而5个月的长远航对他们的身心健康均造成明显影响。女性医疗队员在长远航任务中的身体健康需要更多关注,而医院船海外人道主义救援任务给医疗管理人员造成的工作负荷和巨大压力可能是导致其生理得分较医护人员下降明显的主要原因。个人信心和家庭支持分别对生理变化和心理变化影响明显,提示在任务前做好队员的心理状态调整,获得家人支持非常重要。此外,医疗队员抽组应有一定的年龄限制。

The health related quality of life in medical staffs working on the hospital ship Peace Ark during long voyage: a cohort study

LIU Xu, HAN Yingnan, Tang Bihan, HU Chaoqun, ZHANG Lulu*

* Correspondence to Lulu Zhang, Department of Health Service, Faculty of Health Service, Naval Medical University, Shanghai 200433; E-mail: zllrmit@163.com

Abstract: Background Since 2010, the ark of peace hospital ship has carried out "harmony mission" overseas humanitarian medical assistance missions nine times, visited 43 countries and regions, and provided medical services for more than 230000 person times. In the harmony mission-2017, the hospital ship visited 8 countries, including Djibouti, Sierra Leone, Gabon, Congo, Angola, Mozambique, Tanzania and East Timor, from Zhoushan, China, for 155 days. Most of the medical staff who carried out the mission came from the former Navy General Hospital and the Affiliated Hospital of the Navy Military Medical University. A large number of literature studies have confirmed that long-distance voyage has a significant impact on the physical and mental health of seafarers. For the medical personnel who usually work in military hospitals and are temporarily recruited to the hospital ship, the 155 day long voyage challenges their physical and mental health. The purpose of this study was to investigate the quality of life and its changes of medical staff before and after the implementation of the harmonious mission-2017 mission, and to explore its influencing factors, so as to provide reference and suggestions for the manpower selection of follow-up tasks. Method Health related quality of life SF-12 scale was used to evaluate the health status of medical staff. There

were 12 items in SF-12. The overall physical and mental health level of the subjects was evaluated by PCs and MCS. The questionnaire also includes basic information such as age, gender, major, personal confidence, social and family support. A cohort study design was used to investigate the health status of all medical personnel on board the ship before and 5 months after the voyage. Descriptive statistics was used for data analysis. T test and Wilcoxon rank sum test were used for comparison between the two groups. Kruskal wallish test was used for comparison of the three groups. Stepwise linear regression analysis was used to analyze the influencing factors. Result A total of 91 medical team members participated in the cohort study, accounting for 82.73% of all medical team members. The PCs and MCS of medical team members were higher than the norm before sailing, but after 5 months of sailing, PCs and MCS decreased significantly. Regression analysis showed that PCs of female crew members decreased more significantly. In addition, the PCs of medical managers decreased more significantly than that of doctors and nurses. In terms of mental health score, age (older age) and lack of family support are the risk factors leading to the decline of MCS during long-distance voyage. Conclusion Before the voyage, the health status of the medical team members was in a good level both physically and psychologically, and the long voyage of 5 months had a significant impact on their physical and mental health. More attention should be paid to the health of female medical team members in long-distance voyage. The workload and great pressure caused by the overseas humanitarian rescue mission of hospital ship may be the main reason for the obvious decrease of their physiological scores compared with the medical staff. Personal confidence and family support have significant effects on physiological and psychological changes respectively, which indicates that it is very important to adjust the psychological state of team members before the task and obtain family support. In addition, there should be a certain age limit for the selection of medical team members.

多感觉整合促进空管员视觉搜索

董超武 高羽晨曦 孔研 晏碧华 (通讯作者)

陕西师范大学心理学院, 西安, 710062, yanbihua@snnu.edu.cn

摘 要 空中交通管制 (Air traffic control, ATC) 是保障航空安全的重要环节, 基于对管制员的人为差错及其影响因素进行研究具有重要意义。伴随我国航空业的蓬勃发展, 管制员的工作负荷逐渐增大, 尤其在机起飞、进近和降落阶段, 管制员面临视觉负荷过载, 严重影响了管制员的视觉搜索。已有研究结果显示, 通过在视觉搜索任务中加入外源性听觉线索能够有效促进视觉搜索。当前有关管制员视觉搜索的研究主要集中在改进单一视觉通道显示, 有关多感觉整合对管制员视觉搜索的影响还未展开。本研究对传统的 pip and pop 视觉搜索范式进行场景化改良, 考察在不同通道条件下外源性空间线索对视觉搜索的影响。研究包括三个实验, 反应变量包括视觉搜索的正确率、反应时和多通道竞争模型指标。实验 1 采用 2 (线索有效性: 有效线索、无效线索) × 3 (感觉通道类型: 听觉、视觉、视听觉) 两因素被试内设计, 结果表明有效的视听觉线索可以促进视觉搜索; 实验 2 采用 2 (线索类型: 常规线索、空间化线索) × 3 (感觉通道类型: 听觉、视觉、视听觉), 结果显示在视听整合条件下, 空间化视听觉线索对视觉搜索的促进作用最大; 实验 3 在实验 2 的基础上, 通过持续播放管制音频作为干扰刺激, 结果表明在干扰条件下只有空间化视听觉线索显著促进视觉搜索。结论: 多感觉整合和空间化线索可以提高管制员的视觉搜索绩效。

关键词 多感觉整合, 空间化线索, 视觉搜索

Multi-sensory integration promotes visual search for air traffic controllers

Chaowu Dong, Yuchenxi Gao, Yan Kong, Bihua Yan¹

School of Psychology, Shaanxi Normal University, Xi'an 710062, China

Abstract: Air traffic control (ATC) is an important part of ensuring aviation safety, and it is of great significance to study the human error of the controller and its influencing factors. With the vigorous development of our country's aviation industry, the workload of controllers has gradually increased, especially during the take-off, approach and landing phases of aircraft. Controllers face visual overload, which seriously affects the visual search of controllers. Previous research showed that by adding exogenous auditory cues to the visual search task can effectively promote visual search performance. The current research on the controller's visual search is mainly focused on improving the single visual channel display, and the impact of multi-sensory integration on the controller's visual search has not yet been launched. In this study, the traditional pip and pop visual search paradigm was improved in a scene, and the influence of exogenous spatial cues on visual search under different channel conditions was investigated. The research includes three experiments. The response variables include the correct rate of visual search, response time and multi-channel competition model indicators. Experiment 1 used 2 (cue validity: valid cues, invalid cues) $\times$ 3 (sensory channel types: auditory, visual, audio-visual) two-factor design within the subject, and the results showed that effective visual and auditory cues can promote visual search; Experiment 2 used 2 (cue types: conventional cues, spatialized cues) $\times$ 3 (sensory channel types: auditory, visual, audiovisual), the results showed that under the condition of audiovisual integration, spatialized audiovisual cues have the greatest effect on visual search; 3 Based on Experiment 2, we played the control audio continuously as interference stimuli in experiment 3. The results showed that only spatialized audiovisual cues significantly promote visual search under interference conditions. Conclusion: Multi-sensory integration and spatial cues can improve the visual search performance of controllers.

军人焦虑变迁的横断历史研究

陈婷丽¹ 蓝木贵¹ 朱金香¹ 黄德润¹

¹ 第二机动总队某支队, 莆田, 351100

摘要 目的: 军人是执行特殊任务的武装集团, 其职业的特殊性决定了军人经常要面临较大的生理和心理压力。他们不但要面临战争的高风险, 还要面临部队、家庭和社会应激事件等诸多问题。由于军事环境的特殊性, 使得军人焦虑发生相对普通人群更高。已有研究发现军人的心理状态随社会变迁而发生改变, 那么军人焦虑水平如何随年代变迁而变化呢? **方法:** 运用横断历史元分析的方法, 在中国学术期刊(CNKI)的中文全文数据库中, 以“军人”、“状态--特质焦虑量表”、“STAI”、“心理健康”、“心理卫生”等字段在题名、关键词、摘要或全文中搜索文献。选取 2002 至 2018 年间采用 Spielberger 编制的状态--特质焦虑量表(STAI)测量军人状态焦虑(共有 28 篇文献、28949 名被试)和特质焦虑(共有 37 篇、46425 名被试)的文献调查数据进行分析, 考察军人状态--特质焦虑水平随年代变化的趋势。结果: (1) 2002 至 2018 年军人的状态焦虑均值与年代有显著负相关($r = -0.34, p < 0.05$)。而特质焦虑均值也随年代逐渐降低, 但相关不显著。说明军人状态焦虑水平随年代变迁明显下降, 特质焦虑水平随年代变迁下降, 但不显著; (2) 2002 至 2018 年军人的状态焦虑得分下降了 6.08 分, 降低了 0.70 个标准差, 即年代的效果量为-0.70; 特质焦虑得分下降了 4.48 分, 降低了 0.56 个标准差, 即年代效果量为-0.56。近 16 年来军人的状态焦虑和特质焦虑水平均有一定程度的下降, 且状态焦虑水平下降幅度要大于特质焦虑, 这与前面的年代相关分析结果相符。结论: 2002 至 2018 年的 16 年间, 军人的焦虑水平总体上是呈下降趋势。

A cross-temporal meta-analysis of changes in soldiers anxiety

Chen Tingli¹, Lan Mugui¹, Zhu Jinxiang¹, Huang Derun¹

¹ A detachment of the second Mobile Corps , Putian , 351100

Abstract: Aim: A soldier is an armed group on a special mission, the particularity of their occupation determines that soldiers often have to face greater physical and psychological stress. They not only face the high risk of war, but also many problems such as military, family and social stress events. Due to the particularity of military environment, the occurrence of soldiers anxiety is higher than that of the general population. The study found that the psychological state of soldiers changes with the society. How does the level of soldiers anxiety change over time? Methods: Using the cross-temporal meta-analysis, In the chinese full-text database of Chinese Academic Journals (CNKI), "Soldier", "State-trait Anxiety Scale", "STAI", "psychological health", "mental health" and other fields were used to search literature in title, keywords, abstract or full text. From 2002 to 2018, the state--trait anxiety scale (STAI) developed by Spielberger was used to measure the stae anxiety of soldiers (28 articles and 28,949 subjects) and the trait anxiety of soldiers (37 articles and 46,425 subjects). The literature survery data were analyzed to investigate the trend of the soldiers state-trait anxiety level over time. Results: (1)From 2002 to 2018,the state anxiety of soldiers was negatively correlated with age ($r = -0.34, P < 0.05$), trait anxiety decreased gradually with age, but the correlation was not significant. The results showed that the level of state anxiety in soldiers decreased with the change of time, and the level of trait anxiety decreased with the change of time, but not significantly;(2)From 2002 to 2018, the score of state anxiety of soldiers decreased by 6.08 points and 0.70 standard deviations, the effect size of age was -0.70. The score of trait anxiety of soldiers decreased by 4.48 points and 0.56 standard deviations, the effect size of age was -0.56. In recent 16 years, the level of state anxiety and trait anxiety of soldiers have decreased to a certain extent, and the level of state anxiety has decreased more than that of trait anxiety, which is consistent with the results of the previous age correlation analysis. Conclusion: Over the 16 years, from 2002 to 2018, the level of soldiers anxiety is on decline.

空间定向障碍多因素影响程度分析模型

孔研 董超武 晏碧华(通讯作者)

陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室, 西安, 710062, yanbihua@snnu.edu.cn

摘 要 背景: 飞行空间定向(spatial orientation)是飞行人员对地空目标、自身飞行状态、空间位置以及自身与飞行环境之间空间关系进行识别和判断的一种认知过程。空间定向障碍(spatial disorientation, SD)是飞行员在空中飞行时, 由于视觉、前庭、心理的同时作用而对飞机姿态做出错误判断的感觉, 这种感觉往往会导致严重的飞行事故。影响空间定向障碍发生的因素较为复杂, 且由空间定向障碍(SD)引起的事故率和致死率占比高。分析影响空间定向障碍(SD)发生的因素, 可从飞行员选拔、培训以及飞行场景各个阶段避免空间定向障碍(SD)发生, 从而降低事故率。目的: 本研究旨在探究影响空间定向障碍(SD)发生的因素并对其影响程度进行分析, 得出影响空间定向障碍(SD)发生的多因素影响程度分析模型。方法: 从美国国家航空航天局(NASA)的航空安全报告系统(ASRS)数据库, 以“spatial disorientation”为关键词筛选出 2000 年至今的飞行事故, 共计 48 起。本研究基于这 48 起事故的飞行员主观报告与 50 余篇近 20 年公开发表于国内外杂志研究主题为空间定向障碍(SD)的文献, 从飞行员、飞机、飞行情境三个角度分析, 得出 22 个影响空间定向障碍(SD)发生的风险因素。根据这些影响因素构建影响空间定向障碍(SD)发生风险因素指标体系, 并邀请 120 名飞行员为每个因素的重要程度打分, 采用李克特 6 点量表, 收集到数据后使用物元分析法进行分析。结果: 使用物元分析法确定了 22 个影响因素的权重, 并通过关联度以及综合关联度的计算, 确认了每个因素的评价等级。结论: 空间定向障碍(SD)影响因素较多且关联性较强, 空间定向障碍(SD)发生的多因素影响程度综合模型为实现多因素多阶段多方法避免空间定向障碍(SD)的发生提供了一定的理论支持。

An Analysis Model of the Degree of Influencing Multi-factors of Spatial Disorientation

Kong Yan, Dong Chaowu, Yan Bihua

School of Psychology, Shaanxi Normal University, Xi an 710062, China

Abstract: Background: Spatial orientation (SD) is a cognitive process by which pilots recognize and judge ground-to-air targets, their own flight status, spatial position, and the spatial relationship between themselves and the flight environment. SD is the feeling that a pilot makes a wrong judgment on the attitude of the aircraft due to the simultaneous effects of vision, vestibule, and psychology when flying in the air. This feeling often leads to serious flight accidents. The factors affecting the occurrence of spatial disorientation are more complicated, and the accident rate and fatality rate caused by SD account for a high proportion. Analyze the factors that affect the occurrence of SD, which can avoid the occurrence of space SD from pilot selection, training, and flight scenarios, thereby reducing the accident rate. Purpose: The purpose of this study is to explore the factors that affect the occurrence of SD and analyze the degree of their influence, and obtain a multi-factor influence degree analysis model that affects the occurrence of SD. Method: From the Aviation Safety Reporting System (ASRS) database of the National Aeronautics and Space Administration (NASA), with "spatial disorientation" as the key word, a total of 48 accidents from 2000 to the present were screened. This study is based on the pilot's subjective reports of these 48 accidents and more than 50 articles published in domestic and foreign journals in the past 20 years on the subject of SD. It is analyzed from the three perspectives of pilots, aircraft, and flight situations. 22 risk factors affecting the occurrence of SD. Based on these influencing factors, an indicator system of risk factors affecting the occurrence of SD was constructed, and 120 pilots were invited to score the importance of each factor, using the Likert 6-point scale, and using matter element analysis after collecting the data Perform analysis. Results: The matter-element analysis method was used to determine the weight of 22 influencing factors, and the evaluation level of each factor was confirmed through the calculation of the degree of relevance and the comprehensive degree of relevance. Conclusion: There are many factors influencing SD and the correlation is strong. The comprehensive model of the degree of influence of multiple factors in the occurrence of SD provides a multi-factor, multi-stage and multi-method to avoid the occurrence of SD With certain theoretical support.

Keywords: spatial disorientation, matter-element analysis, aviation safety, military pilots

情境意识的预期功能评估的实验研究

张军恒 晏碧华（通讯作者）

陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室，西安，710062，yanbihua@snnu.edu.cn

摘 要 情境意识是飞行员最重要的飞行能力之一，缺失情境意识会提升飞行员人因失误的概率。Endsley(1955)提出了情境意识的信息加工三水平理论，认为情境意识是对外界环境信息的感知、理解以及对情境发展的预期。前人采用冻结探测技术、实时探测技术、SART 评定法等方法对情境意识进行了综合和分解研究，分解研究大部分集中在感知和理解水平，很少涉及预期水平。在动态情境中，感知信息“断片”情况时常发生，需要个体在缺少情境信息的情况下利用情境意识对情境发展做出预期，因此，关注情境意识的预期功能既可以丰富情境意识的多水平研究也能为减少情境缺失情况下预期错误提供理论支持。本研究自创了动态情境片段化的情境缺失来探讨情境意识的预期功能。情境为动态飞行场景，其中飞机和云朵以不同速度移动，背景为静止大山。采用掩蔽范式模拟“断片”式的情境缺失，实验 1a 考察了目标物(飞机)运动速度和遮蔽时间长短(0s、3s、6s、9s)对情境意识预期功能的影响，遮蔽期间云朵保持与飞机同方向缓慢运动，遮蔽结束后被试立刻报告飞机的俯仰角度；实验 1b 在遮蔽阶段加入干扰任务，考察干扰对情境意识中单客体态势判断的影响程度。实验 2a 在实验 1a 基础上控制了云朵运动方向，在遮蔽结束后被试立刻报告飞机和云朵的相对位置关系；实验 2b 在实验 2a 基础上加入干扰任务，考察干扰对情境意识中多客体态势判断的影响程度。

结果发现：(1) 目标速度越快、遮蔽时间越长，对飞机俯仰姿态预期越差；(2) 遮蔽时间越长，飞机与云朵的相对位置关系判断越差；(3) 干扰极大地降低了单客体和多客体态势预期绩效。

结论：“断片”探测技术可用于情境意识的预期功能评估，单客体和多客体态势判断可作为情境意识的预期功能评估指标。此外，干扰会严重影响情境意识预期功能，可能是导致情境意识丧失的重要原因。

Experimental research on the evaluation of the predicted function of situation awareness

ZHANG Junheng, YAN Bihua (corresponding author)

School of Psychology, Shaanxi Normal University, Xi'an 710062, China

Abstract: Situation awareness is one of the most important flight abilities of pilots. The loss of situation awareness will increase the probability of pilots' human errors. Endsley (1955) proposed a three-level theory about information processing of situation awareness. The theory says that situation awareness is composed of awareness and understanding of external environmental information and the prediction of situation development. Predecessors have used freeze probe techniques, real time probe techniques, situation awareness rating techniques and other methods to comprehensive and decomposed research on situation awareness. Most of the decomposed researches focused on perception and understanding, while rarely involved the prediction of situation awareness. In dynamic situations, “fragments” of perceptual information often occur. Individuals are required to use situation awareness to make predictions of situational development in the absence of situational information. Therefore, paying attention to the predicted function of situation awareness can enrich multi-level research on situation awareness and provide theoretical support for reducing predicted errors in the absence of situational information. This study created the fragments' loss of dynamic situation to explore the predicted function of situation awareness. The situation is a dynamic flight scene, in which an airplane and clouds moved at different speeds, and the background was a static mountain. The masking paradigm was used to simulate the “fragments” of situational loss. Experiment 1a examined the influence of the speed of the target (airplane) and the length of the masking time (0s, 3s, 6s, 9s) on the predicted function of situation awareness. During the masking period, clouds moved slowly with airplane in the same direction, and the subjects immediately reported the pitch angle of the airplane after the masking was over; Experiment 1b added interference tasks during the masking period to investigate the influence of the interference on the situational judgment of the single object in situation awareness. Experiment 2a controlled the directions of clouds movement on the basis of Experiment 1a, and the subjects immediately reported the relative position relationship between the airplane and the cloud after the masking was over; Experiment 2b added interference task on the basis of experiment 2a to investigate the influence of interference on multi-object situation judgment in situation awareness. The findings of the two experiments were as follows. When the target speed was faster and the masking time was longer, the predictions of the airplane' pitch angle were worse; when the masking time is longer, the judgments of the relative position relationship between the airplane and the clouds were worse; the interference greatly reduces the performance of the single-object and multi-object situation. In conclusion, the “fragment” probe technology can be used to evaluate the predicted function of situation awareness, and single-object and multi-object situation judgment can be used as the evaluation indicator of the predicted function of situation awareness. In addition, interference can seriously influence the prediction function of situation awareness and may be an important reason for the loss of situation awareness.

4 浙江大学心理科学研究中心, 杭州, 310012

摘 要 飞行安全对于民航产业的稳定快速发展至关重要, 客舱安全又是民航安全的重中之重。作为客舱工作的一线员工, 空乘人员的首要任务是确保客舱安全, 其安全绩效水平对于现代民航安全具有重要意义。已有研究表明, 主动性人格对个体的工作绩效具有显著的预测作用。此外, 个体的工作行为还会受到社会认知和组织氛围的深刻影响。因此, 本研究试图将人格特质方法、社会认知方法和组织方法相结合, 探究空乘人员安全绩效的潜在机制。我们主要关注两个研究问题: (1) 安全态度在主动性人格与安全绩效之间是否起到中介作用; (2) 安全氛围是否会影响主动性人格与安全绩效之间的关系。方法: 本研究采用主动性人格量表、安全态度量表、安全氛围量表和安全绩效量表对中国南方航空公司的 560 名空乘人员进行调查, 运用 SPSS22.0 对数据进行分析 and 处理。结果显示: (1) 主动性人格、安全态度、安全氛围与安全绩效两两之间均呈显著正相关。(2) 控制年龄和工作年限的中介分析表明主动性人格既可以直接影响安全绩效, 也可以通过安全态度的中介作用间接影响安全绩效。(3) 安全态度的中介作用受到安全氛围的调节, 安全氛围调节了主动性人格—安全态度—安全绩效这一中介过程的后半段。具体而言, 随着安全氛围水平的升高, 安全态度对安全绩效的正向影响不断减弱。结论: 本研究揭示了主动性人格对安全绩效的影响及其作用机制, 丰富了相关研究, 同时也为航空安全管理提供了一定的指导意义。首先, 航空公司在招聘过程中可以将主动性人格作为甄选标准之一。其次, 航空管理部门可以开展安全态度培训增强个体的安全态度。最后, 航空公司还可以通过营造良好的安全氛围以提升空乘人员的安全绩效。

Proactive Personality and Flight Attendants' Safety Performance: a Moderated Mediation Model

Bo Liu^{1,2}, Xiaoyang Xin^{3,4}, Ming Ji^{1,2}, Xuqun You^{1,2}

1 School of Psychology, Shaanxi Normal University, Xi'an, Shaanxi 710062, China

2 Shaanxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, Shaanxi 710062, China

3 Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, Zhejiang 310012, China

4 Center for Psychological Sciences, Zhejiang University, Hangzhou, Zhejiang 310012, China

Abstract: Flight safety is essential to the stable and rapid development of the civil aviation industry, and cabin safety is the top priority of civil aviation safety. As front-line employees working in the cabin, the primary task of flight attendants is to ensure cabin safety, and their safety performance is of great significance to the safety of modern civil aviation. Previous studies have shown that proactive personality has a significant predictive effect on individual work performance. In addition, the work behavior of individuals will be profoundly affected by social cognition and organizational climate. Therefore, this study attempts to combine personality traits, social cognitive and organizational methods to explore the potential mechanisms of flight attendants' safety performance. We mainly focus on two

questions: (1) Whether safety attitudes play a mediating role between proactive personality and safety performance; (2) Whether safety climate affects the relationship between proactive personality and safety performance. Method: The Proactive Personality Scale, Safety Attitude Scale, Safety Climate Scale and Safety Performance Scale were used to survey 560 flight attendants of China Southern Airlines and processed the data through SPSS22.0. The results showed that: (1) There was a significant positive correlation between proactive personality, safety attitude, safety climate and safety performance. (2) After controlling for age and working years, the result shows that proactive personality can directly affect safety performance, but also indirectly affect safety performance through the mediating effect of safety attitudes. (3) The mediating role of safety attitude is moderated by the safety climate, which moderates the latter half of the mediation process of proactive personality-safety attitude-safety performance. Specifically, as the level of safety climate increases, the positive impact of safety attitudes on safety performance continues to weaken. Conclusion: This study reveals the influence of proactive personality on safety performance and its mechanism, enriches related research, and also provides certain guiding significance for aviation safety management. First of all, airlines can use proactive personality as one of the selection criteria in the recruitment process. Secondly, aviation management departments can carry out safety attitude training to enhance individual safety attitudes. Finally, airlines can also improve the safety performance of flight attendants by creating a good safety climate.

君子之乐：君子人格与主观幸福感——敬畏的中介作用

葛泉语 侯玉波（通讯作者）

北京大学心理与认知科学学院暨行为与心理健康北京市重点实验，北京，100871, houyubo@pku.edu.cn

摘 要 “君子之乐”是儒学的重要议题，自孔子以来，为历代学者广泛研讨。本研究以经典文献中的哲学理论为基础，结合实证研究的相关证据，提出君子人格预测主观幸福感、敬畏在其中起中介作用的假设。为验证这些假设，本研究通过多种方法进行了考察。研究一考察君子人格对主观幸福感的预测作用；研究二引入敬畏的内在机制，采用跨时间点测量的方法对特质性敬畏在君子人格对主观幸福感效应中的中介作用进行考察；研究三考察受到回忆启动操纵的敬畏对主观幸福感的影响，弥补自我报告的问卷测量法的局限；研究四通过视频启动法将敬畏进行人为控制，考察其对君子人格与主观幸福感关系的影响，以进一步厘清因果关系；研究五采用中美两国被试，检验上述效应在不同的文化背景中的适用性。通过多样的研究方法，本研究发现，君子人格显著地正向预测主观幸福感。这一结果具有较强的稳健性，在对主观幸福感的5种不同自我报告问卷测量中表现出了一致性，无论是同时时间点测量还是跨时间点测量都支持这一效应，无论是中国文化背景还是美国文化背景都发现了该效应。此外，君子人格显著地正向预测敬畏，敬畏显著地正向预测主观幸福感，敬畏在君子人格对主观幸福感的正向效应中起到了部分中介作用。无论是测量的敬畏还是操纵的敬畏都支持这一效应，但这一效应只在中国文化背景中存在，在美国文化背景中没有发现该中介作用。本研究通过实证研究验证了经典文献广为论述的君子人格与主观幸福感的关系，并发现其中的内在机制部分地通过敬畏来达成。这对我们丰富对君子人格的理解、探寻“君子之乐处”具有理论意义，对于当今社会积极心理议题也具有现实价值。

Confucian Ideal Personality Traits (Junzi Personality) and Subjective Well-Being: The Mediating Role of Awe

Xiaoyu Ge, Yubo Hou

The School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Address: Room 1222, Wang Kezhen Building, Peking University, No. 5, Summer Palace Road, Haidian District, Beijing, China, 100871

Abstract: “Junzi and well-being” is an important topic in Confucianism. Since Confucius, it has been widely discussed by scholars of all ages. Based on the philosophical theories in the classical literature and the relevant evidence of empirical research, I proposed the hypotheses that Junzi personality positively predicts subjective well-being through the mediation of awe. In order to examine these hypotheses, five studies were conducted with various methods. In Study 1, the proposed effect of Junzi personality on subjective well-being was examined. Study 2 shed light on the underlying mechanism of awe, and the mediating role of trait awe in the effect of Junzi personality on subjective well-being were examined with the method of measuring in three stages over a 4-month period. In Study 3, awe were manipulated with the method of recall priming, and the effect on subjective well-being were examined, which made up for the limitations of self-reported questionnaire measurement. In Study 4, awe were manipulated with the method of video priming, and how it impacted the effect of Junzi personality on subjective well-being were examined, so as to further clarify the causal relationship. In study 5, both Chinese and American participants participated the study, and the applicability of the above effects in different cultural backgrounds were examined. Through a variety of research methods, the results showed that Junzi personality significantly positively predicted subjective well-being. This result had a strong robustness, showing consistency in the five different self-reported questionnaire measures of subjective well-being. Both the cross-sectional measurement and cross-time point measurement supported this effect. And the effect was found in both Chinese and American cultural background. In addition, Junzi personality significantly positively predicted awe, awe significantly positively predicted subjective well-being, and awe partially mediated the positive effect of Junzi personality on subjective well-being. Both measured awe and manipulated awe supported this effect. But this effect only existed in Chinese cultural background, rather than American cultural background. These studies examined the relationship between Junzi personality and subjective well-being, which was widely discussed in the classical literature, and shed light on awe as a partial underlying mechanism. These findings enriched our understanding of Junzi personality, and were also of practical value for the positive psychological issues in current society.

摘要 大学生就业问题一直备受关注，这是大多数大学生必须要面临的问题，对于学生及其背后家庭都有着重要的意义。大学毕业生数量逐年增加、传统就业观念的束缚以及社会提供就业岗位数量的限制等诸多因素可能导致大学生在择业期间承受着不同程度的心理压力，个体难免会产生择业焦虑情绪，缓解大学生择业焦虑对于个体的身心健康及择业工作的顺利进行都具有积极意义。择业焦虑会受到来自周围环境中各方各面的理解与帮助程度、个体在面对择业时所采取的行为方式和态度以及对于目标的明确与坚定程度等诸多因素的影响。为深入探究择业焦虑的影响机制，本研究采用实证研究方式，以《领悟社会支持量表》、《简易应对方式量表》、《生活目的测验》及《高校毕业生择业焦虑问卷》为测量工具，对内蒙古自治区3所高校共

675 名大学生进行调查研究, 探讨领悟社会支持与择业焦虑之间的关系, 以及应对方式和生命意义感在其中的中介作用, 根据研究结果和分析讨论最终得出以下结论: (1) 女生领悟社会支持总分显著高于男生; 大一学生积极应对得分显著高于大三、大四学生; 男生生命意义感总分显著高于女生, 大一学生生命意义感水平显著高于其他年级学生; 女生择业焦虑程度较男生而言更高, 并且择业焦虑在大学生群体中具有明显的学科类别及年级差异, 文史类学生较理工类学生而言会有更多地择业焦虑情绪, 大三及大四学生的择业焦虑程度显著高于大一学生。(2) 领悟社会支持可以通过应对方式间接影响个体的择业焦虑, 领悟社会支持通过应对方式影响择业焦虑的关系中, 应对方式在领悟社会支持与择业焦虑关系间起中介作用; 领悟社会支持通过生命意义感影响择业焦虑, 生命意义感在领悟社会支持与择业焦虑关系间起中介作用; 在多重中介效应模型中, 应对方式和生命意义感为领悟社会支持影响择业焦虑的中介变量, 应对方式及生命意义感在领悟社会支持与择业焦虑关系间起多重中介作用。

Abstract: The employment of college students has been paid much attention, which is a problem most college students have to face, and it is of great significance to students and their families. There are many factors, such as the increasing number of university graduates, the restriction of the traditional concept and the limitation of the number of jobs provided by the society, which have caused the university students to bear different degrees of psychological pressure during the job-hunting. It is inevitable for the individuals to have job-selection anxiety. Alleviating college students' job anxiety is of great significance for their physical and mental health and the smooth development of job selection. Vocational Selection Anxiety is influenced by many factors, such as the degree of understanding and help from all sides in the surrounding environment, the behavior and attitude of individuals when choosing a career, and the degree of clarity and firmness for the purpose. In order to explore the mechanism of Vocational Selection Anxiety, this study adopts empirical research and qualitative interview, using the Perceived Social Support Scale, the Coping Style Scale, the Purpose in Life Test and the Vocational Selection Anxiety Questionnaire for college graduates as measuring tools to explore the role of Coping Style and Life Meaning Feeling in the relationship between Perceived Social Support and Vocational Selection Anxiety. The 675 college students from three universities in Inner Mongolia were investigated, using semi-structured interview to explore the composition and characteristics of various variables in the group of college students, as well as the specific mechanism of action among the variables. According to the research results and analysis, the conclusions are as follows: (1) The total score of Perceived Social Support of female students is significantly higher than that of male students. The Positive Coping Scores of freshmen are significantly higher than that of juniors and seniors. The total score of Life Meaning Feeling of male students is significantly higher than that of female students, and the level of life meaning of freshmen is significantly higher than that of other grades. There are obvious differences in the subject categories and grades among the college students, and the students of literature will have more Vocational Selection Anxiety than the students of science and engineering. The anxiety degree of junior and senior college students is significantly higher than that of freshmen. (2) Perceived Social Support can indirectly influence individuals' Vocational Selection Anxiety through Coping Style, and Perceived Social Support can influence Vocational Selection Anxiety through Positive Coping Style, Coping Style plays an mediating role in the relationship between Perceived Social Support and Vocational Selection Anxiety, and Perceived

Social Support affects Vocational Selection Anxiety through Life Meaning Feeling, which mediates the relationship between Perceived Social Support and Vocational Selection Anxiety in the model, Coping Style and Life Meaning Feeling are the mediating variables that Perceived Social Support affects Vocational Selection Anxiety. Coping Style and Life Meaning Feeling play multiple mediating roles in the relationship between Perceived Social Support and Vocational Selection Anxiety.

摘 要 创造性人格是指个体所具有的对创造性发展和创造任务完成起促进或保证作用的个性特质。幼儿阶段是创造性人格发展和培养的关键时期，该时期的人格塑造对幼儿以后的创造和成功起着关键的作用。因此，非常有必要对幼儿的创造性人格的形成做更多探索。在幼儿创造性人格形成的过程中，家庭因素是十分重要的。其中关于家庭规则对其的影响，有学者认为规则包含顺从大人的期望、自制力、遵守安全规则、自我照顾等因素，会限制幼儿的行为，导致遵守规则的幼儿缺乏创造性。这种对规则的定义包含了家族长辈的意志指定，具有绝对的权威性和强制性。其实，“规则”也可以是在所有社会成员共同约定之下形成的人人平等思想的体现，这种规则的约束能够保证一种不超越底线的自由状态，使孩子生活在和谐与秩序中。有学者认为，这种人人平等的家庭规则能够维持幼儿发展的持续性和稳定性，并为他们提供安全感和舒适感，从而促进其创造性人格的发展。张帆修订的家庭规则问卷反映的正是这种积极有序的家庭规则。因此，可预期这种规则将促进幼儿创造性人格的发展。因为有研究者认为这种规则越稳定，孩子的独立性、自我监管及自控能力就会增强，进而促进其自主性发展，不少研究表明，幼儿自主性与幼儿创造性人格倾向存在显著正相关，幼儿自主性可以有效促进幼儿创造性人格的形成。综上，本研究采用家庭规则问卷、幼儿自主性发展问卷和Williams 创造性倾向量表对 664 名 3 岁~6 岁幼儿进行调查，考察家庭规则对幼儿创造性人格的影响，以及自主性发展在家庭规则与幼儿创造性人格关系中的中介效应，回答家庭规则是“如何”影响幼儿创造性人格的，为培养和塑造幼儿创造性人格提供理论基础。研究结果表明：（1）家庭规则与幼儿创造性人格存在显著正相关，表明家庭规则的制定有利于幼儿创造性人格的发展；（2）幼儿自主性发展与幼儿创造性人格存在显著正相关；（3）自主性发展是家庭规则与幼儿创造性人格之间关系的中介变量，效应量为 52.9%。

关键词 创造性人格，家庭规则，自主性发展

The formation of preschooler's creative personality: the promotion mechanism of positive family routines

Dong Shenghong, Yan Yuzhi

School of Psychology, Jiangxi Normal University, Nanchang 330022

Abstract: Creative personality refers to the individual's personality characteristics that can promote or guarantee the creative development and the completion of creative tasks. Preschool stage is the key period for the development and cultivation of creative personality, and personality shaping in preschool children plays a key role in children's future creation and success. Therefore, it is very necessary to conduct more exploration on preschooler's creative personality. Family factors are very important in the formation of preschooler's creative personality. As for the influence of family routines, some scholars think that family routines include obedience to adults' expectations, self-control, compliance with safety rules, self-care and other factors, and consider that routines will limit preschooler's behavior, and thus the preschooler who follow the rules lack creativity. This definition of routines includes the will of the family elders, which is absolutely authoritative and mandatory. In fact, the "routines" can also be the embodiment of the idea that everyone is equal under the common agreement of all members of society. Its' restraint and guidance can ensure a

free state that does not exceed the bottom line, so that preschoolers can live in harmony and order. Some scholars believe that the family routines can maintain the continuity and stability of preschooler's development and provide them with a sense of security and comfort, and create a safe and free psychological environment, thus promoting the development of their creative personality. Zhang's revised family routines scale reflects this positive and orderly family routines, and it can be expected that this routine will promote the development of preschooler's creative personality. Some studies believe that the more stable the family routines are, the stronger the preschooler's independence, self-regulation and self-control ability will be, so as to promote their autonomy. Many studies have shown that there is a significant positive correlation between preschooler's autonomy and creative personality, and preschooler's autonomy can effectively promote the formation of their creative personality. In summary, the current study tested 664 participants aged 3 ~6 years by adopting three questionnaires: family routines scale, autonomy of children scale and the Williams creativity assessment packet to explore the influence of family routines on preschooler's creative personality and the mediating role of autonomous. So that we can illuminate how family routines affect preschooler's creative personality, thus providing theoretical basis for cultivating and shaping preschooler's creative personality. The results show that: (1) family routines had a positive effect on among Chinese preschooler's creative personality, which shows that family routines is conducive to the development of preschooler's creative personality; (2) autonomous had a significant effect on preschooler's creative personality; (3) Autonomous is an intermediary variable in the relationship between family routines and creative personality, with an effect of 52.9%.

社会距离与社会价值取向对大学生利他倾向的影响

陈文玉¹ 方平¹ 姜媛² (通讯作者)

1 首都师范大学心理学院, 北京, 100048

2 北京体育大学心理学院, 北京, 100084, jiangyuan97@sina.cn

摘要 社会价值取向指个体对自己和他人收益分配的特定偏好。社会距离指个体感知到的自我与他人差异的大小, 或人际距离的亲疏, 可以通过改变人们的认知进一步影响到个体的行为。其中利他行为作为一种积极的社会行为, 在维持人际关系和创建和谐社会方面都有重要意义。探究个体的利他倾向受哪些因素的影响, 有助于提高个体的利他行为水平, 促进社会形成互帮互助的融洽氛围。本研究采用问卷调查法和实验法, 结合人格特质和情境因素, 从内隐和外显两个层面探究社会价值取向和社会距离对利他倾向的影响。实验一以 42 名大学生为研究对象, 采用单因素被试内设计进行内隐联想测验(IAT), 结果显示个体对不同社会距离对象的内隐利他倾向不同, 与他人相比, 对自我的内隐利他倾向更高; 不同社会价值取向个体的内隐利他倾向也存在显著差异, 与亲自我取向个体相比, 亲社会取向个体的内隐利他倾向更高。实验二以 65 名大学生为研究对象, 采用 2(社会距离: 陌生人, 熟悉人)×2(社会价值取向: 亲自我, 亲社会)混合设计, 因变量为研究参与者在捐献意愿上的得分。结果显示社会距离的主效应显著, 相比于陌生他人, 个体对熟悉他人的捐献意愿更高; 社会价值取向主效应不显著, 表明社会价值取向对利他倾向的影响可能在内隐认识与外显态度上相分离。社会距离和社会价值取向的交互作用显著, 相比于亲自我取向个体, 亲社会取向个体受到社会距离的影响小。

The Influence of Social Distance and Social Value Orientation on College Students' Altruistic Tendency

Wenyu Chen¹, Ping Fang¹, Yuan Jiang² (corresponding author)

1 Department of Psychology, Capital Normal University, Beijing, 100048

2 Department of Psychology, Beijing Sport University, Beijing, 100084

Abstract: Social value orientation refers to the individual's specific preference for income distribution between himself and others. Social distance refers to the size of the self-perceived difference between individuals and others,

or the closeness of interpersonal distance, which can change people's cognition and further affect individual behavior. As a positive social behavior, altruistic behavior plays an important role in maintaining interpersonal relationship and creating a harmonious society. By exploring the factors that influence the altruistic tendency of individuals, it is helpful to improve the level of individual altruistic behavior and promote the formation of a harmonious social atmosphere of mutual help. Combining personality traits and situational factors, we explore the influence of social value orientation and social distance on altruistic behavior from two levels of implicit and explicit. Questionnaire method and experimental method were adopted. In the first experiment, 42 college students were selected as subjects. The Implicit Association Test (IAT) was designed by single factor test. The implicit altruistic tendencies of different social distance objects are different. Compared with the otherness dimension, the implicit altruistic tendency towards ego dimension is higher; the implicit altruistic tendencies of individuals with different social value orientations also have significant differences, that is, the pro-social orientation individuals tend to be higher. In the second experiment, 65 college students were enrolled. The mixed design of 2 (social distance: strangers, familiar people) $\times$ 2 (social value orientation: myself, prosocial) was adopted. The results showed that the main effect of social distance was significant. The main effect of social value orientation is not significant, which indicates that the effect of social value orientation on altruistic tendency may be separated from implicit cognition and explicit attitude. The interaction between the two is significant. Compared with self-oriented individuals, prosocial oriented individuals are less affected by social distance.

Keywords: College students, social value orientation, social distance, altruism

中学生社会排斥与自杀意念的关系：一个有调节的中介模型

刘致宏¹ 张珊珊¹（通讯作者） 张野¹ 陈颖¹ 吴家钰¹

¹ 沈阳师范大学教育科学学院, 沈阳, 110034, zhangxiaobai2@163.com

摘 要 自杀是全球性的公共卫生问题。世卫组织的数据显示, 全球每年约有 80 万人自杀身亡。青春期是自杀行为的高发年龄阶段, 也是个体的自杀意念、自杀意图达到峰值的时期。自杀意念是个体在思想或认知上想要结束生命的想法、念头, 是产生自杀行为必然的心理过程, 因此, 阻断自杀意念的形成是防范青少年自杀行为的有效手段。本研究采用青少年社会排斥量表、青少年自杀意念量表、核心自我评价量表和儿童及青少年社会支持量表, 对辽宁省和北京市共 612 名学生进行问卷调查。运用 SPSS 25.0 和 Amos 24.0 对数据进行分析 and 处理, 探讨社会排斥对自杀意念的影响以及核心自我评价和教师支持的作用。在控制性别和年级变量之后, 研究结果表明: (1) 社会排斥正向预测中学生的自杀意念, 即遭受社会排斥越多的学生越容易出现自杀意念。(2) 核心自我评价在社会排斥与自杀意念之间起中介作用, 即社会排斥通过影响中学生的核心自我评价进而影响中学生的自杀意念(3) 教师支持调节该中介模型的直接路径和中介效应前半段。具体而言, 青少年的教师支持水平越低, 社会排斥对青少年自杀意念的正向预测作用越强, 同时对青少年核心自我评价的负向预测作用越弱。本研究一方面揭示了社会排斥是中学生自杀意念的重要心理机制, 同时还强调核心自我评价等积极人格倾向和教师支持对遭受社会排斥后引发的自杀意念均具有较好的抑制作用, 给予了青少年更多的情感支持, 有效地保护和促进了青少年的身心健康发展。

关键词 社会排斥, 自杀意念, 核心自我评价, 教师支持

Relationship between Social Exclusion and Suicide Ideation in Middle School Students: A Moderated Mediation Model

Liu Zhihong¹, Zhang Shanshan¹, Zhang Ye¹, Chen Ying¹, Wu Jiayu¹

¹ School of Education Shenyang Normal University No. 253, Yellow River North Street, Huanggu District, Shenyang City, Liaoning Province

Abstract: Suicide is a global public health problem. Worldwide, about 800,000 people commit suicide each year, according to the WHO. Adolescence is the age of high incidence of suicidal behavior, and it is also the period when suicidal ideation and suicidal intention reach the peak. Suicidal ideation is an individual's thought of ending life in thought or cognition, and it is the inevitable psychological process of suicidal behavior. Therefore, blocking the formation of suicidal ideation is an effective means to prevent adolescent suicidal behavior. A total of 612 students in Liaoning Province and Beijing were surveyed by using the Ostracism Experience Scale for Adolescents, Positive and Negative Suicide Ideation, Core Self-evaluations Scale, and Child and Adolescent Social Support Scale. The data were analyzed and processed using SPSS 25.0 and Amos 24.0 to explore the impact of social exclusion on suicidal ideation and the role of core self-evaluation and teacher support. After controlling for gender and grade level variables, the results showed that (1) social exclusion positively predicted suicidal ideation among middle school students, the more socially excluded students were, the more likely they were to have suicidal ideation. (2) Core self-evaluation mediated between social exclusion and suicidal ideation, social exclusion influenced middle school students' suicidal ideation by influencing their core self-evaluation (3) Teacher support moderates the direct path and the first half of the mediating effect of this mediation model. Specifically, the lower the adolescent's level of teacher support, the stronger the positive predictive effect of social exclusion on adolescent suicidal ideation and the weaker the negative predictive effect on the adolescent's core self-evaluation. On the one hand, the study reveals that social exclusion is an important psychological mechanism for suicidal ideation among middle school students, and at the same time, it emphasizes that positive personality tendencies such as core self-evaluation and teacher support have a better inhibitory effect on suicidal ideation triggered by social exclusion. Giving teenagers more emotional support, effectively protects and promotes the development of the adolescents' physical and mental health.

Keywords: social exclusion, suicidal ideation, core self-evaluation, teacher support

思维方式与心理健康：心理弹性与自尊的作用

黄连琼¹ 罗曦¹ 侯玉波¹(通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871, houyubo@pku.edu.cn

摘要 社会的快节奏生活和激烈竞争给人们带来了巨大的心理压力, 往往使人们感到焦虑、紧张, 从而威胁他们的心理健康。本研究探究了中国人思维方式对心理健康的影响, 以及心理弹性和自尊在其中的作用。研究采用问卷法, 通过线上发放问卷的方式邀请被试填写了中国人整体思维方式量表、心理弹性量表、罗森伯格自尊量表和一般健康问卷, 共收集有效问卷 630 份。结果表明: (1)思维方式的联系性维度能够显著正向预测心理健康, 矛盾性则显著负向预测心理健康, 变化性维度对心理健康的预测作用不显著; (2)自尊对思维方式的联系性/矛盾性维度与心理健康之间关系的调节作用均显著; (3)心理弹性在思维方式的联系性/矛盾性维度与心理健康的关系中起部分中介作用; (4)在以思维方式的联系性为自变量、心理弹性为中介变量、自尊为调节变量、心理健康为因变量的模型中, 心理弹性部分中介联系性与心理健康的关系, 自尊调节联系性对心理健康的直接影响, 并同时调节心理弹性中介效应的前半路径和后半路径, 有调节的中介模型成立; (5)在以思维方式的矛盾性为自变量、心理弹性为中介变量、自尊为调节变量、心理健康为因变量的模型中, 心理弹性部分中介矛盾性与心理健康的关系, 自尊调节心理弹性中介效应的后半路径, 有调节的中介模型成立。本研究不仅探讨了思维方式在影响中国人心理健康水平方面的重要意义, 而且揭示了思维方式作用于心理健康的内部机制。研究结果启示我们, 通过训练和强化人们的思维方式来增强心理弹性将有助于提高他们的心理健康水平, 未来的研究应进一步探究思维方式的训练对心理健康的促进作用。

The Chinese thinking style and mental health: The role of mental resilience and self-esteem

Lianqiong Huang¹, Xi Luo¹, Yubo Hou¹

¹ School of Cognitive and Psychological Sciences, Peking University, Beijing, 100871

Abstract: The fast pace of life and fierce competition in today's society bring people heavy psychological pressure, which often makes people feel anxious and nervous, thus threatening their mental health. The present study explored the influence of Chinese thinking style on mental health, as well as the role of mental resilience and self-esteem. The questionnaire method was used in this study, which invited participants to fill in the Chinese Holistic Thinking Style Scale, the Mental Resilience Scale, the Rosenberg Self-esteem Scale and the General Health Questionnaire by distributing questionnaires online and 630 valid questionnaires were collected. The results showed that: (1) the connectedness dimension of Chinese thinking style could significantly predict mental health in a positive way, while the contradiction dimension significantly predicted mental health in a negative way, and the predicting effect of the change dimension on mental health was not significant. (2) Self-esteem played a significant moderating role in the relationship between the connectedness/ contradiction dimension of Chinese thinking style and mental health; (3) Mental resilience played a partial mediating role in the relationship between the connectedness/ contradiction dimension of Chinese thinking style and mental health; (4) In the model with the connectedness dimension of Chinese thinking style as independent variable, mental resilience as mediator, self-esteem as moderator and mental health as dependent variable, mental resilience partially mediated the relationship between the connectedness and mental health, self-esteem moderated the direct effect of connectedness on mental health and also played a moderating role on the mediating effect of mental resilience, both moderated the first half path and the second half path, thus the moderated mediating model was significant. (5) In the model with the contradiction dimension of Chinese thinking style as independent variable, mental resilience as mediator, self-esteem as moderator and mental health as dependent variable, mental resilience partially mediated the relationship between the contradiction and mental health, and self-esteem moderated the mediating effect of mental resilience, thus the moderated mediating model was significant. The present study not only examined the significance of Chinese thinking style in affecting the level of mental health, but also revealed how Chinese thinking style affected mental health. The results of this study enlighten us that enhancing mental resilience by training and strengthening people's holistic thinking style will contribute to improve their mental health status. Future researchers should further explore the positive influence of Chinese thinking style training on mental health.

Keywords: Chinese Thinking Style, Mental Health, Mental Resilience, Self-esteem

讨好型人格量表的编制

欧咏恬¹ 梁平原¹ 陈潇¹ 李嘉雯¹ 于孟可² (通讯作者)

¹ 北京师范大学心理学部, 北京, 100875

² 北京师范大学心理学部, 北京, 100875, 201921061085@mail.bnu.edu.cn

摘要 近年来, “讨好型人格”作为一种人际交往中常见的人格模式, 在日常生活及公众媒体中引发了广泛的讨论。有观点认为“讨好型人格”是一种负面的人格, 对个体的心理健康发展有着消极作用。但学术领域对“讨好型人格”的研究尚缺乏系统的界定和测量方法。本研究旨在探讨讨好型人格的内涵与结构, 并编制适用于科学研究的讨好型人格量表。根据对讨好行为和讨好型人格的分析, 本研究将讨好型人格界定为: 个体在社会互动中形成的对内贬抑、对外褒扬的稳定心理特质。招募不同年龄段、地区和职业的有效被试共 351 名, 选取霍妮-柯立芝人格问卷、人际敏感性量表、企业员工逢迎行为量表、亲密关系经历量表、艾森克人格问卷和人际反应指针量表的部分项目, 并编制符合讨好型人格特质的新项目, 共评定筛选出 74 项进行

施测。进行了探索性因素分析($N = 175$), 删除在所有因子上载荷均低于 0.3 的题目、两个及以上因子上载荷差值小于 0.2 的题目、不符合维度构想的题目、只有一个项目的因子, 最终保留 32 个项目、6 个因子, 对方差的解释率为 50.40%; 验证性因素分析($N = 176$)显示, 量表六因子模型拟合指数良好($\chi^2/df = 1.68$, $CFI = 0.79$, $TLI = 0.76$, $RMSEA = 0.06$, $SRMR = 0.08$), 确定量表由妥协牺牲、自卑抑制、和善恭顺、换位思考、恭维迎合、人际敏感六个维度构成, 共计 28 个项目。量表总体的内部一致性 α 系数为 0.83, 六维度的 α 系数为 0.62~0.78。总体的分半信度为 0.88, 六维度的分半信度为 0.63~0.81。结果表明量表具有较好的信度。各个参数基本符合测量学指标, 可以用于进一步的研究。讨好型人格的六维度中, “人际敏感”与“换位思考”是讨好型人格的能力基础和先决条件, “自卑抑制”和“和善恭顺”是讨好型人格的特质基础和人格动力, “妥协牺牲”和“恭维迎合”则是讨好型人格的外部表现。六维度模型在特质和行为层面共同作用, 有机统合为讨好型人格的组合系统。本研究填补了讨好型人格的结构与测量方面的理论空缺, 对个体社会化、心理健康教育和社会心理建设方面有重要的现实意义。

关键词 讨好型人格, 人格结构, 信度, 因素分析

The Development of Compliant Personality Scale

OU Yongtian, LIANG Pingyuan, CHEN Xiao, LI Jiawen, YU Mengke

Beijing Normal University, Beijing, 100875

Abstract: In recent years, "compliant personality", as a common personality model in interpersonal communication, has aroused extensive discussion in daily life and public media. Some argument goes that "compliant personality" is a personality that has a negative effect on the individual's mental health and personal growth. However, there is still a lack of systematic definition and measurement methods in the academic field. The purpose of this study is to explore the connotation and structure of compliant personality and develop a scale of compliant personality suitable for scientific research. Based on the analysis of compliant behaviors and compliant personality, this study defined compliant personality as a stable psychological trait formed by individuals in social interaction, which is derogatory towards oneself and complimentary towards others. Three hundred and fifty-one valid participants of different ages, regions and occupations were recruited. Some items of the Horney-Coolidge Type Inventory, Inter-personal Sensitivity Measure, Enterprise Employee Ingratiation Behavior Scale, Experiences in Close Relationship Inventory, Eysenck Personality Questionnaire and Interpersonal Reactivity Index were selected and new items consistent with the compliant personality trait were developed. A total of 74 items were selected for evaluation. Exploratory factor analysis was conducted ($N = 175$). Delete items with loads lower than 0.3 on all factors, items with loads difference less than 0.2 on two or more factors, items that do not conform to the dimensional vision, and factors with only one item. In the end, 32 items and 6 factors were retained, and the explanatory rate of the variance was 50.40%. Confirmatory factor analysis ($N = 176$) showed that the six-factor model fits well ($\chi^2/df = 1.68$, $CFI = 0.79$, $TLI = 0.76$, $RMSEA = 0.06$, $SRMR = 0.08$). The scale consists of six dimensions, namely, self-sacrifice, self-abasement, submissiveness, perspective-taking, flattery, and interpersonal sensitivity, with a total of 28 items. The Cronbach's Coefficient Alpha of the whole scale is 0.83. The Cronbach's Coefficient Alpha of each dimension is at least 0.62 and at most 0.78. The split and half reliability of the whole scale is 0.88. The split and half reliability of each dimension is at least 0.63 and at most 0.81. The results show that the reliability of this scale was good. Each parameter basically conforms to the measurement index, and can be used for further research. In the six dimensions of compliant personality, "interpersonal sensitivity" and "perspective-taking" are the ability basis and prerequisite of the compliant personality, "self-abasement" and "submissiveness" are the trait basis and personality drive of the compliant personality, and "self-sacrifice" and "flattery" are the external manifestations of the compliant personality. The six dimensional model is a combination system of compliant personality, which works together at the level of trait and behavior. This study fills the theoretical vacancy in the structure and measurement of gratified personality, and has practical value in individual socialization, mental health education and social psychosocial construction.

Keywords: compliant personality, personality structure, reliability, factor analysis

基于三元精神病态模型的精神病态亚型研究：一项潜在剖面分析

郭培杨 王梦雅 程诚（通讯作者）

天津大学教育学院；天津大学应用心理研究所；

天津市教育委员会自杀心理与行为研究实验室，天津 300350

摘要 精神病态作为暴力犯罪、累犯和青少年犯罪的重要预测变量，在临床心理学和司法领域受到了广泛重视。早期研究发现了精神病态群体内部的异质性，即精神病态亚型的存在。三元精神病态模型通过大胆、卑劣和去抑制三个维度对精神病态进行了操作化定义，提供了一条理解不同精神病态亚型的框架。通过三元精神病态量表，以及其他精神病态相关特征（特质焦虑、情绪失调、行为抑制与激活系统），当前研究在中国大学生群体内（ $n=791$ ）检验了精神病态亚型的存在。潜在剖面分析的结果表明，在高精神病态特征的大学生（ $n=131$ ）群体中存在三种符合理论描述的精神病态亚型：（1）成功精神病态，具有高水平的大胆和卑劣特征，在去抑制、特质焦虑、情绪失调、行为抑制系统上得分最低；（2）原发性精神病态，表现出显著高于正常群体的大胆、卑劣和去抑制得分，以及低于正常群体的特质焦虑、行为抑制系统得分；（3）继发性精神病态，具有低于正常群体的大胆分数，在其他特征上均显著高于正常群体。这些结果表明了三元精神病态模型在区分不同的精神病态亚型方面的有效性。高大胆和卑劣是成功精神病态的重要特征，原发性精神病态则在大胆、卑劣和去抑制上均表现出较高水平，而继发性精神病态则表现出高度的卑劣和去抑制。此外，三个亚型的卑劣特征均显著高于正常群体的水平，也表明了卑劣在精神病态人格中的核心地位。这些结果表明了亚型之间的异质性，对不同亚型的临床评估和干预提供了启示。

The Utility of TriPM in Distinguishing Psychopathic Subtypes: A Latent Profiles Analysis in Chinese Undergraduates

Peiyang Guo, Mengya Wang, Cheng Cheng

(School of Education; Institute of Applied Psychology, Tianjin University; Laboratory of Suicidology, Tianjin Municipal Education Commission, Tianjin 300350, China)

Abstract: As an important predictor of violent crime, recidivism, and juvenile delinquency, psychopathy has received extensive attention in clinical psychology and justice research. Early theoretical concepts indicate that psychopathy is a heterogeneous structure. The Triarchic Model of Psychopathy conceptualizing psychopathy as the constellation of three different phenotypic structures including boldness, disinhibition, and meanness, provides a framework to further understand the etiology of distinct psychopathic subtypes. The current study examined psychopathic subtypes in a mixed sample of Chinese college students ($n = 791$). Based on the subscales of TriPM (i.e., boldness, meanness, and disinhibition) and other psychopathy-related traits including trait anxiety, emotion dysregulation, behavioral inhibition system (BIS), and behavioral activation system (BAS), we obtained three distinct psychopathic variants through latent profile analysis in a subsample ($n = 131$) with high psychopathic characteristics: 1) successful psychopathy displayed high boldness and meanness, low disinhibition, trait anxiety, emotion dysregulation, and BIS; 2) primary psychopathy evidenced moderately high boldness, meanness, and disinhibition, low trait anxiety, and BIS, slightly high emotion dysregulation, and BAS; 3) secondary psychopathy exhibited low boldness, high meanness, disinhibition, trait anxiety, emotion dysregulation, and BIS. These results indicate the availability of the TriPM model in distinguishing different psychopathic subtypes. Moreover, the broad nomological network of TriPM not only provides perspectives from neurobiological and developmental precursors to further understand the psychopathic subtypes but also information for clinical assessment and intervention of psychopathy.

Keywords: TriPM, psychopathic subtypes, successful psychopathy, primary psychopathy, secondary psychopathy

物质主义对不道德行为的影响：来自多角度的证据

岳磊¹ 曾祥丽¹ 李静¹（通讯作者）

¹ 华中师范大学心理学院，武汉，430079, jinglee@ccnu.edu.cn

摘要 高铁霸座、碰瓷、老赖等现象近年来多次出现在人们的视野之中，每次都引起全社会的热议，造成了诸多不良影响。不道德行为是指违法的或道德上不被大众所接受的行为，它包括暴力、非暴力犯罪、违法、欺骗等诸多行为。前人研究发现物质主义是不道德行为的重要影响因素，但是以往研究多使用问卷法对二者的关系进行探讨，缺乏多样的视角对二者关系进行验证。本研究将从大数据、问卷法和实验法三个角度，共四个研究探讨物质主义对不道德行为的影响，以期丰富二者关系研究的角度，并增强研究结论的可靠性。研究1使用第六次世界价值观调查，共89565个样本，在控制收入、年龄和性别后，物质主义显著正向预测欺骗、盗窃、受贿、家暴等多种不道德行为。研究2a使用物质主义价值观量表和诚实-谦虚子量表对四川、上海和辽宁三地的245名被试进行调查，在控制性别、年龄和主观社会阶层后发现，物质主义可以正向预测个体的不诚实行为；为增加样本的代表性和提高结论的可靠性，研究2b使用物质主义价值观量表、不道德决策量表和道德基础神圣性问卷对浙江、湖南和陕西三地的342名被试进行调查，在控制性别、年龄和主观社会阶层后发现，物质主义可以正向预测个体在社会生活情境中的不道德行为。研究3使用实验法探讨物质主义与不道德行为的因果关系，通过想象范式启动个体的物质主义，使用不可能任务测量个体的不道德行为，结果发现：物质主义启动组的不道德行为高于控制组。本研究从多角度证实了物质主义对不道德行为的影响，不仅丰富了二者关系的研究方式，也启示我们对于不道德行为的干预可以从物质主义价值观着手。

关键词 物质主义，不道德行为，多角度

The Influence of Materialism on Unethical Behavior: Evidence from Multiple Perspectives

Lei Yue¹, Xiangli Zeng¹, Jing Li¹

¹ School of Psychology, Central China Normal University, Wuhan

Abstract: People such as deadbeats, incident-faking extortionists and seat robbers have appeared in people's field of vision many times in recent years, each time it has caused heated discussions in the whole society and led to adverse impact. Unethical behavior is defined as behavior that is illegal or morally unacceptable to the larger community, which includes violent and nonviolent crime, delinquency, cheating, and other behaviors that violate ethical principles. Previous studies mostly used questionnaires to explore the relationship between materialism and unethical behavior, and found that materialism was an important influencing factor of unethical behavior, but lacked a variety of perspectives to verify the relationship between the two. In the present research, we explored the influence of materialism on unethical behavior in 4 studies, using big data, questionnaires and experiments, to enrich the perspective of the study on the relationship between the two and enhance the reliability of the research conclusions. Using the Sixth World Values Survey, Study 1 ($N=89565$) found that materialism positively predicted a wide range of unethical behaviors such as cheating, theft, bribery and domestic violence, after controlling for income, age and gender. Studies 2a and 2b replicated the finding of Study 1 by presenting evidence from surveys. Specifically, study 2a surveyed 245 participants from Sichuan, Shanghai and Liaoning using the Materialistic Values Scale and the Honest-Humility subscale. Study 2b surveyed 342 participants from Zhejiang, Hunan and Shaanxi provinces using the Materialistic Values Scale, the Unethical Decision Making Scale and the Moral Foundations Sacredness Scale. Both studies controlled for gender, age and subjective social class. In Study 3, we manipulated individuals' materialism through the imagination paradigm and used impossible tasks to measure individuals' unethical behavior, the result confirmed that experimentally induced materialism increased unethical behaviors. This study provides multi-angle evidence for the influence of materialism on unethical behavior, and suggests that the intervention of unethical behavior can start from materialism values.

摘要 头控操作是虚拟现实(VR)中的主要交互方式之一, 了解头控的操作特性对三维交互设计有重要的指导意义。近几年, VR 技术广泛应用于娱乐和训练等领域, 用户经常需要在身体偏转的情况下完成操作, 比如在飞行模拟器上完成射击游戏等。然而目前还不清楚头控在身体偏向情况下的操作表现。本研究通过两个实验探讨了身体朝向以及朝向角度对人类头控操作表现的影响。在实验 1 中, 被试坐在模拟器内, 佩戴 Oculus Rift 虚拟现实头盔, 通过转头的方式将一个光标小球快速准确地放入静止的目标球体内。我们改变了模拟器的偏转方向(前, 后, 左, 右)和偏转角度(0°, 30°, 45°, 60°), 并记录了被试的操作时间和错误率。实验任务完成后, 被试填写一份 7 点评分的操作难度问卷。结果显示, 向前偏转的难度得分最低, 操作时间最短, 并且随着目标尺寸的减少操作时间优势逐渐增大。其他三个方向的操作时间没有显著区别, 但是向后偏转的难度得分显著高于向左偏转和向右偏转。此外, 偏转角度对操作时间的影响有限, 操作时间随着偏转角度的增大缓慢增加。在实验 2 中, 我们进一步增加任务的难度, 被试在相同的场景中通过头控将光标快速准确地放入移动的目标球体内。实验 2 获得了与实验 1 相似的结果。向前偏转操作效率和正确率最高, 向后偏转的效率和正确率最低, 向左和向右偏转的操作表现没有显著差异。本研究结果表明头控在身体向前偏转时操作难度最低, 向后偏转时操作难度最大, 向左和向后偏转的难度一致, 并且在 60°的偏转范围内能够保持较好的稳定性。本研究结果将为基于头控操作的三维应用设计人员以及特殊人群的训练提供重要的参考。

The effect of body tilt on human performance of head-gaze interaction in virtual reality environment

Cheng-Long Deng, Ming Zhao, Shu-Guang Kuai

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, the Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

Abstract: Head-gaze interaction is one of the main interactive modes in virtual reality. Knowing the human performance of head-gaze interaction is helpful for user interface design in three-dimensional space. In recent years, virtual reality has been widely used in various fields, like entertainment and training, and users often operate in virtual scene when body is not upright, such as playing shooting games in a flight simulator. However, it remains unclear how human with tilted body performs when using head-gaze interaction. In this study, we conducted two experiments to explore the effect of different tilted directions and angles of body on human performance. In the first experiment, participants sat in a flight simulator and wore an Oculus Rift helmet-mounted display to position a cursor sphere from a start position into a larger stationary target sphere as quickly and accurately as possible by rotating their head. We varied the tilted direction (front, back, left, right) and angle (0°, 30°, 45°, 60°) of the simulator and recorded the participants' operating time and error rate. After the task, participants filled out a 7-point scale for evaluating the operation difficulty of various tilted directions and angles. The results showed that tilting forward had the best performance of the easy-of-operation score and operating time and the time advantage increased as the target

size decreased. Although there was no significant difference in the operating time among the other three tilted directions, the easy-of-operation score of back tilt was significantly higher than that of left and right tilt. In addition, the tilted angle had a limited effect on the operating time which increased slowly with the increasing of the tilted angle. In the second experiment, we further increased the difficulty of the task to ask participants to position the cursor into a moving target sphere in the same condition as experiment 1. Experiment 2 obtained the similar results as experiment 1. Tilting forward had the highest operating efficiency and correct rate, and tilting backward had the lowest performance. There was no significant difference between the performance of left and right tilt. The results of this study indicated that head-gaze interaction is most difficulty when body tilts backward, followed by tilting leftward and rightward, and is the most easily for tilting forward. Moreover, head-gaze interaction can maintain a good stability when body tilts within a range of 60°. Our findings help to further understand the process of head-gaze interaction and provide useful guidelines for 3D application designers and special human trainings.

多目标追踪情境交互测验的开发与信效度检验

姚丹旭¹ 姬鸣² (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知科学重点实验室, 西安, 710062, jiming@snnu.edu.cn

摘要 多目标追踪是在动态场景中同时追踪多个目标物体并排除其它干扰的一种认知能力, 无论在日常生活中, 还是对驾驶员、飞行员、运动员等特殊职业群体都具有重要意义。然而, 传统多目标追踪范式由于任务无意义和反应单一等问题而缺乏生态效度。因此, 本研究旨在开发基于情境交互的目标追踪情境测试, 试图提高多目标追踪能力评估的有效性, 为特殊职业群体的心理选拔和训练提供技术支持。基于此, 本研究开展了两个实验。实验一基于 Pylyshyn(2004)的经典范式, 构建了多目标追踪情境交互测验, 共 30 个试次。招募 85 名被试 (男性 20 名, 女性 65 名, 18-28 岁), 检验多目标追踪情境交互测验的可靠性和有效性。实验二招募 137 名被试 (男性 61 名, 女性 76 名, 17-28 岁), 采用近红外脑功能成像技术 (fNIRS) 揭示了多目标追踪情境交互测验激活的脑区以及多目标追踪高能力组和低能力组的脑区激活程度差异。结果表明: 1) 多目标追踪情境交互测验具有良好的实证效度、效标关联效度和内部一致性信度; 2) 多目标追踪情境交互测验主要激活的脑区有额叶 (包括额上回、额中回)、顶叶 (包括顶下叶、顶上叶) 和楔前叶, 这一结果与以往研究基本一致; 3) 高能力组比低能力组的脑区激活程度更大。总体上, 本研究开发的多目标追踪情境交互测验具有较好的可靠性和有效性, 达到了测量学的基本要求, 可以作为复杂视觉条件下多目标追踪能力评估的有效工具, 为特殊职业心理选拔和训练提供了重要的技术支持。

2 Shannxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, Shannxi, 710062, China

Abstract: Multiple object tracking (MOT) is a cognitive ability to track multiple objects simultaneously in dynamic scenes and eliminate the interference of other objects. It is vital for both daily life and various professional groups such as pilots, pilots and athletes. However, the traditional MOT paradigm lacks certain ecological validity due to meaningless task and single response. Therefore, this study aims to develop a multiple object tracking situational interaction test, improving the effectiveness of MOT ability assessment and providing technical support for psychological selection and training of special professional groups. Based on this, two experiments were carried out in this study. In Experiment 1, based on the classic MOT paradigm(Pylyshyn,2004), this study constructed a MOT

situational interaction test with 30 trials. A total of 85 subjects (20 males, 65 females, 18-28 years old) were recruited to examine the reliability and validity of MOT situational interaction test. In Experiment 2, 137 subjects (61 males and 76 females, aged 17-28) were recruited to study the brain regions activated by the MOT situational interaction test and the differences of the activation degree between the high and low ability groups of MOT by using fNIRS technique. The results show as follows: 1) the MOT situational interaction test has good empirical validity, criterion correlation validity and internal consistency reliability; 2) The frontal lobe (including superior frontal gyrus, middle frontal gyrus), parietal lobe (including inferior parietal lobe, superior parietal lobe) and precuneus are the main brain regions activated by the MOT situational interaction test, which is basically consistent with previous studies. 3) The high ability group has a greater degree of brain activation than the low ability group. In general, the MOT situational interaction test developed in this study has good reliability and effectiveness, and meets the basic requirements of metrology. It can be used as an effective tool for the evaluation of MOT ability with complex visual conditions, and provides important technical support for the psychological selection and training of special professional groups.

无人机编队飞行中飞行参考信息的转换对操控员空间定向的影响

兰天珺¹² 常明¹² 姬鸣¹² (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知神经科学重点实验室, 西安, 710062, jiming@snnu.edu.cn

摘 要 随着无人机制造水平的提高, 无人机编队飞行如今胜任各种任务, 如战地探情, 阅兵表演等。在无人机操控台中, 无人机操控员可以参考无人机本体姿态信息 (从无人机后侧拍摄的无人机本体姿态) 进行目视飞行, 也可以参考无人机的姿态仪信息进行仪表飞行。研究表明, 对飞行姿态信息的错误整合会导致飞行员产生空间定向障碍 (spatial disorientation, SD), 具体表现为飞行员在姿态复原任务中向错误的方向调整飞行姿态, 产生反转错误 (roll reversal error, RRE), 使飞行姿态进一步偏离水平位置。本文主要探讨无人机操控员在面临不同飞行参考信息间的转换与冲突时, 是否会产生空间定向障碍。研究结果有助于减少无人机飞行事故的发生。三个实验均采用掩蔽范式。实验 1 探讨当僚机操控员在丢失长机飞行姿态信息后, 被迫从目视飞行转换为仪表飞行时, 飞行参考信息的转换对操控员空间定向的影响。实验 1 任务: 模拟地面站中无人机操控台情境, 提醒被试相信姿态仪信息。在左侧屏幕呈现长机飞行视频 30 秒, 要求被试关注长机的飞行状态, 随后左屏黑屏, 2 秒后, 右侧屏幕显示无人机姿态仪信息, 并要求被试立即根据姿态仪指令将无人机姿态复原至水平位置, 记录被试反应的正确率和反应时。实验 1 关注长机本体姿态信息与无人机姿态仪信息的转换, 实验 2 进一步讨论无人机本体姿态信息与无人机姿态仪信息发生转换时对操控员空间定向的影响。实验 1、2 中不同飞行参考信息继时呈现, 在实验 3 中将不同飞行参考信息综合呈现, 探讨无人机本体姿态信息、长机本体姿态信息和无人机姿态仪信息呈现不同偏转角度关系时 (完全相同、完全相反、不一致) 对操控员空间定向的影响。研究结果表明, 飞行参考信息的转换会导致无人机操控员产生空间定向障碍。飞行参考信息发生转换时, 被试产生更多的反转错误, 且错误试次的反应时显著长于正确试次。当不同飞行参考信息以不同的偏转角度综合呈现时, 被试在完全相反条件下的飞行绩效最差。研究结果对无人机操控员的空间定向障碍研究提供了新方向。

The Influence of the Conversion of Flight Information from Different Reference System on the Space Orientation of the Operator during the Formation Flight of Uninhabited Aerial Vehicles

Tianjun Lan^{1,2}, Ming Chang^{1,2}, Ming Ji^{1,2}

1 Shaanxi Normal University, Department of Psychology, China, Shaanxi, Xi 'an, 710062

2 Shaanxi Key Laboratory of Behavior and Cognitive Neuroscience, Shaanxi, Xi 'an, 710062

Abstract: In the console of uninhabited aerial vehicles (UAV), the operator can refer to the body attitude information of UAV for visual flight, or reference the attitude indicator information of UAV for instrumentation flight. Studies have shown that the incorrect integration of flight attitude information can cause pilots to produce spatial disorientation (SD), which is specifically manifested in the pilot's adjustment of the flight attitude in the wrong direction during attitude restoration tasks, resulting in roll reversal errors to further deviate the flight attitude from the horizontal position. This article aims to explore whether the UAV operator's spatial disorientation will be caused when the flight information from different reference system are converted or conflicted. All experiments adopt the masking paradigm. Experiment 1 explores the impact of the conversion of flight reference information on the space orientation of the operator when the operator of wingman is forced to switch from visual flight to instrument flight after losing the information of the lead plane. Experiment 1 focuses on the relationship between the lead plane and the attitude indicator of UAV; Experiment 2 discusses the impact of the conversion between the posture of UAV and the attitude indicator of UAV on the operator's spatial orientation. In experiment 3, the information from different reference was comprehensively presented at the same time, discussing the posture of UAV, and the posture of lead plane and attitude indicator of UAV at different angles simultaneously presents the influence on the operator's spatial orientation. The result reveals that the flight information from different reference system will affect the operator's decision on the deflection direction, resulting in more roll reversal errors.

安全氛围对城市轨道交通调度员安全行为的影响： 心理资本的中介与工作压力的调节效应

郭喜莲^{1,2} 兰继军^{1,2}（通讯作者） 王卓^{1,2}

1 陕西师范大学心理学院，西安，710062

2 陕西省行为与认知神经科学重点实验室，西安，710062, spchild@163.com

摘要 近年来党和国家高度重视人民安全，但现实案例中公共交通领域安全事故仍屡见不鲜，新形势下公共交通安全面临的各種风险挑战联动效应日益明显。城市轨道交通调度员作为负责行车组织、设备维修、信息收发、故障应急处理等重要任务的安全关键岗位，是轨道交通运营的“心脏”和“大脑”，对全线运行所有列车、区间线路、车站进行监控管理和调度指挥，负责处理各种突发事件。为探究组织的安全氛围与调度员的安全行为、心理资本、工作压力之间的关系，促进企业安全管理持续健康发展。基于社会认知理论和人本安全理论，本研究采用整群抽样法，对某市轨道交通集团运营分公司全部调度员（共 270 名）施测安全氛围量表、安全行为量表、心理资本问卷和工作压力量表，有效问卷 265 份。研究表明：（1）安全氛围对调度员安全行为有显著的正向预测作用($\beta = 0.84, t = 20.13, p < 0.001$)；（2）心理资本在安全氛围与调度员安全行为间具有显著的部分中介效应(间接效应大小为 0.13, 占总效应的 15.66%, 95%CI: 0.05-0.24)；（3）工作压力显著调节了心理资本中介作用的前半段($\beta = 0.17, t = 2.16, p < 0.05$)；（4）工作压力显著调节了安全氛围对调度员安全行为的直接作用($\beta = -0.15, t = -3.01, p < 0.01$)。因此，城市轨道交通调度员的安全行为不仅受到自身感知到的安全氛围这一安全环境因素的影响，心理资本和工作压力等个体心理状态和认知因素也发挥着重要作用。企业要塑造和培养本质安全型员工，实现人本安全目标，从安全观念文化和安全行为文化入手，创造良好的安全物态及环境文化，提升企业安全管理水平，以构建企业安全文化新模式，建设本质安全型企业。

The relationship between safety climate and safety behavior among urban rail transit dispatchers: Work stress as mediator and psychological capital as moderator

GUO Xilian^{1,2}, LAN Jijun^{1,2}(Corresponding Author), WANG Zhuo^{1,2}

1 School of Psychology, Shaanxi Normal University, Xi'an, 710062

2 Shaanxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, 710062

Abstract: In recent years, the party and China attach great importance to people's safety, but in reality, accidents in the field of public transport are still common. Under the new situation, the coupling Induction of various risks and challenges faced by public transport safety is increasingly obvious. As a key safety position responsible for traffic organization, equipment maintenance, information sending and receiving, fault emergency treatment and other important tasks, urban rail transit dispatchers are the "heart" and "brain" of rail transit operation. They are responsible for monitoring, managing and dispatching all trains, section lines and stations in the whole line, and handling all kinds of emergencies. In order to explore the relationship between the safety climate of the organization and the safety behavior, psychological capital and work stress of dispatchers, and promote the sustainable and healthy development of enterprises safety management. Based on the social cognitive theory and people-oriented safety theory, this study adopts cluster sampling method to measure the safety climate scale, safety behavior scale, psychological capital questionnaire and work stress scale of all dispatchers (a total of 270 people) in the operation branch of a city rail transit group. There were 265 valid questionnaires. The results show that: (1) Safety climate has a significant positive predictive effect on the safety behavior of dispatchers ($\beta = 0.84, t = 20.13, p < 0.001$). (2) Psychological capital had significant partial mediating effect between safety climate and safety behavior (indirect effect was 0.13, accounting for 15.66% of the total effect, 95% CI: 0.05-0.24). (3) Work stress significantly moderates the first half of the mediating role of psychological capital ($\beta = 0.17, t = 2.16, p < 0.05$). (4) Work stress significantly moderates the direct effect of safety climate on safety behavior of dispatchers ($\beta = -0.15, t = -3.01, p < 0.01$). Therefore, the safety behavior of urban rail transit dispatchers is not only affected by their perceived safety climate, but also affected by individual psychological state and cognitive factors such as psychological capital and work stress. The enterprise should shape and cultivate intrinsically safe employees, realize the goal of people-oriented safety, start with safety concept culture and safety behavior culture, create good safety material state and environment culture, and improve the safety management level of enterprises, so as to build a new mode of enterprises safety culture and build intrinsically safe enterprises.

摘要 空间视觉化是空间认知能力的核心要素, 对飞行员的作业绩效产生重要影响。然而, 以往空间视觉化实验任务大多缺乏空间情景和生态效度。因此, 本研究基于情景交互技术构建空间视觉化能力测试。研究基于立方体测试(the Cube Construction Task)范式并与现实场景相结合, 编制了不同难度的36个试次。实验一招募了39名大学生(男性18名, 女性21名, 18-25岁)与32名飞行员(均为男性, 18-28岁), 进行项目分析并检验信效度。实验二招募33名被试(男性14名, 女性19名), 采用近红外脑功能成像(fNIRS)氧合血红蛋白浓度指标检测空间视觉化情境交互测验激活的脑区以及空间视觉化不同能力组脑区激活程度差异。结果表明: (1)27个测试项目具有较好的区分度; (2)修正后测试具有较高的分半信度和内部一致性;

(3) 空间视觉化情景交互测试准确率与传统测试准确率、图形推理能力测试分数和客体-空间表象和言语认知风格测验分数显著相关, 高能力组和低能力组在情境交互测试中出现显著性差异, 说明情境测试具有较好的效标关联效度、结构效度与实证效度; (4) 空间视觉化情景测试有效地激活了被以往研究证实的额上回、辅助运动区和顶叶(顶下叶、上顶叶)等脑区, 高低能力组在额中回、额上回、中央前回、中央后回、顶下叶区域激活中出现显著性差异, 飞行员、飞行学院和大学生群体在额上回、额中回、辅助运动区、中央前回、上顶叶区域激活中出现显著性差异, 表明情境交互测试具有良好的区分效度和实证效度。上述结果表明空间视角化情景测验具有较好的可靠性和有效性, 可以作为空间视觉化能力评估的有效工具, 为飞行员心理选拔提供了重要的技术支持。

Construction of Spatial Visualization Test Based on Situational Interaction Pattern

Huang Lei^{1,2}, Xu Quan^{1,2}, Ji Ming^{1,2}

1 School of Psychology, Shaanxi Normal University, Xi'an, Shannxi, 710062, China

2 Shannxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, Shannxi, 710062, China

Abstract: Spatial visualization is the core element of spatial ability, which has an important impact on pilot performance. However, the previous methods for evaluating and testing spatial visualization lack ecological validity. Therefore, the purpose of this study is to construct a spatial visualization ability test using situational interaction model. This research is adapted from the Cube Construction Task, combined with the real scene, using real objects as the test material, and compiling 36 trials of different difficulty. In Experiment 1, 39 students (18 males, 21 females, 18-25 years old) and 32 pilots (all males, 18-28 years old) were recruited to conduct project analysis and test reliability and validity. In the experiment 2, 33 students (14 males and 19 females) were recruited. Functional Near-infrared Spectroscopy (fNIRS) was used to detect the brain regions activated by spatial visualization interaction test and the differences in the brain regions activated by different ability group. Results:(1) 27 test items had great differentiation. (2) The modified test has a high split and half reliability and the internal consistency. (3) The Spatial Visualization Test was significantly associated with traditional test, the spatial reasoning test and the Object-Spatial-Verbal cognitive style test, significant differences appear in the different ability group, show that spatial visualization test has great criterion correlation validity, structure validity and empirical validity.(4) The results of fNIRS showed spatial visualization test effectively activated the frontal gyrus, the auxiliary motor area and the parietal lobe (inferior parietal lobe and superior parietal lobe), which had been confirmed by previous studies. Different ability group show the significantly differences in the activation of the middle frontal gyrus, superior frontal gyrus, anterior central gyrus, posterior central gyrus and inferior parietal lobe, and different type group show the significant differences in the activation of superior frontal gyrus, middle frontal gyrus, auxiliary motor area, anterior central gyrus and superior parietal lobe, indicating that the situational interaction test had great discriminant validity and empirical validity. In general, the spatial perspective situational test developed in this study meets the basic requirements of surveying, can be used as an effective tool for spatial visualization ability assessment and selection, and provides an important technical support for pilot psychological selection.

全面屏手机屏幕交互舒适区用户体验研究

李祥^{1,2} 姬鸣^{1,2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知科学重点实验室, 西安, 710062, jiming@snnu.edu.cn

摘要 全面屏智能手机的显示功能对用户视觉体验产生重要影响, 而屏幕交互区域位置则成为影响用户操作体验的核心要素。本研究旨在探究用户屏幕交互舒适区位置及影响舒适区操作体验的因素。实验 1 选取 40 名大学生被试在单手拇指操作手机的条件下, 屏幕不同区域的操作舒适度。实验 2 选取 40 名大学生被试探讨不同任务(单击、双击、拖动), 操作姿势(坐立、行走)和操作频率(慢、中、快)条件下对手机屏幕不同区域操作体验的影响。因变量采用绩效指标、肌电数据(EMG)和主观舒适度对操作体验进行测量和分析。结果表明:(1)单手拇指操作全面屏手机完成单击任务时, 根据操作效率和主观舒适度可将屏幕划分成舒适区、可触及区和困难区, 用户操作效率和主观舒适度在舒适区显著高于可触及区, 可触及区显著高于困难区。(2)任务类型不同时, 单击任务和双击在舒适区比其他区域的操作效率、主观舒适度较高, 肌肉疲劳程度较低, 而这一差异在拖动任务中并不显著。(3)操作姿势不同时, 前臂有支撑坐立和前臂无支撑坐立操作手机在舒适区的操作效率和主观舒适度显著高于其他区域, 肌肉疲劳程度更低, 而在行走时差异不显著。(4)点击频率不同时, 较慢和中等频率的点击在舒适区比其他区域的操作效率、主观舒适度较高, 肌肉疲劳程度较低, 频率较快时差异不显著。上述结果表明, 单手拇指操作时用户在屏幕舒适区进行交互的用户体验更好, 在简单任务、操作频率中等和坐立条件下屏幕舒适区的用户体验更好。研究这一结论为交互设计优化提供了重要参考, 也为提升全面屏手机操作体验提供了科学依据。

Research on user experience in the screen interaction comfort area of full-screen mobile phone

Li Xiang^{1,2}, Ji Ming^{1,2}

1 School of Psychology, Shaanxi Normal University, Xi'an, Shannxi 710062, China

2 Shannxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, Shannxi 710062, China

Abstract: The display function of a full-screen smartphone has an important impact on the user's visual experience, while the location of the screen interaction area becomes the core factor affecting the user's operation experience. The purpose of this study is to explore the location of user's screen interaction comfort area and the factors that affect the operating experience of the comfort area. In experiment 1, 40 college students were selected to study the operating comfort of different areas of the screen under the condition that they operated the mobile phone with one hand thumb. In experiment 2, 40 college students were selected to explore the effects of different tasks (click, double click, drag), operation posture (sitting, walking) and operation frequency (slow, medium, fast) on the operation experience in different areas of the mobile phone screen. The dependent variables were measured and analyzed by performance indicators, EMG data and subjective comfort. The results show that : (1) when using a full-screen phone with one hand thumb to complete the click task, the screen can be divided into comfort area, reachchable area and difficult area according to the operation efficiency and subjective comfort. The user's operation efficiency and subjective comfort area are significantly higher in the comfort area than in the touchable area, and the touchable area is significantly higher than in the difficult area. (2) When the task types were different, the operating efficiency and subjective comfort were higher in the comfort area, and the muscle fatigue was lower in the comfort area. However, this difference was not significant in the drag task. (3) When the operating posture is different, the operating efficiency and subjective comfort in the comfort area of the mobile phone with and without forearm support are significantly higher than those in other areas, and the muscle fatigue degree is lower, while the difference in walking is not significant. (4) When the click frequency is different, the operation efficiency and subjective comfort of the slow and

medium click frequency in the comfort area are higher than other areas, and the muscle fatigue degree is lower. When the click frequency is faster, the difference is not significant. The above results indicate that the user experience in the comfort area of the screen is better when the user operates with the thumb of one hand, and the user experience in the comfort area of the screen is better when the user performs simple tasks, medium operation frequency and sitting condition. The conclusion of this study provides an important reference for the optimization of interaction design, and also provides a scientific basis for improving the full-screen mobile phone operating experience.

听觉干扰负荷与工作记忆能力对飞行员情境意识的影响 ——基于眼动的证据

解旭东¹² 李甜田¹² 兰天珺¹² 姬鸣¹² (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知神经科学重点实验室, 西安, 710062, jiming@snnu.edu.cn

摘要 情境意识是个体对动态环境信息的感知、理解以及对未来状态的预测。在飞行过程中, 维持良好的情境意识是飞行员做出正确决策的前提条件。有研究表明, 听觉干扰会争夺认知资源, 对个体获取和处理信息的过程产生负面影响, 进而损害情境意识。然而, 不同听觉干扰负荷对情境意识的影响尚不明确。工作记忆能够引导和优化认知资源分配, 保持良好情境意识, 同时能够维持个体更好的认知控制。本研究旨在探讨听觉干扰负荷与工作记忆能力对飞行员情境意识的影响及作用机制。本实验招募 52 名航线飞行员, 采用 2(听觉干扰负荷: 高负荷 vs. 低负荷) × 2(工作记忆能力: 高 vs. 低) 混合设计, 听觉干扰负荷为被试内变量, 工作记忆能力为被试间变量。因变量指标为情境意识得分和眼动数据(任务相关兴趣区的平均注视时间、平均注视率和眼动熵)。结果表明: (1) 在情境意识得分方面, 听觉干扰负荷和工作记忆能力的主效应与交互效应均显著, 工作记忆能力低的被试在高听觉干扰负荷下情境意识得分显著小于低听觉干扰负荷下得分。(2) 在眼动指标方面, 听觉干扰负荷和工作记忆能力对眼动熵的主效应显著, 对任务相关兴趣区的平均注视时间、注视率的主效应与交互效应均显著, 工作记忆能力低的被试在高听觉干扰负荷下对任务相关兴趣区的平均注视时间、注视率显著小于低听觉干扰负荷下的表现。结论: 工作记忆能力较高的飞行员能够保持更好的情境意识; 听觉干扰负荷对工作记忆能力较低飞行员的情境意识损害更大; 高负荷听觉干扰对视觉注意及视觉扫描模式产生负面影响, 而低负荷听觉干扰只对视觉注意产生负面影响。本研究结论拓展了情境意识相关理论, 并为飞行员选拔及对其在干扰条件下维持良好情境意识的训练提供了科学依据。

The Effect of Auditory Distraction Load and Working Memory Capacity on Pilots' Situation Awareness——An Eye-tracking Study

Xudong Xie¹², Tiantian Li¹², Tianjun Lan¹², Ming Ji¹²

1 School of Psychology, Shaanxi Normal University, Xi'an, Shaanxi, 710062, China

2 Shaanxi Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, Shaanxi, 710062, China

Abstract: Situation awareness is defined as the individual's perception and comprehension of dynamic environmental information and the projection of the future state. Maintaining good situation awareness is the precondition to make correct decision during the flight. Auditory distractions compete for cognitive resources, which negatively affects the pilots' information acquisition and processing process, and further impair situation awareness. However, the impact of different auditory distraction loads on situation awareness is still unclear. Working memory guides and optimizes the allocation of cognitive resources, maintains good situation awareness, and at the same time maintains individuals'

better cognitive control. The purpose of this study was to investigate the effects of auditory distraction load and working memory capacity (WMC) on pilots' situation awareness and the mechanism. Methods: This experiment recruited 52 airline pilots and used 2 (auditory distraction load: high load vs. low load) $\times$ 2 (working memory capacity: high WMC vs. low WMC) mixed design. The within-subject variable was auditory distraction load and the between-subject variable was working memory capacity. The dependent variables were situation awareness score and eye movement data (average fixation time of the task-related AOIs, average fixation rate of the task-related AOIs, and entropy). The results showed that: (1) In terms of situation awareness score, the main effects and interaction effects of auditory distraction load and working memory capacity were both significant. The situation awareness scores of participants with poorer working memory ability in high auditory distraction load condition were significantly lower than those in low auditory distraction load condition. (2) In terms of eye movement indicators, the main effects of auditory distraction load and working memory capacity on entropy were significant; the main effects and the interaction effects of auditory distraction load and working memory capacity on average fixation time and average fixation rate of task-related AOIs were significant, the average fixation time and fixation rate of participants with low working memory capacity on the task-related AOIs in high auditory distraction load condition were significantly lower than those in low auditory distraction load condition. Conclusions: Pilots with good working memory capacity maintain better situation awareness than pilots with poor working memory capacity; auditory distraction load has more serious damage to situation awareness of pilots with low working memory capacity; high-load auditory distraction has negative effects on visual attention and visual scanning mode, and low-load auditory distraction only has a negative effect on visual attention. The conclusions of this study expand the relevant theories on situation awareness, and provide scientific bases for pilot selection and training to maintain good situation awareness in distraction conditions.

社会规范对驾驶员让行行为的助推作用

刘馨泽¹ 瞿炜娜¹ 葛燕¹ (通讯作者)

¹ 中国科学院心理研究所, 北京, 100101, gey@psych.ac.cn

摘要 驾驶员未按规定让行是造成交通事故的主要原因, 探讨有效方法提升驾驶员的让行行为尤为重要。社会规范是一种有效、易操作的助推方式, 在环境保护、健康等领域得到了广泛证明, 但并未应用在驾驶情境中, 因此本研究尝试使用呈现社会规范标语的方式来促进驾驶员的让行行为。本研究从社会规范类型(动态规范、静态规范、命令性规范及动态+静态规范)和社会规范焦点(积极、消极)两方面入手, 设计了8种社会规范标语。使用联合分析和方差分析的方法来对比不同社会规范标语对驾驶员让行行为的助推作用, 并进一步探究行人特征(行人数量、行人年龄、行人性别、是否遵守交通规则)及情境因素(行人与车辆的横向距离、纵向距离)对驾驶员右转路口处让行决策的影响。通过对254份有效问卷的分析, 发现与静态规范、命令性规范和动态+静态规范相比, 积极焦点的动态规范对驾驶员的让行行为有更强的助推作用。联合分析结果显示, 社会规范对驾驶员让行决策的影响最大(32.28%), 其次是行人是否遵守交规(23.33%)以及行人年龄(18.40%)。本研究结果支持了社会规范作为一种简单易行的方法来促进驾驶员让行行为的可能性, 有助于道路标语的内容设计, 为促进驾驶员做出更多的积极行为提供了一个新的干预视角。此外, 研究结果还表明, 研究者不仅要从驾驶员特征出发来促进驾驶员的让行行为, 也要关注影响驾驶员让行决策的重要因素, 从改善整体交通环境的角度促进驾驶员与行人的友好互动。

The nudging effect of social norms on drivers' yielding behaviour

Xinze Liu¹, Weina Qu¹, Yan Ge¹

¹ CAS Key Laboratory of Behavioral Science, Institute of Psychology, Beijing, China

Abstract: Failing to yield is one of main causes of traffic accidents, so it is important to explore effective methods to improve drivers' yield behavior. Social norms are effective and practicable nudging ways, which has been widely proved in environmental protection, health and other fields, but not applied in driving situations. Therefore, this study tried to use the way of presenting social norms to promote drivers' yielding behaviors. This study designed eight kinds of social norm slogans from two aspects: the types of social norms (dynamic norms, static norms, injunctive norms and dynamic + static norms) and the focus of social norms (positively worded and negatively worded). Using the methods of conjoint analysis and variance analysis, this study compared the nudging effect of different social norms slogans on drivers' yielding behavior, and further explored the impact of pedestrian characteristics (number of pedestrians, pedestrian age, pedestrian gender, and whether the pedestrian complied with traffic rules) and situational factors (lateral distance and longitudinal distance between pedestrians and vehicles) on drivers' yielding decision at turning-right intersection. By analysing 254 valid questionnaires, it was found that compared with static norms, injunctive norms and dynamic + static norms, positively worded dynamic norms have a better nudging effect on drivers' yielding behaviour. The results of conjoint analysis showed that social norms have the greatest impact on drivers' decisions to yield (32.28%), followed by whether pedestrians comply with traffic rules (23.33%) and the age of pedestrian (18.40%). The results of this study support the possibility and application significance that social norms can be used as a simple and easy-operated method to nudge driver's giving way behaviour, contribute to the content design of road slogans, and provide a new intervention perspective for promoting more positive behaviour among drivers. What's more, the results also indicated that we should not only start with the drivers' characteristic to nudge yielding behaviour, but also pay attention to the important factors that influence driver's yielding decision-making, promoting the friendly interaction between drivers and pedestrians from the perspective of improving the overall traffic environment.

脑机接口技术环境下小学低年级学生学习分享意愿的研究：

AR 学习与文本学习的学业情绪是否是一致的？

赵小军 康欣蕊 李旭鹏（通讯作者）

河北大学教育学院，保定，071002，lixupeng0711@foxmail.com

摘 要 学业情绪是反映个体发展的重要指标，积极学业情绪可以帮助学生培养积极的学习态度，促进学生自主学习。随着学生学习压力的增加，培养学生积极的学业情绪至关重要，增强现实作为目前教育应用的新兴技术，在教学过程中得到了长足的应用，以往研究表明，增强现实技术辅助学校教育，其虚实结合、立体成像等特点带给学生多感官刺激，AR 仿真交互让学生亲身参与体验，更具有沉浸感，产生积极的学习情绪。增强现实技术为教育教学提供了全新的可能性，AR 新技术在未来课堂中的应用前景研究有利于优化教育教学过程，帮助小学生培养更积极的学业情绪。本研究以小学三年级学生为研究对象，采用实验方法，旨在考察相对于文本学习模式，AR 学习模式是否激活了学习者更良好的学业情绪。采用 AR 设备、12 张 AR 识别卡和印有相同 AR 卡片图案的英语课本以及基于脑机接口技术的 BrainLink Pro 系统对 116 名学生进行研究。结果发现：(1)在学习过程中，AR 学习组在学习时的注意力和放松度与文本学习组没有显著差异；(2)在分享过程中，注意力方面，学习模式主效应显著，AR 学习组在分享时的注意力显著高于文本学习组，是否分享主效应不显著且二者交互作用不显著；放松度方面，学习模式、是否分享主效应及二者交互作用不显著；(3)在分享意愿上，学习模式主效应显著，AR 学习组的分享意愿显著高于文本学习组。在分享过程中，无论是否分享，AR 组学生的注意力都显著高于文本组，且学习者分享行为偏好作为良好学业情绪的观测指标。AR 支持下的教育环境能够激发学生良好的学业情绪，为改善小学生学业情绪提供了一定的指导意义。

Learning sharing willingness of lower grades students under the environment of brain computer interface technology: are the academic emotions of AR and text learning consistent?

Zhao Xiaojun, Kang Xinrui, Li Xupeng

School of education, Heibei University, Baoding, 071002, E-mail: lixupeng0711@foxmail.com

Abstract: Academic emotion as an important indicator of individual development, positive academic emotion can help students develop positive learning attitude and promote students' autonomous learning. With the increase of students' learning pressure, it is very important to cultivate students' positive academic emotions. As an emerging technology of educational application, augmented reality has been widely applied in the teaching process. Previous studies have shown that augmented reality technology assisted school education, its combination of virtual and real, three-dimensional reconstruction bring students multi-sensory stimulation, AR simulation interaction enables students to experience personally, have a sense of immersion, and produce positive learning emotions. Augmented reality technology provides a new possibility for education. The research on the application prospect of AR in the future teaching is conducive to optimize the education and teaching process and help primary school students develop more positive academic emotions. This study takes the third grade students as the research object, using the experimental method, aims to investigate whether AR learning model activates better academic emotions than text learning model. 116 students were studied by the AR equipment, 12 AR cards and English textbooks with the same pattern on the AR cards, and BrainLink Pro system based on brain computer interface. the results showed that (1) In the process of learning, there was no significant difference in attention and relaxation between AR group and text group; (2) In the process of sharing, in terms of attention, the main effect of learning mode is significant. The attention of AR learning group is significantly higher than that of text learning group. The main effect of sharing and the interaction between the two is not significant; In terms of relaxation, the main effect of learning mode, sharing and the interaction between them are not significant; (3) On the sharing willingness, the main effect of learning mode is significant, and the sharing willingness of AR learning group is significantly higher than that of text learning group. In the process of sharing, regardless of sharing or not, the attention of the AR group is significantly higher than that of the text group, and the learners' sharing willingness is used as an observation index of good academic emotions. The education environment supported by AR can stimulate students' good academic emotions, and provides some guidance for improving primary school students' academic emotions.

不同表征方式对小学生 AR 多媒体学习绩效的影响研究： 视听设计与情绪设计

赵小军 李娟娟 寇玉婷（通讯作者）

河北大学教育学院，保定，071002，2049935402@qq.com

摘 要 随着科技的发展，AR 多媒体技术逐渐应用到教育学习领域。为探讨 AR 多媒体技术对学习效果的影响，本研究以 225 名小学低年级学生为被试，以 AR 英语识别卡片为材料，通过两项实验探究 AR 多媒体学习中不同视听设计和情绪设计对学习动机和认知负荷的影响。实验 1 采用 2（AR 材料性别：男、女）×3（音高：原始音、高音、低音）的被试间设计，探讨不同条件下听觉设计对小学生学习动机和认知负荷的影响。实验 2 采用 2（材料性别：男、女）×2（情绪设计：积极、中性）×2（感知互动：AR、文本）×3（音高：原始音、高音、低音）的混合实验设计，探讨不同视听设计和情绪设计对小学生学习动机和认知负荷的影响。结果表明：（1）小学生的学习动机和认知负荷在 AR 材料性别上存在差异，AR 女性材料的学习动机高于 AR 男性材料的学习动机，AR 男性材料的认知负荷低于 AR 女性材料的认知负荷。（2）接受情绪设计组(实验组)

的积极情绪显著高于中性组(对照组);实验组与对照组在认知负荷上不存在显著差异,但在学习动机上存在显著差异,即相对于对照组来说,实验组的学习动机更低。(3)在认知负荷上,情绪和 AR 材料性别存在交互作用,即在实验组中,男性材料组的认知负荷显著高于女性材料组的认知负荷,而在对照组中,男性材料组的认知负荷与女性材料组的认知负荷无显著差异。(4)在学习动机上,情绪和 AR 材料性别存在交互作用,即在实验组中,男性材料组的学习动机显著低于女性材料组的学习动机;而在对照组中,男性材料组的学习动机显著高于女性材料组的学习动机。可见,AR 多媒体学习能够激发小学生学习兴趣,加强小学生学习体验,进而提高小学生英语学习能力。

A Study on the Influence of Different Representations on Learning Effects of Primary School Students' AR Multimedia Learning : Audiovisual Design and Emotional Design

Zhao Xiaojun, Li Juanjuan, Kou Yuting

School of education, Hebei University, Baoding, 071002, E-mail: 2049935402@qq.com

Abstract: With the development of science and technology, AR multimedia technology has been gradually applied to the field of education and learning. In order to explore the impact of AR multimedia technology on learning effects, this study took 225 students in the lower grades of elementary school as the subjects and used AR English recognition cards as materials to explore the influence of different audiovisual design and emotional design on learning motivation and cognitive load in AR multimedia learning. In Experiment 1, an inter subject design of 2 (AR material gender: male, female) $\times$ 3 (pitch: original tone, high pitch, low pitch) was used to explore the effects of auditory design on pupils' learning motivation and cognitive load under different conditions. Experiment 2 used a mixed experimental design of 2 (material gender: male, female) $\times$ 2 (emotional design: positive, neutral) $\times$ 2 (perceptual interaction: AR, text) $\times$ 3 (pitch: original tone, high pitch, low pitch) to explore the effects of different audiovisual design and emotional design on the learning motivation and cognitive load of primary school students. The results show that (1) In Experiment 1, the learning motivation and cognitive load of primary school students are different on the gender of AR materials. The learning motivation of female AR materials is higher than that of male AR materials, and the cognitive load of male AR materials is lower than that of female AR materials. (2) In Experiment 2, the positive emotions in the receiving emotional design group (experimental group) were significantly higher than those in the neutral emotional design group (control group). There was no significant difference in cognitive load between the experimental group and the control group, but there was a significant difference in learning motivation, that is, compared with the control group, the learning motivation of the experimental group was lower. (3) In terms of cognitive load, there is an interaction between emotion and gender of AR materials, that is, in the experimental group, the cognitive load of male materials group is significantly higher than that of female materials group, while in the control group, there is no significant difference between the cognitive load of male materials group and that of female materials group. (4) In terms of learning motivation, there is an interaction between emotion and gender of AR materials, that is, in the experimental group, the learning motivation of male materials group is significantly lower than that of female materials group; In the control group, the male material group had significantly higher motivation than the female material group. The results show that AR multimedia learning can stimulate primary school students' interest in learning, enhance their learning experience, and improve their English learning ability.

头-躯失谐对空间构图中内在偏向的影响

张军恒 孙敬雯 晏碧华 (通讯作者)

陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室, 西安, 710062, yanbihua@snnu.edu.cn

摘要 空间内容体的物理特征及客体的空间位置影响着构图审美的判断。空间框架内的物体位置有朝向中心的审美偏向, 这被称为空间构图中的内向偏差。以往研究通过采用实物、动物和人的图像发现其位置、隐含运动、朝向和目光等都影响个体对其空间和谐性的判断。身体姿态中特别是头部和躯体在空间构图的内在偏向中起到的影响尚未有研究, 而在一副画作中或照片中人的身体姿态并不都是正襟危坐式, 艺术作品中人物姿态更是千变万化, 因此, 关注头部和躯干之间的位置关系对内在偏向的影响既是空间知觉理论研究的拓展也是艺术审美的理论支撑。故本研究旨在探讨当头部和躯干不在同一冠状面时, 如何影响空间构图中的内在偏向。采用失谐范式, 将模拟人的头部和躯干进行解离, 三个实验分别考察了单因素条件下头部角度(正面 0°、向左转动+15°或右转动-15°、向左+30°或右转动-30°)和躯干朝向(朝前 0°、向左转动+15°或右转动-15°、向左+30°或右转动-30°)对空间中内在偏向的影响, 以及在头部与躯干转向叠加时空间构图中的内在偏向竞争。模拟人随机出现在图片的不同位置, 被试可以拖动模拟人将其放置在被试认为最合适的位置, 因变量为模拟人移动距离和其与中轴线的距离。研究发现: (1)单因素条件下, 不论是头部还是躯干转动, 随二者转动角度的增加, 模拟人与空间中轴线的距离随之增加; (2)当头部和躯干的转动方向一致时, 模拟人出现偏离空间中轴线的趋势, 具体表现为头部和躯干的转动角度和越大距离越远; (3)当头部和躯干的转动方向不一致时, 如果头部和躯干角度和的绝对值越大距离中轴线就越远。

结论: 头部和躯干都对空间构图中的内在偏向产生影响, 随着相应部位的角度增加, 中心趋向性也随之减少。同时, 头部-躯干之间存在对内在偏向影响的竞争关系。

The effect of head-to-body dissociation on the inward bias of space composition

ZHANG Junheng, SUN Jingwen, YAN Bihua (corresponding author)

(School of Psychology, Shaanxi Normal University, Xi'an 710062, China)

Abstract: The objects' physical properties and their positions in space affect the judgment of the composition aesthetics. The position of objects in the space frame has an aesthetic bias toward the center, which is called the inward bias in the spatial composition. Previous studies have used images of objects, animals and humans to find that their position, implied motion, orientation and gaze all affect individuals' judgment of spatial harmony. The influence of body postures, especially the inward bias of the head and body in the spatial composition has not been studied, and the body postures of people in a painting or photograph are not all in a sitting style with neat attires and proper posture. On the contrary, it is ever-changing. Therefore, paying attention to the influence of the positional relationship between the head and the trunk on the inward bias is not only the expansion of the spatial perception theory research but also the theoretical support of artistic aesthetics. The purpose of this study was to explore how the inward bias in spatial composition is affected when the head and body are not on the same coronal plane. The misalignment paradigm was adopted to dissociate the simulated human head and body. Three experiments respectively examined the effects of the head angle (0°, +15° left or -15° right, +30° left or -30° right) and body angle (0°, +15° or -15°, +30° or -30°) on the inward bias of space composition under single factor conditions, and the inward bias competition in spatial composition when the head and torso turn superimposed. Simulators appeared randomly at different positions in the picture. The subjects dragged the simulator to place it in the most suitable position. The dependent variables were the distance the simulator moves and its distance from the central axis. The findings of the three experiments were as follows. First, under the condition of single factor, the distance between the simulated person and the central axis of space increased with the increase of the rotation angle of both the head and the body. Second, when the rotation direction of the head and torso was the same, simulators had a tendency to deviate from the central

axis of space, which was specifically manifested as the greater the angle and distance between them. Third, when the rotation direction of the head and torso was inconsistent, the greater the absolute value of the angle sum between the head and torso, the farther it was from the central axis. In conclusion, the results of this study suggested that both the head and body have an effect on the inward bias in spatial composition, and the central tendency decreases with the increase of the angle of the corresponding parts. At the same time, there is a competition between the head and the body for the influence of inward bias.

跨期决策中的维度差别判断强度：来自眼动追踪的信息加工证据

刘洪志^{1*} 李秋月¹ 付江洪¹ 黄怡婷¹

¹ 南开大学周恩来政府管理学院社会心理学系, 天津, 300350, *liuhz@nankai.edu.cn

摘要 跨期决策是指对发生在未来不同时间点上的结果做出选择的决策过程, 它需要决策者在眼前利益与未来利益之间做出权衡与取舍。例如, 是选择今天获得 10 元钱还是一周后获得 12 元钱。跨期决策中的单维占优模型, 如齐当别模型、权衡模型、相似性模型等, 假设人们在跨期决策过程中会比较时间维度和金钱维度的差别, 并基于差别最大的维度进行决策。大量基于结果检验和过程检验的证据均表明, 单维占优模型能够很好地描述个体的跨期决策行为。然而, 现有单维占优模型往往基于确定性模型的假设, 关注于对跨期决策行为的定性解释, 更关注于维度差别的判断过程中“哪个维度差别更大”, 却忽视了维度差别判断的强度, 即“两个维度的差别究竟有多大”。鉴于此, 本研究采用已被前人验证有效的“直观模拟天平”范式测量跨期决策中的维度差别判断强度, 并结合眼动追踪技术, 考察了跨期决策中的信息加工过程是否能够反映个体的维度差别判断强度。本研究发现: 1) 维度差别判断强度越大, 个体违背转移性原则的可能性越大; 2) 反应时和眼跳熵(衡量眼跳数量的指标)可负向预测维度差别判断强度; 3) 维度相对注视时间和瞳孔大小可预测维度差别判断强度。研究结果证实了维度差别判断强度与信息加工过程的联系, 为单维占优模型提供了进一步的过程证据。同时, 本研究结果也提示, 相比于确定性模型, 概率性的跨期模型能更好地描述跨期决策行为, 为今后跨期决策模型的发展指明了方向。

The strength of the dimension-based difference judgment in intertemporal choice: Evidence from eye-tracking

Hong-Zhi Liu^{1*}, Qiu-Yue Li¹, Jiang-Hong Fu¹, Yi-Ting Huang¹

Department of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin
300350, China; *Email: liuhz@nankai.edu.cn

Abstract: Intertemporal choice refers to decisions that involve tradeoffs among outcomes at different points of time. It is not only a unique characteristic of human behavior, but is also a relevant matter to policymaking and national welfare. The dimension-based models, such as equate-to-differentiate theory, tradeoff model, and similarity model, show that individuals tend to compare the difference between dimensions of delay and outcome before deciding in a single dimension when selecting between a smaller, sooner outcome (SS) and a larger, later outcome (LL). Considerable empirical evidence from behavioral data and process data supports the use of dimension-based models. The existing dimension-based models provide qualitative explanations for individual's intertemporal choice and focus

“which dimension is the greater difference dimension”, but ignore the strength of dimension-based difference judgment (i.e., “how much different of the difference between the two dimensions”). Accordingly, the present study examined the relationship between the strength of dimension-based difference judgment, which is measured by the visual analogue scale paradigm, and the information process, which is measured by eye-tracking technique. We found that: 1) the greater of the strength of dimension-based difference judgment, the more violations of transitivity; 2) response time and transition entropy can negatively predict the strength of dimension-based difference judgment; 3) the dimension-based time advantage and pupil size can predict the strength of dimension-based difference judgment. Our findings approved the correlation between the strength of dimension-based difference judgment and information process, providing further process evidence for priority models. The results of present research also suggest that compared to the determinant models, the probabilistic models can better describe individual’s intertemporal choice, highlighting the direction of the development of intertemporal models.

Keywords: intertemporal choice, priority, strength of dimension-based difference judgment, eye-tracking technique

内隐风险感知对跨期决策即时偏好的影响

摘 要 跨期决策领域研究发现, 相比于未来选项, 人们更加偏好即时选项, 为什么在跨期决策中存在偏好即时选项? 研究通常使用“时间折扣”对这一现象加以描述。“时间折扣”是指随着时间的延迟人们对于同等数量的获益或损失的价值加以折扣, 因此更加倾向选择效用更大的即时选项。与此同时, 有研究指出, 时间延迟增加了未来选项的风险性进而影响选择偏好。然而, 人们对于未来往往是内隐风险感知, 特别是现有的经典跨期决策任务的研究范式难以分离出内隐风险对跨期决策的影响。本研究设计一个回溯选择任务范式, 试图将潜在风险从延迟折扣任务中分离出来, 明确内隐风险在跨期决策中的影响机制。基于此, 我们开展了两项研究。研究 1a 采用单因素被试内实验设计, 招募 216 名有效被试, 所有被试均完成标准条件、过去条件和未来条件三个条件。首先要求被试完成时间间隔为 1 个月的跨期决策任务, 并测量内隐风险感知程度。结果表明, 相比于现在条件和未来条件($M_{\text{now}} = 0.36, M_{\text{future}} = 0.42$), 被试在分离内隐风险感知后的过去条件下, 时间折扣率显著降低($M_{\text{past}} = 0.28, p_{\text{past-now}} < 0.001; p_{\text{past-future}} < 0.003$)。风险感知程度上, 过去条件下被试的风险感知 (44.51 ± 25.94) 显著低于现在条件 (48.71 ± 23.13) 与未来条件 (53.91 ± 24.63)。研究 1a 采用被试内设计可能存在共同方法偏差, 且可能存在冲动性等混淆变量的影响。因此, 设计研究 1b 采用被试间设计, 招募 294 名有效被试, 要求每位被试只完成一个条件, 同时控制冲动性等变量, 结果与研究 1a 类似, 相比于现在条件和未来条件($M_{\text{now}} = 0.39, M_{\text{future}} = 0.47$), 被试在分离内隐风险感知后的过去条件下, 时间折扣率显著降低 ($M_{\text{past}} = 0.19, p_{\text{past-now}} < 0.05; p_{\text{past-future}} < 0.01$)。风险感知程度上, 过去条件下被试的风险感知显著低于现在条件与未来条件。为进一步检验结果的稳健性, 明确风险感知在其中的作用, 研究 2 同样采用单因素被试间研究设计, 但将跨期决策任务调整为长时距情境 (10 年)。该研究招募 238 名有效被试, 要求每位被试完成与研究 1 类似的跨期决策任务。结果与研究 1 相一致, 相比于现在条件和未来条件相比, 过去条件降低被试的跨期决策时间折扣率, 具有更低的风险感知程度。此外, 内隐风险感知在时间框架与跨期选择偏好之间起中介作用。本研究创制了回溯选择任务范式, 有效地在跨期决策中分离内隐风险感知。研究 1 和研究 2 的结果深入探讨了内隐风险感知对跨期决策选择即时偏好的影响。

关键词 跨期决策, 时间折扣, 内隐风险感知, 即时偏好

The Effect of Implicit Risk Perception on the Immediate Preference of Intertemporal Choice

Abstract: When given the choice between two different outcomes displaced only by time, we are invariably drawn to the more immediate outcome. This is, as outcomes displaced by time, have questionable certainty relative to more immediate options. In past studies of intertemporal choice, this fundamental attribute of time (future) displaced choices has been reasoned to be a confound in tasks designed to manipulate the quantitative or subjective risk perception of participants. However, no real attempt has been made to effectively control this effect. We hope to demonstrate that this fundamental attribute of future-displaced choices can be nullified in tasks aimed at assessing the effect of risk on time preference by effectively shifting the temporal framework of choice tasks. In this particular instance, we seek to demonstrate how the shifting of the decision frame from present-future to past-present effectively maintains the original uncertainty manipulations. This particular demonstration will be of interest to the study of time preference as well as to our fundamental understanding of the effects of implicit risk on intertemporal choice and choice in general, through the isolation of the implicit risk factor in intertemporal choice tasks. Based on this, we conducted two studies. In Study 1a, 216 participants completed the intertemporal choice task under past condition, present condition and future condition respectively (the time interval was 1 month). The repeated measurement variance analysis showed that, compared with the present condition ($M_{\text{now}} = 0.36$, $M_{\text{future}} = 0.42$), the participants preferred the delayed option in the intertemporal choice under the past condition ($M_{\text{past}} = 0.28$, $p_{\text{past-now}} < 0.001$; $p_{\text{past-future}} < 0.003$). However, there may have comparatively effective due to use within-subject design in Study 1a. In addition, Study 1a may be affected by personality traits such as impulsive personality. Although we don't think impulsive personality traits are enough to affect results of Study 1a, to further test the robustness of the research results. Study 1b used between-subject design was carried. In Study 1b, 294 participants completed the intertemporal decision task. There are three conditions, and each participant was asked to completed one condition. Similar with Study 1a, the results of Study 1b showed that, compared with the present condition ($M_{\text{now}} = 0.39$, $M_{\text{future}} = 0.47$), the participants preferred the delayed option in the intertemporal choice under the past condition ($M_{\text{past}} = 0.19$, $p_{\text{past-now}} < 0.05$; $p_{\text{past-future}} < 0.01$). In Study 2, 238 participants completed the intertemporal decision task of the same three conditions as Study 1 (the time interval was 10 year). The repeated measure variance analysis showed that, compared with the present condition, the subjects preferred the delay option in the intertemporal decision making under the past condition. Additionally, both Study 1 and Study 2 verify the mediating effect of implicit risk perception between the conditional setting and the time delay discount rate.

摘要 全球健康现状严峻。健康行为有利于改善现状, 然而大多数人存在健康行为偏差问题, 亟需探讨造成健康行为偏差的原因。跨期决策是理解和解释健康行为的重要视角, 但前人研究未区分不同健康行为在跨期决策性质上的差异。同时, 近年提出的资源匮乏理论从资源匮乏的角度, 解释了金钱、时间的匮乏对人们行为偏差的影响, 但其在健康领域的适用性尚不清楚。因此, 本研究从跨期决策的视角理解和归类健康行为,

并借鉴资源匮乏理论的基本假设,探索健康匮乏对不同种类健康行为偏好及其特征偏好的影响。研究1通过问卷调查,在中国文化情境中验证了跨期决策视角下健康行为的分类结构。结果发现,基于努力、时间、健康影响三个特征可将健康行为分为长期-费力的与短期不费力的两类。研究2利用公开的数据库数据,通过多层回归建模的方法,探索了居民健康状况与两类健康行为偏好的相关关系。结果发现,健康匮乏者对长期-费力的健康行为的偏好更弱,对短期-不费力的健康行为的偏好更强。研究3采用组间比较的实验设计,通过提供不同特征维度占优的选择,探讨健康匮乏对健康行为特征偏好的影响。结果发现,相较于健康良好者,在努力和时间特征中,健康匮乏者更偏好努力特征占优的选项;但在时间与健康影响特征中,健康匮乏者则更偏好时间特征占优的选项。研究4采用了准实验设计,借助2020年新冠肺炎疫情,在健康匮乏的真实环境测量人们的主客观健康匮乏状况,综合探讨了健康匮乏对两类健康行为及其特征偏好的影响。结果发现,存在健康行为类别的效应,但并未发现健康匮乏与健康行为类别的交互影响。总之,本研究表明健康匮乏是造成健康行为偏差的重要原因,为现实生活中健康行为的干预、改善不良健康行为提供了新思路。

The effect of health scarcity on different characteristics of health behavior preferences

WU Xiao-Ju, LIANG Zhu-Yuan

Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract: The health status of China and the world is grim, and many people are in a state of health scarcity, such as sub-health. Healthy behaviors can promote and improve people's health status. However, most people have poor healthy behaviors and health behavior bias. People are prone to perform health behaviors, such as medical treatment and health care, excessively while under-executing long-term behaviors, such as a balanced diet and physical activity. Therefore, the key to solving the problem of health behavior bias is to enable people to make beneficial and long-term decisions when facing health choices. Previous studies have linked health behaviors with intertemporal decision-making and explained people's health behavior from the perspective of intertemporal preference. However, these studies only focused on the relationship between the two in general and did not distinguish the differences among different health behaviors in the nature of intertemporal decision-making. As a consequence, they failed to study health behaviors well within the framework of intertemporal decision-making. Recently, resource scarcity theory proposed that many behavioral biases can be explained from the perspective of resource scarcity, such as poverty, lending, and busyness. However, whether resource scarcity theory can apply to the field of health behavior remains unclear. Therefore, this study aims to understand and classify health behaviors from the perspective of intertemporal decision-making. Based on the basic hypothesis of resource scarcity theory, this study attempts to explore the effect of health scarcity on the different categories of health behavior preferences and their characteristic preference and explain the causes of health behavior bias from the perspective of health scarcity. This study has four sub-studies, all of which are based on Chinese adult samples. Study 1 validates the classification structure of health behaviors from the perspective of intertemporal decision-making using a questionnaire in the Chinese cultural context. Study 1 assesses the differences among different health behaviors from their three characteristics, including effort time and health influence. Results show that differences are observed in three characteristics among different health behaviors. Health behaviors could be classified into "effortful long-term pay-offs" and "easy immediate pay-offs." Study 2 explores the correlation between residents' health status and preferences for the health behaviors of "effortful long-term pay-offs" or "easy immediate pay-offs" by using open database data and multilevel regression modeling. Results show that health scarcity predicts the preference for health behaviors. Those with poor health have a weaker preference for the health behavior of "effortful long-term pay-offs" and a stronger preference for the health behavior of "easy immediate pay-offs." Study 3 explores the effect of health scarcity on preferences for different characteristics in the same type of health behavior by comparing experimental designs between groups. The study

provides superior choices in different characteristic dimensions. The study also observes the behavioral preferences of the health-deficient group and the control group in health behaviors dominant in different characteristic dimensions. Results show that health scarcity has an impact on health behavior preference. In terms of the effort and time characteristics of healthy behaviors, those with poor health are concerned more about effort characteristics than those with good health and prefer the option in which effort characteristics prevail. In terms of the characteristics of time and health influence of health behaviors, those with poor health are more concerned about time characteristics than those with good health and prefer the option in which time characteristics prevail. Study 4 adopts a quasi-experimental design to measure people's subjective and objective health scarcity in a real environment in the context of the novel coronavirus pneumonia epidemic in 2020. It comprehensively explores the effect of health scarcity on the two types of health behaviors and characteristic preferences. Results show the effects of health behavior categories, compared with the health behaviors of "easy immediate pay-offs", in the health behaviors of "effortful long-term pay-offs", Individuals pay more attention to effort characteristics than time characteristics and prefer the option in which effort characteristics prevail. Moreover, they are concerned more about time characteristics than health influence characteristics and prefer the dominant option of time characteristics. However, the results do not show an interaction between health scarcity and health behavior categories. In the two types of health behavior, those with poor health have the same preference for health behavior characteristics. In summary, this research indicate that health scarcity is an important cause of health behavior bias, confirming the applicability of resource scarcity theory in the field of health and providing new ideas and basic evidence for the intervention of health behaviors in real life.

跨期决策中奖赏大小与延迟时间的神经表征机制

汪强 王雅洁 白学军（通讯作者）

天津师范大学心理学部，天津，300387，baixuejun@126.com

摘要 为了长期目标而抵制眼前的诱惑的能力对个人的发展和成功至关重要。许多研究探讨了跨期决策的神经基础，但很少有人系统地研究了未来奖赏的两个属性（即奖励金额和延迟时间）的独立神经表征。更重要的是，目前还没有研究使用表征连接分析（RCA）的新方法，该方法允许我们在多元神经表征水平上绘制二维功能性脑网络（Kriegeskort et al., 2008）。本研究同时独立地操控跨期决策任务中报酬的金额和延迟时间。单变量和多变量模式分析均表明，背内侧前额叶皮质（DMPFC）和额叶外侧皮质（LFPC）的大脑活动受奖赏大小的调节，而 DMPFC 和背外侧前额叶皮质（DLPFC）的大脑活动受延迟时间的调节。此外，表征相似性分析（RSA）显示，即使在 DMPFC 的两个维度之间重叠的区域，它们也表现出不同的神经活动模式。在个体差异上，延迟折扣率（ k ）较大者，其 DMPFC 和 LFPC 活性随奖励金额的增加而增加，但随着延迟时间的增加，DMPFC 和 DLPFC 活性降低。最后，RCA 发现，隶属延迟时间的功能连接的拓扑度量（即全局和局部效率）可以反向预测个体的冲动性。这些发现为跨期决策中奖赏的两个维度的神经表征提供了新的见解，并为构建拓扑特性与冲动性相关的任务型功能性脑网络提供了新的途径。

Abstract: The ability to resist immediate temptations in favor of long-term goals is critical for an individual's development and success. Numerous studies have examined the neural substrates of intertemporal decision-making, but few have systematically investigated separate neural representations of the two attributes of future rewards (i.e., the amount of the reward and the delay time). More importantly, no study has used the novel analytical method of representational connectivity analysis (RCA), which allows us to map the two dimensions' functional brain networks at the level of multivariate neural representations. This study simultaneously and independently manipulated the amount and delay time of rewards during an intertemporal decision task. Both univariate and multivariate pattern analyses showed that brain activity in the dorsomedial prefrontal cortex (DMPFC) and lateral frontal pole cortex (LFPC) was modulated by the amount of rewards, whereas brain activity in the DMPFC and dorsolateral prefrontal cortex (DLPFC) was modulated by the length of delay. Moreover, representational similarity analysis (RSA) revealed that even for the regions of the DMPFC that overlapped between the two dimensions, they manifested distinct neural activity patterns. In terms of individual differences, those with large delay discounting rates (k) showed greater DMPFC and LFPC activity as the amount of rewards increased but showed lower DMPFC and DLPFC activity as the delay time increased. Finally, RCA suggested that the topological metrics (i.e., global and local efficiency) of the functional connectome subserving the delay time dimension inversely predicted individual impulsivity. These findings provide novel insights into neural representations of the two dimensions of rewards in intertemporal decision making, and offer a new approach to constructing task-based functional brain networks whose topological properties are related to impulsivity.

跨期选择中对金额和时间信息的交互式注意分配机制和计算模型

何黎胜¹ (通讯作者) Sudeep Bhatia³

¹ 上海大学悉尼工商学院, 上海, 201800,

² 美国宾夕法尼亚大学心理学系, 费城, 19104, felix8.he@gmail.com

摘要 经济决策不仅影响决策者的当前处境, 还常常关忽决策者长远的工作和生活。这种同时影响多个时间点的决策行为通常被称为跨期选择。跨期选择一直是心理学、管理学和认知神经科学等学科的重要研究课题之一。最近, Amasino 等人 (2019, *Nature Human Behaviour*) 通过分析 190 名被试的跨期选择眼动数据, 得出了“金额信息和时间信息对跨期选择的影响相互独立”这一结论。然而, 这一结论与以往的行为决策研究有两大矛盾之处。首先, 绝大多数跨期选择的理论和实证研究都认为金额信息和时间信息对跨期选择的影响不是独立的、而是交互式的。特别是有经济学渊源的折扣效价理论, 这些理论认为人们会综合考虑每个选项的金额和时间信息, 在此基础上形成对每个选项的效用值。即便是基于属性的 (attribute-wise) 跨期选择理论, 也常常假设金额信息与时间信息之间存在某种交互影响, 并以此来解释跨期选择中的常见行为现象。其次, 在其它经济决策 (例如风险决策和多属性决策) 的眼动研究中, 被试对不同属性的注意分配通常不是相互独立的, 而是相互影响的。基于此, 我们用计算建模的方法重新分析了 Amasino 等 (2019) 公开的眼动数据, 发现人们对金额信息和时间信息的注意分配存在极强的相互关联性。具体地说, 如果选项的金额很高, 人们

会更关注该选项中的时间信息，因为高金额使得与之相应的时间信息变得更重要。相应地，如果选项的时间延时很短，人们也会更加关注该选项中的金额信息，因为短的时间延时使得与之相应的金额信息变得更加重要。本论文还进一步讨论了这种交互式注意机制在连接偏好累积（preference accumulation）的认知模型与传统的经济学意义上的效用模型上的重要意义。总之，本论文通过对跨期选择的眼动数据进行计算建模分析，表明金额信息和时间信息对跨期选择的影响并不是相互独立的、而且是相互作用的。

Interdependent attention to amount and time information in intertemporal choice and computational model of attention dynamics

Lisheng He¹, Sudeep Bhatia²

¹ SILC Business School, Shanghai University, Shanghai, 201800

² Department of Psychology, University of Pennsylvania, Philadelphia, PA 19104, USA

Abstract: Most economic decisions involve consequences spread over time and can thus be considered intertemporal choice. Understanding how people make intertemporal choice has been a major focus of research across numerous academic disciplines. Recently, Amasino et al. (2019, Nature Human Behaviour) have contributed to this topic with a large-scale eye-tracking study (with 190 participants), in which they claim that “amount and time exert independent influences on intertemporal choice”. Amasino et al.’s contribution is important, and that their dataset offers a valuable resource for research on intertemporal choice. Yet, their main claim contradicts nearly all theories of intertemporal choice, which posit an interactive relationship between amount and time (usually in the form of a discounted utility). Even attribute-wise models of intertemporal choice (which posit that amount and time are compared as separate attributes, rather than directly multiplied together into a discounted utility) assume some type of interaction between amount and time in order to explain common behavioral regularities in choice involving single-dated amounts, as well as sequences of outcomes. Their claim also contradicts prior empirical work on attention in decision making, which finds that attention probabilities to attributes (e.g. time) depend on the values of the other attributes (e.g. amount). Here, we re-analyze data from Amasino et al., and find a strong relationship between attention to time delays and the monetary amounts associated with the time delays, and vice versa, using a computational model of attention dynamics. Specifically, a higher (more desirable) amount leads to more attention to its associated time delay and a lower (more desirable) time delay leads to more attention to its associated monetary amount. Thus the probability of attending to and evaluating one attribute depends on the value of the other. Furthermore, we argue that the interactive attention dynamics, combined with independent accumulators of amount and time information posited by Amosino et al., can yield emergent interactive preferences similar to those assumed by economic utility-based models. Overall, our re-analysis indicates that amount and time do not exert independent influences on intertemporal choice, and by doing so, we resolve the inconsistencies between Amasino et al.’s conclusions and the existing research. Our re-analysis also demonstrates the benefits of transparent data-sharing and open science.

“早死早超生”个体决策的神经机制

王雅洁¹ 冯杰¹ 祝文伟¹ 魏诗雨¹ 汪强¹（通讯作者）

¹ 天津师范大学心理学部，天津，300382，wangqiang113@gmail.com

摘要 在日常生活中，人们面对未来损失奖赏抉择时存在两种截然不同的决策模式，分别为“早死早超生”（FDG）和“好死不如赖活”（DG）类型。我们先前的行为研究已经证实该两组被试在选择立即损失和反应时指标上存在显著差异，表现为“早死早超生”更倾向于选择立即损失和更快的决策。然而，“早死早超生”个体特异的决策模式背后的认知和神经机制仍然不清晰。本研究将继续采用新颖的损失框架下延迟折扣范式，独立操纵立即和延迟损失（固定时间为半年后）奖赏大小，通过单变量和多体素模式分析（MVPA）考察该个

体的价值计算和抉择的神经基础。根据价值决策理论,我们预测“早死早超生”个体可能对于立即损失有着更好的敏感性和未来损失的不敏感性。为了回答上述问题,我们招募了 57 名大学生被试 (FDG=33 人, DG=24 人) 在磁体间完成行为实验决策任务,同时采集其脑影像数据。在价值编码阶段,单因素和 MVPA 分析结果显示, DG 组负责表征立即损失奖赏大小的脑区为右侧背内侧前额叶皮层 (DMPFC)、右外侧枕叶 (LOC)、左侧颞下回 (ITG) 和左侧背外侧前额叶皮层 (DLPFC); 负责表征延迟损失奖赏大小的脑区有, 顶下小叶 (IPL)、右侧楔前叶/后扣带回皮层 (PCC) 和 LOC。对比与 DG 组, FDG 组表现出不同的价值计算特点, 具体为, 负责表征立即损失奖赏大小的脑区为右侧楔前叶; 而负责延迟损失奖赏大小的脑区为顶上小叶 (SPL) 和右侧楔前叶/PCC。进一步组间比较显示, DG 组在 DMPFC、LOC 和 SPL 负责未来价值计算脑区上的激活显著强于 FDG 组, 这说明 FDG 对未来损失的恐惧是由于 DMPFC、LOC 和 SPL 对未来损失主观评价的敏感性降低导致的, 这可能是 FDG 更有可能选择立即损失而不是延迟损失的关键解释。随后, 脑-行为关联分析发现, 负责延迟损失奖赏价值计算的上述脑区 (DMPFC, SPL, LOC) 激活程度越低, 个体越倾向于选择立即损失选项。我们的结果表明, 之所以会表现出“早死早超生”决策模式, 可能是由于对于未来奖赏损失价值计算异常有关。这些发现为探究在面临未来损失时“早死早超生”个体决策的神经表征提供了新的见解, 并为深入探究其认知调控机制提供了思路。

Neural substrates of individual decision making of “future-dread group”

Yajie Wang¹, Jie Feng¹, Wenwei Zhu¹, Shiyu Wei¹, Qiang Wang¹ (corresponding author)

¹ Department of psychology, Tianjin Normal University, Tianjin, China

Abstract: In daily life, people face two completely different decision-making modes when they make decisions about future losses and rewards, namely, “future-dread group” (FDG) and “discounting group” (DG). Our previous behavioral research had confirmed that the two groups of subjects had significant differences in choosing immediate loss and reaction indicators, which was manifested as “future-dread group” was more inclined to choose immediate loss and faster decision-making. However, the cognition and neural substrates behind the individual-specific decision-making model of “future-dread group” are still unclear. The study would continue to adopt the delayed discount paradigm under the novel loss framework, independently manipulated the immediate and delayed loss (fixed time is half a year later) reward size, and examined the neural basis of the individual's value calculation and decision through univariate and multi-voxel pattern analysis (MVPA). According to the value decision theory, we predicted that individuals with “future-dread group” may have better sensitivity to immediate losses and insensitivity to future losses. In order to answer the above questions, we recruited 57 college students (FDG=33, DG=24) to complete behavioral experiment decision-making tasks in the magnetic room, and collect their brain image data. In the value coding stage, the results of univariate and MVPA analysis showed that the brain areas in the DG group that was responsible for representing the magnitude of the immediate loss of reward was the right dorsomedial prefrontal cortex (DMPFC), the right lateral occipital lobe (LOC), the left inferior temporal gyrus (ITG) and the left dorsolateral prefrontal cortex (DLPFC); brain areas responsible for characterizing delayed loss rewards was the inferior parietal lobule (IPL), the right precuneus/posterior cingulate cortex (PCC) and LOC. Contrast with the DG group, the FDG group showed different value calculation characteristics. Specifically, the brain area responsible for the size of the immediate loss reward was the right precuneus; while the brain area responsible for the delayed loss reward was the parietal lobule (SPL) and the right precuneus /PCC. Further comparisons between groups showed that the DG group had significantly stronger activation in DMPFC, LOC, and SPL in the brain regions responsible for future value calculations than the FDG group, indicating that FDG's fear of future losses was due to the subjective evaluation of future losses by DMPFC, LOC and SPL. The reduced sensitivity may be the key explanation that FDG is more likely to choose immediate loss instead of delayed loss. Subsequently, the brain-behavioral association analysis found that the lower the activation degree of the above-mentioned brain regions (DMPFC, SPL, LOC) responsible for the

calculation of the delayed loss reward value, the more likely individuals are to choose the immediate loss option. Our results show that the reason for the “future-dread” decision-making model may be due to the abnormal calculation of the value of future rewards and losses. These findings provide new insights into the neural representations of individual decision-making in the face of future loss, and provide ideas for in-depth exploration of their cognitive regulation substrates.

Keywords: future losses, intertemporal decision-making, multi-voxel pattern analysis. fMRI

表征方式对小概率持续风险决策的影响机制

魏子晗¹ 刘洪志² (通讯作者)

¹ 天津师范大学心理学部, 天津, 300387

² 南开大学周恩来政府管理学院社会心理学系, 天津, 300350, liuhz@nankai.edu.cn

摘要 小概率持续风险决策指的是人们对发生概率较小但风险会持续存在的风险选项之间的权衡与取舍, 其结果可影响关乎国计民生的重要领域。在描述小概率持续风险时, 通常使用风险事件的单次发生概率(如, 每月发生概率为 1%)来表征风险选项, 但此种表征方式可能阻碍个体正确地认知风险, 导致个体做出非理性决策。以平均风险时间(如, 平均 10 个月发生一次)来表征风险选项或可提高风险维度(即, 概率维度或平均风险发生时间维度)的可评估性, 改变决策者对风险维度与结果维度的相对决策权重, 或可引导个体作出更理性决策。因此, 本研究通过 3 个实验考察了概率和平均风险时间两种表征方式对小概率持续风险决策行为的影响特点及心理机制。实验 1 和实验 2 的结果表明, 两种表征方式下, 个体的小概率风险决策行为存在差异, 且受到选项风险大小的调节。当选项风险较高(即概率较小或平均风险发生时间较长)时, 相比概率表征, 平均风险时间表征方式能促进个体更加风险规避; 当选项风险相对较低(即概率较大或平均风险发生时间较短)时, 相比于概率表征, 平均风险时间表征方式能促进个体更加风险寻求。进一步的眼动实验(实验 3)结果表明, 两种表征方式改变了个体在小概率持续风险决策中对不同维度的注意权重, 个体对风险维度的相对注意权重可中介表征方式对小概率持续风险决策行为的效应。本研究加深了人们对小概率持续风险决策的心理机制与理论构建的深层次理解。同时, 该研究结果提示我们, 用平均风险时间表征风险, 或可避免决策者高估小概率, 低估中大概率, 使决策更理性, 这为干预个体的风险决策行为提供了理论与方法支持。

The effect of the presentation format on the low probability continuing risk decisions making and the mechanism behind

Zi-Han Wei¹, Hong-Zhi Liu^{2*}

¹ Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

² Department of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin 300350, China; *Email: liuhz@nankai.edu.cn

Abstract: Low probability continuing risk decision refers to decisions that involve tradeoffs among the options with low but continuing risk. It is a relevant matter for policymaking and national welfare. People often use the probability of a single event (e.g., the probability of occurrence is 1% per month) to present the low probability continuing risk options. However, such presentation format may induce misunderstanding of risk and lead to irrational risky decisions. Representing the low risk by the average time of risk occurrence (e.g., on average, it happens once every 10 months) may improve the evaluability of the risk dimension (i.e., the probability dimension or the average time of risk occurrence dimension), and change the relative decision weight of risk dimension to outcome dimension, thereby leading to more rational decision making. Therefore, three studies were conducted in the present research to examine

the effect of the presentation format of average time of risk occurrence and the presentation format of probability on low probability continuing risk decisions and further explored the underlying mechanism. Study 1 and Study 2 showed that in two of the presentation formats, people behaved differently in low probability continuing risk decisions making, and the differences were moderated by options' magnitude of risks. When the risk is relatively high (i.e., the probability is very small or the average time of risk occurrence is very long), compared to the presentation format of probability, the presentation format of average time of risk occurrence can make people be more risk aversion; whereas, when the risk is relatively low (i.e., the probability is relatively large or the average time of risk occurrence is relatively short), compared to the presentation format of probability, the presentation format of average time of risk occurrence can make people be more risk seeking. Further results from an eye-tracking study (Study 3) showed that the presentation format changed the attentional weight of different dimension during the low probability continuing risk decisions making. The relative attentional weight of risk dimension mediated the effect of the presentation format on the low probability continuing risk decisions making. The present research helped us have a deep understanding of the mechanism of the low probability continuing risk decisions making and the results were conducive to further theory development in the relevant field. Meanwhile, the findings indicated that the presentation format of average time of risk occurrence may prevent decision maker from overestimating the small probability and underestimating the moderate and large probability, therefore help them make decision more rational. The research provided both theoretical and methodological support for risk decision making intervention.

4 中国科学院大学心理学系, 北京, 100049

摘要 框架效应已得到普遍证实：决策偏好会受到对结果或属性描述方式的影响。在金融领域，个体经常为自己和他人决策。而在两人情境中，当决策结果平均分配给两个人时可以用两种不同的方式来表述，也即分配框架：1.自我分配框架：为自己做决策，他人分得一半结果；他人分配框架：为他人做决策，自己分得一半结果。本研究包含4项实验，提供了一致的证据表明，人们在自我分配框架下比他人分配框架下决策时更加风险寻求。在实验1中，研究假设得到了证实，同时研究表明分配框架效应只存在于收益情境，而非损失情境中。实验2重复了实验1的研究结果，同时排除了决策对象（即为谁做决策）这一可能的其他解释。实验3旨在实验室中模拟两种真实的分配框架情境，同时采用真实的金钱激励，再次重复研究结果。实验4通过改变分配给决策者的收益百分比，将研究结果扩展到其他分配情境中。我们认为风险偏好的差异是由参考点所引起的。由于决策对象的差异（对自己和对他人），个体的参考点会发生变化。因此，在不同分配框架下，给定的分配结果（分得一半）会被个体视为相对收益和相对损失，进而影响个人的风险偏好。分配框架的发现对自我-他人决策的研究有着重要的研究价值。

Risk Preferences in Self-Other Decisions: The Effect of Payoff Allocation Framing

Haihong Li^{1,2}, Yimo Yang¹, Dingrui Liu^{3,4}, Xiaofei Xie^{1,*}

1 School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871

2 Guanghua School of Management, Peking University, Beijing, 100871

3 Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101

4 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049

Abstract: The effect of framing is well established: decision makers' preferences are influenced by how outcomes or attributes are phrased. In the financial domain, individuals often make decisions for themselves as well as for others. Therefore, decisions in a two-person context with the outcome equally allocated can be framed in two different ways, defined as the *allocation framing*: 1. Self-allocation frame: making a decision for oneself, with half of the outcome shared by another person; 2. Other-allocation frame: making a decision for the other person, and sharing half of the outcome. The results of four studies provided consistent evidence that people are more risk-seeking in self-allocation frame than other-allocation frame. In Study 1, we demonstrated that the effect of different allocation conditions was only noteworthy in the gain domain but not loss. Study 2 replicated findings from Study 1 with an alternative explanation of decision target (i.e., for whom such decisions are made) excluded. Study 3 was designed to include actual monetary payoffs rather than hypothetical ones in two simulated conditions. Study 4 extended our findings to various allocation proportions by changing the percentage of payoffs allocated to the decision maker. We suggest that the difference in risk preference was induced by the reference point. The reference point shifts due to differences in the decision target (for oneself vs. for others). Therefore, the given outcome (half of the payoffs) would be perceived as relative gains and relative losses in different allocation frames, which would then influence individuals' risk preferences. Findings of allocation framing serve meaningful contributions to studies of self-other decision making.

知“心”者更留心：内感受知觉对悬空情境中 风险决策的调节作用

陈碧璐¹ 朱文玮¹ 陈学芳¹ 马剑虹¹（通讯作者）

1 浙江大学心理与行为科学系，杭州，310028，jhma@zju.edu.cn

摘要 具身认知视角下，躯体标记假设认为决策过程受情绪等在生物调节过程中产生的躯体状态（标记信号）的调节。而内感受作为个体对躯体状态的感知，除了是对自身生理反应的觉察，亦影响着情绪体验与决策过程。一般认为，内感受知觉较为稳定，但近年来也有研究支持内感受知觉的可变性，关于其是否可变及变化的条件仍有待探索。已有研究表明，个体内感受知觉与情绪体验强度、唤醒关注关系密切，也与情绪调节、行为调控及直觉性决策等认知过程相关。心跳知觉任务作为内感受测量中的常用范式，以心跳知觉为主要指标，代表个体对躯体状态的综合感知能力。基于以上理论，本研究假设，个体内感受知觉（Interoceptive awareness, IA）会受实验情境影响而发生改变，个体内感受知觉水平高低及其在场景中的变化会影响个体的情绪体验强度与风险决策过程。研究采用被试间设计，通过虚拟现实(VR)设置悬空/平地场景模拟悬空/平地感受，实验组为悬空情境，控制组为控制相同元素及视角的平地情境。实验以在VR情境中采集的指脉率作为生理指标，采用心跳知觉任务中的精神追踪范式前后测被试的内感受知觉，并通过气球模拟风险决策任务考察被试的风险偏好，以探究IA高低、变化对情绪体验及风险决策的影响。结果显示，悬空组的后测IA显著高于平地组，其中悬空组前测IA较低的被试IA提升更为显著。悬空组较平地组表现出显著的情绪唤起与更多的风险规避，且在悬空组中，前测IA较高的被试比低IA被试及平地组被试在风险决策任务中表现出更多的风险回避。研究结果表明，内感受知觉水平在悬空情境较平地情境有所提升。内感受知觉调节了不同高度情境对风险决策的影响，悬空情境下前测内感受知觉水平较高的被试更趋于风险规避。本研究揭示了内感受知觉

存在一定的情境可变性，内感受知觉或可调节不同高度情境中的风险决策行为，在探究内感受知觉本身同时，也为系统探究躯体标记假设下，内感受在身心复杂交互关系中的作用拓展了方向。

Abstract: From the perspective of embodied cognition, the somatic marker hypothesis suggests that decision-making is a process that is influenced by somatic states (marker signals) that arise in bioregulatory processes such as emotions. And interoception, as the perception of somatic states, is not only a kind of perception of one's own physiological responses but also influences the emotional experience and decision-making process. It is generally accepted that interoceptive awareness is stable, and in recent years there have been studies supporting the variability of interoceptive awareness, and the conditions as to whether it is variable and how it changes remain to be explored. It has been shown that interoceptive awareness is closely related to the intensity of emotional experience and arousal attention, as well as to cognitive processes such as emotion regulation, behavior regulation and intuitive decision-making. Among the measurements of interoceptive awareness, the heartbeat perception tasks, as a common paradigm, take heartbeat perception as the main index, which represents an individual's comprehensive perception of the physical state. Based on the above theories, this study hypothesizes that the interoceptive awareness (IA) will be altered by experimental situations and that the level of IA and its changes in the situation will affect the intensity of emotional experience and risk decision-making process. This study used a between-subjects design. The virtual reality (VR) of hanging or leveling situation was used to simulate the experience of being hanging or leveling. The experimental group was in the hanging situation and the control group was in the leveling situation with the same elements and perspectives controlled. The finger pulse rate collected during the situation of VR was used as a physiological indicator, and the subjects' interoceptive awareness was measured before and after using the mental tracking paradigm within the heartbeat perception task. The subjects' risk preference was measured via the balloon analogue risk task to investigate the effects of IA and its change on emotional experience and risk decision-making. The results showed that the post-test IA of the hanging group was significantly higher than that of the flat ground group, and the IA of the hanging group with lower pretest IA improved more significantly. The hanging group showed significantly greater emotional arousal and risk avoidance than the flatland group, and the subjects in the hanging group with higher pretest IA showed more risk avoidance in the balloon analogue risk task than the subjects with lower IA and the flatland group. The results indicated that interoceptive awareness was enhanced in the hanging situation compared to the flat ground situation. Interoceptive awareness modulated the effect of situations of different altitudes on risk decision-making, and subjects with higher pretest interoceptive awareness tended to be more risk-averse in the hanging situation. This study reveals that interoceptive awareness has a certain degree of contextual variability, and that it may regulate risk decision-making behavior in situations of different altitudes. While exploring interoceptive awareness itself, this study also expands the direction for systematic inquiry into the role of interoceptive awareness in the complex interactions between mind and body under the somatic marker hypothesis.

群际情境中，社会比较对为自我和为群体风险决策的影响

孙玲超 肖奕琳 聂昕晓 王大伟（通讯作者）

山东师范大学心理学院，济南，250358，wdw112@163.com

摘要 社会比较理论认为，与他人社会比较的结果对风险决策具有不可忽视的意义，但目前社会比较影响个体风险决策的研究尚处于起步阶段。以往研究仅从个人层面关注社会比较方向，聚焦于为自我决策，尚未考虑到群际情境中社会比较对个体为自我和为群体风险决策的影响。本研究设计两个实验，实验一聚焦内群体情境，实验二聚焦外群体情境，均采用2（社会比较：上行比较，下行比较） $\times$ 3（决策者角色：为自我，为“我们”，为“他们”）的被试内设计，探究群际情境中社会比较对为自我和为群体风险决策的影响。结果发现：（1）在外群体情境，被试在上行比较条件下比下行比较条件下更加风险寻求。而在内群体情境，上行比较与下行比较之间不存在显著差异。（2）不同决策者角色条件下，被试的风险寻求倾向存在差异，该结果在外群体和内群体情境中是一致的。为他们决策比为自我和为我们决策更加冒险，后两者之间的风险寻求倾向无显著差异。（3）决策者角色与社会比较的交互作用显著，但在内群体情境和外群体情境中表现有差别。在外群体情境中，为我们决策和为他们决策时，被试在上行比较条件下比下行比较条件下更加风险寻求，为自我决策时，上行比较和下行比较之间不存在显著差异。而在内群体情境中，为他们决策时，被试在上行比较条件下比下行比较条件下更加风险寻求，为自我决策和为我们决策时，上行比较与下行比较之间不存在显著差异。

The Effect of Social Comparison on Self-Group Risk Decision-making in Intergroup Contexts

Lingchao Sun, Yilin Xiao, Xinxiao Nie, Dawei Wang

Shandong Normal University, Jinan, 250358, wdw112@163.com

Abstract: Social comparison theory holds that the results of social comparison with others are of great significance to risk decision-making, but the research on the influence of social comparison on individual risk decision-making is still in its infancy. Previous studies only focused on the direction of social comparison from the individual level, focusing on self decision-making, but did not consider the impact of social comparison in intergroup contexts on individual self-group risk decision-making. Two experiments were designed in this study. Experiment 1 focused on in-group situation, and Experiment 2 focused on out-group situation. Both of them used 2 (social comparison: upward comparison, downward comparison) $\times$ 3 (decision maker role: for self, for "us", for "them") within-subjects design to explore the influence of social comparison on risk decision-making for self and for group in intergroup contexts. The results showed that: (1) In the out-group situation, participants were more risk seeking under the condition of upward comparison than under the condition of downward comparison; while in the in-group situation, there was no significant difference between the upward comparison and the downward comparison. (2) Under the condition of different decision-maker roles, there is distinction in the risk seeking tendency of the participants, and the results are consistent in the situation of out-group and in-group. Decision making for "them" was more risky than making decisions for "us" and for self; while no significant difference was found in risk seeking tendency between the latter two. (3) The interaction between decision maker role and social comparison is significant, but there are differences between the in-group situation and the out-group situation. In the out-group situation, when making decisions for "us" and for "them", participants were more risk seeking under the condition of upward comparison than that under the condition of downward comparison; while making decisions for self, there was no significant difference between the upward comparison and the downward comparison. In the in-group situation, when making decisions for "them", participants were more risk seeking under the condition of upward comparison than under the condition of downward comparison; while no significant difference was found between the upward comparison and the downward comparison when making decisions for self and for "us".

摘要 是否给一家企业贷款是银行要做的一项重要决策。企业在申请贷款过程中提供的信息或线索是判断其是否能正常还贷的基础。但银行职员们能合理利用这些线索, 做出准确的决定吗? 如果不能的话, 有何方法可以帮助他们? 在本研究中, 我们收集了 411 个在某银行成功获得贷款的企业的数据, 包括每个企业的信用等级、职工人数、担保方式等 17 条线索及其最终的还贷情况(正常或不良)。此后, 我们邀请了 19 名从事银行信贷业务的资深职员, 让他们根据每个企业的线索, 在不知道该企业还贷结果的情况下, 决定是否给其发放贷款。每个受邀请对象需要对 20 个随机选取的企业进行决策, 我们共收集到 376 个有效决策。结果发现, 这些职员的整体决策准确率为 53.0%, 略高于随机猜测水平。这表明, 即使是一线的工作人员, 他们对企业是否能够正常还贷的判断力还存在很大不足。以往的研究发现, 在是与否的二元决策中, 一个名为“快速简洁树”(Fast-and-frugal Trees, FFT) 的启发式往往可以帮助人们做出快速且准确的决策。在一个二元决策中, 如果共有 m 个线索可以利用, 那么 FFT 是一种具有 $m+1$ 个决策出口, 其中前 $m-1$ 个线索只有一个出口, 第 m 个线索具有两个出口的决策树。每个 FFT 都可以用几个顺序执行的、简单的“If-then”法则来描述。我们对现有的样本进行大量建模和测试, 发现一个仅利用 17 条线索中 4 条线索(征信报告、存贷比、担保方式和与银行合作关系)的 FFT 的决策效果最佳。而且, 与 8 种常用的机器学习算法相比, 该 FFT 在学习样本较小的情况下可以达到与最好的算法相同的准确率; 随着学习样本的增加, 最好的算法的准确率会比该 FFT 更好, 但两者之间的差距并不大。我们将该 FFT 应用到银行职员所完成的 376 个决策中时, 结果得到的准确率为 82.2%, 远高于职员们的准确率。与机器学习算法相比, FFT 具有结构简单, 过程透明, 执行灵活等优点, 且在信息不足的“小数据”任务中的准确率尤为出色。本研究验证了 FFT 可在放贷决策中大幅度提升职员的决策准确率, 是一个值得大力推广的决策辅助工具。

Abstract: To decide whether to approve companies' loan applications is an important type of decisions for a bank. The information or cues provided by a company during its application is the basis for such a decision. Can bank managers integrate and utilize these cues effectively to make accurate loaning decisions? If not, how to improve? In this study, we collected information of 411 companies whose loan applications to a bank were approved. For each company, there were 17 different cues, such as number of employees, relationship with the bank, and credit grade; and importantly, we knew whether the company had successfully repaid the loan at the end. We then invited 20 senior bank employees to make loan decisions based on the 17 cues. Each employee was asked to decide on 20 randomly selected companies without knowing the result, and there were 376 valid decisions made in total. The overall accuracy of their decisions was 53.0%, only slightly better than guessing. This suggests that even employees working in the frontline are poor in judging whether a company can repay its loan. Previous research shows that in this type of “yes/no” binary decision tasks, a heuristic named “Fast-and-frugal Trees” (or FFT) often can help people make quick and accurate decisions. Given there are m cues available for a decision, an FFT is a decision tree that has $m+1$ exits, with one exit for each of the first $m-1$ cues and two exits for the last cue. Each FFT can be described by a

bunch of sequentially ordered simple “if-then” rules. We conducted much modeling and testing in the 411-company dataset, and found that an FFT composed of only four cues out of the 17 achieved the best overall performance. In comparison to 8 commonly applied machine-learning algorithms, this FFT could be as accurate as the best machine-learning algorithm when learning sample was small; when the learning sample became larger, the best algorithm became better than this FFT, but not by much. When we applied this FFT to the 376 decisions made by the bank employees, it resulted in an accuracy of 82.2%, substantially better than the employees’ accuracy. Compared to sophisticated machine-learning algorithms, FFTs have a simpler structure, their decision-making processes are more transparent, the implementation of an FFT is more flexible, and FFTs perform especially well in limited “small data” task environments. We demonstrated that an FFT could help banks improve the accuracy of their loan decisions drastically. Given this and results of previous studies, we suggest that FFTs need to be studied and applied more extensively for financial and other types of decisions.

物质利益如何抵扣精神损失？

孙倩 郭静 段如雪 刘永芳（通讯作者）

华东师范大学心理与认知科学学院，上海，200062，yfliu@psy.ecnu.edu.cn

摘要 分配公平是合作行为产生的重要前提。个体在公平条件下的合作行为显著多于在劣势不公平条件下的合作行为。值得注意的是，分配不公平不仅包括劣势不公平还包括优势不公平。然而，已有的研究仅仅关注了人们在公平及劣势不公平分配条件下的合作行为，尚未明确优势不公平分配如何影响人们的合作行为。此外，已有的研究指出，经历过不同程度社会排斥的个体在合作行为上存在差异，受到低社会排斥的个体会比受到高社会排斥的个体做出更多的合作行为。同时，这些个体在分配公平感知上也存在差异，受到高社会排斥的个体会对不公平分配更敏感。那么，社会排斥是否会与分配公平共同对合作行为产生影响呢？目前鲜有研究对此进行探讨。为了解决上述两个问题，本研究设计了三个实验。实验 1 通过独裁者游戏操纵分配公平，初步考察个体在公平、劣势不公平及优势不公平分配条件下的合作行为。实验 2 通过社会排斥问卷测量社会排斥水平，进一步考察长期社会排斥经历对分配公平与合作行为间关系的调节作用。实验 3 通过网络掷球游戏操纵社会排斥，进一步考察状态性社会排斥对分配公平与合作行为间关系的调节作用。结果发现：（1）被试在公平分配条件下的合作行为显著多于两种不公平（劣势、优势）分配条件下的合作行为，在优势不公平条件下的合作行为显著多于在劣势不公平条件下的合作行为（实验 1）；（2）社会排斥调节分配公平与合作行为的关系（实验 2，3）：社会排斥一定程度上减少了公平分配条件下的合作行为，显著减少了劣势不公平条件下的合作行为，却显著增加了优势不公平条件下的合作行为。这些发现揭示了社会排斥对于理解分配公平和合作行为之间的关系的重要作用，说明物质利益在一定程度上可以弥补精神损失带来的负面作用。

Abstract: Distributive fairness is the vital premise to cooperative behavior. Specifically, individuals would cooperate more in the fair-outcome condition rather than in the disadvantageous-unfair-outcome condition. Notably, distributive unfairness conditions involve both disadvantageous unfairness and advantageous unfairness conditions. Nevertheless, previous studies exclusively focused on individuals’ cooperative behavior in fair-outcome and disadvantageous-unfair-outcome conditions, leaving an open question whether and how

advantageous-unfair-outcome affect individuals' cooperative behavior remains unknown. Additionally, it has been found that cooperative behavior differs in individuals with different social exclusion experience, and individuals who experienced lower level of social exclusion would cooperate more than those who experienced higher level of social exclusion. Moreover, fairness perception differs in individuals with different social exclusion experience, and individuals who experienced higher level (vs. lower level) of social exclusion would be more sensitive to unfairness. So far, whether and how social exclusion moderates the association between distributive fairness and cooperative behavior remains unclear. To address the aforementioned two issues, we designed three experiments. In Experiment 1, participants' cooperative behavior was measured in fair-outcome, disadvantageous-unfair-outcome, and advantageous-unfair-outcome conditions by using the Dictator Game to manipulate distributive fairness. Experiment 2 investigated the moderating effect of social exclusion on the relationship between distributive fairness and cooperative behavior by using the Social Exclusion Scale to measure long-lasting social exclusion. Experiment 3 further investigated the moderating effect of social exclusion on the relationship between distributive fairness and cooperative behavior by using the Cyberball Game to prime social exclusion. Results showed that: (1) in Experiment 1, participants' cooperative behavior in fair-outcome condition was higher than that in the two unfair-outcome (disadvantageous-unfair-outcome and advantageous-unfair-outcome) conditions. (2) in Experiments 2 and 3, social exclusion moderated the relationship between distributive fairness and cooperative behavior. Specifically, in fair-outcome condition, participants with higher social exclusion experience cooperated the same as those with lower social exclusion experience; in disadvantageous-unfair-outcome condition, participants with higher social exclusion experience behaved less cooperatively than those with lower social exclusion experience; in advantageous-unfair-outcome condition, participants with higher social exclusion experience behaved more cooperatively than those with lower social exclusion experience. The present study shed light on the vital role of social exclusion in understanding the relationship between distributive fairness and cooperative behavior, and reveal that material interest may compensate for mental loss to some degree.

摘要 一段给定的空间距离既可以用长度单位也可以用时间单位来测量。对于同一空间选择问题而言, 采用空间框架和时间框架来描述同一距离在逻辑上是等价的。根据不变性原则, 同一选择问题的不同表现形式会产生相同的偏好。本研究旨在考察: (1) 当空间选择问题采用时间和空间框架等价描述时, 是否会出现违背不变性原则的行为(命名为“时空框架效应”); (2) 如果存在, 这一效应究竟是如何产生的? 为回答第一个问题, 我们利用恒定的速度构建了6组空间(跨期)选择问题, 设置不同的决策情境(研究1-2包括求职情境、租房情境、选择餐厅情境和春节探亲情境, 研究3包括3组不同的求职情境), 不同的研究设计(研究1和3采用被试间设计, 研究2采用被试内设计), 以及多种网络样本(研究1-2采用普通成人样本, 研究3采用特定的应届大学毕业生样本), 进行了3项研究。为回答第二个问题, 我们进一步增设了维度差异比较任务(研究2-3)和折扣值比较任务(研究3), 以考察以下两类模型是否能进行有效解释, 并比较这两类模型的解释效力: (1) 属性比较模型, 该模型假设产生框架效应是因为框架改变了人们对两个选项在时间/空间维度上的差异与结果维度上的差异之间的相对大小关系的判断; (2) 效用比较模型, 该模型假设产生框架效应是因为框架改变了人们对两个选项总体效用之间的相对大小关系的判断。结果表明, 采用时间和空间框架描述同一空间选择问题会显著改变人们的选择偏好, 即存在时空框架效应; 且这种新的时空框架效应可以用属性比较模型而非效用比较模型来解释。我们的发现可以支持创建一种新的选择架构, 以改善关于健康、财富和幸福的决策。

A new effect of time–space framing that violates the invariance principle in spatial choice

Abstract: A given spatial distance can be measured using either a length or a time unit. A spatial-choice problem with given distances represented in a *space* frame and in a *time* frame is logically equivalent. Different representations of the same choice problem should yield the same preferences according to the invariance principle. The purpose of this study was twofold: first, to examine whether invariance-violating behavior (defined as the *time–space framing effect*) could be detected when the spatial-choice problem is described by space and time frame equivalently; and second, if so, how is this effect achieved. To address the first purpose, six spatial- (intertemporal-) choice problems were constructed and performed in three experiments using different scenarios (job-hunting, apartment-renting, restaurant-selection, and visiting parents during the Spring Festival choice problems in Studies 1 and 2, three pairs of job-hunting choice problems in Study 3), different experimental designs (between-subjects in Studies 1 and 3, and within-subjects in Study 2), and multiple online samples (ordinary adults in Studies 1 and 2, fresh graduates as special adults in Study 3). To address the second purpose, an intradimensional difference comparison task in Studies 2–3 and a discounted value comparison task in Study 3 were added and performed, to determine whether two models—the *attribute comparison* model, which predicts a framing effect occurs if framing shifts people’s judgment of the inequality relationship between the differences of two options in time/space dimension and that in outcome dimension, and the *utility comparison* model, which predicts that a framing effect occurs if framing shifts people’s judgment of the inequality relationship between two options’ overall utility—could account for it, and which of these two models wins the race (Studies 2–3). The results indicate that a time–space framing effect existed, as people’s preference orders were significantly changed by the different descriptions of spatial-choice problems, and this new time–space framing effect could be satisfactorily explained by the *attribute-comparison* rather than the *utility comparison* model. Our findings could support the creation of new forms of choice architecture that improve decisions about health, wealth, and happiness.

众人围观者必为高手？观众人数的过度泛化效应

邱天¹ 陆静怡¹（通讯作者）

¹ 华东师范大学心理与认知科学学院, 上海, 200062, jyly@psy.ecnu.edu.cn

摘要 在日常生活中, 能力强的表演者往往可以吸引更多观众。相反, 观众多却可能由外部偶然因素所造成, 并不意味着表演者能力强, 错误理解二者的关系可能导致不合理的判断。本研究提出观众人数的泛化效应, 即观众人数较多时（与观众人数较少时相比）, 判断者认为表演者能力更强, 即使观众人数由偶然因素所决定、无助于判断。我们认为这是由于人形成了根据观众人数推测表演者能力的启发式, 并将其过度泛化到不适用的情境下。我们通过六项研究检验了该效应及其下游影响。研究将被试随机分配至观众人数多或观众人数少的情境, 要求其想象将展示某种能力（例如舞蹈、演奏等）, 情境中观众人数由工作人员的偶然失误所决定（例如发错邮件）, 无法有效反映被试的能力。随后被试评价自身能力强弱。研究 1a 和 1b 分别以数字或文字描述观众人数, 检验了基本效应, 并排除了数字锚定的解释。研究 2a 和 2b 考察了该效应的

下游影响。结果表明，观众多时，被试认为自己能力强，进而自信可在新业务中获取更高的报酬、有更大的可能被聘用。研究3探究了效应的边界条件，操纵被试对自身能力的认知（了解或不了解自身能力）。结果显示，在被试了解自身能力时，观众人数对能力判断的影响减弱。研究4将被试从表演者改为旁观者，并以录播的形式展示能力，效应仍然稳定存在，排除了自我增强解释（相信任何对自己有利的线索）以及人数影响实时表演过程的可能性。本研究发现了一种新的启发式——依据观众人数推断表演者能力，加深了对过度泛化和启发式决策的理解，即过度泛化不仅影响个体对外部世界的认知，也影响个体对自身的判断，并揭示了其下游影响。本研究的结果提示人们理性看待观众人数，形成正确的自我认知。

The Mere Audience-Size Effect: A large Audience Nonnormatively Inflates Perceived Competence of Actors

Tian QIU¹, Jingyi LU¹

¹ School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

Abstract: Oftentimes, competent actors attract more audience members. But a large audience does not necessarily mean that actors are competent, which could lead to irrational judgment. The current study identifies a mere audience-size effect, showing that actors who are observed by a large (vs. small) audience are inferred to be more competent, even when the audience size results from incidental factors and offers nondiagnostic information about actors' competence. We propose that this is the overgeneralization of a heuristic that connecting actors' competent with the audience size. We conducted six studies to test the hypothesized effect and its downstream consequences. Participants imagined the actor (themselves or another person) performing (e.g., dancing and playing the piano) to a large or small audience. The audience size was determined by incidental mistakes (e.g., a new employee sent a wrong email by accident), thus offered nondiagnostic information about the actor's competence. Then participants evaluated the actor's competence. Studies 1a and 1b revealed the basic pattern—actors believed that they were more competent when observed by a large (vs. small) audience described by number or text, ruling out the account of numeric anchoring. Studies 2a and 2b showed the downstream consequences of this mere audience-size effect—actors perceived themselves as more competent, thus they believed that they deserved a higher salary and were more likely to be employed. Study 3 manipulated actors' knowledge about their competence and found that the mere audience-size effect was attenuated when actors explicitly received feedbacks about their competence. In Study 4, the actors' show was prerecorded to minimize the influence of audience on live performance. Besides, participants imagined themselves as observers. The mere audience-size effect was replicated, ruling out the account of self-enhancement. This research shows a new heuristic—inferring actors' competence from the audience size and contributes to research on overgeneralization and heuristic decision making. Our findings reveal that overgeneralization biases not only judgement about others but also judgment about oneself. This overgeneralization is consequential. Understanding the current heuristic promotes an accurate perception of competence.

摘要 确证性偏差 (confirmation bias) 是人们判断和决策中的一种常见偏差, 它指的是人们倾向于以支持自己原有观念、期望或假设的方式来解释或搜索证据。这一偏差会带来诸如有偏判断、忽视反方证据等负面影响。在快节奏而又信息过载的现代生活中, 人们总是感受到巨大的时间压力, 这一环境因素可能对人们日

常生活中的判断与决策产生影响。本文试图探索不同的时间条件（时间压力 vs. 时间宽裕）会如何影响不同情境中确证性偏差的强弱。通过 7 个实验，我们变换了不同信念和不同的确证性偏差测量方式，最终在美国和中国样本中验证了确证性偏差独立于时间条件的稳定性。研究 1 通过测量人们与日常辐射相关的信念和对辐射有害信息的判断来衡量确证性偏差的强弱，结果发现个体日常感知到的时间稀缺性与确证性偏差不相关，研究 2 通过指导语操纵了时间压力和时间宽裕两种时间条件，并使用了食品天然性信念，结果发现时间压力组的确证性偏差强于时间宽裕组。研究 3 和 4 分别使用相对固定（政治意识形态）和可变（即时决策结果）的信念及相应的信息判断任务，并加入无时间提示的控制组，结果发现三组的确证性偏差并无显著差异。为确认效应的稳定性，研究 5 在更广泛的样本中重复了研究 2，结果并未发现时间条件对确证性偏差的效应。研究 6a 和 6b 使用转基因相关信念，并在判断任务中使用了与信念一致/不一致及正确/错误的信息，在美国和中国样本中再次验证了不显著的结果。单文章元分析结果显示，时间压力不会加剧、时间充裕（深思熟虑）也不会减弱确证性偏差。我们的研究结果表明，环境因素在影响人们日常生活中的确证性偏差上可能作用甚微，未来的研究可以探讨其它环境因素对于确证性偏差的影响。

Confirmation Bias and the Effects of Time Pressure and Deliberation

Zhu Minfan¹, Hu Tianyi², Wang Feining³, Chen Zhiqin^{1*}

²Department of Psychology, Shanghai Normal University, Shanghai

³Faculty of arts and science, University of Toronto, Toronto

Abstract: Confirmation bias refers to a tendency to interpret or seek evidence in ways that support one's existing beliefs, expectations, or hypotheses, which is very common in people's judgments and decision making. It would cause serious negative consequences such as biased judgment and ignorance of opposite evidence. In the ubiquitous stresses and information overload of modern life, people always feel tremendous time pressure, impacting their daily judgment and decision making. We, therefore, wanted to understand how different time-related conditions (time pressure vs. time affluence) would influence the degree of confirmation bias in different situations. By varying the prior belief and the measure of confirmation bias with both the U.S. and Chinese samples in seven studies, we found the robustness of confirmation bias regardless of time-related conditions. In Study 1, we examined the correlation between the perceived time scarcity and confirmation bias that results from a prior belief and the associated perceived reliability of misinformation regarding daily radiation harmfulness and found no relation between time scarcity and confirmation bias. In Study 2, we manipulated time pressure and time affluence conditions and used belief regarding food naturalness and found that people under time pressure suffered a higher degree of confirmation bias in contrast to those in the time affluence condition. In Studies 3 and 4, we employed a more fixed belief regarding personal political ideology and a more flexible belief regarding the instant decision after reading the materials with an additional third neutral condition. We found no effect of time conditions on the confirmation bias. To further confirm our results, we conducted Study 5 to replicate Study 2 with a larger and more representative sample and found no significant effect of time conditions. In Studies 6a and 6b, we employed beliefs regarding genetically modified organisms and included both consistent/inconsistent facts and misinformation to rule out the influence of information veracity and belief-consistent information on confirmation bias and further confirmed the non-significant effect of time conditions. Furthermore, we conducted a single-paper meta-analysis and revealed that time pressure would not aggravate, and time affluence (deliberation) would not alleviate confirmation bias. Our findings suggested that environmental factors might play a minor role in reducing confirmation bias in people's daily lives.

Keywords: confirmation bias, time pressure, deliberation, misinformation

摘要 决策信心是指个体在决策后, 对自己决策的最优性或正确性的信心程度评价。对决策信心的形成机制一直备受研究者关注。研究者将近年来能够良好解释决策行为的顺序抽样模型用于解释决策信心的形成机制, 发展了一系列新的模型, 如基于扩散的信心理论与基于累积的信心理论。此类模型认为, 决策者在各选项中随机抽样并累积证据, 选项间累积证据的差异即可反映决策信心。然而, 目前关于此类模型的证据多基于反应时数据的拟合, 缺少更直接的过程证据支持。鉴于此, 本研究借鉴注意漂移扩散模型的相关假设, 提出了用于解释决策信心机制的注意信心累积模型, 基于眼动注视去解释决策信心的形成过程。本研究采用眼动追踪技术, 考察个体在基于价值的决策中的眼动注视信息, 并记录其随后的决策信心评价。研究结果发现, 注意信心累积模型可定量描述视觉注视与决策信心的关系。具体来说: 1) 注意信心累积模型的预测优于现有模型; 2) 注意信心累积模型可预测决策信心反映于视觉注视的一些特性; 3) 注意信心累积模型的相关参数可反映个体的决策信心特点。本研究结果为描述视觉注视与决策信心的关系提供了新的证据, 加深了人们对决策信心形成机制的理解, 为今后决策信心的相关研究提示了新的方向。

Abstract: Decision confidence is the strength an individual's belief about the optimization or correctness of a prediction, judgment, or choice. The mechanism underlying the formation of decision confidence has raised considerable concern. Researchers have used sequential sampling models, which have successfully explained individuals' decisions in recent years, to explain the formation mechanism of decision confidence, and developed a series of new models, such as diffusion-based confidence theory and cumulator-based confidence theory. Such models assume that decision makers randomly sample among options and accumulate evidence, and that differences in the cumulative evidence among options reflect the decision confidence. However, the current evidence on such models is mostly from the model fitting based on the response time data and lacks more direct process evidence. Accordingly, in the present research, we proposed an attentional accumulative confidence model to explain the mechanism underlying decision confidence based on eye-tracking data, drawing on the assumptions related to the attentional drift diffusion model. This study used eye-tracking technique to examine individuals' visual attention in the value-based choice and to record their subsequent evaluation of decision confidence. The results revealed that the attentional accumulative confidence model can quantitatively describe the relationship between visual fixation and decision confidence. Specifically: 1) attentional accumulative confidence model performed better than existing models; 2) the model predicted some characteristics of the decision confidence reflected in visual fixation; and 3) the relevant parameters of the model reflected some characteristics of individual decision confidence. This study provides new evidence to describe the relationship between visual fixation and decision confidence, deepen the understanding of the mechanism of decision confidence formation, and suggest new directions for future research related to decision confidence.

Keywords: decision confidence, value-based choice, visual fixation, sequential sampling model, attentional accumulative confidence model

新冠肺炎疫情期间居家高血压老年人的生活方式与认知健康

孙雅雯¹ 陈天勇^{1,2} (通讯作者)

¹ 中国科学院心理健康重点实验室 (中国科学院心理研究所), 北京, 100101

² 中国科学院大学, 北京, 100049, chenty@psych.ac.cn

摘要 目的: 不良生活方式是造成慢性病高发的重要原因, 而高血压是一种典型的“生活方式病”。同时, 生活中的生活习惯、行为都影响着认知健康。新冠肺炎疫情期间, 人们过上了居家隔离的生活, 生活方式有很大改变。因此, 本研究旨在调查新冠肺炎疫情居家期间高血压老年人生活方式改变与认知健康状况。方法: 认知测试部分采用电话询问版成人认知测试(Test of adult cognition by telephone, TACT)(Tun & Lachma, 2005)中即时与延迟词语回忆、数字倒背、词语类别、数字计数五项分测验, 分别来测试即时与延迟情景记忆、工作记忆广度、言语流畅性、加工速度。通过自编问卷对老年人的人口学信息、生活方式进行调查。生活方式因素主要包括身体活动(身体活动量、久坐时间)与饮食(吸烟饮酒情况、饮食口味)两大因素。采取方便取样方法, 通过微信报名的方式招募了 86 名 60 岁以上高血压老年参与者, 所有参与者均签署知情同意书。结果: (1) 疫情期间, 高血压老年人生活方式发生改变, 但改变程度不大, 其中 46 人认为生活方式改变很小, 18 人认为改变比较很小, 23 人认为改变中等, 其中有 76.2% 的人自述最大改变在于活动量变少。同时, 所有参与者都认为疫情期间活动量减少或基本持平, 这说明疫情期间高血压老年人生活方式改变主要体现在身体活动的减少。单因素方差分析结果表明, 不同程度身体活动量改变下, 整体认知能力无显著差异($F = 1.255, p = 0.290$)。但在词语类别($F = 4.656, p = 0.012$)、数字计数($F = 5.685, p = 0.005$)成绩上有显著差异, 身体活动量减少越多, 认知成绩越差。单因素方差分析结果表明, 不同身体活动量下, 整体认知能力无显著差异($F = 1.430, p = 0.240$)。但不同身体活动量下, 延迟词语回忆($F = 4.130, p = 0.009$)、数字计数($F = 4.750, p = 0.004$)成绩差异显著, 身体活动量越少, 认知成绩越差。结论: 疫情期间, 高血压老年人生活方式发生改变, 但改变不大, 主要体现在身体活动减少; 活动量改变影响认知健康, 活动量少的高血压老年人记忆、言语流畅性、加工速度受损更大。因此, 提示我们改善高血压老年人认知能力要尤其注重加强身体活动, 减少久坐时间。

老年人身体意象对主观幸福感的影响: 控制感的中介及社会支持的调节

马梦佳¹ 张宝山² (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710062

² 陕西师范大学心理学院, 西安, 710062, zhangbs@snnu.edu.cn

摘要 身体意象是指一个人对自己的外表和身体机能的心理感受, 是衡量生理健康和心理健康的重要指标之一。但相关研究大多聚焦于青少年和中年人群, 而忽略了身体意象对老年人群的特殊含义。衰老带来的一系列身体外观和功能的重大变化都导致了老年人成为身体意象脆弱群体, 因此探讨老年人身体意象及其内在机制具有重要意义。本研究将身体意象、主观幸福感、控制感和社会支持(包括家庭支持和朋友支持)整合到一个模型中, 系统地考察了身体意象对老年人主观幸福感的可能影响, 并探讨控制感在这一效应中的中介作用和社会支持在这一效应中的调节作用。采用身体意象量表, 控制感量表, 纽芬兰纪念大学幸福度量表以及社会网络量表, 对 814 名老年人进行调查。结果发现: (1) 身体意象显著预测主观幸福感。(2) 控制感在身体意象和主观幸福感之间起到中介作用。(3) 社会支持调节了身体意象与控制感以及控制感与主观幸福感之间的关系, 且家庭支持和朋友支持调节了不同的路径, 具体而言, 家庭支持调节了身体意象与控制感的关系。

关系,相较于低家庭支持的老年人,在高家庭支持的老年人中身体意象对控制感的影响更强;朋友支持调节了控制感与主观幸福感之间的关系,相较于高朋友支持的老年人,在低朋友支持的老年人中,控制感对幸福感的影响更强。本研究关注了身体意象对老年人的重要影响,以及家庭支持和朋友支持作为重要外部资源对老年人的不同作用和意义,揭示了身体意象对主观幸福感的作用机制,丰富了老年人幸福感的研究领域。

Body image and subjective well-being in old adults: the mediating role of sense of control and the moderating role of social support

Mengjia Ma¹, Baoshan Zhang²

School of Psychology, Shaanxi Normal University, Xi'an, Shaanxi

School of Psychology, Shaanxi Normal University, Xi'an, 710062, zhangbs@snnu.edu.cn

Abstract: body image refers to the psychological feeling that one has about his or her appearance and body functioning, which is one of the important indicators to measure physical and mental health. However, most of the studies on body image mainly focused on the populations of adolescents and middle-aged people, while ignoring the special meaning of body image for older adults. A series of significant changes in physical appearance and function brought by aging have led to older adults becoming a group fragile to the body image, thus, it is of great significance to explore the body image of the older adults and its internal mechanism. This study integrated body image, sense of control, subjective well-being, and social support (including family support and friend support) into a model to systematically explore the relationship between body image and subjective well-being, as well as the mediating role of sense of control and the moderating roles of family support and friend support. 814 older adults were surveyed using the Body Image Concern Inventory, the Sense of Mastery Scale, the Memorial University of Newfoundland Scale of Happiness, and the Lubben Social Network Scale. The results showed that: (1) Body image was a significant predictor of subjective well-being in older adults. (2) Sense of control partially mediated body image and subjective well-being. (3) Social support moderated the patterns of relationship between body image and sense of control, as well as that sense of control and subjective well-being, and family support and friend support moderated different pathways. Specifically, family support moderated the relationship between body image and sense of control. Compared to older adults with a low level of family support, there is a stronger relationship between body image and sense of control in those with a high level of family support. And friend support moderated the relationship between sense of control and subjective well-being. The association between sense of control and subjective well-being was stronger for older adults with a low level of friend support than for those with a high level. This study focuses on the important impact of body image, as well as the different roles of family support and friend support which are important external resources for older adults, and reveals the mechanism of body image on subjective well-being, enriches the research field of well-being of older adults.

Keywords: body image, subjective well-being, sense of control, social support, older adults

快慢速整体运动知觉老化具有不同的脑灰质结构基础

严世振^{1,2,3} 阴晓娟^{1,2,3} 陈俊涛^{1,2,3} 魏士琳^{1,2,3} 金花^{1,2,3}

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

摘 要 整体运动知觉(global motion perception)指个体将视觉场景中局部运动元素的单个轨迹按照一定的规则进行选择整合,从而形成更大的全局性的运动知觉,并获得运动物体的方向和速度等信息。研究发现快速和慢速 GMP 的发育和老化存在不同步性,提示 GMP 的快、慢速两种不同的知觉系统具有不同的神经基础。然而目前尚无研究考察这两种知觉系统的老化是否存在脑结构老化的分离。本研究拟通过比较老年人和

年轻人在不同速度下的运动一致性阈值的变化及其与背侧视觉通路相关皮层灰质体积变化的相关性,旨在分离快、慢速 GMP 老化的脑灰质结构基础。实验招募 93 名健康老年人 (65.50 ± 4.17 岁) 和 95 名大学生 (21.09 ± 2.04 岁), 运用随机点阵范式采集被试在 10 种速度条件下的整体运动知觉一致性阈值(下简称“阈值”), 采用结构磁共振成像技术采集他们 T1 结构像数据。行为数据分析发现, 老年人 10 种速度条件下的阈值均显著大于年轻人, 提示存在 GMP 老化现象。以阈值变化率((老年人-年轻人)/年轻人)为指标, 将 10 种速度条件均分为快、慢两种条件, 发现慢速条件下阈值变化率平均为 64.98%, 快速条件为 41.92%, 提示慢速 GMP 老化更为显著。基于双侧 V1 区、V3 区和 MT+ 区的兴趣区分析发现, 老年人上述脑区灰质体积均显著小于年轻人。进一步的脑与行为相关分析发现, 当以性别和全脑灰质体积作为协变量后, 快速条件下的阈值与右侧 V3 区、双侧 V5 区灰质体积呈显著负相关(右侧 V3 区: $r=-0.18$, $p<0.01$; 左侧 V5 区: $r=-0.19$, $p<0.01$; 右侧 V5 区: $r=-0.24$, $p<0.001$); 慢速条件下的阈值与所有脑区灰质体积相关均不显著; 但老年人快慢速条件下的阈值与其上述脑区灰质体积的相关不显著。综上, 本研究结果初步提示, 快慢速 GMP 的老化可能有着不同的神经基础, 快速 GMP 系统的老化可能和右侧 V3 区、双侧 V5 区灰质体积的萎缩有关, 而慢速 GMP 老化似乎不依赖于背侧视觉通路上灰质结构的变化。后继研究宜结合基于多模态脑成像技术获得的数据更好地揭示不同速度 GMP 系统老化潜在的神经基础。

2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

Abstract: Global motion perception (GMP) is an important aspect of visual perception. Numerous studies have found that GMP of cognitively healthy elderly declines with aging. It is found that the maturation and aging of the fast GMP and the slow GMP are not synchronous, which suggests that there be different neural basis underlying fast GMP and slow GMP. However, there is no empirical evidence to show that two types of GMP aging have different basis of brain structure. This study compared the differences in the motion coherence threshold between the elderly and the young at different speeds and their correlation with the differences in cortical gray matter volume in the dorsal visual pathway, in an attempt to reveal the different brain structure alteration underlying the fast and slow GMP aging. Ninety-three healthy older adults (mean age 65.50 ± 4.17 years) and 95 college students (mean age 21.09 ± 2.04 years) were recruited in this study. Global motor perceptual coherence thresholds were collected using random dot kinematogram paradigm at ten different speeds and structural magnetic resonance imaging was used to acquire their T1 Structural image data. Behavioral data analysis revealed that the coherence thresholds at 10 speeds were significantly greater in the elderly than those in the young. Using the threshold change rate as the index, it was found that the average threshold change rate was 64.98% in the slow speed condition and 41.92% in the fast speed condition, suggesting the decline of GMP was more obviously in slow condition. Region of interest analysis based on bilateral regions V1, V3, and MT+ revealed that gray matter volumes in all of those brain regions were significantly smaller in the old than in the young. Brain-behavior correlation analysis revealed that, when gender and whole-brain gray matter volumes were used as covariates, thresholds in the fast condition were negatively correlated with gray matter volumes in the right V3 and bilateral V5 (right V3: $r=-0.18$, $p<0.01$; left V5: $r=-0.19$, $p<0.01$; right V5: $r=-0.24$, $p<0.001$). The correlation between the thresholds in the slow speed condition and the gray matter volumes of all brain regions was not significant; however, the correlation between the thresholds in the fast or slow speed conditions and the gray matter volumes of those brain regions in the elderly was not significant. In summary, the results suggest that the aging

of the fast GMP and the slow GMP may have different neural basis, and aging of the fast GMP may be related to the decrease of gray matter volumes in the right V3 and bilateral V5 regions, while the aging of the slow GMP does not seem to depend on the changes of gray matter in dorsal visual stream. Multimodal MRI data should be used to better discover the unique neural basis underlying the fast and the slow GMP aging.

民汉混合班铸牢大学生中华民族共同体意识的逻辑再探索 ——基于群际接触理论分析

崔萨础拉¹, 张学敏²

1 内蒙古师范大学 心理学院, 呼和浩特 010022

2 西南大学 西南民族教育与心理研究中心, 重庆 400715

摘要 在新的历史时期, 民汉混合班因其新的时代特征和自身的独特价值, 对铸牢大学生中华民族共同体意识具有重要的现实意义。群际接触理论是分析不同群体之间交往的一整套理论体系, 其“最优条件”和“范畴化策略”为民汉混合班铸牢大学生中华民族共同体意识提供了新的理论视角和实践策略。在具体实践中, 民汉混合班并不具备铸牢大学生中华民族共同体意识的“最优条件”和环境。为此, 民汉混合班铸牢大学生中华民族共同体意识, 先从平等地位、共同目标、群体合作、制度支持等几个方面优化“培育环境”, 在此基础上, 结合民汉混合班各民族学生的实际情况, 从“去范畴化”到“突显范畴化”、再到“重新范畴化”逐渐打牢“共同体意识”。

关键词 民汉混合班, 群集接触理论, 中华民族共同体意识

A further exploration of the logic of Cultivating College Students' sense of Chinese national community in the mixed class ——Analysis based on group contact theory

CUI Sa-chu-la¹, ZHANG Xue-min²

Inner Mongolia Normal University, Hohhot 010022, China, Southwest University, Chongqing
400715, China

Abstract: In the new historical period, because of its new characteristics of The Times and its own unique value, the mixed class of people and Han has an important practical significance for the formation of college students' consciousness of Chinese nation community. Intergroup contact theory is a set of theoretical system to analyze the communication between different groups, and its "optimal conditions" and "categorization strategy" provide a new theoretical perspective and practical strategy for the mixed class to forge the consciousness of Chinese nation community among college students. However, in practice, the mixed class does not have the "optimal conditions" and environment to consolidate the consciousness of the Chinese nation community among college students. For this purpose, the people of the han class cast on college students' community consciousness of the Chinese nation, begin with equal status, common goals, group cooperation, institutional support from several aspects such as optimizing the cultivation environment ", on this basis, combining with the actual situation of han people mixed ethnic students, from the "category" to "highlights the category" to "new category" stress gradually a "community".

Key Words: Min-Han mixed class, Cluster contact theory, Consciousness of Chinese national community

晚期肺癌患者及其照顾者的心理弹性与生活质量的关系： 基于主客体互倚模型

王慧¹ 封丹璐¹ (通讯作者)

¹ 山东大学护理学院, 济南, 250012, fdj19@sdu.edu.cn

摘要 目的: 心理弹性是指个体从重大创伤性事件中恢复的能力, 亦是一种积极适应逆境的过程。弹性可以帮助个体更好的面对现实, 缓解负面压力的不利影响, 从而促进较好的健康结局, 提高生活质量。以往的研究多从患者或照顾者的单一角度探讨心理弹性与生活质量的关系。根据互倚理论, 患者和照顾者具有较强的人际关系互动, 在应对癌症过程, 是相互依赖的整体。然而, 目前尚缺乏从二元水平探讨患者和照顾者的心理弹性对生活质量影响的研究。本研究采用主客体互倚模型, 探究晚期肺癌患者和照顾者心理弹性对生活质量的影响, 并考察照顾者身份(配偶/非配偶)是否会调节这一关系。**方法:** 选取山东省三家三级甲等医院 304 名晚期肺癌患者及其照顾者进行问卷调查, 研究工具包括一般资料调查表, 心理弹性量表、8 条目简明生活质量问卷。**结果:** 患者的心理弹性对生活质量的主体效应显著, 但客体效应不显著; 即患者的心理弹性可以正向预测其自身生活质量, 但不能预测照顾者的生活质量。照顾者的心理弹性对生活质量的主体效应显著, 客体效应也显著; 即照顾者的心理弹性可以正向预测其自身的生活质量, 同时也可以预测对方的生活质量。为了探讨心理弹性对生活质量的关系是否存在由照顾者身份(配偶/非配偶)造成的差异, 多群组分析结果显示, 照顾者身份对心理弹性与生活质量关系的调节效应不显著影响。**结论:** 患者、照顾者的心理弹性可以促进自身生活质量的提高, 同时, 照顾者的心理弹性可作为患者处理癌症这一重大创伤事件的应对资源, 促进其生活质量的提高。

Relationship between psychological resilience and quality of life among patients with advanced lung cancer and their caregivers: A Study Based on Actor-Partner Interdependence Model

Hui Wang¹, Danjun Feng¹

¹ School of Nursing, Shandong University, Jinan 250012, Shandong, China

Abstract: Objectives: Resilience refers to the ability to recover from traumatic events, and it is also a good adaption process to adversity. Resilience can help individuals have a better grasp of reality, alleviate the adverse effects of negative stressors, and thus improve the quality of life (QoL). Previous studies mostly examined the relationship between resilience and QoL from the single perspective of patients or caregivers. According to interdependence theory, there is a strong interpersonal interaction between patients and caregivers. Patients and caregivers should be regarded as an interdependent unit when coping with cancer. Whereas, there is still a lack of evidence exploring the relationship between resilience and QoL in patients and caregivers simultaneously. The objective of this study is to examine the effects of resilience and QoL in advanced lung cancer patients and their caregivers and to examine whether caregiver identity (spouse/non-spouse) can moderate this relationship. **Methods:** A total of 304 dyads of advanced lung cancer patients and caregivers were recruited from three tertiary hospitals in Shandong Province to finish a questionnaire survey. Measurement tools included the general information questionnaire, the Connor-

Davidson Resilience Scale, Short Form-8 (SF-8) Health Survey. **Results:** Patients' resilience had a significant actor effect on patients' QoL, whereas, the partner effect of patients' resilience was not significant. In other words, patients' resilience positively predicted their own QoL, but didn't predict caregivers' QoL. Caregivers' resilience had significant actor and partner effects on QoL, which mean that caregivers' resilience not only positively predicted their own QoL, but also positively predicted patients' QoL. In order to explore whether there is any difference in the relationship between resilience and QoL among different caregivers' identity(i.e., spouse/non-spouse), the results of multi-group analysis indicated that the moderating effect of caregivers' identity on the relationship between resilience and quality of life was not significant. **Conclusion:** The resilience of patients and caregivers can promote their own quality of life. Meanwhile, the resilience of the caregivers also can be considered as one coping resource for patients to deal with traumatic events and promote the improvement of patients' QoL.

Keywords: lung cancer, resilience, Quality of life (QoL), Actor-Partner Interdependence Model

晚期肺癌患者生命意义与影响因素的质性研究

李玉梅

上海市肺科医院护理部, 上海, 200433

摘要 **目的** 探讨晚期肺癌患者生命意义的内涵及相关影响因素。**方法** 采用质性研究法对 21 例住院晚期肺癌患者进行深度访谈, 对收集的资料采用 Colaizzi7 步分析法整理得出结果。**结果** 晚期肺癌患者的生命意义包含 3 个维度, 涉及 7 个主题 10 个亚主题, 分别为: 纬度(一)生命意义的核心为“自我迭代”, 包含自我再认识、珍惜生命 2 个主题; 纬度(二)生命意义的存在形式为“有为”, 包含自立和利他 2 个主题; 纬度(三)生命意义体现在 3 个层面: 过去、当下和未来, ①回顾过往的感动, 包含感恩、愧疚与自责、回避 3 个亚主题; ②珍惜当下的生活, 包含利用支持系统、积极应对、独立与完整 3 个亚主题; ③未来可期, 包含陪伴亲人、死亡准备、高质量地生活、担忧 4 个亚主题。生命意义的各个维度受到宗教信仰、价值观和社会文化的影响。生命意义的核心与生命意义的存在形式相互构成影响。**结论** 医护人员可根据患者特征提供有针对性专业指导和心理支持, 帮助患者发现生命意义, 从而提升其生命意义感, 提高生活质量, 达到善终。

摘要 **目的** 研制焦虑障碍患者自我管理量表并验证其信效度。**方法** 以 Lorig 自我管理理论和邹海鸥五因子模型为理论框架, 通过文献研究法、理论分析法、内容分析法和专家咨询法建立初量表。分别选取 185 和 205 例患者进行条目筛选和信效度验证。**结果** 正式量表包括 2 个分量表, 31 个条目, 疾病医学管理分量表 15 个条目、社会心理管理 16 个条目。总量表的 Cronbach's α 系数为 0.920, 分半信度为 0.787, 重测信度为 0.843。各分量表的 Cronbach's α 系数为 0.873~0.879, 分半信度为 0.729~0.835, 1 周后重测信度为 0.815~0.863。分量表通过探索性因子分析分别提取 3 个公因子, 累计方差贡献率分别为 61.003%和 53.788%。验证性因子分析显示, 该量表具有较好的结构的效度。该量表与席汉残疾量表及焦虑自评量表均呈负相关($P<0.001$)。**结论** 焦虑障碍患者自我管理量表具有良好的信效度, 可作为科学评估焦虑障碍患者自我管理能力的评估工具。**关键词** 焦虑障碍; 自我管理; 量表; 信度; 效度

Development and psychometric test of Self-management Scale for Patients with Anxiety Disorder

Mengmeng Wang¹, Chi Feng², Na Meng¹, Xiaolin Li¹

1. West China School of Nursing/West China Hospital, Sichuan University Chengdu 610041

2. Department of Nursing, Guangzhou First People's Hospital, School of Medicine, South China University of Technology Guangzhou 510180

Abstract: Objective: To develop a scale for measuring the level of self-management in patients with anxiety disorder and test its reliability and validity. Methods: On basis of self-management theory and five-factor model, the first version of self-management scale was formed through literature review, theoretical analysis and content analysis. Totally 185 and 205 patients were recruited to preform item screening and verify its reliability and validity. Results: The Self-management Scale for Patients with Anxiety Disorder included two subscales, medical management of disease (15 items) and psychosocial management (16 items), with 31 items. The Cronbach's α coefficient of the total scale was 0.920, split-half reliability coefficient was 0.787, and one-week test-retest reliability was 0.843. The Cronbach's α coefficient of two subscales was a range with 0.873 ~ 0.879, a range with 0.729 ~ 0.835 for a split-half reliability coefficient and a range with 0.815 ~ 0.863 for one-week test-retest reliability, respectively. Three common factors were extracted from the subscales by exploratory factor analysis, and the cumulative variance contribution rates were 61.003% and 53.788%, respectively. Confirmatory factor analysis showed that the scale had good construct validity. The scale was negatively correlated with both Sheehan Disability Scale and Self-Rating Anxiety Scale ($P < 0.001$). Conclusion: The Self-management Scale for Patients with Anxiety Disorder has good validity and reliability. It can be used as a tool to evaluate the self-management level of patients with anxiety disorder scientifically.

Keywords: Anxiety disorder; Self-management; Scale; Reliability; Validity

摘要 目的: 探索肝移植术后患者心理整合情况及其心理体验。方法: 2021年3-4月通过目的抽样选取湖南省某三甲医院30名肝移植术后患者。采用现象学研究法, 对其进行面对面半结构式访谈, 现场录音, 借助NVivo 8.0软件, 根据Colaizzi分析法对资料进行分析编码, 提炼主题。结果: 提取出3个主要主题和8个次要主题。1) 接受移植肝主要表现为承认移植肝是自己身体的一部分且爱护移植肝。2) 对捐肝者的情感主要表现为感激捐肝者提供给自己生命延续的机会; 受到捐肝者奉献精神的感染和激励; 为捐肝者的不幸感到惋惜。3) 活在当下主要表现为做好移植后自我照护; 调整负面心理状态; 随遇而安地生活。肝移植术后患者在心理整合方面情况良好, 没有访谈对象认为移植肝是外来异物或出现心理上排斥移植肝的情况。这一方面他们文化程度较高且不信仰宗教有关, 另一方面因为尸肝移植更有利于促进患者心理整合。国外研究指出活体肝移植术后患者在自身或捐肝者的健康状况出现问题时更容易感到担忧和自责, 这些负面状态加强了“移植肝是外来器官”的认知并阻碍患者心理上接纳移植肝。而对于尸肝移植术后患者来说, 他们感激捐肝者并受到其激励, 他们认为移植肝是自己的一部分且应当爱护移植肝, 这样才没有辜负捐肝者。他们在日常生活中做好自我照护及调整负面心理状态, 但是不忧虑潜在的健康问题和经济压力, 随遇而安地生活, 展现了活在当下的人生智慧。结论: Fredrickson的拓展-建构理论提出积极情绪具有拓展和建构功能, 积极情绪体验可以拓展个体即时的思维—行动范畴并建构个体长久的身体、认知和社会等的资源。对捐肝者的感恩和生命延续带来的希望和幸福让患者赋予珍惜健康更厚重的意义, 长远来看, 患者以乐观豁达的态度和积极行动来面对生

活，对于改善移植术后健康水平和生活质量具有重要意义。后期研究可进一步积极心理学在促进肝移植术后患者身心健康上的作用。

2 The Second Xiangya Hospital Of Central South University, Changsha, Hunan, 410011

3 The Second Xiangya Hospital Of Central South University, Changsha, Hunan, 410011

4 Central South University, Xiangya Nursing school, Changsha, Hunan, 410013

Abstract: Aims: to explore the psychological integration and experience of patients after liver transplantation. Methods: a total of 30 patients with liver transplantation from March to April in 2021 were selected by objective sampling. By using phenomenological method, the author conducted a face-to-face semi-structured interview and recorded on the spot. With the help of NVivo 8.0 software, the data were analyzed and coded according to Colaizzi analysis method, and the subject was extracted. Results: 3 major themes and 8 minor themes were extracted. 1) accepting a liver transplant is primarily about acknowledging that the liver is part of your body and caring for it. 2) emotions for the donor are expressed in gratitude to the donor for the opportunity to extend their lives; being inspired by the donor's spirit of dedication; and feeling sorry for the donor's misfortune. 3) living in the moment, which includes self-care after transplantation, adjustment of negative mental state, and living with ease. After liver transplantation, the patients' psychological integration is good. No interviewees think that the transplanted liver is a foreign body or psychologically reject the transplanted liver. On the one hand they are highly educated and not religious related, on the other hand because cadaveric liver transplantation is more conducive to the psychological integration of patients. Foreign studies indicate that patients are more likely to feel worried and self-blame when their own or donor's health status is wrong after liver transplantation. These negative states strengthen the perception that the transplanted liver is a foreign organ and prevent patients from accepting the transplanted liver psychologically. And for cadaveric liver transplant patients, they are grateful and inspired by the donor, they think the liver transplant is a part of themselves and should cherish the transplant, so as not to disappoint the donor. They take good care of themselves and adjust negative mental state, but don't worry about potential health problems and economic pressure, Which show the wisdom of living in the present. Conclusion: Fredrick son's theory of Expansion-Construction suggests that positive emotions have the function of expansion and construction, and that positive emotion experience can expand the individual's immediate thinking and action and construct the individual's long-lasting physical, cognitive and social resources. The gratitude to the donor and the hope and happiness brought by the continuation of the life of the donor endows the patient with a more profound meaning of cherishing health. In the long run, the patient live with an optimistic and open-minded attitude and positive actions, which is of great significance for improving the physical and mental health and quality of life after transplantation. The late research may further promote the role of positive psychology in promoting the physical and mental health of patients after liver transplantation.

乳腺癌患者反刍性沉思与自我感受负担的相关性研究

贾晶晶¹ 梁桃云¹ 李婷婷¹ 史铁英¹ (通讯作者)

大连医科大学附属第一医院, 大连, 116011

摘要 目的 乳腺癌是全球女性常见的恶性肿瘤, 根据 2018 年全球癌症统计数据显示, 乳腺癌新增病例约 210 万, 占女性癌症新增病例的四分之一, 死亡病例约 63 万, 高居首位。另外, 乳腺癌诊断、治疗及化疗过程中, 往往需要他人的长期照顾, 在长期接受别人照顾的同时常存在成为别人负担的心理感受, 且较高的心理负担将导致患者出现抑郁、焦虑、内疚等不良情绪, 影响患者的生活质量和治疗效果, 而积极反刍心理可减轻患者焦虑、抑郁情绪, 提高生活质量。因此, 本研究调查乳腺癌患者反刍性沉思与自我感受负担的相关性, 为改善乳腺癌患者自我感受负担提供参考。方法 采用方便抽样法对辽宁省某三级甲等医院 182 名乳腺癌患者应用反刍性思维量表、自我感受负担量表进行问卷调查。结果 乳腺癌患者反刍性沉思总分为(48.67±27.68)分, 反刍性沉思各维度由高到低依次为强迫性反刍、侵入性反刍、建设性反刍, 得分分别为(18.71±13.01)、(18.39±12.92)、(11.57±5.79); 乳腺癌患者自我感受负担总分为(46.35±16.52)分, 自我感受负担各维度由高到低依次为经济负担、情感负担、照护负担、治疗负担, 得分分别为(16.86±7.73)、(11.23±4.64)、(10.68±4.64)、(7.59±2.85)。乳腺癌患者反刍性沉思与自我感受负担呈正相关($P < 0.05$)。结论 乳腺癌患者的反刍性沉思与自我感受负担水平处于中等水平, 反刍性沉思越强, 自我感受负担越重, 两者仍需进一步减轻。因此, 可通过降低乳腺癌患者反刍性沉思从而降低患者的自我感受负担水平。

关键词 乳腺癌, 反刍性沉思, 自我感受负担, 相关性

Correlation between Rumination and Self-perceived burden in breast cancer patients

Jing-Jing Jia¹, Tao-Yun Liang¹, Ting-Ting Li¹, Tie-Ying Shi¹

The First Affiliated Hospital of Dalian Medical University, Dalian

Abstract: Objective Breast cancer is a common malignant tumor in women all over the world. According to the global cancer statistics in 2018, there are about 2.1 million new cases of breast cancer, accounting for a quarter of the new cases of female cancer, with about 630,000 deaths, ranking first. In addition, in the process of diagnosis, treatment and chemotherapy of breast cancer, long-term care of others is often needed, and while taking care of others for a long time, there is often a psychological feeling of being a burden to others. Higher psychological burden will lead to depression, anxiety, guilt and other bad emotions, which will affect the quality of life and treatment effect of patients. Active rumination can alleviate patients' anxiety and depression and improve their quality of life. Therefore, this study investigated the correlation between rumination and self-perceived burden of breast cancer patients, and provided reference for improving self-perceived burden of breast cancer patients. Methods Using convenient sampling method, 182 breast cancer patients in a third-class first-class hospital in Liaoning Province were investigated with rumination scale and self-perceived burden scale. Results The total score of rumination in breast cancer patients was (48.67±27.68), and the dimensions of ruminant meditation from high to low were forced ruminant, invasive ruminant and constructive ruminant, with scores of (18.71±13.01), (18.39 ±12.92) and (11.57±5.79) respectively. The total score of self-feeling burden of breast cancer patients is (46.35 16.52). The dimensions of self-feeling burden are economic burden, emotional burden, care burden and treatment burden from high to low, and the scores are (16.86±7.73), (11.23±4.64), (10.68±4.64) and (7.59±2.85) respectively There is a positive correlation between ruminaion and self-perceived burden in breast cancer patients ($P < 0.05$). Conclusion The rumination and self-perceived burden of breast cancer patients are at a medium level. The stronger rumination is, the heavier the self-perceived burden is, and both need to be further reduced. Therefore, the self-perceived burden level of breast cancer patients can be reduced by reducing rumination.

电子护理文书任务中工作干扰与护士心理负荷的混合性研究

单亚维¹ 尚静¹ 叶旭春¹ (通讯作者)

¹ 海军军医大学护理学院, 上海, 200433

通讯作者: 叶旭春, E-mail: ye_xch8639@163.com

摘要 背景: 电子病历系统 (Electronic Health record, EHRs) 护理文书是现代护理工作的重要组成部分, 但文书任务中的干扰已成为护理工作之常态。工作干扰分散护士的工作注意, 影响工作效率, 甚至导致重要信息的疏漏与人误事件的发生, 最终可能影响护理质量与患者安全。**目的:** 本研究旨在观察电子护理文书任务中的工作干扰、护士行为以及错误发生, 并分析护士心理负荷及错误与干扰等因素之间的相关性。**方法:** 本研究于 2021 年 6 月至 7 月于上海某三级甲等医院开展临床观察与调查。42 位护士接受了完整工作班次的观察, 研究通过观察记录表记录全天 EHRs 护理任务中的干扰、中断 (任务切换)、双任务、错误或接近错误的发生情况; 并调查护士 EHRs 护理任务工作心理负荷、环境 (干扰)、任务 (任务复杂度与执行时间)、技术 (系统可用性)、个体特征 (一般人口学资料、工作能力、自我效能) 四层面的潜在影响因素; 且通过相关性分析, 探究各因素间的相关性。**结果:** 42 个班次的 EHRs 护理任务净执行时间为 46.55 小时, 共发生 620 次干扰 (平均 13.23 次/小时), 排位前五的干扰源为: 患者 (216, 34.84%)、护士 (175, 28.32%)、自身 (86, 13.87%)、医生 (32, 5.16%)、系统或设备问题 (30, 4.84%); 其中, 73.39% 的干扰导致了任务中断或任务切换, 26.61% 转为双任务状态。共计观察到错误或接近错误 65 次 (1.55 次/班), 但 89.23% 均可自行纠正。护士 EHRs 护理任务心理负荷水平为 $49.25 \pm SD 16.56$, 其与错误发生 ($r = 0.341, p = 0.027$)、环境音量 ($r = 0.497, p = 0.001$)、积极情绪 ($r = -0.573, p = 0.000$)、消极情绪 ($r = 0.667, p = 0.000$) 及自我效能 ($r = -0.376, p = 0.014$) 具有相关性; 错误发生与心理负荷 ($r = 0.341, p = 0.027$)、任务执行时间 ($r = 0.438, p = 0.004$)、环境音量 ($r = 0.347, p = 0.024$)、任务中断 ($r = 0.391, p = 0.01$) 和负性情绪 ($r = 0.358, p = 0.02$) 相关。**结论:** 工作干扰在 EHRs 护理任务中具有普遍性与多源性的特征, 并可导致不良影响。研究通过观察工作干扰后的中断与双任务事件, 为 EHRs 护理任务干扰问题提供了新的理解视角; 并通过分析影响工作心理负荷与任务错误的潜在因素, 可为干预策略的提出提供参考依据。

Workflow interruption and nurses' mental workload in electric health records task: a mixed-method study

Shan Yawei¹, Shang Jing¹, Ye Xuxchun¹

¹ School of Nursing, Navy Medical University, Shanghai, 200433

Corresponding author: Ye Xuxchun, E-mail: ye_xch8639@163.com

Funding resource: National Natural Science Foundation of China (71974196)

Abstract: Background Electronic health record (EHR) plays an integral role in nursing care to facilitate documentation practice such as assessment, care planning and evaluation. However, nursing interruptions are frequently encountered by nursing staff during EHRs tasks, which may affect nurse's attention, increasing the time required to perform activities and reducing work efficiency, leading to an increase in negligence and human error. This adversely affects the quality of care and patient safety. **Objective** This study aims to observe the occurrence of interruption, reaction and error of nurses during EHRs tasks, and investigate the relationship between interruption and nurses' mental workload as well as errors. **Methods** A prospective observational and investigational study were conducted in a tertiary hospital during June to July in 2021. Forty-two nurses were observed during the EHRs tasks, documenting for each interruption and the reaction (task switching or concurrent multitasking), as well as error and near error in whole shift. Questionnaire surveys were followed at the end of EHRs tasks to measure their mental

workload towards EHRs tasks and to explore the correlation between environmental factors (interruptions), task demand (task complexity and task time), technology (system usability), characteristics (professional experience and self-efficacy) and mental workload based on the human factors and ergonomics archetype. **Results** In 42 shifts' observations, 620 nursing interruptions occurred (mean of 13.23 interruptions per hour) in a total duration of EHR tasks (46.55 hours). The top five sources of interruption events were as followed: patients (216, 34.84%), nursing colleagues (175, 28.32%), the nurses themselves (86, 13.87%), doctors (32, 5.16%), system and equipment disorder (30, 4.84%). Of these interruptions, 73.39% were priority events leading to the task switching, while 26.61% were concurrent multitasking. The incidence of error or near error due to interruptions was 65, with average 1.55 errors per shift, while 89.23% could be corrected by themselves. The total mean average level of mental workload in EHR task was 49.25 (SD 16.56), which was associated with task errors ($r=0.341$, $p=0.027$), environmental sound ($r=0.497$, $p=0.001$), positive emotion ($r=-0.573$, $p=0.000$), negative emotion ($r=0.667$, $p=0.000$) and self-efficacy ($r=-0.376$, $p=0.014$). The occurrence of error was associated with mental workload ($r=0.341$, $p=0.027$), task time ($r=0.438$, $p=0.004$), environmental sound ($r=0.347$, $p=0.024$), task switching ($r=0.391$, $p=0.01$) and negative emotion ($r=0.358$, $p=0.02$). **Conclusions** Nursing interruption events occur frequently in EHRs tasks, and come from different sources and may lead to negative outcomes. By analyzing the reaction of the interruption, we propose a novel approach to understanding the interruption during EHRs tasks, and by explore the potential variables related to mental workload and task errors, we offer a new perceptible for prevention strategies.

A qualitative study of stress among emergency nurses against major infectious diseases

Ren Minmin¹, Sun Xiangjie¹, FengDanjun²

1 Nursing and Rehabilitation department, Shandong University, Jinan, China, 250000.

2 Nursing and Rehabilitation department, Shandong University, Jinan, China, 250000.

Abstract: Objective To understand the stressors of emergency nurses in the rescue process of major infectious disease epidemic, so as to provide reference for preventing or solving these stressors and further protecting the physical and mental health of emergency nurses. **Methods** From October to December in 2020, a semi-structured interview was conducted among 18 emergency nurses in Hubei Province, and the data were analyzed by Colaizzi's 7-step analysis method. **Results** The stressors of emergency nurses can be divided into three themes: pressure source before the rescue, pressure source in the rescue (stressors of protection appliance, stressor of management, stressors

of daily life health care, stressors of patients, stressors of shortage professional skills and medical resources and stressors of the news media), and pressure source after the rescue. **Conclusion** The family, hospital, government and society should take active measures to help the emergency nurses solve the problems related to stressors in the whole process of rescue.

Key words: Major infectious diseases, Emergency nurses, Stressor, Qualitative research

护士职业妥协与工作压力、主观幸福感的关系研究——中介效应模型分析

蒋召彬¹, 王胜男¹, 董萍萍², 杨秀木^{1,2} (通讯作者)

蚌埠医学院 1.护理学院; 2.全科医学教育发展研究中心; 蚌埠 233000

通讯作者 E-mail: 0700013@bbmc.edu.cn

摘要 目的: 探讨护士职业妥协、工作压力和主观幸福感的关系, 探究工作压力在职业妥协和主观幸福感的中介效应, 为护士调节工作压力、提升幸福感提供理论依据和参考。方法: 对安徽省北部多家医院的护士进行了职业妥协量表、护士工作压力源量表和主观幸福感量表的调查。结果: 共收集到 14 所公立医院共计 1624 名护士的数据。用人单位用工性质影响护士职业妥协水平, 合同制护士的职业妥协水平显著高于标志护士 ($P<0.05$); 护士参加工作的前 10 年内, 工作压力水平随工龄的增长而增加, 工龄 <2 年的护士与工龄 2-5 年、工龄 6-10 年的护士工作压力水平差异显著 ($P<0.05$)。护士职业妥协与工作压力水平显著正相关 ($r=0.23$, $P<0.05$); 职业妥协与幸福感显著负相关 ($r=-0.25$, $P<0.05$); 工作压力与幸福感显著负相关 ($r=-0.45$, $P<0.05$)。职业妥协对幸福感的总效应显著 ($\beta=-0.29$, $P<0.05$), 职业妥协对幸福感的间接效应显著 ($\beta=-0.26$, $P<0.05$), 职业妥协对幸福感的直接效应不显著 ($\beta=-0.03$, $P>0.05$)。结论: 护士的职业妥协水平正向预测工作压力, 负向预测幸福感; 工作压力在职业妥协和幸福感之间起到完全中介作用。可以通过就业指导或相关干预降低护士的职业妥协水平以调节护士工作压力, 提高幸福感。

关键词 护士, 职业妥协, 工作压力, 幸福感, 中介效应

Relationship between career compromise and subjective well being of nurses: A mediation model of job stress

Jiang Zhao-bin¹, Wang Sheng-nan¹, Dong Ping-ping², Yang Xiu-mu^{1,2}

Bengbu Medical College 1. School of Nursing; 2. General Practice Education Development

Research Center; Bengbu 233000 Corresponding author E-mail: 0700013@bbmc.edu.cn

Abstract: Objective: To explore the relationship between nurses' career compromise, job stress, and subjective well-being, and to explore the mediating effect of job stress on career compromise and subjective well-being, so as to provide a theoretical basis and reference for nurses to adjust job stress and improve well-being. Methods: Totally 1624 nurses from 14 public hospitals in northern Anhui Province were investigated with career compromise scale, nurse job stressors scale and subjective well-being scale. Results: The nature of the employment affected the level of nurses' career compromise. The level of career compromise of contract nurses was significantly higher than that of authorized nurses ($P<0.05$). In the first 10 years of nurses' employment, the level of job stress increased with the increase of working years, and there was significant difference between nurses working years less than 2 years and those working years 2-5 years and 6-10 years ($P < 0.05$). Nurses' career compromise was significantly positively correlated with job stress ($r=0.23$, $P<0.05$); career compromise was significantly negatively correlated with well-being ($r=-0.25$, $P<0.05$); job stress was significantly negatively correlated with well-being ($r = -0.45$, $P<0.05$). The overall effect of career compromise on well-being was significant ($\beta=-0.29$, $P<0.05$), the indirect effect of career compromise on well-being was significant ($\beta=-0.26$, $P<0.05$), and the direct effect of career compromise on well-being was not significant ($\beta=-0.03$, $P>0.05$). Conclusion: The level of nurses' career compromise positively predicts job stress, and negatively predicts subjective well-being; job stress plays a complete mediating role between career compromise and

subjective well-being. Career guidance or related interventions could be used to reduce the level of nurses' career compromise to adjust job stress and improve their well-being.

新型冠状病毒肺炎患者心理痛苦的护理经验： 一项混合方法的横断面研究

李娟¹ 王安妮¹ 柏晓玲² 刘蕾³ 陈雪⁴ 张静平^{1*} (通讯作者)

1 中南大学湘雅护理学院, 长沙, 410013, jpzhang1965@csu.edu.cn

2 贵州护理职业学院, 贵阳, 550000

3 贵州中医药大学第一附属医院肾内科, 贵阳, 550000

4 龙里县中医院护理部, 龙里, 551200

摘要 [目的]本研究的目的是调查影响新型冠状病毒肺炎(COVID-19)患者心理痛苦的个人内部和人际关系因素,并描述医护人员照护患者心理痛苦的经验。[方法]本研究采用了横断面调查和质性访谈的混合研究方法。在量性部分,采用 CD-RISC-10、Herth 希望指数、心理痛苦温度计、修订版的 Mishel 疾病不确定感量表、维克森林医师信任量表对 120 名 COVID-19 患者进行了问卷调查。在质性部分,邀请了在抗疫一线工作的 17 名护士和 8 名医生共 25 名医务工作者参加访谈,使用半结构化的在线视频采访来收集数据。使用 Colaizzi 的现象学方法对转录的文本进行了分析。[结果]结果显示,25.7%的患者报告了较高水平的心理痛苦水平($n=31$, 评分 ≥ 4 被认定为存在心理痛苦)。在控制了社会人口统计学变量后,在回归模型中,只有 COVID-19 的严重程度($\beta=0.282, P=0.025$)和疾病不确定感($\beta=0.345, P=0.007$)对心理痛苦有显著影响($F=10.862, R^2=0.222, P<0.001$)。医务工作者的心理护理经验出现了五个主题:特别需要的心理护理、消极情绪的表现、主动适应的表现、缓解心理痛苦的策略。以及提供有效的心理护理后的收获。[结论] 本研究表明,25.7% 的 COVID-19 患者仍遭受心理痛苦。在这次疫情中,应及时关注 COVID-19 患者的心理痛苦程度,同时疾病的严重程度和疾病的不确定感是影响其心理痛苦的重要因素。未来应考虑培训医务工作者甄别患者的心理痛苦的不同表现形式,提供准确及时的疾病信息以减少对疾病的不确定感,并运用沟通策略缓解心理痛苦,帮助医务工作者获得心理成长,减轻工作压力。

Caring for psychological distress of patients with Coronavirus Disease 2019: A mixed-method cross-sectional study

Juan Li¹, An-ni Wang¹, Xiaoling Bai², Lei Liu³, Xue Chen⁴, Jing-ping Zhang^{1*}

¹ Xiangya School of Nursing, Central South University, Changsha, Hunan, P.R. China

² Guizhou Nursing Vocational College, Guiyang, Guizhou, P.R. China

³ Nephrology Department of the First Affiliated Hospital of Guizhou University of Traditional Chinese Medicine, Guiyang, Guizhou, P.R. China

⁴ Nursing Department of the Chinese Medicine Hospital of Longli County, Longli, Guizhou, P.R. China, Corresponding author e-mail: jpzhang1965@csu.edu.cn

Abstract: [Objective] The purposes of this study were to: analyze the intrapersonal and interpersonal factors of psychological distress of patients with COVID-19; and to describe the experience of healthcare workers dealing with the psychological distress of the patients. [Methods] This study uses a mixed research method of cross-sectional survey and qualitative interviews. In the quantitative part, a cross-sectional survey of 120 patients with COVID-19 was conducted using the Connor-Davidson Resilience Scale-10, the Herth Hope Index, the Distress Thermometer, the

Revised Chinese Version of Mishel Uncertainty in Illness Scale, the Chinese Version of Wake Forest Physician Trust Scale and several sociodemographic variables. In the qualitative part, 25 healthcare workers (HCWs) of 17 nurses and 8 physicians working in the frontline were invited using convenient and purposive sampling. Data was collected using a semi-structured online video interview. The transcribed text was analyzed using Colaizzi's phenomenological method. [Results] The results reveal that 25.7% of patients reported higher level of psychological distress ($n=31$, scoring ≥ 4). After controlling the sociodemographic variables, only severity of COVID-19 ($\beta=0.282$, $P=0.025$) and uncertainty in illness ($\beta=0.345$, $P=0.007$) shown significant effect on psychological distress in the regression model ($F=10.862$, $R^2=0.222$, $P<0.001$). The experience of healthcare workers emerged five themes: particularly needed psychological care, manifestation of negative emotion, Manifestation of proactive adaptation, Strategies relieving psychological distress, and gains of healthcare workers after delivering effective psychological care. [Conclusion] In conclusion, the current study has demonstrated that 25.7% of patients with COVID-19 still suffered from psychological distress. In this new epidemic, the psychological distress level of patients with COVID-19 should be given timely attention, and the severity of disease and uncertainty in illness had significant effect on distress. Training the healthcare workers on detecting the different manifestation of inner feelings of distress, offering exact and timely information about disease to decrease the uncertainty, and applying communication strategies to relieve psychological distress should be considered in the future, which may help the healthcare workers to gain psychological growth and mitigate working stress as well.

Keywords: coronavirus disease 2019, patients, psychological distress, healthcare workers, mixed-method study

炎症性肠病患者疾病获益感的潜在剖面分析

孙彩云¹ 林征^{1,2}(通讯作者) 周美景¹ 顾子君¹ 罗丹³ 王咪¹

1 南京医科大学护理学院, 南京, 211166

3 北京大学护理学院, 北京, 100191

摘要 目的 探究炎症性肠病患者疾病获益感的潜在类别, 分析不同类别患者的特征差异。**方法** 采用便利抽样法选取于2020年9月至2021年4月在南京市某三级甲等医院就诊的226例炎症性肠病患者为研究对象, 使用一般资料调查表、疾病获益感量表、伯克利情绪表达量表和社会支持评定量表进行调查。**结果** 炎症性肠病患者疾病获益感可分为3个类别: 低获益-应对无力组(51.0%)、中等获益组(28.3%)和高获益-感知被爱组(20.7%); Logistic回归分析显示, 相比于低获益-应对无力组, 中等获益组中处于中重度活动期的患者比例更低($OR=0.141$, $P=0.038$), 且中等获益组和高获益-感知被爱组中患者正性情绪表达更多($OR=1.272$, $P=0.029$; $OR=1.627$, $P=0.021$), 主观支持更高($OR=2.356$, $P<0.001$; $OR=8.031$, $P<0.001$)。**结论** 炎症性肠病患者疾病获益感存在明显的分类特征, 类别的影响因素涉及疾病活动度、正性情绪表达和主观支持, 需多关注疾病活动度高的患者, 鼓励患者表达疾病相关积极感受并促进其对社会支持的感知, 以提高患者的疾病获益感。

Abstract: Objective To explore the potential categories of benefit finding in patients with inflammatory bowel diseases (IBD), and the different characteristics of each category. **Methods** 226 patients with IBD were selected in a

tertiary hospital in Nanjing by convenient sampling method from September 2020 to April 2021. General information questionnaire, benefit finding scale, Berkeley expressivity questionnaire and social support rating scale were used to conduct the investigation. **Results** The benefit finding in patients with IBD has 3 potential categories, namely low benefit finding-coping disability class (51.0%), moderate benefit finding class (28.3%) and high benefit finding-perceived loved class (20.7%). Logistic regression analysis showed that compared to low benefit finding-coping disability class, the proportion of patients with moderate to severe activity in moderate benefit finding class was lower ($OR=0.141$, $P=0.038$), and the patients in the moderate benefit finding class and high benefit finding-perceived loved class expressed more positive emotion ($OR=1.272$, $P=0.029$; $OR=1.627$, $P=0.021$) and perceived higher support ($OR=2.356$, $P<0.001$; $OR=8.031$, $P<0.001$). **Conclusion** Patients with IBD had obvious classification characteristics of benefit finding. The influencing factors were disease activity, positive emotional expression and perceived support. To improve benefit finding of patients, medical staff should pay more attention to patients with high disease activity, encourage to express disease-related positive feelings and promote the perception of social support.

失独父母的社会认同威胁与心理弹性：一项诠释学研究

王安妮¹ 张静平² (通讯作者)

¹ 复旦大学护理学院, 上海, 200023

² 中南大学湘雅护理学院护理心理学研究中心, 长沙, 410013, jpzhang1965@163.com

摘要 目的: 将社会认同威胁应用于解读失独父母的丧亲体验, 探索社会认同威胁的发生发展、以及心理弹性与社会认同威胁相互作用。方法: 采用目的抽样, 选择不同年龄组, 性别, 居住地区, 婚姻状况和孩子离世信息的 17 名失独者进行访谈, 以 Gadamer 诠释学范式解读其丧子体验, 采用 Van Manen 方法进行提炼主题。结果: 访谈结果诠释出三个主题: “带着新身份复原”、“身份威胁触发的再次崩溃”、“弹性和威胁交叉的不同模式”。社会认同威胁始于身份重建, 自我认同和社会认同相继进行, 悲伤随着身份重构而缓解。一旦被归类为失独群体, 失独父母会因内在自卑和外任污名而产生社会认同威胁, 社会认同威胁导致绝望和社会隔离, 加剧了痛苦和悲伤。个体弹性和威胁交织形成了四种不同的反应模式: 低弹性高威胁、低弹性低威胁、高弹性高威胁、高弹性低威胁。结论: 社会认同威胁是促进失独父母心理复原不可忽略的重要部分。结合中国文化观念, 开发心理弹性干预方案来促进身份重建、减少内化自卑非常有必要。本研究所发现的一些韧性应对策略, 可以考虑被纳入到心理弹性的干预方案当中。同时, 解除或者弱化内在威胁感, 可以减少对政府的苛责促进社会和谐、改善社交回避。

Social identity threat and resilience of Chinese parents following the loss of an only child: an interpretive qualitative study

Anni Wang¹, Jingping Zhang² (Correspondence author)

¹School of Nursing, Fudan University, Shanghai, China

²Nursing Psychology Research Center, Xiangya School of Nursing, Central South University, Changsha, China

Abstract: Objective: To interpret the social identity threat of those parents who have lost their only child, and explain how the psychological resilience acts to the threat of social identity, and to enrich the content of each theme in resilience program. Method: In the three administrative regions of urban, rural and urban-rural integration (town), 17 parents who have lost their only child were interviewed, with different age, gender, areas of residence, marital status and loss-related information. The Gadamer hermeneutic paradigm was used to interpret the experience, and the Van Manen method was used to identify the theme. Results: Three themes were identified: “Recovering with a new

identity", "Collapse again triggered by identity threat", "Different patterns of resilience and threat". The social identity threat began with identity reconstruction, self-identification and social identity were carried out one after another, and grief was alleviated with identity reconstruction. Once classified as a group of parents who have lost their only child, the parents were threatened by this social identity due to intrinsic inferiority and external stigma. The social identity threat led to despair and social isolation, which exacerbated pain and sorrow. Resilience and threat interweaved and formed four different reaction patterns, which were low resilience-high threat, low resilience-low threat, high resilience-high threat, and high resilience-low threat. Conclusions: The social identity threat was an important part of promoting the psychological recovery of parents who have lost their only child. It was necessary to develop a psychologically resilience intervention program, to promote identity reconstruction and reduce internalized inferiority. Some resilient strategies can be incorporated into interventions. Relieving or weakening the inner threat could reduce the blame on the government, promote social harmony, properly balance external exclusion, and improve the social avoidance of parents.

接纳与承诺疗法对疾病照顾者的心理灵活性影响的 meta 分析

朱萍 毕钰 卢元峰 张爱华

山东第一医科大学(山东省医学科学院)护理学院 山东泰安 271016

通信作者: 张爱华 zhangah818@163.com

摘要 背景: 接纳与承诺疗法 (Acceptance and commitment therapy) 是“认知与行为疗法第三浪潮”中最具代表性的治疗方法之一, 该疗法基于功能性语境主义和关系框架理论, 由两个过程六大核心技术组成。正念和接纳过程包括认知解离、以己为景和接纳, 行为改变过程包括承诺行动、关注当下以及明确价值。有研究证明该方法对慢性疼痛, 癌症患者干预有效。但是目前没有对疾病照顾者的干预效果进行评价, **目的** 通过 META 分析系统评价接纳与承诺疗法 (ACT) 对疾病照顾者心理灵活性, 疾病接受度及焦虑、抑郁和压力的干预效果。**方法** 计算机检索 Web of Science、EBSCO、PubMed、Ovid、EMbase、Cochrane Library、中国生物医学文献数据库、CNKI 和万方数据库中关于接纳与承诺疗法 (ACT) 对疾病照顾者的随机试验, 采用 RevMan5.3 软件进行分析。**结果** 最终纳入 13 篇文献, 合计样本量 1276 例, 其中干预组 607 例, 对照组 669 例。结果显示, ACT 能够提高疾病照顾者的心理灵活性[MD=-10.38, 95% (-18.89~-1.87), P<0.001], 疾病照顾者的接受度[MD=1.02, 95% (0.76~1.26), P<0.001], 减轻焦虑 [SMD=-0.63, 95% CI (-1.23~-0.03), P<0.001], 抑郁[SMD=-0.56, 95% (-1.10~-0.01), P<0.001]和压力[MD=-2.44, 95% (-2.68~-2.21), P<0.001]。**结论** 接纳与承诺疗法 (ACT) 对疾病照顾者的心理灵活性, 疾病接受度和焦虑、抑郁、压力的干预是有效的。

The effect of acceptance and commitment therapy on psychological flexibility of disease caregivers:meta analysis

Zhu Ping, Bi Yu, Lu Yuanfeng, Zhang Aihua

School of nursing, Shandong First Medical University (Shandong Academy of Medical Sciences),

Shandong Tai'an 271016, corresponding author: Zhang Aihua, zhangah818@163. Com

Abstract: Background: acceptance and commitment therapy is one of the most representative treatment methods in the "third wave of cognitive and behavioral therapy". Based on functional Contextualism and relational framework theory, it consists of two processes and six core technologies. The process of mindfulness and acceptance includes cognitive dissociation, taking oneself as the scene and acceptance. The process of behavior change includes commitment to action, paying attention to the present and clarifying value. Studies have proved that this method is effective in the intervention of patients with chronic pain and cancer. However, there is no evaluation of the

intervention effect of disease caregivers. **Objective:** to evaluate the intervention effect of acceptance and commitment therapy (ACT) on mental flexibility, disease acceptance, anxiety, depression and stress of disease caregivers through meta analysis system. **Methods:** the randomized trials of acceptance and commitment therapy (ACT) on disease caregivers in web of science, EBSCO, PubMed, Ovid, EMBASE, Cochrane Library, Chinese biomedical literature database, CNKI and Wanfang database were searched and analyzed by revman5.3 software. Results 13 literatures were finally included, with a total sample size of 1276 cases, including 607 Cases in the intervention group and 669 cases in the control group. The results showed that act could improve the psychological flexibility of disease caregivers [MD = - 10.38, 95% (- 18.89 ~ - 1.87), $P < 0.001$], the acceptance of disease caregivers [MD = 1.02, 95% (0.76 ~ 1.26), $P < 0.001$], reduce anxiety [SMD = - 0.63, 95% CI (- 1.23 ~ - 0.03), $P < 0.001$], depression [SMD = - 0.56, 95% (- 1.10 ~ - 0.01), $P < 0.001$] and stress [MD = - 2.44, 95% (- 2.68 ~ - 2.21), $P < 0.001$]. **Conclusion:** acceptance and commitment therapy (ACT) is effective in intervening the psychological flexibility, disease acceptance, anxiety, depression and stress of disease caregivers.

摘要 双语认知控制优势一直是双语研究中的热点, 最新的研究发现, 语言转换训练能促进双语者的监控与抑制控制能力, 说明语言转换是促进双语认知控制优势产生的一个重要因素。同时, 也表明双语语言控制与一般认知控制在机制上存在一定程度的重叠。那么语言转换是如何作用并影响一般认知控制的发展? 进一步讲, 与一般语言训练相比, 语言转换训练有对非目标语言的抑制, 也有不同语言的转换。语言转换是如何促进一般认知控制中抑制和转换能力的发展? 已有的研究尚无法做出解释。针对以上问题, 本研究设计两个行为实验, 系统探究语言转换对双语者不同认知控制成分的影响。实验一探讨不同语言转换频率双语者在不同认知控制成分上的差异, 结果表明, 高语言转换频率双语者在干扰抑制任务和转换任务中的表现显著好于低语言转换频率双语者, 但高、低语言转换频率双语者在反应抑制任务的表现没有差异。实验二探讨语言训练和语言转换训练对认知控制成分的影响, 低语言转换频率双语者随机进行不同的数字命名训练: 中文命名、英文命名和中英命名, 训练前、后分别完成同实验一的认知控制任务。实验二结果表明, 中文命名训练的双语者在认知控制任务上没有显著差异; 英文命名训练的双语者在干扰抑制任务的表现存在显著差异, 训练后的成绩显著好于训练前, 在反应抑制和转换任务上的表现没有显著差异; 中英命名训练的双语者在干扰抑制和转换任务的表现存在显著差异, 训练后的成绩显著好于训练前, 在反应抑制任务上的表现没有显著差异。综合两个实验结果, 双语者进行语言转换包括了两个认知加工: 一是对非目标语言的抑制; 二是不同语言的转换。抑制非目标语言的加工提高了双语者认知控制的干扰抑制能力; 转换至目标语言的加工促进了双语者认知控制的转换能力, 但语言转换并未促进认知控制中反应抑制能力的提高。综上所述, 本研究认为语言转换会促进双语者认知控制能力并在干扰抑制和转换成分上进一步表现出双语认知控制优势。

Abstract: The advantage of bilingual cognitive control has stayed a hot issue in bilingual research. The latest research has found that language switching training promotes the ability of monitor and inhibit control in bilinguals, indicating that language switching is an important factor on the bilingual cognitive control advantages. At the same time, it demonstrates that there is a certain extent of overlap between bilingual language control and domain-general cognitive control. However, how does language switching function and affect the development of domain-general cognitive control? Furthermore, compared with general language training, language switching training includes the inhibition of non-target languages and the switch of different languages. How does language switching promote the development of inhibition and switching in domain-general cognitive control? It still remains unexplainable in current studies. This study designed two behavioral experiments, so as to systematically explore the influence of language switching on different cognitive control components in bilinguals. Experiment 1 explored the influence of different language switching frequencies on cognitive control components. Bilinguals with high and low language switching frequency were required to complete the same cognitive control tasks. Experiment 1 demonstrated that in the interference suppression and switching tasks, bilinguals with high language switching frequency performed significantly better than low language switching frequency. However, there was no difference in response inhibition task between bilinguals with high and low language frequency. Experiment 2 investigated the effects of language switching training on cognitive control components. Bilinguals with low language switching frequency randomly participated in different number naming trainings: Chinese naming, English naming and Chinese-English naming tasks. All bilinguals got through the same tasks with Experiment 1 before and after training. No significant differences were found in the cognitive control tasks for bilinguals trained in Chinese naming; The performance of bilinguals trained in English naming had significant differences in the interference suppression tasks, which was better after training than before training. But no significant differences were found in response inhibition and switching tasks; The performance of bilinguals trained in Chinese-English naming had significant differences in interference suppression and switching tasks, which was better after training than before training. Yet no significant differences were found in response inhibition task. Considering the results of two experiments, language switching includes two cognitive processes: the inhibition in the non-target languages and the switching to the target languages. Suppressing the non-target languages promotes bilinguals' ability of inhibition, switching to the target language facilitates bilinguals' ability of switching, whereas language switching does not promote the ability of response inhibition in domain-general cognitive control. In summary, this study believes that language switching facilitates the domain-general cognitive control and further shows the bilingual advantages in terms of interference suppression and switching.

高低熟练英汉双语者执行注意的差异研究

许家琳¹ 李杰² (通讯作者)

¹ 内蒙古师范大学心理学院, 呼和浩特, 010000

² 内蒙古师范大学心理学院, 呼和浩特, 010000, healthlj2004@163.com

摘要 近几十年来, 有关双语经验的认知效应受到研究者的广泛重视, 有研究者提出, 执行注意是双语认知效应的解释框架, 其中, 执行注意是指记忆表征在外界干扰下保持高度活跃状态的一种能力, 这些表征可能反映了环境中的行动计划、目标状态或任务相关刺激。这种执行注意的能力是潜在的, 可以由两个成分——目标维持和干扰维持作为测量指标。那么执行注意是否可以作为双语认知效应的内在机制? 本研究试通过将英语过专业八级作为高熟练英汉被试, 英语没过四级的作为低熟练英汉被试, 探讨高低熟练英汉双语者在目标维持和干扰维持上的差异及电生理机制。预期结果, 研究一: 在高任务难度程度下, 高熟练双语组延迟匹配任务上的表现优于低熟练组 (实验 1a); 高熟练双语组和低熟练双语组在不同的延迟时间中信息维持程度不同 (实验 1b), 具体表现为高熟练双语者的表现优于低熟练双语者。高熟练组在低任务难度中的 N2 幅度与低熟练组无差异, 随着任务难度增加, 高熟练组的 N2 成分更大, 并具有更大的 P2 振幅, 高熟练组的 P3 随着任务难度增加而增加, 而在更高的任务难度上降低。研究二: 在有干扰任务情况下, 高熟练双语者对目标信息的保持和对干扰任务的处理更好。在有干扰任务下, 高熟练双语者的 P300 振幅低于低熟练双语者, 高熟练组的 N2 成分更大。

A Study on the Difference of Executive Attention of High and Low Proficiency Bilinguals

Jialin Xu¹, Jie Li² (Corresponding author)

² College of psychology, Inner Mongolia Normal University, Hohhot, Email: healthlj2004@163.com

Abstract: In recent decades, researchers have paid extensive attention to the cognitive effects of bilingual experience. Some researchers have proposed that executive attention is the explanatory framework of bilingual cognitive effects. Executive attention refers to the ability of memory representation to maintain a highly active state under external interference. These representations may reflect action plans, target states or task related stimuli in the environment. This ability to perform attention is potential and can be measured by two components - goal maintenance and interference maintenance. So can executive attention be the internal mechanism of bilingual cognitive effect? This study attempts to explore the differences and electrophysiological mechanisms of goal maintenance and interference maintenance between high and low skilled English-Chinese bilinguals. Expected results: Study 1: under the high task difficulty, the performance of the highly skilled bilingual group on the delayed matching task is better than that of the low skilled group (Experiment 1a); High skilled bilingual group and low skilled bilingual group had different degrees of information maintenance in different delay time (Experiment 1b); specifically, the performance of highly skilled bilinguals is better than that of low skilled bilinguals. The N2 amplitude of the highly skilled group in the low task difficulty is no different from that of the low skilled group. With the increase of task difficulty, the N2 component of the highly skilled group is larger and has a larger P2 amplitude. The P3 of the highly skilled group increases with the increase of task difficulty and decreases in the higher task difficulty. Study 2: in the case of interference tasks, highly skilled bilinguals had better retention of target information and processing of interference tasks. Under the interference task, the P300 amplitude of high skilled bilinguals was lower than that of low skilled bilinguals, and the N2 component of high skilled group was greater.

自主语言转换中的抑制控制机制：来自 ERP 的证据

李璐¹ 焦鲁¹ 刘聪¹ (通讯作者)

1 青岛大学心理学系, 青岛, 266071, congu902@gmail.com

摘要 基于抑制控制模型, 先前研究对语言转换的内在加工机制进行了系统的探讨, 发现抑制控制是双语者语言转换的重要加工机制。然而, 先前的研究发现主要是基于生态效度较低的强制语言转换, 而日常生活中较常发生的自主语言转换的内在加工机制尚不清楚。本研究拟基于抑制控制模型和词汇通达理论之争, 借助事件相关电位(ERP)技术, 通过对比自主语言转换和强制语言转换内在加工机制的异同, 系统探讨双语者在自主语言转换中是否存在抑制控制机制, 以及如何进行抑制控制加工。非熟练的汉-英双语者分别完成强制语言转换任务和自主语言转换任务, 同步采集其脑电数据。结果发现, 在自主语言转换中出现了经典的语言转换代价和语言优势反转效应, 以及 N2 和 LPC 成分, 表明自主语言转换中同样存在抑制控制加工, 并且该抑制控制加工同时发生在自主语言转换的早期和晚期阶段; 此外, 我们发现, 与强制语言转换相比, 自主语言转换中存在更小的转换代价和语言优势反转效应, 并且两者引发的 N2 与 LPC 波幅大小也存在显著不同。综上, 本研究的实验结果表明了抑制控制是自主语言转换的重要加工机制, 并且其抑制控制加工过程与强制语言转换存在显著不同。

关键词 自主语言转换, 抑制控制机制, 转换代价, ERP

Inhibitory Control mechanism in voluntary language switching: evidence from an ERP study

Lu Li¹, Lu Jiao¹, Cong Liu¹ (corresponding author)

1 Department of Psychology, Qingdao University, Qingdao, 266071

Abstract: Basing on the Inhibitory Control Model (Green,1998), previous studies have systematically explored the internal processing mechanism of language switching and found that inhibitory control is an important processing mechanism of bilingual language switching. However, findings of previous studies mainly based on the mandatory language switching which had low ecological validity. The processing mechanism of the voluntary language switching which occurs more frequently in daily life, remains controversial. Based on the controversy between the inhibitory control model and the lexical accessibility-only account, the present study aimed to investigate if the inhibitory control processing existed in the voluntary language switching and how the inhibition control processing was implemented in the voluntary language switching, by comparing the internal cognitive processing mechanism underlying the voluntary and mandatory language switching through the event related potential (ERP) technique. Non-proficient Chinese-English bilinguals completed the mandatory language switching and voluntary language switching task respectively, and the EEG data were collected simultaneously. Significant language switching cost and reversed language dominance effect were observed in the voluntary language switching, as well as the N2 and LPC components, which suggested that the inhibitory control processing existed in the voluntary language switching and it occurred in both the early and late stages of the voluntary language switching. Furthermore, we found smaller switching cost and reversed language dominance effect in the voluntary language switching as compared to the mandatory language switching. The differences in amplitude of N2 and LPC between the voluntary language switching and the mandatory language switching also reached significance. In sum, our findings indicated that the inhibitory control was an important processing mechanism of the voluntary language switching, but such inhibitory control processing was significantly different from that in the mandatory language switching.

Keywords: voluntary language switching, inhibitory control mechanism, switch cost, ERP

二语熟练度调节双语控制对一般领域认知控制的依赖

王启萍^{1,2} 计艳楠^{1,2} 闫国利^{1,2} 吴俊杰^{1,2} (通讯作者)

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

2 天津师范大学心理学部, 天津, 300387, psywujunjie@tjnu.edu.cn

摘要 双语控制与一般领域认知控制的关系一直是双语领域的热点研究问题。前人研究大多通过考察同一批双语者在语言控制与非语言控制任务下行为表现的相关来回答这一问题, 并根据相关系数的显著性一般做出三类论断: 语言控制与一般领域认知控制完全相同、部分相同或者完全不同。这些矛盾的论断很可能是因为以往研究在考察该问题时忽略了二语熟练度可能的调节作用, 即双语控制与一般领域认知控制的关系可能在二语熟练度不同的双语者中有不同的表现。为了检验这一假设, 本研究招募了 36 名汉-英非平衡双语者, 让他们完成西蒙任务 (Simon task) 以测试一般领域认知控制能力, 完成牛津分级测试 (Oxford Placement Test) 以测试二语熟练度, 完成单语和双语情境下的图片命名任务以测试局部和全局的语言控制。结果发现: 低熟双语者的切换代价 (即, 在双语情境下切换到另一种语言比重复同一种语言所额外花费的时间) 能够显著地被其西蒙分数所正向预测, 但该现象没有在高熟双语者中出现; 高熟双语者的混合代价 (即, 在双语情境下重复同一种语言比在单语情境下重复同一种语言所额外花费的时间) 能够被其西蒙分数所正向预测, 但该现象没有在低熟双语者中出现。该结果表明双语者的二语熟练度确实会调节其双语控制对一般领域认知控制的依赖。即, 二语熟练度越低的双语者越依赖一般领域认知控制发挥语言局部控制功能, 语言熟练度越高的双语者越依赖一般领域认知控制发挥语言整体控制功能。这意味着, 在语言发展的过程中, 双语者调用一般领域认知控制系统来解决语言领域认知冲突的过程存在者从局部主导向全局主导的转变。

Second language proficiency modulates the dependency of bilingual language control on domain-general cognitive control

Wang Qiping^{1,2}, Ji Yannan^{1,2}, Yan Guoli^{1,2}, Wu Junjie^{1,2} (Corresponding author)

1 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387

2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, psywujunjie@tjnu.edu.cn

Abstract: The relationship between bilingual language control (BLC) and domain-general cognitive control (DGCC) has been a hot topic in the research field of bilingualism. Previous studies mostly examined the correlation between performances for bilinguals in language control tasks and that in non-verbal control tasks and came to conclusions like BLC and DGCC are overlap, partially overlap, or qualitatively different. These contradictory conclusions are possibly due to the neglect of moderating effect of second language (L2) proficiency, that is, the relationship between BLC and DGCC might vary with the L2 proficiency of bilinguals. To exam this hypothesis, we recruited 36 unbalanced Chinese-English bilinguals to perform the Simon task (to assess DGCC), Oxford Placement Test (to assess L2 proficiency), and picture naming tasks in single-and dual-language contexts (to evoke local and global language control). We find a significant positive correlation between switching costs (the extra time spent in switching to a different language than repeating the same language) and Simon scores in bilinguals with low L2 proficiency, but not in bilinguals with high L2 proficiency. Furthermore, a significant positive correlation between mixing costs (the extra time spent in repeating the same language in dual-language context than that in single-language context) and Simon scores in bilinguals with high L2 proficiency, but not in bilinguals with low L2 proficiency. These results verify the moderating effect of L2 proficiency on the relationship between DGCC and BLC, that is, bilinguals with less proficient L2 rely on DGCC more for local language control, whereas bilinguals with more proficient L2 rely on DGCC more for global language control. This may imply a shift from local to global for the dependency of BLC on DGCC during the L2 development of bilinguals.

语言相似性影响双语者执行控制相关脑机制的元分析

李智林 齐芸 王小娟（通讯作者）

陕西师范大学心理学院，陕西西安，710062，wangxj@snnu.edu.cn

摘要 双语者需要在两种语言之间切换，他们比单语者往往表现出更强的执行控制加工能力。而且，语言间的相似性越高，双语者完成语言切换任务时需要的执行控制加工负荷就越强。但是，双语者的执行控制加工负荷受语言相似性的影响还缺乏神经生理方面的研究证据。本研究通过对现有双语者的脑功能成像研究进行元分析，对比考察高、低语言相似性的双语者的在完成语言执行控制加工时的大脑神经机制。本元分析共纳入了1990年到2020年发表的26篇fMRI研究，主要收集了双语者在完成语言切换、翻译任务时的神经激活。将双语者分为语言高、低相似两组：高相似组双语者的母语和第二语言均为英语、法语等拼音文字，共有24个实验对比；低相似性组的母语为中文，第二语言为英语、法语等拼音文字，共有20个实验对比。激活似然估计(ALE)发现低相似组比高相似组更多激活了右侧扣带回、左侧中央前回和枕下回区域，表明语言低相似组需要征用更多的脑区进行语言学属性的加工。而高相似组比低相似组更多激活的脑区主要分布在左侧前额叶及右侧额下回后部，这些脑区与执行控制网络有较大关联，表明双语者在进行翻译、语言切换过程时，较高的语言相似性会带来更大的执行控制负荷。本研究揭示了双语者所掌握的两种语言的相似性会影响其执行控制加工负荷，并塑造双语者在完成语言切换时独特的大脑神经机制。

Meta-analysis of brain mechanisms related to language similarity affecting executive control of bilinguals

Zhilin Li, Yun Qi, Xiaojuan Wang

School of Psychology, Shaanxi Normal University, Xi'an, 710062, China

Abstract: Bilinguals showed a higher capability of executive control processing than monolinguals because bilinguals require more switch processing between the two languages. Evidences have shown that bilinguals with higher similar languages required a heavier load of the executive control processing in language switching tasks. However, there is still a lack of neurophysiological research evidence that the executive control load of bilinguals is affected by language similarity. This study used a meta-analysis of existing bilingual brain function imaging research to compare and investigate the brain neural mechanisms of bilinguals with high and low language similarity when they completed language executive control processing. This meta-analysis included 26 fMRI studies published from 1990 to 2020 and mainly collected the neural activation of language switching and translation tasks in bilinguals. Bilinguals were divided into two groups: high and low similarity groups. The high similarity group refers that the first and second language are both alphabetic languages such as English-French, and this group included a total of 24 contrasts; The low similarity group refers that the first language is Chinese and the second language is alphabetic languages such as English, and this group included a total of 20 contrasts. Activation Likelihood Estimation (ALE) found that the low similarity group activated the right cingulate gyrus, left precentral gyrus, and inferior occipital gyrus more than the high similarity group, indicating that the low similarity group needs to recruit more brain regions for processing linguistic differences. The high-similarity group activated more left prefrontal cortex and the right inferior frontal gyrus than the low-similarity group. These brain regions are closely related to the executive control network, indicating that higher language similarity will bring greater execution control processing load in language switching and translation tasks. This study reveals that the similarity of languages mastered will affect the executive control processing load and shape bilinguals' unique brain neural mechanism when they complete language switching.

摘要 语言与文化关系密切, 但以往概念加工的研究较少关注文化语义加工。本文将探讨汉英双语者母语和二语表征的背景和客体概念间文化语义关系加工差异, 以进一步明确文化场景语义的加工及其机制。本研究将操纵文化场景关系 (一致 vs. 不一致), 并纳入文化背景词启动 (中国文化 vs. 西方文化) 与呈现语言 (汉语 vs. 英语) 为自变量, 采用语言内语义启动范式, 以探究文化场景启动效应是否受呈现语言的影响。实验前匹配中国文化属性和西方文化属性的背景客体配对词, 以汉语或英语呈现的文化背景词和文化客体词分别为启动词和目标词。实验 1 任务为语义分类, 对词汇的加工程度较深; 实验 2 任务为词汇命名, 对词汇的加工程度较浅。两个实验分别有 47 名和 56 名中国大学生参与。结果发现无论是语义分类任务出现了语义启动效应在母语与二语呈现的分离: (1) 语义分类任务中, 材料以汉语呈现时, 中国文化背景词与西方文化背景词启动均能出现语义启动效应, 即文化场景一致条件下的反应要显著快于文化场景不一致条件; 材料以英语呈现时, 只有西方文化背景词启动出现了语义启动效应。(2) 词汇命名任务中, 材料以汉语呈现时, 中国文化背景词与西方文化背景词启动均能出现语义启动效应; 材料以英语呈现时, 两种文化背景词均启动下未能出现语义启动效应。结果表明, 母语表征的具有母语所在文化属性背景概念和客体概念以及具有二语所在文化属性背景概念和客体概念能通过文化场景知识在母语语义网络中紧密联结, 无论是在语义加工深还是浅的任务中均能激活这些联结; 二语表征的具有二语所在文化属性背景概念和客体概念在二语语义网络中存在相对较弱的联结, 只有在语义加工较深的情况下被激活; 二语呈现的母语所在文化场景词对的文化语义关系则较难被提取, 无论是在语义加工深还是浅的任务中均没能激活这些联结。

关键词 文化场景关系, 语言内语义启动, 概念加工, 双语

Differences in priming effects of cultural scene relations between L1 and L2 in Chinese-English bilinguals

Abstract: Concept processing is subject to the cultural system of a given group. This study continues to explore the conceptual processing of cultural scene relations in Chinese-English bilingual people in order to further clarify the processing mechanism of cultural scene semantics. Specifically, based on previous research, the present study took presented language as an independent variable and adopted a within-language semantic priming paradigm to explore whether the cultural scene semantic priming effect is affected by the presented language. In Experiments 1 and 2, researchers administered a semantic categorization task and a word-naming task, respectively. Before the main experiment, the background-object pairs with Chinese cultural attributes and Western cultural attributes were strictly

matched (e.g., spring festival-dumplings; Christmas eve-pizza). The results showed that the priming effect of L1 and L2 presentation were disassociated: (1) in the semantic categorization task, when the materials were presented in L1, semantic priming effects were found when the priming words were Chinese and Western background words, that is, the reaction under the condition of cultural scene consistency was significantly faster than that under the condition of cultural scene inconsistency; while when the materials were presented in English, the semantic priming effect was only found when the priming words were Western background words. (2) In the naming task, when the materials were presented in L1, semantic priming effects were found when the priming words were Chinese and Western background words, that is, the reaction under the condition of cultural scene consistency was significantly faster than that under the condition of cultural scene inconsistency; while when the materials were presented in English, no semantic priming effect was found when the priming words were Western background words. The results of indicated that for unbalanced Chinese-English bilingual people, words associated with cultural scene relations with the culture of L1 and L2 presented in L1 Chinese are stored closely to each other in L1 semantic networks; the association between word pairs in cultural scene relations of L2 presented in L2 English is relatively weaker; Chinese-English bilinguals cannot establish a cultural scene semantic connection with the culture of L1 in L2 semantic networks. This indicates that it is difficult for Chinese-English bilingual people to extract the cultural semantic relations of word pairs in cultural scene relations with the culture of L1 presented in L2. This study further enriches our understanding of concept processing in bilingual people with regard to the relations between background and object in L1 and L2 representations and expands the theory of semantic memory and conceptual knowledge.

Keywords: cultural scene relations, within-language semantic priming, concept processing, bilingual

音高手势在二语词汇声调学习中的作用

余可可, 张捷, 王瑞明 (通讯作者)

广东省心理健康与认知科学重点实验室/教育部脑认知与教育科学重点实验室、

华南师范大学心理学院/心理应用研究中心, 广州, 510631, wangrm@scnu.edu.cn

摘要 声调是声调语言 (例如汉语和泰语) 的一个重要语音特征, 能够用于区别词汇的意义, 对声调语言作为第二语言的学习有重要意义。声调的主要特征在于音节水平的音高变化, 音高手势则是学习者利用手部动作来模拟声调的音高变化。具身认知理论认为, 手势的使用能够为学习者提供感知与运动等多模态的经验, 有助于个体的认知加工。相比对声调音高变化的观察 (音高观察), 音高手势更有具身性。但这种方法是否更有助于二语词汇声调的学习, 先前的研究结果并不一致。此外, 先前研究只初步探讨了音高手势对声调范畴学习 (识别声调的范畴) 的影响。而声调学习除了范畴的学习外, 还有音高声学特征 (区分声调的音高声学特征) 和语音-语义联结 (判断声调词的语义) 的学习。音高手势对这两方面声调学习的影响仍有待探讨。因此, 本研究的目的在于进一步考察音高手势在音高声学特征, 声调范畴和语音-语义联结等多个层面二语词汇声调学习中的作用。具体来说, 本研究以没有泰语学习经验的汉语母语者为研究对象, 采用区分范式、辨认范式和词图匹配范式, 分别比较了三种方法 (音高手势, 音高观察, 无手势与观察) 对泰语声调的音高声学特征, 声调范畴和语音-语义联结学习的影响。总体研究结果显示, 相比音高观察和无手势与观察两种方法, 音高手势对泰语声调的学习有显著的促进作用, 这种促进作用表现在各个层面的声调学习中。而音高观察和无手势与观察对泰语声调各层面学习的影响均没有显著差异。本研究揭示了音高手势在二语词汇声调学习中的作用, 也体现了具身经验对二语语音学习的促进作用。

The role of pitch gesture in the learning of second language lexical tones

Keke Yu, Jie Zhang, Ruiming Wang

Guangdong Provincial Key Laboratory of Mental Health and Cognitive Science, Key Laboratory of Brain Cognition and Education Science of Ministry of Education, Center for Studies of Psychological Application, School of Psychology, South China Normal University, Guangzhou

Abstract: Lexical tone is an important phonological feature for tonal languages like Mandarin and Thai. It could differentiate the word meanings, and is significant to tonal language as a second language (L2) learning. Lexical tone is a kind of pitch variation on the syllable level, and pitch gesture refers to that learners adopt their hand movements to simulate the pitch variation of lexical tones. The embodied cognition theory proposes that the use of gesture provides learners multi-model experience including perception and motion, which can promote individuals' cognitive processing. Compared with pitch observation, pitch gesture could provide learners more embodied experience. But it was controversial that whether the pitch gesture could facilitate L2 lexical tone learning better than the pitch observation. Moreover, previous studies mainly explored the role of pitch gesture in lexical tone identification. How this method affects lexical tone discrimination and word-meaning association remains to be further investigated. Therefore, the present study aims to explore the role of pitch gesture in L2 lexical tone learning, including lexical tone discrimination, lexical tone identification, and word-meaning association. Specifically, we recruited native speakers of Mandarin who did not have Thai learning experience to participate in the experiment, and compared the effects of three approaches (pitch gesture, pitch observation, no gesture or observation) on the three aspects of Thai lexical tone learning, via discrimination, identification, and word-picture matching paradigms respectively. The results showed that the pitch gesture played a significant better role than the pitch observation and no gesture or observation in the learning of Thai lexical tones, including lexical tone discrimination, lexical tone identification, and word-meaning association. But the pitch observation and no simulation or observation played similar roles in the three aspects of lexical tone learning. These results revealed the role of pitch gesture in the learning of L2 lexical tones, and suggested that the embodied experience could facilitate L2 speech learning.

汉语双字词加工中的家族大小效应 以及个体语言认知能力差异的影响

熊建萍¹, 张玉杰¹ (通讯作者), 居萍²

1 河南师范大学教育学部, 河南新乡, 453007, sunshinyzyj@163.com

2 河南师范大学教育学部, 河南新乡, 453007

摘要 词汇是文本阅读最基本也是最重要的单位。中英文研究表明, 视觉词汇识别会受其正字法家族大小的影响。目前拼音文字的家族大小效应研究已经得出较为一致的结果, 而家族大小在汉语双字词识别中的影响作用目前仍然存在争议, 尤其是忽视了语义加工在汉语词汇识别中的作用以及首字字频与家族大小间的共变。此外, 拼音文字的研究表明成年熟练读者的个体差异也是影响词汇通达的重要因素, 而汉语阅读研究极少关注词汇识别中熟练读者的个体差异因素, 并且目前仍秉持“所有熟练阅读者以相同的方式进行阅读”的观点, 极少关注熟练读者的个体语言认知能力的差异对词汇识别的影响。基于此, 本研究以成年正常汉语读者为研究对象, 采用词汇判断任务, 同时操纵词频和首字家族大小, 严格控制首字字频、笔画数等因素, 探讨汉语双字词识别中的家族大小效应。然后采用根据汉语成年读者的特点自编的拼写听写测验和阅读理解测验对被试的语言能力进行测验, 探讨成年读者在语言能力上的个体差异对词汇识别的影响。结果表明: (1) 在汉语双字词识别中, 首字家族大小表现为促进效应, 但这一效应受词频的调节, 主要表现在低频词的识别中; (2) 相对于高能力者来说, 这种促进效应在低能力者身上更为明显。

Abstract: Recognizing word is the most basic and important process during reading. A large number of studies have shown that neighborhood size is an important factor affecting word recognition. At present, the research on the of neighborhood size effect of alphabetic writing had reached relatively consistent results. The effect of neighborhood size on Chinese word recognition is unclear, especially ignoring the role of semantic processing in Chinese lexical recognition and the covariation between the frequency of the initial character and the neighborhood size. In addition, the study of alphabetic writing shows that the individual difference of adult skilled readers is also an important factor affecting word access, while the research on Chinese reading still adheres to the view that "all skilled readers read in the same way" and pays little attention to the influence of individual differences in linguistic skills on word recognition. In this research, we studied recognition of Chinese two-character words in a lexical decision task by manipulating neighborhood size and word frequency, and controlling the frequency of the initial constituent character. Individual differences in linguistic skills were assessed through tests of spelling and reading comprehension. The results of Linear Mixed Models showed that: (1) a larger neighborhood size of the initial character had a facilitative effect on Chinese word recognition, but mainly for low-frequency words, and (2) this pattern was clearer for readers with lower vs. higher linguistic abilities.

摘要 书面阅读是个体从外界获取语言视觉信息的重要方式, 包括篇章阅读、句子阅读、词汇识别和单字识别。其中词汇识别是语言学习中不可缺少的一部分。一些已知的中英文研究表明, 词汇识别会受其一些词汇特性影响, 本研究更感兴趣的是正字法家族词和词频。拼音文字中的家族大小效应已经确定为在低频词上, 大家族词比小家族词表现出促进性效应。拼音文字和汉语的语言系统之间的正字法深度有所不同。并且已有研究表明在汉语双字词的家族大小效应上没有一致的结论。本研究通过操纵首字家族大小和词频, 同时控制尾字家族大小、首尾字字频和笔画数等, 采用了能够分别表现出词汇识别不同阶段的三个实验任务, 包括命名、词汇决策和阅读 (测量目标单词的眼睛注视时间) 来观察家族词作用于词汇识别的阶段及作用效果量。最后使用 R 线性混合模型进行数据分析, 结果显示: 在命名和词汇判断任务中的反应时和正确率上均表现出家族大小和词频的促进性效应, 即大家族的反应时显著低于小家族; 高频词的反应时显著小于低频词; 在句子阅读中的首次注视时间和凝视时间上均表现出促进的家族效应。但家族大小在三个实验任务中表现出具体效应量不同, 词汇判断的家族效应量要大于句子阅读, 命名次之, 根据 Li(2015)的语义激活模型, 这种促进效应可能是由于目标词与家族词之间形成的语义网络链接系统, 家族词越多, 链接越强, 进而导致语义激活以加速单词的识别。

Abstract: Written reading is an important way for individuals to obtain language visual information from the outside world, including text reading, sentence reading, lexical recognition and character recognition. Among them, lexical recognition is an indispensable part of language learning. Some known Chinese and English studies have shown that lexical recognition will be influenced by its lexical characteristics, and this study is more interested in orthographic neighborhood words and word frequency. The neighborhood size effect in alphabetic language has been determined to be that in low-frequency words, large neighborhood words show a promoting effect compared with small neighborhood words. There are differences in orthographic depth between alphabetic and Chinese language systems. Studies have shown that there is no consistent conclusion on the neighborhood size effect of Chinese double words. In this study, three experimental tasks, including naming task, lexical decision task and reading (measuring the eye gaze time of target words), were adopted to observe the stages and effects of neighborhood words on lexical recognition by manipulating the first character neighborhood size and word frequency, controlling the size of the last word neighborhood, the frequency of the first and last words and the number of strokes. Finally, the R linear mixed model is used to analyze the data. the results show that the neighborhood size and word frequency show facilitative effect on the reaction time and accuracy in naming and lexical judgment tasks, that is, the reaction time of large neighborhood is significantly lower than that of small neighborhood; The reaction time of high-frequency words is significantly smaller than that of low-frequency words. Both the first fixation time and gazing time in sentence reading show the facilitative effect of neighborhood size. However, neighborhood size has different specific effects in the three experimental tasks, and the neighborhood effect of lexical decision task is greater than that of sentence reading, followed by naming. According to the semantic activation model of Li(2015), this promotion effect may be due to the semantic network link system formed between target words and neighborhood words. The more neighborhood words, the stronger the link, which leads to semantic activation to accelerate word recognition.

参数相关的 fMRI 揭示汉字阅读的正字法、语音和语义加工脑机制

陈晨 党敏 杨剑峰 (通讯作者)

陕西师范大学心理学院, 陕西西安, 710062, yangjf@snnu.edu.cn

摘要 视觉词汇阅读涉及了正字法、语音和语义三种认知加工。汉字阅读的认知神经科学研究对上述认知加工相关的脑机制积累了大量证据, 但仍然存在着不一致的认识。主要是因为大量研究都是采用因素设计的方法来探讨与上述加工相关的脑区, 从而发现相同的脑区可能对应着不同的认知加工。本研究采用多参数相关的 fMRI 研究, 收集了 10 名健康大学生被试阅读 360 个汉字材料时的脑区激活, 这些汉字材料同时考察了与正字法加工相关的部件数和笔画数、与语音加工相关的声旁规则性和一致性、以及与语义加工相关的可表象性、具体/抽象性以及形旁透明度等词汇属性。基于数据驱动的独立成分分析(ICA)方法, 通过计算每种词汇属性值的时间序列与独立脑成分的时间序列之间的相关性, 系统地探讨汉字阅读神经网络中与不同属性相关的脑区激活。结果发现与词形、语音和语义属性都相关的脑区涉及了前人发现的整个阅读神经网络, 主要分布在双侧枕下至梭状回, 扣带回后部以及楔叶, 颞叶区域包括颞上回、颞下回及其附近的颞中回, 以及前额叶和脑岛。进一步的联合分析发现, 与正字法加工相关的脑区主要包括双侧梭状回和楔前叶、颞上回前部、额上回和额中回脑区。而与语音加工相关的脑区主要位于左侧颞上回; 与语义加工相关的脑区主要包括左侧

角回和脑岛。研究结果基于数据驱动的方法为汉字阅读的正字法、语音和语义三种认知加工相关的脑区激活提供了新的研究证据。

A Multiparametric fMRI reveals the brain mechanism of orthographic, phonetic, and semantic processing in Chinese character reading

Chen Chen, Ming Dang, Jianfeng Yang

School of Psychology, Shaanxi Normal University, Xi'an, China

Abstract: Visual word reading involves the cognitive processing of orthography, phonology, and semantics. A considerable amount of evidence for the brain mechanisms of the above-mentioned cognitive processing has been accumulated from cognitive neuroscience research on Chinese character reading. However, there are still inconsistent understandings. The main reason is that many studies adopted the method of factor design to explore the brain areas related to the processing mentioned above and found that the same brain area may correspond to different cognitive processing. The current study used a multiparametric approach in fMRI to collect the brain activation of ten healthy university students when they read 360 Chinese characters. These Chinese characters were well-designed by evaluating their attributes, including the number of radicals and strokes associated with orthographic processing, the regularity and the consistency of the phonetic radical associated with phonological processing, as well as the imageability, concreteness/abstraction, and transparency of the semantic radical associated with semantic processing. Based on the data-driven independent component analysis (ICA) method that calculates the correlation between the time series of each attribute score and independent brain components, we systematically explored the brain activation related to different attributes in the neural network of Chinese character reading. The results showed that the brain areas associated with orthographic, phonological, and semantic attributes involved the entire reading neural network discovered by previous studies, mainly distributed in the bilateral inferior occipital cortex to fusiform gyrus, the posterior of the cingulate gyrus, the cuneus, and the temporal lobes including the superior temporal gyrus, the inferior temporal gyrus, and the nearby middle temporal gyrus, as well as the prefrontal lobe and insula. Further conjunction analysis revealed that the brain areas associated with orthographic processing mainly included bilateral fusiform gyrus and precuneus, anterior superior temporal gyrus, superior frontal gyrus, and middle frontal gyrus. The brain areas associated with phonological processing were mainly located in the left superior temporal gyrus, while the brain areas associated with semantic processing mainly included the left angular gyrus and the insula. The current data-driven approach provided new evidence for the activation of brain regions associated with the cognitive processing of orthography, phonology, and semantics in Chinese character reading.

Keywords: Chinese character reading, orthography, phonology, semantics

汉语二语学习者语言层级结构的神经追踪研究

陆灵犀^{1*} 邓雅婷¹ 肖哲¹

¹ 北京语言大学语言认知科学学科创新引智基地, 北京, 100083, lingxilu@blcu.edu.cn

摘要 在言语知觉中, 母语者能够快速构建和识别语言层级结构(如字、词和句子)从而达成语言理解。这一过程依赖于大脑中枢神经系统对语言层级结构的内部神经表征, 是实现言语交流和沟通的基础。二语学习者的语言加工能力与母语者存在差距, 与第二语言相关的神经加工与表征能力可能受到限制。目前尚不清楚的是: 与汉语母语者相比, 以汉语为第二语言的学习者加工语言层级结构的神经活动有怎样的特点? 针对这一问题, 本研究采用脑电记录方法和多层级神经追踪实验范式, 将连续语音刺激中不同语言结构(字、词和句)标记在 4 Hz、2 Hz 与 1 Hz 三个目标频率上, 从而考察汉语母语者(24 名, 19-31 岁)与汉语二语学习者(24 名, 21-31 岁)两组被试在主动注意和被动注意两种实验条件下对不同语言结构的神经追踪活动。通过试次间相位相干性分析, 研究结果发现汉语母语者在不同注意条件下对字、词和句频率均有显著的高相干

性，即无论是否注意听觉通道，汉语母语者均能够成功追踪不同层级的语言结构，同时注意对字和词频率的相位相关性具有调节作用。汉语学习者仅在主动注意的条件下能够追踪字和词层面的语言结构，对句层面的结构无法成功追踪；在非注意状态下无法追踪高级语言结构（词和句）。这一结果表明，相对于汉语母语者的自动化语言层级加工，汉语学习者对更高级的语言结构（例如句子）的神经表征受到局限且依赖于注意。本研究从皮层神经追踪的角度出发，为二语习得中的汉语学习者构建语言层级结构的加工过程提供了神经层面的重要实证证据。

Cortical tracking of hierarchical linguistic structures in Chinese as Second Language learners

Lingxi Lu^{1*}, Yating Deng¹, Zhe Xiao¹

¹ Center for the Cognitive Science of Language, Beijing Language and Culture University, Beijing, 100083

Corresponding author: Lingxi Lu, E-mail: lingxilu@blcu.edu.cn

Abstract: In speech perception, native speakers can rapidly construct and recognize hierarchical linguistic structures (such as syllables, words, phrases and sentences) to achieve language comprehension. This progress relies on the internal neural representation of hierarchical linguistic structures in brain's center system, which is the basis for speech communication. It is known that the language processing ability of second language learners is weaker than that of native speakers, which probably limits brain's capacity to precisely represent language structures. So far to our knowledge, an exploration of how the brain tracks hierarchical linguistic structures in Chinese as Second Language (CSL) learners is to-date missing. To address this issue, we applied electroencephalogram (EEG) recording and frequency tagging paradigm to track the neural activities in line with the internal construction of linguistic structures of syllables, phrases and sentences at 4 Hz, 2 Hz and 1 Hz, correspondingly, in 24 native Mandarin speakers (19 to 31 years) and 24 CSL learners (21 to 31 years) when they were actively or passively listened to the connected speech stimuli. Inter-trial phase coherence (ITPC) analysis revealed that in both active and passive conditions, there were significant spectral peaks at the syllable-, phrase- and sentence-level frequencies with a modulational effect of attention. However, CSL learners could only track the syllable- and phrase-level structures when they were paying attention to the auditory stimuli but not when passively listened to them. These results indicated that the hierarchical language processing in native speakers were automatic, while CSL learners' cortical tracking of higher-order linguistic structures were limited and were largely modulated by attentional resources. The present study provided important empirical evidence of the hierarchical linguistic structure construction in second language acquisition from the perspective of brain cortical tracking.

Not all abstract words benefit from social experience in semantic priming

Zhao Yao^{1,2}, Peiying Wang², Fei Wang¹

¹ School of Humanities, Xidian University, Xi'an, 710126

² School of Foreign Studies, Xi'an Jiaotong University, Xi'an, 710049

Abstract: Humans have the ability to learn and use thousands of abstract words (e.g., *freedom*, *idea*), even when they do not have bounded or clearly perceivable referents. The way in which abstract concepts are represented has recently

become a topic of intense debate, especially after the emergence of the embodied (grounded) approaches to cognition. A novel embodied view, multiple representation theory, recently proposed a crucial role for social experience in the grounding of abstract words, but empirical work in this area is still in its infancy. The present study investigated the contribution of social experience that is provided by real-life pictures to different categories of abstract words and the influence of stimulus onset asynchronies (SOAs) and valence on this contribution. We employed a picture-word semantic priming paradigm using a lexical decision task at SOAs of 250 ms (Experiment 1) and 900 ms (Experiment 2). Eight experimental conditions were compared: semantically related/unrelated pictures-emotional abstract words (EA words) and semantically related/unrelated pictures-social abstract words (SA words). All prime-target pairs shared a positive or negative valence. The results of the two experiments consistently indicated that the semantic priming effect was only observed for picture-SA word pairs, with quicker responses to semantically related pairs than to semantically unrelated pairs. By contrast, no significant differences in response times were observed between semantically related and unrelated picture-EA words pairs. Moreover, this pattern of results was not modulated by SOA or the valence of pairs. According to spreading activation theory, we infer that a possible reason for the difference in the semantic priming effect between EA and SA words is that SA words share a closer semantic association with related pictures than EA words, because SA words might more readily benefit from the related social experience of prime pictures to strengthen the semantic association between them, whereas EA words do not. These findings imply that not all abstract words can equally benefit from social experience that is based on personal preexisting social situational knowledge, at least in the present lexical decision-priming task. In short, the present study provides evidence of the multiple represent view and suggest a limited contribution of social experience to the grounding of abstract words, because of the subtle difference in the degree of embodiment between them. Further research is needed to determine how different kinds of abstract words impact other behavioral tasks and investigate whether and how their neural representation differs.

粤语喻意型歇后语前、后语节相互作用的研究

马利军（通讯作者）黄琳 何耀健 朱睿

广州中医药大学心理系，广州，511400，malj@gzucm.edu.cn

摘要 采用启动范式设计，通过实验探讨粤语、潮汕语、客家语、汉语四类不同母语被试在加工粤语喻意型歇后语前、后语节过程中的异同规律，并探究熟悉度这一重要语义性质在粤语语汇理解中的作用。实验1结果发现，前一语节启动后一语节时的启动量在正确率和反应时上都大于相反方向，但四类人群中正确率和反应时的启动量差异均不显著，说明结果不受被试个人粤语熟练度影响。实验二加入熟悉度变量，结果表明，前一语节启动后一语节比相反方向的启动的反应时更小，正确率更高；粤语人群中熟悉度对正确率的效应显著，高熟悉度条件下正确率显著高于低熟悉度条件；汉语人群中熟悉度对反应时的效应显著，高熟悉度条件下反应时显著低于低熟悉度条件。总体而言，相较于非粤语母语人群，粤语母语人群对粤语歇后语的判断更为快速和准确。研究结果认同粤语喻意型歇后语前一语节是“流”，后一语节是“源”，前、后语节具有结构和语义上的同一性。本研究支持概念合成理论以及心理模型的语用推理理论，不完全支持概念隐喻理论。歇后语是语言中文化内涵高度浓缩的部分，而粤语又具备较多的特殊词汇和表达，因此对粤语歇后语的理解是与其熟悉度紧密相关的。研究还认为需重视当下粤语、潮汕语、客家语三种方言互相渗透影响和磨蚀的现象，思考方言的保留与发展之道。

关键词 粤语歇后语，前、后语节，母语，熟悉度

Cantonese metaphor type two-part allegorical sayings section preceding and concluding part interaction research

Lijun Ma, Lin Huang, Yaojian He, Rui Zhu

Guangzhou University of Chinese Medicine's Department of Psychology, Guangzhou

Abstract: Start paradigm was adopted to design, through the experiment to investigate the cantonese, chaoshan language and hakka language, Chinese four kind of different language subjects before processing type cantonese metaphor two-part allegorical sayings, after the similarities and differences in the process of law, and to explore the familiarity nature of this important semantic role in cantonese vocabulary to understand. The results of Experiment 1 showed that the priming amount in the first and second language sections was larger than the opposite direction in both accuracy and response time, but the difference in accuracy and response time was not significant among the four groups, indicating that the results were not affected by the subjects' individual Cantonese proficiency. In experiment 2, familiarity variables were added, and the results showed that the response of the first section was smaller and the accuracy rate was higher than that of the other side. In Cantonese, the effect of familiarity on accuracy was significant, and the accuracy under the condition of high familiarity was significantly higher than that under the condition of low familiarity. In Chinese population, the effect of familiarity on reaction time is significant, which is significantly lower under the condition of high familiarity than under the condition of low familiarity. In general, compared with non-native Cantonese speakers, native Cantonese speakers judge Cantonese two-part allegorical sayings more quickly and accurately. The results agree with cantonese metaphor type two-part allegorical sayings language before a day is a "flow", after a day is the "source", before and after language section with identity on the structure and semantics. This study supports the theory of conceptual synthesis and pragmatic inference theory of mental models, but not fully supports the theory of conceptual metaphor. Two-part allegorical sayings is a highly concentrated part of the cultural connotation in the language, and Cantonese has many special words and expressions, so the understanding of two-part allegorical sayings in Cantonese is closely related to its familiarity. The study also suggests that we should pay more attention to the interpenetrating influence of Cantonese, Chaoshan and Hakka dialects, and consider the ways to retain and develop dialects.

Keywords: Two-part Cantonese allegorical sayings, preceding and concluding part, Mother tongue, Familiarity

摘要 嗓音是语言的一个重要媒介，承载了多重信息，包括语音、语义等语言学信息以及身份、情绪等副语言学信息。在人际交流与沟通中，听话者需要同时加工说话者嗓音中的这些多重信息。先前研究对这些信息的加工存在不同观点：“抽象观”认为，嗓音中的身份信息不影响言语理解（语言学信息的加工）；而“情节观”则认为，身份信息会影响言语理解。另外，如果身份信息会影响言语理解，那么这种影响的发生阶段是在早期还是晚期，先前研究也还存有争议。本研究采用 ERPs 技术，通过两个实验进一步探讨了身份信息对言语理解的作用机制。实验一首先采用启动范式与真假词判断任务，通过比较身份信息、语音信息和语义信息等三种启动条件对目标词判断的影响，考察身份信息是否影响言语理解以及影响的发生阶段。结果显示，身份信息会影响言语理解的早期阶段（P2）和晚期阶段（晚期负波），并且，身份信息和语音信息条件引发的 P2 和晚期负波的平均波幅均不存在显著差异，但两者都和语义信息条件引发的 P2 和晚期负波的平均波幅存在显著差异，表明嗓音身份信息对言语理解的影响与语音信息类似，但和语义信息存在差异。由于实验 1 的实验材料无法完全分离语音和语义信息，实验二进一步采用真词（既有语义信息，也有语音信息）和假词（只有语音信息）更好地分离了这两种信息，并采用被动 Oddball 范式，通过比较真词身份信息和真词语义信息，假词身份信息和假词语音信息等变化条件对 MMN 波幅的影响，考察身份信息对言语理解的影响是否会受到语

义信息的调节。结果显示,在真词条件下,语义信息变化诱发的MMN波幅大于身份信息变化,而在假词条件下,身份信息与语音信息变化诱发的MMN波幅没有显著差异,说明身份信息对言语理解的影响还会受到语义信息的调节。综合实验1和实验2的结果,嗓音中的身份信息对早期和晚期的言语理解均有一定影响,并且,身份信息对言语理解的影响还会受到语义信息的调节。

The identity information in speaker's voice affects speech comprehension

Shuqi Yin, Keke Yu, Ruiming Wang

Guangdong Provincial Key Laboratory of Mental Health and Cognitive Science, Key Laboratory of Brain Cognition and Education Science of Ministry of Education, Center for Studies of

Psychological Application, School of Psychology, South China Normal University, Guangzhou

Abstract: The human voice is the carrier of language, which carries not only linguistic information like phonological and semantic information but also paralinguistic information such as speakers' identity and affective information. In interpersonal communication, the listener needs to process these multiple information in the speaker's voice. Previous studies proposed different views on the processing of these information: the Abstractionist View considers that the identity information does not play a role in speech comprehension (that is, the processing of linguistic information), while the Episodic View considers that the identity information affects speech comprehension. Moreover, whether the identity information affects the early or late processing stage of speech comprehension remains to be controversial. Therefore, the present study aimed to use ERPs to explore whether and how the identity information affects speech comprehension via two experiments. Specifically, Experiment 1 adopted the priming paradigm with a lexical decision task. By comparing the effects of three priming conditions, including identity information, phonological information and semantic information, we found that the identity information affected the early stage (P2) and late stage (late negative potential) of speech comprehension. Moreover, there was no significant difference between the identity and phonological information as reflected by P2 and late negative potential amplitudes. But both of them were significantly different from semantic information. The results indicated that the influence of identity information on speech comprehension was similar to that of phonological information, but their roles in speech comprehension were different from the semantic information. Since the experimental materials in Experiment 1 could not completely separate the phonological from semantic information, we further distinguished these two types of information by using real words (both including semantic information and phonological information) and pseudo words (including only phonological information) in Experiment 2 and adopted a passive oddball paradigm to investigate whether the role of identity information would be modulated by the semantic information. We compared the mismatch negativity (MMN) amplitudes elicited by the identity and semantic information in the real words, and the identity and phonological information in the pseudo words, and found that for the real words, the MMN amplitude of the semantic information was larger than that of the identity information, while in the pseudo words, there was no significant difference between the amplitude of MMNs evoked by the identity and phonological information. The results indicated that the semantic information modulated the role of identity information in speech comprehension. Based on the findings from Experiment 1 and 2, the identity information affected the early and late processing stage of speech comprehension, and the role of identity information in speech comprehension was modulated by the semantic information.

摘要 自闭症是一种具有临床多样性、病原学异质性并常伴发多种其他疾病的神经发育障碍。自闭特质指自闭症状在正常群体中的谱系性存在状态。正常人群中的高自闭特质者会表现出与临床的自闭症障碍个体程度较轻但具有高度相似的特异性行为表现。近年来,越来越多的研究者关注自闭特质个体的言语习得过程——统计学习。统计学习指个体通过对包含在序列性材料中的统计信息的无意识计算(Daikoku, 2018),自动地、无意识地获得环境中的复杂知识、模式或结构的过程。为了考察自闭特质水平是否对个体的统计学习有影响,本研究通过两个实验分别考察了非社会性刺激和社会性刺激作为学习材料时,不同自闭特质水平的个体的统计学习是否存在差异。实验一采用自闭谱系商数问卷(AQ)对 877 名大学生进行自闭特质水平调查,以 AQ 量表总分的第一个四分位数和第三个四分位数(分别为 109 和 124)作为划分高低自闭特质者的界限(Stevenson & Hart, 2017),随机选取高自闭特质组被试 38 名,低自闭特质组被试 38 名。采用语词切分任务考察自闭特质水平对统计学习的影响。结果显示,以纯音为学习素材时,高低自闭特质组均能习得声音刺激流中所包含的语词,且高自闭特质组的统计学习成绩显著高于低自闭特质组。实验二除了学习材料为汉语双拼音节之外,其他与实验一相同。结果显示,低自闭特质组的统计学习成绩显著高于几率水平(50%)且显著高于高自闭特质组,而高自闭特质组的统计学习成绩与几率水平不存在显著差异。本研究对于理解“学习如何受到自闭特质水平的影响”具有重要意义,此外,这项研究对自闭症患者和高自闭特质个体的临床干预有重要意义。

² School of Philosophy and Public Administration, Henan University, Kaifeng, China

Abstract: Autism spectrum disorder (ASD) is associated with classical weaknesses in social communication and interaction but potential strengths in perceptual processing of non-social stimuli. Here, we examine this dissociation in the context of statistical learning (SL), which is the ability to learn statistical regularities from environmental input. Rather than focus on individuals with a diagnosis of ASD, we take a spectrum approach to autism and examine undiagnosed adults who either have high or low levels of autistic traits (ATs). The well-studied word segmentation SL task was adopted to investigate the possible influences of ATs on SL by selecting Chinese college students with different ATs levels as assessed with the Autism-Spectrum Quotient. Experiment 1 incorporated non-social and non-linguistic auditory input (pure tones) whereas Experiment 2 used socially-meaningful input (spoken Chinese disyllables). The results showed a striking dissociation between the different SL tasks. For the non-social stimuli (Experiment 1), both individuals with high and low ATs showed evidence of SL of the input regularities, but the individuals with high levels of ATs showed significantly better performance than those with low levels of ATs. On the other hand, when socially-meaningful stimuli were incorporated (Experiment 2), only the individuals with low ATs showed evidence of SL; the high ATs group performance was not significantly different from chance levels. This research improves our understanding of how cognitive processing and learning for non-social and socially-meaningful stimuli are affected by the presence of ATs. Moreover, this research has implications for clinical interventions for ASD and individuals with high ATs.

摘要 语言和思维相互影响, 语言是民族思维的历史沉淀, 能折射出一个民族观察、感知和理解世界所独具的思维方式。有研究提出“汉语具有空间性特征, 英语具有时间性特征”, 从构词上, 相较于汉语, 英语更加遵循一维的线序时间特征, 从左往右并且不可逆地进行构词。另一方面, 汉语的表达中更加关注名词信息, 名词所负载的是事物的空间属性, 而英语更关注能够体现时间发展的动词信息。但是, 汉语和英语在时空特征上的差异是否以及如何影响时空的认知加工有待进一步的探讨。因此, 本研究试图从对时间感知和空间感知出发, 通过两个行为实验来探讨这一问题。具体而言, 实验 1 采用启动范式初步考察汉英两种语言在时空特征上的差异对时空感知的影响。结果显示, 在空间感知上, 相比于英语启动条件, 汉语启动条件下的表现更好。但是在时间感知上, 汉语和英语两种启动条件没有表现出差别。实验 2 在实验 1 的基础上, 针对时间感知进行进一步的研究, 实验同样采用启动范式, 但是控制了实验材料(句子)对结果可能产生的调节作用。结果显示, 相比汉语启动条件, 英语启动条件下的表现更好。综合实验 1 和实验 2 的结果, 本研究发现, 汉英时空特征上的差异会相应地对个体的时空感知产生影响, 汉语的空间性会促进空间感知, 英语的时间性会促进时间感知。本研究也进一步为语言影响思维提供了证据。

Abstract: Language and thinking influence each other. A language represents a nation's unique way of thinking in observing, perceiving, and understanding the world. There have been several researches put forward that Chinese is spatiality-dominant and English is temporality-dominant. In terms of morphology, compared with Chinese, English is constructed by one-dimensional letters in irreversible order. On the other hand, for the textual construction, Chinese focuses on the nouns which can reflect spatial properties or relations of entities or substances. While English pays more attention to the verbs, indicating a subject's motions and changes over time. However, it remains to be further discussed whether and how the differences between Chinese and English in spatio-temporality affect the time and spatial cognitive processing. In the present study, we aim to investigate it from the perspective of time and spatial perception through two behavioral experiments. Experiment 1 investigated the influence of the differences in spatiotemporal characteristics between Chinese and English on spatiotemporal perception via priming paradigm. The results showed that in the spatial perception, compared with the English priming condition, the Chinese priming condition performed better. However, there was no difference in time perception between Chinese and English priming conditions. Based on Experiment 1, Experiment 2 used the same priming paradigm to further explore the different influences of Chinese and English on time perception, but the underlying moderating effect of experimental materials (sentences) was controlled. Results showed that the English priming condition performed better than the Chinese priming condition in time perception. In summary, this study found that the differences between Chinese and English spatiotemporal characteristics have an impact on individual spatiotemporal cognition. Chinese spatiality

promoted spatial cognition, while English temporality promoted time cognition. The current study provides more evidence for the influence of language on thinking.

Keywords: bilingualism, thinking, temporality, spatiality

不同社区责任感的居民对利他信息意识与无意识加工的分离

杨超(通讯作者) 董之婕 罗天培 闻浩言

贵州师范大学心理学院, 贵阳, 550025, yangchaopsy632@163.com

摘要 已有研究发现居民的内隐利他行为倾向在社区责任感水平上存在显著差异, 但是研究者们发现内隐社会认知的直觉加工中也有着理性加工的参与。目的: 本研究旨在以行为习惯化理论为基础, 探讨个体对利他信息加工过程中意识和无意识的贡献率以及社区责任感的影响。方法: 参照经典的加工分离程序, 设计了 $2 \times 2 \times 2$ 的混合实验, 102 名城市居民参加了实验, 其中男性 25 人, 女性 77 人, 年龄段为 20~50 岁($M = 33.58$, $SD = 8.71$)。结果: (1) 无论是包含测验还是排除测验, 被试对利他词汇的再认成绩都显著优于中性词汇的再认成绩; (2) 具体的加工过程中, 被试对利他词汇的提取比中性词汇需要更多的意识参与和更多的无意识参与, 且无意识的贡献率大于意识的贡献率; (3) 重复测量方差分析显示, 词汇类型与加工方式的主效应显著, 词汇类型、加工方式与被试类型的三重交互作用显著, 进一步比较发现, 社区责任感的个体差异只体现在对利他词汇的意识提取上。结论: 高社区责任感的个体比低社区责任感的个体对利他词汇进行加工时需要更少的意识参与, 更多的是一种无意识的、自动化的加工过程。

Residents with Different Sense of Community Responsibility Separate the Awareness and Unconscious Processing of Altruistic Information

Yang Chao, Dong Zhijie, Luo Tianpei, Wen Haoyan

School of Psychology, Guizhou Normal University, Guiyang, 550025

Abstract: Studies have found that residents' implicit altruistic behavior tendencies have significant differences in the level of sense of community responsibility, but researchers have found that the intuition processing of implicit social cognition also involves rational processing. Purpose: Based on the theory of behavior habituation, this research aims to explore the individuals' conscious and unconscious contribution rate of the process of altruistic information processing and the influence of sense of community responsibility. Method: According to the classic processing dissociation procedure, a $2 \times 2 \times 2$ mixed experiment was designed. 102 urban residents participated in the experiment, including 25 males and 77 females, aged 20-50 years ($M = 33.58$, $SD = 8.71$). Results: (1) Regardless of whether it is an inclusion test or an exclusion test, the subjects' recognition of altruistic vocabulary is significantly better than that of neutral vocabulary; (2) The subjects' extraction of altruistic vocabulary during the specific processing require more conscious participation and more unconscious participation than neutral words, and the unconscious contribution rate is greater than the conscious contribution rate; (3) Repeated measures analysis of variance shows that the main effect of vocabulary type and processing method is significant. The triple interaction among vocabulary type, processing methods and subject types is significant. Further comparisons show that individual differences in sense of community responsibility are only reflected in the awareness of altruistic vocabulary. Conclusion: Individuals with high sense of community responsibility need less conscious participation in processing altruistic vocabulary than individuals with low sense of community responsibility. It is an unconscious and automated processing process.

保障公平与政府信任的关系： 社会保障满意度及生活满意度的中介作用

谭秋蓉¹ 支愧云¹ 陈永进¹（通讯作者） 吴晓琴¹ 薛忱恺¹

¹ 重庆大学公共管理学院，重庆，400044，yjchen@cqu.edu.cn

摘要 政府信任与政府绩效密切相关。新时代社会公平、民生福利以及纯公共产品领域绩效已经超过经济绩效对政府信任的影响。保障公平反映了社会保障服务过程和结果的公平程度，涉及养老保障、医疗保障、就业保障等保障系统的公平。目前已有不少研究探讨公共服务供给、公共服务满意度、社会公平、社会保障服务对政府信任的影响，但鲜少关注保障公平与公众政府信任的关系及其心理机制。本研究基于公平理论和期望失验理论，考察保障公平与政府信任的关系及社会保障满意度和生活满意度在其中的链式中介作用。通过分析 2019 年中国社会状况综合调查数据（N=7403）并用 2017 年数据（N=6973）进行稳健性检验，结果发现：（1）保障公平、社会保障满意度、生活满意度与政府信任之间呈显著正相关；（2）保障公平对政府信任的正向预测随着政府层级的下降而逐渐增强，呈“央弱地强”态势，相对于高层级政府而言，保障公平对区县、乡镇等低层级政府信任水平的提升作用更为明显，其中公共医疗公平不论是对整体的政府信任还是中央、区县、乡镇三级政府信任的影响均强于养老保障公平和就业公平，就业公平的影响最弱；（3）保障公平可以通过社会保障满意度、生活满意度以及二者的链式中介作用三条间接路径预测政府信任。本研究揭示了保障公平与政府信任之间的内在机制，为提升政府信任水平提供了新的思路。

关键词 政府信任，保障公平，社会保障满意度，生活满意度

Relationships between Security Equity and Government Trust: The Mediating Role of Social Security Satisfaction and Life Satisfaction

TAN Qiurong, ZHI Kuiyun, CHEN Yongjin, WU Xiaoqin, XUE Chenkai

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: Government trust is closely related to government performance. In the new era, the impact of social equity, people's livelihood welfare and pure public goods performance has exceeded the impact of economic performance on government trust. Security equity refers to the degree of equity in the process and outcome of social security services, involving the equity of pension security, medical security, employment security systems. Previous research has shown that public service supply, public service satisfaction, social equity and social security services play important roles in government trust, but few studies have explored the impact of security equity on public government trust and its psychological mechanism. Based on Equity Theory and Expectancy Disconfirmation Theory, we examine the impact of security equity on government trust and the chain mediating role of social security satisfaction and life satisfaction. By Analyzing the data of Chinese Social Survey in 2019(N=5403) and using the data of 2017(N=6973) for robustness test, it is found that: (1) Security equity, social security satisfaction and life satisfaction were positively related to government trust. (2) The positive impact of security equity on government trust gradually increases with the decline of government level, showing a trend of "the central government is weak and the local government is strong". Compared with high-level government, security equity plays a more significant role in promoting the trust level of low-level government such as district and country, township government. The impact of public health care equity on the overall government trust and the trust of central, district and country, township government is the strongest, and the influence of employment equity is the weakest. (3) Security equity can not only affect government trust through the independent mediating role of social security satisfaction or life satisfaction, but also have a positive impact on local government trust through the chain mediating role of "social security satisfaction → life satisfaction". This

study reveals the internal mechanism between security equity and government trust, and provides valuable new ideas on how to improve the level of government trust.

Keywords: Government Trust, Security Equity, Social Security Satisfaction, Life Satisfaction

无手机恐惧心因性预测因素的探索：基于 Lasso 回归

任世秀¹ 薛的妮² 刘拓^{2,3,4}(通讯作者)

¹ 北京师范大学中国基础教育质量监测协同创新中心, 北京, 100875

² 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

³ 天津师范大学心理学部, 天津, 300387

⁴ 学生心理发展与学习天津市高校社会科学实验室, 天津, 300387, liutuo@tjnu.edu.cn

摘 要 据《第 45 次中国互联网统计报告》统计, 我国手机网民人数高达 8.97 亿, 其中即时通讯用户占比 99.2%, 网络新闻用户占比 81.0%, 网络视频用户占比 85.6%...可见, 手机已经普及到个体生活的方方面面, 但它也给我们带来了一些消极的影响, 如无手机恐惧(Nomophobia, NMP)。而无手机恐惧仅是种行为表现, 其背后的心理机制才是问题的关键。研究表明个体的人格特质、自尊水平、独处行为、社会支持都能显著预测与无手机恐惧概念相近的手机成瘾, 那这些变量是否也可以显著预测无手机恐惧? 此外, 目前针对于无手机恐惧的研究大多数都是选用基础统计方法去探索变量间的关系, 但这些方法在预测变量较多且存在测量误差时, 得到的结果并不会很稳定。因此, 本研究以线性回归为基础, 选用机器学习中的收缩法 Lasso 进一步“理解”无手机恐惧和人格特质、自尊水平、独处行为和社会支持各变量间的关系。第一步, 先用 Pearson 相关探索各变量的关系, 结果表明无手机恐惧与五种人格特质($r \in [0.11, 0.33]$, $p < 0.001$)、四种独处行为($r \in [0.24, 0.61]$, $p < 0.001$), 与社会支持中的主观社会支持($r = 0.315$, $p < 0.001$), 与个体自尊水平($r = 0.315$, $p < 0.001$)均呈显著正相关。第二步, 使用 t-test 检验无手机恐惧在不同性别水平上是否存在差异, 结果显示不同性别间的无手机恐惧水平存在显著差异($t_{(676)} = 2.599$, $p < 0.05$)。第三步, 将人口学变量(性别)、心理学变量(5 种人格特征、4 种独处行为、3 种社会支持和自尊水平), 共 14 个都为自变量, 无手机恐惧为因变量, 并用 R 包 *glmnet* 中的 Lasso 回归探索影响无手机恐惧的关键因素。使用 Lasso 算法, 通过训练集得到最小均方误差(Mean Squared Error, MSE)处的 λ 为 0.05, $\lambda + 1se$ 为 0.27, 本研究选用的最佳 λ 值为 $\lambda + 1se$, 这是因为最小 MSE 对应 λ 的惩罚幅度小, 不能完全解决过拟合的问题。故将 0.27 代入测试集中, 最终保留的变量有孤独(LON)、孤僻(ECC)、社交回避(SCO)、神经质(NEU)、责任性(CON), 而通过 *covTest* 包显著性检验的只有 LON 和 ECC 变量, 模型 R^2 为 0.33, MSE 为 0.99。第四步, 进一步验证孤独和孤僻的重要作用, 将其从模型中剔除后再次建模, 最终模型的 R^2 下降为 0.21, MSE 增大为 1.16。因此, 最终确定回归方程为 $NMP = 2.023 + 0.547 * LON + 0.008 * ECC$ 。综上所述, 可推断出个体的孤独感和孤僻感是预测无手机恐惧的关键因素, 也就是说个体的孤独感和孤僻水平较高时, 很可能会导致个体无手机恐惧现象加重, 而其中孤独感的预测作用相对较大。

³ Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

⁴ Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin, 300387

Abstract: According to the "45th Statistical Report on Internet Development in China", the number of mobile phone users is 817 million., among them, messaging users accounted for 99.2%; the user who browses the web news accounted for 81.0%, the user of the web video accounted for 85.6... Visible, mobile phones have been popular in every aspect of individual life, which also brought some negative effects, such as nomophobia (NMP). The nomophobia is only a kind of behavior, and the psychological mechanism behind it is the key to the problem. Studies have shown that individual personality traits, self-esteem, solitude behavior, social support and so on can significantly predict smartphone addiction which was similar to the concept of nomophobia. Can these variables also significantly predict nomophobia? In addition, most of the current research on nomophobia had chosen some basic statistical methods to explore the relationship between variables, but the results of these methods will not be very stable when there are many prediction variables and there are measurement errors. Therefore, the study based on linear regression, Lasso, a shrinkage method in machine learning, was selected to further "understand" the relationship between nomophobia and personality traits, self-esteem, solitude behavior and social support. Firstly, Pearson correlation was used to explore the relationship between the variables. The results showed that there were significantly positive correlations between nomophobia with five personality traits ($r \in [0.11, 0.33]$, $p < 0.001$), four kinds of solitude $r \in ([0.24, 0.61]$, $p < 0.001$), subjective social support in social support ($r = 0.315$, $p < 0.001$), and the individual self-esteem level ($r = 0.315$, $p < 0.001$). Secondly, using a separate t-test to test whether there were gender differences in nomophobia. The final results showed a significant difference in nomophobia levels between men and women ($t_{(676)} = 2.599$, $p < 0.05$), that is to say, the level of nomophobia is affected by gender. Thirdly, gender, personality characteristics, solitary behavior, social support and self-esteem level all as independent variables, nomophobia as a dependent variable. Using *glmnet* package in R to predict the regression equation by Lasso algorithm, and further explore the key factors that affect the nomophobia. Using Lasso algorithm, the λ is 0.05 at the minimum Mean Squared Error (MSE) through the training set. The best λ value selected in this study is $\lambda + 1se$. because the penalty range of the minimum MSE corresponding is small, and the problem of overfitting can't be solved. Therefore, 0.27 will be included in the test data, the final retention of variables were loneliness (LON), eccentricity (ECC), social avoidance (SCO), neuroticism (NEU) and conscientiousness (CON), while only LON and ECC passed the significance test of the *covTest* package, R^2 is 0.33, MSE is 0.99. Fourthly, removing LON and ECC from the model and re-modeling in order to verify the importance of them, the final R^2 dropped to 0.21, MSE increased to 1.16. Therefore, the regression equation is $NMP = 2.023 + 0.547 * LON + 0.008 * ECC$. To sum up, it can be inferred that the loneliness and eccentricity of the individual are the key factors to predict the nomophobia. That is to say, when the level of loneliness and eccentricity was higher, it was likely to lead to the aggravation of the nomophobia, and the predictive effect of loneliness is relatively greater.

Keywords: nomophobia, loneliness, eccentricity, machine learning, Lasso regression

负性情绪，还是人际问题和压力会使人们更常使用手机社交媒体？

张舒¹ 刘拓² 孟慧¹（通讯作者）

1 华东师范大学心理与认知科学学院，上海，200062，hmeng@psy.ecnu.edu.cn

2 天津师范大学心理学部，天津，300387

摘要 随着科技的进步，手机和互联网的普及使得在线社交网站得到了广泛的使用。根据社交增强假说和社交补偿假说，网络给个体和他人的交流提供了新的可能的方式，那些在线下感到孤独的人可能会通过访问社交媒体来获得另一种与他人交流的途径，从而扩大他们的社交世界和获得慰藉（Song et al., 2014; Bessière et al., 2008）。还有研究表明负性情绪和压力水平高的个体倾向于使用社交媒体来缓解这些不好的体验。但以往研究较少采用追踪研究设计来探寻变量间的预测关系，并且受传统研究方法限制，无法同时梳理诸多变量间纷繁复杂的关系。因此，本研究基于网络分析方法，采用追踪设计探究负性情绪、人际问题和压力是否会影响个体的手机社交媒体使用行为。研究一采用问卷法调查了 431 名在校大学生的手机社交媒体使用时长、孤独、错失恐惧、抑郁、焦虑、人际问题和压力状况，回收得到有效问卷 425 份。利用相关网络分析、贝叶斯网络分析方法探究这 7 个变量之间的相关关系以及可能存在的因果关系。结果表明大学生社交媒体使用时长与错失恐惧（ $r = .16, p < .01$ ）和孤独（ $r = .10, p < .05$ ）存在正相关关系；错失恐惧具有最高的中介中心度和接近中心度，居于相关网络的中心位置，且可能是直接影响社交媒体使用需求的因素。研究二采用追踪研究设计（2 次调查，间隔时间为 2 周）对 336 名在校大学生进行了调查。利用交叉滞后分析方法探究社交媒体使用与负性情绪、人际问题和压力之间的相互影响，结果表明只有错失恐惧可以显著正向预测手机社交媒体使用（ $\beta = .09, SE = 0.04, p < .05, 95\% CI = [.01, .17]$ ），其余变量的模型过拟合或路径系数不显著。本研究的研究结果提示错失恐惧可以直接正向预测个体的手机社交媒体使用行为。并且，错失恐惧在变量的相关网络中占据中心位置，与其他变量联系紧密。因此当个体错失恐惧水平较高时，应该多加注意，以防引起共病。

关键词 社交媒体使用，人际问题，心理健康，网络分析，交叉滞后模型

What motivate people to use mobile social media more often, negative affect, interpersonal problems, or stress?

Shu Zhang¹, Tuo Liu², Hui Meng¹ (Corresponding)

1 School of Psychology and Cognitive Sciences, East China Normal University, Shanghai, China

2 Faculty of Psychology, Tianjin Normal University, Tianjin, China

Abstract: With the rapid development of technology, mobile phones and the Internet have been popular. Consequently, online social networking sites have been widely used. According to the social augmentation hypothesis and the social compensation hypothesis, the Internet provides a new possibility for communicating with others. Individuals who feel lonely offline would find another way to communicate with others by using social media in order to augment their social network and get comfort (Song et al., 2014; Bessière et al., 2008). Many studies showed that individuals having higher levels of negative affect and stress would relief these negative experiences by using social media. Nonetheless, few longitudinal studies were conducted to explore the predictable relationship between these variables. Furthermore, limited by traditional analysis methods, the complex relationship between these variables cannot be clarified clearly. Thus, the present study was based on the network analysis. And a longitudinal study was conducted to examine whether negative affect, interpersonal problems, and stress would affect SMU. In the first study, 431 college students answered the questions about social media use, loneliness, FoMO, depression, anxiety, interpersonal problems, and stress. There were 425 valid questionnaires. Correlation network analysis and Bayesian network analysis were conducted to examine the relationship between these variables and potential causal relationship. Results showed that SMU was positively correlated with FoMO ($r = .16, p < .01$) and loneliness ($r = .10, p < .05$). In the correlation network, FoMO had the highest betweenness centrality and closeness centrality, indicating it was the central node. And FoMO might directly affect SMU. The second study was a longitudinal study (including 2 surveys, with an interval of 2 weeks), involving 336 college students. Cross-lagged panel analysis was conducted to explore

the interactions between SMU and negative affect, interpersonal problems, and stress. Results showed that only FoMO can positively predict SMU ($\beta = .09$, $SE = 0.04$, $p < .05$, 95% $CI = [.01, .17]$). The rest models were over-fitted, or the path coefficients were not significant. The results of the present study indicated that FoMO can directly positively predict SMU. And FoMO was in the center of the correlation network, having close relationship with other variables. So, people should pay more attention when having higher level of FoMO to prevent comorbidities.

Keywords: social media use, interpersonal problem, mental health, network analysis, cross-lagged panel model

青少年网络利他行为的发展趋势及社会阶层的影响： 一项 2 年追踪研究

陈慧萍¹ 郑显亮¹（通讯作者）

¹ 赣南师范大学教育科学学院，赣州，341000，zx12004@sina.com

摘要 通过文献梳理发现，研究者对网络利他行为的特征、现状、影响因素与机制及对个体的影响等方面进行了探讨。但目前研究大多是横断设计，缺乏对网络利他行为发展趋势的纵向研究。另外，从个体发展的过程来看，青少年时期是一个重要的过渡阶段，该阶段中的个体常表现出动态性、连续性和发展性等特征。青少年的亲社会行为也经历了一个发展历程，网络利他行为是在互联网情境中发生的不求回报的亲社会行为。那么，青少年网络利他行为的发展模式会和现实中的亲社会行为的发展模式一样吗？综上，本研究拟采用纵向研究设计考察青少年网络利他行为的发展趋势以及社会阶层对青少年网络利他行为发展趋势的影响，以便丰富和深化网络利他行为的研究内容，为青少年网络行为的引导提供参考依据。以 832 名 12~20 岁的青少年为研究对象进行为期 2 年共 4 次的追踪调查，考察青少年网络利他行为的发展趋势以及社会阶层与青少年网络利他行为发展趋势的关系。考虑到在追踪研究过程中部分被试的流失以及被试参与调查的次数不相同，本研究的数据分析采用多层线性模型技术，运用 HLM 软件对数据进行分析，结果表明：(1)时间对青少年网络利他行为有显著的正向预测作用，即青少年网络利他行为随着时间的推移呈现上升趋势。(2)性别、每周上网时间和客观社会阶层对青少年网络利他行为发展趋势的影响不显著。(3)主观社会阶层对青少年网络利他行为发展趋势的影响显著，即青少年的主观社会阶层越高，其网络利他行为随着时间的推移呈现的上升趋势越强。上述结果进一步阐明了青少年网络利他行为的发展特点，丰富了网络利他行为的研究内容。主观社会阶层对青少年网络利他行为发展趋势具有正向影响，这对鼓励和引导青少年网络利他行为、培养青少年良好的道德品质具有一定的实践意义。

Development Trends of Adolescents' Internet Altruistic Behavior and the Influence of Social Class: A 2-year Longitudinal Study

Chen Huiping¹, Zheng Xianliang¹

¹ School of Education Science, Gannan Normal University, Ganzhou, 341000, Email:
zx12004@sina.com

Abstract: Through literature review, it is found that researchers have discussed the characteristics, current situation, influencing factors and mechanisms of Internet altruistic behavior and its impact on individuals. However, most of the current researches are about cross-sectional design, and lack of longitudinal research on the development trend of Internet altruistic behavior. In addition, from the perspective of the process of individual development, adolescence is an important transitional stage, in which individuals often show dynamic, continuous and developmental characteristics. Teenagers' prosocial behavior has also gone through a development process. Internet altruistic behavior is a kind of prosocial behavior that occurs in the Internet situation and does not ask for return. So, will the development model of teenagers' Internet altruistic behavior be the same as that of prosocial behavior in reality? To sum up, this study intends to use a longitudinal research design to investigate the development trend of teenagers'

Internet altruistic behavior and the influence of social class on the development trend of teenagers' Internet altruistic behavior, so as to enrich and deepen the research content of Internet altruistic behavior and provide reference for the guidance of teenagers' Internet altruistic behavior. 832 adolescents aged 12-20 were selected as the research objects, and four follow-up tests were conducted for two years to investigate the development trend of Internet altruistic behavior of adolescents and the relationship between social class and the development trend of Internet altruistic behavior of adolescents. Considering the loss of some subjects in the process of tracking research and the different times of participants participating in the test, the data analysis of this study adopts multi-layer linear model technology, and uses HLM software to analyze the data. The results show that: (1) time has a significant positive predictive effect on Teenagers' Internet altruistic behavior, That is to say, the Internet altruistic behavior of teenagers shows an upward trend over time. (2) Gender, weekly online time and objective social class have no significant influence on the development trend of Internet altruistic behavior. (3) The higher the subjective social class is, the stronger the upward trend of the Internet altruistic behavior is. The above results further clarify the development characteristics of adolescent Internet altruistic behavior and enrich the research content of Internet altruistic behavior. Subjective social class has a positive impact on the development trend of teenagers' Internet altruistic behavior, which has a certain practical significance for encouraging and guiding teenagers' Internet altruistic behavior and cultivating teenagers' good moral quality.

Keywords: Internet altruistic behavior, subjective social class, objective social class, longitudinal study, adolescents

孤独在大五人格与问题性手机使用之间的中介作用： 一项结构方程模型元分析

芦旭蓉¹ 陈雪明¹ 刘拓^{1,2,3}（通讯作者）

1 天津师范大学心理学部，天津，300387

摘 要 随着时代的发展，手机已经成为日常生活中必不可少的沟通交流工具。尽管手机的使用能为日常生活带来便利，但是过度依赖手机就会引发问题性的手机使用，影响个体的身心健康。众多的研究表明人格特质与问题性手机使用的关系密切，以往的研究表明不同的人格特质会引发不同的手机使用行为，例如神经质、开放性和外向性是问题性手机使用的重要预测源，而情绪稳定性与问题性手机使用呈负相关关系。由于手机在日常生活中的作用是联系与沟通，因此孤独感较高的个体更容易引发问题性的手机使用。此外，孤独感背后更深层次的原因可能是不同的人格特质所导致，因此可以推测存在一条人格-孤独-问题性手机使用的路径。尽管已经有较多的研究考察了孤独与手机、人格与孤独以及人格与手机的关系，但是很少有同时探究三者的关系，而且不同人格特质与问题性手机使用的关系尚且存在争议。基于上述问题，本研究采用结构方程模型元分析的方法来探究大五人格与问题性手机使用的关系，以及孤独起到的中介效应，使用 R 语言的 metafor 和 metaSEM 包对数据进行分析。本研究使用 CNKI 知网、万方、维普、Web of Science、PsycINFO 以及 EBSCO 数据进行文献检索，以 r 值作为效应值进行提取，最终得到符合要求的 55 篇文献（中文文献 26 篇，英文文献 29 篇），共 60 个独立样本，总样本量为 44024。主效应结果表明宜人性和严谨性与问题性手机使用呈现显著负相关关系，神经质与问题性手机使用呈现显著正相关关系，孤独与问题性手机使用呈现显著正相关关系。中介效应分析结果表明孤独在神经质与问题性手机使用关系的模型中起到了正向的部分中介效应，孤独在严谨性、外向性和问题性手机使用关系的模型中起到了负向的部分中介效应，此外孤独在宜人性、开放性和问题性手机使用的关系中起到了负向的完全中介效应。本研究结果提示在未来问题性手机使用的研究中要更多地关注人格、孤独产生的影响，以及这些影响在不同的条件下是否存在不同的效应，从而更好地解释问题性手机使用的发生机制。

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China, mikebonita@163.com

Abstract: With the development of society, mobile phone has become an essential tool for communication. Although the use of mobile phone can bring convenience, excessive reliance on mobile phones will lead to problematic mobile phone use (PMPU), which can cause a lot of harm to individuals' physical and mental health. Lots of researches indicate that personality has close relationship with PMPU, and different personality traits can trigger different mobile phone use behaviors. For example, neuroticism, openness and extraversion are important predictive factors of PMPU, while emotional stability has a negative correlation with PMPU. Due to the main function of mobile phone is to contact and communicate with others, so individuals with higher loneliness level are more likely suffering from PMPU. Furthermore, the deeper reasons behind loneliness may be caused by different personality traits. Therefore, it can be inferred that there is a path of personality - loneliness - problem mobile phone use. Although there are many researches that are explored relationship between loneliness and PMPU, personality and PMPU, and loneliness and personality, there are few studies that investigate relationships among three concurrently. And it is controversial about the relationships between different personality traits and PMPU. Based on the above problems, a meta-analysis structural equation modelling was conducted to investigate the relationship between big-five personality and PMPU, and the moderating effect of loneliness. metafor and metaSEM packages of R language were used to analyze the data. Firstly, the databases of CNKI, Wanfang, Weipu, web of science, PsycINFO and EBSCO were used to retrieval and select literatures, and the r value was used as the effect value. After screening according to the criteria, 55 articles (29 in English and 26 in Chinese) met the requirements, with 60 independent samples and 44024 total sample sizes. The results of main effect analysis showed that agreeableness and conscientiousness had negative correlation with PMPU, and neuroticism and loneliness had negative correlation with PMPU. The results of mediation effect analysis showed that loneliness played a positive partial mediating effect in the model of neuroticism and PMPU, and played a negative partial mediating effect in the model of conscientiousness, extraversion and PMPU. In addition, loneliness played a negative complete mediating effect in the relationship between agreeableness, openness and PMPU. The results of this study suggest that in the future research on problem mobile phone use, the more attention should be paid to the effects of personality and loneliness, and whether these effects have different effects under different conditions. It is helpful to better explain the mechanism of problem mobile phone use.

Keywords: Big Five Personality, Loneliness, Problematic Mobile Phone Use, Meta-analysis Structure Equation Model

亲子关系与青少年手机依赖的关系： 个人成长主动性的中介效应与同伴关系的调节效应

江伊茹 朱成伟 全晰 张彩（通讯作者）

北京师范大学中国基础教育质量监测协同创新中心，北京，100875，caibnu@163.com

摘 要 在我国，青少年群体中手机的使用越来越普遍。手机在带给青少年新的学习资源和机会的同时，也容易诱发青少年对其的过度使用，导致手机依赖行为的产生，从而对青少年的身心健康造成不良影响。在影响青少年手机依赖的诸多因素中，家庭因素尤为重要。其中，家庭因素中的亲子关系是影响手机依赖的最重

要因素之一。以往许多研究也证明了亲子关系不良的青少年更容易产生手机依赖，但很少有研究全面考察家庭、个人和学校因素对青少年手机依赖的影响机制。因此，为拓展现有研究的内容，本研究构建了一个有调节的中介模型来考察家庭因素（如亲子关系）与青少年手机依赖之间的作用，并考察了个体因素（如个人成长主动性）在其中的中介作用以及学校因素（如同伴关系）的调节作用。本研究采用方便取样法选取了山东省青岛市 65 所中学 3355 名高二年级学生为被试，采用关系网络问卷、简版问题性手机使用量表、个人成长主动性量表、同伴关系量表对其进行了调查。结果发现：（1）在控制了性别和上网时间后，亲子关系对青少年手机依赖具有显著的负向预测作用；（2）个人成长主动性在亲子关系与青少年手机依赖之间起部分中介作用；（3）亲子关系对青少年手机依赖的直接作用、个人成长主动性的中介作用均受到同伴关系的调节，且相对于同伴关系水平低的个体，亲子关系对手机依赖、亲子关系对个人成长主动性以及个人成长主动性对手机依赖的作用都在同伴关系水平高的个体中更强。本研究有利于揭示亲子关系是如何影响青少年手机依赖的，以及在何种条件下对青少年手机依赖的影响更强/更弱，对移动互联网时代预防青少年手机依赖有一定启示意义。

关键词 亲子关系，个人成长主动性，同伴关系，手机依赖

Parent-child relationship and smartphone dependence among Chinese adolescents: The Mediating Role of personal growth initiative and the Moderating Role of peer relationship

JIANG Yiru, ZHU Chengwei, QUAN Xi, ZHANG Cai

Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

Abstract: In China, the use of smartphones is becoming more and more common among adolescents. Smartphones have brought learning resources and opportunities to adolescents, but also easily induced adolescents' excessive use of them, leading to the generation of smartphone dependence, which has a negative impact on the physical and mental health of adolescents. Among the many factors that affect smartphone dependence, family factors are particularly important. Among them, family relationships, especially parent-child relationship, are one of the most important factors affecting smartphone dependence. Although many prior studies have provided ample evidence of the negative effects of poor parent-child relationship on adolescents' smartphone dependence, little research exists that comprehensively examines the influence of family, individual, and school factors on adolescents' smartphone dependence. In order to expand the content of existing research, the present study constructed a moderated mediation model to test the mediating role of individual factors (e.g., personal growth initiative) and the moderating role of school factors (e.g., peer relationship) in the connection between family factors (e.g., parent-child relationship) and smartphone dependence among Chinese adolescents. A sample of 3355 high school students who come from Qingdao, China, an economically developed coastal city completed a battery of self-report questionnaires measuring their parent-child relationship, smartphone dependence, personal growth initiative and peer relationship. The results are as follows. (1) After controlling for gender and time spent online per day, parent-child relationship have a negative direct effect on smartphone dependence. (2) The negative association between parent-child relationship and smartphone dependence is mediated by the personal growth initiative. (3) The effect of parent-child relationship on smartphone dependence, the effect of parent-child relationship on personal growth initiative, and the effect of personal growth initiative on smartphone dependence were all moderated by peer relationship and were stronger in adolescents with a high level of peer relationship. The present study highlights the mediating role of personal growth initiative and the moderating role of peer relationship in the effect of parent-child relationship on smartphone dependence. This study also contributes to a better understanding of the effects, paths, and conditions of parent-child relationship on the smartphone dependence of adolescents and provides constructive suggestions for preventing adolescents' smartphone dependence in the mobile Internet era.

Keywords: parent-child relationship, personal growth initiative, peer relationship, smartphone dependence

3 武汉商学院马克思主义学院, 湖北, 430056

摘要 随着网络的普及, 欺负出现了新的形式: 网络受欺负和网络欺负, 并且引起了研究者的广泛关注。网络欺负是由个人或团体带有攻击性、蓄意地通过信息与通信技术实施的攻击行为, 会导致权力失衡, 这种行为会重复发生, 在该过程中受害者难以保护自己。网络受欺负是个体或团体在网络欺负中受到攻击的行为, 可以被认为是一种有压力的生活事件。网络受欺负对网络欺负有显著的预测作用, 同时是促使个体产生压力感的重大因素。个体在面临压力事件时, 通常会对消极事件进行自发性的反复思考, 即反刍, 同时会促使个体采取消极的应对措施(如网络欺负)来释放压力。目的: 本研究拟构建模型, 探讨压力感和反刍在网络受欺负与网络欺负之间所起的链式中介作用。方法: 采用方便抽样, 使用了《网络受欺负量表》、《网络欺负量表》、《压力感量表》和《反刍思维量表》4个量表对来自两所大学共 890 名被试进行了施测。结果发现: (1) 网络受欺负和网络欺负在性别和家庭来源上存在显著差异, 其中男性的网络受欺负与网络欺负程度均高于女生, 来源于城市的大学生更容易遭受网络欺负且更容易有网络欺负行为; (2) 网络受欺负、压力感、反刍思维及网络欺负之间均存在显著的相关, 网络受欺负对网络欺负有显著的预测作用; (3) 反刍思维在网络受欺负与网络欺负之间起部分中介作用; (4) 压力感与反刍思维在网络受欺负与网络欺负之间起链式中介作用。结论: 压力感与反刍思维在网络受欺负与网络欺负之间起链式中介作用。由于网络欺负发生在虚拟空间, 被欺负的个体难以找到欺负的源头和对象, 导致欺负行为无法得到及时制止, 由此对被欺负者所造成了一系列压力, 如果不能使用合理的方式来纾解压力, 可能会促使被欺负者用“以牙还牙”的方式去欺负其他人, 造成了被欺负者去欺负他人的连锁反应。

The Relationship Between Cyber Victimization and Cyberbullying: The Chain Mediating Effect of Stress and Rumination

Luo Qing, Tian Yuan, Huang Lu

School of Public Administration, Nanchang University, Jiangxi;

School of Psychology, Central China Normal University, Hubei;

School of Marxism, Wuhan Business University, Hubei

Abstract: With the popularity of Internet, new forms of bullying have emerged: cyberbullying and cyber victimization. Cyberbullying refers to aggressive, deliberate attacks committed by individuals or groups through information and communication technologies that lead to power imbalances, which can be repeated, and in which victims have difficulty protecting themselves. Cyber victimization refers to the act of an individual or group being attacked in cyberbullying and can be considered as a stressful life event. Cyberbullying had a significantly predicted effect on Cyber victimization, as well as was a significantly factor contributing to individuals' feelings of stress. When faced with a stressful event, individuals usually engage in spontaneous recurrent thinking about the negative event, i.e., rumination, and are prompted to adopt negative coping measures (e.g., cyberbullying) to release the stress. Aim: This study proposes to construct a model to explore the chain mediating effect of stress and rumination in the

relationship between cyber victimization and cyberbullying. Method: The questionnaire survey was carried out on 445 college students from two universities with convenient sampling by using the questionnaires of Cyber Victimization questionnaire, Cyberbullying questionnaire, Perception of Stress Scale, and Rumination questionnaire. Results: (1) There were significant differences in cyberbullying and cyberbullying in terms of gender and family origin, with males having higher levels of cyber victimization and cyberbullying than females, and college students from urban areas being more vulnerable to cyber victimization and more likely to engage in cyberbullying behaviors; (2) There was a significant correlation between cyber victimization, stress, rumination and cyberbullying, and cyber victimization was a significant predictor of cyberbullying; (3) Rumination partially mediated the relationship between cyber victimization and cyberbullying; (4) Stress and rumination played a chain mediating effect between cyber victimization and cyberbullying. Conclusion: Stress and rumination played a chain mediating effect between cyber victimization and cyberbullying. Because cyberbullying occurs in virtual space, it is difficult for the bullied individual to find the source and target of the bullying, which makes it impossible to stop the bullying behavior in time. If failure to use reasonable ways to relieve stress, may encourage the cyber victimization to bully others in an "eye for an eye" manner, creating a chain reaction of the bullied bullying others.

Keywords: Cyberbullying, Cyber Victimization, Stress, Rumination

粗暴养育与网络成瘾： 情绪调节困难与非适应性认知的序列中介作用

王欢 姜媛（通讯作者）

北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘 要 互联网技术的普及极大便利人们的同时，也带来了网络成瘾的负面影响。网络成瘾指个体过度沉迷网络，且因无法控制这种行为造成其出现健康问题、社会适应问题和学业成绩下降等。由于青少年时期是个体身心发展的关键阶段，研究者重点关注导致学生群体网络成瘾的影响因素及其内在机制，以期进行针对性预防和干预工作。尽管已有研究关注家庭和个体因素对学生网络成瘾的影响，但聚焦于特定教养方式对网络成瘾影响机制的研究尚不充分，且涉及个体的情绪和认知因素的内在机制仍未明确。根据病理性网络使用的认知-行为模型(Pathological Internet Use, PIU)与自我情绪调节模型，本研究旨在探究情绪因素（情绪调节困难）与认知因素（非适应性认知）在粗暴养育与网络成瘾关系中的作用。采用问卷法对 927 名中学生进行施测，以了解其粗暴养育经历、情绪调节困难、非适应性认知、网络成瘾的情况。采用 SPSS 22.0 进行数据统计与分析。结果发现：（1）各量表的信效度良好，本研究不存在严重的共同方法偏差；（2）相关分析表明，粗暴养育、情绪调节困难、非适应性认知和网络成瘾两两呈正相关；（3）中介效应检验显示，情绪调节困难和非适应性认知在粗暴养育对网络成瘾的影响中起中介作用，且该中介作用包含三条中介路径：情绪调节困难的单独中介作用、非适应性认知的单独中介作用、情绪调节困难和非适应性认知的序列中介作用。因此，粗暴养育不仅能直接影响中学生的网络成瘾，还能通过情绪调节困难和非适应性认知的单独中介作用及序列中介作用间接影响其网络成瘾。本研究结果进一步拓展了病理性网络使用的认知-行为模型模型的内部机制，验证了以往有关环境因素通过情绪和认知因素共同影响网络成瘾的假设，有助于家庭和学校开展中学生网络成瘾的预防和干预工作。

Harsh Parenting and Internet Addiction: The Chain Mediating Effect of Difficulties in Emotional Regulation and Maladaptive Cognitive

WANG Huan, JIANG Yuan(corresponding author)

School of Psychology, Beijing Sport University, Beijing 100084, jiangyuan97@sina.cn

Abstract: The popularity of Internet technology greatly facilitates people, but also brings the negative impact of Internet addiction. Internet addiction refers to excessive Internet addiction, which leads to health problems, social

adaptation problems and academic performance decline. As adolescence is the key stage of individual physical and mental development, researchers focus on the influencing factors and internal mechanism of students' Internet addiction, in order to carry out targeted prevention and intervention. Although previous studies have focused on the influence of both family factors and individual factors on Internet addiction, the research which focusing on the influence mechanism of specific parenting style on Internet addiction is still not enough, and the internal mechanism involving individual emotional and cognitive factors is still unclear. According to the pathological internet use (PIU) and self emotion regulation model, this paper aims to explore the role of emotional factors (difficulties in emotional regulation) and cognitive factors (maladaptive cognitive) in the relationship between harsh parenting and Internet addiction. 927 adolescents were tested by four questionnaires to understand their harsh parenting experience, difficulties in emotional regulation, maladaptive cognitive and Internet addiction. SPSS 22.0 was used for data statistics and analysis. The results showed that: (1) All questionnaires have adequate reliability and validity, and there was no seriously common method biases. (2) The association between harsh parenting and Internet addiction coincided with the PIU. That was to say, harsh parenting experience would lead to high levels of Internet addiction in adolescents. (3) The analyses of the underlying mechanisms showed that difficulties in emotional regulation and maladaptive cognitive played multiple mediating roles in the influence of harsh parenting on Internet addiction. Specifically, harsh parenting can influence Internet addiction through the simple mediating effects of difficulties in emotional regulation, maladaptive cognitive, and through the chain-mediating role of difficulties in emotional regulation and maladaptive cognitive. In conclusion, the results of the study further expand the internal mechanism of the cognitive behavioral model of PIU, verify the previous hypothesis that environmental factors affect Internet addiction through emotional and cognitive factors, and help families and schools to carry out the prevention and intervention of Internet addiction among adolescents.

移动社交媒体使用对情绪图片注意偏向的影响： 社会比较方向的中介作用

陈火红^{1,2} 马婧^{1,2} 周志豪^{1,2} 史滋福^{1,2} (通讯作者)

1 湖南师范大学教育科学学院心理系, 长沙, 410081

2 湖南省认知与人类行为重点实验室, 长沙, 410081, shizf@hunnu.edu.cn

摘 要 目的: 通过探讨不同类型移动社交媒体使用对不同效价情绪图片注意偏向的影响以及社会比较方向在二者关系之间的中介作用, 进而揭示移动社交媒体使用者情绪图片注意偏向的表现模式特点及其影响机制。

方法: 本研究共包含两个实验。正式实验开始前, 均先通过填写问题性移动社交媒体使用量表筛选被试, 后根据量表得分, 实验 1 和实验 2 分别选取了 89 名被试 (问题性使用组: 41 人, 正常使用组: 48 人)、90 名被试 (问题性使用组: 45 人, 正常使用组: 45 人)。用点探测范式测量注意偏向; 用社会比较量表测量社会比较方向。**结果:** (1) 重复测量方差分析结果显示, 配对情绪图片类型的主效应不显著, 而被试分组的主效应、配对情绪图片类型与被试分组的交互作用均显著; (2) 简单效应分析结果显示, 问题性使用组被试对负性情绪图片存在更高的注意偏向得分, 而正常使用组被试对正性情绪图片存在更高的注意偏向得分; (3) 中介作用分析结果显示, 下行社会比较在问题性移动社交媒体使用和负性情绪图片注意偏向之间的关系中起部分中介作用, 而在正常移动社交媒体使用和正性情绪图片注意偏向之间起完全中介作用。上行社会比较在二者之间的中介作用均不显著。**结论:** 本研究结果表明, 问题性使用者倾向于对负性情绪图片投入更多的认知资源, 而正常使用者则倾向于更关注正性情绪图片。下行社会比较为移动社交媒体使用者情绪图片注意偏向产生的中间机制。因此, 未来研究一方面可结合眼动技术进一步对情绪图片注意偏向的成分进行探讨。另一方面可通过正性注意偏向训练来改善问题性移动社交媒体使用者的情绪状态, 通过引导其适中地下行社会比较来促进其情绪健康。

The impact of mobile social media use on emotional picture attention bias: The mediating effect of social comparison direction

Huohong Chen^{1,2}, Jing Ma^{1,2}, Zhihao Zhou^{1,2}, Zifu Shi^{1,2} (corresponding author)

1 Department of psychology, College of Educational Sciences, Hunan Normal University, Changsha, 410081.

2 Hunan Key Laboratory of cognition and human behavior, Changsha, 410081, shizf@hunnu.edu.cn

Abstract: **Objective:** By exploring the impact of different types of mobile social media use on different valence emotional picture attention bias and the mediating effect of social comparison direction in the relationship between them, this paper reveals the performance mode characteristics and influence mechanism of emotional picture attention bias of mobile social media users. **Methods:** This study included two experiments. Before the formal experiment, subjects were screened by filling in the problematic mobile social media use scale. Then, according to the score of the scale, 89 subjects (problematic use group: 41 people, normal use group: 48 people) and 90 subjects (problematic use group: 45 people, normal use group: 45 people) were selected in experiment 1 and experiment 2 respectively. Attention bias was measured by point detection paradigm; The direction of social comparison was measured by social comparison scale. **Results:** (1) the results of repeated measurement analysis of variance showed that the main effect of paired emotional picture types was not significant, but the main effect of subject groups and the interaction between paired emotional picture types and subject groups were significant; (2) The results of simple effect analysis showed that subjects in the problematic use group had higher attention bias scores on negative emotion pictures, while subjects in the normal use group had higher attention bias scores on positive emotion pictures; (3) The mediation analysis results show that downward social comparison plays a partial mediating role in the relationship between problematic mobile social media use and negative emotional picture attention bias, while it plays a complete mediating role between normal mobile social media use and positive emotional picture attention bias. The mediating effect of upward social comparison between the two is not significant. **Conclusion:** the results of this study show that problematic users tend to invest more cognitive resources in negative emotional pictures, while normal users tend to pay more attention to positive emotional pictures. Downward social comparison is the intermediate mechanism of mobile social media users' emotional picture attention bias. Therefore, on the one hand, future research can further explore the components of attention bias in emotional pictures in combination with eye movement technology. On the other hand, we can improve the emotional state of problematic mobile social media users through positive attention bias training, and promote their emotional health by guiding them to make moderate social comparison.

Keywords: mobile social media use, emotional pictures, attention bias, social comparison direction

不同情绪信息对游戏成瘾者反应抑制的影响及其神经机制

陈雨舟 余虹伶 高雪梅 (通讯作者)

西南大学心理学部, 重庆, 400715, zhenggao@swu.edu.cn

摘要 游戏成瘾是对于游戏行为缺乏控制并导致功能损害的成瘾行为, 成瘾者通常具有高冲动性的特质, 表现为较弱的反应抑制能力。在情绪信息加工上, 游戏成瘾者拥有更多的负性情绪和较弱的情绪调节能力, 并且更加偏向负性刺激。已有大量研究证实游戏成瘾者的反应抑制能力受损, 然而其成因及影响因素仍是未解之谜。因此, 本研究基于情绪认知交互作用的理论, 采用 Go/Nogo 范式与事件相关电位技术 (ERP), 探究不同类型的情绪信息对游戏成瘾者反应抑制的影响。研究将情绪信息分为加工水平 (内隐和外显) 和情绪效价 (正性和负性) 两个部分, 采用 2 (加工水平: 内隐、外显) × 2 (情绪效价: 正性、负性) × 2 (组别: 游戏成瘾组、控制组) 的混合实验设计。实验过程中记录被试脑电波的变化, 以 Nogo-N2 和 Nogo-P3 的平均波幅作为测量反应抑制的指标。结果显示: (1) 游戏成瘾组的 Nogo 正确率: 内隐任务显著小于外显任务, 愤怒面孔显著小于开心面孔下; (2) 在内隐任务中, 游戏成瘾组的 Nogo-N2 波幅显著小于控制组, Nogo-P3 波幅显著大于控制组; 外显任务中两组的 Nogo-N2 和 Nogo-P3 波幅差异不显著。以上结果表明, 游戏成瘾者

的反应抑制能力受到情绪加工水平和情绪效价的影响,在内隐和负性情绪信息下的反应抑制能力减弱,表现为行为抑制失败、冲突控制减弱,以及需要付出更多的认知资源和意志努力来完成反应抑制。这一结果从情绪认知交互作用的角度,为游戏成瘾者反应抑制能力受损的问题提供了证据,并为游戏成瘾的干预提供了更加具体的线索。

Influences of Different Emotional Information on Response Inhibition in Gaming Disorder and Its Neural Mechanism

Chen Yuzhou, Yu Hongling, Gao Xuemei (Corresponding Author)

Faculty of Psychology, Southwest University, Chongqing, 400715

Abstract: Gaming disorder (GD) is an addictive behavior which lacks control over gaming behaviors and leads to functional impairment. Individuals with GD usually have high impulsivity characteristics, manifested by weak response inhibition ability. In terms of emotional information processing, individuals with GD have more negative emotions, weaker emotional regulation ability and attentional bias towards negative stimuli. A large number of studies have found that Individuals with GD have impaired response inhibition, but its causes and influencing factors are still an unsolved mystery. Therefore, based on the theory of emotion and cognitive interaction, this study adopted event-related potential (ERP) technology to explore the response inhibition ability of individuals with GD under different emotional information through the Go/Nogo task. In this study, emotional information was divided into two aspects: processing level (implicit or explicit) and valence (happy or angry). The design was a 2 (groups: gaming disorder group versus control group) $\times$ 2 (processing levels: implicit versus explicit) $\times$ 2 (valences: happy versus angry) mixed design. The electroencephalograms of participants were recorded during the experiment and average amplitudes of Nogo-N2 and Nogo-P3 were used as indicators for measuring response inhibition. The results indicated that: (1) Nogo accuracy in GD group: implicit task was significantly lower than explicit task; angry faces was significantly lower than happy faces. (2) In implicit task, the amplitudes of Nogo-N2 in the GD group were significantly smaller than those in the control group; the amplitudes of Nogo-P3 were significantly larger than those in the control group, the changes of Nogo-N2 and Nogo-P3 were not significant in the explicit task. The findings showed that the response inhibition of individuals with GD is regulated by the level of emotional processing and emotional valence. Under the condition of implicit and negative emotional information, the response inhibition ability of individuals with GD is weakened. This effect is manifested as failure of behavior inhibition and weakened conflict control, resulting in more cognitive resources and volitional efforts required to complete response suppression. This study provided evidence for impaired response inhibition of GD from the perspective of interaction between emotion and cognition, and provided more detailed clues for the intervention of GD.

网络使用对青少年抑郁症状的影响： 认知专注和网络警觉的链式中介作用

吴佳荫 高小也 刘勤学（通讯作者）

华中师范大学心理学院, 武汉, 430079, qinxueliu@mail.ccnu.edu.cn

摘 要 青少年时期是个体生理和心理发展的重要时期,也是抑郁症状的高发阶段。尽管前人基于不同角度对青少年抑郁的前因变量展开了研究,但对于“数字土著”一代而言,其网络使用行为与抑郁症状的关系仍值得进一步探索。初中生身心尚未成熟,其大量的网络使用可能会对其认知变化和倾向产生影响。一方面,研究表明大量的网络使用可能会强化个体与网络的认知联结,促进深度参与;另一方面,网络已经渗透到人们生活的方方面面,个体大量的网络使用行为可能会使其进一步表现出对网络相关信息的持续关注。以上过程均可能会干扰青少年正常的学习和生活,增大抑郁风险。因此,本研究构造了一个链式中介模型,旨在考察网络使用对青少年抑郁症状的影响,以及认知专注和网络警觉的作用机制。本研究采用网络使用行为问卷、

认知专注量表、网络警觉量表和抑郁症状问卷，对湖北省两所中学共 1528 名初中生（男生 50.3%， $M_{age}=12.84\pm0.72$ ）进行了为期两年的纵向调查。本研究采用自我报告法，在 T1 时收集被试的网络使用情况，间隔 1 年（即 T2）后要求被试完成认知专注量表、网络警觉量表和抑郁症状问卷。结果表明：（1）T1 网络使用行为与 T2 认知专注、T2 网络警觉和 T2 抑郁症状存在显著的两两相关。（2）T1 时初中生的网络使用行为能够正向预测其 T2 时的抑郁症状。（3）T2 认知专注和 T2 网络警觉在网络使用对青少年抑郁症状的影响中发挥着链式中介作用。本研究从认知层面揭示了青少年网络使用行为对其抑郁症状的潜在机制，启示人们应合理监管青少年的网络使用，减少抑郁症状。

The Effect of Internet use on Adolescents' Depressive Symptoms: The Mediating Role of Cognitive Absorption and Online Vigilance

Jiayin Wu, Xiaoye Gao, Qinxue Liu

School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: Adolescence is not only an important period for physiological and psychological development but also the main stage of depressive symptoms. Although previous researchers have studied the antecedents of adolescent depression from different perspectives, however, for the “digital native” generation, the relationship between adolescents' Internet use behavior and depressive symptoms deserves further exploration. Junior middle school students are physically and mentally immature. Their extensive Internet use may have an impact on their cognition and behavior. On the one hand, research indicated that excessive Internet use may strengthen the cognitive connection between individuals and the Internet, and promote adolescents' deep involvement. On the other hand, Internet has penetrated various aspects of people's life. A large number of Internet use behaviors may further make adolescents show continuous attention to Internet-related information. The above processes could interfere with adolescents' study and life, and further increase the risk of depression. Therefore, this study constructed a multiple mediation model to investigate the effect of Internet use on adolescents' depressive symptoms and explore the roles of cognitive absorption and online vigilance. The current study used the Internet use questionnaire, cognitive absorption scale, online vigilance scale, and depressive symptoms questionnaire. This two-year longitudinal study investigated 1528 junior middle school students (male 50.3%, $m_{age} = 12.84 \pm 0.72$) from two schools in Hubei Province. In this study, the self-report method was used to collect data about participants' Internet use at Time1 (T1). One year later (i.e., Time2, T2), participants need to complete the cognitive absorption scale, online vigilance scale, and depressive symptom questionnaire. The results showed that: (1) Internet use behavior at T1 was significantly correlated with cognitive absorption at T2, online vigilance at T2, and depressive symptoms at T2. (2) Adolescents' Internet use at T1 could positively predict their depressive symptoms at T2. (3) Cognitive absorption at T2 and online vigilance at T2 played the mediating role in the effect of Internet use on adolescents' depressive symptoms. This study reveals the potential mechanism of adolescents' Internet use behavior on their depressive symptoms from the aspect of cognition, and further enlightens people to appropriately manage adolescents' Internet use to reduce depressive symptoms.

Keywords: Internet use, depressive symptoms, cognitive absorption, online vigilance

大学生网络表情符号使用对在线交流效果的影响

鲁星求¹ 仲文静¹ 岳竹英¹ 王伟军¹ (通讯作者)

¹ 华中师范大学心理学系, 武汉, 430000, wangwj@mail.ccnu.edu.cn

摘要 近年来, 线上交流已经成为研究者关注的话题之一, 作为线上交流中的辅助工具, 网络表情符号已被人们广泛接受和认可, 有研究发现, 网络表情符号能够有效弥补线上交流中缺乏非语言线索这一缺陷, 并能有助于个体准确理解信息, 在一定程度上对在线交流效果具有积极影响。目前的研究对于网络表情符号这一具体的网络使用行为对在线交流效果的影响研究相对较少。本研究结合问卷调查和线上实验法, 在了解大学生网络表情符号使用特点的基础上, 关注网络表情符号具体使用对在线交流效果的影响。研究一: 自编《大学生网络表情符号使用情况调查问卷》调查了 334 名大学生在社交平台中网络表情符号的使用情况, 结果发现, 微信是使用频率最高的社交工具; 以使用图片类表情为主; 聊天对象和聊天主题均会对个体的表情符号使用产生影响; 个体更习惯将表情符号置于句子的末尾。基于研究一的结果制作后续研究实验材料。研究二: 采用 2 (主题: 社交、任务) × 3 (强度: 高、中、低) 组内实验设计考察 43 名大学生在社交主题和任务主题下不同表情符号强度对在线交流效果的影响, 结果发现, 使用中等强度表情符号的在线交流效果最好; 相比于任务主题, 社交主题下网络表情符号使用对在线交流效果的影响更显著。研究三: 采用 2 (主题: 社交、任务) × 3 (类型: 纯文字、文字+图释、纯图释) 组内实验设计考察 39 名大学生在社交主题和任务主题下不同表情符号类型对在线交流效果的影响, 结果发现, 使用文字+图释的表情符号和使用纯图释表情符号的在线交流效果比纯文字的表情符号的在线交流效果更好。研究四: 将文本+图释的表情符号根据非语言信息和语言信息的不同互动性质细分为加强型表情符号、否认型表情符号以及取代型表情符号, 采用 2 (主题: 社交、任务) × 3 (互动性质: 加强、取代、否认) 组内实验设计考察 42 名大学生网络表情符号内部信息的不同互动性质对在线交流效果的影响, 结果发现, 使用加强型网络表情符号能够积极影响在线交流效果。

The influence of college students' emoticons usage on the online communication effect

Lu Xingqiu¹, Zhong Wenjing¹, Yue Zhuying¹, Wang Weijun¹

¹ Central China Normal University, Wuhan, 430000, China

Abstract: In recent years, online communication has become one of the topics that researchers pay attention to. As an indispensable part of online communication, online emoticons have been widely accepted and recognized by people. Related research has found that online emoticons can effectively compensate for the lack of non-verbal clues in online communication, and can help individuals understand information accurately, and can achieve good online communication effect. In the current stage of research, there is relatively little research on the influence of the specific internet use behavior of emoticons on the effect of online communication (the OC effect). Therefore, this study uses a combination of questionnaires and online behavioral experiments to understand the characteristics of college students' use of emoticons, and investigate the influence of the specific emoticon usage on the OC effect. Study 1: The questionnaire method was used to get a preliminary understanding of college students' online emoticons usage on social platforms among 334 college students. The results showed that WeChat is the social tool most frequently used by college students; college students mainly use picture facial expressions; both the chat object and the chat topic will affect the individual's use of emoticons; individuals are more accustomed to placing emoticons at the end of sentences. Based on the results of study 1, make experimental materials for follow-up research. Study 2: Adopt 2 (theme: social, task) × 3 (intensity: high, medium, low) behavioral experimental design to investigate the influence of the intensity of emoticons usage on the OC effect under social or task theme among 43 college students.

The results showed that the effect of online communication is the best when using medium-strength emoticons. Compared with task-theme, the OC effect is better with the intensity of online emoticon usage under social-theme than that under task-theme. Study 3: Adopt 2 (theme: social, task) $\times$ 3 (type: text, text + sticker, sticker) behavioral experimental design to investigate the influence of the type of emoticons usage on the OC effect under social or task theme among 39 college students. The results showed that the type of online emoticons usage can significantly affect the OC effect. The OC effect of text + sticker and sticker emoticons was better than that of high-purity text emoticons. Study 4: it further subdivided the text + sticker emoticons into enhanced emoticons, denial emoticons, and replacement emoticons according to the different interactive nature of non-verbal information and language information. In this study, adopt 2 (theme: social, task) $\times$ 3 (interactive nature: enhanced, denial, substitution) behavioral experimental design to investigate the influence of different interactive nature of internal information of the network emoticons on the OC effect among 42 college students. The results showed that using enhanced emoticons has the best OC effect.

Keywords: Emoticons, chat theme, intensity, types, Online communication effect

同伴性话题沟通对网络色情偏差行为的影响： 羞耻感和性感觉寻求的链式中介作用

张璐 (通讯作者) 郭思毅

四川师范大学大学心理学院, 成都, 610066, 1821553318@qq.com

摘要 随着网络技术的持续发展, 互联网让生活更加丰富与便利, 但同时网络的隐匿性与便捷性使偏差行为容易在网络社会中发生, 网络色情偏差行为是指在互联网上进行与性有关的活动, 具体包括色情聊天、浏览色情图文、观看色情录像以及进行网络虚拟性爱等方式。研究表明大学生在网络上与同伴或者与现实中同性同伴进行性话题的沟通对其性适应中的社会适应和性控制力会造成负面影响; 当与同伴进行性话题的沟通时, 个体会产生对自我的省察, 而对性话题内容的兴趣以及对社会规范的逃避会使个体产出负性的自我评价, 随之而来的则是强烈的羞耻感。羞耻感常常引发个体出现言语、身体攻击等偏差行为, 高羞耻感体验使个体更容易进入不能冷静的应激状态; 性感觉寻求作为一种人格特质, 对个体的日常行为会产生影响, 高性感觉寻求的个体更容易被奇异、变化的活动吸引, 可能有更多的危险性行为。本研究为探讨同伴性话题沟通对网络色情偏差行为的影响机制, 以及羞耻感和性感觉寻求在二者关系中的作用机制, 采用同伴性话题沟通频率量表、羞耻体验量表、性感觉寻求量表、青少年网络偏差行为量表对 781 名大学生进行测试。结果表明: (1) 同伴性话题沟通、羞耻感、性感觉寻求及网络色情偏差行为水平彼此之间显著正相关。(2) 同伴性话题沟通可以显著预测大学生网络色情偏差行为水平。(3) 同伴性话题沟通通过羞耻感和性感觉寻求的链式中介作用预测大学生网络色情偏差行为水平。研究结果启示, 要引导大学生进行健康的同伴性话题沟通; 从减少网络色情偏差行为产生的角度, 为教育者们的性健康教育提供一些思考, 如何减少大学生与同伴间不健康的性话题沟通, 减少羞耻感体验, 控制寻求性方面的新奇体验, 从而使大学生网络色情偏差行为有所减少, 值得未来研究者的关注。

Influence of Peer Sex Topic Communication on Deviant Behavior of Internet Pornography: The Chain Mediating Role of Shame and Sexual Sensation Seeking

ZHANG LU, GUO SIYI

School of Psychology, Sichuan Normal University, chengdu

Abstract: With the continuous development of network technology, the Internet makes life richer and more convenient, but at the same time, the concealment and convenience of the Internet make deviant behavior easy to occur in the network society. Internet pornographic deviant behavior refers to sex-related activities on the Internet,

including pornographic chatting, browsing pornographic pictures and texts, watching pornographic videos and having virtual sex on the Internet. Studies have shown that college students' communication on sexual topics with their peers on the Internet or with their peers of the same sex in reality will have a negative impact on their social adaptation and sexual control in sexual adaptation; When communicating with peers on sexual topics, individuals will have self-examination, while interest in sexual topics and evasion of social norms will lead to negative self-evaluation, followed by a strong sense of shame. Shame often leads to deviant behaviors such as speech and physical attack, and high shame experience makes it easier for individuals to enter a stress state that can not be calm; As a personality trait, sexual sensation seeking will have an impact on individual's daily behavior. Individuals seeking high sexual sensation are more likely to be attracted by strange and changing activities, and may have more dangerous behaviors. In order to explore the mechanism of influence of peer-to-peer topic communication on the behavior of internet pornography bias, and the mechanism of shame and sexual feeling seeking to play a role in the relationship between the two, 781 college students were tested by using peer-to-peer topic communication frequency scale, shame experience scale, sexual feeling seeking scale and adolescent network bias behavior scale. The results show that: (1) Peer sexual topic communication, shame, sexual sensation seeking and online pornography deviation behavior level are significantly positively correlated with each other. (2) Peer-to-peer topic communication can significantly predict college students' deviant behavior level of online pornography. (3) Peer-to-peer topic communication predicts college students' deviant behavior level of online pornography through the chain mediation of shame and sexual sensation seeking. The results of the study suggest that college students should be guided to communicate on healthy peer topics. From the perspective of reducing the deviation behavior of online pornography, this paper provides some thoughts for educators' sexual health education, and how to reduce unhealthy sexual topic communication between college students and peers, reduce shame experience and control novelty experience in seeking sex, so as to reduce the deviation behavior of online pornography of college students, which deserves the attention of future researchers.

Keywords: Communication on peer sex topics, Deviant behavior of Internet pornography, The sense of shame, Sexual sensation seeking

儿童青少年问题性手机使用症状的动态网络视角：三年追踪研究

黄顺森¹ 来泉雄¹ 黎亚军² 代欣然¹ 王耘¹ (通讯作者)

1 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, wangyun@bnu.edu.cn

2 光明区教育科学研究院, 深圳, 518107

摘要 背景: 近两年大量的纵向研究和元分析表明, 儿童青少年问题性手机使用会影响其心理健康、学业水平、睡眠质量及生活质量。基础和临床研究者基于传统的干预视角, 提供了一些治疗建议和干预方案。但近年来, 随着精神疾病网络理论和相应的网络分析方法的发展, 一些研究者开始从网络视角探索儿童青少年问题性手机使用症状之间的关系, 并提出对网络中重要核心症状进行干预将更加有利于促进儿童青少年问题性手机使用的治疗。尽管以往研究基于网络视角提出了儿童青少年问题性手机使用的核心症状, 但是均基于横断数据, 难以得出因果推论。此外, 横断数据下的网络视角通常无法区分被试间和被试内变异, 难以做出正确的统计推论。方法: 为此, 本研究对 3,377 名儿童青少年 (Male = 1735, $M_{age} = 12.27 \pm 2.27$) 进行三年追踪研究, 使用图形向量自回归模型 (GVAR) 对数据进行网络模型拟合, 以探索问题性手机使用症状 (教育/关系损害、戒断反应、沉迷、注意偏差、情绪缓解、失控、失去兴趣、陷入循环) 的被试内时间变化网络、被试内同时性网络和被试间网络, 并计算各个网络的中心性。结果: 时间变化网络中, 陷入循环可以预测下一年的其余 7 个症状 ($\beta = 0.04$ to $0.16, p < 0.05$), 自我控制可以预测下一年的教育/关系损害 ($\beta = 0.04, p < 0.05$) 和陷入循环 ($\beta = 0.04, p < 0.05$), 其余症状不存在相互预测效应; 同时性网络中, 各个症状之间连接紧密, 存在正向的相关关系 (partial $r = 0.05$ to $0.29, p < 0.05$), 核心症状是陷入循环和失控; 被试间网络中, 网络整体十分稀疏, 教育/关系损害与戒断反应存在较高的负相关 (partial $r = -0.42, p < 0.05$)。结论和讨论: 儿童青少年问题性手机使用的核心症状是陷入循环和自我控制, 未来的干预手段中融入对陷入循环和自我控制能力的干预, 或许更能够更加有效。但是, 被试间教育/社会关系损害与戒断反应的负向关系进一步证实中小手机管理

政策及家庭教育对学生手机使用的干预或许有利于减少学生手机使用的沉迷性，这为相关政策制定提供了潜在的科学基础。另外，被试间稀疏的网络表明问题性手机使用的个体差异较大，未来干预治疗应该更加注重制定个性化的干预方案。

Dynamic network of problematic smartphone use symptoms in children and adolescents: A three years cohort study

Shunsen Huang, Xiaoxiong Lai, Yajun Li, Xinran Dai, Yun Wang (Corresponding author)

¹ State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, China.

² Guangming Institute of Education Sciences, Shenzhen, Guangdong, China.

Abstract: BACKGROUND: A large number of longitudinal studies and meta-analyses in the last two years have shown that problematic smartphone use in children and adolescents affects their mental health, academic performance, sleep quality and quality of life. Basic and clinical researchers have provided a number of treatment recommendations and intervention programmes based on traditional intervention perspectives. In recent years, however, with the development of network theories of mental illness and corresponding network analysis methods, some researchers have begun to explore the relationship between symptoms of problematic smartphone use in children and adolescents from a network perspective, and suggest that interventions that address the core symptoms of problematic smartphone use in the network would be more beneficial in promoting the treatment of problematic smartphone use in children and adolescents. Although previous studies have suggested core symptoms of problematic smartphone use in children and adolescents based on a network perspective, they are based on cross-sectional data, making it difficult to draw causal inferences. In addition, the network perspective with cross-sectional data often fails to distinguish between and within-subject effect, making it difficult to make correct statistical inferences. METHODS: To this end, this study followed 3,377 children and adolescents (Male = 1735, $M_{age} = 12.27 \pm 2.27$) for three years and fitted network models to the data using a graphical vector-autoregressive model (GVAR) to explore the relationships between problematic smartphone use symptoms (educational/relationship impairment, withdrawal, preoccupation, distraction, emotional alleviation, loss of control, loss of interests, caught in the loop) in the within-subject temporal network, within-subject contemporaneous network and between-subject network. Besides, the centrality of each network was calculated. RESULTS: In the temporal network, caught in the loop (lag-n-1) predicted the remaining seven (lag-n) symptoms in the next year ($\beta = -0.04$ to 0.17 , $p < 0.05$), loss of control predicted the next year caught in the loop ($\beta = 0.04$, $p < 0.05$) and educational/relationship impairment ($\beta = 0.04$, $p < 0.05$), and no reciprocal predictive effect existed for the remaining symptoms; in the contemporaneous network, symptoms were strongly and positively correlated (partial $r = 0.05$ to 0.29 , $p < 0.05$), with the core symptom remaining Caught in the loop; for the between-subjects network, the whole network was very sparse, with a high negative correlation between educational/relational impairment and withdrawal (partial $r = -0.42$, $p < 0.05$). CONCLUSIONS AND DISCUSSION: The core symptom of problematic smartphone use in children and adolescents is caught in the loop, and future interventions that incorporate interventions for caught in the loop and loss of control may be more effective. However, the negative relationship between educational/social relationship impairment and withdrawal in between-subject network further confirms that smartphone management policies for students and family education interventions on students' smartphone use may be beneficial in reducing the addictive nature of students' smartphone use, which provides a potential scientific basis for relevant policies. In addition, the sparse between-subject network suggests that there may exist dramatic individual differences in PSU and future intervention should focus more on developing personal intervention program.

异性拒绝与大学生网络色情偏差行为： 一个有调节的中介模型

郭思毅(通讯作者) 张璐

四川师范大学大学心理学院，成都，610066，1875255424@qq.com

摘要 随着科技的进步和互联网的不断发展，网络已经在人们日常生活中占据着十分重要的地位。网络在带给人们便利的同时，其消极影响也日益为研究者所关注，如不良信息泛滥、网络成瘾和网络偏差行为等。网络色情偏差行为指的是在互联网上浏览色情图片、进行色情聊天、观看色情录像以及进行网络虚拟性爱等与性有关的活动，网络色情偏差行为属于网络偏差行为的一种。已有的研究发现网络色情偏差行为会对大学生的身心发展带来不利的影响，且大学生群体与其他群体相比网络偏差行为有着更高的发生率且情况更为复杂。而异性拒绝是指个体在日常生活中遭受来自异性的拒绝和排斥，它作为社会排斥的一种形式，会阻碍个体亲密关系和性欲望的满足。以往的研究发现社会排斥致使个体的社会联结受损，并显著增强了个体的网络偏差行为。本研究为了探讨异性拒绝对大学网络色情偏差行为的影响，以及羞耻感和性别在二者关系中的作用机制，采用异性拒绝经历量表（MRES）、羞耻体验量表（ESS）以及青少年网络偏差行为量表（SAID），对 775 名高校学生进行集体实测。在控制恋爱经验的基础上，结果发现：（1）异性拒绝、羞耻感和网络色情偏差行为之间均呈显著正相关；（2）异性拒绝通过羞耻感中介作用对网络色情偏差行为产生影响（ $\beta=0.05$ $t=5.90$, $p<0.001$ ）；（3）在羞耻感对网络色情偏差行为的简单效应中，性别起调节作用（羞耻感与性别的乘积项： $\beta=0.05$, $t=-2.66$, $p<0.01$ ）。研究结果启示，教育工作者要关注生活中经常被异性拒绝的大学生，着重提升大学生的人际交往能力，从源头上减少个体被拒绝的经历；引导他们进行合理的归因、掌握调节情绪的好方法；引导大学生安全文明地上网。

关键词 异性拒绝，网络色情偏差行为，羞耻感，性别

Opposite-sex refusal and deviant behaviors of College Students' Internet pornography: A moderated mediation model

GUOSIYI, ZHANGLU

School of Psychology, Sichuan Normal University, chengdu

Abstract: With the progress of science and technology and the continuous development of the Internet, the network has played a very important role in People's Daily life. While the Internet brings convenience to people, its negative effects are also increasingly concerned by researchers, such as the flood of bad information, Internet addiction and network deviant behavior. The deviant behavior of Internet pornography refers to the activities related to sex such as browsing pornographic pictures, chatting, watching pornographic videos and having virtual sex on the Internet. The deviant behavior of Internet pornography belongs to one kind of deviant behavior of Internet. Existing studies have found that deviant behaviors of Internet pornography will have a negative impact on the physical and mental development of college students, and college students have a higher incidence of deviant behaviors and the situation is more complex than other groups. Opposite-sex rejection means that individuals are rejected and excluded by the opposite sex in daily life. As a form of social exclusion, it will hinder the satisfaction of intimate relationship and sexual desire of individuals. Previous studies have found that social exclusion damages individuals' social connection and significantly enhances individuals' network deviant behavior. In order to explore the influence of opposite-sex rejection on deviant behaviors of college Internet pornography, and the mechanism of the relationship between shame and gender, this study used the Opposite-sex rejection Experience Scale (MRES), shame Experience Scale (ESS) and Adolescent Deviant Behaviors Scale (SAID) to conduct collective measurement on 775 college students. After controlling for love experience, the results showed that : (1) there was a significant positive correlation between opposite-sex rejection, shame and deviant behavior of Internet pornography; (2) The opposite sex rejection had an effect on the deviant behavior of Internet pornography through the mediating effect of shame ($\beta = 0.05$, $t=5.90$, $P < 0.001$); (3) Gender moderated the simple effect of shame on deviant behavior of Internet pornography ($\beta=0.05$, $t=-2.66$, $P < 0.01$). The results suggest that educators should pay attention to college students who are often rejected

by the opposite sex in their daily life, focus on improving their interpersonal skills, and reduce the experience of individual rejection from the source. Guide them to make reasonable attribution and master the good method of emotion regulation; Guide college students to surf the Internet safely and civilized.

Keywords: opposite-sex rejection, Internet porn deviant behavior, shame, gender

社交媒体情感依赖和大学生人际科技干扰与问题性社交网络使用的关系：错失焦虑与孤独感的中介作用

麻巍葳 晏碧华（通讯作者）

陕西师范大学心理学院，西安，710062, yanbihua@snnu.edu.cn

摘要 错失焦虑是个体因担心错失他人的新奇经历或正性事件而产生的一种弥散性焦虑，其本质是一种稳定的个体特质变量，近年来受到了越来越多研究者的关注。在前期影响因素方面，现有研究大多探讨一些内源性因素对错失焦虑的影响，比如个体的负性情绪、认知方式、人格特质等，而较少探讨外源性因素与错失焦虑的关系，比如人际因素与群际因素。人际科技干扰是指在人际交往过程中随着电子科技产品的侵入，对人与人之间的沟通以及其他日常人际交往所产生的干扰。作为重要的人际因素，人际科技干扰应该会对个体问题性社交网络使用产生影响，而这项研究并未开展。为了探讨和比较作为内源性因素的社交媒体情感依赖与作为外源性因素的人际科技干扰对错失焦虑以及问题性社交网络使用的影响，本研究以 500 名中国高校大学生为研究对象，考察了社交媒体情感依赖和人际科技干扰与问题性社交网络使用的关系，以及错失焦虑和孤独感在其间的中介作用。本研究的测量工具包括社交媒体情感依赖量表、大学生人际科技干扰自编量表、错失焦虑量表、孤独感量表和问题性社交网络使用量表，数据分析采用描述性统计、Pearson 相关系数和 bootstrap 方法。结果发现：（1）大学生错失焦虑在性别上差异显著，女生错失焦虑更高，更容易受到人际科技干扰的影响。（2）社交媒体情感依赖与错失焦虑、孤独感以及问题性社交网络使用呈显著正相关，人际科技干扰与错失焦虑和问题性社交网络使用呈显著正相关，与孤独感相关并不显著。（3）社交媒体情感依赖能够通过错失焦虑影响问题性社交网络使用，也可以通过错失焦虑——孤独感链式中介影响问题性社交网络使用，大学生人际科技干扰能够通过错失焦虑影响问题性社交网络使用。结论：内源性的个体因素和外源性的人际因素可以共同预测问题性社交网络使用，错失焦虑在两条作用途径中均可起到中介作用。

关键词 社交媒体情感依赖，人际科技干扰，错失焦虑，孤独感，问题性社交网络使用

The correlation of problematic use of social networks with the emotional dependence on social media and the interpersonal technology interference of college students: the mediating roles of missing anxiety and loneliness

Weiwei Ma, Bihua Yan*

School of Psychology, Shaanxi Normal University, Xi'an, 710062, E-mail: yanbihua@snnu.edu.cn

Abstract: Missing anxiety, a stable individual characteristic variable, is a kind of diffuse anxiety caused by individuals worrying about missing other people's novel experiences or positive events, which has received extensive attention from numerous researchers in recent years. In terms of the early influencing factors of missing anxiety, most of the existing studies focused on the influence of endogenous factors, such as negative emotions, cognitive styles, personality traits, on missing anxiety, but less on the relationship between missing anxiety and exogenous factors such as the interpersonal factors and intergroup factors. Interpersonal technology interference refers to the interference caused by the intrusion of electronic technology products in the process of interpersonal communication and other daily interpersonal interaction. As an important interpersonal factor, interpersonal technology interference should have an impact on the individual problematic use of social networks, but this research has not been carried out. In order to explore and compare the influence of the emotional dependence on social media as an endogenous factor

and the interpersonal technology interference as an exogenous factor on missing anxiety and problematic use of social networks, 500 Chinese college students are selected as the research objects in this study to investigate the correlation of problematic use of social networks with the emotional dependence of social media and the interpersonal technology interference, as well as the mediating role of missing anxiety and loneliness. The research methodology of this study includes the scale of the emotional dependence on social media, the self-designed scale of the interpersonal technology interference of college students, the missing anxiety scale, the loneliness scale, and the scale of problematic use of social networks. Descriptive statistics, Pearson correlation coefficient, and bootstrap method are used for data analysis. The results show that: (1) There is a significant gender difference in missing anxiety among college students. Female students have higher missing anxiety and are more susceptible to interpersonal technology interference. (2) The emotional dependence on social media is significantly positively correlated with missing anxiety, loneliness, and problematic use of social networks. Interpersonal technology interference is significantly positively correlated with missing anxiety and problematic use of social networks, but it is not significantly correlated with loneliness. (3) The emotional dependence on social media can affect the problematic use of social networks through missing anxiety, and it can also affect the problematic use of social networks through missing anxiety-loneliness chain intermediary. Interpersonal technology interference of college students can affect problematic use of social networks through missing anxiety. In conclusion, endogenous individual factors and exogenous interpersonal factors can jointly predict the problematic use of social networks, and missing anxiety can play a mediating role in both ways.

摘 要 截止 2020 年 1 月, 社交媒介的全球普及率达到 49%, 社交网站用户数量达到 36 亿, 约占世界人口的一半。人们在网络上进行各种活动, 网络使人们的利他行为从现实生活延伸至网络空间。网络利他行为的发生能在网络环境中营造积极向上、互助互利的空间氛围, 构建和谐的网络环境并使网络的积极作用得到充分发挥。回顾已有研究发现, 目前大多数研究关注的是网络交往对网络利他行为的影响, 尚未有研究关注社交网站使用强度如何影响网络利他行为, 尤其是社交网站使用强度如何影响(中介作用)以及在何种条件下(调节作用)影响网络利他行为。为明确社交网站使用强度对个体网络利他行为的影响及作用机制, 本研究构建了一个共同调节的中介模型, 考察了网络社会支持在二者关系中的中介作用以及隐性自恋和性别的共同调节作用。本研究对 726 名大学生的社交网站使用强度、网络社会支持、隐性自恋及网络利他行为进行问卷调查。结果显示: (1)社交网站使用强度越高, 个体表现的网络利他行为越多; (2)网络社会支持在社交网站使用强度与网络利他行为的关系中起中介作用; (3)到隐性自恋和性别的共同调节社交网站使用强度和网络社会支持的关系。高隐性自恋女性的社交网站使用强度对网络社会支持的预测作用与低隐性自恋女性没有显著差异; 高隐性自恋男性的社交网站使用强度对网络社会支持的预测作用较低隐性自恋男性更小。本研究对探究关于社交网站使用强度与网络利他行为的关系的认识具有重要的理论意义; 本研究结果对引导个体, 尤其是隐性自恋水平较高的男性, 合理理性地使用社交网站进行人际交往, 克服性格弱点, 从而在网络交往中获得更多的网络社会支持, 进而表现出更多的网络利他行为、营造和谐的网络环境具有一定的启示意义。

Relationship between Social Network Sites Intensity and Internet altruistic behavior: Mediating Role of Online Social Support and Joint Moderating Role of covert narcissism and Gender

Fengqiang Gao¹, Ting Han¹, Mohan Sang¹, Yanru Zhan¹, Weizi Li¹, Lei Han¹

School of Psychology in ShanDong Normal University, Jinan, 250014, hanlei-0333@163.com

Abstract: As of January 2020, the global penetration rate of social media has reached 49%, and the number of social network users has reached 3.6 billion, approximately half of the world's population. People carry out various activities on the Internet, and the Internet extends people's altruistic behaviors from real life to cyberspace. The occurrence of internet altruistic behavior can create a positive and mutually beneficial space atmosphere in the network environment, construct a harmonious network environment and give full play to the positive role of the internet. Reviewing existing studies, most of the current studies focus on the impact of online communication on internet altruistic behavior, no studies have focused on how the social network sites intensity affects internet altruistic behavior, especially how the social network sites intensity affects (mediating effect) and under what conditions (moderating effect) it affects internet altruistic behavior. In order to clarify the influence of social network sites intensity on internet altruistic behavior and its mechanism, this study constructed a co-moderating mediation model to examine the mediating role of online social support in the relationship between social network sites intensity and internet altruistic behavior, and the jointly moderating role of covert narcissism and gender. In this study, 726 college students were surveyed on the intensity of social network sites intensity, online social support, covert narcissism and internet altruistic behavior. The results showed that : (1) the higher the social network sites intensity, the more internet altruistic behaviors individuals exhibited; (2) Online social support played a mediating role in the relationship between the social network sites intensity and internet altruistic behavior; (3) Covert narcissism and gender moderated the relationship between social network sites intensity and online social support. There was no significant difference in the predictive effect of social network sites intensity on online social support between the women with high covert narcissism and the women with low covert narcissism. In men with high covert narcissism, the intensity of social network sites intensity had a lower predictive effect on online social support than in men with low covert narcissism. This study has important theoretical significance for exploring the understanding of the relationship between the social network sites intensity and internet altruistic behavior. This research results to guide the individual, especially men with higher levels of covert narcissistic, reasonable rationally using social networking sites for interpersonal communication, overcome weaknesses personality, thus to gain more online social support in network communication, and then show more altruistic behavior, create a harmonious network environment has the certain enlightenment significance.

社交媒体自我控制失败对用户幸福感的预测： 日常挫折和主观活力感的中介作用

杜捷¹（通讯作者） 汪宇²

1 重庆工商大学工商管理学院，重庆，400067, jdu@ctbu.edu.cn

2 重庆理工大学管理学院，重庆，400054

摘要 社交媒体自我控制失败（Social media self-control failure）指使用社交媒体与其他目标（如学习、工作）发生冲突时无法控制使用的现象。移动互联网环境下，“无时无刻、无处不在”地使用社交媒体使得自我控制失败的几率增加，并被感知为一种日常挫折（Daily hassle）。本研究旨在探索社交媒体自我控制失败及感知到的日常挫折通过降低主观活力感对用户幸福感（积极情绪、消极情绪）的预测。采用网络调查问卷，本研究对 490 名 16 至 54 岁（ $M = 24.2$, $SD = 8.3$ ）的社交媒体用户（其中女性占 72.4%）进行了在线调查。

结果发现：（1）社交媒体自我控制失败对积极情绪和消极情绪的直接效应显著；（2）社交媒体自我控制失败对积极情绪的预测被日常挫折和主观活力感完全中介；（3）社交媒体自我控制失败对消极情绪的预测被日常挫折和主观活力感完全中介；（4）主观活力感完全中介了日常挫折对积极情绪的预测，部分中介了日常挫折对消极情绪的预测。结果表明，社交媒体自我控制失败越频繁的用户，其日常挫折感越强，主观活力感越低。降低的主观活力感预测了他们更低的积极情绪和更高的消极情绪。本研究探索了社交媒体自我控制失败对用户幸福感的预测路径，有助于进一步丰富移动互联网环境对个体心理影响的研究。

The prediction of social media self-control failure on well-being: the mediating role of daily hassle and subjective vitality

Jie Du¹(corresponding author), Yu Wang²

1 Chongqing Technology and Business University, School of Business Administration, 400019

2 Yu Wang, Chongqing University of Technology, Management School, 400054

Abstract: Social media self-control Failure refers to the failure in controlling social media use when it conflicts with other goals (e.g., study, work). Being “permanently online, permanently connected” in a media-saturated environment increases the risk of self-control failure, which is perceived as a daily hassle. The aim of this study was to explore the prediction of social media self-control failure and perceived daily hassle on users’ well-being (i.e., positive and negative emotions) by reducing subjective vitality. Using an online questionnaire, 490 social media users (72.4% female) aged between 16 and 54 ($M = 24.2$, $SD = 8.3$) were surveyed online. The results showed that: (1) Social media self-control failure had a significant direct effect on positive and negative emotions; (2) The prediction of social media self-control failure on positive emotions was completely mediated by daily hassle and subjective vitality; (3) The prediction of social media self-control failure on negative emotions was fully mediated by daily hassle and subjective vitality; (4) The subjective vitality fully mediated the prediction of daily hassle on positive emotions, and partially mediated the prediction of daily hassle on negative emotions. The results showed that users with more frequent social media self-control failures experienced greater daily hassle and lower subjective vitality. Reduced subjective vitality predicted lower positive emotions and higher negative emotions. This study explores the predictive path of social media self-control failure on users’ well-being, which helps to enrich the research on the impact of mobile Internet environment on psychological health.

Keywords: Social media, Self-control, Daily hassle, Well-being, Mediation effect

儿童期心理虐待与网络欺负的关系：一个有调节的中介模型

张姝婧¹² 周宗奎¹²(通讯作者)

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院，武汉，430079, zhouszk@mail.ccnu.edu.cn

摘要 随着互联网和移动通讯工具的快速发展，欺负行为的发生场所逐渐扩宽至网络空间，并随之产生一种新的欺负形式——网络欺负。网络欺负有别于传统欺负，已在大学生群体中逐渐发展成重要的欺负形式。本研究基于一般压力理论与心理分析理论构建了一个有调节的中介模型，探讨大学生儿童期心理虐待与网络欺负的关系，并进一步探讨消极情绪的中介作用和生命意义感的调节作用。采用儿童期心理虐待量表、网络欺负量表、消极情绪量表以及生命意义感量表对河南省 667 名大学生进行调查，结果发现：（1）儿童期心理虐待、消极情绪和网络欺负两两之间呈显著正相关，生命意义感与儿童期心理虐待、消极情绪和网络欺负呈显著负相关；（2）儿童期心理虐待既可以直接预测网络欺负，还能通过消极情绪的中介作用间接预测网络欺负；（3）生命意义感调节儿童期心理虐待对网络欺负的直接效应和中介效应的后半段。具体来说，与低生命意义感的个体相比，高生命意义感个体的儿童期心理虐待经历和因此而产生的消极情绪均更不容易导致网络欺负行为。生命意义感作为缓冲机制，可以缓解儿童期心理虐待和消极情绪对网络欺负行为的影响，通过增

加大学生的生命意义感,可以减少网络欺负行为。本研究不仅解释了网络欺负是如何产生的,以及在什么条件下影响更大,也为减少网络欺负的发生提供了重要依据。

The Relationship between Childhood Psychological Abuse and Cyberbullying: A Moderated Mediated Model

ZHANG Shujing¹², ZHOU Zongkui¹²

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University), Ministry of Education, Wuhan, 430079

2 School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: With the rapid development of the Internet and mobile communication tools, the place of bullying has gradually expanded to cyberspace, and a new form of bullying-Cyberbullying has emerged. Unlike to traditional bullying, cyberbullying has gradually developed into another main form of bullying amidst college students. Based on the General Stress Theory and Psychoanalysis Theory, the study constructed a moderated mediation model to explore the inner relationship between childhood psychological abuse and cyberbullying among college students, and further explored the mediating role of negative emotions and the moderating role of the meaning in life. The Childhood Psychological Abuse Scale, Cyberbullying Inventory, Positive and Negative Affect Scale as well as the Meaning in Life Questionnaire to survey 667 college students in Henan Province, the results showed that: (1) Childhood psychological abuse, negative emotions and cyberbullying has significant positive correlation between two, the meaning in life and childhood psychological abuse, negative emotions and cyberbullying has significant negative correlation; (2) Childhood psychological abuse can not only directly predict cyberbullying, but also indirectly forecast cyberbullying through the mediating effect of negative emotions. (3) The meaning in life both moderates the direct effect and the second half of the mediating effect of childhood psychological abuse on cyberbullying. Specifically, individuals with a high meaning in life who had experienced childhood psychological abuse and the negative emotions associated with it were less likely to cause cyberbullying than individuals with a low meaning in life. As a buffer mechanism, the meaning in life can alleviate the impact of childhood psychological abuse and negative emotions on cyberbullying. By increasing the meaning in life, cyberbullying is able to be reduced effectively. This study not only explains how cyberbullying occurs and under what conditions the effect is greater, but also provides an important basis for reducing the occurrence of cyberbullying.

物质主义与青少年问题性社交网站使用：自尊和错失恐惧的中介作用

王梦云 何宁（通讯作者）

陕西师范大学心理学院，西安，710062，hening@snnu.edu.cn

摘要 目的：随着互联网技术的成熟和智能手机的普及，微信朋友圈、微博与QQ空间等社交网站已成为青少年人际交往的重要工具。然而，社交网站带来便利的同时也不可避免地引发了相应的心理社会问题，即对社交网站的过度精神依赖所产生的系列心理困扰和身体不适。近年来，越来越多的研究者开始致力于探索影响问题性社交网站使用的保护性和风险性因素，但鲜有研究涉及物质主义与问题性社交网站使用之间的关系及其潜在的作用机制。尤其当前我国经济社会处于快速发展时期，青少年的物质生活水平获得了大幅提升，使其心理与行为问题日益凸显。因此，本研究基于个体-情感-认知-执行相互作用框架，旨在考察青少年物质主义与问题性社交网站使用的关系，并进一步探讨自尊和错失恐惧在其中的作用。**方法：**采用物质主义价值观量表、自尊量表、错失恐惧量表及Facebook侵扰问卷对550名高中生（54%女生； $M_{\text{年龄}} = 16.29$ 岁； $SD_{\text{年龄}} = 0.99$ ）进行调查。**结果：**（1）物质主义与自尊显著负相关，与错失恐惧、问题性社交网站使用显著正相关；自尊与错失恐惧、问题性社交网站使用显著负相关；错失恐惧与问题性社交网站使用显著正相关；（2）在控制

了性别与年龄后,物质主义能够显著正向预测青少年的问题性社交网站使用;(3)物质主义通过自尊和错失恐惧的中介作用对问题性社交网站使用产生影响,且该中介作用包含了两条路径:一是错失恐惧的单独中介作用;二是自尊-错失恐惧的链式中介作用。**结论:**强烈物质追求的青少年往往具有消极的自我评价,进而会增加错失恐惧这一消极体验,并最终通过对社交网络的过度使用来加以缓解。这些发现为青少年价值观的培养,以及问题性社交网站使用的预防和干预提供了新的视角。

Materialism and Problematic Social Network Sites Use among Chinese Adolescents: The Mediating Roles of Self-esteem and Fear of Missing Out

Mengyun Wang, Ning He

School of Psychology, Shaanxi Normal University, Xian, 710062

Abstract: Objective: With the maturity of Internet technology and the popularity of smartphones, social networking sites (SNS) such as WeChat moments, Weibo and Qzone have become important tools for teenagers to communicate in everyday life. Despite great convenience has brought, spending too much time on SNS is supposed to be detrimental and defined as problematic SNS use, which refers to a psychosocial phenomenon, involving an inordinate mental dependence on the use of SNS and in turn triggering psychological distress and physical discomfort. In recent years, more and more researchers have begun to focus on the protective and risk factors of problematic SNS use. Although existing research has ascertained some critical factors of problematic SNS use; however, little is known about the link between materialism and problematic SNS use, and the possible mediating mechanisms underlying this relation. Especially, in the period of rapid economic and social development in China, the material living standards of teenagers have been greatly improved, which making their psychological and behavioral problems increasingly prominent. **Method:** Based on the Interaction of Person-Affect-Cognition-Execution (I-PACE) model, a sample of 550 senior high school students (54% girls; $M_{age} = 16.29$; $SD_{age} = 0.99$) was recruited to complete a survey including demographics, the Materialism Value Scale, the Rosenberg Self-esteem Scale, Fear of Missing Out (FoMO) Scale, and the Facebook Intrusion Questionnaire. The present study examined whether materialism would be positively correlated with adolescents' problematic SNS use, as well as whether self-esteem and FoMO would mediate this association. **Results:** (1) Materialism was negatively correlated with self-esteem, and positively related to FoMO and problematic SNS use; self-esteem was negatively associated with FoMO and problematic SNS use; FoMO was positively associated with problematic SNS use. (2) After controlling for gender and age, materialism can significantly positively predict adolescents' problematic SNS use. (3) Materialism can influence problematic SNS use through the mediating effect of self-esteem and FoMO, and this mediating effect includes two paths: one is the separate mediating role of FoMO; the second is the chain-mediated role of both self-esteem and FoMO. **Conclusion:** Adolescents with strong material aspirations tend to have negative self-evaluations, which in turn increase the negative experience of FoMO, and eventually alleviated it through excessive use of SNS. These findings provide a new perspective for the cultivation of adolescents' values, as well as and the prevention and intervention of problematic SNS use.

正念与网络成瘾：自尊和自控的序列中介作用

李昕婷 张桥 梁三才（通讯作者）

陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室, 西安, 710062, liangsancai@snnu.edu.cn

摘要 前人研究表明正念是防止网络成瘾的一项保护性因素, 正念水平高的个体网络成瘾水平更低。这可能是由于正念减少了个体自动化的行为反应, 同时减少了个体负性情绪。本研究旨在探讨自尊和自控在正念

水平与网络成瘾间的中介作用,为进一步干预大学生网络成瘾提供有效依据。我们假设正念和自尊是正念和网络成瘾之间的中介变量。此外,自尊可以显著的预测自控,也就是说自尊和自控的中介关系是一前一后的。综上,本研究假设:自尊和自控在正念与网络成瘾之间起序列中介作用。本研究采用简易版五因素正念量表、Rosenberg 自尊量表、自我控制量表和社交网站成瘾倾向量表在西北地区两所大学抽取 438 名大学生进行施测,被试的平均年龄为 18.56 ± 0.88 岁。结果发现:①正念和网络成瘾呈显著负相关,和自尊、自控呈显著正相关;自尊和自控呈显著正相关,和网络成瘾呈显著负相关;自控和网络成瘾呈显著负相关;②正念对网络成瘾预测作用显著;③正念和自尊在正念和网络成瘾之间存在单独的中介作用;④正念→自尊→自控→网络成瘾路径显著。这些结果表明,正念不仅直接影响网络成瘾,还存在三条间接路径:自尊的单独中介作用、自控的单独中介作用、自尊和自控的链式中介作用。进一步揭示了正念对网络成瘾的作用机制,同时也为提升正念和自尊水平干预网络成瘾提供了依据。

Mindfulness and Internet Addiction among Chinese College Students: Mediating Effects of Self-esteem and Self-control

LI Xinting, ZHANG Qiao, LIANG Sancai

(School of Psychology, Shaanxi' Normal University; Shaanxi Key Laboratory of Behavioral and Cognitive Neuroscience, Xi'an 710062, China)

Abstract: Previous studies have shown that mindfulness is a protective factor against Internet addiction. Individuals with higher levels of mindfulness prone to have lower levels of Internet addiction, which may be due to the fact that mindfulness reduces individuals' automatic behavioral responses and negative emotions. To explore the mediating effect of self-esteem and self-control between mindfulness and Internet addiction, and to provide basis for further intervention in college students' online addiction. Thus, we hypothesize that self-esteem and self-control would mediate the link between mindfulness and Internet addiction. In addition, self-esteem can predict self-control significantly. We further hypothesize that self-esteem and self-control sequentially mediate the effect of mindfulness and Internet addiction. A sample of 438 college students was surveyed with Short-Form Five Facet Mindfulness Questionnaire Instrument, Rosenberg Self-esteem Scale, Self-control Scale and Chinese Internet Addiction Scale-Revised. The subjects ($Mean\ age=18.56, SD=.88$) were recruited from two universities in Xi'an to take part in this study, and 2.42% of them were excluded because they failed to finish the questionnaires. Results showed that: ① Mindfulness was negatively correlated with Internet addiction, and was positively correlated with self-esteem and self-control; Internet addiction was negatively correlated with self-esteem and self-control, self-esteem was positively correlated self-control; ②mindfulness predict Internet addiction significantly; ③self-esteem and self-control would mediate the link between mindfulness and Internet addiction significantly; ④ self-esteem and self-control sequentially mediate the effect of mindfulness and Internet addiction. We can conclude that self-esteem and self-control clarity exert a serial mediating effect on the relationship between mindfulness and Internet addiction. This study further revealed the mechanism of the effect of mindfulness and Internet addiction, and provides empirical evidence to decrease Internet addiction by increasing the levels of mindfulness and self-esteem.

认知策略调节社会排斥对疼痛共情的影响：一项 ERP 研究

范敏¹ 竭婧² 罗品超¹ 于高文¹ 郑希付¹ (通讯作者)

1 华南师范大学心理学院, 广州, 510631, zhengxf@scnu.edu.cn

2 海南大学生物医学工程学院, 海口, 570228

摘要 疼痛共情是指个体对他人疼痛的感知、判断和情绪反应, 会受到多种生理、心理和社会因素的影响。我们之前的研究发现, 社会排斥会削弱个体对他人疼痛共情的晚期加工。以往研究发现低水平的共情水平与攻击行为联系密切, 且社会排斥也会导致攻击行为。因此寻找方法在一定程度上削弱社会排斥对疼痛共情的影响对于减少社会排斥给被排斥者带来的负面影响可能具有一定的实践意义。尚未有研究探讨过怎样调节社会排斥对共情的影响。本研究使用时间分辨率较好的 ERP 技术, 研究不同的认知策略对社会排斥影响疼痛共情的调节效果差异。实验采用 2 (组别: 认知重评组和分心组) × 2 (图片类型: 疼痛图片和中性图片) 混合设计。首先采用网络抛球游戏诱发被试的被社会排斥感, 然后将被试随机分为两组, 要求一组被试接受认知重评任务, 另一组接受分心任务, 最后所有被试均完成疼痛图片判断任务。我们招募了 43 名大学生, 认知重评组 21 人, 分心组 22 人, 组内性别平衡。结果发现: (1) 操作检验结果验证了认知策略的有效性, 且只有认知重评可以显著改善被排斥个体的社会拒绝感、需求水平受损和提升正性情绪。(2) 两组被试观看疼痛图片相比中性图片诱发了更低的额区 N2 (240-270ms) 波幅和顶区 P3 (340-400ms) 波幅, 但是认知重评组观看两类图片时诱发的顶区和中央区 P3 波幅均边缘显著高于分心组; LPP (400-700ms) 成分上, 相比中性图片, 两组被试在观看疼痛图片时都表现出显著更高的中央区和顶区 LPP 波幅, 但是认知重评组观看疼痛图片的顶区 LPP 波幅显著高于分心组, 这也泛化到了中性图片上。上述结果表明认知策略的调节作用主要是在晚期有意识的控制加工阶段, 认知重评的干预效果好于分心。在控制加工的早期阶段 (340-400ms), 两个认知策略组均未出现共情反应, 但是认知重评组观看疼痛图片诱发的 P3 波幅更大说明相比分心组对他人疼痛投入了更多注意力资源; 在晚期阶段 (400-700ms), 两组均出现了共情反应, 但是相对分心组, 认知重评组观看疼痛图片诱发的 LPP 波幅更大说明其对他人的疼痛投入了更多的认知努力, 对他人生理性疼痛的敏感度与情绪反应更强。我们的研究为如何减少社会排斥对可能给个体带来的负面作用提供了一定的理论依据, 也为认知行为疗法调节个体消极情绪的有效性提供了一定的实证支持。

关键词: 社会排斥, 疼痛共情, 认知策略, ERP

The effect of social exclusion on empathy for pain: the moderation of cognitive strategy: an ERP study

Min Fan¹, Jing Jie², Pinchao Luo¹, Gaowen Yu¹, Xifu Zheng¹

1 School of Psychology, South China Normal University, Guangzhou, 510631

2 School of Biomedical Engineering, Hainan University, Haikou 570228

Abstract: Empathy for pain implies perception, judgement and affective response of another person's pain. It's influenced by many physiological, psychological and sociological factors. One of our previous studies has demonstrated that social exclusion weakens pain empathy towards strangers. Studies also suggest that low level of empathy are highly related to aggressive behaviors and social exclusion causes aggressive behaviors. Therefore, finding ways of diminishing the influence of social exclusion on empathy for pain may have some practical significance for weakening the negative impacts of social pain. The current study adopted the high time-resolution event-related potentials (ERPs) to compare the regulating effect of different cognitive strategies on the influence of

social exclusion on empathy for pain. We used a 2 (group: cognitive reappraisal group and distraction group) $\times$ 2 (type of picture: neutral pictures and painful pictures) mixed experimental design. First, cyberball was used to induce participants' feelings of being socially excluded and then participants were randomly assigned to two groups. Participants randomly assigned to the cognitive reappraisal group received a cognitive reappraisal task and those randomly assigned to distraction group received a distraction task. Finally all subjects completed the same empathy for pain task. The subjects were 43 college students including 21 students for cognitive reappraisal group and 22 for distraction group and the amounts of the male and female are almost the same in each group. The results were as follows: (1) We successfully manipulated different cognitive strategies and cognitive reappraisal groups can significantly reduce sense of social rejection and improve impaired levels of fundamental needs and positive affect of excluded individuals. (2) For early frontal N2 (240–270ms) component and late parietal P3 (340–400ms) component, relative to the neutral pictures, painful pictures elicited a positive shift of the ERPs in these time windows. But cognitive reappraisal group showed marginally significantly larger P3 amplitudes at central-parietal site than distraction group did while watching both painful and neutral pictures. As for late central-parietal LPP component (400–700ms), both groups showed significantly larger LPP amplitudes while watching the painful pictures than neutral pictures but cognitive reappraisal group showed significantly larger LPP amplitudes at parietal site than distraction group did while watching painful pictures, which also generalized to the neutral pictures. The results indicate that the regulating effect of cognitive strategy is mainly in the late conscious controlled processing stage, and the intervention effect of the cognitive reappraisal is better than that of distraction. In the early stage of controlled processing (340–400ms), there was no empathic response in both groups, but the result that cognitive reappraisal group showed larger P3 amplitudes for painful pictures than distraction group did indicates that the cognitive reappraisal group invests more attention resources on others' pain than the distraction group; in the late stage (400–700ms), both groups presents empathic response, but the result that cognitive reappraisal group showed larger LPP amplitudes for painful pictures than distraction group did indicates that the cognitive reappraisal group puts more cognitive efforts on others' pain and increases the sensitivity to painful pictures. Our study provides some theoretical basis for how to reduce the negative effects of social exclusion and also provides some empirical support for the validity of cognitive behavioral therapy to regulate negative emotions.

父母认知情绪调节方式对子女焦虑和抑郁的影响： 教养方式的中介作用

赵丰 岸本鹏子（通讯作者）

南开大学周恩来政府管理学院社会心理学系，天津，300350, tomokopp@126.com

摘要 目的：调查父母认知情绪调节方式、教养方式和子女焦虑抑郁的现状，探讨父母认知情绪调节方式、教养方式和子女焦虑、抑郁之间的关系及其内在作用机制。**方法：**采用方便抽样的方法，选取内蒙古乌兰察布市、鄂尔多斯市和山东省德州市某五所中学的初中和高二年级共 414 对学生及其家长进行问卷调查。采用认知情绪调节方式量表（CERQ）、父母教养方式评价量表（EMBU）、儿童焦虑性障碍筛查量表（SCARED）和儿童抑郁障碍量表（CDI）进行两次施测。第一次测量学生家长的认知情绪调节方式；间隔 3 个月后进行第二次测量，包括对其父母教养方式的评价和焦虑、抑郁的水平。**结果：**①女生焦虑分数和抑郁分数均显著高于男生。②父母教养方式在各维度上均有显著差异，在情感温暖和理解、过分干涉和过分保护、拒绝和否认、偏爱被试 4 个方面母亲显著高于父亲，在惩罚和严厉方面父亲明显高于母亲。③认知情绪调节方式中父亲的责备他人与教养方式中母亲的情感温暖呈显著负相关，与父亲的拒绝否认、惩罚严厉均呈显著正相关。认知情绪调节方式中母亲的沉思与教养方式中母亲的过分干涉、父亲的过度保护均呈显著正相关。④教养方式中母亲的情感温暖与子女抑郁呈显著负相关，父亲的拒绝否认、惩罚严厉与子女抑郁呈显著正相关。母亲的过分干涉和父亲的过度保护与子女焦虑、抑郁均呈显著正相关。⑤认知情绪调节方式中父亲的责备他人与子女抑郁呈显著正相关。母亲的沉思与子女焦虑和抑郁均呈显著正相关。⑥母亲情感温暖在父亲责备他人和子女

抑郁之间起部分中介作用。父亲拒绝否认在父亲责备他人和子女抑郁之间起完全中介作用。父亲惩罚严厉在父亲责备他人和子女抑郁之间起完全中介作用。父亲过度保护在母亲沉思和子女焦虑或抑郁之间均起部分中介作用。母亲过分干涉在母亲沉思和子女焦虑之间起部分中介作用，在母亲沉思和子女抑郁之间起完全中介作用。**结论：**父母的认知情绪调节方式是影响子女焦虑和抑郁的重要因素，并通过教养方式的中介作用间接影响子女的焦虑和抑郁水平。

关键词 认知情绪调节方式，父母教养方式，焦虑，抑郁，青少年

Cognitive emotion regulation strategy of parents influence on anxiety and depression of children: parenting styles play mediating role

ZHAO Feng, KISHIMOTO tomoko

Department of Social Psychology, Zhou Enlai School of Government, NanKai University, Tianjin 300350, China

Abstract: Objective: To investigate the status quo of parents' cognitive emotion regulation strategy, parenting styles and children's anxiety and depression, then to discuss the relationship and the internal mechanism between parents' cognitive emotion regulation strategy, parenting styles, children's anxiety and depression. Methods: Using the method of convenience sampling, a total of 414 pairs of students and their parents were selected from five middle schools in Ulanqab City, Ordos City of Inner Mongolia and Dezhou City of Shandong Province. Cognitive Emotion Regulation Questionnaire(CERQ), Egna Minnen av Barndoms Uppfostran(EMBU), The Screen for Child Anxiety Related Emotional Disorders(SCARED) and Children's Depression Inventory(CDI) were used for two tests. For the first time, parents' cognitive emotion regulation strategy was measured; The children were measured three months later, including assessments of their parenting styles and levels of anxiety and depression. Results: ① The anxiety and depression scores of girls are significantly higher than boys. ② There are significant differences in parenting styles in all dimensions. Mothers were significantly higher than fathers in emotional warmth and understanding, over-interference and over-protection, refusal and denial, and preference. Fathers were significantly higher than mothers in punishment and severity. ③ The fathers' blaming others of cognitive emotion regulation strategy was negatively correlated with the mothers' warmth & understanding of parenting styles, it were positively correlated with the fathers' refusal & denial, and punishment & severity of parenting styles. The mothers' rumination of cognitive emotion regulation strategy were positively correlated with the fathers' over protection, and mothers' over-interference of parenting styles. ④ The mothers' warmth & understanding of parenting styles was negatively correlated with the children's depression. The fathers' refusal & denial, and punishment & severity of parenting styles were positively correlated with children's depression. The mothers' over-interference and fathers' over protection of parenting styles were positively correlated with the children's anxiety and depression. ⑤ The fathers' blaming others of cognitive emotion regulation strategy was positively correlated with children's depression. The mothers' rumination of cognitive emotion regulation strategy were positively correlated with children's anxiety and depression. ⑥ The mother's warmth and understanding plays a partial mediation between the father's blaming others and the children's depression. The father's refusal and denial plays a total mediation between the father's blaming others and the children's depression. The father's punishment and severity plays a total mediation between the father's blaming others and the children's depression. The father's over protection plays partial mediations between mother's rumination and children's anxiety or depression. The over-interference of mother plays a partial mediation between the mother's rumination and the children's anxiety; It plays a total mediation between mother's rumination and children's depression. Conclusion: Parents' cognitive emotion regulation strategy is an important factor affecting children's anxiety and depression, and indirectly affects the level of anxiety and depression through the mediating role of parenting styles.

Keywords: Cognitive emotion regulation strategy, parenting styles, anxiety, depression, adolescent

使用表达抑制策略进行自动情绪调节的神经机制

彭家欣¹ 罗跃嘉² (通讯作者)

² 北京师范大学心理学院, 北京, 100101, luoyj@bnu.edu.cn

摘要 目的: 自动情绪调节是情绪调节中的重要部分, 并且是日常生活中最常用的一种情绪调节。自动情绪调节, 是指个体不需要注意到情绪调节的过程, 不需要做任何有意识的决定, 也不需要有意地对情绪进行控制, 但是个体情绪的某些方面(如体验等)在目标驱动下发生了改变。近年来, 人们开始意识到自动情绪调节的重要意义, 但是其神经机制至今仍然不清楚。本研究通过事件相关电位(event-related potential, ERP)的技术和自我报告相结合的方法探讨了表达抑制策略自动情绪调节的时间进程。方法: 本研究共招募了 51 名(其中女生 29 名)北京师范大学在校生自愿者, 并随机分配到表达组、抑制组、无关组, 每组 17 人。采用表达抑制的情绪调节的策略, 使用含有情绪调节目标(表达、抑制或者无关)启动词的句子整理任务(Sentence Unscrambling Task, SUT)来启动自动情绪调节, 并记录被试在完成 SUT 任务前后的进行 1-back 任务时观看威胁性图片(张大嘴的蛇、熊等动物)时恐惧情绪的评分, 在 $P_{z3/4}$ 、 $CP_{z3/4}$ 电极点记录的 P2 (200-280ms) 和 LPP (300-500ms), 在 $F_{z3/4}$ 、 $C_{z3/4}$ 电极点记录的 N2 (200-280 ms) 和 N400 (300 - 500ms)。

结果: 发现了相对于完成 SUT 前, 在表达的条件下, 被试完成 SUT 后观看恐惧图片时体验到较高的恐惧情绪, 并且诱发一个较大的 P2 成分; 在抑制的条件下, 被试完成 SUT 后观看恐惧图片时体验到较低的恐惧情绪, 并且诱发了较小的 P2 和 (late positive potential, LPP) 以及较大的 N2 和 N400, 在无关的条件下, 被试完成 SUT 前后体验到的恐惧情绪和 ERP 成分(除了 N400)差异不显著。结论: 这些结果说明了, P2、N2、LPP 和 N400 可以作为检验自动情绪调节的有效的 ERP 指标(ERP marks), 被试在完成 SUT 时自动激活了情绪调节的目标(表达、抑制或者保持), 并且进一步改变被试再次看恐惧图片时的情绪体验以及诱发的 ERP 成分。

The neural mechanism Automatic emotion regulation of the fearful images by the usage of expressive suppression strategy

Peng Jiaxin¹, Luo Yuejia²

¹ SHAOGUAN UNIVERSITY, SHAOGUAN, 512000

² BEIJING NORMAL UNIVERSITY, 100101, luoyj@bnu.edu.cn

Abstract: So far, studies on emotion regulation have focused on intentional emotion regulation, while we know little about automatic emotion regulation. Automatic emotion regulation refers to the change of any aspect of one's emotions (like experience) driven by goals, but without paying attention to the process of regulating, without making any conscious decision, and without engaging in deliberate control. Since automatic emotion regulation plays an important role in the construct of "emotion regulation" and is one of the most common kinds of emotion regulation in daily life, people start to realize the significant of automatic emotion regulation, but its neural mechanism is unclear. The present studies examined the time cause and the neural response of automatic emotion regulation by the usage of expressive suppression strategy, using the methods of self-report and ERP. Fifty-one subjects (29 females) were recruited from either the South China Normal University or Beijing Normal University of China. In this study, the adapted Sentence Unscrambling Task (SUT), which embraced emotion expression terms, emotion suppression terms or non-emotion terms, was used to imitate the automatic emotion regulation strategy of expressive suppression. Self-reported ratings of the fearness and event-related potential (ERP) were recorded when subjects viewed fearful during the 1-back task before and after the SUT. The ERP marks in the present study are P2 (200 ~280ms) and LPP (300 ~500ms) at $P_{z3/4}$, $CP_{z3/4}$ electrodes, and N2 (200 ~280ms) and N400 (300 ~500ms) at $F_{z3/4}$, $C_{z3/4}$ electrodes. The results shown that in the emotion expression condition, the participants felt higher fearful experience and enhanced P2 when viewing fearful images after SUT compared to before SUT; in the emotion suppression

condition, the participants felt lower fearful experience and attenuated P2 when viewing fearful images after SUT compared to before SUT; there is no significant difference (except the result of N400) between viewing fearful images before SUT and after SUT in non-emotion condition.

Keywords: emotion, emotion regulation, automatic emotion regulation, expressive suppression, sentence unscrambling task, ERP

述情障碍特质影响高孤独症特质大学生情绪表达能力： 表达抑制的中介作用

黎兆康¹，石利娟¹（通讯作者），欧建君²

1 湖南科技大学教育学院，湘潭 411201，zijuand@hnust.edu.cn

2 中南大学湘雅二医院精神卫生研究所，长沙 410008

摘 要 情绪表达是个体内在反应倾向和向外表达情感的能力，作为情绪智力的重要成分，情绪表达能力对于情绪智力及其发展具有重要意义。与临床 ASD 患者类似，普通群体中的高孤独症特质个体可能同样会出现情绪表达问题。本研究基于“述情障碍假设”，试图探讨述情障碍特质对高孤独症特质大学生情绪表达能力的影响，并进一步验证情绪调节策略在高孤独症特质大学生的述情障碍特质与情绪表达能力之间的中介作用。通过孤独症谱系问卷对 419 名大学生中的高孤独症特质个体以及低孤独症特质个体进行筛选。然后采用多伦多述情障碍量表，情绪调节量表以及情绪表达量表分别对两组被试进行测查。结果发现高孤独症特质组大学生的情绪表达的情绪抑制维度得分显著大于低孤独症特质组。述情障碍特质能显著正向预测高孤独症特质大学生的情绪抑制，但孤独症特质对高孤独症特质大学生情绪表达能力的情绪抑制及情绪表达都没有显著影响。并且，在高孤独症特质大学生组中，述情障碍特质可以通过表达抑制策略间接影响情绪抑制。本研究支持了述情障碍假设在高孤独症特质大学生的情绪表达能力上同样适用。为日后对高孤独症特质个体情绪表达的干预提供了新的目标以及思路。

Abstract: Emotional expression is an individual's internal reaction tendency and the ability to express emotions outwards. As an important component of emotional intelligence, emotional expression ability has great significance to emotional intelligence and its development. Similar to clinical ASD patients, individuals with high autistic traits in the general population may also have emotional expression problems. Based on the "Alexithymia hypothesis", this study attempts to explore the influence of alexithymia traits on the emotional expression ability of college students with high autistic traits, and to further examine that emotion regulation strategies has mediating effects between alexithymia traits and emotional expression ability of college students with high autistic traits. Through the autism spectrum questionnaire(AQ), 66 college students with high autistic traits and 74 individuals with low autistic traits were recruited. Then the Toronto Alexithymia Scale, Emotion Regulation Scale and Emotion Expression Scale were used to invest of two groups of subjects. The results showed that the scores of emotional inhibition dimension of emotional expression of college students in the high autism trait group were significantly higher than those in the low autism trait group. The alexithymia trait can positively predict the emotional suppression of college students with high autistic traits, but the autistic trait has no significant effect neither on emotional suppression dimension nor

emotional expression dimension of college students with high autistic traits. Moreover, in the group of college students with high autistic traits, alexithymia traits can indirectly affect emotional suppression through expression suppression strategies. This research supports the alexithymia hypothesis that is equally applicable to the emotional expression ability of college students with high autistic traits. It provides new goals and ideas for the future intervention of the emotional expression of individuals with high autistic traits.

自闭特质对社交焦虑症状的预测作用：情绪调节的中介作用

侯璐璐¹ 李秀君¹ 石文典¹（通讯作者）

¹ 上海师范大学教育学院心理学系，上海，200234，swd_nx@shnu.edu.cn

摘要 社交焦虑障碍是全世界范围内最普遍的精神障碍之一。国内最新的研究表明，大学生的社交焦虑水平显著高于常模平均分数，中度和重度社交焦虑个体的检出率分别为 68.3% 和 20.0%。因此，对社交焦虑影响因素的探究具有重要的理论与实践价值。以往研究发现，自闭特质和社交焦虑的共发性在达到与未达到临床诊断的群体中广泛存在。有研究者甚至认为，情绪调节障碍是连接两者的关键因素，并且实证证据已初步证明自闭症患者一系列的非适应性的认知加工方式和神经生理反应导致了其情绪调节方面的困难，而情绪调节障碍则可能是社交焦虑形成的重要原因，因此成为连接两者的桥梁，但该理论模型尚未得到实证研究的证实。基于此，本研究采用纵向追踪的实验设计，分别于 2020 年 11 月（T1）和 2021 年 5 月份（T2）对 451 名大学生的自闭特质、社交焦虑严重程度以及认知重评、表达抑制和沉思三种情绪调节策略的使用频率进行测量。结果表明：（1）除 T1 的认知重评与两个时间点的表达抑制以及 T2 的认知重评与 T2 的表达抑制和沉思相关不显著外，其他变量均存在两两相关关系；（2）T1 和 T2 的认知重评和表达抑制的即时中介作用均不显著，但沉思的中介作用在两波数据中均显著；（3）表达抑制的纵向中介作用和沉思的纵向中介作用均显著，其他的纵向中介作用均不显著。以上结果表明，非适应性情绪调节策略（尤其是沉思）的使用在自闭特质对社交焦虑症状的预测作用中起到了即时和纵向的中介作用，这意味着高自闭特质的个体由于其固有的认知和行为模式，导致其更多地使用沉思这种非适应性的情绪调节策略（而非更少地使用适应性的调节策略），进而导致了其社交焦虑水平较高。

The predictive effect of autistic traits on social anxiety symptoms: The mediating role of emotion regulation

Hou Lulu¹, Li Xiujun¹, Shi Wendian¹

¹ Department of psychology, School of Education, Shanghai Normal University, Shanghai, 200234, swd_nx@shnu.edu.cn

Abstract: Social anxiety disorder is one of the most common mental disorders in the world. The latest research showed that the severity of social anxiety of college students is significantly higher than the average score of the norm. The prevalence of moderate and severe anxiety in China was 68.3% and 20.0%, respectively. Therefore, it has important theoretical and practical value to explore the influencing factors of social anxiety. Previous studies have found that the comorbidity of autistic traits and social anxiety exists widely in the groups with or without clinical diagnosis. Some researchers even proposed that emotional regulation is the key factor to connect them, and empirical evidence has preliminarily proved that a series of non-adaptive cognitive processing and neurophysiological reactions of individuals with high autistic traits led to their emotional regulation difficulties, and further lead to social anxiety. However, the theoretical model has not been confirmed by empirical research. Based on this, the study used longitudinal experimental design to measure autistic traits, social anxiety symptoms, cognitive reappraisal, expression inhibition and rumination of 451 college students in November 2020 (T1) and May 2021 (T2). The results showed that: (1) there was significant correlation among all variables except between cognitive reappraisal at T1 and

expression inhibition at two time points, and between cognitive reappraisal at T2 and expression inhibition and rumination at T2; (2) For T1 and T2, the immediate mediating effects of cognitive reappraisal and expression inhibition were not significant, while the mediating effects of meditation were significant in two time points (T1: 0.03 [0.02, 0.04]; T2: 0.04 [0.02, 0.06]); (3) The longitudinal mediating effects of expression inhibition (0.01 [0.00, 0.03]) and rumination were significant (0.05 [0.03, 0.07]), while other longitudinal mediating effects were not significant. The above results indicates that the use of non-adaptive emotion regulation strategies (especially rumination) plays an immediate and longitudinal mediating role in the relationship between autistic traits and social anxiety. In other words, due to their inherent cognitive and behavioral patterns, individuals with high autistic traits use more non-adaptive emotion regulation strategies (rather than less adaptive emotion regulation strategies), which leads to a higher level of social anxiety.

摘 要 乐观人格对青少年的适应和发展具有重要保护作用, 尤其是在面对如当前新型冠状病毒肺炎全球爆发这种重大灾难, 以及不确定性的情境, 乐观更是个体保持积极情绪、维持身心健康和主观幸福感、从灾难和不确定性中获得意义感和价值感的重要心理资本。这可能源于不同乐观类型的青少年情绪调节特点有所不同。本研究基于人格、应对与情绪的自上而下模型 (top-down model of personality, coping, and emotion), 结合个体中心和变量中心的方法, 采用问卷法调查了 7-10 年級的 2012 名中学生 (男生占 57.30%): 的乐观人格 (生活定向测验中学生修订版)、情绪调节策略 (情绪调节问卷、接纳与行动问卷) 和心理适应状况 (流调中心用抑郁量表、自陈焦虑量表、生活满意度量表), 探讨青少年的乐观人格、情绪调节特点及其与心理适应的关系。结果: (1) 个体中心的分析发现, 基于乐观人格的乐观-悲观二因子结构进行潜变量剖面分析, 可将青少年分为乐观型 (47.27%)、理性型 (41.45%) 和悲观型 (11.28%); (2) 不同乐观类型的青少年在情绪调节策略的使用、心理适应各指标中均两两差异显著, 表现为乐观型青少年, 会更多地使用积极认知重评、更少有经验性回避, 更低的抑郁、焦虑水平和更高的生活满意度; (3) 变量中心的分析发现, 青少年的乐观人格可以显著预测其心理适应, 情绪调节策略在乐观人格与青少年心理适应关系中起中介作用。研究结果揭示了青少年的乐观类型及人数比例, 以及不同乐观类型青少年的情绪调节与心理适应特点, 并进一步检验了情绪调节在青少年乐观人格与心理适应间的中介作用, 支持了人格、应对与情绪的自上而下模型, 也为对悲观型青少年从情绪调节角度实施针对性干预提供依据。

Adolescents' Optimistic Personality and Relations to Emotion Regulation and Well-being: Based on Variable- and Person-Centered Approaches

Rong Zou^{1,2}, Xia Xu^{1,2}, Xiaobin Hong^{1,2}, Jiajin Yuan^{3*}

1 Department of Psychology, Wuhan Sports University, Wuhan, 430079, China;

2 Hubei Key Laboratory of Sport Training and Monitoring, Wuhan Sports University, Wuhan, 430079, China;

3 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, 610066

Abstract: Optimistic personality plays an important role in the protection of adolescents' positive adaptation and development. Especially in the uncertain situations or major disasters such as the current global outbreak of COVID-19, optimism is an important psychological capital for individuals to maintain positive emotions, physical and mental health and subjective well-being, as well as to obtain a sense of meaning and value from disasters and uncertainties. This may be due to the different characteristics of emotional regulation in adolescents with different levels of optimism-pessimism. This study is based on the top-down model of personality, coping, and emotion. Integrating the approaches of person- and variable-centered, we investigated the optimistic personality (measured by the Life Orientation Test-Revised version), emotion regulation strategy (measured by the Emotion Regulation Questionnaire, the Acceptance and Action Questionnaire--2nd Edition) and psychological adaptation (the Chinese version of Center for Epidemiologic Studies Depression Scale, Self-reported Anxiety Scale, Life Satisfaction Scale) of 2012 middle school students (boys accounted for 57.30%) in grade 7-10 to explore the relationship between optimistic personality, emotional regulation and psychological adaptation of adolescents. Results: (1) Person-centered analysis found that adolescents could be divided into optimistic (47.27%), rational (41.45%) and pessimistic (11.28%) based on the latent profile analysis of optimistic personality; (2) There were significant differences in the use of emotion regulation strategies and psychological adaptation among different types of adolescents. Optimistic adolescents tend to use more positive cognitive reappraisal, less experience avoidance, lower levels of depression and anxiety and higher life satisfaction; (3) Variable-centered analysis found that adolescents' optimism significantly predicted their psychological adaptation, and emotion regulation strategies played a mediating role in the relationship between optimism and adolescents' psychological adaptation. These results revealed the optimistic types and the corresponding proportion of adolescents, as well as the characteristics of emotion regulation and psychological adaptation of adolescents with different optimistic types. This study further tested the mediating role of emotion regulation between optimism and psychological adaptation of adolescents, which supports the top-down model of personality, coping and emotion, and also provides basis for pessimistic adolescents on targeted intervention from the perspective of emotional regulation.

摘 要 考察正念冥想训练对于不安全依恋大学生的干预效果。选取当前恋爱时间六个月以上且成人依恋类型为不安全型依恋的大学生 78 人作为研究对象, 采用实验组、对照组前后测的实验设计, 在匹配被试年龄性别后随机分入实验组 (n=39 人) 和对照组 (n=39 人), 实验组接受八周正念冥想训练 (MBSR), 对照组处于无干预的自然学习、生活状态。在干预前后两组被试均完成正念五因素量表 (FFMQ)、亲密关系经历量表 (ECR)、关系问卷 (RQ) 和情绪调节自我效能感量表 (SRESE)。实验结果表明: (1) 正念水平与成人依恋

焦虑和依恋回避水平呈显著负相关,与情绪调节自我效能感呈显著正相关;(2)八周正念冥想训练对改善不安全依恋大学生群体的亲密关系质量效果显著,不安全依恋大学生的依恋焦虑和依恋回避两个维度在实验干预后下降显著,情绪调节自我效能感中的管理消极情绪自我效能感水平干预后显著提升。

Abstract: To investigate the intervention effect of mindfulness meditation training on college students of insecure attachment. 78 college students who have been in love for more than six months and whose adult attachment type is unsafe attachment are selected as the subjects. After matching the age and sex of the subjects, they were randomly divided into experimental group ($n = 39$) and control group ($n = 39$). The experimental group received eight weeks of mindfulness training (MBSR), and the control group was in a state of natural learning and life without intervention. Before and after the intervention, the subjects in both groups completed the FFMQ, ECR。RQ and SRESE. The results show that: (1) mindfulness is negatively correlated with adult attachment anxiety and attachment avoidance, and positively correlated with emotional regulation self-efficacy. (2) Eight weeks mindfulness training has a significant effect on improving the intimate relationship quality of college students with unsafe attachment. The two dimensions of attachment anxiety and attachment avoidance have been significantly descended after the experimental intervention., and the level of management negative emotional self-efficacy in emotional regulation self-efficacy of college students of insecure attachment have been significantly improved after the experimental intervention.

Keywords: mindfulness training, insecure attachment, college students, intervention

抑郁的代际传递：青少年自尊与感知社会支持的作用

赵清玲 宋乙宁 陈琼 李彩娜（通讯作者）

陕西师范大学心理学院, 陕西省儿童青少年心理与行为健康重点研究中心,

北京师范大学基础教育质量评估协同创新中心陕西师范大学分中心, 西安, 710062, chinali7371@163.com

摘要 抑郁是一种常见的情绪障碍,通常伴随着情绪低落,对事物失去兴趣等表现,其在青少年中发病率较高,且对个体的身心健康发展具有持续的消极影响。已有研究表明,抑郁具有代际传递性,即父母抑郁会增加子女罹患抑郁的风险,但其中的作用机制还有待进一步澄清。抑郁代际传递整合模型(The Integrative Model for the Transmission of Risk to Children of Depressed Parents)指出,除遗传等生理因素外,抑郁父母往往对子女表现出较多的批评和敌意,青少年会内化父母对自己的消极评价产生低自尊,进而增加了罹患抑郁的风险。此外,已有理论表明社会支持会影响环境对个体的消极作用,且存在两种可能的作用机制:其一,社会支持能够缓解父母抑郁对青少年自尊和抑郁产生的消极影响(压力缓冲模型;The Stress-Buffering Model);其二,当父母抑郁的消极作用较高时,社会支持可能无法为青少年提供有效的帮助,从而加重父母抑郁对青少年自尊和抑郁的消极影响(反压力缓冲模型;The Reverse Stress-Buffering Model)。基于此,本研究在探究父母抑郁对青少年抑郁影响的基础上,重点考察青少年自尊的中介和社会支持的调节作用。本研究以陕西省904名初中生(57%男生; $M_{age} = 12.73$, $SD = 0.43$)及其父母(62%母亲; $M_{age} = 40.14$, $SD = 5.36$)为研究对象,通过问卷法进行为期3年的3次追踪调查。结构方程模型结果发现:(1)T1父母抑郁对T3青少年抑郁

的直接预测作用不显著，但可通过 T2 青少年自尊间接预测 T3 抑郁。（2）教师情感支持可以显著调节 T1 父母抑郁对 T3 青少年抑郁影响的前半路径，即当教师支持水平较高时，T1 父母抑郁能显著降低 T2 青少年自尊，进而增加 T3 抑郁，而当教师支持较低时，此预测关系不显著。说明高教师支持不但没有起到缓冲作用，反而加重了父母抑郁的消极影响，支持了反压力缓冲模型。（3）父母支持和同伴支持的调节作用均不显著。本研究结果表明，青少年自尊是父母抑郁影响青少年抑郁的一个重要内在机制，且该机制受到青少年感知到教师支持的影响，这为科学认识和有效干预父母抑郁对青少年适应问题的影响提供了理论依据。

关键词 抑郁，代际传递，自尊，教师支持，青少年

The Inter-generational Transmission of Depression: The Roles of Adolescents' Self-Esteem and Perceived Social Support

ZHAO Qingling, SONG Yi-ning, CHEN Qiong, LI Caina*

School of Psychology, Shaanxi Normal University,

Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health,

Shaanxi Normal University Branch of Collaborative Innovation Center of Assessment toward Basic

Education Quality at Beijing Normal University, Xi'an, China, 710062, chinali7371@163.com

Abstract: Depression is a common affective disorder characterized with low mood and loss of interest, which has a higher incidence in adolescence, and exerts detrimental effects on their physical and psychological health. Furthermore, depression has documented to possess a nature of inter-generational transmission that parental depression would elevate adolescents' risk of developing depression, yet the underlying mechanisms remain unclear. The Integrative Model for the Transmission of Risk to Children of Depressed Parents postulates that depressed parents tend to be more critical and hostile to their children, and adolescents will internalize their parents' negative evaluation of them, resulting in low self-esteem, which increases their risk of depression. Additionally, recent theories suggest that social support can moderate the negative effects of environment on individuals, and there are two potential contrary mechanisms: social support, on the one hand, may alleviate the negative effects of parental depression on adolescents' self-esteem and depression (The Stress-Buffering Model); on the other hand, when parental detrimental influence is high, social support may not provide effective help for adolescents, thus exacerbating the negative impact of parental depression on adolescent self-esteem and depression (The Reverse Stress-Buffering Model). Based on this, this study explored the influence of parental depression on adolescent depression, and focused on the mediating effect of adolescent self-esteem and perceived social support. A total of 904 junior high school students (57% male; Mage = 12.73, SD = 0.43) and their parents (62% of mothers; Mage = 40.14, SD = 5.36) completed questionnaires at three-time points, one year apart. The results of structural equation model indicated that: (1) Though T1 parental depression was not significantly predictive of T3 adolescent depression, it was significant through T2 self-esteem. (2) Teacher support moderated the direct effect of T1 parental depression on T3 adolescent depression via self-esteem, that is, when teacher support was higher, T1 parent depression could significantly decrease T2 adolescent self-esteem and then increase T3 adolescent depression, while when teacher support was lower, this predicted relationship was no longer significant. It suggests that teacher support does not play a buffer role, but aggravates the negative effects of parental depression, which supports The Reverse Stress-Buffering Model. (3) The moderating effect of parental support or peer support was not significant. These findings indicate that parental depression can elevate adolescent depression by affecting adolescents' self-esteem, and this mechanism is also affected by adolescents' perceived teacher support, which provides a theoretical basis for scientific understanding and effective intervention of the influence of parental depression on adolescent adjustment problems.

消极完美主义对青少年自伤行为的影响：一个有调节的中介模型

顾红磊（通讯作者）¹ 夏天生²

¹ 湖南师范大学心理学系，长沙，410081，GHL@hunnu.edu.cn

² 广东工业大学艺术与设计学院，广州，510090

摘要 自我伤害行为(简称自伤)是指在没有自杀意图的前提下，个体以不被社会文化认可的方式对自己的身体或身体组织进行故意的、直接地伤害。自伤通常开始发生于12至14岁，在青少年时期最常见。一项元分析研究显示，自伤在青少年群体中的发生率为17.2%，而在青年人群体中的发生率为13.4%，在成年人群中仅为5.5%。自伤与很多心理和行为问题有关，包括抑郁、焦虑、边缘型人格障碍和自杀等。鉴于青少年是自伤行为的高发人群，以及自伤带来的严重危害，有必要对自伤行为的影响因素及其作用机制进行深入探讨。本研究采用Frost多维完美主义量表、焦虑抑郁压力量表、正念注意知觉量表和青少年自伤行为问卷对841名青少年进行测试，探讨消极完美主义对青少年自伤行为的影响及作用机制。结果表明：（1）消极完美主义可以显著正向预测青少年的自伤行为，心理困扰在二者的关系中起中介作用；（2）正念调节了心理困扰在消极完美主义和自伤之间的中介效应，且调节作用在中介效应的前后半段路径均有发生，即正念水平较高时，消极完美主义对心理困扰的正向预测作用以及心理困扰对青少年自伤行为的正向预测作用均有所减弱。因此，消极完美主义和青少年自伤行为之间存在有调节的中介效应。本研究的结果为青少年自伤行为的预防和干预提供了一些有价值的启示。首先，要正确引导青少年完美主义的发展方向。在青少年日常的学习及生活中，老师及家长要有意识地培养青少年合理制定个人目标以及正确对待成长道路上遇到的成功以及挫折的能力。其次，对心理困扰等负面情绪要用正确的途径加以疏导，避免其通过自伤这一极端的方式进行情绪宣泄。最后，本研究证实了正念对于负性情绪调节和自伤行为干预的重要作用。因此，可以尝试在课堂教学中加入正念训练课程(例如，正念认知疗法，MBCT)，或者给青少年布置相关的正念练习，提升其情绪调节的自我效能感，减少自伤行为的发生。

Maladaptive perfectionism and adolescent NSSI: A moderated mediation model

Honglei Gu¹, Tiansheng Xia²

¹ Department of Psychology, Hunan Normal University, Changsha, GHL@hunnu.edu.cn

² School of Art and Design, Guangdong University of Technology, Guangzhou

Abstract: Non-suicidal self-injury (NSSI) is defined as the deliberate, direct, and socially unacceptable destruction of one's own body tissue without conscious suicidal intent. NSSI usually begins between 12 and 14 years of age, and is most common in adolescence. A meta-analysis study demonstrates that the lifetime prevalence of NSSI was 17.2% among adolescents, 13.4% among young adults, and 5.5% among adults. More importantly, NSSI is associated with a variety of psychiatric disorders, such as depression, anxiety, and borderline personality disorder, and acts as a robust risk factor for future suicidal behaviors. Given the high prevalence of NSSI in adolescents and its clinical significance, identifying risk factors for NSSI is important to effectively prevent such behavior. In the present study, 841 adolescents anonymously completed questionnaires regarding maladaptive perfectionism, psychological distress, mindfulness, and NSSI. The results revealed that maladaptive perfectionism was positively associated with adolescent NSSI, and this association was mediated by psychological distress. Mindfulness weakened the association between maladaptive perfectionism and psychological distress, as well as the association between psychological distress and NSSI. The results from our study provide evidence to explain how psychological distress mediates the relationship between maladaptive perfectionism and NSSI, and when this mediation is most apparent. These findings have at least three implications for the prevention and treatment of adolescent NSSI. First, we should correctly guide the development direction of adolescent perfectionism. In the daily life, parents and teachers should consciously cultivate adolescents to establish reasonable personal goals and their ability to give right attitude towards success and

setbacks on the road they grow. Second, our findings suggest that psychological distress plays an important role in transmitting the effect of negative perfectionism on adolescent NSSI. It may be useful to support interventions focused on teaching effective emotion regulation skills to adolescents. Finally, our findings suggest that mindfulness significantly weakened the association between negative perfectionism and psychological distress, as well as the association between psychological distress and NSSI. Thus, educators should add some mindfulness training courses (e.g., MBCT) in classroom teaching, or assign relevant mindfulness exercises to adolescents to improve their self-efficacy in emotional regulation and reduce the engagement of NSSI.

情绪信念与主观幸福感的关系：一项交叉滞后研究

张蒙¹ 孔凤¹ 游旭群²

1 陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室, 西安, 710000

2 陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室, 西安, 710000, youxuqun@snnu.edu.cn

摘要 情绪信念是指个体形成的一组关于情绪可变性的信念。以往横断研究表明, 情绪信念与主观幸福感的某些维度, 例如积极情绪和消极情绪等存在显著的相关。然而, 目前尚缺乏对情绪信念与主观幸福感在因果层面的系统研究。基于幸福感的动力模型(engine model of well-being)、自我决定理论以及扩展建构理论, 本文运用交叉滞后模型, 尝试性地探索了情绪信念与主观幸福感之间的因果关系。采用情绪信念量表, 生活满意度量表(SWLS)以及积极与消极情绪量表(SPANE), 以2个月为时间间隔, 在两个时间点测查了499名成年人。采用SPSS22.0进行基本数据处理及相关分析, 并使用Mplus8.0软件建立并检验了情绪信念与主观幸福感的交叉滞后路径分析的结构方程模型。结果表明, T1时间点的情绪信念水平显著预测T2时间点的主观幸福感水平, 模型拟合程度良好($\chi^2 = 2010.583$, $df=782$, $p < .001$, $RMSEA = 0.056$, $SRMR = 0.092$, $CFI = 0.907$, $TFI = 0.897$)。此外, T2时间点的主观幸福感水平无法反向预测T1时间点的情绪信念水平。结果表明情绪信念可以单向预测主观幸福感, 这支持了幸福感的动力模型以及自我决定论的相关观点。综上, 本研究通过交叉滞后模型, 初步发现了情绪信念对于主观幸福感的预测作用, 为情绪信念与主观幸福感之间的因果关系提供了初步证据, 揭示了情绪信念在促进个体提升幸福感水平中的作用和地位。

Relation of beliefs about emotion to subjective well-being: a two-wave longitudinal study

Meng Zhang, Feng Kong, Xuqun You

School of psychology, Shaanxi Normal University

199 Changannan Road, Xi 'an, Shaanxi Province, China

Abstract: Prior research has shown emotion malleability beliefs are positively related to subjective well-being, but less is known about the causal relation between both variables. Based on engine model of well-being, self-determination theory and the broaden-and-build theory, the present study used a two-wave longitudinal design to examine the causal relation between emotion malleability beliefs and subjective well-being in a total of 499 Chinese adults. Using cross-lagged models, we found that emotion malleability beliefs positively predicted all three dimensions of subjective well-being two months later and the model showed a good fit: $\chi^2 = 2010.583$, $df=782$, $p < .001$, $RMSEA = 0.056$, $SRMR = 0.092$, $CFI = 0.907$, $TFI = 0.897$. Moreover, we did not detect any reverse or reciprocal effect between emotion malleability beliefs and subjective well-being. In all, our study provided primary evidence for the predictive causal link between beliefs about emotion and subjective well-being.

Keywords: Beliefs about emotion, Subjective well-being, Longitudinal study, cross-lagged model

基于数字游戏的心理障碍干预效果的元分析研究

王智铿¹ 蔡志慧² (通讯作者)

摘要 随着严肃游戏的发展, 基于数字游戏的精神障碍干预在临床心理学实践中涌现出许多新的尝试。由于采用数字游戏进行心理障碍干预是一个相对较新的研究领域, 因此有必要确定其对精神障碍干预的有效性。虽然越来越多的人研究了基于数字游戏的干预对精神障碍的治疗效果, 但研究结果并不一致。一些研究证实了游戏化干预对心理障碍的积极作用, 而一些研究的结论并未发现显著的改善效果, 甚至出现了冲突的结论。因此, 目前仍缺乏有力的证据来支持数字游戏在临床心理学实践中的应用。本研究将数字游戏对精神障碍干预有效性的相关研究进行了全面地系统性综述。采用三水平元分析的方法, 通过系统地文献检索, 共纳入 37 篇原始文献, 包含 225 个效应量和 1782 名参与者 (精神障碍患者), 分别考察了对照实验和前后测实验条件下, 数字游戏对精神障碍的干预效果。采用随机效应模型, 首先考察了前后测实验条件下 (10 篇初始文献, 47 个效应量, 139 名患者) 的总效应。元分析结果发现, 相较于干预前, 数字游戏化干预后, 心理障碍的改善呈现中等大小的正效应 ($g = 0.33, 95\% CI [0.20, 0.45]$)。其次考察了对照实验条件下 (27 篇初始研究, 178 个效应量, 1631 名患者), 数字游戏对精神障碍的干预效果。结果发现, 相比于对照组, 基于数字游戏干预组对心理障碍的干预起到了显著的改善作用 ($g = 0.43, 95\% CI [0.25, 0.61]$)。此外, 由于各初始研究间呈现出显著的异质性, 进一步调节效应分析的结果表明, 患者的年龄和干预持续的时间对基于数字游戏的干预效果均起到显著的调节作用。研究发现数字游戏干预持续时间越长, 对心理障碍的干预效果越好。并且数字游戏化干预的方式对老年人心理障碍的改善效果更好。未来需要更多的研究进一步揭示基于数字游戏干预的机制, 并确定其改善精神障碍症状的关键组成部分。

Effects of Digital Game-based Intervention for Mental Disorders: A Meta-Analytic Review

Wang Zhikeng, Cai Zhihui

Central China Normal University, Wuhan

Abstract: A lot of attention has been paid to the digital game-based interventions for mental disorders. Many new attempts have been conducted to intervene mental disorders using digital games. Since the application of digital game-based interventions for mental disorders is a relatively new research field, it is necessary to figure out its effectiveness. Although more and more studies were conducted to investigate the effects of digital game-based interventions for mental disorders, the results were not consistent. Some studies have confirmed the positive effects of digital game-based intervention for mental disorders, while some studies have not found a statistically significant improvement effect, and even conflicting conclusions have appeared. Therefore, there is still a lack of strong evidence to support the application of digital games in clinical psychology practice. This study conducted a comprehensive three-level meta-analysis on the effectiveness of digital gaming interventions for mental disorders to figure out the effectiveness and the importance factors that may play moderate role on the effectiveness of digital game-based intervention. A total of 37 studies were included with 225 effect sizes reported from 1782 participants (all are patients). Dividing all included articles into two conditions, 10 only reporting pre-post test data of experimental group (139 patients, 47 effect sizes), 27 reporting pre-post test data of experimental group and control group (among 1643 patients 861 in the digital game interventions conditions, 178 effect sizes). Using a random-effects model in a three-level meta-analysis, a small-to-medium effect size of digital games interventions on mental disorders ($g = 0.43, 95\% CI: [0.25, 0.61]$) was revealed. In addition, a statistically significant positive averaged effect was also found among 10 pre-post experimental studies ($g = 0.33, 95\% CI: [0.20, 0.45]$). In addition, due to the significant heterogeneity of the primary studies, the follow-up moderation analyses identified that

participants' age, the length of intervention duration play a moderating role on the effect of game-based intervention on mental disorders. The longer the duration of digital game intervention, the better the effect of intervention on mental disorders. Moreover, digital game-based intervention has a better effect on the improvement of mental disorders in the elderly. Future studies need to explore the mechanism of digital game-based interventions and identify the key components that improve mental disorders symptoms.

Keywords: digital game, mental disorder, intervention, three-level meta-analysis

今天的你还是昨天的你吗？ 高低频生活事件的时间比较对自我连续性的影响

安薪如^{1,2} 尹彬¹（通讯作者）

1 福建师范大学心理学院, 福州, 350108, Email: byin@fjnu.edu.cn

2 暨南大学管理学院, 广州, 510632

摘要 自我连续性是自体心理学的重要概念, 但个体对自我连续性判断的依据是什么还未有清晰的解释。文章基于前人研究, 设计了两个研究来探讨时间比较、时间聚焦观与自我连续性之间的关系, 并在此基础上进一步探究了个体主观幸福感的时间存续性问题。研究 1 以聚焦时间段与个体经历的生活事件的频率为自变量, 时间比较为因变量, 采用 2×2 的混合设计探讨了聚焦时间段与生活事件频率对时间比较值的影响; 研究 2 在研究 1 时间比较的基础上额外进行自我连续性的测量, 研究时间比较、生活事件频率与自我连续性之间的关系。两个研究的实验结果为: 聚焦时间段与生活事件频率的主效应显著且二者之间产生了交互作用, 共同影响时间比较: 高频生活事件的时间比较中存在聚焦主义而低频生活事件的时间比较中聚焦主义不明显; 时间比较的绝对值越大, 自我连续性的差值就越大。结论为时间比较中存在聚焦主义且聚焦主义产生的偏差主要体现在高频生活事件上; 时间比较的变化在一定程度上能够预测自我连续性的值。研究 3 在此基础上, 探究了个体的主观幸福感是受个体经历的“小确幸”事件影响而处于断续的离散状态还是受个体经历的重要生活事件(他人)的影响而处于连续的稳定状态, 结果发现个体经历的高频且重要的生活事件通过自我连续性的中介正向影响了主观幸福感的时间存续性。这一研究丰富了自我连续性的内涵, 拓展了它对心理健康教育的启示。

Are You the Same Today Like You Were Yesterday? The Effects of Time Comparison of High or Low Frequency Events on Self-Continuity

AN Xinru^{1,2}, YIN Bin¹

1 School of Psychology, Fujian Normal University, Fuzhou 350108, Email: byin@fjnu.edu.cn

2 School of Management, Jinan University, Guangzhou 510632

Abstract: Self-continuity is an important concept in self psychology. However, there is no clear explanation about the basis of self-continuity judgment. Based on previous studies, this paper designs two studies to explore the relationship among time comparison, temporal focalism and self-continuity, and further explores the temporal persistence of individual subjective well-being. In Study 1, a survey experiment was adopted within which the focused time and life event frequency were taken as independent variables and the values of time comparison were taken as dependent variables. The mixed design of 2×2 was adopted to discuss the influence of focused time and life event frequency on time comparison. In Study 2, a questionnaire survey was used to measure the same subjects' self-continuity as in study 1, and the relationship between time comparison and self-continuity was discussed. The results of the two studies are as follows: the main effects of focused time and life event frequency are significant, and

the focused time and life event frequency have an interactive effect and jointly affect the time comparison. There is focalism in the time comparison of high frequency life events, while there is no focalism in the time comparison of low frequency life events. The greater the absolute value of the time comparison, the greater the difference of self-continuity. The conclusion is that there is focalism in time comparison and the deviation caused by it is mainly reflected in high frequency life events. The change of time comparison can predict the value of self-continuity to some extent. On this basis, Study 3 further explored whether the subjective well-being of individuals is in intermittent discrete state affected by the "small but happy" life events, or is in a continuous and stable state under the influence of important life events (some significant others) of individual experience. The results show that the high-frequency important life events positively affect the temporal persistence of subjective well-being through the mediating effect of self-continuity. This study enriches the connotation of self-continuity and expands its enlightenment on mental health education.

Keywords: temporal comparison, frequency of life events, temporal focalism, self-continuity, temporal persistence of subjective well-being

电子屏幕化的特里尔社会应激测验能够有效诱发急性压力反应

古海霞¹ 赵晶晶¹ 刘春宇^{1, 2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 纽约州立大学上州医科大学精神病学系, 纽约, 美国, liuch@upstate.edu

摘要 背景: 特里尔社会应激测验(Trier Social Stress Test, TSST)能够有效诱发急性社会心理的压力反应。然而, 受到高成本和施测情景不一致性的限制, TSST 局限于小样本研究且缺乏可靠性。因此, 本研究提出一种高通量、标准化的替代范式, 即电子屏幕化的特里尔社会应激测验(Trier Social Stress Test - Electronic Screen, TSST-ES), 以诱导稳健的急性压力反应。**方法:** 97 名健康成人受试者(男性 13 名, 女性 84 名; Mage = 19.50 ± 0.18)参与了研究。每组 2~6 人同时参与实验, 每名参与者各自在提前录制的伴有中性反馈的“观众”(通过笔记本电脑播放)面前进行演讲和心算任务。采用压力感知量表(Perceived Stress Scale, PSS)、状态-特质焦虑量表(State-trait Anxiety, STAI)和演讲者自信心评定量表(Personal Report of Confidence as a Speaker, PRCS)对被试的心理特征进行评估。正式实验持续 60 分钟, 在 6 个时间点重复采集受试者收缩压(SBP)、舒张压(DBP)、脉搏(Pulse)和主观视觉模拟评分(VAS, 包括压力感、威胁感、挑战感三个条目, 0~10 计分)数据。通过曲线下面积(Area under the curve with respect to ground, AUC_G)衡量实验中受试者的整体的压力释放量。采用 k-means 方法对四个曲线下面积变量进行聚类分析, 以确定高、低压力反应模式。此外, 受试者报告了对实验场景真实性的主观感受(0~10 计分)。**结果:** 单因素重复测量方差分析显示, TSST-ES 能够有效诱发急性压力反应(SBP: $F(4.51, 452.70) = 4.30, p = .001$; DBP: $F(4.44, 421.79) = 2.57, p = .032$; Pulse: $F(4.53, 430.55) = 3.54, p = .005$; VAS: $F(3.19, 306.29) = 106.10, p < .001$)。而且, 两组压力反应者(高反应者: $N = 61$; 低反应者: $N = 35$; SSb/SS_t = 29.5%)在重复测量的压力指标上存在显著的组间差异(SBP: $F(1, 94) = 62.60, p < .001$; DBP: $F(1, 94) = 39.21, p < .001$; Pulse: $F(1, 94) = 0.01, p = .918$; VAS: $F(1, 95) = 29.11, p < .001$)。AUC_GSBP 与 AUC_GDBP 存在显著相关($p = 0.716, p < .001$)。AUC_GVAS 与 AUC_GSBP、AUC_GDBP 的相关性呈边缘显著($p = -0.238, p = .019$; $p = 0.203, p = .046$)。两独立样本 T 检验发现, 聚类分组不受心理评估状态的影响。此外, 被试报告了中等程度的场景真实性感受($4.20 \pm 0.27, p < .001$)。**结论:** TSST-ES 能有效地诱发受试者生理和心理的应激反应, 并且区分出高、低压力响应者。生理、心理应激指标之间存在高一致性。此外, 受试者在该范式中体验到了中等程度的真实性。综上, TSST-ES 有助于开展快速、大量、可靠的急性压力研究。

The Trier Social Stress Test-Electronic Screen (TSST-ES) Induces Acute Stress Responses Efficiently

Haixia Gu¹, Jingjing Zhao¹, Chunyu Liu^{1,2,*}

¹ School of Psychology, Shaanxi Normal University, Xi'an 710062, China

² Department of Psychiatry, SUNY Upstate Medical University, Syracuse, NY, United States, Email: liuch@upstate.edu

Abstract: Background: The Trier Social Stress Test (TSST) could effectively induce acute socio-psychological stress responses. However, TSST studies were limited to small samples and lacked reliability, because of high costs and inconsistent situations. Hence, we propose a high-throughput and standardized alternative, i.e., the electronic screen-based Trier Social Stress Test (TSST-ES), to induce robust acute stress responses. **Methods:** Ninety-seven healthy adults (13 males and 84 females; Mage = 19.50 ± 0.18) participated in this study. Multi-subjects (2 to 6 in each group) will participate in the experiment simultaneously. Each subject will take the public speaking task and mental arithmetic task in front of pre-recorded audiences with neutral feedback played through the laptops independently. Subjects' psychological characteristics were assessed by questionnaires, i.e., Perceived Stress Scale (PSS), State-trait Anxiety Inventory (STAI), and Personal Report of Confidence as a Speaker (PRCS). Subjects' systolic blood pressure (SBP), diastolic blood pressure (DBP), Pulse, and subjective Visual Analogue Scale (VAS, including stress, challenge and threaten items, from 0-10) were repetitively collected at 6 time-points during the 60-min formal experiment. The area under the curve with respect to ground (AUC_G) was used to quantify the overall stress release of the subjects. Cluster analysis of four AUC_G variables was performed with k-means to define high/low-stress pressure response patterns. Also, subjects' perception of the reality of the experiment scene was evaluated (from 0-10). **Results:** One-way repeated measures ANOVA showed that the TSST-ES effectively evoked acute stress responses (SBP: $F(4.51, 452.70) = 4.30, p = .001$; DBP: $F(4.44, 421.79) = 2.57, p = .032$; Pulse: $F(4.53, 430.55) = 3.54, p = .005$; VAS: $F(3.19, 306.29) = 106.10, p < .001$). Two stress responder groups (high responder: $N = 61$; low responder: $N = 35$; SSb/SSt = 29.5%) showed significant differences in repeated measured indicators (SBP: $F(1, 94) = 62.60, p < .001$; DBP: $F(1, 94) = 39.21, p < .001$; Pulse: $F(1, 94) = 0.01, p = .918$; VAS: $F(1, 95) = 29.11, p < .001$). AUC_GSBP had significant correlations with AUC_GDBP ($\rho = 0.716, p < .001$). AUC_GVAS had borderline correlations with AUC_GSBP and AUC_GPulse ($\rho = -0.238, p = .019$; $\rho = 0.203, p = .046$). Two independent sample t-tests found cluster groups did not influenced by the status of psychological assessments. Furthermore, subjects reported a moderate feeling of authenticity ($4.20 \pm 0.27, p < .001$) after being exposed to this scenario. **Conclusions:** TSST-ES could effectively elicit both physiological and psychological acute stress responses, and differentiate high/low-stress responders. There are high consistencies among these physiological and psychological stress indicators. Also, the subjects have a moderate sense of authenticity in this paradigm. To sum up, TSST-ES will contribute to the quick, massive, and reliable acute stress studies.

催产素对微表情识别的影响

吴奇^{1,2} (通讯作者) 谢艳妮^{1,2} 刘炫辰^{1,2}

¹ 湖南师范大学教育科学学院心理系, 长沙, 410081, sandwich624@yeah.net

² 湖南师范大学认知与人类行为湖南省重点实验室, 长沙, 410081

摘要 催产素是下丘脑分泌的一种神经多肽。研究表明, 催产素能促进个体对于宏表情 (即普通表情) 的识别。然而, 除宏表情外, 人类还存在一种非常快速 (持续时间小于 1/2 秒) 的微表情, 它表达了人们被压抑的真实情感, 是谎言识别的有效线索, 在安全、司法、临床、教育等众多领域有着极高的应用价值。考虑人们在微表情识别上存在的巨大困难和微表情识别的重大应用价值, 对其加工过程进行研究十分必要。而催产素系统作为一个能促进人类对于微妙社会线索检测的重要系统, 它在微表情识别过程中又扮演了怎样的角

色? 对这一问题的回答, 将加深我们对微表情识别过程的理解, 为设计有效的微表情识别辅助工具提供科学基础。本研究通过 40 IU 单剂量鼻内催产素给药、安慰剂对照混合实验的方式研究了催产素对微表情识别的影响。其中, 实验一 ($n = 72$) 和实验二 ($n = 75$) 采用了经典的 JACBART 范式分别考察了在三种微表情持续时间 (50 ms、150 ms、333 ms) 条件下催产素对高表情动作强度 (100%) 和低表情动作强度 (25%) 的愤怒、恐惧、快乐、惊讶、悲伤、厌恶的六种标准化微表情的识别过程的影响。而实验三 ($n = 126$) 和实验四 ($n = 72$) 则进一步采用来自于真实社会情境中的自然微表情材料, 考察了催产素对自然微表情识别的准确率、反应时和眼动过程的影响。实验一和二的结果显示, 催产素显著延长了对 150 ms 的惊讶微表情的识别反应时, 降低了对 150ms 和 333 ms 的标准化厌恶微表情的识别准确率。实验三和四结果也显示, 催产素降低了对厌恶和惊讶的自然微表情的识别准确率, 且这一效应是由于催产素给药会增加对厌恶和惊讶面孔的眉眼区域的首次进入时间所致。这些研究结果说明, 催产素系统参与了微表情识别的加工过程, 特别是对惊讶和厌恶的微表情的识别起到了抑制作用。本研究结果提示微表情识别与宏表情识别在神经生理机制上就存在着显著差异, 而这可能是导致人们很难识别微表情的根本原因。除此外, 考虑催产素在促进人际信任与依恋中的重要作用, 本研究结果还提示, 对微表情的识别可能是人类进行欺骗检测的适配器。

Effects of Oxytocin on Micro-expression Recognition

Qi Wu^{1,2} (Corresponding Author), Yanni Xie^{1,2}, Xuanchen Liu^{1,2}

1 Department of Psychology, School of Educational Sciences, Hunan Normal University, Changsha, China, sandwich624@yeah.net

2 Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University, Changsha, China

Abstract: The neuropeptide oxytocin is essential for bonding and attachment in mammals and has also been associated with human social behaviors. Considering that the ability to decode another's facial expression is a pre-requisite for social interaction, it is not surprising that oxytocin was found to improve the recognition of emotional expressions for human subjects. These studies mainly focused the recognition of macro-expressions which are direct expressions of ones' true emotion. However, in real life situations, sometimes people need to hide and inhibit their true emotions to manipulate and deceive others. Despite our efforts to hide, the true emotions may still leak, and these leaked emotions are usually displayed in the form of micro-expressions. Micro-expressions are fleeting facial expressions which lasts no longer than 0.5 s. It usually occurs in the high-stake situations and it is an essential clue for lie and dangerous demeanor detection. However, it is difficult for us to detect micro-expressions. What role does the oxytocin system play in the recognition process of micro-expressions? Answers to this question will deepen our understanding of the micro-expression recognition process, and it can help us to design better micro-expression recognition tools. In the present study, we utilized a double-blind, placebo-controlled, mixed-model experimental design to investigate the effects of oxytocin on the recognition of micro-expressions. Participants were asked to perform a standardized micro-expression recognition task (presented by employing the classic JACBART paradigm) after self-administration of a single dose of intranasal oxytocin (40 IU) or placebo (containing all ingredients except for the neuropeptide). Specifically, in Experiment 1 ($n = 72$) & 2 ($n = 75$), participants were asked recognize six categories of intense or subtle micro-expressions (happiness, disgust, fear, angry, surprise, and sadness) under three kinds of duration conditions (50, 150, 333 ms). The data of recognition accuracy and reaction time were recorded for these tasks. In Experiment 3 ($n = 126$) & 4 ($n = 72$), we further examined the effects of oxytocin on the recognition of natural micro-expressions. The results of Experiment 1 showed that, a single dose of intranasal oxytocin did not affect the recognition accuracy for intense micro-expressions, but it significantly increased the reaction time for the recognition of intense micro-expressions of surprise. The results of Experiment 2 showed that, oxytocin significantly decreased the recognition accuracy for subtle micro-expressions of disgust under duration conditions of 150 ms and 333 ms, but it did not affect the recognition accuracy and reaction time for other categories

of subtle micro-expressions. The results of Experiment 3 & 4 replicated the results of Experiment 1 & 2 by showing that oxytocin significantly reduced the recognition accuracy for natural micro-expressions of disgust and surprise. Eye-movement results of Experiment 4 further revealed that this phenomenon was caused by the prolonging effect of oxytocin on the first entering time in the eye brow and eye regions of natural micro-expressions of disgust and surprise. These results showed that the oxytocin system participates in the recognition of micro-expressions, but contrary to its facilitation role in the recognition of macro-expressions, the oxytocin mainly plays an inhibiting role in the recognition of micro-expressions. Consistent with previous studies, these results suggest that there are fundamental differences in the neurophysiological mechanisms for the recognition of macro and micro-expressions, and the recognition of micro-expressions may be an adaptation to cheating detection problems. The present study is the first to investigate the effect of oxytocin on micro-expression recognition and it provides a theoretical basis for understanding the effect of oxytocin on micro-expression recognition.

虚拟现实环境中个体情绪与存在感的关系：一项元分析

朱艺璇 李林（通讯作者） 宋静静 周春燕

中国地质大学(武汉)心理科学与健康研究中心，武汉 430074，lilin@cug.edu.cn

摘要 心理学领域中的虚拟现实（VR）技术主要用于提高实验的生态效度或作为情绪唤醒工具。整理文献发现，与指向系统技术层面的沉浸感不同，个体在虚拟环境中的存在感主要指感觉到与虚拟刺激或环境相关或参与的程度，是一种主观意识状态，也是衡量 VR 技术有效性的关键指标。已有研究指出 VR 环境中个体的情绪状态与其感受到的存在感密切联系，但是结论存在争议。本文归纳整合了 VR 中情绪与存在感关系相关研究，使用元分析的方法对二者相关性进行探究，通过文献检索，纳入符合要求文献 27 篇，共 36 个效应值。同质性检验结果表明，纳入研究的异质性较高，故进一步以二维情绪理论和情绪动机模型为基础，探究二者关系在不同情绪维度上的差异，并考察了以往实验研究中 VR 场景的空间导航性及存在感的测量工具对情绪与存在感关系的影响。结果显示：虚拟现实环境中情绪与存在感中等程度正相关($r=0.304$)；情绪效价、动机强度的调节效应显著，唤醒度的作用不显著；空间导航性的调节作用显著，测量工具的作用不显著。未来研究可丰富对情绪类型的考察，检验各情绪维度的调节效应；同时在测量工具上开发虚拟现实环境中更适合的存在感客观、实时测量指标；在实验过程中关注场景的空间导航性，优化应用中虚拟场景设计。

The influence of individual emotional state on the sense of presence in the virtual reality environment: A meta-analysis

ZHU Yixuan, LI Lin, SONG Jingjing, ZHOU Chunyan

Research Center for Psychological and Health Sciences, China University of Geosciences, Wuhan 430074, China

Abstract: Virtual reality (VR) technology in the field of psychology is mainly used to improve the ecological validity of experiments or as a tool for emotional arousal. According to the literature, it is different from the immersion that points to the technical level of the system. The presence of an individual in the virtual environment mainly refers to the degree to which the individual feels related to or participates in the virtual stimulus or the environment. It is a state of subjective consciousness and a measure of the effectiveness of VR technology. The key indicators are proposed. Studies have pointed out that the emotional state of individuals in the VR environment is closely related to the sense of presence they feel, but the conclusion is controversial. This paper summarizes and integrates the research on the relationship between emotion and presence in VR, and uses meta-analysis to explore the correlation between the two. Through literature search, 27 documents that meet the requirements are included, with a total of 36 effect values. The homogeneity test results show that the included studies are highly heterogeneous, so based on the

two-dimensional emotional theory and emotional motivation model, the relationship between the two in different emotional dimensions is explored, and the VR in previous experimental studies The influence of the spatial navigation of the scene and the presence measurement tools on the relationship between emotion and presence. The results show that emotion and presence in virtual reality are positively correlated to a moderate degree ($r=0.304$); emotional valence and motivation intensity have a significant regulating effect, while arousal is not significant; spatial navigation has a significant regulating effect, and the role of measurement tools not obvious. Future research can enrich the investigation of emotion types and test the adjustment effects of various emotional dimensions; at the same time, develop objective and real-time measurement indicators for the sense of existence that are more suitable in the virtual reality environment on the measurement tools; pay attention to the spatial navigation of the scene during the experiment, Optimize the virtual scene design in the application.

摘要 以往多数研究探讨了情绪对人的认知加工过程比如记忆、问题解决等的影响, 但是作为基本情绪之一的惊讶情绪是否影响问题解决却并不清楚。惊讶情绪在研究早期被定义为引起吃惊、错愕的中性体验, 但在新近的研究中发现, 惊讶情绪的内容也存在着效价的不确定性。出现惊讶体验的情境以及惊讶体验的内容会赋予惊讶情绪不同的效价, 正性的惊讶被定义为惊喜, 负性的惊讶被定义为惊吓。本研究旨在探讨不同效价的惊讶情绪是怎样影响创造性问题解决。研究采用经典的情绪诱发范式, 以汉字组块破解作为创造性问题解决的实验材料。实验一的情绪诱发方式为效果最可观的观看视频, 探索中性情绪与惊讶情绪下的汉字组块破解任务的成绩差异。实验二使用表情模仿的方式以诱发不同效价的具身惊讶情绪, 探索中性情绪与正性惊讶、负性惊讶情绪下的汉字组块破解成绩差异。结果显示: (1) 惊讶情绪对于创造性问题解决的反应时具有显著影响, 较之于负性惊讶, 正性惊讶条件下的被试反应时更短。(2) 惊讶情绪条件下的创造性问题解决任务的解答率高于中性情绪条件, 但差异并不显著。上述发现表明惊讶情绪对于创造性问题解决具有正性作用, 可以使人更快地产出创造性问题的解决方案。惊讶情绪具有正负二重效价性, 正性的惊讶情绪对于创造性问题解决具有更大程度的促进作用。

关键词 创造性问题解决, 惊讶情绪, 具身情绪, 表情模仿, 组块破解

Effects of surprise emotion on creative problem solving

Yifan Shao¹, Zetao Lin¹, Meixin Jiang¹, Yitong Zeng¹, Zhonglu Zhang^{1,*}

¹ Department of Psychology, School of Education, Guangzhou University,
Guangzhou, China

Abstract: Most previous research has explored emotional states play an important role in human cognitive processing, such as memory and problem solving. As one of the basic emotions, surprise, however, is not clear whether affect problem solving. Surprise emotion was defined as a neutral experience that caused surprise and shock. However, surprise has recently been found to have dual dimensions of valence in composition, positive and negative, and plays different roles in different situations. The purpose of this study was to investigate whether surprise emotion affect on creative problem solving. In this study, the classical emotional elicitation paradigm was used and Chinese character chunk decomposition was used as the experimental material for creative problem solving. In the first study, the emotion eliciting mode was watching video. Its purpose was to explore the difference in the performance of Chinese character chunk decomposition task under neutral emotion and surprise emotion. In the second study, emotion eliciting mode was facial expression imitation to explore the difference of Chinese character block decoding performance under neutral emotion, positive surprise and negative surprise. The results showed that: (1) The main effect were significant for emotions on the response time of creative thinking, positive surprise make solving creative problem more quickly

than negative surprise.(2) The response rate of creative problem solving task in the surprise emotion condition was higher than that in the neutral emotion condition, but the difference was not significant. These findings indicated that surprise has a positive effect on creative thinking and make people produce creative problem solutions more quickly. Surprise emotion has its dual valence of positive and negative, and positive surprise emotion can promote creative thinking to a greater extent.

共情对重大事件中居民替代性创伤的影响： 认知偏向和应对方式的作用

韦晓¹（通讯作者） 万春¹ 梅里¹ 王萍¹ 韦晔²

¹ 六盘水师范学院教育科学学院，六盘水，553004

² 华中科技大学同济医学院，武汉，430030, 1325502635@qq.com

摘要 人类心理常受到来自外界刺激带来的直接或间接的心理体验，如：创伤后应激障碍（PTSD）或替代性创伤（VT），2020 年新年伊始，人们通过媒体紧密跟踪着疫情信息。绝大多数人从未到过疫情严重的地区或接触过感染者，但是，当看到新闻里每日上涨的数据、等待就诊的市民、忙碌的一线医护人员，很多人因此陷入了不安和抑郁，这种因为体验到他人所经历的灾难后，间接导致自己的身心出现困扰，乃至精神崩溃的现象被称为“替代性创伤”。然而，影响替代性创伤的因素仍然知之甚少。证据表明，共情（理解或他人的情感体验产生共鸣的能力）是影响替代性创伤的关键因素之一。尽管有证据表明共情与替代性创伤有关，但大多数研究表明共情作为替代性创伤的影响因素仅仅是从情绪情感中来衡量的，它与认知资源和积极心理是否有关？研究以 16-51 岁的 661 名手机用户为被试，在新型冠状病毒于全国爆发 25-35 天时，采用人际指针量表测查被试的共情能力，同时采用应对方式问卷（TCSQ）、认知偏向问卷和事件影响量表测查被试的应对方式、认知偏向和替代性创伤，从负性事件视角考察重大事件中共情能力对居民替代性创伤的影响，并探讨认知偏向和应对方式在其中的作用。结果显示，共情可直接正向预测替代性创伤；共情对替代性创伤的预测可分别通过认知偏向和应对方式的中介进行；这一发现提示，未来的负性生活事件后心理辅导工作除更加关注情绪的变化外，还应从个体认知资源和积极心理层面开展。研究提出一些平衡共情和替代性创伤之间关系的建议，如认知训练和自我关怀等，并对后续研究提出了建议，如评估替代性创伤的类型和程度，预防、应对和干预替代性创伤的策略。

关键词 共情，替代性创伤，认知偏向，应对方式

The impact of empathy on residents' vicarious traumatization in major events: the role of cognitive bias and coping style

Wei Xiao¹, Wan Chun¹, Mei Li¹, Wang Ping¹, Wei YE²

² Tongji Medical College, Huazhong University of Science & Technology, Wuhan, 430030, China

Abstract: Human is often subjected to direct or indirect psychological experiences from external stimuli, such as post-traumatic stress disorder (PTSD) or vicarious traumatization (VT). At the beginning of 2020, people closely follow the COVID-19 through the media. The vast majority of people have never been to a severely affected area or have been in contact with an infected person. However, when seeing the daily rising data in the news, the citizens waiting for treatment, and the busy frontline medical staff, many people fell into anxiety and depression. After experiencing the disaster experienced by others, this phenomenon indirectly leads to physical and mental distress, and

even mental breakdown, is called "vicarious traumatization ". However, the factors affecting vicarious traumatization are still poorly understood. Evidence shows that empathy (the ability to understand or resonate with the emotional experience of others) is one of the key factors affecting vicarious traumatization. Although there is evidence that empathy is related to vicarious traumatization, most studies show that empathy as an influencing factor of vicarious traumatization is only measured from emotions. Is it related to cognitive resources and positive psychology? The study used 661 mobile phone users aged 16-51 as subjects. When the COVID-19 broke out in the country for 25-35 days, the interpersonal indicator scale was used to measure the empathy ability of the subjects, and the coping style questionnaire (TCSQ), The Cognitive Bias Questionnaire and the Event Impact Scale measure participants' coping styles, cognitive biases, and vicarious traumatization. From the perspective of negative events, it examines the impact of empathy on residents' vicarious traumatization in major incidents, and explores cognitive bias and The role of coping styles. The results show that empathy can directly and positively predict vicarious traumatization; empathy can predict vicarious traumatization through the mediation of cognitive bias and coping style respectively; this finding suggests that future psychological counseling work after negative life events In addition to paying more attention to emotional changes, it should also be carried out from the individual cognitive resources and positive psychological levels. The research puts forward some suggestions to balance the relationship between empathy and vicarious traumatization, such as cognitive training and self-care, and makes recommendations for follow-up research, such as assessing the type and extent of vicarious traumatization, preventing, coping and intervening vicarious traumatization strategy.

Keywords: Empathy, vicarious traumatization, cognitive bias, coping style

新冠疫情下室内绿植对个体心理压力的影响

刘涛¹ 于文环² 何琳² Thomas Freudenreich²

1 浙江大学市场营销系, 杭州, 310058, liu_tao@zju.edu.cn

2 浙江大学市场营销系, 杭州, 310058

摘 要 目的: 本研究以新冠疫情为背景, 考察生活办公空间中摆放绿植对个体的心理压力的影响。方法: 预实验通过线上问卷调查中国受访者在新冠疫情期间(2020年2至5月)的压力水平及其疫情期间所在城市等信息, 并将其所在城市与2020年5月期间各省市累计确诊病例数配对, 用以确定疫情严重程度对心理压力的影响。实验1通过线上问卷了解中国受访者在疫情期间的生活中是否有绿植和绿植的生长状态, 以及受访者在疫情期间的感知压力, 以探究室内绿植对感知压力的应对效果。实验2在实验1的基础上增加积极情感消极情感量表进一步验证积极情绪的中介作用。实验3通过现场实验检验绿植数量对绿植效应的影响, 以确定边界条件。通过在疫情复工后某公司的三个不同办公空间中摆放不同数量的绿植(无绿植; 中等数量绿植; 较多数量绿植)来操纵自变量。三个办公空间的员工在不同数量绿植的环境中办公20天后接受问卷调查, 汇报这20天内的感知压力水平。结果: 预实验结果显示, 新冠疫情的严重程度显著增加个体的感知压力水平。实验1结果证实, 生活环境中有绿植能有效减少个体在疫情期间的感知压力。绿植的生长状态也显著影响个体的感知压力, 绿植生长状态越好, 个体的感知压力越小。实验2结果显示积极情绪完全中介绿植与感知压力之间的关系。实验3显示, 办公空间中无绿植的员工和较多数量绿植组员工的感知压力均显著高于中等数量绿植组的员工。有较多数量绿植组的员工感知压力和无绿植的员工几乎相同。即, 绿植数量显著影响绿植效应的强度, 合理数量的绿植能有效降低个体的感知压力。一种可能的解释是, 较多绿植会造成空间拥挤感知, 从而导致个体的感知压力升高。结论: 本研究将丰富自然环境与人类福祉联系的相关研究。其结果对维持人们心理健康具有积极的实践意义。另外, 本研究的结果具有较大的社会意义, 受疫情影响, 各类隔离措施限制了以往人们赖以缓解压力的社交活动以及外出活动, 而本研究建议的方法易实施、限制少且成本低。

The Plants effect on mental stress during the COVID-19 period

Tao Liu, Wenhuan Yu, Lin He, Thomas Freudenreich

Department of Marketing, School of Management, Zhejiang University

No. 866 Yuhangtang Road, Zhejiang University, Hangzhou 310058, China

Abstract: Objects: This study takes the new crown epidemic as the background to investigate the impact of green plants in the living office space on the psychological pressure of individuals. Method: In the pretest, we conducted an online questionnaire to investigate the stress level of Chinese respondents during the new crown epidemic (February to May 2020) and their city during the epidemic, and compare their city to the provinces and cities in May 2020. The cumulative number of confirmed cases is matched to determine the impact of the severity of the epidemic on psychological stress. Using online questionnaires, Study 1 find out whether there are green plants and the growth status of green plants in the living environment of Chinese respondents during the epidemic, as well as the respondents' perceived pressure during the epidemic, to explore the response of indoor green plants to perceived pressure effect. Study 2 added the Positive Affects and Negative Affects Scale based on Study 1 to further verify the mediating role of positive emotions. Study 3 tested the influence of the number of green plants on the effect of green plants through a field study to determine the boundary conditions. The independent variables were manipulated by placing different numbers of green plants (no green plants; the medium number of green plants; the large number of green plants) in three different office spaces of a company after the epidemic resumed work. Employees in the three office spaces took a questionnaire survey after working in a different number of green plants for 20 days and reported their perceived stress levels during the 20 days. Results: The results of pretest show that the severity of the new crown epidemic significantly increases the individual's perceived stress level. The results of Study 1 confirmed that green plants in the living environment can effectively reduce the perceived pressure of individuals during the epidemic. The growth status of green plants also significantly affects the individual's perceived pressure. The better the growth status of green plants, the lower the individual's perceived pressure. The results of Study 2 show that positive emotions completely mediate the relationship between green plants and perceived stress. Study 3 shows that the perceived pressure of employees without green plants and the large number of green plants in the office space is significantly higher than that of employees in the medium green group. Employees with the large number of green plants perceive the pressure as almost the same as those without green plants. That is, the number of green plants significantly affects the intensity of the green plant effect, and a reasonable number of green plants can effectively reduce the perceived pressure of individuals. One possible explanation is that more green plants will cause the perception of spatial crowding, which will lead to an increase in the perceived pressure of the individual. Conclusion: Our research enriched the related research on the connection between the natural environment and human well-being. The findings have positive practical significance for maintaining people's mental health. In addition, the results of this study have greater social significance. Affected by the epidemic, various isolation measures have restricted social activities and outing activities that people used to relieve stress. The methods suggested in this study are easy to implement, less restrictive, and low cost.

Keywords: Plants, Stress, Positive affects, Spatial crowding, COVID-19

自然环境干预提高中国新冠肺炎疫情一线人员复工后主观幸福感

摘要 新冠肺炎疫情期间我国一线工作人员(警察与医护群体)作出巨大奉献,但疫情结束复工后他们的心理健康缺少关注。本研究目的是为其主观幸福感的维护与提高提供一种基于自然环境的干预方法。共90名参与当地一线抗疫的工作人员自愿参与本研究,并在5天干预研究中被随机分为两组,一组接受自然环境相

关刺激的干预，另一组则接受城市环境相关刺激作为对照组。干预研究开始前获取参与者知情同意和人口统计学信息，后者在后续分析作为协变量。整体干预效果和每日干预即时效果均得到评估，涉及主观幸福感的多个方面，即正负性情绪、生活满意度、压力和焦虑体验以及职业倦怠感。结果表明，自然环境干预能有效处理负面情绪，提升积极情绪并累积产生整体效果，即在高压力的工作环境中维持对生活满意度的评价，表现出自然环境干预的临床应用价值。对日常即时效果的纵向数据分析表明，接触自然环境具有修复性功能，包括即刻压力降低和负面情绪减少，因此可作为日常情绪管理的应对策略。自然环境干预符合一线工作人员对情绪健康管理的实际需要，并提供一种易得、轻松且高效的外部资源来保障其主观幸福感。我们认为基于自然环境的干预可为更广泛人群的心理健康提供积极帮助，并提出未来研究的建议以进一步探索。

Abstract: The goal of the present study was to provide a nature-based intervention for essential workers (i.e., policer-officers and medical health workers) subjective well-being who sacrificed themselves during the COVID-19 epidemic. Ninety participants were randomly assigned to two groups in our 5-day intervention program, one group viewing natural stimuli while the other urban stimuli as a controlled group. Participant consents and demographic information were obtained prior to the study, which worked as covariates in the analysis. Both the intervention effectiveness and daily instant benefits were measured by various dimensions of subjective well-being (i.e., positive and negative affect, life satisfaction, stress, anxiety and job burnout). Results indicated natural stimuli intervention had clinically potential to address negative affect, increase positive affect, and accumulate to sustain the satisfaction with life despite their stressful working characteristics. Additional evidence was found by nested longitudinal analysis that natural stimuli worked well as a daily coping strategy to facilitate instant restorative benefits, including immediate stress reduction and negative affect decline. The designed study intervention perfectly matches the real need of those essential workers and provides an easy-to-access, effortless but high-effective resources supporting their well-being. We foresee a nature-based intervention might achieve population health benefits, hopefully lightened by future studies.

网络受欺凌个体的情绪注意偏向及注意偏向训练的干预研究

肖丹鹤¹ 葛操（通讯作者）

郑州大学，河南，450001

郑州大学教育学院心理系，郑州，450001，15736998305@163.com

摘要 随机选取 84 名大学生为研究对象采用《大学生遭受网络欺凌行为量表》筛选出 42 名网络受欺凌个体，并以 42 名未受欺凌个体为对照组进行实验。研究网络受欺凌个体的情绪注意偏向。在此基础上结合眼动技术，探究注意偏向训练对网络受欺凌个体产生的干预作用。研究分为两个实验：实验一采用点探测范式，采用 2（被试分组：网络受欺凌组、对照组）× 2（情绪面孔：正性-中性、负性-中性）× 2（一致性条件：一致、不一致）的混合实验设计。被试间变量是被试分组，被试内变量是情绪面孔和一致性条件，探索网络受欺凌个体的情绪注意偏向。实验结果如下：（1）在一致条件下，网络受欺凌个体对于负性情绪面孔的反应比正性情绪面孔的反应更快，差异显著（ $p < 0.05$ ）。（2）在一致条件下，网络受欺凌组和对照组被试对负性情

绪面孔的反应时差异显著 ($p < 0.05$)，即网络受欺凌被试对负性情绪面孔注意偏向的程度显著高于对照组。实验二在实验一的基础上结合眼动技术，采用点探测范式，以 2 (实验分组：实验组、控制组) $\times$ 2 (情绪面孔：正性、负性) $\times$ 2 (测量阶段：前测、后测) 的混合实验设计，用注意偏向训练任务重点对实验组进行了为期四周，共八次的正性情绪注意偏向训练，探究其对网络受欺凌个体的注意偏向产生的干预作用。实验结果如下：(1) 网络受欺凌被试通过注意偏向训练任务，实验组在前测和后测中对不同情绪面孔的注意偏向值差异显著 ($p < 0.05$)；控制组在前测和后测中对不同情绪面孔的注意偏向值差异不显著。(2) 网络受欺凌被试在不同实验分组条件下，被试的眼动指标首视点潜伏期在前测和后测差异显著 ($p < 0.05$)；在后测实验中，实验组和控制组的眼动指标首视点潜伏期差异显著 ($p < 0.05$)，实验组对于正性情绪面孔表现更多的注意偏向。研究结论如下：(1) 网络受欺凌个体对负性情绪面孔存在注意偏向。(2) 注意训练任务对于网络受欺凌个体能够起到积极干预作用，增强了网络受欺凌个体对于正性情绪面孔的注意偏向。

关键词 网络受欺凌，情绪注意偏向，注意偏向训练，点探测范式

Emotional attentional bias of Internet bullied individuals and the intervention of attentional bias training

XIAO Danhe, GE Cao

Zhengzhou University, He Nan

Abstract: A total of 84 college students were randomly selected as the research objects. 42 Internet bullied individuals were selected by using the Internet bullying behavior scale for college students, and 42 non bullied individuals were selected as the control group. Objective to study the emotional attention bias of Internet bullied individuals. On this basis, combined with eye movement technology, to explore the intervention effect of attentional bias training on Internet bullied individuals. The study was divided into two experiments. In Experiment 1, point detection paradigm was used, and 2 (subjects were divided into network bullying group and control group) $\times$ 2 (emotional faces: positive neutral, negative neutral) $\times$ 2 (consistency condition: consistent, inconsistent). The inter subject variable is the grouping of subjects, and the intra subject variable is the emotional face and consistency condition. The results are as follows: (1) under the same conditions, the response of Internet bullied individuals to negative emotional faces is faster than that to positive emotional faces, and the difference is significant ($p < 0.05$). (2) Under the same conditions, there was a significant difference in the reaction time of negative emotional faces between the Internet bullying group and the control group ($p < 0.05$), that is, the degree of attention bias of Internet bullying subjects to negative emotional faces was significantly higher than that of the control group. In Experiment 2, based on Experiment 1, eye movement technique was used, and point detection paradigm was used $\times$ 2 (emotional faces: positive and negative) $\times$ 2 (measurement stage: pre-test, post test) mixed experimental design, using attention bias training task focus on the experimental group for four weeks, a total of eight times of positive emotional attention bias training, to explore its intervention effect on the attention bias of Internet bullied individuals. The results are as follows: (1) through the attentional bias training task, the attentional bias values of different emotional faces in the experimental group were significantly different in the pre-test and post test ($p < 0.05$); In the control group, there was no significant difference in the attentional bias of different emotional faces in the pretest and posttest. (2) There was a significant difference in the first view latency between pre-test and post-test ($p < 0.05$); In the post test experiment, there was a significant difference in the first view latency between the experimental group and the control group ($p < 0.05$). The conclusions are as follows: (1) Internet bullied individuals tend to pay attention to negative emotional faces. (2) Attention training task can play a positive intervention role for Internet bullied individuals, and enhance the attention bias of Internet bullied individuals to positive emotional faces.

Keywords: cyberbullying, attentional bias attentional, bias training point, point detection paradigm

童年创伤经历、反刍思维及同伴依恋与大学生心理困扰的关系： 有调节的中介效应分析

肖青露¹ 肖莹莹¹ 吴宇彤¹ 付艳艳¹ 连帅磊² (通讯作者)

¹ 长江大学教育与体育学院, 荆州, 434100

² 长江大学心理学系, 荆州, 434023, lslyzpsy@yangtzeu.edu.cn

摘要 心理健康问题在国内外大学生群体中具有较高的检出率(40%-56%), 且随着社会经济的高速发展, 大学生面临的各种压力不断增多, 心理健康问题呈逐年增长的趋势。它不仅会诱发大学生休学、退学等学业适应不良问题, 而且会对大学生的身心健康发展造成威胁, 甚至导致大学生犯罪、自杀等社会问题。因此, 大学生心理问题的形成机制得到了诸多研究者的关注, 并取得了一系列成果。近年来, 不良环境特征与个体特征作为大学生心理问题产生和发展的潜在风险因素日益为研究者所重视。研究者分别从不同的视角对不良环境特征(如父母婚姻冲突、心理虐待与忽视、师生关系、同伴关系不良等)和个体特征(如性别、年龄、人格特质等)导致大学生心理问题的作用机制进行了探讨。但随着研究的深入, 研究者认为有必要从多因素整合的视角, 同时探讨环境特征和个体特征因素对大学生心理困扰的影响, 以进一步提高模型的解释力。基于此, 本研究构建了一个有调节的中介模型, 重点考察了个体早期环境特征(童年创伤经历)与大学生心理困扰的关系以及个体特征(反刍思维)的中介作用和当前环境特征(同伴依恋)的调节作用。本研究以1000名大学生为被试($M=19.50$ 岁, $SD=1.21$), 采用问卷法对其童年创伤经历、心理困扰、反刍思维以及同伴依恋进行调查。结果表明: (1)童年创伤经历、反刍思维、心理困扰两两之间均显著正相关, 童年创伤经历、心理困扰与同伴依恋之间均显著负相关; (2)童年创伤经历不仅能够显著直接预测心理困扰, 而且能够通过反刍思维的中介作用对心理困扰产生间接的预测作用, 且童年创伤经历对心理困扰的直接预测效应以及反刍思维的中介效应均会受到同伴依恋的调节, 即童年创伤经历的直接效应以及反刍思维的中介效应在低同伴依恋群体中更加显著。研究结果有助于揭示童年创伤经历对大学生心理困扰的影响及其作用机制, 对维护与促进个体良好的心理健康发展有一定启示意义。

Childhood Maltreatment Experiences, Rumination, Peer Attachment and Psychological Distress in university students: Moderated Mediation Analysis

Xiao Qinglu, Xiao Yingying, Wu Yutong, Fu Yanyan, Lian Shuailei

School of Education and Sports, Yangtze University

Department of Psychology, Yangtze University, Jingzhou 434023, China

Abstract: Along with the rapid growth of the social economy, the different kinds of pressure that university students need to face as well as the mental health problems among them are in a growing tendency in recent years. Therefore, scholars have started investigating the formation mechanism of psychological distress among university students. Among many factors influencing psychological distress of university students, The features of adverse environmental and individual characteristics have increasingly received attention of both practitioners and researchers over the past few years. There is substantial literature documenting that adverse environmental features (such as inter-parental conflict, psychological abuse and neglect, teacher-student relationship, unfavorable peer attachment, etc.) and individual characteristics (such as gender, age, personality traits, etc.) have an important influence on university students' psychological distress, few studies have investigated the mutual relationship among university students' psychological distress concerns with individual characteristics and early environment as well as the current environment in environment features. The present study attempts to bridge this gap by constructing a moderated mediation model to examine the effect of early environment features (childhood maltreatment experiences), current environment features (peer attachment), and individual characteristics (rumination) on university students' psychological distress and the underlying mechanisms. Specifically, this study will explore the relation between

childhood maltreatment experiences and psychological distress among university students, and analyzes the mediating role of rumination as well as the moderating role of peer attachment in this link. A total of 1000 university students (mean age = 19.5 years, SD = 1.21) participated in this study. Childhood maltreatment experiences were assessed with the CTQ-SF scale. The short form of ruminative responses scale was used to assess rumination traits. Psychological distress was assessed with Depression Anxiety Stress Scales. Peer attachment was measured by the modified version of The Inventory of Parent and Peer Attachment scale. All the measures have good reliability and validity. Results indicated that: (1) Childhood maltreatment experiences, rumination, and psychological distress were significantly positively correlated with each other; Childhood maltreatment experiences, psychological distress, and peer attachment were significantly negatively correlated with each other. (2) Childhood maltreatment experiences can not only affect psychological distress directly but also indirectly through the mediation of rumination, the association between childhood maltreatment experiences and psychological distress as well as the mediating role of rumination were moderated by peer attachment. Specifically, the direct effect of childhood maltreatment experiences and the mediating role of rumination were more significant for people with lower peer attachment. These findings contribute to our understanding of how and when childhood maltreatment experiences impact university students' psychological distress from the attachment theory of peers and the response styles theory of rumination. On the one hand, the experiences of childhood maltreatment as well as the rumination induced by childhood maltreatment may serve as a more important role on the emergence and development of university students' psychological distress. On the other hand, educators should pay more attention to the university students with lower levels of peer attachment (especially reduce the bad influence of childhood maltreatment experiences) and university students with higher levels of childhood maltreatment experiences (especially enhance their peer attachment). Last but not the least, educators should pay attention to not only the effect of early environment features (especially childhood maltreatment experiences) and current environment features (peer attachment) as well as individual characteristics (especially negative personality traits, such as rumination), but also the combined influence of those factors to realize the prevention and interventions for university students' psychological distress.

Keywords: childhood maltreatment experiences, psychological distress, peer attachment, rumination

睡眠剥夺影响工作记忆子过程的认知神经机制

王乐同 邵永聪（通讯作者）

北京体育大学心理学院，北京，100084，budeshao@aliyun.com

摘要 工作记忆涉及几乎所有的认知任务，在人类复杂的认知过程中起着至关重要的作用。工作记忆可以区分为维持（maintenance）和操作（manipulation）两个子过程，维持过程对信息进行储存、监控和匹配，操作过程则负责对信息进行排序和更新。许多研究报告了与睡眠缺失相关的工作记忆受损，但这种表现下降的机制仍需要讨论。本研究采用功能性磁共振成像技术，探究睡眠剥夺对工作记忆中维持与操作两个子过程的影响及其不同的认知神经基础。对 14 名健康男性被试（ 25 ± 2.01 岁）进行了 36 小时睡眠剥夺，剥夺前后分别在磁共振扫描下完成三个条件的 n-back 任务，即 0-、1-和 2-back，1-和 0-back 的差异反映了信息的临时储存（维持过程），而 2-和 1-back 的差异代表信息的在线处理（操作过程）。行为指标结果显示，睡眠剥夺后 0-、1-、2-back 反应正确率均有显著下降（ $p < 0.001$ ）。fMRI 结果显示，与基线条件相比，睡眠剥夺后维持过程募集了更广泛脑区的参与，主要包括双侧楔前叶、锯状皮层、扣带回、上内侧回、右侧缘上回及右侧辅助运动区；操作过程则更多地激活了左侧额上回、额下回（布鲁卡区）、顶下小叶等脑区。结果表明，睡眠缺失对

工作记忆不同子过程的损害机制不同, 疲劳状态下大脑对于认知任务的不同要求做出了不同策略的回应。睡眠剥夺后语音工作记忆任务中语言相关各脑区激活水平发生了变化, 除此之外维持过程和操作过程的能力下降还可能与广泛的功能网络连接改变有关, 需要进一步探究。

关键词 睡眠剥夺, 工作记忆, fMRI

Cognitive neural mechanisms of sleep deprivation affecting working memory sub-processes

Wang Letong, Shao Yongcong (corresponding author)

School of Psychology, Beijing Sport University, Beijing

Abstract: Working memory is involved in almost all cognitive tasks and plays a crucial role in human complex cognitive processes. Working memory can be divided into two sub-processes: maintenance and operation. The maintenance process stores, monitors, and matches information, while operation is responsible for sorting and updating information. Many studies have reported impaired working memory associated with sleep loss, but the mechanisms underlying this deterioration need to be discussed. In this study, functional magnetic resonance imaging was used to investigate the effects of sleep deprivation on two sub-processes of working memory, maintenance and manipulation, and their different cognitive neural bases. Fourteen healthy male subjects (25 ± 2.01 years old) were subjected to 36 hours of sleep deprivation. They completed the n-back task under three conditions, namely 0-, 1- and 2-back. The difference of 1- and 0-back reflected the temporary storage of information (maintenance). The difference between 2-back and 1-back represents the online processing of information (manipulation). The results of behavioral indexes showed that the accuracy of 0-, 1- and 2-back response was significantly decreased after sleep deprivation ($p < 0.001$). fMRI results showed that, compared with the baseline condition, maintenance after sleep deprivation involved a wider range of brain regions, including bilateral precuneus, calcarine gyrus, cingulate gyrus, superior medial gyrus, right superior marginal gyrus, and right supplementary motor area. The left superior frontal gyrus, inferior frontal gyrus (Broca's area) and inferior parietal lobule were more activated during the manipulation. The results show that the mechanisms of sleep loss damage different sub-processes of working memory, and the brain responds to different demands of cognitive tasks with different strategies under fatigue state. In addition to the changes in the activation levels of language-related brain areas in verbal working memory tasks, the decreased ability to maintain and manipulation processes may also be related to the changes in extensive functional network connections, which need further investigation.

摘要 自闭特质个体通常被认为在抑制控制能力方面存在缺陷, 这与自闭症谱系障碍(ASD)类似。许多研究利用功能磁共振成像技术(Functional Magnetic Resonance Imaging, fMRI)探讨临床 ASD 病人的抑制控制能力, 但很少有研究利用基于任务态的功能磁共振成像技术探讨 ASD 阈下水平的抑制控制能力, 特别是在青年群体中的探讨。本研究中, 我们收集了具有不同程度自闭特征的中国人被试, 目的是通过功能磁共振成像的停止信号任务来探讨自闭特质个体抑制控制能力较差的神经关联。结果表明, 自闭特质得分越高的个体, 其抑制控制能力越差。功能连接分析结果显示, 显著性网络(SN)与左侧边缘上回(SMG)的功能连接显著下降; 背侧注意网络(dorsal attention network, DAN)与左舌回(left lingual gyrus, LG)的功能连接显著降低; 额顶网络(FPN)

与左中央后回(PCG) 功能连接显著增高;LN(语言网络)与蚓部 4 5 的功能连接显著增加,与左侧颞下回(ITG)的功能连接显著减少。为了从更确切更具体的角度来探讨自闭特质的抑制反应能力的神经基础,进行 ROI-to-ROI 分析,结果发现,SMG、PCG、LG 和颞叶这些脑区同样出现在 take network as seed to voxel 的分析结果中。此外,我们还发现 AQ 及其子维度也与我们前面提到的这四个脑区存在显著的相关性。这一研究在一定程度上说明自闭特质个体在执行反应抑制任务时,其受到其他功能区的干扰,而其不能很好的避免这种干扰。这也从另一个侧面验证了上述四个脑区在自闭特质的执行功能中的特异性作用,在一定程度上说明这些脑区在其中起到的生物标记作用,其可能是反应抑制的基本神经基础。

³ Key Laboratory of Cognition and Personality, Ministry of Education, Chongqing, China

Abstract: Individuals with autistic-like traits are often thought to have deficit in inhibitory control ability, which is similar to ASD (autism spectrum disorder). Many studies explored inhibition control using fMRI (Functional Magnetic Resonance Imaging) measures in clinical level of ASD, rarely have studies explored it in subliminal level using a task-based fMRI, especially in young adults. Here, we focused on young adults with different levels of autistic-like traits, and aim to identify the neural correlate of this deficit using stop-signal task of fMRI. The results showed that young adults with autistic-like traits, whose have poor ability of inhibition control in task performance. The results of functional connectivity (FC) analysis showed the SN (salience network) has a significant decreased FC with left supramarginal gyrus (SMG); the DAN (dorsal attention network) has a significant decreased FC with left lingual gyrus (LG); the (frontoparietal network) FPN has a significant increased FC with left postcentral gyrus (PCG); the LN (language network) have significant increased FC with vermis 4 5 and decreased FC with left inferior temporal gyrus (ITG). Also, the SMG, PCG, LG and temporal gyrus are shown in the results of region of interests (ROI)-to-ROI analysis. Additionally, we also found AQ and its sub-dimensions also have significant correlations with these four brain regions that we aforementioned. Thus, young adults with autistic-like traits might have non-traditional neuro development of the response cognitive ability associated with these SMG, PCG, LG and temporal gyrus, which may be the basic neuro foundation of response inhibition.

抑郁症青少年和成人亚属前扣带皮层和杏仁核之间的静息态功能连接

王愉茜¹ 樊时佳¹ 汪寅² (通讯作者) 臧寅垠¹ (通讯作者)

¹ 北京大学心理与认知科学学院和行为与心理健康北京市重点实验室, 北京 100871

² 认知神经科学与学习国家重点实验室, IDG/麦戈文脑科学研究所, 北京师范大学, 北京, 100875

摘要 重度抑郁症的神经病理是神经影像学研究中的重要问题之一。其中, 亚属前扣带皮层和杏仁核作为在抑郁症中被广泛研究的两个区域, 二者之间的功能连接也受到关注, 但目前结果存在争议。因此, 本研究拟基于两个公开数据库 (CMI-HBN, Child Mind Institute Healthy Brain Network dataset; REST-meta-MDD), 检验并厘清亚属前扣带皮层和杏仁核之间的功能连接。本研究共对 39 名青少年抑郁症患者和 29 名青少年健康被试的静息态功能核磁共振扫描进行了基于种子区的全脑体素分析和感兴趣区 (ROI) 相关分析, 同时对包含 848 名成年抑郁患者和 794 名健康成人被试的数据集也进行了感兴趣区相关性分析。结果表明, 青少年的亚

属前扣带皮层-杏仁核功能连通性之间无显著组间差异；与成人健康对照组相比，成人抑郁症组表现出亚属前扣带皮层-杏仁核功能连通性的显著降低。进一步分析发现，相对于健康对照组和首次患病且未接受过药物治疗的抑郁成年人，复发性抑郁症成年人功能连通性显著降低。然而，健康对照组与首次患病且未接受过药物治疗的抑郁成年人之前组间差异不显著。本研究结果进一步厘清了以往研究中亚属前扣带皮层-杏仁核功能连通性损伤的争论：抑郁症网络亚区间功能连通性具有细微性和复杂性，青少年和成人重度抑郁症患者可能存在不同的功能异常倾向，即青少年更容易出现躯体症状（如，食欲不振，失眠），而成年人更易出现情感症状（如，无望感，情绪低落）。值得注意的是，本研究是使用了最新开放数据集探究和验证抑郁症网络亚区域功能连通性的争议性问题的研究。由于神经影像学研究结果的可重复性较低，对以往研究重要发现的验证具有重要意义。

2 State Key Laboratory of Cognitive Neuroscience and Learning, and IDG/McGovern Institute for Brain Research, Beijing Normal University, Beijing, China, 100875

Abstract: Background: Currently, a vast majority of literature on neuroimaging is devoted to understanding the dysfunction of neural pathophysiology in Major Depressive Disorder (MDD). In this study, we employed two open neuroimaging datasets with MDD adolescents and adults to retest and verify the functional connectivity (FC) between two core subregions of MDD-related brain network: subgenual anterior cingulate cortex (sgACC) and amygdala.

Methods: This study analyzed resting-state FC between sgACC and amygdala. Specifically, seed-based voxel-wise analysis and ROIs correlation analysis was conducted on 39 MDD adolescents and 29 health control (HC) adolescents from the Child Mind Institute Healthy Brain Network dataset (CMI-HBN), and ROIs correlation analysis was performed on 848 MDD adults and 794 HC adults from REST-meta-MDD consortium. We also conducted exploratory analyses on subgroups (e.g., MDD with a single episode, recurrent episode, or medication).

Results: No significant sgACC-amygdala FC group differences between MDD and HC were found in adolescents. However, compared to HC, MDD adults displayed significantly decreased sgACC-amygdala FC. Meanwhile, recurrent MDD adults had significantly reduced FC relative to both HC and first-episode drug-naïve MDD adults, whereas there was no significant sgACC-amygdala FC difference between HC and first-episode drug-naïve MDD adults. **Conclusion:** Our results resonate with previous mixed findings of sgACC-amygdala FC in MDD, underscoring the nuanced and complex nature of brain connectivity in psychiatric disorders. Our work used the latest open datasets to verify the debatable findings of sgACC-amygdala FC. Due to the low repeatability of neuroimaging results, it is of significance for the verification of important findings in previous studies.

右侧鼻周皮质对个体积极情绪的预测作用

冯杰¹ 王雅洁¹ 祝文伟¹ 魏诗雨¹ 汪强¹（通讯作者）

1 天津师范大学心理学部，天津，300387, wangqiang113@gmail.com

摘要 海马体不仅在记忆中扮演着重要角色，而且在积极情绪体验中有着重要作用。大量研究显示，个体早期经历特别是创伤性经历会通过影响海马结构和功能进而调节个体的压力应对和反应。动物和脑影像证据

同样揭示,海马参与情绪调节。考虑到海马体是由多个亚区构成,这些不同亚区如何参与积极情绪过程仍然不清楚。本研究采用 3T Prisma 磁共振扫描仪和高清海马 T2 成像序列在大样本数据集考察海马亚区与正负性情绪体验的关联($n=209$)。正性负性情绪量表(PANAS)用于测量个体的最近一段时间正负性情绪主观体验。同时,采用海马自动分割软件(ASHS)对高清海马 T2(分辨率为 $0.2\text{mm}\times 0.2\text{mm}\times 1.5\text{mm}$)和结构像 T1 进行海马体亚区分割,特别是将海马分割为七个亚区(包括 CA1, DG, CA2+3, PHC, PRC, SUB, ERC),进而测量海马体和亚区的灰质体积。为了构建海马体亚区体积与正负性情绪体验的关联,我们采用线性回归统计方法,同时对海马及亚区体积的计算进行两种方式校正,分别为基于颅内体积校正法(校正体积 = 海马亚区原始体积 - b (颅内体积-平均颅内体积), b 是海马亚区原始体积对颅内体积的回归系数)和基于海马总体积校正法(例如,每个亚区体积除以对应侧海马总体积)。同时,将被试的性别、年龄、父母的受教育程度作为协变量,对校正过后的 14 个海马体子区体积和个体的积极情绪与消极情绪得分做多重线性回归。结果发现,个体的积极情绪与右侧海马中鼻周皮质(PRC)区域体积(基于全脑体积校正法)呈线性相关($\beta=0.0031, p=0.0011$, Bonferroni 校正 $p=0.05/28=0.0017$)。同样,我们在基于海马体积校正法中,个体积极情绪依然与右侧海马鼻周皮质体积显著相关($\beta=46.53, p=0.00021$, Bonferroni 校正 $p=0.05/28=0.0017$)。然而,在其他 13 个亚区中并没有发现和积极情绪有显著相关。另外,我们也未曾发现消极情绪与海马子区体积的关联性。本研究的结果说明,海马特别是其中的右侧鼻周皮质,参与积极情绪体验,可能与鼻周皮质负责应激反应时的调节功能有关。未来需要进一步考察鼻周皮质的功能激活和功能连接如何参与积极情绪体验过程。

The prediction of the right hippocampal subfield's PRC volume on individual's positive emotions

Jie Feng¹, Yajie Wang¹, Wenwei Zhu¹, Shiyu Wei¹, Qiang Wang¹

¹ Faculty of Psychology, Tianjin Normal University, Tianjin

Abstract: The hippocampus not only plays an important role in memory, but also engages in positive emotional experiences. A large number of studies have shown that individuals' early experiences, especially traumatic experiences, can regulate the individuals' stress responses via influencing hippocampal structure and function. Animal and brain imaging evidence also reveals that the hippocampus is involved in emotion regulation. Considering the fact that the hippocampus is composed of multiple subfields, it is still unclear how these different subfields involve the emotional experiences. To answer this question, this study used the 3T Prisma MRI scanner and high-definition hippocampal T2 imaging sequence (i.e., a resolution of $0.2\text{mm}\times 0.2\text{mm}\times 1.5\text{mm}$) to explore the associations between hippocampal subfields and positive/negative emotional experience in a relatively large sample data set ($n=209$). The Positive and Negative Affect Schedule (PANAS) is high-efficiency tool to measure the individual's subjective experiences of positive and negative emotions in the most recent period of time. The hippocampus automatic segmentation software (Automatic Segmentation of Hippocampal Subfields: ASHS) is used to segment the hippocampus into seven subfields, including CA1, DG, CA2+3, PHC, PRC, SUB, ERC. Then, a linear regression model was employed to uncover the correlations between hippocampal subfields' volumes and the positive and negative emotional experience with two distinct strategies of hippocampal volume corrections, such as the intracranial volume correction method (adjusted volume = raw volume - b (ICV - mean ICV), b is the coefficient of regression of the region volume on ICV) and the total hippocampal volume correction method (for example, the volume of each subregion divided by the total volume of the corresponding side of the hippocampus). In this model, 14 hippocampal subregions' corrected volumes were independent variables, whereas individual's positive and negative emotion experiences were considered as dependent variables, and selecting the subjects' gender, age, and parents' education as covariates. The findings showed that the individual's positive emotion experiences were linearly correlated with the volume of the Perirhinal cortex (PRC) in the right hippocampus (based on the whole brain volume correction method) ($\beta=0.0031, p=0.0011$, Bonferroni correction $p=0.05/28=0.0017$). Similarly, in our hippocampal volume correction method also observed same positive associations ($\beta=46.53, p=0.00021$, Bonferroni

correction $p = 0.05/28 = 0.0017$). However, similar pattern did not been found in the remaining 13 subfields. In addition, we did not detect the correlations between negative emotion experiences and hippocampal subfields' volume. Our findings suggest that the hippocampus, especially the right Perirhinal cortex, is involved in positive emotional experience, which may depend the modulation of the Perirhinal cortex in stress responses. In future, it is necessary to further investigate how the Perirhinal cortex' activation and functional connectivity with other regions support positive emotional experience.

辨别真假记忆的神经机制及其年龄差异：来自多变量模式分类的证据

邵旭浩¹ 刘文志¹ 李傲¹ 朱磊^{1,2} (通讯作者)

1 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, zhubi@bnu.edu.cn

2 北京师范大学发展心理研究院, 北京, 100875

摘 要 个体在学习一系列语义相关词(如:做梦、叫醒、床铺等)之后,对于已学词(如:做梦)的准确再认被称为真实记忆;而再认出一些没学过但语义相关的诱饵词(如:睡觉)被称为错误记忆;但却极少再认出一些没学过且语义无关的无关词(如:钢笔)。以往研究表明,中老年人比年轻人更难辨别真假记忆。以往脑成像研究主要采用单变量分析方法,考察记忆老化的神经加工过程。但还不清楚在记忆提取阶段的辨别真假记忆的神经表征模式差异,也不了解老化对它的影响。因此,当前研究采用功能磁共振脑成像技术和多变量的模式分类分析方法,用于检验记忆老化的神经表征去分化假说。研究采用 3T 西门子磁共振扫描仪,对 19 名中老年人(54-74 岁)和 19 名年轻人(19-25 岁)完成词语错误记忆测验的过程进行了脑扫描。在记忆编码阶段,被试学习 9 组词(每组 8 个词)。在记忆提取阶段(脑扫描阶段),被试完成再认测验(判断 108 个已学词、诱饵词、无关词是否学过)。在验证以往行为研究结果(中老年人辨别真假记忆能力下降)的基础上,当前研究针对记忆提取阶段的脑成像数据,采用多变量的模式分类分析方法,探索哪些脑区的神经激活模式能辨别已学词、诱饵词和无关词。在项目类型上建立了“已学词 vs. 无关词”和“已学词 vs. 诱饵词”两个二元分类器。首先对两类分类器分别进行全脑搜索分析,然后对两类分类器的结果进行联合分析。多变量模式分类结果表明:在大脑初级视觉皮层(右侧舌回)和顶叶内侧(右侧楔前叶),中老年人在“已学词 vs. 无关词”和“已学词 vs. 诱饵词”两个分类器上的准确率均低于年轻人。此外,在记忆提取阶段,个体在大脑感知觉皮层上的信息表征精度与其辨别真假记忆能力有关。个体在右侧舌回和右侧楔前叶脑区对“已学词 vs. 诱饵词”的神经模式分辨准确率越高,个体辨别真假记忆能力越强。它表明中老年人在记忆提取阶段的感知觉信息神经表征精度下降,导致了其辨别真假记忆能力的降低。

Age-related differences in the neural basis of discrimination of true and false memories:

Evidence from multivoxel pattern classification

Xuhao Shao¹, Wenzhi Liu¹, Ao Li¹, Bi Zhu^{1,2} (corresponding author)

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875, corresponding author E-mail: zhubi@bnu.edu.cn

2 Institute of Developmental Psychology, Beijing Normal University, Beijing, China, 100875

Abstract: After learning a list of semantic-related words (e.g., dream, awake, bed, etc.), the recognition of the studied words (e.g., dream) is called true memory, and recognition of unstudied but semantically related lures (e.g., sleep) is called false memory; however, non-related unstudied words (e.g., pen) are rarely recognized. Previous behavioral

studies have shown that it is more difficult for older adults to distinguish true from false memories than younger adults. Previous neuroimaging studies mainly used univariate analysis methods to investigate the neural processing of memory aging. However, it is still unclear about the age-related differences in the neural representation underlying true and false memories during memory retrieval. The current study used the functional magnetic resonance imaging (fMRI) and multivariate pattern classification analysis methods to test the neural dedifferentiation hypothesis of memory aging. Nineteen older adults (age: 54-74) and 19 younger adults (age: 19-25) completed the semantic false memory task. During encoding, subjects studied 9 lists of word, each consisting of 8 words. During retrieval, subjects were asked to make judgements about whether they had just learned the 108 words (including targets, lures, and foils) in a 3T MRI scanner. After verifying the behavioral result that the ability to distinguish true from false memories declines with age, the current study used multivariate pattern classification analysis methods to analyze neuroimaging data during memory retrieval, to explore which brain regions can distinguish targets from lures and foils. Two binary classifications of "Targets vs. Foils" and "Targets vs. Lures" were set up to perform the whole-brain searchlight analyses and then a joint analysis for the results of these two classifications. Results showed that, compared with younger adults, the accuracy of both classifications in older adults was lower in the right lingual gyrus and the right precuneus. In addition, the higher the accuracy of the classification of "Targets vs. Lures" in the right lingual gyrus and right precuneus, the better the ability to distinguish true from false memories. They suggest that older adults have reduced accuracy in the neural representation of sensory information during memory retrieval, which leads to a reduction in their ability to discriminate between true and false memories.

内容预测对话轮转换加工的影响——基于近红外成像的研究

廉宇煊¹ 张环¹ 刘拓^{1*}

¹ 天津师范大学心理学部, 天津, 300387, mikebonita@163.com

摘要 在话轮转换的过程中, 听者通过某种方法预测说者即将到来的话语内容, 且预测内容可以帮助预测说者发言何时结束, 从而使听者能更好的准备自己的回应。前人对于听者进行预测的认知过程, 提出了早期计划和延迟计划两种假说。早期计划假说认为, 听者会尽早准备一个回应, 并在该轮次结束时说出自己所准备的内容; 而延迟计划假说认为, 当听者相信自己很快就会有参与对话的时候, 他们才会开始准备清楚表达他们的回应。本研究旨在考察内容预测对话轮转换加工过程的影响及其神经机制, 并对该过程的早期计划假说和延迟计划假说进行探讨。使用行为实验和近红外光谱成像技术相结合的方法, 以内容是否可预测为自变量, 反应时、氧合血红蛋白浓度变化量为因变量。将前人研究中所使用的句子进行本土化并进行重评, 选择了适合母语为中文的被试的中文陈述句作为实验材料, 并将其转化为录音, 以录音材料模拟说者所说的内容, 观测听者的反应。结果表明可预测条件下听者的预测反应时显著快于不可预测条件下反应时间 (研究一: $t(54) = 5.43, p < 0.001$; 研究二: $t(22) = 8.92, p < 0.001$), 主要激活额极、背外侧前额叶、颞上回等脑区 (p 均小于 0.05)。将内容可预测性和实验时程进行 2×2 重复测量分析, 内容可预测性的主效应显著 ($F(1, 1) = 3371.86, p < 0.001$), 时程的主效应显著 ($F(1, 1) = 146.92, p < 0.001$), 内容可预测性和时程的交互作用显著 ($F(1, 1) = 2631.59, p < 0.001$)。本研究证明说者所说内容的可预测性对听者的话轮转换的预测过程具有显著影响, 此现象在中文语境下具有跨文化的一致性; 无论可预测条件还是不可预测条件, 均在前额叶及右侧颞叶的部分脑区有所激活, 不可预测条件比可预测条件需要更多的认知资源, 激活程度在背外侧前额叶存在显著差异, 背外侧前额叶与语义理解及预测存在密切关系; 听者话轮转换过程中既会采取早期计划假说, 也会采取延迟计划假说, 当听者越确定话轮转换点何时到来时, 越容易采用早期计划假说。

The Effect of Content Prediction on the Turn-taking Process: A fNIRS Study

Lian Yuxuan¹, ZHANG Huan¹, LIU Tuo^{1*}

¹ Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

Abstract: In the process of turn-taking, the listener can predict the upcoming content of the speaker in some way, and the predicted content can help to predict when the speaker will finish speaking, so that the listener can better prepare their response. Two hypotheses, early planning and late planning, have been proposed for the cognitive process of listeners' prediction. The early planning hypothesis states that the listener prepares a response as early as possible and delivers what he or she has prepared by the end of the round; the late planning hypothesis suggests that listeners will only begin to prepare their responses clearly when they believe they will have an opportunity to participate in the conversation soon. In order to investigate the neural mechanism of content-predictive conversational turn-taking process, and to explore the contradiction between the early planning hypothesis and the late planning hypothesis, we used behavioral experiment and fNIRS experiment in this study. The predictability of the content was taken as the independent variable, and the variation of the reaction time and oxyhemoglobin concentration was taken as the dependent variable. The sentences used in previous studies were localized and reevaluated. Chinese declarative sentences suitable for native Chinese speakers were selected as experimental materials, and they were converted into recordings. The speaker was simulated with the recording material to observe the response of the listeners. The results showed that the predictive reaction time of the listener in the predictable condition was significantly faster than that in the unpredictable condition (Study1: $t(54) = 5.43, p < 0.001$; Study2: $t(22) = 8.92, p < 0.001$), mainly activating the frontopolar area, dorsolateral prefrontal cortex, superior temporal gyrus and other brain regions (all $p < 0.05$). The predictability of the content and the experimental time series were analyzed by 2×2 repeated measurements. The results showed that the main effect of content predictability was significant ($F(1, 1) = 3371.86, p < 0.001$), and the main effect of time history was significant ($F(1, 1) = 146.92, p < 0.001$). The interaction between content predictability and time history was significant ($F(1, 1) = 2631.59, p < 0.001$). This study demonstrates that the predictability of the speaker's speech has a significant impact on the prediction process of the listener's turn of speech, which is consistent across cultures in the Chinese context. In both predictable and unpredictable conditions, there was activation in the prefrontal and part of the right temporal lobe. The unpredictable condition required more cognitive resources than the predictable condition, and the degree of activation was significantly different in the dorsolateral prefrontal cortex, which was closely related to semantic understanding and prediction. What's more, the listeners adopted both early planning hypothesis and delayed planning hypothesis. The more certain the listeners were about when the speaker would end their speech, the more likely they were to adopt early planning hypothesis.

人类腹内侧前额叶皮层三功能图谱

宋东辉, 汪寅 (通讯作者)

认知神经科学与学习国家重点实验室, 北京师范大学

北京市海淀区新街口外大街 19 号 19, 100875, yin.wang@bnu.edu.cn

摘要 介绍:腹内侧前额叶皮层 (vmPFC) 涉及众多的功能, 大量的文献表明这些功能主要与社会, 价值和情绪相关。然而, 这些功能在 vmPFC 的分布依然不够清楚。另外, 之前的研究都是使用直接推理的方式去探索 vmPFC 的功能, 而这种方法经常受到大量的噪音和混淆变量的影响, 反向推理方法可以减少直接推理所带来的偏差。因此在这个研究当中, 我们使用一个大规模神经影像数据库-Neurosynth 去进行反向推理元分析来确定 vmPFC 的功能分布。方法: 首先, 我们使用反向推理后验概率排名的方法对 vmPFC 的功能进行提取。我们使用共激活元分析的方法对 vmPFC 进行分割,随后我们对分割的亚区再次进行反向推理排名, 用来确定各个亚区的主要功能。最后我们对提取的 vmPFC 功能进行解码, 用来验证这些功能术语更有可能来自于哪个

亚区。结果：在前 100 个术语当中，排除结构和意义不明的术语之后，总共有 18 个功能术语被保留，我们将这些功能术语进行分类，最终组成社会，价值和情绪三类功能主题。共激活元分析对 vmPFC 的分割表明 3 个亚区是最优的分割方式，三个亚区呈现从前往后的模式。每个分区反向推理功能术语排名结果显示位于前面的亚区 1 包含更多的社会相关的功能术语，价值相关的术语在位于中间的亚区 2 占主要优势，而情绪相关术语都只在位于后面的亚区 3 当中出现。18 个功能术语在这三个亚区当中的解码结果表明所有社会相关的术语更大可能来自于亚区 1，所有的情绪相关术语都最可能出现在亚区 3，而价值术语出现在三个亚区当中，但是在所有术语当中，只有术语“value”出现在了亚区 2。结论：这项研究当中我们使用大规模数据库反向推理的方法验证了 vmPFC 主要包括社会，价值和情绪三种功能，并且确立了 vmPFC 内的三功能图谱，这个图谱依照社会，价值和情绪呈现从前往后的分布模式。

Three functional subregions in human ventromedial prefrontal cortex

Dong-Hui Song, Yin Wang (corresponding author)

National Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University

19 Xijiekouwai Street, Haidian District, Beijing, China, 100875 E-mail: yin.wang@bnu.edu.cn

Abstract: Introduction: the ventromedial prefrontal cortex (vmPFC) involves diverse functions, a lot of literature show that these functions are mainly related to social, value and emotion. However, distribution of these functions in vmPFC still unclear. In addition, previous studies use forward reference to explore function of vmPFC, which often are affected by several noise and confound, reverse reference can reduce bias from forward inference. In the study, we use Neurosynth, a large-scale neuroimaging database to perform reverse inference meta-analysis to determine the function distribution of vmPFC. Methods: Firstly, we perform function extraction of vmPFC using reverse inference posterior probability. We use the Meta-Analytic Co-Activation parcellation method to parcel vmPFC and perform reverse inference ranking for each parceled subregion to identify their function. Finally, we decode extracted functional items from vmPFC to identify which subregion these functional terms most likely to come from. Results: 18 functional terms were maintained after excluding structure and meaningless terms in top 100 terms, then categorizing these terms and generate three functional topics: Social, Value and Emotion. vmPFC is parceled to three subregions by Meta-Analytic Co-Activation and three subregions are the optimal results, and the three subregions show a from anterior to posterior pattern. The results from reverse inference ranking for each parceled subregion indicate that social-related functional terms dominate in subregion 1 (anterior), while emotion-related terms are all located in subregion 3 (posterior), value-related terms are in subregion 2 (middle). The decode results for 18 functional terms show that all social-related terms are more probability come from subregion 1, all emotion-related terms are more probability appear in subregion 3, and value-related terms appear in all three subregions, but among all terms, only term "value" appears in subregion 2. Conclusion: The study results identify that function of vmPFC mainly involves three functions including social, value and emotion and generate three functional subregions which present anterior-to-posterior functional distribution according to social, value and emotion in vmPFC by reverse inference meta-analysis from a large-scale neuroimaging dataset.

摘要 作为音乐的灵魂, 音乐情感信息被广泛应用在音乐检索和推荐系统中, 因为追求情感体验是人们听音乐的主要动机之一。为了获取海量音乐的情感信息, 计算机科学家通过提取音乐特征来自动识别音乐情感, 但这种方法忽视了个体差异。大量音乐心理学研究显示个体对音乐感知情感的判断会受到年龄、性别、音乐教育程度、移情、性格等各种因素的影响。对个体音乐感知情感进行自动识别时, 我们也应该考虑个体特征。因此, 本研究通过计算建模的方式, 探索个体特征、音乐特征和音乐感知情感间的关系。并在传统音乐情感识别模型中加入个体特征, 尝试优化模型识别效果。研究结果显示, 动态个体特征(包括对目标音乐的偏好和熟悉程度、被音乐唤起的情感、情感唤起机制和生理状态)能显著提升模型预测效果, 而稳定个体特征(例如性别、性格、音乐经历等)对模型效果无明显作用。随后, 我们通过特征重要性分析对预测模型进行解释。结果显示音乐特征在音乐感知情感识别中占据主导地位, 而其它个体特征对音乐情感的感知存在不同程度的影响。综上, 本研究通过机器学习方法探索了变量间的关系, 同时构筑和优化了个性化音乐情感识别模型, 从而能为人们提供更精准的音乐情感信息。本研究也为未来构筑个性化的音乐检索和推荐系统提供了重要参考。

Predictive effect of stable and dynamic individual features on perceived emotion of music

Xin Wen¹, Liang Xu¹, Qiuying Qian¹

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028

Abstract: As the soul of music, emotion information has been widely used in music retrieval and recommendation systems, because the pursuit of emotional experience is the main motivation for music listening. To obtain the emotion information of massive music, computer scientists extract musical features to identify musical emotions, but this method ignores listeners' individual differences. Music psychology researches have shown that the individual's judgment of perception of music emotion would be affected by various factors, such as age, gender, music education, empathy, personality, etc. When automatically recognizing an individual's perception of music emotion, we should consider individual features. Therefore, this study investigated the relationship among individual features, music features and music emotion in a computational modeling way. By adding individual features into the traditional music emotion recognition models, we also attempted to improve the model effect. The results show that dynamic individual features (including preference for target music, felt emotion of music, mechanism indices, and physiological features) can significantly improve the model's effect, and stable individual features (e.g., sex, personality, and music experience) have no effect. We then conducted model interpretation by analyzing feature importance. The results show that music features occupied a dominant position in music emotion recognition, while other individual features had varying degrees of influence. This study investigated the relationship between variables, and constructed and optimized personalized music emotion recognition models to provide people with more accurate music emotion information. This study can also provide a reference for the creation of personalized music retrieval and recommendation systems.

皮下核团对音乐声音的编码可塑性及强度与音乐旋律中的音高分辨能力独立相关

张骁晨^{1,2} 宫琴^{1,3}

1 清华大学医学院, 北京, 100084

2 上海交通大学医学院附属精神卫生中心, 200030, xiaochen.zhang@smhc.org.cn

3 上海大学医学院, 200444, gongqin@mail.tsinghua.edu.cn

摘要 皮下听觉核团对音高感知有贡献, 但大脑对声音的皮下神经编码如何与音乐音高处理产生联系仍不清楚。传统观点认为, 皮下声音编码活动的增强是更优的音高分辨的基础。然而, 也有文献报导了皮下声音编码的情境相关可塑性与更优的听觉感知有关。本研究通过分析大脑皮下核团对在可预测情境和随机情境中呈现的音乐声音的频率跟随响应(frequency-following response, FFR)来探索音乐音高感知的皮下神经相关物。我们发现 FFR 的试次间锁相(inter-trial phase-locking, ITPL)与音乐旋律中音高分辨的行为表现呈显著负相关。我们引入了可塑性指数用以测量 FFR 所表征的皮下听觉核团对呈现于两种情境的相同声音的差异化编码, 其与 FFR 试次间锁相呈高度负相关, 而与音高分辨能力呈显著正相关。这说明音乐音高感知与皮下听觉核团的情境相关可塑性正相关。此外, 虽然 FFR 频谱强度与音高分辨能力没有显著相关性, 但是一旦通过偏相关方法将 FFR 试次间锁相控制, 则 FFR 频谱强度与行为表现之间呈显著正相关, 这表明皮下核团对声音编码的神经活动强度也是音乐音高感知的基础之一。通过偏相关方法将 FFR 频谱强度控制, FFR 试次间锁相与行为表现之间的显著负相关关系仍保持。我们进一步发现, FFR 试次间锁相、可塑性指数、FFR 频谱强度均与音乐音高分辨能力显著相关, 而与音乐节奏分辨能力相关性很弱。这些发现表明: 皮下核团对音乐声音的编码的情境相关可塑性与神经活动强度独立地、特异地与音乐旋律的音高感知有关。

Context-dependent plasticity and strength of subcortical encoding of musical sounds independently underlie pitch discrimination for music melodies

Xiaochen Zhang^{1,2}, Qin Gong^{1,3}

2. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine;

3. School of Medicine, Shanghai University

Abstract: Subcortical auditory nuclei contribute to pitch perception, but how subcortical sound encoding is related to pitch processing for music perception remains unclear. Conventionally, enhanced subcortical sound encoding is considered underlying superior pitch discrimination. However, associations between superior auditory perception and the context-dependent plasticity of subcortical sound encoding are also documented. Here, we explored the subcortical neural correlates to music pitch perception by analyzing frequency-following responses (FFRs) to musical sounds presented in a predictable context and a random context. We found that the FFR inter-trial phase-locking (ITPL) was negatively correlated with behavioral performances of discrimination of pitches in music melodies. It was also negatively correlated with the plasticity indices measuring the variability of FFRs to physically identical sounds between the two contexts. The plasticity indices were consistently positively correlated with pitch discrimination performances, suggesting the subcortical context-dependent plasticity underlying music pitch perception. Moreover, the raw FFR spectral strength was not significantly correlated with pitch discrimination performances. However, it was positively correlated with behavioral performances when the FFR ITPL was controlled by partial correlations, suggesting that the strength of subcortical sound encoding underlies music pitch perception. When the spectral strength was controlled by partial correlations, the negative ITPL-behavioral correlations were maintained.

Furthermore, the FFR ITPL, the plasticity indices, and the FFR spectral strength were more correlated with pitch than with rhythm discrimination performances. These findings suggest that the context-dependent plasticity and the strength of subcortical encoding of musical sounds are independently and perhaps specifically associated with pitch perception for music melodies.

治疗性歌曲写作对乳房切除后的女性乳腺癌患者自我概念与抑郁症状的影响

李忆楠

中国康复研究中心北京博爱医院 心理科音乐治疗中心, 北京, 100068, Edlyn626@163.com

摘要 根据世界卫生组织国际癌症研究机构发布的 2020 年全球最新数据显示, 乳腺癌已取代肺癌成为全球第一大癌症。随着个体自我防御意识的增强、医疗水平以及疾病筛查技术的发展, 乳腺癌的死亡率呈下降趋势。乳房根治术作为目前常用的治疗方式之一, 当患者生理层面疾病逐渐得到治疗或康复, 其造成的心理疾病也随之而来。与传统的癌症患者心理干预方式相比, 音乐心理治疗更能激发患者的语言表达以及减轻消极情绪体验, 对悲伤、丧失主题的应对能力有调节和改善作用, 并能够为较好的生活质量提供动力和支持。治疗性歌曲写作通常以热身活动开始, 旨在唤起无意识的感觉或记忆, 将隐藏的精神物质带到表面, 激发个人思考, 从情感层面入手, 将精神物质通过歌曲写作转化为具体想法。接下来的歌曲创作紧接着情感体验的部分, 通过歌词填空、歌曲模仿、策略性写作, 让即使是没有音乐训练背景的患者, 也可以完成歌曲写作, 将内心的体验转化成有意义的音乐作品。本研究针对乳切除后的女性乳腺癌患者的自我概念与抑郁症状, 采用小样本多基线设计, 以 3 名女性乳腺癌患者 (42~45 岁) 作为被试, 使用治疗性歌曲写作作为核心技术的个体音乐心理治疗干预。测量工具采用抑郁自评表及田纳西自我概念量表。被试所写歌曲的旋律大多明朗、流畅, 以四四拍、四三拍居多, 速度在小广板与小行板之间, 风格以流行为主, 旋律流畅、明朗, 没有复杂的配器, 都是以吉他的拨弦、扫弦为主的伴奏肢体。在歌词写作过程中, 当被试描述了过往经历, 抒发了哀伤、愤怒, 宣泄了绝大部分的消极情感体验后, 更多的是对未来生活的期待和规划。研究结果显示, 3 名被试经干预在自我概念和抑郁症状水平都有明确的改善。治疗性歌曲写作作为女性乳腺癌患者的心理照护提供了新的视角和途径。

摘要 音乐是否可以影响道德判断是音乐社会功能研究领域的重要议题。古今中外学者对于音乐与道德的关系有丰富的论述, 然而已有论述也存在较多的争议。解决争论的关键在于以“绝对音乐”作为诱发材料考察音乐影响道德判断的脑机制。在这项研究中, 我们采用中国情绪音乐材料库 (CAMS) 中选取绝对音乐作为诱发材料, 在聆听音乐之后让被试完成最后通牒任务, 以此验证音乐是否具备影响道德判断的功能。研究结果表明, 相比无声音组合, 快乐音乐组对较不公平的分配方案的接受率显著降低, 白噪声组的接受率没有显著变化。然后, 我们利用大尺度时变网络分析揭示了不同实验组之间多样化的网络模式, 发现不同的网络模式可以解释不同组的接受率差异。大尺度时变网络分析结果表明, 在中等不公平方案中, 快乐音乐组相较于无声音组呈现更强的自上而下的网络, 而无声音组相较于快乐音乐组呈现更强的自下而上的网络。源定位分析表明, 快乐音乐组相较于无声音组呈现更强的奖赏系统激活。我们推测, 音乐诱发的快乐情绪作为决策时

的偶然情绪,激活了被试的奖赏系统,进而代偿了被试在决策任务中选择接受分配方案获得自我利益的奖励,以一种不同于其他情绪的方式与自上而下的大脑网络模式共同解释了为何在听了快乐音乐后,被试对于不公平分配方案的接受率显著下降。

工尺谱韵唱中的内隐学习研究——以安次东张务音乐会为例

朱坤丽¹ 蒋聪²

¹ 首都师范大学音乐学院,北京,100048

² 首都师范大学音乐学院,北京,100048, congjiang@cnu.edu.cn

摘要 工尺谱是中国传统音乐使用最广泛的记谱法,自明清盛行以来,许多民间乐种依然保留着工尺谱的记载和传承。韵唱即指念唱乐谱,是润腔形式的一种,在中国传统器乐传承过程中,乐师们真正拿乐器之前都会有“念谱”这一环节。在河北音乐会中,乐师通过韵唱将工尺谱本和口头旋律结合在一起,共同构成我国传统器乐传承中“口传心授”的主要方式和内容。笔者为探讨工尺谱的谱面记载和阿口韵唱之间的关系,通过梳理工尺谱的相关研究,发现工尺谱的韵唱学习是一个内隐学习的过程。大多数学者在研究中认为,“阿口”根据工尺字的组合排列以及板眼的不同,在韵唱上有其规律可循。通过对民间乐师的访谈,发现他们虽然在学习过程中并没有意识到工尺谱的学习有内在规律所遵循,但大部分人却已经熟练掌握该规则,并自动运用到韵唱和乐器的演奏中。本文从工尺谱的韵唱过程出发,以韵唱中的规律为依据,探索该学习中的内隐学习过程。通过对这一过程的研究,为工尺谱的学习寻找更行之有效的教学方法。研究采用实验法,以安次东张务音乐会的乐师为研究对象,结合现存的工尺谱例和实际的乐器演奏,对东张务音乐会乐师们的工尺谱学习过程和学习结果进行实验研究,结果发现学习过程中韵唱规律的学习是无意识、自动学习的过程。乐师虽然不知道韵唱规律,也没意识到规律的存在,但是在实际使用中却已经掌握了该规律,并可以区分各乐社韵唱规律的不同。通过这一研究,讨论在工尺谱的韵唱教学中,是否可以形成一套科学、严密的音乐教学体系,为工尺谱的韵唱学习提供便利,使历史中失去了活态传承的乐曲重新焕发光彩,并为传统音乐进课堂提供较大的可能性和可操作性。

Research on implicit learning in Gongche notation rhyme singing -- Taking Anci District Dongzhangwu Village in Hebei Province Ritual Associations as an example

Kunli Zhu¹, Cong Jiang¹

¹Capital Normal University, 105 Xisanhuan North Road, Haidian District, Beijing

Abstract: The Gongche notation is one of the most popular notation in Chinese traditional music. During Ming and Qing dynasties, Gongche notation was widely used in many folk music genres. Rhyme singing refers to reading and singing music score, which is a form of moistening cavity. In the process of inheriting Chinese traditional instrumental music, musicians will have the link of "reading music score" before they really take the instrument. In Hebei Province Ritual Associations, musicians combine Gongche notation book and oral melody through rhyme singing, which together constitute the main way and content of "Oral teaching and feeling with heart" in the inheritance of traditional instrumental music in China. In order to explore the relationship between the Gongche notation recording and akou rhyme singing, through combing the relevant research of Gongche notation, the author finds that the rhyme singing learning of Gongche notation is an implicit learning process. Most scholars believe that "a Kou" has its own rules to follow in rhyme singing according to the combination and arrangement of gongche words and "ban yan" different inflexibility. Through the interview with folk musicians, it is found that although they do not realize that there are internal rules to follow in the study of Gongche notation, most people have mastered the rules and automatically applied them to rhyme singing and musical instrument performance. Starting from the rhyme

singing process of Gongche notation and based on the law of rhyme singing, this paper explores the implicit learning process in this learning. Through the study of this process, we can find a more effective teaching method for the study of Gongche notation. Using the experimental method, taking the musicians of Anci District Dongzhangwu Village in Hebei Province Ritual Associations as the research object, combining with the existing Gongche notation examples and actual musical instrument performance, this paper makes an experimental study on the learning process and learning results of Gongche notation of Dongzhangwu Village in Hebei Province Ritual Associations musicians. The results show that the learning of rhyme and singing law in the learning process is an unconscious and automatic learning process. Although musicians do not know the rhyme singing law and are not aware of the existence of the law, they have mastered the law in practical use and can distinguish the different rhyme singing laws of various music clubs. Through this research, the paper discusses whether a scientific and rigorous music teaching system can be formed in the rhyme singing learning of Gongche notation, which not only provides convenience for the popularization and learning of Gongche notation, so as to facilitate the of Gongche notation, make the music that has lost its living inheritance in history glow again, but also provides greater possibility and operability for traditional music into the classroom.

“2+1”式三字词的汉字位置加工：基于眼动实验的证据

赖馨¹ 陶雯祎² 江新^{1,2} (通讯作者)

1 北京语言大学心理学院, 北京, 100083, jiangxin6@163.com

2 北京语言大学汉语国际教育研究院, 北京, 100083

摘 要 阅读过程中需要对文本内部词汇进行识别, 而词汇识别需要对字符位置信息进行编码, 即位置加工。转置效应, 即转置字母非词 (spack) 比替换字母非词 (spuok) 更能促进原词 (speak) 的激活, 表明字母位置编码比较灵活。关于复合词词素边界对字母位置编码的影响, 已有的研究观点不一, 同时, 关于汉字位置加工问题的研究仍有待拓展。汉字的位置加工是否灵活, 是否会受到词边界的影响? 本研究以 31 名汉语母语者为被试, 利用眼动追踪技术和边界范式, 通过操纵“2+1”式三字词的后两个字 (相同条件: 预视刺激和目标刺激相同, 如品德课-品德课; 转置条件: 预视刺激为三字词后两个字进行调换的非词, 如品课德-品德课; 替换条件: 预视刺激为三字词后两个字被其他字代替后的非词, 如品织满-品德课) 来探讨这些问题。研究结果显示, 在首次注视时间、总注视时间和凝视时间上, 相同条件与转置条件没有显著差异, 替换条件显著长于相同条件和转置条件, 转置效应存在。研究结果表明, 三字词直接以整词形式进行加工, 不支持词汇等级加工模型; 三字词的位置加工比较灵活, 词边界不会影响汉字位置加工。该研究从三字词的角度加深了对汉字位置编码认知机制的理解, 对汉字位置加工模型的建立具有重要启示, 也为词汇识别与词切分模型的修正提供了依据。

Character Position Processing of "2+1" Three-character Chinese Words: Evidence from Eye Movement

Lai Xin¹, Tao Wenyi¹, Jiang Xin^{1,2}

1 School of Psychology, Beijing Language and Culture University, Beijing, 100083

2 Research Institute of International Chinese Language Education, Beijing Language and Culture University, Beijing, 100083

Abstract: We need to recognize words in the text when we are reading, and word recognition needs to encode the character position (i.e., position processing). The transposition effect, which means that a transposed letter nonword (e.g., spaek) can activate its base word (e.g., speak) to a greater degree than a substituted letter nonword (e.g., spuok), indicates that letter position coding is flexible. However, according to the existed studies, it remains unclear whether letter position coding is influenced by morpheme boundaries of compound words. Furthermore, the researches of Chinese character position processing require to be expanded. Is the position processing of Chinese characters flexible, and will it be affected by word boundaries? In this study, 31 native Chinese speakers participated in the experiment, using eye-tracking and boundary paradigm to manipulate the last two characters of the "2+1" three-character word (identity condition: the preview was identical to the target word (e.g., "pindeke" as the preview of "pindeke"); transposed-character condition: the preview was a nonword that was a transposition of the last two characters of the target word (e.g., "pinkede" as the preview of "pindeke"); substituted-character condition: the preview was a nonword that the last two characters of the target word were replaced by other two characters (e.g., "pinzhiman" as the preview of "pindeke") to explore these issues. The results showed that in the first fixation duration, total fixation duration and gaze duration: there was no significant difference between the identity condition and the transposed-character condition; the substituted-character condition was significantly longer than the identity condition and the transposed-character condition, indicating that the transposition effect existed. These results suggest that three-character words are processed as the whole words, which is not supported by the hierarchical model. What's more, the position processing of three-character words is flexible, and not affected by the word boundaries. This research has deepened the understanding of the cognitive mechanism of Chinese character position encoding from the perspective of three-character words and has important implication for the establishment of Chinese character position processing models. It also provides a basis for the revision of word recognition and word segmentation models.

Keywords: position processing, transposition effect, "2+1" three-character words, word boundaries

反义形容词的预期性对不同阅读风格大学生预视加工的影响

王晓敏¹（通讯作者） 刘飞迁² 周铁民¹

1 沈阳师范大学教育科学学院, 沈阳, 110034, 1014512757@qq.com

2 山东畜牧兽医职业学院基础教学部, 潍坊, 261061

摘要 预期性与预视加工作为影响阅读效率的重要因素贯穿阅读的整个过程。在中文表达中, 形容词修饰名词且置于名词前时会对其后的名词进行限定, 限定的程度反映出形容词预期性的高低。当注视点移动到形容词位置时, 读者能否注意到形容词之后的内容, 这属于预视加工研究的内容。形容词预期性的高低是否影响读者预视加工, 并且意义相反的形容词以及读者的阅读风格是否对两者的关系产生影响是本研究探讨的问题。本研究通过眼动仪记录读者阅读时的眼动规律, 运用边界范式探讨反义形容词的预期性是否影响不同阅读风格大学生的预视加工。实验1采用3(形容词预期性: 高、低、无)×2(预视类型: 一致、不一致)的被试内设计, 分析了形容词N和名词N+1两个区域的眼动指标, 探讨形容词的局部预期性是否存在, 若存在, 不同预期性是否对预视加工产生影响。结果表明在词N+1区域, 形容词的局部预期性和预视类型的主效应均显著, 且二者交互作用显著, 形容词高预期更能促进预视加工。实验2采用3(阅读风格: 形容词倾向型、名词倾向型、无差异型)×2(形容词词性: 积极、消极)×2(形容词预期性: 高、低)×2(预视类型: 一致、

不一致)的混合设计,探讨形容词词性、大学生阅读风格对预期性与预视加工交互作用的影响。结果发现,在部分眼动指标上,与消极形容词相比,积极形容词更能促进预视加工,但会削弱预期性对预视加工的影响。与其他阅读风格被试相比,在形容词倾向被试的阅读中,高预期形容词对预视加工的促进作用更小;当目标名词被消极形容词修饰时,与形容词倾向的被试相比,名词倾向的被试在阅读时,高预期条件更能促进预视加工。因此,本研究结论如下:(1)中文阅读中,形容词的局部预期效应存在。(2)形容词的局部预期性影响预视加工,符合平行加工模型,且存在副中央凹-中央凹效应。(3)相反意义的形容词以及大学生的阅读风格均会影响预期性与预视加工的交互作用。

关键词 反义形容词,局部预期性,阅读风格,预视加工

The Effect of Antonymous Adjectives' Predictability on the Preview Processing of College Students with Different Reading Styles

Wang Xiaomin¹, Liu Feiqian², Zhou Tiemin¹

1 College of Educational Science, Shenyang Normal University, Shenyang, 110034, E-mail address of corresponding author: 1014512757@qq.com

2 Basic Teaching Department, Shandong Vocational Animal Science and Veterinary College, Weifang, 261061

Abstract: Predictability and preview processing are important factors that affect reading efficiency throughout the entire reading process. In Chinese expression, when an adjective modifies a noun and is placed in front of a noun, it will restrict the nouns after it. The degree of this restriction reflects the level of predictability of the adjective. When the fixation point moves to the adjective position, whether the reader can notice the content after the adjective, this is the content of the preview processing research. And whether the level of adjective predictability affects the reader's preview processing, and whether adjectives with opposite meanings and the reader's reading style affect the relationship between the two are the questions discussed in this study. This study used an eye tracker to record the reader's eye movement patterns during reading, and used the boundary paradigm to explore whether the predictability of antonym adjectives affects the preview processing of college students with different reading styles. Experiment 1 used 3 (Adjective predictability: high, low, none) $\times$ 2 (Preview type: consistent, inconsistent) within the subject design, and analyzed adjective N and noun N+1 eye movement indicators in two regions, to explore whether the local predictability effects of adjectives exists, and if so, whether different predictability has an impact on preview processing. The results showed that in the N+1 region, the main effects of local predictability of adjectives and preview types were significant, and the interaction between them was significant. High predictability condition could promote preview processing better. Experiment 2 adopted 3 (Reading style: adjective tendency type, noun tendency type, undifferentiated type) $\times$ 2 (Adjective part of speech: positive, negative) $\times$ 2 (Adjective predictability: high, low) $\times$ 2 (Preview type: consistent, inconsistent) mixed design to explore the effects of adjective part of speech and reading style on the interaction between adjective predictability and preview processing. It was found that in some eye movement indicators, compared with negative adjectives, positive adjectives could promote preview processing more, but weaken the effect of predictability on preview processing. Compared with other reading style subjects, the high predictability of adjectives had less effect on preview processing in the reading of subjects with adjective tendency; when the target noun was modified by a negative adjective, compared with the adjective tendency subjects, the high predictability adjectives could promote the preview processing of the noun tendency subjects. Therefore, the conclusions of this study are as follows: (1) In Chinese reading, the local predictability effect of adjectives exists. (2) The local predictability of adjectives affects preview processing, conforms to the parallel processing model and has a parafoveal-on-foveal effect. (3) Adjectives with opposite meanings and the reading style of college students all affect the interaction between predictability and preview processing.

时间压力下应急标识的搜索绩效:显著性和线索类型的调节作用

马小芳 郑姣姣 关荐 (通讯作者)

宁夏大学, 教育学院, 银川, 750021, guanjian@nxu.edu.cn

摘要 应急标识是应急管理的支撑结构, 能够指示逃生信息, 引导疏散, 在防范及化解安全风险方面起到了重大作用。时间压力、视觉显著性和线索是影响个体搜索应急标识的主要因素。然而, 我国目前对于应急标识的研究忽视了以人为本的设计理念, 缺乏个体对于应急标识搜索中心理过程的研究。因此, 本研究采用视觉搜索范式, 借助眼动追踪技术, 以真实商场图片为材料, 探讨时间压力、视觉显著性和线索类型对应急标识视觉搜索绩效的影响。实验一考察时间压力对应急标识视觉搜索绩效的影响; 实验二在时间压力条件下, 考察个体的认知功能受损时, 视觉显著性和线索能否影响及调节应急标识视觉搜索的绩效; 实验三在实验二的基础上, 考察时间压力条件下语词线索类型对应标识搜索的调节作用。结果表明: (1) 时间压力会降低应急标识的搜索绩效, 影响个体视觉注意过程。(2) 在时间压力条件下, 高视觉显著性应急标识调节搜索应急标识的绩效。同时, 高视觉显著性应急标识在注意资源有限的情况下能够获得较深的加工。此外, 与普通标识相比, 个体对应急标识的搜索动机更加强烈, 易出现注意窄化现象。(3) 在时间压力条件下, 直接语词线索调节搜索应急标识的绩效。也就是说, 线索提示具有注意引导作用, 线索提示越具体, 引导效应就越强。(4) 语词线索类型对于搜索反应时的影响只体现在高视觉显著性应急标识中。

Search performance of emergency signs under time pressure: moderation of saliency and clue type

Ma Xiaofang, Zheng Jiaojiao, Guan Jian

School of Education Ningxia University, Ningxia, Yinchuan750021, guanjian@nxu.edu.cn

Abstract: Emergency signs are the supporting structure of emergency management, which can indicate escape information, guide evacuation, and play a major role in preventing and resolving safety risks. Time pressure, visual saliency and cues are the main factors that affect individuals' search for emergency signs. However, the current research on emergency signs in our country ignores the human-oriented design concept, and lacks individual research on the psychological process of emergency signs search. Therefore, this study adopts the visual search paradigm, with the help of eye tracking technology, and uses real market pictures as materials to explore the influence of time pressure, visual saliency, and cue types on the visual search performance of emergency signs. Experiment 1 examines the influence of time pressure on the visual search performance of emergency signs; Experiment 2 examines whether visual saliency and cues can affect and regulate the performance of visual search of emergency signs under time pressure conditions when the individual's cognitive function is impaired; Third, on the basis of Experiment 2, the moderating effect of word clue type corresponding to logo search under time pressure is investigated. The results show that: (1) Time pressure will reduce the search performance of emergency signs and affect the process of individual visual attention. (2) Under time pressure conditions, high-visually significant emergency signs regulate the performance of searching emergency signs. At the same time, emergency signs with high visual saliency can be deeply processed when attention resources are limited. In addition, compared with ordinary signs, individuals have stronger search motives for emergency signs and tend to narrow attention. (3) Under time pressure, direct verbal clues adjust the performance of searching for emergency signs. In other words, the clue reminder has an attention guiding effect, and the more specific the clue reminder, the stronger the guiding effect. (4) The impact of word clue types on search response time is only reflected in the high visual saliency emergency signs.

摘要 中文词切分的认知机制一直是心理学关注的热点问题之一。拼音文字有空格为读者提供词边界信息, 汉语无外显的词间空格且中文组词的模糊性也加大了词切分难度, 但中文读者并未遭遇特殊阅读困难, 研究发现中文读者能寻找到词与词之间隐含的边界, 其可使用词素位置概率等语言线索帮助词切分。词素位置概率是指汉字出现在词首或词尾时双字词的出现次数占该汉字组成的所有双字词(无论出现在首字还是尾字)的比重。例如, “消”可以组成 39 个双字词, 其出现在词首可组成 33 个词, 如“消息”“消炎”“消失”等, 为此, 其词首词素位置概率为 0.85。可见, “消”常居于双字词的词首位置, 这为读者提供了较为清晰的词边界信息。若当前汉字的实际位置信息与固有位置信息相匹配, 则激活水平较高, 进而有可能被优先识别与切分, 反之亦然。然而, 词首与词尾词素位置概率的作用以往研究的观点并不一致, 有研究指出在词汇切分与识别过程中词尾词素位置概率的作用甚于词首, 另有研究认为词首与词尾的词素位置概率同等重要。为进一步推动上述争议的解决, 本研究通过行为和眼动追踪实验, 操纵双字词词首与词尾的词素位置概率, 考察词素位置概率线索在中文词汇切分与识别中的作用。实验 1 采用词判断任务, 采用 2 (词首词素位置概率: 高、低) × 2 (词尾词素位置概率: 高、低) 的两因素被试内实验设计。结果发现, 在正确率和反应时指标上, 词首的词素位置概率效应显著, 词尾词素位置概率效应不显著。实验 2 采用句子阅读任务, 考察在自然阅读情境中被试对词素位置概率的运用情况。结果发现, 在凝视时间、回视路径时间和总注视时间指标上, 词首的词素位置概率效应显著, 词尾词素位置概率效应不显著。行为和眼动证据共同表明, 词素位置概率信息是中文读者重要的语言词切分线索, 且与词尾词素位置概率相比, 词首词素位置概率在词汇切分与识别过程中发挥的作用更大。

The role of character positional frequency in Chinese reading: evidence from behavioral and eye movement

Cao Haibo^{1,2}, Lan Zebo¹, Wang Jingxin¹

1 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

2 School of Art, Hebei Normal University, Hebei, 075000

Abstract: The cognitive mechanism of Chinese word segmentation has been one of the hot issues in psychology. Alphabetic characters have spaces to provide readers with information about word boundaries, there are no explicit spaces between words in Chinese and the fuzziness of Chinese phrases also increases the difficulty of word segmentation, but Chinese readers do not encounter any special reading difficulties, it is found that Chinese readers can find the hidden boundary between words, and they can use such language clues as character positional frequency to help word segmentation. The character positional frequency refers to the proportion of the number of double-character words in all double-character words (whether appearing in the first or last word) when Chinese characters appear at the beginning or end of a word. For example, “xiao” can be composed of 39 double-word words, its appearance at the beginning of the word can be composed of 33 words, such as “Message” “Anti-inflammatory” “Disappear” and so on, for this reason, the character positional frequency of its initial morpheme is 0.85. It can be seen that “xiao” usually occupies the first position of two-character words, which provides readers with clear information about word boundary. If the actual position information of the current Chinese character matches with the inherent position information, the activation level is higher, and then may be identified and segmented first, and vice versa. However, previous studies on the role of the character positional frequency of the initial and the final in words are not consistent. Some studies have pointed out that the character positional frequency of the the final in the process of segmentation and recognition is more important than that of the final, other studies suggest that the

character positional frequency of the initial and final of a word is equally important. To further promote the resolution of the above-mentioned disputes, the present study manipulated the character positional frequency of the initial and the final of two-character words by behavioral and eye-tracking experiments to investigate the role of the the initial and the final cues in Chinese word segmentation and recognition. In Experiment 1, the lexical decision task was performed using a 2×2 (the positional frequency of the initial: high and low) $\times 2$ (the positional frequency of the final: high and low) experimental design. The results show that the character positional frequency of the initial is significant, but not the character positional frequency of the final. In Experiment 2, sentence reading task was used to investigate the character positional frequency in the natural reading situation. The results showed that the character positional frequency of the initial is significant, but not the character positional frequency of the final. Behavioral and eye movement evidence show that the character positional frequency of the final is an important language segmentation cue for Chinese readers, and compared with the character positional frequency of the final, the character positional frequency of the initial plays a more important role in the process of word segmentation and recognition.

Keywords: positional character frequency, word segmentation, eye movement, Chinese reading

情绪共情对食物注意偏向的影响：来自眼动的证据

朱晓倩¹ 颜志强^{1,2} (通讯作者)

1 湖南师范大学教育科学学院心理学系, 长沙, 410081, yanzhiqiangpsy@hunnu.edu.cn

2 湖南师范大学认知与人类行为湖南省重点实验室, 长沙, 410081

摘 要 肉悖论一直是饮食研究中的重要问题, 已有研究表明情绪共情是引发个体产生肉悖论的重要影响因素。然而, 尽管有研究发现情绪共情会使得个体降低肉食意愿, 但是尚不清楚情绪共情是如何影响个体的认知加工过程的。本研究拟采用眼动追踪技术, 通过两个实验来分别探讨情绪共情对不同类型食物注意偏向的影响。实验 1 采用 2 (情绪共情: 高, 低水平) $\times 2$ (食物类型: 肉类, 蔬菜) 的混合实验设计, 结合自由观看范式进行考察, 共招募了 79 名被试。实验 2 同实验 1, 采用 2 (情绪共情: 高, 低水平) $\times 2$ (食物类型: 红肉, 白肉) 的混合实验设计, 结合自由观看范式进行考察, 共招募了 82 名被试。实验 1 的结果发现, 情绪共情与食物类型的交互效应显著 ($F(1,77) = 7.01, p < 0.01$), 事后检验表明高情绪共情水平组的被试对于蔬菜的首次注视到达时间要显著快于肉类 ($t(77) = 2.63, p < 0.05$), 其余结果无显著差异。实验 2 的结果发现, 情绪共情与食物类型的交互效应显著, 分别体现在首次注视到达时间 ($F(1,80) = 6.16, p < 0.05$)、注视次数 ($F(1,80) = 4.88, p < 0.05$) 和停留时间 ($F(1,80) = 4.05, p < 0.05$) 上, 事后检验表明低情绪共情组的被试对于红肉的首次注视到达时间要显著快于白肉 ($t(80) = -2.07, p < 0.05$), 对于白肉的注视次数更多 ($t(80) = -3.04, p < 0.05$) 和停留时间更长 ($t(80) = -2.85, p < 0.05$)。这些结果表明, 情绪共情会影响个体对于食物的注意加工过程, 情绪共情越高对于蔬菜有着更强的注意偏好, 情绪共情越低则对红肉有着更强的注意偏好。今后的研究可以进一步探讨和关注如何通过改变个体对于食物的注意从而促进健康饮食习惯的养成。

The effect of affective empathy on food attentional bias: Evidence from eye movements

ZHU Xiaoqian¹, YAN Zhiqiang^{1,2}

1 Department of Psychology, School of Educational Science, Hunan Normal University, Changsha, 410081

2 Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University, Changsha, 410081

Abstract: The meat paradox has always been an important issue in diet research. Previous studies link affective empathy as the trigger for meat paradox. Although some studies have found that affective empathy reduces the

willingness to eat meat, the cognitive processing is still not clear. Thus, we present two experiments that investigated the effect of affective empathy on attentional bias of different types of food. The experiment1 was a 2(empathy: high, low)×2(food types: meat, vegetables) mixed design and combined with the free viewing paradigm, 79 participants were recruited. Similarly, in experiment 2, 82 participants were recruited in a 2 (empathy: high, low) ×2 (food type: white meat, red meat) mixed design combined with the free-viewing paradigm. The results of experiment 1 showed that the interaction between affective empathy and food types was significant ($F(1,77) = 7.01, p < 0.01$). The post-hoc pairwise comparisons of these interaction showed that the time to first fixation for vegetables in the higher affective empathy group was faster than that for meat ($t(77) = 2.63, p < 0.05$). The results of experiment 2 showed that affective empathy had a significant interaction with food types, time to first fixation ($F(1,80) = 6.16, p < 0.05$), fixation counts ($F(1,80) = 4.88, p < 0.05$) and dwell time ($F(1,80) = 4.05, p < 0.05$), respectively. The post-hoc pairwise comparisons showed that the time to first fixation for red meat was significantly faster than that for white meat in the lower affective empathy group ($t(80) = -2.07, p < 0.05$). The lower empathy group also had more fixation counts ($t(80) = -3.04, p < 0.05$) and longer fixation time ($t(80) = -2.85, p < 0.05$) on white meat than that for red meat. These results suggest that affective empathy affects the attention processing of food. Individuals with higher affective empathy have a stronger attentional bias for vegetables, and those with lower affective empathy have a stronger attentional bias for red meat. Future research could explore the ways to promote healthy eating habits by changing individuals' attention to food.

Keywords: affective empathy, attentional bias, eye movements, free viewing, meat paradox

萌对不同类型道德困境信息加工的影响——来自眼动的证据

王欢蕾 全宇光（通讯作者）

河北大学应用心理学系，河北保定，071000，yumuchenxiang@sina.com

摘 要 萌是对一系列由视觉感知的婴儿外貌或行为特征的概括性描述。已有研究发现萌可以扩大道德圈，促使人们给予更多的道德关怀。然而现有研究鲜有探讨萌对道德困境信息的加工可能产生的影响。本研究围绕两个问题：（1）个体受到萌的影响后，是否会倾向于做出某种特定类型的决策？（2）萌对道德困境的影响发生在信息加工的哪个阶段？在研究中将大学生被试（ $N=63$ ）随机分为萌组和控制组，参考经典道德困境任务范式，比较大学生受到萌的影响后，对于道德困境信息的眼动加工和道德决策倾向有何差异。研究分为两个阶段。在启动阶段，萌组的被试首先会看到故事主角的娃娃脸面孔，并观看小猫视频；控制组的被试看到故事主角的成熟脸面孔，并观看中性视频。随后进入针对故事短文的加工与决策阶段。每个被试阅读随机呈现的2种类型的8个有关道德困境的故事短文（个人困境、非个人困境），以短文的第一句和与生死信息有关的句子等五个区域为兴趣区。故事短文的正下方呈现主角面孔，面孔的下方呈现决策问题和选项，要求被试针对故事内容做出道德决策（道义论决策：拒绝打破道德规范；功利主义决策：伤害他人以避免更大损失）。道德决策的主要结果显示：个体受到萌的影响后，道义论决策比例显著高于控制组，这说明个体受到萌的影响后会做出相对较多的道义论决策。实时阅读的眼动结果显示：萌组与控制组在晚期指标（回视时间、注视次数）、决策阶段指标（决策兴趣区总注视时间）上差异显著，在某些兴趣区的早期指标（首次注视时间、凝视时间）上差异显著。这说明，在道德困境信息的实时加工中，萌的影响部分发生在早期的情绪激活部分，也发生在基于对萌的感知，在冲突中建构道德意义的晚期阶段，也发生在做出决策的整合阶段。本研究对于探查人们如何在受到萌的影响后进行道德信息加工和决策具有一定的理论意义，为在社会情境下诱发人们表现出更多的道义论行为提供了理论依据。同时，这一研究也有助于启发萌对日常道德冲突的影响，推动后续道德干预相关研究进程。

The effects of cuteness on the processing of different types of moral dilemmas —— An eye-tracking study

Wang Huanlei, Tong Yuguang

Department of Applied Psychology, Hebei University, Baoding, Hebei

Abstract: Cuteness is usually defined descriptively as a range of visually perceived physical and behavioral infantile features. It has been found that cuteness can enlarge the moral circle and prompt people to give more moral care. However, little research has been done on the effect of cuteness on the real-time processing of moral dilemma information. This study focuses on two questions: (1) does an individual tend to make a particular type of decision when he or she is influenced by cuteness? (2) at which stage of information processing does the influence of cuteness on moral conflict occur? In the study, college students ($N = 63$) were randomly divided into two groups: the cute group and the control group. Referring to the Classic Moral Dilemma Task Paradigm, to compare the differences of eye-movement processing and moral decision-making tendency of them under the influence of cuteness. The study was divided into two stages. In the priming phase, subjects in the cute group saw the baby face of the main character and watched a cat video, while those in the control group saw the mature face of the main character and watched a neutral video. Then it enters the stage of processing and decision-making for the short story. Each participant read eight randomly presented short stories of two types (personal dilemma, impersonal dilemma) about moral dilemmas, with the first sentence of the short story and interest area related to life and death information. The main character's face is presented directly below the story, and the decision questions and options are presented below the face, which require participants to make moral decisions about the story (deontological decision: refuse to break moral rules; utilitarianism decision: harm others to avoid greater loss). The main results were as follows: the proportion of deontological decision-making in both personal and impersonal dilemmas was significantly higher than that in control group, this shows that individuals will make relatively more deontological decisions under the influence of cuteness. There were significant differences between the cute group and the control group in terms of late-stage indexes (recall time, gaze times), decision-making stage indexes (total fixation time in the decision-making interest area), and early indexes (first fixation time, gaze time) in some areas of interest. This suggests that in the real-time processing of moral conflict information, the effect of cuteness partly occurs in the early emotional activation stage, but also occurs in the perception of cuteness, the late stage of constructing moral meaning in conflict, also occurs in the integration stage of decision making. This study is of theoretical significance to explore how people process moral information and make decisions after the influence of cuteness, and provides theoretical basis for inducing more deontological behavior in social situations. At the same time, this study is also helpful to inspire the influence of cuteness on daily moral conflict and promote the following research process of moral intervention.

专家信任的影响因素：一项基于扎根理论的研究

刘世玉

中国海洋大学教育系，青岛，266100，shiyuliu@ouc.edu.cn

摘要 公众对专家的信任程度直接影响着科学知识的普及与推广。在“新冠”疫情等重大公共危机事件面前，专家观点的公信力对于政府应急机制的实施和社会舆情的稳定具有至关重要的作用。但是，已有研究表明，新媒体的飞速发展降低了信息传播门槛，在人人皆媒体的“后真相”时代，公众对专家的信任度不断下滑，直

接制约了理性观点采择和行为决策。本研究旨在通过心理学质性研究手段,深入探索影响专家信任的因素及其作用机制,为提升专家公信力提供理论和实证依据。研究采用半结构化访谈方式,根据年龄、受教育水平等人口学变量进行理论抽样,以近年来国内外社会热点问题为背景内容,探索个体对专家观点的认知。访谈录音经过文本转录后使用 NVivo 进行开放性编码、主轴编码和选择性编码三级编码。根据扎根理论研究思路,数据收集与编码分析循环进行,并在编码实现理论饱和后停止,最终被访者人数为 29 人。研究表明,个体对领域知识本质特征的理解直接影响关于专家观点可信度和权威性的认知,而科研胜任力、研究方法、利益冲突等因素是个体对专家观点可信度的最主要评价标准。研究还发现,将知识视作固定事实的个体通常以研究动机和科研胜任力作为评价专家可信度的核心指标,而认为知识具有相对性的个体则更多强调对于专家的信任程度应当取决于话题内容、问题情境等外部因素。在此基础上,本研究构建了专家信任的影响因素模型,深入挖掘与阐释认知、情感等个体内部因素以及学科领域、话题内容、社会文化等外部因素之间的相互作用。在“新冠”疫情防控的常态化工作中,理解公众对专家观点的认知对于科普宣传与社会稳定发展意义重大。本研究发挥质性研究的优势深入探索专家信任的心理机制,对提升公众科学素养和专家公信力具有重要的现实意义。

The Influential Factors of Trust in Experts: A Grounded Theory Study

Shiyu Liu

The Ocean University of China, Qingdao

Abstract: The degree of public trust in experts directly affects the popularization and promotion of scientific knowledge. In the face of the COVID-19 pandemic and other major public crisis events alike, the credibility of expert opinions plays an important role in the implementation of government emergency mechanism and the stability of social sentiment. However, studies have shown that the rapid development of new media has lowered the threshold of information dissemination. In the "post truth" era where everyone is media, the public's trust in experts has been declining, which directly restricts individuals' rational opinion taking and decision making. The purpose of this study was to explore the factors influencing expert trust and its mechanism through qualitative psychological research methods to provide theoretical and empirical basis for improving the credibility of experts. Based on demographic variables such as age and education level, this study conducted semi-structured interviews through theoretical sampling to explore individuals' views of expert opinions regarding heated social issues in recent years. The interview recordings were transcribed and analyzed through open coding, axial coding and selective coding using NVivo. Based on the grounded theory method, data collection and coding took place iteratively until theoretical saturation was reached. The final number of interviewees was 29. Results showed that individuals' understanding of the nature of knowledge directly affected their understandings about the credibility and authority of expert opinions, and factors such as scientific research competence, research methods and conflict of interests were the main evaluation criteria for the credibility of expert opinions. It was also found that individuals who viewed knowledge as fixed facts tended to attribute research motivation and scientific research competence as the core indicators of expert credibility, while individuals who believed in the relativity of knowledge emphasized that the degree of expert trust should depend on external factors such as topics of interest and problem situation. Finally, a theoretical model was constructed which demonstrated in-depth the influential factors of expert trust and their relationships, considering both internal factors such as cognition and emotion, and external factors such as disciplinary fields, topic content as well as social and cultural issues. As the prevention and control of the COVID-19 pandemic becomes normalized, it is of great significance to understand the public's understanding and attitudes toward experts' opinions to promote science popularization as well as social stability and development. This study extended the benefits of qualitative research to reveal the psychological mechanism of expert trust, which provided important practical implications for enhancing the public's scientific literacy and expert credibility.

Keywords: expert credibility, influential factors, grounded theory

自杀意念者与自杀尝试者的自杀相关动机过程之差异

应梦婷¹（通讯作者） 江光荣²

1 武汉体育学院健康科学学院心理学系，武汉，430079, ymt108@hotmail.com

2 青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079

摘要 研究者以大学生为研究对象，通过一项质性研究考察自杀意念者与自杀尝试者在广义自杀意念的内容或成分上的差异。在对两者自杀意念的比较中，不仅关注狭义自杀意念的产生，还包括对自杀相关动机过程的了解；既包括言语性内容，又涉及自杀意念中的心理意象及情感成分等。在此基础上，探索什么样的自杀意念具有更高的行动风险。从某市某综合医院精神科选取过去一年内仅有自杀意念（13人）或曾有自杀尝试（13人）的住院大学生，通过半结构式访谈收集26名被试从产生自杀意念到采取/放弃自杀行动这一过程中的近端认知情感过程，采用共识性质性研究方法（CQR）对访谈材料进行深入分析。结果发现，从自杀想法产生到个体最终采取或放弃自杀行动，影响其最终行为的因素可划分为5个方面：自杀意念产生（我想死），自杀结果权衡（要不要自杀），自杀过程预期（如何实施自杀），自杀/死亡相关信念与态度，自杀意念调控，这五个方面组成一个有机整体，可以从近端因素的角度大致描述自杀行为的发生过程。自杀意念者与自杀尝试者在自杀意念的产生上无明显差异，但在自杀意念产生后的自杀相关动机过程上存在差异，主要表现为：

（1）个体在自杀意念产生后会对自杀结果利弊及生活、现实、未来等作进一步的思考与权衡，而自杀意念者与自杀尝试者表现出不同的自杀结果预期思考内容及模式；（2）不论是自杀意念者还是自杀尝试者均会对自杀行动进行相关思考，但两者对自杀过程的预期和想象不同，自杀尝试者比自杀意念者有更多关于自杀实施过程的心理意象，并伴随更多的积极情绪；（3）自杀意念者与自杀尝试者在自杀/死亡相关信念与态度上也存在差异，其在个体的自杀意念中以潜移默化的方式起作用；（4）与自杀尝试者相比，自杀意念者更多地对自己的自杀想法存在元认知觉察及自我抑制，且在相当一部分自杀意念者中，存在自杀想法的情绪调节现象。

关键词 自杀意念者，自杀尝试者，质性研究

A Study on the Differences in Suicide-Related Motivational Process between Suicide Ideators and Suicide Attempters

YING Mengting¹, JIANG Guangrong²

1 Department of Psychology, College of Health Science, Wuhan Sports University, Wuhan 430079, ymt108@hotmail.com

2 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079

Abstract: This study aims to explore the differences in the content or composition of suicidal ideation among college students with suicidal ideation or suicidal attempts. While comparing different aspects of suicidal ideation, we not only pay attention to the formation of suicidal ideation, but also explore the suicide-related motivational process after having suicidal ideation. We focus on verbal components of suicidal ideation, as well as suicidal imagery and emotional components in their ideation. In order to identify which kind of suicide ideators have the highest risk to commit suicide. The subjects were from a psychiatric department in a general hospital in Wuhan. 13 students who had suicidal ideation along with another 13 students who had suicidal attempts in the past year were selected. Using semi-structure interviews, we collected the proximal cognitive emotional states in the process from generating suicide thoughts to taking or abandoning suicide action. Then, investigators conducted an in-depth analysis for the interview materials using Consensus Qualitative Research (CQR). The qualitative analysis found that, from the occurrence of suicide trigger events (or non-existence) to the individual's final behavior (take or abandon suicide), the factors

affecting their final action can be divided into five aspects: formation of suicide ideation (I want to die), evaluations of suicide outcomes (whether I should commit suicide or not), expectations on suicide process (how to commit suicide), suicide/death related beliefs and attitude, and suicidal ideation adjustment. These five aspects together can describe the development of suicide behavior from the perspective of proximal factors. By comparing the differences between suicide ideators and suicide attempters in these five aspects, it is found that suicide ideators and suicide attempters do not differ in the formation of suicidal ideation, but they do have differences in suicide-related motivational process after forming suicidal ideation. The biggest differences are from evaluations of suicide outcomes and expectations on suicide process. Also suicide ideators and suicide attempters tend to have different suicide/death related beliefs and attitude. Compared with suicide attempters, suicide ideators are more likely to be aware of their suicidal thoughts and try to suppress them.

增强现实（AR）学习环境下小学低年级学生的高效率学习研究： 一项 NVIVO 的质性分析

赵小军 石常秀 贾文静（通讯作者）

河北大学教育学院，保定，071002, 1361757964@qq.com

摘要 为了解小学低年级学生通过使用增强现实（AR）学习技术如何影响其高效率学习。AR 技术是把现实环境中的真实场景同计算机中输出的文字和图形等进行组合拼接，通过影响使用者的视觉和听觉等系统来发挥作用。基于扎根理论，采用访谈的研究方法，进行基于 NVIVO 的质性分析。本研究选取河北省两所学校的 41 名三年级小学生进行半结构化的深入访谈，根据学习方式将样本分为 AR 组和文本组，其中 AR 组 21 人，文本组 20 人。将被试叙述的文本进行三级编码，其中核心编码为 AR 学习中促进小学生高效率学习的影响因素，将主轴编码分为内部因素和外部因素，内部因素分为学业情绪因素、学业认知因素、兴趣因素、学习适应性。其中学业情绪因素包括积极高情绪、积极低情绪、消极高情绪和消极低情绪，大部分的学生在学习中属于积极高情绪，学业认知因素包括学业归因、学业成就目标定向。外部因素包括学习环境、同伴关系、父母支持。外部因素参考点共 32 个，内部因素参考点共 176 个。整体来看，AR 学习中促进学习高效率学习的影响因素是多方面的，在综合因素作用下对学生的高效率学习产生影响的。研究结果表明，采用 AR 技术学习以及有相关学习经历的学生都认为，AR 学习会提升他们的学习效率，并且通过内外部因素共同影响学生的高效率学习，此研究的意义在于建立 AR 学习中学生高效率学习影响因素的结构模型，为促进学生高效率学习提供理论依据。

Efficient learning of lower grade students in an augmented reality (AR) learning environment: a qualitative analysis of NVIVO

Zhao Xiaojun, Shi Changxiu, Jia Wenjing

School of education, Hebei University, Baoding, 071002, 1361757964@qq.com

Abstract: In order to understand how the low-grade primary school students use augmented reality (AR) learning technology to influence their efficient learning. AR technology combines the real scene in the real environment with the text and graphics output from the computer, and plays a role by influencing the visual and auditory systems of users. Based on the grounded theory, the qualitative analysis based on NVIVO is carried out by using the interview research method. In this study, 41 third-grade pupils from two schools in Hebei Province were selected for semi-structured in-depth interviews, and the samples were divided into AR group and text group according to their learning styles, including 21 in AR group and 20 in text group. The texts narrated by the subjects are coded at three levels, in which the core coding is the influencing factors that promote pupils' efficient learning in AR learning, and the main axis coding is divided into internal factors and external factors, while the internal factors are divided into

academic emotion factors, academic cognition factors, interest factors and learning adaptability. Among them, academic emotion factors include positive high emotion, positive low emotion, negative high emotion and negative low emotion, and most students belong to positive high emotion in their study, while academic cognitive factors include academic attribution and academic achievement goal orientation. External factors include learning environment, peer relationship and parental support. There are 32 reference points for external factors and 176 reference points for internal factors. On the whole, there are many influencing factors to promote high-efficiency learning in AR learning, and the comprehensive factors have an impact on students' high-efficiency learning. The results show that students who use AR technology to study and have relevant learning experience think that AR learning will improve their learning efficiency, and both internal and external factors will affect students' efficient learning. The significance of this study is to establish a structural model of influencing factors of students' efficient learning in AR learning, and provide theoretical basis for promoting students' efficient learning.

阈下和阈上奖赏影响创造性问题解决的时变脑网络

崔璨¹ 姜英杰¹(通讯作者)

¹ 东北师范大学心理学院, 长春, 130024, jiangyj993@nenu.edu.cn

摘要 以往研究发现阈下奖赏更能促进创造性问题解决, 且阈下和阈上奖赏影响创造性问题解决的过程中诱发了不同的 P200-600 波幅。然而, 个体在进行创造性任务时, 大脑中多个相关脑区的协作是有效完成任务的基础, 研究不同条件下的动态网络模式, 有助于阐明脑内信息加工机制。本研究采用电生理(EEG)技术研究了阈下和阈上金钱奖赏对汉字复合远距离联想问题(CRA)解决的影响, 基于自适应定向传递函数(Adaptive directed transfer function, ADTF), 从时变脑网络(time-varying networks)角度揭示了阈下和阈上奖赏条件下个体解决 CRA 问题的动态网络模式。实验结果显示, 奖赏呈现后问题解决各个阶段的大脑网络模式存在差异。另外, 两种奖赏条件下呈现出不同的问题解决的时变网络模式。本研究将相应的大脑网络状态分为两个阶段, 早期阶段(100-200 ms)和问题解决阶段(200-600 ms)。阈上奖赏条件下, 左侧前额区为早期阶段的核心源, 左前额和顶枕区的信息交互为主要的大脑活动。信息流从左侧前额区流向顶叶区域, 这可能反映了对刺激呈现的视觉加工以及对奖赏干扰的抑制。在问题解决阶段, 顶枕区尤其是顶叶区域成为新的核心源节点, 这反映了问题成功解决早期新颖联想的形成。而在阈下奖赏条件下, 被试在早期阶段主要有左侧前额和顶枕区两个区域内部的连接, 并无两区域的信息交互。这说明与阈上奖赏相比, 阈下奖赏受到的干扰较低, 不太需要消耗认知资源对其进行抑制, 也就无需激活左前额到顶叶区域的信息交互。在问题解决阶段, 阈下奖赏条件下的核心区域也同样转移到顶枕区, 但其大脑网络边比阈上奖赏条件更多。这反映了更强的大脑响应, 说明阈下奖赏条件下个体对当前任务投入资源更多, 大脑激活更强, 从而更能促进新颖联想的形成。本研究从时变脑网络角度拓展了先前研究, 结果表明, 与阈上奖赏相比, 阈下奖赏条件下的干扰更小, 对创造性任务的注意资源投入更多, 因而有更好的任务表现。

The time-varying networks of the effects of subliminal and supraliminal rewards on creative problem solving

Can Cui¹, Yingjie Jiang¹(corresponding author)

School of psychology, Northeast normal university, Changchun, 130024, jiangyj993@nenu.edu.cn

Abstract: Previous studies have suggested that subliminal reward can facilitate creative problem solving, and subliminal and supraliminal rewards induce different P200-600 amplitude. However, the interactions between various brain regions are the basis for the effective completion of task. The present study investigated the impact of subliminal and supraliminal rewards on Chinese verbal compound remote-associated (CRA) problem solving using electrophysiological techniques, and utilized the time-varying network analysis to reveal the dynamic network structures based on the adaptive directed transfer function (ADTF). The results showed differences in the patterns of brain networks at different stages of problem solving after the rewards were presented. In addition, the two reward conditions induced different time-varying network patterns of creative problem solving. In this study, the brain network states were divided into two phases, the early phase (100-200 ms) and the problem-solving phase (200-600 ms). In the supraliminal reward condition, the left prefrontal region was the control source of the early stage, with a much stronger information flow from the left prefrontal region to the parieto-occipital regions. This result may reflect the visual processing of stimulus presentation and the suppression of reward distraction. In the problem-solving phase, parietal lobe becomes the new control source node, which may reflect the formation of novel associations in the early stage of successful problem solving. However, in the subliminal reward condition, there was no information exchange between the left prefrontal and parietal occipital regions in the early phase. This suggests that compared with supraliminal reward, subliminal reward is less disturbed and requires less cognitive resources to suppress distraction, thus it does not need to activate information interaction between the left prefrontal and parietal lobe region. During the problem-solving phase, subliminal rewards' control source also shifted to the parietal-occipital region, but more parietal-occipital activation was found. This reflects a stronger brain response, indicating that participants employ more resources to the creative task, and the brain is more activated, which can better promote the formation of novel associations. These results extend prior research by mining time-varying network and suggest that compared with supraliminal reward, subliminal reward has less distraction, more attention resources are employed in current creative task, and thus better performance.

趋近和回避动机影响创造性思维的认知机制

张华敏¹ 薛婷²

天津中医药大学管理学院应用心理, 天津, 301617, 1429692214@qq.com

摘要 拥有创造性思维是在个人学习和社会生活中获得进步和成功的基础。为探究趋近和回避动机与创造性思维之间的关系, 采用事件相关电位(ERP)技术对30名大学生(男生10名、女生20名)在趋近和回避动机的诱发以及远距离联想任务中的问题解决过程进行了研究。将被试随机分为趋近动机组和回避动机组, 以趋-避动机(趋近动机、回避动机)为自变量, 被试远距离联想能力的正确率、反应时以及N400波幅及其潜伏期为因变量。结果表明远距离联想题目诱发的N400波幅及其正确率在趋-避动机上的主效应显著($p<0.01$)。趋近动机组的远距离联想能力测验正确率得分高于回避动机组的个体, 且这种差异没有受到实验操作本身引起的任务喜爱度和疲倦程度的影响, 说明趋近动机对远距离联想过程有促进作用; 趋近动机条件下远距离联想测验诱发的N400波幅显著高于回避动机条件, 说明趋近动机条件下个体在语义网络中拥有较强的信息检索能力, 并能够较长时间保持注意的稳定性, 因而促进了新颖性连接的形成, 使远距离联想的问题更容易得到解决。趋避动机与创造性思维的研究丰富了创造力和动机的研究理论, 对创造性思维的培养和提升提供了理论依据。

The Effects and Mechanisms of Approach and Avoidance Motivation on Creative Thinking

Huamin Zhang¹, Ting Xue²

Tianjin University of Traditional Chinese Medicine

No. 10, Poyang Lake Road, West District, Tuanbo New City, Jinghai District, Tianjin, China

Abstract: Having creative thinking is the basis for progress and success in personal learning and social life. In order to explore the relationship between approach and avoidance motivation and creative thinking, event-related potential (ERP) technology was used to induce approach and avoidance motivation and remote associates task for 30 undergraduates (10 males and 20 females). The problem-solving process in the paper was studied. The subjects were randomly divided into an approaching motivation group and an avoiding motivation group. The approaching-avoidance (approaching motivation, avoiding motivation) are independent variable, the ACC and RT of the remote associates test amplitude and the latency of the N400 evoked by the Remote Associates Test are the dependent variables. The results show that the main effect of the N400 evoked by the remote associates test and its accuracy under the approaching-avoidance motivation is significant ($p < 0.01$). The correct rate of the remote associates test of the approaching motivation group is higher than that of the avoiding motivation group, and this difference is not affected by the degree of task love and fatigue caused by the experimental operation itself, indicating that the approaching motivation have a huge positive impact on the process of the remote association. The N400 evoked by the remote associates test under the condition of approaching motivation is significantly higher than that of the condition of avoiding motivation, indicating that the individual has strong information retrieval ability in the semantic network under the condition of approaching motivation and can maintain attention for a long time. The stability of the system promotes the formation of novel connections, making it easier to solve the problem of remote associates. The research on the approaching-avoidance motivation and creative thinking not only enrich the theory research, but also have important implications for creativity cultivation and promotion.

Keywords: Approaching Motivation, Avoidance Motivation, Remote Associates Task, Creative thinking

刺激不确定性对类别特异注意定向的影响

王赞², 王浚哲², 苗志伟², 姜云鹏^{1,2,3}, 吴瑕^{1,2,3} (通讯作者)

摘要 刺激不确定性是指与心理运算量大小有关的感觉信息的特征, 主要包括认知负载和预期有效性, 两者在类别特异注意定向中有重要作用。为了考察刺激不确定性对类别特异注意加工的影响, 从而进一步探究类别特异注意定向的神经机制, 研究采用事件相关电位技术 (ERPs), 在视觉搜索任务中, 将目标定义为形状类别 (“X”或“O”形), 通过改变分心物的同质性来控制认知负载水平, 通过改变声音线索与目标反应的有效性来控制预期有效性。实验记录了被试的反应时、正确率及 N2pc 成分。行为结果发现, 认知负载和预期有效性均会影响注意定向的加工水平, 且存在交互作用: 高负载时, 预期有效性作用较大; 低负载时, 预期有效性作用较小。说明两者的作用既存在一定的独立性, 也涉及了共同的加工过程。ERP 结果发现, 低负载时, 相比有效预期, 无效预期时的目标诱发了更大的 N2pc; 高负载时, 有效与无效预期条件下诱发的 N2pc 无明显差异。说明在低负载条件下可以根据预期有效性对目标进行注意定向, 但在高负载时则更加依赖即时信息。总的来说, 研究不仅考察了类别特异注意定向的时间进程, 探讨了类别注意定向的加工机制, 还为应对现实世界中复杂的不确定性事件提供了依据和指导。

The effect of stimulus uncertainty on category-specific attention orientation

Yun Wang², Junzhe Wang², Zhiwei Miao², Yunpeng Jiang^{1,2,3}, Xia Wu^{1,2,3}

1 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China

2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

Abstract: Stimulus uncertainty refers to the characteristics of sensory information related to the amount of mental calculation, including cognitive load and predicted validity, which play an important role in category-specific attention orientation. In order, the present study used ERPs technology and employed visual search paradigm to investigate the neural mechanism of category-specific attention orientation, and the effect of uncertainty on it. Target was defined by shape category ('X' or 'O'), cognitive load was manipulated by the homogeneity of distractors, and predicted validity was manipulated by the validity between sound cue and target response. Reaction time, accuracy and N2pc component were recorded. Behavioral results showed the cognitive load and predicted validity both affect the processing of attention orientation, and the interaction between them showed that the effect of validity is higher in the high-load condition than that in the low-load condition, indicating that two factors can operate independently, also interfere with same processing of attention. ERP results found that in the low-load condition, a higher N2pc was elicited in the invalid condition, rather than in valid condition; in the high-load condition, no significant N2pc difference was found. The results indicate that in the low-load condition, attention orientation was depended on the validity, but in the high-load condition, such orientation was determined by the instant information. In general, these results not only investigate the time course of category-specific attention orientation and probe the process mechanism of attention orientation, but also provide guidance for coping complex uncertain events in real world.

Keywords: category-specific attention, visual orientation, cognitive load, predicated validity, stimulus uncertainty

面孔熟悉感形成的动态时间进程： 基于周期性快速刺激呈现的 EEG 范式

孙梦丹¹ 高晓卿^{1,2}

1 心理科学研究中心，浙江大学，杭州，310007

xiaoqinggao@zju.edu.cn

摘要 我们对熟悉面孔的短暂一瞥，就会唤起一种“温暖、轻松、满足”的感觉，即熟悉感。然而，大脑形成面孔熟悉感的时间进程仍不清楚。本研究采用了基于频率标记的 EEG 范式快速呈现面孔刺激，并操纵了刺激呈现异步性（SOA），以研究大脑在感知面孔熟悉度时的“阈值”。在本研究中，自然场景下的面孔刺激以每秒 8、12、16 或 20 张的速度周期性呈现（基线刺激频率），即，每张面孔的呈现时间为 125 ms、83.33 ms、62.50 ms 或 50 ms。在该刺激序列中，熟悉面孔以每秒 2 张的速度呈现（奇异刺激频率：2 Hz），每两张熟悉面孔中穿插多张陌生面孔。基于该范式，奇异刺激频率上观察到的脑电信号反映了大脑从陌生面孔中辨别出熟悉面孔的加工过程。此外，本研究不要求被试对面孔刺激进行反应，因此测量了大脑内隐的面孔加工。对频率域的脑电信号分析后发现，四种基线刺激频率下均存在显著的对熟悉面孔的偏好反应，该反应在 P8 和 PO8 等电极最为强烈，并表现出右侧偏侧化效应。时间域的分析结果显示，存在两个波幅显著不同于基线的时间窗：N170 和 P300。其中，所有条件均观察到显著的 N170 成分，而且其波幅随着 SOA 时间增加呈现出线性趋势；而 P300 成分只出现在 SOA 较大的两个条件中（12 和 8 Hz），其波幅随着 SOA 时间增加呈现出

非线性趋势。据此,本研究认为,熟悉面孔加工包含两个加工阶段,早期阶段反应自动化的前馈过程(以 N170 为神经标志),而当 SOA 超过一个特定"阈值"之后,则进入晚期加工过程(以 P300 为神经标志),此时熟悉感才真正形成。

How the percept of familiarity from faces unfolds over time

Mengdan Sun¹, Xiaoqing Gao^{1,2}

Center for Psychological Science, Zhejiang University

Abstract: A brief glance of familiar faces arouses a feeling of “warmth, ease, and contentment”, referred to as percept of familiarity. How the percept of familiarity from faces unfolds over time remains unclear. The current study adopted a sensitive EEG paradigm based on frequency tagging and investigated the “threshold” SOA in perceiving familiarity, using briefly presented and masked faces with systematically varied SOAs. In our study, natural images of faces were periodically presented at a fast speed (base frequency: 8, 12, 16, or 20 Hz; corresponding to 125 ms, 83.33 ms, 62.50 ms, or 50 ms SOA). Among the streams, personally familiar faces were presented at a fixed rate (i.e., oddball frequency, 2 Hz). This paradigm directly measures discrimination between familiar and unfamiliar faces, as the EEG responses at the oddball frequency reflect differential responses (i.e., familiar-face-selective) from the responses evoked at the base frequency. To ensure an implicit face processing, the stimuli were viewed passively by participants without any behavioral response. We found significant responses at the oddball frequencies in all speed conditions, peaking around occipitotemporal areas (P8 and PO8), showing a lateralization effect to the right hemisphere. Regarding the temporal dynamics of the familiarity-selective response in the occipitotemporal areas, we observed two ERP components, N170 and P300. The N170 was significant in all conditions, even when each face was presented for only 50 ms, and its amplitudes increased progressively with the presentation times. In contrast, the P300 component was observed when the SOA was larger than approximately 80 ms. We believed that two stages are involved in familiar face processing, with the early stage reflecting a feedforward process, followed by the later stage after a consciousness threshold SOA is exceeded.

Keywords: EEG, familiar face, Fast Periodic Visual Stimulation, frequency tagging

羽毛球专项大学生应对心理不应期的神经机制研究

魏佳凝¹ 冯琰² (通讯作者)

1 上海体育学院, 上海, 200438

2 沈阳体育学院运动人体科学学院, 沈阳, 110102, fy241919@qq.com

摘要 目的: 随着羽毛球运动的不断发展, 运动员在比赛中的竞争日益激烈, 运动员在时间压力较大的情况下能够快速而准确地进行预判变得越来越重要。由于心理不应期现象的存在, 一旦预判错误, 运动员在短时间内快速纠正错误就变得困难。本研究借助事件相关电位技术, 探讨在应对心理不应期时, 羽毛球专项大学生的行为优势及神经机制特点, 旨在为高校羽毛球教学与运动员科学选材提供参考依据。方法: 本研究采用标准实验变换信号任务范式 (change-signal task, CST), 将经典素材替换为羽毛球专项素材, 通过模拟专项运动情境来设置专项实验情境; 采用专家—新手研究范式 (羽毛球专项大学生 14 名, 羽毛球选修大学生 14 名), 运用 ERP 脑电数据采集技术, 通过对比不同水平羽毛球大学生在应对心理不应期现象时的行为反应及脑神经活动水平, 揭示羽毛球专项大学生可能存在的行为优势及神经活动特点。结果: 行为方面, 专家组的专项 go 反应时、change 反应时、心理不应期时间显著快于新手组 ($P<0.05$), 专家组准确率显著高于新手组 ($P<0.05$); ERP 方面, 突发后场球视频诱发的脑电成分上, 专家组的 N1、N2 波幅显著小于新手组 ($P<0.05$), 专家组的 P3、PSW 波幅显著大于新手组 ($P<0.05$), 在发网前球视频诱发的脑电成分上, 专家组的 N1 波幅显著大于新手组 ($P<0.05$), 专家组的 P2、N2、P3 波幅显著小于新手组 ($P<0.05$)。结论: (1) 运动水平越高, 在应对心理不应期过程中越具有行为反应优势, 其行为偏向于执行快速转换策略, 即提高转换速度的同时保持反应速度不下降, 从而能够快速、准确地应对心理不应期; (2) 运动水平越高, 在应对心理不应期

过程中，对刺激任务的感知阶段投入的认知资源越少，对刺激的辨别、加工、整合、反应阶段投入更合理、更大量的认知资源，信息加工方式越具有优势，心理运算资源利用越具有节省化优势，任务难度越大，这种优势越明显。

Study on Neural Mechanism of College Badminton Majors During Coping with Their Psychological Refractory Period

Wei Jiaying¹, Feng Yan²(correspondent author)

1 Shanghai University of Sport, Shanghai ,200438

2 Shenyang Sport University of Human Movement Science, Shenyang ,110102.fy241919@qq.com

Abstract: Purposes: With the continuous development of badminton, the competition of athletes in the competition is becoming more and more fierce, and it is more and more important for athletes to be able to predict quickly and accurately under the condition of great time pressure. Because of the phenomenon of psychological refractory period, it is difficult for athletes to correct mistakes quickly in a short period of time once the prediction is wrong. With the help of event-related potential technique, this study explores the behavioral advantage and neural mechanism of badminton college students in dealing with psychological refractory period. It can provide reference for college badminton teaching and athletes scientific selection. Methods: In this study, specific situation experiment have been applied; The standard paradigm of experimental signal-transforming task (“Change”-signal task, CST) has been adopted, and the classic materials have been replaced with materials related to badminton events, In order to simulate special sports situations. the paradigm of expert—novice has been adopted (14 badminton majors and 14 students of optional badminton courses); Application of ERP EEG Data Acquisition Technology. By comparing the behavior response and brain activity level of different badminton college students in dealing with psychological refractory period, the possible behavioral advantages and neural activity characteristics of the expert group were revealed. Findings: Behavioral findings, The “Go” response time, the “Change” response time and the psychological refractory period of the expert group are significantly shorter than those of the novice group ($P<0.05$), and the accuracy of the expert group is significantly higher than that of the novice group ($P<0.05$). ERP findings, Among the EEG components induced by the videos of flash backcourt ball, the N1, N2 amplitudes of the expert group are significantly smaller than those of the novice group ($P<0.05$), and the P3, PSW amplitudes of the expert group are significantly larger than those of the novice group ($P<0.05$). Moreover, among the EEG components induced by before-serving videos, the N1 amplitude of the expert group is significantly larger than that of the novice group ($P<0.05$), and the P2, N2, P3 amplitudes of the expert group are significantly smaller than those of the novice group ($P<0.05$). Conclusions: (1) The higher sports level the players are in, the more behavioral response advantages they have in the process of dealing with the phenomenon of psychological refractory period. Their behaviors are inclined to carry out the strategy of fast conversion, that is, increasing the conversion speed while keeping the reaction speed, so that the deviation of the prediction can be adjusted immediately and accurately; (2) The higher sports level the players are in, the less cognitive resources they invest in the perceptual stage of the stimulation task in the process of dealing with the phenomenon of psychological refractory period. They can invest more reasonable and larger amount of cognitive resources in the stimulation on the stages of identification, processing, integration and response, and have more advantages on the way of information processing; and the utilization of their brain resources is more economical. The more difficult the tasks are, the more obvious advantages the experts have.

无功不受禄：高估他人对非应得好处的积极评价

陈晓娅¹ 陆静怡¹（通讯作者）

¹ 华东师范大学心理与认知科学学院，上海，200062，jylu@psy.ecnu.edu.cn

摘要 为取悦他人，人们有时会给予他人理所不应得的好处，例如，营销人员为消费者提供预期之外的免费升舱、意料之外的酒店房间升级等。然而在得到这些莫名其妙的好处后，接收者是否真如分配者预想的那样满意？本研究（ $N = 1069$ ）提出并揭示了关于莫名其妙给好处的预测偏差，即分配者高估了接收者对莫名其妙的好处感到满意的程度。研究一和二旨在揭示分配者的预测偏差。在研究一中，分配者想象自己给接收者分配了超出其工作量的奖金或与工作量相对应的奖金，并预测接收者的满意程度；接收者想象自己被分配了超出自己工作量的奖金或与工作量相对应的奖金，并评价自己的满意程度。结果显示，当奖金高于接收者的付出时，分配者高估了接收者的满意程度；而当奖金等于接收者的付出时，分配者能准确估计接收者的满意程度。研究二恒定收入，改变付出，复制了分配者的预测偏差。当分配者分配给接收者的工作量少于其理应付出时，分配者高估了接收者的满意程度；当分配给接收者的工作量等于其理应付出时，分配者能作出准确估计。研究三和四旨在探讨上述预测偏差的机制。本研究提出，得到非应得的好处会让接收者感到焦虑不安，但是分配者较难预料到接收者的焦虑不安。研究三和四通过操纵得到的好处是否可归因来改变接收者的焦虑不安程度。研究三中，在接收者提出请求后分配者给予其好处；研究四中，分配者因回报接收者先前给予自己的恩惠而为接收者提供好处。由于接收者知道分配者为何给自己好处，因而不会感到焦虑不安。结果显示，分配者能准确预测接收者得到好处后的满意程度，由此支持了本研究提出的机制。研究五旨在排除不公平的竞争假设，设置了多给好处（分配者分配给接收者的奖金多于其付出）和少给好处（少于接收者的付出）两种不公平方案。结果显示，分配者的预测偏差只出现在多给好处组，由此排除了上述竞争假设。本研究揭示了一种新的预测偏差，即分配者高估了接收者得到莫名其妙的好处的满意程度，丰富了预测偏差的研究，该效应启示营销人员在给予消费者好处时要提供原因，从而减少消费者的不安焦虑，提升其满意度。

关键词 预测偏差，莫名其妙的好处，焦虑

Givers' overestimation about satisfaction experienced by recipients who receive unearned benefits

Xiaoya Chen, Jingyi Lu

School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

Abstract: People sometimes offer unearned benefits to others in order to please others. For example, marketers provide an unexpected free upgrade of flights or hotel rooms to consumers. However, will recipients who receive unearned benefits feel satisfied as givers predict? Our study ($N = 1,069$) reveals a misprediction made by givers that givers overestimate how much recipients feel satisfied with unearned benefits. Studies 1 and 2 showed the misprediction made by givers. In Study 1, givers imagined that they allocated more pay to recipients than recipients' contribution or exact the pay corresponds to recipients' contribution, and then predicted recipients' satisfaction. Recipients imagined that they got more pay than their contribution or exact the pay corresponds to their contribution, and then rated their satisfaction. The result showed that givers overestimated recipients' satisfaction with unearned benefits, yet accurately predicted recipients' satisfaction with earned benefits. Study 2, where recipients' payoff was manipulated while their income was fixed, replicated the misprediction made by givers. Givers overestimated recipients' satisfaction after allocating less workload to recipients than supposed, yet accurately predicted recipients'

satisfaction after allocating supposed workload to recipients. Studies 3 and 4 tested the mechanism of the misprediction made by givers. We propose that recipients feel anxious about unearned benefits, however, givers underestimate recipients' anxiety. Studies 3 and 4 manipulated recipients' anxiety by offering the reason for unearned benefits. In Study 3, givers gave the recipients unearned benefits after recipients requested; in Study 4, givers gave unearned benefits to recipients to reciprocate the recipients' favor. Knowing the reason for unearned benefits, the recipients did not feel anxious. The results showed that givers accurately predicted recipients' satisfaction, thus supported our mechanism. Study 5 ruled out the alternative explanation of unfairness by setting two unfair distributions: unearned benefits (more pay than contribution) and fewer benefits (less pay than contribution). The result showed that the misprediction made by givers was specific to unearned benefits. Therefore, the alternative explanation of unfairness was ruled out. Our study reveals a novel misprediction and carries practical implications for marketers. When giving undeserved benefits to consumers, marketers should provide reasons for unearned benefits to reduce consumers' anxiety and improve consumers' satisfaction.

Keywords: misprediction, unearned benefits, anxiety

人与机器人互动中机器人的预期社会治理问题

涂阳军（通讯作者） 刘唯 杨智

湖南大学工商管理学院，长沙，410082，tuyangjun@hnu.edu.cn

摘要 智能服务机器人被《国家十三五规划纲要》和《国家中长期科技发展规划纲要（2006-2020年）》列为重要发展战略和先进制造的前沿技术。越来越多的智能服务机器人开始进入家庭承担扫地等生活事务、执行陪学早教或娱乐游戏等功能。用于老年人照看陪护、健康管理或疾病康复的智能服务机器人也开始大量使用。餐饮、酒店、零售、接待/旅行、机场、银行等场所也开始部署智能服务机器人。突发疫情促进了用于非接触式医疗服务（如送药）的医用智能服务机器人的快速发展。在广泛多样的服务场景中，智能服务机器人与人类的互动引发了如何对机器人进行预期社会治理（Anticipatory Governance）的问题。人机互动中机器人的社交性是引发机器人预期社会治理议题的根本前提，它包括三个层面的意蕴。其一为机器人自身的社交特征，如人形外观、面部表情或体态动作等。其二为人类是否愿意接受与机器人互动，即人类何时及在何种条件下接受与何种机器人互动（许丽颖，喻丰，2019）。其三为人机互动中人类预设的机器人似人还是像机器的人性假设。人机互动中的社交性又可进一步衍生出机器人预期社会治理中的五个议题，它们分别是人机信任、人机同理、机器人责任、机器人虐待和人机互动伦理，其中人机信任是机器人预期社会治理的重要基础、人机同理是机器人预期社会治理的主要手段、机器人责任是机器人预期社会治理的最佳保障、机器人虐待是机器人预期社会治理的法制内涵、人机互动伦理是机器人预期社会治理的基本底线。

Research on the Issues of Robots Anticipatory Governance in Human-Robot Interaction (HRI)

Yangjun TU (Corresponding author), Liu Wei, Zhi YANG

School of Business, Hunan University, Changsha, People's Republic of China

Abstract: Smart service robots have been listed as an important development strategy and frontier technology of advanced manufacturing by the Outline of the National Thirteenth Five-Year Plan and the Outline of the National Medium and Long-Term Science and Technology Development Plan (2006-2020). More and more smart service robots are beginning to enter the family to undertake sweeping and other living affairs, the implementation of accompanying schooling early education or entertainment games and other functions. Intelligent service robots used for elderly care, health management or disease rehabilitation are also beginning to be used in a large scale. Smart service robots are also being deployed in restaurants, hotels, retail, hospitality/travel, airports and banks. Outbreaks of epidemics have contributed to the rapid development of medical robots for non-contact medical services (e.g.

medicine delivery). The Human Robot Interaction (HRI) in a wide variety of service scenarios raises the question of Robots Anticipatory Governance (RAG). The social nature of robots in HRI is the fundamental premise that raises the issue of RAG, which has three levels of implications. One is the appearance characteristics of the robot itself, such as its humanoid appearance, facial expressions, or body movements. The second is whether humans are willing to accept interaction with robots, i.e., when and under what conditions they accept to interact with which robots (Xu Liying, Yu Feng, 2019). The third is the human-being assumption of whether humans presuppose that robots are human-like or machine-like in HRI. The sociality in HRI can further be derived from five issues in RAG, which are human-robot trust, human-robot empathy, robot responsibility, robot abuse, and human-robot interaction ethics, where human-robot trust is an important foundation of RAG, human-robot empathy is the main means of RAG, robot responsibility is the best guarantee of RAG, and the Robot abuse is the legal connotation of RAG and the ethics of human-robot interaction is the basic baseline of RAG.

危机历史与应对策略对慈善组织意外型危机信任修复的影响

刘与哲¹ 柳郑捷¹ 袁旭辉¹ 孙炳海¹ 李伟健¹ (通讯作者)

¹ 浙江师范大学教师教育学院, 金华, 321004, xlxh@zjnu.cn

摘要 情境危机传播理论(Situational Crisis Communication Theory, SCCT)针对不同的危机类型提供了不同的危机应对策略。其中代表组织无意行为的意外型危机是组织高发危机,且在意外型危机中组织危机应对更为复杂。SCCT理论认为,当组织面对意外型危机时,若其不存在危机历史,则需采取弱化策略;若其存在危机历史,则需采取重建策略。但后续部分研究者的研究显示意外型危机下非营利组织采取弱化策略和重建策略的修复效果不存在显著差异。此外,尚未有实证研究探讨有危机历史的慈善组织在面对意外型危机时,是否适用SCCT所提供的相应危机应对策略。因此,本研究将基于SCCT理论,探究在意外型危机下,危机历史及危机应对策略对慈善组织信任修复效果的影响。研究采用2(危机历史:有危机历史 vs 无危机历史)*2(危机应对策略:弱化策略 vs 重建策略)的被试间实验设计。重复测量方差分析结果表明,危机历史的主效应显著,危机历史、危机应对策略与时间因素的三重交互作用显著。进一步分析发现,在无危机历史的情况下,弱化策略可有效修复信任。在有危机历史的情况下,重建策略可显著修复信任。因此,本研究得出以下结论:面对意外型危机时,无危机历史的慈善组织采取弱化策略可有效修复信任,有危机历史的慈善组织采取重建策略可有效修复信任。研究结果支持了SCCT理论的假设。

关键词 情境危机传播理论, 危机历史, 危机应对策略, 信任修复

The impact of crisis history and crisis response strategies on trust restoration of charitable organizations in the accidental crisis

Liu Yuzhe, Liu Zhengjie, Yuan Xuhui, Sun Binghai, Li Weijian (corresponding author)

College of Teacher Education, Zhejiang Normal University, Jinhua 321004, China.

Abstract: Situational Crisis Communication Theory (SCCT) provides guidelines for matching crisis response strategies to crisis types. Among them, the accidental crisis which represents the unintentional behavior of the organization is the high occurrence of the organization crisis, and the organizational crisis response is more complicated in the accidental crisis. According to the SCCT, when an organization is faced with an accidental crisis, if it does not have a crisis history, it needs to adopt a diminish strategy. If it has a history of the crisis, it needs to adopt a rebuild strategy. However, subsequent studies by some researchers show that there is no significant difference in the repair effect between the diminish strategy and the rebuild strategy adopted by the organization under the accidental crisis. In addition, no empirical research has been conducted to explore whether charitable organizations with a history of crisis can apply the corresponding crisis response strategies provided by SCCT in the face of accidental crises. Therefore, based on the SCCT, this study will explore the impact of crisis history and crisis

response strategies on the trust restoration effect of charitable organizations in accidental crises. The study adopted an inter-subject design of 2 (crisis history: with history of crisis vs. with no history of crisis) * 2 (crisis response strategy: the diminish strategy vs. the rebuild strategy). The results of repeated measure ANOVA show that the main effect of crisis history is significant, and the triple interaction of crisis history, crisis response strategy, and time factor is significant. Further analysis shows that under the condition of no crisis history, the weakening strategy can effectively restore trust. In situations with a history of the crisis, reconstruction strategies can significantly restore trust. Therefore, the following conclusions are drawn: in the face of unexpected crises, charitable organizations with no crisis history can effectively restore trust by adopting weakening strategies, while charitable organizations with crisis history can effectively restore trust by adopting reconstruction strategies. The results support the hypothesis of the SCCT theory.

Keywords: Situational Crisis Communication Theory, history of crisis; crisis response strategy, trust repair

摘要 在疫情隔离期间人们主要通过媒体获取有关疫情的信息，而对此类媒体内容的过度关注可能会影响个体的心理健康。因此，本研究的目的是探究疫情爆发初期个体浏览媒体内容与死亡焦虑的关系。研究采用网络问卷形式调查了全国范围内 917 名被试的媒体使用行为与心理健康状况，问卷内容包括《正负性情绪量表（PANSA）》以及自编的疫情背景下的《媒体使用行为问卷》和《死亡焦虑问卷》。利用 Mplus 8.0 软件探索了以 6 种媒体内容（疫情爆发严重程度、疾病相关知识、专家解读、来自熟人有关疫情的信息（通过朋友圈、微博等）、医院相关报道和英雄事迹）为自变量，个体正性情绪和负性情绪为中介变量，个体死亡焦虑为因变量，年龄为控制变量的中介模型。结果发现：（1）正性情绪在 3 种媒体内容专家解读（间接效应 $\beta=-0.020^*$ ）、医院相关报道（间接效应 $\beta=-0.015^*$ ）和英雄事迹（间接效应 $\beta=-0.022^*$ ）与死亡焦虑的关系中起到了部分中介作用（3 种内容均正向预测正性情绪 $\beta \in [0.136, 0.262]$ ，进而负向预测死亡焦虑 $\beta \in [-0.084, -0.077]$ ），其它 3 种媒体内容为自变量的中介效应模型不成立。（2）负性情绪在 6 种媒体内容疫情爆发严重程度（间接效应 $\beta=0.094^{***}$ ）、疾病相关知识（间接效应 $\beta=0.072^{***}$ ）、专家解读（间接效应 $\beta=0.098^{***}$ ）、来自熟人有关疫情的信息（间接效应 $\beta=0.087^{***}$ ）、医院相关报道（间接效应 $\beta=0.105^{***}$ ）和英雄事迹（间接效应 $\beta=0.080^{***}$ ）与死亡焦虑的关系中均起到了部分中介作用（6 种媒体内容均正向预测负性情绪 $\beta \in [0.151, 0.232]$ ，进而正向预测死亡焦虑 $\beta \in [0.453, 0.476]$ ）。研究结果表明不同媒体内容与正负性情绪的关系不同，进而有区别地预测死亡焦虑水平。由此得出专家解读、医院相关报道和英雄事迹的媒体内容对民众的心理健康既产生了消极影响也产生了积极影响，而疫情爆发严重程度、疾病相关知识、来自熟人的信息的媒体内容只对民众的心理健康带来了消极影响。这提醒研究者应关注疫情期间相关的媒体内容对民众心理的影响以及背后的机制，以及媒体工作者应通过合理呈现媒体内容来使媒体在此类公共卫生事件中发挥更多的积极作用。

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China, liutuo@tjnu.edu.cn

Abstract: In the time of COVID-19, people obtained the disease-related information mainly from media, but paying too much attention to COVID-19-related media content might have impacts on individuals' mental health. Therefore, the aim of this study was to examine the relationships between COVID-19-related media content and death anxiety during the initial phase of the outbreak. In the current study, an online survey was conducted to investigate individuals' COVID-19-related media use behaviors and psychological outcomes. There were 917 Chinese adults completed our questionnaires which was composed of Positive and Negative Affect Scale (PANAS) and two adapted pandemic-related questionnaires (Media Use Questionnaire and Death Anxiety Questionnaire). Mplus 8.0 was utilized to examine mediation models with six kinds of media contents (severity of the outbreak, knowledge of disease, speeches from experts, information from acquaintances online, reports from hospitals and people being heroic) as independent variables (one at a time), positive affect and negative affect as the mediating variables (one at a time), death anxiety as the dependent variable, and age as the control variable. The results showed that positive affect partially mediated the relationships between three kinds of media contents: speeches from experts(indirect effect $\beta=-0.020^*$), reports from hospitals(indirect effect $\beta=-0.015^*$) and people being heroic(indirect effect $\beta=-0.022^*$) and death anxiety (all three kinds of media contents positively predicted positive affect, $\beta \in [0.136, 0.262]$ and then negatively predicted death anxiety $\beta \in [-0.084, -0.077]$), the mediating effects of the other 3 kinds of media content as independent variables were not significant; negative affect played a partial mediating role in the relationships between all kinds of media contents: severity of the outbreak(indirect effect $\beta=0.094^{***}$), knowledge of disease(indirect effect $\beta=0.072^{***}$), speeches from experts(indirect effect $\beta=0.098^{***}$), information from acquaintances online(indirect effect $\beta=0.087^{***}$), reports from hospitals(indirect effect $\beta=0.105^{***}$) and people being heroic(indirect effect $\beta=0.080^{***}$) and death anxiety (six kinds of media contents all positively predicted negative affect $\beta \in [0.151, 0.232]$, and then positively predicted death anxiety $\beta \in [0.453, 0.476]$). The results indicated that different kinds of media contents have different relationships with positive and negative affect, which predicted death anxiety differentially. It can be concluded that the media content of speeches from experts, reports from hospitals and people being heroic had both negative and positive effects on people's mental health, while the media content of the severity of the outbreak, knowledge of disease, speeches from experts information from acquaintances online, reports from hospitals and people being heroic had only negative effects on people's mental health. This reminds researchers to pay attention to the impact of media contents on individuals' mental health during the pandemic and the mechanism of this impact. And media workers should make media play a positive role by presenting media content properly.

4 天津市港南强制隔离戒毒所心理矫治中心, 天津, 300387

摘要 当今世界, 毒品问题愈发严峻, 《2020 年中国毒品形势报告》中显示, 截至 2020 年底, 全国现有吸毒人员 180.1 万名; 2020 年共查处吸毒人员 42.7 万人次, 其中超半数均为复吸人员。毒品不仅损害人们的身心健康, 还给家庭带来经济负担, 影响社会秩序。毒品依赖包括躯体依赖和心理依赖, 心理依赖是指吸毒者对过去体验过的精神活性物质效应的一种难以克制的渴望, 亦称为心瘾。以往研究表明心瘾越强的吸毒者在未来的生活中复吸的可能性越大。社会支持作为吸毒心瘾的重要影响因素, 能有效地抑制复吸。对于吸毒者而言, 较低的社会支持水平往往对应着更大程度的吸毒心瘾, 但关于社会支持是如何对吸毒心瘾产生影响的机制尚不明确, 需要进一步探索。本研究的目的是探究社会支持通过何种机制作用于吸毒心瘾, 这将有利于在将来的戒毒工作中更有针对性地对吸毒者进行干预从而降低其吸毒心瘾, 进而减少其在未来复吸的可能性。本研究采用自编毒品成瘾心理因素评估量表对 316 名戒毒人员(男 130 名, 女 186 名)进行施测, 调查社会支持与吸毒心瘾间的关系, 并进一步探讨自尊和心理弹性在其中担任的角色。研究发现: (1) 相关分析结果显示, 吸毒心瘾、社会支持、自尊、心理弹性两两变量得分间均呈显著正相关关系。(2) 中介模型检验结果显示, 模型拟合指标为 $\chi^2/df=1.684$, CFI=0.979, TLI=0.967, RMSEA=0.048, SRMR=0.036, 模型拟合良好。自尊和心理弹性在社会支持与吸毒心瘾的关系间起部分中介作用。具体来看, 社会支持可通过心理弹性间接作用于吸毒心瘾(95%置信区间为[0.050, 0.170]), 亦可通过由自尊、心理弹性组成的链式中介间接作用于吸毒心瘾(95%置信区间为[0.014, 0.234])。本研究表明戒毒人员的社会支持、自尊、心理弹性与其吸毒心瘾存在紧密的联系。为戒毒人员提供更高水平的社会支持可能会有助于戒毒工作的推进。在此过程中, 戒毒人员自身的心理特质亦会发挥重要作用, 戒毒工作者应给予低自尊、心理弹性较差的戒毒人员更多的关注, 并帮助他们有效提高自尊水平和心理弹性。

4 Gangnan drug rehabilitation centers in Tianjin, Tianjin 300387, China

Abstract: Nowadays, the drug problem is becoming more and more serious. According to the 2020 China Drug Situation Report, by the end of 2020, there were 1,801,000 drug addicts in China. In 2020, a total of 427,000 drug users were investigated and punished, more than half of whom were relapse addicts. Drugs not only harm people's physical and mental health, but also impose economic burdens on families and affect social order. Drug dependence includes physical dependence and psychological dependence. Psychological dependence refers to the addict's uncontrollable desire for the effects of psychoactive substances they experienced in the past, which is also called craving. Previous studies have shown that drug addicts with stronger craving were more likely to relapse later in life. As an important influencing factor of craving, social support can effectively inhibit relapse. However, the internal

psychological mechanism of social support's influence on drug craving remains unclear. The purpose of this study was to explore how social support influences drug craving, which will be conducive to more targeted intervention on drug addicts to reduce their drug craving, and future reduce the possibility of relapse. 316 drug addicts (130 males, 186 females) were selected to investigate the relationship between social support and drug craving, and to further explore the roles of self-esteem and resilience by using self-design psychological factors assessment scale for drug addiction. The results showed that : (1) The scores of drug craving, social support, self-esteem and resilience were significantly positively correlated with each other. (2) The chain mediation modeling analysis showed that model fit indexes were $\chi^2/df=1.684$, CFI=0.979, TLI=0.967, RMSEA=0.048, SRMR=0.036. Self-esteem and resilience played a partial mediating role in the relationship between social support and drug craving. Social support played an indirect role in drug craving through resilience (95% CI [0.050, 0.170]), and also played an indirect role through the chain intermediary composed of self-esteem and mental resilience (95% CI [0.014, 0.234]). This study shows that social support, self-esteem, and resilience of drug addicts are closely related to drug craving. It may be helpful for the promotion of drug rehabilitation to provide higher level of social support for drug addicts, and in this process, the psychological characteristics of drug addicts may also play an important role. Rehabilitation workers should pay more attention to drug addicts with lower self-esteem and resilience, and help them effectively improve their self-esteem and mental resilience.

当记忆足够强大：中期测试对错误信息的影响

李梦¹ 何宁¹（通讯作者）

¹ 陕西师范大学心理学院，西安，710062, hening@snnu.edu.cn

摘要 当今社会高速发展，信息交流的方式也愈加多样，网络等非正式渠道所产生的信息在日常生活中占有越来越大的比重，错误信息也越来越多地出现在人们的生活中。错误信息是指客观上不准确的信息，与谣言不同，错误信息并非以欺骗为目的，但其泛滥依然给个人的利益与社会的发展带来了极大的危害。为了减轻相关的负面影响，研究者们对错误信息的产生、发展与变化作了诸多探索，并形成了经典的错误信息范式。在此基础上，有研究者受到测试效果的启发，在经典范式中引入了中期测试，试图以此减少错误信息的暗示性。但据以往研究来看，中期测试的存在表现出两种截然不同的效果：它有时减少了错误信息的负面影响，有时却又增强了错误信息的暗示性。本研究由此出发，旨在探究两种现象发生的内在机制。研究表明，对原始信息拥有强大的记忆可以减轻错误信息的影响，但仅以中期测试是否正确来衡量“强大”与否所得出的研究结果并不稳定。因此，本研究分别从被试记忆的客观强度（中期测试正确率）和主观强度（反馈结果）入手，试图进一步拓展已有研究的成果。研究一考察中期测试正确率对最终测试的影响；研究二在中期测试阶段加入了反馈，以提供被试对自己记忆是否正确的元认知知识。结果发现，中期测试的正确率及反馈结果影响了被试对错误信息的注意力和最终测试的正确率。当被试对原始信息记忆强度较好时，更容易注意到错误信息，且当给予“正确”反馈时，更不容易受到错误信息的影响；而当被试对原始信息的记忆较差时，对测试后所有信息的注意无显著差异，但阅读时间比无中期测试的被试更长，更易受到错误信息的暗示。

When memory is strong enough: the impact of interim test on misinformation

Meng Li¹, Ning He² (Corresponding author)

School of Psychology, Shaanxi Normal University, Xi'an

Abstract: With the rapid development of today's society, the ways of information exchange are becoming more and more diverse. The information generated by informal channels such as the network occupies an increasing proportion in daily life, and more and more misinformation appears in people's life. Misinformation is factually inaccurate

information. Different from rumors, misinformation is not for the purpose of deceiving, but it still brings great harm to personal interests and social development. In order to reduce the related negative effects, researchers have made a lot of explorations on the generation, development and change of misinformation, and formed the classic misinformation paradigm. On this basis, inspired by the testing effect, some researchers introduced the interim test into the classical paradigm, trying to reduce the suggestibility of misinformation. However, according to previous studies, the existence of interim test shows two distinct effects: it sometimes reduces the negative impact of misinformation, and sometimes enhances the suggestibility of misinformation. This study aims to explore the internal mechanism of the two phenomena. Studies have shown that having a strong memory of the original information can reduce the impact of misinformation, but the results are not stable only based on whether the interim test is correct. Therefore, this study attempts to further expand the existing research results by starting with the objective strength (accuracy rate of interim test) and subjective strength (feedback result) of memory. Study 1 examined the effect of the accuracy of the interim test on the final test; In Study 2, feedback was added to the interim test to provide the subjects with metacognitive knowledge about whether their memory was correct or not. The results show that the accuracy of the interim test and the feedback results affect the subjects' attention to the misinformation and the accuracy of the final test. When the subjects have better memory of the original information, they are more likely to notice the misinformation, and when they get "correct" feedback, they are less likely to be affected by the misinformation; However, when their memory of the original information was poor, there was no significant difference in the attention to all the information after the test, but the reading time was longer than that of the subjects without the interim test, and they were more likely to be hinted by false information.

文化依恋的理论建构与问卷编制

梁 丽¹ 杨伊生² (通讯作者)

1 西南石油大学 心理发展与服务中心, 四川 成都, 610500

2 内蒙古师范大学 心理学院, 内蒙古 呼和浩特, 010022, yangys1965@163.com

摘 要 在跨文化心理学的新近研究中, 关注个体进入新文化的情感过程成为当前跨文化心理学研究的一个重点转向。已有学者在研究跨文化适应的过程中, 提出了一种新的理论框架——文化依恋理论, 来阐述个体与不同文化及文化群体形成的情感联结作用。文化依恋理论认为, 文化依恋的产生过程类似于婴儿对其主要抚养者产生依恋的过程, 并遵循与传统依恋相似的原则。由于文化依恋作为一个全新的研究领域, 在我国理论界还是一个较陌生的术语, 现有为数不多的文化依恋研究也多直接采用国外研究的模型、方法和工具, 缺乏对文化依恋的概念体系、结构特征和测量工具编制的系统分析和研究。要系统的探索我国多元文化背景下的文化依恋, 首先需要明确文化依恋的理论结构, 编制符合测量学要求的工具。为此, 本研究根据我国社会、文化、历史的特点, 以依恋的原始模型, 以及依恋扩展领域的相关模型为依据, 从“文化”和“依恋”两个概念的特征出发, 编制普适性的文化依恋问卷并检验其信效度。首先结合前期的文献分析、开放式问卷调查和个别访谈, 构建了文化依恋的理论维度并编制了初始问卷。然后, 以 392 名大学生为被试, 对初始问卷进行项目分析和探索性因素分析; 选取另外 679 名大学生进行正式测试, 对所得数据进行验证性因素分析和信效度检验。结果表明: 文化依恋问卷共有 16 个项目, 包括文化-自我关联度、文化情感联结和文化亲近行为 3 个因子, 累计方差贡献率为 71.23%; 验证性因素分析表明 3 因子模型拟合良好; 问卷信效度指标符合心理测量学要求, 能够作为测量个体文化依恋的有效工具。

Theoretical construction and questionnaire compilation of cultural attachment

LIANG Li¹, YANG Yi-sheng²

1 Psychological Development and Service Center, Southwest Petroleum University, Chengdu, Sichuan 610500

2 School of Psychology, Inner Mongolia Normal University, Hohhot, Inner Mongolia, 010010, yangys1965@163.com

Abstract: In the recent research of cross-cultural psychology, paying attention to the emotional process of individuals entering the new culture had become a focus of cross-cultural psychology. In the process of studying cross-cultural adaptation, Hong et al. put forward a new theoretical framework-cultural attachment theory, to elaborate the emotional connection between individuals and different cultures and cultural groups. According to the theory of cultural attachment, the process of cultural attachment was similar to that of infants' attachment to their main caregivers, and follow the principle similar to traditional attachment. As a new research field, cultural attachment was still a relatively unfamiliar term in China's theoretical circle. Currently, a few studies on cultural attachment were mostly based on foreign research models, methods and tools, lacking systematic analysis and research on the conceptual system, structural features and measurement tools of cultural attachment, moreover, there was no theoretical system and paradigm of localization in China. Therefore, this study attempted to explore and construct the theoretical and empirical research system of cultural attachment in the context of multiculturalism, to enrich the theoretical content of cultural attachment research in China, promote the localization of cultural attachment research, and expand the field of cultural psychology and attachment research. In order to systematically explore the cultural attachment under the multicultural background in China, it is necessary to clarify the theoretical structure of cultural attachment and develop the tools that meet the requirements of surveying. To develop and validate the Scale of Cultural attachment that measures one's experience of Cultural attachment. The theoretical dimension was constructed and the preliminary questionnaire was compiled based on the characteristics of China's society, culture and history, prototypical model of Cultural attachment and extensional model, combined with the results of previous literature review, open questionnaire survey, individual interview. Then, items analysis and exploratory factors analysis was conducted in the first sample (n=392), and confirmatory factor analysis, reliability analysis and validity analysis were performed in the second sample (n= 679) to form the final scale. 16 items were selected and seven factors were extracted by exploratory factor analysis, including Cultural-self relevance, cultural emotional connection and cultural intimacy. The cumulative variance contribution rate was 71.23%. Confirmatory factorial analysis confirmed that the three-dimensional model fitted well. The results of reliability analysis, content validity, construct validity and criterion validity showed the Scale of Cultural attachment of College Students reached the psychometric standard and can be a valid tool to measure one's experience of Cultural attachment.

Keywords: cultural attachment, theoretical construction, development of questionnaire, reliability and validity

文化依恋对文化适应压力的影响：文化适应策略的调节作用

梁 丽¹（通讯作者）, 杨伊生²

1 西南石油大学 心理发展与服务中心, 四川 成都, 610500

2 内蒙古师范大学 心理学院, 内蒙古 呼和浩特, 010022, liang2060li@163.com

摘 要 文化依恋是个体与特定文化之间形成的一种具有积极认知性和情感性的心理联结, 并由此导致的对该文化的热爱、接近及依赖倾向。“心理联结”表现为个体对该文化的信赖感和归属感, 以及个体从该文化中获得的安全感和支持感。本研究根据该内涵构建了文化依恋的理论结构, 即包括文化-自我关联度、文化情感

联结和文化亲近行为 3 个因子,在此基础上编制了具有较高信效度,符合心理测量学要求的文化依恋量表,并运用该量表采用问卷调查法,使用文化适应策略量表和文化适应压力量表,以内蒙古自治区、江苏、重庆、四川等地区的 828 名大学生作为调查样本,考察了文化依恋、文化适应压力、文化适应策略类型(整合、同化、分离、边缘化)三者的关系。结果发现:(1)文化依恋与文化适应压力呈显著的负相关,并且文化依恋对文化适应压力有显著的负向预测作用。(2)不同文化依恋的个体,在文化适应过程中,采取的文化适应策略不同。对本民族文化的文化依恋程度越高的个体,倾向于采取整合策略,对文化依恋程度最低的个体,倾向于采取边缘化策略。(3)文化适应策略可以调节文化依恋对文化适应压力的影响。在整合策略下,文化依恋对文化适应压力有较好的预测性。

关键词 文化依恋,文化适应策略,文化适应压力,调节

The influence of cultural attachment on cultural adaptation pressure: the moderating effect of cultural adaptation strategies

LIANG Li¹, YANG Yi-sheng²

1 Psychological Development and Education Center, Southwest Petroleum University, Chengdu,
Sichuan 610500;

2 School of Psychology, Inner Mongolia Normal University, Hohhot, Inner Mongolia, 010010

Corresponding author: liang2060li@163.com

Abstract: Cultural attachment is a positive cognitive and emotional psychological connection between an individual and a specific culture, which leads to the tendency of loving, approaching and depending on the culture. "Psychological connection" refers to the sense of trust and belonging to the culture, as well as the sense of security and support from the culture. According to this connotation, this study constructs the theoretical structure of cultural attachment, which includes three factors: cultural-self correlation, cultural emotional connection and cultural closeness behavior. On this basis, a cultural attachment scale with high reliability and validity and in line with psychometric requirements is developed. The scale is used to conduct questionnaire survey, cultural adaptation pressure scale and cultural adaptation strategies scale, 828 college students from Inner Mongolia Autonomous Region, Jiangsu, Chongqing and Sichuan provinces were selected as research samples to investigate the relationship among cultural attachment, cultural adaptation pressure and types of cultural adaptation strategies (integration, assimilation, separation and marginalization). The results show that: the interdependent (1) There is a significant negative correlation between cultural attachment and acculturation stress, and cultural attachment has a significant negative predictive effect on acculturation stress. (2) Individuals with different cultural attachment adopt different cultural adaptation strategies in the process of cultural adaptation. Individuals with higher degree of cultural attachment to their own culture tend to adopt integration strategies, while those with the lowest degree of cultural attachment tend to adopt marginalization strategies. (3) Acculturation strategies can regulate the influence of cultural attachment on acculturation pressure. Under the integration strategy, cultural attachment can predict the pressure of cultural adaptation.

在韩国留学生学业文化适应性研究

赵龙飞

天津职业技术师范大学应用心理系, 天津, 300000

摘 要 随着中韩建交后两国交流的日益增强、地域的临近性,以及“韩流”的影响,越来越多的中国学生前往韩国留学。虽然多数中国留学生都能很好地适应韩国的学业与生活,但仍然有人因为各种原因经历着身心和学业上的困扰。特别是那些受到学业警告的学生,他们背后都有自己的个人原因,甚至是难言之隐。因此,本研究旨在了解和发现在韩中国留学生的学业文化适应问题,发掘学生取得学业警告的原因,并结合质性研

究, 根据每个学生不同的特点, 将其深层的原因挖出。在通过面谈形式与各个留学生深入接触后, 深入了解和发现中国留学生的内心世界、在韩生活情况, 以及文化适应等多个方面的问题。为此, 在遵循伦理原则的基础上, 本研究对位于首尔的 S 大学校内 8 名在校中国留学本科生进行了半结构式深度访谈。在征得受试者同意的前提下, 研究人员对每次访谈内容进行了录音, 并记录下可被观察到的表情、身体动作和语调。访谈结束后, 对访谈录音及时整理, 并在此基础上, 加以编码、归档, 构建扎根理论。分析结果最终可归类为“两国间的教育文化差异”、“语言屏障”、“心理因素”、“人际因素”四大主题。本研究对于了解中韩教育的差异性和留学生在文化适应过程中的深层因素提供了可靠的依据, 并为今后留学生更好地适应韩国的留学生活, 以及制定和研发相关的对策方案提供了有力的参考。

Study on the Academic Acculturation of Overseas Chinese Students in South Korea

Zhao Longfei

Tianjin University of Technology and Education, Tianjin

Abstract: With an increasing exchanges between China and Korea, a rising number of Chinese students choose to study in Korea because of territorial proximity and the influence of "South Korean Fad". Although most students can well adapt to their study and life in Korea, a few of them still feel frustrated and suffer from their academic problems. Especially those under academic probation, they all face their unique troubles, or even predicaments. Therefore, this study is purposed to understand the academic acculturation of Chinese students studying in Korea. With an exploration on the factors leading to their academic probation, the paper conducted a qualitative study to dig deeper based on individual characteristics. And though in-depth interviews with each interviewee, it leads to a deeper understanding on their interiors, life in Korea, acculturation, etc. Therefore, based on ethical principles, this study conducted semi-structured interviews with eight Chinese undergraduates studying in S University in Seoul. With prior consent of interviewees, the researcher recorded the talks of each interview, including observable expressions, body movements and tone of voice. Such recordings were timely sorted out after the interviews, and then they were was coded and archived to construct the grounded theory. At last, The results of the analysis were clarified into four major themes, i.e., "educational and cultural differences", "language barrier", "psychological factors" and "interpersonal factors". The research provides a reliable frame for understanding the differences between Chinese and Korean education, as well as the fundamentals for overseas students' adaptation to a foreign culture and academic life. Besides, it provides a basic reference for developing relevant countermeasures and programs to help future overseas students in their adaptation in Korea.

Keywords: overseas Chinese students, South Korea, academic acculturation

中国人恐惧管理中的远端防御： 死亡焦虑的中介作用及联系性思维的调节作用

王坤 侯玉波（通讯作者）

北京大学心理与认知科学学院, 北京, 100871, houyubo@pku.edu.cn

摘要 恐惧管理理论(TMT)的跨文化研究表明, 中国人在死亡提醒后表现出的远端防御策略与西方人不同, 甚至不会表现出文化世界观防御。有研究表明, 恐惧管理中的效应大小和防御机制差异是由于忽略了诸多调节因素, 例如跨文化研究主要对恐惧管理过程中的情绪、行为倾向差异进行比较, 而对文化内容和建构本身, 以及认知特性影响机制的研究甚少。全球新冠大流行的背景对大众心理产生广泛的死亡威胁, 因而在此背景下的 TMT 研究十分必要。为了解决过往研究中所遗留的问题和矛盾, 本研究以转世信念和认命倾向这两种死亡应对态度作为中国文化下的远端防御策略, 通过线上实验 ($N=143$) 检验阈上死亡提醒后, 中国人在远端防御上的效应和反应倾向, 并在此过程中验证联系性思维对死亡焦虑缓冲的调节作用和死亡焦虑的中介作用。

研究表明：(1)死亡提醒能提高个体的转世信念，然而对认命倾向的影响并不显著。(2)联系性思维调节了死亡提醒后中国被试的死亡焦虑程度：当联系性思维水平较低时，死亡提醒会使个体产生更高的死亡焦虑；当联系性思维水平较高时，死亡提醒对死亡焦虑没有显著影响。也就是说，仅仅认知特性上趋近于母文化系统就能帮助个体更好地缓冲死亡焦虑。(3)死亡焦虑只中介了死亡提醒和转世信念之间的关系，而对认命倾向的中介作用不显著。本研究对所得结果与先前相关研究结果的差异进行了讨论。此外，本研究还探讨了中国传统宗教文化中对死亡的“理智化”认知和民众朴素观念之间的关系，并对研究结果进行了解释。最后，本研究讨论了局限和未来的研究方向，以及 TMT 研究中的实践意义。

关键词 恐惧管理，死亡提醒，文化心理，思维方式

Distal defenses in Chinese terror management: The mediating role of death anxiety and the moderating role of relation thinking

WANG Kun, HOU Yubo

School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871

Abstract: Cross-cultural studies of Terror Management Theory (TMT) suggest that Chinese exhibit distal defenses strategies following mortality salience differently, even do not exhibit cultural worldview defenses. It has been suggested that controversies in effect sizes and defense mechanisms are due to the neglect of some moderating factors, e.g., cross-cultural studies have mainly contrasted differences in emotional and behavioral dispositions in terror management process, while little research has been conducted on the influence of cultural content and constructs themselves, also cognitive characteristics. The global context of the COVID-19 pandemic produces widespread death threats to the mass psyche, and thus relevant TMT study seems necessary. To address the issues and contradictions left, this study ($N=143$) examined the effects and response tendencies on distal defenses after supraliminal mortality salience, using two death coping attitudes, belief in reincarnation and resignation to fate, as distal defenses in Chinese culture. Moreover, this study verified the moderating role of relation thinking on death anxiety buffering and the mediating role of death anxiety in Chinese. The results showed that: (1) Mortality salience increased individuals' belief about reincarnation, however, the effect on resignation belief was not significant. (2) Relation thinking moderated the level of death anxiety in Chinese after reminders of death: When the level of relation thinking was low, mortality salience caused higher death anxiety; when the level of relation thinking was high, mortality salience had no significant effect on death anxiety. That is, mere convergence to the maternal culture system in cognitive characteristics can help individuals to better buffer death anxiety. (3) Death anxiety mediated the relationship between mortality salience and reincarnation, but no mediating effect on resignation to fate. The study discussed the differences between the results obtained and the findings of past research. In addition, the relationship between the "rationalization" of death in traditional Chinese religious culture and people's naive concept has been discussed, to explain the findings. Finally, present study explored the limitations and future directions, as well as practical implications in TMT cross-cultural research.

焦虑情绪对自我提升消费意愿的影响 ——控制感的中介和内隐人格观的调节作用

张滕薇¹ 田宇¹ 钟建安¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310028, jiananzhong@zju.edu.cn

摘要 焦虑情绪是人们在面对不确定的危险或威胁时产生的一种不安、担心、紧张、烦恼等不愉悦的复杂情绪,然而消费领域对于如焦虑这样的具体情绪的影响研究却不多。本研究基于自我差异理论和补偿性消费行为模型探究了焦虑对个体的自我提升消费意愿的影响,并旨在厘清该影响背后的心理机制。研究一以 164 名大学生为被试,通过回忆操纵范式激发其焦虑情绪后发现,焦虑情绪下的被试具有更强烈的自我提升消费意愿,且控制感起到部分中介作用。研究二以 174 名大学生为被试,通过心理社会压力暴露的方式唤起其焦虑情绪,并测量其自我提升消费意愿、内隐人格观和控制感,结果验证了一个有调节的中介模型。当个体感到焦虑时,个体的自我提升消费意愿更高,控制感在其中起到了部分中介的作用。内隐人格观调节了控制感对自我提升消费意愿的影响,当个体持有渐进论的人格观点时,焦虑情绪所导致的低控制感会使其更倾向于进行自我提升消费,进而提升自我能力;而当个体持有实体论的人格观点时,焦虑情绪并不会影响其控制感以及后续的自我提升消费意愿。总之,本研究验证了焦虑情绪对自我提升消费意愿的积极促进作用,并验证了控制感的部分中介作用以及内隐人格观的调节作用。本研究不仅在理论上探究了某一具体情绪对消费行为的影响,同时为焦虑情绪突出的社会背景下如何利用该情绪产生积极作用,帮助自身成长、促进有益消费等提供了有价值的参考建议。

关键词 焦虑,自我提升消费,控制感,内隐人格观

The Effect of Anxiety on Self-improvement Consumption ——Perceived Control as a mediator and Implicit Theory of Personality as a moderator

Zhang Mengwei¹, Tian Yu¹, Zhong Jianan¹ (Corresponding author)

¹ Department of Psychology and Behavioral Sciences, Zhejiang University; 148 Tianmushan Rd., Hangzhou 310028, China. Email: jiananzhong@zju.edu.cn

Abstract: The emotion of anxiety is a feeling occurs when people face uncertain danger or threat and is a mixed emotion that integrates restlessness, worry, tension, and annoyance. Somehow, studies about the effect of a specific emotion, such as anxiety, on consumption behaviors did not receive much attention from researchers in consumption areas. Basing on the self-discrepancy theory and the compensatory consumer behavior model, this study aims to explore the effect of anxiety on self-improvement consumption and the psychological mechanism underlying this effect. One hundred and sixty-four university students participate in study 1 and those in the experiment group are asked to recall a recent experience in which they feel anxious. Results of study 1 show that individuals have greater self-improvement consumption preferences after feeling anxious, and perceived control partially mediates the relationship between anxiety and self-improvement consumption. Study 2 uses 174 university students as a sample, elicits participants' anxious feeling by social stress manipulation, and assesses participants' self-improvement consumption preferences, perceived control and implicit theory of personality. The results of study 2 prove a moderated mediation model. When people feel anxious, their self-improvement consumption preferences would be increased, and perceived control partially mediates this effect. Also, implicit theory of personality moderates the

mediating effect. Incremental theorists would feel lower perceived control after feeling anxious and would increase their preferences for self-improvement consumption, whereas entity theorists wouldn't change their perceived control and consequent self-improvement consumption preferences. In conclusion, a moderated mediation model has been proved, in which feeling anxious would significantly increase self-improvement consumption with perceived control partially mediating and implicit theory of personality moderating this relationship. Not only does this study focus on the effect of a specific emotion on consumption behaviors, but it also provides individuals and marketers with valuable advises on how to utilize such a negative emotion to create beneficial influences on personal and marketing growth.

Keywords: anxiety, self-improvement consumption, perceived control, implicit theory of personality

时间和金钱哪个更重要？来自注意偏向的证据

伍晓青¹, 齐鑫¹, 吴洪翔¹, 顾姣¹, 吴文峰¹ (通讯作者)

¹ 贵州师范大学心理学院, 贵阳, 550025, wwfhsd@aliyun.com

摘要 时间和金钱是稀缺而宝贵的资源, 人们不仅会经历时间不足的压力, 也会担心钱不够用。以往研究者们将时间和金钱作为两个维度考查人们行为差异已做了大量研究, 如道德、社会联系、消费决策等。但对个体信息加工前时间和金钱的注意情况却很少有研究涉及。基于稀缺是“所拥有的”总是少于“所需要的”, 稀缺会俘获大脑, 使得个体注意到稀缺事物, 从而需要投入更多的注意去解决稀缺。因此, 本研究采用 2 (稀缺类型: 时间稀缺、金钱稀缺) × 2 (探测位置: 一致、不一致) × 3 (词语类型: 时间—中性词、金钱—中性、中性—中性词语) 三因素混合实验设计, 通过点探测实验范式, 操作稀缺情境对 60 名大学生被试的注意行为进行研究, 探讨在金钱和时间稀缺的情况下, 大学生对金钱和时间相关信息的注意偏向情况。结果显示: 在金钱稀缺情况下, 会同时引发被试对金钱和时间相关词语刺激的关注; 以中性条件为基线, 被试对金钱和时间的反应时都显著小于中性词语, 但对金钱和时间词语差异不显著; 进一步分析被试的注意偏向成分发现在两种稀缺情境下被试对金钱都存在注意定向加速, 而对时间存在注意脱离困难。结论: 金钱和时间稀缺会引发个体对金钱和时间相关信息的注意偏向。与时间信息相比个体对金钱相关信息更加敏感。

Which is more important, time or money?

Evidence from attentional bias

Wu Xiaqing¹, Qi Xin¹, Wu Hongxiang¹, Gu Jiao¹, Wu Wenfeng¹

¹ School of psychology, Guiyang Normal University, Guiyang, China

Abstract: Scarcity theory points out that scarcity can capture individual attention, and will cause people to follow with interest in the scarce things. Time and money are both precious and limited resources. Many people feel temporally and financially constrained in their day-to-day lives. Prior time and money literature have linked behavior, decision-making, and happiness to support time and money scarcity. However, whether this indispensable attention discrepancies to time or money remains equivocal. A sample of 60 college students completed the visual dot-probe paradigm under priming of the scarcity to investigate attentional bias about the information of money or time. The results revealed that participants in the condition of scarcity of money showed stronger attention to the stimulus of money-and-time-related words. When contrasted of reaction with neutral words, the participants' responded to words related to money and time are significantly less than those of them. Critically, there was no significant difference in the reaction to the words between money and time. The attentional components thorough analysis and comparison, the attention-oriented acceleration for money words but had difficulty in attention-disengagement from time words in the two scarce conditions. Thus, the process of information shows significant differences in two priming types. It is plausible that money scarcity attracts individuals' attention to money-and-time-related information and have a faster reaction to money words. Compared with time information, individuals pay more attention to information about

money. The results of this research not only enrich and expand the previous consequences of congener studies but also deepen the content and detail of it, which may motivate further meaningful inspirations to explain the distinct behaviors of individuals in the face of time and money scarcity.

5G 背景下消费者在直播购物中的感知体验对冲动性购买行为的影响 研究：一个有调节的中介模型

宋颖¹² 张守臣³ 孙宜甲² 赵振智¹ (通讯作者)

1 中国石油大学经济管理学院, 青岛, 266000

2 青岛理工大学商学院, 青岛, 266000

3 哈尔滨师范大学教育科学学院, 哈尔滨, 150025

摘要 伴随着数字化、信息化的持续发展和智能手机的普及, 电子商务发展进入全民移动客户时代, 网络购物成为消费者新的行为习惯。由于网络购物相比传统购物方式具有更大的便利性和偶然性, 使得在线购物的消费者更容易产生冲动购买行为。随着直播的日益普及, 社交商务平台上的许多商家都将直播作为提升中国销售业绩的工具, 这导致了一种新的社会商业形式的出现, 即直播购物。而 5G 技术的出现, 从营造购物环境角度看, 使得网店商家有能力为网上顾客提供远超从前的新颖体验, 这对消费者的购物体验感及决策行为都产生了极大的影响。本研究基于非计划购买模型, 旨在探讨消费者体验对消费者冲动性购买行为的影响及作用机制, 并进一步探究直播购物中主播口碑认同和网络质量变化如何发挥其影响作用。本研究采用冲动消费量表、网络质量量表、消费感知体验量表、口碑认同量表, 对 893 名直播消费用户进行问卷测量。结果显示, (1) 消费者直播购物个体体验和群体体验对消费者冲动性购买行为有显著正向预测作用, 其中个体体验主要包含互动性、关系导向、心流体验, 群体体验主要包含参与度、认知交流和共振蔓延; (2) 主播口碑认同在消费者体验和购买行为之间起中介作用; (3) 网络质量在消费者体验和主播口碑认同之间起到调节作用, 即 4G 网络下, 消费者体验对主播口碑认同影响较为显著, 5G 网络背景下, 消费者体验对主播口碑认同的影响较小, 网络沉浸感和感知安全性较高。研究结果揭示了直播经济和 5G 背景下, 消费者冲动性购买行为的影响机制, 有利于解释消费者在购物决策行为选择的内在心理机制, 深入解释不同的体验以及口碑、网络质量对消费者偏好形成的内在逻辑, 丰富和发展现有的网络经济心理学理论, 对企业营销实践提供一定的理论指导和建议。

The impact of the consumer perceived experience in live-stream shopping on their impulsive purchasing behavior under the 5G background: a moderated mediation model

Song Ying¹², Zhang Shouchen³, Sun Yijia², Zhao Zhenzhi¹

1 School of Economic and Management, China University of Petroleum, Qingdao, 266000

2 Business School, Qingdao University of Technology, Qingdao, 266000

3 School of Educational Science, Harbin Normal University, Harbin, 150025

Abstract: Today, with digitalization, informatization, and the popularity of smartphones growing in leaps and bounds, the e-commerce era to the era of national mobile customer, and online shopping have become the new behavioral habit of the consumers. Compared to the traditional shopping methods, online shopping is ostensibly more convenient and more accidental, it became easier for the online shoppers to purchase on impulse. With the increasing popularity of live streaming, online shopping has been used by many merchants as a tool to improve sales performance in China on social business platforms, which leads to the emergence of live shopping, a new social business culture. From the perspective of creating a unique shopping environment, the emergence of the 5G technology enables online shop merchants to provide online customers with a novel experience far beyond the earlier ones, with tremendous impact

on the shopping experience and decision-making behaviors of the consumers. Based on the non-purchase model, this study endeavors to explore the impact of consumer experiences on the impulsive buying by the consumers and the mechanism it follows. Moreover, this study shall explore how the word-of-mouth recognition and network quality change of live streamers play a role in live commerce. 893 netizens who engaged in live commerce purchases were surveyed through a questionnaire, including Impulse Consumption Scale, Network Quality Scale, Consumer Perception Experience Scale, and Word-of-Mouth Identity Scale. The results indicated that (1) The individual experience and the group experience of consumers in live commerce had a significant positive predictive effect on the impulsive buying by the consumers. Amongst them, the individual experience mainly included interaction, relationship orientation, and flow experience, while the group experience mainly involved participation, cognitive communion and resonant contagion. (2) The word-of-mouth recognition of live streamers plays an intermediary role between the consumer experience and the purchase behavior. (3) The network quality also has a moderating role between the consumer experience and the word-of-mouth recognition of the live streamers. Under the 4G network, consumer experience has a significant impact on the word-of-mouth recognition of the live streamers, while this influence tends to be very small under the 5G network, with high network immersion and perceived security being very high. The research results revealed the influence mechanism of the impulsive buying behavior of the consumers under the background of live commerce and the 5G network, which turned out to be beneficial in explaining the internal psychological mechanism of the choice of shopping decision behavior of the consumers, determining the internal logic of the various experiences and the formation of the preferences of the consumers by the word-of-mouth publicity and the network quality, enriching and developing the existing psychological theory of network economy, and providing certain theoretical guidance and suggestions for the marketing practice by the enterprises.

正念特质与感知压力的关系：有调节的中介模型

张瑶瑶¹，滕召军¹，缪华灵¹，吴慧敏¹，张译支¹，郭成¹

西南大学心理健康中心，重庆，中国，400715

摘要 目的：青少年的压力水平与其感知到的心理压力息息相关。正念压力缓冲假说强调正念在压力过程中的功能，但正念特质与感知压力之间的潜在机制仍不清楚。因此，本研究将在中国青少年样本中，考察问题解决在正念特质与感知压力之间的中介作用及压力源在其中的调节作用。**方法：**3,287 名中国青少年（ $M_{age}=15.63$ 岁，52.2%为男性）参加了研究。通过青少年生活事件自评表（ASLEC）、中国儿童和青少年正念测量（C-AMM）、中学生应对方式量表（CSSMSS）和感知压力量表（PSS）收集自我报告数据进行中介与调节分析。**结果：**结果显示，正念特质和感知压力之间存在着明显的负相关关系。问题解决在正念特质（即接受非监测）和感知压力之间的关系中起到了中介作用。压力源在正念特质（接纳）与感知压力之间的直接路径以及问题解决中介效应的路径中起调节作用。**结论：**正念特质（接纳）能够通过问题解决影响青少年的感知压力，且这一关系受到压力源水平的调节。

The Relationship Between Trait Mindfulness and Perceived Stress: A Moderated Mediation Analysis

Abstract: Objectives: Adolescents' stress levels are closely related to their perceived psychological stress. Although the *mindfulness stress-buffering hypothesis* emphasized that the functions of mindfulness in the stress transactional process, it is still unclear about the potential mechanism between trait mindfulness and perceived stress. Thus, this study would examine the mediation role of problem-solving and the moderating role of stressors in the relationship between trait mindfulness and perceived stress among a sample of Chinese adolescents. **Methods:** 3,287 Chinese adolescents (*Age* = 15.63 years, 52.2% male) participated in the study. Self-reported data were collected by the Adolescent Self-Rating Life Events Checklist (ASLEC), the Chinese Child and Adolescent Mindfulness Measure (C-CAMM), the Coping Style Scale for Middle School Students (CSSMSS), and the Perceived Stress Scale (PSS). The mediation and path analysis would be conducted in this study. **Results:** The results revealed that there were significant negative correlations between trait mindfulness and perceived stress. Problem-solving played a mediating role in the relationship between virtuous trait mindfulness (i.e., acceptance) and perceived stress. Specific, stressors play a moderating role in the direct pathway between trait mindfulness (i.e., acceptance) and perceived stress and in the pathway of the mediating effect of problem-solving. **Conclusions:** These findings suggested the mechanism of the links between trait mindfulness and perceived stress. Trait mindfulness (acceptance) impacts adolescents' perceived stress through problem-solving, and this relationship is moderated by the level of the stressors.

感恩的认知-情感双维结构及其与主观幸福感的关系

张琳婷¹ 李文洁¹ 李程程¹ 孔凤¹ (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710000, kongfeng87@126.com

摘要 感恩是个体意识到施恩者给予自己的恩惠或帮助后产生的一种感激并且力图做出回馈的一种情感特质。根据情绪的 ABC 理论, 个体会对诱发事件进行评价、解释, 进而产生情绪和行为反应。感恩作为一种积极的情感特质, 也存在类似的过程。当得到帮助或馈赠时, 个体会对这些行为进行分析并做出利益评价。然后, 对帮助和恩惠的积极评价会诱发感恩情绪。因此, 感恩实际上包含了对施恩者和相关事件的认知过程以及由此引发的情感过程。然而, 已有的研究较少对感恩的认知与情感维度进行区分。因此, 本研究通过两个纵向研究对感恩的双维结构进行检验, 并探讨了认知感恩和情感感恩对主观幸福感的预测作用。研究 1 采用感恩问卷和感恩形容词评定量表分别作为认知感恩与情感感恩的测量工具, 生活满意度量表、积极与消极体验量表作为主观幸福感的测量工具, 对 482 名大学生进行了间隔 7 个月的追踪调查。结果发现: (1) 验证性因素分析的结果表明, 与单维结构相比, 感恩的双维结构拟合良好 ($\chi^2/df = 3.055$, RMSEA = 0.065, CFI = 0.948, TLI = 0.931); (2) 回归分析结果表明, 在控制了幸福感的自回归路径后, 认知感恩只能预测积极情感 ($\beta = 0.225$, $p < .001$), 而情感感恩可以预测生活满意度 ($\beta = 0.151$, $p = .011$) 和积极情感 ($\beta = 0.165$, $p = .016$)。为了检验研究结果的稳定性, 研究 2 ($N = 460$) 以高中生为研究对象, 采用相同的量表和研究方法, 进行了间隔 3 个月的追踪调查。最终, 研究 2 重复了研究 1 的结果。因此, 本研究揭示了感恩的双维结构, 以及这两个维度对主观幸福感不同的预测作用。这在一定程度上拓展了对感恩本质的认识, 并启示未来感恩的研究应充分考虑感恩的双维结构。

The cognitive-affective two-dimensional structure of gratitude and its relationships with subjective well-being

Linting Zhang¹, Wenjie Li¹, Chengcheng Li¹, Feng Kong*

School of Psychology, Shaanxi Normal University, Xi'an, 710062

Abstract: Gratitude is a kind of emotional trait that an individual feels grateful to the benefactor for the favor or help

they have received and tries to give back. According to the ABC theory of emotion, the individual evaluates and interprets the induced events, and then generates emotional and behavioral responses. Gratitude, as a positive emotional trait, goes through a similar process. When receiving help or gifts, individuals would analyze these behaviors and make a benefit appraisal. Then, positive appraisals of help and favors induce feelings of gratitude. Therefore, gratitude actually involves the cognitive process of the giver and related events, as well as the emotional processes that result from it. However, there were few studies to distinguish the cognitive and affective dimensions of gratitude. Thus, the present study examined the two-dimensional structure of gratitude through two longitudinal studies, and explored the predictive effects of cognitive gratitude and affective gratitude on subjective well-being. Study 1 used the Gratitude Questionnaire and the Gratitude Adjective Checklist as the measurement tools of cognitive gratitude and affective gratitude respectively, and the Life Satisfaction Scale and the Positive and Negative Experience Scale as the measurement tools of subjective well-being. A sample of 482 college students was surveyed twice at an interval of 7 months. The results showed that: (1) Confirmatory factor analysis indicated that compared with the one-dimensional structure, the two-dimensional structure of gratitude fitted well ($\chi^2/df = 3.055$, RMSEA = 0.065, CFI = 0.948, TLI = 0.931); (2) The results of regression analysis showed that after controlling the autoregressive paths of well-being, cognitive gratitude could only predict positive affect ($\beta = 0.225$, $p < .001$), while emotional gratitude could predict life satisfaction ($\beta = 0.151$, $p = .011$) and positive affect ($\beta = 0.165$, $p = .016$). In order to test the stability of the study results, study 2 ($N = 460$) utilized the same research methods and recruited high school students who completed the same questionnaires twice at an interval of 3 months. Finally, study 2 replicated the findings of study 1. Therefore, this study revealed the two-dimensional structure of gratitude and the different predictive effects of these two dimensions on subjective well-being. To some extent, it broadens the understanding of the nature of gratitude and suggests that the two-dimensional structure of gratitude should be fully considered in future studies of gratitude.

中小学教师领悟社会支持对工作绩效、工作满意度及睡眠质量的影响： 自我效能感和希望的链式中介效应

罗昕¹ 李瑛²

陕西师范大学心理学院，陕西西安，710062

陕西师范大学心理学院，陕西西安，710062，liying@snnu.edu.cn

摘要 中小学教师的心理健康状况不仅关系到自身的工作效能和生活质量，而且深刻影响学生的学习发展与身心成长。本研究结合职业健康心理学“工作要求—控制—支持”理论模型和积极心理学相关理论，探讨领悟社会支持、自我效能感、希望对中小学教师工作行为结果及生理心理健康状态的影响。研究共向 243 名中小学教师发放了问卷，采用社会支持评定量表（SSRS）、一般自我效能感量表（GSES）、成人特质希望量表（ADHS）、明尼苏达工作满意度问卷短式版（MSQ）、教师工作绩效量表及匹兹堡睡眠质量指数量表（PSQI）6 个量表。结果显示，女性教师的领悟社会支持度高于男性教师；年龄越大、教龄越长、学历越高、职称越高，教师的自我效能感、希望、工作绩效和工作满意度越高；领悟社会支持可正向预测中小学教师的工作绩效、工作满意度和睡眠质量，自我效能感和希望在这其中起着链式中介作用。本研究结果表明，领悟社会支持可以通过自我效能感和希望的链式中介效应对中小学教师的工作绩效、工作满意度和睡眠质量产生影响。采取一定措施提升中小学教师的社会支持、自我效能感和希望感，将有助于这一群体的身心健康和有效工作行为。

关键词 领悟社会支持，自我效能感，希望，工作绩效，工作满意度

The Effects of Primary and Secondary School Teachers' Perceived Social Support on Job Performance, Job Satisfaction and Sleep Quality: the Chain mediating Roles of Self-efficacy and Hope

LuoXin¹, LiYing²

Shaanxi Normal University, Shaanxi, Xi'an

Abstract: The quality of primary and secondary school teachers' mental health is not only related to their own job performance and well-being, but also affects the learning development and mental health of students. This study combined the "job demand-control-support" model in occupational health psychology with positive psychology theories to explore the effects of perceived social support, self-efficacy, and hope on the job performance, job satisfaction and sleep quality of primary and secondary school teachers. 243 primary and secondary school teachers were tested with Social Support Rating Scale (SSRS), General Self-Efficacy Scale (GSES), Adult Hope Scale (ADHS), Minnesota Satisfaction Questionnaire (MSQ), Teacher Job Performance Scale and the Pittsburgh Sleep Quality Index Scale (PSQI). The results showed that female teachers had higher level of perceived social support than male teachers; Teachers who with higher age, longer teaching experience, higher educational background and higher professional title, had higher score of self-efficacy, hope, job performance and job satisfaction. Perceived social support can positively predict job performance, job satisfaction and sleep quality of primary and secondary school teachers, self-efficacy and hope play a chain mediating roles in this process. The results of this study indicate that perceived social support can influence the job performance, job satisfaction and sleep quality of primary and secondary school teachers through the chain mediating effects of self-efficacy and hope. Taking some measures to improve the social support, self-efficacy and hope of primary and secondary school teachers will contribute to their physical and mental health as well as their job performance.

Keywords: Perceived social support, Self-efficacy, Hope, Job performance, Job satisfaction

医护人员积极心理健康的网络分析

任垒 冯廷炜 毋琳 刘旭峰（通讯作者）

空军军医大学军事医学心理学系，西安，710032，lxf_fmму@163.com

摘要 提升积极心理健康对个体实现自我价值、有效应对日常压力、保持高效工作水准并为社会做出贡献具有重要意义。然而，积极心理健康是一个复杂的心理学概念。想要更有效的提升积极心理健康仍需对其有更深入的理解。本研究以医护人员为样本，使用网络分析法来探究其积极心理健康的网络结构及其核心项目，以期进一步理解医护人员积极心理健康并为其积极心理健康的提升提供重要的干预靶点。本研究对 420 名医护人员的沃里克-爱丁堡积极心理健康量表中文版项目进行正则化偏相关网络分析，尤其关注网络中各项目的预期影响和可预测性。使用软件 R 对网络进行统计分析和可视化。结果表明在积极心理健康网络中，项目“面对未来我很乐观”和“我感觉自己很有用”之间、“我能很好地处理问题”和“我的头脑一直都很清醒”之间以及“我一直都自我感觉良好”和“我一直都很自信”之间存在最强关联，其正则化偏相关系数分别为 0.41、0.39 和 0.39。项目“我感觉很愉快”的中心性程度最高，其预期影响为 1.62（z 分数）。项目预期影响的相关稳定性系数为 0.67，表明其具有足够的稳定性。本研究首次运用网络分析法分析医护人员积极心理健康的网络结构，结果表明积极情绪（愉快）是其积极心理健康的核心项目。以积极情绪（愉快）为优先的干预措施可能会更大程度地提升医护人员整体积极心理健康水平。

Network analysis of positive mental health in healthcare workers

REN Lei, FENG Tingwei, WU Lin, LIU Xufeng

Department of Military Medical Psychology, Air Force Medical University, Xi'an, 710032,
lxf_fmму@163.com

Abstract: Improving positive mental health is of great significance for individuals to realize their abilities, cope with the normal stresses of life effectively, work productively and fruitfully, and make contributions to their community. However, positive mental health is a complex psychological construct. A better understanding of positive mental health is needed to effectively promote it. The present study aims to explore the network structure of positive mental health in healthcare workers and identify the core items to provide targets for related intervention. We used network analysis to explore the relations among items of Warwick-Edinburgh Mental Well-being Scale (Chinese version) in 440 healthcare workers. Specifically, we computed the expected influence and predictability for each item. Software R was used for statistical analysis and visualization. In the positive mental health network, we found three strongest edges were between “I have been feeling optimistic about the future” and “I have been feeling useful” (regularized partial correlation = 0.41), between “I have been dealing with problems well” and “I have been thinking clearly” (regularized partial correlation = 0.39), and between “I have been feeling good about myself” and “I have been feeling confident” (regularized partial correlation = 0.39). In addition, item “I have been feeling cheerful” had the highest expected influence in the network (z-scored = 1.62). The stability of node expected influence was adequately stable (correlation stability coefficient = 0.67). The present study is the first to investigate the relations among items of positive mental health in healthcare workers. Our findings indicate that “I have been feeling cheerful” had the highest expected in the network. Targeting “I have been feeling cheerful” may maximum the overall level of positive mental health in healthcare workers.

心理弹性和家庭关怀对绝经转变期女性心理困扰的影响： 基于多项式回归与响应面分析的探索

王清 赵迪 厉萍（通讯作者）

山东大学护理与康复学院，济南 250012, pingli12@sdu.edu.cn

摘要 背景 绝经转变期是女性经历生殖功能的衰退进而走向衰老的过程，在这期间女性心理困扰的发生率较高。心理弹性和家庭关怀可以分别从内外部角度影响绝经转变期女性的心理困扰程度，但二者是如何相互协调共同发挥作用，尚不明确。基于此，本研究旨在探讨心理弹性与家庭关怀如何相互作用，影响绝经转变期女性的心理困扰。**方法** 利用方便抽样法在山东省某地级市选取了 858 名正处于绝经转变期的中年女性进行问卷调查。调查工具包括一般资料调查表、弹性量表简化版(Connor-Davidson Resilience Scale, CD-RISC)、家庭关怀度指数量表(Family Care Degree Questionnaire, APGAR)和 Kessler 心理困扰量表(Kessler Psychological Distress Scale, K10)。采用 SPSS25.0 版本进行数据录入和分析，运用 RSA.3.0.30 插件进行多项式回归和响应面分析。**结果** 在“心理弹性-家庭关怀”匹配情形下，二者的联合效应与绝经转变期女性的心理困扰呈负向曲线关系（倒 U 形），“高-高”组合的绝经转变期女性的心理困扰程度不一定降低，反之亦然。在“心理弹性-家庭关怀”不匹配情况下，二者的联合效应与绝经转变期女性的心理困扰呈负向曲线关系（倒 U 形），随着“高-低”、“低-高”组合的内部差异加大，绝经转变期女性的心理困扰程度逐渐减小。**结论** 在未来针对绝经转变期女性的干预研究中，要实时关注个体心理弹性和家庭关怀的交互协调作用，灵活调整干预手段以达到资源利用最优化，从而更好地提升绝经转变期女性的心理健康水平。

关键词 心理弹性，家庭关怀，心理困扰，多项式回归，响应面分析

The Effect of Resilience and Family Care Match on Psychological Distress among Women in Menopausal Transition: An Investigation based on Polynomial Regression and Response Surface Analysis

Wang Qing, Zhao Di, Ping Li (corresponding author)

School of Nursing and Rehabilitation, Shandong University, Jinan 250012, pingli12@sdu.edu.cn

Abstract: **Background** Menopausal transition was a natural process from reproductive decline to aging for women. During this period, women presented a higher prevalence of psychological distress. Resilience and family care could affect psychological distress of women in the menopausal transition from internal and external perspectives, respectively. But it is unclear how they might be coordinated to exert the effect. Based on this, the goal of the present study was to investigate how resilience and family care interact with each other to influence psychological distress of women in the menopausal transition. **Methods** Convenience sampling method was used to select 858 women during the menopausal transition from a prefecture-level city in Shandong Province. All the participants completed questionnaires for socio-demographic information, 10-item Connor-Davidson Resilience Scale (CD-RISC), family care degree questionnaire (APGAR) and Kessler Psychological Distress Scale (K10). Data were entered and analyzed by using SPSS version-25. RSA was used for polynomial regression and response surface analysis. **Results** In the case of agreement between resilience and family care, the joint effect was a negative curve (inverted u-shaped) related to the psychological distress of women in the menopausal transition. In the cases of congruence, elevated level of psychological distress did not necessarily when resilience and family care were both high, and vice versa. In the case of disagreement between resilience and family care, the joint effect was a negative curve (inverted u-shaped) related to the psychological distress of women during the menopausal transition. In the cases of incongruence, with the increased of internal differences, the psychological distress among women in the menopausal transition gradually decreased. **Conclusion** Future intervention studies targeting women in menopausal transition should consider the coordinated actions of resilience and family care. And adjusting interventions flexibly to optimize the utilization of resources, so as to better improve the mental health of women in the menopausal transition.

Keywords: Resilience, Family care, Psychological distress, Polynomial regression, Response surface analysis

追求快乐还是追求意义：幸福动机和幸福感的交叉滞后分析

李文洁¹ 张琳婷¹ 贾宁¹ 赵晶晶¹ 孔凤¹ (通讯作者)

¹ 陕西师范大学心理学院, 陕西西安, 710062, kongfeng87@126.com

摘要 追求幸福是人类行为的根本动机。幸福动机包括两种取向, 一种是享乐论动机, 追求当下的一种愉悦和享受; 一种是实现论动机, 追求个人能力的发展和人生的完满。以往研究发现, 幸福动机与幸福感存在显著相关, 但是缺乏二者因果性的证据。一方面, 幸福感的引擎模型认为, 输入成分(如特质)会通过过程成分(影响个体进行选择的内状态)对结果成分(幸福感结果)产生影响。而动机作为影响个体选择的内状态, 可能会对幸福感结果产生影响。从自我决定理论出发, 个体有内在的成长倾向以及基本的心理需求, 而实现论动机相比于享乐论动机, 更可能促使个体去满足心理需求, 进而提升幸福感。另一方面, 自我效能感理论提出, 人们相信自己有能力完成目标, 这决定了他们的动机和行为, 而这种能力又会受到成败经验的影响。因此, 过去的幸福感作为一种积极的体验, 可能会通过影响个体的信念从而对幸福动机产生影响。为了检验以上假设, 本研究使用问卷调查法, 以486名大学生为对象, 采用5个月的纵向设计, 考察幸福动机与幸福感的纵向因果关系。交叉滞后模型分析发现, 在控制了自回归路径后, 实现论动机对随后的幸福感预测作用显著($\beta_{\text{享乐论幸福感}} = -0.132, p < 0.05, \beta_{\text{实现论幸福感}} = 0.198, p < 0.01, \beta_{\text{社会幸福感}} = 0.219, p < 0.001$), 但享乐论动机对随后的幸福感预测作用以及幸福感对随后的两种幸福动机的预测作用均不显著($ps > 0.05$)。此外, 在控制了性别、年龄、主观社会地位之后, 结果无显著变化。本研究结果为幸福感的引擎模型以及自我决定理论提供了证据, 强调了实现论动机在幸福感中的重要作用, 这对幸福感的提升具有一定的启示。

Pursuing Pleasure or Meaning: A Cross-lagged Analysis of Happiness Motives and Well-Being

Wenjie Li, Linting Zhang, Ning Jia, Jingjing Zhao, Feng Kong

School of Psychology, Shaanxi Normal University, 199 South Chang'an Road, Xi'an, China

Abstract: The pursuit of well-being is the fundamental motive of human behavior. There are two types of happiness motives, hedonic motives and eudaimonic motives. Hedonic motives refer to seeking pleasure and enjoyment, while eudaimonic motives are defined as seeking to try their best to use and develop themselves. Previous studies have found a significant correlation between happiness motives and well-being, but lack causal evidence. On the one hand, the engine model of well-being suggests that the input elements (e.g., traits) could affect the outcomes (i.e., well-being outcomes) through the process variables (i.e., internal states that influence individuals' choices). Motives, as an internal state that affects choices, may influence the well-being outcomes. From the perspective of self-determine theory, people have an internal trend to grow, and have inherent psychological needs. Eudaimonic motives, rather than hedonic motives, are more likely to promote individuals to meet psychology needs, and enhance well-being. On the other hand, according to self-efficacy theory, people believe that they are capable of certain tasks, which determines how they motivate themselves and behave. And this kind of belief could be influenced by their past experiences of success and failure. Well-being in past time, as an experience of positive outcomes, may affect people's belief and thus influence their happiness motives. To test the above hypotheses, this study used a questionnaire survey to investigate the longitudinal causal relationship between happiness motivation and well-being among 486 college students. The cross-lagged model analysis showed that after controlling the autoregressive path, the eudaimonic motives could significantly predict the subsequent well-being ($\beta_{\text{hedonic well-being}} = 0.132, p < 0.05$, $\beta_{\text{eudaimonic well-being}} = 0.198, p < 0.01$, $\beta_{\text{social well-being}} = 0.219, p < 0.001$), but the hedonic motives could not significantly predict the subsequent well-being, and the well-being could not significantly predict the subsequent two kinds of happiness motives ($ps > 0.05$). After controlling gender, age, and subjective social status, there were no significant differences. These results provide evidence for the engine model of well-being and self-determine theory, and emphasize the important role of eudaimonic motives in well-being, which has enlightenment for the improvement of well-being.

Keywords: Hedonic and eudaimonic motives, Well-being, Cross-lagged

正念干预对残疾人康复的效果及其影响因素：系统综述和 meta 分析

刘冯铂¹ 张忠秋² 刘书强¹

1 北京体育大学心理学院, 北京, 100084

2 国家体育总局体育科学研究所, 北京, 100061, zhongqiuzhang@vip.sina.com

摘要 目的: 康复是残疾人实现权利的基本条件和首要前提, 大量临床研究证实了正念对残疾人的身心康复效果。但是, 目前正念干预对于残疾人康复的效果大小尚无定论, 其次, 迄今为止, 正念干预在东西方文化背景下对于残疾人的效果是否相同也不明确。因此, 本研究参考 Meta 分析研究优先报告项目-方案, 将东西方国家在残疾人正念干预领域的研究均纳入分析, 系统考察正念干预对残疾人的干预效果, 并探讨潜在调节因素及其作用程度。方法: 检索英文数据库(Web of Science、EBSCO、APA PsycInfo、Psychology and Behavioral Sciences Collection、MEDLINE), 与中文数据库(中国知网 CNKI 数据库、万方数据知识服务平台), 获取经过评审的相关论文全文。文献时间跨度设定为 2010 年 1 月 1 日至 2020 年 11 月 30 日, 检索时间为 2020

年12月10日。由2名研究者独立筛选文献、提取资料并评价纳入研究的质量,文献质量评估采用Jadad量表。采用Review Manager 5.3软件进行Meta分析,使用标准化均数差Cohen's d作为实验组(正念组)与对照组(非正念组)的效果量。采用漏斗图法、Egger线性回归法和Begg秩相关法进行发表偏倚检验。基于循证医学理念,从被试特征、干预特征和研究特征这三个方面关注可能存在的调节变量。结果:最终纳入东西方国家实证研究共15项(1065名被试)。64项结局指标评价了正念干预对残疾人康复的影响,其合并结果间统计学异质性高($p<0.00001$; $I^2=73\%$)。效果量评价结果显示,正念干预对残疾人康复的整体效果量显著 $d=0.51$, 95% CI [0.38, 0.63], $p<0.00001$ 。漏斗图显示研究多集中在顶部,且左右顶部对称性良好;Egger线性回归检验结果显示,截距为0.79($p=0.151>0.5$),95% CI [-0.30, 1.88]包含0;Begg秩相关检验结果显示, $Z=1.88<1.96(p=0.060>0.5)$,显示研究不存在发表偏倚。亚组分析结果显示干预周期($p=0.03$, $I^2=79\%$)和家庭练习($p=0.03$, $I^2=78\%$)显著调节残疾人的康复效果。结论:正念干预对残疾人的康复具有中等效果;康复效果受干预周期和家庭练习的影响。

Effectiveness of mindfulness training on rehabilitation for people with disabilities: a systematic review and meta-analysis

LIU Fengbo¹, ZHANG Zhongqiu², LIU Shuqiang¹

1 School of Psychology, Beijing Sport University, Beijing, China

2 China Institute of Sport Science, Beijing, China

Abstract: Objective: Rehabilitation is the basic condition and primary prerequisite for the disabled to realize their rights. A large number of clinical studies have confirmed the effect of mindfulness on the physical and psychological rehabilitation of the disabled. However, at present, the effect of mindfulness training is still inconclusive. Secondly, it is not clear whether mindfulness training has the same effect in the context of Eastern and Western cultures. Therefore, this study aims to systematically review the effect size of mindfulness training on people with disabilities' rehabilitation. **Methods:** Web of Science, EBSCO, APA PsycInfo, Psychology and Behavioral Sciences Collection, MEDLINE, CNKI, and Wanfang were electronically searched to collect studies on the current status of people with disabilities' rehabilitation from January 1st, 2010 to November 31th, 2020. Two reviewers independently screened literature, extracted data and assessed the qualities of included studies. Then, meta-analysis was performed by using Review Manager 5.3 software. The funnel plot method, Egger linear regression method and Begg rank correlation method were used for publication bias test. Based on the concept of evidence-based medicine, it pays attention to the possible moderating variables from three aspects: participant characteristics, intervention characteristics and research characteristics. **Results:** Fifteen researches were revealed in our analyses from both Eastern and Western countries ($k=64$ samples, $n=1065$ participants). The results of meta-analysis showed that mindfulness training for people with disabilities' rehabilitation was shown to be significant efficacious ($d=0.51$, 95% CI [0.38, 0.63], $p<0.00001$). The funnel plot showed that the researches were mostly concentrated at the top, and the left and right tops were symmetrical; Egger linear regression test results showed that the intercept was 0.79 ($p=0.151>0.5$), 95% CI [-0.30, 1.88] contained 0; Begg rank correlation test result showed that $Z=1.88<1.96(p=0.060>0.5)$. Subgroup analysis showed that training time ($p=0.03$, $I^2=79\%$) and home practice ($p=0.03$, $I^2=78\%$) significantly moderated the effect of mindfulness training. **Conclusion:** Mindfulness training for people with disabilities' rehabilitation is efficacious with a medium effect, which is influenced by training time and home practice.

Keywords: mindfulness training, people with disabilities, rehabilitation, influencing factors, systematic review

学校氛围调节马基雅维利主义人格与欺负行为的关系： 认知机制与情绪机制

张洁^{1,2} 潘斌^{1,2} 李腾飞^{1,2} 刘晓薇^{1,2} 张文新^{1,2} (通讯作者)

1 山东师范大学心理学院, 济南, 250014

2 山东师范大学儿童青少年发展研究院, 济南, 250014, zhangwenxin@sdsu.edu.cn

摘 要 马基雅维利主义是一种以操纵他人為自己谋利的人格倾向。马基雅维利主义人格与欺负行为间存在显著正向关联。然而, 鲜有研究考察马基雅维利主义人格影响欺负行为的作用机制。积极的学校氛围下, 师生关系和生生关系融洽、学生对学校有强烈的归属感, 学校对不接纳的行为有清晰公平的规则。这些特征可能会促使马基雅维利主义者认识到欺负事件的严重性, 产生对受欺凌者的同情, 进而减少其欺负行为。本研究以 1366 名 5~8 年级儿童青少年 (平均年龄 13.10 ± 1.26 岁, 女生 48.6%) 为研究对象, 考察学校氛围如何以及为何调节马基雅维利主义人格与欺负行为间的关系。采用自我报告方法对马基雅维利主义人格、学校氛围、感知到的欺负事件的严重性、对受欺负者的同情和欺负行为进行测量。结果发现, 学校氛围能够缓冲马基雅维利主义人格与欺负行为间的关系。在积极的学校氛围中, 马基雅维利主义者更少表现出的欺负行为。积极的学校氛围会通过增加马基雅维利主义者对受欺负者的同情, 进而减少其欺负行为, 但个体对欺负事件的严重性的认知的中介作用不显著。这些研究结果表明, 在校园欺凌预防与干预项目中, 要关注具有马基雅维利主义人格的学生, 同时注重改善学校氛围, 训练和提升学生对受欺负者的同情能力。

School climates moderated the association between Machiavellianism and bullying in preadolescence:

The cognitive and emotional mechanisms

ZHANG Jie^{1,2}, PAN Bin^{1,2}, LI Tengfei^{1,2}, LIU Xiaowei^{1,2}, ZHANG Wenxin^{1,2}

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan
250014

Abstract: Machiavellianism is a personality characterized by the practice of manipulating others for self-interest. Studies have demonstrated that Machiavellianism was positively associated with bullying behavior. However, less is known about potential mechanisms accounting for the Machiavellianism-bullying association. Positive school climates include high quality and supportive interpersonal relationships, a strong sense of belonging to school, and clear and fair school rules for unacceptable behavior. Such features might make Machiavellians realize the seriousness of bullying behavior and feel sympathetic toward victims, there reducing bullying behavior of Machiavellians. The current study aims to investigate how and why school climates moderated the association between Machiavellianism and bullying behavior, and examine the its cognitive mechanism (perceived seriousness of bullying behavior) and emotional mechanism (sympathy toward victims). Participants were 1366 students from grade 5 to grade 8 ($M_{age} = 13.10 \pm 1.26$ years, 48.6% girls). Machiavellianism, bullying behavior, school climate, sympathy toward victims and perceived seriousness of bullying was assessed via self-report. Results from mediated moderating model revealed that school climates moderated the positive association between Machiavellianism and bullying behavior. Specifically, Machiavellians were less likely to engage in bullying behavior in schools with positive school

climates. Positive school climates could mitigate the level of Machiavellians' bullying behavior through enhancing their sympathy toward victims, but not through increasing their perceived seriousness of bullying incidents. The findings suggest that antibullying program should pay more attention to students with Machiavellianism personality trait, creating positive school climates, and to enhance students' sympathy toward victims.

Keywords: Machiavellianism, bullying behavior; school climate, cognitive mechanism, emotional mechanism

受欺凌对主动性、反应性攻击的影响：敌意归因和愤怒冗思的作用

邹小慧^{1,2} 宋丽雯^{1,2} 纪林芹^{1,2} 张文新^{1,2} (通讯作者)

1 山东师范大学心理学院, 济南, 250014

2 山东师范大学儿童青少年发展研究院, 济南, 250014, zhangwenxin@sdsu.edu.cn

摘要 欺凌现象在青少年中普遍存在, 受欺凌者会产生一系列心理社会适应问题。根据一般压力理论, 攻击行为是个体由受欺凌经历所引起的不良应对策略。已有研究揭示了青少年受欺凌与攻击行为间的关系, 但鲜有研究考察二者关系的作用机制。此外, 社会信息加工模型强调了敌意归因对攻击行为的预测作用。而综合认知模型强调了敌意归因和愤怒冗思对攻击的预测, 且敌意归因先于愤怒冗思。因此, 敌意归因和愤怒冗思可能在受欺凌与攻击行为间存在链式中介作用。此外, 攻击行为可分为主动性攻击和反应性攻击, 受欺凌对不同类型的攻击行为的影响及其潜在认知机制可能存在差异。本研究以 494 名七年级学生 (平均年龄 13.38 ± 0.50 岁, 男生 247 人) 为研究对象进行为期 1 年的追踪研究, 考察了受欺凌与青少年主动性、反应性攻击间的关系, 以及敌意归因和愤怒冗思在其中的链式中介作用。受欺凌、敌意归因、愤怒冗思及主动性反应性攻击行为均采用自我报告。结果发现: (1) 受欺凌显著正向预测随后的反应性攻击, 不能显著预测随后的主动性攻击; (2) 敌意归因在受欺凌与主动性/反应性攻击间存在中介作用, 愤怒冗思在受欺凌与主动性/反应性攻击间存在中介作用; (3) 敌意归因和愤怒冗思在受欺凌与主动性/反应性攻击间起链式中介作用。结果表明, 青少年的受欺凌经历可能会对其认知过程产生一定的影响进而使其产生攻击行为, 因此要注重对受欺凌青少年的认知干预, 对于防止其从受侵害者变为侵害者具有重要启示。

The Association between Bullying Victimization and Proactive/Reactive Aggression in Adolescence: The Role of Hostile Intent of Attribution and Angry Rumination

ZOU Xiaohui^{1,2}, SONG Liwen^{1,2}, JI Linqin^{1,2}, ZHANG Wenxin^{1,2}

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan, 250014

Abstract: Bullying is a common phenomenon among adolescents, and the victims of bullying have a series of adverse psychosocial adjustment problems. According to the general stress theory, aggressive behavior was an individual's maladaptation coping strategy evoked by the bullying experience. Existing research has found links between bullying victimization and aggressive behavior among adolescents, but few research has examined the mechanisms. The social information processing theory emphasized that hostile intent of attribution predicted aggressive behavior, and the integrative cognitive model emphasized that hostile intent of attribution and angry rumination predicted aggressive behavior, and hostile intent of attribution preceded angry rumination. Therefore, hostile intent of attribution and angry rumination may have a chain mediating effect between bullying victimization and aggression. In addition, aggression was divided into proactive aggression and reactive aggression. The effects of bullying victimization on different types of aggressive behavior and underlying cognitive mechanisms may be different. The current study was to explore the association between bullying victimization and proactive/reactive aggression, and the mediating role of hostile intent of attribution and angry rumination. 494 teenagers of Grade 7 ($M_{age} = 13.38 \pm 0.50$ years; 247 boys) were investigated

for a one-year longitudinal study. The results showed that: (1) Bullying victimization was positively predicted subsequent reactive aggression but not proactive aggression; (2) Hostile intent of attribution mediated between bullying victimization and proactive/reactive aggression, and angry rumination mediated between bullying victimization and proactive/reactive aggression; (3) Hostile intent of attribution and angry rumination played a chain of mediating roles between bullying victimization and proactive/reactive aggression. The results showed that adolescents' experience of being bullied may influence their cognitive process, which leads to aggressive behaviors. Therefore, it is important to pay attention to the cognitive intervention of adolescents who are bullied, which has important implications for preventing them from victim to victimizer.

Keywords: bullying victimization, hostile intent of attribution, angry rumination, proactive aggression, reactive aggression

教师干预欺负的意愿：个体因素与情境因素的作用

余易达^{1,2}、潘斌^{1,2}、李腾飞^{1,2}、纪林芹^{1,2}、张文新^{1,2}

1 山东师范大学心理学院，济南，250014

2 山东师范大学儿童青少年发展研究院，济南，250014, zhangwenxin@sdu.edu.cn

摘要 教师是欺负预防与干预工作的主要实施者。教师积极干预欺负事件的意愿能显著降低欺负、受欺负的发生率。以往研究大多仅关注教师干预欺负的意愿对学生欺负、受欺负的影响，较少有研究探讨影响教师干预欺负的意愿的个体和情境因素及其作用机制。根据社会生态模型和旁观者干预模型的观点，学校氛围和教师对欺凌的归因方式，可能通过影响教师干预欺凌的效能感，进而影响其干预欺凌的意愿。因此，本研究构建一个有调节的中介模型，检验教师干预欺负的效能感在教师的归因方式（对欺负事件的内部归因和外部归因）和干预欺负的意愿间的中介作用，及学校氛围的调节作用。本研究选取了全国7个省市的36所中小学，总计929名教师进行调查（平均年龄 37.8 ± 8.8 岁，教龄 14.6 ± 9.8 年，女教师80.1%）。结果表明：（1）在控制了性别、受教育水平、教龄后，教师的内部归因能够负向预测教师的干预意愿，外部归因正向预测干预意愿；（2）教师干预欺负的效能感在教师的内、外归因方式和干预意愿间均起中介作用；（3）教师感知到的学校氛围调节了“内部归因—效能感”的关系，即教师感知到积极的学校氛围能够削弱内部归因对干预意愿的阻碍作用；此外，教师感知到的学校氛围还调节了“效能感—干预意愿”间的关系，即当教师感知到的积极学校氛围水平较低时，效能感对干预意愿的促进作用增强。这些研究结果表明，校园欺凌预防与干预项目中，要注重营造良好的学校氛围，引导教师形成恰当的归因方式，帮助其建立干预欺凌效能感。

Teachers' willingness to intervene bullying situation: The role of the individual characteristic and contextual factors

YU Yida^{1,2}, PAN Bin^{1,2}, LI Tengfei^{1,2}, JI Linqin^{1,2}, ZHANG Wenxin^{1,2}

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan, 250014

Abstract: Teachers are one of the main implementer of bullying prevention and intervention work in schools, whose positive willingness to intervene bullying can significantly decrease the prevalence of bullying perpetration and victimization among students. The majority of previous studies have focused on the impact of teachers' willingness to intervene bullying on bullying perpetration and victimization, however, fewer studies have looked at how individual and contextual characteristics of teachers relate to their willingness to intervene bullying, as well as the mediating and moderating mechanisms underlying this relation. With reference to social ecology model and bystander intervention model, teachers' perceived school climate, as well as their attribution (internal or external attribution) of bullying episode may be associated with their willingness to intervene via teachers' self-efficacy. Therefore, the present study

constructed a moderated mediation model to examine whether teachers' attribution (internal or external) of bullying episode is indirectly related to teachers' willingness to intervene through self-efficacy, as well as the moderating role of teachers' perceived school climate on these paths. A total of 929 teachers from six provinces across China (mean age= 37.8±8.8, teaching age= 14.6±9.8, 80.1% female teachers) participated in this study. Using structural equation model to control the nested effect of school level factors, the results showed that: (1) After controlling for gender, educated level and teaching age, internal attribution had a negative impact on willingness to intervene, and external attribution had a positive impact on willingness to intervene. (2) Both impact of internal and external attribution on willingness to intervene were mediated by teachers' self-efficacy. (3) Teachers' perceived school climate moderated the relation between internal attribution and self-efficacy, specifically, the negative effect of internal attribution on self-efficacy was attenuated by the positive perception of school climate. In addition, teachers perceived school climate moderated the relationship between self-efficacy and willingness to intervene, specifically, the positive effect of self-efficacy on willingness to intervene was stronger for teachers with less perception of positive school climate. As for school-based prevention and intervention programs, these results underscored the importance of creating positive school climate, leading teachers to attribute bullying episode appropriately and helping them enhance self-efficacy to intervene bullying.

Keywords: internal attribution, external attribution, self-efficacy, willingness to intervene, school climate

班级师生关系调节学生反欺负态度与欺负行为的关系： 一项多水平分析

余易达^{1,2}、潘斌^{1,2}、李腾飞^{1,2}、纪林芹^{1,2}、张文新^{1,2}

1 山东师范大学心理学院，济南，250014

2 山东师范大学儿童青少年发展研究院，济南，250014, zhangwenxin@sdu.edu.cn

摘要 个体反欺负态度是影响欺负行为的重要社会认知因素之一。然而，已有研究发现，一些具有较强反欺负态度的儿童也可能欺负他人。根据计划行为理论，个体态度与行为的关系会受到其所处情境的影响。教师是影响学生心理社会发展的重要情境因素。当拥有较强反欺负态度的学生与教师建立温暖、信任的师生关系时，会对其行为产生更强的控制感，减少自身欺负行为。但目前尚未有研究考察师生关系对学生反欺负态度与欺负行为关系的影响。此外，已有关于师生关系与欺负行为关系的研究对个体感知的师生关系和班级整体水平的师生关系未加区分，这不仅会导致统计推断的偏差，还会导致理论建构方面的问题。因此，本研究采用多水平模型考察学生反欺负态度对个体欺负行为的影响，以及个体感知和班级水平的师生关系在其中的调节作用。本研究被试来自46个班级的1725名5~8年级学生（男生940人，女生785人，平均年龄12.78±1.14岁），结果发现：（1）学生反欺负态度能显著负向预测学生的欺负行为；（2）个体感知的师生关系能显著负向预测学生的欺负行为；（3）班级水平师生关系在学生反欺负态度与欺负行为之间起调节作用，在学生与教师间具有温暖、信任的情感联结的班级中，学生反欺负态度与欺负行为间存在的负向关联，而在师生关系较差的班级中反欺负态度与欺负行为无显著关联。这一结果表明，校园欺负的有效防治不仅需促进学生的反欺负态度，而且需注重与学生建立温暖、信任的关系。

关键词 反欺负态度，欺负行为，师生关系

Teacher-student Relationship on Class Level Moderated the Relation Between Students' Anti-bullying Attitudes and Bullying Behavior: A Multilevel Analysis

YU Yida^{1,2}, PAN Bin^{1,2}, LI Tengfei^{1,2}, JI Linqin^{1,2}, ZHANG Wenxin^{1,2}

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Child and Adolescent Development Research Institute, Shandong Normal University, Jinan 250014

Abstract: It is well recognized that student's anti-bullying attitude is one of the detrimental social cognitive factors associated with individual bullying. However, previous studies have demonstrated that some children with strong anti-bullying attitude are still bullying others. According to planned behavior theory, the connection between individual attitude and behavior could be affected by context they are in. Teachers are essential contextual factors associated with students' psychosocial development. Students with strong anti-bullying attitude will have a greater sense of control, which in turn reduce their bullying, when they build a warm and trust relationship with their teacher. Little research has investigated the moderating role of teacher-student relationship between students anti-bullying attitude and bullying behavior. Further, existing studies regarding the connection between teacher-student relationship and bullying behavior didn't distinguish between individual perceived teacher-student relationship and the overall teacher-student relationship of class, which could not only generate statistical inference bias, but also resulted in the issue of theoretical construction. Therefore, the present study investigated the effect of student's anti-bullying attitude on individual bullying behavior, as well as the possible moderation effect of the teacher-student relationship (both on individual and class level) between students' attitude and bullying behavior. A total of 1725 students from fifth and eighth grade (940 boys and 785 girls, mean age= 12.78± 1.14) were investigated in this study. Using multilevel model, the results showed that : (1) Student's anti-bullying attitude were negatively associated with peer-reported bullying behavior. (2) Students were less likely to bully when they perceived a positive teacher-student relationship. (3) Teacher-student relationship at the class level moderated the association between anti-bullying attitude and individual bullying behavior. Specifically, students' anti-bullying attitude were negatively associated with individual bullying in classroom where students had a warm and trust emotional connection with teachers, while this relation was not significant in classroom with negative teacher-student relationship. The results of this study indicated that the effectiveness of school bullying prevention and intervention should not only help students to promote anti-bullying attitude, but also set up a warm and trust teacher-student relationship.

Keywords: anti-bullying attitude, bullying behavior, teacher-student relationship

中国初中生受欺凌状况及学校背景因素的城乡差异

辛国刚 张李斌 王晨旭 张云运¹

1 北京师范大学中国基础教育质量监测协同创新中心, 北京, 100875, yyzhangff@126.com

摘要 中国校园欺凌状况及其影响因素存在一定的城乡差异, 明确不同区域受欺凌的特点, 并进一步探明其影响因素, 对于学校的反欺凌计划实施和政策制定具有重要意义。本研究考察了中国学生受欺凌状况的城乡差异, 并基于生态系统理论探究学校背景因素(微观水平变量: 教师保护、班级环境; 中层水平变量: 家校沟通; 外层水平变量: 学校管理、学校德育资源)对于受欺凌的影响。分析包括 868 所中学的 13046 名八年级学生和 6196 名班主任及各学校的校长。描述统计结果显示, 农村学生的受欺凌水平比城市学生高, 除学校管理外, 不同水平的学校背景因素均存在显著城乡差异。多层次分析的结果表明, 微观水平变量(教师保护、班级环境)、中层水平变量(家校沟通)均显著预测个体受欺凌水平, 且存在城乡一致性, 而外层水平各变量(学校管理、学校德育资源)影响不同。在农村学校中, 学校管理显著预测受欺凌水平; 学校德育资源对受欺凌水平预测作用在城市学校和农村学校中均不显著。结果表明不同层次对学校背景因素对个体受欺凌水平影响不同, 且部分变量存在城乡差异, 在进行校园欺凌相关政策制定和计划实施时需考虑其地域差异。

关键词 校园欺凌, 初中生, 城乡差异

The Association of School Contextual Variables with Bullying Victimization: Comparison between Urban and Rural

Xin Guogang, Zhang Libin, Wang Chenxu, Zhang Yunyun

Beijing Normal University Collaborative Innovation Center of Assessment
for Basic Education Quality, Beijing, 100875

Abstract: There are some urban-rural differences in the characteristics and factors of campus bullying in China. Clarifying the characteristics of bullying victimization in different regions and examining its related factors are of great significance for anti-bullying plans and policy-making. This study investigated the urban-rural differences of bullying victimization among Chinese students and the relationship of school contextual factors (micro-level factors: teacher protection, class environment; meso-level factor: home school communication; exo-level factors: school management, school moral education resources) with bullying victimization based on ecosystem theory. The sample included 13046 eighth grade students, 6196 head teachers and principals of 868 middle schools. Descriptive statistics show that the bullying victimization level of rural students is higher than that of urban students. Except for school management, there are significant urban-rural differences in school contextual factors at different levels. The results of multi-level analysis show that micro-level factors (teacher protection, class environment) and meso-level factor (home school communication) significantly predict the level of individual bullying victimization, and there is consistency between urban and rural areas, while the effects of exo-level factors (school management and school moral education resources) are different. In rural schools, school management significantly predicts the level of bullying victimization. The predictive effect of school moral education resources is not significant in urban schools and rural schools. The results show that school contextual factors at different levels have different effects on bullying victimization, and some factors have urban-rural differences. Regional differences should be considered when making policies and implementing plans related to campus bullying.

Keywords: Campus bullying, Junior middle school students, Urban-rural differences

² 华南师范大学哲学与社会发展学院, 广州, 510631

摘要 随着科技的发展, 儿童有着越来越多的机会接触网络。有学者指出, 年龄较小的儿童并不能避免卷入网络欺负和被欺负, 也不能免受网络欺负和被欺负的不良影响。此外, 童年到青春期的转换期可能是网络欺负和被欺负发展的一个关键易感期。然而, 过往对网络欺负和被欺负的研究主要集中在青少年群体, 尚缺乏对儿童群体中网络欺负的关注。因此, 本研究计划使用 4 波段纵向测量, 以 6 个月为时间间隔, 探究从儿童到早期青少年网络欺负和被欺负的异质性亚组, 及亚组间的转换模式。共 4326 名中国儿童 (44.6%是女生, $M_{age}=9.94$) 完成了自我报告的问卷调查。本研究目的包括: (1) 使用潜在剖面分析探究各个波段儿童和早期青少年网络欺负和被欺负的亚组; (2) 使用潜在转换分析探究不同网络欺负亚组间随时间的转换模式; (3) 探究网络欺负亚组和转换中的多系统风险和保护因素, 具体包括: 自我控制, 感知父母情感温暖、感知教师

支持、同伴友谊质量、抑郁症状、家庭虐待、同伴攻击和受害、教师心理虐待。研究发现,在每个波段都识别出3个网络欺负亚组:无卷入者、网络被欺负者、网络欺负-被欺负者。网络欺负和被欺负者的流行率从童年中期到童年晚期下降,但在童年晚期到青少年早期有略微上升。总体而言,儿童中的网络欺负并不稳定,但是从童年到青春早期,网络被欺负者和网络欺负-被欺负者的稳定性一直在上升。同伴攻击、自我控制、家庭虐待是网络欺负-被欺负组的稳定预测因素,同时,友谊质量、教师心理虐待对网络欺负-被欺负组的预测作用也有发现但并不稳定。同伴受害、家庭虐待和抑郁症状是网络被欺负者的稳定预测因素,同时,同伴攻击和友谊质量的预测作用也有发现但并不稳定。此外,研究还发现了一些对网络欺负亚组间转换的显著预测作用。

² School of Philosophy and Social Development, South China Normal University, Guangzhou, 510631

Abstract: Children are having more access to the Internet these days. While studies on cyberbullying mainly focused on adolescents, young children are not immune from cyberbullying. Moreover, the childhood to adolescence transition might be a potential vulnerable period for cyberbullying development. The current longitudinal study explored the profiles and transitions of cyberbullying involvement from childhood to adolescence, along with its multisystemic risk and protective factors. A total of 4326 Chinese children (44.6% female, $M_{age} = 9.94$) participated in self-report assessments at four time points with six-month intervals. Cyberbullying profiles were identified using latent profile analysis and its transitions were examined using latent transition analysis. Multisystemic predictors were tested, including self-control, perceived parental warmth, perceived teacher support, friendship quality, depressive symptoms, family abuse, peer victimization, peer aggression, and, psychological maltreatment by teacher. At all four time points, three cyberbullying profiles were identified: cyberbully-victims, cybervictims and non-involved children. The prevalence rate of cyberbullying decreased from middle to late childhood and then increased at the transition to early adolescence. While cyberbullying involvement seemed unstable during this period, the stability of cyberbullying involved children kept increased. Peer aggression, self-control, and, family abuse were stable predictors for cyberbully-victims, while the significant predictive effects of friendship quality and psychological maltreatment by teacher were only observed at the first two time points. Peer victimization, family abuse and depressive symptoms were stable predictors for cybervictims, while several unstable predictive effects of peer aggression and friendship quality were also observed. Meanwhile, several predictive effects in cyberbullying transitions were found.

Keywords: Cyberbullying, Risk factors, Protective factors, Children and Early adolescents, Latent transition analysis

童年中期到青少年早期教师心理虐待和同伴侵害的关系: 抑郁和同伴攻击的中介作用

郭楠¹ 田丽丽¹ (通讯作者) 刘旺² 公雪¹ 周正¹ 黄静怡¹

¹ 华南师范大学心理学院, 广州, 510631, paipaishu@163.com

² 华南师范大学哲学与社会发展学院, 广州, 510631

摘要 教师心理虐待和同伴侵害是广泛影响中国及世界其他地区严重的全球性公共卫生问题,但是针对教

师心理虐待与同伴侵害之间关系的研究较少。因此本研究旨在探讨童年中期到青少年早期教师心理虐待与同伴侵害之间的交叉滞后关系，以及抑郁和同伴攻击在二者之间的中介作用。本研究采用整群抽样法抽取 4945 名小学生为被试（平均年龄 9.92 ± 0.73 岁，男生 2621 人）自 3 年级追踪至 6 年级，通过纵向交叉滞后模型和随机截距交叉滞后模型，考察了教师心理虐待与同伴侵害间的双向关系以及抑郁和同伴攻击在二者之间的中介作用。结果发现，（1）在交叉滞后模型中，教师心理虐待和同伴侵害均可相互预测；但在随机截距交叉滞后模型中仅同伴侵害可以预测教师心理虐待。（2）在交叉滞后模型中，抑郁在教师心理虐待和同伴侵害之间起中介作用；而在随机截距交叉滞后模型中，仅同伴侵害可以通过抑郁影响教师心理虐待。（3）无论是交叉滞后模型还是随机截距交叉滞后模型，同伴攻击在教师心理虐待和同伴侵害关系之间起中介作用。这些结果表明，童年中期至青少年早期教师心理虐待与同伴侵害之间符合同伴驱动模型，即同伴侵害对随后的教师心理虐待具有更明显预测作用。此外，同伴侵害会通过抑郁增加教师心理虐待的风险。该结果说明需关注儿童青少年的教师心理虐待与同伴侵害经历，以及在此过程中其心理健康问题（如抑郁），并及时采取干预措施避免儿童青少年陷入同伴侵害与教师心理虐待的暴力循环之中。

Transactional Associations Between Psychological Maltreatment by Teachers and Peer Victimization from Middle Childhood to Early Adolescence: Depressive Symptoms and Peer Aggression as Mediators

Nan Guo¹, Lili Tian¹(Corresponding author), Wang Liu², Xue Gong¹, Zheng Zhou¹, Jingyi Huang¹

¹ School of Psychology, South China Normal University, Guangzhou, 510631

² School of Philosophy and Social Development, South China Normal University, Guangzhou, 510631

Abstract: This study examined the transactional associations between psychological maltreatment by teachers (PMT) and peer victimization, and the mediating roles of depressive symptoms and peer aggression from middle childhood to early adolescence, using a five-wave longitudinal design. A total of 4945 Chinese students from Grades 3 and 4 (Mage = 9.92 years, 53% boys) completed a packet of measures on 5 occasions at 6-month intervals. After controlling the students' gender, cross lagged panel models (CLPMs) and random-intercept cross-lagged panel models (RI-CLPMs) indicated that: (a) CLPMs showed bidirectional associations between PMT and peer victimization. However, RI-CLPMs only provided support for the negative effect of PMT on peer victimization; (b) PMT indirectly predicted peer victimization via depressive symptoms and vice versa in CLPMs. However, only peer victimization indirectly predicted PMT via depressive symptoms in RI-CLPMs; (c) both in CLPMs and RI-CLPMs, peer aggression had no mediating effect between PMT and peer victimization. These findings highlight the peer driven path (i.e., peer victimization affects PMT via depressive symptoms) of negative teacher-student interpersonal interaction in the school environment, and that it is beneficial to distinguish between between-person and within-person effects in research informing the development of prevention and intervention programs.

社会排斥对合作行为的影响：内外群体身份的调节作用以及年龄差异

刘春艳 杜雪梅 陈光辉（通讯作者）

山东师范大学心理学院，济南，250014, chengh2100@126.com

摘要 社会排斥是指个体被他人或群体拒绝，从而使归属需求等受到阻碍的现象。社会排斥影响个体的合作行为，且其作用方向尚未获得一致性研究结论。社会排斥通常会使被排斥者产生敌意，从而降低其合作行为；截然相反的结果显示，社会排斥能够激发被排斥者获得归属感的动机，进而增加其合作行为。合作对象的内外群体身份可能是缓和这一矛盾性结果的重要因素。遭到内群体还是外群体成员排斥所引发的结果可能

不同,被排斥后与内、外群体成员的合作行为动机强度也可能存在差异。鉴于此,本研究旨在探究内外群体身份在社会排斥影响合作行为中的调节作用,并进一步探究儿童和成人的年龄段差异。本研究采用颜色方块估计任务分组,采用线上抛球游戏(Cyberball)操纵社会排斥,共分为三个子研究。子研究一以61名小学生和69名大学生为被试,采用2(排斥条件:排斥组、对照组) $\times$ 2(年龄:儿童、成人) $\times$ 3(合作对象:内群体、外群体、未知群体)混合实验设计,考察社会排斥对合作行为的影响以及合作对象内外群体身份的调节作用和年龄差异。子研究二和三各自以129名(65名小学生;64名大学生)和146名(67名小学生;79名大学生)学生为被试,分别考察内群体和外群体互动条件下,社会排斥对合作行为的影响。结果显示,1.不区分内外群体时,被排斥儿童的合作行为显著低于对照组,成人的合作行为与对照组无显著差异;2.区分内外群体时,被排斥者与外群体、未知身份成员的合作行为显著更低,但与内群体成员的合作行为无显著差异;3.个体被外群体成员排斥时,被排斥成人与外群体成员的合作行为显著降低,与内群体成员的合作行为显著增加;被排斥儿童与内、外群体成员的合作水平均显著降低;4.个体被内群体成员排斥时,被排斥成人与外群体成员的合作行为显著增加,与内群体成员的合作行为无显著变化;被排斥儿童与内、外群体成员的合作行为均显著降低。内外群体身份、年龄在社会排斥与合作行为关系上的调节作用有助于深入了解合作行为的发生发展机制。

The Age Differences of the Moderation Effect of Group Identity between Social Exclusion and Cooperative Behavior

LIU Chunyan, DU Xuemei, CHEN Guanghui

School of Psychology, Shandong Normal University, Jinan 250014, chengh2100@126.com

Abstract: Social exclusion refers to the phenomenon and process in which belonging and social relationship are threaten due to being excluded or rejected by a group or others. Social exclusion affects people's cooperative behavior, but the direction of its influence has not been confirmed. On the one hand, social exclusion can make the excluded people hostile and reduce their cooperative behavior. On the other hand, the opposite research results show that social exclusion can stimulate the motivation of the excluded people to obtain a sense of belonging and then increase their cooperative behavior. The internal and external group identity of the partners may be an important factor to mitigate the contradictory results. The results of being excluded by in-group members or out-group members may be different, and the motivation intensity of cooperative behavior with in-group members and out-group members after being excluded may also be different. In view of this, this study aims to explore the moderating role of group identity in the effect of social exclusion on cooperative behavior, and to further explore the age difference between children and adults. This study was divided into three studies. Participants were divided into groups by color square estimation task, and then manipulated the sense of exclusion by using Cyberball paradigm to investigate the differences of individuals' cooperative behaviors in public goods games under different conditions. In the first study, 61 primary school students and 69 college students participated in the experiment. To investigate the effect of social exclusion on individual cooperative behavior and the moderating role of partner group identity and age differences, the 2 (exclusion condition: exclusion group, control group) $\times$ 2 (age: children, adult) $\times$ 3 (partner group identity: in-group, out-group, unknown group) mixed experimental design was used. Studies II and III were selected with 129 (65 primary school students; 64 college students) and 146 (67 primary school students; 79 college students) students to investigate the effect of social exclusion on cooperative behavior under in-group and out-group interaction conditions. The results showed that: 1. When the group identity of the partner is unknown, the cooperative behavior of excluded children was significantly lower than that of the control group, while the cooperative behavior of adults was not significantly different from that of the control group. 2. When the partner is divided into in-group members and out-group members, the cooperative behavior of excluded individuals with out-group and unknown members is significantly lower, but there is no significant difference with in-group members' cooperative behavior; 3. When an individual is excluded by an out-group member, the cooperative behavior of the excluded adult with the out-group

member is significantly decreased, and the cooperative behavior with the in-group member is significantly increased; The cooperative behavior of excluded children with in-group and out-group members was significantly reduced. 4. When an individual is excluded by an in-group member, the cooperative behavior between the excluded adult and the out-group member increases significantly, but has no significant difference with the in-group member; The cooperative behavior of excluded children with in-group and out-group members was significantly reduced. The moderating effects of internal and external group identity and age on the relationship between social exclusion and cooperative behavior are helpful to further understand the occurrence and development mechanism of cooperative behavior.

暴力电子游戏接触与早期青少年的欺凌变化： 特质攻击和道德认同的纵向调节作用

滕召军（通讯作者） 聂倩 郭成

西南大学心理学部, 心理健康教育研究中心, 重庆, 400715, tengzj@swu.edu.cn

摘要 已有的理论（例如，一般攻击模型）和实证研究表明，媒体暴力与攻击、欺凌行为存在显著正相关。特别地，对于儿童和青少年的研究发现，暴力电子游戏接触可能增强儿童和青少年的攻击和欺凌行为。早期青少年（初中生）由儿童晚期过渡而来，是电子游戏成瘾易感和校园欺凌发生率较大的时期。因此本研究聚焦于早期青少年，采用纵向研究考察暴力电子游戏接触对其欺凌行为变化趋势的影响。基于一般攻击模型（Anderson & Bushman, 2002, 2018），本研究将采用个体内和个体间视角考察暴力电子游戏是否会随时间变化预测欺凌行为，并且特质攻击和道德认同存在调节作用。样本包含 5 所初中一年级学生 774 名（61.8% 的男生，年龄在 12-15 岁）。采用暴力电子游戏接触问卷、欺凌行为量表、特质攻击和道德认同量表对选取的初中生进行一学期间隔的三次测量。研究结果显示：（1）暴力电子游戏接触纵向预测欺凌行为的变化，即暴力电子游戏对欺凌行为的预测存在个体内效应（即给定一个青少年，其暴力电子游戏的变化会导致欺凌行为的变化）。（2）暴力电子游戏接触对欺凌行为的预测存在个体间效应（即对于高暴力电子游戏接触的群体而言，其欺凌行为要比低暴力电子游戏接触的群体发生频率要低）。（3）攻击特质在个体间及跨层次（cross-level）调节了暴力电子游戏对欺凌行为的预测，对于高特质攻击的个体而言，暴力电子游戏接触与欺凌行为的纵向关系很强，但是对于低特质攻击的个体而言，暴力电子游戏接触与欺凌行为的纵向关系较弱。（4）道德认同仅仅调节了个体间暴力电子游戏接触与欺凌行为的关系，即对于高道德认同的青少年群体而言，暴力电子游戏接触与欺凌行为的相关较弱，但是对于低道德认同的青少年群体而言，暴力电子游戏接触与欺凌行为的关系较强。本研究结果揭示了特质攻击作为暴力电子游戏接触与欺凌行为之间的风险因素，验证和扩展了一般攻击模型关于情景变量和个体变量交互作用对攻击行为的影响。本研究结果强调降低特质攻击和增强道德认同可以作为预防校园欺凌，降低媒体暴力对欺凌行为预测的重要策略。

关键词 暴力电子游戏接触，欺凌行为，特质攻击，道德认同，早期青少年

Violent Video Game Exposure and Bullying in Early Adolescence: A Longitudinal Study Examining Moderation of Trait Aggressiveness and Moral Identity

Zhaojun Teng¹, Qian Nie¹, and Cheng Guo¹

¹ Research Center of Mental Health Education, Faculty of Psychology, Southwest University;

Abstract: Existing theories (e.g., General Aggression Model) and empirical studies have suggested a positive linkage between media violence exposure and aggressive behaviors, including bullying. However, we still do not know if violent video game exposure has a longitudinal association with the development of daily bullying perpetration behaviors. This study examined whether bullying perpetration is associated with violent video game exposure at both within- and between-individual levels among 774 Chinese early adolescents (61.8% boys, aged 12-15 years) over one

year. We also examined whether trait aggressiveness and moral identity moderate the longitudinal link between violent video game exposure and bullying perpetration. Results showed that violent video game exposure was positively associated with bullying perpetration (i.e., within-individual effect), and trait aggressiveness moderated this relationship at both the between-individual and cross-levels. Adolescents with a higher level of trait aggressiveness showed a stronger link between violent video game exposure and bullying perpetration. Moral identity moderated this relationship between violent video game exposure and bullying perpetrators but only at the between-person level (i.e., not cross-level). This result suggests that adolescents with a high moral identity score have a weaker association between violent video game exposure and bullying perpetration at the between-individual level. The findings indicate the added risk of trait aggressiveness to the longitudinal effect of violent video game exposure on bullying perpetration between individuals. The findings also highlight the importance of develop strategies to reduce trait aggressiveness and promote positive moral development among early adolescents in bullying prevention and intervention efforts.

Keywords: Violent video game exposure, bullying perpetration, trait aggressiveness, moral identity, early adolescents

儿童受欺凌与情绪问题的关系：希望与宽恕的调节作用

王凤巧 张钰晗 陈光辉（通讯作者）

山东师范大学心理学院，济南，250014，chengh2100@126.com

摘要 受欺凌是指个体遭受力量较强同伴故意伤害且无法有效保护自己的经历，也即校园欺凌事件中受害者的经历。近年来，严重校园欺凌事件频发并引发了政府、学界和社会公众的广泛关注，如何有效保护受欺凌者成为当下亟需尽快解决的热点问题。情绪问题是儿童遭受欺凌后出现的不良影响之一，并在儿童学业失败、同伴关系恶化以及自伤自杀等不良后果中发挥重要中介作用。及时阻断受欺凌对情绪问题（如抑郁、焦虑）的不良影响，是有效帮助受欺凌者的一种可能策略。个体的积极心理品质是外界危险因素（如受欺凌）的有效缓冲因素，如希望（个体想要达成目标的积极期望）、宽恕（受害者消除了对攻击者持有的负面认知、情绪和行为反应）。鉴于此，本研究尝试探究儿童的希望、宽恕特征在阻断受欺凌与情绪问题关系中的作用效果。本研究以山东省某小学 708 名小学生（平均年龄=9.67 岁，50%的被试为男性）为被试进行问卷调查。结果发现：1.儿童受欺凌与情绪问题存在显著正相关，儿童受欺凌程度越高，出现焦虑、抑郁的风险均越大；2.希望和宽恕均在儿童受欺凌与各个情绪问题的关系中发挥调节作用，随着儿童希望或宽恕水平的升高，受欺凌对焦虑、抑郁的预测作用均会显著降低；3.儿童的希望与宽恕对情绪问题的保护作用符合“独立模式”，即二者单独发挥对焦虑、抑郁的调节作用。本研究证实了希望和宽恕这两个积极心理品质能够有效调节受欺凌对情绪问题的不利影响，并对小学生校园欺凌防治与心理健康教育实践具有重要启示。

关键词 受欺凌，希望，宽恕，焦虑，抑郁

The Relationship Between Bullying Victimization and Emotional Problems in Children:

The Moderating Effects of Hope and Forgiveness

WANG Fengqiao, ZHANG Yuhang, CHEN Guanghui

School of Psychology, Shandong Normal University, Jinan, 250014

Abstract: Bullying victimization refers to the experience of an individual being deliberately hurt by a powerful peer and unable to effectively protect himself or herself, which is also the experience of the victim in school bullying. In recent years, the frequent occurrence of serious school bullying incidents have aroused widespread concern from the government, academia and the public. How to effectively protect the victim has become a hot issue that needs to be solved as soon as possible. Emotional problems are one of the negative effects of bullying victimization, and play an important mediating role in children's academic failure, peer relationship deterioration and self-injury suicide. Blocking the negative effects of bullying on emotional problems (such as depression and anxiety) in time is a

possible strategy to effectively help the bullied. An individual's positive psychological qualities are effective buffering factors for external risk factors (e.g., bullying victimization). Such as hope (the positive expectation that the individual wants to achieve a goal) and forgiveness (the victim removes negative cognitive, emotional and behavioral responses to the attacker). In view of this, this study attempted to explore the effect of children's hope and forgiveness characteristics on blocking the relationship between bullying victimization and emotional problems. In this study, 708 primary school students (average age =9.67 years old, 50% of the subjects were male) were investigated by questionnaire from a primary school in Shandong Province. The results showed that: 1. There was a significant positive correlation between bullying victimization and emotional problems. The higher the level of bullying victimization, anxiety and depression also have greater risk; 2. Both hope and forgiveness played a moderating role in the relationship between bullying victimization and emotional problems in children. With the increase of hope or forgiveness level, the predictive effects of bullying victimization on anxiety and depression were significantly reduced. 3. The protective effect of hope and forgiveness on emotional problems in children conforms to the "independent mode", that is, both of them play a separate regulatory role on anxiety and depression. This study confirms that hope and forgiveness, two positive psychological qualities, can effectively regulate the negative impact of bullying victimization on emotional problems, and has important implications for the prevention and treatment of bullying and mental health education of primary school students.

炎症性肠病患者病耻感与疾病获益感的关系： 自我表露和家庭功能的链式中介作用

孙彩云¹ 林征^{1,2}(通讯作者) 周美景¹ 顾子君¹ 罗丹³ 王咪¹

¹ 南京医科大学护理学院, 南京, 211166

² 南京医科大学第一附属医院护理部, 南京, 210029, linzheng100@163.com

³ 北京大学护理学院, 北京, 100191

摘要 目的 基于压力应对理论探究炎症性肠病患者自我表露和家庭功能在病耻感与疾病获益感之间的中介作用。**方法** 采用横断面研究, 以便利抽样的方式选取于 2020 年 10 月至 2021 年 6 月在南京市某三级甲等医院就诊的 246 例炎症性肠病患者为研究对象。使用一般资料调查表、慢性病病耻感量表、伯克利情绪表达量表、家庭亲密性与适应性量表和疾病获益感量表进行调查。采用 AMOS 26.0 软件建立结构方程模型, 并采用偏差校正百分位 Bootstrap 法检验中介效应模型。**结果** 相关分析显示, 病耻感、自我表露、家庭功能、疾病获益感得分两两之间均相关($r=-0.366\sim-0.620$, $P<0.01$); 中介效应模型检验表明: 病耻感通过自我表露($\beta=-0.192$, $P<0.001$)、家庭功能($\beta=-0.109$, $P=0.002$)的单独中介及自我表露-家庭功能的链式中介($\beta=-0.067$, $P<0.001$)三条中介路径间接对疾病获益感产生影响, 总中介效应为 $-0.368(P<0.001)$ 。**结论** 炎症性肠病患者病耻感可通过自我表露和家庭功能的中介作用影响疾病获益感, 应鼓励存在病耻感的患者表达疾病相关感受, 并注重提高患者家庭的亲密关系和适应能力, 以提升疾病获益感。

Relationship between stigma and benefit finding in patients with inflammatory bowel diseases: Chain Mediating effect of self-disclosure and family function

Sun Caiyun¹, Lin Zheng^{1,2}, Zhou Meijing¹, Gu Zijun¹, LuoDan³, Wang Mi¹

1 School of Nursing, Nanjing Medical University, Nanjing 211166, China

2 Nursing department, Jiangsu Province Hospital, Nanjing 210029, China

3 School of Nursing, Peking University, Beijing 100191, China

Abstract: Objective To explore the mediating effect of self-disclosure and family function between stigma and benefit finding in patients with inflammatory bowel diseases (IBD) based on stress and coping model. **Methods** 226 patients with IBD were selected in a tertiary hospital in Nanjing by convenient sampling method from October 2020 to June 2021. General information questionnaire, stigma scale for chronic illness, Berkeley expressivity questionnaire, cohesion and adaptability scale and benefit finding scale were used to conduct the investigation. We established structural equation model by AMOS 26.0 and test the intermediary effect model by deviation correction percentile Bootstrap method. **Results** Correlation analysis showed that stigma, self-disclosure, family function and benefit finding were correlated with each other ($r=-0.366\sim-0.620$, $P<0.01$). Mediation modeling analysis showed that stigma indirectly affected benefit finding through three mediating paths: the separate mediation role of self-disclosure ($\beta=-0.192$, $P<0.001$) and family function ($\beta=-0.109$, $P=0.002$), and the chain mediating role of self-disclosure and family function ($\beta=-0.067$, $P<0.001$). The total mediating effect was -0.368 ($P<0.001$). **Conclusion** The stigma can affect perceived benefit finding through the intermediary role of self-disclosure and family function in patients with IBD. To enhance benefit finding of patients, medical staff should encourage patients with a sense of stigma to express their disease-related feelings and pay attention to improve their family relationship and adaptability.

童年期情感虐待与重复心理社会应激心血管反应适应性： 母子依恋的调节作用

张雨¹ 吕薇² (通讯作者)

1 陕西师范大学心理学院, 西安, 710061

2 陕西师范大学心理学院, 西安, 710061, lvwei@snnu.edu.cn

摘要 童年期虐待作为一种早期生活压力会导致心血管应激反应失调, 表现为较大或钝化的应激反应性。然而以往研究没有区分不同类型虐待的影响, 尤其是特定类型童年期虐待对反复应激暴露下生理反应适应性的影响还缺乏深入探讨。本研究采用重复应激暴露实验范式, 探讨童年期情感虐待与重复心理社会应激(演讲任务)心血管反应适应性的关系, 并考察母子依恋质量作为环境保护因素在两者关系中的调节作用。102 名大学生参加了本研究, 在实验开始前完成中文版儿童创伤问卷(CTQ)情感虐待分量表和中文版青少年依恋问卷(IPPA)母子依恋分量表, 随后在实验室完成重复心理社会应激任务(公共演讲任务), 采用无创血压测量仪在实验的四个阶段(基线, 应激暴露 1, 任务间休息, 应激暴露 2)持续地采集生理数据(心率, 血压, 心输出量, 总外周阻力)。研究结果发现: (1)童年期情感虐待与第一次应激暴露中钝化的心率反应性、收缩压反应性、心输出量反应性有关, 与重复应激暴露过程中减弱的心率反应适应性、心输出量反应适应性有关; (2)母子依恋质量调节童年期情感虐待与重复应激心输出量反应适应性、总外周阻力反应适应性的关系, 即在低母子依恋条件下, 情感虐待与重复应激心输出量反应适应性、总外周阻力反应适应性显著负相关, 而在高母子依恋条件下不存在这一联系。这些研究结果表明, 早期较高的情感虐待经历可能会破坏重复应激情境下的心血管反应适应性, 而高质量的母子依恋可以缓冲情感虐待对重复应激心血管反应适应性的不利影响。

Childhood Emotional Abuse and Cardiovascular Response Adaptation to Repeated Psychosocial Stress: Moderating Role of Maternal Attachment

Yu Zhang, Wei Lü (Corresponding Author)

School of Psychology, Shaanxi Normal University, 199 South Chang'an Road, Xi'an

Abstract: Childhood maltreatment as an early-life stress leads to cardiovascular stress response dysregulation manifested by either exaggerated or blunted stress responses. However, the effects of different subtypes of childhood maltreatment have not been well distinguished in previous studies, especially the effect of specific childhood maltreatment on adaptation to repeated stress exposures which remains to be further discussed. The present study used repeated stress exposure paradigm to examine the relationship between childhood emotional abuse and cardiovascular response adaptation to repeated psychosocial stress (speech task), as well as the moderating effect of maternal attachment on this relationship. Scales of Childhood Emotional Abuse (subscale of Childhood Trauma Questionnaire, CTQ) and Parental Attachment (subscale of Inventory of Parent and Peer Attachment, IPPA) were administered to 102 undergraduate students who underwent continuous cardiovascular monitoring [heart rate (HR), blood pressure (BP), cardiac output (CO) and total peripheral resistance (TPR)] while facing two consecutive psychosocial stress exposures (public speaking tasks). Results showed that: (1) Childhood emotional abuse was associated with reduced HR, SBP, CO reactivity to the first stress exposure, and attenuated HR, CO response adaptation to repeated stress. (2) Childhood emotional abuse and maternal attachment interactively affect CO and TPR response adaptation to repeated stress. Specifically, Childhood emotional abuse negatively predicted CO and TPR response adaptation to repeated stress among individuals with low maternal attachment, but not among those with high maternal attachment. These findings suggest that greater early emotional abusive experiences disrupt cardiovascular response adaptation to repeated stress, while high-quality maternal attachment might buffer this negative effect.

摘要 当前,越来越多的学者已经开始关注留守儿童的心理发展与适应问题,但仅有较少研究关注留守妻子这一特殊群体,且没有研究对留守妻子自身发展如何影响其对子女的教养问题进行系统探究。留守妻子是指丈夫外出流动后作为妻子留守在户籍所在地的女性,相应的,由留守妻子监护的儿童则属于单亲监护型留守儿童。作为子女的主要抚养人,留守妻子的生存与发展状况对单亲监护型留守儿童的发展与适应具有不可替代的深远影响。鉴于此,本研究基于家庭系统理论与自我决定理论,以380个亲子对(留守妻子及其子女)为研究对象,在中国文化背景下综合考察了家庭因素(婚姻满意度)和个体因素(错失焦虑、领悟社会支持)对留守妻子教养行为(心理控制)的影响及作用机制,并构建了一个有调节的中介模型,结果表明:(1)在控制了社会经济地位、留守妻子年龄等因素后,婚姻满意度对留守妻子心理控制具有显著的负向预测作用。(2)中介效应检验表明,留守妻子错失焦虑在婚姻满意度与心理控制间具有部分中介作用。(3)有调节的中介效应检验表明,留守妻子对社会支持的领悟调节了错失焦虑对心理控制的影响强度。即对社会支持的较高领悟可以缓解留守妻子的错失焦虑感,进而减轻其对子女的心理控制。

关键词 留守妻子, 婚姻满意度, 错失焦虑, 心理控制, 领悟社会支持

Marital satisfaction and psychological control of left-behind wives in China: a moderated mediating model

Xiao Wu¹, Yixin Hu¹

School of Psychology, Shandong Normal University, Jinan, China

Abstract: Currently, a growing body of research has focused on left-behind children, little is known about left-behind wives and how the development of left-behind wives affects their children through parenting behaviors. Left-behind wives refer to women staying at the place of household registration alone after their husbands getting out to make a living. Correspondingly, the children under the supervision of left-behind wives are single-parent left-behind children. As the main supporter of the children, the survival and development of left-behind wives has an irreplaceable and profound influence on the development and adaptation of single-parent left-behind children. Given that, guided by family system theory and self-determination theory, the current study aims to exploring the effect of family factor (marital satisfaction) and individual factors (fear of missing out, perceived social support) on parenting behaviors (psychological control) among left-behind wives through constructing a moderated mediation model. The results showed that: (1) After controlling for socioeconomic status, mother's age and other factors, marriage satisfaction has a significant negative predictive effect on the psychological control of left-behind wives. (2) The intermediary effect test showed that the fear of missing out of left-behind wives has a partial mediation effect between marriage satisfaction and psychological control. (3) The intermediary effect test with regulation showed that the perceived social support of left-behind wives regulates the intensity of fear of missing out on psychological control, which indicates that a higher perceived of social support can relieve the sense of fear of missing out of left-behind wives, and thereby reducing their psychological control of their children.

Keywords: left-behind wives, marital satisfaction, fear of missing out, psychological control, perceived social support

粗暴养育与中小学生智能手机成瘾的关系：一个多重中介模型

周孟孟¹ 王大伟¹（通讯作者）

¹ 山东师范大学心理学院，济南，250358

摘要 据中国互联网络信息中心的最新调查报告显示，我国手机网民中青少年的比例高达 17.5%。随着智能手机越来越普遍，中小学生对智能手机产生了强烈的依赖性，甚至达到成瘾水平。因此，青少年的智能手机成瘾问题也引起研究者的广泛关注。智能手机成瘾导致许多消极后果的产生，如心理健康、情绪问题、睡眠和学业问题。本研究聚焦于中小学生智能手机成瘾的影响因素及机制，选取 727 名中小学生，使用粗暴养育、智能手机成瘾、抑郁和社会疼痛量表，基于家庭系统理论和补偿性互联网使用理论，探讨父母粗暴养育与中小学生智能手机成瘾的关系，并进一步探究抑郁和社会疼痛的在粗暴养育和智能手机成瘾关系中的中介作用。结果显示，（1）智能手机成瘾与粗暴养育、抑郁和社会疼痛之间存在显著正相关关系，粗暴养育与抑郁和社会疼痛之间显著正相关关系，抑郁与社会疼痛之间存在显著正相关关系；（2）粗暴养育对抑郁、社会疼痛和智能手机成瘾有显著正向影响。抑郁和社会疼痛对智能手机成瘾有显著正向影响。抑郁和社会疼痛在粗暴养育和智能手机成瘾的关系中起到部分中介作用，并且，抑郁在粗暴养育和智能手机成瘾的关系中起到更大的中介作用；（3）抑郁和社会疼痛在父亲粗暴养育和智能手机成瘾的关系中起到部分中介作用，并且，抑郁在父亲粗暴养育和智能手机成瘾的关系中起到更大的中介作用，而抑郁和社会疼痛在母亲粗暴养育和智能手机成瘾的关系中起到完全中介作用，并且，抑郁在母亲粗暴养育和智能手机成瘾的关系中起到更大的中介作用。本研究为干预中小学生智能手机成瘾提供了直接路径（改善家庭教养方式）和间接路径（降低抑郁和社会疼痛水平），为改善中小学生的智能手机成瘾状况提供了实证依据和理论依据。

The relationship between harsh parenting and smartphone addiction among primary and secondary school students: a multiple mediating model

Zhou Mengmeng¹, Wang Dawei¹ (corresponding author)

¹ School of Psychology, Shandong Normal University, No.88. East Wenhua Road, Jinan, Shandong, China

Abstract: According to the latest survey by the China Internet Network Information Center, adolescents accounted for 17.5% of mobile phones users in China. With the increasing popularity of smartphones, primary and secondary school students had a strong dependence on smartphones, and even reached the level of addiction. Therefore, the adolescents' smartphone addiction also attracted extensive attention of researchers. Smartphone addiction was found to be related to a lot of adverse influences, such as physical health problems, emotional problems, sleep disturbances, and academic failures. This study that focused on the antecedents and mechanism of smartphone addiction among primary and secondary school students, selecting 727 primary and secondary school students, using the harsh parenting, smartphone addiction, depression and social pain scale, based on the family system theory and the compensatory Internet use theory, explored the relationship between parents harsh parenting and primary and middle school students' smart phone addiction, and further explored the mediating role of depression and social pain in the relationship between harsh parenting and smart phone addiction. The results showed that: (1) There was a significant positive correlation between smart phone addiction and harsh parenting, depression and social pain, and a significant positive correlation between harsh parenting and depression and social pain, there was a significant positive correlation between depression and social pain. (2) Harsh parenting had significant positive effects on depression, social pain and smart phone addiction. Depression and social pain had significant positive effects on smart phone addiction. Depression and social pain played a partial mediating role in the relationship between harsh parenting and smart phone addiction, and depression played a greater mediating role in the relationship between harsh parenting and smart phone addiction. (3) Depression and social pain played a partial mediating role in the relationship between father harsh parenting and smart phone addiction, and depression played a greater mediating role in the relationship between father harsh parenting and smart phone addiction, depression and social pain played a complete mediating role in the relationship between maternal harsh parenting and smart phone addiction, and depression played a greater mediating role in the relationship between maternal harsh parenting and smart phone addiction. This study provided direct (to improve parenting style) and indirect pathways (to decrease depression and social pain levels) for intervention in primary and secondary school students' smart phone addiction. The present study also provided the empirical basis and theoretical basis for decreasing the mobile phone addiction of primary and middle school students.

Keywords: harsh parenting, smart phone addiction, adolescents, multiple mediation model

短期戒断对冰毒依赖者执行功能的影响

韩磊¹ 刘兴嘉¹ 王一媚¹ 梁东波¹ 赵宇飞¹(通讯作者)

¹ 山东师范大学心理学院, 济南, 250000

摘要 《2019 年中国毒品形势报告》指出, 截止到 2019 年底, 中国现有吸毒人员 214.8 万人, 其中冰毒作为丙胺类兴奋剂在我国使用最多, 高达 118.6 万人。吸食毒品会导致个体的执行功能受损, 而执行功能在抵制吸毒冲动、抑制毒品相关刺激所引起的行为激活中起着重要作用, 所以在戒断期间的个体容易产生复吸行为, 已有研究发现通过长期戒断(戒断时间 ≥ 6 个月)的个体的执行功能可以得到显著恢复, 而短期戒断(戒断时间 < 6 个月)对执行功能的恢复目前尚无研究。根据 Miyake 对执行功能划分的划分, 本研究采用纵向追踪设计的研究方法, 分别使用 n-back 任务、Stroop 任务和数字转换任务考察冰毒依赖者执行功能的三个子成分, 工作记忆刷新功能、认知抑制功能和工作记忆转换功能随戒断时间的恢复情况。结果发现, 随着戒断时间的增加, 冰

毒依赖者的执行功能可以得到一定的恢复，具体表现为：(1)冰毒依赖者在 n-back 任务中的反应时逐渐缩短，反应正确率逐渐提高，表明戒断者的工作记忆刷新功能可以得到一定恢复；(2)在 Stroop 任务中，冰毒依赖者的冲突反应时逐渐缩短，反应时干扰分数逐渐降低，正确率干扰分数逐渐增高，表明戒断者的认知抑制功能在逐渐恢复；(3)在数字转换任务中，冰毒依赖者戒断三个月时的转换成本显著低于戒断两个月和一个月的转换成本，表明戒断者的工作记忆转换功能可以得到一定恢复。

The effect of short-term abstinence on the executive function of methamphetamine-addicted people

Lei han¹, Xing-Jia Liu¹, Yi-Mei Wang¹, Dong-Bo Liang¹, Yu-Fei Zhao^{1*}

¹ School of Psychology, Shandong Normal University, No. 1, Daxue Road, Guyun Lake Street, Jinan, Shandong, China.

Abstract: The "Report on China's Drug Situation in 2019" pointed out that as of the end of 2019, there were 2.148 million drug users in China, of which methamphetamine was used the most as propylamine stimulant in my country, reaching 1.186 million. Taking drugs can damage the executive function of the individual, and executive function plays an important role in resisting the impulse to take drugs and inhibiting the activation of behavior caused by drug-related stimuli. Therefore, individuals during the withdrawal period are prone to relapse behavior. Studies have been conducted It was found that individuals with long-term withdrawal (withdrawal time ≥ 6 months) can achieve significant recovery of executive function, while short-term withdrawal (withdrawal time < 6 months) has no research on the recovery of executive function. According to Miyake's division of executive functions, this study employed a longitudinal tracking design to investigate the recovery of updating, inhibition and shifting function in methamphetamine-addicted people during abstinence by using the n-back task, the Stroop task and the more-odd shifting task, respectively. The results showed that executive function in methamphetamine-addicted people can be recovered to a certain extent over the course of abstinence. The specific findings were as follows: (1) The reaction time of methamphetamine-addicted people in the n-back task gradually shortens during abstinence, and their response accuracy rate gradually increases, indicating that their updating function can be recovered to a certain extent; (2) In the Stroop task, the conflict reaction time of methamphetamine-addicted people gradually shortens during abstinence, the interference score during reaction gradually decreases, and the correct interference score gradually increases, indicating that inhibitory function gradually recovers during methamphetamine abstinence; (3) In the more-odd shifting task, the conversion cost in methamphetamine-dependent patients was significantly lower at three months of abstinence than at two months or one month of abstinence, indicating that their shifting function can be recovered to a certain extent.

Keywords: short-term abstinence, methamphetamine dependence, updating function, inhibitory function, shifting function

新冠疫情爆发初期媒体内容对个体心理健康的影响：一项纵向研究

薛的妮² 刘晓瑞² 刘拓^{1,2,3} (通讯作者)

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

2 天津师范大学心理学部, 天津, 300387

3 国民心理健康评估与促进协同创新中心, 天津, 300387, mikebonita@163.com

摘 要 多项调查和研究表明, 新型冠状病毒肺炎病毒的爆发严重威胁着人们的身心健康。因此为了进一步防止或减轻疫情期间心理创伤可能带来的潜在负面影响, 研究疫情期间大众心理健康状况的影响因素以及其背后的影响机制十分必要。不同于以往的流行病, 在疫情初期, 全国各地均采取了严格的居家隔离措施以防止病毒的进一步扩散, 媒体也因此成为了大众获取外界信息的主要途径; 同时在公共卫生事件发生时, 媒体也承担着向大众传递事件相关讯息的社会责任。多项研究结果发现有关疫情的媒体报道会影响大众的心理状况。在已有的相关研究中, 可以发现前人研究关注的变量大多集中于社交媒体这一媒体类型而非关注媒体报道内容, 且大多进行的是横断研究。但横断研究不利于探究变量之间的因果关系。因此本研究采用纵向研究, 探究在疫情爆发期间大众浏览的媒体内容对心理健康的长期影响。研究采用线上问卷调查的方式从 2019 年 1 月 28 日开始, 对来自全国范围内的 132 名被试进行了为期三周的追踪调查, 通过建立交叉滞后模型探究疫情爆发期间个体浏览有关疫情的媒体内容类型与抑郁情绪的关系, 研究采用自编的疫情背景下的《媒体使用行为问卷》测量被试的媒体使用行为以及中文版本的《抑郁-焦虑-压力 量表》测量被试的心理健康状况, 信效度分析结果良好, 三个维度分量表的内部一致性均在 0.76~0.79 之间, 且总量表的内部一致性为 0.89。数据分析使用 Mplus 8.0 软件检验了以各媒体内容类型作为自变量、民众抑郁情绪作为因变量的交叉滞后模型。结果发现 T1 和 T2 时被试浏览“来自熟人的信息”即“从亲戚朋友、微信群聊以及朋友圈分享中获得的关于疫情的相关信息”这一媒体内容的时间可以显著正向预测被试在 T2 和 T3 时的抑郁水平 ($\beta_1=0.223, p<0.05; \beta_2=0.193, p<0.01$) 且模型拟合指数良好 ($\chi^2/df=10.353, RMSEA=0.000, TLI=1.001, CFI=1.000, SRMR=0.046$)。总的而言, 纵向研究的结果说明, 相对于焦虑和压力而言, 疫情媒体信息对人们的抑郁有明显的影 响, 而这其中又特别需要关注非官方信息, 如熟人、亲戚朋友等所带来的负向影响。

The influence of media contents on individual mental health in the early stage of the COVID-19 outbreak: a longitudinal study

XUE dini², LIU xiaorui², LIU tuo^{1,2,3}(Corresponding author)

1 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China;

2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China;

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China, mikebonita@163.com

Abstract: A number of investigations and studies had shown that the outbreak of the COVID-19 became a serious threat to people's physical and mental health. Therefore, in order to further prevent or reduce the potential negative effects of psychological trauma after the outbreak, it is necessary to study the factors affecting the public's mental health during the epidemic and the mechanism behind it. This outbreak was different from previous epidemic

outbreaks, home quarantine measures had been taken across the country to prevent further spread of the virus, therefore the media has become the main way for the public to obtain information. At the same time, when public health crises occur, the media also bear the social responsibility of transmitting the event-related information to the public. Multiple studies have found that media coverage of an outbreak can affect the mental health of the population. In the related previous studies, it can be found that they mostly focused on social media rather than media report coverage, and most of them are cross-sectional studies. However, cross-sectional studies are not conducive to exploring the causal relationship between variables. From January 28, 2019, an online questionnaire was used to conduct a follow-up survey on 132 participants from across the country for three weeks. We used cross-lagged regression analyses to explore the relationship between the types of media content individuals viewing and depression. In this study, the self-edited Media Use Questionnaire under the background of epidemic was used to measure the media use behavior of the participants, and the Chinese version of DASS-21 Scale was used to measure the participants' mental health status. The reliability and validity analysis results were good, specifically, the internal consistency of the three dimension subscales was between 0.76 and 0.79, and the internal consistency of the total scale was 0.89. We used Mplus 8.0 software to test the cross-lagged panel models with each media content type as the independent variable and depression as the dependent variable. The results showed that the time of participants viewing the media content of "information from acquaintances", i.e. "Information about the surrounding disease infection and the severity of infection obtained through the circle of friends, Weibo, friends and family." at T1 and T2 could significantly positively predict the level of depression at T2 and T3 ($\beta_1=0.223$, $p<0.05$; $\beta_2=0.193$, $p<0.01$) and the model fitting index was good ($\chi^2/df=10.353$, $RMSEA=0.000$, $TLI=1.001$, $CFI=1.000$, $SRMR=0.046$). Overall, the results of longitudinal studies suggest that, compared with anxiety and stress, media information about the epidemic has a significant impact on people's depression, and there is a particular need to pay attention to the negative impact of unofficial information, such as acquaintances, relatives and friends.

摘 要 安全生产对于企业至关重要, 安全生产的一个重要保障就是员工执行安全行为。因此, 企业必须高度重视员工的安全问题, 采取必要措施提高员工的安全行为。在当今社会逐渐进入 5G 时代的背景下, 各种社交媒体层出不穷, 社交软件种类繁多, 对安全行为也必然产生了一定的影响, 因此社交媒体使用与安全行为之间的关系引起了我们的关注。在现有的社交媒体使用的研究当中, 关于社交媒体使用对员工行为的影响观点不一, 到目前为止, 还没有研究具体指出社交媒体使用与安全行为(安全遵守和安全参与)之间的关系以及它们的内在机制。因此, 本研究基于 JD-R 模型与自我决定理论, 探讨社交媒体使用与安全遵守和安全参与之间的关系, 并进一步探讨心理资本与工作投入的链式中介作用。本研究共两个研究, 研究一选取建筑行业 and 邮政行业 780 名员工为被试, 对社交媒体使用量表进行修订, 研究二采用社交媒体使用量表、心理资本量表、工作投入量表和安全行为量表为测量工具对随机抽选的建筑行业 623 名员工进行问卷调查, 采用 SPSS19.0 和 Mplus7.0 对数据进行分析。结果发现: (1) 社交媒体使用与安全遵守、安全参与存在正相关; 社交媒体使用与心理资本、工作投入呈显著正相关; 心理资本与工作投入、安全遵守、安全参与呈显著正相关; 工作投入与安全遵守、安全参与呈显著正相关; (2) 心理资本与工作投入在社交媒体使用与安全遵守、安全参与之间起中介作用; (3) 心理资本和工作投入在社交媒体使用与安全遵守、安全参与之间起链式中介作用。

The relationship between the social media use and safety behavior : the mediating role of psychological capital and work engagement

Yunxia Xu¹, Zifang Wang¹, Zhenzhen Sun¹, Dawei Wang^{1 2}

1 School of psychology, Shandong Normal University, 250358

2 EAP center of Shandong Normal University, Jinan Shandong, 250358, wdw112@163.com

Abstract: Safety production is very important for enterprises, and an important guarantee of safety production is the safety behavior of employees. Therefore, enterprises must pay great attention to the safety of employees and take necessary measures to improve the safety behavior of employees. In the context of the 5G era, various social media emerge in endlessly, and the variety of social software is complex, which inevitably has a certain impact on safety behavior. Therefore, the relationship between the social media use and safety behavior has attracted our attention. Among the existing researches on the use of social media, opinions differ on the influence of social media use on employee behavior. So far, no research has specifically pointed out the relationship between social media use and safe behavior (safety compliance and safety participation) and their internal mechanism. Therefore, based on JD-R model and self-determination theory, this study explored the relationship between social media use and safety compliance and safety participation, and further explored the chain mediating role of psychological capital and work engagement. This study consists of two studies. In study one, 780 employees from the construction industry and the postal industry were selected as participants to revise the social media usage scale, The second study used social media use scale, psychological capital scale, work engagement scale and safe behavior scale as measuring tools to conduct a questionnaire survey on 623 randomly selected employees in the construction industry, and the data were analyzed using SPSS 19.0 and Mplus 7.0. The results showed that: (1) Social media use is positively correlated with safety compliance and safety participation; Social media use is significantly positively correlated with psychological capital and work engagement; Psychological capital was significantly positively correlated with work engagement, safety compliance, and safety participation; There was a significant positive correlation between work engagement and safety compliance and safety participation. (2) Psychological capital and work engagement mediate the relationship between social media use and safety compliance, and between the use of social media and safety participation. (3) Psychological capital and work engagement play a chain intermediary role between social media use and safety compliance, and between the social media use and safety participation.

行为决策理论在健康行为中的应用

徐晨晨¹ 薛婷¹

1 天津中医药大学管理学院, 天津, 301617

2 天津中医药大学管理学院, 天津, 301617, xueting_11@163.com

摘要 健康行为关系着个体和国民的健康和福祉, 决策在个体的在行为改变过程及健康行为的选择与维持中发挥着重要作用。健康行为包括体育锻炼、营养饮食、参与体检、播种疫苗等。只有深入探索健康行为的产生机制和影响健康行为的关键因素, 才能提出针对性的干预措施。本文梳理了心理学中行为决策的理论在健康领域的应用和研究成果, 从决策理论中的古典决策理论到启发式决策理论, 如决策偏差在健康行为中的表现, 还有决策双系统模型和模糊痕迹在健康行为中的应用。因为很多健康行为需要个体现在付出一些时间、金钱和享受上的成本来获得未来的健康收益, 所以跨期决策理论在健康领域中也应用广泛; 风险决策理论在吸烟、酗酒等一些健康风险行为中有所应用。同时, 决策理论中的框架效应也存在于健康领域, 信息描述的不同框架会影响人们进行行为决策。另外, 本文还总结了影响个体进行健康行为相关决策的影响因素, 其中主观因素有认知风格、风险感知、时间观、情绪情感、主观幸福感等, 客观因素有健康信息呈现、社会支持等。最后, 本文从决策模型的验证和整合、研究方式的改进和加强健康行为干预措施的角度对未来相关研究提出建议。希望心理学领域的决策理论能更多的应用于健康领域, 促进人们的健康行为, 改善人们的健康水

平。

Application of Behavior Decision Theory in Health Behavior

ChenChen Xu, XUE Ting

Tianjin University of Traditional Chinese Medicine College of Management, TianJin

Tianjin University of Traditional Chinese Medicine College of Management, TianJin

Abstract: Healthy behavior is related to the health and well-being of individuals and nationals, and decision-making plays an important role in the process of individual behavior change and the choice and maintenance of healthy behavior. Health behaviors include physical exercise, nutritious diet, physical examination, vaccination, etc. Only by deeply exploring the mechanism of health behavior and the key factors affecting health behavior, can targeted intervention measures be put forward. This paper reviews the application and research results of behavioral decision-making theory in psychology in health field, from classical decision-making theory to heuristic decision-making theory, such as the performance of decision-making bias in health behavior, and the application of decision-making dual-system model and fuzzy trace in health behavior. Because many health behaviors require individuals to pay some time, money and enjoyment costs to obtain future health benefits, intertemporal decision-making theory is also widely used in the health field; Risk decision theory has been applied to some health risk behaviors such as smoking and alcoholism. At the same time, the frame effect in decision theory also exists in the field of health, and different frames of information description will affect people's behavior decision. In addition, this paper also summarizes the influencing factors that affect individuals' decision-making on health behavior, among which subjective factors include cognitive style, risk perception, time view, emotion and subjective well-being, while objective factors include health information presentation and social support. Finally, this paper puts forward suggestions for future related research from the perspectives of verification and integration of decision-making models, improvement of research methods and strengthening of health behavior intervention measures. It is hoped that the decision-making theory in the field of psychology can be more applied to the field of health, promote people's healthy behavior and improve people's health level.

Meta-analysis of the effect of perceived work meaning on mental health of employees

Zhang Lei¹, Meng yi¹

¹ School of Law and Sociology, Chongqing Technology and Business University, Chongqing, 400067, zz18113375741@163.com

Abstract: **Aim:** To explore the relationship between work meaning and negative mental health indicators by using meta-analysis technique in order to solve the negative mental health problems of employees. **Methods:** Cross-sectional studies on the relationship between sense of work meaning and mental health were retrieved from Chinese and foreign databases using the retrieval method. A total of 29 literatures were included, and 34 independent samples met the meta-analysis criteria (N= 15667). Effect analysis was conducted using CMA 2.0 software, and meta-analysis was conducted using random effects model according to the heterogeneity test results. **Results:** (1) There was a significant negative correlation between work meaning and overall mental health negative indicators; (2) work meaning was negatively correlated with depression, stress and burnout; (3) There were significant differences between perceived work meaning and different mental health indicators. (4) Different measurement tools affect the correlation between perceived work meaning and mental health. **Conclusion:** Work meaning is negatively correlated with negative mental health indicators, but its causality and other moderating variables are worthy of further study.

Keywords: Work meaning; Mental health; META analysis; Moderating effect

新冠疫苗讨论对疫苗接种意向的影响：客观风险的调节作用

张琼寒¹ Alexander S. English²（通讯作者）

¹ 浙江工商大学工商管理学院，杭州，310000

² 浙江大学心理与行为科学系，杭州，310000, AEnglish@zju.edu.cn

摘要 新冠肺炎疫情爆发至今，世界各国纷纷推进新冠疫苗接种计划以期达到群体免疫的目标。在此背景下，研究者们观察到各国广泛存在新冠疫苗犹豫的现象，影响民众们的接种意愿。其中，中国由于疫情控制良好，民众对新冠疫情风险感知不强，出现了“搭便车”的心理，同样导致国内新冠疫苗接种计划推进受阻，直到2021年5月广东、安徽各地陆续出现了小范围的本土疫情病例，为人们敲响了风险的警钟，民众们才转变态度积极接种疫苗。这一特殊的现象为研究者们提供了一个机会以尝试厘清影响民众的新冠疫苗接种意向的关键因素。风险感知态度框架（risk perception attitude framework）认为个体采取健康行为的意图由风险感知与风险效能两个因素决定，且两个因素之间存在交互作用。立足于这一经典理论，本研究首先提出“新冠疫苗讨论”作为有效增强个体感知到的新冠疫苗的风险效能的一种途径，能够显著增加民众的新冠疫苗接种意愿（H1）。即民众与身边的家人、朋友针对新冠疫苗的接种发起的讨论越频繁，越有助于增加民众对疫苗有效性的了解，从而增加接种意愿。其次，本研究将民众与本土疫情爆发地的地理距离作为客观风险的指标，尝试探究客观风险是否能够调节新冠疫苗讨论与疫苗接种意愿的关系（H2）。为验证上述假设，在广州荔湾区于2021年5月21日爆发疫情之际，通过在线问卷调查的方法，收集了广东省共245名被试的数据，包括了自我报告的新冠疫苗讨论频率、新冠疫苗接种意愿、所在地区以及人口统计学变量。回归分析结果显示：（1）新冠疫苗讨论有效促进民众的疫苗接种意向：讨论越频繁，接种意向越高；（2）客观风险调节了新冠疫苗讨论与疫苗接种意向的关系：当客观风险越低，即民众所在地与疫情爆发地距离越远时，新冠疫苗讨论对于疫苗接种意向的正向影响越强；若客观风险较高，即距离较近时，新冠疫苗讨论对疫苗接种意向无显著影响。总而言之，本研究验证了“新冠疫苗讨论”增强疫苗接种意愿的效果以及边界作用，为政府推进疫苗接种计划提供了全新的理论依据。

The influence of covid-19 vaccine talk on vaccine intention: the moderating role of objective risk

Qionghan Zhang¹, Alexander S. English² (Corresponding Author)

¹ School of Business Administration, Zhejiang Gongshang University, Hangzhou, 310000

² Department of psychology and Behavioral Sciences, Zhejiang University, Hangzhou, Hangzhou, 310000, AEnglish@zju.edu.cn

Abstract: Since the outbreak of the COVID-19, countries around the world have promoted mass vaccination campaigns in order to achieve herd immunity. Under such context, researchers have observed the existence of widespread COVID-19 vaccine hesitancy in various countries, which affected citizen's COVID-19 vaccine intention. Among these countries, due to the good control of the epidemic, the Chinese public has a lower perception of the COVID-19 risk, and the "free rider" also hindered the promotion of the government's COVID-19 vaccination plan. The phenomenon continued until May 2021, when a few areas in China such as Guangdong and Anhui Provinces have reported a local outbreak of COVID-19. The new outbreak of local cases of the epidemic has sounded a warning bell for citizens, and the people have changed their minds and actively got vaccinated. This unique phenomenon provided researchers with a good opportunity to clarify the key factors that affected people's COVID-19 vaccine hesitancy. The risk perception attitude framework proposed that an individual's intention to adopt a healthy behavior is determined by two factors, risk perception, and risk efficacy, and there is an interaction between the two factors. Based on this classic theory, the current research first proposed the "COVID-19 vaccine talk" as a way to effectively enhance individuals' perceived risk efficacy of the COVID-19 vaccine, and thus significantly increased the public's vaccine intention (H1). That is to say, the more frequent discussions between individuals and their family members and friends about the COVID-19 vaccine, the more helpful it is to increase the public's understanding of the effectiveness of the vaccine, thereby increasing their vaccine intention. Secondly, the current study used the geographic distance between individuals and the pandemic outbreak center as an indicator of objective risk, and tried to explore whether the objective risk can moderate the relationship between the COVID-19 vaccine talk and COVID-19 vaccine intention (H2). In order to verify the above hypotheses, during the outbreak of the COVID-19 epidemic in Liwan District of Guangzhou on May 21, 2021, we collected online questionnaire data from a total of 245 subjects from Guangdong Province, including their self-reported COVID-19 vaccine talk, COVID-19 vaccine intention, current location, and demographic variables. The regression analysis showed: (1) The COVID-19 vaccine talk effectively promoted COVID-19 vaccine intention: the more frequent the talk of COVID-19 vaccine, the higher the intention of vaccination; (2) the objective risk moderated the relationship between COVID-19 vaccine talk and COVID-19 vaccine intention: when the objective risk was lower, that is, the farther the individuals were from the outbreak center, the stronger the positive impact of COVID-19 vaccine talk on COVID-19 vaccine intention; when the objective risk was higher, that is, the individuals were from the outbreak center, COVID-19 vaccine talk has no significant impact on COVID-19 vaccine intention. In short, this study verifies the promoting effect of COVID-19 vaccine talk on COVID-19 vaccine intention and its border effects, and thus provides a new theoretical perception for the government to promote COVID-19 vaccination plans.

艾滋病阳性男男性行为者多重少数身份的交叉污名及其在死亡信念与心理症状关系中的中介作用：一项纵向研究

陈晨¹ 于肖楠¹ (通讯作者)

¹ 社会与行为科学学系, 香港城市大学, 香港, nancy.yu@cityu.edu.hk

摘要 多重交叉污名的研究框架的应用增加了我们对拥有多重少数身份的个体, 如艾滋病阳性男男性行为者与污名相关的经历的理解。然而, 现有的研究对交叉污名相互作用的机制及其对个体心理适应的影响仍然

知之甚少。本研究旨在探讨与艾滋病相关的污名与男男性行为者身份相关的污名之间的交叉关系，并进一步检验污名在死亡信念与心理症状之间的中介作用。共计 111 名近三个月内新确诊的艾滋病阳性男男性行为者参与了此项纵向研究，参与者分别完成了基线以及六个月后的随访问卷调查。问卷测量了基线的与 HIV 疾病状态相关以及男男性行为者身份相关的交叉污名，包括负面自我形象、家庭污名和告知担忧这三个维度，同时被试报告了基线和六个月后的死亡信念，以及包括创伤后应激反应、抑郁和焦虑的心理症状。针对交叉污名的网络分析结果显示，与艾滋病状态相关的以及男男性行为者身份相关的负面自我形象、家庭污名和告知担忧六者之间存在密切联系，其中家庭污名起到核心作用。行动者对象中介模型检验的结果进一步支持了艾滋病状态相关的家庭污名和男男性行为者身份相关的家庭污名，作为交叉污名的重要维度，在负面自我形象和告知担忧之间的中介作用。此外，结构方程模型结果表明，在控制基线的心理症状后，基线的交叉污名在死亡信念与六个月后的心理症状之间存在显著的中介效应。我们的研究结果揭示了家庭污名在多重少数身份相关的污名的强关联中的中心地位，以及交叉污名的各维度之间相互依赖的效应，这为多重少数身份群体的交叉污名相互作用机制提供了新的证据。研究结果还为研究人员和医疗服务人员制定针对减少艾滋病阳性男男性行为者污名的干预项目提供了新的视角与思路，希冀以此提高新确诊的艾滋病阳性男男性行为者心理适应情况。

Intersectional stigma related to minority identities of Chinese HIV positive men who have sex with men and its mediating role in the effect of death-related belief on psychological symptoms

Chen Chen¹, Yu Nancy Xiaonan¹

¹ Department of Social and Behavioural Sciences, City University of Hong Kong, 83 Tat Chee Avenue, Kowloon Tong, Kowloon, Hong Kong SAR

Abstract: Intersectional stigma framework expands the understanding of stigmatized experience of people with multiple minority identities, such as men who have sex with men (MSM) living with HIV. Yet the mechanism of intersectional stigma and its effect on psychological adjustment remains poorly understood. The current study aimed to investigate the interdependence among dimensions of intersectional stigma related to HIV status and MSM identity, and further examined the mediation effect of intersectional stigma in the association between death-related belief and psychological symptoms. A total of 111 Chinese HIV+ MSM who were newly diagnosed within three months participated in this longitudinal study. In addition to completing baseline measures on intersectional stigma related to HIV status and MSM identity respectively with three dimensions of negative self-image, family stigma and disclosure concern, participants provided information on death-related belief of “better off dead”, and psychological symptoms including PTSD, depression and anxiety at baseline and follow-up (six months later). The network analysis results on intersectional stigma related to HIV status and homosexuality showed that negative self-image, family stigma, and disclosure concern were closely associated with each other, with family stigma playing a central role. The APIMeM test further supported the mediation role of family stigma, a key dimension of intersectional stigma both related to HIV status and MSM identity, in the association between negative self-image and disclosure concern. Furthermore, the SEM results showed that baseline intersectional stigma mediated the effect of baseline “better off dead” belief on psychological symptoms six months later after controlling for the baseline psychological symptoms. Our results highlight the central role of family stigma in the midst of strong associations and interdependent nature of intersectional stigma dimensions, which provides new evidence to elucidate the mechanism of the intersection of multiple identities. The findings also have strong implications for researchers and healthcare providers to develop intersectional stigma-focused reduction intervention programs in the purpose to facilitate the psychological adaptation of HIV+ MSM following their HIV diagnosis.

摘 要 时间的表征具有空间性, 左侧空间对过去词、短时距、早的时间概念反应更快, 右侧空间对将来词、长时距、晚的时间概念反应更快, 该现象被称为空间—时间联合编码效应(spatial—temporal association of response codes effect, STEARC)。在不同空间方向、实验材料、文化背景、运动方式上都发现了 STEARC 效应的普遍性, 但它也受到阅读、书写习惯、训练、参照框架、工作记忆等因素的影响。人类在成长过程中, 逐步掌握从他人的角度看待事物的能力, 这种能力被称为视角采择, 不同视角下被试表现出阅读方向的差异。本研究首次从视角采择的角度, 探索空间和时间表征关系的可变性。实验一考察不同视角的影响, 时间词出现在屏幕中央位置。采用 2 (视角: 自我、他人) × 2 (时间词: 过去、未来) × 2 (反应按钮: 左、右) 混合实验设计。他人组需要完成视角转换练习, 自我组直接进入正式试验。视角转换训练中, 被试需正确识别具有两种视角的数字或者字母, 如: 6 和 9、W 和 M 等。实验阶段, 两组被试分别想象处于自己和他人的视角, 设置了两处互动环节, 分别需要被试在额头上比划出视角方向的直线以及选择出正确视角阅读方向。实验程序采用时间词分类任务, 当时间词出现在屏幕中央, 要求被试对刺激的时间属性作出表示过去或者未来的按键反应。结果发现, 视角、时间词主效应显著, 视角与时间词交互作用显著, 视角、时间词、反应按钮三重交互作用显著, $F(1,58)=7.26$, $p<0.05$, 简单效应分析, 他人组中, 呈现过去词语时, 用右手按键反应时快于用左手按键(1159.14±39.24 ms vs. 1220.37±34.24 ms), 自我组中, 呈现过去词语时, 用左手按键反应时快于用右手按键(1050.46±34.24 ms vs. 1099.82±39.24 ms)。表明在他人组中, 出现“右-过去”STEARC 效应, 自我组中, 出现“左-过去”STEARC 效应。实验二考察视角与空间位置的交互影响, 时间词出现在屏幕左右两边, 采用 2 (不同视角: 自我、他人) × 2 (空间位置: 左侧、右侧) × 2 (时间词: 过去、未来) × 2 (反应按钮: 左、右) 的混合实验设计。结果发现, 视角、空间位置、时间词主效应显著, 视角、空间位置、反应按钮三重交互作用显著, 但四重交互作用不显著, 自我和他人组均未出现 STEARC 效应。研究表明, 自我和他人视角影响时间和空间的关系表征, 这种影响与空间位置有关, STEARC 效应表现出可变性, 支持了多元表征理论。

关键词 STEARC 效应, 视角采择, 空间位置

The Influence of Perspective-taking on Time-Space Relationship

Wang Jia¹, Bi Cuihua² (corresponding author)

1 College of Psychology, Sichuan Normal University, Chengdu 610068, China

2 College of Psychology, Sichuan Normal University, Chengdu 610068, cuihuabi1215@163.com

Abstract: Time is spatial-temporal. The spatial temporal association of Response Codes effect (STEARC) on the left side is temporal more quickly on the past words, short distance and early time concepts, while the right side is temporal on the future words, long distance and late time concepts. The universality of STEARC effect was found in different spatial directions, experimental materials, cultural background and movement modes, but it was also affected by reading, writing habits, training, frame of reference, working memory and other factors. As human beings grow up, they gradually acquire the ability to see things from the perspective of others. This ability is called perspective-taking, in which people show different reading directions from different perspectives. This study is the first to explore the variability of spatial and temporal representation from the perspective of perspective selection. Experiment 1 examines the effects of different perspectives, with time words appearing in the center of the screen. 2 (perspective: self, others) × 2 (time word: past, future) × 2 (reaction button: left, right) was adopted for mixed experimental design. The others were required to complete the perspective-shifting exercise, and the self group went directly into the formal experiment. In the perspective conversion training, the subjects should correctly identify the

Numbers or letters with two perspectives, such as 6 and 9, W and M. In the experiment, two groups of subjects imagined themselves and others' perspectives. Two interactive sessions were set up, in which subjects were required to draw a straight line of Angle of view on their foreheads and choose the correct Angle of view to read. The program USES the time word classification task. When the time word appears in the center of the screen, the subjects are required to make a button response representing the past or future of the time attribute of the stimulus. Results found that Angle of view, the word denoting time main effect significantly, interaction perspective with word denoting time significantly, Angle of view, word denoting time, triple interaction significant response buttons, $F, 58(1) = 7.26, p < 0.05$, the simple effect analysis, others in the group, present words in the past, when the button with the right hand faster than with his left hand button (1159.14 ± 39.24 ms vs. 1220.37 ± 34.24 ms), self in the group, present words in the past, The reaction time was faster when pressing left hand keys than when pressing right hand keys (1050.46 ± 34.24 ms vs. 1099.82 ± 39.24 ms). The results showed that there was a right-past STEARC in the other group and a left-past STEARC in the self group. Experiment 2 investigates the interaction between perspectives and spatial positions. Time words appear on both sides of the screen, and adopts a mixed experimental design of 2 (different perspectives: self and others) $\times$ 2 (spatial positions: left and right) $\times$ 2 (time words: past and future) $\times$ 2 (response buttons: left and right). The results showed that the main effect of visual Angle, spatial position and time word was significant, and the interaction of visual Angle, spatial position and reaction key was significant, but the quadruple interaction was not significant, and STEARC did not appear in the self group and the others group. Studies have shown that the perspectives of self and others affect the representation of the relationship between time and space, which is related to spatial location. STERAC shows variability, which supports the theory of multiple representations.

Keywords: STEARC, perspective-taking, spatial location

未来导向与幸福感的非单调关系：中谷效应

陆嘉琦¹ 何贵兵¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310028, gbhe@zju.edu.cn

摘要 在快节奏的生活中, 个体和社会都十分重视未来导向的作用, “未雨绸缪”被视为优秀的标签。近年来, 研究者一直采用单调假设来探究未来导向的作用。理性经济人假说将未来导向视为理性行为, 是效用最大化的体现; 心理学家则将现在导向视为自我控制失败或冲动性的体现。研究也证实了未来导向与各领域积极结果有正向线性关系(如学业成就、工作满意度、健康行为等), 而现在导向则与许多消极结果有正向线性关系(如拖延、成瘾等)。那么, 这单调假设真的对吗? 换言之, 随着未来导向程度的上升, 个体的幸福感真的会持续上升吗? 有研究发现未来导向程度的上升并不一定能带来幸福感的上升, 甚至会因过度未来导向而削弱其积极作用。同时, 正念理论和现在导向研究揭示了被忽视的现在导向同样能够促进幸福感的提升。据此, 本研究认为应选取非单调的视角来探讨未来导向和幸福感的关系。本研究选取 2018 年欧洲社会调查数据, 包含来自 29 个国家的 47688 名被试。研究将基于个体嵌套国家的多层模型, 采用多项式回归挑选出最符合未来导向和主观幸福感的模型。结果发现, 在控制性别、年龄等与幸福感相关的变量后, 未来导向的四次方程是预测主观幸福感的最优模型。整体来看, 随着未来导向程度的上升, 个体主观幸福感先上升再下降, 在未来导向中等程度时下降至曲线极点后再上升。不同国家曲线有所差异, 分为正 U 型, N 型(与整体水平相似)和 M 型(两端出现略微下降)。其中, 3 种曲线均在未来程度中点时出现幸福感极低点, 本研究将其称为“中谷效应”。该效应说明相较在某一导向上有所坚持的个体, 在现在和未来导向相对中立的个体较不幸福。据此, 当个体期望通过提升未来导向来改善幸福感时, 应在明确某一主导导向的基础上, 在适应范围内有所提升, 而非盲目提升或摒弃其余导向。总之, 本研究首次揭示了未来导向与主观幸福感存在非线性非单调的关系且存在“中谷效应”, 打破了原有线性单调的认知, 对于干预未来导向来改善幸福感的手段具有指导意义。

A nonmonotonic relationship between future orientation and well-being: the middle valley effect

Jiaqi Lu¹, Guibing He¹

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, China

Abstract: Nowadays, no matter the family, school or society would flaunt the future orientation as a shortcut to obtain happy life, while taking "preparing for a rainy day" as an essential capability for outstanding individuals. Researchers have adopted a monotonic assumption to understand the functions of future orientation in adaptiveness for decades. Economists regard future orientation as rational behavior, which reflects the rationality of utility maximization in economics. On the other hand, behaviorists treat the tendency to prefer present-oriented behaviors to future-oriented ones as self-control failure or impulsivity. In line with these views, several studies have supported that future orientation has a positive linear relationship with positive outcomes in various domains (such as academic achievement, job satisfaction, health behavior, etc.). Meanwhile, evidence has suggested that present orientation is linearly positive associated with multiple negative outcomes like procrastination, substance use, and risky driving behaviors. Nevertheless, what if the monotonic assumption is invalid? In other words, is it true that individuals could be constantly better when they are more future-oriented? Some studies suggest the increase of future orientation might not necessarily lead to the rise of well-being, and even weaken the positive role due to excessive future orientation. Furthermore, Mindfulness Theory and studies on present orientation have revealed that neglected present orientation could also promote well-being. Therefore, we suppose that a non-monotonic perspective should be selected to explore the relationship between future orientation and subjective well-being (SWB). The present study adopted an open dataset from European Social Survey, including 47,688 participants from twenty-nine countries. We adopted polynomial regression to select the optimal model for the relationship between future orientation and SWB, based on multilevel model of individuals nested within countries. The results showed that after controlling covariates like gender and age, we ultimately selected the quartic model of future orientation as the optimal model. At the individual level, participants' ratings of SWB increased and reached a peak at the first inflection point, and decreased until the second inflection point (at the midpoint of the scale). After that, their ratings continued to increase. At the country level, different European countries had different curve patterns, including positive U-shaped, N-shaped (similar to the individual level) and M-shaped (with a slight decline at both ends). The same pattern of three shapes was the lowest SWB at the midpoint of degree in the future orientation, defining it as the "Middle Valley Effect". This effect suggested that individuals who were relatively neutral in their present and future orientation were less happy than those who adhered to a certain orientation. Therefore, when individuals expect to improve their SWB by improving future orientation, they should improve within the adaptive range on the basis of clarifying a certain dominant orientation, rather than blindly improving or abandoning other orientations. In conclusion, this study firstly reveals a non-linear and non-monotonic relationship between future orientation and SWB, which breaks the original linear monotonous cognition and provides a guideline for intervening the means of future orientation to improve SWB.

摘要 人们倾向于将具有较大亮度、响度、质量、大小等属性的刺激物对应于更长的时距, 这种数量效应被视为是数量理论 (ATOM) 的有效外延, 即在个体的认知系统中, 时间、空间和量由一个普遍性数量系统共同表征, 大脑在加工量的信息时会对时间知觉产生影响。从数量认知视角对刺激物的属性进行符号性—连

续性的二维分类，可以推断该类效应（即 ATOM 中的“量”）亦存在相应的二维结构分类。本研究尝试以具有数量含义的汉字为载体，运用恒定刺激法，通过两个平行实验来探究汉字语义的数量效应，以期将符号性连续数量纳入 ATOM，扩大该理论中“量”的外延。实验 1 采用 4（比较刺激类型：大数量、小数量、非数量、无汉字） $\times$ 7（比较刺激呈现时长：1200, 1300, 1400, 1500, 1600, 1700, 1800 ms）的被试内设计，探究符号性连续数量对秒上水平时距知觉的影响。其中无汉字组呈现与恒定刺激相同的黑色实心圆，后者固定呈现 1500 ms。将实验参与者的反应通过 logistic 回归拟合计算主观相等点（PSE）和韦伯比率（WR）。结果表明，不同汉字类型间 PSE 差异显著，且小数量型汉字组的 PSE 显著大于大数量、非数量和无汉字组，表现出明显的时距压缩效应；其他组别的差异均未达到显著水平。而不同汉字类型间 WR 差异不显著，即汉字的语义不影响人们时距知觉的敏感性。鉴于不同时间量级（秒上、秒下）的时距知觉或存在机制差异，实验 2 将实验 1 中所有刺激缩短 1000 ms，探究符号性连续数量的秒下级效应。结果表明，不同刺激类型的 PSE 和 WR 均无显著效应，表明符号性连续数量对于秒下刺激的 PSE 和 WR 影响较小。为全面评价研究结果，以时间量级作为组间变量，汉字类型为组内变量，对实验 1、2 的 PSE 数据进行两因素重复测量 ANOVA 综合分析。结果表明，时间量级的主效应显著，实验参与者所知觉的秒上刺激的主观时距显著高于秒下刺激；汉字类型的主效应显著，且小数量型汉字组的 PSE 显著大于大数量、非数量和无汉字组，表现出明显的时距压缩效应；其他组别的差异均未达到显著水平。时间量级和汉字类型的交互作用边缘显著，且汉字的不同类型在秒上时间级对 PSE 有显著影响，在秒下差异未达到显著水平。对 WR 的分析未发现显著效应，表明时距知觉的敏感性不受汉字语义和时间量级的影响。整项研究结果表明，汉字语义的数量信息对于时距知觉存在数量效应，尤其表现为小数量型汉字对主观时距的压缩；且可能是由于不同的认知神经机制，符号性连续数量在不同时间级的效应亦不相同。本研究对于将以汉字为载体的符号性连续数量纳入 ATOM 模型提供了初步的支持性证据，即 ATOM 中的“量”或可以延伸至符号性连续数量的范畴。

From Non-Symbolic Number to Symbolic Magnitude: Chinese Characters of Semantically Small Magnitudes Lead to Duration Underestimation

Yi-Chen ZHANG, Xuye YUAN, Han ZHAO, Rui LI, Weiqi ZHENG*, Lizhong CHI*

School of Psychology, Beijing Sport University, Beijing, 100084

Abstract: Generally, our subjective duration of a given interval positively correlates with the magnitude (e.g. luminance, loudness, weight, size, etc.) of the stimulus. Such effect is often explained by the A Theory of Magnitude (ATOM) model, which suggests an existence of a common “magnitude system” where time, space, and quantity have shared neural representations. Due to the unified metric, the measurement of duration can be thus influenced by that of quantity. From the perspective of numerical cognition, we found out that the previous work on the magnitude effects (or quantity in ATOM) mostly fell into the taxonomy of non-symbolic number, non-symbolic magnitude, and symbolic number. And we hypothesize that the category of symbolic magnitude will bring about a similar effect. By virtue of Chinese characters of semantically different magnitudes, two psychophysical (method of constant stimuli, to be specific) experiments were conducted to investigate the influence of symbolic magnitude on duration perception. Experiment 1 adopted a 4(type of comparison stimuli: Chinese characters of semantically great magnitude, small magnitude, or non-magnitude vs. no characters) $\times$ 7(duration of comparison stimuli: 1200, 1300, 1400, 1500, 1600, 1700, 1800 ms) within-subject design to figure out the magnitude effect of symbolic magnitude on duration perception on a supra-second time scale. In no character conditions, a black disc same as the constant stimuli shows, the latter of which appears for constantly 1500 ms. The point of subjective equality (PSE) and the Weber ratio (WR) were obtained through logistic regressions of the responses by participants. A repeated-measures ANOVA on PSE revealed a significant effect of stimuli type. Post hoc comparisons showed that Chinese characters of semantically small magnitude led to significantly greater PSE than any other condition, suggesting a compression of subjective

duration. No other significant effects were found. A repeated-measures ANOVA on WR revealed no significant effects either, which indicated little influence of the semantics on the sensitivity of duration perception. Given the possible distinctions of the underpinning mechanisms between different time scales (supra- vs. sub- second) in duration perception, Experiment 2 (4×7 within-subject design) shortened all the stimuli by 1000 ms as compared to those in Experiment 1 to investigate the magnitude effect on a sub-second time scale. No significant effects were found by repeated-measures ANOVAs either on PSE or on WR, indicating little implication of symbolic magnitude on the sub-second time scale. To synthesize the findings of our current study, we used a mixed effects ANOVA (between-subject factor, time scale; within-subject factor, stimuli type) on PSE and revealed significant main effects of the two factors. Post hoc tests showed that Chinese characters of semantically small magnitude led to significantly greater PSE than any other condition, suggesting a compression of perceived duration. The interaction was marginally significant, whose simple effects test revealed a significant magnitude effect of character type on PSE on supra-second timescale; on sub-second timescale the effect was found non-significant. We also ran an ANOVA on WR where no significant effects were obtained. Taken together, the present study suggests an influence of symbolic magnitude on duration perception with semantic representation of Chinese characters, especially evidenced by the duration compression effect triggered by the characters with smaller magnitudes. Besides, the symbolic magnitude effects turned out different on sub- and supra-second scales, possibly owing to their dissociable neuroanatomical substrates. The results preliminarily support the integration of symbolic magnitude (of semantically heterogeneous Chinese characters) into the ATOM model; or in essence, the “quantity” construct in ATOM may well constitute symbolic magnitude as well.

时间范围选择对时间知觉和估计研究的影响

王春蕾¹ 郑玮琦¹ (通讯作者)

¹ 北京体育大学心理学院, 北京, 100048, weiqi71@126.com

摘要 时间是生命的基本维度。尽管人类没有专门的时间感受器, 却有知觉时间的能力。这是人们理解生活中时间进程的智力结构的一部分, 是心理学重要的研究对象之一。根据现象学和实验数据, 将人们对时间的加工分为时间知觉 (perception of time) 和时间估计 (estimation of time/duration)。时间知觉平均为 2-3 秒, 不超过 5 秒, 涉及当前的心理体验; 超过这个范围的时间加工为时间估计, 需要记忆参与。时间知觉和估计的研究方法主要基于两种范式: 回溯性和前瞻性研究范式。由于这两种研究范式的时间范围选用均比较广, 从亚秒到超秒至分钟甚至更长, 也有同时包括亚秒、超秒和分钟的研究, 这导致部分研究存在对时间范围界定不清的问题, 体现在相同的非时间影响因素可能得出不一致的结论。部分研究得出比较可靠的结果, 但如果不对时间范围进行区分, 只用“时间知觉”得出结论会引起混淆。本文将对在年龄、性别、任务性质三个方面可能由于时间范围的选择混淆或影响研究结果的文章进行综述。尽管有相当一部分研究表明, 时间范围不影响时间估计的准确性和精确度, 但对时间范围界定不清很难对潜在的加工机制进行分离, 得出更为清晰、一致、可靠的结论。认知神经科学研究发现, 在微秒范围, 时间加工主要依靠小脑, 在几秒到几分钟的范围内, 时间加工涉及到形成丘脑-皮质-纹状体回路的大脑区域网络激活, 特别是基底神经节、辅助运动区、前额皮层和后顶叶皮层。因此, 对时间知觉和估计研究的时间范围的明确选择是十分必要的。在今后的研究中, 一方面需要对任务的时间范围进行区分, 另一方面可以将不同的时间范围结合时间知觉和估计的非时间影响因素进行对比研究, 有利于进一步整合研究结果, 更有针对性的对时间知觉和估计的研究进行深层次的探讨。

The influence of time range selection on the study of time perception and estimation

Chunlei Wang, Weiqi Zheng

School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: Time is a fundamental dimension of life. Human beings have the ability to perceive time, even though there is no specialized time receptor. The ability is a part of the intellectual structure which helps people understand the course of time in life and also an important research object in psychology. The processing of time is divided to the perception of time and estimation of duration according to phenomenological and experimental data. The average duration of time perception which refers to the current psychological experience is 2-3 seconds, but no more than 5 seconds; beyond that range is the so-called estimation of time which requires involvement of memory. Methods applied to time perception and estimation are based on two paradigms: retrospective and prospective paradigm. The time range of researches based on the above paradigms is mostly wide which can range from sub-seconds to supra-seconds to minutes to even longer. Some of them mixed sub-seconds and supra-seconds or minutes together. This may lead to some problems that some studies nowadays are not clear enough to express the range of time applied in their studies so that inconsistent conclusions come from the same non-temporal factors. Some studies draw reliable results to some degree, however, if no explicit distinction is made between time range may make a confusion conclusion on time perception. The present article will review some essays based on retrospective and prospective paradigms on age, gender and the character of the task which may confuse time range and influence research results. Although quite a number of studies have shown that time range selection does not affect the accuracy and precision of time perception or estimation, blurring the time range may cause the difficulties to isolate the underlying processing mechanisms and obtain more clear, consistent, and reliable conclusions. Researchers have found that the processing of time for millisecond range relies on the cerebellum. The time encoding in the seconds-to-minutes range involves the activation of a network of brain areas that form part of the thalamo-cortico-striatal circuits, especially the basal ganglia, the supplementary motor area, the prefrontal cortex, and the posterior parietal cortex. Above all, it is necessary to distinguish time perception and estimation through the correct selection of the time range. Future studies should pay more attention to the range selection of time, and different time ranges can be combined with non-temporal factors for comparative study. So that it is beneficial to integrate the result of researches and to do an in-depth discussion on the knowledge of time perception and estimation purposefully.

摘要 “没时间”是人们不进行运动锻炼的最主要原因, 然而每次运动需达到一定的时间才能产生更好的效果, 如何度过这段时间可能影响人们对运动时距的判断。本文从性别、年龄、运动任务性质、情绪和注意这几个方面对运动锻炼领域时距估计的研究进行综述。首先, 从性别因素来看, 在估计 60 秒的运动时, 女性比男性有更高的时距估计。但这不等于运动时间的流逝感存在性别差异, 只有当时距大于 2 分钟时, 时距估计才与时间流逝感相关。第二, 从年龄因素来看, 从儿童到成年, 人们对时距判断的敏感性有所提高, 成年后不存在年龄差异。在长时距估计的研究中发现, 老年人比年轻人感觉时间过得更快, 对时距低估。年龄会导致相同运动体验上的差异, 可能间接影响运动时距判断。第三, 运动性质包括难度、强度、熟悉程度等, 这些性质很难进行独立的划分, 运动强度增加会伴随着难度增大或熟悉度降低。在回溯时间范式的研究中, 参与者对短时距范围的熟悉运动时距低估; 在长时距范围, 当运动强度增大时, 熟悉的运动时距被低估, 不熟悉的被高估, 运动强度和熟悉度交互起作用。在预期时间范式的研究中, 研究参与者的运动自感用力程度越高, 时距估计扭曲的程度越大。这可能与自感用力程度升高时, 人们运动的愉悦感降低并期待更快结束运动

有关。第四，情绪对时距估计的影响大多集中在负性情绪的研究上，例如，恐怖等消极情绪会引起时距的高估。人们对运动的态度和体验可能会影响运动的情绪，进而影响时距判断。第五，注意对时距估计的影响体现在：分配给时间相关信息的注意越多，时距估计越长；对非时间信息注意的越多，时距估计越短；若刺激本身为时间判断的关注点，会导致对刺激时距的高估。因此，在估计运动时距时，如果改变人们对运动的注意，就可能对该运动的时距估计产生影响。总结而言，目前运动领域时距估计的研究主要是围绕预期时间范式的短时距刺激反应速度和准确性开展的，长时距范围基于回溯范式对运动时距的估计还需在今后的研究中进行探索。

关键词 时距估计，运动时距，预期范式，回溯范式

Factors influencing physical activity duration estimation and research progress

Chunlei Wang, Weiqi Zheng

School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: "Lack of time" is the top reason why people do not do physical activity. However, exercise requires a certain amount of time to achieve better results each time. And how to spend that time may affect how you feel the elapse of time. This paper reviews the research on duration estimation in physical activity from gender, age, nature of physical activity task, emotion, and attention. First, in terms of gender, women had a higher time estimate than men when estimating running exercise in the 60s. However, this does not mean there is a gender difference in the perceived lapse of time. Only if the time distance is greater than 2 minutes, the duration estimation is related to the perceived lapse of time. Second, from the age perspective, people's sensitivity to time increases from children to adults, and there is no age difference after adulthood. In studies of long-duration estimation, older people perceive time to pass faster than younger people and underestimate time. Age may lead to different experiences of the same exercise, which may affect the judgment of physical activity duration indirectly. Third, sport task properties include difficulty, intensity, and familiarity, which are difficult to be divided. Increasing task intensity is always accompanied by increasing the level of difficulty or decreasing the familiarity degree. In the study of retrospective time paradigm, participants underestimated the familiar task's time distance of short-distance range; In the long time range, when the intensity of exercise increased, the common task's duration is underestimated, whereas the unfamiliar task's duration is overrated. Physical activity intensity and familiarity work interact. Under the study of the perspective time paradigm, the higher the rate of perceived exertion during physical activity, the higher distortion of the time judgment people made. This phenomenon may have to do with the decreased enjoyment of a task and the expectation of a quicker completion of the task as self-perceived exertion increases. Fourth, the impact of emotion on time estimation mainly focuses on negative emotions, such as fear and other passive emotions that will cause the overestimation of time. People's attitude and experience of physical activity may affect their feelings when doing sports, so that it may affect the judgment of time duration. Fifth, attention impacts time estimation as following: the more attention allocated to time-related information, the longer time duration is estimated; The more focus distributed to non-temporal related things, the shorter time duration estimation is. If the stimulus is the focus of time judgment, the duration of which will overestimate. Based on previous research and model, it is possible to impact the time estimation of exercise if people change the way or direction of attention to physical activity. In summary, current research on time estimation in physical activity focuses on the reaction time and accuracy of short duration range of time stimuli based on the perspective time paradigm. The judgment of the physical activity duration based on the retrospective time paradigm needs to carry out in future studies.

父母感恩教养行为对青少年感恩行为的影响： 父母共同教养的中介作用

利振华¹ 李千蔚¹ 聂衍刚¹(通讯作者) 刘海涛¹

¹ 广州大学教育学院青少年心理与行为研究中心, 广州, 510006, nie-yangang@gzhu.edu.cn

摘 要 感恩是指受惠者在意识到受到外界的恩惠后,在内心产生认可、并意欲回报的一种积极的情绪特质,这种积极的情绪特质能促使个体做出回报外界的行为。根据生态系统理论,微系统中的家庭和父母因素对青少年的心理与行为发展有着重要影响,从父母那里得到更多感恩社会化教育的孩子更善于感恩。随着协作性共同养育的兴起,父母共同教养成为了新兴的研究领域,根据家庭系统论的观点,共同教养作为家庭环境中独特的一个子系统对孩子的发展具有重要作用,父母对子女的教养行为通过合作、支持型的共同教养环境将有助于孩子安全感的获得以及积极社会行为的发展。基于此,本研究选取广州市普通小学及初中各一所,分层抽样选取四年级至初三共计 13 个班 1132 名青少年的父母为问卷调查对象,旨在考察父母感恩教养行为与青少年感恩行为的关系,以及父母共同教养在两者间的中介作用。结果发现:(1)父母日常感恩教养行为、父母共同教养和父母报告的青少年日常感恩行为总体处于中上水平;(2)父母感恩教养行为与父母共同教养($r=0.365, p<0.001$)、父母报告孩子的日常感恩行为($r=0.512, p<0.001$)呈显著正相关,父母共同教养与父母报告孩子的日常感恩行为呈显著正相关($r=0.265, p<0.001$);(3)父母日常感恩教养行为能正向预测孩子的日常感恩行为($B=0.514, p<0.001$),父母日常感恩教养行为能正向预测父母共同教养($B=0.237, p<0.001$),父母共同教养能正向预测孩子的日常感恩行为($B=0.140, p<0.01$),进一步中介分析显示,父母共同教养在父母感恩教养行为与父母报告孩子的日常感恩行为之间起部分中介作用(effect = 0.033)。研究表明,父母感恩教养行为会通过父母共同教养最终影响孩子的感恩行为,因此,父母双方应注重日常对子女的感恩教育,努力形成合作型的教养氛围,从而促进子女感恩情感和行为的获得。

The influence of parents' gratitude behavior on teenagers' gratitude behavior: the mediating role of co-parenting

Li Zhenhua¹, Li Qianwei¹, Nie Yangang^{1*}, Liu Haitao¹

¹ Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, 510006, Guangzhou

Abstract: Gratitude refers to a kind of positive emotional quality that the beneficiaries will recognize and intend to return after they realize the kindness from the outside world, and such positive emotional quality will motivate individuals to reciprocate the outside world. According to the theory of ecological system, the system of family and parents elements have important effect on the psychological and behavioral development of teenagers, Children who received more socialization education in gratitude from their parents were more grateful. In recent years, With the rise of collaborative co-parenting, parental co-parenting has become an emerging field of research. According to the viewpoint of family system theory, co-parenting, as a unique subsystem in the family environment, plays an important role in children's development. Through cooperative and supportive co-parenting environment, parents will contribute to children's security and development of positive social behaviors.. Based on this, this study selected one ordinary primary school and one junior middle school in Guangzhou, stratified sampling of 1132 teenagers' parents

from 13 classes from grade 4 to grade 9 as questionnaire respondents, aiming to investigate the relationship between parents' gratitude and teenagers' gratitude behavior, and the mediating effect of parents' co-parenting. The results showed that : (1) the parent's daily gratitude behavior, the parents' co-parenting and the parents-report of child's daily gratitude behavior were in the above average level. (2) there was a significant positive correlation between parents' gratitude behavior and parents' co-parenting ($r = 0.365, p < 0.001$), parents' report of child's daily gratitude behavior ($r = 0.512, p < 0.001$), and parents' co-parenting and parents' report of children's daily gratitude behavior have a significant positive correlation ($r = 0.265, p < 0.001$). (3) parents' daily gratitude behaviors can positively predict parent-report daily gratitude behavior of the children ($B = 0.514, p < 0.001$), parents' daily gratitude behavior can positively predict co-parenting ($B = 0.237, p < 0.001$), co-parenting can positively predict parent-report daily gratitude behavior of the children ($B = 0.140, p < 0.01$), and mediation analysis showed that the co-parenting of parents plays a part in mediating the relationship between parents' daily gratitude behaviors and parent-report daily gratitude behavior of the children(effect =0.033). Research showed that parents' gratitude behavior will eventually affect their children's gratitude behavior through co-parenting. Therefore, both parents should pay attention to the daily gratitude education of their children and try to form a cooperative parenting atmosphere, so as to promote the acquisition of their children's gratitude emotion and behavior.

父母调节焦点与高中生生涯适应力的关系： 一个跨层级的调节中介模型

朱丽娟（通讯作者） 彦廷鹤

宿迁学院教师教育学院，宿迁，223800, zhulijuan2016@163.com

摘 要 生涯适应力是个体对可预测的生涯任务与生涯角色的准备状态，以及应对不可预测的生涯转换引发的问题的自我调整能力，被视为个体在快速变化的现代社会中获得生涯成功的关键能力，是国内外近年来生涯教育领域中一个新的理论生长点。处于高中阶段的青少年面临着择校、选专业等重要的生涯任务，是习得并巩固生涯适应力的关键时期。考察高中生生涯适应力的影响因素和边界条件可以为提升其生涯适应力提供可操作的干预策略。以往研究表明，父母的调节焦点是高中生生涯适应力重要影响因素，并且，友谊质量可能在两者中发挥桥梁作用。同时，教师在高中生群体中扮演着重要角色，其自主支持可以调控父母调节焦点对个体友谊质量的影响，进而提升其生涯适应力。鉴于此，本研究旨在考察友谊质量在父母调节焦点与高中生生涯适应力之间的中介作用以及教师自主支持在其中的跨层级调节作用。采用感知父母调节焦点量表、友谊质量量表、学习气氛量表以及高中生生涯适应力问卷对 30 个班级的 974 名高中生进行调查。结果表明：（1）生涯适应力与父母促进焦点、友谊质量以及教师自主支持呈显著正相关，与父母防御焦点呈显著负相关；（2）父母促进焦点显著正向预测高中生的生涯适应力，父母防御焦点对高中生生涯适应力的预测作用不显著；（3）友谊质量在父母促进焦点与高中生生涯适应力之间起部分中介作用、在父母防御焦点与高中生生涯适应力之间起部分中介作用；（4）教师自主支持在父母防御焦点→友谊质量→生涯适应力的前半段起跨层级调节作用，并且，随着教师自主支持水平的提升，父母防御焦点对友谊质量的作用方向由负变为正。这表明父母调节焦点不仅可以直接作用于高中生的生涯适应力，还能够通过友谊质量对其产生影响，并且，教师自主支持能够缓解父母防御焦点对友谊质量的负向影响，进而提升个体的生涯适应力。

关键词 父母调节焦点，生涯适应力，友谊质量，教师自主支持

The relationship between parent regulatory focus and high school students' career adaptability:

A cross-level moderated mediation model

ZHU Lijuan(Corresponding author), YAN Tinghe

School of Teacher Education, Suqian University, Suqian, 223800, zhulijuan2016@163.com

Abstract: Career adaptability is an individual's preparation for predictable career tasks and career roles, as well as the self-adjustment ability to cope with the problems caused by unpredictable career transition. It is regarded as the key ability for an individual to achieve career success in a rapidly changing modern society, and it is a new theoretical growth point in the field of career education at home and abroad in recent years. Teenagers in high school are faced with important career tasks such as choosing schools and majors, which is a key period to acquire and consolidate their career adaptability. Investigating the influencing factors and boundary conditions of high school students' career adaptability may provide an operational intervention strategy to improve their career adaptability. Previous studies have shown that the parent regulatory focus is an important factor in the high school students' career adaptability. Moreover, the friendship quality might play a bridge role between them. At the same time, teacher played an important role in high school students, and their autonomy support can regulate the influence of parent regulatory focus on the friendship quality, thus improving their career adaptability. In view of this, this study aims to examine the mediation role of friendship quality between parent regulatory focus and high school students' career adaptability, and the cross-level moderation role of teacher autonomy support. This study used the perceived parent regulatory focus scale, the friendship quality scale, the learning atmosphere scale, and the high school students' career adaptability questionnaire to conduct 974 high school students in 30 classes. The results showed that: (1) high school students' career adaptability were positively correlated with parent promotion focus, friendship quality and teacher autonomy support, and negatively correlated with parent prevention focus. (2) The parent promotion focus significantly positively predict the career adaptability among high school students, and the parent prevention focus cannot predict the career adaptability of them. (3) The friendship quality played a partly mediation role between parent regulatory focus and the career adaptability among high school students. (4) The teacher autonomy support played a cross-level moderated role in the first half of the "parent prevention focus→ friendship quality→ career adaptability". The results of this study showed that parent regulatory focus can not only directly affect career adaptability among high school students, but also influence them through friendship quality. Moreover, teacher autonomy support can alleviate the negative influence of parent regulatory focus on friendship quality among high school students, and then enhance their career adaptability.

摘要 教学评价是以教学为评价对象的一种教育评价。教学评价是依据一定的教学目标和标准, 采用定量与定性相结合的方法, 对教与学的效果进行的价值判断。教学评价是教学的重要环节, 是对教学效果的基本判定。它可以促进教学方法、内容的改革, 并提高教学质量和水平, 为教学活动更有效地开展提供基本的依据。然而, 已有的教学评价方法存在“主观性”、“片面性”与“静态化”等问题。超扫描技术是一种能实时记录两名或多名被试在同一个认知任务中大脑神经活动从而考察社会互动脑机制的脑成像技术。自 Holper 等人于 2013 年发表第一篇超扫描技术运用于教学互动领域以来, 这一技术开始受到了教育领域研究者的广泛关注。为了推动教育评价的改革, 促进超扫描技术在教育评价领域的进一步发展, 本文旨在对超扫描技术在教学评价中的应用做一综述性总结。本文首先简要介绍了超扫描技术的概念、超扫描研究的国内外研究现状。紧接

着,本文重点总结了超扫描技术运用于教学过程、教学效果、教学方法评价中的实证研究成果。最后,阐述了超扫描技术在教学评价中运用的局限性及其研究前景。未来研究者们可以在完善现有研究的基础上,从以下几个方面进行思考和探究:“构建多模态、多学科融合的教学评价方式”、“增加研究情境的学生人数,拓宽研究对象的学段范围”等。

From the Laboratory to the Classroom: The Application of Hyperscanning in Teaching Evaluation

Weilong Xiao¹, Hui Zhou², Binghai Sun¹, Weijian Li¹

1 Zhejiang Normal University Teacher Education College, Jinhua, 321004

2 The Institute of Advanced Studies of Jinhua, Jinhua, 321004

Abstract: Teaching evaluation is an educational evaluation with teaching as the evaluation object. Teaching evaluation is based on certain teaching goals and standards, using a combination of quantitative and qualitative methods to evaluate the value of teaching and learning. Teaching evaluation is an important part of teaching and a basic judgment of teaching effect. It can promote the reform of teaching methods and content, and improve the quality and level of teaching, and provide a basic basis for more effective teaching activities. However, the existing teaching evaluation methods have problems such as "subjectivity", "one-sidedness" and "staticization". Hyperscanning technology is a brain imaging technology that can record the neural activity of two or more subjects in the same cognitive task in real time to investigate the social interaction brain mechanism. Since Holper et al. 2013 published the first hyperscanning technology to be used in the field of teaching interaction, this technology has begun to attract widespread attention from researchers in the education field. In order to promote the reform of educational evaluation and promote the further development of super-scan technology in the field of educational evaluation, this article aims to make a summary of the application of super-scan technology in teaching evaluation. This article first briefly introduces the concept of hyperscanning technology and the current status of hyperscanning research at home and abroad. Next, this article focuses on the empirical research results of the application of super-scan technology in the teaching process, teaching effect, and teaching method evaluation. Finally, the limitations and research prospects of the application of super-scan technology in teaching evaluation are expounded. In future research, researchers can conduct research from "building a multimodal and multidisciplinary teaching evaluation method", "increasing the number of students in the research situation, and broadening the scope of the study object".

Keywords: teaching evaluation, hyperscanning technology, brain-to-brain synchrony, teacher-student interaction

积极还是消极?焦虑对大学生拖延行为的影响

冯喜珍 郭玉丹(通讯作者) 姬梦璇 贺男

山西师范大学教育科学学院, 临汾, 041000, gydd16@foxmail.com

摘要 人的天性是懒散松垮的,如果没有外界的强制约束,很容易养成“今日事,明日毕”的习惯,能拖则拖。如疫情期大学生缺少了学校和老师的监督,越来越多的人进入了“蜗牛”状态,居家生活伴随着各种拖延和低效行为。拖延行为是指个体有意或无意的推迟完成任务的表现。焦虑作为一种消极情绪,虽

然会起到一定的副作用,但在一定程度上可以成为推动人前进的动力。本研究采用问卷法和实验法相结合的方式探究焦虑对大学生拖延行为的影响。(1)研究一采用 STAI 中的特质焦虑分量表和一般拖延量表对 400 名大学生进行调查。结果表明大学生的特质焦虑水平与特质拖延水平均高于平均水平,特质焦虑与特质拖延在年级、性别和专业上的差异并不显著;特质焦虑与特质拖延呈显著正相关,特质焦虑能正向预测特质拖延。(2)研究二采用焦虑诱发任务和参照练习-测验范式设计拖延任务实验。第一部分为检验焦虑诱发任务有效性的预实验,第二部分为正式实验,采用 2(特质焦虑:高/低)×2(特质拖延:高/低)×2(状态焦虑:实验组/控制组)被试间设计。将研究一中的被试根据特质焦虑和特质拖延的得分分成四组,再根据诱发焦虑

与否进一步分配被试,一共得到八组被试。焦虑诱发组被试需要完成焦虑诱发和拖延任务,控制组被试则只需完成拖延任务。结果表明焦虑诱发任务前后被试状态焦虑分数差异显著,其焦虑分数明显较高;特质焦虑、状态焦虑以及特质拖延各自的主效应和交互效应均显著,即各组被试的拖延行为存在显著差异,但当焦虑达到一定程度时,个体会因为高焦虑状态而减少或终止拖延行为。因此,既要看到焦虑的消极面,也要充分利用焦虑的积极面,从而进一步减少大学生自身的拖延行为。

关键词 状态焦虑, 特质焦虑, 特质拖延, 拖延行为

Positive or Negative? The Influence of Anxiety on Procrastination Behavior of College Students

Feng Xizhen, Guo Yudan, Ji Mengxuan, He Nan

Institute of Education Science, Shanxi Normal University, LinFen, 041000

Abstract: Human nature is lazy and flabby. If there is no external constraint, it is easy to form the habit of "doing things today, finishing tomorrow", if you can, you can procrastinate. For example, during the epidemic period, college students lack the supervision of their schools and teachers, and more and more people fall into the "snail" state. Living at home is accompanied by all kinds of procrastination and inefficient behaviors. Procrastination refers to the behavior that an individual intentionally or unintentionally delays the completion of a task. Anxiety, as a negative emotion, can have certain side effects, but to a certain extent, it can become a driving force for people to move forward. In this study, the influence of anxiety on college students' procrastination behavior was explored by combining questionnaire method and experimental method. (1) In the first study, 400 college students were investigated using the trait anxiety subscale and the general procrastination scale in STAI. The results show that the trait anxiety level and trait procrastination level of college students are both higher than the average level, and the differences between them in grade, gender and major are not significant; trait anxiety is positively correlated with trait procrastination, and trait anxiety can positively predict trait procrastination. (2) In the second study, anxiety-induced task and exercise-test paradigm were used to design procrastination task experiments. The first part is a preliminary experiment to test the effectiveness of the anxiety-induced task. The second part is a formal experiment, designed between 2 (trait anxiety: high/low) $\times$ 2 (trait procrastination: high/low) $\times$ 2 (state anxiety: experimental group/control group) subjects. The subjects in study 1 were divided into four groups according to their trait anxiety and trait procrastination scores, and then further assigned to them according to whether they induced anxiety or not. A total of eight groups of subjects were obtained. Subjects in the anxiety-inducing group were required to complete anxiety-inducing and procrastination tasks, while subjects in the control group were required to complete procrastination tasks. The results showed that the scores of state anxiety were significantly different before and after the anxiety-induced task, and the scores of state anxiety were significantly higher; the main effect and interaction effect of trait anxiety, state anxiety and trait procrastination are significant, that is, there are significant differences in the procrastination behaviors of each group. However, when the anxiety reaches a certain level, the individuals will reduce or stop the procrastination behaviors due to the high anxiety state. Therefore, we should not only see the negative side of anxiety, but also make full use of the positive side of anxiety, so as to further reduce the procrastination behavior of college students.

不同效价元刻板印象对农村留守儿童群际关系的影响

徐璐璐¹ 贺雯² (通讯作者)

¹ 上海交通大学医学院, 上海, 200025

² 上海师范大学心理学系, 上海, 200234, 通讯作者 E-mail: hewen@shnu.edu.cn

摘要 元刻板印象是指个体关于外群体成员对其所属群体所持刻板印象的信念或看法, 其效价可以是消极

的、中性的或积极的,但以往研究较多集中于考察消极元刻板印象对群际关系的影响,关于积极元刻板印象的研究较为缺乏。本研究以 196 名农村留守儿童为被试,采用指导语操控的方式随机分为积极元刻板印象激活组(积极组)、消极元刻板印象激活组(消极组)和元刻板印象未激活组(控制组),考察不同效价元刻板印象对农村留守儿童群际关系的影响。结果发现:(1)积极组群际关系水平(50.15 ± 6.86)显著高于消极组(43.42 ± 6.00)和控制组(46.92 ± 8.09),控制组显著高于消极组, $p < 0.01$;消极组群际焦虑水平(35.30 ± 9.18)显著高于积极组(28.29 ± 12.56)和控制组(29.50 ± 10.86), $p < 0.01$,积极组和控制组差异不显著, $p > 0.05$;(2)积极元刻板印象正向预测群际关系($\beta = 0.43$, $SE = 0.18$, $p < 0.05$),消极元刻板印象负向预测群际关系($\beta = -0.47$, $SE = 0.17$, $p < 0.01$);(3)群际焦虑在消极元刻板印象和农村留守儿童群际关系之间起完全中介作用($\beta = -0.17$, $SE = 0.06$, $p < 0.01$),在积极元刻板印象中不起中介作用($p > 0.05$)。因此农村留守儿童积极元刻板印象激活后出现促进效应。

The Influence of Different Valance Metastereotypes on the Intergroup Relations of Left-Behind Children

Lulu Xu¹, Wen He²

1. Shanghai Jiao Tong University School of Medicine, Shanghai 200025, China;

2. Department of Psychology, Shanghai Normal University, Shanghai 200234, China

Abstract: Metastereotype refers to a person's beliefs regarding the stereotype that out-group members hold about their own group, their valance can be negative, neutral, or positive, most of the previous studies focused on the impact of negative metastereotype on intergroup relations, while the research on positive metastereotype was relatively lacking. The study aimed to explore the effects of different valance metastereotypes on intergroup relations of left-behind children. A sample of 196 left-behind children from the primary schools in Jiangsu province participated in the present study. Participants were randomly assigned to the negative metastereotype activation, positive metastereotype activation or the control condition according to different instructions. Then all participants completed the Intergroup Anxiety and Intergroup Relation scale. Results were as follows: (1) The intergroup relation under the positive metastereotype activation condition (50.15 ± 6.86) was higher than the case of the negative metastereotype (43.42 ± 6.00) and control condition (46.92 ± 8.09), and there was significant difference between negative metastereotype activation and the control condition, $p < 0.01$; The intergroup anxiety under the negative metastereotype activation condition (35.30 ± 9.18) was higher than the case of the positive metastereotype (28.29 ± 12.56) and control condition (29.50 ± 10.86), $p < 0.01$, but there was no significant difference between positive metastereotype activation and the control condition, $p > 0.05$. (2) Positive metastereotype could positively impact intergroup relations ($\beta = 0.43$, $SE = 0.18$, $p < 0.05$), while negative metastereotype could negatively impact intergroup relations ($\beta = -0.47$, $SE = 0.17$, $p < 0.01$). (3) Intergroup anxiety is a significant completely mediator between the negative metastereotype and intergroup relations ($\beta = -0.17$, $SE = 0.06$, $p < 0.01$), but not in positive metastereotype, $p > 0.05$. In conclusion, activating the negative metastereotype of left-behind children could produce threat effect, while activating positive metastereotype could have the promotion effect.

情绪效价和情感亲密度对大学生道德判断的影响：行为与 ERP 研究

楼珂¹, 卢家楣² (通讯作者)

¹ 上海师范大学, 上海, 200234

² 上海师范大学教育学院心理系, 上海, 200234, lujiamei@vip.163.com

摘要 近年来,解释水平理论为道德判断的深层机制提供了一个新颖的构思,除了个体本身产生的情绪外,个体与他人之间不同的情感联结程度也可能产生解释水平上的差异,从而影响道德判断的结果。当个体与

道德行为对象的情感亲密度较强时，其道德判断能力会有所下降。研究道德判断的时称加工特点能够帮助我们进一步理解其背后的心理机制。本文以大学生日常行为作为实验语料素材，编制和评定当代大学生日常行为中的道德和不道德事件，同时采用阈下启动范式，通过 ERPs 技术，试图从内隐的维度研究和探讨道德判断的时程加工机制。其主要目的为探究情绪效价和情感亲密度对大学生道德判断的作用。全文包括两个实验：实验一从行为层面考察情绪效价和情感亲密度对大学生日常道德判断的影响。采用阈下启动范式探究正性、负性、中性三种情绪效价与熟人、陌生人两种情感亲密度对大学生日常道德行为和道德行为两种判断的影响及其交互作用。实验结果表明（1）情绪效价与情感亲密度的交互作用显著。相比于中性情绪，大学生个体在正性、负性情绪下对熟人判断的正确率低于陌生人，且在正性情绪下的差异显著性更大。（2）情绪效价与行为类别的交互作用显著。相比于中性情绪，大学生个体在正性、负性情绪下对道德行为判断的正确率低于不道德行为。为进一步研究正性情绪下道德判断的加工机制，实验二从电生理层面进行考察。实验结果表明在脑电指标上，在正性情绪下，大学生个体对熟人比对陌生人做出的行为道德判断所诱发的 N400 和 LPP 波幅更大。而在中性情绪下，大学生对熟人和对陌生人作出的行为道德判断所诱发的 N400 和 LPP 波幅无显著差异。总而言之，本研究围绕“情”的角度，从道德判断的行为反应和电生理反应指标上表明，大学生个体的情绪与情感亲密度，在无意识状态下会影响日常生活行为的道德判断，这对高校大学生的道德教育与培养提供了一定理论依据和实证支持。

关键词 大学生，道德判断，情绪，情感亲密度，ERP

The Influence of Emotional Valence and Affective Closeness on Undergraduates' Moral Judgment: A Behavioral and ERP Study

Ke Lou¹, Jiamei Lu²

1 Shanghai Normal University, Shanghai, 200234

2 Shanghai Normal University Department of Psychology, Shanghai, 200234,

lujiamei@vip.163.com

Abstract: In recent years, the theory of explanatory level has provided a new perspective for the deep mechanism of moral judgments. In addition to the emotions generated by individuals themselves, the degree of emotional connection between individuals may also affect the results of moral judgments. When the emotional intimacy between the individual and the object of moral behavior is weak, the individual's moral judgment ability is lower, that is, the correct rate of judgment is lower. In order to understand the psychological mechanism of moral judgment clearly, it is necessary to explore the time processing characteristics of moral judgment. In this study, we collect and compile the daily behaviors of college students as the experimental corpus material and evaluate the moral events in the daily behavior of these university students. At the same time, the subthreshold priming paradigm is adopted and the ERP technology is used to try to study and explore the time-history processing mechanism of moral judgments from the implicit dimension. The target of our two experiments was to investigate the effects of emotional valence and emotional closeness on college students' moral judgments. This paper includes two studies: In Experiment One, the purpose of experiment examined the effects of emotional valence and emotional intimacy on college students' daily moral judgments from the behavioral level. Subthreshold priming paradigm was used to explore the effects of three different emotional valences and two kinds of emotional closeness on college students' daily moral behavior judgments and their interaction. The results show that, (1) The significant interaction between emotion valence and behavior category shows, compared with neutral emotions, the correct judgment rate of moral behavior in positive and negative emotions is lower than that of unethical behavior. (2) The interaction between emotional valence and emotional intimacy was significant. Compared with neutral emotions, the accuracy of college students' judgment of acquaintances in positive and negative emotions is lower than that of strangers, and the difference is more significant in positive emotions. Therefore, in order to further study the processing mechanism of moral judgment under positive emotions, Experiment Two examined the effects of behavioral objects with different emotional closeness on moral judgment of college students under positive and neutral emotions during subthreshold priming from the

electrophysiological level. In Experiment Two, the results showed that under positive emotions, the amplitude of N400 and LPP induced by college students' behavioral moral judgments about acquaintances rather than strangers is larger. However, we didn't see the discrepancy in the amplitude of N400 and LPP induced by the moral judgments of acquaintances and strangers in neutral emotions. To sum up, this study around the angle of "emotion", from the behavior of moral judgment and electrophysiological reaction on indicators show that college students' individual emotions and emotional intimacy, in unconscious state will affect daily life behavior of moral judgment, which provides some academic basis and empirical support for moral education and training of the college students.

Keywords: college students, moral judgment, emotion, affective intimacy, ERP

新手—熟手—专家型教师对课堂教学情绪加工的比较 ——基于生理多导的研究

汪海彬¹ 史玉燕¹ 杨远帆¹ 卢家楣² (通讯作者)

摘要 课堂教学情绪指的是教师在课堂教学过程中对人际关系、教学内容、教学进程、教学方式、教学效果等因素的态度体验。教师对课堂教学情绪的加工不仅影响教师自身的心理健康, 还影响情感教学效果, 进而影响课堂教学质量。为考察不同类型教师对课堂教学情绪加工的差异, 从而为培养教师情绪情感能力提供一定的依据, 研究采用新手-熟手-专家型教师范式, 选取 20 名新手教师、25 名熟手教师和 15 名专家教师, 以常见的课堂教学情绪文字材料为研究材料并利用 Spirit-32 生物反馈仪记录被试的生理反应。结果发现教师类型和效价的交互效应在皮电和脉搏血容上的差异显著, 表现为新手教师在负性课堂教学情绪上的皮电显著高于熟手和专家教师、新手教师在课堂教学情绪上的脉搏血容显著高于熟手教师, 但其他类型教师之间的差异不显著。可见, 不同经验影响教师对课堂教学情绪的加工, 新手教师在加工课堂教学情绪过程中生理唤醒最为明显。

Abstract: Classroom teaching emotion refers to the teacher's attitude experience to the interpersonal relationship, teaching content, teaching process, teaching method, teaching effect and other factors in the classroom teaching process. Teachers' processing of classroom teaching emotions not only affects teachers' mental health, but also affects the effect of emotional teaching, which in turn affects the quality of classroom teaching. In order to compared the differences in the processing of classroom teaching emotion among different types of teachers, so as to provide a certain basis for training teachers' emotional abilities. The "novice-proficient-expert" paradigm was adopted and 20 of the novice teachers, 25 proficient teachers and 15 expert teachers were recruited. They were asked to process the common classroom emotional text materials as research materials, and the Spirit-32 biofeedback device recorded the physiological response of the subjects. The results showed that the interaction effect of teacher type and conflict type was significantly in the GSR/SC and BVP, which was manifested as that novice teachers' GSR/SC in negative classroom teaching emotion was significantly higher than that of proficient and expert teachers. The BVP of novice teachers was significantly higher than that of proficient teachers, but the difference between other types of teachers was not significant. It can be seen that different experiences affect teachers' processing of classroom teaching emotion. Novice teachers have the most obvious physiological responses in the process of processing classroom teaching

emotion.

摘 要 课堂突发事件是在课堂教学过程中由教师、学生或环境等因素引发, 对教师教学和学生课堂学习产生一定影响, 出乎教师意料之外的事件, 具有不确定性、复杂性和突发性的特点。妥善应对课堂突发事件是教师专业标准中专业能力的重要体现, 对于教师的专业发展, 尤其是新手教师的专业发展具有重要意义。为了解新手-熟手-专家型教师对不同课堂突发事件加工的差异, 从而为新手教师妥善应对课堂突发事件提供一定借鉴, 研究采用新手-熟手-专家型教师范式, 选取 20 名新手教师、25 名熟手教师和 15 名专家教师, 以课堂突发情景文字描述为材料并利用 Spirit-32 生物反馈仪记录被试的生理反应。结果发现: 教师类型和冲突事件类型的交互效应在皮电和脉搏血容上的差异显著, 具体表现为新手教师在四种冲突类型上的皮电和脉搏血容上显著高于熟手教师, 但其他类型教师之间的差异不显著。可见, 不同经验影响教师对课堂突发事件的加工, 突发事件对新手教师的生理唤醒最为明显。

Abstract: Classroom emergency was caused by the teacher, student, or environmental factors in the process of teaching, there was a certain influence on teachers' teaching and students' classroom learning, even surprised teachers, it is uncertainty, complexity and sudden. Master the countermeasures to deal with emergencies was very important for teachers, especially to the novice teachers, which was an important embodiment of teachers' professional competence. To examine the processing strategy differences on the classroom emergency emotional scenes among novice, proficient and expert teachers, the "novice-proficient-expert" paradigm was adopted and 20 of the novice teachers, 25 proficient teachers and 15 expert teachers were recruited. They were asked to process the emergency scene in class as the research material, and the Spirit-32 biofeedback device recorded the physiological response of the subjects. The results showed that the interaction effect of teacher type and conflict type was significantly in the GSR/SC and BVP. The GSR/SC and BVP of novice teachers were significantly higher than proficient teachers. It can be concluded that the experiences have an important impact on teachers' response to classroom emergencies, and emergencies have the most obvious physiological impact on novice teachers.

摘要 目的: 探讨重大疫情下“停课不停学”过程中学生的适应能力、消极学业情绪、领悟社会支持与学习投入的关系及其内在作用机制。**方法:** 采用适应力量表、学业情绪量表、领悟社会支持量表与学习投入量表对全国 4226 名学生进行实测。采用 SPSS 进行描述统计和相关分析, Hayes 的 SPSS 宏程序 PROCESS 组件进行模型检验和 Bootstrap 分析。**结果:** ①适应能力与消极学业情绪呈显著负相关, 与学习投入呈显著正相关; 消极学业情绪与学习投入呈显著负相关; ②适应能力不仅能够直接预测学习投入, 还能够通过消极学业情绪的中介作用对学习投入产生影响; ③适应能力对学习投入的直接效应以及消极学业情绪的中介效应均受到领悟社会支持的调节, 对于高领悟社会支持的学生, 适应能力对消极学业情绪及学习投入的预测作用更加显著。**结论:** 消极学业情绪在适应能力对学习投入的影响中起部分中介作用, 且这一中介作用受到领悟社会支持的调节。本研究结果进一步解释了疫情背景下学生适应能力与学习投入程度的内部机制, 并提示我们, 对于适应能力较弱的学生, 给予更多的关怀以及降低他们的消极情绪可能更有助于提高学生的学习投入水平。本研究在一定程度上对突发公共卫生事件下学生适应能力和学习投入之间的关系这一重要理论问题进行了补充, 研究结果显示增加针对学生适应能力的训练有一定的必要性, 同时为领悟社会支持能有效影响学生的学习投入提供了实证支持。

Effects of Adaptability on Learning Engagement under COVID-19: A Moderated Mediating Model

Hu zhonghui¹, Ye Haimou¹, Zhang Keshun²

Qingdao University, No. 308, Ningxia Road, Qingdao

Abstract: Objective: This study examined the relationship between students' adaptability and learning engagement under the coronavirus disease 2019 (COVID -19) epidemic, the mediating role of negative academic emotion, and further explored whether perceived social support played a moderating role in the relationship between adaptability and engagement and the relationship between adaptability and negative academic emotion. **Methods:** Using the Questionnaire of adaptability scale, academic emotion scale, perceived social support scale(PSSS), and learning engagement scale, a sample of 4426 students from all over country attended in the survey. SPSS was used for descriptive statistics and correlations analysis. Hayes' PROCESS macro for SPSS was adopted to estimate the model and Bootstrap analysis. **Results:** Adaptability was negatively correlated with negative academic emotion, but positively correlated with engagement. Negative academic emotion was negatively correlated with engagement. Adaptability not only directly predicted the engagement of the students, but also affected engagement through the mediating role of negative academic emotion. The effect of adaptability on negative academic emotion and engagement was moderated by perceived social support. **Conclusion:** Negative academic emotion partially mediates the relationship between adaptability and engagement. This indirect effect is more significant for students studying during the coronavirus outbreak with higher perceived social support. The results of this study further explained the internal mechanism of the influence of adaptability on learning engagement in students, and suggested that, giving more care and reducing their negative emotions may more help to improve students' learning engagement level for students with low level of adaptability. This study focus the important issue about the relationship between adaptability and study engagement under public health emergencies. This study not only show that it is necessary to increase the training for students' adaptability, but also provide an evidence that perceived social support can effectively influence learning engagement.

不同类型认知好奇心对创造性科学问题提出能力的影响

吴丽君¹ 赵昆¹ 弓晓伟¹ 李云洲¹ 任有文¹ 韩琴¹ (通讯作者)

¹ 山西师范大学教育科学学院,太原,030000,hbiner@126.com

摘要 好奇心是人们探求新知识、自身学习和发展的内在动力。认知好奇心包括感知好奇和认识性好奇心,气氛被好奇心将成为创造力的重要影响因素。但好奇心与创造力的关系还未得到重视。本研究将整合好奇与创造力相关研究,结合多种方法,探索好奇心与创造性科学问题提出能力(CSPF)的关系。实验一采用2(认知好奇心:感知好奇、认识性好奇)*2(CSPF形式:开放、封闭)的被试间实验设计。感知好奇组呈现新奇物品,而认识性好奇组则通过操纵认知缺口来诱发好奇心,随后完成《创造性科学问题提出能力》测验。预期结果:1.两组均显著诱发相应好奇心;2.认识性好奇组被试的表现显著优于感知好奇组。实验二采用2(认知好奇诱发方法:间接、直接)*2(CSPF形式:开放、封闭)的被试间实验设计。在实验一的基础上,进一步操纵诱发认识性好奇心的方法,分别采用间接诱发与直接诱发的方法诱发被试的好奇心。预期结果:1.直接诱发比间接诱发更能诱发被试的认识性好奇心;2.直接诱发组被试在CSPF上的表现显著优于间接诱发组,这种优势表现在独特性与灵活性上。本研究在以往好奇心研究的基础上,从创造性问题提出的角度出发进一步探讨了好奇心与创造力的关系,好奇能够激励人们去学习自身感兴趣的知识,通过关注新的和具有挑战性的信息,来拓展自身的知识面,提高个体的技能,并学习用心的方式思考与探索,跳出思维定势,提出更具创造力的问题。本研究以小学生为被试,为小学一线科学课程教学提供意见与建议,将研究结论更好的应用于科学课堂。

关键词 感知好奇心,认识好奇心,创造性科学问题提出能力

The influence of different types of cognitive curiosity on Creative Scientific Problem Finding Ability

Lijun Wu¹, Kun Zhao¹, Xiaowei Gong¹, Yunzhou Li¹, Youwen Ren¹, Qin Han¹

¹ School of Educational Science, Shanxi normal University, TaiYuan, 030000

Abstract: Curiosity is the internal driving force for people to explore new knowledge, learn and develop themselves. Cognitive curiosity includes perceptual curiosity and cognitive curiosity. Atmosphere curiosity will become an important factor of creativity. However, the relationship between curiosity and creativity has not been paid attention to. This study will integrate the research on curiosity and creativity, and explore the relationship between curiosity and Creative Scientific Problem Finding Ability (CSPF). Experiment 1 was an inter subject experimental design of 2 (cognitive curiosity: sensory curiosity, cognitive curiosity) * 2 (CSPF form: open and closed). The perceptual curiosity group presented novel items, while the cognitive curiosity group induced curiosity by manipulating the cognitive gap, and then completed the test of creative scientific problem-raising ability. Expected results: 1. Both groups significantly induced corresponding curiosity; 2. The performance of cognitive curiosity group was significantly better than that of perceptual curiosity group. Experiment 2 was an inter subject experimental design of 2 (cognitive curiosity inducing method: indirect and direct) * 2 (CSPF form: open and closed). On the basis of Experiment 1, the methods of inducing cognitive curiosity were further manipulated, and the subjects' curiosity was induced by indirect and direct methods respectively. The expected results are as follows: 1. The cognitive curiosity of subjects can be induced more directly than indirectly; 2. The performance of subjects in the direct induction group is significantly better than that in the indirect induction group, which is manifested in uniqueness and flexibility. On the basis of previous studies on curiosity, this study further discusses the relationship between curiosity and creativity from the perspective of creative problems finding. Curiosity can encourage people to learn the knowledge they are interested in, expand their knowledge, improve individual skills, and learn to think and explore in a attentive way by paying attention to new and challenging information, Jump out of the mindset and ask more creative problems. This study takes primary school students as subjects to provide opinions and suggestions for the first-line science

curriculum teaching in primary school, and better apply the research conclusions to the science classroom.

摘要 感恩作为个体的一种积极人格特质或者生活取向, 对于增进初中生幸福感和提高生命意义感具有重要意义。已有研究发现高水平的家庭功能对初中生感恩培养具有重要作用, 但家庭功能对感恩的作用机制及作用条件还有待探讨。本研究采用整群抽样的方法, 以家庭亲密度和适应性量表、初中生感戴量表、人际反应指针量表和青少年亲子沟通量表为研究工具, 对陕西省、江西省 4 所中学共 1124 名初中生进行问卷调查, 探究了家庭功能与感恩的关系, 并进一步考察了亲子沟通在家庭功能与感恩间的中介作用以及共情对此过程的调节作用。结果发现: (1) 家庭功能、感恩、亲子沟通、共情之间两两显著正相关; (2) 在控制了生源、年级后, 家庭功能正向预测初中生的感恩; (3) 亲子沟通在家庭功能与初中生感恩之间起部分中介作用; (4) 共情正向调节了“家庭功能→亲子沟通→感恩”的前半段, 即当初中生的共情能力更高时, 家庭功能对亲子沟通的促进作用更强。结果表明, 家庭功能不仅直接影响初中生的感恩, 而且通过亲子沟通间接影响初中生的感恩; 并且, 良好的共情能力会促进家庭功能对亲子沟通的正向作用。本研究从个体层面和家庭环境层面进一步厘清了家庭功能和初中生感恩之间的作用机制和作用条件, 为初中生感恩的培养和发展提供了一定参考。

3 Provincial Key Laboratory of Behavioral and Cognitive Neuroscience, Xi'an, 710062

Abstract: Gratitude, as an individual positive personality trait and life orientation, is of great significance for improving the sense of happiness and promoting the sense of life meaning of junior high school students. High level family functioning has been found to have an important impact on junior high school students' gratitude, but the mechanism and conditions of family functioning on gratitude remain to be explored. Therefore, this study intends to explore the relationship between family functioning and gratitude, and to further investigate the mediating role of parent-child communication and the moderating role of empathy. Using cluster sampling method, a total of 1124 junior high school students from four middle schools in Shaanxi and Jiangxi Province were surveyed with Family Adaptability and Cohesion Evaluation Scales-II, Gratitude of Junior High School Students Scale, Interpersonal Response Index Scale and Parent-Child Communication Scale. The results showed that: (a) there was a significant positive correlation between family functioning, gratitude, parent-child communication and empathy; (b) family functioning positively predicted junior high school students' gratitude after controlling for factors such as the origins of student and grade; (c) parent-child communication played a part of mediating role between family functioning and junior high school students' gratitude; (d) empathy had a positive moderating role in the first half of "family functioning → parent-child communication → gratitude", that is, when the ability of empathy of junior high school student was improved, family functioning had a stronger promoting effect on parent-child communication. The

findings suggested that family functioning not only directly affected the gratitude of junior high school students, but also indirectly affected the gratitude of junior high school students through parent-child communication. Moreover, stronger empathy ability enhanced the role of family functioning on parent-child communication. This study further clarified the mechanism and conditions between family functioning and gratitude of junior high school students from the individual level and the family environment level, which can provide meaningful insights for the cultivation and development of middle school students' gratitude.

Keywords: Junior high school students, Family functioning, Gratitude, Parent-child communication, Empathy

留守/非留守儿童领悟社会支持与希望的关系： 一个有调节的中介模型

孙婉靖¹ 白慧慧¹ 王雨晴¹²（通讯作者）

¹ 陕西师范大学心理学院，西安，710062

² 陕西省行为与认知神经科学重点实验室，西安，710062，wyq1994@snnu.edu.cn

摘要 希望感是积极心理学的核心概念之一，自提出后逐渐成为心理学研究的一个热点。已有研究发现领悟社会支持有助于提升留守儿童的希望水平，但其作用机制和作用条件还有待探讨。因此，本研究基于 Snyder 的希望理论，探讨留守/非留守儿童领悟社会支持对希望的影响以及自尊的中介作用和社交焦虑的调节作用。本研究采用整群抽样的方法，以领悟社会支持量表、儿童希望感量表、自尊量表与社交焦虑量表为研究工具，对陕西省某小学共 492 名儿童（留守儿童 314 名）进行调查。结果发现：（1）留守儿童和非留守儿童领悟社会支持、希望、自尊和社交焦虑均无显著性差异，留守/非留守儿童希望与领悟社会支持、自尊显著正相关；（2）在控制了年级、性别、家庭收入后，留守和非留守儿童领悟社会支持均正向预测希望，且非留守儿童的领悟社会支持对希望的预测作用显著大于留守儿童；（3）有调节的中介效应检验表明，当留守/非留守儿童的社交焦虑处于平均值或低于平均值一个标准差的水平时，自尊在领悟社会支持和希望之间的中介效应显著，且在留守儿童群体中自尊的中介效应量更大；当留守/非留守儿童的社交焦虑处于高于平均值一个标准差的水平时，该中介效应不显著。结果表明，领悟社会支持不仅直接影响留守/非留守儿童的希望，也通过自尊间接影响留守/非留守儿童的希望，且对于留守儿童而言，领悟社会支持对希望的促进作用低于非留守儿童，即不仅可以通过提高社会支持来提升留守儿童的希望水平，也可以考虑培养留守儿童自身积极特质，如自尊，来提升儿童希望水平。本研究关于领悟社会支持对希望的作用机制和作用条件的研究结果，对于儿童、尤其留守儿童的希望感培养提供了一定的参考。

关键词 留守儿童，领悟社会支持，希望，自尊，社交焦虑

The Relationship between Perceived Social Support and Hope of Left-behind/Non-left-behind Children: A Moderate Mediation Model

Wanjing Sun¹, Huihui Bai¹, Yuqing Wang¹²³

¹ School of Psychology, Shaanxi Normal University, Xi'an, 710062

² Provincial Key Laboratory of Behavioral and Cognitive Neuroscience, Xi'an, 710062

Abstract: Hope, as one of the core concepts of positive psychology, has become a hot topic in psychology research since it was proposed. Perceived social support has been found to have a positive impact on left-behind children's hope, but the mechanism and conditions of perceived social support on hope remain to be explored. Therefore, based on Snyder's theory of hope, this study intends to explore the relationship between left-behind/non-left-behind children's perceived social support and hope, and to further investigate the mediating role of self-esteem and the moderating role of social anxiety. Using cluster sampling method, a total of 492 children (314 left-behind children) from a primary school in Shaanxi Province were surveyed with Perceived Social Support Scale, Children's Hope Scale, the Self-Esteem Scale and Social Anxiety Subscale of the Self-Consciousness Scale. The results showed that: (a) there was no significant difference between left-behind children and non-left-behind children in terms of perceived social

support, hope, self-esteem and social anxiety, and the hope of left-behind/non-left-behind children was positively correlated with perceived social support and self-esteem; (b) after controlling for factors such as grade, sex and family income, the perceived social support of left-behind children and non-left-behind children positively predicted hope, and this predictive effect in non-left-behind children was significantly greater than that in left-behind children; (c) the testing of moderated mediation effect further indicated that, when the social anxiety of left-behind/non-left-behind children was at the average or one standard deviation below the average level, self-esteem had a significant mediating effect between perceived social support and hope, and the mediating effect of self-esteem is greater in left-behind children; and when the social anxiety of left-behind/non-left-behind children was at a level one standard deviation higher than the average, the mediating effect was not significant. The findings suggested that perceived social support not only affected hope of left-behind/non-left-behind children, but also indirectly affected their hope through self-esteem. For left-behind children, perceived social support played a lower role in promoting hope than that of non-left-behind children, that is, left-behind children's hope can be improved by improving social support and more importantly by cultivating their own positive traits such as self-esteem. This study clarified the mechanism and conditions between perceived social support and hope, which can provide meaningful insights for children, especially left-behind children, to cultivate their hope.

Keywords: Left-behind children, Perceived social support, Hope, Self-esteem, Social anxiety

感知教师情感支持与留守儿童学校适应： 教师情绪劳动的跨层调节作用

汤彩云 顾皎 伍晓青 吴文峰 卢永彪（通讯作者）

贵州师范大学心理学院，贵阳，550025，lybhsd@sohu.com

摘要 留守儿童普遍存在亲情缺位，家庭教育缺失的问题，学校教育的适当补位非常重要。而学校想要充分发挥其教育功能，改善留守儿童学校适应是首要前提。在学校教育环境中，教师是对留守儿童最具影响力的成年人，教师提供的情感支持是预测其学校适应的最佳变量之一。相比于实际支持，对教师情感支持的感知对留守儿童的影响更强烈。这就要求教师需要努力控制自己的情绪表达，展现出有利于师生沟通与信任的情绪状态，这种努力即为教师情绪劳动。感知教师情感支持能否对留守儿童学校适应起促进作用，教师情绪劳动可能是关键因素。为探讨感知教师情感支持与留守儿童学校适应的关系以及教师情绪劳动对两者关系的调节作用，研究采用教师情绪问卷调查了 38 名教师，采用感知教师情感支持问卷和学校适应问卷调查了 969 名留守儿童，并使用多层线性模型分析教师与学生的层级嵌套模型数据。结果发现：（1）感知教师情感支持显著正向预测留守儿童学校适应（ $\beta = 0.27, p < 0.001$ ）；（2）教师情绪劳动与留守儿童感知教师情感支持的交互作用显著预测留守儿童学校适应（ $\gamma = 0.009, p < 0.001$ ）。简单效应分析表明，留守儿童学校适应随感知教师情感支持水平升高而升高，且教师高情绪劳动的留守儿童学校适应预测线斜率显著高于教师低情绪劳动的预测线斜率。本研究揭示了感知教师情感支持与留守儿童学校适应的关系以及这一关系何时更强或更弱，这对学校教育相关人员如何改善留守儿童学校适应具有一定的指导意义。

关键词 学校适应，感知教师情感支持，教师情绪劳动，留守儿童

Perceived Teacher's Emotional Support and School Adjustment in Left-behind Children: the Moderating Role of Teacher's Emotional Labor

TANG Cai-Yun, Gu Jiao, Wu Xiao-Qing, WU Wen-Feng, LU Yong-Biao

Department of Psychology, Guizhou Normal University, Guiyang, 550025, lybhsd@sohu.com

Abstract: Left-behind children generally have the problem of lack of family affection and lack of family education. It is very important to properly supplement school education. The primary prerequisite for schools to give full play to their educational functions is to improve the school adjustment of left-behind children. In the school education

environment, teachers are the adults who have the most influence on left-behind children, and their provided emotional support is one of the best variables to predict left-behind children's school adjustment. Compared with actual support, the perception of teacher emotional support has a stronger impact on left-behind children. This requires teachers to work hard to control their emotional expression and show an emotional state that is conducive to teacher-student communication and trust. This kind of effort is teacher emotional labor. Perceive whether teacher emotional support can promote the school adjustment of left-behind children, teacher emotional labor may be a key factor. To explore the relationship between perceived teachers' emotional support and left-behind children's school adaptation and the moderating effect of teachers' emotional labor on the relationship, the study used teacher emotional labor questionnaire to survey 38 teachers, using perceived teacher emotional support questionnaire and school adjustment questionnaire to survey 969 left-behind children. The hierarchical structure data was analyzed by HLM. The results show that: (1) Perceived teacher emotional support significantly positively predicts left-behind children's school adjustment ($\beta = 0.27$, $p < 0.001$); (2) The interaction of perceived teacher emotional support and emotional labor predicted left-behind children's school adjustment significantly. The simple effect analysis showed: the left-behind children's school adjustment increased with the rise of perceived teacher emotional support, and the predicted line slope value of high emotional labor was significantly less than the predicted line slope of low emotional labor. This study reveals the relationship between perceived teacher emotional support and school adjustment of left-behind children and when this relationship is stronger or weaker. This has certain guiding significance for school education personnel on how to improve left-behind children's school adjustment.

新冠病毒疫情下大学生信息焦虑对手机成瘾的影响

姜立君

大连大学心理健康教育中心, 辽宁大连, 116622, 792576290@qq.com

摘要 为探索新冠病毒疫情下大学生信息焦虑对手机成瘾的影响以及负性信息注意偏向和反刍思维的影响作用, 本研究以辽宁某大学 595 名在校生为研究对象, 采用信息焦虑量表 (IAS)、手机成瘾指数量表 (MPAI)、负性注意偏向量表 (ANI)、反刍思维量表 (RRS) 为研究工具, 通过网上问卷的方式进行调查。采用 SPSS 22.0 软件对数据进行整理和录入、分析, 采用 Hayes 编制的 Process 插件来分析有中介的调节效应。结果表明: (1) 信息焦虑对手机成瘾有直接预测作用。大学生关注死亡病例、网络谣言等负性信息, 引发一定程度的信息焦虑; 居家隔离带来的活动空间限制和活动内容单一带来的无聊感, 加深大学生的焦虑状态; 大学生选择通过手机游戏或社交软件排解焦虑情绪, 在线教学和疫情信息日报工作也增加学生手机的使用时间和使用频率, 从而潜在影响手机过度使用而导致的手机成瘾。(2) 负性信息注意偏向起到调节作用。负性信息注意偏向是一种认知倾向, 个体会偏向于注意负性信息并放大负性信息的影响或抑制其他信息的作用。大学生的负性信息注意偏向水平越高, 个体越倾向于主动搜寻信息来验证负性信息的真伪、对自己的影响多少, 会加剧信息焦虑对手机使用的影响。(3) 反刍思维起到部分中介作用。反刍思维是个体面对问题时消极、反复思考, 并负性认知放大潜在影响的心理特质。个体对新冠病毒疫情的信息焦虑, 会让个体反复思考分析已经获得的信息, 并不断怀疑否定积极的想法, 让自己陷入消极反刍的状态, 引发进一步搜索相关信息来消除担心, 从而产生更多的信息焦虑和手机使用。(4) 人口统计学变量存在差异。男大学生信息焦虑水平显著高于女大学生, 女大学生反刍思维水平显著高于男大学生; 文科生的反刍思维显著高于理科生; 疫情影响严重大学生的信息焦虑、负性注意偏向、反刍思维和手机成瘾均显著高于疫情影响一般大学生。综上所述, 本研究认为新冠病毒疫情下大学生信息焦虑对手机成瘾具有直接影响, 负性信息注意偏向起到调节作用, 反刍思维起到中介作用。

关键词 信息焦虑, 手机成瘾, 负性信息注意偏向, 反刍思维

The Effect of Information Anxiety on Mobile Phone Addiction of College Students Under the New Coronavirus Epidemic Situation

JIANG Li-jun

Counseling Center for Mental Health Education, Dalian University, Dalian, 116622

Abstract: In order to explore the influence of information anxiety on mobile phone addiction of college students under the coronavirus epidemic and the effect of negative information attention bias and ruminant thinking. In this study, 595 undergraduates in a university in Liaoning province were selected as research objects. Information Anxiety Scale (IAS), Mobile Phone Addiction Index (MPAI), Attention to Negative Information (ANI) and Ruminant Scale (RRS) were used as research tools to conduct the survey through online questionnaire. SPSS 22.0 software was used to sort out, input and analyze the data, and the Process plug-in compiled by Hayes was used to analyze the moderating effect with mediation. The results show that: (1) information anxiety has a direct predictive effect on mobile phone addiction. College students pay attention to negative information such as death cases and Internet words, which causes information anxiety to a certain extent. College students choose to relieve their anxiety through mobile games or social software. Online teaching and epidemic information daily work also increase students' use time and frequency of mobile phones, thus potentially affecting mobile phone addiction caused by excessive use of mobile phones. (2) The attention bias of negative information plays a moderating role. The attention bias of negative information is a cognitive tendency. Individuals tend to pay attention to negative information and amplify the influence of negative information or inhibit the effect of other information. The higher the level of negative information attention bias of college students, the more likely they are to actively search for information to verify the authenticity of negative information and how much it affects them, which will aggravate the influence of information anxiety on mobile phone use. (3) Ruminant thinking plays a partial mediating role. Ruminant thinking is a psychological trait of the individual in the face of problems, which is negative, repetitive and negative. The anxiety of the novel Coronavirus epidemic will cause the individual to think and analyze the information obtained repeatedly, and constantly doubt and deny the positive thoughts, so that the individual will fall into the state of negative rumination. Trigger further searches for relevant information to allay concerns. This leads to more information anxiety and more cell phone use. (4) There are differences in demographic variables. The information anxiety level of male college students is significantly higher than that of female college students, and the ruminant thinking level of female college students is significantly higher than that of male college students. The ruminant thinking of liberal arts students is significantly higher than that of science students. Information anxiety, negative attention bias, ruminant thinking and mobile phone addiction were significantly higher than those of college students with severe epidemic situation.

To sum up, this study believes that novel Coronavirus epidemic has a direct impact on the information anxiety of college students on mobile phone addiction, while negative information attention bias plays a regulating role and ruminant thinking plays an intermediary role.

Keywords: Information anxiety; mobile phone addiction; negative information attention bias; ruminant thinking

自我控制对高中生抑郁的影响：学业拖延与反刍思维的链式中介作用

苗振东 贺宁 柯杰（通讯作者）

山西师范大学教育科学学院，临汾，041000，1729775294@qq.com

摘要 抑郁是青少年面临的主要情绪问题之一，在应对各种生活事件时由于解决问题的经验不足和情绪敏感性较高，长期经历负性事件和消极情绪的青少年更容易抑郁。前人研究表明，自我控制与青少年抑郁呈负相关，自我控制失败导致的放纵行为虽然会带来一时的满足，但随后会产生抑郁等消极情绪。学业拖延是青少年中普遍存在的问题，同时也是一种典型的由自我控制失败导致的行为，而抑郁则是长期拖延造成的众多负性情绪之一。反刍思维是指个体反复思考负性事件和消极情绪，这种自发的思考行为非但不能解决问题，

而且还会使个体在“咀嚼”负性情绪时越陷越深,进而引发抑郁。目标进程理论认为,个体没有达到预期目标时会产生反刍思维,试图通过反刍思维从心理上降低现状与目标间的差距。学业拖延程度较高的个体往往会由于自我控制力不足,而常常处于多个学业任务目标无法按时完成的境地,按照目标进程理论,更容易产生反刍思维,继而产生抑郁情绪。青少年群体中,高中生与初中和小学生相比,面临压力更大,也更有产生抑郁的风险,且以往研究并未过多探究自我控制对青少年抑郁的影响机制和具体路径。综上,本研究欲探讨自我控制对高中生抑郁的预测作用以及学业拖延和反刍思维在其间的中介作用。使用中学生自我控制量表、中学生学业拖延问卷、反刍思维量表和流调中心抑郁量表,采用方便取样对 436 名高中生进行调查,结果发现:(1)自我控制分别与抑郁、学业拖延呈显著负相关。学业拖延、抑郁、反刍思维之间存在显著正相关。(2)自我控制除了可以负向预测高中生抑郁外,还存在两条间接路径:自我控制通过学业拖延和反刍思维的链式中介作用影响高中生抑郁,自我控制通过学业拖延影响高中生抑郁。本研究探讨了自我控制对于高中生抑郁的一种影响机制,为青少年抑郁的干预提供了思路,未来研究可着眼于由自我控制失败引发的其他负性事件或消极情绪对青少年抑郁的影响。

The Influence of Self-control on Depression in High School Students: the Chain Mediating Role of Academic Procrastination and Rumination

Zhendong Miao, Ning He, Jie Ke

Institution of Education Science, Shanxi Normal University, Linfen, 041000

Abstract: Depression is one of the main emotional problems faced by adolescents. Adolescents who have experienced negative events and negative emotions for a long time are more prone to depression due to their insufficient experience in solving problems and high emotional sensitivity when dealing with various life events. Previous studies have shown that self-control is negatively related to depression in adolescents. Although the indulgence caused by failure of self-control will bring temporary satisfaction, it will subsequently produce depression and other negative emotions. Academic procrastination is a common problem among teenagers, and it is also a typical behavior caused by failure of self-control. Depression is one of many negative emotions caused by long-term procrastination. Ruminating thinking refers to the individual's repeated thinking about negative events and negative emotions. This spontaneous thinking behavior not only fails to solve the problem, but also makes the individual "chewing" negative emotions deeper and deeper, which will lead to depression. The goal progress theory believes that when an individual fails to reach the expected goal, he will produce ruminating thinking, and try to reduce the gap between the status quo and the goal psychologically through ruminating thinking. Individuals with a high degree of academic procrastination tend to be in a situation where multiple academic tasks cannot be completed on time due to insufficient self-control. According to the goal progress theory, they are more likely to produce ruminating thoughts and then depression. Among adolescents, high school students are more stressed than junior middle school and elementary school students, so they are more at risk of depression, and previous studies have not explored the mechanism and specific pathways of self-control on adolescent depression. In summary, this study intended to explore the predictive effect of self-control on depression in high school students and the mediating effect of academic procrastination and ruminating thinking. Using the Self-Control Scale for Middle School Students, Academic Delay Questionnaire for Middle School Students, Rumination Thinking Scale and CES-D, a convenient sampling was adopted to survey 436 high school students. The results showed that: (1) Self-control was significantly negatively correlated with depression and academic procrastination. Academic procrastination, depression, and ruminating thinking was significantly positively correlated. (2) In addition to self-control which could negatively predict depression in high school students, there were two indirect paths: self-control affected high school students' depression through academic procrastination and rumination, and self-control affected high school students' depression through academic

procrastination. This study explored an influence mechanism of self-control on depression in high school students, and provided an idea for the intervention of depression in adolescents. Future research may focus on the influence of other negative events or negative emotions caused by failure of self-control on depression in adolescents.

Keywords: self-control, academic procrastination, rumination, depression

测验和反馈在分段视频学习中的作用

冷晓雪¹ 王福兴¹ (通讯作者) 成美霞¹

¹ 华中师范大学心理学院, 武汉, 430079, 通讯作者 Email: fxwang@ccnu.edu.cn

摘要 分段原则是多媒体学习中一个有效的学习促进原则, 被很多实证研究所证实其有效性(Mayer, 2021)。分段通过在连续动画或视频中添加停顿的方式将学习材料分为几个小单元, 为学习者提供时间来加工前一单元的信息, 从而降低学习者在视频学习过程中额外的认知负荷, 减少学习者不断处理新信息的需要。以往的积极分段研究采用了回忆、总结、解释等任务, 本研究扩展不同的学习任务, 使用测验对分段进行积极干预。实验1选取42名大学生为被试, 对比了观看分段视频和在分段暂停中进行测验两种情况下的学习效果, 发现了测验在简单材料中的积极效应, 结果表明: 1)学习者在分段中进行测验后保持测验和迁移测验的成绩更好; 2)在分段暂停中进行测验的学习者在学习后一周的回忆测验中表现比观看分段视频的学习者更好。实验2提高了材料的难度, 对比了观看分段视频、在分段中进行测验和在分段中进行测验并且阅读形成性反馈三种情景下学习者的学习表现。结果发现: 1)在分段中进行测验的学习者最终的保持测验、迁移测验和延迟测验成绩都和观看分段视频的学习者没有显著差异; 2)在测验后接受反馈的学习者在保持测验和延迟保持测验上的学习表现都好于其他两组; 3)接受额外反馈的学习者在迁移测验和延迟迁移测验上的学习表现与其他两组学习者没有显著差异。结果表明测验本身在困难材料中并没有产生积极作用, 但如果向学习者呈现形成性反馈, 便能够重新观察到测验的积极效应。本研究发现了在分段视频中测验和反馈的积极效应, 扩展了积极分段的相关研究, 丰富了对多媒体学习和线上学习的理解。

Incorporated Self-test and Feedback Enhances Learners' Learning Outcomes during the Learning with Segmentation

Leng Xiaoxue, Wang Fuxing, Cheng Meixia

Department of Psychology, Central China Normal University, Wuhan

Abstract: The segmentation principle is an effective learning facilitation principle in multimedia learning, which has been proved by many empirical studies (Mayer, 2021). Segmentation divides the animation into several small units by adding pauses in the continuous animation, so as to provide learners with additional time to process the information of the previous unit, thus reducing cognitive load of learners. Active segmentation further adds learning activities to the traditional form of segmentation, and enhances learners' cognitive processing of the previous information through various learning tasks, so that segmentation can be more meaningful. Previous studies on active segmentation used tasks such as recall, summary, explanation and etc. In this study, different learning tasks were extended and self-test strategy was used to actively intervene in segmentation. In Experiment 1, we recruited 42 undergraduates and compared learning outcomes of watching segmented videos group and receiving self-test in segmented pauses group. Positive effects of testing were observed. The results showed that: 1) learners performed better in retention test and transfer test after receiving self-test between segments; 2) learners who were tested in segment pauses outperformed on a recall test a week later than those who just watched segmented videos. Experiment 2 increased the difficulty of learning material and compared the learning performance of learners in three conditions: watching segmented videos, taking tests between segments, and receiving formative feedback after testing. The results showed that: 1) The final scores of retention test, transfer test and delayed test were not significantly different from those of learners who watched the segmented video; 2) learners who received feedback after the test performed

better on retention test and delayed retention test than the other two groups; 3) learners who received additional feedback had no significant difference in learning performance on transfer test and delayed transfer test compared with the other two groups. The results indicated that self-test does not have a positive effect on the difficult material, but when learners are given formative feedback, the positive effect of self-test can be re-observed. This study found the positive effects of self-test and feedback in segmented videos, expanded the relevant research on active segmenting, and enriched the understanding of multimedia and online learning.

青少年心理素质在学习压力与自杀意念关系中的调节作用

蔡婷婷 桂腾娅 付进进 彭小凡

贵州师范大学心理学院, 贵阳, 550025, 通信作者: 彭小凡 Pengxf@gznu.edu.cn

摘 要 探讨不同心理素质水平下青少年学习压力、正负情绪及自杀意念之间的内在心理作用机制, 为中小学开展心理健康教育和预防自杀工作提供实证支持和指导。采用简单分层抽样, 在 7~12 年级中按照年级分层, 对 1841 名中学生进行学习压力量表、正负情绪量表、心理素质量表和青少年自杀意念量表测量。结果发现:

(1) 学业压力既能直接影响自杀意念, 也能通过减少(增加)正(负)情绪间接影响自杀意念, 正负情绪均在学习压力与自杀意念之间起部分中介作用。(2) 心理素质只调节负性情绪对自杀意念的影响, 具体而言, 相比于心理素质高的个体, 心理素质低的个体的负性情绪对自杀意念的预测作用更大。研究结果启示, 当青少年面对学习压力时, 积极情绪会降低自杀意念, 消极情绪则会增加自杀意念。无论个体心理素质水平的高低, 心理健康教育应该对青少年无差别实施, 学习压力会对他们产生同样的痛苦。

Moderating effect of psychological Sushi on relationship between study stress and suicidal ideation in adolescents

CAI Tingting, GUI Tengya, FU Jinjin PENG Xiaofan

School of Psychology, Guizhou Normal University, Guiyang, 550025, China

Abstract: To examine the relationship among study stress, positive and negative affect and adolescents' suicidal ideation at different levels of Psychological Suzhi, and to provide reference for preventing suicide and promoting mental health of adolescents. A total of 1841 middle school students were investigated. The Study Stress Questionnaire for Middle School, Positive and Negative Affect Scale, Adolescent's Psychological Suzhi Questionnaire (simplified version) and Positive and Negative Suicide Ideation Scale was used to assess study stress, affect state, psychological sushi, and suicide ideation respectively. Results: (1) the study stress not only directly predicted adolescents' suicidal ideation, but also indirectly through positive and negative affect. Positive and negative affect played partial mediating effect between study stress and suicidal ideation. (2) Psychological sushi played a moderating role in the relationship between negative affect and suicidal ideation. Specifically, it had stronger predictive effects for students who had lower level of psychological sushi than those who had higher psychological sushi. Conclusion: when adolescents suffer study stress, positive affect can reduce suicidal ideation, while negative affect can increase suicidal ideation. Regardless of the level of psychological sushi, mental health education should be carried out for adolescents without any difference, because study stress might produce the same pain to them.

Keywords: adolescents; study stress; positive and negative affect; psychological sushi; suicidal ideation

父母情感温暖对儿童青少年学校投入的影响：有调节的中介模型

李瑞菁¹ 丘彩霞¹ 丁宁¹ 陈偲菡¹ 聂衍刚¹ (通讯作者)

¹ 广州大学教育学院青少年心理与行为研究中心, 广州, 510006, nie-yangang@gzhu.edu.cn

摘 要 大量研究指出学校投入对儿童青少年的发展起着至关重要的作用, 它不仅能对儿童青少年的问题行

为起到预防作用，还可以为儿童青少年积极发展提供许多机会。以往研究发现，积极的父母教养方式能影响儿童青少年的学校投入水平，但是两者之间具体的影响机制有待进一步探究。因此，本研究探索了儿童青少年自我管理能力和父母情感温暖与学校投入的中介作用，以及学校氛围对上述中介效应的调节作用。采用父母情感温暖量表、青少年自我管理量表、学校氛围量表和学校投入量表对广州市五所中小学校的 1033 名学生进行测试。结果表明：（1）在控制了性别、年龄后父母情感温暖可以正向预测学校投入；（2）自我管理在其中起中介作用，即父母情感温暖可以通过自我管理间接影响学校投入；（3）父母情感温暖影响学校投入的有调节的中介模型成立，学校氛围在调节中介模型的前半段（父母情感温暖→自我管理）中，感知更优的学校氛围可以强化父母情感温暖对自我管理能力的促进作用，而在不良学校氛围感知中，父母情感温暖对自我管理能力的相对影响较小。学校氛围在调节中介模型的后半段（自我管理→学校投入）中，相对于学校氛围水平较高的青少年，自我管理对于学校投入水平较低的青少年更显著。研究揭示了父母情感温暖影响青少年学校投入的机制，这对改善父母教养方式、增强儿童青少年学校投入的实践工作具有一定的参考价值。因此，父母在面对儿童青少年学业发展问题时，除了给予物质的支持以外，应更多给予温暖、鼓励等心理层面的支持，促进儿童青少年形成自主定向。学校和教育工作者应当在明确孩子自我管理和学校氛围水平后，更多关注和改善低自我管理个体的学校氛围状况，更多提升和促进自我管理低个体的学校氛围水平。

The Effects of Parental Emotional Warmth on School Engagement of Children and Adolescents: A Moderated Mediation Model

Ruijing Li¹, Caixia Qiu¹, Ning Ding¹, Siai Chen¹, Yangang Nie^{1*}

¹ Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006, China

Abstract: A large number of studies have pointed out that school engagement plays a vital role in the development of children and adolescents. It can not only prevent the problem behaviors of children and adolescents, but also provide many opportunities for the positive development of children and adolescents. Previous studies have found that positive parenting styles can affect the level of school engagement of children and adolescents, but the specific influencing mechanism between the two needs to be further explored. Therefore, this study explored the mediating effect of children and adolescents' self-management ability on parental emotional warmth and school engagement, and the moderating effect of school climate on the above mediating effect. The parents' emotional warmth scale, adolescent self-management scale, school climate scale and school engagement scale were used to measure 1033 students from primary and middle schools in Guangzhou. The results showed that : (1) parental emotional warmth positively predicted school engagement after controlling for gender and age; (2) Self-management plays a mediating role, that is, parental emotional warmth can indirectly affect school engagement through self-management; (3) The moderated mediating model of parental emotional warmth affecting school engagement was established. In the first half of the mediating model (parental emotional warmth → self-management), the better perceived school climate can strengthen the promoting effect of parental emotional warmth on self-management ability, while in the negative school climate perception, the influence of parental emotional warmth on self-management ability is relatively small. In the second half of the mediating model (self-management → school engagement), self-management was more significant for adolescents with low school engagement than for adolescents with high school climate. The study reveals the mechanism of how parents' emotional warmth affects teenagers' school engagement, which has certain reference value for improving parents' parenting style and enhancing teenagers' school engagement. Therefore, parents should provide psychological support such as warmth and encouragement in addition to material support when facing the problems of children and adolescent academic development, so as to promote the formation of independent orientation of children and adolescents. Schools and educators should pay more attention to and improve the school climate of individuals with low self-management, and promote the school atmosphere level of individuals with low self-management ability after clarifying the level of children's self-management and school climate.

青少年退避行为和学习焦虑的关系：链式中介效应及性别差异

王淑茵 卢家楣（通讯作者）

上海师范大学，上海，200000, lujiamei@vip.163.com

摘要 退避行为是一种消极的心理防御机制，其实质是习得性无助的表现，常伴有自卑、焦虑、敏感等个性特征，退避行为也是心理倦怠的一种表现，并且退避行为还预示着消极的应对方式。青少年的退避行为常表现为适应不良和社交障碍等，但在青少年群体中退避行为和其学业情绪的关系尚不明确。基于学业情绪的控制-价值理论和性别动机理论，本研究考察了客观支持和情绪管理在青少年退避行为对学习焦虑影响中的链式中介作用及性别差异。本研究采用应对方式量表、青少年学业情绪量表、社会支持量表和情绪管理量表对洛阳市的一所公立学校的 1022 名中学生进行调查。结果发现：（1）退避行为与青少年学习焦虑呈显著正相关，退避行为对青少年学习焦虑有显著的正向预测作用，退避行为对青少年学习焦虑的直接效应无性别差异；（2）在客观支持的单独中介作用中存在性别差异，男生群体的中介效应显著，女生群体的中介效应不显著；（3）在情绪管理的单独中介作用中存在性别差异，男生群体的中介效应不显著，女生群体的中介效应显著；（4）在客观支持和情绪管理的链式中介作用中不存在性别差异，在男生群体和女生群体中的中介效应皆显著。本研究结果显示了客观支持和情绪管理可以减少有退避行为青少年学习焦虑的产生和发展，有助于揭示退避行为对不同性别青少年学习焦虑的影响及其作用机制，对有退避行为青少年的学习焦虑的预防和干预提供了参考意见并具有一定的指导意义。

The Relationship between Adolescents' Avoidance and Learning Anxiety: A Serial Mediation Model and Gender Differences

Wang Shuyin, Lu Jiamei (Corresponding Author)

Shanghai Normal University, Shanghai 200000, China. E-mail: lujiamei@vip.163.com

Abstract: Avoidance is a kind of negative psychological defense mechanism. It's the manifestation of learned helplessness, which is often accompanied by inferiority, anxiety, sensitivity and other personality characteristics. Avoidance is also a manifestation of mental burnout, and it also indicates negative coping style. However, the relationship between adolescents' avoidance and learning anxiety is not clear. Based on the control-value theory of academic emotions and gender motivation theory, the current study aims to explore the role of objective support and emotion management in the association between avoidance and learning anxiety among adolescents and whether there are gender differences in the mediating effects. Adolescents ($N=1022$, 525 boys and 497 girls) were selected from a middle school in the city of Luoyang. Participants completed the Coping Style Questionnaire, Social Support Questionnaire, Emotional Management Scale and Academic Emotions Questionnaire. All the measures showed good reliability and validity in the present study. Data was analyzed using SPSS 21.0 and MPLUS 7.1. The analysis of structural equation model found that (1) Avoidance was positively correlated with learning anxiety significantly and had a significant positive predictive effect on learning anxiety. There was no gender difference in the direct effect of avoidance on learning anxiety. (2) There was a gender difference in the separate mediating effects of objective support. The mediating effect was significant in the boy group but not in the girl group. (3) There was a gender difference in the separate mediating effects of emotion management. The mediating effect was significant in the girl group but not in the boy group. (4) No gender difference in the serial mediating effect of objective support and emotion management was found. The mediating effect was significant in both the boy group and girl group. The results are helpful to reveal the relationship and mechanism of avoidance on learning anxiety among adolescents of

different genders. The implications of our findings for the prevention and intervention of adolescents' learning anxiety are also discussed.

中学生积极/消极情感对学校适应的影响：亲子亲合调节的性别差异

葛文静¹ 姚良莎¹ 陈思洁¹ 曾练平¹ (通讯作者)

¹ 贵州师范大学心理学院, 贵阳, 550001, zenglianping@163.com

摘要 对于中学生而言, 能否良好适应学校环境是评价其心理健康发展水平的指标之一。社会、学校和家长也一直致力于帮助中学生提升其学校适应水平。基于已有研究可知情绪会对个体适应能力产生影响, 拓展-构建理论也为此提供了理论依据, 因此本研究关注积极/消极情感对中学生适应的影响。家庭是中学生除学校以外的重要成长环境, 根据家庭系统理论和依恋理论可知良好的家庭模式有利于提升个体适应水平。亲子关系是众多家庭关系中的重要一环, 而亲子亲合是亲子关系中的积极方面, 那么亲子亲合能否调节不同情绪对中学生学校适应的影响呢? 这有待考证。此外, 多项研究表明亲子关系会因孩子性别不同而存在差异, 性别也可能会影响到亲子亲合的调节作用。综上, 本研究构建一个双调节模型, 以贵州省 1100 名中学生为调查对象, 以积极/消极情感量表、学校适应量表、亲子亲合量表作为测量工具, 运用 SPSS26.0 和 Mplus7.4 进行数据分析。结果发现: (1) 积极情感与学校适应正相关 ($r=0.46, p<0.001$), 消极情感与学校适应负相关 ($r=-0.34, p<0.001$); (2) 亲子亲合调节积极情感与学校适应之间的关系, 高低亲子亲合水平下均显著; (3) 亲子亲合对消极情感与学校适应的调节作用存在显著的性别差异, 各水平下均显著。结论: 社会、学校和家长应及时关注中学生情绪问题对其学校适应的影响, 不同亲子亲合水平的男女中学生应得到不同的关注度, 进而更有效地帮助中学生提升学校适应水平。

Influence of Middle School Students' Positive/Negative Affect on School Adjustment: Moderating Effect of Parent-Child Cohesion and Its Gender Difference

Ge Wenjing¹, Yao Liangsha¹, Chen Sijie¹, Zeng Lianping¹

School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract: For middle school students, whether they can adapt to the school environment is one of the indicators to evaluate their mental health development level. Society, schools and parents have also been working to help middle school students improve their school adjustment. Based on existing studies, it can be known that emotions will have an impact on individual adaptive ability, and the Broaden-and-Build Theory also provides a theoretical basis for this. Therefore, this study focuses on the impact of positive/negative affect on the adaptation of middle school students. Family is an important growing environment for middle school students besides school. According to Family System Theory and Attachment Theory, a good family pattern is conducive to improving the level of individual adaptation. Parent-child relationship is an important part of many family relationships, and parent-child cohesion is a positive aspect of parent-child relationship. Then, can parent-child cohesion moderate the influence of different emotions on school adjustment of middle school students? That remains to be seen. In addition, a number of studies have shown that parent-child relationship is different depending on the gender of the child, and gender may also affect the moderating effect of parent-child cohesion. To sum up, this study constructed a dual-moderation model, taking 1100 middle school students in Guizhou province as survey objects, using positive/negative affect scale, school adjustment scale and parent-child cohesion scale as measurement tools, and using SPSS26.0 and Mplus7.4 for data analysis. The results showed that : (1) positive correlation between positive affect and school adjustment ($r=0.46, p<0.001$); Negative affect were negatively correlated with school adjustment ($r=-0.34, p<0.001$); (2) Parent-child cohesion moderates the relationship between positive affect and school adjustment, which is significant at both high and low

parent-child bonding levels; (3) There is a significant gender difference in the moderating effect of parent-child cohesion on negative affect and school adjustment, which is significant at all levels. Conclusion: The society, schools and parents should pay close attention to the influence of emotional problems of middle school students on their school adjustment. Male and female middle school students with different parent-child cohesion levels should get different attention, so as to help middle school students improve their school adjustment level more effectively.

MAOA 基因 rs6323 多态性与同伴侵害对青少年自伤行为的影响

李金文¹ 魏 铭¹ 刘 霞¹ (通讯作者)

¹ 北京师范大学发展心理研究院, 北京, 100875, liuxia@bnu.edu.cn

摘 要 自伤行为是一种在青少年群体中广泛存在的复杂且危险的心理病理行为, 严重影响着青少年的身心健康水平, 甚至导致自杀等后果。从基因和环境交互作用的视角探讨 MAOA 基因 rs6323 多态性与同伴侵害对青少年自伤行为的作用模式, 对于深入揭示青少年自伤行为的产生机制, 尤其是基因和环境在这一过程中的联合作用方式具有重要意义。

本研究结合基因检测技术与问卷调查, 主要探讨了 MAOA 基因 rs6323 多态性与同伴侵害(关系侵害、身体侵害)对青少年自伤行为的影响及其性别差异。结果发现: (1) 控制年龄和抑郁水平后, 同伴侵害对男生自伤行为的主效应显著, MAOA 基因 rs6323 多态性对女生的主效应显著; (2) MAOA 基因 rs6323 多态性和同伴侵害对男女生的交互作用均显著, 但这一交互作用模式存在显著的性别差异: 在男生群体中, 同伴侵害主要对携带 G 等位基因的男生具有显著的预测作用, 对携带 T 等位基因者的预测作用不显著; 而在女生群体中, 同伴侵害主要对携带 T 等位基因的女生有显著的预测作用, 而对携带 G 等位基因者无显著预测作用。本研究结果启示, 同伴侵害对青少年自伤行为的影响会受到 MAOA 基因 rs6323 多态性和性别的调节作用, 不同性别的 MAOA 基因 rs6323 多态性等位基因携带者, 其对同伴侵害消极影响的敏感程度存在显著差异, 这为青少年自伤行为的预防和干预提供了重要科学借鉴。

关键词 自伤行为, MAOA 基因 rs6323 多态性, 同伴侵害, 青少年

The Influence of MAOA Gene Rs6323 Polymorphism and Peer Victimization on Adolescents' Non-suicidal Self-injury

LI Jinwen, WEI Ming, LIU Xia

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: Non-suicidal self-injury is a complex and dangerous psychopathological behavior widely existing in adolescents, which seriously affects the physical and mental health of adolescents, and even leads to suicide and other consequences. Discussing the mode of action of rs6323 polymorphism of MAOA gene and peer victimization on adolescent non-suicidal self-injury from the perspective of gene-environment interaction is of great significance to reveal the mechanism of generation of adolescent non-suicidal self-injury, especially the joint action mode of gene and environment in this process.

In this study, combined with gene detection technology and questionnaires, the effects of MAOA gene rs6323 polymorphism and peer victimization on non-suicidal self-injury of adolescents and their gender differences were investigated. The results showed that: (1) After controlling for age and depression level, the main effect of peer victimization on boys' non-suicidal self-injury was significant, and the main effect of the MAOA gene rs6323 polymorphism on girls was significant; (2) The interaction between the polymorphism of MAOA gene rs6323 and peer victimization on adolescents' non-suicidal self-injury was significant, and there was a significant gender difference in this interaction pattern. Specifically, in the male group, peer victimization could positively predict the G allele carriers' non-suicidal self-injury, while it couldn't predict T allele carriers' non-suicidal self-injury. In contrast, in the female group, peer victimization could positively predict T allele carriers' non-suicidal self-injury, while it

couldn't predict the G allele carriers' non-suicidal self-injury. The results of this study indicate that the influence of peer victimization on adolescents' non-suicidal self-injury behavior is moderated by MAOA gene rs6323 polymorphism and gender. The sensitivity of MAOA gene rs6323 polymorphism allele carriers to the negative effects of peer victimization is significantly different, which provides an important scientific reference for the prevention and intervention of adolescent non-suicidal self-injury.

Keywords: Non-suicidal self-injury, MAOA gene rs6323 polymorphism, Peer victimization, Adolescents

摘 要 高中生正面临人生的重大考验——高考，繁重的课业和频繁的考试使高中生不同程度地出现学习倦怠现象。所谓学习倦怠是指学生因长期的学业负荷而产生的精力耗竭、对学校课业及活动的热忱消失、对同学态度冷漠和疏离的行为及成绩未如预期而对学校课业产生的一种消极态度。学习倦怠不仅直接影响学生的学业，还会引发心情抑郁烦闷，甚至出现社交回避、睡眠障碍等更严重的心理问题。相关研究表明，学业倦怠与个体因素和外部环境因素密切相关，本研究拟从个体角度出发，选取羞怯这一重要的人格特质变量，探讨其与高中生学业倦怠的关系及学业焦虑的中介机制；同时，基于努力——恢复模型所指出的恢复体验对个体焦虑等状态具有重要的缓冲作用，本研究选取恢复体验这一积极变量，探讨其对学业焦虑的中介效应是否具有缓冲作用，从而为高中生学业倦怠的辅导干预提供一些指导借鉴。采用方便取样，从山东省济南市的两所高中抽取 585 名高中生作为被试，以羞怯量表、学业焦虑量表、恢复体验量表、学业倦怠量表为测量工具对被试进行问卷调查，探讨羞怯与学业倦怠的关系及学业焦虑的中介作用和恢复体验的调节作用。主要研究结果如下：（1）高中生学业倦怠程度总体偏高。高中生的学业倦怠程度在年级上存在显著差异，高二学生的学业倦怠程度显著高于高一学生。（2）高中生羞怯、学业焦虑与学业倦怠之间两两正相关。（3）学业焦虑在高中生羞怯与学业倦怠之间起部分中介作用，羞怯不仅能够直接正向预测高中生的学业倦怠程度，还通过学业焦虑间接预测学业倦怠。（4）恢复体验在羞怯与学业焦虑起到调节作用，与低恢复体验相比，高恢复体验条件下，羞怯对学业焦虑的正向预测作用更大，整体上高恢复体验的个体学业焦虑始终低于低恢复体验的个体。这一结果启示我们要高度关注高中阶段学生的学业倦怠情况，特别是具有羞怯特质的学生群体，为其创造良好的学习环境，使其形成高恢复体验，最大限度地降低学业焦虑情绪，从而降低学业倦怠程度。

The Relationship between High School Students' Shyness and Academic Burnout: A Moderated Mediation Model

SUN Changlin, ZHANG yifang, ZHENG yuanhua, ZHANG Hai, HU Yongqi, CHEN Yingmin

Shandong Normal University, Shandong, Jinan, 250358

Abstract: High school students are facing a great test of life - The university entrance examination, heavy schoolwork and frequent examinations make high school students appear learning burnout in different degrees. The so-called learning burnout is a kind of passive attitude to the school work, which is caused by the students' exhaustion of energy, the loss of enthusiasm to the school work and activities, the behavior of indifference and estrangement to the classmates, and the scholastic attainment fell short of expectations duing to long-term academic load. Learning burnout not only directly affects students' academic performance, but also leads to depression, even social avoidance, sleep disorders and other more serious psychological problems. Research on academic burnout shows that academic burnout is closely related to individual factors and external environmental factors. This study intends to select the important personality traits of shyness from an individual perspective, and explore its relationship with academic burnout of high school students and academic anxiety in the intermediary mechanism; at the same time, based on the

effort-recovery model, the recovery experience has an important buffer effect on individual anxiety and other states. This study selected the positive variable of recovery experience to explore whether its mediating effect on academic anxiety has a buffer Function, so as to provide some guidance for intervention of academic burnout of high school students. Using convenient sampling methods, 585 high school students were selected from two high schools in jinan in Shandong Province as subjects. The shyness scale, academic anxiety scale, recovery experience scale and academic burnout scale were used as the measurement tool, conducted a questionnaire survey on the subjects to explore the relationship between shyness and academic burnout, as well as the mediating role of academic anxiety and the regulatory role of recovery experience. The main findings are as follows: (1) The academic burnout of high school students is generally high. There is a significant difference in grades of academic burnout among senior high school students. The degree of academic burnout of the students in grade two is significantly higher than that of the students in grade one. (2) There are two positive correlations among shyness, academic anxiety and academic burnout of high school students. (3) Academic anxiety plays a partial intermediary role between high school students' shyness and academic burnout. Shyness can not only directly predict the degree of academic burnout of high school students, but also indirectly predict academic burnout through academic anxiety. (4) Restorative Experience Moderates Shyness and academic anxiety, compared with the low recovery experience, shyness has a greater positive predictive effect on academic anxiety under the high recovery experience, On the whole, the academic anxiety of individuals with high recovery experience was always lower than that of individuals with low recovery experience. This result suggests that we should pay close attention to the high school students' academic burnout, especially the group of students characterized by shyness, and create a good learning environment for them to form a high recovery experience, reduce the academic anxiety to the greatest extent, thus reducing the degree of academic burnout.

Keywords: Academic burnout, shyness, academic anxiety, recovery experience, high school students

在职母亲工作家庭平衡对青少年情绪调节自我效能感的影响： 基于亲子配对数据分析

曾小叶¹ 王语嫣¹ 熊文强² 骆玉群³ 曾练平¹(通讯作者)

摘 要 根据溢出交叉理论和家庭系统理论, 个体在工作与家庭领域的平衡体验会溢出到亲子系统。同时, 中国在职母亲作为孩子的主要抚养人, 其工作家庭平衡带来的后效影响对其子女的心理健康发展与内外化适应问题更为显著。以往研究表明, 随着时间的推移母亲的工作家庭冲突体验与儿童内化问题显著正相关, 有鉴于此, 本研究基于亲子匹配数据, 从中国在职母亲的工作家庭平衡视角入手来探讨青少年情绪调节自我效能感的影响因素及其形成机制, 并且考察母亲感知家庭功能与青少年感知家庭功能在其中的链式中介作用。采用工作家庭平衡量表、总体家庭功能问卷和青少年情绪调节自我效能感问卷对 560 名青少年及其在职母亲进行调查研究, 运用 SPSS24.0 和 PROCESS 宏插件对数据进行统计分析。结果发现: (1) 除在职母亲的工作家庭平衡与青少年感知家庭功能未呈现显著相关外, 在职母亲工作家庭平衡、母亲感知家庭功能与青少年情绪调节自我效能感均两两之间呈现显著正相关($r=0.61, p<0.00$; $r=0.13, p<0.05$; $r=0.13, p<0.05$); (2) 在职母亲工作家庭平衡对青少年情绪调节自我效能感具有显著的直接预测作用($\beta=0.35, p<0.05$); (3) 母亲感知家庭功能和青少年感知家庭功能在在职母亲的工作家庭平衡与青少年情绪调节自我效能感之间起链式中介作用(95%CI=0.15~0.45)。结论: 本研究从亲子匹配数据入手, 分析在职母亲工作家庭平衡如何跨越亲子系统对青少年的情绪调节自我效能感产生影响, 揭示了亲子分别感知到的家庭功能在其中的链式中介作用, 为家庭和社会思考如何有效改善青少年情绪调节自我效能感, 增强积极情绪表达能力和调节消极情绪提供了理论支撑与实证数据。

3 ZunYi No.15 High School, Zunyi, 563000

Abstract: According to the theory of spillover and crossover and the theory of family system, the balance experience of individuals in the field of work and family will overflow to the parent system. At the same time, working mothers in China are the main supporters of their adolescent, and the after-effects of their work family balance have more significant problems with their children's mental health development and internal and external problems. Previous studies have shown that mothers' experience of work-family conflict is significantly positively correlated with children's internalization problems over time. In view of this, this study is based on parent-child dyadic data to explore adolescents' emotional regulation from the perspective of work-family balance of working mothers in China. The influencing factors of self-efficacy and its formation mechanism, and the intermediary effect of mothers' perception of family function and teenagers' perception of family function in it. The Work Family Balance Scale, the Overall Family Functioning Questionnaire and the Adolescent Emotion Regulation Self-Efficacy Questionnaire were used to investigate and research 560 adolescents and their working mothers. The data were statistically analyzed using SPSS24.0 and the PROCESS. The results found that: (1) Except for the work family balance of working mothers and adolescents' perceived family functioning, there is no significant correlation, while working mothers' work family balance, mothers' perceived family functioning and adolescents' emotional regulation self-efficacy are all positively correlated. ($r=0.61, p<0.00$; $r=0.13, p<0.05$; $r=0.13, p<0.05$); (2) Working mothers' work family balance has a significant direct predictive effect on the self-efficacy of adolescents' emotion regulation ($\beta=0.35, p<0.05$); (3) The mother's perceived family function and the adolescent's perceived family function play a chain mediating role between the working mother's work family balance and the self-efficacy of adolescent emotion regulation ($95\%CI=0.15 \sim 0.45$). Conclusion: Starting from the data of parent-child dyad, this study analyzes how working mothers' work family balance has an impact on adolescents' emotional regulation self-efficacy across the parental system, revealing the chain mediating role of family functions perceived by parents and children. It provides theoretical support and empirical data on how to effectively improve the self-efficacy of adolescents' emotional regulation, enhance their ability to express positive emotions and regulate negative emotions.

摘要 自杀意念作为自杀行为的关键预测因素，是指个体在思想或认知层面上产生想要结束自己生命的想法。因此，探究自杀意念的影响因素对高中生心理健康发展具有重要意义。前人研究发现，亲子亲合体现在亲子间积极的行为互动和心理的亲密感受之中，可作为保护性因素以降低高中生自杀意念。此外，亲子亲合还可能通过使个体感受到来自父母的支持，从而降低抑郁-焦虑-压力水平，最终减少自杀意念。鉴于此，本研究拟探讨亲子亲合对自杀意念的影响以及领悟社会支持和抑郁-焦虑-压力在其中的链式中介作用。采用家庭适应与亲合评价量表II、领悟社会支持量表、简版抑郁-焦虑-压力量表、青少年自杀意念量表，采取方便抽样法通过实地发放问卷的方式，在高中生群体中收集 2413 份有效问卷。采用 SPSS25.0 及 PROCESS 插件对数据

进行统计分析。结果发现：（1）亲子亲合与领悟社会支持呈显著正相关（ $r=0.43, p<0.001$ ），与抑郁-焦虑-压力和自杀意念呈显著负相关（ $r=-0.30, p<0.001$ ； $r=-0.35, p<0.001$ ）；领悟社会支持与抑郁-焦虑-压力和自杀意念呈显著负相关（ $r=-0.31, p<0.001$ ； $r=-0.45, p<0.001$ ）；抑郁-焦虑-压力和自杀意念呈显著正相关（ $r=0.55, p<0.001$ ）；（2）亲子亲合对高中生自杀意念具有显著负向预测作用（ $\beta=-0.11, p<0.001$ ）；（3）领悟社会支持和抑郁-焦虑-压力在亲子亲合与自杀意念之间起链式中介作用（95%CI=-0.06~-0.04）。结论：本研究分析了亲子亲合如何对高中生自杀意念产生影响，揭示了领悟社会支持和抑郁-焦虑-压力在其中的链式中介作用，为学校思考如何有效降低高中生自杀意念水平，增强积极情绪体验和提升心理健康水平提供了实证依据。

The Effect of Parent-Child Cohesion on Suicidal Ideation in High School Students: The Chain Intermediary Role of Perceived Social Support and Depression-Anxiety-Stress

Zeng Xiaoye¹, Zhang Rongsheng², Zeng Lianping¹

1.School of Psychology, Guizhou Normal University, Guiyang 550001, China

2.Sansui Ethnic High School, Southeast Guizhou, 556500

Abstract: Suicidal ideation, a key predictor of suicidal behavior, refers to an individual's thoughts at the ideological or cognitive level of wanting to end his or her life. Therefore, it is important to explore the factors influencing suicidal ideation for the development of mental health of high school students. Previous research has found that parent-child cohesion, which is embodied in positive behavioral interactions and psychological intimacy between parents and children, can serve as a protective factor to reduce suicidal ideation in high school students. Further, parent-child cohesion may also allow individuals to feel supported by their parents. This may decrease the individual's depression-anxiety-stress levels and ultimately reduces their suicidal ideation. In view of this, the present study was designed to investigate the effect of parent-child cohesion on suicidal ideation and the chain mediating role of perceived social support and depression-anxiety-stress in it. The Positive and Negative Suicide Ideation (PANSI), The Depression Anxiety Stress Scales (DASS-21), Perceived Social Support Scale (PSSS), Family Adaptability and Cohesion Evaluation Scale (FACES-II) was used to collect 2413 valid questionnaires from high school students through field distribution using a convenience sampling method. SPSS25.0 and PROCESS plug-in were used for statistical analysis of the data. The results revealed that (1) parent-child cohesion was significantly and positively correlated with perceived social support ($r=0.43, p<0.001$), and it negatively correlated with depression-anxiety-stress and suicidal ideation ($r=-0.30, p<0.001$; $r=-0.35, p<0.001$); perceived social support was significantly and negatively correlated with depression-anxiety-stress and suicidal ideation ($r=-0.31, p<0.001$; $r=-0.45, p<0.001$); depression-anxiety-stress and suicidal ideation were significantly positively correlated ($r=0.55, p<0.001$); (2) parent-child cohesion was a significant negative predictor of suicidal ideation among high school students ($\beta=-0.11, p<0.001$); (3) Parent-child cohesion indirectly influences suicidal ideation through a chain mediating effect of perceived social support and depression-anxiety-stress (95% CI=-0.06~-0.04). This study analyzed how parent-child cohesion affects suicidal ideation in high school students and revealed the chain mediating role of perceived social support and depression-anxiety-stress in it. This provided an empirical basis for schools to consider how to effectively reduce the level of suicidal ideation, and enhance positive emotional experiences and improve psychological well-being in high school students.

互联网使用对高中生求知欲的影响： 自我控制和儒家传统价值观的双重中介作用

曾小叶¹ 肖仕飞² 曾练平¹ (通讯作者)

1 贵州师范大学心理学院, 贵阳, 550001, 通讯作者 E-mail: zenglianping@163.com

2 贵州省遵义市第十五中学, 遵义, 563000

摘要 随着互联网的迅猛发展, 信息量爆炸性增长, 高中生想要从庞大信息量中获取有用的知识并进行深入探究, 求知欲在其中发挥着极其重要的作用。求知欲是高中生进行创新活动的开端, 是创新型人才的基本特质, 它强调即使知识的实用价值并不直接显现出来, 也能对知识产生好奇和热衷, 并进一步尝试去学习和理解。对于互联网使用, 前人研究主要集中在其消极方面, 例如病理性网络使用、网络成瘾等。本文从积极的角度出发, 拟探讨互联网使用对求知欲的影响以及自我控制与儒家传统价值观在二者之间的中介作用。采用互联网使用偏好量表、自我控制量表、儒家传统价值观量表、求知欲量表对贵州省某中学的 1798 名高中生进行了调查。对各个量表进行相关分析发现: 互联网使用与自我控制、儒家传统价值观和求知欲均存在显著的正相关关系 ($r=0.04, p<0.05$; $r=0.08, p<0.01$; $r=0.19, p<0.01$); 自我控制与儒家传统价值观和求知欲存在显著的正相关关系 ($r=0.11, p<0.01$; $r=0.20, p<0.01$); 儒家传统价值观和求知欲有显著的正相关 ($r=0.20, p<0.01$)。模型的各项拟合指标为: ($\chi^2=430.23, df=60, CFI=0.92, TLI=0.90, SRMR=0.05, RMSEA=0.06$ (90%CI[0.05, 0.06])。均达到可接受标准, 拟合度良好, 双重中介模型成立。其中互联网使用对儒家传统价值观具有显著正向预测作用 ($\beta=0.23, p<0.001$), 儒家传统价值观对求知欲具有显著正向预测作用 ($\beta=0.49, p<0.001$), 互联网使用对自我控制具有显著正向预测作用 ($\beta=0.46, p<0.001$), 自我控制对求知欲具有显著正向预测作用 ($\beta=0.19, p<0.01$), 互联网使用对求知欲具有显著正向预测作用 ($\beta=0.77, p<0.001$)。结果表明: (1) 互联网使用、自我控制、儒家传统价值观与求知欲之间呈显著正相关; (2) 互联网使用通过自我控制和儒家传统价值观的双重中介作用影响求知欲。这表明互联网使用不仅能直接影响求知欲, 也能间接地通过自我控制和儒家传统价值观对其产生影响。

关键词 互联网使用, 求知欲, 自我控制, 儒家传统价值观

The Effect of Internet Use on Inquisitiveness among High School Students: The Dual Mediating Role of Self-Control and Traditional Confucian Values

Zeng Xiaoye¹, Xiao Shifei¹, Zeng Lianping¹

1 School of Psychology, Guizhou Normal University, Guiyang 550001, China

2 ZunYi No.15 High School, Zunyi, 563000

Abstract: With the rapid development of the Internet and the explosive growth of the amount of information, high school students want to obtain useful knowledge from the huge amount of information and conduct in-depth exploration, and the thirst for knowledge plays an extremely important role. The thirst for knowledge is the beginning of high school students' innovative activities. It is the basic characteristic of innovative talents. It emphasizes that even if the practical value of knowledge is not directly manifested, it can still be curious and enthusiastic about knowledge, and further try to learn and understand. For Internet use, previous studies mainly focused on its negative aspects, such as pathological Internet use and Internet addiction. From a positive perspective, this article intends to explore the influence of Internet use on intellectual inquisitiveness and the mediating role of self-control and traditional Confucian values. Using the Internet Preference Scale, Self-Control Scale, Confucian Traditional Value Scale, and Inquisitiveness Scale, 1798 high school students in a middle school in Guizhou Province were surveyed. Correlation analysis of the various scales found that: Internet use and self-control, Confucian traditional values and inquisitiveness are all significantly positively correlated ($r=0.04, p<0.05$; $r=0.08, p<0.01$; $r=0.19, p<0.01$); there is a significant positive correlation between self-control and traditional Confucian values and thirst for knowledge ($r=0.11, p<0.01$; $r=0.20, p<0.01$); traditional Confucian values and thirst for knowledge have a significant positive correlation

($r = 0.20, p < 0.01$). The fitting indicators of the model are: ($\chi^2 = 430.23, df = 60, CFI = 0.92, TLI = 0.90, SRMR = 0.05, RMSEA = 0.06$ (90%CI[0.05, 0.06])). All meet the acceptable standards, The fit is good, and the dual mediation model is established. Among them, Internet use has a significant positive predictive effect on Confucian traditional values ($\beta = 0.23, p < 0.001$), and Confucian traditional values have a significant positive predictive effect on inquisitiveness ($\beta = 0.49, p < 0.001$), Internet use has a significant positive predictive effect on self-control ($\beta = 0.46, p < 0.001$), self-control has a significant positive predictive effect on inquisitiveness ($\beta = 0.19, p < 0.01$), Internet use The desire to know has a significant positive predictive effect ($\beta = 0.77, p < 0.001$). The results show that: (1) Internet use, self-control, traditional Confucian values, and inquisitiveness are significantly positively correlated; (2) Internet use through self The dual mediating effects of control and traditional Confucian values affect inquisitiveness. This shows that Internet use can not only directly affect inquisitiveness, but also indirectly affect it through self-control and traditional Confucian values.

Keywords: internet use, inquisitiveness, self-control, traditional confucian values

父母特定生涯行为与高一学生职业成熟度的关系及干预

龚伟 王天北 方芳 苏燕平 程亚荣 陈朝阳 (通讯作者)

宁波大学心理学系, 宁波, 315211, ccy6409@sina.com

摘要 高中阶段是青少年职业发展的重要阶段。研究表明, 在高一阶段对学生进行生涯相关的干预效果更好, 可以提高其职业成熟度。职业成熟度是指在一定的职业决策知识和态度的基础上做出适宜的职业决策的准备程度。以往针对在生涯教育领域的父母行为研究大多集中在父母教养方式上。然而, 父母教养方式在不同教育情境下有不同体现。探讨父母在青少年职业生涯中的教养行为, 即父母特定生涯行为更具有针对性和说服力。因此, 采用两项研究分别探讨父母特定生涯行为与高一学生职业成熟度的关系以及生涯课程对职业成熟度的影响。研究一采用中学生职业成熟度量表、父母特定生涯行为量表和职业决策自我效能量表对 430 名高一学生进行了调查。结果发现: 父母生涯支持对职业成熟度有正向预测作用, 且职业决策自我效能在其中起完全中介作用; 父母生涯缺失对职业成熟度有负向预测作用, 且职业决策自我效能在其中起部分中介作用; 父母生涯干预对职业成熟度没有显著的预测作用。在此基础上, 研究二结合不同父母特定生涯行为为学生生涯发展情况, 采用 3 课程分组(补充课程、自主课程、传统课程) $\times$ 2 前后测(前测、后测) $\times$ 3 被试类型(干预型、缺失型、支持型)的混合实验设计, 选取了 238 名被试, 进行为期八周, 每周一次的课程干预, 拟比较不同课程的干预效果。结果发现: (1)在职业决策自我效能上, 补充课程和自主课程自我评价分维度后测得分显著高于前测; 补充课程收集信息分维度后测得分均显著高于前测; 传统课程组学生职业决策自我效能感的两个分维度前后测差异不显著。(2)在职业成熟度上, 补充课程组后测得分显著高于前测。(3)经自主课程干预后, 父母生涯干预型学生的独立性得分有显著提升。由此可见, 补充课程对三类学生均有促进作用。自主课程适用于父母生涯干预型学生, 有助于提升独立性, 缓解亲子沟通问题。

The Relationship and Curricular Intervention between Career-specific Parental Behaviors and Vocational Maturity of High School Students

GONG Wei, WANG Tian Bei, FANG Fang, SU Yan Ping, CHENG Ya Rong, CHEN Chao-yang

Department of Psychology Ningbo University, Ningbo 315211, ccy6409@sina.com

Abstract: High school is an important stage of teenagers' career development. Researchs have shown that the effect of career-related intervention is better for senior one high school students, which can improve their career maturity. Career maturity refers to the degree of preparation for making appropriate career decisions based on certain career decision-making knowledge and attitude. The studies about parents' behavior in the field of career education focused on the parental rearing style. However, parental rearing style are different in different educational situations, the term "Career-specific Parental Behaviors" is more targeted and persuasive. Therefore, we examined the relationship

between parents' specific career behaviors and senior one high school students' vocational maturity and the effect of career curriculum on career maturity by two studies. In study 1, 430 senior one high school students were investigated by using vocational maturity scale, parent specific career behavior scale and career decision-making self-efficacy. The results shows that: (1) Parental career support positively associated with career maturity, and career decision-making self-efficacy plays a completely mediating role; lacking of engagement negatively associated with career maturity, and career decision-making self-efficacy plays a part of mediating role; Interference had no significant predictive effect on career maturity. Then on the base of study 1, study 2 combined with different parents specific career behavior of students career development, to compare the effects of intervening, we adopt 3×2×3 mixed experimental design, 238 subjects were selected for different courses intervention last for 8 weeks, once a week. The results shows that: (1) In terms of career decision-making self-efficacy, the score of supplementary courses and independent courses in the sub-dimensions of self-evaluation in the post-test was significantly higher than the pre-test; The scores of the information collected in the supplementary course were significantly higher in the post-test than the pre-test; There was no significant difference in the two dimensions of self-efficacy in the traditional course group. (2) In terms of vocational maturity, the post-test score of the supplementary course group was significantly higher than the pre-test. (3) After the intervention of independent curriculum, the independence scores of parents' career intervention students were significantly improved. In conclusion, supplementary courses have a promoting effect on all the three types of students. Autonomous courses are suitable for students with parental career intervention, which is conducive to improve their independence and alleviate parent-child communication problems.

父母工作家庭冲突对儿童问题行为的影响： 负性情绪的中介和父母养育内疚感的调节

陈诗¹ 曾练平²(通讯作者)

1 贵州师范大学心理学院, 贵阳, 550001

2 贵州师范大学心理学院, 贵阳, 550001, 通讯作者 E-mail: zenglianping@163.com

摘 要 问题行为的存在不仅会阻碍幼儿生理和心理的发展, 严重地还会危害到其以后的学习、生活及未来的社会化发展, 甚至能够延续到青春期乃至更长时间。溢出理论指出, 工作角色和生活角色之间是彼此依赖并相互影响的, 个体在工作中的情绪、态度和行为很容易延伸到家庭领域, 或将家庭中的情绪、态度和行为带进工作领域。研究发现父亲或母亲报告的工作家庭冲突越多, 自身的负性情绪越多, 其孩子的负面情绪和消极行为结果也越多。另外, 父母养育内疚感作为一把“双刃剑”不仅会给儿童的问题行为带来积极影响, 也会带来一定消极影响。鉴于此, 本研究从“溢出理论”和“内疚感是把双刃剑”的观点出发, 考察父母工作家庭冲突对儿童问题行为的影响机制。采用工作家庭冲突量表、长处与困难问卷、抑郁-焦虑-压力量表和父母养育内疚感量表调查了 896 名 3-6 岁幼儿的父母。结果显示: (1)工作家庭冲突、父母养育内疚感、负性情绪及问题行为两两之间均呈显著正相关($r=0.12-0.37$, $P<0.001$); (2)父母的负性情绪部分中介了父母工作家庭冲突和儿童问题行为的关系(95%CI: [0.06-0.11]), 中介效应占总效应的 23%; (3)父母养育内疚感调节了该中介模型的直接路径和中介效应后半段, 即①与低父母养育内疚感相比, 高父母养育内疚感可以减弱工作家庭冲突对儿童问题行为的预测作用(由 $\beta=0.36$, $P<0.001$ 减弱为 $\beta=0.20$, $P<0.001$); ②与低父母养育内疚感相比, 高父母养育内疚感会增强负性情绪对儿童问题行为的预测作用(由 $\beta=0.11$, $P<0.05$ 增强为 $\beta=0.28$, $P<0.001$)。本研究不仅丰富了溢出理论, 还为预防和干预儿童问题行为提供理论指导和实证依据。

关键词 工作家庭冲突, 儿童问题行为, 负性情绪, 父母养育内疚感

The Effect of Parents' Work Family Conflict on Children's Problem behavior: The mediating Role of Negative Emotions and the Moderating Role of Parenting Guilt

CHEN Shi¹, ZENG Lianping¹

¹ School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract: The existence of problem behaviors not only hinder the physical and psychological development of children, but also seriously endanger their future study, life and future social development, and even extend to puberty and even longer time. The spillover theory points out that the work role and life role are interdependent and influence each other, and the individual's emotions, attitudes and behaviors at work can easily be extended to the family field, or the family's emotions, attitudes and behaviors can be brought to the work field. The study found that the more work-family conflict a father or mother reported, they will have the more negative emotions, and their children will also have the more negative emotional and behavioral outcomes. In addition, parenting guilt as a "double-edged sword" will not only bring positive influence to children's problem behavior, but also bring some negative influence. Therefore, this study explores the influence mechanism of parents' work-family conflict on children's problem behaviors from the perspective of "spillover theory" and "guilt is a double-edged sword". The Work Family Conflict Scale, the Strengths and Difficulties Questionnaire, the Depression Anxiety Stress Scale-21 and the Guilt about Parenting Scale were used to investigate 869 toddler parents of 3-6 year olds. The results indicate the following: (1) Work-family conflict, parenting guilt, negative emotions and problem behavior were significantly positively correlated($r=0.12-0.37$, $P<0.001$); (2) Negative emotions played a partial mediating role between parents' work family conflict and children's problem behavior(95%CI: [0.06-0.11]), mediating effect is the total effect 23%; (3) Parenting guilt moderated the direct path of the mediation model and the mediating effect in the second half: ① Compared with low parental guilt, high parental guilt can weaken the predictive effect of work-family conflict on children's problem behavior (decreased from $\beta=0.36$, $P < 0.001$ to $\beta=0.20$, $P < 0.001$); ② Compared with low parental guilt, high parental guilt increased the predictive effect of negative emotions on children's problem behavior (enhanced from $\beta=0.11$, $P < 0.05$ to $\beta=0.28$, $P < 0.001$). This research not only enriches spillover-crossover theory, but also provides theoretical guidance and empirical evidence for preventing and intervening in children's problem behaviors.

Keywords: work family conflict, children's problem behavior, negative emotions, parenting guilt

负性情绪刺激加工对自伤青少年抑制控制的影响

刘金梦¹ 刘霞² (通讯作者)

¹ 北京师范大学发展心理研究院, 北京, 100875

² 北京师范大学发展心理研究院, 北京, 100875, liuxia@bnu.edu.cn

摘要 非自杀性自伤 (Non-Suicidal Self-Injury, NSSI,以下简称自伤) 是指在没有明确自杀意图的情况下, 个体故意、重复地改变或伤害自己身体组织的行为, 这种行为不被社会认可、且不具有致死性或致死性较低。青少年时期是自伤行为的高发期, 研究发现自伤青少年不仅具有更高的行为冲动性, 而且在情绪感受方面表现出更多的脆弱性 (情绪易唤起、强度高、难平复)。当前, 尽管青少年情绪加工的相关研究已受到广泛关注, 但关于自伤青少年情绪加工过程中的知觉特点尚不清楚。另外, 已有研究发现自伤青少年普遍存在情绪加工异常模式, 这种异常加工是否会进一步影响其行为控制过程, 还需要进一步探讨和关注。

本研究共包含两个实验, 其中实验一采用情绪图片感知范式, 检验对照组和自伤组在三类情绪图片 (中性、正性、负性) 的效价和唤醒度上的评分差异, 结果表明自伤组 and 对照组仅在负性情绪图片的效价评分中存在显著差异, 表现为自伤组对负性情绪图片的评分更低。实验二采用改进的双选 Oddball 范式, 首先检验自伤青少年的抑制控制能力是否受损, 并进一步考察三类情绪刺激对自伤青少年抑制控制能力的影响。结果发现: (1) 不论是在标准刺激还是在偏差刺激中, 自伤组和对照组的正确率均不存在显著差异; (2) 在偏差

刺激中, 自伤组的反应时显著大于对照组, 表现为自伤组在负性情绪和中性情绪条件下的反应时均显著高于对照组。研究结果提示, 自伤青少年对负性情绪图片的加工存在一定的认知偏差, 且这种偏差的情绪认知加工模式进一步影响了其抑制控制能力, 使得自伤青少年表现出较高的冲动性。

关键词 自伤行为, 情绪加工, 抑制控制, 双选 Oddball

Negative emotion disturbed inhibitory control in non-suicidal self-injury adolescence

Liu Jinmeng, Liu Xia

Institute of Developmental Psychology, Beijing Normal University, Beijing, China

Abstract: Nonsuicidal self-injury (NSSI) is defined as the deliberate, self-inflicted damage to one's body tissue without suicidal intent and for purposes that are not socially or culturally sanctioned. Adolescence is a period of the high incidence of NSSI. Research has found that adolescents with NSSI not only have higher behavioral impulsivity, but also show more vulnerability in emotional feelings (emotions are easy to arouse, high intensity, and difficult to calm). Although the related research on the emotional processing of adolescents has received extensive attention, it is still unclear about the perception of the emotional processing among NSSI adolescents. In addition, existing studies have found that adolescents with NSSI generally have abnormal pattern of emotional processing. Whether this abnormal processing will further affect their behavioral control process requires discussion and attention.

This study consists of two experiments. Experiment 1 used the emotional picture perception task to test the difference in the valence and arousal of the three types of emotional pictures (neutral, positive, and negative) between the control group and the NSSI group. The results showed that the NSSI group and the control group only had significant differences in the valence scores of negative emotion pictures, and the NSSI group had a significantly lower scores for negative emotion pictures. Experiment 2 adopted the improved two-choice Oddball task examined whether the self-injured youth's inhibition and control ability is impaired, and further explored the influence of the three types of emotional processing on the youth's behavioral inhibitory control. The results showed that: (1) There was no significant difference in the correct response rate between the self-injury group and the control group in either the standard stimulus or the deviation stimulus; (2) In the deviation stimulus, the NSSI group had significantly greater response time than the control group, and showed that the reaction time of the NSSI group under negative emotion and neutral emotion conditions was significantly higher than that of the control group. The results suggest that adolescence with NSSI have certain cognitive biases in processing negative emotion pictures, and this biased emotional cognitive processing pattern further affects their inhibitory control, making them showing higher impulsivity.

工作心理脱离与生活满意度的关系：一个有调节的中介模型

宋 香¹ 金青青¹ 曾练平¹ (通讯作者)

¹ 贵州师范大学心理学院, 贵阳, 550001, zenglianping@163.com

摘 要 近年来, 随着教育的改革和发展, 中小学教师工作量普遍超负荷, 导致其个体资源在工作领域的过度消耗, 而忽视了对生活领域的资源投入。根据努力-恢复模型, 工作心理脱离是实现工作和生活领域资源平衡的有效途径。这种工作心理脱离能够使得个体资源得以恢复, 促进其生活满意度的提升。前人研究已经证实了工作心理脱离与生活满意度呈显著正相关, 但现有的研究很少深入探讨二者之间的内在作用机制。因此, 本研究从工作心理脱离这一重要方面着手, 考察工作心理脱离对生活满意度的影响以及工作家庭平衡的中介作用和性别的调节作用, 以期提升中小学教师的幸福感水平和促进教育事业的发展提供理论依据和实践指导。本研究采用工作心理脱离量表、生活满意度量表和工作家庭平衡量表对贵州省遵义市 1250 名中小学教师进行调查, 运用 SPSS24.0 和 Mplus7.4 对数据进行统计分析。研究结果发现: (1) 工作心理脱离对生活满意

度起正向预测作用；（2）工作家庭平衡在工作心理脱离与生活满意度之间起到完全中介作用；（3）性别调节工作心理脱离与工作家庭平衡之间的关系，具体而言，相比于女教师，男教师的工作心理脱离通过工作家庭平衡的中介作用而带来的生活满意度的提升效应更强($\beta_{\text{女性}}=0.40, P<0.001, \beta_{\text{男性}}=0.60, P<0.001$)。结论：工作心理脱离作为中小学教师的一种重要恢复资源，它对生活满意度的积极影响是一个有调节的中介过程。

Psychology Detachment and life Satisfaction:

A Moderated Mediation Model

Song Xiang¹, Jin Qinqing¹, Zeng Lianping¹

School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract: In recent years, with the reform and development of education, primary and secondary school teachers work overload, lead to the individual resource excessive consumption in the field of work, and neglect of resources in the field of life. According to efforts - recovery model, psychology detachment is to realize the effective way of working and living area resource balance. This kind of psychology detachment allows individual resource was restored, promote the life satisfaction of ascension. Psychology detachment from previous studies have confirmed that the work and life satisfaction have significant positive correlation, but the existing research rarely delve into the internal mechanism between them. Therefore, this research from psychology from the important aspects, makes a research on the psychology detachment work from the influence of life satisfaction and work family balance of intermediary role and the adjustment of gender role, in order to improve the well-being of primary and secondary school teachers and promote the development of education undertakings provide theoretical basis and practical guidance. This research adopts the psychology detachment scale, life satisfaction scale and work family balance scale to investigate 1250 primary and secondary school teachers in Zunyi, Guizhou, using SPSS24.0 and Mplus7.4 data for statistical analysis. The results showed that: (1)psychology detachment work from the plays a role of positively predicted life satisfaction.(2) the work family balance between psychology detachment and life satisfaction have complete mediation effect;(3) gender balancing work psychology from work and family, the relationship between the specifically, compared to women teachers, male teachers of psychology detachment through the role of the mediation work family balance the effect of life satisfaction of ascension is stronger ($\beta_{\text{women}} = 0.40, P < 0.001, \beta_{\text{males}} = 0.60, P < 0.001$).Conclusion: psychology detachment as a kind of important resources recovery of primary and secondary school teachers, it is the positive influence to the life satisfaction on a mediation process.

学校氛围影响青少年抑郁：有调节的中介模型

陈偲嵩¹ 聂衍刚¹（通讯作者） 李瑞菁¹ 丁宁¹ 丘彩霞¹ 何晓清¹ 利振华¹

1 广州大学教育学院青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn

摘要 学校氛围与青少年心理健康发展息息相关，本研究采用纵向研究设计，T1 使用学校氛围问卷、生命意义感量表，T2 使用自我控制能力问卷，T3 使用抑郁量表，对 630 名青少年进行问卷测量，旨在考察自我控制的中介作用和生命意义的调节作用。结果显示：（1）在控制了性别、年龄后，学校氛围、生命意义感、自我控制、抑郁两两显著相关，抑郁与学校氛围、生命意义感、自我控制呈显著负相关；（2）自我控制在学校氛围和抑郁的关系之间起显著中介作用，消极的学校氛围能通过较低的青少年自我控制预测更高的抑郁程度；（3）生命意义感在学校氛围和自我控制之间起调节作用，生命意义感水平较低的青少年，学校氛围对自我控制具有更强的负向预测作用（ $\text{simple slope} = -0.08, t = -8.81, p < 0.001$ ）；而生命意义感较高的青少年，学校氛围虽然也会对自己控制产生负向预测作用，但其预测作用较小（ $\text{simple slope} = -0.38, t = -6.25, p < 0.001$ ）。结论：积极的学校氛围能够有效防止青少年抑郁，也能通过提升青少年的自我控制减少抑郁的情况，而生命意义感能够调节学校氛围和自我控制之间的关系，说明生命意义感可以作为保护性因子，在青少年面

对消极的学校氛围时,可以通过生命教育提升青少年生命意义感,避免自我控制能力的下降,减少抑郁的发生。

School Climate and Depression Among Adolescents: A Moderated Mediation Model

Chen Si'ai¹, Nie Yangang^{1*}, Li Ruijing¹, Ding Ning¹, Qiu Caixia¹, He Xiaoqing¹, Li Zhenhua¹

¹ Adolescent Psychology and Behavior Research Centre of Education College in Guangzhou
university, Guangzhou

Abstract: School climate is closely related to the mental health development of adolescents. In this study, 630 adolescents were measured using the School Climate Questionnaire, the Sense of Meaning in Life Scale at T1, using the Self-Control Scale at T2 and the Depression Scale at T3, to find out the moderate effect of self-control and the mediate effect of the meaning of life. Results : (1) After controlling for gender and age, school climate, sense of meaning of life, self-control and depression were significantly correlated. Depression was negatively correlated with school atmosphere, sense of meaning of life and self-control. (2) Self-control played a significant mediating role in the relationship between school climate and depression. Negative school climate predicted higher levels of depression through lower adolescents' self-control. (3) the meaning of life played a moderating role in the relationship between school climate and self-control, and the school climate had a significant negative predictive effect on self-control in the teenagers with low sense of meaning of life (simple slope = -0.08, $t = -8.81$, $p < 0.001$); For adolescents with high sense of life meaning, school climate also had a negative predictive effect on self-control, but its predictive effect was small (simple slope = -0.38, $t = -6.25$, $p < 0.001$). Conclusion: Positive school atmosphere can effectively prevent adolescent depression, also can reduce depression through ascending teenagers self-control, and sense of life meaning can adjust the school atmosphere and self control, the relationship between the meaning of life can be used as a protective factor, when teenagers face negative school climate, we can protect self-control by the life education, to avoid the decline of self-control and reduce the occurrence of depression.

兴趣特长潜能对初中生身心发展水平的影响：基于潜在剖面分析

薛琦¹ 张敏强¹ (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631, Zhangmq1117@qq.com

摘 要 青少年时期是个体身心发展的关键期,青少年身心发展存在着一般性的发展规律,也存在着个体差异。个体的主观能动性是身心发展的内在动力,而主观能动性可以通过个体的活动表现出来,在青少年中,主要表现为兴趣特长等。但是,目前尚未有研究探讨青少年的兴趣特长潜能与身心发展水平之间的关系。本研究拟采用潜在剖面分析法,探究初中生身心发展水平的异质性特征,并考察兴趣特长潜能与身心发展水平之间的关系。本研究使用了2018年广州市中小学教育质量阳光评价项目的6654名初三学生的身心发展水平测验(包含身体健康、心理健康、自我管理3个维度)和兴趣特长潜能测验(包含审美修养、爱好特长、实践能力、创新意识4个维度)的数据,采用潜在剖面分析法探究初三学生身心发展水平的异质性。结果发现:(1)根据身心发展水平,初三学生可以分为3个类别:发展水平优异组(占39.48%);发展水平一般组(占47.52%);发展水平欠佳组(占13.00%)。(2)除在身体健康维度发展水平优异组与发展水平一般组表现相似外,其他各维度发展水平优异组得分高于发展水平一般组,高于发展水平欠佳组。(3)在发展水平优异组中,心理健康得分最高;在发展水平优异组和发展水平一般组中,身体健康得分最高。后续采用多元logistic回归考察兴趣特长潜能对身心发展水平的影响。结果发现:与发展水平优异组相比,审美修养、爱好特长、实践能力和创新意识均可以负向预测发展水平一般组和发展水平欠佳组;与发展水平欠佳组相比,审美修养、爱好特长、实践能力和创新意识均可以正向预测发展水平优异组和发展水平一般组。本研究结果启示,教育

工作者们和家长们可以从培养兴趣爱好, 审美素养, 创新能力等着手来提升青少年的身心发展水平。

Effects of Interest on Physical and Mental Development of Junior School Students: A Latent Profile Analysis

Qi Xue¹, Minqiang Zhang¹ (corresponding author)

¹ School of Psychology, South China Normal University, Guangzhou, 510631,

Zhangmq1117@qq.com

Abstract: Adolescence is a critical period for individual physical and mental development. There are general development laws as well as individual differences in the physical and mental development of adolescents. The individual's subjective initiative is the internal driving force of physical and mental development, and the subjective initiative can be expressed through individual activities, in teenagers, it mainly shows interest and specialty. However, there is no research on the relationship between interest and physical and mental development of adolescents. This study intends to use the latent profile analysis to explore the heterogeneous characteristics of the physical and mental development of junior school students, and to investigate the relationship between their interest and physical and mental development.

This study used the data from the physical and mental development level questionnaire (including three dimensions of physical health, mental health, and self-management) and the interest questionnaire (including four dimensions of aesthetic accomplishment, hobbies and specialties, practical ability, innovative consciousness) of 6654 junior school students in the Guangzhou Sunshine Education Quality Monitoring Evaluation Project in 2018, and used latent profile analysis to explore the heterogeneity of the physical and mental development level of junior school students. The results showed that, (1) According to the physical and mental development level, junior three students can be divided into three categories: excellent development level group (accounting for 39.48%); general development level group (accounting for 47.52%); poor development level group (accounting for 13.00%). (2) Except in terms of physical health, the performance of the excellent development level group and the general development level group is similar, the scores of the excellent development level group in other dimensions are higher than the general development level group and higher than the poor development level group. (3) In the excellent development level group, the mental health score is the highest; in the excellent development level group and the general development level group, the physical health score is the highest. Then a multivariate logistic regression model was used to investigate the influence of interest on physical and mental development. The results showed that, compared with the excellent developmental level group, aesthetic accomplishment, hobbies and specialties, practical ability and innovative consciousness can negatively predict the general developmental level and the poor development level group; compared with the poor development level group, four dimensions of interest can positively predict the excellent development level group and the general development level group. The results of this study suggest that educators and parents can improve the level of physical and mental development of teenagers from the cultivation of hobbies, aesthetic qualities, and innovative abilities.

大学生羞怯与拖延行为的关系：元认知和负性情绪的多重中介作用

郑元华¹ 李迎丽¹ 孙长林¹ 邢素素¹ 朱玉娥¹ 陈英敏² (通讯作者)

¹ 山东师范大学心理学院, 济南, 250300

² 山东师范大学心理学院, 济南, 250300, cc8030306@163.com

摘 要 拖延行为已经成为影响大学生身心发展和学习生活的一大难题, 会带来一系列负面影响, 如降低个体学业成绩、使人产生情绪问题, 影响人们的心理健康。Chu 和 Choi (2005) 认为存在一种拖延能够给人带

来短期利益,是个体刻意做出拖延的决定,利用时间压力,在任务期限之内完成任务并取得令人满意的结果,并将其称之为主动拖延,将传统意义上的拖延称为被动拖延。拖延行为的产生是由个体的消极评估致使个体感到焦虑,从而产生回避行为。羞怯作为一种人格特质,具有负性认知评估,易于焦虑、抑郁,以及回避退缩的行为方式,羞怯能否显著预测拖延行为值得探讨。本研究采用方便取样的方法从山东省两所大学共抽取834人为被试,以大学生羞怯量表、元认知问卷(MCQ-30)、抑郁-焦虑-压力量表、一般拖延量表和主动拖延问卷进行调查,以探索大学生羞怯对拖延行为的影响机制。结果表明:(1)羞怯和元认知、负性情绪均与被动拖延显著正相关,与主动拖延显著负相关;羞怯和元认知、负性情绪之间呈两两正相关。(2)羞怯可以直接影响被动拖延,也可以通过两条路径的中介作用影响:一是羞怯-元认知-负性情绪-被动拖延;二是羞怯-负性情绪-被动拖延。羞怯可以直接影响主动拖延,也可以通过元认知的中介作用间接影响主动拖延。本研究结果揭示出羞怯者的拖延特点及其独特机制。羞怯大学生拥有更消极元认知和更多的负性情绪,更容易采取拖延行为,因此可以针对性矫正其不合理认知,正确面对和处理负性情绪,增强自身的感知能力与自我控制能力,以克服拖延困扰。

The Relationship between College Students' Shyness and Procrastination: The Multiple Mediating Effect of Metacognition and Negative Emotions

Zheng Yuanhua, Li Yingli, Sun Changlin, Xing Susu, Zhu Yu'e, Chen Yingmin

School of Psychology, Shandong Normal University, Jinan, 250300

Abstract: Procrastination behavior has become a problem that affects the physical and mental health and study life of college students. It brings a series of negative effects, such as reducing individual academic performance, causing emotional problems, and affecting people's mental health. Chu and Choi (2005) believe that there is a delay that can bring short-term benefits to people. It is an individual who deliberately makes a delay decision, using time pressure to meet the deadline complete the task and achieve satisfactory results. Call it proactive procrastination, and procrastination in the traditional sense as passive procrastination. The procrastination behavior is caused by the individual's negative evaluation, which causes the individual to feel anxious, which leads to avoidance behavior. As a personality trait, shyness has negative cognitive assessment, prone to anxiety, depression, and avoidance and withdrawal behaviors. It is worth exploring whether shyness can significantly predict procrastination. In this study, a total of 834 people were selected from two universities in Shandong Province using a convenient sampling method. The College Students' Shyness Scale, the Metacognitive Questionnaire (MCQ-30), the Depression-Anxiety-Stress Scale, the General Procrastination Scale and the Proactive Probability Questionnaire were used as survey tools to investigate the impact of college students' shyness on procrastination. The results show that: (1) Shyness, metacognition, and negative emotions are significantly positively correlated with passive procrastination, and significantly negatively correlated with active procrastination; There is a pairwise positive correlation between shyness and metacognition and negative emotion. Shyness can directly affect passive procrastination, or it can be influenced by two mediating effects: one is shyness-metacognition-negative emotion-passive procrastination; the other is shyness-negative emotion-passive procrastination. Shyness can directly affect procrastination, and it can also affect procrastination through the mediating role of metacognition. The results of this study reveal the procrastination characteristics and unique mechanisms of shy people. Shy people have more negative metacognition and more negative emotions, and are more likely to adopt procrastinating behaviors. Therefore, they can correct their unreasonable cognitions, correctly face and deal with negative emotions, and enhance their own perception and self-control ability to overcome procrastination.

摘要 互联网技术和设备的发展与革新给教育信息化提供了支持与便利, 网络学习已经逐渐深入人们的生活。受新冠肺炎的影响, “停课不停课”, 全国的学校都进行了网络授课。与中学生和大学生相比, 小学生的自主学习能力弱, 获取良好的学习效果需要家长、教师、学生三方合作。对小学网络学习活动情况进行调查, 了解小学生网络学习现状, 探究小学生网络学习活动中这三方该如何进行互动, 具有很强的现实意义。本研究采用了自编的小学生网络学习情况问卷(家长版/教师版), 调查小学家长和教师对网络课堂执行情况、效果、互动、建议等方面的看法, 并在调查的基础上采用分段随机抽取的方式对家长、教师、学生分别进行访谈, 每年级 12 人(家长、教师、学生各 4 名), 共 72 人。采用扎根理论的方法, 以活动理论为分析框架, 对访谈资料进行分析。结果发现: (1) 在学习效果方面, 家长和教师普遍认为网络学习效果不佳, 但学生认为网络学习效果很好; (2) 在教学模式上, 三方均普遍认为由学生线下任课教师进行的直播课堂优于其他直播或录播课堂; (3) 与传统教学相比, 网络教学中教师与学生互动主要通过作业、提问、讨论进行, 但是教师与小学生的互动性更差, 互动频率更低; (4) 由于小学生普遍缺乏网络学习经验, 自主学习能力一般, 小学网络学习活动中主要依赖家长对学生监管, 教师对学生的监管性更差, 家长与小学生的互动增多, 对学生的成绩影响更大, 但对家长如何监管与承担何种工作方面, 三方持不同意见; (5) 与传统教学相比, 小学生在进行网络学习期间会通过家长与教师互动, 形成一个由家长中介的学生-教师互动形式, 其次网课期间, 家长与小学生的互动显著多于在校上课期间, 家长-学生互动对学生学习效果影响变大。

Abstract: The development and innovation of Internet technology and equipment provide support and convenience for education informatization, and network learning has gradually penetrated into people's lives. As affected by COVID-19, and in response to the call for "no suspension of school attendance", schools across the country have conducted online teaching. Compared with middle school students and college students, the process of primary school students' online learning is not only teachers and students participating in learning activities, but also parents, teachers and students. Therefore, it is necessary to study the network learning activities of primary school students and explore the interaction process. This study adopted the self-made a survey to investigate the opinions of primary school parents and teachers on the implementation, effect, interaction and suggestions of online classroom. On the basis of the survey, parents, teachers and students were interviewed in a piecemeal and random way. There were 12 students (4 parents, 4 teachers and 4 students each year), a total of 72 people. The method of grounded theory and activity theory are adopted to analyze the interview data. The results show that: (1) in terms of learning effect, parents and teachers generally think that online learning effect is not good, but students think that online learning effect is very good; (2) in the teaching mode, the three parties generally think that the live classroom conducted by students and teachers is better than other live or recorded class; (3) compared with traditional teaching, the interaction between teachers and students in online teaching is mainly through homework. However, the interaction between teachers and students is worse, and the interaction frequency is lower; (4) due to the lack of online learning experience of primary

school students and the general ability of autonomous learning, primary school online learning activities mainly rely on parents to supervise students, teachers' supervision of students is weak, the interaction between parents and students becomes more, which has a greater impact on students' performance. The three parties hold different opinions on how parents supervise and undertake what kind of work; (5) compared with traditional teaching, primary school students will form a form of student teacher interaction mediated by parents through the interaction between parents and teachers during online learning. Secondly, the interaction between parents and students during online class is significantly more than that during school. The effect of action on students' learning becomes greater.

短视频过度使用对初中生抑郁的影响：一个有调节的中介模型

王涛 马金良 曹苗苗 尹忠泽（通讯作者）

山西师范大学，临汾，041004，1059328061@qq.com

摘要 抑郁是初中生情绪健康的重要测量指标。抑郁不仅会降低大学生的生活满意度，也会对其心理及行为适应产生严重的不良影响。研究表明，短视频过度使用与初中生的上行社会比较有密切的关系，短视频过度使用及其短视频中的内容会使中学生产生更多的上行社会比较，从而更易产生抑郁的可能性。因此，本研究旨在探讨上行社会比较是否在初中生短视频过度使用和抑郁之间起中介作用。此外，由于初中生在核心自我评价的四个方面的人格特质：自尊、一般自我效能感、神经质和控制源方面均存在差异，本研究将进一步探讨核心自我评价是否调节了该中介模型。本研究探讨短视频使用强度对初中生抑郁的影响，以及上行社会比较的中介作用和核心自我评价的调节作用。方法：采用短视频使用强度量表、上行社会比较量表、核心自我评价问卷及流调中心抑郁量表对 336 名初中生进行调查。结果：①短视频使用强度显著正向预测抑郁。②上行社会比较在短视频使用强度影响抑郁中起部分中介作用。③核心自我评价调节了短视频使用强度通过上行社会比较影响抑郁的中介作用前半路径，相对于高核心自我评价的大学生，短视频使用强度更容易在低自我评价的个体进行上行社会比较时发生抑郁。

关键词 短视频使用强度，上行社会比较，核心自我评价，抑郁，初中生

The Effect of Short Video Overuse on Junior High School Students' Depression: A Moderated Mediation Model

Wang Tao, Ma Jinliang, Cao Miaomiao, Yin Zhongze

Shanxi Normal University, Linfen, 041004

Abstract: Purpose: Depression is an important measure of the emotional health of junior high school students. Depression not only reduces the life satisfaction of college students, but also has serious adverse effects on their psychological and behavioral adaptation. Studies have shown that the excessive use of short videos is closely related to the upward society of junior high school students. The excessive use of short videos and the content in the short videos will make middle school students have more upward social comparisons, which is more likely to produce depression. Therefore, this study aims to explore whether the upward social comparison plays a mediating role between the overuse of short videos and depression in junior high school students. In addition, due to differences in the personality traits of junior high school students in the four aspects of core self-evaluation: self-esteem, general self-efficacy, neuroticism, and source of control, this study will further explore whether core self-evaluation regulates the mediation model. This study explores the influence of short video use intensity on junior high school students' depression, as well as the mediating role of upward social comparison and the moderating role of core self-evaluation. Methods: A survey of 336 junior high school students was conducted using the Short Video Use Intensity Scale, the Uplink Social Comparison Scale, the Core Self-evaluation Questionnaire, and the Flow Regulation Center Depression Scale. Results: ① The intensity of short video use significantly positively predicts depression. ② Upward social comparison plays a partly mediating role in the influence of the intensity of short video use on depression. ③ The

core self-evaluation adjusts the intensity of short video use to influence the first half of the mediating effect of depression through upward social comparison. Compared with college students with high core self-evaluation, short video use intensity is more likely to occur when individuals with low self-core evaluation perform upward social comparison. Depression.

Keywords: Short video usage intensity, upward social comparison, core self-evaluation, depression, junior high school students

摘要 已有的研究表明, 青少年由于缺乏应对新冠肺炎疫情等重大突发公共事件的适应能力, 会更容易对他们的情绪产生影响并对其学业造成巨大挑战, 而以往针对学生适应能力、学业情绪和学习投入的研究, 都是基于传统面对面教学展开的, 不足以解释疫情背景下在线学习中存在的问题。本文探讨重大疫情背景下学生的适应能力、学业情绪与学习投入的关系及其内在作用机制。使用适应力量表、学业情绪量表与学习投入量表对全国 4226 名学生进行实测, 并采用 SPSS 进行描述统计和相关分析, Hayes 的 SPSS 宏程序 PROCESS 组件进行模型检验和 Bootstrap 分析。结果显示: ①适应能力与消极学业情绪呈显著负相关, 与积极学业情绪及学习投入呈显著正相关; ②适应能力可以直接正向影响学习投入, 积极学业情绪和消极学业情绪分别在该过程中起到部分中介作用。结论: 个体适应能力的提高, 能够提升学生积极学业情绪水平, 降低消极学业情绪水平, 从而增加学习投入程度。本研究结果启示教育研究者和各级教学单位应该注重锻炼学生的适应能力, 尤其是对于适应能力较弱的学生, 应给予更多的关怀以及降低他们的消极情绪, 以便更好地适应学习环境变化, 从而让青少年以更加积极的心态适应如新冠肺炎疫情等重大突发事件的影响, 更加坚定地应对学业挑战。

Abstract: Studies indicated that students are more likely to have an impact on their emotions and study than other groups, due to a lack of adaptability to adjust major public events like the coronavirus disease 2019 (COVID -19) pandemic. However, the main objectives of the previous studies were to examine associations of students' adaptability, academic emotion, and student engagement based on the traditional face-to-face learning, instead of the online learning. This study examined the relationship between students' adaptability and student engagement under the coronavirus disease 2019 (COVID -19) pandemic, and the mediating role of academic emotion of online learning. By using the adaptability scale, academic emotion scale, and student engagement scale, a sample of 4,426 students from all over China attended in the survey. SPSS was used for descriptive statistics and correlation analysis, and Hayes' SPSS macro program Process component was used for model test and Bootstrap analysis. The results showed that student adaptability (the ability to respond to changes) and student engagement are significantly positively correlated with positive academic emotion and negatively correlated with negative academic emotion. Furthermore, adaptability not only directly predicts student engagement, but also affects student engagement through the mediation

of positive academic emotion and negative academic emotion. This study may provide references for educational researchers and schools in dampening the negative effects of COVID-19 on students' learning by improving their adaptability and developing positive academic emotions.

Keywords: adaptability, student engagement, academic emotion, mediating role

发展性阅读障碍：记忆系统的缺陷还是认知策略的匮乏？

李佩瑾¹ 邢强¹（通讯作者）

¹ 广州大学，广州，510000, qiang_xingpsy@126.com

摘要 发展性阅读障碍（developmental dyslexia, 简称 DD）是一种比较常见的学习障碍，发展性阅读障碍者往往没有明显的神经或器质性损伤，但阅读水平却显著落后于其相应智力水平或生理年龄的儿童。根据之前的研究报告，我国 DD 的发病率约在 5%到 15%这个区间内。但是随着数字时代的到来，电子设备取代了纸质课本，拼音输入法将音素和英文字母与字符联系起来，当儿童输入字母时，他们的拼写不再依赖于再现汉字的视觉图形属性，而这却是中文阅读所必需的一步，种种原因使得阅读障碍的发生率在我国有进一步增长的趋势。发展性阅读障碍会持续影响患者的阅读功能和学习能力，并将进一步损害他们的认知功能和社会性的发展，还会引发自效能感低、厌学、焦虑等一系列的学业倦怠问题。在许多研究中都发现这些儿童在记忆任务上表现得较差，因此国内外学者用记忆的“无效策略”和“功能缺陷”两种假说对这一现象进行了解释，其中前者认为发展性阅读障碍儿童存在认知策略相关功能如执行能力和元认知的缺陷，后者则认为发展性阅读障碍儿童存在记忆系统功能上的缺陷。本文以发展性阅读障碍儿童的记忆缺陷为立足点，对有关“无效策略”和“功能缺陷”两种假说的相关支持文献进行梳理并深入讨论。在综述基础上提出研究展望，未来可以尝试采用纵向与横向结合的研究方式，并结合认知神经科学技术进一步加深对汉语发展性阅读障碍儿童元认知功能、认知策略特点及其他记忆领域（如：内隐序列记忆、前瞻性记忆、回溯性记忆、遗忘等）的研究，明确阅读障碍者的缺陷特征并为后期的干预指导提供帮助。

Developmental dyslexia: defects in memory system or deficiencies in cognitive strategies?

Li Peijin, Xing Qiang

Department of Psychology, Guangzhou University, Guangzhou, 510006

Abstract: Developmental dyslexia is a kind of common learning disability. People with developmental dyslexia often have no obvious neurological or organic impairment, but the reading level is significantly behind of children with corresponding intelligence level or biological age. According to previous research, the incidence of DD in China is in the range of 5% to 15%. With the advent of the digital era, electronic equipment to replace the paper textbooks, bopomofo input method link phonemes and letters and characters. When children enter letters, their spelling no longer depends on reproducing the visual graphical properties of Chinese characters, and this is a necessary step of Chinese reading, the incidence of a variety of reasons make reading disorder in our country has a tendency to grow further. Developmental dyslexia will continue to affect the reading function and learning ability of patients and further damage their cognitive function and social development. What's more, it may cause a series of academic burnout problems such as low sense of self-efficacy, weariness, anxiety and so on. In many studies, these children have been found to perform worse on memory tasks. Therefore scholars both at home and abroad proposed "invalid strategies" and "deficient memory function" two hypotheses to explain this phenomenon, of which the former think children with developmental dyslexia have defects in cognitive strategy-related functions such as executive ability and metacognition, the latter says children with developmental dyslexia have defects in memory system function. Based on the memory deficits of children with developmental dyslexia, this paper reviews and discusses the supporting literature on the two hypotheses of "invalid strategies" and "deficient memory function". Based on the

review, the research prospect is put forward. In the future, a combination of vertical and horizontal research methods can be tried, and combined with cognitive neuroscience techniques to deepen the research on metacognitive function, cognitive strategy characteristics and other memory areas (such as implicit sequence memory, prospective memory, retrospective memory, forgetting, etc.) of Chinese developmental dyslexia children. This will identify the characteristics of dyslexia and provide help for later intervention guidance.

摘要 已有研究表明成人进行屏幕阅读时的元理解监测精确性较低, 存在“屏幕劣势”。当代儿童在幼年时期就接触电子产品, 进行较为频繁的屏幕阅读, 这使得他们的阅读习惯和媒介偏好与成人有较大的差异。目前仅有少量研究探讨了呈现载体对儿童元理解监测绝对精确性的影响, 结果发现没有显著差异。现有研究没有考虑文本体裁对儿童的影响。当代儿童较早地在屏幕上阅读绘本故事, 更加熟悉记叙文的文本结构; 而说明文内部连贯性较低, 使其比记叙文更难理解。且当前研究多以绝对精确性来测量儿童的元理解监测精确性, 而相对精确性是元理解的主要测量方式, 其反映的是个体对不同项目进行区分或辨别的能力。因此, 我们假设: 儿童进行屏幕阅读时的元理解监测精确性较低; 针对记叙文, 纸质阅读和屏幕阅读的元理解监测精确性无显著差异; 针对说明文, 屏幕阅读的元理解监测精确性低于纸质阅读。研究采用 2 (呈现载体: 纸质阅读和屏幕阅读) × 2 (文本体裁: 记叙文和说明文) 的完全被试内实验设计, 因变量为元理解监测绝对精确性、相对精确性以及阅读成绩。66 名五年级学生分别在不同的呈现载体上阅读记叙文和说明文, 然后完成元理解任务。结果显示: 在绝对精确性方面, 呈现载体主效应显著, 纸质阅读的绝对精确性显著高于屏幕阅读。呈现载体与文本体裁的交互作用边缘显著: 记叙文条件下, 纸质阅读和屏幕阅读的绝对精确性无显著差异; 说明文条件下, 纸质阅读的绝对精确性高于屏幕阅读。在相对精确性方面, 呈现载体主效应显著, 纸质阅读的相对精确性高于屏幕阅读。在阅读理解成绩方面, 呈现载体主效应显著, 纸质阅读的阅读成绩优于屏幕阅读。文本体裁主效应显著, 记叙文的阅读成绩优于说明文。两者交互作用显著: 记叙文条件下, 纸质阅读和屏幕阅读的阅读成绩无显著差异; 说明文条件下, 纸质阅读的阅读成绩优于屏幕阅读。研究结果表明, 五年级学生存在“屏幕劣势”, 且在屏幕上阅读说明文时的元理解监测精确性和阅读成绩低于纸质阅读。

The effect of text presentation carrier and text genre on children's metacomprehension monitoring accuracy

Ma Xiaofeng^{1,2} (Corresponding author), Jia Ruihong^{1,2}, Wei Jie^{1,2}, Ji Xiying^{1,2}

1 Key Laboratory of Behavioral and Mental Health, Gansu Province, China,

2 School of Psychology, Northwest Normal University, Lanzhou, 730070, China,

Corresponding author. E-mail: psymaxiaofeng@126.com

Abstract: Previous researches have shown that adults' metacomprehension monitoring accuracy is low when they are reading on screen, and there is a “screen inferiority”. Contemporary children have been exposed to electronic products at an early age, and they read on the screen more frequently, which makes their reading habits and media preferences quite different from adults. Only a few studies have examined the effect of presentation carrier on the absolute accuracy of metacomprehension monitoring in children and found no significant differences. Existing studies have not involved the effects of text genre on children. Contemporary children read picture books early on the screen and are more familiar with the text structure of narrative. But the internal coherence of the expository text is

low, making it more difficult to understand. And most current studies measure children's metacomprehension monitoring accuracy with absolute accuracy. Relative accuracy is the main measurement of metacomprehension, reflecting the ability of individuals to distinguish or distinguish between different items. Therefore, we hypothesized that: the metacomprehension monitoring accuracy in children's screen reading is low. For narrative text, the metacomprehension monitoring accuracy of paper reading and screen reading has no significant difference. For expository text, the metacomprehension monitoring accuracy of screen reading is lower than that of paper reading.

A complete in-subject design of 2 (presentation carrier: paper reading and screen reading) $\times$ 2 (text genre: narrative and expository) was adopted. The dependent variables were the absolute accuracy, relative accuracy and reading performance. Sixty-six fifth-graders read narratives and expository texts on different presentation carriers and then completed the metacomprehension tasks. The results show that: firstly, the main effect of presentation carrier is significant, and the absolute accuracy of paper reading is significantly higher than screen reading. The interaction between the presentation carrier and the text genre has a marginal significant. There was no significant difference in absolute accuracy between paper reading and screen reading under narrative condition. The absolute accuracy of paper reading is higher than screen reading under expository conditions. Secondly, the main effect of presentation carrier is also significant, and the relative accuracy of paper reading is higher than screen reading. Finally, the main effect of the presentation carrier is significant, and the reading performance of paper reading is better than screen reading. The main effect of text genre is significant, and the reading performance of narrative text is better than expository text. The interaction between the presentation carrier and text genre is significant. There was no significant difference in reading performance between paper reading and screen reading under narrative condition. The reading performance of paper reading is higher than screen reading under expository conditions.

The results show that, fifth-graders have “screen inferiority”, and the metacomprehension monitoring accuracy and reading performance of expository text on screen reading are lower than those of paper reading.

Keywords: metacomprehension monitoring accuracy, reading performance, presentation carriers, text genre

大学生羞怯与心理幸福感及社会幸福感的关系:有调节的中介模型

胡永祺 肖胜 张海 刘颖 陈英敏 (通讯作者)

山东师范大学心理学院, 济南, 250358, cc8030306@163.com

摘 要 幸福是人生追求的终极目标之一。近年来, 积极心理学强调提升人的幸福感, 学者们对幸福感的研究也越来越关注。2019 年全球幸福指数报告显示, 中国的幸福指数在 200 多个国家和地区中排名仅第 93 位, 这表明虽然我国物质生活水平得到了极大的提高, 但也由此引发了诸多的社会心理问题。大学生即将步入社会, 处于从以学习为主向以工作和建立社交网络为主的过渡和准备时期, 他们的幸福感状况不仅会影响自身社会适应状况, 更对未来社会的和谐具有举足轻重的意义。此外, 已有研究主要关注个体的主观幸福感, 较少考察个体的社会幸福感状况, 且对影响幸福感的人格因素关注不够。因此, 本研究拟引入羞怯这一人格变量, 考察其对大学生心理幸福感和社会幸福感的影响, 并进一步考察个人成长主动性的中介作用及个人公正世界信念的调节作用, 以期丰富有关幸福感的研究, 并为羞怯大学生幸福感的提高提供理论依据和指导。采用方便取样的方法, 以羞怯量表、心理幸福感量表、社会幸福感量表、个人成长主动性量表和个人公正世界信念量表为研究工具对山东省济南市和青岛市 2 所高校的 701 名大学生进行问卷调查。结果显示: (1) 大学生羞怯处于中等偏下水平, 心理幸福感和社会幸福感处于偏上水平; (2) 羞怯显著负向预测大学生心理幸福感和社会幸福感; (3) 个人成长主动性在羞怯与心理幸福感和社会幸福感之间起中介作用; (4) 在羞怯与心理幸福感的关系中, 个人公正世界信念调节中介模型的全部路径; 在羞怯与社会幸福感的关系中, 个人公正世界信念调节中介模型的前半路径和直接路径。这一结果提示教育者应高度关注羞怯大学生的心理幸福感和社会幸福感状况, 提高他们的个人成长主动性及个人公正世界信念, 以促进其身心健康发展。

The Relationship among Shyness, Psychological Well-being, and Social Well-being of College Students: A Moderated Mediation Model

Yongqi Hu, Sheng Xiao, Hai Zhang, Ying Liu, Yingmin Chen*

Shandong Normal University, No. 88, East Wenhua Road, Ji'nan, Shandong, China

Abstract: Happiness is one of the ultimate goals pursued in life. In recent years, positive psychology has emphasized the improvement of people's happiness, and scholars have paid more and more attention to happiness research. The 2019 Global Happiness Index report showed that Chinese happiness index ranks only 93 among more than 200 countries and regions. It shows that although Chinese material standard of living has been greatly improved, it has also triggered a lot of social psychology problems. College students are about to enter the society and in the transition and preparation period from learning to work and social networking. Their well-being will not only affect their own social adaptation but also play a decisive role in the harmony of the future society. In addition, previous studies mainly focus on the individual's subjective well-being, and seldom examine the individual's social well-being, moreover pay insufficient attention to personality factors that affect well-being. Therefore, the present study aimed to introduce shyness as a personality variable to examine its impact on college students' psychological well-being and social well-being, and to further examine the mediating role of personal growth initiative and the moderating role of individual justice world belief, in order to enrich the research on happiness and provide theoretical basis and guidance for the improvement of shy college students' happiness. A questionnaire survey was conducted among 701 college students from Jinan and Qingdao in Shandong province using The Shyness Scale, Psychological Well-being Scale, Social Well-being Scale, Personal Growth Initiative Scale and Personal Justice World belief Scale. The results showed that: (1) College students' shyness was below the average level, and their psychological well-being and social well-being were above the average level; (2) College students' shyness significantly negatively predicted the psychological well-being and social well-being; (3) Personal growth initiative played the mediating role between shyness and psychological well-being, social well-being; (4) In the relationship between shyness and psychological well-being, individual justice world belief moderated the full paths of the mediation model; In the relationship between shyness and social well-being, individual justice world belief moderated the first half path and the direct path of the mediating model. These findings suggest that educators should pay close attention to the psychological well-being and social well-being of shy college students, improve their personal growth initiative and individual justice world belief, and promote their physical and mental health development.

Keywords: shyness, personal growth initiative, individual justice world belief, psychological well-being, social well-being

大学生羞怯与创业意向的关系： 生涯阻碍知觉和生涯适应力的中介作用

张海 张仁杰 胡永祺 申钰晶 陈英敏（通讯作者）

山东师范大学，山东省济南市，250358

山东师范大学，心理学院，济南，250358

摘要 就业难成为困扰当今大学生的一大难题，不仅会给大学生个体造成极大的心理压力，也容易导致某些社会问题。十九分組议指出，当今我国发展现代化经济的强有力支撑就是创业。大学生有着灵活的头脑和先进的知识，他们有思想、有魄力，创业不仅可以将个人的潜力发挥出来，实现个人的价值，更可以为社会注入新鲜的动力，促进社会经济的进一步发展。但根据已有研究，大学生有创业意向的并不太多。所谓创业意向是指个体在未来时间里进行创业活动的倾向性。究竟哪些因素困扰大学生的创业意向呢？根据 Bird 提出的创业意向模型，个体的人格对其创业意向有着重要作用。羞怯是一种比较常见的人格特质，具体表现为人际情境下的不舒适和/或抑制，这种不舒适和/或抑制会进一步阻碍个体对人际目标和职业目标的追求。鉴于羞

怯可能阻碍“职业目标的追求”，本研究欲考察羞怯对创业意向的影响，并进一步探究生涯阻碍知觉和生涯适应力在其中的中介机制。研究采用方便抽样的方法，抽取山东省三所大学共计 1617 名学生作为被试，使用大学生羞怯量表、生涯阻碍知觉量表、生涯适应力量表和创业意向问卷进行调查。结果显示：（1）大学生创业意向总体处于中等水平，但在性别和年级上存在显著差异，男生创业意向水平显著高于女生，大一学生创业意向水平高于其他三个年级；（2）羞怯与创业意向、生涯适应力之间显著负相关，与生涯阻碍知觉显著正相关；生涯阻碍知觉与创业意向及生涯适应力之间均呈显著负相关；生涯适应力与创业意向显著正相关；（3）羞怯可以直接影响创业意向，也可以通过三条中介路径影响创业意向，按中介效应值大小分别为：羞怯→生涯阻碍知觉→创业意向；羞怯→生涯阻碍知觉→生涯适应力→创业意向；羞怯→生涯适应力→创业意向。本研究在某种程度上揭示了羞怯对创业意向的影响机制，可为今后的相关研究及创业教育等提供一定的参考与依据。

关键词 羞怯，创业意向，生涯阻碍知觉，生涯适应力

The Relationship between College Students' Shyness and Entrepreneurial Intention: The Mediating Effect of Perception of Career Barriers and Career Adaptability

Hai Zhang, Renjie Zhang, Yongqi Hu, Yujing Shen, Yingmin Chen
Shandong Normal University, Shandong, Jinan, 250358

Abstract: Difficulty in obtaining employment has become a major problem that plagues college students today. It is not only cause great psychological pressure on individual college students, but also easily lead to certain social problems. The 19th National Congress of the Communist Party of China pointed out that the strong support for the development of modern economy in China today is entrepreneurship. College students have flexible minds and advanced knowledge. They are thoughtful and courageous. Entrepreneurship can not only realize personal potential and realize personal value, but also inject fresh impetus into society and promote the further development of social economy. However, according to existing research, not many college students have entrepreneurial intentions. Entrepreneurial intention refers to the tendency of individuals to carry out entrepreneurial activities in the future. What factors trouble the entrepreneurial intention of college students? According to the entrepreneurial intention model proposed by Bird, individual's personality plays an important role in his entrepreneurial intention. Shyness is a relatively common personality trait, which is manifested as discomfort and/or inhibition in interpersonal situations. This discomfort and/or inhibition could further hinder the individual's pursuit of interpersonal and professional goals. In view of the fact that shyness may hinder the pursuit of "career goals", this study intended to investigate the influence of shyness on entrepreneurial intentions, and further explore the mediating roles of the perception of career barriers and career adaptability. This study adopted conveniently sampling, and selected a total of 1,617 participants from three universities in Shandong Province, and used the College Student Shyness Scale, Career Barriers Perception Scale, Career Adaptability Scale, and Entrepreneurship Intention Questionnaire to investigate. The results showed: (1) Entrepreneurial intention of college students was generally at a medium level, but there are significant differences in gender and grade. The level of entrepreneurial intention of boys is significantly higher than that of girls, and the level of entrepreneurial intention of freshman students is higher than that of the other three grades; (2) Shyness was significantly negatively correlated with entrepreneurial intention and career adaptability, and was significantly positively correlated with career hindrance perception. The perception of career barriers was significantly negatively correlated with entrepreneurial intention and career adaptability. Career adaptability and entrepreneurial intention were significantly positive correlation; (3) Shyness can directly affect entrepreneurial intention, and also indirectly affect entrepreneurial intention through three mediated paths. According to the size of the mediated effect, they are: shyness → perception of career barriers→ entrepreneurial intention; Shyness→ perception of career barriers→ career adaptability→ entrepreneurial intention; Shyness→ career adaptability→

entrepreneurial intention. To some extent, this study reveals the mechanism of shyness on entrepreneurial intention, which can provide a certain reference and basis for future related research and entrepreneurial education.

Keywords: shyness, entrepreneurial intention, perception of career barriers, career adaptability

视觉空间工作记忆研究综述

冯茹钰

宁夏大学教育学院, 银川, 750021

摘 要 工作记忆(Working memory, WM)是一种对信息进行暂时性加工和存储的能量有限的记忆系统, 自从工作记忆模型被提出以后, 研究者围绕着它的子成分进行了大量的研究, 如今大多数概念化的定义是工作记忆存在言语工作记忆和视觉空间工作记忆两种形态。其中视觉空间工作记忆还存在着分离现象, 即人类的视觉空间工作记忆存在着不同的子系统或者子成分: 分别为不同维度特征的视觉信息组合而成的客体工作记忆和对空间信息暂时保存的空间工作记忆。使用双任务范式心理学家的研究结果支持了空间和客体工作记忆的分离。早期关于工作记忆的研究主要集中于言语工作记忆, 而近年来随着神经影像学的发展, 视觉空间工作记忆领域被逐渐深入。本文主要就视觉空间工作记忆进行概述, 基于视觉空间记忆的经典研究范式, 梳理视觉空间工作记忆的生理机制, 探讨性别, 情绪, 病理因素如孤独症谱系障碍, 注意缺陷多动障碍及阅读障碍对其的影响。但是已有的很多研究结果仍存在争议, 尚无确切定论, 同时缺乏现代科学技术记忆研究范式的迭代且研究方向有待进一步拓展。目前的研究采用的方法大多综合了各种途径的训练, 缺少单一途径训练之间或单一途径与多途径训练之间的效果比对, 因此难以判断哪种途径的工作记忆训练对于干预不同病症下的认知功能更为有效。未来的研究可对多形态工作记忆训练的机制、训练强度及效果进行展开探讨, 为临床干预提供有力证据, 以及在“五育”并举的教育体系背景下为更好促进学生体育和劳育发展提供有效指导。

关键词 视觉空间工作记忆 研究范式 生理机制 影响因素

Abstract: Working memory (WM) is a memory system with limited energy for temporary processing and storage of information. Since the working memory model was proposed, researchers have done a lot of research around its sub-components. Nowadays, the definition of most conceptualization is that there are two forms of working memory: verbal working memory and visual spatial working memory. There are different subsystems or sub-components in human visual spatial working memory: the object working memory which is composed of visual information with different dimensional characteristics and the spatial working memory which is temporarily preserved. The research results of psychologists using dual-task paradigm support this point. The early research on working memory mainly focused on verbal working memory, but in recent years, with the development of neuroimaging, the field of visual spatial working memory has been gradually deepened. This paper mainly summarizes visual spatial working memory, based on the classical research paradigm of visual spatial working memory, combs the physiological mechanism of visual spatial working memory, and discusses the effects of gender, emotion and pathological factors such as Autism Spectrum Disorder, Attention Deficit Hyperactivity Disorder and Dyslexia on it. However, many research results are still controversial and inconclusive, lack of iteration of modern scientific and technological memory research paradigm, and the research direction needs to be expanded. Most of the working memory training used in the current research integrates various ways of training, and there is a lack of comparison between single-way training or single-way training and multi-way training. Therefore, it is difficult to judge which way of working memory training is more effective in interfering with cognitive function under different diseases. The future research progress can explore and compare the mechanism, training intensity and effect of polymorphous working memory training, and provide strong evidence for clinical intervention. Under the background of the education system of "five educations", it can also provide effective guidance for promoting the development of students' physical education and labor education.

附加维度的相关性和数量对直接的与间接的非监控类别学习的影响

张馨楠¹ 黄利² 刘婷² 刘万伦²(通讯作者)

1 浙江师范大学教师教育学院心理学系, 浙江金华, 321004

2 浙江师范大学, 金华, 321004, 通讯作者 wlliu2008@zjnu.cn

摘 要 真实世界中的每一物体都存在着大量维度, 早期使用的实验材料维度数量较少, 大多在家族相似性结构下进行, 而类别结构会受到附加维度数量和相关性的影响。以往大多数关于类别学习的研究都是在监控模式下进行的, 这种模式不符合真实学习情境, 直接的与间接的非监控学习更广泛地存在于真实的学习情境中, 且二者可能存在不同的认知加工过程, 表现为不同的分类策略和类别表征。因此, 本研究采用 2(附加维度的相关性: 相关、无关)×3(附加维度数量: 4、8、12)被试间设计, 探讨附加维度的相关性和数量对直接的与间接的非监控类别学习的影响, 比较直接的与间接的非监控类别学习在学习效果和类别表征上的差异。研究结果显示: (1) 附加维度与类别归属相关的类别的学习效果要好于附加维度与类别归属无关的类别。学习者在附加维度与类别归属相关的类别中能够形成相似性表征, 在附加维度与类别归属无关的类别中不会形成相似性表征。(2) 随附加维度数量增加, 倾向规则表征的人数更少, 直接的非监控类别学习部分学习者由规则表征转向相似性表征, 间接的非监控类别学习相似性表征学习者人数无显著变化, 表明附加维度数量损害规则表征的学习, 不影响相似性表征的学习。(3) 直接的非监控类别学习的学习效果要好于间接的非监控类别学习。直接的非监控类别学习学习者倾向规则表征; 间接的非监控类别学习学习者既倾向规则表征, 也倾向相似性表征, 无明显分类策略倾向。本研究更加深入地了解真实情境下人类类别学习的认知过程, 丰富类别学习理论模型。

Correlation and Number of Additional Dimensions Impact on Direct and Incidental Unsupervised Category learning

Xinnan Zhang, Li Huang, Ting Liu, Wanlun Liu

Department of Psychology, College of Teacher Education, Zhejiang Normal University 321004, Jinhua

Abstract: Each object in the real world has a large number of dimensions, and the early experimental materials had a few dimensions, mostly under the family similarity structure, while the category structure is affected by the number and relevance of additional dimensions. Most of the previous studies on category learning were carried out under the supervised mode, which did not conform to the real learning environment. Direct and incidental unsupervised learning is more widely existing in the real learning situation, and the two may have different cognitive processes, which are manifested by different classification strategies and category representations. Therefore, the present study adopt 2 (relevance of additional dimensions: relevant, irrelevant) × 3 (number of additional dimensions: 4, 8, 12) between-subjects design to explore the effects of the relevance and number of additional dimensions on direct versus incidental unsupervised mode and to compare the differences in learning effects and category representations between direct and incidental unsupervised category learning. The results show that: (1) The learning effect of the category with additional dimension related to category attribution is better than that of the category with additional dimension unrelated to category attribution. Learners can form similarity-based representations in categories with additional dimensions related to category attribution, but not in categories with additional dimensions unrelated to category attribution. (2) With the increase of the number of additional dimensions, fewer learners tend to rule-based representation, and some learners on direct unsupervised category learning turn from rule-based representation to similarity-based representation, while the number of similarity-based representation learners on incidental unsupervised category learning has no significant change. It indicates that the number of additional dimensions damages the learning of rule-based representation and does not affect the learning of similarity-based representation. (3) The learning effect of direct unsupervised category learning is better than that of incidental unsupervised category

learning. Direct unsupervised category learning learners tend to rule-based representation; incidental unsupervised category learning learners tend to both rule-based representation and similarity-based representation, without obvious classification tendency. This study provides a deeper understanding of the cognitive process of human category learning in real situations and enriches the theoretical model of category learning.

正念对青少年心理幸福感的影响： 情绪调节的中介作用及班级角色差异

岳汝怡 彭雪映 曹军胜 侯雨君 尹忠泽（通讯作者）

山西师范大学教育科学学院，临汾，041004，1059328061@qq.com

摘要 现代教育者认为提高青少年的心理幸福感水平，减少青少年情绪障碍对学习和生活造成的不良影响，让青少年更加健康有活力，更好的获得自我实现是现代教育应关注的焦点问题。研究目的：探究正念水平、青少年心理幸福感、情绪调节三者之间关系及心理作用机制。方法：采用儿童青少年正念量表（CAMS）、情绪调节量表、心理幸福感量表对山西某几个高中随机选择的1325名普通班学生进行问卷调查研究。结果表明：（1）正念水平能够显著正向预测青少年的心理幸福感；（2）正念水平通过情绪调节的中介作用预测心理幸福感；（3）班级角色调节该中介模型的前半路径和直接路径。具体来说，相对于未担任班级干部的同学，担任班干部的同学的正念水平对情绪调节和心理幸福感的预测作用均更大。本研究结果能够为后续的心理幸福感的相关研究提供有价值的理论基础，以及对高校的心理健康教育发展提供一定的理论依据。

Effect of Mindfulness on Teenagers' Psychological well-being: Mediating Effect of Emotion Regulation and Class role Difference

Yue RuYi, Peng XueYing, Cao JunSheng, Hou YuJun, Yin ZhongZe

School of education science, Shanxi Normal University, LinFen, 041004, 1059328061@qq.com

Abstract: Modern educators believe that improving the level of psychological well-being of teenagers, reducing the negative impact of emotional disorders on learning and life, and making adolescents more healthy and energetic, better self-realization is the focus of modern education. Objective: to explore the relationship among mindfulness level, adolescent psychological well-being, emotion regulation and the mechanism of psychological action. Methods: A total of 1325 ordinary students randomly selected from several high schools in Shanxi Province were investigated with CAMS, Mood Regulation Scale and Psychological well-being Scale. The results were as follows: (1) the level of mindfulness significantly predicted the psychological well-being of adolescents; (2) the level of mindfulness predicted the psychological well-being through the mediation of emotion regulation; (3) the class role regulates the first half path and the direct path of the mediation model. Specifically, compared with the students who did not serve as class leaders, the students who served as class leaders' level of mindfulness had a greater predictive effect on emotional regulation and psychological well-being. The results of this study can provide a valuable theoretical basis for the follow-up research on psychological well-being and the development of mental health education in colleges and universities.

Keyword: mindfulness, emotional regulation, psychological well-being, teenagers

少数民族青少年心理健康的变迁(1978~2020): 一项横断历史研究

李婷¹ 田小艳¹ 姚成奎¹ 罗杰²

¹ 贵州师范大学心理学院, 贵阳, 550031

摘要 目前, 有关青少年心理健康的研究多以汉族为主, 而我国作为一个多民族国家, 少数民族青少年的心理健康状况同样重要。那么, 这么多年以来少数民族青少年的心理状况发生了怎样的变化呢? 为探究我国少数民族青少年心理健康的变化趋势, 采用“横断历史研究”方法对 1978~2020 年发表的 53 篇采用 90 项症状自评量表 (SCL-90) 的研究文献进行分析。结果显示: (1) 年份显著正向预测 SCL-90 中 5 个因子 (躯体化、强迫症状、抑郁、敌对、偏执) 得分, 且年份可解释 1978~2020 年以来少数民族青少年 9 个因子 1.44%~13.4% 的变化, 除了躯体化和精神病性外其余 7 个因子增加 0.09~0.27 分, 说明少数民族青少年心理健康水平整体呈下降趋势; (2) 东部地区的少数民族青少年心理健康水平比西部地区下降趋势更大; (3) 男生在躯体化、人际敏感、抑郁、焦虑、恐怖、偏执、精神病性这 7 个因子得分有所下降, 而女生在强迫症状、抑郁、焦虑、敌对、恐怖这 5 个因子得分有所上升, 显然, 男生的心理健康水平呈上升趋势, 而女生的心理健康水平逐渐恶化, 整体来说, 男生的心理健康水平优于女生; (4) 少数民族青少年 SCL-90 得分与社会威胁、教育状况、经济状况等方面的 4 项社会指标呈显著相关, 25 年来中国社会的变迁进程解释了少数民族青少年心理健康水平的下降, 且少数民族青少年心理健康水平的下降也能预测教育经费和居民消费水平和粗离婚率。最后针对结论从社会、学校、家庭、个人层面提出建议。

Changes in the Mental Health of Ethnic Minority Adolescents(1978~2020): A Cross-sectional Historical Study

Ting Li¹, Xiaoyan Tian¹, Chengkui Yao¹, Jie Luo²

¹ School of Psychology, Guizhou Normal University, Guiyang, China

² School of Psychology, Guizhou Normal University, Guiyang, China

Abstract: At present, the research on the mental health of adolescents is mostly Han nationality. As a multi-ethnic country, the mental health of minority adolescents is equally important. So, what changes have taken place in the psychological conditions of ethnic minority youths over the years? In order to explore the changing trend of the mental health of ethnic minority adolescents in my country, the method of "cross-sectional historical research" was used to analyze 53 research documents published from 1978 to 2020 that used the 90-item self-rating symptom scale (SCL-90). The results showed that: (1) The year significantly positively predicted the scores of 5 factors (somatization, obsessive-compulsive symptoms, depression, hostility, and paranoia) in SCL-90, and the year can explain the 9 factors of minority adolescents from 1978 to 2020 A change of 1.44%~13.4%. Except for somatization and psychosis, the other 7 factors increased by 0.09~0.27 points, indicating that the mental health of ethnic minority adolescents is on an overall downward trend; (2) The mental health of ethnic minority adolescents in the eastern region is lower than that in the western region The trend is even greater; (3) Boys have decreased scores on the 7 factors of somatization, interpersonal sensitivity, depression, anxiety, horror, paranoia, and psychosis, while girls have scores on the 4 factors of somatization, interpersonal sensitivity, paranoia, and psychosis. It has declined. Obviously, the mental health of boys is on the rise, while the mental health of girls is gradually deteriorating. On the whole, the mental health of boys is better than that of girls; (4) SCL-90 scores of ethnic minority teenagers and social threats The four social indicators in terms of education, education, and economic conditions are significantly correlated. The process of social changes in China over the past 25 years has explained the decline in the mental health of ethnic minority adolescents, and the decline in the mental health of ethnic minority adolescents can also predict education funding and Resident consumption level and crude divorce rate. In the end, suggestions are made from the social, school, family, and individual levels to the conclusion.

Keywords: Adolescents, Mental health, SCL-90, Cross-sectional historical research

教师支持、失败恐惧与学生生活满意度的关系：基于 PISA2015 与 PISA2018 的中介作用分析

蒋锡平¹ 李悦¹ 王梓昕¹ 薛子原¹ 刘源¹ (通讯作者)

¹ 西南大学心理学部, 重庆, 400715, 邮箱: lyuuan@swu.edu.cn

摘要 教师支持, 是教师倾听、鼓励和尊重学生程度的重要表现, 认知支持、能力支持、情感支持是教师支持的三个维度, 其中, 认知支持和情感支持是经济合作与发展组织 (OECD) 对教育的重点考察内容。在中国对中学生心理健康愈加重视的大背景下, 本研究依据 OECD 公开的 PISA2015 和 PISA2018 大型教育数据集, 分析探索中国四省市教师支持对中学生生活满意度的影响机制, 基于结构方程模型 (SEM) 分析失败恐惧 (在 PISA2015 中表述为失败考试焦虑) 在两者间的中介模型, 纵向对比该作用机制随着时间的变化, 以及探究该结论在跨文化环境中的有效性。结果发现, 结果发现, (1) 在 PISA2015 的学生群体中 ($N = 9841$), 中介模型拟合良好 ($\chi^2 = 227.194$, $df = 23$, $CFI = 0.991$, $TLI = 0.985$, $RMSEA = 0.030$, $SRMR = 0.023$), 考试焦虑仅在教师认知支持与学生生活满意度之间有显著中介作用, 效应量为 4.32%; (2) 在 PISA2018 的学生群体中 ($N = 12058$), 中介模型进一步得到了验证 ($\chi^2 = 2436.955$, $df = 23$, $CFI = 0.991$, $TLI = 0.986$, $RMSEA = 0.039$, $SRMR = 0.019$)。相比较 PISA2015 的分析结果, 该模型在 2018 年数据中的适用性更好, 失败恐惧在教师情感支持、认知支持两个因子与学生生活满意度之间的中介作用均显著, 效应量分别为 6.83% 和 3.42%。(3) 除纵向研究之外, 该中介模型在跨文化环境也得到了验证 (以同期美国学生测评数据进行同样的分析), 即教师支持对学生的生活满意度有显著正向预测作用, 可以通过降低学生的失败恐惧来实现这一提升。无论是教师提供给学生的学习建议、指导、评价等认知支持, 还是积极关注、鼓励、关爱等情感支持, 都可以降低学生的失败恐惧, 然后提升学生的生活满意度。基于上述结果, 建议一线教学岗位的老师可以给学生提供更多的支持和帮助, 这种支持会让学生以更积极的态度面对生活和学习中的失败, 进而对生活更加满意, 有更加健康的心理状态。同时, 学校可以设置教育环节让学生有面对失败的正确态度, 这也会增加学生的生活满意度, 更加积极地面对生活。

关键词 PISA 测试, 教师支持, 失败恐惧, 生活满意度

How Teacher Support Influences Students' Life Satisfaction: the Mediating Analysis Based on PISA2015 and PISA2018

Jiang Xiping¹, Li Yue¹, Wang Zixin¹, Xue Ziyuan¹, Liu Yuan¹

¹ Southwest University Faculty of Psychology, Southwest University, Chongqing, China

Abstract: Teacher support is an important manifestation of teachers' listening, encouraging and respecting students. Cognitive support, ability support and emotional support are the three dimensions of teacher support. Among them, cognitive support and emotional support are the key investigation contents of education by the Organization for Economic Cooperation and Development (OECD). Under the background that China pays more attention to the mental health of middle school students, this study analyzes and explores the impact mechanism of teacher support on middle school students' life satisfaction in four provinces of China, and analyzes the mediating model of fear of failure (expressed as test anxiety in PISA2015) based on structural equation model (SEM), and explore the effectiveness of the conclusion in the cross-cultural environment and different time. The result of the SEM indicated that (1) the mediating model fits well with PISA2015 data ($\chi^2 = 227.194$, $df = 23$, $CFI = 0.991$, $TLI = 0.985$, $RMSEA = 0.030$, $SRMR = 0.023$), nevertheless, test anxiety only played a mediating effect between teachers' cognitive support and students' life satisfaction (effect size = 4.32%); (2) the mediating model is further validated with PISA2018 data ($\chi^2 = 2436.955$, $df = 23$, $CFI = 0.991$, $TLI = 0.986$, $RMSEA = 0.039$, $SRMR = 0.019$). Compared with the analysis results of PISA2015, the applicability of the model in 2018 is better. Fear of failure played the mediating effects between teachers' emotional support and students' life satisfaction (effect size = 6.83%), and

teachers' cognitive support and students' life satisfaction (effect size = 4.32%); (3) in addition to longitudinal studies, the hypothesis has also been tested in cross-cultural context with analyzing American student assessment data for the same period. In other words, teacher support shows a significant positive predictive effect on students' life satisfaction, which can be achieved by reducing students' fear of failure (or test anxiety). Whether teachers provide students with cognitive support such as learning suggestions, guidance and evaluation, or emotional support such as active attention, encouragement, and care, they can reduce students' fear of failure and improve students' life satisfaction. Based on the above results, it is suggested that teachers in front-line teaching work can provide more support and help to students. This support will enable students to face failures in life and learning with a more positive attitude, to be more satisfied with life and have a healthier psychological state. At the same time, schools can set up educational links to let students have a correct attitude towards failure, which will also increase students' life satisfaction and face life more actively.

音乐情感认知对青少年情绪调节的影响：行为及 ERP 研究

葛琼¹ 卢家楣¹ (通讯作者)

1 上海师范大学教育学院, 上海, 200234, 通讯作者 E-mail: lujiamei@vip.163.com

摘要 音乐情感认知是对音乐信息的收集与感知并在大脑中综合作用的结果, 是将音乐信息获取、加工、转化、存储的过程。音乐情感认知是音乐教育的本质性特征, 旨在培养学生的感受力, 正确调控情绪。为证明音乐情感认知是否对青少年的情绪调节产生促进作用, 本研究选取了 30 名未接受过任何音乐学习的青少年进行了两个实验, 借助脑成像技术 ERP, 同时记录被试的行为数据, 实验一, 选用听觉属性相对简单的民族乐器琵琶的文曲武曲各十首音乐片段, 音乐家以两种不同的呈现方式 (有感情、无感情) 演奏, 提取音乐高潮部分 30s, 30 名青少年对音乐情感的唤醒度和效价评分。实验二, 高低情感认知能力个体的情绪调节差异。为揭示音乐情感认知的整个情感变化过程, 实验记录听音乐 (前、中、后) 的脑电活动的情感差异。基于情绪调节策略, 采用 2 (情感认知能力: 高, 低) × 2 (音乐情绪类型: 正性, 中性, 负性) × 2 (实验组, 对照组) 混合设计。研究结果发现, 在行为方面, 音乐呈现方式中有感情演奏情感唤醒显著高于无感情演奏。在脑电方面, FCZ、FZ 在 N1P2 有情感认知差异。相比于中性情绪音乐, 正负性音乐更强的激活颞上回。相比于低音乐情感认知能力的被试, 高情感认知能力容易诱发更多的情感调节策略。本研究假设: (1) 音乐家自身的音乐表现方式的差异会产生被试不同的情感认知体验。(2) 音乐情感认知会促进青少年情绪的自动化评估以及调节。

The Influence of Music Affective Cognition on Adolescent Emotion Regulation: A Behavioral and ERP Study

QiongGe¹, Jiamei Lu^{1*}

1 School of Education, Shanghai Normal University, Shanghai, 200234 Email:

lujiamei@vip.163.com

Abstract: Music emotion cognition is the result of the collection and perception of music information and the comprehensive effect in the brain. It is a process of acquiring, processing, transforming and storing music information. Music emotion cognition is the essential feature of music education, which aims at cultivating students' sensibility and regulating emotions correctly. To prove whether music emotion cognition on adolescents' emotion regulation, this study selected 30 do not accept any music study teenagers carried out two experiments, using brain imaging technology of ERP, record the behavior of the participants data at the same time, the experimental one, selects the acoustic properties of relatively simple folk instrument Pi-pa represents every ten first music clips, The musicians played in two different ways (emotional and non-emotional), and 30 teenagers rated the emotional arousal and

valence of the music for 30s from the climax of the music. Experiment 2: The differences of emotion regulation among individuals with high and low affective cognitive abilities. In order to reveal the whole emotional change process of music emotional cognition, the experiment recorded the emotional difference of brain electrical activity before, during and after listening to music. Based on the emotion regulation strategy, a mixed design of 2 (emotion cognitive ability: high, low) $\times$ 2 (music emotion type: positive, neutral, negative) $\times$ 2 (experimental group and control group) was adopted. The results showed that emotional arousal was significantly higher in music presentation than in non-emotional performance. In terms of EEG, FCZ and FZ showed differences in emotional cognition in N1P2. Compared with neutral emotional music, positive and negative music activated the superior temporal gyrus more strongly. Compared with the subjects with low musical affective cognitive ability, high affective cognitive ability was more likely to induce more affective regulation strategies. The hypotheses of this study are as follows: (1) The differences of musicians' musical expression styles will lead to different affective cognitive experience of the subjects. (2) Music emotional cognition can promote the automatic assessment and regulation of adolescents' emotions.

不同公益感大学生公益行为后的道德许可效应

郑童¹ 卢家楣¹ (通讯作者)

1 上海师范大学教育学院, 上海, 200234, Lujiaimei@vip.163.com

摘要 公益感是指乐于参与爱护公物、保护环境、节约资源等公众利益活动的情感。道德许可效应是指个体过去做了道德行为, 会允许自己在未来减少做道德行为, 或者出现做不道德行为的现象。以往对于公益感的研究, 往往以公益广告为出发点, 以促进公益行为作为目的, 然而在这一过程中就忽视了道德许可效应的存在。即使公益广告促进了个体之后的公益行为, 但是如果个体因为道德许可在公益行为后放松了对道德自我的监控, 做出了非公益的行为甚至是不道德行为, 从整体而言, 他们的行为并不能算是公益。本研究旨在探讨大学生公益行为中存在的道德许可效应与公益感之间的关系, 为未来大学生公益教育以及公益事业发展的提供依据。实验一采用 2(被试类型: 高公益感、低公益感) $\times$ 2(活动情景: 进行环保活动、不进行环保活动)的两因素组间设计, 以环保活动为例, 探索不同公益感大学生在公益行为后的不同的道德许可效应。实验二将个体动机加入自变量, 采用 2(公益感: 高、低) $\times$ 3(参与环保活动动机: 外部动机、内部动机、不参与)的组间实验设计, 探究不同公益感大学生出于不同动机做出公益行为后的不同的道德许可效应。实验三采用 2(公益感水平: 高、低) $\times$ 2(产品类型: 绿色-中性、非绿色-中性) $\times$ 2(探测点位置: 同位、异位)的三因素混合实验设计, 探究公益行为后, 不同公益感大学生面对不同类型产品时的脑电特点。研究结果表明: (1)公益感水平较低的大学生在公益行为后出现了明显的道德许可效应, 在环保活动后更倾向于做出非绿色消费; 公益感水平较高的大学生无论是否参与了公益行为, 都倾向于做出绿色消费。(2)低公益感大学生, 出于内在动机参与环保活动会促进绿色消费; 高公益感大学生, 无论出于何种动机参与环保活动都会促进绿色消费。(3)低公益感大学生在公益行为后, 非绿色产品诱发了更大的 N1, P3 以及 LPP 成分波; 高公益感大学生在公益行为后, 绿色产品诱发了更大的 P3 以及 LPP 成分波。本研究结果表明公益感对于公益行为后道德许可效应的抑制作用, 并且同时表明了不同公益感大学生在公益行为后对不同产品的注意偏好和情感偏好不同, 其认知加工顺序为注意偏向阶段, 决策选择阶段和情感偏好阶段。

The moral licensing effect after the public welfare behavior of college students with different emotion of public welfare

Zheng Tong¹, Lu Jiamei¹

1 Shanghai Normal University, 100 Guilin Road, Xuhui District, Shanghai, China

Abstract: Emotion of public welfare refers to the feeling of being willing to participate in public interest activities such as protecting public property, protecting environment and saving resources. Moral permission effect refers to the

phenomenon that an individual who has done moral behavior in the past will allow himself to do less moral behavior or immoral behavior in the future. In the past, the research on the emotion of public welfare often starts from the public service advertisement and aims at promoting the public service behavior. However, in this process, the existence of moral permission effect is ignored. Even if public service ads promote the public welfare behavior of individuals, if individuals relax the monitoring of moral self after public welfare behavior because of moral permission, and make non-public welfare behavior or even immoral behavior, their behavior can not be regarded as public welfare. The purpose of this study is to explore the relationship between the moral permission effect and the emotion of public welfare in college students' public welfare behavior, so as to provide the basis for the future development of College Students' public welfare education and public welfare undertakings. In the first study, a two-factor design of 2(subjects' type: high emotion of public welfare, low emotion of public welfare) $\times$ 2(activity scenario: environmental protection activities, no environmental protection activities) was used to explore the different moral licensing effects of college students with different emotion of public welfare after public welfare behavior. In the second study, individual motivation was added into the independent variable, and an inter-group experiment design of 2(emotion of charity: high, low) $\times$ 3(motivation to participate in environmental protection activities: external motivation, internal motivation, and no participation) was adopted to explore the different moral permission effects of students with different emotion of charity acting out of different motivations for public welfare. In the third study, a three-factor mixed experimental design of 2(high and low level of emotion of charity) $\times$ 2(product type: green-neutral, non-green-neutral) $\times$ 2(location of detection points: isostatic and ectopic) was adopted to explore the EEG characteristics of college students with different emotion of charity when faced with different types of products after public welfare behavior. The results show that : (1) College students with a low emotion of public welfare have a significant moral license effect after public welfare behavior, and are more inclined to make non-green consumption after environmental protection activities; Students with a higher emotion of public welfare tend to make green consumption regardless of whether they participate in public welfare activities. (2) College students with a low emotion of public welfare have intrinsic motivation to participate in environmental protection activities, which will promote green consumption; Students with a high emotion of public welfare will promote green consumption regardless of their motivation to participate in environmental protection activities. (3) Non-green products induced greater N1, P3 and LPP component waves after the public welfare behavior of students with low emotion of public welfare; The green products induced greater P3 and LPP component waves in the students with high emotion of public welfare. The results of this study show that the emotion of public welfare can inhibit the moral permission effect after public welfare behavior. At the same time, it shows that the attention preference and emotional preference of college students with different emotion of public welfare to different products are different after public welfare behavior. The cognitive processing order is attention bias stage, decision-making stage and emotional preference stage.

Keywords: College students; emotion of public welfare; moral licensing effect

母亲教养压力与儿童抑制控制的关系：身体攻击教养行为的中介效应

蒋启梦¹ 周楠¹ (通讯作者)

¹ 首都师范大学学前教育学院, 北京, 100048, 通讯作者 E-mail: nanzhou@cnu.edu.cn

摘 要 学前阶段是儿童抑制控制发展的关键阶段。母亲的教养压力与幼儿抑制控制能力呈负相关。根据溢出假说理论, 如果母亲的教养压力得不到有效的缓解, 会将由压力引发的负面情绪转移到其教养行为中。身体攻击教养行为是中国文化背景下发生率较高的一种父母严厉管教行为。因此, 本研究拟通过建构中介模型, 探究母亲教养压力、身体攻击教养行为及儿童抑制控制的关系。

采用延迟满足任务考察 200 名儿童 ($M_{age}=4.63$ 岁, $SD=0.30$; 108 名男孩, 92 名女孩) 的抑制控制水平。儿童的母亲 ($M_{age}=36.43$ 岁, $SD=3.63$) 完成教养压力(Crnic & Booth, 1991)和身体攻击教养行为(Robinson 等, 2001) 问卷。采用 SPSS 23 Process 对母亲教养压力、身体攻击教养行为和儿童抑制控制之间进行分析处理。

结果显示：（1）母亲教养压力与儿童抑制控制呈显著负相关；（2）母亲教养压力与身体攻击教养行为呈显著正相关；（3）日常育儿压力通过身体攻击教养行为负向预测儿童抑制控制，身体攻击教养行为在预测中起完全中介作用， $R^2=0.01, F(1,198)=11.81, p<0.001, 95\%CI[-0.029,-0.004]$ ；育儿困难压力通过身体攻击教养行为负向预测儿童抑制控制，身体攻击教养行为在预测中起完全中介作用， $R^2=0.13, F(1,198)=29.74, p<0.001, 95\%CI[-0.025,-0.002]$ 。本研究的结果为缓解母亲教养压力，减少身体攻击教养行为，促进儿童抑制控制发展提供针对性的科学依据。今后应更加关注母亲教养压力对儿童抑制控制发展的影响，通过各种方式缓解母亲的教养压力和提高教养的幸福感，为儿童创造良好的家庭环境。

Maternal Parenting Style in Relation to Parenting Stress and Preschoolers' Inhibitory Control

Qimeng Jiang, Nan Zhou

Capital Normal University, Beijing, 100048

Abstract: The preschool phase is the key stage of the development of inhibitory control. Maternal parenting pressure is negatively correlated with children's inhibitory control. According to the theory of spillover hypothesis, if the mother's parenting stress is not alleviated effectively, the negative emotion caused by the stress can be transferred to parenting behavior. Physical aggressive parenting is a kind of parental harsh discipline with a high incidence in Chinese culture. Therefore, this study aimed to explore the association between maternal parenting pressure, physical aggressive parenting, and children's inhibitory control.

A total of 200 urban mothers ($M_{age}=36.4, SD=3.63$) with preschoolers ($M_{age}=4.63, D=0.30$, 92girls and 108 boys) filled out questionnaires on their parenting stress and physical aggressive parenting. Delay of gratification task was used to test children's inhibitory control. SPSS 23 process was used to analyze the associations between maternal parenting stress, physical aggression and child inhibitory control.

The results showed that: (1) maternal parenting stress was negatively correlated with child inhibitory control. (2) Maternal parenting stress was positively correlated with physical aggression. (3) Physical aggressive parenting played a mediating role in the association between daily parenting stress and child inhibitory control, $R^2=0.01, F(1,198)=11.81, p<0.001, 95\%CI[-0.029,-0.004]$. and physical aggressive parenting also plays a mediating role in the association between parenting difficulty stress and child inhibitory control, $R^2=0.13, F(1,198)=29.74, p<0.001, 95\%CI[-0.025,-0.002]$. The results of this study provided a scientific basis for promoting the development of child inhibitory control through reducing maternal parenting stress and physical aggression. In the future, more attention should be paid to various ways to relieve the mother's parenting stress, improve the parenting happiness, and create a good family environment for children.

Keywords: Maternal parenting stress, physical aggressive parenting, inhibitory control, preschoolers

颜色熟悉性影响转换代价的不对称性：ERP 研究

周勤¹ 潘童谣² 谭金凤¹（通讯作者）

湖北师范大学教育科学学院，黄石，435002, tanjff@163.com

摘要 当在难度不等的任务之间进行转换时，简单的任务转换成本往往比困难任务的转换成本大，这一现象被命名为转换代价的不对称效应（Asymmetrical switch cost）。研究发现，物体颜色信息输入的颜色与形状联结一致时，有助于视觉系统快速、有效地辨别物体。本研究以高颜色诊断性物体的图片为材料 2（任务材料：颜色一致、不一致）×2（任务类型：简单任务、复杂任务）×2（任务序列：重复、转换）记录并分析了 18 位正常被试在上述两种任务间进行转换时的行为数据和 EEG 数据。行为实验结果显示：1.复杂任务的时长显著长于简单任务；转换任务时长显著长于重复任务。2.在复杂任务条件下，不熟悉物体颜色材料的反应时长于熟悉的物体颜色反应时长。说明任务难度会影响熟悉性的加工，在较难任务条件下需要更大的认知资源，

相比简单条件无法更好的抑制不熟悉物体颜色冲突。3.任务序列和任务类型只在刺激材料为在不熟悉的物体颜色的条件下显著,说明转换代价的不对称效应会受到熟悉性的调节,简单任务的转换代价较大,复杂的转换代价较小。脑电结果显示:在复杂任务条件下,在枕叶诱发了P1波幅,而相同时间窗口内简单任务诱发了负向的N1波幅,这说明了简单任务的抑制更强,而对复杂任务的积极反应更强。从困难的任务转换到容易的任务,需要抵消对复杂的任务的强烈正向引诱和对相关任务的强烈负向引诱,而反方向的转换则需要抵消较弱的引诱效应,从而使简单任务的转换成本更大。

关键词 事件相关电位,任务转换,转换代价不对称性,颜色熟悉性

Color Familiarity Affects the Asymmetry of Conversion Cost: An ERP study

Qin Zhou¹, Tong Yao Pan², Jin feng Tan¹ (Corresponding author)

College of Education Science, Hubei Normal University, Huangshi, 435000,

Corresponding author E-mail: tanjff@163.com

Abstract: When switching between tasks of unequal difficulty, the switching cost for simple tasks tends to be larger than that for difficult tasks, a phenomenon named the asymmetrical switch cost effect (Asymmetrical switch cost). It was found that when the color of object color information input is consistent with the shape association, it helps the visual system to discriminate objects quickly and efficiently. In this study, the behavioral data and EEG data of 18 normal subjects were recorded and analyzed when switching between the above two tasks using pictures of highly color diagnostic objects as materials² (task materials: divided into color-consistent and inconsistent pictures) $\times$ 2 (task type: simple task, complex task) $\times$ 2 (task sequence: repetition, switching). The results of the behavioral experiment showed that: 1. the duration of the complex task was significantly longer than that of the simple task; the duration of the switching task was significantly longer than that of the repetition task. 2. the duration of the response to unfamiliar object color material was longer than that of the familiar object color response in the complex task condition. This indicates that task difficulty affects familiarity processing, requiring greater cognitive resources in the harder task condition and failing to better suppress unfamiliar object color conflict compared to the simple condition. 3. Task sequences and task types were significant only in the condition where stimulus material was in unfamiliar object color, with greater switching costs for the simple task and smaller switching costs for the complex. In the familiarity condition, the difference in conversion cost across task types was not significant. This suggests that the asymmetric effect of conversion cost is moderated by familiarity. EEG results showed that in the complex task condition, a P1 wave amplitude was evoked in the occipital lobe, whereas the simple task evoked a negative N1 wave amplitude in the same time window, indicating a stronger inhibition to the simple task and a stronger positive response to the complex task. Switching from difficult to easy tasks requires offsetting strong positive priming for complex tasks and strong negative priming for related tasks, whereas switching in the opposite direction requires offsetting weaker priming effects, resulting in greater switching costs for simple tasks.

学前儿童执行功能与情绪调节关系的交叉滞后研究

单美辰¹ 周楠¹ (通讯作者)

¹ 首都师范大学学前教育学院, 北京, 100048, 通讯作者 E-mail: nanzhou@cnu.edu.cn

摘要 执行功能和情绪调节是儿童自我调节发展的重要组成部分。执行功能上的缺陷可能导致儿童产生社会情感能力发展的一系列问题,而执行功能影响儿童情绪调节的发展。执行功能与情绪调节的纵向关联尚不明确,因此,本研究通过交叉滞后设计探究学前儿童执行功能与情绪调节的双向关系。

本研究采用实验法,选取北京市166名幼儿($M_{age} = 3.91$, $SD = 0.3$, 98 boys and 68 girls)作为研究对象,分别在小班和中班测量其执行功能和情绪调节。采用白天黑夜、礼物延迟、图片指认以及卡片维度任务分别

对幼儿冷抑制控制、热抑制控制、工作记忆以及认知灵活性进行测量，使用失望礼物任务对情绪调节进行测量。

结果发现：（1）幼儿执行功能中的冷抑制控制、工作记忆、认知灵活性从小班到中班阶段均呈现出显著增强的趋势，热抑制控制无增长变化但存在显著的性别差异，女童的热抑制控制能力显著高于男童。（2）幼儿情绪调节能力中综合情绪反应强度得分从小班到中班显著增强，不同性别儿童的情绪调节能力之间不存在显著差异，且这种差异不随时间而发生变化。（3）通过交叉滞后回归分析发现，执行功能中冷抑制控制、热抑制控制与情绪调节存在预测作用，冷抑制控制能正向预测控制情绪的努力程度，控制情绪的努力程度对冷抑制控制的预测作用不显著；综合情绪的反应强度能负向预测冷抑制控制，冷抑制控制对综合情绪的反应强度的预测作用不显著；控制情绪的努力程度能正向预测热抑制控制，热抑制控制对控制情绪的努力程度的预测作用不显著；认知灵活性和工作记忆则未发现与情绪调节存在预测关系。

本研究采用纵向研究考察学前儿童执行功能、情绪调节之间的关联性，了解幼儿在消极情境下情绪调节水平，以便帮助幼儿园教师发现幼儿的不良情绪、不良行为，通过合理引导提升幼儿的人际交往能力，这对于促进幼儿身心发展具有重要的意义。

A longitudinal study on the association between executive function and emotional regulation in preschool children

Meichen Shan, Nan Zhou

Capital Normal University, Beijing, 100048

Abstract: Executive function and emotional regulation are important components of children's self-regulation development. Defects in executive function may lead to a series of problems in the development of children's socioemotional ability, and executive function affects the development of children's emotional regulation. The longitudinal association between executive function and emotional regulation is not clear. Therefore, this study explores the bidirectional relationship between executive function and emotional regulation of preschool children through cross-lag design.

In this study, 166 children in Beijing ($M_{age} = 3.91$, $SD = 0.3$, 98 boys and 68 girls) were selected to participate using experimental methods, and their executive functions and emotional regulation were measured in small classes and middle classes. The tasks of day and night, gift delay, card sorting, and card dimension were used to measure children's cold inhibitory control, hot inhibitory control, working memory, and cognitive flexibility, and the disappointment gift task was used to measure emotional regulation.

The results showed that: (1) Cold inhibitory control, working memory and cognitive flexibility of children's executive function showed a significant increasing trend from small class to middle class. There was no increase in hot inhibitory control, but suggested significant gender differences where girls scored higher than boys. (2) The scores of comprehensive emotional response intensity in children's emotion regulation ability increased significantly from small class to middle class. There was no significant gender difference in emotion regulation ability, which did not change with time. (3) Through the cross-lag regression analysis, cold inhibitory control, hot inhibitory control and emotion regulation in executive function was suggested to have predictive effects. Cold inhibitory control positively predicted the degree of emotional control effort, but the degree of emotional control effort had no effect on cold inhibitory control. Comprehensive emotional reaction intensity negatively predicted cold inhibitory control, but cold inhibitory control did not predict comprehensive emotional reaction intensity. The effort of emotional control positively predicted the degree of hot inhibitory control, but the predictive effect of hot inhibitory control on the effort of emotional control was not significant. Cognitive flexibility and working memory had no predictive relationship with emotion regulation.

Through cross-lag design, the present study investigated the associations between preschool children's executive function and emotional regulation. The findings can help better understand emotional regulation of preschool children

in negative situations, and guide kindergarten teachers to facilitate children's development of inhibitory control and emotional regulation.

Keywords: Preschool children, executive function, emotion regulation, predictive effect

我国学生批判性思维水平变迁的横断历史研究

郭胜利¹ 范会勇² (通讯作者)

摘要 学生的批判性思维水平直接关系着我国的创新水平。然而, 以往研究者对于我国学生批判性思维的变迁状况争论不休。有的认为在逐年提高, 有的认为在逐年下降, 有的则认为没啥变化。那么, 我国学生批判性思维倾向到底是如何变化的呢? 该文采用横断历史研究方法对 2005 年至 2019 年 170 篇使用批判性思维倾向量表的研究进行了元分析, 涉及学生群体共 74923 人。结果显示: (1) 批判性思维倾向与年代呈正相关关系, 但相关关系不显著; 其中, 思想开放性维度与年代呈现显著正相关 ($p=0.025$); 寻求真相与年代之间呈现负相关关系, 分析能力、系统性、自信心、求知欲和认知成熟度与年代呈现正相关关系, 但其相关关系都不显著。这说明 15 年来我国学生群体批判性思维倾向总体变化趋势不明显。(2) 批判性思维倾向得分的地区差异显著 ($Q_{\text{between}}=31.584, p<0.001$), 表现为华南<东北<西南<西北<华东<华北<华中。(3) 批判性思维倾向得分的年级差异显著 ($Q_{\text{between}}=11.658, p<0.05$), 表现为高中生<大学生<研究生<初中生<小学生。(4) 高一至高三年级学生的批判性思维倾向差异不显著 ($Q_{\text{between}}=1.388, p<0.001$); 大学一年级至大学五年级学生的批判性思维倾向差异不显著 ($Q_{\text{between}}=4.066$); 研一至研三年级学生的批判性思维倾向差异不显著 ($Q_{\text{between}}=5.011$)。 (5) 批判性思维倾向得分的学生群体类型差异显著 ($Q_{\text{between}}=27.905, p<0.001$), 表现为工科<医学<文科<理科。(6) 批判性思维倾向得分的学校类型差异显著 ($Q_{\text{between}}=5.473, p<0.05$), 表现为普通高校<重点高校。(7) 批判性思维倾向得分的性别差异不显著 ($Q_{\text{between}}=0.005$)。 (8) 批判性思维倾向得分的城市、农村差异不显著 ($Q_{\text{between}}=0.071$)。 (9) 批判性思维各维度与经济社会指标的相关均不显著。该文还讨论了批判性思维变化的原因, 并提出了将来研究的方向。

A Cross-Temporal Meta-Analysis of Changes in Chinese Students' Critical Thinking Level

Guo Shengli¹, Fan Huiyong² (corresponding author)

¹ Bohai University, Jinzhou

² Bohai University, Jinzhou

Abstract: The level of critical thinking of students is directly related to the level of innovation in our country. However, in the past, researchers have been arguing about the changes in critical thinking among Chinese students. Some think it is increasing year by year, some think it is decreasing year by year, and some think there is no change. So, how does the critical thinking tendency of our students change?

This article uses the cross-temporal meta-analysis to analyze 170 studies using the Critical Thinking Tendency Scale from 2005 to 2019, involving a total of 74,923 students. The results show that: (1) Critical thinking tendency is positively correlated with the age, but the correlation is not significant; among them, the open-mindedness dimension is significantly positively correlated with the age ($p=0.025$); the truth-seeking is negatively correlated with the age, Analytical ability, systemicity, self-confidence, thirst for knowledge, and cognitive maturity show a positive correlation with age, but their correlations are not significant. This shows that the overall trend of critical thinking tendencies of our student groups in the past 15 years has not been obvious. (2) There are significant regional differences in critical thinking tendency scores ($Q_{\text{between}}=31.584, p<0.001$), which is expressed as South China < Northeast < Southwest < Northwest < East China < North China < Central China. (3) The grade difference of critical

thinking tendency score is significant ($Q_{\text{between}}=11.658, p<0.05$), which is expressed as high school students < college students < graduate students < junior high school students < primary school students. (4) There is no significant difference in the critical thinking tendency of the first to third grade students ($Q_{\text{between}}=1.388, p<0.001$); the critical thinking tendency of the first to fifth grade students is not significantly different ($Q_{\text{between}}=4.066$); There was no significant difference in the critical thinking tendency of the third grade students ($Q_{\text{between}}=5.011$). (5) There is a significant difference in the types of students with critical thinking tendency scores ($Q_{\text{between}}=27.905, p<0.001$), which is expressed as engineering < medicine < liberal arts < science. (6) There is a significant difference in the types of schools with critical thinking tendency scores ($Q_{\text{between}}=5.473, p<0.05$), which is expressed as ordinary colleges < key colleges. (7) The gender difference in critical thinking tendency score is not significant ($Q_{\text{between}}=0.005$). (8) There is no significant difference between urban and rural areas for critical thinking tendency scores ($Q_{\text{between}}=0.071$). (9) The correlation between all dimensions of critical thinking and economic and social indicators is not significant. The article also discusses the reasons for the change in critical thinking and suggests the direction of future research.

中小学教师心理健康素质量表编制及发展特征研究

周冉玲^{1,2} 杨伊生¹

1 内蒙古师范大学心理系, 呼和浩特, 010022, yangys1965@163.com

2 重庆市云阳高级中学校, 重庆, 404500

摘 要 为了对中小学教师心理健康素质进行深入分析和探讨, 本研究首先编制了测量中小学教师心理健康素质的量表, 接着用此量表进行施测以了解中小学教师心理健康素质的发展特征。研究方法: 在量表理论结构假设的过程中采用文献法、开放式问卷调查法和访谈法, 在理论假设的基础上对开放式调查和访谈结果进行分类处理, 确定中小学教师心理健康素质的基本假设结构。在理论假设结构的基础上初次编写了 88 个项目, 形成预测问卷。将预测问卷对 240 名中小学教师进行施测, 对有效数据进行项目分析和探索性因素分析, 剔除不合格的项目后最后确定 53 个项目, 将剩余题目重新编号形成正式量表。发放 450 份正式问卷, 收回有效问卷 386 份, 进行信效度检验。采用自编中小学教师心理健康素质正式量表对中小学教师心理健康素质发展特征进行研究。共发放问卷 550 份, 有效问卷 507 份。数据回收整理后, 对中小学教师心理健康素质在性别、民族、地区、学校所在地、所教学校类型、所教年级、是否骨干教师、教龄、职称等方面进行差异分析。研究结果: 中小学教师心理健康素质量表分为一般心理健康素质分量和职业心理健康素质分量。一般心理健康素质包括认知特性、情绪协调、意志品质、行为适应四个维度; 职业心理健康素质包括职业认同、职业能力、职业品质三个维度, 共 53 个项目。中小学教师心理健康素质量表的信效度良好。验证性因素分析各拟合指标均达到测量学标准, 各维度与总分呈中高程度相关, 各维度之间呈中低程度相关, 有良好的结构效度; 该量表与自尊量表的相关性为 0.461, 与职业倦怠量表的低成就感分量表相关性为-0.777, 都达到了中高程度的相关, 效标效度良好; 重测信度为 0.816, 内部一致性系数处于 0.804~0.970 之间, 信度优良。中小学教师心理健康素质在性别、民族、地区、学校所在地、所教学校类型、所教年级上整体不存在差异, 而受职称、是否为骨干教师、教龄的影响较明显。

Study on Scale Establishment and Development Characteristics of Psychological Health-Diathesis about Primary and Secondary School Teachers

Zhou Ranling^{1,2}, Yang Yisheng¹

1 Department of psychology, Inner Mongolia Normal University, Hohhot, 010022,
yangys1965@163.com

2 Chongqing Yunyang high school, Chongqing, 404500

Abstract: In order to conduct an in-depth analysis and discussion on the mental health of primary and secondary school teachers, this study first compiled a scale to measure the mental health of primary and secondary school teachers, and then used this scale to conduct tests to understand the development characteristics of the mental health of primary and secondary school teachers. Research method: The literature method, open questionnaire survey method and interview method are used in the process of the theoretical structure of the scale. The open survey and interview results are classified and processed on the basis of theoretical assumptions to determine the mental health quality of primary and secondary school teachers. Basic hypothetical structure. Based on the theoretical hypothetical structure, 88 items were compiled for the first time to form a prediction questionnaire. The prediction questionnaire was tested on 240 elementary and middle school teachers, and the effective data was analyzed by item analysis and exploratory factor analysis. After excluding unqualified items, 53 items were finally determined, and the remaining items were renumbered to form a formal scale. 450 formal questionnaires were issued, and 386 valid questionnaires were retrieved for reliability and validity testing. A self-compiled official scale of primary and secondary school teachers' mental health quality was used to study the development characteristics of primary and secondary school teachers' mental health quality. A total of 550 questionnaires were distributed and 507 valid questionnaires were issued. After the data is collected and sorted out, differences in the mental health of primary and secondary school teachers in terms of gender, ethnicity, region, school location, type of school taught, grade of teaching, whether or not they are key teachers, teaching age, professional title, etc., are analyzed. The results show that the mental health quality scale of primary and secondary schoolteachers can be divided into general mental health quality subscale and occupational mental health quality subscale. General mental health quality includes four dimensions: cognitive characteristics, emotional coordination, will power quality and behavioral adaptation. Occupational mental health quality includes three dimensions: professional identity professional ability and professional quality, totaling 53 items. The reliability and validity of the Mental Health Quality Scale for Primary and Secondary School Teachers are good. Confirmative factor analysis showed that all the fitted indicators met the measurement standard, and the dimensions were moderately and highly correlated with the total score, and the dimensions were moderately and moderately correlated with each other, with good structural validity. The correlation between the scale and the self-esteem scale was 0.461 and the correlation between the scale and the low achievement subscale of the occupational burnout scale was 0.777, which reached a moderate and high degree of correlation, and the calibration validity was good. The reliability is 0.816, the internal consistency coefficient is between 0.804 and 0.970, and the reliability is excellent. The mental health quality of primary and secondary schoolteachers does not differ in gender, nationality, region, school location, type of school taught, grade taught, but the influence of professional title, whether they are backbone teachers and teaching age is more obvious.

初中生亲子三角关系与网络欺凌的关系研究：自我分化与抑郁症状的链式中介效应分析

韩晶晶¹ 张珊珊¹（通讯作者）

1 沈阳师范大学教育科学学院，沈阳，110034，zhangxiaobai2@163.com

摘要 近年来，随着智能手机和网络的普及，网络欺凌作为一种新的欺凌行为日渐增多，综合世界各国调查情况来看，网络欺凌现象在各国出现情况较为普遍。相关研究表明，青少年是卷入网络欺凌的主要人群，而且还会由于个体接触网络年龄的不断下降，致使更多处于青春期早期的初中生涉足网络欺凌行为中，尤其是具有不良亲子关系的青少年，更易实施网络欺凌行为。为减少青少年网络欺凌行为，提高青少年心理健康水平，本研究基于家庭系统理论及压力的相互作用模型，揭示亲子三角关系对网络欺凌的影响机制，以期为青少年网络欺凌问题提供理论依据。本研究采用亲子三角关系量表，流调中心用抑郁量表，自我分化量表和中学生网络欺凌问卷对 1301 名初中生进行调查。采用 SPSS 24.0 和 Amos24.0 对研究数据进行分析与处理并建立结构模型，探讨亲子三角关系与网络欺凌的关系以及自我分化与抑郁症状的链式中介效应。研究结果表明：（1）亲子三角关系对青少年网络欺凌行为具有正向预测作用，即子女卷入三角关系的程度越深，产生网络欺凌行为的可能性越大。（2）自我分化在亲子三角关系与网络欺凌间起中介作用，卷入亲子三角关系程度越深，自我分化水平越低，越容易产生网络欺凌行为。（3）抑郁症状在亲子三角关系与网络欺凌间起中介作用，即亲子三角关系通过影响青少年抑郁水平进而导致青少年网络欺凌行为的产生。（4）自我分化和抑郁症状在亲子三角关系与网络欺凌间起链式中介作用，卷入亲子三角关系的青少年自我分化水平较低，易产生抑郁情绪进而产生网络欺凌行为。研究结果揭示了亲子三角关系对青少年网络欺凌行为的消极影响，提示我们要重视家庭关系对青少年线上问题行为的影响，必要时还应介入心理干预手段事前防范青少年网络欺凌的发生。

The influence of Parent Child Triangle Relationship on Cyberbullying of Junior Middle School Students: Chain Mediating Effect of Self-differentiation and Depression Symptoms

Han Jingjing¹, Zhang Shanshan¹

1 School of Education Shenyang Normal University No.253, Yellow River North Street, Huanggu District, Shenyang City, Liaoning Province

Abstract: In recent years, with the popularity of smart phones and the Internet, cyberbullying, as a new bullying behavior, is increasing day by day. According to the survey of countries around the world, cyberbullying is more common in various countries. Relevant research shows that teenagers are the main group involved in cyberbullying, and because of the declining age of individual contact with the Internet, more junior high school students in early adolescence are involved in cyberbullying, especially teenagers with bad parent-child relationship, who are more likely to implement cyberbullying. In order to reduce teenagers' cyberbullying behavior and improve teenagers' mental health level, this study reveals the influence mechanism of parent-child triangle on cyberbullying based on family system theory and stress interaction model, in order to provide theoretical basis for teenagers' cyberbullying problem. In this study, 1301 junior high school students were investigated with the Parent-child Triangle Relationship Scale, Depression Scale, Self-Differentiation Scale and Middle School Students Cyber Bullying Questionnaire. SPSS 24.0 and Amos24.0 were used to analyze and process the research data and build a structural model to explore the relationship between parent-child triangle and cyberbullying, and the chain mediating effect between self-differentiation and depressive symptoms. The results show that: (1) Parent-child triangular relationship has a positive predictive effect on teenagers' cyberbullying behavior, that is, the deeper children are involved in triangular relationship, the greater the possibility of cyberbullying behavior. (2) Self-differentiation plays an intermediary role between parent-child triangle and cyberbullying. The deeper the involvement in parent-child triangle, the lower the

level of self-differentiation, and the easier it is to produce cyberbullying. (3) Depression plays an intermediary role between parent-child triangular relationship and cyberbullying, that is, parent-child triangular relationship leads to adolescent cyberbullying behavior by influencing adolescent depression level. (4) Self-differentiation and depressive symptoms play a chain mediating role between parent-child triangle and cyberbullying. Adolescents involved in parent-child triangle have a low level of self-differentiation, and are prone to depression and then cyberbullying. The results reveal the negative influence of parent-child triangle on teenagers' cyberbullying behavior, and suggest that we should pay attention to the influence of family relationship on teenagers' online problem behavior, and intervene in psychological intervention to prevent teenagers from cyberbullying if necessary.

初中生社会支持、道德脱离、自我效能感和校园欺凌中旁观者行为的关系研究

张梦园

赣南师范大学教育科学学院，赣州，341000，1550051593@qq.com

摘要 校园欺凌是一种普遍的现象，以往研究注重校园欺凌的欺凌者和被欺凌者，而忽视了同一情境中人数最多且影响着欺凌事件发展过程和方向的旁观者，所以对校园欺凌中旁观者行为进行研究具有重要的意义，根据作用机制将旁观者行为分为保护者行为、强化者行为和局外人行为。目前，关于校园欺凌中旁观者的研究还处于起步阶段，以往的研究表明：社会支持、道德脱离和自我效能感对校园欺凌中旁观者行为具有重要影响，但缺乏对其行为机制的探讨。本研究旨在考察初中生社会支持与校园欺凌中旁观者行为的关系，以及道德脱离和自我效能感在两者中是否存在中介作用。研究选取赣州市两所中学初一至初三共 550 名的学生作为被试，采用《参与者角色问卷》、《社会支持量表》、《道德脱离量表》、《一般自我效能感量表》作为研究工具，使用 SPSS、PROCESS 等软件进行统计分析。结果显示：（1）学生在校园欺凌中扮演的旁观者角色行为有强化者行为，保护者行为与局外人行为，而其中占比最高的是保护者行为，同时存在性别和年级的差异。（2）社会支持与强化者行为之间存在负相关，与保护者行为之间存在正相关，与局外人行为之间存在负相关。（3）道德脱离、自我效能感在社会支持与强化者行为、保护者行为和局外人行为之间存在中介效应。

The Relationship between Social Support, Moral Disengagement, Self-efficacy and Bystander Behavior in School Bullying in Junior High School Students

Zhang Mengyuan

School of Educational Science, Gannan Normal University

Nan Shi Yuan Road, Rongjiang New District, Ganzhou City, Jiangxi Province, China

Abstract: School bullying is a common phenomenon. Previous studies focused on the bullies and the bullied, while ignoring the largest number of bystanders in the same situation who affect the development process and direction of bullying incidents. Therefore, it is of great significance to study the behavior of bystanders in school bullying. According to the mechanism of action, bystander behavior is divided into protector behavior, reinforcer behavior and outsider behavior. At present, the research on bystanders in school bullying is still in its infancy. Previous studies have shown that social support, moral disengagement and self-efficacy have important effects on bystanders' behavior in school bullying, but there is a lack of discussion on the mechanism of bystanders' behavior. The purpose of this study was to investigate the relationship between social support and bystander behavior in school bullying in junior high school students, and whether moral disengagement and self-efficacy mediate the two. In this study, a total of 550 students from the first to the third grade of two middle schools in Ganzhou city were selected as subjects.

Participants' Role Questionnaire, Social Support Scale, Moral Disengagement Scale and General Self-efficacy Scale were used as research tools. SPSS, PROCESS and other software were used for statistical analysis. The results show that : (1) the bystander behavior of students in school bullying includes reinforcer behavior, protector behavior and outsider behavior, among which protector behavior accounts for the highest proportion, and there are gender and grade differences. (2) There is a negative correlation between social support and reinforcer behavior, a positive correlation between social support and protector behavior, and a negative correlation between social support and outsider behavior. (3) Moral disengagement and self-efficacy had a mediating effect between social support and reinforcer's behavior, protector's behavior and outsider's behavior.

Keywords: social support, moral disengagement, self-efficacy, bystander behavior, relationship research

父母自主支持对初中生数学学业表现的影响：数学焦虑和学业投入的序列中介作用

柳欣雨¹ 黄碧娟¹ 郭凯玥¹ 司继伟¹ (通讯作者)

1 山东师范大学心理学院, 济南, 250014, sijiwei1974@126.com

摘要 自主支持(autonomy support)是一种积极的教养行为, 指处于权威地位的人(如父母)采纳他人(如子女)的观点, 接受他人的感受, 为他人提供选择机会, 并且减少对他人的控制, 鼓励他人自主解决问题和自我决策的行为。自我决定理论认为自主支持作为环境中的一种心理变量, 在提升学生的学习动机与学业投入, 进而提升其学业成就方面起着重要作用。然而, 父母自主支持对于青少年时期个体数学学业表现的作用机制目前尚不明晰。为深入探究中学阶段父母自主支持、数学学习投入、数学焦虑对于学生数学学业表现的具体影响, 本研究使用由学生自我报告的数学焦虑量表、父母自主支持量表、中学生数学学习投入量表对 514 名七、八年级初中生被试进行调查。研究结果表明, (1)在控制性别、智力因素后父母自主支持与学生数学学业表现呈显著正相关($r = 0.108, p < 0.05$), 与数学焦虑呈显著负相关($r = -0.217, p < 0.05$)、学业投入呈显著正相关($r = 0.361, p < 0.05$), 学业表现与数学焦虑呈显著负相关($r = -0.414, p < 0.05$)、学业投入呈显著正相关($r = 0.349, p < 0.05$); (2)父母自主支持可通过学业投入和数学焦虑的链式中介作用对数学学业表现产生影响($\beta = 0.2265, \text{BootLLCI} = 0.733, \text{BootULCI} = 0.3947$), 父母自主支持也可通过学业投入对学业表现产生影响($\beta = 0.2681, \text{BootLLCI} = 0.1635, \text{BootULCI} = 0.3894$)。上述发现意味着今后在家庭教育中, 父母应注意给予子女更多的自主支持, 以提高学业投入, 降低他们对数学的焦虑水平, 从而达到提升数学学业成就的目的。

How Parents Autonomy Support Impact Academic Performance in Mathematics in Secondary School Pupils? The Serial Mediating Roles of Math Anxiety and Academic Engagement

Xinyu Liu¹, Bijuan Huang¹, Kaiyue Guo¹, Jiwei Si¹ (Corresponding author)

Shandong Normal University, School of psychology, Jinan, sijiwei1974@126.com

Abstract: Autonomy support is a kind of positive parenting behavior, which refers to the behavior that people in a position of authority (ei. parents) adopt the opinions of individuals (ei. children), accept the feelings of individuals, provide choices for individuals, reduce their control over individuals, and encourage individuals to solve problems and make decisions independently. Self-determination theory holds that autonomous support, as a psychological variable in the environment, plays an important role in improving students' learning motivation and academic engagement, thereby enhancing their academic achievement. However, the mechanism of parent autonomy support on adolescent individuals' math academic performance is not clear. To delve into parent autonomy support, mathematics learning in mathematics, mathematics anxiety for secondary school pupils academic performance of the specific impact, the study used the self-reported Mathematics Anxiety Scale for Children, Parent Autonomous Support Scale, and Math Academic Engagement Scale to investigate 514 students in seventh and eighth grade.

Research indicates: (1) parent autonomy support was significantly positively correlated with mathematics students' academic performance after controlling for gender and intelligence factors ($r = 0.108, p < 0.05$), which was significantly negatively correlated with math anxiety ($r = -0.217, p < 0.05$), and significantly positively correlated with academic engagement ($r = 0.361, p < 0.05$). There was a significant negative correlation between academic performance and math anxiety ($r = -0.414, p < 0.05$), and a significant positive correlation between academic engagement and math anxiety ($r = 0.349, p < 0.05$). (2) Parent autonomy support had an impact on math academic performance through the chain mediating effect of math engagement and math anxiety ($\beta = 0.2265$, BootLLCI = 0.733, BootULCI = 0.3947). Parent autonomy support can also affect academic performance through academic involvement ($\beta = 0.2681$, BootLLCI = 0.1635, BootULCI = 0.3894). The above findings suggest that in the future, parents should pay more attention to giving their children more autonomy support in future family education to increase children's academic engagement, reduce their level of math anxiety, so as to achieve the purpose of improving academic achievement in mathematics.

Keywords: Secondary school pupils, Math anxiety, Autonomy support, Academic engagement

父母行为控制与青少年主观幸福感的纵向研究：未来规划的作用

宋舒心 孙瞻 赵景欣

山东师范大学心理学院, 济南, 250014, jingxinzha@126.com

摘要 主观幸福感是青少年生活质量和身心健康的有效指标。随着积极心理学研究的深入, 如何提升青少年的主观幸福感成为研究者关注的重要主题。长期以来, 父母行为控制被认为是促进青少年积极发展的重要保护因素。但是, 对于自主性开始发展的早期青少年群体而言, 父母行为控制是否可以提升其主观幸福感尚未可知。同时, 青少年期是未来规划快速发展、分化和拓展的重要时期。根据目标理论的观点, 目标取向决定着个体的主观幸福感, 青少年进行未来规划就是确定自己发展目标的过程, 因此青少年自己进行未来规划并达成目标时, 其主观幸福感也会提高。此外, 根据社会控制理论的观点, 父母的行为控制会通过给予青少年行为上的指导和建议对青少年的未来规划提供方向和规范。但是, 父母行为控制能否通过青少年的未来规划而对其主观幸福感产生作用呢? 这有待于实证研究的支持。因此, 本研究以青少年早期个体作为研究对象, 考察父母行为控制、未来规划这两个保护因素对其主观幸福感的预测作用, 并检验未来规划在父母行为控制与青少年主观幸福感之间的中介作用及其性别差异。

基于追踪研究设计, 对 834 名 6、7、8 年级学生进行每隔半年的三次测查, 在 T1、T2 和 T3 分别测量青少年的父母行为控制、未来规划和主观幸福感。结果表明: (1) 父亲行为控制和母亲行为控制均可以显著正向预测青少年的主观幸福感; (2) 未来规划中的教育投入和职业投入均可以显著正向预测青少年的主观幸福感; (3) 青少年的教育投入在母亲行为控制与主观幸福感之间起中介作用, 这对于男生和女生均是如此; (4) 青少年的职业投入在母亲行为控制与主观幸福感之间起中介作用, 但是该中介作用仅存在于女生之中。这表明, 在自主性开始发展的青少年早期, 父母行为控制仍然可以提升青少年的主观幸福感, 母亲行为控制则可以通过提升青少年的教育和职业投入来增强其主观幸福感。

A Longitudinal Study on Parental Behavior Control and Adolescents' Subjective Well-being: The Role of Future Planning

Shuxin Song, Zhan Sun, Jingxin Zhao

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract: Subjective well-being is an effective indicator of adolescents' quality of life and physical and mental health. With the further development of positive psychology, how to improve adolescents' subjective well-being has become a major concern of researchers. For a long time, parental behavior control has been regarded as an important protective factor promoting the positive development of adolescents. Yet, for the early group of adolescents whose

autonomy has started to develop, whether parental behavior control can improve their subjective well-being still remains unclear. At the same time, adolescence is an important period for the rapid development, differentiation and expansion of future planning. According to the goal theory, goal orientation determines adolescents' subjective well-being. For adolescents, making future planning is exactly a process of determining their development goals. Thus, when adolescents plan for their future and achieve their goals, their subjective well-being will also be improved. In addition, according to the social control theory, parental behavior control will provide direction and norms for adolescents' future planning by giving them guidance and suggestions in behavior. However, can parental behavior control affect adolescents' subjective well-being through their future planning? It remains to be proved by the empirical researches. For this reason, the present study, in a sample of individuals in early adolescence, investigated the effects of parental behavior control and future planning on subjective well-being, and the mediating effect of future planning on the relationship between parental behavior control and subjective well-being and its gender differences.

Based on longitudinal design, a total of 834 adolescents in grades 6, 7, and 8 were measured three times at intervals of 6 months. Adolescents' parental behavior control, future planning, and subjective well-being were measured at T1, T2, and T3 respectively. Results showed that: (1) Paternal behavior control and maternal behavior control both positively predicted adolescents' subjective well-being; (2) Both educational commitment and occupational commitment in future planning positively predicted adolescents' subjective well-being. (3) Adolescents' educational commitment played a mediating role between maternal behavior control and subjective well-being, which was true for both boys and girls; (4) Adolescents' occupational commitment played a mediating role between maternal behavior control and subjective well-being, but this effect existed only among girls. This indicated that during early adolescence when autonomy has started to develop, parental behavior control can still improve adolescents' subjective well-being. What's more, maternal behavior control can also improve adolescents' subjective well-being through improving their educational and occupational commitment.

Keywords: parental behavior control, subjective well-being, future planning

我国中小学生学习家庭作业时间变迁的横断历史研究

摘 要 家庭作业时间是一个标志性变量。在过去几十年里, 教育行政部门一直在严控作业时间。然而, 近年来有关家庭作业时间的变化趋势却争论不休。有研究认为我国学生的家庭作业时间在不断增加; 有研究认为没有变化; 也有研究认为在减少。那么, 我国中小学生的家庭作业时间是怎么变化的呢? 为回答该问题, 该研究采用横断历史研究对发表于 2003 至 2019 年间的 177 篇研究报告进行了元分析, 涉及中小学生学习 123311 人。结果表明: (1) 年代效应不显著。家庭作业时间与年代呈负相关关系, 但相关关系不显著, 说明随着年代变化, 家庭作业时间没有显著变化。(2) 地区效应显著。初中生作业时间的地区差异极其显著 ($p=0.000$), 具体为华北地区>西南地区>中南地区>华东地区>西北地区。(3) 年级效应显著。初中>高中>小学 ($p=0.001$)。小学 ($p=0.000$) 和高中 ($p=0.006$) 学生的学术性科目之间的作业时间差异显著, 初中学生的学术性科目之间的作业时间差异不显著 ($p=0.973$)。(4) 性别效应不显著。性别的作业时间差异不显著 ($p=0.853$)。(5) 科目效应显著。高中学生的语文、数学、英语三科的作业时间总体上随年代呈现上升趋势 ($r=0.548$, $p=0.001$)。 (5) 经济社会指标中的教育投入、GDP 与学生家庭作业时间相关显著。

总体上看, 我国中小学生的家庭作业时间总体上没有变化, 但高中学生的语文、数学、外语方面的作业时间反而在增加。该文还讨论了将来研究需要注意的地方。

A Cross-temporal Meta-analysis of Changes in Primary and Middle School Students' Homework Time in China

Jinghua Zhai¹, Huiyong Fan²

1 Bohai University, Jinzhou

2 Bohai University, Jinzhou

Abstract: Homework time is a hallmark variable. In the past few decades, the education administration has been strictly controlling the homework time. However, in recent years, the trend of changes in homework time has been controversial. Some studies believe that the homework time of Chinese students is increasing; some studies believe that there is no change; some studies believe that it is decreasing. How does the homework time of primary and middle school students in China change? To answer this question, the study used the cross-temporal meta-analysis to analyze 177 research reports published between 2003 and 2019, involving 123,311 primary and middle school students. The results show: (1) The age effect is not significant. There is a negative correlation between the time of homework and the age, but the correlation is not significant, indicating that the time of homework has not changed significantly with the change of age. (2) The regional effect is significant. The regional differences in homework time of junior high school students are extremely significant ($p=0.000$), specifically: North China>Southwest China>Central South>East China>Northwest China. (3) The grade effect is significant. Junior high school>High school>Primary school ($p=0.001$). Primary school ($p=0.000$) and high school ($p=0.006$) students have significant differences in homework time between academic subjects, and junior high school students have no significant differences in homework time between academic subjects ($p=0.973$). (3) The gender effect is not significant. There was no significant difference in work time between genders ($p=0.853$). (4) The subject effect is significant. The homework time about Chinese, mathematics, and English of senior high school students showed an upward trend over the years ($r=0.548$, $p=0.001$). (5) Educational investment and GDP in economic and social indicators are significantly correlated with students' homework time.

Overall, the homework time of primary and middle school students in China has not changed, but the homework time of high school students in Chinese, mathematics, and English is increasing. The article also discusses areas that need attention in future research.

Keywords: homework time, elementary and middle school students, cross-temporal meta-analysis, meta-analysis

空间关系表征的大脑偏侧化与高中生学业成绩

谢尚琰 常帅 孟明（通讯作者）

华南师范大学心理学院，广州，510631，mingmeng@m.scnu.edu.cn

摘要 视觉认知加工需要建立视觉元素间的空间关系，一般认为视觉系统存在类别和坐标两种空间关系表征，前者表示空间结构上通用的属性，后者则负责更为精确的空间关系。利用单侧视野速示技术，以往研究发现左半球相较于右半球，更擅长类别空间关系表征，而右半球则是在加工坐标空间关系表征时表现得比左半球更好。语言认知中有大量类别表征，也具有明显的左半球优势，这一点与类别表征的左半球优势类似。因此，类别空间关系表征的左半球优势是否与青少年语言相关的学科学习能力有关？也就是说，类别空间关系表征中左半球偏侧化程度较高的个体是否可能具有更好的语文和英语成绩？另一方面，坐标表征的右半球优势表明右半球更擅长加工需要精确度量的空间关系，而在数学学习中无论是代数还是几何都需要精确的信息表征，这意味着数学是否可能与坐标空间关系表征的关系更紧密，相较于语文和英语，数学成绩更有可能与坐标表征中右半球偏侧化程度相关？为了探究这些问题，本研究以在校高中生为被试，首先在表象生成任务中验证这两种空间关系表征的大脑半球偏侧化，并尝试建立偏侧化与各学科成绩之间的关系。结果发现：

（1）任务类型和左右视野的交互作用显著，存在两种空间关系表征在左右半球加工效率上的分离；（2）类别任务中左半球偏侧化较大的人群拥有更高的语文成绩；（3）坐标任务中右半球偏侧化较大的人群拥有更高的数学成绩。通过探究不同学科学习成绩对左右半球的不同依赖程度，本研究为理解大脑偏侧化和不同学科

学习提供新的视角,提示对于偏科的学生,类别训练或强调精确度量表述的学习方式或许有助于提高相应的学科成绩。

Hemispheric lateralization in spatial relations representations and academic achievements of high school students

Shanglian Xie, Shuai Chang, Ming Meng

School of Psychology, South China Normal University, 55 West Zhongshan Ave, Tianhe District, Guangzhou, Guangdong, China, 510631. Email: mingmeng@m.scnu.edu.cn

Abstract: Visual cognition often requires establishing spatial relations among visual elements. There are two types of spatial relations: categorical representations capture general and abstract properties of the spatial structures, while coordinate representations are responsible for processing precise spatial locations or distances. Using a hemifield visual presentation paradigm, previous studies have found that the left hemisphere is better than the right hemisphere at categorical spatial relations representations, and the right hemisphere performs better when processing coordinate spatial relations compared to the left hemisphere. A large number of categorical representations exist in language cognition, as well as a significant left hemispheric lateralization, which is similar to the left hemispheric dominance of categorical representations. Therefore, it is hypothesized that the left hemispheric dominance in categorical tasks may be reflected in the learning of language-related subjects to some extent. In other words, individuals with higher left hemispheric lateralization in categorical tasks are likely to have higher Chinese and English grades. On the other hand, the right hemispheric dominance of coordinate representations indicates that the right hemisphere is better at processing spatial relations that need precise measurement. Since in mathematics learning, both algebra and geometry require accurate information representation, mathematics may be more closely related to coordinate representations, and compared to Chinese and English, mathematical grades might be more likely to be predicted by the degree of right hemispheric lateralization in coordinate representations. In the present study, high school students were recruited as participants in order to test hemispheric lateralization in these two spatial representations in imagery generation tasks, and to establish the relationship between lateralization and academic achievements. The results showed that: (1) the interaction effect between task types and visual hemifields was significant, suggesting the separation of two types of spatial relations representations in the processing efficiency of the left and right hemispheres; (2) people with a greater left hemispheric lateralization in categorical tasks had higher Chinese grades; (3) people with a greater right hemispheric lateralization in coordinate tasks had higher mathematical grades. By exploring the different degrees of dependence of academic achievements on the left and right hemispheres, this study provides a new perspective for understanding hemispheric lateralization and different subjects learning. For those students with biases in subject scores, categorical training or the learning methods emphasizing precise specification may be helpful to improve the corresponding academic achievements.

初中生核心自我评价与主观幸福感的关系：链式中介效应分析

杨涛¹² 蒙秋芬¹² 高荣芬¹² 刘馨泽¹² 陈维¹²

1 贵州师范大学心理学院, 贵阳, 550025

2 贵州师范大学心理大数据研究中心, 贵阳, 550025, chenweihb@yeah.net

摘要 核心自我评价是个体对自身是否有能力完成任务或事业的一种信念。研究发现核心自我评价能够预

测个体的主观幸福感,但缺乏在初中生群体中的研究。本研究以贵州省初中生为研究对象,探讨核心自我评价、自尊、生命意义和主观幸福感两两之间的相关关系,以及自尊和生命意义在核心自我评价和主观幸福感之间的链式中介作用。研究工具包括核心自我评价量表(CSES)、Rosenberg自尊量表(RSES)、生命意义问卷修订版(MLQR)、幸福感指数量表(IWC)。研究结果表明:(1)独立样本 t 检验表明,男女初中生在主观幸福感上差异不显著,但在核心自我评价上有显著差异。(2)核心自我评价与主观幸福感、自尊、生命意义均呈显著正相关;自尊与生命意义、主观幸福感均呈显著正相关;生命意义和主观幸福感呈显著正相关;(3)核心自我评价可以直接影响青少年主观幸福感($\beta=0.24, p<0.001$),还可以通过自尊和生命意义的单独中介作用这两条路径对主观幸福感产生影响($\beta=0.16, 0.06$; 均 $p<0.05$),且核心自我评价还可通过第三条路径即自尊和生命意义的链式中介作用对主观幸福感产生影响。结论:(1)男生核心自我评价水平显著高于女生;(2)核心自我评价显著正向预测主观幸福感、自尊、生命意义;(3)自尊、生命意义在核心自我评价与主观幸福感之间起单独中介作用,核心自我评价通过主自尊和生命意义的链式中介作用对主观幸福感产生间接预测作用。

2 Psychology Big Data Research Center, Guizhou Normal University, Guiyang, 550025

Abstract: Core self-evaluation is an individual's belief in whether he/she has the ability to complete a task or career. Research has found that core self-evaluation can predict individual subjective well-being, studies in the adolescent population are limited. This study took Guizhou students as the research object to explore the correlation between core self-evaluation, self-esteem, meaning of life and subjective well-being, and the chain of self-esteem and life meaning between core self-evaluation and subjective well-being mediating role. Instruments includes Core Self-Evaluation Scale (CSES), Rosenberg Self-Esteem Scale (RSES), Meaning in Life Questionnaire Revision (MLQR), Index of Well-being Scale (IWC). The results show that: (1) The independent samples t -test showed that there is no significant difference in subjective well-being between boys and girls, but there is a significant difference in core self-evaluation. (2) core self-evaluation were significantly positively correlated with subjective well-being, self-esteem, and meaning in life; self-esteem were significantly positively correlated with meaning in life and subjective well-being; the meaning in life and subjective well-being are significantly positively correlated; (3) core self-evaluation positively predicts adolescents' subjective well-being ($\beta=0.24, p<0.001$), the two paths of self-esteem and the meaning in life can also affect subjective well-being ($\beta=0.16, 0.06, p<0.05$), and core self-evaluation can also be through the third path, namely, the chain mediation of self-esteem and meaning of life has an impact on subjective well-being. In conclusion: (1) The core self-evaluation level of boys is significantly higher than that of girls; (2) The core self-evaluation significantly positively predicts subjective well-being, self-esteem, and meaning in life; (3) Self-esteem and meaning in life are in core self-evaluation and subjective happiness senses play a separate mediating role, and core self-evaluation can indirectly predict subjective well-being through the chain mediation of main self-esteem and meaning in life.

摘要 作为将个体拒绝经历与适应问题相联系的重要机制之一, 拒绝敏感性指一种对暗示或公开的拒绝线索持有焦虑或愤怒地期待、感知和/或反应过度的认知-情感倾向。本研究采用多数据源主体评估方法(自我报告、同伴提名), 对 590 名中小學生进行了为期一年的追踪数据收集, 以考察拒绝敏感性与社会情绪适应之间的纵向关联并探讨情绪调节在其中的调节作用。其中, 社会适应包括个体的同伴拒绝和同伴侵害, 情绪适应包含个体的抑郁感、孤独感、社交焦虑、自我价值感。结果表明: (1) 男生的同伴拒绝与同伴侵害水平均显著高于女生; 中学儿童的抑郁感、孤独感和社交焦虑水平均高于小学儿童, 而自我价值感则低于小学儿童。(2) 在控制性别和年级的影响后, 第一年的拒绝敏感性水平能够显著正向预测第二年的情绪适应问题水平, 但不能显著预测同伴问题水平; 第一年的情绪调节能力能够显著负向预测第二年的情绪适应问题及同伴问题水平。(3) 在控制性别、年级和拒绝敏感性的影响后, 情绪调节在第一年拒绝敏感性预测第二年情绪适应问题以及同伴问题的关系中均起调节作用, 具体而言, 低情绪调节个体的拒绝敏感性水平能够显著正向预测情绪适应问题及同伴问题, 但在高情绪调节的个体中该预测关系则不显著。因此, 本研究在中国文化下探讨了拒绝敏感性的独特含义, 尽管拒绝敏感性会随着时间推移而带来发展风险, 但情绪调节可能是中国青少年的一大保护因素, 这为儿童社会性发展及适应问题的研究提供了新的启示。

1 Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

3 Department of Psychology, Shanghai Normal University, Shanghai 200234, China

Abstract: As one of the important mechanisms that link individual rejection experiences to maladjustment in various domains, rejection sensitivity (RS) is referred to a cognitive-affective disposition to expect, perceive, and/or overreact to the implied or overt rejection cues anxiously or angrily. The present study collected one-year longitudinal data from 590 children's rejection sensitivity and socio-emotional functioning through multi-source assessment (i.e., self-reports and peer nominations) to examine the longitudinal relationships between rejection sensitivity and emotional and social difficulties, and explore the moderation effect of emotion regulation. Social problems include peer rejection and peer victimization, and emotional problems include depression, loneliness, social anxiety, and general self-worth. The results indicated that: (1) Boys had significantly higher scores on peer rejection and peer victimization than girls. Children in middle school had significantly higher scores on depression, loneliness, and social anxiety than children in elementary school, and lower scores on general self-worth than children in elementary school. (2) After controlling for the effects of gender and grade, rejection sensitivity at Time 1 significantly predicted higher levels of emotional problems at Time 2, but did not significantly predict peer problems at Time 2; emotion regulation at Time 1 negatively and significantly predicted emotional and peer problems at Time 2. (3) After controlling for the effects of gender, grade, and rejection sensitivity, the relationships between rejection sensitivity and emotional and peer problems were moderated by emotion regulation. The follow-up simple effects analyses indicated that for children with low emotion regulation, rejection sensitivity at Time 1 positively predicted emotional

problems at Time 2 ($\beta = .21, p < .01$) and peer problems at Time 2 ($\beta = .12, p < .01$). However, for children with high emotion regulation, these effects were attenuated. This study discusses the unique meaning of rejection sensitivity in Chinese culture, and these findings suggest that rejection sensitivity can be regarded as distinct vulnerabilities for risk in maladjustment, even in socio-emotional problems. Also, although rejection sensitivity poses developmental risk over time, emotion regulation may serve as a protective factor and have a buffering effect for Chinese youth, which provides new enlightenment for future related researches on children's social development and adjustment problems.

4 丹麦奥尔堡大学学习与哲学系, 通讯作者: liutr@psych.ac.cn & shijn@psych.ac.cn,

摘要 目的: 在延迟折扣任务中, 青少年比成人表现出更加冲动, 即更加偏爱即时奖赏, 而这种冲动往往与青少年执行功能不成熟有关, 具体是哪些成分还不得而知。工作记忆和抑制是执行功能两个重要的成分, 这些能力可能都与个体延迟折扣任务中的表现有关, 本研究旨在探讨青少年偏爱即时奖赏与哪种执行功能成分的发展不成熟有关。**方法:** 实验对象包括青少年中期个体和成年大学生, 青少年个体主要为 15-16 岁中学生, 42 人, 其中男生 23 人, 女生 19 人; 成年个体为 22 岁左右大学生, 70 人, 其中男女各半。采用延迟折扣任务和两者执行功能任务, 其中延迟折扣任务要求被试在即时小奖赏和未来大奖赏之间进行选择, 执行功能任务采用测量工作记忆和抑制的任务, 工作记忆采用 2-back 任务, 2-back 任务要求被试从第三个数字开始判断, 当前数字与倒数第二个数字是否相同, 主要考察被试的工作记忆能力。抑制任务采用数字 stroop 任务, 该任务要求被试对两个一位数的数字数值大小进行判断, 而忽视数字字号的大小, 任务中, 数值字号大小会对被试的数值大小判断形成干扰, 从而出现 stroop 效应, 该任务可以考察被试的抑制能力。**结果:** 研究发现, 青少年个体比成人更多选择即时奖赏, 2-back 正确率更低, 数字 stroop 中易化效应更高, 干扰效应更大但没有达到统计显著水平。从相关分析可见, 对于成人组, 与延迟折扣选择即时奖赏比例显著相关的有工作记忆任务 2-back 和抑制任务数字 stroop。而对于青少年而言, 与延迟折扣选择即时奖赏比例显著相关的仅工作记忆任务 2-back。**结论:** 对成人而言, 执行功能的工作记忆和抑制成分都与个体的延迟折扣情况有关, 对于青少年而言, 执行功能的工作记忆成分与他们的延迟折扣情况有关, 且工作记忆能力比成人更差, 而抑制成分与他们的延迟折扣选择无关, 且抑制中抗干扰能力与成人差异不显著。研究说明青少年偏爱即时奖赏很可能与工作记忆这种执行功能成分发展不成熟有关。

Relationship between delay discounting ability and development of executive function in adolescents

Yu Mei^{1,2}, LIU TongRan^{1,2}, LU Jianping³, SHI Jiannong^{1,2,4}

1 Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

3 The 12th Middle School of Chang 'an District, Xi 'an 710115, China

4 Department of Learning and Philosophy, Aalborg University, Denmark)

Abstract: Objective: Adolescents show more impulsiveness than adults in delay discounting tasks, i.e. a preference for immediate rewards. This impulsiveness is often associated with immature executive function in adolescents. The exact components of this executive function are unknown. Working memory and inhibition are two important components of executive function, which may be related to individual performance in delay discounting task. This

study was conducted to investigate which components of executive function are associated with adolescents' preference for immediate rewards. **Methods:** The subjects included middle adolescent individuals and adult college students. Forty-two teenagers were mainly middle school students aged 15-16, including 23 boys and 19 girls. Adults were about 22 years old college students. There were 70 adult participants and half of them were males. There were 3 tasks used: delay discounting task, 2-back task and digital stroop task. The delay-discounting task required participants to choose between a small immediate reward and a large future reward. In the 2-back task, the participants were asked to judge whether the current number was the same as the penultimate number from the third digit. In the 2-back task, the working memory ability of the participants was mainly examined. Digital stroop task was used for testing suppression, which required the subjects to judge the size of two one-digit numeric values while ignoring the size of the numeric size. In the task, the size of the numeric size would interfere with the judgment of the subjects' numeric size, resulting in the Stroop effect. This task could be used to investigate the inhibition ability of the subjects. **Results:** The study found that compared with adults the adolescents chose the immediate rewards more, their accuracy of 2-back was lower, the facilitation effect of the adolescents was higher in the digital stroop, and the interference effect of them was larger but not to the level of statistical significance. Correlation analysis showed that for adults, the proportion of immediate rewards was significantly correlated with working memory task, 2-back and inhibition task, digital stroop. For adolescents, only working memory task, 2-back was significantly correlated with the proportion of immediate rewards. **Conclusion:** for adults, working memory and inhibition were related to individuals' delay discounting ability, for teenagers, only working memory component was related to their discount ability, and their working memory capacity was less than adults, and inhibition has nothing to do with their delay discounting choice, and their inhibition of anti-interference ability was not significantly different from adults. The study suggests that adolescents' preference for immediate rewards may be related to the immature development of working memory, an executive function component.

Keywords: teenagers, delay discounting, executive function, working memory, inhibition

青少年暴力电子游戏接触与攻击行为的关系： 道德敏感性和父亲在位的作用

李佳钰¹ 高雪梅¹

1 西南大学心理学部，重庆，400715, zhenggao@swu.edu.cn

摘 要 本研究使用游戏使用问卷、攻击行为问卷、道德敏感性问卷和父亲在位量表，对 3094 名 12-19 岁的中学生（其中男生 1533 名，女生 1561 名）的暴力电子游戏接触与攻击行为的关系进行了调查，并且分性别对道德敏感性和父亲在位在二者间的作用进行了探讨。研究结果发现：（1）暴力电子游戏接触和道德性、父亲在位在性别上具有显著差异，男生显著高于女生；（2）暴力电子游戏接触、道德敏感性、父亲在位与攻击行为两两显著相关；（3）暴力电子游戏接触能够正向预测攻击行为；（4）道德敏感性在青少年暴力电子游戏接触和攻击行为的关系中起部分中介作用，父亲在位在此中介关系中起调节作用。具体而言，随着父亲在位程度的减少，暴力电子游戏接触更有可能通过降低道德敏感性水平来诱发攻击行为；（5）父亲在位的调节效应存在性别差异，男生组父亲在位对暴力电子游戏接触与道德敏感性的调节显著，女生组不显著；而女生组父亲在位对道德敏感性与攻击行为的调节显著，男生组则不显著。总的来说，本研究得到了高水平的道德敏感性、高水平的父亲在位是导致青少年在暴力电子游戏接触后降低攻击性的重要保护因素。因此，在学校的德育教育中，要为中学生树立良好的道德规范，加大对中学生道德判断的教育，以提高其道德敏感性水平，进而有效预防不道德行为的发生。在家庭的父亲教育中，也要维持良好的父子关系，建立良好的代际关系作为榜样，促进青少年的道德发展，减少攻击行为的发生。

Exposure to violent video games and aggression in adolescents: The roles of moral sensitivity and father presence

Li Jiayu¹, Gao Xuemei¹

¹ Faculty of Psychology, Southwest University, Chongqing, 400715, zhenggao@swu.edu.cn

Abstract: This study using Video Game Questionnaire, Buss-Perry Aggression Questionnaire, Moral Sensitivity Questionnaire and Father Presence Questionnaire explored the relationship between exposure to violent video games and aggression in adolescents (males=1533, females=1561), taking into account the effects of moral disengagement and parental rearing patterns (N=3094, 12-19 years old). The results showed that (1) Violent video game exposure (VVGE), moral sensitivity and father presence was significantly different between the gender, and male students are significantly higher than female students. (2) VVGE, moral sensitivity, father presence and aggression were significantly correlated; (3) VVGE could positively predict aggression; (4) Moral sensitivity played a partial mediating role between VVGE and aggression, and father presence moderated the mediation effect. Specifically, with the decreasing father presence, VVGE is more possibly to induce aggression by decreasing the level of moral sensitivity. (5) There was a significant gender difference in the moderating effect. Thus, high level of moral sensitivity, high level of father presence are protective factors for promoting aggression after exposure to violent video games among adolescents. Therefore, in the school moral education, we should establish a good moral standard for students and increase the education of moral judgment, in order to improve their moral sensitivity level, and then effectively prevent the occurrence of immoral behavior. In the family father education, it is also necessary to maintain a good father-son relationship, establish a good intergenerational relationship as an example to promote the moral development of adolescents, and reduce the occurrence of aggressive behavior.

Keywords: violent video game exposure, aggression, moral sensitivity, father presence, gender

母亲消极教养行为与青少年攻击、违纪的关系：观点采择的中介作用与多巴胺系统多基因的调节作用

林小楠¹ 秦夏青¹ 李曦¹ 迟晓慧¹ 田相娟¹ 曹衍淼¹ 张文新¹ (通讯作者)

¹ 山东师范大学心理学院, 山东师范大学儿童青少年发展研究院, 济南, 250014, zhangwenxin@sdsu.edu.cn

摘要 反社会行为根据其攻击性分为攻击和违纪, 两者在影响因素和发生机制上均存在明显的差异。反社会行为受到遗传、环境和认知因素等多水平因素的影响, 多水平因素对攻击和违纪的影响及其作用机制亦可能存在不同, 但目前对此的研究十分匮乏。研究显示, 母亲消极教养行为能够增加儿童青少年参与反社会行为的风险, 但是母亲消极教养行为对青少年攻击和违纪的影响程度不同, 且其中介机制存在差异。根据社会化理论, 观点采择是母亲消极教养行为影响反社会行为的中介机制之一, 且其对攻击和违纪的作用存在差异。此外, 研究显示消极教养行为经由观点采择影响反社会行为的中介路径受到个体多巴胺系统基因的调节。但是, 当前分子遗传学研究主要采用单基因研究范式, 忽略了多基因间的联合效应, 因而其研究的可靠性和解释率受到限制。基于此, 本研究采用多基因累加得分范式, 以 1053 名汉族青少年为被试 (初次测评时 $M_{age} = 13.32 \pm 0.49$, 50.1%女生) 进行为期 3 年的追踪研究, 构建有调节的中介模型, 重点考察了观点采择在母亲消极教养行为与攻击、违纪间的中介作用以及多巴胺系统多基因累加得分对该中介机制的调节作用。研究采用 *DAT1* 基因 rs27072 多态性、*COMT* 基因 rs6267 多态性和 *DRD2* 基因 rs6275 多态性等三个基因位点作为多巴胺系统多基因指标, 分别采用母亲报告、自我报告与教师报告测评消极教养行为、观点采择和攻击、违纪行为。结果发现: (1) 控制性别和早期攻击 (或违纪) 后, 母亲消极教养行为能够显著正向预测青少年的攻击与违纪; (2) 观点采择在母亲消极教养行为与青少年攻击间起中介作用, 但在母亲消极教养行为与青少年违纪间的中介作用不显著; (3) 多巴胺系统多基因累加得分能够调节“母亲消极教养—观点采择—攻击”的前半路径和直接路径。具体表现为, 与多基因累加得分较高的青少年相比, 母亲消极教养行为显著降低了低多基因累加得分青少年的观点采择能力, 进而增加了其攻击行为的风险。本研究结果显示攻击和违纪行为具有不同的影响因素和发生机制。为反社会行为的异质性与反社会行为的多基因遗传基础提供了证据。

关键词 攻击, 违纪, 消极教养行为, 观点采择, 多巴胺系统基因×环境

Maternal Negative Parenting and Adolescent Aggression and Rule Breaking: The Mediating Role of Perspective Taking and the Moderating Role of Dopaminergic Multilocus Genetic Variants

LIN Xiaonan, QIN Xiaqing, LI Xi, CHI Xiaohui, TIAN Xiangjuan, CAO Yanmiao, ZHANG Wenxin
School of Psychology, Research Institute of Child and Adolescent Development, Shandong Normal University, Jinan 250014

Abstract: Antisocial behaviors consist of behaviors and attitudes that violate societal norms, including aggression and rule breaking. Antisocial behaviors are common problem among adolescents, which increases risk for academic failure, psychopathology problems, as well as criminal activity during adulthood. Evidence suggested multiple factors, such as environmental, genetic, and cognitive factors, jointly contributes to the emergence and maintenance of antisocial behavior. More importantly, theoretical and empirical findings have suggested that there are differences in predictors and mechanisms between aggression and rule breaking. However, few studies have explored whether these environmental, genetic, and cognitive factors operate differently across these two distinct subtypes of antisocial behavior. It is well established that maternal negative parenting plays an important role but to a different degree in predicting aggression and rule breaking. Furthermore, existing studies have suggested that maternal negative parenting increases risk of aggression and rule breaking by impairing adolescents' perspective taking. Moreover, molecular genetics studies also shown that genetic factors would moderate the effect of maternal negative parenting on antisocial behavior and perspective taking. However, the majority of studies have commonly examined the moderating role of single loci in candidate genes, ignoring the polygenic traits of antisocial behavior. Therefore, the present study aimed to examine the relationship between negative parenting and aggression and rule breaking, the mediating role of perspective taking, and the moderating role of dopaminergic multilocus genetic variants by adopting the approach of multilocus genetic profile score (MGPS). Participants were 1053 adolescents (mean age 13.32 ± 0.49 years old at the first time point, 50.1% females) recruited from the community. Using a 3-year longitudinal data, mother-reported maternal parenting and teacher-reported aggressive behavior and rule breaking were collected at Time 1 and Time 3. At Time 2, saliva samples of adolescents and self-reported perspective taking were collected. All measures showed good reliability. The MGPS was created by *DAT1* rs27072 polymorphisms, *COMT* rs6267 polymorphism and *DRD2* rs6275 polymorphisms. Genotyping in three dopaminergic genes were performed for each participant in real time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom). Bootstrapping procedures were used to test moderated mediation. The results found that after gender and previous aggressive behavior (or rule breaking) were controlled for, negative parenting is positively related to adolescent aggressive behavior and rule breaking. The effect of negative parenting on aggressive behavior was mediated by perspective taking, while the mediating effect did not hold for rule breaking model. The mediating effect of perspective taking was moderated by MGPS. Specifically, the indirect effect of negative parenting on aggressive behavior via perspective taking were significant only among adolescents with lower MGPS. Besides, compares to adolescents with higher MGPS, adolescents with lower MGPS exhibited more aggressive behavior when experiencing negative parenting. These findings suggest that there are differences in the mechanism of negative parenting on subtypes of antisocial behavior. This study provides new evidence for the heterogeneity of antisocial behavior and the polygenic underpinnings of antisocial behavior subtypes.

Keywords: aggression, rule breaking, maternal negative parenting, perspective taking, dopaminergic genetic variants-environment interaction

抑郁倾向青少年自我评价的消极偏向源于其母亲？

鲍未¹ 王允宏¹ 罗俊龙¹（通讯作者）

¹ 上海师范大学教育学院心理学系，上海市，200234，luo831023@163.com

摘要 抑郁认知理论认为，抑郁个体具有自我评价的消极偏向，这种评价是在第一视角下进行，而个体通过他人视角对自己的评价则是在第三视角下进行。然而，目前鲜有研究对自我评价的第一、第三视角进行探讨。此外，以往研究表明，中国青少年将母亲表征为自我的一部分，但抑郁个体在母亲视角下的自我评价还有待进一步探索。因此，本研究通过两个实验探讨抑郁倾向青少年的自我评价在第一、第三视角下是否具有 consistency。实验1招募60名被试（抑郁倾向组29人，控制组31人），实验2招募77名被试（抑郁倾向组36人，控制组41人）。通过 Remember/Know 自我评价范式考察抑郁倾向个体在第一、第三视角下是否均会产生消极偏向（实验1），以及第三视角下的自我评价是否会因不同他人视角产生分离（实验2）。实验1结果发现，在 Remember/Know 任务中无论是抑郁倾向组还是控制组，自我评价（第一视角）的积极词汇再认率都高于消极词汇。相反，抑郁倾向组的母亲反思自我评价（母亲第三视角）则表现为消极词汇再认率高于积极词汇。实验2结果发现，相较于朋友和同学反思自我评价而言，母亲反思自我评价的消极词汇再认率高于积极词汇。本研究结果表明，无论是抑郁倾向个体还是非抑郁倾向个体，均存在积极的自我认知偏向，而抑郁倾向个体的消极自我认知偏向可能源于个体在母亲视角下的反思自我评价。因此，在中国抑郁倾向青少年的早期心理干预中，应当重视母亲角色的重要作用。

Is the Negative Bias in Self-appraisal of Adolescents with Mild Depression Derived from their Mother?

Wei Bao¹, Yunhong Wang¹, Junlong Luo¹ (Corresponding author)

¹Department of Psychology, Education College, Shanghai Normal University, Shanghai, China. Zip Code: 200234, E-mail: luo831023@163.com

Abstract: BACKGROUND: According to Becks' cognitive theory of depression, individuals with depression exhibit negative bias in self-appraisals under the first-person perspective. However, comparative research between the self-appraisals in the first-person and third-person perspectives (e.g., mother's perspective) is rare. Moreover, the mother is represented as a part of self among Chinese adolescents. OBJECTIVE: This study examined whether the negative bias in self-appraisal is consistent between the first-person and third-person perspectives among adolescents with mild depression. METHODS: Adolescents with mild depression (29 in Experiment 1a and 36 in Experiment 2a) and adolescents without a diagnosis of depression (31 in Experiment 1b and 41 in Experiment 2b) were separately tested on their recognition memory using the Remember/Know self-reference paradigm in two experiments. RESULTS: In Experiment 1, there were higher recognition scores for positive valence adjectives than negative valence adjectives in both adolescents with and without mild depression. In contrast, the reflected self-appraisals of the mother exhibited a negative bias. In Experiment 2, reflected self-appraisals of the mother displayed a higher negative bias than that of a friend or classmate. CONCLUSION: Positive self-cognition exists in both adolescents with and without mild depression. Negative self-cognition of adolescents with mild depression might be derived more from the third-person perspective of the mother than that of a classmate or a friend, indicating that the mother's negative perspective was more valued. Thus, it is important to consider the mother's support during psychological interventions with Chinese adolescents in the early stages of depression.

Keywords: self-cognition, reflected self-appraisals, mother's perspective, mild depression, Chinese adolescents

家庭教养方式对幼儿科学能力发展的影响：家园共育的中介作用

张 琪 邓 铸（通讯作者） 顾本柏

南京师范大学心理学院，南京，210097，zdeng_psy@163.com

摘 要 科学领域发展是儿童全面发展的重要部分，教育部 2012 年发布的《3-6 岁儿童学习与发展指南》中明确指出，幼儿科学领域的发展是指幼儿在解决实际问题的过程中发现和理解事物本质和事物间关系的过程，主要包括科学探究和数学认知，培养其探究能力、逻辑思维能力，为其它领域的深入学习奠定基础。而学前期幼儿正处在家庭与幼儿园的双重环境中，对于幼儿的教育不是家庭教育能够独立完成的，只有两者通力配合才能达到充分的效果。因此为了探究家庭教养方式、家园共育对幼儿科学领域能力发展的影响，本研究使用《儿童科学领域发展水平量表》、《家庭教养方式评价量表》和《家园共育量表》，在某省 18 所幼儿园抽取 10561 名大班幼儿进行量表施测，量表由儿童的主要抚养者进行填写，其中男生 5647 名，女生 4914 名。结果显示：（1）幼儿科学能力和家庭教养方式都存在显著的性别差异（ $p < 0.001$ ），且两者之间呈显著正相关（ $r = 0.54$ ）；（2）家园共育在家庭教养方式和科学能力间起着部分中介的作用，中介效应量为 26.85%。结论如下：（1）总体来看，父母的家庭教养方式较为积极，大班幼儿的科学能力发展水平较高。（2）父母对女生的教养方式更为积极；女生的科学能力表现更好，这与我们通常的认知相反，这表明男性和女性之间科学能力的性别差异并不是先天俱来的，更可能是随着学校教育偏向及社会刻板印象的影响而产生的。（3）积极的教养方式可以直接促进儿童科学能力的发展，也可以通过提高家园共育参与度来促进幼儿科学能力的发展。因此，加强学校与家庭的联结意义重大，通过多种形式保证双向的信息畅通，学校和家庭密切配合，及时商量教育对策，使更多的家长积极投身到子女教育的行列中。

The influence of parenting style on children's scientific ability: The mediating role of Family-kindergarten Co-education

ZHANG Qi, DENG Zhu, GU Ben-bai

School of Psychology, Nanjing Normal University, Nanjing 210097

Abstract: Development in the field of science as an important part of the overall development of the child. The Guide to Learning and Development for Children Aged 3-6, published by the Ministry of Education in 2012, clearly states that the development of early childhood science refers to the process of discovering and understanding the nature of things and the relationships between things in the process of solving practical problems, mainly including scientific inquiry and mathematical cognition. It can cultivate children's inquiry ability and logical thinking ability, which can lay the foundation for in-depth study in other fields. In the pre-school period, children are in the dual environment of home and kindergarten. The education of children is not a family education that can be completed independently, but only with the cooperation of both can the full effect be achieved. Therefore, in order to explore the impact of family parenting style and family-kindergarten co-education on the development of young children's abilities in the science domain, this study used the Children's Science Domain Development Level Scale, the Family Parenting Style Evaluation Scale and Family-Kindergarten Co-education Scale. A total of 10,561 large-class children in 18 kindergartens in a province were selected for scale measurement, including 5,647 boys and 4,914 girls. The scale was filled in by the main caregivers of the children. The results show that: (1) There were significant gender differences ($p < 0.001$) in both children's scientific ability and parenting style, and there was a significant positive correlation between the two ($r = 0.54$); (2) Family-kindergarten co-education plays a partially mediating role between family parenting style and scientific ability, with a mediating effect volume of 26.85%. The conclusions are as follows: (1) Overall, parents' family education style is more positive, and the scientific ability of large class children has a higher level of development. (2) Parents are more positive in their upbringing of girls; girls perform better in science, contrary to common perceptions, suggesting that the gender difference in scientific ability between men and women is not inherent, but are more likely to result from schooling biases and social stereotypes. (3) Positive parenting style

can directly promote the development of children's scientific abilities, or through increased the involvement of Family-kindergarten co-education. Therefore, it is of great significance to strengthen the connection between kindergartens and families. We should ensure the smooth flow of two-way information through various forms, with kindergartens and families working closely together to discuss educational strategies in a timely manner, so that more and more parents can actively participate in their children's education..

初中生家庭功能、积极心理资本与欺凌旁观行为的关系：一个有调节的中介模型

张文娟

临沂大学教育学院，临沂，276005，zhangwenjuan@lyu.edu.cn

摘 要 学校欺凌，是指对无力保护自己的学生重复实施的攻击行为，对学生的身心健康有着多方面的消极影响和危害。欺凌是一个群体事件，除了欺凌者和受欺凌者，同伴会表现出起哄煽动、置身事外或积极干预等行为，影响到欺凌事件的持续。总体上研究者更多关注了影响欺凌旁观行为的个体因素以及同伴、教师因素，相对忽视了家庭环境，尤其是家庭功能这一整体环境系统的影响。家庭功能可以有效增加个体的心理资本，正向预测心理资本中的自我效能等因素，进而影响到同伴在欺凌事件中的旁观行为。相关研究发现，欺凌旁观行为、家庭功能和心理资本的发展水平上均存在显著的性别差异，由于这些性别差异的存在，积极心理资本在家庭功能与欺凌旁观行为的中介作用可能会受到性别的调节。为此，本研究以 1035 名初中生为对象，采用家庭功能问卷、欺凌参与角色问卷、积极心理资本问卷，考察家庭功能、积极心理资本与欺凌旁观行为的关系，以及性别在其中的调节作用。结果发现：（1）家庭功能、积极心理资本与保护行为呈显著正相关，与煽风点火、置身事外行为呈显著负相关，协同欺凌与家庭功能呈显著负相关；（2）积极心理资本在家庭功能对各欺凌旁观行为的影响中均具有部分中介作用。（3）性别调节了心理资本的中介作用，和男生相比，女生积极心理资本对欺凌旁观行为的预测作用更强。

关键词 家庭功能，积极心理资本，学校欺凌，旁观行为，初中生

Relationships among Family Function, Positive Psychological Capital and Bystanders Behavior in School Bullying among Junior High School Students: A moderated Mediation Effect

Zhang Wenjuan

Department of Education, Linyi University, Linyi, 276005

Abstract: School bullying has been defined as an aggressive, repetitive behavior against a victim who cannot easily defend him or herself, and to be associated with many serious health problems. It has repeatedly been described as a group phenomenon in which, as well as the victims and the bullies, other peers play a crucial roles such as the reinforcer, outsider or defender. Generally research has shown peer bystanders may contribute to the cycle of bullying. Researchers pay more attention to the influence of the individual factors and school factors on the bystander behavior, while neglecting the family factors. Factor function as a whole environment system, can influence the peer bystander behavior by increasing the individual's psychological capital, such as it can positively predict the self-efficacy and etc. Research shows that there are significant gender differences in family function, positive psychological capital and bystander behavior in bullying, so gender probably moderate the mediated effect of positive psychological capital. Considering the aforementioned reasons, the present study examined the relationships among family function, positive psychological capital, and the moderating effect of gender. The Family Function Questionnaire, the positive psychological capital Questionnaire and the Participant Role Questionnaire in Bullying were administered to 1035 adolescents from junior high schools in Linyi city. The main results were shown below: (1)Both family function and positive psychological capital were positively associated with defending victims, and negatively associated with

outsider behavior and reinforcer behavior. (2)Positive psychological capital partly mediated the relationship between family function and different bystander behaviors. (3)Gender moderates the mediating effect of positive psychological capital. Compared with boys, positive psychological capital had a more obvious predictive effect on girls' bystander behaviors.

Keywords: family function, positive psychological capital, school bullying, bystander behaviors, junior high school students

大学生父母教养方式对幸福感的影响 ——人格、自我效能感的中介作用

曹军胜 尹忠泽（通讯作者）

山西师范大学教育科学学院，临汾，041004，1059328061@qq.com

摘 要 总体幸福感是个体对自身生活做出的总体评价，能够直接反映个体是否幸福。总体幸福感受到众多因素影响，其中父母教养方式是影响大学生总体幸福感的重要因素。本文通过对大学生进行问卷调查，研究父母教养方式对总体幸福感的影响，以及人格、自我效能感的中介作用机制。本研究通过方便取样的方法，通过网络平台对大学生进行问卷调查，共回收问卷 330 份，有效问卷 300 份，有效问卷率 90.9%。采用的问卷有：《简式父母教养方式问卷中文版》（s-EMBU-C）、《艾森克人格问卷简式量表中国版》（EPQ-RSC）、《一般自我效能感量表》（GSES）以及《总体幸福感量表》（GWB）。研究中采用了独立样本 t 检验、单因素方差分析、相关分析、回归分析、中介效应检验、路径分析等统计学方法。研究结果显示：（1）大学生父母教养方式、人格、自我效能感和总体幸福感在部分人口学变量上存在显著性差异；（2）大学生父母教养方式、人格、自我效能感和总体幸福感两两变量之间存在显著相关；（3）大学生父母教养方式、人格、自我效能感均能够显著预测总体幸福感；（4）人格在大学生父母教养方式和总体幸福感之间起部分中介作用；（5）自我效能感在大学生父母教养方式和总体幸福感之间起部分中介作用；（6）人格和自我效能感在大学生父母教养方式和总体幸福感之间起链式中介作用。通过研究可知，大学生父母教养方式可以直接影响总体幸福感，也可以通过人格和自我效能感的中介效应及其两个变量的链式中介效应来间接影响总体幸福感。因此，本研究提示可以通过改善父母教养方式，尤其是采用父母对孩子表现出温暖与理解的教养方式，也可以通过改善大学生的人格特质，提高大学生自我效能感水平，进而提升大学生总体幸福感。

The Influence of Parental Rearing Styles on Well-Being of College Students——Mediating role of personality and self-efficacy

Junsheng Cao, Zhongze Yin

School of education science, Shanxi Normal University, LinFen,041004, 1059328061@qq.com

Abstract: General happiness is an individual's overall evaluation of his own life, which can directly reflect whether an individual is happy or not. The overall happiness of college students is affected by many factors, among which the parenting style is an important factor affecting the overall happiness of college students. Through a questionnaire survey of college students, this paper studies the influence of parenting style on overall happiness, as well as the mediating mechanism of personality and self-efficacy. Through the method of convenient sampling, this study conducted a questionnaire survey on college students through the network platform. A total of 330 questionnaires were collected, among which 300 were valid, and the effective questionnaire rate was 90.9%. The following questionnaires were used: Short-Form Egnä Minnen av Barndoms Uppfostran for Chinese(s-EMBu-C), Eysenck Personality Questionnaire (Chinese version) (EPQ-RSC), General Self-Efficacy Scale (GSES) and General Well-Being Scale (GWB). Statistical methods such as independent sample t test, one-way analysis of variance, correlation analysis, regression analysis, mediating effect test and path analysis were used in this study. The results show that :(1) There are significant differences in parental rearing style, personality, self-efficacy and general

well-being of college students on some demographic variables; (2) There is a significant correlation between college students' parental rearing style, personality, self-efficacy and general happiness. (3) Parental rearing style, personality and self-efficacy can significantly predict the overall well-being of college students; (4) Personality plays a partial mediating role in the relationship between college students' parental rearing style and their overall well-being; (5) Self-efficacy plays a partial mediating role in the relationship between college students' parental rearing style and their overall well-being; (6) Personality and self-efficacy play a chain-mediated role in the relationship between college students' parental rearing style and overall happiness. Through the study, it can be seen that the parenting style of college students can directly affect the overall well-being, and it can also indirectly affect the overall well-being through the mediating effect of personality and self-efficacy and the chain mediating effect of the two variables. Therefore, this study suggests that the overall well-being of college students can be improved by improving the parenting style, especially the parenting style in which parents show warmth and understanding to their children, and also by improving the personality traits of college students and the level of self-efficacy.

道德认同对大学生自私行为传递效应的影响

孙倩玮¹ 姜媛¹ (通讯作者)

¹ 北京体育大学心理学院, 北京, 100084, jiangyuan97@sina.cn

摘要 自私行为在社会生活中普遍存在, 做出自私行为的个体常常以自我为中心, 为满足自己不合理的私欲不惜以侵害他人的正当权益为代价。因此, 自私行为具有一定的危害性。已有研究发现, 自私行为具有可传递性, 那么避免自私行为持续发生十分重要, 如何削弱自私行为传递的效应值得研究。道德认同对自私行为的产生有抑制作用已被证实, 道德认同水平高的个体更加认可道德品质和规范, 更愿意与内心保持一致, 做出符合道德规范的行为。本研究旨在探讨中国文化背景下道德认同对大学生自私行为传递效应的影响。研究对象是 160 名在校大学生, 其中男女生人数分别为 66 和 94, 年龄在 18 到 23 岁之间。通过问卷调查法测量道德认同, 实验采用 2 (道德认同: 高、低) × 2 (分配条件: 自私、公平) 的二因素被试间设计, 自变量为道德认同和分配条件, 因变量为独裁者博弈任务中参与者分配给自己的金额数量。结果表明, 道德认同的主效应显著, $F(1,156) = 25.976, p < .05$, 即道德认同对大学生自私行为的产生有影响, 与低道德认同的个体相比, 高道德认同水平的人表现出更少的自私行为; 分配条件的主效应显著, $F(1,156) = 6.022, p < .05$, 即中国文化背景下存在大学生自私行为传递效应; 道德认同和分配条件的交互作用显著, $F(1,156) = 5.131, p < .05$ 。进一步进行简单效应分析, 结果发现高道德认同组的参与者分配给自己的金钱数量在自私条件($M = 3.050, SD = .639$)和公平条件下($M = 3.025, SD = .620$)不存在显著差异($F(1, 156) = .018, p = .894$); 而低道德认同组在自私条件和公平条件下存在显著差异($F(1,156) = 11.135, p < .01$), 相较于公平条件($M = 3.400, SD = .982$), 自私条件下参与者分配给自己的金钱数量更多($M = 4.025, SD = 1.025$)。这一结果表明道德认同对自私行为的传递效应有抑制作用, 即使遭遇了他人的自私行为, 高道德认同水平的人相较于低水平的人, 会更加关注公正, 保持自身的公平行为。

关键词 大学生, 道德认同, 自私行为传递效应

The Effect of Moral Identity on College Students' Pay-forward Effect of Selfish Behavior

Qian-Wei Sun, Yuan Jiang

Department of Psychology, Beijing Sport University, Beijing 100084, China

Abstract: Selfish behavior is common in social life. Individuals who act selfishly are often self-centered, and satisfy their unreasonable selfish desires at the cost of infringing others' legitimate rights and interests. Therefore, selfish behavior is harmful. Previous studies have found that selfish behavior is transferable, so it is very important to avoid the continuous occurrence of selfish behavior, and it is worth studying how to reduce the pay-forward effect of selfish

behavior. It has been confirmed that moral identity has an inhibitory effect on selfish behavior. Individuals with a high level of moral identity are more likely to recognize moral qualities and norms, and are more willing to conform to their hearts and act in accordance with moral norms. This study aims to explore the effect of moral identity on college students' pay-forward effect of selfish behavior in the context of Chinese culture. Questionnaire and experimental methods have been used in this study. 160 college students were selected as the research participants, including 66 males and 94 females, aged between 18 and 23. Moral identity was measured by questionnaire, and the experiment used 2 (moral identity: high, low) $\times$ 2 (resource allocation: selfish, fair) between subjects design, moral identity and distribution conditions were independent variables. In the task of dictator game, the amount of money allocated by participants to themselves was dependent variable. The results of this study showed that the main effect of moral identity was significant, $F(1,156) = 25.976, p < .05$, which meant that moral identity has an impact on college students' selfish behavior, compared with individuals with low moral identity, people with high moral identity show less selfish behavior. The main effect of distribution conditions was significant, $F(1,156) = 6.022, p < .05$. Therefore, there is a college students' pay-forward effect of selfish behavior in the context of Chinese culture. The interaction between moral identity and distribution conditions was significant as well, $F(1,156) = 5.131, p < .05$, which meant that moral identity could inhibit pay-forward effect of selfish behavior. Further simple effect analysis showed that there was no significant difference ($F(1, 156) = .018, p = .894$) in the amount of money allocated to participants in the high moral identity group under selfish condition ($M = 3.050, SD = .639$) and fair condition ($M = 3.025, SD = .620$). However, as for low moral identity group, there was significant difference between selfish condition and fair condition ($F(1,156) = 11.135, p < .01$). Compared with the fair condition ($M = 3.400, SD = .982$), participants in the selfish condition allocated more money to themselves ($M = 4.025, SD = 1.025$). This result indicates that moral identity has an inhibitory effect on the pay-forward effect of selfish behavior. Even when confronted with others' selfish behavior, people with high moral identity will pay more attention to justice and maintain their own fair behavior compared with those with low moral identity.

情绪的动机维度对创造性科学问题提出能力的影响及其机制

吴丽君¹ 赵昆¹ 胡金山¹ 韩琴¹ (通讯作者)

1 山西师范大学教育科学学院, 太原, 030000, hbiner@126.com

摘 要 关于情绪与创造力关系的研究丰硕,但结论不一,甚至互相矛盾。Gable 等人提出情绪的动机维度模型,认为目前的研究大多依据情绪的效价维度划分情绪,而诱发的积极情绪属于低动机强度,如愉悦;诱发的消极情绪却属于高动机强度,如恐惧,故导致结论相反。创造力作为高级认知功能,对人才发展和国家进步至关重要。以往研究中多采用经典问题解决范式测量创造力,但研究者们日益认为提出问题比解决问题更需要创造力。因此本研究依据情绪的动机维度模型,并结合多种情绪理论探索动机维度、效价维度对创造性科学问题提出能力(CSPF)的影响及其认知机制。实验一采用 2(动机方向:趋近、回避) $\times$ 2(强度:高、低) $\times$ 2(CSPF 形式:开放、封闭)的混合实验设计,并设置中性情绪控制组。随机选择 150 名被试分入 5 组中,使用图片和视频诱发相应情绪后,让被试完成《创造性科学问题提出能力》测验(Hu et al., 2010),对被试的回答在独创性、新颖性和灵活性三个维度上进行评分。预期结果:1.低动机强度组表现显著优于高动机强度组,主要表现在流畅性和独特性上;2.情绪对 CSPF 是受动机维度和效价维度共同影响。实验二选择 150 名被试,随机分入五种情绪组中,以情绪图片作为实验材料,测量被试的“热”执行功能,随后分别完成 CSPF 测验。预期结果:1.低动机强度组在工作记忆刷新、抑制和转换上的反应时均显著优于高动机强度组;2.执行功能在情绪与创造力的关系中起部分中介作用。结果表明,情绪通过影响执行功能,进而影响个体的 CSPF。本研究在以往情绪与创造性科学问题提出能力研究的基础上,从情绪的动机维度出发进一步探讨了情绪与创造性科学问题提出能力的关系,表明情绪的动机维度对创造性科学问题提出能力的重要性,并发现执行功能在其中起中介作用。

The influence of emotional motivation dimension on Creative Scientific Problem Finding Ability and its mechanism

Lijun WU¹, Kun ZHAO¹, Jinshan HU¹, Qin HAN¹

¹ School of Educational Science, Shanxi normal University, TaiYuan,030000

Abstract: There are abundant researches on the relationship between emotion and creativity, but the conclusions are different, even contradictory. Gable et al. Put forward the motivation dimension model of emotion, and thought that most of the current researches divided emotion according to the valence dimension of emotion, and the positive emotion induced by emotion belonged to low motivation intensity, such as pleasure; However, the negative emotions are of high motivation intensity, such as fear, which leads to the opposite conclusion. Creativity, as an advanced cognitive function, is of great importance to talent development and national progress. In the past, classical problem-solving paradigm has been used to measure creativity, but researchers increasingly believe that creativity is more needed to ask questions than to solve problems. Therefore, based on the motivation dimension model of emotion, this study explores the influence of motivation dimension and valence dimension on Creative Scientific Problem Finding Ability (CSPF) and its cognitive mechanism. In Experiment 1, 2 (motivation direction: approach, avoidance) * 2 (intensity: high, low) * 2 (CSPF form: open, closed) mixed experimental design was adopted, and neutral emotion control group was set. A total of 150 subjects were randomly divided into 5 groups. After using pictures and videos to induce corresponding emotions, the subjects were asked to complete the "ability to ask creative scientific questions" test (Hu et al., 2010), and their answers were scored on the three dimensions of originality, novelty and flexibility. Expected results: 1. The performance of low motivation intensity group was significantly better than that of high motivation intensity group, mainly in fluency and uniqueness; 2. The effect of emotion on CSPF is influenced by both motivation dimension and potency dimension. In Experiment 2, 150 subjects were randomly divided into five emotion groups. Emotional pictures were used as experimental materials to measure the hot executive function of the subjects, and then the CSPF test was completed. Expected results: 1. The reaction time of working memory refresh, inhibition and conversion in low motivation intensity group was significantly better than that in high motivation intensity group; 2. Executive function partly mediates the relationship between emotion and creativity. The results show that emotion affects executive function, and then affects individual CSPF. On the basis of previous studies on emotion and Creative Scientific Problem Finding Ability, this study further explores the relationship between emotion and creative scientific problem finding ability from the perspective of emotion motivation dimension, indicating the importance of emotion motivation dimension to creative scientific problem finding ability, and finds that executive function plays an intermediary role in it.

贫困地区儿童希望与心理韧性： 领悟社会支持的中介作用和亲子依恋的调节作用

孙婉靖¹ 白慧慧¹ 崔换换² 王雨晴¹³ (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710062

² 富平县齐村学校, 渭南, 711700

³ 陕西省行为与认知神经科学重点实验室, 西安, 710062, wyq1994@snnu.edu.cn

摘 要 心理韧性是指个体在面对压力和困境时表现出来的良好适应能力, 对于儿童、尤其贫困地区儿童的成长和发展起着重要作用。本研究基于生态系统理论, 从个体、家庭、社会环境相互作用的角度出发, 探讨希望对心理韧性的作用及领悟社会支持在其中的中介作用与亲子依恋对此过程的调节作用。采用整群抽样的方法, 以儿童希望感量表、Connor-Davidson 心理韧性量表、领悟社会支持量表和亲子依恋问卷为研究工具, 对陕西省某贫困地区共 481 名儿童进行问卷调查。结果发现: (1) 希望、心理韧性、领悟社会支持、亲子依恋之间两两显著正相关; (2) 在控制了家庭收入、年级后, 希望正向预测心理韧性; (3) 领悟社会支持在

希望与心理韧性之间起部分中介作用；（4）亲子依恋负向调节了“希望→领悟社会支持→心理韧性”的前半段，即当贫困地区儿童的亲子依恋降低时，希望对领悟社会支持的预测作用增强。结果表明，希望不仅直接影响贫困地区儿童的心理韧性，也会通过领悟社会支持间接影响贫困地区儿童的心理韧性；当亲子依恋较低时，希望通过领悟社会支持对心理韧性的作用增强，表现出了一种补偿作用，即当亲子关系不如意时，个体会转向其他关系寻求情感性联结，这支持了心理韧性的动态观。这些结果为儿童心理韧性的培养和发展提供了一定的参考，即不仅可以注重培养儿童自身积极特质，如希望，也可以为儿童提供家庭和家以外的支持。

3 Provincial Key Laboratory of Behavioral and Cognitive Neuroscience, Xi'an, 710062

Abstract: Resilience refers to a positive adaptability of individuals in the face of stress and difficulties, which plays an important role in the psychological growth and development of children, especially children in poor areas. Based on ecological systems theory, this research intends to explore the role of hope on resilience from the perspective of the interaction between individuals, families and social environment, and to further investigate the mediating role of perceived social support between hope and resilience, and the moderating role of parent-child attachment on this process. Using cluster sampling method, a total of 481 underprivileged children in a poor area of Shaanxi Province were surveyed with Children's Hope Scale, Connor-Davidson Resilience Scale, Perceived Social Support Scale and Inventory of Parent-child Attachment. The results showed that: (a) there was a significant positive correlation between hope, resilience, perceived social support and parent-child attachment; (b) hope positively predicted resilience after controlling factors such as the family income and grade; (c) perceived social support played a part of mediating role between hope and resilience; (d) parent-child attachment had a negative moderating role in the first half of “hope → perceived social support → resilience”, that is, when the level of parent-child attachment of underprivileged children was decreased, the predictive effect of hope on perceived social support increased. These findings suggested that hope not only directly affected underprivileged children's resilience, but also indirectly affected underprivileged children's resilience through perceived social support. In addition, when the level of parent-child attachment was lower, hope would have a stronger effect on resilience through perceived social support, which showing a compensatory effect. That is to say, when the parent-child relationship was not satisfactory, individuals would turn to other relationships for emotional connection, which supports the dynamic view of resilience. These results provide meaningful references for the cultivation and development of underprivileged children's resilience, that is, we can focus on the cultivation of underprivileged children's own positive characteristics, such as hope, as well as on the support for underprivileged children within and outside the family.

Keywords: Underprivileged children, Hope, Resilience, Perceived Social Support, Parent-Child Attachment

T2 加权像提升儿童青少年个体脑皮层结构分割效果

摘要 基于 T1 加权的 MRI 图像可以显示大脑皮层的厚度、髓鞘化等脑解剖方面的信息, 有助于了解儿童青少年认知行为的脑解剖学基础。大脑皮层分割的准确性是至关重要的。本研究试图对儿童青少年群体增加 T2 加权像, 以便改善皮层分割效果。本研究汇集了齐鲁医院(Qilu)儿童数据集(N = 84; 男性, N = 70, 年龄 = 2.88 ± 0.89 岁; 女性, N = 14, 年龄 = 2.87 ± 1.06 岁)、纽约儿童所的 Healthy Brain Network(HBN)青少年早期数据集(N = 109; 男性, N = 64, 年龄 = 11.80 ± 3.74 岁; 女性, N = 45, 年龄 = 11.21 ± 3.75 岁)以及西南大学的 Gene Brain Behavior (GBB) 青少年晚期数据集(N = 155; 男性, N = 50, 年龄 = 20.65 ± 1.56 岁; 女性, N = 105, 年龄 = 20.66 ± 2.01 岁)。对每个数据集的所有被试, 使用 Freesurfer(6.0 版本)同时进行 T1 图像的脑皮层分割以及 T1+T2 图像的皮层分割。随后, 对其皮层厚度、髓鞘化等形态学指标进行对比分析。总体结果发现, 增加 T2 加权像的皮层分割显著增加了儿童及青少年的皮层厚度、髓鞘化指数。基于 vertex 水平的结果进一步发现, 皮层分割显著改善皮层厚度的区域位于内外侧的前额叶、双侧的顶叶及颞叶区域, 也就是额顶网络、默认网络、感知觉运动网络为最显著。尽管皮层髓鞘化显著改善的区域同样位于上述区域, 但是显著改善的程度低于皮层厚度。最后, 我们对青少年晚期(GBB)与青少年早期(HBN)及儿童期(Qilu)的改善程度进行了比较。在皮层厚度及髓鞘化方面, 青少年晚期被试在额顶网络等负责高级认知的脑功能区域都呈现出更大程度的改善, 但是在颞上回及中央前后回等负责感知觉及听觉的低级脑功能区呈现出更小程度的改善。综合以上结果, T2 加权图像对儿童青少年脑解剖的皮层分割会起到显著改善的效果。未来研究增加 T2 加权像会促进青少年高级认知功能区域分割及其与认知行为关联的准确性。

关键词 T2 加权像, 皮层分割, 皮层厚度, 髓鞘化, 儿童青少年

T2 weighted images improve the structural parcellation of cerebral parcellation in children and adolescents

Abstract: T1-weighted MRI images inform us the brain anatomy with generated cortical thickness and myelination. The information could be potentially explored as neurocognitive marker of children and adolescents. However, the accuracy of cortical parcellation is of vital importance for the examination. Using T2-weight MRI images to improve the individual parcellation was attempted in the present study with subjects of children and adolescents. We included three cohorts, children dataset from Qilu Hospital (Qilu) (N = 84; male, N = 70, age = 2.88 ± 0.89 years; female, N = 14, age = 2.87 ± 1.06 years), early adolescence dataset from the Health Brain Network (HBN) of Child Mind Institute (N = 109; male, N = 64, age = 11.80 ± 3.74 years; female, N = 45, age = 11.21 ± 3.75 years) and late adolescence dataset from Gene Brain Behavior (GBB) of Southwest University (N = 155; male, N = 50, age = 20.65 ± 1.56 years; N = 105, age = 20.66 ± 2.01 years). For all subjects, cortical parcellation was performed two times with only T1 image and T1+T2 weighted images using Freesurfer (version 6.0). Subsequently, we compared the cortical thickness and myelination between two preprocessing methods. We found that cortical parcellation based on T1+T2 images

significantly improved the cortical thickness and myelination in children and adolescents. At the vertex level, we further found the improved regions were located at medial and lateral prefrontal lobes, bilateral parietal and temporal regions for cortical thickness. That is, frontoparietal network, default mode network and sensorimotor network were considered as the most significant. With similar regions that improved with T2 weighted images in cortical myelination, the significance was less than that in cortical thickness. Finally, we compared the improvement among children, early adolescence and late adolescence. Interestingly, subjects in late adolescence showed greater improvement in heteromodal association cortex, the frontoparietal network, but less improvement in unimodal cortices, such as the superior temporal gyrus and the precentral and postcentral gyrus which are responsible for somatosensory and auditory perception. To sum up, T2-weighted images can significantly improve the cortical parcellation of brain anatomy in children and adolescents. Future studies with T2-weighted images might improve the segmentation in regions that be responsible for higher-order cognitive functions and the accuracy in the associations between brain and cognition in adolescents.

亲子互动对两岁幼儿语言能力的影响： 父母语言输入与父母敏感性的作用

陈伊诺¹ 王腊梅²（通讯作者）

1 深圳大学，深圳，518061

2 深圳大学心理学院，深圳，518061, wanglamei@szu.edu.cn

摘 要 2-3 岁是幼儿语言能力发展的关键时期，与父母的语言互动则是幼儿语言获得的重要因素。本研究以 37 个普通话家庭为研究对象，通过家访在亲子阅读和自由游戏任务中探究亲子互动中亲子对话、父母语言输入以及父母敏感性对两岁幼儿语言发展的影响。研究结果表明：父母语言输入存在差异。母亲在互动中的词类总数显著多于父亲，平均话语长度显著长于父亲，父亲的提问数量则显著多于母亲。幼儿语言输出和语言能力存在性别差异。女童在亲子互动中的词汇总数和词类总数显著多于男童，平均话语长度显著长于男童，女童的词汇和句子能力显著高于男童。两个任务中父母分别与幼儿的对话与幼儿语言能力和语言输出显著正相关；父母在亲子阅读中的提问数量与幼儿语言输出显著相关；父亲的语言重复性与幼儿语言能力显著正相关，母亲的语言重复性与幼儿语言输出的数量和词汇多样性显著负相关；母亲在自由游戏环节中的词汇多样性和提问数量与幼儿语言输出显著相关。在控制父母双方教育程度和母亲语言输入变量后，两个任务中的父子对话回合数仍能显著预测幼儿输出的词汇总数、词类总数以及幼儿词汇量；父母的提问数量与幼儿语言输出之间存在显著相关关系，在控制父母教育程度和家庭月收入之后，父母提问总数能够显著预测幼儿输出的词汇总数和词类总数；幼儿参与度在父母敏感性和幼儿词汇量之间起完全中介作用。

关键词 亲子互动，对话回合数，语言输入，父母敏感性，幼儿语言能力

The impact of parent-child interaction on 2-year-olds' language ability: the role of parental language input and parental sensitivity

Yinuo Chen, Lamei Wang

Shenzhen University, Shenzhen 518061

School of Psychology, Shenzhen University, Shenzhen 518061, wanglamei@szu.edu.cn

Abstract: The age of 2-3 years is a critical period for children's language development, the language-based interaction with parents is an important factor in children's language acquisition. In this study, 37 Mandarin-speaking parent-child dyads completed book reading and free play tasks in home visits. The influence of parent-child conversation, parental language input, and parental sensitivity on the language development of two-year-old children was investigated. The gender differences in parental language input and children's language output and ability were

also analyzed. The results showed that word types and the mean length of utterances of mothers was significantly more and longer than that of fathers, while fathers' total number of questions was significantly higher than that of mothers. As children's language output and ability, word tokens and word types of girls were significantly more than that of boys, the mean length of utterances was significantly longer than that of boys, and the vocabulary and sentence ability of girls were significantly higher than boys. Parent-child conversation turn-taking in both tasks was significantly and positively associated with children's language outputs and ability; the number of questions of fathers and mothers was correlated to children's language outputs. Fathers' language repetition was positively correlated with children's language ability, while mothers' language repetition was negatively correlated with children's language output and vocabulary. Maternal vocabulary diversity and the number of questions in the free play task were significantly related to children's language output. After controlling parental education level and language input of the mother, the number of father-child conversation turns in the two tasks could still significantly predict children's word tokens, word types and vocabulary. There was a significant correlation between the number of questions of parents and children's language output; after controlling parental education level and family income, the total number of questions of parents could significantly predict children's word tokens and types. Children's engagement played a significant mediating role between parental sensitivity and children's vocabulary.

幼儿性别颜色隐喻的发生与发展

吴金金¹ 邓铸² (通讯作者)

1 吴金金, 南京师范大学心理学院, 南京, 210000

2 邓铸, 南京师范大学心理学院, 南京, 210000, zdeng_psy@163.com

摘 要 为了探究 3.0-4.5 岁幼儿性别颜色隐喻的发生与发展, 以及其在心理理论上的表现, 本研究设计了 2 个实验。实验 1 采用对偶比较法探究了 186 名幼儿 (男生 89 名, 女生 92 名) 对七种颜色的偏好 (红、橙、黄、绿、蓝、紫、粉) 以及性别意识的分化的现状, 结果表明: (1) 幼儿在颜色偏好选择结果上存在性别差异, 女孩对于粉色的偏好显著高于男孩, 男孩对黄色的偏好显著高于女孩; (2) 幼儿性别意识在 3.0-4.5 岁之间不断发展, 幼儿优先发展出对自我性别的认知, 随后发展出对他人性别的认知。实验 2 在实验 1 的基础上引用了情景变量, 探究幼儿在自我情景、假设情景、同性情景、异性情景四种情景下的性别颜色偏好, 以此揭示幼儿性别颜色隐喻的发生与发展, 结果表明: (1) 3.0-3.5 岁的幼儿尚未形成性别颜色隐喻, 3.5-4.0 岁的幼儿开始形成性别颜色隐喻, 4.0-4.5 岁的幼儿形成相对稳定的性别颜色隐喻; (2) 幼儿性别颜色隐喻受心理理论水平的影响, 表现为在假设情景、异性情景、同性情景下的性别意识水平高于自我情景; (3) 随着幼儿年龄的增长, 幼儿形成的性别颜色隐喻越来越丰富, 3.5-4.0 岁时幼儿将 5 种颜色与性别建立了联系, 4.0-4.5 岁时幼儿将 7 种颜色与性别建立了联系。

zdeng_psy@163.com

Abstract: In order to explore the occurrence and development of gender color metaphor in 3.0-4.5 years old children, as well as its performance in theory of mind, this study designed two experiments. In experiment 1, 186 children (89 boys and 92 girls) were used to investigate the preference of seven colors (red, orange, yellow, green, blue, purple, and pink) and the differentiation of gender consciousness. The results showed that: (1) There are gender differences in the results of children's preference for color preference. Girls have a significantly higher preference for pink than

boys, and boys have a significantly higher preference for yellow than girls; (2) Children's gender awareness continues to develop between 3.0 and 4.5 years old. Children first develop their own gender cognition, and then develop the gender cognition of others. Experiment 2, based on experiment 1, used situational variables to explore children's gender color preferences in four situations: self situation, hypothesis situation, same sex situation and opposite sex situation, so as to reveal the occurrence and development of children's gender color metaphor. The results showed that: (1) 3.0-3.5 years old children have not yet formed gender color metaphors, 3.5-4.0 years old children begin to form gender color metaphors, 4.0-4.5 years old children form relatively stable gender color metaphors; (2) Children's gender color metaphor is influenced by the level of theory of mind, which shows that the level of gender awareness in hypothetical situation, heterosexual situation and homosexual situation is higher than that in self situation; (3) With the growth of children's age, children formed more and more rich gender color metaphors. When 3.5-4.0 years old, children established the connection between five colors and gender, and when 4.0-4.5 years old, children established the connection between seven colors and gender.

父母心理控制与青少年外化问题行为： 心理需求的满足与学校参与的作用

黄佳慧¹ 张丹¹ 邓玉婷² 喻承甫² 张卫¹（通讯作者）

¹ 华南师范大学心理学院/心理应用研究中心，广州，510631, zhangwei@scnu.edu.cn

² 广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006

摘要 大量研究表明父母心理控制与青少年外化问题行为之间存在联系。然而这两者之间的中介与调节机制尚未被探明。基于自我决定理论和压力缓冲模型，本研究将探讨心理需求的满足是否在父母心理控制与青少年外化问题行为之间起中介作用，以及学校参与在父母心理控制与青少年外化问题行为之间是否起调节作用。采用问卷法对来自中国南方的 966 名初中生（男生 467 名，女生 499 名；平均年龄 12.72 岁，标准差为 0.74 岁）进行问卷调查，考察了基本心理需求的满足在父母心理控制与青少年外化问题行为之间的中介作用，以及学校参与在这一关系中的调节作用。结果发现：（1）心理需求的满足显著中介父母心理控制与青少年外化问题行为之间的正向关系；（2）学校参与显著调节中介路径“父母心理控制 → 心理需求的满足 → 青少年外化问题行为”；具体而言，在低学校参与青少年群体中，父母心理控制会通过削弱其心理需求的满足进而增加其外化问题行为，然而，在高学校参与青少年群体中，这一中介效应不显著。这些结果启示我们，在家庭生活中，父母应该减少对青少年的心理控制，因为心理控制会促使青少年发展出外化问题行为。除此之外，在学校中，学校教育者可以通过提高青少年的学校参与去减少受到父母心理控制的青少年发展出外化问题行为的风险。

Parental psychological control and adolescent externalizing problem behaviors: The effect of psychological needs satisfaction and school engagement

HUANG Jiahui¹, ZHANG Dan¹, DENG Yuting², YU Chengfu², ZHANG Wei¹

¹ School of Psychology/Center for studies of Psychological Application, South China Normal University, Guangzhou, 510631, zhangwei@scnu.edu.cn

² Department of Psychology/Center for studies of Adolescent Psychological and Behaviors, Guangzhou University, Guangzhou, 510006

Abstract: Abundant evidence has demonstrated an association between parental psychological control and adolescent externalizing problem behaviors. However, the mediating and moderating mechanisms underlying this relation are still under-investigated. Grounded in the self determination theory and stress-buffering model, this study investigated

whether satisfaction of psychological needs mediates the relation between parental psychological control and adolescent externalizing problem behaviors, and whether this indirect link is moderated by school engagement. A total of 966 junior middle school student (467 boys, 499 girls; $Mean_{age} = 12.72$ years, $SD = 0.74$) from southern China were tested by questionnaires to examine the mediating effect of satisfaction of psychological needs and the moderating effect of school engagement between parental psychological control and adolescent externalizing problem behaviors. The results indicated that : (1) Satisfaction of psychological needs mediated the relationship between parental psychological control and adolescent externalizing problem behaviors. (2) school engagement moderated the indirect link “parental psychological control $\rightarrow$ satisfaction of psychological needs $\rightarrow$ adolescent externalizing problem behaviors”. Specifically, for adolescents with low school engagement, parental psychological control could weaken their satisfaction of psychological needs, which in turn increase the likelihood of externalizing problem behaviors. However, this indirect link was nonsignificant for adolescents with high school engagement. These results suggest that parents should avoid controlling their adolescents’ psychological world in family life, as it might cause them to develop externalizing problem behaviors. In addition, school educators can effectively help adolescents (especially those with high parental psychological control) avoid developing externalizing problem behaviors by increasing their school engagement.

Keywords: parental psychological control, psychological needs satisfaction, school engagement, externalizing problem behaviors, adolescent

父母生涯教养对青少年生涯发展的影响： 心理弹性中介作用的纵向研究

彭小燕¹ 吴福霜¹ 梁玥¹ 刘庆奇¹ 罗浩诚¹ 利振华¹ 丁宁¹ 聂衍刚¹ (通讯作者)

¹ 广州大学教育学院青少年心理与行为研究中心, 广州, 510006, nie-yangang@gzhu.edu.cn

摘要 青少年早期是个体进行生涯探索的重要阶段, 他们需要开始逐渐了解不同的职业, 对未来职业生涯规划等。生涯决策和自我效能感的提升是青春期最重要的发展任务之一。家庭作为青少年成长的重要环境, 父母生涯教养方式会对个体的生涯发展产生影响。因此了解青少年早期个体的生涯发展轨迹及其影响因素, 能为家庭及学校干预个体的生涯问题提供依据, 更好的促进青少年早期个体心理健康成长。本研究采用亲子生涯一致性量表、父母生涯相关行为量表、父母生涯支持行为量表、生涯困扰量表、生涯决策自我效能感量表、心理弹性量表, 考察父母生涯教养对青少年早期个体生涯困扰和生涯决策自我效能感发展的影响及其中介机制。以广东省 706 名青少年及其父母为被试, 分别在 2018 年 11 月 (T1)、2019 年 5 月 (T2)、2019 年 11 月 (T3) 进行 3 次施测, 被试平均年龄为 12.08 ± 1.54 岁。结果表明: 心理弹性在父母生涯教养与生涯发展纵向中介模型拟合指数良好($\chi^2 = 30.28$, $df = 6$, $p < 0.001$, $CFI = 0.911$, $RMSEA = 0.077$, $90\%CI [0.051, 0.106]$, $SRMR = 0.031$), 即“高一一致-高支持组”的父母生涯教养相对于“高忽视-不支持”、“高干预-不支持”更有助于提升青少年的心理弹性水平从而提升其生涯决策自我效能感和降低其生涯困扰水平。研究结果说明了父母对孩子的生涯发展表现出一定程度的重视, 给予高水平的支持与适度干预, 以及与孩子的生涯相关的目标、方向保持一致性, 更能促进青少年的生涯发展。这些结果可以作为生涯顾问和教育工作者了解家庭环境如何影响青少年的生涯发展的重要信息来源, 为今后父母对孩子进行生涯教养提供理论依据。

Influence of Career-specific Parental Behaviors on Adolescent career Development:

A Longitudinal Study on the Mediating Effect of Resilience

PENG Xiaoyan¹, WU Fushuang¹, LIANG Yue¹, LIU Qingqi¹, LUO Haocheng¹, LI Zhenhua¹, DING Ning¹, NIE Yangang^{1*}

¹ Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, 510006, Guangzhou

Abstract: Early adolescence is an important stage of individual career exploration, in which adolescents need to start learning about different professions and plan their future career. Career decision-making and self-efficacy promotion is one of the most important developmental tasks for adolescence. As an important environment for child to grow up, the career-specific parental behaviors will have an impact on the individual's career development. Therefore, understanding the career path and its influencing factors can provide the basis for family and school to intervene the individual's career problems, and better promote the early adolescent individual's mental health growth. This study used adolescent-parent career congruence scale, career-related parental behaviors scale, parental career support behavior scale, career ambivalence scale, career decision-making self-efficacy scale, resilience scale to investigate the impact of career-specific parental behaviors on early individual career ambivalence and career decision-making self-efficacy development of adolescents and its intermediary mechanism. The subjects of 706 adolescents and their parents in Guangdong province were tested three times in November 2018(T1), May 2019(T2) and November 2019(T3). The average age of subjects was 12.08 ± 1.54 years. The data fit well in the longitudinal mediation model of resilience plays a part in the relationship between career-specific parental behaviors and adolescent career development ($\chi^2 = 30.28$, $df = 6$, $p < 0.001$, $CFI = 0.911$, $RMSEA = 0.077$, $90\%CI [0.051, 0.106]$, $SRMR = 0.031$). Specifically, Highly congruent-supportive group" relative to "Highly neglect-unsupportive" group and the "Highly interference-unsupportive" group is more conducive to improving adolescents' resilience, career decision-making self-efficacy, and reducing their career ambivalence. The results show that parents pay more attention to their children's career development, give high level of support and moderate intervention, and keep consistent goals and directions related to their children's career, which can promote the career development of adolescent. These results can be used as an important source of information for career counselors and educators to understand how the family environment affects the career development of adolescent, and provide a theoretical basis for parents to carry out career upbringing for their children in the future.

青少年网络成瘾与生活满意度的关系： 自我控制和个人公正世界信念的链式中介作用

何莎莎 罗禹 梅冬梅¹ (通讯作者)

贵州师范大学, 心理学院, 贵阳, 550025, mayer_sysu@outlook.com

摘要 电子科技的蓬勃发展, 给人们带来便捷的同时也带来了诸多社会问题, 譬如青少年网络成瘾以及由此带来的个人主观幸福感的降低。基于此本研究旨在探讨青少年网络成瘾 (*Internet addiction*) 与生活满意度 (*Life satisfaction*) 的关系, 同时考察自我控制 (*Self-control*) 和个人公正世界信念 (*Individual Belief in a just World*) 在二者之间的作用。研究方法: 本研究以 452 名青少年 (17.53 ± 1.10 岁) 为研究对象, 通过网络成瘾诊断问卷、自我控制量表、公正世界信念量表和生活满意度量表进行了数据收集。相关分析结果显示: 网络成瘾与自我控制、个人公正世界信念和生活满意度呈显著负相关 (网络成瘾与自我控制, $r = -0.48$, $p < 0.01$; 网络成瘾与个人公正世界信念, $r = -0.09$, $p < 0.05$; 网络成瘾与生活满意度, $r = -0.15$, $p < 0.01$); 自我控制、个人公正世界信念与生活满意度均显著正相关 (自我控制与个人公正世界信念, $r = 0.19$, $p < 0.01$; 自

我控制与生活满意度, $r = 0.25$, $p < 0.01$; 个人公正世界信念与生活满意度, $r = 0.47$, $p < 0.01$)。此外, 中介作用分析结果显示: 自我控制与个人公正世界信念在青少年网络成瘾与生活满意度之间起中介作用。其中, 网络成瘾既可以通过自我控制的单独中介作用影响生活满意度, 即随着网络成瘾程度的增加, 青少年的自我控制能力减弱, 随之生活满意度降低的可能性会增加 ($B = -0.07$, $SE = 0.03$, 95% CI [-0.124, -0.016]); 也可以通过自我控制→个人公正世界信念的链式中介作用影响生活满意度 ($B = -0.04$, $SE = 0.01$, 95% CI [-0.069, -0.015])。研究结论: 网络成瘾对生活满意度有负向影响, 自我控制和个人公正世界信念在二者之间起链式中介作用。因此, 提升青少年的自我控制能力和个人公正世界信念感对于改善青少年网络成瘾对个人主观幸福感的影响具有重要意义。

Assosiation between Internet Addiction and Life Satisfaction in Adolescents: The Mediating Role of the Self-control and Personal Belief in a just World

Shasha He¹, Yu Luo¹, Dongmei Mei (Corresponding Author)¹

¹ School of Psychology, Guizhou Normal University, Guiyang, 550025, China, Corresponding Author: mayer_sysu@outlook.com

Abstract: The rapid development of electronic technology not only brings convenience to people, but also brings many social problems, such as teenagers' Internet addiction and the resulting decrease of personal subjective well-being. Based on this study, the purpose of this study is to explore the relationship between Internet addiction and life satisfaction, and the mediators of self-control and individual belief in a just world. Methods: Data were collected from 452 adolescents (17.53±1.10 years old) using Diagnostic Questionnaire of Internet Addiction (Young & Rogers, 1998; Lee et al., 2012), self-control scale (Tan & Guo, 2008), belief in a just world scale (Su, Zhang et al., 2012), and Satisfaction with Life Scale (Diener, Emmons, Larsen & Griffin, 1985). The results of correlation analysis showed that Internet addiction was negatively correlated with self-control ($r = -0.48$, $p < 0.01$), personal belief in a just world ($r = -0.09$, $p < 0.05$), and life satisfaction ($r = -0.15$, $p < 0.01$); however, life satisfaction was positive correlated with self-control ($r = 0.25$, $p < 0.01$) and individual belief in a just world ($r = 0.47$, $p < 0.01$), and self-control was positively correlated with individual belief in a just world ($r = 0.19$, $p < 0.01$). In addition, a bootstrapped mediation analyses (Hayes, 2013; Zhao, Lynch, & Chen, 2010) indicated that self-control and belief in a just world mediated the decreased effect of Internet addiction on life satisfaction among adolescents. In which, Internet addiction impact life satisfaction through the separate mediating effect of self-control, that is, with the increase of Internet addiction degree, teenagers' self-control ability is weakened, and the possibility of life satisfaction is increase ($B = -0.07$, $SE = 0.03$, 95% CI [-0.124, -0.016]); life satisfaction can also be influence by the chain mediating effect of self-control → individual belief in a just world ($B = -0.04$, $SE = 0.01$, 95% CI [-0.069, -0.015]). Conclusion: Internet addiction negatively impact on life satisfaction, and self-control and belief in a just world act as a chain mediator between them. Therefore, it is of great significance to adjust the influence of internet addiction on teenagers' subjective well-being by improving their self-control ability and belief in a just world.

摘要 为探讨幼儿攻击性行为与亲子关系的发展状况及其二者之间的关系, 采用家长和教师报告的测量法,

使用学前和幼儿园行为量表(PKBS)与亲子关系量表对180名3~6岁幼儿进行了测量。结果发现:1)幼儿攻击性行为在性别与年龄上存在差异,其中男孩的外部攻击强于女孩,女孩的关系攻击强于男孩;外部攻击随年龄增高而下降,而关系攻击逐渐增多。2)幼儿亲子关系也表现出性别差异与年龄特征,其中女孩在亲密性、冲突性方面均好于男孩,且随年龄增长不断发展。3)幼儿亲子关系与外部攻击及攻击总分之间均呈显著负相关,且前者能负向预测后者;亲子关系与关系攻击相关不显著。本研究结果提示,幼儿攻击性行为与亲子关系均具有年龄特征与性别差异;良好的亲子关系是幼儿攻击性行为的保护性因素。

Abstract: To explore the development status and relationship between aggressive behavior and parent-child relationship of young children, 180 children aged 3-6 years old were measured with the Pre-school and Kindergarten Behavior Scale (PKBS) and Parent-child Relationship Scale reported by parents and teachers. The results showed that: (1) children's aggressive behavior showed gender and age differences, in which boys' external attack was stronger than girls' one, and girls' relationship attack was stronger than boys' one; external attack decreased with age, while relationship attack increased. (2) Children's parent-child relationship also showed gender differences and age characteristics, in which girls were better than boys in intimacy and conflict dimension, and developed with age. (3) There was a significant negative correlation between parent-child relationship and external aggression and total score of aggression, and the former could negatively predict the latter, while the parent-child relationship had no significant correlation with relational aggression. The results suggest that children's aggressive behavior and parent-child relationship have age characteristics and gender differences; children's parent-child relationship has a significant impact on external aggression, and good parent-child relationship is the protective factor of children's aggressive behavior.

摘要 青春期是个体发生深刻发展变化的时期,在这一阶段建立清晰的自我观念(Self-view)是青少年发展的一项重要任务。“自我取向”(Self-orientation)和“群体取向”(Group-orientation)代表了个人看待世界和与世界互动的两种主要方式,是自我观的重要组成部分(Oyserman, 2017)。同伴间的互动为他们提供了一种形成和塑造关于“我是谁”的重要方式,其中与朋友之间的互动尤为重要。以往的研究大多集中于从变量中心的水平上分析自我观点与同伴关系的关系(例如友谊质量与自我概念之间的关系),但这仅仅是基于描述性范式或个体层面的分析,很少有研究从个体角度探讨友谊关系与自我观念之间的动态发展过程。同时,在高度重视社会交往和群体功能的中国文化背景下,对持不同自我观点的青少年的友谊生态了解甚少。因此,本研究拟从社会网络分析的角度出发,试图探讨持不同自我观念的中国青少年的友谊网络的特点,以及自我观念间的相似性是否会影响青少年自我观念的发展,例如自我观念相似的青少年会不会更容易成为朋友(相似-选择效应),并

且随着时间的发展他们的自我观念水平会更相似(相似-影响效应)。本研究选取 1254 名来自 22 个班级的 7 年级学生(48.4% girls, $M_{age}=13.2$ 岁, $SD=0.40$ 岁), 每年追踪一次, 共追踪三年。通过自我报告和友谊提名获得个体及其朋友的自我观念的数据和友谊网络数据。使用 SPSS 20.0 对原始数据进行录入、整理和描述性统计。使用 R 程序进行班级戏剧数据的分析和友谊提名数据的格式转换。使用 RSiena 软件包(Ripley, Snijders, & Preciado, 2011)对友谊网络和自我价值取向的相互作用进行建模。研究结果表明:

(1)高个体价值取向的青少年在社会互动中比低自我价值取向的青少年会更主动发出社会连接($Est.=0.11$, $p<0.01$), 同样的情况也出现在高群体价值取向的青少年身上($Est.=0.11$, $p<0.01$);

(2)从相似-选择效应来看, 相对于个体价值取向的相似性($Est.=0.11$, $p<0.01$), 青少年容易选择在集体价值取向上更相似的同伴成为朋友($Est.=0.30$, $p<0.01$);

(3)从相似-影响效应来看, 随着时间的发展, 青少年与其朋友的个体价值取向会朝着一致的水平发展($Est.=2.60$, $p<0.01$)。进一步分析表明, 这种影响效应存在性别的差异, 女生的个体价值取向更容易受到朋友的影响($Est.=2.60$, $p<0.01$)。

Abstract: Establishing a clear self-view is a key developmental task of adolescent. Peer interactions provide them with a salient way to form and shape the views about who I am, and friendships are especially important in this process. The previous studies mostly focused on the relations on self-views and peer relations at a variable-centered level, which was merely based on a descriptive paradigm or individual-level analysis. However, little is known about the friendship ecology of adolescents who hold different self-views, especially in the Chinese cultural context which highly values social interaction and group functioning. This study aimed to investigate the friendship network characteristics of the Chinese adolescents who hold different types of self-views (i.e., self-orientation and group-orientations), as well as examining whether selection (i.e., adolescents tend to befriend with peers who are similar to them in self-view) and influence effects (i.e., adolescents' self-views could be influenced by their friends over time) could explain the similarity in self-views between adolescents and their friends. Participants ($N=1254$, 48.4% girls, $M_{age}=13.2$ years, $SD=0.40$ year at Time 1) came from 22 junior school classes in mainland China followed over three years from Grade 7 to Grade 9. Measures of adolescents' self-views and friend relationships were obtained each year from a combination of adolescents' self-reports and friendship nomination. All analysis was operated in the Simulation Investigation for Empirical Network Analysis software package in R (RSiena), package version 1.2-1.2. Results showed that (1) Higher self-orientation adolescents have, more initiatively they act in the social relationship ($Est.=0.11$, $p<0.01$), the same pattern could also be found on higher group-orientation adolescents ($Est.=0.23$, $p<0.01$). Moreover, higher group-orientated adolescents are more popular in their social networks than lower group-orientated adolescents ($Est.=0.12$, $p<0.01$). (2) For the similarity-selection hypothesis, the results showed that adolescents tend to select friends with similar levels of group-orientation ($Est.=0.30$, $p<0.01$) rather than self-orientation ($Est.=-0.03$, $p>0.5$). (3) As regards similarity-influence hypothesis, we found that friends increase each other's self-orientation as relationship endure ($Est.=2.60$, $p<0.01$); further analysis on gender difference

suggested that girls' self-orientation is more influenced by their friends' self-orientation level than boys' (Est.=1.85, $p<0.01$). These results emphasized the significance of looking at the interplay between adolescents' self-views and friendships over time, especially embedded in social networks.

选择还重要吗？选择效价对学龄前儿童理解和评价选择权的影响

李思贤¹ 赵欣² (通讯作者)

1 华东师范大学心理与认知科学学院, 上海, 200062

2 华东师范大学教育心理学系, 上海, 200062, xzhao@dep.ecnu.edu.cn

摘要 人们通常表现出自主选择偏好, 即相比于他人给自己做选择, 更加偏好自己做出选择。并且, 近期社会善念方面的研究发现, 人们对于给予他人选择的权利的行为比限制他人选择权利的行为评价更高。但以往研究主要关注人们面临正性或中性的选择的情况, 少有关关注选择为负性的情况。本文探究, 选择的效价(正性或负性)对成人及儿童对于给他们留选择的的行为的评价的影响。特别地, 当选择为负性时, 儿童和成人是否还会认为选择权很重要? 本研究采用社会善念范式, 采用2(留选择 vs. 不留选择, 被试内)×2(正性 vs. 负性, 被试间)混合设计, 共招募120名4-6岁儿童和124名成人参与实验。我们让被试评价两个人物在选择水果(或玩具)时的表现; 其中一个人物在自己选择水果(玩具)时给排在后面的人留下两种不同水果(即, 给予后者的选择权); 另一个人物则给排在后面的人留下两个相同的水果(即, 剥夺后者的选择权)。在正性选项条件下, 所有的水果(玩具)都是完好的; 在负性选项条件下, 水果(玩具)是被损坏的。我们让儿童分别评价两个排在前面的人物对后面的人有多好, 并让儿童对排在后面的人的情绪进行推断。除此之外, 我们还测量了儿童在心理理论任务中的表现。结果发现, 其一, 随着年龄发展, 儿童的评价逐渐受到选项性质的影响。具体而言, 不论选项好坏, 4、5岁儿童均对给后者留选择的人物的评价更高, 而6岁儿童及成人在负性选项条件下对是否给他人留选择人物的评价差异要显著小于正性条件下的评价差异。其二, 4-5岁儿童均认为排在后面的人物在拥有选择时或选项为正性时情绪更积极, 但6岁儿童和成人则认为, 相比于拥有选择权, 当选择权被剥夺时, 选项性质对排在后面的人物的情绪几乎没有影响。最后, 我们发现儿童对不同情境中人物的评价以及对后者的情绪推断与心理理论存在显著相关。综上所述, 4-6岁儿童对选择权的认识逐渐成熟, 并且受到心理理论发展的影响。本研究对探究儿童对选择权的认识、理解和评价及其发展机制有重要意义。

Does choice still matter? The influence of valence of choice on preschoolers' understanding and evaluation of the freedom to choose

Sixian Li¹, Xin Zhao² (Corresponding author)

1 The School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

2 Department of Educational Psychology, East China Normal University, Shanghai, 200062, xzhao@dep.ecnu.edu.cn

Abstract: People desire for the freedom to choose, that is, they usually prefer to make their own choices instead of abdicating the opportunity to others. Recent studies on social mindfulness revealed that people evaluated those who left a choice for others as nicer than those who deprived others' freedom of choice. However, previous studies only focused on attractive or neutral choice, it is largely unknown how people's evaluations may change when the options are aversive. So, in this study, we explored whether the valence of choice (good vs. bad) affects adults and children's evaluation of the actions of leaving a choice for others (or not). In particular, we wondered, when all the options are bad, whether it is still important for adults and children to make their own choice. We adopted the social mindfulness paradigm, using a 2 (leaving a choice vs. leaving no choice, within subjects) × 2 (good options vs. bad options,

between subjects) mixed design. We recruited 120 4- to 6-year-old children and 124 adults to participate in the study. We asked participants to evaluate the performance of two character when picking fruit (or toys). One character left two different kinds of fruit [toys] for the next character to choose from (i.e., leaving a choice). The other character left two identical fruit [toys] for the next character (i.e., leaving no choice). In the good choice condition, the fruits [toys] to pick were in good condition; while in the bad choice condition, the fruits [toys] were damaged. The participants were asked to rate how nice the first character was, and then infer the feeling of the second character. After that, the children participated in the theory-of-mind tasks. Our findings are as follows. First, with age, children's evaluations of the actions were increasingly influenced by the valence of choice. Specifically, 4- to 5-year-olds thought the first character who left a choice was much nicer than the character who left no choice, regardless of the valence of choice. However, 6-year-olds evaluated the character leaving a choice as significantly nicer in the good choice condition than in the bad choice condition, and they evaluated the character leaving no choice as equally nice in the good choice condition and the bad choice condition, which is highly consist with adults' evaluation. Second, children of 4 and 5 inferred the second character as happier when being left a choice (than when being left no choice) and when the items were in good condition (rather than in bad condition). But 6-year-olds and adults only inferred the character being left a choice as happier (than the one being left no choice) in the good choice condition, but not in the bad choice condition. Last, we found that children's evaluation of niceness and inference of feelings are significantly related to children's theory-of-mind abilities. In conclusion, children's understanding of choice gradually develops during age 4 to 6, and such understanding is related to the development of theory-of-mind. Our research makes great contributions to the investigation of children's understanding and evaluation of choice and its developmental mechanism.

语素意识和句法意识对幼儿听力理解的影响

朱丹丽 杨宇欣 王志刚 李利平 (通讯作者)

山西师范大学教育科学学院, 临汾, 041000, liliping2092@163.com

摘 要 听力理解是从口头语言中获取信息的过程, 是儿童同伴交往和发展社会能力的前提。建构整合模型(Kintsch, 1988)认为, 听力理解作为口头语言技能的组成部分是一个建构整合的过程, 它不仅需要词汇和短语等底层的解码和加工, 还需要句法来分析和整合信息。而语素意识反映了儿童对词汇的最小语义单位的意识与操作, 儿童将词分解成语素并通过重新组合来构建整词意义, 这一过程在理解口头语言中尤其重要。句法意识反映的是儿童反思句子内在语法结构的能力, 儿童利用句法意识将字词组成有意义的句子, 对口头语言的理解有促进作用, 因此听力理解与这两种元语言意识密切相关。此外, 幼儿期是儿童元语言意识发展的重要时期, 语素意识在幼儿期开始萌芽并且整个幼儿园阶段都处于不断提高的状态, 句法意识从 2~3 岁开始萌芽, 4~8 岁迅速发展(Tunmer & Grieve, 1984)。已有研究(Ku & Anderson, 2003; Plaza, 2001)表明语素意识和句法意识的发展对儿童口头语言技能的提升至关重要, 但少有研究关注这两种元语言意识与幼儿听力理解的关系。为了考察语素意识和句法意识对幼儿听力理解的影响, 选取了 186 名幼儿园中班和 212 名大班儿童作为被试, 分别测查了儿童的语素意识、句法意识、工作记忆和听力理解。在控制了工作记忆之后, 结果发现: (1) 中班和大班儿童的语素意识分别解释了听力理解 8.7%和 8.6%的方差; (2) 中班和大班儿童的句法意识分别解释了听力理解 3.5%和 12.6%的方差。研究表明语素意识和句法意识均影响幼儿的听力理解, 但二者的预测力并不相同, 句法意识对幼儿听力理解的预测作用随年龄的升高而增强。

关键词 语素意识, 句法意识, 听力理解

The Influence of Morphological Awareness and Syntactic Awareness on Kindergarteners' Listening Comprehension

Danli Zhu, Yuxin Yang, Zhigang Wang, Liping Li*

School of Education Science, Shanxi Normal University, Linfen, 041000

Abstract: Listening comprehension is a skill of acquiring information from oral language, which is the premise of communication and social development. The construction-integration model (Kintsch, 1988) proposed that listening comprehension as an important part of oral language skills was the process of construction and integration, it required not only bottom level decoding of words and phrases, but also syntactic processing to analyze and integrate information so as to understand meaning of oral language. Morphological awareness reflects the ability of controlling semantic unit, children decode words into morphemes and construct the meaning of whole words, and the process plays important role in oral language. Syntactic awareness reflects to manipulate the grammatical structure of sentences, which prompts children to compose meaningful sentences with words, thus listening comprehension is closely related to morphological awareness and syntactic awareness. At the same time, the kindergarten is a critical stage for children development (Tunmer & Grieve, 1984). The prior studies (Ku & Anderson, 2003; Plaza, 2001) have shown that the development of morphological awareness and syntactic awareness played a role in the improvement of children's oral language skills, but few studies focused on the relationship between two metalinguistic awareness and listening comprehension. In order to investigate the influence of morphological awareness and syntactic awareness on listening comprehension for kindergarteners, 186 middle grade and 212 senior grade kindergarteners were tested by morphological awareness, syntactic awareness, working memory and listening comprehension. After controlling the role of working memory, the results showed that: (1) Morphological awareness accounted for 8.7% and 8.6% variances of listening comprehension in middle grade and senior grade kindergarten respectively; (2) Syntactic awareness accounted for 3.5% and 12.6% variances of listening comprehension in middle grade and senior grade kindergarten respectively. The conclusion indicated that both morphological awareness and syntactic awareness influenced listening comprehension for kindergarteners. The predictive power of syntactic awareness on kindergarteners' listening comprehension increased with grade.

心理理论和执行功能对 3-5 岁儿童抵制诱拐行为的预测作用

吴小双¹ 翟羽佳¹ 龚天姿¹ 王震炎¹ 张宁¹ 刘思思¹ 李庆功¹ (通讯作者)

¹ 浙江师范大学心理系, 金华, 321004, 通讯作者 E-mail: liqinggong@zjnu.cn

摘 要 儿童诱拐案件屡屡发生, 引起广大父母的强烈担忧和社会各界的广泛关注。儿童抵制诱拐行为是指在面对陌生人诱拐时, 儿童能够根据各种线索认识到存在风险, 并正确拒绝对方的行为。本研究旨在模拟的诱拐场景中探讨 3~5 岁儿童抵制诱拐行为的年龄发展趋势及其认知因素对抵制诱拐行为的预测作用。本研究模拟真实的诱拐场景: 首先由儿童熟悉的主试 1 将其单独带到室外并借故离开。主试 2(陌生人)试图跟儿童搭讪, 并试图用诱惑物引诱儿童离开。根据儿童的表现进行计分(0~3 分), 分数越高说明儿童越能抵制陌生人的诱拐。之后采用心理理论五任务量表(Wellman & Liu, 2004)和 Flanker Fish (丁晓攀, 2008; RÖthlisberger & Neuenschwander, 2011)分别测试心理理论和执行功能。本研究共纳入 90 名 3~5 岁($M_{\text{age}} = 4.54$, $SD = 0.80$)儿童被试, 其中男生 44 名, 女生 46 名。方差分析结果显示, 年龄的主效应显著($F(2, 88) = 10.33$, $p < 0.001$)。3 岁儿童(1.03 ± 1.10)相比于 4 岁(2.13 ± 1.07)和 5 岁儿童(2.21 ± 1.15)更容易被陌生人拐走, 而 4 岁和 5 岁儿童之间没有显著差异。采用回归分析发现在控制了年龄和性别之后, 心理理论对儿童抵制诱拐行为有显著的正向预测作用($\beta = 0.38$, $p < 0.01$), 执行功能的两个子成分灵活转换和抑制控制对抵制诱拐行为的预测作用都不显著($ps > 0.05$)。这项研究表明 3~5 岁儿童随着年龄的增长抵制诱拐行为表现越好, 4 岁可能是儿童抵制诱拐行为发展重要的转折点; 心理理论的发展水平越高的儿童抵制诱拐行为表现越好, 执行功能的发展水平则不能预测儿童的抵制诱拐行为。

关键词 儿童, 抵制诱拐行为, 心理理论, 执行功能

The Predictive Effect of Theory of Mind and Executive Function on 3- to 5-year-old Children's Behavior to Resist Abduction

Wu Xiaoshuang¹, Di Yujia¹, Gong Tianzi¹, Wang Zhenyan¹, Zhang Ning¹, Liu Sisi¹,

Li Qinggong¹ (corresponding author)

¹ Zhejiang Normal University, Department of Psychology, JinHua, 321004

Abstract: Child abduction have occurred frequently, causing strong concerns among parents and widespread concern from all walks of life. Children's behavior to resist abduction means that when facing abduction by stranger, children can recognize the risk based on various clues and correctly reject the stranger. This study aims to explore the age development trend of 3- to 5-year-old children's behavior to resist abduction and the predictive effect of cognitive factors on children's behavior to resist abduction in a simulated abduction scenario. This study simulated a real-world abduction scenario: First, the experimenter 1 who child had been familiar with took child outside alone and left with excuses. The experimenter 2 (stranger) tried to talk to the child and attempted to lure the child away. Children's response to the stranger was coded to score 0~3, a higher score meaning children's better resistance to the abduction of stranger. Later, the theory of mind five task scale (Wellman & Liu, 2004) and Flanker Fish (Ding Xiaopan, 2008; RÖthlisberger & Neuenschwander, 2011) were used to test theory of mind and executive function respectively. A total of 90 children aged 3 to 5 years ($M_{age} = 4.54$, $SD = 0.80$) were included in this study, including 44 boys and 46 girls. The results of the analysis of variance showed that the main effect of age was significant ($F(2, 88) = 10.33$, $p < 0.001$). 3-year-old children (1.03 ± 1.10) were more likely to be abducted by strangers than 4-year-old (2.13 ± 1.07) and 5-year-old children (2.21 ± 1.15), and there was no significant difference between 4-year-old and 5-year-old children. Regression analysis found that after controlling for age and gender, theory of mind had a significant positive predictive effect on children's behavior to resist abduction ($\beta = 0.38$, $p < 0.01$). Flexible shifting and inhibitory control, the two subcomponents of executive function, did not have a significant predictive effect on children's behavior to resist abduction ($ps > 0.05$). This study shows that children aged 3 to 5 years old perform better in resisting abduction as aging, and 4 years old may be an important turning point in the development of children's behavior to resist abduction. Children with a higher level of development of theory of mind have a better performance in resisting abduction. The level of development of executive function cannot predict children's behavior to resist abduction.

戒毒所干警工作家庭冲突对职业倦怠的影响： 前摄应对与工作繁荣的链式中介作用

陈诗¹ 曾练平²(通讯作者)

¹ 贵州师范大学心理学院, 贵阳, 550001

² 贵州师范大学心理学院, 贵阳, 550001

通讯作者 E-mail: zenglianping@163.com

摘要 戒毒所干警长期处于高负荷、高对抗、高风险的应激状态, 是职业倦怠的高危易感人群。强制隔离戒毒所干警经常面临教育矫治对象依从性差、复吸率高、教育矫治难度大的特殊性, 及环境封闭性的特点, 因此职业角色的付出通常难以抵消家庭角色的收益, 引发强烈的工作家庭冲突体验, 导致职业倦怠的产生。基于积极心理学视角, 越来越多学者将研究重点放在能够促使个体积极应对问题以及保持学习和活力状态的工作繁荣问题上, 这有利于减轻个体职业倦怠水平。前摄应对是一种朝向未来的、以目标达成为导向的积极应对方式, 是个体为预防潜在危险发生所做的努力, 可以缓冲角色压力带来的不良影响, 能有效减轻工作倦怠。另外, 良好的工作家庭关系能促进个体在工作中实现繁荣旺盛状态, 能够更好学习、能量恢复、不易倦

怠、减少缺勤和减轻压力。因此本研究主要探讨工作家庭冲突对戒毒所干警职业倦怠的影响，及前摄应对和工作繁荣在其中的作用机制。方法：采用工作家庭冲突量表、职业倦怠量表、前摄应对量表和工作繁荣量表对贵州省某强制隔离戒毒所的 311 名干警进行问卷调查。运用 SPSS21.0 对数据进行统计分析。结果：（1）工作家庭冲突与职业倦怠呈显著正相关($r=0.57, p<0.001$)。（2）前摄应对在工作家庭冲突与职业倦怠之间起着部分中介作用，中介效应为 0.04，其中介效应占总中介效应值的 7.02%；工作繁荣亦然，中介效应为 0.15，其中介效应占总中介效应值的 26.32%。（3）前摄应对和工作繁荣在工作家庭冲突与职业倦怠的关系中具有链式中介效应，中介效应为 0.07，其中介效应占总中介效应值的 12.28%。结论：本研究的结果为预防和干预戒毒所干警的职业倦怠提供了有效的实证依据与理论参考，也对降低其职业倦怠具有明显的应用价值。

The Influence of Work-Family Conflict on Job Burnout about Police Officers in Drug Rehabilitation Center: the Chain Mediated Effect of Proactive Coping and Thriving at Work

CHEN Shi¹, ZENG Lianping¹

¹ School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract: The police officers in drug rehabilitation center are in the state of high load, high resistance and high risk for a long time, and they are the high risk susceptible population of job burnout. Police officers in drug rehabilitation center are often faced with the particularity of poor compliance, high relapse rate, difficulty in education correction, and the characteristics of closed environment. Therefore, the pay of professional role is usually difficult to offset the benefits of family role, trigger a strong experience of work family conflict, and further lead to job burnout. Based on the perspective of positive psychology, more and more scholars focus their research on individuals can actively cope with problems and the problems of thriving at work that keep learning and active, which is conducive to reducing the level of individual job burnout. Proactive coping is a positive and futures-oriented coping style, and also is an effort that individual to prevent the occurrence of potential danger. It can relieve the negative effects of role pressure and effectively reduce job burnout. In addition, a good work-family relationship can promote individuals' thriving at work, which can help individuals learn better, recover energy, reduce burnout, reduce absenteeism and reduce stress. Therefore, this study aims to explore the relationship between work-family conflict and job burnout among police officers in drug rehabilitation center, as well as the mechanism of proactive coping and thriving at work. Methods: Work-Family Conflict Scale, Job Burnout Scale, Proactive Coping Scale and Thriving at Work Scale were used to conduct investigation on 311 police officers in drug rehabilitation center. The research used SPSS21.0 to statistically analyze the data. Results: (1) Work-family conflict was significantly and negatively correlated with job burnout($r=0.57, p<0.001$). (2) Their proactive coping and thriving at work could partial mediate between work-family conflict on job burnout, the mediation effect of proactive coping and thriving at work were 0.04 and 0.15, of which the mediation effect accounted for 7.02% and 26.32% of the total mediation effect value.(3) Proactive coping and thriving at work showed a chain mediating effect in the relationship between work-family conflict and job burnout, the mediating effect was 0.07, and the mediating effect accounted for 12.28% of the total mediating effect value. Conclusion: This study reveals the effect of work-family conflict on their job burnout, which offers a effective guidance and theoretical reference for the prevention and intervention in job burnout about police officers in drug rehabilitation center, and has obvious application value about improving their job burnout.

Abstract: Objective: To explore the chain mediating role of trait anxiety and shyness between loneliness and aggression. Methods: 606 college students were investigated with the College Students' CC-BPAQ, Trait Anxiety Inventory, UCLA Loneliness Scale and the College Students' Shyness Scale. Results: There were significant gender differences in hostility, physical aggression and irritability of college students, and the irritability of college students with love objects was significantly higher than that of college students without love objects. There were significant positive correlations among loneliness, shyness and trait anxiety and aggression. The mediating effects of trait anxiety and shyness between loneliness and aggression in undergraduate were significant. The chain mediating effect of trait anxiety and shyness was significant. Conclusion: In undergraduate, trait anxiety and shyness have a chain mediating effect on the relationship between loneliness and aggression.

摘要 以数字技术为中介的信息存储和传递的新媒介在大众社会交往中逐渐普及，它以互联网为依托、手机和微信为主要载体，成为现代社会人际沟通的主流工具，同时在家庭亲子沟通中扮演着重要的角色。新媒介的普及革新了人际之间的沟通交流方式，其中家庭成员间，尤其是父母与子女间的沟通受到显著影响。以往文献大多从传播学角度出发，采用质性研究和问卷调查相结合的研究方法，从留守儿童亲子沟通、住宿中学生和国外留学生、“成年初期”子女等不同年龄层孩子与双亲沟通出发，对新媒介广泛应用下亲子网络沟通的利弊问题，以及由此带来的“数字鸿沟”和与之对应的“技术反哺”等问题做了较多研究。但是，从心理学角度出发进行的量化研究却为数不多，已有的研究也多把目光集中在青少年、大学生身上，而较少关注新媒介变革下父母一辈的心理变化。因此，在后续研究中，网络亲子沟通中父母与子女双方的心理动态都值得受到积极关注。结合亲子双方视角揭示在数字媒介日新月异变化下的中国家庭沟通模式及其隐私管理方法，并且探究网络亲子沟通中父母子女双方关系的变化及每位家庭成员的心理发展。

Network parent-child communication under the new media of social communication Literature review

Yan-hong Kuo

College of Psychology, Inner Mongolia Normal University, Inner Mongolia, 011022,

18340869983@163.com

Abstract: Digital technology as the intermediary of information storage and transmission of new media in the mass social communication is gradually popular, it takes the Internet as the basis, mobile phone and WeChat as the main carrier, become the mainstream tool of modern social interpersonal communication, at the same time in the parent-child communication plays an important role. The popularization of new media has revolutionized the ways of interpersonal communication, among which the communication between family members, especially between parents and children, has been significantly affected. Mostly from the perspective of communication studies in the literature, by adopting the combination of qualitative research and questionnaire survey research methods, from the left-behind children and students in the parent-child communication, accommodation of foreign students, "into early stage" of different age children such as children and parents communication, under the new media widely used the pros and cons of parent-child communication network problems, and as a result of the "digital divide" and the corresponding problems such as "technical feedback" to do more research. However, there are few quantitative studies from the perspective of psychology, and most of the existing studies focus on teenagers and college students, but pay less attention to the psychological changes of parents under the new media revolution. Therefore, in the follow-up research, the psychological dynamics of both parents and children in online parent-child communication are worthy of positive attention. From the perspective of parents and children, this paper reveals the Chinese family communication mode and its privacy management method under the ever-changing digital media, and explores the changes in the relationship between parents and children in online parent-child communication and the psychological development of each family member.

校园欺凌中青少年共情与旁观者保护行为的关系：三水平元分析

杨俊茹¹（通讯作者） 邓小平¹

¹ 赣南师范大学教育科学学院，江西，34100，501884555@qq.com

摘要 尽管许多研究表明，青少年的共情与校园欺凌中的旁观者保护行为呈正相关，但部分研究未能发现这两个变量之间的显著关联。为了解释这一差异，本研究对 27 篇论文(35 篇独立研究，N = 25012 名青少年)进行了三级荟萃分析。结果表明，共情与旁观者保护行为呈正相关。此外，共情类型和保护行为的评价主体对共情与旁观者保护行为之间的关系有调节作用。情感共情与旁观者防御的相关系数($r = 0.27$, 95% CI [0.22, 0.32])显著强于认知共情与旁观者防御的相关系数($r = 0.22$, 95% CI [0.17, 0.28])；采用自我评价测量旁观者保护行为获得的相关系数要显著高于采用同伴评价测量旁观者保护行为获得的相关系数。结果表明，共情与旁观者保护行为密切相关。因此，可以从增强青少年共情的角度来预防校园欺凌。

关键词 欺凌，共情，旁观者保护行为，三水平元分析，青少年

Adolescent Empathy Influences Bystander Defending in School Bullying: A Three-Level Meta-Analysis

Yang Junru, Deng Xiaoping

College of Educational Science, Gannan Normal University, Jiangxi 34100

Abstract: Even though numerous studies have shown that adolescent empathy is positively related to bystander defending in school bullying, others have failed to detect a significant association between these two variables. To address this discrepancy, a three-level meta-analysis of 27 papers (35 independent studies, N = 25,012 adolescents)

was conducted. The results showed that empathy was positively correlated with bystander defending. Furthermore, the strength of the relationship between empathy and bystander defending was moderated by the type of empathy and the evaluators of defending. Specifically, the correlation coefficient between affective empathy and bystander defending ($r = 0.27$, 95% CI [0.22, 0.32]) was significantly stronger than that between cognitive empathy and bystander defending ($r = 0.22$, 95% CI [0.17, 0.28]). Finally, the strength of the relationship between empathy and bystander defending was moderated by the evaluator of defending behavior. That is, the correlation coefficient of bystander defending measured by self-evaluation was significantly stronger than that measured by peer-evaluation. The results showed that empathy was closely related to bystander defending. Thus, school bullying can be prevented from the perspective of enhancing empathy among adolescents.

成年与老年个体工作记忆刷新中面孔情绪加工的差异

陈玉田 黄丕兰 陈睿（通讯作者）

云南师范大学教育学部，昆明，650500，13759599505@163.com

摘要 情绪在信息传播过程中起着重要的作用，其中面部表情是情绪表达最直接的方式。个体在识别不同情绪面孔时存在差异。部分研究者的研究结果显示，相比积极情绪面孔，个体对消极情绪面孔加工更有优势，而其他研究者则持相反态度。但对于成人和老年人个体对不同情绪面孔加工差异的研究则较少。据此，本研究以探讨面孔的情绪（积极、中性、消极）在成年与老年个体工作记忆刷新中的差异为目的。采用 N-back 实验范式，选取 40 张情绪面孔为刺激材料，使用情绪面孔一致性判断任务，对 21 名成人和 24 名老年人进行研究。结果发现，（1）正确率数据结果显示，两组被试的年龄特征主效应显著（ $F(1,38) = 6.525$, $p = 0.015$, $\eta^2 = 0.147$ ）。成年被试的正确率（80.5%）显著高于老年人被试（74.1%）。（2）反应时数据结果显示，两组被试的年龄特征主效应显著（ $F(1,38) = 46.836$, $p < 0.001$, $\eta^2 = 0.939$ ）。成年人被试情绪面孔刷新的反应时（959ms）显著快于老年人被试对情绪面孔刷新的反应时（1714ms）。（3）面孔情绪×年龄特征交互效应显著（ $F(2,76) = 7.242$, $p = 0.001$, $\eta^2 = 0.16$ ）。老年人对积极情绪面孔刷新正确率高于消极和中性情绪面孔，成年人对三种情绪面孔刷新正确率无明显差异。研究结果显示，首先，老年人执行功能减退可能是导致老年人情绪面孔识别反应时较慢，正确率低于成年人的原因。其次，老年人对消极情绪加工功能先行衰退，可能是导致对积极情绪面孔存在加工优势的原因。

Differences in emotion faces processing between adults and older working memory updating

CHEN Yu Tian, HUANG Pi Lan, CHEN Rui

Education Department of Yunnan Normal University, Kunming, 650500, 13759599505@163.com

Abstract: Emotion plays an important role in the process of information dissemination and facial expression is the most direct way of emotional expression. There are differences in the recognition of different emotional faces. The results of some researchers show that people have more advantages in processing negative emotional faces than positive emotional faces, while others hold the opposite attitude. However, there are few studies on the processing differences of different emotional faces between adults and older. Based on this, this study used N-back experimental paradigm that selected 40 emotional faces as stimulus materials, and used emotional face consistency judgment task to explore the differences of facial emotion (positive, neutral, negative) in working memory-updating test between adult and older. The results showed that: (1) the main effect of age characteristics of probe was significant ($F(1,38) = 6.525$, $p = 0.015$, $\eta^2 = 0.147$). The correct rate of adult subjects (80.5%) was significantly higher than that of older subjects (74.1%). (2) Reaction time data showed that the main effect of age characteristics of the two groups was significant ($F(1,38) = 46.836$, $p < 0.001$, $\eta^2 = 0.939$). The reaction time (959 ms) of adult subjects was significantly

faster than that of older subjects (1714 ms). (3) The interaction effect of facial emotion $\times$ age characteristics was significant ($F(2,76)=7.242, p=0.001, \eta^2=0.16$). The updating accuracy rate of positive emotional faces was higher than that of negative and neutral emotional faces, while there was no significant difference among adults. Conclusion that the decline of executive function in the older may be the reason that the response time of emotional face recognition is slower and the accuracy rate is lower than that of adults. Secondly, the older people's processing function of negative emotion first declines, which may be the reason for the processing advantage of positive emotional faces.

科学家印象对初一学生科学学习动机的影响

李丹¹ 郝嘉佳² (通讯作者)

1 天津师范大学心理学部, 天津, 300387

2 天津师范大学心理与行为研究院, 天津, 300387, haojjia@tjnu.edu.cn

摘要 在科技强国的大背景下培养科技创新人才成为当务之急, 提高正接受基础学习的中学生的科学学习动机就显得尤为重要。新型冠状病毒肺炎疫情期间, 亲赴一线的科学家们向普罗大众们诠释了“苟利国家生死以, 岂因祸福避趋之”的深刻内涵, 他们用实际行动展示了科学技术的力量。以此为契机, 本研究目的是探究疫情期间(于2020年2月23日进行线上测试)中学生对科学家的印象, 并进一步探究科学家印象对其科学学习动机的影响。鉴于此, 本研究以362名初一学生为研究对象, 其中包括189名男生, 173名女生。分别采用自编科学家印象问卷调查初一学生疫情期间对科学家的印象, 使用科学学习动机量表(SMTSL)调查其在校期间, 疫情期间的科学学习动机, 探讨科学家印象对初一学生科学学习动机的影响。结果发现: (1) 科学家印象与初一学生科学学习动机变化呈正相关; (2) 男生相较于女生更愿意在未来的大学学习中选择与科学相关的专业, 男生相较于女生更愿意未来从事与科学相关的专业。以上结果表明, 疫情期间增强了初一学生对科学家的正面印象, 科学学习动机有明显的增强, 科学学习动机的变化与初一学生对科学家印象的增强有关。相对于女生而言男生对学习科学、从事科学相关职业的意愿更强, 因此在此结果的基础上, 可以采取相应干预措施, 提高女生相应意愿。

The Influence of Scientists' Impression on Science Learning Motivation of Junior high school students

Li Dan¹, Hao Jiajia²

1 Department of Psychology, Tianjin Normal University

2 Institute of Psychology and Behavior, Tianjin Normal University

Abstract: Under the background of powerful country with science and technology, it is urgent to cultivate innovative talents in science and technology. It is particularly important to improve the motivation of science learning of middle school students who are accepting basic learning. During the outbreak of novel coronavirus pneumonia, scientists who went to the front line interpreted the profound meaning of "Gou Li's life and death, and why it was avoided by evil and fortune". Taking this opportunity, the purpose of this study is to explore the impression of middle school students on scientists during the epidemic period (on February 23, 2020), and further explore the impact of scientists' impression on their science learning motivation. In view of this, this study takes 362 junior high school students as the research object, including 189 boys and 173 girls. In order to explore the effect of impression of scientists on science learning motivation of junior high school students, the self-designed impression questionnaire of scientists was used to investigate the influence of impression of scientists on science learning motivation of junior high school students during the epidemic period, and the Science Learning Motivation Scale (SMTSL) was used to test their science learning motivation. The results show that: (1) there is a positive correlation between the impression of

scientists and the change of science learning motivation of junior high school students; (2) boys are more willing to choose science related majors than girls, and boys are more willing to engage in science related majors than girls. The results showed that the positive impression of the first grade students on the scientists was enhanced during the epidemic period, and the motivation of science learning was significantly enhanced. The change of science learning motivation was related to the enhancement of the impression of the scientists on the students. Compared with girls, boys are more willing to learn science and engage in science related professions. Therefore, based on the results, corresponding intervention measures can be taken to improve the corresponding willingness of female students.

孤独症谱系障碍儿童对社会互动动作“给-要”的理解

侯文文^{1,2} 杨运梅^{1,2} 李晶^{1,2} (通讯作者)

1 中国科学院心理研究所, 中国科学院行为科学重点实验室, 北京 100101

2 中国科学院大学心理学系, 北京 100049, 通讯作者 E-mail: lij@psych.ac.cn

摘要 在快速多变的世界中理解和预测他人的行为是社会互动成功与否的一个重要因素。本研究考察了孤独症儿童对基本的社会互动动作“给-要”动作的理解。实验一考察了孤独症儿童对“给”动作的理解, 选取了36名5-8岁的孤独症儿童和36名匹配的正常发育儿童, 采用眼动技术探讨了他们在正常“给”和异常“给”两种条件下的眼动注视特征。实验二考察了孤独症儿童对“要”动作的理解, 选取了38名5-8岁的孤独症儿童和34名匹配的正常发育儿童, 采用眼动技术探讨了他们在正常“要”和异常“要”两种条件下的眼动注视特征。结果发现孤独症儿童能够预测“给”和“要”这两种动作, 但是相比于正常发育儿童来说, 他们对具有社会交流意义的“给”动作的敏感性要更低。此外孤独症儿童对“要”动作的理解似乎没有缺陷。这些结果说明孤独症儿童对简单的互动动作进行预测的基本机制可能是完整的, 但是他们在自上而下的心理状态的推理上可能还是存在缺陷, 而且他们在动作预测时更多地依赖物理线索(如运动轨迹), 而对目标指向的社会互动进行心理状态推理时会存在困难。

The understanding of give-and-take interactions in children with autism spectrum disorder

Hou Wenwen^{1,2}, Yang Yunmei^{1,2}, Li Jing^{1,2}

1 CAS Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China;

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract: Understanding and predicting others' behavior in a dynamic and rapidly changing world is crucial for success in social interactions. The current study investigated the understanding of give-and-take interactions in children with autism spectrum disorder. Experiment 1 examined the understanding of giving action in children with ASD and 36 5- to 8-year-old children with ASD and 36 typically developing children participated in the experiment. Experiment 2 investigated children with ASD's perception of taking action and 38 5- to 8-year-old children with ASD and 34 typically developing children were recruited. We found that children with ASD could predict actions, but they were less sensitive to the social meaning of the giving action compared with typically developing children. Children with ASD's prediction of taking was preserved and it seemed that they could understand the taking action. These results indicate that the basic mechanisms of action prediction are intact in children with ASD whereas there may be deficits in the top-down mental state inferences. Moreover, children with ASD rely more on physical cues such as the kinematic information and have difficulties in mental inference when processing goal-directed social interactions.

摘 要 光感是基本的视觉功能，包含基本的原始光刺激反射和对不同波长光的辨别能力，反映了神经发育状态，临床上多用于判断异常发育、预后、死亡、自主反应等。由于研究方法和刺激选择等差异，光感的发育过程尚有争议。本研究研制了一套标准的光感测试体系（笔式手电筒和 5 种不同颜色反光板），招募了来自中国 5 个不同省份 868 名 0~36 个月婴幼儿，测量了由光线增强引起的瞳孔收缩和眼睑闭合反应，以及对不同颜色光斑的注视和躲避等光斑感知反应。结果发现，婴幼儿的瞳孔对光反射、光刺激瞬目反射、白色、红色、黄色、绿色、蓝色光反应的通过率均值分别为 76.7%（ $\pm 1.4\%$ ）、67.4%（ $\pm 1.6\%$ ）、62.4%（ $\pm 1.6\%$ ）、60.1%（ $\pm 1.6\%$ ）、59.9%（ $\pm 1.7\%$ ）、54.3%（ $\pm 1.7\%$ ）、52.0%（ $\pm 1.7\%$ ）；在每个项目中，7~12 个月通过率都高于均值以及其他年龄组。分层卡方检验表明，瞳孔对光反射在 0~7 个月发育速度显著快于其他项目，7 个月之后一致，且总体通过率高于其他功能；光刺激瞬目反射的发育节奏与不同颜色光反射一致，但总体通过率略高；白色和长波长光（红色和黄色）在项目通过率和发育节奏上均无显著差异，短波长光（绿色和蓝色）在项目通过率和发育节奏上也无显著差异，但前者总体通过率略高于后者。本研究在较大样本范围内证实了不同光感功能发育的异步性，瞳孔对光反射优先发育，光刺激瞬目反射和其他色光反射步调一致，都在 12 个月以后发育相对成熟；在不同色光中，长波长光感与短波长光感的发育节奏一致，但其成熟度高于短波长光感，表明长短波长光感的发育可能存在一定的不均衡。

Abstract: Light sensation, a foundational visual function, includes primitive reflex to light and the ability to distinguish lights of different wavelengths, reflecting neurodevelopmental status, and was widely used to diagnose premature and/or abnormal development, prognosis, death, and autonomic reaction in the clinic. The exact route map of light sensation development is still controversial. The current study established a set of standard test materials and associated procedures for light sensation assessment, screened pupillary constriction and eyelid closure with light enhancement paradigm, and the reflex of five lights of different wavelengths in 868 Chinese infants aged from 0~36 months across five different provinces in China. Average passing rate in pupillary light reflection, blink response to light, the reflex of white, red, yellow, green and blue light was 76.7%($\pm 1.4\%$), 67.4%($\pm 1.6\%$), 62.4%($\pm 1.6\%$), 60.1%($\pm 1.6\%$), 59.9%($\pm 1.7\%$), 54.3%($\pm 1.7\%$), 52.0%($\pm 1.7\%$), respectively; the passing rate in the group of 7-12 months was higher than that in all other age groups for all measures. A Cochran-Mantel-Haenszel test (CMH test) indicated that the developmental pace of pupillary light reflection was significantly faster than that of other functions

before the age of 7 months, although they were comparable thereafter, and the overall passing rate was also higher than that of other measures. The developmental pace of blink response to light was consistent with the reflex of chromatic lights, with higher passing rate. There was no significant difference in the passing rate and developmental pace between reflex response to white, red and yellow lights, as well as between green and blue lights, but the overall passing rate of the former three function was slightly higher than that of the latter two. Our results confirmed the asynchrony of different light sensation development in a large Chinese infant sample. Our results also indicated imbalance in the development of long- and short-wavelength light sense.

Keywords: light sensation, primitive reflexes, reflex of long-wavelength light; reflex of short-wavelength light, abnormal development of light sensation

大学生成人依恋与死亡态度的关系：社会支持的调节作用

徐旋^{1,2} 陈雪莲³ 宋友志^{1,2} 周宗奎^{1,2}(通讯作者)

通讯作者 E-mail: zhouszk@mail.ccnu.edu.cn

摘要 死亡态度是指个体对死亡表现出的积极或消极的稳定心理倾向, 与个体的生命意义感、抑郁、焦虑及自杀行为关系密切。同时, 大学生正处于自我成长和统合的关键期, 死亡态度的形成是重要且具有挑战性的阶段性发展任务。但目前为止, 针对我国大学生群体的死亡态度研究仍然较少。因此, 探究大学生死亡态度的影响因素和机制具有重要意义。本研究在恐惧管理理论的研究框架下, 检验成人依恋对于死亡态度的预测作用, 并探究社会支持的调节效应。本研究使用亲密关系体验问卷、社会支持评定量表和死亡态度描绘量表(包括死亡恐惧、死亡逃避、逃离接受、自然接受和趋近接受五个维度)对 414 名大学生进行问卷调查。结果发现: (1) 大学生依恋回避与死亡恐惧、趋近接受及逃离接受的死亡态度呈显著正相关, 与自然接受呈显著负相关。依恋焦虑与死亡恐惧、死亡逃避、趋近接受与逃离接受的死亡态度呈显著正相关; (2) 大学生依恋回避正向预测逃离接受的死亡态度; (3) 社会支持在依恋回避和逃离接受的死亡态度间起到显著的调节效应。当社会支持越高, 依恋回避越强的个体就越不容易形成逃离接受的死亡态度。研究发现, 当个体的依恋回避风格越强时, 越容易形成回避当前问题、视死亡为解脱的逃离接受的死亡态度, 而较高的社会支持可以降低此风险。这提示我们, 在针对大学生的死亡教育中, 需注意个体的成人依恋风格, 提供必要的社会支持。

Adult Attachment and Death Attitude in College Students: the Moderating Effect of Social Support

Xuan Xu^{1,2}, Xuelian Chen³, Youzhi Song^{1,2}, Zongkui Zhou^{1,2}

¹ Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University), Ministry of Education, Wuhan, 430079

² School of Psychology, Central China Normal University, Wuhan, 430079

³ School of Humanities, Hubei University of Chinese Medicine, Wuhan, 430065

Abstract: Death attitude refers to the individual's positive or negative stable psychological tendency to death, which is closely related to the low level of sense of life meaning, high depression, anxiety and suicidal behavior. Meanwhile, college students are in a critical period of growth and integration in self, and the formation of suitable death attitude is an important and challenging developmental task in this period. But up to now, there are still few studies on the death attitude of college students in China. Therefore, it is of great significance to explore the influencing factors and mechanism of college students' death attitudes. Within the framework of fear management theory, this study

examined the association between adult attachment and death attitude and explored the moderating effect of social support in this association. In this study, 414 college students were investigated with Intimacy Experience Scale, Social Support Rating Scale, and Death Attitude Description Scale (including five dimensions of death fear, death escape, fleeing acceptance, natural acceptance, and approaching acceptance). The results showed that: (1) Attachment avoidance of college students was significantly positive correlated with death fear, approaching acceptance, and death attitude of fleeing acceptance, while significantly negative correlated with natural acceptance. And attachment anxiety had a significant positive correlation with death fear, death escape, approaching acceptance, and death attitude of fleeing acceptance. (2) The death attitude of attachment avoidance was positively associated with fleeing acceptance among college students; (3) Social support played a significant moderated role in the relationship between attachment avoidance and death attitude of fleeing acceptance. When social support was higher, an individual with stronger attachment avoidance was less likely to form death attitude of fleeing acceptance. The study found that the stronger the attachment avoidance style of college students was, the easier it was to form the death attitude of fleeing acceptance that led to avoid the current problem and regard death as relief, and the higher social support could reduce such risk. This suggests that we should pay attention to individual adult attachment style and provide necessary social support in the death education for college students.

摘 要 农村留守儿童是我国庞大而又特殊的群体之一, 他们能否良好地适应当前环境, 顺利融入社会并健康发展, 不仅关系到留守儿童自身成长、农民家庭的幸福、农村教育发展, 对于早日建成高水平的小康社会也具有重要意义。因此, 农村留守儿童社会适应性相关研究一直是研究者关注的焦点。然而, 经过文献梳理发现, 适用于测量我国农村留守儿童社会适应性的成熟工具较少。本研究以 963 名农村儿童为研究样本, 并对其中 187 名农村儿童进行重复测量, 经过项目分析、探索性因素分析、验证性因素分析, 生成 26 个项目五个维度的《农村儿童社会适应问卷》, 问卷内部一致 α 信度系数为 0.919, 总问卷与各维度之间的相关系数在 0.337–0.925 之间, 重测信度在 0.334–0.446 之间, 具有良好的结构效度与相容效度。随后, 研究从 2919 名农村儿童中筛选出 1440 名留守儿童为被试, 考察了农村留守儿童的社会适应现状, 并构建了父母教养方式、亲子沟通、友谊质量、师生关系、人格、社会支持等因素影响社会适应性的结构方程模型 (SEM)。结果发现: (1) 农村留守儿童社会适应性显著差于农村非留守儿童, 农村留守儿童中双亲留守类型的留守儿童社会适应性显著差于单亲留守类型的留守儿童; (2) 农村留守女童社会适应性显著好于农村留守男童; 小学阶段的农村留守儿童社会适应性显著好于中学阶段的农村留守儿童。 (3) 与父母联系频率越高的农村留守儿童社会适应性越好; 对父母外出打工持有支持或不支持态度的农村留守儿童得分显著好于持无所谓态度的农村留守儿童。 (4) 农村留守儿童的师生关系、同伴友谊质量、自我意识直接影响其社会适应性; 亲子沟通分别通过师生关系、同伴友谊质量、自我意识间接影响其社会适应性; 同伴友谊质量分别通过师生关系、自我意识对社会适应性产生间接影响; 社会支持分别通过师生关系、同伴友谊质量、自我意识间接影响其社会适应性。

关键词 大数据、农村留守儿童、社会适应性

Research on social Adaptability of Rural Left-behind Children under the background of big data

FU Shuying¹, PENG Mei^{1 2}, DAI Binrong¹

1 Jiangsu Key Constructive Laboratory for Big Data of Psychology and Cognitive Science,
Yancheng Teachers University, Yancheng, 224000

2 Faculty of Psychology, Tianjin Normal University; Tianjin 300387

Abstract: Left-behind children in rural areas are one of the large and special groups in China, Whether they can adapt well to the current environment, smoothly integrate into the society and develop healthily is not only related to the growth of left-behind children themselves, the happiness of farmers' families and the development of rural education, but also of great significance for the early building of a high-level well-off society. Therefore, studies on social adaptability of left-behind children in rural areas have always been the focus of researchers' attention. However, through literature review, we found that there are few mature tools suitable for measuring the social adaptability of rural left-behind children in China. This study took 963 rural children as research samples, and repeated measurements were made on 187 of them. Through project analysis, exploratory factor analysis and confirmatory factor analysis, a five-dimension questionnaire on Social Adaptation of Rural Children in 26 projects was generated. The a reliability of the scale was 0.919, and the correlation coefficient between the scale and each dimension was between 0.337 and 0.925, retest reliability between 0.334 and 0.446, has good structure validity and consistency validity. Subsequently, we selected 1440 left-behind children from 2919 rural children as subjects, investigated the social adaptation status of rural left-behind children, and constructed a structural equation model (SEM) for the influence of factors such as parenting style, parent-child communication, friendship quality, teacher-student relationship, personality and social support on social adaptability. The results showed that: (1) The social adaptability of left-behind children in rural areas is significantly worse than that of non-left-behind children in rural areas. The social adaptability of left-behind children with both parents working outside the city is significantly worse than that of left-behind children with only one parent working outside the city. (2) The social adaptability of rural left-behind girls is significantly better than boys. The social adaptability of rural left-behind children in primary school is significantly better than that in secondary school. (3) The higher the frequency of contact with parents, the better the social adaptability of left-behind children in rural areas. Rural left-behind children who supported or did not support their parents to go out to work scored significantly better than those who did not care. (4) The teacher-student relationship, peer friendship quality and self-consciousness of left-behind children in rural areas directly affect their social adaptability. Parent-child communication indirectly affects their social adaptability through teacher-student relationship, peer friendship quality and self-consciousness. The quality of peer friendship has indirect influence on social adaptability through teacher-student relationship and self-consciousness. Social support affects their social adaptability indirectly through teacher-student relationship, peer friendship quality and self-consciousness.

Keywords: Big data, Left-behind children in rural areas, Social adaptation

道德推脱与校园欺负参与者角色的关系：三水平元分析

杨雪莹¹（通讯作者） 邓小平¹

1 赣南师范大学教育科学学院, 江西, 341000, 15679371537@163.com

摘 要 校园欺负是世界范围普遍存在的问题, 诸多研究分别探讨了道德推脱与校园欺负参与者角色的关系, 但研究结果存在很大差异。为了检验校园欺负中青少年道德推脱与各参与者角色之间的关系, 通过文献检索最终获得 64 篇文献(194 项独立样本研究, 43615 名被试)进行三水平元分析。结果发现: (1)道德推脱与欺负者和受害者角色存在正相关, 与防御者角色存在负相关; (2)道德推脱与欺负者和受害者之间的相关受年龄的调节, 随着年龄增长, 道德推脱与欺负者和受害者的相关呈下降趋势; (3)道德推脱与欺负者、受害者和局外者的相关受评价主体的调节, 采用自我评价获得的相关系数要显著高于采用同伴评价测量的相关系数; (4)道

德推脱与受害者之间的相关受欺负发生场景的调节,网络发生场景的相关系数要显著高于传统发生场景的相关系数。结果表明,道德推脱与参与者角色关系密切,未来可以从道德推脱角度来预防校园欺负的发生。

关键词 校园欺负,道德推脱,参与者角色,三水平元分析

The relationship between moral disengagement and the role of participants in school bullying: A three-level meta-analysis

Xueying Yang

Gannan Normal University, Ganzhou

Abstract: School bullying is a widespread problem worldwide. Many studies have explored the relationship between moral disengagement and the role of participants in school bullying, but the results are quite different. In order to examine the relationship between adolescent moral disengagement and the role of each participant in school bullying, a three-level meta-analysis of 64 papers (194 independent samples, $N = 43,615$ subjects) was conducted. The results showed that moral disengagement was positively correlated with the role of bully and victim, and negatively correlated with the role of defender. Furthermore, the relationship between moral disengagement and the bully and the victim was moderated by age, the relationship between moral disengagement and the bully and the victim decreased with age. In addition, the evaluator moderated the relationship between moral disengagement and bully, victim and outsider, the correlation coefficient between moral disengagement and the bully, the victim and the outsider by self-evaluation was significantly higher than that measured by peer-evaluation. Finally, The context of bullying moderates the correlation between moral disengagement and victim, the correlation coefficient of the online scene is significantly higher than the correlation coefficient of the traditional scene. The results show that moral disengagement is closely related to the role of participants, and moral disengagement can be used to prevent school bullying in the future.

Keywords: School bullying, Moral disengagement, The role of the participant, Three-level meta-analysis

照顾者心灵智慧与农村幼儿的不安全依恋： 心理理论和留守类型的有调节的中介模型

杨蕊¹ 张丽锦¹ (通讯作者) 吴秀娟¹ 付倩倩¹

¹ 陕西师范大学心理学院, 西安, 710062, zhanglijin2013@snnu.edu.cn

摘要 农村留守幼儿因在早期与父母长时间分离使其不安全依恋问题凸显。幼儿期的不安全依恋很可能成为他们身心健康发展和社会适应的羁绊,并影响其人格的健全发展。但是,如果父母之外的照顾者对幼儿当下心理状态给予主动关注和理解,便倾向于做出恰当的教养行为,这就可能减少和缓解幼儿的不安全依恋。Meins等人(1998)提出的“心灵智慧”概念,指的是照顾者将幼儿看作是有思想的独立个体,并尽力去了解幼儿内心想法的倾向。研究发现,照顾者心灵智慧影响着亲子互动的质量(Meins等人,2018)。因此,本研究首先探查有亲子分离经历的中国农村留守幼儿不安全依恋的特征表现,其次探查照顾者心灵智慧如何起影响作用以及照顾者心灵智慧是否通过幼儿其他相关心理因素(心理理论)影响其不安全依恋。选取163对3.00~6.69岁的农村幼儿(年龄: $M \pm SD = 5.26 \pm 1.09$;其中,女孩92人,男孩71人;留守幼儿74人,非留守幼儿89人)及其主要照顾者(年龄范围:27~73岁),进行照顾者心灵智慧、幼儿不安全依恋和心理理论的测量。结果发现:(1)农村留守与非留守幼儿照顾者心灵智慧、留守幼儿与非留守幼儿的不安全依恋和心理理论均差异显著,具体表现为留守幼儿照顾者心灵智慧水平显著低于非留守幼儿照顾者,留守幼儿总体不安全依恋和混乱型不安全依恋显著高于非留守幼儿、心理理论水平显著低于非留守幼儿;(2)幼儿心理理论在照顾者心灵智慧与幼儿不安全依恋之间起部分中介作用($ab/c = 50.1\%$);(3)留守类型调节了“照顾者心灵智慧→幼儿心理理论→幼儿不安全依恋”的后半段,即留守幼儿照顾者心灵智慧通过幼儿心理理论影响其不安全依恋的中介效应显著,而非留守幼儿的中介效应不显著。换言之,虽然留守与非留守幼儿照顾者心灵智慧都会影响幼儿的不安全依恋,但留守幼儿更容易受到自身心理理论水平的影响。高心理理论水平会减缓留守幼儿的不安全

依恋，而低心理理论水平则会加剧其不安全依恋。对于非留守幼儿，仅照顾者心灵智慧负向预测了其不安全依恋，心理理论水平没有产生影响作用。

关键词 农村留守幼儿，心灵智慧，不安全依恋，心理理论

Caregiver's mind-mindedness and young children insecure attachment in rural China: A moderated mediation model of theory of mind and type of left-behind

Rui Yang¹, LiJin Zhang¹, Xiujuan Wu¹, QianQian Fu¹

Corresponding author e-mail: zhanglijin2013@snnu.edu.cn

Abstract: Left-behind children in rural areas are separated from their parents for a long time in the early stage, making insecure attachment prominent. Insecure attachment in early childhood is likely to become the fetters of their physical and mental development and social adaptation, directly affecting their personality's healthy development. However, caregivers outside parents actively pay attention to and understand children's current mental state is the precondition for making appropriate parenting behavior, reducing and alleviating children's insecure attachment. "Mind-mindedness" is assessed in terms of parents and/or other caregivers' tendency to comment appropriately on their child's thoughts and feelings, specifically to focus on mental characteristics when given an open-ended invitation to describe their children (Meins et al., 1998). Previous studies had shown that the mind-mindedness of caregivers affected the quality of parent-child interaction (Meins et al., 2018). Therefore, this study first explored characteristics of insecure attachment of left-behind children with parent-child separation experience in a rural area of China, and then explored how the mind-mindedness of caregivers affected their insecure attachment through other related psychological factors (i.e., theory of mind). This study selected 163 dyads of 3-6-year-old rural children ($M \pm SD = 5.26 \pm 1.09$; Among them, 92 girls, 71 boys; 74 left-behind children, 89 non-left-behind children) and their main caregivers (Age range = 27-73 years old). The mind-mindedness of caregivers, children's insecure attachment, and theory of mind were measured. The results showed that: (1) there were significant differences in mind-mindedness, insecure attachment and theory of mind between rural left-behind children and non-left-behind children. Specifically, the level of mind-mindedness of left-behind children was significantly lower than that of non-left-behind children; the level of left-behind children's insecure-disorganized was significantly higher than that of non-left-behind children, the level of theory of mind of left-behind children was significantly lower than that of non-left-behind children. (2) children's theory of mind played a partial mediating role between caregivers' mind-mindedness and children's insecure attachment ($ab/c = 50.1\%$); (3) the mediating effect of children's theory of mind was moderated by types of left-behind. Specifically, in left-behind children, the mediating effect of caregiver's mind-mindedness on children's insecure attachment through children's theory of mind was significant, but the mediating effect on non-left-behind children was insignificant. In other words, although the mind-mindedness of left-behind and non-left-behind caregivers affected children's insecure attachment, left-behind children were more likely to be affected by their theory of mind. The high level of theory of mind would slow down the left-behind children's insecure attachment, while the low level of theory of mind will intensify the left-behind children's insecure attachment. For non-left-behind children, only caregivers' mind-mindedness negatively predicted their insecure attachment, while the level of theory of mind did not affect.

校园欺凌中的“袖手旁观”： 校园氛围、学校联结和道德推脱的作用

储怡佳^{1,2} 王帆³ 柳希希⁴ 鲍振宙¹ (通讯作者)

¹ 赣南师范大学教育科学学院, 赣州, 341000, baozhenzhou0819@163.com

摘要 局外者行为指青少年在校园中无视欺凌事件, 独善其身, 采取不介入的消极态度对待欺凌事件。以往研究指出, 校园氛围是预测青少年局外者行为的重要因素。但校园氛围如何影响局外者行为少有研究涉及。“情境—过程—结果”模型指出, 情境(校园氛围)会通过影响青少年的心理过程(包括个人的情感和认知)进而影响其行为结果(局外者行为)。在回顾以往文献的基础上, 本研究认为情感因素(学校联结)和认知倾向(道德推脱)都可能是校园氛围影响局外者行为的重要中介变量。采用方便抽样的方法, 选取江西省四地八所中学共 1556 名青少年 ($M_{age} = 14.39$, $SD = 1.00$) 作为被试, 匿名填写特拉华州校园氛围量表、学校联结问卷、道德推脱量表以及保护者与局外者行为问卷中的局外者行为分问卷。结果显示: (1) 在控制了性别、年龄和年级后, 积极的校园氛围对局外者行为具有显著的负向预测作用。(2) 学校联结、道德推脱在校园氛围和局外者行为之间起中介作用。具体而言, 校园氛围通过三条路径对局外者行为产生作用, 即学校联结的单独中介作用, 道德推脱的单独中介作用以及二者的链式中介作用。本研究揭示了校园氛围与局外者行为之间的关系及其中介机制, 对减少青少年在校园欺凌中的“不作为”具有一定启发。

The Effect of School Climate on Adolescents' Outsider Behaviors: The Chain Mediating Role of School Connectedness and Moral Disengagement

Chu Yijia^{1, 2}, Wang Fan³, Liu Xixi⁴, Bao Zhenzhou¹(Corresponding author)

¹ School of Educational Science, Gannan Normal University, Ganzhou, 341000

Abstract: Bullying as a group interactional process involved perpetrators, victims as well as bystanders. However, previous research on school bullying has examined the participant roles of perpetrators and victims, few studies have focused on the roles of bystanders who have witnessed the bullying. Salmivalli et al. (1996) identified four types of bystander roles in the school bullying: assistants are those who actively help the perpetrators and participate in the bullying; reinforcers support and provide positive feedback to perpetrators by cheering and laughing; defenders take sides with the victims by helping, supporting, and comforting; and outsiders remain passive or neutral and try to stay outside. Despite lack of involvement, the outsiders' passive responses facilitate the occurrence of school bullying. Recent research has suggested bullying can be significantly reduced by changing passive outsiders to act on behalf of the victims. Therefore, it is necessary to investigate the potential mechanisms of outsider's behaviors so as to design effective prevention and intervention programs.

Given the considerable time students spend at school and the critical role of school plays in promoting adolescents' positive development, previous literature has documented that school climate has an important influence on adolescents' outsider behaviors. However, little is known about the mediating processes underlying the above relation. “Context—Process—Outcomes” model proposed that the distal context affects adolescents' behavior through proximal psychological processes. Based on the “Context—Process—Outcomes” model, we tested whether emotional factor (school connectedness) and cognitive tendency (moral disengagement) served as mediators in the relationship between school climate and adolescents' outsider behaviors. A total of 1556 adolescents ($M_{age} = 14.39$, $SD = 1.00$) in Jiangxi Province was recruited to participate in this study. The participants anonymously filled out Delaware School Climate Surveys Scale, School Connectedness Questionnaire, Moral Disengagement scale as well as the subscale of Self-Reported Defender and Outsider Roles. Data was analyzed using SPSS 26.0 and *Mplus* 8.0. A bias-corrected bootstrapping method was used to calculate the mediating effects of school connectedness and moral disengagement in the relationship between school climate and adolescents' outsider behaviors. The results showed

that: (1) After controlling for gender, age, and grade, positive school climate is negatively related to adolescents' outsider behaviors. (2) school connectedness and moral disengagement mediated this association, which contained three significant mediating pathways: the separate mediating effects of (a) school connectedness and (b) moral disengagement, and the chain mediating effect of (c) school connectedness and moral disengagement. The mediation effects were 0.13, 0.04, and 0.04 respectively. These indirect effects accounted for 80.77% of the total effect. The present study uncovered the mechanisms underlying the relationship between school climate and adolescents' outsider behaviors, which contributes to the understanding of the internal psychological mechanisms of adolescents' outsider behaviors and provides suggestions for future bullying prevention interventions.

摘要 儿童的语言能力从出生开始就在不断发展, 良好语言技能的缺失会增加儿童产生学习、社会交往和心理健康等问题的风险。除了个体因素, 生态科技微系统理论还提出家庭、学校以及社区中电子媒介的使用是微系统中直接影响儿童发展的重要环境因素。随着科技的进步, 电子媒介在儿童语言发展中的角色愈发重要。此外儿童的大脑还未发育完善, 电子媒介的使用也可能通过影响儿童大脑的功能连接从而间接影响语言发展。因此, 本研究包含两部分, 研究一选取 138 名儿童, 分别在 5 岁、7 岁和 9 岁进行追踪研究, 通过行为测试收集了儿童的家庭基本信息、电子媒介接触情况以及词汇理解能力分数, 从行为层面探讨 5-9 岁儿童电子媒介接触时间和词汇理解的关系; 研究二利用功能磁共振成像技术收集 47 名 9 岁儿童静息态功能连接的数据, 探究儿童 9 岁时电子媒介接触时间影响词汇理解能力的神经基础。研究一从行为结果发现, 在个体内水平上, 5-9 岁儿童电子屏幕使用时间显著负向预测儿童词汇理解能力, 背景屏幕暴露时间无论在个体内还是个体间与儿童词汇理解之间的关系均不显著。脑与行为的关系分析表明, 电子屏幕使用时间与左颞中回-左额上回、右颞中回-额中回/右额上回、左颞上回-左额上回之间功能连接正相关; 背景屏幕暴露时间与左颞中回-左额下回、右颞中回-左额中回、左颞上回-左枕中回/内侧额上回之间的功能连接正相关。为探究这些功能连接是否可以解释为电子媒介接触时间影响儿童词汇理解能力的神经机制, 进行中介分析发现左颞上回-左枕中回的功能连接在背景屏幕暴露时间和词汇理解能力之间起到部分中介作用。这些结果为电子媒介接触时间对儿童词汇理解能力的影响提供了静息态脑网络方面的证据。

Abstract: Children's language skills develop from birth. Lack of good language skills will lead to academic failure, social difficulties as well as mental health problems in adulthood. Except from children's personal characteristics, Ecological Techno-Microsystem theory suggests that electronic media exposure is an important environmental factor

that affects children's development directly. With the advance of science and technology, electronics plays a crucial role in their language development. Moreover, electronic media exposure may affect language acquisition and development in children indirectly by influencing the functional connectivity of children's brains as children's brains are still developing. In study 1, we examined these issues in 138 children aged 5, 7, and 9 years by inventory to explore the relationship between electronic media exposure and vocabulary comprehension in children. In study 2, we examined the neural basis for electronic media exposure and vocabulary comprehension in 47 participants by assessing resting-state brain activity. Behaviorally, at the within-person level, children's screen use time negatively predicted vocabulary comprehension. The relationship between background screen time and vocabulary comprehension was not significant either within-person or between-person. Whole-brain correlation analyses revealed that screen use time is positively correlated with the following functional connections: LMTG-LSFG, RMTG-LMFG/RMFG/RSFG, LSTG-LSFG. Background screen time is positively correlated with the following functional connections: LMTG-LIFG, RMTG-LMFG, LSTG-LMOG/FSM. Functional connectivity in the LSTG-LMOG partially mediated the relationship between background screen time and vocabulary comprehension. These results provide resting-state evidence that background screen time affects children's vocabulary comprehension.

母亲言语反应性与幼儿早期语言发展：流动和城市家庭对比

亓婷婷^{1,2} 刘小宁^{1,2} 安淑敏^{1,2} 朱煜赫^{1,2} 李倩倩^{1,2} 卢珊^{1,2} (通讯作者) 王争艳^{1,2}

1 北京市“学习与认知”重点实验室, 首都师范大学心理学院, 北京, 100048

2 首都师范大学儿童发展研究中心, 北京, 100048, 通讯作者: 卢珊 lushan79@163.com

摘要 母亲言语反应性是指母亲对孩子的快速、依随和恰当的言语反应, 对幼儿语言发展起重要作用。此外, 研究发现流动儿童与城市儿童在语言、认知、社会性等方面的发展中存在差异。因此探讨城市和流动家庭中母亲言语反应性对幼儿语言发展的影响, 对理解和发展这一关键年龄的语言学习和制定干预策略具有重要意义。本研究以一项追踪项目中的 46 个流动家庭 (男孩 28 名) 和 76 个城市家庭 (男孩 31 名) 为研究对象, 探究了在幼儿 3 岁时城市和流动家庭中的母亲言语反应性 (通过对母子互动录像编码测量母亲有无反应、是否复现反应以及母亲反应的具体类型) 特点以及母亲言语反应性与幼儿的接受性语言 (使用皮博迪图片词汇测量) 和表达性语言 (使用国际儿童语言数据交流系统测量) 之间的具体关系。研究结果表明: (1) 城市母亲与流动母亲使用最多的均是母亲有反应和母亲复现反应, 在两类家庭上不存在显著差异, 在母亲非复现反应上存在显著差异, 城市母亲使用较多非复现反应。(2) 城市幼儿在表达性语言发展上优于流动幼儿。(3) 两类家庭的母亲有反应和复现反应均显著预测幼儿表达性语言, 而且在城市家庭中母亲非复现反应也显著预测幼儿表达性语言。(4) 通过调节分析发现, 城市母亲复现反应越多, 男孩的语言发展越好。本研究结果表明, 城市和流动家庭在母亲言语反应性和幼儿语言发展上均存在显著的差异, 这就提示我们对待城市母亲和流动母亲制定不同的干预方法。因此, 在促进母亲复现反应的同时, 也要注重流动家庭母亲非复现反应能力的培养, 更加有利于促进幼儿早期语言能力的发展。

Maternal responsiveness and early childhood language: a comparison of rural-to-urban migrant families and urban families

Tingting Qi^{1,2}, Xiaoning Liu^{1,2}, Shumin An^{1,2}, Yuhe Zhu^{1,2}, Qianqian Li^{1,2},

Shan Lu^{1,2} (Corresponding author), Zhengyan Wang^{1,2}

1 Beijing Key Laboratory of Learning and Cognition, Capital Normal University, Beijing 100048, China

2 Center for Child Development, Capital Normal University, Beijing 100048, China

Corresponding author: Shan Lu, lushan79@163.com

Abstract: Maternal responsiveness refers to mothers' rapid, follow-through and appropriate verbal responses to their children, which play an important role in young children's language development. Moreover, research has found that there are differences in language, cognition, and social development between rural-to-urban migrant children and urban children. Therefore, this research focuses on exploring the differences and influencing factors of early language development between different groups, and provides a theoretical basis for further active intervention to promote language development. The participating families include 46 rural-to-urban migrant families (28 boys) and 76 urban families (31 boys) from a longitudinal study. This study explored the characteristics of maternal responsiveness (mother-child interaction video coding was used to measure whether the mother responses and whether reproductive responses, as well as the specific types of mother's responses) in urban and mobile families when children are 3 years old and the specific relationship between maternal responsiveness and children's receptive language (measured with the Peabody Picture Vocabulary Test) and expressive language (measured with the International Children's Language Data Exchange System). Research indicates: (1) The most used in urban mothers and rural-to-urban migrant family mothers are both response and reproductive responses, there is no significant difference between the two types of families, there is a significant difference in mother nonreproductive responses, and urban mothers use more nonreproductive responses. (2) Urban children are better than rural-to-urban migrant family children in the development of expressive language. (3) Both the response and reproductive responses significantly predict the child's expressive language, and in urban families, the mother's nonreproductive responses also significantly predict the child's expressive language. (4) Through moderation analysis, it is found that the more the urban mother reproductive responses the better the language development of boys. The results of this study show that there are significant differences in maternal responsibility and children's language development between urban families and rural-to-urban migrant families, which prompt us to develop different intervention methods for urban mothers and migrant mothers. Therefore, while promoting mother's reproductive responses, we should also pay attention to the cultivation of the nonreproductive responses ability of mothers of migrant families, which is more conducive to promoting the development of early childhood language ability.

社会支持对中学生生命意义感的影响：一个链式中介模型

岳磊¹ 吴佳珂¹ 吴幸哲¹ 许心阳¹ 邓慧颖¹ 李静¹（通讯作者）

¹ 华中师范大学心理学院，武汉，430079, jinglee@ccnu.edu.cn

摘要 生命意义感是指个体领会到生命的意义，并觉察到自己生命的目的、使命和首要目标。生命意义感的获取和维持是人类的基本动机之一，对个体的身心健康具有重要影响。中学阶段是个体生命意义感形成的关键时期，也是社会化的关键时期，关系对其身心发展十分重要。以往研究揭示社会支持对生命意义感的影响及其机制，但是较少从关系的视角考察二者关系的内在机制。本研究拟探讨关系需要满足和关系自尊在社会支持和生命意义感之间的链式中介作用。本研究采取整群抽样法，在四川和湖北选取四所中学，使用领悟社会支持量表、关系需要分量表、关系自尊量表和生命意义感量表，对 1064 名中学生进行调查，通过 SPSS25.0 和 Process 插件对数据进行处理和分析。结果表明：（1）社会支持、关系需要满足、关系自尊和生命意义感两两之间显著正相关；（2）关系需要满足的中介作用不成立；（3）关系自尊在社会支持和生命意义感之间起中介作用，中介效应占总效应的 36.76%；（4）关系需要满足→关系自尊的链式中介作用成立，占总效应的 24.30%。综上，社会支持不仅可以直接影响中学生的生命意义感，还可以通过关系自尊的中介作用，以及关系需要满足关系自尊的链式中介作用间接影响中学生的生命意义感。本研究启示学校和家庭教育中可以关系的视角来引导中学生生命意义感的形成和良好发展，从而减少生命意义感缺失所带来的负面影响。

The Influence of Social Support on Middle School Students' Meaning in Life: A Chain Mediating Model

Lei Yue¹, Jiake Wu¹, Xingzhe Wu¹, Xinyang Xu¹, Huiying Deng¹, Jing Li¹

¹ School of Psychology, Central China Normal University, Wuhan

Abstract: Meaning in life refers to individual's understanding of the meaning of life and awareness of the purpose, mission, and primary goal of his life. The acquisition and maintenance of meaning in life is one of the basic motivations of human beings, which has an important influence on the individual's physical and mental health. The middle school stage is a vital period for the formation of an individual's meaning in life and also a key period for socialization. The relationship is very important for their physical and mental development. Previous studies have revealed the influence of social support on meaning in life and its mechanism, but few have examined the internal mechanism of their relationship from the perspective of "relationships". This study selected four middle schools in Sichuan and Hubei by cluster sampling approach and using perceived social support scale, relatedness need subscale, relational self-esteem scale and meaning in life questionnaire. Using SPSS 25.0 and Process macro for data processing and analyzing. The results showed that: (1) There was a significant positive correlation between social support, relatedness need satisfaction, relational self-esteem and meaning in life; (2) The mediating role of relatedness need satisfaction was not supported; (3) The mediating role of relational self-esteem was supported, accounting for 36.76% of the total effect; (4) the chain mediating of relatedness need satisfaction and relational self-esteem was supported, accounting for 24.30% of the total effect. In conclusion, social support can not only directly affect middle school students' meaning in life, but also indirectly affect their meaning in life through the mediating effect of relational self-esteem, and the chain mediating effect of relatedness need satisfaction and relational self-esteem. This study suggests that school and family education could guide the formation and good development of middle school students' meaning in life through relationships perspective, to reduce the negative impact caused by the loss of meaning in life.

Keywords: middle school students, social support, meaning in life, relatedness need satisfaction, relational self-esteem

结果预期和心理距离对网络助人意愿的影响

王杨春子 辛诗瑶 吴鹏（通讯作者）

湖北大学心理学系，武汉，430062，reavenwp@hubu.edu.cn

摘 要 互联网技术的成熟以及移动电子设备的广泛普及使得越来越多的人开始利用微博、微信等网络社交软件发布求助信息或为他人提供帮助。本研究通过两个研究考察结果预期和心理距离对网络助人意愿的影响。研究1采用单因素被试内实验设计，探讨结果预期（有回报/无回报）对个体网络助人意愿的影响。研究2通过4个实验，分别探四种心理距离（时间距离、空间距离、社会距离、概率距离）和结果预期对网络助人意愿的影响。研究发现：（1）结果预期、四种心理距离的主效应均显著。与无回报的结果预期相比，有回报的结果预期会产生更多的网络助人意愿；对时间距离、空间距离、社会距离而言，距离越近，网络助人意愿越多；对于概率距离而言，距离越远，网络助人意愿越多。（2）结果预期与时间距离及结果预期与空间距离的交互作用均不显著；结果预期与社会距离及结果预期与概率距离的交互作用均显著。当社会距离近时，结果预期有回报组和无回报组间的网络助人意愿不存在显著差异；当社会距离远时，有回报组的网络助人意愿显著多于无回报组；当概率距离近时，结果预期有回报组和无回报组间的网络助人意愿不存在显著差异；当概率距离远时，有回报组的网络助人意愿显著多于无回报组。本研究进一步验证了代价-回报理论、互惠利他理论和解释水平理论。

关键词 结果预期，心理距离，网络助人意愿

The effect of outcome expectation and psychological distance on online helping intention

Wang Yangchunzi, Xin Shiyao, Wu Peng

Department of Psychology, Hubei University, Wuhan, 430062, reavenwp@hubei.edu.cn

Abstract: With the maturity of Internet technology and the popularity of mobile electronic devices, more and more people begin to use Weibo, WeChat and other network social software to ask for help or offer help to others. This study investigated the effects of outcome expectation and psychological distance on online helping willingness through two studies. In study 1, a single-factor within-subject design was used to investigate the effect of outcome expectation (with or without reward) on individuals' willingness to help online. In study 2, four experiments were conducted to explore the effects of four psychological distances (temporal distance, spatial distance, social distance, and probability distance) and outcome expectation on online helping willingness. The results showed that: (1) the main effects of outcome expectation and four kinds of psychological distance were significant. Compared with the non-rewarding outcome expectation, the rewarding outcome expectation will produce more online helping willingness. In terms of temporal distance, spatial distance and social distance, the closer the psychological distance, the more willingness to help online; For the probability distance, the closer the probability distance, the less willingness to help online. (2) The interaction between outcome expectation and time distance and between outcome expectation and temporal distance was not significant; The interaction between outcome expectation and social distance and between outcome expectation and probability distance was significant. When the social distance was close, there was no significant difference in the willingness to help online between the rewarding group and the non-rewarding group. When the social distance was far, the online helping willingness of the rewarding group was significantly higher than that of the non-rewarding group. When the probability distance is close, there is no significant difference in the willingness to help online between the rewarding group and the non-rewarding group. When the probability distance was far, the willingness to help online in the group with reward was significantly higher than that in the group without reward. This study further validated the cost-reward theory, reciprocal altruism theory and explanatory level theory.

Keywords: outcome expectation, psychological distance, online helping willingness

社交网站使用与孤独感关系的元分析

摘要 社交网站作为一个网络交流平台, 因其快速高效获取信息的便捷性、隔空联络其他用户的异步性和不暴露自己信息的情况下浏览他人信息的匿名性等特点, 受到用户的青睐。社交网站的迅速普及引发了研究者对社交网站使用与孤独感之间关系的关注, 由此产生了很多研究成果。孤独感对个体心理发展的负面影响以及关于社交网站与孤独之间关系的不一致的研究结论是本研究的出发点, 本研究采用元分析的方法探究了两者之间的总体关系。研究者通过文献搜索和筛选, 最终纳入了 82 篇文献, 产生了 90 个效应值, 包括 48383 名被试。研究分别使用随机效应模型和混合效应模型进行主效应分析和调节效应分析, 结果发现, 社交网站使用与孤独感存在显著但较小的正相关 ($r=0.052$); 社交网站使用类型调节了两者之间的关系, 具体来说, 非正常社交网站使用和被动性社交网站使用与孤独感显著正相关, 但社交网站使用与孤独感之间的关系在一般性使用和主动性使用中不存在显著差异。此外, 性别、年龄和文化的调节效应均不显著。

社交网站使用与孤独感的显著正相关结果为替代假说和社交补偿假说提供了证据支持。个体因为社交网站使用的增多占用线下人际交往的时间, 用线上的较弱的关系替代了线下较强的关系, 导致线下友谊质量下

降,体会到较强的孤独感;反过来,孤独感较强的人也容易被社交网站提供的便利功能所吸引,将社交网站使用作为缓解负面情绪的一个方式,引发更多的社交网站使用。根据社会比较理论和病理性网络使用的认知模型,由向上社会比较带来的嫉妒、缺乏归属感和社会支持引发的孤独感以及社交网站使用与孤独感之间的恶性循环可以解释被动性社交网站使用和非正常社交网站使用对两者关系的正向调节。本研究的结果提醒我们,对于社交网站使用产生的负面心理效应客观地看待,尽管社交网站使用与孤独感之间相关显著,但效应值很小,说明该领域还有很多值得关注的问题。未来我们应考虑关注社交网站带来的积极影响,推动社交网站在生活领域的积极应用。

亲子冲突与青少年非自杀性自伤的关系: 同伴侵害和拒绝敏感性的作用

陈章毅¹ 陈彦蓉¹ 张卫¹

¹ 华南师范大学心理学院/心理应用研究中心, 广州, 510631, zhangwei@scnu.edu.cn

摘要 尽管大量研究表明家庭环境中不利因素(如不良教养方式)会对青少年非自杀性自伤(non-suicidal Self-Injury, NSSI)产生负面影响,但从青少年亲子冲突的角度探讨其与NSSI之间关系及其机制的研究相对较少。依据NSSI发展的综合理论模型,童年虐待或家庭成员的对抗以及敌意等家庭因素作为NSSI的远端风险因素,将会对NSSI带来一定的影响。亲子冲突作为家庭成员之间对抗的重要表现,其与NSSI之间的关系是不能被忽视的。因此,本研究考察了青少年亲子冲突与NSSI之间的关系,同时考察了同伴侵害在其中的中介作用,以及该过程是否受到拒绝敏感性的调节。本研究采用问卷法对广东省三所初中的1006名青少年(女生521人,占51.78%,平均年龄为13.16,标准差为0.67)进行问卷调查。结果表明:(1)青少年亲子冲突与同伴侵害和NSSI呈正相关,同伴侵害与NSSI存在正相关关系,拒绝敏感性与同伴侵害和NSSI呈正相关;(2)同伴侵害显著中介了青少年亲子冲突与NSSI之间的正相关关系;(3)拒绝敏感性调节了青少年亲子冲突与NSSI之间的关系,具体而言,对于高拒绝敏感性的个体,青少年的亲子冲突会显著提高NSSI,而对于低拒绝敏感性的个体而言,该路径不显著;(4)拒绝敏感性调节了中介模型的后半段(同伴侵害→NSSI),具体而言,对于高拒绝敏感性的个体,同伴侵害会显著提高NSSI,而对于低拒绝敏感性的个体而言,该路径同样不显著。这些发现强调了同伴侵害是将青少年亲子冲突与NSSI联系起来的潜在机制,而高拒绝敏感性是放大这种间接影响的重要风险因素。本研究提示我们,预防青少年NSSI问题的出现,不仅需要青少年有良好的亲子关系,还要尽可能避免其遭受同伴侵害,拥有良好的同伴关系,此外,还要重视负面个人特质(如拒绝敏感性)对青少年NSSI的影响。

The relationship between parent-adolescent conflict and non-suicidal self-injurious behavior: The role of peer victimization and rejection sensitivity

CHEN Zhangyi¹, CHEN Yanrong¹, ZHANG Wei¹

¹ School of Psychology/Center for studies of Psychological Application, South China Normal University, Guangzhou, 510631

Abstract: Many studies have shown that risky factors from family environment, such as problematic parenting styles, have negative effects on non-suicidal self-injury (NSSI) in adolescents. However, few studies have explored the relationship between parent-adolescent conflict and NSSI and the underlying mechanisms between them. According to the integrated theoretical model of the development and maintenance of nonsuicidal self-injury, family factors such as childhood abuse or confrontation and hostility between family members are distal risk factors of NSSI. The relationship between parent-adolescent conflict and NSSI cannot be ignored, as the former is an important manifestation of confrontation between family members. Therefore, the current study examines the relationship

between parent-adolescent conflict and NSSI, as well as the mediating role of peer victimization between them, and whether the pathways could be moderated by rejection sensitivity. In this study, 1006 adolescents (51.78% females, $n=521$, $M_{age}=13.16$, $SD=0.67$) from three junior middle schools in Guangdong Province were surveyed by questionnaire. The results showed that : (1) Parent-adolescent conflict was positively correlated with peer victimization and NSSI, peer victimization was positively correlated with NSSI, and rejection sensitivity was positively correlated with peer victimization and NSSI. (2) Peer victimization significantly mediated the positive correlation between parent-adolescent conflict and NSSI; (3) Rejection sensitivity moderated the relationship between parent-adolescent conflict and NSSI. Specifically, for individuals with higher level of rejection sensitivity, parent-adolescent conflict significantly increased the prevalence of NSSI, while for individuals with lower level of rejection sensitivity, this pathway was not significant. (4) Rejection sensitivity moderated the latter part of the mediation model (peer victimization $\rightarrow$ NSSI). Specifically, for individuals with higher level of rejection sensitivity, peer victimization significantly increased the occurrence of NSSI, while for individuals with lower level of rejection sensitivity, the pathway was not significant. These findings highlighted peer victimization as a potential mechanism linking parent-adolescent conflict to NSSI, and high rejection sensitivity was suggested to be an important risk factor that amplified the indirect effect. This study suggests that the prevention of adolescent NSSI problems requires not only a good parent-child relationship, but also a good peer relationship to avoid peer victimization. In addition, it is necessary to pay attention to the impact of negative personal traits, such as rejection sensitivity, on adolescent NSSI.

遭受情感和言语虐待与女大学生自杀风险的关系： 一个有调节的中介模型

李子涵¹ 石绪亮¹ (通讯作者)

河北大学教育学院, 保定, 071002, shixl163@163.com

摘要 亲密关系暴力与自杀作为重要的公共卫生问题一直以来都受到人们的重视。根据埃里克森的心理社会发展理论, 大学生正处于与他人建立亲密关系的时期。亲密伴侣的情感和言语虐待会给女大学生带来消极的心理健康影响, 增加自杀风险。目前国内针对大学生亲密关系暴力研究多集中于流行病学调查与相关分析, 对遭受亲密关系暴力对自杀风险影响的背后机制还有待深入探讨。本研究探讨了抑郁症状是否在情感和言语虐待与自杀风险之间起中介作用, 以及这种中介过程是否受到痛苦不耐受的调节。本研究基于广东省三所大学的中国大学生的大规模健康相关队列数据, 共 1968 名当前或曾经处于亲密关系的女大学生完成了情感和言语虐待、抑郁症状、痛苦不耐受和自杀风险的问卷调查。结果表明: 37.7% ($n=742$) 的参与者经历过至少一次情感和言语虐待, 8.3% ($n=164$) 的参与者报告了自杀风险。在控制了年龄、独生子女、家庭居住地、父亲文化水平、身体健康状况和饮酒等人口统计学变量后, 情感和言语虐待与自杀风险呈正相关。中介分析表明, 抑郁症状在情感和言语虐待与自杀风险之间起部分中介作用。有调节的中介检验进一步显示, 痛苦不耐受调节了后半段中介路径。具体来说, 对于痛苦不耐受较高的个体而言, 抑郁症状对自杀风险的预测作用更强。研究结果有助于制定有针对性的干预措施, 以减少那些经历过亲密关系暴力个体的自杀风险。

Emotional and verbal abuse and suicidal risk among Female college students: A moderated mediation model of depression symptoms and distress intolerance

Zihan Li, Xuliang Shi

College of Education, Hebei University, Baoding, 071002, China

Abstract: As an important public health problem, intimate partner violence and suicide have been paid much attention. According to Erikson's theory of psychosocial development, college students are in the period of establishing intimate

relationships with others. Emotional and verbal abuse by intimate partners can have a negative mental health impact on female college students and increase the risk of suicide. At present, domestic research on IPV among college students mainly focuses on epidemiological investigation and related analysis. It remains unclear the underlying mechanism how IPV victimization increases suicide risk. The present study examined whether depression symptoms mediate the relationship between emotional and verbal abuse and suicidal risk, and whether this mediating process is moderated by distress intolerance. The study is based on data from a large-scale health-related cohort among Chinese college students at three universities in Guangdong Province. A sample of 1,968 female college students who were currently dating someone or had dated someone completed questionnaires regarding emotional and verbal abuse, depression symptoms, distress intolerance, and suicidal risk. The results showed that: Of 1968 female college students sampled, 37.7% ($n=742$) of participants experienced at least one emotional and verbal abuse, and 8.3% ($n=164$) of participants reported suicidal risk. After controlling for demographic variables such as age, only child, residence, father education, physical health and current drinking, emotional and verbal abuse was positively associated with suicidal risk. Mediation analysis indicated that depression symptoms partially mediated the association between emotional and verbal abuse and suicidal risk. Tests of moderated mediation further revealed that distress intolerance moderated the second part of the mediation process. Specifically, the positive relationship between depression symptoms and suicidal risk was stronger for those individuals with higher distress intolerance. These findings may be helpful for developing targeted interventions to reduce suicidal risk for those who had experienced IPV.

因人而异？受益人道德品质对学龄前儿童体贴行为评价的影响

余小曼¹ 赵欣²（通讯作者）

¹ 华东师范大学心理与认知科学学院，上海，200062

² 华东师范大学教育学部教育心理学系，上海，200062, xzhao@dep.ecnu.edu.cn

摘要 “燃烧自己，照亮他人”是中华民族的传统美德。大量关于亲社会行为的研究聚焦于直接让接受者受益的亲社会行为，如帮助、分享等。这些行动通常包括有明确目的的物资、资源或信息的转移，会为受援者带来直接的、积极的影响。近期，研究者们开始关注一种间接亲社会行为——体贴的社会善念行为，即个体实现自身目标的同时考虑他人选择权的亲社会行为。已有研究发现，理解和评价体贴行为的能力在4-6岁得到发展，到6岁的时候，中美儿童都会对体贴行为做出更高评价，但尚未有研究探究这种社会评价是否受到受益人的特质的影响。本研究从受益人道德品质的角度探究儿童体贴行为评价的影响因素及发展情况。共有101位儿童（4-6岁）及78位成人参与本研究。研究采用2（体贴行为 vs 不体贴行为）*2（受益人道德品质：高 vs. 低）被试内设计。我们让被试评价两个人物在选择水果时的表现：其中一个人物在自己选择水果时给排在后面的人（即受益人）留下两种不同的水果（即，表现出体贴行为）；另一个人物则给排在后面的人留下两个相同的水果（即，表现出不体贴行为），并操控排在后面的受益人的道德品质高低。在故事呈现之后，我们让被试评价排在前面的人物做得有多好。对于成人和儿童的评价进行2X2重复测量方差分析，均发现：留选择与否主效应显著（成人： $F(1,77)=112.38, p<0.001$ ；儿童： $F(1,100)=5.19, p=0.025$ ）、受益人道德品质主效应不显著、两者交互作用显著（成人： $F(1,77)=14.16, p<0.001$ ；儿童： $F(1,100)=10.07, p=0.002$ ）。具体来说，相比不留选择的个体，儿童及成人都对留选择的个体评价更高。重要的是，儿童及成人对体贴行为的评价都会受到受益人道德品质的影响。对于成人来说，虽然无论受益人道德品质高或低，成人对体贴行为的评价都显著高于不体贴行为，但当受益人道德品质低时，此评价差异显著缩小；对儿童来说，他们只有在受益人道德品质高时才会对体贴行为做出更高评价，在受益人道德品质低时对体贴行为与不体贴行为的评价不存在显著差异。

Does it vary from person to person? The influence of moral character of beneficiary on preschoolers' understanding and evaluation of considerate behavior

Xiaoman Yu¹, Xin Zhao² (Corresponding author)

1 The School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

2 Department of Educational Psychology, East China Normal University, Shanghai, 200062, xzhao@dep.ecnu.edu.cn

Abstract: "Burn oneself to illuminate others" is a traditional virtue in Chinese culture. A large body of research on early prosocial behaviors have focused on prosocial actions that are directly intended to benefit recipients, such as helping, sharing, etc. Such actions usually involve purposeful transfer of physical aid, resources or information aimed to create direct and positive consequences for the recipient. Recently, researchers have started to investigate one type of indirect prosocial action – considerate, socially mindful actions that simultaneously benefit the self and are considerate of another's freedom of choice. Existing research has shown that the ability to understand and evaluate considerate behaviors develops between the ages of 4 and 6. By age 6, both Chinese and American children evaluate someone who leaves a choice for another person as "nicer" than someone who does not. However, no previous research has explored whether such social evaluation is influenced by characteristics of beneficiaries. This study aims to explore the influence of moral character of beneficiaries on preschoolers' understanding and evaluation of considerate behavior. A total of 101 children (4-6 years old) and 78 adults participated in the study. The study used a 2 (considerateness of the first person's behavior: considerate behavior vs inconsiderate behavior) * 2 (beneficiary's moral character: moral vs. immoral) within-subject design. We asked participants to evaluate how good two characters were in fruit selection scenarios: one character left two different kinds of fruits for the next character (the beneficiary) to choose from (i.e., considerate behavior) while the other character left two identical fruits for the beneficiary (i.e., inconsiderate behavior). We also manipulated whether the beneficiary was a moral person or an immoral person. After the story was presented, we asked participants to evaluate how good the first character was. Repeated measure ANOVAs on participants' responses revealed significant main effects of considerateness of the first person's behavior (adults: $F(1,77) = 112.38, P < 0.001$; children: $F(1,100) = 5.19, P = 0.025$), and significant interactions between considerateness of the first person's behavior and the beneficiary's moral character (adults: $F(1,77) = 14.16, P < 0.001$; children: $F(1,100) = 10.07, P = 0.002$). Specifically, both children and adults evaluate characters who left a choice for the other as better than those who left no choice. Importantly, both children's and adults' evaluations of considerate behavior were influenced by the moral character of beneficiaries. For adults, although the evaluation of considerate behavior was significantly higher than that of inconsiderate behavior regardless of beneficiaries' moral character, this evaluation gap was significantly smaller when the beneficiaries were immoral. For children, children evaluate considerate behavior more positively only when beneficiaries were moral, but not when beneficiaries were immoral.

比较和位置图片启动对 4-6 岁幼儿位置关系类别学习的影响

汤静静¹ 潘伟伟² 史英杰² 刘万伦² (通讯作者)

1 浙江师范大学, 金华, 321001

2 浙江师范大学心理系, 金华, 321001, wlliu2008@zjnu.cn

摘要 关系类别是指类别成员因具有一个共同的关系而形成的类别。掌握关系能力是人类智力发展的标志之一, 也是人类区别于其他物种的能力之一。已有研究表明, 4-6 岁幼儿进行分类的依据是从表面特征(形状、颜色、大小)到内部特征(情景、功用)再到本质特征的发展过程, 但目前对幼儿关系类别学习的年龄发展

特征及发展趋势尚不明确。类别学习中加入比较能够促进分类,但增加比较是否能帮助幼儿更好的进行关系类别学习仍需进一步探讨。另外,由于已有研究中的实验材料、实验设计上存在一些不足,使得幼儿关系类别学习的研究结果存在争议。因此,有必要对幼儿关系类别学习进行深入探讨。本研究旨在探究幼儿位置关系类别学习的发展,以及增加比较和位置图片启动是否能促进幼儿的关系类别学习。研究分三个实验进行。实验一以4、5、6岁幼儿为被试,年龄为被试间变量,以黑白动物图片为实验材料,考察幼儿在位置关系类别学习上的发展特征。实验二选取了4、5岁幼儿为被试,增加了比较项,采用2(年龄:4岁、5岁)×2(有无比较:有比较、无比较)的被试间设计,考察比较能否促进幼儿在位置关系类别学习中倾向于选择位置关系匹配。实验三以4岁幼儿为被试,增加位置图片启动,以有无位置图片启动为被试间变量,进一步考察位置图片启动能否帮助4岁幼儿提高在位置关系类别学习中的表现。实验结果表明,(1)幼儿位置关系类别学习从基于形状相似性转向基于位置关系匹配。4岁幼儿倾向于选择形状相似性,6岁幼儿倾向于选择位置关系,5岁幼儿处于转折期。(2)增加比较对于4、5岁幼儿学习位置关系类别都具有促进作用。(3)提供位置图片启动能更好的促进4岁幼儿学习位置关系类别。(4)口语报告的分析结果表明,在基线条件下,4岁幼儿倾向于关注动物的形状和功能特征;在比较条件下,5岁幼儿比4岁幼儿更多地选择位置关系,且可进行归纳推理;在图片启动下,4岁幼儿能够更多地报告和启动图片相关的内容。

关键词 关系类别,位置关系,4-6岁幼儿,比较,位置图片启动

Effects of Comparison and Location Picture Priming on Category Learning of Location Relationships in Children Aged 4-6 Years

Tang Jingjing, Pan Weiwei, Shi Yingjie, Liu Wanlun

Department of Psychology, Zhejiang Normal University, Jinhua 321001

Abstract: A relationship category formed by the members having a common relationship. Mastering relationships is one of the hallmarks of human intelligence and one of the most important abilities that distinguish humans from other species. Studies have shown that the classification of 4-6 year olds is based on the development process from surface features (shape, color, size) to internal features (scene, function) and then to essential features. However, the age developmental characteristics of children relationship category learning are not clear. Some studies have found that comparison improves to learn relationship category, but it is not clear whether comparison also helps children learn relationship category. In addition, there are some deficiencies in experimental materials and experimental design in the existing researches, which also make the research results inconsistent. Therefore, it is necessary to further explore children's relation category learning by improving the research materials and designs. In order to explore how children learn about the positional relation category, and whether comparison and the starting of position picture can help children to learn the positional relation category. This study designed three experiments. In experiment 1, children aged 4-6 were selected as subjects and age was taken as the inter-subject variable and black-and-white animal pictures as experimental materials to investigate the developmental characteristics of children in positional relation category learning. In experiment 2, 4- and 5-year-old children were selected as subjects, and comparison terms were added. 2 (age: 4, 5) × 2 (with or without comparison: with comparison or without comparison) was adopted as the inter-subject design, to investigate whether increased comparison can promote children to choose the matching of position relation in the category learning of position relation. In experiment 3, 4-year-old children were taken as subjects, and position picture priming was added, and whether or not position picture priming was taken as an inter-subject variable, to further investigate whether position picture priming could help 4-year-old children improve their performance in position relation category learning. This study draws the following conclusions:

(1) Children's learning of the category of positional relationship changes from shape matching to location matching. To be specific, 4-year-old children are more likely to choose shape similarity, 6-year-old children are more likely to choose position relation, and 5-year-old children are in a transition period from shape similarity classification to position relation classification.

(2) Providing comparison can promote the selection of positional relationship matching by 4- and 5-year-olds.

(3) Providing priming of position pictures can better promote 4-year-olds to learn the category of location relationships.

(4) The analysis of the oral report shows that: under the baseline condition, 4-year-olds tend to pay more attention to the shape and function of animals. Under the condition of comparison, 5-year-olds children choose more position relation than 4-year-olds children, and can carry on inductive reasoning. Under the influence of residual attention, 4-year-olds reported more content related to image activation.

儿童早期母亲与父亲的侵入性养育：一项系统综述与元分析

姜梓鑫 梁熙 张琳琳（通讯作者）

首都师范大学心理学院，儿童发展研究中心，北京市“学习与认知”重点实验室，北京，100048，

linlinzhang.psy@hotmail.com

摘要 养育科学的研究已经从只关注母亲在儿童照料中的单一作用转变为强调父母双方的重要性。然而，在同一个家庭中父母的养育是更为相似还是存在差异的？父母的养育行为对儿童发展的影响是否有所不同？仍然是有待回答的问题。本研究旨在通过系统综述和元分析比较儿童早期父亲与母亲的侵入性养育的相似性与差异性，以及比较和确定它们各自在儿童发展中的作用。对四个数据库的系统检索获得的 55 项研究（385 个效应值；20,621 名参与者）使用随机效应模型进行三水平的元分析，分别估计了 1) 父母侵入性养育的相似性 (r)，2) 父母侵入性养育均值水平上的差异 (hedges' g) 以及父母侵入性养育与儿童发展结果之间的关系 (r)。结果表明：1) 父母侵入性养育有着中等程度的正相关 ($r = .256$, 95% CI = [0.180, 0.329])，2) 父母侵入性养育在均值水平上没有显著差异 ($g = 0.035$, 95% CI = [-0.034, 0.103])，3) 父母侵入性养育与儿童发展结果间的关系是相似的，父母侵入性养育都与儿童的情绪社会性问题有着正向关系（母亲： $r = 0.098$, 95% CI = [0.051, 0.145]；父亲： $r = 0.098$, 95% CI = [0.113, 0.162]；父母侵入性养育与儿童的认知能力均都没有显著的相关。尽管效应值之间存在显著的异质性，只有样本来自的国家可以解释父亲与母亲侵入性养育之间的部分异质性。东亚国家中母亲的侵入性养育的水平显著高于父亲的侵入性养育的水平，而西方国家的父母之间没有发现这种差异。总之，这些结果揭示了在侵入性养育行为方面中，同一个家庭中父母之间的相似性大于差异性，而且文化可能在塑造具有性别特异性养育行为中发挥了作用。

Intrusive Parenting of Mothers and Fathers in Early Childhood: A Systematic Review and Meta-Analysis

Zixin Jiang, Xi Liang, Linlin Zhang

Department of Psychology, Key Laboratory of Learning and Cognition, Capital Normal University, Beijing, 100048

Abstract: Developmental research on parenting has shifted from emphasizing solely the role of mothers in caregiving to acknowledging the importance of both parents. Yet, whether parenting between mothers and fathers within the same family are more similar or different? Whether the effects of parenting between mothers and fathers on the child development are different? These questions still remain to solve. This research is through systematic review and meta-analysis to compare the similarities and differences between intrusive parenting between fathers and mothers, and compare and determine their respective roles in child development. A total of 55 studies (385 effect sizes; 20,621 participants) were identified from a systematic search in four databases. We conducted three-level meta-analyses using random-effects models to estimate 1) the similarity between mothers' and fathers' intrusive parenting (r), 2) the mean-level difference between mothers' and fathers' intrusive parenting (hedges' g), and 3) the relations of mothers' and fathers' intrusive parenting with child developmental outcomes (r). Results indicated that 1) mothers' and fathers'

intrusive parenting were moderately and positively correlated, ($r = .256$, 95% CI = [0.180, 0.329]), 2) mothers and fathers did not differ on mean levels of intrusive parenting, ($g = 0.035$, 95% CI = [-0.034, 0.103]), 3) mothers' and fathers' intrusive parenting were both positively related to children's social-emotional problems, (mothers: $r = 0.098$, 95% CI = [0.051, 0.145]; fathers: $r = 0.098$, 95% CI = [0.113, 0.162]), mothers' and fathers' intrusive parenting were not related to children's cognitive skills. Despite the significant heterogeneity of effect sizes, only the country of the sample explained a small proportion of the heterogeneity in the mean difference of mothers' and fathers' intrusive parenting. Mothers from East Asia were more intrusive than fathers, whereas no such difference was found for western parents. In conclusion, these results reveal more similarities than differences in mothers' and fathers' intrusive parenting and that culture likely plays a role in shaping gender-specific parenting behaviors.

童年期情感忽视对青少年问题性社交网站使用的影响： 一个有调节的中介模型

王梦云 何宁（通讯作者）

陕西师范大学心理学院，西安，710062，E-mail: hening@snnu.edu.cn

摘要 随着互联网的快速发展及智能手机的普及，社交网站已成为青少年日常交往的重要平台。然而，由于社交网站具有较强的社会粘性，用户频繁地登陆社交网站被证明是有害的，这可能会导致问题性社交网站使用。考虑到其对个体身心发展所带来的诸多消极后果（如焦虑，抑郁甚至自杀倾向），越来越多的研究者开始关注问题性社交网站使用的影响因素。情感忽视是一种常见的童年期虐待，被定义为父母在情感上的无能为力和无反应，其特征是父母和孩子之间缺乏互动。尽管其与问题性社交网站使用之间的关系也得到了一些研究者的关注，但我们对这两者间的作用机制仍知之甚少。因此，本研究基于生命史理论，拟探讨未来消极时间洞察力和同伴关系在童年期情感忽视与青少年问题性社交网站使用关系中的作用。采用横断设计，从陕西省西安市的两所中学随机选取了 842 名初高中生（46.9%女生； $M_{\text{年龄}}=14.76$ 岁； $SD_{\text{年龄}}=1.64$ ），使其完成有关人口学变量、童年期情感忽视、未来消极时间洞察力、同伴关系及问题性社交网站使用的调查。结果发现，在控制个体的性别和年龄后：(1)童年期情感忽视对问题性社交网站使用具有显著的正向预测作用；(2)未来消极时间洞察力在童年期情感忽视与问题性社交网站使用之间起完全中介作用；(3)童年期情感忽视和未来消极时间洞察力的关系（中介效应的前半段路径）受到同伴关系的调节，即童年期情感忽视对未来消极时间洞察力的正向影响随着同伴间的关系越好而越强。这些发现不仅从新的视角（未来消极时间视角）解释了童年期情感忽视和问题性社交网站使用之间的关系，而且提示良好的同伴关系并不总是起保护作用，特别是随着家庭因素的恶化，学校因素的保护作用会逐渐减弱。

关键词 童年期情感忽视，问题性社交网站使用，未来消极时间洞察力，同伴关系，青少年

Childhood emotional neglect and problematic social media use among Chinese adolescents: A moderated mediation model

Mengyun Wang, Ning He

School of Psychology, Shaanxi Normal University, Xian, 710062

Abstract: With the rapid development of the Internet and the popularity of smartphones, social networking sites (SNS) have become an important platform to communicate with each other for teenagers. However, due to the strong social stickiness of SNS, spending too much time on SNS is supposed to be detrimental, which may lead to problematic SNS use. Considering that excessive use of SNS may have many negative effects on individuals' mental and health, such as anxiety, depression, and even suicidal tendencies, A growing body of researchers have begun to concern the antecedents of problematic SNS use. Emotional neglect is a relatively common type of childhood maltreatment. It is defined as a parent's emotional unavailability and unresponsiveness, and is characterized by a lack of interaction between parent and child. Although the relationship between childhood emotional neglect and problematic SNS use

has obtained attention from some researchers, little is known the potential mechanisms. Thus, based on the life history theory, this study aims to examine the effect of future negative time perspective and student-student relationship in the link between childhood emotional neglect and problematic SNS use among adolescents. Using a cross-sectional design, 842 adolescents (46.9% girls; M age =14.76 years; SD age =1.64) were recruited randomly from two middle schools in Xi'an of Shaanxi province. They completed this survey regard demographic variables, childhood emotional neglect, future negative time perspective, student-student relationship, and problematic SNS use. After controlling for gender and age, the results showed that, (a) Childhood emotional neglect can significantly positively predict adolescents' problematic SNS use. (b) Future negative time perspective fully mediated the association between childhood emotional neglect and problematic SNS use. (c) The relationship between childhood emotional neglect and future negative time perception was moderated by student-student relationship, namely, the positive effect of childhood emotional neglect on future negative time perspective was stronger as better student-student relationship. These findings not only shed new light on the relationship between childhood emotional neglect and problematic SNS use, but also suggest that better student-student relationship do not always play a protective role, especially as the protective effect of school factors gradually weakened with the deterioration of family factors.

Keywords: Childhood emotional neglect, Problematic social networking sites use, Future negative time perspective, Student-student relationship, Adolescents

同伴侵害、抑郁与青少年非自杀性自伤的关系： GABRA2 基因 rs279827 多态性的调节作用

摘要 非自杀性自伤（Non-suicidal self-injury, NSSI）是指个体在没有自杀意图的前提下，故意伤害自己的身体，包括咬、切、烧等行为。理论和实证研究表明同伴侵害对青少年 NSSI 的形成和发展具有重要影响，但是目前针对同伴侵害与青少年 NSSI 关系的具体机制的研究较少。动机意志理论（integration theory of motivation will）认为表明，消极的生活事件造成个体抑郁，影响个体情绪调节能力，进而导致 NSSI。此外，来自神经生物学的证据表明，GABRA2 基因 rs279827 多态性能够调节个体对情绪的调节，进而影响个体的社会适应性。据此，本研究采用同伴侵害量表、抑郁量表、非自杀性自伤量表对 468 名青少年进行调查（Mage=13.31 岁，SD=0.47；男生占 52.45%），探讨同伴侵害与青少年 NSSI 的关系，以及抑郁的中介作用、GABRA2 基因 rs279827 多态性的调节作用。结果发现：（1）同伴侵害可以通过抑郁间接影响青少年 NSSI；（2）GABRA2 基因 rs279827 多态性显著调节“同伴侵害→抑郁→青少年 NSSI”的前半段路径以及“同伴侵害→青少年 NSSI”这一直接路径。具体而言，携带 AA 基因型的青少年，同伴显著正向预测抑郁，并进一步正向预测青少年 NSSI。相反，携带 G 等位基因的青少年，“同伴侵害→抑郁→青少年 NSSI”这一中介路径不显著。此外，只有携带 AA 基因型的青少年，其同伴侵害显著预测 NSSI。本研究结果为理解同伴关系影响青少年 NSSI 的内部机制提供了证据，同时为揭示 NSSI 的“基因 X 环境→行为”框架提供了启示。

Peer victimization and non-suicidal self-injury(NSSI): The mediating role of depression and moderating role of GABRA2 Gene rs279827 polymorphism

Li Meijin, Deng Yuting, Xie Qi, Yu Chengfu

School of Psychology, Guangzhou University, Guangzhou 510006

Abstract: Non-suicidal self-injury (NSSI) refers to an individual intentionally injuring his body without suicidal intention, including biting, cutting, burning and other behaviors. The study found that the annual prevalence of NSSI

among adolescents in China ranged from 15% to 32.7%. Theoretical and empirical studies have shown that peer victimization plays an indispensable role in the formation and development of adolescent NSSI, but there are few studies explore the underlying mechanism. According to the integration theory of motivation will (IMV), negative life events cause individual depression, affect individual emotion regulation ability, and then lead to NSSI. Furthermore, neurobiological evidence suggests that the GABRA2 Gene rs279827 may regulate individual emotion, and then affect individual social adaptability. A total of 469 adolescents (52.45% boys, $n = 246$) ranging in age from 12 to 15 (Mage = 13.31 years old, $SD = 0.47$) participated in this study. First, we collected saliva from adolescents for DNA. Then, adolescents reported the frequency of peer victimization, depression symptoms, and rate of NSSI. All the measurement methods have good reliability and validity. In this study, Model 4 and Model 59 of PROCESS for SPSS were used to test the mediating effect and moderated mediating effect, respectively. The results showed that: (1) peer victimization and depression positively predicted adolescent NSSI. (2) The mediating effect showed that the effect of peer victimization on adolescent NSSI partially mediated by depression. (3) The GABRA2 Gene rs279827 moderated the mediating role of depression on the relationship between peer victimization conflict and adolescent NSSI. Specifically, for adolescents with AA genotype, peer victimization significantly positively predicted depression and further positively predicted adolescent NSSI. In contrast, the pathway of peer victimization $\rightarrow$ depression $\rightarrow$ adolescent NSSI was not significant in adolescents with G allele. In addition, peer victimization significantly predicted NSSI only in adolescents with AA genotype. The results of this study provided evidence for understanding the underlying mechanism of peer relationship affecting adolescent NSSI, and provide enlightenment for revealing the “gene x environment-behavior” framework of NSSI.

摘要 研究儿童诱拐现象从而预防和减少该现象的发生, 对社会安定和家庭幸福都具有重要意义。目前较少有研究探讨家庭防拐安全教育对于培养儿童的防诱拐意识的有效性。因此本研究旨在探究日常家庭防拐教育和事先叮嘱能否影响 3-5 岁幼儿在抵制诱拐时的行为表现。本研究采用生态效度较好的模拟诱拐场景, 首先儿童跟主试 1 进入场景, 主试 1 借故离开, 主试 2 (陌生人) 进入场景对儿童实施“诱拐测试”。儿童跟随陌生人离开则视为测试不通过, 计为 0; 儿童拒绝与陌生人离开则测试通过, 计为 1。

研究一选取 121 名 3~5 岁儿童作为被试, 父母对儿童进行日常防拐安全教育的频率为自变量, 探究父母日常防拐教育是否能有效地培养儿童抵制诱拐意识; 研究二选取 124 名 3~5 岁儿童作为被试, 采取以离开前事先叮嘱 (有叮嘱 VS 无叮嘱) 为自变量的单因素被试间实验设计, 探究离开前的事先叮嘱是否能够有效地向儿童传授防拐安全知识, 使儿童在面临诱拐时做出正确的反应。

采用二元 Logistic 回归分析对数据进行分析, 结果表明年龄能够正向预测 3~5 岁幼儿在抵制诱拐中的表现 ($\beta = 0.10, p < 0.001, OR = 1.10$), 随着年龄的增长, 能够拒绝与陌生人离开的幼儿的比例逐渐上升; 父母日常防拐教育频率不能显著地预测儿童在诱拐测试中的表现 ($\beta = -0.20, p = 0.954, OR = 0.98$); 而事先叮嘱能够显著地正向预测儿童在诱拐测试中的表现 ($\beta = 1.20, p = 0.002, OR = 3.31$), 受到事先叮嘱的儿童在接下来的诱拐测试中更不容易与陌生人离开。本研究的研究结果对于指导未来的家校防拐安全教育具有重要价值。

Abstract: Studying the phenomenon of child abduction to prevent and reduce the occurrence of this phenomenon is of great significance to social stability and family happiness. At present, there are few studies to explore the effectiveness of family education about abduction prevention in cultivating children's awareness to resisting abduction. Therefore, this study aims to explore whether daily family education about abduction prevention and advance warning can affect the behavior of 3-5 year old children in resisting abduction. This study uses a simulated abduction test with good ecological validity. The child entered the scene with the experimenter 1 and the subject tried to leave with an excuse, and the experimenter 2 entered the conversation, and she implements the "abduction test" on the child. If a child leaves with a stranger, the test is considered as a failure and counts as 0; if a child refuses to leave with a stranger, the test is passed and counts as 1.

Study 1 selected 121 children aged 3 to 5 years old as the subjects, and the frequency of the parents' daily safety education about abduction prevention to the children was used as an independent variable to explore whether the parents' daily safety education can effectively cultivate children's awareness of resisting abduction; study 2 selected 124 Children aged 3~5 years old were taken as subjects, and adopted one way between subjects design with advance warning before leaving (with warnings VS no warning) as the independent variable, to explore whether the advance warning before leaving can effectively teach children about the safety of abduction prevention, so that children can make the right response when facing abduction.

Using binary logistic regression analysis to analyze the data, the results show that age can positively predict the performance of 3~5 years old children in resisting abduction ($\beta = 0.10$, $p < 0.001$, $OR = 1.10$). As age increases, The proportion of children who refuse to leave with strangers is gradually increasing; the frequency of parents' daily safety education about abduction prevention cannot significantly predict the performance of children in the abduction test ($\beta = -0.20$, $p = 0.954$, $OR = 0.98$); and advance warnings can significantly predicts the child's performance in the abduction test ($\beta = 1.20$, $p = 0.002$, $OR=3.31$), and children who have been instructed in advance are less likely to leave with strangers in the subsequent abduction test. The results of this study are of great value for guiding future home and school abduction prevention education.

屏幕暴露对学龄前儿童情绪调节的影响：家长介入的作用

于佳露¹ 伍珍¹ (通讯作者)

¹ 清华大学心理学系, 北京 100084, zhen-wu@mail.tsinghua.edu.cn

摘要 情绪调节指的是个体采用各种有意识或无意识的策略, 来提高、维持或减弱情绪反应, 以达到目的的过程, 对个体的发展至关重要, 其发展受到诸多因素的影响。已有研究发现过度使用社交媒体不利于青少年的情绪调节, 随着近年来屏幕暴露呈现低龄化趋势, 探究其对学龄前群体情绪调节的影响势在必行。本研究采用家长报告法, 通过结构方程模型探讨屏幕暴露与情绪调节能力之间的关系: 1) 向外的情绪调节, 即为了达到适应社会情境的目的, 抑制不恰当的情绪的能力; 2) 向内的情绪调节, 即对自身情绪觉察、维持和恰当表达的能力; 3) 适应性和非适应性情绪调节策略, 其中, 适应性策略包括认知重建, 问题解决和替代活动, 非适应性策略包括发泄和被动应对。研究1测量了897名2~6岁幼儿, 探究屏幕暴露对向外的情绪调节能力以及策略使用情况的影响。研究发现, 1) 在家长陪伴使用频率较高时, 屏幕暴露时间越长, 幼儿向外的情绪调节能力越好。2) 在家长陪伴使用频率较低时, 屏幕暴露时间越长, 儿童使用适应性情绪调节策略的比例越

低。研究表明家长陪伴使用调节了屏幕暴露对向外的情绪调节能力的影响作用。研究 2 测量了 633 名 2~6 岁幼儿，探究屏幕暴露对向内的情绪调节的影响及作用机制，并在研究 1 的基础上，进一步探究两种家长介入方式（筛选、引导）的作用。研究发现，1）家长陪伴使用的频率越高，儿童向内的情绪调节越好，屏幕暴露的主效应和交互效应均不显著。2）屏幕暴露时间能够通过增加幼儿使用非适应性策略的频率，对其向内的情绪调节产生不利影响；3）家长的筛选和引导均能够通过提高认知重建策略的使用频率，对幼儿向内的情绪调节起到保护作用，此外，家长筛选还能够通过被动应对策略的中介产生保护作用。综上，本研究揭示了屏幕暴露的时间和方式对儿童向内和向外情绪调节的不同影响及作用机制，对科学指导儿童使用电子屏幕设备具有重要意义。
