1.大会重点报告

1.1 大会重点报告一

社会治理视域下的阶层心理研究

郭永玉

（南京师范大学心理学院）

报告人简介：

郭永玉：南京师范大学特聘教授，心理学院博士生导师、人格与社会心理研究所所长；兼任教育部高校心理学类教学指导委员会委员，中国心理学会常务理事、心理学与社会治理专业委员会创会主任；曾任中国心理学会理论心理学与心理学史专业委员会主任、人格心理学专业委员会副主任；主持国家社会科学基金重点项目两项、国家自然科学基金面上项目两项、教育部人文社科基金项目一项；在中英文期刊上发表论文 200 余篇，出版专著、译著及主编、参编学术著作或教材 10 余部；获得中国心理学会学科建设成就奖、教育部高等学校科学研究优秀成果二等奖、湖北省优秀教师等多项奖励。

报告摘要：

心理学视角下的社会阶层指的是一种用来反映个体在社会层级阶梯中相对位置高低的社会分类，一个人的社会阶层代表了其所占有的客观社会资源及其主观上所感知到的自身社会地位。当前全球的经济不平等形势日益严峻，关注社会阶层对于个体或群体心理与行为的影响，对于理解和缓解不平等现状、促进社会治理与政治文明的进步具有重要意义。十年来，本研究小组结合我国社会文化与社会治理实际，持续关注社会阶层心理学问题。首先，以国际学术同行关于社会阶层心理学理论框架和实证研究为基础，将阶层心理与社会公平问题相结合，关注与社会公平正义相关的不同社会阶层者的心理与行为。其次，我们通过序列研究积累，从不同变量揭示了不同层面的阶层心态差异，提出了归因和补偿（认知和动机）作为一系列不同表现背后的心理基础。低阶层者更倾向于对社会事件进行外归因，同时有更多的认知失调补偿过程，这使其相对于高阶层者有着较低的系统合理信念、更高的结构需求倾向和阴谋论信念。再次，针对于低阶层者在社会竞争中的劣势处境，我们的研究挖掘了多方面不利于低阶层向上流动的典型特征，包括低阶层者的物质主义倾向、短视的决策风格、更高的威胁敏感性与相对剥夺感以及由此引发的集群行为意向，这些都需要引起政府和学界足够重视并探讨改善之策。最后，我们从提升其系统合理信念、促进其目标追求、增强其社会参与意愿、引导其经济决策等不同侧面，分析了有助于低阶层者摆脱困境、向上流动的社会治理思路，同时也考察了促进高阶层者再分配意愿的干预策略。综上我们建议，应关注社会阶层心理学之于社会治理的理论与实践意义，面对当下中国社会的矛盾，深入考察不同阶层者心理和行为的特征、需求、机制及其干预方法，为切实加强和创新社会治理提供心理学智慧与支持。

1.2 大会重点报告二

中国儿童青少年积极发展研究：基于中国文化的视角

林丹华

（北京师范大学心理学部）

报告人简介：

林丹华：北京师范大学心理学部教授，中国心理学会认定心理学家。教育部高等学校心理学类专业教学指导委员会副主任委员，中国心理学会学校心理专委会副主任委员，中华预防医学会行为健康分会副主任委员。担任 SSCI 收录期刊 *Applied Psychology: Health and Wellbeing* 杂志副主编。作为首席专家主持国家社会科学基金重大项目、国家自然科学基金项目、北京市教育科学“十三五规划”重点项目等多项国家级和省部级重要项目。发表中英文学术文章 150 余篇，其中在 *Child development* 和 *Applied Psychology: Health and Wellbeing* 杂志上发表的文章入选“ESI 全球高被引论文”（2020，2021）。获得中国学位与研究生教育学会研究生教育成果奖二等奖（2016）、北京市高等教育教学成果奖二等奖（2017）。主持的课程获得首批国家级一流本科课程（2020）。

报告摘要：

积极青少年发展(Positive Youth Development, PYD)观是近年来发展心理学领域理论与实证研究范式的重大转变，变“缺陷模型”视角为关注青少年的自身优势和潜能，对儿童青少年发展的公共政策和教育实践均起着重要且关键的作用。目前国外该领域的研究方兴未艾，但我国尚缺少基于中国文化的积极青少年发展的理论、内涵和测量工具，系统的实证研究也很欠缺，尤其是在处境不利儿童中开展的积极发展研究非常欠缺。那么，我国青少年积极发展的理论、结构与内涵具有哪些浓厚的中国文化特色，我国儿童青少年（尤其是留守儿童等处境不利儿童）的积极发展具有哪些发展变化的趋势与轨迹特征，影响我国留守儿童等处境不利儿童积极发展的“神经生理-心理-社会”作用机制是什么？回答这些问题至关重要，在国家社会科学基金重大项目的资助下，过去五年多我们运用长期追踪研究设计，采用深度访谈法、问卷法等多种研究方法，综合采用多模态磁共振成像技术以及唾液和头发皮质醇检测等技术手段，在基于我国文化背景下积极青少年发展的理论建构、测量工具研发、我国普通和处境不利儿童青少年积极发展的轨迹与变化趋势的多元性、积极发展与内外化问题之间是共存还是“此消彼长”的关系、留守儿童积极发展的内在“神经生理-心理-行为”作用机制等方面进行了一系列深入的研究，取得了系列成果，在理论上建构了中国文化下青少年积极发展的内涵和结构，制定了青少年积极发展的指标体系和测评工具，建立了可向心理学、公共卫生学、社会学等多学科开放的青少年积极发展数据库和共享平台。并将研究成果及时转化为政策建议和教育实践指南，提出应建立处境不利儿童“减少问题与促进积极发展并重”的公共政策，开展了一系列深入的针对留守儿童、流动儿童等处境不利儿童的“减少问题与促进积极发展并重”的应用实践工作。研究成果被《光明日报》专栏《光明调查》整版刊发，相关内参报告被中宣部所采纳。本报告将对以上内容做全面、深入、多角度的介绍与诠释。

1.3 大会重点报告三

社会交互场计算模型预测人类面对面交互行为

蒯曙光

（华东师范大学心理与认知科学学院）

报告人简介：

蒯曙光：华东师范大学心理与认知科学学院教授，担任视觉空间认知和虚拟现实实验室负责人，博士生导师，入选紫江优秀青年学者。蒯曙光博士主要使用数学和工程建模方法研究人类交互行为。曾以第一或通讯作者在 *Nature Neuroscience*, *Nature Human Behavior*, *Current Biology*, *Plos Biology*, *Journal of Neuroscience*, *Psychological Science*, *Cerebral Cortex* 等国际心理学与神经科学杂志发表 10 余篇的学术论文。蒯曙光博士先后主持了包括国家自然科学基金优秀青年基金等多个国家项目。

报告摘要：

作为社会性动物，我们生活在一个复杂的社会环境中。面对面的社会互动在我们的生活中起着重要的作用。之前的研究发现，人们在面对面的交互中会形成一定的空间结构。之前的研究提出了空间关系理论定义了人类不同个人和社会空间，并依此解释人类面对面交互中形成的空间关系。但是这些理论仅仅限于对空间关系的定性化描述，缺乏定量化的分析和数学化的计算模型。我们的研究利用最新的虚拟现实实验平台，量化控制社会场景中的各种参数，把传统实验心理学中的心理物理法，应用到分析各种社会场景中的因素与人类交互行为的量化关系，并依此构建了社会交互场的计算模型。该模型成功预测了人们在多人、复杂社会场景下，人们面对面交互形成的动态过程和最终的空间结构。该计算模型可以应用到服务机器人等行业中，提升机器人的宜人性和人类交互的融入性。

脑-音乐交互：理论、方法与应用

尧德中

（电子科技大学、四川省脑科学与类脑智能研究院）

报告人简介：

尧德中：四川省脑科学与类脑智能研究院院长（2018-）、神经信息教育部重点实验室主任（2009-）/科技部国家级国际联合研究中心主任（2013-），全国人大代表（2018-），电子科技大学生命科学与技术学院创院院长（2001-2017）。中国脑电联盟理事长（2018-），中国生物医学工程学会副理事长（2015-），中国医学科学院神经信息创新单元负责人（2019-）。2005 年获得国家杰出青年基金，2006 获聘教育部长江学者，2010 年获评为全国优秀教师，2017 入选美国医学与生物工程院（AIMBE）Fellow, 2018 获国际脑电图与临床神经科学学会(ECNS) Roy John Award。

主要成绩：原创脑电零参考技术，建立无标度脑波音乐技术，提出脑器交互学概念。先后发表期刊论文 200 余篇，Google 引用 1 万余次，h 指数 55。2014-2018 入选 Elsevier “中国高被引学者”榜单，新近入选 World's Top 2% Scientists 的神经科学领域的 “生涯影响力”（1960-2020）和 “年度影响力”（2020）榜单。

报告摘要：

本报告将从“和谐”入手，讨论脑波音乐的创作；讨论 Mozart 音乐效应及其节奏效应；讨论音乐家大脑的影像特征，以及音乐训练与音乐创作的脑影像；讨论音乐和脑波音乐在干预调控脑功能方面的研究。

1.5 大会重点报告五

拖延的认知神经机制及干预

冯廷勇

（西南大学心理学部）

报告人简介：

冯廷勇：西南大学心理学部教授，博士生导师，教育部青年长江学者，美国宾夕法尼亚大学访问学者，重庆市学术技术带头人，认知与人格教育部重点实验室副主任，国际儿童心理与家庭咨询研究中心主任（西南大学）。研究领域：时间认知与决策（拖延行为、跨期选择）的神经机制及干预、儿童认知发展及脑可塑性（包括正常儿童、ASD、ADHD）。先后主持了 4 项国家自然科学基金项目和 10 余项省部级等各类项目，以第一或通讯作者在国际心理学顶级期刊 JEP: *General*、*Cerebral Cortex*、*Neuroimage*、*Human Brain mapping* 等发表 100 多项研究成果（SCI/SSCI 50 多篇），研究成果入选国际顶级刊物《Science》的 Editor's Choice。

报告摘要：

跨文化研究表明，不同文化背景下有 15%~20% 的成年人存在慢性拖延，超过 70% 的学生承认自己存在学业拖延行为，甚至部分人群会形成病理性拖延。首先，提出拖延的时间决策模型（TDM）从任务负性过程和任务正性结果的权衡及自我调控角度揭示了拖延产生的认知机制；其次，通过行为-脑、脑-行为和机器学习的联合分析，揭示了拖延行为的三重神经结构拓扑网络：自我控制网络（背外侧前额叶和前扣带回为核心）、情绪调节网络（以脑岛和眶额叶为核心）和预期想象网络（以腹内侧前额叶和海马为核心）；最后，通过预期想象训练或者 TDCS 阳性刺激左侧背外侧前额叶，都能够有效提高执行力，降低拖延行为，其作用机制包括降低任务过程的负性情绪和提高任务结果的正性价值，进一步证实了拖延的时间决策模型。

1.6 大会重点报告六

与不确定性共处：适应与主动行为

陆昌勤

（北京大学心理与认知科学学院）

报告人简介：

陆昌勤：北京大学心理与认知科学学院研究员，博士生导师，管理与社会心理学系副主任，研究领域为管理心理学和职业健康心理学。

陆昌勤博士主持、参与多项国家自然科学基金、国家自然科学基金重大研究计划(子课题)、国家科技支撑计划等课题，以及国际合作项目；研究成果发表在 *Journal of Applied Psychology*, *Personnel Psychology*, *Journal of International Business Studies*, *Journal of Organizational Behavior*, *Journal of Vocational Behavior*, 《心理学报》等专业期刊上，曾获得美国管理学会(AOM)、美国工业与组织心理学学会(SIOP)的年度最佳会议论文和优秀审稿人，以及北京大学教学优秀奖等荣誉；目前担任国际应用心理学会(IAAP)会刊 *Applied Psychology: An International Review* 副主编，以及 *Journal of Managerial Psychology*, *International Journal of Stress Management*(APA)等多家国际学术期刊编委和审稿人，曾为多家企事业单位提供人力资源管理方面的咨询和培训服务。

报告摘要：

当今社会与经济环境的一个主要特征就是不确定性。不确定性的存在打破了个体与组织之间交换关系的平衡，使得个体、组织的应对与行为选择面临着困境与挑战，但同时也会蕴藏着机遇与重塑的空间。本次会议报告以工作不安全感(job insecurity)这一工作场所中的不确定性事件为主题，汇报作者开展的系列研究(Lu, Wang, Lu, Du, & Bakker, 2014; Xu, Du, Johnson, & Lu, 2021; Yang, Zheng, Liu, Lu, & Schaubroeck, 2020; Wang, LeBlanc, Demerouti, & Lu, 2018; Wang, Lu, & Siu, 2015; 冯冬冬, 陆昌勤, 萧爱铃, 2008)，重点从组织和个体的视角来探讨组织公平、个体主动行为在人们应对不确定性威胁中的作用，以及作用机制和边界条件，期望能够丰富不确定性管理方面的理论，并为不确定性管理与应对提供合理化的建议。。

亲子冲突与 CLOCK 基因 rs1801260 多态性对学前儿童助人行为的交互影响

刘倩文 王振宏*

陕西师范大学心理学院, 陕西省儿童青少年心理与行为健康哲学社会科学重点研究基地, 西安, 710062,

wangzhenhong@snnu.edu.cn

摘要 已有研究表明, 家庭环境因素会对个体的助人行为会产生重要影响。个体(基因)—环境交互作用理论认为, 助人行为可能是遗传和家庭环境相互作用的结果。但是有关于学前儿童助人行为的个体(基因)—环境的交互机制目前鲜有研究予以探讨。本研究以 461 名学前儿童($M_{\text{年龄}} = 4.90$ 岁, $SD = 0.89$)为被试, 通过家长报告的《亲子关系问卷》中的亲子冲突分问卷测量学前儿童的亲子冲突水平, 《长处与困难问卷》中的助人行为题目测量儿童的助人行为, 从唾液样本中提取 DNA 进行分型, 获得 CLOCK 基因 rs1801260 位点多态性, 进而考察亲子冲突与 CLOCK 基因 rs1801260 多态性对学前儿童助人行为的交互作用以及性别在其中的调节作用。结果表明, 亲子冲突对学前儿童助人行为的主效应显著, 亲子冲突与 CLOCK 基因 rs1801260 多态性对学前儿童助人行为存在交互作用, 但该交互作用仅在男孩中显著。具体来说, 亲子冲突对学前儿童助人行为具有显著的负面影响, 亲子冲突与 CLOCK 基因 rs1801260 多态性交互作用于男孩的助人行为, 即与 TC/CC 基因型的男孩相比, TT 基因型的男孩在亲子冲突水平较低情况下表现出更多的助人行为, 而在亲子冲突水平较高的情况下表现出更少的助人行为, 该交互作用符合差别易感性模型。而亲子冲突与 CLOCK 基因 rs1801260 多态性对女孩的助人行为无显著交互作用。本研究发现推进了学前儿童助人行为的个体(基因)—环境的交互研究, 并为差别易感性模型提供了新的研究证据。

关键词 亲子冲突, CLOCK 基因, 学前儿童, 助人行为, 个体(基因)—环境交互

The interaction effect of parent-child conflict and the CLOCK rs1801260 polymorphism on preschoolers' helping behaviors

Qianwen Liu, Zhenhong Wang*

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062

Corresponding authors: Zhenhong Wang, E-mail: wangzhenhong@snnu.edu.cn

Abstract: It has been demonstrated that family environmental factors play a key role in the development of an individual's helping behaviors. The gene-environment (G×E) interaction model proposed that individuals' helping behaviors may be the result of the interaction between heredity and environment. However, few studies focused on preschoolers' helping behaviors from the perspective of the interaction between gene and environment. The present study sought to investigate the interaction effect of parent-child conflict and CLOCK rs1801260 polymorphism on preschoolers' helping behaviors. A total of 416 children ($M_{\text{age}} = 4.90$, $SD = 0.89$) participated in the present study. Parents of the participants completed questionnaires regarding parent-child conflict and helping behaviors. DNA samples of children were extracted from their saliva to genotype the CLOCK rs1801260 polymorphism. After controlling for age and family socioeconomic status, the results indicated that parent-child conflict was negatively

associated with preschoolers' helping behaviors. Moreover, the significant interaction effect of parent-child conflict and the CLOCK rs1801260 polymorphism was verified, which only existed in boys. Specifically, parent-child conflict had a negative effect on preschoolers' helping behaviors and the interaction effect of parent-child conflict and the CLOCK rs1801260 polymorphism was significant in boys, i.e., boys with TT genotype performed more helping behaviors than in case of the lower level of parent-child conflict and performed less helping behaviors in case of the higher level of parent-child conflict than TC/CC genotype carriers, which provide evidence for the Differential Susceptibility Model. However, there was no significant interaction effect in girls. The findings of the present study expand our knowledge about the G×E underpinnings of preschoolers' helping behaviors.

Keywords: parent-child conflict, CLOCK gene, preschoolers, helping behaviors, gene-environment interaction

儿童对不同权力情境中权力者亲社会行为的预期

程南华^{1,2,3} 万紫佳^{1,2} 朱莉琪^{1,2} (通讯作者)

1 中国科学院心理研究所, 北京, 100101, zhulq@psych.ac.cn

2 中国科学院大学心理系, 北京, 100049

3 首都师范大学心理学院, 北京, 100048

摘要 社会权力关系普遍存在于儿童的日常生活中, 社会权力的认知在儿童的社会活动中起重要作用。研究显示, 成人对于高低社会权力者会有不同的社会行为预期(Tiedens, Ellsworth, & Mesquita, 2000), 但目前少有实证研究关注儿童对高低权力者行为的预期和推断。儿童获得权力的途径一般有两种: 基于支配(自己夺取获得权力)和基于声望(他人授予获得权力)的权力获得策略。不同权力获得策略在不同年龄阶段受到不同的关注, 产生不同的影响(Hawley, 1999), 因此不同年龄阶段的儿童对采用不同策略获得资源的权力者可能存在不同的亲社会预期。本研究在这两种权力获得情境中考察了 4-8 岁儿童($N = 116$)对高低权力者亲社会行为的预期。儿童分别观看基于声望的和基于支配两种权力情境的视频后, 对视频中的高低权力者的资源占有和分享行为做出预估。随后, 儿童判断两个情境中的高权力者谁更有可能占有或分享资源, 以及更愿意和谁成为朋友。结果显示: 学前儿童(4-6 岁)预期两种权力情境的高权力者均比低权力者更可能占有资源; 学龄早期儿童(7-8 岁)预期基于支配的高权力者比低权力者更可能占有资源, 更不可能分享资源, 但对声望情境中的高低权力者的占有资源和分享资源行为没有预期差异。此外, 4-8 岁的儿童更喜欢与通过他人授予的权力者作好朋友, 他们也都认为有声望的权力者而非支配性的权力者更可能分享资源; 但是在资源占有上, 4-8 岁儿童均没有明显的行为预期差异。这说明从学前期到学龄期, 儿童对两种不同权力获得方式的态度和信念由未分化状态逐渐表现出分化。学前期儿童预期两种方式的权力获得者均会更加自利, 而学龄儿童对高权力者的行为预期在两种权力情境中出现差异, 预期基于支配的高权力者会更加自利, 而对于基于声望的高权力者的行为不再表现出自利的预期偏好。

3 School of Psychology, Capital Normal University, Beijing, 100048

Abstract: Social power relations exist in children's daily life. Children's understanding of social powers plays a key role in their social life. Research shows that adults have different social expectations for people with high and low power status (Tiedens, Ellsworth, & Mesquita, 2000), but there has been limited empirical research on children's expectations for people with different power status. Children most commonly gain power by two strategies: dominance-based (power grabbed) strategy and reputations-based (power granted) strategy. Different strategies are received differently in different age groups and lead to different consequences (Hawley, 1999). Therefore, children in

different age groups may have different prosocial expectations for power holders based on how they acquired power. The present study examined 4- to 8-year-old children's ($N = 116$) expectations regarding prosocial behaviors of power holders in different power situations. Children watched videos introducing a reputation-based power situation and a dominance-based power situations respectively, and reported their expectations for the members with high power and low power regarding their resource occupying and sharing behaviors. Children were then asked which one of the two power holders in these two power situations were more likely to occupy or share resources, and who the children would like to befriend. Results showed that preschool-aged children (4- to 6-year-olds) predicted that power holders in both power situations would be more likely to occupy resources, whereas early school-aged children (7- to 8-year-olds) predicted that the power holder in dominance-based power situations would be more likely to occupy resources and less likely to share resources. School-aged children predicted no difference in occupying and sharing behaviors between the member with high power and the member with low power in the reputation-based power situation. In addition, children in both age groups preferred to befriend the power holder whose power was granted by others, and they believed the reputation-based power holder would be more likely to share resources. Children did not expect a difference in occupying behaviors between the power holders in the two situations. The findings show that children's attitudes and beliefs towards power strategies shift from undifferentiated to differentiated as they become school-aged. Preschool-aged children expected power holders in both power situations to be more self-interested, whereas early school-aged children expected the two to act differently, namely, power holder in the dominance-based power situation would be more self-interested, whereas power holder in the reputation-based power situation would not show any preference for self-interest.

家庭功能与儿童亲社会行为发展的纵向关系： 催产素受体基因多态性的调节作用

张润竹 王振宏*

陕西师范大学心理学院，陕西省儿童青少年心理与行为健康哲学社会科学重点研究基地，西安，710062，

wangzhenhong@snnu.edu.cn

摘 要 本研究考察了家庭功能和小学儿童亲社会行为发展的纵向关系，并进一步探究了催产素受体（oxytocin receptor, OXTR）基因多态性 OXTR rs2254298 在其中的调节作用。208 名西安市某小学一年级儿童（98 名女孩，47.1%）参与了研究。研究采集儿童唾液样本进行 DNA 提取和 OXTR 基因多态性检测，并邀请儿童父母在儿童一年级、二年级、三年级时分别填写长处与困难问卷中的亲社会行为问卷以及家庭适应性和亲密度问卷中文版来报告儿童的亲社会行为和家庭功能。研究结果发现，家庭功能和儿童亲社会行为发展的纵向关系显著，从一年级到三年级家庭功能的提高能够显著预测儿童亲社会行为的生长，并且三年间良好的家庭功能能够预测儿童更高的亲社会行为表现。更重要的是，研究发现 OXTR rs2254298 基因多态性能够显著调节家庭功能和儿童亲社会行为发展的纵向关系，家庭功能的提高能够显著促进儿童亲社会行为的发展，这种积极作用在携带 OXTR rs2254298 GG 基因型（相比 A 等位基因）的儿童中更为明显。当家庭功能有较大提升时，携带 OXTR rs2254298 GG 基因型的儿童亲社会行为将显著高于携带 A 等位基因儿童的亲社会行为。研究结果表明，小学儿童亲社会行为会受到儿童家庭功能和 OXTR 基因多态性的共同影响。OXTR rs2254298 和家庭功能对儿童亲社会行为发展的交互影响模式符合优势敏感模型，rs2254298 GG 基因型表征了儿童对更良好的家庭功能的敏感性。研究结果为理解 OXTR 基因和家庭功能对儿童亲社会行为发展的基因-环境交互作用模型提供了依据。

关键词 儿童亲社会行为发展，催产素受体基因多态性，家庭功能

Longitudinal association between family functioning and prosocial development in children: The moderating effect of oxytocin receptor gene polymorphism

Runzhu Zhang, Zhenhong Wang*

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062, wangzhenhong@snnu.edu.cn

Abstract: The present study examined the longitudinal association between family functioning and prosocial development in elementary school-age children, and further explored the moderating role of oxytocin receptor (OXTR) gene polymorphism OXTR rs2254298 in such association. 208 children (98 girls, 47.1%) at 1st grade participated the present study, OXTR rs2254298 (GG vs AA/AG genotypes) was genotyped among children at 1st grade, and parents completed the prosocial scale of the Strength and Difficulties Questionnaire and the Family Adaptability and Cohesion Evaluation Scale to assess children's prosocial behaviors and family functioning at 1st, 2nd and 3rd grades. The results showed the significant longitudinal association between family functioning and children's prosocial development. Increased family functioning significantly positively associated with children's increased prosocial behaviors from 1st to 3rd grade, and children with higher family functioning could exhibit more prosocial behaviors during the three years. More importantly, the present study found the significant moderating effect of OXTR rs2254298 on the longitudinal association between family functioning and children's prosocial behaviors. The growth of family functioning could significantly facilitate the development of children's prosocial behaviors, and this positive effect was much stronger in children with the OXTR rs2254298 GG genotype (compared to the A allele). When family functioning was greatly improved, children with the OXTR rs2254298 GG genotype would behave more prosocial behaviors than children with the A allele. The present study demonstrated the significant interaction effects of family functioning and OXTR rs2254298 on prosocial behaviors in elementary school-age children. Moreover, the findings suggested the interaction model was more conform to the Vantage Sensitive model, and the rs2254298 GG genotype represent children's environmental sensitivity to improved family functioning. The present findings have helped to understanding the gene-environment interaction model of OXTR gene polymorphism and family environment on children's prosocial development.

Keywords: children's prosocial development, OXTR gene polymorphism, family functioning

接受对象的常规行为与资源需求对 5~6 岁幼儿分享行为的影响

张文洁^{1,3} 范增² 黎蕾¹ 刘毅⁴ 钟毅平^{2,3} (通讯作者)

1 湖南师范大学教育科学学院学前教育系, 湖南长沙, 410081

2 湖南师范大学教育科学学院心理系, 湖南长沙, 410081, ypzhong@hunnu.edu.cn

3 认知与人类行为湖南省重点实验室, 湖南长沙, 410081

摘要 本研究探究接受对象的常规行为与资源需求对幼儿分享行为的影响。采用两因素被试间设计考察 5~6 岁幼儿在不同常规行为表现与资源需求程度条件下分享行为的差异。被试任务是根据接受对象的常规行为与资源需求的特征, 决定最终分享的糖果数量。结果发现, 常规行为的主效应显著, 相比常规行为差的接受对象, 幼儿给常规行为好的接受对象分享的糖果更多。资源需求的主效应显著, 与无资源需求相比, 接受对象有资源需求时, 幼儿分享的糖果更多。常规行为与资源需求的交互作用显著, 与其他条件相比, 接受对象常规行为好且有资源需求时, 幼儿分享的糖果更多。此外, 结果可能表明, 常规行为好比有资源需求更能促使 5~6 岁幼儿慷慨分享。

The Influence of Recipients' Conventional Rule and Resource Neediness on Sharing behavior among preschoolers at age of 5~6

Wenjie Zhang^{1, 3}, Zeng Fan², Lei Li¹, Yi Liu⁴, Yiping Zhong^{2, 3}

1 Department of Early Childhood Education, School of Education Science, Hunan Normal University, Changsha, Hunan, 410081; 2 Department of Psychology, School of Education Science, Hunan Normal University, Changsha, Hunan, 410081; 3 Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University, Changsha, Hunan, 410081; 4 The Second Kindergarten of Yuelu District Preschool Education, Changsha, Hunan, 410000;

Abstract: This study explored the effects of recipients' conventional rule and resource neediness on preschoolers' sharing behavior. A two-factor between-subjects design was used to investigate the difference of sharing behavior among preschoolers aged 5 ~ 6 years under different conditions of conventional rule and resource neediness. According to the difference of recipients' conventional rule and resource neediness, the participant would decide the amount of candy to be shared. The results showed that the main effect of conventional rule was significant, and the amount of candy shared by participants to recipients with good behavior in conventional rule was more than that to recipients with bad behavior in conventional rule. The main effect of resource neediness was significant. Compared to recipients without resource neediness, participants shared more candy when recipients preformed resource in need. The interaction between Conventional rule and Resource neediness was significant. Compared with other conditions, when recipients performed good behavior in conventional rule and resource in need, participants shared more candy. These results perhaps indicate that preschoolers prefer to share with recipients who performed good behavior in conventional rule and resource in need. Moreover, our results may indicate that good behavior in conventional rule can induce more generously sharing behavior among preschoolers aged 5~6, in contrast with resource neediness.

Keywords: sharing behavior, conventional rule, resource neediness, preschoolers at age of 5~6, recipients

探究适应创新与脑电微状态的关系：以入睡困难为调节

丁晓茜¹（通讯作者） 曹凤芝¹ 王圣涵¹ 张云姝¹ 于丽静¹ 王薪舒¹ 唐一源²

1 辽宁师范大学，大连，116029, dingxq@lnnu.edu.cn

2 德克萨斯理工大学心理科学系，美国德克萨斯州拉伯克，79402

摘要 科顿适应创新的效率性与大五人格的尽责性关系密切。尽责性与突显网络(Salience Network, SN)的主要组成部分—背侧前扣带皮层(dorsal anterior cingulate cortex)和脑岛(insula)的功能连通显著相关，脑电微状态 MS3 也与该脑区关系密切。然而，在先前失眠症研究中，经常观察到 SN 的过度激活。因此为探讨效率性、微状态与睡眠三者间的关系，本研究对中国大学生发放科顿适应创新量表和匹兹堡睡眠质量量表，并采集了静息态脑电数据。研究结果表明（1）科顿适应创新效率性与 MS3 的持续时间呈显著的正相关；（2）入睡时间与 MS3 持续时间呈显著的正相关；（3）入睡时间在科顿适应创新效率性预测 MS3 持续时间的关系中起正向调节作用，即对于入睡时间长的被试，效率性正向预测 MS3 的持续时间；而对于入睡时间短的被试，则无此效应。为此，我们得出结论（1）对于科顿适应创新效率性更高的人或入睡时间更长的人，MS3 持续更久；（2）在入睡时间的调节下，只有在入睡时间长的人群中，当其效率性上升时 MS3 的持续时间才有显著增长，而在入睡时间短的人群中则没有此效应。本研究在中国大学生群体中发现了效率性、入睡困难和 MS3 持续时间的关系，揭示了在入睡时间的调节作用下，高效率群体的神经异质性。

Abstract : Efficiency subcomponent in Kirton Adaption-Innovation Inventory (KAI) is closely linked to conscientiousness in Big-Five personality traits. Neurologically, conscientiousness is associated with the functional connection of dorsal anterior cingulate cortex (dACC) and insula, two main components of Salience Network (SN). However, an over-activated SN was frequently observed in previous insomnia research. Therefore, to explore the relationships among efficiency, MS3 and sleep quality, Chinese college students' adaption-innovation and sleep quality were measured by KAI and Pittsburgh sleep quality index, and the resting state EEG data were collected for microstate analysis. The results showed that: (1) There was a significant positive correlation between efficiency and MS3. (2) Duration of MS3 was positively correlated with sleep latency. (3) We also found a significant effect of the duration of MS3 on Efficiency, which was moderated by Sleep Latency. That was, the duration of MS3 has a significant positive predictive effect on efficiency in subjects with long sleep latency. However, for the subjects with short sleep latency, there was no such effect. Therefore, we conclude that (1) people with more efficiency or people with more long sleep latency have longer MS3 duration; (2) There is a significant increase in the duration of MS3 when efficiency increases only in people with long sleep latency, without those with short sleep latency. This study finds the relationships among efficiency, MS3 and falling asleep difficulty, and reveals the neural heterogeneity of high-efficiency groups under the regulation of different sleeping latency through Chinese college students.

思维枯竭状态下样例新颖性及多样性对创造力的影响

袁欢¹ 张超² 杨翠蓉¹ (通讯作者)

¹ 苏州科技大学教育学院, 苏州, 215000, yangsun2004@mail.usts.edu.cn

² 浙江师范大学杭州幼儿师范学院, 杭州, 321012

摘要 在创造性观点生成过程中, 常出现思维枯竭状态。呈现样例线索是激发创造性的有效手段。已有创造性思维枯竭研究中, 样例线索多为高新颖、多样化, 且多聚焦在特殊性领域如设计领域, 较少关注样例新颖水平、类别变化对领域一般性创造性思维的影响。因此, 本研究分别探究创造性思维枯竭状态下样例新颖性水平及类别多样性对创造性的作用。研究包括两个实验, 采用非常规用途任务测量发散性思维, 实验范式皆为阶段一诱发思维枯竭状态; 阶段二呈现不同新颖水平的样例并在相同规定时间内继续完成任务。实验1招募96名高二学生, 分别分配至高、中、低新颖组及控制组, 并完成阶段一和阶段二的非常规用途任务。结果发现: (1) 阶段一任务完成时间及任务表现存在组别差异, 表现为在新颖性表现上高、中新颖样例组好于控制组, 控制组阶段一用时长于低新颖组; (2) 当阶段一用时与任务表现作为协变量控制后, 整体任务的表现(流畅性、新颖性及灵活性)皆发现组别差异, 具体表现为: 思维枯竭存在时, 高新颖样例更能促进想法的新颖性, 而低新颖样例更能促进想法的流畅性和灵活性; 且样例组的表现皆好于控制组。实验2前期通过产品改进任务筛选出高、低创造力84名高二学生, 同样在诱发思维枯竭后呈现样例, 与实验1不同的是样例皆为高新颖水平想法, 且区分出同类别样例和不同类别样例两种条件。结果发现: (1) 在阶段一任务完成时间及任务表现上, 高创造力个体用时显著长于低创造力个体, 且在任务流畅性和灵活性表现上显著好于低创造力个体。(2) 当阶段一用时与任务表现作为协变量控制后, 相较于低创造力个体, 高创造力个体在流畅性、新颖性和灵活性上受样例的促进作用更大。此外, 多类别样例条件下, 个体灵活性表现好于同类别样例条件。

两个实验结果证实了线索同化假说及 SIAM 理论, 为未来激发创意工作人员灵感及教育领域创造力的培养提供启示。

The role of example's novelty and relevance in the stimulation of creative idea generation under creative exhaustion

Huan Yuan¹, Chao Zhang², Cuirong Yang¹

1 Suzhou University of Science and Technology, Suzhou

2 Zhejiang Normal University, Hangzhou

E-mail: yangsun2004@mail.usts.edu.cn

Abstract: People usually get exhausted during creative ideation. How to understand and cope with creative exhaustion is an important issue. Presenting example cues during creative ideation is an effective way to stimulate creativity. Previous studies have paid little attention to the novelty and semantic relevance of examples during creative exhaustion. This study aimed to explore these two factors' influence under creative exhaustion. The study included two experiments, both of which adopted a two-stage task paradigm. Stage one was intended to induce creative exhaustion while stage two presented different examples. In Experiment 1, 96 senior high school students were randomly assigned to four groups including high, medium and low-novelty example group and control group. Results showed that: (1) creativity performance and task duration in stage 1 were different among the four groups. Specifically, participants in high-novelty and medium-novelty groups performed better in originality than those in control group. In addition, task duration was longer in control group than that in low-novelty group. (2) When controlling the possible effect of task duration and creativity performance in stage 1, the whole creativity performance including fluency, originality and flexibility differed among the four groups. In particular, high-novelty examples facilitate originality while low-novelty examples were beneficial for fluency and flexibility. In Experiment 2, 84 senior high school students were selected by production improvement task from 182 students. Experiment 2 adopted the same paradigm except that the examples were high and varied in category. The results showed that: (1) For task duration and performance in stage 1, high-creativity individuals spent long time and performed better in fluency and flexibility than low-creativity individuals. (2) When excluding the possible role of task duration and creativity performance in stage 1, high-creativity group benefited more from examples than low-creativity group. Moreover, examples of different categories facilitated flexibility more than examples of the same categories. Findings of both experiments were consisted with the SIAM (Search Idea in Associative Memory) theory and opportunistic assimilation hypothesis. This study provide insight for fostering creativity under creative exhaustion exactly for designers.

在线互动背景下的社会创意产生研究

谷传华(通讯作者) 郭雅绮 杨晓梦

青少年网络心理与行为教育部重点实验室(华中师范大学)暨人的发展与心理健康湖北省重点实验室, 武汉,

430079, guchuanhua@mail.ccnu.edu.cn

摘要 关于头脑风暴的研究发现, 在创意产生过程中情境因素与个体特征均可能具有显著的影响, 但是, 对于可以促进或抑制创意产生的环境线索, 已有的研究结果并不一致, 而且, 已有的研究尚未澄清认知风格和动机这些个体特征在这一过程中可能发挥的调节作用。此外, 作为一种重要的个体特征, 动机尤其是内在动机是创意产生的核心动力, 内在动机较高的个体的创意的新颖性和灵活性通常更高。但是, 已有的研究尚未澄清创意产生过程中个体的内部动机与环境线索之间的交互作用。而且, 关于社会创意产生的研究也可能具有领域特殊性。本研究以招募的大学生为被试, 采用在线头脑风暴技术, 以常见的社会性问题为创意产生

的实验任务,探讨了在线互动背景下不同认知风格的个体在不同环境线索条件下的创意表现,探讨了环境线索与动机特别是内在动机在这一过程中的交互作用。结果表明,具有场独立认知风格的个体的创造性水平显著高于具有场依赖认知风格的个体,但是,在有线索的情况下,两种认知风格的个体的创造力没有显著差异;环境线索的数量显著影响社会创意的新颖性,动机水平可以调节这种影响;线索特征对社会创意的流畅性和灵活性的影响受到内在动机的调节,线索越新颖,被试创意的水平就越高。社会创造力的培养应兼顾个体与情境的作用及其交互影响。

The Research on Social Creative Idea Generation in the Context of Online Interaction

Chuanhua Gu, Yaqi Guo, Xiaomeng Yang

Key Laboratory of Adolescent Csyberpsychology and Behavior (Central China Normal University),
Ministry of Education, & Hubei Province Key Laboratory of Human Development and Mental
Health, Wuhan, 430079

Abstract: The studies on brainstorming have found that both situational factors and individual characteristics may have a significant impact on the process of creative idea generation. However, the results of previous studies are inconsistent on the environmental cues that can promote or inhibit creative idea generation. Moreover, previous studies have not clarified the regulatory role of cognitive style and motivation in this process. In addition, as an important individual characteristic, motivation, especially intrinsic motivation, is the core power of creativity. Individuals with higher intrinsic motivation usually have higher originality and flexibility. However, previous studies have not clarified the interaction between individual intrinsic motivation and environmental cues in the process of creative idea generation. Moreover, the research on the creative idea generation in social creativity may also have domain specificity. The present study adopted electronic (online) brainstorming (EBS) technology and used common social problems as the experimental task of creativity generation to explore the creative performance of individuals with different cognitive styles under the background of online interaction with different environmental cues, and to explore the interaction between environmental cues and motivation, especially intrinsic motivation in this process among recruited college student participants. The results showed that the creativity level of the individuals with field independent cognitive style was significantly higher than that of the individuals with field dependent cognitive style, but there was no significant difference between two groups when there were clues; the number of environmental cues significantly affected the novelty of social creativity, which was moderated by the level of motivation; the effect of cue characteristics on the fluency and flexibility of social creativity was regulated by intrinsic motivation. The more novel the cue was, the higher the level of creativity was. The cultivation of social creativity should take into account the interaction of individuals with situations.

“越创造, 越幸福!”创造性培养提高小学生主观幸福感

武晓菲¹(通讯作者) 何梦婷¹ 李小倩¹

杭州师范大学经亨颐教育学院心理系, 杭州, 311121, wuxiaofei0425@hznu.edu.cn

摘要 积极心理学观点认为, 创造性和幸福感之间有正相关关系, 但也有研究者基于精神病症的观察认为两者呈负相关关系。本研究探索了创造性与小学生主观幸福感之间的关系。研究一采用主观幸福感问卷(包括生活满意度分量表和快乐感分量表), 威廉斯创造性倾向测验问卷, 托伦斯创造性测验(TTCT, 包括AUT任务和图形测验)测量 165 名学生的主观幸福感和创造性水平。结果表明, 威廉斯创造性倾向测验分数与小学生生活满意度以及积极情绪正相关, 但是与消极情绪相关不显著。研究二进一步采用行为学实验, 对学生的创造性进行训练, 分别从两个小学中各选择三个班级参与实验, (平均)每个班级 30 人给予同一实验处理,

两个学校作为平行实验进行数据处理。对于每个学校的三个班级，一组接受 6 周的创造性训练，一组接受 6 周常规认知训练，另外一组不接受训练，三组被试均在训练前后完成主观幸福感测验以及创造性的平行测验（AUT 测验，图形测验）。结果表明，创造性训练组主观幸福感的增加（后测-前测）显著的高于其他两组。以上结果表明，创造性越高的被试，主观幸福感越高；且创造性训练有助于提升被试的主观幸福感，即“越创造，越幸福！”

关键词 创造性，主观幸福感，小学生

“Creativity makes you feel better!”

——Creative training improves the subjective well-being

Xiaofei Wu¹, Mengting He¹, Xiaoqian Li¹

Psychological department, educational school, Hangzhou Normal University, Hangzhou, 311121

Email: wuxiaofei0425@hznu.edu.cn

Abstract: The positive psychology suggests that there is a strong positive correlation between creativity and happiness, however, other researchers have observed a negative correlation based on psychiatric disorders. The present study explores the relationship between creativity and subjective well-being of primary school students. The subjective well-being (life satisfaction and happiness) and creativity levels of 165 students were measured using the subjective well-being questionnaire, the Williams creative tendency questionnaire and the creativity tests. The results show that Williams creative tendency test score is positively correlated with life satisfaction and positive emotions of primary school students, but not significantly correlated with negative emotions. In the second study, a behavioral experiment was further adopted to train students' creativity. Three classes were selected from two primary schools to participate in the experiment. Thirty students in each class were given the same experimental treatment (on average), and the data of two schools were analyzed as parallel experiments. Three experimental conditions were creativity training group, conventional cognitive training group and no training group, separately, three groups of subjects completed subjective well-being test and creative parallel test (AUT tests, graphical test) before and after the training. The result shows that the subjective well-being score(post-pre) of creative training group is significantly higher than that of the other two groups. The finding suggests that the people who engaged in more creative activities experienced higher levels of well-being; In addition, creative training is helpful to improve the subjective well-being, that is, "creativity makes you feel good!"

创造力的 5-I 训练理论模型以及训练工具的功能特定性

谷晓静¹（通讯作者），曾行¹，刘晓瑾¹

北京师范大学珠海校区教育科技中心，珠海，519087, xiaojing_gu1900@bnu.edu.cn

摘要 创造力被认为是 21 世纪最重要的能力之一。以往研究证实，训练是提高人的创造潜力最有效的方式。创造力发展的多层面理论认为，创造力虽然有特定的认知基础，但是它的发生发展受到个人特质，认知风格和环境等多方面因素的影响。基于此，我们的研究提出了一个新的创造力训练模型：5-I 训练模型。该模型包含五个训练成分，*Inclination, Ideation, Interaction, Identification, and Inspiration*，每个成分包含多个训练工具，目的是训练一个或多个影响创造力的因素。在本次报告中，我将首先以一个 5 周的在线创造力训练项目作为示范，介绍 5-I 训练模型的设计方式，训练工具及其有效性。进一步，我们的研究检验了针对特定创造力认知成分的训练工具的效果。研究采用多个创造性测验指标，检验了四种特定的创造力训练工具（SCAMPER，随机联接，模式冲突和简单想法生成），在促进创造力的发散和聚合思维上的作用差异性。结果发现，SCAMPER 工具在某种程度上促进了新颖性，随机联接和模式冲突两种工具促进了流畅性和灵活性，而简单想法生成没有显著性的效果。

Stimulating Creativity: Examining the Effectiveness of the 5-I Training Framework and Whether Techniques differ in Enhancing Specific Creativity Indicators

Xiaojing Gu¹, Hang Zeng¹, Xiaojin Liu¹

Center for Educational Science and Technology, Beijing Normal University at Zhuhai

Abstract: Creativity is among the most desired work and life skills in the 21st century. Training has been a preferred and effective way to foster creativity. As suggested by the multifaceted nature of creativity, creativity does not rely on cognitive processing alone. Rather, other non-cognitive factors (e.g., personal and contextual) also come into play in the creative process. This suggests that when aiming to train creativity, one has to take into account the interdependence and interaction among the creative process and these factors. In our earlier work, we proposed a new theoretical framework for training creativity, the 5-I training framework. It consisted of five components, Inclination, Ideation, Interaction, Identification, and Inspiration. Several training techniques were incorporated, each focusing on one or several components of the 5-I training framework. During this presentation, I will talk about the design and the effectiveness of the 5-I training framework in fostering university students' creativity throughout a five-week online training. Furthermore, I will talk about whether and how training techniques (SCAMPER, random connection, schema violation, and simple ideation) involving different cognitive processes that underlie creativity differ in the type of creative performance they enhance. Our earlier results suggested that the SCAMPER technique showed a potential to enhance originality, the random connection and the schema violation technique tended to improve fluency and flexibility, while the simple ideation technique led to no creativity enhancement.

基于技术支持的创造性教育整合模型

汤超颖 邢子伟

中国科学院大学, 经济管理学院, 北京, 100190

摘要 教育应当以提高学生的创造力为重要目标。在数字时代, 信息和数字技术在课程中得到了广泛的应用, 为促进创造性教学和改革传统课堂教学提供了巨大的潜力。然而, 有关信息和数字技术对学生创造力的影响机制尚不清楚。为此, 本研究系统回顾了创造力研究所涉及的 8 大类 35 种技术产品, 分析得出技术产品通过知识与信息、高阶思维能力、动机、合作能力、创造性学习环境促进学生创造力, 从而构建了以技术产品支持创造性教育的整合模型。最后, 论文就数字时代创造性教育对教师和教师培训者的相关要求, 以及关键研究议题进行了讨论。

An Integrative Model of Teaching for Creativity Supported by Technology

Chaoying Tang, Ziwei Xing

School of Economics and Management,

University of Chinese Academy of Sciences, Beijing, China

Abstract: Improving student creativity is a primary goal of all levels of education. In the digital era, information and digital technologies have been widely used in courses. They have demonstrated a big potential of improving teaching for creativity as well as reforming traditional teaching strategies in classrooms. However, the influence mechanism of using information and digital technologies to improve student creativity keeps unclear. This study aims to fill this gap by systematically reviewing the literatures which focused on student creativity and use of technical products in classrooms. Taken together, 35 technical education products belong to 8 categories of technology were demonstrated

benefit student creativity through improve knowledge and information, high-order thinking skills, motivation, cooperation skills and learning environment for creativity. This paper generates an integrated model of teaching for creativity supported by technology. At last, requirements for teachers and teacher educators as well as the critical research issues about how to improve teaching for creativity by technology are discussed.

农村青少年网络成瘾模式与抑郁症状和问题行为的纵向关系： 基于潜在剖面分析

孙亚东^{1,2} 邵景进^{1,2}（通讯作者）

¹ 西南大学心理心理健康教育研究中心，重庆，400715

² 西南大学心理学部，重庆，400715, jingjinshao@126.com

摘 要 网络成瘾是青少年面临的重要心理社会问题之一。已有研究证实网络成瘾给青少年带来很多不利的影响，但很少有研究系统考察中国农村青少年群体网络成瘾的内部异质性及其对抑郁和问题行为的纵向预测作用。本研究通过为期一年的追踪研究，对 1194 名农村青少年（ $M_{age}=14.53$, $SD=0.72$ ）进行调查，采用潜在剖面分析的方法，探究网络成瘾剖面的不同模式亚群组的影响因素及其对抑郁和问题行为的预测作用。研究发现：1）农村青少年网络成瘾模式可分为四个亚群组：正常网络使用组（41%）、风险网络使用组（39%）、过度网络使用组（9%）和网络游戏组（11%）；2）农村青少年网络成瘾模式人群与性别、越轨同伴和亲子疏离具有显著的相关关系，但与留守状态不相关；3）风险网络使用组、过度网络使用组以及网络游戏组的抑郁水平均高于正常网络使用组。过度网络使用组和风险网络使用组比正常网络使用组表现出更高的问题行为水平，而网络游戏组的问题行为水平高于其他三个亚群组。这些发现表明，中国农村青少年的网络成瘾存在相当大的异质性，并且性别、越轨同伴和亲子疏离是影响农村青少年网络成瘾的风险因素，且网络成瘾剖面能够对农村青少年的抑郁和问题行为产生不同程度的影响。该项研究结果可以提供针对性的干预以及预防策略，减少农村青少年网络成瘾，进而降低农村青少年抑郁和问题行为的风险。

Pattern of Internet Addiction among Rural Chinese Adolescents: Longitudinal Relations with Depressive Symptoms and Problem Behaviors

Yadong Sun^{1,2}, Jingjin Shao^{1,2}

¹Center for Mental Health Education, Southwest University, Beibei, Chongqing, China. 400715

²Faculty of Psychology, Southwest University, Beibei, Chongqing, China. 400715

Abstract: Internet addiction is one of the important psychosocial problems faced by teenagers. It has been proved that Internet addiction has brought a lot of adverse effects on teenagers, but more attention has been paid to urban adolescents, while less research has been done on rural adolescents. In addition, few studies have systematically investigated the internal heterogeneity of adolescents' internet addiction and its predictive role. Through a one-year follow-up study, 1194 rural adolescents ($M_{age} = 14.53$, $SD = 0.72$) were investigated. The latent profile analysis was used to explore the influencing factors of different subgroups of internet addiction profile and their predictive effects on depressive symptoms and problem behaviors. The results show that: 1) The internet addiction patterns of rural adolescents can be divided into four subgroups: normal internet use group (41%), risk internet use group (39%), excessive internet use group (9%) and online game group (11%); 2) There is a significant correlation between rural adolescents' internet addiction patterns and gender, deviant peers and parent alienation, but not with left behind status;

3)The level of depressive symptoms in risk internet use group, excessive internet use group and online game group were higher than those in normal network use group. The level of problem behavior in the excessive internet use group and risk internet use group are higher than that in the normal internet use group, while the problem behavior level of the online game group is higher than that of the other three subgroups. These findings indicate that there is considerable heterogeneity in internet addiction among rural adolescents in China, and gender, deviant peers and parent alienation are risk factors of internet addiction among rural adolescents, and the profiles of Internet addiction can have different degrees of impact on depressive symptoms and problem behaviors of rural adolescents. The results of this study can provide targeted intervention and prevention strategies to reduce rural adolescents' internet addiction and inhibit the development of rural adolescents' depressive symptoms and problem behaviors.

留守儿童亲子亲合与安全感的关系： 领悟社会支持与自我效能感的链式中介作用

潘毅¹ 刘改改¹ 吴丽娜¹ 赵俊峰^{1,2} (通讯作者)

¹ 河南大学教育科学学院, 开封, 475004

² 河南省弱势群体身心健康国际科技合作研究中心, 开封, 475004, jfzhao63@hotmail.com

摘要 由于长期的亲子分离、缺乏父母的关爱与教养, 留守儿童表现出一系列的心理与行为问题, 其中安全感作为影响留守儿童心理健康发展的重要因素, 具有极高的研究价值。已有研究表明, 儿童的安全感与社会支持、父母教养方式、同伴关系等因素密切相关, 但较少探究留守儿童亲子亲合与安全感之间的关系。本研究以留守儿童安全感量表、亲子亲合量表、领悟社会支持量表和一般自我效能感量表作为测量工具, 对来自2所小学、2所初中和2所高中的1005名留守儿童(男生518名, 女生487名)进行问卷调查。通过数据分析, 研究结果如下: 差异分析显示: (1)在安全感方面, 单留守儿童安全感水平显著高于双留守儿童; 男生安全感水平显著高于女生。(2)在亲子亲合方面, 母子亲合水平显著高于父子亲合水平; 男生亲子亲合水平显著高于女生。相关分析显示: 留守儿童亲子亲合、领悟社会支持、自我效能感与安全感两两之间存在显著正相关。多重回归分析显示: (1)留守儿童的亲子亲合能够显著正向预测领悟社会支持、自我效能感与安全感; (2)留守儿童领悟社会支持在亲子亲合与安全感中起部分中介作用; (3)留守儿童自我效能感在亲子亲合与安全感中起部分中介作用; (4)留守儿童领悟社会支持、自我效能感在亲子亲合与安全感的链式中介作用中起部分链式中介的作用。研究结果说明了亲子亲合对留守儿童安全感的重要影响以及社会支持、自我效能感的中介作用机制, 有助于加强学校、家庭和社会各方面对留守儿童安全感的重视程度, 从而促进留守儿童的心理健康发展。

Abstract : Due to the long-term separation of parents and children, the left-behind children show a series of psychological and behavioral problems. At the same time, as an important factor affecting the mental health development of left-behind children, sense of security has high research value. Previous studies have shown that children's sense of security is closely related to social support, parental rearing style, peer relationship and other factors, but little research has been done on the relationship between parent-child affinity and security of left-behind

children. In this study, 1005 left-behind children (518 boys and 487 girls) from two primary schools, two junior high schools and two senior high schools were investigated by using the left-behind children's sense of security scale, parent-child affinity scale, perceived social support scale and general self-efficacy scale. Through data analysis, the following conclusions are drawn. The difference analysis showed that: (1) in terms of sense of security, the level of single left-behind children was significantly higher than that of double left-behind children; the level of security of boys was significantly higher than that of girls. (2) In the aspect of parent-child affinity, the level of mother-child affinity was significantly higher than that of father-child; the level of parent-child affinity of boys was significantly higher than that of girls. Correlation analysis showed that parent-child affinity, perceived social support, self-efficacy and security of left-behind children were positively correlated. Multiple regression analysis showed that: (1) left-behind children's parent-child affinity could significantly positively predict perceived social support, self-efficacy and security; (2) perceived social support of left-behind children played a part of mediating in role parent-child affinity and security; (3) self-efficacy of left-behind children played a part of mediating in parent-child affinity and sense of security; (4) left-behind children's perceived social support and self-efficacy played the role of chain mediation in the relationship between parent-child affinity and security. The results showed that parent-child affinity had an important impact on left-behind children's sense of security and the mediating mechanism of social support and self-efficacy, which could help to strengthen the attention of school, family and society to the sense of security of left-behind children, so as to promote the mental health development of left-behind children.

农村留守妇女与儿童焦虑的代际传递：HPA 轴活动的作用

赵金霞¹（通讯作者） 李振² 刘莉³

1 临沂大学教育学院，临沂，276005，zhaojinxia@163.com

2 临沂大学初等教育学院，费县，273400

3 山东师范大学心理学院，济南，250014

摘要 焦虑是儿童青少年期最普遍的心理障碍之一，观察学习理论和西方研究均表明，焦虑具有代际传递性。在中国农村，由于配偶长期外出务工，留守妇女较之非留守妇女承受着更多的心理压力，这可能提升了其焦虑水平及其母子焦虑的代际传递程度。此外，尽管焦虑具有代际传递性，但并非所有父母焦虑的儿童都具有焦虑问题。发展心理病理学认为，个体的生理压力反应系统对外在环境的差别易感性影响不利处境对儿童发展的影响。HPA 轴(下丘脑-垂体-肾上腺轴，hypothalamic-pituitary-adrenal axis，简称 HPA)是人体应对压力的重要神经内分泌系统，其终产物-皮质醇常作为衡量个体压力反应的生理指标。对父亲外出的儿童来说，尽管外出打工的父亲为家庭提供了更多的经济支持，但传统的家庭结构发生了重大变化，在这一不利处境下，他们的 HPA 轴活动及其对焦虑代际传递的影响可能与农村完整家庭的儿童有所不同。为此，本研究以农村 169 名留守与非留守的母亲及其子女为被试，采用问卷调查法（母亲报告、儿童报告）和唾液皮质醇检测法，考察了 HPA 轴活动对留守、非留守母子焦虑代际传递的调节作用。结果发现：(1)留守与非留守母子焦虑的代际传递程度基本相当；(2)伴随上午基线皮质醇水平的提高或皮质醇一日变化节律的增强，留守母子焦虑的代际传递由显著变得不再显著；(3)伴随下午基线皮质醇水平的提高，非留守母子焦虑的代际传递变得不再显著。这表明，农村家庭结构模式影响不同的 HPA 轴活动指标对母子焦虑代际传递的调节效应。

关键词 焦虑，代际传递，HPA 轴活动，留守妇女，儿童

The Moderating Role of HPA Axis Activity in the Transmission of Anxiety from rural Left-behind Women to Children

Zhao Jinxia¹(Corresponding author), Li Zhen², Liu li³

1 Department of Education, Linyi University, Linyi, 276005

2 Department of Primary Education, Linyi University, Feixian, 273400

3 Department of Psychology, Shandong Normal University, Jinan 250014

Abstract: Anxiety disorders represent one of the most common psychiatric disorders in childhood and adolescence. Social learning theories and Western empirical studies suggested that parental anxiety is transmitted to their offspring. In rural China, left-behind women compared to their non-left-behind counterparts take on more environmental stress due to the migration of their husbands, which might increase the anxiety level of left-behind women and the strength of the transmission of anxiety from left-behind women to the next generation. Additionally, although offspring of parents with anxiety symptoms are, in general, at raised risk for the disorder themselves, only a proportion are affected. The perspectives of developmental psychopathology suggest that individuals' differential susceptibility to adverse environments due to sensitivity of stress response systems may affect their psychological and behavioral outcomes. HPA axis is one of the core stress systems in response to environmental threat and stress. HPA axis activity can be estimated using measures of its end products, salivary cortisol. For children from families with a migrating father, although migrant fathers provide more economic benefits for their family members, traditional family structure has experienced dramatic changes. In this vulnerable situation, their HPA axis activity and the effect of HPA axis activity on the intergenerational transmission of anxiety may different from those of children from non-migrant families. Considering the aforementioned reasons, the present study examined the intergenerational transmission of anxiety and the potential moderated mechanisms of HPA activity in this association with the survey of questionnaire (mother and child reports) and the test of salivary cortisol, by using a cross-sectional data of 169 mother-child dyads in families with a migrating father and non-migrant families. The main results were shown below: (1) The extents of the transmission of anxiety from mothers to children in families with a migrating father and non-migrant families were at the same level. (2) High level of the morning basal cortisol and diurnal cortisol change broke the transmission of anxiety from left-behind mothers to children. (3) High afternoon basal cortisol broke the transmission of anxiety from non-left-behind mothers to their offspring. These findings to some extent demonstrated that the interactive effects of mother's anxiety and children's HPA axis activity on the intergenerational transmission of anxiety varied between families with a migrating father and non-migrant families in rural China.

Keywords: anxiety, intergenerational transmission, HPA axis activity, left-behind women, children

亲子分离背景下同伴侵害对青少年主观幸福感的影响

陈子循¹ 王晖¹ 冯映雪¹ 刘霞¹ (通讯作者)

1 北京师范大学发展心理研究院, 北京, 100875, liuxia@bnu.edu.cn

摘要 伴随着城市化进程的不断加快, 农村父母外出务工现象日益普遍, 导致父母与子女间亲子分离的状况频繁发生。据统计, 超过 6000 万农村青少年正承受亲子分离的困扰。在亲子分离背景下, 青少年遭受同伴侵害的现象时有发生, 日益成为损害农村青少年心理健康的重要危机事件。根据自我系统信念模型, 自尊是解释风险因素对主观幸福感影响作用的重要变量。那么在亲子分离的背景下, 同伴侵害是否会通过降低青少年的自尊进而降低其主观幸福感? 哪些保护性因素可以缓解同伴侵害带来的消极作用? 已有研究主要从横断研究角度关注了同伴侵害的直接危害作用, 缺乏从积极发展视角考察其长期影响及其缓解机制。本研究采用整班施测方式对贵州省 487 名青少年进行两次追踪调查, 考察同伴侵害对遭受亲子分离后的青少年的主观幸福感的长期影响以及自尊在同伴侵害与主观幸福感之间的中介作用, 同时检验朋友支持和教师支持对该中介路径的调节作用。结果表明: (1) 同伴侵害不仅能长期显著负向预测遭受亲子分离后青少年的主观幸福感, 还能通过自尊的中介作用间接预测主观幸福感; (2) 朋友支持可以调节同伴侵害与遭受亲子分离的青少年主观幸

幸福感之间的关系，相对于高朋友支持的个体，同伴侵害对遭受亲子分离的青少年主观幸福感的影响在低朋友支持的个体中更显著；(3) 教师支持可以调节遭受亲子分离的女生同伴侵害与主观幸福感之间的关系，相对于高教师支持的女生，同伴侵害对主观幸福感的影响在低教师支持的女生中更显著。此外，教师支持还可以调节遭受亲子分离的女生同伴侵害与自尊之间的关系，相对于低教师支持的女生，同伴侵害对自尊的影响在高教师支持的女生中更显著。

关键词 亲子分离，同伴侵害，主观幸福感，自尊，社会支持

Effect of peer victimization on the subjective Well-being in Adolescents Based on the Features of Parent-child Separation

CHEN Zixun, WANG Hui, FENG Yingxue, LIU Xia

(Institute of Developmental Psychology, Beijing Normal University, Beijing 100875)

Abstract: With the acceleration of urbanization, the phenomenon of rural parents going out to work is increasing frequently, leading to a rise of separations between parents and children. According to statistics, more than 60 million rural teenagers are suffering from parent-child separation. Under the background of parent-child separation, the phenomenon of peer victimization in adolescents occurs from time to time, which has increasingly become an important crisis event to damage the mental health of rural adolescents. Based on the self-system belief model, self-esteem is an important variable to explain the impact of risk factors on subjective well-being. In the context of parent-child separation, will peer victimization reduce the subjective well-being of adolescents through self-esteem? Which protective factors can moderate the negative effects of peer aggression? The existing studies mainly focus on the direct harmful effects of peer victimization with cross-sectional studies but lack the recognition of long-term effects and moderation mechanisms from the perspective of positive development. To investigate the long-term effects of peer victimization on adolescents' subjective well-being and the mediating role of self-esteem between victimization and well-being, as well as the moderating roles of friend support and teacher support under the experience of parent-child separation, a total sample of 487 adolescents was recruited from Guizhou province through the longitudinal design of two follow-up surveys. The results show that: (1) Peer victimization not only significantly and negatively long-term predicted the subjective well-being of teenagers, but also indirectly predicted subjective well-being through the mediating role of self-esteem after separation from parents. (2) Friend support significantly moderated the relationship between peer victimization and the subjective well-being of adolescents: higher levels of peer victimization negatively predicted subjective well-being only among those who reported less friend support after separation from parents. (3) Teacher support significantly moderated the relationship between peer victimization and the subjective well-being of girls after separation from parents: more teacher support alleviated the negative influence of peer victimization on subjective well-being. Also, teacher support could moderate the relationship between peer victimization and self-esteem of girls after separation from parents: more teacher support exacerbated the negative effect of peer victimization on self-esteem.

亲子分离经历与大学生抑郁的关系： 亲子亲合与迷走神经活动的作用

赵景欣（通讯作者） 陈燕 上官梦麒

山东师范大学心理学院，济南，250014, jingxinzha@126.com

摘要 生命早期的亲子分离经历会显著提高个体出现心理病理问题的风险，且这种影响持续终生。随着父母外出务工所致的亲子分离成为一种全球性现象，揭示亲子分离对个体发展的持续影响、探明能够降低亲子分离消极影响的因素及作用机制成为亟待解决的重要科学问题。然而，已有研究主要关注亲子分离的即时影响以及环境因素的作用，相对忽视了亲子分离经历对个体产生的长期持续影响以及神经生物因素在其中的作

用。本研究将聚焦具有早期亲子分离经历的大学生，以亲子亲合作为家庭保护因素的指标，以迷走神经活动作为个体对压力的生物敏感性指标，系统探讨早期亲子分离经历对个体抑郁的长期持续影响以及亲子亲合、迷走神经活动在其中的交互作用。对 261 名大学生的亲子分离经历、亲子亲合和抑郁进行测查，并运用 MP160 生理多导仪采集了大学生在静息状态和压力任务下的 RSA 水平（Respiratory Sinus Arrhythmia，迷走神经活动的测量指标）。结果发现：（1）有亲子分离经历大学生的抑郁水平显著高于无亲子分离经历的大学生，其母子亲合和父子亲合水平均显著低于无亲子分离经历的大学生；（2）母子亲合和父子亲合均能够显著负向预测大学生的抑郁，且能够调节亲子分离经历与抑郁的关系；（3）RSA 反应性能够调节亲子分离经历与男大学生抑郁之间的关系；（4）RSA 反应性与父子亲合的交互作用能够调节亲子分离经历与抑郁的关系，但该调节作用仅存在男生中。这表明，早期的亲子分离经历能够对个体成年后的抑郁水平产生长期持续影响，但是这种影响会因为亲子亲合水平、个体迷走神经活动水平和性别的不同而存在差异。

关键词 亲子分离经历，亲子亲合，迷走神经活动，抑郁，大学生

The Relationship Between Parent-child Separation Experience and Depression in College Students: The Roles of Parent-child Cohesion and Vagus Nerve Activity

Jingxin Zhao, Yan Chen, Mengqi Shangguan

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract: Parent-child separation has been considered as the most serious form of early life adversity, which puts individuals at increased risk for suffering psychopathological problems. Considering that parent-child separation caused by parents' migration has become a global phenomenon, it is critical to explore the long-lasting effects of parent-child separation, identify the protective factors and its underlying mechanism. However, existing research has typically focused on the immediate effect of parent-child separation and the role of environmental factors, which ignores the longitudinal effects of parent-child separation on individuals' development, and the role of neurobiological factors in the associations between parent-child separation and individuals' development outcomes. Thus, the current study aims to examine the impact of early parent-child separation experience on undergraduates' depression, and explore the moderating role of parent-child cohesion and vagus nerve activities in the association between early parent-child separation experience and undergraduates' depression. A total of 261 college students were asked to complete the questionnaires of parent-child separation experience, parent-child cohesion, and depression. RSA (respiratory sinus arrhythmia; an indicator of vagus nerve activity) data was collected using a Biopac system (MP160, Biopac System Inc., Goleta, CA). The results indicated that: (1) Undergraduates with parent-child separation experience had significantly higher levels of depression, but had significantly lower levels of mother-child cohesion and father-child cohesion than those without parent-child separation experience; (2) Both mother-child cohesion and father-child cohesion can significantly predict undergraduates' decreased depression, and moderate the link between parent-child separation experience and depression; (3) RSA reactivity moderated the link between parent-child separation experience and depression, but only for male; (4) The interaction between RSA reactivity and father-child cohesion moderated the association between parent-child separation experience and depression, but only for male. These findings suggest that early parent-child separation has a long-lasting harmful effect on individuals' depression, and the effects of early parent-child separation on depression vary by parent-child cohesion, vagus nerve activity, and gender.

Keywords: Parent-child separation experience, Parent-child cohesion, Vagus nerve activity, Depression, College students

家庭情感虐待、情感忽视与留守青少年的孤独感：同伴接纳的作用

王千 赵景欣（通讯作者）

山东师范大学心理学院，济南，250014，赵景欣，jingxinzha@126.com

摘要 父母一方或双方长期外出务工极大增加了留守青少年经历家庭情感虐待和忽视的风险。大量研究表明，遭受家庭情感虐待、情感忽视的青少年更易产生较高水平的孤独感。在亲子分离的不利处境下，家庭情感虐待和忽视的消极影响可能会更强。因此，探讨能够缓解家庭情感虐待和忽视对留守青少年消极影响的保护因素就成为该领域研究中一个重要的研究问题。然而，已有的研究主要关注家庭情感虐待和忽视对青少年发展的直接影响，相对忽视了对能够缓解其消极影响的保护因素的探究，对于留守青少年群体的关注也相对不足。随着个体进入青少年期，同伴的作用日趋重要。在亲子分离的背景下，同伴接纳就成为青少年满足社交需求、获得情感支持和安全感的重要源泉。鉴于此，本研究以山东省的1631名农村青少年为被试，基于留守青少年和非留守青少年的比较，在分别考察家庭情感虐待、情感忽视与青少年孤独感关系的基础上，重点揭示了同伴接纳在其中的保护作用，并探讨了变量间关系的性别差异。结果表明：（1）相比非留守青少年、父亲外出青少年，双亲外出青少年经历了更高水平的情感忽视；（2）情感忽视显著正向预测青少年的孤独感，情感虐待显著正向预测父亲外出青少年和非留守青少年的孤独感；与情感虐待相比，情感忽视对孤独感的预测作用更强；（3）在父亲外出家庭中，情感忽视对女生孤独感的正向预测作用高于男生；（4）同伴接纳能够调节情感虐待与双亲外出儿童孤独感之间的关系，高同伴接纳可以缓冲情感虐待对孤独感的正向预测强度。这表明，家庭情感虐待和忽视对青少年孤独感的影响因留守类别和性别的不同而有所差异，可以通过提升同伴接纳水平来缓解情感虐待对双亲外出青少年孤独感的消极影响。

关键词 留守青少年，情感虐待，情感忽视，孤独感，同伴接纳

Emotional Abuse, Emotional Neglect and Left-behind Adolescents' Loneliness in Rural China: The Role of Peer Acceptance

WANG Qian, ZHAO Jingxin

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract: Parent absences, caused by parents' rural-to-urban migrations, have greatly increased left-behind adolescents' risk of experiencing emotional abuse and neglect. Many studies have suggested that emotional abuse and neglect were associated with adolescents' increased loneliness. In the unfavourable context of parental-child separation, emotional abuse and neglect may have stronger effects on adolescents' loneliness. Thus, it is critical to identify the protective factors that may buffer the harmful effects of emotional abuse and neglect. Although existing research has examined the associations between emotional abuse and neglect and adolescents' loneliness, the associations among left-behind adolescents have been relatively unexplored, and little is known about the protective factors in buffering the detrimental effects of emotional abuse and neglect on loneliness. Peers play an increasingly important role in adolescents' lives. For left-behind adolescents, peer acceptance becomes an important source for them to meet the needs of social contact, obtain emotional support and sense of security. Therefore, the current study aimed to examine the unique impact of emotional abuse and neglect on loneliness among Chinese rural left-behind adolescents, non-left-behind adolescents from the same rural areas as the comparison group, with an exploration of the moderating role of peer acceptance and gender. A total of 1631 rural adolescents were recruited from Shandong Province. The results indicated that: (1) Adolescents from both-parent migrant families experienced higher levels of emotional neglect than those from father-only migrant families and non-left-behind adolescents; (2) Emotional neglect was significantly associated with increased adolescents' loneliness; Emotional abuse significantly predicted higher levels of loneliness among adolescents from father-only migrant families and non-left-behind adolescents; Emotional neglect was more strongly associated with loneliness than emotional abuse in three groups; (3) In father-migrant group, the association between emotional neglect and loneliness was stronger in girls than in boys; (4) Peer acceptance was significantly moderated the association between emotional abuse and loneliness in adolescents

from both-parent migrant families. Specifically, emotional abuse was positively associated with adolescents' loneliness at lower levels of peer acceptance, but such association was not significant at higher levels of peer acceptance. These findings suggested that the effects of emotional abuse and neglect on adolescents' loneliness vary by left-behind status and gender. Providing interventions to improve peer acceptance is beneficial in mitigating the effect of emotional abuse on loneliness among adolescents from both-parent migrant families.

数学焦虑与基本算术能力的关系： 认知反思、专业 and 性别的作用

黄碧娟¹ 刘晓宇¹ 张明亮^{1,2} 司继伟¹ (通讯作者)

¹ 山东师范大学心理学院, 济南 250358, sjiwei1974@126.com

² 中共山东省委党校 (山东行政学院), 济南, 250103

摘要 数学焦虑 (MA) 指的是在需要使用数字和数学的情境下产生的消极情绪体验 (Hembree, 1990)。Ashcraft 和 Kirk (2001) 曾报道, 在涉及数学或数学活动的情况下, 大约 20% 的人群会表现出焦虑。在数字认知领域, 大量的横断和纵向研究都揭示了数学焦虑对数学表现的消极影响, 数学焦虑不仅会降低个体在复杂任务中的表现, 也会导致个体在简单的计数、加法和乘法任务中表现不佳。现有理论多从工作记忆的角度进行对两者之间的关系进行解释, 但其他认知因素 (如认知反思) 和个体因素 (如性别和专业差异) 的作用也不容忽视。因此本研究基于已有实证研究, 以认知与自我调节学习的整合模型为基础, 探讨数学焦虑与数学表现之间的关系, 揭示认知反思、专业和性别在数学焦虑中的作用。选择 1026 名大一新生, 测量他们的数学焦虑、认知反思、基本算术能力。结果发现, 仅在理科学生中, 数学焦虑可通过认知反思影响基本算术能力, 而在文科学生中并未发现该间接效应; 将性别纳入分析发现, 并非所有的理科学生都表现出该间接效应, 而是仅在女生个体中存在。本研究的发现对于教学实践具有重要意义, 从认知反思的角度出发, 教育实践者可以通过一些认知训练 (如元认知策略), 来提高理科女生的认知反思能力, 进而提高女生的数学表现。

The Roles of Conflict Reflection, Major and Gender in the Relationship between Math Anxiety and Basic Arithmetic Skills

Bijuan Huang¹, Xiaoyu Liu¹, Mingliang Zhang¹, Jiwei Si^{1,*}

¹ School of Psychology, Shandong Normal University, Jinan 250358

² Shandong Administrative Institute

Abstract: Math anxiety (MA) refers to the negative emotional experience in the situation of using numbers and mathematics (Hembree, 1990). Ashcraft and Kirk (2001) reported that about 20% of the population would show anxiety when they were involved in mathematics or mathematical activities. In the field of numerical cognition, a large number of cross-sectional and longitudinal studies have revealed the negative impact of math anxiety on mathematical performance. Math anxiety not only reduces the performance of individuals in complex tasks, but also leads to poor performance in simple counting, addition and multiplication. The relationship between MA and math performance are usually explained by the view of working memory. However, cognitive factors, such as cognitive reflection, and individual factors, such as gender and major also play an important role on the correlation. Based on the empirical studies and Integrating the Model of Epistemic Cognition and Self-regulated Learning, this study was designed to reveal the effect of cognitive reflection, major and gender on the relationship between MA and math

performance. We recruited 1026 freshmen measuring their math anxiety, cognitive reflection and basic arithmetic ability. The results showed that math anxiety predicted the basic arithmetic ability through cognitive reflection only among the students majoring in science. Further analysis revealed that this indirect effect only existed in female students, not for students majored in arts. The findings of this study are of great significance, from the perspective of cognitive reflection, teachers in education are suggested to adopt cognitive training(such as metacognition strategies) in order to improve cognitive reflection ability and mathematical performance for females majoring in science .

Keywords: Math anxiety, Basic arithmetic skills, Cognitive reflection, Major, Gender

抑制控制在类比推理发展中的作用

于晓 陈英和（通讯作者）

北京师范大学心理学部发展心理研究院，北京，100875，chenyinghe@bnu.edu.cn

摘 要 类比推理作为抽象逻辑思维的一种重要形式，是将相关元素从一个熟悉任务的心理表征转移到另一个任务中，从而使人们在目标任务中缩小表征的差距(Chuderski & Chuderska, 2009)，被认为是人类智能的主要载体之一(Holyoak, 2012)。当个体在加工类比问题时，需要考虑多种关系及物体，这时激活与目标相关的信息并有效抑制干扰或分心刺激就很重要。已有研究采用不同的研究范式在不同的年龄群体中发现了抑制控制在类比推理中的重要作用（Richland et al., 2006; Simms, et al., 2018; 马晓清, 冯廷勇, 李宇和李红, 2008）。但少有研究从发展的角度揭示抑制控制在类比推理中的作用如何随着年龄的增长而变化的。负启动范式作为经典的抑制控制测量范式，可以通过负启动量这一量化的指标来揭示不同年龄群体在同一认知任务的抑制控制效率的变化。此外，认知负载理论提出任务难度可能会影响个体在认知过程中抵制分心的效率。鉴于此，本研究采用负启动范式揭示抑制控制在不同年龄群体类比推理中的发展模式，并进一步探究任务难度如何影响抑制控制效率的发展。实验1以31名7岁儿童、33名10岁儿童和34名成年人为被试，设置相对大小匹配的负启动任务考察抑制控制在类比推理中的作用。该任务由测验条件和控制条件组成，每个条件包含启动刺激和探测刺激。测验条件的启动刺激呈现的是表面相似性匹配和相对大小关系匹配相冲突的类比匹配任务，控制条件的启动刺激则为中性的类比匹配任务。测验条件和控制条件的探测刺激均为表面相似性匹配和相对大小关系匹配一致的类比匹配任务。结果发现，三个年龄群体都出现了负启动效应，且负启动量随着年龄的增长不断降低。这表明，随着年龄的增长，个体完成类比推理的抑制控制效率不断提高。在实验2中，30名7岁儿童、30名10岁儿童和32名成人完成和实验一类似但任务难度较小的相对大小匹配的负启动任务。结果发现所有年龄群体都出现了负启动效应，但是三个年龄群体间的负启动量无显著差异。这说明，当任务难度下降时，儿童和成人完成类比推理任务的抑制控制效率无显著差异。

The Role of Inhibitory Control in the Development of Analogical Mapping: Task Difficulty Matters

Yu Xiao, Chen Yinghe

School of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: Analogy is one of the most important ways for human beings to understand concepts and transfer knowledge to new situations, which might require complex cognitive processes that place a burden on individuals' executive functions. (Gentner, 1983; Glady, et al., 2017; Thibaut, et al., 2010). However, how general cognitive processes, especially inhibitory control, engage in the analogical mapping remains unclear. Negative priming (NP) paradigm can tap on the inhibitory control component in cognitive processes and provide straightforward evidence (e.g., NP effect) for the role of inhibitory control and its changes. The logic of NP is as follows: if response to an item was previously inhibited, then the subsequent processing of the same or similar item will be less efficient, resulting in slower or less accurate responses (Tipper, 2001). In addition, the perceptual load theory suggests that task difficulty

would affect the role of inhibitory control in analogical mapping. Taken together, the aim of the present study was to establish the role of inhibitory control efficiency in analogical mapping with the NP paradigm among children at different ages and adults. To achieve the goal, in Experiment 1, we tested 7-year-olds, 10-year-olds, and adults with a size-mapping task using NP paradigm. In the paradigm, participants were supposed to respond to two conditions: the test condition and the control condition. Each condition included pairs of stimuli: the prime stimuli and the probe stimuli. Participants' performance on probes in test condition would be compared with their performance on probes in control condition. Findings revealed the NP effect in all participants and the effect decreased with ages. To test whether task difficulty might influence the efficiency of inhibitory control in analogical mapping, in Experiment 2 we intended to change the materials in Experiment 1 into stimuli with lower cognitive demands. Specially, the number of objects required to be processed in Experiment 2 was significantly decreased compared to Experiment 1. In Experiment 2, thirty 7-year-olds, thirty 10-year-olds, and thirty-two adults completed a similar task which was easier than the task in Experiment 1. Results also demonstrated the NP effect among all participants, but the effects showed no differences with ages. The current study suggests the importance of inhibitory control and task difficulty in the development of analogical mapping.

教师重评创造力的测验编制及其与职业幸福感的关系

宋诗博^{1,2} 赵鑫¹ 师保国¹ (通讯作者)

1 首都师范大学心理学院, 北京市“学习与认知”重点实验室, 北京, 100048

2 郑州枫杨外国语学校, 郑州, 450001, baoguoshi@cnu.edu.cn

摘要 重评创造力是日常生活创造力的重要表现, 是情绪背景中的创造性思维。这一能力需要灵活使用超越常规的新的思维模式, 对负面情境产生有创造力的重评意味着在情绪背景下具有较高创造力。中小学教师在日常工作中需要处理与学生、同事、领导以及家长等多个人群的复杂人际关系, 经常会遭遇人际冲突、矛盾等负面情境。本研究首次将重评创造力定义引入职业领域, 具体研究教师群体的重评创造力表现, 通过编制教师重评创造力测验, 探究其对职业幸福感的影响。具体研究由两个部分构成: 研究一以 210 名中小学教师为研究对象进行问卷调查, 并完成了教师重评创造力测验的情境材料筛选和信效度分析, 最终编制了教师重评创造力测验; 在研究二中, 以 202 名中小学教师为研究对象, 进一步考察了教师重评创造力和其职业幸福感之间的关系, 以及开放性人格和性别在其中的作用。结果发现: (1) 本研究开发的教师重评创造力测验的评分者信度、内部一致性信度以及校标关联效度符合心理测量学各项标准, 能够用于客观测量教师在工作中的重评创造力; (2) 教师使用重评创造力能有效降低愤怒情绪, 其独特性能够预测情绪调节的有效性; (3) 教师重评创造力与职业幸福感呈显著正相关, 对职业幸福感有预测作用; (4) 开放性人格在教师重评创造力和职业幸福感之间起中介作用, 教师重评创造力可以通过开放性人格影响职业幸福感; (5) 性别在教师重评创造力对开放性人格的影响中起调节作用, 对女性教师而言, 这一影响更加显著, 重评创造力越高, 对开放性人格预测作用越大; 对男教师则效果微弱。上述结果对于了解职业领域中的重评创造力表现特点, 提升中小学教师的情绪调节能力、职业幸福感均具有重要的意义。

Teachers' Reappraisal Inventiveness: The Measurement and Its Relationship with Professional Well-being

Shibo Song^{1,2}, Xin Zhao¹, Baoguo Shi¹

1 School of Psychology and Beijing Key Laboratory of Learning and Cognition, Capital Normal University, Beijing, 100048

2 Zhengzhou Fengyang Foreign Language School, Zhengzhou, 450001

Abstract: Reappraisal inventiveness is an important manifestation of daily creativity; it is also a form of creative

thinking in emotional context. This ability requires flexible use of new unconventional thinking patterns. Reappraisal inventiveness in negative situations means high level of creativity in emotional context. Primary and secondary school teachers need to deal with complex interpersonal relationships with students, colleagues, leaders, and parents in their daily work. They often encounter negative situations such as interpersonal conflicts and contradictions. This study introduces reappraisal inventiveness into the professional field for the first time, and specifically studied the performance of reappraisal inventiveness in teacher groups. In addition, this study also explored its impact on professional well-being through the teachers' reappraisal inventiveness test (TRIT). The specific research consists of two parts: Study 1 conducted a questionnaire survey among 210 primary and secondary school teachers. The teachers' reappraisal inventiveness test (TRIT) was ultimately compiled through both situational material selection and testing of reliability and validity. In the second study, the influence and function of teachers' reappraisal inventiveness were further explored. 202 primary and secondary school teachers were involved to explore the relationship between teachers' reappraisal inventiveness and professional well-being, as well as the role of openness to experience and gender. Results are as follows: (1) The inter-rater reliability, internal consistency reliability and criterion relevance validity of the TRIT meets to the requirements of psychometrics. (2) Teachers' reappraisal inventiveness can effectively reduce anger, and its uniqueness can predict the effectiveness of emotional regulation. (3) Teachers' reappraisal inventiveness has a significant positive correlation with professional well-being, and it can predict their professional well-being. (4) Openness to experience plays a mediating role between teachers' reappraisal inventiveness and professional well-being. Besides, teachers' reappraisal inventiveness can influence occupational well-being through openness to experience. (5) Gender plays a moderating role in influencing teachers' reappraisal inventiveness on openness to experience, which is even more pronounced for female teachers. The higher the reappraisal inventiveness is, the greater the predictive effect on open personality. However, this effect is weak on male teachers. These results are of great significance for understanding the features of reappraisal inventiveness performance in the occupational field; it also has important implications in improving emotional regulation ability and occupational well-being for primary and secondary school teachers.

Keywords: teachers, reappraisal inventiveness, emotion regulation, professional well-being, openness to experience

整数比数字结构中乘法策略的过度使用及其认知机制

李晓东（通讯作者） 江荣焕 蔡梦婕

深圳大学心理学院，深圳，518060, lxd_psy@163.com

摘 要 乘法是数学学习中最常用的问题解决策略之一，掌握乘法思维更是学生学习高阶数学知识的必备条件。小学生从加法思维到乘法思维的转变标志了他们开始能够理解数值的相对大小以及数量之间的相互关系，这对于学生进一步理解比率、比例、分数、线性方程等具有至关重要的作用。然而，许多研究发现，学生熟练掌握了乘法思维之后却很容易过度使用乘法思维。例如，对于“A 和 B 在操场上跑步，两人速度一样但是 A 比 B 先开始跑，当 B 跑了 3 圈的时候，A 跑了 6 圈，请问当 B 跑了 9 圈时，A 跑了多少圈？”这样的问题，许多学生会得出 18 圈的答案，而题目中涉及的是加法关系，正确的答案为 12 圈。以往的研究发现这种乘法思维的过度使用与题中的数字比结构有关，当数字比为整数时（如： $6/3=2$ ），学生更容易使用乘法思维来解题。然而，为什么整数比的结构会诱发学生使用乘法思维，这一现象背后所涉及的内在机制却仍不清楚。本研究认为整数比的数字结构会优先激活乘法策略，导致学生在解决非乘法运算的题目上错误地使用乘法策略，而正确完成整数比结构下的非乘法运算，则需要抑制乘法策略的干扰。研究一基于双加工的视角，以 3 至 8 年级以及大学生为被试，发现各个年级的学生在整数比数字结构的题目中均出现了乘法策略的过度使用，且不同的年级存在发展性差异。与加法运算相比，乘法运算的反应时更短，错误率更低，出现自动激活的特征。研究二基于抑制控制模型，采用负启动实验范式，考察了 3 至 8 年级以及大学生被试是否需要抑制自动激活的乘法策略来完成加法运算。结果发现，各个年级的学生都出现了负启动效应，说明学生需要依赖抑制控制来完成整数比数字结构的加法运算，且儿童、青少年和成人三个群体之间的抑制效率逐渐提高。研究三采用 ERP 技术探讨整数比数字结构中乘法运算与加法运算的脑电波差异，结果发现，与整数比结构的加法运算相

比，乘法运算激活更大的 P2 和 P3 波幅，进一步证明乘法策略是基于直觉的自动化激活策略，而完成整数比的加法运算需要更多的认知资源。

The Overuse of Multiplication Strategy in Integer Ratio Structure Problems and Its Cognitive Mechanism

Xiaodong Li, Ronghuan Jiang, Mengjie Cai

School of Psychology Shenzhen University

Abstract: Multiplication is one of the most commonly used problem-solving strategies in mathematics learning. Mastering multiplication thinking is also critical for students to understand advanced mathematics knowledge. For elementary school students, the transformation from additive thinking to multiplicative thinking allows them to understand the relative magnitude of values and the interrelationships between quantities, which is vital for them to further understand ratios, proportions, fractions, and linearity. However, studies have found that when students are getting familiar with multiplication, they start to show a strong tendency to overuse multiplication strategies. For example, for the problem “A and B are running on the playground, they run equally fast but A started earlier. When B has run 3 laps, A has run 6 laps. If B has run 9 laps, how many laps has A run?” Many students will come up with the answer of 18 laps while the question involves an additive covariation and the correct answer is 12 laps. Previous studies have found that the overuse of multiplicative thinking is related to the number ratio structure in the question. When the number ratio is an integer (eg: $6/3=2$), students are more likely to use multiplication strategies to solve the problem. However, it is still unclear why the structure of integer ratios could induce students’ multiplicative thinking and what is the underlying mechanism of this phenomenon. The present study suggested that multiplication strategies will be automatically activated when there is an integer ratio number structure, causing students to use the multiplication strategy to solve non-multiplication problems. Moreover, completing the non-multiplication operation under the integer ratio structure requires students to inhibit the multiplication strategy. Based on the dual-process theory, study 1 found that 3 to 8 graders and college students all demonstrated the overuse of multiplication strategies in the non-multiplication problems with an integer ratio number structure, developmental differences were observed. Besides, compared to addition operations, the reaction time of the multiplication operation showed a shorter response time and a lower error rate. Indicating that multiplication is an automatic activation process. Based on the inhibitory control model, study 2 employed the negative priming paradigm to investigate whether 3 to 8 graders and college students need to inhibit the multiplication strategy to complete the addition operation. The results found that students in all grades demonstrated a negative priming effect, indicating that students need to rely on the inhibitory control mechanism to complete the addition problems with an integer ratio numbers structure. We also found that inhibitory control efficiency gradually increased from children to adults. Study 3 used the Event-related potential (ERP) technology to explore the brainwave difference between multiplication and addition operations in the problems with an integer ratio structure. The results showed that comparing to addition operations, multiplication operation activates larger P2 and P3 amplitudes. The findings further proved that the multiplication strategy is an intuition-based strategy that will be automatically activated when the integer ratios structure is presented in the problem while addition operation requires more cognitive resources.

Keywords: Integer ratio number structure, overuse of multiplicative thinking, dual-process theory, inhibitory control, Event-related potential

科学发现、科技开发、技术发明与创造力培养

张奇

辽宁师范大学心理学院心理学系，大连，116029，Email: zq55822@163.com

摘要 科学发现是采用科学研究的方法探究、发现和表达规律的社会实践活动。规律是事物间内在的、本质的、必然的联系或关系。探究、发现和验证规律需要采用一定的方法和技术。为此而开发和发明新方法、新工具、新技术、新材料的活动是创造性社会实践活动。发现规律后，需要表达规律和制订科学规则供人类共享。科学原理就是对规律的表达。科学规则是根据规律或科学原理制订的支配人心理与行为活动的准则。建构科学原理和制订科学规则也是创造性社会实践活动。掌握了科学原理和科学规则就可以实现对事物运动变化的预测、控制和利用。科技开发就是根据规律、科学原理或科学规则开发出新技术、新材料、新设计等创造性社会实践活动。运用新技术、新材料和新设计可以生产或创造出新产品。技术发明是为了满足人们的需要，探究新技术、制作新工具、制造新产品的创造性社会实践活动。因此，从事科学研究、科技开发和技术发明等创造性社会实践活动都需要人的创造能力。人的创造力从哪里来？从创造性社会实践活动中来。人的创造力怎么培养？在创造性社会实践活动中培养。所以，各级各类的创造性教育必须为学生从事创造性社会实践活动提供条件，诸如时间、空间、信息、工具和材料等；还要制订学生从事创造性社会实践活动质量、价值和效果的评价指标和评定标准以及鼓励和奖励等强化措施。如此才能激励学生积极从事创造性社会实践活动，并将其培养为创造性科技人才。

Scientific Discovery, Scientific and Technological Development, Technological Invention and Creativity Cultivation

Zhang Qi

School of Psychology, Liaoning Normal University, Dalian

Abstract: Scientific discovery is a social practice in which laws are explored, discovered and expressed by means of scientific research. Law is the intrinsic, essential, necessary connection or relationship between things. It is necessary to adopt certain methods and techniques to explore, discover and verify laws. To develop and invent new methods, tools, technologies and materials is a creative social practice. After discovering the law, we need to express the law and make the scientific rules for human sharing. Constructing scientific principles and formulating scientific rules are also creative social practices. Master the scientific principles and rules can realize the prediction, control and utilization of the changes in the movement of things. Scientific and technological development is to develop new technology, new material, new design and other creative social practice activities according to law, scientific principles or scientific rules. Technological invention is a creative social practice activity to explore new technology, make new tools and produce new products to meet people's needs. Therefore, engaged in scientific research, scientific and technological development and technological invention and other creativity social practices activities need people's creativity. Where does human creativity come from? From creative social practices. How to cultivate people's creativity? Cultivate in creative social practice. Therefore, creative education at all levels and of all kinds must provide conditions for student to engage in creative social practice activities, such as time, space, information, tools and materials, etc. In addition, the evaluation index and evaluation standard of the quality, value and effect of the creative social practice activities as well as the reinforcement and reward should be formulated. In this way, students can be encouraged to activity engage in creative social practice and cultivate creative scientific and technological talents.

Keywords: scientific discovery, scientific and technological development, technological invention, creativity cultivation

摘要 创造力对于个体和社会发展均具有极为重要的意义。知识多元性作为影响创造力的关键因素之一, 一直是研究者关注的一个重要主题。大量研究显示, 知识多元性和创造力之间的关系是复杂的; 无论从多元文化经验视角还是从相同文化视角来看, 二者的关系均存在着诸多不一致之处。我们认为, 造成二者之间关系不一致的一个重要原因, 是不同的研究中使用了不同的知识多元性和创造性评估方式。近年来, 在新高考政策的推动下, 部分省区实行了“6选3”的选科模式。这种做法为我们考察个体的知识多元性提供了一个相对客观的视角。有鉴于此, 本研究旨在以高中生的不同选科组合作为衡量个体知识多元性的指标, 同时采用多种任务考察创造性的方式, 进一步探讨知识多元性与创造力的关系。本研究包含四项具体研究。研究对象均为上海已分科的高中生。研究1以年级、选科组合和生活经验多样性为自变量, 考察其在图形想象、非常规用途任务和创造性观点与行为量表的得分。研究2a和2b考察不同选科组合与创造力的关系, 及智力、开放性人格的智能特征的中介作用和认知需求的调节作用。研究3以选科组合和性别为自变量, 考察其在特殊领域创造力的得分。本研究的结论为: (1) 高中生的不同选科组合与其创造力存在一定关联: 无论在一般领域创造力(图形想象任务和AUT任务)还是特殊领域创造力(设计笔任务)方面, 纯理组合的学生的创造性水平都显著高于文理组合的学生。(2) 智力在不同选科组合和一般领域创造力(图形想象任务和AUT任务)的关系间起完全中介作用: 相比文理组合的学生, 纯理组合的学生因为推理等方面的智力更强, 所以在一般领域创造力(图形想象任务和AUT任务)方面的表现更好。(3) 认知需求边缘显著地调节了不同选科组合和某些发散思维能力(AUT灵活性)之间的关系。本研究为高中生创新能力的培养提供一定的理论依据, 即在培养高中生的创造力时, 要充分注意选科组合、智力及认知需求在其中所具有的重要作用。

关键词 6选3新高考, 选科组合, 创造力, 智力, 认知需求

The Relationship Between High School Students' Subject Selection and Their Creativity in the Context of New College Entrance Exam

Pingping Zhu^{1,2}, Jiajun Guo¹, Weiguo Pang¹ (corresponding author)

1 School of Psychology and Cognitive Science, East China Normal University, 3663 North Zhongshan Road, Shanghai, 200062

2 Putian No.1 Middle School, Putian, Fujian, 351100

Abstract: Creativity is of great importance to individual and social development. Diversity of knowledge which affect creativity greatly was paid sustained attention from researchers. A large number of studies have shown that the relationship between them is complex; no matter whether this connection is examined from the perspective of multicultural experience or from the perspective of the same culture, findings remain mixed. We believe that an important reason for those inconsistencies is that diversity of knowledge and creative are assessed in different ways across studies. In recent years, under the background of implementing the new college entrance examination reform policy, some provinces and regions of China have applied the "choose 3 from 6" subject selection mode. This approach provides a relatively objective perspective for us to investigate the construct of the diversity of individual knowledge. Given this perspective, current study aims to take subject selections as indicators of diversity of individual knowledge and use a variety of tasks to investigate the creativity of high school students and furtherly explore the relationship between the diversity of knowledge and creativity. This study consists of four well-defined studies. The study used high school students who had finished subject selection in Shanghai as participants. In study 1, the creativity scores on figural imagination and alternative uses tasks (AUT) along with scores on Runco Ideational Behavior Scale (RIBS) of the participants in different grades, with diverse selection combination and diversity of life experience were examined. In study 2a and 2b, we examined the relationship between different choices of subjects

and domain-general creativity, the mediating effect of the intelligence and intellect characteristics of openness, and the moderation effect of the need for cognition. In study 3, we aimed to explore how different combinations of subject selection and gender affect the domain-specific creativity. In general, under the conditions of this study, the following conclusions can be drawn: (1) Different subject selections of high school students were correlated with their creativity to some extent: both in domain-general fields (figural imagination tasks and AUT tasks) and in domain-specific fields (the pen designing task), students with pure sciences combination selection had a significantly higher level of creativity than students with arts and sciences combination. (2) Intelligence completely mediated the relationship between different combinations selection of subjects and domain-general creativity (figural imagination tasks and AUT tasks): compared with the students chose arts and sciences subjects group, students with pure science subject selections had stronger intelligence in reasoning, so they performed better in the domain-general creativity (figural imagination tasks and AUT tasks). (3) The need for cognition marginally moderated the relationship between different combination of subject selections and some divergent thinking ability (AUT flexibility). The conclusion of this study provides a theoretical basis for the cultivation of high school students' creativity, that is to say, in the cultivation of high school students' creativity, we should focus on the important role of subject selection, intelligence levels and the need for cognition levels.

3 温州大学学生处, 温州, 325035, hyunjun@126.com

摘 要 课堂无聊是学生在课堂学习过程中普遍体验到和经常抱怨的一种消极和低唤醒的情绪。教师热情是指教师对所学科和教学的热情行为、个人特质或者积极情绪, 可以从教师报告、学生感知等多个层面进行测量。此前的研究结果表明, 相对教师报告的热情, 学生感知到的教师热情对其课堂无聊有更显著的负向预测作用。在成就情绪研究领域, Pekrun 提出的成就情绪的控制-价值理论将教师因素看作是课堂环境的重要因素, 认为影响学生包括课堂无聊在内的成就情绪的教师主导的环境变量主要包括教学质量、价值诱发和自主支持等, 其中教师热情是价值诱发的核心成分。其实在教育学研究领域, 教师热情很早就被看作是教师胜任力和教学有效性的核心要素, 近年来随着教育心理学研究领域中学生情绪和教师情绪研究的升温, 教师热情对学生学习的影响重新受到了研究人员的关注。此前的横断研究结果表明: 学生感知到的教师热情可以显著地负向预测其体验到的课堂无聊, 学生感知到的任务价值在教师热情和课堂无聊间起到了显著的中介作用。相对使用横断数据进行的中介机制研究, 纵向中介机制研究结果具有更高的说服力和价值。本研究拟使用纵向数据探讨学生感知到的教师热情对其体验到的课堂无聊的纵向预测作用及学生感知到的任务价值在两者中间可能起到的纵向中介作用。使用问卷调查的方法在一个学期内 4 次调查了 5 所大学的 1371 名大学生。结果表明: 学生感知到的教师热情显著地负向预测了其体验到的课堂无聊; 学生感知到的任务价值在教师热情和课堂无聊间起到了显著的纵向中介作用。

The longitudinal mediating role of college students' perceived task value in the relation between perceived teacher enthusiasm and class-related boredom

Guanyu Cui¹, Xia Zhang², Yunjun Hu³

1 Department of Psychology, School of education, Wenzhou University, Wenzhou, 325035

2 Department of Nursing, Henan Medical College, Zhengzhou, 451191

3 Department of Student Affairs, Wenzhou University, Wenzhou, 325035

Abstract: Class-related boredom is a negative and low-arousal emotion widely experienced and complained by students. Teacher enthusiasm has been defined as enthusiastic behaviors, personal disposition or positive emotion for subject and teaching, which can be measured by teachers' self-report and students' perceiving et al. Based on Pekrun's control-value theory of achievement emotions, main environmental variables influencing achievement emotions include multiple teacher factors, for instance, instruction, value induction and autonomy support. Among these variables, teacher enthusiasm is the core of value induction. In fact, teacher enthusiasm considered as a core factor in the evaluation of teacher competence and teaching effectiveness for a long time. With the increasing research on students' and teachers' emotions in the domain of educational psychology in recent years, more importance has been attached to the effects of teacher enthusiasm on student learning. Previous cross-section researches showed that students' perceived teacher enthusiasm predicted students' experienced class-related boredom significantly and negatively, students' perceived task value playing mediating role in the relation between perceived teacher enthusiasm and class-related boredom. Compared with mediating mechanism proposed in the cross-section model, longitudinal mediating model has a higher persuasion and value. The current research aimed to explore the longitudinal predicting role of students' perceived teacher enthusiasm on their class-related boredom and the longitudinal mediating role of perceived task value between them. Questionnaire survey was used to measure 1371 college students in five colleges at four time point. Results showed that students' perceived teacher enthusiasm predicted class-related boredom significantly and negatively across the four time point. Also, students' perceived task value playing longitudinal mediating role between them.

Keywords: Teacher enthusiasm, Class-related boredom, task value, longitudinal mediating role, College student

家庭环境质量、成就目标、学业情绪和学业倦怠之间的关系： 来自巴基斯坦和中国青少年的证据

Shagufta bibi 权思翔 王振宏（通讯作者）

陕西师范大学心理学院，陕西省儿童青少年心理行为健康哲学社会科学重点研究基地，西安，710062

wangzhenhong@snnu.edu.cn

摘要 初中生学业倦怠是环境因素和个体因素共同作用的结果。家庭环境质量，学业情绪和成就目标是与学业倦怠有密切关系的环境和个体变量。已有关于学业倦怠的研究大多基于同一文化群体下的个体，少有研究着眼于初中生学业倦怠的文化差异性。中国和巴基斯坦两国有不同的文化渊源，文化差异较大。因此，环境（家庭环境质量）和个体因素（学业情绪、成就目标）对学业倦怠的作用机制在中国和巴基斯坦青年少年中是否存在差异值得探讨。本研究运用问卷调查的方法，分别以 813 名巴基斯坦（426 男，387 女）和 420 名（224 男，196 女）中国初中生为被试，所有被试分别填写人口学调查问卷，家庭环境质量问卷，学业情绪问卷，成就目标问卷和学业倦怠问卷。结果发现，家庭环境质量和学业倦怠间的关系具有跨文化的一致性，无论在中国文化背景下还是巴基斯坦文化背景下，家庭环境质量和学业倦怠之间均呈显著负相关。学业情绪和趋近成就目标在两国文化背景下均在家庭环境质量和学业倦怠间起中介作用。但是，回避成就目标只在巴基斯坦文化背景下在家庭环境质量和学业倦怠间起中介作用。该跨文化研究为中国和巴基斯坦两国的家长、教师及学校结合本国的实际情况，采取不同的措施有效预防初中生学业倦怠的产生提供了依据。

Association among Family Environment Quality, Achievement Goals, Academic Emotions and School Burnout: Evidence from Pakistani and Chinese Adolescents

Shagufta bibi, Sixiang Quan, Zhenhong Wang (corresponding author)

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062, China

Abstract: The school burnout of adolescents is the results of the combined effects of environmental factors and individual factors. Previous studies suggested that family environment quality, academic emotion, achievement goals are all related to adolescents' school burnout. In addition, many studies on school burnout are based on the same cultural group. China and Pakistan have different culture origins and the cultural differences are large. Whether the mechanism of environmental (family environment quality) and individual factors (academic emotion, achievement goals) on academic burnout are different between Chinese and Pakistani adolescents is worth exploring. Totally 420 Chinese adolescents and 813 Pakistani adolescents were recruited from China and Pakistan. All participants completed five questionnaires, including Demographic Questionnaire, Achievement Goals Scale, Maslach Burnout Inventory-Student Survey, Academic Emotions Questionnaire and Beach Center Family Quality Of Life Scale. The results suggested that no matter under Chinese or Pakistani culture, the family environment quality is negatively related to school burnout. The academic emotion and approach achievement goal play mediators between family environment quality and school burnout under both Chinese and Pakistani culture. However, the avoidance achievement goal plays a mediator between family environment quality and school burnout just under Pakistani culture. This cross-culture study provides an evidence for school burnout prevention for Chinese and Pakistan educators.

网络学习中师生交互与大学生学习投入的关系： 自主动机与学业情绪的序列中介作用

郎悦茹 龚少英（通讯作者） 曹阳 吴亚男

华中师范大学心理学院，武汉，430079, gongsy@mail.ccnu.edu.cn

摘要 在抗击新冠肺炎疫情的背景下，网络学习已然成为当今大学生的主流学习方式。如何优化网络教学过程、改善网络学习体验也因此受到了高校教师和管理者的广泛关注。其中，网络学习中的师生交互对大学生的网络学习投入具有重要影响，但少有研究涉及其内部作用机制。为了探索大学生在网络学习中师生交互与学习投入的关系，以及自主动机和学业情绪在其中的中介作用，本研究在结合有指导的教学会谈理论、控制-价值理论和自我决定理论的基础上，采取问卷调查法，使用师生交互问卷、自主动机问卷、大学生学业情绪量表、学习投入量表，对 563 名大学生开展调研。结果发现：（1）网络学习中师生交互、自主动机、积极情绪与学习投入两两显著正相关，消极情绪仅与自主动机显著负相关；（2）网络学习中的师生交互既可以直接显著正向预测学习投入，也可以通过积极情绪间接影响学习投入，还可以依次通过自主动机和积极情绪的链式中介作用正向预测学习投入，而消极情绪在其中的中介作用不显著，自主动机也并未在其中起到简单中介作用。研究结果表明，高质量的师生交互能激发大学生网络学习的自主动机，让大学生体验到更多积极情绪，从而提高其学习投入水平。因此，在网络教学实践中，教师应注重优化师生交互过程，培养学生的自主学习动机，关注学生的情绪体验并给予及时的反馈和支持，以此促进学生的学习投入。

The Relationship Between Teacher-Student Interaction and College Students' Learning Engagement in Online Learning: Mediation of Autonomous Motivation and Academic Emotion

LANG Yueru, GONG Shaoying, CAO Yang, WU Yanan

School of Psychology, Central China Normal University, Wuhan 430079

Abstract: During the period of fighting against COVID-19, online learning has become the mainstream learning mode among college students. Accordingly, how to optimize the online learning process and improve the learning experience has been widely considered by teachers and administrators in universities. The teacher-student interaction has shown great effect on learning engagement in online learning. However, few studies so far focused on their internal functioning mechanisms. In order to explore the relationship between teacher-student interaction and learning engagement, as well as the role of autonomous motivation and academic emotion in online course, Teacher-Student Interaction Questionnaire, Learning Self-Regulation Questionnaire, Academic Emotions Questionnaire for College Student and Utrecht Work Engagement Scale-Student were used to measure 563 college students based on the Guided Didactic Conversation Theory, Control-Value Theory and Self-Determination Theory. Results were as follows: (1) In the context of online learning, teacher-student interaction, autonomous motivation, positive emotion and learning engagement were all positively correlated with each other, while negative emotion was only negatively correlated with autonomous motivation. (2) The internet teacher-student interaction could not only directly predict learning engagement positively, but also could affect learning engagement positively through the mediation of positive emotion and the chain mediation of autonomous motivation and positive emotion. However, the mediating effect of negative emotion was not significant, and the autonomous motivation did not play a simple mediating role either. These results show that teacher-student interaction with high quality in online learning can stimulate autonomous motivation of college students, promote positive emotion and improve their learning engagement. Therefore, teachers should focus more on optimizing the interaction with students, cultivating autonomous motivation, paying more attention on emotional experience as well as providing students with timely feedback and support, so as to promote the engagement in online courses.

知觉教师自主支持和控制与学生课堂学业情绪的双向关系

刘红瑞¹ 姚梅林¹ (通讯作者)

¹ 北京师范大学心理学部, 北京, 100875, mlyao@bnu.edu.cn

摘要 基于自我决定理论和控制-价值理论, 本研究对 455 名小学生进行了连续五周的问卷追踪调查, 深入考察了知觉教师教学风格 (自主支持和控制) 与学生课堂学业情绪 (愉悦、无聊、焦虑和绝望) 间的双向关系。通过构建三阶段的纵向结构方程模型, 研究 1 发现教师自主支持和控制与学生课堂学业情绪间的相互作用可在较短时期内发生, 且两者间存在双向的循环回路: “学生课堂愉悦高→教师自主支持增多→学生课堂愉悦进一步增强”, “教师控制高→学生课堂绝望增多→教师控制进一步加剧”。研究 2 则综合考虑变量的特质和状态属性, 采用潜变量增长曲线模型, 更为细致地考察了教师教学风格与学生课堂学业情绪间的双向关系。结果发现, 学生在某节课中的状态性学业情绪主要取决于其先前特质性课堂学业情绪及教师当下的状态性教学风格; 学生先前特质性课堂焦虑和绝望对教师状态性控制的初始水平的负面影响较为顽固, 具有一定的延续性, 表现在即使控制教师先前的特质性控制和学生状态性课堂学业情绪后, 这些影响依旧存在; 学生状态性课堂学业情绪可预测同一时间点的教师状态性教学风格。整体而言, 本研究揭示了知觉教师教学风格和学生课堂学业情绪间的双向关系, 丰富和拓展了现有理论框架及实证研究, 深化了对班级内教师“教”与学生“学”相互作用的认识, 为教育工作者如何进一步优化或改善教学等提供了启示。

Reciprocal Relations Between Perceived Teacher Autonomy Support and Control and Student Academic Emotions in the Classroom

Hongrui Liu, Meilin Yao (corresponding author)

Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: Grounded in control-value (CVT) and self-determination (SDT) theories, the current investigation, a multi-wave longitudinal study spanning five weeks, aimed to systematically explore whether teacher teaching style is reciprocally associated with student academic emotions in the classroom by surveying 455 primary students. With three-wave longitudinal structural equation model analysis, Study 1 found the reciprocal effects between perceived teacher teaching style and student class-related emotions in the short time frame and some reciprocal feedback loops: High enjoyment in class → increased perceptions of teacher autonomy support → increased enjoyment in class, high perceptions of teacher control → increased hopelessness in class → increased perceptions of teacher control. Study 2 further deeply examined the bidirectional effects between teacher teaching style and student academic emotions in the classroom by using the latent growth curve analysis and considering the state and general perceptions of the main variables simultaneously. Results revealed that (a) state academic emotions among students in a specific class mainly depended on their momentary perceptions of teacher teaching style and their prior general academic emotions in the classroom, yet the predictive role of prior general teacher teaching style seemed to be not prominent; (b) general class-related anxiety and hopelessness had salient effects on the initial levels of state perceived teacher control, with higher prior anxiety and hopelessness aggravating students' state perceptions of teacher control even after controlling for prior general perceived teacher control and incorporating state anxiety or hopelessness; and (c) students' class-related emotions seemed to exert immediate effects on perceived teacher teaching style in a specific class. As a whole, the findings indicate the reciprocal relationship between perceived teacher teaching style and student academic emotions, further contribute to SDT- and CVT- based research efforts in educational psychology, bear important implications for our understanding of the reciprocal relation between teachers' teaching and students' learning in the classroom, and give more accurate guides for how teachers optimize education effectiveness.

Keywords: Teacher autonomy support, teacher control, student class-related emotions, reciprocal relation

学业自我概念对学业成就的影响及其神经基础

吴慧敏¹ 郭逸群² 郭成¹ (通讯作者)

¹ 西南大学心理学部, 重庆, 400715, guochen@swu.edu.cn

² 重庆邮电大学创新创业教育学院, 重庆, 400065

摘要 学业自我概念是指个体在学业情境中形成的对自己在学业发展方面比较稳定的认知、体验和评价, 其与学生的课程选择、成就目标、学业兴趣和学业成就密切相关, 因此被视为教育的一个重要目标。研究者们提出了三个模型描述学业自我概念和学业成就的关系: 自我提升模型(学业自我概念能够显著预测学业成就, 而学业成就对学业自我概念没有影响)、技能发展模型(学业成就能够显著预测学业自我概念, 而学业自我概念对学业成就没有影响)和交互作用模型(学业自我概念与学业成就是互相影响的, 同时包含自我提升效应和技能发展效应)。许多实证研究为技能发展效应提供了支持, 而对自我提升效应尚存在较大争议由于意识到了自我概念对一系列心理、行为和社会结果的重要性, 研究者们开发了许多针对提升自我概念的干预项目, 这些项目背后所依赖的假设是自我提升效应, 而这个假设是否成立不得而知。本研究共招募了 105 名小学高年级学生 ($M_{\text{年龄}} = 10.07 \pm 0.96$ 岁), 从神经科学角度结合行为数据及脑成像数据探究了学业自我概念对学业成就的影响及其神经基础。层级回归分析结果表明, 在控制了当前的学业成就后, 个体的学业自我概念及其学业能力知觉和学业情感体验仍然能够显著地预测其未来的学业成就, 支持了自我提升效应。VBM 结果发现, 与学业自我概念显著负相关的脑区是左侧 dIPFC 和 dmPFC, 而且左侧 dIPFC 的灰质体积能够显著预测学生一年后的学业成就。中介分析结果表明, 左侧 dIPFC 的灰质体积在学业自我概念及学业能力知觉、学业情感体验对一年后的学业成就的影响中发挥着部分中介作用, 这些结果表明了左侧 dIPFC 可能是自我提升效应的神经基

础。

The Influence of Academic Self-Concept on Academic Achievement and Its Neural Basis

Huimin Wu¹, Yiqun Guo², Cheng Guo¹

1 Faculty of Psychology, Southwest University, Chongqing, 400715, guochen@swu.edu.cn

2 School of Innovation and Entrepreneurship Education, Chongqing University of Posts and Telecommunications, Chongqing

Abstract : Academic self-concept (ASC), which was defined as the relative stable cognition, experience and evaluation of individual in the academic context was closely related to course selection, achievement goals, academic interest and academic achievement, were thus considered as a significant goal of education. Researchers have proposed three models to describe the relationship between ASC and academic achievement: the Self-Enhancement Model (ASC could significantly predict achievement, but achievement has no effect on ASC), the Skill-Development Model (achievement could significantly predict ASC, but ASC has no effect on achievement) and the Reciprocal Effects Model (ASC and achievement are mutually related, and includes self-enhancement effect and skill-development effect). Many empirical studies have provided support for the skill development effect, but there was still much controversy over the self-enhancement effect. Aware of the importance of self-concept to a range of psychological, behavioral and social outcomes, researchers have developed many intervention programs which relied the hypothesis of self-enhancement effect aimed at improving ASC (Marsh, Richards, & Barnes, 1986). However, it is unknown whether this hypothesis holds. The present study combined behavioral data and fMRI data to explore the impact of ASC on academic achievement and its neural basis from the perspective of neuroscience. 105 children ranging in age from 9.11 to 11.03 years were assessed on ASC and achievement. Hierarchical regression analysis showed that after controlling T1 academic achievement and the individual's ASC, academic competence perception and academic emotional experience could still significantly predict their future academic achievements, which validates the self-enhancement effect. VBM results found that the gray matter volume (GMV) of left dlPFC and dmPFC was significantly negatively related to ASC, and the GMV of the left dlPFC could significantly predict students' academic achievement at T2. In addition, the results of mediation analysis revealed that the GMV of left dlPFC plays a part mediating role in the effect of T1 ASC, academic competence perception and academic emotional experience on T2 achievement. Thus, left dlPFC may be the neural basis underlying the influence of ASC on achievement.

留守儿童社会适应及其与家庭亲密度的关系：心理素质的中介作用

缪华灵 郭成（通讯作者）

西南大学心理学部/心理健康教育研究中心, 重庆, 400715 guochen@swu.edu.cn

摘 要 父母外出务工使留守儿童在成长中面临诸多不良家庭因素, 并导致留守儿童出现各种社会适应问题。因此, 本研究旨在考察留守儿童社会适应（人际和谐、环境认同、生活独立、学习自主）的现状, 以及心理素质及各成分在家庭亲密度和社会适应间的中介作用。采用问卷星形式在网上发布调查, 共测得留守儿童 17375 人（小学生 8521 人, 中学生 8854 人）, 平均年龄为 12.78 岁（7~19 岁, $SD=2.52$ ）。结果发现：（1）留守儿童社会适应在性别、独生子女、居住地、学段、年级和留守时长上均存在显著差异。具体地, 女生的社会适应及各维度均显著高于男生; 独生子女的生活独立显著低于非独生子女, 在社会适应及其他维度上差异不显著; 居住在城镇的学生的社会适应、人际和谐、环境认同、学习自主均显著高于居住在农村的学生,

在生活独立上差异不显著；小学生的社会适应、人际和谐、环境认同、学习自主显著高于中学生，生活独立显著低于中学生；社会适应及各维度均存在显著的年级差异，大致表现为先缓慢增长（小学），然后逐渐下降（初中），最后又有所回升（高中）的趋势；社会适应及各维度在不同留守时长上均存在显著差异，大致表现为留守时长在半年以内和 5 年以上的学生显著高于留守 1~2 年和 2~5 年的学生。（2）相关分析发现家庭亲密度、心理素质、社会适应间两两显著正相关。（3）在中介效应分析中将人口学变量作为协变量进行控制后发现，心理素质及其各成分均在家庭亲密度和社会适应间起到部分中介作用，说明家庭亲密度不仅可以直接影响社会适应，还可以通过心理素质及各成分的中介作用间接影响社会适应。这启示教育者和监护者不仅应重视不同人口学特征对社会适应的影响，还可以通过增强家庭亲密度、培养留守儿童心理素质来提高其社会适应水平。

关键词 留守儿童，家庭亲密度，心理素质，社会适应，中介作用

Social adaptation of left-behind children and its relationship with family cohesion: The mediating role of psychological *suzhi*

Hualing Miao, Cheng Guo

Faculty of Psychology / Research Center of Mental Health Education, Southwest University,
Chongqing, 400715, China

Abstract: Parents working outside make left-behind children face many bad or unhealthy family factors in their growth, and lead to various social adaptation problems. Therefore, this research aimed to investigate the characteristics of left-behind children's social adaptation (e.g., interpersonal harmony, environmental identity, independent life, and learning autonomy), as well as the mediating role of psychological *suzhi* and its components between family cohesion and social adaptation. The survey was published online in the form of wx.cn. A total of 17375 left-behind children (8521 pupils and 8854 middle school students) participated in the test, with an average age of 12.78 years (7-19 years old, $SD = 2.52$). The results showed that: (1) There were significant differences in the social adaptation of left-behind children in gender, only child, place of residence, school period, grade, and length of stay-behind. Specifically, the social adaptation and all dimensions of girls were significantly higher than boys; The independent life of only children was significantly lower than that of non-only children, and the difference in social adaptation and other dimensions was not significant; The social adaptation, interpersonal harmony, environmental identity, and learning autonomy of students living in cities or towns were significantly higher than those of students living in rural areas, and there was no significant difference in independent life; Primary school students' social adaptation, interpersonal harmony, environmental identity, and learning autonomy were significantly higher than those of middle school students, and their independent life was significantly lower than middle school students; There were significant grade differences in social adaptation and each dimension, which was roughly manifested as a slow increase (primary school), then a gradual decline (junior high school), and finally a trend of recovery (high school); There were significant differences in social adaptation and all dimensions for different stay-behind time. The students who stay behind for less than half a year or more than five years were significantly higher than those who stay behind for 1-2 years or 2-5 years. (2) Correlation analysis found that there were significant positive correlation between family cohesion, psychological *suzhi*, and social adaptation. (3) After controlling for demographic variables as covariates in the mediating effect analysis, it was found that psychological *suzhi* and its three components play a partial mediating role between family cohesion and social adaptation, indicating that family cohesion can not only directly affect social adaptation, but also indirectly affect social adaptation through the mediating effects of psychological *suzhi* and its components. Those results suggest that educators and guardians should not only pay attention to the impact of different demographic characteristics on social adaptation, but also improve left-behind children's social adaptation level by enhancing family cohesion and cultivating their psychological *suzhi*.

Keywords: left-behind children, family cohesion, psychological *suzhi*, social adaptation, mediating role

分阶综合运动大社交干预对自闭症谱系障碍儿童的症状改善

赵凡¹ 马姗姗² 刘电芝¹ (通讯作者)

1 苏州大学教育学院, 苏州, 215123, E-mail dianzhiliu@foxmail.com

2 蚌埠学院文学与教育学院, 蚌埠, 233000

摘要 本研究根据自闭症谱系障碍(ASD)儿童诸多方面的缺陷, 如共同注意缺陷、社交困难、运动障碍等, 基于皮亚杰的发展认知理论、勒温的团体动力学理论与“微生物-肠-脑轴”理论, 并结合国际循证实践, 设计了社交分阶综合运动训练的大社交干预方案并实施干预, 以期改善 ASD 儿童多方面的症状, 帮助他们更好地融入社会。“分阶综合运动训练”的分阶: 一指运动从易到难, 从单项的热身运动开始, 逐渐过渡到 2 种动作组合的运动, 再到多种动作的组合运动; 二指从单人运动到亲子互动、同伴互动再到团体互动。综合: 指团体干预、注意指引、运动、游戏四元素的有效结合, 多种功能融为一体, 并引入考察运动强度的心率实时监控, 挖掘运动训练的多功能与潜能。两次干预共 75 名 4-10 岁 ASD 儿童被随机分为干预组和对照组, 两组同时接受常规康复训练, 干预组在此基础上给予每周 3 次, 每次 1 小时, 共计 15 次的分阶综合运动大社交干预, 采用主客观指标相结合的方式评估运动干预的有效性, 在训练前期、中期、后期和训练结束一个月采用《自闭症治疗评估量表》和《社交反应量表》量表评估; 在训练前、训练后分别对 ASD 儿童的肠道微生物进行考察, 分析其与 ASD 症状的关联。结果发现中高强度的运动干预能显著改善 ASD 儿童感知觉、交往、躯体、自理方面的能力, 且干预效果存在一定延时性, 至少可保持至干预结束后一个月; 该方案对轻度、中度 ASD 儿童症状都有一定改善。中度组较轻度组患儿在语言、行为和交往能力方面进步幅度更大, 且在感觉、自理能力上进步更早; 生化指标检测发现干预能使致病的丹毒丝菌属减少, 保证代谢、维持肠道正常生理功能的拟杆菌属增加, 引起体内脂肪堆积的厚壁菌属减少; 有益菌霍氏真杆菌属、副萨特氏菌属有明显增加, 说明中高强度运动训练对 ASD 儿童个体的肠道菌群的改善有一定作用。

Effects of stepped integrated sport-group social intervention on children with autism spectrum disorder

Zhao Fan¹, Ma Shan-shan², Liu Dianzhi¹

1 School of Education, Soochow University, Suzhou

2 School of Literature and Education, Bengbu College, Bengbu

Abstract: This study bases on the multiple deficiencies in children with ASD, including joint-attention deficits, social interaction difficulties, and dyskinesia as well as developmental cognitive theory, group dynamics theory, microbe-gut-brain axis theory, and in line with international evidence-based practices, this dissertation designs an intervention means of social interaction stepped integrated exercise training to relieve symptoms of children with ASD and help them better integrate into society. “Stepped” first refers to the movement from easy to difficult, starting from a single warm-up exercise, and gradually transitioning to a combination of two movements, and then to a combination of multiple movements; second refers to the movement from single movement to parent-child interaction, peer interaction and group interaction. “Integrated” refers to the effective combination of the four elements of team intervention, attention guidance, exercise and games. Through this model, multiple functions have been integrated, tapping into the multi-functionality and potential of exercise training and fully ensuring the feasibility and effectiveness of training. 75 children with autism spectrum disorder aged 4-10 years were randomly divided into an intervention group and a control group. The two groups received routine rehabilitation training at the same time. On this basis, the intervention group was given 3 times a week for 1 hour each time. A total of 15 staged comprehensive sports social interventions, using the “Autism Treatment Evaluation Scale” and “Social Response

Scale” to conduct immediate and short-term follow-up evaluation of intervention effects. We use a combination of subjective and objective indicators to evaluate the effectiveness of sports interventions. Scales were used for evaluation in the early, mid, late and one month after training. The intestinal microbes of ASD children were analyzed before and after training to investigate the impact of exercise intervention on the physiological indicators of ASD children, and the relationship between intestinal microbes and intestinal microbes. We find that moderate to high-intensity exercise intervention can significantly improve the sensory, communication, physical, and self-care abilities of children with ASD, and the intervention effect is somewhat delayed. This proposal can somewhat relieve the symptoms of children with mild and moderate ASD. In the moderate group, the improvement in language, behaviors, and communication skills is greater than those in the mild group and the improvement in sensory and self-care abilities comes earlier. This study introduced biochemical index testing and found that social exercise training can help improve the intestinal flora of ASD. Through moderate to high-intensity exercise intervention, the disease-causing erysipelas decreased, the Bacteroides that ensure metabolism and maintain the normal physiological functions of the intestine increased, and the Firmicutes that caused the accumulation of fat in the body decreased; at the same time, the beneficial bacteria Eubacterium_hallii_group and the genus Parasutterella have increased significantly, indicating that the medium-to-high intensity exercise training has a role to play in improving the intestinal bacteria in individual children with ASD.

感恩者心理资本发展的叙事研究

和仕杰 罗鸣春（通讯作者）

云南民族大学教育学院心理学系，云南昆明，650504，E-mail: mingchunluo@126.com

摘 要 感恩是人类的一种心理特质，可划分为认知成份、情感成份和行为成份三个层面。心理资本是个体在成长和发展过程中表现出来的一种积极心理状态，包括自我效能、韧性、乐观和希望四个方面。文章从心理资本建设的角度出发，采用叙事研究方法，以个体 M 的感恩成长经验为例，采用生命线图作为线索进行访谈，在生命线图上标出 M 成长历程中的关键事件，凭此来回顾 M 的生命故事。文章从感恩的认知、情感和行为三个层面对个体心理资本建设的经验进行归纳分析，得出强化个体的感恩特质可以提升其心理资本的结论。以期为个体的心理资本发展和积极心理品质培养分享感悟和经验。

关键词 感恩，心理资本，叙事研究

Narrative Research on the Development of Gratitude's Psychological Capital

He Shijie, Luo Mingchun

School of Education, Yunnan Minzu University, Kunming, 650504, China

Abstract: Gratitude is a psychological trait of human beings, which can be divided into three levels: cognitive component, emotional component and behavioral component. Psychological capital is a positive psychological state shown by individuals during their growth and development, including self-efficacy, resilience, optimism and hope. From the perspective of psychological capital construction, this paper adopts narrative research method, takes the grateful growth experience of individual M as an example, uses life line diagram as a clue to interview, and marks the key events in M's growth process on the lifeline diagram, so as to review M's life story. This paper sums up and analyzes the experience of individual psychological capital construction from three levels of gratitude cognition, emotion and behavior, and draws the conclusion that strengthening individual gratitude characteristics can enhance their psychological capital. With a hope to sharing insights and experiences for the development of individual psychological capital and the cultivation of positive psychological quality.

自闭症干预取向转型：从行为主义到建构主义

江茂欣¹ 秦弋² 刘电芝¹

1 苏州大学教育学院, 苏州, 215123, dianzhiliu@foxmail.com

2 恒星乐乐, 杭州, 310014

摘要 根据美国最新精神障碍手册第五版, 自闭症谱系障碍的核心症状是社交障碍和重复刻板行为。自闭症个体的社交障碍随着年龄增长和发展不会得到改善, 甚至当他们的社交需求已经超过其所拥有的社交技能时, 社交障碍的症状会更加明显并影响着他们的身心健康, 同时自闭症个体被社会孤立和同伴欺压的风险也正在增加。基于大脑损害的神经可塑性原理, 自闭症个体可以通过早期密集的干预改善症状。越来越多的自闭症干预方法被开发出来, 基于底层原理不同, 这些干预方法可以分为两种主要干预取向: 行为主义干预取向和建构主义干预取向。前者以行为主义为底层原理, 以行为改变为干预目标, 以操作性条件反射原理为核心手段的应用行为分析是当前自闭症干预的主导取向。然而, 行为主义取向的自闭症干预方法只能处理较为表层、静态的行为问题以及更关注于表面、静态的行为, 难以形成动态、灵活的适应情景的社交能力, 改善更深层的认知缺陷, 是一种碎片化的加工方式, 故近年来受到越来越多的批评。以建构主义为底层原理的自闭症干预方法是未来更加有前景的干预取向, 通过促进动态社交能力的发展和改善更深层的认知问题, 把儿童通过主动学习搭建新旧经验融合的知识网络放在最为核心的位置, 认为儿童不是被动接受知识, 而是主动探索世界, 通过经验与“活动”建构自己的知识世界, 把学习看做是根据经验发展变化的过程, 是一种整体化的加工方式。相比于行为主义取向的干预方法, 建构主义取向的干预方法体系性仍然较弱。本文系统总结了自闭症建构主义取向干预方法的原理和框架, 指出建构主义取向干预方法未来发展的方向, 并介绍了笔者三年多来, 开发的一套“大社交”自闭症干预体系。“大社交”干预基于皮亚杰的建构主义理论、班杜拉的社会学习理论、维果斯基的最近发展区理论与勒温的团体动力学理论等先进教育和心理学理论, 设计了从易到难、新中有旧、旧中有新的进阶团体活动课程, 通过多轮干预实验, 已取得良好效果。

Transition of Intervention Approach in Autism: From Behaviorism to Constructivism

Maoxin Jiang¹, Yi Qin², Dianzhi Liu¹

1 School of Education, Soochow University, Suzhou 215123, China

2 Stellar LeLe, Hangzhou, 310014, China

Abstract: According to the fifth edition of the latest American Mental Disorder Handbook, the core symptoms of autism spectrum disorder are social disorders and repetitive stereotyped behaviors. The social barriers of individuals with autism will not be improved with age and development, and even when their social needs have exceeded their social skills, the symptoms of social barriers will be more obvious and affect their physical and mental health at the same time, individuals with autism are at increased risk of social isolation and peer bullying. Based on the neuroplasticity principle of brain damage, individuals with autism can improve their symptoms through early and intensive interventions. More and more intervention methods for autism have been developed. Based on the different underlying principles, these intervention methods can be divided into two main intervention approaches: behaviorist approach and constructivist approach. Applied behavior analysis with behaviorism as the underlying principle, behavior change as the intervention goal, and operational conditioning principle as the core means is the dominant approach of current autism intervention. However, behaviorist-approach autism intervention methods can only deal with more superficial and static behavior problems and more attention to surface and static behaviors. It is difficult to train dynamic and flexible social skills to adapt to the situation and improve deeper cognition defects, defect is a fragmented processing method. So it has been criticized more and more in recent years. The autism intervention method with constructivism as the underlying principle promotes the development of dynamic social skills and improves deeper cognitive problems, which is a more promising intervention approach in the future. Constructivism puts children at the core of building a knowledge network that integrates new and old experiences through active

learning. It believes that children do not passively accept knowledge, but actively explore the world and construct their own knowledge world through experience. Constructivism regards learning as a process of development and change based on experiences which is a holistic processing method. But compared with behavioral approach intervention methods, constructivism approach intervention methods are still relatively weak. This article systematically summarizes the principles and framework of constructivism approach intervention methods for autism, and points out the future development direction of constructivism approach intervention methods and introduces the author developed a set of "Great Social" autism intervention system in the past three years. . The "Great Social" intervention is based on Piaget's constructivism theory, Bandura's observational learning theory, Vygotski's theory of the zone of recent development and Lewin's group dynamics theory and other advanced educational and psychological theories. Designed advanced group activity courses from easy to difficult, old in the new, and new in the old. Through multiple rounds of intervention experiments, good results have been achieved.

摘要 目的: 编制《自闭症症状干预进阶评估问卷》, 为考察自闭症谱系障碍 (Autism Spectrum Disorder, ASD) 儿童核心障碍所处阶段、设计符合 ASD 儿童最近发展区的个别化干预方案与评估干预效果提供参考。

方法: 根据美国《精神障碍诊断与统计手册》(第五版) 初定问卷维度。基于对 19 位家长访谈、13 位家长日常观察和 ASD 干预视频分析, 并参考 3-6 岁儿童发展指南、0-6 岁儿童发展里程碑、经典的自闭症评估问卷编制题项。以社会融入为目标, 症状减轻为核心, 遵循从熟悉到陌生、简单到复杂、个体到集体原则设计进阶。初步编制《自闭症症状干预进阶评估问卷》。按照 15 位 ASD 研究者, 7 位 ASD 干预教练和医生、6 位 ASD 儿童家长的建议逐一修订题项和进阶。对 58 名 ASD 儿童, 76 名非 ASD 儿童测评结果进行项目分析和信效度检验。**结果:** 《自闭症症状干预进阶评估问卷》包括《社交进阶评估问卷》、《受限和重复的行为干预评估问卷》。社交与受限、重复的行为维度的内部一致性信度分别为: 0.893, 0.881。社交与受限、重复的行为维度得分相关 ($r=0.538$, $P<0.05$) 低于二者与总问卷得分的相关 ($r=0.940$ 、 $r=0.793$, $P<0.05$)。社交与受限、重复的行为维度得分、总问卷得分均与《自闭症治疗评价问卷》得分呈显著相关 ($r=-0.595$ 、 -0.517 、 -0.756 ; $P<0.05$)。非 ASD 儿童在社交与受限、重复的行为维度得分和总问卷得分 (55.63 ± 7.85 、 46.20 ± 6.77 、 101.83 ± 11.86) 均高于 ASD 儿童 (28.09 ± 10.25 、 36.29 ± 8.82 、 64.38 ± 14.11), 差异显著 ($P<0.05$)。**结论:** 《自闭症症状干预进阶评估问卷》内部一致性信度、结构效度、校标效度和区分效度良好, 能考察 ASD 儿童核心症状所处等级和改善状况。

3 Tin Ka Ping School of Education Science, Jiangnan University, Wuxi, 214122, China

Abstract: Objective: To develop Progressive Assessment Questionnaire for Autism Symptom Intervention for providing a reference for investigating the stages of core symptoms in children with Autism Spectrum Disorder(ASD), designing individualized intervention programs to meet the nearest developmental zone of children with ASD, and

evaluating the effectiveness of interventions Methods: The dimensions of questionnaires were initially determined according to the US Diagnostic and Statistical Manual of Mental Disorders (Fifth Edition). Based on interviews with 19 parents, daily observations of 13 parents, and video analysis of ASD interventions, and referring to the development guidelines for children aged 3-6, developmental milestones for children aged 0-6, and classic autism assessment questionnaires, items were prepared. With social integration as the goal and symptom reduction as the core, the progression was designed following the principles from familiar to unfamiliar, simple to complex, and individual to collective. Progressive Assessment Questionnaire for Autism Symptom Intervention was developed. The items and levels were revised one by one as suggested by 15 ASD researchers, 7 ASD intervention coaches and physicians, and 6 parents of children with ASD. The Progressive Assessment Questionnaire for Autism Symptom Intervention includes the Progressive Evaluation Questionnaire of Sociality, Progressive Evaluation Questionnaire of Restricted and Repetitive Behavior. Results: The internal consistency reliability of social and restricted, repetitive behaviors dimensions were 0.893 and 0.881, respectively. The scores of social and restricted, repetitive behavior dimensions and total scores of the questionnaire were significantly correlated with the autism treatment evaluation questionnaire ($r = -0.595, -0.517, -0.756; P < 0.05$). The scores of social and restricted, repetitive behaviors dimensions and total scores of the questionnaire of non-autistic children ($55.63 \pm 7.85, 46.20 \pm 6.77, 101.83 \pm 1.8$) were higher than those of ASD children ($28.09 \pm 10.25, 36.29 \pm 8.82, 64.38 \pm 14.11$), the difference was statistically significant ($P < 0.05$). Conclusion: The Progressive Assessment Questionnaire for Autism Symptom Intervention has good internal consistency reliability, structural validity, calibration validity and discrimination validity and can investigate the level and improvement of the core symptoms of ASD children.

基于 SOME 模型的共情大社交干预对自闭症谱系障碍儿童的改善

马姗姗¹ 赵凡² 刘电芝² (通讯作者)

¹ 蚌埠学院文学与教育学院, 蚌埠, 233000

² 苏州大学教育学院, 苏州, 215123, dianzhiliu@foxmail.com

摘要 SOME 模型(The self to other model of empathy)在已有理论和证据的基础上提供了一个理解自闭症谱系障碍个体共情机制的整合式框架, 可以用来指导自闭症儿童共情和社交干预的实践, 但具体训练方法仍待探索。本研究以 SOME 模型为理论基础, 以模型中的情境情绪理解、观点采择与意图归因和情感表达与反应评估 3 个子系统为课程的基本构成要素, 首次设计以改善 ASD 儿童多种典型症状为目标的共情团体大社交干预项目并实施干预。49 名 4~10 岁自闭症谱系障碍(ASD)儿童被随机分为干预组和对照组, 两组同时接受常规康复训练, 干预组在此基础上给予每周 3 次, 每次 1.5 小时, 共计 18 次的共情团体大社交训练, 采用《社交反应量表》、《自闭症治疗评估量表》和《格里菲斯共情测验(父母版)》对干预效果进行即时和短期追踪评估。结果发现: (1)在即时效果方面, 干预组社交反应症状后测得分显著低于前测, 后测的共情能力显著高于前测, ASD 症状表现显著低于前测, 对照组差异不显著; (2)在延迟效果方面, 干预组的社交能力得到提升, 在社交沟通和 ASD 行为方式上, 追踪阶段还有进步。干预组的共情能力和 ASD 症状表现的追踪测结果总体上与后测差异不显著, 说明干预效果至少可以持续 1 个月, 特别在认知维度的症状表现上, 追踪阶段仍有改善。研究表明, 基于 SOME 模型的共情大社交干预可以在一定程度上提升 ASD 儿童的社交能力和共情能力, 改善其症状表现。

Empathy-social Group Intervention and Improvement in Children with Autism Spectrum Disorder Based on SOME Model

MA Shan-shan¹, ZHAO Fan², LIU Dian-zhi²

¹School of Literature and Education, Bengbu College, Bengbu Anhui 233030, China

² School of Education, Soochow University, Suzhou Jiangsu 215123, China

Abstract: Based on previous theories and evidences, SOME Model (The Self to other model of empathy) provides an integrated framework for understanding the empathy mechanism of individuals with autism spectrum disorder (ASD). It can be used to guide intervention practices, but the relevant methods remain to be explored. The present study, which based on SOME model, first designed an empathy-social group intervention program aiming at improving typical symptoms of children with ASD. Our study attempted to use a 2 (group: SOME empathy-social training vs regular training) $\times$ 3 (test time: pre vs 6-week post vs 11-week post) between-and within-subjects design to investigate the effect of SOME empathy-social training on improving 4-to-10-year-old ASD children's empathy ability and presentation of symptoms. The SOME empathy-social training consisted of 18 sessions, 90 minutes per session, and three sessions per week for about 2 months. ASD children were assigned to two groups, SOME empathy-social training group (N=26) and control group (N=23). In the empathy-social training group, the instructor guided children to perform activities of empathy, while both groups received routine training. In this intervention project, each structured intervention course contains three key training elements: situational emotion understanding, viewpoint selection and intention attribution, emotion expression and response assessment. ASD children's empathy ability and presentation of symptoms were measured before and after training and 1 month after training using the Social Responsiveness Scale (SRS) and the Griffith Empathy Measure Parent Ratings (GEM-PR) and the Chinese version of Autism Treatment Evaluation Checklist (ATEC) (e.g. Inhibition Control: Age, Gender, Verbal IQ: PPVT, Raven's IQ: CRT, Educational level of parents and Household income). To investigate whether SOME empathy-social training can enhance children's ability of empathy and improve their symptoms, we performed 2 (group: SOME empathy-social training vs regular training) $\times$ 3 (test time: pre vs 6-week post vs 11-week post) repeated measures ANOVA. The results revealed that the GEM-PR and the SRS scores of the SOME empathy-social training group at week 6 and week 11 were significantly higher than baseline while the ATEC scores of this group at week 6 and week 11 were significantly lower than baseline. The total scores of the intervention group on these two questionnaires at week 6 and week 11 had no significant differences. However, in terms of social communication and ASD behavior of SRS and terms of Cognitive symptoms of ATEC, the week 11 test was significantly better than the test at week 6. For the control group, no significant differences were found among the scores of before, week 6 and week 11. In conclusion, these results suggested that the positive effects of this interventional approach on social skills, empathy and ASD symptoms in 4-to-10-year-old ASD children and these effects last for at least 1 month. The training program can be tried and extended to children with ASD, and its intervention methods and long-term effects need to be further tested in future studies.

自闭症儿童 N170 的特异性及作为干预效果评估生物标志物的可靠性

疏德明 刘电芝 (通讯作者)

苏州大学教育学院, 苏州, 215123, dianzhiliu@foxmail.com

摘要 研究目的: 探索自闭症儿童情绪面孔加工诱发 N170 的特异性, 以及作为干预效果评估的生物标志物的可靠性。研究过程: 对 12 名自闭症儿童进行为期 1 个月, 共 18 次的感觉统合团体训练。参与者需在干预训练前和干预训练后分别在电脑上完成面孔加工任务, 同时记录脑电, 离线分析面孔加工任务诱发的 N170 成分特征。同期有 10 名正常发展儿童完成相同面孔加工任务作为对照。研究结果: 经过感觉统合团体训练后,

自闭症儿童的行为指标得到显著改善。N170 的潜伏期和波幅的分析结果如下：（1）对 N170 的潜伏期进行 2（前测、后测）*4（负性面孔、正性面孔、中性面孔、非面孔）*3（额区、中央区、顶区）的重复测量方差分析，发现前后测 N170 的潜伏期差异显著（ $p < 0.01$, $\eta_p^2 = 0.528$ ），后测 N170 的潜伏期显著短于前测。位置主效应显著（ $p < 0.001$, $\eta_p^2 = 0.632$ ），额区和中央区的潜伏期显著短于顶区（ $p < 0.01$, $p < 0.001$ ）。（2）对 N170 的波幅进行 2*4*3 的重复测量方差分析，发现前后测、图片类型主效应不显著。位置主效应显著（ $p < 0.001$, $\eta_p^2 = 0.757$ ），额区和顶区大于中央区（ $p < 0.05$, $p < 0.001$ ）。（3）对自闭症前测与对照组的潜伏期进行重复测量方差分析，发现被试间差异显著（ $p < 0.05$, $\eta_p^2 = 0.242$ ），前测潜伏期显著长于对照组。（4）对自闭症组前测与对照组的波幅进行重复测量方差分析，发现被试间差异不显著。（5）对自闭症组后测与对照组的潜伏期进行重复测量方差分析，发现被试间差异不显著。（6）对自闭症组后测与对照组的波幅进行重复测量方差分析，发现被试间差异不显著。研究结论：经过感觉统合团体训练，自闭症儿童行为指标有显著改善，情绪面孔加工诱发的 N170 潜伏期显著缩短。表明自闭症儿童情绪面孔加工的神经机制具有可塑性，情绪面孔加工的 N170 的潜伏期可以作为自闭症干预训练效果的生物标志物，具有一定可靠性。

Atypicality of the N170 in children with autism and its reliability as a biomarker for evaluating intervention effects

SHU Deming, LIU Dianzhi (Corresponding Author)

School of Education, Soochow University, Suzhou, 215123, dianzhiliu@foxmail.com

Abstract: Research purpose: To explore the atypicality of N170 induced by emotional face processing in children with autism and its reliability as a biomarker for evaluating intervention effects. Research process: A total of 18 times sensory integration group trainings were conducted on 12 children with autism for 1 month. Participants are required to complete face processing tasks before and after intervention training on computer, record EEG, and analyze the N170 ERP components induced by face processing tasks. During the same period, 10 children with typical development completed the same face processing tasks as a control group. Research results: After sensory integration group training, the behavioral indicators of children with autism have been significantly improved. The analysis results of the latency and amplitude of N170 ERP component are as follows: (1) A repeated measurement analysis of variance of the latencies were conducted, 2 (pre-test, post-test) *4 (negative face, positive face, neutral face, non-face) *3 (frontal, central, parietal), the results show the difference in the latencies of N170 before and after the training were significantly different ($p < 0.01$, $\eta_p^2 = 0.528$), the latencies of the N170 in the post-test was significantly shorter than that in the pre-test. For N170 latency, there was a main effect of electrode positions ($p < 0.001$, $\eta_p^2 = 0.632$), the N170 latencies of the frontal area and central area were significantly shorter than that of the parietal area ($p < 0.01$, $p < 0.001$). (2) A 2*4*3 repeated measurement analysis of variance was performed on the amplitudes of N170, there were no main effect of pre-post test and picture type. The difference between positions was significant ($p < 0.001$, $\eta_p^2 = 0.757$), such that the frontal area and the parietal area had larger N170 amplitudes than the central area ($p < 0.05$, $p < 0.001$). (3) Repeated measures analysis of variance was performed on the latencies of the pre-test of ASD group and the control group. For N170 latency, there was a main effect of groups ($p < 0.05$, $\eta_p^2 = 0.242$), such that the pre-test of ASD group had a longer latency. (4) Repeated-measure analysis of variance was performed on the

amplitudes of the pre-test of ASD group and the control group, there was no main effect of groups. (5) Repeated-measure analysis of variance was performed on the latencies of the post-test of ASD group and the control group, there was no main effect of groups. (6) Repeated-measure analysis of variance was performed on the amplitude of the post-test of ASD group and the control group, there was no main effect of groups. Research conclusion: After sensory integration group training, the behavioral indicators of autistic children are significantly improved, and the latency of N170 induced by emotional face processing become shorter, indicating that the neural mechanism of emotional face processing in autism is plastic, and the latency of N170 ERP component is reliable as a biomarker for evaluating intervention effects.

自闭症儿童尿液汞含量与团体运动进阶干预的关系

张剑心¹ 赵凡² 刘电芝² (通讯作者)

1 江南大学教育学院, 无锡, 214122

2 苏州大学教育学院, 苏州, 215123, psydzliu@163.com

摘要 已有研究对自闭症儿童进行有效的运动干预, 但未采取团体进阶设计; 发现汞含量与自闭症状正相关, 但未考察与干预效果的关系。因此本研究建立团体运动进阶干预模式, 考察尿液汞含量与自闭症状和干预效果的关系。实验组 and 对照组分别为自闭症儿童 14 人和 11 人。两组年龄 ($M \pm SD = 6.11 \pm 1.60, 7.05 \pm 3.52$)、自闭症 ABC 总分和各维度得分差异都不显著, $P_s > 0.05$ 。实验组团体运动进阶干预 15 次, 每周 3 次, 每次 1 小时。每次干预由单人运动进阶到两人互动运动, 再进阶到团体情境运动。整个干预前中后期, 认知复杂性和社交情境性逐步增加, 前中后期也形成进阶关系。采用自闭症状 ABC 量表进行前中后测和延迟后测。实验组在整个干预前后各采集一次尿液, 依据 WS/T 26-1996, 采用 AFS-8520 型原子荧光光度计检测汞含量, 检测室温度 24.0°C, 湿度 48.0%。对照组不进行运动进阶干预, 只接受日常学习和其它干预。发现: (1) 干预效果。自闭症状 ABC 总分的中、后、延迟后测显著小于前测 ($p_s < 0.05$); 运动、自理、语言、交往症状的中、后和延迟后测显著小于前测 ($p_s < 0.05$); 自理症状延迟后测显著小于中测 ($p < 0.05$)。对照组 ABC 总分及各维度前后测差异不显著。表明团体运动进阶干预减轻了自闭症状。(2) 损害效应。尿液汞含量前测 ($M \pm SD = 0.0172 \pm 0.0165, \text{ug/L}$) 与后测 ($M \pm SD = 0.0177 \pm 0.0178$) 差异不显著, 表明运动进阶干预不能改变尿液汞含量。但尿液汞含量前后测, 与自闭症状 ABC 总分、交往症状前后测、自理症状前测显著正相关 ($r = 0.56-0.70$ 之间, $p_s < 0.05$), 表明尿液汞含量可作为自闭症状标记物。尿液汞含量对自闭症儿童有损害效应, 尿液汞含量越大, 自闭症状越严重。(3) 基线效应。尿液汞含量前后测及其差值(前减后, $M \pm SD = -0.0005 \pm 0.0082$), 与自闭症状干预效果大部分正相关, 少部分负相关, 表明尿液汞含量影响干预效果。尿液汞含量对干预效果有基线效应, 尿液汞含量越大, 自闭症状越严重, 干预效果却越好, 反映对汞的代谢排泄能力。本研究开发的团体运动进阶干预模式对中、重度自闭症儿童效果更好。

关键词 自闭症儿童, 团体运动进阶干预, 干预效果, 尿液汞含量, 损害效应, 基线效应

Relationship between urinary mercury content and advanced group motor intervention in children with autism

Jianxin Zhang¹, Fan Zhao², Dianzhi Liu^{2,*}

1 School of Education, Jiangnan University, Wuxi 214122, China

2 School of Education, Soochow University, Suzhou 215123, China

The E-mail of corresponding author: psydzliu@163.com

Abstract: Some studies have conducted effective motor intervention for children with autism, but have not adopted group advanced design. Mercury content was found to be positively correlated with autism, but the relationship with intervention effect was not examined. Therefore, this study established a progressive intervention model of group movement, and investigated the relationship between urine mercury content and autism symptoms and intervention

effect. Fourteen children with autism were selected in the experimental group and 11 in the control group. There were no significant differences between the two groups in age ($M \pm SD = 6.11 \pm 1.60, 7.05 \pm 3.52$), ABC total score and scores of all dimensions ($P > 0.05$). The experimental group received 15 advanced group exercise interventions, 3 times a week, for 1 hour each time. Each intervention progressed from single movement to two people interactive movement, and then to group situational movement. The cognitive complexity and social contextuality increased gradually in the whole period before, during and after intervention, and a progressive relationship was formed in the period before, during and after intervention. The ABC scale was used for pre -, medium - and posttest. The urine of the experimental group was collected once before and after the intervention, and the mercury content was detected by AFS-8520 atomic fluorescence spectrophotometer according to WS/T 26-1996. The temperature in the test room was 24.0C, and the humidity was 48.0%. The control group received only daily learning and other interventions without exercise progression intervention. Findings: (1) Intervention effect. The ABC total score in posttest, posttest and posttest was significantly lower than that in pretest ($P < 0.05$). The posttest, posttest and delayed posttest were significantly lower than those of pretest ($P < 0.05$). The posttest of self-care symptoms was significantly lower than the median test ($P < 0.05$). There was no significant difference in ABC total score and all dimensions in control group. It showed that advanced intervention of group exercise alleviated autism symptoms. (2) Damage effect. There was no significant difference in urine mercury content between pretest ($M \pm SD = 0.0172 \pm 0.0165, \text{ug/L}$) and posttest ($M \pm SD = 0.0177 \pm 0.0178$), indicating that advanced exercise intervention could not change urine mercury content. However, there was a significant positive correlation between the urine mercury content before and after measurement and the total ABC score of ASD, before and after measurement of social symptoms, and before and after measurement of self-care symptoms ($r = 0.56-0.70, P < 0.05$), indicating that the urine mercury content could be used as a marker of ASD. The higher the urine mercury content, the more severe the autism. (3) Baseline effect. The difference of urine mercury content between before and after measurement ($M \pm SD = -0.0005 \pm 0.0082$) was positively correlated with the intervention effect of autism, while a small part was negatively correlated, indicating that urine mercury content affected the intervention effect. The urine mercury content had a baseline effect on the intervention effect. The higher the urine mercury content, the more severe the autism, the better the intervention effect, reflecting the metabolic and excretion ability of mercury. The group movement progressive intervention model developed in this study has a better effect on children with moderate and severe autism.

Keywords : Children with autism, Advanced group motor intervention model, intervention effect, urine mercury content, impairment effect, baseline effect

父母严厉管教与青少年焦虑的双向关系： 基于交叉滞后与随机截距交叉滞后模型的分析

刘仕凡¹ 付聪¹ 王美芳² (通讯作者) 房馨² 洪松岳²

1 首都师范大学心理学院, 北京, 100037

2 首都师范大学初等教育学院, 北京, 100037, meifangw@hotmail.com

摘 要 双向亲子关系理论强调父母与儿童之间存在相互影响。但以往关于父母严厉管教与儿童焦虑的研究较多关注父母驱动效应, 即父母严厉管教对儿童焦虑的影响, 较少关注儿童驱动效应, 即儿童焦虑对父母严厉管教的影响。基于此, 本研究以 610 名青少年及其父母为被试, 采用从初一到初三连续三年、间隔一年的追踪研究设计, 通过构建交叉滞后模型(cross-lagged panel model, CLPM)和随机截距交叉滞后模型(random intercept cross-lagged panel model, RI-CLPM)来考察父亲、母亲严厉管教(包括体罚和心理攻击)与青少年焦虑的双向关系。结果发现: 在 CLPM 模型中, 儿童驱动效应显著。具体表现为 T1、T2 的青少年焦虑正向预测一年后青少年报告的父母心理攻击和母亲体罚, T1 青少年焦虑正向预测一年后青少年报告的父亲体罚、父亲报告的父亲心理攻击和体罚, 以及母亲报告的母亲心理攻击; 在父母驱动效应方面, 仅发现 T2 时父亲报告的父亲心理攻击正向预测一年后的青少年焦虑。在 RI-CLPM 模型中, 在家庭内水平上, 仅发现 T2 时青少年焦虑的增加显著预测一年后母亲报告的母亲心理攻击的减少。在家庭间水平上, 与焦虑水平较低的青少年相比, 焦虑水平较高的青少年报告了更多的父母心理攻击和体罚, 其父母也报告了更多的心理攻击。多群组分析未发现父母严厉管教与青少年焦虑的双向关系中存在性别差异。结论: 综合 CLPM 与 RI-CLPM 的结果, 父母严厉管教与青少年焦虑的关系主要表现为儿童驱动效应, 且这一效应更多源于稳定的家庭间差异, 而非家庭内的动态变化。此外, 在家庭内水平上, 本研究发现青少年焦虑的增加显著预测一年后母亲报告的心理攻击的减少, 但并未显著预测青少年报告的母亲严厉管教的变化, 这一结果也在一定程度上体现了青少年和母亲对母亲教养的不同认知。本研究结果强调了区分家庭间差异和家庭内动态变化的重要性, 而且干预研究和儿童保护机构应高度关注高焦虑青少年家庭并对其父母的教养方式给予恰当指导和帮助。

Abstract: The bidirectional theory of parent-child relations emphasizes the transactional influence between parents and children. Notably, prior research on the relations between parental harsh discipline and adolescents' anxiety primarily focused on the effects of parental harsh discipline on children's anxiety (i.e., parent-driven effects), and there is a dearth of literature examining the effects of children's anxiety on parental harsh discipline (i.e., child-driven effects). To address above gaps, present study followed 610 children and their parents across three time points (from Grade 1 to Grade 3 in junior high school; one year apart), and examined the reciprocal relations between both father's and mother's harsh discipline (including psychological aggression and corporal punishment) and adolescent's anxiety using the cross-lagged panel model and the random intercept cross-lagged panel model. The results of CLPM

indicated significant child-driven effects. Specifically, adolescent's anxiety at T1 and T2 positively predicted adolescent-reported parental psychological aggression and maternal corporal punishment one year later; Adolescent's anxiety at T1 positively predicted adolescent-reported paternal corporal punishment, father-reported their own psychological aggression and corporal punishment, as well as mother-reported their own psychological aggression one year later. As for parent-driven effects, father-reported psychological aggression at T2 positively predicted adolescent's anxiety one year later. According to the results of RI-CLPM, at the within-family level, increments in adolescent's anxiety at T2 predicted decrements in mother-reported their own psychological aggression one year later. At the between-family level, compared to the adolescents who reported lower anxiety, those adolescents who reported higher anxiety experienced more parental psychological aggression and corporal punishment. Finally, no adolescent gender differences were found in the above relations. To sum up, adolescent's anxiety in a given year positively predicted parental harsh discipline in the next year (child-driven effects), and these child-driven effects were primarily due to stable between-family differences instead of within-family fluctuations. Moreover, at the within-family level, the present study found that increments in adolescent's anxiety predicted decrements in mother-reported but not adolescent-reported maternal psychological aggression one year later, and these results reflected the discrepancy between mothers' and adolescents' perception of harsh parenting. Our findings illustrate the importance of distinguishing among between-family and within-family associations, and also highlight that adolescents with higher anxiety are more likely to suffer from parental harsh discipline. Therefore, intervention projects and child protective agencies should give adequate attention and timely support to these adolescents.

Keywords: parental harsh discipline, adolescent's anxiety, within-family effects, between-family effects

学龄前儿童执行功能与接受性语言的双向关系： 基于随机截距交叉滞后模型的分析

邢晓沛¹ 王美芳²（通讯作者）

1 首都师范大学心理学院，北京，100037

2 首都师范大学初等教育学院，北京，100037, meifangw@hotmail.com

摘要 高级认知调节能力与语言发展之间的关系一直以来是发展心理学研究者关注的热点问题之一。特别是在儿童早期，高级认知调节能力的重要成分之一执行功能与接受性语言均发生快速且显著的发展变化。基于 Fischer 等提出的动态技能理论，心理技能的发展并不是孤立的，而是彼此间会发生动态性的相互影响，并且这一影响还会随年龄与情境的变化而变化。基于该理论，作为学前期同时快速发展的两种重要的技能，研究者推测执行功能与接受性语言之间可能也会以动态互动的方式发展，而且一方对另一方的影响可能会随时间而发生变化。同时，考虑到执行功能与语言在发展早期表现出一定的儿童性别差异，两者间的双向影响中是否会存在性别差异也是本研究感兴趣的问题之一。因此，本研究拟聚焦于学前儿童，采用 3 个时间点追踪研究设计和随机截距交叉滞后模型从个体间与个体内层面上来揭示执行功能子成分与接受性语言之间的双向关系及其性别差异。研究被试为 320 名学前儿童，执行功能采用 Willoughby 编制的 EF Touch 程序任务进行调查，接受性语言采用 PPVT-4 进行调查。结果发现：在 T1 与 T2 时间点上，抑制控制和注意转移与接受性语言存在相互预测效应，但在 T2 与 T3 时间点上，仅抑制控制和注意转移对接受性语言的预测显著，而语言对两者的预测效应不再显著；在三个时间点上，工作记忆与接受性语言间存在稳定的个体内双向预测效应；多群组分析没有发现执行功能子成分与接受性语言的双向关系中存在儿童性别差异。结论：在学前阶段，执行功能与接受性语言的发展在个体内水平上存在双向影响，且这一影响因执行功能子成分的不同而异；研究结果在一定程度上强调了旨在提升接受性语言或执行功能的训练可以对两者起到相互促进的作用，同时包括 EF 与语言的早期多元指导干预策略可能比仅关注其中一方的干预策略效果更佳。

Reciprocal Relation between Executive Function and Receptive Vocabulary in Chinese Preschoolers: Based on the Random Intercept Cross-Lagged Panel Model Analysis

Xiaopei Xing¹, Meifang Wang²(corresponding author)

1 Department of Psychology, Capital Normal University, Beijing

2 College of Elementary Education, Capital Normal University, Beijing

Abstract : The relationship between high cognitive regulation and language skill has long been in the focus of theoretical and empirical research in developmental psychology. Preschool is a critical period of rapid growth and considerable individual variability in children's executive function and language skills. Within the dynamic skill theory framework, one child's development proceeds along a developmental web with multiple independent strands that branch and join, and the developing skills in one strand could inevitably influence developing skills in another. Accordingly, executive function and language skills may develop in dynamic interaction and the effects of one on the other may change over time. In addition, gender difference patterns in the development of executive function and receptive language during early childhood also inspired us to explore whether the reciprocal relations between EF and language skills would also differ for boys and girls. By using a three-time longitudinal design, the present study focused on three components of executive function (EF) respectively to examine whether the relation between EF and receptive vocabulary was reciprocal and whether the direction of the above relation would differ by EF components and child gender. A total of 320 Chinese preschool children were assessed when they enrolled in preschool the first year (T1), the second year (T2) and the third year (T3), respectively. Children's EF was assessed by six computerized tasks and receptive vocabulary was assessed by the Peabody Picture Vocabulary Test (PPVT-4). Data was analyzed in the random intercept cross-lagged panel model (RI-CLPM). Findings provided some support for within-person reciprocal relations between EF and receptive vocabulary, but the reciprocal patterns varied depending on EF components. In specific, inhibitory control/attention shift and receptive vocabulary were reciprocally predicted between T1 and T2, and inhibitory control/attention shift at T2 could significantly predict receptive vocabulary at T3, but not vice versa. Working memory and receptive vocabulary were reciprocally predicted between T1 and T2 and between T2 and T3. That is, after adjusting for any prior fluctuation in both EF and receptive vocabulary, when children's EF increased beyond their own typical levels at the beginning of preschool, they were more likely to display increases in their own typical levels of receptive vocabulary at the middle preschool, and likewise, when children's receptive vocabulary increased beyond their own typical levels at the beginning of preschool, they were also more likely to display increases in their own typical levels of EF one year later, but the changes of inhibitory control and attention shift can not promote the improvement of receptive language at least during late preschool. Finally, no child gender differences were found in the above relations. Our findings make an important contribution to our understanding of how two important skills dynamically relate across times and how reciprocal patterns vary according to EF components and child gender, and also implicate that the instructions and interventions integrating EF and language skills may be an important avenue for enhancing success across skills.

摘要 心理控制这一教养方式往往会对儿童内心产生侵扰，不利于其社会情绪功能的发展。然而，心理控制与儿童发展之间的关系在不同年龄段存在怎样的差异目前研究关注的并不多。本研究采用时间变异效应模型（Time-Varying Effect Modeling, TVEM）考察了父母心理控制与儿童获益解释、抑郁症状发展关系的年龄差异，以及父母角色和儿童性别在其中的作用。研究选取 1204 名 3-7 年级学生（ $M_{age}=11.75$ 岁， $SD=1.53$ ）为研究对象，采用儿童报告和父母报告方式测量父母心理控制、儿童获益解释以及抑郁症状。研究结果表明，男孩父母报告和男孩知觉的心理控制在 8-14 岁之间呈上升趋势，且在此年龄段父母报告的心理控制可正向预测男孩的抑郁症状。女孩父母报告和女孩知觉的心理控制在 10-13 岁之间呈显著上升趋势，且在此年龄段父母报告的心理控制可正向预测女孩的抑郁症状。上述结果表明，青春期早期可能是一个关键时期，在此阶段，父母采取更多的心理控制尤其不利于儿童社会情绪功能的发展。

3 University of Maryland, Baltimore County

Abstract: Psychologically controlling parenting has been found to be detrimental to children's social-emotional development across cultural contexts. However, the developmental changes of psychologically controlling parenting and its associations with child development across childhood and adolescence remain less well understood. The present study used time-varying effect modeling to examine the age-varying associations between parents' psychologically controlling parenting, children's cognitive appraisals of such parenting, and children's depressive symptoms in Chinese families and the roles of parent and child gender in these age-varying associations. Children ($N=1204$, $M_{age}=11.75$ years) in Shanghai, China, reported their perceived levels of psychological control from parents, their cognitive appraisals of how much their parents engaged in psychological control for children's own good, and depressive symptoms. Children's both parents reported their engagement in psychologically controlling parenting and demographic information. The results indicated that parent-reported and boy-perceived psychological control increased from 8 to 14, which overlapped the age range within which parent-reported psychological control was significantly associated with boys' depressive symptoms. Similarly, parent-reported and girl-perceived psychological control increased from 10 to 13, which overlapped the age range within which parent-reported psychological control was significantly associated with girls' depressive symptoms. Findings highlighted early adolescence as a risk period during which parents used more psychological control and such an increase in psychological control may be particularly detrimental to child development.

Keywords: psychological control, positive interpretation, depressive symptoms, developmental change, early adolescence, time-varying effect modeling

留守青少年抑郁的发展轨迹：亲子分离和亲子联结的作用

赵景欣（通讯作者） 刘媛

山东师范大学心理学院，济南，250014, jingxinzha@126.com

摘要 父母外出务工所导致的亲子分离已经成为一种全球性现象，在极大程度上提升了留守青少年经历抑郁症状的概率。虽然与父母长期分离，但是留守青少年与父母之间依然存在情感上和行为上的联结（例如，远程沟通、父母回家探望时的面对面沟通等）。在这一背景下，亲子分离和亲子联结如何作用于留守青少年抑郁症状的发展，已经成为该领域研究中的一个热点问题。该问题的解决不仅有利于深入认识留守家庭中的亲子系统与个体抑郁发展之间的关系，而且对于留守青少年抑郁的预防和干预具有重要意义。然而，已有研究多采用横断设计，难以深入探究留守青少年抑郁的发展轨迹以及亲子分离、亲子联结对其发展轨迹的共同作用。本研究对 1549 名初一年级学生（426 名双亲外出青少年，681 名父亲外出青少年，442 名非留守青少年）进行了间隔 6 个月的 3 次追踪测量，通过潜变量增长模型考察了双亲外出、父亲外出、非留守青少年抑郁的发展轨迹，以及亲子分离（分离形式、分离年龄和分离时长）、亲子情感联结（父子亲合、母子亲合）和行为联结（亲子远程沟通、面对面沟通间隔）与其发展轨迹之间的关联。结果表明：（1）青少年的总体抑郁轨迹呈下降趋势，但是双亲外出青少年抑郁的初始水平显著高于父亲外出青少年，非留守青少年抑郁的下降速度显著快于父亲外出青少年；（2）亲子分离时间越长，留守青少年抑郁的初始水平越高，下降速度越快，但是这种关联仅存在于亲子远程沟通间隔较长的情况下；（3）母子亲合水平越高，留守青少年抑郁的初始水平越低，但是这种负向预测作用仅出现在双亲外出家庭中；在父亲外出家庭中，父子亲合水平越高，青少年抑郁的初始水平越低；（4）分离年龄越大，留守青少年抑郁的下降速度越快，但这种正向预测作用仅存在于母子亲合水平较低，或亲子远程沟通间隔较长的情况下。这表明，亲子分离特征和亲子联结是留守青少年抑郁发展轨迹的重要影响因素，且亲子间的情感联结和行为联结对于留守青少年抑郁发展轨迹的保护作用存在差异。

Developmental Trajectory of Depressive Symptoms among Left-Behind Adolescents: The Effects of Parent-Adolescent Separation and Parent-Adolescent Cohesion

Jingxin Zhao(corresponding author), Yuan Liu

Department of Psychology, Shandong Normal University, Jinan

Abstract : The parent-adolescent separation as a result of parents' migration for work has become a global phenomenon, which increases left-behind adolescents' possibility of experiencing depressive symptoms to a great extent. Although left-behind adolescents have been separated from their parents for a long period of time, there is still bond between them in emotion and behavior (for example, long-distance communication, and face-to-face communication when parents go home for a visit). Under this background, how the parent-adolescent separation and parent-adolescent bond affect left-behind adolescents' development of depressive symptoms has become a hot issue in this field. The solution of the issue not only benefits the in-depth insight into the relation between parental system and adolescents' depression development, but also has important guiding meaning for the prevention and intervention of left-behind adolescents' depressive symptoms. However, the existing studies have mostly adopted cross-sectional design, making it difficult to investigate the developmental trajectory of depressive symptoms among left-behind adolescents, and the combined effect of parent-adolescent separation and parent-adolescent bond. A total of 1549 rural adolescents were recruited as the study sample, containing 426 from both-parent migrant families, 681 from father-only migrant families and 442 from non-parent migrant families. The data were collected at three time points during the period of a year with six months apart. Latent growth curve model was adopted to examine the developmental trajectory of depressive symptoms among both-parent migrant, father-only migrant and non-parent migrant families, and the trajectory's association with parent-adolescent separation (left-behind status, age of

separation and time of separation), parent-adolescent bond in emotion (father-adolescent cohesion, mother-adolescent cohesion) and parent-adolescent bond in behavior (the interval of long-distance and face-to-face communication). Results indicated that: (1) The general trajectory of depressive symptoms among left-behind adolescents showed a decreasing trend. But adolescents from both-parent migrant families showed significantly higher initial levels of depressive symptoms than adolescents from father-only migrant families; adolescents from non-parent migrant families showed significantly faster decreasing rate of depressive symptoms than adolescents from father-only migrant families. (2) Longer time of separation was associated with higher initial level and faster decreasing rate of depressive symptoms among left-behind adolescents, but the associations existed only when the interval of long-distance communication was long. (3) Higher level of mother-adolescent cohesion was associated with lower initial level of depressive symptoms among left-behind adolescents, but the negative prediction existed only in the both-parent migrant families; in the father-only migrant families, higher level of father-adolescent cohesion was associated with lower initial levels of depressive symptoms. (4) Greater age of separation was associated with faster decreasing rate of depressive symptoms among left-behind adolescents, but the positive prediction existed only when the level of mother-adolescent cohesion was low, or the interval of long-distance communication was long. This study indicated that the characteristics of parent-adolescent separation and parent-adolescent bond were important factors affecting the trajectory of depressive symptoms among left-behind adolescents, and there are differences between the protective effects of parent-adolescent bond in emotion and behavior to the trajectory of depressive symptoms among left-behind adolescents.

青少年抑郁与同伴依恋的动态关系： 基于交叉滞后模型与随机截距交叉滞后模型的分析

邢晓沛¹ 马云青¹ 王美芳² (通讯作者) 刘莉³

1 首都师范大学心理学院, 北京, 100037

2 首都师范大学初等教育学院, 北京, 100037, meifangw@hotmail.com

3 山东师范大学心理学院, 济南, 250014

摘要 抑郁是青少年期常见的心理健康问题之一。以往横断研究表明同伴依恋作为保护性因素可以降低青少年抑郁, 但关注青少年抑郁与同伴依恋之间是否存在双向关系的研究较少且未区分个体间效应和个体内效应。随机截距交叉滞后模型 (RI-CLPM) 克服了传统交叉滞后模型 (CLPM) 无法分离个体间变异的不足, 能够真正地在个体内水平上揭示变量间的双向预测效应。鉴于此, 本研究以山东省某中学七年级学生为被试 ($N = 651$, $M_{\text{年龄}} = 12.22$, 47.6% 为女生) 开展为期两年 (共 3 个时间点) 的追踪调查, 并同时采用 CLPM 和 RI-CLPM 两种统计分析模型, 探讨并比较青少年抑郁与同伴依恋间的纵向双向关系并进一步对双向关系中可能存在的性别差异进行了挖掘。结果如下: 基于 CLPM 分析发现, 抑郁症状、同伴依恋的自回归路径均呈显著正向; T1 和 T2 抑郁症状均显著负向预测 T2 和 T3 同伴依恋; T2 同伴依恋能够显著负向预测 T3 抑郁症状, T1 同伴依恋对 T2 抑郁症状的预测作用则不显著。基于 RI-CLPM 分析发现, 与 CLPM 结果模式较为一致, 在个体内水平上, 抑郁症状和同伴依恋均表现出较高的稳定性; T1 和 T2 抑郁症状的增加能够显著预测 T2 和 T3 同伴依恋质量的下降; T2 同伴依恋质量的提升能够显著预测 T3 抑郁症状的下降, T1 同伴依恋的变化与 T2 抑郁症状的变化无显著预测关系。在个体间水平上, 相比于具有低抑郁症状的青少年, 高抑郁症状的青少年的同伴依恋质量更差。CLPM 和 RI-CLPM 多群组分析表明, 青少年抑郁与同伴依恋间的双向关系无显著性别差异。结论: 青少年抑郁与同伴依恋的双向影响在个体间水平与个体内水平上均存在, 有必要关注抑郁青少年的同伴关系质量, 并通过提升其同伴依恋质量帮助预防和改善青少年抑郁的发生。

The Dynamic Associations between Depression Symptoms and Peer Attachment in Adolescence: Based on the Cross-Lagged Panel Model and the Random Intercept Cross-Lagged Panel Model Analysis

Xiaopei Xing¹, Yunqing Ma¹, Meifang Wang²(corresponding author), Li Liu³

1 Department of Psychology, Capital Normal University, Beijing

2 College of Elementary Education, Capital Normal University, Beijing

3 Department of Psychology, Shandong Normal University, Jinan

Abstract: Depression is a common mental health problem in adolescence. Prior cross-sectional studies have indicated that peer attachment as a protective factor can reduce adolescents' depressive symptoms. However, research focusing on the longitudinal relationship between depressive symptoms and peer attachment in adolescence is limited and also fails to distinguish between- and within-person effects. Random intercept cross-lagged panel model (RI-CLPM) overcomes the shortage of traditional cross-lagged panel model (CLPM) and can clarify the bidirectional nature between variables at the within-person level. Given above, a sample of middle school students at Grade 7 in Shandong Province ($N = 651$, $M_{age} = 12.22$, 47.6% were girls) participated in a two-year longitudinal study (three time points in total), and CLPM and RI-CLPM were simultaneously used to examine the longitudinal relationship between adolescents' depressive symptoms and peer attachment and then multiple group analysis were further used to explore the potential gender differences underlying this bidirectional relationship. Results were as follows: The CLPM analyses indicated that there are significant positive autoregressive paths for depressive symptoms and peer attachment; Depressive symptoms at T1 and T2 negatively predicted peer attachment at T2 and T3; Peer attachment at T2 could negatively predict depressive symptoms at T3, but peer attachment at T1 did not predict depressive symptoms at T2. The RI-CLPM analyses indicated that at the within-person level, there were high carry-over stability effects for depressive symptoms and peer attachment; When adolescents' depressive symptoms increased beyond their own average levels at T1 and T2, they tended to display decreases in their own average level of peer attachment at T2 and T3; When adolescents' peer attachment increased beyond their own average levels at T2, they tended to display decreases in their own average level of depressive symptoms at T3, however, changes in peer attachment at T1 did not predict changes in depressive symptom at T2. At the between-person level, compared to children with lower level of depressive symptoms, those children with higher depressive symptoms had poorer peer attachment. In both CLPM and RI-CLPM, multiple group analyses suggested that the relations between depressive symptoms and peer attachment did not differ significantly for boys and girls. Conclusions: results confirm the bidirectional effects between depressive symptoms and peer attachment at both between-person and within-person levels. These findings also highlight the necessity of paying attention to the quality of peer relationships among depressive adolescents, and promoting the quality of peer attachment could be helpful for preventing and reducing adolescents' depression.

Keywords: depressive symptoms, peer attachment, adolescence, cross-lagged panel model, random intercept cross-lagged panel model

父母婚姻质量与儿童问题行为：家庭间和家庭内关系

王学思¹ 王美芳² (通讯作者) 杨丽莹² 田文秀²

1 山东师范大学心理学院, 济南, 250014

2 首都师范大学初等教育学院, 北京, 100037, meifangw@hotmail.com

摘 要 认知-情境框架和情绪安全理论均强调, 低婚姻质量家庭中的儿童更易表现出问题行为。家庭系统理论进一步指出, 父母婚姻质量不仅是儿童问题行为产生的原因, 也可能是儿童问题行为导致的结果, 即二者间可能存在动态性相互影响。先前关于这一相互影响的研究大多是基于交叉滞后模型(cross-lagged panel model, CLPM)等传统分析方法, 该方法不能区分家庭间和家庭内关系, 无法真正揭示在家庭内部两者间动态影响的模式。因此, 本研究以 976 名小学一至三年级儿童及其父母为被试, 进行连续三年的追踪调查, 同时采用传

统的分析方法(CLPM)和能够区分家庭间和家庭内关系的分析方法(随机截距交叉滞后模型; random intercept cross-lagged panel model, RI-CLPM), 较为全面地考察父母婚姻质量和儿童问题行为的家庭间和家庭内关系。结果: CLPM 的结果发现, 父母婚姻质量显著负向预测一年后的儿童内化和外化问题行为, 但儿童内化和外化问题行为不能显著预测一年后的父母婚姻质量。RI-CLPM 的结果发现, 在家庭间水平上, 父母婚姻质量与儿童内化和外化问题行为呈显著负相关; 在家庭内水平上, 父母婚姻质量的变化不能显著预测一年后儿童内化和外化问题行为的变化, 但儿童内化问题行为的增加能够显著预测一年后父母婚姻质量的降低。结论: 尽管传统的 CLPM 发现, 低婚姻质量家庭中的儿童更容易出现内化和外化问题行为, 但 RI-CLPM 发现, 儿童内化问题行为的增多会导致父母婚姻质量的降低。这一结果提示了区分家庭间和家庭内关系的重要性, 也提示了要高度关注父母婚姻质量较低家庭以及通过降低儿童内化问题行为来改善父母婚姻质量的必要性和重要性。

Parental Marital Quality and Child Problem Behavior: Between- and Within-Family Associations

Xuesi Wang¹, Meifang Wang²(corresponding author), Liying Yang², Wenxiu Tian²

1 Department of Psychology, Shandong Normal University, Jinan

2 College of Elementary Education, Capital Normal University, Beijing

Abstract: The cognitive-contextual framework and emotional security theory emphasize that lower marital quality is associated with more child problem behavior. Family systems theory further points that marital quality is likely both an antecedent and a consequence of child problem behavior. In this way, the association between marital quality and child problem behavior may reflect a process of dynamic interaction. Empirical support for this association is largely based on traditional analyses such as cross-lagged panel model (CLPM). These traditional analyses cannot disentangle the influence of between-family differences and within-family fluctuations, limiting the within-family associations that might be drawn. Based on three annual waves of survey data gathered from 976 families with Grade 1 to 3 children, we examine between- and within-family associations among marital quality and child problem behavior utilizing CLPM and random intercept cross-lagged panel model (RI-CLPM), the latter can disentangle between-family differences and within-family fluctuations. The findings of CLPMs showed that marital quality significantly and negatively predicted child internalizing and externalizing behaviors 1 year later, but both internalizing and externalizing behaviors had no effect on marital quality. As for RI-CLPMs, at the between-family level, marital quality was negatively associated with child internalizing and externalizing behaviors. At within-family level, changes in marital quality had no effect on changes in child internalizing and externalizing behaviors, but increases in child internalizing behavior predicted subsequent decreases in marital quality. In summary, although CLPMs indicated that lower marital quality predicted subsequent more child internalizing and externalizing behaviors, RI-CLPMs indicated that increases internalizing behavior predicted decreases in marital quality. These results shed light on the importance of distinguishing between- and within-family associations and the necessity and importance of focusing on families with lower marital quality and improving marital quality by reducing child internalizing behavior.

摘要 作为儿童社会关系的重要组成部分，师生关系与儿童发展密切相关。根据发展情境论，师生关系不仅受到儿童问题行为的影响，也对儿童的行为适应有重要作用。即师生关系与儿童发展之间存在动态双向影响。但以往探讨师生关系与儿童问题行为之间关系的纵向研究均采用传统的交叉滞后模型(CLPM)，这一方法的缺陷之一是无法区分个体间效应和个体内效应，这一方法分析师生关系和问题行为之间关系所得的研究结果可能并不能揭示两个变量在个体内的发展及相互影响过程。与之相比，随机截距交叉滞后模型(RI-CLPM)能够弥补上述缺陷，较好地个体内水平上来考察师生关系和儿童问题行为之间的纵向影响及这一影响随着时间的变化，进而为干预目标的确定和修正提供更具说服力的实证依据。基于此，本研究拟同时采用 CLPM 与 RI-CLPM 来探讨师生关系和儿童问题行为之间的双向关系，并进一步揭示两种分析方法所得到的两者间的关系是否会存在不同。以我国 640 名四、五年级小学生及其父母为被试，以师生关系问卷、儿童行为核查表(CBCL)和儿童自我报告表(YSR)为研究工具来调查小学生的师生关系与内外化问题行为，共进行 3 个时间点的追踪。结果：1)CLPM 的分析发现，在控制了儿童性别的影响后，师生亲密性和内、外化问题行为存在双向关系；师生冲突性与内化问题行为仅在前两个时间点存在双向关系，与儿童外化问题行为不存在双向影响，仅发现儿童外化问题行为对师生冲突性的正向预测作用；2)RI-CLPM 分析表明，在控制了儿童性别后，在个体间水平，仅发现师生亲密性和儿童外化问题行为呈显著负相关，师生亲密性和儿童内化问题行为以及师生冲突性与儿童内、外化问题行为相关均不显著。在个体内水平，师生亲密性和冲突性的变化对儿童内外化问题行为变化的纵向预测不显著，但儿童内、外化问题行为的增加能够预测后一时间点师生亲密性的下降和师生冲突性的上升。结论：尽管传统的 CLPM 模型发现了师生关系与儿童问题行为的双向影响，但 RI-CLPM 发现在个体内关系层面上，两者间的关系更多地体现在儿童问题行为对师生关系的预测，而师生关系对儿童问题行为的预测作用主要表现在个体间水平。

Relations between Teacher-Student Relationship and Children's Problem Behaviors: A Longitudinal Study

Yan Sun¹, Meifang Wang¹(corresponding author), Kaijiao Guo², Xin Hong³, Jing Liu¹

1 College of Elementary Education, Capital Normal University, Beijing

2 Department of Psychology, Capital Normal University, Beijing

3 College of Education, Capital Normal University, Beijing

Abstract: As an important part of children's social relationships, teacher-student relationship is closely related to the development of children. According to the developmental contextualism, children's behavior could affect the foundation of the relationships with teachers, and meanwhile teacher-student relationships also influences children's social adjustment, that is, there is reciprocal interactions between teacher-student relationship and children's problem behavior. However, most longitudinal studies examining the association between teacher-student relationship and children's problem behaviors typically used the cross-lagged panel model (CLPM), which has a major limitation that it does not separate between-person effects from within-person effects, and the results from CLPM have not precisely tested whether cross-lagged associations represent within-person associations. In this regard, the random intercept cross-lagged panel model (RI-CLPM) addressed this gap and permits estimates of the within-person processes underlying the pathways between teacher-student relationship and children's problem behaviors over time, and results from RI-CLPM could provide a more convincing empirical basis for the practical intervention. Therefore, the present study followed 640 children and their parents across three time points, and examined the reciprocal relations between

the teacher-student relationship and children's problem behaviors using both the CLPM and the RI-CLPM, and further examined whether the above relations would differ by two analysis techniques. The Chinese version of the Student-Teacher Relationships Scale (STRS), the Child Behavior Checklist (CBCL), and the Youth Self-Report Scale (YSR) were used as the main assessment tools. Results are as follows: 1) Based on CLPM, there are significant reciprocal relations between teacher-student closeness and children's problem behaviors (including externalizing and internalizing problem behaviors) after controlling child gender. Specifically, both externalizing and internalizing problem behaviors negatively predicted teacher-student closeness one year later, and teacher-student closeness negatively predicted two types of problem behaviors one year later; teacher-student conflict and children's internalizing problem behaviors were reciprocally predicted from T1 to T2; children's externalizing problem behaviors positively predicted teacher-student conflict one year later, but not vice versa. 2) The RI-CLPM showed that, after controlling child gender, at the between-person level, teacher-student closeness was negatively correlated with children's externalizing problem behaviors, and the relations between teacher-student closeness and children's internalizing problem behaviors, as well as the relations between teacher-student conflict and children's externalizing or internalizing problem behaviors were not significant; at the within-person level, only the increments in children's externalizing and internalizing problem behaviors predicted decrements in teacher-student closeness and increments in teacher-student conflict. Overall, although the results of CLPM indicated the reciprocal relations between teacher-student relationship and children's problem behaviors, the results of RI-CLPM indicated the effects of children's problem behaviors on teacher-student relationship mainly due to within-person fluctuations, and the effects of teacher-student relationship on children's problem behaviors mainly due to stable between-person differences.

Keywords: teacher-student relationship, problem behaviors, reciprocal relation, random intercept cross-lagged panel model

“惩罚”还是“补偿”？

社会阶层对学前儿童第三方公平行为的影响

赵 纾 武雨晴 汪祚军（通讯作者）

宁波大学心理学系暨心理研究所，宁波，315211，wangzuojun@nbu.edu.cn

摘 要 合作是人类社会生存与发展的基石。合作之所以能够产生和维持，一个很重要的原因在于人类具有公平的观念和维护公平的行为。人们不仅会拒绝与自身利益相关的不公平分配(第二方公平行为)，而且会不惜以牺牲自身利益为代价，也要维护他人之间的公平(第三方公平行为)。相比第二方公平行为，第三方公平行为更是一种亲社会行为。第三方公平行为有两种形式，即惩罚不公平的实施者（第三方惩罚）或补偿不公平的受害者（第三方补偿）。虽以往有大量研究考察了诸多社会情境因素（文化、内外群体身份等）对儿童第三方公平行为的影响，但未有研究考察宏观社会阶层因素对儿童第三方公平行为的影响。本研究旨在基于社会阶层文化群体视角考察城乡儿童第三方公平行为的影响。不仅如此，本研究旨在从具体的人际情境中考察社会阶层对儿童第三方公平行为的影响。研究 1 着重考察了在朋友或陌生人作为不公平实施者时城乡儿童在不公平感知和行为上的差异。采用 2(地区：城市、农村)×2(不公平实施者身份：陌生人、朋友)×3(年龄段：4 岁、5 岁、6 岁)×4(情境：1:1、2:1、3:1、4:1)混合实验设计。结果表明，在陌生人作为不公平的实施者时，城乡儿童感知到的不公平程度没有显著差异；但在朋友作为不公平的实施者时，农村儿童报告了更低的不公平感知。研究 2 着重考察了在朋友或陌生人作为不公平接受者时城乡儿童在不公平感知和行为上的差异。采用 2(地区：城市、农村)×2(不公平接受者身份：陌生人、朋友)×3(年龄段：4 岁、5 岁、6 岁)×4(情境：1:1、2:1、3:1、4:1)混合实验设计。结果表明，在陌生人作为不公平的接受者时，城乡儿童感知到的不公平程度没有显著差异；但在朋友作为不公平的接受者时，农村儿童报告了更高的不公平感知。本研究结果在理论上有利于从社会阶层文化视角考察阶层文化对儿童第三方公平行为发展的影响，促进城乡儿童道德发展具有重要

的现实意义。

"Punishment" or "compensation"? The influence of social class on the third-party fair behavior of preschool children

Zhao Shu, Wu Yuqing, Wang Zuo-Jun

Department of Psychology, Ningbo University, Ningbo, 315211

Abstract: Cooperation is the cornerstone of the survival and development of human society. A very important reason why cooperation can be produced and maintained is that human beings have the concept of fairness and the behavior of maintaining fairness. People will not only refuse unfair distribution related to their own interests (fair behavior of the second party), Compared with the fair behavior of the second party, the fair behavior of the third party is a kind of pro-social behavior. There are two forms of fair third-party behavior, namely, punishing unfair perpetrators (third-party punishment) or compensating unfair victims (third-party compensation). Although a large number of previous studies have examined the influence of many social contextual factors (culture, internal and external group identity, etc.) on children's third-party fairness behavior, no research has examined the impact of macro social class factors on children's third-party fairness behavior. This research aims to investigate the influence of third-party fairness behaviors of urban and rural children based on the perspective of social class and cultural groups. Not only that, this research aims to examine the influence of social class on children's third-party fair behavior from specific interpersonal situations. Study 1 focuses on the differences in the perception and behavior of unfairness between urban and rural children when friends or strangers are the perpetrators of unfairness. Use 2 (region: urban, rural) $\times$ 2 (identity of unfair perpetrator: stranger, friend) $\times$ 3 (age group: 4 years old, 5 years old, 6 years old) $\times$ 4 (situation: 1:1, 2:1, 3:1, 4:1) mixed experimental design. The results show that there is no significant difference in the degree of unfairness perceived by urban and rural children when strangers act as perpetrators of unfairness; but when friends act as perpetrators of unfairness, rural children report lower perceptions of unfairness. Study 2 focuses on the differences in the perception and behavior of unfairness between urban and rural children when friends or strangers are recipients of unfairness. Use 2 (region: urban, rural) $\times$ 2 (identity of unfair recipient: stranger, friend) $\times$ 3 (age group: 4, 5, 6) $\times$ 4 (situation: 1:1, 2:1, 3:1, 4:1) Mixed experimental design. The results show that when strangers are unfair recipients, there is no significant difference in the degree of unfairness perceived by urban and rural children; but when friends are unfair recipients, rural children report higher perceptions of unfairness. The results of this study are theoretically helpful to investigate the influence of class culture on the development of children's third-party fair behavior from the perspective of social class culture, and it has important practical significance to promote the moral development of children in urban and rural areas.

Keywords: Urban and rural socio-economic status, Interpersonal situation, preschool children, third-party unfair behavior

社会阶层对学前儿童不公平厌恶的影响： 基于中国城乡差异的研究

程雪岩 周晓玲 汪祚军（通讯作者）

宁波大学心理学系暨研究所, 宁波, 315211, wangzuojun@nbu.edu.cn

摘 要 人类天生具有一种不公平厌恶的倾向。不公平厌恶有两种形式：劣势不公平（为了避免接受比对方更少的东西）和优势不公平（为了避免接受比对方更多的东西）。以往大量研究考察了社会文化因素对儿童不公平厌恶的影响，然而鲜有研究考察社会阶层如何影响儿童的不公平厌恶。本研究基于中国城乡差异的社会背景，从阶层的群体文化视角考察社会阶层如何影响学前儿童的不公平厌恶。本研究假设城市儿童相比农村儿童对劣势不公平更加敏感，产生更多的不公平规避行为。研究 1 选取一所东部城市幼儿园和一所西部农

村幼儿园共 245 名儿童,通过不平等分配范式将儿童随机分配在公平、劣势不公平和优势不公平三种情境中,考察儿童在上述情境中的不公平感知、情绪体验以及行为反应。结果表明,相比农村儿童,城市儿童在劣势不公平情境中表现出了更强的不公平感知、更强烈的负性情绪体验以及更多的拒绝行为;在公平以及优势不公平条件下均无显著差异。研究 2a 采用与研究 1 大体一致的程序,在不同城乡儿童群体中重复验证了研究 1 的结果。研究 2b 旨在检验上述结果是否是由于农村儿童缺少公平观念所致。为检验该假设,实验中让儿童作为第三方,观察研究者给另外两名儿童进行不公平分配。结果表明,在作为无关第三方时,无论是城市儿童还是农村儿童,在面临他人遭受不公平时的不公平感知、情绪体验和反应均无差异。这一结果意味着农村儿童在面临不公平分配时更低的不公平厌恶并非是由于缺少公平观念。本研究结果丰富和深化了社会情境因素影响儿童不公平厌恶的研究,对于促进儿童社会性发展亦具有借鉴意义。

The influence of social class on preschool children's inequality aversion: A Study in the Context of Urban-rural differences in China

Xueyan Cheng, Xiaoling Zhou, Zuojun Wang

Department of psychology and research institute, Ningbo university, Ningbo, 315211

Abstract: Human beings are born with a tendency of inequity aversion. Inequity aversion takes two forms Disadvantageous inequity aversion (DI) and Advantageous inequity aversion (AI). Recent work has demonstrated that sociocultural shape children's fairness. However, so far no study has examined to social class how influence children's inequity aversion. Based on the background of urban and rural in China, the purpose of this study is to explore how social class influences preschool children's inequity aversion from the perspective of sociocultural. We hypothesize that compared with rural children, urban children would have higher unfairness perception and unfairness avoidance behavior in disadvantage unfair condition. In total, 245 children from an Eastern Urban Kindergarten and a Western Rural Kindergarten were recruited in Study 1. By a Inequity Game, children are randomly assigned to three allocation conditions: fair condition, disadvantage unfair condition, and advantage unfair condition. Then children's perception of unfairness, their emotional response, and whether they would reject or accept condition were measured in the above conditions. Results showed that compared with rural children, urban children have higher perception of unfairness, higher negative emotional and more avoidance behavior. Study 2a replicated the findings in Study 1 by recruiting participants from different rural and urban areas by using the similar procedure to study 1. By a Third Party Game, Study 2b aimed to examine whether the above results were due to rural children's lack of fairness concept. The results suggests that no difference in unfair perception, emotional experience and behavioral response in urban children or rural children. This means that rural children's less inequality aversion is not due to a lack of fairness concept. The study enrich the research on the influence of sociocultural to children's inequity aversion, and also have reference for promoting children's social development.

贫困家庭儿童亲社会行为的发展轨迹：平均趋势与个体差异

赵纤^{1,2} 黎志华¹ (通讯作者)

1. 湖南科技大学教育学院,湘潭 411201

2. 湖南农业大学教育学院,长沙 410128, lzhua1018@163.com

摘要 目的: 评估贫困家庭儿童亲社会行为的发展轨迹及其相关的影响因素。方法: 采用儿童长处与困难问卷(SDQ)中的亲社会行为分量表,家庭功能问卷(PAGAR)和青少年社会支持问卷(ASS),对814名贫困家庭儿童进行了历时两年的四次追踪调查。其中,小学阶段儿童485名,平均年龄 10.11 ± 1.45 岁($M \pm SD$),男生199人(41%),女生286人(59%);中学阶段儿童309名,平均年龄 14.44 ± 1.44 岁($M \pm SD$),男生127人(42%),女生182人(58%)。分别采用潜变量增长模型以及混合增长模型建模,从平均趋势和群体

异质性两个不同的角度分析贫困儿童在不同学段的亲社会行为发展轨迹。**结果：**（1）在整体平均趋势上，小学阶段的贫困家庭儿童亲社会行为的发展轨迹呈显著的线性下降趋势，而中学阶段的贫困家庭儿童亲社会行为的发展轨迹无显著变化；中学阶段男生的亲社会行为初始水平显著高于女生，但发展速度上不存在显著的性别差异。（2）在群体异质性上，贫困家庭儿童的亲社会行为发展轨迹在不同发展阶段上均表现出显著的个体差异。根据相关的统计学指标，小学阶段可以划分为3个潜在类别：急剧下降组、缓慢下降组和适度增长组；中学阶段可以划分为2个潜在类别：急剧下降组和适度增长组；（3）家庭功能和社会支持在两个阶段均可以缓冲儿童亲社会行为的下降趋势；中学阶段平稳上升组的家庭功能、社会支持总分、主观支持和支持利用度的得分更高。**结论：**小学阶段和中学阶段的贫困家庭儿童亲社会行为的发展轨迹有显著差异，且在两个发展阶段均存在显著的异质性，良好的家庭功能和社会支持可以缓冲贫困家庭儿童亲社会行为发展的整体下降趋势。

Developmental Trajectory of Prosocial Behavior in Impoverished Children: The Average Tendency And Individual Differences

ZHAO Xian^{1,2}, LI Zhihua¹

1. Institute of Education, Hunan University of Science and Technology, Xiangtan 411201

2. College of Education, Hunan Agriculture University, Changsha 410128

Abstract: Objectives: This study aimed to longitudinally explore the developmental trajectory of impoverished children's prosocial behaviors and the predictive effects. Methods: The prosocial behavior subscale in the Strengths and Difficulties Questionnaire (SDQ), family APGAR and adolescent social support scale (ASS) were used to track the 815 impoverished children for four times in two years. A sample of 485 impoverished children in elementary school (mean age = 10.11 ± 1.45), 199 males and 268 females and 309 impoverished children in middle school (mean age = 14.44 ± 1.44 years old), 127 males and 182 females were investigated four times in two years. The average tendency and individual differences of prosocial behavior in impoverished children with latent growth modeling and latent growth mixture model analysis. Results: (1) The average tendency, impoverished children's prosocial behavior of the trajectory linear downward trend in elementary school, there no significant trajectory change in middle school, and the prosocial behavior of the boys initial is significantly higher than female in middle school, but the development speed of no significant gender differences. (2) With the analysis of the latent growth mixed growth model, found that there are significant individual differences in the development trajectory of prosocial behaviors of impoverished children in elementary and middle schools, and the impoverished children's prosocial behavior development trajectories can be divided into three heterogeneity categories in elementary school: the sharp decline group, the slow decline group and the moderate growth group. The impoverished children's prosocial behavior development trajectories can be divided into two heterogeneity categories in middle school: the steep decline group and the moderate increase group. (3) Family functioning and social support can relieve the decline speed of the impoverished children's average prosocial behavior of elementary and middle school; with high score of family functioning, social support, subjective support and support utilization degree of impoverished children are more likely in the middle school stage of the steady rise group. Conclusion: The developmental trajectory of prosocial behavior of impoverished children in primary and secondary schools is significantly different, and there is significant heterogeneity in both development stages. High family function and social support level can relieve the decline rate of prosocial behavior development of impoverished children.

主观社会经济地位对成年早期幸福感的影响： 阶层流动信念和贫富差距归因的链式中介

李倩莹 刘方 黎志华（通讯作者）

宁波大学心理学系暨研究所，宁波，315211，lzhua1018@163.com

摘要 多项研究发现主观社会经济地位（SSS）对成年早期幸福感具有正向预测作用，高主观社会经济地位个体的主观幸福感显著高于低主观社会经济地位个体。同时，成年早期幸福感还可能受到童年期社会经济地位的影响。然而，对于两种社会经济地位影响成年早期幸福感的内在机制还不明确。本研究探讨了童年社会经济地位、主观社会经济地位与成年早期幸福感的关系，并考察了阶层流动信念和贫富差距归因的中介作用。本研究采用网络问卷进行调查，从湖南省抽取四所大学共 1120 名学生完成问卷调查，剔除无效数据，最终得到有效问卷 1059 份。采用童年社会经济地位量表、主观社会经济地位量表、阶层流动信念量表、贫富差距归因问卷、生活满意度量表和抑郁-焦虑-压力自评量表，对成年早期被试($M_{age}=20.15\pm1.62$ 岁)进行调查。结果发现：(1)童年社会经济地位、主观社会经济地位与阶层流动信念、贫富差距归因和生活满意度呈显著正相关，与抑郁-焦虑-压力负相关；(2)童年社会经济地位、主观社会经济地位不仅直接影响成年早期幸福感，还存在两条间接路径：阶层流动信念的单独中介作用；阶层流动信念和贫富差距归因的链式中介作用。结论：童年社会经济地位和主观社会经济地位均可以通过强化阶层流动信念进而增强贫富差距内归因倾向来增加成年早期个体的幸福感。应当注重引导成年早期个体增强阶层流动信念、训练内归因倾向，提高其幸福感水平。

关键词 主观社会经济地位，童年社会经济地位，阶层流动信念，贫富差距归因，幸福感

The impact of subjective socioeconomic status on well-being in early adulthood: The Serial mediating roles of perceived socioeconomic mobility and attribution for the gap between the rich and the poor

LI Qianying, LIU Fang, LI Zhihua

Department of Psychology, Ningbo University, Ningbo 315211, China

E-mail: lzhua1018@163.com

Abstract: A number of studies have indicated that the subjective socioeconomic status (SSS) positively predicted the well-being in early adulthood, and the subjective well-being of individuals with high SSS is significantly higher than that of individuals with low SSS. Meanwhile, happiness in early adulthood may also be influenced by childhood socioeconomic status. However, the underlying mechanism by which the two socioeconomic status influences happiness in early adulthood is unclear. The present study explored the relationship between childhood socioeconomic status, subjective socioeconomic status and well-being in early adulthood, and examined the mediating role of perceived socioeconomic mobility and attribution for the gap between the rich and the poor. In this study, a total of 1120 students from four universities in Hunan Province were selected to complete the questionnaire. Invalid data were eliminated, and 1059 valid questionnaires were finally obtained. The childhood socioeconomic status scale, MacArthur scale of subjective socioeconomic status, Perceived socioeconomic mobility scale, Wealth gap attribution questionnaire, Satisfaction with life scale and Depression anxiety stress scales were used to investigate the individuals in early adulthood($M=20.15$). The results showed that: (1) Childhood socioeconomic status, subjective socioeconomic status were positively correlated with perceived socioeconomic mobility, attribution for the gap between the rich and the poor and life satisfaction, and negatively correlated with depression-anxiety-stress; (2) Childhood socioeconomic status, subjective socioeconomic status not only directly affect well-being in early adulthood, but also have two indirect pathways: the separate mediation effect of perceived socioeconomic mobility, and the chain mediation effect of perceived socioeconomic mobility and attribution for the gap between the rich and the poor. Conclusion: Perceived socioeconomic mobility and attribution for the gap between the rich and the poor exert a serial mediating effect on the relationship between childhood / subjective socioeconomic status and subjective well-being.

社会阶层影响小学生在道德情境下的亲社会行为： 基于中国城乡差异的研究

魏颖 张婷婷 汪祚军（通讯作者）

宁波大学心理学系暨研究所，宁波，315211，wangzuojun@nbu.edu.cn

摘要 以往研究表明，社会阶层会影响个体的亲社会行为，但研究结论不尽一致。有研究表明，高阶层个体更亲社会，但也有研究表明，低阶层个体更亲社会。导致以往研究结论不尽一致的一个重要原因在于忽略了特定的情境因素对个体亲社会行为的影响。本研究旨在考察不同道德情境下社会阶层与儿童亲社会行为的关系。具体而言，本研究旨在考察当他人做出道德行为和非道德行为并遭遇不幸时个体的亲社会行为，包括安慰、帮助分享行为。与以往研究不同，本研究基于中国城乡差异从阶层的群体文化视角来进行考察。研究1假设：高社会阶层儿童（城市儿童），相对于低社会阶层儿童（农村儿童），在他人做出不道德行为并遭遇不幸时会产生更少的亲社会行为，并且幸灾乐祸这一道德情绪在其中起着中介作用。分别选取309名农村儿童和524名城市儿童，采用故事场景呈现道德情景和非道德情境，随后儿童完成亲社会行为和道德情绪的测量。研究结果支持上述假设。研究2有两个目的，其一在于重复研究1的结果，其二目的在于进一步上述研究结果的产生机制，即城市儿童之所以产生更高的幸灾乐祸是由于更低的共情还是由于更高的应得性感知，亦或两种机制共同导致的结果。分别选取216名农村儿童和173名城市儿童，采用类似于研究1的实验程序进行考察。研究结果表明社会阶层通过影响应得性感知、到影响幸灾乐祸，进而影响儿童的亲社会行为；而共情反应在上述关系中并未起中介作用。这表明高阶层儿童是由于具有更高的应得性感知(并非更强的共情反应)，比低阶层儿童产生更强的幸灾乐祸，从而表现出更低的亲社会行为。本研究结果在理论上深化了对社会阶层对亲社会行为的研究，在实践上，对于有针对性地促进城乡儿童社会性发展具有借鉴意义。

关键词 社会阶层，亲社会行为，城乡差异，幸灾乐祸

Social Class and Children's Prosocial Behavior in Moral Situation: A Study in the Context of Urban-rural differences in China

Ying Wei, Tingting Zhang, Zuojun Wang

Department of psychology and research institute, Ningbo university, Ningbo, 315211

Abstract: Previous studies have shown that social class affects an individual's prosocial behavior, but the conclusions of research are inconsistent. Some studies have shown that lower class individuals are more prosocial than higher class individuals. However, others have shown that higher individuals are more prosocial than lower individuals. An important factor for the inconsistency of previous conclusions is the neglect of the influence of specific social context on individual's prosocial behavior. In more specific, the purpose of this research is to investigate the individual's prosocial behavior, when the other child pursues a morally positive /negative goal and suffers misfortune later, including comforting and helping sharing behaviors. Unlike previous research, this study investigates from the sociocultural perspective based on the differences between urban and rural areas in China. We hypothesized that: when actor pursues the morally negative goal and suffers misfortune later, higher class children experience higher schadenfreude than the lower class children, and therefore showing lower prosocial behavior to the actor (H1). In study 1, 309 rural children and 524 urban children were recruited respectively, using story scenes to present moral and non-moral context. Then schadenfreude, prosocial behavior towards the suffering child were assessed. The results support the above hypothesis. Study 2 has two purposes: one is to repeat the results of the study 1 and the other is to explore the possible mechanisms of the influence of social class on prosocial behavior in moral context. In more specific, we aimed to explore whether the higher schadenfreude of high class children than lower class children when the actor pursues the morally negative goal valence and suffers misfortune later, is driven by a weaker empathic

response to the misfortune, a higher sense of deservingness, or both. In study 2, 216 rural children and 173 urban children were recruited respectively, and the experimental procedure similar to study 1. Study 2 found that the relationship between social class and children's prosocial behavior is sequentially mediated by deservingness and schadenfreude. The results of the study 2 indicate that social class influences children's prosocial behavior through the deservedness and schadenfreude. Empathy does not play a mediating role in the above relationship. This research results theoretically deepen the understanding of how social class exerts its impact on prosocial behavior and provide theoretical guidance for promotion of the social development of urban and rural children.

青少年早期贫困家庭儿童的情绪问题发展轨迹： 群体异质性及影响因素

董雅坤¹ 徐亚楠¹ 李倩莹¹ 邹镇宇¹ 黎志华¹（通讯作者）

¹ 宁波大学心理学系暨研究所，宁波，315211，lzhua1018@163.com

摘 要 贫困家庭儿童的情绪发展常落后于其他同龄儿童，且心理问题检出率更高。本研究关注贫困家庭儿童在青少年早期情绪问题的发展状况，并探讨影响其情绪问题发展轨迹的生态风险因素和积极心理资源。研究以 444 名在当地建档立卡的贫困家庭初中生为被试，参考以往研究收集了个体早期的生态风险和积极心理资源信息，采用困难与长处量表中情绪分量表测量了个体的情绪问题并进行了历时两年的 3 次追踪。运用潜变量混合增长模型(Latent Growth Mixture Model, LGMM)，以个体中心视角对其情绪问题的发展轨迹进行分析。模型拟合结果显示，贫困儿童在青少年早期存在情绪问题平稳组、上升组和缓解组三种发展轨迹。随后采用 logistics 回归的方法考察性别、年龄、生态风险、积极心理资源对情绪发展轨迹亚群组的影响。情绪问题发展各亚组间在累积风险上存在差异：情绪问题平稳组和缓解组高于情绪问题上升组；情绪问题缓解组的累积心理资源高于情绪问题上升组。此外，在控制性别、年龄和初始的情绪问题后，累积生态风险和累积心理资源对第三次测量的情绪问题的回归分析表明，累积心理资源能预测情绪问题上升组的情绪问题。研究结果表明，贫困家庭儿童在青少年早期的情绪问题发展存在异质性，遭遇风险较多的个体情绪问题也较高，拥有积极心理资源较多的个体情绪问题更可能减轻。

The Development track of emotional problems of Children from needy families in early adolescence: group Heterogeneity and influencing factors

DONG yakun¹, XV yanan¹, LI qianying¹, ZOU zhenyu¹, LI zhihua¹

¹Department and Institute of Psychology, Ningbo University, Ningbo, 315211

Abstract: The emotional development of children from poor families often lags behind other children of the same age, and the detection rate of psychological problems is higher. This study focused on the development of emotional problems in children from poor families in early adolescence, and explored ecological risk factors and positive psychological resources that influenced the developmental trajectory of emotional problems. In this study, 444 junior high school students from poor families with local records were selected as the subjects. Based on previous studies, the ecological risk and positive psychological resources of individuals were collected, and the emotional problems of individuals were measured by the emotional problems subscale of the Strengths and Difficulties questionnaire, and followed for three times for two years. The Latent Growth Mixture Model (LGMM) was used to analyze the developmental trajectory of their emotional problems from an individual-centered perspective. The results of model fitting show that the needy children in early adolescence have three developmental trajectories: the stable group, the rising group and the recovering group. Then, the method of logistics regression was used to investigate the effects of gender, age, ecological risk, and positive psychological resources on the subgroups of emotional development

trajectory. There are differences in cumulative risk among the subgroups of emotional problem development: the emotional problem stable group and remission group are higher than the emotional problem rising group, and the cumulative psychological resources of the emotional problem remission group are higher than those of the emotional problem rising group. In addition, after controlling gender, age and initial emotional problems, the regression analysis of cumulative ecological risks and cumulative psychological resources to the emotional problems measured for the third time shows that cumulative psychological resources can predict the emotional problems of the rising group of emotional problems. The results show that there is heterogeneity in the development of emotional problems of children from poor families in early adolescence, and the emotional problems of individuals with more risk are also higher, and the emotional problems of individuals with more positive psychological resources are more likely to be alleviated.

摘要 很多研究发现双语儿童比单语儿童在认知灵活性、抑制控制和工作记忆等方面都存在着一定的优势, 甚至有研究者提出了双语认知控制优势的观点。但是也有一些研究者认为双语认知控制优势并不存在。正因如此, 早期二语学习经验对个体认知发展的影响目前仍然是双语领域的研究热点之一。另外, 第二语言学习是否存在关键期, 不同的年龄阶段开始学习二语对个体的认知发展是否有不同, 这也是双语领域的一个研究热点。基于这些研究问题, 我们梳理了早期二语学习影响个体认知发展方面的研究成果, 并以 450 名初中生为研究对象, 考查了早期英语学习开始时间及学习经验对个体词汇通达能力和一般认知能力的影响。研究结果发现, 英语的始学年龄不仅对被试的词汇通达能力有影响, 对一般认知能力也有影响; 不同始学年龄的被试的词汇通达能力和一般认知能力存在显著差异, 其中 3 岁是个体英语学习的重要转折点, 3 岁开始学习英语的被试的词汇通达能力和一般认知能力是最高的; 英语学习兴趣和学习策略在其中有部分中介作用。该结果揭示了早期二语学习会对个体认知发展产生影响, 并且这种影响会随着二语始学年龄的变化而不同。本研究最后还进一步明确了该研究领域在未来研究中需要进一步解决的问题。

Abstract: Many studies found that bilingual children have certain advantages over monolingual children in cognitive flexibility, inhibitory control, working memory, and other aspects. Some researchers have proposed the theory of bilingual cognitive control advantages. However, others argue that the bilingual advantage in cognitive control does not exist. For this reason, the effects of early-stage second language learning on individual cognitive development are still interesting issues in the field of bilingualism. In addition, whether there is a critical period for second language learning, and whether the onset age and the experiences of second language learning have different effects on

cognitive development, which are also of strong interest for researchers. Therefore, we carried out a systematic review on the studies of early-stage second language learning at home and abroad. We randomly assigned 450 junior high school students as the subjects. The present study aimed to examine the effects of the onset age of second language learning on individual lexical-access ability and general cognitive abilities. Results showed that the onset age of second language learning not only affected the lexical-access ability, but also the general cognitive skills. There were significant differences in the lexical-access ability and general cognitive skills of the subjects of different onset ages. The age of 3 was an important turning point for English learning, because the lexical-access ability and general cognitive abilities were the highest for the subjects who started learning English at 3 years old. Results also showed that English learning interest and learning strategies played a partial mediating role. In summary, the present study revealed that early-stage second language learning would have effects on individual cognitive development, and the effects would vary with the onset age. Finally, the paper clarified the problems to be further solved in future research in this research field.

摘要 第二语言学习是一项极具挑战性的任务, 母语背景在二语学习中发挥着重要的作用。汉语和英语是两种差异巨大的语言。英语是拼音文字, 字母-语音整合是英语单词解码的关键。与此相对, 汉语是非拼音文字, 汉语阅读并不涉及字母-语音整合。已有研究发现, 母语背景限制了汉语母语者的英语字母-语音整合(Wang et al., 2018; Yang et al., 2016)。本研究旨在探讨英语和音乐训练对汉语母语者英语字母-语音整合的作用。我们将招募到的小学2-4年級的汉语儿童随机分为英语训练组($n = 53$)、音乐训练组($n = 40$)和控制组($n = 37$)。训练时长为每周2次, 每次1小时, 共50次, 持续一学年。结果发现, 在训练前, 三组儿童均无法整合英语字母-语音, 但是在经过一学年的训练后, 英语和音乐训练组儿童都可以自动化整合英语字母-语音, 而控制组依然无法整合。进一步, 本研究发现两种训练经验的加工机制存在不同, 音乐训练组可能采用自上而下的加工机制, 英语训练组可能采用自下而上的听觉-知觉加工和自上而下的认知加工相结合的机制。本研究揭示了英语和音乐训练均有助于汉语母语儿童克服母语背景的限制, 按照目标语言的要求建立起字母和语音间的自动化连接, 但两种训练经验的加工机制存在不同。

Abstract: Learning second language is challenging, and native language background plays an important role in second language learning. Chinese and English are two different language systems. English is an alphabetic language, letter-sound integration is critical for English word decoding. In contrast, Chinese is a non-alphabetic language, and Chinese character reading does not involve letter-sound integration. Studies found that native language background constraint native Chinese speakers' English letter-sound integration (Wang et al., 2018; Yang et al., 2016). The

present study aimed to investigate whether English and music training could help native Chinese speakers integrate English letter-sound successfully. We randomly assigned the grade 2 to 4 primary school children into English training group ($n = 53$), music training group ($n = 40$), and control groups ($n = 37$). The training period is twice a week, each time for one hour, totally 50 hours. Before training, three groups could not integrate English letter-sound. After training, both English and music training group could integrate English letter-sound successfully, while control group still could not integrate English letter-sound. We further explored the mechanisms of English and music training experience. The results found that music training group may use top-down cognitive modulation to integrate English letter-sound, while English training group may use both auditory-perceptual bottom-up processing and top-down cognitive modulation to integrate English letter-sound. In summary, the present study revealed that both English and music training could help native Chinese speakers build automatic integration of English letter-sound, but the mechanisms of English and music training are different.

母语技能在我国儿童英语阅读中的作用：基于 SVR 模型的验证

李世峰¹ 陶沙² (通讯作者)

1 西北师范大学心理学院, 兰州, 730070

2 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100101, taosha@bnu.edu.cn

摘要 阅读 SVR 理论 (simple view of reading) 是当前理解阅读获得的重要理论。大量来自不同语言背景的研究都表明文字解码和语言理解可以解释不同年级儿童阅读理解的多数变异。来自二语/外语阅读研究的证据表明这一理论也适用于理解二语/外语阅读学习。然而多数已有研究只考察二语/外语技能的作用。由于外语阅读学习和母语阅读学习存在重要的内在联系, 因此, 在理解外语阅读学习的发展模式中必须回答一个重要问题: 母语阅读及其技能在外语阅读学习中起着什么样的作用? 尤其是在宏观语言环境不是目标语言的外语学习中。因此本研究通过横断和追踪的设计, 考察了汉字文字解码和语言理解在我国小学儿童英语阅读学习中的作用。研究 1a 基于横断数据 (198 名小学五、六年级儿童), 研究 1b 继续对其中 78 名小学五年级儿童进行了为期一年的追踪。研究结果都显示, 汉字认读、汉语听力理解对英语阅读理解的直接解释、预测作用不显著, 但汉字认读和汉语听力理解分别可以通过英语单词认读和英语听力理解间接地影响英语阅读理解, 且汉字认读对一年后英语阅读理解的间接作用也显著; 汉语阅读理解对英语文字解码和阅读理解的解释和预测作用均不显著。值得关注的是, 汉字认读对同时和后续英语单词认读都具有显著的独立解释、预测作用。这表明对于外语阅读初学者, 母语技能, 尤其是母语的文本解码能力在外语阅读学习中具有重要的支持作用。

Abstract: The simple view of reading (SVR) is the most influential model for understanding reading acquisition. Study 1 examined the roles of decoding and language comprehension in one's native language in second language reading based on SVR. One hundred ninety-eight native Chinese-speaking English learners were tested at Grades 5 and 6 (Study 1a), and 78 5th graders were also followed one year later (Study 1b). The results showed: a. Chinese

character reading and listening comprehension did not significantly predict English reading comprehension concurrently and longitudinally after English word reading and listening comprehension being controlled for; b. Chinese character reading and language comprehension had indirect effects on English reading comprehension via corresponding English components concurrently, Chinese character reading also had indirect effects on English reading comprehension via English word reading longitudinally; c. Chinese character reading accounted for unique variance of English word reading both concurrently and longitudinally. d. Chinese reading comprehension could not account for English word reading or reading comprehension significantly. These results suggested that native language skills, particularly decoding in one's native language may play important roles both in foreign language decoding and reading comprehension.

摘要 已有元分析发现左侧顶下小叶在第二语言阅读中起到了重要作用。一项有关第二语言学习的成人研究发现, 学习后左侧顶下小叶的激活会增加, 并且与阅读速度呈现正相关。但是还没有直接的证据表明儿童在进行二语学习的过程中, 左侧顶下小叶是如何发生变化的。在本研究中, 我们使用一种基于语音的训练方法(Fast ForWord), 对学习英语作为第二语言的中国儿童进行英语训练。训练持续 8 周, 在训练前和训练后对大脑进行功能性磁共振成像扫描。功能性磁共振成像的任务包括汉语语音任务, 英语正字法任务和英语语音任务。我们以先前元分析中发现的特异于二语加工的左侧顶下小叶为感兴趣区, 结果发现, 相比于汉语语音任务, 训练前左侧顶下小叶在英语语音任务中表现出更强的激活, 说明了左侧顶下小叶在二语加工中的特异性。接下来我们将儿童分为训练组和控制组, 进一步考察左侧顶下小叶在训练前后脑活动的变化。结果显示, 训练组的左侧顶下小叶激活有显著增强, 但是控制组没有相似发现, 全脑激活分析也印证了这一结果。此外, 我们对训练前和训练后的大脑激活模式进行了相关分析, 结果发现, 训练组训练前后左侧顶下小叶的激活模式差异越大, 儿童的成绩提高的就越多。除激活结果外, 我们还发现了训练效应体现在训练后左侧顶下小叶和左侧枕上回的功能连接有显著增强。总体来说, 这些结果说明了第二语言学习依赖于左侧顶下小叶自身的功能可塑性以及它和负责视觉正字法加工的脑区之间的连接。这些发现为我们理解大脑是如何学习一种新语言的提供了新的视角。

Abstract: Previous meta-analyses showed that the left inferior parietal lobule (LIPL) plays a particularly important role in second language (L2) reading. An existing training study also reported increased activation in the LIPL and its positive correlation with reading speed during L2 learning in adults. However, direct investigation remains unclear how this brain region functionally changes during second language acquisition in child learners. Here, we addressed this issue by utilizing a phonological-based training program (the Fast ForWord program) to train the ability of the second language (English) in Chinese child learners. The training session lasted eight weeks, and brain images were acquired via functional magnetic resonance imaging before and after training. We found that the LIPL showed greater activation in the phonological task in L2 compared to L1 before training, confirming the specific role of the LIPL in second language processing. We then examined the brain activity of the LIPL before and after training and observed increased brain response in this region in the training group but not in the control group, which pattern was validated by a voxel-based whole brain analysis. To assess individual differences in brain plasticity, a multivariate spatial correlation analysis was conducted between pre-training patterns of brain activity and post-training patterns of brain activity. The results revealed that greater differences in activation patterns in the LIPL across time correspond to larger performance gains in the training group. Besides brain activation, we also observed a significant training effect on functional connectivity of the LIPL to the left superior occipital gyrus. Put together, these results suggest that second language acquisition heavily relies on the functional plasticity of LIPL and its connection with brain areas for visual-orthographic processing. The findings offer new insights as to how the brain adapts to a new language.

英汉阅读困难的共发与分离： 汉语儿童英语阅读困难者的英汉阅读技能缺陷分析

徐琴芳¹ 陶沙² (通讯作者)

¹ 南京特殊教育师范学院, 南京, 210038

² 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, taosha@bnu.edu.cn

摘要 二语阅读往往建立在母语阅读基础上, 英汉阅读困难是否共发一直是二语研究关注的问题。本文对比了 402 名 4-6 年级的中国儿童在英汉阅读能力及英汉语音加工和正字法加工技能上的特点。结果显示: (1) 英语阅读困难儿童在英汉语语音意识和英汉快速命名技能和英语正字法意识上均显著低于英语阅读正常儿童, $F(3, 861) = 39.75, p < .001, \eta^2_p = .122$, 效应量为 0.56-1.43, 但是英语阅读困难组和正常组在汉语正字法意识上不存在显著差异。(2) 英语阅读困难者汉语语音意识缺陷的发生率为 34%, 数字快速命名的缺陷率为 31%, 显著高于英语阅读正常儿童, 但是汉语正字法意识缺陷跟正常儿童无显著差异。(3) 英语阅读困难者中英汉语语音意识、英汉快速命名缺陷均存在关联; 虽然英汉正字法意识缺陷同样存在关联, 但是汉语正字法意识缺陷率 (9%) 显著低于英语正字法意识缺陷率 (68%)。(4) 潜变量分析显示存在汉语阅读正常而英语阅读困难的学习者, 英语阅读困难者在英语语音意识、快速命名和正字法意识上存在显著缺陷, 同时也有部分英汉

阅读双重困难者，他们在英汉语音意识、语音记忆和快速命名上存在缺陷，但是正字法意识正常。上述结果提示，英语阅读困难在认知技能缺陷上的亚型不是汉语阅读能力或汉语认知技能的简单映射，汉语阅读能力和英语阅读困难认知技能缺陷亚型没有明显关联，英语阅读困难具有英语语言的独特性。

Coincidence and Separation of English and Chinese Reading Difficulty: Analysis of English and Chinese Reading Skills Deficits of Chinese Children with Poor English Reading

Qinfang Xu¹, Sha Tao²

1 School of Languages, Nanjing Normal University of Special Education, Nanjing, 210038

2 State Key Laboratory of Cognitive Neuroscience and Learning and IDG/McGovern Institute for Brain Research, Beijing Normal University, Beijing, 100875, taosha@bnu.edu.cn

Abstract: The acquisition of second language reading depends on first language reading. This research compared 402 fourth to sixth grades in English and Chinese phonological and orthographic skills. The results showed that (1) All the English reading difficulty subtypes were significantly worse than the typically developing children on English and Chinese word reading, phonological awareness, phonological memory and rapid digit naming and English orthographic awareness, $F(3, 861) = 39.75, p < .001, \eta_p^2 = .122, ds = 0.56-1.43$, but there was no significant difference on Chinese orthographic awareness. (2) The rate of Chinese phonological awareness deficit was 34 percent, Chinese rapid digit naming deficit was 31 percent, Chinese phonological memory deficit was 12 percent and Chinese orthographic awareness deficit was 9 percent. (3) The deficits of phonological memory and rapid naming in English and Chinese were significantly correlated, but the deficits of phonological awareness in English and Chinese were not significantly correlated. Although English and Chinese orthographic awareness deficits were significantly correlated, the rate of Chinese orthographic awareness (9 percent) was significantly lower than English counterpart (68 percent). (4) The latent profile analysis revealed that poor English readers had deficits in English phonological awareness, rapid naming and orthographic awareness. The readers with both English and Chinese reading difficulties had deficits in phonological processing skills but intact in orthographic awareness. The results suggested that the subtypes of English skill deficits were not the simple reflection of Chinese reading skills and there were no significant differences among the subtypes of English reading difficulties in Chinese reading. Thus, English reading difficulties have specific English skill deficits.

模仿控制启动对心理状态推理中自我-他人区分的影响

王协顺^{1,2} 苏彦捷² (通讯作者)

1 山东师范大学心理学院, 济南, 250014

2 北京大学心理与认知科学学院, 行为与心理健康北京市重点实验室, 北京 100871, yjsu@pku.edu.cn

摘要 当人们同时处理自我和他人的信息时, 需要对自我和他人相关表征进行区分。已有证据表明, 不管是控制对他人动作的自动模仿(模仿控制)还是推理他人的心理状态(心理理论), 自我-他人区分可能是一个共通的加工过程。对自我-他人区分共通性的探讨有助于对心理状态推理个体差异及其加工机制的理解。研究旨在通过模仿控制启动来考察自我-他人区分对心理状态推理加工的影响。33名大学生($M_{age} = 19.5$ 岁, $SD = 0.98$)完成一个改编版错误信念任务, 被试根据线索提示推断自己的(自我指向)或他人的(他人指向)信念。在进行信念推理之前, 被试接受自我-他人区分降低、自我-他人区分增强和基线三种不同的启动条件。自

我-他人区分减弱条件下, 被试需要模仿他人的手指动作; 自我-他人区分增强条件下, 被试需要反模仿他人的手指动作; 基线条件下, 被试不做任何反应。结果发现, 模仿控制启动只影响他人指向的信念推理。具体来说, 自我-他人区分降低条件下, 被试进行他人指向信念推理的反应显著慢于其他两条件, 说明当自我-他人区分水平暂时降低时, 被试的对他人心理状态的推理会更困难。这提示心理状态推理有赖于对自我和他人相关表征的区分能力, 为构建有效的心理理论失调的干预方案提供了支撑。

The Influence of Imitative Control Priming on Self-other Distinction in Mental State Reasoning

Wang Xieshun^{1,2}, Su Yanjie² (corresponding author)

¹ School of Psychology, Shandong Normal University, Jinan, 250014

² School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871

E-mail: yjsu@pku.edu.cn

Abstract: People need to distinguish between self- and other-related representations while concurrently processing the information of self and others. Prior evidence has suggested that the self-other distinction (SOD) may be a common process in both controlling automatic imitation of others' actions (i.e., imitative control) and reasoning about other people's mental states (i.e., theory of mind). Investigating the commonality of SOD would be helpful to understand the individual difference in mental state reasoning and its processing mechanism. This study aimed to investigate the effect of SOD on the processing of mental state reasoning through imitative control priming. Thirty-three college students ($M_{\text{age}} = 19.5$ years old, $SD = 0.98$; 20 females) completed a modified version of the false-belief task, in which participants were prompted with a cue to attribute a belief to either themselves (self-oriented) or another person (other-oriented). Participants accepted one of three priming conditions before belief attribution, namely SOD decreasing, SOD enhancing, and a baseline condition. In the SOD decreasing condition, participants were asked to imitate the finger movements of others; In the SOD enhancing condition, participants were asked to counter-imitate the finger movements of others; In the baseline condition, participants did not make any response. Our results showed that the imitative control priming only affected the other-oriented belief attribution. Specifically, the performance of other-oriented belief attribution in the SOD decreasing condition was significantly slower than that in the rest other two conditions, thus indicating that, when the level of SOD was temporarily reduced, it would be more difficult for participants to reason about other people's mental states. This suggests that mental state reasoning depends on the ability to distinguish between self-related and other-related representations, which provides support for building effective intervention programs on the disorders of theory of mind

Keywords: imitative control, theory of mind, self-other distinction, mental state reasoning

青少年灵活转换的发展及其与情绪调节策略的关系

林悦 苏彦捷 (通讯作者)

北京大学心理与认知科学学院, 行为与健康北京市重点实验室, 北京, 100871, yjsu@pku.edu.cn

摘要 青少年的社会情绪系统与认知控制系统发展不同步, 不成熟的认知控制系统如果无法处理过高的情绪反应会带来情绪失调等问题。与在中性任务间转换(认知性灵活转换)相比, 在情绪任务和中性任务之间的转换(情绪性灵活转换)与情绪调节的关系更为密切。有效的情绪调节涉及到灵活地参与和脱离情绪信息, 而灵活转换的适应性又会受到情境的影响, 稳定性-灵活性失衡会导致僵化或者分心, 探究其在情绪情境中的平衡也有助于解释情绪信息在灵活转换中的作用。基于此, 研究考察认知性灵活转换与情绪性灵活转换在青少年中晚期的发展差异, 并探究其与情绪调节策略的关系。148名15~25岁的青少年完成了数字-字母转换任务和情绪-性别转换任务以及情绪调节问卷。结果发现数字-字母任务的转换代价(转换试次反应时与重复试次

反应时的差值)与年龄无显著相关,而情绪-性别任务的转换代价(从性别任务转换到情绪任务的反应时与重复情绪任务反应时的差值)与年龄呈显著非线性关系。这一结果表明认知性灵活转换能力在青少年中晚期已趋于稳定,而情绪性灵活转换能力在青少年中晚期先降低后升高,在20岁左右灵活转换能力最容易受到情绪信息的影响,即呈U型曲线关系。结果还发现从性别任务转换到情绪任务的转换代价与表达抑制策略倾向呈显著非线性关系,情绪性灵活转换能力中等时表达抑制策略倾向最低,即呈U型曲线关系;从情绪任务转换到性别任务的转换代价与女生的认知重评策略倾向呈显著非线性关系,情绪性灵活转换能力中等时女生的认知重评倾向最高,即呈倒U型曲线关系。这一结果提示中等情绪性灵活转换更具有适应性。认知性灵活转换与情绪性灵活转换的发展差异从灵活转换的角度为双系统模型提供了证据,情绪性灵活转换与情绪调节策略的非线性关系有助于理解情绪情景中的稳定性-灵活性平衡。

Development of Adolescent Switching Flexibility and Its Relationship with Emotion Regulation Strategies

Lin Yue, Su Yanjie

School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing, 100871

Abstract: Social emotional system and cognitive control system develops asynchronously during adolescence. Immature cognitive control system cannot deal with excessive emotional response might lead to emotional dysregulation and other problems. Compared to switching between neutral tasks flexibly (cognitive flexibility), switching between a neutral and an emotional task flexibly in the presence of affective information (affective flexibility) is more closely related to emotion regulation. Effective emotion regulation requires the flexible engagement and disengagement from affective information. The adaptability of flexibility is also vulnerable to context, dysregulation of stability-flexibility balance can result in overly rigid or overly distractible behavior, and exploring its balance in an emotional context can contribute to explaining the effect of affective information on switching flexibility. The current study investigated the developmental differences of cognitive flexibility and affective flexibility during middle and late adolescence as well as their relationships with emotion regulation strategies. Adolescents (15 ~ 25 years old) participated and completed the number-letter task, affective switching task and emotion regulation questionnaire. The results showed that there was no significant correlation between age and the switch costs of number-letter tasks (calculated by subtracting the mean response times for all repeat trials from the mean of all switch trials), while the switch costs of emotion-gender task (calculated by subtracting the mean response times for repeat trials on emotional tasks from the mean of all trials switching to emotional tasks) showed a non-linear relationship with age. These results indicated that the cognitive flexibility tended to be stable during middle and late adolescence, while the affective flexibility was firstly decreased and then increased, and the affective flexibility was most vulnerable to emotional information around 20 years old, indicating a U-shaped trajectory. The results also revealed that the switch cost from the gender task to the emotion task showed a non-linear relationship with suppression, indicating that the medium affective flexibility predicted the lowest suppression (U-shaped relationship). The switch cost from the emotion task to the gender task also showed a non-linear relationship with cognitive reappraisal among girls, indicating that the medium affective flexibility predicted the highest cognitive reappraisal among girls (inverted U-shaped relationship). These findings suggest that medium affective flexibility was more adaptive than overly high or low flexibility. The developmental difference of cognitive flexibility and affective flexibility contributed to the theoretical framework of dual systems model from the perspective of switching flexibility. The non-linear relationship between affective flexibility and emotion regulation strategies also provided a more comprehensive view of stability-flexibility balance in an emotional context.

正常个体自闭特质与情感心理理论表现关系的元分析

赖嘉钊 柳跃跃 石静 刘松 陈顺森

1. 闽南师范大学教育科学学院,

2. 福建省应用认知与人格重点实验室,

3. 应用认知与人格心理福建省高校重点实验室, 漳州, 363000

摘要 自闭特质是与自闭症谱系障碍相关行为特征、人格和认知特点的集合。以往的研究表明自闭特质在正常人群中呈量化分布, 且正常发育的高自闭特质个体可能表现出与自闭症相似的认知模式与行为特点。根据自闭症谱系障碍在基于眼中读心任务(Reading the Mind in the Eyes Test, REMT)的情感心理理论表现上存在缺陷, 许多研究推测正常个体中的自闭特质与情感心理理论能力存在关系, 但研究结果仍然存在争议。从检索文献中筛选出纳入元分析的 20 篇文献与 24 个独立效应量, 共包含 4589 名被试。根据异质性检验的结果确定选择随机效应模型是正确的, 并且为了避免发表偏差对元分析的影响, 使用剪粘法发现发表偏差不影响元分析的结果。通过随机效应模型的元分析表明, 自闭特质与眼中读心任务表现有显著的负相关($r = -0.182, 95\% \text{ CI} = [-0.232, -0.131], p < 0.0001$); 调节效应分析发现自闭特质的测量工具对自闭特质与情感心理理论的关系不存在影响。这说明, 正常发育人群中的自闭特质越高的个体可能在眼中读心任务的表现, 即情感心理理论上表现的越差, 并且高自闭特质的正常发育个体在情感心理理论表现上可能与自闭症谱系障碍有相似的特点。

Association between Autistic Traits and Affective Theory of Mind in Typically Developing Population: A Meta-Analysis

LAI Jia-fan, LIU Yue-yue, SHI Jing, LIU Song, CHEN Shun-sen

1. College of Education Science, Minnan Normal University; 2. Fujian Key Laboratory of Applied Cognition & Personality; 3. Fujian Province University Key Laboratory of Applied Cognition & Personality, Zhangzhou, 363000, China)

Abstract: Autistic traits are a set which tightly related to autism spectrum disorder in the aspects of behavioral features, personality and cognitive features. Previous research has presented that autistic traits are quantitative distribution in the normal population and the high autistic trait person may have a similar cognition style as well as behavioral features with autism spectrum disorder. According to the autism spectrum disorder have a worse performance than typically developing population in the affective theory of mind based on Reading the Mind in the Eyes Test (REMT), some researches predicted that autistic traits are associated with the performance affective theory of mind. However, the current research results are still controversial. Through literature retrieval and selection, in terms of the criteria for inclusion in the meta-analysis, 24 independent effect sizes (20 studies, 4589 participants) were picked out as meta-analysis unit. The test for heterogeneity illustrated that there was significant heterogeneity in 24 independent effect sizes, and also random effects model was an appropriate model for subsequent meta-analysis. The publication bias test indicated that the impact of publication bias was modest but the major finding remained still valid. The research revealed that a negative relationship between autistic traits and the performance of RMET ($r = -0.182$). The moderator analysis revealed that the measurements of autistic traits do not affect the relationship between autistic traits and affective theory of mind. The result suggested that individuals with higher autistic traits in typically developing population perform worse and have similar features with ASD on the affective theory of mind.

Keywords: Autistic traits, affective theory of mind, REMT

任务难度和完成结果对老年人情绪预测的影响

摘要 有研究表明，任务难度和完成结果（成败）会影响年轻人的情绪预测。对老年人而言，一方面对任务难度的主观认知可能与年轻人不同；另一方面，根据社会情绪选择理论（SST），老年人更关注具有积极情绪意义的信息，回避具有消极情绪意义的信息，不同的成败结果对他们的影响可能也不同。因此，本研究通过两个实验试图考察任务难度和完成结果对老年人情绪预测的影响。实验1选取年轻人和老年人各120名，采用2（任务难度：高 vs. 低）×2（年龄：年轻人 vs. 老年人）的组间设计，要求被试预测任务成功完成后的情绪体验，或者在实际完成任务后评估此时的情绪状态。结果发现，在成功完成简单任务条件下，年轻人和老年人都表现为低估实际体验的积极情绪；成功完成困难任务条件下，年轻人能够准确预测完成后的情绪，而老年人仍表现为低估。实验2选取年轻人和老年人各240名，在难度的基础上加入了完成结果，采用2（任务难度：高 vs. 低）×2（年龄：年轻人 vs. 老年人）×2（完成结果：成功 vs. 失败）的组间设计，通过操控任务时间来操纵任务完成结果。结果发现，成功完成简单任务条件下，年轻人的表现与实验1相似，但老年人预测相对准确；成功完成困难任务条件下，年轻人表现出高估，而老年人则是低估；对于未完成任务，无论任务是简单还是困难，年轻人和老年人都会高估失败后的难过情绪。实验2时间限制的加入提升了被试感受到的任务难度，因此老年人在简单任务中，年轻人在困难任务中都提高了预期完成任务后的积极情绪。综上，对任务失败的情绪预测，老年人和年轻人在不同难度任务上的表现是相似的，他们都会高估自己失败后的难过程度。但对任务成功的情绪预测却出现了不同的模式：老年人会低估完成简单任务带来的快乐，在有时间限制时（难度增加）预测会比较准确，会低估完成困难任务后的积极情绪，而年轻人则会高估困难任务完成后的积极情绪。这可能是由于老年人觉得完成此类任务是不可能的，从而主观贬损成功完成后的积极体验。

The Influence of Task Difficulty and Task Completion Outcome on Emotion Prediction of Older Adults

WANG Na LIU Yan(Corresponding author), ZHANG Xiaojing

School of Psychology, Liaoning Normal University, Dalian 116029

Corresponding author: psysabrina@126.com

Abstract: Studies have shown that young people's emotion prediction will be influenced by task difficulty and task completion outcome. For older adults, on the one hand, their subjective perception of task difficulty may be different from that of younger adults; on the other hand, according to Social Emotional Selection Theory (SST), older adults pay more attention to information with positive emotional significance and avoid negative information. So different outcomes (success or failure) may have different effects on them. Therefore, the present study attempted to examine the effects of task difficulty and task completion outcome on older adults' emotional predictions through two experiments. Experiment 1 selected 120 young and 120 older adults, and used a 2 (task difficulty: easy vs. difficult) × 2 (age: young vs. old) between-group design. We asked participants to predict the emotional experience after successful completion of the task or to assess the actual emotional state after completion of the task. The results showed that in the successful completion of the easy task condition, both young adults and older people showed underestimation of the actual experienced positive emotion. In the successful completion of the difficult task condition, young people were able to accurately predict the post-completion emotion, while older adults still showed underestimation. Experiment 2 selected 240 young and 240 older adults and added outcome variables. We used a 2 (task difficulty: easy vs. difficult) × 2 (age: young vs. older) × 2 (completion result: success vs. failure) between-group design, manipulating task completion results by limiting task time. The results showed that in the successful completion of the easy task condition, young people performed similarly as they did in Experiment 1. But older adults predicted relatively accurately. In the successful completion of the difficult task condition, young people

showed overestimation while older adults underestimated their feelings. For failure tasks, both young and older adults overestimated sadness after failure, whether the task was easy or difficult. The time limit in Experiment 2 made subjects feel more tense and improve the difficulty of the task. So older adults in the easy task and younger adults in the difficult task both increased the expected positive emotion after completing the task. In summary, emotional predictions of task failure are similar for older and younger adults on tasks of different difficulty: they both overestimate how sad they will be when they fail. However, different patterns emerge for the prediction of emotion after success: older adults underestimate the pleasure that comes from completing easy tasks, predict more accurately when there is a time limit, and underestimate the positive emotion after completing difficult tasks, whereas younger adults overestimate their feeling in this condition. This may be because older adults feel that completing such tasks is impossible, thus subjectively devaluing the positive experience of successful completion.

父母养育倦怠与青少年亲社会倾向的关系：共情的作用

王启忱¹ 苏彦捷¹（通讯作者）

¹ 北京大学心理与认知科学学院和行为与心理健康北京市重点实验室，北京，100871，yjsu@pku.edu.cn

摘要 青少年的亲社会倾向与其主观幸福感、学业和社会适应等密切相关。已有研究关注亲子交流、父母教养方式等家庭因素对青少年亲社会倾向的作用。考虑到青少年阶段亲子冲突程度的加剧，养育倦怠（parental burnout）作为反映父母养育子女过程中对养育角色产生消极情绪或态度等综合表现的家庭环境因素，其对于青少年发展的消极影响不容忽视。父母自身的情绪状态可能影响其处理子女情绪的方式以及子女面对他人情绪时的行为模式，由此研究关注父母养育倦怠对于青少年子女亲社会倾向的影响及亲子双方的共情在其中的作用。通过亲子配对设计，纳入 488 名 12-19 岁青少年及其主要养育者（父亲或母亲），采用问卷法，由父母报告养育倦怠及其对子女的共情，由青少年子女报告其自身的共情和亲社会倾向。结果发现，父母养育倦怠程度越高，对子女的认知共情越低，青少年子女表现出更低的他人指向的共情能力（对他人情绪表现出较低的关注程度或难以理解情绪产生的原因），对其亲社会倾向产生负性作用。在控制了亲子双方的年龄、性别、社会赞许性等因素后，上述链式中介模型仍拟合良好， $\chi^2/df = 1.77$, $RMSEA = 0.04$, $SRMR = 0.02$, $CFI = 0.99$, $TLI = 0.99$ 。这一结果反映了养育中父母倦怠的情绪通过亲子双方的内表型，进而作用于子女的社会行为表现的过程。研究揭示了养育倦怠作为家庭环境因素对于父母养育行为和子女的社会性发展的负性作用，深化了对于情绪社会化理论的理解；在实践层面提示青少年亲社会行为的培养需要青少年自身及其家庭的共同参与。

Parental burnout and prosocial tendencies among adolescents:

The role of empathy

Wang Qichen¹, Su Yanjie¹

¹ School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing, 100871

Abstract: Adolescent prosocial tendencies not only relate to their subjective well-being, but also play important roles in their academic and social adjustment. The role of family environment factors on adolescents' prosocial tendencies cannot be ignored, and previous studies have mainly focused on the influence of family factors such as parent-child communication and parenting style. Considering the increase of parent-child conflict during adolescence, parental burnout, as a family environment factor characterized by parents' negative emotions or attitudes toward parenting role, should not be neglected in adolescent prosocial tendencies investigation. Given that parents' own emotional states and their patterns of dealing with their children's emotions may influence the way their children deal with the emotions of others, this study, thus, focused on the effects of parenting burnout on the pro-social tendencies of adolescents and the

role of parents' and adolescent empathy in this relationship. Adopting a parent-child matched design, the current study included 488 adolescents aged 12-19 years and their caregivers (fathers or mothers), and questionnaires were used in which parents reported parenting burnout and parental empathy towards their children, and adolescent reported their own empathy and prosocial tendencies. Results found that parents with higher parenting burnout showed lower cognitive empathy towards their children, which in turn negatively affected adolescents' other-oriented empathy (characterized by less attention to others' emotions and difficulty in understanding the cause of others' emotions) and then had a negative effect on adolescents' prosocial tendencies. The sequential mediated model fitted well after controlling for factors such as age, gender, and social desirability of both parents and adolescents, $\chi^2/df = 1.77$, RMSEA = 0.04, SRMR = 0.02, CFI = 0.99, TLI = 0.99. The sequential mediated process reflects the process in which burnout as a negative emotion state during parenting act on their children's social behavioral tendencies through parental and adolescent endophenotypes. This result brings the negative effect of parenting burnout both on parenting behavior and on children's social development to light, and deepens the understanding of emotional socialization theory. At the practical level, it suggests that cultivation of adolescents' prosociality requires the joint participation of adolescents themselves and their families.

孤独症成年人心理理论的多重缺陷：一项元分析

高世欢¹ 王协顺^{1,2} 苏彦捷¹ (通讯作者)

1 北京大学心理与认知科学学院, 行为与心理健康北京市重点实验室, 北京 100871, yjsu@pku.edu.cn

2 山东师范大学心理学院, 济南, 250014

摘要 孤独症个体往往伴随着心理理论的缺陷, 心理理论是一种多方面的能力。已有研究中通常采用多种心理理论任务来测量和反应心理理论的不同方面。随着个体的发展, 认知能力是否会在一定程度上补偿心理理论的缺陷, 这在成年孤独症个体的研究中是存在争议的。从心理理论缺陷多样性的角度去探讨成年孤独症个体心理理论的表现, 有助于我们更好地了解成年孤独症个体心理理论的问题所在, 能够为制定具有针对性的临床干预措施提供依据。本研究中, 我们梳理了成年孤独症个体的心理理论研究中使用的任务, 根据这些任务的特点和形式, 将其划分阅读理解任务、知觉情景理解任务、综合情景理解任务和认知操纵任务这四种类别。使用随机效应模型, 对符合纳入标准的 122 项研究 (其中包括 2262 名成年孤独症个体和 2366 名成年典型发展个体) 进行元分析。结果发现, 在纠正了发表偏差后, 成年孤独症个体在四个任务类别中的表现都比成年典型发展个体差 ($g = -0.76$, 95% $CI [-0.85, -0.67]$, $z = -16.18$, $p < 0.001$), 并且这种表现在四种类别的任务之间不存在差异 ($z = -1.89$, $p = 0.058$)。未来研究建议采用多种心理理论测量方法来进一步解释成年孤独症个体在社会能力上的异质性。

A Meta-analysis to Examine Whether Autistic Adults Have Multiple-Deficits in Theory of Mind

Shihuan Gao¹, Xieshun Wang^{1,2}, Yanjie Su¹ (corresponding author)

1 School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871, China, yjsu@pku.edu.cn

2 School of Psychology, Shandong Normal University, Jinan, 250014

Abstract: Autistic individuals are often accompanied by the defects of theory of mind (ToM), a multifaceted ability. In previous studies, various tasks of ToM were often used to measure and reflect the characteristics of different aspects of ToM. With the development of individuals, whether cognitive ability will compensate for the defect of ToM to a certain extent is controversial in the study of adult autistic individuals. The performance of ToM in autistic adults is discussed from the perspective of diversity of defects of ToM, which will not only help us to better

understand where the problems are, but also provide a basis for the formulation of targeted clinical intervention measures. In this study, according to the characteristics and forms of the tasks, we sorted out tasks used in the ToM study of adult autistic individuals, and those tasks were divided into four categories: reading comprehension task, perceptual situational comprehension task, comprehensive situational comprehension task, and cognitive manipulation task. Then, a random-effects model was used to conduct a meta-analysis for 122 studies (including 2,262 autistic adults and 2,366 neurotypical adults) that met the inclusion criteria. After being corrected for publication bias, results showed that autistic adults have worse performance in all four ToM task categories compared to neurotypical adults ($g = -0.76$, 95% CI $[-0.85, -0.67]$, $z = -16.18$, $p < 0.001$), and there was no difference among the four categories of tasks ($z = -1.89$, $p = 0.058$). Future studies are suggested to adopt multiple ToM measures to further explain the heterogeneity in social ability among autistic adult individuals.

环境线索对儿童作弊行为的影响

赵立¹（通讯作者） 郑怡¹ 孙文金¹ 郑佳欣¹ 毛海盈¹

¹ 杭州师范大学心理系, 杭州, 311121, zhaoli@hznu.edu.cn

摘要 作弊是全世界普遍存在的社会性问题, 然而到目前为止鲜有研究探讨了其在儿童时期的发生发展及其早期干预。本研究旨在考察细微的物理环境变化对学前儿童作弊行为的影响。研究者在幼儿园招募了 500 名 5-6 岁幼儿参加了无人监考的数学测试。在测试开始前, 研究者将答案放在离儿童有一定距离的另一张桌子上, 随后借故离开房间, 并告知其“不允许偷看答案”。儿童在整个测试过程中做出的偷看和抄袭答案的作弊行为, 由事先安装在房间内的隐形摄像机所记录。研究一 ($N = 200$) 通过改变儿童与答案之间的物理距离 (0.6 米、1 米、2 米和 3 米) 后发现, 随着距离的增加 (即 1 米、2 米和 3 米条件, 较之 0.6 米条件) 儿童作弊行为的发生率显著降低, 但两者呈现非线性关系 (即 1m, 2m, 3m 条件的作弊率两两不存在显著差异)。研究二、三通过分别操纵距离和答案的可见性, 来进一步探讨上述效应的潜在机制。研究二 ($N = 200$) 表明, 当答案的可见性保持一定时, 答案距离儿童的远近未对作弊率产生显著影响。研究三 ($N = 100$) 表明, 当答案与儿童的距离一定时, 答案高度可见条件下儿童的作弊率较不可见条件显著更高。上述结果表明, 答案的可见性, 而非答案与儿童之间的距离, 是导致儿童作弊行为随物理距离变化而改变的主要原因。更为重要地, 本研究结果启示, 儿童对物理环境线索十分敏感, 微小的环境改变可以显著减少其作弊行为。

Effects of Environmental Cues on Young Children's Cheating Behavior

Li Zhao¹, Yi Zheng¹, Wenjin Sun¹, Jiaxin Zheng¹, Haiying Mao¹

¹ Hangzhou Normal University, Yuhang Pond Road 2318, Yuhang District, Hangzhou, 311121

Abstract: Cheating is a pervasive problem but little is known about its developmental origins, or how to prevent it before it becomes normalized. The present research investigated the effects of subtle environmental cues on young children's cheating behavior. Five- to six-year-old preschoolers took part in an unproctored challenging math test. Before starting the test, the experimenter placed an answer key to the test on the other table at certain distance away from the child, instructed the child not to peek at it, and then made an excuse to leave the room. Whether the child peeked at the answer key in the absence of the experimenter, which was recorded by a hidden camera, served as the primary dependent variable. In Study 1 ($N = 200$), we manipulated the distance between the table where the child sat and the table that held the answer key systematically (i.e., 0.6 m, 1 m, 2 m, and 3 m). We found a significant decrease

in cheating rate from 0.6 m to 1 m or greater, but no differences between any two of the 1m, 2m or 3m conditions. In Studies 2 and 3, we either manipulated proximity of the answer key to the child (i.e., the inter-table distance) or its visibility to further disengage the potential effects driven by these two factors. Study 2 ($N = 200$) showed that, when the answer key's visibility was made constant (either highly visible or not invisible), children's cheating rate did not change significantly with proximity. Study 3 ($N = 100$) showed that, when the answer key's proximity was made constant, the cheating rate decreased significantly when it was not visible than when it was highly visible. These results taken together showed that the visibility of the answer key was more important than its proximity to children to affect their cheating behavior. More importantly, our findings suggest that even young children are very sensitive to environmental cues, and subtle alternations in the physical environment can nudge them to cheat less.

情绪对儿童亲社会行为的影响：共情的作用

伍珍¹（通讯作者） 郭睿¹

¹ 清华大学社会科学学院心理学系，北京，100084，zhen-wu@tsinghua.edu.cn

摘要 亲社会行为是个体社会适应性的一个重要指标，而情绪是影响亲社会行为的重要因素。然而，这种情绪效应如何从儿童时期发生发展，目前尚不明晰。本研究结合行为实验和问卷测量，探究了从学龄前儿童到青少年阶段情绪对亲社会行为的影响，以及共情在其中的作用。实验1采用行为实验，测量了学龄前儿童（ $n = 218$ ）的共情能力，并通过视频引发儿童的积极、消极或中性情绪，然后采用独裁者游戏测量儿童的分享行为。结果发现，消极情绪减少了低共情而不是高共情儿童的分享，积极情绪增加了高共情儿童的分享，说明共情能力可能缓冲了消极情绪对亲社会行为的削弱效应。实验2采用在线问卷测量的方式，测量了1到9年级的小学生和中学生（ $n = 3313$ ）的正负性情绪、共情能力、亲社会行为倾向。结果发现：总体而言，积极情绪与亲社会倾向正相关，消极情绪与亲社会倾向负相关，而共情在情绪与亲社会倾向这一关系中的调节作用随着年龄的增长而发生变化：与学龄前幼儿中的结果一致，对于小学1-3年级儿童，低共情个体中消极情绪对亲社会倾向的削弱效应比高共情个体显著更大，支持了共情能力的缓冲作用，然而该缓冲作用在小学4-6年级消失（高共情和低共情个体中情绪与亲社会倾向的关系没有差异）；到初中7-9年级，与之前共情的缓冲作用相反，高共情个体中消极情绪对亲社会倾向的削弱效应比低共情个体更大，表明了共情的“放大”作用。以上结果表明，总体来说积极情绪促进亲社会行为，消极情绪减弱亲社会行为，此效应受到共情能力的影响，并随着年龄增长而变化：学龄前阶段，共情减弱消极情绪对亲社会倾向的负向效应，呈现缓冲作用；这一作用不断减弱，在小学低年级仍然存在，但在小学高年级消失；初中阶段共情反而放大了消极情绪的负向效应，共情越高的个体越容易受到消极情绪的影响而减少亲社会倾向。研究揭示了共情在情绪与亲社会行为之间的不同调节作用，未来需进一步探讨为何会有此发展变化，为提高亲社会行为、促进社会适应提供实证研究依据。

The Influence of Emotions on Children's Prosocial Behaviors: The Role of Empathy

WU Zhen, GUO Rui

Psychology Department, Tsinghua University, Beijing, China, 100084

Abstract: Prosocial behavior is an important indicator of social adaptability, and emotion significantly affects prosocial behavior. However, how this emotional effect develops from childhood remains unclear. Through behavioral experiments and questionnaire measurements, the current study explored the influence of emotions on prosocial behaviors from preschoolers to adolescents, and analyzed the role of empathy, a high-level emotional ability. Experiment 1 used behavioral experiments to measure the empathy ability of preschool children ($n = 218$), and used cartoons to induce children's positive, negative, or neutral emotions, and then used dictator games to measure

children's sharing behaviors. The results showed that negative emotions reduced the sharing of children with low empathy but not high empathy, and positive emotions increased the sharing of children with high empathy, indicating that empathy might buffer the weakening effect of negative emotions on prosocial behavior. Experiment 2 used online questionnaire measurements to measure the positive and negative emotions, empathy ability, and prosocial behavior tendency of pupils and middle school students ($n = 3313$) from grade 1 to grade 9. Results found that: overall, positive emotions are positively correlated with prosocial tendencies in grades 1-9, while negative emotions are negatively correlated with prosocial tendencies; furthermore, the moderating effect of empathy on the relationship between emotions and prosocial tendencies changes with age. Consistent with the results in preschool children, for primary school children in grades 1-3, negative emotions in low empathy individuals have a greater weakening effect on prosocial tendencies than high empathy individuals, but the buffering effect disappeared in grades 4-6 of elementary school; for students from 7-9 grades of junior high school, contrary to the buffering effect of empathy aforementioned, the weakening effect of negative emotions on prosocial tendencies among individuals with high empathy is greater than that of low-empathy individuals. The above results indicate that the relationship between emotion and prosocial behavior conforms to the "positive feedback loop", that is, positive emotion promotes prosocial behavior, and negative emotion weakens prosocial behavior; but this loop, especially the effect of negative emotion, is affected by empathy, and varies with age. In the preschool stage, empathy weakens the negative effect of negative emotions on prosocial tendencies, showing a buffering effect; this effect continues to weaken with age. Even though it exists in the lower grades of elementary school, it disappears in the upper grades of elementary school. Contrary to the buffering effect, in junior high school, empathy amplifies the negative effect of emotions, as individuals with higher empathy ability are more likely to be affected by negative emotions, thus reducing prosocial tendencies. Research reveals the developmental differences about moderating effects of empathy towards the emotional effect on prosocial behaviors. Future studies need to further explore why the effect of empathy differs with age, which will provide empirical evidence for improving prosocial behaviors and promoting social adaptation.

抑制气质儿童的特质推理及其对社会适应的影响

翟舒怡 何洁（通讯作者）

浙江大学心理与行为科学系，杭州，310058, jiehe@zju.edu.cn

摘 要 儿童自出生以来就在情绪反应、活动水平等方面表现出了稳定的个体差异，即具有不同的气质类型。其中，在面对新颖刺激时表现出较多消极情绪和退缩行为的儿童被称为抑制气质儿童，他们更有可能表现出社会退缩，或发展出更多的内化情绪问题。为什么抑制型儿童会出现社会适应不良的情况？根据社会信息加工理论，在社会交互过程中，儿童对于社会信息的认知加工会影响儿童采取的社交行为。其中，儿童基于他人先前行为进行的特质推理就可能会影响儿童是否愿意与此人交往。因而，对陌生事物表现出消极回避的抑制气质儿童在特质推理上可能更为谨慎，而这种消极的特质推理最终可能会影响其社会适应。因此，特质推理或是抑制气质儿童出现社会适应不良问题的关键因素。本研究对抑制气质儿童特质推理的特点及其对社会适应的影响进行了探究。首先，我们通过一项横断研究（研究1）和一项纵向研究（研究2）探讨了抑制气质和特质推理之间的关系。接着，我们通过纵向追踪研究探讨了特质推理在早期抑制气质与后期社会适应中（研究3：内化情绪问题；研究4：信任倾向）的作用。最后，我们通过实验考察抑制气质儿童是否愿意与具有积极或消极行为线索的交互对象进行交往（研究5：社交行为）和是否愿意相信具有积极或消极行为线索的他人（研究6：信任倾向），从而探明特质推理如何影响抑制气质儿童的社会适应。结果表明，抑制气质儿童具有更加消极的特质推理倾向。此外，特质推理对抑制气质儿童的社会适应有中介和调节作用。中介分析发现，早期抑制气质可以预期后期更消极的特质推理，从而进一步导致儿童产生更多的内化情绪问题；调节分析发现，消极的特质推理会强化抑制气质儿童的内化情绪问题，并导致其对他人产生更多的不信任。实验研究也发现，抑制气质儿童对他人的消极行为线索更加敏感，从而更加谨慎地进行社

交或更难信任他人。本研究结果支持了社会信息加工理论,并为对基于儿童气质特点的因材施教具有指导意义。

Trait Inference in Inhibited Children and Its Influence on Their Social Adaptation

Shuyi Zhai, Jie He

Department of Psychology and Behavioral Sciences, Zhejiang University

Abstract: Children show individual differences in emotional response, activity level and other characteristics since birth; that is, they have different temperamental types. Children who display more negative affect and withdrawal behaviors are considered as inhibited children, and they are more likely to display social withdrawal and experience an increased risk for internalizing behaviors. Why do inhibited children become socially maladjusted? According to the model of social information processing, children's processing of social information may influence the social behaviors they choose. Specially, children's trait inference based on the previous behaviors of others may influence their decisions whether to interact with others. Accordingly, we inferred that inhibited children, who show avoidance towards novel stimuli, may be more vigilant in trait inference, and such a negative bias of trait inference would finally influence inhibited children's social adaptation. Perhaps, trait inference is a key factor in inhibited children's social maladjustment. This study explored the characteristics of trait inference of inhibited children and its influence on their social adaptation. First, the relation between behavioral inhibition and trait inference was explored using a cross-sectional study (Experiment 1) and a longitudinal study (Experiment 2). Second, we explored the role of trait inference in relation between early temperamental inhibition and later social adaptation (Experiment 3: internalizing emotional problem; Experiment 4: trust propensity) using a longitudinal design. Finally, we explored how trait inference influences inhibited children's social adaptation by examining whether inhibited children were willing to interact with individuals with positive or negative behavioral cues (Experiment 5: social behavior), and whether they were willing to trust individuals with positive or negative behavioral cues (Experiment 6: trust propensity). Results suggested that inhibited children showed more negative trait inference than uninhibited children. Besides, trait inference had both mediating and moderating effects on inhibited children's social adaptation. The mediation analysis showed that early temperamental inhibition positively predicted negative trait inference, further resulting in more internalizing emotional problem. The moderation analyses showed that inhibited children showed an increased risk of internalizing emotional problem and low level of trust propensity when they had more negative trait inference. In the experiments, inhibited children were more sensitive to negative behavioral cues, and thereby were more cautious to socialize or to trust with others. The current study supported the model of social information processing, and provided with useful suggestions for the education of social adaptability in children with different temperament.

分析不同类型文本的阅读和写作： 高级心理理论与学龄期儿童读写能力有关吗？

高奇扬¹ 陈佩瑶² 张茹茹³

¹ 绍兴文理学院, 大脑心智与教育研究中心, 绍兴, 312000, 21106302@zju.edu.cn

摘 要 阅读和写作是学龄期儿童书面语言发展的重要任务之一。前人研究发现, 心理理论与个体阅读理解和写作之间存在显著正相关。在学龄期, 儿童开始接触不同文体类型的阅读或写作, 例如记叙文, 说明文等。然而, 学龄期儿童的心理理论水平能否积极预测所有类型文本阅读或者写作, 或是心理理论只能对其中特定类型的文本有显著预测作用。这一问题还有待探明。为了解决这一问题, 本研究考察了学龄期儿童高级心理理论与不同类型文体的阅读理解和写作水平之间的关系。本研究对 262 名三至五年级儿童进行了调查。通过

调查儿童的高级心理理论（包括情感成分和认知成分），阅读理解（包括记叙文阅读、说明文阅读），写作（包括记叙文写作、说明文写作），流体智力以及当年两次语文成绩，探讨高级心理理论和不同文体类型读写能力的关系。结果发现：(1)当控制语文成绩和瑞文智力测验成绩，学龄期儿童在阅读识心任务或陌生故事任务中得分越高，其记叙文阅读得分就越高。然而，说明文阅读上两者没有显著相关。(2)当控制语文成绩和瑞文智力测验成绩，学龄期儿童在阅读识心任务中得分越高，其记叙文写作得分越高。然而，说明文写作上两者没有显著相关。此外，在陌生故事得分与记叙文写作或说明文写作均无显著相关。本研究结果表明，高级心理理论与记叙文读写有更强的关系。心理理论不同成分与读写能力之间关系存在一定程度的分离。

Exploring Reading and Writing Different Types of Texts: Is Advanced Theory of Mind Related to School-Age Children's Literacy Skills?

Qiyang Gao¹, Peiyao Chen², and Ruru Zhang³

1 Shaoxing University, Brain, Mind and Education Research Center, Shaoxing, 312000, China

E-mail: 21106302@zju.edu.cn

Abstract: Reading and writing are important tasks for the written language development of school-age children. Previous studies have found that theory of mind (ToM) was significantly related to reading comprehension and writing. During school age, children are exposed to different genres of reading or writing, such as narrative and expository texts. However, it still remains to be explored whether the order of ToM among school-age children can positively predict all types of text reading or writing, or specific types of text. To address this challenge, the present study examined the relationship between advanced ToM and reading comprehension and writing levels for different types of texts among school-age children. This study recruited 262 children from third grade to fifth grade. The relationship between advanced ToM and literacy skills in different genres was explored by measuring children's advanced ToM (affective and cognitive components), reading comprehension (narrative and expository texts), writing (narrative and expository writing), fluid intelligence, and Chinese academic performance. Results revealed that (1) when controlling for Chinese performance and fluid intelligence, school-aged children, who perform better in reading eye task or strange story, had higher scores in narrative reading. However, there were no significant relationship between advanced ToM and expository reading. (2) When controlling for Chinese performance and fluid intelligence, the scores of the reading eye task was positively related to writing scores, but unrelated to expository writing scores. In addition, there was no significant correlation between scores on strange story and either narrative writing or expository writing. These findings suggested that advanced ToM has a stronger relationship with narrative reading and writing. There was a degree of separation in the relationship between the different components of ToM and literacy skills.

坏人是否值得怜悯？

儿童和成人对不道德人物和中性人物的共情反应和帮助倾向

王一伊¹ 苏彦捷¹（通讯作者）

1 北京大学心理与认知科学学院，行为与心理健康北京市重点实验室，北京，100871, yjsu@pku.edu.cn

摘要 共情对象的道德特征会影响个体的共情反应。前人研究发现，个体对不道德人物的共情显著少于对道德人物的共情，且更愿意去帮助道德人物而非不道德人物。然而，直接比较个体对不道德人物和道德人物的共情无法帮助我们确定这种差异是由个体对不道德人物的共情减少还是对道德人物的共情增加所带来的。为了解决这一问题，本研究考察了儿童和成人对不道德人物和中性人物的共情反应和帮助倾向，并探究了不幸类型在其中可能起到的作用。实验一比较了4-8岁儿童对不道德人物和中性人物的共情反应和帮助倾向，

首先向儿童呈现人物的道德行为，然后询问儿童对人物经历的不幸事件的共情反应和帮助倾向。实验采用 2（道德水平：不道德人物、中性人物） $\times$ 2（不幸类型：物理性不幸、社会性不幸）两因素混合实验设计，其中不幸类型为被试内变量，不道德人物组和中性人物组各有 30 名儿童。结果发现，儿童对物理性不幸的共情显著强于对社会性不幸的共情；和中性人物相比，儿童更不想去帮助不道德人物，但是对中性人物和不道德人物的共情没有显著差异。实验二采用了和实验一基本相同的任务，比较了成人对不道德人物和中性人物的共情反应和帮助倾向，不道德人物组有 32 名成人，中性人物组有 23 名成人。结果发现，和中性人物相比，成人更不想去帮助不道德人物，且对不道德人物的共情也更少。本研究的结果提示，4-8 岁的儿童表现出了共情反应和帮助倾向的分离，尽管尚未像成人一样表现出对不道德人物和中性人物的共情差异，但是会减少对不道德人物的帮助倾向。儿童对不道德人物和中性人物的共情差异可能在 8 岁之后才出现，有待未来研究进一步探究。

Do Bad People Deserve Empathy? Children's and Adults' Empathetic Responses and Helping Tendencies Towards Immoral and Neutral Characters

Wang Yiyi¹, Su Yanjie¹

1. School of Psychological and Cognitive Sciences, Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871

Abstract: Targets' moral characteristics can influence individuals' empathetic responses and helping behaviors. Previous studies found that individuals show significantly less empathy towards immoral characters than towards moral characters and are more willing to help moral characters rather than immoral characters. However, directly comparing individuals' empathy towards immoral and moral characters can not help us determine whether the differences are caused by the decrease of empathy towards immoral characters or the increase of empathy towards moral characters. To solve this question, this study examined children's and adults' empathetic responses and helping tendencies towards immoral characters and neutral characters, and also explored the possible influence of the type of misfortunes. Experiment 1 compared 4- to 8-year-old children's empathetic responses and helping tendencies towards an immoral character and a neutral character. We first showed children the character's moral behaviors and then asked their empathetic responses and helping tendencies towards the character's misfortunes. We adopted a mixed design with 2 (Moral level: immoral vs. neutral) $\times$ 2 (Misfortune type: physical vs. social), in which the misfortune type was the within-subject variable. Both immoral-character and neutral-character groups included 30 children. Children showed significantly more empathy towards physical misfortune than social misfortune. Children were less willing to help the immoral character than the neutral character but showed similar empathetic responses towards the immoral character and the neutral character. Experiment 2 compared adults' empathetic responses and helping tendencies towards an immoral character and a neutral character adopting a task similar to that in Experiment 1. The immoral-character group included 32 adults, and the neutral-character group included 23 adults. Adults were less willing to help the immoral character than the neutral character and showed less empathy towards the immoral character than the neutral character. These results suggest that 4- to 8-year-old children have separated empathetic responses and helping tendencies. Although they did not show different empathy towards the immoral character and the neutral character, they showed decreased tendency to help the immoral character. Children's varied empathy towards immoral characters and neutral characters might appear after 8 years of age, which warrants future studies.

两难情境中儿童的资源分配

张真

中国科学院心理研究所, 北京, 100101, zhangzhen@psych.ac.cn

摘要 公平分配资源是维持合作稳定的重要机制。分配合作收益时只有让每个成员都满意, 合作才能维持。有不同的原则决定着资源如何分配, 但现实生活中, 不同原则间往往相互冲突, 这就构成了资源分配的两难情境。考察儿童如何在两难情境中分配资源, 能揭示儿童如何权衡不同的公平原则, 从而有助于理解公平行为的发展。我们在两种冲突情境中考察了儿童如何处理分配两难。首先, 是劳动贡献和社会关系的冲突。已有研究发现儿童在资源分配中既会考虑劳动贡献也会考虑社会关系。研究通过 3 个实验考察了 7 岁儿童 ($N=204$) 如何在和自己社会距离不同的两个体间 (好朋友 vs. 陌生人; 不喜欢的人 vs. 陌生人) 分配资源, 而好朋友/不喜欢的人要么和陌生人干的一样多 (实验 1), 要么比陌生人干的少 (实验 2a) 或者多 (实验 2b)。结果发现, 当好朋友和陌生人贡献相同时, 儿童分给好朋友更多; 好朋友比陌生人干的少时, 也可以得到和陌生人一样多; 但不喜欢的人即使比陌生人干的多, 也只能得到和陌生人一样。这些结果表明, 当劳动贡献和社会关系冲突时, 7 岁儿童主要根据社会关系进行资源分配。其次, 是避免不公平和避免浪费的冲突。已有研究发现, 西方儿童宁愿把无法公平分配的资源扔掉也不愿让一方多得。考虑到中国文化强调节俭, 中国儿童会如何在这两者间权衡? 研究通过 4 个实验考察了 7 岁儿童是否愿意扔掉 (vs. 收回) 无法公平分配的资源以避免不公平。结果发现在第三方 (实验 1, $N=83$) 和第一方任务中 (实验 2, $N=116$), 如果只有扔掉资源才能避免不公平, 儿童没有表现出对不公平的回避 (实验 1a, 实验 2); 而当扔掉资源变成收回资源时, 他们不仅避免另外两个个体间所得不公 (实验 1b,c), 更避免别人比自己得到的多/少 (实验 2)。这些结果表明, 在资源分配中, 避免浪费和避免不公平对中国儿童来说一样重要。两难情境中儿童资源分配的特点拓展了我们对儿童公平行为的理解, 提示对不同分配原则的不同排序可能是造成分配公平性个体和文化差异的一个重要原因。

Children's resource allocation in the dilemma context

Zhen Zhang

Institute of Psychology, Chinese Academy of Sciences

Abstract: Fairness is a key mechanism stabilizing human cooperation. Only if every member gets satisfied with how the collaboratively acquired resources are distributed, they are motivated to sustain the cooperative relationships. There are different principles that determine how resources are allocated. However, in real life, different principles often conflict with each other, which constitutes a dilemma of resource allocation. The investigation of how children allocate resources in the dilemmas could uncover how children weigh the competing principles of fairness, which as a result contributes to our understanding of children's developing sense of fairness. Here, we examined how children allocated resources in two dilemma contexts. In the first context, social relationship was pitted against merit. Previous work has provided evidence that both merit and social relationships guide resource distribution in children. A series of three studies were conducted to assess how 7-year-old children ($N=204$) distributed rewards for work performed by two recipients who differed in social distance with the participant (child's friend vs. stranger; a disliked peer vs. stranger). Child's friend/disliked peer either have completed the same amount of work as the stranger did (Study 1), or have completed less (Study 2a) or more (Study 2b) work to deserve the rewards. Results showed that children gave more resources to their friend than to an equally deserving stranger (Study 1) and distributed resources equally when the friend was less deserving (Study 2a and Follow-Up combined). However, children distributed resources equally when the disliked peer was more deserving than the stranger (Study 2b). These findings suggest that, by 7 years of age, children resolve conflicts between social relationships and merit by basing resource allocation decisions on relationships, but they moderate those decisions depending on the recipients' merit. In the second context, inequity aversion was pitted against waste aversion. By middle childhood, children from Western cultures are even willing to discard resources to avoid inequity. Given that Chinese culture emphasizes the value of "Thrift" (i.e., waste aversion),

the question arises as to how Chinese children would balance between the competing considerations of inequity aversion and waste aversion. A series of four studies were conducted to assess whether 7-year-old children would rather discard (vs. withhold) a resource than distribute unequally. Results showed that, in third-party (Study 1, N = 83) and first-party (Study 2, N = 116) distributive interactions, children accepted inequity in the presence of waste (Study 1a, Study 2) but avoided inequity in the absence of waste (Study 1b, c; Study 2). These findings suggest that, in resource allocation, waste aversion may be at least as important as inequity aversion among Chinese children. How children allocate resources in the dilemma context expands our understanding regarding the development of fairness, and suggests that the individual and cross-cultural difference on distribute justice may result from the difference in ranking-order different consideration involved in resource allocation.

摘 要 多中心影像学队列研究为理解注意缺陷多动障碍 (ADHD) 的脑认知机制提供了证据。尽管这些研究发现了一些 ADHD 相关的异常脑活动和结构, 然而这些发现主要来自合并多中心数据的分析结果, 这些结果在不同中心间的一致性还不清楚。针对这一问题, 本团队基于 ADHD-200 多中心公共数据库, 采用三类影像学分析常用的指标, 即局部脑活动、功能连接、基于体素的形态学分析, 研究了 ADHD 脑功能活动和结构异常在不同中心间的一致性。我们发现合并多中心数据, 可以检测到 ADHD 异常的脑功能活动和脑结构, 然而这些结果在各中心间的一致性很低; 基于小波的低频振幅在敏感性和可重复性方面优于基于快速傅立叶变换的结果。进一步区分亚型以及排除共病患者可以提高结果在各中心之间的一致性。这些发现提示了 ADHD 脑活动和结构异常存在着较高的异质性。将来的研究, 需要考虑诊断的客观性、分型与共病、功能磁共振分析方法的敏感性和特异性等因素, 并且在多中心之间互相验证, 是 ADHD 脑影像机制研究的主要方向之一。

Email: zangyf@hznu.edu.cn

Abstract: Studies using multi-MRI datasets provide evidence for understanding the brain cognitive mechanism underlying attention deficit hyperactivity disorder (ADHD). Albeit abnormal brain activity and structure for children

with ADHD were determined, few studies illustrated that to what extent these findings were consistent across different datasets. The present study aimed to probing this issue by analyzing three widely used measures, i.e., local brain activity, functional connectivity and voxel-based morphometry across the datasets from a public-access ADHD datasets, namely, ADHD-200. We determined a high inconsistency of abnormal local activity, functional connectivity and voxel-based morphometry across individual datasets. Analysis on subtypes and excluding co-morbidity could improve this inconsistency. Wavelet-based ALFF showed more sensitivity and reproducibility than fast Fourier transform ALFF. These findings suggested a high heterogeneity of the abnormal brain activity and structure in ADHD. Future studies based on multi-site large-sample dataset should be conducted by focusing on the factors of objective assessment, subtypes and comorbidity, as well as new analytic methods with higher sensitivity and reproducibility.

学龄儿童脑发育与学校适应北京队列：学龄儿童脑功能网络模块化成熟及其心智关联分析

王延培¹ 陶沙^{1*} (通讯作者)

¹ 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, taosha@bnu.edu.cn

摘要 人脑功能网络模块化在学龄期如何发育, 如何与重要认知和非认知功能联系? 对这些问题的系统研究可深化对儿童脑智发育规律的理解, 并为科学评估和预测儿童适应提供重要依据。而人脑功能网络模块包括运动感知网络, 扣带回/岛盖网络, 听觉网络, 视觉网络, 默认网络, 额顶控制网络, 突显网络, 背侧和腹侧注意网络等不同的模块, 学龄期重要的适应功能包括注意、记忆、情绪、决策等多个方面。已有研究多基于小样本、横断设计、针对某一认知或非认知能力, 难以从整体的角度揭示儿童脑功能网络模块化的成熟及其如何支持认知与非认知能力发展的图景。因此, 针对学龄儿童的较大样本前瞻性队列研究, 通过对儿童脑发育和重要认知与非认知能力的系统追踪, 可以为探讨上述问题提供新的证据。2016年以来, 我们启动建设了学龄儿童脑发育与学校适应北京队列研究, 完成基线数据采集 800 例, 追踪超过 800 人次, 数据包括结构、静息与任务态 MRI 影像, 注意、记忆等认知能力、以及情绪与决策等非认知能力等。本研究以其中 404 个 6-12 岁学龄儿童的基线和追踪数据为基础, 以静息态和任务态 MRI 影像数据考察脑功能网络模块化特征, 并建立其与儿童注意、工作记忆、情绪识别、风险决策的预测模型。分析在静息和任务执行过程中脑功能模块内与模块间连接的变化, 结果显示, 无论认知或非认知行为发展主要受到特异性子网络模块化水平的预测, 特别是子网络中网络信息传递的全局效率提高是脑功能模块化的重要特征。在认知和非认知能力发展过程中, 脑功能网络模块化在拓扑属性上的优化来自模块内与模块间长连边的增强和短连边的削弱, 可能反映了神经修剪机制。

Beijing Cohort Study of School Functions and Child Brain Development: Functional Brain Network Modularity and Its Mind Association Studies in School Children

Yanpei Wang¹, Sha Tao¹(Corresponding author)

¹ State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875

Abstract: How does the modularity of the child brain functional networks develop and contribute to major cognitive and non-cognitive functions critical for schooling? Exploration in this area would deepen our understanding of child brain and mind development, and further help transform developmental assessments and predictive models for developmental risks. The human brain is functionally organized into multiple networks, such as the somatosensory-motor, cingulo-opercular, auditory, visual, default mode, fronto-parietal task control, salient, dorsal and ventral attention networks. Similar, school functions involves many componential skills, including attention,

working memory, emotion, decision making and so on. Despite of huge progresses, our understanding is significantly constrained by relatively small samples, cross-sectional designs, limited measures that may be observed in many existing studies. Thus, prospective cohort studies of larger samples may offer a broader perspective in terms of the roles of brain functional modularity in children's cognitive and non-cognitive functions. Since 2016, we have conducted a cohort study on brain development and school function in school children in Beijing. We have 800 children completed the baseline assessments, and have been following yearly. For each year, we collected structural, resting and functional MRI imaging data, attention, memory, emotion and decision-making, and etc.. Based on the baseline and follow-up data from 404 children aged 6-12 years, we examined the modularity of functional brain networks using resting and task functional MRI imaging data and predicted the development in attention, working memory, emotion recognition, and risk taking. Results showed that higher level of modularity of specific sub-networks, shown by the increased global efficiency of network information transfer in certain sub-networks, predicted higher cognitive and non-cognitive functions. The optimized topological properties of brain functional network modularity may result from the enhancing long connectivity edges and weakening short connectivity edges within and between modules, suggesting neural pruning may be one underlying mechanism.

摘要 学龄期儿童与青少年（6-18岁）个体之间差异日益增加，发育神经影像队列是解析脑智发育个体差异的有力工具。通过建设“彩巢计划-成长在中国”的学龄期脑智发展研究型纵向加速队列，本团队聚焦生长发育曲线研究，开展了长期的测量方法学积累，绘制了中国学龄儿童青少年脑形态生长发育曲线，揭示了不同文化背景之间生长发育曲线的异同，发现：基础功能（如视觉和体感运动）区域，在中美学龄儿童中具有简单而平行的发育轨迹，联合功能（如认知控制和语言以及自我参照）区域，在中美学龄儿童青少年中则表现出复杂而不同的时空发育轨迹，空间上主要分布于左半球默认网络和右半球额顶网络，时间上则主要表现为青春期的前后；分年级的人脑功能连接梯度分析进一步为上述形态发育曲线差异提供了人脑动力学组织特性的证据，发现：人脑功能连接从小学阶段的基础功能网络为主导，在青春期（12-14岁）及以后快速转化为以高级认知为主的联合功能网络。上述个体差异是人类大脑在演化、遗传、环境和文化上的综合体现，提示了建设各国脑智发育队列的必要性，为理解人类青春期的起源和学龄期儿童青少年发育提供了新角度。

New Progresses of Color-Nest Project ‘Growing Up in China’ The Revelation of Puberty

Xi-Nian Zuo^{1,2,3}

1 Beijing Normal University, Beijing 100875; 2 Institute of Psychology, Chinese Academy of Sciences, Beijing 100101; 3 National Basic Science Data Center, Beijing 100190

Abstract: Individual differences increasingly emerge in school-aged children and adolescents (6-18 years). Developmental neuroimaging cohorts are powerful tools for revealing these individual differences in brain and mind development. By building an accelerated longitudinal cohort, namely Chinese Color Nest Project (CCNP) ‘Growing Up in China’, the CCNP team focuses on growth charts research, and accumulates long-term knowledge on psychometric theory and methodology as well as delineates the developmental trajectories of Chinese brain

morphology and reveals their differences between different cultural backgrounds. Specifically, primary cortical (e.g., visual and somatomotor) areas exhibited simple and parallel trajectories between Chinese and American samples. In contrast, associative (e.g., cognitive control and default mode) areas showed complex and distinct trajectories between Chinese and American. These differences are distributed in the left default mode networks and the right fronto-parietal network spatially while reflected around the period of puberty temporally. Further grade-wide gradient analysis of the functional connectome provided evidence on the puberty-related changes in terms of human brain dynamical organization. It witnesses the shifting gradients of macroscale cortical organization marking the transition from childhood to adolescence, which is dominated by the primary networks during the primary school periods and by the high-order associative networks since the puberty (12-14 years old). These individual differences observed reflect potential evolutionary, genetic, environmental and cultural factors of the human brain, indicating the need of building nation-wise neurodevelopmental cohorts, and offering a new perspective for understanding the origin of puberty and school-aged pediatric development.

自然刺激下神经状态切分能力的儿童个体差异与认知发展

蔡清

华东师范大学心理与认知科学学院、脑科学与教育创新研究院 上海, 200062, qcail@psy.ecnu.edu.cn

摘要 为了理解不断变化的世界, 人们需要维持对当前情境的稳定的表征, 并在当前情境不适更新表征。这种维持和切分信息的能力具有认知发展层面上的重要意义。传统的任务切换范式与儿童的真实生活情境并不契合, 且儿童在任务中维持注意状态具有一定的困难。近期相关研究使用自然化实验材料和多体素神经模式的状态边界切分算法, 考查了神经状态边界与事件边界的一致性, 但尚不明确神经状态切分的表现是否能表征个体差异, 特别是一般性认知能力。通过磁共振影像学大队列研究, 我们考察儿童(6-8岁)观看定制卡通片的脑活动, 其中认知任务穿插在叙事情节中。使用神经状态切分算法, 我们发现一些脑网络中神经状态边界与电影中的状态边界相吻合。为了体现个体差异, 我们计算了一个神经模式分离指标来代表儿童的神经模式在多大程度上能区分相邻的电影状态。我们发现该分离指标在两次扫描中具有信度, 且与儿童的智商具有相关, 即儿童的神经模式状态切分能力越强, 则具有更高的智商。相比于与任务相关的单变量激活程度指标, 该分离指标与智商的相关更高。总体来说, 这些结果表明儿童的神经状态切分能力具有个体差异, 且该能力可能能够指示儿童的总体认知发展。同时这一方法可能具有更好的跨平台鲁棒性。

Individual differences in children's neural state segmentation ability are related to intelligence

Qing Cai

School of Psychology and Cognitive Science, Institute of Brain and Education Innovation, East China Normal University, Shanghai 200062

Abstract: To understand the ever-changing world, humans need to maintain a stable representation of the current context, and segregate the contextual information when it is no longer relevant. The ability to maintain and segment information is of developmental significance. Traditional task-switching tasks might not conform well with children's real-life context and may fail to catch children's attention. Using naturalistic materials as stimuli, studies have used neural state segmentation algorithms to identify state boundaries in neural activity patterns and found that neural state boundaries co-occur with movie event boundaries. However, it remains unknown whether the goodness of neural state segmentation might be indicative of individual differences in development of general cognitive abilities. Here, we scanned children (age: 6-8) watching a customized animation in which cognitive tasks and narrative events were interleaved. We found that neural state boundaries in several cortical networks align with movie state boundaries. To

index individual differences, we calculated a neural pattern differentiation score to represent how well children's neural patterns differentiate between consecutive movie states. We found that in the frontoparietal network, the differentiation score was reliable across two runs, and correlated with children's intelligence score such that higher neural state segmentation performance was associated with higher intelligence score. Moreover, this score based on neural pattern information outperformed univariate task-related neural response magnitude in predicting intelligence. Together, these results showed that there were meaningful individual differences in children's neural state segmentation abilities and such ability might be indicative of general cognitive development.

2 Sino-Danish College, University of Chinese Academy of Sciences, Beijing 100049

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049

Abstract: This project is a part of the “Children's learning and learning disability, and its relationship with brain network development” funded by the Beijing Brain Initiative of Beijing Municipal Science & Technology Commission. We, at the Institute of Psychology, Chinese Academy of Sciences, aim to study the development of body, mind, and brain in twins. The goal is to investigate the developmental trajectory of these variables with age and how they are influenced by the interaction of genetics and environment. We constructed three sets of measurements in these three domains, including two for body, six for mind and behavior, and six for neuroimaging. Each set of

measures took about 1.5 hours to collect and was administered in modules. Data collection from the projected 200 subjects are still in progress. We analyzed the ongoing data and found the followings: 1) The physical fitness level of children and adolescents in general indicated a trend of steady increase with age, which showed gender differences and was affected by genetic factors. 2) Compared with primary school students, junior high school students had significant improvement in hearing and speech ability, which was independent of gender but influenced by genetic factors. 3) Attention Network Test (ANT) showed an increasing trend with age, but no significant correlation between twins. 4) Children and teenagers preferred warm and bright colors rather than cool and dark colors. They preferred for primary colors over derived colors. Junior high school students preferred cold and dark colors more than primary school students. 5) Reading fluency, reading accuracy and other reading-related skills showed an increasing trend with age and were affected by genetic factors. 6) For speech comprehension, all the subjects showed semantic integration effect and were able to process the deep semantic meaning of sentences during reading. The effect of semantic rationality decreased with age, showed no gender difference, and was affected by genetic factors. 7) For emotion recognition, the ability of emotion recognition of children and adolescents increased with age and was affected by genetic factors. 8) For social decision-making, the rate of social cooperation increased with age, and was significantly higher for girls than boys, but there was no significant correlation between twins.

青少年早期情绪调节困难发展轨迹及其与自杀意念的动态关系

杨洋 刘羽 杨亚楠 李莹娜 邱少劼 林琳 (通讯作者)

教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300074

天津师范大学心理学部, 天津, 300387

国民心理健康评估与促进协同创新中心, 天津, 300074, linlin@tjnu.edu.cn

摘 要 自杀是一个世界性的公共卫生问题。自杀行为在儿童时期比较少见,但随着年龄的增长,青少年自杀的发生率会越来越高。儿童期的自杀率仅约为 0.7/100000,而 15 至 19 岁的青少年自杀发生率骤升至 7.4/100000 左右。自杀意念,自杀企图和自杀尝试是自杀行为的三个阶段,其中自杀意念作为自杀行为形成的第一个阶段,是个体实施实际自杀行为的极其重要且最为敏感的预测因素。在我国,青少年自杀意念发生率一直处于一个较高水平,约为 12.1%至 29.9%。由此可见,探讨青少年自杀意念的影响因素对于后续研究和预防青少年自杀行为有重要意义。本研究在自杀的动机意志整合模型和人类发展的生态生物学模型的基础上,从发展心理学的角度,考察青少年早期情绪调节困难的基本特点、变化趋势及其与自杀意念的动态关系。本研究采用自杀意念/自杀企图问卷、情绪调节困难问卷,对 216 名初二年级学生进行总共三次,时间间隔为半年、为期一年的追踪调查。结果发现: (1) 青少年早期自杀意念随年龄不断增长,总体呈现递增趋势; (2) 青少年早期情绪调节困难水平亦随年龄不断增长,总体呈现递增趋势; (3) 青少年早期情绪调节困难与自杀意念之间存在共同发展轨迹,即情绪调节困难的初始水平越高,青少年意念初始水平越高,自杀意念发展变化趋势同情绪调节困难发展变化趋势存在显著正相关,情绪调节困难随时间变化增长越快,自杀意念水平增长越快。研究结果揭示了情绪调节困难在青少年早期自杀意念发展变化过程中的重要作用,发现了作为自杀意念影响因素的情绪调节困难在青少年阶段与自杀意念的发展变化存在相同发展趋势,有助于深入理解青少年自杀意念的发展及变化与其本身情绪调节能力缺陷之间的联系,丰富和发展现有的自杀理论,为后续青少年阶段自杀意念和自杀行为的预防提供了一定的理论基础。

linlin@tjnu.edu.cn

Abstract: Suicide is a worldwide public health problem. Suicidal behavior is relatively rare in childhood, but as the age increases, the incidence of suicide among teenagers will increase. The suicide rate in childhood is only about 0.7 per 100,000, while the suicide rate of 15 to 19-year-old teenagers soars to about 7.4 per 100,000. Suicide ideation, suicide attempt, and suicide attempt are three stages of suicide. Suicidal ideation, as the first stage of suicidal behavior, is an extremely important and most sensitive predictor of actual suicidal behavior. In China, the incidence of suicidal ideation among teenagers has been at a high level, about 12.1% to 29.9%. Therefore, it can be seen that exploring the influencing factors of adolescent suicidal ideation is of great significance for follow-up research and prevention of suicidal behavior among adolescents. Based on the integrated motivational– volitional model of suicidal behavior, and the process – person – context – time model, this study examines the basic characteristics, changing trends, and their dynamic relationship between difficulty in emotion regulation and suicidal ideation of early adolescents. This study used the Suicide Ideation/Suicide Attempt Questionnaire and the Difficulties in Emotion Regulation Scale to conduct a total of three follow-up surveys of 216 junior and second graders, with an interval of six months. The results showed that: (1) suicidal ideation of early adolescent continued to increase with age, showing an overall increasing trend; (2) the level of difficulties in emotion regulation also increased with age, and the overall trend was increasing; (3) there was a common development trajectory between difficulties in emotion regulation and suicidal ideation, that is, the higher the initial level of difficulties in emotion regulation, the higher the initial level of adolescents' suicidal ideation. The developmental trajectory of suicidal ideation and the developmental trajectory of difficulties in emotion regulation are significantly positively correlated, the faster the level of difficulties in emotion regulation increase over time, the faster the level of suicidal ideation increases. The results reveal the important role of emotional regulation difficulties in the development and change of suicidal ideation in the early stages of adolescents. It is found that difficulties in emotion regulation as an influencing factor of suicidal ideation have the same development trajectory as the development of suicidal ideation in the adolescent stage. It helps to deeply understand the connection between the development and changes of adolescent suicidal ideation and their own emotional regulation deficits. In addition, the results enrich and develop the existing suicide theories, and provide a certain theoretical basis for the prevention of suicidal ideation and suicidal behavior in adolescents.

Keywords: Difficulty in emotional regulation, Adolescent, Suicidal ideation, Developmental trajectory

青少年自伤与抑郁的共发性及产生机制

王晖¹ 刘霞² (通讯作者) 高叶淼¹ 刘金梦¹ 梁纯希¹

² 北京师范大学发展心理研究院, 北京, 100875, liuxia@bnu.edu.cn

摘 要 自伤青少年往往伴随抑郁情绪, 他们会报告更高的抑郁水平, 但也并非所有自伤个体均表现出抑郁情绪。为考察青少年自伤与抑郁的共发性及其产生机制, 本研究将采用两个研究分别进行探讨。研究一旨在考察青少年自伤与抑郁的共发率及转变情况, 对 989 名青少年 (平均年龄为 13.50 岁) 进行为期半年的追踪调查。研究发现: (1) 两次调查中, 青少年抑郁自伤共发组的比例分别为 24.6%和 30.9%, 单独抑郁组的比例分别为 32.4%和 27.8%, 单自伤组的比例分别为 7.0%和 6.9%, 无抑郁无自伤组的比例分别为 36.1%和 34.4%。

这说明青少年群体中抑郁和自伤具有一定共发性。(2) 对各组进行转变分析, 结果发现, T1 抑郁自伤共发组中有 63.0% 的青少年在 T2 仍同时具有抑郁和自伤行为; 有 19.8%、10.7%、6.6% 的青少年分别转变为单抑郁组、无抑郁无自伤组和单自伤组。此外, T1 的单自伤组、单抑郁组和无抑郁无自伤组均有可能转变为抑郁自伤共发组, 其转变比例依次为 44.9%、26.9% 和 10.1%。这说明抑郁和自伤的共发性具有较高稳定性, 但同时也具有一定变化性, 这既体现在抑郁和自伤共发组可能转变为其他组, 又体现在其他各组均有可能转变为自伤抑郁共发组。研究二从基因和环境交互作用的角度, 考察童年期负性经历和 THP2 基因 rs4570625 多态性对青少年抑郁与自伤共发的交互作用, 被试为 296 名青少年 (平均年龄为 12.80 岁)。结果发现: (1) 童年期负性经历能够显著增加青少年自伤与抑郁的共发几率: 以抑郁无自伤为参照组, OR=1.94, 95% CI 为 1.46~2.57; 以单自伤为参照组, OR=1.69, 95% CI 为 1.02~2.82。(2) THP2 基因 rs4570625 多态性显著调节童年期负性经历与自伤抑郁共发性的关系。具体而言, 对于 GG/GT 型基因携带者, 其经历童年期负性经历越多, 越可能表现为抑郁与自伤共发, 而非单抑郁或单自伤 (以单抑郁组为参照组, OR=1.34, 95% CI 为 1.07~1.68; 以单自伤组为参照组, OR=2.45, 95% CI 为 1.14~5.26); 对于 TT 型基因携带者, 童年期负性经历的数量与抑郁自伤的共发性不存在显著关系。本研究揭示了青少年自伤与抑郁的共发与转变情况, 并且对抑郁与自伤共发性的产生机制进行了初步探讨, 为后续研究提供了依据。

关键词 自伤行为, 抑郁, 共发性, 童年期负性经历, 基因-环境交互作用

The Co-occurrence and Mechanism of Non-suicidal Self-injury and Depression among Adolescents

Hui Wang, Xia Liu, Yemiao Gao, Jinmeng Liu, Chunxi Liang

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: Adolescent non-suicidal self-injury (NSSI) usually co-occurred with depression. However, not all NSSI adolescents would show depression symptoms. Using two studies, we aimed to explore the co-occurrence and mechanisms of NSSI and depression. Study 1: Two-wave longitudinal data over six months were collected from a total of 989 adolescents ($M_{age}=13.50$). Subgroups of the adolescents with different NSSI and depression symptoms were identified to describe the co-occurrence of NSSI and depression as well as the transitions between subgroups over the study period. Results showed that: (1) Four subgroups were identified: *NSSI with depression* ($T1=24.6\%$, $T2=30.9\%$), *depression only* ($T1=32.4\%$, $T2=27.8\%$), *NSSI only* ($T1=7.0\%$, $T2=6.9\%$), and *no NSSI and no depression* ($T1=36.1\%$, $T2=34.4\%$). The results suggested that NSSI and depression were co-occurring. (2) Transition analysis found that 63.0% of *NSSI with depression* subgroup in T1 remained in the *NSSI with depression* subgroup in T2, while 19.8%, 10.8%, and 6.6% changed to *depression only*, *no NSSI and no depression*, and *NSSI only* subgroups respectively. Besides, 44.9% of *NSSI only*, 26.9% of *depression only*, and 10.1% of *no NSSI and no depression* subgroups changed to *NSSI with depression* subgroup. The results suggested that the co-occurrence of depression and NSSI had both stability and variability. Study 2: Using a cross-sectional design, a total of 296 adolescents ($M_{age}=12.80$) were recruited to explore the role of adverse childhood experiences and TPH2 Gene rs4570625 polymorphism. Results showed that: (1) Adverse childhood experiences were significantly associated with higher probabilities in *NSSI with depression*. (2) TPH2 Gene rs4570625 polymorphism significantly interacted with adverse childhood experiences in predicting the co-occurrence of NSSI and depression. Particularly, among adolescents with GG/GT genotype, adverse childhood experiences were significantly associated with higher probabilities in *NSSI with depression* compared with *depression only* and *NSSI only*. Among adolescents with TT genotype, adverse childhood experiences were not associated with co-occurrence of NSSI and depression. This research revealed the subgroups and transition of co-occurrence of NSSI and depression, and preliminarily explored the gene $\times$ environment mechanism of co-occurrence of NSSI and depression, which provided a basis for future research.

Keywords: non-suicidal self-injury, depression, co-occurrence, adverse childhood experiences, gene $\times$ environment interaction

情绪表达冲突与青少年自伤的关系：一个纵向的中介调节模型

周星霖¹ 郭佳琪¹ 吴慧娇¹ 陈丹睿¹ 攸佳宁¹（通讯作者）

¹ 华南师范大学心理学院，广州，510630, youjianing@gmail.com

摘要 非自杀性自伤（non-suicidal self-injury 简称自伤）是指个体在没有自杀意图的情况下，以不被社会认可的方式有意的直接的伤害自己身体的行为。近年来，青少年自伤的发生率不断升高，已经成为全球的公共卫生问题。情绪表达冲突是指个体处于既想要表达情绪，同时又担心表达真实情绪将导致消极后果的矛盾心理状态。以往大量研究表明，情绪表达冲突与心理症状（如心理痛苦、抑郁、焦虑）、非适应性行为（如进食障碍）呈正相关。青春期是一个闭锁性与开放性并存的时期，处于该时期的青少年可能经历更多的情绪表达冲突。然而，尚未有研究探讨情绪表达冲突与青少年自伤的关系及其相关机制。因此本研究采用纵向追踪设计，考察情绪表达冲突与青少年自伤的关系，同时探究焦虑的中介作用和拒绝自伤效能感的调节作用。本研究对广州一所中学的 1672 名学生（ $M_{age}=16.12$ 岁， $SD=1.56$ ）进行调查，其中男生 766 名，女生 906 名。调查共进行两次，间隔时间为 6 个月。研究采用 SPSS 的 PROCESS 插件检验中介调节效应，结果显示（1）情绪表达冲突与青少年自伤呈正相关；（2）在控制了性别和基线的自伤后，情绪表达冲突完全通过焦虑预测自伤；（3）拒绝自伤效能感的调节效应显著，当青少年的拒绝自伤效能感较高时，情绪表达冲突和焦虑对自伤预测不显著；反之，情绪表达冲突和焦虑均显著预测自伤。本研究首次探究了情绪表达冲突与青少年自伤的关系，并进一步揭示了其潜在作用机制，为今后的相关研究提供了一定的启示。

关键词 自伤，情绪表达冲突，焦虑，拒绝自伤效能感

The Relationship between Non-suicidal Self-injury and Ambivalence over Emotional Expression among Chinese adolescents: A Longitudinal Moderated Mediation Model

Xinglin Zhou¹, Jiaqi Guo¹, Huijiao Wu¹, Danrui Chen¹, Jianing You¹ (correspondence)

¹ School of Psychology, South China Normal University, Guangzhou, Guangdong China

Abstract: Non-suicidal self-injury (NSSI) is defined as the deliberate and direct damage of one's own body tissue in the absence of intent to die. NSSI has become a significant mental health concern for adolescents. Ambivalence over emotional expression refers to having the desire to express emotion but failing to do so. Previous empirical studies have showed that ambivalence over emotional expression is positively associated with psychological and behavioral problems. Adolescence is a stage where closedness and openness coexist, so adolescents may experience more ambivalence over emotional expression. However, there is no research to explore the relationship between ambivalence over emotional expression and NSSI among adolescents, let alone mechanisms. Therefore, this study used the longitudinal design to examine the relationship between ambivalence over emotional expression and NSSI among Chinese adolescents. Meanwhile, the current study also explored the mediating role of anxiety symptoms and the moderating role of NSSI refusal self-efficacy. In the current study, 1672 students ($M_{age}=16.12$ years, $SD=1.56$) in a middle school in Guangzhou were investigated, including 766 males and 906 females. The investigation was conducted twice, with an interval of 6 months. We examined the moderated mediating model in PROCESS macro. The results showed that (1) ambivalence over emotional expression is positively correlated with NSSI; (2) after controlling for gender and baseline NSSI, anxiety symptoms fully mediated the association between ambivalence over emotional expression and NSSI; (3) the association between ambivalence over emotional expression and NSSI was stronger when individuals reported lower NSSI-RSE, but weaker when individuals reported higher NSSI-RSE. Similarly, anxiety symptoms significantly and negatively predicted NSSI when NSSI refusal self-efficacy was lower, in contrast, anxiety symptoms were unrelated to NSSI when NSSI refusal self-efficacy was higher. This study is the first to explore the relationship between ambivalence over emotional expression and NSSI among adolescents, and further reveal its potential mechanism, which provides some enlightenment for future related research.

Keywords: Non-suicidal self-injury, ambivalence over emotional expression, anxiety symptoms, NSSI refusal

性少数污名对 LGB 群体非自杀性自伤的影响： 性取向隐瞒、自我批评、抑郁的中介作用

陈丹睿¹ 应洁峰¹ 周星霖¹ 吴慧娇¹ 攸佳宁¹（通讯作者）

¹ 华南师范大学心理学院，广州，510630, youjianing@gmail.com

摘要 自伤行为作为自杀的一个重要预测因素，在 LGB 群体（女同性恋者、男同性恋者和双性恋者）中的发生率大大高于异性恋群体。考虑到自伤的严重后果和 LGB 群体自伤行为的高发生率，探讨 LGB 群体自伤的发生机制是十分必要的。根据少数压力模型，性少数污名是影响 LGB 群体心理健康的重要因素。但是目前尚未有研究探讨性少数污名和自伤行为之间的潜在机制。因此本研究将考察性取向隐瞒、自我批评、抑郁在性少数污名和自伤行为之间的多重中介作用。采用同性恋污名量表、自我隐瞒量表、自我批评量表、简版抑郁焦虑量表的抑郁子量表和自伤行为评估问卷对 666 名 LGB 个体（64.0%男性， $M_{age} = 24.49$ 岁）进行问卷调查。研究结果表明：（1）性少数污名、性取向隐瞒、自我批评、抑郁和自伤之间均呈显著正相关；（2）性取向隐瞒、自我批评和抑郁分别在性少数污名和自伤行为之间起部分中介作用；（3）性取向隐瞒和自我批评、自我批评和抑郁在性少数污名和自伤行为之间的多重中介作用均显著，性取向隐瞒和抑郁在性少数污名和自伤行为之间的多重中介作用不显著；（4）性取向隐瞒、自我批评和抑郁在性少数污名和自伤行为之间的多重中介作用显著。研究进一步揭示了性少数群体 NSSI 的形成机制，理论上支持和完善了少数压力模型，为今后相关研究提供了理论支持；实践上有助于性少数群体自伤行为的预防和干预。

Sexual Minority Stigma and Non-suicidal Self-injury among LGB Populations: A Serial Mediation Model

Danrui Chen¹, Jiefeng Ying¹, Xinglin Zhou¹, Huijiao Wu¹, Jianing You¹ (correspondence)

¹ School of Psychology, South China Normal University, Guangzhou, Guangdong China

Abstract: Non-suicidal self-injury (NSSI), a significant predictor of suicide, is much more prevalent in LGB populations (i.e., lesbian, gay, and bisexual) than in heterosexual populations. Given the severe consequences of NSSI and high prevalence of NSSI in the LGB populations, it is very essential to explore the mechanisms of NSSI in LGB populations. The Minority Stress Model proposed that sexual minority stigma (SMS) is a distal stress faced by LGB populations and could affect their maladaptive behavior, including NSSI. However, the potential mechanism underlying the relationship between SMS and NSSI remains unclear. Therefore, the current study will examine the relationship between sexual minority stigma (SMS) and NSSI, and explore the serial mediation roles of sexual minority concealment (SOC), self-criticism, and depression. In this study, we recruited 666 individuals (64.0% male, $M_{age} = 24.49$ years) who self-identified as LGB populations to complete questionnaires. The findings indicated that (1) SMS, SOC, self-criticism, depression, and NSSI were positively correlated; (2) SOC, self-criticism, and depression respectively played partial mediation roles between SMS and NSSI; (3) SOC and self-criticism, self-criticism and depression respectively played serial mediating roles in the relationship between SMS and NSSI; (4) SOC, self-criticism and depression played serial mediating roles in the relationship between SMS and NSSI. The study theoretically supported the Minority Stress Model and practically contributed to the prevention and intervention of NSSI among LGB populations.

情绪反应性对青少年自杀意念的影响：一个纵向的链式中介模型

吴慧娇¹ 高倩倩¹ 陈丹睿¹ 周星霖¹ 攸佳宁¹（通讯作者）

¹ 华南师范大学心理学院，广州，510630, youjianing@gmail.com

摘要 自杀是一种有意结束自己生命的行为，近几年在我国青少年中的发生率越来越高，对家庭和社会造成了不可挽回的损失。自杀意念是自杀行为发生的必要条件，因此探讨自杀意念的影响因素对青少年自杀风险的识别与预防具有重要意义。以往研究发现，情绪反应性是自杀意念的有效预测因素，但是关于两者之间具体的影响机制知之甚少，有待进一步研究。相关理论和研究表明，痛苦不容忍和抑郁可能在情绪反应性和自杀意念之间扮演重要作用。因此，本研究试图探讨情绪反应性影响自杀意念的路径模型，并考察痛苦不容忍和抑郁在其中的中介作用。本次调查共 5,423 名青少年参与 ($M_{age} = 14.63$ 岁, $SD = 1.25$)，其中，女生占比 52.7%，男生占比 47.3%，分别完成了关于情绪反应、自杀意念、痛苦不容忍和抑郁的自我报告问卷。调查共进行了两个波段，每波段相隔 6 个月。研究发现：(1)情绪反应性、痛苦不容忍和抑郁均能显著正向预测自杀意念。(2)在控制了性别和基线自杀意念后，情绪反应性主要通过三条中介路径影响自杀意念（总中介效应=0.19, 95%CI=[0.16,0.21]）：痛苦不容忍和抑郁在情绪反应性和自杀意念之间的单独中介作用，痛苦不容忍和抑郁在情绪反应性和自杀意念之间的链式中介作用。研究揭示了情绪反应性到自杀意念的潜在机制，表明针对情绪反应性的干预措施可能是降低青少年产生自杀意念风险的有效方法。

关键词 情绪反应性，自杀意念，痛苦不容忍，抑郁

Emotion Reactivity and Suicide Ideation among Adolescents: A Longitudinal Serial Mediation Model

Huijiao Wu¹, Qianqian Gao¹, Danrui Chen¹, Xinglin Zhou¹, Jianing You¹ (correspondence)

¹ School of Psychology, South China Normal University, Guangzhou, Guangdong China

Abstract: Suicide is an act of intentionally ending one's life. In recent years, the incidence of suicide among adolescents in our country keeps rising, causing irreparable damage to the family and society. Given that suicide ideation is an inevitable stage preceding individual's suicide, exploring risk factors for suicide ideation among adolescents is important to promote suicide prevention and intervention efforts. Previous studies have shown that emotion reactivity is an important predictive factor for suicide ideation. However, the mechanism underlying their relationship has remained largely unexplored. Theoretical and empirical studies indicated that distress intolerance and depressive symptoms may play important roles in the relation between emotion reactivity and suicide ideation. The current study aims to investigate the serial mediating roles of distress intolerance and depressive symptoms in the relationship between emotion reactivity and suicide ideation. A total of 5,423 Chinese adolescents (52.7% females, $M_{age} = 14.63$ years, $SD = 1.25$) completed self-report questionnaires regarding emotion reactivity, suicide ideation, distress intolerance, and depressive symptoms. Assessment was conducted for two waves, 6 months apart. In bivariate analyses, emotion reactivity, distress intolerance, and depressive symptoms were positively related to suicide ideation. In serial mediation analyses, there was a significant total effect of emotion reactivity on suicide ideation. After controlling for gender and baseline suicide ideation, distress intolerance and depressive symptoms independently and serially mediated the relationship between emotion reactivity and suicide ideation, with emotion reactivity influencing suicide ideation through three mediation pathways (total mediation effect = 0.19, 95% CI = [0.16, 0.21]). Findings of this study demonstrate a potential mechanism underlying the path from emotion reactivity to suicide ideation. Interventions that target emotion reactivity may be an effective way to reduce the risk of developing suicide ideation among adolescents.

Keywords: emotion reactivity, suicide ideation, distress intolerance, depressive symptoms

初中生自伤行为的发展趋势：友谊质量与亲子沟通的作用

王玉龙（通讯作者） 苏慧娟 赵婧斐

1 湖南师范大学教育科学学院，湖南师范大学认知与行为湖南省重点实验室，长沙 410081

2 湖南师范大学教育科学学院，长沙，410081，E-mail: yulongwang107@126.com

摘要 自伤是指那些不以自杀为目的，且不为社会文化所接纳的蓄意、反复伤害自己身体的行为。初中阶段是自伤行为发生的高峰期。本研究从发展的角度，采取纵向追踪设计和运用多层线性模型（HLM）考察初中生自伤行为的发展趋势，以及友谊质量和亲子沟通的作用。采用青少年自我伤害问卷、友谊质量问卷和亲子沟通问卷对 1134 名初一学生分别在 2018 年 12 月、2019 年 10 月和 2020 年 10 月进行 3 次施测，最后筛选出 3 次中至少有 1 次自伤行为的 595 名初中生进行分析。结果显示：（1）从初一上学期到初三上学期，初中生的自伤行为有越来越严重的趋势，初中生自伤的初始水平和发展趋势都存在显著的个体差异，而且初始水平越高，变严重的趋势越快；（2）友谊质量能够显著负向预测初中生自伤行为的发展趋势；（3）母子沟通显著负向预测初中生的自伤行为，同时对友谊质量与初中生自伤的关系有显著的正向调节作用，但对初中生自伤的发展趋势无显著影响，父子沟通对初中生自伤的初始水平、发展趋势以及友谊质量与初中生自伤之间关系的调节作用均不显著。研究表明，初中生的自伤行为在整个初中阶段有越来越严重的趋势，较高的友谊质量对初中生自伤行为的发展趋势有延缓作用，而良好的母子沟通有助于提高友谊质量的这种保护作用。

关键词 初中生，自伤，友谊质量，亲子沟通

Trajectories of Self-injury among Junior High School Students: The role of Friendship Quality and Parent-child communication

WANG Yulong(Corresponding Author), SU Huijuan, ZHAO Jingfei

1 School of Education, Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University, Changsha, 410081

2 School of Education, Hunan Normal University, Changsha, 410081, E-mail: yulongwang107@126.com

Abstract: Self-injury is most commonly described as deliberate, repetitive, direct destruction or alteration of body tissue without conscious suicidal intent, which is deemed socially unacceptable. Non-suicidal self-injury is prevalent among junior high school students. From a development perspective, this study explored trajectories of self-injury among junior high school students and highlighted the role of friendship quality and parent-child communication by using the multilevel model (HLM). A total of 1134 seventh graders responded to questionnaires assessing self-injury, friendship quality, and parent-child communication three times, the first test was conducted in December 2018, and the second and third tests were conducted in October 2019 and October 2020 respectively. Finally, 595 junior high school students who have engaged in self-injury at least one time were selected for further analysis. The results indicated that: (1) From the seventh grade to the ninth grade, self-injury among junior high school students has a growing trend. There are significant individual differences in the initial level and the trend of self-injury of junior high school students. Also, high initial level of self-injury accelerates the tendency of self-injury; (2) Having high-quality friendships can lessen junior high school students' tendencies to self-injury; (3)

Mother-child communication can predict self-injury among junior high school students, and shows obviously positive regulating effect on the relationship between friendship quality and self-injury of junior high school students. It has no significant effect on the changing trend of self-injury among junior high school students. However, father-child communication has little influence on the initial level of self-injury and does not play a regulating role between friendship quality and self-injury. This study confirms that self-injury has a growing tendency throughout the junior high school stage. Having high-quality friendships can lessen junior high school students' tendencies to self-injury, and establishing good mother-child communication can improve the protective effects of friendship.

Keywords: junior high school students, non-suicidal self-injury, friendship quality, parent-child communication

儿童社会适应的结构与内涵——基于访谈的质性研究

刘文(通讯作者) 王依宁 王薇薇 林爽

辽宁师范大学心理学院, 大连, 116029 wenliu703@126.com

摘要 结合已有的社会适应理论与实践成果, 本研究采用质性研究的方法, 选择儿童、家长、教师、校长和社区工作者共 88 人进行个体访谈, 采用主题分析法对访谈文本进行三个阶段的编码分析, 并据此提出了动态社会适应理论, 该理论认为儿童的社会适应是其与环境互动的动态过程与结果, 包括个体状态、适应过程、适应结果三个主要阶段, 个体状态会影响社会适应的过程, 从而影响适应结果, 社会适应结果又会重新调整个体状态。个体状态包括自我状态与情绪状态, 适应过程包括行为适应与认知适应, 适应结果包括学业适应、人际适应与规范适应。儿童的社会适应是一个循环动态的社会化过程。

The structure and connotation of children's social adaptation: an interview-based qualitative study

Wen Liu (corresponding author), Yining Wang, Weiwei Wang, Shuang Lin

College of Psychology, Liaoning Normal University, Dalian, 116029

Abstract: Combined with the existing theories and practical results of social adaptation, this study adopted the qualitative research method and selected 88 children, parents, teachers, principals and community workers to conduct individual interviews. Subject analysis method was used to conduct three-stage coding analysis of the interview text, and based on this, the dynamic social adaptation theory was proposed. According to this theory, children's social adaptation is a dynamic process and result of their interaction with the environment, including three main stages: individual state, adaptation process, and adaptation result. Individual state will affect the process of social adaptation, thus affecting the adaptation result, and the social adaptation result will readjust the individual state. The individual state includes self-state and emotional state, the adaptation process includes behavioral adaptation and cognitive adaptation, and the adaptation results include academic adaptation, interpersonal adaptation and normative adaptation. Children's social adaptation is a circular and dynamic socialization process.

农村留守儿童人际关系不良的团体整合性沙盘游戏干预研究

陈雯雯¹ 李灵²(通讯作者) 尹倩²

¹ 渤海大学附属高级中学, 锦州, 121000.

² 辽宁师范大学心理学院应用心理学系, 大连, 116029, 通讯作者 phdliling@126.com

摘要 农村留守儿童是一个特殊群体, 他们数量巨大、分布广泛, 没有完整家庭的陪伴, 缺乏及时的沟通和关爱。独特的家庭环境导致了很多心理问题的产生, 人际关系不良比较常出现在中学生身上, 在农村留守儿童的身上体现的更为明显。人际关系不良会影响学生很多方面的发展, 在一个相对和谐、友好的环境中会激发学生更多的潜能, 而在一个人际关系不良的环境中则会对学生的学业、心理发展等造成不利影响。本研究运用团体整合性沙盘游戏疗法来对留守儿童的人际交往进行干预。整合性沙盘游戏治疗以分析心理学为理论主体, 整合了积极心理学、家庭治疗、短程焦点解决等多种理论和技术, 在被试制作沙盘的过程中, 内心想法外化, 更加清晰的看到自己的问题与不足, 促进被试的自愈, 从而实现治疗目的。首先, 本研究选取某农村中学初中部 86 名被试, 采用《人际关系综合诊断量表》进行测试(量表分为人际交谈、人际交友、待人接物、与异性交往四个维度, 分数越高表明该维度的问题越严重)。结果发现: 留守儿童和非留守儿童的人际关系状况的总均分存在着显著差异, 留守儿童得分显著高于非留守儿童。其次, 挑选留守儿童中问题严

重且愿意接受后续干预的学生组成干预组与对照组, 每组各 10 人。再次, 对干预组进行整合性沙盘游戏疗法干预, 对照组不干预。团体整合性沙盘干预共 10 次, 每周一次, 主题对照量表的几个维度, 分别为“我的一天”、“我的人际现状”、“我能做出什么样的努力”、“家庭情景中的礼节”“学校情境中的礼节”、“异性交往”等。干预后进行后测。第四, 通过对比被试干预前后的量性结果和质性分析, 结合沙盘作品的动态九宫格分析, 参考被试的自述感受, 证明了整合性沙盘游戏疗法对于留守儿童人际交往得分有显著降低作用。最后, 从实际出发, 提出了一些改善农村留守儿童人际关系的建议。

Intervention Study of Integrated sandplay therapy in group for left-behind children's Poor Interpersonal Relationship in rural areas

Chen Wenwen¹, Li Ling²(corresponding author), Yin Qian²

¹ Bohai University affiliated high school, Jinzhou, 121100

² Department of Applied Psychology, College of Psychology, Liaoning Normal University, Dalian, 116029, corresponding author, phdliling@126.com

Abstract: The Left-behind children in China is a special group of people who are numerous and widely distributed, lack the company of a complete family, and lack timely communication and care. The unique family environment has led to a lot of psychological problems, interpersonal relationship is more often found in middle school students, in the Left-behind children in China body reflected more obvious. Bad interpersonal relationship will affect students' development in many aspects. In a relatively harmonious and friendly environment, it will stimulate students' more potential, however, in an environment of bad interpersonal relationship, students' study and psychological development will be adversely affected. In this study, group-integrated sandplay therapy was used to intervene left-behind children's interpersonal communication. Integrative sandplay therapy takes analytical psychology as the theoretical main body, integrates various theories and techniques such as positive psychology, family therapy, short-term focus solution, etc. . In the process of making sandplay, the subjects' inner thoughts are externalized, more clearly see their own problems and shortcomings, promote the self-healing subjects, so as to achieve treatment purposes. The first, in this study, 86 subjects from a rural Middle School were selected and the comprehensive interpersonal relationship diagnostic scale (irlds) was used as an experimental tool, the higher the score, the worse the problem. The results showed that there was a significant difference between left-behind children and non-left-behind children, and the scores of left-behind children were significantly higher than that of non-left-behind children. The second, the left-behind children who had serious problems and were willing to accept follow-up intervention were selected to form the intervention group and the control group, each group consisted of 10 students. The third, the intervention group was treated with integrated sandplay therapy for 10 times, once a week, on several dimensions of the thematic control scale, for my day, my interpersonal status, what efforts I can make, family situation in the etiquette, school situation in the etiquette, the opposite sex, and so on. The control group did not interfere, and then conducted a post-test. The fourth, through the quantitative results and qualitative analysis before and after the intervention, combined with the dynamic nine-grid analysis of sand table works, reference to the self-reported feelings of the participants, it is proved that the integrative sandplay therapy can significantly reduce the scores of left-behind children in interpersonal communication. Finally, the author puts forward some suggestions to improve the interpersonal relationship of Left-behind children in China.

Keywords: Integrated Sandplay Therapy in group, left-behind children, poor interpersonal relationship, intervention study

朝鲜族留守初中生积极心理品质与学习倦怠关系

摘要 延边朝鲜族自治州作为朝鲜族人口集中居住的地区，每年都会有大量的年轻人进入韩国企业，这使延边州地区出现了大量的留守儿童。留守初中生作为朝鲜族留守儿童的主要群体，其心理问题较为复杂，这不仅会影响其积极心理的健康发展，也会使其学业成绩受到消极的影响。本文以朝鲜族留守初中生作为研究对象，探讨了积极心理品质、社会支持、以及学习倦怠之间的关系，并探索了社会支持在积极心理品质与学习倦怠之间的中介作用。本研究使用积极发展问卷、学习倦怠问卷、社会支持问卷对延吉市某三所初中的 400 名朝鲜族留守初中生进行了调查，得出以下结论：（1）朝鲜族留守初中生积极心理品质总平均分高于均值水平，总分在成绩排名、父母外出状况和父母文化程度上差异显著。（2）朝鲜族留守初中生社会支持水平略高于常模水平，即处在基本健康的状态。朝鲜族留守初中生的社会支持与成绩排名、父亲文化程度、以及母亲文化程度上呈现出显著的正相关。（3）朝鲜族留守初中生存在不同程度的学习倦怠情况。学习倦怠的各维度与学生年级、成绩排名、父母外出状况、父母外出时间呈现相关关系。（4）朝鲜族留守初中生积极心理品质与学习倦怠各维度之间也呈现显著的负相关，积极心理品质与社会支持各维度之间均呈现显著的正相关，社会支持与学习倦怠各维度之间均呈现出明显的负相关。（5）积极心理品质不仅对学习倦怠有直接的影响，并通过社会支持的部分中介作用对学习倦怠产生影响。根据以上结论提出以下教育建议：（1）关注与理解初中生不稳定的情绪特点，培养朝鲜族留守初中生积极心理品质。（2）提升朝鲜族留守初中生自我认知与评价能力，引导其通过积极的思维方式解决问题。（3）基于社会支持在积极心理品质与学习倦怠之间的中介作用，消除朝鲜族初中生学习倦怠。

多重依恋对农村留守儿童内外化问题的影响：个体为中心的视角

陈慧 蔺秀云（通讯作者）

北京师范大学发展心理研究院，北京，1008752，linxy@bnu.edu.cn

摘要 随着个体的成长，个体不仅与家庭成员之间具有依恋关系，也慢慢地开始与家庭之外的重要他人建立长久的情感联结，即形成多重依恋（multiple attachment），并且个体的多重依恋关系会随着年龄的增长而表现出一致性，即可能会出现累积效应。对于处于中小学阶段的农村留守儿童，其多重依恋的对象主要为父母、主要照顾者、同伴及教师。从心理健康的角度来说，良好的多重依恋水平能够正向预测儿童及青少年的心理社会适应，减少内外化问题出现的风险，因而研究多重依恋非常有必要，尤其对于留守儿童来说。以往研究多关注农村留守儿童的亲子依恋状况，发现农村留守儿童由于长期的亲子分离，其亲子依恋水平往往低于非留守儿童；而农村留守儿童与主要照顾者、同伴和教师之间的依恋情况及其对内外化问题的影响缺乏充分研究。为探讨多重依恋对农村留守儿童内外化问题的影响，本研究采用问卷调查的方法，以个体为中心的视角，通过潜剖面分析对农村留守儿童的多重依恋进行分组，并通过多元逻辑回归考察了人口学变量（性别、年龄、社会经济地位、留守类型）对潜在剖面的影响。潜剖面分组后农村留守儿童的内外化问题水平差异也通过方差分析和事后检验进行了比较。研究被试为 1349 名农村留守儿童（688 名男生，660 名女生，1 名性别缺失；平均年龄 = 12.11， $SD = 1.60$ ），采用父母与同伴依恋量表（IPPA）测量了其多重依恋（包括母子依恋、父子依恋、照顾者依恋、同伴依恋和师生依恋）情况，抑郁焦虑压力量表（DASS）的抑郁和焦虑分量表测量了其内化问题，青少年品行问题行为倾向问卷（CPTIA）测量了其外化问题。结果发现：（1）农村留守儿童的多重依恋具有累积效应，表现为四个多重依恋潜在剖面：均低组（14.23%）、中等组（48.18%）、偏高组（26.69%）以及均高组（10.90%）；（2）女生、年龄大、社会经济水平高的农村留守儿童，越可能高水平多重依恋；而留守类型在潜在剖面分组上无显著差异；（3）对农村留守儿童的内化问题而言，所属潜在剖面的多重依恋水平越高，内外化问题越少。研究提示，减少农村留守儿童的内外化问题，可从提高其与多个重要他人之间的依恋关系入手，且尤其应多关注多重依恋属于均低组的农村留守儿童。

关键词 多重依恋，内外化问题，农村留守儿童

The Roles of Multiple Attachment in Rural Left-Behind Children' Internalizing and Externalizing Problems: A Person-Centered Perspective

CHEN Hui, LIN Xiu-yun

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: As children grow up, they not only develop attachment relationships with family members, but also be able to form long-term emotional connections with significant others outside the family, that is, multiple attachment. The consistency of multiple attachment will increase with age, which have been described as a cumulative effect. Higher level of multiple attachment positively predicts greater psychosocial adaptation in children and adolescents, and reduce the risk of internalizing and externalizing problems. As for the rural left- behind children in primary and secondary school stages, their attachment figures are mainly parents, primary caregivers, peers and teachers. Previous studies paid much attention to the status of parent-child attachment in rural left-behind children. Due to long-term parent-child separation in rural left-behind children, it was found that the level of parent-child attachment in rural left-behind children was lower than that of non-left-behind children. The attachments in rural left-behind children with their primary caregivers, peers and teachers and the impact of multiple attachment on internalizing and externalizing problems are not fully studied. In order to explore the influence of multiple attachment on the internalizing and externalizing problems in rural left-behind children, the current study adopted a person-centered perspective by conducting the latent profile analysis to identify the best number of the potential multiple attachment profiles in rural left-behind children, and examined the influence of demographic variables (including gender, age, socio-economic status, and left-behind type) on the potential profiles by conducting multivariate logistic regression. The differences of internalizing and externalizing problems of rural left-behind children in each meaningful profile had also been analyzed by ANOVAs and post hoc tests (Bonferroni). Our sample included 1349 rural left-behind children (688 boys, 660 girls, 1 gender missing; $M_{age} = 12.11$, $SD = 1.60$). The multiple attachments (including mother-child attachment, father-child attachment, primary caregiver attachment, peer attachment and teacher-student attachment) were measured by the Inventory of Parent and Peer Attachment (IPPA). The internalizing problems were measured by the depression subscale and anxiety subscale of the Depression Anxiety Stress Scale (DASS), and the externalizing problems were measured by the Conduct Problem Tendency Inventory for Adolescents (CPTIA). The results found that: (1) Multiple attachment in rural left-behind children had cumulative effect, which identified four meaningful profiles: average low group (14.23%), medium group (48.18%), high group (26.69%) and average high group (10.90%); (2) Girls, older rural-left behind children with high SES level were more likely to be classified into average high group; left behind types had no significant effect on potential profiles; (3) For the internalizing and externalizing problems in rural left-behind children, children in potential profiles with higher level of multiple attachment indicated less internalizing and externalizing problems. The current study suggests that to reduce the level of internalizing and externalizing problems in rural left-behind children, we may start with improving their attachment relationships with significant others, and pay more attention to the rural left-behind children in potential profiles with low level of multiple attachment.

Keywords: multiple attachment, internalizing and externalizing problems, rural left-behind children

留守儿童人际敏感与攻击行为的关系： 留守类型和共情的调节作用

于明阳 姜英杰*

东北师范大学心理学院，长春 130024, jiangyj993@nenu.edu.cn

摘要 攻击行为是儿童行为问题的主要外化表现，是指任何试图伤害他人的行为。人际敏感往往与攻击行为呈现正相关，与非留守儿童相比，留守儿童更容易产生攻击行为。留守儿童由于家庭结构的原因，更容易

产生情绪问题，不良的情绪调节与攻击行为有关。主要表现为低情感共情个体很难理解他人的情绪，并由于在反应决策上存在社会技能缺陷，无法准确处理社会信息，即共情水平较低的儿童面对模糊不清或敌对性较低的社交情景时，不能及时有效的感知对方的情感或心理状态，难以控制自己的攻击倾向，产生攻击行为。为探究导致留守儿童攻击行为较高的影响因素，本研究通过对 991 名留守儿童的问卷调查探讨留守儿童人际敏感与攻击行为之间的关系，以及留守类型和共情在其中的调节作用。本研究采用调节模型检验各变量间的关系，结果表明：（1）留守儿童人际敏感与攻击行为之间存在显著正相关（2）留守类型和共情均可负向调节人际敏感和攻击行为之间的关系，父外留守可抑制低人际敏感儿童的攻击行为，而高共情可抑制高人际敏感儿童的攻击行为。这表明，减少留守儿童攻击行为不仅需要降低儿童的人际敏感性，也可以通过采取父外留守和提高儿童共情水平的方式降低留守儿童的攻击性。这为减少留守儿童攻击行为提供了重要的教育实践启示。

The Relationship between Interpersonal Sensitivity and Aggressive Behavior of Left-Behind Children: The Moderating Role of Left-behind Type and Empathy

Yu Mingyang, Jiang Yingjie

School of Psychology, Northeast Normal University, ChangChun, 130024

Abstract: Aggressive behavior is the main externalization of children's behavioral problems, which refers to any behavior that tries to harm others. Interpersonal sensitivity is often positively correlated with aggressive behavior. Compared with non-left-behind children, left-behind children are more likely to have aggressive behavior. Left-behind children are more likely to have emotional problems due to family structure, and poor emotional regulation is related to aggressive behavior. The results showed that individuals with low affective empathy had difficulty in understanding the emotions of others and could not accurately process social information due to the deficiency of social skills in response decision-making. That is to say, when children with low level of empathy are faced with ambiguous or hostile social situations, they cannot timely and effectively perceive the emotion or psychological state of the other party, and it is difficult to control their aggressive tendency and produce aggressive behavior. In order to explore the influencing factors of left-behind children's higher aggressive behavior, this study investigated the relationship between interpersonal sensitivity and aggressive behavior through a questionnaire survey of 991 left-behind children, as well as the moderating effects of left-behind children's type and empathy. This research adopts the moderation model to examine the relationship between the variables, the results show that: (1) there is a significant positive correlation between interpersonal sensitivity and aggressive behavior among left-behind children; (2) both left-behind type and empathy can negatively moderate the relationship between interpersonal sensitivity and aggressive behavior. Father-left children can inhibit aggressive behavior of children with low interpersonal sensitivity, while high empathy can inhibit aggressive behavior of children with high interpersonal sensitivity. This suggests that reducing left-behind children's aggression not only requires reducing children's interpersonal sensitivity, but also can reduce children's aggression by taking measures such as father-left and improving children's level of empathy. This provides an important educational practice for reducing left-behind children's aggressive behavior.

大学生良心的团体干预研究

邱小艳¹ 燕良轼² (通讯作者)

1 湖南科技学院教师教育学院, 永州, 425199

2 湖南师范大学教育科学学院心理学系, 长沙, 410081, 1458558267@qq.com, yanliangshi@hunnu.edu.cn

摘要 目的: 本研究旨在考察团体干预对提升大学生良心水平的可行性与有效性, 以期为大学生的良心培育及道德教育提供参考。方法: 将 61 名低良心水平的大学生随机分配到干预组 (男 13 人, 女 17 人) 和对照组 (男 12 人, 女 19 人)。干预组被试接受为期 18 周的良心团体干预, 对照组被试不接受任何处理。干预涵盖良心的八个维度, 综合运用情境讨论、角色扮演、榜样示范、脑力激荡、善行记录、冥想等多种方式。采用过程评估与结果评估相结合、客观评估与主观评估相结合的方法, 综合考察团体干预的效果。过程评估在干预的第 9 周进行, 采用团体活动反馈表了解干预组被试对团体过程的感受; 结果评估包含四个方面: 一是干预组、对照组良心水平的前后测比较及 2 个月后的跟踪结果比较, 二是干预组被试对团体气氛进行评估, 三是干预组被试对团体辅导课程的满意度进行评价, 四是干预结束后让干预组被试撰写心得体会来评估团体干预的成效。结果: (1) 干预前干预组和对照组被试在良心问卷的总分及各维度分上差异不显著, 干预后干预组被试在良心问卷上的总分显著高于对照组 ($t=5.528, p<0.01$), 两个月后追踪结果中干预组的得分也显著高于对照组 ($t=5.484, p<0.01$)。 (2) 干预组成员对团体过程、团体气氛给予了积极评价, 对团体辅导课程的有效性、趣味性、启发性及价值性给予了充分肯定, 干预组成员干预后的主观反馈也表明团体干预收到了良好的效果。结论: 团体干预是提升大学生良心水平的有效途径; 团体干预不仅有效, 其效果还具有一定的持久性。

2 Institute of Educational Sciences, Hunan Normal University, Changsha, 410081,

yanliangshi@hunnu.edu.cn

Abstract: Objective: This study aims to investigate the feasibility and effectiveness of group intervention in improving the level of conscience of college students, so as to provide reference for the cultivation of conscience and moral education of college students. Methods: 61 college students with low conscience were randomly assigned to intervention group (13 males and 17 females) and control group (12 males and 19 females). The intervention group was subject to 18 weeks of conscience group intervention, and the control group was not treated. Intervention covers eight dimensions of conscience, which includes situation discussing, role playing, model demonstrating, brainstorming, good deeds recording, meditation and other ways. The results of group intervention were comprehensively investigated by the methods of process evaluation and result evaluation, objective evaluation and subjective evaluation. The process evaluation was conducted at the 9th week of intervention, and the group activity feedback form was used to understand the participants' feelings of group process; Results the evaluation includes four aspects: one is the comparison of the conscience level of the intervention group and the control group and the comparison of the follow-up results after two months; the second is the evaluation of the group atmosphere in the intervention group; the third is the satisfaction evaluation of the group counseling course in the intervention group; the fourth is to let the participants in the intervention group write their experience to evaluate the effectiveness of

group intervention. Results: (1) Before the intervention, there was no significant difference between the intervention group and the control group in the total score and each dimension score of the conscience questionnaire. After the intervention, the total score of the intervention group was significantly higher than that of the control group ($t = 5.528$, $P < 0.01$), and the score of the intervention group was significantly higher than that of the control group two months later ($t = 5.484$, $P < 0.01$). (2) The members of the intervention group gave positive evaluation to the group process and group atmosphere, and fully affirmed the usefulness, interest, inspiration and value of the group counseling course. The subjective feedback of the intervention group members also showed that the group intervention received good results. Conclusion: group intervention is an effective way to improve the level of conscience of college students; Group intervention is not only effective, but also has a certain persistence.

良心的理论解读及其在青少年教育中的价值

燕良弼^{1,2} 李婵^{1,2} 李海亮^{1,2} 胡燕^{1,2}

1 湖南师范大学文化心理与行为研究中心, 长沙, 410081

2 湖南师范大学教育科学学院心理学系, 长沙, 410081

摘要 西方先哲对人性的探讨偏重知识或智慧视角, 中国先哲对人性的理解则偏道德层面。因此我们可以将西方的人性论称为知识人性论或智慧人性论, 而将中国的人性论称为道德人性论或伦理人性论; 前者是工商文明的产物, 后者则是农耕文明的产物。这种最初对人性论理解上的偏好又造成了中西方文化的差异。良心是中国儒家道德人性论的代表。良心是人们一种内在的有关正邪、善恶的理性判断和评价能力, 是正当与善的知觉, 义务与好恶的情感, 控制与抉择的意志, 持久的习惯和信念在个人意识中的综合统一, 是一套以辨别是非善恶为核心的避恶趋善的内在道德标准。“良心”及“良知”是中国先秦时期孟子在继承孔子“仁”学思想基础上所创建概念。这个概念一经产生就在中国大地不胫而走, 雅俗共赏, 对中国社会两千余年的道德心理产生了十分深远的影响。它几乎成为人们日常生活中道德与心理的代名词。如果说西方心理学是热衷于对人们知识之心的阐发, 那么中国儒家则执着于对人们道德之心, 即良心的经营。在儒家的视野中, 良心即人心, 即人区别于动物之心, 也即说在儒家看来, 有良心即是人, 就有人性, 无良心就是禽兽, 就没有或丧失了人性。在儒家看来, 探讨人心就是探讨良心, 离开良心就没有人心。所以良心人人皆有, 只是有些人的良心被邪恶迷惑、遮蔽无法显现出人性之本真。本研究运用文献法、问卷法、深度访谈法, 进行探索性因素分析和验证性因素分析等相关统计方法, 从青少年群体中提炼出良心的八个维度: 即当代中国青少年的良心是由: 是非心、羞耻心、恻隐心、宽恕心、孝敬心、诚信心、感恩心、责任心组成。青少年良心教育的价值在于: (一) 教育的目的就是不断提升良心的水平和层次。教育的基本要求就是让青少年成为“君子”, 而不能堕落为“小人”, 更高的标准则是成为贤人与圣人。(二) 良心是积极、健康之心。一个人缺乏良心, 道德不健康, 他的身心也不可能真正健康。(三) 良心是公心, 是利他之心。儒佛两家主张为他人奉献, 是“救人以难”, “有益于人”的, 而老庄学说, 只是用来明哲保身, 自私的。(四) 良心可提升认知功能、专注力及情感功能;(五) 良心有可能改善大脑的结构与功能;(六) 良心可助人克服恶念, 影响寿命。(七) 良心是立人或自立之本、强国之本、教育之本;(八) 良心是可以干预和培养的。

The Theoretical Interpretation of Conscience and Its Value in Youth Education

Yan Liangshi^{1,2}, Li Chan^{1,2}, Li Hailiang^{1,2}, Hu Yan^{1,2}

1 School of Educational science, Hunan Normal University, Changsha, 410081

2 Research Center for Cultural Psychology and Behavior, Hunan Normal University, Changsha, 410081

Abstract: Philosophers in western countries focused on the perspective of knowledge or wisdom in the exploration of

human nature, while Chinese philosophers' used to be understanding of human nature was more on the moral level. Therefore, we can call the theory of human nature in western countries as intellectual theory or intelligent theory, and Chinese theory of human nature as moral theory or ethical theory; The former one is the product of industrial and commercial civilization, and the latter is the product of agricultural civilization. This initial preference for the understanding of the theory of human nature has caused the difference between Chinese and Western cultures. Conscience is the representative of Chinese Confucian theory of moral human nature. First, conscience is a kind of internal rational judgment and evaluation ability of people about righteousness and unrighteousness, good and evil. Secondly, it is also the perception of righteousness and good, the emotion of obligation, likes and dislikes, the will to control and make choices, and the comprehensive unity of lasting habits and beliefs in personal consciousness. Thirdly, conscience is a set of internal moral standards to promote good and suppress evil with distinguishing right from wrong, good from evil as the core. "Conscience" are concepts created by Mencius in Pre-Qin Dynasty of China on the basis of inheriting Confucius' "benevolence" thought. This concept spread all over China as soon as it came into being with appreciation of both the saint and ordinary people have had a profound impact on the moral psychology of the Chinese society for over 2000 years. And it has almost become synonymous with morality and psychology in people's daily life. Psychology in western countries is keen on elucidating people's intellectual aspect, while Chinese Confucianism is obsessed with the management of people's moral aspect which is conscience. From the perspective of Confucianism, they consider conscience as the nature difference between humans and animals, and conscience is people with humanity, and an unconscience is a beast without humanity. They also think there is no human mind without the conscience and explore the human mind through exploring the conscience. Therefore everyone has conscience, but some people's consciences are obscured by evil and unable to show the true nature of human nature. The current study uses the literature method, questionnaire method, in-depth interview method, via exploratory factor analysis and confirmatory factor analysis and other related statistical methods to extract an eight-dimensional structure of conscience from the youth group: shame, sympathy, right and wrong, forgiveness, filial piety, honesty and credibility, gratitude and responsibility. The value of conscience education lies in: (1) The purpose of education is to continuously improve the level of conscience. And the basic requirement of education is to let young people become "gentlemen" instead of "lousy mean person". What's more, the higher standard is to become wise men and saints. (2) Conscience is a positive and healthy quality. If one lacks of conscience, his body and mind cannot be truly healthy. (3) Conscience is public and altruistic. Confucianism and Buddhism advocate dedication to others, which is "saving people from difficulty" and "good for others", while the doctrine of Chuang-tzu and Lao-tzu's is only used to protect oneself and be selfish. (4) Conscience can improve cognitive function, concentration and emotional function; (5) Conscience may improve the structure and function of the brain; (6) Conscience can help people overcome evil thoughts and affect life span. (7) Conscience is the foundation to be human being or self-reliance, the foundation of a strong country, and the foundation of education; (8) Conscience can be intervened and cultivated.

摘 要 道德伪善(Moral hypocrisy)是个体出自非纯粹的社会动机, 向外倡导自己善的欲望, 使行为外表具有道德特征, 但又设法避免真实行善付出代价的行为倾向(Jordan & Sommers, 2020; Effron, Connor, Leroy, and Lucas, 2018; 寇戡等, 2015; Walkowitz et al., 2014; Baston, Rucker, & Petty, 2005)。道德伪善在日常生活中非常普遍, 常表现为“表里不一”、“说一套, 做一套”等, 表现为诱发强烈的认知冲突和情绪反应。根据前人的

研究,当决策情境的公开性(revelation)程度不同时,个体在道德伪善决策中的行为和神经反应不同,且不同良心水平的决策者,其在道德决策中的行为和神经反应不同。因此,本研究在总结前人研究的基础上,结合行为测量、主观报告和事件相关电位技术,考察情境公开性对道德伪善的影响,并探讨个体内在的良心特质在其中的调节机制。实验采用改编的独裁者游戏范式,先呈现决策的情境公开性程度(公开局 vs.秘密局),然后让被试完成决策分配任务,考察良心水平在情境公开性影响道德伪善决策影响中的调节作用。实验结果发现,与低良心水平个体相比,高良心水平个体做出了较少的伪善选择。高良心个体在秘密局中的非伪善选择显著高于公开局。且在秘密局中的决策时间更长,并分别在情绪反应和认知推理阶段诱发了更大波幅的P260和LPP(300-450ms),表现出情境抑制效应。然而,决策时间和神经反应上的这种差异在低良心水平下却消失了。研究结果表明高、低良心个体的伪善决策在行为选择、主观报告和神经反应上表现出了显著差异,受到了情境公开性的影响,高良心个体在公开局中的伪善决策消耗了更多的情绪和认知成本。

yanliangshi@hunnu.edu.cn

Abstract: Moral hypocrisy (MH) is the desire to behave morally while seeking opportunities to avoid adopting behaviors that actually result in morally good outcomes (Jordan & Sommers, 2020; Effron, Connor, Leroy, and Lucas, 2018; Kou Yu et al., 2015; Walkowitz et al., 2014; Baston, Rucker, & Petty, 2005). Moral hypocrisy is very common in daily life. MH has two manifestations. First, people adopt harsher and stricter standards of moral judgment for others than those they adopt for themselves (Valdesolo and DeSteno, 2008; Lammers et al., 2010), and this type of hypocrisy occurs at the intrapersonal level. Second, at the interpersonal level, hypocrisy is manifested in people's morality standards, which are inconsistent with their actual behavior; that is, their actual behavior fails to meet their claimed moral requirements of behavior (Watson and Sheikh, 2008; O'Connor et al., 2020). Which are manifested as inducing strong cognitive conflicts and emotional reactions. According to previous studies, when the decision-making situation is different (different revelation of the situation), the behavior and neural response of individuals in moral hypocritical decision-making are different, and the behavior and neural response of decision-makers with different levels of conscience in moral decision-making different. Therefore, on the basis of summarizing relevant research, the present study aimed to combine with behavioral measures, subjective reports and event-related potential technology, through one ERPs experiment to investigate influence of conscience and revelation on moral hypocrisy. The experiment adopts an adapted dictator game paradigm, first presents the degree of contextual publicity of decision-making (revealed vs. unrevealed), and then asked subjects to complete assignment tasks, and examines the influence of conscience and contextual publicity on moral hypocrisy. The results of the experiment found that compared with low conscience, participants with high conscience made fewer hypocritical choices. The non-hypocritical selection of individuals with high conscience in the unrevealed situation was significantly higher than that in the revealed situation. And the decision-making time in the unrevealed situation was longer. Moreover, compared within the revealed situation, MH decisions took longer times, and elicited larger P260 and LPP (300-450ms) in the unrevealed situation, showing a situational inhibitory effect. However, this difference in decision-making time and neural response disappeared in low level of conscience group. The results suggested that the behavioral responses, subjective reports and neural representations of MH were significant different between high and low conscience level individuals. Influenced by the revelation of the situation, compared to individuals with low conscience level, individuals with high conscience level made less hypocritical choices, but

consumed more emotional and cognitive costs to solve moral conflicts.

童年期不良经历对中学生良心的影响及干预

王小凤^{1,2} 丁道群² 燕良轼² (通讯作者)

1 中南林业科技大学学生工作部, 长沙, 410004

2 湖南师范大学教育科学学院, 长沙, 410081, yanliangshi@hunnu.edu.cn

摘要 孟子、朱熹、陆九渊将良心视为本然之心,是一切道德发展之端绪。中学生正处于青少年期,该阶段是道德发展的重要时期,也是良心发展的重要时期。本研究以生物生态学理论和自我控制资源模型为理论框架,提取童年期不良经历(adverse childhood experiences, ACE)作为微观环境系统变量,特质自我控制和自我损耗作为个体水平变量,系统地探讨中学生良心形成和发展的机制,并基于该影响机制模型遵循仁爱冥想和叙事取向团体辅导的基本架构制定干预方案,考察这两种方式对高ACE中学生良心的干预效果,可为中学生良心培育和干预提供理论依据和实践借鉴。本研究共包括两部分:研究一采用整群取样法抽取湖南省7所城市7所中学初一到高三学生共3648名,使用ACE问卷、青少年良心问卷、特质自我控制量表和自我调节疲劳量表进行了问卷调查。结果发现:(1)ACE负向预测中学生良心;(2)特质自我控制和自我损耗在ACE和中学生良心间起部分中介作用;(3)特质自我控制和自我损耗在ACE和中学生良心间起链式中介作用;研究二将62名低良心/高ACE水平(ACE≥2)的中学生随机分配到仁爱组(21人)、叙事组(22人)和对照组(19人)。两个实验组被试均分别接受连续10周的团体干预,对照组被试不接受任何处理。3(组别:仁爱组/叙事组/对照组)×2(测试时间:前测/后测)重复测量方差分析的结果显示:(1)三组被试良心前测差异不显著,干预后两个实验组被试较对照组良心得分显著提升;(2)三组被试特质自我控制和自我损耗前测差异不显著,干预后两个实验组被试认知损耗得分均显著低于对照组,其中仁爱组被试冲动控制得分较对照组有显著提升。研究结果表明,ACE不仅是影响中学生良心的重要外部因素,还会通过影响特质自我控制和经由自我损耗对中学生良心产生间接作用;以特质自我控制和自我损耗为切入点进行的仁爱冥想和叙事取向团体辅导,可有效提升高ACE中学生的良心水平。

Abstract: Mencius, Zhu Xi and Lu Jiuyuan all regard conscience as the original heart and the thread of all moral development. Middle school students are in adolescence, which is an important period of moral development, and also an important period of conscience development. This study took the theory of bioecology and the model of self-control resource as the theoretical framework, systematically discussed the mechanism of the formation and development of middle school students' conscience by extracting the adverse childhood experiences (ACE) as a micro environment system variable and trait self-control and ego-depletion as individual level variables. Based on the mechanism model of the influence of ACE on the conscience of middle school students, the intervention programs were formulated and executed according to the basic framework of Loving-Kindness Meditation (LKM) and narrative orientation group counseling, and the intervention effects of these two methods on the conscience of high ACE middle school students were investigated, which could provide theoretical basis and practical reference for the cultivation and intervention of middle school students' conscience. This study consists of two parts. In study 1,

cluster sampling method was used to select 3648 students from 7 middle schools in 7 cities of Hunan Province. ACE questionnaire, adolescent conscience questionnaire, trait self-control scale and self-regulation fatigue scale were used to investigate. The results showed that: (1) ACE negatively predicted the conscience of middle school students; (2) Trait self-control and self-depletion played a partial mediating role between ACE and middle school students' conscience; (3) trait self-control and self-depletion played a chain mediating role between ACE and middle school students' conscience. In study 2, sixty-two middle school students with low level of conscience/high adversity ($ACE \geq 2$) were randomly assigned to LKM group (21 people), narrative group (22 people) and control group (19 people). Participants in the LKM group and the narrative group received group intervention for 10 consecutive weeks, and the control group did not accept any treatment. Three groups of subjects were pre-tested and post-tested using all the questionnaires of Study 2. The results of 3 (group: LKM /narrative/ control group) $\times$ 2 (test time: pre-test / post-test) repeated measurement analysis of variance showed that: (1) There was no significant difference in the pre-test results of conscience among the three groups. After the intervention, compared with the control group, the level of conscience of two experimental groups was significantly improved; (2) There was no significant difference in the pre-test results of trait self-control and self-depletion among the three groups. The cognitive depletion scores of the two experimental groups were significantly lower than those of the control group in the post-test scores. Compared with the control group, the impulse control score of the LKM group was significantly improved after intervention. The results show that ACE is not only an important external factor affecting middle school students' conscience, but also has an indirect effect on middle school students' conscience through influencing trait self-control and self-depletion. LKM and narrative oriented group counseling based on trait self-control and self-depletion can effectively improve the conscience level of high ACE middle school students.

自我损耗情境下，良心对欺骗行为的影响

熊恋^{1,2}, 燕良轼^{1,2} (通讯作者), 赵盼^{1,2}

1 湖南师范大学教育科学学院, 长沙, 410081, yanliangshi@hunnu.edu.cn

2 湖南师范大学文化心理与行为研究中心, 长沙, 410081

摘要 背景: 良心是具有中国传统文化特色的道德概念, 是以辨别是非善恶为核心的一套扬善抑恶的内在道德标准, 它贯穿于个体的知情意三大心理过程, 既可以是理性的道德判断, 也可以是义务与好(hào)恶的情感, 还可以是控制与选择的意志。自我损耗是一种自我控制资源消耗引发的自我控制失败的现象, 两者都对欺骗行为产生影响。而公平又与良心关系密切。目的: 本研究意在考察在自我损耗和公平/不公平情境下, 良心对欺骗行为的影响以及放松对高良心者在高自我损耗和遭遇不公平情境后的欺骗行为的恢复作用。方法: 实验一以 135 名大学生为被试, 采用双因素被试间设计, 自变量为自我损耗(高损耗、低损耗)和良心(高良心、低良心), 因变量为欺骗行为(点游戏任务的欺骗反应正确率)。实验二以 98 名高良心组为被试, 采用单因素被试间设计, 自变量为公平感(公平感组、不公平感组、对照组), 因变量同实验一。实验三, 以 60 名高良心组为被试, 采用单因素被试间实验设计, 自变量为放松(放松组, 对照组), 因变量同实验一。结果: 实验一结果显示自我损耗和良心主效应显著, 两者交互作用显著, 高自我损耗后高良心组欺骗反应正确率没有降低; 实验二结果显示高自我损耗后, 不公平感会增加欺骗行为, 公平感不会减少欺骗行为。实验三结果发现, 放松组的欺骗行为反应正确率显著低于对照组。结论: 良心具有抑恶功能, 能抑制个体的欺骗行为, 自我损耗会增加欺骗行为, 良心的抑制作用比自我损耗的增进作用更强, 但这种抑制作用也无法抵御不公平情境带来的冲突, 放松能有效克服自我损耗, 抵消不公平, 减少欺骗行为, 恢复良心的抑恶功能。

Abstract: Background: Conscience is a moral concept with the characteristics of Chinese traditional culture. It is a set of internal moral standards to promote good and suppress evil with distinguishing right from wrong, good from evil as the core. It runs through the three psychological processes of one's cognition, emotions and will, which can be rational moral judgment, emotion of obligation and likes and dislikes, as well as the will to control and choose. Ego depletion is a phenomenon of self-control failure caused by the consumption of self-control resources. Deceptive behavior are influenced by both conscience and ego depletion. And fairness is also related to conscience. Object: This study aimed to discuss the influence of conscience on deceptive behavior under ego depletion and fairness/unfairness, and explore the recovery effect of relaxation on deceptive behavior of high conscience people after high self depletion and unfair situation. Methods: The first experiment is 2×2 complete randomalized multifactors experimental design with ego depletion(high, low) and conscience (high score,low score) as independent variables and deceptive behavior as dependent variable. The second experiment is randomalized single-factor design with sense of fairness(high group, low group, control group) as the independent variables and deceptive behavior as dependent variable. The third experiment is randomalized single-factor design with relaxation (relaxation group, control group) as the independent variables and deceptive behavior as dependent variable. Results: The first experiment had found that the main effect of ego depletion and conscience on deceptive behavior and the interaction between them were significant. The deceptive behavior of high scored conscience was not affected by ego depletion. The second experiment had found that fairness had no effect on deceptive behavior, while unfairness had increased deceptive behavior. The third experiment found that the correct rate of deception reaction of the relaxation group was significantly lower than that of the control group. Conclusion: Conscience has a function of restraining evil(inhibiting deceptive behavior) which was not affected by ego depletion ,But it does not work after suffering from unfairness. Relaxation can effectively overcome self depletion, offset injustice, reduce deception and restore the function of suppressing evil of conscience.

(corresponding author's Email: yanliangshi@hunnu.edu.cn)

Abstract: Trust is a psychological state that is based on positive expectations toward the intentions or behaviors of others, and informs the willingness to commit to a relationship or cooperate with others (Rousseau et al., 1998; Bock, Lee, Kuan, & Kim, 2012; Bozic et al., 2018). Trust critically influences human interaction and as a crucial social capital, it is a prerequisite for establishing good relationships between people in society, fosters special attachment relationships, and is a major factor in the development and maintenance of happiness and well-functioning interpersonal relationships (Chen, Wu, & Chang, 1991; Chaudhuri & Gangadharan, 2002; Bozic, Siebert, & Martin, 2018). However, trust is fragile and easily threatened or broken. Trust is a fundamental component of social

relationships and a prerequisite for smooth and efficient interactions. However, trust is fragile and easily threatened or broken. Recovering trust as quickly and effectively as possible is a top priority. The current study examined how individuals' moral conscience and certain scenarios influenced trust violation and repair strategies. By conducting three experiments (N = 1026), we demonstrated the effect of moral conscience on the degree of trust violation and also the following repair strategies used in scenarios in which the trust violation occurs. We demonstrated that conscience can either increase or reduce interpersonal trust and influence repair strategies depending on the scenarios in which the trust violation occurs. Specifically, moral conscience elicited trusting behavior after trust violation (Experiment 1), in the real scenario, participants with low conscience levels perceived more serious breaches of trust than did those with high conscience levels; in the virtual scenario, no difference was observed between the trust violation perceptions of participants with high and low conscience (Experiment 2). The results of Experiment 3 revealed that in the real scenario, trust repair strategies were more effective for participants with high conscience levels than for those with low conscience levels, whereas in the virtual scenario, no significant difference was observed in the effectiveness of strategies between the high- and low-conscience groups. Participants with high conscience levels were concerned with whether the trustee used the apology strategy for trust repair, but those with low conscience levels were concerned with the use of the financial compensation and besides, participants favored the financial compensation strategy for trust repair in the real scenario but preferred the apology strategy in the virtual scenario. Together, moral conscience mattered: higher conscience level diminished the breaches of trust violation perceptions and made trust restoration easier, furthermore, the authenticity of scenario has played a positive role in the influence of moral conscience on trust violation and restoration, and it also predicted the effectiveness of different restoration strategies. On the basis of the findings of our three experiments, we can draw the following conclusions: First, participants with low conscience levels perceived the trust violations to be more serious than did those with high conscience levels only in the real scenario; however, only participants with high conscience levels were more likely to trust others when trust violation occurred, regardless of whether in the virtual or real scenarios. Second, participants with high conscience levels took more effective trust repair strategies (i.e., apology) and thus had a more positive effect on trust recovery after violations compared to those with low conscience levels in the real scenarios. However, in the virtual scenario, the difference in the effectiveness of the trust repair strategies between the high- and low-conscience groups was not significant. Third, participants favored the financial compensation strategy for trust repair in the real scenario but preferred the apology strategy in the virtual scenario. This study's theoretical and practical implications go beyond a specific assessment procedure and apply to a broad array of assessment and dealing strategies that rely on scenarios.

家庭给予幸福，何以可能？儒家文化视域下的理论探讨

舒曼

华东交通大学，心理素质教育研究院，南昌，330013，sm927@126.com

摘 要 家庭形成的情感圈如水中的波纹不断向外拓展，并逐渐形成由家庭走向家族，最后形成家国一体的格局。循此逻辑，研究如何促进家庭幸福感是实现幸福中国的有效路径。家庭先于个体而存在，个体与家庭处于共生共存的状态，研究人类精神世界应回到家庭本身。家庭的发展是一种“类生命”的过程，本文在梳理家庭发展史的基础上，分析家庭基本功能，并提出“集体性、组织性、生活性、社会性及宗教性”五位一体的家庭结构逻辑体系，旨在剖析影响家庭幸福感的诸多影响因素。一旦找到影响家庭幸福感的基本因素，就可据此促进家庭幸福感，研究家庭幸福感对于促进国家幸福感具有重大意义。

How is it possible for families to give happiness?

A Theoretical Discussion in the Perspective of Confucian Culture

Professor at Institute of Psychological Education, East China Jiaotong University, Nanchang, 330013,
sm927@126.com

Abstract: The emotional circle formed by the family is like a ripple in the water expanding outward, and gradually forming a pattern from the family to the clan, and finally forming the family and the state as one. Following this logic, studying how to promote family happiness is an effective way to achieve a happy China. The family exists before the individual, and the individual and the family are in a state of symbiosis and coexistence, so the study of the human spiritual world should return to the family itself. The development of family is a "life-like" process. Based on the history of family development, this paper analyzes the basic functions of family and proposes a logical system of family structure with five elements: collective, organizational, living, social and religious, aiming to analyze the many factors influencing family happiness. Once the basic factors affecting family well-being are identified, family well-being can be promoted accordingly, and the study of family well-being is of great significance to the promotion of national well-being.

Keywords: family, family happiness, five-in-one

新时代学校良心教育论析

胡燕^{1, 2}(通讯作者) 燕良轼¹

1 湖南师范大学 教育科学学院, 长沙, 410000, zixunhuyan@126.com

2 华东交通大学 心理素质教育研究院, 南昌, 330013

摘要 良心教育应成为道德教育的核心, 新时代的学校良心教育可以从羞耻心、宽容心、孝敬心、诚信心、责任心、是非心、感恩心、恻隐心等八个方面展开。教学理念的主旨既要遵循西方良心心理学理论, 也要崇尚中国传统文化精神, 教育过程的实施既要加强社会主义核心价值观的培育和践行, 也要依据学生成长成才的规律, 精准设计有针对性的、生动的、与时俱进的、学以致用良心教育内容和教育方式, 注重在课堂上的审问、慎思、明辨, 注重在生活情境中体验、感悟、笃行, 最终由外至内发展和滋养学生的良心。

On Conscience Education in schools in the New Era

HU Yan^{1, 2}, YAN Liangshi¹

1 Institute of Psychological Quality Education, East China Jiaotong University, Nanchang 330013,
China

2 School of Educational Science, Hunan Normal University, Changsha 410081 China

Abstract: Conscience education should be the core of moral education. In the new era, school conscience education can be carried out from eight aspects: shame, forgiveness, filial piety, honesty and integrity, responsibility, right and wrong, gratefulness and compassion. The main idea of teaching should not only follow the theory of western psychology of conscience, but also advocate the spirit of Chinese traditional culture. At the same time, in the process of carrying out the educational process, we should not only strengthen the cultivation and practice of socialist core values, but also set targeted, vivid, updated conscience education contents and methods according to the law of students' growth and talents. We should pay attention to the interrogation, careful thinking and discerning in class, and lay emphasis on the experience, perception and earnest action in the life situation, so as to ultimately develop and nourish students' conscience from outside to inside.

Research on the Localization of Psychological Counseling Based on Yangming's Theory of Mind

Jing Wu

Center for Brain, Mind and Education Research, Shaoxing University, Shaoxing, 312000

Abstract: The continuous enrichment of material life and the continuous acceleration of the modernization process have led to significant changes in people's life goals and value orientations, making people's pursuit of life gradually change from satisfying survival needs to more advanced individual needs. How to enable visitors to overcome the emptiness of life and gain a sense of meaning in life has become one of the important contents of modern psychological counseling. On the surface, mental problems such as neurosis and mental anxiety are problems of consciousness and behavior, but the deeper reason for them lies in culture and unhealthy lifestyle. Returning to traditional Chinese culture, digging out psychological resources in traditional culture, and developing models and methods for creating local psychological counseling have become the consensus of many scholars in recent years. Yangming Xinxue is an important component of excellent traditional culture and an important cultural resource for the development and growth of modern psychological counseling. Studying Wang Yangming's thoughts of the mind and exploring and explaining the value of psychological consultation contained in his mind is not only of great significance to the theoretical development and practical operation of psychological consultation, but also of great value to the improvement of the level of modern people's mental health. This research focuses on a new understanding and interpretation of the value of psychological counseling from four aspects: counseling goal, counseling relationship, counseling technology, and counseling process.

新儒学李二曲《悔过自新说》的心理分析初探

吴博

西北师范大学心理学院, 兰州, 730070

摘要 李二曲, 又名李颀, 他不仅是关学大儒, 亦是清初三大学之一。“悔过自新”说是李二曲工夫论的基石, 该学说以人性本善和“人皆有过的”作为“悔过自新”之可能和必要的形上根据赋予了“过”以普遍和形上的内涵, 这与《道德经》七十一章的“病”有共通之意; 并将消极意义的“悔”改造为积极的修养方法, 发挥了人的主观能动性, 这与心理分析的“积极想象”和积极心理学的“积极”中的 active 不谋而合。本文将从心理分析的角度对悔过自新进行探索, 去发现《悔过自新说》对于每一个平常人达到“天人合一”、“内圣外王”的“成为自己”的可能性, 对于个体的意义, 以及对中国人集体心灵的意义: 悔, 作为一种态度和情绪; 过, 作为一种状

态和对状态的认知；自，作为一种本体和原型；新，作为一种目标；悔过又作为一种行为，自新又成为一种追求或意念；这构成了人类的基本心理活动，也在这“实修”之上，使得平常之人在“日用常行”中躬行践履，在“起心动念”处下工夫实现内圣心灵的追求，这与分析心理学中“自性化”-成为自己的历程又有共通之处；它是对儒家学说精髓的发挥，也是二曲先生毕生追求的目标，它对培养和增强现代人的道德意识、弘扬现代人的主体精神、自我价值感、独立意识、态度的开放性以及探寻现代人的终极关怀等问题具有其不可忽视的现代价值，值得我们深入研究和探讨。

On the New Confucianism Representative Li Erqu's Work-The Psychological Analysis of "Repentance and Renewal Theory"

Wu Bo

School of Psychology, Northwest Normal University, Lanzhou, 730070

Abstract: Li Erqu, also known as Li Yong, is not only a great Confucian in Guan Xue, but also one of the three Confucianists in the early Qing Dynasty. The theory of "repenting and renewing" is the cornerstone of Li Erqu's gongfu theory. This theory uses human nature and "everyone has a fault" as the possible and necessary metaphysical basis for "repenting and renewing". The connotation of the above, which has the same meaning as the "illness" in Chapter 71 of the Tao Te Ching; transforming the negative meaning of "repentance" into a positive cultivation method, and exerting people's subjective initiative. "Positive imagination" coincides with the "active" in positive psychology. This article will explore the repentance and self-renewal from the perspective of psychological analysis, to discover the possibility of "repentance and self-renewal" for every ordinary person to achieve "the unity of heaven and man" and "internal sage and external king". The meaning of the individual and the meaning of the Chinese collective mind: regret, as an attitude and emotion; passing, as a state and cognition of the state; self, as a noumenon and archetype; new, as a kind of Goal; repentance is once again an act, and renewal becomes a desire; this constitutes the basic human mental activity, and is also on top of this "practical practice", allowing ordinary people to practice in "daily use" Practicing, working hard to realize the desire of the inner sacred soul in the "inspiring thoughts", this has something in common with the process of "individuation"-becoming oneself in analytical psychology; it is an expression of the essence of Confucianism, and The goal that Mr. Erqu has pursued throughout his life is to cultivate and enhance modern people's moral consciousness, promote modern people's subjective spirit, self-worth, independent consciousness, openness of attitude, and explore the ultimate concern of modern people. Its modern value is worthy of our in-depth study and discussion.

Keywords: Repentance and Renewal , psychology, analysis

情绪的迷失：中国人抑郁症的儒家文化解读

郭斯萍

广州大学教育学院，广州，510006

摘要 不管是古希腊人，还是古罗马人，都乐观地相信人类是理性的，自然而然地就能与他人共存，建立一个公正、和谐的社会。他们认为“人是一种介于动物和神之间的生物”，理性被认为是人类生活的重要品质，能控制个人主义的激情，包括过度膨胀的自傲和野心，来维持人格内部的一种关键平衡。到了中世纪，宗教强烈反驳了这一观点，他们肯定人类如果没有信仰的帮助和恩典的从中协助，就无法引导个人的激情，行使自己在社会上的职责。从此，宗教信仰，加上后来的科学文化、经济理性，逐渐形成调节个人主义激情的西方文化“三角”。儒家从周公开始成型，历经孔孟到理学的变迁，成为三千多年中国文化的传统与主流。在对个人情绪的调控方面，儒家直接跳过外在宗教的环节，“完全信赖人类自己”（梁漱溟），以伦理道德代替宗教信仰，加上礼乐文化及专制政治，形成中国人“习惯性无我”或“集体人格优势”的儒家文化“三角”。从1840年以来，古老的儒家文化一直处于现代化的转型之中，历经坎坷，几千年的资产不断贬值，甚至呈现“内卷化”

的不利趋势，给我们的心理健康带来潜在的威胁。人的情绪情感的体验和表达是受文化控制的，中国人在儒家集体主义价值观要求下的个人情绪和体验，往往是改头换面的。中国人的抑郁症表征，最早是说成神经衰弱，后来就说成是躯体化，现在可以表达为抑郁症了，但是我们个人的情绪体验或表达并不成熟，甚至没有能力，这会不会导致我们抑郁症严重，甚至自杀率比较高呢？

关键词 西方文化，儒家文化，内卷化，抑郁症

Emotional Loss: A Confucian Cultural Interpretation of Chinese Depression

Guo siping

School of Education of Guangzhou University, Guangzhou

Abstract: Whether the ancient Greeks or the ancient Romans were optimistic to believe that human beings are rational and can naturally coexist with others and build a just and harmonious society. They believe that "man is a creature between animals and gods." Reason is considered to be an important quality of human life. It can control the passions of individualism, including over-inflated pride and ambition, to maintain a critical balance in internal personality. In the Middle Ages, religions strongly refuted this view. They affirmed that without the help of faith and the assistance of grace, human beings would not be able to direct an individual's passion to exercise his / her social duties. Since then, religious beliefs, together with later scientific culture and economic rationality, have gradually formed a Western cultural "triangle" that regulates individualistic passions. Confucianism began to be shaped by Zhongong and went through the changes from Confucius and Mencius to Neo-Confucianism, becoming the tradition and mainstream of Chinese culture for more than three thousand years. Regarding the regulation of personal emotions, Confucianism skipped the external religious link, "completely trusting in human beings" (Liang Shuming), replacing religious beliefs with ethics and morality, together with ritual music culture and despotism, forming the Confucian culture "triangle" of "habitual selflessness" or "collective personality advantage". Since 1840, the ancient Confucian culture has been undergoing a modern transformation. After ups and downs, the assets of thousands of years have been continuously devalued, and even show an unfavorable trend of "involution", which has brought potential threats to our mental health. The experience and expression of human emotions are controlled by culture. The personal emotions and experiences of Chinese people under the requirements of Confucian collectivist values are often changed. The symptoms of depression in the Chinese were first described as neurasthenia, and later as somatization, and now it is expressed as depression. However, our personal emotional experience or expression is immature, or even it is hard to express. Will it cause severe depression or even a relatively high suicide rate?

Keywords: Western culture, Confucian culture, involution, depression

皮亚杰的创造性思维理论及其教育应用

庞维国

华东师范大学心理与认知科学学院

摘要 在皮亚杰的理论体系中，创造性居于极为重要的地位。首先，他认为创造是发展不可缺少的过程，“新颖性，如创造，是一直介入发展过程的”（Piaget, 1971, p.5）；其次，他强调知识是通过个人建构而创造意义的结果，“理解即创造”（To Understand is to Invent, 1973）；再次，他认为创造性思维是通过反思抽象来实现的，创造性思维本质上是从低级图式和概念中构建出高级图式（Piaget, 1981, p. 225）。因循皮亚杰的理论思路，费德曼在“平衡”概念的基础上增加了“转变”（transformation）概念，认为创造是在平衡状态下能够带来新

知识的一种转变活动(Feldman, 1989);伦克和贝加托等则提出了个人创造(personal creativity)和微创造(mini creativity)概念,认为个人创造或微创造本质上是一种个人意义的建构,是一种个性化的解释(Runco, 2003; Beghetto & Kaufman, 2007),它们是一切创造活动的基础。皮亚杰的创造性思维理论对当今教育至少具有两方面重要含义:其一,对知识进行个性化解释和建构是学生创造性思维发展的基础;其二,引导学生对概念进行抽象和综合是一种重要的创造性教学策略。

皮亚杰理论重要概念中文翻译的旨趣

蒋柯

温州医科大学精神医学学院,温州,325035

摘要 皮亚杰的理论体系可以用“纷繁复杂”来形容,首先是涉及的领域广,包括生物学、物理学、哲学、心理学等重要的知识部类;其次是理论建构的层次复杂,有跨领域的类比研究、经验层面上的实证研究,还有认识论层面上的精密的推论。当我们在阅读皮亚杰的论著时,一定会被他的旁征博引所折服,也常常会因为他在各个认识层面上自由切换而又不失精确性的理论思考而感到眩晕。皮亚杰的著作中,包含的许多关键性概念,诸如:结构、平衡化、逻辑、格式、协调……等等,其中许多都是皮亚杰为了自己的理论建构而创造性地整合了前人的概念而设计出来的,有的甚至是创造了全新的概念。为了准确理解皮亚杰的理论体系,我们除了要仔细辨析这些概念在皮亚杰理论体系中的特别意义之外,似乎还应该厘清这些概念之间的逻辑关系。但是,对这些概念之间逻辑关系的探索工作常常令读者无所适从,因为我们很难从皮亚杰的著述中梳理出一条清晰的 $A \rightarrow B \rightarrow C \rightarrow D \dots$ (A 蕴含 B 蕴含 C 蕴含 D……)逻辑线索。应对这个问题的关键是我们需要先匡正对皮亚杰的“发生”观念的理解。值得注意的是,皮亚杰用来 genetic 这个词来形容儿童心理的起源。发生认识论的英语表达是 genetic epistemology 法语则是 l'épistémologie génétique。其中, genetic 或 genetical(或者法语的 génétique)这个词通常被翻译为“基因的”或“遗传的”。如果在这个意义上,儿童的心理结构是先天地获得的,或者说是通过遗传而获得的,这就暗合了康德的先验范畴学说。但是,皮亚杰虽然承袭了康德的认识论架构,但是他并不认可将认识的起点归因于某种先天因素的形而上学进路(熊哲宏:《皮亚杰发生认识论的康德哲学框架》,2000;皮亚杰,《哲学的洞察与错觉》)。皮亚杰在使用 genetic 这个词时,并不是在使用它的遗传的、或基因的这一层含义。因为这些意义都不可避免地儿童心理的起源引向了先天论的解释。从词源上分析, genetic 是 gene 的衍生词,根据韦氏词典的释义, genetic 或 genetical 有两个含义。第一个含义是指“决定事物的起源、发展的,或对此有因果性前提性的,或与之相关的(属性)”(relating to of determined by the origin, development, or causal antecedents of something);第二个含义才是指“基因的、与基因相关的,由基因引起的或控制的(属性)”(of, relating to, caused by, or controlled by genes)。可以看出, genetic 这个词一方面表达了“有机体受先天性的条件,以及基因的决定性特征”;另一方面还表达了“某些内容的起源、生成或发展性特征”。如果我们以儿童的出生作为界线, genetic 所形容的过程可以分成两个部分,第一是儿童出生前已经具备的“前提”,第二是“前提”在出生后的表达或事实性生成。汉语“遗传的”对应地翻译了第一部分的含义,“发生的”则对应翻译了第二部分的含义。

源起与回归:皮亚杰与当代道德心理学研究

王云强(通讯作者) 郭本禹

南京师范大学心理学院,南京,210097

摘要 皮亚杰肇始了当代的道德发展心理学研究。他从个人主义、集体主义与关系主义,遵守规则与形成规则,道德实在论与主观责任,说真话与关系,以及合作、有意识实现与发展公正观念等方面构建了自己的道德认知发展理论,并提出了从他律到自律的道德发展规律。皮亚杰极大影响了科尔伯格等对道德发展的研究:康德理性主义的哲学基础、实证研究方法、道德发展的阶段论以及跨文化一致性等。后科尔伯格时代的道德心理学研究在内容上,新主题不断出现且可大体分为“认知之后”和“认知之外”两类;在方法上,访谈法和问卷法逐步让位于实验法和认知神经科学方法;在观点上,由强调认知、到关注情感、到知情并重、再到重情轻知。这些变化既适应了当代心理学理论发展和研究方法的科学化趋势,又与西方美德伦理学的复兴密不可分。在看到当代道德心理学研究的丰硕成果时,人们也应反思已有研究远离“心理”、脱离“生活”的不足。

对于如何深入剖析道德心理现象和揭示道德发展规律,皮亚杰至少可以从以下三个方面提供有益借鉴:关注儿童实际的道德生活,而非将个体看作抽象的理念意义上的人;采用建构主义方法,提高道德研究的生态效度;强调个体建构与社会互动并重,在道德认知能力提升与良好氛围营造的结合中推进个体的道德发展。

关键词 皮亚杰, 科尔伯格, 道德心理学, 建构主义, 社会互动

Origin and return: Piaget and contemporary moral psychology

Wang Yunqiang, Guo Benyu

(School of Psychology, Nanjing Normal University, Nanjing, 210097)

Abstract: Piaget initiated the study of contemporary moral development psychology. He constructed his own moral cognitive development theory from the aspects of individualism, collectivism and relationism, abiding by rules and forming rules, moral realism and subjective responsibility, telling the truth and relations, as well as cooperation, conscious realization and development of the concept of justice, and put forward the law of moral development from heteronomy to autonomy. In the content of moral psychology research in the post Kohlberg era, new themes continue to appear, and can be roughly divided into "after cognition" and "outside cognition"; in terms of methods, interview method and questionnaire method gradually give way to experimental method and cognitive neuroscience method; on the conclusion, from emphasizing cognition to paying attention to emotion, to paying equal attention to cognition, and then to paying more attention to emotion than cognition. These changes not only adapt to the scientific trend of the development of contemporary psychological theory and research methods, but also are inseparable from the revival of western virtue ethics. When seeing the fruitful results of contemporary moral psychology research, people should also reflect on the shortcomings of existing research away from "psychology" and "life". Piaget can provide useful reference on how to deeply analyze moral psychological phenomena and reveal the law of moral development from at least the following three aspects: paying attention to children's actual moral life rather than seeing individuals as people in the sense of abstract ideas; adopt constructivism to improve the ecological validity of moral research; emphasize both individual construction and social interaction, and promote individual moral development in the combination of improving moral cognitive ability and creating a good atmosphere.

Keywords: Piaget, Kohlberg, moral psychology, constructivism, social interaction

从物理量到因果性的个体发生

摘要 发生认识论是认识人类自身成长的重要工具, 对发生认识论的深入研究必然要求回归其研究主题。

《皮亚杰文集》第八卷涵盖了皮亚杰发生认识论范畴的个体发生研究著作 7 册和论文集 1 部, 从儿童的数概念、基本科学概念、力概念、因果概念四个方面展示了皮亚杰在范畴的个体发生领域的原创性工作。具体包括: (1) 《儿童的数概念》(*The Child's Conception of Number*) 和《儿童对物理量的建构和发展——守恒和原子论》(*The Child's Construction of Quantities: Conservation and Atomism*) 通过数概念、物质数量、重量和体积的个体发生探讨思维产生的机制, 研究儿童如何将实际生活中的感知——运动组织进运算系统, 这些运算产生了数、连续的量等范畴。(2) 《儿童的运动和速度概念》(*The Child's Conception of Movement and Speed*) 是儿童发展系列研究的一部分, 并与《儿童时间概念的形成》(*The Child's Conception of Time*)、《儿童的空间概念》(*The Child's Conception of Space*) 等共同构成了皮亚杰有关基本科学概念发展的研究系列。时间、运动和速度三个概念相互联系, 密切相关, 运动和速度是时间概念的后续研究。(3) 《力观念的形成》(*La Formation de la Notion de Force*) 和《力的组合与向量问题》(*La Composition des Forces et le Problème des Vecteurs*) 均于 1973 年以法文形式出版。借由这两本书, 我们得以了解儿童关于力的概念的形成过程。(4)

《儿童的物理因果性概念》（*The Child's Conception of Physical Causality*）与《理解因果性》（*Understanding Causality*）阐述因果性的个体发生。皮亚杰认为动作或活动是理解因果关系的起点，因果概念是主客体在活动的过程中逐渐建构起来，他认为人的认识“从来就没有什么绝对的开端”而是必然经历从较贫乏的认识向较丰富的认识的过渡。总之，《皮亚杰文集》第八卷从物理量到因果性，带领我们重新认识皮亚杰发生认识论中的范畴及其个体发生，这对于我们理解皮亚杰学术思想的“纯粹之处”及其对整个发展心理学的意义提供了有益的知识图谱；同时，关于数概念、基本科学概念、力概念、因果概念的个体发生研究可以为物理、数学及其它通识课教学提供科学指导。

Abstract: Genetic epistemology serves as an important tool to learn and understand human growth, and it's of necessity to draw back to the research theme for the elaboration of genetic epistemology. The eighth volume of *Piaget's Anthology* covers seven volumes and one collection of papers on the ontogenesis of Piaget's category of genetic epistemology, all of which demonstrate Piaget's original work in the ontogenesis field from four aspects, namely, child's number conception, basic scientific conception, force conception, and causality conception. These four aspects can be elaborated in the following details. (1) *The Child's Conception of Number*, and *The Child's Construction of Quantities: Conservation and Atomism* explore the generated mechanism of thinking through the ontogenesis of number conception, quantities, weight, volume. They study how children organize the perception-movement from real life into the operation system and thus these operations can generate categories such as numbers, continuous quantities. (2) *The Child's Conception of Movement and Speed*, as a part of a series of studies on child development, together with *The Child's Conception of Time*, and *The Child's Conception of Space*, consist of the Piaget's research series about the development of basic scientific conception. The conception of time, motion, and speed are closely related to each other, and the latter two are the follow-up studies of the conception of time. (3) *La Formation de la Notion de Force*, and *La Composition des Forces et le Problème des Vecteurs*, both published in French in 1973, help us to understand the construction of child's conception of force. (4) *The Child's Conception of Physical Causality*, and *Understanding Causality* explore the ontogenesis of Causality, in which Piaget believed that action or activity is the starting point of understanding causality, and the conception of causality is constructed gradually in the process of activity of subjects and objects. He also believed that human knowledge "never has any absolute beginning", but always experiences a transition from poor knowledge to rich knowledge. To conclude, the eighth volume of *Piaget's Anthology*, from quantities to causality, leads us to restudy the categories and ontogenesis in Piaget's epistemology of genesis, which provides an instructive mind map for us to understand the "pureness" of Piaget's thought and its implications for developmental psychology as a whole. In the meanwhile, the studies of child's number conception, basic scientific conception, force conception, and causality conception provide scientific and pedagogical references physics, mathematics and other general courses.

Keywords: Piaget, Number Conception, Quantities, Causality, Ontogenesis

皮亚杰的函数心理研究溯源

张勇

西南民族大学教育学与心理学学院, 四川成都, 610041

摘要 为了探索儿童的思维是如何从前运算阶段发展到具体运算阶段的, 皮亚杰在晚期引入了函数这一概念。他区分了构成性函数和构成化函数, 并假定构成性函数可以描述儿童在前运算阶段的思维特征, 而构成化函数则对应于具体运算阶段。皮亚杰认为, 构成性函数可以很好地描述前运算阶段的思维特点, 比如看重顺序、单向结构、定性比较等。借助于构成性函数, 儿童逐步理解了共变规律, 动作格式的协调也变得概括化。皮亚杰一直强调, 函数起源于动作格式, 产生于动作格式的同化, 即动作格式在客体中的应用。而构成性函数是处于前逻辑水平的儿童所使用的一种推理形式, 由于它是单向的关系, 具有方向性和顺序, 尚缺乏可逆和补偿, 所以这种单向关系只构成一种半逻辑。直到运算思维水平, 儿童才建构出符合数学规范的量化函数, 即构成化函数。在皮亚杰看来, 构成性函数在感知运动动作和逻辑运算之间, 架起了一座不可或缺的桥梁。构成性函数可以精准地描述前运算水平儿童的推理活动, 尤其是儿童犯错或者做不到的事情, 比如不可逆、缺乏协调及其概括化等。构成性函数所包含的双项结构, 是一种非常基础、非常典型的思维结构, 它是构成化函数(可逆运算)的前提。不过后来, 皮亚杰在关于态射与范畴的研究中, 重新界定了构成性函数, 将其定义为“内态射水平的对应”。对皮亚杰关于函数心理的研究追根溯源, 具有重要的理论意义和历史价值。

皮亚杰与维果茨基：两种平行的建构主义

麻彦坤

广州大学教育学院, 广州, 510006, ykma@gzhu.edu.cn

摘要 皮亚杰与维果茨基是发展心理学领域的两位大师, 他们关于学习的观点影响了上个世纪甚至当代的教学观。皮亚杰的发生认识论聚焦于学习中的个体, 维果茨基的文化历史理论关注了学习中的社会因素。他们共同描绘了学习的完整图景, 分别融入了个体建构主义与社会建构主义, 在当代的发展心理学领域焕发出了盎然生机。面对类似的科学问题, 皮亚杰与维果茨基选择了两条不同的道路。两人的生活与工作存在着不少类似之处, 同时, 其科学观点存在着显著差异, 他们从同样的原点出发, 如承认语言在认知形成过程以及人类文化价值同化过程中的作用, 儿童的自我中心言语是发展中的一个阶段等, 选择了有关认知和言语发展过程的不同取向, 形成了心理与学习发展的不同观点。皮亚杰认为, 人的心理是自然进化的结果, 它有助于在环境中寻求平衡, 帮助人们适应不同的生活条件, 因此, 心智的发展是一种生物过程, 它具有自己独特的源泉与规则(如发展阶段与顺序等), 其发展是持续不断变化的结果, 体现了自然与生物机制的社会化。社会化是心理机能发展的基础。维果茨基认为, 心智自身及其发展不是生物进化的结果, 而是儿童通过与成年人的交往接受人类文化历史经验的结果, 儿童的心智一开始就是由社会因素以及内化的社会因素决定的, 作为一种心理机制调节儿童的行为, 相应的, 教育不仅仅是一种影响因素, 而且是一种发展的本质形式。两位心理学家观点的最明显分歧体现为对待儿童自我中心言语的看法。皮亚杰认为, 自我中心言语是自然的个体言语向社会言语转变的一个阶段, 也就是说是一种社会化的形式, 是言语发展中较为低级的形式。维果茨基认为, 内部言语是一种原发形式, 很早就作为内部对话开始发展。儿童言语的发展并非始于内部言语而是源于与成人相关联的言语。维果茨基认为, 言语的形成过程是从社会言语转变为内部言语, 内部言语作为调节心智的内部心理工具是儿童思维发展的最重要阶段。

Piaget and Vygotsky: Parallel Paths to Constructivism

Ma Yankun

Department of Education, Guangzhou University

Abstract: Piaget and Vygotsky are two masters in the field of developmental psychology, and their views on learning influenced the teaching view of the last century and even the contemporary world. Piaget's epistemology focuses on

individuals in learning, and Vygotsky's theory of cultural history focuses on social factors in learning. Together, they paint a complete picture of learning, integrate individual constructivism and social constructivism, and give full vitality to the field of contemporary development psychology. Faced with similar scientific problems, Piaget and Vygotsky chose two different paths. There are many similarities between two people's life and work, at the same time, there are significant differences in their scientific views, they start from the same origin, such as recognition of the role of language in the cognitive formation process and the process of assimilation of human cultural values, children's egocentric speech is a stage of development, choose the cognitive and speech development process of different orientations, forming a different view of psychological and learning development. Piaget believes that the human mind is the result of natural evolution, it helps to find balance in the environment, help people adapt to different living conditions, therefore, the development of the mind is a biological process, it has its own unique sources and rules (such as stages and sequence of development, etc.), its development is the result of continuous change, reflecting the socialization of natural and biological mechanisms. Socialization is the basis of the development of psychological function. Vygotsky believes that the mind itself and its development is not the result of biological evolution, but the result of children's acceptance of human cultural and historical experience through interaction with adults, children's minds are determined from the beginning by social factors and internalized social factors, as a psychological mechanism to regulate children's behavior, correspondingly, education is not only an influence factor, but also an essential form of development. The most obvious difference between the views of the two psychologists is the perception of egocentric speech in children. Piaget believes that egocentric speech is a stage of natural individual speech transition to social speech, that is to say, a form of socialization, is a lower form of speech development. Vygotsky believes that internal speech is a form of origin and began to develop early as an internal dialogue. The development of children's speech does not begin with internal speech but with speech associated with adults. Vygotsky believes that the formation process of speech is changed from social speech to internal speech, and internal speech as an internal psychological tool to regulate the mind is the most important stage of children's thinking development.

语言的具身性：手部动作与语言进化的关系

殷融

潍坊学院，潍坊，261061

摘 要 手部动作和语言具有紧密复杂的关系。虽然在日常生活中开口说话是最常见的交流方式，可声音并不是人们交谈时唯一的信息传输媒介，手势是一种普遍存在的辅助沟通手段。手部动作与语言机制间是否具有更深层次的关系？语言起源的镜像系统假说认为，识别动作的镜像系统为语言进化提供了基础，而手势语则是人类语言的前驱。正是镜像系统的存在，人类祖先才可以使用手部动作对具体的物品、行为或想法进行表征，进而导致人类逐渐形成了使用手势进行复杂交流的能力。现代人所使用的成熟语言源于手势语，而镜像系统中与执行、识别和模仿手部动作有关的神经回路，为大脑的语言功能进化提供了基础架构。关于手语的研究发现，手语与口语具有许多共同特征：手语可以像任何一门语言一样表达出丰富复杂的涵义；在学习机制上，手语学习与口语学习规律并不存在显著差异。认知神经科学研究证明，手部运动和语言加工具有部分共享神经机制。发展心理学研究则表明，婴幼儿运用手势的能力可以显著预测他们今后的语言发展水平。手势起源假说必须要解答的问题是，如果语言最早源于手势，为什么后来在进化过程中会转向“语音”这种有声表达模式。既然手势语也可以具有完善的语法规则、语言结构以及丰富的表达性，为什么口语会取代手语，成为最通用的语言形式？另外，其他灵长目动物也具有用手势进行交流及识别其他个体动作意图的能力，但为什么其他猿类没有在这些能力的基础上发展出像人类一样复杂完备的语言？

关键词 手部动作; 手势; 镜像系统; 语言; 进化

预测加工：走出两代认知科学的历史僵局

董达¹ 陈巍¹ (通讯作者)

¹ 绍兴文理学院大脑、心智与教育研究中心, 绍兴, 312000, anti-monist@163.com

摘要 表征-计算观与具身行动观对认知的本质几乎做了截然相反的强调。近年来, 预测加工理论的发展为统一两代认知科学提供了契机。预测加工是层级预测加工与主动预测加工这两大理论部件的合称, 前一部分主要继承了第一代认知科学中的层级计算加工进路, 后一部分则发扬了第二代认知科学中与行动有关的理论, 这两大理论部件被视为同一个统一整合理论的两个不同方面。在当代, 预测加工被认为有望成为未来认知科学的新范式。层级预测加工的基本加工方式为: 上行预测-下行预测误差权衡。基于适应性原则, 上行预测与下行预测误差之间始终存在着权衡。一般而言, 上行预测信号是抑制性的, 下行预测误差信号是兴奋性的。主动推断是与自由能原理互补的行动决策理论部件, 其基本理念为: 预测模型通过对不同行动策略赋值, 从而使认知主体基于贝叶斯模型均值尽可能给出行动选择的最优解, 最终实施行动。通过比较, 预测加工可能给出了第三种新范式。一般而言, 表征-计算观的目标是产生内部表征, 加工方式是抽象算法匹配, 最终获得的知觉对象被认为是关于世界“如其所是”的精细的、不变的表征; 具身行动观的目标是实施行动, 加工方式是身体与环境之间的动力学耦合, 该范式的激进立场反对头脑中存在关于外部世界的内部表征。预测加工范式大致体现出对前两种范式的融合态势, 它的目标是实现知觉-行动循环, 加工方式是基于层级神经网络的上行预测-下行预测误差权衡。

A Predictive Processing:

Breaking the Impasse of Two Generations of Cognitive Science

DONG Da¹, CHEN Wei¹ (Corresponding Author)

¹ Center for Brain, Mind and Education, Shaoxing University, Shaoxing, 312000

Abstract: Nowadays, quarrels and fights between two generations of cognitive science almost result in an inevitable impasse. For instance, a deep theoretical relations between J. J. Gibson and David Marr has been carved off, and of which two theories each other have been pushed toward the opposite side; which could be viewed as a portrayal of these overt states of affairs. The central tenet of the First-Generation Cognitive Science summarizes as: The Representational-Computational Approach; and the central tenet of the Second-Generation Cognitive Science: The Embodied Action Approach. What is the nature of “mind” at all? These two approaches conflict each other; and the either/or choice seems the only game in the town. In recent years, researchers attempt to integrate both strains of sources, hoping to provide a unified framework, thus of which could be viewed as prospectively break the impasse of two generations of cognitive science in the near future. It calls “Predictive Processing”. This approach apparently originates in hierarchal predictive coding of visual& auditory studies (since 1980s), and thereby has been modified substantively by the neuroscientist Karl Friston, et al., into a mode of action-oriented. Predictive Processing combines with two indispensable components: Hierarchical Predictive Processing and Active Predictive Processing. In rough, the Hierarchical Predictive Processing mainly inherits from hierarchical predictive coding theories of the First-Generation Cognitive Science(e.g., Marr’s multi-level computational theory of vision, hierarchical neural networks, etc.); and the Active Predictive Processing somehow advocates various versions of theories of the Second-Generation Cognitive Science relating with action(e.g., Gibson’s affordances theory, enactive cognition, etc.). Both components which could be viewed as dual aspect of a single unified theory. In Predictive Processing, the Free Energy Principle views adaptivity as the fundamental principle of the theory construction of neural & cognitive systems, and until—self-organizing adaptive systems. The overall aim of Hierarchical Predictive Processing is to make the cognitive agency adaptable and sustainable as much as possible. Next, the optimization problem of

adaptation turns into problems of surprises minimization or “prediction errors minimization” by means of Bayesian inference & Bayesian statistics. The basic working mechanism of Hierarchical Predictive Processing: ascending prediction-descending prediction errors tradeoffs. The so-called “Active Inference” which is the complementary component of Free Energy Principle; and which be seen by Paul Cisek et al., is confirmed with multiple affordances competition mechanism. The Active Predictive Processing shows perception-action tradeoffs, or “epistemic-pragmatic tradeoffs”. Both perception (epistemic value) and action (pragmatic value) ultimately serves for adaptivity (adaptive value). Perception-action cycle of Predictive Processing which could be regarded as a second-order cycle based on first-order embodied reflex arc (in Deweyan sense); which could also be seen as an internalized closed loop within the corporal brain. Thus on the nature of cognition, contrasting with past two generations of cognitive science, Predictive Processing may has made revolutionary breakthrough at all. Cognition as the systemic function of general adaptive system complies with the fundamental adaptivity principle. The conventional object-invariants analysis beneath paradigms of two generations of cognitive science, thus ought to give way to mind-world adaptivity analysis underlying the Predictive Processing paradigm. Philosophically speaking, Predictive Processing seems be consistent with a process theory. In the end, on the basis of the currents and trends of Predictive Processing, we attempt to propose an integrated view. In our view, the pressing contemporary task of Predictive Processing is trying to integrate two generations of cognitive science—Representational-Computational Approach and Embodied Action Approach.

内感受具身认知：迈向一种身心对话的构成性理论框架

陈巍¹ 张静²（通讯作者）

1 绍兴文理学院教师教育学院，绍兴，312000

2 杭州电子科技大学心理健康研究所，杭州，310018, jingzhanghz@163.com

摘要 具身认知的支持者强调，心灵根植于身体，身体体验对认知过程有重要影响。然而，身体和大脑之间的交流是如何发生的，或者在什么条件下发生的，还没有得到充分的描述。近年来，越来越多的证据表明，内感受与具身感、具身情感、具身自我和具身社会认知密切相关。我们假设具身认知是构成性的，而不是因果性的，提出了内感受性具身认知假说。在这个假说中，内感受性充当了具身心理内部和外部成分之间的重要桥梁，为身心交流提供了一个建设性的理论框架。系统地探讨内感受的起源和具身心灵的构成要素有助于揭示身心沟通的不确定性。

2 Institute of Psychological Health, Hangzhou Dianzi University, Hangzhou 310018, China

3 Leiden Institute for Brain and Cognition, Leiden University, Leiden 2333 AK, Netherlands

jingzhanghz@163.com

Abstract: Proponents of embodied cognition emphasize that the mind is rooted in the body and that physical experiences have an important impact on cognitive processes. However, how the communication between body and mind occurs, or under what conditions it takes place, has not been fully described. In recent years, increasing evidence has shown that interoception is closely related to sense of embodiment, embodied emotion, embodied self, and embodied social cognition. Assuming a constitutive rather than a causal-account of embodied cognition, we propose the interoceptive embodied cognition hypothesis, in which interoception serves as an important bridge

between the internal and external components of the embodied mind, to provide a constructive theoretical framework for the communication between mind and body. The systematic exploration of the origin of interoception and the constitutive components of the embodied mind helps reveal the uncertainties around communication between the body and mind.

Keywords: interoception; embodied cognition; sense of embodiment; multi-sensory integration; constitutive account

具身模拟论的直接社会感知困境与出路

崔中良

1 南京信息工程大学当代中国马克思主义研究院, 江苏南京, 210044

2 华东师范大学, 哲学系, 上海, 200062

摘要 认知的具身化运动使得他心问题他心的身体转向, 镜像神经元的发现和具身模拟论的提出为此转向提供了大量的理论和实验证据。近年来, 他心感知的具身模拟论进路除了向纵深发展以外, 也开始向其它学科扩展并取得了丰硕成果。以具身模拟论的纵深研究为纵轴, 跨学科应用为横轴全面论述当前具身模拟论的走向, 并通过阐述具身模拟论、心智理论和现象学的关系探析具身模拟论所面临的困境, 最后建议具身模拟论从融合社交、强具身认知、动态交互性等三个方面进行视域转换, 以此来完善他心直接感知的具身模拟论路径, 从而增强此理论的解释力。

The Challenge and Outlet: A Study on the Embodied Simulation Approach to Direct Social Perception

CUI Zhong-liang

1 Institute of Contemporary Chinese Marxism, Nanjing University of Information Science & Technology, Nanjing 210044, China

2 Department of Philosophy, East China Normal University, Shanghai 200062, China

Abstract: Along with the emergence of the embodied cognition, the study of social cognition also appears the body turning. The discovery of the mirror neurons and the proposal of embodied simulation theory provides a great deal of theoretical and experimental evidence for this turning. In recent years, in addition to its in-depth development, the study of embodied imitation theory has begun to expand to other subjects of humanities and social sciences, which has gained fruitful results. As the vertical axis on the study of embodied simulation theory, and interdisciplinary application as the horizontal axis, we comprehensively discuss the research direction of embodied simulation theory. By analyzing the relationship between embodied simulation theory, theory of mind and phenomenology, lastly, embodied simulation theory is suggested to make up for the shortcomings from the perspective of philosophical foundation, cognitive foundation, interactive theory.

Keywords: direct perception; embodied simulation theory; mirror neurons; Neurophenomenology; challenge and outlet

具身机制的认知边界：一项具身认知新探

朱林蕃

复旦大学哲学学院

摘要 具身认知研究在最近几年已经出现许多新的研究范式, 特别是自延展认知 (extended cognition) 之后, 许多学者都在试图解释心灵与世界之间的重新划界问题 (The Problem of Re-demarcation)。旧的认知边界理论存在三种理论: 第一种还原主义 (reductionism) 进路试图将认知的边界与生理边界重合进行解释; 第二种进路为概念论 (conceptualism) 进路, 即认为认知的边界是将符合认知特性的认知现象划入的概念特征 (conceptual marks); 第三种进路是延续计算的功能主义的认知边界 (computationalism), 即认为认知的边界即计算的边界。本文试图在第三种进路的基础上提出一种新的认知边界概念, 即具身机制的认知边界。具

身机制的认知边界认为，人类的认知边界是伴随着一系列认知活动而成为可塑的（plasticible）和可延展的（malleable）。本文认为，具身机制的认知边界不仅可以弥合笛卡尔式二元论认知鸿沟，还可为试图阐明颅内与颅外信息回路的科学解释提供新的理论工具。

关键词 认知边界，具身认知，机制的边界，延展认知

The Cognitive Boundary of Embodied Mechanism: An Exploratory from Embodied Cognition

Linfan Zhu

(School of Philosophy, Fudan University)

Abstract: Over the last few years, the research of embodied cognition has transformed many new paradigms. Since the hypothesis of extended cognition, many psychologists and philosophers have tried to provide new approach on the re-demarcation problem between mind and the world. Traditionally, psychologists believe in three approaches on cognitive boundary: reductionism, conceptualism and computationalism. Reductionists believe that cognitive boundary is overlapped with our skin and skull (biological boundary). Furthermore, conceptualists assert that cognitive boundary is conceptualizing with cognitive marks for discriminating that behaviors are cognitive or not. The last but not least, computationalists believe that cognitive boundary is the boundary where computation happens. In this thesis, I will along with the computational view with a new explanation, the cognitive boundary of embodied mechanism (CBEM). CBEM insists that human cognitive boundary functions with tremendous cognitive events that establish such CBEM to be pasticible and malleable with the environment. We believe that CBEM will collapse with the gap of Cartesian dualism and provide new theoretical forms for the scientific explanation of intracranial and extracranial information loops.

感知觉系统中的预测与渗透

郁锋

华东师范大学哲学系, fyu@philo.ecnu.edu.cn

摘要 知觉系统的目标是促使生物体对生态中的相关刺激做出适应性反应。由于知觉信息的输入是模糊而不确定的，知觉系统需要依赖在进化中积累的先验信息将感觉能量转化为有效引导行动的信息。然而，感知觉是被锁定在一个认知无法渗透的模块中还是会受到认知状态的影响，这一问题仍然存在着巨大争议。已有研究显示，期望、先验信息和情境任务可以在多个层次上塑造感知觉。本文将从层级的预测加工和预测误差最小化的理论框架(Clark 2013, 2015)出发来阐释感知觉普遍的认知渗透性。在层级化的预测系统中，当用更高层次的信息来约束较低层次的过程以最小化全局预测误差时，认知的渗透就是必不可少的。高层的状态可以导致更准确的下层预测，它们会影响相应的下层预测加工。自下而上的感觉材料与自上而下的预测不匹配可以在较高层上有效地解决，而较低层次的表征受到的影响较小。本文还将试图回应批评感知的认知渗透性的各种观点(Fodor 1988)。最后，文章认为感知的认知渗透性是其适应性的重要表现，因为这样的感知系统在瞬息万变且可预测的世界中才能更适切地引导行为。

关键词 知觉系统；预测心灵；认知渗透性；具身认知

Prediction and Penetration in Perceptual System

YU Feng

Department of Philosophy, East China Normal University

Abstract: The aim of the perceptual system is to make organisms respond adaptively to relevant stimuli in the ecology. Since the input of perceptual information is vague and uncertain, the perceptual system needs to rely on the prior information accumulated in the evolution to transform sensory energy into information that can effectively guide

actions. However, whether perception is locked in a cognitively impenetrable module or will be affected by the cognitive state is still a huge controversy. In this article, I argue that expectations, prior information, and situational tasks can shape perception on multiple levels. I will start from the theoretical framework of hierarchical prediction processing and prediction error minimization (Clark 2013, 2015) to explain the universal cognitive penetration of perception. In a hierarchical prediction system, when higher-level information is used to constrain lower-level processes to minimize global prediction errors, cognitive penetration is essential. The state of the higher layers can lead to more accurate lower layer predictions, and they will affect the corresponding lower layer prediction processing. The mismatch between bottom-up sensory data and top-down predictions can be effectively resolved at higher levels, while lower-level representations are less affected. I will also try to respond to various views criticizing the cognitive permeability of perception (Fodor 1988). Finally, I think that the cognitive penetration of perception is an important manifestation of its adaptability, because such a perception system can more appropriately guide behavior in a rapidly changing and predictable world.

Keywords: Perceptual system; Predictive mind; Cognitive permeability; Embodied cognition

团体创造活动的超脑网络特征

卢克龙¹ 高桢妮¹ 王欣悦¹ 郝宁¹ (通讯作者)

¹ 华东师范大学心理与认知科学学院, 上海市心理健康与危机干预重点实验室, 上海, 200062

通讯作者 E-mail: nhao@psy.ecnu.edu.cn

摘要 本研究旨在探讨团体创造活动背后的超脑神经网络特征。研究者共招募 230 名在校大学生, 并将其随机两两配对, 组成 115 组双人小组。在实验过程中, 受试者需要各完成一个创造力任务和一个非创造力的控制任务。前者为非常规用途任务, 后者为物体特征任务。在整个实验过程中, 研究者通过功能性近红外光谱成像技术同步记录每组内的两个个体的大脑活动。初步分析结果表明, 在右侧前额叶皮层和右侧颞顶联合区皮层之间的脑际功能连接上, 双人小组在创造力任务期间的连接值要高于非创造力任务期间的连接值。其次, 图论分析结果表明, 与非创造力任务相比, 双人小组的超脑网络在创造力任务期间的特征路径长度(characteristic path length)更短, 聚类系数(clustering coefficient)更低, 而全局效率(global efficiency)和局部效率(local efficiency)更高, 且前额叶皮层和颞中回皮层两个节点在超脑网络中的全局效率更高。脑与行为的相关分析结果表明, 非常规用途任务的观点流畅性与全局系数呈正相关, 而与特征路径长度呈负相关。上述发现表明前额叶皮层和右侧颞顶皮层可能在团体创造活动中起着非常重要的作用, 且创造活动背后的超脑网络具有如下特征: 高度的整合性、全局信息传输的高效性和对不合理信息整合的高容忍性。

Abstract: This study aimed to explore the hyper-brain network that underlies group creation. A total of 230 college students were recruited in this study. Participants were then randomly assigned to 115 dyads to solve one creativity

task (AUT, alternative uses task) and one control task (OCT, object characteristics task). Functional near-infrared spectroscopy (fNIRS)-based hyperscanning was used to simultaneously record the brain activities of each dyad. We observed higher interpersonal functional connectivity between the right prefrontal cortex and temporal-parietal junction during the AUT than the OCT. Network analysis showed that the characteristic path length (L_p) and clustering coefficient of the hyper-brain network was lower during the AUT than the OCT, whereas global (Eglob) and local efficiency were higher during the AUT than the OCT. Moreover, AUT fluency was positively correlated with Eglob but negatively correlated with L_p . We also found the prefrontal and middle temporal areas have higher Eglob in the network. These findings indicate the validity of using network analysis to unveil the neural correlate underlying verbal group creativity, namely a hyper-brain network with a high degree of integration, global information transfer efficiency and tolerance capacity for unreasonable information integration.

Keywords: Group creativity, hyperscanning, hyper-brain network, fNIRS

认知灵活性对顿悟问题解决的作用：心理定势打破的中介作用

摘要 认知灵活性指个体认知活动中进行灵活转换的能力, 可以看作个体面临变化的环境时能够克服优势思维并调节思维以适应新的变化的环境的能力。有研究表明认知灵活性与创造性具有正相关关系, 在创造性思维中, 顿悟问题解决是一种代表形式。个体能否摆脱固有问题表征的限制打破心理定势是实现创造性顿悟问题解决的关键, 在这个过程中认知灵活性起着重要的作用。本研究开展了以下实验: 研究一在实验室条件下开发了基于汉字形声字规则性的心理定势打破任务, 实验一以声旁字拼音与组合字拼音一致的形声汉字(规则字)作为引导定势形成的刺激材料、以声旁字拼音同组合字拼音不一致的形声汉字(不规则字)作为定势打破的探测材料; 实验二以不规则字作为定势引导材料、规则字作为定势打破的探测材料, 通过两项实验验证了该任务可以有效诱发被试形成心理定势并探测定势打破效应。研究二使用任务转换任务训练被试的认知灵活性, 通过连续十天的训练, 发现认知灵活性训练能够有效提高个体的心理定势打破表现及顿悟问题解决能力。研究三采用研究一开发的定势打破任务, 探讨认知灵活性与顿悟问题解决的关系机制, 结果发现心理定势打破在认知灵活性和顿悟问题解决中起中介作用。

Abstract: Cognitive flexibility refers to the ability of an individual to perform flexible transformations in cognitive activities. It can be regarded as the ability of an individual to overcome dominant thinking and adjust thinking to adapt to a new and changing environment when facing a changing environment. Studies have shown that cognitive flexibility and creativity have a positive correlation, and insight problem solving is a representative form of creative thinking. Whether an individual can get rid of the limitations of inherent problem representations and break mental set is the key to achieve creative insight problem solving, and cognitive flexibility plays an important role in this process. The following experiments were carried out in this research: Study 1 developed a mental set-breaking task based on the regularity of the pictophonetic characters of Chinese characters under laboratory conditions. Experiment

1 uses the phonetic Chinese characters (regular characters) whose phonetic characters are consistent with the pinyin of the combined characters as the stimulus material to guide the formation of mental set, and the phonetic Chinese characters (irregular characters) whose phonetic characters are inconsistent with the pinyin of the combined characters are used as the mental set breaking detection material. In Experiment 2, irregular characters were used as guiding materials for the formation of mental set, and regular characters were used as the detection materials for mental set-breaking. These two experiments verify that this task can effectively induce participants to form mental set and detect mental set breaking effects. Study 2 used task switching tasks to train participants' cognitive flexibility. After ten consecutive days of training, it was found that cognitive flexibility training can effectively improve the individual's mental set breaking performance and insight problem solving ability. Study 3 uses the mental set-breaking task developed in Study 1 to explore the mechanism of the relationship between cognitive flexibility and insight problem solving. It turns out that mental set breaking plays a mediating role in cognitive flexibility and insight problem solving.

Keywords: Cognitive flexibility, Mental set, Insight

创造性思维中语义搜索过程

赵庆柏¹ (通讯作者) 陈嫣然¹ 梁正¹ 周治金¹ 于全磊¹

¹ 青少年网络心理与行为教育部重点实验室 (华中师范大学) 暨人的发展与心理健康湖北省重点实验室, 心理学院, 华中师范大学, 武汉, 430079, zqbznr@ccnu.edu.cn

摘要 创造性思维的语义搜索过程即长时记忆中的语义信息激活过程。先前研究指出, 该过程符合语义网络的激活扩散模型, 可能表现出负加速和聚类特征。不过与一般性语义激活不同的是, 创造性思维需要激活远距离的新颖信息, 因此会通过执行控制功能抑制优势反应信息, 避免就近搜索。本研究通过描绘发散性思维测验 (物品多用途, AUT) 中答案生成在累积函数和语义相似性等一系列参数上的量化特征, 揭示创造性思维的语义搜索过程。结果发现: (1) 新颖 AUT 任务中, 答案的新颖性与答案个数不存在显著相关, 说明创造性思维的语义搜索过程并非简单的由近及远的激活扩散过程。(2) 新颖 AUT 的序列答案与题目均具有较低的语义相似性, 且显著小于寻常 AUT 条件, 说明新颖性要求使个体在最初搜索时便开始摆脱题目的语义限制, 避免了就近搜索。(3) 新颖条件比寻常条件表现出显著更低的答案间聚类, 在寻常条件下, 与未聚类答案相比, 可聚类答案与题目的语义相似度更高, 新颖性更低, 而在新颖条件下, 可聚类答案与未聚类答案在与题目的语义相似度均较低, 且不存在显著差异, 二者在新颖性上也不存在显著差异。这说明, 创造性思维的语义搜索过程会避免在题目附近搜索, 但是在远离题目的语义场内可能会进行局部就近搜索。

Sematic search process in creative thinking

Qingbai Zhao*, Yanran Chen, Zheng Liang, Zhijin Zhou, Quanlei Yu

Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, and Key Laboratory of Human Development and Mental Health of Hubei Province, School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: The semantic search process of creative thinking is the activation process of semantic information in long-term memory. Previous studies have pointed out that this process conforms to the spreading activation mechanism of semantic network and may show negative acceleration and clustering. However, different from general semantic activation, creative thinking needs to activate novel and distant information, so it will suppress the dominant response information through executive control function to avoid nearby search. In this study, we described the quantitative characteristics of answer generation on a series of parameters such as cumulative function and semantic similarity in the Divergent Thinking Test (AUT) to reveal the semantic search process of creative thinking. The results showed that: (1) In the novel AUT task, there was no significant correlation between the novelty of answers and the number of answers, suggesting that the semantic search process of creative thinking was not a simple process

of spreading activation from near to far. (2) The sequential answers of the novel AUT and the items had a low semantic similarity, which was significantly lower than that of the normal AUT conditions, indicating that the novelty requirement made the individuals start to get rid of the semantic restriction of the questions at the initial search, and avoided the nearby search. (3) Compared with normal AUT, novel AUT showed a significantly lower clustering between the answers. In normal AUT, compared with non-clustering answers, the clustering answers had higher semantic similarity with the items, and their novelty was higher; while in novel AUT, both non-clustering and clustering answers showed low semantic similarity with the items, and they showed no significant difference in novelty. This indicated that the semantic search process of creative thinking avoided the search near the question, but in the semantic field far away from the topic might conduct local nearby search.

摘要 基于联想理论提出的远距离联想任务(Remote Association Test, RAT)已被广泛应用于创造性思维过程的研究中。传统的 RAT 任务更多反映的是在没有其他因素影响下的自由联想过程,然而实际的远距离联想过程可能会受到知觉和语义加工等因素的干扰,但目前关于这方面的研究还比较缺乏,其加工过程和可能的认知机制也仍待探讨。鉴于此,本研究将知觉和语义组块引入 RAT 任务中,采用 ERP 技术,探讨两种组块类型对远距离联想过程的影响,并通过认知控制任务对其认知机制进行研究。行为结果显示,语义组块条件的正确率显著低于知觉组块和无组块条件,而知觉组块和无组块条件差异不显著。在反应时上只发现语义组块条件的反应时间显著长于无组块条件。同时,对三种条件的认知机制进行研究发现,分心物抑制控制效率越高,正确解答语义组块和无组块条件的速度越快。优势反应抑制控制效率越高,在知觉组块条件上的正确率越高。ERP 结果显示,在 P200 成分上语义组块条件的波幅显著大于知觉组块和无组块条件,反映出语义组块条件需要更多注意资源的投入。在 N400 成分上,无组块条件的波幅显著大于知觉组块和语义组块条件,显示出知觉组块和语义组块条件的联想过程受到了削弱。在 SPW(Slow Positive Wave)成分上,知觉组块和语义组块条件的波幅显著大于无组块条件,反映出知觉和语义组块条件需要更多的认知资源来完成对生成答案的评估。本研究揭示出知觉组块和语义组块对远距离联想过程的阻碍,并且发现这种影响可能来自前期注意力资源的较多占用。

The Influence of Perceptual and Semantic Chunking on Remote Association and Its Cognitive Mechanism

Tie Sun¹, Feng Xiao², Peipeng Liang¹, Jing Luo¹

1 School of psychology, Capital Normal University, Beijing 100048, China.

2 Department of Education Science, Shanxi Normal University, Linfen 041004, China

Abstract: The Remote Association Test based on Association theory has been widely adopted in the study of creative thinking process. Traditional RAT test can just reflect the free association process in the absence of other factors influencing, the actual remote association process may be disturbed by factors such as perceptual or semantic processing. However, there is still a lack of research on this theme, and its time course and possible cognitive mechanisms are still to be explored. From this, present study introduces perceptual and semantic chunks into RAT test to investigate the cognitive mechanism and time course by adopted cognitive control task and Event-Related Potential (ERP) technology. The behavioral results showed that semantic chunk condition had lowest solving rate than other

two conditions, but other two conditions had not reach significant difference, moreover, only semantic chuck condition cost significant longer response time than non-chuck condition. The study of the cognitive mechanism of the three conditions found that the higher the efficiency of distraction inhibition control, the faster the correct answers to semantic and non-chuck conditions. The higher the control efficiency of the prepotent response inhibition, the higher the solving rate of the perceptual chuck conditions. And the ERP results showed that the semantic chuck condition elicited larger P200 amplitude than perceptual and non-chuck conditions, which reflected that semantic chuck condition need more attention resource. The non-chuck condition evoked larger N400 amplitude than other two conditions, which indicated that association process of semantic and perceptual chuck condition is weakened. And the semantic and perceptual chuck conditions elicited larger Slow Positive Wave (SPW) than non-chuck condition, which reflected that these two conditions need more cognitive resource to evaluate answer. From above all, presented study reveals that perceptual and semantic chunks hinder remote associations, and this effect may come from excessive investment in early attention resources.

爱会让人更有创造力吗？一项基于 fNIRS 的超扫描研究

王一凡¹ 段海军¹（通讯作者） 韩炳淑¹ 汪明静¹ 郭晓雨¹

¹ 陕西师范大学现代教育教学技术教育部重点实验室，西安，710062

摘要 爱是人类永恒的话题，爱情和浪漫关系也是无数文学和艺术作品的灵感来源。俗话说身无彩凤双飞翼，心有灵犀一点通。处于热恋中的恋人是否真的心心相印，在处理任务的过程中有高度的默契呢？本研究探讨了恋人在创造性任务上相互协作的机制，以及他们的协作是否不同于陌生人或彼此没有浪漫关系的个体，首次从双人互动的视角考察了“爱”影响创造性问题解决的认知神经机制。被试分为恋人组和陌生男女组两组，要求他们完成团体创造力任务——现实问题解决任务（realistic presented problems, RPP），运用近红外光学脑成像（functional near-infrared spectroscopy, fNIRS）的超扫描技术，记录了情侣组和陌生男女组在任务过程中前额叶（prefrontal cortex, PFC）和右侧颞顶联合区（right temporal-parietal junction, r-TPJ）的大脑活动变化。研究结果发现，与陌生男女组相比，情侣组在创造力任务中的原创性和流畅性更好，合作指数也更高。fNIRS 数据显示，与陌生组相比，情侣组在创造力任务中脑间同步性（interpersonal brain synchronization, IBS）更高，且与合作指数呈显著正相关。以上结果说明了，坠入爱河或因爱合作可能为创造力开启了一扇大门。fNIRS 技术的使用为探讨情侣如何通过合作创造性解决问题的加工机制插上了一双翅膀，将恋人之间心有灵犀的奇妙过程外显化，成为将埋藏在内心深处的爱呈现给人们欣赏的绝佳工具。未来研究可以借助 fNIRS 技术进一步揭示团体合作和团体创造性行为的脑间互动机制，并考察不同亲密关系、不同亲密程度、不同人际互动模式和不同互动环境对团体创造力表现的影响及其潜在的认知神经机制。

Abstract: Love is the eternal topic of human beings. Love and romantic relationships are the core inspiration for countless literary and artistic works. As the saying goes, even when the bodies of lovers are not fluttering side by side like phoenix wings, hearts are the thread from root to tip of the magic horn. Are lovers really heart to heart and have a high degree of tacit understanding in the process of handling tasks? This study explores the mechanisms of how lovers collaborate with each other on creative tasks and whether their collaboration differs from that of strangers or individuals without romantic relationships, providing the first examination of the cognitive neural mechanisms by

which "love" influences creative problem solving from the perspective of individual interactions. We divided participants into two combinations of unfamiliar male and female groups and heterosexual couples and asked them to complete the group creativity task-Realistic Presented Problems (RPP). Functional near-infrared spectroscopy (fNIRS) were used to record changes in brain activity in the prefrontal cortex (PFC) and right temporal-parietal junction (r-TPJ) during the task for two groups. The behavioral results found that originality and fluency in the lover dyads were significantly higher than in the stranger dyads. Moreover, compared to the stranger group, the behavioral index of cooperation was significantly higher in the lover dyads. Significantly increased interpersonal brain synchronization was observed when the lover group was solving the RPP task. Furthermore, in the lover group, interpersonal brain synchronization was positively correlated with cooperation performance and RPP originality. These data indicate that lovers had more advantages in interaction and cooperation, and this contributed to the solving of group creative problems. The use of fNIRS technology gives a pair of wings to explore the processing mechanism of how couples solve problems creatively through collaboration, externalizing the amazing process of heart-to-heart between lovers and becoming an excellent tool for examining the manifestation of love we hide in the heart. Future research should consider the use of fNIRS technology to clarify the inter-brain interaction mechanism and group creative behavior of participants, and further investigate people's group creativity performance and its underlying cognitive neural mechanisms in the perspective of different intimacy relationship, different degree of intimacy, different modes of interpersonal interaction, and different interaction environments.

摘要 广告在日常生活中无处不在, 在商业营销、品牌延伸甚至宣传方面都发挥着重要作用。研究表明, 广告引导着许多顾客的品牌选择和购买决策, 尽管大多数人没有表现出刻意的意愿去寻找广告或者在广告出现时抵制它。什么因素促使广告发挥作用? 现有研究证据表明, 广告促进购买意图, 品牌偏好和决策至少部分通过无意识的过程, 在观看广告, 即使观察者很少甚至不会刻意观看广告, 也许只给它一个短暂的一瞥或回眸。营销和广告中无意识加工的重要性也由三种常见的广告方法来说明, 它们被称为软广告 (如企业社会责任广告), 植入式广告 (如产品的标志或品牌植入电影) 和潜意识广告 (如。潜意识广告 (例如, 在播放电影时在屏幕上投影 "吃爆米花" 和 "喝可口可乐" 的字样), 所有这些都是为了吸引顾客和推广广告产品或品牌。自然, 作为一个功利行为, 广告的设计是为了达到最大的认知特别是营销效果 (如购买意向)。为了达到这样的效果, 虽然无意识和有意识的广告策略有时会被独立使用, 但更多的情况是它们被结合起来。在这个意义上, 许多广告的有效性是有意识和无意识元素的产物。换言之, 为了最大限度地提高营销效果, 许多有意识和无意识的元素被同时运用在广告活动中。然而, 人们对有意识和无意识过程对创意广告的认知有效性的各自的贡献知之甚少, 其中一些广告还可能诱发洞察力体验。为了量化商业广告中有意识和无意识过程在记忆有效性中的作用, 我们采用了一种双过程、信号检测技术来分离 80 个印刷广告所引起的有意识回忆和无意识辨别的贡献, 其中一半被认为是标准的, 另一半是创造性的。共有 51 名参与者完成了即时 (5 分钟后) 和延迟 (3 天后) 的记忆识别测试。与标准广告相比, 创意广告被发现能增强识别能力, 并在有意识和无意识的记忆中表现出优势, 这种优势在测试时间间隔内有所下降。进一步的分析表明, 由广告诱发的洞察力时刻, 无论它是标准的还是创造性的, 都能巩固无意识的记忆, 而没有诱发洞察力的广告则能改善有意识的记忆。本文讨论了这些发现的意义。

Quantifying the Roles of Conscious and Unconscious Processing in Insight-Related Memory Effectiveness within Standard and Creative Advertising

Wangbing Shen, Haiping Bai, Yuan Yuan

School of Public Administration, Hohai University, China

School of Education, Nanjing Normal University of Special Education, China

Abstract: Advertising pervades daily life, playing vital roles in commercial marketing, brand extension and even publicity propaganda. Research has indicated that advertising guides many customers' brand choices and purchase decisions, although most individuals show little deliberate willingness to either seek out advertising or to resist it when it is present. What makes advertising work? Accumulating evidence suggests that advertising facilitates purchase intentions, brand preferences and decision making at least in part through unconscious processes that arise during the viewing of an advertisement, even if the observer does not deliberately engage with the advertisement, perhaps only giving it a brief and transient glance. The importance of unconscious processing in marketing and advertising is also illustrated by three common advertising approaches, which are termed soft advertising (e.g., corporate social responsibility advertisements), implanted advertising (e.g., products' logos or brands implanted in movies) and subliminal advertising (e.g., subliminally projecting the words "eat popcorn" and "drink Coca-Cola" on the screen during showing movies), all of which have been developed to attract customers and promote the advertised product or brand. Naturally, as a utilitarian business, advertising is designed for maximum cognitive especially marketing effectiveness (e.g., purchase intent). To achieve such effectiveness, although unconscious and conscious advertising strategies are sometimes used in isolation, it is more often the case that they are combined. In this sense, the effectiveness of many advertisements is a product of both conscious and unconscious elements. In other words, to maximize marketing effectiveness many conscious and unconscious elements are simultaneously employed within campaign advertising. However, little is known about the individual contributions that conscious and unconscious processes make to the cognitive effectiveness of creative advertisements, some of which may also induce insight experiences. To quantify the roles of conscious and unconscious processes in memory effectiveness within commercial advertising, a dual-process, signal-detection technique was adopted to separate the contributions of conscious recollection and unconscious discrimination induced by 80 printed advertisements, among which half were considered standard and the other half creative. A total of 51 participants completed immediate (5 minutes later) and delayed (3 days later) memory recognition tests. In contrast to standard advertising, creative advertising was found to enhance recognition and to demonstrate advantages in both conscious and unconscious memory, which decreased across the test-time intervals. Further analyses showed that a moment of insight induced by an advertisement, regardless of whether it is standard or creative, can consolidate unconscious memory, whereas advertisements that do not induce insight improve conscious memory. The implications of these findings are discussed.

Keywords: creative advertising, memory, unconscious memory, consciousness, insight

面孔吸引力评价背景效应的连续转换趋势

刘春晓¹ 侯文霞¹ 王丹¹ 王雨薇¹ 孙嘉唱¹ 陈文锋^{1*}

¹ 中国人民大学心理学系, 北京 100872, wchen@ruc.edu.cn

摘 要 以往研究表明目标面孔的吸引力评价受到背景面孔的影响, 产生同化或对比效应。但以往研究中对同化/对比效应的计算常常是对不同背景下目标面孔吸引力评分进行比较(相对标准定义), 并没有考虑目标面孔单独呈现时的初始吸引力水平, 因而可能是虚假的同化或对比效应。本文以单独呈现的目标面孔吸引力

评分作为基准值计算同化/对比效应（绝对标准定义），以目标与背景之间的相似性为切入点，考察了目标与背景面孔吸引力的不同差异对目标面孔吸引力评价的影响。实验1以低吸引力的面孔作为评价目标，中高吸引力的面孔作为背景，操纵目标与背景之间的吸引力差值，并采用绝对标准定义的计算方法验证同化/对比效应。结果发现，在中高吸引力背景面孔下，个体对低目标吸引力的评价会升高，出现同化效应。同时发现了同化向对比连续转换的趋势，即目标背景差异变大的条件下，个体对目标的评价变成低评，出现了往对比效应转换的趋势。实验2进一步让被试直接对实验1的目标和背景面孔进行分类判断，验证相似性影响分类进而影响到同化/对比效应的产生。结果发现，差异大的目标和背景面孔的确更容易被分为不同的类别，而差异较小的目标和背景面孔更容易归为一类；并且这种分类倾向与同化/对比效应大小显著相关。这些结果表明，面孔吸引力评价的背景效应是客观存在的，这种效应受到目标与背景之间吸引力相似性的调节，表现为同化向对比连续转换的趋势，并影响目标与背景的归类而导致不同的背景效应，即同化或对比效应的产生。

关键词 同化效应；对比效应；相似性；连续转换趋势

The Shift Trend of Contextual Effect of Facial Attractiveness Evaluation

Liu Chunxiao¹, Hou Wenxia¹, Wang Dan¹, Wang Yuwei¹, Sun Jiachang¹, Chen Wenfeng^{1*}

¹ Department of Psychology, Renmin University of China, Beijing 100872, China.

Abstract: Previous studies suggested that the attractiveness evaluation of a face was influenced by context face, resulting in assimilation or contrast effect. However, these results were usually based on the comparison among evaluations of the target faces under different attractiveness contexts, without considering the attractiveness of the target face in isolation (i.e., relative standard), and might lead to incorrect conclusion on the contextual influence on target evaluation. Base on the perspective of face categorization, this study investigated the influence of attractiveness difference between the target and the context faces on the evaluation of target face. The assimilation/contrast effect was measured with the attractiveness of the same face in isolation as a comparison value (i.e., absolute standard). In Experiment 1, the low-attractive faces were selected as the rating target, while medium and high attractive faces were selected as the context. We manipulated the attractiveness difference between the target and context and verified the assimilation/contrast effect by the calculation method defined by absolute standard. The results found that under the medium-high attractive background faces, individuals' evaluation of the attractiveness of the low target would increase, showing an assimilation effect. At the same time, a shift trend from assimilation to contrast was found, where a contrast effect appeared in the condition of largest attractiveness difference. In Experiment 2, participants were asked to classify the target and context faces in Experiment 1 to verify that how the target-context similarity influences the categorization and its relationship with assimilation/contrast effect. The results showed that the face pair with large attractiveness difference were indeed more likely to be categorized into different categories, while the faces with less difference were more likely to be categorized into a same category. In addition, the tendency of categorization was significantly related to the size of assimilation/contrast effect. These results indicated that the context effect of facial attractiveness evaluation is robust, and is moderated by the similarity between the target and the context, manifested in a shift trend from assimilation to contrast. The similarity also leads to different context effects, i.e. assimilation or contrast effect, via resulted different categorization of the target and the context.

陌生关系的知觉者和被知觉者的人格特质 对面孔-人格知觉准确性的影响

闫鹏昊 史晓露 吴琦 李东 闫向博 任梦迪 蒋重清（通讯作者）

辽宁师范大学心理学院，大连，116029, jzqcjj@hotmail.com

摘要 人格知觉是评价和判断被试人格特质的过程。判断他人和自我的特征是日常生活中普遍存在的一项重要活动。已有研究总结出影响人格知觉判断准确性的四个因素，即知觉对象的性质、被知觉的特征、判断所依据的信息（数量和质量）以及知觉者。然而，这四个因素对人格判断准确性的影响究竟有多大，目前尚不清楚。因此，本研究旨在探讨知觉者与目标人的人格特质如何影响基于目标人脸部照片的准确人格判断。在本研究中，我们招募了两组年轻人。一组为感知者，另一组是目标。这两组人间是陌生关系。我们收集了所有这些人的 16PF 自测数据，以及目标人的脸部照片。然后我们让这组感知者用 10 分的量表来判断目标人的 7 个特质。这 7 个特质是从 16PF 中选出的，考虑了它们的可观察性和可理解性。它们是聪慧性、独立性、紧张性、乐群性、幻想性、支配性和开放性。以知觉者的自我评价得分与目标者的自我评价得分之差作为人格判断的准确性指标。从知觉者的角度来看，知觉者的乐群性越高，人格知觉的整体准确度越低；知觉者聪慧性越高，人格知觉的整体准确性越高。其次，知觉者的聪慧性和自立性越高，其对聪慧性和自立性的知觉准确性也越高；感知者的乐群性越高，对乐群性的知觉准确度就越低。从被知觉者的角度看，被知觉者的乐群性越高，其人格被知觉的整体准确性越低；支配性越高，人格知觉的整体准确性越高。其次，被知觉者的幻想性和紧张性越高，其幻想性和紧张性的知觉准确性越低。虽然本研究评估了人格特质的可理解性和可观察性作为从 16PF 人格特质做出选择的依据，是否有一个更适合于面孔的人格知觉研究的特质表值得进一步探讨。另外，本文的研究结果是基于相关分析的。本文结果中的交叉特征关联过于复杂，尚未讨论。简而言之，这些相关性背后的原因需要更深入的探索。

Abstract: Personality perception is the process to evaluate and judge the personality traits of targets. Judging the traits of others and the self is a ubiquitous and consequential activity of daily life. It is summarized that there are four factors affecting the accuracy of personality judgment, which are properties of the target of judgment, the trait that is judged, the information upon which the judgment is based (its quantity and quality), and the individual who does the judging. However, it is still unclear about the details that the four factors contribute to the accuracy of personality judgment. Therefore, present study aims to investigate how the perceiver and the target person's personality affect the accuracy personality judgement based on the target person's face photo. In present study, we recruited two groups of young people. One group was arranged as the perceiver, the other group was the target. These two groups of people were strangers. We collected all these people's 16PF self-test data, and the target person's face photos. Then we asked the group of perceiver to judge the target person's 7 traits in 10 points scale. These 7 traits were chosen from the 16PF, considering their observability and comprehensibility. They were intelligent nature, self-Reliance, tension, warmth, abstractedness, dominance, and openness to change. We took the difference between the perceiver's rating and the target person's self-rate score as the accuracy index of the personality judgment. From the perspective of the perceiver, the higher warmth of the perceiver, the lower overall accuracy of personality perception; the more intelligent perceiver, the higher overall accuracy of personality perception. Secondly, the higher intelligent and self-reliance of the perceiver, the higher the accuracy of reasoning and self-reliance trait perception; the higher

warmth of the perceiver, the lower accuracy of the perception of warmth. From the perspective of the target, the higher warmth of the target, the lower the overall accuracy of the perception of personality; the higher dominance, the higher the overall accuracy of the perception of personality. Secondly, the higher the abstractedness and tension of the perceived person, the lower the perception accuracy of abstractedness and tension. Although this study evaluated the comprehensibility and observability of personality traits as a basis for making choices based on the 16PF personality traits. Whether there is a better fit for face-personality perception research is worth of further exploration. In addition, the results of this study are based on correlation analysis. The cross-characteristic correlations in the results of this article are too complicated and have not been discussed. In short, the reasons behind these correlations require more in-depth exploration.

摘要 与非面孔物体相比, 面孔具有明显的类别优势效应。面孔加工的优势从何而来? 依据前人研究结果, 一种可能的原因是整体构型加工优势: 与非面孔物体相比, 面孔更依赖于整体的构型加工。另一种可能性为局部特征加工优势: 面孔的局部特征(如眼睛、嘴巴、皮肤纹理等)提供了大量有关身份、情绪、意图等社会信息, 在视觉加工中具有高显著性。此外, 面孔的类别优势效应在客体不可见时依然存在。那么进一步的, 不同视觉意识水平下面孔优势的原因是否相同? 在日常生活中, 一些似脸的非面孔物体也能使人产生面孔的生动知觉。这些似脸物体具有与面孔类似的整体构型, 但局部的特征却都不是面孔, 从而可以巧妙分离面孔整体构型和局部特征的作用。本研究拟采用似脸的非面孔物体与真实面孔、普通物体进行比较, 并结合双眼竞争和视觉拥挤范式操控客体的视觉意识水平, 探究不同视觉意识水平下面孔加工优势的具体认知机制。实验一采用双眼竞争范式, 结果发现在受抑制阶段(多数时间处于不可见状态下), 似脸物体与真实面孔具有类似的竞争优势, 即比普通物体更快地突破抑制; 在主导阶段(多数时间处于可见状态下), 似脸物体与普通物体更类似, 而面孔刺激具有最长的主导时间, 体现出面孔独有的意识上双眼竞争优势。为了更好地控制反应偏向的影响, 实验二采用了视觉拥挤范式结合信号检测论的实验方法, 结果发现随着干扰物数量的增加, 真实面孔的知觉敏感性降低, 但似脸物体并不受影响。更有趣的是, 在干扰物最多的条件下(不可见程度最高), 真实面孔的知觉敏感性降至与似脸物体相似的水平。该结果暗示了面孔的加工优势来自于整体构型和局部特征两个方面, 并只有后者会受到视觉意识水平的调节作用。

综合实验一和实验二的结果表明, 不同视觉意识水平下面孔加工优势具有分离效应: 不可见条件下的面孔优势效应主要依赖面孔的整体构型, 而可见条件下的面孔优势效应离不开面孔独特的局部特征。最后我们对该效应可能的神经心理机制进行了讨论。

Twofold advantages of face processing with or without visual awareness

Liu-Fang Zhou, Keyu Wang, Ling He, and Ming Meng

School of Psychology, South China Normal University, Guangzhou, China

Abstract: The advantages of face processing over processing items in other object categories have been found in conditions both with and without visual awareness. This study examines the possible mechanisms underlying the advantages of processing visible and invisible faces. Specifically, contributions from face-like configurations and face-specific local attributes are evaluated by comparing perceptual processes of three image types: genuine faces, face-like objects and non-face-like objects. Illusory face perception induced from face-like objects largely depends on information from a global configuration level, with a high tolerance for variations in local features. Comparable

processing advantages for real faces and face-like objects are observed in invisible conditions using interocular rivalry and crowding paradigms. However, the visible face advantage seems to be exclusive to genuine faces. These results suggest that the face processing privilege is twofold: it is strongly triggered by global configuration without visual awareness, but with awareness it relies on facial local attributes.

Keywords: face superiority, visual awareness, binocular rivalry, crowding, pareidolia

基于面孔年龄、面孔情绪和面孔吸引力的可信度判断

李永娜¹ 陈子炜² 刘勋² 齐玥¹ (通讯作者)

1 中国人民大学心理学系, 北京, 100872, qiy@ruc.edu.cn

2 中国科学院心理研究所, 北京, 100101

摘要 人们可以基于面部特征来判断对方是否值得信任, 但有关面孔年龄是否影响人际信任及如何影响人际信任还未能得到一致结果。本研究采用信任博弈范式, 探究面部年龄与面孔吸引力、面孔情绪在基于面孔的信任判断中的相互作用。在实验 1 和 2 中, 要求被试分别在 2000 毫秒和 33 毫秒的面孔呈现时间后对先前呈现的青年或老年面孔进行金额分配。结果显示, 相较青年面孔, 个体分配给老年面孔的金额数更多。同时, 面孔年龄和面孔吸引力之间也存在交互作用, 只有当低吸引水平下, 个体相较青年面孔分配给老年面孔的金额数更多。而面孔年龄与面孔情绪的交互作用则在两个实验中并不一致: 实验 1 中, 在快乐和悲伤水平下, 个体相较青年面孔分配给老年面孔的金额数更多; 实验 2 中, 仅在只在快乐水平下, 个体相较青年面孔分配给老年面孔的金额数更多。以上结果表明, 个体在接触不同年龄的陌生人时, 可能会根据多种面部线索进行可信度判断。

Abstract: People can make trustworthiness judgements based on facial characteristics. However, the previous findings regarding on whether facial age influences interpersonal trust are inconsistent. Using the trust game, the current study investigated the interactions of facial age with attractiveness and emotional expression in regarding to trustworthiness judgements. In experiments 1 & 2, younger participants were asked to invest in either younger or older faces that were shown for 2000 ms and 33 ms respectively. The results showed that people trust the faces of older people more than they do of younger people. There was also an interaction between facial age and attractiveness. The participants invested more money in older faces than in younger faces only when they perceived the faces to be less attractive. However, the interaction between facial age and emotional expression was inconsistent in the two experiments. The participants invested more money in older faces that were shown for 2000 ms when they perceived the happy and sad emotions, but they invested more money in older faces that were shown for 33 ms when they perceived the happy emotion. These results reveal that people make trustworthiness judgements based on multiple facial cues when they view strangers of different ages.

Keywords: trust game, trustworthiness, facial age, attractiveness, emotional expression

自我面孔诱发大小知觉错觉

摘要 过去的大量研究表明自我面孔享有识别、注意、记忆等方面的加工优势。我们最近开展的一项研究发现自我面孔的这种加工优势能够影响基本的知觉过程从而诱发大小错觉。实验1采用大小辨别范式,发现与相同大小的他人面孔相比,自我面孔会被知觉得更大。为排除熟悉性因素的影响,实验2将他人面孔替换为被试高度熟悉的名人面孔,发现与相同大小的名人面孔相比,自我面孔同样会被知觉得更大,说明自我面孔诱发的大小错觉特异于自我面孔加工。为进一步排除面孔物理特征、熟悉性等因素对研究结果的混淆,实验3将大小辨别范式与联结匹配范式相结合,把两张不同的卡通面孔随机分配至自我面孔条件和他人面孔条件,两张卡通面孔便被赋予了自我面孔和他人面孔的具象意义,进而探究具有相同熟悉性的卡通面孔在联结匹配前后大小知觉的变化。实验结果发现,自我联结面孔比相同大小的他人联结面孔看起来更大,说明自我面孔诱发的大小高估错觉可以延伸至自我联结面孔。实验4将艾宾浩斯错觉范式的变式作为测量工具,考察自我面孔知觉优势加工是否可以调节情境中其他物体的大小知觉,结果表明当联结面孔作为情境刺激时,自我面孔优势加工还会进一步调节对其他物体的大小知觉,使得物体的大小被低估,产生类艾宾浩斯错觉。综上,该研究发现了一种新的自我面孔加工优势——自我面孔大小高估错觉,而且,这一错觉效应可以延伸至自我联结面孔,进而调节其他物体的大小知觉。当前的研究结果从大小知觉层面为自我面孔加工特异性提供了新的证据,并强调了自我意识在大小知觉中发挥的重要作用。

My own face looks larger than yours: A self-induced illusory size perception

Ying Zhang^{1,2,3}, Li Wang^{1,2,3*}, Yi Jiang^{1,2,3*}

¹Institute of Psychology, Chinese Academy of Sciences, 16 Lincui Road, Beijing 100101, China

Abstract: Size perception of visual objects is highly context dependent. Here we report a novel perceptual size illusion that the self-face, being a unique and distinctive self-referential stimulus, can enlarge its perceived size. By using a size discrimination paradigm, we found that the self-face was perceived as significantly larger than the other-face of the same size. This size overestimation effect was not due to the familiarity of the self-face, since it could be still observed when the self-face was directly compared with a famous face. More crucially, such illusion effect could be extended to a new cartoon face that was transiently associated with one's own face and could also exert further contextual influences on visual size perception of other objects. These findings together highlight the role of self-awareness in visual size perception and point to a special mechanism of size perception tuned to self-referential information.

瞳孔扩张与面孔信任判断准确度的关系

孙俊才¹ (通讯作者), 孙悦¹, 董天天²

1 曲阜师范大学心理学院, 曲阜, 273165, sunjuncai266@163.com

2 上海师范大学心理系, 上海, 200234

摘要 准确区分陌生面孔的可信程度, 具有重要的社会效用研究发现, 基于面孔的信任判断具有群体一致性 (Rule et al., 2013), 例如, 面孔结构的宽-高比例 (width-to-height ratio FWHR) 可以预测信任判断, 宽-

高比例越小，信任度判断越高（Costa, Lio, Gomez, & Sirigu, 2017）。微笑表情的面孔可信度判断较高，而愤怒表情的面孔可信度判断较低（Dunn, & Schweitzer, 2005）。然而，在面孔可信度的研究中，研究者主要侧重群体主观判断的一致性，没有充分考量主观可信度判断是否符合客观可信度的标准。因此，本研究通过系统操作客观可信度这一自变量，并结合眼动加工指标，探究人们是否能够准确区分不同等级客观可信度的面孔，以及哪些视觉加工指标对可信度判断加工具有显著预测作用。本研究采用 2（警觉提示：无、有）× 6（客观可信度：1、3、5、7、9、11）混合实验设计，警觉提示为被试间变量，客观可信度为被试内变量。因变量为面孔呈现时的眼动指标（首次注视时间，瞳孔校正值，总注视时间）以及投资金额和投资反应时。从中国公安部颁发的通缉令中挑选 15 名男性和 15 名女性通缉犯证件照，用 FreeMorphing 软件将性别相同的通缉犯与普通面孔合成为每组包括 11 等级的面孔图片集合，共获得 30 组图片。在本实验中，挑选每组中 1、3、5、7、9、11 等级的面孔共 180 张，作为客观可信度的操作，等级越高，客观可信度越高。瞳孔校正值结果表明，客观可信度等级越低，瞳孔扩张越显著，而且 1、3、5、7 级都显著大于 11 级，达到显著水平。从首次注视时间来看，客观可信等级最低的面孔首次注视时间最长，瞳孔扩张及首视点的数据都表明，早期信息编码在面孔社会决策中发挥重要作用。客观可信度显著地影响投资金额，并且效应量较大（ $\eta^2 p = 0.56$ ），同时贝叶斯检验的结果， $BF_{10} > 1000$ ，这些结果表明可以在较高可信度水平上推测投资决策受到对面孔客观可信度判断的影响。鉴于瞳孔变化具有注意警觉性和非意识控制性的特点，本研究表明视觉加工能够在感知觉水平上准确区分客观可信度不同等级的面孔，且影响社会决策。

Relationship Between Pupil Dilation and Accuracy of Face Trust Judgment

Sun Juncai, Sun Yue, Dong Tiantian

Qufu Normal University, Qufu, 273165

Shanghai Normal University, Shanghai, 200234

Abstract Assessing trustworthiness of others accurately is a extremely important social skill. Researchers have investigated how people form consensual judgments of trustworthiness from facial features. However, previous studies tend to focus on the consistency of group subjective judgments, ignoring whether the results of subjective judgments meet the criteria of objective trustworthiness. The goal of this study was to investigate whether people could distinguish faces with different levels of objective trustworthiness accurately, and which visual processing indicators can predict the trustworthiness judgment. In this study, wanted criminal faces and ordinary faces with the same sex were combined into a set of 11 rated faces for each group using Morphing software. Faces at levels 1, 3, 5, 7, 9, 11 in each group were selected as the levels of objective trustworthiness. The higher the rating, the higher the objective trustworthiness. The experiment was 2(Alert Prompt: alert prompt, non-alert prompt) × 6(Objective Trustworthiness: 1, 3, 5, 7, 9, 11) mixed design. The Alert Prompt was a between-subjects variable, and the Objective Trustworthiness was a within-subjects variable. Three eye-movement indicators (Pupil calibration, First fixation duration, Total fixation duration), Investment amount and Investment response time were dependent variables. The experimental task was to invest in a group of venture capital recruiters. Before the task, participants were told that they had 1000 ¥ of virtual coins, and each time they could choose one of 0 ¥, 200 ¥, 400 ¥, 600 ¥, 800 ¥, 1000 ¥ to invest. And on each investment, the venture capitalist promised to give them four times the return on their investment. In the investment task, participants first saw the photos of the venture capitalist recruiter. After the photos disappeared, they chose the amount to be invested. Compared to the non-alert prompt group, the alert prompt group had the alert warning added to the instructions “Please note that 20% of these venture capitalists are fraudsters. Please be careful with your investments”. Given pupil dilation has the characteristics of involuntary control and attentional vigilance, which is better than other eye movement index in the aspect of reflecting non-controlled vigilance processing. Therefore, this study focused on the indicator of pupil dilation. The results showed that the increase of trust alert of pupils was consistent with the decrease of investment amount in investment judgments for objective trustworthiness

faces. The lower the objective trustworthiness rating was, the more significant the pupil dilation was, and the lower the investment amount was. This tendency was even more pronounced in the absence of alert prompt. And the faces with the lowest objective trustworthiness had the longest first fixation duration time. The total fixation duration time of the face with the highest objective trustworthiness was significantly higher than that of the faces with other objective trustworthiness levels. In conclusion, the degree of pupil dilation reflected trustworthy alertness, that is, objective trustworthiness can be distinguished by the visual perception of facial information. From the perspective of visual processing, this study proved the objective accuracy of face trustworthiness judgment and the significance of information processing of sensory perception to social decision-making.

Keywords : face trustworthiness; objective credibility; pupil dilation

摘要 新冠肺炎疫情爆发以来，医护人员冲在抗疫第一线，是救治新冠肺炎患者的核心力量。但由于疾病的突发性、不确定性，一线的医护人员承受着巨大的心理压力。本研究通过自编的《心理需求量表》对 826 名一线医护的心理需求进行了调查，并根据教育部华中师范大学心理援助热线平台医护工作者的来电情况，对来电的 161 名医护人员的心理求助问题、具体表现和情绪状态随时间变化的趋势进行分析。结果显示：（1）心理需求调查结果表明，有较大心理压力的医护人员占比 60% 以上，其中压力非常大的医护有 21.7%，同时有一半以上的医护人员表示需要心理支持。在希望获得的心理帮助类型中，选择放松减压的人数最多，约占 77%；其次是情绪疏导，约占 52%。在希望获得的心理帮助方式中，选择放松活动的人数最多，约占 73%；其次是选择视频、音频、文字等自助材料，占比 40% 以上；而选择专业的心理咨询的比例相对较低，占比不到 20%。（2）心理援助热线平台医护人员来电数据显示，医护来电者面临的问题中，自我情绪问题最为突出，约占 44.6%，并在 6 月中旬达到了峰值；其次是人际关系问题，约占 38.7%，在 5 月中旬后出现增多，并在 6 月初和 6 月底达到了峰值，面临问题中除人际关系问题呈上升趋势外其他问题总体呈下降趋势。（3）医护人员来电者的具体表现以焦虑最为突出，约占 60.1%，并在 5 月初和 6 月上、中旬三次达到峰值；其次是抑郁和睡眠障碍，分别占比 20.4% 和 13.3%。具体表现中焦虑和睡眠障碍有下降趋势，但抑郁表现略有上升趋势。（4）医护人员来电者的情绪状态主要为担忧，约占 44.8%，在 6 月中旬达到峰值；其次是身心疲惫和压力骤增，分别占比 33.1% 和 29.6%。担忧情绪和压力骤增情绪在总体上略有上升趋势，其他各类情绪均呈下降趋势。本研究结果表明，有较大比例的医护心理压力较大，需要心理支持，专业人员要采取更加主动、灵活的方式为其提供心理服务。随着疫情的发展，医护面临的问题和情绪状态也会有所变化，为后疫情时期医护工作者的心理援助工作提供了参考。

Analysis of Psychological Needs and Hotline Cases Among Medical Staff during COVID-19

XIA Meng, ZHU Xu, WANG Jing, HE Yixuan, LIU Siqu

School of Psychology in Central China Normal University, Key Laboratory of Human Development and Mental Health of Hubei Province, Key Laboratory of Adolescent Cyberpsychology and Behavior (Ministry of Education), Wuhan, 430079

Abstract: Since the outbreak of COVID-19, medical personnel have been worked on the front line to fight against the epidemic. Undoubtedly, they are the core force in the treatment of patients with COVID-19. However, due to the suddenness and uncertainty of the disease, the front-line medical staff are under tremendous psychological pressure. In this study, the psychological needs of 826 first-line medical personnel were investigated through the self-compiled "Psychological Needs Scale". According to the calls of medical personnel on the MOE-CCNU Mental Health Service Platform, psychological help-seeking problems, specific manifestations and trends of emotional state of the 161 medical personnel were analyzed. The results showed that: (1) The psychological needs survey showed that more than 60% of medical personnel had greater psychological pressure, of which 21.7% were very stressed. More than half of the medical personnel reported that they needed psychological support. In terms of type of psychological assistance that they wanted to get, a majority of medical personnel chose relaxing and reducing pressure, accounting for about 77%, followed by counseling for their emotion, accounting for about 52%. In terms of way of psychological

help that they wanted to get, relax activities was chosen by the most medical personnel, accounting for about 73%; followed by self-help materials such as videos, audios, and text, accounting for more than 40%; and the least medical personnel would choose professional psychological counseling, accounting for less than 20%. (2) According to the record of psychological assistance hotline platform, emotional problems of medical personnel were the most prominent, accounting for 44.6%, and reaching a peak in mid-June, followed by interpersonal relationship problems, accounting for about 38.7 %, which increased after mid-May, and reached a peak at the beginning of June and the end of June. The number of most problems were generally decline except the number of interpersonal relationship problems which were on the rise. (3) The specific manifestations of medical personnel were anxiety, accounting for 60.1%, and peaking three times in early May, early and mid-June, followed by depression and sleep disorders, accounting for 20.4% and 13.3% respectively. In the specific manifestations, anxiety and sleep disorders had a downward trend, but depression performance had a slight upward trend. (4) The emotional state of medical personnel callers was mainly worry, accounting for about 44.8%, reaching a peak in mid-June; followed by physical and mental exhaustion and a sudden increase in stress, accounting for 33.1% and 29.6% respectively. The mood of worry and the sudden increase in pressure showed a slight upward trend in general, and all other kinds of sentiments showed a downward trend. The results of this study showed that a large proportion of medical care workers were under greater psychological pressure and need psychological support. Professionals should take a more active and flexible way to provide psychological services for them. With the development of the epidemic, the problems and emotional states faced by medical staff will also change, providing a reference for the psychological assistance work of medical workers in the post-epidemic period.

摘要 目的: 探讨新型冠状病毒肺炎病房一线医护人员的心理健康水平、应对及心理服务需求。方法: 采用方便取样的方法, 在疫情开始两周后, 向武汉收治新冠肺炎患者的某定点医院的一线医护人员 311 人发放了心理健康自评问卷 (SRQ-20) 和自编问卷。结果: 39% 的一线医护人员存在焦虑、抑郁等心理症状, 心理症状的严重程度与应对行为的频率显著负相关, 与使用的心理服务次数显著负相关。中介效应分析显示, 事件应对在医护人员面对感染风险和心理健康之间起到积极的中介作用。一线医护人员主要使用的心理服务方式有浏览心理学公众号和阅读心理学书籍 (61%, 57%), 10% 曾拨打心理服务热线; 在心理服务需求方面, 主要希望有放松安眠小程序和心理学知识链接推送的心理服务 (68%, 57%), 有近三分之一的医护人员希望有网络视频心理咨询或电话咨询服务。结论: 抗疫一线医护人员存在一定比例的焦虑抑郁心理症状, 积极的事件应对方式与症状的缓解有密切关系, 并且有较多的心理服务需求。

Abstract: Objective: To explore the mental health status, coping strategies and psychological service needs of

first-line health care workers in New Coronavirus pneumonia ward. *Methods:* Self-reporting questionnaire (SRQ-20) and self-designed questionnaire were distributed to 311 first-line health care workers in a designated hospital in Wuhan after two weeks of the outbreak. *Results:* The findings showed that 39% of the front-line medical staff had anxiety, depression or other psychological symptoms. The severity of psychological symptoms was negatively correlated with the frequency of coping behavior and the number of psychological services. The mediating effect analysis showed that event coping played a positive mediating role between infection risk and psychological symptoms. The main psychological services used by front-line medical staff are browse psychology official account and reading psychology book (61%, 57%), 10% have called psychological service hotline. In the aspect of psychological service demand, we mainly hope to have psychological service (68%, 57%) which is pushed by relaxing sleeping app and psychological knowledge link. Nearly one third of medical staff hope to have online video or telephone counseling service. *Conclusion:* there are a certain proportion of anxiety and depression symptoms in the front-line medical staff, positive event-related coping style is closely related to the relief of symptoms, and there are more psychological service needs.

组织支持对抗疫一线医护人员创伤后应激反应的影响： 抗疫效能感和积极应对策略的链式中介作用

周婷¹ 官锐园¹ 孙立群²

1 北京大学医学人文学院医学心理学系，北京，100191，zhouting.92@163.com

2 南京医科大学第二附属医院重症医学科，南京，210011

摘要 目的：本研究旨在调查参与武汉新冠肺炎抗疫一线工作的医护人员在结束抗疫工作后的创伤后应激(PTSD)症状，检验组织支持感对一线医护人员 PTSD 症状的影响及相关机制；**方法：**采用短期纵向追踪研究方法，分别在 2020 年 3 月中（抗疫工作中）和 2020 年 4 月中（结束抗疫工作）对武汉一家新冠肺炎定点医院的医护人员进行两次网络问卷调查，共有 107 名医护人员同时参加了这两次调查。调查主要了解抗疫一线医护人员的组织支持感、抗疫效能感、抗疫应对策略和创伤后应激反应；**结果：**1) 样本中 59.8%一线医护人员无明显 PTSD 症状，35.5%一线医护人员有轻度 PTSD 症状，4.7%出现中度 PTSD 症状。本地医护人员的 PTSD 症状得分显著高于援鄂医疗队成员；2) 抗疫工作中的组织支持感对抗疫工作后的 PTSD 症状有显著负向预测作用；3) 抗疫效能感和疾病应对策略在这一关系中起到链式中介作用。**结论：**本研究结果提示，有相当比例的抗疫一线医护人员出现 PTSD 症状，应注意对相关人员的心理健康水平进行监测，并进行必要干预。组织支持感对降低一线医护人员的心理症状有重要作用，因此，在现阶段常态化抗疫工作以及今后的类似工作中，要注意从组织层面加强对一线医护人员的支持。

Abstract: Objective: the present study aimed to 1)investigate the PTSD symptoms among the frontline healthcare

workers during the COVID-19 outbreak in Wuhan; 2) examine the effect of organizational support on the PTSD symptoms of the frontline healthcare workers; 3) explore the underlying mechanism of organizational support and PTSD link by examining the mediating effects of efficacy to overcome the crisis and positive coping strategies. **Methods:** A short-term longitudinal study design was used. One hundred and seven medical staff participated in two waves of online survey conducted in March and April. The mental health status, efficacy to overcome the crisis, the positive coping strategies and perceived organizational support were reported at each wave. **Results:** 1) 59.8% healthcare workers were free of PTSD symptoms, 35.5% reported mild PTSD symptoms and 4.7% of them reported moderate PTSD symptoms. Local healthcare workers had greater risk of PTSD than the members of medical rescue teams; 2) Perceived organizational support had a significant negative effect on the PTSD symptoms among the frontline healthcare workers; 3) Efficacy to overcome the crisis and positive coping strategies fully mediated the association between perceived organizational support and PTSD symptoms. **Conclusion:** The findings highlight the needs for monitoring psychological adaptation of the frontline medical staff after the work combatting COVID-19 and providing interventions to those with significant PTSD symptoms. The results also emphasize the importance of organizational support in psychological protection of the frontline medical staff.

The Effectiveness of Psychological Intervention of Balint Group among Medical Staff during COVID-19 Outbreak

Yan Ya-jun¹, Wu Da-xing^{1,2}

1 Medical Psychological Center, The Second Xiangya Hospital, Central South University, Changsha, Hunan, China.

2 National Clinical Research Center for Mental Disorders, Changsha, Hunan, China.

Abstract: Purpose During the COVID-19 outbreak, medical staff faced great challenges and heavy pressure, and undertook the intensive and stressful work, resulting in a series of psychological stress reactions, which seriously affected the physical and mental health of medical staff and decreased the efficiency of fighting against COVID-19. The study aimed to assess the effectiveness of psychological interventions of Balint group among the medical staff during COVID-19. **Method** A quasi-experimental design with convenient sampling comparing pre- and

post-intervention was used. Fourteen registered nurse participators working in fever clinics and isolation wards were targeted for intervention, 13 female and 1 male. The nurses' emotional state and posttraumatic growth level were evaluated using the Delighted-Terrible Faces Scale (FS), Emotional Thermometer (ET) and Posttraumatic Growth Inventory (PTGI) prior to group intervention and again post-intervention. **Results:** The overall feeling of life scores increased significantly ($t=-2.82, p=.014$) after the intervention. In the three dimensions of distress, anxiety and angry, the score has dropped but has not yet reached a significant level ($t=2.03, p=.063, t=1.94, p=.075, t=1.82, p=.092$); In the Posttraumatic Growth Inventory, scores of appreciation of life raised significantly ($t=-2.86, p=.013$), two subscales of new possibility, spiritual change, and the total scores also increased but not reaching a significant level ($t=-1.95, p=.074, t=-2.02, p=.065, t=-1.92, p=.077$). **Conclusion:** The Balint group activities have improved their emotional state, further promoted the posttraumatic growth of frontline medical staff during the COVID-19, are propagable and applicative for mental health of nurses.

Abstract: Objective: The purpose of this study was to investigate the prevalence and influencing factors of depression and anxiety in the general population in the context of Covid-19. Methods: This study collected data from 6,130 Chinese citizens by means of convenient sampling. A cross-sectional and self-report survey was conducted by using an online questionnaire. Anxiety and depression levels was estimated by using the 7-item generalized anxiety disorder (GAD) scale and the 9-item patient health questionnaire. Results: The prevalence of anxiety and depression was 7.1% and 12%, respectively, among 6,130 Chinese citizens. Multiple logistic regression analysis showed that psychological disorders were related to the possibility of sequela after NCIP treatment, daily online time, sources of NCIP related information, frequency of receiving NCIP related information, and negative emotions caused by social media. Conclusion: The government and social media need to send a consistent message to reduce public panic and confusion, and to reduce public exposure to persistent negative information.

摘要 冰毒成瘾者在日常交往中会表现出社会功能的异常。探索冰毒成瘾者的亲社会行为有助于了解冰毒成瘾对个体社会功能的影响、帮助改善冰毒成瘾者的社会适应性。本研究通过两个实验, 比较了冰毒成瘾者和健康被试在一个独裁者博弈变式任务中的表现。实验1招募了55名冰毒成瘾被试和34名健康被试, 实验任务是一系列的选择, 每次选择包含两个金钱分配方案, 每个方案是给自己和一个陌生人分配一定数额的金钱, 被试需要在两个金钱分配方案之间做出选择。实验2招募了62名冰毒成瘾被试和31名健康被试, 实验任务与实验1相同。但是, 每次在被试看到分配方案之前, 会先看到与冰毒相关的图片。两个实验结果一致发现, 当分配方案对自己不利时, 冰毒成瘾被试比健康被试做出更少的亲社会选择。使用漂移扩散模型 (Drift-diffusion model) 对数据进行拟合的结果表明, 相比于健康被试, 冰毒成瘾被试较低的亲社会水平是由于他们给他人的收益赋予了更低的权重。模型拟合的结果还发现, 在看到冰毒图片后, 冰毒成瘾被试在做决策时比健康被试更加不谨慎、编码和行动速度也更慢。此外, 冰毒使用年限越长, 在看到冰毒图片后, 决策时就越不谨慎。揭示冰毒成瘾者与健康人亲社会行为的差异及心理机制对诊断和治疗冰毒成瘾有重要意义。

Abstract: Methamphetamine (MA) dependents commonly exhibit socially problematic behaviors. Investigating the prosocial decision making of MA dependents could enable a better understanding of the impact of MA use on social functioning and help improve their social relationships. We conducted two studies to examine the performance of MA dependents and healthy controls on a modified dictator game. In Study 1, 55 MA-dependent and 34 healthy male participants made a series of choices between two pairs of monetary prizes for themselves and for others. In Study 2, we integrated MA-related pictures into the task, with 62 MA-dependent and 31 healthy male participants making the same choices as in Study 1 after a short exposure to MA-related pictures. In both studies, we consistently found context dependency of decreased prosociality in MA dependents. That is, MA dependents made fewer prosocial choices than healthy people in disadvantageous contexts (but not advantageous contexts). The computational model results suggested that the lower prosociality of MA dependents in disadvantageous contexts was attributed to the lower weight placed on others' benefits. Moreover, when exposed to MA-related pictures, MA dependents showed less caution and slower encoding/motor speed than healthy people, and MA dependents with a longer history of MA

use tended to respond less cautiously. Our findings provide evidence that MA dependents in disadvantageous contexts showed reduced prosociality and less consideration of others' benefits. Identifying the origin of the alterations in prosocial decision making has implications for diagnosis and treatments.

摘要 成瘾药物相关的记忆是导致复吸的重要因素。在记忆提取后, 记忆变得不稳定, 即为再巩固过程。但是诱发再巩固的神经通路尚不清楚。本研究应用大鼠自给药行为模型, 探索投射到基底外侧杏仁核 (basolateral amygdala, BLA) 的神经通路在吗啡相关记忆再巩固的诱发中的作用。结果表明, 吗啡 (非条件性刺激, US) 和伴随吗啡的线索 (条件性刺激, CS) 共同暴露可以诱发吗啡自给药记忆的再巩固, 单独 CS 暴露则不能诱发再巩固, 并且与 CS 暴露相比, US 和 CS 共同暴露可以激活更多的 BLA 以及孤束核 (nucleus tractus solitarius, NTS) 中的神经元, 但是蓝斑 (locus coeruleus, LC) 中激活的神经元数目没有明显增加。随后, 我们应用化学遗传学方法, 分别失活或者激活 NTS-BLA 或 LC-BLA 神经通路, 检测对再巩固的影响。发现在 US 和 CS 共同暴露的同时, 失活 NTS-BLA 通路可以抑制再巩固的诱发, 相反, 在 CS 单独暴露的同时, 激活 NTS-BLA 通路可以促进再巩固的诱发。这两个条件下失活或激活 LC-BLA 对诱发再巩固没有影响。我们的结果找到了一条可能在阿片类药物相关记忆的再巩固中发挥重要作用的神经通路。

Abstract: Drug related memory contributes to the chronic relapse problem. This persistent memory can be transiently destabilized by memory retrieval, after which memories are reconsolidated. However, the specific neural circuits underlying this induction of reconsolidation remain essentially unknown. Here we studied the role of afferent projections into the basolateral amygdala (BLA) in the induction of morphine self-administration memory reconsolidation in male rats. We first showed that morphine (unconditioned stimulus, US) + morphine-associated conditioned stimuli (CS) exposure, rather than CS exposure, induced reconsolidation of morphine self-administration memory. Then, we measured projection-specific activation after US + CS or CS retrieval test, by using Fos (activity marker)-labeling in projection areas. We found that compared with CS exposure, US + CS exposure induced more neurons activation in the BLA and the nucleus tractus solitarius (NTS), but not in the locus coeruleus (LC). Next, we determined the effects of chemogenetic inactivation or activation of NTS or LC projections to BLA (NTS-BLA or LC-BLA) on the reconsolidation. We found that NTS-BLA but not LC-BLA inactivation during US + CS exposure prevented induction of reconsolidation. Furthermore, NTS-BLA but not LC-BLA activation during CS retrieval induced reconsolidation. Taken together, our results identify a specific neural circuit underlie the transformation of a stable opiate related memory into an unstable memory.

摘要 药物成瘾者的行为会随着戒断时间的长短而变化。临床前研究发现: 在戒断初期, 成瘾者渴求感随戒断时间而增强(孵化效应)。在该横断面研究中, 156 名戒断期不同(少于 1 个月, 1-3 个月, 3-6 个月, 6-12 个月, 和 12-24 个月)的甲基苯丙胺成瘾者完成渴求, 冲动性, 睡眠, 抑郁, 焦虑的测量, 同时使用 128 导高密度脑电测试成瘾者的静息态脑电。结果显示: (1) 渴求和睡眠症状在戒断期前三个月逐渐增强(孵化效应), 之后减弱。冲动性和其他生理心理症状在戒断期 3 个月后逐渐减弱。(2) 和其他戒断期的成瘾者相比, 戒断期 1-3 个月的病人表现出 theta (4-8Hz) 和 Alpha (8-13Hz) 相对波段功率的降低, Beta (13-30Hz) 相对波段功率的增加, 差异主要集中在中部电极上。成瘾者的症状与 theta 和 beta 的相对波段功率均相关。(3) 全脑电极群-置换检验发现: 五组戒断期不同的成瘾者 Theta 和 Beta 功率比值的差异集中在额叶的电极上, 并与渴求, 冲动, 睡眠, 抑郁和焦虑呈负相关。(4) 分层回归模型显示额叶 Theta 和 Beta 功率比值能解释渴求变化的 8% 的效应, 整体模型能解释 78.7% 的渴求变化。结果揭示: 甲基苯丙胺成瘾者渴求感和睡眠在戒断期 3 月以下时随戒断时间增强(孵化效应), 前额叶 Theta 和 Beta 功率比值可以作为渴求变化的电生理标记物。

2 Research Center of Brain and Cognitive Neuroscience, Liaoning Normal University, Dalian, China

Abstract: Abstinence induces dynamic changes in behavior of drug use disorder. Previous preclinical research has indicated incubation effect of cue induced drug seeking in initial period. 156 male methamphetamine dependents (MAs) dependents with varying duration of abstinence (i.e. less than 1 month, 1~3 months, 3~6 months, 6~12 month, 12~24 month) participated in this cross-sectional study. Participants completed ratings of self-reported impulsivity, anxiety, depression, sleep quality, craving. Resting-state, eye-closed 128 channel EEG signals were used to track physiological signature across different abstinent individuals. MA patients' rating of cued craving and sleep symptoms increased until 3 months of abstinence and decreased after 3 months. Self-reported impulsivity and other mood symptoms improved after 3 months from MA. Moreover, MAs in 1~3 months group exhibited decreased theta band (4-8 Hz) and alpha band (8-13Hz), and increased in beta band (13-30 Hz), primarily across central regions. The results also showed decreasing trend for cued-craving and increased frontal theta/beta power ratio (TBR) after 3 months of abstinence. The dynamic changes of frontal TBR measured during the abstinence were associated with craving and other neuropsychological functions. A multiple hierarchical regression model was used to examine the predictive value of frontal TBR while controlling the severity of other neuropsychological symptoms. Frontal TBR explained additional 8% of the variance of craving, explained a total of 78.7% of the variance in the prediction of drug-seeking behavior. The current findings indicate incubation of cued craving and sleep symptoms during 1~3 month of abstinence. These results suggest that frontal TBR might be regarded as biomarker to identify patients who are at risk of relapse.

药物成瘾记忆的操纵

薛言学¹ (通讯作者) 时杰¹ 陆林¹

北京大学中国药物依赖性研究所, 北京, 100101, yanxuexue@bjmu.edu.cn

摘要 记忆再巩固更新理论提出条件性刺激 (conditioned stimulus, CS) 可诱导记忆进入再巩固更新状态, 这一假说为消除病理性记忆提供了契机。在既往的工作中, 我们课题组基于记忆的更新理论, 提出“条件性刺激唤起-消退”行为学范式用于消除病理性记忆, 即利用环境线索短期暴露 (CS 唤起) 后记忆不稳定的特点进行消退训练; 在多种成瘾动物模型以及海洛因成瘾者中均发现该范式可持续降低心理渴求。在既往研究的基础上, 课题组根据一个非条件性刺激 (unconditioned stimulus, US) 可以和多个 CS 形成关联记忆这一基本神经原理, 又提出—靶向干预 US 诱导的记忆再巩固过程—这一新的理论策略, 即和传统理论策略不同的是, 通过 US 而非 CS 进行记忆激活, 可诱导多种成瘾记忆印记进入不稳定状态, 再进行药理学和非药理学干预, 发现①在可卡因成瘾动物模型中 US 唤起记忆后进行消退训练能够抑制所有记忆线索诱导的觅药行为, 表明这种范式可以更全面彻底地消除成瘾记忆; ②应用临床用药—利他灵—代替可卡因进行记忆唤起, 然后联合消退训练, 同样可以消除多个成瘾记忆, 从而为靶向干预 US 诱导的记忆再巩固理论策略的临床转化提供了依据; 该模式在海洛因成瘾记忆模型中同样适用, 而且该范式不仅可以消除新的成瘾记忆, 对陈旧的、久远的成瘾记忆同样具有效果。我们课题组还将靶向干预 US 诱导的记忆不稳定状态和再巩固过程转化应用于成瘾人群。研究发现在尼古丁成瘾记忆动物模型和吸烟者中, 利用①小剂量的尼古丁作为 US 唤起记忆后, 给予肾上腺素受体阻滞剂普萘洛尔, 能够破坏所有与尼古丁关联的记忆, 包括新获得的尼古丁成瘾记忆和已经形成多年、陈旧的记忆, 降低多个吸烟相关线索 (如打火机等) 诱导的心理渴求。这些研究深化了病理性记忆理论, 也为基于记忆更新理论和记忆编辑策略的临床转化提供了新证据。

The modulation of drug memories

Yanxue Xue¹ (corresponding author), Jie Shi¹, Lin Lu¹

National Institute on Drug Dependence, Peking University, Beijing, China, 100101

corresponding author: yanxuexue@bjmu.edu.cn

Abstract: The theory of memory reconsolidation and updating suggests that conditioned stimulus (CS) can induce memory to enter a state of reconsolidation and updating, and this hypothesis provides an opportunity to eliminate pathological memory. In the previous work of our group, based on the theory of memory updating, we proposed the behavioral paradigm of "conditioned stimulus retrieval-extinction" for the erasure of pathological memory, namely, to make use of the instability of memory after short-term exposure to environmental cues (CS retrieval) to conduct extinction training. In multiple animal models of addiction and human individuals with heroin addiction, we observed that this paradigm can sustainably reduce psychological craving. On the basis of previous research, according to the basic neural principle that an unconditioned stimulus (US) can form an associated memory with multiple CSs, our group proposed a new theoretical strategy: a targeted intervention for the US-induced memory reconsolidation process. Unlike traditional theoretical strategies, before pharmacological and non-pharmacological interventions, multiple drug memory traces was destabilized by memory activation via US rather than CS, and it was found that ① in animal models of cocaine addiction, extinction training following US memory retrieval was able to inhibit all memory cue-induced drug-seeking behaviors, suggesting that this paradigm can eliminate drug memories more fully and thoroughly; ② The drug that has been approved for clinical use, Ritalin, was used as a replacement for cocaine to retrieve memory, followed by combined extinction training, also eliminated multiple drug memories, thus providing the basis for the clinical translation of the theoretical strategy of targeted intervention for US-induced memory reconsolidation; the paradigm is equally applicable in the heroin drug memory model, and it not only eliminated new drug memory, but was equally effective for stale, long-standing drug memory as well. Our group has also translated the targeted intervention for US-induced memory instability and reconsolidation process to addicted populations. It was found that in animal models of nicotine drug memory and in smokers, US memory retrieval with a

small dose of nicotine followed by adrenergic receptor blocker, propranolol, was able to disrupt all nicotine-associated memories, including newly acquired nicotine drug memories and memories that had been formed for years and were stale, and reduce psychological craving induced by multiple smoking-related cues (e.g., lighters). These studies deepen the theory of pathological memory and provide new evidence for clinical translation based on memory updating theory and memory editing strategies.

摘要 GABAB 受体激动剂 Baclofen 已被用于治疗酒精成瘾与其他多种物质滥用。但是目前 Baclofen 的药效作用机制尚不明确。本研究拟通过研究慢性酒精暴露后皮层中 GABAB 受体的动态变化来阐明其可能的神经机制。离体脑片的结果显示慢性酒精暴露后, 皮层中 GABAB 介导的电流显著降低。另外皮层中的 GABAB1/2 受体与下游的 GIRK2 蛋白表达均显著降低。这一皮层功能的改变, 有可能是 GABAB2 受体亚基上 ser-783 位点的去磷酸化影响了 GABAB 受体的膜表达而引起的。在成瘾患者中, 配对经颅电刺激(TMS)研究结果进一步证实了 GABAB 受体介导的皮层抑制的发生。药理学研究证实了 Baclofen 可以通过调控 GABAB 系统功能来缓解皮层抑制。我们的研究结果首次提出了慢性酒精暴露伴随着皮层中 GABAB 受体功能损伤, 同时阐明了 Baclofen 的可能作用机制。

Abstract: The GABAB receptor (GABABR) agonist, Baclofen, has been used to treat alcohol use disorder and several other types of substance abuse; yet the neural mechanism underlying its clinical efficacy remains to be elucidated. The present study aims to investigate cortical GABABR dynamics following chronic alcohol exposure. Ex vivo brain slice recording from animal model of chronic alcohol exposure revealed decreased GABAB receptor mediated currents, together with reduced GABAB1/2 and GIRK2 expression levels in cortex. This is likely to be mediated by dephosphorylation of serine 783 (ser-783) in GABAB2 subunit, which regulates GABABR surface expression. In human alcoholics, paired transcranial magnetic stimulation (TMS) study further confirmed the reduced GABAB receptor mediated cortical inhibition. The results provide the first cortical evidence that chronic alcohol exposure associates with impaired GABABR functioning, which might therefore rationalize the therapeutic effects of Baclofen as re-potential of the GABABR system.

早期致幻剂使用对成年期社会功能的影响

余志鹏 沈昊伟* (通讯作者)

宁波大学医学院药理学系, 宁波, 315211, shenhaowei@nbu.edu.cn

摘要 青春期是致幻剂滥用的高发年龄段, 可导致性格和社交能力的长期改变。本研究通过使用青春大鼠慢性暴露五羟色胺类致幻剂模型, 测试其行为学、多脑区间神经振荡及功能耦合改变, 试图阐明早期致幻剂使用对成年期社会功能影响的神经环路机制。青春期慢性致幻剂暴露动物存在着显著的社会等级下降和社交意愿的提升, 且两者呈负相关。致幻剂暴露组动物从海马 CA1 脑区至眶额叶皮层 (orbital frontal cortex, Orb) 场电位间 θ 波 (6-10Hz) 频率相干性较对照组动物显著降低。在社交状态下, 对照组动物 CA1-Orb 之间 θ 波频率相干性显著增强, 而致幻剂暴露组动物无显著变化。以上结果提示青春期慢性致幻剂暴露会造成的社会功能改变与异常的 CA1-Orb 间 θ 波频率相干性相关。

The effect of early psychedelic use on social function in adulthood

Zhi-Peng Yu, Hao-Wei Shen (correspondence)

Department of Pharmacology, Medical School of Ningbo University, Ningbo, Zhejiang, 315211, China, shenhaowei@nbu.edu.cn

Abstract: The prevalence of hallucinogen abuse is high during adolescence, which may lead to long-term changes in personality and social function. To clarify the neural circuit mechanism of early psychedelic use on social function in adulthood, we investigated the interhemispheric neural oscillations and functional coupling in adult rats which chronically exposed to serotonergic psychedelic during adolescence. Psychedelic-exposed animals during adolescence showed a significant decline in social rank and an increase in social willingness. Coherence of theta waves (6-10Hz) from the hippocampal CA1 to the orbital frontal cortex (Orb) was significantly reduced in the psychedelic-exposed animals compared to the control animals. During the social task, the coherence of theta waves between CA1 and Orb was significantly enhanced in the control animals, but not in the psychedelic-exposed animals. These results suggest that the altered social function caused by chronic psychedelic exposure during adolescence is associated with abnormal CA1-Orb theta-wave coherence.

鉴谎与微表情自动分析技术

陈通

西南大学电子信息工程学院, 重庆, 400715,

中国科学院心理研究所, 北京, 100101, c_tong@swu.edu.cn

摘要 微表情是人类在抑制自身情感时产生的表情泄露, 具有时间短、强度弱、不易被察觉的特点。由于微表情对应着真实的人类情感, 因此微表情分析在侦查讯问、商业背景调查、真实意图判断等领域具有潜在的应用价值。微表情分析技术首先在长段的视频中检测出微表情发生的短暂时刻, 然后进一步判断该微表情所属的类别。本文介绍微表情自动分析的原理与最新研究进展, 包括基于深度学习的微表情检测与识别, 基于权重自适应分配的微表情识别, 通过滑动窗技术排除眨眼等微小动作影响的微表情自动检测; 通过真实案例说明微表情分析技术在谎言识别领域的优势与挑战。案例场景包括讯问、商业贷款人可信度分析、人物的真实意图分析等。在讯问过程中, 微表情分析技术的优势在于非接触式的采集方式和结果的准确性, 其可以运用到讯问前的谈话和实际心理测试的全过程, 能够与传统的心测技术相辅相成, 相互验证和矫正。在商业贷款人可信度分析过程中, 微表情分析可以提供更加不受身体晃动影响的非接触式分析手段, 并能给出可用

于真实场景的检测结果。在人物的真实意图分析中，我们给出运用微表情分析技术分析国外政要的公开电视访谈给出人物的内在真实意图和想法的实例。通过以上案例总结微表情自动分析技术用于谎言识别的未来研究与应用方向。

Lie detection and automatic analysis of micro-expression

Tong CHEN

Southwest University, Chongqing, 400715, China

Institute of Psychology, CAS, Beijing, 100101, China

Abstract: Micro-expression happens when a person fails to hide his/her emotion. It features short duration, low intensity, and hard to be detected. Because the time of micro-expression happening corresponds to the time of real emotion induced, the analysis of micro-expression has potential application in interrogating, commercial background investigation, real intent detection. This report introduces the theory and research progress of automatic analysis of micro-expression, including the recognition and spotting of micro-expression based on deep learning, micro-expression recognition based on automatically feature weight allocation, micro-expression spotting robust to the eye blinking based on sliding window methods. The report also highlights the advantages and challenges of micro-expression analysis in lie detection through real applications. In the application of interrogating, the micro-expression analysis features in non-contact data obtaining and fairly high accuracy of analysis results. It can be applied in both pre-interrogating talk and real interrogating. The results of the analysis can be a reference to the results of polygraph and help to make the final decision. In the application of credit investigation of borrower, the analysis can provide non-contact method robust to body movement and produce high enough spotting accuracy for the real application. In the intent analysis, we demonstrate the results of analyzing the video of television interview of politicians. The reports concludes the future research and application direction of micro-expression analysis towards lie detection.

基于大数据的智能化罪犯危险性评估体系研究

刘晓倩 马皑（通讯作者）

中国政法大学社会学院，北京，100088, chinafzxl@163.com

摘要 罪犯危险性评估按照性质分为再犯危险性评估和狱内危险性评估。国外可应用的再犯危险性评估工具已发展至第四代，专门针对狱内风险评估的研究较少。传统的危险性评估主要采用量表自评或专家通过访谈后进行他评，上述方法难以避免由于社会赞许性带来的结果失真问题，且由于评估工具中预测因子数量有限，并不能全面真实地反映服刑人员的危险性水平。随着人工智能技术的全面发展，智能化分析技术能够综合已知的海量数据对于未来情况做出预测，本研究聚焦于探索该种可结合大量动静态预测因子对罪犯危险性程度进行预测的智能化评估体系。具体做法是利用人工智能技术对已有的标签数据进行深度学习，将大量“预测值”进行组合建立模型，预测个体的狱内、再犯危险性程度。模型建立后可叠加历史静态数据和动态数据进行分析，对服刑人员的风险程度进行实时计算，实现服刑人员风险的精准评估。这种基于大数据评估罪犯危险性的方法可以做到数据直观，将模糊的风险数值化，为监狱实时整体风险防控提供全新的途径。本文将对基于人工智能技术下的罪犯危险性评估理论依据、国内外发展应用现状、体系构建设想等进行介绍，并提出人工智能技术在罪犯心理测评中的应用前景。

Research of intelligent criminal risk assessment system based on big data

Liu Xiaoqian, Ma Ai

Faculty of Social Science, China University of Political Science and Law, Beijing, 100088

Abstract: The risk assessment of criminals can be divided into recidivism risk assessment and prison risk assessment according to the nature. The recidivism risk assessment tools available abroad have been developed to the fourth generation, but few studies have specifically focused on risk assessment in prison. Traditional risk assessment mainly adopts self-rating scale or assessment by experts after interviews. These above methods can't avoid the distortion of results caused by social desirability. Moreover, due to the limited number of predictors in the assessment tools, the risk level of criminals cannot be fully and truly reflected. With the comprehensive development of artificial intelligence technology, intelligent analysis technology can predict the future situation based on the known massive data. This study focuses on exploring an intelligent risk assessment system that can predict the risk degree of criminals by combining a large number of dynamic and static predictors. The specific approach is to use the artificial intelligence technology to conduct deep learning on the existing label data, and build a model from the combination of a large number of "predicted values", so as to predict the risk degree of the individual in prison and recidivism. After the model is established, historical static data and dynamic data can be superimposed for analysis, and the risk degree of criminals can be calculated in time, so as to achieve accurate risk assessment of criminals. This method, which is based on big data to evaluate the risk level, can make the data intuitive, numerical value the fuzzy risk, and provide a new way for the real-time overall risk prevention and control of prisons. This paper will introduce the theoretical basis, domestic and foreign development and application status, system construction assumption of the criminal risk assessment based on artificial intelligence technology, and put forward the application prospect of artificial intelligence technology in the criminal psychological assessment.

Keywords: big data, artificial intelligence, criminal risk assessment

心测技术的科学、有效方法——认知综合测试法

范刚

甘肃政法大学犯罪心理测试技术研究中心, 兰州, 730070, fangang369@126.com

摘要 传统的以 Polygraph 为指代的多导心理生理测试(“测谎”)技术,经过近百年的发展已由以准绳问题测试法(CQT)为代表的测试被测人是否说谎的“测谎”,发展为以隐藏信息测试法(CIT)为代表的检测被测人是否有相关认知经历的“测真”。我们在大量实案测试和实验室研究的基础上创新形成的认知综合测试法(CCT),是对隐藏信息测试法的创新和发展。其坚持以心理科学理论为指导,编题中严格遵循案件发生发展的逻辑顺序和涉案人心理活动的规律,不仅有犯罪情节测试题,而且增加了自我认知测试题,以检测被测人对作案人自传体信息有无相应的认知。同时加入了探查涉案人作案过程中和测试时心理活动的即时心态测试题,以唤起和检测涉案人在作案过程中及测试时的情绪状态等心理活动。保证了所编制的目标问题系涉案人认知清晰、体验深刻、记忆良好的问题。确保了编制的测试题能够有效地唤醒涉案人对案件相关信息的记忆等心理活动,并且扩充了目标题目的数量,改善了隐藏信息测试法目标题数量不足的问题。从而提高了编题的质量和效度及其测试的准确性和有效性,为判定被测人与案件的关系及案件相关情况开创了新的方法。经过大量实案测试的检验和实验室研究的验证,与国内外现有其它方法相比,认知综合测试法更具科学性和有效性。其不仅能准确地甄别被测人与案(事)件的关系,而且能为案(事)件的调查审理提供更多的信息和支撑,已在各类疑难案件的侦破中发挥了显著的作用,是心理测试技术的创新和发展。

The scientific and effective method of psychometric technology-- cognitive comprehensive test method

Fan Gang

Gansu University of political Science and Law, Research Center of Criminal Psychology Testing
Technology, Lanzhou, 730070

Abstract: Traditionally, people refer to multimodal psychophysiological testing technique as polygraph test ("lie detection") technology, the development of the past hundred years has been tested by the control question test (CQT) represented by the test measured one is lying "lie detection", for the development of testing method to concealed information (CIT) is a representative of testing has tested whether cognitive experience of "true". Based on a large number of practical tests and laboratory studies, CCT is an innovation and development of concealed information testing method. Guided by the theory of psychological science, it strictly follows the logical sequence of the occurrence and development of the case and the law of the psychological activities of the person involved in the case in compiling the questions. It not only has the crime scenario test questions, but also adds the self-cognition test questions to test whether the person tested has the corresponding cognition of the autobiographical information of the person involved. At the same time, an instant mental state test for investigating the criminal's psychological activities during the crime and during the test was added to arouse and detect the criminal's emotional state and other psychological activities during the crime and the test. It ensures that the compiled target problems are those involving clear cognition, deep experience and good memory. It ensures that the test questions prepared can effectively arouse the mental activities such as the memory of information related to the case, expand the number of target questions, and improve the problem of insufficient number of target questions in the hidden information test. Thus, it improves the quality and validity of the question preparation and the accuracy and validity of the test, and creates a new method for determining the relationship between the tested person and the case and the relevant situation of the case. Compared with other methods at home and abroad, the cognitive synthesis test is more scientific and effective. It can not only accurately identify the relationship between the tested person and the case (incident), but also provide more information and support for the investigation and trial of the case (incident). It has played a significant role in the detection of all kinds of difficult cases, and is the innovation and development of psychological testing technology.

青少年获得感的心理机制：个体和群体获得感的作用

王道阳^{1,2} 徐艳² 柳肖肖²

1 杭州师范大学教育学院, 杭州, 311121

2 安徽师范大学教育科学学院, 芜湖, 241000

摘要 基于自适应潜能循环增长模型,我们构建了一个青少年个体/群体获得感与成长思维、学校适应的自适应假设模型。为了验证假设模型,本研究调查45所中职学校学生33167人(T1,年龄13-19岁,男性占58.3%),一年后有24307人完成了第二次测试(T2,男性占56.9%),测试内容包括性别等背景变量、获得感(财富获得、健康获得、学业获得、机会获得、满足感获得、认同感获得)、成长思维以及学校适应变量(推理能力、阅读能力、学校心理环境感知、心理适应)。结果显示:(1)除了财富获得对推理能力、阅读能力的预测作用不显著,学业获得对“安全与秩序”、注意问题的预测作用不显著。获得感的其他维度或所有维度对学校适应各变量的预测作用均显著。(2)成长思维在健康获得、学业获得、认同感获得与学校适应各变量(推理能力、阅读能力、学校心理环境感知、心理适应)关系中的部分中介作用显著,中介效应占总效应的19.16%-36.13%。(3)群体学业获得和群体机会获得增强了成长思维对推理能力的预测作用;群体健康获得

和群体认同感获得增强了成长思维对阅读能力、“安全与秩序”“公平与公正”的预测作用；群体满足感获得减弱了成长思维对执行问题的负向预测作用，群体财富获得减弱了成长思维对注意问题的负向预测作用，对亲社会行为的正向预测作用。这说明，对于青少年个体/群体获得感与成长思维、学校适应的关系，构建的多水平有调节的中介模型假设能构成立。

关键词 青少年，获得感，学校适应，成长思维

Psychological Mechanism of Adolescent Sense of Gain: The Role of Individual and Group Sense of Gain

Daoyang Wang^{1, 2}, Yan Xu², Xiaoxiao Liu²

1 College of Education, Hangzhou Normal University, Hangzhou, China, 311121

2 School of Educational Science, Anhui Normal University, Wuhu, China, 241000

Abstract: Based on the cycle of adaptive potential model, we construct an adaptive hypothesis model of adolescents' individual/group sense of gain and growth mindset, and school adaptation. To verify the hypothesis model, this study surveyed 33,167 students (T1, age 13-19 years, male 58.3%) from 45 secondary vocational schools, and 24,307 completed the second test one year later (T2, male 56.9%). The content of the test included gender and other background variables, sense of gain (wealth gain, health gain, academic gain, opportunity gain, satisfaction gain, identity gain), growth mindset and school adaptation variables (reasoning ability, reading ability, perception of school psychological environment, psychological adjustment). The results showed that : (1) Except that wealth Gain had no significant predictive effect on reasoning ability and reading ability, academic Gain had no significant predictive effect on "safety and order" and attention problems. Other dimensions or all dimensions of sense of gain had significant predictive effects on the variables of school adaptation. (2) Growth mindset has a significant mediating effect on the relationship between health Gain, academic Gain, identity Gain and various variables of school adaptation (reasoning ability, reading ability, school psychological environment perception, psychological adaptation), and the mediating effect accounts for 19.16%-36.13% of the total effect. (3) Group academic Gain and group opportunity Gain enhanced the predictive effect of growth mindset on reasoning ability; Group health Gain and group identity Gain enhanced the predictive effect of growth mindset on reading ability, "safety and order", "fairness and justice"; The Gain of group satisfaction weakens the negative predictive effect of growth mindset on executive problem, the Gain of group wealth weakens the negative predictive effect of growth mindset on attention problem, and the positive predictive effect of prosocial behavior. These results indicate that the hypothesis of multi-level mediated model can be established for the relationship between adolescent's individual/group sense of gain and growth mindset and school adaptation.

Keywords: adolescents, sense of gain, school adaptation, growth mindset

社会规范与欺凌类型对欺凌情境下旁观者保护行为的影响

吴心玥 甄瑞（通讯作者） 沈凌雁

杭州师范大学教育学院，杭州，311121, zhenrui1206@126.com

摘要 欺凌情境下旁观者对受欺凌者的保护行为可以有效地阻止欺凌事件的发生和发展。但由于受到同伴群体行为和具体情境因素的影响，旁观者不一定会在欺凌情境下出现保护行为。为了探究群体因素社会规范和情境因素欺凌类型对旁观者保护行为的影响，本研究采用4（社会规范：描述性、命令性、描述命令、无规范）×4（欺凌类型：身体、言语、关系、网络）二因素混合设计对325名高中生进行了考察。其中，社会规范为被试间变量，欺凌类型为被试内变量，因变量为欺凌情境中的保护行为。社会规范分为描述性规范和命令性规范，研究通过向被试呈现大多数人都认为欺凌情境中采取了保护行为（描述性规范）或大多数人都认为应该采取保护行为（命令性规范）的比例图来对不同的社会规范进行控制。通过文字描述设置了不同的欺凌类型情境，让被试分别在身体、言语、关系和网络欺凌情境中结合所呈现的规范信息，对每个情境下列出

的保护行为与自己的符合程度进行评分。结果发现：社会规范主效应不显著；欺凌类型主效应显著，言语欺凌情境下的保护行为水平显著高于身体欺凌和关系欺凌。社会规范和欺凌类型的交互效应显著，只有在描述性规范和命令性规范同时呈现时，言语欺凌情境下的保护行为显著高于身体欺凌，同时网络欺凌情境下的保护行为也会显著高于身体欺凌。这些结果说明社会规范和欺凌类型会共同影响旁观者的保护行为，对于揭示欺凌旁观者保护行为的产生机制和如何提高旁观者保护行为具有一定的启示意义。在今后的欺凌干预中可以发挥描述性和命令性规范对于低风险欺凌情境（言语和网络）中保护行为的共同促进作用。另外，干预者也应加强旁观者在身体欺凌和其他欺凌情境中采取安全且有效保护行为的指导。

关键词 校园欺凌，社会规范，欺凌类型，保护行为，旁观者

The Influence of Social Norms and Bullying Types on Bystanders' Defending Behavior in Bullying Situations

Xinyue Wu, Rui Zhen, Lingyan Shen

School of Education, Hangzhou Normal University, Hangzhou 311121, China

Abstract: The defending behavior of bystanders to the bullied in the bullying situations can effectively prevent the occurrence and development of the bullying incident. However, due to the influence of peer group behavior and specific situational factors, bystanders may not necessarily exhibit defending behavior in bullying situations. In order to explore the influence of social norms (group factor) and bullying types (situational factor) on bystanders' defending behavior, a 4 (social norms: descriptive, injunctive, descriptive and injunctive, no norms) $\times$ 4 (bullying types: physical, verbal, relational, cyber) tow-factor mixed design was used to investigate 325 senior high school students. Social norm was between-subjects variable; bullying type was within-subjects variable and defending behavior in bullying situations was dependent variable. Social norms include descriptive norms and injunctive norms. This study manipulated different social norms through showing to the subjects the proportion chart of most people adopting defending behavior (descriptive norms) or most people thinking they should adopt defending behavior (injunctive norms) in the bullying situations. Different situations of bullying types (physical, verbal, relational, cyber) were set up using text description. Participants were asked to rate the degree of conformity between the defending behaviors listed in each situation and their own combining with the presented normative information. The results showed that the main effect of social norms was not significant; the main effect of bullying types was significant, and the level of defending behavior in verbal bullying was significantly higher than that in physical and relational bullying. The interaction effect between social norms and bullying types was significant. Only when descriptive norms and injunctive norms were presented at the same time, the level of defending behavior in verbal and cyber bullying was significantly higher than that in physical bullying. These results indicated that social norms and bullying types would jointly affect the bystanders' defending behavior, which had certain enlightenment significance for revealing the mechanism of the bystanders' defending behavior in bullying and how to improve the defending behavior. In the future bullying intervention, descriptive and injunctive norms can play important roles in promoting defending behavior in low-risk bullying situations (verbal and cyber) jointly. In addition, interveners should also strengthen the guidance of bystanders to take safe and effective defending behaviors in physical and other bullying situations.

青少年创伤后应激障碍与抑郁的关系：一项交叉滞后的网络分析

叶莹莹 元军军 周宵（通讯作者）

浙江大学心理与行为科学系，杭州，310028, psyzx@zju.edu.cn

摘要 背景：地震等重大创伤性事件可能会引发多中消极心理反应，如抑郁和创伤后应激障碍(PTSD)等，这些消极心理反应可能存在共病现象。其中，网络模型的广泛应用，一定能够程度上揭示了症状间的相互作用

用。然而，以往的网络模型研究主要关注于症状之间的横断关系，而难以揭示症状间的因果关系。因此，本研究采用交叉滞后网络模型探究 PTSD 和抑郁症状间的影响作用，以期发掘维系症状网络的内在因素，为心理干预提供依据。方法：本研究采用 DSM-5 PTSD 量表和流调中心用抑郁量表，在九寨沟地震发生后的 12 个月(T1), 21 个月(T2), 27 个月(T3)中对 386 名中学生进行施测。采用交叉滞后网络分析 T1-T2 和 T2-T3 时间段内 PTSD 和抑郁共病的症状网络特征。结果：在 T1-T2 的网络中，抑郁中的开心(Was happy)、有好事要发生(Something good going to happen)和 PTSD 中的闪回(Flashbacks)对其他症状的预测效果较强，PTSD 中的易怒(Irritability)最容易受到其他症状的预测。在 T2-T3 的网络中，抑郁中的悲伤(Felt sad)、觉得人们不喜欢我(Felt people dislike me)和 PTSD 中的侵入性想法(Intrusive thoughts)对其他症状的预测效果较强，PTSD 中易怒(Irritability)和分离(Detachment)更容易受到其他症状的预测。结论：研究结果显示了 PTSD 和抑郁的症状之间存在预测作用。但不同时间段的交叉之后网络特征存在差异。在 T1-T2 时，T1 时积极的情绪因素有助于减轻抑郁和 PTSD 症状，而闪回可能会加重共病症状。在 T2-T3 时，T2 时消极的情绪因素和侵入性症状可能会加重 PTSD 和抑郁症状。因此，在创伤后不同时期内，心理干预所重点关注的靶点症状也应是不同的。

Comorbidity of post-traumatic stress disorder and depression in adolescents: A cross-lagged network analysis

Ye Yingying, Qi Junjun, Zhou Xiao (Corresponding author)

Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, China

Abstract : Background: Major traumatic events such as earthquakes may trigger many negative psychological reactions, such as depression and posttraumatic stress disorder (PTSD), which may have comorbidities. Among them, the wide application of the network model should be able to reveal the interaction between symptoms to a certain extent. However, the previous network model research mainly focused on the cross-sectional relationship between symptoms, and it is difficult to reveal the causal relationship between symptoms. Therefore, this study uses the cross-lag network model to explore the influence of PTSD and depressive symptoms, in order to explore the internal factors that maintain the symptom network and provide a basis for psychological intervention. Methods: In this study, 386 middle school students were measured at 12 months (T1), 21 months (T2), and 27 months (T3) after the Jiuzhaigou earthquake, using the DSM-5 PTSD scale and center for epidemiologic studies depression scale. The cross-lagged network analysis was used to present the symptom network characteristics of PTSD and depression comorbidities in the T1-T2 and T2-T3 time periods. Results: In the T1-T2 network, *was happy* and *something good going to happen* in depression, and *flashbacks* in PTSD have a strong predictive effect on other symptoms, while in PTSD *irritability* is most predictable for other symptoms. In the T2-T3 network, *felt sad* and *felt people dislike me* in depression, and *intrusive thoughts* in PTSD have a strong predictive effect on other symptoms. *Irritability* and *detachment* in PTSD are more likely to be predicted by other symptoms. Conclusion: The findings demonstrated a predictive effect between symptoms of PTSD and depression, but the network characteristics differed over time periods. At T1-T2, positive emotional factors at T1 contribute to the reduction of symptoms of depression and PTSD, while flashback may exacerbate comorbidities. At T2-T3, negative emotional factors and invasive symptoms at T2 may exacerbate symptoms of PTSD and depression. Therefore, psychological interventions should focus on different symptoms at different periods of post-traumatic stress.

青少年公正世界信念对生活满意度的影响：同伴关系的中介作用

苑彬¹ 王道阳^{1,2} (通讯作者)

¹ 安徽师范大学教育科学学院, 芜湖, 241000

² 杭州师范大学教育学院, 芜湖, 241000, daoyangwang@126.com

摘要 青少年时期是个体成长过程中重要的转折期, 是心理发展显著变化的阶段。青少年群体的身心健康一直是我国社会各界的关注热点。然而, 近年来我国儿童青少年心理行为问题发生率和精神障碍患病率仍呈现逐渐上升趋势。生活满意度作为心理健康的指标之一, 以往学者对青少年生活满意度的影响因素有很多的探索, 但对公正世界信念对生活满意度影响机制的探索却显得不够重视。为了探讨青少年公正世界信念对生活满意度的影响以及同伴关系在二者之间的作用机制, 该研究采用公正世界信念量表、生活满意度量表、同伴关系量表, 对 1059 名青少年 ($M=17.48$ 岁, $SD=1.72$) 进行调查。使用 SPSS23.0 进行统计分析与处理, 并使用依次回归的方法来检验同伴关系的中介作用。结果表明: 男女青少年在公正世界信念上存在着显著性差异 ($p<0.05$), 女性的一般公正世界信念和个人公正世界信念得分均高于男性。高三年级学生生活满意度水平最高, 高一年级学生最低。生活满意度与一般公正世界信念、个人公正世界信念和同伴关系之间呈现显著正相关 ($p<0.001$)。中介效应检验结果显示, 公正世界信念对同伴关系有显著的预测作用 ($\beta=0.26$, $p<0.001$), 公正世界信念对生活满意度有显著的预测作用 ($\beta=0.54$, $p<0.001$), 同伴关系对生活满意度同样有显著的预测作用 ($\beta=0.43$, $p<0.001$) 即, 同伴关系在青少年公正世界信念与生活满意度之间起部分中介作用, 中介效应占总效应的 7.1%。基于以上研究结果, 本研究得出结论 (1) 女性青少年的公正世界信念显著高于男性; (2) 青少年公正世界信念对生活满意度有显著影响; (3) 同伴关系在青少年公正世界信念与生活满意度之间起部分中介作用。

The Effect of adolescent's belief in a just world on life satisfaction: the mediating role of peer relationship

Yuan Bin¹, Wang Daoyang^{1,2} (corresponding author)

(1 School of Educational Science, Anhui Normal University)

(2 College of Education, Hangzhou Normal University)

Abstract: Adolescence is an important turning point in the process of individual growth and a stage of significant changes in psychological development. The physical and mental health of the youth group has always been the focus of attention in all sectors of our society. However, in recent years, the incidence of mental and behavioral problems and the prevalence of mental disorders in children and adolescents in our country still show a gradual upward trend. Life satisfaction is one of the indicators of mental health. In the past, scholars have explored the influencing factors of adolescents' life satisfaction, but the exploration of the mechanism of the impact of justice world belief on life satisfaction seems to be insufficient. In order to explore the impact of adolescent justice world belief on life satisfaction and the mechanism of peer relationship between the two, the study used the justice world belief scale, life satisfaction scale, peer relationship scale, for 1059 adolescents ($M=17.48$ years old, $SD=1.72$) conducted an investigation. Use SPSS23.0 for statistical analysis and processing, and use the method of sequential regression to test the mediation effect of peer relationship. The results show that there are significant differences between male and female adolescents in the belief in a just world ($p<0.05$). Women's general just world belief and individual just world belief scores are higher than men's. The third grade high school students have the highest level of life satisfaction, and the first grade high school students have the lowest. There was a significant positive correlation between life satisfaction and general just world beliefs, personal just world beliefs and peer relationships ($p<0.001$). The test results of the mediation effect show that the just world belief has a significant predictive effect on peer relationship ($\beta=0.26$, $p<0.001$), and the just world belief has a significant predictive effect on life satisfaction ($\beta=0.54$, $p<0.001$). Peer relationship also has a significant predictive effect on life satisfaction ($\beta=0.43$, $p<0.001$). That is, peer

relationship plays a partial mediating role between adolescents' just world beliefs and life satisfaction. The mediating effect accounts for 7.1% of the total effect. Based on the above research results, this study concludes that (1) female adolescents' just world beliefs are significantly higher than males; (2) adolescents' just world beliefs have a significant impact on life satisfaction; (3) Peer relationship plays a part of the mediating role between adolescents' just world belief and life satisfaction.

Keywords: adolescents, belief in a just world, life satisfaction, peer relations, mediating role

新冠疫情下中小学教师急性应激症状对职业倦怠的影响： 控制感的调节作用

甄宝华 姚本先（通讯作者）

安徽师范大学心理学系，芜湖，241000，ybx7756@126.com

摘 要 新型冠状病毒肺炎在给人们带来身体创伤的同时，也可能导致人们出现各种心理健康问题，急性症状（ASS）是其中常见的一种。中小学教师是新冠疫情下的一个特殊群体，他们不仅需要调节新冠肺炎对其自身带来的心理健康压力，还承担着缓解学生心理健康问题的责任和教学压力。如果教师产生较强的急性应激症状，可能会导致其无法承担教学工作，产生职业倦怠。不过也有研究发现，急性应激症状程度相似的教师，其职业倦怠程度可能存在差异。一个可能的原因是急性应激症状对职业倦怠的作用受到其他调节变量的影响，确定控制感可能是其中的一个重要的调节变量。为探究新冠疫情下教师急性应激症状对职业倦怠的影响以及控制感在其中的作用，本研究采用急性应激症状量表、职业倦怠量表和确定控制感量表对 751 名中小学教师进行调查。结果表明，急性应激症状对职业倦怠中的情绪衰竭和非人性化具有显著的正向预测作用，对低成就感的直接预测作用不显著。确定控制感在急性应激症状与情绪衰竭和非人性化的关系之间不起调节作用，但确定控制感在急性应激症状与低成就感的关系之间起调节作用，即在教师确定控制感的高水平条件下，急性应激症状对低成就感产生显著的正向预测作用；在教师确定控制感的低水平条件下，急性应激症状对低成就感产生显著的负向预测作用。

关键词 急性应激症状，职业倦怠，控制感，中小学教师

The Relation between Acute Stress Symptoms and Job Burnout: Moderating Role of Sense of Control

Zhen Baohua, Yao Benxian (Corresponding author)

Department of Psychology, Anhui Normal University, Wuhu, 241000

Abstract: The COVID-19 not only caused physical trauma to people, but also negatively impacted people's mental health, including stress, anxiety, fear and other acute stress symptoms. Primary and secondary school teachers are a special group during the COVID-19 epidemic. They not only need to regulate their own psychological pressure brought by COVID-19, but also need to help students solve psychological problems and undertake the task of teaching. Acute stress symptoms may cause teachers to be unable to carry on teaching work and produce job burnout. The stronger the teachers' acute stress symptoms, the stronger their job burnout may be. However, the study found that there are differences in the degree of job burnout among teachers with similar acute stress symptoms. One possible reason was that the relation between acute stress symptoms and job burnout might be moderated by some variables, and teachers' sense of control may be one of the important moderating variables. In order to explore the effect of teachers' acute stress symptoms on job burnout and the role of sense of control during the COVID-19 epidemic, 751 primary and secondary school teachers were investigated with acute stress symptoms scale, job burnout scale and sense of control scale. The results showed that acute stress symptoms could positive predicted emotional exhaustion and depersonalization in job burnout, but acute stress symptoms could not predict the reduced personal accomplishment. The sense of control did not moderate the relations between acute stress symptoms and emotional exhaustion and depersonalization, but the sense of control played moderating role in the relation between

acute stress symptoms and reduced personal accomplishment. Specifically, under the condition of high sense of control, acute stress symptoms positive predicted reduced personal accomplishment; under the condition of low sense of control, acute stress symptoms negative predicted reduced personal accomplishment.

加强疫后青少年学生心理健康教育的政策探讨

姚本先

合肥师范学院, 安徽 合肥, 230601

摘要 基于广大青少年学生新冠肺炎疫情时期产生的大量心理问题, 以及疫情结束后可能演化为更严重的心理和精神疾病, 如创伤后应激障碍(PTSD), 全社会应高度重视, 积极应对, 注重顶层设计, 加强政策支持, 有效开展疫后心理辅导和干预, 全面推进疫后青少年学生心理健康教育工作, 提高他们面对灾难和挫折的心理复原力, 培育自尊自信、理性平和、积极向上的社会心态。为此应从建立工作机制、健全法律体系、制定相关政策、开展舆论引导、建设专业队伍、加强科学研究、完善信息系统等方面着力推进。

关键词 疫情后 青少年学生 心理健康教育 政策建议

Policy discussion on strengthening Mental Health Education of Adolescent students after COVID-19 epidemic

Benxian Yao

Hefei Normal University, Anhui Hefei, 230601

Abstract: Based on a large number of psychological and behavioral problems of young students during the COVID-19 epidemic period, and after the end of the epidemic may evolve into more serious psychological and mental illness, such as post-traumatic stress disorder (PTSD), the whole society should attach great importance to it, actively deal with it, pay attention to top-level design, strengthen policy support, and effectively carry out post-epidemic psychological counseling and intervention. Comprehensively promote the mental health education of young students after the epidemic, improve their psychological resilience in the face of disasters and setbacks, and cultivate self-esteem, self-confidence, rational peace, and positive social mentality. To this end, efforts should be made to promote it from the aspects of establishing the working mechanism, perfecting the legal system, formulating relevant policies, guiding public opinion, building a professional team, strengthening scientific research, perfecting the information system, and so on.

摘要 人们生活在常变的情境中, 也因此, 古希腊哲学家赫拉克利特说“世界上唯一不变的就是变化”。应对变化自然是人们日常生活中必有的构成部分, 理解和接受变化对于个体成长至关重要。但对于很多人来说

接纳变化并非易事，人们似乎更倾向于抗拒变化(拒变)甚至惧怕变化(惧变)，尤其当出现类似新冠肺炎疫情这样的巨变时，不少人会出现适应问题。可见，对变化的接纳是有效应对变化的重要基础，是弹性成长的重要心理资源。通过文献查阅发现，心理学虽在抗拒变化方面的研究有一定积累，将拒变视为一种心理防卫机制，但在变化接纳方面却探讨得不够，仅有一篇西方文献主要基于组织背景研究变化接纳并研制了一个 20 题的测量工具(Di Fabio & Gori, 2016)，尚未见到基于更广泛生活情境的接纳变化评估量表。本研究基于中国“顺变”和“抱一”思想，结合积极心理学的“超越”观(比如 Huta, 2017)，编制出一个 5 题 5 点 Likert 计分的接纳变化量表(CACS)。探索性因素分析(EFA)表明其为单一维度(样本 1, $n = 411$, KMO = 0.89, Bartlett 球形检查 $\chi^2 = 1860.40$, $p < 0.0001$, 特征值 4.05, 解释了 81.06% 的总体方差), 内部一致性信度系数 Cronbach's $\alpha = 0.94$; 验证性因素分析(CFA)提示其具有良好的结构效度(样本 2, $n = 750$, $\chi^2/df = 3.77$, $p = 0.002$, CFI = 0.996, TLI = 0.993, SRMR = 0.008, RMSEA = 0.061, 标准因素载荷 0.86 ~ 0.91); 接纳变化量表总分与主动求助显著相关(样本 2, $r = 0.50$, $p < 0.001$), 与心理弹性、积极社会心态、应对认知、应对能力显著正相关(样本 3, $n = 4925$, $r = 0.42 \sim 0.61$, $ps < 0.001$), 与心理资本显著正相关(样本 4, $n = 659$, $r = 0.33$, $p < 0.001$), 提示其具有良好的准则关联效度。总之, 该量表不仅心理测量属性良好且简短易测, 方便用于对常变情境中人们变化接纳程度的评估。

Abstract: People live in ever-changing situations. Therefore, Heraclitus, the ancient Greek philosopher, maintained that there is nothing permanent except change. Naturally, coping with change is an essential part of people's daily life, in fact, understanding and accepting change is crucial for individual growth. However, people are more inclined to resist change or even fear change, for many persons, accepting change is definitely no easy in daily life and even harder when facing acute change like COVID-19 pandemic, which will cause adaptation difficulties. In this sense, acceptance of change is an important basis for effective response to change and an important psychological resource for resilience. Through literature review, we found that although resistance to change with considering it a defense mechanism has been well documented in psychology, whereas literature on acceptance of change is sparse. We searched online and found only one article on development of an instrument for assessing acceptance of change in settings of organizations. In their article, Di Fabio and Gori (2016) reported a 20-item scale for assessing acceptance of change. Unfortunately, we did not find a scale assessing acceptance change based on broader life situations. Adopting Chinese traditional ideology about contingency (顺变) and oneness (抱一), and meta-thinking from some positive psychologist (e.g., Huta, 2017), we developed a self-report Chinese measure for assessing acceptance of change. This Chinese Acceptance of Change Scale (CACS) uses a 5-point Likert-type scale that consists of 5 items. The results of exploratory factor analysis (EFA) indicated a unidimensional structure (sample 1, $n = 411$; KMO = 0.89, and the Bartlett's test of sphericity $\chi^2 = 1860.40$, $p < 0.0001$; the single factor had an eigenvalue of 4.05 and accounted for 81.06% of the total variance explained) with an excellent internal consistency reliability coefficient Cronbach's $\alpha = 0.94$ and confirmatory factor analysis (CFA) goodness of fit indices indicated a good fit of the model to data (sample 2, $n = 750$, $\chi^2/df = 3.77$, $p = 0.002$, CFI = 0.996, TLI = 0.993, SRMR = 0.008, RMSEA = 0.061, standardized factor loadings were from 0.86 to 0.91); the total score of the CACS was found significantly correlated with that of the Active Help-Seeking scale (sample 2, $r = 0.50$, $p < 0.001$), the brief version of the Connor-Davidson Resilience Scale (CD-RISC), the Positive Social Mentality Subscale, and two coping efficacy subscales (the Coping

Cognition Subscale and the Coping Competence Subscale) (sample 3, $n = 4925$, $r = 0.42 \sim 0.61$, $p < 0.001$) and that of Compound PsyCap Scale (CPC-12) (sample 4, $n = 659$, $r = 0.33$, $p < 0.001$), demonstrating good criteria-related validity. In general, the CACS is a brief and easily administered tool with good reliability and validity for assessing acceptance of change among people in ever-changing situations.

基于 PERMA 模型的积极心理品质团体辅导：过程及效果

吴洁琼 樊富珉（通讯作者）

清华大学心理学系，北京，100084，ffm@tsinghua.edu.cn

摘要 积极心理品质是一种相对稳定的正向心理特质，是个体应对外界压力的调节和缓冲机制。积极心理品质与心理健康之间有着密切的关系，提升积极心理品质可以促进心理健康发展，并能提升幸福感水平。因此对积极心理品质进行干预具有一定的现实意义和价值。本研究采用以积极心理学幸福理论 PERMA 模型为理论架构设计的团体辅导干预方案，旨在探讨积极心理取向的团体辅导对研究生积极心理品质干预的有效性。研究随机选取某高校 31 名研究生为实验组，采用方便抽样方法抽取 31 名研究生组成对照组。其中实验组接受每周一次的团体辅导干预，共计 15 次，对照组不进行任何干预。采用一般健康问卷（GHQ-20）和大学生积极心理品质量表对两组被试实施前测、后测以及 1 个月追踪测，收集数据以检验团体干预的有效性。研究结果表明，实验组 GHQ-20 的后测和追踪测得分显著低于前测，实验组的后测得分显著低于对照组。同时，实验组大学生积极心理品质量表的后测得分显著高于前测，并且显著高于对照组后测得分。综上所述，PERMA 框架下的团体辅导能够显著提升研究生的积极心理品质和心理健康水平，并具有一定的持续作用。

The Process and Effect of Group Guidance on Positive Psychological Quality of Postgraduates Based on PERMA Model

Jieqiong Wu, Fumin Fan (Corresponding Author)

Department of Psychology, Tsinghua University, Beijing, 100084

Abstract: Positive psychological quality is a relatively stable positive psychological characteristic which can help the individual adjust and buffer the external pressure. There is a close relationship between positive psychological quality and mental health and subjective well-being, improving positive psychological quality can promote the level of mental health and well-being. Therefore, it is of certain significance and value to intervene the positive psychological quality. Based on the PERMA model of positive psychology, this study designed a group guidance. The purpose of this study is to explore the effectiveness of PERMA model-based group guidance on the intervention of postgraduates' positive psychological quality. In this study, 31 graduate students from a certain university were randomly selected as the intervention group, and the same number students were selected as the control group by convenient sampling method. The intervention group received group guidance intervention once a week for a total of 15 times while the control group did not conduct any intervention. The study used the General Health Questionnaire (GHQ-20) and College Students' Positive Psychological Quality Questionnaire to conduct pre-test, post-test and follow-up tests in one month. The results of the study showed that the GHQ-20 scores of the post and follow-up tests were significantly lower than the scores of the pre-test. The post-test scores of the intervention group were significantly lower than those of the control group. At the same time, the post-test scores of the College Students' Positive Psychological Quality Questionnaire of the intervention group were significantly higher than those of the pre-test, and the post-test scores of the intervention group were significantly higher than those of the control group. Studies have shown that group guidance based on the PERMA model can significantly improve the positive psychological quality and mental health of graduate students, and has a certain sustained effect.

两岸四地大学生幸福感及相关因素：我的研究与思考

岳晓东

首都师范大学心理学院，北京，100048

摘要 本报告分三部分，研究1调查了北京大学、南京大学、清华大学601名大学生的幸福感现况与其相关的个人因素，主要发现有：1.在三校中，清华大学的大学生的幸福感、乐观感、自尊、感恩心、创造力、正义感、亲和型幽默、自强型幽默、复原力、生活意义均排位最高；此外，清华大学的大学生于所有满意度的比较中均排位最高；2.南京大学的大学生的抑郁程度、攻击型幽默及自贬型幽默排位最高；3.学校排名高低和幸福感有直接关系，学校排名越高的学生幸福感比学校排名低的学生高。研究2调查了中国广州、香港、澳门和台湾812多名大学生的幸福感现况与其相关的个人因素（中山大学177名、香港城市大学267名，澳门科技大学182名，台湾静宜大学186名）。主要发现有：1.香港大学生的幸福感、感恩心和创造力均排位最低；2.广州大学生的幸福感排位最高，其抑郁程度亦排位最低；3.台湾大学生的宽恕、乐观和自尊排位最低，抑郁程度排位最高；4.澳门大学生的正义感和攻击性幽默排位最高；5.女生在心理层面都有“双高、双低”的现象，即，女生同时具有高幸福感和高抑郁感，而男生则反之；6.学校排名高低和幸福感并没有直接关系，学校排名略低的学生幸福感反而比学校排名高的学生高。研究3访问了5000多名中国大学生，就个人幸福感与其相关因素有下列发现：1.个人的年龄、年级、学校类别、家庭收入、兄弟姐妹数目和宗教信仰均与幸福感相关甚低；2.个人因素例如外向性、开放性、亲和性、责任心和社会支持等均与幸福感有中度相关性；3.乐观态度、自尊感、生活满意度和低抑郁症状与幸福感密切相关。4.学校排名高低和幸福感并没有直接关系，学校排名中位的学生幸福感反而比学校排名很高与很低的学生高。总之，本研究发现（1）幸福感较高的学生，其抑郁程度和不宽恕感亦会相对较低；（2）学校的排名高低和幸福感高低无直接关系，学校排名略低的学生更具幸福感；（3）女生比男生更容易发现生活中的开心事件。

关键词 幸福感，大学生，两岸四地

Happiness and its related factors among university students: My studies and reflections

Abstract: This report includes findings of three studies. Study 1 examined 601 university students' subjective happiness at Peking University, Nanjing University and Tsinghua University and its related factors. The major findings include: 1. Among the three universities, Tsinghua university students ranked the highest in terms of happiness, optimism, self-esteem, gratitude, creativity, sense of justice, affinity humor, self-improvement humor, resilience, and meaning of life; in addition, Tsinghua university students ranked the highest in all satisfaction comparisons; 2. Nanjing University students ranked the highest in terms of depression, aggressive humor and self-defeating humor; 3. The higher the school ranking is, the higher the happiness is. Study 2 examined 812 university students from Guangzhou, Hong Kong, Macao, and Taiwan for their subjective happiness and related factors. The major findings include: 1. Hong Kong university students ranked the lowest in terms of happiness, gratitude and creativity; 2. Guangzhou university students ranked the highest in terms of subjective happiness and the lowest in depression; 3. Taiwan university students ranked the lowest in forgiveness, optimism and self-esteem, and the highest in depression; 4. Macao University Students' sense of justice and aggressive humor ranked the highest; 5. Female students have "double high, double low" phenomenon in psychological level, that is, girls have high happiness and high depression, while boys have the opposite; 6. There is no direct relationship between school ranking and subjective happiness. Students with lower school ranking have higher happiness than those with higher school ranking. Study 3 examined over 5000 Chinese university students in terms of their subjective happiness and its related factors, with the following major findings: 1. Age, grade, school type, family income, number of siblings, and religious belief are significantly correlated with subjective happiness; 2. Extroversion, openness, affinity,

responsibility and social support are moderately correlated with subjective happiness; 3. Optimism, self-esteem, life satisfaction, and low depression are closely related to subjective happiness; 4. There is no direct relationship between school ranking and subjective happiness. Students in the middle of school ranking have higher happiness than those with high and low school ranking. In conclusion, these studies found that: (1) the students with higher subjective happiness had a lower level of depression and unforgiving; (2) there was no direct relationship between the ranking of schools and the level of happiness, and the students with lower school ranking were more happy; (3) girls were more likely to find happy events in life than boys.

青年生活压力与国家认同：一个有调节的中介模型

苗瑞凯¹ 王俊秀² (通讯作者)

1 石家庄铁道大学 心理健康教育指导中心, 石家庄, 050043

2 中国社会科学院社会学研究所, 北京, 100732, casswjx@163.com

摘要 习近平总书记在党的十九大报告中提出, 要“筑牢中华民族共同体意识”。在新时代背景下, 中华民族共同体意识的主要表现之一即是国家认同。国家认同是国家内的公民对其所属国家文化、制度、主权、道德价值观等的认可和感情依附。根据认同理论的观点, 国家认同的核心在于建构自我与国家社会的关系, 但纵观以往关于国家认同影响因素的研究, 多集中于探讨经济、社会结构或文化等宏观因素, 忽视了对日常生活等个人微观因素的考察。因此, 本研究聚焦于生活压力这一因素, 对 4997 名青年 (不包含在读学生) 进行问卷调查, 考察生活压力与青年国家认同的关系, 同时探讨社会公平感的中介作用以及党员身份的调节作用。在控制了性别、教育、收入后, 结果显示: (1) 生活压力与青年国家认同、社会公平感呈显著负相关关系, 社会公平感与国家认同呈显著正相关关系; (2) 社会公平感在生活压力与国家认同的关系间起中介作用; (3) 党员身份对生活压力与国家认同的中介过程起调节作用, 与群众相比, 党员社会公平感对国家认同的预测作用更加显著。研究结果不仅启示相关部门应关注青年的生活压力问题, 通过提升其社会公平感进而增强国家认同; 同时也应重视青年群体中党员干部队伍的培养, 发挥其模范作用, 带动民众的国家认同。

Life Stress and National Identity of youth:

A Moderated Mediation Model

Miao Ruikai¹, Wang Junxiu²

1 Mental Health Education Center, Shijiazhuang Tiedao University, Shijiazhuang, 050043

2 Institute of Sociology, Chinese Academy of Social Sciences, Beijing, 100732

Abstract: The report of the 19th National Congress of the Communist Party of China stated that it is necessary to “consolidate the sense of community of the Chinese nation.” In the context of the new era, one of its main manifestations is national identity. National identity refers to the recognition and emotional attachment of citizens to the culture, system, sovereignty and values of their country. According to the viewpoint of identity theory, the core of national identity lies in constructing the relationship between self and national society. However, previous studies on the influencing factors of national identity mostly focused on macro factors such as economy, social structure or culture, but neglected the investigation of micro factors such as daily life. Therefore, this study focused on the factor of life stress. A questionnaire survey was conducted among 4997 young people (excluding current students) to investigate the relationship between life stress and national identity, and to explore the mediating role of social justice

and the moderating role of Party membership. After controlling for gender, education and income, the results showed that : (1) life stress was negatively correlated with national identity and social justice of young people, while social justice was positively correlated with national identity; (2) social justice played a mediating role between life stress and national identity; (3) Party membership could significantly moderate the relationship between social justice and national identity. These findings suggest that relevant departments should pay attention to the life stress of young people and enhance their national identity by maintaining their social justice. At the same time, the state should also attach importance to the training of young Party members to promote the national identity of the people.

Keywords: life stress, national identity, social justice, Party membership, youth

当代青年隐私关注对其隐私保护行为的影响： 信息过度收集与隐私担忧的多重中介作用

张舒¹ 王俊秀² (通讯作者)

1 上海大学社会学院, 上海, 200444

2 中国社会科学院社会学研究所, 北京, 100732, casswjsx@163.com

摘要 数字社会带来了多样化的个人信息使用, 也引起了人们对数字隐私的空前关注。各类手机 App 对权限的过度申请、获取信息的起止时间、内容、使用目的、所获信息去向等完全不透明, 甚至有些 App 存在违规窃取用户敏感信息的情况, 加之近些年层出不穷的个人信心泄露事件, 让民众担忧隐私安全的神经紧绷。看似无偿的“个人信息换取服务”不过是一场“浮士德”式的交易, 人们愈发意识到隐私保护的重要性和必要性。研究从社会治理角度出发, 基于“中国社会科学院社会学研究所社会心理学研究中心 2019 年社会心态调查数据”, 以青年群体为研究对象, 选取“隐私关注”“信息过度收集”“隐私担忧”以及“隐私保护行为”等条目, 考察青年信息过度收集与隐私担忧在隐私关注于隐私保护行为之间的中介作用。研究结果显示: 青年的隐私关注不仅直接影响了其隐私保护行为倾向, 同时通过信息过度收集和隐私担忧间接影响青年的隐私保护行为, 信息过度收集与隐私担忧在隐私关注与隐私保护行为之间起多重中介的作用。研究结论: 数字社会中的个人信息具有无限的创造性价值, 但让这些价值能够真实落地实施的前提, 需要严格按照合理适度的收集为基础, 避免因过度收集而引起民众的过度担忧, 进而导致极端的隐私保护, 得不偿失。

The influence of Contemporary Youth Privacy Concern on their Privacy Protection Behavior: Multiple mediating effects of Excessive Information Collection and Privacy Concerns

Abstract: The digital society has brought about diversified use of personal information and aroused unprecedented attention to digital privacy. The over-application of permissions, the starting and ending time, content, purpose of use and the destination of information obtained by various mobile apps are completely opaque. Some apps even illegally steal users' sensitive information. In addition, in recent years, there have been numerous personal confidence leakage events, which make the public nervous about privacy security tense. The seemingly gratuitous exchange of personal information for service is just a Faustian transaction, and people are increasingly aware of the importance and necessity of privacy protection. Research from the perspective of social governance, based on the data of Chinese Academy of Social Sciences Institute of Sociology and Social Psychology Research Center Social Mentality Survey 2019", to the youth group as the research object, select 'Privacy Concern' 'Excessive Information Collection' 'Privacy Concerns' and 'Privacy Protection Behavior' items, to investigate the mediating effect of excessive information collection and privacy concerns on privacy protection behaviors of young people. The results show that privacy concern of young people not only directly affect their tendency of privacy protection behaviors, but also indirectly affect their privacy protection behaviors through excessive information collection and privacy concerns. Excessive information collection and privacy concerns act as multiple intermediaries between privacy concern and

privacy protection behaviors. Research conclusion: Personal information in the digital society has unlimited creative value, but the premise for the implementation of these values should be strictly based on reasonable and moderate collection, so as to avoid excessive collection of public concerns, which will lead to extreme privacy protection.

后疫情时期不同群体的需求满足感及其与防护行为的关系： 社会信任和风险感知的链式中介作用

张衍¹ 王俊秀¹（通讯作者）

¹ 中国社会科学院社会学所，北京，100739, casswjx@163.com

摘要 目的：后疫情时期，疫情基本得到控制但仍有反复，不能完全松懈；与此同时，人们的生活因疫情的冲击而面临困难，使得某些需求无法得到满足。因此，本研究考察了后疫情时期人们的需求满足感及其与防护行为的关系，并希望通过探讨社会信任和风险感知在其中的链式中介作用，以发现促进后疫情时间人们防护行为的方式。**方法：**本研究将需求分成三类：防护需求、发展需求和生活需求；并将防护行为分成合理防护行为（如佩戴口罩）和不合理防护行为（如服用抗生素）两类。采用自编问卷在问卷宝平台发放，共回收问卷 8720 份，剔除非正常作答问卷和异常数据后，得到有效问卷 8306 份，有效率为 95.3%。被试年龄为 18~70 岁($M = 28.9$; $SD = 8.8$)，其中男性 4646 人(55.9%)。**结果：**1) 后疫情时期人们的生活需求较为满足，但防护需求和发展需求满足感一般。2) 没有固定工作、长期居住地在农村、社会等级更低、经历过 SARS、有疫情相关感染或隔离经历的被试，感到三类需求更没有得到满足。3) 发展需求和生活需求未满足的被试更容易产生补偿性的防护行为，合理和不合理的防护行为都更多，但防护需求对防护行为的影响不显著。4) 需求满足感与社会信任呈正相关，而与风险感知呈负相关；社会信任与合理和不合理的防护行为均呈显著正相关，而风险感知仅与不合理防护行为呈显著负相关，与合理防护行为没有显著相关。5) 社会信任和风险感知在防护需求与不合理防护行为间起完全中介作用，在发展需求和不合理防护行为（占总效应的 35.1%）、生活需求和不合理防护行为间（占总效应的 26.2%）起部分中介作用；仅社会信任在防护需求和防护行为间起完全中介作用，在发展需求和合理防护行为（占总效应的 19.6%）、生活需求和合理防护行为间（占总效应的 25.8%）起部分中介作用。**结论：**后疫情期间应更关注社会底层、有疫情相关感染或隔离经历群体的防护、发展和生活需求，并通过增加社会信任来提高人们的防护行为，但通过强调风险严重程度来增加民众的风险感知仅能提高不合理防护行为。

Need Satisfaction of Different Groups in the Post-COVID-19 Era and its Relationship with Protecting Behaviors: Multiple Mediating Role of Social Trust and Risk Perception

Yan Zhang, Junxiu Wang

Institute of Sociology, Chinese Academy of Social Science, Beijing, 100739

Abstract: Objectives: In the post-COVID-19 era, the epidemic was under control basically but recurrent from time to time; and people could not take no protecting behaviors. At the same time, life was stricken by the epidemic leading to some needs dissatisfied. Thus, the study aimed to explore the relationship between need satisfaction and protecting behaviors in the post-COVID-19 era, and find out ways to increase protecting behaviors by studying the multiple mediating role of social trust and risk perception. **Methods:** The study divided needs into three kinds - protecting, developing, and living need, and divided protecting behaviors into two kinds - rational (e.g., wearing masks) and irrational (e.g., taking antibiotic drugs). A total of 8,720 questionnaires were distributed and collected online. After eliminating abnormal responses and data, 8,306 questionnaires were obtained, with an effective rate of 95.3%. Participants were aged from 18 to 70 years old ($M = 28.9$; $SD = 8.8$), including 4,646 men (55.9%). **Results:** 1) In the post-COVID-19 era, living needs were relatively satisfied, but the protecting and developing needs were average

satisfied. 2) Participants without permanent jobs, living in rural areas, with lower social class, having SARS experiences, having infection or isolation experiences of COVID-19, felt that the three needs were less satisfied. 3) Participants whose developing and living needs were less satisfied were more likely to have compensatory behaviors, with more rational and irrational protecting behaviors; however, the impact of protecting needs on protecting behaviors was not significant. 4) Need satisfaction is positively correlated with social trust, but negatively correlated with risk perception; social trust is significantly positively correlated with both rational and irrational protecting behaviors, while risk perception is only significantly negatively correlated with irrational protecting behaviors, but not rational protecting behaviors. 5) Social trust and risk perception played a complete mediating role between protecting need satisfaction and irrational protecting behaviors, and played a partial mediating role between developing need satisfaction and irrational protecting behaviors (35.1% of the total effect) and living need satisfaction and irrational protecting behaviors (26.2% of the total effect). Only social trust played a complete mediating role between protecting need satisfaction and rational protecting behaviors, and played a partial mediating role between developing need satisfaction and rational protecting behaviors (19.6% of the total effect) and living need satisfaction and rational protecting behaviors (25.8% of the total effect). **Conclusion:** In the post-COVID-19 era, more attention should be paid to the protecting, developing, and living needs of people at the bottom of society and people who have epidemic experiences. We should also try to improve social trust to increase protecting behaviors, but increasing risk perception by emphasizing the severity of epidemic can only increase irrational protecting behaviors.

Keywords: post-COVID-19 era, need satisfaction, protecting behaviors, social trust, risk perception

基于社会心态的城市治理途径与方法

陈满琪

(中国社会科学院社会学研究所, 北京 100732)

摘要 快速城镇化给城市治理带来一系列挑战,“人”在城市治理过程的作用越来越突出,要达到治理成效必须了解市民的社会心态。社会心态在城市治理中起着调节阀、缓冲器的作用。在社会心态指标体系框架中,社会认知、社会情绪、社会价值、社会行为倾向分别与城市吸引力治理、城市幸福治理、城市精神治理、与城市文化融合相对应。基于这些指标与城市治理维度的关联,利用提供公共场域、完善制度政策、探索社区治理模式、健全社会心理服务体系的途径和方法培育良好的社会心态,可提高城市的弹性与韧性,推动城镇化朝更健康方向发展。

Approaches and Methods of Urban Governance Based on Social Mentality

Chen Manqi

(Institute of Sociology, Chinese Academy of Social Science, Beijing 100732, China)

Abstract: Rapid urbanization has brought a series of challenges to urban governance. The role of "people" in the urban governance process is becoming more and more prominent. To achieve governance results, it is necessary to understand the citizens' social mentality. The social mentality plays a role as a regulating valve and a buffer in urban governance. In the framework of the social mentality index system, social cognition, social emotions, social values, and social behavior tendencies respectively correspond to urban attractiveness, urban happiness, urban spirit, and urban culture. Based on the correlation between these indicators and the dimensions of urban governance, providing public venues, improving institutional policies, exploring community governance, and improving the social psychological service system can cultivate a good social mentality, improve the resilience of cities, and promote urbanization towards a healthier direction.

Keywords: social mentality; urban governance; urbanization

不同强度的高兴表情对面孔社会知觉的影响

李雅宁^{1,2} 杨伊生¹ 蒋重清² (通讯作者)

1 内蒙古师范大学心理学院, 呼和浩特, 010022

2 辽宁师范大学心理学院, 大连, 116029, jzqcjj@hotmail.com

摘要 面孔社会知觉指知觉者基于面孔所有者的面孔信息对面孔所有者的人格特质等进行知觉推断的过程。表情是人们进行面孔社会知觉的关键线索之一。本研究的目的是探究不同强度高兴表情对面孔社会知觉的影响。通过广告招募 32 名大学生, 根据对不同强度的高兴表情面孔图片的观察, 就 11 项人格特质(可信度、尽责性、吸引力、善交际、自信心、聪颖度、攻击性、支配性、能力、温暖度、坚韧性)进行 7 点评价(1 为“非常不××”, 7 为“非常××”), 以各人格特质评分为因变量进行 2(高兴表情强度)×2(图片性别)×11(人格特质类型)的重复测量方差分析。结果显示, 同一种高兴表情, 会因其强度不同而对面孔社会知觉的影响不同, 具体来说, 在善交际、温暖度的评价上, 高强度高兴表情比低强度高兴表情面孔的得分高; 在支配性、攻击性、聪颖度、胜任力的评价上, 低强度高兴表情比高强度高兴表情面孔的得分高; 在可信度、吸引力、尽责性、自信心、坚韧性上两者无显著差异。由此, 我们可以得出以下结论: 高强度与低强度高兴表情对面孔社会知觉的促进效应受人格特质类型的影响。低强度比高强度高兴表情面孔在能力维度(支配性、攻击性、能力、聪颖度)上的评价更高, 但在热情维度(善交际、温暖度)方面评价更低, 可信度、吸引力、尽责性、自信心和坚韧性的知觉结果不随高兴表情强度的变化而变化。

The Effect of Smile Intensity on Social Perceptions of Face

Li Yaning^{1,2}, Yang Yisheng¹, Jiang Zhongqing²

1 School of Psychology, Inner Mongolia Normal University, Huhehaote, 010022

2 School of Psychology, Liaoning Normal University, Dalian, 116029, jzqcjj@hotmail.com

Abstract: Social perception of face is a process in which the perceiver makes perceptual inferences about the personality traits of the face owner based on the face information of the face owner. Facial expression is one of the key cues for Social perception of face. The purpose of this study is to compare the influence of high-intensity and low-intensity happy expression on social perception of face. Thirty-two college students were recruited through advertisements to watch a series of face pictures of high-intensity or low-intensity happy expression and rate their 11 personality traits (trustworthiness, responsibility, attractiveness, sociability, confidence, intelligence, aggressiveness, dominance, competence, warmth, tenacity) on seven points (1 was "very not ××", 7 was "very ××") scales. The score of each personality trait evaluation was taken as the dependent variables to conduct the repeated measurement ANOVA with happy expression intensity, picture gender and personality trait type as within independent variables. The results showed that the happy expression has different effects on the social perception of face due to its different intensity. Specifically, the high-intensity happy expression got higher scores than the low-intensity happy expression in sociability and warmth. As for dominance, aggressiveness, intelligence and competence, the high-intensity happy expression got lower scores than the low-intensity happy expression; there was no significant difference in the scores of trustworthiness, attractiveness, responsibility, confidence and tenacity. From this, we can draw the following conclusions: The stimulative effect of high and low intensity happy expression on social perception of face is influenced by personality type. Compared with the low-intensity happy expression, the high-intensity happy expression will lead to the perceptual outcome of the personality traits related to the warmth(sociability, warmth), and reduce the perceptual outcome of personality traits related to the competence(dominance, aggressiveness, competence and intelligence), and have no effect on trustworthiness, attractiveness, responsibility, confidence and tenacity.

Key words: happy expression, Social perception of face, intensity

互依型自我构念对文化依恋的影响： 民族本质论的中介作用

梁 丽^{1,2} 杨伊生¹ (通讯作者)

1 内蒙古师范大学 心理学院, 内蒙古 呼和浩特, 010022, yangys1965@163.com

2 西南石油大学 心理发展与教育中心, 四川 成都, 610500

摘要: 文化依恋是个体与特定文化之间形成的一种具有积极认知性和情感性的心理联结, 并由此导致的对该文化的热爱、接近及依赖倾向。“心理联结”表现为个体对该文化的信赖感和归属感, 以及个体从该文化中获得的安全感和支持感。本研究根据该内涵构建了文化依恋的理论结构, 即包括文化-自我关联度、文化情感联结和文化亲近行为 3 个因子, 在此基础上编制了具有较高信效度, 符合心理测量学要求的文化依恋量表, 并运用该量表采用问卷调查法, 使用一般自我构念量表和民族本质论量表, 以内蒙古自治区、北京市、江苏省、湖北省、四川省、陕西省的 10 所大学的 2442 名大学生作为调查样本, 考察了个体的自我构念、民族本质论对文化依恋的影响以及民族本质论在个体自我构念和对本民族文化的文化依恋之间的中介作用。结果表明: 自我构念中的互依型自我构念和民族本质论可以预测个体的文化依恋; 民族本质论在个体互依型自我构念和对本民族文化的文化依恋关系中有中介作用。

关键词: 文化依恋, 互依型自我构念, 民族本质论, 中介

The influence of Interdependent Self Construction on Cultural Attachment: The Mediating Role of Psychological Essentialism of Ethnicity

LIANG Li^{1,2}, YANG Yi-sheng¹

1. School of Psychology, Inner Mongolia Normal University, Hohhot, Inner Mongolia, 010010;

2. Psychological Development and Education Center, Southwest Petroleum University, Chengdu, Sichuan, 610500, Corresponding author: yangys1965@163.com

Abstract: Cultural attachment is a positive cognitive and emotional psychological connection between an individual and a specific culture, which leads to the tendency of loving, approaching and depending on the culture. "Psychological connection" refers to the sense of trust and belonging to the culture, as well as the sense of security and support from the culture. According to this connotation, this study constructs the theoretical structure of cultural attachment, which includes three factors: cultural-self correlation, cultural emotional connection and cultural closeness behavior. On this basis, a cultural attachment scale with high reliability and validity and in line with psychometric requirements is developed. The scale is used to conduct questionnaire survey, general self-construction scale and national essentialism scale, 2442 college students from 10 universities in Inner Mongolia Autonomous Region, Beijing, Jiangsu, Hubei, Sichuan and Shaanxi provinces were selected as research samples to investigate the influence of individual self-construction, national essentialism on cultural attachment, and the mediating role of national essentialism between individual self-construction and cultural attachment to national culture. The results show that: the interdependent self-construction and national essentialism in self-construction can predict the individual's cultural attachment; the national essentialism plays a mediating role in the relationship between individual interdependent self construction and cultural attachment to the national culture.

Keywords: cultural attachment, interdependent self-construction, psychological essentialism of ethnicity, mediation

发现游戏中的欺骗：来自恐惧表情自动编码的证据

申寻兵¹ 范高洁² 牛草原¹ 陈振彩¹

¹ 江西中医药大学, 南昌, 330004 (shenxunbing@yahoo.com)

² Louisiana State University, Baton Rouge, 70803

摘要 根据 Ekman 的泄露理论, 欺骗时人们一般都会害怕欺骗被发现, 特别是当欺骗被发现有着较严重的后果的时候。欺骗的泄露理论预测高度利益攸关的情境下欺骗者会无法控制的泄露出内心体验到的情绪, 或恐惧或高兴(欺骗愚弄他人的快感), 因此通过分析恐惧表情可以揭露可能存在的欺骗。人工检测和分析细微的恐惧表情是一个巨大的挑战, 采用计算机视觉技术, 加上机器学习来进行分类可以有效的弥补人工分析的不足。我们用计算机视觉开源软件 OpenFace 分析了一个真人游戏节目“The moment of truth”中人物在说谎和说真话时的恐惧表情的面部动作单元, 将软件的输出用机器学习软件 WEKA 进行分类。结果发现单纯利用恐惧表情的面部动作单元机器能达到 80%以上分类正确率, 而综合考虑其他指标(如瞳孔大小)后机器的分类正确率可以到达 99%以上。同时, 我们也分析了诚实和欺骗条件下人物表情动作单元(AU20)的持续时间, 发现欺骗条件下的表情持续时间显著短于诚实条件下的表情持续时间; 进一步的分析表明之所以欺骗条件下持续时间短是因为从表情最大幅度到消失的时间更短。对诚实和欺骗条件下人物左右面部表情动作(眼周)的对称性进行分析发现欺骗条件下对称性显著差于诚实条件。以上结果表明: 存在可以区分诚实和欺骗的面部线索, 且欺骗可以利用恐惧表情进行区分。

² Louisiana State University, Baton Rouge, 70803

Abstract: The leakage theory in the field of deception detection claimed that the liar could not repress the leaked felt emotions (fear or delight). Based on the theory of leakage, we can predict that people who is lying will feel fear (to be discovered), especially under the high-stake situations. Therefore, we can reveal deceits through analyzing the fear facial expressions. Detecting and analyzing the subtle leaked fear facial expressions is a challenging task for naïve people. It is, however, a relatively easy job for computer vision and machine learning. To test the prediction, we analyzed video clips from a game show “The moment of truth” by using the OpenFace (for outputting the Action Units of fear and face landmarks) and WEKA (for classifying the video clips in which the players was lying or telling the truth). The results showed that some algorithms could achieve an accuracy over 80% merely using AUs of fear; we could get an accuracy over 99% while adding more indicators (such as size of pupil and AUs of happiness). Besides, we compared the durations of AU 20 of fear and found that the duration of fear under the deception condition was significant less than that under the truth-telling condition. And the cause was that the duration from peak to offset of AU20 under the lying condition was less than that under the truth-telling condition. The results also showed that the symmetry of facial movements (around the eyes) was different between the truth-telling and lying, it was more symmetrical while telling the truth. The results suggested that there do exist facial clues to deception, and fear could distinguish lying from truth-telling.

表情识别与背腹侧通路

刘明童^{1,2} 赵科^{1,2} 傅小兰^{1,2}

1 中国科学院心理研究所, 脑与认知科学国家重点实验室, 北京, 100101

2 中国科学院大学心理学系, 北京, 100049, zhaok@psych.ac.cn; fuxl@psych.ac.cn

摘要 表情识别是人类社会交互过程中理解他人情绪的重要能力, 这一过程依赖于枕叶皮层、颞叶皮层及前额叶皮层等的共同参与。其中, 腹侧与背侧两条神经通路在表情识别中的作用一直是研究者关心的问题。以往研究发现背侧通路如颞上沟负责表情识别, 而腹侧通路如梭状回负责面孔身份加工, 关于这一问题却有争论。本研究采用元分析的方法, 通过脑成像的荟萃结果探究了表情处理网络中的腹侧背侧通路的参与程度。元分析选用了 GingerALE 提供的激活似然性评估(ALE)算法, 将 92 篇正常成年被试进行面部感知任务且报告全脑激活坐标的 fMRI 与 PET 研究纳入元分析。情绪面孔与中性面孔的比较结果显示, 腹侧通路主要参与面孔表情感知中的情绪加工部分; 通过比较研究范式, 外显识别(被试识别情绪)、内隐识别(被试判断性别、年龄等)、自然观看的结果, 研究发现自然观看比外显、内隐范式显著激活视觉皮层区域, 三类范式共同激活杏仁核。

Facial expression recognition with dorsal and ventral pathways

Mingtong Liu^{1,2}, Ke Zhao^{1,2}, Xiaolan Fu^{1,2}

1 State Key Laboratory of Brain and Cognitive Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101

2 Department of Psychology, University of Chinese Academy of Science, Beijing, 100101

Abstract: Facial expression recognition is an essential ability to comprehend the emotion of others in social interactions. This process relies on the participation of the occipital cortex, temporal cortex and prefrontal cortex, among which, the roles of the ventral and dorsal pathways in facial expression perception have gained considerable attention by researchers. It is still a matter of debate whether the dorsal or ventral pathway is responsible for the perception of facial expression. Utilizing activation likelihood estimate (ALE) meta-analysis, we explored the involvement of ventral and dorsal pathways in the facial expression. Ninety-two fMRI and PET studies employing facial perception tasks to healthy adults and reporting results of whole-brain analyses were included. For the contrast of emotional faces versus neutral faces, results showed that the ventral pathway is mainly responsible for the emotional processing part of facial expression perception. By comparing the studies using different paradigms, explicit (participants were asked to indicate emotions through paradigms such as choice-from-array tasks or matching tasks), implicit (participants indicated gender or age) and passively viewing tasks, we found that passively viewing tasks triggered more activation in the occipital cortex than the explicit and implicit tasks; the results of conjunction analyses revealed their consistent activation in amygdala.

Keywords: facial expression recognition, dorsal and ventral pathways, meta-analysis

情感的非接触识别：优势与挑战

陈通

西南大学电子信息工程学院, 重庆, 400715,

中国科学院心理研究所, 北京, 100101, c_tong@swu.edu.cn

摘要 目前计算机具有强大的逻辑智能, 但还不具备情感智能。计算机的情感智能是指使得计算机能够识别、理解和产生人类情感。这也是情感计算领域的终极目标。正确识别人类情感是实现情感智能的第一步。情感的非接触识别通过各种成像手段非接触地采集各种生理信号和面部视频信号, 使得情感的识别过程更加自然和隐蔽。本文介绍情感识别的原理与最新研究进展, 包括基于面部组织血氧的情感识别, 基于外周生理信号的情感识别, 微表情检测与识别。通过真实案例(包括讯问、面试人可信度分析、人物的真实意图分析)

说明情感非接触识别技术的优势与挑战，并总结情感非接触识别的未来研究与应用方向。

关键词 微表情分析，面部血氧，生理信号，情感非接触识别，人工智能

Non-contact Recognition of Affective States: Advantages and Challenges

Tong CHEN

Southwest University, Chongqing, 400715, China

Institute of Psychology, CAS, Beijing, 100101, China

Abstract Nowadays computers have high level logic intelligence, but less affective intelligence. The aim of affective intelligence is to equip the computers the ability to recognize, understand and even have affective states or emotion, which is also the final object of affective computing. To accurately recognize emotion is the first step of achieving affective intelligence. The non-contact recognition of affective states relies on the non-contact sensing of physiological signals and facial expressions, and makes the recognition more naturally and concealed. This report introduces the theory and latest development of non-contact recognition of affective states, including the recognition based on facial tissue oxygen saturation (StO₂), the recognition based on physiological signals, and spotting and recognition of micro-expression. Through real applications, including interrogating, credit investigation of interviewers, and intent analysis, this report highlights the advantages and challenges of non-contact recognition of affective states, and concludes the direction of future research and application.

基于视频中日常行为分析的心理生态化感知技术研究

刘晓倩^{1,2} 王亚猛^{1,2} 汪晓阳^{1,2} 赵楠^{1,2} 朱廷劭^{1,2} (通讯作者)

1 中国科学院心理研究所，北京，100101，tszhu@psych.ac.cn

2 中国科学院大学，北京，101408

摘要 我们的日常生活已经和网络有深度的融合，在国内像抖音、快手这样的短视频平台包含着用户丰富的多模态行为数据，比如视频中的面部、肢体动作和语音，这些数据可以被远程、生态化、长期纵向的捕捉和记录，构成庞大复杂的网络数据空间。已有大量研究提出了心理指标和行为线索之间的相关性，我们在前人研究的基础上，通过计算机手段获取和量化视频中个体面部和步态行为的变化，利用数据挖掘技术将行为线索和心理指标间的映射关系进行科学的数字量化，从而实现基于行为分析的心理生态化感知模型，实现对人格、情绪及心理健康指标的有效识别，给心理学研究应用带来巨大的影响，同时对人工智能领域的发展起到重大的推动作用。

1 Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, tszhu@psych.ac.cn

2 University of Chinese Academy of Sciences, Beijing, 101408

Abstract: Our daily life has been deeply integrated with the Internet. In China, some short video platforms like “TikTok” and “SnackVideo” contain rich multi-modality behavioral data, such as face, body movements and voice in video, which can be captured and recorded remotely, ecologically and in long-term, forming huge and complex network data space. Many studies have proposed the correlation between psychological indicators and behavioral cues. Based on previous studies, we obtain and quantify the changes of individual's face and gait behavior in video by computer means, and quantify the mapping relationship between behavior cues and psychological indicators scientifically using data mining algorithm, so as to realize the psychological recognition based on behavior. In our

study, the psychological recognition model can effectively identify personality, emotion and several mental health indicators, has a great impact on the psychological research and application, and plays a significant role in promoting the development of artificial intelligence.

Keywords: Psychological perception, Facial behavior, Gait analysis, Data mining

基于步态的时频特征情绪识别

薛鹏辉 李保滨

中国科学院大学, 北京, 100049

摘要 情绪是由外界环境和认知评估产生的生理和心理状态, 自动、高效的情绪识别技术对于人机交互、心理健康和心理疾病的预防等研究具有重要作用。人体步态信息是一种重要的用于识别情绪的模式。在现有的基于步态的研究中, 大多主要关注运动特征, 如: 速度、步幅等。这些运动特征并不能完全表达步态信息, 也不能有效的应用于情绪识别。本研究利用信号处理中时频分析技术, 针对 Kinect 采集到的非接触步态信息, 分别在时域和频域提取与人类情绪紧密相关的特征, 并利用机器学习的方法建立情绪识别模型。实验结果表明, 这些时频步态特征能有效的表示出人类的不同情绪。

Emotion Recognition based on Gait Time-frequency Features

Penghui Xue, Baobin Li

University of Chinese Academy of Sciences, Beijing 100049, China

Abstract: Emotion is the physical and psychological state produced by the external environment and cognitive evaluation. Automatic and efficient emotion recognition technology plays an important role in the research of human-computer interaction, mental health and the prevention of mental illness. Human gait information is an important pattern used to recognize emotions. In the existing gait-based research, most of them mainly focus on movement characteristics, such as speed, stride, etc. These motion characteristics cannot fully express gait information, nor can they be effectively applied to emotion recognition. In this study, the time-frequency analysis technology in signal processing was used to extract features closely related to human emotions in the time domain and frequency domain for the non-contact gait information collected by Kinect, and the emotion recognition model was established using machine learning methods. Experimental results show that these time-frequency gait features can effectively express different human emotions.

Keywords: Emotion Recognition, Gait, Time-frequency analysis, Mental health

青少年创伤后应激症状的代际影响：一个多重中介效应的检验

黄佳丽 周宵（通讯作者）

浙江大学心理与行为科学系, 杭州, 310028, psyzx@zju.edu.cn

摘要 创伤后应激障碍（PTSD）是普遍存在于创伤后人群中的典型消极心理反应，目前的研究主要关注成年人/青少年个体的 PTSD 状况及其发生机制，忽略从家庭系统视角探究 PTSD 的发生机制并实施干预，以致灾后长时间内青少年的 PTSD 依旧持续存在。在模糊角色理论和情绪传染理论看来，父母的 PTSD 势必会诱

发其孩子出现类似的症状，甚至加剧孩子 PTSD 的严重性，导致创伤的代际影响，造成青少年 PTSD 的持久性。为了从家庭系统视角对自然灾害后青少年 PTSD 进行有针对性的干预，有必要明确不同 PTSD 症状簇的代际影响及其深层机制。为此，本研究采用纵向配对数据来检验经历台风利奇马后父母 PTSD 不同症状簇对孩子 PTSD 症状簇的长期影响，以及孩子的感知家庭支持、安全感和灾难化情绪调节策略的中介作用。研究采用自陈量表获取父母和子女纵向配对数据 495 对，其中父母（24.4%为父亲； $M_{\text{年龄}} = 40.11$ 岁， $SD = 5.42$ ）报告了他们在台风后 3 个月（T1）的创伤后应激症状（PTSS），青少年（42.2%为男生； $M_{\text{年龄}} = 15.44$ 岁， $SD = 1.22$ ）报告了他们在台风后 15 个月（T2）的 PTSS、家庭支持、安全感和灾难化的情绪调节策略。结果发现在控制父母和孩子的创伤暴露后，只有母亲 T1 的侵入性症状能够显著正向预测女儿 T2 的侵入、回避、负性认知和情绪改变（NCEA）以及高警觉四个症状；父亲和母亲 T1 的 PTSS 对儿子 T2 的 PTSS 以及父亲 T1 的 PTSS 对女儿 T2 的 PTSS 的影响作用均不显著。女儿 T2 感知的家庭支持、安全感和灾难化在母亲 T1 的侵入症状对女儿 T2 的四个症状簇的正向预测中起多重中介作用，具体表现在母亲 T1 的侵入症状可以通过 T2 女儿感知的家庭支持间接地正向预测 T2 女儿的 NCEA 症状，也可以通过 T2 女儿感知的家庭支持经安全感间接地正向预测 T2 女儿的侵入、NCEA 和高警觉症状，还可以通过 T2 女儿感知的家庭支持经安全感由灾难化间接地正向预测 T2 女儿的侵入、回避、NCEA 和高警觉症状。这些结果说明台风后 PTSS 在女性同性别中存在着长期的代际影响，其中侵入性症状为主要的受影响症状。该结果提示临床工作者在对自然灾害后青少年 PTSS 进行家庭干预时应关注母亲对女儿的影响，重点改善母亲的侵入性症状，并提升来自家庭的支持以缓解女儿的不安全感和灾难化的情绪调节方式，从而缓解其 PTSS。

Long-term intergenerational effect of PTSS among parents and their offspring following super typhoon Lekima: An analysis of multiple mediation model

Jia-li HUANG, Xiao ZHOU

Department of Psychology and Behavioral Sciences, Zhejiang University Hangzhou China

Abstract: Posttraumatic stress disorder (PTSD) is considered as one common negative reaction among adolescents following nature disasters. The literature of PTSD mainly focused on its prevalence and mechanism from individual perspective, and ignored exploring its mechanism and related intervention from family perspective, which may lead to the long-term PTSD for traumatized adolescents. Based on the role ambiguity theory and emotional contagion theory, parental PTSD would induce in their children's similar symptoms inevitably, and even aggravate children's more PTSD, resulting in the intergenerational effect of PTSD. Therefore, in order to intervene adolescents' PTSD effectively from the family perspective, it is necessary to clarify the underlying mechanism of distinct PTSD symptoms intergenerational effect. In the current study, longitudinal dyads data was used to examine the long-term influence of parental PTSD symptoms on children's PTSD symptoms, and the mediating effect of children's family support, sense of security, and catastrophizing. A total of 495 longitudinal parent-child dyads were collected using self-report scale. Parents (24.4% were fathers; $M_{\text{age}} = 40.11$ years old, $SD = 5.42$) reported their PTSD symptoms 3 months after typhoon (T1), and children (42.2% were boys; $M_{\text{age}} = 15.44$ years old, $SD = 1.22$) reported their PTSD symptoms, family support, sense of security, and catastrophizing 15 months after typhoon (T2). The results found that after controlled for parental and children's trauma exposure, only maternal intrusion symptom at T1 could significantly positively predicted daughters' intrusion, avoidance, negative cognition and emotional alternation (NCEA), and hyperarousal symptoms at T2. The influence of parental PTSD symptoms at T1 on sons' PTSD symptoms at T2, and the predication from paternal PTSD symptoms at T1 to daughters' PTSD symptoms at T2 were not significant. Daughters' family support, sense of security, and catastrophizing at T2 played the mediating role in the relationship from maternal intrusion symptom at T1 to daughters' intrusion, avoidance, NCEA, and hyperarousal symptoms at T2. To be specific, maternal intrusion symptom at T1 showed indirectly positive relationship to

daughters' NCEA symptoms at T2 via daughters' family support at T2, positively predicted daughters' intrusion, NCEA, and hyperarousal symptoms at T2 via the path from daughters' family support to sense of security at T2, and positively predicted daughters' intrusion, avoidance, NCEA, and hyperarousal symptoms at T2 via the path from daughters' family support to sense of security to catastrophizing at T2. The results indicated that PTSS has long-term intergenerational effects between the same sex among females after typhoon, and intrusion symptom was the key influencing symptom. That advises clinical workers paying more attention to the influence from mothers to daughters after natural disaster, and focusing on improving mothers' intrusive symptom as well as enhancing family support to alleviate daughters' sense of insecurity and catastrophizing, in order to alleviate daughters' PTSD symptoms.

Keywords: PTSD symptoms, intergenerational effect, family support, sense of security, catastrophizing

震后青少年自我同情与非自杀性自伤的关系: 感恩与创伤后成长的中介作用及其性别差异

刘艾祎 王文超 伍新春(通讯作者)

北京师范大学心理学部, 应用实验心理北京市重点实验室, 北京 100875, xcwu@bnu.edu.cn

摘要 采用自我同情量表、感恩问卷、创伤后成长问卷和非自杀性自伤问卷在九寨沟地震 1.5 年后对 597 名经历过地震的青少年进行问卷调查。考察自我同情对非自杀性自伤(NSSI)的影响, 并检验感恩和创伤后成长(PTG)在其间的中介作用及其性别差异。结果发现, 在整体样本中, 积极的自我同情对 NSSI 有负向预测作用, 而消极的自我同情对 NSSI 有正向预测作用。此外, 感恩和 PTG 在自我同情和 NSSI 之间发挥了显著的链式中介作用。多群组分析结果显示, 在男性群体中, 感恩和 PTG 在自我同情与 NSSI 之间的中介作用均显著; 但在女性群体中, 只有感恩发挥了显著的中介作用。积极的自我同情可以降低青少年的 NSSI 风险, 而消极的自我同情会提高青少年 NSSI 风险。感恩和 PTG 是自我同情与 NSSI 之间的重要机制, 但二者的作用因性别不同而表现出显著的差异。

关键词 自我同情, 感恩, 创伤后成长(PTG), 非自杀性自伤(NSSI), 青少年

Exploring the Relationship between Adolescents' Self-Compassion and Non-Suicidal Self-Injury after Earthquake: Gender Differences in the Mediating Roles of Gratitude and Posttraumatic Growth

Aiyi Liu, Wenchao Wang, Xinchun Wu (Corresponding author)

Beijing Key Laboratory of Applied Experimental Psychology, Faculty of Psychology, Beijing Normal University, Beijing 100875

Abstract: Previous research has found that self-compassion is associated with adolescent's non-suicidal self-injurious (NSSI) behaviors. However, few studies have explored the underlying mechanisms of the relationship between self-compassion and NSSI from a positive perspective or factors that might strengthen or weaken these processes. This study examined the moderating role of gender and the mediating roles of gratitude and posttraumatic growth (PTG) in the association between self-compassion and NSSI among Chinese adolescents after the Jiuzhaigou earthquake. A total of 597 adolescents who had experienced the Jiuzhaigou earthquake volunteered to complete the Self-Compassion Scale, Gratitude Questionnaire, Posttraumatic Growth Inventory, and Inventory of Statements about Self-Injury. The mean age of the participants in the current study was 13.89 ($SD = 1.20$) for male ($N=305$) and 13.54 ($SD = 1.19$) for female students ($N = 282$). In the entire sample, positive self-compassion had a negative effect on NSSI, and negative self-compassion had a positive effect on NSSI. In addition, gratitude and PTG played significant mediating roles between self-compassion and NSSI, as well as the multiple mediating paths from gratitude to PTG. In the multiple-group comparison analysis, the mediating roles of gratitude PTG in the correlation between self-compassion and NSSI were significant in the male group. But in the female group, only gratitude had a significant mediating effect. Positive self-compassion was associated with lower levels of NSSI in adolescents, while

negative self-compassion was associated with higher levels of NSSI. The mediating effects of gratitude and PTG on the relationship between self-compassion and NSSI were different by gender.

Keywords: Self-compassion; Gratitude; PTG; NSSI; Gender difference; Adolescents

台风后儿童青少年 PTSD 的症状结构：一项交叉滞后的网络分析

孙睿 周宵（通讯作者）

浙江大学心理与行为科学系，杭州，310028，psyzx@zju.edu.cn

摘要 自然灾害不仅威胁到了人们的生命，还给人带来了一系列消极的心理反应，其中创伤后应激障碍（PTSD）就是较为常见的一种。近年来，研究者开始使用网络分析的方法，从新的角度理解 PTSD 的症状结构。根据网络理论，心理障碍并非由潜在的共同因素导致，而是通过症状之间的相互作用来建构的。每个症状都有其独特的作用。随着网络分析方法逐渐兴起，探索 PTSD 症状结构的研究数量快速增加。但现有研究大多利用横断数据进行网络估计，不能确定 PTSD 症状间的因果关系。基于此，本研究采用了交叉滞后网络分析方法，利用纵向数据考察 PTSD 症状之间的相互影响。研究采用问卷法，以经历利奇马台风的 1570 名中小學生为研究对象，在灾后 3 个月，15 个月分别对其 PTSD 症状进行测量。控制了台风暴露和疫情暴露的影响后，结果表明闪回和注意力问题是最具影响力的症状，而高警觉症状容易受到其他症状的影响。网络内的强连接主要从侵入性症状和唤醒性症状发出（例如，闪回 → 回避外部线索；注意力问题 → 消极信念），指向回避性症状和负性认知和情绪改变症状。这一研究首次采用纵向的视角，考察了自然灾害后青少年的 PTSD 症状结构，研究结果拓展了现有的 PTSD 症状网络结果，揭示出不同症状簇在 PTSD 发生发展中可能发挥着不同的作用。针对儿童青少年的灾后心理干预应以预防和缓解闪回症状为重点，并重视注意力问题。

关键词：创伤后应激障碍，儿童青少年，网络分析

PTSD in children and adolescents: A cross-lagged panel network analysis

Sun Rui, Zhou Xiao (Corresponding author)

Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028, China

Abstract: The natural disaster not only threatened people's physical health, but also brought a series of negative psychological reactions to the survivors, among which posttraumatic stress disorder (PTSD) was one of the most common psychopathologies. Recently, network analysis emerged as a popular way to investigate the PTSD structure. It provided a new perspective on the development of mental disorder. According to network theory, disorders were constructed based on the causal relationships between symptoms, and each symptom has its own function. Despite the increasing literature on cross-sectional PTSD network, the direction of these interactions were missing. In light of this, we used to cross-lag panel network analysis to identify the temporal relationships between the PTSD symptoms. The longitudinal data were collected 3 and 15 months after the Typhoon Lekima respectively. After controlling the typhoon exposure and pandemic exposure, flashbacks and concentration problems appeared as the most influential symptoms. In contrast, hypervigilance was easily affected by other symptoms inside and even outside the symptom cluster. Strong edges mainly started from intrusive and arousal symptoms (e.g., flashbacks → avoidance of external reminders, concentration problems → negative beliefs). This is the first study assessed the PTSD network of children and adolescents from a longitudinal perspective. These findings extended the contents of PTSD structure, suggesting the shifting roles of the symptoms in PTSD. Targeted treatment for children and adolescents with PTSD should focus on the prevention of flashbacks, and pay attention to concentration problems as it might be a unique core symptom of PTSD in the youths.

Keywords: Posttraumatic stress disorder, children and adolescents, cross-lagged panel network analysis

新冠疫情下青少年基本心理需要满足与抑郁的关系： 安全感与反刍的中介作用

沈凌雁¹ 甄瑞¹ 吴心玥¹ 刘宣文¹ (通讯作者) 周宵²

1 杭州师范大学教育学院, 杭州, 311121, zsdwxw@163.com

2 浙江大学心理与行为科学系, 杭州, 311028

摘要 新冠疫情不仅对人们的生命健康产生巨大威胁, 还对其心理产生消极的影响, 导致诸如焦虑、抑郁、创伤后应激反应等症状的出现。其中, 抑郁是青少年疫情期间出现的一种常见心理问题。不过并非经历此次疫情的青少年都会出现抑郁, 基于自我决定理论(Deci & Ryan, 2000)和反应风格理论(Nolen-Hoeksema, 1991), 疫情下青少年的基本心理需要能否得到满足、其出现反刍思维的程度均有可能影响其抑郁情绪的出现。同时, 青少年感知到的安全感对其是否产生抑郁情绪也至关重要。基于以往研究, 我们推测疫情下基本心理需要满足在影响青少年抑郁情绪的过程中也会与其安全感、反刍产生重要关联, 但目前较少有研究将这些因素整合起来探讨具体的影响机制。为此, 本研究采用自陈式问卷对新冠疫情期间湖北某地的 683 名中学生进行了施测, 通过建立结构方程模型对疫情下青少年的基本心理需要满足、安全感、反刍与抑郁之间的关系进行考察, 同时比较自主、关系和胜任需要满足对于抑郁的独特影响机制。结果发现: 在控制了疫情暴露之后, 自主、胜任和关系需要满足不仅可以直接负向预测抑郁, 也能通过安全感来负向预测抑郁, 但是不能通过反刍对抑郁发挥显著的预测作用; 自主和关系需要满足可以通过安全感经反刍的多重中介作用来负向预测抑郁, 胜任需要满足影响抑郁的这一多重中介作用不显著。这些结果说明心理需要满足是增加疫情期间青少年安全感、降低消极认知、缓解抑郁的重要因子; 自主、胜任和关系需要满足通过安全感和反刍来影响抑郁的机制之间既有相同点也有不同之处。

Basic Psychological Need Satisfaction and Depression in Adolescents during the COVID-19 Pandemic:

The Mediating Roles of Feelings of Safety and Rumination

Lingyan Shen¹, Rui Zhen¹, Xinyue Wu¹, Xuanwen Liu¹, & Xiao Zhou²

1 School of education, Hangzhou Normal University, Hang Zhou 321121, China

2 Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou 310028, China

Abstract: The COVID-19 pandemic has not only been a threat to people's lives and health, but has also had a negative effect on their mental health, leading to symptoms such as anxiety, depression, and post-traumatic stress responses. Depression is one of the most common psychological problems in adolescents during the pandemic. However, not all adolescents who have experienced this pandemic will suffer from depression. According to the self-determination theory (Deci & Ryan, 2000) and response styles theory (Nolen-Hoeksema, 1991), whether adolescents' basic psychological needs are satisfied and the degree of their rumination may account for whether they experience depression. At the same time, feelings of safety are crucial to their depression experience. Based on previous research, we speculate that basic psychological need satisfaction will also have important relations with adolescents' feelings of safety and rumination in the process of affecting adolescents' depression during the pandemic. But limited studies have integrated these factors to explore the specific influencing mechanisms. Therefore, self-report questionnaires were distributed to 683 middle school students from Hubei province in China, structural equation modelling was used to investigate the relations among basic psychological need satisfaction, feelings of safety, rumination, and depression. The influencing mechanisms of autonomy, competence, and relatedness need satisfaction on depression were compared. The results found that after controlling for pandemic exposure, autonomy, competence, and relatedness need satisfaction not only had direct and negative effects on depression, but also had indirect negative effects on depression via feelings of safety. However, need satisfaction did not have a significant

effect on depression through rumination. Autonomy and relatedness, but not competence need satisfaction, had multiple indirect and negative effects on depression via feelings of safety through rumination. These findings indicate satisfaction of basic psychological needs is important in increasing adolescents' feelings of safety, reducing negative cognitions, and alleviating their depression level during the pandemic. There were both similarities and differences in the ways that autonomy, competence, and relatedness need satisfaction affected depression via feelings of safety and rumination.

Keywords: COVID-19 pandemic, basic psychological need satisfaction, feelings of safety, rumination, depression

人际暴力循环：中国文化背景下父母虐待与儿童欺凌的双向关系

摘要 校园欺凌是一种最常见的校园暴力现象，它危害着学生的身心健康。欺凌行为具有故意伤害、反复发生和双方力量不均衡的特征。作为家庭中的一种人际暴力，父母虐待与欺凌行为具有相似特征，因而可能影响儿童在学校中的人际暴力——导致欺凌行为。但在中国文化背景下盛行着“打是亲骂是爱”“不打不成器”等观念，因此父母虐待很可能被解释为是父母关爱和管教孩子的体现。因此两种人际暴力之间的传递关系可能在一定程度上被遮掩。此外，中国人认为“养不教父之过”。当孩子欺凌别人，父母可能因为管教不力而受到社会舆论的责备。因此，儿童的欺凌行为也可能引起父母随后更严厉的管教。综上，本研究旨在考察中国文化背景下父母虐待与儿童欺凌之间跨时间的暴力循环关系及其发生机制。研究采用童年创伤量表和Olweus欺负问卷对安徽省897名8-11岁儿童进行三次追踪调查。结果表明：(1)父母身体虐待稳定预测随后的儿童欺凌行为，父母心理虐待对欺凌行为的预测作用不显著；(2)儿童欺凌行为稳定预测随后的父母身体虐待、心理虐待；(3)父母虐待与儿童欺凌之间存在跨时间的暴力循环关系；(4)身体虐待与男生欺凌行为紧密相关，心理虐待与女生欺凌行为紧密相关。本研究揭示了中国文化背景下父母虐待与儿童欺凌行为的暴力循环关系，为提高中国父母对虐待消极后果的认识提供了依据。此外，父母虐待与儿童欺凌行为的暴力循环警示中国父母应当学习科学的家庭教育知识和应对欺凌的策略，从根本上打破这种暴力循环。这种暴露循环的机制也提示校园欺凌的相关干预工作需要家庭的参与。最后，暴力循环的性别差异强调家庭教育需要关注儿童的性别特征，针对不同性别的儿童采取差异化教养。

关键词 中国文化，父母虐待，欺凌，暴力循环

Cycle of interpersonal violence: Bidirectional relationship between parental maltreatment and children's bullying in the context of Chinese culture

Wu Wei, Xie Ruibo, Ding Wan (corresponding author)

College of Teacher Education, Zhejiang Normal University, Jinhua, 321004

E-mail of corresponding author: dingwan@zjnu.edu.cn

Abstract: School bullying is a most common phenomenon of school violence, which endangers the physical and mental health of students. Bullying has the characteristics of deliberate injury, repeated occurrence, and imbalance in the strength between bullies and victims. As a kind of interpersonal violence in the family, parental maltreatment has similar characteristics with bullying, which may affect children's interpersonal violence in school, leading to bullying. However, in the context of Chinese culture, concepts such as "beating is caring, and scolding is loving" and "spare the rod, and spoil the child" are prevailing. Therefore, parental maltreatment is likely to be interpreted as parent's care and discipline for their children. Therefore, the transmission relationship between the two kinds of interpersonal violence may be concealed to a certain extent. In addition, the Chinese believe that "parents are to blame for their child's faults." When children bully others, parents may be blamed by the public for poor discipline. Therefore, children's bullying may also result in parent's harsh discipline. In summary, this study aimed to investigate the cycle

of interpersonal violence between parental maltreatment and children's bullying over time in the context of Chinese culture, and its mechanisms. 897 children aged 8-11 years in Anhui Province were recruited to complete the Childhood Trauma Questionnaire and Olweus Bullying Questionnaire at three time points. The results showed that: (1) Parental physical maltreatment stably predicted subsequent children's bullying, and parental psychological maltreatment did not have a significant predictive effect on children's bullying; (2) Children's bullying stably predicted subsequent parental physical maltreatment and psychological maltreatment; (3) The cycle of interpersonal violence between parental maltreatment and children's bullying has been found; (4) Physical maltreatment was closely related to boys' bullying, whereas psychological maltreatment was closely related to girls' bullying. This study reveals the cycle of interpersonal violence between parental maltreatment and children's bullying under the Chinese cultural background, and provides a basis for raising Chinese parents' awareness of the negative consequences of maltreatment. In addition, the cycle of violence between parental maltreatment and children's bullying warns that Chinese parents should learn scientific knowledge of family education and strategies to cope with bullying, which helps to fundamentally break such cycle of violence. This mechanism of the cycle also suggests that the intervention of school bullying needs the participation of families. Finally, the gender difference in the cycle of violence emphasizes that family education needs to pay attention to the gender characteristics of children and adopt differentiated upbringing for children of different genders.

Keywords: Chinese culture, parental maltreatment, bullying, cycle of violence

新冠疫情期间儿童焦虑的发展轨迹及其亚类型

吴沁知¹ 李思颖¹ 赵嘉琦¹ 媛媛¹ (通讯作者)

¹ 南京师范大学心理学院, 南京, 210023, anran220@163.com

摘要 背景: 2020年新冠疫情肆虐全球, 儿童作为危机的易感人群, 在疫情期间因隔离、网课等容易产生焦虑、抑郁等负性情绪, 而家庭抗逆力作为家庭整体应对危机的能力可以支持减轻儿童的负面情绪, 对儿童的心理适应具有积极作用。本研究旨在考察疫情期间儿童最为常发的焦虑情绪的发展轨迹及其亚类型, 并探究性别、家庭抗逆力对焦虑发展亚类型的预测作用。**方法:** 选取江苏省四所中小学的883名学生(男生452人, 女生431人, 平均年龄 11.41 ± 2.27 岁), 使用自编人口学量表、焦虑自评量表(SAS)和儿童家庭抗逆力量表(FRAS-CR)于2020年2月29日、3月14日、3月28日进行三个时间点的追踪测评, 并采用潜变量混合增长模型和多元逻辑回归模型进行数据分析。**结果:** 疫情发生(2020年2月至3月)期间, 儿童焦虑情绪的发展轨迹存在3个亚类型, 分别是持续稳定组(87.9%)、动态上升组(6.8%)和先高后低组(5.3%); 性别、家庭抗逆力对儿童焦虑情绪轨迹的预测作用显著($p < 0.05$), 与持续稳定组相比, 女生有更高的概率属于动态上升组; 同时, 家庭抗逆力总分并不能预测焦虑的轨迹, 但是其分维度(家庭沟通和问题解决维度)得分更低的儿童更有可能属于动态上升组。**结论:** 儿童焦虑情绪的发展轨迹具有群体异质性, 存在不同类别的发展趋势, 性别和家庭抗逆力对儿童焦虑情绪的发展轨迹存在显著预测效应。本研究对分类识别和支持危机中儿童焦虑情绪有着一定的临床价值, 以及通过促进父母与儿童的沟通交流和问题协商解决, 可以缓解儿童在危机中焦虑的上升趋势。

Developmental Trajectory of Anxiety among Children during the early stage of COVID-19: A Latent growth mixture model

Qinzi Wu¹, Siying Li¹, Jiaqi Zhao¹, Yuanyuan An¹

¹ School of Psychology, Nanjing Normal University, No.1 Wenyuan Street, Nanjing, China

Abstract: Background: The COVID-19 outbreak is spreading around the world during 2020. Children, as a vulnerable group of the crisis, are especially easy to be affected by crisis events such as quarantine and online classes during the pandemic, which may lead to negative emotions such as anxiety and depression. Moreover, family

resilience, functioning as the ability of the family as a whole to cope with the crisis, supports the decrease of children's negative emotions and plays an important role in the psychological adaptation of children. This study examines the dynamic developmental trajectories and subgroups of the most common symptom anxiety in children during the pandemic, and explores the predictive effect of gender and children's family resilience on latent trajectories of anxiety. **Methods:** A total of 883 students (452 boys, 431 girls, average age 11.41 ± 2.27 years) were selected in four primary and secondary schools in Jiangsu Province. They were assessed with a self-designed demographic scales, the Self-Rating Anxiety Scale (SAS), and the shortened Chinese version of the Family Resilience Assessment Scale (FRAS-CR), and tracked on three time points, respectively February 29, March 14, and March 28, 2020. Latent mixture growth model (LGMM) and a multi-logistic regression model were used for data analysis. **Results:** During the severest period of COVID-19 (from February to March, 2020), there were three anxiety subgroups in children, namely, the low stable group (87.9%), the dynamic increasing group (6.8%) and the moderate decreasing group (5.3%). The general anxiety level of the children showed a relatively stable state over time. The low stable group and the moderate decreasing group showed a decreasing trend over time, while the anxiety level of the dynamic rising group showed an obvious upward trend. The predictive effect of gender and family resilience were both significant ($p < 0.05$) on children's anxiety trajectories. The girls had a higher probability of belonging to the dynamic increasing group than the low stable group; additionally, although the total score of family resilience has no significant effect on the trajectories of anxiety, the children with lower scores in the dimension, family communication and problem solving in family resilience, were more likely to be in the dynamic increasing group. **Conclusion:** Showing group heterogeneity, the trajectories of children's anxiety performed different types of development trends. Gender and family resilience can significantly predict the trajectories of children's anxiety. This study has certain clinical value to classify, identify and intervene children's anxiety in crisis, and promote parents to communicate and solve problems in a consultative manner, consequently alleviate the increasing trend of anxiety among children in crisis.

新冠疫情相关的创伤后应激障碍症状分类：潜在剖面分析

¹赵春晓 ¹史从戎 ¹任志洪（通讯作者）¹蒋宛月 ¹赵子仪 ¹海曼

¹青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘要 2019 新型冠状病毒（COVID-19）的爆发给公众的身心健康造成了严重的影响，其中创伤后应激障碍症状（posttraumatic stress disorder symptoms, PTSS）极具破坏性，而探索 COVID-19 背景下的 PTSS 的异质性和分类，有助于有针对性地制定干预策略。本研究旨在探索中国公众 COVID-19 相关的 PTSS 的不同亚组。采取横断面调查的方式，收集参与者的人口学变量，PTSS，焦虑，抑郁，生活质量的信息。最终纳入 1407 例样本，对 PTSS 进行潜在剖面分析，并以多项式 logistic 回归探索人口学变量对 PTSS 的预测作用，并比较不同亚组在抑郁、焦虑、生活质量方面的差异。潜在剖面分析确定了 PTSS 的 5 个亚组，分别为低症状组(42.89%的样本)，低症状伴高认知和情绪的负性改变和警觉组(25.80%)、中度症状组(14.8%)、低再体验和回避伴高认知和情绪的负性改变和警觉组(10.31%)和严重症状组(6.25%)。多项 logistic 回归分析发现，年龄、性别、地区、教育程度、婚姻状况和就业状况可以区分这五种人群。五组在抑郁、焦虑和生活质量方面存在显著差异。本研究结果表明新冠疫情影响下的创伤后应激障碍有不同与其他创伤时间下创伤后应激障碍症状的独特性。应针对 PTSS 的不同类型制定针对性的干预策略。

Man Hai

Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education; School of
Psychology at Central China Normal University; Key Laboratory of Human Development and
Mental Health of Hubei Province, Wuhan, 430079

Abstract: This study aimed to distinguish subgroups of general population exposed to COVID-19 based on posttraumatic stress disorder symptoms (PTSS). An anonymous web-based cross-sectional survey was conducted. A sample of 1407 participants (M age = 25.36 years, SD = 9.96) was analyzed with latent profile analysis. A three-step approach was used to explore predictors of latent profiles, and membership differences on several self-reported measures. A 5-profile model yielded the best fit to the data, and each profile was respectively labelled as Low symptom group (42.89% of the sample), Low symptom with High Negative Alterations in Cognitions and Mood (NACM) and Hyperarousal (HA) group (25.80%), Moderate symptom group (14.8%), Low Reexperience and Avoidance with High NACM and HA group (10.31%), and Severe symptom group (6.25%). Multinomial logistic regression found that age, gender, region, educational level, marital status, and employment status can differentiate the five groups. And there were significant differences on depression, anxiety, and quality of life across the five groups. Individuals exposed to COVID-19 exhibited heterogeneous PTSS patterns. Risk factors of PTSS were identified.

摘要 本研究选取抗疫公安干警 9631 人, 采用自编的疫情心态调查问卷、GAD-7 问卷、抑郁自评量表 SDS 作为研究工具, 进行在线调查与 EEP 在线心理干预。结果显示: 1 疫情下公安干警心态状况特点 (1) 性别: 相比于女性干警, 男性干警更容易“自觉不健康”, 认为疫情对自己“很有影响”与“非常有影响”, 更容易寻求专业帮助, 更不容易得到家人的支持, 并容易发生家庭冲突。(2) 年龄: 41-50 岁干警“自觉不健康”与“家人能支持理解但偶有矛盾”选项占比最高, 51 岁以上干警受疫情影响最大, 在家人支持各选项中占比均不是最高, 且这 2 个年龄组均更愿意选择“自我忍受”与“自我宣泄”的压力调节方式; 值得注意的是 31-40 岁干警在压力调节各选项中占比均低于其他年龄组, 且在“家人不理解, 常冲突, 能缓解与不能化解”选项中占比最高。(3) 单位: 基层派出所与一线业务大队“自觉不健康”与受疫情影响占比最高, 且更愿意选择“自我忍受”与“自我宣泄”的压力调节方式; 一线业务大队在“家人不理解支持, 常冲突, 能化解”选项占比最高; 基层派出所所在“家人不理解支持, 常冲突且难化解”与“理解支持偶有冲突”选项占比均为最高。(4) 编制: 公务员群组“自觉不健康”与受疫情影响的占比均为最高, 且都选择了“自我忍受”、“自我宣泄”的压力调节方式, 在“家人不理解支持, 常冲突, 能化解”与“理解支持偶有冲突”选项占比最高。2 疫情下公安干警抑郁特点 (1) 公安干警的抑郁发病率为 29.1%。(2) 男性干警的抑郁发生率与严重程度均明显高于女性干警。(3) 抑郁发病率随着年龄增长, 30-60 岁四个年龄组干警的抑郁发病率依次为 26.7%, 28.4%, 30.3% 与 32.8%。3 疫情下公安干警焦虑特点 (1) 公安干警的焦虑发病率为 43.4%。(2) 男性干警的焦虑发生率与严重程度均明显高于女性干警。(3) 干警焦虑发病率随着年龄增长呈倒 U 曲线, 41-50 岁干警焦虑发病率最高, 四个年龄段发病率依次为 35%, 44%, 48.9% 与 47.7%。4 经过连续 6 个月的公安干警“心灵成长阳光工程”EEP 在线心理干预, 效果显著。

Abstract: In order to explore the mental health status of the public security police with high work pressure under the public health emergency, the 9631 anti-epidemic public security police were selected as the research objects. Self-compiled epidemic mentality questionnaire, GAD-7 questionnaire and Self-Rating Depression Scale were used as research tools to conduct online survey. Furthermore, EEP online was carried out. The result show that: 1. Characteristics of mentality of the public security police under pandemic (1) Gender: Compared with women, male police are more likely to "perceive unhealthy", thinking the epidemic has a "great impact" or "exceedingly impact" on them, seeking professional assistance more easily, getting supports from families less easily. Equally, they are more likely to exist family conflicts. (2) Age: Policemen aged 41-50 have the highest proportion of "perceive unhealthy" and "families can support and understand them, but occasionally have conflicts between them and their families". Policemen over the age of 51 are the most affected by the pandemic" and "families understand them and support, but occasionally conflict with them" are the highest. (3) Department: Grassroots police stations and front-line service groups are the most affected by the pandemic, and they are the most likely to report "perceive unhealthy". Likewise, they are more willing to choose the stress regulation methods of "self tolerance" and "self-catharsis". For front-line service groups, the option of "families do not understand them and support often conflicting with them, conflict can be resolved" was chosen in the highest proportion. For grass-roots police stations, the proportions of "families do not understand them and support, often conflicting with them, conflict can be resolved but difficult" and "families understand them and support, but occasionally conflict with them" are the highest. (4) Authorized strength: Civil servants are the most affected by the pandemic, and they are the most likely to report "perceive unhealthy". At the same time, they all chose the stress regulation methods of "self-tolerance" and "self-catharsis". Options of "families do not understand them and support, often conflicting with them, conflict can be resolved" and "families understand them and support, but occasionally conflict with them" were chosen in the highest proportion among civil servants. 2. Depression characteristics of the public security police under pandemic (1) The incidence of depression among the public security police is 29.1%. (2) The incidence and severity of depression in male police are significantly higher than that in female police. (3) The incidence of depression increases with age. The incidences of depression in the public security police aged 30-60 years are 26.7%, 28.4%, 30.3% and 32.8%. 3. Anxiety characteristics of the public security police under the pandemic (1) The anxiety incidence rate of the public security police is 43.4%. (2) The incidence and severity of anxiety of male police are significantly higher than that of female police. (3) The incidence of police anxiety shows an inverted U curve with the increase of age. The incidence of police anxiety is the highest among policemen aged 41-50, and the incidences are 35%, 44%, 48.9% and 47.7% in the four age groups. 4. After 6 months of "Spiritual growth sunshine Project" online psychological service for public security police, the results show that the effect of intervention is significant.

疫情下羞耻对孤独感的影响：自我表露与社会支持的多重中介效应

刘倩¹ 鲁小华¹（通讯作者） 张英俊² 牛勇¹ 马征¹ 张晴雪³

1 北京交通大学学生心理素质教育中心，北京 100044, xhlu@bjtu.edu.cn

2 清华大学社会学系，北京，100084

3 清华大学附属中学广华学校，北京 100024

摘 要 COVID-19 疫情是公共卫生领域的创伤事件，围创期羞耻感普遍存在。居家隔离措施客观上造成了人际疏离，使孤独感成为重要的一种情绪体验。在情绪理论中，羞耻感是在社会威胁或应激下所产生的一种非常典型的负性感受，会增强退缩和抑制行为（如渴望逃离、躲藏和回避），引发更强烈的孤独感，影响心理健康。本研究在积极心理学视角下，关注潜在的心理复原因素，考察疫情期间孤独感的影响因素并进行路径分析，为研发团体心理干预方法提供理论支持。方法：采用领悟社会支持量表、UCLA 孤独感量表、羞耻感量表和痛苦表露指数问卷，对不同地域不同专业的 621 人进行线上调查。有效数据 619 份，其中男性 167 人。结果表明：（1）领悟社会支持，孤独感，羞耻感和自我表露之间两两显著相关，且羞耻感显著正向预测孤独感；（2）自我表露和领悟社会支持在羞耻与孤独之间起显著的中介作用，且领悟社会支持的中介作用显著高于自我表露。模型总效应为 0.52，中介效应占总效应的比例为 35.32%，两个间接效应占总效应的比值分别为 10.87% 和 24.43%。结论：羞耻感既可以对孤独产生直接的影响，也可以通过自我表露和领悟社会支持间接影响孤独感；自我表露与领悟社会支持减弱了羞耻感对孤独的负向影响，对心理健康起到了保护作用。团体心理干预方法的研发可通过设计不同环节，营造团体氛围，促进成员的自我表露，提供社会支持，来降低疫情期间的情绪反应。

3Tsinghua University High School Guanghua, Beijing 100024

Corresponding author: Lu xiaohua, xhlu@bjtu.edu.cn

Abstract: COVID-19 pandemic is a traumatic event in the field of public health, shame is widespread in the peri-traumatic period. “Home self-quarantine” objectively cause interpersonal alienation and make loneliness a prominent emotion. In emotional theory, shame is a very typical negative feeling under social threat, which will cause withdrawal and inhibition behaviors (such as longing to escape, hide and evade), so to enhance loneliness and affect mental health. From the perspective of positive psychology, this study focuses on the potential psychological recovery factors, explore the influencing factors and path analysis of loneliness during the pandemic, with hope to provides theoretical support to innovate group psychological intervention methods. Methods: A total of 621 people from different regions and majors were investigated online with Perceived Social Support Scale, UCLA Loneliness Scale, Experience of Shame Scale and Distress Disclosure Index Questionnaire. There are 619 valid data, including 167 males. The results show that: (1) Perceived social support, loneliness, shame and self-disclosure are significantly correlated in pairs, and shame significantly positively predicts loneliness; (2) Self-disclosure and perceived social support play a significant mediating role between shame and loneliness, and the mediating role of perceived social support is significantly higher than self-disclosure. The total effect of the model is 0.52, the ratio of intermediate effect to total effect is 35.32%, and the ratio of two indirect effects to total effect is 10.87% and 24.43%, respectively. Conclusion: Shame can not only directly affect loneliness, but also indirectly affect loneliness through self-disclosure and perceived social support. Self-disclosure and perceived social support weaken the negative influence of shame on

loneliness and protect mental health. Group psychological intervention can reduce the emotional reaction during the pandemic by designing different activities, to create a secure climate, to promote members' self-disclosure and provide social support.

摘要 目的: 探索突发公共卫生事件下大学生网络减压团体的效果及其有效因素。方法: 2020年3月, 在南京两所高校通过网络公开招聘大学生23人, 分3批进行抗疫减压网络团体辅导。选取自愿参与访谈的团体成员17人作为研究对象, 在干预后48小时内进行一对一的半结构式访谈, 通过共识性质性研究方法分析访谈资料。结果: (1) 新冠肺炎疫情中大学生网络减压团体干预效果涉及成员收获1个主题, 包括改善情绪感受、调整认知反思、习得行为技能、扩展人际交往4个类别, 这些类别在个案上的代表性都为“典型”。(2) 通过分析成员参加网络团体的经历, 特别是有帮助的、印象深刻的事件, 提取网络减压团体的有效因素, 包括团体动力、成员互动、带领者带领、网络环境四个主题10个类别。其中, 气氛融洽、包容互助、倾诉宣泄、了解他人、发现普遍性、帮助他人、带领者态度行为因素在个案中具有典型性。(3) 网络环境对团体效果的影响表现在影响自我揭露、影响互动交流两个方面, 不同成员对于网络影响的感受并不一致。成员的个性特质和参与度、带领者的专业胜任力在其中起中介作用。结论: (1) 突发公共卫生事件下, 网络减压团体干预对大学生心理健康具有积极作用; (2) 网络减压团体具有线下团体类似的有效因素; (3) 网络环境对团体效果有利有弊且因人而异。

³Mental Health Education Center, Nanjing University of the Arts, Nanjing, 210013

Abstract: Objective: To investigate the effects and the effective factors of online group counseling on college students' stress reduction under the public health emergencies. Methods: In March 2020, 23 college students were recruited through the Internet in two universities in Nanjing, and they were divided into three groups to join the online group counseling. 17 group members who voluntarily participated in the interview were selected as the research objects. They received one-to-one semi-structured interviews within 48 hours after the intervention. The data were analyzed through the consensual qualitative research (CQR) methods. Results: (1) The effect of the online group counseling was shown in four categories: improving emotion, adjusting cognitive and reflection, acquiring behavioral skills, and expanding interpersonal communication. The representativeness of all these categories among the cases was "typical". (2) By analyzing the members' experiences participating in the online group, especially the helpful and impressive events, the effective factors of the online group were found in four themes and 10 categories, including group dynamics, member interaction, leader's leadership, and network environment. Among them, the harmony group atmosphere, tolerance and mutual assistance among members, talking and venting emotions, understanding

others, discovering the universality, helping others, and the leader's attitude and behavior were typical factors in the cases. (3) The influence of the network environment on the group effect was manifested in two aspects: self-disclosure and interactive communication. Different members had different feelings about the influence of the network. The personality traits and participation of the members, and the professional competence of the leader played an intermediary role. Conclusions: (1) Under the public health emergencies, online group counseling is effective for the mental health of college students. (2) Online group counseling has similar effective factors to face-to-face group counseling. (3) The network environment has both advantages and disadvantages for the effect of online group counseling, and the influence of the network varies from person to person.

Keywords: online group counseling; public health emergencies; college students; effect; qualitative research.

新冠肺炎风险感知与排外反应：有调节的中介效应分析

余壮^{1,2} 席居哲(通讯作者)^{1,2} 侯湘玲^{1,2} 李丹^{1,2} 董镭^{1,2} 季卫东^{1,2}

1 华东师范大学附属精神卫生中心, 心理与认知科学学院, 华东师范大学, 上海, 200062, jzxi@psy.ecnu.edu.cn

2 上海市长宁区精神卫生中心, 上海, 200335

摘要 排外反应是指个体对外来者态度、情感与行为上的偏见。从本质上而言, 排外表示的是对视为威胁的外群体成员的消极态度。近些年的研究发现, 在疾病威胁(特别是传染性疾病)背景下, 个体倾向于对外群体成员(如主要疫区群体)表现出排外反应。虽然现有研究发现, 疾病威胁与排外反应密切相关, 但很少有研究探讨疾病威胁下排外反应的发生机制。基于此, 本研究拟在当前新冠肺炎疫情背景下, 探讨疾病风险感知影响排斥反应的心理机制, 以期能够为疫情下排外现象的社会治理提供一些参考依据。本研究基于整合威胁理论(Integrated Threat Theory, ITT)及相关实证研究, 在当前 COVID-19 威胁的背景下, 考察了疾病威胁和排外反应之间关系中负面情绪的中介作用和共情反应的调节作用。其中, 排外反应被操作化定义为国内其他地区民众对武汉群体的偏见态度。研究采用网络问卷形式, 对 1697 名全国样本施测了新冠肺炎风险感知问卷(测量疾病威胁)、保护效能问卷、消极情绪体验问卷和排外量表。研究结果显示, 负性情绪在 COVID-19 威胁与排外反应之间起到完全中介作用。然而, 与我们的预期相反, 共情反应并没有缓解疾病威胁与排外反应之间的关系。相反, 共情反应加剧了这种关系。具体来说, 使用越多共情反应来应对 COVID-19 威胁的个体更可能对外群体(如武汉人)表现出排外反应。本研究为疾病威胁如何以及何时转化为排外反应提供了新的视角, 研究结果具有重要的理论和实践意义。

COVID-19 Threat and Xenophobia: A Moderated Mediation Model of Empathic Responding and Negative Emotions

She Zhuang^{1,2}, Xi Juzhe^{1,2}, Hou Xiangling^{1,2}, Li Dan^{1,2}, Dong Rong^{1,2}, Ji Weidong^{1,2}

1 Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

2 Shanghai Changning Mental Health Center, Shanghai 200335, China

Abstract: Studies have suggested that disease threat was linked to increased xenophobia; however, less is known about the underlying process that may shape this relationship. Based on the potential model of intergroup threat and existing researches, we examined the mediating effects of negative emotions and moderating effects of empathic responding in the relationship between disease threat and xenophobia in the context of the COVID-19 threat in China. A large sample with 1697 Chinese participants completed a survey, indicating their perceptions of risk to COVID-19, negative emotions experienced and xenophobic tendencies. As expected, the results show that the negative emotions fully mediated the relationship between perceived COVID-19 threat and xenophobia. However, contrary to our expectation, the empathic responding did not weaken the relation between perceived COVID-19 threat and xenophobia; instead, it exacerbated the relationship. Specifically, using more empathic responding for coping with

COVID-19 was related to greater xenophobia response toward outgroup (e.g., Wuhan people). Our findings provide new insight into the underlying mechanism on how and when disease threat is translated into xenophobia bearing important theoretical and practice implications.

Keywords: empathy, disease threat, xenophobia, COVID-19, risk perception, negative emotions

健康焦虑者对威胁相关刺激的注意偏向：一项多水平元分析

史从戎¹ 杜夏雨¹ 张涛¹ 卢珊¹ 任志洪¹ (通讯作者)

¹ 青少年网络心理与行为教育部重点实验室, 华中师范大学心理学院, 湖北省人的发展与心理健康重点实验室, 武汉, 430079, ren@ccnu.edu.cn

摘要 背景: 在病毒爆发或大流行的背景下, 高度健康焦虑者容易将无害的身体感觉和变化误解为被感染的证据。健康焦虑发展和维持的主要因素之一是对健康威胁相关刺激的注意偏向。然而, 已有研究对于健康焦虑者对威胁相关刺激是否表现出注意偏向的回答并不完全一致。为此, 本研究试图通过元分析, 以综合效应探索健康焦虑者对威胁相关刺激的注意偏向, 以及注意偏向发生的条件。方法: 为了充分利用已有研究的效应量信息, 增强统计检验力, 本研究运用多水平元分析方法, 考察健康焦虑者对威胁相关刺激的注意偏向的组间(健康焦虑组与对照组)及组内(威胁相关刺激与中性刺激)效应。结果: 组间效应分析共纳入 20 项研究, 57 个效应量; 健康焦虑组的组内效应分析共纳入 7 项研究, 17 个效应量; 对照组的组内效应分析共纳入 5 项研究, 13 个效应量。结果发现: (1) 与对照组相比, 健康焦虑组对威胁相关刺激表现出显著的更大的注意偏向($g = 0.321$)。 (2) 与中性刺激相比, 健康焦虑组对威胁相关刺激表现出显著的更大的注意偏向($g = 0.193$), 且显著大于对照组($g = 0.139$)。 (3) 与对照组相比, 在情绪 Stroop 范式、症状词刺激、疾病词刺激条件下, 健康焦虑组对威胁相关刺激表现出显著的更大的注意偏向。 (4) 与对照组相比, 健康焦虑组对威胁相关刺激表现出显著的注意警觉($g = 0.323$)。结论: 健康焦虑者对威胁相关刺激存在真实的注意偏向; 以往研究结果的不一致, 可能源于研究范式、刺激类型的影响。

关键词 健康焦虑, 注意偏向, 多水平元分析

Attentional bias towards threat-related stimuli in health anxiety: A three-level meta-analysis

Shi Congrong¹, Du Xiyu¹, Zhang Tao¹, Lu Shan¹, Ren Zhihong¹

¹ Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan, China

Abstract: Background: In the context of a virus outbreak or pandemic, people with high health anxiety are prone to misinterpret harmless bodily sensations and changes as evidence of infection. An attentional bias towards health-threat related stimuli has been proposed as one of the main factors for the development and maintenance of health anxiety. However, previous studies have not been entirely consistent in whether an attention bias towards threat-related stimuli is shown in health anxiety. Thus, this meta-analysis aims to explore the attention bias towards threat-related stimuli in health anxiety and examine potential moderators. **Methods:** To fully extract effect sizes from extant studies and strengthen the statistical power of the tests, a multilevel meta-analysis was used to investigate the between-group (health anxiety vs. control) differences in the attention bias towards threat-related stimuli and within-group (threat-related stimuli vs. neutral stimuli) differences. **Results:** 57 effect sizes were computed from 20 studies included in the between-group meta-analysis, 17 effect sizes from 7 studies included in the within-health-anxiety-group analysis, and 13 effect sizes from 5 studies included in the within-control-group analysis. We found that: 1) compared with the control group, the health anxiety group showed a significantly greater attentional bias to threat-related stimuli ($g = 0.321$). 2) compared with neutral stimuli, the health anxiety group showed a significantly greater attentional bias to threat-related stimuli ($g = 0.193$), which was significantly greater

than that of the control group ($g = 0.139$). 3) compared with the control group, the health anxiety group showed a significantly greater attentional bias to threat-related stimuli under the condition of emotional Stroop paradigm, symptom word, and illness word stimuli. 4) compared with the control group, the health anxiety group showed significant attentional vigilance towards threat-related stimuli ($g = 0.323$). **Conclusions:** People with high health anxiety have a true attentional bias to threat-related stimuli. Inconsistencies in the results of previous studies may come from diverse types of paradigm and stimulus.

Keywords: health anxiety, attentional bias, multilevel meta-analysis

疫情下大学生手机依赖、焦虑与大五人格的关系 及在线正念冥想训练研究

李灵¹ (通讯作者) 蔡政¹ 刘含聪¹

¹ 辽宁师范大学心理学院应用心理学系, 大连, 116029, phdliling@126.com

摘 要 目前手机已经成为人们必不可少的工具,在人们的沟通交流以及信息获取中发挥着重要作用。尤其在疫情期间,在国家停课不停学的政策之下,大学生群体的手机使用率显著提高。根据中国工信部门的统计,到2015年2月,已有12.9亿人民使用移动电话,其中大学生用户占很大一部分。据调查,我国15%~30%的大学生会表现出手机依赖的倾向,国外的大学生手机依赖率也在28%左右。除外部因素之外还有哪些因素影响大学生手机依赖,这一问题值得我们去深入研究。近年来有大量学者开始逐步探索大五人格和手机依赖的内在联系,试图以大五人格为突破口寻找手机依赖的内在原因,并且有了一些实质性的进展。本研究为探讨大学生手机依赖、焦虑与大五人格的关系,以及焦虑是否在手机依赖与大五人格间起到中介作用,从辽宁省内大学本科生中选取396人为被试;采用《大学生智能手机依赖问卷》、《焦虑自评量表》以及《大五人格问卷》作为研究工具,进行在线调研与针对性在线正念冥想干预。结果显示:(1)疫情下大学生手机依赖在性别、年级上存在显著差异,女生手机依赖程度显著高于男生,年级与手机依赖呈正相关。(2)疫情下大学生焦虑水平偏高,焦虑在性别上存在显著差异,男生焦虑程度显著高于女生。(3)疫情下大学生大五人格五个维度均与手机依赖呈正相关;焦虑与手机依赖呈正相关;大五人格中神经质与焦虑呈正相关,严谨性、宜人性、外向性、开放性与焦虑呈负相关。(4)疫情下大学生大五人格、焦虑对手机依赖有预测作用,焦虑在严谨性、宜人性、外向性和手机依赖之间起中介作用。(5)在线正念冥想可显著缓解大学生焦虑与手机依赖,女生效果优于男生,个体冥想的干预效果优于团体冥想。

关键词 大学生, 大五人格, 焦虑, 手机依赖, 在线正念冥想

The relationship between mobile phone dependence, anxiety and Big Five Personality of undergraduate students and Online mindfulness meditation training under the epidemic situation

Li Ling¹(corresponding author), Cai Zheng¹, Liu Hancong¹

¹ Department of Applied Psychology, College of Psychology, Liaoning Normal University, Dalian, 116029, phdliling@126.com

Abstract: At present, mobile phone has become an essential tool for people. It plays an important role in people's communication and information acquisition. Especially during the outbreak, under the national policy of suspension of classes and non-stop schooling, the mobile phone usage rate of undergraduate students increased significantly. According to the statistics of the Ministry of industry and information technology of China, by February 2015, 1.29 billion people had used mobile phones. Among them, undergraduate students account for a large part. According to the survey, 15%-30% of undergraduate students in China tend to rely on mobile phones, foreign undergraduate

students' mobile phone dependence rate is also around 28%. Besides external factors, what other factors affect undergraduate students' mobile phone dependence. This problem is worthy of our in-depth study. In recent years, a large number of scholars began to gradually explore the internal relationship between Big Five Personality and mobile phone dependence. Want to take big five as a breakthrough to find the internal reason of mobile phone dependence, and there has been some substantial progress. In order to explore the relationship between mobile phone dependence, anxiety and big five personality of undergraduate students, and whether anxiety played a mediating role between mobile phone dependence and big five personality. 396 people were selected as subjects from undergraduates in Liaoning Province. We used undergraduate students' mobile phone dependence questionnaire, self-rating anxiety scale and NEO Personality Inventory (NEO-PI-R) as research tools, and conduct online research and targeted online mindfulness meditation intervention. The results showed that: (1) Under the epidemic situation, there were significant differences in gender and grade in the dependence of undergraduate students on mobile phones: compared to male students, the degree of mobile phone dependence of female students was significantly higher; there is a positive correlation between grade and mobile phone dependence. (2) Under the epidemic situation, the anxiety level of undergraduate students was high, and the anxiety had significant differences in gender: compared to female students, the anxiety degree of male students is significantly higher. (3) Under the epidemic situation, the five dimensions of undergraduate students' personality were positively correlated with mobile phone dependence; Anxiety was positively correlated with mobile phone dependence; Neuroticism was positively correlated with anxiety, conscientiousness, agreeableness, extroversion, and openness were negatively correlated with anxiety. (4) Under the epidemic situation, undergraduate students' Big Five and anxiety had a predictive effect on mobile phone dependence, anxiety played a partial mediating role in the three dimensions of conscientiousness, agreeableness, extroversion and mobile phone dependence. (5) Anxiety and mobile phone dependence among undergraduate students can be relieved significantly by online mindfulness meditation. The effect of female is better than that of male, and individual meditation is better than group meditation.

Keywords: the epidemic situation, undergraduate students, Big Five Personality, mobile phone dependence, Online mindfulness meditation training

新冠肺炎疫情大流行期间中国大学生自杀意念的发生率及影响因素： 一项三波次重复调查研究

梁舜薇¹ 刘立力¹ 彭晓丹¹ 陈建斌¹ 黄安迪¹ 汪夏永¹ 赵静波¹ (通讯作者) 范方²

¹ 南方医科大学公共卫生学院心理学系, 广州, 510515, mingtian@smu.edu.cn

² 华南师范大学心理学院, 广州, 510631

摘要 背景: 新冠肺炎疫情 (COVID-19) 大流行是一场重大的公共危机, 给个体的心理健康带来负面影响。本研究旨在检验中国大学生在 COVID-19 大流行的不同阶段自杀意念的发生率和相关影响因素。**方法:** 采用重复的横断面调查设计, 对广东省 22 所高校的大学生进行了三波次在线调查: 暴发期 (T1: 2020 年 2 月 3 日至 2 月 10 日, N=164101)、缓解期 (T2: 2020 年 3 月 24 日至 4 月 3 日, N=148384) 和常态化防控期 (T3: 2020 年 6 月 1 日至 15 日, N=159187)。采用 PHQ-9 问卷的第九项对自杀意念进行测量, 使用多元逻辑回归分析方法对社会人口学特征、抑郁、焦虑、失眠、先前存在的心理健康问题和 COVID-19 相关因素与自杀意念的关系进行了评估。**结果:** T1、T2 和 T3 的自杀意念发生率分别为 8.5%、11.0% 和 12.6%。男性 (aOR: 1.35-1.44, $P < 0.001$), 自我感觉心理状况不佳 (aOR: 2.25-2.81, $P < 0.001$), 精神疾病 (aOR: 1.52-2.09, $P < 0.001$), 有心理咨询经历 (aOR: 1.23-1.37, $P < 0.01$), 对 COVID-19 流行风险持负面认知 (aOR: 1.14-1.36, $P < 0.001$), 抑郁症状 (aOR: 2.51-3.03, $P < 0.001$) 和焦虑症状 (aOR: 1.62-101.11, $P < 0.001$) 与自杀意念增加有关。**结论:** 新冠肺炎疫情大流行期间, 中国大学生的自杀意念发生率呈增加趋势。多种因素, 尤其是心理健康问题, 与自杀意念密切相关。在 COVID-19 大流行期间和之后均应密切监测大学生的自杀意念状况, 并提供及时心理社会干预, 以降低自杀风险。

Abstract: Objective: The coronavirus disease 2019 (COVID-19) pandemic, a major public crisis, has negative impact on individuals' mental health. This 3-waves repeated survey aimed to examine the prevalence and correlates of suicidal ideation at different stages of the COVID-19 pandemic in a large sample of college students in China. **Methods:** Using a repeated cross-sectional survey design, we conducted 3 online surveys of college students during the COVID-19 pandemic in 22 universities in Guangdong, China. The 3 surveys were conducted during the outbreak period (T1: 3 February to 10 February 2020, N=164101), remission period (T2: 24 March to 3 April 2020, N=148384), and normalized prevention and control period (T3: 1 June to 15 June 2020, N=159187), respectively. Suicidal ideation was measured by the ninth item of the Patient Health Questionnaire-9. A range of suicide-related factors were assessed, including sociodemographic characteristics, depression, anxiety, insomnia, pre-existing mental health problems, and COVID-19-related factors. **Results:** The prevalence of suicidal ideation were 8.5%, 11.0% and 12.6% at T1, T2, and T3, respectively. Male sex (aOR: 1.35-1.44, Ps<0.001), poor self-perceived mental health (aOR: 2.25-2.81, Ps<0.001), mental diseases (aOR: 1.52-2.09, P<0.001), prior psychological counseling (aOR: 1.23-1.37, Ps<0.01), negative perception of the risk of the COVID-19 epidemic (aOR: 1.14-1.36, Ps<0.001), depressive symptoms (aOR: 2.51-3.03, Ps<0.001) and anxiety symptoms (aOR: 1.62-101.11, Ps<0.001) were associated with increased risk of suicidal ideation. **Conclusion:** Suicidal ideation appears to increase during the COVID-19 pandemic remission period among college students in China. Multiple factors, especially mental health problems, are associated with suicidal ideation. Psychosocial interventions should be implemented during and after the COVID-19 pandemic to reduce suicide risk among college students.

新型冠状病毒肺炎流行期间 大学生多重心理健康问题与自杀意念的纵向关系

马紫娟¹ 王东方¹ 张一凡¹ 范方¹ (通讯作者) 赵静波²

¹ 华南师范大学心理学院/华南师范大学心理应用研究中心, 广州, 510631, fangfan@scnu.edu.cn

² 南方医科大学公共卫生学院心理系, 广州, 510515

摘要 目的: 最近的研究表明, COVID-19 相关的多重心理健康问题可能诱发自杀意念, 然而, 鲜少研究探讨大学生群体中多重心理健康问题与自杀意念的关系。本研究旨在探讨 COVID-19 爆发期和缓解期多种心理健康问题与自杀意念之间的关系。**方法:** 本研究共有 68685 名大学生参与疫情爆发期和缓解期的调查。本研究主要在疫情爆发期评估了多重心理健康问题(急性应激、抑郁、焦虑、失眠、强迫症、自杀意念)和社会人口学特征, 并在疫情缓解期再次评估了自杀意念。基于 SPSS25.0 通过分层回归分析分别探究多种心理健康问题对疫情爆发期和缓解期自杀意念的影响。**结果:** 大学生的自杀意念从 COVID-19 爆发期的 7.6% 上升到 COVID-19 缓解期的 10.0%。随着心理健康问题数量的增加, 在疫情爆发期自杀意念呈二次曲线增长, 在疫情

缓解期自杀意念呈稳定增长。此外，男生在疫情爆发期和缓解期着两个阶段的自杀意念都比女性有更快、更显著的上升。**结论：**在 COVID-19 大流行期间，应实施公共卫生干预措施降低与 COVID-19 相关的急性压力、抑郁、焦虑、失眠、强迫等心理健康问题。

¹School of Psychology and Center for Studies of Psychological Application, South China Normal University, Guangzhou 510631, China

² Department of Psychology, School of Public Health, Southern Medical University, Guangzhou, 510515

Abstract: **Objectives:** Recent research suggests that the COVID-19-related multiple mental health problems can be associated with increased risk for suicidal ideation (SI), but population-based data on these associations are scarce. This study aimed to examine the association between multiple mental health symptoms during the outbreak and SI at outbreak (T1) and remission (T2) of the COVID-19. **Methods:** A total of 68,685 college students in China participated in the survey at two phases of the pandemic (T1 and T2). Mental symptoms (acute stress, depression, anxiety, insomnia, obsessive-compulsive symptoms) and socio-demographic characteristics were measured at T1, and SI was assessed at T1 and T2. Hierarchical regression analysis was used to investigate the combined effect of multiple mental health problems on SI at T1 and T2. **Results:** The prevalence of SI among college students in China increased from the COVID-19 outbreak (7.6%) to the COVID-19 remission stage (10.0%). With the rising number of mental health problems, there was a dramatic growth of SI in a quadratic fashion at T1 and a reasonably steady increase of SI at T2. Moreover, male participants' SI at both T1 and T2 witnessed faster and more significant rise compared with females', as shown by the accumulation of their psychological distresses. **Conclusion:** Public health interventions to decrease risk of SI during the COVID-19 pandemic should address pandemic-related acute stress, depression, anxiety, insomnia, obsessive-compulsive symptoms, especially male students who has several mental health symptoms at the same time.

摘要 研究背景 大量证据表明，新型冠状病毒肺炎（COVID-19）大流行对心理健康具有重要影响。然而 COVID-19 不同发展阶段下青年人群心理问题的发展变化如何，相关纵向研究少见。**研究目的** 比较 COVID-19 两个不同发展阶段（爆发期与控制转折期），中国大学生群体三项心理问题（急性应激，焦虑和抑郁症状）的检出率与相关影响因素。**研究方法** 本项基于网络问卷调查的 2 波次大样本研究，于 2020 年 2 月 3 日至 4 月 3 日期间，在广东省各高校进行。研究被试为广东省高校大学生，其地域分布涉及中国 34 个省、市、自治区，其所在高校涉及广东省高校的各个层次及理工农医艺体综合等高校类别。分别采用事件影响量表 (IES-6)、

抑郁症状筛查量表（PHQ-9）和广泛性焦虑量表（GAD-7）对被试在疫情不同发展阶段的急性应激、焦虑、抑郁症状进行测量。采用无序多分类 Logistic 回归模型对被试在人口学变量、健康行为、COVID-19 相关因素以及心理社会方面的预测因素进行分析。**研究结果** 在 2020 年 2 月 3 日至 10 日之间（T1：爆发期），参与第一波调查的 164101 名大学生中，有 68685 人（41.9%）参与了自 2020 年 3 月 24 日至 4 月 3 日期间的第二波调查（T2：转折控制期）。第二次调查中，疫情急性应激反应较第一次显著下降（T1：34.6%； T2：16.4%）；而抑郁症状（T1：21.6%； T2：26.3%）和焦虑症状的检出率（T1：11.4%； T2：14.7%）显著升高。分析疫情发展不同时期大学生心理问题的影响因素，结果发现：高年级学生、居住社区有感染或疑似病例者、COVID-19 相关担忧，与两次调查中至少一波次出现心理问题显著相关（AORs> 1.20, $ps < 0.001$ ）。体育运动较少，低社会支持以及家庭功能失调也是大学生各类心理问题持续存在的重要预测因素。**研究结论** 在 COVID-19 流行期间，大学生中急性应激，焦虑和抑郁症状普遍存在，并且从疫情爆发到控制期，大学生焦虑、抑郁症状呈“逆向增长”趋势。部分大学生，特别是具有上述危险因素的大学生，表现出持续性或迟发性心理问题。应密切注意高风险的学生，并立即有针对性地采取措施消除学生疫情防控期间新增的或加剧的各种风险因素。

³ Center for Public Health Initiatives, University of Pennsylvania, Philadelphia, PA, USA

Abstract : IMPORTANCE Growing evidence supports a clear association between the COVID-19 pandemic and mental health. However, little is known about the longitudinal course of psychopathology in young adults at different stages of the pandemic. **OBJECTIVE** To compare the prevalence of three mental health problems (acute stress, anxiety, and depressive symptoms) at two phases of the pandemic (early vs under-control) and identify correlates of these patterns among a large sample of college students in China. **METHODS** This large-scale, 2-wave longitudinal, population-based, online survey was conducted in China from February 3 to April 3, 2020. It involved students from all 34 province-level regions in China and at each level of college and university. The rates of acute stress, depressive and anxiety symptoms, and their change patterns across two time points were measured using the Impact of Event Scale-6, Patient Health Questionnaire-9, and Generalized Anxiety Disorder-7. Predictors of changes in mental health symptoms were examined via multivariate regression and examined demographics, health behavior, COVID-19 related and psychosocial factors. **RESULTS** Among the 164,101 college students who participated in the first wave survey between 2/3-10/2020 (T1=during onset of outbreak), 68,685 (41.9%) completed a follow-up survey between 3/24 and 4/3/2020 (T2=during remission). The prevalence of probable acute stress (T1: 34.6%; T2: 16.4%) decreased, while the rates of depressive (T1: 21.6%; T2: 26.3%) and anxiety symptoms (T1: 11.4%; T2: 14.7%) were increased during the follow-up. Senior students, having infected or suspected cases in their community, COVID-19 related worries (all AORs > 1.20, $ps < 0.001$) were related to higher risk of developing mental health problems in at least one wave. Less physical exercise, low perceived social support, and having a dysfunctional family were also common predictors for not developing resistance or abated symptoms. **CONCLUSIONS AND RELEVANCE** Acute stress, anxiety, and depressive symptoms are prevalent among college students during the COVID-19 epidemic, and showed

significant increase after the initial stage of the outbreak. Some college students, especially those with the risk factors noted above, exhibit persistent or delayed symptoms. Close attention should be paid to the students at higher risk.

¹ 南方医科大学公共卫生学院心理学系, 广州, 510515, mingtian@smu.edu.cn

摘要 目的: 越来越多的证据表明在新冠肺炎疫情期间, 与新冠疫情相关的恐慌和焦虑是不断上升的。然而, 随着疫情防控常态化, 恐慌和焦虑的纵向变化及其相关因素仍需关注和探索。**方法:** 共同参与两次调查的大学生总计 22,578 名。参与者在常态化防控阶段 (T1, 2020 年 6 月 1—15 日) 和广州本土新增病例阶段 (T2, 2021 年 6 月 10—18 日) 完成在线调查。采用多元线性回归分析人口学变量与预测未来的恐慌和焦虑的关系。**结果:** 与新冠疫情相关的恐慌在 T2 时显著降低 ($t = 66.64, p < 0.001$), 但焦虑在 T2 时显著上升 ($t = -5.03, p < 0.001$)。日常生活的变化 (如经济问题和学业问题) 和对新冠疫情的关注与 T1、T2 的恐慌以及恐慌的变化显著相关, 而这三个因素与焦虑的变化无关。然而, 日常生活的变化 (如社会关系问题) 与 T1、T2 的焦虑和焦虑的变化显著相关, 而与恐慌的变化无显著相关 (所有 $p < 0.001$)。**结论:** 这些结果表明, 随着新冠肺炎疫情的出现, 焦虑 (恶化) 和恐慌 (缓解) 发生了不同的变化。并且, 恐慌和焦虑变化的相关因素也不同。这些发现对于未来规划心理健康危机以及此次新冠肺炎疫情之后的长期影响具有重要意义。

Abstract: Background: Growing evidence supports that fear related to COVID-19 and anxiety have increased during the COVID-19 pandemic. However, with regular epidemic prevention and control measures, the longitudinal changes and associated factors in fear and anxiety were needed to be explored. **Methods:** Participants in both two wave studies included 22,578 college students. Participants completed online surveys at normalization prevention stage (T1, from June 1 to 15, 2020) and the new locally transmitted in the Guangdong Province (T2, from June 10 to 18, 2021). Multiple linear regressions were used to examine predict later fear and anxiety from demographic characteristics. **Results:** Fear related to COVID-19 was significantly decreased at T2 ($t = 66.64, p < 0.001$), however, anxiety was significantly increased at T2 ($t = -5.03, p < 0.001$). Change in daily life (i.e., financial concern and academic concern) and pay attention to COVID-19 was positively associated with fear related to COVID-19 at T1, T2 and change in fear (all $p < 0.001$), while these three factors were insignificantly associated with change in anxiety. However, change in daily life (i.e., social relationship concern) was positively associated with anxiety at T1, T2 and change in anxiety, while was insignificantly associated with change in fear (all $p < 0.001$). **Conclusions:** These results suggest a different change in anxiety (deterioration) and fear (mitigation) occurred as the COVID-19 pandemic emerged. Meanwhile, related factors for the changes of fear and anxiety were also different. These findings have implications for planning mental health crisis provisions and for long-term impact beyond this pandemic.

摘要 背景: 新冠肺炎疫情期间大学生心理健康问题的前期研究结果存在不一致。本研究试图使用异质性视角, 通过潜增长混合模型, 从疫情开始, 到随后的解封, 再到充满不确定性常态化防控阶段, 估计中国大学生心理健康问题的不同发展轨迹, 并找出与之相关的因素。**方法:** 本研究在中国广东省 22 所高校的大学生中进行了大样本调查。研究分五个调查时段进行: 2020 年 2 月 3 日至 10 日(T1); 2020 年 3 月 24 日至 4 月 3 日(T2); 2020 年 6 月 1 日至 15 日(T3); 2020 年 9 月 10 日至 10 月 17 日(T4); 2021 年 6 月 10 日至 18 日(T5)。共有 8118 名学生参与。抑郁症状采用患者健康问卷(PHQ-9)测量, 焦虑症状采用广泛性焦虑障碍量表(GAD-7)测量。使用潜增长混合模型来识别在抑郁症状和焦虑中有不同变化轨迹的个体亚组。采用有序 logistic 回归模型识别不同轨迹组相关的变量。**结果:** 研究发现了抑郁症状和焦虑的三个轨迹组: 无影响组(69%), 中度增加组(29%)和脆弱组(2%)。与轨迹组相关的因素为女性($p<0.001$)、心理健康状况(服用精神药物, $p<0.01$, 心理咨询经历, $p<0.001$)、生活方式(饮酒, $p<0.001$, 饮食不规律, $p<0.001$)和对 COVID-19 的负面认知和行为($ps<0.05$)。**结论:** 多数调查对象情绪稳定, 少部分学生在疫情期间心理健康状况恶化。这些学生可能需要来自大学心理健康中心的额外支持, 以促进他们的健康。

Abstract : Background. Previous research on mental health problems of college students during the COVID-19 pandemic had unclear results. The current study tries to use a heterogeneity point of view to estimate the different trajectories of mental health problems during the start and subsequent easing of lockdown restrictions and the follow up regular prevention full of uncertainty within China, and find what factors may be associated with the diverse trajectories. **Methods.** This study was conducted on a large sample of college students from 22 colleges and universities in the Guangdong Province of China. The study was carried out in five survey periods: February 3--10, 2020 (T1); March 24 to April 3, 2020 (T2); June 1--15, 2020 (T3); September 10 to October 17, 2020 (T4), and June 10--18, 2021 (T5). A total 8,118 students participated. Depressive symptom was measured using the Patient Health Questionnaire (PHQ-9), Anxiety was measured using Generalized Anxiety Disorder Scale (GAD-7). Changes in mental health outcomes were modelled across the five waves. The growth mixture model was used to identify subgroups of individuals with different trajectories of change in depressive symptom and anxiety. The ordinal logistic regression model was used to identify variables associated with different trajectory groups. **Results.** Three trajectory

groups of depressive symptom and anxiety were identified: Resilient (69%), moderate-increased (29%), and vulnerable (2%). The factors associated with trajectory groups were female ($p<0.001$), mental health condition (take psychiatric medication, $p<0.01$, psychological counseling experience, $p<0.001$), living style (drinking, $p<0.001$, eating irregularly, $p<0.001$), negative cognition and behavior towards COVID-19 ($ps<0.05$). **Conclusions.** Most participants showed stable emotional status; however, some participants experienced deteriorating mental health during the pandemic. These students may need additional support from mental health providers of college to promote their wellbeing.

对团体带领者进行督导的实践模式——来自中国的经验

樊富珉（通讯作者）

清华大学心理学系，北京，100084，ffm@tsinghua.edu.cn

摘要 团体心理工作是指在团体的环境中所给予的专业帮助，它涉及到一位具有专业胜任力的团体带领者，应用与团体有关的心理学理论和方法，帮助一群有共同困惑的团体成员，达到提升心理健康，增进社会适应的目标。团体心理工作包括具有心理教育意义和培养技能团体辅导，解决人际问题的团体咨询，以及人格重建的团体治疗。团体带领者（Group Leader）也称团体领导者，是指在团体运作过程中负责带领和指引团体走向的专业人员，包括带领团体心理辅导、团体心理咨询或团体心理治疗的社会工作者、医护人员、教育工作者或心理咨询与心理治疗师。随着我国心理健康服务的需求越来越强烈，团体工作的优势和价值日益凸显，培养具有胜任力的团体带领者成为专业人才培养的重要议题。督导是咨询师专业成长不可或缺的培养环节，目前国内还没有对团体带领者进行督导的相关研究和讨论。本报告依据成为有效团体带领者的必要条件，从清华大学心理学系建构的团体带领者系统的专业训练入手，描述了一般团体带领者养成的过程，探讨了对团体带领者进行督导的模式，重点阐述了团体督导对于团体带领者成长重要性，介绍了几种适合中国国情的团体带领者训练常用的团体督导模式。尤其是介绍了我们团队构建的团体带领者胜任力模型以及编制的团体带领者胜任力量表，作为督导师评价督导效果的评估工具。

Practice Modes of Supervising Group Leaders: Experience from China

FAN Fu-min(Corresponding author)

The Department of Psychology, Tsinghua University, Beijing 100084, China

ffm@tsinghua.edu.cn

Abstract: Group work refers to the professional help given in the group environment, which involves a group leader with professional competence applying the group-related theories and methods to help members with common confusion, so as to improve their mental health and social adaptation. Group work includes group guidance for psychological education and skills development, group counseling for solving interpersonal problems, and group therapy for personality reconstruction. Group leader refers to a professional who is responsible for leading and guiding the team during the group process, including a social worker, medical worker, educator, psychological counselor or psychotherapist who leads group guidance, group counseling or group therapy. With the increasing demand for mental health services in China, the advantages and values of group work have become increasingly prominent, and training competent group leaders has become an important issue in talent cultivation. Supervision is

an indispensable part of the professional growth of counselors. At present, there is no relevant research and discussion on the supervision of group leaders in China. Based on the necessary conditions for an effective group leader, this report introduced the professional training system created by the Department of Psychology, Tsinghua University, described the training process of general group leaders, discussed the mode of supervision of group leaders, focused on the importance of group supervision for the growth of group leaders, and introduced several group supervision modes which are frequently used and suitable for the training of group leaders in China. In particular, this report introduced the competency model of group leaders and the scale of group counselors' competency developed by our research team, which will serve as an effective evaluation tool for supervisors to evaluate the effectiveness of supervision.

“师门制”督导模式在临床与咨询心理学历教育中的应用

蔡远¹ 李荔波² 王建平³ (通讯作者)

1 南京审计大学, 南京, 211815

2 宁波大学科学技术学院, 宁波, 315300,

3 北京师范大学, 北京, 100875, wjphh@bnu.edu.cn

摘要 “师门制”督导是指学历教育背景下在实验室导师总督导下, 专业博士对咨询与临床心理学专硕(MAP)的督导训练。该模式既为专博提供实习督导的训练机会, 也为专硕提供受督导的机会。师门制督导实行前, 专博与专硕通过一年的共学进行相互了解, 在此基础上双向选择。同时, 组建实习督导师团体, 综合 CBT 督导模型和胜任力督导模型制定师门制督导协议, 并与总督导共同确定实施方案。督导聚焦于毕业论文个案, 实习督导师全程参与。总督导师则定期对实习督导师进行督导之督导, 协助其觉察督导关系状态, 督导胜任力的变化以及提升个案概念化和策略实施之能力。在对师门制督导的反馈中发现, 实习督导师认为自己在督导和咨询胜任力上得到了双重提升, 对督导关系之觉察能力显著提高; 受督者则认为师门制督导帮助其将所学理论与实践贯通的同时, 提供了支持和安全感, 使其能更有信心地与来访者工作。同时, 师门制督导中存在的多重/多重督导关系和被评价压力值得觉察和反思。结论: 师门制督导有利于打破现有条件的限制, 建立易于落实和执行的督导体系, 在拓展专业发展路径和提高胜任力方面使督导双方受益。同时, 需要格外留意督导关系给双方带来的影响。总体而言, 师门制督导是对临床与咨询心理学历教育的一种有益尝试。

The Application of Mentor-Centered Supervision model in the academic education of clinical and counseling psychology

CAI Yuan¹, LI Libo², WANG Jianping³

1 Cai Yuan, Nanjing Audit University, Nanjing, 21815

2 Li Libo, College of Science & Technology, Ningbo University, Ningbo, 315300

3 Wang Jianping, Beijing Normal University, Beijing, 100875 wjphh@bnu.edu.cn

Abstract: Mentor-Centered Supervision refers to the supervision training provided by the Professional Doctorate to the Master of Applied Psychology(MAP) under the supervision of the chief supervisor in the background of academic education. This model benefits both Doctorate and Master students by provided the training of supervision internship and the chance of being supervised. The Doctorate and Master students generally spend one whole year learning together in the lab to know each other better and make a two-way choice before the carrying out of Mentor-Centered Supervision. Meanwhile, the group of practice supervisor is built to integrate CBT supervision model and competency model to set out the protocol of Mentor-Centered Supervision and the implementation plan with the chief supervisor. The supervision focuses on the case of graduate paper, the practice supervisors participate in the whole procedure. The chief supervisor conducts regular supervision of the practice supervisors to assist them in being aware

of the supervisory relationship, changes in supervisory competence, and improving the competence of case conceptualization and strategy implementation. In their feedback about Mentor-Centered Supervision, the practice supervisors think that their competence in supervision and counseling has been enhanced, and their awareness of the supervisory relationship has been significantly improved. The supervisees think that Mentor-Centered Supervision helps them to integrate the theory and practice they have learned, at the same time, it provides them with support and sense of safety, so that they can work with clients with more confidence. Meanwhile, the dual/multiple supervisory relationship and the pressure of being evaluated in Mentor-Centered Supervision should be noticed and reflected upon. Conclusions: Mentor-Centered Supervision is conducive to breaking the limitations of existing conditions, establishing a supervisory system that is easy to implement and carry out, and benefiting both sides of supervision in terms of expanding professional development and improving competence. At the same time, extra attention should be paid to the impact of the supervisory relationship on both sides. In general, Mentor-Centered Supervision is a beneficial attempt to the degree program of clinical and counseling psychology.

中国心理学会注册系统督导体系的创建与发展 ——基于督导胜任力模型

贾晓明¹

¹ 北京理工大学, 北京, 100081, jiaxiaoming@bit.edu.cn

摘要 20 世纪 80 年代国内的心理咨询、心理治疗服务逐步开展, 但少有规范的学历教育培训, 更缺少相应地专业督导, 而督导是培养心理咨询与心理治疗专业人员的重要途径和专业活动。中国心理学会临床心理学注册工作委员会(同“临床与咨询心理学专业机构与专业人员注册系统”, 简称注册系统)于 2006 年成立之时, 注册了中国心理学会第一批注册督导师, 开始创建督导体系。基于督导师胜任力模型, 即督导师的胜任力包括知识、能力、态度三个方面, 注册系统在 2007 年于中国心理学报发布的《中国心理学会临床与咨询心理学专业机构与专业人员注册标准》中, 首次建立了注册督导师的注册标准, 并在同时发布的《临床与咨询心理学专业工作伦理守则》中, 制定了督导伦理的相关内容, 开启了中国心理咨询与治疗督导的重要实践。在注册系统 14 年的发展历程中, 督导体系在六个方面进行发展建设, 一是进一步完善注册督导师注册标准, 并在 2018 年发布的第二版注册标准中做了修订; 二是按照注册督导师注册标准扩大督导师队伍; 三是从 2012 年起在全国大部分省、直辖市、自治区建立督导点, 以督导点为平台组织持续、规范的专业督导; 四是注册督导师在全国各个领域为国内从事心理咨询、心理治疗的专业人员进行督导, 提升其专业胜任力; 五是参与学历教育培训方案的制定, 推动学历教育中督导制度的建设; 六是加强督导伦理培训。注册系统督导体系建设的实践有效的推动了国内督导专业工作的规范开展, 更促进了心理咨询与治疗专业人员的专业胜任力提升, 使接受心理咨询与治疗服务的来访者的利益得以保障。

The Establishment and Development of Supervision System Practiced by the Registration System of the Chinese Psychological Society

JIA Xiaoming¹

¹School of Humanities and Social Sciences, Beijing Institute of Technology, Beijing 102488,
jiaxiaoming@bit.edu.cn

Abstract: The psychological counseling and therapy gradually developed in the 1980s in China, but there were few standardized academic education and formal training, especially professional supervision, which was one of the professional activities and served as an important way to train professionals in psychological counseling and psychotherapy. The first registered supervisors of the Chinese Psychological Society were registered when the Clinical Psychology Registration Work Committee of the Chinese Psychological Society (also known as Professional

Registration System for Clinical and Counseling Psychology Organizations and Professionals of the Chinese Psychological Society, referred to the Registration System) was established in 2006, which indicated a beginning to establish the supervision system in China. Not long after that, the Registration System released *the Registration Criteria for Clinical and Counseling Psychology Organizations and Professionals the Chinese Psychological Society* in the *Acta Psychologica Sinica*, and the registration criteria for supervisors were included based on the competency model for supervision, namely the supervisor's competencies were composed by knowledge, abilities and attitudes/values. Besides, the supervision ethics were emphasized in *the Code of Ethics for Clinical and Counseling Psychology Organizations and Professionals the Chinese Psychological Society* published at the same time. These two documents represented the milestones for the supervision practices of clinical and psychological counseling. During the 14-year development of the Registration System, the supervision system has been constructed and developed in six major aspects: (1) The registration criteria for supervisors have been further improved and revised in the second edition of the registration criteria released in 2018; (2) To augment the registered supervisors according to the registration criteria; (3) Beginning in 2012, the Registration System has started building supervision stations all over China since 2012, serving as platforms for continuous and formal supervisions; (4) The registered supervisors in all areas of the country supervised the domestic psychological counselors and therapists to improve their competencies; (5) Actively participate in the establishment and adjustment of programs and promote the construction of supervision system in academic education; (6) strengthen the training of supervision ethics. The practices in constructing the supervision system of the Registration System effectively promote the orderly development of professional supervision in China, improved the professional competencies of psychological counselors and therapists, and the benefits of clients were protected.

教育部华中师大抗疫心理援助热线三层督导模式

吴才智 任志洪 江光荣（通讯作者）

华中师范大学心理学院，武汉，430079，grjiang@yeah.net

摘 要 2020 年新冠疫情期间，教育部依托华中师范大学已有工作资源，设立教育部华中师范大学心理援助热线平台，面向湖北及全国大众、海外华人华侨、留学生等提供 24 小时抗疫心理援助热线公益服务。该平台在高峰时有近 1700 名咨询师上线值班。鉴于多数咨询师并非出自学历教育、理论基础与实践操作技能可能存在不足，疫情心理热线有时间限制、文字咨询方式有难度，对咨询师挑战大，疫情期间咨询师本身也不能免于感染风险、更容易耗竭，咨询师需要及时提供督导；同样的，督导师也非出自学历教育，也需要定期提供督导的督导。平台因此设计了三层督导架构，第一层是咨询师，直接面向社会大众提供心理援助服务；第二层是督导师，定期为咨询师提供督导；第三层是资深督导师，定期为督导师提供督导的督导。注册系统湖北心理援助督导组全面负责教育部华中师大心理援助热线的督导管理与运行工作。为保障督导质量，提升专业性，督导组一方面注重质量控制，把好各类人员入选关，由专家工作组审定标准；审核各种专业工作方案；另一方面，规范过程管理，如督导前签署协议，督导中全程记录，督导后填写反馈，设立督导投诉信箱等。实践证明，该督导设计比较切合实际，运行效果良好。截止 7 月底，该平台累计完成各类督导超过 23000 人次；受督者对督导的满意度平均 9 分以上。

A Three-Layer Supervision Model of MOE-CCNU Mental Health Service Platform

WU Caizhi, REN Zhihong, JIANG Guangrong (corresponding author)
School of Psychology, Central China Normal University, Wuhan, 430079
(Corresponding author: JIANG Guangrong, E-mail: grjiang@yeah.net)

Abstract: During the epidemic of COVID-19 in 2020, Ministry of Education, relying on the existing working resources of Central China Normal University, set up the MOE-CCNU Mental Health Service Platform to provide 24-hour anti-epidemic psychological hotline service voluntarily to the Hubei and the national public, overseas Chinese, international students and so on. The platform has nearly 1,700 counselors on duty at peak hours. Given the non-academic education of most counselors, their theoretical foundation and practical skills may be inadequate. Moreover, the counseling time of one-session psychological hotline is limit, text counseling is difficult and challenging for counselors, and the counselors themselves were at risk of infection during the epidemic. Therefore, they need supervision timely in order to avoid exhaustion. Similarly, supervisors who have not received academic educations also need regular supervision (supervision of supervisors). Therefore, the platform designed a three-layer supervision structure: the first layer is the counselor, who provides psychological assistance services directly to the public; the second layer is the supervisor, who provides regular supervision to the counselor; and the third layer is the senior supervisor, who provides regular supervision to the supervisor. The registered system Hubei psychological assistance supervision team is fully responsible for the supervision management and operation of the MOE-CCNU Mental Health Service Platform. In order to ensure the quality of supervision and enhance professionalism, on the one hand, the supervision team pays attention to quality control, ensuring the competence of all counselors through validating the standards and reviewing various professional work programs. On the other hand, the supervision team is responsible for standardizing process management, such as signing an agreement before supervision, keeping full records during supervision, filling in the feedback after supervision, establishing supervision complaints mailbox, and so on. It has been proved that the supervision structure is practical and works well. By the end of July, the platform has completed more than 23,000 person-times of various kinds of supervision and the supervisee's satisfaction with the supervision is above 9 points on average.

感知社会支持在中国消防队员特质正念与情绪调节关系中的调节作用：一项追踪研究

余思¹（通讯作者） 徐慰²

1 北京师范大学心理学部 yusi2012psy@163.com

2 北京师范大学, 北京, 100101

摘要 情绪调节是个体对情绪困扰的反应和处理方式,有效的情绪调节策略有助于个体缓解各种心理问题,提高生活质量。在诸多群体中,消防员经常面临压力、创伤和危险等特殊群体特征决定了情绪调节能力在该类群体中的突出作用。从认知行为疗法来看,源自东方冥想的正念疗法被证明可有效减少情绪调节困难。现有为数不多的横断研究检验了特质正念和情绪调节之间的关系,但结果并不一致,可能原因是两者之间存在其他的调节变量。研究拟基于人与环境相互作用理论,探究在个体发展中起重要作用的环境因素——感知社会支持,是否在消防员特质正念与情绪调节中起调节作用。采用追踪调查,对江苏省某消防员培训中心的消防员通过两次问卷调查收集数据。共有 340 名消防员(男性 100%; Mage= 21.33 岁; SD = 1.55)在基线(T1)

和三个月后的随访（T2）中报告了其特质正念、情绪调节和感知社会支持水平。结果表明，在控制被试年龄、工作时间、创伤后应激症状以及抑郁的条件下，T1 感知社会支持可以显著调节 T1 特质正念与 T2 表达抑制（交互项 $\beta = -.12, p < .05$ ），但 T1 感知社会支持在 T1 特质正念和 T2 认知重评之间的调节作用不显著。研究表明，高感知社会支持水平可以加强正念对表达抑制的负向预测作用。感知社会支持较高的个体容易获得安全感和归属感，以及他人的理解、尊重和帮助。外部的社会支持和内部的积极认知活动共同作用，激励个体采取积极的方式应对困难，而不是抑制表达。研究结果揭示了正念与感知社会支持之间的作用对消防员情绪调节的重要影响，能够为后续针对紧急服务专业人员情绪调节能力干预提供科学依据。

摘要 2019 新型冠状病毒（COVID-19）大流行严重影响了公众的身心健康，甚至造成了部分民众的创伤后应激障碍（post-traumatic stress disorder, PTSD）。本研究在 2020 年 5 月 20 日至 6 月 20 日期间，测试了湖北省 522 名被试的正念水平、情绪弹性、正负情绪、PTSD 症状表现以及对于疫情的态度。比较高低正念水平、不同性别、亲友是否被感染对各项指标的影响，以及情绪弹性在正念水平与创伤后应激症状中的中介效应。研究结果发现：（1）高正念水平个体与低正念水平个体相比，情绪弹性得分更高，正性情绪得分更高，负性情绪得分更低，PTSD 各项指标得分更低。对新冠的恐惧程度更低。（2）男性与女性相比，情绪弹性得分更高，正性情绪得分更高，负性情绪得分更低。认为新冠病毒的死亡率更低，自己感染的可能性更低，恐惧程度更低。（3）亲友被感染的个体，认为自己被感染的可能性更高，PTSD 回避症状得分更高。（4）正念水平与情绪弹性、正性情绪成显著正相关关系，与 PTSD 症状得分成显著负相关关系；情绪弹性与正性情绪显著正相关，与负性情绪、PTSD 症状表现成显著负相关关系。（5）情绪弹性尤其是情绪恢复能力，在正念水平与 PTSD 症状之间起中介作用。以上结果表明性别影响个体疫情后的情绪反应以及对于疫情的态度；正念水平高低以及亲友是否被感染影响个体的 PTSD 症状表现；正念水平作用于情绪恢复能力，减少 PTSD 症状表现。

Effect of Mindfulness on Post-traumatic Stress Disorder: Emotional Resilience as a Mediator

Yuzheng Wang^{1,2}, Xinya Liu^{1,2}, Jing Chen^{1,2}, Fei Luo^{1,2}

1 CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences,
Beijing 100101, People's Republic of China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, People's
Republic of China

Abstract : The COVID-19 pandemic has greatly affected public health and well-being, and even induced post-traumatic stress disorder (PTSD). In this study, 522 subjects in Hubei province were tested for their levels of mindfulness, emotional resilience, positive and negative emotions, PTSD symptoms and attitudes toward the COVID-19 during May 20, 2020 - June 20, 2020. Different levels of mindfulness, genders, whether relatives or friends were infected were compared as the independent variables, and the mediating effects of emotional resilience on the levels of mindfulness and post-traumatic stress symptoms was also analyzed. Results showed that (1) individuals with high levels of mindfulness have higher scores for emotional resilience, positive emotions, but lower scores for negative emotions, and PTSD. They also have less fear of the COVID-19. (2) Men have higher score of emotional resilience and positive emotions, but lower score of negative emotions. Men tends to believe that the

COVID-19 have a lower mortality rate, a lower likelihood of infection, and have less fear. (3) Individuals whose relatives or friends were infected rated themselves as more likely to be infected, and scored higher on PTSD avoidance symptoms. (4) The level of mindfulness was significantly positively correlated with emotional resilience and positive emotions, and was significantly negatively correlated with PTSD symptoms. Emotional resilience was positively correlated with positive emotions, and negatively correlated with negative emotions and PTSD symptoms. (5) Emotional resilience, especially emotional resilience, plays a mediating role between mindfulness levels and PTSD symptoms. These results indicate that gender affects the emotional response and the attitude to the COVID-19. The level of mindfulness and whether a friend or relative was infected affected the individual's PTSD symptoms. Emotional resilience mediates the relationship between mindfulness and PTSD symptoms.

正念干预缓解情绪困扰机制初探：痛苦评估的纵向中介作用

刘冰茜¹ 谢强² 管烨¹ 张家琪¹ 刘兴华¹ (通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871

² 北京师范大学心理学部, 北京, 100875, xinghua_liu@pku.edu.cn

摘要 既往研究已表明正念干预可有效缓解个体情绪困扰, 然而其背后的干预作用机制尚待探明。鉴于现代以正念为基础的干预手段其核心理念在于改变个体与消极思维或情绪的相处方式而非消极思维或情绪本身, 痛苦忍受性, 即个体如何与痛苦相处可能是干预起效的重要机制变量。本研究通过对 129 名高情绪困扰成人进行的随机对照试验, 采用多时间点测量考察了为期八周的线上正念干预期间的正念水平、情绪困扰水平及痛苦忍受性的忍受、评估、沉浸和调节四个维度的发展趋势, 并对痛苦忍受性在正念干预与情绪困扰缓解间的纵向中介作用机制进行检验。被试共完成四次测量: 干预前 (3 月 20 日至 3 月 23 日)、第三周 (4 月 6 日至 4 月 14 日)、第六周 (4 月 27 日至 5 月 6 日)、干预后 (5 月 15 日至 5 月 24 日)。对前、后测进行的混合设计方差分析表明, 正念干预对情绪困扰的缓解作用再次得到验证, 对痛苦忍受性的干预效果则与前人发现不一致。考虑到新冠疫情的可能影响, 本研究仅对前三个处于疫情期间的时点进行建模。潜在增长模型显示, 组别显著预测正念观察、正念不反应和总体正念水平的增长速度, 显著预测个体痛苦忍受性中痛苦评估子维度的降低速度。纵向中介分析发现, 干预通过显著降低第三周时个体对痛苦的负性评估, 提升个体第六周的不反应水平, 与此同时对第六周的情绪困扰起到缓解作用。以上发现表明痛苦评估, 即个体将痛苦评估为负性, 可能是正念干预前期起效的重要机制变量, 对临床研究者与实践者的未来工作具有启发性。

How does Mindfulness-based Intervention lead to changes in emotional distress: Longitudinal mediating effect of distress appraisal

Bingqian LIU¹, Qiang XIE², Ye GUAN¹, Jiaqi ZHANG¹, Xinghua LIU¹

¹ School of Psychological and Cognitive Science, Peking University, No.5 Yiheyuan Road Haidian District, Beijing, P.R.China

² Faculty of Psychology, Beijing Normal University, No. 19, XinJieKouWai St., HaiDian District, Beijing, P.R.China

Abstract: Mindfulness-based Intervention (MBI) has been shown a beneficial impact on alleviating emotional distress. It remains unclear how the desired effects could be achieved. The core concept of Modern MBI is to alter the way one interacts with negative thoughts or emotions, rather than directly targeting the latter. In this context, distress tolerance (i.e. the capacity to experience and withstand negative psychological states) might be an important mechanism variable of MBI. In the present study, 129 participants were randomized into MBI groups or waiting list group. Participants completed questionnaires over four time points: pretest, week 3, week 6, and posttest. Mindfulness and emotional distress were considered as outcome variables, and distress tolerance (tolerance, appraisal, absorption, and

regulation) as mediators. Mixed-designed ANOVA showed significant time by group interactions on mindfulness and emotional distress, but only a marginal interaction on distress appraisal. The developmental trajectories modeled by the latent growth curve modeling showed that the factor Group significantly predicted the slope of observation, non-reactivity, and overall mindfulness, as well as the slope of distress appraisal in the first six weeks. A longitudinal mediation analysis revealed that the effect of MBI on Non-reactivity at week 6 was fully mediated by distress appraisal at week 3. The distress appraisal could also significantly predict lower emotional distress at week 6. Our results indicated that distress appraisal might be an important mechanism of MBI, which might contribute to a more specified intervention program in the future.

摘要 2020年一月,我国爆发新型冠状肺炎。作为国际公共卫生紧急事件,新冠传染性高,造成了大量确诊与死亡病例,因此易使个体感到生命被威胁,产生负性心理反应,其中创伤后应激症状(Posttraumatic Stress Symptom, PTSS)最为典型。PTSS的产生与发展受创伤暴露和个体对创伤感知的影响,在疫情的背景下表现为主客观疫情严重程度。但现实中大部分身处疫情重灾区的群众仍保持心理健康,可能得益于正念缓冲了疫情严重程度对PTSS的预测作用。因此,本研究分别探究主、客观疫情严重程度与PTSS的关系,以及状态、特质正念在其中的调节作用。本研究共招募107名被试(22.53%男性,平均年龄22.16岁,SD=2.16)。以被试所在省每日新增确诊人数作为客观疫情严重程度的指标;被试感知疫情严重程度作为主观疫情严重程度的指标。首先,动态研究为期7天的生态瞬时评估,主试每天登记被试所在省份的新增确诊人数作为客观疫情严重程度指标,并于每天11:00, 16:00及22:00通过微信调查被试在每个时间点上的主观疫情严重程度,PTSS与状态正念水平。纵向研究中,采用疫情期间各被试主客观疫情严重程度与正念的均值作为基线数据,并待两个月后疫情初步稳定时,采用问卷测量被试经历疫情后的PTSS水平。结果表明:(1)从动态层面讲,状态正念能调节主观疫情严重程度与PTSS间的正向关系,具体表现为当个体t时刻状态正念水平较低时,t-1时刻主观疫情严重程度正向预测t时刻的PTSS水平;然而当个体t时刻状态正念水平较高时,t-1时刻主观疫情严重程度负向预测t时刻的PTSS水平;(2)从特质层面讲,特质正念不能调节主、客观疫情严重程度与两月后PTSS的负向关系。上述结果表明,状态正念与特质正念在不同疫情严重程度与PTSS关系中的角色不同,体现了正念在动态与特质层面上的不同作用。

The severity of the pandemic and Posttraumatic Stress Symptoms: the moderating role of state and trait mindfulness

Xue WEN¹, Xiaoyan LIU², Wei XU²

1 School of Psychology, Nanjing Normal University, Nanjing, 100101

2 Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: In January 2020, Corona Virus Disease 2019 (COVID-19) broke out in China. As an international public health emergency, COVID-19 was highly infectious and caused a large number of confirmed and death cases. Therefore, it was easy for individuals to feel that their lives were in danger and have negative psychological reactions, among which the posttraumatic stress symptoms (PTSS) were the most typical. The generation and development of PTSS were affected by trauma exposure and personal perception of trauma. In the context of COVID-19, they were manifested as the subjective and objective severity of the pandemic. In fact, however, most people who were in the

severely affected areas still maintained good mental health, which might benefit from the buffering effect of mindfulness on reducing the predictive effect of the severity of the pandemic on PTSS. Therefore, this study explored the relationships between the subjective and objective severity of the pandemic and PTSS, as well as the moderating effects of state and trait mindfulness. A total of 107 participants were recruited (22.53% male, average age 22.16 years, $SD = 2.16$). The daily numbers of newly diagnosed cases in the province where the participants were located were used as the objective severity of the pandemic; the participant's perceptions of the severity of the pandemic were used as the subjective severity of the pandemic. First, the dynamic study was a 7-day Ecological Momentary Assessment (EMA) process. The researchers recorded the number of the newly diagnosed in the province where the participant was located each day as the objective severity of the pandemic, and conducted WeChat surveys on each participant at 11:00, 16:00 and 22:00 every day to measure the subjective severity of the pandemic, PTSS and state mindfulness levels. In the longitudinal study, the average values of subjective and objective severity of the pandemic and mindfulness of each participant during the EMA process were used as baseline data. When the pandemic situation was initially stable after two months, questionnaires were used to measure the PTSS levels. The results showed that: (1) From the momentary perspective, state mindfulness could moderate the association between the subjective severity of the pandemic situation and PTSS. Specifically, when participants were low in state mindfulness levels at t time point, their subjective severity of the pandemic at $t-1$ time point positively predicted the PTSS level at t time point; however, when participants were high in state mindfulness levels at t time point, their subjective severity of the pandemic at $t-1$ time point negatively predicted the PTSS level at t time point; (2) From the longitudinal perspective, trait mindfulness could not moderate the association between the subjective and objective severity of the pandemic and PTSS two months later. The results above showed that state and trait mindfulness played different roles in the relationship between different kinds of the severity of pandemic and PTSS, reflecting the distinct effects of state and trait mindfulness.

短期正念训练降低反应性攻击——接纳及愤怒的作用

彭异芳¹ 宋晓兰^{1,2} (通讯作者)

1 浙江师范大学心理系, 金华, 321004

2 浙江师范大学正念研究实验室, 金华, 321004, xlsong@zjnu.cn

摘要 反应性攻击指行为者在受到外界因素的激惹后由愤怒情绪驱使而对他人采取的攻击行为, 正念训练已被证实可有效减少服刑人员、临床及非临床群体的攻击行为, 但正念效应的机制尚不明晰。本研究旨在探讨正念训练降低反应性攻击的内部原因。研究一以 107 名大学生为被试(平均年龄 19.52 ± 1.46 岁, 女性 59 人)采用费城正念量表及泰勒攻击范式探讨正念特质与反应性攻击的关系, 结果表明愤怒情绪及特质正念的接纳维度均与反应性攻击水平均存在显著负相关, 接纳在愤怒及反应性攻击之间起到调节作用, 随着愤怒情绪的升高, 高接纳水平被试的反应性攻击显现出下降的趋势, 而低接纳水平被试的反应性攻击显现出上升的趋势。研究二旨在探讨正念训练中的接纳及觉察因素分别对反应性攻击的影响, 189 名被试(平均年龄 20.03 ± 1.75 岁, 女性 105 人)随机分配到标准正念组、觉察训练组、放松训练组与控制组中, 四组被试均进行十五分钟的音频干预, 并测量干预后的反应性攻击水平。结果表明标准正念组经过包含接纳与觉察成分的干预后, 接纳水平显著高于其他三组。同时, 标准正念组在反应性攻击任务中表现出较其他三组更少的愤怒情绪与攻击水平。干预方式在愤怒情绪与反应性攻击之间存在调节效应, 控制组中愤怒情绪可以显著正向预测攻击水平, 而在标准正念组、觉察训练组与放松训练组中愤怒情绪与攻击水平之间不存在显著的关系。为探讨愤怒情绪

的改变是否在正念训练与反应性攻击之间起到中介作用, 研究三将被试随机分配到正念组与控制组, 均进行反应性攻击的前测与后测。结果表明愤怒水平的改变值在正念水平及反应性攻击的改变值之间起到部分中介作用: Indirect effect=[-.0581, -.0 020]。研究结果表明愤怒的改变及正念中的接纳维度均与反应性攻击存在密切联系, 正念中接纳维度的提升具有缓和愤怒和反应性攻击的作用, 正念训练在一定程度上通过降低愤怒情绪降低反应性攻击水平, 但愤怒情绪的降低可能并非正念训练降低反应性攻击水平的唯一路径。

关键词 正念训练, 觉察, 接纳, 愤怒, 反应性攻击

Brief mindfulness training attenuated reactive aggression—the effect of mindful acceptance and anger

Yifang Peng¹, Xiaolan Song¹²

¹ Department of Psychology, Zhejiang Normal University, Jinhua, China

² Laboratory of Mindfulness, Zhejiang Normal University, Jinhua, China

Abstract: Reactive aggression is an impulsive reaction motivated by anger to a perceived provocation or frustration. It has been confirmed that mindfulness training could attenuated aggression in previous studies, but the mechanisms of mindfulness is still not explicit. Therefore, the aim of our study is to clarify the reason why mindfulness training reduces reactive aggression based on Monitor and Acceptance Theory. In study 1 we examined the link between trait mindfulness and reactive aggression in 107 undergraduates (Mean age=19.52±1.46, female:59), results demonstrated that trait acceptance, but not trait awareness was negatively related with anger and reactive aggression. Moreover, Trait mindful acceptance moderated the association between anger and reactive aggression. Participants with higher acceptance showed decreased reactive aggression as anger rose, while those with lower acceptance showed increased reactive aggression as anger rose. In study 2 we were going to clarify the effect of state acceptance and state awareness improved by different training respectively on reactive aggression. 189 Participants (Mean age=20.03±1.75, female:105) were randomly assigned to Mindfulness Group, Awareness Group, Relaxation Group and Control Group. Results demonstrated that participants receiving mindfulness training which contained cultivation of mindful acceptance showed less angry and reactive aggression after provocation compared with other three groups in which contained no mindful acceptance. Moreover, the intensity of anger did not predict the intensity of reactive aggression in mindfulness group while the prediction of anger on reactive aggression was significant in Control group. In order to figure out if the change of anger intensity mediates the relationship between mindfulness and reactive aggression, the participants were allocated randomly in mindfulness group and control group and we measured the intensity of reactive aggression at both pre-test and post-test. Results demonstrated that the change of anger mediated between mindfulness and reactive aggression: Indirect effect=[-.0581, -.0 020]. Our findings provide evidence that mindful acceptance and anger play a key role in reducing reactive aggression. Mindful acceptance improved by training can reduce anger and reactive aggression. To some extent, mindfulness training can attenuate reactive aggression through mitigating anger, however there may exist another pathways between mindfulness and reactive aggression to be explored.

基于正念的心身减压课程对医务人员焦虑抑郁的改善效果评价

孙梦云¹ 郑睿敏¹ (通讯作者) 赵德峰³ 王淑霞² 杨濛³

¹ 中国疾病预防控制中心妇幼保健中心, 北京, 100081, zhengruimin@chinawch.org.cn

² 中国疾病预防控制中心营养与健康所, 北京, 100050

³ 中国妇幼保健协会妇女心理保健技术学组, 北京, 100081

摘要 目的: 评价基于正念的心身减压课程对医务人员焦虑和抑郁情绪的改善效果, 并分析焦虑、抑郁情绪与正念水平的关系。**方法:** 在 2018 年 9 月至 2019 年 10 月期间, 采用干预研究的方法, 招募四川、河南、

陕西、广州、山东和浙江的医务人员接受基于正念的心身减压课程，包括 2 日团体学习和 21 日网络练习。分别于 2 日团体学习前、2 日团体学习后，以及 21 日网络练习后采用自评焦虑量表 (SAS)、自评抑郁量表 (SDS) 和五因素正念量表 (FFMQ) 进行前测、中测和后测。采用配对资料的 t 检验分析干预前后医务人员焦虑、抑郁和正念水平的改变。**结果：** 分别有 405 人、288 人和 386 人进行了前测、中测和后测。与前测相比，SAS 和 SDS 后测总分的下降均有统计学意义 (SAS: $t=5.97$, $P<0.0001$; SDS: $t=8.06$, $P<0.0001$)，FFMQ 后测总分和“观察”、“不行动”分维度得分的上升均有统计学意义 (FFMQ: $t=-7.86$, $P<0.0001$; “观察”: $t=-12.22$, $P<0.0001$; “不行动”: $t=-5.68$, $P<0.0001$)，“觉知的行动”分维度得分的下降有统计学意义 ($t=2.48$, $P=0.0136$)；中测“观察”和“觉知的行动”分维度得分的改变均有统计学意义 (“观察”: $t=-5.73$, $P<0.0001$; “觉知的行动”: $t=7.59$, $P<0.0001$)。此外，在前测中，SAS、SDS 总分与 FFMQ 总分均呈负相关关系 (SAS: $r=-0.63$, $P<0.0001$; SDS: $r=-0.62$, $P<0.0001$)。研究对象 100% 完成 2 日团体课程。85.43% 基本完成 21 日家中练习打卡 (练习天数 ≥ 20 次)。**结论：** 基于正念的心身减压课程在一定程度上可缓解医务人员的焦虑和抑郁情绪，提高正念水平。医务人员的焦虑抑郁情绪与正念水平呈负相关关系。

Effect of Mindfulness based stress reduction courses on anxiety and depression among medical professionals

Sun Mengyun¹, Zheng Ruimin¹, Zhao Defeng³, Wang Shuxia², Yang Meng³

1 National Center for Women and Children's Health, Chinese CDC, Beijing, 100081

2 National Institute for Nutrition and Health Chinese CDC, Beijing, 100050

3 Women's Mental Health Technology Group, China Maternal and Child Health Association, Beijing, 100081

Abstract: Objective: To evaluate the effect of mindfulness based stress reduction courses on anxiety and depression among medical professional, and explore the relationship between anxiety, depression and the level of mindfulness.

Methods: From September 2008 to October 2019, medical professionals from Sichuan, Henan, Shaanxi, Guangzhou, Shandong and Zhejiang were recruited in the intervention study of mindfulness based stress reduction courses, including, including 2-day group training and 21-day self-practice. Self-Anxiety Scale (SAS), Self-Depression Scale (SDS) and Five Facet Mindfulness Questionnaire (FFMQ) were used to assess the level of anxiety, depression and mindfulness before 2-day group training (1st assessment), after 2-day group training (2nd assessment), and after 21-day self-practice (3rd assessment) respectively. Paired t test was used to analyze the change of anxiety, depression and the level of mindfulness. **Results:** 405, 288 and 386 medical professionals were received 1st assessment, 2nd assessment and 3rd assessment respectively. Compared to 1st assessment, the total score of SAS and SDS in 3rd assessment were significantly reduced (SAS: $t=5.97$, $P<0.0001$; SDS: $t=8.06$, $P<0.0001$), and the total score of FFMQ and “Observation”, “No motion” score in 3rd assessment were significantly increased (FFMQ: $t=-7.86$, $P<0.0001$; “Observation”: $t=-12.22$, $P<0.0001$; “No motion”: $t=-5.68$, $P<0.0001$), and “conscious motion” reduced ($t=2.48$, $P=0.0136$). The change of “Observation” and “conscious motion” from 1st assessment to 2nd assessment were significant (“Observation”: $t=-5.73$, $P<0.0001$; “No motion”: $t=7.59$, $P<0.0001$). Besides, the scores of SAS and SDS are negatively related to FFMQ score (SAS: $r=-0.63$, $P<0.0001$; SDS: $r=-0.62$, $P<0.0001$). 100% medical professionals completed 2-day group training and 85.43% completed 21-day self-practice. **Conclusion:** Mindfulness-based stress reduction courses could improve anxiety, depression and level of mindfulness among medical professionals, and the level SAS and SDS are negatively related to the level of mindfulness.

正念干预对中国孕产妇分娩恐惧影响的随机对照研究

孙梦云, 郑睿敏*

中国疾病预防控制中心妇幼保健中心, 北京, 100081

摘要 目的 评估正念干预对改善孕产妇分娩恐惧及抑郁、焦虑症状的干预效果, 探索孕产期心理保健新方法。方法 研究对象来自四川、山东、河南、河北省的符合入组标准自愿参加研究的孕产妇, 随机分为研究组 (n=67) 和对照组 (n=67), 干预组接受 2 天正念训练现场课程及 21 天正念训练加健康教育网络课程, 对照组在同期仅接受 21 天健康教育网络课程。采用分娩预期量表 (WDEQ-A)、正念五因素量表 (FFMQ)、焦虑自评量表 (SAS) 和爱丁堡产后抑郁量表 (EPDS) 对研究对象在干预前一周和干预后一周进行测评。结果 两组研究对象的人口学特征均衡可比。研究组的正念水平较干预前上升了 3.14 分 ($t=-2.046, P=0.045$), 分娩恐惧得分下降 9.4 分 ($t=3.939, P=0.000$), 抑郁得分下降了 2.49 ($t=4.349, P=0.000$), 焦虑得分下降 2.52 ($t=2.113, P=0.039$)。而对照组的正念水平较基线下降了 2.77 分, 其分娩恐惧、抑郁、焦虑得分较干预前有所降低, 但是差异无统计学意义。干预组和对照组之间的分娩恐惧得分也存在显著差异 (分别为 58.81 分和 63.22 分, $F=4.722, P=0.032$)。正念水平与分娩恐惧呈负相关 ($r=-0.314, P<0.05$)。结论 正念训练可提高孕妇的正念水平, 稳定情绪波动, 是降低分娩恐惧, 改善抑郁、焦虑情绪较为有效的保健方法。

关键字 正念训练、孕产妇、分娩恐惧、抑郁、焦虑

The influence of mindfulness on maternal fear of childbirth in China: A multicenter randomized controlled study

Sun Mengyun, Zheng Ruimin*

(National Center for Women and Children's Health, China CDC, Beijing, 100081)

Abstract: **Purpose** To evaluate the effect of mindfulness on improving fear of childbirth, depression and anxiety. The aim is explore new methods of maternal mental health care. **Methods** The pregnant women who conformed to the inclusion criteria and voluntarily participated in the study come from Sichuan, Shandong, Henan and Hebei province. They were randomly divided into intervention group (n=67) and control group (n=67). The intervention group received 2-day mindfulness training on-site and 21-day mindfulness training plus health education on the internet, while the control group only received 21-day health education on the internet in the same period. The study used Wijma Delivery Expectancy Questionnaire (WDEQ), Five Facet Mindfulness Questionnaire (FFMQ), Self-Rating Anxiety Scale (SAS), Self-Rating Depression Scale (SDS). Assessments were conducted at one week pre-intervention and one week post-intervention. **Results** The demographic characteristics of the two groups were balanced. The mindfulness level of the intervention group increased by 3.14 points ($t=-2.046, P=0.045$). The fear of childbirth score decreased by 9.4 points ($t=3.939, P=0.000$). The depression score decreased by 2.49 ($t=4.349, P=0.000$), and the anxiety score decreased by 2.52 ($t=2.113, P=0.039$). The mindfulness level of the control group decreased by 2.77 points compared with the baseline. The scores of fear of childbirth, depression and anxiety decreased but the difference was not statistically significant. There were also significant differences in the scores of fear of childbirth between the intervention group and the control group (58.81 points and 63.22 points respectively, $F=4.722, P=0.032$). The level of mindfulness was negatively correlated with fear of childbirth ($r=-0.314, P<0.05$). **Conclusion** Mindfulness training increased the mindfulness level and stabilized the mood swings of pregnant women. Mindfulness is an effective health care method to reduce the incidences of FOC, depression, and anxiety.

八周网络视频、自助正念课程增强内感觉觉察、降低情绪困扰

管烨 刘兴华（通讯作者）

北京大学心理与认知科学学院，北京，100871, xinghua_liu@pku.edu.cn

摘要 背景:已有大量研究表明正念训练能有效缓解抑郁、焦虑等情绪困扰，而内感觉觉察被认为是正念干预起效的机制之一。2020 年的新冠疫情下，通过网络开展的正念课程可成为缓解情绪困扰、促进心理健康的便捷、高性价比途径。本研究考察八周网络视频和自助正念课程提升高情绪困扰人群的内感觉觉察的效果。方法:受情绪困扰的被试 126 人（年龄 32.16 ± 9.25 ，女性 102 人，男性 24 人）被随机分入八周网络课程组（第 1 组，41 人）、自助课程组（第 2 组，43 人）、等待对照组（第 3 组，42 人）。在干预开始前、第 6 周课程前、干预后分别测量被试的情绪困扰、正念和内感觉觉察。情绪困扰测量使用 Kessler 情绪困扰量表（K10 量表）、中文版知觉压力量表（CPSS），使用多维度内在感受觉察（MAIA）测量内感受觉察。结果:线性混合模型分析表明，干预显著降低了情绪困扰，提升内感觉觉察，尤其 MAIA 专注力调适分维度分数。将两个干预组合并，是否进行训练作为自变量，MAIA 总分、分量表得分的前后测变化作为中介变量，情绪困扰或压力的前后测变化作为结果变量，进行简单中介分析，结果表明正念训练可以预测内感觉觉察的提升、情绪困扰/压力的缓解，并且内感觉觉察与情绪困扰/压力的缓解负相关，间接效应显著。此外，MAIA 第 3 周、第 6 周时相对于前测的变化在干预缓解情绪困扰/压力的效果中起中介作用。说明身体内感觉觉察的提升可能是正念训练降低情绪困扰和压力的可能机制。结论:正念干预提升内感觉觉察，这可能是干预缓解情绪困扰的可能机制。此外，本实验室开发的在线自助课程可以得到和八周训练同等的效果，为进一步开发便捷有效的正念干预项目奠定基础。

关键词 正念，随机对照试验，内感觉觉察，情绪困扰，网络干预

8-week online mindfulness intervention and self-help mindfulness improve interoceptive awareness and reduce psychological distress

Guan Ye, Liu Xinghua (Corresponding author)

School of Psychological and Cognitive Sciences, Peking University, 100871, China

Abstract: Mindfulness-based interventions (MBIs) have been shown to alleviate psychological distress such as depression and anxiety. It has been proposed that improved interoceptive awareness is a potential mechanism of MBIs. Online MBIs can be a convenient and cost-effective way to relieve psychological distress and boost mental health, especially in the context of COVID-19 pandemic. The current study investigated the effect of 8-week online mindfulness intervention and self-help mindfulness on interoceptive awareness among individual with elevated psychological distress. Method: 126 psychologically distress participants (age 32.16 ± 9.25 , female 102, male 24) were randomly assigned to 8-week online mindfulness training (group 1; $N=41$), 8-week online self-help course (group 2; $N=43$) and waitlist control group (group 3; $N=42$). Psychological distress, perceived stress, interoceptive awareness were measured before, after the intervention and before the 6th week's intervention. Psychological distress was measured by the Kessler 10 (K10). Perceived stress was measured by the Chinese version of Perceived Stress Scale (CPSS). Interoceptive awareness was measured by Multidimensional Assessment of Interoceptive Awareness (MAIA). Linear mixed effect models showed that the intervention alleviated psychological distress and improved interoceptive awareness (specifically the Self-Regulation subscale). The two intervention groups were combined into a single intervention group for further mediation analysis, with the pre-post change of MAIA and its subscales' scores as mediators and change scores of psychological distress or perceived stress as the outcome variables. Results revealed significant indirect effects. The intervention significantly predicted increased interoceptive awareness and decreased psychological distress. Interoceptive awareness was negatively related to psychological distress. Furthermore, the 3rd week to baseline and the 6th week to baseline change score of MAIA mediated the effect of the intervention on psychological distress and stress. It suggested that interoceptive awareness could be a mechanism of mindfulness training effect on psychological distress. Conclusion: These findings provided evidence that mindfulness intervention

may ease psychological distress through increasing interoceptive awareness. In addition the online self-help course could produce identical treatment effect with the online course that required regular weekly class meeting. This finding paved the way for future development of cost-effective mindfulness intervention program.

Keywords: mindfulness, RCT, interoceptive awareness, psychological distress, online intervention

四周在线自助正念课程对情绪困扰人群的效果

巨睿琳^{1*} 招颖诗^{1*} 臧寅垠¹ 刘兴华² (通讯作者)

摘要 目标: 新冠病毒(COVID-19)的爆发, 可能激发或者恶化部分个体的情绪困扰。在线自助形式的正念课程是一个更灵活且可行的干预形式。本研究开发了针对情绪困扰人群的为期4周的在线自助正念课程, 并在疫情期间测试了干预的有效性, 以及正念水平和焦虑、抑郁、压力和情绪困扰之间的关系。方法: 本研究开展于2020年2月3日至2020年5月20日, 共招募682名情绪困扰得分高的非临床个体。正念干预组($n=358$)进行连续28天, 每天30~60分钟的自助正念课程; 等待组($n=324$)在28天等待后接受在线正念课程。在干预前后和干预期间对两组被试的正念水平、感知压力、情绪困扰、焦虑和抑郁水平共进行5次测量。结果: 线性混合模型分析发现, 在所有结果变量中有显著的时间和组别的交互作用。与等待组相比, 干预组的参与者在焦虑、抑郁、压力、情绪困扰和正念水平方面都有显著改善。对5个时间点的结果进行交叉滞后分析表明, 正念水平在所有时间点均可以反向预测下一个时间点的焦虑水平, 正念水平与抑郁、压力和情绪困扰在不同的时间点有相互的预测关系。讨论: 尽管这项研究有一定局限性, 包括没有随机分配参与者和缺乏长期随访, 本研究初步表明针对情绪困扰人群的4周自助在线正念干预的积极效果, 并表明正念水平的提升可能预测焦虑的降低, 正念水平的提升与抑郁、压力和情绪困扰的降低可能在干预期间相互作用, 这为正念水平和这些心理变量的时间性和因果性关系提供了部分实证支持。

Abstract: Objectives: The outbreak of coronavirus (COVID-19) may stimulate or worsen the emotional distress of some individuals. The online self-help mindfulness course is a more flexible and feasible intervention method. Current study developed a 4-week online self-help mindfulness course for people with emotional distress and tested the effectiveness of the intervention as well as the relationship between mindfulness skills and anxiety, depression, stress and emotional distress during the epidemic. Methods: This study was conducted from 3rd February 2020 to 20th May 2020 and a total of 682 non-clinical individuals with high emotional distress score was recruited. The mindfulness intervention group ($n=358$) engaged in the self-help mindfulness course which lasted 30 to 60 minutes per day for 28 consecutive days. The waiting-list group ($n=324$) received mindfulness course after 28 days of waiting. The levels of mindfulness skills, perceived stress, emotional distress, anxiety and depression were measured five times before, after, and during the intervention. Results: Using linear mixed models, significant group-by-time interactions in all outcome variables were found. Participants in intervention group exhibited significant

improvements in anxiety, depression, stress, emotional distress and mindfulness skills compared with the waiting-list group. The cross-lagged analysis of the results at five time points showed that mindfulness skills negatively predicted subsequent anxiety at all time points, and that mindfulness skills and depression, stress and emotional distress predicted each other at different time points. Discussion: Despite limitations of this study, including no random allocation of participants and lack of a long-term follow-up, this study preliminarily demonstrated the positive effects of a 4-week self-help online mindfulness intervention for people with emotional distress. It also suggested that changes in mindfulness skills may predict changes in anxiety, and that mindfulness skills and depression, stress and emotional distress may reciprocally influence each other during the intervention. We provided empirical support for the temporality and causality between mindfulness skills and other psychological outcomes.

摘要 基于多媒体学习的信号原则(signaling principle)，突显学习材料的关键部分有利于学生对学习内容的注意加工，从而提高学生的学习效果（Mayer, 2021）。近期研究发现，基于眼动样例(EMME, Eye Movement Modeling Examples)的注意引导能够积极促进学习者的学习表现和注意加工(Wang, et al., 2020; Xie, et al., 2021)。本研究基于已有的信号原则，进一步关注两种基于信号原则的注意引导方式（传统视觉线索，EMME）对学生注意加工和学习成绩的影响。实验 1 招募 67 名大学生被试，以短时长的教学视频（2 分 11 秒）为实验材料，采用单因素 3 水平（EMME，传统视觉线索组，控制组）的实验设计探讨短时长条件下 EMME 与传统线索的有效性对比。结果发现，眼动样例和传统视觉线索对注意加工和保持、迁移成绩均有促进作用；相比于传统视觉线索，眼动样例的注意引导作用更强，但是这种更强的注意引导作用没有引起 EMME 组更优的学习表现。实验 2 进一步在长时长的教学视频（9 分 20 秒）中验证实验 1 的结果，使用了不同的学习材料，并且控制了材料难度。实验 2 的实验设计与实验 1 相同，共招募大学生被试 71 名。结果发现，眼动样例和传统视觉线索对注意加工和迁移成绩有促进作用，眼动样例对保持成绩有促进作用；眼动样例相比于传统线索有更强的注意引导作用，但两组在学习成绩上没有差异。综合两个实验结果，结论认为眼动样例与线索都可以促进学习，并没有发现眼动样例在学习效果上优于传统视觉线索，证实了 EMME 的积极作用主要来自于注意引导，与传统线索具有相同的作用(Mayer, 2021; Wang et al., 2020)。未来研究应进一步不同经验水平学习者的 EMME 对学习效果和注意引导的作用，以及学习者本身经验的影响作用。

Eye Movement Modeling Examples and Conventional Cues as Attention Guidance in Multimedia Learning

Wang Fuxing, Zhao Tingting, Kuang Ziyi

School of Psychology, Central China Normal University, Wuhan 430079

Abstract: Based on the signaling principle, highlighting key parts of learning materials facilitates students' attention to the processing of learning content, thereby improving their learning outcomes (Mayer, 2021). The purpose of this study is to pay attention to the influence of two attention guidance methods (traditional visual cues, eye movement modeling example) on students' attention processing and academic performance. Experiment 1 took the short-term

teaching video (2 minutes and 11 seconds) as the experimental material, and used the experimental design of single-factor 3 level (eye movement modeling example group, traditional visual cues group, control group), and recruited a total of 67 college students to be tested. The results showed that EMME and traditional visual cues promoted attention processing, retention and transfer; compared with the traditional visual cues, EMME had stronger attention guidance, but this stronger attention guidance did not lead to better learning performance. Experiment 2 further verified the results of Experiment 1 in the long-term teaching video (9 minutes and 20 seconds), adopted the same experimental design as experiment 1, and recruited a total of 71 college students to be tested. The results show that the EMME and the traditional visual cue have the effect of promoting the attention processing and transfer results, and the EMME can promote the retention test; EMME have a stronger attention-guidance effect than traditional cues, but there is no difference in knowledge test between the two groups. In summary, this study found that EMME and traditional cue can promote learning, which validates the results of previous studies (Mayer, 2021; Wang et al., 2020), but this study did not find that EMME are better than traditional visual cues in learning effect. Future research should further explore the influence of different experience on the effect of EMME.

Keywords: eye movement modeling example, traditional visual cues, video learning, multimedia learning

基于意图推断的动态显控设计

徐杰¹

¹ 浙江大学心理科学研究中心, 杭州, 310007, xujie0987@zju.edu.cn

摘要 未来高度自主化的复杂人机系统中, 为了维持人在环路的任务绩效, 研究提出了人机界面透明化的设计原则, 以维持人在作业时的态势感知。然而, 透明化设计带来的信息量的增大, 会增加人信息过载的风险。要解决信息过载的问题, 人机界面需要从传统静态的、空分制设计转化到动态的、时分制设计。在这种动态显控设计下, 人机界面需要按照人和系统的实时需求实现显控信息的动态呈现。在复杂人机系统的人机界面设计实践中, 我们提出了基于操作者意图推断的动态显控设计框架, 以为新型智能人机界面设计提供理论和技术上的支撑。其中, 操作者意图的实时推断以任务-情境-操作者意图推断模型来实现。任务-情境-操作者意图推断模型的构建过程先针对特定人机系统, 采用认知工作分析的方法, 结合目标-计划-行动多层次的意图结构模型, 得出特定任务-情境下人的操作意图集合; 然后采用眼动追踪和神经生理计算等技术, 实现实时的特定意图识别。在人机界面层, 根据人的意图集合与特定意图, 可以采用区块推送、即点推送和视点推送等方法, 实现显控信息的按需显示。本报告将介绍基于操作者意图推断的动态显控设计框架, 并探讨这种人机界面设计思路如何能够应对复杂人机系统中的其他人因工程问题, 如注意隧道效应和人机决策偏差等。

Human-Intention-Inference-based Dynamic Human-System Interface

Jie Xu

Center for Psychological Sciences, Zhejiang University, Hangzhou, 310007, E-mail:

xujie0987@zju.edu.cn

Abstract : To control the out-of-the-loop performance problem in highly automated systems, researchers have proposed the transparency principle for human-system interface (HSI) design. According to the transparency design principle, information regarding the current states of the automated system should be presented to the operator to maintain the operator's situation awareness. However, adding more information to the HSI may lead to information overload on the operator and result in reduced performance. One potential solution to this problem is to design a dynamic and proactive HSI, which presents information according to the needs of the operator and the system. To this end, we proposed a human-intention-inference-based HSI design framework. In this design framework, dynamic HSI is driven by a human intention inference (HII) model. The HII model for a human-machine system is built through a set of human factors engineering methods, including a modified cognitive work analysis which incorporates an intention analysis component, and physiological computing models to recognize human cognitive states and intention

under certain task contexts. In practice, combining the HII model and gaze-contingent display techniques, the HSI could optimize information display in real-time. In this talk, I will introduce the analysis and design process of the HII-based dynamic HSI, and also discuss how this design methodology can potentially be used to control human factors issues such as attentional tunneling and decision bias.

Keywords : Cognitive work analysis, intention inference, eye-tracking, human computer interface, augmented cognition

使用眼动追踪考察学龄前自闭症儿童的语言发展

周鹏

清华大学外文系, 北京, 100084, zhoupeng1892@mail.tsinghua.edu.cn

摘要 自闭症儿童的语言能力存在很大的变异性, 尤其是他们的产出性语言 (expressive language)。有的自闭症儿童的结构性语言技能 (句子的语法结构) 良好, 能够达到正常水平; 有的产出的句子有语法问题; 有的开口说话较晚, 但也能获得语言, 尽管他们最终的语言水平和典型儿童相比还存在差距; 有的虽然接受了语言干预, 但始终不能开口说话, 或者只有很少的语言。除了产出性语言差异外, 自闭症儿童的理解性语言 (receptive language) 也存在很大变异性。研究大多认为和产出性语言相比, 自闭症儿童的理解性语言受损的程度更大。但目前考察自闭症儿童语言理解的研究还远远不足, 对他们语言理解能力的了解还很不充分, 更缺少对他们语言理解背后相关机制的探讨。表面上看自闭症儿童在语言理解方面有严重的缺陷, 但这种表面上看起来严重的缺失可能更多地和他们缺乏社会性响应 (social responsiveness) 相关, 而非语言加工上的缺失。以往研究在考察自闭症儿童的语言理解能力时多采用离线 (offline) 实验任务, 如标准化测试和父母的报告。此类离线任务往往对互动和反馈有很高的要求, 而这样的互动和反馈对自闭症儿童来说是尤其困难的。他们自身的行为和症状特征经常会干扰他们完成相关实验任务, 从而掩盖他们真实的语言理解能力。在该报告中, 我们汇报使用眼动追踪的视觉-情境范式所采集的 3 到 5 岁汉语普通话自闭症儿童的在线语言理解数据, 并在此基础上探讨 (i) 自闭症儿童如何使用词汇语义、形态句法和韵律等不同信息理解句子语义, (ii) 他们的语言加工机制的特征以及与典型儿童相关能力比较的差异。我们也讨论眼动追踪的视觉-情境范式在检测学龄前典型与非典型儿童语言与认知能力发展中的优势。

Using eye-tracking to investigate language development in preschool children with autism spectrum disorder

Peng Zhou

Tsinghua University, Beijing, 100084, zhoupeng1892@mail.tsinghua.edu.cn

Abstract : There is enormous variability in the language profiles of children with autism spectrum disorder (ASD), especially in their expressive language. Some children with ASD never acquire functional spoken language; some have relatively good structural language, some exhibit deficits in both lexical and grammatical domains, and some demonstrate impaired grammar. In addition, their receptive language seems to be relatively more impaired than expressive language. Previous research seems to suggest that the language comprehension abilities of children with ASD might be particularly impaired. However, their poor language comprehension abilities are likely to be related more to these children's overall lack of social responsiveness than to language processing deficits. Much previous research that assessed the language comprehension abilities of children with ASD used offline tasks like standardized tests or caregiver reports. These offline tasks often require high response demands or interactions with the experimenters, which might pose particular difficulties for children with ASD, because children with ASD often exhibit various kinds of challenging behaviors or symptoms which might interact with the high task and communication demands, and thus frequently mask the comprehension abilities of these children. The present talk presents findings from a set of experiments that investigated the real-time language comprehension by 3- to

5-year-old Mandarin-speaking children with ASD using the visual world paradigm of eye-tracking. On the basis of these findings, we then discuss (i) how children with ASD use different types of linguistic cues in understanding sentence meanings, and (ii) the nature of their language comprehension mechanism in comparison with typically developing (TD) children. In addition, we discuss the advantages of the visual world paradigm for testing the language and cognitive development in preschool TD children and children with ASD.

Keywords: children with ASD, preschool, eye-tracking, language production, language comprehension

注意与眼动系统的耦合：来自 24 个空间线索任务的结果

王治国（通讯作者） 丁云

浙江大学，杭州，310027, zhiguo@zju.edu.cn

摘要 注意与眼动系统有密切关联。注意的“前运动理论”（premotor theory）认为空间注意与指向特定位置的运动编码的神经通路相同，行为实验也发现注意会在眼跳发生前转移到眼跳目标位置。线索范式是空间注意研究的经典实验任务。在该实验任务中，线索和目标刺激可以是呈现在中央视野但是指向一个目标位置的箭头，也可以是在边缘视野突现的视觉刺激。对于线索刺激，被试可以做出眼跳反应、按键反应，或者不做出任何反应；对于目标刺激，被试可以做出眼跳或者按键反应。因此，线索范式可能有 24 种不同的变式。以线索范式中经典的“返回抑制”效应为标记，本研究采用被试内设计对线索范式的 24 种可能的变式进行了系统的考查，以揭示注意与运动系统，特别是眼动系统的关系。本研究发现：(1) 有 22 种线索任务中有返回抑制效应；(2) 与 Taylor 和 Klein (2000) 的理论相左，返回抑制效应不能基于眼动系统的激活状态被划分为感觉和运动两类；(3) 在需要对线索做出眼跳反应的任务中，返回抑制效应整体更强。这些研究结果表明注意与眼动系统有紧密的耦合。

关键词 眼动，空间注意，眼动追踪，线索范式，注意的前运动理论

Tight coupling of attention and the oculomotor system: The results from 24 spatial cueing tasks

Zhiguo Wang (corresponding author), Yun Ding

Zhejiang University, Hangzhou, 310027, zhiguo@zju.edu.cn

Abstract: Attention is closely linked to the oculomotor system. The premotor theory speculates that spatial attention derives from the same circuits responsible for programming motor behavior toward specific spatial locations. In line with this theory, it has been shown that attention towards a saccade target preceeds the saccade itself. The cueing paradigm is a classic paradigm designed to probe spatial attention. In a cueing task, the cue and the target stimuli could be an arrow pointing to a location or an visual onset in the peripheral. The participant could respond to the cue by initiating a saccade or pressing a button towards the target, or simply ignore the cue. For the target stimuli, the participant could initiate a saccade or press a button. Consider the types of stimuli and response that could be used in a cueing task, a total of 24 possible cueing tasks can be used to probe spatial attention. An inhibitory aftereffect, frequently referred to as inhibition of return (IOR), is typically observed in cueing tasks. Using IOR as a behavioral marker for spatial attention, the present study adopted a within-subject design to examine all 24 possible cueing tasks, in an effort to reveal the link between attention and the motor systems, especially the oculomotor systems. The results revealed that: (a) IOR effects were seen in 22 out of the 24 possible cueing tasks; (b) contrary to the theory proposed by Taylor and Klein (2000), IOR effects cannot be categorized into sensory and motor ones based on the active involvement of the oculomotor system; (3) IOR effects were overall stronger in tasks that required saccadic responses than those that did not require saccadic responses. These findings suggest a tight coupling of attention and the oculomotor system.

基于摇杆隐喻的遥操作眼控交互 eye-stick 及其可用性研究

蔡佳烨¹ 葛贤亮¹ (通讯作者) 刘旭涛¹ 葛列众¹ 万华根¹

¹ 浙江大学心理科学研究中心, 浙江杭州, 310027

摘要 (背景) 传统 GUI 交互以鼠标、键盘为主, 需要使用双手作为操作媒介, 以致使用环境存在较大局限性, 在遥操作任务中, 视角转换过程还会增加认知负荷。眼动交互对于可视化的目标和任务是一种非常有前景的交互方式, 具有方向控制连续、沉浸感强等优点。现有眼动控制遥操作方式主要有凝视触发策略、平滑追踪策略、眼势策略等类型, 可以仅靠眼睛完成交互而无需使用双手, 但这些交互方式主要是将眼动控制用于触发指令(如前进后退), 虽然触发方式有所不同, 触发操作与整个遥操作控制过程是分离的, 这意味着操作者在选择执行触发操作前可能还是无法避免空间转换的问题。基于此, 本研究以摇杆隐喻为设计原型, 开发了眼动控制遥操作交互方式: eye-stick。**(方法)** eye-stick 来源于摇杆隐喻并加入 PID 避障算法, 使用“上帝视角”显示小车行驶情景并直接作为控制界面, 同时呈现操作者的视线点, 通过视线参考点, 操作者在启动小车后, 只要看向期望小车行驶位置, 小车就能跟随视线移动。为考察 eye-stick 的可用性和易学性, 本研究在 Unity 平台上设计了不同道路类型下的遥操作虚拟小车测试任务, 加入传统 GUI 交互方式(手柄)作为对比进行工效学研究。实验采用 2(控制方式: 手柄, eye-stick) × 3(测试次数: 1 次, 2 次, 3 次)两因素混合设计。实验共招募 40 名被试, 按控制方式分为 2 组, 手柄组使用 Xbox 控制小车, 通过实物手柄上的摇杆来控制虚拟小车的左右和前进后退。每位被试需要完成 3 次遥操作虚拟小车任务, 每次任务内容相同, 均包含 24 次驶出迷宫操作, 每次任务后被试均需完成一套主观体验评价问卷。**(结果)** 实验结果显示, (1) 在第一次测试中, 相比手柄, eye-stick 操作时间显著更少、行驶距离显著更短, 但碰壁次数显著更多; (2) 第三次测试中, eye-stick 相比手柄依旧操作时间显著更少、行驶距离显著更短、碰壁次数更多; (3) 随着测试次数增加, eye-stick 的行驶距离减少量显著少于手柄; (4) 在第一次使用时, eye-stick 的可用性评分显著低于 Xbox 模式, 随着测试次数的增加, 两种模式工作负荷评分均显著下降, eye-stick 模式的易学性评分显著低于 Xbox 模式。**(结论)** 本研究设计的眼控交互方式 eye-stick 可以顺利完成遥操作虚拟小车任务, 且相比传统手柄, eye-stick 的操作时间更短、行驶所需距离更少。eye-stick 的设计可以为遥操作眼动交互提供新方案, 工效学研究结果对该交互的应用有指导意义, 研究所开发的遥操作虚拟小车任务场景可以被不断丰富并为不同的遥操作交互方式提供多样化的测试环境。

The Usability Evaluation of eye-stick : An Intelligence Gaze Interactions for Teleoperation

Jiaye Cai¹, Xianliang Ge¹, Xutao Liu¹, Liezhong Ge¹, and Huagen Wan¹

¹ Center for Psychological Sciences, Zhejiang University, Hangzhou, Zhejiang Province, P. R. China

Abstract: Conventional teleoperation interactions (e.g. mouse, keyboard) are mainly rely on hands to control, result in limitations in operation environments and workload increased in perspective-taking. Gaze interaction is a promising teleoperation interaction based on eye-movement interaction technology. Current gaze interaction has various methods to control objects, like dwell times selection strategy, smooth pursuit selection strategy and gaze gestures strategy, and manage to control agents without hands. However, these strategies almost all utilize eye movement to trigger commands; so the operator cannot avoid the problem of perspective-taking before he sends the operation command when the controlled agents' perspective is incongruous with the operator's perspective. Therefore, this study developed an intelligent gaze interaction *eye-stick* based on human joystick metaphor to ease the perspective-taking problem and enhance operation performance. The interface of *eye-stick* was designed with the “God perspective” (the point of regard and controlled object location in the same interface), utilized 2D vectors from the coordinates of the point of regard on the screen and the object location to control the object locomotion direction while the distance to control the speed. In addition, we optimized with the PID control algorithm to reduce the influence of the deviation of the sight or the gaze tracking error by the eye tracker. Furthermore, we conducted a use

study to test the usability and learnability of eye-stick with a virtual vehicle teleoperation task developed on the Unity platform. We recruited 40 participants (20 females, 20 males) and divided them into two groups, half of the participants used *eye-stick* to control the virtual vehicle (*eye-stick* condition), the other group used Xbox (Xbox condition). Each group were asked to complete 3 times of teleoperation tasks (at least 25 minutes interval), each task contains 24 mazes to be driving out. Participants needed to complete three subjective experience evaluation questionnaires after operation. Our results showed that (1) compared with Xbox condition, the *eye-stick* condition had less operation time, shorter driving distance, and more collisions in the first test. (2) In the third test, the *eye-stick* condition still had less operation time, shorter driving distance, and more collisions. (3) With the increase of test times, the *eye-stick* condition had less decrement of driving distance than Xbox condition. (4) The usability subjective evaluation of *eye-stick* condition was lower than Xbox condition in the first test, the workload significantly declined as test time increased and the learnability subjective evaluation was lower than Xbox condition. In conclusion, *eye-stick* is a feasible interaction and has special operation performance advantages, which is helpful to develop intelligent gaze interaction and promising for application. In addition, the virtual vehicle teleoperation task designed in this study can be developed and provide a diversified evaluation tasks for teleoperation interactions.

Keywords: gaze interaction, eye-stick, teleoperation, virtual vehicle

限制性饮食者在句子阅读中对食物词的注意偏向

马国杰

陕西师范大学心理学院, 西安, 710062, magj@snnu.edu.cn

摘要 食物相关的注意偏向是指相对于其它线索, 个体对食物相关刺激的优先注意。以往研究发现食物相关的注意偏向存在于不同状态以及特质类型的群体中。然而, 人类自然阅读中是否存在食物相关的注意偏向, 目前尚无定论。在阅读中, 注意分配的重要指标是预视效应和副中央凹-中央凹效应。在该项目中, 我们通过边界范式探讨自然阅读中的是否存在对食物词的注意偏向, 即食物词相对于非食物词是否存在更大的预视效应以及副中央凹-中央凹效应。研究结果表明, 在匹配无关词汇属性的基础上, 食物词相对于非食物词的整体加工时间更短, 体现了食物词的词优效应。此外, 通过对目标词边界之前的双字词兴趣区分析发现, 食物词相对于非食物词的目标词前兴趣区注视时间更长。进一步分析发现, 该副中央凹-中央凹效应主要体现在限制性饮食群体中, 在非限制饮食群体中差异不显著。该研究表明, 在注视食物词之前, 读者尤其是限制性饮食者可能已经通过预视加工, 知觉到食物和非食物线索的差异。因此, 在食物词条件下, 形成一定的趋避冲突或更强的词汇识别竞争, 导致目标词前兴趣区加工时间延长。最后, 我们讨论了该研究对于理解食物相关的注意偏向以及中文阅读中的眼动控制的意义。

Faster food word processing especially for restrained eaters in Chinese reading

Guojie Ma

Shaanxi Normal University, Xi'an, 710062, E-mail: magj@snnu.edu.cn

Abstract: Food-related attentional bias indicates that individuals have priority to attend food-related stimuli compared with non-food related stimuli. Previous studies have found that the attentional bias was modulated by different physiological states and participants characteristics. However, it is still unknown whether food-related attentional bias can be found in natural sentence reading tasks. In the present study, we investigated the above question using the boundary paradigms. The preview benefit and parafoveal-on-foveal effects were reported to study the potentially food-related attentional bias in Chinese reading. The data showed that the target food words were fixated with less time than the non-food words. On the pretarget region, readers fixated with more time in the food word than non-food word conditions. Further analysis showed that the food-related parafoveal-on-foveal effects were only found among restrained eaters. This phenomenon might reveal that restrained eaters were more likely to perceive the difference

between food and non-food words using parafoveal vision. Thus, there might be more competition between restraint and hedonism for restrained eaters. We discussed the possible implications on food-related attentional bias and eye movement control in Chinese reading.

不同人际距离对联合行动绩效的影响——一项来自近红外的研究

李家琪^{1,2} 宋晓蕾^{1,2} (通讯作者)

1 陕西师范大学心理学院, 西安, 710062

2 陕西省行为与认知神经科学重点实验室, 西安, 710062, songxiaolei@snnu.edu.cn

摘要 联合行动为个体随着时间和空间的不断变化而调整自己的行为以适应他人 (Sebanz, 2006)。联合行动绩效既取决于操作者的操作技能, 更取决于操作者的协作能力。关注操作者的协作能力是提高联合行动绩效的关键。但是以往少有研究关注操作者之间的协作能力以及人际因素对协作能力及任务绩效的影响。基于此, 本项目将从人际距离视角出发, 以研究人际协作能力的联合 Simon 任务为实验范式, 采用心理物理学实验并结合近红外光谱的超脑扫描技术, 研究协同作业中不同人际距离对操作者协作能力与作业绩效的影响及其机理。研究结果表明: 一方面, 在与抑制控制、具身模拟以及心理理论相关的背外侧前额叶、额下回和内侧前额叶均出现了不一致条件下的脑内激活显著大于一致条件下的结果, 表明操作者在不一致条件下从上述脑区调动了更多的认知资源。另一方面, 在与心理理论相关的内侧前额叶只在朋友组出现一致性效应, 表明朋友组在联合任务表征中对他们心理活动有更多的推测与预期; 脑间相关分析的结果表明, 在不同人际距离水平下, 双侧背外侧前额叶、双侧额下回和内侧前额叶, 普遍参与脑间相关, 表明这些脑区也许是联合行动中涉及共同表征的主要脑区。此外, 值得关注的是, 本研究结果表明与抑制控制、具身模拟、心理理论相关的通道 6、9 和 27 (分别位于左侧背外侧前额叶、左侧额下回和右侧颞极) 的脑间同步性与联合任务绩效之间的显著相关, 即这些区域的脑同步性越高, 联合任务反应时越短, 绩效越高。表明脑同步与更好的任务绩效相联系, 缩短人际距离, 提高脑同步是促进联合行动绩效的重要途径。本研究丰富了对联合行动的研究, 为人际距离对联合行动绩效的影响提供了行为和神经生理的证据, 研究结果将为提高联合行动绩效提供一定启示。

The influence of interpersonal distance on joint action performance --- a near infrared study

Jiaqi Li^{1,2}, Xiaolei Song^{1,2}

1 School of Psychology, Shaanxi Normal University, Xi'an 710062, China

2 Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, Xi'an 710062, China

Abstract: joint action is individuals adjust their actions to those of another person in time and space (Sebanz, 2006). Joint action performance depends not only on the operator's operational skills, but also on the operator's collaborative ability. Focusing on operators' collaborative ability is the key to improving the performance of joint actions. Few previous studies, however, have focused on the effects of the collaborative ability between operators and interpersonal factors on the collaborative ability and operational performance. In consideration of this status, from the perspective of interpersonal distance, this study will take the joint Simon task as the experimental paradigm to investigate the interpersonal collaborative ability, the psychophysical experiment combined with the near infrared spectroscopy and hyperscanning were adopted to study the underlying mechanism of different interpersonal distance on the operators' collaborative ability and task performance in joint action. The results show that channel 6, channel 9

and channel 27 (located in the left dorsolateral prefrontal lobe, left inferior frontal gyrus and right temporal pole) related to inhibition control, embodied simulation and theory of mind are significantly correlated with joint task performance, that is, these areas of the brain synchronicity is higher, the shorter the joint task response, the higher the performance. It is shown that brain synchronization is related to better task performance, shortening interpersonal distance and improving brain synchronization are important ways to promote the performance of joint action. This study can enrich the research on joint action, and provide behavioral and neurophysiological evidence for the influence of interpersonal distance on the task performance of joint action. The results above will provide some enlightenment for promoting the performance of joint action.

基于神经工效学的团队认知增强研究

徐杰¹

¹ 浙江大学心理科学研究中心, 杭州, 310007, xujie0987@zju.edu.cn

摘要 成功的团队协作既需要每个团队成员有效的任务作业, 也需要成员之间有效的团队作业。基于神经工效学的团队认知增强技术是优化团队协作绩效最有前景的干预手段之一。传统认知增强技术常被用于支撑单人任务作业。该技术通过神经生理传感与计算, 实现人的认知状态的实时监测; 并根据认知状态的动态变化, 以通过动态人机功能分配、增强显示等方式优化单人任务作业绩效。认知增强技术要在团队协作场景中有效地应用, 最大的技术难点之一是如何有效地对团队认知状态进行实时监测。近年来不少研究通过如近红外脑成像等脑成像工具结合超扫描技术, 实现了多人交互场景下脑同步程度的测量。研究表明, 脑同步可以作为团队层级的认知状态的有用的神经工效学指标。本报告将介绍两个脑同步与团队协作的研究。第一个研究使用便携式近红外脑成像技术探索了麻醉师二人团队高仿真训练中的脑同步模式。训练过程中, 麻醉师二人团队本别经过了单人任务工作阶段、团队协作阶段以及训练后团队讨论阶段。结果表明, 团队成员之间前额叶的脑同步程度在团队协作阶段显著高于单人任务工作阶段。第二个研究采用近红外脑成像技术探索了无人机二人操作员团队在搜索救援任务团队协作中的脑同步模式。无人机二人操作员团队通过言语沟通, 实现飞机飞行控制操作和雷达传感操作的协同, 以有效地完成搜索救援工作。研究组正在对实验数据进行分析; 研究组预期团队脑同步程度将与团队协同性呈正相关, 并与团队绩效呈正相关。基于这些研究结果, 以及其它在不同场景中的团队协作脑同步研究, 本报告还将探讨未来认知增强技术将如何利用基于神经生理同步的团队层级认知状态监控方法以实现团队认知增强。

Facilitating Teamwork with Augmented Cognition Technology

Jie Xu

Center for Psychological Sciences, Zhejiang University, Hangzhou

Abstract: Successful team cooperation requires not only effective taskwork by each of the team members, but also effective teamwork among them. One of the promising approaches to promote teamwork is to facilitate team cognition in real time through technological intervention. In recent years, augmented cognition technologies have been developed to improve individual taskwork by real-time cognitive state monitoring based on physiological and neurophysiological sensing, and system adaptation based on the dynamically changing cognitive state. One of the biggest challenges in applying augmented cognition technology in teamwork is real-time monitoring of team-level cognitive states. We propose that physiological compliance and neural synchronization metrics are useful indicators of team-level cognitive states. In this talk, I will summarize recent findings on neural synchrony in clinical crisis management team training and unmanned aerial vehicle control team operation experiments. I will also discuss how future augmented cognition technologies can integrate team-level cognitive state monitoring techniques to achieve team augmented cognition.

Keywords: Neuroergonomics, teamwork, neural synchrony, function near-infrared spectroscopy, augmented cognition

设计师与消费者对产品设计的认知差异研究

章俊杰², 何琳¹, 于文环¹, Thomas Freudenreich¹, 刘涛¹ (通讯作者)

¹ 浙江大学管理学院市场营销系, 杭州, 310058, liu_tao@zju.edu.cn

² 中国美术学院设计艺术学院工业设计系

摘要 在消费升级的新时代, 满足消费者的需求已成为企业的首要任务。现有研究多从消费者的角度入手, 讨论不同产品设计对消费者的影响。少有研究从设计师的角度出发, 探讨其是否能够准确解码消费者的偏好。本文利用近红外光谱脑功能成像技术, 旨在探索 (1) 不同设计元素对设计师和消费者产品感知的影响, 以及 (2) 设计师与消费者对产品设计感知差异的认知机制。为此, 我们招募了 20 位设计师分别以“舒适性”“艺术性”“文化性”为主题, 设计三款水杯。一个月之后, 我们分别让设计师与 22 位消费者浏览并评价这些水杯, 同时测量他们的大脑活动。行为结果表明, 与消费者相比, 设计师对自己设计的作品给予了更高的评价。更为重要的是, 设计师认为影响消费者购物态度的主要因素为舒适性和文化性; 而消费者则认为影响其购物态度的主要因素为舒适性和艺术性。脑成像结果进一步显示, 总体而言, 设计师在查看自己设计的产品时奖赏脑区 (左侧眶额叶皮层) 激活更高。而且, 从不同的设计元素来看, 设计师在浏览艺术性产品时, 奖赏脑区激活水平较消费者更高。在浏览文化性产品时, 消费者认知压力相关脑区 (右侧背外侧前额叶) 表现出更高的激活, 表明消费者难以理解产品设计。我们进一步证明了消费者和设计师对文化性产品的感知差异是由于知识结构不同造成的。因此, 当设计师希望通过产品来传递特定的价值时, 应该避免主观服务偏差, 从消费者的角度思考, 尽量降低消费者的理解负荷; 或是在产品推出之前对消费者进行先行教育, 以弥补设计师与消费者之间的认知差异。

Abstract: Satisfying consumers' requirements has now become the top priority for every company. However, the existing research mainly focus on the perspective of consumer. Little has been discussed about whether product designers can accurately decode consumers' preferences. Using functional near-infrared spectroscopy (fNIRS), the current study aims to explore (1) how different design elements affect designers' and consumers' perceptions of a product, respectively, and also (2) the cognitive mechanism underlying the perception differences between the consumers and designers when viewing a product. In the current research, 20 designers were asked to design 3 cups focusing on comfortability, artistry, and cultural attribute, respectively. 22 consumers were asked to view the cups and evaluate them from several perspectives. The designers were also asked to view the cups designed by themselves and by other designers. We measured the brain activations of designers and consumers during the whole process. Behavioral results indicated that, compared with consumers, designers gave higher ratings to the cups that they designed. More importantly, designers believed that the main factors that affect consumers' shopping attitudes are comfortability and cultural attribute, while consumers thought that the main factors that affect their shopping attitudes are comfortability and artistry. fNIRS results showed that, overall, compared with consumers, designers showed higher activation in the left orbitofrontal cortex when viewing products designed by themselves, indicating higher reward experience. Moreover, from the perspective of different design elements, while viewing products emphasizing

artistry, designers experienced higher reward than consumers. When viewing products emphasizing cultural attribute, consumers showed higher activations in brain regions related to cognitive pressure (right dorsolateral prefrontal cortex), indicating difficulty in understanding the product design. We further demonstrated that the perception differences between the consumers and designers while viewing products emphasizing cultural attributes resulted from different knowledge structure. Therefore, when delivering specific values through products, designers should avoid subjective service deviations and try to empathize with consumers, so as to minimize consumers' cognitive load. Moreover, firms may also educate consumers before launching a new product, so as to bridge the cognitive gap between consumers and designers.

Keywords: designer, consumer, perception differences, neurodesign, functional near-infrared spectroscopy

利用社会交互场模型构建人性化机器人

周晨¹ 缪明诚¹ 陈欣然¹ 胡逸斐¹ 茆琦¹ 鄢明远¹ 蒯曙光¹ (通讯作者)

摘要 近年来, 服务机器人的产业迅猛发展, 并在可见的未来极有可能成为人类生活不可或缺的伴侣。与工业机器人不同, 服务机器人的核心功能之一是如何与人类进行有效的交互。设计出社会友好型的服务机器人十分重要。这一问题既涉及到心理学科的理论概念也涉及到工程学科的技术解决方案。心理学等相关学科对人类社会交互行为进行了长期的研究。但是多数研究仍停留在人文科学概念层面上的描述, 缺乏对人类行为量化的测量、计算化的建模以及算法化的描述。另一方面, 工程领域主要以工程效率为目标对机器人行为进行优化, 缺乏对机器人拟人性以及社会交互能力的关注。为了解决这一问题, 首先需要对人类社会交互行为规律进行定量化描述和计算化建模。我们的研究构建了基于虚拟情景下的人类社会行为实验平台, 利用最新的虚拟现实技术, 定量化收集人类社会交互行为数据, 并进一步利用计算建模的方法, 建立数学模型, 最终将模型算法化后应用到机器人的空间导航任务中。我们的研究把心理学理论和工程实践相结合, 有效的提升了服务机器人空间宜人性和拟人性。

Developing humanoid robots based on social interaction field model

Chen Zhou, Ming-Cheng Miao, Xin-Ran Chen, Yi-Fei Hu, Qi Chang, Ming-Yuan Yan, Shu-Guang Kuai

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, the Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

Abstract: Recent years witness a growing interest in service robots, which is likely to become an indispensable companion of human life in the foreseeable future. Unlike industrial robots, service robots frequently interact with humans. It is important to understand the rules governing human social behaviors and design user-friendly service robots. Psychological studies have described human social interaction behaviors for many years. However, most of these studies only focus on general principles of interaction behaviors conceptually, but lack quantitative measurements and computational modeling. On the other side, engineering researchers mainly optimize the efficiency of robots from an engineering perspective, while pay little attention to the human-like interaction behaviors of robots. To address the issue, it is important to fill the gap between the theoretical psychological concepts and engineering technical solutions. In our study, we utilized cutting-edge virtual reality technology to analyze human social interaction behaviors and develop a computational model of the social interaction field. We finally implement the model into the robot's navigation algorithms, which effectively enhances the social friendliness and humanoid level of service robots.

正念冥想对海军官兵心理增强的干预研究

吴荔荔^{1,2}, 孙露娜^{1,2}, 尚志蕾^{1,2}, 刘伟志^{1,2} (通讯作者)

1. 海军军医大学心理系基础心理学教研室, 上海 200433

2. 海军军医大学心理系 PTSD 防护实验室, 上海 200433, liuweizhi@smmu.edu.cn

摘要 目的 正念冥想研究日益增多,但在海军部队应用研究相对较少。因此,本研究基于循证探讨正念冥想用于增强中国海军官兵心理能力的有效性和可行性,为正念冥想在中国部队的应用与推广提供实证依据。

方法 本研究分为三部分。研究一采用对照研究,选取长期冥想者(2年以上)及对照组,进行生命质量和大脑执行功能的比较。研究二选取49名新兵,分为正念冥想组与候补组,并在参与后的4个时间点(基线、5周、8周、12周)分别对两组人员进行问卷调查,探讨正念冥想对一般健康状况及压力的影响。研究三通过设置实验组和对照组,开展为期8周的正念冥想练习,探讨系统性的正念冥想联系对军事创伤后应激症状及相关心理状况的影响。结果 研究一发现,长期冥想者生理健康总评(84.50 VS 80.42, $p=0.004$)、心理健康总评(80.16 VS 73.44, $p<0.001$)和生命质量总分(82.33 VS 76.93, $p<0.001$)显著优于对照组;每周达到冥想状态的时间大于40分钟者,心理健康总评(83.55 VS 76.44, $p=0.003$)和生命质量总分(85.71 VS 78.77, $p=0.001$)与小于40分钟者相比有显著性差异;每周达到冥想状态的频率大于2次者,心理健康总评(81.94 VS 76.05, $p=0.019$)和生命质量总分(83.70 VS 79.19, $p=0.031$)与低于两次者有显著性差异;另外发现采用注意瞬脱范式探索工作记忆功能时,发现长期冥想组的注意瞬脱程度低于对照组,差异有统计学意义($t=2.993$, $p<0.05$)。研究二发现,与候补组相比,在12周的随访中,正念冥想组在正念($F(1,43)=3.28$, $p<0.05$)和一般健康($F(1,43)=4.593$, $p<0.01$)方面表现出了更多的改善。研究三发现冥想组经过8周正念冥想练习,正念水平的提升较对照组明显($\beta=3.902$, $SE=0.995$, $p<0.001$),军事创伤后应激症状的改善较对照组明显($\beta=-3.173$, $SE=0.818$, $p<0.001$),而正念水平在正念冥想练习和军事创伤后应激症状改善之间起到中介作用。结论 研究一表明长期冥想可以全面提升个体生命质量,以及提升执行功能的工作记忆功能,改善认知能力下降。研究二提示正念冥想能有效改善新兵的一般健康状况,减轻新兵的压力。研究三表明正念冥想可以有效缓解军事创伤后应激症状,提升正念水平,正念水平在正念冥想练习和军事创伤后应激症状改善之间起到中介作用。

Intervention of Mindfulness Meditation on the Mental Enhancement of Navy Officers and Soldiers

Lili Wu^{1,2}, Luna Sun^{1,2}, Zhilei Shang^{1,2}, Danfeng Guo^{1,2}, Guangyu Liu^{1,2}, Weizhi Liu^{1,2}

1. Department of Basic Psychology, Faculty of Psychology, Naval Medical University, Shanghai 200433

2. Lab for Post-Traumatic Stress Disorder, Faculty of Psychology, Naval Medical University, Shanghai 200433, liuweizhi@smmu.edu.cn

Abstract: Objective The research on mindfulness meditation is increasing, but there is relatively little research on its application in the navy. Therefore, this study is based on evidence to explore the effectiveness and feasibility of using mindfulness meditation to enhance the psychological ability of Chinese navy officers and soldiers, and to provide an empirical basis for the application and promotion of mindfulness meditation in the Chinese army. Methods This study is divided into three parts. Study one compared quality of life and executive function among long-term meditators (> 2 years) and a control group. In the second study, 49 recruits were selected and divided into the mindfulness meditation group and the control group. At 4 time points (baseline, 5 weeks, 8 weeks and 12 weeks) after the participation, questionnaire surveys were conducted to the two groups respectively to explore the effects of mindfulness meditation on general health and stress. In study three, an experimental group and a control group were set to conduct 8 weeks of mindfulness meditation practice to explore the effects of systemic mindfulness meditation on military post-traumatic stress symptoms and mental health. Results In the first study, the scores of physical health

(84.50 VS 80.42, $P=0.004$), mental health (80.16 VS 73.44, $P<0.001$) and quality of life (82.33 VS 76.93, $P<0.001$) of the long-term meditators were significantly better than those of the control group. There were significant differences in mental health scores (83.55 VS 76.44, $P=0.003$) and quality of life scores (85.71 VS 78.77, $P=0.001$) between the subjects who spent more than 40 minutes in meditation state per week and those who spent less than 40 minutes. There were significant differences in mental health scores (81.94 VS 76.05, $P=0.019$) and quality of life scores (83.70 VS 79.19, $P=0.031$) between those who meditated more than twice a week and those who meditated less than twice. In addition, when using attentional blink paradigm to explore working memory function, it was found that the degree of attentional blink in the long-term meditation group was lower than that in the control group, and the difference was statistically significant ($t=2.993$, $P<0.05$). Study 2 found that, compared to the control group, the mindfulness meditation group was significantly more likely to be mindful ($F(1,43)=3.28$, $p<0.05$) and general health ($F(1,43)=4.593$, $p<0.01$) showed more improvement. Study 3 found that after 8 weeks of mindfulness meditation practice, the improvement of mindfulness level in the meditation group was significantly greater than that in the control group ($\beta=3.902$, $SE=0.995$, $p<0.001$), the improvement of military post-traumatic stress symptoms was significantly higher than that of the control group ($\beta=-3.173$, $SE=0.818$, $p<0.001$) and mindfulness levels were a mediator between mindfulness meditation practice and improvement in military post-traumatic stress symptoms. Conclusion The first study showed that long-term meditation can promote the quality of life and the working memory of executive function, and improve the cognitive decline. Study 2 suggested that mindfulness meditation can effectively improve the general health of recruits and reduce their stress. Study 3 showed that mindfulness meditation can effectively relieve the military post-traumatic stress symptoms and improve the level of mindfulness, which played a mediating role between mindfulness meditation practice and the improvement of military post-traumatic stress symptoms

摘要 研究探讨了自我客体化的恐惧管理功能，揭示了自我客体化在两性中分别通过文化依从和肉身回避来防御死亡焦虑的不同心理机制。研究1从特质的角度发现，两性的自我客体化水平与死亡焦虑特质正相关，而且男性（而非女性）的自我客体化水平能够被其死亡焦虑特质直接预测；在此基础上，研究2和研究3分别探讨、比较了两性对客体化的“文化依从”和“肉身意识”在死亡焦虑引发自我客体化中扮演的角色。总结而言，在自我客体化的恐惧管理功能上本研究有一些与过往TMT研究不同的发现：死亡焦虑能够提高男女两性的自我客体化水平，但这一过程在两性中存在不同的机制：对于女性而言，文化中普遍存在客体化女性的文化，面对死亡焦虑时女性依从文化而进行自我客体化，以通过文化世界观和自尊防御对抗死亡焦虑；而男性有更明显的肉身性，在面对死亡焦虑时男性通过回避肉身——将自我客体化为不死之“物”来对抗死亡焦虑。

³ School of Aviation, UNSW, Sydney, 2052

Abstract: Objectification of women exists across cultures and has a long history. Objectification theory and related literature pointed out that self-objectification could lead to mental health problems, such as somatic anxiety, eating disorders, and substance abuse. Terror Management Theory (TMT) can be used to explain the underlying psychological mechanisms of self-objectification from the death anxiety and defense perspective. Based on TMT, the present research aims to explore the roles of "cultural worldview compliance" and "creatureliness avoidance" in both men's and women's self-objectification, respectively. As a start point, the preliminary study results confirmed that self-objectification is more prevalent among females than among males. Notably, contrast to the traditional view, the empirical evidence reveals that masculinity could trigger the stronger awareness of creatureliness than femaleness. Then we conducted three studies to investigate further the relationship between death anxiety and the level of self-objectification in both men and women. Study 1 indicates that death anxiety is positively correlated to self-objectification. Furthermore, men's death anxiety level could predict their self-objectification level, but this is not the case for women. The findings of Studies 2 and 3 suggest that after mortality salience (MS), women's self-objectification level is moderated by "cultural worldview compliance", while "creatureliness avoidance" plays a critical role in men's self-objectification. Our research presents empirical evidence which challenges some basic TMT-based assumptions of female self-objectification. By examining both women and men's self-objectification, we observed that "Cultural worldview compliance" and "creatureliness avoidance" influence men and women's self-objectification in different patterns.

最优化决策者偏好更多的选择：对代价的敏感程度的中介作用

刘正泰¹ 栾墨² 李虹¹ (通讯作者)

¹ 清华大学心理学系, 北京, 100084

² 对外经济贸易大学商学院, 北京, 100029

³ 清华大学心理学系, 北京, 100084, lhong@mail.tsinghua.edu.cn

摘要 前人的研究表明, 对更多选择的偏好是最优化决策者在决策中存在的一种强烈倾向, 但是对于最优化决策者进行选项搜索乃至于此付出巨大代价的原因, 却知之甚少。本研究探讨了最优化决策倾向在何种条件下会增强个体对更多选择的偏好和这种效应背后的机制。通过四个实验, 本研究发现即便更多的选择并不带来更好的结果, 与满意化决策者相比, 最优化决策者仍然在更多的选择有代价的条件下偏好更多的选择 (实验 1)。本研究通过中介回归模型分析进一步证明了对代价的敏感程度是决策心态和对更多选择的偏好之间的中介机制, 并排除了对选择的重视程度和对代价的重视程度这两个可能的备择解释 (实验 2 和实验 3)。本研究还发现当代价得到凸显时, 最优化决策者会意识到代价, 并将对更多选择的偏好限制到和满意化决策者相同的水平, 因此对代价的敏感程度的在决策心态和对更多选择的偏好之间的中介作用得到了进一步的支持 (实验 4)。本研究的主要结论是: 对代价的敏感程度不同是最优化决策者比满意化决策者偏好更多选择的内在机制。主要的理论贡献是: 探究了最优化决策者进行选项搜索的原因, 为解释最优化悖论做出贡献, 并更深入地指出了最优化决策者和满意化决策者的区别。在实验方面, 本研究还开创了更具生态效度的决策实验范式。

Insensitivity to Costs and Preference for More Alternatives: A New Approach to Maximization

Zhengtai Liu¹, Mo Luan², Hong Li^{3*}

1 Department of Psychology, Tsinghua University

2 International School of Business, University of International Business and Economics

3 Department of Psychology, Tsinghua University, Beijing, 100084, lhong@mail.tsinghua.edu.cn

Abstract: Prior research showed that preference for more alternatives is a common propensity for maximizers, but little is known about why they pursue them despite the high costs. This research examines why maximizing tendency would enhance one's preference for more alternatives. We show that maximizers prefer more alternatives only under cost condition but not cost-free condition (Experiment 1). In addition, we demonstrate that sensitivity to costs serves as the mechanism underlying this effect, and rule out other possible explanations: importance attached to alternatives and costs (Experiment 2 and 3). Furthermore, we show that when cost is emphasized, maximizers restrict their pursuit for alternatives to the degree of satisficers. Thus, the mediating role of sensitivity to costs is further supported (Experiment 4).

Keywords: maximizer, satisficer, alternatives, costs

个体在被观察时会如何建构事物?

栾墨^{1,2} 李虹² (通讯作者)

1 对外经济贸易大学国际商学院, 北京, 100029

2 清华大学心理学系, 北京, 100084, lhong@mail.tsinghua.edu.cn

摘要 我们的生活中常常存在着真实或预期的观察者。一百多年来, 社会心理学家探索了观察者对我们的行为表现等方方面面的影响, 本研究则首次关注个体在被观察时(与私密情境相比)会如何建构事物。通过7项实验, 本研究发现, 个体更倾向于在被观察时采取更高的解释水平建构事物。具体而言, 当被观察时, 个体倾向于从更整体的角度建构事物, 在表达时着眼于更本质的特征, 在消费决策中也更看重商品的核心属性。本研究对该效应的机制进行了进一步的探讨, 发现在被观察时, 个体更倾向于采纳他人的视角, 视角的转化拉远了原有的心理距离, 进而提高了建构事物的解释水平。最后, 本研究发现这一效应在控制个体的唤起水平后仍然存在, 且仅当个体被观察时(而非他人在场但并未观察时)存在。

关键词 解释水平理论, 被观察情境, 私密情境, 他人视角

How Do People Construe Objects When Being Observed?

Luan Mo^{1,2}, Hong Li¹

1 International School of Business, University of International Business and Economics, Beijing 100029, China

2 Department of Psychology, Tsinghua University, Beijing 100084, China

Abstract: The current research aims to explore how people construe objects when being observed (vs. in a private context). Using different manipulations of observation and measures of construal, we demonstrate that people are more likely to apply higher-level construals when observed than in a private context (Studies 1–3); this effect holds when controlling for arousal level (Study 2) and is obtained under conditions of observation but not the mere presence of others (Study 3). Studies 4–6 explore the underlying mechanism of this effect: adopting the perspectives of others in the presence of observers. Study 4 demonstrates that when observed, people align their own preferences to their inference of the preferences of others, but this effect is not present in a private context. In Study 5, a mediation analysis suggests that individuals prefer the high-level option when observed because they adopt the perspectives of others. In addition, the link between context and construal level is broken when participants are explicitly asked to focus on their own perspective when observed or to adopt the perspectives of others in a private

context (Study 6). Finally, Study 7 examines implications for evaluation of gifts.

Keywords: construal level, being observed, private context, perspectives of others

感恩对决策后悔的影响：时间焦点的中介作用

摘要 感恩作为一种特定的积极情绪,可以提升个体的幸福感,促使个体的利他行为。以往关于感恩的研究着重于探讨感恩与幸福感之间的联系,而关于感恩与决策相关情绪的关系研究较少。后悔是决策中常见的消极情绪,不仅影响决策满意度,对于个体总体幸福感也会产生影响。本研究旨在探讨感恩与决策后悔的关系,以及其内在的作用机制。实验1选取美国 Amazon Turk 平台的被试 102 人,采用量表的方法测量特质感恩与后悔,结果发现,特质感恩对于后悔具有负向预测作用。实验2选取问卷星平台的被试 130 人,启动状态感恩测量具体决策情境中的后悔,结果发现,与控制组相比,感恩组的个体较少体验到后悔。实验3a选取问卷星平台的被试 135 人,采用量表测量特质感恩,并用情景实验的方法测量具体决策情境中的后悔,结果发现,感恩程度较高的个体更少体验到后悔,而且时间焦点在其中起到中介作用。实验3b选取美国 Amazon Turk 平台的被试 100 人,采用量表的方法测量感恩、后悔与时间焦点,结果发现,感恩对后悔具有负向预测作用,而且时间焦点在其中起到中介作用。综上所述,本研究一致发现,感恩可以较少决策中的后悔体验,而且时间焦点在其中起到中介作用。本研究丰富了感恩与决策后悔领域的相关研究,拓宽了感恩的积极作用。

The effect of gratitude on regret: the mediating role of temporal focus

Yufeng Zhang¹, Xiaoyu Wang¹, Mo Luan²

1 Faculty of Education, Beijing Normal University, No.19 Xijiekouwai Street, Beijing

2 School of Business, University of International Business and Economics, No. 10, Huixin Dongjie,
Beijing

Abstract: Gratitude, as a specific positive emotion, can enhance happiness and promote altruistic behavior. Previous studies on gratitude focused on the relationship between gratitude and well-being, but less on the relationship between gratitude and emotions related to decision-making. Regret is a negative emotion related to decision-making, which not only affects decision-making satisfaction, but also affects individuals' overall well-being. The purpose of this study is to explore the relationship between gratitude and regret, as well as the underlying mechanism. In Study 1, 102 subjects from Amazon Turk were recruited. Trait gratitude and regret were measured via scales. The results showed that trait gratitude could negatively predict regret. In Study 2, 130 participants from wjx.cn were recruited. Trait gratitude was measured via GQ-6 scale and regret was measured in the specific decision-making situation. The results showed that compared with the control group, grateful individuals experienced less regret. In Study 3a, 135 participants were recruited. Trait gratitude and regret in specific decision-making situation were measured. The results showed that grateful individuals experienced less regret, and temporal focus (i.e., focus on the past) played a mediating role in this relationship. In Study 3b, 100 subjects from Amazon Turk were recruited. Trait gratitude, regret and temporal focus were measured via scales. The results showed that gratitude could negatively predict regret, and temporal focus played a mediating role. To sum up, this study found that gratitude reduces regret in decision-making, and temporal focus plays a mediating role. This study enriches the related research in the field of gratitude and regret, and broadens the positive roles of gratitude.

Keywords: gratitude, regret, temporal focus, past, decision

享乐品与实用品对选择偏好的影响：社会比较的中介作用

邵爱萍¹ 李虹¹（通讯作者）

¹ 清华大学心理系，北京，100084, lhong@mail.tsinghua.edu.cn

摘要 当前研究探讨产品类型（享乐品/实用品）如何影响绝对好与相对好选择偏好。我们在五个研究中通过操纵不同的享乐品与实用品或者同一产品的不同实用目标或享乐目标，测量了消费者的选择偏好和愿意支付价钱。结果表明，消费者选择享乐品时更偏好绝对好选择，而选择实用品时更偏好相对好选择（研究 1a 和 1b）。当消费者选择享乐品时，也显著愿意为绝对好选择相比相对好选择支付更多的钱。但是，当消费者选择实用品时，他们愿意为相对好选择比绝对好选择支付更多的钱，但是两者的差异并不显著（研究 2 和 3）。社会比较中介了产品类型与选择偏好间的关系。尤其是，相比于享乐品，社会比较提升了消费者对实用品的相对好选择偏好（研究 4）。此外，竞争对手调节了产品类型对选择偏好的效应（研究 5）。本研究是第一个从产品类型（享乐品/实用品）视角探讨消费者最好选择偏好的研究。该研究的理论意义还包括探讨了社会比较对消费者选择偏好的影响取决于竞争对手，验证了产品类型对选择偏好的竞争优势，并且使用社会比较解释了产品类型对选择偏好的深层机制。该研究发现也对享乐品与实用品消费有重要的实践意义。本研究结果有助于旧款产品的促销和利用社会比较获得比较优势策略从而提升业绩。

关键词 选择偏好，享乐品，实用品，产品类型，相对好与绝对好，社会比较

How do utilitarian versus hedonic products influence choice preferences: Mediating effect of social comparison

Aiping Shao, Hong Li

Department of Psychology, Tsinghua University, Beijing, China

Abstract: The present research explores how product type influences the trade-off between relative and absolute best choice. We measure consumers' choice preferences and willingness to pay in five studies by manipulating different utilitarian versus hedonic products or different utilitarian versus hedonic goals of the same product. The results demonstrate that consumers prefer the absolute best choice for hedonic products and the relative best choice for utilitarian products (Studies 1a and 1b). When choosing a hedonic product, consumers are willing to pay significantly more for absolute than relative best choice. However, when choosing a utilitarian product, consumers are willing to pay more for the relative than absolute best choice, but the differences are not significant (Studies 2 and 3). Social comparison mediates the relationship between product type and choice preference. Specifically, compared to hedonic products, social comparison increases the relative best choice preference of utilitarian products (Study 4). Moreover, rivals moderate the effect of product type on choice preference (Study 5). The theoretical implication includes demonstrating the comparative advantage of product type on choice preference and interpreting the underlying mechanisms using social comparison. The findings also have important practical implications for utilitarian and hedonic consumption.

Keywords: choice preference, hedonic product, product type, relative and absolute best, social comparison, utilitarian product

付出和获益如何共同影响感恩与亏欠，进而影响整体情绪？

黄荷¹ 李虹²（通讯作者）

¹ 清华大学心理学系，北京，100089

² 清华大学心理学系，北京，100089, lhong@mail.tsinghua.edu.cn（小五号宋体）

摘要 当接受不同人的帮助时，情绪体验是不一样的，有时感激，有时则让人有负疚感。事实上，一旦人们受到他人的帮助，感恩和亏欠两种情绪都会产生。然而，它们是两种截然不同的情绪。本研究旨在探讨当受到帮助时，感恩和亏欠是如何产生的，以及感恩与亏欠两种不同的情绪如何共同影响人们在受到帮助时的整体情绪状态。本研究共包含三个实验：实验 1 探究了不同情境下，资助人的付出对受助人的感恩及亏欠两

种情绪的影响；实验 2 进一步探究资助人的付出对受助人的情绪产生影响的边界，即资助人的获益的调节作用，并研究感恩和亏欠对整体情绪的贡献；实验 3 将实验 2 的结论应用于政府资助和私人资助两种不同的背景下，探讨不同资助进行资助时，受助人的情绪差别及原因。主要研究结果：（1）资助人的付出影响受助人的感恩程度与亏欠程度，付出越高，感恩程度与亏欠程度越高；（2）资助人的付出对受助人的感恩的影响只体现在高获益时，而对亏欠的影响则无此边界；（3）感恩与亏欠的差值中介了资助人的付出对受助人的整体情绪的影响；（4）受助者对资助人的付出评估中介了资助者类型（政府/私人）对感恩程度和亏欠程度的影响，且感恩与亏欠的差值中介了资助者类型（政府/私人）对整体情绪的影响，具体而言，受到政府资助的受助人的感恩与亏欠的差值更高，因此，整体情绪更加积极。

关键词 感恩，亏欠，整体情绪，政府资助，私人资助

How Cost and Benefit Jointly Influence Gratitude and Indebtedness, and in Turn General Emotion

Abstract: This study aims to explore how gratitude and indebtedness occur when receiving help and how the gratitude and indebtedness contribute to general emotion, respectively. We conducted three studies to investigate how the cost (to benefactors) and benefit (for beneficiary) jointly influence the experience of gratitude and indebtedness, and how these two emotions in turn together construct people's general emotion. We found that the cost to the benefactor enhances gratitude and indebtedness. Furthermore, the cost to the benefactor enhances gratitude only when the help is of high benefit to the beneficiary while enhances indebtedness regardless of the value, and the gratitude level minuses the indebtedness level (measured by the same rating scale) mediates the effect the cost (to benefactor) on general emotion state. Applying the findings into the contexts of government aids and private aids, we found that the perceived cost to benefactor mediates the effect the type of benefactor on gratitude and indebtedness, and the gratitude level minuses the indebtedness level is higher for beneficiaries who receive help from government, thus their general emotion state is more positive.

Keywords: gratitude, indebtedness, general emotion, government aids, private aids

抗疫一线护士心理培训需求调查

吴菁，邓娟，王婧婷，闫妍，叶旭春（通讯作者）

海军军医大学护理系，上海，200433，ye_xch8639@163.com

摘要 背景：在抗击疫情过程中，面对被感染死亡的风险、高强度的工作任务等，如何保持适宜心理状态、维持积极的工作状态对护士的心理调适提出了巨大挑战。目的：了解抗疫一线护士的心理现状及心理培训需求，为制定执行应急保障任务医护人员的培训提供指导。方法：以武汉一线救援护士为调查对象，采用 PHQ-9、GAD-7 和 WHO-5 评估一线护士的心理状况（焦虑、抑郁和幸福水平），采用自编问卷了解护士对于心理培训的需求等，包括培训的时长、形式、时间等，基于问卷星编辑并发放问卷。结果：共回收有效问卷 477 份，被调查护士的平均年龄 32.31 ± 5.32 ，工作年限 10.12 ± 5.92 ，既往仅有 8.4% 参加过应急保障任务，38.8% 既往参加过心理调适技能的培训。79% 护士认为执行此次任务对自己的心理调适技能产生了调整，65.4% 认为

自己能够应对, 85%以上的护士认为有必要在日常工作中、执行任务前、中、后开展心理调适技能培训, 在执行任务前、中、后开展心理培训的必要性比较发现, 更多的护士认为在执行任务过程中需要心理培训的介入, 培训的内容包括心理素质训练、任务环境中可能心理问题及应对、情绪调控训练(如积极心理暗示等)、团队合作与配合等, 线上学习和任务现场教学是护士首选的 2 种方式, 而培训时间以 3 天以内为主。结论: 抗疫一线护士在执行任务前、中、后存在心理培训的需求, 而在执行应急保障任务中应给以即时心理支持, 以线上或者任务现场教学为主的短期培训更能满足抗疫一线医护人员的培训需求。

Investigation on psychological training needs of nurses fighting with COVID-19

Jing Wu, Juan Deng, Jingting Wang, Yan Yan, Xuchun Ye (Correspondence author)

School of Nursing, Naval Medical University, 200433, ye_xch8639@163.com

Abstract: Background: In the process of fighting against COVID-19, facing with the risk of infection and death and high-intensity work tasks, how to maintain a suitable psychological state and maintain a positive working state poses a great challenge to the psychological adjustment of nurses. Objective: To understand the psychological status and psychological training needs of front-line nurses fighting with COVID-19 and provide guidance for the training of medical staff who may take emergency support tasks. Methods: PHQ-9, GAD-7 and WHO-5 were used to evaluate the psychological status (anxiety, depression and well-being) of the first-line rescue nurses in Wuhan. A self-designed questionnaire was used to understand the nurses' needs for psychological training, including the duration, form and duration of the training. Results: A total of 477 valid questionnaires were collected. The average age of the investigated nurses was 32.31 ± 5.32 , and the working years were 10.12 ± 5.92 . Only 8.4% of the nurses had participated in the emergency support task and 38.8% had participated in the psychological adjustment skills training before. 79% of nurses thought that their psychological adjustment skills had been challenged during the task, 65.4% thought they could cope with it, and more than 85% of nurses thought it was necessary to carry out psychological adjustment skills training in their daily work, before, during and after the implementation of tasks. The content of the training includes psychological resilience training, possible psychological problems in the task environment and coping, emotional regulation training (such as positive psychological suggestion), team cooperation and communication, etc. Online learning and task on-site teaching were the two preferred methods for nurses, and the training time was mainly within 3 days. Conclusion: Front-line nurses need psychological training before, during and after the implementation of the task, and should be given psychological support in the implementation of emergency support tasks based on their needs. The short-term training based on online or task on-site teaching can better meet the training needs of the nurses.

基层防疫人员积极情绪和自我效能对睡眠质量的影响

毛芳香¹ 宋海东¹ 孙瑶瑶¹ 刘泓¹ 曹枫林¹ (通讯作者)

¹ 山东大学护理学院, 济南, 250012, caofenglin2008@126.com

² 杭州第七人民医院, 杭州, 310013

摘要 目的: 探究新冠疫情期间, 基层防疫人员积极情绪和自我效能对睡眠质量的保护性作用。方法: 在 2020 年 3 月 2 日-3 月 6 日期间, 通过微信应用平台, 对某市 14 个区基层防疫人员进行线上问卷调查。研究使用中文版正性负性情力量表中积极情绪分量表(PANAS-P)、一般自我效能量表(GSES)和匹兹堡睡眠质量指数量表(PSQI)分别对基层防疫人员的积极情绪水平、自我效能水平和睡眠质量进行评估。本研究在将因变量睡眠质量进行二元分类转换。研究采用二元 logistics 回归模型, 在控制年龄、性别、婚姻、学历、职称和职业后, 探究基层防疫人员积极情绪和自我效能对睡眠质量的影响。所有统计分析均在 SPSS26.0 中进行。

结果：本研究最终纳入基层防疫人员 709 名，其中全科医生 404 名，全科护士 158 名，医技人员 64 名，社区工作者 41 名，其他人员 42 名。在控制年龄、性别、婚姻、学历、职称和职业后，基层防疫人员的积极情绪水平越高，发生睡眠质量问题的发生风险越低（OR, 0.977; 95%CI, 0.955-0.999）；自我效能水平越高，发生睡眠质量问题的风险越低（OR, 0.925; 95%CI, 0.902-0.946）。结论：积极情绪和自我效能是降低基层防疫人员发生睡眠问题的保护性因素。临床管理者和研究人员应该采取干预策略，通过提高基层防疫人员积极情绪和自我效能水平，进而改善基层防疫人员睡眠质量。

Abstract: Aims: To investigate the protective effects of positive emotions and self-efficacy on sleep quality among community epidemic prevention workers in COVID-19. Methods: From 2nd March to 6th March, by Wechat App, an online investigation for 14 communities in one city in China was conducted. The Chinese version of Positive and Negative Affect Questionnaire-Positive Subscale(PANAS-P), General Self-efficacy Scales(GSES), and Pittsburgh Sleep Quality Index(PSQI) were used to assess the positive emotions, self-efficacy and sleep quality respectively. After controlling for age, gender, marital status, education status, professional title and job, binary regression model was used to explore how positive emotions and self-efficacy associated with sleep quality. All the analysis was conducted in SPSS 26.0. Results: 709 community epidemic prevention workers were recruited in the final analysis, the number of general doctors was 404, general nurses was 158, medical technician was 64, community workers was 41, others was 42. After controlling for age, gender, marital status, educational status, professional title and job, positive emotions was negatively correlated with low levels of sleep quality(OR,0.977; 95%CI:0.955-0.999); self-efficacy was negatively correlated with low levels of sleep quality(OR,0.925;95%CI,0.902-0.946). Conclusion: positive emotions and self-efficacy were protective factors of sleep quality. Clinical managers and researchers should take measures targeting at improving positive emotions and self-efficacy to improve sleep quality of epidemic prevention workers.

摘要 **目的** 了解新冠病毒疫情期间医护人员情绪状况及其与应对方式的关系。**方法** 使用突发性公共卫生事件心理问卷、简易应对方式问卷和自编一般情况问卷，对来自武汉地区、华东地区、华南地区、西部地区、华北和东北地区的医护人员进行调查，发放问卷 530 份，收回有效问卷 503 份。**结果** 女性医护人员的抑郁、神经衰弱、恐惧和疑病反应得分均显著高于男性（ $p<0.05$ ， $p<0.01$ ），护士 5 个维度的情绪反应得分均显著高于医生（ $p<0.05$ ， $p<0.01$ ），初级职称医护人员神经衰弱得分显著高于中级以上职称医护人员（ $p<0.05$ ），武汉地区医护人员五个维度的情绪反应得分均显著高于其它地区（ $p<0.01$ ），疫情定点医院医护人员 5 个维度情绪反应得分均显著高于非定点医院（ $p<0.05$ ， $p<0.01$ ）。积极应对方式使用越多，医护人员的抑郁、神经衰

弱、强迫与焦虑程度越低。消极应对方式使用越多,医护人员的抑郁、神经衰弱、恐惧、强迫与焦虑、疑病程度越高。控制了性别、职业、职称、所在地和医院性质的影响后,积极应对方式和消极应对方式能够显著预测情绪状况($\beta = -0.27$, $p < 0.001$; $\beta = 0.27$, $p < 0.001$)。结论 应对方式是疫情期间医务人员情绪反应的重要影响因素。无论积极应对还是消极应对,对抑郁情绪的影响往往最大。

4. Department of Nautical Psychology, Naval Medical University, Shanghai, 200433

Abstract: **Objective** To investigate the relationship between emotional status and coping styles of medical staff during the COVID-19 outbreak. **Methods** Psychological questionnaire, simple coping style questionnaire and self-compiled general situation questionnaire were used to investigate medical staff from Wuhan, east China, south China, west China, north China and Northeast China. Totally 530 questionnaires were issued and 503 valid questionnaires were collected. **Results** Depression, neurasthenia, fear and hypochondriacal reaction scores were significantly higher for female medical staff than that of male ($p < 0.05$, $p < 0.01$). Five dimensions of emotional response score were significantly higher for nurses than doctors ($p < 0.05$, $p < 0.01$). Scores of neurasthenia were significantly higher in medical staff with primary titles than those with intermediate title of above ($p < 0.05$). Five dimensions of emotional response scores were significantly higher in Wuhan doctors than those from other areas ($p < 0.01$). The five dimensions of emotional response scores were significantly higher for medical staff in COVID-19 designated hospitals than other hospitals ($p < 0.05$, $P < 0.01$). Lower levels of depression, neurasthenia, obsessiveness and anxiety were associated with positive coping styles. Higher levels of depression, neurasthenia, fear, compulsion, anxiety and hypochondriasis were observed to be associated with negative coping styles. After adjusting for gender, occupation, job title, location, and hospital nature, positive and negative coping styles were significant independent predictors for emotional status ($= -0.27$, $P < 0.001$; $= 0.27$, $P < 0.001$). **Conclusion** Coping style is an important factor affecting the emotional response of medical staff during the COVID-19 outbreak. Both positive and negative responses tend to have the greatest impact on degree depression.

通讯作者 E-mail (ye_xch8639@163.com)

摘要 目的: 调查抗疫一线护士工作心理负荷现状, 并分析其影响因素, 为促进突发公共卫生安全事件护理人员心理防护、提高护理质量提供参考依据。**方法:** 于2020年3月8日到2020年3月19日采用便利抽样法调查武汉404名抗疫一线护士, 采用护士版NASA任务负荷指数量表和护士应对方式问卷分别对护士的工作心理负荷和应对方式进行调查评估, 并对调查结果进行单因素分析、相关性分析及多元线性回归分析。**结果:** 一线护士工作心理负荷总分为(64.95±12.30)分, 其中脑力要求(70.71±22.91)分、体力要求(86.44±18.19)

分、时限要求(74.06±21.90)分、自我表现(32.05±28.30)分、努力程度(84.05±18.23)分、受挫感(42.41±28.17)分;单因素分析结果显示,不同居住情况、医院所在地、工作年限、抗疫一线工作性质、平均年收入的护士工作心理负荷得分差异有统计学意义($P<0.05$)。相关性分析结果显示,工作心理负荷总分与问题解决、回避与自责、缓解情绪困扰、寻求社会支持呈正相关($P<0.05$)。多元回归分析结果显示,居住情况(和家人居住、独居、合租及其他)、医院所在地、问题解决、回避与自责是抗疫一线护士工作心理负荷的主要影响因素。**结论:**在抗疫一线高强度体力要求与努力负荷下,护士具有较好的自我表现及较低的受挫感。一线护理管理应促进护士积极应对,并通过人口学因素识别潜在高负荷人群,给予相应的有效干预。

The level of mental workload and influencing factors among frontline nurses in COVID-19 pandemic

Jing Shang¹, Yawei Shan¹, Yan Yan¹, Deying Hu², Xuchun Ye¹

1 School of Nursing, Naval Medical University (Second Military Medical University), Shanghai, 200433

2 Department of Nursing, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, 430022

Abstract: Objective: To investigate the level of mental workload of nurses working in the frontline in COVID-19 pandemic to explore the influencing factors to provide evidence for psychological improvement of nursing staff and improve nursing quality in public health emergencies. **Methods:** A total number of 404 frontline nurses were participated during March 8th to 19th, 2020 in Wuhan, China. The Chinese Version of *National Aeronautics and Space Administration Task Load Index* (NASA-TLX) and Coping Style for Nurses scale were employed in this study. The single factor analysis, correlation analysis and multiple linear regression analysis were conducted to explore the influencing factors to mental workload. **Results:** The total mean level of mental workload was (64.95±12.30) and the mental demands, physical demands, temporal demands, performance, effort and frustration were (70.71±22.91), (86.44±18.19), (74.06±21.90), (32.05±28.30), (84.05±18.23) and (42.41±28.17), respectively. The single factor analysis showed that the factors of living status, hospital locations, years of clinical practice, working positions and income were statistically significant between groups. The correlation analysis indicated the relationship between mental workload and problem solving, avoidance or self-accusation, emotional distress alleviation and social support seeking. In addition, the result of multiple linear regression analysis showed that the main influencing factors to mental workload were living status, hospital locations, problem solving and avoidance or self-accusation. **Conclusion:** Frontline nurses were under great task load while in good self-reported performance and low frustration. Nursing management in frontline could facilitate the positive coping of nurses to promote nursing care. Identifying the individuals with high mental workload by sociodemographic factors could provide references to put forward effective interventions.

COVID-19 轻症患者的心理弹性与焦虑, 抑郁的关系研究: 一项横断面调查

张杰¹ 杨振² 王潇³ 李娟¹ 董丽丽² 王福生² 李奕霏¹ 魏睿宏² 张静平¹ (通讯作者)

1 中南大学湘雅护理学院护理心理研究中心, 长沙, 410013, jpzhang1965@163.com

2 汕头大学医学院第二附属医院, 汕头, 515021

3 中南大学湘雅三医院, 长沙, 410013

摘 要 COVID-19 的爆发对个体会产生负面影响, 但心理弹性在处于压力下人们的反应中起着决定性的作用, 可以帮助他们更有效地应对压力。因此, 本研究拟探讨心理弹性在焦虑和抑郁中的作用, 并澄清他们在 COVID-19 轻症患者中的关系。本研究采用横断面的研究设计, 采用方便抽样的方法, 抽取武汉方舱医院的 296 名轻症患者参与本研究。主要采用一般资料问卷, Connor-Davidson 心理弹性量表, 医院焦虑抑郁量表对符合纳入排除标准的 COVID-19 轻症患者进行调查。结果显示, 该研究中约 20.9% 和 18.6% 的患者存在焦虑情绪 (处于临界值以上焦虑状态和重度焦虑) 和抑郁情绪 (处于临界值以上抑郁状态和重度抑郁)。研究对象的心理弹性得分为 69.53, 标准偏差为 16.98, 略低于普通中国成年人的正常水平。心理弹性与焦虑 ($OR = 0.362, p < 0.001$) 和抑郁 ($OR = 0.301, p < 0.001$) 均呈负相关, 并且是其保护因素。其中焦虑的危险因素包括女性 ($OR = 2.227, p = 0.009$) 和同事中患有 COVID-19 ($OR = 2.849, p = 0.005$), 而抑郁情绪的危险因素是家庭成员患有 COVID-19 ($OR = 2.039, p = 0.039$)。这项研究表明, 在控制一般人口统计资料的影响后, COVID-19 轻症患者中较高的心理弹性与较低的焦虑和抑郁情绪相关。卫生专业人员, 尤其是临床护士, 需要了解 COVID-19 患者的心理状况, 并提高其心理弹性, 以改善其心理健康。

关键词 心理弹性, 焦虑, 抑郁, COVID-19

The relationship between resilience, anxiety, and depression among patients with mild symptoms of COVID-19 in China:

A cross-sectional study

Abstract: The outbreak of COVID-19 has negatively affected some individuals but resilience plays a decisive role in the response of individuals under pressure and can help them deal with pressure more effectively. The aims and objectives of this study was to explore the role of resilience in anxiety and depression and to clarify their relationships among patients with mild symptoms of coronavirus disease 2019 (COVID-19) in Wuhan, China. This was a cross-sectional descriptive correlational survey. In total, 296 patients from Fang Cang Hospital in Wuhan, Hubei, China with mild symptoms of COVID-19 were recruited. Participants were recruited through convenience sampling. The data collected included their demographic information, the Connor-Davidson Resilience Scale, and Hospital Anxiety and Depression Scale. The Results indicated that approximately 20.9% and 18.6% of the patients in this study had above threshold anxiety (subthreshold anxiety and major anxiety) and depression (subthreshold depression and major depression). The mean total resilience score of the participants was 69.53, and the standard deviation was

16.98 which was slightly below the normal level of ordinary Chinese adults. Resilience was inversely associated with and was a protective factor for both anxiety (OR=0.362, $p < 0.001$) and depression (OR=0.301, $p < 0.001$). in our samples. Risk factors for anxiety include being female (OR=2.227, $p=0.009$) and having colleagues with COVID-19 (OR=2.849, $p=0.005$), while a risk factor for depression was having family members with COVID-19 (OR=2.039, $p=0.039$). This study shows that after taking the general demographics into consideration, higher levels of resilience was associated with lower anxiety and depression among mild COVID-19 patients in Wuhan, China. Health professionals, especially clinical nurses, need to be aware of the psychological status of COVID-19 patients and promote resilience in order to improve their mental health.

The status and influencing factors of posttraumatic stress disorder in public health emergency

JIANG Tongtong, SHI Tieying, LU Yu, LI Fanglin, SONG Chunli, XU Pengzhu. The First Affiliated Hospital of Dalian Medical University, Dalian 116011, China; Chiba University, Japan, 260-8672

Abstract: Objective To study the status quo and influencing factors of posttraumatic stress disorder in public during the outbreak of Novel Coronavirus Pneumonia, to provide a reference basis for developing and implementing specific psychosocial health guidance in the next stage. **Methods** Totally 998 cases were investigated using general information questionnaire and posttraumatic stress disorder checklist-civilian version. **Results** A total of 257 cases were positive for posttraumatic stress disorder, with an incidence of 25.75%. Logistic regression analysis showed that gender and place of residence were associated with posttraumatic stress disorder in public health emergency ($P < 0.05$). **Conclusion** The public had psychological health problems during the outbreak of Novel Coronavirus Pneumonia. It's necessary to strengthen the psychological health intervention for the public during the outbreak of Novel Coronavirus Pneumonia, especially men and urban residents, so as to relieve their physical and psychological stress from the aspects of physiology, emotion, cognition and behavior, in order to promote the public to actively respond to the outbreak of Novel Coronavirus Pneumonia in the best psychological state.

1 新乡医学院第一附属医院, 河南新乡, 453003, zzzqy@126.com

2 新乡医学院护理学院

摘要 目的探讨湖北省新型冠状病毒患者隔离期间的孤独焦虑抑郁现状,以便为患者提供相应的护理措施。**方法**选择2020年1月至3月的117例由感染科负责隔离诊治的疑似及确诊病人为研究对象,运用孤独量表、焦虑自评量表和抑郁自评量表对其进行调查。**结果**117名隔离病房患者中,98名(83.8%)出现孤独情况,72名(61.5%)出现焦虑情况,97名(82.9%)出现抑郁情况。单因素及独立样本t检验分析结果表面,性别、年龄、婚姻状况和慢性病患病情是影响患者孤独感的主要因素;性别、年龄、可支配收入和慢性病患病情是影响患者焦虑症状发生的主要因素;可支配收入、家庭关系和确诊情况是影响患者抑郁症状发生的主要因素。**结论**新型冠状病毒隔离病房患者的孤独、焦虑、抑郁情况发生率较高,影响患者心理健康,从而对患者病情恢复产生消极作用。医护人员应当高度重视隔离病房患者的心理状况,尤其加强对其中女性患者,老年患者及低收入群体患者的关注,制定相应的心理干预体系和措施,通过减轻患者孤独焦虑抑郁水平来加速患者病情恢复。

Analysis of the loneliness, anxiety and depression in patient with novel coronavirus in isolation ward of hubei province and potential influence factors

Zhiqin Zhang¹, Quanying Zhang^{1*}, Chaohui Zhang¹, Shuxian He¹, Hongjuan Chang², Chenggang Zhao¹, Aihui Li¹, Jingxian Guan¹

1 The First Affiliated Hospital of Xinxiang Medical University;

2 School of Nursing, Xinxiang Medical University.

Abstract: **Objective** To explore the status of loneliness, anxiety and depression during isolation of patients with COVID-19 in order to provide patients with corresponding nursing measures. **Methods** A total of 117 suspected and diagnosed patients from January to March 2020 were selected as the research subjects, who were isolated and treated by the department of infectious diseases. The loneliness scale, anxiety self-rating scale and depression self-rating scale were performed to investigate the psychological status of patients. **Results** Among the 117 patients in isolation wards, 98 (83.8%) developed loneliness, 72 (61.5%) developed anxiety, and 97 (82.9%) developed depression. The further statistical analysis showed that gender, age, marital status and chronic disease prevalence were the main factors affecting the loneliness of patient; gender, age, disposable income and chronic disease prevalence were the main factors affecting the anxiety symptoms of patient; disposable income, family relationship, and confirmed diagnosis were the main factors affecting the occurrence of depressive symptoms in patient. **Conclusion** The patients in isolation wards with COVID-19 exhibit high incidence of loneliness, anxiety, and depression, which significantly affect their psychological health. Therefore, the medical staff should attach great importance to the psychological status of patients in isolation wards, especially pay more attention to the female, elderly, and low-income patients; simultaneously, the medical staff should set up corresponding intervention measures to reduce the level of loneliness, anxiety and depression of patients.

分级心理护理对新型冠状病毒疑似患者隔离期间心理问题的影响

万欢¹ 黄丽芳 王利纯 姚嘉佩 刘艳辉 谭朝红 秦月兰² (通讯作者)

¹ 湖南省人民医院护理部, 湖南, 410005

² 湖南师范大学附属第一医院, 长沙市, 410000, 912542420@qq.com

摘要 目的 探讨隔离期间新型冠状病毒疑似患者的心理问题,探索分级心理护理对改善其负性情绪效果。方法 采用心理痛苦温度计(DT)、广泛性焦虑自评量表(GAD-7)、9条目病人健康问卷抑郁量表(PHQ-9)对新型冠状病毒疑似患者隔离期间的心理状况进行测评,根据心理问题的严重程度进行针对性护理干预,干预后再用GAD-7、PHQ-9对隔离的新型冠状病毒疑似患者进行测评.采用SPSS 26.0统计软件对干预前后各项测评指标进行分析。结果 大多数新型冠状病毒疑似患者出现不同程度的心理行为反应;干预组新冠病毒疑似患者痛苦、焦虑、抑郁得分均显著低于干预前,差异有统计学意义($P<0.05$);对照组干预后新冠病毒疑似患者痛苦、焦虑、抑郁得分均明显高于干预组,差异有统计学意义($P<0.05$)。结论 突发事件对公众的心理可产生不良影响,分级护理能有效改善新型冠状病毒疑似患者心理痛苦、焦虑抑郁状态。但由于新型冠状病毒疑似患者的隔离期短,长期效果未能观察,希望在以后的研究中能增加院外干预及随访。

Effects of hierarchical psychological nursing intervention on psychological problems of patients with 2019-nCoVAvian Influenza during isolation

Wan Huan, Huang Lifang, Wang Lichun, Yao Jiawei, Liu Yanhui, Tan Chaohong, Qin Yuelan
The First Affiliated Hospital of Hunan Normal University, Changsha, Hunan Province

Abstract: Objective: To explore the mental health of the patients with 2019-nCoVAvian Influenza during isolation, and to explore the effect of hierarchical psychological nursing on improving their negative emotions .Methods : Psychological distress thermometer (DT), generalized anxiety self-rating scale (GAD-7), and 9-item patient health questionnaire depression scale (PHQ-9) were used to evaluate the psychological status of patients suspected of 2019-nCoVAvian during isolation. According to the severity of psychological problems carried out targeted nursing intervention. Then the novel coronavirus suspected patients were assessed by GAD-7 and PHQ-9 after intervention SPSS 26.0 statistical software was used to analyze the evaluation indexes before and after the intervention .Results: Most of the patients showed different degrees of psychological and behavioral responses. Scores of the patients' DT, GAD-7, and PHQ-9 were more significantly reduced after intervention than those before intervention in the intervention group ($P<0.05$); Scores of the patients' DT, GAD-7, and PHQ-9 were more significantly reduced in the intervention group than those in the control group ($P<0.05$). Conclusion: Emergency events can have adverse effects on public psychology, and hierarchical psychological can effectively improve the psychological distress, anxiety and depression of patients suspected of 2019-nCoVAvian. However, the novel coronavirus suspected patients had a short isolation period, so that the long-term effect was not observed. We hope that in the future research, we can increase the out of hospital intervention and follow-up.

Keywords: the patients with 2019-nCoVAvian Influenza, hierarchical psychological nursing, intervention

摘要 语言理解中存在的预测性及其可预测的范围和程度是心理语言学研究中的热议话题。该实验旨在考察读者在阅读过程中可以对特定语义特征进行预测, 如生命性特征。该实验采用脑电技术与表征相似度分析相结合的方式, 使用量词-名词短语(数词+量词+名词, 如“一位老师”)作为实验材料, 量词分为修饰有生命特征名词的量词(如“一位”、“一头”)和修饰无生命特征名词的量词(如“一朵”、“一块”)两种条件。我们对脑电活动进行了表征相似性分析, 分别计算了两种量词呈现之后到名词呈现之前的神经活动相似度。结果发现, 修饰有生命特征名词的量词的神经活动相似度比修饰无生命特征名词的量词所引发的神经活动相似度更大。结果表明, 尚未呈现的名词的生命性特征被预先激活, 生命性特征引发更大的神经表征相似性。该结果为语言理解中语义特征的预测提供了神经证据。

Abstract: The present study aims to seek neural evidence for the claim that readers predict specific semantic features such as animacy of upcoming words during language comprehension. We have used electroencephalography (EEG), in combination with representational similarity analysis (RSA). Participants read classifier phrases (Numeral-Classifier-Noun, e.g., 一位老师). Classifiers constrained for either animate or inanimate semantic features of upcoming nouns. We computed the similarity between brain activity following the classifiers until just before the presentation of the nouns. RSA revealed that the similarity between neural activity following animate-constraining classifiers was greater than following inanimate-constraining classifiers, indicating the pre-activation of the animacy feature of upcoming nouns. These findings provide clear neural evidence for semantic prediction in reading comprehension.

Keywords: Semantic prediction, Language comprehension, EEG, Representational Similarity Analysis

回视对汉语阅读中预测加工的影响： “如履薄冰”还是“破釜沉舟”？

李琳¹ (通讯作者) 辛丹仪¹ 徐乐阳¹ 靳金金¹

1 天津师范大学心理学部, 天津, 300387, linpsy@outlook.com

摘要 预测加工是大脑的基本工作方式之一。在阅读过程中, 读者基于前文语境不断地对后文内容进行预测, 提升对下文即将出现的词汇的加工效率。回视是眼睛向着与正常阅读方向相反的方向运动, 这一行为占

正常阅读中所有眼睛运动的 15%-25%。已有采用拼音文字进行的眼动研究报告了在回视过程中，读者会对前文语境信息进行再次整合加工，以促进对阅读内容的理解。汉语书写系统的一个重要特点是没有明确的词边界信息，这使读者可能更加依靠前文信息进行词汇的切分和识别。但是，在汉语阅读中回视怎样影响预测加工仍是尚未解决的问题。因此，当前研究的目的是考察：在不同的回视条件下，读者会如何利用前文语境信息进行预测加工？当无法回视时，读者的预测加工是“如履薄冰”的谨慎还是“破釜沉舟”的风险？当前研究采用 2(预测性:高&低)* 2(回视条件:允许回视&不允许回视)的被试内设计。目标词预测性高低的判断标准：招募 20 名被试进行基于目标词前文语境的完形任务，目标词的完型概率 $\geq 80\%$ 为高预测性；完型概率 $\leq 15\%$ 为低预测性。回视条件的操纵：采用随注视点变化的边界范式的变式，允许回视的句子正常呈现；不允许回视的句子中的每两个词之间均设置不可见边界，当被试从左到右阅读时，句子正常呈现，当被试进行回视并越过词左侧边界时，边界之前的所有内容均消失，以达到不允许回视的目的。在天津师范大学招募被试 40 人（18~21 岁），采用 EyeLink 1000 Plus 桌面式眼动仪记录被试在阅读过程中眼动轨迹，考察在汉语阅读中回视对预测加工的影响。结果发现：(1)在注视时间类指标上均发现了预测性和回视条件的主效应，但并未发现交互作用，即在不同的回视条件下存在相似的预测性效应；(2)在眼跳落点位置上发现了预测性和回视条件的交互作用，在不允许回视的条件下高预测性具有显著更远的眼跳落点位置。

关键词 回视，预测加工，汉语阅读，眼动研究

The function of regressions on predictive processing during Chinese reading

Lin Li, Danyi Xin, Leyang Xu, Jinjin Jin

Faculty of Psychology, Tianjin Normal University, Tianjin

Abstract: Predictive processing is one of the basic functions of human brain. During normal reading, readers predict the following content based on the information of the previous text continuously, in order to improve the processing efficiency of upcoming words. Regressions are the eyes movement to the opposite to the opposite of the normal reading direction, which accounts for 15%-25% of all eye movements in normal reading. Studies using alphabetic language have shown that during the regressions, readers would re-process and integrate the context information of the previous text, and promote the understanding of reading content to a considerable extent. An important feature of the Chinese writing system is that there is no clear word boundary information, which makes Chinese readers rely on the previous information for vocabulary segmentation and recognition. However, how the regressions influence prediction processing in Chinese reading is still an unsolved problem. Therefore, the purpose of the current research is to examine: in different regressions conditions, how do readers use the context information for predictive processing effectively? Would the predictive processing be more cautious or risky when regressions are not allowed? The current study had a 2 (prediction: high & low) * 2 (regression conditions: regressions allowed & regressions not allowed) within subject design. 20 subjects performed a completion task based on the context of the pre-target word. Completion probability of the words $\geq 80\%$ considered to be the high-prediction target words, and $\leq 15\%$ the low-prediction target words. Manipulation of regression conditions was via the boundary paradigm variation, Invisible boundaries are set between each of the two words in a sentence, the sentence presents normally when the participants read from left to right, and when they regressive and crosse the left boundary of the word, everything before the boundary disappears in order to achieve the goal of not allowing regressions. 40 participants (18-21 years old) from Tianjin Normal University were recruited, an EyeLink 1000 Plus desktop eye tracker was used to record the eye movements during reading, and to examine the impact of regressions on the predictive processing during Chinese reading. The results showed that: (1) Main effects of prediction and regression conditions were found in the fixation time measures, no interaction was significant, which means that there were still reliable predictive effects even when regressions were not allowed. (2) The interaction between prediction and regression conditions was found in landing position, which suggests more risky eye movement characteristics were shown under conditions that did not allow regressions.

Keywords: Regressions, predictive processing, Chinese reading, eye movements

语言预期加工的灵活性及音乐经验的调控作用

摘要 语言预期加工不仅依赖于听者/阅读者的知识系统、而且与特定认知能力密切相关。本研究考察了音乐专业经验是否、如何影响口语理解过程中的语义预期加工倾向性。在脑电实验中, 音乐家和非音乐家聆听高或低语义限制性的口语句子, 在句子之前呈现与该句韵律长时程结构一致或不一致的启动刺激。首先, 锁时在目标名词上的分析发现, 音乐家组和非音乐家组都产生了 N400 降低效应 (高语义限制性 vs. 低语义限制性), 表明高限制性语境促进被预期词汇的语义加工; 在韵律不一致启动条件下 (vs. 韵律一致启动) 这一效应的起始潜伏期相对延迟, 尤其是在音乐家组中 (vs. 非音乐家)。其次, 锁时在目标名词之前的及物动词上的分析发现: 1) 在音乐家组中, 在韵律不一致启动条件下, 高语义限制性 (vs. 低语义限制性) 引起事件相关电位 (ERP) 的正波波幅增加, 同时, 在韵律一致 / 不一致启动条件下, 高语义限制性 (vs. 低语义限制性) 引起 beta 频段时频成分 (19-25Hz) 能量增加 / 降低, 当控制了其他语义和声学的混淆变量后, 这些 ERP 波幅 / beta 能量幅值都与即将到来的目标名词的可预期性 (完型概率) 显著相关; 此结果表明, 在关键动词处, 音乐家在预期随后将要出现的目标名词, 而且这一预期效应在不一致启动条件下更突显; 2) 在非音乐家组中, 在韵律一致和不一致启动条件下, 高语义限制性 (vs. 低语义限制性) 引起 ERP 正波波幅增加, 但这一 ERP 幅值与当前加工的动词的可预期性显著相关、与名词可预期性无显著相关; 此结果表明, 在关键动词处, 非音乐家在此实验情景中没有表现出显著的预期加工。综合以上结果表明, 音乐经验虽然没有益化最终的语义理解效果, 但是提高了听者在口语理解过程中的语义预期加工倾向性 (特别是表现在相对困难的听觉加工条件下)。可见, 语言预期加工不仅仅具有音灵活性、策略性的特点; 音乐经验对语言语义预期加工倾向的促进作用不仅仅是高效声学 / 语音感知加工的副产品、而可能与更高级的认知促进机制有关。

Abstract: Musical experience has been found to aid speech perception. This electroencephalography study further examined whether and how musical expertise affects high-level predictive semantic processing in speech comprehension. Musicians and non-musicians listened to semantically strongly/weakly constraining sentences, with each sentence being primed by a congruent/incongruent sentence-prosody. At the target nouns, a N400 reduction effect (*high vs. low predictable*) was observed in both groups, with the onset-latency of this effect being delayed for incongruent (*vs. congruent*) priming, especially for musicians (as compared to non-musicians). At the transitive verbs preceding these target nouns, musicians' event-related-potential amplitude (in incongruent-priming) and beta-band oscillatory power (in both priming) showed a semantic-constraint effect, and were correlated with the predictability of incoming nouns; non-musicians only demonstrated an event-related-potential semantic-constraint effect, which was correlated with the predictability of current verbs. These results indicate musical expertise can enhance anticipatory

semantic processing in speech comprehension, and this effect might be not just an aftereffect of facilitated acoustic/phonological processing.

Keywords: Musical expertise, Semantic prediction, Prosodic processing, Speech comprehension

句子理解过程中线索比例对刻板印象加工的影响：来自 ERP 的证据

杜雅楠 张亚旭（通讯作者）

北京大学心理与认知科学学院，北京，100871，yxzhang@pku.edu.cn

摘要 为了快速理解语言，理解者需要根据语境以及已有的世界知识（包括社会知识）预测即将出现的语言信息。语言加工中预期机制的性质一直是语言认知研究的中心问题。然而，迄今为止，该领域大多数研究关注的是基于句子语境的词汇水平的语义预期或句法预期，很少涉及世界知识或社会知识。这一局面限制了我们对语言加工中预期机制性质的完整理解。为此，本研究考察汉语句子理解过程中，语言刺激环境中与读者刻板印象相关的语言线索如何通过改变读者的预期，来动态调节刻板印象这种社会知识在句子加工中的作用。研究通过操纵实验刺激中的填充材料，构造出“高比例”和“等比例”两种条件。其中，高比例条件中，与刻板印象一致的句子，如“老王的女儿是一名**护士**，……”，占 80%，而与刻板印象不一致的句子，如“老王的儿子是一名**护士**，……”，占 20%。等比例条件中，一致和不一致两种句子各占 50%。实验采用 2（刻板印象一致性：一致、不一致）× 2（刻板印象一致的比例：高比例、等比例）被试内设计，测量不同比例环境中刻板印象不一致所引发的 ERP 效应。实验时，被试阅读逐词呈现的句子，并且对偶尔出现的理解问题进行“是”或“否”的回答。初步结果（基于 32 名被试，其中女生 19 名；更多被试的数据正在采集中）显示，当先进行高比例后进行等比例实验时，等比例条件下，刻板印象不一致比一致引发更大的 N400（350–450 ms）和晚期负活动（LN，500–700 ms）。其中，LN 效应随试次的增加而减小，表现出预期适应现象。相比之下，高比例条件下，刻板印象不一致与一致所引发的 N400 和 LN 均不存在显著差异。此外，当先进行等比例后进行高比例实验时，刻板印象一致性与试次之间存在边缘交互作用（ $p = .09$ ），随着试次增加，刻板印象不一致所引发的 N400 效应增强。这些结果提示，语言刺激环境中与读者刻板印象一致的句子材料所占的比例，以及不同比例实验的先后顺序会动态调节刻板印象这种社会知识的加工（可能通过影响读者与刻板印象相关的预期）。论文立足于社会知识，从语言预期和语言加工的自动-控制特点两个角度，对上述发现进行了理论讨论。

The influence of cue validity to gender stereotypical comprehension during Chinese reading: Evidence from event-related potentials

Du Ya-Nan, Zhang Ya-Xu

School of Psychological and Cognitive Sciences, Peking University, Beijing, China

Abstract: Based on contextual knowledge and world / social knowledge, comprehenders can generate predictions about upcoming input in order to process it as it unfolds. Many experiments have shown the processes of lexical and syntactical predictability, relatively little is known about the dynamic predication of social language comprehension. The present study conducted an event-related potential experiment to investigate whether and how readers predict and adapt their expectations to gender stereotypical sentences. To address this issue, we experimentally manipulated the probability of occurrence of stereotypical sentences (e.g., Wang's daughter / son is a *nurse*,.....). For the high block, stereotypical congruence sentences were presented more frequently than incongruent sentences to incongruence ones (80% vs. 20%), while they were presented as frequently as incongruent sentences in the equal probability block. Linear mixed-effect models were used to examine how the size of the N400 and LN effect changed as the experiment went along. The results based of 32 Chinese (19 female, note that more data are collecting) showed that when participants read high block first, stereotypical congruent sentences elicited larger N400 and LN than incongruent sentences in equal proportion condition, and LN effect was increasingly smaller over the course of the experiment,

suggesting an adaptation to stereotypical incongruence. Besides, when participants read equal block first, there was a marginal interactive effect between stereotypical and trial, which revealed stereotypical N400 effect was increasingly larger over the course of the experiment. Therefore, these results demonstrated how social knowledge affect language predication dynamically.

自然言语理解中句子水平预测表征的脑认知机制

周发新¹ 杨梦涵¹ 卢春明^{1*} (通讯作者)

¹ 北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, luchunming@bnu.edu.cn

摘要 预测性在语言理解中发挥着重要作用。但是以往研究大多在音位和词水平进行, 句水平的预测机制仍不清楚。为此, 本研究通过结合计算建模方法和功能磁共振技术探讨了自然言语理解中句子水平的预测表征问题。我们首先使用 BERT 模型对语境信息和待预测语言单元(包括词单元和句单元)进行向量化表征, 并在此基础上分别创建单词和句子的预测表征模型。基于所创建的模型, 对选取的实验材料(连续的故事)进行计算, 分别生成词水平和句水平的预测向量表征。此外, 我们使用功能磁共振技术记录了 31 名被试在倾听故事及其倒放版本时的神经活动(倒放作为对照条件), 并将生成的预测向量表征与脑活动进行关联分析。结果表明, 词水平特异的预测表征位于颞上回后部、右侧脑岛和额下回, 而句水平特异的预测表征脑区则位于右侧额中回后部。进一步的联合分析表明跨层级的预测表征(即在词、句两个水平上都存在显著激活)为左侧背内侧前额叶与左侧额中回前部。这些结果将自然语言理解过程中的预测机制从音位和词汇水平拓展到了句子水平, 并提示大脑中存在着层级特异和层级无关的预测表征神经基础。

The Neurocognitive Mechanism of Sentential Predictive Representation During Natural Speech Comprehension

Faxin Zhou¹, Menghan Yang¹, and Chunming Lu¹

¹ State Key Laboratory of Cognitive Neuroscience and Learning & IDG/McGovern Institute for Brain Research, Beijing Normal University, Beijing 100875, China.

Abstract: It is well recognized that prediction plays an important role in language comprehension. Previous studies on the predictive mechanism, however, was mainly conducted at the phonemic and lexical level. Thus, little is known about the sentential predictive mechanism. Here we addressed this issue by combining computational model and functional magnetic resonance imaging (fMRI) technique. We firstly vectorized the language context and the upcoming language unit (word or sentence) with the Bidirectional Encoder Representations from Transformers (BERT) model, based on which the predictive representation models at the lexical and sentential levels were built. The trained models were used to generate the predictive representations of 3 stories. Additionally, 31 participants were scanned while they listened to forward and backward (control condition) audio recordings of the 3 stories. By conducting R^2 -based random effect analysis and region of interest (ROI) analysis, we tested the relationship between the lexical or sentential predictive representations and the brain activities. The results showed that the right insula, inferior frontal gyrus, and posterior superior temporal gyrus were associated with the predictive representations at the lexical level, while the right posterior middle frontal gyrus was associated with the predictive representations at the sentential level. Additionally, conjunction analysis showed that the left dorsomedial prefrontal cortex and the left anterior middle frontal gyrus were associated with the predictive representations of both levels. Together, these findings filled the gap of knowledge in the current literature about the predictive representation during natural language comprehension by extending the evidence from the lower level to the sentential level. The above results also reveal hierarchy-specific and hierarchy-general systems for the predictive representation during natural language comprehension.

句子理解中的预期加工：理论与争议

王穗苹（通讯作者）

华南师范大学心理学院，广州，510631, wangsuiping@m.scnu.edu.cn

摘要 语言理解是人类特有的一种极其迅速而高效的认知过程。随着“预测脑”概念的提出，研究者越来越多地关注语言预期在理解中的作用，强调自上而下的信息在目标信息输入前所发挥的作用。对语言预期加工的机制的研究，为解释语言高效加工提供了新角度。在本次报告中，我对语言理解中的预期加工的相关理论和研究进行了介绍，并呈现我们针对以往的分歧所开展的一些工作。根据这些工作，我们讨论了未来在语言预期研究方面应加以关注的一些问题。

关键词 句子理解，预期加工，自上而下加工

Prediction in sentence comprehension: Theory and Controversy

Suiping Wang

School of Psychology, South China Normal University, Guangzhou

Abstract: Language comprehension is an extremely rapid and efficient cognitive process peculiar to human beings. With the introduction of the concept “predictive brain”, researchers have increasingly paid attention to prediction in language comprehension, emphasizing the role of top-down information that exists before bottom-up input actually occurs, which provides a new perspective for explaining the efficient language comprehension. In this talk, I will introduce research and theoretical issues related to prediction processing in language comprehension, as well as present our own work in the effort of solving some of the disagreements among research in this area. Based on these works, we raised several key points for consideration in future studies of prediction processing.

Keywords: sentence comprehension, predictive processing, top-down processing

社区干部治理内生动力机制的质性研究

岳童

西南大学心理学部，心理学与社会发展研究中心，中国社区心理学服务与研究中心，重庆，400715，

yue.suhong@163.com

摘要 社区干部是我国社区治理体系建设中的重要力量，其主动投入社区治理的心理因素及内在动力机制目前仍少有研究进行揭示。本研究以社区干部的治理内生动力为切入点，以探索提升其治理效能的长效心理作用路径为目标，采用基于开放式主题访谈的扎根理论方法，对全国5个省市7个城市辖下17个社区的24名社区干部(其中绩效优秀和普通者各半)进行了访谈，构建出社区干部的治理内生动力机制模型。研究表明：(1) 以治理价值观为核心，继而自然衍生出的自我定位和治理情怀构成了社区干部的治理内生动力系统；(2) 在治理内生动力的驱动下，社区干部可以积极主动地提升自身治理素质来应对社会转型过程中繁杂的社区治理工作，充分释放其治理效能；(3) 良好的治理表现可以使得社区干部在治理工作和居民积极评价中获得自我价值的实现，从而实现通过自我激励增强内生动力的正向循环模式，充分释放其社区干部的治理效能。

A Qualitative Study on the Endogenous Dynamic Mechanism of Community Cadres' Governance

YUE Tong

(School of Psychology, Southwest University ; Research Center for Psychology and Social Development, Southwest University; China Community Psychology Service and Research Center Chongqing 400715, China)

Abstract: Community cadres are an important force in the construction of community governance system in China, and there are few studies on the psychological factors and internal dynamic mechanism of their active participation in community governance. Taking the endogenous power of community cadres as the breakthrough point, and aiming at exploring the long-term psychological path of improving their governance efficiency, this study uses the grounded theory method based on open-ended topic interview to interview 24 community cadres (half of them are excellent and half are ordinary) from 17 communities in 7 cities of 5 provinces and cities in China, and constructs the governance vitality of community cadres Force model. The results show that: (1) with the governance values as the core, the self positioning and governance feelings naturally derived form the governance endogenous power system of community cadres; (2) driven by the governance endogenous power, community cadres can actively improve their governance quality to deal with the complicated community governance work in the process of social transformation, and fully release their governance effectiveness; (3) the governance of community cadres is not only the core of the governance value, but also the governance of community cadres Good governance performance can enable community cadres to realize their self-worth in the governance work and positive evaluation of residents, so as to realize the positive circulation mode of enhancing endogenous power through self motivation, and fully release the governance efficiency of community cadres.

居民社区信任结构探索及影响因素研究

徐荣 吴继霞(通讯作者)¹

苏州大学教育学院心理学系, 苏州, 215123; wujixia@suda.edu.cn

摘要 在社会发展的过程中,信任的建设是必不可少的一环。而社区作为社会的基本细胞,信任在社区也不可忽视。人们生活在社区中,避免不了相互之间的联系与沟通,这种联系与沟通往往建立在信任的基础之上。所以社区信任是能够促进社区内居民进行合作的重要因素,在社区范围内的群体合作活动中起到重要的润滑作用,能够减少群体内的摩擦,提升社区活动效率。研究者大都认为社区信任是在这种特定的社会性地域空间内形成的信任形式,是指在社区的空间范围内社区生活的个体对于同社区的他者的信任程度。但是学者们对于社区信任的具体内涵有着不同的看法。为了解社区信任的内涵和结构,本研究通过深入社区,与居民进行对话,用访谈的方式来获取居民对于社区信任的看法与感受。采用协商一致小组进入4个社区,共访谈了居民23人。通过质性研究的方法进行文本分析,来对社区信任的内涵和结构进行本土化探索,并分析对社区信任产生影响的因素。研究主要得出以下结论:(1)居民的社区信任由四个成分构成,分别是对**社区组织**、**物业公司**、**邻居**和**居民委员会**这四个对象的信任。居民对**社区组织**的信任主要涉及管理、政策、活动等方面;对**物业公司**的信任涉及所提供的服务方面,如环境卫生、安全、设施、服务等;对**邻居**的信任是人际信任,也是对社区信任的直接感受;**居民委员会**是居民和社区及物业之间沟通的桥梁,居民通过他们向社区传递意见,同时社区也通过他们联系居民,了解居民情况。居民对居委会的信任也是对信息传递的信任。(2)社区信任的影响因素有客观因素和主观因素构成。客观因素主要有服务质量、安全稳定程度、环境卫生情况、关怀程度、和谐氛围及社区活动等方面;主观因素包括居民参与社区活动频率、居民与社区他者接触情况以及居民普遍信任水平等。

关键词 社区信任,社区服务,居民

Community trust structure and influencing factors

Xu Rong, Wu Jixia¹

School of education, Soochow University

Abstract: In the process of social development, the construction of trust is an essential part. Society is composed of communities, and trust can not be ignored in communities. People living in the community cannot avoid contact and communication, which is often based on trust. Therefore, community trust can promote cooperation among residents in the community, reduce conflicts within groups and improve the efficiency of community activities. Most researchers believe that community trust is the trust formed in this specific social geographical space, which refers to the degree of trust of individuals living in the community to others in the same community. However, researchers have different views on the specific connotation of community trust. In order to study the connotation and structure of community trust, this study obtained residents' views and feelings about community trust by entering the community, talking with residents and interviewing. We entered 4 communities and interviewed 23 residents. Through text analysis, this paper explores the connotation and structure of community trust, and analyzes the influencing factors of community trust. The main conclusions are as follows: (1) Residents' community trust consists of four components, namely, trust in community organizations, property companies, neighbors and resident representative. Trust in community organizations mainly involves management, policies, activities; trust in property companies involves the services provided, such as environmental hygiene, safety, facilities and services; trust in neighbors is interpersonal trust and a direct feeling of community trust; resident representative are the bridge between residents and communities ,properties. Residents pass on their opinions to the community through them, and the community also contacts residents through them to understand their situation. Trust in resident representatives is also trust in information transmission. (2) The influencing factors of community trust include objective factors and subjective factors. Objective factors mainly include service quality, safety and stability, environmental sanitation, care, harmonious atmosphere and community activities; subjective factors include the frequency of participating in community activities, contact with others in the community and the general trust level of residents.

Keywords: Community trust, community service, residents

摘 要 幸福感在社会生活中是一个衡量人们生活质量的指标。大量的研究表明人格是预测个体幸福感的最稳定且有效的因素之一, 并认为它是幸福的一个相比于种族、社会阶级、金钱、工作等更大的决定因素。在人格的相关研究中, 中心特质是构成个体独特性的重要特质, 是在各种情境下控制个体行为的人格特征。那么, 影响个体幸福感的众多人格特质中, 哪些会是类似于“中心特质”的、对个体幸福感产生影响的重要、稳定、跨时间一致性的特质呢? 中国人的人格特征有别于西方, 中国人的幸福人格特质也可能有别于西方。比如, 中国讲究“吃亏是福”、“独乐乐不如众乐乐”, 等等。因此, 探讨中国人幸福人格的结构和内涵是十分重要的。本研究基于词汇学假设, 从本土语言体系里与幸福感相关的词汇中提炼幸福人格的结构, 探查中国文化下幸福人格的内涵。为保证词汇信息的完整性, 本研究以王登峰、黄希庭、沐守宽等人编制人格测验的最初词表为基础, 初步收集 2077 个人格词汇。通过筛选与幸福感相关的词汇、删除生僻难懂的词汇、同义词汇总等过程对词汇表进行分析和整理, 共得到幸福人格词汇 225 个。正式施测后通过筛查词汇与幸福维度之间的相关、探索性因素分析、验证性因素分析以及分析比较结构模型拟合指数, 结果保留了 49 个词汇描述幸福人格, 模型拟合良好 ($\chi^2/df=5.1614$, RMSEA=0.066, SRMR=0.054, CFI=0.98, NFI=0.98, NNFI=0.98), 揭示了中国人的幸福人格是一个包括胆识、美德、乐观的三因子结构。

The happiness personality in Chinese Culture:

Personality structure and connotation

Yan Yuzhi^{1,2}, Dong Shenghong^{1,2} (Corresponding author)

(1 School of psychology, Jiangxi Normal University, Nanchang 330022) (2 Jiangxi Key Laboratory of Psychology and Cognitive Science, Nanchang 330022)

Abstract: Happiness is an important index to measure the quality of our social life. Happiness in researches was divided into social happiness, subjective happiness, psychological happiness and other different categories. Nevertheless, most psychologists still define it as a kind of psychological experience or subjective feeling when people need to be satisfied. Numerous studies have shown that personality is one of the most stable and effective factors in predicting individual's happiness. What's more, some scholars believe that personality is a greater determinant of happiness than race, social class, money, jobs, and so on. Hence, it can be seen that personality is an important factor that affects individual happiness. While the research on personality shown that the central trait is an important characteristic which constitutes the uniqueness of individual and a personality trait that controls one's behavior in various situations. Previous studies on the relationship between personality and happiness have rarely discussed the structure and connotation of happiness personality in depth, just used a personality questionnaire to explore the factors related to happiness or focused on the relationship between happiness and certain personality traits (such as gratitude, wisdom, self-esteem, etc.). Therefore, it is necessary to explore the happiness personality of Chinese people, and the connotation of happiness personality in Chinese culture from the vocabulary related to happiness in the native language system on the lexicology hypothesis. Firstly, we collected the adjective list of Chinese personality traits compiled by Wang, and that of personality compiled by Huang, as well as that of virtue compiled by Mu. After eliminating the same words, 2,077 personality words were remained. Secondly, by using the method of Delphi, we filtrated the vocabulary and 306 of them were left. After the initial test of 2,608 people, 225 words of happiness personality were obtained. In the formal test, we explored the dimensions of happiness personality, using exploratory factor analysis (EFA) with Sample 1 (n=1098) and confirmatory factor analysis (CFA) with Sample 2 (n=1097). In order to reduce the difficulty of individual assessment in the test, the subjects were only asked to evaluate whether the adjectives provided by the question matched their own personality characteristics or not in the preliminary or formal test. Then selected items on the basis of the vocabulary and the relevant well-being questionnaire. These selected items have lower requirements for the judgment ability of the subjects and is good for the subjects to answer clearly and easily. The results revealed that there are three dimensions of the happiness personality: courage and insight, virtue and optimistic. The words of the courage dimension include those words such as wisdom, bravery, admirable and success. Those of virtue dimension are such as magnanimity, contentment, justice, and responsibility. And the words of optimistic dimension include those such as cheerful, optimistic, and smiley. Thus, we employed a happiness personality lexical rating scale including 49 items. The result shows that the measurement performance of the test is up to the standard by internal consistency reliability, exploratory factor analysis, confirmatory factor analysis, and the correlation analysis with the criterion test. The study found three-factor structures of happiness personalities by using the lexical approach and psychometrics methods, which contributes to the knowledge on happiness. The happiness personality characteristics of Chinese people are different from those in the west, for instance, as the saying goes "Disadvantage is a blessing" "Happiness alone is not as good as happiness with others". Therefore, it is necessary to explore the happiness personality of Chinese people, which is useful for researchers who are interested in Chinese indigenous psychology.

摘 要 亲社会行为是指一切有益于他人和社会的积极行为, 包括分享、助人、利他、合作等行为。已有研究发现亲社会行为的增加有助于提升个体的幸福感、生活满意度、生命意义感、生活质量等, 缓解抑郁、焦虑、孤独感等。亲社会行为不仅有利于个体更好地适应环境和应对变化, 而且从社区层面而言, 社区居民的亲社会行为有助于构建融洽的邻里关系, 对和谐社区的建设与发展起到一定的“助推”作用。系统公平信念(System-justifying Beliefs)是个体相信当前的社会体系公平、正当、合理, 并对其加以拥护和支持的态度与观念。已有研究大多关注系统公平信念形成过程的理论解释及其影响因素, 相对忽视了系统公平信念的结果变量, 尤其是系统公平信念对亲社会行为的影响。因此, 本研究在社区背景下, 探讨系统公平信念对亲社会行为的影响及其心理机制。共招募 668 名社区居民(男性 441 名, 年龄 30.15 ± 8.04 岁), 采用系统合理化量表(System Justification Scale)、社区认同量表、亲社会倾向问卷(Prosocial Tendencies Measure, PTM)进行测量。结果: ①相关分析表明, 系统公平信念、社区认同、亲社会行为两两之间呈显著的正相关 ($r=0.40-0.45$, $p < 0.01$); ②中介分析表明, 系统公平信念可以显著预测社区居民的亲社会行为($B = .25$, $SE = .02$; 95% CI [.20, .29]), 且社区认同在系统公平信念和社区居民的亲社会行为之间起部分中介作用($B = .09$, $SE = .01$; 95% CI [.07, .12]), 中介效应占总效应的比例为 37.06%。结论: 系统公平信念不仅可以直接预测居民的亲社会行为, 还可以通过社区认同的中介作用间接预测亲社会行为。研究结果对社区建设具有一定的启发和指导意义, 政府机构和社区管理人员可以通过一定措施(如维护社区规范)提高社区居民的系统公平信念和社区认同, 这将在一定程度上有利于增加社区居民的亲社会行为。

A Relationship between System-justifying Beliefs and Prosocial Behavior of Community Residents: the Mediating Role of Community Identity

Gu Xiaoli, Wang Yanli, Li Qingqing, Chen Hong (Corresponding author)

¹ Faculty of Psychology, Southwest University, Chongqing 400715

² Key Laboratory of Cognition and Personality (Southwest University), Ministry of Education, Chongqing 400715

Abstract: Prosocial behavior refers to all positive behaviors that benefit others and the society, including sharing, helping others, altruism, cooperation and so on. Previous studies have found that the increase of prosocial behaviors is conducive to the improvement of individual happiness, life satisfaction, sense of meaning of life, quality of life, etc., as well as the alleviation of depression, anxiety and loneliness. Prosocial behavior not only helps individuals to better adapt to the environment and cope with changes, but also contributes to building harmonious neighborhood relations and promoting the construction and development of harmonious communities from the perspective of community. System-justifying beliefs is the attitude and concept that individuals believe the current social system is fair, legitimate and reasonable, and support it. Most of the existing researches focus on the theoretical explanation of the formation process of system-justifying beliefs and its influencing factors, but relatively ignore the outcome variables of system-justifying beliefs, especially the influence of System-justifying Beliefs on prosocial behavior. Therefore, in the context of community, this study explores the influence of system-justifying beliefs on prosocial behavior and its psychological mechanism. A total of 668 community residents (441 males, 30.15 ± 8.04 years old) were recruited and measured by system justification scale, community identity scale and prosocial tendencies measure. Results: Correlation analysis showed that there was a significant positive correlation between system-justifying beliefs, community identity and prosocial behavior ($r=0.40-0.45$, $p < 0.01$). The intermediary

analysis shows that the system-justifying beliefs can significantly predict the prosocial behavior of community residents ($B = .25$, $SE = .02$; 95% CI [.20, .29]), and community identity plays a partial mediating role between the system-justifying beliefs and the pro-social behavior of community residents ($B = .09$, $SE = .01$; 95% CI [.07, .12]), the explanation rate of mediating effect was 37.06%. Conclusion: The system-justifying beliefs can not only directly predict the prosocial behavior of residents, but also indirectly predict the prosocial behavior through the mediating effect of community identity. The results of this study have some enlightening and guiding significance for community construction. Government agencies and community managers can improve the system-justifying beliefs and community identity of community residents through certain measures (such as maintaining community norms), which will be beneficial to increase the prosocial behaviors of community residents to a certain extent.

回忆启动范式下公平感对社区居民亲社会行为的影响

谷晓丽¹ 陈红^{1,2,3} (通讯作者) 黄宇鹏¹

1 西南大学心理学部, 重庆, 400715

2 认知与人格教育部重点实验室, 重庆, 400715

3 西南大学心理学与社会发展研究中心, 重庆, 400715, chenhg@swu.edu.cn

摘要 公平感是个体对所处环境公平与否的主观感知, 以往研究发现公平感对个体的心理与行为存在着广泛的影响。在构建和谐社区的过程中, 公平是维护和谐社区秩序的内在力量与规则底线。因此, 开展社区心理学视野下的公平研究, 对推进社会心理服务体系建设, 为社区中自然法与国家法的融合建立社区心理基础都具有十分重要的意义。亲社会行为不仅有利于个体更好地适应环境和应对变化, 而且从社区层面而言, 社区居民的亲社会行为有助于构建融洽的邻里关系, 对和谐社区的建设与发展起到一定的“助推”作用。为探究公平感对居民亲社会行为的影响及心理机制, 本研究招募 129 名社区居民 (男性 69 名, 年龄 35.29 ± 10.79 岁), 采用单因素被试间设计, 运用回忆启动范式来操控社区居民的公平感水平, 随后对参与实验的社区居民进行亲社会行为测量, 同时还考察了公平启动下居民的社区认同水平。结果: ①公平启动组被试的社区内亲社会行为水平显著高于不公平启动组 ($F=10.49$, $p < 0.01$)。②公平感对社区认同有着正向的预测作用 ($B=0.48$, $SE=0.16$, $p < 0.01$), 社区认同对社区内亲社会行为的正向预测作用显著 ($B=0.47$, $SE=0.05$, $p < 0.001$)。公平感对社区内亲社会行为的直接效应不显著 ($B=0.14$, $SE=0.09$, $p = 0.123$), 但可通过社区认同正向预测社区内亲社会行为的变化且间接效应显著 ($B=0.23$, $SE=0.06$; 95% CI[0.07,0.45])。中介效应占总效应的比例为 62%。结论: 公平感显著正向影响了居民的社区内亲社会行为, 社区认同在公平感对居民的社区内亲社会行为的影响中起完全中介作用。研究结果对社区建设具有一定的启发和指导意义, 政府机构和社区管理人员可以采取一定措施 (如维护社区规范) 提高社区居民的公平感和社区认同, 这在一定程度上有利于增加社区居民的亲社会行为。

The Impact of Justice on the Prosocial Behavior of Community Residents under the Recall Priming Paradigm

Gu Xiaoli¹, Chen Hong^{1,2,3} (Corresponding author), Huang Yupeng¹

1 Faculty of Psychology, Southwest University, Chongqing 400715

2 Key Laboratory of Cognition and Personality (Southwest University), Ministry of Education, Chongqing 400715

3 Research Center for Psychology and Social Development, Southwest University, Chongqing 400715

Abstract: The sense of justice is an individual's subjective perception of whether the environment is fair or not. Previous studies have found that the sense of justice has a wide range of influences on the individual's psychology

and behavior. In the process of building a harmonious community, justice is the inner strength and the bottom line of rules to maintain the order of the harmonious community. Therefore, the development of justice research from the perspective of community psychology is of great significance to the promotion of the construction of the social psychological service system and the establishment of a community psychological foundation for the integration of natural law and national law in the community. Prosocial behaviors not only help individuals better adapt to the environment and respond to changes, but from the community level, the prosocial behaviors of community residents help build harmonious neighborhood relationships, and play a certain role in the construction and development of harmonious communities. In order to explore the impact of justice on residents' prosocial behaviors and the psychological mechanism, this study recruited 129 community residents (69 males, age 35.29 ± 10.79 years), adopted a single-factor inter-subject design, and used the recall paradigm to manipulate community residents. Then, the pro-social behavior measurement of the community residents who participated in the experiment was carried out, and the community identification level of the residents under the fair start was also examined. Results: ①The prosocial behavior level of subjects in the fair start group was significantly higher than that in the unfair start group ($F=10.49, p < 0.01$). ②The sense of justice has a positive predictive effect on community identity ($B=0.48, SE=0.16, p < 0.01$), and community identity has a significant positive predictive effect on pro-social behavior in the community ($B=0.47, SE=0.05, p < 0.001$). The direct effect of fairness on pro-social behavior in the community is not significant ($B=0.14, SE=0.09, p = 0.123$), but community identity can be used to positively predict changes in prosocial behavior in the community and the indirect effect is significant ($B=0.23, SE=0.06; 95\% CI[0.07, 0.45]$). The mediation effect accounted for 62% of the total effect. Conclusion: The sense of justice significantly positively affects the level of residents' prosocial behavior in the community, community identity plays a complete mediating role in the influence of the sense of justice on the prosocial behavior of residents in the community. The research results have certain enlightening and guiding significance for community construction. Government agencies and community managers can take certain measures (such as maintaining community norms) to improve the sense of justice and community identity of community residents, which will help increase community residents to a certain extent prosocial behavior.

共赢观量表的编制与检验

张杉¹ 张锋^{1*} (通讯作者)

¹ 河南大学教育科学学院, 开封, 475004, Email: zgfzhang@163.com

摘要 共赢观主要体现为个体在寻求个人利益时会主动考虑并照顾他人利益, 这是新时代值得大力提倡的重要价值取向。共赢是我国优秀传统文化中的重要思想, 也是构筑和平稳定的世界秩序的关键要素。不过, 目前鲜有研究从心理学视角直接探讨共赢观, 同时也缺乏准确而有效的共赢观的测评工具。因此, 本研究的目的是编制一个具有高信效度的共赢观的测量工具。在预研究中, 开发了 49 个条目的题库, 涉及 5 个维度并包含 29 个特征词。在正式研究一中, 先通过项目分析对条目进行初步筛选, 然后使用探索性因素分析 (EFA) 抽取共同因素, 确定了初始量表的 5 个维度以及 25 个题项, 并将 5 个维度分别命名为诚信性、先进性、利他性、和谐性和协作性。在正式研究二中, 使用包含 25 个题项的初始问卷对 250 名被试进行调查并进行一阶验证性因素分析 (first-order CFA) 以及二阶验证性因素分析 (second-order CFA), 同时对量表的构念效度进行检验。为增进模型简约性, 在一阶验证性因素分析中根据 MI 指数、理论基础以及题项含义删除了 9 个题项, 最终保留 16 个题项, 模型拟合指数均达标。二阶验证性因素分析结果中的因素构念负荷量以及信度指标值也均达到标准。最后对量表进行了内部一致性信度检验、收敛效度检验, 结果均良好。因此, 本研究编制的共赢观量表分为诚信性、先进性、利他性、和谐性和协作性 5 个维度, 是能有效测量共赢观的可靠工具。

Corresponding Author E-mail: zgzhzhang@163.com

Abstract: Win-win mainly reflected in the situation that individuals actively consider and take care of others' interests when seeking personal interests. This is an important value orientation that recommendable in new era. Win-win is an important thought in Chinese excellent traditional culture, and also a key factor to build a peaceful and stable world. However, there are few studies in psychology directly discussed the content of win-win. At the same time, there lacks an accurate and effective tool to win-win. Therefore, this research aims to develop a measurement tool to evaluate win-win with high reliability and validity. In our pilot study, we developed the item pool containing 49 items, which was involved in the five dimensions and 29 feature words. In the first study, we screened the items through item analysis and extracted common factors using exploratory factor analysis (EFA), and determined a total of 25 items in the initial scale. The five dimensions are named as honesty, advanced, altruism, harmony and collaborative. In the second study, we used the initial scale with 25 items to test the survey results of 250 subjects through first and second-order confirmatory factor analysis (CFA), and test the construct validity of the scale. In order to improve the model parsimony, we deleted 9 items according to the model modification index, the theoretical basis and the meaning of the items, final remaining 16 items, all the model fitting index are up to standard in the first-order CFA and the second-order CFA. Finally, we tested the internal consistency reliability and convergence validity and the results indicating that the scale had good reliability and validity. Therefore, we have formed a win-win scale involved five dimensions that honesty, advanced, altruism, harmony and collaborative, which is an effective tool to measure win-win.

流动人口政治疏离感及其对差序政府信任的影响

陈永进¹ (通讯作者) 杨大容¹ 吴晓琴¹ 贺雪¹ 李茂¹

1 重庆大学公共管理学院, 重庆, 400044, yjchen@cqu.edu.cn

摘要 城乡二元体制结构下, 由于制度和非制度性阻碍的存在, 流动人口处于“融不进城市、回不去故乡”的政治疏离困境, 促使政治冷漠、相对剥夺感攀升等问题愈发突显, 极易影响他们对各级政府的信任度。基于 621 名流动人口的调查数据, 分析流动人口政治疏离感现状及其对差序政府信任的关系及内在作用机制。结果显示: 1) 流动人口政治疏离总体上处于一般偏上水平, 包括主动疏离过程认知、主动疏离行为倾向、被动疏离过程认知、被动疏离结果体验 4 个方面, 其中被动政治疏离感得分高于主动政治疏离感; 2) 流动人口政治疏离感在学历、政治面貌、职业类型等人口学变量上存在差异, 同时在性别、年龄、学历、政治面貌、职业类型、年收入、户籍类型、流动方向、居住时间、流动理由上存在显著二阶交互作用; 3) 流动人口政治疏离感及其各维度均显著正向预测差序政府信任。4) 相对剥夺感在流动人口政治疏离对差序政府信任的影响中起部分中介作用。可从优化政府管理、改善社会工作、提升公民素养等方面着手缓解流动人口政治疏离感和相对剥夺感, 进而消除差序政府信任现象, 全面提升政府公信力。

关键词 流动人口政治疏离, 差序政府信任, 相对剥夺感

Political Alienation of Floating Population and Its Impact on the Difference of Government Level Trust

CHEN Yongjin, YANG Darong, WU Xiaoqin, HE Xue, LI Mao

School of Public Affairs, Chongqing University, Chongqing, 400044

Abstract: Under the dual urban-rural structure, the floating population is in a dilemma of political alienation that cannot integrate into the city and cannot return to their hometown, due to the institutional and non-institutional obstacles, which makes political indifference and relative deprivation more prominent. It will easily affect their trust in various levels of government. Based on the survey data of 621 floating population, analyzed the current situation of the floating population's political alienation and its relationship with the government's trust and its internal mechanism. The results show that:1)The floating population's political alienation is generally at a relatively high level, including four aspects: the process of active alienation, the tendency of active alienate behavior, the process of passive alienation, and the experience of passive alienation results., among which the passive political alienation scores high on the active political alienation;2) The floating population's political alienation differs in demographic variables such as education, political outlook, occupation type;3)The political alienation of floating population is different in demographic variables such as educational background, political status and occupation type, and there are significant second-order interactions in gender, age, educational background, political status, occupation type, annual income, household registration type, mobility direction, residence time and mobility problem;4)Relative deprivation plays a part of the mediating role in the influence of the political alienation of the floating population on the difference of government level trust. We can start to alleviate the sense of political alienation and relative deprivation of the floating population from aspects such as optimizing government management, improving social work, and enhancing citizenship, so as to eliminate the phenomenon of disorderly government trust and comprehensively enhance government credibility.

Keywords: Political alienation of floating population, Difference of government level trust, Relative deprivation

社区居民疫情风险感知、感知压力与心理健康的关系： 未来时间洞察力和信心的作用

李小保¹, 吕厚超¹ (通讯作者)

Epidemic Risk Perception, Perceived Stress, and Mental Health during COVID-19 Pandemic: A Moderated Mediating Model

Li Xiaobao, Lyu Houchao

Faculty of Psychology, Time Psychology Research Center, China Community Psychology Service and Research Center-SWU, Southwest University, Chongqing, 400715

Abstract: The aim of the present study was to investigate relationships among epidemic risk perception, perceived stress, mental health (depression and anxiety), future time perspective and confidence in society during the novel coronavirus disease (COVID-19) pandemic in China. Especially, we wonder that whether perceived stress mediates associations between epidemic risk perception and mental health and that whether future time perspective and confidence in society moderate the link between perceived stress and mental health. This cross-sectional study was conducted among 693 Chinese adults aged 18–60 years. The results showed that epidemic risk perception was positively related to perceived stress, depression, and anxiety. The correlations between epidemic risk perception and depression and anxiety were reduced when perceived stress was included, suggesting that perceived stress can mediate these relationships. Moreover, the boundary conditions for the associations among perceived stress, depression, and anxiety were found in the study. Specifically, positive future time perspective can buffer the negative effects of perceived stress on depression, and confidence in society can weaken the negative effects of perceived stress on anxiety. These findings highlight the important role of future time perspective and confidence in society in maintaining mental health, and will provide practical guidance and theoretical implications for the public to maintain mental health during the novel coronavirus disease (COVID-19) pandemic. Limitations and future directions are also discussed.

Keywords: future time perspective, confidence in society, risk perception of coronavirus disease (COVID-19), perceived stress, Mental Health

中文版心理幸福感量表在残疾人群体中的修订及应用

郎瑞¹ 王子灵² 李祚山³ (通讯作者)

1 重庆安全技术职业学院, 重庆, 404020

2 西南大学心理学部, 西南大学心理学与社会发展研究中心, 重庆, 400715

3 重庆师范大学应用心理学重点实验室, 重庆, 401331, 642662213@qq.com

摘要 目的: 检验中文版心理幸福感量表(C-PWBS-42)在残疾人群体中的信效度, 并探讨人口学因素对残疾人心理幸福感的影响。方法: 先后以 C-PWBS-42 和修订得到的 C-PWBS-16 为工具, 通过残联渠道进行施测, 分别获取有效样本 352 人和 513 人。另取 40 名残疾人进行间隔四周的重测。结果: 修订后的中文心理幸福感量表共 16 个题项(C-PWBS-16), 包含环境掌控、生命成长、积极心态和自主四个因子, 具有良好的结构效度、聚合效度、区分效度和效标效度; 总量表和各因子的内部一致性信度在 0.71~0.89 之间, 重测信度在 0.76~0.93 之间。残疾人心理幸福感的人口学差异表现在: 女性高于男性、先天残疾高于后天残疾、重度残疾高于轻度残疾; 受教育水平越高, 心理幸福感越高; 肢残者心理幸福感最低。结论: 修订后的 C-PWBS-16 在残疾人群体中具有良好的信度和效度, 可以作为测量残疾人心理幸福感的工具; 性别、先/后天残疾、残疾等级、残疾类型和受教育水平是影响残疾人心理幸福感的重要因素。

Revision and Application of the Chinese Version of Ryff's Scale of Psychological Well-being in People with Disabilities

Lang rui¹, Wang Lingyu², Li Zuoshan³

1 Chongqing Vocational Institute of Safety & Technology, No. 583 anqing Road, baiyanba, Wanzhou District, Chongqing

2 Southwest University, No. 2 Tiansheng Road, Beibei District, Chongqing

3 Chongqing Normal University, No. 12 Tianchen Road, Shapingba District, Chongqing

Abstract: Objective: To examine the reliability and validity of the Chinese Version of Ryff's Scale of Psychological Well-being (C-PWBS-42) in people with disabilities. Meanwhile, to explore demographic factors that affect the psychological well-being of the disabled. Methods: C-PWBS-42 and the revised C-PWBS-16 were administered to two valid sample ($n_1 = 352$, $n_2 = 513$) through Disabled Persons' Federation channels, respectively. Other 40 disabled persons were retested after an interval of 4 weeks. Results: The revised version of C-PWBS-42 included 16 items (C-PWBS-16), consisting of four factors, namely, environmental mastery, life growth, positive mind, and autonomy. C-PWBS-16 demonstrated satisfactory coefficients for construct, convergent, discriminant and criterion validity. Internal consistency reliability of total scale and four factors ranged from 0.71~0.91, and test-retest reliability ranged from 0.76~0.93. The demographic differences in psychological well-being of the disabled are as follows: women are higher than men, congenital disabilities are higher than acquired disabilities, and severe disabilities are higher than mild disabilities; the higher the level of education, the higher the psychological well-being; people with physical disabilities have the lowest psychological well-being. Conclusion: The revised C-PWBS-16 is reliable, valid, and suitable for measuring psychological well-being of people with disabilities. Gender, congenital/acquired disability, disability level, disability type and education level are important factors influencing psychological well-being of the disabled.

Abstract: Since the outbreak of COVID-19 in China, people have been exposed to a flood of media news related to the epidemic every day. Studies have shown that media news about public crisis events have a significant impact on individuals' depression. However, how and when the duration of attention to pandemic news predicts depression still remains an open question. This study established a moderated mediating model to investigate the relationship between duration of attention to pandemic news and depression, the mediating effect of risk perception and the moderating effect of future time perspective on the relationship. In early February 2020, 701 individuals from 29 provinces, autonomous regions and municipalities across China were asked to self-report their duration of attention to pandemic news, level of depression, risk perception, and future time perspective during the COVID-19 outbreak. Results show that there is a significant positive correlation between duration of attention to news on COVID-19 and depression, risk perception mediates the association between duration of attention to news and depression; and future time perspective plays a moderating role between risk perception and depression. The findings of the present study provide theoretical implications and practically throw some light on alleviating the public's depression during pandemic periods. We highlight the individual's hope for a better future, focusing positive news and time perspective balance during epidemic disease are also beneficial to promote positive emotion and reduce the depression.

Keywords: COVID-19, duration of attention to pandemic news, depression, risk perception, future time perspective

公共服务认同与政府公信力的阶层差异化研究

陈庚¹ 陈永进¹ (通讯作者) 黄葳¹ 张攀¹ 董超华¹

1 重庆大学公共管理学院, 重庆, 400044, yjchen@cqu.edu.cn

摘要 改革开放以来, 社会阶层的变迁一直是中国社会转型的核心问题之一, 而在近年来我国政府致力于增强政府公信力, 建设人民满意的服务型政府的时代背景之下, 理清社会上不同地位群体的公共服务认同与政府公信力水平的阶层差异现状成为推动公共服务均等化、提升政府公信力的重要现实和理论问题。本文立足于 2017 年中国社会状况综合调查(CSS)数据, 以包含个体收入水平、职业类型和教育程度的综合指标为标准, 将样本人群划分为基础、中等和高社会阶层群体, 对我国民众公共服务认同和政府公信力水平的阶层分布和差异化现状进行分析。研究发现, 我国民众的公共服务认同感和政府公信力水平总体上均处于中等较高水平; 民众的公共服务认同存在显著的阶层差异, 其中基础社会阶层民众的公共服务认同度要显著低于中等社会阶层的民众; 民众的政府公信力水平也存在显著的阶层差异, 中和高等社会阶层民众的政府公信力水平均显著高于基础社会阶层民众, 而中等社会阶层民众和高社会阶层民众的公信力水平没有显著差异; 民众的公共服务认同度高会显著提高其政府公信力水平, 而社会阶层地位在中间起负向调节作用, 个体所处的社会阶层越低, 其公共服务认同度对政府公信力水平的提升作用越明显。

关键词 社会阶层, 公共服务认同, 政府公信力

Research on Differentiated Class Identity in Public Service and Government Credibility

CHEN Geng, CHEN Yongjin, HUANG Wei, ZHANG Pan, DONG Chaohua

1 School of Public Affairs, Chongqing University, Chongqing, 400044

Abstract: Since the Economic Reform and open up, the change of social class has always been one of the core issues of China's social transformation. In recent years, the Chinese government has been committed to enhancing the government's credibility and building a service-oriented government that satisfies the people. The status quo of the group's public service identity and the level of government credibility has become an important practical and theoretical issue to promote the equalization of public services and enhance the government's credibility. Based on the 2017 Chinese Social Survey (CSS) data, this paper uses comprehensive indicators including individual income levels, occupational types, and education levels as the standard, and divides the sample population into basic, middle and high social class groups. Analyze the status quo of class distribution and differentiation of service recognition and government credibility. The study found that the public service identity and government credibility of the Chinese people are generally at a medium-high level; there are significant class differences in the public's public service identity, and the public service identity of the basic social class is significantly lower than that of the middle society. There are also significant differences in the level of government credibility among the people of different classes. The government credibility level of the middle and upper social classes is significantly higher than that of the basic social class, while the credibility levels of the middle and high social classes are not significant. Difference; the public's public service recognition will significantly improve the level of government credibility, while the social class status plays a negative role in the middle. The lower the individual's social class, the more public service recognition will improve the government credibility level.

Keywords: social class, public service recognition, government credibility

新冠疫情下高校复学的学生心理干预研究

魏静¹ 李媛²

1 四川建筑职业技术学院学生心理健康中心, 四川德阳, 618000

2 电子科技大学心理健康中心, 四川成都 610000 liyuan@uestc.edu.cn

摘要 新冠疫情下高校复学学生心理干预, 不仅是协同高校在特殊时期做好疫情防控, 亦是提供后新冠疫情期的校园心理服务; 既帮助少数大学生消减疫情下持续的过度应激状况, 亦协助大多数学生整合自身资源进行心理保健和自助, 对于大学生的“创伤后成长”(PTG)意义重大。本文就高校复学学生心理干预的特殊性进行细致分析, 明确高校复学学生心理干预的工作原则, 在此基础上, 对高校复学学生心理干预的方案设计进行了探讨。高校复学学生心理干预具有特殊性, 其与高校常态化心理危机干预在工作原则、工作思路、工作目标及工作程序等方面均有差异。其次, 高校复学学生心理干预的评估与筛查亦具有特殊性, 既需面向全体高校学生, 亦应重点关注九类人群。高校学生复学心理干预应有序、科学地开展, 贴近大学生心理需求, 有针对性开展工作, 干预的有效性是重要的评估标准。基于此, 高校学生复学心理干预方案设计应遵循“纵横结合, 优化整合”理念。就纵向开展工作而言, 探索建构“校园心理服务五级体系”, 充分考量高校学生复学前复学后的心理需要, 有层级渐进有序开展心理干预工作。就横向工作而言, 制定“重点群体心理干预专案”, 有针对性开展心理干预工作。心理干预方法应注重优化整合, 从校园环境稳定、身心及人际“联结”、专业的创伤疗愈、生命价值观深度思考等不同维度进行分析和探讨。对高校学生复学心理干预的思考, 从宏观到微观, 从自愈到治愈, 从特殊到常态, 试图探索一条新冠疫情下高校复学安全又健康的心路。

Research on psychological intervention against the Coronavirus-19 for students in reopened colleges

Wei Jing¹, Li Yuan²

1 Sichuan College of Architecture and Technology, Deyang, Sichuan

2 University of Electronic Science and Technology of China, Chengdu, Sichuan,

liyuan@uestc.edu.cn

Abstract: Psychological intervention against the Coronavirus-19 for students in reopened colleges assists the disease control of university administration in the unusual period. It also works as mental healthcare on reopened campuses in the post Coronavirus-19 era, helping a few students release their enduring over-stress in the epidemic, and enabling a lot to reassign inner resources for their mental fitness and self-healing, which are of significance for their 'Post-Traumatic Growth (PTG)'. This essay analyses, in detail, the particularity of psychological intervention for students in reopened colleges and sorts out working principles to serve as the base for a further discussion on the design of intervention plans. We argue that, for colleges students in reopened colleges, psychological intervention during this period is different from mental crisis intervention on campus on daily bases in aspects like working principles, lines of thought, goals, procedures, and so on. The premise of the intervention, i.e. psychological evaluation and surveys, are distinctive in that they should include all students on campus and, at the same time, pay more attention on 9 categories of mentally-featured students. We also argue that conduction of the intervention should follow orderly and customized plans in response to students' mental needs, for the effectiveness is one of those key variables to assess the intervention. The plan design of the intervention should be guided by the principle of 'optimizing and reassigning resource both chronically and synchronically'. To design chronically means to build up 'a hierarchical on-campus mental healthcare system of 5 levels' in order to have the intervention practices in orderly and progressive manners and in response to students' mental needs before and after the reopening of campus. Synchronic design of the intervention means composing 'specified plans of mental intervention for focused groups' and conducting them precisely. In the analysis and discussion of intervention plans design, optimizing and reassigning resources should be focused with considerations from multiple dimensions like the stability of campus environment, the connection between the body and the heart as well as between persons, expertise of trauma healing service, and the depth of thoughts of life and value. The essay argues for psychological intervention of students in reopened colleges from standpoints both macro and micro, by the means of both self-healing and healing by others, concerning both normality and particularity. By this way should the authors sort out a safe mental approach to secure the reopening of colleges in the Coronavirus-19 epidemic.

大学生媒体多任务对社会幸福感的影响：一个有调节的中介模型

何晓宇¹ 黄洁华²（通讯作者）

1 广东科技学院，东莞，523083

2 广州大学教育学院，广州，510006, jhhuang@gzhu.edu.cn

摘要 媒体多任务是指个体同时对多个电子或非电子媒体进行操控。随着信息技术的高速发展和手机媒体、数字电视等新媒介形式的不断更新，媒体多任务逐渐成为当代青少年习惯化的行为模式。但这种行为模式可能会对个体的情绪和认知产生影响。相关研究发现，媒体多任务行为显著影响青少年的生理健康、心理健康和幸福感。社会幸福感是研究幸福感的新视角，其更关注个体在社会关系中适应的好坏及程度，而媒体本身

便具有社会属性。但以往研究却未探讨媒体多任务与社会幸福感的关系及其作用机制。为了更全面地了解媒体多任务对大学生的影响,本研究探讨大学生媒体多任务与社会幸福感的关系,并检验二者之间的内在作用机制和影响因素,即在两者关系中学校社区感的中介作用与自我控制的调节作用。本研究采用问卷调查法,以 642 名大学生为研究对象。研究结果如下:(1)大学生平均媒体多任务指数(MMI)为 3.4,即大学生在同一时间平均进行 3.4 个媒体活动。(2)大学生媒体多任务对社会幸福感具有显著的负向预测作用,对学校社区感具有显著的负向预测作用;学校社区感对社会幸福感具有显著的正向预测作用;学校社区感在大学生媒体多任务和社会幸福感的关系中起部分中介作用。(3)自我控制在学校社区感与社会幸福感的关系中起调节作用;在自我控制的五个维度中,健康习惯和专注工作/学习两个维度均在媒体多任务、学校社区感和社会幸福感中介模型中的前半段路径和后半段路径起调节作用。本研究还讨论了研究结果的实践启示。

The influence of media multitasking on social well-being of college students: A moderated mediation model

Xiaoyu He¹, Jiehua Huang²

1 Guangdong University of Science and Technology, Dongguan, 523083

2 School of Education, Guangzhou University, Guangzhou, 510006, Email: jhhuang@gzhu.edu.cn

Abstract: Media multitasking refers to the simultaneous manipulation of multiple electronic or non-electronic media by individuals. With the rapid development of information technology and constant renewal of new forms of media such as mobile media, digital TV and so on, media multitasking behavior has gradually become a habitual behavior model for teenagers, which may affect their emotion and cognition. It has been found that media multitasking can significantly affect teenagers' physical and mental health as well as their sense of well-being. Social well-being, which is a new perspective to study well-being, pays more attention to the quality and degree of individual adaptation in social relation, and the media itself bears the social attribute. However, no research has previously explored the relationship between media multitasking and social well-being, its internal mechanism and influencing factors. In order to understand the influence of media multitasking on college students more comprehensively, this study explores the relationship between media multitasking and social well-being of college students, and further tests the internal mechanism and influencing factors between them: the mediating role of sense of school community and the moderating role of self-control. Used questionnaire, there are 642 college students from Guangdong province and Jiangsu province participating in this study. The results are as follows: (1) The average media multitasking index (MMI) of college students of this study is 3.4, which means that college students carry out 3.4 media activities on average at the same time. (2) The media multitasking of college students has a significant negative predictive effect on social well-being and a significant negative predictive effect on sense of school community. The sense of school community has a significant positive predictive effect on social well-being. The sense of school community plays a partial mediating role in the relationship between media multitasking and social well-being. (3) Self-control plays a moderating role in the relationship between sense of school community and social well-being. Among the five dimensions of self-control, health habits and the focus on work / learning play a moderating role in the first half and the second half of the mediating model of media multitasking, sense of school community and social well-being. The implications of this study were discussed.

Keywords: media multitasking, social well-being, sense of school community, self-control, college students

父母手机冷落行为对青少年神经质的影响： 父母拒绝与青少年自尊的链式中介作用

蔡保贞¹ 方杰¹（通讯作者） 李美华¹

1 广东财经大学应用心理学系，广州，510320，fangji@gdufe.edu.cn

摘要 父母手机冷落行为是指父母在与孩子互动时使用手机或被手机分心的现象。近年，父母手机冷落行为对青少年心理健康的负面影响已引起学界和社会各界的广泛关注。但目前关于父母手机冷落行为对青少年神经质的影响以及其内在的作用机制还不清楚。本研究基于情境-过程-结果模型，即情境因素（父母手机冷落行为）通过一定的过程（父母拒绝、青少年自尊）影响青少年人格特质（神经质）的结果，提出假设：父母拒绝和青少年自尊在父母手机冷落行为与青少年神经质之间起链式中介作用。以 557 名初中生为被试，采用父母手机冷落行为量表、中国大五人格问卷简式版的神经质分量表、简式父母教养方式问卷的拒绝分量表和罗森伯格自尊量表问卷进行测试。结果发现：（1）父亲的链式中介模型和母亲的链式中介模型结果基本一致。（2）多重中介效应检验表明，父亲/母亲手机冷落行为对青少年神经质的影响路径有四条：父亲/母亲手机冷落行为可以直接影响青少年神经质；父亲/母亲拒绝在父亲/母亲手机冷落行为与青少年神经质之间起中介作用；青少年自尊在父亲/母亲手机冷落行为与青少年神经质之间起中介作用；父亲/母亲拒绝与青少年自尊在父亲/母亲手机冷落行为和青少年神经质之间起链式中介作用。（3）对比中介效应发现，在父亲的链式中介模型中，父亲手机冷落行为通过父亲拒绝和青少年自尊影响青少年神经质的链式中介效应显著大于其他中介效应；而在母亲的链式中介模型中，母亲手机冷落行为通过母亲拒绝影响青少年神经质的中介效应显著大于其他中介效应。这些研究结果为父母合理使用手机以及青少年的神经质的干预提供了实证依据。

Parental Rejection and Self-esteem as mediators between Parental Phubbing and Adolescent neuroticism

Cai Baozhen¹, Fang Jie¹, Li Meihua¹

Department of Psychology, Guangdong University of Finance and Economics, Guangzhou, 510320,
fangji@gdufe.edu.cn

Abstract: Parental phubbing refers to the phenomenon that parents use mobile phones or are distracted by mobile phones when interacting with their children. In recent years, the negative impact of parental phubbing on adolescents' mental health has aroused widespread concern in academia and society. However, it is still unclear about the influence of parental phubbing on adolescents' neuroticism and its internal mechanism. This research is based on the situation-process-result model that contextual factors (parental phubbing) affect a person's mental health outcomes (adolescents' neuroticism) through a certain process (parental rejection, adolescent's self-esteem), discussing father and mother separately and proposing an assumption: father's/mother's rejection and adolescents' self-esteem play a chain intermediary role between father's/mother's phubbing and adolescents' neuroticism. 557 junior high school students were tested with the parental phubbing scale, the neuroticism subscale of the Chinese Big Five Personality Inventory Brief Version, the parental rejection subscale of the Short-form Egna Minnen av Barndoms Uppfostran and Rosenberg self-esteem scale. The results found that: (1) The father's chain mediation model and the mother's chain mediation model have basically the same results. (2) Multiple intermediary effect tests show that there are four paths for father's/mother's phubbing to adolescents' neuroticism: Father's/Mother's phubbing can directly affect adolescents' neuroticism; father's/mother's rejection plays an intermediary role between father's/mother's phubbing and adolescents' neuroticism; adolescents' self-esteem plays an intermediary role between father's/mother's phubbing and adolescents' neuroticism; father's/mother's rejection and adolescents' self-esteem play a chain intermediary role between father's/mother's phubbing and adolescents' neuroticism. (3) Comparing the mediation effects, it is found that in father's chain mediation model, the chain mediation effect that father's phubbing affects adolescents' neuroticism through father's rejection and adolescents' self-esteem is significantly greater than other mediating

effects, while in mother's chain mediation model, the mediation effect that mother's phubbing affects adolescents' neuroticism through mother's rejection is significantly greater than other mediating effects. The results of the study provide empirical evidence for the rational use of mobile phones by parents and intervention of adolescents' neuroticism.

大学生友谊质量与抑郁情绪的关系：孤独感的中介作用

曾珠微（通讯作者） 李美华

广东财经大学应用心理学系，广州，510320，z845126358@163.com

摘要 在社会飞速发展的背景下，社会对于大学生的要求越来越高，处在高压下的大学生很容易受到抑郁情绪的困扰。根据对相关研究的 meta 分析来看，大学生的抑郁人数情况不容乐观，近年来大学生抑郁情绪检出的人数占 29.3%。鉴于此，有必要对影响大学生抑郁情绪排解的因素进行探讨，通过及时排解以避免抑郁情绪带来更大的危害，以提高大学生的心理健康水平。大学生大多离开家庭在外求学，此时友谊就成为大学生社会支持中的主要部分。本研究以大学生为研究对象，采用测量方法，旨在探讨大学生友谊质量、孤独感和抑郁情绪之间的关系及其内部作用机制。采用《大学生抑郁量表》SDS、UCLA 孤独量表（第三版）、友谊质量量表对 500 名大学生进行调查。本研究在前人的基础上提出了以下假设：（1）大学生友谊质量对抑郁情绪有负相关，即大学生友谊质量越好，抑郁情绪得分越低；（2）大学生友谊质量对孤独感有负相关，友谊质量越好，则孤独感体验越少；（3）友谊质量除了与抑郁情绪有直接关系外，还可以通过产生孤独感与抑郁情绪产生间接联系，即孤独感在友谊质量和抑郁情绪之间起中介作用。本研究有利于揭示大学生抑郁情绪调节影响因素，为改善大学生抑郁情绪提供了一定的指导意义。

The relationship between friendship quality and depression of college students: the mediating role of loneliness

Zeng Zhuwei, Li Meihua

Department of Psychology, Guangdong University of Finance and Economics, Guangzhou, 510320,
corresponding author E-mail: z845126358@163.com

Abstract: In the context of rapid social development, society has higher and higher requirements for college students who are easily troubled by depression under great pressure. According to meta-analysis of related research, the number of depression among college students is not optimistic. In recent years, 29.3% of college students have detected depression. In view of this, it is necessary to explore the factors that affect the resolution of depression in college students, and resolve them in time to avoid greater harm to depression, so as to improve the level of college students' mental health. Most college students leave their homes to study abroad, and friendship has become a major part of college students' social support. This study takes college students as the research object and uses measurement methods to explore the relationship between college students' friendship quality, loneliness and depression and their internal mechanisms. A survey of 500 college students was conducted using the "College Student Depression Scale" SDS, UCLA Loneliness Scale (third edition), and Friendship Quality Scale. This study puts forward the following hypotheses based on predecessors: (1) The friendship quality of college students is negatively correlated with depression, that is, the better the friendship quality of college students, the lower the depression score; (2) The friendship quality of college students is negative for loneliness. Related, the better the quality of friendship, the less the experience of loneliness; (3) In addition to the direct relationship between the quality of friendship and depression, the quality of friendship can also be indirectly related to the feeling of loneliness and depression, that is, loneliness is in the quality of friendship and depression. Play an intermediary role between. This research is helpful to reveal the factors affecting the regulation of depression in college students, and provides certain guiding significance for

improving depression in college students.

Keywords: friendship quality, loneliness, depression

受手机冷落者的手机冷落行为： 愤怒反刍的中介和道德推脱的调节作用

陈林琦¹ 方杰¹（通讯作者） 李美华¹

¹ 广东财经大学应用心理学系，广州，510320，fangji@gdufe.edu.cn

摘要 手机冷落行为是指在社交场合使用手机而冷落他人的行为，会给手机冷落行为的实施者和受手机冷落者都造成严重的心理后果，已经引起学界和社会各界的密切关注。先前研究发现，受手机冷落者倾向于使用智能手机，但关于其内在的作用机制还不清楚。根据期望违背理论，受手机冷落者经历了他们期望得到的关注状态与当前遭受的冷落状态之间的冲突。这种差异会引发愤怒反刍。愤怒反刍的多系统模型表明，愤怒反刍会影响攻击的认知和情感基础。大量的经验证据表明，愤怒反刍积极预示攻击行为，对挑衅者甚至对无辜他人的攻击行为增加。因此，我们预期愤怒反刍在受手机冷落和手机冷落行为之间起中介作用。还有研究表明，道德推脱在其他变量对个体不道德行为影响中起调节作用，我们同时也考察道德推脱在愤怒反刍的中介模型中是否起到调节作用。采用受手机冷落影响通用量表、愤怒反刍量表、手机冷落行为量表、道德推脱量表，对576名大学生进行问卷调查。结果发现：1）受手机冷落正向预测手机冷落行为；2）愤怒反刍在受手机冷落和手机冷落行为关系中起部分中介作用；3）道德推脱在受手机冷落和手机冷落行为之间，以及受手机冷落和愤怒反刍之间都起调节作用。具体的，相对于低道德推脱水平个体，高道德推脱水平个体受手机冷落时更可能发生愤怒反刍和手机冷落行为。

关键词 受手机冷落，手机冷落行为，愤怒反刍，道德推脱

Phubbees' Phubbing Behavior: The Mediating Role of Anger Rumination and the Moderating Role of Moral Disengagement

Chen Linqi¹, Fang Jie¹, Li Meihua¹

¹ Department of Psychology, Guangdong University of Finance & Economics, Guangzhou, 510320, corresponding author E-mail:fangji@gdufe.edu.cn

Abstract: “Phubbing” is defined as the behavior that a person starts snubbing someone by paying attention to his/her smartphone in a social situation. Phubbing has a serious psychological influence on phubbers and phubbees, which has attracted the close attention of all sectors of society and scholars. Previous studies have shown that a person who being phubbed tended to use his/her smartphone, but the mechanism of its action is not clear. According to Expectancy Violations theory, phubbees experience a conflict between their expected state of attention and their current state of being snubbed. And this discrepancy will cause anger rumination. The Multiple Systems Model of Anger Rumination shows that anger rumination can affect the cognitive and emotional underpinnings of aggression. A lot of empirical evidence shows that anger rumination positively predicts aggressive behavior against provocateurs and even innocent people. Thus, we expect anger rumination to play a mediating role between being phubbed and phubbing. Other studies have shown that moral disengagement moderates the influence of other variables on individual immoral behavior, meanwhile we also examine whether moral disengagement plays a moderating role in the mediating model of anger rumination. Generic Scale of Being Phubbed(GSBP), Anger Rumination Scale(ARS), Generic Scale of Phubbing(GSP) and Moral Disengagement Scale were used to investigate 576 college students. The results indicated that: (1) Being phubbed positively predicts phubbing behavior. (2) Anger rumination plays a part of mediating role between being phubbed and phubbing behavior. (3) Moral disengagement moderates both the relations between being phubbed and phubbing as well as being phubbed and anger rumination. Specifically, compared with phubbees with low moral disengagement, phubbees with higher moral disengagement tend to occur anger rumination and phubbing behavior.

Keywords: being phubbed, phubbing, anger rumination, moral disengagement

学术型硕士研究生专业认同、职业决策自我效能感与职业决策困难的关系研究

张晓黎¹ 车丽萍¹ (通讯作者)

¹ 上海理工大学管理学院, 200093, cheliping@usst.edu.cn

摘要 近年来, 研究生的职业决策和就业问题愈益成为社会热点问题。专业认同和职业决策自我效能感等因素对研究生的职业决策困难问题存在直接影响。本研究立足于学术型硕士的特点, 在文献研究和相关理论研究的基础上, 对上海市具有代表性6所高校中的学术型硕士, 采用“线上+线下”问卷调查方式展开调研, 得出以下结论: 职业决策困难在学术型硕士中普遍存在, 并呈中度以上水平; 学术型硕士的专业认同、职业决策自我效能感和职业决策困难在人口统计学变量上存在显著性差异; 学术型硕士的专业认同与职业决策自我效能感显著正相关, 职业决策困难与职业决策自我效能感显著负相关; 专业认同对职业决策困难有负向预测作用, 职业决策自我效能感对职业决策困难有负向预测作用; 并且职业决策自我效能感可以在专业认同和职业决策困难中起部分中介作用。研究提出如下建议: 激发研究生个体主观能动性, 提高其专业认知水平; 优化专业软硬环境建设, 完善配套专业体系; 了解个体目的与动机, 改善个体行为方式; 为有效提升个体自我效能, 积极开发心理资本; 增强自我认知与核心竞争力, 选择正确的归因方式; 多方引导, 帮助学硕生树立正确职业价值观, 加强团体咨询干预; 识别并关注长期困难, 建立健全困难干预机制; 搭建校园到职场的互通平台, 完善在校学生由“自我—职业”的认知。

关键字 学术型硕士, 专业认同, 职业决策自我效能感, 职业决策困难

A Study on the Relationship between Professional Identity, Career Decision-Making Self-efficacy and Career Decision-Making Difficulties of Academic Postgraduates

Zhang Xiaoli, Che Liping

University of Shanghai for Science & Technology Business School, Shanghai

Abstract: In recent years, career decision-making and employment issues for graduate students have increasingly become social hot issues. Factors such as professional identity and career decision-making self-efficacy have a direct impact on graduate students' career decision-making difficulties. This research is based on the characteristics of academic masters, and on the basis of literature research and related theoretical research, the "online + offline" questionnaire survey method is used to investigate the academic masters of six representative universities in Shanghai. The following conclusions are drawn: career decision-making difficulties are common in academic masters, and are at a moderate level or above; academic masters' professional identity, career decision-making self-efficacy and career decision-making difficulties have significant differences in demographic variables; The professional identity of academic masters is significantly positively correlated with career decision-making self-efficacy, and career decision-making difficulties are significantly negatively correlated with career decision-making self-efficacy; professional identity has a negative predictive effect on career decision-making difficulties, and career decision-making self-efficacy is associated with career decision-making difficulties. It has a negative predictive effect; and career decision-making self-efficacy can play a part of mediating role in professional identification and career decision-making difficulties. The research puts forward the following suggestions: to stimulate individual subjective initiative of graduate students and improve their professional cognition; optimize the construction of professional soft and hard environment, improve the supporting professional system; understand individual goals and motivations, and improve individual behavior; to effectively enhance individual self-efficacy, actively develop Psychological capital; enhance self-awareness and core competitiveness, choose the correct attribution method; multi-direction, help students establish correct professional values, strengthen group consultation and intervention; identify and pay

attention to long-term difficulties, establish and improve the difficulty intervention mechanism; build a campus The intercommunication platform to the workplace will improve the students' awareness of "self-career".

Keywords: Academic master degree, Professional identification, self-efficacy of professional decision-making, Difficulty in career decision-making

大学生依恋对网络欺凌旁观者干预的影响： 网络人际信任的中介作用和安全依恋的调节效应

支愧云¹（通讯作者）刘枚枚¹ 王羽仪¹ 吴晓琴¹ 张尚贤¹

¹ 重庆大学公共管理学院，重庆，400044, kyzhi@cqu.edu.cn

摘要 大学生作为社交网站使用的主力军，会不可避免地成为网络欺凌事件中的旁观者，其行为影响着事件的发展演变。网络欺凌旁观者干预指旁观者在目睹网络欺凌事件时，通过直接或间接方式做出的制止欺凌者或保护受害者的行为。先前研究证实，网络欺凌旁观者干预能够在欺凌事件中为受害者提供即时帮助，并预防未来网络欺凌事件的发生，然而少有研究从积极心理学的角度探索网络欺凌旁观者干预的影响因素。本研究采用自编的大学生网络欺凌旁观者干预问卷、亲密关系经历量表（ECR）和网络空间人际信任问卷为研究工具，对440名大学生进行调查。同时，对61名大学生进行了情境实验。研究结果表明：（1）依恋回避和依恋焦虑可负向预测网络欺凌旁观者干预，网络人际信任可正向预测网络欺凌旁观者干预；（2）网络人际信任在依恋回避与网络欺凌旁观者干预之间起部分中介作用，网络人际信任在依恋焦虑与网络欺凌旁观者干预之间起完全中介作用；（3）事件严重程度可正向预测网络欺凌旁观者干预的干预意愿以及直接和间接干预水平。安全依恋可调节事件严重程度对旁观者间接干预水平的影响，即安全依恋启动时，严重程度低对间接干预水平的正向影响减弱。本研究从特质依恋和状态依恋的角度揭示了依恋和网络欺凌旁观者干预之间的关系，为未来针对网络欺凌旁观者干预的研究提供了新的思路，同时给网络欺凌预防体系的建设提供了实证参考依据。

关键词 网络欺凌，网络欺凌旁观者干预，依恋，网络人际信任

Cyberbullying Bystander Intervention and Its Relationship with Attachment: The Mediating Effect of Online Interpersonal Trust and the Moderating Effect of Security Attachment

ZHI Kuiyun, LIU Meimei, WANG Yuyi, WU Xiaoqin, ZHANG Shangxian

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: As an important part of Internet users, college students will inevitably become cyberbullying bystanders. Their behaviors will affect the development of cyberbullying. Cyberbullying bystander intervention refers to bystander's direct or indirect actions to stop the bully or protect the victim when they witness cyberbullying. Previous studies have confirmed that cyberbullying bystander intervention can provide immediate assistance to victims in bullying incidents and prevent the occurrence of future cyberbullying. However, few studies have explored the influencing factors of cyberbullying bystander intervention from the perspective of positive psychology. The study investigated 440 college students with self-designed questionnaire of bystander intervention in cyberbullying, Experience in Close Relationships Inventory (ECR) and the questionnaire of interpersonal trust in cyberspace. Moreover, situational experiments were carried out on 61 college students. The results show that: (1) There was a significant negative correlation between attachment avoidance/anxiety and cyberbullying bystander intervention. There was a significant positive correlation between online interpersonal trust and cyberbullying bystander intervention; (2) Online interpersonal trust played a partial mediating role between attachment avoidance and cyberbullying bystander intervention. Online interpersonal trust played a fully mediating role between attachment avoidance and cyberbullying bystander intervention; (3) The incident severity can positively predict the intervention willingness of cyberbullying bystanders and the level of direct/indirect intervention. Security attachment can adjust

the influence of incident severity on the level of indirect intervention of bystanders, that is, the positive effect of low severity on the level of indirect intervention is weakened when security attachment priming is activated. This study reveals the relationship between attachment and cyberbullying bystander intervention from the perspective of characteristic of attachment and state of attachment, and provides a new mentality for future research on cyberbullying bystander intervention. At the same time, it provides an empirical reference for the construction of cyberbullying prevention system.

Keywords: Cyberbullying, Cyberbullying bystander intervention, Attachment, Online interpersonal trust

Study on the Empirical Mode of psychological service for the poor people in urban Community

1 Faculty of Psychology, Southwest University, Service and Research Center of Chinese Community Psychology, Chongqing 400715, China

2 Social Assistance Department of Chongqing Civil Affairs Bureau, Chongqing Social Assistance Foundation, Chongqing 401121, China

Abstract: In his report to the 19th National Congress of the CPC, General Secretary Xi Jinping stressed the importance of strengthening the construction of the social psychological service system and fostering self-esteem, self-confidence, rationality and peace. The positive social mentality puts forward specific requirements and points out the working direction for the construction of the psychological service system for the disadvantaged people in urban communities. The purpose of this study is to provide psychological counseling through psychological care for the needy people and their families Crisis intervention and psychological services, to foster positive social mentality, effective stress, the optimistic faith, our lives eventually help them get rid of the psychological poverty, build a complete urban community difficult people psychological service system, so as to perfect the system of social psychological service system construction theory, the modernization of the grassroots community governance system and management ability. This study sorted out the status quo and deficiency of psychological services for the disadvantaged people in urban communities, summarized the main psychological problems of the disadvantaged

people in the community, and discussed the main psychological problems of the disadvantaged people in the community through a questionnaire survey. According to the needy urban community psychological service policy background and theoretical background, constructs the city community difficult people psychological service system, it puts forward the model of urban community difficult people psychological service experience, the long-term poverty and mental health of urban community difficult people to analyze the psychological mechanism of interaction between, finally for the urban community psychological service puts forward the countermeasures and the needy advice.

Keywords: Urban community; People in straitened circumstances; Psychological services; Construction of social psychological service system; Mental health.

平衡时间洞察力与心理健康的关系：情绪调节策略的中介作用

李小保, 吕厚超 (通讯作者)

西南大学心理学部, 时间心理学研究中心, 重庆, 400715

摘要 平衡时间洞察力是个体对过去、现在和未来的整体积极认知, 根据情境特点表现出适应性时间取向的能力。大量研究表明平衡时间洞察力对于心理健康的维持具有重要作用, 然而二者之间的作用机制尚不清楚。本研究以 1432 名 ($M=29.04$, $SD=14.38$) 成年人为被试, 探究平衡时间洞察力与心理健康的关系, 并检验情绪调节策略的中介效应。结果发现: (1) 平衡时间洞察力与主观幸福感正相关, 与焦虑负相关。(2) 平衡时间洞察力与认知重评正相关, 与表达抑制负相关。认知重评与主观幸福感正相关, 与焦虑负相关。表达抑制与主观幸福感负相关, 与焦虑正相关。(3) 认知重评、表达抑制在平衡时间洞察力与主观幸福感之间起部分中介作用; 表达抑制在平衡时间洞察力与焦虑之间起部分中介作用。研究结果强调了平衡时间洞察力对人们的情绪调节和心理健康的重要意义, 并给出了培养和构建平衡时间洞察力的建议。

Balancing Time Perspective and Mental Health: The Mediating Role of Emotion Regulation Strategies

Li Xiao-Bao, LYU Hou-Chao (corresponding author)

Center for Time Psychology, Faculty of Psychology, Southwest University, Chongqing, 400715,
China

Abstract: Balanced time perspective (BTP) refers to an individual's overall positive cognition of the past, present and future, and the ability to show adaptive time perspective depending on a situation's demands. Numerous studies have generally found a positive and strong association between balanced time perspective and indicators of mental health. However, little is known about the mediating mechanism underlying the link between balanced time perspective and mental health. The present study aims to examine the mediating effect of emotion regulation strategies between balanced time perspective and mental health. A total 1432 adults (mean age = 29.04 years, $SD = 14.38$) participated in the present study. The results showed that (1) balanced time perspective positively related with subjective well-being and negatively linked with anxiety. (2) Balanced time perspective positively related with cognitive reappraisal and negatively linked with expression suppression. Cognitive reappraisal positively related with subjective well-being and negatively related with anxiety. Expression suppression was negatively related to subjective well-being and positively related with anxiety. (3) Cognitive reappraisal and expression suppression mediated the relationship between balanced time perspective and subjective well-being. Expression suppression mediated the relationship between balanced time perspective and anxiety. Limitations and future directions are also discussed.

Keywords: Balanced time perspective; mental health; subjective well-being; anxiety; emotion regulation strategies

口腔保健社区化模式下的医务社工体系探索

何伊伦¹ 吴薇莉² (通讯作者)

¹ 西华大学, 成都, 611730

² 西华大学社会发展学院, 成都, 611730, 469131538@qq.com

摘要 随着现代化水平的提高, 大众对于口腔健康的关注度也在日益增加, 当前口腔预防工作也正面临着从传统生物治疗模式到医学—心理—社会模式的转变, 而医务社会工作的介入可以优化社区内资源的配置与使用, 并能以多种方式在社区口腔保健领域中开展服务, 合理的运用社区口腔保健资源。为了能达到社区口腔保健服务与医务社工服务的内在融合, 本文进行了两个方面的研究。研究一是针对口腔保健社区化模式的探索, 该研究从社区的既有资源出发, 将社区口腔保健的地点固定在社区内, 将保健服务的范围固定在居民的口腔保健与问题预防上, 更注重社区口腔保健服务对口腔疾病的“预防性”。研究二是针对医务社工在口腔保健社区化模式中的管理与服务体系的探索。本文以社区医疗健康主题下的口腔健康为切入点, 以生态系统理论以及行为转变理论为指导, 采用了参与式观察法、访谈法、问卷调查法进行研究。在社区中通过组建跨专业的复合式团队, 优化口腔保健服务流程与服务结构, 探索口腔保健社区化模式该如何开展。在社区口腔保健服务中积极探索口腔医务社工的管理体系。在口腔医务社工的服务体系中通过分诊、宣教、运用三阶段来达成口腔保健观念意识化、口腔保健行为日常化、口腔健康问题预防化的目标。通过对社区服务提供者的访谈资料的分析显示, 口腔保健社区化模式的运作可以有效地为社区口腔保健领域进行服务; 通过对服务开展的过程与结果进行评估显示, 口腔医务社工的介入对居民的口腔健康知识、信念有了显著的改变, 但是居民口腔健康行为的改变并不明显。由此得出结论, 经由医务社工有体系地在社区内开展口腔保健社区化模式, 可以有效的进行口腔健康服务队伍的建设, 促使居民培养正确的口腔保健意识, 形成正确的口腔保健观念, 但是短期内对居民口腔健康行为的促进作用还不够明显。

Exploration of medical social work system under the mode of community of oral health care

He Yilun

Xihua University, Chengdu

Abstract: With the improvement of modernization level, the public attention to oral health are also growing, the current oral preventive work also is facing from the traditional biological treatment mode to - psychology - social medical model transformation, and the medical affair social work intervention can optimize the configuration and use of community resources, and can in a variety of ways to carry out the services in the field of community oral health, the use of the community oral health resources rationally. In order to achieve the internal integration of community oral health service and medical social worker service, two aspects were studied in this paper. The first study is to explore the community-based model of oral health care. Starting from the existing resources of the community, the location of community oral health care is fixed in the community, and the scope of health care services is fixed on the residents' oral health care and problem prevention, paying more attention to the "prevention" of oral diseases by community oral health care services. The second study is to explore the management and service system of medical social workers in the community-based model of oral health care. In this paper, the oral health under the theme of community health is taken as the entry point, and the ecosystem theory and behavioral change theory as the guidance, the participatory observation method, interview method and questionnaire survey method are adopted to carry out the research. Through the establishment of a cross-professional compound team in the community, the process and structure of oral health services are optimized to explore how to carry out the community-based model of oral health care. Actively explore the management system of oral medical social workers in community oral health services. In the service system of oral medical social workers, the goals of awareness of oral health care, daily oral health care behavior and prevention of oral health problems are achieved through triage, education and application of three stages.

The analysis of the interview data of community service providers shows that the operation of the community-based model of oral health can effectively serve the field of oral health in the community. The evaluation of the process and results of the service development showed that the intervention of oral medical social workers had significant changes in residents' oral health knowledge and beliefs, but the changes in residents' oral health behaviors were not obvious. Thus concluded that a system by medical social worker within the community to carry out the oral health community model, can be effective for oral health service team construction, encourage residents to develop correct oral health awareness, to form a correct concept of oral health care, but in the short term for residents to promote oral health behavior obvious enough.

医务社会工作视角下儿童口腔治疗恐惧的就医支持服务模式探索

贾正宇¹ 吴薇莉² (通讯作者)

1 西华大学社会发展学院, 成都, 610000

2 西华大学心理健康服务与研究中心, 成都, 610000, 469131538@qq.com

摘要 伴随着生物心理社会医学模式的兴起,“全人”照顾的医疗服务日益被重视,因此面对儿童口腔治疗的恐惧,从个人到环境层面的全方位支持十分必要。本文旨在通过了解儿童口腔治疗恐惧的就医支持现状,寻找有效缓解儿童口腔治疗恐惧的介入对策,这对于解决儿童就医多方面和较复杂的个人、家庭或社会问题具有重要作用。笔者通过文献回顾发现,口腔治疗恐惧让儿童身心健康的发展经受着挑战,因此,口腔治疗恐惧的儿童处于相对弱势的处境,他们需要来自生理、心理和社会层面的支持。本研究以口腔治疗恐惧的儿童为研究对象,旨在探索出医务社会工作视角下的就医支持服务模式,充分发挥社会工作者整合系统资源的作用,协助患儿缓解或克服恐惧。全文采用质性的研究方法,运用访谈法和参与式观察法来探究与儿童紧密相关的两大环境系统(医疗机构和家庭系统),并以类属分析的方法进行资料整理。笔者基于生态系统理论和社会支持理论展开研究,本文的研究共分为三个部分:第一部分是医务社工针对儿童口腔治疗恐惧的就医支持现状研究;第二部分是儿童口腔治疗恐惧的就医支持服务模式构建研究;第三部分是复合式儿童口腔治疗支持服务模式的评估研究。最终得出本文的结论:第一,介入儿童口腔治疗恐惧不仅需要关注儿童本身的需求,也需要考虑儿童所处生态环境系统的影响;第二,医务社工能够作为服务模式的主导者和服务的实施者,运用专业的知识、理论和方法体现其整合功能的优势,主动与医疗机构建立合作,以医疗机构为阵地,将社会工作者、医护人员和心理咨询师组建成复合式的团队,提供利他的支持性服务;第三,本文所提出的服务模式其作用体现有:在医务社工的参与下能够为口腔患儿、儿童家庭和医疗机构提供系统的就医支持,并通过科学的评估方法检验该服务模式的有效性,使其能够具有一定的推广价值。总之,笔者所提出的服务模式,为解决儿童口腔治疗恐惧打开了新的思路和方法,也是社会工作在医务领域的较新探索,为处理儿童口腔治疗恐惧这一问题提供了一些参考和方向。

Exploration of Medical Support Service Mode for Children's Fear of Oral Treatment from the Perspective of Medical Social Work

Jia Zhengyu¹, Wu Weili²

1 Xihua University College of Social Development, Chengdu

2 Xihua university psychological health service and research center, Chengdu

Abstract: With the rise of bio-psycho-social medical model, "whole person" care of medical services is increasingly valued. Therefore, in the face of children's fear of oral treatment, all-round support from the individual to the environment level is necessary. The purpose of this article is to find out the current situation of medical treatment support for children's fear of oral treatment, and to find effective intervention countermeasures to alleviate children's

fear of oral treatment, which plays an important role in solving various and more complicated personal, family or social problems of children's medical treatment. Through literature review, the author found that children's physical and mental health development is challenged by fear of oral therapy. Therefore, children with fear of oral therapy are in a relatively weak position, and they need support from physiological, psychological and social levels. This study takes children with fear of oral therapy as the research object, aiming to explore the medical support service mode from the perspective of medical social work, give full play to the role of social workers in integrating system resources, and assist children to alleviate or overcome fear. The full text uses qualitative research methods, interviews and participatory observation methods to explore the two major environmental systems (medical institutions and family systems) closely related to children, and uses generic analysis methods to collate data. Based on the ecosystem theory and the social support theory, the research in this paper is divided into three parts: The first part is the research on the status quo of medical support for children's fear of oral treatment by medical social workers; The second part is the research on the construction of medical support service model for children's fear of oral treatment. The third part is the evaluation and research of the composite oral treatment support service model for children. Finally, the conclusions of this paper are as follows: First, the intervention of children's fear of oral therapy not only needs to pay attention to the needs of children themselves, but also needs to consider the impact of the ecological environment system in which children live; Second, medical social workers can act as the dominant and implementer of the service mode, use professional knowledge, theories and methods to embody the advantages of its integration function, actively establish cooperation with medical institutions, and take medical institutions as the position to form a composite team of social workers, medical personnel and psychological consultants to provide altruistic and supportive services. Third, the service mode proposed in this paper has its functions as follows: it can provide systematic medical support for children with oral diseases, children's families and medical institutions with the participation of medical social workers, and test the effectiveness of the service mode through scientific evaluation methods, so that it can have certain promotion value. In a word, the service mode proposed by the author opens up new ideas and methods for solving children's fear of oral treatment, and is also a relatively new exploration of social work in the medical field, providing some references and directions for dealing with the problem of children's fear of oral treatment.

性别歧视对婚前、婚外、同性性行为包容度的影响 ——基于中国综合社会调查（CGSS）数据的城乡对比

石思润¹ 支愧云¹(通讯作者)杨晓菲¹ 薛丹 张莹

¹ 重庆大学公共管理学院, 重庆, 400044, kyzhi@cqu.edu.cn

摘要 在我国,与性别歧视有关的言论一直不断,尽管在国家政策影响和倡导下显性歧视已经变得非常少,隐性歧视却依旧存在,与此同时,婚前、婚外、同性性行为的问题备受政府、社会以及网络媒体等各界的关注,然而国内在性别歧视与婚前、婚外、同性性行为包容度的研究领域同时聚焦城乡差异的实证研究还比较有限。本研究采用 spss24.0 软件,对 2015 年中国综合社会调查(CGSS)的 10968 名城市和农村参与者的相关数据进行了描述性分析和回归分析,其中城镇人口样本 4774 个,农村人口样本 6194 个。分析结果表明:在个体因素变量中,在城镇和农村中,男性都表现出对婚前性行为和婚外性行为包容度更高;年龄越小对婚前性行为和同性性行为包容度都越高;少数民族都比汉族更能包容同性性行为;受教育程度越高越能包容同性性行为;而在农村地区,汉族人民比少数民族对婚前性行为和同性性行为包容度低,而在城市地区没有表现出显著影响;城市地区,身体健康状况对婚前性行为和同性性行为的包容度产生显著正向影响,婚姻状况对同性性行为的包容度产生显著负向影响,在农村地区这两者都没有表现出显著影响。在控制个体因素的情况下,城乡地区性别歧视对婚前、婚外、同性性行为三者包容度表现出异同;相同的地方在于城乡地区性别歧视均对婚前性行为的包容度和婚外性行为的包容度产生显著正向影响,不同的地方在于性别歧视在农村地区对同性性行为的包容度有显著正向影响,在城镇中则没有显著影响。由此可见,城乡地区经济发展水平、传统文

化、社会规范和生活环境的不同，会影响到人们的价值观念和态度，政府、媒体和社会要采取正确的和多样的方式引导公众性态度的合理化定型，并减轻社会上的性别歧视现象，降低性别歧视带来的负面影响。

The Correlation between Gender Discrimination and Sexual Tolerance in China: an urban - rural comparison

SHI Sirun, ZHI Kuiyun, YANG Xiaofei, XUE Dan, ZHANG Ying*

School of Public Affairs, Chongqing University, Chongqing, 40044

Abstract : In China, there have been constant speeches related to gender discrimination. Although explicit discrimination has become very rare under the influence and advocacy of national policies, implicit discrimination still exists. The problems of premarital, extramarital, and same-sex sexual behavior have received attention from the government, society, and online media. However, domestic research on gender discrimination and premarital, extramarital, and same-sex sexual tolerance while focusing on urban-rural differences is still relatively limited. This study uses spss24.0 to perform descriptive analysis and regression analysis on the relevant data of 10968 urban and rural participants in the 2015 China Comprehensive Social Survey (CGSS), including 4,774 urban population samples and 6,194 rural population samples . The analysis results show that in individual factor variables, both in urban and rural areas, men show greater tolerance for premarital sex and extramarital sex; the younger the age, the higher the tolerance for premarital sex and same-sex sex. Minorities are more tolerant of same-sex sexual behavior than Han people; the higher the level of education, the more tolerant of same-sex sexual behavior; while in rural areas, Han people are less tolerant of premarital sex and same-sex behavior than ethnic minorities, while in urban Regions did not show a significant impact; in urban areas, physical health status has a significant positive impact on the tolerance of premarital sex and same-sex sexual behavior, and marital status has a significant negative impact on the tolerance of same-sex sexual behavior. In rural areas, both None of them showed a significant impact. Under the control of individual factors, gender discrimination in urban and rural areas shows similarities and differences in the tolerance of premarital, extramarital, and same-sex sexual behavior; the same thing is that both urban and rural gender discrimination in tolerance of premarital sex and extramarital sexual behavior The difference is that gender discrimination has a significant positive impact on the tolerance of same-sex sexual behavior in rural areas, but has no significant impact in urban areas. This shows that differences in the level of economic development, traditional culture, social norms, and living environment in urban and rural areas will affect people's values and attitudes. The government, the media, and society should adopt correct and diverse ways to guide the rationalization and finalization of public sexual attitudes, and reduce gender discrimination and the negative impact of gender discrimination.

Keywords: gender discrimination; sexual tolerance; urban-rural comparison

受艾滋病影响青年的歧视和人生意义感特点：宽恕的中介作用

李雅爽¹ 吴丽娜¹ 王会会¹ 赵俊峰¹（通讯作者）

¹ 河南大学教育科学学院，开封，475004，jfzhao63@hotmail.com

摘 要 随着艾滋病在全球范围内的蔓延，受艾滋病影响群体这一弱势群体的数量也在不断增长。他们不仅要承受家人的患病或死亡带来的巨大伤痛，还要承受来自外界对“艾滋病”这个有色标签的歧视和排斥，对于他们的身心健康带来不利影响，进而对他们处理人际伤害、领会生活意义等方面造成严重的负面影响。采用歧视量表、青少年宽恕量表和人生意义感量表对河南省某县 175 名受艾滋病影响青年进行问卷调查研究，结合相应的统计分析软件对受艾滋病影响青年的歧视经历、宽恕以及人生意义感的关系进行分析，并在此基础上分析宽恕在歧视经历对人生意义感中的中介作用。研究结论如下：第一，受艾滋病影响青年的歧视经历在其接受教育程度上存在显著差异，接受教育程度较低的受艾滋病影响青年遭受的歧视经历多于接受教育程

度较高的受艾滋病影响青年；第二，受艾滋病影响青年的人生意义感在接受教育程度上存在显著差异，接受教育程度较高的受艾滋病影响青年的人生意义感更高；第三，受艾滋病影响青年的歧视经历与宽恕、人生意义感呈显著负相关，宽恕和人生意义感呈显著正相关；第四，受艾滋病影响青年的歧视经历对其宽恕、人生意义感的负向预测作用显著；宽恕对人生意义感的正向预测作用显著；第五，受艾滋病影响青年的宽恕在歧视经历和人生意义感之间起部分中介作用。

关键词 受艾滋病影响群体，歧视，宽恕，人生意义感

The Characteristic of Stigma and Life Meaning among Adolescents Affected by HIV/AIDS: The Intermediary Role of Forgiveness

Li Yashuang¹, Wu Lina¹, Wang Huihui¹, Zhao Junfeng¹(corresponding author)

Institute of Behavior and Psychology, Henan University, Kaifeng, 475004, jfzhao63@hotmail.com

Abstract: With the spread of HIV/AIDS worldwide, the number of vulnerable groups affected by HIV/AIDS is also increasing. They not only have to endure the enormous pain caused by the illness or death of their family, but also have to deal with the discrimination and rejection of the label “HIV/AIDS” from the outside world, which has an adverse impact on their physical and mental health, which will further affect their interpersonal injuries management and the understanding of life meaning. This study, by using Hearland forgiveness scale, the scale for stigma and the questionnaire for meaning in life to test 175 adolescents affected by HIV/AIDS from a rural area of Henan province, aims to explore the relationship between forgiveness, stigma and life meaning in adolescents affected by HIV/AIDS. The conclusions are as follows: First, the adolescents affected by HIV/AIDS prove the significant educational level difference in stigma experience, the adolescents affected by HIV/AIDS with lower educational level experience more stigma than the adolescents affected by HIV/AIDS with a higher level of education. Secondly, there was a significant difference in the sense of life meaning among the adolescents affected by HIV/AIDS in the level of education, and the adolescents affected by AIDS with higher education level have a higher sense of life meaning. Thirdly, stigma experience of HIV/AIDS affected adolescents is negatively correlated with forgiveness and life meaning respectively, forgiveness is positively correlated with life meaning.

Fourthly, negative predict effect of stigma experience to forgiveness and life meaning is significant, positive predict effect of forgiveness to life meaning is significant. Finally, forgiveness partially mediated between stigma experience and life meaning.

Keywords: adolescents affected by HIV/AIDS, stigma, forgiveness, life meaning

依恋对大学生网络欺凌旁观者干预的影响：网络人际信任的中介作用

支愧云¹（通讯作者）张舒瑞¹ 刘枚枚¹ 宗雪琴¹ 张梓涵¹ 曹莹¹ 张尚贤¹

¹ 重庆大学公共管理学院，重庆，400044, kyzhi@cqu.edu.cn

摘 要 大学生作为社交网站使用的主力军，会不可避免地成为网络欺凌事件中的旁观者，其行为影响着事件的发展演变。网络欺凌旁观者干预指旁观者在目睹网络欺凌事件时，通过直接或间接方式做出的制止欺凌者或保护受害者的行为。已有研究证实，网络欺凌旁观者干预能够在欺凌事件中为受害者提供即时帮助，并预防未来网络欺凌事件的发生。依恋作为一种较为稳定的特质会对个体的人际信任产生重要影响，而人际信任与网络中的助人行为等存在密切关系，因此我们假设大学生依恋既可能会直接预测网络欺凌旁观者干预，也可能通过人际信任产生间接的预测作用。本研究采用自编的大学生网络欺凌旁观者干预问卷、亲密关系经历量表和网络空间人际信任问卷，对 440 名大学生进行调查，考察大学生依恋、网络人际信任与网络欺凌

旁观者干预之间的关系。结果表明：（1）依恋回避和依恋焦虑负向预测网络欺凌旁观者干预，网络人际信任正向预测网络欺凌旁观者干预；（2）网络人际信任在依恋回避与网络欺凌旁观者干预之间起部分中介作用，而在依恋焦虑与网络欺凌旁观者干预之间起完全中介作用。该研究揭示了依恋和网络欺凌旁观者干预之间的关系及其机制，为网络欺凌的预防和干预提供了实证参考依据。

关键词 网络欺凌旁观者干预，依恋，网络人际信任，大学生

The Influence of College Students' attachment on Cyberbullying Bystander Intervention: The Mediating Effect of Online Interpersonal Trust

Kuiyun Zhi*, Shurui Zhang¹, Meimei liu¹, Xueqin Zong¹, Zihan Zhang¹, Ying Cao¹, Shangxian Zhang¹

¹ School of Public Policy and Administration, Chongqing University, Chongqing, China

Abstract: As an important part of Internet users, college students will inevitably become cyberbullying bystanders. Their behaviors will affect the development of cyberbullying. Cyberbullying bystander intervention refers to bystander's direct or indirect actions to stop the bully or protect the victim when they witness cyberbullying. Previous studies have confirmed that cyberbullying bystander intervention can provide immediate assistance to victims in bullying incidents and prevent the occurrence of future cyberbullying. Attachment, as a relatively stable trait, will have an important impact on individual interpersonal trust, which is closely related to helping others on the Internet. Therefore, we assume that college students' attachment may not only directly predict the intervention of cyberbullying bystanders, but also indirectly predict it through interpersonal trust. The study investigated 440 college students with self-designed questionnaire of bystander intervention in cyberbullying, Experience in Close Relationships Inventory(ECR) and the questionnaire of interpersonal trust in cyberspace. The results show that: (1) There was a significant negative correlation between attachment avoidance/anxiety and cyberbullying bystander intervention. There was a significant positive correlation between online interpersonal trust and cyberbullying bystander intervention; (2) Online interpersonal trust played a partial mediating role between attachment avoidance and cyberbullying bystander intervention. Online interpersonal trust played a fully mediating role between attachment avoidance and cyberbullying bystander intervention. This study reveals the relationship between attachment and cyberbullying bystander intervention from the perspective of characteristic of attachment and state of attachment, and provides a new mentality for future research on cyberbullying bystander intervention. At the same time, it provides an empirical reference for the construction of cyberbullying prevention system.

Keywords: Cyberbullying bystander intervention, Attachment, Online interpersonal trust, College student

一次单元团体辅导：企事业员工心理健康服务需求的实践研究

陈秋燕¹ 石宇宁¹ 王晓刚²

西南民族大学社会学与心理学学院，成都，610041，mycqy@163.com

摘要 目的：当前我国企事业员工面临着对心理健康服务的需求较高，但对其了解程度和易得性均显不足的状况，这不利于员工身心健康发展和社会心理服务体系的建设，社会亟须创新心理健康服务形式来调和这一矛盾。因而本研究的目的在于，了解企事业员工对于社会心理健康服务在内容和设置方面的需求，在此基础上提出一次单元团体辅导的心理健康服务方式，并探究其在满足企事业员工心理健康服务需求方面的效果。方法：根据自编的心理健康服务需求问卷和满意度评估表，选取了123名企事业单位员工，对他们采用一次单元团体辅导的服务方式，探究一次单元团体辅导对企事业员工心理健康服务的效果。结果：1，企事业员工心理健康服务需求的特点是在上班期间、单位以外提供一次性的体验活动，主要以自我认识、压力应对、人际关系、职业规划和工作成效等内容为主。2，一次单元团体辅导对企事业员工在知识技能、自我满意度、人际互动、团体满意度等方面具有良好效果，总体满意度达到“满意和非常满意”的比率为78%。3、人际互动与

工作成效、人际关系以及压力应对等维度显著相关,人际互动在企事业单位员工的心理健康服务中作用显著,能激励和催化员工信任和参与团体,使人际关系更为融洽,可以疏解工作和生活中的压力,进而提高其应对工作时的信心。结论:一次单元团体辅导是满足企事业单位员工社会心理健康服务需求的一种有效方式。

关键词 心理健康服务需求,企事业单位员工,一次单元团体辅导

Single Session Group Counseling: A practical study on the mental health service demand of employees in enterprises and institutions

Chen Qiuyan¹, SHI Yunning¹, WANG Xiaogang²

College of Sociology and Psychology, Southwest Minzu University, Chengdu

Abstract: At present, employees of enterprises and institutions in China are facing a high demand for mental health services but a lack of understanding and accessibility, which is not conducive to the physical and mental health development of employees and the construction of a social psychological service system. Therefore, the purpose of this study is to explore the needs of employees for psycho-social services in terms of content and settings, and to propose single session group counseling approach to psycho-social health services and investigate its effectiveness in the needs of employees for psycho-social health services. Methods: Based on a self-administered mental health service demand questionnaire and satisfaction assessment form, 123 employees of enterprises and institutions were selected, and single session group counseling service was applied to them to investigate the effect of the single session group counseling on the mental health service of employees of enterprises and institutions. Results: 1, the demand for mental health services in enterprises and institutions is characterized by the provision of one-time experiences during work-time and outside the workplace, mainly focusing on self-awareness, stress coping, interpersonal relationships, career planning and work effectiveness. 2, the single session group counseling has a good effect on knowledge and skills, self-satisfaction, interpersonal interaction and group satisfaction, and the overall satisfaction rate is 78% of which is "satisfied" and "very satisfied". 3. Interpersonal interaction is significantly related to work effectiveness, interpersonal relationship and stress coping, and it plays a significant role in mental health services of enterprises and institutions, which can motivate and catalyze employees to trust and participate in groups, make interpersonal relationship more harmonious, relieve pressure in work and life, and further improve their confidence in dealing with work. Conclusion: Single session group counselling is an effective way to meet the demand for psycho-social health services for employees in enterprises and institutions.

人格特质对校园欺凌的影响：一个有调节的中介模型

张运¹ 李祚山² 谭雅兰¹ 张玺¹ 陈薪¹ 赵青煜¹

1 重庆师范大学应用心理学重点实验室, 重庆, 401331

2 重庆师范大学应用心理学系, 重庆, 401331, 642662213@qq.com

摘要 青春期(12至18岁)的青少年由于生理和心理都处在急剧变化时期,面临自我统一和角色混乱的冲突(黄希庭, 2007),这个阶段极易产生问题行为,校园欺凌便是广泛存在的问题之一。影响校园欺凌的因素众多,其中人格特质对校园欺凌的影响尤为明显。Nail等人(Nail, Simon, Bihm, & Beasley, 2005)提出的修订后的攻击性补偿模型认为防御性人格结构才是欺凌的重要原因。为了更好地探究人格特质对校园欺凌的影响,本研究纳入中介变量孤独感与调节变量自我概念以1631名中学生为被试进行问卷调查。研究采用SPSS宏程序PROCESS对数据进行分析,结果表明:神经质对受欺凌具有显著的正向预测作用,外向性对受欺凌具有显著的负向预测作用,宜人性对欺凌/受欺凌具有显著的负向预测作用。孤独感在神经质与受欺凌行为、外向性与受欺凌行为、宜人性与欺凌/受欺凌行为之间起中介作用。此外,自我概念在孤独感对神经质、外向性、宜人性与受欺凌行为的中介路径中起调节作用。进一步使用简单斜率分析发现低孤独感的学生,在发生校园欺凌行为时,自我概念的调节能力更明显,个体的自我概念水平对于是否发生欺凌行为具有更显著

的作用。较高孤独感会加剧欺凌/受欺凌的发生，而较好的自我概念能减少校园欺凌的发生。因此，帮助学生清晰自我概念是减少校园欺凌行为发生的重要途径；降低学生的孤独感也是避免欺凌行为发生的重要举措。

关键词 人格特质，校园欺凌，孤独感，自我概念

The Effect of Personality Traits on School Bullying: A Moderated Mediation Model

Yun Zhang¹, Zuoshan Li², Yalan Tan¹, Xi Zhang¹, Xin Chen¹, Qingyu Zhao¹

1 Key Laboratory of applied psychology, Chongqing Normal University, Chongqing 401331, China

2 School of Applied Psychology, Chongqing Normal University, Chongqing 401331, China

Abstract: Due to the rapid physiologic and psychological changes, adolescents (12-18 years old) are confronted with conflicts between self-identity and role confusion. At this stage, problem behaviors are readily lead to occur, and school bullying is one of the widespread problems, the detection rate of school bullying victim among Chinese teenagers is around 20%. It can be seen that the phenomenon of school bullying is widespread and has been a practical problem to be solved urgently. There are many factors affecting school bullying, among which the impact of personality traits is significant. In addition, whether personality traits directly affect school bullying behavior and whether there are interactions between personality traits and other factors in the process of personality traits influencing school bullying behavior, deserve our consideration. Researches have proved that personality traits influence loneliness, and loneliness affects school bullying behavior. Individuals with weak self-concept tend to form high levels of loneliness, and high levels of loneliness predict individuals' aggressive behavior. Therefore, different levels of self-concept can affect the formation of loneliness level, which in turn enhance or weaken the impact of personality traits on school bullying. In this, we propose two hypotheses: (1) loneliness acts as the mediator between personality traits and school bullying behavior; (2) self-concept plays a moderating role in the mediating process of loneliness to personality traits and school bullying behavior. To test the hypotheses, this study adopted questionnaire method to conduct collective anonymous test on 1631 middle school students who were took a class as a unit to explore the relationship between their personality traits and campus bullying, and to clarify the mediating function of self-concept and loneliness between their personality traits and school bullying behavior. The SPSS macro program PROCESS plugin was used for data analysis, and percentile Bootstrap method with deviation correction was used for repeated sampling 5000 times for testing, and 95% confidence interval was calculated. The results show that: (1) Neuroticism has a significant positive predictive effect on being bullied. Extroversion has a significant negative predictive effect on it. And agreeableness has a significant negative predictive effect on bullying/being bullied. (2) Loneliness plays an intermediary role between neuroticism and bullied behavior, extroversion and bullying behavior, agreeableness and bullying/bullied behavior. (3) Self-concept plays a role in adjusting the loneliness to neuroticism and bullied behavior, to extroversion and bullied behavior, and to agreeableness and bullied behavior. But it does not adjust loneliness to agreeableness and bullying behavior. In summary, school bullying/ being bullied is harmful to the development of the adolescents' both mind and body health, bullying at school is worth our continued attention and reflection. In terms of personality traits, the score of neuroticism, openness and agreeableness can positively or negatively predict the occurrence of bullying behavior. In addition, high-level loneliness which affected by parent-child relationship, peer relationship, campus atmosphere, social support and other factors will enhance the occurrence of school bullying/being bullied, and a better self-concept can reduce the occurrence of bullying behavior on the basis of reducing loneliness. Therefore, helping students clear their self-concept is an important way to reduce bullying behavior, and alleviating their loneliness is also an needful measure. Families, schools and society should be united to keep bullying away from teenagers.

Keywords: campus bullying, personality traits, loneliness, self-concept

教育获得感如何影响大学生的未来目标选择？ ——未来时间洞察力和自我控制的调节作用

陈永进¹（通讯作者）董超华¹ 黄葳¹ 张攀¹ 薛忱恺¹

¹ 重庆大学公共管理学院，重庆，400044，yjchen@cqu.edu.cn

摘要 大学生未来目标选择不仅是解释个体行为的重要动机变量，也会对其未来职业生涯规划起到重要引导作用。本研究对未来目标选择的影响机制和因素进行了丰富和补充，为大学生未来的人生目标的引导提供了帮助。在本研究中，采用了未来目标选择问卷、教育获得感问卷、未来时间洞察力问卷和自我控制问卷对304名在校大学生进行了调查，随后对调查数据进行了回归分析和调节作用检验。结果发现：①大学生教育获得感在个体之间差距较大，并受到自身成绩水平的影响，且他们的未来时间洞察力和自我控制水平也体现出了较大的异质性水平；②知识性目标会在不同年级和自身成绩水平上存在差异，情绪调节性目标会受到自身成绩的影响；③教育获得感作为一项人格特质能够显著地影响个体未来目标的选择倾向，它对知识性目标（ $r=0.793$, $p<0.01$ ）和情绪调节性目标（ $r=0.715$, $p<0.01$ ）都有着较明显的预测作用；④未来时间洞察力和自我控制在其中存在调节作用，低未来时间洞察力的个体比高未来时间洞察力的个体更加敏感，即更容易受到教育获得感的影响而改变自身的目标选择倾向，自我控制能力较差的个体亦然。自我控制能力强的个体往往能够提升知识性目标，降低情绪调节性目标。基于上述研究结果看到了教育获得感对不同个体未来目标选择的影响作用，应对不同的学生采取不同的提升教育获得感的方式。

关键词 未来目标选择，教育获得感，未来时间洞察力，自我控制，大学生

How the sense of education gain affects the future goal selection of college students?——The regulation role of future time perspective and self-control

CHEN Yongjin, DONG Chaohua, HUANG Wei, ZHANG Pan, XUE Chenkai

¹ School of Public Affairs, Chongqing University, Chongqing, 400044

Abstract: The future goal selection of college students is not only an important motivation variable to explain individual behavior, but also plays an important role in guiding their future career planning. This study enriches and complements the mechanism and factors of the future goal selection, which provides help for the guidance of college students' future life goals. In this study, 304 college students were surveyed by future target selection scale, the sense of education gain scale, future time perspective scale and self-control scale, and then the regression analysis and adjustment effect test were carried out on the survey data. The results showed that: (1) College students' sense of education gain was greatly different from the individual, which was affected by their own level of achievement, and their future time perspective and self-control also reflected the greater heterogeneous level; (2) Knowledge goals will vary in grades and their own grades, and emotional goals will be influenced by their own grades; (3) As a personality trait, the sense of education gain can significantly influence the choice tendency of individual's future goal selection, which has a more obvious predictive effect on the intellectual goal ($r=0.793$, $p<0.01$) and the emotional regulation target ($r=0.715$, $p<0.01$); (4) future time perspective and self-control have a regulatory effect, and individuals with low future time perspective are more sensitive than individuals with high future time perspective, i.e. more susceptible to the influence of the sense of educational gain and change their tendency to change their own goal choices, and poor self-control. Individuals with strong self-control ability are often able to improve their knowledge goals and reduce their emotional goals. Based on the above research results, we see the influence of educational acquisition on the future goal selection of different individuals, and different students should adopt different ways to enhance the sense of educational gain.

Keywords: future goal selection, sense of education gain, future time perspective, self-control, college students

道德领导对公共部门职工绿色行为的影响 ——组织绿色倡导和环保热情的中介作用

陈永进¹（通讯作者）何宁¹ 祁可¹ 陈庚¹ 杨剑¹

¹ 重庆大学公共管理学院, 重庆, 400044, yjchen@cqu.edu.cn

摘要 绿色组织行为是近年来新兴的一个研究领域, 而职工绿色行为正是其中一个重要议题。众多研究已经指出, 随着环境问题日益严重, 如何提升组织和职工绿色行为成为值得研究的问题。为了节约组织运行成本、提高环境绩效、增强社会责任感, 公共部门有必要向绿色管理发展。因此, 本研究基于社会学习理论构建一个双中介模型, 从情境因素和个体因素两方面对道德领导与公共部门职工绿色行为之间的关系进行讨论。本研究采用职工绿色行为问卷、道德领导量表、组织绿色倡导问卷和环保热情问卷对 299 名公共部门职工进行调查, 数据分析结果显示: 道德领导对职工绿色行为有显著正向预测作用; 组织绿色倡导、环保热情都在道德领导与职工绿色行为之间起部分中介作用, 环保热情的中介效应更强。此外, 道德领导与职工绿色行为的关系在不同类型公共部门中表现不同, 具体而言, 道德领导与职工绿色行为在政府部门和社会组织中存在积极影响, 而在事业单位和国有企业中不显著; 组织绿色倡导、环保热情只在政府部门道德领导与职工绿色行为间起双重中介作用, 而在社会组织中, 只有环保热情起部分中介作用。本研究试图丰富职工绿色行为的研究内容以及道德领导的研究范围, 并从道德领导、组织绿色氛围和职工个体三方面对公共部门组织绿色人力资源管理提供实践启示。

关键词 职工绿色行为; 道德领导; 组织绿色倡导; 环保热情; 绿色人力资源管理

The Impact of Ethical Leadership on Employee Green Behavior in Public Sector: A Dual-Mediator Model of Organization's Green Advocacy and Harmonious Environmental Passion

CHEN Yongjin, HE Ning, QI Ke, CHEN Geng, YANG Jian

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: Green Organization behavior is a new research field in recent years, and employee green behavior is one of the important core issues. Many studies have pointed out that with the growing environmental problems, how to improve the organization and employees' green behavior become a problem worthy of study. In order to save the running cost of the organization, improve the environmental performance and enhance the sense of social responsibility, it is necessary for the public sector to develop to green management. Based on social learning theory, this study constructs a dual-mediator model, and investigated the effects of ethical leadership and employee green behavior of public sector from both situational and individual factors. In this study, 299 public sector employees were investigated with employee green behavior questionnaire, Ethical Leadership Scale, organization's green advocacy questionnaire and harmonious environmental passion questionnaire. The results show that ethical leadership positively predicted employee green behavior; organization's green advocacy and harmonious environmental passion mediated the relationship between ethical leadership and employee green behavior, moreover, the mediation effect of harmonious environmental passion is stronger. In addition, the relationship between ethical leadership and employee green behavior is different in different types of public sectors. Specifically, the positive effect of ethical leadership and employee green behavior is significant in government departments and social organizations, but not in public institutions and state-owned enterprises; organization's green advocacy and harmonious environmental passion play a dual-mediator model between the ethical leadership of government department and employee green behavior, while in social organizations, harmonious environmental passion plays a part of intermediary role. According to this, it attempts to enrich the research about employee green behavior and ethical leadership, and provides a reference for the organization's green human resource management from the ethical leadership, the organization green atmosphere and the staff individual three aspects.

Abstract : Objective: This study was to explore the improvement effect of behavior contract on a primary school student with academic procrastination. Methods: Using single-participant research design, a primary school student received behavior contract to intervene on academic procrastination. This study adopted the A-B baseline experiment design which was divided into three stages: the baseline (1-6 days), intervention (7-26 days) and follow-up (27 to 33 days), and combined the methods of observation, interview and questionnaire. Result: The intervention of behavioral contract law reduced the level of academic procrastination, which means, the frequency of academic procrastination in the follow-up period and the intervention period was lower than that in the baseline period. Conclusion: The behavioral contract method can improve the primary school students' level of academic procrastination, and it has sustained effect.

社交媒体素养对手机依赖的影响：正念和网络自我控制的中介作用

支愧云¹(讯作者) 孙欣欣¹ 杨松瑜¹ 曹莹¹ 黄惠珍¹

1 重庆大学公共管理学院, 重庆, 400044, 通讯作者 E-mail: kyzhi@cqu.edu.cn

摘要 随着社交媒体的普及, 社交媒体对个体身心健康的影响引起学术界的广泛关注。社交媒体素养是个体对社交媒体信息发布过程要素的认知能力。以往研究表明, 社交媒体素养与手机依赖、问题性网络使用等健康危险行为密切相关, 但社交媒体素养与手机依赖的内在作用机制还有待深入探讨。研究采用自编社交媒体素养问卷、网络使用自我控制量表认知分量表、五项正念注意觉知量表(MAAS-5)和手机依赖指数量表(MPAI)中文版对 539 名被试进行调查。结果显示: (1) 社交媒体素养和正念、网络自我控制、手机依赖呈显著正相关; 正念、网络自我控制和手机依赖呈显著负相关; 正念和网络自我控制呈显著正相关; (2) 采用多元层次回归分析方法对正念、网络自我控制在社交媒体素养与手机依赖关系中的链式中介效应进行检验, 其中特定中介效应: 社交媒体素养→正念→手机依赖产生, (Bootstrap 法重复抽取 5000 次) 95% 的区间为[-0.02, 0.01],

中介作用不显著；社交媒体素养→网络自我控制→手机依赖产生 95%的区间为[-0.18, -0.06]，中介作用显著，中介效应值为-0.12；社交媒体素养→正念→网络自我控制→手机依赖产生 95%的区间为[-0.04, -0.001]，中介作用显著，中介效应值为-0.02，故正念、网络自我控制在社交媒体素养与手机依赖关系中起链式中介作用。本研究揭示了社交媒体素养与手机依赖的关系和内在机制，丰富了传统媒体素养的理论，并为社交媒体素养教育应用于手机依赖的预防提供了基本证据。

关键词 社交媒体素养，手机依赖，正念，网络自我控制

Social Media Literacy and Its Relationship with Mobile Phone Dependence: The Mediating Effect of Mindfulness and Self-Control in Internet Use

ZHI Kuiyun, SUN Xinxin, YANG Songyu, CAO Ying, HUANG Huizhen;

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: With the popularity of social media, its impact on physical and mental health have attracted widespread attention. Social media literacy is an individual's cognitive ability to the elements of the social media information publishing process. Previous studies have shown that social media literacy is closely related to health risk behaviors such as mobile phone dependence and questionable internet use, but the internal mechanism of social media literacy and mobile phone dependence deserves further discussion. The study investigated 539 participants with self-designed questionnaire of social media literacy, the cognitive subscale of Internet Usage Self-Control Scale (IUSCS), the 5-items version of Mindful Attention Awareness Scale (MAAS-5) and the Chinese version of Mobile Phone Addiction Index (MPAI). The results show that: (1) There was a significant positive correlation between social media literacy, mindfulness, self-control in internet use and mobile phone dependence; while mindfulness and self-control in internet use were significantly and negatively correlated with mobile phone dependence; mindfulness have been shown to correlate with self-control in internet use positively and significantly; (2) Multiple hierarchical regression analysis was used to test the chain mediating effect of mindfulness and self-control in internet use in the relationship between social media literacy and mobile phone dependence. It is composed of three indirect effects: The 95% confidence interval of social media literacy→mindfulness→mobile phone dependence (Bootstrap repeated extraction 5000 times) is [-0.02, 0.01], and the mediating effect is not significant; The 95% confidence interval of social media literacy→self-control in internet use→mobile phone dependence is [-0.18, -0.06]. The mediating effect is significant, and the mediating effect value is -0.12; The 95% confidence interval of social media literacy→mindfulness→self-control in internet use→mobile phone dependence is [-0.04, -0.001]. The mediating effect is significant, and the mediating effect value is -0.02. Therefore, mindfulness and self-control in internet have chain mediating effect in the relationship between social media literacy and mobile phone dependence. This study reveals the relationship and internal mechanism between social media literacy and mobile phone dependence, enriches the theory of traditional media literacy, and provides basic evidence for the application of social media literacy education in the prevention of mobile phone dependence.

Keywords: Social media literacy, Mobile phone dependence, Mindfulness, Self-control in internet use

加强老年心理学研究的必要性

李怡锦

摘要: 以往关于心理学的科普读物以及相关研究大多是集中在青少年、青年以及中年人等群体。随着近年来医疗技术的不断发展，我国的人均寿命也在不断增加。这意味着我国的老年人在整个人口结构中所占比例将会与日俱增。老年人面临的社会问题也越来越多，例如养老，医疗以及赡养等问题，往往给老年人的心理健康带来打击。而中华民族向来就有着尊老爱老的优良传统，所以老年人的心理健康也不容忽视，我们迫切需

是人生中心必会经历的一个阶段。而老年的健康不仅指物质器官的健康,也包含心理健康。所以在关注老年人心理健康的同时,我们不仅是在关注老年人,其实也是在关注我们自己。老年也易发生心理障碍,例如脑功能衰退和性格变化。因为随着人生阅历的提升,老年人往往会经过更多的困难、例如退休、丧偶、少了子女的陪伴……而性格变化就包括变得固执、易怒、有较大的孤独感……而如果在心理学研究方面也加强对老年心理学的研究,就可以在每一代老年人变老之时进行及时的心理疏导,增强老年人的心理健康,这样就有利于正确处理家庭生活,有利于防止身心疾病,甚至是有利于老年人延缓衰老的到来。而加强老年人心理学的研究,也有助于让子女更为科学地关注老年人的心理健康。特别是近年来兴起的养老行业,对于老年心理学就需要有更进一步的研究。因此老年心理学在我国的研究具有十分重要的意义,有利于营造出一个美丽的社会环境。

关键词: 老年心理学、老年人心理健康、性格变化、社会环境

The necessity of strengthening the research of geriatric psychology

Abstract: In the past, popular science books and related researches on psychology were mostly concentrated on teenagers, young people and middle-aged people. With the continuous development of medical technology in recent years, the life expectancy of our country is also increasing. This means that the proportion of the elderly in the whole population structure will increase day by day. The elderly are facing more and more social problems, such as pension, medical care and support, which often bring a blow to the mental health of the elderly. The Chinese nation has always had a fine tradition of respecting and loving the elderly, so the mental health of the elderly can not be ignored. We urgently need to change the problem that the mental health of the elderly is easily ignored. Whether young people, young people or middle-aged people, they will eventually become old age. Old age is a stage that must be experienced in life. The health of the elderly not only refers to the health of physical organs, but also includes mental health. Therefore, while paying attention to the mental health of the elderly, we are not only paying attention to the elderly, but also paying attention to ourselves. Old age is also prone to psychological disorders, such as brain function decline and personality changes. Because with the improvement of life experience, the elderly often go through more difficulties, such as retirement, widowhood, lack of children's company And character changes include becoming stubborn, irritable, and having a greater sense of loneliness If we also strengthen the research on psychology of the elderly, we can conduct timely psychological counseling when the elderly of each generation get older, and enhance their mental health. This is conducive to correctly handling family life, preventing physical and mental diseases, and even delaying the arrival of aging. Strengthening the research on the psychology of the elderly will also help children pay more scientific attention to the mental health of the elderly. In particular, the rising pension industry in recent years requires further research on geriatric psychology. Therefore, the research of geriatric psychology in China is of great significance, which is conducive to creating a beautiful social environment.

Keywords: geriatric psychology, mental health of the elderly, personality change, social environment

心理适应对务工型流动老年人长期居留意愿的影响： 剩余生活成本的调节作用

王庆娅¹ 支愧云¹ (通讯作者) 安蔚¹ 谭秋蓉¹ 张梓涵¹

¹ 重庆大学公共管理学院, 重庆, 400044 通讯作者 E-mail: kyzhi@cqu.edu.cn

摘 要 随着我国人口老龄化趋势的不断加强, 流动人口中老年人的比重也越来越大。外出务工、养老、家庭随迁是老年人口流动的三大原因, 相比于养老型与随迁型流动老年人而言, 务工型流动老年人的长期居留意愿更低。为探究务工型流动老年人长期居留意愿的心理机制, 本文采用了 2017 年卫计委全国流动人口数据筛

选了 60 周岁以上且流动原因为务工的流动老年人口,有效数据为 928 份,并将其分为城镇户籍 138 份与农村户籍 890 份,利用 process 进行检验。结果表明:(1)城镇户籍务工型流动老年人心理适应的三个维度中,身份认同与长期居留意愿有显著的相关关系($r=0.32^{**}$),行为习惯与歧视感知于长期居留意愿没有显著相关;而农村户籍的务工型流动老年人口身份认同($r=0.348^{**}$)、行为习惯($r=0.108^{**}$)、歧视感知($r=0.136^{**}$)与长期居留意愿均有显著的相关;(2)剩余生活成本在心理适应对城镇户籍的务工型流动老年人的长期居留意愿的关系中起负向调节作用($\beta=-0.8393$, $p<0.01^{**}$);使用 Johnson-Neyman 法对农村户籍务工型流动老年人的剩余生活成本进行简单斜率分析,剩余生活成本在对农村户籍的老年人而言,只正向调节了前半段路径,标准化的取值范围在 $[-1.71, 1.89]$ 时,简单斜率都显著不为 0。结论:剩余生活成本负向调节了城镇户籍务工型流动老年人心理适应对长期居留的关系;对农村户籍而言则是部分路径正向调节了它们的关系。

关键词 流动老年人, 长期居留意愿, 心理适应

The effect of psychological adaptation on long-term residence intention of migrant workers: the moderating effect of residual cost of living

WANG Qingya, ZHI Kuiyun, ANWei, TAN Qiurong, ZHANG Zihan

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: With the increasing trend of population aging in China, the proportion of middle-aged and elderly people in floating population is also increasing. The three main reasons for the flow of the elderly population are migrant workers, pension and family migration. Compared with the elderly and mobile elderly, migrant workers have lower long-term residence intention. In order to explore the psychological mechanism of long-term residence intention of migrant workers, based on the national floating population data of the national health and Family Planning Commission in 2017, this paper selects the floating elderly population over 60 years old who are migrant workers, the valid data were 928, which were divided into 138 urban household registration and 890 rural household registration. The results show that: (1) In the three dimensions of psychological adaptation of migrant elderly with urban household registration, there is a significant correlation between identity and long-term residence intention($r=0.32^{**}$), there was no significant correlation between behavior habit and discrimination perception on long-term residence intention; However, the identity ($r=0.348^{**}$), behavior habits ($r=0.108^{**}$) and discrimination perception ($r=0.136^{**}$) were significantly correlated with long-term residence intention; (2) Residual cost of living negatively moderates the relationship between psychological adaptation and long-term residence intention of migrant elderly with urban household registration ($\beta=-0.8393$, $P < 0.01^{**}$), this paper uses Johnson Neyman method to analyze the residual cost of living of migrant elderly with rural household registration. For the elderly with rural household registration, the residual cost of living only positively adjusts the first half of the path. When the standardized value range is $[-1.71, 1.89]$, the simple slope is not 0. Conclusion: the residual cost of living negatively moderates the relationship between the psychological adaptation of migrant elderly with urban household registration and long-term residence; for rural household registration, it is part of the path that positively regulates their relationship.

公共事务参与与流动老人流入地认同的关系研究

安蔚¹ 支愧云¹ (通讯作者) 林秋韵¹ 谭秋蓉¹ 薛忱恺¹

¹ 重庆大学公共管理学院, 重庆, 400044, kyzhi@cqu.edu.cn

摘要 根据国家卫计委发布的《中国流动人口发展报告 2018》,我国流动老人的规模正快速增加,截止 2015 年,流动老人的数量已达到流动人口总量的 7.2%,流动老人成为越来越需要关注的群体。流入地认同是个体适应流入地环境和主观融入流入地的一个动态过程,主要包括城市认同、身份认同、文化认同以及群体归属感。目的:考察流动老人的流入地认同现状,以及公共事务参与和流动老人流入地认同的关系,为鼓励我

国流动老人积极参与公共事务,提升流动老人流入地认同提供一定借鉴。方法:利用2017年全国流动人口动态监测调查数据,通过多元线性回归模型,分析了公共事务参与对流动老人流入地认同的关系($N=5645$)。结果:流动老人总体的公共事务参与度较低($M=4.519$, $SD=1.173$),流入地认同相对较高($M=25.780$, $SD=3.423$);除文化认同维度外,公共事务参与对流入地认同的各维度均有正向预测作用($\beta=0.03\sim 0.07$, 均 $P<0.05$),其中公共事务参与对提高流动老人城市认同的作用最为突出($\beta=0.07$, $P<0.01$);另外,控制了样本的个人特征、家庭特征以及社区特征后,公共事务参与依然显著预测我国流动老人对流入地的认同。结论:流动老人的公共事务参与度越高,其流入地认同越高。流动老人的个人特征、家庭特征以及社区特征都与流入地认同有显著相关。

关键词 流入地认同, 公共事务参与, 流动老人

Public Affairs Participation and Its Relationship with Identity of In-Migration Areas of the Migrant Elderly

AN Wei, ZHI Kuiyun, LIN Qiuyun, TAN Qiurong, XUE Chenkai

School of Public Affairs, Chongqing University, Chongqing, 400044

Abstract: "Report on the development of migrant population in China 2018" issued by the national health and Family Planning Commission, reports that the scale of China's elderly migrant population is increasing rapidly. As of 2015, the elderly migrants account for 7.2% of the total migrant population, and the migrant elderly have become a group that needs more attention. The identity of in-migration areas is a dynamic process in which an individual adapts to the environment of the in-migration areas and integrates into the in-migration areas subjectively, it mainly includes urban identity, identity, cultural identity and group belonging. Objective: To investigate the identity of in-migration areas of migrant elderly people, and the relationship between the participation in public affairs and the identity of in-migration areas of migrant elderly people, so as to provide some reference for encouraging the migrant elderly people to actively participate in public affairs and enhance their identity of in-migration areas. Methods: Using the data from 2017 China Migrants Dynamic Survey, through multiple linear regression model, this paper analyzes the impact of public affairs participation on migrant elderly identity ($n = 5645$). Results: The participation of the migrant elderly in public affairs was low ($M = 4.519$, $SD = 1.173$), and their identity of in-migration areas was relatively high ($M = 25.780$, $SD = 3.423$); except for the dimension of cultural identity, public affairs participation had a positive predictive effect on other dimensions of identity ($\beta = 0.03-0.07$, all $P < 0.05$), among which public affairs participation played the most prominent role in improving urban identity of migrant elderly ($\beta = 0.07$, $P < 0.01$). In addition, after controlling the sample's personal characteristics, family characteristics and community characteristics, public affairs participation still significantly predicted the identity of in-migration areas of migrant elderly. Conclusion: The higher the participation of migrant elderly in public affairs, the higher their identity of in-migration areas, the personal characteristics, family characteristics and community characteristics of migrant elderly will affect the sample's in-migration areas identity.

Keywords: Identity of In-Migration Areas, Public Affairs Participation, Elderly Migrants

农村老年人的社会排斥体验与健康状况：有调节的中介模型

张登浩 王鸿飞 董妍¹ (通讯作者)

¹ 中国人民大学心理学系, 北京, 100872, dong8958@126.com

摘要 著名社会学家费孝通先生曾用“差序格局”描述了中国传统农业社会中的人际格局。在传统农业社会中,老年人在农村家庭中是享有威望并受到尊重的。但是随着现代经济的发展,越来越多的农村年轻人在外出务工过程中获得了财富、增长了新的见识,老年人的家庭地位逐渐降低,参与的社会角色也越来越少,并面临着一定程度的社会排斥问题。受到社会排斥的老年人会失去对社会的归属感,感受到自己和主流社会发生了分离,进而会产生一系列身心健康问题。本研究基于社会排斥的多元动机模型、负性情绪影响健康的

四通路模型,采用社会排斥体验量表、抑郁-焦虑-压力量表、人际信任量表等测量工具,对覆盖中国 31 个省级行政区(不含港澳台)的农村居民开展社会调查,考察了 1803 名农村老年人社会排斥体验与健康状况的关系,以及负性情绪、人际信任、经济状况在两者中的作用。结果表明,农村老年人的社会排斥体验负向预测其健康状况;负性情绪在农村老年人社会排斥体验和健康状况之间起中介作用;人际信任在农村老年人社会排斥体验和负性情绪之间起调节作用;经济状况在农村老年人负性情绪和健康状况之间起调节作用;整体有调节的中介模型成立。该调查属于大样本调查,且采用了分层多阶段抽样方法,其结论可以推广至全国范围的农村老年人群体。本研究为农村的养老服务体系建设和农村老年人的健康服务工作提供了启示。在农村养老服务体系建设和过程中,应关注遭受社会排斥的老年人群体,采取有效的干预措施减少其社会排斥体验,避免对老年人身心健康造成损害;同时应注重提升农村老年人的人际信任水平,从而缓解社会排斥所带来的消极影响。其次,在农村老年人心理健康实践中,应更多关注老年人的负性情绪体验,从而缓解负性情绪对健康的不利影响。另外,在农村精神文明建设过程中,要引导农村老年人树立健康生活的理念,避免经济状况较好的农村老年人因过度吸烟、饮酒等因素导致的健康问题。

Social Exclusion Experience and Health Condition among the Rural Elders: The Moderated Mediation Model

Denghao Zhang, Hongfei Wang, Yan Dong

Department of Psychology, Renmin University of China, Beijing, 100872

Abstract: Based on the multimotive model of social exclusion and the model of pathways linking affective disturbances to physical disorders, the current study investigated 1803 rural elders from the 31 provinces (excluding Hong Kong, Macao, and Taiwan) in China, in order to test the influence of social exclusion experience on health condition, and the effects of negative emotional states, interpersonal trust, and economic conditions between them. The results showed that (1) social exclusion experience negatively predicted health condition. (2) Negative emotional states mediated social exclusion experience and health condition. (3) Interpersonal trust moderated the link between social exclusion experience and negative emotional states. (4) Economic condition moderated the link between negative emotional states and health condition. The current study not only verifies and extends the two theoretical models but also provides some implications for the construction of rural elderly care and health services.

Keywords: social exclusion, health, negative emotional states, interpersonal trust, rural elders

社区老年人衰弱与生理、心理、社会因素的关系

胥仙红 李彦章* 张玉平 熊梅

成都医学院心理学院, 成都, 610500

摘要 **目的** 调查社区老年人的衰弱情况及考察生理心理社会因素和社区老年人衰弱之间的关系。**方法** 采用方便抽样法,用自编基本情况调查表、Tilburg 衰弱量表(TFI)、简易体能状况量表(SPPB)、简版老年抑郁量表(GDS-15)、日常生活能力量表(ADL),于 2019 年 11 月至 2019 年 12 月对四川省某三个社区 178 名 65 岁及以上的老年人进行调查。采用卡方检验比较衰弱与非衰弱老年人在体能、抑郁、经济状况等方面的差异,用相关分析和二分类 Logistic 回归分析衰弱与不同因素的关系。**结果** (1) 社区老年人的衰弱率为 23%。(2) 社区老年人衰弱组与非衰弱组在肌肉功能、抑郁情况、经济状况和日常生活能力方面存在显著组间差异($P < 0.05$)。(3) 衰弱与抑郁、经济状况和日常生活能力得分均显著正相关,相关系数分别为 0.476 ($P < 0.01$)、0.303 ($P < 0.01$)、0.313 ($P < 0.01$),衰弱与肌肉功能中的椅上起坐测试得分有显著负相关,相关系数为-0.203 ($P < 0.01$)。(4) Logistic 回归分析结果显示,抑郁、经济状况、日常生活能力是影响社区老年人衰弱的重要因素。相较于无抑郁症状、经济状况较好、日常生活能力未受损的老年人,有抑郁症状、经济状况较差、日常生活能力受损的老年人衰弱的 OR 值分别为 4.466 ($P < 0.01$)、2.172 ($P < 0.05$)、0.245 ($P < 0.05$)。**结论** 社区老年人衰弱率较高,并受生理、心理、社会等因素的影响。社区老年人需要在相关专业人员的协助

下从生理心理方面进行自我改善,制定相关政策,加强老年人的社会经济和医疗等保障。以内外结合、多角度入手来改善社区老年人的衰弱状况。为节省医疗开支,提高老年人的自主性,改善其生活质量,需要制定相应的干预措施来预防及管理衰弱。

关键词 社区老年人,衰弱,影响因素

Associations between physical, psychological and social factors and frailty among community-dwelling old adults

XU Xianhong, LI Yanzhang*, Zhang Yuping, Xiong Mei

1 School of Psychology, Chengdu Medical College, Chengdu, 610500

Abstract: **Objective** To investigate the frailty of the elderly in community and the relationship between physiological, psychological and social factors and the frailty of the community-dwelling old adults. **Methods** 178 elderly people aged 65 and above in four communities of Sichuan Province were investigated from November 2019 to December 2019 by using convenient sampling method with self-made general condition scale, Tilburg Frailty Indicator(TFI), Short Physical Performance Battery(SPPB), Geriatric Depression Scale Short-form(GDS-15) and Activities of Daily Living(ADL). Chi-square test was used to compare the differences in physical fitness, depression and economic status between frail and non-frail community-dwelling old adults, and correlation analysis and binary Logistic regression were used to analyze the relationship between frailty and different factors. **Results** (1)The prevalence of frailty among community-dwelling old adults was 23%. (2) There are significant differences in muscle function, depression, economic status and activities of daily living between the frail group and the non-frail group ($P < 0.05$). (3) Frailty has a significant positive correlation with depression, economic status and daily living ability scores, with correlation coefficients of $0.476(P < 0.01)$, $0.303(P < 0.01)$ and $0.313(P < 0.01)$, while frailty has a significant negative correlation with the score of chair sitting-standing test of muscle function, with correlation coefficient of $-0.203(P < 0.01)$ (4)Logistic regression analysis showed that depression, economic status and ability of daily living were the important factors affecting the frailty of the elderly in the community. Compared with the elderly with no depressive symptoms, good economic condition and impaired ADL, the OR values of the elderly with depressive symptoms, poor economic condition and impaired ADL were $4.466(P < 0.01)$, $2.172(P < 0.05)$ and $0.245(P < 0.05)$, respectively. **Conclusion** The frailty rate of the community-dwelling old adults is high, which is influenced by physiological, psychological and social factors. Considering subjective factors, the elderly in community need to improve themselves from physiological and psychological aspects with the help of relevant professionals. From an objective point of view, it is necessary to build social and medical system security, and improve the frailty of the elderly in the community by combining internal and external aspects. Interventions are needed to prevent and manage frailty in order to save medical expenses, increase the autonomy of old adults and improve their quality of life.

Keywords: Community-dwelling old adults, Frailty, Influencing factor

社区老年人抑郁与衰弱的关系：生活满意度的中介作用

杨玉洁,李彦章* 熊梅 张玉平

成都医学院心理学院, 成都, 610500

摘要 **目的:** 考察社区老年人的抑郁和衰弱之间的关系,以及生活满意度在其中的作用,为社区老年衰弱干预提供思路。**方法:** 采用自编一般情况调查问卷、Tilburg 衰弱量表(TFI)、老年抑郁表简版(GDS-15)和生活满意度量表(SWLS)对 180 名成都市 65 岁及以上的街道社区老年人进行调查。统计方法使用描述统计,相关分析,回归分析和中介效应检验。**结果:** ①社区老年人的抑郁总分为 (5.61 ± 1.960) , 抑郁检出率为 43.9%,社区老年人的衰弱总分为 (3.21 ± 2.72) , 衰弱发生率为 23.3%。②社区老年人抑郁和衰弱总分($r = 0.50, p < 0.01$)、以及身体衰弱($r = 0.44, p < 0.01$)和心理衰弱($r = 0.39, p < 0.01$)呈显著正相关,而抑郁和生活满意度呈显著负相关($r = -0.28, p < 0.01$), 衰弱和生活满意度呈显著负相关($r = -0.31, p < 0.01$)。③社区老年人抑郁得

分对衰弱得分的正向预测作用显著($\beta = 0.50, t = 7.50, p < 0.01$), 且当放入生活满意度做中介变量后, 抑郁对衰弱的直接预测作用依然显著 ($\beta = 0.46, t = 6.66, p < 0.01$), 抑郁对生活满意度的负向预测作用显著($\beta = -0.25, t = -3.36, p < 0.01$), 生活满意度对衰弱的负向预测作用也显著($\beta = -0.21, t = -3.20, p < 0.01$); **结论:** ①社区老年人的抑郁和衰弱检出率较高, 应当予以重视; ②社区老年人衰弱情况受到抑郁和生活满意度的影响, 抑郁不仅能够直接影响衰弱, 还能够通过生活满意度的中介作用影响衰弱。未来对社区老年人的衰弱干预应当与抑郁干预结合, 还要考虑提高老年人的生活满意度。

关键词: 社区老年人; 抑郁; 衰弱; 生活满意度

The relationship between depression and frailty in the community-dwelling old adults: a mediate role of life satisfaction

Yang Yujie, Li Yanzhang*, Xiong Mei, Zhang Yuping

School of Psychology, Chengdu Medical College, Chengdu

Abstract: **Objective:** To investigate the relationship between depression and frailty in the elderly in the community, and the role of life satisfaction in it, and provide ideas for community elderly frail intervention. **Method:** A total of 180 community-dwelling older adults aged 65 years and above in Chengdu city were investigated by self-made general survey questionnaire, Tilburg Frailty Indicator (TFI), Geriatric Depression Scale Short-form(GDS-15), and Satisfaction With Life Scale(SWLS). The statistical methods used descriptive statistics, correlation analysis, regression analysis and mediation effect test. **Results:** ① The total score of depression for the elderly in the community was (5.61 ± 1.960) , the incidence of depressive symptoms was 43.9%, and the total score of frailty for the elderly in the community (3.21 ± 2.72) , the incidence of frailty was 23.3%. ② There is a significant correlation between the depression score and the frailty score of the elderly in the community ($r = 0.50, p < 0.01$), and the depression score has a significant positive correlation with the physical frailty ($r = 0.44, p < 0.01$) and mental frailty ($r = 0.39, p < 0.01$) in the frailty dimension. There is a significant negative correlation between depression score and life satisfaction score ($r = -0.28, p < 0.01$), and there is a significant negative correlation between frailty score and life satisfaction score ($r = -0.31, p < 0.01$). ③ The depression of the elderly in the community had a significant predictive effect on frailty ($\beta = 0.50, t = 7.50, p < 0.01$), and when life satisfaction is added as an intermediary variable, the direct predictive effect of depression on frailty is still significant ($\beta = 0.46, t = 6.66, p < 0.01$), and the negative predictive effect of depression on life satisfaction is significant($\beta = -0.25, t = -3.36, p < 0.01$), life satisfaction has a significant negative predictive effect on frailty ($\beta = -0.21, t = -3.20, p < 0.01$). **Conclusion:** ①The detection rate of depression and frailty among the elderly in the community is very high and should be taken seriously; ②The frailty of the elderly in the community is affected by depression and life satisfaction. Depression can not only directly affect frailty, but also through life satisfaction. In the future, debilitating interventions for the elderly in the community should be combined with depression interventions, and consideration should be given to improving the life satisfaction of the elderly.

主动参与公益活动与流动老人心理融入的关系： 歧视知觉和接纳知觉的中介作用

林秋韵¹ 支愧云¹ (通讯作者) 王庆娅¹ 王兵¹ 宗雪琴¹

¹ 重庆大学公共管理学院, 重庆, 400044, kyshi@cqu.edu.cn

摘要 近年来流动老人数量持续增长, 但心理融入普遍处于较低水平, 吸引越来越多学者的关注。已有研究表明, 社会参与度低或感知到歧视、排斥均会导致流动人口心理融入失败, 这可能与沟通交流的缺乏和刻板印象的存在有关。通过提供良性互动的机会, 公益活动参与可能改变流动老人对本地人态度的感知, 利于其心理融入。本研究利用 2017 年全国流动人口动态监测调查数据, 以 5705 位流动老人为研究对象, 构建链

式中介模型,探讨主动参与公益活动与流动老人心理融入的关系及其作用机制。结果表明:(1)主动参与公益活动与流动老人歧视知觉呈显著负相关,与接纳知觉、心理融入呈显著正相关;(2)歧视知觉和接纳知觉在主动参与公益活动与心理融入间起中介作用,且该中介作用包含三条路径:歧视知觉的单独中介作用显著,中介效应值为0.003;接纳知觉的单独中介作用显著,中介效应值为0.052;歧视知觉-接纳知觉的链式中介作用显著,中介效应值为0.007。这一发现表明主动参与公益活动可通过影响流动老人的歧视知觉和接纳知觉来促进其心理融入,为提高流动老人心理融入水平的相关干预提供了实证依据。未来应重视提高流动老人参与公益活动的积极性,增进其与本地居民的交流,改变其对本地居民态度的错误认知,以加快流动老人的社会融入进程。

The Relationship between Active Participation in Public Benefit Activity and Psychological Integration of Migrant Elderly People: The Mediating Effects of Stigma Perception and Acceptance Perception

LIN Qiuyun, ZHI Kuiyun, WANG Qingya, WANG Bing, ZONG Xueqin

School of Public Affairs, Chongqing University, Chongqing 400044, China

Abstract: In recent years, the number of migrant elderly people has continued to increase, but their psychological integration is generally at a low level, attracting more and more scholars' attention. Studies have shown that not only low social participation but also perceived discrimination or exclusion led to the failure of the migrant population's psychological integration. This may due to the lack of communication and the existence of stereotypes. By providing opportunities for benign interaction, participation in public benefit activities may change the perception of elderly migrants' attitudes towards locals, therefore facilitating their psychological integration. Using the data from 2017 China Migrants Dynamic Survey, a serial mediation model was conducted to examine the mediating role of stigma perception and acceptance perception in the relation between active participation in public benefit activity and psychological integration in a sample of 5705 migrant elderly people. The main findings of this study were as follows: (1) Active participation in public benefit activities was significantly negatively correlated with elderly migrants' stigma perception, and significantly positively correlated with acceptance perception and psychological integration. (2) Mediation analysis revealed that active participation in public benefit activity affected psychological integration through the mediation of stigma perception and acceptance perception. The mediating effect included three paths: Firstly, the separate mediating effect of stigma perception was significant, with a mediating effect value of 0.003. Secondly, the separate mediating effect of acceptance perception was significant, with a mediating effect value of 0.052. Thirdly, the chain mediating effect of stigma perception - acceptance perception was significant, with a mediating effect value of 0.007. These findings show that the active participation of migrant elderly people in public benefit activity can promote psychological integration by changing their stigma perception and acceptance perception, providing empirical evidence for interventions to improve the level of psychological integration of elderly migrants. It suggests that in the future, attention should be paid to increasing the enthusiasm of migrant elderly people in participation in public benefit activities, enhancing their communication with local residents, and changing their misperceptions about the attitudes of local residents, so as to speed up the process of social integration of migrant elderly people.

3 长江大学教育与体育学院, 荆州, 434023

摘要 背景: 家庭与学校作为青少年成长的重要场所, 其保护性作用的重要性不言而喻。以往有研究者提出, 不同保护性因子之间可能存在交互作用, 并根据作用方向的不同, 提出了“保护假说”与“排除假说”两种观点。然而, 据我们所知目前在网络受欺负领域, 仍未有研究将家庭与学校两个方面的保护性因素同时纳入。因此家庭、学校与网络受欺负之间联系的内部机制在很大程度上仍是未知的。本研究首次结合积极感知学校氛围探讨亲子关系与网络受欺负的中介与调节机制, 以便未来有针对性地增加青少年成长过程中的保护性因素, 减少网络受欺负。**方法:** 采用《亲子关系问卷》、《青少年学生心理资本问卷》、《网络受欺负量表》及《校园氛围问卷》在湖北省和福建省两地, 选取总共 4 所中学的 1340 名中学生进行问卷调查。采用 SPSS 的宏 PROCESS 进行数据处理。**结果:** (1) 亲子关系显著负向预测网络受欺负; (2) 偏差校正的百分位 Bootstrap 中介效应检验表明, 心理资本在亲子关系与网络受欺负之间起部分中介作用; (3) 中介作用后半段受到积极感知学校氛围的调节。具体而言, 当个体积极感知学校氛围较高时, 亲子关系通过心理资本对网络受欺负的负向预测作用不显著, 只有在中低积极感知学校氛围的情况下, 亲子关系才能通过心理资本负向预测网络受欺负。**结论:** 较高水平的亲子关系不仅直接预测了较低的网络受欺负, 还能通过提高心理资本间接降低青少年网络受欺负, 并且这种间接效应受到感知学校氛围的调节。本研究结果支持了“保护因子—保护因子模型”的排除假说, 表明在网络受欺负的影响机制中, 家庭与学校的关系可能是“美不胜收”, 即良好的亲子关系可以降低网络受欺负风险, 而对于亲子关系不良的学生, 同样可以通过提升其积极感知学校氛围减少网络受欺负。该结果不仅有利于揭示亲子关系与网络受欺负的关系与内部心理机制, 且对网络受欺负的干预实践, 维护青少年良好成长环境有着建设性意义。

1 Key Laboratory of Adolescent Cyberpsychology and Behavior, School of Psychology, Central China Normal University, Wuhan, 430070

2 Key Laboratory of Adolescent Cyberpsychology and Behavior, School of Psychology, Central China Normal University, Wuhan, 430070, zhouzk@yahoo.com

3 School of Education and Physical Education, Yangtze University, Jingzhou, 434023

Abstract: Background: Family and school are important for teenagers, and their protective role is self-evident. Previous studies have suggested that there is an interaction between different protective factors, which are divided into two viewpoints according to the different directions of interaction: ‘conservation hypothesis’ and ‘exclusion hypothesis’. As far as we know, no studies have included both family and school protective factors in the field of cyberbullying victimization. So, the internal mechanism of the association between family, school and cyberbullying victimization remains largely unknown. This study is the first to explore the mediating and regulating mechanism

between parent-child relationship and cyberbullying victimization in combination with positive perceived school climate, so as to increase the protective factors and reduce cyberbullying victimization. **Methods:** In this study, questionnaires including the perceived school climate scale, the revised cyberbullying victimization inventory, the adolescent psychological resource scale, and the parent-child relationship scale were administrated to 1340 junior high school students in Hubei and Fujian province. Data were collected and analyzed with SPSS 23.0 and SPSS macro PROCESS. **Results:** (1) Parent-child relationship significantly negatively predicted cyberbullying victimization; (2) The mediation effect test results of the bias-corrected percentile Bootstrap method showed that psychological resource played a partial mediating role between parent-child relationship and cyberbullying victimization; (3) The mediating effect of psychological resource were regulated by positive perceived school climate. Specifically, when the positive perceived school climate was high, the negative prediction effect of parent-child relationship on cyberbullying victimization through psychological resource was not significant. Only in the middle and low positive perceived school climate, the mediating effect was significant. **Conclusion:** High parent-child relationship not only directly predicted less cyberbullying victimization, but also indirectly reduced cyberbullying victimization by increasing psychological resource. The indirect effect is moderated by perceived school climate. These results supported the 'exclusion hypothesis': High parent-child relationship can reduce the risk of cyberbullying victimization, and for students with poor parent-child relationship, it can also reduce cyberbullying by improving the perceived school climate. The results are not only helpful to reveal the relationship and the underlying psychological mechanism between parent-child relationship and cyberbullying victimization, which is of constructive significance to interfere with cyberbullying victimization and to guide teenagers to use the Internet healthily.

女性青少年网络约会虐待受害与睡眠质量：破碎假设理论的视角

王宏霞¹ 耿靖宇¹ 雷雳² (通讯作者)

¹ 中国人民大学理学院心理学系, 北京, 100872

² 中国人民大学教育学院, 北京 100872, dr.leili@qq.com

摘要 在青春期, 开始恋爱关系是一项正常的发展任务, 但技术的进步加速了青少年不健康的交往方式。网络约会虐待受害与女性青少年生理健康之间的关系在很大程度上是一个被忽视的全球健康问题。本研究从破碎假设理论的视角出发, 探讨了网络约会虐待通过公正世界信念和自尊的中介作用与睡眠质量的关系。此外, 我们还探讨了独生子女状况在网络约会虐待与睡眠质量之间的直接和间接联系中的调节作用。以 420 名中国女性青少年为研究对象, 采用网络约会虐待问卷、公正世界信念量表、罗森伯格自尊量表和中文版匹兹堡睡眠质量指数量表进行调查。结果表明, 网络约会虐待受害与睡眠质量呈正相关关系, 且公正世界信念和自尊在这个关系中起中介作用。此外, 独生子女状况调节了网络约会虐待受害与公正世界信念和睡眠质量之间的关系。独生子女家庭女性青少年网络约会虐待和睡眠质量之间的关系强于非独生子女家庭女性青少年。而公正世界信念在网络约会虐待受害与睡眠质量之间的中介作用仅在非独生子女女性青少年中显著。本研究首次从破碎假设理论的角度探讨了中国女性青少年网络约会虐待受害与睡眠质量之间的关系, 未来研究应进一步关注如何改善遭受网络约会虐待的女性青少年的世界观假设、自我评价和睡眠问题。

Cyber dating abuse victimization and sleep quality among female adolescents: A perspective of shattered assumption theory

Hongxia Wang¹, Jingyu Geng¹, Li Lei^{2,*}

¹Department of Psychology, Renmin University of China, China

²School of Education, Renmin University of China, China

Abstract: The relevance between cyber dating abuse victimization (CDAV) and female adolescents' physical

problems is a largely ignored global health issue. From the perspective of shattered assumption theory (SAT), the current study explored how CDAV is related to sleep quality (SQ) through the mediating roles of belief in a just world (BJW) and self-esteem (SE). Additionally, we also investigated the moderating role of only-child status in the direct and indirect link between CDAV and SQ. A total of 420 Chinese female adolescents were included and administered multiple scales, including the cyber dating abuse questionnaire, belief in just world scale, Rosenberg self-esteem scale and Chinese version of the Pittsburgh Sleep Quality Index. The results indicated a positive relationship between CDAV and SQ, which was mediated by BJW and SE. Besides, only-child status moderated the link between CDAV and BJW and SQ. Specifically, the positive correlation between CDAV and SQ was stronger for female adolescents from only-child families than those from non only-child families. Surprisingly, the mediating role of BJW in the relationship between CDAV and SQ only exist among non only-child female adolescents. These results provide a first insight into the association between CDAV and SQ among Chinese female adolescents from an perspective of SAT. More attention should be given to improve female adolescents world assumptions, self-assessment and sleep problems after being abused.

Keywords: Cyber dating abuse victimization, Belief in a just world, Self-esteem, Sleep quality, only-child

青少年线上自我表露能加剧父母心理控制与网络受欺负的关系吗？ 核心自我评价的中介作用

耿靖宇¹ 王宏霞¹ 雷雳² (通讯作者)

1 中国人民大学心理学系, 北京, 100872

2 中国人民大学教育学院, 北京, 100872, dr.leili@qq.com

摘 要 网络欺负是一种普遍存在的破坏性的网络偏差行为。遭受网络欺负能够导致个体产生严重的内化问题和外化问题。考虑到网络受欺负在青少年群体中的普遍性和危害性, 本研究旨在探讨网络受欺负的风险因素和保护因素。已有研究发现父母对青少年行为方面的监控和干预有助于青少年网络受欺负的减少, 而父母对青少年的心理控制对其网络受欺负的影响尚不清楚, 因此本研究考察了父母心理控制对青少年网络受欺负的影响。为了进一步探索这种影响机制, 本研究基于相关理论和实证证据, 探究了父母心理控制对青少年网络受欺负的影响机制, 将核心自我评价作为中介因素, 线上自我表露作为调节因素进行了考察。821 名青少年 (男孩占 51.0%, 年龄 $M = 13.11$, $SD = 1.19$) 完成了中文版的父母控制问卷、网络受欺负问卷、线上自我表露分量表和核心自我评价量表。相关分析表明, 父亲心理控制、母亲心理控制、网络受欺负和线上自我表露间呈显著两两正相关; 父亲心理控制、母亲心理控制和网络受欺负分别于核心自我评价呈现正相关; 另外, 线上自我表露与核心自我评价无显著相关。模型检验表明, 核心自我评价在父亲心理控制与网络受欺负之间其完全中介作用, 而在母亲心理控制与网络受欺负之间起部分中介作用。调节效应检验发现, 线上自我表露能够加强母亲心理控制与网络受欺负之间的直接关系。也能够增强核心自我评价在母亲心理控制与网络受欺负之间的中介作用以及在父母心理控制与网络受欺负之间的中介作用。本研究的结果揭示了对于减少青少年网络受欺负的干预措施需要聚焦于减少青少年的线上自我表露、促进积极核心自我评价的建立, 以此降低青少年在遭受父母心理控制后可能遭受网络欺负的可能性。

关键词 父母心理控制, 核心自我评价, 网络受欺负, 线上自我表露, 有调节的中介模型

Does online self-disclosure aggravate cyberbullying victimization after suffering parental psychological control?

The mediating role of core self-evaluations

Jingyu Geng¹, Hongxia Wang¹, Li Lei²

1 Department of Psychology, Renmin University of China, No. 59 Zhongguancun Street, Haidian District, Beijing 100872, China

2 School of Education, Renmin University of China, No. 59 Zhongguancun Street, Haidian District, Beijing 100872, China

Abstract: Given the high prevalence and significant harmful implications of cyberbullying victimization, a growing number of studies focused on the risk and protective factors of cyberbullying victimization. However, the association and underlying mechanisms of parental psychological control with adolescent cyberbullying victimization are still unclear. To fill these gaps, based on self-determination theory, this study aimed to explore the relationship between parental psychological control and cyberbullying victimization and the mediating role of core self-evaluations and moderating role of online self-disclosure in this relation. The present study recruited 821 Chinese middle school students (51.0% boys; mean age = 13.11, SD = 1.19) to completed questionnaires on parental psychological control, core self-evaluations, cyberbullying victimization, and online self-disclosure. Correlation analysis indicated that paternal psychological control and maternal psychological control were positively associated with adolescent cyberbullying victimization. Mediation analysis revealed that core self-evaluations completely mediates the relationship between paternal psychological control and cyberbullying victimization, and partially mediates the relationship between maternal psychological control and cyberbullying victimization. Moderated mediation analysis provided that online self-disclosure strengthens the direct associations of maternal psychological control and core self-evaluations with cyberbullying victimization, and further aggregates the indirect associations of paternal psychological control and maternal psychological control via mediating effect of core self-evaluations. The current results revealed that interventions focused on decreasing online self-disclosure and promoting core self-evaluations can alleviate the risk of cyberbullying victimization among adolescents suffering parental psychological control.

摘要 以往研究表明, 青少年感知的校园氛围对其网络欺负行为有重要影响。但是, 校园氛围对青少年网络欺负的内在影响机制, 以及积极的校园氛围(学校因素)、心理资本(个体因素)和友谊质量(同伴因素)等不同类型的保护性因素在青少年网络欺负中的作用还有待进一步探讨。本研究基于生态系统理论, 在整合“情境—过程—结果模型”和“保护因子—保护因子模型”的基础上提出一个有调节的中介模型, 考察了青少年感知的校园氛围与网络欺负的关系, 以及心理资本的中介作用和友谊质量的调节作用。以湖北省和福建省4所中学的1320名青少年作为研究对象, 采用校园氛围感知问卷、心理资本问卷、友谊质量问卷和网络欺负问卷进行问卷调查。结果表明: (1) 在控制了性别、年级、工作日和节假日日均上网时长后, 积极的校园氛围显著负向预测青少年的网络欺负。(2) 心理资本在校园氛围与青少年网络欺负的关系中起部分中介作用。

(3) 校园氛围影响青少年网络欺负的间接效应的前半段路径受到友谊质量的调节。具体来说,在友谊质量较高或较低水平的青少年群体中,校园氛围对心理资本的正向预测作用均显著,但在友谊质量较高的青少年群体中校园氛围对心理资本的正向预测作用更强。研究结果有助于了解校园氛围对青少年网络欺负的作用机制,厘清不同类型的保护性因素在青少年网络欺负中所起的作用,对预防以及减少青少年网络欺负具有一定的现实意义。

Abstract: Previous studies have documented that perceived positive school climate is associated with adolescents' cyberbullying. However, the mechanism of school climate on adolescent cyberbullying, and the role of different types of protective factors such as positive school climate, psychological capital and friendship quality in youth cyberbullying remain to be further explored. According to the ecological systems theory, the "context-process-outcomes model" and the "protective-protective model", the present study constructed a moderated mediation model to examine whether psychological capital mediated the relationship between school climate and adolescent cyberbullying, and whether this mediating process was moderated by friendship quality. A total of 1320 adolescents (mean age = 13.86 years, SD = 1.64) from 4 schools of Hubei province and Fujian province were invited to take part in this study. Participants anonymously completed Perception of School Climate Questionnaire, Psychological Capital Questionnaire, Friendship Quality Questionnaire, and Cyberbullying Questionnaire. Results showed that: (1) After controlling for gender, grade, and average daily online hours on weekdays and holidays, positive school climate negatively predicted adolescent cyberbullying. (2) Psychological capital partially mediated the relationship between school climate and adolescents' cyberbullying. (3) The first half of the mediating effects of "school climate—psychological capital—cyberbullying" was moderated by Friendship quality. Specifically, the positive prediction effect of school climate on psychological capital was much stronger for individuals with high friendship quality compared to those with low friendship quality. The results revealed the mechanism of school climate on adolescent cyberbullying, and the role of different types of protective factors in adolescent cyberbullying. It suggests that the school administrators and educators should pay attention to the important role of school climate, psychological capital and friendship quality in adolescent cyberbullying, which can contribute to the prevention of cyberbullying.

Keywords: school climate, cyberbullying, psychological capital, friendship quality, adolescents

亲子关系与青少年网络欺负行为: 友谊质量与心理资本的序列中介效应

摘要 随着智能手机和计算机网络的普及,网络欺负作为一种新的欺负行为日渐增多。网络欺负会给青少

年的成长带来一系列负面影响,迫切需要学校采取相应的干预措施。家庭环境因素会对青少年网络欺负行为产生重要影响,其中缺乏良好的亲子关系更容易导致问题行为。同时处于青春期的个体,友谊质量对其的影响也日益增强。青少年知觉到的亲子关系会影响其对友谊质量的知觉,进而影响个体的发展。然而,亲子关系、友谊质量作为个体的外部因素,不一定能直接作用于外部行为,会借助其他个体内部因素发挥一定的作用,其中心理资本就是一个重要的个体内部因素。因此,本研究拟探讨亲子关系对青少年网络欺负行为的预测作用及其内部作用机制,在生态系统理论、依恋理论和一般攻击模型的基础上,建构了一个序列中介效应模型,考察青少年友谊质量和心理资本的中介作用。研究采用亲子关系量表、友谊质量量表、心理资本量表和网络欺负量表,对湖北省和福建省4所中学的1320名青少年进行问卷调查,研究结果发现:(1)亲子关系、友谊质量、心理资本和网络欺负之间两两相关显著;(2)亲子关系显著负向预测青少年网络欺负行为;(3)友谊质量和心理资本在亲子关系与青少年网络欺负行为之间起序列中介作用,具体而言,亲子关系通过两条路径影响青少年网络欺负行为,一是心理资本的单独中介作用;二是友谊质量和心理资本的链式中介作用。本研究验证了家庭系统(亲子关系)、同伴系统(友谊质量)和个人系统(心理资本)对青少年网络欺负行为的联合作用,为从家庭、同伴和个体层面预防和干预青少年网络欺负行为提供了参考。

Parent-child Relationship and Cyberbullying in Adolescents: A Serial Mediation Effect of Friendship Quality and Psychological Capital

Hu Yang^{1,2,3}, Shi Huifen^{1,2}, Zhou Ting^{1,2,4}, Niu Gengfeng^{1,2}, Fan Cuiying^{1,2}

1 Key Laboratory of Adolescent Cyberpsychology and Behavior, Wuhan, 430079

2 School of Psychology, Central China Normal University, Wuhan, 430070

3 Hubei Preschool Teachers College, Ezhou, 436032

4 School of Education and Sports Science, Yangtze University, Jingzhou, 434023

Abstract: With the popularity of smartphones and computer networks, cyberbullying as a new form of bullying is increasing. Cyberbullying has a series of negative effects on the development of adolescents, so there is an urgent need for appropriate interventions in schools. Family factors have an important impact on cyberbullying, among which the lack of a good parent-child relationship is more likely to lead to problem behavior in adolescents. At the same time, for adolescents, the impact of friendship quality on them is also increasing. Adolescents' perceived parent-child relationship will affect their perception of friendship quality, and then affect their development. However, parent-child relationship and friendship quality are external factors, which may not directly affect individuals' behaviors, but they can play a role with the help of other internal factors of individuals, among which psychological capital is an important internal factor of individuals. Therefore, this study aims to explore the mechanism between the parent-child relationship and cyberbullying in adolescents. Based on the ecological systems theory, attachment theory, and general aggression model, a serial mediating effect model is constructed to investigate the mediating role of friendship quality and psychological capital. A sample of 1320 adolescents from 4 schools in Hubei and Fujian provinces completed the Parent-child Relationship Scale, Friendship Quality Scale, Psychological Capital Scale and Revised Cyber Bullying Inventory. The results showed that: (1) Parent-child relationship, friendship quality, psychological capital and cyberbullying were significantly correlated with each other; (2) Parent-child relationship can significantly negatively predict cyberbullying in adolescents; (3) Friendship quality and psychological capital played mediating roles between parent-child relationship and cyberbullying in adolescents. In particular, parent-child relationship affected cyberbullying through two paths: the separate mediation effect of psychological capital, and the chain mediation effect of friendship quality and psychological capital. This study validates the combined influence of family factors, peer factors, and individual factors on cyberbullying in adolescents, which provide a reference for the prevention and intervention of cyberbullying.

Keywords: parent-child relationship, cyberbullying, friendship quality, psychological capital, adolescents

SEL 教育变革视角下疫期大学生孤独感与网络欺负行为的关系 及干预对策探析

方勇^{1,2,3} 范翠英^{1,2} (通讯作者) 崔佳^{1,2} 陈红^{1,2} 周婷^{1,2}

1 青少年网络心理与行为教育部重点实验室, 武汉, 430079

2 华中师范大学心理学院, 武汉, 430079

3 湖北中医药大学护理学院, 武汉, 430065

摘要 为考察疫期大学生孤独感与网络欺负行为之间的关系, 采用孤独感量表、网络欺负量表对 1125 名大学生进行测量。结果发现: 孤独感、网络欺负、网络受欺负三者之间两两正相关; 孤独感能显著地正向预测网络欺负行为; 只有网络受欺负水平高的大学学生的孤独感才能显著预测网络欺负行为, 即网络受欺负调节孤独感与网络欺负行为的关系。社会情感学习 (SEL) 是当前教育变革的重要价值取向, 在此视角下针对疫期大学生孤独感与网络欺负行为的关系而提出了一些干预对策。

An Analysis of the Relationship between Loneliness and Cyberbullying among College Students and Its Intervention Countermeasures in Epidemic Period from the Perspective of SEL Education Reform

Fang Yong^{1,2,3}, Fan Cuiying^{1,2}, Cui Jia^{1,2}, Chen Hong^{1,2}, Zhou Ting^{1,2}

1. Key Laboratory of Adolescent CyberPsychology and Behavior (CCNU), Ministry of Education, Wuhan, 430079

2. School of Psychology, Central China Normal University, Wuhan, 430079

3. School of Nursing, Hubei University of Chinese Medicine, Wuhan, 430065

Abstract: In order to investigate the relationship between loneliness and cyberbullying, 1125 college students were measured by the Loneliness Scale and Cyberbullying Scale. The results showed that loneliness, cyberbullying and cybervictimization were positively correlated with each other. Loneliness can significantly predict cyberbullying behavior. Only the loneliness of college students with high level of cybervictimization can predict the cyberbullying significantly, that is, the cybervictimization moderates the relationship between loneliness and cyberbullying. Social emotional learning (SEL) is an important orientation of education revolution in modern world. From this perspective, some intervention countermeasures are proposed for the relationship between loneliness and cyberbullying of college students during the epidemic period.

问题性手机使用与青少年焦虑的关系: 核心自我评价和积极应对的作用

魏新益¹ 雷雳² (通讯作者)

1 中国人民大学心理系, 北京, 100872

2 中国人民大学教育学院, 北京, 100872, dr.leili@qq.com

摘要 越来越多的研究表明, 问题性手机使用 (PSU) 与包括焦虑在内的情绪健康问题有关。然而, 一些研究并没有发现这种联系或发现这种联系存在个体差异。通过文献回顾, 我们发现青少年核心自我评价 (CSE) 和积极应对 (PC) 可能分别是 PSU 和焦虑之间联系的关键的中介变量和调节变量。通过相对无偏的参数估计方法——潜调节结构方程建模, 我们使用 428 名青少年的数据 (年龄 = 15.27±1.27 岁) 检验了我们的理论模

型。青少年完成了自我报告调查,包括 PSU、CSE、焦虑、PC 等。在控制了性别、年级和家庭所在地后,结果发现:(1) PSU 与焦虑相关不显著;(2) CSE 完全中介了 PSU 与焦虑之间的联系;(3) 积极应对调节了所有三条路径。也就是说,当青少年积极应对水平较高(而非较低)时,PSU 与焦虑显著正相关。然而,当青少年积极应对水平较低(而非较高)时,PSU 通过 CSE 与焦虑显著正相关;(4) 通过计算调节的总效应,我们发现总体而言较高(而非较低)的积极应对增强了 PSU 与焦虑的联系。这些发现进一步加深了对问题性手机使用期间青少年情绪症状形成过程的理解,为有效干预青少年情绪健康问题带来了启发。

Problematic Smartphone Use and Adolescent Anxiety: The Roles of Core Self-Evaluation and Positive Coping

Xinyi Wei, Li Lei

Renmin University of China, No. 59, Zhongguancun Street, Haidian District, Beijing

Abstract: An increasing number of studies have documented problematic smartphone use (PSU) was linked to emotional health problems including anxiety. However, some studies have not found this link or found that there are individual differences in this link. By reviewing the literature, we assume that adolescent core self-evaluation (CSE) and positive coping (PC) may be critical mediating and moderating variables respectively. By Latent Moderated Structural Equations (LMS), which generate relatively unbiased parameter estimations, we examined our theoretical model with 428 adolescents (Mage = 15.27 years, SD = 1.27). Adolescents completed self-reported surveys, including PSU, CSE, anxiety, PC, and so on. After controlling for gender, grade, and family location, results found that: (a) PSU wasn't associated with anxiety. (b) CSE fully mediated the link between PSU and anxiety. (c) PC moderated the link between all three paths. That is, PSU associated with anxiety when individuals with higher (vs. lower) PC. However, PSU associated with anxiety through CSE when individuals with lower (vs. higher) PC. (d) by calculating the moderated total effect, we found that higher (vs. lower) positive coping promoted the effect of PSU on anxiety. These findings further deepen the understanding of the formation process of emotional symptoms during PSU and provide insights for the effective intervention of adolescent emotional health problems.

Keywords: Adolescents. Problematic smartphone use. Core self-evaluation. Anxiety. Positive coping

网络疑病症与青少年心理健康：不安全感的中介作用

刘宇潇 周宗奎（通讯作者）

青少年网络心理与行为教育部重点实验室, 武汉, 430079, zhouzk@mail.ccnu.edu.cn

摘要 网络疑病症是指由于反复进行有关医疗信息的在线检索而导致个体过度关心自身身体健康的临床现象。鉴于新冠疫情对于个体的影响十分严重与深远,本研究拟在后疫情时代背景下探讨网络疑病症是否以及如何影响青少年的心理健康。基于心理健康的双因素模型,选取幸福感与抑郁作为心理健康指标。依据健康信念模型与需要层次理论以及以往的实证研究,考察了不安全感在网络疑病症与心理健康之间的中介作用。本研究以 1108 名中学生与大学生为被试(年龄范围 12-23 岁,平均年龄 16.78 岁,标准差 3.42; 32.5%男生),通过网络问卷进行调查。采用《网络疑病症量表》、《安全感量表》、《主观幸福感量表》和《流调中心用抑郁量表》对核心变量进行测量。在控制了人口学变量、手机成瘾、压力和 COVID-19 焦虑后,路径分析结果表明:(1) 在控制了一系列协变量后,网络疑病症水平高的个体抑郁水平较高,主观幸福感水平较低;(2) 网络疑病症会通过个体安全感的降低,进而增加其心理健康问题的风险,降低其幸福感水平。因此,本研究结果揭示了网络疑病症作为后疫情时代的重要公共卫生问题对青少年心理健康产生的不利影响,本研究中介检验结果进一步阐明了心理不安全感在这一过程中的重要中介作用。具体而言,网络疑病症水平高的个体过度担心自身健康状况,在疫情的影响下他们倾向于认为周围环境是不可控的,自身的安全感得不到保障,安全需要难以满足,这最终会影响他们的心理健康。通过识别网络疑病症对心理健康的潜在影响及个体自身安全感在其中的潜在机制,本研究为后疫情时代青少年心理健康的预防与干预提出了具有可塑性的目标。

关键词 COVID-19, 网络疑病症, 不安全感, 幸福感, 抑郁

Cyberchondria and mental health among adolescents: The mediating role of insecurity

Yuxiao Liu, Zongkui Zhou

Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan

Abstract: Cyberchondria refers to the clinical phenomenon in which repeated Internet searches regarding health information result in excessive concerns about their own physical health. Given that the serious and far-reaching impact of the COVID-19 outbreak on individuals, this study is intended to explore whether and how Cyberchondria affect the mental health of adolescents in the context of the post-epidemic era. Based on the dual-factor model of mental health, chose both well-being and mental illness (depression) as our mental health indicators. According to the health belief model and hierarchical theory of needs as well as previous empirical research, the mediating role of insecurity between cyberchondria and mental health were investigated. A total of 1,108 middle school students and undergraduates (age ranged 12 to 23 years, $M_{age} = 16.78$ years, $SD = 0.89$; 32.5% male) through an online survey. The study variables were measured by the Short Cyberchondria Scale, the Security Questionnaire, the Subjective Well-Being Index, Center for Epidemiological Studies Depression Scale. The covariates (i.e., demographic variables, smartphone addiction, stress, and COVID-19 anxiety) were held constant in each analysis. The results of path analysis show that: (1) after controlling a series of covariates, individual who reported higher level of cyberchondria showed higher levels of depressive symptoms and lower levels of subjective well-being, and (2) psychological insecurity mediated the relationship between Cyberchondria and mental health (both well-being and depressive symptoms). Therefore, the results of this study reveal the Cyberchondria as an important public health problem in the post-epidemic era, may have adverse effects on adolescent mental health. The results of our mediating model test further demonstrate the important mediating role of psychological insecurity in this process. Specifically, individuals with high levels of Cyberchondria are overly concerned about their health, and under the influence of the COVID-19 outbreak they tend to believe that their surroundings are uncontrollable, then their safety needs are difficult to meet, which ultimately affects their mental health. By identifying the potential effects of Cyberchondria on mental health and the underlying mechanism of security, this study puts forward plastic targets for the prevention and intervention of adolescent mental health in the post-epidemic era.

Keywords: COVID-19, Cyberchondria, insecurity, well-being, depressive symptoms

儿童学校归属感与病理性网络游戏使用的关系：有调节的中介模型

徐旋 高峻峰 周宗奎（通讯作者）

青少年网络心理与行为教育部重点实验室，武汉，430079, zhouzk@mail.ccnu.edu.cn

摘要 病理性网络游戏使用是指个体过度投入网络游戏，其行为失去控制，并造成个体和社会功能受损等不利后果。它不仅会造成儿童的社交孤立、睡眠不足、学业不良和生活满意度降低，还会诱发焦虑症、抑郁症、周围神经病变等身心疾病。因此，探究儿童病理性网络游戏使用的风险和保护因素，已成为备受关注的公共卫生问题。在生态系统理论和发展资源框架的视域下，学校归属感的不足可能是导致儿童形成病理性网络游戏使用的重要风险因素。但目前少有研究关注学校归属感对病理性网络游戏使用的影响及内在机制。本研究构建一个有调节的中介模型，考察心理韧性在学校归属感预测儿童病理性网络游戏使用中的中介作用，以及正念对上述中介路径的调节作用。本研究采用方便抽样的方法，选取武汉市某小学3至6年级学生进行整体施测。测量工具包括：人口学资料问卷、《病理性网络游戏使用量表》、《学校归属感量表》、《儿童青少年心理韧性量表》及《儿童青少年正念量表》。结果表明：（1）在控制了年龄之后，学校归属感负向预测病理性网络游戏使用。（2）心理韧性在学校归属感和病理性网络游戏使用间起部分中介作用。即儿童学校归属感的不足，会降低心理韧性，进而增加病理性网络游戏使用。（3）正念调节“学校归属感→心理韧性→

病理性网络游戏使用”的前半段路径,即当儿童正念水平较高时,能缓冲学校归属感不足对心理韧性的负向预测作用。本研究发现,学校归属感不足,会损耗儿童的心理韧性,最终导致病理性网络游戏使用的产生;同时,较高的正念水平能有效补偿学校归属感不足对儿童心理韧性的不良影响。本研究揭示了学校系统和个人系统对病理性网络游戏使用的作用机制,对儿童病理性网络游戏使用的防治防控提供了理论依据。

关键词 儿童,病理性网络游戏使用,学校归属感,心理韧性,正念

Relationship between children's school belonging and pathological online games use: A Moderated Mediating Model

Xuan Xu, Lingfeng Gao, Zongkui Zhou

Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan

Abstract: Pathological online game use refers to the over-indulgence of individuals in online games, the loss of control of their behavior, and resulting in individual and social function damage as well as other adverse consequences. It not only causes social isolation, lack of sleep, poor school performance and reduced life satisfaction, but also causes physical and mental disorders such as anxiety, depression, and peripheral neuropathy. Therefore, it has become a public health issue of great concern to explore the risk and protective factors of children's pathological online game use. In the perspective of ecological systems theory and development resource framework, the lack of school belonging may be an important risk factor for children's pathological online game use. However, few studies have focused on the effect of school belonging on pathological online game use and its underlying mechanism. This study constructs a moderated mediating model to examine the mediating role of resilience in school belonging in predicting children's pathological online game use, and the moderated role of mindfulness in this mediating path. In this study, the convenience sampling method was adopted to select students from grade 3 to grade 6 in a primary school in Wuhan. The instruments included demographic data questionnaire, Pathological Online Game Use Measure, School Belonging Measure, Child and Youth Resilience Measure, and Child and Adolescent Mindfulness Measure. The results show that: (1) after controlling for age, school belonging negatively predicted pathological online game use. (2) resilience plays a part of mediating role between school belonging and pathological online game use. That is, children's lack of school belonging will reduce the resilience, thus increase the possibility of pathological online game use. (3) mindfulness moderated the first half path of "School belonging → resilience → pathological online game use", that is, the negative predictive effect of school belonging on resilience can be buffered when children have a relatively high mindfulness. This study found that the lack of school belonging can damage the child resilience and eventually lead to the pathological online game use. At the same time, a higher level of mindfulness can effectively reduce the negative impact of school belonging on child resilience. This study reveals the mechanism of school system and personal system on pathological online game use, and also provides theoretical basis for prevention and control of children's pathological online game use.

Keywords: children, pathological online games use, school belonging, well-being, mindfulness

智能手机使用与自我扩展的关系: 认知专注与心理需求网络满足的链式中介作用

吴佳荫 刘勤学(通讯作者) 周宗奎

华中师范大学心理学院, 武汉, 430079, qinxueliu@mail.ccnu.edu.cn

摘要 作为现代社会最为普遍的手持工具, 智能手机与人们的生活有着密切的联系。以往的研究大量地讨论了智能手机使用对于个体心理和行为的消极影响, 但少有研究从自我扩展的视角考察了智能手机使用与自我的关系, 即手机自我扩展。自我扩展是个体通过获取新的资源、视角、身份等以促进自我成长和提升的根本动机。青少年处于自我概念发展的重要时期。他们可能会更加积极主动地通过各种各样的途径扩展自我。在与智能手机的互动中, 青少年可能会深度地沉浸其中, 并从中感知到更多的心理需求满足, 进而将多功能

性的智能手机视为获取知识,丰富自我的有效途径。因此,基于自我扩展模型,本研究旨在考察青少年智能手机使用与手机自我扩展的关系,并进一步探究认知专注和心理需求网络满足在其中的作用机制。研究采用智能手机使用问卷、手机自我扩展量表、认知专注量表和心理需求网络满足量表,对武汉市某中学 874 名高中生进行了问卷调查。最终得到有效问卷 866 份,其中男生 389 人,女生 477 人,被试平均年龄为 15.96 岁($SD = 0.84$)。结果表明:(1)智能手机使用、认知专注、心理需求网络满足和手机自我扩展存在显著的正相关关系;(2)青少年的智能手机使用能够正向预测其手机自我扩展;(3)认知专注、心理需求网络满足在智能手机使用对手机自我扩展的影响中发挥着链式中介作用。本研究结果进一步揭示了智能手机与自我的关系,加深人们对智能手机的影响的认识,启示父母应鼓励青少年进行有益的智能手机活动以促进自我发展。

关键词 智能手机使用,自我扩展,认知专注,心理需求网络满足

Smartphone Use and Self-Expansion via Smartphone: The Mediating Roles of Cognitive Absorption and Online Basic Psychological Need Satisfaction

Jiayin Wu, Qinxue Liu, Zongkui Zhou

School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: As the most popular handheld tech tool in modern society, smartphones have been closely tied to people's lives. Previous studies widely discussed the negative influence of smartphone use on people's psychology and behavior. However, few studies examined the relationship between smartphone use and the self from the perspective of self-expansion, that is self-expansion via smartphone. Self-expansion is the basic motivation which drives people to gain resources, perspective and identities for growth and improvement. Adolescents are experiencing an important period of self-concept development. They may be fundamentally motivated to improve and expand the self through various ways. When interacting with the smartphone, adolescents may be deeply absorbed and perceive more need satisfaction, thus, they tend to consider the multi-functional smartphone as an efficient way to acquire knowledge and enrich the self. Therefore, based on the self-expansion model, this study aimed to examine the relationship between adolescents' smartphone use and self-expansion via smartphone, and further explored the mechanisms of cognitive absorption and online basic psychological need satisfaction. The current study used the smartphone use questionnaire, smartphone self-expansion scale, cognitive absorption scale and online basic psychological need satisfaction scale, and investigated 874 high school students from a high school in Wuhan. Finally, a total of 866 participants provided valid data, and there were 389 male and 477 female students. The average age of all participants was 15.96 ($SD = 0.84$). The results showed that: (1) There were significant positive correlations among smartphone use, cognitive absorption, online basic psychological need satisfaction, and self-expansion via smartphone; (2) Adolescents' smartphone use can positively predict self-expansion via smartphone; (3) Cognitive absorption and online basic psychological need satisfaction served as the underlying mediators of the relation by which smartphone use is associated with self-expansion via smartphone. These findings help to reveal the relationship between smartphones and the self, and deepen people's understanding of the influence of smartphones. This study also enlightens parents to encourage beneficial smartphone activities to promote adolescents' self-development.

Keywords: smartphone use, self-expansion, cognition absorption, online basic psychological need satisfaction

父母低头行为降低青少年核心自我评价的作用机制

申昕苑 谢笑春(通讯作者)

东北师范大学心理学院, 长春, 130024, xiexc713@nenu.edu.cn

摘 要 核心自我评价是个体对自身价值和能力的最基本评价。青少年期是自我评价发展的重要时期。家庭是影响青少年社会发展的重要环境变量。家庭作为一个生态环境的子系统,父母通过实际参与和指导,可以直接影响儿童和青少年的行为和人格特质,促进孩子自我评价的发展。在数字媒介快速发展的当下,手机已

经成为生活中必不可少的设备。父母使用手机忽视和排斥孩子的情境已逐渐成为常态。父母低头行为是指在家庭环境中，父母低头使用手机而忽视亲子的面对面交流，使孩子感受到被父母忽视的现象。已有研究表明父母低头行为会增加青少年手机成瘾、抑郁的风险。但少有研究者关注父母低头行为对青少年自我评价的影响。本研究旨在探讨父母低头行为对青少年核心自我评价的影响，以及基本心理需求满足的中介作用和反刍思维的调节作用。本研究采用父母低头量表、基本心理需求满足量表、反刍思维量表、核心自我评价量表对 811 名青少年进行调查。结果发现：(1)父母低头行为负向预测青少年的核心自我评价；(2)基本心理需求满足在父母低头行为与核心自我评价之间起部分中介作用；(3)反刍调节了基本心理需求满足与核心自我评价之间的关系。与低反刍水平的青少年相比，高反刍思维水平的青少年在基本心理需求没有得到满足时，核心自我评价更易受贬损。结果表明：父母低头行为会使青少年的基本心理需求没有得到满足，进而贬损青少年的核心自我评价。在此过程中，较高的反刍思维水平会增强基本心理需求没有得到满足对核心自我评价的消极作用。本研究结果有助于理解青少年核心自我评价的内在机制及其与父母低头行为的关系。

关键词 父母低头行为，核心自我评价，基本心理需求满足，反刍思维

Parental Phubbing Decreases Adolescents' Core Self-evaluation

Xinyuan Shen, Xiaochun Xie

School of Psychology, Northeast Normal University, Changchun

Abstract: Core self-evaluation is the most basic evaluation of individuals' value and ability. Adolescence is an important period for the development of self-evaluation. Family is an important environmental variable affecting adolescents' psychological development. As a subsystem of the ecological environment, parents can affect the behavior and personality traits of adolescents and promote the development of children's self-evaluation through practical participation and guidance. With the rapid development of digital media, the mobile phone has become an indispensable device in life. The situation that parents ignore and reject their children using mobile phones has gradually become the norm. Parental phubbing means that in the family environment, parents use their mobile phones and ignore face-to-face communication with their children so that children feel neglected by their parents. Studies have shown that parental phubbing increased the risk of adolescents' mobile phone addiction and depression. However, few researchers pay attention to the impact of parental phubbing on adolescents' self-evaluation. The purpose of this study was to explore the impact of parental phubbing on adolescents' core self-evaluation, the mediating role of basic psychological needs satisfaction, and the moderating role of rumination. In this study, 811 adolescents completed the Parental Phubbing Scale, Basic Psychological Needs Satisfaction Scale, Rumination Scale, and Core Self-evaluation Scale. The results showed that: (1) parental phubbing negatively correlated with adolescents' core self-evaluation; (2) basic psychological needs satisfaction played a partial mediating role between parental phubbing and core self-evaluation; (3) rumination moderated the relationship between basic psychological needs satisfaction and core self-evaluation. Compared with adolescents with low rumination level, adolescents with high rumination level are more vulnerable to derogation when their basic psychological needs are dissatisfied. The results show that parental phubbing deteriorated adolescents' core self-evaluation through decreasing basic psychological need satisfaction. In this process, a higher level of rumination enhanced the negative effect of basic psychological needs satisfaction on core self-evaluation. The results of this study are helpful to understand the underlines mechanism of adolescents' core self-evaluation and its relationship with parental phubbing.

Keywords: parental phubbing, core self-evaluation, basic psychological need satisfaction, rumination

摘要 在当前信息社会, 数字素养已成为个体的基本素养, 是影响个体数字使用及其发展适应结果的重要因素。在这一背景下, 数字素养的影响因素及其干预对策已成为相关领域研究者关注的热点问题。基于此, 本研究拟探讨在小学生和初中生群体中家庭社会经济地位对数字素养的影响及其内在机制——积极父母干预和限制性父母干预在其间的中介作用。本研究采用方便取样方法, 在湖北省选取 4 至 8 年级的 1058 名学生 ($M_{age}=11.82\pm1.43$; 男生 493 人, 46.60%) 为研究对象, 使用家庭社会经济地位量表、父母干预量表以及数字素养量表对学生进行调查。结果发现: (1) 家庭社会经济地位、积极父母干预、限制性父母干预和数字素养两两之间均呈显著正相关; (2) 家庭社会经济地位对数字素养的直接正向预测效应显著; (3) 采用 Hayes 编制的 SPSS 宏中的 Model 4 对父母干预进行并行中介效应分析发现, 积极父母干预在家庭社会经济地位和数字素养关系中的中介效应显著, 但限制性父母干预在这一关系中的中介效应不显著; 具体而言, 家庭社会经济地位显著正向预测积极父母干预和限制性父母干预, 积极父母干预显著正向预测数字素养。这表明家庭社会经济地位不仅能对数字素养产生直接正向预测作用, 还通过增加积极父母干预对数字素养产生正向预测作用。本研究不仅有助于加深对数字素养影响因素的理解, 还能为中小学生的数字素养的干预提升提供实证依据。

关键词 家庭社会经济地位, 数字素养, 积极父母干预, 限制性父母干预

The Association Between Family Socioeconomic Status and Digital Literacy: The Mediating Role of Parental Internet Mediation

Abstract: In the current information society, digital literacy has become a basic literacy, which has an important impact on digital use and the outcomes of development and adaptation. In this context, the influencing factors of digital literacy and its intervention strategies have become a hot issue for researchers in related field. Therefore, the present study intends to investigate the influence of family socioeconomic status on digital literacy among elementary and junior high school students and its mechanism—the mediating role of active parental mediation and restrictive parental mediation. This study used convenience sampling method, selected Grade 4-8 students in Hubei province 1058 ($M_{age}=11.82\pm1.43$; boys 493, 46.60%) for the study. Participants completed the following questionnaires: Family Socioeconomic Status Scale, Parental Mediation Scale and Digital Literacy Scale. The results showed that: (1) Family socioeconomic status, active parental mediation, restrictive parental mediation and digital literacy are all significantly positively correlated; (2) Family socioeconomic status has a significant direct positive predictive effect on digital literacy; (3) Using Model 4 in the SPSS macro compiled by Hayes to analyze the mediating effect of parental mediation and found that the mediating effect of active parental mediation in this relationship between

family socioeconomic status and digital literacy is significant, but the mediating effect of restrictive parental mediation in this relationship is not significant. Specifically, family socioeconomic status significantly positively predicts active parental mediation and restrictive parental mediation, and active parental mediation significantly positively predicts digital literacy. This shows that family socioeconomic status can not only directly predict digital literacy, but also positively predict digital literacy by increasing active parental mediation. This research not only helps to deepen the understanding of the factors affecting digital literacy, but also provides empirical evidence for the intervention and improvement of digital literacy among primary and middle school students.

Keywords: family socioeconomic status, digital literacy, active parental mediation, restrictive parental mediation

父母积极干预与学习适应的关系： 视频游戏使用的中介作用及越轨同伴交往的调节作用

摘要 学习适应是教育者及父母非常关注的问题。研究发现, 当儿童有良好的学习习惯时就会涉及到较好的学习适应, 而学习适应与学习效果有直接关系。学习适应不良严重影响儿童学业和身心健康。因此, 有必要识别影响儿童学习适应的因素及其作用机制。众多研究表明, 父母干预是影响儿童行为的重要因素。但是, 少有研究在学习适应领域探究父母干预的影响及其作用机制。本研究通过构建一个有调节的中介模型, 旨在考查视频游戏使用在父母积极干预与儿童学习适应之间的中介作用以及越轨同伴交往在该过程的调节作用。本研究采用随机整群抽样法对湖北省两所小学的 683 名小学生 (平均年龄 11.1 岁, $SD=0.92$) 进行调查。测量工具包括人口学背景资料问卷、“父母积极干预问卷”、“视频游戏行为问卷”、“学习适应问卷”以及“越轨同伴交往问卷”。结果表明: (1) 在控制了年龄、性别之后, 父母积极干预显著正向预测学习适应。(2) 父母积极干预显著负向预测视频游戏使用行为, 进而增加儿童学习适应能力, 即视频游戏使用在父母积极干预和儿童学习适应之间起着中介作用。(3) 父母积极干预通过视频游戏使用对儿童学习适应的间接作用受到越轨同伴交往的调节, 越轨同伴交往调节了视频游戏使用与儿童学习适应的关系, 即视频游戏使用行为对儿童学习适应的影响, 随着越轨同伴交往程度的提高而降低。因此, 父母积极干预对儿童学习适应的影响是有调节的中介效应。

关键词 父母积极干预, 学习适应, 视频游戏使用, 越轨同伴交往

Parental Active Internet Mediation and Children's Academic Adaptation: The Mediating Role of Video Gaming and Moderating Role of Deviant Peer Affiliation

Abstract: Academic adaptation is a concern of educator and parents. Studies have found that good learning habits involve academic adaptation, and academic adaptation is directly to the learning effect. Lower academic adaptation seriously affects children's academic and physical and mental health. Therefore, it is necessary to identify the

influencing factors and mechanisms of children's academic adaptation. Although numerous research has shown that parental mediation is an important factor affecting children's behavior, less is known about the impact of parental mediation on academic adaptation and the process and mechanism underlying this association. The present study would test a moderated mediation model in which video gaming served as a mediator between parental active mediation and children's academic adaptation and deviant peer affiliation moderated the mediation processes. Participants were 683 children (mean age =11.1 years, SD=0.92) recruited from 2 primary schools in Hubei province of china through stratified and random cluster sampling. They completed a series of questionnaires regarding demographic variables, parental active mediation, video gaming, deviant peer affiliation, academic adaptation. The results indicated that: (a)parental active mediation was positively associated with academic adaptation among children after controlling for gender, age; (b) parental active mediation reduced video gaming among children, which in turn increased academic adaptation, such that video gaming mediated the relationship between parental active mediation and academic adaptation; and (c)The indirect effects of parental active mediation on academic adaptation through video gaming were moderated by deviant peer affiliation. Deviant peer affiliation moderated relationship between video gaming and academic adaptation, that is, the influence of video gaming on academic adaptation reduced with the improvement of deviant peer affiliation. Therefore, the influence of parental active mediation on children's academic adaptation is a moderated mediation model.

摘 要 在现代信息社会，网络技术及其诸多应用在人们生活中发挥着日益重要的作用，但伴随着这一趋势，病理性网络使用的问题也日益凸显，特别是在青少年群体中更是如此。病理性网络使用在青少年群体中不仅具有较高的发生率，还会对青少年个体的身心健康带来严重的消极影响。基于此，青少年的病理性网络使用及其影响因素一直是社会关注的热点问题。以往研究指出，家庭相关因素特别是父母监管，是影响青少年包括病理性网络使用在内的诸多社会适应指标的重要环境因素；且伴随着网络的普及，父母的监管行为也延伸到网络使用领域，研究者将其界定为父母网络监管。与此同时，数字素养也日益受到研究者和社会的广泛关注，它指个人能够正确使用数字工具和设备、利用数字资源等的意识、态度和能力；作为个人在数字社会中生存所需的基本能力，数字素养是影响个体在数字化时代发展适应的重要因素，特别是它有助于塑造良好的使用行为，减少个体沉迷数字使用的风险。基于以上论述，在生态科技亚系统理论的视角下，本研究拟探讨父母网络监管行为（积极监管和限制性监管）对青少年病理性网络使用的影响及其内在作用机制——数字素养的作用。使用父母网络监管问卷、青少年病理性互联网使用量表和数字素养量表对 533 名青少年进行调查，结果发现：（1）父母积极和限制性监管、以及数字素养均与病理性网络使用呈显著负相关；（2）积极监管不仅可以直接影响病理性网络使用，还能通过数字素养的中介作用产生影响；但数字素养在限制监管与病理性网络使用关系中的中介作用不显著。本研究结果表明，虽然积极和限制性网络监管均有助于降低青少年病理性网络使用的风险，但积极监管还有助于培养青少年个体的数字素养水平；这不仅有助于加深我们对父母监管的作用、数字素养和病理性网络使用影响因素及其作用机制的理解，还能为合理健康的网络使用、父母监管方式的选择以及青少年数字素养的培养提供更具针对性和有效性的指导。

The Influence of Parental Mediation on Adolescents' Problematic Internet Use: The Mediating Role of Digital Literacy

Wenhui Yang^{1,2}, Yao Li^{1,2}, Xiaohan Shi^{1,2}, Xiaojun Sun^{1,2,3}, Gengfeng Niu^{1,2,3*}

¹ School of Psychology, Central China Normal University, Wuhan, 430079, China; ² Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan, 430079, China; ³ Central China Normal University Branch, Collaborative Innovation Center of Assessment toward Basic Education Quality, Wuhan 430079, China

Abstract: In the modern information society, Internet technology and its various applications are playing an increasingly important role in individuals' lives. However, along with this trend, the problem of problematic Internet use is also becoming more and more prominent, especially among adolescents. Problematic Internet use not only has high incidence in adolescents, but also has a serious negative impact on adolescents' physical and mental health. Based on this, adolescents' problematic Internet use and its influencing factors have always been a hot issue in society. Previous research pointed out that family-related factors, especially parental mediation, are important environmental factors affecting many social adaptation indicators of adolescents (including problematic Internet use); and with the popularization of the Internet, parental mediation behavior also extended to the field of network use. Researchers define it as parental mediation of Internet use. At the same time, digital literacy has also received wide attention from researchers and society. It refers to the awareness, attitude and ability of individuals to correctly use digital tools and equipment, and use digital resources in a specific situation; in the digital society, digital literacy is an important factor that affects the development and social adaptation of individuals. In particular, it helps to shape good use behaviors and reduce the risk of individuals indulging in digital technology. Based on the discussion above, this study aimed to examine the influence of parental Internet mediation (active and restrictive) on adolescents' problematic Internet use, as well as the mediating role of digital literacy. A sample of 533 adolescents (mean age = 14.92 years) were recruited to participate into the study. They were asked to complete a set of questionnaires, on the *Parental Internet Mediation Scale*, *Problematic Internet Use in Adolescents Scale* and *Digital Literacy Scale*. Based on the perspective of the ecological techno-subsystem theory, a mediation model was constructed to analyze the mediating effects of digital literacy in the association between parental mediation and problematic Internet use. Results indicated that: (1) Parents' active and restrictive mediation, as well as digital literacy, were all negatively correlated with problematic Internet use. (2) Active mediation was not only associated with problematic Internet use directly, but also could influence problematic Internet use through the mediating effect of digital literacy; however, the mediating effect of digital literacy was insignificant in the relationship between restrictive mediation and problematic Internet use. The present study reveals that although both active and restrictive Internet mediation can help reduce the risk of adolescents' problematic Internet use, active mediation can also help cultivate adolescents' digital literacy. It may contribute to a better understanding on the association between parental mediation and adolescents' problematic Internet use. Even with several limitations, the findings of this study still have implications for the prevention and intervention of adolescents' problematic Internet use, as well as how to conduct appropriate mediation

媒介素养的新结构：一项质化分析

吴思奇 谢笑春（通讯作者）

东北师范大学心理学院，长春，130024, xiexc713@nenu.edu.cn

摘要 互联网是当今社会生活中不可或缺的信息传播渠道。媒介素养是人们利用互联网获取信息和解决问题的必备能力，是21世纪公民必备的素质之一，也是21世纪学生发展的核心素养之一。尽管已有大量研究对媒介素养的结构进行了充分讨论，但目前较为成熟的媒介素养结构模型仍有一些有待完善之处。信息过载时代下，应该从媒介使用知识和媒介道德行为的视野来探讨媒介的科学使用。为进一步完善媒介素养的结构，

本研究对 30 名大学生（其中，男生 15 名，女生 15 名；平均年龄为 20.93 岁，标准差为 1.39）开展半结构化访谈，并采用协商一致的质的研究方法对访谈结果进行分析。结果发现，媒介素养是一个 3（知识性、批判性、道德性）×2（获取，创作）的多维交叉结构，共包含 6 个一级维度：知识性获取、批判性获取、道德性获取、知识性创作、批判性创作、道德性创作。每个一级维度下有 2-4 个二级维度，共有 18 个二级维度。对每个维度的含义及其与现有理论和研究的关系进行了讨论。本研究还发现，大学生对媒介信息可靠性的判断较为理性并体现出一定的质疑精神。但是由于缺乏相关的媒介知识，大部分学生将焦点放在媒介信息本身，而不是媒介信息本身是如何构建的以及创作媒介信息的积极性上。新结构将媒介知识和媒介道德行为考虑其中，既丰富了媒介素养的结构，还符合我国文化特征和信息时代的发展需求，为后续媒介素养的量化研究和高校的媒介素养教育提供了新思路。

关键词 媒介素养，知识性，批判性，道德性

New structure of media literacy: a qualitative analysis

WU Siqi, XIE Xiaochun (Corresponding author)

School of Psychology, Northeast Normal University, Changchun, 130024, xiexc713@nenu.edu.cn

Abstract: Internet is an indispensable channel of information dissemination in today's social life. Media literacy is the necessary ability for people to obtain information and solve problems by using the Internet, one of the necessary qualities for citizens in the 21st century, and one of the core qualities for students' development in the 21st century. Although a large number of studies have fully discussed the structure of media literacy, the mature model of media literacy structure still has some problems to be improved. In the age of information overload, we should discuss the scientific use of media from the perspective of media use knowledge and media moral behavior. In order to further improve the structure of media literacy, this study investigated 30 college students (including 15 females and 15 males; The average age is 20.93 years old, and the standard deviation is 1.39). Semi-structured interviews were conducted, and the results of interviews were analyzed by consensus qualitative research methods. The result showed that media literacy is a multi-dimensional cross structure of 3 (knowledge, criticism and morality) ×2 (acquisition and creation), which included six first-level dimensions: knowledge acquisition, critical acquisition, moral acquisition, knowledge creation, critical creation and moral creation. There were 2-4 secondary dimensions under each primary dimension, with a total of 18 secondary dimensions. The meaning of each dimension and its relationship with existing theories and research were discussed. This study also found that college students' judgment on the reliability of media information was rational and reflected a certain spirit of questioning. However, due to the lack of relevant media knowledge, most students focused on the media information itself, rather than how the media information itself was constructed and the enthusiasm of creating the media information. The new structure takes media knowledge and media moral behavior into account, which not only enriches the structure of media literacy, but also meets the development needs of Chinese cultural characteristics and information age, and provides new ideas for the follow-up quantitative research of media literacy and media literacy education in colleges and universities.

自我扩展的科技陷阱：手机自我扩展对智能手机成瘾的影响

李珺^{1,2} 刘勤学^{1,2}（通讯作者） 周宗奎^{1,2}

1 青少年网络心理与行为教育部重点实验室，武汉 430079

2 华中师范大学心理学院，武汉 430079, qinxueliu@mail.ccnu.edu.cn

摘 要 智能手机成瘾是指个体由于对智能手机的过度使用行为而导致其社会功能受损、并带来心理和行为问题的一种新型行为成瘾，而青少年作为该成瘾行为的易感人群，他们智能手机的使用问题备受研究者关注。以往关于青少年智能手机成瘾的研究大多集中于家庭层面（父母粗暴养育、科技干扰）、个人特质层面（神经质、回避型依恋、感觉寻求倾向），但极少有研究聚焦于自我层面变量（手机自我扩展）。然而根据以往研究与自我扩展理论，手机自我扩展对青少年智能手机成瘾具有重要影响。鉴于此我们有必要探究其中的内在

机制。基于自我扩展理论和理性成瘾理论,本研究构建了一个有中介的调节模型来检验注意控制在青少年手机自我扩展和问题性智能手机之间的中介作用以及这一中介效应是否被内部觉知所调节。采用手机自我扩展量表、注意控制量表、内部觉知量表以及智能手机成瘾量表对 863 名中学生($M_{\text{年龄}} = 15.96$ 岁)进行调查研究。结果表明:(1)手机自我扩展显著正向预测青少年智能手机成瘾,并且注意控制在其中起部分中介的作用;(2)个体的内部觉知调节中介效应的前半段,具体而言,随着内部状态意识水平的降低,通过智能手机进行的自我扩展与注意控制之间的相关性变得更强。结果显示,通过对注意控制和内部觉知的合理干预,可以一定程度减少手机自我扩展对青少年智能手机成瘾的消极影响。

关键词 手机自我扩展, 智能手机成瘾, 注意控制, 内部觉知, 青少年

The technology trap of self-expansion: The effect of self-expansion via smartphone on smartphone addiction

Li Jun^{1,2}, Liu Qinxue^{1,2}, Zhou Zongkui

1 Key Laboratory of Adolescent Cyberpsychology and Behavior(CCNU), Ministry of Education

2 School of Psychology, Central China Normal University, Wuhan, 430079

Corresponding author: Liu Qinxue, qinxueliu@mail.ccnu.edu.cn

Abstract : Smartphone addiction usually refers to a new type of behavioral addiction in which an individual's uncontrollable overuse of smartphones, which leads to impaired social functioning and psychological and behavioral problems. As a vulnerable group, the overuse of smartphones by adolescents has triggered increased concerns. Previous studies have focused on smartphone addiction at the family level (e.g., parental rough nurturing, technological interference) or personality traits(e.g., neuroticism, avoidant attachment, sensory seeking), but few researchers stay on important variables on the ego level(self-expansion via smartphone). However, according to previous research and self-expansion theory,self-expansion via smartphone has a significant impact on adolescent smartphone addiction. In view of this, it is necessary to explore the underlying mechanisms. Based on self-expansion theory and rational addiction theory, a mediated moderation model was constructed to examine the mediating role of attentional control between adolescent self-expansion via smartphone and smartphone addiction and whether this mediating effect was moderated by internal awareness. A total of 863 middle school students ($M_{\text{age}} = 15.96$ years) completed measures of self-expansion via smartphone, attentional control, internal state awareness, and smartphone addiction. The results showed that (1)self-expansion via smartphone significantly and positively predicted adolescent smartphone addiction and that attentional control partially mediated this effect, and (2) individuals' internal awareness moderated the first half of the mediating effect. Specifically, the correlation between self-expansion via smartphone and attentional control became stronger as the level of internal state awareness decreased. The results suggest that the negative effects of self-expansion via smartphone on adolescent smartphone addiction can be reduced to some extent through reasonable interventions for attentional control and internal awareness.

Keywords : self-expansion via smartphone, smartphone addiction, attentional control, internal state awareness, adolescents

网络电子游戏过程中前额叶功能活动的实时功能近红外光谱监测

龙克鸿¹ 李玥^{1,2} 张绪柘¹ 雷皓^{1,2} (通讯作者)

1 中国科学院精密测量科学与技术创新研究院, 武汉, 430071

2 华中科技大学武汉光电国家研究中心, 武汉, 430074, leihao@wipm.ac.cn

摘要 世界卫生组织近期在 ICD-11 中将电子游戏障碍列为了精神疾病的一种。电子游戏障碍的发病可能与长期玩电子游戏所引发的脑可塑性改变有关。之前有实验证据表明: 频繁地玩电子游戏会影响大脑前额叶皮层 (prefrontal cortex, PFC) 以及其它一些脑区的结构、功能与网络连接。为进一步探究电子游戏相关脑可塑性改变的神经机制, 我们在本研究中利用功能近红外光谱 (fNIRS) 技术, 实时监测了被试在完成一局多人线上对战竞技游戏 (massively multiplayer online battle arena, MOBA)——英雄联盟 (League of Legends, LOL) 的过程中三个 PFC 亚区中的氧合及去氧血红蛋白含量的变化, 并用之反映这些脑区在游戏过程中的功能 (负) 激活情况。我们对游戏开始阶段以及一些特定游戏事件相关的脑激活进行了分析, 同时对比了高段位玩家与低段位玩家脑激活的异同。结果表明: 游戏开始伴随有腹外侧前额叶 (ventrolateral prefrontal cortex, VLPFC) 的显著正激活以及背外侧前额叶 (dorsolateral prefrontal cortex, DLPFC) 和额极区 (frontal pole area, FPA) 的显著负激活。特定游戏事件 (如击杀敌人或被敌人击杀) 伴随有锁时 (time-locked) 且区域特异性的 PFC 响应; 但并不是所有游戏事件均是如此 (如推塔)。此外, 我们还发现击杀敌人和被敌人击杀这些游戏事件相关的 FPA 响应受到被试游戏段位的影响。这些实验结束表明: fNIRS 技术可被用于实时监测网络电子游戏过程中 PFC 的功能活动, 且具有较好的生态效度。

Real-time monitoring prefrontal activities during on-line video game playing by functional near-infrared spectroscopy

Kehong Long¹, Yue Li^{1,2}, Xuzhe Zhang¹, Hao Lei^{1,2*}

1 Innovation Academy for Precision Measurement Science and Technology, Chinese Academy of Sciences, Wuhan

2 Wuhan National Laboratory for Optoelectronics, Huazhong University of Science and Technology, Wuhan

Abstract: Gaming disorder may be linked to brain neuroplasticity induced by frequent video game playing (VGP). It is well-documented that structure, function and connectivity of the prefrontal cortex (PFC) are affected by VGP. In this study, functional near-infrared spectroscopy (fNIRS) was used to monitor real-time changes of hemodynamics/oxygenation in the PFC of subjects playing a massively multiplayer online battle arena (MOBA) video game, League of Legends (LOL), under naturalistic conditions. The regional brain activities related to game onset and specific game events were assessed, and compared between high-rank and low-rank players. It was demonstrated that game onset was associated with a significant activation in the ventrolateral prefrontal cortex (VLPFC) and concomitant deactivations in the DLPFC and frontal pole area (FPA). Certain game events, such as Slaying and Slain, were associated with time-locked and brain region-specific PFC responses, but not the others, for example, Destroying A Turret. Furthermore, it was shown that the player's rank had significant modulatory effects on the game event-related PFC responses, especially for the event with negative outcome or valence (i.e., Slain). It is concluded that it is feasible to use fNIRS to monitor real-time prefrontal activities during on-line VGP under naturalistic settings.

脑岛在网络游戏成瘾中的重要性：一项 fMRI 研究

何清华¹（通讯作者） 魏雷¹ Ofir Turel²

1 西南大学心理学部，重庆，400715, heqinghua@swu.edu.cn

2 美国加州州立大学富勒顿分校，富勒顿，CA 92834

摘要 网络游戏障碍（IGD）是一个令人关注的需要进一步研究的问题。在本研究中我们尝试考察其神经机制，尤其是脑岛在其中的重要作用。根据我们之前提出的三元神经认知模型，我们假设（a）电子游戏线索会引起玩家与对照组之间更强的奖赏系统激活和较弱的前额叶激活；（b）玩家的 IGD 得分与奖励系统的激活呈正相关，与前额叶区域的激活呈负相关，（c）剥夺视频游戏会导致脑岛激活的增加，尤其是当游戏者接触视频游戏线索（相比于中性线索）时；以及（d）在剥夺条件下，脑岛与其他两个神经系统之间会分别产生正向和负向耦合。实验是招募了两组被试（长期游戏玩家与对照组），所有参与者都需要面对游戏刺激与中性刺激，而对于游戏玩家还需要在剥夺游戏时和正常状态下两个时间参加 fMRI 扫描。fMRI 结果显示 IGD 评分与右腹纹状体的活动呈正相关，与右背外侧前额叶皮层（DLPFC）的活动呈负相关。当观察剥夺状态下的视频游戏线索时，左脑岛皮层活动最高。最后，与在剥夺条件下观看对照视频时相比，左脑岛与左腹纹状体之间的耦合增加，与左 DLPFC 的耦合减少。这些结果说明脑岛在平衡剩下两个系统的激活，以达到一个平衡，这揭示了游戏成瘾背后的脑机制。

The role of insula in internet game disorder: an fMRI study

Qinghua He¹, Lei Wei¹, Ofir Turel²

1 Faculty of Psychology, Southwest University, Chongqing, 400715

2 Information Systems and Decision Sciences, California State University, Fullerton, CA 92834

Abstract: Internet gaming disorder (IGD) is a concerning issue that requires further research. Here, we seek to examine its neural etiology with an emphasis on the role of the insula. To do so, we relied on the tripartite neurocognitive model of addictive behaviors as applied to IGD. We hypothesized that (a) video game cues will elicit stronger reward system activation and weaker prefrontal activation in gamers vs controls, (b) the IGD scores of gamers will be positively associated with activation of the reward system and negatively with activation of prefrontal regions, (c) deprivation from video gaming will result in increased activation of the insula, when gamers are exposed to video game cues vs to neutral cues, and (d) in deprivation conditions, there will be positive and negative coupling, respectively, between activation of the insula and the reward and prefrontal regions in gamers. We tested these hypotheses with a design with one between-subjects factor (gamers vs controls) and two within-subject factors: stimuli (gaming vs neutral; for all participants) and session (deprivation vs satiety; only for gamers). Findings based on functional magnetic resonance imaging (fMRI; applied to all 52 subjects, 26 gamers, and 26 controls) and psychophysiological interaction (PPI; applied to the 26 gamers) engaged in a video reactivity task supported our assertions. The IGD score positively correlated with activity in the right ventral striatum and negatively with activity in the right dorsolateral prefrontal cortex (DLPFC). Left insular cortex activity was the highest when observing video gaming cues under deprivation. Lastly, there was an increased coupling between the left insula and left ventral striatum and a decreased coupling with left DLPFC when observing video gaming cues compared with when watching control videos in the deprivation condition.

药物线索诱导的背外侧前额叶皮层的激活预测海洛因依赖者的治疗结果

刘爽¹ 袁凯¹ (通讯作者)

¹ 西安电子科技大学, 西安, 710071

摘要 药物滥用和成瘾是世界范围的健康问题。然而, 很少有研究使用 fMRI 来研究海洛因依赖者线索反应后的大脑激活与治疗结果之间的关系。为了丰富这一领域的知识, 我们采集了 29 名海洛因使用障碍患者和 23 名健康对照者的脑功能成像。结果显示, 海洛因使用者在接触毒品相关线索时, 左背外侧前额叶皮层、左侧苍白球、左侧丘脑、右侧额叶皮层和双侧楔前叶的大脑活动增加。两组参与者对色情图片的大脑反应没有显著差异。此外, 我们对 29 名海洛因依赖者进行了治疗和跟踪, 最后我们对 15 名海洛因依赖者进行了治疗后渴望评分。毒品相关线索诱导的左背外侧前额叶皮层激活与治疗前后渴望改变呈正相关。综上所述, 研究表明, 海洛因使用障碍患者在暴露于毒品相关线索时, 其大脑活动是独特的。此外, 我们的结果表明, 毒品相关线索诱导的左背外侧前额叶皮层的激活可以预测海洛因依赖者的治疗结果。

Activation of DLPFC induced by Drug Cue predicts treatment outcomes in heroin dependent individuals

Shuang Liu¹, Kai Yuan¹ (Corresponding Author)

¹ School of Life science and Technology, Xidian University, xi'an, 710071

Abstract: Drug abuse and addiction are worldwide health problems. However, few studies have used fMRI to investigate the correlation between brain activation following cue-reactivity and treatment outcomes in the heroin dependent individuals. To enrich knowledge in this field, functional brain imaging was conducted during a cue-reactivity paradigm task in 29 individuals with heroin use disorder, and 23 healthy control subjects. The results showed that heroin user have increased brain activity in the left dorsolateral prefrontal cortex(DLPFC), the left pallidum, the left thalamus, the right frontal cortex (OFC) and the bilateral PCC/precuneus, when exposed to drug-related cues. No significant differences in brain activity in response to pornographic images were found between the two groups. Additionally, we treated and followed 29 heroin dependent individuals, and we ended up with a post-treatment craving score for 15 heroin dependent individuals. The activation of DLPFC induced by drug-related cues was positively correlated with alterations in craving before treatment and after treatment. In conclusion, the present study indicates that, individuals with heroin use disorder have unique brain activity when exposed to drug-related cues. Additionally, our results illustrate that the activation of DLPFC induced by drug-related cues predicted treatment outcomes in heroin dependent individuals.

摘要 儿童青少年网络游戏成瘾已经成为世界性的心理健康问题。游戏成瘾自 2013 年和 2019 年分别被精神疾病诊断和统计手册 (第 5 版) 和国际疾病分类体系 (第 11 版) 收录以后, 得到了越来越多的关注。总结

以往围绕这一问题的干预研究，心理行为干预仍然是主流模式；特别是以认知行为疗法为主的个体、团体干预可改善个体对网络使用的不良认知、减少网络游戏时间、改善网络成瘾程度。此外，已有的研究还围绕个体的冲动性、渴求和不良家庭关系等重点影响因素进行了一定的探索，也初步认为能够改善成瘾问题。我们课题组在过去的几年内相继进行了多项网络游戏成瘾干预研究。在基于网络游戏成瘾渴求降低的心理行为团体干预研究中，成瘾者接受了每周一次每次约三小时持续六周的团体行为干预，辅以平时的正念冥想训练。结果发现，这一团体干预可有效地降低游戏成瘾者对游戏的渴求、每周的网络游戏时间，并改善网络游戏成瘾程度。同时神经影像结果发现，干预前成瘾者的奖赏环路的核心区域——腹侧纹状体与左侧顶下小叶、额中回和右侧额下回的静息态功能连接异常，并与游戏成瘾程度呈正相关；而接受了团体干预的游戏成瘾组还表现出腹侧纹状体与顶下小叶的功能连接异常的改善；并在完成线索诱发渴求任务时表现出右侧脑岛活动的激活增强及其与角回功能连接的减弱。此外，正在进行的一项采用随机分组、双盲设计的情感联结偏向矫正干预研究显示，持续一周的训练可以有效地减少网络游戏成瘾者的游戏时长、改善对游戏线索的加工，并得到了奖赏系统关键区域——壳核活动及其与额叶功能连接改善等影像学的证据。这些结果促进了人们对心理行为干预在网络游戏成瘾中的作用及起效机制的理解。

Abstracts: Internet Gaming Disorder (IGD) among children and adolescents may constitute a widespread and serious mental health problem. It has received increasing attention since it was included in the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) and the International Classification of Diseases (ICD-11) in 2013 and 2019, respectively. To sum up the previous intervention research around this problem, psycho-behavioral intervention is still predominate in the treatment of Internet Gaming Disorder (IGD). Individual and group intervention based on cognitive behavioral therapy can improve individuals' maladjusted cognitive of internet use, reduce the time spent on internet games, and reduce the severity of internet addiction. Besides, some existing studies have explored the important factors such as impulsivity, craving, and family relationships, and they preliminarily believe that it can improve the addiction problem. In the past few years, our group has conducted several studies on the intervention of IGD. In the intervention study to reduce the craving for internet games, addicts received a group behavioral intervention once a week for about three hours each time for six weeks, followed by daily mindfulness meditation training. The results showed that this group intervention could effectively reduce the craving for games, the weekly hours of internet games, and decreases in addiction severity. At the same time, neuroimaging results showed that resting-state functional connectivity (rsFC) of the ventral striatum (VS), the core region of reward circuit, to left inferior parietal lobule (IPL), right inferior frontal gyrus and left middle frontal gyrus was positively associated with IGD severity cross-sectionally. The IGD group that received group intervention also showed a greater decrease in VS-IPL connectivity. During an fMRI cue-reactivity task, the intervention group also showed enhanced activation in the right insula and decreased insular connectivity with the lingual gyrus in a treatment-sensitive manner.

Moreover, an ongoing intervention study using a randomized grouping and double-blind design shows that a week-long emotional connection bias correction training can effectively reduce the hours of internet game and optimize the processing of game cues. We also have imaging evidence of improved activity in the putamina, a key region of the reward system, and its connection to frontal gyrus. These results promote people's understanding of the role and mechanism of psychological behavior intervention in online game addiction.

网络游戏成瘾的特异性特征是控制失败而不是逃避负面情绪 ——来自行为和神经影像数据的证据

查汝晶¹ 洪伟¹ 张效初¹ (通讯作者)

¹ 中国科学技术大学生命科学学院, 合肥, 230026

摘要 目前, DSM-5 和 ICD-11 中有关网络游戏成瘾的诊断标准依然存在争议。本研究通过行为评估和功能磁共振成像 (fMRI) 结合的方法来检验网络游戏成瘾诊断两个潜在核心标准的特异性, 即 DSM-5 中“控制玩网络游戏失败” (控制失败) 和“通过网络游戏逃避或缓解情绪” (逃避负面情绪)。招募了年龄为 14 至 32 岁的符合 DSM-5 针对互联网游戏障碍的标准的网络游戏成瘾被试 (PIGD); 网络游戏非成瘾被试 (NIGP) 和正常被试进行实验。实验方法: 实验 1 测量控制失败相关的行为 (Barratt 冲动量表的非计划性冲动子量表和逃避负面情绪评估) 和大脑网络 (延迟折扣任务)。实验 2 测量逃避负面情绪的评估和大脑网络 (爱华博弈任务)。实验 3 为回顾性研究; 网络游戏成瘾被试和正常被试有关冲动控制和逃避负面情绪的行为的测量。实验结果: 实验 1 被试总数 $n=141$ (男性 $n=135$), PIGD 组 ($n=32$, 年龄 $=19.53\pm3.23$) 其正常被试对照组 ($n=32$, 年龄 $=20.44\pm2.82$); NIGP 组 ($n=35$, 年龄 $=23.51\pm1.80$) 其正常被试对照组 ($n=42$, 年龄 $=24.29\pm2.33$); 与正常被试相比, 只有 PIGD 组提高了折扣率 (平均值 $=0.093$; 95% CI, $0.034-0.152$) 和计划外冲动 (平均值 $=2.249$; 95% CI, $0.076-4.422$), 以及额叶前额网络的改变 (平均值 $=3.458$; 95% CI, $0.163-6.754$); 实验 2, 被试总数 $n=119$ 名 (男性 $n=103$), PIGD 组 ($n=30$, 年龄 $=20.00\pm3.23$), 其正常被试对照组 ($n=25$, 年龄 $=20.48\pm2.99$); NIGP 组 ($n=28$, 年龄 $=23.57\pm1.60$), 其正常被试对照组 ($n=36$, 年龄 $=23.89\pm2.12$); 与正常被试相比, PIGD 组和 NIGP 组均增加逃避负面情绪和损失减去收益固着 (平均值 $=0.306$; 95% CI, $0.002-0.610$) 并改变了前扣带回皮层-脑岛-杏仁核网络 (平均值 $=3.576$; 95% CI, $0.208-6.945$)。实验 3, 回顾性研究表明, PIGD 组逃避负面情绪变化增加, 但冲动控制没有变化。结论: 行为评估和功能磁共振的结果一致证明 IGD 的特异性特征是控制失败而不是逃避负面情绪。本研究对网络游戏成瘾的定义, 诊断和预防具有重要意义。

Unsuccessful Control Is Specific but Negative Mood Escape Is Non-specific for Internet Gaming Disorder: Evidence from Behavioral and Neuroimaging data

Rujing Zha¹, Wei Hong¹, Xiaochu Zhang¹ (Corresponding author)

¹ School of Life Science, University of Science and Technology of China, Hefei, 230026

Abstract: Diagnostic criteria of Internet gaming disorder (IGD) in DSM-5 and ICD-11 remain controversial. Objective: We combined behavioral assessments and functional magnetic resonance imaging (fMRI) to examine the specificity of two potential core criteria for IGD diagnosis, i.e., the “unsuccessful attempts to control the participation in Internet games” (unsuccessful control) and the “use of Internet games to escape or relieve a negative mood” (negative mood escape) in the DSM-5. Design, Setting, and Participants: This observational study was conducted between October 2012 and June 2020. Retrospective type for Experiment 3. Eligible participants aged 14 to 32 years were enrolled. In Experiment 1 and 2, patients with IGD (PIGD), non-dependent Internet gaming participants (NIGP), and controls were enrolled. In Experiment 3, PIGD patients and controls were enrolled. Analysis began February

2015 and ended June 2020. Exposures: PIGD met the DSM-5 criteria for Internet gaming disorder. Main Outcomes and Measures: In Experiment 1, unsuccessful control-related behavioral and brain network measures. In Experiment 2, negative mood escape-related behavioral and brain network measures. In Experiment 3, retrospective behavioral data on impulse control and negative mood escape. Results: In Experiment 1, 141 participants (135 male) and the mean (SD) age was 19.53 (3.23) and 23.51 (1.80) for PIGD and NIGP respectively. In Experiment 2, 119 participants (103 male) and the mean (SD) age was 20.00 (3.23) and 23.57 (1.60) for PIGD and NIGP respectively. Compared to controls, the PIGD but not the NIGP showed increased discounting rate (mean, 0.093, 95% CI, 0.034-0.152)/Non-planning impulsiveness (mean, 2.249; 95% CI, 0.076-4.422) as well as altered frontoparietal network (mean, 3.458; 95% CI, 0.163-6.754), while both the PIGD and NIGP showed increased negative mood escape/loss minus gain perseverance (mean, 0.306; 95% CI, 0.002-0.610) and altered anterior cingulate cortex-insula-amygdala network (mean, 3.576; 95% CI, 0.208-6.945). Retrospective data showed an increased change in negative mood escape but not impulse control in PIGD. Conclusions and Relevance: This study provides consistent behavioral and neuroimaging evidence supporting that unsuccessful control rather than negative mood escape represents a specific feature of IGD. These findings have implications for the definition, diagnosis, and prevention of IGD in the future.

青少年吸烟成瘾者短期戒断状态下的脑电研究

董芳¹ 喻大华¹ (通讯作者)

¹ 内蒙古科技大学信息工程学院, 包头, 014010, fmydh@imust.edu.cn

摘要 吸烟是全球可预防的主要死亡原因之一。我国 15-24 岁青少年吸烟率从 2003 年的 8.3% 上升到 2013 年的 12.5%。早期吸烟和青少年时期的持续性吸烟会发展成为尼古丁依赖, 甚至导致终身吸烟。以往研究发现, 尼古丁戒断不仅会引起吸烟者大脑功能的变化, 还会造成认知控制能力的降低和对香烟渴求的增加, 促使戒烟失败而导致复吸。在本研究中, 我们采用 Go/NoGo 任务和 Flanker 任务, 通过青少年吸烟者在吸烟满足状态和 12 小时短期戒断状态下, 观察并比较与抑制控制相关的成分 N200、P300 和与错误处理相关的成分错误相关负电位 (ERN)、错误正电位 (Pe) 的波幅和潜伏期, 分析青少年吸烟者在满足状态和戒断状态下的事件相关电位 (ERP) 及行为学的变化, 探讨戒断对青少年吸烟者认知控制能力和错误监测能力的影响。实验结果显示, 青少年吸烟者在 12 小时戒断状态下, N200 潜伏期延长。同时, N200 潜伏期与戒断状态下行为学表现中的 NoGo 错误数和 Go 反应时具有显著相关关系。此外, 青少年吸烟者在 12 小时戒断状态下的 Pe 波幅明显降低。这些结果表明, N200 潜伏期可能与青少年吸烟者在短期戒断条件下的抑制控制能力有关。更重要的是, 青少年吸烟者在短期戒断状态下对错误发生后的错误处理能力降低, 这可能是由戒断引起。这些研究结果可能为青少年吸烟者短期戒断状态下的神经生理学机制提供新的见解。

EEG Study of Adolescent Smoking Addicts in Short-term Abstinence

Dong Fang, YU Dahua

School of Information Engineering, Inner Mongolia University of Science and Technology, Baotou
014010, China

Abstract: Smoking is one of the main preventable causes of death in the world. The smoking rate of adolescents aged 15–24 in China rose from 8.3% in 2003 to 12.5% in 2013. Early smoking and persistent smoking during adolescence may develop into nicotine dependence and even lead to lifelong smoking. Previous studies have found that nicotine abstinence may not only cause changes in the brain function of smokers, but also cause decrease of cognitive control ability and increase in craving for cigarettes which promote failure of smoking cessation and lead to relapse. In this study, we used the Go/NoGo task and the Flanker task to observe and compare the amplitude and latency of N200, P300 associated with inhibition control and error-related negative (ERN), error positive potential (Pe) associated with error processing for adolescent smokers between satiety state and 12-hours short-term abstinence state, to analyze the

changes in event-related potentials (ERP) and behaviors in two states, and to explore the effect of abstinence on the cognitive control ability and error monitoring ability of adolescent smokers. The results showed that the latency of N200 was prolonged in adolescent smokers after 12-hours abstinence. At the same time, there were significant correlations between the latency of N200 and behavioral performance of NoGo errors and Go reaction time in abstinence. In addition, the Pe amplitude of adolescent smokers in 12-hours abstinence state was significantly reduced. These results indicated that the latency of N200 may be related to the inhibitory control ability of adolescent smokers under short-term abstinence conditions. More importantly, the ability to handle errors after an error occurs of adolescent smokers in abstinence reduced, which may be caused by abstinence. These findings may provide new insights into the neurophysiology mechanism of adolescent smokers in short-term abstinence state.

社会治理背景下青少年智能手机成瘾的生成与治理

姜永志^{1,2,3}

1 内蒙古民族大学教育科学学院, 通辽, 028000

2 内蒙古师范大学心理学院, 呼和浩特, 010022

3 南开大学周恩来政府管理学院, 天津, 300350

摘要 智能手机成瘾作为移动新媒体发展衍生出的社会问题, 对人们的身心健康发展和社会秩序的良性发展均产生了一定的负面影响。智能手机成瘾的形成受到个体内部驱动力与外部驱动力的双重作用。从个体内部诱发驱动力来看, 主要包括源自个体内部的心理需求动机、人格特质、情绪体验等。从个体外部诱发驱动力来看, 移动新媒体时代的社会背景和环境“迫使”青少年不得不使用智能手机, 而社会线索刺激则加剧了人们对智能手机使用的心理渴求感。开展对智能手机成瘾问题的“由心而治”和实现智能手机成瘾问题的“善治”, 既要考虑智能手机成瘾的内部诱因驱动力, 也要兼顾智能手机成瘾的外部诱因驱动力, 同时还要站在社会管理的社会治理视角寻求智能手机成瘾治理的多元解决路径。研究1采用心理测量法, 对青少年人格特质(神经质、外向性、自恋性等)、负性情绪(错失恐惧、社交焦虑、孤独感等)、心理动机(积极评价、社会支持、缓解压力、寻求满足等)与智能手机成瘾(尤指问题性社交媒体使用)的关系及作用机制进行了研究, 揭示了上述变量对智能手机成瘾的影响及作用机制。研究2采用行为实验, 对青少年智能手机成瘾(尤指问题性社交媒体使用)的注意偏向和智能手机使用的心理渴求感进行实验研究, 发现图片相关刺激能诱发被试更强烈的使用心理渴求感, 并且智能手机成瘾者对成瘾相关刺激存在注意偏向, 且成分为注意警觉和注意转移困难。研究3采用干预实验, 使用正念认知训练和心理健康教育活动课对智能手机成瘾者进行矫正干预, 发现正念认知训练和心理健康教育活动课对智能手机成瘾者能产生一定积极干预效果。基于相关理论与实证研究, 提出智能手机成瘾的治理路径可从智能手机成瘾治理的个体心理发展路径, 家庭、学校和社会教育路径, 以及社会管理路径三个方面开展社会行为干预与矫正。

The Formation and Management of Smart Phone Addiction in Adolescents under the Background of Social Governance

Jiang Yongzhi^{1,2,3}

1 School of Education Science, Inner Mongolia University for Nationalities, Tongliao 028000

2 School of psychology, Inner Mongolia Normal University, Hohhot 010022

3 Zhou Enlai School of government management, Nankai University, Tianjin 300350

Abstract: As a social problem derived from the development of mobile new media, smart phone addiction has a certain negative impact on people's physical and mental health development and the healthy development of social order. The formation of smart phone addiction is affected by both internal and external driving forces. From the perspective of individual internal driving force, it mainly includes psychological needs motivation, personality traits, emotional experience and so on. From the perspective of individual external driving force, the social background and environment of mobile new media era "force" adolescents to use smart phones, while social cues stimulate people's psychological desire for smart phones. To carry out the "heart to heart" and "good governance" of smart phone addiction, we should not only consider the internal incentive drive of smart phone addiction, but also take into account the external incentive drive of smart phone addiction. At the same time, we should also seek multiple solutions from the perspective of social management. In Study 1, the relationship between personality traits (neuroticism, extroversion, narcissism, etc.), negative emotions (fear of missing out, social anxiety, loneliness, etc.), psychological motivation (positive evaluation, social support, stress relief, seeking satisfaction, etc.) and intelligent hand addiction (especially the use of problematic social media) were studied by psychometric method. The effects of the above variables on the addiction of smart phones and its mechanism were discussed. In Study 2, behavioral experiments were conducted to investigate the attentional bias and psychological craving of adolescents with smart phone addiction (especially problematic social media use). It was found that picture related stimuli could induce more intense psychological craving. Moreover, the attention bias of smart phone addicts to addiction related stimuli was found, and the components were attention vigilance and it is difficult to transfer. In the third study, mindfulness cognitive training and mental health education activities were used to correct and intervene smart phone addiction. It was found that mindfulness cognitive training and mental health education activities could have a positive effect on smart phone addiction. Based on the relevant theoretical and empirical research, the governance path of smart phone addiction is proposed, which can be carried out from three aspects: individual psychological development path, family, school and social education path, and social management path.

Keywords: smart phone addiction, problematic social media use, inducing mechanism, social governance

新冠肺炎疫情中在线摄影干预对网络成瘾的降低：一项随机对照试验

马金金¹ 贺雯琪¹ 强晓薇¹ 李凡姝¹ 朱焕雅¹ 甘怡群¹ (通讯作者)

1 北京大学心理与认知科学北京市行为与健康重点实验室, 北京, 100871

摘要 新冠肺炎疫情期间长期的居家隔离和社会恐慌, 导致民众对生活的控制感降低, 网络成瘾的现象越来越严重。针对疫情期间减少接触的现实要求, 本研究开发了在线的摄影干预, 并通过随机对照试验考察了在线摄影干预是否可以通过增加控制感, 缓解疫情期间的网络成瘾及压力、焦虑、抑郁情绪, 提升心理健康。在线招募具有网络成瘾倾向的参与者, 将其随机分配到干预组 ($n=64$) 和控制组 ($n=81$), 干预组将完成连续十天的摄影干预任务, 控制组在追踪完成后再进行训练, 分别在干预前、干预后、干预结束 7 天后进行了前测、后测和追踪。结果表明将性别、年龄、教育水平, 主观社会经济地位和社会支持作为协变量控制后, 将网络成瘾水平作为因变量, 是否干预 (干预组 vs. 控制组) 与时间 (前测 vs. 后测 vs. 追踪) 的交互作用显著 ($F(1.68, 238.71)=5.51, p=0.007, \eta_p^2=0.037$), 干预组与控制组相比, 网络成瘾水平在后测和追踪中降低的效应量更大 ($\eta_p^2=0.342$ vs. $\eta_p^2=0.095$)。压力、焦虑、抑郁、正负性情绪作为因变量, 时间的主效应显著 (Pillai's trace = 0.135, $F(10, 133)=2.08, p=0.030, \eta_p^2=0.135$), 无论干预组还是控制组情绪状态均有改善。此外, 社会支持能显著调节

控制感（后测）对干预和网络成瘾水平（追踪）的中介作用($\beta=0.17$, $SE=0.072$, $95\%CI=[0.029, 0.315]$), 只有对高社会支持的个体而言, 中介作用显著($\beta=0.27$, $SE=0.104$, $95\%CI=[0.066, 0.478]$)。研究结果表明当社会支持充足时, 在线摄影干预可以通过提升控制感, 帮助个体降低因新冠疫情导致的网络成瘾, 为通过在线心理干预进行疫情防护的可行性和有效性提供了重要证据。

Online Photography Intervention Reduces Internet Addiction During COVID-19: A Randomized Controlled Trial

Jinjin Ma¹, Wenqi He¹, Xiaowei Qiang¹, Fanshu Li¹, Huanya Zhu¹, Yiqun Gan^{1*}

¹ Beijing Key Laboratory of Behavior and Mental Health, School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871

Abstract: During COVID-19 epidemic period, long-term home quarantine and social panic has led to a reduction in people's sense of control over their lives, and Internet addiction has become more and more serious. In response to the realistic requirement of reducing face-to-face contact during the epidemic, this study developed online photography intervention, and investigated whether it can increase a sense of control and relieve Internet addiction, stress, anxiety, and depression during the epidemic through a randomized controlled trial. Participants with Internet addiction tendencies were recruited online and randomly assigned to the intervention group ($n=64$) and the control group ($n=81$). The intervention group completed ten-day photographic intervention tasks, while the control group completed training after follow-up test. The pre-test, post-test, and follow-up performed before the intervention, after the intervention, and 7 days after the intervention respectively. The results showed that after controlling gender, age, education level, subjective socioeconomic status and social support as covariates, and using Internet addiction level as the dependent variable, the interaction effect of intervention (intervention group vs. control group) and time (pretest vs. posttest vs. follow-up) was significant ($F(2,138)=5.355$, $p=0.006$, $\eta_p^2=0.072$), such the intervention group($\eta_p^2=0.342$) had a larger effect size of reduced internet addiction levels at post-test and follow-up compared to the control group($\eta_p^2=0.095$). With stress, anxiety, depression, positive and negative emotion as the dependent variables, the main effect of time was significant (Pillai's trace =0.135, $F(10,133)=2.08$, $p=0.030$, $\eta_p^2=0.135$), such that emotional status improved in both the intervention and control groups. In addition, social support significantly moderated the mediating effect of sense of control (post-test) on the relationship of intervention and Internet addiction (follow-up) ($\beta=0.17$, $SE=0.072$, $95\% CI=[0.029, 0.315]$), and the mediating effect was significant only for individuals with high social support ($\beta=0.27$, $SE=0.104$, $95\% CI=[0.066, 0.478]$). The finding suggests that when social support is adequate, online photography intervention can help individuals reduce Internet addiction during COVID-19 by enhancing the sense of control, providing important evidence for the feasibility and effectiveness of epidemic protection through online psychological interventions.

Abstract: COVID-19, photography intervention, Internet addiction, sense of control

后疫情时代的网络成瘾问题和在线干预方案

甘怡群（通讯作者） 朱焕雅 马金金

北京大学心理与认知科学学院, 北京, ygan@pku.edu.cn

摘要 新冠肺炎的爆发破坏了民众正常生活秩序, 加剧了网络成瘾的问题。我们用大样本比较了新冠肺炎爆发前后青年人网络成瘾的变化, 发现疫情显著增加了网络成瘾的症状。在公共危机状态下, 心理援助资源的稀缺和保持社交距离的要求使开发高效易得的干预新范式势在必行。因此, 如何将疫情作为契机催生临床和健康心理学范式变革, 利用智能技术健全援助体系成为亟待解决的问题。远程心理健康干预(Tele-mental health)是解决这个问题的方案。开发一系列循证、零花费、易操作、个体化的低强度数码干预包是疫情期值得推行的干预新途径。为此, 我们团队开发了 2 套缓解网络成瘾提升心理健康的在线干预包, 分别采用摄影

干预和基本需要满足干预,通过随机对照研究初步验证了其有效性。这两个程序通过提升自我控制的中介机制降低了成瘾性的缺乏控制和渴求维度。下一步工作包括建立心理健康干预包公众自助平台,配合现有热线和咨询服务,使之在疫情后仍能长期发挥作用。

基本需要满足在线干预对网络成瘾现象的缓解:一项随机对照试验

朱焕雅¹ 张聪¹ 苏嘉宝¹ 李忻奕² 马金金¹ 甘怡群¹ (通讯作者)

1 北京大学心理与认知科学学院北京市行为与健康重点实验室,北京,100871, ygan@pku.edu.cn

2 北京师范大学心理学部,北京,100875

摘要 新冠肺炎疫情爆发时期,自我隔离和主动保持社交距离已成为民众生活的一部分。这样的生活习惯转变加剧了网络成瘾的问题。网络成瘾的产生主要与控制感、归属与社交、自我实现和自我超越等心理需求相关,这与自我决定理论中的自主、能力、关系三个基本心理需要密切相关。疫情防控的需要产生了对心理需求满足的环境限制,导致通过网络满足心理需要的情况更易发生。但随着疫情缓解和复工复产,仍然保持网络使用相关的成瘾行为,可能会对已恢复的正常生活带来负面影响。因此,本研究针对疫情背景下加剧的网络成瘾问题,着眼于通过非网络渠道满足民众的心理需要,根据自我决定理论开发出基本需要满足远程心理干预,并通过随机对照研究初步验证了其缓解网络成瘾现象的有效性。本研究在线招募有网络成瘾倾向的参与者,将其随机分配到干预组($n=66$)和控制组($n=85$),干预组将完成持续十天的需要满足干预,控制组在追踪完成后再进行训练,分别在干预前、干预第五天、干预后、干预结束7天后进行了前测、中测、后测和追踪。结果表明,MANCOVA分析因变量发现,干预前后两组网络成瘾的总体得分和分维度得分均有显著下降,同时后测时干预组的总体得分($p=0.022$, $95\%CI=[-5.69,-0.44]$, $Cohen's d=0.38$)、失控($p=0.024$, $95\%CI=[0.24,3.32]$, $Cohen's d=0.28$)和渴求($p=0.031$, $95\%CI=[-2.89,-0.14]$, $Cohen's d=0.40$)分维度得分均显著低于对照组。在干预和前后测时间点的交互作用上,网络成瘾总体显著($F(1,135)=5.34$, $p=0.022$, $\eta^2=0.038$);其中失控($F(1,139)=5.24$, $p=0.024$, $\eta^2=0.036$)和渴求($F(1,139)=4.72$, $p=0.031$, $\eta^2=0.033$)维度均显著。随后的中介分析发现,消极情绪中介心理需要满足的变化对网络成瘾和焦虑抑郁的影响。研究结果表明在线基本需要满足干预可以帮助个体降低新冠疫情背景下的网络成瘾。

关键词 新冠肺炎(COVID-19),网络成瘾,心理需要满足,在线干预,随机对照

Basic Psychological Need Satisfaction Online Intervention Reduces Internet Addiction During COVID-19: A Randomized Controlled Trial

Huanya Zhu¹, Cong Zhang¹, Jiabao Su¹, Xinyi Li², Jinjin Ma¹, Yiqun Gan¹

2 Psychology Department, Beijing Normal University, Beijing, 100875

Abstract: Self-isolation and social distance have become parts of people's life during COVID - 19 outbreak period, which aggravates the problem of Internet addiction. The generation of Internet addiction is mainly related to psychological needs such as sense of control, belonging and social contact, self-realization and self-transcendence, which is closely related to the three basic psychological needs of autonomy, competence and relationship in the self-determination theory. The need for epidemic prevention and control has created environmental constraints to satisfy psychological needs, making it more likely that psychological needs can be met through the Internet. However, as the epidemic abates and work resumes, maintaining Internet addictive behaviors may have a negative impact on the normal life that has been restored. Therefore, this research aims at the problem of Internet addiction aggravated in the context of the COVID - 19 epidemic. It focuses on satisfying people's psychological needs through non-network channels, and develops an online basic psychological needs intervention based on self-determination theory, and

initially verifies its effects through a randomized controlled trials study. This study recruited participants with Internet addiction tendency online and randomly assigned them to intervention group ($n = 66$) and control group ($n = 85$). The intervention group completed a ten-day need satisfaction intervention and the control group will be trained after the follow-up is completed. The pre-test, mid-test, post-test and follow-up will be performed before the intervention, on the fifth day, after the intervention, and 7 days after the intervention. MANCOVA analysis of the dependent variables found significant decreases in overall and sub-dimension scores for Internet addiction in both groups before and after the intervention, along with significant decreases in overall scores in the intervention group at posttest ($p=0.022$, 95% $CI=[-5.69,-0.44]$, $Cohen's d = 0.38$), loss of control ($p=0.024$, 95% $CI=[0.24,3.32]$, $Cohen's d = 0.28$) and craving ($p=0.031$, 95% $CI=[-2.89,-0.14]$, $Cohen's d = 0.40$) sub-dimension scores were significantly lower than the control group. On the interaction between intervention and pre- and posttest time points, Internet addiction was significant overall ($F(1,135) = 5.34$, $p = 0.022$, $\eta_p^2 = 0.038$); where the loss of control ($F(1,139) = 5.24$, $p = 0.024$, $\eta_p^2 = 0.036$) and craving ($F(1,139) = 4.72$, $p = 0.031$, $\eta_p^2 = 0.033$) dimensions were significant. Mediation analysis found that negative affect mediates changes in psychological needs satisfaction for Internet addiction, anxiety and depression. The results suggested that needs satisfaction online interventions can help individuals reduce Internet addiction in the context of COVID-19 epidemic.

Keywords: COVID-19, internet addiction, online psychological intervention, psychological need satisfaction, randomized controlled trials

手机端解释偏差修正训练对青少年社交焦虑的干预研究

崔丽霞¹ 毛宁宁¹ 高金帆¹

¹ 首都师范大学心理系, 北京市“学习与认知”重点实验室, 北京, 100048

摘要 青春期是发展理性思维的敏感时期。适应性思维模式的培养对青少年理性思维的培养和社会焦虑的预防具有重要意义。最近的研究表明, 解释认知偏差修正(CBM-I)可以促进乐观解释偏差的产生, 降低青少年的社交焦虑。本研究旨在通过应用软件探讨八期 CBM-I 训练对中国青少年社交焦虑的影响。将 30 名中国高社交焦虑青少年随机分为训练组 and 对照组。训练组每周两次登录 CBM-I 申请, 连续四周接受 CBM-I 阳性训练, 对照组在等待四周集中接受与训练组相同测试任务和问卷测验后, 并集中进行相同的认知训练。训练后, 训练组的正解释偏差显著增加, 负解释偏差显著低于对照组($p < 0.05$)。训练组的社交焦虑得分显著低于对照组($p < 0.05$)。这说明 CBM-I 应用程序作为中国青少年社交焦虑的多时段干预可能具有潜在的应用价值。

关键词 青少年, 多时段, CBM-I 手机 app, 解读偏差, 社交焦虑

Effects of the Ambiguous Scenarios Paradigm on Social Anxiety in Chinese Adolescents Based on a Mobile App

Lixia Cui¹, Ningning Mao¹, Jinfan Gao¹

¹ Beijing Key Laboratory of Learning and Cognition and School of Psychology, Capital Normal University, Beijing, China

Abstract: Adolescence is a sensitive period in the development of rational thinking. The training of adaptable thinking mode is of great significance for the cultivation of adolescents' rational thinking and the prevention of social anxiety. Recent evidence has shown that cognitive bias modification of interpretation (CBM-I) may promote an optimism interpretation bias and reduce adolescents' social anxiety. The purpose of this study was to explore the eight-session CBM-I training effect on the social anxiety of Chinese adolescents based on an app. Thirty Chinese adolescents with high social anxiety were randomly assigned to the training group and the control group. The training group logged into the CBM-I application twice a week for four weeks to accept positive CBM-I training, and the control group only accepted the same recognition test task and questionnaire as the training group after 4-week waiting, and then received the same training in two hours. After training, the positive interpretation bias in the

training group was significantly increased, with significantly reduced negative interpretation bias compared to the control group ($p < 0.05$). The social anxiety score of the training group was significantly lower than that of the control group ($p < 0.05$). This indicates that the CBM-I app may have potential applications as a multi-session intervention for social anxiety in Chinese adolescents.

基于接纳承诺疗法的 DNA-V 模型：线下和线上干预效果的比较研究

张烨¹ 崔丽霞¹

¹ 首都师范大学心理系, 北京市“学习与认知”重点实验室, 北京 100048

摘要 研究基于接纳承诺疗法的青少年干预 DNA-V 线下和线上干预对我国中学生焦虑情绪的影响作用及认知融合的中介作用, 为下一步针对青少年的学校心理干预提供指导依据。方法: 以北京市某中学初二年级的学校课程为背景, 以班级为单位, 随机分为 DNA-V 干预组 ($n=40$)、DNA-V 网络干预组 ($n=53$)、主动干预对照组 (学校常规心理课程; $n=46$) 同步进行 6 周干预。采用中学生焦虑量表、认知融合量表 (Cognitive Fusion Questionnaire, CFQ) 分别在干预前 2 周内 (T1)、干预后 1 周内 (T2)、干预结束后 2 个月 (T3) 进行施测; 并在干预后 1 周内进行随机选取 12 名被试进行访谈。结果: 对焦虑情绪的重复测量结果显示: 时间与组别的交互作用显著 [$F = 2.52, p = 0.046, \eta_p^2 = 0.04$]。DNA-V 组在 T3 的分数显著低于 DNA-V 网络组 ($p = 0.061$), DNA-V 组的 T3 分数显著低于 T1 ($p = 0.000$) 和 T2 ($p = 0.043$)。对认知融合的重复测量结果显示: 时间与组别的交互作用显著 [$F = 3.71, p = 0.007, \eta_p^2 = 0.05$]。DNA-V 组在 T3 的分数显著低于主动对照组 ($p = 0.073$) 和 DNA-V 网络组 ($p = 0.008$), DNA-V 组的 T3 分数显著低于 T1 ($p = 0.001$) 和 T2 ($p = 0.003$)。对焦虑情绪的 HLM 分析结果表明: DNA-V 组和主动对照组相比, 对焦虑分数的降低有加速的作用, 可以使降低的速度显著加速 3.12 分, 但认知融合的中介作用不显著。结论: 基于接纳承诺疗法的 DNA-V 干预可以在我国学校课堂背景下, 有效降低中学生的认知融合水平和焦虑情绪, 可考虑作为提高中学生心理健康水平的有效训练。

DNA-V Models Based on Acceptance Commitment Therapy: A Comparative Study of The Effects of Online and Face to face interventions

Zhang Ye¹, Cui Li-Xia¹

¹ Department of Psychology, Capital Normal University,
Beijing Key Laboratory of Learning and Cognition, Beijing 100048, China)

Abstract: To evaluate the influence of DNA-V face to face and online intervention for adolescents based on acceptance commitment therapy on anxiety of Middle school students in China and the mediating effect of cognitive fusion, so as to provide guidance for the next step of school psychological intervention for adolescents. Methods: Based on the school curriculum of grade two in a middle school in Beijing, the students were randomly divided into DNA-V face to face intervention group ($n=40$), DNA-V web-based intervention group ($n=53$) and active control group (school routine psychological curriculum; $N = 46$) Synchronous intervention for 6 weeks. The anxiety Scale and Cognitive Fusion Questionnaire (CFQ) for middle school students were used within 2 weeks before the intervention (T1), 1 week after the intervention (T2), and 2 months after the intervention (T3). Twelve students were randomly selected for interviews within one week after the intervention. Results: Repeated measures of anxiety showed significant interaction between time and group [$F = 2.52, p = 0.046, \eta_p^2 = 0.04$]. The T3 score of DNA-V face to face group was significantly lower than that of DNA-V web-based group ($P = 0.061$), and the T3 score of DNA-V face to face group was significantly lower than that of T1 ($p = 0.000$) and T2 ($p = 0.043$). Repeated measures of cognitive fusion showed significant interaction between time and group [$F = 3.71, p = 0.007, \eta_p^2 = 0.05$]. The T3

score of DNA-V face to face group was significantly lower than that of the active control group ($p = 0.073$) and the DNA-V web-based group ($p = 0.008$), and the T3 score of DNA-V face to face group was significantly lower than that of T1 ($p = 0.001$) and T2 ($p = 0.003$). The HLM analysis of anxiety showed that compared with the active control group, The DNA-V face to face group had an accelerated effect on the reduction of anxiety scores, which could significantly accelerate the reduction by 3.12 points, but the mediating effect of cognitive fusion was not significant. Conclusion: The DNA-V intervention based on acceptance commitment therapy can effectively reduce the cognitive integration level and anxiety of middle school students in the classroom setting of our country, and can be considered as an effective training to improve the mental health level of middle school students.

资源匮乏抑制亲社会行为的脑机制

崔芳¹ 刘洁² 古若雷³

1 深圳大学心理学院, 深圳, 518060

2 深圳大学脑疾病与认知研究中心, 深圳, 518060

3 中国科学院心理研究所, 北京, 100101

摘要 行为研究表明, 资源匮乏的情况下, 人的行为模式、特别是与匮乏资源相关的亲社会行为(例如分享)会显著改变: 个体更加自私, 亲社会行为明显减少。而这一现象尚未从神经科学的角度被深入探讨, 神经证据的缺乏阻碍了对这一重要社会现象的理解、预测和调节。近期, 本课题组通过系列实验, 试图从神经科学层面探讨资源匮乏对亲社会分享行为的调节机制。本系列实验设计了“噪音解救资源”范式, 可以有效诱发共同面临危险而关键性资源匮乏的现实情境。实验1发现, 当解救资源匮乏时, 相比于资源充足情况下, 被试的分享行为更自私。神经层面上发现, 颞顶联合区、内侧前额叶和后扣带皮层等脑区在资源匮乏时激活显著降低。动态因果模型分析显示, 右侧颞顶联合区到内侧前额叶的功能连接强度随着资源匮乏程度的提高而增强。此外, 相关分析发现, 个体共情特质与资源匮乏对分享行为的调节强度相关: 共情越高, 资源匮乏对分享行为的影响越弱。实验2通过引入噪音威胁的不确定性因素发现: 强噪音出现的可能性越大, 个体体验到的焦虑水平越高, 其在分享行为中就越自私。神经层面上发现, 双侧前脑岛的激活水平受到不确定性的调节, 并与主观焦虑水平评价相关。而个体分享行为的自私程度受到不确定性调节的强度与左侧颞顶联合区的激活强度相关。动态因果模型分析显示, 右侧前脑岛与左侧颞顶联合区之间的功能连接强度预测了个体分享行为受不确定性焦虑影响的程度。本系列实验初步验证了以下两个假设: 第一, 在确定性情境下, 资源匮乏会通过抑制共情相关脑网络, 降低共情水平, 导致个体更加自我中心, 从而减少亲社会行为的发生。第二, 在不确定性情境下, 不确定性诱发的焦虑情绪反应为杏仁核或脑岛的激活; 这些边缘系统通过干扰共情相关脑网络的正常工作, 降低共情水平, 从而减少亲社会行为。

2.Center for Brain Disorders and Cognitive Neuroscience, Shenzhen University, Shenzhen, China;

3. CAS Key Laboratory of Behavioral Science, Institute of Psychology, Beijing, China;

Abstract: Previous behavior studies have shown that, in the case of resource scarcity, people's behavior patterns, especially the prosocial behaviors (such as sharing), would change significantly: individuals become more selfish and sharing behaviors are significantly suppressed. However, this phenomenon has not been deeply explored from the perspective of neuroscience. Through a series of experiments, our lab explored the modulating mechanism of resource scarcity on prosocial sharing behavior. To investigate these issues, we designed a novel paradigm in which participants decided whether (and how much) to share an amount of "relieving resources" (for counteracting unpleasant noises), which mimics real-life situations that we cost our own resources to help others escape from adversity. Experiment 1 found that when the rescue resources were scarce, participants were more selfish in sharing decision makings than when the resources were sufficient. At the neural level, the activation of the temporoparietal junction(TPJ), medial prefrontal cortex(mPFC), and posterior cingulate cortex(PCC) decreased significantly when resources were scarce. Dynamic causal modeling (DCM) analysis showed that the strength of functional connectivity from the TPJ to mPFC was modulated by the scarcity of the resource. In addition, the correlational analysis found that empathy trait was related to the modulating strength of resource scarcity on sharing behavior such that the higher the empathy scores one has, the weaker the impact of resource scarcity on his/her sharing behavior. In Experiment 2,

by introducing the uncertainty of noise threat, we found that the greater the probability of receiving an unpleasant strong noise, the higher the level of anxiety individuals experienced, and the more selfish they are in sharing decisions. On the neural level, the activation level of the bilateral anterior insula (AI) was modulated by uncertainty and correlated with a subjective rating of anxiety. The degree of an individual's selfishness in sharing behavior modulated by uncertainty is related to the activation of the TPJ. DCM analysis showed that the strength of functional connectivity between the AI to TPJ predicted the degree of individual sharing behavior affected by uncertainty anxiety. This series of experiments preliminarily verified the following two hypotheses: (1) Resource scarcity may reduce the level of empathy by inhibiting the brain regions related to empathy (e.g., TPJ, mPFC, PCC), leading to more egocentric-thinkings, thus reducing sharing behaviors; (2) in the uncertain situation, the anxiety induced by uncertainty triggered the activation AI. These limbic systems reduce the level of empathy and prosocial behavior by interfering with the normal work of empathy- such as TPJ.

E-mail:yuanjiajin168@sicnu.edu.cn

摘 要 自发的情绪调节与人们的心理健康密切相关，以往研究表明自发认知重评的增多与减弱的情绪反应及抑郁水平下降有关。然而，迄今为止自发认知重评的内在神经机制尚未明晰。因此，我们使用个体差异的研究方法，结合核磁共振技术从静息态与任务态两个角度对自发认知重评的神经机制进行探究。在研究中除了评估被试自发认知重评的程度之外，我们基于 105 名被试的静息态 fMRI 数据分析了他们大脑默认模式网络的时间动态性差异，并利用任务态 fMRI 考察了 50 名被试在图片观看任务中的杏仁核功能连接变化，进而探究个体自发认知重评的程度与这些指标变化之间的联系。我们的结果发现倾向于自发认知重评的个体其默认模式网络有着较高的时间复杂性，并且在观看任务中他们的眶额叶皮层和基底杏仁核的功能连接会更强。进一步的中介分析结果表明，在自发认知重评的过程中，个体前额叶皮层的时间复杂性与眶额叶皮层和基底杏仁核的功能连接发挥着重要作用。一方面，前额叶皮层的高时间复杂性反映出自发认知重评个体有着较强的认知灵活性。另一方面，在自发认知重评的过程中，眶额叶皮层对基底杏仁核的调制可能是个体情绪反应发生变化的必要条件。总之，当前的研究发现澄清了自发认知重评的神经机制，有助于人们理解那些与情绪调节异常有关的脆弱性因素。

The neural mechanism of spontaneous reappraisal

Wei Gao, JiaJin Yuan

The Affect Cognition and Regulation Laboratory (ACRLab), Institute of Brain and Psychological Science, Sichuan Normal University, Chengdu, Sichuan

Faculty of Psychology, Southwest University, Chongqing, China

Correspondence: JiaJin Yuan, E-mail: yuanjiajin168@sicnu.edu.cn

Abstract: Spontaneous emotion regulation is known to be associated with mental health, and increased spontaneous reappraisal is closely correlated with decreased emotion reaction and depression. However, neural mechanisms subserving spontaneous reappraisal is unclear. Here, we investigated resting-state and task-based spontaneous reappraisal processes by using an individual-difference approach. Besides assessing the degree of spontaneous reappraisal, we also explored the temporal complexity of the default mode network (DMN) from 105 participants during resting-state, and the alteration functional couplings of amygdala from 50 participants during

emotional-picture watching task, respectively. Our results showed that individuals with spontaneous reappraisal were significantly correlated with higher temporal complexity of DMN during resting-state, and higher functional coupling between the orbitofrontal cortex (OFC) and the basolateral amygdala (BLA) during watching task. Moreover, further mediation analyses suggested that temporal complexity of medial prefrontal cortex (MPFC) and functional coupling of the right OFC-BLA play important roles in spontaneous reappraisal processes. On the one hand, individuals with spontaneous reappraisal have increased temporal complexity of MPFC represent higher cognitive flexibility. On the other hand, in spontaneous reappraisal processes, the modulation of BLA activity from OFC may be necessary for changing emotional response. These findings clarify the neural mechanisms of spontaneous reappraisal, which may help shed light on important vulnerability factors implicated in emotional dysregulation.

Keywords: reappraisal, temporal complexity, DMN, emotion regulation, amygdala

社会拥挤对个人空间圈的影响

韩明 汪学敏 蒯曙光 (通讯作者)

华东师范大学心理与认知科学学院, 脑科学与教育创新研究院, 上海市心理健康与危机干预重点实验室认知神经科学研究所, 上海, 200062

摘要 个人空间圈是指在心理上属于个体的、在身体外周的一个不可见区域。当他人侵入我们的个人空间圈时, 我们会感受到威胁和不舒适。传统的研究对个人空间圈仅作了概念化的定义, 并未对其进行精确量化的描述。我们的研究利用虚拟现实的技术构建场景和人物, 并且量化的操纵这些场景。同时, 我们采用停止距离实验范式, 让一个虚拟人在预设的虚拟场景中从被试的正前方走向被试, 直至被试感受到不舒适并要求虚拟人停止靠近, 从而获得个人空间圈的大小。通过这样的实验, 我们精确地测量出个体的个人空间圈。我们的结果发现个人空间圈不是一个固定的区域, 而是受到人们感受到的威胁程度而动态调节的。在较为安全的环境中, 个人空间圈较小, 而当危险场景出现时, 人们需要更大的个人空间圈。此外, 对于环境的量化操控使得我们进一步发现, 社会拥挤会降低个人空间圈的需求。当场景中人物数量增加时, 个人空间圈会随之收缩。这种收缩仅限于社会拥挤, 而非物理拥挤。同时, 这种个人空间圈的收缩现象只会发生在安全友善的社会场景中。这一研究量化描述了人类个人空间圈及其影响因素。其研究结果对智能机器人交互设计具有一定的应用意义。

关键词 社会拥挤, 个人空间, 虚拟现实

Effect of social crowding on human personal space

Ming Han, Xue-Min Wang, Shu-Guang Kuai

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, the Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

Abstract: The personal space is an invisible area around a human. Humans feel threatened and uncomfortable when others intrude into his/her personal space. Previous research has only conceptualized the human personal space and but has not provided a quantitative description. Our current study used virtual reality techniques to construct and manipulate virtual scenes. We applied the stop-distance paradigm to measure the size of personal space. In particular, an avatar walked towards a participant in a pre-defined virtual scene until the participant felt uncomfortable and stopped the avatar. We found that the personal space was not a fixed area, but was dynamically adjusted by the perceived threat. Participants' personal space was smaller in a safer environment, while they needed larger personal space when in a dangerous situation. Further experiments found that social crowding decreased the size of the personal space. This effect was limited to social crowding but not physical crowding and only occurred in safe and friendly social scenes. This study provides a quantitative description of human personal space and the factors that influence it and valuable guides to design of humanoid social robots.

Keywords: social crowding, personal space, virtual reality

策略性决策框架下的交流行为及其认知神经机制

朱露莎

北京大学 心理与认知科学学院, 北京, 10087, lushazhu@pku.edu.cn

摘要 交流是人类最重要的社会行为之一。不同于竞争、合作、共情等高级社会认知功能,我们对复杂交流行为所依赖的认知和神经机制知之甚少。理解交流行为不仅需要交流信号本身(如表情、手势、语音、词义、句法等)进行研究,还需要探索这些信号是如何在具体的社会情境中被灵活使用,表达含义。本研究将决策神经科学、计算语言学以及博弈论等多学科研究方法相结合,提出通过目标导向的策略性行为这一角度,来探索大脑如何因地制宜地编码和解码交流信号,为研究社会交流这一难题开辟了新的定量研究的思路。研究表明,人类大脑通过灵活、自动、理性地模拟他人的合作行为,来逆向推断交流信号的潜在含义。利用计算模型和脑成像等方法,我们发现交流信号接收方的腹内侧前额叶表征了对说话人行为的模拟,纹状体则参与了基于该模拟结果推断说话人意图的计算过程。这一过程和以贝叶斯为代表的逆向推理计算模型高度吻合,说明了交流意图推断的潜在神经机制,为理解社会交流提供了一个简单、可扩充的认知神经模型。

关键词 社会决策、交流、合作、腹内侧前额叶、fMRI

Communication as Goal-Directed, Strategic Decision-Making

Lusha Zhu

School of Psychological and Cognitive Sciences, Peking University, China

Abstract: Communicative reasoning - how the human brain understands what is and is not being said by conversational partners - is a topic of tremendous importance and disciplinary breadth. Yet our knowledge about its neural mechanisms remains in its infancy. The challenge relates to not only the inherent complexity in human communication, but also the lack of quantitative instruments capable of decomposing the complex mental processes in a principled way to probe the related neural activity. Here we propose to examine inferences and choices in intentional communication through the lens of goal-directed, strategic decision-making, bringing together strands of decision neuroscience, game theory, and computational linguistics. In this talk, I will present recent fMRI findings on neurocomputations underlying communicative reasoning in a referential communication game. Our results suggest a neural generative process, subserved by the frontal-striatal circuits, by which the listener rationally simulates the speaker's choice process and inverts the inference to recover the speaker's most probable meaning.

社会联结对人类群体中不同等级个体神经同步性的影响

倪军, 张荷婧, 杨佳欣, 马焱娜(通讯作者)

认知神经科学与学习国家重点实验室, 北京师范大学, 北京, 100875, yma@bnu.edu.cn

摘要 社会层级是自然界中大部分物种的基本特征,并对群体的生存和繁衍发挥着至关重要的作用。因此维持层级化的社会结构已经演变为每个群体的关键要素。社会联结(social bonding)作为一种普遍存在的社会现象,被广泛得用来强化人际互动,从而稳定群体结构。然而,在层级化的社会群体中存在着层级内与层级间两种不同的社会互动,社会联结是否以及如何分别作用于这两种不同的社会交互仍是未知的。本研究招募了528名健康被试,进一步分成了176个三人小组。被试被随机地分配至社会联结条件或控制条件中完成组内互动任务。在此期间,他们就给定的话题进行小组讨论,然后民主地选举出小组领导,模拟社会等级制度的自然建立过程。与此同时,研究采用了功能近红外光谱成像超扫描技术,同时记录了社会层级中每个成员的背外侧前额叶与颞顶联合区的神经活动并分别计算了层级内与层级间的脑间神经活动同步。研究发现,社会联结显著地改变了群体成员间的神经活动同步,并进一步影响群体行为,这两者都受到了社会层级的调节作用。具体来说,社会联结选择性地提升了层级间的背外侧前额叶神经同步性,该结果进一步预测了行为层面上群际偏好的提升。此外,层级间的背外侧前额叶的神经同步性还表现出了时间不对称性,即领导者的神经活动比追随者早1~6秒,表明了领导者对追随者的心理活动进行预测,从而实现层级间自上而下

的神经活动同步。最后，我们还发现这种神经预测与领导者的背外侧前额叶-颞顶联合区的功能连接有显著的正相关关系。本研究揭示了社会联结的功能特异性，即对层级间的社会互动的选择性增强，并对此提供了直接的认知神经机制，研究结果对社会层级的管理具有实际的应用意义。

关键词 社会等级，社会联结，神经同步性，近红外同步扫描

Social bonding modulates hierarchical neural alignment in human groups

Jun Ni, Hejing Zhang, Jiaxin Yang and Yina Ma

State Key Laboratory of Cognitive Neuroscience and Learning, IDG/McGovern Institute for Brain Research,

Beijing Normal University, Beijing 100875, China.

Abstract: Social hierarchy is identified across species, from insects, to nonhuman and human primates. Hierarchical social structures clarify the roles of individual group members and facilitate social coordination. Social bonding has been suggested to strengthen inter-individual affiliations and consequentially to stabilize social structures. Yet, whether and how bonding distinctively modulates inter-class and intra-class interactions in hierarchical groups remains unknown. Using functional near-infrared spectroscopy (fNIRS), we simultaneously recorded brain activity of 3 interactive individuals, and examined neural synchrony between individuals with different (or same) status (i.e., inter-classes or intra-class neural synchrony) in 176 triadic, hierarchical groups engaging (or not) in social bonding. We found that bonding (vs. control) elevated the inter-classes neural synchrony in the dlPFC, which accounted for the follow-up escalated intergroup discrimination. The potentiated inter-classes neural synchrony in dlPFC showed temporal asymmetry that it emerged when higher-class individuals' neural activity preceded that of lower-class individuals for 1 to 6 seconds. This suggested that higher-class individuals predicted or inferred lower-class individuals' mind to achieve the top-down neural alignment after social bonding. Furthermore, such predictive alignment was associated with dlPFC-TPJ functional connectivity of higher-class individuals. Our findings decipher how social bonding and interpersonal neural coupling impact the formation of social hierarchy and shape hierarchical interactions.

Keywords: Social hierarchy, Bonding, Inter-brain synchrony, fNIRS hyper-scanning

我国音乐治疗专业的发展历程与教育教学标准

刘明明（通讯作者）

中央音乐学院音乐治疗中心，北京，100031, lmingming@ccom.edu.cn

摘要 音乐协助健康的各种应用实践在世界各地各民族文化中古已有之，而作为一门集艺术与医学、心理学的新兴交叉学科，“音乐治疗/Music Therapy”创建于美国，历经七、八十年的发展已经形成了完整的理论体系、治疗原则和应用技术，并且通过循证实践和科学研究验证了它的有效性。我国音乐治疗专业的发展开始于上世纪八十年代，经历了初步探索、学科建立、教学项目完善、临床实践与应用研究各阶段，现在国内已有十几所高校开设音乐治疗专业。音乐治疗专业人才培养标准，在北美、欧洲、亚洲的韩国等音乐治疗发展较先进地区已经形成了规范的教育教学标准和成功的教育经验。制定科学、清晰的音乐治疗专业教育教学

标准，培养符合国际标准的音乐治疗专业人才，是我国音乐治疗发展现阶段的一个重要工作目标。随着社会经济水平的提高和医学人文观念在医疗领域与在民众中的推广，社会对音乐治疗的接纳与需求在迅猛发展，问题也随之快速增长。很多人误解音乐治疗为用音乐作为“处方”；不能分辨何为音乐治疗，将一切使用音乐协助健康的方式方法都误作“音乐治疗”；对音乐治疗的专业性认识不足，致使培训速成的“音乐治疗师”比比皆是。这些问题都在破坏音乐治疗这一协助医疗进行身心康复的学科的专业性、科学性、严肃性。本文将梳理音乐治疗在我国发展历程中的失败与成功经验；对比成熟的音乐治疗专业教学标准与我国的科学音乐治疗教学设置；分析我国音乐治疗发展现存的主要问题与可能的解决方案。

关键词 音乐治疗，发展历史，教育教学标准，问题与应对

The Development History and Educational Standards of Music Therapy in China

Ming-Ming Liu

Central Conservatory of Music, Beijing, 100031, China

Abstract: Music has a long history of application to health among various ethnic groups around the world, and as an emerging interdisciplinary discipline spanning music, psychology and medicine, "music therapy" was founded in the United States. It has been developed over the past 70 to 80 years, and its effectiveness has been verified through evidence-based practice and scientific research. The development of music therapy in China began in the 1980s and has gone through the stages of initial exploration, discipline establishment, teaching program improvement, clinical practice and application research. Music therapy professional training standards have formed standardized education and teaching standards and successful educational experiences in North America, Europe, Asia's Korea and other regions with more advanced music therapy development. The development of scientific and clear education and teaching standards for the music therapy profession and the training of music therapy professionals who meet international standards is an important goal of work at this stage of music therapy development in China. As the socio-economic level increases and medical humanistic concepts are promoted in the medical field and among the population, the acceptance of and demand for music therapy in society is growing rapidly, and so are the problems. Many people misunderstand music therapy as the use of music as a "prescription"; they cannot distinguish what music therapy is, and mistake all ways and means of using music to assist health as "music therapy"; they have little understanding of the professional nature of music therapy, resulting in the training of quick-fire "music therapists" who are more qualified than those who are not. There is a lack of understanding of the professionalism of music therapy, resulting in a plethora of trained "music therapists". These problems are undermining the professionalism, science and seriousness of music therapy as a discipline that assists medical treatment for physical and mental rehabilitation. This paper will sort out the failures and successes in the development of music therapy in China; compare the mature professional teaching standards for music therapy with the scientific music therapy teaching settings in China; and analyze the main existing problems and possible solutions for the development of music therapy in China.

Abstract: Music therapy, development history, educational standards, problems and solutions

GIM 连续模式在成人音乐心理治疗中的研究与应用

陈洛婷

中央音乐学院，北京，100031，WJ040@ccom.edu.cn

摘 要 音乐引导想象 (Guided Imagery and Music, GIM) 也称邦妮方法音乐引导想象 (Bonny Method of GIM, BMGIM)。由 Helen Bonny 在 20 世纪 70 年代初，创造发展出并应用于临床中，是常被用于成人心理干预的音乐心理治疗技术方法之一。BMGIM 方法是利用 30 分钟已编排好的古典音乐组合，在音乐中引导聆听者跟随音乐进入潜意识进行深层次情绪情感体验，跟随音乐发展意象进行探索。GIM 连续模式 (Continuum Model

of GIM), 由 Lisa Summer 教授根据 BMGIM 原始层次模型和概念拓展出了音乐与想象 (Music and Imagery, MI) 的方法, 并将 GIM 以及 MI 根据 Wheeler 提出的实践层次理论发展了架构: 支持性 (Supportive) 层次, 涉及积极的内部资源的发展, 关注以内部资源的稳定化为目标; 再教育性 (Re-educative) 层次, 直接涉及来访者的具体症状, 更多关注内在情绪情感的相关议题和模式; 和重构性 (Reconstructive) 层次, 涉及无意识中资源和症状的根源, 聚焦于减少核心议题对日常生活的影响以及灵活性和自我内在探索。GIM 连续模式的整体架构是两种方法在三个层次上的应用, 因而形成了六种方法, 音乐治疗师能够更好的根据来访者不同能力水平及需求, 灵活应用 GIM 连续模式中的不同干预层次方法。音乐的选择及干预方式能更直接的将外部与内部心理状态和情绪感受建立链接, 利用音乐更贴近来访者不同能力水平的心理状态是在 GIM 连续模式应用中重要的一环。本文将通过研究文献与案例, 展现在研究与临床中发现的音乐应用的层次对来访者意象发展的影响。

关键词 音乐心理治疗, 音乐引导想象(GIM), 音乐与想象(MI)

Application of Continuum Model of GIM in Adult Psychotherapy Intervention

Loting Chen

Central Conservatory of Music , Beijing

Abstract: Guided Imagery and Music (GIM) is also called the Bonny Method of GIM (BMGIM). By Helen Bonny in the early 1970 s, creation was developed and applied in clinical practice. It is one of the music psychotherapy techniques often used in adult psychological intervention. The BMGIM method is to use the 30-minute arranged classical music combination to guide the listener to follow the music into the subconscious for deep emotional experience, and explore the music development of images. Continuum Model of GIM, taught by Professor Lisa Summer, expands the methodology architecture of music and images (MI) based on BMGIM's original hierarchical model and concepts. Apply GIM and MI according to the practice hierarchy of Wheeler; Supportive level: involving the development of positive internal resources, focusing on the stabilization of internal resources; The level of Re-educative: directly involves the specific symptoms of visitors, with more attention on the relevant issues and patterns of emotional; Reconstructive levels: involving the roots of resources and symptoms in the unconscious, more on reducing the impact of core issues on daily life and spirituality and self-internal exploration. The overall architecture of GIM continuous mode is the application of two methods at three levels, thus forming six methods. Through the overall architecture of the continuum model of GIM, the music therapists are better able to flexibly apply the different intervention levels methods in the continuum model of GIM according to the different ability levels and needs of the visitors. In clinical practice, the level of music application will affect the development of the visitor's image. The choice music and intervention mode of music can more directly link the external and internal psychological state and emotional feelings. The psychological state of music closer to the different ability levels of the visitor is an important link in the application of the Continuum Model of GIM.

音乐治疗在老年领域中的研究与应用

林思思

中央音乐学院, 北京, 100031, lsisi@ccom.edu.cn

摘要 随着许多国家老年人口占比的增加, 人口老龄化已成为了一种全球性现象。它给我们带来挑战的同时也带来了许多机遇。音乐治疗能够为老年人带来什么帮助, 也成为了当今音乐治疗研究者和临床工作者努力的方向。衰老的过程会带来认知、社会交往、交流沟通、情绪以及生理健康方面的变化。大量的研究显示音乐治疗对于老年人的干预具有积极意义, 包括音乐治疗能够控制疼痛、降低抑郁和焦虑, 减少激越等问题行为、召回长期记忆、建立与他人的积极社会交往、辅助肢体康复, 以及提高生命质量等。接受过专业训练并

且具备执业资格的音乐治疗师会为每位来访者进行全面的评估，然后制定个性化目标，再通过个体或团体治疗进行干预来达到个性化需求。在这个过程中音乐治疗师在关注来访者需要面对的问题和需要的同时，也着重关注于老年人所拥有的优势和资源。音乐治疗师会根据来访者的个人音乐喜好、音乐性、家庭社会文化、现存能力以及人生经历选择音乐和音乐体验形式，并带领来访者参与到有意义的音乐治疗活动中。音乐治疗师在老年人中常用的方法包括再创造式、即兴式、创作式以及接受式音乐治疗方法。研究显示音乐治疗师在老年领域主要工作的人群有：健康的老年人、在养老机构居住的老年人、神经认知障碍患者、临终关怀患者、专业医护照料者以及患者家属。在老年领域中，音乐治疗师常与其他医护人员进行跨学科合作，为老年人提供全面、持续的服务。

Research and Clinical Application of Music Therapy in Elderly Population

Sisi Lin

Central Conservatory of Music, Beijing

Abstract: As the rapid growth in proportion of older persons in many countries, Population Ageing has been recognized as a global phenomenon. It brought us challenges, as well as chances. What kind of professional health care music therapy could offer to the elderly, has become a direction, where music therapy researchers and clinical practitioners strive for. Ageing process brings changes in cognition, social interaction, communication, emotion, and physical health. A substantial amount of researches have demonstrated the positive results regarding the effectiveness of music therapy for older adults, including music therapy assists in pain management, reduces depression and anxiety, decreases agitation and other problem behaviors, recalls long-term memory, establishes positive social interactions, helps with physical rehabilitation, and improves the quality of life, etc. Professionally trained and qualified music therapist comprehensively assesses each client, followed by individualized treatment plan, and then implement music therapy interventions designed to meet client's unique needs through individual or group session. During this procedure, music therapist focus on client's problems and needs, also pay close attention to their strengths and resources, as well. Music therapists choose music and music experiences according to client's own preference, musicality, family and social culture, existing functions, and rich life history, and engage clients in meaningful music therapy activities. The methods that music therapists most commonly applied with older adults are re-creative, improvisational, compositional and receptive music therapy methods. Researches have shown that the targeted clients which music therapists work with are healthy older adults, elderly residents in nursing facilities, older persons with neurocognitive disorders, clients with terminal illness, and professional health caregivers, as well as the family members of patients. Within this elderly population clinical field, music therapist often work with other professionals in an interdisciplinary team, to provide comprehensive, systematic and continuum services.

结合音乐的甲基苯丙胺成瘾者的情绪测量和干预研究

陈慧静（通讯作者）

中国科学院心理研究所，北京，100101, chenxijing@psych.ac.cn

摘要 情绪失调是造成毒品成瘾者滥用毒品和复吸的重要原因。研究显示毒品成瘾者对毒品药物奖赏反应增高，而对天然奖赏的情绪反应降低。音乐作为一种审美体验，不仅能强烈激活奖赏系统，也能激活情绪体验和情绪调节的相关脑区，有着改善毒品成瘾者情绪失调问题的潜力。本研究首先探索了甲基苯丙胺成瘾者对于正负性音乐的情绪反应特征及其认知神经机制，然后探索了团体音乐治疗的方法对于改善甲基苯丙胺成瘾者负性情绪和情绪调节功能的疗效。实验一比较了30名女性甲基苯丙胺成瘾者和30名健康女性被试对于愉悦、恐惧和平静音乐的自评（效价，唤醒度，趋近度）和惊跳反射的反应。结果发现与健康对照相比，女

性甲基苯丙胺成瘾者对正负性音乐刺激的惊跳反应、效价和唤醒度的感知都出现异常。他们对负性（恐惧）音乐的惊跳反应减弱，对负性音乐的效价升高和唤醒度降低，对正性音乐的唤醒度也降低。实验二中，研究者将 31 名甲基苯丙胺成瘾者被试随机分成两组，实验组（n=16）接受每周 2 次，每次 90 分钟，共 8 次的团体音乐想象干预，对照组（n=15）接受戒毒所内的标准处置。在干预前后采用自评量表和情绪 stroop 测试评估被试的抑郁、焦虑、情绪调节能力、以及对正负性情绪线索和毒品线索的情绪反应。结果发现实验组经过团体音乐想象治疗后，显著的改善了抑郁和情绪调节能力，降低了毒品渴求，对于正性情绪的情绪调节能力也显著提高。研究结果表明音乐治疗能有效的改善毒品成瘾者的负性情绪，提高情绪调节能力。

The application of music in the study of emotion reactivity measurement and intervention for people with methamphetamine use disorder

Xijing Chen

CAS Key Laboratory of Behavioral Science, Institute of Psychology,
Chinese Academy of Sciences, Beijing, China

Abstract: Emotional dysregulation is one of the important reasons for drug abuse and relapse. Research show that people with drug abuse problems have an increased response to drug rewards, and a decreased response to natural rewards. Music as a aesthetic experience not only can activate reward system, but also stimulate the brain areas related to emotional experience and regulation, as well as the functional connection between these areas. My research work explored the mechanism of emotional responses in people with methamphetamine use disorder and the effects of music therapy for this population. In Experiment 1, the researcher compaired the responses of 30 female methamphetamine addicts and 30 healthy female subjects to pleasure, fear and calm music in temrns of self-evaluation (valence, arousal, approach) and startle reflex. The results showed that compared with healthy controls, female methamphetamine addicts had abnormal startle response, valence and arousal to negative music stimuli. Their startle response to negative (fear) music was decreased, and the valence and arousal level to negative music were increased. The arousal of positive music was decreased. In Experiment 2, 31 methamphetamine addicts subjects were randomly divided into two groups. The experimental group (n = 16) received group 8 sessions of music imagery intervention (twice a week, 90 minutes per session). The control group (n = 15) received the standard treatment in drug rehabilitation center. Before and after the intervention, self rating scale and emotional Stroop test were used to evaluate the subjects' depression, anxiety, emotion regulation ability, and emotional response to positive and negative emotional cues and drug cues. The results showed that after group music imagery intervention, the experimental group significantly improved depression and emotion regulation ability, reduced drug craving, and significantly improved the ability of emotion regulation for positive emotions. The results show that music therapy can effectively improve the negative emotion of people with drug use disorders and improve their ability of emotion regulation.

Keywords: Music, emotion reactivity, music therapy, methamphetamine use disorder

音乐治疗在烧伤患者功能锻炼疼痛管理中的作用研究

李瑾怡

陆军军医大学基础医学院，重庆，400038，lijy613@126.com

摘 要 疼痛是人类最基本的感觉，被列为第五大生命体征，对于人类生存有重要的意义。由于疼痛给人类带来了巨大的痛苦和经济损失，因此消除疼痛成为关乎全球健康的公共卫生问题。烧伤疼痛极具特殊性，管理不当会导致一系列生理和心理问题。药物镇痛是目前烧伤疼痛干预的主要手段，但由于其副作用，在烧伤患者功能锻炼中使用受限。目前，音乐治疗作为一种非药物的干预方式已经成为重要的临床辅助手段，被广泛地应用于多种疼痛治疗中并取得了很好的疗效。然而音乐治疗在烧伤领域的应用还十分有限，对烧伤患者

功能锻炼中疼痛的干预效果尚不清楚。本研究选择四肢关节部位烧伤后瘢痕增生造成关节功能障碍的患者为研究对象,采用前瞻、随机对照设计,进行为期30天临床试验,应用基于音乐的想象(MBI)和音乐交互参与(MAE)的音乐治疗方法对烧伤患者功能锻炼中的疼痛干预效果的评价。通过51名患者(测量患肢73例)在功能牵伸中疼痛、焦虑、生命体征、关节活动度、疼痛度、疼痛控制满意度的测量。研究显示,音乐治疗组、背景音乐组和对照组患者在治疗中的平均疼痛评分为2.57、3.37、3.69,音乐治疗组的平均疼痛评分低于对照组,差异有统计学意义,且随着治疗时间增加疼痛评分降低(P 值 <0.0001)。音乐治疗组、背景音乐组和对照组患者在治疗中焦虑降低的平均值分别为1.09、1.46、2.06,音乐治疗组的平均焦虑评分显著低于对照组,且随着治疗时间增加焦虑评分降低越显著(P 值 <0.0001)。此外,对烧伤患者功能锻炼中的呼吸频率、血压(舒张压)有明显改善作用。但音乐治疗对于心率、血压(收缩压)和血氧饱和度的改善尚无统计学意义,且对关节活动度、依从性和疼痛控制满意度的改善不明确,还需要进一步的研究。

The of Effect of music therapy on pain of burn patients

Jinyi Li

Army Medical University, Chongqing

Abstract: Pain is a basic feeling, which has a great significance for human beings. It has been generally accepted as one of the five vital signs for human beings. However, pain has brought tremendous suffering and economic loss. Pain management has become one of the important issues for global public health. Burn pain is extremely special. Inadequate pain management leads to a series of physiological and psychological problems, which makes the treatment of burn very challenging. Functional exercise is the main means of burn rehabilitation. The pain caused in this process may bring great suffering to burn patients, leading to their poor compliance in the process of functional training, and thus seriously influencing the effect of rehabilitation treatment. In recent years, drug analgesia is the main method of burn pain treatment, but since most of the analgesic drugs have side effects, the use of drug analgesia in functional exercise of burn patients is limited. Currently, As a non-pharmacotherapy, music therapy has become an important clinical treatment method. It has been widely used in pain management and better effect has been achieved. However, The application of music therapy in the field of burn treatment is still very limited, and the effect of music therapy on pain by burn patients during functional training is still unclear. Therefore, this study is a clinical trial of prospective, randomized controlled design, to evaluate the effect of music therapy on pain intervention in burn patients performing functional exercise. During 30 day, the patients with joint dysfunction caused by hyperplastic scar after joints of limbs burn were invited as research participants. The pain, anxiety, vital signs, joint range of motion, pain degree and pain control satisfaction of 51 patients were measured during functional exercise. The results showed that the average pain scores during the process of total treatment in MT group, BM group, and UC group were 2.57, 3.37, and 3.69, respectively. The average pain score in MT group was lower than in UC group, and the difference was statistically significant. The repeated measures analysis showed that treatment time also had an influence on pain score, which would be low with the increase of treatment time ($p<0.0001$). The average anxiety scores during the process of total treatment in MT group, BM group, and UC group were 1.09, 1.46, and 2.06, respectively. The average anxiety score in MT group was significantly lower than in UC group, and it remarkably decreased with the increase of treatment time ($p<0.0001$). In addition, the research results suggested that the application of music therapy in the treatment process of burn patients had an obvious improving effect on their respiratory rate and blood pressure (diastolic pressure). However, there was no statistical significance on the changes of heart rate, blood pressure (systolic pressure) and oxyhemoglobin saturation in MT group and it is also unclear if music therapy could improve joint mobility, compliance and satisfaction of pain control. Therefore, futher research is still needed to verify the effect of music therapy on pain management for joint burn patients during functional exercise.

诺道夫·罗宾斯音乐治疗： 即兴“创造音乐”在特殊儿童治疗中的可行性研究

张名明（通讯作者）

流光华彩音乐治疗工作室，北京，10020，minmin.cheung@outlook.com

摘要 “每个人都有与生俱来的音乐敏感性”，不论来访者有什么障碍与局限，在音乐里音乐治疗师都能找到与来访者的连接之处。治疗师强调的不是来访者做不到的事情，而是如何从他们能做的事情里面延伸，突破障碍。建立在这种理念之上的诺道夫·罗宾斯音乐治疗采用即兴音乐与来访者一同打造出所需的治疗性的“音乐空间”。音乐在普遍认知里是名词，而在诺道夫·罗宾斯音乐治疗里音乐被视为动词“musicing/创造音乐”，使音乐从被动转向了互动，强调有意识的享受音乐中的体验。来访者在音乐中的微妙回应，可以体现出他们充满个性化的互动。身体的动作，发出的声音，呼吸的方式，每个弹奏的音符，甚至是微妙的眼神接触都能作为调动来访者的契机。许多研究显示没有音乐基础的孩子也能觉知并理解与感受音乐当中传递的情感，而在分析了音乐治疗互动后人们发现，特殊儿童可以在音乐互动中展现出在其他地方无法体现的复杂认知过程。音乐中包含了许多人与人互动中常见的“行动模式”，其中包括我们的“沟通性乐感”。在音乐中培养非语言交流的互动暗示与婴孩时期的母婴互动中有许多相似之处。前语言时期，婴儿与母亲的互动建立在共同的“声音”对话上。这“对话”包含了如何掌握节奏时机，回应顺序，相互凝视，延长专注力，如何运用声音与身体，和能否享受两人分享一个主题的能力。结合以上几点，音乐治疗师会带领来访者通过生动的互动式音乐演奏，去捕捉每位来访者的优势，一同发展来访者的潜能。本文将通过大量研究与直观的案例，呈现诺道夫·罗宾斯音乐治疗方法在特殊儿童领域的应用原理与治疗程序，展现音乐治疗师是如何通过音乐体验的力量有针对性地对生活产生积极的影响，建立健康的关系，表达自我，提升专注力，培养创造力和对世界的好奇心。

Nordoff-Robbins Music Therapy: The therapeutic possibilities improvisational musicing holds for children with developmental disabilities

Min-Min Cheung

Tempo Rubato Music Therapy, Beijing, 10020

Abstract: “Every person is born with an innate sensitivity to music”. Regardless of ability and cognition, it will always be possible to find a connecting point within the music. The music therapist emphasizes not on what the individual is unable to do but instead focuses on how to extend and develop upon what the individual can do. Built upon these principles Nordoff-Robbins music therapy uses improvised live music to create a “music space” tailored to the client’s music therapy needs. Music is usually a noun but in Nordoff-Robbins music therapy the verb “musicing” is used. Musicing sees music as a “human activity”, where in the act of music there is engagement, interaction, as well as shared enjoyment. The change shifts passive music into an active musical experience. It is there, in the musical personal factors and the subtleties of the response that we can see the child’s character and content of the child’s engagement – giving the therapist a direction to take the creative work. Body movement, vocalizations, breathing patterns, musical selection, even the slightest eye contact and become the opportunity to connect and begin the therapeutic process. Research has shown that children are able to recognize, understand and convey the emotions in music and through musical analysis it uncovered the presence of complex cognitive processes that were not detectable through other means in individuals with developmental delays. The development and understanding of non-verbal communication cues are similar to the mother-infant communications process formed in early childhood. While learning to interact with the environment we develop many “patterns of action” including our “communicative musicality”. Infants with no language learn to share meaning by being in communication, which maybe through a “musical conversation”, this includes rhythm, sequencing, mutual gaze, attention, vocalizations, affect and body

movement, as well as the ability to share joy in joint interaction. By combining the above factors therapy aims to amplify individual strengths, discover their hidden potential, and bring about positive inner change. Through precise interactive music engagement Nordoff-Robbins music therapists can help children with developmental delays form skills to build healthy relationships, self-expression, increase their attention span, develop their creativity, and cultivate a curiosity towards the external world.

音乐训练干预老年人抑制控制能力的脑机制探索： 基于 GoNoGo 任务

郭思嘉¹ 周俊臣¹ 王嘉伟¹ 冯梁峰¹ 尧德中¹ 卢竞¹ (通讯作者)

1 电子科技大学, 生命科学与技术学院, 成都, 611731, lujing@uestc.edu.cn

摘要 研究表明与认知控制相关的 theta 频段能够影响被试在 GoNoGo 任务中的表现, 而 NoGo 试次中发现, theta 振荡可能与年轻人的抑制反应有关。随着年龄的增长, 老年人的抑制控制能力逐渐下降, 影响老年人的行为技能。研究发现音乐训练是一种有效的认知老化干预手段, 但其起效机制尚不清晰, 因此, 本研究拟从抑制控制能力改变的角度来对该问题展开探索。我们招募了 16 名健康的老年人进行为期 3 个月的音乐训练, 在音乐训练前后使用 BioSemi Active Two 采集系统记录了被试执行 GoNoGo 任务的脑电图。我们使用 Brainstorm 工具包对数据进行处理, 首先, 我们检查并排除了被试错误反应的试次。随后, 对连续脑电图进行滤波并对每一个刺激前 500 ms 与后 1000 ms 进行分析。时频分析结果显示, 音乐训练前老年人 NoGo 试次的 theta 振荡显著大于 Go 试次 ($p=0.02$, $t=2.61$); 在 NoGo 试次中, 老年人在音乐训练后的 theta 振荡小于音乐训练前 ($p=0.07$, $t=-1.95$)。该结果表明: 相比于其他频段, 老年人的 theta 振荡无论是在 NoGo 还是 Go 试次下均占主导地位, 但是老年人需要更强的 theta 振荡以完成抑制控制任务, 而经过 3 个月的音乐训练后, 老年人 NoGo 试次中 theta 振荡降低, 这可能是由于音乐训练后老年人在执行抑制控制任务时所需要的资源减少。该工作有助于认识音乐训练干预老年人抑制控制的脑机制, 为理解音乐干预认知老化的起效机制提供了切入点。

关键词 theta 振荡, 老年人, 音乐训练, GoNoGo, 抑制控制

The brain mechanism exploration of music training affects older adults' inhibitory control ability: Based on GoNoGo task

Sijia Guo¹, JunChen Zhou¹, JiaWei Wang¹, Liangfeng Feng¹, Dezhong Yao¹, Jing Lu¹

1 School of Life Science and Technology, University of Electronic Science and Technology of China, Chengdu, 611731

Abstract: Studies suggested that theta band which is associated with cognitive control, affects subjects' performance in the GoNoGo task. Theta oscillation has been found in NoGo trials, which may be associated with the inhibitory response of young adults. Ability of inhibitory control has been suggested to be decreased gradually with the increase of age and it will influence the behavioral skills of older adults. Studies found that music training is an effective intervention for cognitive aging, but its brain mechanism is still not clear. Thus, this study intends to explore the problem from the perspective of changing of inhibitory control ability. 16 healthy older adults were recruited for 3 months music training and EEG was recorded before and after music training by using a BioSemi Active Two acquisition system. The processing of data was completed by using Brainstorm toolbox. First, we checked and eliminated trials with false reaction. Then, we filtered continuous EEGs and analyzed 500 ms of pre-stimulus activity

and 1000 ms of post-stimulus activity. Results of time-frequency analysis shown that before music training, the theta power of NoGo trials is significantly greater than that of Go trials ($P=0.02$, $t=2.61$). At NoGo trials, the theta power of subjects after music training is smaller than that before music training ($P=0.07$, $t=-1.95$). The results show that, compared with other bands, theta brain oscillation of older adults is dominant whether in NoGo or Go trials. But older adults need greater theta oscillation to complete the task of inhibitory control. However, the theta oscillation of older adults in NoGo trials decreases after 3 months music training. This may because older adults who received music training need less resources to carry out tasks of inhibitory control. This work is helpful for understanding the brain mechanism of music training affects inhibitory control of older adults and provides an entry point for understanding the mechanism behind the benefits of music training on cognitive aging.

Keywords: theta brain oscillation, older adults, music training, GoNoGo, inhibitory control

老化和音乐训练经验对脑功能偏侧化与言语知觉的影响研究

靳鑫虎¹ 张磊¹ 杜忆¹

¹ 中国科学院心理研究所, 北京, 100101, duyid@psych.ac.cn

摘要 老化会伴随有明显的言语感知和理解能力的下降, 而音乐训练经验被发现可能对抗和延缓老化所引起的噪音下言语感知能力衰退。这提示了老化和音乐训练经验对言语感知的交互作用, 但这种交互作用背后的脑机制目前尚不明确。言语认知功能存在脑偏侧化, 之前研究发现年龄和音乐训练经验都可能会对人脑的言语认知功能及其脑偏侧化产生一定的影响。因此, 言语知觉相关的脑功能偏侧化是不是在上述交互作用中起着至关重要的作用就值得我们去探索。本研究采集了 93 名被试(青年音乐家/非音乐家、老年音乐家/非音乐家)的功能磁共振影像数据, 基于同位区域自发连接图谱(AICHA)定义了全脑的同位区, 采用静态功能连接的方法得到了两种测量左右半球同位区功能偏侧化的计算方式: 功能整合与功能分离。针对大脑中某一对同位区, 前者表示该区域倾向于在半球间信息交流, 而后者表示该区域倾向于在半球内信息交流。研究结果发现在这两种脑功能偏侧化上, 老化和音乐训练经验交互作用显著的脑区呈现出明显的前后差异。功能整合交互作用显著的脑区主要位于额叶, 包括额下回、额下沟以及中央前沟、颞上回和颞中回的部分区域等, 功能分离交互作用显著的脑区则主要位于除额叶以外的大脑中后部。而且两种指标的交互作用都主要是老年音乐家更强的右偏所导致, 提示老化和音乐训练经验引发的右半球对言语知觉的代偿性作用。与行为的相关分析结果显示, 功能整合交互作用显著的额中回眶部和岛叶的功能整合指标与噪音下视听言语音节辨别正确率呈显著负相关; 功能分离交互作用显著的岛叶、颞上回、缘上回和舌回等区域的功能分离指标与正确率则呈显著正相关。以上这些结果证明了老化和音乐训练经验对额叶功能整合与颞-顶-枕叶功能分离的交互作用, 同时提示了与言语知觉直接相关的颞上回、岛叶等区域的功能偏侧化在老化/音乐训练经验和言语知觉行为之间的桥梁作用。

Effects of aging and musical training experience on brain functional lateralization and speech perception

Xinhu Jin,¹ Lei Zhang,¹ and Yi Du¹

¹ Institute of Psychology, Chinese Academy of Sciences, Beijing, China

Abstract : Aging is associated with a significant decline in speech perception and comprehension, while music training experience has been found to counteract and delay the decline of speech perception under adverse listening conditions induced by aging. This suggests an interaction between aging and music training experience on speech perception, but the brain mechanism behind this interaction is not clear yet. Previous studies have found that aging and music training experience may have certain influence on speech cognition as well as its brain lateralization. Therefore, it's worth exploring whether brain functional lateralization plays a crucial role in this interaction of speech perception. This study adopted resting-state functional connectivity to obtain two functional lateralization indices of

homotopic brain regions based on an atlas of intrinsic connectivity of homotopic areas (AICHA), using functional magnetic resonance imaging data from 93 subjects (young musicians/non-musicians, old musicians/non-musicians). Functional integration means the interactions between left and right hemispheres, while functional segregation implies a tendency for greater intra-hemispheric relative to inter-hemispheric interactions. Our results found a distinct whole-brain anterior-posterior difference of interactions between aging and music training experience on the two functional lateralization indices. Regions with significant interactions of functional integration mainly located at frontal lobe, including inferior frontal gyrus, inferior frontal sulcus and parts of precentral sulcus, superior temporal gyrus, middle temporal gyrus. However, regions with significant interactions of functional segregation were widely distributed over the brain except the frontal lobe. And both types of interactions were mainly driven by stronger right lateralization in older musicians, indicating an age- and musical experience-related compensation by right hemisphere in speech perception. Brain-behavior correlation analysis showed significant negative correlations between functional integration in orbital middle frontal gyrus, insular and audiovisual syllable-in-noise identification accuracy. Functional segregation in areas such as insular, superior temporal gyrus, supramarginal gyrus and lingual gyrus were positively associated with accuracy. Our findings truly confirmed the interactions between aging and music training experience on functional integration in frontal lobe and functional segregation in temporal-parietal-occipital lobe. In addition, the correlations suggested a role of functional lateralization in areas such as superior temporal gyrus, insular and so on, as a bridge between aging/musical training experience and speech perception.

音乐乐句层级结构动态加工和学习的神经机制：一项 EEG 研究

吴伊扬¹, 滕相斌², 杜忆¹

1 中国科学院心理研究所, 北京, 100101

2 马克斯·普朗克人类发展研究所, 柏林, 14195, wuyy@psych.ac.cn

摘要 与语言加工一样, 人脑对音乐的加工也存在一套复杂的系统, 对音乐的理解在很大程度上受到句法的影响。前人研究表明个体对音乐句法的加工依托于对不同层级音乐结构的感知, 且受到音乐训练经历和注意的调节。但目前大脑如何加工/追随动态的音乐信息, 尤其是根据音乐的句法结构将其切分为有意义的单元或整合成完整内容的神经机制尚未明确, 与乐句切分有关的神经特征还不明朗。为了回答这些问题, 本研究选用了 10 首巴赫的众赞歌选段, 去除声学线索后按局部(保留正常乐句边界音符)与整体倒转的方式打乱音乐的结构, 与原曲一同组成三种条件的刺激。我们让 30 名非音乐家被试在安静环境下反复聆听三遍音乐刺激, 并同时使用 EEG 记录被试的脑电响应, 以考察个体如何在线加工与整合音乐的不同层级结构。研究结果发现, 与前人研究一致, 个体的大脑低频神经振荡对音乐的节奏会产生跟踪响应, 且受到音乐训练经历的调节。对时域(时间响应函数)和频域(调制频谱)分析的结果都显示个体对音乐片段的加工受到乐句周期的调节, 对乐句神经跟踪响应的幅度在原曲和局部倒转音乐中均高于整体倒转音乐, 且响应幅度随着聆听次数的增加逐渐减弱。本研究同时计算了对乐句跟踪的相位提前指数, 结果发现聆听次数的增加并没有促进对乐句边界神经响应相位的提前, 表明对音乐层级结构的学习和预测可能需要个体先验知识的参与。本研究提示大脑可以通过对音乐乐句的跟踪实现在线切分与加工连续音乐流, 为音乐层级结构的动态加工提供了强有力的神经指标。

The Neural Mechanisms Underlying Dynamic Processing And Learning Of Hierarchical Structure In Music: An EEG Study

Yiyang Wu,¹ Xiangbin Teng,² and Yi Du¹

¹ Institute of Psychology, Chinese Academy of Sciences, Beijing, China

² Max-Planck-Institute for Human Development, Berlin, Germany

Abstract: Same as language, there is a complex system for music processing in our brain, which is largely affected by musical syntax. Previous studies in music neuroscience have shown that to what degree can listeners learned the musical syntax depends on their perception of different levels of music structures, and is modulated by music training experience and distribution of attention. However, how does the brain track dynamic music information, especially the neural mechanism of segmenting music into meaningful units or establishing high-level music structures during music listening is not yet clear. In order to answer these questions, we presented 10 Bach chorales for 3 times consecutively to 30 non-musician subjects in quiet condition undergoing electroencephalogram (EEG) recording. The acoustics correlates of musical phrase were removed, then the structures of the music stimuli were disrupted by locally or globally reversing the harmonic progression, to contrast with the original condition. Our results found a low-frequency neural component that modulated the neural rhythms of beat tracking, which was associated with the music training experience. Using temporal response function and power modulation spectrum we discovered that the phrase tracking was modulated by phrasal structure manipulation as the modulation magnitude was significantly stronger in the original and local reversal conditions than the global reversal condition, and showed a significant decrease with repetitions. We also calculated the phase precession index to investigate the predictive process of musical phrase segmentation. The results showed that the repetitions did not facilitate the learning of the phrase boundary, indicating that the prediction of phrase requires prior knowledge of classical music. This study suggests that the brain can segment continuous music streams online via tracking phrasal boundaries, and provides a robust neural signature of processing the musical syntax.

Abstract: musical syntax, phrase segmentation, neural tracking response, phase precession index

鼓圈对害羞大学新生适应性的干预研究

张靖敏¹ 邓炜²(通讯作者)

摘要 目的: 验证鼓圈干预对改善害羞大学新生入学后适应不良问题的干预效果。方法: 采用亨德森-津巴多害羞量表(ShyQ)筛选害羞程度高的大一新生44名,并随机分配到干预组(n=22)和对照组(n=22),干预组接受每隔2日1次,共7次鼓圈干预,干预分为三个阶段,分别是关系中心、任务中心和自我中心,对照组不做任何干预,并保持其它条件与干预组一致。采用ShyQ、评估他人量表(EOS)和大学生适应性量表对干预前后新生的状态进行测量;采用团队活动满意评估表对每次干预效果进行评估,采用团队成员角色行为评估问卷对每个阶段干预效果进行评估。结果: 新生对干预的满意度随干预次数的增加而增加,第三次的满意程度较第一次产生了显著性变化($p<0.05$),在团队角色行为评估的维度上,关系中心和自我中心阶段发生了显著性的变化($p<0.05$);组间比较结果显示,干预组在7次干预后ShyQ和大学生适应性量表的得分与对照组产生显著性的差异(均 $p<0.05$);组内比较结果显示,干预组在7次干预后ShyQ、EOS和大学生适应性量表的得分均低于干预前得分(均 $p<0.05$),而对照组只有ShyQ的前后测得分存在显著性差异($p<0.05$)。结论: ①鼓圈针对害羞大学生适应性的干预效果显著;②鼓圈能有效地降低害羞大学新生的害羞程度和对他人负向评价,从而提高害羞大学新生的适应性问题。

The Intervention Study of Group Drumming in the Adaptability of Shy University Freshmen

Jingmin Zhang

Wuhan Sports University, Wuhan, Hubei

Abstract: Objective: To verify the effect of drum circle intervention on improving the poor adaptation of shy college freshmen. Methods: The Henderson-Zimbardo shyness scale (ShyQ) was selected and randomly assigned to the intervention group (n=22) and n=22, received once every 2 days, divided into three stages, relationship center, task center and self-center, and kept other conditions consistent with the intervention group. The status of freshmen before and after the intervention was measured using the ShyQ, assessment (EOS) and the student adaptability scale; the effectiveness of each intervention was evaluated using the team activity satisfaction assessment table and each stage using the team member role behavior assessment questionnaire. Results: Freshmen satisfaction increased with the number of intervention, The third degree of satisfaction produced significant changes from the first ($p < 0.05$), On the dimensions of the team role behavior assessment, Significant changes occurred in the relationship center and self-center phases ($p < 0.05$); The inter-group comparison results show, A significant difference between the scores of the ShyQ and the control scale after 7 interventions (both $p < 0.05$); In-group comparison results show, Both the ShyQ, EOS and college student fitness scales after 7 interventions were lower than the pre-intervention scores (both $p < 0.05$), There were significant differences in the ShyQ ($p < 0.05$). Conclusion: Drum circle effectively reduces the adaptability of shy college students and improves the adaptability of shy college students.

Abstract: shy, group drumming, adaptability, college freshmen

平静音乐干预状态焦虑的效果探索

摘要 状态焦虑是一种特定形式的焦虑, 任何人都可以体验到。长期的焦虑如果不进行干预会形成抑郁, 有自杀的风险。焦虑的干预方式包括药物干预和非药物干预, 非药物干预包含迷走神经刺激、快速经颅刺激和音乐干预。但其中的一些手段都存在耗时长、操作不便等问题, 音乐干预以其无创性和便利性的特点吸引了临床学者的关注。一些临床研究已经表明平静音乐对焦虑具有缓解作用, 但是其脑机制尚不清楚。本研究招募了 41 名健康且没有焦虑的大学生, 随机分为两组, 在使用自主设计的焦虑诱发范式诱发状态焦虑后分别接受平静音乐刺激和无声刺激的干预, 并全程记录脑电。行为学结果表明, 平静音乐组在干预后的状态焦虑水平下降程度显著高于无声刺激组; 功率谱结果显示, 在聆听平静音乐后, 枕叶的功率谱密度在 γ_2 频段显著下降 ($p < 0.05$), 而在聆听无声刺激后, 没有显著的差异; 进一步通过脑网络分析发现, 在平静音乐干预后, 枕叶与左额叶的在 γ_2 频段的脑网络连接增强 ($p < 0.05$)。上述结果表明, 音乐对状态焦虑具有干预效果, 并且音乐干预状态焦虑的脑机制与枕叶功率谱的下降和枕叶到左额叶的脑网络连接增强有关, 表明中性音乐的干预可能依赖于注意力、情绪和共情的三重调节。本研究深入了解平静音乐干预状态焦虑的脑机制, 进一步推动今后非药物干预的临床干预。

Effect of neutral music on state anxiety

Binxin Huang, Yan Liu, Ruijie Xu, Jing Lu

School of Life Science and Technology, University of Electronic Science and Technology of China, Chengdu, 611731

Glasgow College, University of Electronic Science and Technology of China, Chengdu, 611731

Abstract: State anxiety is a specific form of anxiety that anyone can experience. Long-term anxiety, if state anxiety is

not intervened, it can lead to depression and risk of suicide. Anxiety intervention methods include drug intervention and non-drug intervention. Non-drug intervention includes vagal nerve stimulation, rapid transcranial magnetic stimulation and music intervention. However, some of these methods have problems such as time-consuming and inconvenient operation. Music intervention has attracted the attention of clinical scholars due to its non-invasive and convenient characteristics. Some clinical studies have shown that neutral music has a relieving effect on anxiety, but its brain mechanism is still unclear. In this study, 41 healthy and non-anxious college students were recruited and randomly divided into two groups. After using the self-designed anxiety-inducing paradigm to induce state anxiety, they received the intervention of neutral music stimulus and blank stimulus respectively, and were recorded EEG throughout the process. Behavioral results showed that the level of state anxiety decreased in the neutral music group after the intervention was significantly higher than that in the blank stimulus group, and the power spectrum results showed that after listening to neutral music, the power spectrum density of the occipital lobe decreased significantly in the gamma2 band ($p<0.05$), while under the condition of blank stimulus, there was no significant difference. Further brain network analysis found that the power spectrum density of the occipital lobe decreased significantly in the gamma2 band ($p<0.05$). After the intervention, the brain network connection between the occipital lobe and the left frontal lobe in the gamma2 band was enhanced ($p<0.05$). The above results indicate that music has an intervention effect on state anxiety, and the brain mechanism of music intervention in state anxiety is related to the decrease of the power spectrum of the occipital lobe and the enhancement of the brain network connection from the occipital lobe to the left frontal lobe, which might rely on a ternary role modulation of attention, emotion and empathy after listening neutral music. This study has an in-depth understanding of the brain mechanism of neutral music intervention in state anxiety, and further promotes future non-pharmacological interventions in clinical interventions.

Abstract: neutral music, state anxiety intervention, power spectrum, brain functional connectivity

音乐训练影响汉语歧义短语加工的神经过程

魏琪¹, 杨晓虹², 张政华¹, 韩梅¹, 李卫君¹ (通讯作者)

1 辽宁师范大学脑与认知神经科学研究中心, 大连, 116029, li_wj@126.com

2 中国科学院心理研究所, 北京 100101

摘要 音乐和言语作为高度复杂的两类声学系统, 都可通过相同的参数如音高、时程、响度等来表示其音韵学特征, 并共享一些基本的神经环路和加工机制 (Knösche et al., 2005; Koelsch, Gunter, & Wittfoth, 2005; Koelsch, 2006; Levitina & Menon, 2003; Patel, Gibson, Ratner, Besson, & Holcomb, 1998)。随着认知神经科学技术的发展, 一些研究者开始关注音乐训练如何影响语言加工 (Dawson, 2014; Milovanov & Tervaniemi, 2011; Peretz, Vuvan, Lagrois, & Armony, 2015)。本研究利用 ERPs 技术, 采用启动范式, 探索了音乐训练影响听者加工韵律短语启动的神经过程。实验以 400 ms 间隔成对呈现歧义短语 (前一个为启动项, 后一个为目标项), 要求音乐组和控制组依次完成词汇判断 (某个词汇是否在两个短语中呈现) 和结构判断任务 (前后呈现两个短语的结构是否一致)。结果发现, 在 100~500ms 时间窗, 启动项中, 音乐组和控制组在加工歧义短语边界时诱发了无差别的反映韵律切分的脑电效应 CPS; 在目标项中, 只有音乐组加工被启动的目标项时, CPS 波幅明显更小, 产生了显著的韵律启动效应, 并且该效应受到实验任务和短语结构的调节。结果表明音乐训练可以跨领域影响言语韵律加工, 音乐组产生明显的韵律启动效应可能是由于其对边界加工的各种声学参数 (如音高, 时长) 更加敏感, 加工启动项时激活的音韵模板更稳定或者能更准确预期目标项结构。

Abstract: As two highly complex auditory systems, music and speech represent phonological characteristics with the same parameters, such as pitch, duration, stress, etc., and share some basic neural circuits and processing mechanisms. Along with the development of cognitive neuroscience technology, some researchers begin to pay attention to how music training affects language processing. Using the structural priming paradigm, the present study investigates the neural processes by which music training influences listeners' processing of prosodic phrases priming. The experiment presented ambiguous phrases in pairs with a 400 ms interval (the prior one is Prime and the later one is Target) and asked musicians and nonmusicians to finish lexical judgment task (whether a word was presented in the two phrases) and structural judgment task (whether the structure of the two phrases are the same). The results indicated that, in the 100~500 ms time window, the prosodic boundaries embedded in ambiguous phrases elicited the CPS stably, which reflects prosodic segmentation, regardless of whether the participants were trained in music. More importantly, we found that only in musicians, the CPS amplitude reduced and generated significant prosodic priming effect, when they processed the target phrases. This effect was also affected by experiment tasks and phrases structure. The results may suggest that music training had a cross-domain effect on speech prosody processing. The obvious prosodic priming effect in musicians may because they are more sensitive to various auditory parameters (i.e. pitch, duration, etc.) of boundary processing, and thus the phonological template activated by Primes can be utilized to anticipate the structure of Targets more stably or more accurately.

Abstract: music training, prosodic processing, ambiguous phrase, CPS, prime.

从具身认知角度谈钢琴音色在演奏者-听众之间的传达与交流

李申 Renee Timmers 王伟军 (通讯作者)

华中师范大学心理学院, 武汉, 430000, wangwj@mail.ccnu.edu.cn

谢菲尔德大学音乐学院, 谢菲尔德, 英国,

摘要 在钢琴表演中, 钢琴家往往通过精湛的演奏技巧试图塑造和表现不同的音色 (如明亮的, 圆润的等), 以期与听众进行音乐交流。但是与交流情感或音乐表现力的研究相比, 现有研究对于演奏者-听众之间有关音色交流的研究较少, 在不同的视听呈现条件下演奏者是否能向听众可靠地传达他们的音色意图这一点仍是未知的。笔者以往的研究 (Li & Timmers, 2020) 揭示了演奏者对钢琴音色的隐喻受肢体运动和身体体验的影响, 而这些具身化的过程丰富了演奏者在表演过程中的主观体验, 这一点暗示了音乐表演中视觉信息对听众音乐感知的重要性。据此我们设计了一个音色感知实验, 以验证钢琴表演中听觉信息和视觉信息对听众音色感知的影响。该实验采用了 3 (三位演奏者) × 3 (三种视听条件) × 2 (音色对照) 设计的重复测量方差分析, 检验了演奏者-听众之间 10 种音色 (明亮的/灰暗的, 沉重的/轻盈的, 圆润的/尖锐的, 紧张的/松弛的, 干涩的/天鹅绒般的) 的交流是否可行。三首曲目由三位不同的钢琴演奏者用 10 种音色演绎完成 (即 30 首), 21 位听众要求在三种视听条件下 (纯音频, 纯视频, 音视频兼具) 对这 30 首音乐材料进行音色判断 (1-7 里克特量表)。结果显示了九种音色均可以可靠地交流和传达, 灰暗的音色 (dark) 除外; 视觉信息提高了紧张的和松弛的两种音色的交流准确性, 且不受演奏者这一因素的干扰。对于其他的几组音色, 我们发现了不同演奏者对依赖视觉线索以提高交流准确性的偏好和能力有所不同。该实验表明, 钢琴音色的交流不完全只依赖于声音线索 (即音色的声学特征), 也与音乐表演中的视觉线索 (即观察到的表演姿态, 动作) 有关。这一实证研究丰富了具身认知理论在音乐表演和音乐交流研究领域中的应用, 即演奏者和听众在肢体运动和身体体验方面的共识为音色的具身化交流奠定了基础。

Abstract: Studies on the audio-visual presentation of musical performance have investigated its impact on perceived expressiveness and musical appreciation/evaluation. Little is known about whether a precise timbral intention by a pianist can be communicated to listeners. An interview study (Li & Timmers, 2020) on the conceptualization of piano timbre revealed pianists' extensive utilization of timbral intentions in piano performance. The findings also suggested that timbre metaphors are enriched by embodied experience such as bodily movements and feelings, indicating the relevance of visual cues. The perceptual experiment reported in this article explored whether the communication of five pairs of timbral intentions (bright/dark, heavy/light, round/sharp, tense/relaxed, dry/velvety) between pianists and listeners is reliable and the extent to which performers' gestures provide visual cues that influence the perceived timbre. Three pianists played three musical excerpts with ten different timbral intentions (3x10=30 music stimuli) and twenty-one piano students were asked to rate perceived timbral qualities on both unipolar Likert scales under three modes (vision-alone, audio-alone, audio-visual). The results revealed that nine of the timbral intentions were reliably communicated between the pianists and the listeners, except for the dark timbre. The communication of tense and relaxed timbres was improved by the visual conditions regardless of who is performing; for the rest, we found the individuality in the pianists' preference for using visual cues. This study implies that the communication of piano timbre is not based on acoustic cues alone but relates to a shared understanding of sensorimotor experiences between the performers and the listeners. This research enriches the understanding of embodied perspective on music communication, that the shared knowledge of sensorimotor experience and bodily movements between pianists and listeners lays a foundation of embodied music communication.

N400 标识音乐和语言中共享的运动信息

李雨璐 周统权¹ (通讯作者)

曲阜师范大学翻译学院, 日照, 276827, zhoutongquan@126.com

摘要 过往研究发现音乐蕴含的运动概念能促进具有运动信息的图片(如飞鸟)的加工,但对表达静止信息的图片(如站着的鸟)没有影响。假如跨类的运动概念普遍存在的话,具有运动属性的音乐能否启动表达运动概念的语言?在此背景下,本研究旨在探索音乐能否以及如何影响不同语言学范畴(动词和名词)的加工。本研究由两个ERP实验构成,探讨音乐启动条件下汉语动词和名词的加工情况。实验一(包括任务一和任务二)考察音乐启动动词(动作动词和状态动词)的加工,音乐分有节奏变化的音乐(加速音乐和减速音乐)和没有节奏变化的音乐(快速音乐和慢速音乐)两种。实验二(由任务三和任务四组成)采用实验一相同的音乐,考察名词(有生命名词和无生命名词)在音乐启动下的加工情况。两个实验均采用跨通道概念启动范式,首先给无音乐经验的被试播放一段音乐,音乐结束之后呈现一个词,被试的任务是判断该词与刚听到的音乐是否在运动概念上一致。任务一和任务三结果显示,在有节奏变化的音乐启动下,状态动词和无生命名词分别比动作动词和有生命名词在前部脑区引发了更大的N400波幅。但在这类音乐内部,N400效应只发生在动作动词和有生命名词上,基本上对状态动词和无生命名词无影响;在加速音乐条件下引发的N400波幅比减速条件下更大。然而,在任务二和任务四中,当无节奏变化的音乐启动动词和名词时,没有出现N400

成分。总之，两个实验表明，只有有节奏变化的音乐才能影响动词和名词的加工。具体来说，在有节奏变化的音乐启动下，动作动词和有生命名词比状态动词和无生命名词加工更容易，说明 N400 成分是标记运动概念的脑电指标。尽管音乐和词是截然不同的两类范畴，但理解音乐和词中的运动概念都离不开具身性（我们的身体经验）。所有这些都表明，运动作为一种物理知觉信息可以转化为人们语言认知中的一个概念信息，并相应地影响着不同范畴的加工。从方法论视角看，本研究为音乐意义和语言意义的比较研究提供了一个可以借鉴的研究范式。

N400 Indexing the Motion Concept Shared by Music and Language

Li Yulu¹, Zhou Tongquan¹, (Corresponding Author)

¹ School of Translation, Qufu Normal University, Rizhao, 276827

Corresponding author Email: zhoutongquan@126.com

Abstract: Previous studies found that motion concept implied by music helps facilitate the processing of dynamic entities (e.g., a picture of a flying bird) but exerts no impact on static entities (e.g., a picture of a standing bird). To date, however, no study has been conducted on whether such a relationship holds between music and language provided that motion concept is ubiquitous across categories. Against this background, the current study aims to investigate whether and how music can affect different linguistic categories like verbs and nouns when primed by music. The whole study is composed of two ERP experiments on the processing of Chinese verbs and nouns under different music priming conditions. Experiment 1 tested the processing of verbs (action verbs vs. state verbs) primed by music, i.e., the music with tempo changes (accelerating music vs. decelerating music) in Task 1 and the music without tempo changes (fast music vs. slow music) in Task 2 while Experiment 2 (made of Task 3 and Task 4) tested the processing of nouns (animate nouns vs. inanimate nouns) using the same set of music stimuli as adopted in Experiment 1. Following the cross-modality concept priming paradigm, participants were required to hear a piece of music prior to judging whether the word is semantically congruent with the motion concept conveyed by the music. The results of Task 1 and Task 3 showed that when primed by music with tempo changes, state verbs and inanimate nouns elicited larger N400 amplitudes than action verbs and animate nouns in the anterior regions. But between the music sub-types, the effect occurred only on action verbs and animate nouns (but basically not on state verbs or inanimate nouns), i.e., the N400 amplitudes were larger in accelerating music condition than in decelerating music condition. In Task 2 and Task 4, nevertheless, the N400 component was absent as verbs and nouns were primed by music without tempo changes. In sum, Experiment 1 and Experiment 2 reveals that only music with tempo changes can affect the processing of verbs and nouns. Specifically, action verbs and animate nouns become easier to process than state verbs and inanimate nouns when they are primed by music with tempo changes, indicating the motion concept indexed by N400. Despite the fact that music and words represent two distinct categories, they have shared concept of motion derived from embodiment (our bodily experience). All this suggests that motion as a physical perception can turn into a conception in people's linguistic cognition and affect the processing of diversified categories accordingly. Apart from the point, this study provides an applicable research paradigm to the meaning study encoded by music and language.

自闭特质者跨通道视听情绪整合加工：来自 ERP 的证据

王莞琪¹ 杜梦¹ 江俊² 王嘉博² 蒋存梅² (通讯作者)

¹ 上海师范大学教育学院心理学系，上海，200234

² 上海师范大学音乐学院，上海，200234, cunmeijiang@126.com

摘要 自闭症谱系是以社会交往和交流障碍、有限的/重复的行为、兴趣或活动模式为主要症状的一种神经发展障碍。跨通道情绪整合加工是社会交往的核心之一。由于自闭症者个体差异较大、存在共病，导致已有

研究结果不一致。考虑到高自闭特质者具有相似的自闭症状，但没有存在共病，本研究试图通过 ERP 技术探究高自闭特质者对音乐和面孔情绪的整合加工。为了避免同时呈现视听刺激存在的干扰效应。本研究采用跨通道情感启动范式（视听情绪刺激先后呈现）：实验 1 启动刺激是表现愉悦或不愉悦情绪的和弦，目标刺激是与和弦情绪一致或不一致的面孔图片。实验 2 启动刺激是愉悦或不愉悦的情绪面孔图片，目标刺激是与面孔图片情绪一致或不一致的和弦。脑电结果显示，无论启动刺激是和弦还是面孔图片，与情绪一致条件相比，低自闭特质者对情绪不一致条件均诱发 N400 成分。与此相反，高自闭特质者对情绪一致和不一致两个条件的神经反应没有存在差异。为了进一步探究高自闭特质者的情绪整合障碍是否缘于他们对和弦与面孔情绪识别的能力，实验 3 和 4 通过单通道情绪启动范式（和弦启动和弦，或面孔启动面孔）分别探究他们对和弦情绪和面孔情绪的识别。研究结果显示，对于和弦情绪来说，高低自闭特质者大脑均能对和弦情绪变化做出反应，体现出高自闭特质者具有正常的音乐情绪信息的局部加工能力。然而，对于面孔情绪来说，与低自闭特质者不同，高自闭特质者大脑不能觉察出面孔情绪的变化。这些结果说明，尽管高自闭特质者可以识别出和弦情绪，但由于他们大脑无法觉察面孔情绪的变化，导致他们无法对跨通道的视听情绪信息进行整合加工。

Impaired audiovisual integration of emotion in individuals with autistic traits: Evidence from ERP

Wanqi Wang¹, Meng Du¹, Jun Jiang², Jiabo Wang², Cunmei Jiang^{2*}

¹ Department of Psychology, Shanghai Normal University, Shanghai, 200234

² Music College, Shanghai Normal University, Shanghai, 200234

Abstract: Autism spectrum disorder is a neurodevelopmental condition characterized by deficits in social communication and social interaction, and restricted/repetitive patterns of behaviors, interests or activities. One of the cores of social interaction is audiovisual integration of emotional signals. Previous studies have yielded inconsistent results, which may be due to the large individual differences and other comorbidities in individuals with autism. Considering that individuals with high autistic traits have similar symptoms of autism and have no comorbidities, this study used ERPs to investigate the integration of emotional information from music and face in individuals with high autistic traits. A crossmodal affective priming paradigm was used in Experiments 1 and 2, in which target facial expressions or chords were preceded by affectively congruous/incongruous chords or facial expressions with a 250-ms stimulus onset asynchrony (SOA). Results showed that incongruous targets evoked an increased N400 than congruous targets in individuals with low autistic traits but not in individuals with high autistic traits. To further examine whether the deficits in audiovisual integration of emotional information resulted from impaired musical and facial emotion recognition, a unimodal affective priming paradigm was used in Experiments 3 and 4, in which target chords or facial expressions were preceded by affectively congruous/incongruous chords or facial expressions with the SOA of 250 ms. while amusics failed to exhibit such a N400 effect. We found that both individuals with high and low autistic traits exhibited a similar P3 in response to incongruous target chords, while only individuals with low autistic traits showed a larger N400 in response to incongruous target facial expressions. These results suggest that facial expression recognition deficits are responsible for the impaired audiovisual integration of emotional signals in individuals with high autistic traits.

形旁语义分解促进汉语伴随词汇学习：基于眼动的证据

贺斐 梁菲菲 白学军 (通讯作者)

天津师范大学心理学部, 天津, 300387, bxuejun@126.com

摘要 作为阅读的基本加工单位, 词汇在毕生发展中不断积累。当词汇量积累到一定程度, 阅读中伴随习得词汇成为个体拓展词汇量的主要方式。在阅读浅层正字法书写系统(如希伯来语)的文本时, 读者通过“语音解码”, 自发地在阅读中建构新词表征, 这是完成词汇学习的核心机制(Share, 1995, 2008)。而作为深层正字法书写系统, 汉语形-音对应相对不系统, 但具有由形知义的特点, 即形旁可以在亚词素水平提供语义线索。那么, 形旁语义线索如何作用于汉语阅读伴随词汇学习? 该效应如何随着新词表征的逐步积累而变化? 本研究通过操纵新词的形旁语义是否透明, 对上述两个问题进行研究。构造两类双字假词作为新词: 一类新词的形旁可以提示整词语义(形旁语义透明条件); 一类新词的形旁不能提示整词语义(形旁语义不透明条件)。在学习阶段, 通过 15 个强限制性学习语境, 把每个新词描述为某种语义类别下的新成员; 为降低学习负荷, 将整个学习阶段均分于五个子阶段, 阅读期间记录被试的眼动轨迹。在测试阶段, 通过正字法选择、语义类别判断、新词释义任务考察学习效果。结果发现, 在与语义测试相关的两个测试中, 读者在形旁语义透明条件下的表现显著优于形旁语义不透明条件, 表现出典型的形旁语义透明度效应。此外, 在分析整个学习阶段的眼动数据时, 仅发现微弱的形旁语义透明度效应(仅反映在回视入概率上)。基于前一次或几次阅读在整个阅读伴随词汇学习中的重要作用, 我们又对第一个语境的眼动数据进行分析, 结果发现, 形旁语义透明条件下对新词的回视入概率显著降低, 且总注视时间、总注视次数均显著少于形旁语义不透明条件, 表明在第一次阅读新词时获得了更大的形旁语义透明度效应, 该效应主要发生在词汇加工的晚期阶段。上述研究结果表明, 汉语熟练读者会自发利用亚词素形旁语义信息促进阅读伴随词汇学习。由此证明, 阅读伴随词汇的学习机制在具有语言普遍性的同时(Li et al., 2018; Li et al., 2019), 也具有语言间的特异性。

Semantic radical decomposition facilitated incidental word learning during Chinese reading: Evidence from eye movements

Fei He, Feifei Liang, Xuejun Bai

Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

Abstract: As the primary processing unit of reading, word is accumulated over a lifetime of development. When vocabulary was accumulated at a certain level, incidental vocabulary learning became the main way of lexical development and expanding vocabulary. When reading texts in shallow orthographic writing systems (e.g., Hebrew), the spontaneously gradual construction of new word representations through "phonological recoding" is the sine qua non of reading acquisition and vocabulary learning (Share, 1995, 2008). Chinese, as a deep orthographic writing system, its orthography is remarkably different from alphabetic language. Character is the basic writing unit of Chinese, and about 80% of modern Chinese are compound characters, which contain semantic and phonetic radicals. Furthermore, orthography-to-meaning mapping is more reliable than orthography-to-phonology mapping. As submorphemic units, semantic radicals would be semantic cues for words. So, how does semantic radical transparency in submorphemic level affect incidental word learning in Chinese? How does the effect change as new words representations gradually accumulated during incremental vocabulary learning? This study investigated these two issues by manipulating whether the semantic radical of new words was transparent. Two groups of semantic

radicals with high or low semantic transparency were selected and combined with low-frequency right-hand radicals to form left-right structured pseudo-characters. And then, two types of two-characters pseudowords were constructed as novel words: one type of them had a semantic radical that could give clues of whole word meanings (semantic radical transparent condition); the other type of novel words had a semantic radical that could not prompt whole word meanings (semantic radical non-transparent condition). This study applied "learning-test" paradigm, and combined eye-tracking technology during the learning phase to examine the effect of semantic transparency across sentence reading. Firstly, in the learning phase, fifteen informative sentences were created for each novel word to support word learning. Meanwhile, to ensure that the novel words were genuinely novel, we created semantic cues for each novel word as a new concept of a kind of semantic category and presented those cues before the target word to support lexical learning. In order to reduce the learning load, the learning contexts were evenly divided into five learning sessions, and the participants were required to read and comprehend one session every half day. Secondly, in the testing phase, the learning effect was examined through an orthographic choice task, semantic category choice task, and definition task. The analysis of three offline testing task found that the performance of semantic category choice task and definition task exhibited a typical promotion effect of semantic radical transparency, that is to say, the scores of novel words was significantly higher in semantic radical transparent condition than in semantic radical non-transparent condition. Besides, when analyzing eye movement data throughout the learning phase, only a weak semantic radical transparency effect was found, which reflected only in the probability of regressions in the novel words. Based on the critical role of the first exposure of novel words during incidental word learning, we also analyzed the eye-tracking data on the first sentence and every first sentence of five learning sessions. We found that the probability of regressions in the target words was significantly lower in the transparent condition, and the total fixation time and the total number of fixations on transparent novel words were significantly less than that on low non-transparent ones. It showed that a more substantial semantic radical transparency effect was obtained during the first reading of novel words, and this effect mainly occurred in the late stage of novel words processing. All the above findings indicated that proficient Chinese readers would spontaneously use the semantic information of submorphemic semantic radical units to facilitate incidental novel words learning. Thus, it was demonstrated that the learning mechanism of incidental Chinese word learning not only showed linguistic universal but also had its specificity.

摘要 根据词汇质量假说, 阅读效率高(快速)的读者词汇表征质量更高, 在词汇加工中对语境信息的依赖更少; 而阅读效率低(慢速)的读者则更依赖语境信息来弥补较低的词汇表征质量(Andrews, 2015; Perfetti, 2007)。相反, 预测编码理论则认为, 与阅读效率低的读者比, 阅读效率高的读者拥有更丰富的阅读经验, 更善于利用语境来预测即将出现的词汇(Hawelka et al., 2015)。在中文阅读中, 不同阅读效率的成人读者对预测性的依赖还不清楚, 本研究借助 Eyelink 1000 眼动仪并通过两个实验检验这两种观点。实验 1 通过比较 15 组快速与慢速读者在句子阅读中对目标词(高或低预测)的注视情况, 来考察两组读者在中央凹词汇加工中利用预测性信息的差异。实验 1 共有 60 对高-低预测实验句子。实验 2 使用边界范式(Rayner, 1975)操纵 60 个高预测词的副中央凹预视(相同、视觉相似假字、低预测词和无关假字)来考察预视对 20 组快速与慢速读者加工预测性信息的影响。整体结果显示, 快速组比慢速组对目标词的注视更少、更短, 跳读更多。实验 1 发现高预测词比低预测词的注视时间更短, 即预测性效应, 且该效应在两组上表现一致。实验 2 发现了

显著的预视效应，且该效应受阅读组别调节：慢速组在低预测预视和无关预视下的注视时间长于快速组，而在相同预视下两组的注视时间相似；另外，在跳读率上，慢速组对相同预视下目标词的跳读显著多于低预测预视，而快速组对相同预视和低预测预视下目标词的跳读没有差异。本研究结果表明，在中文阅读中，快、慢速读者对预测性信息的依赖程度没有差异，不支持词汇质量假说和预测编码框架理论；但是，与快速读者相比，无关预视对慢速读者的目标词加工和下一次眼跳目标选择的干扰更大，反映了慢速读者对无关或不恰当信息激活的抑制较弱。

关键词 预测性，中央凹加工，副中央凹加工，快速读者，慢速读者

The effect of lexical predictability on word processing in fast and slow readers during Chinese reading

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin, 300387

Abstract: According to the lexical quality hypothesis, highly-proficiency (fast) readers have well-specified lexical representations which enable automatic word identification and less context decoding (Andrews, 2015; Perfetti, 2007), while low-proficiency (slow) readers rely on context for word identification during reading due to their imprecise lexical quality. In contrast, the predictive coding framework assumes that highly-proficiency readers rely on their more reading experience to predict the upcoming context compared to low-proficiency readers (Hawelka et al., 2015). However, it is still unclear how skilled readers with different levels of reading proficiency rely on context information (e.g., predictability) for word processing during Chinese reading. In two experiments, the present study aimed to investigate individual differences in the use of lexical predictability for word identification by using the eye-tracking technique. In Experiment 1, eye movements of fast and slow readers were recorded while reading sentences containing predictable or unpredictable target words to investigate differences between predictability effects of the two groups of readers. Sixty pairs of predictable-unpredictable target words were selected, each of which was embedded into the same sentence frame. Fifteen groups of fast and slow readers participated in Experiment 1. In Experiment 2, parafoveal previews of the 60 predictable target words (identical, visually similar pseudocharacter, unpredictable word or unrelated pseudocharacter previews) were manipulated by using the boundary paradigm (Rayner, 1975) to explore how parafoveal preview influences the processing of predictability information of fast and slow readers. Twenty groups of fast and slow readers took part in Experiment 2. The results showed that fast readers fixated shorter and less on the target words and were more likely to skip the target words than slow readers. Although reliable predictability effects (i.e., predictable words were fixated shorter than unpredictable words) were found in Experiment 1, a similar pattern was observed in the two groups. Moreover, Experiment 2 showed robust parafoveal preview effects on the target word which interacted with the reading group. In particular, the two groups had the same first-pass fixation times at the target word under the identical previews while slow readers made longer fixations than fast readers on the target words with unpredictable previews or unrelated previews. In addition, fast readers skipped target words at a similar probability between the identical preview and unpredictable preview conditions while slow readers tended to skip less with unpredictable than identical previews. The current findings indicate that both fast and slow readers rely on context information (i.e., predictability) to identify words with no difference while processing such information during Chinese reading, which provides no evidence for either the lexical quality hypothesis or the predictive coding framework. However, compared to fast readers, slow readers are disturbed more by unrelated parafoveal information for their word processing as well as saccadic targeting, suggesting that slow readers are less effective at suppressing unrelated or inappropriate information during reading.

Abstract: lexical predictability, foveal processing, parafoveal processing, fast readers, slow readers

中文阅读中长距离回视引导机制的眼动研究

杨帆 隋雪(通讯作者)

辽宁师范大学心理学院, 辽宁大连, 116029, suixue88@163.com

摘要 回视是阅读中的一种常见现象。研究者根据回视距离, 将其分为长距离和短距离回视。对长距离回视引导机制进行解释的理论存在争议: 空间编码假设认为长距离回视由空间记忆引导, 而言语重构假设认为其由言语记忆引导。对长距离回视中的修正眼跳的主导因素也还没有确切结论。因而, 本研究采用最初回视误差、最初回视大小、累积回视大小、回视反应时等回视指标, 通过三个实验探究中文阅读中长距离回视的引导机制, 以完善相关研究。实验一采用 2 (回视条件: 阅读、不阅读) $\times$ 2 (词频: 高频、低频) $\times$ 3 (目标词位置: 前三分之一、中间三分之一、后三分之一) 三因素混合实验设计。结果发现, 阅读组最初回视误差更低, 最初回视大小在目标词位置之间差异显著, 不阅读组则不显著; 目标词位置在所有回视指标上的主效应都显著。实验二采用 2 (回视可见性: 可见、不可见) $\times$ 2 (词频: 高频、低频) $\times$ 3 (目标词位置: 前三分之一、中间三分之一、后三分之一) 三因素混合实验设计。结果发现, 不可见组的最初回视误差更小, 最初回视大小更大。实验三采用 3 (回视目标: 原词、近义词、形近非词) $\times$ 3 (目标词位置: 前三分之一、中间三分之一、后三分之一) 的被试内实验设计。结果发现, 句中目标词为形近非词时的累积回视大小显著小于原词和近义词, 而原词的回视反应时小于近义词。实验结果表明, 长距离回视的最初回视由空间记忆引导, 支持空间编码假设; 修正眼跳受文本视觉信息和言语记忆引导。

Eye movement study of long distance regression mechanism in Chinese reading

Yang Fan, Sui Xue (Corresponding author)

College of Psychology, Liaoning Normal University, Dalian, Liaoning 116029, China.

suixue88@163.com

Abstract: Regression is a common phenomenon in reading. According to the regression distance, the researchers divided it into long distance and short distance regression. Theories explaining the long-distance regression mechanism are controversial: the spatial coding hypothesis holds that long-distance regression is guided by spatial memory, while the speech reconstruction hypothesis holds that long-distance regression is guided by verbal memory. There is also no definitive conclusion as to the dominant factors for corrected saccades in long distance regression. Therefore, in this study, initial regression error, initial regression size, cumulative regression size, reaction time and other regression indicators were adopted to explore the guidance mechanism of long-distance regression in Chinese reading through three experiments. Experiment 1 adopted a three-factor mixed experimental design of 2 (regression condition: reading, not reading) $\times$ 2 (word frequency: high frequency, low frequency) $\times$ 3 (target word position: first third, middle third, and last third). The results showed that the initial regression error was lower in the reading group, and the initial regression size was significantly different between the positions of the target words, but not significant in the non-reading group. The main effect of the target word position on all the regression indexes was significant. Experiment 2 adopted a three-factor mixed experimental design of 2 (regression visibility: visible, invisible) $\times$ 2 (word frequency: high frequency, low frequency) $\times$ 3 (target word position: first third, middle third, and last third). The results showed that the initial regression error was smaller and the initial regression size was larger in the invisible group. In experiment 3, 3 (regression target: original word, synonym, and similar-looking non-word) $\times$ 3 (target word position: the first third, the middle third, and the last third) was adopted. The results show that the cumulative regression size of similar-looking non-word is significantly smaller than that of the original word and the synonym condition, while the regression size of the original word is smaller than that of the synonym. The results

show that the initial regression of long distance regression is guided by spatial memory and supports the hypothesis of spatial coding. Corrected saccade is guided by textual visual information and verbal memory.

摘 要 在阅读过程中读者不仅通过中央凹注视获取完成阅读所需要的信息，还可以通过副中央凹预视获取随后被注视文本的信息。通过副中央凹预视加工所获取的预视信息对随后的眼动控制产生显著的影响。在拼音文字中由于存在词间空格标记了词边界信息，因此读者在副中央凹的加工是以词为单位进行的，去除词间空格会显著地阻碍读者的副中央凹加工。虽然词在汉语阅读中具有重要的作用，但是汉语文本缺少词间空格作为外显的词切分线索。汉语读者能够对副中央凹中的字进行预视加工，根据之前的理论假设，对字进行部分加工即可激活词水平的加工，那么在汉语阅读的副中央凹加工中能够激活词水平的加工呢？为探讨该问题，本研究采用眼动仪记录了 40 名大学生阅读过程中的眼动行为，采用边界范式，在副中央凹呈现与双字目标词（高校）相同的预视、同音词预视（高效）、同音非词预视（高笑）、非同音非词预视（高曹）。在目标词的注视时间上发现，目标预视的注视时间显著短于其他预视条件，同音词预视条件显著短于非同音非词预视与同音非词预视，而同音非词预视与非同音非词预视的差异并不显著。结果表明，汉语读者在副中央凹加工中能够获得双字词的语音信息，但是并不能获取非词的语音信息，因此我们认为汉语读者在副中央凹加工中能够激活词水平的加工。

Abstract: During reading, the readers can not only obtain the information needed to complete the reading through the foveal vision, but also extract the information of the text from parafoveal vision. And the information obtained through the parafovea preprocessing has a significant impact on the eye movement control. In alphabetic languages, because there are spaces between words to mark word boundary information, the readers' processing of the parafoveal is carried out in units of words. Removing the spaces between words will significantly hinder the reader's processing of the parafoveal. Although words play an important role in Chinese reading, Chinese text lacks space between words as an explicit word segmentation clue. Since Chinese readers are able to pre-process the characters in the parafovea, according to the previous theoretical hypothesis, partial processing of the characters can activate word level processing. Then, in the parafoveal preprocessing of Chinese reading, can it activate word level processing? In order to explore this problem, this study used eye tracker to record 40 college students' eye movements during reading. Boundary paradigm has been used to manipulate the type of preview of two-character word, including identical preview, word of homophones preview, non-word of homophones preview and control preview. The fixation

duration of the target word under identical preview was significantly shorter than other preview conditions. And the fixation duration of target was shorter with word of homophones preview than non-word of homophones preview and control preview, but there was no difference between non-word of homophones preview and control preview. The results suggest that Chinese readers can obtain the the phonological information of two-character words in parafoveal preprocessing, but not the non-word phonological information. Therefore, we believe that Chinese readers can activate the word-level processing in the parafoveal preprocessing.

摘要 阅读的知觉广度是指读者在阅读过程中每次注视能够获取有效信息的有限区域。研究发现, 知觉广度沿着阅读方向呈现不对称性。对此, 研究者提出阅读方向引起的注视点两侧注意资源分布不对称假设。但是尚未有明确的实证能够支持该假说, 因此本研究通过两个实验考察蒙古文阅读知觉广度的同时考察视觉注意在读者阅读过程中的分布特征, 以此验证注意假说是否成立。实验1采用经典的移动窗口范式, 以音节作为窗口单位, 设计 9 符号作为掩蔽字符, 制定 8 种不同的窗口条件。将其他 7 种条件与正常阅读条件进行对比分析发现, 当窗口呈现上方一个音节和下方三个音节时阅读时间显著长于正常阅读条件。由此得出蒙古文阅读中的知觉广度上限为注视点上方一个音节, 下限为注视点下方三个音节, 并沿着阅读方向呈现上下不对称特征。实验2将文本阅读任务与刺激探测任务创新性地结合在一起, 采用边界范式, 在阅读过程中当被试的眼睛越过边界后句子消失, 接着在眼睛落点位置的周围呈现一个红色方块作为探测刺激, 刺激呈现的位置有七个不同的距离水平。结果发现被试对呈现在注视点位置的刺激探测反应时最短, 当探测刺激呈现在注视点上方时反应时显著长于呈现在注视点下方的条件, 探测刺激呈现在知觉广度范围外时反应时显著长于呈现在知觉广度范围内的条件, 注意资源的分布呈现出与知觉广度相吻合的不对称性。表明知觉广度范围内注意资源分布较多, 也是造成知觉广度不对称的重要原因。

Abstract: The perceptual span is defined as the amount of visual information that is processed in a given fixation. Many studies have found that perceptual span is asymmetrical along the direction of reading. In this regard, the attention bias hypothesis argues that readers allocate more attention to upcoming novel information, leading to an increased perceptual span in the reading direction. However, there is no clear empirical evidence to support this hypothesis. Therefore, this study conducted two experiments to investigate the perceptual span of Mongolian reading and the distribution characteristics of visual attention in the process of reading, to verify the validity of the attention bias hypothesis. Experiment 1 uses the moving window paradigm, with syllables as window units, design 9 symbols as a masking character, and 8 different window conditions are formulated. Comparisons of window conditions with

the normal reading condition showed that the Mongolian readers reached asymptotic performance in a reading time when windows revealed at least one syllable above and three syllables below the currently fixated one. The results of this experiment demonstrate an asymmetry in Mongolian reader's perceptual span. In experiment 2, an eye-movement-contingent probe detection task was used to determine the allocation of visual attention during reading. On a subset of trials, a to-be-detected visual probe replaced visual text when the eyes crossed and landed at the bottom of an invisible interword boundary. The probe was either near the fixated location or at a more distant location in the upper or lower visual field. Probe detection latencies were shorter for probes that were closer to fixation, and they were shorter when the probes were shown in the lower rather than the upper visual field. In the same way, the response time within the perceptual span is shorter than outside the perceptual span. It shows that more attention is distributed within the perceptual span, which is also an important reason for the asymmetry of the perceptual span.

Abstract: Mongolian reading, Perceptual span, Visual attention, Asymmetry, Eye movements

蒙语词汇阅读的注视位置效应

侯友^{1,2} (通讯作者) 那日苏¹

1 内蒙古师范大学心理学院, 呼和浩特, 010022, houyouimnu@163.com

2 内蒙古自治区心理学重点实验室, 呼和浩特, 010022

摘 要 注视位置效应是眼动阅读研究的重要内容。以英语、汉语等不同文字为对象的研究均发现存在词汇加工的注视位置效应。研究发现, 词频、词汇类型等高水平语言学因素是影响注视位置效应的主要因素, 但仍存在争议, 特别是表现在不同的语言文字系统中。蒙古语是古老的民族语言之一, 属于阿尔泰语系蒙古语族, 是由 31 个蒙文字母 (7 个元音、24 个辅音) 构成的音素文字。蒙文的书写方式是上下连书, 行款从左到右; 有词间空格, 但字母之间没有空格。本文以蒙古语为研究对象, 试图揭示蒙古语阅读中的注视位置效应及眼动特征, 丰富已有眼动控制理论的内容。共设计了两个实验, 均为单因素被试内设计。实验一探讨词频因素 (高频词、低频词) 对蒙古语阅读过程中注视位置效应的影响。实验二以蒙古语的构词特点为切入点, 探讨词汇类型 (派生词、单纯词) 对注视位置效应产生的影响。结果发现: (1) 单次注视条件下, 词频影响具体词汇的注视位置。高频词的首次注视落在词中心区域字母四的概率最高, 低频词的首次注视集中在词首的字母二和字母三上。词频也影响再注视模式, 高频词中, 当首次注视落在词首时, 再注视位置集中于词尾部分; 低频词中, 当首次注视落在词首时, 再注视位置集中于词中心区域。(3) 词汇类型不影响读者阅读过程中的首次注视位置, 但影响晚期指标注视次数和再注视模式。派生词的注视次数和再注视概率均少于单纯词。当首次注视落在派生词的词首时, 落在词尾的再注视概率最高; 当首次注视落在单纯词的词首时, 再注视更多落在词中心区域, 而首次注视落在单纯词的词中心时, 再注视则落在词尾的概率最高。表明读者阅读派生词时, 通常需要注视词首和词尾就能完成词汇识别。而注视单纯词时, 由于没有帮助理解的词根在词中, 因此通常在词首、词中心以及词尾都需要注视一次才能达到词汇识别。结果表明: (1) 蒙古语阅读过程中存在偏向注视位置, 同时也表现出一定的语言特点。(2) 高水平的语言因素对蒙语词汇识别的影响支持阅读认知加工的 SWIFT 模型。

The Fixation position effect of Mongolian vocabulary reading

HOU YOU^{1,2}, NA RISU¹

1. Inner Mongolia Normal University, School of Psychology, Hohhot

2. Inner Mongolia Key Laboratory of Psychology, Hohhot

Abstract: The effect of fixation position has been consistently found in the study of English phonetic characters and Chinese hieroglyphics. It is also found that the high level of linguistic factors such as word frequency and word type

are the main factors that influence the fixation effect, but there are still some disputes on this issue, especially in different language systems. Mongolian language is one of alphabetic languages. And Mongolian writing is top to down style, there is spaces between words, but no spaces within word. The goal of the present study was to reveal the fixation position effect and eye movement characteristics in Mongolian reading. Two experiments were conducted in present study. The first one measured whether word frequency (high vs low) affects the landing position in Mongolian words. And the second one examined whether word types (simple vs derived) influence the decision of where to move the eyes next. Results as follows: (1) Initial landing position is nearer to the centre of words for high-frequency words than low-frequency words. And they also show differences emerge in later measures. When readers' initial fixation close to the beginning of high-frequency word, then the refixation will be targeted towards the end of the word. While readers' initial fixation close to the beginning of low-frequency word, then the refixation will be targeted towards words' centre, and the end of the word at the third time. (2) It's exhibited a strong tendency to fixate at the slightly above of the word centre in single-fixation cases and at the word beginning in multiple-fixation cases for two types of Mongolian words. They do not differ in initial landing positions, but do differ in refixation behaviour. Readers tend to refixate on the end of derived word when their initial landing position targeted on the beginning of that word at first. While readers target their eyes at the centre of the simple word, when they fixate at the beginning of that word in the first fixation event. Conclusions as follows: There is in an fixation location effect during reading Mongolian. Word frequency and word types as higher level linguistic factors support SWIFT model from cognitive model.

摘要 本研究通过移动窗口范式探讨了小学生在汉语阅读过程中注意分布的发展变化情况。研究采用4(年级: 一年级、二年级、三年级、五年级)×7(窗口条件: L1R1, L1R2, L1R3, L2R1, L2R2, L3R1, FL)的两因素混合实验设计, 其中年级为被试间变量, 窗口条件为被试内变量。所有的被试(共144名)均要阅读相同的一年级水平的材料。结果发现: 第一, 在眼动指标上表现出了基本的阅读发展趋势, 比如一年级学生的阅读时间(平均注视时间、凝视时间、单一注视时间)与注视次数最多, 五年级学生的阅读时间与注视次数最少; 在阅读速度与平均向右眼跳距离上, 一年级学生的阅读速度最慢, 眼跳距离最短, 五年级学生的阅读速度最快, 眼跳距离最长。第二, 在阅读速度上, 一年级小学生在L1R1窗口条件下的阅读速度与FL整行不存在显著性差异; 二年级、三年级与五年级学生均在L1R2条件下的阅读速度与FL整行条件不存在显著差异。第三, 当对L1R2与L2R1窗口条件下的阅读速度进行比较时, 研究发现L1R2与L2R1条件下的阅读速度在二年级学生中不存在显著差异, 但在三年级与五年级学生中的差异显著, 且五年级学生受到的L1R2与L2R1窗口的差异效应要显著大于三年级学生。总之, 本研究使用移动窗口范式首次探讨了小学生在阅读过程中的注意分布发展情况。首先, 研究结果重复了典型的眼动阅读发展趋势, 即随着年级的升高, 读者的阅读速度越来越快, 注视时间与注视次数越来越少, 向右眼跳距离增长。第二, 一年级学生的阅读知觉广度为L1R1; 二年级、三年级及五年级学生的阅读知觉广度为L1R2。第三, 一年级学生在阅读时的注意分布表现出了对称性的特点, 二年级学生在阅读时表现出了比较灵活的注意分布特点, 三年级与五年级学生在阅读时的注意分布表现出了向右的不对称性特点, 且这种不对称性在五年级学生中表现更加明显。

Development of Perceptual Span for Primary School Students: From Symmetry to Asymmetry

Guoli Yan^{1,2,3}, Sainan Li², Xiaoyuan Yuan², Jingen Wu², Yongsheng Wang^{1,2,3}

1 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China

2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

Abstract : Using moving-window paradigm, the present study mainly explored the developmental trajectory of attention allocating during Chinese reading. A total of 144 students in Grade 1, Grade 2, Grade 3 and Grade 5 from a primary school was recruited. We also manipulated six window sizes (L1R1, L1R2, L1R3, L2R1, L2R2, L3R1) and a full-line control condition (FL). All of the participants were required to read the same materials that appropriate for first graders. The results showed that: (1) there was a basic reading developmental pattern, such as reading time (average fixation, first fixation and gaze duration) and fixation count among first graders were the longest, while among fifth graders were the shortest; in a similar fashion, the reading speed was slowest and mean rightward saccade amplitude were the shortest for Grade 1 students, the reading speed was fastest and mean rightward saccade amplitude were the longest for fifth graders. (2) On the measure of reading speed, the difference between L1R1 and FL in Grade 1 students was not significant, however, there was no significant difference between L1R2 and FL condition among second, third and fifth graders, indicating that first graders could extract information from 3 characters, while for higher graders, they could get information from 4 characters during a single fixation. (3) When comparing the reading speed under L1R2 and L2R1, we found that the difference between L1R2 and L2R1 was not significant for second graders, however, the reading speed was faster in L1R2 condition than L2R1 condition for both Grade 3 and 5 students, and this difference was more robust for fifth graders compared with third graders. In summary, the present study firstly replicated the typical eye movement developmental trajectory, reading performance becomes proficiency with grade. Second, the reading perceptual span for first graders was L1R1, while the perceptual span for higher graders was L1R2. Third, the attention allocation among first graders is symmetric, that's to say, they allocated the same attention to the right and left fixation; Grade 2 students adopted a flexible attention allocation strategy during reading; for third and fifth graders, they would put more attention resource to the right of fixation to keep a fluent reading.

汉语儿童自然文本阅读中的词长效应及其发展

刘妮娜（通讯作者） 李希缘 王永胜 闫国利

天津师范大学心理学部，天津，300074, Innair@163.com

摘 要 有效的词汇识别是儿童阅读能力发展的基础。词长是影响词汇加工效率的重要因素之一，长词相比较短词加工时间更长、识别速度更慢（即词长效应）。基于前人孤立词汇识别的反应时研究显示，词长效应随儿童年龄增大而逐渐减小，反映了儿童从分析式加工到整体性加工的识词策略的发展变化。然而，在汉语自然文本阅读中，由于词与词之间无词空格，并存在词边界歧义等因素，儿童能否有效获得并利用词长信息并不清楚。基于此，本研究采用眼动追踪技术，以小学三、五年级 54 名儿童和 30 名大学生为对象，操作句子中目标词的长度（单字词、双字词、三字词）和儿童的阅读技能水平，探究汉语儿童读者在自然句子阅读中的词长效应及其发展特点，这对深化儿童词汇加工规律和汉语阅读眼动控制发展问题具有重要启示。结果显示：（1）在自然句子阅读中，儿童能够获取词长信息并利用其进行词汇识别和眼动控制，表现为随词汇长度的增加，儿童对目标词的注视时间更长、跳读率更低，且眼跳注视位置更靠近词汇右侧，与熟练大学生读者表现相似。（2）随着年龄的增长，儿童对词长信息的利用效率逐渐增大，表现为词长效应在注视时间维度

上随儿童年龄的增大而减小,在注视位置维度上随年龄的增大而逐渐增大,支持自然句子阅读中从分析式加工到整体性加工的识词策略变化。(3)词汇理解技能的发展对儿童词长效应的调节作用最大,且其作用广泛分布于眼动行为的注视时间和注视位置维度之上。

Word Length Effect in Developing Readers during Chinese Sentences Reading

Nina Liu¹, Xiyuan Li¹, Yongsheng Wang¹, Guoli Yan¹

Faculty of psychology, Tianjin Normal University, Tianjin, China

Abstract: Effective word recognition is the foundation of the development of children's reading skills. Word length is one of the most important factors to influencing word processing efficiency for developing readers. Long words are identified for longer than that of short words, that is, word length effect. The response time research based on isolated word recognition shows that children's word length effect gradually decreases with age, which demonstrated the change of word recognition strategies from analytical processing to holistic processing. However, it is not clear whether children can effectively obtain and use word length information since there are no spaces marking word boundaries in Chinese text. Therefore, to investigate the word length effect and its development characteristics in developing readers when Chinese text reading, 54 children in grade 3 and 5 of primary school and 30 college students were recruited as participants and their eye movements was recorded as reading sentences containing a one-, two-, or three-character word. Children's reading skills were manipulated as well. Results showed that (1) Children could obtain and use word length information to identify words and control eye movement behaviors in Chinese text reading, which showed that longer words were fixated for longer and less likely to be skipped and the fixation position was closer to the right side of the word than that of short words for both children and adults. (2) children's utilization efficiency of word length information gradually increased with the increase of age, which was manifested in that the word length effect decreased with the increase of children's age in the dimension of fixation time and increased with the increase of age in the dimension of fixation position, supporting the change of word recognition strategies from analytical processing to holistic processing. (3) The development of word comprehension skills had the greatest moderating effect on children's word length effect, and its effect widely distributed on both behaviors of when and where to move the eyes.

Abstract: word length effect, analytical processing, holistic processing, eye movements, developing readers

预测性与词素变换对中文阅读的影响及年龄差异

摘要 阅读在日常生活中发挥着重要作用,而老年人由于认知老化与视力退化等原因会在阅读上表现出与青年人不同的模式。阅读时前文语境的可预测性是影响阅读的重要因素,在拼音文字和中文阅读的眼动研究中均发现高预测性词的跳读率高、注视时间更短、注视次数以及回视次数都更少。拼音文字研究中还进一步发现语境预测性会对换位字母效应产生影响。换位字母效应是指将某个单词内的字母互换位置对阅读带来的干扰要小于对应字母替换为其他的字母带来的干扰,在高限制性语境条件下,换位条件的启动效应与替换条件一致,也就是说语义预测性消除了字母换位效应。在中文研究中也发现了词素的换位效应,双字词的两词素换位带来的干扰明显小于词素替换。在拼音文字中预测性与字母换位都会对阅读产生影响而且两者有交互作用,那么在汉语中语境预测性与词素换位对阅读的影响是怎样的呢?是否也会存在交互作用呢?而老年人和青年人是否会表现出相似的模式呢?使用 Eyelink 1000 plus 眼动仪,进行了两个实验对以上问题进行探讨。实验1选取48名青年被试与36名老年被试,采用自然阅读范式,进行2(年龄:青年人、老年人)×2(预测

性：高、低）×3（呈现条件：原词、换位非词、替换非词）的混合实验设计，考察在正常阅读条件下语境预测性与词素换位对阅读的影响及其年龄差异，结果发现：低预测条件下换位非词与原词之间的总注视时间差异大于高预测条件，高预测条件下替换非词与换位非词之间的差异大于低预测条件，而且老年人在高预测条件下替换非词与换位非词之间的差异显著高于青年人。实验2选取60名青年被试与36名老年被试，采用边界范式，进行2（年龄：青年人、老年人）×2（预测性：高、低）×3（预视条件：原词、换位非词、替换非词）的混合实验设计，考察在预视条件也就是在加工的早期阶段语境预测性与词素换位对阅读的影响及其年龄差异，结果发现：高预测性条件下的词素换位效应要显著大于低预测条件下，但年龄差异不显著。

Abstract: A word's predictability from the prior linguistic context has been shown to have an important influence on mechanisms of eye movement control in reading. With this presentation, I will report a series of experiments that provide new insights into effects of word predictability on eye movement control in Chinese reading. This will include two experiments that reveal differences in the basic effects of word predictability on the eye movements of young (18-30 years) and older (65+ years) adults, which may provide the clearest evidence to date for adult age differences in word predictability effects. The Eyelink 1000 plus was used to carry out two experiments to discuss the above problems. In experiment one, 48 young participants and 36 old participants were selected, and a mixed experimental design of 2 (age: young people, old people) × 2 (predictive: high, low) × 3 (presentation conditions: identity, transposed-character and substituted-character) was carried out using natural reading paradigm. The influence of context predictability and morpheme transposition on reading under normal reading conditions and their age differences are investigated. The results show that the difference in total fixation time between transposed non-words and identity under low prediction conditions is greater than that under high prediction conditions, the difference between substituted non-words and transposed non-words under high prediction conditions is greater than that under low prediction conditions, and the difference between substituted non-words and transposed non-words under high prediction conditions is significantly higher for the elderly than for the young. In experiment 2, 60 young participants and 36 old participants were selected, and a mixed experimental design of 2 (age: young people, old people) × 2 (predictive: high and low) × 3 (preview condition: identity preview, transposed non-word preview and substituted non-word preview) was carried out by using the boundary paradigm. The effects of contextual predictive and morpheme transposition on reading and their age differences were investigated under the predictive condition, i.e. in the early stage of processing. The results showed that the morpheme transposition effect under the high predictive condition was significantly greater than that under the low predictive condition, and there was no age difference in this different effect.

汉语印刷和手写文本阅读中正字法邻近字启动的抑制效应

李馨(通讯作者) 于慧婧 张海雨 王永胜 梁菲菲

天津师范大学心理学部，天津，300387, lixinpsy1983@126.com

摘要 在日常沟通交流和获取信息的过程中，汉语常采用手写体和印刷体两种形式。手写体是最早的书写形式；随着科技的发展，印刷体逐渐成为人们获取信息的主要载体，但是手写体仍有其不可替代的作用。那么读者阅读分别以手写体和印刷体呈现的汉语文本的加工过程是否存在差异，是研究者关注的研究问题。

已有研究表明, 汉字词汇识别会受正字法邻近字的影响。但手写体汉字的书写中, 往往会出现部件、笔画简略等现象, 不仅破坏读者原本熟悉的字形信息, 而且对汉字不同水平的正字法信息产生影响, 这一现象在多笔画汉字中尤为明显。以往研究发现, 读者阅读汉语印刷文本中存在正字法邻近字启动的抑制效应和笔画数效应。前者指在词汇识别或阅读中, 对先出现的邻近字的加工会抑制对后出现的目标字的识别; 后者指与笔画数少的字或词相比, 对笔画数多的字或词的注视时间更长。那么, 当读者识别和阅读笔画或部件简略的汉语手写文本时, 是否也会出现正字法邻近字启动的抑制效应和笔画数效应? 两种文本呈现形式中的以上两种效应是否表现出差异? 实验一采用 2 (文本类型: 印刷体、手写体) $\times$ 2 (笔画数: 多笔画、少笔画) $\times$ 2 (启动类型: 正字法邻近字、控制字) $\times$ 2 (SOA: 43ms、57ms) 的被试内设计。利用启动范式, 材料为形近、音异的正字法邻近字对, 考察在印刷体和手写体汉字的识别中的正字法邻近字启动的抑制效应和笔画数效应。实验二采用 2 (文本类型: 印刷体、手写体) $\times$ 2 (笔画数: 多笔画、少笔画) $\times$ 2 (启动类型: 正字法邻近字、控制字) 的被试内设计。利用眼动记录法, 考察读者阅读印刷和手写文本中的正字法邻近字启动的抑制效应和笔画数效应。本研究初步得出以下结论: (1) 读者在对印刷文本和手写文本进行词汇识别和阅读时均存在显著的笔画数效应。(2) 与印刷体汉字相比, 手写体汉字的阅读代价更大。(3) 读者识别和阅读汉语印刷文本过程中, 均存在正字法邻近字启动的抑制效应, 且该效应仅发生在词汇识别的早期, 但在手写文本中无此效应。

The Inhibitory Neighbor Priming Effect during Chinese Printed and Handwritten Text Reading

Li Xin, Yu Huijing, Zhang Haiyu, Wang Yongsheng, Liang Feifei

Faculty of Psychology, Tianjin Normal University, Tianjin

Abstract: In daily communication and information acquisition, there are two main written forms of Chinese characters, which are handwritten and printed. Handwritten character is the earliest form of writing and communication. With the development of science and technology, printed character has become the main form for people to communicate and obtain information, but the handwritten character still plays its irreplaceable role. Therefore, the researchers have focused on the processing of recognizing and reading the two forms of characters, whether the above two processing process are different. Orthographic processing is an important processing process during Chinese character recognition. However, in handwritten character, a large number of strokes and radicals have been simplified, which destroy the original structure and orthographic information of Chinese characters at different levels. This phenomenon is particularly obvious in the Chinese characters with more strokes. Previous studies have found inhibitory neighbor priming effect and stroke number effect during the processing of printed characters. The inhibitory neighbor priming effect refers to that during the word recognition or sentence reading, the processing of orthographic neighbor will inhibit the recognition of the later target words. Stroke number effect means that compared with words with fewer strokes, the recognition of words with more strokes is more difficult and takes longer time. In the present study, the inhibitory neighbor priming effect and stroke number effect were investigated during the character recognition and sentence reading, which the Chinese characters and sentences were presented in the handwritten and printed form. The experiment one was a 2 (text type: printed text, handwritten text) $\times$ 2 (stroke number: more strokes, less strokes) $\times$ 2 (priming type: orthographic neighbor, control word) $\times$ 2 (SOA: 43ms, 57ms) within-subject design. The priming paradigm was adopted, and orthographic neighbors with similar shape and different pronunciation were used as experimental materials. Readers were asked to complete the naming task, in order to investigate inhibitory neighbor priming effect and stroke number effect in single printed and handwritten Chinese character recognition. The experiment two was a 2 (text type: printed text, handwritten text) $\times$ 2 (stroke numbers: more strokes, less strokes) $\times$ 2 (priming type: orthographic neighbor, control word) within-subject design. Eye tracker was used to investigate the inhibitory neighbor priming effect and the stroke number effect during printed and handwritten sentence reading. According to the results of the two experiments, the conclusion was shown as

follows. (1) The stroke number effect was significant for the printed and handwritten texts during character recognition and reading. (2) Compared with printed text, the character recognition and reading for handwritten text showed more reading cost. (3) During the process of recognition and reading of printed text, the inhibitory neighbor priming effect was significant, and it only occurs in the early stages of character recognition. But there is not significant for the handwritten text.

Keywords: Chinese handwritten character, Orthographic neighbor, Stroke number effect

不同线索有效性下文本预期性对预视加工的影响

李蓉蓉, 赵继龙, 苏钰涵, 徐晓晨, 崔磊 (通讯作者)

山东师范大学心理学院, 济南, 250014, cuilei_cn@163.com

摘要 本研究采用眼动追踪技术, 结合边界范式(Rayner, 1975), 探究在正常阅读时, 不同线索有效性条件下, 文本的高、低预期性对预视加工的影响, 从而探讨预期性加工是自动激活的还是受策略控制的。根据自动激活模型, 阅读过程中, 输入的刺激激活了相关语义后, 会自动激活语义网络中相近位置上的信息, 该过程自动、快速且无意识地发生, 预期性加工不会受到所处阅读环境的影响, 是一个自下而上的过程(Brothers, Swaab, & Traxler, 2017)。根据策略加工模型, 阅读过程中读者会根据阅读环境来对预期性加工的策略进行调整, 这是一个自上而下的过程(Huetting, 2015; Lupyan & Clark, 2015)。实验1和实验2分别在高线索有效性(87.5%)和低线索有效性(12.5%)下探讨预期性对预视效应的影响, 采用 2(预期性: 高, 低) $\times$ 2(预视类型: 一致预视, 不一致预视)被试内实验设计。实验1结果发现显著的预期性和预视的主效应, 且二者存在交互作用, 高预期条件下预视效应更大; 实验2结果发现了呈边缘显著的预期性效应以及显著的预视效应, 二者的交互作用不显著。将两实验结果进行合并分析, 未发现显著的三重交互作用; 但发现, 在高预期条件下, 线索有效性的高低不会影响预视效应的大小; 但在低预期条件下, 低线索有效性会呈现出更大的预视效应, 表现为不一致预视条件下会产生更大的阅读阻碍。通过本研究发现, 读者对不同水平的预期性加工呈现出不同的加工机制, 高预期词的加工呈现出一种自动激活的特点, 但低预期词的加工会受到读者阅读策略的控制。

Influence of Contextual Predictability on Preview Processing in Different Validity of Cues

Rongrong Li, Jilong Zhao, Yuhao Su, Xiaochen Xu, Lei Cui (corresponding author)

Department of Psychology, Shandong Normal University, Jinan, 250014, cuilei_cn@163.com

Abstract: In this study, eye-tracking technology and boundary paradigm (Rayner, 1975) were used to explore the influence of high and low contextual predictability on preview processing in different validity of cues during normal reading, so as to discuss whether predictive processing is automatically activated or controlled by strategy. According to the automatic activation model, when the input stimulus activates the relevant semantics in the process of reading, the information at a similar position in the semantic network will be automatically activated. This process occurs quickly and unconsciously, and the predictive processing will not be affected by the reading environment, which is a bottom-up process (Brothers, Swaab, & Traxler, 2017). According to the strategically controlled model, readers will adjust the predictive strategies according to the reading environment, which is a top-down process (Huetting, 2015; Lupyan & Clark, 2015). In experiment 1 and 2, the influence of predictability on preview effect was investigated under the high (87.5%) and low validity of cues (12.5%) respectively. 2 (predictability: high, low) $\times$ 2 (preview type: identical preview, dissimilar preview) within subject design was adopted in the experiments. The results of Experiment 1 showed that there were significant predictability effect and preview effect, in addition, the interaction effect was found, the preview effect was larger in high than low predictability. The results of experiment 2 showed that the marginal significant predictability effect and the significant preview effect, but the interaction between them was not significant. By combining the results of two experiments, no significant three-way interaction was found.

However, the result indicated that when in the high predictability condition, the validity of the cues did not affect the size of the preview effect, but when in the low predictability, low validity of cues will show a larger preview effect, which is resulted from a greater reading difficulty under the dissimilar preview. Through this study, it is found that readers have different mechanisms for different levels of predictive processing. The processing of high predictive words presents the feature of automatic activation, while the processing of low predictive words is controlled by readers' reading strategies.

中文阅读中三字复合词的词切分

周钧毅^{1,2} 李兴珊¹ (通讯作者)

¹ 中国科学院心理研究所, 北京, 100101

² 福建师范大学体育科学学院, 福州, 350117, lixs@psych.ac.cn

摘要 本研究通过两个眼动实验考察了中文阅读中三字复合词的切分过程。复合词是由多个字组成的词, 其特点是其中所包含的字能够独立组成另一个词, 这个独立组成的词汇被称为嵌套词。例如, 在三字复合词“老板娘”中, 前两个字能够独立组成“老板”(嵌套词)。在两个实验中, 读者阅读包含三字复合词的句子, 通过变换三字复合词之前的动词对三字复合词和嵌套词的合理性进行了操纵。在实验1中, 保持三字复合词与动词的组合始终合理, 操纵嵌套词与动词组合的合理性, 形成嵌套词合理与嵌套词不合理两种实验条件。眼动数据表明, 当三字复合词始终合理的条件下, 未发现嵌套词的合理性效应。在实验2中, 同时操纵三字复合词和嵌套词的合理性, 形成复合词合理-嵌套词合理、复合词合理-嵌套词不合理、复合词不合理-嵌套词合理、复合词不合理-嵌套词不合理四种实验条件。结果发现, 在三字复合词合理的条件下, 未发现嵌套词的合理性效应, 然而, 在三字复合词不合理的条件下, 发现了嵌套词的合理性效应。当前结果表明, 中文读者在词切分的过程中倾向于切分更大的词汇单位, 但是, 在文本不合理条件下, 中文读者则会转而切分更小的词汇单位以期构建一个合理的心理表征。

On the Segmentation of Chinese Incremental Words

Junyi Zhou^{1,2}, Xingshan Li¹

¹CAS Key Laboratory of Behavioral Science, Institute of Psychology, Beijing, China

²Provincial University Key Laboratory of Sport and Health Science, School of Physical Education and Sport Science, Fujian Normal University, Fuzhou, China

Abstract: In the present study, we report two eye-tracking experiments investigating how Chinese readers segment incremental words while reading Chinese. Incremental words are multicharacter words containing a subset of characters that constitute another word (referred to as the *embedded word*). For example, in a word containing three characters ABC (e.g., “老板娘”, meaning landlady), the first two characters AB (“老板”, meaning boss) constitute an embedded word. In two experiments, Chinese readers read sentences with 3-character incremental words. In Experiment 1, the incremental words were always plausible, and the verbs prior to the target words were manipulated so that the embedded word of the incremental word was either plausible or implausible as an independent word. The eye-movement data showed that the plausibility manipulation did not influence the reading times on the incremental words or their embedded words. In Experiment 2, we manipulated the plausibility of both incremental words and embedded words. No plausibility effect of the embedded word was observed when the incremental words were plausible. However, the plausibility effect of the embedded word was obtained when the incremental words were implausible. These results suggest that Chinese readers tend to segment larger lexical units (i.e., incremental words in

the present study) from the rest of a character string. However, when the text is implausible, Chinese readers segment the incremental words as smaller lexical units (i.e., embedded words within incremental words in the present study), intending to construct a coherent representation.

Keywords: Chinese reading, eye movements, incremental words, word segmentation

汉语阅读伴随词汇学习：视觉复杂性效应

梁菲菲¹ (通讯作者) 贺斐¹ 白学军¹ Simon P. Liversedge²

¹ 天津师范大学心理学部, 天津, 300387

² University of Central Lancashire, Preston, PR12HE, feifeiliang_329@126.com

摘要 词汇是语言建筑的重要材料, 是阅读发展的核心成分。学龄期儿童约 80% 的词汇是在阅读中伴随习得。拼音文字阅读中 (如英语), 视觉复杂性 (如词长) 是影响阅读伴随词汇学习的重要因素之一。汉语的词长相对固定, 其视觉复杂性主要体现在笔画数多少上。已有研究发现, 笔画数多少是影响汉语阅读词汇识别的重要因素之一, 即多笔画词的加工时间显著长于少笔画词 (见 Liversedge et al., 2014)。那么, 视觉复杂性如何影响汉语阅读的伴随词汇学习? 该效应如何随学习的逐步积累而变化? 这是本研究两个实验目的。基于新词相当于极端低频词加工, 心理词典中事先没有相应词汇表征, 倾向于采用自下而上的逐字加工方式, 我们预期: (1) 阅读伴随词汇学习中可能存在更大的笔画数效应; (2) 随着学习次数的增多, 新词的熟悉性逐步增强, 读者更偏向于在整词水平上加工新词, 由此推断, 笔画数效应可能随学习次数的增多逐步减弱。构造两类假词作为新词: 一类新词由两个多笔画汉字构成; 一类由两个少笔画汉字构成。将每个新词嵌在 15 个强限制语境中, 分五天学习, 供被试 (成人读者) 构建新词的词汇表征。在学习阶段记录被试阅读时的眼动轨迹。在测试阶段, 要求被试完成三项主观测试 (包括正字法学习测试、语义类别学习测试, 和具体语义信息学习测试)。结果发现, 两种实验条件下的首次注视时间无显著差异, 多笔画新词的凝视时间及总注视时间显著长于少笔画词, 表明阅读伴随词汇学习的笔画数效应反映在词汇加工的相对晚期阶段; 此外, 与多笔画新词相比, 被试在少笔画新词上的首次眼跳定位更加靠近词中心。上述结果表明, 阅读伴随词汇学习中的笔画数效应, 同时反映在阅读眼动控制的“when”和“where”方面。此外, 研究并未发现笔画数多少和学习次数的交互作用, 表明笔画数效应并未随着新词学习效果的累积而逐步减弱, 再次证明笔画数作为汉字最为显著的视觉特征之一, 独立于词汇熟悉性, 稳定地作用于阅读伴随词汇学习的全程。

关键词 伴随词汇学习, 视觉复杂性, 汉语阅读

Examining novel word learning during Chinese reading: The effect of visual complexity

Feifei Liang¹, Fei He¹, Xuejun Bai¹, & Simon P. Liversedge²

¹ Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

² School of Psychology, University of Central Lancashire, Preston, PR12HE

Abstract: Vocabulary is an important building material of language and is generally considered as a core component of reading development. From mid-childhood onward, over 80% of the novel words are acquired implicitly via reading. In alphabetic reading (like English), visual complexity (as indexed by word length) influences novel word learning in reading, such that long novel words are processed with longer fixations and more refixations relative to short novel words during reading. In Chinese, word length is relatively constant, most words are one or two characters long. The characteristic of visual complexity of Chinese character is highly relevant to how many strokes each character has. Previous studies have shown that when reading known words, those with low visual complexity are processed more quickly than those with high visual complexity (as indexed by number of strokes, e.g., Liversedge et al., 2014). In the present study, we aimed to investigate how visual complexity influenced novel word learning in Chinese reading; specifically, we investigated how such effect changes within a short period of learning. Given that novel words are considered as extreme cases of low frequency words which are processed with a basis of

character-to-character sequentially rather than processing adjacent characters holistically, and there is no pre-existing lexical representation in mental lexicon, we predicted that there might be a larger visual complexity effect in novel word learning in Chinese reading. Furthermore, as novel words become more familiar over cumulative learning, they might be processed more and more holistically and be less dependent on the visual features of each constituent character of a novel word. Given this, we predicted that the visual complexity effect might be gradually reduced over learning. We constructed two-character pseudowords as novel target words, and the number of strokes of novel words was manipulated as being either high or low. Each pseudoword was embedded within 15 meaningful sentences in a learning phase. Participants' eye movements were monitored throughout the learning phase. In the test phase, three unexpected offline tests were also set to assess orthographic and semantic knowledge of the newly learned pseudowords. The participants made shorter gaze durations and total fixation duration on pseudowords with low than high visual complexity throughout exposure, and there was no significant difference for the measure of first fixation duration in the two conditions, indicating that visual complexity effect occurs in the relatively late stage of novel word processing. In addition, the participants tended to target their initial saccades further into the novel words with low than high visual complexity, suggesting that the decisions of where to move the eyes are also influenced by how many strokes a novel word has. Finally, we did not find interactive effects between visual complexity and exposure for all the eye movement measures, showing that visual complexity effect is not reduced over the learning of novel words in reading. Together with these findings above, we argued that, the number of strokes, as salient visual feature of Chinese characters, independent of word familiarity, might influence all the processes of novel lexical representations, including instantiation, configuration and integration.

学习及视觉搜索中的暴露频率效应

王梦思^{1,2} Hazel I. Blythe³ Simon P. Liversedge² 白学军¹

1 天津师范大学心理学部, 天津, 300387, mwang19@uclan.ac.uk

2 中央兰开夏大学, 普雷斯顿, 英国

3 诺森比亚大学, 纽卡斯尔, 英国

摘要 词频效应是正常文本阅读中的经典效应(即高频词比低频词更快实现词汇通达),然而词频效应是否会出现于文本的视觉搜索任务中仍然存在争议(如, Rayner & Fischer, 1996)。本研究采用眼动技术,首先探讨了频率效应在英文假词学习中的形成过程(学习阶段),接着探讨了假词学习中模拟的频率效应是否会出现于不同词切分条件下(空格切分、颜色切分、无切分)的假词文本的视觉搜索任务中(扫描阶段)。结果显示:学习阶段,高频暴露的假词比低频暴露的假词学习得更好更快(如,更高的准确率,更短的反应时、注视时间)。学习阶段成功且有效地模拟出阅读中经典的频率效应。相比之下,在扫描阶段的目标假词搜索任务中,没有出现频率效应,但词切分方式显著影响了目标假词识别以及眼跳目标选择。无词切分条件下的注视时间最长,颜色切分条件次之,空格切分条件最短。无词切分条件下平均眼跳距离显著短于空格切分以及颜色切分条件下的平均眼跳距离。此外,无词切分条件下,首次注视落点位置集中在假词的词首;空格切分或颜色切分条件下,首次注视落点位置靠近假词中心。与空格条件相比,颜色切分条件下首次注视点位置偏左。本研究表明,假词文本视觉搜索任务中不存在频率效应,空格切分相比于颜色切分对于眼动控制有更大的促进作用。

Exposure frequency effects occurred in learning but not maintain to string scanning

Mengsi Wang^{1,2}, Hazel I. Blythe³, Simon P. Liversedge², Xunjun Bai¹

1 Tianjin Normal University, China

2 University of Central Lancashire, UK

3 University of Northumbria, Newcastle, UK

Abstract: Despite the clarity that exists regarding frequency effects in the literature, it remains controversial as to whether frequency effects exist for visual search in text (e.g., Rayner & Fischer, 1996). We examined how frequency effects were established during the learning of novel stimuli (i.e., English pseudowords) and how simulated frequency influenced eye movements during scanning of longer strings under different demarcation presentations (spaced vs. unspaced shaded vs. unspaced). Main findings were as follows: Robust exposure frequency effects occurred during learning, but exposure frequency effects did not maintain to string scanning. Robust spacing effects occurred. Spacing facilitated target identification and saccadic targeting during scanning to a greater level relative to shading. These findings demonstrate that exposure frequency does not affect eye movements in visual search and spacing works more effective in directing eye movements relative to shading in even non-linguistic visual search task.

无法忍受不确定性对急性应激水平的影响： 反刍的中介作用和媒体暴露时间的调节作用

王少凤 何向材 李金津 罗禹 张禹

贵州师范大学心理学院, 贵阳 550025, yuzhang331@163.com

摘要 目的: COVID-19 的爆发作为一种创伤性的公共突发事件, 具有不可预测性、突发性和传播迅速等特点。此外, 在公众面临长期居家隔离等情况下, 媒体广泛传播各种信息, 这可能会使公众对现状更加感到不确定。在这种情况下, 公众的心理健康受到威胁。急性应激反应 (ASR) 是个体急性应激后产生的一系列认知、情绪、行为及生理反应。ASR 的发生和严重程度不仅与应激事件有关, 而且与当时个体的人格特征、对应激源的认知和态度、应对方式、身体健康和生活状况密切相关。以往研究表明, 社会创伤事件发生后, 无法忍受不确定性 (IU) 是导致心理疾病产生的一个脆弱性认知因素, 并通过反刍来加强 IU 与不良心理症状之间的关系。社会风险放大模型中认为媒体会导致公众感知的风险增加, 并且在以往集体创伤事件后对媒体曝光的研究中也发现了其对人们急性应激反应的影响。因此, 本研究在人们面临疫情危机和长时间隔离的情况下, 在探讨 IUS 对 ASR 的作用显著的基础上, 探索反刍在 IUS 和 ASR 之间的中介作用, 以及媒体暴露在反刍与 ASR 之间的调节作用。方法: 采用无法忍受不确定性量表 (IUS)、反刍反应问卷 (RRS)、斯坦福急性应激量表 (SASRQ) 和媒体暴露时间自评量表对 1411 个人进行了问卷调查。结果: (1) 无法忍受不确定性既可以直接影响急性应激反应, 也可以通过反刍的中介作用间接影响急性应激反应。(2) 媒体暴露调节了无法忍受不确定性通过反刍影响急性应激反应的中介过程的后半路径。更长时间的媒体暴露下, 个体的反刍思维对急性应激反应的影响更为显著。本研究有助于提高人们对反刍和媒体暴露在 IU 和这些负面心理症状之间的关系中的作用的认知, 对当前重大疫情下缓解人们急性应激反应的干预措施提供了理论依据。

The relationship between intolerance of uncertainty and acute stress reaction: The mediating role of rumination and the moderating role of duration of media exposure related to COVID-19

Shaofeng Wang, Xiangcai He, Jinjin Li, Yu Zhang, Yu Luo;

School of Psychology, Guizhou Normal University, Guiyang, China

Abstract: Objectives : As a traumatic public emergency, the COVID-19 outbreak characterized by unpredictability, abruptness and rapid transmission. In addition, when the public is facing a long period of home isolation and other circumstances, the media widely spread various information, which may make the public more uncertain about the current situation. In this case, the public's mental health is threatened. Acute stress reaction (ASR) is a series of cognitive, emotional, behavioral and physiological responses after people exposure to a traumatic event. The occurrence and severity of ASR are not only related to stress events, but also closely related to the individual's personality characteristics, cognition and attitude to stressors, coping styles, physical health and living conditions at the time. Previous studies have shown that intolerable uncertainty (IU) is a cognitive factor of vulnerability that leads to negative psychological outcomes after traumatic events, and rumination is used to strengthen the relationship between IU and negative psychological outcomes. The social amplification of risk model holds that media will increase the risk of public perception, and in the literature about media exposure after social traumatic events have also found its impact on public acute stress response. Therefore, present study explores the mediating effect of rumination between IUS based on the significant role of IUS on ASR, and the moderating role of duration of media exposure between rumination and ASR during people are facing epidemic crisis and prolonged isolation. Methods: Intolerance of Uncertainty Scale (IUS), Rumination Response Questionnaire (RRS), Stanford Acute Stress Reaction Scale (SASRQ) and Duration of Media Exposure Self-Rating Scale were used to survey 1411 individuals. Results: (1) Intolerance of Uncertainty could directly affect the acute stress response, but also indirectly affect the acute stress response through the mediating effect of rumination. (2) Duration of media exposure moderating the latter half of the mediation process in which intolerance of uncertainty on the acute stress response through rumination. With prolonged media exposure, the individual's rumination thinking has a more significant impact on the acute stress response. This study helps to improve public's understanding of the role of rumination and duration of media exposure in the relationship between IU and acute stress symptoms, and provides a theoretical basis for interventions to alleviate people's acute stress response facing the current epidemic.

大学生择业价值取向与求职自我效能感的纵向研究

康廷虎 万明媛 (通讯作者)

西北师范大学心理学院视觉认知实验室, 兰州, 730070, 1813657226@qq.com

摘要 为探讨社会变迁及新冠肺炎疫情对大学生择业价值取向和求职自我效能感的影响, 选择 2004 年和 2020 年共 843 名大学生填写问卷, 结果发现 2004 年个人价值取向大学生可以预测其求职自我效能感, 社会价值取向大学生不能预测, 而 2020 年个人价值取向和社会价值取向大学生都可以预测其求职自我效能感; 2004 年和 2020 年个人价值取向的大学生的求职自我效能感都高于社会价值取向的大学生; 2020 年社会价值取向的大学生的求职自我效能感显著高于 2004 年社会价值取向的大学生的求职自我效能感。研究结果表明, 个人价值取向的大学生对自己求职效能评价更积极; 比起 2004 年, 2020 年社会价值取向的大学生对自己求职效能评价更积极。

A Longitudinal Study on the College Students' Value Orientation of Career Choice and Job-seeking Self-efficacy

Kang Tinghu, Wan Mingyuan (Corresponding author)

Visual Cognition Lab, School of Psychology, Northwest Normal University, Lanzhou, 730070,
1813657226@qq.com

Abstract: In order to explore the influence of social changes and COVID-19 pandemic on college students' job-seeking value orientation and job-seeking self-efficacy, a total of 843 college students in 2004 and 2020 were selected to fill out questionnaires. The results showed that college students with personal value orientation in 2004 could predict their job-seeking self-efficacy, but college students with social value orientation could not, while college students with personal value orientation and social value orientation in 2020 could predict their job-seeking self-efficacy. In 2004 and 2020, the self-efficacy of college students with personal value orientation was higher than that of college students with social value orientation. The job-seeking self-efficacy of college students with social value orientation in 2020 is significantly higher than that of college students with social value orientation in 2004. The results show that college students with personal value orientation have a more positive valuation of their job search effectiveness. Compared with 2004, college students with social value orientation in 2020 have a more positive evaluation of their job search effectiveness.

3 学生心理发展与学习天津市高校社会科学实验室, 天津, 300387, yanghaibo@tjnu.edu.cn

摘要 新冠疫情给全社会民众带来了巨大的心理冲击。疫情后刚入学的大学新生面临着适应新生活的挑战, 其心理健康值得得到重点关注。本研究以人类发展的生态系统理论和自我决定论为基础, 考察后疫情时代大学新生的心理健康状况, 并探讨儿童期虐待、安全感、友谊质量在其中的作用机制。采用儿童期虐待量表 (Childhood Trauma Questionnaire, 28 item Short Form, CTQ-SF)、安全感量表 (Security Questionnaire, SQ)、友谊质量量表 (Friendship Quality Inventory, FQI) 和抑郁-焦虑-压力量表 (The short-form version of the Depression Anxiety Stress Scales, DASS-21) 对天津市两所高校的 750 名大学生进行问卷施测, 被试平均年龄 18.23 岁 ($SD=0.65$), 男生 244 人 (34.4%), 女生 466 人 (65.6%)。研究结果表明: (1) 大学生抑郁情绪阳性检出率为 19.6%, 焦虑情绪阳性检出率为 36.8%, 压力情绪阳性检出为 25.5%; (2) 不同性别大学生抑郁、压力程度之间的差异有统计学意义, 女生抑郁、压力程度高于男生; 而不同性别大学生焦虑程度之间的差异无统计学意义; (3) 儿童期虐待能显著正向预测大学生负性情绪 (抑郁、焦虑、压力); (4) 安全感在儿童期虐待与大学生负性情绪的关系中起中介作用, 儿童期虐待通过安全感影响大学生负性情绪体验; (5) 友谊质量调节了中介模型的前半段路径, 即友谊质量在儿童期虐待和安全感的起调节作用。在高、低友谊质量水平条件下, 儿童期虐待均可显著负向预测安全感, 但是在友谊质量水平较高的大学生中, 儿童期虐待对安全感的负向预测作用更强。 (6) 有调节的中介效应模型仅在女生被试群体中成立, 在男生被试群体中不成立。

Mental health of college freshmen in a post-epidemic era: the role of childhood abuse, safety, and friendship quality

Li Man¹²³, Zhang Jiahui², Duan Wenjin², He Xinyue², Jia Yimeng², Xu Zhansheng¹²³,
Yang Haibo^{123*} (corresponding author)

1 Key Research Base of Humanities and Social Sciences of Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, 300387; 2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387; 3 Center of Collaborative Innovation for Assessment and Promotion of Mental Health, Tianjin, 300387

Abstract: COVID-19 has brought a huge psychological impact to the whole society. The mental health of new college students who are facing the challenge of adapting to a new life after the outbreak deserves special attention. Based on the ecosystem theory of human development and self-determinism theory, this study investigated the mental health status of college freshmen in the post-epidemic era, and explored the mechanisms of childhood abuse, security, and friendship quality. Childhood Trauma Questionnaire (28 item Short Form, CTQ-SF), Security Questionnaire (SQ), Friendship Quality Inventory (FQI), and The Short-Form Version of The Depression Anxiety Stress Scales (DASS-21) were used to test 750 college students from two universities in Tianjin. The average age of the participants was 18.23 years old (SD=0.65). There were 244 male (34.4%) and 466 female (65.6%) students.

The results showed that: (1) The positive detection rate of depression, anxiety and stress was 19.6%, 36.8% and 25.5%, respectively. (2) There were statistically significant differences in the degree of depression and stress among college students of different genders. The degree of depression and stress of female students was higher than that of male students. However, there was no statistical significance in the degree of anxiety among college students of different genders. (3) Childhood abuse can significantly positively predict college students' negative emotions (depression, anxiety, stress); (4) The sense of security plays a mediating role in the relationship between childhood abuse and college students' negative emotions. Childhood abuse affects college students' negative emotions through the sense of security; (5) Friendship quality moderated the first half of the mediating model, i.e. friendship quality moderated the relationship between childhood abuse and security. Under the condition of high and low friendship quality, childhood abuse was significantly negative predictor of security, but among college students with higher friendship quality, childhood abuse had a stronger negative predictor of security. (6) The moderated mediating effect model was only valid in female subjects, but not in male subjects.

Keywords: Mental health, Childhood abuse, Security, Friendship quality

疫情防控常态化下大学生社会心态现状调查

周广东¹²³ 李士一¹²³ 杨海波¹²³ 李馨¹²³ 白学军^{123*} (通讯作者)

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387,

2 天津师范大学心理学部, 天津, 300387,

3 国民心理健康评估与促进协同创新中心, 天津, 300387, bxuejun@126.com

摘要 调查疫情防控常态化下大学生的社会心态现状。选取 DASS21 问卷测量大学生的压力、焦虑和抑郁, 采用 PANAS 量表测量积极和消极情绪, 自编 71 道题目测量大学生的新冠知识、对政府及小区防控措施的态度、疫情的影响、生命意义、自杀意念与风险、麻痹与厌战心理、应对方式和前景判断。采用分层抽样, 于 7 月 18 至 27 日在全国 9 个省市自治区的 13 所大学进行了在线调查。收取有效样本 3629 人, 男生 1111 (30.6%), 女生 2518 (69.4%), 他们分布在全国除香港和台湾外的 32 个省市自治区 (海外 1 人)。结果显示: 压力、焦虑和抑郁的检出率分别为 8.4%、20.4% 和 16%; 21.99% 的大学生有过自杀念头, 8.87%-17.63% 的大学生存在自杀风险; 绝大多数大学生对新冠肺炎病毒的传播途径、症状表现等知识了解较为准确; 对已康复的新冠肺炎患者和疫区来的人存在担心被传染的风险; 72.75% 的家庭收入减少, 24.52% 的家庭收入不变, 只有 2.73% 的家庭收入增加; 大部分人有积极的生命意义感; 有 11%-14% 的大学生存在麻痹和厌战心理; 90% 以上的大

学生赞同国家和小区的防控措施，并认为防控效果非常有效，只有 14.19%的大学生认为国外的防控措施非常有效，绝大多数大学生（90%以上）对战胜疫情、恢复经济发展有较大信心。在男女差异方面，女生的新冠知识更准确、小区防控上更赞同；但男生在方针政策上更赞同、有更多的麻痹心理、更高的厌战心理和更乐观的前景判断。家庭收入减少者有更多的消极情绪、更不准确的新冠病毒知识、更多的麻痹心理、更悲观的前景判断、生活习惯变化更大、生活状态更加清闲、生命意义感更低。对小区防控的态度影响个体的生命意义、心理健康和前景判断，且这种影响力大于国家防控措施的影响。本研究说明，大学生在心理健康和社会心态上受疫情影响较大，但对国家的防控非常满意，且对未来充满信心。结果还提示，做好小区防控是落实国家防控方针政策的关键。

Abstract: Objective to investigate the current situation of College Students' social mentality under the normalization of COVID-19 prevention and control. DASS21 questionnaire was used to measure the stress, anxiety and depression of college students. The positive and negative emotions were measured by PANAS scale. 71 items were designed to measure college students' COVID-19 knowledge, attitude to government and community prevention and control measures, impact of epidemic situation, meaning of life, suicide ideation and risk, paralysis and war weariness, coping style and prospect judgment. Using stratified sampling, an online survey was conducted in 13 universities in 9 provinces and autonomous regions of China from July 18 to 27. A total of 3629 valid samples were collected, including 1111 boys (30.6%) and 2518 girls (69.4%). They were distributed in 32 provinces and autonomous regions except Hong Kong and Taiwan (one overseas). The results showed that the detection rates of stress, anxiety and depression were 8.4%, 20.4% and 16% respectively. 21.99% of college students had suicide thoughts, and 8.87%-17.63% students had suicidal risk. Most college students were more accurate in understanding the transmission routes and symptoms of COVID-19, and were worried about the risk of infection for those who recovered from the COVID-19 and those in the affected areas. 72.75% of the family income decreased, 24.52% of the family income remained unchanged, only 2.73% of the family income increased; most of the people had a positive sense of life meaning; 11% - 14% of the college students had paralysis and war weariness; more than 90% of the college students agreed with the national and community prevention and control measures, and thought it was very effective, only 14.19% of the college students thought that the foreign prevention and control measures were very effective. Most college students (more than 90%) have great confidence in overcoming the epidemic situation and recovering economic development. In terms of gender differences, girls' knowledge of COVID-19 is more accurate and community prevention and control is more favorable; but boys are more in favor of government preventions, more paralytic psychology, higher weariness of war and more optimistic prospect judgment. Those with decreased family income have more negative emotions, more inaccurate knowledge of new coronavirus, more paralytic psychology, more pessimistic prospect judgment, greater changes in living habits, more leisure life state and lower sense of life meaning. The attitude of community prevention and control affects individual's life meaning, mental health and prospect judgment, and this influence is greater than that of national prevention and control measures. This study shows that the mental health and social mentality of college students are greatly affected by the epidemic situation, but they are very satisfied with the prevention and control of the country, and are full of confidence in the future. The results also indicate that the key to implement the national prevention and control policies is to do a good

宗教信仰与自我构念的关系探析

乔艳阳¹ 宋征莉² 张积家³ (通讯作者)

1 中共天津市委党校 (天津行政学院 天津党史研究室), 天津, 300191

2 中央民族大学教育学院, 北京, 100081, zhangjj1955@163.com

摘 要 既往研究认为, 宗教信仰差异可能是东西方之间在自我构念上存在差异的原因。西方人的社会取向根植于犹太教和基督教, 强调自主独立性, 培养了其明显的个体主义和独立型自我构念特征。而东方人的社会取向源于儒家思想, 强调个人服从整体, 有明显的集体主义倾向和依存型自我构念特点。但既往研究尚存不足, 突出表现为两点: 首先是关于宗教信仰与自我构念的实证研究较少, 而除宗教信仰差异外, 东西方之间在语言、经济等方面也存在差异, 这都研究结论的因果性造成了影响; 其次, 既往研究的思路多局限于宗教对心理及行为的影响, 缺乏对二者之间交互作用的考察。为此, 研究采用亲亲性测试和深度访谈相结合的混合研究方法, 使用单文化拓展范式对信基督教景颇族和传统景颇族的大学生被试予以考察, 同时对其语言、经济状况等额外变量予以控制, 旨在深入研究宗教信仰与自我构念的双向影响。亲亲性测试结果发现: 与信传统宗教的景颇族大学生比, 信基督教的景颇族大学生表现出更明显的独立型自我构念; 深度访谈结果显示: 信传统宗教和信基督教的景颇族大学生多是家族信教, 部分景颇族同胞因追求文明生活和戒除不良习俗等原因选择了信基督教。同时, 信传统宗教的景颇族家庭表现出强调长幼有序的垂直型集体主义特点, 而信基督教的景颇族家庭表现出强调“博爱”、“平等”的水平型个体主义特点。总体研究结果表明, 民族宗教信仰与自我构念存在双向影响, 为揭示宗教心理和行为的背后原因、民族地区的基层治理和青少年心理健康教育提供了借鉴。

An Analysis of the Relationship between Religious Belief and Self

Qiao Yanyang¹, Song Zhengli², Zhang Jijia³

1. Public Administration Department, Tianjin Municipal Party School of CPC (Tianjin University of Administration, Tianjin Party History Research Office), Tianjin, 300191;

2. School of Education, Minzu University of China, Beijing, 100081;

3. Department of Psychology, Renmin University of China, Beijing 100872)

Abstract: Previous studies have suggested that religious belief differences may be the reason for the differences in self-construal between East and West. Westerners' social orientation is rooted in Judaism and Christianity, which emphasize on independence. Therefore, they have developed an individualism culture and independent self-construal. Easterns' social orientation originated from Confucianism, which emphasizes on the subordination to the whole and harmonious interpersonal relationship. Therefore, they have developed an collectivism culture and interdependent self-construal. However, there were still some deficiencies in previous studies. Firstly, there were few empirical studies with regard to the influence of religious belief to self-construal. In addition to differences in religious belief, there were also some differences between the East and the West, such as languages and economic conditions. Secondly, previous studies were limited to the influence of religion on human psychology and behavior, however, few researches focus on the interaction between them. For this purpose, this research used the self-inflation test and

in-depth interview to investigate the relationship between self-construal and religious belief with Christianity and traditional Jingpo ethnic college students. Besides, the language and the condition of economic control were controlled in this study. The result of self-inflation test showed that compared with the traditional jingpo students, the Christianity Jingpo students showed a more independent self-construal. The results of in-depth interviews showed that the majority of Jingpo college students are religious families, and some Jingpo student chose to believe in Christianity because of to live a more civilized life and to get rid of some bad customs. At the same time, the Jingpo family who believed in traditional religion showed a more vertical collectivism culture emphasizing the order in their family living, while the Jingpo family that believes in Christianity showed a more horizontal individualism emphasizing "fraternity" and "equality". The overall results showed that ethnic religious beliefs and self-construal have a two-way influence, which provides reference for revealing the reasons behind religious psychology and behavior, grass-roots governance in ethnic areas and teenagers' psychological counselling.

Keywords: Jingpo nationality, Self-Construal, Christianity

从边陲到中央：叙事治疗与自我叙说的困与解

黄福生

厦门大学心理咨询与教育中心 厦门 361005

摘要 叙事治疗和自我叙说在台湾流行有其社会背景因素，其中深入人心的多元文化理念是重要元素。叙事治疗强调在地文化可以超越主流文化，成为自己认定的自我文化。对主流文化的超越，是有治疗意义的，这和时下台湾的文化氛围是相对契合的。辅仁大学心理学系是台湾自我叙说研究的大本营，系上元老翁开诚先生在布置期末论文时，最常要求是“写一篇十年后你自己会记得的东西”。这有强烈对个人意义的肯定、对个人叙事的鼓励，没有外在要求，唯一的标准是符合你的内心。系上的陆生大多爱这个系爱的深沉，不是因为发论文技能的提升，而是对个人价值和意义的允许与肯定。一位陆生曾在论文中写“自由而开放，人文而真诚。这是辅大心理系给我的专业准则”。在大陆，叙事治疗有着不错声誉，有一群热情高涨的学习者和实践者，但很多学习叙事治疗的咨询师反映，觉得叙事治疗看起来很美，可实践起来却不知如何下手。也有依靠好奇和欣赏让自己初具叙事治疗师雏形，但却难有切实疗效，最终让自己的叙事治疗有些轻浮和隔靴搔痒。如何解构主流叙事，如何充分肯定个人在地文化和支线叙事，是很多人忽视的功课，这和大社会和文化氛围有关。主流叙事成为显学，而个人支线叙事只能在个人内心暗流涌动。笔者在编辑机构的历史手册时，便深切体会到这种拉扯：历史是集体的、抽象的，是和人相对无关的，过多人的色彩出现是不合适的。自我叙说在大陆尚未被广泛接纳为一种研究取径，常听到“就是写自己故事”、“怎么能算一种研究呢”？潜在话语是抽象的才有意义，具体是没有意义的。相对来说，边陲的台湾有较天然的优势去允许支线和多元，大陆是中央容易忽略支线和多元。无论叙事治疗和自我叙述研究，都需要额外反身去看自己身处的主流文化和主流论述，从中央进到边陲视角，才能真正用好叙事治疗和做好自我叙说研究。

关键字 自我叙说，叙事治疗，人文心理，心理咨询

From the frontier to the mainland: the dilemma and solution of narrative therapy and self narrative

Fusheng Huang

Psychological counseling and education center of Xiamen University, Xiamen 361005

Abstract: The popularity of narrative therapy and self narrative in Taiwan has its social background factors, among which the multi-cultural concept deeply rooted in the hearts of the people is an important element. Narrative therapy emphasizes that local culture can transcend the mainstream culture and become self identified culture. It is of therapeutic significance to transcend the mainstream culture, which is relatively consistent with the current cultural atmosphere in Taiwan. The psychology department of Fu Jen University is the headquarters of Taiwan's self narrative research. When Mr. Kai-Cheng Wong, the veteran of psychology department, was arranging his final paper, he often

asks "write something you will remember in ten years". There is a strong affirmation of personal meaning and encouragement of personal narration. There is no external requirement. The only criterion is to conform to your heart. Most of the Mainland students in the Department love this department deeply, not because of the improvement of thesis writing skills, but because of the permission and affirmation of personal value and significance. One Mainland student once wrote in his paper "free and open, humanistic and sincere. This is the professional criterion given to me by the psychology department of Fu Jen University. In mainland China, narrative therapy has a good reputation. There are a group of enthusiastic learners and practitioners. However, many consultants who study narrative therapy think that narrative therapy looks beautiful, but they don't know how to start it in practice. Others rely on curiosity and appreciation to make themselves take shape as narrative therapists, but they are difficult to achieve effective results. Finally, their narrative therapy is somewhat frivolous and superficial. How to deconstruct the mainstream narrative, how to fully affirm the individual local culture and branch narrative are the lessons that many people ignore, which is related to the big society and cultural atmosphere. The mainstream narrative has become a prominent school, while the individual branch narrative can only flow in the private heart. When editing the history Manual of the organization, the author deeply realized this kind of pull: history is collective, abstract, and has nothing to do with people. It is inappropriate for too many people to appear in color. Self narrative has not been widely accepted as a research approach in mainland China? Only when the potential discourse is abstract can it be meaningful, while the concrete one is meaningless. Comparatively speaking, Taiwan in the border area has a natural advantage to allow branch lines and diversification, while mainland is the center, so it is easy to ignore the branch line and diversity here. No matter narrative therapy or self narrative research, we need extra reflexivity to see the mainstream culture and mainstream discourse. Only from the central perspective to the frontier perspective can we really make good use of narrative therapy and self narrative research.

Keywords: self narrative, narrative therapy, humanistic psychology, psychological counselling

鄂伦春人生计方式的百年变迁和心理印记 ——基于个体叙事的角度

关宇霞 梁静 强健

呼伦贝尔学院教育学院, 内蒙古 呼伦贝尔 021008

摘 要 鄂伦春族是我国东北地区人口最少的民族之一, 长期在山林中持续着集狩猎、渔业和采集于一体的游猎生计方式。由于定居、环境变化等因素影响, 鄂伦春人的生计方式在近百年中发生巨大变迁, 经历了传统的狩猎—半农半猎—农牧林结合为主、狩猎为辅—狩猎生计终止、生计多样性—文化旅游生计兴起的变迁过程。从个体叙事的角度出发, 通过鄂伦春人对不同年代生计方式的记忆, 可以串联出一个鲜活、生动和具体的社会变迁口述史, 并从中探寻这百年来的生计变迁带给鄂伦春人怎样的特殊心理印记。

关键词 鄂伦春人, 生计方式, 百年变迁, 心理印记, 个体叙事

The Centennial change and psychological imprint of Olunchun's life plan

Abstract: As one of the least populated ethnic groups in northeast China, the Oroqen, maintains a living pattern of hunting, fishing and gathering for a long time. Considering settlement, environmental change and other factors, the way of the Oroqen's livelihood has changed greatly in the past hundred, and experience the transition process of traditional hunting - half agriculture and half hunting - combination of agriculture, herding and forestry, supplemented by hunting - diversity of livelihood, termination of hunting livelihood - prosperity of cultural tourism livelihood. Long-term hunting livelihood has been withdrawn from the Oroqen's life, and a new way of livelihood has changed their life. From the perspective of individual narration, this study records the memory of different generations and endeavors to connect them in terms of the four stages of the development of the Oroqen's society: the

period of forest hunting, the period of collective labor after settlement, the period of commodity economy and the new century. This study aims to describe a vivid and humane history of the Oroqen's living way through one hundred years and explore how special psychological imprints could be left on the Oroqen with a hundred years.

Keywords: Oroqen, means of livelihood, transition of one hundred years, psychological imprint, Individual narration

土家族留守高中生的生存发展状况 ——基于恩施州 F 县支教的人种志研究

盛小桐 陈建文

华中科技大学教育科学研究院, 武汉, 430074, chenjianwen@hust.edu.cn

摘要 我国留守高中生的生存发展状况长期以来被学界所忽视, 然而高中阶段是其青春期身心发展的关键期, 亦是其人生的重要转折期, 着实值得高度关注。本文基于笔者一年支教工作所得的质性资料, 将该地留守高中生所处的寄宿制学校视为文化共同体, 用人种志方法展现该文化系统中的留守高中生内部以及与外界诸角色之间的互动情况, 以剖析当前该群体生存发展所存在的问题, 构建留守高中生成长外部不利影响因素模型, 并提出相关建议。研究表明, 当前相关社会保障及管理服务等方面仍有诸多不足; 监护不力是导致该群体学业、身心发展出现诸多问题的根源; 留守寄宿制学校教育管理问题严重; 社会闲散人员则对该群体身心健康发展构成安全隐患, 需投入更多关注。

The survival and development of left-behind high school students ——Based on the investigation of a county in Enshi during a supporting education

Sheng Xiaotong, Chen Jianwen

School of Educational Sciences, Huazhong University of Science and Technology, Wuhan,
430074, China

Abstract: The survival and development of left-behind high school students in China has not been paid enough attention for a long time. However, the high school stage is an important period for the physical and mental health of adolescence and the choice of life path, which deserves great attention. As a member of the 2018 graduate education support group, the author went to a county in Enshi Prefecture of Hubei Province for one year. And based on the qualitative data obtained from one year of supporting education, this research regards the boarding school where the left-behind high school students are located as a cultural community, and uses ethnographic methods to show these students' daily interpersonal interaction. And then analyzes the current problems in the survival and development of this group, establishes a model of external adverse influence factors for left-behind high school students and makes relevant suggestions. The research shows that there are still many deficiencies in the current social security and management services; inadequate supervision is the root cause of many problems in the academic and physical and mental development of the group; the education and management problems of left behind boarding schools are serious; the social idle personnel constitute a potential safety hazard for the physical and mental health development of the group, which needs more attention.

斗士的一生——文人李敖的心理传记学分析

摘要 心理传记学是运用心理学的理论框架, 在社会历史背景下重点研究那些著名的、神秘的、非凡的、有争议的个体, 从而将个人生命史转换成一个连续且具有启发性的故事。李敖是台湾著名学者、作家、近代

史学者及时事批评家，他跨越海峡两岸，曾亲历战乱、深陷囹圄，饱受苦难依旧笔耕不辍，凭借长篇历史小说《北京法源寺》获得了诺贝尔文学奖提名。本研究从心理传记学的角度，采用质性研究的方法对传主李敖展开分析，以李敖勤勉写作、敢怒敢言、偏执的性格特点为主要悬疑性问题。通过搜集其自传、书信等第一手材料以及他人对李敖的传记、回忆和评价，利用凸显性指标与原型情景理论筛选资料并进行文本分析，兼用心理传记学中的因果式解释模式与连贯式解释模式，从成长性关键因素和传主所处的时代背景以及文化环境入手，多方面诠释传主李敖一生中的悬疑性问题：因以父亲为观察学习的榜样、长时间对其自我同一性的探索、以及出狱后对不能自由写作的补偿作用，李敖一生都勤勉写作，最终著作等身；民主型的教养方式让李敖在求学时代拥有独立个性和自由思考的能力，并形成了良好的心理韧性，帮助他在度过多年牢狱生活后依然笔耕不辍、口伐不停；坐牢多年的李敖不再信任朋友，与人交往中倾向于带着猜疑和偏执。

关键词 李敖，心理传记，教养方式，偏执

The Life of a Fighter -- an Analysis of Li Ao's Psychobiography

Abstract: Psychobiography uses the theoretical framework of psychology and focuses on the well-known, mysterious, extraordinary, and controversial individuals in the context of social history. In this way, the personal life history is transformed into a continuous and inspiring story. Li Ao is a well-known formosan scholar, writer, modern historian and current affairs critic. He crossed the Taiwan Strait, had experienced wars and was deeply imprisoned, suffered hardships and continued to work hard. He won with the novel "Beijing Fayuan Temple" nominated for the Nobel Prize in Literature. From the perspective of psychobiography, this study used qualitative research methods to analyze the biographee Li Ao, taking Li Ao's diligent writing, daring to speak up, and paranoid personality character as the main suspenseful issues. We using first-hand materials such as the biographee's autobiographies, letters, as well as others' biographies, memories, and evaluations of Li Ao. "Indicators of Saliency" and "The Prototypical Scene" were used to screen and process the relevant data. Using both the causal interpretation mode and the coherent interpretation mode in psychobiography, starting from the key factors of growth and the background and cultural environment of the biographee, the suspenseful issues in the life of the biographee Li Ao are interpreted from various aspects: Li Ao's life is due to his father's role as an example of observation and learning, his long-term exploration of his self-identity, and his compensation for his inability to write freely after his release from prison. Li Ao is diligent in writing and eventually has many works; the democratic education style enables him to have an independent personality and the ability to think freely in the era of study, and forms a good psychological resilience, which helps him to continue to write and speak after many years of prison life; Li Ao, who has been in prison for many years, no longer trusts his friends and tends to be suspicious and paranoid in his communication with others.

乡下人的志向：做一个力争上游的人

傅安国

海南大学管理学院，海口，570228，fuanguo@hainanu.edu.cn

摘要 “为什么要比别人差？别人吃的是饭，你吃的是糠吗？”贫穷农村家长的这句普通训斥，却深深地烙在传主阿杰幼小的内心，并一直影响着他的整个求学和工作生涯。幸运的是，在“人生就是命，落地八分命”“读书也不包分配，不如早打工”的贫穷价值观念下，阿杰并没有如许多同龄人那样辍学挣钱，他始终坚信“知识能改变命运”，要做“力争上游的人”。从一个贫穷的农村娃，到上大学并攻读博士学位，最终成为某大学的教授。客观来看，阿杰不是一个聪明超凡的人，但他确实是一个异常勤奋的人。是什么样的力量使得一个闭塞落后的农村儿童，有了和周围同伴不一样的志向和信念呢？本文拟从自我叙事与心理传记的路径出发，试图厘清什么样的内生动力使阿杰摆脱世代贫困，而成长为一名大学教授，而这样的内生动力又是又什么样的心路历程和生命事件所促成的？揭示这一蜕变的心路历程，以期为更多徘徊中的青少年提供一

种人生发展的借鉴。

The ambition of the country folk: to be a person striving for the top

Anguo Fu

School of Management, Hainan University, Haikou, 570228, E-mail: fuanguo@hainanu.edu.cn

Abstract: "Why worse than others? Others eat rice, do you eat chaff?" This ordinary reprimand from a poor rural parent was deeply imprinted in Ajie's young heart, and it has been affecting his entire school and working life. Fortunately, under the influence of the poor values of "Life is determined by fate, even if you fall to the ground." and "It is hard to find a job even if you study, so it is better to earn money earlier." Ajie did not drop out of school to earn money like many of his peers. He always believed that "knowledge can change destiny" and made great efforts to be "a person striving for the top". From a poor rural boy, he went to university and got a doctor's degree, and eventually became a professor in a university. Objectively speaking, Ajie is not a smart and extraordinary person, but he is indeed an extremely diligent person. What kind of drive makes a closed and backward rural child have different aspirations and beliefs from his peers around him? Based on the path of self-narration and psychobiography, this paper tries to clarify what kind of endogenous drive makes Ajie get rid of the poverty of generations and grow up to be a university professor. What kind of mental process and life events lead to this endogenous drive? This paper reveals the mental process of this transformation,, in order to provide a reference for the development of life for young people who are more hesitant about their career.

远离尘嚣：一个普通人的遁世情结

李继波

岭南师范学院心理系, 湛江, 524048, vofjlee@126.com

摘要 “我不愿生活在这个不安的、神经质的、忙乱的、琐细的世纪中, 宁可或立或坐, 沉思着, 听任这世纪过去。”梭罗《瓦尔登湖》中的语句不时打动传主小柯的心。生活中类似的时刻很多, 传主身上有一种很强烈的遁世情结。周围人看来的成就无法冲淡小柯内在的寂寞。一个看起来很积极的人为什么有如此强烈的离开的冲动, 这像极了卡夫卡“就当是一场梦”的体验? 生活终无处遁逃, 如何应对这种挣扎, 是传主当下的课题。本文拟从心理传记的视角, 尝试探究是什么样的心路历程和事件造就了传主的遁世情结? 这种情结是否有化解的方法和途径? 这对于理解部分当代青年流露出的饱含遁世元素的生存体验与生命观, 有一定的启示。

关键词 遁世情结, 化解路径, 心理传记

Far from the Madding Crowd: An ordinary person's Hermit complex

LI Jibo

Department of Psychology, Lingnan Normal University, Zhanjiang, 524048, vofjlee@126.com

Abstract: "Rather than live in this restless, nervous, busy, trifling century, I stand or sit, meditating, and let it pass." The words in Thoreau's "Walden" from time to time touched the heart of the narrator, Xiao Ke. There are many similar moments in life. Xiao Ke has a very strong hermit complex. The achievement that the person around looks cannot dilute Xiao Ke's inner loneliness. Why does a seemingly positive person have such a strong urge to escape? It's a lot like Kafka's "Just think of it as a dream" experience. There is no escape from life, how to deal with this struggle, is the narrator's current topic. From the perspective of psychological biography, this paper attempts to explore what kind of mental process and events created the hermit's hermit complex? Whether does this kind of

complex have dissolve method and way? This has certain enlightenment for understanding the existence experience and life view of some contemporary youth which are full of reclusive elements.

磨砺与玫瑰，两种面相的天使 ——女性政治家朴槿惠、昂山素季的比较心理传记学研究

汤浩然¹ 吴继霞²(通讯作者)

1 苏州大学唐文治书院

2 苏州大学教育学院心理学系，苏州，215123，wujixia@suda.edu.cn

摘要 本文采用比较心理传记学研究方法，对两位典型的亚洲黄种人女性政治家——朴槿惠与昂山素季的成长及政治历程进行考察。通过对人物传记、个人著作、媒体采访报道等进行整理，探寻并比较两位女性政治家面对人生坎坷磨炼的复杂内心状态。国内复杂的政治矛盾、被软禁或被监视的经历和宗教都对她们的心路历程产生影响，强大的自我安慰与补偿、对情绪的控制力、高雅的生活情趣使她们取得政治上的成功，并继承与超越了父亲的影响。作为政治人物，成就动机、权力动机在她们面对人生的坎坷时成为前进的动力，在巨大的压力下二人的坚忍的表现也反映出她们非凡的心理素质与政治品格。就现状来看，两人不同的境况也有前期心理因素的累积的原因。用分年龄时段的传叙方式，对两人不同时期的心理进行有效的精神分析与比较，或可理解她们内心世界的丰富性与矛盾性。宗教、哲学等信仰因素也对朴槿惠和昂山素季在逆境中的行为和处世方式造成影响，不同的社会文化背景使得她们的政治构想也有所不同。她们对环境的适应能力、面对挫折时展现的巨大定力与勇气、对情绪的调节能力都是值得我们学习的。在生活中，我们也要学会信任他人、直面逆境与挑战，协调好家庭、事业的关系。朴槿惠、昂山素季对国家的信仰和对目标锲而不舍追求的精神也可以作为我们的榜样。

关键词 朴槿惠，昂山素季，心理传记学

Angels with two faces -- Comparative psychobiography of female politicians Park Geun hye and Aung San Suu Kyi

Haoran Tang¹, Jixia Wu²

1 Tang Wenzhi college, Soochow University

2 Department of psychology, School of education, Soochow University, Suzhou, 215123,

wujixia@suda.edu.cn

Abstract: This paper adopts the method of comparative psychobiography to investigate the growth and political process of two typical Asian yellow women politicians Park Geunhye and Aung San Suu Kyi. Through the collation of biographies, personal works, media interviews and reports, this paper explores and compares the complicated inner state of the two female politicians in the face of life's ups and downs. The complicated domestic political contradictions, the experience of being under house arrest or surveillance and religion all have an impact on their mental process. Their strong self consolation and compensation, their emotional control and their elegant life taste make them succeed in politics and inherit and surpass the influence of their father. As political figures, their achievement motivation and power motivation become the driving force when they face the ups and downs of life. Under the great pressure, their perseverance also reflects their extraordinary psychological quality and political character. As far as the present situation is concerned, there are also reasons for the accumulation of psychological factors in the early stage. By using the narrative method of different age periods, the effective psychoanalysis and comparison of the two people's psychology in different periods can help us understand the richness and contradiction of their inner world. Religious and philosophical factors also influence Park Geunhye and Aung San Suu Kyi's behavior and way of life in adversity. Different social and cultural backgrounds make their political ideas different. Their ability to adapt to the environment, the great determination and courage in the face of setbacks, and the ability

to regulate emotions are all worth learning. In life, we should also learn to trust others, face adversity and challenge, and coordinate the relationship between family and career. Park Geunhye and Aung San Suu Kyi's faith in the country and the spirit of persistent pursuit of goals can also serve as examples for us.

Keywords: Park Geunhye, Aung San Suu Kyi, Psychobiography

天才之完美范例——维特根斯坦的真实与责任

宋衍¹ 吴继霞²(通讯作者)

1 苏州大学唐文治书院

2 苏州大学教育学院心理学系, 苏州, 215123, wujixia@suda.edu.cn

摘要 本文采用心理传记学的研究方法,对现代西方著名哲学家之一的路德维希·维特根斯坦的真实与责任进行了探讨。童年时期的维特根斯坦总是敏感于别人不好的看法,习惯以正确无误的礼貌和对他人的感受力与帮助让自己得到赞美和喜爱。因此“撒谎对自己有利的时候,为什么要说实话?”其本质,是否压倒一切的要求自己是真实的?这是他最早的关于哲学问题的思考。早年他即在父亲的高压统治之下,树立了一种严格的责任意识,这种严格的责任意识不仅在于限制了维特根斯坦发展自我兴趣点的可能,这与他在认为自己攻克了哲学上的难题后无所转向的人生选择有着密切的关系,刨去了对哲学的专注,维特根斯坦发现自己很难再对任何事物产生长久的兴趣。此外,这种责任意识还反映在维特根斯坦对于这个世界强烈的责任感,他的自杀倾向的直接来源:如果自己是多余的,自己不能为这个世界作出自己的一点贡献或者是改变,那么似乎也就没有活着的必要。在成为罗素学生之前的数年里,哲学是维特根斯坦最强烈的冲动这件事在他身上造成的责任和冲动的冲突一直令他深受折磨。他确实相信,人应当——像他父亲、他哥哥汉斯和一切天才那样,是冲动的动物。但他也具有几乎压倒一切的责任感,而且易于产生反复的极度自我怀疑。罗素的鼓励之所以是必须的,恰是因为他能由此而克服这怀疑,在自我探索的过程中做出决策,从而摆脱探询状态,进入自我认同的最高阶段——达成的认同这一阶段。最终他与罗素的分离正是体现了维特根斯坦性格中对于真实的绝对追求,当他认识到了自己和罗素的理想不一致时,他便决然将自己流放,在挪威独自生活,希冀寻找最正确的哲学证明。总之,真实于自己是不容违背的责任,决心不隐藏“自己之所是”成了维特根斯坦总体人生态度的核心。

The perfect example of genius ——Wittgenstein's truth and responsibility

Songyan¹, Jixia Wu²

1 Tang Wenzhi college, Soochow University

2 Department of psychology, School of education, Soochow University, Suzhou, 215123,

wujixia@suda.edu.cn

Abstract: In this paper, one of the most famous modern western philosophers, Ludwig Wittgenstein, is discussed with the method of psycho-biography. As a child, Wittgenstein was always sensitive to other people's bad views, and used to praise and love himself with correct politeness and feelings and help for others. So "why tell the truth when it's good for you to lie?" Is the nature of the overwhelming claim to be true? This is his earliest thinking about philosophy. Wittgenstein was under the father's oppressive rule in his childhood, who had established a strict responsibility sense since then. The strict responsibility consciousness not only restricts the development of Wittgenstein's interest, but it also has to do with him after he solving the philosophical problem. Wittgenstein found it difficult to interest on anything in a long term. In addition, this sense of responsibility is also reflected in Wittgenstein's strong sense of responsibility for the world, and the direct source of his suicidal tendency: if he is redundant and cannot make a contribution or change to the world, then there seems to be no need to live. In the years before he became a student of Russell, Wittgenstein was tortured by the clash of responsibilities and impulses caused by philosophy. He really

believed that people should be impulsive creatures, like his father, his brother Hans, and all geniuses. But he also has an almost overwhelming sense of responsibility and is prone to recurring episodes of extreme self-doubt. Russell's encouragement is necessary precisely because he is able to overcome this doubt and make decisions in the process of self-exploration, so as to get out of the state of inquiry and enter the highest stage of self-identity -- identity achieved. Finally, his separation from Russell reflected Wittgenstein's absolute pursuit of truth. When Wittgenstein realized his inconsistency with Russell's ideal, he decided to exile himself and live alone in Norway, hoping to find the most correct philosophical proof. In brief, Being true to oneself is an inviolable responsibility. The determination not to hide "what I am" became the core of Wittgenstein's overall attitude towards life.

清末四臣比较心理传记学研究：学养与民族关系

刘红晋

1 科学出版社, 北京, 100717, 632462362@qq.com

2 重庆师范大学马克思主义学院, 重庆, 401331

摘要 左宗棠、张之洞、曾国藩和李鸿章是晚清洋务派的四位领军人物，并称为“晚清中兴四大名臣”，他们在各自的舞台上驰骋施展，有时又相互配合。首先，梳理他们的“少时学力”，即少时考取功名的情况，从比较心理传记的角度，在他们的成长环境中加以分析。四人在求学过程中都表现出较强的地域属性，无论是一直在本省内求学，还是迁徙到异地考举，在家长、族亲的引荐下多得同乡学者的指点和提携——可以将其概括为“地方学问”。其次，四人少时的民族环境存在差异，有的在少数民族地区长大，父辈参与镇压民族起义。他们之后形成的“民族意识”从三个方面加以概括：一是跟清朝统治者的亲近程度，二是如何处理汉族一少数民族的关系，三是国际关系考察。由这三个方面组成的“民族意识”，对他们的政治归属和军事选择都产生了一定影响。将“晚清中兴四大名臣”置于其当时的历史时代背景，从社会心理传记的角度，结合其社会关系和典型作品进行考察，试图分析其“民族意识”、“政治归属”、施政措施和军事选择等的形成脉络和理路，这样一方面可以丰富对他们个体的研究，另一方面，也可以探究其时代的教育和成长环境，以及逐渐形成的社会网络和国际关系。

Comparative Psychobiographical Research of the Four Ministers in the Late Qing Dynasty : Education Accomplishments and Ethnic Relations

Hongjin Liu

Science Press, Beijing, 100717, 632462362@qq.com

Chongqing Normal University, Chongqing, 401331

Abstract: Zuo Zongtang, Zhang Zhidong, Zeng Guofan and Li Hongzhang were the four leading figures of the Westernization school in the late Qing Dynasty, and they were known as the “four famous officials of the rejuvenation of the late Qing Dynasty”. They developed in their own realms and sometimes cooperated with each other. First of all, their “youth academic abilities” are traced and compared, that is, their credits and fames obtained in youth are analyzed in their growth environments, from the perspective of comparative psychobiography. Their studying processes all showed a strong regional attribute. Whether they had always been studying in their own provinces or had migrated elsewhere for examination, they all benefited a lot from the guidances and supports from hometown scholars introduced by their parents or clan relatives, which can be summarized as the “indigenous edification”. Secondly, their ethnic environments in youth were different that some grew up in minority regions and their parents participated in suppressing ethnic uprisings. Their “ethnic consciousnesses” formed later on can be summarized from three aspects: first, the closeness to the rulers of the Qing Dynasty; second, how to deal with the

relationship between the Han and the ethnic minorities; third, their international relations. The “ethnic consciousness” composed of these three aspects had a certain impact on their “political affiliations” and military choices. From the perspective of social and historical psychology and by consulting their social relations and typical works, this paper attempts to analyze the formation context and logic of their “ethnic consciousnesses”, “political affiliations”, administrative measures and military choices. On the one hand, it can enrich the study of the four individuals. On the other hand, it can also explore the education and growth environment of their times, as well as the gradually formed social networks and international relations.

Keywords: comparative psychobiography, youth academic ability, indigenous edification, ethnic consciousness, political affiliation

新冠疫情防控下的家庭心理疏导

温芳芳 佐斌（通讯作者）

华中师范大学心理学院暨社会心理研究中心，武汉，430079, zuobin@ccnu.edu.cn

摘要 新冠肺炎疫情给我国民众和社会都带来了极大的影响。在有效防控疫情的隔离环境下，家庭作为社会的细胞单元，成为了安抚和安定人心的最温暖的港湾。而如何有效地对家庭进行健康心态的引导与疏导逐渐成为当前心理学人关注的共同问题。华中师范大学心理学院/社会心理研究中心身处疫情暴发的最严重的武汉地区，具有义不容辞的责任与使命全力投入到这场抗疫行动中。聚焦到家庭的心态建设上，我们主要进行了如下四方面的工作：第一，家庭心态的现状调查和咨政报告。自武汉封城以来，我们与中国科学院行为科学重点实验室合作对 6500 名民众的风险认知、焦虑和家庭支持等进行了动态追踪考察，依据家庭心态现状特点与存在的问题进行有针对性地干预，针对“病亡者家属”人群的创伤后应激障碍及其心理重建的建议被国家有关部门采用；第二，“温馨行动·抗疫心文”的推文科普。我们联合湖北省妇联联合开办“温馨行动·抗疫心文”心理科普栏目，自 2 月 4 日起，针对家庭和妇女群体的心理状态累计推送心理疏导文章 100 篇，其中围绕家庭关系、亲子沟通、夫妻关系、家庭会议、缓解家庭压力、工作家庭平衡等主题的文章 30 余篇，这些推文在“湖北 e 家庭”、“湖北省心理学会”和“印象社会心理”公众号发布，受到了民众的广泛喜爱与好评；第三，“家爱学院”的家庭教育助力。我们和湖北省妇联、湖北省家教研究会共同建设的“家爱学院”，是面向家长的公益教育平台，宗旨是服务家长，关爱生命，美好人格，同心成长。助力家长和孩子一同绽放“生命之花”、体悟“人性之善”、展示“人格之美”、做好“社会之人”。自 2020 年 3 月 8 日上线以来，已累计开课 18 期，服务家长 300 余万人次，受到广泛好评与信赖。第四，编写心理疏导书籍和进行科普讲座。一方面，我们编写出版了疫情时期青少年心理健康指导书籍为疫情期间居家防疫的心态建设提供了专业指导；另一方面，我们针对妇女儿童和一些重要创伤人群如治愈患者的家庭社区融入和心理健康引导进行了科普讲座，对于家庭心态调适和疏导进行了有效的引导。

Family psychological counseling under the prevention and control of COVID-19 epidemic

Wen Fangfang, Zuo Bin

School of Psychology, Center for Studies of Social Psychology, Central China Normal University

Abstract: The COVID-19 outbreak has caused significant impact on citizens and the society. In an isolated

environment that aimed to effectively prevented and controled the epidemic, as the cell units of the society, the familis became the warmest harbor for comfort and claming people. Therefore to effectively guide the families to keep in good mental health had gradually become a major concern of all psychological scholars. The School of Psychology and Center for Studies of Social Psychology in Central China Normal University which is located in Wuhan, where the epidemic is the most serious, has an unshirked responsibility to fully engage in the fight against the epidemic. Focus on the family's attitude construction, we work mainly in the following four aspects: the current state of family mentality survey and consultation report. Since the closure of Wuhan, we have cooperated with the Key Laboratory of Behavioral Sciences of the Chinese Academy of Sciences to conduct dynamic follow-up investigations on 6,500 people's risk perceptions, worries, and family support, and conduct targeted investigations based on the current characteristics of family mentality and existing problems. Intervention, recommendations for post-traumatic stress disorder and psychological reconstruction of the "family of the deceased" are adopted by the relevant state departments; second, we and the Women's Federation of Hubei Province jointly launched the "Warm Action · Anti-epidemic Essays" psychological science column. Since February 4, we have gradually triggered 100 psychological counseling articles on the psychological state of families and women groups, including family relationships. There are more than 30 articles on parent-child communication, husband-wife relations, family meetings, family stress relief, work-family balance and other topics. These articles were published on the "Hubei e-family", "Hubei Provincial Psychological Association" and "Impression Social Psychology" public accounts. It has been widely liked and praised by people; thirdly, the family education of the "Family Love College" is assisted. The "Family Love College" built by us, the Hubei Provincial Women's Federation and the Hubei Provincial Family Education Research Association is a public education platform for parents. It is helpful for parents to care for life and grow together. Since it went online on March 8, 2020, it has started 18 courses, serving more than 300 parents and children, it blooms the "flower of life" and help to understand "The goodness of human nature", show the "beauty of personality", and be a good "person of society." For the fourth time, we write psychological counseling books and conduct popular science lectures. For the last part, we have compiled and published mental health guidance books. For teenagers during the epidemic, the mentality construction of epidemic prevention provides professional guidance; on the other hand, we have conducted popular science lectures for women and children and some important trauma groups, such as family and community mergers and mental health guidance for cured patients, which are effective for family mentality adjustment.

Corresponding Author: Zhi-hong Ren. Email: ren@ccnu.edu.cn

Abstract: The Coronavirus Disease 2019 (COVID-19) is raging worldwide, seriously threatening the public's mental health. Online platform for psychological assistance integrated various sources to promote the public's mental health. This article, using the Mental Health Service Platform at Central China Normal University, Ministry of Education (MOE-CCNU-MHSP) as an example, aims to describe the experience of building an online platform for psychological assistance in a public health emergency. The key elements of this construct include: (1) counselors who provide psychological assistance and (2) help-seekers who need help; (3) channels for communication between counselors and help-seekers; and, (4) a management system to oversee an intervention infrastructure. The administrative system includes expert committee and execution group. The execution group is divided into five sub-groups: a coordination team, a counselor management team, a counseling process monitoring team, a general management team, and a technique service team. The online platform had several design features to maximize its effectiveness. The first design feature was that the psychological assistance provided by the platform should ensure compliance with ethical norms, particularly in ensuring that the counselors are competent, obtaining informed consent from help-seekers, and protecting the rights of counselors. The second, was that standardized crisis intervention procedures would be employed. The third, that a technical problem resolution plan would be developed to support the high-functioning platform. The final design feature was that it would have an evaluation and feedback system and improve the accessibility of the MOE-CCNU-MHSP. Platform construction experience includes striving for government support, integrating professional resources and establishing an efficient operating system. The future direction of the online platform can improve the depth of psychological assistance by developing a rigorous indigenized one-session counseling skill manual and increasing the continuity of psychological assistance. The intervention efficiency of the platform can be improved by internet-based self-help intervention.

高校参与社会心理服务体系建设模式探索

白学军(通讯作者) 杨海波

天津师范大学心理学部, 天津, 300387, baixuejun@tjnu.edu.cn

摘要 社会心理服务体系建设是一项时代新课题, 目前我国社会心理服务工作处于试点和探索阶段, 如何基于相关科学理论, 依托现有的服务基础, 构建切实有效的服务模式, 提供系统、全面的社会心理服务, 需要不断的尝试和探索。高等学校作为专业人才和学术资源的集聚地, 在社会心理服务科普工作、社会心理服务理论支撑等方面具有得天独厚的优势。我们在深入分析区域性社会心理服务体系特点的基础上, 细化区域性社会心理服务需求, 初步形成了高等学校服务社会心理服务体系建设的四级模型。第一, 建立社会心理服务体系建设的智库研究中心, 从理论构建、制度建设等方面提供支撑; 第二, 成立社会心理服务体系建设的科普团队, 科学普及心理科学知识, 推动人民群众对心理健康的科学认识是社会服务体系建设的任务之

一, 通过科学普及, 可以有效提高全民的心理科学素养; 第三, 练就一支服务基层的社会心理服务队伍, 主要服务政府、企业、社区等部门和机构的社会心理服务需求; 第四, 培养社会心理服务人才, 根据国家社会心理服务体系建设的需要, 调整培养方案, 培养社会急需的人才。接下来, 我们将总结前期工作的经验, 进一步研究不同群体心理健康的特点和社会心理服务的需要, 探索精准开展社会心理服务的途径, 提出符合我国国情和特点的社会心理服务模式。

Exploration of the Mode of Universities Participating in the Construction of Social Psychological Service System

Bai Xuejun, Yang Haibo

Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

Abstract: The construction of a social psychological service system is a new topic of the times. At present, China's social psychological service is in the pilot and exploratory stage. How to build a practical and effective service model based on relevant scientific theories and rely on the existing service foundation to provide a systematic and comprehensive society Psychological services require constant experimentation and exploration. As a gathering place of professional talents and academic resources, colleges and universities have unique advantages in the popularization of social psychological services and theoretical support of social psychological services. On the basis of in-depth analysis of the characteristics of the regional psychosocial service system, we refined the needs of regional psychosocial service, and initially formed a four-level model for the construction of the social psychology service system of colleges and universities. First, establish a think tank research center for the construction of a social psychological service system to provide support from theoretical construction and system construction; second, establish a science popularization team for the construction of a social psychological service system, scientifically popularize psychological science knowledge, and promote the people's mental health The scientific understanding of the social service system is one of the main tasks of the construction of the social service system. Through the popularization of science, the psychological science literacy of the whole people can be effectively improved; third, to train a social psychological service team that serves the grassroots, mainly serving the government, enterprises, communities, etc. The social psychological service needs of departments and institutions; fourth, cultivate social psychological service talents, adjust training programs according to the needs of the national social psychological service system construction, and cultivate talents urgently needed by the society. Next, we will summarize the previous work experience, further study the characteristics of mental health of different groups and the needs of psychosocial services, explore ways to accurately carry out psychosocial services, and propose a psychosocial service model that meets my country's national conditions and characteristics.

高阶层者为何更不支持再分配? 贫富差距归因的中介作用

白洁 郭永玉

南京师范大学心理学院, 南京, 210097, yyguo@njnu.edu.cn

摘 要 与低阶层者相比, 高阶层者的再分配偏向为何更低? 长期以来, 有关再分配偏向阶层差异的心理机制备受研究者的关注, 由此这一研究领域发展出了自利动机与公平认知两大研究视角。针对自利动机视角的局限, 公平认知视角认为个体的再分配偏向不仅受到自利动机的驱动, 也在很大程度上受其公平认知的影响。然而在社会阶层与再分配偏向的关系中, 具体的公平认知机制尚不清楚。基于此, 本研究则通过社会阶层不

平等维持模型的观点与相关研究发现,揭示了贫富差距归因的中介作用。研究1基于中介测量设计,通过主观阶层量表、贫富差距归因问卷、自利问卷、再分配偏向量表对448名城乡居民展开了调查。结果发现即使在控制自利动机的情况下,与低阶层者相比,高阶层者的再分配偏向仍然更低;而贫富差距归因在这一过程中起到中介作用。研究2则进一步基于实验因果链设计验证了这一中介路径的因果关系。其中,研究2a通过对124名成人被试进行社会阶层启动,发现与低阶层启动相比,高阶层启动会增强个体对贫富差距的内归因。研究2b通过对155名成人被试进行贫富差距归因启动,发现内归因启动能够降低个体的再分配偏向。本研究结果验证了社会阶层不平等维持模型的重要观点,同时也带来了一定的社会治理启示:即可以通过培育民众更多从外部环境来看待贫富差距或经济不平等,以更好地推动收入再分配、实现发展成果共享。

关键词 社会阶层, 贫富差距归因, 再分配偏向, 经济不平等

Why are higher-class individuals less supportive of redistribution? The mediating role of attributions for rich-poor gap

BAI Jie, GUO Yongyu

School of Psychology, Nanjing Normal University, Nanjing 210097, China

Abstract: Why are higher-class individuals are less supportive of redistribution than lower-class individuals? Regarding social class differences in redistributive preferences, researchers developed a self-interest perspective and an ideology perspective. Due to explanatory limitations of the self-interest perspective, the ideology perspective contends that one's redistributive preferences are not only motivated by self-interest, but also to a large extent influenced by their beliefs or ideologies about social equality. But it's unclear that what is the specific belief mechanism of social class differences in redistributive preferences. According to the inequality maintenance model of social class, the present study uncovered the mediating role of attributions for rich-poor gap. In study 1, we conducted a measurement-of-mediation design among adults ($N = 448$) with the results showing that compared with those from lower social classes, higher-class individuals were more likely to make internal attributions for rich-poor gap, in turn, had lower redistributive preferences. And these associations held controlling for self-interest. In study 2, we conducted an experimental-causal-chain design with the results showing that the experimentally induced higher social class increased internal attributions for rich-poor gap (study 2A, $N = 128$), and priming internal attributions for rich-poor gap lowered redistributive preferences (study 2B, $N = 155$). These findings provide supporting data for the inequality maintenance model of social class and shed some light upon social governance. That is, to promote wealth redistribution and the sharing of developmental fruits, social governance could cultivate individuals' more structural understandings of poverty, wealth, and economic inequality.

Keywords: social class, attributions for rich-poor gap, redistributive preferences, social inequality

健康的阶层差距及其机制与干预研究

胡小勇¹ 钟琪¹ 郭永玉²

1.西南大学心理学部暨认知与人格教育部重点实验室, 重庆 400715;

2.南京师范大学心理学院, 南京, 210097, yyguo@njnu.edu.cn

摘要 本文从心理学视角, 基于社会文化自我模型和社会阶层心理学, 采取实验、纵向追踪研究与大样本问卷调查相结合的方式, 首先考察社会阶层的健康差距的现状; 接着, 重点揭示社会阶层影响健康的机制, 提出社会阶层影响健康的模型, 探索自我健康管理与健康风险行为的连续中介作用(机制), 以及自我健康管理技能教育干预的调节作用(干预)。具体来说, 本研究为了达到在探究社会阶层影响健康水平的机制的基础上, 考察如何缩小社会阶层的健康差距这一目标, 分别从效应、机制及其干预三个方面设计了三个大研究7个子研究。研究一通过全国范围大样本考察社会阶层对健康水平的影响, 发现无论是身体健康, 还是心理健康作为健康的指标, 客观社会阶层显著正向预测个体的健康水平; 主观社会阶层显著正向预测个体健康水平, 证实了前人的研究结论。研究二基于社会阶层心理学和社会文化自我模型探讨了自我因素在社会阶层

影响健康中的机制。中介作用模型分析结果发现自我健康管理能力和自我健康行为在阶层预测健康过程中起到中介作用。对于我国个体来说,主观社会阶层越高,健康水平越高;个体主观社会阶层越高,自我健康管理能力越强;个体自我健康管理能力越强,健康水平越高。主观社会阶层主要通过自我健康管理能力影响人们的健康水平,其影响机制可以描述为:主观社会阶层越高的人自我健康管理能力越强,而自我健康管理能力又直接影响了人们的健康水平。研究三探讨促进低阶层健康水平的干预方案。以96名大学生为被试,进行持续4周的随机对照干预实验研究表明,健康教育与心理支持干预技术,如执行意向可以显著提升人们的自我健康管理能力与健康素养,进而形成良好的生活方式与健康行为,达到增进健康这一目的。本研究结论可作为保障弱势群体的健康权利、解决健康贫困问题的政府公共管理和医疗改革的对策依据。从长远来看本课题研究结论,有利于推动“人口红利”收获,有利“全民健康,全面小康”目标的实现。

Abstract: We carried out field experiment and large sample questionnaire survey to investigate the relationship between social class and health and their psychological mechanism and intervention. That is, the purpose of this project is to: 1) investigate the relationship between social class and health; 2) test the underlying mechanism under the framework of social class psychology and socio-culture self model; 3) explore possible solutions to narrow the social class gap in health. Specifically, Study 1 examines the effect of social class on health. It was found that physical health and mental health were used as indicators of health, the objective social class was significantly positive in predicting individual health status; the subjective social class was significantly positive in predicting individual health status, which confirmed the previous research conclusions. It shows that for our citizens, with the development of economy, the social class gap in health is growing. The results of this study show that the lower the class, the worse the health status. Study 2 explores the mechanisms by which social classes affect health. We found that self-health management ability and self-health behavior play a mediating role in the process of social class affect health. For individuals in China, the higher the subjective social class is, the higher the health status is; the higher the subjective social class is, the stronger the self-health management ability is; the stronger the self-health management ability is, the higher the health status is. The subjective social class mainly affects people's health level through their self-health management ability. Its influence mechanism can be described as: the higher the subjective social class is, the stronger the self-health management ability is, and the self-health management ability directly affects people's health status. Study 3 explores possible solutions to narrow the social class gap in health. Ninety-six college students were selected as subjects in this study. The results of a 4-week randomized controlled intervention experiment showed that the implementation of intention education intervention can significantly improve the lower class' self-rated health. The conclusion of this study can be used as the basis of government public management and medical reform to protect the health rights of vulnerable groups and solve the problem of health poverty. In the long run, the findings of this study is conducive to promoting the goal of "national health and overall well-off".

摘要 过往很多不同领域的研究都发现过这样的一种现象, 即当人们的期望与现实体验发生不一致时, 他

们倾向于表现出各种具有补偿性意味的心理和行为反应。尽管我们可以对于这样的效应做出不同途径的理论解释，但在众多解释中，新兴的差异补偿理论体系可能是最有吸引力的观点之一。基于差异补偿的理论视角认为，当人们遇到现实经验与期望价值的冲突时，会内隐或外显地感到焦虑和不适。为了减轻这种焦虑，人们将诉诸于使用一系列心理和行为策略，这些策略表现为不同类型的补偿性反应。而由于突发公共事件是一种影响范围广，影响力强的社会事件，因此通常会使公众感到期望与现实之间的冲突矛盾。因此，我们认为从差异补偿的视角入手来分析突发公共事件中人们的心理和行为反应具有重要意义。本研究试图从差异补偿理论体系中选取三种不同的理论视角来解释突发公共事件下民众的应激反应。首先，恐惧管理理论可以解释为什么人们在经历灾难后更多地倾向于寻求意义。其次，系统合理化理论有助于理解人们为什么以及何时更多表现出对于现存社会系统的支持与拥护。另外，补偿性控制理论可以从控制感缺失的角度揭示突发公共事件中谣言和阴谋论产生和传播的原因。基于差异补偿的视角，未来的研究可以更深入探索人们在突发公共事件中的反应及其心理机制。此外，对于突发公共事件中的社会心理建设，也可以从差异补偿的角度出发来探索针对于公众心理重建的干预策略。同时，这些研究和探索也将进一步丰富和发展差异补偿理论体系。

² School of Psychology, Nanjing Normal University, Nanjing 210097

Abstract: Previous studies have repeatedly found that people tend to exhibit a variety of compensatory psychological and behavioral responses when they are faced with an inconsistency between their expectations and actual experiences. Although this phenomenon can be explained with a lot of opinions, an emerging theoretical system of inconsistency compensation may be one of the most attractive perspectives. Inconsistency compensatory perspective holds that, when people experience a conflict with their expectations, they feel anxious and uncomfortable. Being motivated to alleviate this anxiety, they will resort to using a series of psychological and behavioral strategies, which manifest as different kind of compensatory responses. Since public emergencies are a sort of social events with a wide range of impacts and relatively strong effects, they usually cause the public to feel inconsistent between expectations and reality. Therefore, we believe that it is of significance to analyze people's psychological and behavioral responses in public emergencies from the perspective of inconsistency compensation. The present study tries to take three different theoretical perspectives in the theoretical system of inconsistency compensation to explain the public response in emergencies. First, terror management theory can explain why people are more inclined to seek meaning after experiencing a disaster. Second, system justification theory helps to understand the effect that why and when people support the prevailing social system. Last but not least, compensatory control theory may reveal the reason why rumors and conspiracy theories are spreading in public emergencies. Based on the perspective of inconsistency compensation, future research may deeply explore people's responses in public emergencies, as well as the psychological mechanism. In addition, applied research can also start from this perspective to explore intervention strategies. Meanwhile, these research explorations will further enrich the theoretical system of inconsistency compensation.

Keywords: inconsistency compensation, public emergency, terror management, system justification, compensatory control

公共卫生事件中阴谋论信奉的成因：风险感知的中介作用

摘要 遭遇重大公共卫生事件时，各类阴谋论往往层出不穷，该研究在新冠疫情大流行期间对全国30个省市区的1524名受访者进行在线问卷调查，考察公共卫生危机中的中国居民对内外群体阴谋论的信奉及其形成机制，结果发现：（1）在新冠疫情大流行早期（2020年1月31日-2月1日），与非湖北地区的居民（ $N=964$ ）相比，处于疫情中心的湖北地区居民（ $N=560$ ）表现出了显著更高的风险感知（ $p<.001$ ）、更加信奉内群体阴谋论（ $p<.001$ ）以及外群体阴谋论（ $p=.001$ ）；（2）地区通过风险感知预测内群体阴谋论信奉的部分中介作用成立，即与非湖北地区居民相比，处于疫情中心的湖北地区居民之所以更相信官方对疫情相关信息的隐瞒，是因为他们感知到了更高水平的疫情风险，激活了其存在动机，进而更倾向于信奉内群体阴谋论；（3）地区通过风险感知预测内群体阴谋论信奉的中介作用不成立。上述结果表明，在公共卫生危机事件中：（1）处于该事件中心的居民可能同时信奉内群体阴谋论和外群体阴谋论；（2）信奉外群体阴谋论可能存在与信奉内群体阴谋论不同的心理机制，需要未来研究进一步探究，如系统合理化的作用等。此外，启示了我们在应对公共卫生事件的社会治理中，对阴谋论的流行应当分类施治。

Causes of conspiracy belief in public health events: the mediating role of risk perception

Zeng Zhaoxie, Ding Yi, Zhang Yue, Guo Yongyu

Nanjing Normal University, Nanjing

Abstract: When encountering public health events, various conspiracy theories often emerge in endlessly. During the COVID-19 pandemic, the study conducted an online questionnaire survey of 1524 respondents in 30 provinces across the country to examine Chinese residents' belief in conspiracy theories of internal and external groups and the formation mechanism. The results showed that: (1) In the early stage of the COVID-19 pandemic, residents of Hubei province at the epicenter of the epidemic showed significantly higher risk perception and more belief in in-group conspiracy theories and out-group conspiracy theories than residents of non-Hubei provinces; (2) The region predicts that partial medium role of the ingroup conspiracy theories through risk perception is established, that is, compared with non-Hubei residents, the reason why Hubei residents is more believe official conceals the epidemic information, is because they perceive a higher level of epidemic risk. Then activates their motivation for existence, and make them are more inclined to believe in ingroup conspiracy theories; (3) The mediating role of regional risk perception in predicting the belief of ingroup conspiracy theories is not hold. The above results indicate that in a public health crisis event: (1) Residents at the center of the event may believe in both ingroup conspiracy theories and outgroup conspiracy theories; (2) There may be a different psychological mechanism between the belief in outgroup conspiracy theory and the belief in ingroup conspiracy theory, which needs further research in the future, such as the role of system rationalization. In addition, it suggests that the prevalence of conspiracy theories should be treated categorically in the social governance of public health events.

摘要 不同社会阶层对教育的满意度不同，但社会阶层影响教育满意度的心理机制尚不明确。本文基于阶层的认知理论，以482名大学生为研究对象，使用问卷法探究其主观家庭社会阶层与高等教育满意度之间的关系，以及成就归因倾向在两者之间的中介作用。研究结果发现：(1)主观社会阶层对高等教育满意度具有显著正向预测作用；(2)个人成就外归因倾向在主观社会阶层与高等教育满意度之间起部分中介作用，主观社会阶层越低，人们越倾向于对个人成就做外归因，他们对高等教育的满意度也就越低。该研究结果表明，个人成就外归因是解释低主观社会阶层成员对高等教育满意度较低的重要因素。

Subjective Social Class and Satisfaction of High Education: The Mediating Role of Attribution Tendency

Kai Li¹, Lin Yan¹, Yongyu Guo* (corresponding author)

1 School of Psychology, Jiangxi Normal University, Nanchang 330022, China

2 School of Psychology, Nanjing Normal University, Nanjing 210097, China

Abstract: People from different social class have different satisfaction with high education, but the mechanism by which social class affects education satisfaction is still unclear. Based on the social cognition theory of social class, this study explores the relationship between family social class and high education satisfaction, and the mediating role of achievement attribution tendency. The results found that: (1) Subjective social class has a significant positive predictive effect on satisfaction of high education; (2) External attribution plays mediate role between subjective social class and satisfaction of high education. The research results show that subjective social class is an important factor affecting satisfaction of high education, attribution tendency is an important factor to explain the relation between social class and satisfaction of high education.

文化心理变迁的社会阶层视角

韦庆旺

中国人民大学心理学系, 北京, 100872, wqwmickey@126.com

摘要 文化心理变迁关注三种变迁模式: 个人主义提升/现代取代传统, 集体主义维持不变/传统得到保持, 个人主义和集体主义并存/传统与现代相融合。越来越多的证据将文化心理变迁最重要的影响因素指向宏观社会经济发展因素和群体或个体的社会阶层因素。因此, 社会阶层可以看作社会变迁的一个缩影和研究文化心理的一个视角, 用来考察文化心理变迁的机制。从社会阶层的角度, 结合跨文化心理学、多元文化心理学和本土心理学有关文化心理变迁的研究, 可以得到有关社会阶层与文化心理维度及其变迁的对应关系。即在中国社会文化变迁的背景下, 个人主义与集体主义并存和自主-关系型自我更能代表文化心理变迁的模式, 同时将社会阶层作为影响这一变迁的显著因素, 可以将这种变迁模式突出地表现出来。因为在中国文化背景下, 本身是一个集体主义文化, 在集体主义文化的基础上随着经济社会的发展, 又增加了个人主义的因素, 最终将表现为个人主义和集体主义双高的模式, 用自我概念的表述, 则是自我-关系型自我。从社会阶层的角度来说, 中国的中高阶层将更明显地表现出这种文化心理变迁模式。

Social Class Perspective of Cultural Psychological Changes

Wei Qingwang

Department of Psychology, Renmin University of China, Beijing

Abstract: Cultural changes focus on three modes of change: Individualism increasing / modernity replacing tradition, collectivism remaining unchanged / tradition being maintained, individualism and collectivism coexisting / tradition and modernity merging. More and more evidences point out that the most important influencing factors of cultural psychological changes point to the macro socio-economic development factors and the social class factors of groups or individuals. Therefore, it can be seen as a microcosm of social change. From the perspective of social class, combined with cross-cultural psychology, multicultural psychology and indigenous psychology, we can get the corresponding relationship between social class and cultural psychological dimensions and their changes. That is to say, under the background of social and cultural changes in China, the coexistence of individualism and collectivism and autonomous-related self are more representative of the mode of cultural psychological change. Taking social class as a significant factor affecting this change can show these change modes prominently. Because under the background of Chinese culture, it is a collectivism culture. On the basis of collectivism culture, with the development of economy and society, the factor of individualism has been added. Finally, it will be expressed in the mode of both individualism and collectivism, or in the mode of autonomous-related self. From the perspective of social class, the middle and upper class in China will show these cultural and psychological change mode more obviously.

Keywords: social class, cultural psychological change, individualism, collectivism, autonomous-related self

集体主义文化之下的一致性行动是如何达成的？ ——以新冠肺炎疫情期间戴口罩行为为例

蔡卓成¹ 蔡磊² 尹彬³（通讯作者）

1 北京师范大学附属实验中学，北京，100032

2 中央编制办公室委员会综合局，北京，100010

摘要 在这次人类防治新冠肺炎疫情的努力中，“戴口罩”一度成为颇受争议的话题。中国人似乎一夜戴上口罩之际，不少国家还在为戴不戴口罩而纠结甚至争执；当中国有效控制疫情、一些人开始在户外摘下口罩时，多数国家的人们却“不约而同”戴上口罩。本文关注的，正是秉持集体主义文化的中国人戴口罩的现象，试图揭示集体主义文化之下戴口罩这样一种一致性行动是如何达成的。研究采用问卷调查法，共收集到来自全国各地各年龄段和身份的4311份有效问卷。分析结果发现：1.新冠肺炎疫情期间，多数人听从官方媒体指导，确认了新冠病毒的严重危害，分别在几个重要时间点不约而同戴上了口罩，并在戴口罩的具体情形和持续时间上都形成了共识。2.“责任感知”是集体主义文化下人们在戴口罩行为上展现出一致性行动的关键心理因素。一方面，个体认为，本人既对自己又对集体的健康安全负有重要责任；另一方面，个体认为，他人同样既对自己又对集体的健康安全负有重要责任。正是在内生责任感知和外在责任感知的双重驱动之下，多数人严格遵守戴口罩的规范，从而为中国人的整体健康安全提供了良好保障。3.与全部调查对象的整体情况相比，受调查的在校中小学生心理呈现出更多的异质性特征：首先，他/她们对自己在集体中的责任有更加积极的认知，在发现问题时，更倾向于积极采取行动；其次，他们具有更为强烈的独立意识和自我保护意识，但他/她们作出的判断更依赖于身边的专业人士和亲友；最后，对他人的行为，他/她们的态度更加包容。本研究对于本土文化心理学在人们生活实践中的理解和应用具有显著意义。

How can concerted actions be achieved in a collectivist culture? A Study on the Chinese people's mask-wearing behavior during the COVID-19 pandemic

CAI Zhuocheng¹, CAI Lei², YIN Bin³

1 The Experimental High School Attached To Beijing Normal University, Beijing, 100032

2 General Bureau, State Commission Office of Public Sectors Reform, Beijing, 100010

3 School of Psychology, Fujian Normal University, Fuzhou, 350108 (Email: byin@fjnu.edu.cn)

Abstract: In the efforts of global COVID-19 prevention and treatment, "wearing masks" has become a controversial topic. It seems that when Chinese people put on masks overnight, many countries were still struggling and even arguing about whether to wear protective masks. When China effectively controlled the pandemic and some people began to take off their masks when outdoors, people in most other countries just started to "coincidentally" wear them. This paper focuses on the mask-wearing behavior of Chinese people who are believed to uphold collectivism (as opposed to individualism), aiming to reveal how such a concerted action of mask-wearing under a collectivist culture is achieved. A total of 4311 valid responses through an online survey were collected from all over the country, including people of different ages and identities. The results of the analysis are as follows: 1. During the COVID-19 epidemic, most Chinese people listened to the official media guidance, understood the seriousness of the coronavirus, and put on masks almost "coincidentally" at several important time points, and formed a consensus on the specific situation and the duration of wearing masks. 2. "Sense of responsibility" is the key psychological factor of Chinese people's concerted action in mask-wearing under a collectivist culture. On one hand, individuals believe that they are both responsible for their own and the collective health and safety; on the other hand, individuals believe that others are equally responsible for their own and the collective health and safety. It is the result of a dual drive of the endogenous responsibility and the external responsibility that most people strictly abide by the norms of wearing

masks, thus providing a good guarantee for the overall health and safety of Chinese people. 3. Compared with the overall situation of all the respondents, the K-12 students' psychology shows some heterogeneous characteristics: firstly, they have a more positive cognition of their collective responsibility and tend to take active actions when they find problems; secondly, they have a stronger sense of independence and self-protection, but their judgments are more dependent on the professionals, relatives and friends around them; finally, their attitudes towards others' behavior are more tolerant. This research is of great significance to the understanding and application of indigenous psychology in people's real life.

Keywords: Collectivism, concerted action, COVID-19, mask-wearing behavior, K-12 students

领导幽默对员工利他行为的双刃剑效应——基于独裁者博弈的研究

王博斌 傅安国（通讯作者）

海南大学管理学院，海口，570228，fuanguo@hainanu.edu.cn

摘要 了解利他行为的新机制对人们的健康和社会发展至关重要。我们研究了工作场所中的领导幽默风格——领导者的亲和式幽默和攻击性幽默风格对下属的利他行为的影响。我们采用独裁者博弈的方法测量利他行为。基于社会交换理论，我们假设，领导者的亲和式幽默风格将促进领导与下属的交换关系，从而促进下属的利他行为；但领导的攻击式幽默则不利于领导与下属建立高质量的交换关系，从而减少下属的利他行为，研究结果支持了我们的观点。我们的研究结果有助于理解领导者的行为，这有助于在领导者和下属之间建立高质量的交换关系，以及理解可能解释领导幽默影响的关系过程。

关键词 领导幽默，社会交换理论，利他行为，独裁者博弈

The mixed blessing effect of leader humor on employee altruistic behavior: evidence from the dictator game

Wang Boxiao, Fu Anguo (corresponding author)

Management School of Hainan University, Haikou

Abstract: Understanding the new mechanism of altruistic behavior is vital to people's health and social development. In this study, we examined the effect of leader humor styles (the leader's affiliative and aggressive humor) on employees' altruistic behaviors in the workplace. We use dictator games to measure altruistic behavior. Based on social exchange theory, we proposed that the leader's affiliative humor will promote the exchange relationship between the leader and his subordinates, thus promoting the altruistic behavior of the subordinates. However, the aggressive humor of the leader is not conducive to the establishment of a high-quality exchange relationship between the leader and the subordinate, thus reducing the subordinate's altruistic behavior. The research results support our view. Our research helps to understand the behavior of the leader, which helps to establish a high-quality exchange relationship between the leader and the subordinates, and to understand the relational process that may explain the influence of the leader humor.

Keywords: leader humor, social exchange theory, altruistic behavior, dictator game

大学生自尊与微信成瘾：状态焦虑和网络人际信任的中介作用

赵敏翔¹ 王红军² 董妍¹（通讯作者） 牛勇³ 方圆¹

1 中国人民大学心理学系，北京，100872

2 中国人民大学医院，北京，100872

3 北京交通大学学生心理素质教育中心，北京，100044

摘要 凭借时尚的界面设计和强大的功能，微信逐渐成为近年来最受欢迎的社交工具之一。虽然微信给我们带来了一些便利，但过度使用也会带来微信上瘾的问题。先前的研究已经发现自尊和社交媒体成瘾之间存在相关性，但其潜在的机制还没有得到进一步的探索。因此，本研究试图探讨自尊与微信成瘾之间的内在机

制。基于社会行为恐惧管理理论,我们认为微信的使用可以弥补由于低自尊产生焦虑的个体的自我价值感缺失,这种需要的满足会强化他们的行为,导致微信成瘾。因此,我们假设状态焦虑在自尊与微信成瘾之间起中介作用。同时,在“富者更富”假设的基础上,高自尊的个体会发展出高的网络人际信任,从而促进微信使用寻求社交。因此,我们认为网络人际信任可能是自尊与微信成瘾之间的另一个中介变量。此外,我们假设焦虑和网络人际信任能够在自尊和微信成瘾中起到链式中介作用。共有 931 名大学生(男 419 人,女 512 人)参与本次研究,平均年龄为 19.59 岁。测量的量表包括罗森伯格自尊量表、微信成瘾量表、状态-特质焦虑量表、网络人际信任量表。采用 SPSS23.0 和 Mplus 7.4 对数据进行统计分析,建构结构方程模型检验焦虑和网络人际信任的中介作用。结果表明:(1)自尊与状态焦虑、微信成瘾呈负相关,状态焦虑与网络人际信任呈负相关,网络人际信任、状态焦虑与微信成瘾呈正相关。(2)自尊虽然不能直接预测微信成瘾,但能够通过状态焦虑影响微信成瘾。(3)状态焦虑和网络人际信任起到了链式中介作用。本研究基于恐惧管理理论和“富者更富”假设,揭示了自尊与微信成瘾之间的内在机制。我们发现网络人际信任能够正向预测微信成瘾,这与前人的研究不一致,却揭示了微信成瘾的特殊性和复杂性。另一方面,自尊不能直接预测网络人际信任,这可能是由于网络关系的复杂性造成的。本研究为区分现实生活中的网络信任和网络中的人际信任提供了一定的证据。未来的研究可以考虑多种方法探索更多影响微信使用动机的因素。

关键词 微信成瘾,自尊,网络人际信任,焦虑,大学生

The Relationship between Self-esteem and WeChat Addiction Among Undergraduate Students: The Multiple Mediating Roles of State Anxiety and Online Interpersonal Trust

Zhao Minxiang¹, Wang Hongjun², Dong Yan¹, Niu Yong³, Fang Yuan¹

¹ Department of psychology, Renmin University of China, Beijing, 100872

² Hospital, Renmin University of China, Beijing, 100872

³ Students' Mental Quality Education Center, Beijing Jiaotong University, Beijing, 100044

Abstract: With fashionable interface design and powerful functions, WeChat has gradually become one of the most popular social tools in recent years. While WeChat has brought us some convenience, excessive use can lead to negative outcomes, such as WeChat addiction. Previous studies have found a correlation between self-esteem and social media addiction, but its underlying mechanisms has not been further explored. Therefore, this study attempted to explore the underlying mechanisms between self-esteem and WeChat addiction. Based on the Terror Management Theory of social behavior, we supposed that for individuals with state anxiety caused by low self-esteem, WeChat use could compensate for the lack of self-worth, and that the satisfaction of this need would strengthen their behavior and would eventually lead to WeChat addiction. Therefore, we assumed that state anxiety would mediate the relationship between self-esteem and WeChat addiction. Meanwhile, based on the “Rich Get Richer” hypothesis, individuals with high self-esteem would develop high online interpersonal trust, thus promoting the use of WeChat to seek social contact, which might increase the susceptibility of WeChat addiction. Therefore, we assumed that online interpersonal trust might be another mediator between self-esteem and WeChat addiction. Furthermore, we supposed state anxiety and internet interpersonal trust would play a serial mediating role between self-esteem and WeChat addiction. A total of 931 undergraduate students (419 males, 512 females) with an average age of 19.59 years old completed a series of paper-and-pencil questionnaires. The questionnaires included the Rosenberg Self-esteem Scale (RSES), WeChat Addiction Scale (WIA), State-Trait Anxiety Inventory (STAI), Online Interpersonal Trust Scale (OIT). Data was analyzed using SPSS 23.0 and Mplus 7.4, and the bias-corrected percentile bootstrap method was used to test the mediating roles of anxiety and online interpersonal trust. Harman’s test suggested that there was not serious common method bias in this study. The results showed that: (1) Self-esteem was negatively correlated with state anxiety and WeChat addiction; state anxiety was negatively correlated with online interpersonal trust; online interpersonal trust and state anxiety were positively correlated with WeChat addiction. (2) Although self-esteem couldn’t directly predict

WeChat addiction, it could predict WeChat addiction via state anxiety. (3) State anxiety and online interpersonal trust played a serial mediating role between self-esteem and WeChat addiction. Based on the Terror Management Theory and the "Rich Get Richer" hypotheses, this study has found the underlying mechanisms between self-esteem and WeChat addiction. Given the social attributes of WeChat, we found that online interpersonal trust can directly predict WeChat addiction. Though not consistent with previous studies, this finding reveals the particularity and complexity of WeChat addiction. On the other hand, self-esteem could not directly predict online interpersonal trust, which may be caused by the complexity of online relationships. This study provides some evidence to distinguish the interpersonal trust in real life from that in the network. Future research can further consider a variety of methods, as well as more factors affecting WeChat use motivation.

个体主义—集体主义文化特征及其对情绪感染的影响

徐迹嘉 胡平（通讯作者）

中国人民大学心理学系，北京，100872，huping@ruc.edu.cn

摘要 中国社会在大多数研究中被定义为“集体主义”，而这种文化背景下的个体大多呈现“互依我”的自我构念。随着社会的发展，宣传和教育模式的改变，中国年轻一代可能更多呈现“个体主义”的文化特征，但在定义自我与他人关系时，依旧保持“互依我”的自我构念。而文化作为一种过程性和陈述性知识的网络，能够影响个体的行为及情绪反应，特别是情绪感染这种由于他人情绪而引发的情绪现象。在“集体主义”文化背景下，个体通常会限制情感表达以确保群体的和谐，而“互依我”个体常以他人参考为核心产生情绪体验。因此，本研究旨在探究大学生的文化特征及其对情绪感染的影响。研究一，使用世界价值观调查(World Values Survey, 以下简称 WVS)与文化特征相关的题目，分析 1994 年到 2020 年之间，30 岁以下中国人集体主义/个体主义取向及自我构念的变化；研究二，采用《个体主义-集体主义量表》，《自我构念量表》及《大学生情绪感染能力量表》探究不同文化特征的个体情绪感染能力的差异。WVS 结果表明，从 1994 年到 2020 年个体在空闲时间选择提升自己技能的比例逐渐升高，选择见朋友的比例逐渐降低，呈现出个体主义的倾向；而选择“朋友最重要”和“家庭最重要”的比例比较平稳，说明依然保持“互依我”的自我构念；问卷结果印证了研究一的发现，且结果表明，焦虑情绪感染能力与“独立我”负相关（ $r = -0.362, p < 0.01$ ），与“集体主义”正相关（ $r = 0.420, p < 0.01$ ），快乐情绪感染能力与“个体主义”正相关（ $r = 0.344, p < 0.05$ ）。总的来说，当今大学生在文化层面上呈“个体主义”，而个体层面呈现“互依我”的特点，这种文化特征的个体，积极情绪感染能力更强，对焦虑情绪的感染能力也更强，本研究探索了大学生文化特征对情绪感染的影响，为提高积极情绪感染，减少焦虑情绪感染提供了理论支持。

The individualism and collectivism of culture characteristics and their influence on emotional contagion

Erjia Xu, Ping Hu

Department of Psychology, Renmin University of China, Beijing 100872, China

Abstract: Chinese society is defined as "collectivism" in most studies, and most individuals under this cultural background present "interdependent" self-construction. With the development of society and changes in propaganda and education models, the younger generation may show more "individualism" cultural characteristics, but they still maintain "interdependence" self-construction when defining relationship between themselves and others. As a network of procedural and declarative knowledge, culture can influence individual behavior and emotion, especially emotional contagion, which is an emotional phenomenon triggered by the emotions from others. In "collectivism" culture, individuals usually suppressed emotional expression to ensure harmony, while "interdependent" individuals often use other people's reference as the core to produce emotional experience. Therefore, this research aims to

explore the cultural characteristics of college students and their influence on emotional contagion. In study 1, we used the topics related with cultural characteristics in World Values Survey (WVS) to analyze the phenomenon of collectivism or individualism and self-construction of Chinese under 30 from 1994 to 2020; In study 2, we used the "Individualism-Collectivism Scale", "Self-Construction Scale" and "College Students Emotional Contagion Ability Scale" to explore the differences in individual emotional contagion abilities with different cultural characteristics. The WVS result shows that (1) from 1994 to 2020, more and more individuals chosen to improve their skills in their free time, while less individuals chosen to meet friends. Which means an increasing tendency of individualism. It also shows that (2) the proportion of chosen "friends/family is most important" is relatively stable, indicating that the self-construction of "interdependence" is still maintained. The results of the questionnaire confirm the findings of Study 1 and show that the ability of anxious contagion is negatively correlated with "independent" self-construction ($r = -0.362, p < 0.01$) and positively correlated with "collectivism" culture background ($r = 0.420, p < 0.01$), while the ability of happy contagion is positively correlated with "individualism" culture background ($r = 0.344, p < 0.05$). In general, nowadays, college students are "individualism" at the cultural level, while at the individual level they present the characteristics of "interdependence". With this cultural characteristic, individuals have a stronger ability of positive emotions contagion, and their contagion ability of anxiety even stronger. In this study, we explored the impact of cultural characteristics on emotional contagion, which provide support for improving positive emotional contagion and reducing anxiety contagion.

Abstract: Individualism, collectivism, self-construction, emotional contagion

时间取向与社区老年人主观幸福感：积极心理资本的作用

杨晓凡¹ 朱镜茹¹ 胡平¹（通讯作者）

¹ 中国人民大学心理学系，北京，100872，huping@ruc.edu.cn

摘要 随着我国人口老龄化进程的加剧，老年人群在社会中占比越来越大，如何有效提升老年人生活质量、提高其幸福感已经成为学界关注的热点问题。以往研究表明时间取向是老年人心理健康和幸福感的的重要预测因素。作为时间取向的重要方面，未来结果考虑（CFC）是指个体当前行为考虑未来结果/现在结果的程度，其与老年人主观幸福感的之间的关系较少被关注，其中的机制也尚不清晰。本研究拟在未来结果考虑概念下探讨老年人未来和现在时间取向对其主观幸福感的影响，并进一步考察积极心理资本中自我效能感和心理弹性的中介作用。具体来讲，在吉林省某社区开展问卷调查，采用未来结果考虑量表、生活满意度量表、PANAS、一般自我效能感问卷和心理弹性量表对 81 名老年人（ $M_{age}=66.03$ ）进行施测。运用 SPSS 和 PROCESS 插件进行统计检验。结果显示：（1）现在取向与生活满意度、积极情绪显著正相关，与自我效能感、心理弹性呈显著正相关，自我效能感、心理弹性与生活满意度、积极情绪显著正相关；未来取向与积极情绪、消极情绪均呈显著正相关，与生活满意度无关；（2）现在取向对主观幸福感有显著的正向预测；未来取向的预测作用则不显著；（3）在控制了社会经济地位、身体健康状况以及有关人口学变量后，自我效能感在现在取向和主观幸福感之间起完全中介作用，心理弹性在现在取向和主观幸福感之间也起完全中介作用。研究结果表明老年人对短期结果的关注与更高的主观幸福感有关，且这种关系是通过积极心理资本的提升来实现的。

关键词 时间取向，主观幸福感，自我效能感，心理弹性，老年人

Time Orientation and Subjective Well-being of the Elderly in Community: The Role of Positive Psychological Capital

Xiaofan Yang¹, Jingru Zhu¹, Ping Hu¹ (corresponding author)

¹ Department of Psychology, Renmin University of China, Beijing 100872, China,

huping@ruc.edu.cn

Abstract: With the exacerbate of the aging process in China, the number of the elderly population is increasing rapidly, so how to effectively improve the life quality of the elderly has already become an important issue of

academic concern. Previous studies have shown that time orientation is an important predictor of mental health and well-being of the elderly. As an important aspect of time orientation, consideration of future consequences (CFC) refers to the extent to which people consider the potential future/immediate outcomes of their current behaviors and are influenced by those potential outcomes. The relationship between CFC and subjective well-being have been rarely studied in the older population, and the underlying mechanism is not clear. This study intends to investigate the influence of future and present time orientation on subjective well-being of the elderly, and further explore the mediating role of two components of positive psychological capital: self-efficacy and resilience. A survey by questionnaire was carried out in a community of Jilin Province. 81 elderly people ($M_{age} = 66.03$) were tested with CFC-14 Scale, Life Satisfaction Scale, PANAS, General Self-Efficacy Scale and Connor-Davidson Resilience Scale. SPSS and PROCESS plug were used for statistical analysis. The results show that: (1) CFC-immediate was significantly positively correlated with life satisfaction and positive emotions, and positively correlated with self-efficacy and resilience; self-efficacy and resilience were both significantly positively correlated with life satisfaction and positive emotions; CFC-future was significantly positively correlated with both positive emotions and negative emotions, but not correlated with life satisfaction; (2) CFC-immediate positively predicted subjective well-being, while CFC-future did not predict subjective well-being; (3) After controlling for the socio-economic status, physical health status and other demographic variables, self-efficacy completely mediated the relationship between CFC-immediate and subjective well-being; psychological resilience also completely mediated the relationship between CFC-immediate and subjective well-being. The results indicated that the elderly's concern for short-term consequences was related to higher subjective well-being, and this relationship was realized through the promotion of positive psychological capital.

文化变迁视角下汉族、景颇族整体-局部型思维方式比较研究

乔艳阳¹, 张积家² (通讯作者)

1 中共天津市委党校 (天津行政学院, 中共天津市委党史研究室), 天津, 300191

2 中国人民大学心理学系, 北京, 100872, Zhangjj1955@163.com

摘 要 文化包括物质文化、制度文化和心理文化三个层次。其中, 物质文化是人们在日常生活中所创造的物质文明, 制度文化是人们在日常生活、实践中创造的各种制度, 心理文化则包括一个民族特有的思维方式、宗教信仰等。在世界多极化、经济全球化、文化多样化、社会信息化的今天, 中国正处于百年未有之大变局中。从宏观层面看, 中国居民的经济环境、居住环境和人际环境都在不断地发生变化, 研究这种文化的变迁对国人思维方式的影响有重要意义。但既往研究尚存不足, 突出表现为两点。首先, 既往研究多使用跨文化比较范式, 但除文化差异外, 不同的跨文化团体间在经济状况、语言等方面也存在差异, 这影响了自变量的推定; 其次, 还缺乏对少数民族的考察。为此, 从云南省德宏市某大学选取了 120 名汉族、传统景颇族和信基督教景颇族大学生, 分别使用跨文化对比范式、单文化拓展范式予以实验。实验 1 通过跨文化对比考察了汉族与信仰传统宗教的景颇族之间在整体-局部型认知方式上的差异, 结果显示: 无论民族, 与经济状况一般组比, 经济贫困组被试在 Navon 字母测试、归因测试中都表现出更明显的整体型认知加工特点; 无论经济状况, 与景颇族被试相比, 汉族被试在分类上都表现出更为明显的局部型认知加工特点。实验 2 通过单文化拓展范式考察了信仰传统宗教的景颇族与信仰基督教的景颇族之间在整体-局部型认知方式上的差异, 结果与实验 1 相似。实验结果证实“变迁的文化”对整体-局部型认知方式的塑造具有不同步性特点: 经济主要影响了 Navon 字母测试和归因测试的结果, 但分类测试受民族文化影响较大。这三种测试涉及不同的认知思维过程, 不能简单归因于由文化某一方面 (比如辩证性) 特质影响所致。

A Comparative Study on Holistic - Local Thinking Style of Han and Jingpo from Perspective of Cultural Change

Qiao Yanyang¹, Zhang Jijia²(corresponding author)

1. Public Administration Department, Tianjin Municipal Party School of CPC (Tianjin University of Administration, Tianjin Party History Research Office), Tianjin, 300191;

2. Department of Psychology, Renmin University of China, Beijing 100872

Email: Zhangjj1955@163.com

Abstract: Culture includes three levels, that is, Material Culture, Institutional Culture and Psychological Culture. Material culture refers to the material civilization created by people in daily life. Institutional culture refers to the various systems and institutions created by people in daily life and practice, and psychological culture includes the unique thinking mode and religious belief of a nation. At a time of World Multi-Polarization, Economic Globalization, Cultural Diversity and Society Information, China is undergoing major changes unseen in a century. From the macro level, the economic environment, living environment and interpersonal environment of Chinese residents are constantly changing, so it is of great significance to study the impact of such cultural changes on the thinking style of Chinese people. The author selected 120 students of Han, traditional jingpo and Christian jingpo from a university in Dehong, Yunnan province. Experiment 1 examined by cross-cultural paradigm between the Han and the traditional Jingpo. The results showed that regardless of ethnic, the poor group of participants showed more holistic thinking style in Navon and Attribution test. Regardless of economic status, the Han subjects showed more obvious analytical cognitive style in categorization. Experiment 2 examined by single cultural expansion paradigm to test the difference between traditional Jingpo and Christian Jingpo in global - local cognitive style, and the result was similar to experiment 1: regardless of ethnic, the poor group of participants showed more obvious global thinking style; Regardless of economic status, the Han subjects showed more analytical in Categorization. These results confirmed that the rapid changes and "mix " culture shape global-local cognitive style with asynchronism characteristics: economic factors could shape the style of attention and attribution, but the categorization was greatly influenced by the specific historical culture of the nation. Research result provides strong supports for the characteristics of cognitive style of Mixing Culture and thinking styles of the poor.

留学经历是否提升辩证思维？来自中国留学生的证据

胡晓檬¹（通讯作者），王扬²，廖珊慧¹，彭凯平²

1 中国人民大学心理学系，北京，xiaomeng825@yeah.net

2 清华大学心理学系

摘要 本研究基于文化启动范式考察了中国留学生的海外学习经历是否提升辩证思维。通过在线行为实验，本研究收集了 258 名正在不同国家和不同地区（比如美国、英国、德国、荷兰、澳大利亚、日本等）留学的中国学生的行为数据。结果发现，相比短期旅行、家乡文化和控制条件，当被试被启动留学经历时更加能够容忍矛盾，即被试认为两个互相矛盾的科学陈述同时具有说服力，而且被试对这些科学观点表现出同等偏好。本研究揭示了留学经历如何影响中国学生的心理过程与行为模式，即留学经历能够提升辩证思维，同时这种效应不会受到特定留学国家和留学地区的影响。未来尚需更多研究来探索以下问题：1）该心理效应是否在辩证思维的其他维度同样存在，比如整体认知和变化预期；2）采用不同的文化启动范式是否能够发现类似的结果；3）如何探索内部机制来解释为何留学经历会提升辩证思维。

关键词 多元文化经历，辩证思维，人类普适，文化差异，中国留学生

Do Studying abroad experiences Promote Dialectical Thinking?

Empirical evidence from Chinese International students

Xiaomeng Hu¹, Yang Wang², Shanhui Liao¹, Kaiping Peng²

(¹ Department of Psychology, Renmin University of China, Beijing, China)

(² Department of Psychology, Tsinghua University, Beijing, China)

Corresponding author: Dr. Xiaomeng Hu, xiaomeng825@yeah.net

Abstract: Our current work seeks to provide direct evidence on whether Chinese international students' studying abroad experiences promote dialectical thinking. We collected behavioral data from 258 Chinese International students in multiple regions (the U.S., U.K., Germany, Netherlands, Australia, Japan, etc.). Our results indicated that when primed with studying abroad (relative to traveling abroad, hometown culture and control condition), participants were more likely to tolerate for contradiction. In other words, they deemed both sides of the contradictory scientific statements were convincing and likable. Taken together, it is plausible that Chinese international students' studying abroad experiences promote their dialectical thinking regardless of their host culture. More work is needed to further this line of research by 1) replicating this effect among other measures of dialectical thinking, 2) adopting differing cultural paradigms to provide robust findings, and 3) explaining why is the case that studying abroad experiences would promote dialectical thinking.

多语经验与锅庄仪式对普米族中老年人执行功能的影响

邵先花 尹可丽 宋芝君 姬弘（通讯作者）

云南师范大学，教育学部，昆明，650500 通讯作者 752919705@qq.com

摘要 中老年人认知功能随年龄增长而衰退的主要原因是执行功能的下降。除语言经验以外，最近的部分研究表明执行仪式也有利于改善执行功能。普米族人使用多语的现象非常普遍，而且大多保留了每日举行锅庄仪式进献祖先的文化习俗。本研究对 57 名普米族中老年人执行功能的抑制、转换和刷新三个任务分别进行了测量。实验 1 采用 Go/No-Go 任务考察多语经验、记诵祖先辈数对执行功能的抑制能力的影响。结果发现：多语者比双语者在抑制控制能力上表现更好；记诵辈数的主效应不显著；交互效应不显著。实验 2 采用局部-整体任务考察多语经验、记诵祖先辈数对执行功能的转换能力的影响。结果发现：语言经验主效应不显著；记诵辈数的主效应不显著。实验 3 采用 N-back 范式考察多语经验、记诵祖先辈数对执行功能的刷新能力的影响。结果发现：语言经验主效应不显著；多记诵辈数者在刷新能力上具有优势；在控制了教育水平后，语言经验和记诵辈数交互作用显著。普米族中老年多语经验者与双语经验者相比，在执行功能方面的优势主要是在抑制控制能力上。在普米族日常举行的锅庄仪式中，记诵辈数对执行功能中的刷新能力有显著影响，记诵祖先辈数越多越能锻炼记忆刷新能力。多语经验与仪式对刷新功能的交互作用受任务难度调节。任务难度较高，多语经验越多、记诵辈数越多者的刷新功能优势越明显。

关键词 认知衰退，执行功能，多语经验，锅庄仪式，记诵辈数

Effects of multilingual experience and Guozhuang ritual on the executive function of Pumi middle-aged and elderly people

Tai xianhua, Yin keli, Song zhijun

(Faculty of Education, Yunnan normal university, Kunming Chenggong, 650500)

Abstract: The main reason for the decline of cognitive function in the middle-aged and elderly is the decline of executive function. Many researches found that language experience and executive rituals can also improve executive function. The phenomenon of multilingualism is very common among the Pumi people, and most of them keep the cultural custom of holding daily Guozhuang ritual to offer ancestors. This study used the related experimental

paradigm of executive function to measure the inhibition, transformation and refresh of executive function of 57 Pumi middle-aged and elderly people. In Experiment 1, Go/No-Go task was used to investigate the effect of multilingual experience and memorization of ancestors on the inhibition of executive function. The results showed that multilinguals performed better than bilinguals in inhibition and control; the main effect of the number of generations of recitation is not significant; the interaction effect is not significant. In Experiment 2, the influence of multilingual experience and the number of ancestors on the ability of executive function transformation was investigated by using local whole task. The results show that: the main effect of language experience is not significant; the main effect of recitation is not significant. In Experiment 3, n-back paradigm was used to investigate the influence of multilingual experience and the number of ancestors on the refresh ability of executive function. The results show that: the main effect of language experience is not significant; those who memorize more than one generation have an advantage in refresh ability; after controlling the level of education, the interaction between language experience and memorization generation is significant. In conclusion, the main conclusions of this study are as follows: Compared with the bilinguals, the middle-aged and old people with multilingual experience have the advantage in executive function mainly in inhibition and control ability. In the daily Guozhuang ritual held by the Pumi people, the number of generations of recitation has a significant impact on the refresh ability in the executive function. The more generations of recitation, the more exercise memory refresh ability. The refreshing function advantage of language and ritual is regulated by task difficulty and individual cognitive ability.

多语表述与框架对彝族中学生道德决策的影响

董绍桂 张云朋 尹可丽 薛秋（通讯作者）

云南师范大学，教育学部，昆明，650500，2111379349@qq.com

摘要 少数民族个体对道德决策与判断任务的认知加工会随着表述的语言形式(母语/汉语普通话/地方汉语方言)的不同而发生改变。框架效应是指相同信息的不同框架表述导致不同决策的现象。为了考察多语表述与损失性、获得性情境表达是否影响彝族中学生的道德决策，实验1选取90名彝族中学生，考察普通话、汉语方言、彝族语的不同表述下，被试对道德困境和非道德困境的决策行为。实验2选取60名彝族中学生，考察普通话地方方言、彝族语对获得性和损失性道德困境的表述下，被试道德决策的差异。结果表明，母语表述下，被试的道德决策倾向于道义论，而在地方方言和普通话表述下倾向于功利主义。彝族中学生的道德决策主要受到语言表述方式的影响，但未出现框架效应。

关键词 多语表述，框架效应，道德决策，彝族中学生

The Influence of Multilingual Representation and Framework on the Moral Decision-making of Yi Middle School Students

Dong Shaogui, Yin keli, Zhang Yun-peng

(Faculty of Education, Yunnan normal university, Kunming Chenggong, 650500)

Abstract : Minority individuals' cognitive processing of moral decision-making and judgment tasks will change depending on the language form of expression (mother tongue / Mandarin / local Chinese dialect). Frame effect refers to the phenomenon that different frame expressions of the same information lead to different decisions. In order to investigate whether multilingual expressions and lossy and acquired situation expressions affect the moral decision-making of Yi middle school students, experiment 1 selected 90 middle school students of Yi nationality, and examined the different expressions of Mandarin, Chinese dialects, and Yi language. Difficult decision-making behavior. In Experiment 2, 60 middle school students of Yi nationality were selected to investigate the differences in moral decision-making of the subjects in the local dialects of Mandarin and the language of Yi nationality regarding

the acquisition and loss of moral dilemmas. The results show that, in the expression of the mother tongue, the subjects' moral decisions tend to be deontological, while in the expressions of local dialects and Mandarin, they tend to be utilitarian. The moral decision-making of middle school students of Yi nationality is mainly influenced by the way of language expression, but there is no frame effect.

Keywords: Multilingual representation, frame effect, moral decision-making, Yi middle school students

新冠疫情中政府治理对民众压力紧张感的作用机制

徐凯

洛阳师范学院 应用心理学系, 洛阳, 471934, 462753358@qq.com

摘 要 新冠肺炎疫情是对我国治理体系和能力的一次大考。民众压力紧张程度既是政府应急管理需要考虑的重要内容,也是衡量政府治理政策行为效应的重要维度。在新冠疫情这一突发重大公共事件中,相比较以个体范式方式进行民众心理疏导和干预,政府治理的状况与民众压力紧张感联系更为密切。本研究基于在疫情爆发初期($N=4590$)和攻坚期($N=1140$)的在线调查,探讨了在疫情不同阶段政府治理对民众压力紧张感的作用机制。结果显示:(1)从疫情爆发初期到攻坚期,民众的压力紧张感显著降低,其政治效能感和政治信任水平继续维持在中等偏上水平;(2)在疫情爆发初期,政策知晓度、政治效能感和政治信任在信息传播管理与民众压力紧张感之间有多重链式中介作用,即信息传播管理正向预测民众的压力紧张感,但同时又通过政策知晓度、政治效能感、政治信任的单独中介作用直接影响民众压力紧张感或者通过政策知晓度与政治效能感、政策知晓度与政治信任的链式中介作用来间接影响民众压力紧张感;(3)在疫情攻坚期,只有政治效能感在信息传播管理和民众压力紧张感中有中介作用,政策知晓度在疫情信息传播管理与政治效能感之间有调节作用,从而形成一个有调节的中介模型。最后,本文进一步探讨了政府治理对民众压力紧张感的影响机制,并为重大突发事件中政府治理效能的提升和民众心理的有效干预提出针对性的建议。

The Mechanism of Government Governance on People's Stress and Tension during the COVID-19

XU Kai

Department of Applied Psychology, Luoyang Normal University, Luoyang, 471934,
462753358@qq.com

Abstract: The COVID-19 is a major test for Chinese governance system and capabilities. The degree of people's psychological stress and tension is not only an important content for government emergency management decision-making, but also an important dimension to measure the policy behavior effect of government prevention and control measures. In the eruptive of this vital emergent event, the government governance is more closely related to people's mental health than the individual paradigm of psychological counseling and intervention. Based on the online survey in the early stage of the outbreak ($N=4590$) and the critical period ($N=1140$), this study explored the impact of the performance of government governance on people's stress and tension, and its different presentation in different stages of the COVID-19. The results showed: (1) from the eruptive period to the critical period of the COVID-19, the public's sense of stress and tension decreased significantly, and the level of political efficacy and political trust remained at the upper middle level; (2) in the eruptive period of the COVID-19, prevention and control policy awareness, political efficacy and political trust had multiple chain mediating roles in the epidemic information dissemination management and people's psychological stress and tension, that is, information dissemination management positively predicted the public's sense of stress and tension, at the same time it directly affected people's

stress and tension through the single mediating role of policy awareness, political efficacy and political trust, or indirectly through the chain intermediary role of policy awareness, political efficacy, policy awareness and political trust; (3) in the critical period of the COVID-19, only political efficacy was found had a moderating role between the epidemic information dissemination management and people's psychological stress and tension, policy awareness played a moderating role between the epidemic information dissemination management and political efficacy, thus forming a moderated mediation model. Finally, this paper further explored the mechanism of government governance on people's stress and tension, and provided useful suggestions for the improvement of government governance efficiency and effective public psychological intervention under vital emergent events.

疫情信息获取模式对政策内化效应的影响研究

周佳¹ 高腾² (通讯作者) 张简³

1 浙江理工大学公共管理系, 杭州, 310018

2 合肥学院旅游与会展学院, 合肥, 230000, gaoteng1963@163.com

3 湖南师范大学公共管理学院, 长沙, 410000

摘要 政策行为效应是衡量政府治理能力的重要标准, 其中, 政策内化效应是政策行为效应的主要测量维度, 公共政策能否转化为个体自发的行为, 很大程度上取决于个体对政策的内化和认同。以往研究从政策质量的角度对政策的合法性和有效性进行了大量探索, 相对而言, 讨论政策信息获取途径对政策内化效应的研究是有限的。在信息大爆炸时代, 政策信息的来源与收集方式, 是否会影响个体对公共政策的认同, 并进而作用于个体的行为选择? 本研究基于新冠肺炎疫情期间收集的 4590 份问卷数据, 着重探讨危机信息获取模式对政策内化效应的影响。研究发现: (1) 信息获取积极性 (信息收集时间与所获信息数量) 正向影响政策内化效应, 即信息获取积极性越高, 则越认同政策并愿意按政策要求采取行动 ($p < 0.001$); (2) 信息获取方式的差异会导致政策内化效应的显著差别, 依靠各类媒体获取信息的个体比通过与人交流的方式获取信息的个体具有更明显的政策内化效应 ($p = 0.001$); (3) 不同媒体信任度的人在政策内化效应方面存在差异显著。政策内化效应最明显的为信任政府新闻发布会和中央官方媒体信息发布平台的个体, 其次为信任地方官方媒体发布平台的个体, 信任自媒体和海外媒体平台的个体的政策内化效应最弱 ($p < 0.001$)。为了找到影响个体政策内化效应的更深层次原因, 本研究还对性别、年龄、学历、收入水平等社会人口学变量的作用进行了探索, 发现以上变量均对政策内化效应产生显著影响 ($ps < 0.005$)。本研究认为, 公共政策的传播和获取途径将会对政策的合法性与有效性 (认同并且遵守) 产生重要影响, 同时, 不同个体在政策内化效应上的差异也应引起关注。

The Effect of Information Acquisition Mode on Policy Internalization During COVID-19

ZHOU Jia¹ GAO Teng² (corresponding author) ZHANG Jian³

1 Department of Public Administration, Zhejiang Sci-Tech University, Hangzhou, 310018

2 Department of Tourism, Hefei University, Hefei, 230000, gaoteng1963@163.com

3 School of Public Administration, Hunan Normal University, Changsha, 410000

Abstract: The policy-behavior effect is an important criterion to measure the government's governance ability. Among them, the internalization effect of policy is the main measurement dimension of the policy-behavior effect. Whether public policy can be transformed into an individual's spontaneous behavior depends largely on the individual's internalization of policy and identification with policy. Previous studies have conducted a lot of research on the legitimacy and effectiveness of policies from the perspective of policy quality. Comparatively speaking, the research

on the internalization effect of policy information acquisition methods is limited. In the era of the information explosion, will the source and collection method of policy information affect individuals' identification with public policies, and in turn affect individual behavior choice? Based on 4590 questionnaire data collected during the COVID-19, this study focuses on the impact of crisis information acquisition mode on the internalization effects of policies. Results reveals that, first, information acquisition enthusiasm (time of information collection and the amount of information obtained) positively affects the internalization effect of policy, that is, the higher the enthusiasm for information acquisition, the more an individual agrees with the policy and is willing to take action as required by the policy ($p < 0.001$); second, differences in information acquisition methods lead to significant differences in the internalization effect of policy. Individuals that rely on various media to obtain information shows more obvious internalization effect of policy than individuals that obtain information through communication with people ($p = 0.001$); third, individuals with different media trust show different internalization effects of policy. The most obvious internalization effect of policy is the group that trusts government press conferences and the central official media information release platform, followed by the group that trusts local official media release platforms, and the group that trusts self-media and overseas media platforms shows the weakest internalization effect of policy ($p < 0.001$). In order to figure out substantial reasons for the internalization effect of policy, this study explores the role of social-demographic variables such as gender, age, education, and income level, and find that the above variables all have a significant impact on the internalization effect of policy ($ps < 0.005$). The dissemination and access of public policy will have an important impact on the legitimacy and effectiveness of the policy (identification and compliance). At the same time, the differences in the internalization effect of policy by different groups should also cause concern.

Keywords: policy-behavior effect, crisis information acquisition, policy communication, public crisis governance, COVID-19

从个人责任到系统信任：政策知晓和社区示范的桥梁作用

毕重增* 尹江昊

西南大学中国社区心理学服务与研究中心, 重庆, 400715, alphapsy@163.com

摘要 系统效率是应对突发性重大公共卫生事件的核心, 公众对系统的信任则是维护效率的基础, 而信任不但来自于规范化、制度化的授权, 还与个人与社会的交互作用息息相关。本文基于 2020 年 2 月新冠疫情期的自我报告数据, 探讨了个人主体性与社会交互通达系统信任的路径。通过路径分析法, 比较个人责任 (3 题, $\alpha = 0.70$) 对于系统信任 (2 题, $\alpha = 0.76$) 的直接作用, 以及个人的社会责任感通过社区示范 (4 题, $\alpha = 0.94$) 及政策知晓 (5 题, $\alpha = 0.90$) 的间接作用。结果发现, 个人出于责任感而对疫情防控措施执行的担当, 解释了系统信任意愿的 35.8%, $\beta = 0.15$, 而通过社区示范和政策知晓产生的间接作用为 63.7%, $\beta = 0.27$ 。说明在疫情防控中, 个人社会责任感会投注为对系统的信任, 个人社会担当感越强, 越能够信任系统及其举措, 个人的责任担当对于系统信任具有直接重要性; 与此同时, 个人责任也需要社会交互过程作为实现的路径, 即宏观政策知晓、社区及熟悉人群的参与、示范, 对于个人责任转化为系统信任, 也具有不可或缺的重要性。总体上来看, 从个人责任到系统信任, 公众的社会互动与认知是实现个人品质到系统信任的重要通达机制。

关键词 社会责任感, 政策知晓, 社区示范, 系统信任

Bridge Personal Responsibility and System Trust: The Influence from Policy and Community

Bi Chongzeng, Yin Jianghao

Center for China Community Psychology Service and Research, Southwest University, Chongqing,
400715, China

Abstract: System efficiency is the kernel to deal with major public health emergencies, and public trust in the system which not only comes from the standardized and institutionalized authorization, but also related to the interaction

between individual and society in the coping process. Based on the self-reported data of the COVID19 pandemic in February 2020, this paper discusses the path of individual subjectivity and social interaction to build system trust. The path analysis showed the direct effect of personal responsibility (3 items, $\alpha = 0.70$) on system trust (2 items, $\alpha = 0.76$) as well as the indirect effect of personal social responsibility through community demonstration (4 items, $\alpha = 0.94$) and policy acquaintance (5 items, $\alpha = 0.90$) on system trust. The sense of responsibility for implementation of epidemic prevention and control measures explained 35.8% of the system trust tendency, $\beta = 0.15$, while the indirect effect by community and policy was 63.7%, $\beta = 0.27$. It shows that in the epidemic prevention and control, personal responsibility will be invested into the system trust, the stronger the sense, the more system trust and its measures acknowledged. At the same time, personal responsibility also needs macro policy acquaintance and demonstration play an indispensable role in transforming personal responsibility into systematic trust. Overall, the social interaction and cognition is an important mechanism transforming personal quality to system trust.

Keywords: Sense of Social Responsibility; Policy Acquaintance; Community Demonstration; System Trust

谣言治理何以精准施策？——基于新冠疫情调查实验的实证分析

傅承哲 谢昊伦 廖了（通讯作者）

华南师范大学 政治与公共管理学院，广州，510006, l_liao@hotmail.com

摘要 自2019年下半年以来，新冠肺炎疫情这一重大危机事件给世界造成了极大的影响，随之而来的是层出不穷的相关谣言，有些谣言甚至造成了公众恐慌。此类谣言的传播已对政府开展防疫工作造成了极大影响，亟需得到治理。如何根据不同谣言的特性“精准施策”，灵活利用不同的政策工具治理谣言，成为谣言治理的关键所在。本研究基于行为公共政策的新视野，考察各类行为政策工具在谣言治理上的效能，以期从微观公众心理层面探索谣言治理的最优解。在研究方法上，首先通过定性谣言资料分析，对本次疫情期间所爆发的谣言进行概括、梳理，归纳出两种谣言类型：个人行为类，以“双黄连能迅速高效治愈新冠肺炎”为案例；疫情发展类，以“新冠肺炎疫苗已被研制成功”为案例。其次引入行为公共政策视角，采用2（疫情谣言分类：个人行为、疫情发展） $\times$ 2（行为政策工具：助力、助推） $\times$ 2（是否快速反应：快速反应、非快速反应）的被试间设计，共形成8种实验条件作为自变量，以谣言治理效果（包括谣言治理的总体效果、政策的性价比以及支持度）为因变量，通过Qualtrics网上调查系统进行，共回收有效样本871个。实验通过了操纵检验与平衡检验，结果显示：（1）谣言内容和是否快速反应的主效应均显著，即个人行为类谣言比疫情发展类谣言治理效果好，快速反应比非快速反应谣言治理效果好；（2）谣言内容和是否快速反应的交互效应不显著（ $F=0.58$, $p>0.05$ ）；行为政策工具和是否快速反应的交互效应极显著（ $F=8.44$, $p<0.01$ ），即是否快速反应对辟谣行为工具的效用有调节作用。进一步进行简单效应检验发现，在快速反应阶段，选择助力比助推谣言治理效果更好；在非快速反应阶段，选择助推比助力谣言治理效果更好。研究启示，谣言的击破不仅仅只是要求民众不信谣不传谣，还要进行科学化精准施策，有的放矢，从底线管理走向信息治理，方能在节省社会成本的基础上取得较好谣言治理效果，并获得民众支持。基于分析结论，本研究对谣言治理的精准施策提出了具有针对性的政策建议。

How can Rumor Governance be Targeted?-- An Empirical Study Based on COVID-19 Survey Experimentation

FU Chengzhe, XIE Haolun, LIAO Liao

School of Politics and Public Administration, South China Normal University, Guangzhou, 510006,

l_liao@hotmail.com

Abstract: Since late 2019, COVID-19 has been a major crisis that has had an enormous impact on the world, and has been followed by numerous rumors, some of which have even caused public panic. The spread of such rumors has greatly affected the government's epidemic prevention efforts and is in urgent need of government. The key to rumor

governance lies in how to make flexible use of different policy tools to manage rumors according to the characteristics of different rumors. Based on the new perspective of behavioral public policy, this study explores the effectiveness of various behavioral policy tools in rumor governance, hoping to explore the optimal solution of rumor governance from the perspective of micro public psychology. Early research use qualitative analysis to summarize and sort out the rumors, and then introduce behavior public policy perspective. Our survey experiment use a 2(Epidemic rumors categories: individual behavior, the epidemic situation development)*2(Behavioral policy tools: boost, nudge)*2(Whether rapid response : rapid response, slow response) survey experiment matrix designs between the subjects, which form eight kinds of experimental conditions as independent variables, and the governance effect of rumor(including the overall effect, cost performance and support) is taken as dependent variables. This survey based on Qualtrics online survey system, a total of 871 valid samples were collected. The experiment passed the manipulation test and balance test, and the results showed that :(1) the main effect of rumor types and whether rapid response was significant, this means that individual behavior kind of rumor is easier to control than the epidemic situation development rumors, rapid response has better governance effect than slow response. (2) There was no significant interaction between rumor content and whether rapid response ($F=0.58, p > 0.05$); The interaction effect between behavioral policy tools and whether rapid response is very significant ($F=8.44, P < 0.01$), which means that whether rapid response has a regulatory effect on the effectiveness of the rumor-refuting behavioral tool. Use a simple effect test, we can found that if in the rapid response stage, chose boosting is more effective than nudging. However, in the stage of non-rapid response, nudging is a better way. The study shows that if government wants to control the rumors, they should not only just asking people do not believe a rumor and do not spread it, Scientific and precise measures should be taken to find policy priorities and move from bottom-line management to information governance. Only in this way can rumor governance achieve better effects and win public support on the basis of saving social costs. Based on our analysis conclusion, this study puts forward targeted policy Suggestions for the precise measures of rumor governance.

Keywords: rumor governance; public crisis management; behavioral public policy; survey experiment

突发公共危机中的群防群治行为效应及其作用机制

傅承哲¹ 姜涵² 丁太平³ (通讯作者)

华南师范大学 政治与公共管理学院, 广州, 510006

粤港澳大湾区战略研究院, 广州, 510000

摘要 群防群治作为我国应对突发公共应急事件的重要经验,是国家实现治理体系与治理能力现代化的重要组成部分。在本次抗击“新冠疫情”的进程中,以群众联防联控为核心的公共应急政策发挥了重要作用,通过构建群防群治的抗疫防线,取得了疫情防控的显著成效。因此,如何总结有益经验,从行为层面优化突发公共应急响应政策的群防群治作用机制,成为今后提升公共危机应对实效,增强基层社会治理能力的重要课题。本文从行为公共管理视角切入,以政策过程机制理论为基础,构建政策—行为互动机制分析框架,从政策感知过程、政策认知过程以及行为转化过程三个阶段考察群防群治行为效应的作用机制,以期进一步发挥群众路线在应急管理中的实践性与有效性。在国内“新型冠状病毒肺炎”疫情爆发期间(2020年2月中上旬),本研究在全国范围内进行了网络问卷调查,共回收有效问卷5090份。通过多元回归的嵌套模型分析发现,在控制了人口学属性、个体心理状态以及信息传播状态等一系列变量后,(1)政策感知变量(政策知晓度)与政策认知中的治理效能对群防群治行为效应有着显著的正向影响;(2)政策认知中的心理效应(政府信任效应、社会凝聚效应)对群防群治行为效应也有着显著的正向影响,并且影响程度略大于政策感知和执行质量的共同影响程度,表明政策效能发生了从政策系统到个体心理的“溢出”转化;(3)政策遵循逻辑(效益计算、回避惩罚、“他者”规范、责任认同)对群防群治行为效应的影响最大,表现为“趋利避害”的理性逻辑与责任承担的情感逻辑,二者共同作用形成合力,成为政策心理效应转化为政策行为效应的关键所在。同时,本研究也应用了机器学习的方法,通过Lasso回归交叉验证了作用机制的稳健性,证明了该机制具有

向外延伸的普适性。研究启示, 通过提升政策认知过程中的“政策—心理”效能转化以及“心理—行为”效应转化效率, 可以有效巩固和发挥应急管理响应政策的群防群治行为效应, 为相关政策的改良优化提供有益参考。

The Behavioral Effect and Mechanism of Mass Prevention and Treatment on Public Emergency Response Policy

FU Chengzhe¹, JIANG Han², DING Taiping³

1 School of Politics and Public Management, South China Normal University, Guangzhou, 510006

2 Institute of Strategy Research for Guangdong, Hongkong and Macao Greater Bay Area, Guangzhou, 510000

3 School of Government, Sun Yat-sen University, Guangzhou, 510275, taiping_lucku@live.com

Abstract: Novel coronavirus pneumonia suddenly struck in the beginning of spring 2020. The Central Committee of the Communist Party of China has implemented a series of public emergency response policies, which closely rely on the people, and achieved positive results. China has always achieved important results in public emergency management, and the mechanism behind mass prevention and treatment needs to be explored. Different from the perspective of traditional policy science, this study starts from the perspective of behavioral public management, based on the theory of policy process mechanism, constructs an analysis framework of policy behavior interaction mechanism, investigates the mechanism of behavioral effect of mass prevention and treatment from three stages of policy perception process, policy cognition process and behavior transformation process, in order to further play the practicality and effectiveness of mass line in emergency management. During the domestic outbreak of the epidemic (early February 2020), an online questionnaire survey was conducted nationwide, and 3274 valid questionnaires were collected. Through the nested model analysis of multiple regression, after controlling a series of variables such as demography attribute, individual psychological state and information dissemination state, the research finds that (1) policy perception variables and implementation quality variables in policy cognition have significant positive effects on mass prevention and treatment behavior; (2) The psychological effects of policy cognition (government trust effect, social cohesion effect) also have a significant positive impact on the mass prevention and treatment behavior effect, and the influence degree is slightly greater than the joint influence degree of policy perception and implementation quality, which indicates that the effect transformation from policy system to individual psychology has taken place; (3) The logic of policy following (benefit calculation, punishment avoidance, "the other" norms, responsibility identification) has the greatest impact on the effect of mass prevention and treatment, which is manifested in the rational logic of "seeking advantages and avoiding disadvantages" and the emotional logic of responsibility identification. The two factors work together to form a joint force, which is the key to transform the psychological effect of policy into the effect of policy behavior. At the same time, this study also uses the method of machine learning to cross verify the robustness of the mechanism through lasso regression, which proves that the mechanism has the universality of extension. The research reveals that by improving the efficiency of "policy psychology" efficiency transformation and "psychological behavior" effect transformation in the process of policy cognition, the mass prevention and treatment behavior effect of emergency management response policy can be effectively consolidated and brought into play, which provides beneficial reference for the improvement and optimization of relevant policies.

直觉还是反思？第三方惩罚中群体偏差的中西文化差异

郭子妍¹ 郭睿¹ 徐丞谊² 伍珍¹ (通讯作者)

¹ 清华大学心理学系, 北京, 100084, zhen-wu@mail.tsinghua.edu.cn

² 剑桥大学家庭研究中心, 剑桥, 英国

摘要 第三方惩罚 (TPP) 是指旁观的第三方对违反社会规范、损害他人权益者进行的惩罚, 即使第三方有时要付出一定代价。第三方惩罚有利于阻止违规行为, 对促进合作和维持社会稳定至关重要。由于社会规范产生于群体之中, 群体关系对第三方惩罚的执行具有重要影响。研究表明, 第三方惩罚中存在两种方向不一致的群体偏差: 内群偏爱 (容忍内群的违规者) 和内群约束 (惩罚内群的违规者)。然而, 目前鲜有研究探讨不一致方向背后的机制。围绕这一问题, 本研究在中国和西方的成年人中进行了五个经济游戏实验 (总人数 $n = 632$), 考察直觉和反思性的决策情境、群体认同及文化对第三方惩罚中群体偏差的交互影响。研究通过操纵认知负荷, 让参与者在直觉或反思的情境下观察到内群和外组成员的不公平分配, 然后决定扣除分配者多少钱作为惩罚。结果表明, 无论在直觉或反思的情境下, 中国被试在第三方惩罚中都表现出内群偏爱, 且群体认同感越强内群偏爱程度越高, 尽管中国被试对内群的违规行为感到内疚。相反, 西方被试中的高群体认同者在直觉情境中表现出内群偏爱, 而在反思情境下对内群的惩罚比外群体更严厉。研究结果有助于揭示第三方惩罚和群体偏差背后的社会心理机制, 也为社会规范执行与群际互动的中西文化差异研究提供了新视角。

Reflexive or Reflective? Group Bias in Third-Party Punishment in Chinese and Western Cultures

Ziyan Guo¹, Rui Guo¹, Chengyi Xu², Zhen Wu¹ (Corresponding author)

¹ Department of Psychology, Tsinghua University, Beijing, China

² Centre for Family Research, University of Cambridge, Cambridge, UK

Abstract: Engaging in costly punishment of norm violators on behalf of bystanders, which is known as third-party punishment (TPP), plays an essential role in maintaining social norms and facilitating coordination. Social norms develop in groups, and thus norm enforcement is deeply influenced by group membership. Researchers have shown two inconsistent directionalities of intergroup bias in third-party punishment: ingroup favoritism (tolerating ingroup norm violators) and ingroup regulation (punishing ingroup norm violators). However, the possible mechanisms underpinning these findings are rarely discussed in existing studies. The current study examined how reflexive and reflective decision-making contexts, group identity, and culture interact to influence group bias in TPP. We conducted five experiments employing economic games among Chinese and Western adults (total $n = 632$). Participants observed ingroup and outgroup members allocated resources unfairly in either reflexive or reflective contexts (by manipulating cognitive load). Then they decided how much money to deduct as a punishment toward the allocator. Results showed that Chinese participants, particularly those who were strongly identified with the group, exhibited ingroup favoritism in TPP regardless of cognitive load, though they felt guilty about ingroup transgressions. In contrast, high group identifiers from Western countries punished ingroups more severely than outgroups in a reflective (rather than reflexive) context. These findings make important contributions to the social-cognitive basis of group bias in TPP and highlight an East-West contrast in norm enforcement during intergroup interactions.

新技术为何难以被接受？个人控制对基因自然主义的影响

杨沈龙¹ 喻丰²（通讯作者）

1 西安交通大学人文社会科学学院社会心理学研究所，西安，710049

2 武汉大学哲学学院心理学系，武汉，430072, psychpedia@whu.edu.cn

摘要 在推进社会治理智能化和社会治理创新的进程中，人们对于新技术的接受程度是一个值得关注的问题。为何很多时候人们不愿意去接受某些新技术以及新技术产品，其中有怎样的心理机制在起作用，这些问题需要心理学予以探索和回应。本研究从个人控制的角度切入，以人们对基因改变农产品的态度为例，考察个人控制对于基因自然主义的影响。基因自然主义指的是人们相信“自然的就是好的”这样一种社会认知与态度。基于补偿性控制理论，研究推测当个体感知到的个人控制水平较低时，他们会形成更高的基因自然主义倾向，即表现为对于基因改变农产品较低的接受程度。这是由于补偿性控制理论提出，个体感知的个人控制较低时，则其对于能够提供结构性、秩序性和确定性的事物就有更强烈的需求。而基因改变的农产品相对于传统农产品而言，人们普遍认为其可预测性和确定性的程度较低，因此研究假设感知个人控制水平较低的人更倾向于拒绝基因改变农作物。研究1通过使用问卷，基于278名有效被试数据发现个人控制可以负向预测人们对基因改变农作物的风险感知，而结构需求在其中起到中介作用。在研究2中，研究者招募了108名有效被试，操纵了个体感知的个人控制，并且发现在较低的个人控制条件下，人们更加意识到基因改变农产品的风险性，从而降低了他们购买基因改变食品的意愿。这些结果表明，人们所感知到的个人控制会影响到人们对于某些他们不熟悉且认为具有不确定性的新技术的接受程度，拥有较高个人控制的个体则更倾向于接受这些事物，而个体对结构性、可预测性和确定性的需求在其中起到中介作用。同时，研究也支持了补偿性控制理论的观点。

关键词 基因自然主义，个人控制，补偿性控制理论，结构需求

Why New Technologies Are Not Easily Accepted? The Influential Effect of Personal Control on Genetic naturalism

Shen-Long Yang¹, Feng Yu^{2*}

1 Institute of Social Psychology, School Humanities and Social Science, Xi'an Jiaotong University, Xi'an, 710049

2 Department of Psychology, School of Philosophy, Wuhan University, Wuhan, 430072

Abstract: Why are people unwilling to accept certain emerging technologies and new technological products? What kind of psychological mechanisms are at work? These problems require psychological exploration. The present study takes people's attitudes towards genetically modified (GM) crops as an example to examine the influence of personal control in this issue. Some previous studies have suggested that people will have a perception and attitude of "genetic naturalism", that is, people believe that "the more natural, the more better". In addition, based on compensatory control theory, as one's perception of personal control is lower, he or she will exhibit a higher tendency of genetic naturalism because of their higher need for structure, order and predictability. Therefore, based on the folk belief that GM crops are more uncertain than traditional crops, we hypothesize that individuals with lower level of personal control are more inclined to reject GM crops. By using questionnaires, Study 1 ($N = 278$) found that individuals' personal control negatively predicted their risk perception of GM foods, and the need for structure played a mediating role. In study 2 ($N = 108$), personal control was manipulated, and it was revealed that under lower-control condition, individuals were more aware of the risk of GM crop, which decreased their willingness to purchase GM food. The results suggest that individuals' personal control will affect their attitude towards the products which they feel unfamiliar, as they are motivated to compensate their lack of control. This findings also support the perspectives of compensatory control theory.

Keywords: genetic naturalism, personal control, compensatory control theory, need for structure

疫情背景下中国社会道德动机动态追踪

摘要 新冠疫情作为全球性大流行疾病, 不光带来了健康威胁, 同时还伴随着民众心理巨震。针对历史上流行病爆发的研究表明, 疾病的爆发与流行往往带来广泛的心理影响, 如个体主义-集体主义倾向的变化、外向性变化、民主化、公民自由性的变化等。灾难通常见证人性, 尤其是道德。诸如此类流行疾病引发的灾难下, 道德所强调的对他人的关爱遭遇个体直接生命健康威胁, 我们会如何取舍? 作为新冠疫情的经历者, 疫情是否会带来了中国社会的道德变化? 基于道德相关理论, 道德行为由能动与共生两种基础动机支配, 前者强调个体的提升、追求与成就, 后者则强调与他人的联结、协同与合作。在此框架下, 道德可以高共生低能动水平来衡量与定义, 共生水平与能动水平的比值即作为道德动机的量化指标。本研究中, 为追踪中国社会道德动机水平在疫情背景下的变化细节, 我们在新浪微博平台抓取官方媒体“人民日报”自2020年1月1日起至2020年4月7日期间全部微博以及微博下的公众评论作为实验语料, 以研究中国社会公众对疫情的直观反应。以心理学能动与共生词表为基础, 设计自然语言分析算法理解微博语义, 统计公众评论中能动与共生表达量, 进而量化道德动机。大数据研究结果表明, 疫情对中国社会道德动机的影响是情境敏感的。具体而言, 相比于疫情前, 疫情严重时期公众道德动机显著提高, 随着疫情得到控制, 疫情平稳时期以及恢复时期道德动机则回落, 疫情恢复期公众道德动机与疫情前无显著差别。细粒度研究结果表明疫情同时刺激能动与共生两维度发生变化, 变化模式均与道德动机相似。

Dynamics of Chinese Public Moral Motivation during COVID-19

Liang Zhao¹, Xiaojun Ding¹, Feng Yu²

¹ School of Humanities and Social Sciences, Xi'an Jiaotong University, Xi'an, Shaanxi, 710049

² Department of Psychology, Wuhan University, Wuhan, Hubei, 430072, psychpedia@whu.edu.cn

Abstract: From the beginning of 2020, the COVID-19 pandemic stroke all over the world. Besides great physical health threats, the pandemic inevitably brings impacts upon a wide array of psychological dimensions, such as individualism-collectivism, extraversion, democratization, restriction rights and civil liberties, etc., according to previous studies over historically infectious diseases. Disasters, such as these influenza pandemics, always manifest human nature, especially the morality. Since individual life security gets threatened by disasters, concern for others which morality emphasizes confronts unignorable self-interest focus. As witnesses of COVID-19, we wonder whether public morality will be promoted by the pandemic and how the morality dynamically evolves during the pandemic. Moral behavior is always driven by two fundamental motives, *agency* and *communion*, which are often conceptualized as being in tension. Agency is the motive to promote the interest of self, reflected as getting ahead, individuating and advancing the self; while on the contrary, communion is the motive to promote the interest of others, with the theme of getting along and contributing to a social collective. Based on the theoretical framework, morality could be guided by a high sense of others-oriented motive and a low level of self-oriented motive, so that moral motivation could be represented as the ratio of communion to agency motives. In this study, We crawled the public comments under the micro-blog posts of People's Daily from 2020/1/1 to 2020/4/7 as the experimental corpus, and retrieve the linguistic expressions associated with the two motives to understand the dynamic evolvement of moral motivation throughout the pandemic. Big data analysis showed disaster impact upon moral motivation was context-sensitive. The severity of the disaster played a leading role in the variation of moral motivation, where disasters increased moral motivation only when the situation was severe, while such augmentation rapidly faded

when the disaster got controlled and recovered. Unpacking moral motivation, we also found the disaster boosted both agency and communion in a similar way to that of moral motivation.

Keywords: moral motivation, agency, communion, big data, COVID-19

算法歧视比人类歧视引起更少道德惩罚欲

许丽颖¹ 喻丰² (通讯作者) 彭凯平¹

¹ 清华大学心理学系, 北京, 100084

² 武汉大学心理学系, 武汉, 430072, psychpedia@whu.edu.cn

摘要 算法的应用被认为可以有效减少人类决策中的歧视, 但算法歧视在现实生活中却仍然存在。那么, 人们对人类歧视和算法歧视的反应是否存在差异? 以往研究聚焦于道德情绪, 比较了人们对算法歧视和人类歧视的道德义愤, 发现人们对算法歧视的愤怒小于对人类歧视的愤怒。然而, 尚未有研究考察人们对算法歧视和人类歧视的行为倾向, 尤其是道德惩罚欲是否存在差异。本研究通过 4 个实验比较了人们对算法歧视和人类歧视的道德惩罚欲, 实验情境涉及日常生活中存在的多种歧视类型, 包括性别歧视 (实验 1)、学历歧视 (实验 2)、民族歧视 (实验 3) 和年龄歧视 (实验 4)。实验 1 发现相对于人类歧视, 人们对算法歧视的道德惩罚欲更少。实验 2 深入探讨这一现象背后的心理机制, 结果发现自由意志在不同主体 (人类 vs. 算法) 歧视对道德惩罚欲的影响中起中介作用, 即人们之所以对算法歧视的道德惩罚欲更少, 是由于认为其相对于人类而言具有更少的自由意志。实验 3 通过操纵人们对自由意志的信念, 进一步验证了本研究假设的理论机制。实验 4 考察了拟人化倾向的调节作用, 结果发现拟人化倾向较低的被试对人类歧视的道德惩罚欲更多, 而拟人化倾向较高的被试对人类歧视和算法歧视的道德惩罚欲则没有显著差异。研究结果在理论上验证了自由意志对道德惩罚欲的影响, 在实践上有助于更好地理解人们对算法歧视的反应。

Algorithmic Discrimination Causes Less Desire for Moral Punishment than Human Discrimination

Liying Xu, Feng Yu² (Corresponding author), Kaiping Peng¹

¹ Department of Psychology, Tsinghua University, Beijing, China

² Department of Psychology, Wuhan University, Wuhan, China

Abstract: The application of algorithm is believed to contribute to reducing discrimination in human decision-making, but algorithmic discrimination still exists in real life. So is there a difference between folk responses to human discrimination and algorithmic discrimination? Previous research that focused on moral emotion compared people's moral outrage when facing algorithmic discrimination as well as human discrimination, and found that people's moral outrage at algorithmic discrimination was less than that at human discrimination. Few studies, however, have investigated people's behavioral tendency towards algorithmic discrimination and human discrimination, especially whether there is a difference in their desire for moral punishment. The present study compares people's desire to punish algorithmic discrimination and human discrimination through four experiments, which involve various kinds of discrimination in daily life, including gender discrimination (experiment 1), educational background discrimination (experiment 2), ethnic discrimination (experiment 3) and age discrimination (experiment 4). Experiment 1 finds that compared with human discrimination, people have less desire to punish algorithmic discrimination. Experiment 2 deeply explores the psychological mechanism behind this phenomenon, and reveals that free will plays a mediating role in the effect of agents (human vs. algorithm) on desire for moral punishment. Experiment 3 further validates the theoretical mechanism by manipulating people's belief in free will. Experiment 4 examines the moderating effect of anthropomorphism tendency, and finds that participants with lower anthropomorphism tendency have more desire to punish human discrimination, but for participants with higher anthropomorphism tendency, there is no significant difference between their desire for moral punishment for human

discrimination and algorithmic discrimination. The results corroborates the influence of free will on desire for moral punishment in theory and contribute to a better understanding of people's responses to algorithmic discrimination in practice.

Abstract: algorithm, discrimination, moral punishment, free will, anthropomorphism

谦逊降低内群体偏见：来自最小群体范式的证据

林闻正¹（通讯作者） 尉兆梁²

1 江西师范大学心理学院，南昌，330022, lin.wenzheng@live.com

2 武汉大学心理学系，武汉，430072

摘要 谦逊作为一种积极的心理品质，被普遍认为同时具有特质性与状态性。相关理论研究指出，谦逊能有效地将个体关注点从自我转移到其他外在事物上：通过降低自我关注，增加对于他人的关注，进而使个体更加倾向于表现出亲社会的特点。心理学实证研究也证实了这一理论假设。不同研究分别揭示了谦逊与包括共情、亲社会情绪、助人行为、宽恕、合作行为等在内的一系列亲社会变量相关。但以往研究较少探索谦逊如何在与敌意倾向潜在相关的群际知觉与态度中发挥作用。本研究假设，谦逊个体因其自我关注的转移，能以更客观的方式评价和看待内外群体成员，从而更少地表现出因群体过程而产生的内群体偏见效应。本研究共招募 129 名大学本科生参与实验。被试首先完成一系列特质性谦逊量表。接着，他们被随机分配至谦逊组（ $n = 66$ ）和控制组（ $n = 63$ ），并分别完成对应唤起任务。谦逊组被试被要求回忆并写下自己表现出谦逊的一次经历，控制组被试则被要求回忆并写下一次中性情绪的日常生活。内群体与外群体的实验操纵使用 Tajfel et al. (1971) 设计的最小群体范式。该范式可以在不基于社会现实的前提下，有效通过社会分类完成对被试内外群体划分的实验室操纵。本研究使用这一经典范式，将被试全部划分为高估组，并要求他们对于内群体（高估组）和外群体（低估组）成员进行态度评分。研究结果表明，状态性谦逊对于内群体偏见的影响，由特质性谦逊所调节。具体而言，谦逊组中的特质性谦逊得分低的被试，相比控制组中的低特质性谦逊得分被试，表现出程度更低的内群体偏见；而高特质性谦逊被试无论是否被唤起状态性谦逊，其内群体偏见均较低。这一发现支持了本研究的研究假设，即谦逊能有效减少个体的内群体偏见现象。本研究揭示了谦逊在群体过程中所扮演的重要作用。作为一种积极的亲社会心理品质，谦逊可以有效减少内群体偏见，进而缓解群际间敌意，促进群际和谐。未来研究可进一步探索谦逊影响内群体偏见的内在机制。

关键词 谦逊，最小群体范式，内群体偏见

Humility in group processes:

Humility attenuates in-group bias in the minimal group paradigm

Abstract: Recent research has identified humility as a prosocial psychological construct with both dispositional and state levels. It is theorized to be able to shift one's egocentric focus to other entities. Supporting this notion, psychological studies have linked humility to a number of altruistic interpersonal outcomes, such as empathy, prosocial emotions, helpfulness, forgiveness, and cooperation. However, few studies have examined how humble individuals might perceive others in group processes. We hypothesized that humble individuals, by shifting their focus from the self to others, would be more likely to perceive out-group members and in-group members in a less biased manner. A total of 129 undergraduate participants were first instructed to complete several measures of dispositional humility. They were then randomly assigned into either a humility ($n = 66$) or a control condition ($n = 63$). Participants in the humility condition were primed with a humble state by recalling and writing down their humble experiences; whereas participants in the control condition were asked to recall and write down neutral

experiences. The in-group versus out-group distinction was manipulated by the minimal group paradigm. The paradigm was first designed by Tajfel et al. (1971) to test in-group favoritism through mere social categorization with no social grounds in reality. Following the classic procedure of this paradigm, participants in this study were all classified as over-estimators and were instructed to indicate their attitudes towards their in-group members (i.e., overestimators) and out-group members (i.e., underestimators). Results revealed that the effect of primed humility on in-group bias was moderated by dispositional humility. In particular, primed humility reduced the in-group favoritism only among those participants who were low in dispositional humility; whereas those participants who were high in dispositional humility maintained a relatively lower level of in-group bias regardless of whether they were primed with state humility. These findings supported the initial assumption that humility can reduce in-group bias. Individuals who are high in dispositional humility tend to resist group bias, showing a relatively balanced attitudes towards both out-group and in-group members. For those individuals who are low in dispositional humility, priming state humility can significantly reduce their in-group bias. This study could be one of the first studies recognizing the significance of humility in group processes. As a prosocial virtue, humility facilitates cohesive intergroup relationships by enabling more balanced and accurate evaluations of both in- and out-groups. Future studies could further investigate the underlying mechanisms of this relationship.

接受痛苦，但不接受“他”带给我的痛苦—— 医疗情境下的人机不对称

邬家骅¹ 许丽颖¹ 喻丰² (通讯作者)

¹ 清华大学心理学系，北京

² 武汉大学心理学系，武汉，430072, psychpedia@whu.edu.cn

摘要 伴随信息技术的日趋发展，人工智能与人类之间的互动也愈发频繁。其间出现一种名为“人机不对称”的现象，即人工智能体和人类相同的行为却引起人们有差别的反应。该现象可以从人对不同目标的心智归因方式加以理解，有研究表明，当医务人员对患者产生非人化后——对患者更少的心智归因，在一定程度上不把患者当作人类感知和对待——会导致医务人员在选择治疗方案时选择更为痛苦且有效的方案。那么，从患者的角度而言，是否会因为察觉医生作为同类却罔顾自己的心智能力而无法接受痛苦的治疗方案？是否又会因为医生是人工智能体而可以接受痛苦的治疗方案？本文在医疗情境下对以上问题及人机不对称现象进行研究，通过三个实验发现：（1）在控制信任、厌恶、欣赏、威胁后，面对由人工智能或人类制定的相同治疗方案，后者的接受度更高；（2）治疗主体和治疗方案的性质之间存在交互作用，并影响对治疗方案的接受度；（3）对医生和人工智能心智感知的归因结果，尤其是对医生与人工智能体在感受性能力归因的差别在上述关系中起中介作用。本研究从心智感知理论的视角尝试对“人机不对称”的现象进行解释，研究结果对于引导人工智能更合理的使用，以及如何对患者进行说服等应用层面具有启示意义。

Accepting the pain, but not the pain that "he" brings me - Human robot asymmetry in medical contexts

Jiahua Wu¹, Liying Xu¹, Feng yu² (Corresponding author)

¹ Department of Psychology, Tsinghua University, Beijing

² Department of Psychology, Wuhan University, Wuhan

Abstract: Along with the increasing development of information technology, the interaction between artificial intelligence and human was even more frequent. In this context, a phenomenon called "Human robot asymmetry" emerged, in which the same behaviors of AI and humans elicited different responses. Human robot asymmetry can be understood in terms of the way people attribute mind capacities to different targets. It has been demonstrated that

when medical professionals dehumanize patients - making fewer mental attributions to patients and, to some extent, not perceiving and treating them as full human - it leads to more painful and effective treatment options. From the patient's perspective, will painful treatment options be unacceptable when they perceive the doctor as a human but disregard his or her own mental abilities? Is it possible to accept a painful treatment plan because the doctor is an artificial intelligence? Based on the above, the current study investigated the above questions and the phenomenon of Human-machine asymmetry in a medical context. Through three experiments it was found that. (1) By controlling for trust, disgust, appreciation, and threat, the latter was accepted more when faced with the same treatment plan developed by an AI or a human. (2) There was an interactional effect between the treatment subject and the nature of the treatment plan, and therefore affected the acceptance of the treatment plan. (3) The results of physician and AI's mind perception capacities, especially the experience capacities mediated in the above relationship. Overall, this study attempted to explain the phenomenon of Human robot asymmetry from the mind perception theory and the findings are revealing at the applied level for guiding the more rational use of AI and how to persuade patients.

摘要 欺骗行为是指个体在明知某一事件或信念是错误的情况下, 有意试图说服他人相信这一事件或信念, 以获得某些好处或避免损失的行为。研究表明, 自我控制资源影响个体欺骗行为的产生, 与自我控制资源相关的因素也可能会影响欺骗行为。根据积极情绪扩展和建构理论, 积极情绪能够建设个体的身心资源、认知资源和人际资源。敬畏作为一种积极情绪, 可以调动个体的心理资源, 敬畏体验可以增加个体的自律行为和自我监控。此外, 敬畏还是一种能引发道德感的情绪, 能提升人们的道德感。那么, 敬畏情绪是否能够通过提高自我控制资源从而对个体欺骗行为施加影响呢? 本研究旨在探究敬畏情绪对欺骗行为的影响及该影响发生的心理机制。本研究共包括三个实验: 实验一探究敬畏情绪对欺骗行为的影响, 采用单因素(敬畏情绪, 中性情绪)被试间实验设计, 通过回忆任务范式诱发两种情绪, 以视觉-感知任务考察被试的欺骗行为和欺骗倾向。预期结果: 当诱发敬畏情绪时, 被试会产生更少的欺骗行为和欺骗倾向。实验二探究敬畏情绪对自我控制资源的影响, 采用 2(敬畏情绪, 中性情绪)*2(自我控制资源衰竭, 自我控制资源未衰竭)的两因素被试间设计, 通过视频任务范式诱发两种情绪, 因变量为坚持性任务的表现(坚持时长)。预期结果: 敬畏情绪组的坚持时长显著高于中性情绪组, 自我控制资源未衰竭的坚持时长显著高于衰竭组。实验三探究敬畏情绪对欺骗行为的影响中自我控制资源的作用。预期结果: 敬畏情绪会减少个体的欺骗行为, 自我控制资源在这一影响中起中介作用。

The Influence of Awe on Deceptive Behavior: The Mediating Role of Self-control

Zhao Ruochen¹, Hou Wenhua¹, Hou Zhe², Zhang Chao¹ (Corresponding author)

1 Institute of Education Science, Shanxi Normal University, LinFen

2 University of Leeds MA education School of Education, Leeds

Abstract: Deceptive behavior refers to the behavior in which an individual knowingly tries to persuade others to believe an event or belief in order to gain some benefits or avoid losses. Studies have shown that self-control

resources affect the generation of individual deceptive behavior, and factors related to self-control resources may also influence deceptive behavior. According to the theory of expansion and construction of positive emotions, positive emotions can build the physical and mental resources, cognitive resources and interpersonal resources of individuals. As a positive emotion, awe can mobilize individual psychological resources, and the awe experience can increase individual self-discipline and self-monitoring. In addition, awe is a moral emotion that can enhance people's sense of morality. So, can awe influence individual deceptive behavior by increasing self-control resources? The purpose of this study is to explore the influence of awe on deceptive behavior and its psychological mechanism. This study consists of three experiments. Experiment 1 explores the influence of awe on deceptive behavior. A single-factor experimental design (awe emotion and neutral emotion) is adopted to induce two kinds of emotions through the recall task paradigm, and the visual perception task is used to investigate the deceptive behavior and deceptive tendency of the subjects. Expected results: When awe was induced, participants were less likely to deceive. Experiment 2 explored the influence of awe on self-control resources. Two-factor design was adopted among subjects to induce two kinds of emotions through video task paradigm. The dependent variable is the performance of persistence task (duration of persistence). Expected results: The persistence time of the awe group was significantly higher than that of the neutral group, and the persistence time of the control resource group was significantly higher than that of the other group. Experiment 3 explores the role of self-control resources in the influence of awe on deceptive behavior. Expected results: Awe will reduce the deceptive behavior of individuals, and self-control resources play a mediating role in this effect.

特质敬畏对中学生攻击性的影响

侯文花¹ 赵若晨¹ 陈泓逸¹ 喻丰² (通讯作者)

1 山西师范大学教育科学学院, 山西临汾, 041000

2 武汉大学哲学学院心理学系, 武汉, 430070, psychpedia@whu.edu.cn

摘要 个体攻击性是指个体以直接或间接方式有意伤害被攻击对象, 使被攻击对象遭受破坏性影响的心理与行为倾向。敬畏作为一种混合了困惑、钦佩、惊奇、服从等多种感觉的复杂的情绪体验, 有特质和状态之分。特质性敬畏反映的是个体在面对敬畏体验时的感受差异, 状态敬畏是指个体在面对自然奇观、艺术杰作、或非凡的人类行为等敬畏诱发源时所感受到的敬畏情绪。已有研究表明状态敬畏可增加个体的亲社会行为, 减少攻击性行为。但目前尚未有研究表明个体特质敬畏与攻击性的关系及其内在的心理机制。本研究以山西省某中学 251 名学生为被试, 采用特质敬畏情绪量表、Buss-Perry 攻击性量表, 同时引入“小我”和“自我控制”两个变量, 采用“感知到的小我”量表以及“自我控制量表”进行测量, 拟探究特质敬畏情绪对中学生攻击性的影响, 以及“小我”与“自我控制”在其中的中介作用。结果表明: (1) 特质敬畏、小我、自我控制、攻击性两两显著相关。具体来说, 特质敬畏($r=-0.148, p<0.05$)、小我($r=-0.157, p<0.01$)、自我控制($r=-0.482, p<0.01$)与攻击性呈显著负相关; 特质敬畏与小我($r=0.145, p<0.05$)、自我控制($r=0.307, p<0.01$)显著正相关; 小我与自我控制呈显著正相关($r=0.254, p<0.01$)。 (2) 特质敬畏能够显著负向预测个体攻击性($\beta=-0.148, p<0.05$)。 (3) 自我控制在特质敬畏与个体攻击性间起中介作用 (效应值 $=-2.04, 95\%CI=[-3.26, -1.02]$) ; 小我与自我控制在特质敬畏与个体攻击性间起链式中介作用 (效应值 $=-0.23, 95\%CI=[-0.54, -0.02]$)。综上, 本研究揭示了特质敬畏对中学生攻击性的影响, 以及自我控制的中介作用和小我与自我控制的链式中介作用, 丰富了敬畏情绪对个体攻击性的实证研究, 为减少个体攻击性提供新思路。

The influence of trait awe on the aggression of middle school students

Wenhua Hou¹, Ruochen Zhao¹, Hongyi Chen¹, Feng Yu² (Corresponding author)

1 Institute of Education Science, Shanxi Normal University, LinFen

2 Department of Psychology, Wuhan University, Wuhan

Abstract: Individual aggression refers to the psychological and behavioral tendency that an individual intentionally harms the victim in a direct or indirect way and causes the victim to suffer destructive effects. Awe, as a complex emotional experience that mixes feelings of confusion, admiration, surprise, and submission, can be divided into trait awe and state awe. Trait awe reflects the differences in the feelings of individuals in the face of awe experience, while state awe refers to the awe that individuals feel in the face of natural wonders, artistic masterpieces, or extraordinary human behaviors and other awe inducing sources. Previous studies have shown that state awe can increase individual prosocial behavior and reduce aggressive behavior. However, there have been no studies to show the relationship between individual trait awe and aggression, as well as its internal psychological mechanism. This study takes 251 students from a middle school in Shanxi Province as the research object. At the same time, this study introduced “small self” and “self-control”, and used trait awe scale, aggression scale, small self scale and self-control scale to explore the influence of trait awe on individual aggression and the mediating role of “small self” and “self-control”. The results showed that (1) Trait awe, small self, self-control and aggression were significantly correlated with each other. Specifically, trait awe ($r=-0.148$, $p<0.05$), small self ($r=-0.157$, $p<0.01$), self-control ($r=-0.482$, $p<0.01$) were negatively correlated with aggression; Trait awe was significantly positively correlated with small self ($r=0.145$, $p<0.05$) and self-control ($r=0.307$, $p<0.01$). There was significant positive correlation between small self and self-control ($r=0.254$, $p<0.01$). (2) Trait awe can significantly and negatively predict individual aggression ($\beta = -0.148$, $p<0.05$). (3) Self-control mediated the relationship between trait awe and individual aggression (Effect= -2.04 , 95%CI= $[-3.26, -1.02]$); Small self and self-control play a chain mediating role between trait awe and aggression (Effect= -0.23 , 95%CI= $[-0.54, -0.02]$). In conclusion, this study reveals the influence of trait awe on the aggression of middle school students, as well as the mediating role of self-control and the chain mediating role of small self and self-control, which enriches the empirical research of awe on individual aggression, and provides new ideas for reducing individual aggression.

摘要 根据最新的《中国居民营养与慢性病状况报告(2020)年》,我国成年居民超重肥胖超过50%,城乡各年龄段居民超重肥胖率持续上升。在引发诸多相关慢性疾病的同时,肥胖问题也会导致个体产生一系列心理问题,例如受到歧视、污名化以及去人性化。敬畏(awe)指当我们面对那些广阔的、浩大的,以及超越我们当前理解范围的事物时产生的惊异的情绪体验。研究表明,敬畏可以减少个体的社会支配取向,改善个体对外群体的刻板印象,因此本研究假设敬畏可以有效减少大众对于肥胖人群的去人性化现象。据此,本研究首先验证了对中国肥胖人群的去人性化现象,并探究了敬畏情绪对该不良现象的影响及其内在机制。研究1(N=130)验证了本土环境下肥胖人群的去人性化现象,并探究了其个体的特质敬畏之间的关系。研究表明,中国肥胖人群遭到了公然去人性化。同时,虽然特质敬畏与肥胖人群去人性化之间无显著相关,但特质敬畏与个体的肥胖偏见和肥胖厌恶情绪均呈显著的负相关。研究2(N=180)采用单因素(情绪类型:愉悦、敬畏、中性)被试间实验设计,采用视频法诱发目标情绪,通过“人类进化水平测试”和“慈善捐赠任务”来测量被试对于肥胖人群的去人性化,并检验社会支配取向的中介作用。结果表明:(1)与愉悦和中性情绪相比,敬畏情绪可以显著降低个体对于肥胖人群的去人性化;(2)与愉悦和中性情绪相比,敬畏情绪可以显著降低个体的

社会支配取向；(3)在敬畏情绪对肥胖人群的去人性化的影响中，社会支配取向起到了中介作用。

关键词 敬畏，去人性化，肥胖人群，社会支配取向

The Effect of Awe on Dehumanization of People with Obesity

Lv Yichao¹, Yu Feng², Zhang Chao³(Corresponding author)

1 Key Laboratory of Modern Teaching Technology, Ministry of Education, Shaanxi Normal University, Xi'an, Shaanxi, 710062

2 School of philosophy, Wuhan University, Wuhan, Hubei, 430072

3 School of Education Science, Shanxi Normal University, Linfen, Shanxi, 041000

Abstract: According to the latest *Nutrition and Chronic Diseases Report in China (2020)*, more than 50 percent of Chinese adults are overweight and obese, and the rate of overweight and obesity continues to rise among urban and rural residents of all ages. Causing many kinds of related chronic diseases, obesity can also lead to a series of psychological problems, such as discrimination, stigmatization and dehumanization. Awe is an amazing emotion we experienced when we faced something vast and beyond our current understanding of the world. Previous studies have implied that awe could reduce individuals' social dominance orientation and the stereotype of the out-group. Thus, this study hypothesized that awe can effectively reduce the dehumanization of people with obesity. The current research aimed to provide the evidence that people with obesity are dehumanized, and explore the effects of awe on dehumanization of people with obesity and the underlying mechanism. Study 1(N=130) examined the dehumanization of obese people in the local environment and explored the relationship between dehumanization and trait awe. The results indicated that Chinese people with obesity were being blatantly dehumanized; although not correlated with the dehumanization, trait awe was significantly negatively correlated with both anti-fat prejudice and disgust towards obesity. In Study 2(N=180), we manipulated state emotions (i.e., positive awe, amusement, and neutral emotion) in a between-subject design, and used the ascent of humans test and the charity donation task to measure the dehumanization of obese people. Besides the effects of awe on dehumanization, Study 2 tested the role of social dominance orientation (SDO). The results indicated that 1) positive awe (relative to neutral and amusement emotion) reduced the dehumanization of obese people; 2) positive awe (relative to neutral and amusement emotion) reduced the SDO; 3) SDO played a mediator in the effect of awe on the dehumanization of people with obesity.

Keywords: awe, dehumanization, people with obesity, social dominance orientation

敬畏会让人睡得更香吗？特质敬畏对大学生睡眠质量的影响

宋金泽 李彤 张恺敏 张潮（通讯作者）

山西师范大学教育科学学院，临汾，041000，zhangchao951217@163.com

摘要 睡眠是维系个体身心健康发展的关键因素，长期低质量睡眠会影响个体的健康、认知水平与社会关系，最新的元分析结果显示，我国大学生睡眠质量呈逐渐恶化趋势。积极情绪拓展-建构理论与国内外实证研究表明，特质敬畏会影响个体体验敬畏情绪的频次和强度，且无论情绪的效价积极与否均对睡眠质量有显著的影响，那么特质敬畏是否可以通过影响个体体验敬畏情绪进而影响睡眠质量还不得而知。研究表明，特质敬畏水平高的个体报告了更低水平的压力，进而增加主观幸福感，主观幸福感水平越高，个体的睡眠质量越好。基于此，本研究采用“匹兹堡睡眠质量指数量表”“特质积极情绪量表”“大学生压力量表”与“幸福感指数量表”对229名大学生进行调查，欲探讨特质敬畏对大学生睡眠质量的预测作用，并进一步探究压力与主观幸福感在两者之间的作用。结果表明：(1)特质敬畏、主观幸福感与睡眠质量三者两两呈显著正相关，压力与特质敬畏、主观幸福感和睡眠质量呈显著负相关；(2)控制性别与年龄后，特质敬畏可以显著正向预测大学生睡眠质量($\beta=0.277, P<0.001$)；(3)特质敬畏能通过压力和主观幸福感的中介作用对睡眠质量产生影响，且该中介作用包含三条路径：压力的中介作用($\beta=0.071, 95\%CI:0.030, 0.119$)、主观幸福感的中介作用($\beta=0.095, 95\%CI:0.038, 0.165$)以及压力→主观幸福感的链式中介作用($\beta=0.019, 95\%CI:0.006, 0.037$)。结论：压力与主观幸福感在特质敬畏与睡眠质量之间起到链式中介作用。未来研究可进一步操纵敬畏变量分析状态敬畏和睡眠质

量之间的内部机制。

Does awe make people sleep better?

Trait-Awe and Sleep Quality Among Undergraduate Students

Song Jinze, Li Tong, Zhang Kaimin, Zhang Chao (Corresponding author)

School of Education Science, Shanxi Normal University, Linfen, 041000

Abstract: Sleep is a key factor in maintaining the physical and mental health of individuals. Long-term low-quality sleep will affect individual health, cognitive level and social relationships. The latest meta-analysis results show that the sleep quality of Chinese college students is gradually deteriorating. The Broaden-and-Build Model of Positive Emotions and empirical research at home and abroad show that trait-awe affects the frequency and intensity of individual experience of awe, and whether the valence of emotions is positive or not, it has a significant impact on sleep quality, but whether trait-awe can affect the quality of sleep by affecting the individual's experience of awe is still unknown. Studies have shown that individuals with high levels of trait-awe report lower levels of stress, which in turn increases subjective well-being. The higher the level of subjective well-being, the better the individual's sleep quality. Based on this, our study used the Pittsburgh Sleep Quality Index, Dispositional Positive Emotions Scale, Stress Scale for College Student, and Well-being Index Scale to survey 229 college students, in order to explore the predictive effect of trait-awe on college students' sleep quality, and further explore the role of stress and subjective well-being between trait-awe and sleep quality. The results showed that: (1) Trait-awe, subjective well-being and sleep quality were positively correlated pairwise, and stress was significantly negatively correlated with trait-awe, subjective well-being, and sleep quality. (2) After controlling for gender and age, traits-awe can significantly positively predict the sleep quality of college students ($\beta=0.277$, $P<0.001$). (3) Trait-awe can affect sleep quality through the mediating effect of stress and subjective well-being, and the mediating effect includes three paths: the mediating effect of stress ($\beta=0.071$, 95%CI: 0.030, 0.119), the mediating effect of subjective well-being ($\beta=0.095$, 95%CI: 0.038, 0.165), and the chain mediating effect of stress and subjective well-being ($\beta=0.019$, 95%CI: 0.006, 0.037). Conclusion: Stress and subjective well-being play a chain mediating role between trait-awe and sleep quality. Future research can manipulate the awe variable to analyze the internal mechanism between state-awe and sleep quality.

Keywords: awe, sleep quality, stress, subjective well-being, chain mediating

敬畏与自杀意念的关系：心理韧性和生命意义感的链式中介作用

刘敏¹ 李雅² 杨洋¹ 张潮¹ (通讯作者)

1 山西师范大学教育科学学院, 临汾, 041000, zhangchao951217@163.com

2 山西师范大学现代文理学院, 临汾, 041000

摘要 自杀意念是指个体在思想或认知上想要结束生命的想法、念头, 是预测未来自杀企图和自杀死亡最可靠的指标之一。近年来, 大学生自杀事件频发, 引起人们的广泛关注, 这也反映出高校在培养学生敬畏情绪上存在缺失, 特别是对生命的敬畏。因此, 关注大学生的心理健康, 研究大学生敬畏情绪对自杀意念的影响, 以及其内部机制尤为重要。本研究从积极心理学的视角, 基于积极情绪的拓展—建构理论和自杀缓冲假设, 考察特质敬畏情绪与自杀意念的关系, 并探讨心理韧性与生命意义感在其中的作用。研究采用特质性积极情绪量表中的敬畏分量表(DPES-r)、青少年心理韧性量表(RSCA)、生命意义感量表(MLQ)和青少年自杀意念量表(PANSI)对251大学生进行问卷调查。结果发现:(1)敬畏、心理韧性和生命意义感两两之间均显著正相关, 敬畏、心理韧性、生命意义感三者均与自杀意念呈显著负相关;(2)敬畏能显著负向预测自杀意念($\beta=-0.403$, $t=-6.682$, $p<0.001$); (3)敬畏能通过心理韧性和生命意义感的中介作用对自杀意念产生影响, 且该中介作用包含了三条路径: 敬畏→心理韧性→自杀意念(Bootstrap法重复抽取5000次, 95%

CI = [-0.315, -0.117], 中介作用显著, 中介效应值-0.205); 敬畏→生命意义感→自杀意念 (95% CI = [-0.089, -0.012], 中介作用显著, 中介效应值-0.044); 敬畏→心理韧性→生命意义感→自杀意念 (95% CI = [-0.072, -0.011], 链式中介作用显著, 中介效应值-0.038)。结论: 敬畏情绪对自杀意念有直接影响, 也可通过影响心理韧性和生命意义感对自杀意念产生间接影响。本研究结果认为高校应注重对大学生敬畏情绪的教育和培养, 提高学生的心理韧性和生命意义感, 提升心理健康水平, 减少自杀意念的产生, 从而有效的预防自杀现象的发生。

关键词 敬畏, 心理韧性, 生命意义感, 自杀意念

Awe and Suicidal Ideation:

The Chain Mediating Effect of Resilience and Meaning in Life

Liu Min¹, Li Ya², Yang Yang¹, Zhang Chao(Corresponding author)¹

¹ Institute of Education Science, Shanxi Normal University, LinFen

² Modern College of Humanities and Sciences of Shanxi Normal University, LinFen

Abstract: Suicidal ideation refers to the thoughts of an individual who wants to end his life in thought or cognition. It is one of the most reliable indicators for predicting future suicide attempts and suicide death. In recent years, the frequent suicides among college students have aroused widespread attention, which also reflects the lack of cultivation of awe among college students, especially the awe of life. Therefore, it is particularly important to pay attention to the mental health of college students and to study the influence of awe on suicidal ideation and its internal mechanism. From the perspective of positive psychology, this research examines the relationship between traits of awe and suicidal ideation, and explores the role of resilience and the sense of meaning life, based on the broaden-and-build theory of positive emotions and suicide buffer hypothesis. A total of 251 college students were investigated by using the awe subscale of Dispositional Positive Emotion Scale (DPES-r), Resilienc Scale for Chinese Adolescent(RSCA), Meaning in Life Questionnaire (MLQ) and Positive and Negative Suicide Ideation (PANSI). The results showed that: (1) Awe, resilience, and meaning in life were positively correlated with each other; awe, resilience, and meaning in life were negatively correlated with suicidal ideation; (2) Awe significantly negatively predicted suicidal ideation ($\beta = -0.403$, $t = -6.682$, $p < 0.001$); (3) Awe can influence suicidal ideation through the mediating effect of resilience and the meaning in life, and the mediating effect includes three pathways: Awe→resilience→suicidal ideation (5000 times repeated by Bootstrap method, 95%CI = [-0.315, -0.117], the mediating effect was significant, the mediating effect value was -0.205); Awe→meaning in life→suicidal ideation (95%CI = [-0.089, -0.012], the mediating effect was significant, the mediating effect value was -0.044); Awe→resilience→meaning in life→suicidal ideation (95%CI = [-0.072, -0.011], the chain mediated effect was significant, the mediating effect value was -0.038). Conclusion: awe has both direct and indirect effects on suicidal ideation, such as via resilience and meaning in life. The results of this study suggest that colleges and universities should pay attention to the education and cultivation of awe of college students, improve students' resilience and meaning in life, enhance their mental health, reduce the generation of suicidal ideation, and effectively prevent suicide.

Keywords: awe, resilience, meaning in life, suicidal ideation

敬畏对跨期决策的影响：时间知觉和小我的中介作用

马昕¹ 占清霞¹ 侯哲² (通讯作者)

¹ 山西师范大学教育科学学院, 山西临汾, 041004

摘要 跨期决策是指对发生在不同时间点上的成本与收益进行权衡进而做出选择的过程。敬畏是个体面对浩大以及超越当前认知范围的事物时产生的一种情绪体验。这些事物包括自然奇观、艺术杰作、或非凡的人

类行为等，而暴露于自然景观下的个体在跨期决策时更偏好延迟的高收益选项。本研究在时间感知基础模型和解释水平理论的基础上引入“时间知觉”和“小我”两个中介变量，旨在探究敬畏情绪对跨期决策的影响以及时间知觉和小我的中介作用机制。研究一采用单因素被试间实验设计，通过自然图片和几何图片分别诱发敬畏情绪和中性情绪，使用延迟折扣范式测量跨期决策，探究敬畏对跨期决策的影响。研究二为排除自然元素的干扰，采用非自然景观视频诱发敬畏情绪，同时在研究一的基础上引入“时间知觉”和“小我”两个中介变量，探究时间知觉和小我在敬畏对跨期决策影响间的中介作用。本研究预期结果：（1）无论是自然还是非自然景观诱发的敬畏情绪与中性情绪相比都能够显著降低跨期决策的延迟折扣率；（2）时间知觉和小我在敬畏与跨期决策间的中介作用显著。总体来说，敬畏可以使人们知觉到的时间更充裕以及将注意力从自身转移到宏大的事物上，进而促进人们在跨期决策中选择等待延迟的高收益。

关键词 敬畏，跨期决策，时间知觉，小我，延迟折扣

The Influence of Awe on Intertemporal Choice: The Mediating Effect of Time Perception and Small Self

Ma Xin¹, Zhan Qingxia¹, Hou Zhe²

1 Institute of Education Science, Shanxi Normal University, Linfen

2 School of Education, University of Leeds, UK, Leeds

Abstract: Intertemporal choice is a process of decision making after weighing costs and benefits that occur at different points in time. Awe is an emotional experience that an individual produces when faced with something vast and beyond the current cognitive range, including natural wonders, masterpieces of art, or extraordinary human behavior and people who exposed to natural landscape prefer the high-yield option of delay in intertemporal choice. Based on the Perceived-time-based model and the Construal level theory, the study introduces two intermediary variables, namely “time perception” and “small self”, to explore the influence of awe on intertemporal choice, as well as the intermediary role of time perception and small self. Study I Using a single-factor experimental design, the subject's awe and neutral emotions were manipulated by presenting mood-inducing images, the intertemporal choice of the subject was measured using the Delay Discounting Task, to examine whether awe affected the intertemporal decision-making of the subject. In study II, to eliminate the interference of natural elements, we use unnatural landscape video to induce awe, and at the same time, on the basis of study I, introduces two intermediary variables, namely “time perception” and “small self”, to explore these two variables' intermediary role between awe and intertemporal choice. Expected results: (1) Awe induced by both natural and unnatural landscapes can significantly reduce the rate of delay discounting for intertemporal choice compared to neutral emotions; (2) The intermediary role of time perception and small self between awe and intertemporal choice is significant. Generally speaking, awe can make people feel more time and shift their attention from themselves to the grander things, which in turn encourages people to choose to wait for delayed high return.

通讯作者 E-mail: zhanglin1@nbu.edu.cn

摘要 受欺凌是指个体受到力量较强同伴故意伤害的经历, 具有重复发生的特点。全世界范围内, 约 32% 的儿童青少年遭受过他人欺凌; 我国约 1.5%~13.4% 的儿童青少年遭受过同伴欺凌。以往的研究发现, 遭受同伴欺凌会导致儿童青少年出现一系列心理社会适应问题, 如抑郁、焦虑、攻击行为、违纪等, 甚至会诱发自残、自杀等极端行为。中学阶段是青少年生理和心理发展的关键时期, 抑郁情绪是衡量心理健康的重要指标之一。根据一般压力理论, 个体在经历压力和紧张时会体验到一种或多种负面情绪, 如失望、抑郁、焦虑、恐惧等。以往的研究表明, 受欺凌可显著正向预测抑郁情绪, 持续受欺凌的学生会表现出更低水平的自尊与更多的抑郁情绪。相较于那些未受欺凌或未参与欺凌事件的个体, 有受欺凌经历的个体更容易出现抑郁情绪, 而且这种抑郁情绪会随着早期受欺凌经历的增加而增加。然而, 目前鲜有研究深入探讨受欺凌影响中学生抑郁情绪的具体过程。本研究试图回应这一问题, 为早期预防和干预中学生抑郁情绪提供具有针对性的依据。采用整群取样方法面向全国三个省区市七所中学的学生进行调查, 共发放问卷 1000 份, 回收有效问卷 978 份, 有效回收率为 97.80%。其中男生 477 名, 女生 501 名; 平均年龄为 15.43($SD=2.16$)。采用受害量表、安全感问卷、自尊量表和抑郁自评量表对 978 名中学生进行调查。结果显示: (1) 受欺凌、安全感、自尊与抑郁情绪两两之间均呈显著相关; (2) 受欺凌对抑郁情绪的直接效应和间接效应均显著。间接效应包括通过安全感的中介作用、通过自尊的中介作用以及通过安全感—自尊的链式中介作用三条路径。本研究的发现揭示了受欺凌是中学生抑郁情绪产生的一个风险因素, 并且受欺凌作为一种负性生活事件会通过影响安全感和自尊间接影响中学生的抑郁情绪。基于需求层次理论和抑郁自尊理论, 能深入了解受欺凌对抑郁情绪的复杂发生机制, 为中学生心理健康教育提供具有针对性的理论基础。因此, 本研究对于抑郁情绪的早期预防与干预具有重要借鉴意义。

3 Mental Health Education Guidance Center, Huzhou University, Huzhou, 313000

Corresponding author E-mail: zhanglin1@nbu.edu.cn

Abstract: Bullying victimization refers to the experience of an individual being deliberately hurt by a stronger peer, which is characterized by recurrence. Around 32% of children and adolescents have been bullied by others over the world; about 1.5% to 13.4% of children and adolescents in China have been bullied by peers. Previous studies have found that being bullied by peers can cause a series of psychological and social adaptation problems in children and adolescents, such as depression, anxiety, aggressive behavior, violation of discipline, etc., and even induce extreme behaviors such as self-harm and suicide. Middle school is a critical period for the physical and psychological development of adolescents, and depression is one of the important indicators to measure mental health. According to

the general stress theory, individuals experience one or more negative emotions when experiencing stress and tension, such as disappointment, depression, anxiety, fear, etc. Previous studies have shown that being bullied can significantly positively predict depression, and students who continue to be bullied will show lower levels of self-esteem and more depression. Compared with individuals who have not been bullied or participated in bullying events, individuals who have experienced bullying victimization are more likely to experience depression, and this depression will increase with the increase of early bullying experiences. However, there are currently few studies that deeply explore the specific process of depression in middle school students affected by bullying victimization. This study attempts to respond to this problem and provides a targeted basis for the early prevention and intervention of depression in middle school students. The cluster sampling method was used to survey students from seven middle schools in three provinces, autonomous regions, and municipalities across the country. A total of 1,000 questionnaires were distributed, and 978 valid questionnaires were returned, with an effective recovery rate of 97.80%. Among them, there are 477 boys and 501 girls; the average age is 15.43 (SD=2.16). The victim scale, security questionnaire, self-esteem scale and depression self-rating scale were used to survey 978 middle school students. The results showed that: (1) There was a significant correlation between bullying victimization, sense of security, self-esteem, and depression; (2) Both the direct and indirect effects of bullying victimization on depression were significant. Indirect effects include three paths through the mediation of security, the mediation of self-esteem, and the chain mediation of security-self-esteem. The findings revealed that bullying victimization is a risk factor for middle school students' depression, and bullying victimization, as a negative life event, can indirectly affect middle school students' depression by affecting their sense of security and self-esteem. Based on the hierarchy of needs theory and depressive self-esteem theory, it can deeply understand the complex mechanism of depression caused by bullying victimization, and provide a targeted theoretical basis for the mental health education of middle school students. Therefore, this study has important reference significance for the early prevention and intervention of depression.

Abstract: bullying victimization, depression, sense of security, self-esteem, middle school students

青少年传统/网络受欺凌与社交焦虑、抑郁情绪的关系： 一项短期交叉滞后分析

张嘉琪 许媛 郭赵明 蒋索（通讯作者）

温州医科大学精神医学学院应用心理学系，温州，325035，jsbnu@163.com

摘 要 校园欺凌是一种特殊类型的攻击行为，涉及的当事人之间存在权力或力量的不平衡(受害人在保护自己不受欺凌方面存在困难)，并且具有重复发生性。校园欺凌可以分为身体欺凌、言语欺凌、关系欺凌（三者并称为传统欺凌）和新型的网络欺凌。大量研究探讨了传统/网络受欺凌与情绪问题（抑郁情绪/社交焦虑）的关系，早期有研究者提出负性循环理论，即有情绪问题的青少年可能有受欺凌的风险，而反复受欺凌可能会加剧情绪问题。发展情境理论也更加支持了这种观点。以往研究较多关注传统受欺凌与抑郁情绪和社交焦虑的关系，网络受欺凌与情绪问题的时间序列关系还存有争议；此外，以往研究较少进行传统/网络受欺凌的比较，即两类受欺凌与抑郁情绪/社交焦虑的时间序列关系和因果关系及效应大小是否不同。本研究拟进行深入比较，为青少年受欺凌的干预提供实证支持。选取 1865 名青少年（10-18 岁； 12.90 ± 2.23 ）进行相隔半年的追踪调查，构建青少年传统/网络受欺凌与社交焦虑和抑郁情绪的交叉滞后模型，结果发现：（1）抑郁情绪与传统/网络受欺凌均可以相互显著正向预测；社交焦虑仅与传统受欺凌显著正向相互预测，与网络受欺凌无法互相预测（表现为：前测网络受欺凌不能显著正向预测后测社交焦虑）；（2）传统受欺凌对个体抑郁情绪和社交焦虑的预测作用比网络受欺凌强；（3）传统/网络受欺凌对个体抑郁情绪的预测作用比对社交焦虑更强；抑郁情绪对传统/网络受欺凌的预测作用更强；（4）抑郁情绪对传统受欺凌的预测作用显著高于对网络受欺凌的预测作用。总之，传统受欺凌的影响更大，突出表现为抑郁情绪；抑郁情绪是传统/网络欺凌的预测因素和结果，而社交焦虑作为预测因素的作用要强于作为结果的作用。

关键词 传统受欺凌，网络受欺凌，抑郁情绪，社交焦虑，青少年

The Relation of Traditional School Bullying/Cyberbullying Victimization and Social Anxiety/Depression in Adolescents: a Cross-lagged Analysis

Jiaying Zhang, Yuan Xu, Zhaoming Guo, Suo Jiang (corresponding author)

School of Psychiatry, Department of Psychology, WenZhou Medical University, Wenzhou, 325035

Corresponding author E-mail: jsbnu@163.com

Abstract: School bullying is a special type of aggressive behavior, which involves the imbalance of strength between the parties (the victim has difficulty in protecting himself from bullying), and it occurs repeatedly. School bullying can be divided into physical bullying, verbal bullying, relational bullying (all three are called traditional bullying) and cyber bullying, the new type of school bullying. A large number of studies have explored the relation between traditional school bullying/cyberbullying and emotional problems (depression / social anxiety). In the early stage, some researchers put forward the Negative Cycle Theory, that is, adolescents with emotional problems may be at risk of being bullied, while repeated victimization may aggravate emotional problems. The Developmental Contextualism supports this view. Previous studies focused more on the relation between traditional school bullying and depression/social anxiety, but the time-series relation between cyberbullying and emotional problems is still controversial. In addition, previous studies rarely compared the traditional school bullying/ cyberbullying, that is, whether the time-series relation, causality and effect size of the two types of school bullying and depression / social anxiety are different. This study intends to conduct in-depth comparison to provide the basis for the intervention of adolescent school bullying. In this study, 1865 adolescents (10-18 years old; 12.90 ± 2.23); The results showed that: (1) depression and traditional school bullying/cyberbullying can significantly positively predict each other; Social anxiety and traditional school bullying significantly positively predicted each other, but not with cyberbullying (Performance: Pretest cyberbullying cannot significantly positively predict posttest social anxiety). (2) Traditional school bullying has a stronger predictive effect on depression and social anxiety than cyberbullying. (3) Traditional school bullying/Cyberbullying has a stronger predictive effect on depression rather than on social anxiety; Depression has a stronger predictive effect on traditional bullying/Cyberbullying. (4) Depression can predict traditional bullying better than Cyberbullying. In a word, traditional school bullying is more influencing, especially on depression; Depression is a predictor and result of traditional school bullying/Cyberbullying, and social anxiety is more important as a predictor than as a result.

摘要 校园欺凌是指在校环境中个体被一个或多个学生有意地、反复地、持续地施以负面行为，造成受害者心理或身体的不适或伤害。以往的研究发现，儿童青少年受欺凌经历能够显著预测其两年后的外化问题行为、内化问题行为、社交问题及学业问题。社会支持的缓冲模型指出，个体在面对同伴侵害等压力事件的情况下，从所处近端社会关系中获得的社会支持是最重要的保护性资源之一。已有研究表明，社会支持可显著负向预测受欺凌程度，高社会支持会拥有更高的应对效能与更积极的应对方式。相对于那些高求助意愿的个体，低求助意愿的个体更容易遭受到欺凌。然而，社会支持是“如何影响”受欺凌程度，以及会受到“何种条件”制约却缺乏深入探讨。本研究试图回应这一问题，为降低青少年受欺凌程度提供具有针对性的依据。采用整群随机抽样选取宁波市某地区4所学校进行问卷施测，总共发放1100份问卷，回收有效问卷1011份，有效率为91.91%。其中男生493名，女生518名；平均年龄为 14.76 ± 2.36 岁。采用社会支持行为量表、

欺凌/受害问卷、应对效能量表、校园欺凌应对方式量表和求助意愿量表对 1011 名青少年进行调查。结果显示：（1）社会支持、应对效能、应对方式、求助意愿与受欺凌程度两两之间均呈显著相关；（2）社会支持对受欺凌程度的直接效应和间接效应均显著，间接效应包括通过应对效能的中介作用、通过应对方式的中介作用以及通过应对效能—应对方式的链式中介作用三条路径；（3）求助意愿在社会支持与受欺凌程度关系的链式中介路径中起调节作用。本研究的发现揭示了社会支持是降低青少年受欺凌程度的一个保护因素，并且社会支持作为一种保护性资源会通过应对效能和应对方式间接预测青少年的受欺凌程度，也受到个体求助意愿的调节。基于社会支持的缓冲模型和压力应对理论，能够深入了解社会支持对受欺凌程度的内在发生机制，为青少年预防校园欺凌提供具有针对性的理论基础。因此，本研究对校园欺凌的干预和防治具有重要借鉴意义。

关键词 社会支持，应对效能，应对方式，求助意愿，受欺凌程度

The relationship between social support and degree of bullying victimization: Moderated chain mediation model

Xinwei Hong¹, Tingting Zhu¹, Yanling Chen¹, Mingyu Zhao¹, Shen Liu², Lin Zhang¹ (corresponding author)

¹ Department and Institute of Psychology, Ningbo University, Ningbo, 315211

² School of Humanities and Social Sciences, University of Science and Technology of China, Hefei, 230022

Abstract: School bullying refers to the intentional, repeated, and continuous negative behaviors of one or more students in the campus environment, causing the victim's psychological or physical discomfort or harm. Previous studies have found that the experience of bullying victimization can significantly predict their behavior of externalized problematic behavior, internalized problematic behavior, social problem and academic problems two years later. The buffer model of social support points out that the social support obtained from the close social relationship is one of the most important protective resources in the face of peer infringement and other pressure events. Some studies have shown that social support can significantly negatively predict the degree of bullying victimization, and high social support will have higher response coping efficiency and more positive coping styles. Compared with those with a high willingness to ask for help, the individuals with a low willingness to ask for help are more vulnerable to bullying victimization. However, how social support “affects” the degree of bullying victimization and the “conditions” it will be restricted by, but there is a lack of in-depth discussion. This study attempted to respond to this problem and provided a targeted basis for reducing the level of bullying victimization among adolescents. The cluster random sampling was used to select 4 schools in a certain area of Ningbo to conduct the questionnaire survey. A total of 1100 questionnaires were distributed, and 1011 valid questionnaires were returned, with an effective rate of 91.91%. 493 boys and 518 girls were male students; The average age was 14.76 (SD=2.36). 1011 teenagers were investigated by the inventory of supportive behavior, bullying/victimization questionnaire, coping efficiency scale, school bullying coping style scale and the willingness to seek help scale. The results showed that: (1) There was a significant correlation between social support, coping efficiency, coping style, willingness to ask for help and the degree of bullying victimization; (2) The direct and indirect effects of social support on the degree of bullying victimization are significant. The indirect effects include three ways through the mediation of coping efficiency, the mediation of coping style and the chain mediation of coping efficiency and coping style; (3) The willingness to ask for help plays a moderated role in the chain mediation path between social support and the degree of bullying victimization. The findings revealed that social support is a protective factor to reduce the degree of bullying victimization among adolescents. Social support, as a protective resource, indirectly predicts the degree of bullying by coping efficiency and coping style and is also moderated by individual willingness to ask for help. Based on the buffer model of social support and the theory of stress coping, they can deeply understand the internal mechanism of social support to the degree of bullying victimization, and provide a theoretical basis for teenagers to

prevent school bullying. Therefore, this study is of great significance for the intervention and prevention of school bullying.

Keywords: social support, coping efficiency, coping style, willing to ask for help, degree of bullying victimization

能力越大，责任越大：公正世界信念与欺凌保护行为的关系

陈燕铃¹ 洪新伟¹ 赵明玉¹ 刘燊² 张林¹（通讯作者）

1 宁波大学心理学系暨研究所，宁波，315211，zhanglin1@nbu.edu.cn

2 中国科学技术大学人文与社会科学学院，合肥，230022

摘 要 公正世界信念是指人们相信自己生活在一个公正的世界里，人们得其所应得，所得即应得。不公正事件与已有公正信念相冲突时个体的公正世界信念会受到影响，而校园欺凌无疑是初中生群体面临的严重不公正威胁。面对校园欺凌这一不公事件，一部分个体会通过保护受欺负同伴来阻止欺负事态的扩大，这不仅维护了自身的公正世界信念，同时对校园欺凌起到有效的干预作用。以往的研究表明，公正世界信念水平越高的青少年个体越容易表现出助人行为，参与欺凌的可能越低，更倾向于保护受欺负的同伴。虽然已有关于公正世界信念的研究非常广泛，但目前鲜有研究深入探讨公正世界信念如何作用于欺凌情境中的保护行为。本研究试图回应这一问题，为促使学生在欺凌事件中做出更多保护行为提供依据。采用整群取样方法，面向东部某省三所初级中学的学生进行问卷调查，共发放问卷 850 份，得到有效问卷 837 份，有效回收率为 98.47%。其中男生 421 名，女生 416 名；平均年龄为 13.6(SD=0.79)。结果显示：（1）公正世界信念、自我效能感、责任感和保护行为两两之间均呈显著相关；（2）公正世界信念对保护行为的直接效应不显著，但可以通过自我效能感的中介作用、责任感的中介作用以及自我效能感—责任感的链式中介作用三条中介路径间接预测保护行为。（3）在自我效能感—责任感的路径上存在性别差异。相比女生，男生的自我效能感对责任感的预测作用更强，进而做出更多保护行为。本研究的发现揭示了公正世界信念作用于欺凌保护行为的认知过程，启示学校教育工作者不仅要塑造学生高水平的公正世界信念，还要注重提升学生的自我效能感和责任感，以促进学生在欺凌事件中做出更多积极干预行为，保护受害者，阻止欺凌事件。

关键词 公正世界信念，保护行为，自我效能感，责任感，校园欺凌

With Great Power Comes Great Responsibility: Relationship between Belief in a Just World and Defending Behavior

1 Department and Institute of Psychology, Ningbo University, Ningbo, 315211

2 School of Humanities and Social Sciences, University of Science and Technology of China, Hefei, 230022, Corresponding author E-mail: zhanglin1@nbu.edu.cn

Abstract: Belief in a just world means that people believe that they live in a just world and that people get what they deserve and what they get is what they deserve. When an unjust incident conflicts with an existing belief in justice, the individual's belief in a just world will be affected, and school bullying is undoubtedly a serious unjust threat faced by junior high school students. Faced with the injustice of school bullying, some individuals will prevent the expansion of bullying by protecting their peers. This not only maintains their belief in a just world, but also plays an effective role in intervening in school bullying. Previous studies have shown that adolescent individuals with a higher level of belief in a just world are more likely to show helpful behaviors, are less likely to participate in bullying, and are more inclined to protect their peers who are being bullied. Although there have been extensive studies on beliefs in a just world, there are few studies that deeply explore how beliefs in a just world can affect defending behavior in bullying. This research attempts to respond to this question and provide a basis for promoting students to make more defending behaviors in bullying. Using the cluster sampling method, a questionnaire survey was conducted for students from three junior high schools in a certain eastern province. A total of 850 questionnaires were distributed and 837 valid questionnaires were obtained, with an effective recovery rate of 98.47%. Among them, there are 421

boys and 416 girls; the average age is 13.6 ($SD=0.79$). The results show that: (1) The belief in a just world, self-efficacy, responsibility and defending behavior are all significantly correlated; (2) The belief in a just world has no significant direct effect on defending behavior, but it can be mediated by self-efficacy, responsibility, and the chain mediation of self-efficacy and indirectly predict defending behavior. (3) There are gender differences in the path from self-efficacy to sense of responsibility, compared with girls, boys' self-efficacy has a stronger predictive effect on the sense of responsibility, and then they make more defending behaviors. The findings of this study reveal that the cognitive process of the belief in a just world affects defending behavior, and enlighten school educators not only to shape students' high-level belief in a just world, but also to enhance students' sense of self-efficacy and responsibility in order to promote students make more active interventions in bullying and protect victims.

Abstract: belief in a just world, defending behaviors, self-efficacy, responsibility, school bullying

父母教养方式与亲欺凌行为的关系：同辈群体的作用

摘要 亲欺凌行为是在欺凌事件发生时, 协助欺凌者一同参与欺凌的行为或在一旁实施围观、鼓噪等煽动性的行为的总称。以往研究发现, 亲欺凌行为在校园欺凌事件中通常起到一种推波助澜的负面作用, 激发了欺凌者施暴的表现欲, 使得一些原本可规避的欺凌事件变得不可逆转。以往研究多从个人角度探究亲欺凌行为的产生原因, 如: 道德推脱、共情水平、责任分散等。鲜有研究从中学生的重要他人的角度探究这一问题。根据生态系统理论, 父母和同伴是个体交往最多、联系最密切的重要他人。父母的教养方式、与同伴的关系以及交往同伴的性质均会对中学生的行为产生重要影响。本研究试图从中学生成长过程中的重要他人入手, 进一步探究亲欺凌行为产生的原因。研究采用整群随机抽样的方法, 共选取 886 名初中生, 其中男生 452 人, 女生 434 人, 平均年龄 13.56 岁 ($SD=0.78$), 采用父母教养方式问卷、同伴关系问卷、越轨同伴交往问卷和亲欺凌行为问卷对其进行调查。研究结果表明: (1) 父母教养方式、同伴关系、越轨同伴交往与亲欺凌行为两两之间均呈显著相关; (2) 父母教养方式对亲欺凌行为的直接效应不显著, 间接效应显著。间接效应包括通过同伴关系的中介作用、通过越轨同伴交往的中介作用, 以及通过同伴关系—越轨同伴交往的链式中介作用三条路径。本研究的发现揭示了父母教养方式是亲欺凌行为产生的一个风险因素, 并且父母教养方式会通过影响青少年同伴关系和越轨同伴交往间接影响中学生的亲欺凌行为。基于父母接纳-拒绝理论和差别交往理论, 能深入了解父母教养方式对亲欺凌行为的复杂发生机制, 为青少年亲欺凌旁观者行为的干预提供具有针对性的理论基础, 对于亲欺凌行为早期预防与干预具有重要借鉴意义。

关键词 父母教养方式, 同伴关系, 越轨同伴交往, 亲欺凌行为, 中学生

The relationship between parenting style and pro-bullying behavior: The role of peer groups

Mingyu Zhao¹, Xinwei Hong¹, Yanling Chen¹, Shen Liu², Lin Zhang¹ (corresponding author)

1 Department and Institute of Psychology, Ningbo University, Ningbo, 315211

2 School of Humanities and Social Sciences, University of Science and Technology of China, Hefei, 230022, Corresponding author E-mail: zhanglin1@nbu.edu.cn

Abstract: Pro-bullying behavior is a general term for assisting the bully to participate in the bullying behavior or performing inflammatory behaviors such as onlookers and uproar when a bullying incident occurs. Previous studies have found that pro-bullying behaviors usually play a negative role in the school bullying incidents, which inspires the bully's desire to express violence and makes some bullying incidents that could have been avoided become irreversible. Previous studies have mostly explored the causes of pro-bullying behavior from a personal perspective, such as: moral evasion, empathy, and decentralized responsibility. Few studies have explored this issue from the

perspective of the important others of middle school students. According to the ecological system theory, parents and peers are the most important and the most closely connected people among individuals. The parenting style, the relationship with peers, and the nature of the companions all have an important influence on the behavior of middle school students. This research attempts to start with important others in the growth process of middle school students to further explore the causes of bullying behavior. The study adopted a cluster random sampling method. A total of 886 junior high school students were selected, including 452 boys and 434 girls, with an average age of 13.56 years ($SD = 0.78$). The parenting style questionnaire, peer relationship questionnaire, deviant peer association questionnaire and relatives were selected. Investigate it with a bullying behavior questionnaire. The research results show that: (1) parenting styles, peer relationships, deviant peer interactions and pro-bullying behaviors are all significantly correlated; (2) parenting styles have insignificant direct effects on pro-bullying behaviors, but significant indirect effects. Indirect effects include three paths: mediation through peer relationship, mediation through deviant peer interactions, and chain mediation through peer relationship-deviant peer interaction. The findings of this study reveal that parental rearing styles are a risk factor for pro-bullying behavior, and parental rearing styles will indirectly affect middle school students' pro-bullying behaviors by influencing teenagers' peer relationships and deviant peer interactions. Based on parental acceptance-rejection theory and differential communication theory, it can deeply understand the complex mechanism of parental rearing styles on pro-bullying behaviors, and provide a targeted theoretical basis for the intervention of youth pro-bullying bystanders, and for the early prevention and prevention of pro-bullying behaviors. Intervention has important reference significance.

Abstract: parenting style, peer relationship, deviant peer interaction, pro-bullying behavior, middle school students

青少年网络受欺凌与反应性攻击的关系：一个有调节的中介模型

周永蓉 郭赵明 许媛 毛然 黄莹莹 姜瑞雪 蒋索（通讯作者）

温州医科大学精神医学学院应用心理学系，温州，325035，jsbnu@163.com

摘要 近年来，随着网络的发展与普及，网络欺凌逐渐成为一种新型且常见的校园欺凌形式，青少年越来越多地遭到来自线上群体或个人的攻击。前人研究已表明，遭受网络欺凌的青少年会更易出现外化问题，如睡眠障碍、学业成绩不佳和攻击行为等。反应性攻击作为个体为应对感知到的威胁或不公而采取的伴有愤怒情绪的伤害行为或倾向，对攻击者和受害者都会带来影响。我国对网络欺凌的研究起步较晚，成果较少，且大多研究着重考察网络受欺凌与网络欺凌的关系，关于网络受欺凌与青少年的反应性攻击的关系及内部机制还尚不明晰。因此，本研究基于一般压力理论和发展情境理论，采用网络受欺凌问卷、抑郁情绪问卷、反应性攻击问卷以及友谊质量问卷对温州地区 11 所中小学校共 1629 名学生进行调查，为探讨青少年网络受欺凌与反应性攻击的关系及其作用机制，建构了一个有调节的中介效应模型，检验抑郁情绪在网络受欺凌与反应性攻击之间的中介作用以及友谊质量的调节作用。结果表明：（1）网络受欺凌显著正向预测反应性攻击。（2）抑郁情绪在网络受欺凌和反应性攻击关系中起部分中介作用。（3）友谊质量调节了“网络受欺凌→抑郁情绪→反应性攻击”的后半段，即当青少年的友谊质量较高时，抑郁情绪对反应性攻击的预测作用减弱。因此，青少年遭受网络欺凌会引起抑郁情绪，从而产生反应性攻击，但是，较高的友谊质量能够降低抑郁情绪对反应性攻击的消极影响，在一定程度上起到了保护作用。本研究验证了压力性生活事件、个体因素和同伴因素对青少年攻击行为的共同作用，对青少年攻击行为的防治具有一定的指导意义。

The Relationship between Cybervictimization and Reactive Aggression in Adolescents: A Moderated Mediation Model

Yongrong Zhou, Zhaoming Guo, Yuan Xu, Ran Mao, Yingying Huang, Ruixue Jiang, Suo Jiang
(corresponding author)

Department of Applied Psychology, School of psychiatry, Wenzhou Medical University, Wenzhou,

Abstract: In recent years, with the development and popularization of the Internet, cyberbullying has gradually become a new and common form of school bullying. More and more young people are attacked by online groups or individuals. Previous studies have shown that adolescents suffering from cyberbullying have been more likely to have externalization problems, such as sleep disorders, poor academic performance and aggressive behavior, etc. Reactive aggression, as an individual's injurious behavior or tendency with anger in response to perceived threat or injustice, will have impact on the attack and the victim. The study of cyberbullying in China started late and hasn't achieved many results. Most studies focused on the relationship between cybervictimization and cyberbullying. The relationship between cybervictimization and reactive aggression among adolescents is still unclear. Therefore, based on the general stress theory and the developmental contextualism, this study used the cybervictimization questionnaire, depression questionnaire, reactive aggression questionnaire and friendship quality questionnaire to survey 1629 students from 11 middle and primary schools in Wenzhou, constructed a moderating mediating effect model to explore the relationship between cybervictimization and reactive aggression, and confirmed the mediating role of depression between cybervictimization and reactive aggression and the moderating role of friendship quality. The results showed that: (1) Cybervictimization can significantly positively predict reactive aggression. (2) Depression partly mediates the relationship between cybervictimization and reactive aggression. (3) Friendship quality moderates the second half of "cybervictimization → depression → reactive aggression", namely, when adolescents' friendship quality is high, the predictive effect of depression on reactive aggression is weakened. Therefore, adolescents suffering from cyberbullying will lead to depression and reactive aggression. However, higher friendship quality can reduce the negative impact of depression on reactive aggression and play a protective role to a certain extent. This study verified the joint effect of stressful life events, individual factors and peer factors on adolescent aggressive behavior, which has a certain guiding significance for the prevention and treatment of adolescent aggressive behavior.

Keywords: cybervictimization, depression, reactive aggression, adolescents

童年情感忽视降低共情准确性

张雪涵 杨娟

西南大学心理学部, 重庆, 400715, valleyqq@swu.edu.cn

摘要 已有研究表明童年情感忽视影响共情, 但研究结果不一致, 这可能是以往研究很少在具体社会情境中将共情准确性作为指标进行考察。共情准确性是指共情高度依赖于特定情境, 因他人之喜而喜, 因他人之悲而悲才是准确性共情。社会接纳和社会排斥情境是与人类生存与生活息息相关的典型的社会情境, 为更细致地探究童年情感忽视对共情的影响, 采用模拟社会接纳与社会排斥情境的方法, 考察童年情感忽视个体对社会排斥/社会拒绝情境中人物对象的共情准确性。92名大学生被试被随机分配到社会排斥共情组和社会接纳共情组, 采用童年创伤问卷(CTQ)测量被试的情感忽视水平, 被试的任务是观看其“同伴”遭受社会排斥或者社会接纳的视频, 然后报告自我的积极和消极情绪。回归分析结果发现, 无论是在社会接纳还是在社会排斥情境下, 情感忽视水平越高, 共情准确性越低。研究结果表明在童年遭遇情感忽视个体, 由于其情感需求没有得到满足, 因此无法体会和感受他人的积极或者消极情绪。这一结果也提示了童年情感忽视对个体社会适应性功能的影响。

关键词 童年情感忽视, 社会接纳, 社会排斥, 共情准确性

Childhood Emotional Neglect Dampens Empathic Accuracy both in Social Inclusion and Social Exclusion Context

Zhang Xuehan, Yang Juan

Faculty of Psychology, Southwest University, Chongqing, 400715

Abstract: Previous studies on the relationship between childhood emotional neglect and empathy are inconsistent, possibly because the influence of social contexts on empathy has been largely neglected. In real life, empathy is highly dependent on specific contexts with a wealth of information. In order to further explore the impact of childhood emotional neglect on empathy, the simulation of social inclusion and social exclusion contexts are used to investigate the influence of childhood emotional neglect on empathic accuracy. We were interested in whether participants could accurately empathic on his/her partner's emotion in a naturalistic environment. A total of 92 participants (mean age=19.83 years, SD=1.56, 52 females) were recruited by online advertisements. Of the sample, 46 (26 females) were randomly assigned into social exclusion context (SE), and another 46 (26 females) were assigned into social inclusion context (SI). The Childhood Trauma Questionnaire (CTQ) was used to investigate childhood maltreatment. In the SI condition, participant's partner was nicely talking with the other two confederates with verbal or nonverbal behaviors (e.g., smiling, nodding). In the SE condition, participant's partner was rejected by the other two confederates verbally and non-verbally (e.g., noncommittal, frowning, or disdainful expression). Empathy was measured by participants' subjective oral report by evaluating "To what extent can you feel the emotion of your partner?" via a 9-point scale (1=hardly, 9=largely). A reference named dI was used to indicate the empathic accuracy in SI context. Specifically, $dI = (\text{empathy for positive emotion} - \text{empathy for negative emotion}) / \text{total standard deviation}$. The higher the value(dI), the higher degree of the empathic accuracy in the SI context. A reference named dE was used to indicate the empathic accuracy in SE context. Specifically, $dE = (\text{empathy for negative emotion} - \text{empathy for positive emotion}) / \text{total standard deviation}$, the higher the dE value, the higher degree of the accuracy in the SE context. Linear regression analyses were used to examine the effect of Childhood emotional neglect on empathic accuracy in both social contexts. Participants' empathic accuracy in the SI context (dI) showed Childhood emotional neglect could negative predict participants' empathic accuracy in the SI context, suggesting the higher level of emotional neglect, the lower level of empathic accuracy. Participants' empathic accuracy in the SE context (dE) showed Childhood emotional neglect could negative predict participants' empathic accuracy in the SE context, suggesting the higher level of emotional neglect, the lower level of empathic accuracy. Overall, the current study indicated individuals who has experienced childhood emotional neglect were less likely to empathy other's emotion, which might dampen their social adaptive function.

Keywords: childhood emotional neglect, social inclusion, social exclusion, empathy accuracy

COVID-19 暴发期间媒体暴露预测急性应激反应和急性应激障碍：一项横断面研究

罗禹 贵州师范大学心理学院 yuluo@gznu.edu.cn

摘要 背景：2019 年冠状病毒病（COVID-19）的大范围流行给公众带来了前所未有的心理压力。在疫情爆发期间，大众媒体报道是 COVID-19 相关信息的主要来源。本研究旨在研究媒体暴露对急性应激反应的影响，并识别急性应激的相关预测因子。方法：于 2020 年 2 月 7 日至 2 月 20 日对 1450 名中国人进行在线调查。编制媒体接触问卷，评估媒体接触时间、媒体接触形式和媒体接触内容。采用斯坦福急性应激反应问卷（SASRQ）测量急性应激水平和可能发生急性应激障碍（ASD）的危险性。进行了一系列多元回归分析。结果：在对人口统计学进行控制后，长时间的媒体接触和社交媒体的使用与更高的急性压力和发生自闭症的几率相关。观察病人的情况与更高的急性应激有关，而查看最新的流行数据与较低的可能发生自闭症的几率有关。女性，居住在湖北省，与她们关系密切的人被诊断为 COVID-19，精神疾病史，不良生活事件和以前的集体创伤暴露是急性应激反应的危险因素。结论：这些发现证实了间接媒体接触流行病事件与急性应激反应之间的关系。

各国政府和其他有关机构应意识到与灾害有关的媒体曝光的负面影响，并采取适当的干预措施，以促进创伤事件后的心理健康。

Media exposure predicted acute stress responses and acute stress disorder during COVID-19 outbreak in China: A cross-sectional study

Abstract: Background: The widespread pandemic of coronavirus disease 2019 (COVID-19) has led to unprecedented psychological stress on the general public. Mass media coverage was the main sources of COVID-19-related information during the epidemic outbreak. This study aimed to examine the effects of media exposure on acute stress responses and recognize associated predictors of acute stress. **Methods:** An online survey was conducted on a sample of 1450 Chinese people from February 7 to February 20, 2020. Media exposure questionnaire was developed to assess media exposure time, media exposure forms and media exposure contents. Stanford Acute Stress Reaction Questionnaire (SASRQ) was used to measure acute stress level and the risk of probable acute stress disorder (ASD). A series of multivariable regressions were conducted. **Results:** After controlling for demographics, longer media exposure time and the use of social media were associated with higher acute stress and odds of probable ASD. Viewing the situation of patients was associated with higher acute stress, whereas viewing latest news about epidemic data was associated with lower odds of probable ASD. Being females, living in Hubei Province, someone close to them diagnosed with COVID-19, history of mental illness, adverse life events and previous collective trauma exposures were risk factors for acute stress responses. **Conclusions:** These findings confirmed the associations between indirect media exposure to epidemic events and acute stress responses. The governments and other relevant agencies should be aware of the negative impacts of disaster-related media exposure, and implement appropriate interventions to promote psychological well-being following traumatic events.

情绪调节神经活动指标预测社会心理应激皮质醇反应和恢复

林俐^{1,2} 湛蕾^{1,2} 王晓宇^{1,2} 张亮^{1,2} (通讯作者)

1 中国科学院心理研究所, 行为科学重点实验室, 北京, 100101, zhangl@psych.ac.cn

2 中国科学院大学, 心理学系, 北京, 100049

摘要 应激反应存在巨大的个体差异, 找到客观有效的应激反应预测指标对应激易感人群早期筛查和高压环境作业人群的选拔都具有重要意义。情绪调节与应激反应紧密联系, 以往研究表明自我报告的情绪调节倾向与急性应激的皮质醇反应相关, 但是研究结果的方向并不一致。本研究旨在采用较为客观的情绪调节神经活动指标对应激下的皮质醇变化(包括反应阶段和恢复阶段)进行预测。本研究共招募 75 名大学生参与实验, 最后用于分析的有效数据为 72 名被试, 平均年龄 20.4 岁, 标准差 1.26 岁。所有被试分两天完成实验。第一天被试到实验室在电脑上完成情绪调节任务(包含观看中性、观看负性、认知重评和表达抑制共四种条件), 并同时记录脑电。第二天下午被试到实验室完成应激任务, 即特里尔社会应激测试(Trier Social Stress Test, TSST), 包括准备、当众演讲和心算三个任务。在应激任务前后我们总共采集 10 次唾液样本以分析唾液皮质醇含量, 并且连续记录应激前后和应激过程中的心率。研究结果表明被试的唾液皮质醇含量在应激结束后 10 分钟左右达到峰值, 而心率则在应激的演讲时即达到峰值并且快速回落。更重要的是, 我们发现情绪调节任务过程中的晚期正电位(the late positive potential, the LPP)能够显著预测社会心理应激的唾液皮质醇上升程度、恢复程度和恢复速率。并且在控制年龄、性别和身体质量指数(Body Mass Index, BMI)变量之后, 对恢复程度和恢复速率的预测依旧显著。本研究结果表明情绪调节活动的神经指标确实能够作为社会心理应激反应的有效预测指标。

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049, China

Abstract: There is considerable individual difference in stress response. Detecting valid predictors of stress response is of great significance for both screening of stress-vulnerable populations and selection of personnel working in high-pressure environment. Emotion regulation is closely related to stress response, and previous studies have shown that self-reported emotion regulation habits are associated with cortisol response to acute stress, but the directions of those findings are inconsistent. The aim of this study was to use an objective indicator, i.e., the neural activity of emotion regulation, to predict cortisol changes under stress (both reaction and recovery phases). A total of 75 university students were recruited in this study, and the final valid data used for analysis were 72 participants (Mean = 20.4 years old, SD = 1.26 years old). All participants visited the lab in two days to complete the whole experiment. On the first day, the participants completed an emotion regulation task on a computer (four conditions: viewing neutral, viewing negative, cognitive reappraisal, and expression suppression), with EEG simultaneously recorded. On the second day, participants came to the lab in the afternoon to complete a stress task, the Trier Social Stress Test (TSST), which consisted of three tasks: preparation, public speaking, and mental arithmetic. A total of 10 saliva samples were collected before and after the stress task to analyze salivary cortisol levels, and heart rate was recorded continuously before, during and after the stress. The results showed that the participants' salivary cortisol levels peaked about 10 minutes after the end of the stress, while the heart rate peaked during the stressful speech and returned back to baseline rapidly. More importantly, we found that the late positive potential (the LPP) during the emotion regulation task significantly predicted the salivary cortisol increase magnitude, recovery magnitude and recovery efficiency during psychosocial stress. The regressions were still significant after controlling for age, gender, and Body Mass Index (BMI). The results of this study suggest that neurological indicators of emotion regulation activity can serve as effective predictor of psychosocial stress response.

Abstract: psychosocial stress, emotion regulation, cortisol response

急性应激影响创造性认知加工过程的认知神经机制

段海军¹（通讯作者） 赵汉璇¹

1 陕西师范大学现代教学技术教育部重点实验室, 西安, 710062

摘要 随着 VUCA (Volatility: 易变性; Uncertainty: 不确定性; Complexity: 复杂性; Ambiguity: 模糊性) 时代的到来, 应激成为每个人都会面临的一种生活方式。当前, 剧烈的社会变革对人类创造性提出了严峻的考验。无论个人还是组织, 经常需要在应激状态下创造性地提出解决问题的策略。例如, COVID-19 危机就是对个体和组织在应激状态下如何创造性解决问题的一次“大考”。因此, 探讨应激状态下创造性的加工机制具有重要的理论价值和现实意义。本研究探讨了急性应激影响创造性认知加工过程的认知神经机制。研究一运用特里尔压力测试 (Trier Social Stress Test, TSST) 诱发个体应激状态, 以唾液皮质醇 (salivary cortisol, sC) 与唾液α淀粉酶 (salivary alpha amylase, sAA) 作为评估压力的指标。结果表明, 应激对发散思维产生了显著的阻碍作用。研究二运用 EEG 技术, 通过高频 (10-12Hz) α波的任务相关功率 (task-related power, TPR) 从时间进程的角度进一步探究了应激状态下创造性活动发生进程中大脑皮层兴奋水平的变化。结果表明, 在应激之前个体的α波只在第一阶段出现同步化, 而在应激之后个体的α波全时程处于去同步化, 反映出自下而上受刺激驱动的加工状态。因此, 急性应激直接影响了创造性认知加工进程中的早期阶段。研究三运用 fNIRS 超扫描技术, 探究了急性应激影响团体创造力的脑间互动机制。结果发现, 急性应激状态下被试小组的合作指数更高, 且右侧颞上回(right superior temporal gyrus, rSTG) 的脑间同步性与创造力任务中流畅性分数呈显著正相关。

未来研究一方面需要深入考察应激影响创造性认知加工进程中个体激素水平的变化对执行功能的影响,进而为揭示应激影响创造力的中介作用机制提供更为系统的解释路径。另一方面应综合运用多模态手段,从神经内分泌系统动态平衡机制的视角,进一步探讨神经内分泌系统的中介作用机制和个体基线的调节作用机制,以期构建起神经科学分子水平-脑网络-行为的综合框架。

The Cognitive Neural Mechanism of Creative Cognitive Processing Under Acute Stress

Haijun Duan¹, Hanxuan Zhao¹

Key Laboratory of Modern Teaching Technology, Ministry of Education, Shaanxi

Normal University, Xi'an, 710062

Abstract: With the advent of VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) era, stress has become a lifestyle that everyone is facing. At present, dramatic social changes have put a severe test on human creativity. Whether individuals or organizations, it is often necessary to generate creative ideas or decisions under acute stress. The recent COVID-19 crisis could be considered as an examination testing how the individuals and organizations propose creative strategies under stress. Hence, exploring the creative processing mechanism under stress has important theoretical value and practical significance. The present study has explored the cognitive neural mechanism of creative cognitive processing under acute stress. Study 1 applied Trier Social Stress Test to induce individual's stress state. Salivary cortisol and salivary alpha amylase have been used as the indicators to assess the effectiveness of acute stress induction. Results showed that acute stress has exerted a significant hindering effect on creative thinking. Study 2 further examined the underlying neural mechanism of acute stress affecting creative thinking using electroencephalography (EEG). Results showed a general decrease in upper-frequency alpha power after stress, compared with that of before stress, indicating that acute stress impaired creative thinking and primarily affected the earlier phase of the process of creative cognition. Study 3 explored the inter-brain neural mechanism of group creativity under acute stress adopting a functional near-infrared spectroscopy (fNIRS) - based hyperscanning technique. Results showed that behavioral index of cooperation under acute stress was significantly higher, and the interpersonal brain synchronization at right superior temporal gyrus was positively correlated with the flexibility scores in the creativity task. Several avenues for future studies have also been proposed. On the one hand, future research needs to investigate the effects of changes in the individual hormone levels on the executive function during the process of creative cognitive processing under stress, providing a more systematic explanatory path for revealing the mediating mechanism of stress affecting creativity. On the other hand, future research should further explore the mediating mechanism of neuroendocrine system and the regulatory mechanism of individual baseline from the perspective of dynamic balance mechanism of neuroendocrine system by combining with multimodal methods such as neuroimaging and biomarker measurement technology, providing a comprehensive framework of neurological molecular level-brain network-behavior on how stress affects creative cognition.

Abstract: acute stress, creativity, divergent thinking

应激与心理健康的关系是线性假说还是曲线假说? 一项系统和元分析综述

甘怡群¹ (通讯作者) 马金金¹

¹ 北京大学心理与认知科学北京市行为与健康重点实验室, 北京, 100871

摘要 尽管应激对心理健康的影响得到了广泛承认, 应激和心理健康的定量研究颇具争议, 线性假说和曲线假说均有实证证据支持。剂量反应理论 (dose-response theory) 更为精准地描述了应激事件与心理健康之间的线性关系 (Turner & Lloyd, 1995), 并随着应激事件种类和数目的增加表现出“积木式”的累积效应。随着对

应激积极视角的转换提出了应激接种模型,对传统的朴素观念提出了挑战,该模型假设生命早期暴露在适度的应激下,反而会有更强的应激应对能力和更好的心理健康。相关概念包括应激接种(Meichenbaum, 2007)、心理复原力(Kalisch et al., 2017)、钢化效应(Rutter, 2012)等,这些现象都指出中等程度的应激能够使人们更好地面对未来的应激事件,进而能在保持更良好的心理健康。也就是说应激事件与心理健康应该具有二次曲线关系。本研究初步纳入了 58 项研究进行系统综述和元分析,对应激和心理健康关系的理论背景、实证研究、争议原因进行了梳理,发现目前研究呈现远端应激支持曲线假说,近端应激支持线性假说的局面,测量偏差和曲线理论验证不足的可能是研究结论不一致的原因。

Does the relationship between stress and mental health conform linear hypothesis or curve hypothesis?

A systematic and meta-analysis review

Yiqun Gan^{1*}, Jinjin Ma¹

¹ Beijing Key Laboratory of Behavior and Mental Health, School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871

Abstract: Although the impact of stress on mental health has been widely recognized, the results from quantitative research on stress and mental health is controversial, and both linear hypothesis and curve hypothesis are supported by empirical evidence. Dose response theory more accurately describes the linear relationship between stress events and mental health, and shows a cumulative effect with the increase of the type and number of stress events. With the transformation of the positive perspective of coping with stress, a stress inoculation model is proposed, which challenges the traditional simple concept. The model assumes that if exposed to moderate stress in the early stage of life, individuals will have stronger stress coping ability and better mental health. Related concepts include stress inoculation, psychological resilience, which all point out that moderate stress can make people better face future stress events and maintain better mental health. In other words, there should be a quadratic relationship between stress events and mental health. This study initially included 58 studies for systematic review and meta-analysis, combed the theoretical background, empirical research and controversial reasons of the relationship between stress and mental health, and found that the distal stress supports curve hypothesis and proximal stress supports linear hypothesis. The measurement bias and insufficient verification of curve theory may be the reasons for the inconsistency of research conclusions.

Keywords: Stress, mental health, linear hypothesis, curve hypothesis, meta-analysis

重复加工的负性刺激预测实验室诱发的急性应激皮质醇反应和对未来生活应激的易感性

段红霞

深圳大学脑疾病与认知中心 duanhx1001@gmail.com

摘要 在日常生活中,经常暴露于负面刺激中,这是焦虑症临床治疗的基础。在这里,我们评估了重复呈现的负面刺激的神经处理是否具有弹性或对压力的敏感性,通过对实验室诱发的急性压力的生理反应以及对日常生活压力的情绪反应来测量。52 名健康的年轻人被要求观看三次负面或中性的图片,同时记录他们的脑电图。在另一天,参与者接受特里尔社会压力测试(TSST),在压力诱导前后测量唾液皮质醇和心率。随后,连续 30 天对参与者的日常压力、焦虑和抑郁进行了测量。结果显示,相对于中性图像,晚期正电位(LPP)波幅增加到重复呈现负电位,显著预示了 TSST 期间皮质醇增加更大。此外,这种对消极画面重复的 LPP 反应也与对日常生活压力的情绪反应有关。具体来说, LPP 振幅增强的参与者在日常生活压力的反应中报告了更多的焦虑和抑郁症状。这是第一个系统地将情绪处理作为压力敏感性的生物标记进行研究的研究,通过控制良好的实验室范式和生态日常生活进行评估。这些发现可能有助于识别个人在发展压力有关的精神病理学

的风险。

Abstract: Repeated exposure to negative stimuli occurs frequently in daily life and is the basis of a well-established clinical therapy for anxiety-related disorder. Here we assessed whether neural processing of repetitively presented negative stimuli confers resilience or susceptibility to stress, measured by the physiological reactivity to laboratory-induced acute stress as well as emotional reactivity to daily life stress. Fifty-two healthy young adults were instructed to view negative or neutral pictures presented for three times while their electroencephalogram was recorded. On a separate day, participants underwent the Trier Social Stress Test (TSST), and salivary cortisol and heart rate were measured before and after stress induction. Subsequently, participants' daily stress, anxiety and depressiveness was measured over 30 consecutive days. Results showed that increased late positive potential (LPP) amplitudes to repetitively presented negative relative to neutral pictures significantly predicted larger cortisol increases during the TSST. Furthermore, this LPP reactivity to negative picture repetition was also associated with emotional reactivity to daily life stress. Specifically, participants who had enhanced LPP amplitudes reported more anxiety and depression symptoms in reactivity to daily life stress. This is the first study to systematically investigate emotion processing as a biomarker of stress sensitivity assessed by both a well-controlled laboratory paradigm and ecological everyday life. These findings may help to identify individuals under risk for developing stress-related psychopathology.

基于非正态数据的测量不变性检验：严格等值与渐近等值的比较研究

邓雅婷¹ 潘俊豪¹ (通讯作者)

¹ 中山大学心理学系, 广州, 510006, panjunh@mail.sysu.edu.cn

摘要 在实证研究中, 研究者常常需要对心理构念进行不同被试组别或时间点上的比较, 进行该比较的前提条件是满足测量不变性。传统测量不变性检验方法, 即严格等值法(exact measurement invariance), 对参数跨组相等的要求过于严格, 可能会导致模型拟合差等问题。而贝叶斯渐近测量不变性, 即渐近等值法(approximate measurement invariance), 通过为参数跨组差异提供均值为零、方差极小的先验分布, 放宽了对参数的严格限制, 因此该方法具有更灵活、拟合更好等优势。然而, 目前关于渐近测量不变性的研究仍局限于正态数据的条件。鉴于非正态数据在心理学领域的常见性及其可能会对估计结果造成的影响, 本研究旨在探讨渐近测量不变性方法在非正态数据下的表现。本研究根据不同数据分布形态、非正态条目数、参数跨组差异、组样本量以及组别数目生成 315 种条件组合, 使用基于稳健最大似然估计的严格等值法和提供不同先验分布的渐近等值法进行分析。结果表明, 在拟合指标方面, 渐近等值法的拟合指标 PPP 值随非正态条目数增多和数据非正态程度的增大而减小。在因子均值差异估计表现方面, 各评价指标受数据非正态性影响较小, 而更多受到其它因素的影响: 跨组差异较小时, 渐近等值法的因子均值差异估计准确性随跨组差异减小、组数减少、组样本量增大和先验方差增大而有所提升, 而跨组差异较大时, 严格等值法和渐近等值法的估计偏差较大且呈现不稳定的趋势。最后, 本文通过一则实例分析展示了两种方法的分析过程, 并对上述结果进行了验证。通过探讨在非正态数据下不同因素对渐近测量不变性方法的影响, 本研究在理论上有助于研究者深入了解该方法在不同条件下的表现, 在实践上也为该方法在非正态数据下的应用提供了相关指导。

Measurement Invariance Based on Non-normal Data: Comparison between Approximate and Exact Invariance

Yating Deng¹, Junhao Pan¹

¹. Department of Psychology, Sun Yat-sen University, Guangzhou, China

Abstract: In empirical studies, an important assumption for multi-group comparison is measurement invariance. Traditional exact measurement invariance (EMI) constraints parameters to be exactly equal across groups to test for the measurement invariance, which is impractical in real data analysis and could lead to problems such as poor model fitting. Compared to the traditional method, Bayesian approximate measurement invariance (AMI) allows for small deviance from the exact equality constraints by imposing zero-mean and small variance prior distribution on parameter differences across groups, thus it is more flexible and yields better model fitting. However, studies on AMI so far are limited to the condition of normal data. Since non-normal data is common in the field of psychology and could bias the results, the current study aims to investigate the performance of AMI under non-normal data. In the simulation study, data were generated according to different data distributions, numbers of non-normal items, levels of parameter non-invariance, group sizes, and numbers of groups, resulting in 315 conditions. Base on those simulated data, analyses of EMI with robust maximum likelihood estimator and AMI with different prior variances

were conducted. Results indicated that the model fit index of PPP values in AMI decrease as the level of non-normality and number of non-normal data increase. Performances of factor mean difference estimation are mainly affected by factors other than normality: when the parameter non-invariance is small, bias in factor mean difference estimation of AMI decreases as the level of non-invariance and number of groups decrease as well as group size and prior variance increase; while under large parameter non-invariance, both EMI and AMI methods yield more severely biased and unstable estimation. Finally, an empirical analysis is illustrated to demonstrate the process of the two methods and to support the results of the simulation study. By investigating the influence factors on the performance of AMI under non-normal data, the current research provides insights for the performance of AMI under various conditions and guidelines on its application under non-normal data.

摘要 面孔包含构形信息和特征信息, 在实验中存在多种操纵这两种信息的方法, 如模糊、倒置或面孔空间频率信息。高空间频率 (high-spatial frequency, HSF) 呈现原始图像的精细细节, 低空间频率 (low-spatial frequency, LSF) 保留视觉刺激的整体形态, 因此 LSF 和 HSF 可以分别看作面孔构形和特征信息的加工, 而宽空间频率 (broadband-spatial frequency, BSF) 则是面孔构形和特征信息的整合。先前的研究表明面孔加工遵循“由粗到细 (coarse-to-fine)”的顺序。我们最近的 ERP 研究发现, 在注意资源充足的情况下, 面孔构形信息和特征信息分别对 P1 和 P2 成分更敏感。然而, 工作记忆负载是否影响面孔构形和特征信息加工的先后顺序仍待研究, 尤其是记忆编码和提取阶段的时间进程是否存在差异, 二者在何时进行整合性加工尚不清楚。因此, 本研究采用 3 (面孔记忆负载: 高, 中, 低) × 3 (面孔空间频率: 低频, 高频, 宽频) 的被试内设计, 通过延迟再认任务, 探究工作记忆负载对面孔空间频率信息加工时间进程的影响。行为实验结果显示, 在较高的面孔记忆负载下, 宽频面孔识别效果最好, 其次是低频面孔, 高频面孔最不容易识别, 说明在高记忆负载下面孔构形和特征的整合加工表现较好, 其次是构形加工。ERP 结果表明工作记忆负载调节面孔空间频率信息的加工, 即在编码阶段 N170 上, 低记忆负载下不同空间频率的面孔加工差异最大, 在提取阶段 N170 和 P2 上, 中记忆负载下不同空间频率的面孔加工差异最大。具体来说, P1 和 N170 在编码和提取阶段分别对宽频和低频面孔更敏感, 而 P2 在编码阶段对宽频面孔更敏感, 在提取阶段对高频面孔更敏感。这些结果表明, 记忆编码阶段总体上遵循整合、构形、整合加工的时间顺序, 提取阶段遵循整合、构形、特征加工的时间顺序, 说明“由粗到细”的加工顺序只适用于记忆提取阶段, 而不适用于编码阶段。

Working memory load impacted the time sequence of face spatial frequency

Anqing Wang, Hang Zhang, Ching H. Borjigin, Enguang Chen, Hailing Wang *

School of Psychology, Shandong Normal University, Jinan, China, 250358.

Abstract: Face contains configural and featural information, there are many ways to manipulate these two kinds of information, such as blurred, inversion or face spatial frequency information. High spatial frequency (HSF) presents fine details of the original image, while low spatial frequency (LSF) retains the large-scale overall shape of visual information. In this case, the process of LSF and HSF can be regarded as configural and featural processing, respectively, and broadband spatial frequency (BSF) is the integration of facial configural and featural information. Previous studies suggested that face processing follows a coarse-to-fine sequence. Recently, our ERP studies found that configural and featural face processing was more sensitive to P1 and P2 component, respectively, with the

attentional resource was sufficient. However, the role of working memory (WM) load in the time course of configural and featural face processing remains to be investigated, especially whether it differs between memory encoding and retrieval stages, and when the two processing information are integration. Therefore, in this study, a 3 (face WM load: load 1, load 2, load 3) $\times$ 3 (face spatial frequency: low spatial frequency, high spatial frequency, broadband spatial frequency) within-subject design was adopted through delayed recognition task. The behavioral results showed that, when WM load was load 3, the recognition of BSF faces was the best, followed by LSF faces, and HSF faces were the least easy to recognize, indicating that under high WM load, the integration of face configural and featural processing is the best, followed by configural processing. ERP results showed that WM load modulated the SF processing, as the difference among different SFs was larger under load 1 at encoding stage on N170 component, and under load 2 at retrieval stage on both N170 and P2 components. Specifically, P1 and N170 were more sensitive to BSF and LSF faces at both encoding and retrieval stages, respectively, whereas P2 was more sensitive to BSF faces at encoding stage and to HSF faces at retrieval stage. These results indicated that the working memory encoding stage generally follows the time sequence of integration, configuration and integration face processing, whereas the retrieval stage follows the time sequence of integration, configuration and feature face processing, suggesting that the coarse-to-fine sequence was applicable to the memory retrieval stage, but not encoding stage.

基于成本最小化信息的社会性意图识别：来自脑电和行为的证据

林 静¹ 黄量杰成¹ 何耘丰¹ 段继鹏² 尹 军¹

1 宁波大学心理学系暨研究所, 宁波大学群体行为与社会心理服务研究中心, 宁波, 315211

2 华东师范大学心理与认知科学学院, 上海, 200062

摘 要 与已有研究着重考察如何识别客体导向性意图(动作以物理对象为目标, 而不涉及其他人)不同, 本研究对人们如何识别社会性意图(动作以指向社会主体为目标以影响对方的交互行为)进行了探讨。基于两交互主体在整体层面应遵循效用最大化的分析, 提出当 A 协助 B 达成目标状态所需要的成本小于 B 单独实现该目标状态所需要的成本时(简称为成本最小化信息), 其可被识别为具有社会性意图。通过在 B 面前设置栅栏的方法操纵成本最小化信息, 以指示不同意图类型的脑电 μ 抑制程度、对不同变化的敏感性(辨别力)为指标, 对该假设进行了检验。结果显示, 相比客体导向性意图的控制条件(即 A 将目标物苹果放置在石头前), 当 A 将目标物苹果放置在被栅栏挡住的 B 前, 其动作可减少 B 单独获取该苹果的动作成本, 即符合成本最小化条件时, μ 的抑制程度更高(实验 1), 且对结构改变(某两个动画中充当相同角色的智能体互换)的辨别力更强, 但对角色交换(某个动画中两个智能体的角色交换)的辨别力更弱(实验 3a); 而当栅栏不存在时, 虽然 A 的运动路径与实验 1 相同, 但 A 将苹果放置在 B 前的成本大于 B 自身获取苹果的成本, 即不符合成本最小化条件, 条件间 μ 抑制的差异消失(实验 2), 且对不同动作模式中变化的辨别相当(实验 3b)。鉴于已有研究表明社会性意图所诱发的 μ 抑制强于客体导向性意图, 且人们对存在社会性意图的两个智能体间的结构改变更容易辨别, 而对角色交换不敏感, 故上述结果揭示, 两个个体的行为是否满足成本最小化影响人们对动作意图的识别, 支持成本最小化信息是社会性意图识别线索的观点。

社会地位知觉对抓握运动的影响

钱彬彬¹ 陈页瑾¹ 张智君^{1,2}

1 浙江大学心理与行为科学系, 杭州, 310028, zjzhang@zju.edu.cn

摘 要 知觉与运动的关系一直是心理学研究的热点问题。前人的研究已经证明, 语言和数字等的知觉对抓握运动具有明显的影响。本研究基于广义数量表征系统模型 (Generalized Magnitude System, GMS), 探究在不同文化体系下, 社会地位知觉对抓握运动的影响。本研究分为两部分实验。第一部分为跨文化的对比实验, 包括实验 1a 和 1b, 分别以中国大学生和西方留学生为对象, 比较相同的社会地位词汇 (县长、省长、总理) 对抓握运动的不同影响。结果发现, 社会地位知觉对抓握运动的影响效应在中国大学生和西方留学生之间存

在差异，中国人在抓握时的反应时和最大抓握孔径受社会地位知觉的显著影响，而西方留学生则不受这种影响。中国人和西方人在社会地位上都有高低的隐喻，但西方人的社会地位知觉与大小的联结程度与中国人存在差异。上述结果表明，社会地位知觉对抓握运动大小度量的影响是源于社会地位中大小隐喻的强烈联结和自动化激活。第二部分在实验 1a 的基础上，通过给被试呈现不同差距的社会地位对比（县长与总理；省长与总理），进一步探究社会地位在抓握运动大小度量系统中的表征特征。结果表明，抓握运动大小度量系统对社会地位知觉的表征方式是提取“大小对比”的信息，并没有表征具体的差异量。

研究结论表明，社会地位知觉能够通过其大小对比隐喻的激活影响抓握运动的计划和执行，且抓握运动系统对知觉信息的加工是基于相对大小，而不是绝对大小。

The influence of social status perception on grasping

Binbin Qian¹, Yejin Chen¹, Zhijun Zhang^{1,2}

1 Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028

2 corresponding author: zjzhang@zju.edu.cn

Abstract: The relationship between perception and action has always been a hotspot issue of psychological research. According to the previous research, the perception such as semantics and number modulates reaction time and grip apertures of grasping. Based on the generalized magnitude system (GMS), the present research is aimed at studying the influence of social status perception on grasping across different cultures. The study is divided into two parts. The first part is a cross-cultural research, including experiment 1a and 1b. Having Chinese and Western college students participated in the study, we examined whether the effect of the same social status words (Mayor, Governor and Prime Minister) on grasping movements varies across cultures. The result indicated that social status perception had different influence patterns on students from different culture systems. The researchers found that the response time and maximum grip aperture were significantly affected by social status perception in the Chinese student group, while there was no significant effect in the Western student group. Both Chinese and Western participants share the same space metaphor “up and down” for social status. But they are different in the magnitude metaphor “big and small” where Chinese have much stronger magnitude metaphor than the westerners. Therefore, we concluded that social status perception influenced the grasping movement through the automatic activation of magnitude metaphor in the social status. The second experiment is based on experiment 1a. By changing the distances between two social status words (Mayor and Governor; Mayor and Prime Minister) in the experiment, the researchers explored how the grasping system represented the social status distance. The results showed that the grasping system of grasping movement represented the difference of social status by extracting the abstract magnitude information (bigger vs. smaller), instead of the concrete distance of social status.

The present research suggested that social status perception could affect the plan and control of grasping through the automatic activation of magnitude metaphor in the social status. Moreover, the grasping system might process information from the perception of relative magnitude instead of absolute magnitude.

Dissociation of Familiarity and Recollection Retrieval Processing on FN400 Under Working Memory N-BACK Paradigm

Chinheg H. Borjigin, Hailing Wang*

School of Psychology, Shandong Normal University, Jinan, China, 250358

Abstract: As a memory retrieval method, recognition involves two dissociated processes: familiarity and recollection. Previous studies employing the N-BACK paradigm have found that working memory (WM) is mainly based on recollection but not familiarity recognition. However, this may be caused by indirect manipulation of the recognition

task. Furthermore, it is unclear when and where the two retrieval methods dissociate. Therefore, the current study aimed to investigate the neural mechanisms underlying WM retrieval using the N-BACK paradigm. We adjusted the N-BACK paradigm to include a recollection and familiarity retrieval that differed in the test stage: the former presented only one test stimulus, while the latter presented two test stimuli. As a result, the late positive complex (LPC) was greater in the familiarity task, and decreased as the memory load increased, indicating that the difference in the LPC between familiarity and recollection may be caused by processing difficulties. However, the frontal N400 (FN400) component was not modulated by memory loads. Importantly, the amplitude of the FN400 component was greater and occurred earlier in the familiarity task than in the recollection task, indicating that the FN400 reflected WM retrieval. Taken together, the current study found that the LPC component reflects processing difficulty, while the FN400 component is responsible for dissociating the retrieval methods and is more sensitive to familiarity-based processing.

面孔特征信息在种族识别中的作用：面孔-词 Stroop 效应

陈恩光¹ 青和浩日博² 王安清³ 汪海玲⁴ (通讯作者)

山东师范大学心理学院, 济南, 250358, hailingwang@sdsu.edu.cn

摘要 面孔是一种常见的视觉刺激, 其所包含的种族信息在人们辨别不同族群、识别身份信息过程中发挥了重要作用。为了探究面孔特征在种族信息判断中的作用, 本研究采用面孔-词 Stroop 实验范式进行了 2(面孔种族: 本族、异族)×3(汉字出现部位: 眼睛、鼻子、嘴巴)×2(面孔汉字: 一致、不一致)的被试内实验设计。实验一要求被试判断面孔的种族, 结果发现, 面孔种族和汉字出现部位存在显著交互作用, 简单效应分析发现, 本族面孔识别, 眼睛作用较大, 嘴巴的作用较小; 而异族面孔识别, 眼睛作用较大, 鼻子的作用较小。汉字出现部位与面孔汉字的交互作用显著, 进一步分析发现, 汉字出现在眼睛时 Stroop 效应最大。面孔种族与面孔汉字显著的交互作用表明, 本族面孔较异族面孔诱发更大的 Stroop 效应。为了增加汉字对面孔种族判断的干扰, 诱发更大的 Stroop 效应, 实验二要求参与者不仅要判断面孔种族而且要出声读出汉字, 反应时结果发现三因素交互作用显著, 进一步分析发现, 对本族面孔来说, 汉字出现在嘴巴部位诱发的 Stroop 效应较大; 对异族面孔来说, 汉字出现在鼻子诱发的 Stroop 效应较大。正确率上的面孔种族与面孔汉字的交互作用也发现本族面孔诱发更大的 Stroop 效应。但是, 上述两个实验都是向被试呈现正立面孔, 为了探究面孔构形信息受到破坏时, 特征信息在种族识别中的作用, 实验三使用了倒置面孔图片并重复了实验二的过程, 结果发现面孔种族和汉字出现部位之间存在交互作用, 简单效应分析结果表明识别本族面孔时眼睛作用较大, 鼻子和嘴巴的作用较小; 识别异族面孔时眼睛作用最大, 其次是嘴巴, 鼻子的作用较小。但是, 倒置面孔下的 Stroop 效应不受面孔种族和汉字出现部位的影响。综上, 本研究表明眼睛包含了种族识别的关键信息, 在正立和倒置面孔的识别中都有重要作用, 嘴巴在异族面孔判断中的作用高于本族面孔。

The Role of Face Featural Information in Face Racial Recognition: Evidence from Face-Word Stroop Effect

Enguang Chen, Chinheg.H.Borjigin, Anqing Wang, Hailing Wang(Corresponding Author)

School of Psychology, Shandong Normal University, Jinan, 250358, hailingwang@sdsu.edu.cn

Abstract: Face is a kind of common visual stimulus, and the racial information it contains plays an important role in distinguishing different ethnic groups and discerning identity information. An experiment designed of 2(face race: own-race vs. other-race)×3(face feature: eyes vs. nose vs. mouth)×2(face Chinese characters: consistent vs. conflicting) was adopted to investigate the role of face featural information in recognizing face race. The participants were required to distinguish the race of faces in Experiment 1, and the results showed a significant interaction between face race and face feature. Simple effect analysis found that the role of eyes was greatest in recognizing the

own-race faces, and the mouth was worst; while in the recognition of other-race faces, eyes' function was greatest, and nose' function was worst. The interaction between face feature and face Chinese characters was significant. Further analysis showed that the Stroop effect was the largest when the Chinese characters appeared on the eyes. The significant interaction between face race and face Chinese characters indicated that the own-race faces had a greater Stroop effect than the other-race faces. In order to increase the interference of Chinese characters on the face race judgment and elicit a greater Stroop effect, Experiment 2 required participants not only to judge the face race but also read the Chinese characters aloud. It was found that the three factors had a significant interaction. For the own-race faces, the mouth part had a greater Stroop effect; for the other-race faces, the nose had a greater Stroop effect. The interaction of face race and face Chinese characters on the correct rate also found that own-race face had a greater Stroop effect. However, the upright faces were presented in these two experiments. To explore the role of features in race recognition when the face configural information was destroyed, Experiment 3 presented the inverted faces with the same task in Experiment 2. The results found that there was an interaction between the face race and the face feature. The simple effect analysis results showed that the eyes had a greater role and the nose and mouth had a smaller role in recognizing the own-race faces; when recognizing the other-race faces, the eyes had the largest effect, followed by the mouth and the nose had the smallest effect. However, the Stroop effect with the inverted faces was not affected by face race and face feature. In summary, the study showed that the eyes contained the key information for racial recognition and played an important role in the recognition of upright and inverted faces. At the same time, the role of the mouth in the judgment of other-race faces is higher than that of own-race faces.

wangpei1970@163.com

Abstract: Objectives: To explore the structure of physician dehumanization in medical practice and its influencing factors. Methods: Using the self-prepared socio-demographic data basic situation questionnaire, doctor-patient relationship basic situation questionnaire, and doctor's humanistic view of medical practice questionnaire as the measurement tools, a total of 2000 questionnaires were distributed, 1762 questionnaires were returned, and 1412 questionnaires were validated by random sampling of doctors from various types of hospitals in several provinces (Yunnan, Zhejiang, Heilongjiang, Hunan, Shanghai, Jiangsu, etc.). The valid questionnaire return rate was 70.6%. Exploratory factor analysis and confirmatory factor analysis were performed using SPSS 26.0 and Mplus 8 software to determine the structure of physician dehumanization; structural equation modeling was performed to model the influencing factors of physician dehumanization. Results: Exploratory factor analysis of half of the validated questionnaire sample revealed that the structure of physician dehumanization consisted of three factors: animalization, mechanization, and medical problem synthesis, which explained 36.249%, 24.197%, and 9.151% of the total variation, respectively. The confirmatory factor analysis of the other half of the validated questionnaire sample found that the factor analysis model fit well, with fit indices CFI=0.904>0.9, TLI=0.876>0.8, SRMR=0.069<0.08. The structural equation model found that doctor-patient conflict (verbal conflict, physical conflict) would act on doctor-patient trust (interpersonal trust, institutional trust), thus Factors influencing animalization, mechanization, and medical problem synthesis in physicians' view of human nature (fit index CFI=0.913>0.9, TLI=0.895>0.8, RMSEA=0.073<0.8, SRMR=0.059<0.08). Conclusion: 1. The structure of physicians' view of human nature can be divided into 3 dimensions, namely animalization, mechanization, and medical problem synthesis; 2. Physicians' experience of physician-patient conflict can lead to a decrease in physician-patient trust, but can then lead to an increase in their view of human nature score.

粤语惯用语语义性质及其内部关系研究——兼与汉语惯用语数据对比

黄琳¹ 马利军² 朱睿³ 林绮文⁴

广州中医药大学

摘要 通过分析 435 名熟练粤语-普通话双语者对 190 个不同结构的粤语三字格惯用语的语义性质评定结果,探究各项性质间的相互作用关系。结果表明,熟悉性、可理解性、可表象性、字面合理性、词素贡献、分解性、预测性、习得年龄两两之间均相关显著;习得年龄与其它语义性质间存在显著负相关。回归分析显示,熟悉性是影响粤语惯用语预测性的主要因素;“2+1”偏正结构惯用语分解性效应显著。动宾结构惯用语熟悉性效果显著。整词惯用语可表象性效应显著。熟悉性、字面合理性、可表象性是影响惯用语的可理解性的主要因素;熟悉性对 4 类结构惯用语的可理解性均有显著影响;除熟悉性外,对于整词惯用语,可理解性的影响因素还包括可表象性和分解性;字面合理性对另 3 类结构惯用语均有影响;粤语惯用语在理解进路与汉语歇后语存在差异,个体更依赖熟悉性的作用。

关键词 粤语, 惯用语, 语义性质, 熟悉性

A study on the semantic properties and internal relations of Cantonese idioms -- a comparison with Chinese idioms

Huang Lin¹, Ma Jun², Zhu Rui³, Lin Qiwen⁴

Guangzhou University of Chinese Medicine

Abstract: Based on the analysis of the semantic properties of 190 Cantonese three character idioms with different structures by 435 proficient Cantonese Putonghua bilinguals, this paper explores the interaction between the properties. The results show that familiarity, comprehensibility, representativeness, literal rationality, morpheme contribution, decomposability, predictability and acquisition age are significantly correlated, while acquisition age is negatively correlated with other semantic properties. Regression analysis shows that familiarity is the main factor affecting the prediction of Cantonese idioms, and the decomposition effect of 2 + 1 positive structural idioms is significant. The familiarity effect of verb object structure idioms is significant. The whole word idiom has a significant representational effect. Familiarity, literal rationality and representativeness are the main factors that affect the comprehensibility of idioms; familiarity has a significant impact on the comprehensibility of the four types of structural idioms; in addition to familiarity, for the whole word idioms, the factors that affect the comprehensibility also include representability and decomposition; literal rationality has an impact on the other three types of structural idioms; Cantonese idioms are in the process of understanding There are differences between Cantonese idioms access and two-part allegorical sayings access, and individuals are more dependent on familiarity.

Keywords: Cantonese; idioms; Semantic properties; familiarity

Reward weakened inhibition of return (IOR) in the near depth plane

Lu FeiFei

Abstract: In attentional orienting, researchers have proposed that reward history is a category of attentional control, as the reward value might enhance the spatial attention process to achieve more efficient goal-directed behavior and to improve target-detection performance. Although the effect of reward-induced motivation on attentional orienting has been studied in two-dimensional (2-D) space, the specific mechanisms underlying the influence of reward on inhibition of return (IOR) of attentional orienting in three-dimensional space (3-D) remain unclear. In the present study, by incorporating the Posner spatial-cueing paradigm into a virtual 3-D environment, we aimed to investigate the influence of reward on IOR in 3-D space. The results showed the following: (1) IOR size in the rewarded condition was smaller than IOR size in the unrewarded condition in the near depth plane, resulting in an IOR difference with or without reward. (2) Reward weakened IOR in the near depth plane because the response to the uncued location was slowed, not because the response to the cued location was accelerated. The present study indicated that the different depth planes of the target location in 3-D space could influence the interaction between reward and IOR, and reward weakened IOR in the near depth plane.

韵律对汉语句子阅读中“N 的 V”结构加工的制约

陈晓霞¹ 龙佳欣² 于秒³

天津师范大学心理学院

摘要 研究表明内隐韵律能够促进书面文本的理解和加工, 但以往研究多集中在对重音节拍语言的考察, 而较少关注汉语这类音节节拍语言中内隐韵律的作用。本研究采用 EyeLink 1000 眼动仪, 探讨了汉语句子阅读过程中, 动词“V”的音节数如何影响“N 的 V”结构的分析过程, 以及这种韵律约束是否与“N”和“V”之间两类语义关系存在交互作用。研究结果发现: 读者对单音节动词的注视时间长于双音节动词, 并且对含单音节动词的异常韵律模式有更多的回视。此外, 动词后区域存在音节与语义关系的交互作用, 只有在受事语义关系中, 单音节动词条件下对该区的凝视时间才显著长于在双音节动词条件下的凝视时间。当前结果表明, 汉语

读者偏好含双音节动词的“N 的 V”韵律模式，且这种偏好的强度在受事语义关系下更强。本研究证实了汉语韵律信息在句子理解早期阶段的即时加工，并为内隐韵律假说提供了来自汉语的证据。

Prosodic Constraints in Silent Reading: An Eye Tracking Study investigating Chinese “N de V” Construction

Chen Xiaoxiao¹, Long Jiaxin², Yu Miao³

School of Psychology, Tianjin Normal University

Abstract: Evidence suggests that implicit prosody can facilitate the processing of written texts. Although there is considerable research on stress-timed languages, the role of implicit prosody in syllable-timed languages, such as Chinese, has not received much attention. The current study explored the cross-linguistic universality of local prosody and how it interacts with the semantic relations of component words (“N” and “V”) in the Chinese “N de V” construction. Eye movements were recorded for Chinese sentences having a “N de V” construction that differed in the number of a verb’s syllables. The results showed that monosyllabic verbs received longer fixation durations than disyllabic verbs, and more regressions were made to anomaly prosodic patterns containing monosyllabic verbs. Moreover, there were interactions between the prosodic pattern and semantic relations in the post-verb area. The findings suggest that Chinese readers prefer the “N de V” prosodic pattern with disyllabic verbs and the preference is stronger in “patient-verb” semantic relationships. Notably, the findings demonstrate the immediate availability of prosodic information in sentence processing in Chinese. They also provide evidence from Chinese sentence reading for the Implicit Prosody Hypothesis.

Keywords: Prosodic pattern constraints, semantic relation, silent reading, eye tracking, Chinese “N de V” construction

不同维度时间-空间映射机制的分离：来自 EEG/ERP 的证据

施灵铮 杨家琛 程晓荣 范焱 定险峰（通讯作者）

华中师范大学心理学院，武汉，430079, xianfengding@ccnu.edu.cn

摘要 人对时间和空间的心理表征有着密切的关系。人类经常用具体的空间信息来表征抽象的时间信息，比如时间-空间映射或心理时间线。以往的行为研究发现，不同维度上的时间-空间映射似乎有着不同的起源和机制。左右维度的时空映射起源于与阅读书写习惯相关联的感觉运动经验，其内在机制是一种低水平的感觉运动机制；而前后维度时空映射起源于语言中的空间隐喻，是一种高水平的语义加工机制。本研究则进一步采用 EEG/ERP 技术，来探索前后和左右维度时空映射是否存在神经机制的分离。我们采用了经典的 STARC 效应范式并通过游戏摇杆来收集反应，记录被试的行为和脑电数据。行为结果表明，无论是在前后还是水平维度，不一致条件下被试的反应时均显著高于一致性条件，证明了两个维度都存在时空映射；基于反应锁定的 ERP 结果则发现，前后维度和左右维度在不一致反应和一致反应的差异波上存在明显差异；进一步的时频分析结果表明，当发生时空匹配冲突时，左右维度在顶叶的β频段（13-18HZ, 150-200ms）和额叶的θ频段（4-7HZ, 200-400ms）比前后维度上都有更强的功率。最后我们还采用了机器学习（支持向量机 SVM）的方法进一步验证了结果。总之，上述结果都支持前后和水平维度的时空映射机制确实存在分离，具有不同的神经生理基础。

关键词 时间-空间映射，STARC 效应，实验性分离，前后和左右维度

Dissociative Neural Mechanisms of Time-Space Mapping in Different Space Dimensions: Evidence from EEG / ERP

Lingzheng Shi, Jiachen Yang, Xiaorong Cheng, Zhao Fan and Xianfeng Ding

School of Psychology, Central China Normal University, Wuhan 430079

Abstract: Time and space are closely connected. Human beings often use specific spatial information to represent

abstract temporal information, such as time-space mapping or mental timeline. Previous behavioral studies have found that time-space mapping in different dimensions seems to have different origins and mechanisms. The horizontal space-time mapping originated from the sensorimotor experience associated with reading and writing habits, which is a low-level sensorimotor mechanism. While the sagittal space-time mapping originated from the spatial metaphor in the language, which is a high-level semantic processing mechanism. In this study, electroencephalographic (EEG) was further used to explore the dissociation of the neural mechanism of spatio-temporal mapping in sagittal and horizontal dimensions. We adopted the classic STARC effect paradigm and joystick to respond, recording the behavior and EEG data. The behavioral results showed that the response times under inconsistent conditions are significantly higher than that under consistent conditions, both in sagittal and horizontal dimensions, which proved that there is a spatio-temporal mapping between the two dimensions. The event-related potential (ERP) results of response-locked analytical techniques indicated that there are significant differences in the difference waves between inconsistent response and consistent response both in the sagittal and horizontal dimensions. Further time-frequency analysis results showed that when spatio-temporal mapping conflict occurs, the parietal beta-band and the frontal theta-band (4-7 Hz, 200-400 ms) in the horizontal dimension have a larger power than which in the sagittal dimension. Finally, we used machine learning (support vector machine) to further verify the results. In conclusion, the above results supported that the spatio-temporal matching mechanism of sagittal and horizontal dimensions are indeed separated and have different neurophysiological foundations.

Keywords: time-space mapping, STARC effect, experimental dissociation, sagittal and horizontal dimensions

摘 要 额叶的 theta / beta 作为持续注意神经反馈训练的脑电指标, 被广泛应用于注意缺陷多动障碍的干预治疗等领域。最近的几项荟萃分析认为对于持续注意的神经反馈训练, beta 比 theta / beta 更有效, 因为以往文献比较一致地报告了在较高持续注意需求的任务中, beta 的功率会升高。然而, 与 theta / beta 相比, beta 对于持续注意是否有更好的特异性和敏感性还不清楚。针对这一问题, 本研究结合脑电技术和行为任务开展了一项实验。66 名健康大学生受试者完成了高/低持续注意需求的两类任务, 即两选择反应时任务和简单注视任务。根据行为指标(个体内反应时变异系数)由低到高的顺序, 受试者被分为高注意水平组(22 人, 女 12 人, 排序位于前 1/3)和低注意水平组(22 人, 女 10 人, 排序位于后 1/3)。两组受试者在不同任务状态下的 beta 功率以及 theta 与 beta 功率的比值被提取出来(Fz 电极)。此后, 我们以持续注意水平(被试间变量, 高/低注意水平组)和任务状态(被试内变量, 高/低注意任务状态)为自变量, 分别对 beta 及 theta/beta 进行重复测量方差分析。研究结果表明 beta 和 theta / beta 在持续注意水平和任务状态两个自变量间的交互作用显著(beta: $F_{(1, 40)}=5.6, p=0.02$, theta / beta: $F_{(1, 40)}=6.9, p=0.012$)。两个脑电指标在任务状态变量上的主效应显著(beta: $F_{(1, 40)}=4.7, p=0.03$, theta / beta: $F_{(1, 40)}=63.8, p=0.001$)。高低注意水平组的 theta / beta 随着任务持续注意需求的增加都呈现出显著升高($t_{\text{高水平}}=2.81, p=0.005$; $t_{\text{低水平}}=17.3, p<0.001$)。而对于 beta, 只有高注意水平组会响应任务持续注意需求的改变($t_{\text{高水平}}=2.37, p=0.01$; $t_{\text{低水平}}=-0.34, p=0.37$)。这些结果表明 beta 与 theta/beta 都对持续注意有敏感性, 但 beta 对持续注意的响应只存在于高注意水平受试者。值得注意的是, beta 与 theta/beta 这两个脑电指标在持续注意水平变量上主效应都不显著(beta: $F_{(1, 40)}=1.05, p=0.31$,

theta / beta : $F_{(1, 40)}=0.42, p=0.52$), 说明这两个脑电指标不能区分不同持续注意水平的受试者。这些发现揭示了持续注意任务状态下脑电节律波指标的特性, 为持续注意神经反馈训练中脑电反馈指标的选择提供了指导依据。

Abstract: The ratio of frontal theta to beta activity (theta/beta ratio) of electroencephalogram (EEG) is commonly employed as a neurofeedback indicator in the field of intervention practice of attention deficit. Recently, several meta-analysis studies suggested that the frontal beta activity could be more effective than frontal theta/beta ratio for the neurofeedback practice, because previous literatures have consistently identified increased power of frontal beta in tasks with high-level requirement of sustained attention. However, it remains unclear whether beta activity has better specificity and sensitivity for sustained attention as compared it with theta/beta ratio. To address this issue, the present study performed an experiment using EEG and behavioral tasks. 66 healthy college students were recruited to complete two tasks with high/low requirement of sustained attention, i.e. two-choice response task and simple fixation task. According to the order of lowest to highest behavioral measurement (coefficient of variation of reaction time), high- and low-level attention groups were acquired (ranked in the top/bottom 1/3 of all subjects, 22 individuals for each group). The power of frontal beta and theta/ beta ratio were calculated first for the subjects in each group and in each task (Fz electrode). A repeated measure of analysis of variance was performed with the factors of the attention (between-subject factor, two levels of high and low ability of attention), and task (within-subject factor, two levels of high and low requirement of attention) to determine the specificity and sensitivity of beta and theta/beta ratio for sustained attention. Our results showed that the power of beta and theta/beta ratio have significant interactions effect between the factors of attention and task (beta: $F_{(1, 40)}=5.6, p=0.02$, theta / beta ratio: $F_{(1, 40)}=6.9, p=0.012$). Both beta and theta/beta ratio showed significant main effect of the factor, task (beta: $F_{(1,40)}=4.7, p=0.03$; theta/beta ratio: $F_{(1, 40)}=63.8, p=0.001$). The theta/beta ratio in both of the high- and low-level attention group showed a significant increase($t_{high}=2.81, p=0.005$; $t_{low}=17.3, p<0.001$) in response to the increased requirement of sustained attention for performing tasks. As for the frontal beta, only the high-level attention group responded to the task with increased requirement of sustained attention ($t_{high}=2.37, p=0.01$; $t_{low}=-0.34, p=0.37$). These results indicate that both beta power and theta/beta ratio are sensitive to sustained attention, but the response of beta to sustained attention only exists in subjects with high-level attention but not in subjects with low-level attention. It is worth noting that both beta and theta/beta ratio have no significant main effect of the factor, attention (beta: $F_{(1,40)}=1.05, p=0.31$, theta/beta ratio: $F_{(1, 40)}=0.42, p=0.52$), and then, the two EEG indicators could not distinguish subjects with different levels of sustained attention. These findings reveal the characteristics of EEG rhythmic oscillation for responding to sustained attention, and also provide theoretical basis for the selection of EEG indicators in the neurofeedback practice of sustained attention.

小样本情况下错误先验信息对贝叶斯估计的影响： 基于多层模型的研究

郑舒方¹ 张沥今¹ 潘俊豪¹（通讯作者）

¹ 中山大学心理学系，广州，510006，panjunh@mail.sysu.edu.cn

摘要 在心理学、教育学和组织行为学等领域的研究中，研究者往往需要利用多层模型解决多层数据中非独立性观测可能带来的问题。在多层模型中，基于传统频率学派的极大似然估计方法(Maximum Likelihood, ML)需要依赖大样本，在小样本下容易出现参数估计及模型收敛等方面的问题。贝叶斯估计在小样本的情况下往往具有更大的优势，但与此同时，也更容易受到先验信息主观设置的影响。为了探讨贝叶斯估计中错误先验信息可能带来的负面影响，并与传统方法进行对比，本文基于多层模型，利用蒙特卡洛模拟，研究在不同样本量和组内相关系数(Intraclass Correlation Coefficient, ICC)的情况下，设有不同信息强度和偏差程度的先验信息对贝叶斯估计的影响。总体结果显示，贝叶斯估计中均值严重偏离真值的先验分布会对参数估计带来较大的负面影响，特别是在 ICC 较大、群组样本量较小、以及先验分布方差较小的情况。本文对多层模型中错误先验信息对贝叶斯估计的影响进行研究并提出建议，希望为贝叶斯估计中先验分布的设置提供一定的理论补充及实证参考。

The Influence of Inaccurate Informative Priors on Bayesian Estimation in Small Samples: A Study Based on Multilevel Modeling

Zheng Shufang¹, Zhanng Lijin¹, Pan Junhao¹

¹. Department of Psychology, Sun Yat-sen University, China

Abstract: In the research of psychology, education, and organizational behavior, researchers often need to conduct multilevel modeling to solve the statistical problems caused by non-independent observations. Traditional frequentist-based maximum likelihood (ML) approach, which relies on large-sample theory, might lead to problems in parameter estimation and model convergence in multilevel modeling with small samples. In contrast, Bayesian approach is often more advantageous in small samples, but it is also more susceptible to the subjective specification of priors. To investigate the potentially detrimental effects of inaccurate prior information on Bayesian approaches and compare their performance to the traditional approaches, we conducted a series of simulations under the multilevel model framework with different sample sizes and intraclass correlation coefficients (ICCs). In sum, the results revealed the devastating impacts of inaccurate prior information on Bayesian estimation, especially in the cases of larger ICC, smaller level 2 sample size, and smaller prior variance. The present study investigated the impacts of inaccurate prior information on Bayesian estimation and provided advice on the specification of priors. We hope that it could contribute to strengthening the theoretical and practical understanding of prior specifications.

情绪面孔中定向遗忘效应的产生机制

王孟帆¹ 易凤¹ 宋晓蕾²（通讯作者）

¹ 陕西师范大学心理学院，西安，710062

² 陕西省行为与认知重点实验室，西安，710062，songxiaolei@snnu.edu.cn

摘要 定向遗忘效应是指在实验条件下个体能够采取自上而下的策略主动限制对遗忘项目的记忆的一种现象。目前定向遗忘效应的产生机制存在两种解释，一是选择性编码理论，二是抑制控制理论。以往研究使用词汇、图片等材料作为研究对象，但未探讨人物面孔定向遗忘效应的产生机制。此外，愤怒和愉悦表情影响认知过程，即个体更难主动遗忘情绪性信息，特别是负性信息，同时表情感知和认知过程都会受到面孔性别

的影响。因此,本研究通过3个实验探究情绪表情、面孔性别对面孔身份识别中定向遗忘效应的影响,并进一步澄清情绪面孔中定向遗忘效应的产生机制。实验1采用项目法定向遗忘范式,操控情绪表情(愤怒、愉悦)和面孔性别(女性、男性)以验证不同表情和性别对定向遗忘效应的影响。实验2在实验1的基础上改变学习阶段材料的呈现时间,探究情绪面孔加工过程中是否存在选择性编码。实验3使用颜色作为认知线索,为抑制控制理论寻找行为层面的证据。实验1的结果发现,愤怒面孔的成绩显著好于愉悦面孔,和男性面孔相比,女性面孔的成绩也更好;实验2的结果发现,随着学习阶段材料呈现时间的增加,定向遗忘效应消失,说明记住项目和遗忘项目的成绩差异不是由于选择性编码;实验3的结果发现,和无线索提示相比,线索出现时个体再认成绩更高,尤其是遗忘项目,说明认知线索的出现解除了抑制控制从而促进了个体对面孔的识别。本研究结果表明:(1)和愉悦表情相比,愤怒表情能够促进信息编码和巩固信息;(2)个体对女性面孔的识别和记忆优于男性面孔;(3)情绪面孔中定向遗忘效应的产生非选择性编码,更可能是由于抑制控制。

Mechanism of directed forgetting effect in emotional faces

Mengfan Wang, Feng Yi, Xiaolei Song

Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, School of Psychology, Shaanxi Normal University, Xi'an 710062, China

Abstract: Directed forgetting effect refers to a phenomenon that individuals can adopt top-down strategies to actively limit the memory of forgetting items under experimental conditions. At present, there are two explanations for the mechanism of directed forgetting effect. One is selective coding theory, the other is the theory of inhibition control. Previous researches have studied different experimental materials, including words and pictures etc., while have not discussed the mechanism of directional forgetting effect in faces. What's more, anger and pleasure expressions affect the cognitive process, that is, it is more difficult for individuals to actively forget emotional information, especially negative information, and both facial perception and cognitive process are affected by the gender of the face. This study explored the effects of emotional expression and face's gender on directed forgetting effect through three experiments, and clarified the mechanism of directed forgetting effect in emotional face. Experiment 1 used the item directed forgetting paradigm and manipulate emotional expressions (anger, pleasure) and face gender (female, male) to verify the effect of different expression and face gender on directed forgetting effect. Based on the results of experiment 1, experiment 2 changed the presentation time of materials in the learning stage to find out whether there was selective coding in the processing of emotional faces. Experiment 3 provides empirical evidence for the inhibition control theory using color as a cognitive cue. Experiment 1 showed that angry faces scored significantly better than happy faces, compared male face, female face performed better too; The results of experiment 2 showed that the effect of directed forgetting gradually disappeared with the increase of the material presentation time in the learning stage, indicating that the difference in performance between the remembered items and the forgotten items was not due to selective coding. The results of experiment 3 showed that, compared with the non-cue, the recognition performance of individuals was higher when the cue was presented, especially the forgetting items. The appearance of cognitive cue lifted the inhibition control and promoted the recognition of faces. Based on this, this study has drawn the following three conclusions: (1) compared with the happy expression, the angry expression can promote the encoding and consolidation of information; (2) the recognition and memory of female faces is better than that of male faces; (3) The directed forgetting effect in emotional faces is not selectively encoded, and is more likely due to inhibitory control.

基本情绪的神经基础:来自 fMRI 与机器视觉技术研究的证据

梁飞, 江瑶, 肖婷炜, 董洁, 王福顺 (通讯作者)

四川师范大学脑与心理科学研究院, 成都, 610066, 13814541138@163.com

摘要 基本情绪理论(basic emotion theory)是情绪科学领域最具代表性的理论, 该理论认为人类情绪是由有限的几种基本情绪组成的, 如恐惧、愤怒、喜悦、悲伤等。基本情绪是为了完成基本生命任务(fundamental life task)进化而来的, 每一种基本情绪都有独特的神经结构和生理基础。尽管基本情绪理论被广泛接受, 但是人类具体有几种基本情绪却莫衷一是。近几十年来, 许多 fMRI 研究试图确定各种基本情绪的独特神经结构基础, 而且取得了许多重要发现, 比如厌恶和脑岛有关, 悲伤和前扣带回有关, 杏仁核是与恐惧有关的重要边缘结构等。但是, 最近有人进行了元分析研究, 发现许多基本情绪存在混淆的大脑区域, 因此对基本情绪的特定脑区理论提出质疑, 甚至否定基本情绪理论。本文通过对基本情绪理论的最新功能性磁共振成像研究进行综述, 提出有关基本情绪理论的争论来源于基本情绪种类的确定, 因为许多所谓的不同基本情绪实际上是同一种基本情绪。本文进一步通过对基本情绪及其神经基础进行探讨, 并根据机器视觉技术应用于基本情绪脑影像研究的探索, 提出人类可能只有三种基本情绪。本文还指出基于机器视觉技术的基本情绪研究在心理疾病诊断与治疗领域的应用前景, 这不仅为基本情绪理论的实证研究提供新思路, 还拓展了其在心理疾病诊疗等领域的意义。

Basic emotion and its neural basis: Evidence from fMRI and machine-vision studies

Liang Fei, Jiang Yao, Xiao Tingwei, Dong Jie, Wang Fushun

Institute of Brain and Psychological Science, Sichuan Normal University, Chengdu, China

Abstract: Basic emotion theory is the most representative theory in the field of emotion science, which holds that human emotions are composed of a limited number of basic emotions, such as fear, anger, joy, sadness and so on. Basic emotions are evolved for fundamental life tasks, and each basic emotion has its own unique neural structure and physiological basis. Although basic emotion theories are widely accepted, there is little agreement on specific basic emotions. In recent decades, many fMRI studies have attempted to determine the unique neural structural underpinnings of each of the basic emotions, and made many important findings, such as disgust is related to the insula, sadness is related to the anterior cingulate gyrus, and the amygdala is an important limbic structure related to fear. However, recent meta-analysis studies have found that many basic emotions share many brain regions. Therefore, the theory of specific brain regions of basic emotions has been questioned and even denied. This paper takes the basic emotion theory and its arguments as clues, and proposes that these arguments stem from the number determination of basic emotions, because many so-called different basic emotions are actually one kind of basic emotion. In this paper, we sort out and discuss the emotion theories based on the basic emotion theories and its arguments. Then, the basic emotions and their neural basis are discussed; the application of machine vision technology to basic emotional brain imaging is proposed, the opinions of humans may have only three basic emotions is proposed, the application prospect of basic emotion research based on machine-vision in the diagnosis and treatment of mental diseases is proposed. Through these work, we hope to provide a new idea for the empirical research of basic emotion theory, and expand its significance in the diagnosis and treatment of mental diseases.

摘要 已有研究表明，大脑基于场景产生预期从而影响面部表情的识别。然而，二者如何相互作用依然没有得到确切的回答。在此，本研究使用频率标记技术和脑电解码技术探讨了基于场景的预期对面部表情表征和神经活动的影响。参与者被要求观察模糊或清晰的面部表情的情绪动态变化，这些表情图片嵌入在场景图片中以 6Hz 的频率闪烁。结果发现，无论是清晰条件还是模糊条件下，与场景情绪意义一致的面部表情都比与场景不一致的面部表情诱发了更大波幅的稳态视觉诱发电位(steady-state visual evoked potentials, SSVEP)。对于面部表情表征强度，我们发现在清晰条件下，与场景预期一致的面部表情表征强于与场景不一致的面部表情表征。在模糊条件下，与场景预期不一致的面部表情表征强于与场景一致的面部表情表征。总之，这些结果表明在视觉皮层面部表情的加工受到自上而下的影响。清晰性调节了这种基于场景的预期对表情表征的影响。此外，我们的研究也显示了神经激活和表征强度并不是相对应的。

2 School of Medical Humanities, Capital Medical University, Beijing 100069, China

3 School of Humanities and Social Sciences, University of Science and Technology of China, Hefei 230022, China

Abstract: Previous studies have shown that the brain generates expectations based on scene that affect facial expression recognition. Yet, although known to interact in perception, how facial expression and scene interact is still poorly understood. Here, we used frequency labeling and decoding techniques to reveal the effects of scene-based expectation on the amplitude and representational content of neural activity. Participants viewed emotional changes in clear or ambiguous facial expressions, which flickered at a rate of 6 Hz in a scene. We found that facial expressions that were congruent with the emotional significance of scene elicited a larger steady-state visual evoked potential (ssVEP) amplitude than facial expressions that were incongruent with the emotional significance of scene, in both clear and ambiguous conditions. We also found that the expected facial expression representation was stronger than the unexpected representation in the clear condition. In the ambiguous condition, the unexpected representation was stronger than the expected representation. Together, these results suggest that facial expression processing in the visual cortex was modulated by top-down signals. The clarity of facial expression moderated the influence of scene on facial expression representation. In addition, our study also showed that neural activation amplitude did not correspond to the representational strength.

红色对时间知觉影响的元分析

冯元玮¹ 洪晓彬^{2, 3}（通讯作者）

1 武汉体育学院 研究生院，武汉，430079

2 武汉体育学院 心理学系，武汉，430079, hongxiaobin1002@163.com

3 武汉体育学院 运动训练监控湖北省重点实验室，武汉，430079

摘要 过往研究中，红色效应会对个体时间知觉产生何种影响的结论并不一致。这些研究通常从红色效应的影响机制等角度探讨导致结果矛盾的原因，往往忽略了研究方法不同而导致研究结果不一致的可能性，因此本研究将对过往红色时间知觉实证研究进行元分析，探讨时间知觉中的红色效应以及研究方法的差异是否

会影响红色效应。经中英文文献搜索，共纳入 17 篇文献和 44 个效应量，总样本量为 1716。元分析结果表明：（1）异质性检验结果表明 $Q=158.080$ ($p<0.001$)， $I^2=72.799$ ，研究间存在较高的异质性，确定了选择随机效应模型的合理性。（2）红色对时间知觉的影响呈现正向较小效应量 $d=0.241$ ($95\%CI [0.101, 0.378]$ ， $p<0.01$)，与蓝绿相比红色导致个体高估持续时间。（3）调节变量检验发现，时间知觉任务 ($Q_b=2.818$ ， $p>0.05$)、被试状态 ($Q_b=1.259$ ， $p>0.05$)、材料性质 ($Q_b=0.042$ ， $p>0.05$) 不具有显著调节作用。被试性别具有显著调节作用 ($Q_b=23.595$ ， $p<0.001$)，表现在男性更容易受红色影响而高估持续时间。颜色呈现方式具有显著调节作用 ($Q_b=1.867$ ， $p<0.05$)，表现在颜色作为背景呈现时，红色导致个体高估持续时间的效果更显著。时间间隔具有显著调节作用 ($Q_b=12.162$ ， $p<0.05$)，表现在实验采用不同时间间隔，个体因红色而高估持续时间的效果有明显差异。（4）发表偏倚性检验发现， Tau 值、 $Intercept$ 值显著，可能存在发表偏倚；删除两个大样本研究再次分析发表偏倚性发现，失安全系数 $Nfs = 365$ ， Nfs 大于 $5k+10=5*42+10$ ， $Tau=1.26$ ($p=0.15$) 不显著， $Intercept=0.18$ ($p=0.09$) 不显著，剪补法显示效应值无明显变化，漏斗图分布均匀，存在发表偏倚性可能性较小。未来研究可以在严格控制好实验选取的时间间隔、颜色呈现方式和被试性别的基础上，再讨论红色对时间知觉的影响。

Time perception in red color: A meta-analysis

Feng Yuanwei¹, Hong Xiaobin^{2,3}

1 Graduate school, Wuhan Sports University, Wuhan, 430079

2 Department of Psychology, Wuhan Sports University, Wuhan, 430079,

hongxiaobin1002@163.com

Abstract: In previous studies, conclusions about the influence of the red effect on individual time perception were not consistent. These studies usually explore the reasons for the contradictory results from the perspective of the red effect mechanism and often ignore the possibility of inconsistent research results due to different research methods. Therefore, this research will conduct a meta-analysis of past empirical research on the time perception of red to explore the red effect in time perception and whether differences in research methods will affect the red effect. After searching the Chinese and English databases yielded a total of 17 articles and 44 effect sizes were included ($n = 1716$ participants). The meta-analysis results revealed that: (1) The heterogeneity test results show that Q value is 158.080 ($p<0.001$), the value of I -squared was 72.799, there is high heterogeneity among the studies, which confirms the rationality of choosing the random effects model (2) Red The impact on time perception presents a positively small effect size $d=0.241$ ($95\%CI [0.101, 0.378]$ ， $p<0.01$). Compared with blue and green, red causes individuals to overestimate duration. (3) The test of modulating variables found that time perception tasks ($Q_b=2.818$ ， $p>0.05$)，participant status ($Q_b=1.259$ ， $p>0.05$)，material properties ($Q_b=0.042$ ， $p>0.05$) did not have a significant moderating effect. The gender of the subjects has a significant moderating effect ($Q_b=23.595$ ， $p<0.001$)，which is reflected in the fact that men are more likely to be affected by red and overestimate the duration. The way of color presentation has a significant regulating effect ($Q_b=1.867$ ， $p<0.05$). When the color is presented as a background, the effect of red causing individuals to overestimate the duration is more significant. The time interval has a significant regulating effect ($Q_b=12.162$ ， $p<0.05$)，which is manifested in the fact that the experiment uses different time intervals, and the effect of individuals overestimating the duration due to red is significantly different. (4) The analysis of publication bias shows that the Tau and $Intercept$ values are significant, and there may be publication bias; delete two large-sample studies and re-analyze the publication bias findings, the loss of safety factor is $Nfs = 365$, and Nfs is greater than $5k+10=5*42+10$, $Tau=1.26$ ($p=0.15$) is not significant, $Intercept=0.18$ ($p=0.09$) is not significant, the clipping method shows that the effect value is weakened by the clipping method to 0, the funnel graph is evenly distributed, and less likely to have publication bias. Future research can discuss the influence of red on time perception on the basis of strictly controlling which include the time interval selected in the experiment, the way of color presentation, and the gender of the participant.

Keywords: meta-analysis, time perception, red, blue, green, color

患者感知共情对就医满意度的影响：一个多重中介作用模型

韩彩霞¹ 王沛² (通讯作者)

¹ 上海师范大学心理学系, 上海, 200234

² 华东师范大学教育学部特殊教育系, 上海, 200062, wangpei1970@163.com

摘要 近年来医患冲突已成为我国的社会热点, 已有研究发现医患共情对和谐医患关系的构建具有积极推动作用。但国内目前缺少对于患者感知共情与就医满意度的确切关系研究。因此本研究从患者视角出发, 旨在探究影响患者感知共情的因素, 考察患者感知共情与医患沟通评价、医患信任、医患关系和就医满意度的关系, 并重点分析患者感知共情对就医满意度的影响, 及医患沟通、医患信任、和医患关系的中介作用。研究采用诊疗关系共情量表(CARE)、SEGUE 量表、维克森林医师信任量表(WFPTS)中文修订版、PDRQ-15 量表和就医满意度问卷及一些社会人口学问题调查了我国 14 个省份的 2254 名患者。结果发现: 1、患者的年龄、就诊医院的等级、医院的类型、就诊时长、有无言语争吵、肢体冲突这些因素对感知共情有显著影响($p<0.001$)。2、医患沟通、医患信任、医患关系和就医满意度两两之间存在显著正相关($r=0.536\sim0.783, p<0.001$)。3、中介效应分析显示患者感知共情可直接正向预测就医满意度($\beta=0.67, p<0.001$), 患者感知共情显著正向预测医患沟通、医患信任和医患关系($\beta=0.65, \beta=0.49, \beta=0.44, p<0.001$), 医患沟通正向预测医患信任、医患关系和就医满意度($\beta=0.22, \beta=0.23, \beta=0.12, p<0.001$), 医患信任正向预测医患关系和就医满意度($\beta=0.24, \beta=0.09, p<0.001$), 医患关系正向预测就医满意度($\beta=0.56, p<0.001$), 而患者感知共情也可通过医患沟通、医患信任、医患关系多重中介影响就医满意度($\beta=0.12, p<0.001$)。即感知共情可直接影响就医满意度, 也可分别通过医患沟通、医患信任和医患关系的中介作用影响就医满意度, 也可通过四条链式中介对就医满意度起作用。结论: 患者年龄、就诊医院的类型和等级以及就诊时长等会对感知共情产生影响。医患共情贯彻整个诊疗互动过程, 可直接预测患者的就医满意度, 也可通过促进融洽的医患沟通、重建医患信任和构建和谐医患关系, 进而提高患者的就医满意度, 即医患沟通、医患信任和医患关系在感知共情对就医满意度的影响中起多重中介作用。

The influence of patient perceived empathy on medical satisfaction: A multiple mediating model

Han Caixia¹, Wang Pei²(Corresponding author)

¹ Department of Psychology, Shanghai Normal University, Shanghai, 200234, China

² Department of Special Education, education department, east China normal university, Shanghai, 200062, China, wangpei1970@163.com

Abstract: In recent years, doctor-patient conflict has become a hot social issue in China. Previous studies have found that doctor-patient empathy plays a positive role in promoting the construction of harmonious doctor-patient relationship. However, there is a lack of research on the exact relationship between patients' perceived empathy and their satisfaction with medical treatment. Therefore, from the perspective of patients, this study aims to explore the factors that affect patients' perception of empathy, examine the relationship between patient's perception of empathy and doctor-patient communication evaluation, doctor-patient trust, doctor-patient relationship and medical satisfaction, and focus on the analysis of patients' perceived empathy the influence on satisfaction with medical treatment, and the mediating role of doctor-patient communication, doctor-patient trust, and doctor-patient relationship. The study used the diagnosis and treatment relationship empathy scale (CARE), SEGUE scale, the Chinese revised version of Wake Forest Physician Trust Scale (WFPTS), PDRQ-15 scale, medical satisfaction questionnaire, and some sociodemographic questions to investigate 2254 patients from 14 provinces of China. The results showed that: 1. The age of the patient, the grade of the hospital, the type of hospital, the length of the visit, the

presence or absence of verbal quarrels, and physical conflict have a significant impact on perceived empathy ($p<0.001$). 2. There is a significant positive correlation between patients' perceived empathy, doctor-patient communication, doctor-patient trust, doctor-patient relationship and medical satisfaction ($r=0.536\sim0.783$, $p<0.001$). 3. The mediating effect analysis shows that patients' perceived empathy can directly and positively predict medical satisfaction ($\beta=0.67$, $p<0.001$), and patients' perceived empathy significantly positively predicts doctor-patient communication, doctor-patient trust, and doctor-patient relationship ($\beta=0.65$, $\beta=0.49$, $\beta=0.44$, $p<0.001$), doctor-patient communication positively predicts doctor-patient trust, doctor-patient relationship and medical satisfaction ($\beta=0.22$, $\beta=0.23$, $\beta=0.12$, $p<0.001$), Doctor-patient trust positively predicts doctor-patient relationship and medical satisfaction ($\beta=0.24$, $\beta=0.09$, $p<0.001$), doctor-patient relationship positively predicts satisfaction ($\beta=0.56$, $p<0.001$), while patient-perceived empathy also affected doctor-patient satisfaction through multiple mediators of doctor-patient communication, doctor-patient trust, and doctor-patient relationship ($=0.12$, $P<0.001$). In other words, perceived empathy can directly affect medical satisfaction, and it can also affect medical satisfaction through the mediating effect of doctor-patient communication, doctor-patient trust and doctor-patient relationship, and it can also affect medical satisfaction through four chain mediations. Conclusion: The age of the patients, the type and grade of the hospital they visited, and the length of time they visited, etc., have an influence on perceived empathy. The doctor-patient empathy implements the entire diagnosis and treatment interaction process, which can directly predict the patient's satisfaction with the doctor's treatment. It can also improve the patient's satisfaction with the doctor's by promoting harmonious doctor-patient communication, rebuilding doctor-patient trust and building a harmonious doctor-patient relationship. Namely, doctor-patient communication, doctor-patient trust, and doctor-patient relationship play multiple mediating roles in the impact of perceived empathy on medical satisfaction.

潜变量交互效应标准化估计：方法比较与选用策略

温忠麟¹ 欧阳劲樱¹ 黄国敏¹

¹ 华南师范大学心理学院/心理应用研究中心, 广州, 510631, ouyangjinying@m.scnu.edu.cn

摘要 标准化估计对模型的解释和效应大小的比较有重要作用。虽然潜变量交互效应的恰当标准化估计公式已经面世超过 10 年, 国内外都在使用和引用, 但至今未见到关于不同估计方法得到的恰当标准化估计的系统比较。通过模拟实验, 比较了乘积指标法、潜调节结构方程(LMS)、无先验信息和有先验信息的贝叶斯法的潜变量交互效应标准化估计在不同条件下的表现。结果发现, 在正态条件下, LMS 和有信息贝叶斯法表现较好; 而在非正态条件下, 乘积指标法比较稳健, 但需要较大的样本(不小于 500), 小样本且外生潜变量之间相关较低时可使用无信息贝叶斯法。

Standardized Estimates for Latent Interaction Effects: Method Comparison and Selection Strategy

Wen, Zhonglin¹, Ouyang, Jinying¹, Huang, Guomin¹

¹ Center for Studies of Psychological Application & School of Psychology, South China Normal University, Guangzhou 510631, China

Abstract: Analyzing the interaction effect of latent variables has become an important topic in both theoretical and empirical studies. Standardized estimation plays an important role in model interpretation and effect comparison. Although Wen et al. (2010) has formulated the appropriate standardized estimation for the latent interaction effects, there is no popular commercial software that provides the appropriate standardized estimation before the launch of Mplus 8.2 in 2019. The previous method comparisons for estimating latent interaction were based on the original

estimation. In this study, through a simulation experiment, the appropriate standardized estimation of latent interaction effects obtained by the product indicator (PI) approach, Latent Moderated Structural Equations (LMS), Bayesian method without prior information (BN), and Bayesian method with prior information (BI) are compared in terms of the bias of estimation, the bias of standard error, type I error rate and statistical power. The true model in the simulation is based on the structural equation $\eta = 0.4\xi_1 + 0.4\xi_2 + \gamma_3\xi_1\xi_2 + \zeta$ where the latent variables η , ξ_1 , ξ_2 each had three indicators with standardized factor loadings of 0.7. Experiment factors include the distribution of two exogenous latent variables (normal, non-normal), correlation ϕ_{12} between two exogenous latent variables (0, 0.3 and 0.7), interaction effect γ_3 (0, 0.2), sample size N (100, 200, and 500) and estimation method (PI, LMS, BN, BI). The results show that: (1) the proportion of proper solution of LMS and the two Bayesian methods were close to 100% in all treatments, while PI was almost fully proper when $N = 500$; (2) Under the normal condition, the bias of standardized estimation of latent interaction obtained by LMS, BI and BN were ignorable, and PI was acceptable when $N = 500$. Under the non-normal condition, the bias of LMS and Bayesian methods inflated seriously with increasing correlation of two exogenous latent variables, but PI was still acceptable when $N = 500$. (3) Under both distribution conditions, the bias of standard error of standardized estimation of latent interaction obtained by LMS and BN were small and acceptable, while PI was acceptable when $N = 500$, and BI tended to overestimate the standard error. (4) Under the normal condition, the type I error rates of LMS were acceptable when the sample sizes were large, while the other methods were acceptable in all conditions. Under the non-normal condition, the type I error rates of PI were still acceptable, while the other methods were acceptable only when sample sizes were small or the correlation between two exogenous latent variables was low. (5) The statistical power of latent interaction obtained by PI was the lowest among four methods, and a large sample size (e.g., $N = 500$) was required to ensure PI with the statistical power over 80%; LMS and BN had higher statistical power, while BI had the highest one in all conditions. For the latent interaction, the comparison results of standardized estimation of different methods are quite similar to those of the original estimation. Under the normal condition, it is recommended to use LMS to estimate the interaction effect of latent variables, with the caution of Type I error rate and effect size for inference. If accurate prior information can be obtained, Bayesian method is preferred, especially in the case of small sample. When the variables are not normally distributed, it is recommended to use the unconstrained product indicator approach which is more robust than the other methods, but the sample size should be large enough ($N = 500$ or above, say). If the correlation between exogenous latent variables is low (it can be estimated and tested by confirmatory factor analysis), Bayesian method without prior information can be considered for small samples.

Keywords: latent variable, interaction effect, standardized estimation, product indicator, Latent Moderated Structural Equations, Bayesian estimation

秒钟失准会导致短时距的主观时间扭曲吗？

任思睿 郑美红（通讯作者）

清华大学心理学系，北京，100084, zhengmh@mail.tsinghua.edu.cn

摘要 虽然大量研究发现操纵钟表的速度会导致时间感知扭曲，但过往研究仅采用了时间估计任务或时间流逝评分，且集中于长时距（10 秒以上）。本研究在未明确提示参与者以秒钟为线索完成时间判断任务的情况下，通过三类时间判断任务（估计/产生/再现），采用 2（时距：3s/5s）*3（相对秒钟转速（秒钟转速与正常秒钟转速的百分比）：75%/100%/125%）的混合设计，系统考察了操纵秒钟速度是否影响短时距的时间感知。组内变量为时距，组间变量为相对秒钟转速，因变量为时间判断相对误差的绝对值(ARE)。结果表明，操纵秒钟转速对短时距加工的影响依赖于时间判断的任务类型，具体为：（1）时间估计任务中，相比相对秒钟转速 100%组，75%组的 ARE 更高，其他组间无显著差异；（2）时间产生任务中，相比 100%组，75%组的 ARE 显著更高，其他组间无显著差异；（3）时间再现任务中，不同相对秒钟转速下的 ARE 无显著差异。综上，在不同类型的时间判断任务中，操纵秒钟速度对短时距的主观时间感知的影响并不一致，并且在产生影响的两类任务中，来自秒钟速度的影响具有不对称性，相比快秒钟，慢秒钟更能使主观时间感知发生扭曲。

作为可提供时间判断时的外部线索的秒钟，其失准对不同范式的时间判断任务的影响不同，这验证了不同时间任务范式涉及的时间加工机制可能具有较大差异。

Do inaccurate clocks cause subjective time distortions in short time intervals?

Sirui Ren, Meihong Zheng

Department of Psychology, Tsinghua University, Beijing, 100084

Abstract: Previous studies have found that covert manipulating the speed of the external clock can affect apparent judgments of time duration or the perceived rate of time passage. However, the previous studies only used time estimation task or subjective ratings on the time passage with long durations (above 10s). It remains uninvestigated whether external cues can produce an effect on time judgment in different temporal paradigms with short durations. The present study aimed to systematically investigate the effect of external cues through three temporal tasks without explicitly prompting participants to use external cues --- estimation, production, and reproduction. A 3 (relative rotation speed of external cues: 75% of standard speed, 100% of standard speed, 125% of standard speed) $\times$ 2 (duration: 3s, 5s) mixed factorial design was used. The between-subject variable was the relative rotation speed of external cues, and the within-subject variable was the duration. And the dependent variable was the absolute value of time judgment relative error (ARE). Significantly, a higher ARE reflected greater subjective deviation, and a lower ARE meant smaller subjective deviation. The participants' task was to determine the duration of the central cross-shaped stimuli. In general, we found that the impact of external cues depended on specific experimental tasks. The results are illustrated below: (1) In the time estimation task, a significant main effect of external cues appeared. Compared with the 100% group, ARE in 75% group was significantly higher, while there was no significant difference between other groups. (2) In the time production task, the main effect of the external cues was significant. Compared with the 100% groups, ARE in 75% group was significantly higher, while there was no significant difference between other groups. (3) In the time reproduction task, we did not find any statistically significant result. Based on these results, it was concluded that the temporal tasks played an essential role in the external cues' influence on apparent time judgment. Specifically, the time performance in the estimation task and production task would be distorted by external cues, while the speed of clocks would not influence the time judgment in the reproduction task. In addition, this study also found that in the production and estimation task, the speed of external cues may have an asymmetrical effect, with the slower clock more likely to bias time processing than the faster clock. The importance and originality of this study were that it explored the effect of clock-speed manipulations on short durations employing different temporal paradigms. Furthermore, the present study clarified that various temporal paradigms might involve different underlying mechanisms from a different perspective.

Keywords: subjective time distortions, production, estimation, reproduction, clocks' relative speed

Anger and Neutral Emotion Do Not Have Spatial-valance Congruence Effect: Revalidation of Polarity Correspondence Theory

Yifan Bi^{1,2}, Ye Liu^{1,2}

1 State Key Laboratory of Brain and Cognitive Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, China 100101

2 Department of Psychology, University of the Chinese Academy of Sciences, Beijing, China

Abstract: Numerous studies had focused on the interaction between emotion concepts and vertical spatial locations from the perspective of cognitive processing. And they found that people classified the emotion concepts that appeared in the metaphor congruent locations faster than those in the incongruent locations, which was called

spatial-valance congruency effect. However, there were two different theoretical explanations (based on the polarity correspondence theory or conceptual metaphor theory) for the mechanism of this phenomenon. According to the polarity correspondence theory, the reason for the congruency effect was the overlapping of the polarity advantages of different concepts, while the conceptual metaphor theory held that the congruency effect was based on the metaphor connection between different concepts. The effect had been confirmed by many studies, but the mechanism underlying the spatial-valance congruency effect was still controversial. Based on the emotional identification task, the present study aimed to compare the predictions of reaction time patterns between the two interpretations by further exploring the connection of the neutral emotion and anger with vertical space. Firstly, the language material evaluation study found that there was a connection between the concept of emotion (positive, neutral, anger and non-anger negative emotions) and the vertical space (up, middle, down). Particularly, in Chinese culture, people would correspond the concept of anger with the upper space. Experiment 1a and 1b used verbal and non-verbal stimulus materials to explore the relationship between the emotional dimension and vertical spatial location. The results showed that there was no spatial-valance congruency effect for neutral emotion and negative emotion, while there was only "positive-up" congruency effect for positive emotion when using facial expression symbols as stimuli. Experiment 2 explored the role of conceptual metaphor on spatial-valance congruency effect by using the separation of anger valence and spatial connection. Participants were asked to classify the negative words (angry words and non-anger negative emotion words) and positive words that appeared in the up and down positions. The results also showed that the spatial-valance congruency effect only occurred in the "Positive-UP" condition, while anger and other non-anger negative emotions have no spatial congruency effect. The response time patterns of three experiments reflected that neither "Neutral-MIDDLE" nor "Negative-DOWN" conditions showed the facilitation effect of spatial location on emotional understanding, only under the "Positive-UP" condition can the spatial valence congruence effect appear. Meanwhile, although there was a congruency effect under "Positive-UP" condition, this result did not exist in all experiments of the study. The above results indicated that the spatial-valance congruency effect had asymmetry and variability in the emotional dimension, these phenomena were consistent with the prediction of the polarity-based account. In addition, although the spatial mapping of anger was different from other negative emotions, there was no difference in the reaction time of negative emotion vocabulary discrimination. Therefore, we inferred that the only reason for the formation of spatial-valance congruency effect was the superposition of the positive polar, while the conceptual connection of emotion and space did not affect the generation of congruency effect. Whether this conclusion can explain other conceptual congruency effects, such as temporal-spatial or moral-spatial congruency effect, remains to be further studied.

人类吸引力信息的自动变化检测：基于视、听觉感知的比较

高瑾¹ 刘梦² Werner Sommer³ 李卫君⁴

辽宁师范大学脑与认知科学研究中心

摘要 检测社会相关信息（如吸引力）的变化，对于个体具有重要的社会和进化意义。本研究结合脑电技术，使用“偏差-标准-反转”的 oddball 范式，考察人们检测面孔和嗓音吸引力信息发生变化的认知进程及二者的差异。实验向 19 名女性被试呈现作为标准（或偏差）刺激的高吸引力面孔和嗓音以及作为偏差（或标准）刺激的低吸引力面孔和嗓音，要求其完成与吸引力无关的红鼻子（面孔加工）或白噪音（嗓音加工）探测任务。结果发现：面孔和嗓音吸引力的变化都诱发了失匹配负波（MMNs）。此外，低吸引力相比高吸引力的信息，在嗓音条件下诱发较大的失匹配负波，而在面孔条件下诱发较大的 P3。本研究表明，人们可以自动检测吸引力信息的变化，尽管面孔和嗓音吸引力的认知加工过程存在差异。此外，无论在视觉还是听觉通道，相比高吸引力信息，人们可以更好地检测低吸引力信息的变化。

Automatic Change Detection of Human Attractiveness: Comparing Visual and Auditory Perception

Gao Jin¹, LIU Meng², Werner Sommer³, LI Weijun⁴

Center for Brain and Cognitive Science, Liaoning Normal University

Abstract: Change detection of social cues across individuals plays an important role in human interaction. Here we investigated the automatic change detection of facial and vocal attractiveness in 19 female participants and recording ERPs. We adopted a 'deviant-standard-reverse' oddball paradigm where high- or low-attractive items were embedded as deviants in a sequence of standard stimuli. We observed that both facial and vocal attractiveness changes elicited mismatch negativities (MMNs). Furthermore, low-attractive versus high-attractive items induced larger mismatch negativities in the voice condition but larger P3 in the face condition. In conclusion, these data confirmed that attractiveness can be automatically detected, although differences exist between facial and vocal attractiveness processing, and unpredictable unattractive information tends to be a better change detector than attractive information.

中医医学术语空间隐喻的心理现实性与匹配效应研究

陈嘉文 胡亦琳 江雪华 李梦 马利军（通讯作者）

广州中医药大学心理学系，广州，510006, malj@gzucm.edu.cn

摘要 隐喻(metaphor)是以身体感知经验为基础，将始源域(Source domain)中熟悉、具体概念映射到目标域(Target domain)中陌生、抽象概念的过程。空间隐喻强调个体的身体结构和活动方式在认知活动中的重要作用，利用空间概念映射到非空间概念，易化对非空间概念的理解。对于无法直接感知的身体生理结构和病理现象，中医学理论基于身体感知和生活实践经验，采用“取象比类”的方法在自然界与人体两个概念系统中建立具体概念到抽象概念的映射关系，构建中医学概念的空间隐喻，以解释生命现象、阐释病理机制。本研究参考贾宁等(2018)的研究范式，采用句子启动范式，探讨中医医学术语的垂直空间隐喻映射的心理现实性以及隐喻映射的具体关系。实验1中首先呈现含有空间变化信息的陈述句，要求被试对随后呈现的中医病证术语进行病位分类判断。为考察被试是否选择性地关注启动句中某一空间位置的信息，在实验2、3中，要求被试仅关注陈述句中表示空间变化前或后的位置信息，即前一空间词汇和后一空间词汇。实验4在实验1的基础上将句-词的间隔时间由500 ms延长至4000 ms，考察句-词的间隔时间对中医术语空间隐喻心理表征的影响。结果发现，当关注启动句中某一空间位置信息时，陈述句的空间信息与病证类型的交互作用显著，表现为“下-病位在下”或“上-病位在上”的隐喻一致性。在启动句为动态空间变化语境的情况下，当句-词的间隔时间为500 ms时，表现为先呈现空间位置从下到上的句子，对随后呈现病位在下的中医病证的反应更快，出现“上-病位在下”的匹配抑制现象；当句-词的时间间隔延长至4000 ms时，表现为先呈现空间位置从下到上的句子，对随后呈现的病位在上的病证反应更快，出现“上-病位在上”的匹配易化现象，匹配抑制现象消失。研究表明，中医医学术语空间隐喻具有心理现实性，且隐喻映射具有不稳定性。同时，空间隐喻具有匹配效应，空间隐喻出现匹配抑制还是匹配易化的关键在于认知资源的竞争与释放。

关键词 中医术语，空间隐喻，句子启动。

Psychological reality and matching effect in spatial Metaphor of Chinese Medical Terms by Sentence Prime Paradigm

Chen Jiawen, Hu Yilin, Jiang Xuehua, Li Meng, Ma Lijun*

Department of Psychology, Guangzhou University of Chinese Medicine, Guangzhou, 510006,
malj@gzucm.edu.cn

Abstract: Metaphor is a process of mapping familiar and concrete concepts in the source domain to unfamiliar and abstract concepts in the target domain based on body perception experience. Spatial metaphor emphasizes the important role of individual body structure and activity mode in cognitive activities, and uses the spatial concept as the source domain to map to the non-spatial concept, thus facilitating the understanding of non-spatial concept. For cannot direct perception of the body physiological and pathological phenomena structure, traditional Chinese medicine (traditional Chinese medicine, TCM) theory based on the body perception experience and life experience, adopt the method of "comparative state" to establish the mapping relationship between the concrete concept and abstract concept in the two conceptual systems of nature and human body, and to construct the spatial metaphor of TCM concept, so as to explain the life phenomenon and explain the pathological mechanism. This study referred to the research paradigm of Jia Ning et al. (2018) and adopted the sentence priming paradigm to explore the psychological reality of vertical spatial metaphor mapping of TCM terms and the specific relationship of metaphor mapping. In experiment 1, a statement containing spatial change information was presented first, and subjects were required to classify and judge the subsequent TCM disease and syndrome terms. In order to investigate whether the subjects selectively pay attention to the information of a spatial position in the primes, in experiments 2 and 3, the subjects were required to pay attention only to the information of the position before or after the spatial change in the statements, namely, the former spatial vocabulary and the latter spatial vocabulary. In Experiment 4, the time interval between sentences and words was extended from 500 ms to 4000 ms on the basis of Experiment 1 to investigate the influence of the time interval between sentences and words on the psychological representation of spatial metaphor in TCM terms. It was found that the spatial information of the statement had a significant interaction with the type of disease, showing the consistency of "down-disease position in lower" or "up-disease position above". In the case that the priming sentence was in the dynamic spatial context, when the time interval between sentences and words was 500 ms, the sentences first present the spatial position from bottom to top, and the response to the TCM terms of disease position in lower subsequently presented was faster, and the matching inhibition phenomenon of "up-disease position in lower" occurred. When the time interval of the sentence-word was been extended to 4000ms, the sentences first present the spatial position from bottom to top, and the response to the TCM terms of disease position above subsequently presented was faster. The matching facilitation phenomenon of "up-disease position above" occurred, and the matching inhibition phenomenon disappeared. The research shows that the spatial metaphor of TCM terms has psychological reality and the metaphor mapping is unstable. At the same time, spatial metaphors have matching effects, and the key to the occurrence of matching suppression or matching facilitation of spatial metaphors lies in the competition and release of cognitive resources.

Keywords: traditional Chinese medicine terms, spatial metaphor, sentence priming.

噪音吸引力对信任合作行为的影响及其神经机制

刘智慧¹ 尚俊辰²(通讯作者)

¹ 辽宁师范大学心理学院, 大连, 116029

² 东南大学人文学院医学人文学系, 南京, 211189, junchen_20081@163.com

摘要 吸引力作为一种高级社会信息, 能够通过面孔、噪音等媒介予以传递。例如, 好看的面孔或好听的噪音使个体得到更积极的社会评价, 具有吸引力的噪音和面孔均能激活奖赏加工相关的脑区, 这提示面孔吸引力和噪音吸引力的加工可能有相似之处。有研究曾采用金钱信任游戏探究面孔吸引力对合作行为的影响,

行为结果显示被试更愿意与高吸引力面孔的合作者进行合作；ERP 结果发现高吸引力面孔会诱发更小的 P2 波幅和更大的 N2 波幅，说明个体对高吸引力面孔的加工较为快速和自动化。两人和三人最后通牒博弈任务的实验结果发现高吸引力的嗓音会提高被试对非公平性方案的接受率，说明高吸引力嗓音在一定程度上激发了个体的亲社会行为。但尚不清楚嗓音吸引力是如何影响合作行为。目前对于嗓音吸引力的神经机制的研究仍有待进一步补充。本研究引用修订后的金钱信任游戏范式，被试先听到合作者的嗓音，然后决定是否用现有的本金与另外一个人进行投资合作。如果被试同意投资，合作者可能会回赠被试金钱，也可能不会给予任何回报。进一步结合 ERP 技术来探究嗓音吸引力加工的神经机制。行为结果显示，被试更愿意与男性合作者和高吸引力嗓音合作者进行金钱投资合作；ERP 的结果发现，高吸引力男性嗓音和低吸引力女性嗓音会诱发更大的 N1 成分；低吸引力男性嗓音诱发更大的 P2 成分。在晚期加工阶段，主要是对嗓音吸引力的高级信息进行加工，高吸引力的男性和女性嗓音均会诱发更大的 P3 成分。由此可见，嗓音诱发的“美貌津贴”现象的存在，即个体更信任高吸引力嗓音的合作者，更愿意同高吸引力嗓音的合作者进行投资。此外，个体更倾向投资给男性的合作者。ERP 的结果发现，在早期加工阶段，对不同嗓音性别信息存在差异化加工。在晚期加工阶段，主要是对嗓音吸引力的高级信息进行加工。综上，嗓音吸引力在一定程度上可以预测信任决策行为。

Vocal attractiveness influence on trusting cooperative behavior: ERP and behavioral evidence

LIU Zhihui¹, SHANG Junchen²

(Department of Medical Humanities, School of Humanities, Southeast University, Nanjing, China)

(School of Psychology, Liaoning Normal University, Dalian, China)

Abstract: Attractiveness is considered as a kind of high-level social information. Attractiveness can be transmitted through face or voice. For example, attractive faces or voices make individuals positive social evaluations. Besides, attractive voices and faces both can activate reward mechanism. This suggests that the processing of facial attractiveness and vocal attractiveness may have similarities. A study used a modified trust game task to explore the impact of facial attractiveness on cooperative behavior. The behavioral results showed that participants were more likely to cooperate with the attractive faces. The ERP analysis for face stimuli showed that a smaller P2 and a larger N2 amplitude were elicited by attractive faces compared to unattractive faces. The result shows that individuals process attractive faces more quickly and automatically. A research adopted a two-person ultimatum game and a three-person ultimatum game to examine the effect of vocal attractiveness on decision-making. The results show the unfair offers from the proposers with attractive voices were more likely to be accepted. It shows that attractive voice stimulates the pro-social behavior of the individual. However, it is not clear how vocal attractiveness affects cooperative behavior. The current research on the neural mechanism of vocal attractiveness needs to be further supplemented. The aim of the present study is to further explore the influence of vocal attractiveness on cooperative behavior in the modified trust game task by using the high temporal resolution of ERPs. Participants first hear the voice of the partners, and then decide whether to invest money to the partners. If the participant agrees to invest, the partners may rebate the participant money or not give anything. Behavioral results show that subjects are more willing to cooperate with male partners and attractive voice partners. The results of ERP found that in the early stage, the information of vocal gender was processed differently. The attractive male and unattractive female voice elicited a more negative N1 amplitude. And unattractive male voice elicited a more positive P2 amplitude. In the late stage, the information of vocal attractiveness was mainly processed. Attractive voice elicited a more positive P3 amplitude. Therefore, vocal attractiveness can induce the “beauty premium”. Individuals trust partners with attractive voices and are more willing to invest in partners with attractive voices. Besides, individuals are more inclined to invest in male partners. The results of ERP found that in the early stage, the information of vocal gender was processed differently. In the late stage, the information of vocal attractiveness was mainly processed. In summary, vocal attractiveness can predict trust cooperative behavior.

Keywords: Vocal attractiveness, Trusting cooperative behavior, ERPs

心智游移与分类学习的关系

施嘉慧¹ 赵剑辉² 王腾飞¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 3100028, tfwang@zju.edu.cn

² 浙江大学医学院, 杭州, 310028

摘要 心智游移是个体的思想内容从外部的环境或任务转移到内部的思维上的现象, 在实验室任务和日常生活中均有发生。根据注意资源理论, 当心智游移发生时, 个体用于当前任务的注意资源减少, 因此心智游移会对任务绩效产生消极的影响。但以往有关心智游移与学习关系的研究多采用基于外显规则的学习任务, 鲜有研究探讨心智游移对基于内隐系统的学习任务表现的影响。而内隐学习作为一种自发的、不需要注意资源参与的过程, 有可能不会受到心智游移的影响。本研究拟选取两种类型的分类学习任务: 基于外显规则的(rule-based)和基于内隐、信息整合的(information-integration), 考察心智游移对不同类型分类学习的影响模式是否不同。本研究招募了 126 名大学生, 随机分配至其中一种分类学习任务。分类学习任务均以光栅作为刺激, 要求被试将一系列光栅分配到两个类别中, 共有 4 轮, 每轮 80 个试次。基于规则的分类学习任务可通过频率完成分类, 而基于信息整合的分类学习任务无外显规则。采用思维取样法(thought sampling)探测学习过程中的心智游移发生率。结果表明: (1)在学习前期, 心智游移与学习绩效均无显著相关; (2)在学习后期, 心智游移与基于规则的分类学习绩效存在显著负相关, 而与信息整合的分类学习绩效无相关; (3)心智游移与基于规则的分类学习绩效增长量存在负相关, 而与信息整合的分类学习绩效增长量无相关。该研究揭示了心智游移与不同类型学习的绩效间存在不同关系模式, 支持并拓展了心智游移的注意资源理论, 即心智游移只对需要注意参与的学习任务存在消极影响, 但不会影响基于内隐系统的学习任务表现。

The Relationship between Mind Wandering and Category Learning

SHI, Jiahui¹, ZHAO, Jianhui², WANG, Tengfei¹

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou

² School of Medicine, Zhejiang University, Hangzhou

Abstract: Mind wandering is a shift in the contents of thought away from an ongoing task and/or from events in the external environment to self-generated thoughts and feelings. It frequently happens in laboratory and daily lives. According to the attentional resources theory, when one's mind wanders, his attention is distracted from the ongoing task, so mind wandering is detrimental to the task performance. However, most of the previous studies about mind wandering used explicit learning tasks, and few explored the relationship between mind wandering and implicit tasks. Implicit learning, as a spontaneous process requiring few attentional resources, may not be affected by mind wandering. The current study intended to adopt two types of category learning task, rule-based learning and information-integration learning, to investigate whether mind wandering had different influence patterns on different types of category learning. 126 participants were recruited and randomly assigned to one of the category learning tasks. The category learning tasks both took Gabor patches as stimuli, and required the subjects to distribute them into two categories, with a total of 4 blocks and 80 trials in each block. Stimuli in rule-based task could be classified by spatial frequency, while the classification in information-integration task have no explicit rules. The measurement of mind wandering used thought sampling method. The results showed that, (1) there was no significant correlation between mind wandering and learning performance in the early stage of learning; (2) in the later stage of learning, mind wandering was negatively correlated with rule-based learning performance, but not correlated with information-integration learning performance; (3) mind wandering was negatively correlated with the increment of rule-based learning performance, but not correlated with that of information-integration learning performance. This study revealed that there were different relationship patterns between mind wandering and category learning tasks. It supported and expanded the attentional resources theory of mind wandering, that is, mind wandering has a negative

effect on cognitive tasks requiring attention, but does not affect those requiring little attention.

Keywords: mind wandering, category learning, thought probe, attentional resources

最后通牒博弈中金钱收益对回应者决策的影响： 公平失效与公平敏感的研究

靳佩佩¹（通讯作者） 常倩² 欧阳劲樱¹ 许伊诺¹ 李卓宇¹ 林无忌¹ 莫雷¹

1 华南师范大学心理学院, ppjin1106@foxmail.com

2 华南理工大学工商管理学院

摘要 传统经济学一个经典假设是“理性经济人”假设。近年来研究者用最后通牒博弈范式通过实验研究探讨人在经济活动中的决策问题,研究结果对传统经济学这一经典假设提出了挑战。尽管前人的研究比较一致地得出人们的经济决策受公平性的影响,随着分配方案公平性的提高,接受分配方案的人数会越来越多。但是,正如近期有研究者提出,相对于比较公平的分配方案,不公平的方案不仅公平性低,同时金钱收益也相对较低。因而,无法分清回应者的拒绝行为是由于不公平还是由于经济收益的降低;同样,在分配总金额固定的条件下,随着公平性的增加,回应者获得的经济利益也在增加,那么,也无法确定,回应者对接受这个趋于公平的分配方案,是由于公平性引起还是由于获得的经济收益增多所引起。目前的研究还无法解答这个问题。基于这个质疑,本研究进一步提出,在最后通牒博弈实验中,公平性是一个相对范畴,在同等的 unfair 分配的情况下,如果增加分配金额,使回应者所分配到的金钱数也增加,回应者是否会随着实际得到的金钱数的增加而逐步淡化对公平性的追究。进一步,本研究一个新的设想是,随着所得的经济利益数量达到一定高度,公平性不再影响人们的经济决策,达到了“公平性失效区”;与此相应,随着所分配的金钱数量不断减少,回应者就会越来越关注公平性,随着所得的经济利益数量降低到一定程度,哪怕公平性很高的分配方案,他们也倾向于不接受,达到了“公平性敏感区”。本研究通过最后通牒范式探究公平性与收益大小对回应者在经济决策中的影响。实验1通过改变收益大小探究公平在决策中的作用;实验2进一步探究了公平性在决策中较为敏感的收益范围。结果发现,公平性在决策中的作用随着经济收益的变化而发生变化,存在公平失效区与公平敏感区。本研究的结果为“理性经济人”理论的适用范围提供进一步的实证支持。

The Influence of Monetary Gains on the Responder's Decision making in the Ultimatum Game:

Research on Fairness Failure and Fairness Sensitivity

Abstract: In Ultimatum Game paradigm, responder's decision making in economic activities not only affected by fairness, but also affected by economic gains. However, in people's economic decision making, the aforementioned two factors always confound. This study analyzes the influence of fairness and monetary gains on economic decision-making through ultimatum game paradigm. By changing the monetary gains, the role of fairness in economic decision-making and the sensitive range of fairness is explored. The role of fairness in decision-making changes with the change of monetary gains, which will reach the “fairness-sensitive zone (FSZ)” and “fairness-failure zone (FFZ)”. The results show that economic decisions will be affected by fairness within a certain range of economic gains. Overall, people's economic decisions still depend on the pursuit of economic gains. This provides further empirical support for the application of rational economic man theory.

摘要 为探究新冠疫情期间社会情绪的动力机制，于新冠疫情期间（2020年2月6日至15日）对263人进行了为期10天的经验取样。结果表明，民众的积极情绪和意义感随时间显著提升，消极情绪随时间显著下降；疫情认识水平越高，积极情绪随时间提升得越快。另外，发生积极事件时，民众的积极情绪和意义感显著提升，消极情绪显著下降；性别和应激正向调节了对积极事件的社会情绪反应性。这些发现一方面揭示了疫情期间社会情绪的动态变化，也为在重大突发公共卫生事件中的社会情绪治理提供了科学依据。

统计规则调节快乐面孔的注意捕获

秦泽杰 冉德育 王相珍 任衍具（通讯作者）

山东师范大学心理学院，济南，250358，renyanju@gmail.com

摘要 许多研究表明，情绪面孔能够引起观察者的视觉注意。作为一种具有社会意义的刺激，情绪面孔对注意的捕获是否与纯粹的刺激驱动的注意捕获一样，并且当干扰项中有情绪面孔时，情绪面孔所在位置的统计规则是否能够减少其对注意的捕获。为了解决这个问题，本研究采用视觉搜索范式，通过三个实验探究快乐面孔能否捕获注意及其是否受统计规则调节。实验一要求被试从由同一模特的四个面孔（两个中性面孔、一个快乐面孔和一个悲伤面孔）中搜索一个悲伤面孔，搜索画面中可能存在也可能不存在快乐面孔（三个中性面孔和一个悲伤面孔），结果发现，当搜索画面中存在快乐面孔时比不存在快乐面孔时被试的搜索绩效（包括反应时和正确率）更低，该结果意味着快乐面孔捕获了观察者的注意。为了排除知觉上的低水平混淆会导致快乐面孔捕获注意，实验二采用倒置面孔组成的搜索阵列，结果发现倒置的快乐面孔并不会影响观察者的搜索绩效，即快乐面孔没有捕获观察者的注意，该结果排除了物理显著性对快乐面孔捕获注意的影响。实验

三操纵快乐面孔在搜索画面中某个位置出现上的概率,使快乐面孔更频繁地出现在某个位置,研究对于快乐面孔的注意捕获是否受统计规则的调节,结果发现与出现在低概率位置的条件相比,快乐面孔出现在高概率位置条件下的注意捕获效应减少了。综合三个实验的结果,我们发现在视觉搜索任务中,快乐面孔不是作为一种纯粹的自下而上的刺激驱动来够捕获观察者的注意,且快乐面孔对注意的捕获受到统计规则的调节。这启示我们统计规则对注意捕获的调节不止局限于刺激驱动的注意捕获,也可以扩展到非纯粹的自下而上的注意捕获,例如面孔所产生的注意捕获。

Statistical Regularities Modulate the Attentional Capture of Happy Faces

Zejie Qin, Deyu Ran, Xiangzhen Wang, Yanju Ren (Corresponding Author)

School of Psychology, Shandong Normal University, Jinan, 250358, renyanju@163.com

Abstract: Many studies have shown that emotional faces can attract the visual attention of observers. As a kind of social stimulus, whether emotional faces capture attention is the same as purely stimulus-driven attentional capture. And whether the statistical regularities of emotional faces' location can reduce their attentional capture when emotional faces are presented as interference items. In this study, we used visual search paradigm to explore whether happy faces can capture attention and whether it can be modulated by statistical regularities. The task of experiments for the participant was to search sad face from the same identity of four faces (two neutral faces, a happy face and a sad face), while the searching array might not exist in happy face (three neutral faces and a sad face). The result showed that performance of subjects is lower when the happy face in the array than that not in the array (including the reaction time and accuracy), indicating that happy faces can capture the attention of the observers. To rule out low level on the perception confusion can lead to a happy face to capture attention, the second experiment used the search array composed of inverted faces. It is found that the inverted faces could not affect the search performance, showing the happy faces didn't capture the attention of the observers. The result ruled out the significant impact of physical property on happy face to capture attention. The third experiment manipulated the probability of happy faces presenting at a certain position in the array, that is the happy faces appeared in a certain position more frequently. Considering that whether the attentional capture of happy face was modulated by statistical regularities, we found that the capture effect of happy face when it appeared to high probable position was less than it appeared to low probable position. Taken together, We found that happy faces were not a bottom-up stimulus to capture attention in the visual search task, and that the capture of attention by happy faces was regulated by statistical rules. This suggested that the modulation of statistical regularities on attentional capture is not limited to stimulus-driven attentional capture, but also can be extended to non-pure bottom-up attentional capture, such as the attentional capture generated by faces.

威胁对个体创造力的消极影响：来自 fNIRS 的证据

尹俊婷 罗俊龙 (通讯作者)

上海师范大学心理学系, 上海, 200234, luo831023@163.com

摘要 威胁(Threats)是指能够对个体身体或者社会地位等造成伤害的刺激,其具有真实性与直接性等特点。创造力(Creativity)是根据一定的目的,产生新颖、有用且有社会价值的产品的能力。发散思维(Divergent Thinking)与聚合思维(Convergent Thinking)是其主导成分。威胁对创造力的影响主要存在三种观点:威胁能够阻碍创造力的发挥;威胁能够促进创造力的产生;威胁与创造力之间呈倒U型关系,即中等程度的威胁最利于创造力的发挥。但因各实验对威胁操纵方式差异过大、创造力任务难度有异以及创造力维度不同,较多研究并未得出一致结论,且相关脑成像研究尚处于探索阶段。因此,本实验注重在控制创造力任务难度的情况下,采用fNIRS技术探究声音刺激所操纵的威胁对个体聚合思维的影响。预实验通过对声音刺激材料的评价

定, 选取了四种威胁声音刺激(两种女性尖叫声, 警报声与白噪音)与四种中性声音刺激(两种哈欠声, 脚步声与打字声)作为正式实验材料。正式实验为单因素被试内设计, 自变量为刺激类型, 共包括三个水平:

(1) 对照组; (2) 中性组; (3) 威胁组。因变量为被试在中文远距离联想任务(Remote association task, RAT)的正确率、正确答案的反应时与Hb和HbO₂的浓度。实验结果发现, RAT任务反应时主效应显著, $F(2, 90) = 4.13, p < 0.05, \eta_p^2 = 0.08$, 事后比较表明, 对照组反应时($M = 10488.00, SD = 3324.75$)显著高于威胁组($M = 8637.23, SD = 2742.75, p < 0.05$); 其余组差异均不显著。RAT任务正确率主效应显著 $F(2, 90) = 4.05, p < 0.05, \eta_p^2 = 0.08$, 对照组正确率($M = 8.00, SD = 1.88; p < 0.05$)显著高于威胁组($M = 6.81, SD = 1.66$), 其余组均不显著。fNIRS结果发现, 共有18个通道主效应显著, 事后比较表明, 18个通道均为对照组激活程度显著高于威胁组, 其余两组无差异, 且对照组、中性组和威胁组的大脑激活水平呈下降趋势, 与行为数据结果一致。以上实验结果验证了观点一, 即威胁能够阻碍创造力的发挥。本研究的发现为厘清威胁对创造力的影响, 以及为现实情境中培养个体创造力提供了借鉴意义。

The negative impact of physiological threats on individual creativity: Evidence from fNIRS

YIN Junting, LUO Junlong

Department of Psychology, Shanghai Normal University, Shanghai 200234, China

Abstract: Threats refer to stimuli that can cause harm to an individual's body or social status, and it has the characteristics of authenticity and directness. Creativity is the ability to produce novel, useful and socially valuable products based on a certain purpose. Divergent Thinking and Convergent Thinking are its leading components. There are three main perspectives on the impact of threats on creativity: threats can hinder creativity; threats can promote creativity; there is an inverted U-shaped relationship between threats and creativity, that is, a moderate threat is most conducive to creativity. Play. However, due to the large differences in the ways of threat manipulation, the difficulty of creativity tasks, and the different dimensions of creativity, many studies have not reached a consistent conclusion, and related brain imaging studies are still in the exploratory stage. Therefore, this experiment focuses on the use of fNIRS technology to explore the impact of physical threats manipulated by sound stimulation on individual aggregated thinking in the case of controlling the difficulty of creative tasks. The preliminary experiment selected four threatening sound stimuli (two female screams, alarm sound and white noise) and four neutral sound stimuli (two yawns, footsteps and typing) through the evaluation of sound stimulus materials. As a formal experimental material. The formal experiment is a single factor within the subject design, the independent variable is the stimulus type, and includes three levels: (1) control group; (2) neutral group; (3) threat group. The dependent variables are the correct rate of the subjects in the Chinese remote association task (RAT), the response time to the correct answer, and the concentration of Hb and HbO₂. The experimental results found that the main effect of the RAT task response was significant, $F(2, 90) = 4.13, p < 0.05, \eta_p^2 = 0.08$, and Post-hoc test found that the control group responded ($M = 10488.00, SD = 3324.75$) was significantly higher than the threat group ($M = 8637.23, SD = 2742.75, p < 0.05$); the differences in the other groups were not significant. The main effect of RAT task accuracy rate was significant, $F(2, 90) = 4.05, p < 0.05, \eta_p^2 = 0.08$, the accuracy rate of the control group ($M = 8.00, SD = 1.88; p < 0.05$) was significantly higher than that of the threat group ($M = 6.81, SD = 1.66$), the other groups were not significant. The results of fNIRS found that a total of 18 channels had significant main effects. Post-hoc test found that 18 channels were all activated in the control group significantly higher than the threat group, and there was no difference between the other two groups, and the control group, neutral group and threat group. The level of brain activation showed a downward trend, which was consistent with the results of behavioral data. The above experimental results verify the first point of view, that is, threats can hinder creativity. The findings of this study provide a reference for clarifying the impact of threats on creativity and for cultivating individual creativity in real situations.

NRF1/miR-4514/ SOCS3 通路调控精神分裂症发病的生物信息学分析

刘乙霖,余蕾,陈雅棠,曾勇

昆明医科大学第六附属医院暨玉溪市人民医院

摘要 背景: 精神分裂症 (Schizophrenia, SZ) 是一种精神病综合征, 其主要特征是出现幻觉、妄想和无逻辑性言语等精神病性症状, 以及执行能力、记忆力和精神理解力受损等认知缺陷。精神分裂症在全球人口普查患病率中约占 1%, 是全球十大致残原因之一。因此, 精分的病因以及发病机制的阐明, 对于提升诊断率和治疗效果有重要的临床应用意义和价值。精神分裂症一直是医学心理研究的热点, 但精分特征的多因素性和临床异质性使精神病学的研究发展面临许多困难。此前医学心理研究显示精分存在遗传性, 属于复杂的多基因遗传疾病, 受多重环境因素影响。选择从生物决定因素的角度去研究精神问题是医学心理研究领域长期存在的方向。方法: 本研究采用生物信息学的方法, 从公共数据库 NCBI-GEO 中下载与精分相关的 mRNA 表达谱 (GSE46509) 进行差异基因筛选, 然后利用 DAVID 数据库进行基因本体论(GO)功能注释分析和京都基因和基因组百科全书(KEGG)通路富集分析。建立了蛋白-蛋白相互作用(PPI)网络来揭示关键基因。随后通过 TargetScan 预测差异关键基因潜在的靶向 miRNA。并在实验验证的数据库中筛选与 miRNA 作用转录因子 (TF), 它们能与 pre-miRNA 启动子区域结合位点。目的是构建出 mRNA-miRNA-TF 调控网络。结果: 我们一共筛选出 1422 个差异基因, 在 GO 与 KEGG 分析结果中发现, 在肽基酪氨酸磷酸化, 转录因子活性以及神经活性配体-受体相互作用通路富集明显。构建了 PPI 网络提取了前 15 个关键基因, 选取其中的基因预测其靶向调控的 miRNA, 发现了多个低表达基因调控的 hsa-miR-4514。最后对调控 hsa-miR-4514 的上游 TF 进行预测, 发现了转录因子 NRF1 并且在 GEO 数据库筛选的基因表达谱中高表达。我们推测在精神分裂患者中存在高表达的 NRF1 调控 hsa-miR-4514 引起 SOCS3, FBXO9 以及 FBXO10 基因的低表达, 从而引起精神分裂症疾病的发生。结论: 本研究旨在利用生物信息学方法, 筛选 SZ 的关键基因、miRNA 和 TF, 构建 mRNA-miRNA-TF 调控网络, 提供精神精神分裂症发病潜在的生物标志物及可能的分子机制。

Bioinformatics analysis of NRF1/miR-4514/ SOCS3 pathway regulating schizophrenia pathogenesis

Liu Yilin, Yu Lei, Chen Yatang, Zeng Yong

The Sixth Affiliated Hospital of Kunming Medical University and Yuxi People's Hospital

Abstract: BACKGROUND: Schizophrenia (SZ) is a psychotic syndrome characterized by psychotic symptoms such as hallucinations, delusions, and illogical speech, as well as cognitive deficits such as impaired executive ability, memory, and mental comprehension. Schizophrenia has a prevalence of approximately 1% in the global census and is one of the top 10 causes of disability worldwide. Therefore, the elucidation of the etiology, as well as the pathogenesis of schizophrenia, has important clinical applications and values to improve the diagnosis rate and treatment outcome. Schizophrenia has been a hot topic in medical psychological research, but the multifactorial nature and clinical heterogeneity of the characteristics have made the development of psychiatric research face many difficulties. Previous medical-psychological studies have shown the existence of SZ, which is a complex polygenic genetic disorder and is influenced by multiple environmental factors. The choice to study psychiatric problems from the perspective of biological determinants is a long-standing direction in the field of medical psychological research. METHODS: In this study, a bioinformatics approach was used to download the mRNA expression profile (GSE46509) associated with SZ from the public database NCBI-GEO for differential gene screening, followed by gene ontology (GO) functional annotation analysis and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment analysis using the DAVID database. A protein-protein interaction (PPI) network was established to reveal hub genes. Subsequently, potential target miRNAs for differential hub genes were predicted by TargetScan. and miRNA-interacting transcription factors (TFs), which can bind to pre-miRNA promoter regions, were screened in the experimentally validated database. The aim was to construct the mRNA-miRNA-TF regulatory network.

RESULTS: We screened a total of 1422 differential genes and found significant enrichment in peptidyl-tyrosine phosphorylation, transcription factor activity, and neuroactive ligand-receptor interaction pathways in the results of GO and KEGG analysis. A PPI network was constructed to extract the top 15 key genes, and selected genes were predicted to target regulated miRNAs, and multiple low-expressing genes were found to regulate hsa-miR-4514. Finally, upstream TFs regulating hsa-miR-4514 were predicted, and transcription factor NRF1 was identified and highly expressed in the gene expression profile screened by the GEO database. We hypothesize that the presence of high expression of NRF1 in schizophrenic patients regulates hsa-miR-4514 resulting in low expression of SOCS3, FBXO9, and FBXO10 genes, which cause schizophrenia disorders. **CONCLUSIONS:** This study aimed to screen key genes, miRNAs, and TFs of SZ using bioinformatics methods, and construct an mRNA-miRNA-TF regulatory network to provide potential biomarkers and possible molecular mechanisms of schizophrenia pathogenesis.

框架效应对第三方惩罚行为的影响

杨佳苗¹, 古若雷², 崔芳³

1 深圳大学心理学系; 2 中国社科院大学心理学系; 3 深圳大学心理学系

摘要 当作为第三方观察者时, 即使事件与自身利益无关, 个体也可能去惩罚违反规范的人。这种第三方惩罚行为是一种亲社会行为, 有利于维护社会规范。先前研究发现, 作为第一方决策者时, 决策倾向会受到“框架效应”的影响。而第三方判断和惩罚行为也可能会受到对违反规范事件的描述方式(即框架)的影响, 这类现象可以被称为“第三方框架效应”。为了探索第三方框架效应的行为模式和神经机制, 本研究设计了一个行为和一个功能磁共振成像实验。实验范式结合了“社会框架”范式和“第三方惩罚”范式。作为第三方个体, 被试被告知将观看先前实验中多个被试在一项社会决策任务中的行为结果: “决策者”决定是否保留自己的经济收益而让另一个人遭受疼痛电击(在不同的框架下描述不同: 在伤害框架下被描述为“电击他人/保留金钱”; 在帮助框架下被描述为“不帮助他人/保留金钱”)。被试随后决定是否用自己的金钱来惩罚该决策者。行为结果表明, 相对于帮助框架, 被试在伤害框架下更愿意执行第三方惩罚, 即发现了显著的“第三方框架效应”。行为实验发现, 被试主观报告的对决策者的愤怒情绪调节了对接受者的疼痛共情和框架效应强度之间的关系。磁共振实验发现, 中扣带皮层和脑岛对框架的主效应均显著;而这些区域之间的功能连接性显著预测了框架效应个体差异。同时, 脑岛激活值在中扣带皮层激活值和行为的框架效应之间起中介作用。本研究揭示了“第三方框架效应”的行为特征及其可能的神经机制, 有助于理解为什么道德标准和道德行为可以是灵活且相对的。此外, 本发现也可能会拓宽对框架效应的一般理解。

To blame or not? Modulating third-party punishment with the framing effect

Yang Jia-miao¹, GU Ruo-lei², CUI Fang³

1 Department of Psychology, Shenzhen University; 2 Department of Psychology, Chinese Academy of Social Sciences; 3 Department of Psychology, Shenzhen University

Abstract: People as third-party observers, without direct self-interest, may punish norm violators to maintain social norms. However, third-party judgment and the follow-up punishment might be susceptible to the way we frame (i.e., verbally describe) a norm violation. We conducted a behavioral and a neuroimaging experiment to investigate the above phenomenon, which we call “third-party framing effect.” In these experiments, participants observed an anonymous perpetrator deciding whether to keep her/his economic benefit while exposing a victim to a risk of physical pain (described as “harming others” in one condition and “not helping others” in the other condition), then they had a chance to punish that perpetrator at their own cost. Our results show that the participants were more willing to execute third-party punishment under the harm frame compared to the help frame, manifesting a framing

effect. In Experiment 1, self-reported anger toward perpetrators mediated the relationship between empathy toward victims and the framing effect. In Experiment 2, insular activation mediated the relationship between mid-cingulate cortex activation and the framing effect; the functional connectivity between these regions could significantly predict the framing effect size. These findings shed light on the psychological and neural mechanisms of the third-party framing effect.

Keywords: framing effect, third-party punishment, functional magnetic resonance imaging, mid-cingulate cortex, insula

风险决策的群体极化效应

张丁柠 胡谊

华东师范大学心理与认知科学学院 上海 200062

摘要 群体决策将个人最初的平均反应往更极端化的方向推进,这一现象称为群体极化。为了探究风险决策的群体极化效应的神经机制,本研究招募共 57 名被试,每 3 名被试组成一个群体,借助 fNIRS-超扫描技术同时记录 3 人在实验任务中前额叶和左侧颞顶区域的脑活动,风险预期(优势、劣势)×得失情景(赢、输)共 4 种决策情景随机出现,每种决策情景出现 12 次,被试先完成 48 轮个体决策,然后在群体决策中集中讨论并对相同的 48 轮决策达成共识。研究发现,在风险优势和劣势情景下出现了不同方向的群体极化:风险优势时群体比个体更加冒险,风险劣势时群体比个体更加谨慎。神经结果发现,相对于个体决策,在群体决策时背外侧前额叶和颞顶联合区出现了更高的脑同步,并且群体极化与群体脑同步增加有关。

关键词 群体极化,群体脑同步,风险决策, fNIRS

The Group Polarization Effect of Risky Decision-making

Zhang Dinning, hu Yi

School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062

Abstract: Group decision-making pushes the individual's initial average response to a more extreme direction, a phenomenon known as group polarization. In order to explore the neural mechanism of the group polarization effect, this study recruited a total of 57 subjects, who formed 19 group of 3 subjects. With the help of fNIRS-hypersanning technology, the brain activities of 3 people were recorded in the prefrontal cortex and left temporal parietal region during the experimental task at the same time. Risk expectations (risk-advantages, risk-disadvantages) × Gain or loss domain (win, lose), formed 4 decision-making scenarios appear randomly, each decision-making scenario appeared 12 times. Participants first completed 48 rounds of individual decision-making, and then in the group came into discussion and reached consensus on the same 48 rounds of decision-making. The study found that group polarization in different directions appeared under risk advantages and disadvantages: groups are more risky than individuals when in risk- advantages case, and are more cautious than individuals when they are risk-disadvantages case. The neurological results found that compared with individual decision-making, higher brain synchronization occurred in the dorsolateral prefrontal lobe and temporoparietal region during group decision-making, and group polarization was related to increased group neural synchronization.

Keywords: Group polarization, Group neural synchronization, Risk decision-making, fNIRS

社交焦虑者注意偏向变化的时间进程:来自稳态视觉诱发电位的证据

郑俊猛 曹斐臻 陈燕铃 余林伟 徐强

宁波大学

摘要 本研究以稳态视觉诱发电位(SSVEP)作为表征注意分配的指标,采用点探测范式,考察亚临床社交焦虑者注意偏向变化的时间进程,并分析注意控制能力与社交焦虑、负性注意偏向之间的关系。结果发现,高社交焦虑组(HSA)在 180~1500ms 时段,相较于快乐和中性面孔,愤怒面孔诱发的 SSVEP 波幅最大;低社交

焦虑组(LSA)在 500~2500ms 时段,快乐面孔诱发的 SSVEP 波幅最大。进一步对差异波的分析发现,在整个刺激呈现过程中(180~2500ms),与快乐-中性、中性-中性条件相比,HSA 组在愤怒-中性条件下的差异波最大;而 LSA 组在快乐-中性条件下的差异波最大。此外,被试的注意控制能力得分与社交焦虑得分、负性注意偏向指数均存在显著的负相关,且 HSA 组被试的注意控制能力得分显著低于 LSA 组。结果表明,高社交焦虑个体对威胁刺激早期表现出注意警觉,随后可能由于注意控制能力受损,未能做出适应性回避,最终表现为持续注意警觉。

The time course of attentional bias in social anxiety: evidence from steady-state visual evoked potentials

Zheng Junmeng, Cao Feizhen, Chen Yanling, Yu Linwei, XU Qiang

Ningbo university

Abstract : This study aimed to use steady-state visual evoked potential (ssVEP) as an indicator to characterize attention allocation to investigate the time course of changes in attentional bias of individuals with social anxiety to threatening social stimuli, and to further analyzed the relationship between attention control ability, social anxiety and negative attention bias. Selected the average amplitude of ssVEP in the period of 180~2500ms for analysis, and divided the four time windows of 180~500ms (time1), 500~1000ms (time2), 1000~1500ms (time3), 1500~2500ms (time4). The results found that in the HSA group, the ssVEP amplitude induced by the angry face was the largest in the 180~1500ms period compared with the happy and neutral faces; in the LSA group, the ssVEP amplitude induced by the happy face was the largest in the 500~2500ms period. Further analysis of the difference wave found that during the whole stimulus presentation process (180~2500ms), the HSA group had the largest difference wave under anger-neutral conditions, while the LSA group had the largest difference wave under happy-neutral conditions. In addition, attention control ability was negatively correlated with social anxiety and negative attention bias. The results showed that individuals with social anxiety initially showed vigilance to threat stimuli, and then may fail to make adaptive avoidance due to impaired attention control ability, and finally showed sustained vigilance.

Keywords: social anxiety, attention bias, attentional vigilance, attentional control, steady-state visual evoked potential.

摘 要 本研究以人教版七年级下册数学教材为知识载体,基于认知诊断理论开发了七年级平面几何诊断测验,并通过测验提供的信息开展了诊断分析,研究结果表明:1.预测卷基于 G-DINA 模型从 S-X2,Disc(区分度),DIF(项目功能差异)这三个指标对项目进行拟合检验后删除了 18 个项目,剩余 24 道题组成了正式卷;2.属性层级一致性指标 HCI 值为 0.638,且测验具有较好的结构效度;3.基于 CTT 框架下,正式卷的测验的克伦巴赫 α 系数为 0.744,基于 CD 框架下,测验的属性分类一致性信度处于[0.754, 0.908]之间,分类精确性信度处于[0.715, 0.897]之间;4.被试的知识属性平均掌握概率处于(0.365, 0.830)之间,被试的掌握模式总共估计出 58 种,其中掌握全部属性(11111111)的人数最多,共有 126 人,占全部总人数(643 人)的 19.5%。总

之, 该测验具有良好的计量指标, 符合测量学要求, 可应用于实践。

Development of the 7th Grade Plane Geometry

Cognitive Diagnostic Test

Gong Yi, Gao XuLang

Guizhou Normal University School of Psychology, Guiyang, 550000, gaoxl9817@foxmail.com

Abstract: This study developed a diagnostic test of 7th grade plane geometry based on the cognitive diagnostic theory by using the mathematics textbook of the second book of 7th grade of the Human Education version as the knowledge carrier, and carried out diagnostic analysis through the information provided by the test. The results showed that: 1. The HCI value of the attribute level consistency index was 0.638, and the test had good structural validity; 3. The mean probability of mastery of the attributes was between (0.365, 0.830), and the total number of mastery patterns was estimated to be 58, among which the largest number of subjects mastered all the attributes (11111111) was 126, accounting for 19.5% of the total number of subjects (643). In conclusion, the test has good measures that meet the measurement requirements and can be applied in practice.

儿童工作记忆训练的效果：来自行为和 ERPs 的证据

徐洁, 邓美琪, 南文雅, 蔡丹 (通讯作者)

上海师范大学教育学院, 上海, 200234 caidan@shnu.edu.cn

摘要 目的: 工作记忆(WM)训练可以提高参与者在相关任务中的行为表现, 但是关于训练对儿童行为表现和神经生理学结果的影响, 目前的研究结果还不尽一致。本研究的主要目的是考察 WM 训练对儿童 WM 任务行为表现及大脑神经活动的影响。方法: 将 31 名儿童(平均年龄 7.70 岁, 女生 13 名, 男生 18 名)随机分为训练组和对照组。对训练组的 21 人开展工作记忆训练, 对照组参加班级自习学习活动。训练任务采用空间 N-back 任务和计算广度任务相结合, 两个任务都是从低难度开始训练, 并根据儿童的任务表现来调整训练任务的难度, 一共完成 20 次训练, 每次训练分钟。在第一次训练和最后一次训练时收集儿童的脑电数据, 在训练开始前和完成后使用 N-back 任务和数字倒背任务考察儿童 WM 水平。结果: 前后测重复测量方差分析结果表明, 训练组 2-back 任务后测成绩的显著提升。同时, ERPs 的结果也表明 WM 训练对儿童的大脑神经活动产生了一定的影响, 在空间 1-back 任务中具体表现为非目标试次 P3a 和 P3b 潜伏期的缩短, 在空间 2-back 任务中具体表现为 P3b 振幅的增加以及 P3a 和 P3b 潜伏期的缩短。结论: WM 训练能够提高儿童在 WM 任务中的行为表现, 同时也会对儿童大脑神经活动产生一定的影响。本研究在一定程度上证明了儿童 WM 训练的效果及可行性, 初步说明了开展相关研究的潜力及局限性, 为日后相关研究的开展提供了一定的参考。

The effects of Working Memory training in children revealed by behavioral responses and ERPs

XU Jie, DENG Mie-qi, NAN Wen-ya, CAI Dan

(School of Education, Shanghai Normal University, Shanghai 200234)

Abstract: Introduction: Recent studies have examined the effect of computerized cognitive training on working memory (WM), but the behavioral and neural effects were uncertain. Also, few studies explored WM training effects on children using event-related potentials (ERP). The purpose of our study was to investigate the effects of WM training in children, including the effects on behavioral performance and neurophysiological outcomes. Methods: A sample of 31 healthy children (mean age=7.70, $SD=0.59$, 13 females) was assigned to the training group and the control group. Over 20 training sessions, the training group participated in two training tasks, computation-span and

spatial n-back tasks, whereas the control group just joined in normal class activities. Event-related potentials (ERPs) data were collected at the first and the last training session to analyze the training effect on P3a and P3b ERP components. Pre- and post-test evaluation on WM tasks (digit span backwards task, n-back task) were performed to examine the training effect on behavior performance. Result: The results showed WM training led to improved performance in the digit span backwards task and 2-back task of post-test evaluation, shortened P3a and P3b latencies in nontarget trials during the spatial 1-back task, shortened P3a latency in target and nontarget trials as well as increased P3b amplitude and shortened P3b latency in target trials during the spatial 2-back task. Conclusion: These results suggested that WM training might enhance children's behavioral performance on WM tasks and brought about neurophysiological changes. This study gives insights into the potential of WM training effects on children's behavioral performance and neurophysiological outcomes.

反刍思维对中学生非自杀性自伤行为的影响：经验性回避的中介作用及心理弹性的调节作用

梁雅婷¹ 攸佳宁²

1 浙江大学心理与行为科学系, 杭州, 310058

2 华南师范大学心理学院, 广州, 510631, youjianing@gmail.com

摘要 非自杀性自伤行为 (Non-suicidal self-injury, NSSI) 是中学生主要的公共健康危害之一。反刍思维与 NSSI 的关系已由情绪级联模型证明, 但潜在的中介、调节因素少有人探索。本文从情绪调节功能的视角检验了经验性回避的中介作用, 以及心理弹性调节直接效应的作用。使用反刍思维量表、接纳与行动问卷、青少年心理弹性量表、NSSI 问卷调查广西 1378 名中学生 (40.1%男生, Mage=14.98), 结果显示: 中学生反刍思维可正向预测 NSSI, 且经验性回避在其中起到部分中介作用; 心理弹性可缓冲反刍思维对 NSSI 的影响。本研究启示心理健康教育者与 NSSI 的临床干预者可以运用心理弹性教学、认知行为治疗等方式改善中学生的消极情绪调节过程与 NSSI。

Effects of rumination on non-suicidal self-injury behavior of middle school students: mediating effect of experiential avoidance and moderating effect of psychological resilience

Liang Yating, Yau Ka Ning

1 Zhejiang University, Hangzhou, 310058

2 South China Normal University, Guangzhou, 510631, youjianing@gmail.com

Abstract : Non-suicidal self-injury (NSSI) is a major public health hazard among middle school students. The relationship between rumination and NSSI has been demonstrated by Emotional Cascade Model, but the potential mediators and moderators, which may aggravate or buffer this influence, have seldom been explored. From the perspective of emotional regulation, the current study tested the mediating effect of experiential avoidance and the moderating effect of resilience on the arising of NSSI. The sample consisted of 1378 Chinese participants (40.1% boys; mean age = 14.98) recruited from middle schools in Guangxi Zhuang Autonomous Region. They completed questionnaires regarding rumination, experiential avoidance, resilience, and NSSI. SPSS 25.0 and Amos 21.0 were applied to conduct bootstrap and hierarchical regression analysis. The results indicated that: Rumination could positively predict NSSI, and this correlation was partly mediated by experiential avoidance; Resilience could weaken the effect of rumination on NSSI. All hypotheses were supported. This model gave an interpretation about how rumination, experiential avoidance, and resilience impact NSSI. Also, it provided a practical implication that cognitive behavioral therapy, psychology lesson on resilience, and so on, may be useful to prevent negative emotional

regulation, as well as NSSI.

Keywords: Rumination, Experiential avoidance, Resilience, Middle school students, Non-suicidal self-injury.

儿童期逆境问卷（ACE-IQ）的修订及其信效度检验

宋炜玲（通讯作者） 周春燕

1 中国地质大学(武汉) 心理科学与健康研究中心, 武汉, 430074, 1242246550@qq.com

摘要 目的: 对儿童期逆境国际问卷(Adverse Childhood Experiences-International Questionnaire, ACE-IQ)在我国中学生群体中进行修订, 并进行信效度检验。方法: 首先由本研究小组3位成员、一位心理学副教授和一位英语专业研究生对项目进行翻译及回译工作。修订版的问卷删除了有关战争和集体暴力的逆境内容, 增加了符合中国现实情况的两种逆境类型(留守经历和目睹灾害伤亡), 对两种逆境的表述进行了改变(欺凌/孤立/排挤和目睹暴力), 对详细描述暴力形式的三个逆境类型的题项进行了合并。修订改编后的ACE-IQ问卷共包含14种逆境类型, 即14个条目, 共22个具体描述, 采用是否计分方式。本研究选取中部地区某省多个县市的初中、普高、中职、职高共计12所学校, 每个学校每个年级随机抽取一个班发放线上问卷, 共收集4909份问卷, 其中有效问卷共4807份, 回收有效率为97.92%。被试年龄在12~18岁, 平均为14.80±1.47岁。对4807份有效问卷进行项目分析、内部一致性系数分析, 2419份用于验证性因素分析, 2388份用于验证性因素分析, 另选取118名中学生进行间隔2周后的重测, 进行重测信度分析。采用抑郁障碍自评量表、中文版焦虑敏感性指数量表和生活满意度问卷作为校标。结果: ①修订后的ACE-IQ问卷共14个条目, 22个逆境描述, 包括4个维度: 儿童虐待忽视、家庭外暴力、家庭功能障碍和父/母缺失。②各项目得分与维度分之间均显著相关($r=0.40\sim0.84, P<0.01$)。采用独立样本t检验比较各条目在高低分组的差异, t值在6.65~61.53之间, $P<0.001$, 各条目区分度良好。探索性因素分析得到4个公因子, 儿童虐待忽视、家庭功能障碍、父/母缺失和家庭外暴力, 累积方差贡献率为50.00%。验证性因素分析结果发现四因子模型与数据拟合较好($\chi^2/df=6.34, CFI=0.92, IFI=0.92, RMSEA=0.05$)。修订后的ACE-IQ问卷的K-R20系数为0.71, 重测信度为0.73。相关分析表明, ACE-IQ总分与抑郁($r=0.36, P<0.01$)呈显著正相关, 与焦虑敏感($r=0.30, P<0.01$)呈显著正相关, 与生活满意度($r=-0.27, P<0.01$)呈显著负相关。③本研究中发生率最高的逆境类型是留守经历(40.65%), 其次是身体忽视(33.26%), 排在第三的是情感忽视(21.47%)。发生率最低的是家庭功能障碍维度的三个逆境类型, 家人入狱(0.92%)、家人患精神疾病(1.12%)、家人有物质滥用(2.16%)。结论: 修订后的中文版儿童期逆境问卷具有良好的信度和效度, 可作为我国中学生儿童期逆境的测量工具。

Reliability and Validity of the Adverse Childhood Experiences - International Questionnaire (ACE-IQ) in the Chinese Adolescents

SONG Weiling, ZHOU Chunyan

Research Center for Psychological and Health Sciences, China University of Geosciences, Wuhan(430074), China

Abstract: Objective: To review and revise the Adverse Childhood Experiences - International Questionnaire (ACE-IQ) among Chinese adolescents. Methods: Three members of the research team, a psychological professor and an English major graduate student translated and back-translated the project. The revised questionnaire deleted adversity on war and the collective violence content, increased the two types of adversity which accords with the reality of China (left-behind experience and witness casualty), to change two kinds of adversity expression (bullying/ isolation/ excluded and witnessing violence), three types of adversity in the form of violence against a detailed description of item merged. The revised ACE-IQ questionnaire contains 14 adversity types, that is, 14 items, a total of 22 specific descriptions, and the scoring method is adopted. A total of 12 schools including junior middle schools, general high schools, secondary vocational schools and vocational high schools were selected from a province in central China. A class was randomly selected from each grade of each school to issue online questionnaires. A total of 4909

questionnaires were collected, of which a total of 4807 were effective, with a recovery efficiency of 97.92%. The middle school students were tested with the adverse childhood experiences - international questionnaire (ACE-IQ), depression self-rating scale for children (DSRSC), childhood anxiety sensitivity index in children (CASI-C) and satisfaction with life scale (SWLS). The test was conducted in 12 middle schools, general high schools, secondary vocational schools and vocational high schools in a province of central China. 4807 valid questionnaires were obtained for project analysis and internal consistency coefficient analysis, 2419 for confirmatory factor analysis, 2388 for confirmatory factor analysis, 118 middle school students were randomly selected for retesting using the revised scale at intervals of six months. Results: ①The revised ACE-IQ consists of 14 items and 22 adversity descriptions, including 4 dimensions: child maltreatment and neglect, violence outside the home, family dysfunction, and parent/parent absence. ②There was a significant correlation between the scores of each item and the dimension scores ($r = 0.40 \sim 0.84$, $P < 0.01$). Independent sample t-test was used to compare the differences between high and low groups. The T value was between 6.65 and 61.53, $P < 0.001$. Four common factors were extracted by exploratory factor analysis, and the cumulative contribution rate was 50.00%. The confirmatory factor analysis data fit well ($\chi^2/df = 6.34$, CFI=0.92, IFI=0.92, RMSEA=0.05), which supported the four-factor model. The K-R20 coefficient for the total scale is 0.71, and the retest reliability was 0.73. The correlation analysis showed that the total scores of childhood adversity and scores of various dimensions were significantly positively correlated with depression ($r=0.36$, $P<0.01$) and anxiety sensitivity ($r=0.30$, $P<0.01$), and negatively correlated with life satisfaction ($r=-0.27$, $P<0.01$). ③In this study, the most common type of adversity was left behind experience (40.65%), followed by physical neglect (33.26%), followed by emotional neglect (21.47%). The three adversity types of family dysfunction dimension had the lowest incidence: family imprisonment (0.92%), mental illness (1.12%) and substance abuse (2.16%). Conclusions: The revised Chinese version of the Adverse Childhood Experiences - International Questionnaire has good reliability and validity, which can be applied to evaluate the level of adverse childhood experiences among Chinese adolescents.

父母问题性手机使用对儿童执行功能的不良影响： 科技干扰的中介作用

江萍¹ 杨晓辉²（通讯作者）

¹ 陕西师范大学，陕西，710062

² 陕西师范大学心理学院，西安，710062, yangxiaohui@snnu.edu.cn

摘要 科技干扰是指人们在日常交往互动中被数字科技设备打断或侵扰的现象。家庭中，由于数字科技设备导致的亲子之间互动的干扰或中断被称为亲子科技干扰，亲子科技干扰通常由父母问题性手机使用导致。已有研究表明，智能手机会干扰亲子关系，这种亲子科技干扰与儿童社会情绪发展有关。然而，目前没有研究探究父母问题性科技使用与儿童执行功能之间的关系。作为一种高级认知过程，执行功能控制和协调各种过程的运作，是与学业成就和社会情感能力相关的一系列发展领域的基础。本研究的目的是探讨父母问题性手机使用与科技干扰是否与儿童执行功能有关。本研究选取 472 名 3-9 岁儿童的家长为被试，通过改编的问题性手机使用量表、科技设备干扰量表和儿童执行功能清单分别调查父母手机使用、科技干扰和儿童执行功能表现的情况。结果表明，父母问题性手机使用会导致亲子互动中更多的科技干扰，并且父母问题性手机使用和科技干扰与儿童执行功能问题呈正相关，科技干扰是父母问题性手机使用与儿童执行功能关系之间的中介因素。本研究的结果强调了父母媒体使用行为对儿童执行功能的重要影响，研究人员和教育工作者应该帮助家长认识到媒体使用的效果取决于科技设备的使用方式，并帮助家长养成健康的媒体使用习惯。

Parents busy with phone Tend to have kids lower in EF: the mediating role of technofence

Ping Jiang, Xiaohui Yang*

School of Psychology, Shaanxi Normal University, No.199, South Chang'an Road, Xi'an, China.

Abstract: Technofence refers to the phenomenon that people are interrupted or disturbed by digital technology devices in their daily interactions. In the family, the interference or interruption in parent-child interaction caused by digital technology devices is called parent-child technofence, which is usually raised by parents' problematic mobile phone use. Studies have shown that smart phones can interfere with parent-child relationship, which is related to children's social emotional development. Nonetheless, no studies examine the association between parental problematic technology use and children's executive function (EF). As an advanced cognitive process, executive function controls and coordinates the operation of various processes, which is the basis of a series of development fields related to academic achievement and social emotional ability. The purpose of this study was to explore whether parental problematic mobile phones use and technofence are associated with EF of children. 472 parents of children aged from 3 to 9 years old were selected as subjects to investigate their mobile phone use, technofence and children's executive function performance through the adapted Problematic Mobile Phone Use Scale, adapted Technology Device Interference Scale and The Childhood Executive Functioning Inventory. Results indicated that parental problematic mobile phone use can lead to more technofence in parent-child interaction, and both parental problematic mobile phones use and technofence were positively associated with the problems of children's EF. Technofence was a mediating factor between parental problematic mobile phones use and children's EF. These findings emphasize the important influence of parental media use behavior on the children's EF. Researcher and educators should help parents realize that the effects of media use depend on how the technology is used, and help parents to develop healthy digital habits.

Keywords: parental mobile phone use, technofence, executive function, media use

熟悉危险，让安全更亲近！ ——熟悉性与威胁性对幼儿无意视盲的影响

冯娜¹ 张慧¹（通讯作者） 王楠¹ 严聪聪¹ 纪倩茹¹

¹ 浙江师范大学杭州幼儿师范学院（特殊教育学院），杭州，310000, zhanghui1987@zjnu.cn

摘要 幼儿对威胁相关刺激的认知经验往往非常有限，这导致他们对威胁刺激的熟悉度较低。现实生活中，真正能造成重大伤害的威胁刺激一般都以意外刺激呈现，快速有效地在非预期条件下觉察威胁刺激对个体的生命安全起着重要的作用。本研究将基于无意视盲（IB）范式，考察刺激的威胁性与熟悉性对幼儿觉察非预期刺激的影响。我们采用改编版的 Odd Ball 范式，考察了 258 名 4-5 岁幼儿对低熟悉-高威胁刺激（蛇和刀）、高熟悉-低威胁刺激（蜗牛和勺子）和低熟悉-低威胁刺激（手电筒和田螺）中的 IB 率。结果发现：（1）在生物性刺激中，幼儿对低熟悉-高威胁刺激的 IB 率显著高于低熟悉-低威胁刺激，威胁性的刺激更不容易被觉察；但是幼儿对低熟悉-高威胁和低熟悉-低威胁刺激的 IB 率没有显著差异。这意味着幼儿在生物性刺激的注意加工中，威胁性发挥着作用，而熟悉性没有。（2）在非生物性刺激中，幼儿对低熟悉-低威胁刺激的 IB 率显著高于高熟悉-低威胁刺激，熟悉的刺激更容易被觉察；但是幼儿对低熟悉-低威胁和高熟悉-低威胁刺激的 IB 率没有显著差异。这表明幼儿对非生物性刺激的加工中，熟悉性起着重要作用，而威胁性没有。本研究结果提示着，熟悉性与威胁性对幼儿注意加工的影响会基于刺激的生物性而有所不同，对非生物性刺激，熟悉性的作用更重要，这意味着适当增加幼儿对威胁相关刺激的认知经验非常重要，尤其对非生物性刺激，比起危险的刺激，他们对熟悉的刺激更敏感。

Can we get children's safety by keeping them away from danger? —No! A study on attentional bias based on inattention blindness

Feng Na¹, Zhang Hui¹, Wang Nan¹, Yan Congcong¹, Ji Qianru¹

¹ Hangzhou College of Preschool Teacher Education, Zhejiang Normal University, Hangzhou, 310000

Abstract: Young children do not have many cognitive experience of threat-relevant stimuli, which makes them not familiar with these things. The harmful threat-relevant stimuli always appear unexpectedly and the attentional bias to these things are critical in daily life. This study would like to explore preschoolers' attentional bias to dangerous and familiar objects based on inattention blindness (IB) task. We applied the adapted Odd Ball paradigm to explore the IB rates to low-familiarity-high-threat stimuli (snakes and knives), high-familiarity-low-threat stimuli (snails and spoons) and low-familiarity-low-threat stimuli (flashlights and escargots) in 258 4-5-year-old preschoolers. We found that (1) For animate stimuli, preschoolers' IB rates on low-familiarity-high-threat stimuli were significantly higher than that of low-familiarity-low-threat stimuli, threatening stimuli are less likely to be detected; but the character of familiarity does not play an important role in these detection, which showed that no significant difference occurred on the IB rates between low-familiarity-low-threat and high-familiarity-low-threat stimuli. (2) For inanimate stimuli, preschoolers' IB rates on low-familiarity-low-threat stimuli were significantly higher than that of high-familiarity-low-threat stimuli, familiarity stimuli are more possible to be detected; but no significant difference occurred on the IB rates between low-familiarity-high-threat and low-familiarity-low-threat stimuli, which means that the character of threaten does not play an important role for these detection. The results suggest that the character of familiarity plays more important role than threaten in inanimate stimuli, but for animate stimuli, the importance of the two characters are opposite. It signified that proper increase of the exposure to threat-relevant stimuli is also crucial, especially for inanimate stimuli, which may increase preschoolers' intuitive cognitive experience and enhance their vigilance to these stimuli.

中国青少年家庭功能的异质性：基于潜在剖面分析

白慧慧¹ 王雨晴^{1,2} 付马亚皓¹

¹ 陕西师范大学心理学院，西安，710062

² 陕西省哲学社会科学重点研究基地-儿童青少年心理与行为健康研究中心，西安，710062，

wyq1994@snnu.edu.cn

摘要 采用家庭亲密度与适应性量表、人际指针量表，对陕西省、江苏省五所普通中小学校的 1922 名青少年进行调查，并用潜在剖面分析方法探索中国青少年家庭功能潜在类别，以及考察不同家庭功能潜在类别的青少年人口学特征及其观点采择能力。结果发现：(1)中国青少年家庭功能存在明显的异质性，分为四种潜在类别：高家庭功能组、家庭功能良好组、中等家庭功能组和家庭功能不良组，分别占比为 17.8%、37.0%、31.0%、14.2%；(2)不同家庭功能潜在类别受性别与年级的影响，女生(比男生)和中学生(比小学生)更容易处于不良家庭功能组；(3)青少年观点采择得分在不同家庭功能潜在类别上存在差异：高家庭功能组 > 家庭功能良好组 > 中等家庭功能组 > 家庭功能不良组。由此，中国青少年家庭功能整体处于较高水平，各类型大致呈现“钟形”分布，且不同家庭功能潜在类别受到人口学变量的影响，同时也不同程度地作用于青少年的发展。

Heterogeneity in Family Function among Adolescents in China: Based on Latent Profile Analysis

Huihui Bai¹, Yuqing Wang^{1,2}, Yahao Fuma¹,

1 School of Psychology, Shaanxi Normal University, Xi'an, 710062

2 Shaanxi Provincial Key Research Center of Child and Mental Health, Xi'an, 710062

Abstract: A total of 1,921 adolescents were surveyed from 5 primary and middle schools in Shaanxi and Jiangsu provinces by using Family Cohesion and Adaptability Evaluation Scales and Interpersonal Index Questionnaire. The results showed that: (1) four profiles of family function were identified: high family function group (17.8%), good family function group (37.0%), medium family function group (31.0%), and family dysfunction group (14.2%); (2) both gender and grade predicted the profile of adolescent's family function, and girls (compared with boys) and middle school students (compared with primary school students) were more susceptible to family dysfunction group; (3) there were significant differences of scores of adolescents' perspective taking in the four profiles: high family function group > good family function group > medium family function group > family dysfunction group. Thus, the overall family function of adolescents in our country was at a relatively high level and the four profiles are roughly "bell-shaped" distribution, meanwhile different profiles of family function were affected by demographic variables and also influenced the development of adolescents to varying degrees.

特质感恩和亲密关系对大学生人际宽恕的影响：来自 ERP 的证据

许忠涛¹ 卢家楣¹（通讯作者）

1 上海师范大学教育学院，上海，200234，lujiamei@vip.163.com

摘要 现实生活中的冒犯事件往往不可避免，而宽恕可以缓解冲突、化解矛盾，有利于构建和谐的人际关系。全国调查研究发现，大学生宽恕感得分在人际情感类别中排名倒数第一，平均分仅有 4.90 分，说明大学生宽恕感总体水平相对较低，亟待提高。以往的研究发现，特质感恩可以正向预测个体的宽恕行为，但这一结论主要基于问卷调查，缺少实证支持。就与冒犯者的关系而言，受害者与冒犯者的亲密关系程度是影响个体人际宽恕的重要因素。本研究从实证角度出发，采用泰勒攻击范式来考察特质感恩感和亲密关系对大学生人际宽恕的影响，并通过使用 ERP 技术考察了特质感恩感和亲密关系对大学生人际宽恕信息加工时电生理反应的影响。研究结果显示：(1)高特质感恩感大学生相比于低特质感恩感大学生对不同亲密关系冒犯者均选择了更低比例的高强度惩罚；(2)相比于陌生冒犯者，受害者均对亲密冒犯者选择了更低比例的高强度惩罚，表现出更高的内在宽恕意向；(3)高特质感恩感大学生和低特质感恩感大学生在选择惩罚强度和输赢结果反馈时的大脑电生理反应不同，具体表现在 LPP 和 P300 波幅上，具体而言，低特质感恩感大学生在选择惩罚强度时表现出更正的 P300 和 LPP 波幅，在输赢结果反馈时表现出更大的 P300 波幅；(4)受害者在面对亲密、陌生冒犯者选择惩罚强度时的大脑电生理反应不同，表现在 LPP 波幅上，具体而言，受害者在面对陌生冒犯者选择惩罚强度时表现出更正的 LPP 波幅。总之，本研究结果表明特质感恩和亲密关系影响大学生的人际宽恕。其结果不仅在实证层面丰富了有关于大学生人际宽恕的研究，还为大学生人际宽恕的干预提供了启示和方向。

The Influence of Trait Gratitude and Intimacy on College Students' Interpersonal Forgiveness: Evidence from ERP

Zhongtao Xu¹, Jiamei Lu^{1*}

1 School of Education, Shanghai Normal University, Shanghai, 200234

*Email: lujiamei@vip.163.com

Abstract: In real life, offensive events are inevitable, while interpersonal forgiveness can ease conflicts, resolve conflicts and build harmonious interpersonal relations. Forgiveness refers to the feeling of forgiving others and peace

of mind. The national survey found that the score of forgiveness of college students ranked the last in interpersonal feelings, the average score was only 4.90, indicating that the overall level of forgiveness of Chinese college students is relatively low and needs to be improved urgently. From the perspective of victims, trait gratitude positively predicted forgiveness behavior, but this conclusion is mainly based on questionnaires and lacks empirical support. In terms of the relationship context of offense, relationship closeness between the victim and the offender is also an important influencing factor of interpersonal forgiveness. From an empirical perspective, this study used Taylor's attack paradigm to investigate the influence of trait gratitude and intimate relationship on interpersonal forgiveness of college students. The results showed that : (1) Compared with individuals with low trait gratitude, individuals with high trait gratitude chose a lower proportion of high-intensity punishment for both close offenders and strangers; (2) Compared with the stranger offenders, the victims all chose a lower proportion of high-intensity punishment for the close offenders, and showed a higher internal forgiveness intention; (3)The brain electrophysiological responses of high trait gratitude individuals and low trait gratitude individuals are different when choosing the intensity of punishment and the feedback of win or lose results. Specifically shown in LPP and P300 amplitudes, low trait gratitude individuals induce more negative P300 and LPP amplitude when choosing punishment intensity and win-lose result feedback, and more negative P300 amplitude when winning and losing result feedback; (4) The brain electrophysiological responses of the victims were different when they chose the intensity of punishment for the close and strange offender, which was reflected in the LPP amplitude. Specifically, the victims induced more negative LPP amplitude when they chose the intensity of punishment for the strange offender. In summary, the results of this study show that gratitude feeling and relationship closeness affect college students' interpersonal forgiveness. The results not only enrich the empirical research on college students' interpersonal forgiveness, but also provide inspiration and direction for the intervention of college students' interpersonal forgiveness.

摘 要 本研究根据价值不同属性细化资源价值的同时，创新定义资源客观价值，首次清晰探究 4-9 岁儿童基于数量、客观价值和主观价值的公平规范执行行为的发展。结果显示：（1）儿童公平规范执行行为的发展会因资源分配情境和不公平提议而存在早晚差异；（2）儿童基于价值的公平规范执行行为出现晚于基于数量的公平规范执行行为；（3）资源主观价值会抑制儿童公平规范执行行为的发展；（4）儿童对绝对不公平提议更容易表现出公平规范执行行为。这些发现不但详细阐述儿童公平规范执行行为的发展特点，而且能够为保障个体之间合作活动的持续性以及进行公平规范教育提供既全面又具针对性的建议。

关键词 资源价值，提议不公平，公平规范执行。

Equal injustice not punishment at the same time: the development characteristics of children's fair and standard implementation behavior in different resource allocation situations

Zhu Naping¹, Liu Yanling², Xiong Hongmei³, Zhao pan⁴

1,3,4 Jiangxi Normal University of science and technology, Nanchang, 330038

2 Department of education, Jiangxi Normal University of science and technology, Nanchang, 330038, 48060302@qq.com

Abstract: While refining resource value according to different attributes of value, this study innovated the definition of objective value of resources, and for the first time clearly explored the development of fair normative execution behavior of children aged 4-9 based on quantity, objective value and subjective value. The results show:(1) The development of children's fair normative enforcement behavior is different in the morning and evening due to the situation of resource allocation and unfair proposals;(2) Children's value-based fair norm enforcement behavior appeared later than quantity-based fair norm enforcement behavior;(3)The subjective value of resources inhibits the development of children's fair and normative executive behavior;(4) Children are more likely to show fair normative behavior in response to absolutely unfair proposals. These findings not only elaborate on the developmental characteristics of children's fair norm enforcement behavior, but also provide comprehensive and targeted suggestions for ensuring the continuity of cooperative activities between individuals and carrying out fair norm education.

Keywords: resource value, the level of unfair proposal, fair and standard implementation

感知教师支持、同伴关系与大学生心理健康的关系： 现实利他行为和网络利他行为的中介作用

张乐琳，王艳红，冯琳琳(通讯作者)

山东理工大学马克思主义学院，山东 淄博，255000

摘 要 目的：根据生态系统理论，微系统作为直接作用于个体发展的近端因素，在个体发展过程中起着关键性作用。除家庭环境之外，学校环境也是对个体产生重要影响的微系统。教师和同伴是学校环境中主要构成要素，尤其对于身处成长关键期的大学生来说，在与教师和同伴的互动过程中，思维理念、实际行动等均会受到影响。因此，本研究探讨感知教师支持、同伴关系与大学生心理健康的关系，以及现实利他行为和网络利他行为在其中的中介作用。方法：采用感知教师支持行为问卷、同伴关系满意度量表、自我报告利他量表、网络利他行为量表和一般健康问卷对 553 名大学生进行问卷调查。结果：(1) 性别差异分析结果显示，感知教师支持和网络利他行为存在显著的性别差异，男生的感知教师支持和网络利他行为水平显著高于女生；(2) 相关分析结果显示，感知教师支持、同伴关系与现实利他行为和网络利他行为呈显著正相关、与心理健康呈显著负相关；现实利他行为和网络利他行为与心理健康呈显著负相关。(3) 结构方程模型分析结果表明，感知教师支持、同伴关系能够正向预测现实利他行为和网络利他行为、负向预测大学生心理健康，现实利他行为和网络利他行为能够负向预测大学生心理健康，现实利他行为和网络利他行为在感知教师支持、同伴关系与大学生心理健康之间的中介作用显著；(4) 性别多群组分析结果表明，现实利他行为和网络利他行为在感知教师支持、同伴关系与大学生心理健康之间的中介作用不存在显著的性别差异。结论：感知教师支持、同伴关系不仅可以直接预测大学生心理健康，而且可以通过现实利他行为和网络利他行为间接预测大学生心理健康。因此，教师应为学生提供足够的支持，形成良好的师生关系，同伴之间应友好相处、互相包容、积极沟通，共同营造和谐健康的互动环境。

关键词 感知教师支持，同伴关系，现实利他行为，网络利他行为，心理健康

Perceived Teachers' Support, Peer Relationship and College Students' Mental Health: The Mediating Effects of Reality and Internet Altruistic Behavior

Zhang Lelin, Yanhong Wang, Feng Linlin (Correspondence)
(School of Marxism, Shandong University of Technology, Zibo Shandong, 255000,
fenglinlin@sdut.edu.cn)

Abstract: According to the microsystem theory, as a proximal factor directly acting on individual's development, microsystem plays a key role in the process of individual's development. In addition to the family environment, the school environment is also a microsystem that has an important impact on individuals. Teachers and peers are the main elements in the school environment. Especially for college students in the critical period of growth, their thinking ideas and practical actions will be affected in the process of interaction with teachers and peers. Therefore, this study explored the relationships between perceived teachers' support, peer relationship and college students' mental health, as well as the mediating effects of reality and internet altruistic behavior. Methods: This study adopted the Perceived Teacher's Support Questionnaire, Peer Relationship Scale, Self-Reported Altruism Scale, Internet Altruism Scale, and General Health Questionnaire to conduct measurements in 553 university students. Results: (1) The results of gender differences analysis indicated that there are significant gender differences in perceived teachers' support and internet altruistic behavior. The level of perceived teachers' support and internet altruistic behavior of boys is significantly higher than that of girls. (2) The results of the correlation analysis revealed that perceived teachers' support, peer relationship, reality and internet altruistic behavior are significantly correlated. (3) The results of the structural equation model analysis indicated that perceived teachers' support and peer relationship can positively predict reality and internet altruistic behavior, and negatively predict college students' mental health, reality and internet altruistic behavior can negatively predict college students' mental health. The mediating effects of reality and internet altruistic behavior are significant. (4) The results of the multi-group analysis of gender differences showed that there is no significant gender difference in the mediating effects of reality and internet altruistic behavior between perceived teachers' support, peer relationship and college students' mental health. Conclusion: Perceived teachers' support and peer relationship can not only directly predict college students' mental health, but also indirectly predict college students' mental health through reality and internet altruistic behavior. Therefore, teachers should provide enough support for students and form a good relationship between teachers and students. Peers should get along well, tolerate each other and communicate actively, so as to jointly create a harmonious and healthy interactive environment.

Keywords: perceived teachers' support, peer relationship, reality altruistic behavior, internet altruistic behavior, mental health

摘 要 2019-nCoV 的出现与爆发不仅引发了我们对公共卫生体系的一些反思, 同时也将在线学习迅速地推

入大众视野。在移动学习迅速发展的今天，在线教育用户规模已然非常庞大。由于在线学习是一种相对缺乏外部监督的学习方式，自我调节对于小学生进行有效的在线学习来说显得尤其重要。因此，探讨在线自我调节学习的影响因素以及研究各因素在时间进程中的特点与关系具有现实的学习者个体意义和重要的社会意义。研究基于自我决定理论和刺激-有机体-反应框架，采用追踪设计对 337 名小学生进行了间隔一学年的三次调查，考察学生人际环境、心境状态对在线自我调节学习的影响。结果发现：（1）感知教师自主支持、感知同伴自主支持均可以通过心境状态的中介作用来对小学生在线自我调节学习发挥作用；（2）在 T2、T3 时间点，心境状态在师生互动与在线自我调节学习的关系中起中介作用，而其在生生互动与在线自我调节学习之间的中介效应不显著；（3）T1 感知教师自主支持能够显著正向预测 T2 自我调节学习，而 T1 感知同伴自主支持不能显著预测 T2 自我调节学习；（4）在线自我调节学习能够显著正向预测之后的师生互动和生生互动。因此，心境状态在教师和同伴的支持性因素与小学生的在线自我调节学习的关系中发挥了重要的中介作用，且这种中介效果在师生互动过程中表现得更加明显。此外，在线自我调节学习作为小学生在学习过程中所表现出的一种积极的行为，也能够为之后的师生互动和生生互动提供一定的反馈作用。最后，研究结果也预示着不同角色的自主支持可能在时间进程中发挥着不同的作用，为在线教育的更有效开展提供了有益的指导。

关键词 在线自我调节学习，自主支持，心境状态，S-O-R 框架，小学生

The Relationship of Different Interpersonal Contexts, Mood State and Primary School Students' Online Self-regulated Learning: A Longitudinal Study

*E-mail: tangyun@ccnu.edu.cn

Abstract: The emergence and outbreak of 2019-nCoV not only triggered some reflections on the public health system, but also quickly pushed online learning into the public's view. With the rapid development of mobile learning today, the scale of online education users is already huge. Since online learning is a learning method that lacks external supervision, self-regulation is especially important for elementary school students to conduct effective online learning. Therefore, exploring the influencing elements of online self-regulated learning and studying the characteristics and relationships of various factors in the time course have practical individual learner significance and crucial social significance. Based on the self-determination theory and the stimulus-organism-response framework (S-O-R), 337 primary school students were recruited three times with one academic year interval using a longitudinal research design to investigate the influence of students' interpersonal contexts on their mood state and online self-regulated learning. The results showed that: (a) perceived teacher's autonomy support and perceived peer's autonomy support could play a role in primary school students' online self-regulation learning through the mediating effect of mood state; (b) Whether it is at T2 or T3, mood state played a mediating role in the relationship between teacher-student interaction and online self-regulated learning, but its mediating effect between student-student interaction and online self-regulated learning was not significant; (c) T1 perceived teacher's autonomy support could significantly positively predict T2 self-regulated learning, while T1 perceived peer's autonomy support cannot significantly predict T2 self-regulated learning; (d) online self-regulated learning significantly positively predicted the subsequent teacher-student interaction and student-student interaction. Therefore, the mood state plays an essential intermediary role in the relationship between the supportive factors of teachers and peers and the online self-regulated learning of primary school students, and this intermediary effect is more obvious in the process of teacher-student interaction. In addition, as a positive behavior displayed by elementary school students in the learning process, online self-regulated

learning may also provide some feedback for subsequent teacher-student interactions and student-student interactions. Finally, the research results also indicate that the autonomous support of different roles may play different roles in the time process, which provides helpful guidance for the more effective development of online education.

高一学生求助数学教师行为对数学成绩的影响： 链式多重中介模型

代文武¹ 李兆岚¹ 贾宁² (通讯作者)

1 河北师范大学教育学院, 石家庄, 050024

2 河北师范大学教育学院, 石家庄, 050024, jnaih@126.com

摘要 数学是科学、工程和技术学科的基础, 如何提升学生数学成绩成为了研究热点。本研究采用整群抽样法抽取甘肃和河北 3 所学校的高一学生共 986 名 (45.1%女生), 采用《中学生感知到的教师支持问卷》、《数学学业情绪量表》、《中学生数学学习投入量表》和《求助数学教师行为问卷》作为测量工具进行调查, 探讨感知到的数学教师支持、积极学业情绪和数学学习投入在高一学生求助数学教师行为对数学成绩的影响机制中的作用。研究发现: (1) 求助数学教师行为、感知到的数学教师支持、积极学业情绪、数学学习投入和数学成绩两两之间存在显著的正相关; (2) 求助数学教师行为对于数学成绩的影响模型中有三重路径, 第一重路径是求助数学教师行为显著正向预测数学成绩; 第二重路径为, 感知到的数学教师支持、积极学业情绪和数学学习投入起简单中介作用; 第三重路径为四条链式中介作用, 包括: 感知到的数学教师支持→积极学业情绪、感知到的数学教师支持→数学学习投入、积极学业情绪→数学学习投入以及感知到的数学教师支持→积极学业情绪→数学学习投入的链式中介作用。因此, 高一学生求助数学教师行为与数学成绩之间存在链式多重中介模型。综上所述, 研究结果有助于理解求助数学教师行为如何影响数学成绩, 强调了为未来教育干预提供了学科指导的必要性。

Asking Teachers for Help and Mathematical Achievement in Chinese Senior One Students: A Multiple Mediation Model

Dai Wenwu¹, Li Zhaolan¹, Jia Ning¹(corresponding author)

1 College of Education, Hebei Normal University, Shijiazhuang, 050024

Abstract: Mathematics is the foundation of many science and technology, so how to improve mathematical achievement has been a research hot spot. This study assessed 986 senior one students (45.1%girls, M-age=15.63 years old, SD=0.81) to examine the role of perceived teacher support, positive academic emotions, and math engagement as mediators in the relationship between asking math teachers for help and mathematical achievement. The results indicated that there is a triple prediction path in the relationship between asking math teachers for help and mathematical achievement. The results show: the first path, asking math teachers for help can positively predict mathematical achievement; the second path contains three simple mediation effects: perceived teacher support, positive academic emotions and math engagement; the third path contains four chain mediation effects: the serial mediation effect of perceived teacher support and positive academic emotions, the serial mediation effect of positive academic emotions and math engagement, the serial mediation effect of perceived teacher support and math engagement, the serial mediation effect of perceived teacher support, positive academic emotions and math engagement. This study shows that for the senior one students, there is a multiple mediation model in the relationship between asking math teachers for help and mathematical achievement. Taken together, findings contribute to understanding how asking math teachers for help influences mathematical achievement and highlight the necessity to provide subject-specific guidance for the future educational intervention.

童年期心理虐待对身体欣赏的影响：自然联结的调节作用

国庆雪（通讯作者） 刘爱书

哈尔滨师范大学，哈尔滨，8800435312@163.com

摘要 目的：探讨自然联结在童年期心理虐待和身体欣赏关系中的调节作用。方法：采用童年期心理虐待量表、自然联结量表、身体欣赏量表对 567 名大学生进行调查。结果：（1）童年期心理虐待和身体欣赏呈显著负相关，自然联结和身体欣赏呈显著正相关；（2）自然联结可以调节童年期心理虐待和身体欣赏之间的关系。在高自然联结水平下，童年期心理虐待对身体欣赏的负向预测作用显著，低自然联结水平下，童年期心理虐待对身体欣赏的负向预测作用不显著。结论：童年期心理虐待对身体欣赏的负向预测作用会随着自然联结水平的升高而减弱。

关键词 童年期心理虐待，自然联结，身体欣赏

Moderating Effects of Connectedness to Nature between Childhood Psychological Maltreatment and Body Appreciation

National Day snow¹, Liu Aishu²

Harbin Normal University

Abstract: Objective: The aim of the present study was to investigate the potential moderating roles of connectedness to nature in the association between childhood psychological maltreatment and body appreciation. Methods: A sample of 576 college students was recruited in this study to complete the Child psychological maltreatment scale, the Connectedness to Nature Scale, and Body Appreciation Scale. Results: (1) Childhood psychological maltreatment was negative were related with body appreciation, connectedness to nature was positive related with body appreciation.(2) Connectedness to nature moderated the relationship between childhood psychological maltreatment and body appreciation. That is, there was a significant negative relationship between childhood psychological maltreatment and body appreciation under the high connectedness to nature, but this relationship was not significant at lower connectedness to nature. Conclusion: The negative predictive effect of childhood psychological maltreatment on body appreciation decreased with the increase of connectedness to nature.

Keyword: child psychological maltreatment, connectedness to nature, body appreciation

童年环境压力对女大学生异性人际信任的影响： 生命史策略的中介作用

田野¹ 刘爱书²

哈尔滨师范大学，哈尔滨，18604582333@163.com

摘要 基于进化心理学的生命史理论探究童年环境压力与女大学生异性人际信任的关系。方法：采用童年经济地位量表、童年亲子关系量表、Mini-K 量表、一般信任量表以及殊化信任量表收集 690 名女大学生样本进行问卷调查。结果：女大学生童年环境压力通过生命史策略对一般男性信任及殊化伴侣信任的间接效应显著。其中，童年亲子关系通过生命史策略对女大学生异性人际信任的遮掩效应显著。结论：童年环境压力对女大学生的异性人际信任存在影响。

Childhood environmental Stress and Heterosexual Interpersonal Trust of Female College Students: The mediating role of the life history strategy

Tian tian¹, Liu Aishu²

Harbin Normal University

Abstract: Objective: To explores the mediating effect of the life history strategy between childhood environmental stress and heterosexual interpersonal trust of female college students. Methods: A sample of 690 female college students were test with childhood socioeconomic status Scale, childhood parent-child relationship Scale, Mini-K scale, general trust scale and Special Trust scale. Results: The indirect effects of childhood environmental stress on male trust and special trust on the partner were significant through life history strategy. Among them, parent-child relationship has a significant covering effect on female college students' heterosexual interpersonal trust through life history strategy. Conclusion: Childhood environmental stress has influence on female college students' heterosexual interpersonal trust.

Keywords: childhood environmental stress, heterosexual interpersonal trust, life history strategy, general trust, special trust

社会比较对高、低耐挫大学生考试失败后悲伤情绪预期的影响

冯萌萌¹ 康佳¹ 杨博茜¹ 都旭¹ 白学军¹ (通讯作者)

1 天津师范大学心理学部, 天津, 300387, baixuejun@tjnu.edu.cn

摘 要 社会比较指个体将自己的处境、能力等与他人进行比较的过程(Festinger, 1954), 会影响个体的情绪体验。本研究旨在考察社会比较是否影响考试失败后的悲伤预期, 以及在何种耐挫心理水平下社会比较对考试失败后的悲伤预期影响更大。研究一, 考察社会比较对失败后悲伤预期的影响。采用单因素 3 水平(社会比较: 无比较、与好朋友比较、与陌生人比较)被试内实验设计。252 名大学生在四六级考试前一周, 回答如下题目: (1) “如果你没有通过四六级考试, 你的难过程度?” (无比较); (2) “如果您的好朋友通过了考试, 您没通过, 您的难过程度?” (与好朋友比较); (3) “如果您不熟悉的人通过了考试, 您没通过, 您的难过程度?” (与陌生人比较), 问题均采用 11 点计分。结果发现: 社会比较存在主效应 ($F_{(2, 502)} = 78.23, p < 0.001, \eta^2 = 0.24$)。大学生与好朋友比较时的悲伤预期 ($M=7.66, SD=3.01$) 显著强于与陌生人比较 ($M=5.71, SD=3.16, p < 0.001$); 无比较时的悲伤预期 ($M=7.79, SD=2.80$) 显著强于与陌生人比较 ($p < 0.001$)。表明大学生与好朋友比较时更易产生强烈的悲伤情绪预期。研究二, 探讨高、低耐挫水平在社会比较对失败后悲伤预期影响中的作用。采用 3 (社会比较: 无比较, 与好朋友比较、与陌生人比较) $\times$ 2 (耐挫分组: 高耐挫组、低耐挫组) 混合实验设计。270 名大学生在四六级考试前一周填写《大学生耐挫心理问卷》, 选取问卷总分前 27% 的被试为高耐挫组 ($n=73$), 后 27% 的被试为低耐挫组 ($n=73$), 实验材料同研究一。结果发现, 交互作用显著 ($F_{(2, 288)}=3.19, p < 0.05, \eta^2=0.04$)。对低耐挫大学生而言, 无比较 ($M=7.56, SD=2.93$) 和与好朋友比较时 ($M=7.85, SD=2.86$) 的悲伤情绪预期显著强于与陌生人比较时 ($M=5.85, SD=3.14, ps < 0.001$), 但无比较和与好朋友比较时的悲伤情绪预期无显著差异 ($p > 0.05$); 对高耐挫大学生而言, 无比较时 ($M=7.15, SD=2.93$) 的悲伤情绪预期显著高于与好朋友比较时 ($M=6.25, SD=3.65$) 和与陌生人比较时 ($M=4.60, SD=3.66, ps < 0.05$), 大学生与好朋友比较时的悲伤情绪预期显著强于与陌生人比较时 ($p < 0.001$)。表明低耐挫大学生在与好朋友比较时更易产生强烈的悲伤情绪预期, 而高耐挫大学生在与好朋友比较时的悲伤情绪预期有所缓解。

关键词 社会比较, 耐挫心理, 四六级考试, 失败后悲伤预期

The influence of social comparison on the sadness expectation of college students with high or low perseverance after failed in the exam

Mengmeng Feng¹, Jia Kang¹, Boxi Yang¹, Xu Du¹, Xuejun Bai¹

¹ Faculty of psychology Tianjin Normal University, Tianjin, 300387, baixuejun@tjnu.edu.cn

Abstract: Social comparison refers to the process in which an individual compares his situation, ability, etc. with others (Festinger, 1954), which will affect an individual's emotional experience. The purpose of current study is to investigate whether social comparison affects sadness expectation after failed in the exam, and under what level of perseverance, social comparison has a greater impact on the expectation of sadness after failing in the exam. The first study examined the effect of social comparison on sadness expectation after failure. One-way ANOVA of three-level (social comparison: no comparison, comparison with good friends, comparison with strangers) in within subject experiment design was conducted. One week before CET-4 and CET-6, 252 college students answered the following questions: (1) "how sad are you if you don't pass CET-4 or CET-6?" (no comparison); (2) "If your good friend passes the exam and you fail, how sad are you?" (compare with good friends); (3) "If someone you don't know passes the exam and you don't, how sad are you?" (compared with strangers). Questions were scored by 11 points. The results showed that the main effect of social comparison was significant ($F_{(2, 502)} = 78.23, p < 0.001, \eta^2 = 0.24$). The college students' sadness expectation of failure in comparison with their good friends ($M = 7.66, SD = 3.01$) was significantly stronger than that in comparison with strangers ($M = 5.71, SD = 3.16, p < 0.001$), and the sadness emotion when not compared ($M = 7.79, SD = 2.80$) was significantly stronger than that when compared with strangers ($p < 0.001$). It reveals that college students are more likely to have strong sadness emotional expectations when compared with good friends. The second study examined the influence of social comparison on the sadness expectation after failure with high or low perseverance college students. Use 3 (social comparison: no comparison, comparison with good friends, comparison with strangers) $\times$ 2 (perseverance group: high perseverance group, low perseverance group) mixed experimental design. One week before CET-4 and CET-6, 270 college students were selected to complete the undergraduate perseverance scale. The first 27% of the total score of the scale were selected as the high perseverance group ($n = 73$), and the last 27% were selected as the low perseverance group ($n = 73$). The experimental materials were the same as those in the first study. The results showed that the interaction was significant ($F_{(2, 288)} = 3.19, p < 0.05, \eta^2 = 0.04$). For the students with low perseverance, the expectation of sadness emotion in no comparison ($M = 7.56, SD = 2.93$) and comparison with good friends ($M = 7.85, SD = 2.86$) was significantly stronger than that in comparison with strangers ($M = 5.85, SD = 3.14, ps < 0.001$), but there was no significant difference between no comparison and comparison with good friends ($p > 0.05$); For college students with high perseverance, the expectation of sadness emotion in no comparison ($M = 7.15, SD = 2.93$) was significantly higher than that in comparison with good friends ($M = 6.25, SD = 3.65$) and strangers ($M = 4.60, SD = 3.66, ps < 0.05$), and the expectation of sadness emotion in comparison with good friends was significantly stronger than that in comparison with strangers ($p < 0.001$). The results show that the students with low perseverance are more likely to have strong sadness emotion expectation when compared with their good friends, while the sadness expectation of the students with high perseverance eases in comparison with their good friends.

Keywords: social comparison, perseverance, CET 4 and CET 6, sadness expectation after failure

儿童期心理受虐者情绪诱发视盲研究

张磊¹ 刘爱书² (通讯作者)

¹ 哈尔滨师范大学发展与教育心理学, 哈尔滨, 150500

² 哈尔滨师范大学发展与教育心理学, 哈尔滨, 150500, liuaishu@163.com

摘要 儿童期遭受心理虐待, 会对个体产生持续的消极影响, 增加其罹患精神疾病的风险。追踪研究发现心理虐待经历与抑郁呈显著正相关, 探究心理虐待经历对抑郁的影响机制有利于提供干预的方法。情绪诱发

视盲 (Emotion-induced blindness, EIB) 是指在识别一个威胁或恐惧刺激干扰图像后, 随后目标刺激识别受损的现象。唤醒偏向竞争理论 (arousal-biased competition theory, ABC) 认为刺激知觉突出性是产生情绪诱发视盲的主要因素。金钱奖赏能激发动机从而提升行为成绩。金钱奖赏可以削弱情绪诱发视盲。研究发现, 心理虐待者存在明显的负性注意偏向, 并且儿童期虐待经历改变了个体奖赏加工方式。根据前人研究与问卷测量提出以下假设: (1) 心理虐待组在负性刺激下情绪诱发视盲效应更强, 持续时间更长。(2) 金钱奖赏削弱了非心理虐待组的情绪诱发视盲, 心理虐待组不受影响。本研究使用实验对照设计, 通过心理虐待量表筛选被试, 筛选心理虐待个体 30 人和与之匹配的非心理虐待个体 30 人参与实验; 采用 RSVP 范式测量情绪诱发视盲。实验 1: 2 (组别) × 2 (干扰物效价) × 4 (Lag) 混合实验设计, 测量心理虐待个体在基线条件下的情绪诱发视盲。实验 2: 2 (组别) × 2 (干扰物效价) × 2 (金钱奖赏类型) 混合实验设计, 探究金钱奖赏对心理虐待个体情绪诱发视盲的削弱作用。研究结果: (1) 在负性刺激干扰条件下, 两组对目标识别的正确率有显著差异。(2) 随着 Lag 位置增加目标识别的正确率逐渐恢复到基线水平。(3) 操纵金钱奖赏水平不能削弱心理虐待组情绪诱发视盲。研究结论: (1) 心理虐待组存在注意脱离困难, 表现为情绪诱发视盲效应更强, 持续时间更长。(2) 心理虐待组改变奖赏加工, 金钱奖赏不能削弱情绪诱发视盲。这些结果提示心理虐待者对负性刺激存在注意脱离困难并且对积极刺激反应不敏感, 这是儿童期心理虐待影响抑郁情绪的影响机制。

Emotion Induced Blindness in Adult Survivors of Childhood Psychological Maltreatment

Zhang Lei¹, Liu Aishu²

1 Harbin Normal University, Harbin

2 Harbin Normal University, Harbin

Abstract: Psychological abuse during childhood has a persistent negative effect on individuals and increases their risk of developing psychiatric disorders. The tracing study found a significant positive correlation between the experience of psychological abuse and depression, and it is beneficial to explore the mechanism of the psychological abuse experience on depression to provide an intervention method. Emotion Induced Blindness (EIB) refers to the impairment in the identification of a neutral target image that follows a threatening or fearful distractor image. Arousal biased competition theory (ABC) suggests that stimulus salience is a major factor in producing emotion induced blindness. Monetary reward would motivate people and enhance the behavior. Studies have shown monetary rewards can attenuate emotion induced blindness. Found significant negative attentional biases in psychological abuse, and childhood maltreatment experiences altered individual reward processing. The following hypotheses were proposed based on previous studies and questionnaire measurements: (1) The psychological abuse group showed stronger and longer lasting emotionally induced blind effects under negative stimuli. (2) Monetary rewards attenuate emotion induced blindness in the non psychological abuse group, while the psychological abuse group is unaffected. This study used an experimental control design, according to Child Psychological Maltreatment Scale, 30 psychological abuse individuals and 30 matched non psychological abuse individuals were selected to participate in the experiment; emotion induced blindness was measured using the RSVP paradigm. Experiment 1: 2 (group) × 2 (distractor valence) × 4 (Lag) mixed task. Measurement of emotion induced blindness under baseline conditions in individuals with psychological abuse. Experiment 2: 2 (group) × 2 (distractor valence) × 2 (monetary reward type) mixed task, probing the attenuating effects of rewards on emotion induced blindness in individuals with psychological abuse. Results: (1) There was a significant difference between the two groups in the rate of correct target recognition when the negative stimulus interfered. (2) The correct rate of target recognition gradually returned to baseline as the lag position increased. (3) Manipulating the level of monetary reward does not attenuate emotion induced blindness in the psychological abuse group. Conclusion: (1) Attention disengagement difficulties were present in the psychological maltreatment group and manifested as stronger and longer lasting effects of emotion induced visual blindness. (2) Childhood psychological abuse experiences altered individual monetary reward processing,

monetary rewards can not attenuate emotion induced blindness. These results implicate attentional disengagement difficulties and insensitivity to positive stimuli in the development of depression in psychological abuse.

Keywords: psychological abuse, emotion induced blindness, monetary reward

孰因孰果？中学生公正世界信念与社会心态关系的纵向追踪

摘要 采用公正世界信念量表、中国人社会心态量表对 373 名中学生（其中初中生 240 名，高中生 133 名）进行为期 17 个月的两阶段纵向追踪调查。其中第一次调查的时间是 2019 年 6 月，共发放问卷 515 份，回收问卷 489 份；第二次调查的时间是 2020 年 10 月，共发放问卷 471 份，回收问卷 436 份。通过交叉滞后回归分析考察中学生公正世界信念与社会心态的发展变化及其相互预测关系。结果发现：（1）前后测公正世界信念、社会心态之间均存在显著差异，在性别上差异不显著；（2）在公正世界信念与社会心态的整体关系上，前测的公正世界信念可以显著正向预测后测的社会心态，前测的社会心态也可以显著正向预测后测的公正世界信念；（3）而对于高社会心态组的中学生，前测公正世界信念能显著正向预测后测社会心态，反之则无法预测。且对于低社会心态组的中学生，两变量间没有预测关系。研究结果提示虽然在整体关系上，两变量间相互预测、互为因果；但是只有当中学生本身处于积极社会心态时，公正世界信念才会对后续社会心态的形成具有预测作用。该结果采用纵向设计的交叉滞后分析方法克服了现有横向研究仅能揭示变量间相关关系的不足，有利于探讨公正世界信念与社会心态间的相互预测关系或因果关系，有利于考察公正世界信念与社会心态间的长期作用机制，从而扩展、深化该领域的理论研究成果；同时，研究成果可以为中学生公正世界信念和积极社会心态的培育实践提供实证性依据和支持，提高中学生公正世界信念水平可以从培育其积极社会心态角度入手，培育中学生积极社会心态也可以从提高其公正世界信念角度入手。

关键词 公正世界信念，社会心态，交叉滞后分析，中学生

What Was Causing What? Longitudinal tracking of the Relationship between Belief in a Just World and Social Mentality among Middle School Students

Feng Wenjing¹, He Anming¹

Abstract: A two-stage longitudinal survey was conducted on 373 middle school students which include 240 junior high school students and 133 high school students using the Just World Belief Scale and the Chinese Social Mentality Scale for 17 months. The first survey was in June 2019, with a total of 515 questionnaires distributed and 489 questionnaires recovered; and the second survey was in October 2020, with a total of 471 questionnaires distributed and 436 questionnaires recovered. The cross-lagged regression analysis was used to investigate the development and prediction of belief in a just world and social mentality among middle school students. The results showed that: (1) There were significant differences in belief in a just world and social mentality before and after test, but no significant differences in gender; (2) On the overall relationship between belief in a just world and social mentality, the pretest belief in a just world can significantly positively predict the post-test social mentality, and the pretest social mentality can also significantly positively predict the post-test belief in a just world; (3) For middle school students in the high social mentality group, the pretest belief in a just world can significantly positively predict the post-test social mentality, and vice versa, it is unpredictable. And for middle school students in the low social mentality group, there is no predictive relationship between the two variables. The results suggest that the two variables predict each other and cause each other in the whole middle school students. However, only when the middle school students themselves are in a positive social mentality, belief in a just world can predict the formation of subsequent social mentality. This result uses the cross-lagged regression analysis to overcome the shortcomings of existing horizontal studies that can only reveal the correlation between variables, and is conducive to exploring the mutual predictive

relationship or causality between belief in a just world and social mentality, and is conducive to investigating belief in a just world the long-term mechanism of interaction with the social mentality, thereby expanding and deepening the theoretical research results in this field; at the same time, the research results can provide empirical evidence and support for the cultivation of middle school students' belief in a just world and a positive social mentality, and improve the level of middle school students' belief in a just world. It can start from the perspective of cultivating their positive social mentality; cultivating a positive social mentality of middle school students can also start from the perspective of enhancing their belief in a just world.

Keywords: belief in a just world; social mentality; cross-lagged regression analyses; middle school students

基于海明距离变异指数的 CD-CAT 选题策略

李俊杰 郑慧婧 康春花 曾平飞 (通讯作者)

浙江师范大学 浙江省智能教育技术与应用重点实验室 浙江 金华 321004 zpf@zjnu.co

摘要 认知诊断计算机化自适应测验 (Computerized Adaptive Testing for Cognitive Diagnosis, CD-CAT) 兼具认知诊断功能和自适应思想,能够量体裁衣式地为个体适于其知识状态的题目进行作答,相比传统认知诊断测验,效率更高,且能够为个体知识状态提供更为丰富的个性化信息。选题策略作为 CD-CAT 的一个核心环节,直接影响整体测验的准确性和效率。当前已有许多研究者提出参数选题策略,通过最大化信息函数、最小化香农熵等方式进行选题,使得某些题目过度曝光,题库安全性下降。本研究拟构建一种基于海明距离变异指数的非参数选题策略(Hamming Distance Non-parametric Difference index, HD-NDI),通过模拟研究探讨其在 CD-CAT 中的题库安全性及选题效果。本研究构建的海明距离变异指数(HD-NDI)是通过使用海明距离对当前被试估计的各种知识状态赋予不同的权重,并据此构建被试在某个项目上理想正确作答的期望。随后根据被试在该题理想正确作答的变异程度,并以题目的变异程度构建本研究的非参数变异指数。最后,各种题目依据非参数变异指数确定哪些题目能够最大程度的确定被试的知识状态,并据此进行选题施测,实现 CD-CAT 的选题过程。在 0-1 计分情境中,构建出海明距离变异指数选题策略。根据当前得到的各 IRP 与 ORP 计算各属性掌握模式的海明距离,选择具有最大 HD-NDI 值 Q 向量所对应的项目。HD-NDI 的具体步骤为:第

一步,找出最适 Q 向量:计算各属性掌握模式 IRP 与被试 ORP 的海明距离;接着计算被试对题目 j 的期望

作答反应并计算 $HD-NDI_j$ 指标。第二步,随机选择 $HD-NDI_j$ 最大的 Q 向量对应的题目为下一题进行

施测。重复上述步骤,直至满足测验终止规则。HD-NDI 第一步可以保证整个 CD-CAT 做到量体裁衣式的自适应测验,提高测验效率;第二步可以降低项目的曝光率,保护题库,提高测验的安全性。研究设置了两个模拟研究,研究一为 4 选题策略(SHE、PWKL、MI、HD-NDI)×3 标定参数样本容量(30, 50, 100)×3 题库质量(高、低、混合)×3 被试分布(均匀分布、低相关多元正态分布、高相关多元正态分布)的四因素模拟设计。研究二为 5 选题策略(HD-NDI、RP_PWKL、DBS、NPS、WNPS)×3 标定参数样本容量(30, 50, 100)×3 题库质量(高、低、混合)×3 被试分布(均匀分布、低相关多元正态分布、高相关多元正态分布)的四因素模拟设计。研究采用长度为 L=25 的定长法来终止测验。采用以下评价指标:属性模式判准率(pattern correct classification

rate, PCCR)、 χ^2 、测验重叠率(Test Overlap Rate, TOR)、选题策略平均用时。结果表明:(1) HD-NDI 的分类准确性高,并优于其他的选题策略;(2) HD-NDI 的题目使用均匀性好,并优于未加入曝光控制的选题策略;(3) HD-NDI 降低测验重叠率效果好,并优于未加入曝光控制的选题策略;(4) HD-NDI 能更有效降低选题消耗的时间。

New CD-CAT Item Selection Method based on Hamming Distance Non-parametric Difference index

LiJunjie, ZhengHuijing, KangChunhua, ZengPingfei (Correspondence)

Key Laboratory of Intelligent Education Technology and Application of Zhejiang Province, Zhejiang
Normal University, Jinhua Zhejiang 321004 zpf@zjnu.com

Abstract: Computerized Adaptive Testing for Cognitive Diagnosis (CD-CAT) is Computerized for Cognitive Diagnosis, which combines Cognitive Diagnosis and Adaptive thinking. Compared with traditional cognitive diagnostic tests, it is more efficient and can provide richer personalized information for individual knowledge state. As a core part of CD-CAT, item selection method directly affects the accuracy and efficiency of the whole test. At present, many researchers have proposed the parameter selection method, which maximizes the information function, Shannon Entropy and other methods to select item, which makes some items overexposed and reduces the security of the items pool. This study intends to construct a non-parametric item selection method based on Hamming distance non-parametric difference index (HD-NDI), and discuss its item bank safety and item selection effect in CD-CAT through simulation study. In this study, the Hamming distance non-parametric difference index (HD-NDI) is constructed by using the Hamming distance to assign different weights to the various knowledge states estimated by the current subject, and based on this, the expectation of the item to give an ideal correct answer on a certain item is constructed. Then the non-parametric difference index of this study was constructed according to the variation degree of the items' ideal correct answers. Finally, according to the non-parametric difference index, various items determine which items can determine the knowledge state of the items to the greatest extent, and then carry out the select item for test accordingly, realizing the selection process of CD-CAT. In the 0-1 scoring situation, the Hamming Distance non-parametric difference index (HD-NDI) selection method was constructed. According to the IRP and ORP obtained currently, the Hamming distance of each attribute mastering mode was calculated, and the item corresponding to the Q vector with the maximum HD-NDI value was selected. The specific steps of HD-NDI are: The first step is to find the optimal Q vector: calculate the Hamming distance between IRP of each attribute mastery mode and ORP of the subject; Then the expected response to the item was calculated and the indicators were calculated. The second step is to randomly select the item corresponding to the largest Q vector for the next item. Repeat the steps until the test termination rule is met. The first step of HD-NDI can ensure that the whole CD-CAT can be tailored to the adaptive test, improve the efficiency of the test; The second step can reduce the exposure rate of the item, item the item bank, and improve the security of the test. Two simulation studies were set up in the study. The simulation study 1 design was based on four factors of 5 selection method (KL, SHE, PWKL, MI, HD-NDI) $\times$ 3 calibration samples (30, 50, 100) $\times$ 3 item pool quality (high, low, hybrid) $\times$ 3 examinees' attribute profiles distribution (uniform distribution, multivariate normal distribution). The simulation study 2 design was based on four factors of 5 selection method (HD-NDI, RP_PWKL, DBS, NPS, WNPS) $\times$ 3 calibration samples (30, 50, 100) $\times$ 3 item pool quality (high, low, hybrid) $\times$ 3 examinees' attribute profiles distribution (uniform distribution, multivariate normal distribution). The study used a fixed length method with length $L=25$ to terminate the test. The following evaluation indicators are adopted: Pattern Correct Classification Rate (PCCR), Test Overlap Rate (TOR), and average time of item selection method. The results showed that:

- (1) the classification accuracy of HD-NDI was higher than that selection methods
- (2) The homogeneity of HD-NDI item selection was better than that without exposure control
- (3) HD-NDI has a better effect on reducing the overlap rate, and is better than the selection method without exposure control
- (4) HD-NDI can effectively reduce the time spent on item selection.

情绪材料的注意促进效应：基于来源记忆的研究

张芸瑞 段亚杰 左炜炜 杨晓悦（通讯作者）

上海师范大学教育学院，上海，200234，Yxy_9797@163.com

摘要 本研究以情绪词为背景材料，在来源记忆框架中探讨注意促进效应的产生及其作用机制。实验采用 2（干扰类型：目标、分心）×2（背景词的情绪效价：正性、负性）×2（背景词的字体颜色：红色、绿色）三因素混合设计，其中背景词情绪效价为组间变量，因变量为再认阶段新旧判断的正确率以及颜色来源判断正确率，并借助 ERP 技术，分析学习阶段几种操纵条件诱发的脑电波幅。行为结果发现，情绪词的来源记忆和项目记忆均出现了注意促进效应。脑电结果显示，相对于分心刺激条件，目标刺激条件的语词编码诱发了更大波幅的 P2 成分，而分心刺激条件的语词编码诱发了更大 N2 波幅，并且在中央区，两种条件诱发的上述波幅差异一直持续到编码的晚期阶段（500-800ms）。以上结果表明，目标和分心刺激的编码不仅包括由物理特征驱动的自下而上的知觉加工，而且包括由大脑内部信息驱动的自上而下的选择与抑制的高级认知过程，注意促进效应是早期知觉编码增强和大脑多路径协调作用的结果。

The attentional boost effect of emotional material:

A study based on source memory

ZHANG Yunrui, DUAN Yajie, ZUO Weiwei, YANG Xiaoyue

College of Education, Shanghai Normal University, Shanghai, 200234

Abstract: In this study, emotional words were used as background materials to explore the generation and mechanism of attentional boost effect (ABE) in the framework of source memory. The experiment used a three-factor mixed design of 2 (interference type: target, distraction) × 2 (emotional valence of background words: positive, negative) × 2 (font color of background words: red, green), the emotional valence of background words was the between-subject variable, and the dependent variable was the correct rate of old and new judgments and the correct rate of color source judgments in the recognition stage. In addition, the ERP technique was used to analyze the amplitude of EEG induced by several manipulative conditions in the learning stage. Behavioral results showed that both source memory and item memory of emotional words had attention promoting effect. EEG results showed that target stimuli induced a larger amplitude of the P2 component than distractor, and the distracted stimulus induced a larger N2 amplitude than target condition, and in the central region, the difference of the target and the distracted stimulus in amplitude can continue to the late stage of coding (500 – 800 ms). These results suggest that the encoding of target and distracted stimuli involves not only the bottom-up perceptual processing driven by physical features, but also the cognitive processing of top-down selection and inhibition driven by the internal information of the brain. The attentional boost effect (ABE) is the result of early perceptual coding enhancement and multipath coordination of the brain.

歧视知觉对留守青少年儿童学校适应的影响： 感知内群体地位与核心自我评价的链式中介作用

杨子硕¹ 孙配贞¹（通讯作者）

¹ 江苏师范大学教育科学学院，江苏徐州，221000，spzh007@163.com

摘要 自 20 世纪 70 年代以来，随着城市化进程的快速推进，大量农民涌入城市，加入了中国的劳动力大军。这些农民工进城寻找更好的就业机会，却将子女留在家中，使双方无法长期生活在一起。于是，外来务工人员的子女被称为留守青少年儿童，年龄在 18 岁以下，并且父母一方或双方外出务工而将其留在原产地 6 个月以上（Zhou et al., 2020）。根据最近的一项研究发现，中国农村留守儿童的数量已经达到 6000 万（Ge et al., 2019）。歧视知觉是指个体感知到自己受到的负面评价和不公平对待（Wooda & Cooka, 2019; Pascoe &

Richman, 2009)。一些实证研究已经证实,歧视知觉对青少年的适应具有一定的影响(e.g., Liebkind, 2004; Brody et al., 2010; Nyborg & Curry, 2003; Williams et al., 2003; Paradies, 2006), 但目前对其中的机制却知之甚少。鉴于此, 本研究旨在探讨歧视知觉与学校适应之间的中介机制。基于相关理论(修订后的拒绝-认同模型和系统理性理论)和实证研究, 我们提出了两个中介变量——感知内群体地位和核心自我评价, 从而拓展和加强对歧视知觉与学校适应之间关系的理解。在此基础上, 根据社会认同理论(Tajfel, 1970), 我们推断感知内群体地位对核心自我评价有正向影响。因此, 感知内群体地位和核心自我评价在歧视知觉与学校适应的关系中起链式中介作用。为此, 我们对苏北农村地区四所初中的 428 名留守青少年进行了调查。利用 AMOS 22.0 软件建立结构方程模型评估中介效应。首先, 我们研究了歧视知觉对学校适应的整体影响。然后, 在本研究假设的基础上, 我们建立了几个可供选择的模型, 并通过拟合指标进行比较, 从而选择出最优的终极模型。然后, 采用 bootstrapping 检验最优模型中中介效应的显著性。同时采用 χ^2 、CFI、TLI、RMSEA、SRMR 等拟合指标对模型进行评价。具体来说, RMSEA 和 SRMR 低于 0.08, TLI 和 CFI 高于 0.9, 表明假设模型的拟合更好(Marsh et al., 2004)。

研究结果表明: (1) 歧视知觉对留守青少年儿童的学校适应具有负向预测作用; (2) 感知内群体地位和核心自我评价在歧视知觉与学校适应的关系中分别起部分中介作用; (3) 感知内群体地位和核心自我评价的链式中介效应显著。

Perceived Discrimination and School Adaptation Among Left-Behind Adolescent Children: The Chain Mediating Roles of Perceived Ingroup Status and Core Self-Evaluation

Yang Zishuo, Sun Peizhen

School of Educational Science, Jiangsu Normal University, Xuzhou, China

Abstract: Since the late 1970s, with the rapid advancement of urbanization, large numbers of farmers poured into cities and joined the workers in China. These migrant workers went to cities to seek better employment opportunities and left their children at home, making it impossible for them to live together for a long time. The children of migrant workers are called left-behind children or adolescents, who are under 18 years old, and are left behind at their original residence for more than six months while one or two parents of them migrate into other places for work (Zhou et al., 2020). The number of left-behind children in rural China has reached 60 million according to a recent study (Ge et al., 2019). Perceived discrimination is defined as individuals' perception that they have been negatively evaluated and unfairly treated (Wooda & Cooka, 2019; Pascoe & Richman, 2009). Some empirical studies have shown the effects of perceived discrimination on adolescents' adaptation (e.g., Liebkind, 2004; Brody et al., 2010; Nyborg & Curry, 2003; Williams et al., 2003; Paradies, 2006), but far less is known about the mechanisms involved. In view of this, we aimed to investigate the mediating mechanism linking perceived discrimination and school adaptation in this study. Based on the relevant theories (the Refined Rejection Identification Model and the Systematic Rationality Theory) and empirical studies, we proposed two mediating variables—perceived ingroup status and core self-evaluation to broaden and strengthen the grasp of the relationship between perceived discrimination and school adaptation. Also, according to the Social Identity Theory (SIT; Tajfel, 1970), we inferred that perceived ingroup status is positively correlated with core self-evaluation. To be further, perceived ingroup status and core self-evaluation play chain-mediating roles in the relationship between perceived discrimination and school adaptation. To do so, 428 left-behind adolescents from four junior high schools in rural areas of northern Jiangsu province China were surveyed. Structural Equation Modeling was established to assess the mediating effects using the AMOS 22.0 software. First, we investigated the overall effect of perceived discrimination on school adaptation. Then, we built several alternative models based on the hypothesis of this study and compared them through fit indices, thus choosing the best and final model. After that, bootstrapping procedure was adopted to test the significance of the mediating effects in the optimal

model. The fit indices of χ^2 , CFI, TLI, RMSEA, and SRMR were used to assess the models. Specifically, RMSEA and SRMR lower than 0.08, TLI and CFI above 0.9 demonstrated a better fit of the hypothesized model (Marsh et al., 2004).

Results demonstrated that: (a) perceived discrimination negatively predicted school adaptation among left-behind adolescents; (b) perceived ingroup status and core self-evaluation not only respectively but also sequentially mediated the relationship between perceived discrimination and school adaptation. This study shed light on the improvement of school adaptation among left-behind adolescents.

Keywords: perceived discrimination, school adaptation, perceived ingroup status, core self-evaluation, left-behind adolescent children

以个体内反应时变异性为指标的注意控制对小学生学业成绩的影响：一个纵向交叉滞后面板模型

孙原¹，王振宏²

陕西师范大学心理学院

摘要 个体内反应时变异性（IIRTV）被认为是注意力或认知控制的指标，被发现与学业成绩有关。然而，IIRTV 与学业成绩之间的纵向和双向关系尚不清楚。目的：本研究旨在探讨作为小学生注意控制指标的 IIRTV 与学业成绩之间的纵向和双向关系。方法：以 237 名中国小学生（111 名女生；M 年龄=7.39 岁，SD=0.49）为样本，采用儿童侧翼任务从一年级到三年级分三个阶段对其 IIRTV 进行评估。每年春季学期结束时，从学校收集孩子们的语文和数学期末成绩。在控制了性别、年龄和家庭社会经济状况后，结果表明：（1）通过通过 Flanker 任务评估的 IIRTV 在纵向上显著相关，语文成绩和数学成绩亦是如此；（2）纵向上，IIRTV 与语文成绩相互预测，只有 IIRTV 对数学成绩有预测作用，而数学成绩对 IIRTV 没有预测作用。结论：这些发现揭示了 IIRTV 指标的注意控制与学习成绩之间的纵向和双向关系，有助于研究者和教师评估和提高儿童的学习成绩。

关键词 学业成绩，个体内反应时变异性，注意控制，交叉滞后，小学生

Attentional Control Indexed by Intraindividual Reaction Time Variability and Academic Achievement of Primary School Students: A Longitudinal Cross-Lagged Panel Model

Sun Yuan¹, WANG Zhenhong²

Shaanxi Normal University

Abstract: Background. Intraindividual reaction time variability (IIRTV), which is considered an index of attentional or cognitive control, was found to be related to academic achievement. However, the longitudinal and bidirectional relationship between IIRTV and academic achievement is still unclear. Aims. The current research aimed to examine the longitudinal and bidirectional relations between IIRTV as an index of attentional control and academic achievement of primary school students. Sample and Method. With a sample of 237 Chinese primary school students (111 girls; M age= 7.39 years, SD = 0.49), the children's flanker task was employed to assess their IIRTV in three waves from the first to third grade. At the end of the spring semester each year, the children's final grades in Chinese and math were collected from the school. Results. After controlling for gender, age, and family socioeconomic status, the results showed that (1) IIRTV to the flanker task decreased with age, which indicated that children's attentional control increased with age; (2) longitudinally, IIRTV and Chinese achievement were predictive of each other, whereas

only IIRTV predicted math achievement, but math achievement did not predict IIRTV. Conclusions. These findings demonstrated the longitudinal and bidirectional relationship between attentional control indexed by IIRTV and academic achievement, which could help researchers and teachers evaluate and improve children's academic achievements.

初中生数学核心素养视域下的几何推理能力认知诊断测验编制

孟凡亭（通讯作者） 王欣瑜

内蒙古师范大学心理学院，呼和浩特，010022，393466171@qq.com

摘要 学者们对中学生数学学力认知诊断测验编制的相关问题进行了探索性的研究，其成果不仅为科学评估中学生数学能力提供了可靠工具，也为进一步推动中学生数学核心素养评价提供了理论与方法借鉴。作为数学核心素养的重要维度，几何推理能力有助于初中生发展学科能力和适应未来社会生活。目前初中数学核心素养教育理念广受关注，但是基于初中数学核心素养框架下标准化几何推理能力诊断工具的相关研究仍显不足。本研究基于认知诊断理论的研究范式，编制初中生几何推理能力认知诊断测验，有利于对初中生几何推理能力的微观认知结构进行细致评估，优化初中数学教学干预方案。研究首先通过对初中数学核心素养框架、课程标准、教材等做内容、结构、目标一致性分析，确定了包括几何直观推理能力、图形表达推理能力、文字表达推理能力、符号表达推理能力、描述分析推理能力与结构关联推理能力等6个关键认知属性的测验Q矩阵，并结合专家评定和学生口语报告分析的结果，编制了含有15个题目的“初中生几何推理能力认知诊断测验”。然后随机抽取642名学生作答，并自编R语言程序选择与数据拟合较好的DINA模型（ $\log\text{like}=-5488.892$ ， $\text{BIC}=11236.37$ ， $p>0.05$ ）进行题目参数估计、测验信效度等一系列分析。结果表明：（1）“初中生几何推理能力认知诊断测验”所有题目参数均与DINA模型有良好拟合，RMSEA取值在0.002~0.049之间，均值为0.022，标准差为0.014；测验平均难度为中等水平（ $b=0.114$ ），平均区分度为中等偏高水平（ $a=1.12$ ），所有项目符合 $g+s<1$ 的原则，测验整体质量较好，能够较好地区分不同几何推理能力的学生，并对其能力的微观结构进行细致诊断。（2）测验克隆巴赫 α 系数为0.71，6个关键认知属性的分类准确率在0.86~0.96之间，且共同解释了题目难度的61%，属性掌握概率解释测验总分83%的变异，测验分数与校标分数相关为0.574（ $P<0.001$ ），研究定义的能力属性完备，层级关系合理，具有良好的结构效度。本研究编制的“初中生几何推理能力认知诊断测验”各项指标均达到了测量学要求，可以作为初中生几何推理能力诊断工具。

Development of Cognitive Diagnostic Test for Geometric Reasoning Ability from the Perspective of Junior High School Students' Math Core Literacy

Fanting Meng (Corresponding author), Xinyu Wang

School of Psychology, Inner Mongolia Normal University, Hohhot, 010022

Corresponding author E-mail: 393466171@qq.com

Abstract: Scholars have made an exploratory study on the establishment of cognitive diagnostic test for middle school students' mathematics ability. The results not only provide a reliable tool for scientific evaluation of middle school students' mathematics ability, but also provide theoretical and methodological reference for further promoting the evaluation of middle school students' mathematics core literacy. As an important dimension of mathematics core literacy, geometric reasoning ability is helpful for junior high school students to develop their subject ability and adapt to future social life. At present, the educational concept of junior high school mathematics core literacy is widely concerned, but the related research on standardized diagnostic tools of geometric reasoning ability under the framework of junior high school mathematics core literacy is still insufficient. Based on the research paradigm of

cognitive diagnosis theory, this study compiles the cognitive diagnosis test of junior high school students' geometric reasoning ability, which is beneficial to evaluate the microcosmic cognitive structure of junior high school students' geometric reasoning ability and optimize the intervention scheme of junior high school mathematics teaching. At first, by analyzing the consistency of contents, structures and goals in the core literacy framework, curriculum standards and teaching materials of junior high school mathematics, the test Q matrix of six key cognitive attributes, including geometric intuitive reasoning ability, graphic expression reasoning ability, literal expression reasoning ability, symbolic expression reasoning ability, descriptive analysis reasoning ability and structural association reasoning ability, was determined. Combined with the results of expert evaluation and analysis of students' oral reports, the "cognitive diagnosis test of junior high school students' geometric reasoning ability" was compiled with 15 questions. Then, 642 students were randomly selected to answer questions, and R language program was compiled to select DINA model (loglike=-5488.892, BIC=11236.37, $p>0.05$), which fitted the data well, to perform a series of analysis such as topic parameter estimation, test reliability and validity. The results show that: (1) all the parameters of the "cognitive diagnosis test of junior high school students' geometric reasoning ability" fit well with DINA model, and the value of RMSEA is between 0.002 and 0.049, with a mean value of 0.022 and a standard deviation of 0.014; The average difficulty of the test is medium ($b=0.114$), and the average discrimination is medium and high ($a=1.12$). All items conform to the principle of $g+s<1$. The overall quality of the test is good, which can better distinguish students with different geometric reasoning abilities and make a detailed diagnosis of the microstructure of their abilities. (2) The test Cronbach's alpha is 0.71, and the classification accuracy rate of six key cognitive attributes is between 0.86 and 0.96, which together explain 61% of the difficulty of the topic, 83% of the variation of the total score of the attribute mastery probability test, and the correlation between the test score and the calibration score is 0.574($P<0.001$). The ability attribute defined by the study is complete, the hierarchical relationship is reasonable, and it has good structural validity. The indicators of the "cognitive diagnosis test of junior high school students' geometric reasoning ability" compiled in this study meet the requirements of surveying, and can be used as a diagnostic tool for junior high school students' geometric reasoning ability.

摘要 随着互联网技术的不断发展, 社交网络俨然已成为青少年生活学习不可或缺的一部分。据中国互联网络信息中心发布的《2020 年全国未成年人互联网使用情况研究报告》显示, 2020 年我国小学、初中、高中、中职学生互联网普及率分别达到 92.1%、98.1%、98.3%和 98.7%, 其中中职生使用不同设备玩游戏的比例高达 75.7%, 为三个学段之首。在此背景下调查中职生这一群体具有重要意义。本研究通过调查山东省 Q 市中职生网络使用的现状, 探究中职生网络成瘾与数学学业成绩的关系, 重点分析学习时间管理和自我效能感的中介影响作用, 为缓解山东省中职生网络成瘾、提升学业表现提供科学依据。采用分层整群抽样方法, 抽取山东省 Q 市 47 所中等职业学校为研究对象。每所学校整群抽取不同专业的中职生, 发放问卷 3855 份并全部回收, 经调查组严格核对后剔除漏填率 $>5\%$ 的无效问卷共 446 份, 最终有效问卷 3409 份, 有效率 88.4%。本研究共包括三部分。研究内容 1: 改编刘炳伦、郝伟、杨德森编制的《青少年上网成瘾自评量表》, 分析中职生网络成瘾现状; 研究内容 2: 分析中职生网络成瘾与数学学业成绩之间的关系; 研究内容 3: 通过构建结构方程模型探讨中职生网络成瘾对数学成绩影响的主要机制。研究结果表明: 1. 中职生网络成瘾存在显著性别差异, 男生成瘾程度高于女生, 整体网络成瘾率为 4.85%。2. 中职生网络成瘾与数学成绩之间存在显著的负向相关关系。3. 行为自我效能感在中职生网络成瘾和数学成绩之间起中介作用。4. 学习时间管理和行为自我

效能感在中职生网络成瘾和数学成绩之间起链式中介作用，且中介效应显著。研究结果有助于阐明中职生网络成瘾与学业成绩的关系及作用机制，从个体监督和动力激发等方面为缓解中职生网络成瘾对学业成绩的不良影响提供理论依据。

关键词 中职生，网络成瘾，学业成绩，学习时间管理，自我效能感

Research on the Relationship between Internet Addiction Disorder and Academic Performance of Secondary Vocational School Students-The mediating role of learning time management and behavioral self-efficacy

Abstract: With the continuous development of Internet technology, social networks have become an indispensable part of young people's life and learning. According to the "Research Report on the Internet Usage of Minors in China in 2020" released by the China Internet Network Information Center, the Internet penetration rate of primary, junior high, high school, and secondary vocational students in my country will reach 92.1%, 98.1, 98.3%, and% and% in 2020, respectively. 98.7%, among which the proportion of secondary vocational students playing games with different devices is as high as 75.7%, which is the top of the three sections. In this context, it is of great significance to investigate the group of secondary vocational students. This study investigates the current situation of Internet use by secondary vocational students in Q City, Shandong Province, explores the relationship between Internet addiction and mathematics academic performance of secondary vocational students, and focuses on the mediating effect of study time management and self-efficacy, in order to alleviate the secondary vocational Provide a scientific basis for students' Internet addiction and improvement of academic performance. Using the stratified cluster sampling method, 47 secondary vocational schools in Q City, Shandong Province were selected as the research objects. Each school selected a group of secondary vocational students from different majors, distributed 3855 questionnaires and recovered them all. After strict verification by the survey team, 446 invalid questionnaires with a missing fill rate of >5% were eliminated. The final valid questionnaire was 3409, with an effective rate of 88.4 %. This research consists of three parts. Research content 1: Adapting the "Adolescent Internet Addiction Self-rating Scale" compiled by Liu Binglun, Hao Wei, and Yang Desen to analyze the status quo of Internet addiction of secondary vocational students; research content 2: Analysis of the relationship between Internet addiction of secondary vocational students and mathematics academic performance Research content 3: Exploring the main mechanism of the influence of Internet addiction of secondary vocational students on mathematics performance by constructing a structural equation model. Research indicates: There are significant gender differences in network addiction among secondary vocational students. The addiction degree of boys is higher than that among girls, and the overall network addiction rate is 4.85%. There is a significant negative correlation between network addiction and mathematics performance in secondary vocational students. Behavioral self-efficacy plays a mediating role between network addiction and math performance in secondary vocational students. Learning time management and behavioral self-efficacy play a chain intermediary role between network addiction and mathematical performance in secondary vocational students, and the intermediary effect is significant. The research results help to clarify the relationship between the Internet addiction of secondary vocational students and academic performance and the mechanism of action, and provide a theoretical basis for alleviating the adverse effects of Internet addiction of secondary vocational students on academic performance from the aspects of individual supervision and motivational stimulation.

低年段小学生的学业能力性别刻板印象及其对兴趣选择的影响： 自我肯定的作用

黄量杰成¹ 闫 艳^{1,2} 尹 军¹

1 宁波大学心理学系暨研究所, 宁波大学群体行为与社会心理服务研究中心, 浙江 宁波, 315211

2 浙江万里学院, 浙江 宁波, 315100

摘 要 近年来, 在中国教育领域, 越来越多的“女强男弱”现象开始出现, 这与既往关于性别刻板印象的研究结论并不相符。为考察在当前教育背景下是否存在相对应的刻板印象及其发展情况, 本研究采用人物选择任务和游戏兴趣任务, 探讨低年段小学生学业能力性别刻板印象的发展特点及其对兴趣选择的影响, 并考察自我肯定这一干预措施的作用。结果发现, 自二年级开始, 低年段小学生认为在学业能力上女生比男生更聪明。其兴趣选择在三年级时出现性别差异, 相比男生, 女生对于需要聪明特质才能完成的游戏表现出更强的兴趣。自我肯定能有效削弱三年级男生关于学业能力的性别刻板印象, 进而提升其对相应游戏的兴趣。上述结果揭示, 学业上“女强男弱”的信念已存在于小学低年段, 且从三年级开始严重影响男生的兴趣选择, 但可采用自我肯定法改变男生的这一信念。

关键词 低年段小学生, 学业能力, 性别刻板印象, 自我肯定

Gender Stereotypes of Academic Ability in Primary School Students in Lower Grades and Their Influence on Interest Selection: The Role of Self-affirmation

Huang Liangjiecheng¹, Yan Yan^{1,2}, Yin Jun¹

(1 Department of Psychology, Ningbo University, Ningbo 315211, China)

(2 Zhejiang Wanli University, Ningbo 315211, China)

Abstract: In recent years, there has been an increasing appearance in the phenomenon of “strong girls and weak boys” in Chinese education. For example, in terms of academic performance, an increasing number of girls in primary and secondary schools outperform boys in academic performance; among students with learning difficulties, the proportion of boys is also higher when compared to girls, and in the field of higher education in China, the number of female graduate students has exceeded that of male graduate students for many years. Previous studies on gender stereotypes on academic ability abroad have found that boys are thought to be better than girls in academic ability. The conclusion of those studies is not consistent with the phenomenon of “strong girls and weak boys” in Chinese education, and few studies have discussed the existence of corresponding gender stereotypes and their development in current Chinese education. Therefore, from the perspective of developing cross-sectional sampling, this study mainly discusses the gender stereotypes of academic ability among primary school students in lower grades (i.e. grades 1 to 3) and its influence on interest selection. We also investigated whether self-affirmation intervention contributes to gender stereotypes in academic ability and influences interest choice. We discuss these problems through three studies. Study 1 selected primary school students and tasked them to select characters by describing “smart” characteristics from a story and allowing them to choose the sex of their chosen characters. This aimed to investigate the development characteristics of gender stereotypes of primary school students’ academic ability. Study 2 selected primary school students for a game interest task which let them choose the game that needs “smart” or “hard” in order to accomplish. This helped to measure the gender stereotypes of academic ability and investigate the influence of gender stereotypes on children’s interest choices. Study 3 used the self-affirmation intervention method to compare whether there are differences in the performance of third-grade boys in character selection and game interest tasks. This in turn helped to explore the role of self-affirmation in the gender stereotypes of academic ability and its influence on interest choice. This study yielded the following main findings: (1) The gender stereotypes of academic ability in primary school students at a lower grade (first to second grades) implies that girls are smarter than

boys in academic ability. (2) There are gender differences in the interest choice of third grade students. Girls are more interested than boys in games that require “smart” traits, and the differences in the interest choice are related to the gender stereotypes of their academic ability. (3) Self-affirmation can effectively weaken the gender stereotypes of the academic ability of boys in the third grade, and thus enhance their interest in “smart” games. This study reveals that the belief of “strong girls and weak boys” in education has existed in the lower grades of primary school and has seriously affected the choice of third-grade boys in interest tasks. It is suggested that parents, teachers, and education managers should change students’ belief knowledge through teaching and activity design, and this intervention is best designed before the third grade of primary school. The self-affirmation method provided in this study provides a practical method for this requirement, suggesting that the activities that boys are good at, can improve the confidence of boys in the academic field, thus changing the gender stereotype in academic ability by creating their own “strong boys” belief.

Different effects of insecure adult attachment on prosocial behaviors: A multilevel meta-analysis

Liu Mengqi¹, Chen Xu²

Abstract : As an important individual variable, attachment is closely associated with prosocial behaviors. This association has been shown by the theory and individual studies testing the relation between secure attachment and prosocial behaviors and often focusing on much younger samples, or only involve the difference between secure and insecure attachment, did not specifically discuss the difference between two insecure attachment dimensions. Therefore, it remained ambiguous how insecure attachment dimensions are associated with adults’ prosocial behaviors. In order to increase the understanding of these associations, a multilevel meta-analysis was performed. By a systematic literate search, 86 independent samples were found from 43 eligible studies. A significant moderate overall effect size was found between attachment avoidance and prosocial behaviors(-.319), which was significantly stronger than the correlation with attachment anxiety. Multivariate analysis of the significant moderators that impacted on the strength of the association between insecure adult attachment and prosocial behaviors showed that the relation between helper and recipient and the prosocial motivation uniquely contributed to the explanation of variance. Thus, this meta-analysis demonstrates robust negative associations between insecure attachment and prosocial behaviors in adult, while there still are some moderators can change this negative outcomes, and results of the meta-analysis and the implications were discussed.

Keywords: Attachment anxiety, attachment avoidance, prosocial behaviors, multilevel meta-analysis

同伴关系对网络成瘾的影响：有调节的中介模型

董津祺 周平艳（通讯作者） 张彩 刘坚 王哲

北京师范大学中国基础教育质量监测协同创新中心，北京，100875, zhoupy@bnu.edu.cn

摘 要 截至 2019 年，未成年人互联网普及率高达 93.1%，其中 32.9%的小学生网民在学龄前就开始上网。随着低龄网络用户人数增加，网络成瘾低龄化趋势也更加明显。而网络成瘾会影响儿童的身心健康，甚至能够正向预测自杀意念，严重威胁儿童的健康发展。因此，有必要对网络成瘾的影响因素及形成机制进行考察。前人研究表明，同伴关系是网络成瘾的保护因素，同伴关系不良的个体更可能成为欺凌者的目标，受到校园欺凌。根据社会补偿理论，受欺负儿童倾向于通过上网释放受欺负所产生的消极情绪和压力，但这种处理压力的方式会导致网络成瘾风险增加。此外，心理韧性的保护因子模型认为，保护因子能够缓解压力对适应的负面影响。心理韧性作为校园受欺负和网络成瘾的保护因素能够缓解不良同伴关系对两者的消极影响，也能够缓解校园受欺负对网络成瘾的影响。本研究期望构建一个有调节的中介模型，考察校园受欺负在同伴关系影响网络成瘾过程中的中介作用以及心理韧性对这一过程的调节作用，为预防与干预网络成瘾提供实证依据。

研究使用同伴关系量表、欺负问卷、中小学生耐挫性量表、网络成瘾测验等工具,对 60197 名四年级学生进行施测。结果发现:①同伴关系负向预测网络成瘾,校园受欺负部分中介同伴关系对网络成瘾的影响。②心理韧性调节中介模型的直接路径和间接路径。结果表明,同伴关系能够通过减少校园受欺负进而减少网络成瘾,心理韧性可以缓冲不良同伴关系对校园受欺负和网络成瘾的消极影响,也能够降低校园受欺负对网络成瘾的负面影响。研究揭示了同伴关系对网络成瘾作用机制,建立了有调节的中介模型,有助于理解同伴关系如何通过直接路径和间接路径影响网络成瘾。心理韧性的调节作用也解释了不同心理韧性水平个体,其直接、间接路径的差异。研究强调了心理韧性的重要作用,在未来干预中需要培养和发挥心理韧性的优势,保护个体免受消极影响。

关键词 同伴关系,网络成瘾,校园受欺负,心理韧性

Relationship between Peer Relationship and Internet Addiction: A Moderated Mediation Model

Dong Jin-Qi, Zhou Ping-Yan, Zhang Cai, Liu Jian, Wang Zhe

Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing 100875, China

Abstract: As of 2019, the Internet penetration rate among minors was 93.1%, with 32.9 % of primary school students going online as early as preschool. With the increasing number of younger Internet users, the trend of younger Internet addiction is obvious. Internet addiction can affect children's physical and mental health, even positively predict suicidal ideation, which seriously threatens children's healthy development. Therefore, it is necessary to investigate the influencing factors and formation mechanism of Internet addiction. Previous studies have shown that peer relationship is a protective factor for Internet addiction. Individuals with poor peer relationships are more likely to be targeted by bullies and be bullied at school. According to the social compensation theory, bullied children tend to release negative emotions and pressures caused by bullying through the Internet, but this way of dealing with pressure will lead to an increased risk of Internet addiction. In addition, the protective factor model of mental resilience suggests that protective factors can alleviate the negative effects of stress on adaptation. As a protective factor of victim and Internet addiction, psychological resilience can alleviate the negative impact of poor peer relationship on victim and Internet addiction, and also can alleviate the impact of victim on Internet addiction. The purpose of this study is to construct a moderated mediation model. We also investigated the influence of peer relationship on Internet addiction through victim and the moderating effect of psychological resilience on this process. This will provide empirical evidence for the prevention and intervention of Internet addiction. Data were collected from 60197 fourth-grade students. The Revised Peer Relationship Scale, Young's Internet Addiction Questionnaire, Bully/Victim Questionnaire and The Revised Resilience Scale were used to conduct the survey. The results found: ① Victim partly mediate the relationship between peer relationship and Internet addiction. ② The direct and indirect paths of the mediating model were moderated by resilience. The results show that peer relationship can reduce Internet addiction by reducing victim. Resilience can reduce the negative impact of low peer relationship on victim and Internet addiction, and can also reduce the negative impact of victim on Internet addiction. Research revealed the mechanism of peer relationship on Internet addiction, and established a moderated mediation model, which is helpful to understand how peer relationship affects Internet addiction through direct and indirect paths. The moderating effect of resilience also explains the difference between the direct and indirect paths of individuals with different levels of resilience. The study highlights the importance of resilience and the need to nurture and leverage its strengths in future interventions to protect individuals from negative impacts.

Keywords: Peer Relationship, Internet Addiction, Victim, Resilience

青少年手机冷落行为对社会心态的影响及其作用机制

翟培培¹ 何安明（通讯作者）

1 信阳师范学院教育科学学院，信阳，464000

摘 要 十九大报告提出“要加强社会心理服务体系建设，培育自尊自信、理性平和、积极向上的社会心态”。社会心态不仅反映了人们对社会现实各个方面的感受与体验，也是经济社会发展的晴雨表。本研究试图探讨青少年手机冷落行为对社会心态的影响及其作用机制——公正世界信念的中介作用和感恩的调节作用。采用手机冷落行为量表、社会心态量表、公正世界信念量表和青少年感恩量表对广东、山西、河南、江苏和湖北五省的3104名青少年进行问卷调查，其中男生1146人（36.92%），女生1958人（63.08%），平均年龄18.04岁（SD=2.87）。结果显示：（1）在控制了性别和年级之后，青少年手机冷落行为可以显著负向预测社会心态；（2）中介效应检验表明，青少年的公正世界信念在手机冷落行为与社会心态之间具有中介作用；（3）感恩调节了“手机冷落行为→公正世界信念→社会心态”的后半段和直接路径：在后半段路径“公正世界信念→社会心态”这一积极情境中，感恩水平高的个体比感恩水平低的个体，其公正世界信念对社会心态的预测能力更强，起“锦上添花”的调节作用；在直接路径“手机冷落行为→社会心态”这一消极情境中，当青少年感恩水平低时，手机冷落行为对社会心态的负向预测作用不显著，当青少年感恩水平高时，手机冷落行为可以显著负向预测社会心态，起“杯水车薪”的调节作用。这些结果说明青少年手机冷落行为不仅会对自身社会心态产生直接影响，也会通过削弱自身的公正世界信念对社会心态产生间接影响，同时验证了感恩在积极情境中所起的“锦上添花”调节模式以及在消极情境中所起到的“杯水车薪”调节模式，对手机网络时代青少年良好的社会心态培育具有一定的启示意义。

关键词 手机冷落行为，社会心态，公正世界信念，感恩，青少年

The Effect of Phubbing on Adolescents' Social Mentality and its Mechanism

Zhai Peipei¹, He Anming¹

1 School of Educational Science, Xinyang Normal University, Xinyang, 464000

Abstract: The report of the 19th National Congress of the Communist Party of China proposed that “the construction of a social psychological service system should be strengthened, and a social mentality of self-esteem, self-confidence, rational peace, and positive progress should be cultivated”. Social mentality not only reflects people's feelings and experiences in all aspects of social reality, but also a barometer of economic and social development. This study attempts to explore the influence of adolescents' phubbing on social mentality and the mediating role of belief in a just world and the moderating role of gratitude. A questionnaire survey of 3104 adolescents in five provinces including Guangdong, Shanxi, Henan, Jiangsu and Hubei was carried out using the Phubbing Scale, Social Mentality Scale, Belief In a Just World Scale, and Youth Gratitude Scale. Among them, 1146 (36.92%) are boys, 1958 are girls (63.08%), with an average age of 18.04 years (SD=2.87). The results showed that: (1) After controlled for gender and grade, adolescents' phubbing could negatively predicted social mentality; (2) The mediation effect test showed that adolescents' belief in a just world played a mediating role between phubbing and social mentality. (3) Gratitude regulated the second half and direct path of “phubbing→belief in a just world→social mentality”: compared with adolescents with a low level of gratitude, the high level of gratitude adolescents' belief in a just world had stronger predictive ability on social mentality. Gratitude played an “charcoal in the snow” moderating effect in the positive context of the second half path “belief in a just world→social mentality”; in the negative context of the direct path “phubbing→social mentality”, when a adolescents' gratitude level was low, phubbing had no significant negative predictive effect on social mentality. When adolescents' gratitude level was high, phubbing could significantly negatively predicted social mentality and played a “drop in the bucket” moderating effect. These results indicate that adolescents' phubbing not only has a direct impact on social mentality, but also has an indirect impact on social mentality by weakening the adolescents' belief in a just world. At the same time, it validates the “charcoal in the snow” moderating mode of gratitude in positive situations and the “drop in the bucket” moderating mode played in negative situations. That has a certain enlightenment for cultivate a good social mentality

among adolescents in the age of mobile phone networks.

Keywords: phubbing, social mentality, belief in a just world, gratitude, adolescents

社会临场感与网络过激行为的关系：双自我意识的并行中介作用

郭嘉程^{1,2} 董柔纯^{1,2} 许放^{1,2} 周宗奎^{1,2} (通讯作者)

1 华中师范大学心理学院, 武汉, 430079

2 青少年网络心理与行为教育部重点实验室, 武汉, 430079, zhouzk@mail.ccnu.edu.cn

摘要 随着网络的普及, 网络渗透了人们生活的方方面面。与现实相比, 网络具有匿名性、去抑制性、互动性等特点, 人们的线上行为也表现出与线下不同的特性。其中, 网络中的谩骂、侮辱等行为使得网络环境恶化, 并严重影响其他用户的使用体验, 成为研究热点。网络过激行为指网络中故意攻击、伤害他人的行为。线索过滤理论和双自我意识视角是理解网络过激行为的经典角度。前者关注网络媒介层面(如社会临场感)对网络过激行为的影响, 后者则关注个体层面(如公我意识和私我意识)。以往研究较少综合两种视角探讨网络过激行为机制, 且双自我意识、社会临场感、网络过激行为间的关系仍不明晰。因此, 基于三元交互理论, 本研究综合线索过滤理论和双自我意识视角, 构建了一个并行中介模型以探讨社会临场感对网络过激行为的影响机制。本研究采用社会临场感量表、公我意识量表、私我意识量表、青少年网络偏差行为量表, 对1625名大学生进行调查。结果表明: (1) 社会临场感和公我意识、私我意识呈显著正相关, 而网络过激行为与私我意识呈显著负相关; (2) 社会临场感能够显著正向预测大学生网络过激行为; (3) 公我意识在社会临场感和网络过激行为间起到了正向中介作用, 私我意识起到了正向中介作用, 且私我意识的中介效应大于公我意识的中介效应。本研究发现高社会临场感不仅能够直接促进网络过激行为的产生, 还能通过提高个体的公我意识或私我意识水平间接地促进或抑制网络过激行为。具体而言, 根据去个性化效应的社会认同模型, 社会临场感和公我意识的增强可能使个体与网络团体中的其他用户保持一致, 进而表现出网络过激行为; 而私我意识增强可能使个体更关注自己的内在感受和道德标准, 更不易做出网络过激行为。未来研究可进一步探讨双自我意识与网络过激行为的作用机制, 以深化理解并为实践提供引导。

关键词 网络过激行为, 社会临场感, 公我意识, 私我意识

The Impact of Social Presence on Online Flaming: The Parallel Mediating Roles of Dual Self-awareness

Guo Jiacheng^{1,2}, Dong Rouchun^{1,2}, Xu Fang^{1,2}, Zhou Zongkui^{1,2}

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University),
Ministry of Education, Wuhan, 430079

2 School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: With the popularity of the Internet, the Internet has penetrated into all aspects of people's life. Compared with real space, the network has the characteristics of anonymity, disinhibition and interaction. People's online behaviors also shows different characteristics from offline. Among these behaviors, online abusive and insulting behaviors deteriorate the environment of Internet, and seriously affect the experience of other users, which has become a hot topic of research. Online flaming refers to the behaviors of deliberately attacking and hurting others online. Cues-filtered-out theory and dual self-awareness perspective are classical angles for comprehending online flaming. The former pays attention to the impact of network media level (such as social presence) on online flaming, while the latter focus on individual level (such as public self-awareness and private self-awareness). Few previous research explored the mechanism of online flaming from both these two perspectives. Moreover, the relationships between social presence, dual self-awareness, and online flaming are still unclear. Therefore, in order to explore the mechanism of social presence on online flaming, based on ternary interaction theory, the current study integrates cues-filtered theory and dual self-awareness perspective into a parallel mediation model. In this study, 1625 college students were investigated by social presence scale, public self-awareness scale, private self-awareness scale, the

scale for adolescent internet deviance. The results show that: (1) social presence positively associated with public self-awareness, private self-awareness, while online flaming negatively associated with private self-awareness; (2) social presence positively predicted online flaming; (3) public self consciousness plays a positive mediating role between social presence and online flaming, and private self consciousness plays a negative mediating role between social presence and online flaming, and the negative mediating effects of private self-awareness outweighed the positive mediating effects of public self-awareness. This study found that high social presence could not promote online flaming, but also promote or inhibit online flaming by improving individual's public or private self-awareness respectively. Specifically, according to social identity model of deindividuation effects, the enhancement of social presence and public self-awareness may make individuals follow other users in network groups, and in turn demonstrate online flaming; while the enhancement of private self-awareness may make individuals pay more attention to their inner feelings and moral standards, and are less likely to show online flaming. In order to deepen our understanding and provide guidance for practice, future research can further explore the mechanism of dual self-awareness on online flaming.

Keywords: Online flaming, social presence, public self-awareness; private self-awareness

什么是横断历史元分析的最佳实践？ ——一项有关横断历史元分析研究的“元”分析

鲍雨霏¹ 范会勇^{2,*}

渤海大学教育学院, 松山新区, 锦州, 辽宁, 中国

1570950454@qq.com, 2chinaxiaofan@126.com

摘 要 横断历史元分析 (Cross-temporal Meta-analysis, CTMA) 常被用来考察某个心理变量随年代的变化趋势, 通过与经济社会指标的相关分析来推测心理变量变动的经济社会原因。自 1997 年以来, 国内外心理学期刊已经发表 120 余篇横断历史元分析研究。近年来, 不时有研究者指出 CTMA 在方法学方面存在某些不足。例如, Donnellan, M. B. 等人认为 CTMA 方法依赖于生态关系——关联两个变量的结果, 每个变量代表在聚合分析层面上存在的个体层面现象, 这可能会导致对研究结果的错误解释; Rudolph, C. W. 等人则认为尽管 CTMA 支持出生组效应作为所得结果的主要解释变量, 但可能混淆了出生组和时代效应。然而, 尚没有研究系统地评估已经发表的 CTMA 研究存在的问题, 也没有研究提供 CTMA 研究应该遵循的规范。为了系统评估已发表的 CTMA 研究存在的问题, 研发 CTMA 研究规范, 该文采用领域评价方法 (Scoping Review) 分析了 127 篇已经发表的 CTMA 研究, 这些研究发表于 1997 到 2020 年之间, 包括 57 篇英文论文和 70 篇中文论文。采用自主开发的 CTMA 审核量表 (包含 27 个项目), 该文着重分析了 CTMA 方法中的效应量计算问题、回归问题、经济社会指标与心理变量之间的关联问题, 以及交叉滞后分析中的年代间隔设置问题。研究结果显示: (1) 在 27 条审查条目中仅有 11 项情况较为良好, 其余 16 项均存在问题。(2) 86.6% 的 CTMA 研究采用了 d 作为效应量, 13.4% 则直接采用平均值为效应量。其中问题有二: 效应量 d 应用于 CTMA 方法中并无数学理论证据支撑; d 的计算过程存在应用错误, 研究者在计算年代改变量的标准误时对产生了群体平均值离散水平的误解。(3) 30.7% 的研究将经济社会指标与心理变量相关联以解释心理变量变化的社会原因。但对于指标的选取, 仍缺乏证据支撑。(4) 6.3% 的研究采用了 meta-regression, 93.7% 研究采用了非 meta-regression。非 meta-regression 的错误在于标准误的计算错误。(5) 14.2% 的研究在交叉滞后分析中的年代间隔采用了 5 年。事实上, 不论采用 5 年、1 年或者其他年份区间, 这些选取方式均没有理论依据。总体上看, CTMA 方法本身存在不少缺陷, 需要进一步完善。该文还初步讨论了 CTMA 研究应遵循的基本规范。

Abstract: Cross-temporal Meta-analysis (CTMA) is often used to examine the trends of a psychological variable over time and to infer the economic and social causes of changes in psychological variables by correlating them with economic and social indicators. Since 1997, more than 120 CTMA studies have been published in national and international psychology journals. In recent years, from time to time, researchers have pointed out certain methodological shortcomings of CTMA. For example, Donnellan, M. B. et al. argue that the CTMA approach relies on ecological relationships - correlating the results of two variables, each representing an individual-level phenomenon that exists at the level of convergent analysis - which may lead to misinterpretation of the findings; Rudolph, C. W. et al. argue that although CTMA supports birth cohort effects as the main explanatory variable for the results obtained, it may confound birth cohort and age effects. However, no studies have yet systematically assessed the problems with published CTMA studies and no studies have provided norms that CTMA studies should follow. In order to systematically assess the problems of published CTMA studies and to develop a standard for CTMA research, this paper analyses 127 published CTMA studies, including 57 English and 70 Chinese papers, published between 1997 and 2020, using the Scoping Review method. Using the self-developed CTMA audit scale (containing 27 items), the paper focuses on the calculation of effect sizes in the CTMA methodology, regressions, correlations between economic and social indicators and psychological variables, and the setting of chronological intervals in cross-lagged analyses. The results of the study showed that: (1) Only 11 of the 27 review entries were in relatively good condition, while the remaining 16 were problematic. (2) 86.6% of the CTMA studies used d as the effect size, while 13.4% used the mean value directly as the effect size. The problems were twofold: the application of the effect size d to the CTMA method was not supported by mathematical theoretical evidence; and there was an application error in the calculation of d . The researchers misinterpreted the standard error of the chronological change in calculating the discrete level of the group mean. (3) 30.7% of the studies correlated economic and social indicators with psychological variables to explain the social causes of changes in psychological variables. However, there is still a lack of evidence to support the selection of indicators. (4) 6.3% of the studies used meta-regression and 93.7% used non-meta-regression. the error in non-meta-regression was the miscalculation of standard errors. (5) In 14.2% of the studies, 5 years was used as the chronological interval in the cross-lagged analysis. In fact, whether 5 years, 1 year or other year intervals are used, there is no theoretical basis for these selections. Overall, the CTMA method itself has a number of flaws and needs further refinement. The paper also provides a preliminary discussion of the basic norms that should be followed in CTMA studies.

父母教养方式对高中生利他行为的影响：自尊和共情的链式中介作用

刘媛媛（通讯作者） 施长君

哈尔滨师范大学, lydla@163.com

摘 要 本研究采用问卷调查法探讨了父母教养方式对高中生利他行为的影响以及自尊和共情在其中的链式中介作用。选取黑龙江省及江苏省某三所高中共 650 名学生为被试, 采用《父母教养方式量表》《Rosenberg 自尊量表中文版》《中文版人际反应指针量表》《利他行为自陈问卷》施测, 得出如下结论: 1. 父母教养方式在高中生性别上存在显著差异, 女生经历了更多的信任鼓励型和情感温暖型教养方式、男生经历了更多的

专制型、忽视型和溺爱型教养方式；父母教养方式在父母是否离异上存在显著差异，父母未离异的高中生经历了更多的情感温暖型教养方式、更少的忽视型教养方式；父母教养方式在学业成就上存在显著差异，学优生经历了更多的情感温暖型教养方式、学困生经历了更多的忽视型教养方式。2.自尊水平在学业成就上存在显著差异，从学优生到学困生自尊水平依次递减。3.共情能力在性别上存在显著差异，女生共情能力更强；共情能力在独生与否上存在显著差异，非独生的高中生共情能力更强；共情能力在班干部与否上存在显著差异，班干部共情能力更强。4.利他行为在班干部与否上存在显著差异，班干部利他行为更多。5.相关分析表明，信任鼓励型和情感温暖型教养方式均与自尊、共情能力以及利他行为显著正相关；溺爱型和忽视型父母教养方式均与自尊、利他行为显著负相关；专制型教养方式与自尊水平显著负相关；自尊与共情能力及利他行为均显著正相关；共情能力与利他行为显著正相关。6.结构方程表明：信任鼓励型、情感温暖型、溺爱型及忽视型教养方式分别通过三条路径影响高中生的利他行为：一是自尊的单独中介作用；二是共情的单独中介作用；三是自尊和共情的链式中介作用。

多媒体教学中分段原则的学习者控制效应

王徐泽睿 张锦坤（通讯作者）

福建师范大学心理学院，福州，350117，jinkunzhang@126.com

摘要 多媒体教学中，分段原则被认为可以有效地降低认知负荷、提升学习成绩。为了解分段原则中预分段和学习者控制这两个功能对学习的作用，本实验通过行为测试研究了74名大学生在无分段组（控制组）、预分段-系统播放组（每一段间隔2.5S后自动播放）、预分段-学习者控制组（每一段播放完后自动暂停、由学习者按键继续）的认知负荷、主观感受和学习成绩（保持和迁移）。结果表明：（1）与无分段组相比，预分段-系统播放的教学设计并没有降低认知负荷，也并未提升学习成绩。（2）由教学设计者预分段，并由学习者自己掌控节奏，可以提升保持测验成绩。（3）提供预分段和学习者控制并没有降低认知负荷、学习者的主观感受均无显著差异。本研究发现分段原则中学习者控制的存在对提升学习成绩有积极作用，如果脱离其存在，对学习没有促进作用。未来研究应当探讨视频时长和材料难度的变化是否会影响分段原则中两个特征对学习的影响。

习惯性含糖饮料摄入者奖赏加工过程的 ERP 研究

毛双双¹ 张梦月¹ 邢小莉¹

¹ 河南大学心理学系，开封，475001，349177030@qq.com

摘要 含糖饮料（sugar-sweetened beverages,SSBs）作为添加糖摄入主要来源之一，其的过量消费对个体的生理、心理均产生了不良影响。已有研究发现习惯性的含糖饮料消费会造成个体奖赏有关脑区活动的降低，本研究基于奖赏加工过程在时间维度上具有连续性的特点，利用时间分辨率较好的ERP技术，从奖赏预期（wanting）和结果评价（liking）两个独立又相关的阶段探索习惯性含糖饮料摄入对奖赏加工的影响，以及在奖赏加工不同阶段这种影响是否存在分离。研究一采用金钱奖励延迟任务，通过2（含糖饮料摄入：高、低）×3（线索类型：奖赏预期线索、损失预期线索、无奖惩预期线索）的混合实验设计比较高低含糖饮料摄入者在金钱奖励延迟任务上的差异，探讨含糖饮料摄入对奖赏预期的影响。行为结果显示两组被试的反应时无显著差异，均在线索类型上有差异，即对奖励和惩罚线索的反应快于无奖惩线索；脑电结果显示，高含糖饮料摄入组的cue-P3、CNV波幅显著小于低含糖饮料摄入组，两组的SPN波幅无显著差异。研究二采用猜门任务，通过2（含糖饮料摄入：高、低）×2（反馈类型：赢、输）的混合实验设计比较高低含糖饮料摄入者在门任务上的差异，探索含糖饮料摄入对奖赏结果评价的影响。行为结果显示两组被试的反应时无显著差异；脑电结果显示，赢钱反馈比输钱反馈诱发更大的RewP、fb-P3；在输赢不同结果反馈下，高含糖饮料

摄入组比低含糖饮料组诱发更大的 RewP、fb-P3 差异波波幅。结论：习惯性含糖饮料摄入者奖赏加工过程存在分离。(1)含糖饮料摄入影响个体的奖赏预期过程，主要表现在高含糖饮料摄入者对奖惩线索的注意、接近动机显著低于低含糖饮料摄入者。(2)含糖饮料摄入影响个体的奖赏结果评价过程，主要表现在高含糖饮料摄入者对奖赏结果获得的满足感显著高于低含糖饮料摄入者。

关键词 含糖饮料，奖赏预期，结果评价，ERPs

ERP study on reward processing of habitual intake of Sugar sweetened beverages

Shuangshuang Mao¹, Mengyue Zhang¹, Xiaoli Xing¹

¹ Department of psychology, Henan University, Kaifeng

Abstract : Sugar sweetened beverages (SSBs) is one of the main sources of added sugar intake. Excessive consumption of SSBs has adverse effects on individual physiology and psychology. Previous studies have found that habitual consumption of SSBs can reduce the activity of reward related brain regions. Based on the continuous feature of reward processing in time dimension, this study uses ERP technology with better temporal resolution. In this study, we explored the effects of habitual SSBs intake on reward processing from two independent and related stages of reward anticipatory and consummatory, and whether the effects were separated in different stages of reward processing. In study 1, Monetary incentive delay (MID) was used to compare the difference of high and low sugar beverages intake in money reward delay task, and to explore the influence of sugar sweetened beverages intake on reward anticipation. The study was 2 (SSBs intake: high, low) $\times$ 3 (Cue Type: no-reward anticipation cue, reward anticipation cue, loss anticipation cue) in the interior design. The results showed that there was no significant difference in the reaction time between the two groups, but there was difference in the types of cues; EEG results showed that the amplitude of cue-p3 and CNV in high sugar sweetened beverages intake group was significantly lower than that in low sugar beverages intake group, and there was no significant difference in SPN amplitude between the two groups. In study 2, the guessing door task was to explore the influence of sugar sweetened beverages intake on the consummatory processing of reward. We used a 2 (SSBs intake: high, low) $\times$ 2 (feedback type: win, lose) mixed experimental design to compare the differences between high and low sugar sweetened beverages intakes in door task. There was no significant difference in reaction time between the two groups; EEG results showed that the feedback of win induced larger Rewp and fb-p3 than the feedback of lose; Under the feedback of different results, the difference wave amplitude of Rewp and fb-p3 in the high sugar sweetened beverages group was larger than that in the low sugar sweetened beverages group. Conclusion: the effect of sugar sweetened beverages intake on reward processing is separate. (1)The results showed that the high sugar sweetened beverages intake had significantly lower attention and approach motivation to reward and punishment cues than the low sugar sweetened beverages intake. (2)The results showed that the satisfaction of high sugar sweetened beverages intake was significantly higher than that of low sugar sweetened beverage intake.

Keywords: sugar sweetened beverages, reward anticipation, reward consummatory, ERP

黑暗三人格与网络游戏成瘾的关系： 基本心理需要满足和消极应对方式的链式中介作用

徐旋^{1,2} 高峻峰^{1,2} 周宗奎^{1,2} (通讯作者)

¹ 青少年网络心理与行为教育部重点实验室，武汉，430079

² 华中师范大学心理学院，武汉，430079

通讯作者 E-mail: zhouzk@mail.ccnu.edu.cn

摘 要 网络游戏成瘾已成为重要的公共卫生议题，对其前因变量和影响机制的研究逐步得到重视。研究发现，黑暗三人格(即马基雅维利主义、自恋和精神病态)与各类问题性网络使用和行为成瘾关系密切。然而，黑

暗三人格预测网络游戏成瘾的作用和路径尚未明确。故本研究基于 I-PACE 模型探讨黑暗三人格与网络游戏成瘾的关系, 并在使用一满足理论以及认知-行为模型的基础上, 进一步考察基本心理需求满足和消极应对方式在黑暗三人格与网络游戏成瘾间的单一和中介作用。研究采用黑暗十二条量表、网络游戏成瘾量表、基本心理需求量表以及消极应对方式量表, 共收集 740 份有效数据进行路径分析。结果表明: (1) 马基雅维利主义、精神病态和自恋均能正向预测网络游戏成瘾。(2) 在马基雅维利主义预测网络游戏成瘾的模型中, 消极应对方式的单一中介作用以及基本心理需求满足和消极应对方式的链式作用显著。(3) 在精神病态预测网络游戏成瘾的模型中, 基本心理需求满足的单一中介作用以及基本心理需求满足和消极应对方式的链式作用显著。(4) 在自恋预测网络游戏成瘾的模型中, 仅有消极应对方式的单一中介作用显著。研究说明黑暗三人格对网络游戏成瘾具有重要影响, 且这种影响是通过基本心理需求满足和消极应对方式的中介路径来实现的。

Dark Triad and Online Gaming Addiction: the Serial Mediation of Basic Psychological Needs and Negative Coping Styles

Xuan Xu^{1,2}, Lingfeng Gao^{1,2}, Zongkui Zhou^{1,2}

¹Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University), Ministry of Education, Wuhan, 430079

²School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: Online gaming addiction has become an important public health topic, and research on its antecedent variables and influencing mechanisms has gradually gained attention. Studies have found that the Dark Triad (i.e., Machiavellianism, narcissism, and psychopathy) are strongly associated with various types of problematic Internet use and behavioral addiction. However, the role and pathways of the Dark Triad in predicting online gaming addiction have not been clarified. Therefore, this study explored the relationship between the dark three personalities and online gaming addiction based on the I-PACE model, and further examined the single and serial mediating role of basic psychological need satisfaction and negative coping styles between the Dark Triad and online gaming addiction based on the use-satisfaction theory and the cognitive-behavioral model. The study used the Dirty Dozen Scale, the Online Gaming Addiction Scale, the Basic Psychological Needs Scale, and the Negative Coping Style Scale to collect a total of 740 valid data for path analysis. The results showed that (1) Machiavellianism, psychopathy and narcissism all positively predicted online gaming addiction. (2) In the model of Machiavellianism predicting online gaming addiction, the single mediating effect of negative coping style and the serial mediating effect of basic psychological need satisfaction and negative coping style were significant. (3) In the model of psychopathy predicting online gaming addiction, the single mediating role of basic psychological need satisfaction and the serial mediating effect of basic psychological need satisfaction and negative coping style were significant. (4) In the model of narcissism predicting online gaming addiction, only the single mediating role of negative coping style was significant. The study indicates that the Dark Triad has a significant influence on online gaming addiction, and this influence is achieved through the mediating path of basic psychological need satisfaction and negative coping style.

儿童友谊质量与心理健康的双向关系：一项纵向研究

刘旭 刘宇潇 周宗奎（通讯作者）

华中师范大学心理学院, 武汉, 430079, zhouzk@mail.ccnu.edu.cn

摘要 本研究基于社会需要理论、孤独的进化理论与发展情境理论, 对武汉市 212 名儿童进行为期三年的纵向研究, 采用随机截距的交叉滞后模型(RI-CLPM)考察儿童友谊质量与心理健康之间的双向关系, 结果发现: (1) 在个体间水平上, 友谊质量分别与幸福感和孤独感之间的随机截距相关; (2) 在个体内水平上, T1 时

的幸福感显著正向预测 T2 时的友谊质量, 其他交叉路径不显著; (3) 在个体内水平上, T1 时的友谊质量显著负向预测 T2 时的孤独感, 进而显著负向预测 T3 时的友谊质量。综上, 儿童友谊质量与孤独感之间存在循环作用关系, 而友谊质量与幸福感之间仅存在幸福感显著预测友谊质量的单向预测关系。因此, 儿童友谊质量与心理健康具有复杂的双向关系。本研究对儿童心理健康的干预和友谊质量的提升具有重要启示。

关键词 友谊质量, 孤独感, 幸福感, 儿童, 随机截距的交叉滞后模型。

Bidirectional Associations Between Friendship Quality and Mental Health Among Children: A Longitudinal Study

Xu Liu, Yuxiao Liu, Zongkui Zhou

School of Psychology, Central China Normal University, Wuhan

Abstract: Based on the Social Needs Theory, the evolutionary theory of loneliness and The Development Contextualism, this study utilized a three-year longitudinal design, sampled with 212 children in Wuhan, employed a random intercepts cross-lagged panel model (RI-CLPM) to investigate the bidirectional associations between children's friendship quality and mental health (well-being and loneliness). Results showed that: (1) At the between-person level, the random intercepts of friendship quality are related to the random intercepts of happiness and loneliness, respectively. (2) At the within-person effects, initial well-being significantly positively predicted friendship quality at Time 2. Initial friendship quality did not predict subsequent well-being. (3) At the within-person level, there were reciprocal relations between friendship quality and loneliness. Specifically, initial friendship quality significantly negatively predicted loneliness at Time 2, which in turn negatively predicted friendship quality at Time3. In general, There was a bidirectional association between friendship quality and loneliness, while the relationship between friendship quality and well-being was unidirectional, that is, well-being could positively predict children's friendship quality. These findings reveal the bidirectional and complex nature of the association between friendship quality and mental health, have important implications for the intervention of children's mental health development and the improvement of friendship quality.

Keywords: friendship, loneliness, well-being, children, RI-CLPM.

中学生作业创造性行为量表的编制及适用性检验

马艺丹¹, 范会勇²

渤海大学

摘 要 目的: 编制中学生作业创造性行为量表(HCBS), 并检验其信度、效度与适用性。方法: 研究一在家庭作业行为整体框架下, 结合开放式访谈的结果, 提出作业创造性的概念并编制 HCBS 初稿。对样本 1 与样本 2 共计 1537 名中学生施测后, 使用 R 进行项目分析、因素分析、信效度检验以及测验等值性检验。研究二在研究一的基础上对样本 2 进行适用性检验, 主要包括人口学差异检验与回归分析。结果: 研究一结果表明 HCBS 包含 1 个维度, 9 道题目, 累计方差解释率在 40%以上; 验证性因子分析显示各因子模型拟合良好, 删除第 7 题后模型达到最佳; 量表总分与威廉姆斯创造性倾向量表总分及四个维度、家庭作业管理量表、作业完成度与学业成绩呈显著正相关, 表明效度良好; 量表内部一致性信度在为 0.86; HCBS 在不同性别与年级水平上具有测量等值性; 研究二结果表明 HCBS 存在显著的性别效应与年级效应, 且男性的 HCBS 得分高于女性, 初中生的 HCBS 得分高于高中生; 中学生作业创造性行为对学业成绩及创造性倾向的预测贡献为 3.5%与 7.5%。结论: 中学生作业创造性行为量表信效度良好, 能够有效预测学生的学业成绩与创造性倾向, 是测量中学生家庭作业行为的有效工具。

A study of the validity and reliability of the Homework Creative Behavior Scale: A psychometric evaluation and application

Ma Yidan¹, Fan Huiyong²

Bohai university

Abstract: Objective: To compile students' Homework Creative Behavior Scale (HCBS) and test its reliability, validity and applicability. Method: Study 1: Under the overall framework of homework behavior, combined with the results of open-ended survey, our study put forward the concept of homework creative behavior and compile the first draft of HCBS. After conducting the test on a total of 1537 junior and high school students in sample 1 and sample 2, R was used to perform item analysis, factor analysis, reliability and validity test, and measurement invariance test. The study 2 carried out the applicability test of the sample 2 on the basis of the study 1, which mainly included the demographic difference test and regression analysis. Results: The result of Study 1 showed that HCBS contains 1 dimension, 9 items, and the cumulative variance explanation rate was more than 40%; Confirmatory factor analysis showed that each factor model fits well, and the model reaches the best after deleting item 7; the total score of HCBS was positively correlated with the total score and the four dimensions of the WCAT, HMS, homework completion and academic performance, indicating HCBS had a good validity; the internal consistency reliability of HCBS is 0.86; HCBS has measurement invariance in different gender and grade levels. The results of study 2 indicated that HCBS had a significant gender and grade effect, that is boys' score was higher than girls' and junior school students' score was higher than high school students. The predictive contribution of homework creative behaviors to academic performance and creative aptitude respectively was 3.5% and 7.5%. Conclusion: HCBS has good reliability and validity. HCBS as an effective tool for measuring students' homework behavior can predict students' academic performance and creative aptitude.

学龄前儿童体育运动参与和问题行为之间的关系： 执行功能缺陷的中介作用

赵梦婕¹ 黄翥青²

首都师范大学

摘要 本研究以 844 名学龄前儿童（男孩 428 名，女孩 416 名， $M_{age} = 4.84$ 岁）的父母为调查对象，以 SPSS 和 Mplus7.0 为工具进行统计分析，探究学龄前儿童体育运动参与、执行功能缺陷和问题行为之间的关系，结果发现：首先，学龄前儿童体育运动参与水平负向预测其执行功能困难和问题行为，并且执行功能困难完全中介了运动参与和问题行为的关系；其次，对男孩和女孩进行分别考察，发现男孩中，执行功能困难的两个维度（执行抑制困难和工作记忆困难）是其问题行为中多动和注意力缺陷的多重中介。总之，本研究不仅发现早期体育可以通过降低执行功能缺陷来减少幼儿的问题行为，并进一步指出，在男孩和女孩中，执行功能困难在运动参与和问题行为之间具有不同作用。

关键词 运动参与，执行功能缺陷，问题行为，学龄前儿童

The Relationship Between Preschool Children's Sport Participation and Problem Behavior: Mediation of Executive Function Deficit

Zhao Mengjie¹, Huang Qing²

Capital Normal University

Abstract: The participants of the current study included 844 preschoolers' (428 boys, 416 girls, $M_{age} = 4.84$ years old) parents. Using SPSS and Mplus7.0 as tools for statistical analysis to explores the relationship between preschool children's sport participation, executive function defects and problem behavior. The results show that: firstly,

preschool children's sport participation level negatively predicts their executive function difficulties and problem behavior, and executive function difficulties completely mediate the relationship between sport participation and problem behavior; Secondly, by investigating boys and girls respectively, it is found that the two dimensions of executive function difficulty (executive inhibition difficulty and working memory difficulty) are the multiple mediators of shyper activity and attention deficit in boys' problem behavior. In a word, this study not only found that early sport can reduce children's problem behavior by reducing executive function defects, but also pointed out that executive function difficulties have different roles between sport participation and problem behavior in boys and girls.

Keywords: sport participation, executive function deficit, problem behavior, preschool children

父母婚姻冲突对青少年主观幸福感的影响： 同胞关系和基本心理需要满足的作用

何然¹ 陈福美¹（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

通讯作者 E-mail: chenfumei@bnu.edu.cn

摘 要 全面二孩政策后，二孩家庭和同胞关系逐步成为了国内研究关注的热点。父母的婚姻质量是影响二孩养育的重要因素，影响青少年主观幸福感的发展。父母间和谐的关系是青少年基本心理需要满足满足的重要来源，有助于提升青少年的主观幸福感。一些研究表明，父母婚姻冲突会对青少年的同胞关系产生负性影响，而家庭成员间和谐的关系有助于青少年基本心理需要满足的满足。因而同胞关系和基本心理需要满足可能在父母婚姻冲突对青少年主观幸福感的影响中存在链式中介作用。此外，也有研究将同胞关系作为调节变量，认为其会缓冲和加剧父母婚姻冲突对个体发展的作用。因而同胞关系可能调节父母婚姻冲突对青少年主观幸福感的影响以及父母婚姻冲突对青少年基本心理需要满足满足的影响。本研究以同胞关系为关键点，分析父母婚姻冲突对青少年主观幸福感的影响及作用机制。抽取山东省某所初中的初一和初二学生参与问卷调查，采用《父母婚姻冲突量表》、《幸福感指数量表》、《基本心理需要满足满足量表》以及《同胞关系量表清单》中的温暖和冲突两个分维度作为测量工具。共收集到有效问卷 907 份，平均年龄 12.67±0.66 岁。结果发现：（1）父母婚姻冲突可以显著负向预测青少年的主观幸福感。（2）基本心理需要满足在父母婚姻冲突和青少年主观幸福感之间起部分中介作用。（3）同胞关系（温暖和敌意）、基本心理需要满足在父母婚姻冲突和青少年主观幸福感之间起链式中介作用。（4）同胞敌意调节父母婚姻冲突对青少年主观幸福感的影响。

The Impact of Interparental Conflict on Adolescents' Subjective Well-Being: the Role of Sibling Relationship and Basic Psychological Satisfaction Needs

HE Ran¹, CHEN Fumei¹ (Corresponding author)

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

Abstract: After the comprehensive two child policy, two-child families and sibling relationship has getting increasing focus of domestic research. The quality of parents' marriage is an important factor affecting the parenting and the development of adolescents' subjective well-being. The harmonious relationship between parents is an important source for adolescent to development their basic psychological satisfaction needs, which is beneficial to improve adolescnet's subjective well-being. Some studies have shown that parents' marital conflict will have a negative impact on adolescnet's sibling relationship, and the harmonious relationship between family members is helpful to satisfy adolescnet's basic psychological satisfaction needs. Therefore, sibling relationship and basic psychological satisfaction needs may play a chain mediating roles in the impact of interparental conflict on adolescents' subjective

well-being. In addition, some studies take the sibling relationship as a moderating variable, believing that it will buffer and aggravate the effect of interparental conflict on individual development. Therefore, sibling relationship may regulate the impact of interparental conflict on adolescents' subjective well-being and the impact of interparental conflict on adolescents' basic psychological satisfaction needs. This study takes the sibling relationship as the key point to analyze the impact and mechanism of interparental conflict on adolescents' subjective well-being. The first and second grade students of a junior middle school in Shandong Province were selected to participate in the questionnaire survey. The Parents' Marital Conflict Scale, Subjective Well-Being Scale, Basic Psychological Satisfaction Needs Satisfaction Scale and two sub dimensions of warmth and rivalry in Sibling Relationship Inventory were used as measurement tools. A total of 907 valid questionnaires were collected. The average age of participants is 12.67 ± 0.66 years. The results show that: (1) interparental conflict can significantly and negatively predict adolescents' subjective well-being. (2) Basic psychological satisfaction needs plays a partial mediating role between interparental conflict and adolescents' subjective well-being. (3) Sibling relationship (warmth and rivalry) and basic psychological satisfaction needs play a chain intermediary roles between interparental conflict and adolescents' subjective well-being. (4) Sibling rivalry moderates the impact of interparental conflict on adolescents' subjective well-being.

3-6 岁亲子依恋及其共情的关系研究—父母教养方式的中介作用

鲁爽 黄嵩青（通讯作者）

首都师范大学，北京，100000, aivita@126.com

摘要 共情作为一种积极的社会情绪反应，在个体的社会化发展进程中发挥着重要的作用。学前阶段是个体社会能力发展的关键时期，家庭是幼儿最初和最重要的人际环境，因此有必要探讨家庭因素对幼儿共情能力的影响。本研究旨在考察亲子依恋、父母教养方式与幼儿共情间的关系。共选取 135 名学前期幼儿（ $M = 5.65$ 岁， $SD = 0.80$, $Range = 2.70-6.65$ ）及其父母作为被试，使用沃特斯—迪因儿童依恋行为分类卡片考察儿童的依恋行为；通过《儿童共情问卷》考察儿童的共情能力，包括情绪感染、关注他人和亲社会行为三个维度；通过《教养方式与维度问卷》考察父母教养方式，包括权威型、专制型和溺爱教养三个维度。结果表明：（1）依恋安全性与父母教养方式三维度（权威型、专制型、溺爱型）及共情中的情绪感染和亲社会行为显著相关，其中与情绪感染、专制型教养和溺爱型教养显著负相关。权威型教养与关注他人和亲社会行为显著正相关，专制型教养与情绪感染和关注他人显著正相关。（2）权威型教养方式在依恋安全性和亲社会行为之间起到部分中介作用。研究表明，家庭中父母的教养方式与依恋关系都能够对儿童的共情能力产生影响。父母应努力采用权威型教养方式，与幼儿建立安全型依恋关系，为幼儿的发展提供温暖的家庭支持。

现实疗法团体辅导改善初中生学业倦怠的效果

石阳¹ 何艳丽¹ 钟建军¹（通讯作者）

¹ 内蒙古师范大学心理学院，呼和浩特，010022, zhongjj709@163.com

摘要 以如何阻断压力、挫折对学业倦怠形成的影响及摆脱学业倦怠性行为反应为靶问题，以降低学业倦怠反应水平为靶目标，探究现实疗法的团体辅导活动对初中生学业倦怠的干预效果。研究采用干预组和对照组的前后测准实验设计，干预组 10 人，对照组 10 人。自编了以 WDEP 技术解决挫折、目标、意义等问题的八个主题性团体辅导活动方案，对干预组实施了每周两次、每次两小时一个主题单元共计八次的自编团体辅导活动方案，对照组没有实施任何干预活动，结果发现：干预组在学业倦怠总分上显著低于对照组，干预组前测学业倦怠总分显著高于后测。身心耗竭维度两组没有差异，但是对于干预组在身心耗竭维度上的前后测表明前测明显高于后测。在学业疏离和低成就感维度上干预组和对照组均有显著差异，均表现为干预组低于对照组，同样，在这两个维度上干预组前后测均表现出前测得分显著高于后测。这一结果在实验结束后对被试的访谈中也得到了印证：他们认为团体心理辅导活动有一定的趣味性，在团体中可以学习他人优点促进自我

成长, 喜欢参加这样的团体, 通过现实疗法知道如何制定可行的学习目标, 促进自我反思, 选择有效行为, 对自己更有信心, 学习上不再迷茫。实验结果说明以构建自主、选择和积极反馈为目的的现实疗法团体辅导对改善初中学生的学业倦怠有效, 并就该方案与其他方案相比的特点及可扩展的人群、学业倦怠成因类型等进行了讨论。

Effects of Group Counseling Based on Reality Therapy on Academic Burnout

SHI Yang, HE Yan-Li, ZHONG Jian-Jun

College of Psychology, Inner Mongolia Normal University, Hohhot, China

Abstract: To explore the effect of group counseling of reality therapy on the academic burnout of junior middle school students, the aim of this study was to block the influence of stress and frustration on academic burnout and to get rid of the behavioral response of academic burnout, and to reduce the level of academic burnout response. The study adopted the pre-test and post test experimental design of the intervention group and the control group. The eight group counseling activities programs of different themes were compiled. Group counseling was implemented for the intervention group, while the control group did not implement any intervention activities. The results showed that the post-test scores of the intervention group were significantly lower than those of the control group on the total score of academic burnout, the dimension of cynicism, and the dimension of low sense of accomplishment. The experimental results show that the reality therapy group counseling is effective in improving the burnout of middle school students, and the characteristics of the program, the extensible population, the causes of burnout and so on are discussed.

母亲人格、爱的撤回和努力控制对学前儿童问题行为的影响机制

邵晨冉¹ 崔慧欣¹ 邢淑芬² (通讯作者)

¹ 首都师范大学, 北京, 100048, xsf2986@163.com

摘要 爱的撤回是心理控制的一个重要维度, 它是指当儿童无法达到父母提出的某种要求或者出现某种不正当行为时, 父母不再给予儿童关爱和照顾的行为。受中国长幼尊卑的传统文化影响, 爱的撤回可能存在不同的含义。中国家庭更多地是“男主外女主内”, 母亲看护儿童的时间和形式要多于其他家庭成员, 因此中国母亲的自身特质与其教养行为得到了研究者的大量关注。同时为了更好地探究儿童发展, 研究者开始在环境与儿童特质的相互影响下, 考察父母教养方式对于不同努力控制水平儿童的差异化影响。本研究采用追踪设计对 111 名学前儿童及其母亲进行问卷调查, 旨在我国母亲爱的撤回使用较多、儿童问题行为不断激增且低龄化的社会背景下, 考察母亲人格、爱的撤回和儿童的气质与学前儿童问题行为的关系。研究结果表明: (1) 爱的撤回的消极作用在我国学前儿童群体中仍然存在。(2) 在控制了 T1 阶段学前儿童的内化、外化问题后, 只有 T1 阶段母亲的宜人性能够通过影响其爱的撤回, 间接地影响 T2 阶段学前儿童的内化、外化问题, 但不存在直接的影响效应。(3) 儿童的努力控制调节了 T1 阶段母亲爱的撤回对 T2 阶段学前儿童内化问题的影响。结论: 具有较高宜人性的母亲慎用爱的撤回能够有效降低学前儿童, 尤其是低努力控制儿童的内化问题的产生。

关键词 爱的撤回, 母亲人格, 问题行为, 努力控制, 学前儿童

Maternal Personality, love withdrawal, and effortful control on preschoolers' problem behaviors

Shao Chenran¹, Cui Huixin¹, Xing Shufen²

¹ Capital Normal University, BeiJing, 100048, xsf2986@163.com

Abstract: Love withdrawal is an important dimension of Psychological Control, which refer to the behavior that

parents stop taking care for children when children can't meet the requirements of their parents or have some misbehavior. Influenced by Chinese traditional culture, the withdrawal of love may have different meanings. Chinese families are more likely to be "Male advocate outside, Female advocate inside", and the time and the form of mother's care for children are more than other family members. Therefore, the Chinese mother's personality and parenting behavior have attracted a lot of attention from researchers. At the same time, in order to better explore child development, researchers began to invest the differential effect of parenting on children with different levels of effort control under the perspective of individual characteristic environment interaction. The current study used a follow-up study experimental design to administer a questionnaire to 111 preschool children and their mothers. The purpose of the study was to examine the relationship between maternal personality, withdrawal of love, and child temperament and preschool children's problem behaviors in a social context where Chinese mothers often use the negative parenting style of withdrawal of love, which has led to an increase in children's problem behaviors, and where children's behaviors tend to be younger. The findings indicated that (1) the negative effects of love withdrawal are still present in the Chinese preschooler population; (2) after controlling for the internalization and externalization problems of preschool children in stage T1, only the mother's agreeableness in stage T1 can indirectly influence the internalization and externalization problems of preschool children in stage T2 by influencing their love withdrawal, but there is no direct influence effect; and (3) children's effortful control moderated the effect of T1-stage mothers' love withdrawal on T2-stage preschoolers' internalizing problems. Overall, mothers with higher agreeableness reduce the frequency of loving withdrawal can effectively reduce the development of internalization problems in preschool children, especially in low effort control children.

虚拟现实环境中空间维度对多目标追踪的影响

马嘉悦¹ 王静¹ 李杰²(通讯作者) 张禹¹(通讯作者) 赵启超³

1 北京体育大学心理学院, 北京 100084, btzy1973@126.com;

2 杭州师范大学心理科学研究院, 杭州 311121, lijie.psy@hznu.edu.cn;

3 北京津发科技股份有限公司, 北京, 100084

摘要 目的: 在目前的研究中多目标追踪范式大多都是以二维平面的形式所呈现, 主要探讨人们在平面条件下的视觉信息加工问题, 然而人们接触的真实场景是三维立体空间, 其深度知觉信息会对人们注意和追踪多个运动物体产生影响。近年来已有学者在以往的多目标追踪(Multiple Object Tracking, MOT)范式中增加立体与深度线索形成 3D MOT 范式进行研究。随着虚拟现实(Virtual Reality, VR)工具的普及, 研究者开始将 VR 技术与 3D MOT 范式相结合, 进一步引入了立体感深度与沉浸感。然而新兴的 3D MOT 与传统的 2D MOT 的关系如何仍然尚不清楚, 采用虚拟现实技术呈现三维空间信息是否有其独特的优势, 也尚不明确。因此, 有必要将传统显示屏 (Traditional Monitor Display, 简称 TMD)和 VR 头戴式显示器 (Head Mounted Display, 简称 HMD)与 2D 和 3D 的空间维度结合, 比较虚拟现实情境(VR)与传统屏幕显示下经典 MOT 范式与 3D MOT 范式追踪表现的差异。方法: 本研究以 30 名大学生为被试, 探讨空间维度与呈现方式对多目标追踪表现的影响。采用 2 (空间维度: 2D, 3D)×2 (呈现方式: 传统显示屏, VR 头戴式显示器)被试内设计, 以自适应调节速度的 MOT 范式探讨 2D 与 3D 场景中动态视觉追踪任务中的追踪表现, 使用小球运动的速度指标作为因变量, 包括速度的平均阈值, 最后四次阈值和极值, 比较虚拟现实与传统屏幕显示下 2D 与 3D 多目标追踪表现的差异。结果: 进行 2 (空间维度: 2D, 3D)×2 (呈现方式: TMD, HMD)的重复测量方差分析发现: 在平均阈值(F(1,29)

=9.910, $p = .004$, $\eta^2 = .255$)、速度极值($F(1,29)=13.454$, $p = .001$, $\eta^2 = .317$)以及最后四次阈值($F(1,29)=13.388$, $p = .001$, $\eta^2 = .302$)上均表现出空间维度的主效应显著,即三维多目标追踪的表现优于二维(M2D 平均阈值=1.160, M3D 平均阈值=1.318; M2D 最后四次=1.176, M3D 最后四次=1.370; M2D 极值=1.597, M3D 极值=1.821),而呈现方式以及交互作用均不显著。结论:三维空间信息对多目标追踪表现有促进作用,且不受 VR 头戴式显示器和传统显示器呈现方式的影响。

Abstract: objective: In the current study multiple object tracking model mostly is presented in the form of a two-dimensional plane, this paper mainly discusses people under the condition of plane visual information processing problems, yet people contact with the real scene is a three-dimensional space, the depth perception information will affect people to pay attention to and tracking multiple motion objects. In recent years, scholars have conducted researches on the FORMATION of 3D MOT by adding 3D and depth cues in the previous Multiple Object Tracking (MOT) paradigm. With the popularity of Virtual Reality (VR) tools, researchers began to combine VR technology with THE 3D MOT paradigm, further introducing the depth of three-dimensional sense and the sense of immersion. However, it is still unclear how the emerging 3D MOT is related to the traditional 2D MOT, and whether the application of virtual reality technology to present 3D spatial information has its unique advantages. Therefore, it is necessary to combine Traditional Monitor Display (TMD) and Head Mounted Display (HMD) with 2D and 3D spatial dimensions to compare the difference in tracking performance between virtual reality situation (VR) and Traditional screen. Methods: In this study, 30 college students were selected as subjects to explore the influence of spatial dimension and presentation mode on the performance of multiple object tracking. Using 2 (spatial dimensions: 2D, 3D) x 2 (presentation: traditional display, VR head-mounted display) within subjects design, with adaptive adjusting speed of MOT paradigm of 2D and 3D dynamic visual tracking performance of tracking tasks in a scene, use the speed of the ball movement indicators as dependent variable, including the average and last four times threshold comparison, extreme value, to compare the difference of 2D and 3D MOT performance between virtual reality and traditional screen display. Results: 2 (spatial dimensions: 2D, 3D) x 2 (presentation: TMD, HMD) of repetitive measure analysis of variance is found that the average threshold ($F(1,29)=9.910$, $p = .004$, $\eta^2 = .255$), speed of extremum ($F(1,29)=13.454$, $p = .001$, $\eta^2 = .317$) on all showed significant main effect dimensions, namely the three-dimensional multi-target tracking performance is superior to two-dimensional (M2D average threshold = 1.160, M3D average threshold = 1.318; M2D last four times threshold = 1.176, M3D last four times threshold = 1.370; M2D extreme value = 1.597, M3D extreme value = 1.821), but the presentation mode and interaction were not significant. Conclusion: 3D spatial information can promote the performance of multi-target tracking, and it is not affected by VR head-mounted display and traditional display.

突发社会事件与大众情绪的共变规律分析

孙虹宇¹ 薛婷¹ (通讯作者) 张萌¹

¹ 天津中医药大学管理学院, 天津, 301617, xueting_11@163.com

摘要 近几年, 频发的突发社会事件通过互联网在短时间内引起民众的大规模关注, 一些负性事件所引发的消极情绪也通过网络迅速扩散, 及时合理地引导大众情绪有助于维护舆情的稳定以及避免可能产生的线上线下的群体性事件。基于此, 本研究为探究突发社会事件和不同类型的大众情绪的共变规律, 选取社会影响较大的四种不同类型事件, 以“新冠疫情”事件、“长春疫苗”事件、“天津滨海爆炸”事件和“九寨沟地震”事件为例, 借助百度指数数据, 在构建代表性事件指标和不同情绪指标的基础上, 对事件和情绪的发展趋势以及事件和情绪之间、不同情绪之间的时间序列关系进行了分析。结果发现: (1) 大众对突发社会事件的关注度都经历了从爆发、衰落到消退的过程, 基本符合生命周期模型; 害怕在部分时间段内的发生轨迹与生命周期模型基本吻合; (2) 大部分的突发社会事件发生之初, 害怕和愤怒是主要的情绪反应, 而对事件的关注消退后, 悲伤和抑郁情绪升高, 抑郁在事件发展的不同阶段出现了不同程度的峰值; (3) 突发事件的关注度能在一定程度上预测事件发生后的大众情绪变化, 例如, 能够预测短期后的害怕, 以及中、长期后的悲伤和抑郁情绪; (4) 不同情绪之间也能够相互预测, 例如, 害怕和愤怒能在不同程度上预测后续的抑郁情绪, 抑郁情绪也能在不同程度上预测害怕和愤怒。该结果在一定程度上从群体层面上验证了个体的应激反应过程, 并对科学的干预和管理突发社会事件引发的大众负面情绪有一定的启发。

Analysis of the covariation between emergent social events and public emotions

Sun Hongyu, Xue Ting, Zhang Meng

University of Traditional Chinese Medicine, Tianjin, 301617

Abstract: In recent years, emergent social events frequently attracted large-scale public attention in a very short time through the Internet, negative emotions caused by some negative events also rapidly spread through the Internet. Timely and reasonable guidance of public emotions can help maintain public opinion stability and avoid possible online and offline mass incidents. Therefore, this study aimed to explore the covariation between emergent social events and different types of public emotion. This study selected four different type events which have a significant influence on society, such as “COVID-19” event, “Changchun Vaccine Scandal” event, “Explosion accident in Tianjin Binhai New Area” event and “Earthquake in Jiuzhaigou” event. Extracting representative event index and sentiment index through Baidu index, we analyzed the correlation between emergent social events and public emotions and the correlation between different types of public emotions through time series test. The results found that public's attention to emergent social events involved in this study has gone through a process from explosion, the decline to fading. Moreover, the trajectory of fear in part of the period is consistent with the life cycle model. We also find that fear and anger are the main emotional reactions at the beginning of most emergent social events, and after the attention to the event subsides, sadness and depression increase, and depression has peaked to varying degrees at different stages of the event. Granger analyses show that most of the event indexes can predict public emotion which caused by emergent social events, such as, event indexes can predict fear in short-term, while they can predict sadness and depression in the middle and long term. Finally, different emotions can also predict each other, such as, fear and anger can more or less predict subsequent sadness and depression, and depression also can predict fear and anger. This study could verify the individual response to stress at the group level, it also has some inspirations for how to reasonably guide and manage public negative emotions caused by emergent social events.

生命意义感量表在中蒙大学生群体间的测量等值性

包昕哲¹ 赵彩玲¹ 仁钦¹ 七十三^{1,2} (通讯作者)

¹ 内蒙古师范大学心理学院, 呼和浩特, 010022

² 内蒙古自治区心理学重点实验室, 呼和浩特, 010022, qshisan@126.com

摘要 研究拟检验生命意义感量表(PIL)在中国和蒙古两国大学生群体间跨文化使用的测量等值性,使用PIL对1317名大学生(中675,蒙642)进行施测,运用验证性因素分析多组比较法进行数据分析。结果发现PIL在中蒙两国大学生群体跨文化样本间的形态等值(CFI=0.93, TLI=0.91, RMSEA=0.049)、弱等值(CFI=0.924, TLI=0.908, RMSEA=0.5)及部分强等值(CFI=0.916, TLI=0.901, RMSEA=0.052)模型拟合参数均达到相应标准,部分严格等值(CFI=0.906, TLI=0.893, RMSEA=0.054)拟合指标尚可接受。研究中PIL量表的克伦巴赫 α 系数为0.876,生活态度、生活目标、生命价值及生活自主四个维度的克伦巴赫 α 系数依次为0.649、0.669、0.724、0.675。在PIL总分上蒙古国大学生得分显著高于中国大学生($t=-7.652, p<0.01$),在生活自主维度上蒙古国大学生得分显著高于中国大学生($t=-8.573, p<0.01$),在生活态度维度上蒙古国大学生得分显著高于中国大学生($t=-6.606, p<0.01$)。PIL的四因子结构模型在中蒙两国大学生群体间具有完全形态等值性、完全弱等值性、部分强等值性以及部分严格等值性,该量表进行中、蒙大学生群体间研究时需谨慎使用。

Measurement Invariance of the Life Meaning Feeling Scale Among Chinese and Mongolian College Students

Bao Xin-zhe¹, Zhao Cai-ling¹, Ren Qin¹, Qi Shi-san^{1,2}

¹ School of Psychology, Inner Mongolia Normal University, Hohhot, 010022

² Inner Mongolia key laboratory of psychology, Hohhot, 010022, qshisan@126.com

Abstract: This study intends to test the cross-cultural equivalence of college students in China and Mongolia by means of the Purpose in life Scale (PIL). 1317 college students (Chinese 675, Mongolian 642) are measured by means of PIL, and multiple groups of comparative method of confirmative factor analysis is used for data analysis. The results show that PIL's fitting parameters of morphological equivalence (CFI=0.93, TLI=0.91, RMSEA=0.049), weak equivalence (CFI=0.924, TLI=0.908, RMSEA=0.5) and partly strong equivalence (CFI=0.916, TLI=0.901, RMSEA=0.052) between cross-cultural samples of college students from China and Mongolia all meet the corresponding standards, while partly strict equivalence (CFI=0.906, TLI=0.893, RMSEA=0.054) are acceptable. In the PIL scale, the Cronbach's alpha is 0.876, and the Cronbach's alpha of life attitude, life goal, life value and life autonomy are 0.649, 0.669, 0.724 and 0.675, respectively. On the PIL total score, Mongolian university students' score is significantly higher than that of Chinese university students ($t=-7.652, p<0.01$), higher than that of Chinese university students on the dimension of life autonomy ($t=-8.573, p<0.01$), and higher than that of Chinese university students on the dimension of life attitude ($t=-6.606, p<0.01$). The Four-factor structural model of PIL has complete morphological equivalence, completely weak equivalence, partly strong equivalence and partly strict equivalence between Chinese and Mongolian university students. This scale should be used carefully in the research between Chinese and Mongolian university students.

大学新生成就目标定向、学习投入与学习适应的关系： 变量中心和个体中心分析

徐铭雪 吴爽 王海英 (通讯作者) 谢笑春

东北师范大学心理学院, 长春, 130024, wanghy178@nenu.edu.cn

摘要 学习适应是大学新生进入校园后面临的主要挑战之一, 学生学习适应不良易导致学业失败, 还可能

诱发一系列心理或行为问题。本研究以 578 名大学新生为研究对象,采用变量中心和个体中心相结合的技术,分析学习投入在成就目标定向与学习适应关系间的中介作用。结果表明:(1)学习投入分别在掌握趋近目标、成绩回避目标两个变量与学习适应的关系中起中介作用;(2)成就目标定向可以分为四种潜在类别:无目标型成就目标、趋近型成就目标、平均型成就目标和冲突型成就目标;(3)相对于平均型成就目标,学习投入在趋近型成就目标与学习适应之间起中介作用。研究体现了成就目标定向的多目标性,结果为大学新生成就目标定向、学习投入和学习适应之间的关系探讨提供了新视角。

The relationship between Achievement Goal Orientation, Work engagement and Learning Adjustment of freshmen: Variable- oriented and Person-oriented Analyses

Xu Mingxue, Wu Shuang, Wang Haiying, Xie Xiaochun

School of Psychology, Northeast Normal University, Changchun, 130024

Abstract: After entering campus, learning adjustment becomes one of the main challenges for freshmen. Learning maladjustment could not only easily lead to students' academic failure, but also generate a series of psychological or behavioral problems. 578 freshmen (The mean age is 18.29 ± 1.04 years, 58.5% female) were recruited as participants and the combination of Variable-center and Person-center techniques was used. This study detects the mediating effect of Work engagement between achievement goal orientation and learning adjustment. The results show that: (1) Work engagement plays a mediating role between learning adjustment and mastery-approach goal, learning adjustment and performance-avoidance goal; (2) Achievement goal orientation could be divided into four potential categories: non-objective achievement goal, approach achievement goal, average achievement goal, and conflict achievement goal; (3) Compared with the average achievement goal, Work engagement plays a mediating role between the approach achievement goal and learning adjustment. The results present the multi-objective of achievement goal orientation, which could provide a new perspective for studies of the relationship between achievement goal orientation, Work engagement and learning adjustment.

2. College of Modern Management, Yango University, Fuzhou, China, 350015

Abstract: Objective: This article developed a scale of student-teacher relationship in private colleges and tested its reliability and validity, PCSTR scale will be used for relationship between students and teachers. Methods: The preliminary questionnaire was prepared through literature analysis and semi-structured interview. The cluster sampling method was used to select the students of private colleges for the prediction test and the formal scale test, then we conduct the reliability and validity test. Results: The private college student-teacher relationship scale (PCSTR) contains 29 items in 6 dimensions: trust (9 items), interaction (4 items), intimacy (5 items), care (4 items), approval (4 items) and comfort (3 items). The total interpretation variance ratio was 66.503%, the Cronbach's coefficient was 0.942, and the confirmatory factor analysis showed that the model fitting degree of the scale was good. Conclusion: This scale has good reliability and validity. As a tool for evaluating the student-teacher relationship in private colleges, it is easy to find that found that the student-teacher relationship in private colleges is better than the average level, and the gender and grade differences are significant.

亲社会态度可以减少危险驾驶行为吗？

刘馨泽（通讯作者） 葛燕 瞿炜娜

中国科学院心理研究所，北京，2725490669@qq.com

摘要 如何减少交通事故，增加交通安全一直是驾驶领域研究的核心问题。在影响驾驶行为的因素中，态度和情境因素是两个重要方面。高亲社会态度的群体通常具有有利于他人或者社会的行为特征，但这类驾驶员在驾驶中有何行为表现并未进行探讨。此外，车流密度是日常生活中对驾驶行为产生重要影响的常见情境因素，高车流密度会导致更加频繁的变道、超车行为，从而导致更多的交通事故，但不同特征驾驶员的驾驶行为也会有所不同。因此本研究探讨高/低亲社会态度驾驶员在高/低车流密度下的驾驶行为差异。本研究采用2(高/低亲社会态度)*2(高/低车流密度)混合设计研究变道和超车行为的亲社会态度与交通密度的交互作用。采用内隐联想测验范式测量亲社会态度，将驾驶员分为两组。要求40名被试在高、低车流密度两种情况下完成模拟驾驶任务，通过驾驶模拟器记录驾驶行为。结果表明，高车流密度导致更多的变道和超车行为。在高、低车流密度下，高亲社会态度的驾驶员均表现出了更好的驾驶能力，但在高车流密度下，低亲社会态度的驾驶员与其他辅助车辆横向距离较小，这可能增加了事故风险。本研究将亲社会态度应用于驾驶行为研究领域，一方面可以为驾驶行为差异的解释提供数据支持，另一方面为职业驾驶员的选拔、培训和干预提供了依据。

新冠疫情期间中国重灾区大众 PTSS 发病率及影响因素： 性别差异至关重要

刘念琪 孙露娜 刘伟志（通讯作者）

海军军医大学心理系，上海，200433，13024141970@163.com

摘要 新型冠状病毒肺炎（COVID-19）于2019年12月份在武汉爆发流行，其以传染性、突发性、公共性、不确定性等特点造成了广大群众的恐慌情绪。目前，COVID-19已被确定为全球关注的大流行和卫生紧急事件，并在世界范围内暴发流行。本研究的目的是，调查COVID-19爆发期间，中国重灾区大众的创伤后应激障碍症状（posttraumatic stress symptoms, PTSS）的患病率和影响因素，特别是探讨PTSS中存在的性别

差异。COVID-19 在中国爆发一个月后,我们使用基于 DSM-5 的创伤后应激障碍量表(the PTSD Checklist for DSM-5, PCL-5)以及匹兹堡睡眠质量指数(the Pittsburgh Sleep Quality Index, PSQI)中的 4 个项目,对武汉及周边城市 285 名居民的 PTSS 和睡眠质量进行了调查。主要采用层次回归分析和非参数检验对数据进行分析。结果表明,COVID-19 爆发一个月后,中国重灾区大众 PTSS 患病率为 7%,且性别差异明显。女性在重新体验、认知或情绪的负性改变和情绪高唤醒三个 PTSS 分量表得分显著高于男性。此外,主观睡眠质量较好或早醒频率较低的受试者 PTSS 发病率显著较低。本研究重点探讨和强调了由新冠疫情引起的 PTSS 的性别差异,证明了女性更容易在疫情期间患 PTSS,为后继爆发新冠疫情的国家和地区提供了信息和依据,具有重要的研究意义。基于本研究结论,建议相关卫生部门设计专业有效的心理健康服务,以帮助灾区群众(特别是生活在重灾区的群众、女性和睡眠质量差的人群)提升心理健康水平。

Prevalence and predictors of PTSS during COVID-19 outbreak in China hardest-hit areas: Gender differences matter

Nianqi Liu, Luna Sun, Weizhi Liu*

Faculty of Psychology and Mental Health, Naval Medical University, Shanghai, China

Abstract: The outbreak of COVID-19 in China in December 2019 has been identified as a pandemic and a health emergency of global concern. Our objective was to investigate the prevalence and predictors of posttraumatic stress symptoms (PTSS) in China hardest-hit areas during COVID-19 outbreak, especially exploring the gender difference existing in PTSS. One month after the December 2019 COVID-19 outbreak in Wuhan China, we surveyed PTSS and sleep qualities among 285 residents in Wuhan and surrounding cities using the PTSD Checklist for DSM-5 (PCL-5) and 4 items from the Pittsburgh Sleep Quality Index (PSQI). Hierarchical regression analysis and non-parametric test were used to analyze the data. Results indicated that the prevalence of PTSS in China hardest-hit areas a month after the COVID-19 outbreak was 7%. Women reported significant higher PTSS in the domains of re-experiencing, negative alterations in cognition or mood, and hyper-arousal. Participants with better sleep quality or less frequency of early awakenings reported lower PTSS. This study emphasized the gender difference of PTSS caused by COVID-19, proving that women are more likely to develop PTSS during COVID-19, providing information and guidance for other countries and regions during COVID-19 outbreak. Professional and effective mental health services should be designed in order to aid the psychological wellbeing of the population in affected areas, especially those living in hardest-hit areas, females and people with poor sleep quality.

Keywords: PTSD, COVID-19, Gender Differences, Sleep quality, Wuhan area

仿人机器人的心智能力对恐怖谷效应的影响

姜英东 尹军

宁波大学, 2460099509@qq.com

摘要 机器人的使用已不再局限于工业制造的领域,而是逐渐走进了人们的日常生活。为提升人与机器人交互的质量,工程师设计出仿人机器人并希望通过提高其外表类人度的方法,以提升人们对机器人的喜好度。但研究发现,外表类人度在一定区间内提高而喜好度则下降,其称为恐怖谷效应。对以服务人类为目标的仿人机器人而言,除了外观以外,仿人机器人还被设计为具有一定的心智能力。就恐怖谷效应而言,虽然研究者考虑了心智能力的作用,但将其视作与外表类人度共变的中介变量,以此来揭示外表类人度影响喜好度的心理机制。然而,心智能力可独立于机器人外表而存在,其可通过机器人的行为来体现,目前鲜有研究探讨心智能力如何影响外表类人度对喜好度的作用,即心智能力如何影响恐怖谷效应。心智能力不仅有存在与否的差异,根据其在社交中的作用,心智能力可分为自身指向的心智能力和他人指向的心智能力,且基于目前智能机器人的发展趋势,其心智能力也将具有可学习性。据此,本研究依次从心智能力的存在性、指向性与可学习性三个特性出发,旨在考察仿人机器人的心智能力对恐怖谷效应的影响。针对上述问题,通过三个实

验对其进行了考察。实验1通过呈现不同的仿人机器人图片来操纵其外表类人度,并呈现描述性文字材料来操纵其心智能力的存在性(即存在与否),旨在探究心智能力存在性如何作用于外表类人度对仿人机器人喜好度的影响,即心智能力存在性对恐怖谷效应的影响。鉴于心智能力指向性的前提是存在心智能力,因此实验2采用与实验1相同的方法,在实验1存在心智能力的条件上,进一步对仿人机器人心智能力的指向性进行操纵,探究恐怖谷效应是否会因仿人机器人心智能力指向性的不同而变化。针对指向性不同的心智能力,其均存在学习发展的过程,因此实验3与实验1和实验2采用的方法相同,在实验2的基础上,加入对仿人机器人心智能力可学习性的操纵,进一步探究在不同心智能力可学习性的条件下,心智能力指向性对恐怖谷效应的影响。获得以下主要结果:(1)无论仿人机器人的心智能力存在与否,人们对高外表类人度仿人机器人的喜好度总是低于低外表类人度的仿人机器人,即均存在恐怖谷效应,但有心智能力的仿人机器人诱发的恐怖谷效应强于无心智能力的仿人机器人;(2)无论仿人机器人的心智能力指向性如何,人们对高外表类人度仿人机器人的喜好度总是低于低外表类人度的仿人机器人,即均存在恐怖谷效应,但心智能力指向性不同的仿人机器人其诱发的恐怖谷效应也不同,具体表现为相比他人指向和无指向性信息,具有自身指向心智能力的仿人机器人诱发的恐怖谷效应增强;(3)虽然具有自身指向心智能力的仿人机器人诱发的恐怖谷效应强于他人指向心智能力的条件,但该结果不受心智能力可学习性的调节。综上所述,仿人机器人所诱发的恐怖效应具有普遍性和稳定性,但若仿人机器人存在心智能力则可增强其诱发的恐怖谷效应,且该效应的增强主要是由具有自身指向的心智能力所解释,其不受仿人机器人心智能力可学习性的影响。因而,在仿人机器人的设计上,应注重考虑开发他人指向的心智能力,以避免恐怖谷效应的增强。

汉语歧义消解加工的心理机制研究进展

王芳

海南师范大学, 海南, 016000

摘要 近年来,对汉语歧义消解加工的心理机制研究主要集中在词汇歧义消解和句法歧义消解两个方面。对于词汇水平的歧义研究,研究结果表明其歧义消解过程的激活抑制机制均离不开语境和意义相对频率的制约,语境会促进适当意义的激活,抑制不适当意义的激活,与意义相对频率共同作用于歧义消解加工时间进程,支持语言理解的相互作用论。尽管认知方式对个体抑制同形歧义词中与语境不一致意义的时间进程存在影响,但总体上同形歧义词歧义消解激活抑制模式相似。同音歧义词歧义消解过程则为对不适当意义的抑制作用在先,对适当意义的激活作用在后。两类歧义词的歧义消解过程因视觉/听觉呈现方式的不同而有所区别。而对于句法水平的歧义研究,研究结果则表明合适的语境除了提供语义信息,还可能保证歧义结构加工的句法自足,从而影响个体歧义消解加工的阅读策略。其中,词类歧义词歧义消解过程因采用的实验范式不同而表现不同。在接近自然阅读状态的眼动记录技术下,个体在歧义词处即时进行句法角色分配,符合基于制约的模型假设。而特殊歧义结构的歧义消解过程则受歧义结构本身相对合理性的影响,合理性较高的歧义结构甚至可以达到语义句法自足而促进句子理解。未来研究还应该加强对较长阅读文本的考察、注重研究被试的群体特点以及提高研究的生态学效度等等。

Research progress in psychological mechanism of Chinese ambiguity resolution processing

Abstract: In recent years, the research on the psychological mechanism of Chinese ambiguity resolution mainly focuses on lexical ambiguity resolution and syntactic ambiguity resolution. For ambiguity study of lexical level, results show that the activation and inhibition mechanisms of ambiguity resolution process are inseparable from the constraints of context and meaning relative frequency. Context will promote the activation of proper meaning, and inhibit the activation of inappropriate meaning. Also, Context and meaning relative frequency act together on the processing of ambiguity resolution, which supports the interaction theory of language understanding. Although

cognitive style has an influence on the time process during which individuals suppress meaning inconsistent with context in homomorphic ambiguous words, the activation and suppression patterns of homomorphic ambiguous words are similar on the whole. In the process of homophone ambiguity resolution, the inhibition of inappropriate meaning comes first and the activation of appropriate meaning comes second. The ambiguity resolution process of two kinds of ambiguous words is different due to the different visual/auditory presentation modes. For ambiguity study of syntactic level, results show that appropriate context can not only provide semantic information, but also ensure syntactic self-sufficiency of ambiguity processing, consequently affecting the reading strategies of individual ambiguity resolution processing. Among them, syntactic category ambiguity resolution process is different because of adopting different experimental paradigms. Under the eye movement recording technique which is close to the natural reading state, individual immediately assigns syntactic roles in ambiguous words, which conforms to the constraint-based model. The ambiguity resolution process of the special ambiguity structure is affected by the relative rationality of the ambiguity structure itself, and the higher rationality of the ambiguity structure can even achieve semantic and syntactic self-sufficiency and promote sentence understanding. In the future, we should strengthen the investigation of longer reading texts, pay attention to the group characteristics of the subjects, and improve the ecological validity of the study.

Keywords: Chinese language, ambiguity resolution, psychological mechanism

大学生人际关系对网络成瘾的影响：孤独感的中介作用

刘玥媛 洪晓彬

武汉体育学院 ailiuyueyuan@sina.com

摘要 随着科学技术的发展,网络已经成为现代人主要的沟通平台和娱乐工具,而与之而来的网络成瘾现象也日益严重,人们对于网络成瘾的心理因素也开始进行研究。通过对已有研究的分析,我们发现大学生网络成瘾和人际关系、孤独感均有联系,而孤独感更是与人际关系息息相关。现实生活中,人际关系有困扰的学生可能会有孤独感的体验,而为了缓解孤独感,他们可能会倾向于上网来远离现实生活,逃避孤独感,从而产生网络成瘾的倾向。前人对于大学生网络成瘾人际关系孤独感这三者之间的关系研究不多,我们可以提出人际关系差所产生的孤独感是否会引发大学生的网络成瘾倾向这样的探讨。本文的目的:为探讨孤独感在人际关系和网络成瘾关系中的中介效应。方法:选取208名大学生(男96人,女112人),运用孤独量表(UCLA)、人际关系综合诊断量表(ICDS)和网络成瘾量表(CAIS)进行调查,并对得到的数据进行描述,相关,回归分析。结果发现:①大学生网络成瘾、人际关系与孤独感之间两两相关显著;②大学生人际关系均能正向预测孤独感($\beta=0.57, P<0.001$)和网络成瘾($\beta=0.47, P<0.001$),而孤独感可以正向预测网络成瘾($\beta=0.39, P<0.001$)。③孤独感在人际关系与网络成瘾之间的部分中介效应显著,中介效应占总效应的24.1%。研究结果提示,通过改善大学生人际关系,有助于降低大学生的孤独感,从而降低其网络成瘾程度。这提醒我们,我们应该关注当代大学生在学校中的社交情况,关心大学生在学校中的生活,学校应多开展集体活动,了解大学生的心理活动,促进学生之间的交流从而促进学生的人际关系适应。学校也应培养学生积极的社交能力,来避免因社交能力不足而产生人际困扰,孤独感增强等负面情绪,预防大学生的网络沉迷行为。

领悟社会支持对产后焦虑的影响：一个有调节的中介模型

闫盼盼¹ 孙琛¹ 徐继红² (通讯作者)

¹ 潍坊医学院心理学院, 山东 潍坊, 261053

² 国家卫生健康委科学技术研究所, 北京, 100081, gracexjh@163.com

摘要 产后焦虑作为产后痛苦的一个重要组成部分,具体指的是发生在产后的一种以焦虑为主的心理疾患,它不仅危害产妇自身的身心健康,还会给婴儿、家庭乃至社会带来不良影响。尽管众多研究表明,领悟社会支持在产后焦虑的发生发展中扮演着重要的角色,然而,领悟社会支持对产后焦虑影响的潜在机制还有待深入探讨。本研究通过构建一个有调节的中介模型,旨在考察自尊在领悟社会支持与产后焦虑之间的中介作用

以及乐观在该过程中的调节作用。研究采用方便抽样方法,通过领悟社会支持量表、焦虑自评量表、自尊量表和生活定向测验问卷对从北京、山东、广东、江西四家妇幼保健院选取的 800 名产妇 ($M_{age} = 30.08$, $SD = 4.85$) 进行调查。结果发现: (1) 在控制了产妇的户口、年龄、胎次、社会经济地位后,领悟社会支持能够显著负向预测产后焦虑 ($\beta = -0.50$, $P < 0.001$); (2) 领悟社会支持、自尊、乐观和产后焦虑均呈显著负相关 ($P < 0.01$), 领悟社会支持、自尊和乐观三者两两之间存在显著正相关 ($P < 0.01$); (3) 自尊在领悟社会支持与产后焦虑的关系间起部分中介作用,中介效应值为 -0.23 [$95\%CI = (-0.28 \sim -0.19)$]; (4) 乐观调节了“领悟社会支持 $\rightarrow$ 自尊 $\rightarrow$ 产后焦虑”的后半段路径,即当产妇乐观水平较低时,自尊对产后焦虑的负向预测作用增强 [$\beta = -0.35$, $95\%CI = (-0.45 \sim -0.46)$, $P < 0.001$]; 当产妇乐观水平较高时,自尊对产后焦虑的负向预测作用减弱 [$\beta = -0.20$, $95\%CI = (-0.29 \sim -0.10)$, $P < 0.001$]。总之,研究结果证实了领悟社会支持不仅会直接影响产后焦虑,还会通过自尊的中介作用和乐观的调节作用对产后焦虑产生间接影响。基于上述发现,本研究认为产后焦虑的预防与干预不仅要关注其远端的影响因素(领悟社会支持),还要重视近端因素(自尊、乐观),以避免或减少产后抑郁情绪的发生。

The Effects of Perceived Social Support on Postpartum Anxiety: A Moderated Mediation Model

YAN Panpan¹, SUN Chen¹, XU Jihong²

¹ School of Psychology, Weifang Medical University, Weifang 261053, China

² National Research Institute for Family Planning, Beijing 100081, China

Abstract : Postpartum anxiety, as an important part of postpartum pain, specifically refers to an anxiety-based psychological disorder that occurs after childbirth. Postpartum anxiety not only jeopardizes the physical and mental health of the mother, but also brings adverse effects to the baby, the family and even society. Numerous studies have shown that perceived social support played an important role in the development of postpartum anxiety. However, little was known about the potential influence mechanism of perceived social support on postpartum anxiety. By constructing a moderated mediation model, this study aimed to examine the mediating role of self-esteem in the relationship between perceived social support and postpartum anxiety, as well as the moderating role of optimism in this process. A convenience sampling method was used to survey 800 women ($M_{age} = 30.08$ years, $SD = 4.85$) within one year of giving birth selected from four maternal and child health care centers in Beijing, Shandong, Guangdong, and Jiangxi. The participants completed anonymous questionnaires including Perceived Social Support Scale, Self-Rating Anxiety Scale, Rosenberg Self-Esteem Scale and Life Orientation Test. The results indicated: (1) After controlling for maternal birthplace, age, parity, and socioeconomic status, perceived social support could significantly negative predicted postpartum anxiety ($\beta = -0.50$, $P < 0.001$). (2) Perceived social support, self-esteem and optimism were significantly negative correlated with postpartum anxiety ($P < 0.01$). There were significantly positive correlation among perceived social support, self-esteem and optimism ($P < 0.01$). (3) Self-esteem played a partially mediating role in the relationship between perceived social support and postpartum anxiety with standardized effect value of -0.23 [$95\%CI = (-0.28 \sim -0.19)$]. (4) Optimism moderated the second half of the path of “perceived social support $\rightarrow$ self-esteem $\rightarrow$ postpartum anxiety”. The effect of self-esteem on postpartum anxiety was more significant among mothers with low levels of optimism than those with high levels of optimism [$\beta = -0.35$, $95\%CI = (-0.45 \sim -0.46)$, $P < 0.001$; $\beta = -0.20$, $95\%CI = (-0.29 \sim -0.10)$, $P < 0.001$]. In conclusion, the study confirmed that perceived social support not only directly affected postpartum anxiety, but also had indirectly impact on postpartum anxiety through the mediating role of self-esteem and the moderating role of optimism. Based on these findings, this study concluded that prevention and intervention of postpartum anxiety should focus on its distal and proximal factors to avoid the occurrence of postpartum depression.

运动相关脑震荡影响青少年的总体症状：一项系统综述和元分析

侯贤芸¹ 费雪根¹ 李杰² 张禹¹

¹ 北京体育大学, 北京, houxianyunya@163.com

² 杭州师范大学, 杭州

摘要 运动脑震荡相关文献和治疗指南对于运动相关脑震荡对青少年认知功能的影响目前尚无定论, 有的研究发现运动相关脑震荡影响青少年的认知功能, 但是有的研究并没有发现这一结果。通常采用脑震荡后立即评估和认知测试 (Immediate Post-Concussion Assessment and Cognitive Testing, ImPACT), 来测试患有运动相关脑震荡的人的认知表现。本研究结构化搜了 Medline/PubMed 和 Web of Science 数据库从 1991 年 8 月至 2021 年 3 月发表的英文文章。本研究遵循系统评价和荟萃分析的首选报告项 (Preferred Reporting Items for Systematic Review and Meta-Analyses, PRISMA) 指南。使用 Downs 和 Black (1998) 提出的标准, 确定最终纳入元分析的定量研究的方法学质量。结果: 在数据库搜索中, 确定了 1762 篇相关研究。其中, 463 篇因重复被删除, 1248 篇文章在筛选标题和摘要后被排除。留下了 50 项研究, 进一步进行全文筛选。根据我们的纳入和排除标准删除另外 21 项研究后, 有 29 项研究进入系统性文献综述。最后, 6 项研究符合元分析纳入标准且均质量良好。从总症状来看, 脑震荡组的分数明显高于对照组。然而, 语言记忆、视觉记忆、反应时间和视觉运动速度结果在统计上没有显著差异。结论: 运动相关脑震荡不影响言语记忆、视觉记忆、反应时间和视觉运动速度。脑震荡组的总症状评分较高, 但没有导致认知表现。本研究启发我们需要采取更多措施来预防青少年发生与运动相关的脑震荡, 未来的研究人员需要探索能够更具针对性且更敏感测量运动相关脑震荡对青少年认知影响的认知测验工具。

不同知识结构图对学生科技说明文阅读理解水平的预测作用

叶国臻¹ 黄熙彤¹ 莫雷² (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631

² 华南师范大学心理学院, 广州, 510631, molei@m.scnu.edu.cn

摘要 Kintsch 和 van Dijk (1978) 提出了建构-整合模型理论(Construction-Integration Model), 该理论认为读者在阅读过程中会形成一个合乎逻辑、有组织的文本表征, 这个文本表征也叫做知识结构(Knowledge Structure)。研究者认为提取读者的知识结构有以下三个步骤: (1) 提取概念之间关系(测量方法), (2) 形成结构图, (3) 评估该结构图的质量。一般来说, 知识结构图的不同就是测量方法的不同, 因此本研究将探讨不同测量方法对阅读理解水平的预测力。前人使用过三种比较常用的测量方法, 分别是相邻性评分(Adjacency)、关联性评分(Relatedness)和总结原文(Essay Summary)。本研究对比结果显示, 相邻性评分和关联性评分能预测阅读理解水平, 而总结原文不能够测; 另外, 相邻性评分比关联性评分更能预测阅读理解水平。其次, 本文提出了一种挑选概念词的方法, 将说明文的概念词分为核心词、主干词和细节词, 并通过验证性因子分析证实了这一假设。在此基础上, 我们对比了由不同数量概念词组成的关联性评分知识结构图对阅读能力的预测力, 结果发现当概念图主要由核心词和主干词组成时预测力最强。最后, 为了验证以上的结果是否也能在相邻性评分方法中出现, 我们进行了实验二。实验二有两个水平, 分别为只有核心词和主干词的水平一(9 个词), 和水平二(15 个词, 水平一加 6 个细节词), 结果发现在相邻性评分中, 在一定范围内, 词的数量越多预测效果越好。本研究证实了不同知识结构图对阅读理解水平的预测作用是不同的, 相邻性评分方法相比关联性评分方法可能更适用于篇章较短的文章。另外, 由于两种文本表征结构性质的不同, 概念的删减对情境模型来说是一个对结构图精简的过程, 而对文本记忆来说是一个细节缺失的过程。研究结论对后续的知识结构的研究和应用有重要的操作指导意义。

2 South China Normal University, School of Psychology, Guangzhou, 510631,

molei@m.scnu.edu.cn

Abstract: Kintsch and van Dijk (1978) have introduced Construction-Integration Model to describe a logical and organizational mental representation formed during reading called Knowledge Structure (KS). Researchers have concluded that there are three steps to derive KS: (a) knowledge elicitation, (b) knowledge representation, and (c) evaluation of an individual's knowledge representation. Generally speaking, different knowledge elicitation methods derive different KSs, and therefore this research investigated the abilities of different methods to predict reading comprehension. There are three main methods commonly used to elicit knowledges: the adjacency, the relatedness and the essay summary. The result showed that the adjacency and the relatedness could predict reading comprehension and the adjacency was better than the relatedness while the essay summary failed to do so. In addition, we introduced an approach to select the terms used to derive a KS, which categorized terms into three kinds: core terms, branch terms and detail terms and validated our assumption via the confirmatory factor analysis. Based on this result, we further compared abilities of different KSs derived by different numbers of terms with the relatedness to predict reading comprehension and the result showed that the predictive ability was greatest when the terms consisted of the core and branch terms. Finally, we attempted to verify whether this result would recur in the adjacency and a distinct result was shown that the predictive abilities increased with the increasing number of terms. The results showed that different methods had different predictive abilities to reading comprehension and the adjacency was likely to predict better than the relatedness did in a short passage. Plus, due the different natures of different KSs, the deletions of terms of the relatedness meant simplification while that of the adjacency meant detail missing. These conclusions have important implications in subsequent researches and its application.

经济流动性感知对消费行为的影响：“经济之梯”操纵方法与双向考察

汪述宁¹ 廖韦伊¹ 樊春雷²(通讯作者) 焦璇¹

1 北京师范大学心理学部, 北京, 100875

2 中国科学院心理研究所, 北京, 100101, fancl@psych.ac.cn

摘要 目前, 全球都面临着收入不平等、阶级固化的问题, 我国作为收入分配差距较大的国家, 脱贫攻坚和共同富裕也是迫切需要解决的问题。在此经济社会背景下, 人们主观上对于经济流动性的感知, 对于经济前景的预期以及这种感知对于消费行为的影响作用就成为富有现实意义的研究话题。经济流动性感知的概念衍生于社会流动性, 表示个体在多大程度上相信社会中的成员提升或降低相对经济地位是取决于自身的行为, 此概念是人们对于其所处社会经济流动状态具有个体化差异的主观信念。近些年来, 国外研究者们对于经济流动性感知开始逐渐关注并发现: 经济流动性感知会影响个体诸多方面的心理和行为, 并且多项研究聚焦于经济流动性感知与消费行为的结合。然而, 经济流动性感知对消费行为的影响还需要进行系统地对照研究, 如: 上行流动感知和下行流动感知的对照, 经济流动性感知的跨文化比较, 消费行为的理性和非理性地测量与比较等。本文对目前关于经济流动性感知的研究进行梳理, 分析了对经济流动性感知产生影响的因素及受到经济流动性感知影响的个体消费行为, 并且引入主观社会经济地位中“经济之梯”的概念, 对经济流动性感知的经典研究范式——“经济之梯”操纵方法和双极测量量表进行介绍。并且, 围绕经济流动性感知对消费行为的影响提出了需要进一步双向考察的对照研究理论框架, 包括上行与下行感知, 不同社会文化环境与市场场景的条件约束等。本文对经济流动性感知和消费心理学研究提供新颖的关注角度, 并且也提出了进一步研究的理论框架, 有助于研究者们围绕其进行更深入探究。

The impact of perceived economic mobility on consumer behavior: A two-way study of the "economic ladder" manipulation

Shuning Wang¹, Weiyi Liao¹, Chunlei Fan², Xuan Jiao¹

1 Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

2 Institute of Psychology, Beijing, 100101, China

Abstract: At present, the world is faced with the problems of income inequality and class solidification. As a country with large income distribution gap, China is also in urgent need of solving the problems of poverty alleviation and common prosperity. Under this background, people's subjective perception of economic mobility, the expectation of economic prospects and the impact of this perception on consumer behavior has become a meaningful research topic. The concept of perceived economic mobility is derived from the concept of social mobility, which indicates the extent to which an individual believes that the promotion or reduction of relative economic status of members of a society depends on his or her own behavior, this concept is a subjective belief that people have individual differences in their social and economic mobility. In recent years, foreign researchers have begun to pay attention to the perception of economic mobility and found that the perception of economic mobility can affect many aspects of the individual's psychology and behavior, and a number of studies have focused on the combination of perceived economic mobility and consumer behavior. However, the effects of perceived economic mobility on consumer behavior need to be studied systematically, such as: the comparison of perceived upward mobility and perceived downward mobility, the cross-cultural comparison of perceived economic mobility, rational and irrational measurement and comparison of consumer behavior. This paper reviews the current research on the perception of economic mobility, analyzes the factors that affect the perception of economic liquidity and the individual consumption behavior influenced by the perception of economic mobility, in addition, the concept of "economic ladder" in the subjective socioeconomic status is introduced, and the classic research paradigm of perception of economic mobility —— "economic ladder" manipulation method and bipolar scale are introduced. And around the impact of economic liquidity perception on consumer behavior, a theoretical framework for comparative research needs to be further examined in both directions, including upward and downward perception, different social and cultural environment and market conditions constraints, and so on. This paper provides a new angle of view for the study of the perception of economic mobility and consumer psychology, and also puts forward a theoretical framework for further study, which will help researchers to carry out more in-depth research around it.

边缘型人格偏离青少年在雨中人绘画中的压力应对特征

杨杨¹ 项锦晶²

北京林业大学, 北京, 100000, 17864195013@163.com

摘要 目的: 探索边缘型人格偏离青少年在“雨中人”绘画中的绘画特征。方法: 对 683 名中学生进行问卷调查并分析“雨中人”中的绘画特征。依据边缘型人格偏离青少年的特点假设出 10 项可能反映压力应对相关的绘画特征。结果: 数据显示 5 项绘画特征有可能反映边缘型人格偏离青少年的压力应对方式, 这类青少年在压力应对主题中会更多的出现画面过大、有闪电、雨中无助、无地平线、伞过小。结论: 雨中人绘画可以作为评估边缘型人格偏离青少年的压力应对机制的工具。

关键词 青少年; 边缘型人格偏离; 雨中人; 压力应对

DAPR Drawing Characteristics about Stress Coping of Teenagers with Borderline Personality Dysfunction

Abstract: Objective: To explore the characteristics of Draw-a-Person-in-the-Rain (DAPR) which reflecting the stress coping in teenagers with borderline personality dysfunction. Methods: 683 teenager students were involved in the current study. The Borderline Personality Diagnostic (BPD) sub-scale of Personality Diagnostic Questionnaire-4 + (PDQ - 4 +) was used to assess the borderline personality dysfunction of teenagers. The Draw -a-Person-in-the-Rain (DAPR) was used to analyze the drawing characteristics about stress coping topic of teenagers. Results: The logistic equation analysis showed 5 drawings characteristics could well predict the stress coping topic of teenagers with borderline personality dysfunction. Further, compared with their peers, teenagers with borderline personality dysfunction showed a more frequency of bigger picture, flashing lighting, helpless in the rain, no ground baseline, relatively smaller umbrella in their drawing characteristics about stress coping topic. Conclusion: It suggests that 5drawing characteristics of Draw -a-Person-in-the-Rain (DAPR), such as bigger picture, flashing lighting, helpless in the rain, no ground baseline, relatively smaller umbrella, may be correlated with the stress coping mechanism of teenagers with borderline personality dysfunction. DAPR can be used as a tool to evaluate the stress coping mechanism of teenagers with borderline personality dysfunction.

“拉人下马”不如“训妒为驹”：自我控制与解释水平对妒忌的影响

张文君¹ 毕艳¹ 李开云¹ (通讯作者) 林丰勋¹ (通讯作者) 贾凡路¹

¹ 济南大学教育与心理科学学院, 济南, 250022, sep_liky@ujn.edu.cn, sep_linf@ujn.edu.cn

摘 要 妒忌是指个体在进行向上社会比较的过程中,发现优势他人拥有自己渴望的能力或物品时产生的一种不愉快的情感体验。妒忌分为善意妒忌和恶意妒忌,两者是彼此独立存在的情绪体验。与善意妒忌相比,恶意妒忌更可能带来一系列消极结果。因此,有必要揭示影响善意妒忌和恶意妒忌的因素,并制定相应的策略,以减少恶意妒忌对社会的潜在危害。鉴于已有研究发现,低控制感导致高妒忌、以及产生较少的善意妒忌,可以推断自我控制可能是妒忌、善意妒忌、恶意妒忌背后的一项重要影响因素。此外,解释水平理论认为个体表征事物有高低水平之分。高解释水平相较于低解释水平个体具有更高的自我控制。那么,解释水平对低自控个体妒忌、善意妒忌、恶意妒忌的影响是一个具有重要意义和新颖的研究课题。本研究旨在探讨自我控制对妒忌程度、善意和恶意妒忌类型的影响,并明确低自我控制状态下,解释水平是否能对妒忌程度、类型进行影响。预实验检验设计的匹配任务的有效性,探究匹配任务中被试对小A(创造的虚拟优势他人)真实性评价以及小A是否满足与被试的高相似性,同时检验自我损耗任务的有效性。结果表明,高相似组比低相似组认为小A更真实地存在、小A与自己更相似;高自我损耗组比低自控损耗组认为损耗更高,匹配任务启动有效。实验1运用匹配任务采用内隐与外显两种方式探讨自我控制和妒忌程度及类型的关系。结果发现,高自我损耗组产生较高的妒忌且为恶意妒忌;低自我损耗组产生较低的妒忌且为善意妒忌,表明较低自我控制是引发大学生恶意妒忌的重要因素。实验2则进一步考察在自我损耗高(即自我控制低)时,解释水平对妒忌程度和类型的影响。结果发现,在高自我损耗状态下,低解释水平组加深了恶意妒忌,而高解释水平组产生了善意妒忌,且比低解释水平表征个体产生更少妒忌,这表明高解释水平能够使低自控状态的大学生产生更少的妒忌、且产生善意而非恶意妒忌。本研究结果表明,高自控引起较低的妒忌且为善意妒忌,较低自控则引发较高的妒忌且为恶意妒忌;即使在低自控状况下,高解能改善妒忌、提升善意妒忌、抑制恶意妒忌。这启示需警觉自控对妒忌的影响,即使过度损耗了自我,也可利用解释水平对妒忌进行扬善抑恶。

关键词 妒忌, 善意妒忌, 恶意妒忌, 自我控制, 解释水平

The Impact of Self-Control and Construal Level on Envy of College Students

ZHANG Wenjun, Bi Yan, LI Kaiyun, LIN Fengxun, JIA Fanlu

School of Education and Psychology, University of Jinan, Jinan 250022

Abstract: Envy is an unpleasant experience generated when an individual finds that others have the ability or goods he desires in the process of upward social comparison. There are two types of envy: benign envy and malicious envy. They are independent emotional experiences. Compared with benign envy, malicious envy is more likely to bring about a series of negative outcomes. Therefore, it is necessary to reveal the influencing factors of benign envy and malicious envy, and formulate corresponding strategies to reduce the potential harm of malicious envy to society. In view of the existing research that low sense of control leads to high envy and less benign envy, we can conclude that self-control may be an important factor behind envy, benign envy and malicious envy. In addition, the construal level theory holds that there are different levels of individual representation. Individuals with high construal level had higher self-control than those with low construal level. The effect of construal level on benign envy and malicious envy in low self-control individuals is an important and novel research topic. The purpose of this study was to investigate the effects of self-control on envy levels, benign and malicious envy types, and to determine whether the effect of low self-control on degree and types of envy could be moderated by construal levels. The preliminary experiment was designed to examine the effectiveness of matching task priming. The purpose of this experiment is to let the subjects evaluate the possibility of A's (who is a fictitious dominant individuality) real existence and whether student A is similar to the subjects, and the effectiveness of the Stroop task. The results showed that compared with the low similarity condition group, the high similarity condition group thought the existence of A was more real, and they were more similar to small A. Compared with the low ego depletion group, the high ego depletion group thought the ego depletion was higher. These results indicate that the matching task manipulated effectively. In Experiment 1, the relationship between self-control and the degree and type of envy was investigated by implicit and explicit matching tasks. The results of this experiment show that the participants with high self-control had a lower degree of envy and benign envy, while the participants with low self-control had a higher degree of envy and malicious envy. This shows that low self-control is an important factor of malicious envy. Experiment 2 further explored the influence of construal level on the degree and type of envy in the case of high ego depletion (that is, the self-control is low). The results showed that in the high ego depletion condition, the subjects in the low construal level group had malicious envy, the participants in the high construal level group had benign envy. Participants with high construal level had less envy and produce less envy than those with low construal level. This shows that high construal level can make individuals with low self-control produce benign but not malicious envy. These results indicate that high self-control leads to lower degree of benign envy, while low self-control leads to higher degree of malicious envy. Under the condition of low self-control, high construal level but not low construal level can improve envy, enhance the benign envy and suppress the malicious envy. This suggests that individuals should be alert to the influence of self-control on envy, and use the construal level to promote the benign envy and suppress the malicious envy even in the condition of excessive ego depletion.

Keywords: construal level, self-control, benign envy, malicious envy, college students

丧亲青少年反刍与创伤后成长的关系：生命意义感的中介作用

张警辉¹ 莫碧波¹ 罗俊龙¹ 张荣伟² 李丹¹ 刘世宏¹ (通讯作者)

1 上海师范大学, 上海, 200234, shhongliu@126.com

2 中共福建省委党校 福建行政学院, 福州, 350025

摘 要 家人去世是人生中难以避免的创伤事件, 一般认为经历这类创伤事件会给个体带来悲伤、抑郁、问题行为等消极影响。然而哀伤的双过程模型(the Dual Process Model of Bereavement; Stroebe&Schut, 1999)认为,

哀伤过程的日常经验除了这种丧失导向,还存在恢复导向,后者指个体专注生活的改变和适应新的角色等积极方面,也即是发生了创伤后成长。Calhoun, Tedeschi, Cann 和 Hanks (2010)提出的哀伤背景下的成长模型(A model of growth in grief)认为,创伤后成长指个体与主要生活危机事件做斗争后所发生的积极改变,包括自我觉知的改变、人际体验的改变、生命价值的改变等三大方面。有研究发现,反刍和生命意义感是影响创伤后成长产生的重要因素。为考察侵入性反刍、主动反刍与创伤后成长之间的关系、以及寻求意义感和存在意义感在上述关系中的中介作用,本研究采用创伤生活事件问卷、反刍问卷、生命意义感量表以及创伤后成长问卷对 887 名经历过家人去世的青少年进行调查。使用 SPSS22.0 进行数据的描述性统计和相关分析,使用 Mplus7.4 构建结构方程模型考察中介效应。结果表明:(1)侵入性反刍与创伤后成长呈显著负相关,侵入性反刍也可通过存在意义感的中介作用影响创伤后成长,侵入性反刍不能通过寻求意义感的中介作用对创伤后成长产生影响;(2)主动反刍与创伤后成长呈显著正相关,主动反刍还可分别通过存在意义感、寻求意义感的单独中介作用对创伤后成长产生影响,主动反刍还可通过寻求意义感至存在意义感的链式中介作用对创伤后成长发挥作用。结果提示对于丧亲青少年可引导其进行主动反刍以完善生命意义感,从而克服丧亲事件给其带来的负面影响,在将来更好的成长。

The Relationship between Rumination and Posttraumatic Growth among Bereavement Adolescents: Mediating Role of Meaning in Life

ZHANG Jinghui, MO Bibo, LUO Junlong, ZHANG Rongwei, LI Dan, LIU Shihong

(Department of Psychology, Shanghai Normal University, Shanghai, 200234)

Abstract: Death of a family member is an unavoidable traumatic event in life. Although such events may cause sad reactions to individuals, they may also promote some positive changes, such as posttraumatic growth. Posttraumatic growth refers to the positive changes that occur after individuals struggle with major life crisis events, including perceived changes in self, changed sense of relationships with others, and changed philosophy of life. Previous studies have found rumination is an important factor affecting post-traumatic growth, but the mechanism is not clear. Some studies have found that rumination affects the search for meaning of life, which meaning in life plays a protective role on individual mental health. Therefore, the purpose of this study was to get better insights into the association between rumination and posttraumatic growth, and to test the possible mediating role of the meaning in life. 887 adolescents (434 males) who have experienced the death of their families members participated in the study. All the participants were 15-19 years old. The scale of lifetime incidence of traumatic events-student form, the meaning in life questionnaire, the event related rumination inventory and posttraumatic growth inventory were used to survey adolescent students. The event related rumination inventory includes two dimensions of intrusive rumination and deliberate rumination, and the meaning in life questionnaire includes presence of meaning and search for meaning in life. The data was analyzed by SPSS22.0 and Mplus7.4. The mediating roles would be assessed by using structural equation model, wherein the painful degree of traumatic would be controlled because its importance. The main results were as following: (1) deliberate rumination had a total positive effect on posttraumatic growth, intrusive rumination had a total negative effect on posttraumatic growth. (2) Presence of meaning mediated the relationship between intrusive rumination and posttraumatic growth. Specifically, the effect of intrusive rumination on presence of meaning was $.33(p < 0.001)$, and the effect of presence of meaning on posttraumatic growth was $.39(p < 0.001)$, showing that intrusive rumination lessened posttraumatic growth through the mediating role of presence of meaning. (3) Presence of meaning mediated the relationship between deliberate rumination and posttraumatic growth. Specifically, the effect of deliberate rumination on presence of meaning was $.30(p < 0.001)$, and the effect of presence of meaning on posttraumatic growth was $.39(p < 0.001)$, showing that deliberate rumination strengthened posttraumatic growth through the mediating role of presence of meaning. (4) Search for meaning

mediated the relationship between deliberate rumination and posttraumatic growth. Specifically, the effect of deliberate rumination on search for meaning was .16($p < 0.01$), and the effect of search for meaning on posttraumatic growth was .12($p < 0.01$), showing that deliberate rumination strengthened posttraumatic growth through the mediating role of search for meaning. (5) Presence of meaning and search for meaning serially mediated the relationship between deliberate rumination and posttraumatic growth. Summary, intrusive rumination has indirect and negative effect on posttraumatic growth by presence of meaning, deliberate rumination has indirect and positive effect on posttraumatic growth by presence of meaning and search for meaning. Therefore, it is essential to improve the meaning in life through deliberate rumination in order to realize posttraumatic growth.

个体权力感对道德圈的影响研究

倪苏杭 谭就阳 吴明证

浙江大学, 杭州, 310000, 15868173447@163.com

摘要 权力与道德的关系是权力研究的重要主题。已有研究主要从行为和社会认知过程出发分析权力如何影响个体的道德行为, 本研究试图从道德认知结构即道德圈 (Moral Circle) 的变化出发, 分析权力如何影响个体的道德行为表现和社会认知过程。不仅如此, 已有研究主要将个体道德行为局限于人际和群际之间。随着人类道德世界的不断扩展, 越来越多的非人类实体被纳入人们的道德关怀中, 判断一个行为道德与否的标准已不再局限于该行为对人类的影响, 已有权力与道德关系的研究已难以全面地概括当前的道德范畴。为了深入了解权力与道德的关系以及弥补当前研究的不足, 本研究以道德圈为切入点, 探究个体权力感是否影响其道德圈, 权力感影响道德圈的中介机制以及权力感影响道德圈的限定条件。研究一包括三项研究。研究 1a 和研究 1b 分别以回忆启动任务、想象启动任务启动被试不同水平的权力感, 以探究权力感与道德圈之间的关系。结果均发现, 与低权力感个体相比, 高权力感个体的道德圈广度和深度更小。为验证研究 1a 和研究 1b 中道德圈的变化确实是由于权力感水平不同造成的, 研究 1c 引入了权力合法性的概念, 探究在权力来源的合法/不合法情况下权力感与道德圈之间的关系。结果发现, 权力的来源特征即权力合法性改变后, 权力感与道德圈之间的关系也随之发生改变: 当权力合法时, 与低权力感个体相比, 高权力感个体道德圈广度和深度更小; 当权力不合法时, 与低权力感个体相比, 高权力感个体道德圈广度和深度更大。这说明权力感确实能够引起道德圈的变化, 并且权力合法性是高权力感个体道德圈广度和深度小于低权力感个体的限定条件。研究二采用角色扮演任务, 探讨了道德注意性在权力感对道德圈影响中的中介作用。结果表明, 道德注意性在权力感对道德圈广度和深度影响中起完全中介作用, 与低权力感个体相比, 高权力感个体道德注意性更低, 由此减小了其道德圈的广度和深度。研究三采用角色扮演任务, 操纵了高权力感个体对权力的机会/责任建构, 探讨了高权力感个体对权力的机会/责任建构在权力感对道德圈影响中的作用。结果发现, 与低权力感个体相比, 将权力建构为机会的高权力感个体表现出较小的道德圈广度和深度, 而将权力建构为责任的高权力感个体的道德圈广度和深度与低权力感个体间没有差异。综上所述, 本研究发现, 权力感减小了个体道德圈的广度和深度, 且道德注意性在权力感对道德圈的影响中起完全中介作用。权力减小道德圈的效应还受到权力合法性与权力建构的影响。权力减小道德圈的效应限于拥有合法权力的高权力者身上, 对于权力来源不合法的高权力者而言权力扩大了其道德圈。高权力者对权力的机会/责任建构对其道德圈也产生影响, 当高权力感个体将权力建构为机会时, 与低权力感个体相比, 其道德圈广度和深度相对更小; 而当高权力感个体将权力建构为责任时, 与低权力感个体相比, 其道德圈广度和深度并未表现出减小的趋势。此外, 本研究还探讨了研究意义、不足及未来研究方向。

多种心理稳定性干预模式对冬季两项运动的心理效应分析

姜学敏 (孙延林)

天津体育学院, 天津, 301617

摘要 目的: 冬季两项运动是越野滑雪与小口径运动步枪射击相结合的冬季奥运会竞技比赛项目。运动员

在比赛中同时承受高速滑行时的高强度运动负荷刺激，又要最快速度的完成由动到静的转变，且追求尽可能短时间内的高命中率。是一个既要考虑速度又要考虑稳定性的运动项目。本文通过总结归纳几种较为流行且效果明显的心理干预方式，以探讨不同心理干预方式所达到的心理效益。方法：本研究通过查阅文献收集心理干预影响技巧性运动项目、速度型运动项目的相关研究，进行总结、比较，以得出冬季两项运动中最行之有效的心理干预方法。（1）生物反馈训练：可以改变运动员心率变异性（HRV），体现在总功率和低频功率上，生物反馈训练可有效提高运动员的竞赛成绩，高频功率的增长率可负向有效预测射击运动员的竞赛成绩，实证研究显示，生物反馈训练可以改变副交感神经的兴奋性进而提升运动员的竞赛成绩。（2）正念训练：我国学者姒刚彦根据我国社会文化提出正念-接受-觉悟-投入训练（The mindfulness-acceptance-insight-commitment, MAIC）正念训练是指一种自我意识的认知、调节和接纳的心理过程和康复手段。实证研究表明，正念训练可有效提升运动员的心理流畅性、提高运动表现。（3）目标设定训练：根据个人不同的处理运动任务的方式，基于成绩目标的两种观点展开的心理训练方式。一些运动领域的文献指出，顶峰表现可能与运动员对任务相关目标的适应性有关。（4）表象训练：表象训练的原理通过充分利用运动中的视觉、听觉、触压觉、平衡觉等所带给感觉器官的感受，将动作完成的结果传入大脑，在脑中反复推演，从而创造新的运动形象和运动情景。研究表明，表象训练不仅能达到身体训练的效果，在技术质量及效果方面强于单纯的身体训练，运动表象训练是促进技能学习和运动表现的有效手段。

Analysis of psychological effects of various psychological stability intervention modes on biathlon

Xuemin Jiang (Yanlin Sun)

Tianjin Sports University, Tianjin, 300617

Abstract : Biathlon is a combination of cross-country skiing and small-bore sport rifle shooting at the Winter Olympics. Athletes in the competition at the same time under the high intensity of the sports load when sliding, and to complete the transition from dynamic to static at the fastest speed, and the pursuit of a high hit rate in the shortest time possible is a sports project that should consider both speed and stability. This paper summarizes several popular and effective psychological intervention methods to explore the psychological benefits achieved by different psychological intervention methods. In this study, by consulting literature and collecting related studies on psychological intervention affecting skill sports events and speed sports events, we summarize and compare them, in order to find the most effective psychological intervention method in biathlon. (1) Biofeedback training: you can change the athlete's heart rate variability (HRV), reflect on the total power and low-frequency power, biofeedback training can effectively improve the athletes' competition performance, the growth rate of high frequency power can be negative to effectively predict the shooters competition results, the empirical research shows that biofeedback training can change the parasympathetic nerve excitability and enhance the competition of athletes results. (2) Mindfulness training: Based on The social culture of our country, Gangyan Si, a Chinese scholar, proposed The mindfulness-acceptance-insights-commitment (MAIC) training, which is a psychological process and rehabilitation means of cognitive adjustment and acceptance of self-awareness Empirical studies show that mindfulness training can effectively improve athletes' mental fluency and athletic performance. (3) Goal setting training: psychological training based on two perspectives of performance goals, depending on how individuals approach athletic tasks. Some sports literature suggests that achieving peak performance may be related to an athlete's adaptability to task-related goals. (4) Image training: The principle of image training is to make full use of the feeling of sensory organs brought by visual sense, auditory sense, touch sense, balance sense and so on in the movement. The result of the movement is transferred to the brain and repeated deduction in the brain, so as to create a new movement image and movement scene The research shows that image training can not only achieve the effect of physical training, but also is better than physical training in terms of technical quality and effect. Motor image training is an effective means to promote skill learning and athletic performance.

自闭症儿童焦虑评估工具的系统评价

吕萍萍¹ 崔乃雪² (通讯作者)

¹ 山东大学护理与康复学院, 济南, 250012

² 山东大学护理与康复学院, 济南, 250012, cnx@sdu.edu.cn

摘要 背景 焦虑是自闭症谱系障碍 (autism spectrum disorder, ASD) 最常见的共患疾病之一, 研究表明焦虑会加重 ASD 儿童的功能缺陷, 因此, 准确识别和评估 ASD 儿童的焦虑十分重要。但是由于两者症状的重叠以及 ASD 儿童语言和认知功能的限制, 准确评估 ASD 儿童的焦虑十分困难。目前学者已开发了多种多样的 ASD 儿童焦虑的测量工具, 了解其各自的特点将十分有助于研究者和实践者选择恰当工具。目的 对国内外 ASD 儿童焦虑评估工具进行系统评价, 并为实践和研究提出建议。方法 计算机检索 PubMed、Web of Science、SCOPUS、CINAHL、PsycInfo、The Cochrane Library、CNKI 中国知网、万方等数据库, 外文数据检索时间从 2010 年 1 月-2021 年 3 月, 中文数据库检索时间从建库以来到 2021 年 3 月。纳入以 ASD 儿童 (年龄小于 18 岁) 为对象并且文献主题为焦虑测量工具编制和/或性能测定的文献, 评估工具的类型、测量方式、计分方式、适用人群、量表维度、条目、心理测量学特性、灵敏度和特异性等方面的特征。结果 最终纳入 35 篇外文文献、15 个儿童焦虑测量工具。这 15 个工具中, 有 10 个是为典型发育儿童制定的焦虑评估工具, 有 5 个专门为 ASD 个体改编制定的工具。为典型发育儿童制定的焦虑评估工具在 ASD 儿童中使用, 评定者间信度较差, 结构效度较差。与之相比, 专门为 ASD 个体改编制定的工具信效度方面表现较好。结论 国外有较多研究关注焦虑评估工具在 ASD 儿童中使用的适用性和信效度, 但国内仍缺乏相关研究。与专门为 ASD 儿童制定的焦虑评估工具相比, 为典型发育儿童制定的焦虑评估工具在 ASD 儿童中的适用性较差, 未来的研究需进一步对其进行验证改编, 以更好的适用于 ASD 儿童。而专门为 ASD 儿童制定的焦虑评估工具虽然表现较好, 但是大多数工具开发的时间较短, 仍需要进一步进行检验。

Systematic Evaluation of Anxiety Assessment Tools for Children with Autism Spectrum Disorder

Pingping Lyu¹, Naixue Cui² (Corresponding author)

¹ School of nursing and rehabilitation, Shandong University, Jinan, 250012

² School of nursing and rehabilitation, Shandong University, Jinan, 250012, cnx@sdu.edu.cn

Abstract: Background Anxiety is one of the most common comorbidities of autism spectrum disorder (ASD). Studies have shown that anxiety can aggravate the functional deficits of children with ASD. Therefore, it is very important to accurately identify and evaluate the anxiety of children with ASD. However, due to the overlap of symptoms and the limitation of communication and cognitive function in children with ASD, it is very difficult to accurately evaluate the anxiety of children with ASD. At present, scholars have developed a variety of anxiety assessment tools for children with ASD. Understanding their respective characteristics will be very helpful for researchers and practitioners to choose appropriate tools. Objectives To systematically evaluate the anxiety assessment tools for children with ASD at home and abroad, and put forward suggestions for practice and research. Methods PubMed, web of science, Scopus, CINAHL, PsycINFO, the Cochrane Library, CNKI, Wanfang and other databases were searched by computer. The retrieval time of foreign language data is from January 2010 to March 2021, and the retrieval time of Chinese database is from the establishment of the database to March 2021. We included studies on the development of anxiety assessment tools and/or performance measurement. In addition, these studies must target ASD children (younger than 18 years old). Analyze measurement methods, scoring methods, applicable population, scale dimensions and items, frequency of use, psychometric characteristics, sensitivity and specificity of assessment tools. Results Finally, 35 foreign literature and 15 children's anxiety measurement tools were included. Among the 15

tools, 10 are anxiety assessment tools for typical developing children, and 5 are specially adapted for ASD individuals. When the anxiety assessment tool developed for typical developmental children is used in ASD children, the inter-rater reliability and structural validity are poor. In contrast, the tools specially adapted for ASD individuals perform better in terms of reliability and validity Conclusion At present, many studies abroad pay attention to the applicability, reliability and validity of anxiety assessment tools in ASD population, but there is still a lack of relevant research in China. Compared with the anxiety assessment tools specially developed for ASD children, the anxiety assessment tools developed for typical developmental children have poor applicability in ASD children. Future studies need to further verify and adapt it to better apply to ASD children. Although the anxiety assessment tools specially developed for ASD children perform well, most of them have been developed for a short time and still need to be further tested.

认知负荷和时间压力对欺诈决策的影响

董韩晨¹ 钱秀莹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310058

摘 要 大学生作为虚拟社交的主力军, 享受着互联网诸多便利的同时, 也成为了网络诈骗的主要对象。依据 360 的《2018 年大学生人群受骗情况分析》, 大学生最容易被骗的网络诈骗类型是虚假兼职刷单, 另外, 恶意程序、理财投资骗局、网络博彩与身份冒充等均为常见骗局类型。个体对于欺诈的易感程度定义为欺诈易感性, 是本研究中用于衡量被试欺诈决策意愿的指标。在先前的研究中, 认知负荷和时间压力是两个影响欺诈易感性较为重要的因素。本研究使用实验室实验探究了在新型网络诈骗场景(亲友借钱、兼职刷单、咸鱼购物、客服来电和游戏交易)下, 认知负荷和时间压力对大学生的欺诈决策行为的影响。在正式实验中, 被试观看编制好的不同网络场景下的图像对话互动材料, 并在最后选择自己的转账意愿。这些网络诈骗场景均为主试自己编制, 并且每个场景都有其真实版本(现实中存在的情景)和欺诈版本(网络诈骗中才会出现的情景)。实验结果发现, 在实验室中, 认知负荷主效应边缘显著, 在认知负荷下被试的欺诈易感性有降低的趋势, 这表明认知负荷下被试会更不容易受骗, 更不愿意做出向骗子转账的行为; 时间压力的主效应显著, 时间压力下被试的欺诈易感性会更高, 更容易被骗。另外, 在本实验中, 在高认知负荷下时间压力的效应会更显著。

The impact of cognitive load and time pressure on fraud decision making

Dong Hanchen, Qian Xiuying

Department of psychology and behavioral science, Zhejiang University, Hangzhou, 310058

Abstract: As the main force of virtual sociality, college students enjoy many conveniences of the Internet, but also become the main target of Internet fraud. According to the "Analysis on the situation of college students being cheated in 2018" by 360, the most vulnerable type of online fraud for college students is false part-time job fraud. In addition, malicious programs, financial investment fraud, online gambling and identity impersonation are common types of fraud. The individual's susceptibility to fraud is defined as the fraud susceptibility, which is used to measure the participants' fraud decision-making intention in this study. In previous studies, cognitive load and time pressure are two important factors affecting the susceptibility to fraud. This study uses laboratory experiments to explore the impact of cognitive load and time pressure on College Students' fraud decision-making behavior under new online fraud scenarios (relatives and friends borrowing, part-time bill brushing, salted fish shopping, customer service calls and game trading). In the formal experiment, the subjects watched the prepared interactive materials of image dialogue in different network scenes, and chose their own transfer intention at the end. These network fraud scenarios

are mainly designed by the author, and each scenario has its own real version (the situation in reality) and fraud Version (the situation only appears in the network fraud). The results show that in the laboratory, the edge of the main effect of cognitive load is significant. Under the cognitive load, the subjects' fraud susceptibility has a decreasing trend, which indicates that the subjects under the cognitive load are less likely to be cheated and are more reluctant to transfer money to cheaters; The main effect of time pressure is significant. Under time pressure, the subjects are more susceptible to fraud and are more likely to be cheated. In addition, in this experiment, the effect of time stress is more significant under high cognitive load.

学习投入、专业认同与医学生评教的路径关系： 基于自我决定理论的中介模型

林国斌¹, 任梦琪¹, 王笛¹, 廖美玲¹

¹ 福建医科大学健康学院应用心理学系, 福州, 350122, 413345610@qq.com

摘要 目的 探究医学生评教与学习投入、专业认同的关系, 了解学习投入、专业认同对医学生评教的作用机制, 为医学院校教学质量改革提供新的对策。方法 采用随机整群抽样法在某医科大学抽取6个班级, 共317名医学生, 使用医学生评教问卷、大学生学习投入问卷、大学生专业认同问卷进行调查, 通过SPSS 21.0 进行数据处理。结果 不同年级、志愿填报方式与就业前景的医学生在评教结果上差异显著(年级 $F=7.512$, $p<0.01$, 志愿 $F=7.263$, $p<0.01$, 就业前景 $t=2.319$, $p<0.05$); 医学生评教与学习投入、专业认同显著正相关(r 分别为0.588、0.611, p 均 <0.001); 学习投入显著正向预测医学生评教($\beta=0.34$, $p<0.001$); 专业认同在学习投入与医学生评教间起完全中介作用, 中介效应占比79.41%。结论 高校应提供支持学生发挥自主性和能力的条件, 促进他们的动机内化整合, 提高专业认同程度, 从而提升他们对教学质量的评价。

The Relationship Between Learning Engagement, Speciality Identity and Medical Students' Evaluation of Teaching: A Mediation Model Based on Self-Determination Theory

Lin Guobin¹, Lin Lihua¹, Ren Mengqi¹, Wang Di¹, Liao Meiling¹

¹Department of Applied Psychology, The School of Health, Fujian Medical University, Fuzhou,
350122, 413345610@qq.com

Abstract: Purpose: To explore the relationship between learning engagement, speciality identity and medical students' evaluation of teaching, to understand the mechanism of learning engagement and speciality identity on medical students' evaluation of teaching, and to provide new countermeasures for teaching quality reform in medical universities. Method: A total of 317 medical students from 6 classes in a medical university were selected by the random cluster sampling method. The questionnaires were conducted by the medical students' teaching evaluation questionnaire, the college students' speciality identity questionnaire and the college students' learning engagement questionnaire. The data were processed by SPSS 21.0 statistical software package. Result: There were significant differences in teaching evaluation among medical students of different grades, application forms and employment prospects (F grade =7.512, $p<0.01$, F application =7.263, $p<0.01$, t prospect =2.319, $p<0.05$); There was a significant positive correlation between medical students' evaluation of teaching and learning engagement and speciality identity ($r=0.588, 0.611, p<0.001$); Learning engagement significantly positively predicts medical students' evaluation of teaching ($\beta=0.34, p<0.001$); Speciality identity plays a completely mediating role in the relationship between learning engagement and medical students' evaluation of teaching, with the mediating effect accounting for 79.41%. Conclusion: Universities should provide conditions to support students to give full play to their autonomy and ability, promote their motivation internalization and integration, improve the degree of professional identity, so as

to improve their evaluation of teaching quality.

双语情景下的语言储蓄假说：不同语言影响未来取向及跨期折扣？

许岳培^{1,2} 梁竹苑^{1,2} (通讯作者)

1 中国科学院行为科学重点实验室 (中国科学院心理研究所), 北京, 100101

2 中国科学院大学心理系, 北京, 100049, liangzy@psych.ac.cn

摘 要 随着全球化进程的推进, 全球超过半数的人口已经成为了双语使用者, 探究使用不同语言对决策的影响是不容忽视的一大现实问题。跨期决策主要涉及不同时期的收益和成本的权衡, 基于语言学中“语言塑造思维”的萨丕尔-沃尔夫假说 (Sapir-Whorf hypothesis), Chen(2011)提出的语言储蓄假说 (Linguistics-saving hypothesis) 也发现: 强未来时态标识的母语 (即动词需要根据未来时态进行变换) 可能减少了个体未来导向的行为, 也影响了个体的跨期决策偏好。前人研究已表明, 短暂地使用其他语言也会对个体的风险决策及时间取向产生影响。据此, 本研究假设: 语言储蓄假说在双语情景下仍然适用, 即当母语是弱未来时态标识语言 (如中文) 的个体, 使用强未来时态标识的外语 (如英文) 时, 由于英文语法强调“现在时”与“未来时”的不同, 使用英文就可能会使得个体的未来时间取向更低、对未来事件的感知更为遥远, 从而产生更大的跨期折扣率。研究 1 采用单因素被试间设计 (中文组 114 人, 英文组 78 人), 利用跨期选择量表及未来取向应对量表分别测量被试的折扣率及未来时间取向, 结果发现: 相较使用中文, 中文母语者在使用英文时的未来时间取向更低 ($p = .006$, Cohen's $d = 0.398$, $BF_{10} = 3.852$), 但两组在跨期折扣率上的差异未达显著 ($p = .198$, Cohen's $d = 0.190$, $BF_{10} = 0.347$)。研究 2 (中文组 215 人, 英文组 208 人) 改用跨期匹配任务, 得到的结果与研究 1 一致: 中文母语者在使用英文时的未来时间取向更低 ($p < .001$, Cohen's $f = 0.364$, $BF_{10} > 100$), 但语言对跨期折扣率 ($p = .362$, Cohen's $f = 0.045$, $BF_{10} = 0.179$)、主观时间知觉的影响不显著 ($p = .560$, Cohen's $f = 0.032$, $BF_{10} = 0.139$)。本研究部分支持了双语情境下的语言储蓄假说, 表明语言对跨期决策的影响不仅体现在母语的长期影响, 即使是短暂的语言转换也可能对个体的未来取向产生影响。但本研究暂未发现语言对跨期折扣率、主观时间知觉的影响, 这可能是由于除时间因素外, 跨期折扣率可能还受到了其他因素 (如: 冲动性人格) 的影响。未来研究可从其双语情境进一步探寻双语储蓄假说的内部机制。

Linguistic-saving hypothesis among bilinguals: Do different languages impact future orientation and intertemporal discounting?

Xu Yuepei^{1,2}, Liang Zhu-Yuan^{1,2}

1 CAS Key Laboratory of Behavioral Science, Institute of Psychology, Beijing, 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049, China

Abstract: With the rapid rise in globalization, over half of the world's population is now bilingual. Thus, whether using different languages has an impact on the decision of individuals is an essential question worth investigating. In intertemporal decisions, individuals are frequently required to calculate the trade-offs between smaller sooner rewards and larger later rewards to make a choice. The Sapir-Whorf hypothesis proposed that language may strongly influence individuals' worldview. Chen's (2011) linguistic-saving hypothesis (LSH) also found that a native language with strong future-time reference (FTR) may lead individuals to be less likely to do future-oriented behaviors, which may also impact their intertemporal preference. Previous studies showed that using different languages in a short term

impacted the risk decision and time orientation of individuals. Accordingly, the current study hypothesized that the LSH still works in a bilingual context. In detail, for low-FTR language native speakers (i.e., Chinese), using a high-FTR foreign language (i.e., English) may make them less future-oriented, perceive future events as more distant, and have higher intertemporal discount rate. In Study 1, with a single-factor between-group design (Chinese group: $n = 114$; English group: $n = 78$), we used the Monetary Choice Questionnaire and the Future-oriented Coping Inventory to measure participants' intertemporal discount rate and future orientation, respectively. Results suggested that compared with the Chinese group, participants in the English group had a significantly lower future orientation ($p = .006$, Cohen's $d = 0.398$, $BF_{10} = 3.85$), but the group difference of discount rate was not significant ($p = .198$, Cohen's $d = 0.190$, $BF_{10} = 0.347$). With the matching-based intertemporal decision task as a different measurement of discounting, Study 2 found similar results with Study 1. Specifically, participants had a lower future orientation when using English ($p < .001$, Cohen's $f = 0.364$, $BF_{10} > 100$), but the effect of language on discounting ($p = .362$, Cohen's $f = 0.045$, $BF_{10} = 0.179$) and subjective time perception ($p = .560$, Cohen's $f = 0.032$, $BF_{10} = 0.129$) was non-significant. The current study partially supports the linguistic-saving hypothesis in a bilingual context, suggesting that the effect of language on intertemporal decision may not only be reflected by the long-term effect of one's native language, because even an instantaneous change of language may also impact the future orientation of individuals. However, our study did not provide evidence to support the language effect on discount rate or subjective time perception. A possible reason is that discount rate is determined by some other factors (e.g., impulsive personality) aside from our measured variables related to future time. Future studies could try to explore the inner mechanism of the bilingual-saving hypothesis from other perspectives and other different bilingual contexts.

深圳青少年 24 小时活动水平和积极心理的关系：一项大样本调查

梁凯欣¹ 陈思同² 迟新丽¹ (通讯作者)

1 深圳大学心理学院, 深圳, 518060, xinlich@126.com

2 维多利亚大学运动与健康研究院, 墨尔本, 8001

摘要 目的: 睡眠、屏幕时间和身体活动, 这三种健康相关的行为以不同的比例分配在一天 24 小时内, 被称为“24 小时活动”。越来越多研究结果表明, 24 小时活动的时间分配和青少年的心理问题(例如, 抑郁症状)有关, 但关于 24 小时活动水平与积极心理健康之间关系的研究仍相对较少。2018 年我国首部《中国儿童青少年身体活动指南》发布, 但尚未对睡眠时间提出建议。因此, 本研究基于得到广泛认可的《加拿大 24 小时儿童 24 小时活动指南》(以下简称指南), 旨在探讨睡眠睡眠、屏幕使用指南和中高强度运动指南的达标情况是否与中国青少年的积极心理健康有关。方法: 采用分层抽样方法选取来自深圳 9 个学区 135 所学校的中小學生进行问卷调查, 收集 24 小时活动时间、积极心理健康指标(主观幸福感、积极品质和心理韧性)以及社会人口学资料, 最终获得包含 67281 名中小學生(平均年龄 13.0 岁)的有效样本。依据指南评定被试的 24 小时活动水平。采用广义线性模型分析 24 小时活动水平与积极心理健康的关系, 并探究两者关系是否因性别和学段而异。结果: 总体而言, 相比于达标 0 条指南, 达到 1、2 或 3 条指南的被试都具有更高水平的主观幸福感、积极品质和心理韧性, 而且指南达标数与积极心理指标的关系呈现出剂量效应, 即达标数越多, 被试越有可能报告更高水平的主观幸福感、心理韧性和积极品质。具体而言, 24 小时活动水平与主观幸福感的关系具有性别和学段差异, 与心理韧性的关系具有学段差异。结论: 达到指南的活动水平与积极心理总体上呈显著正相关, 具体关系因性别和学段而异。提升青少年的 24 小时活动指南达标率, 可能有助于心理健康的积极发展。

关键词 青少年, 身体活动, 屏幕时间, 睡眠, 主观幸福感, 心理韧性, 积极发展

Associations between meeting 24-hour movement guidelines and psychological well-being of Chinese adolescents: Findings from a large sample survey

Kaixin Liang¹, Si-Tong Chen², Xinli Chi¹

1 School of psychology, Shenzhen University, Shenzhen 518060, corresponding E-mail: xinlich@126.com

2 Institute for Health and Sport, Victoria University, Melbourne 8001

Abstract: Background and objective: 24-hour movement guidelines (24HMG) have been released in 2016 with the goal to improve the overall well-being of children and youth. In addition to physical health benefits, increasing research support that meeting 24HMG is also related to adolescent mental health. However, studies on the relationship between meeting 24HMG and psychological well-being are scarce. There are two perspectives for psychological well-being: hedonic well-being and eudaimonic well-being. This study aims to explore whether meeting 24HMG was related to both hedonic well-being and eudaimonic well-being among Chinese adolescents. Methods: Using a stratified sampling method, we selected 135 primary and middle school students from 9 school districts in Shenzhen for a questionnaire survey. Data regarding adherence to 24HMG, hedonic well-being indicators (subjective well-being), eudaimonic well-being (resilience and positive youth development [PYD]), and sociodemographic variables were collected. Finally, 67281 primary and middle school students (mean age: 13.0 years old) were retained for the analytical sample. Generalized linear models were used to analyze the relationship between meeting 24HMG and psychological well-being in total, gender-stratified, and grade-stratified samples. Results: In general, compared with meeting none recommendations in 24HMG, participants who met 1, 2, or 3 recommendations had higher levels of subjective well-being, resilience, and PYD. All three psychological well-being indicators improved as the number of recommendations met increased, presenting a dose-response pattern. The associations between meeting 24-HMG with subjective well-being varied between genders and grades, and the associations with resilience varied between grades. Conclusion: Meeting 24HMG was positively associated with psychological well-being among Chinese adolescents. Encouraging adolescents to meet 24HMG may be a promising approach in mental health promotion.

独处行为及其影响因素的潜在转变分析：一项纵向数据的研究

芦旭蓉¹ 刘拓^{1,2,3} (通讯作者)

1 天津师范大学心理学部, 天津, 300387

2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院, 天津, 300387

3 学生心理发展与学习天津市高校社会科学实验室, 天津, 300387, mikebonita@163.com

摘要 在这个信息快速交流的时代, 个体时常会陷入到随时保持人际关系的状态, 需要时刻塑造和约束自己的行为。当个体频繁出现在社交场合中时, 会承受来自社会和自身的压力, 从而使个体更想要从人群中脱离, 以寻求独处的时光。已经有越来越多的研究者开始关注个体的独处行为。但是以往的研究主要基于变量为中心, 即通过对项目得分进行加和的方式来判断个体偏好独处行为的程度, 这种做法往往会忽视那些在总分上相近的个体可能在量表的作答模式上完全不同, 此外也很少有研究关注独处行为在个体发展过程中的动态变化。因此, 基于上述的分析, 本研究采用潜在剖面分析和潜在转变分析的方法探讨了大学生独处行为的潜在类别以及独处类别随时间的发展规律。本研究采用独处行为量表对在校大学生进行了间隔为半个月的3次问卷调查, 最终获得有效数据258份, 采用SPSS 26.0和Mplus 8.0对数据进行了分析。研究结果显示: (1) Harman单因子结果显示三个时间点的数据不存在共同方法偏差, 第一公因子的解释率分别为26.97%、31.22%和30.47%。(2) 潜在剖面分析的结果表明3个类别的模型拟合良好, 可以将其命名为积极独处型、居中型和高独处型, 积极独处型的被试仅在积极独处维度有较高的作答概率, 居中型被试在积极独处维度的作答概

率最低，在孤僻和社交回避维度的作答概率处于中间状态，高独处型被试在积极独处、孤僻和社交回避维度的作答概率最高。（3）潜在转变分析的结果显示，积极独处型和居中型被试稳定性较强，在 T1、T2 时间点下保持原组的概率分别是 56%和 60%，在 T2、T3 时间点下保持原组的概率分别是 84%和 86%，高独处型的被试在 T1 到 T2 时间下，以及 T2 到 T3 时间下有 47%和 35%的概率向居中型转变。（4）计算不同性别组下的独处潜在类别发生率以及转变概率，结果表明 T1 时间下独处行为潜在类别的发生率以及各个类别发生转变的概率存在性别差异。本研究揭示了个体独处行为的潜在类别及其变化的规律，同时考察了性别的差异，为未来相关领域的研究提供了一定的启示和建议。

Abstract: In this era of rapid information exchange, individuals always fall into the state of maintaining interpersonal relationship at any time, and need to restrict and shape their behavior at all times. Individuals will bear the pressure from society and themselves when they frequently appear in social occasions, so that they want to separate from crowd. More and more researchers have begun to pay attention to individuals' solitude behaviors. Previous studies on solitude behaviors of individuals are mainly based on variable as the center, and the severity of solitude behavior was judged by sum scores of items. However, it is often ignored that individuals with similar total scores might be completely different in the response pattern of the scale. In addition, few studies will pay attention to dynamic changes of solitude behaviors in the process of individual development. Therefore, based on the above analysis, this study plan to explore latent classes of college students' solitude behaviors and development pattern among these classes as the time goes by across the latent profile analysis (LPA) and latent transition analysis (LTA). Solitude Behaviors Scale for Short Version (SBS-S) were used to conduct the measurement. The paper questionnaires were distributed in the university campus three times in half a month. Finally, 258 valid data were finally obtained. Data analysis was conducted with Mplus 8.0 and SPSS 24.0. The results showed that: (1) Harman's single-factor method was used to conduct the testing of common method bias and the results showed that there were no significant common method biases in this study. variances explained by the first common factor at T1, T2 and T3 time points were 26.97%, 31.22% and 30.47% respectively. (2) 3-class models were suitable for measurement data at three time points and these classes could be named positive solitude type, moderate solitude type and high solitude type respectively. Positive solitude type performed better only in positive solitude dimension, moderate solitude type had the lowest response probabilities in positive solitude dimension and the medium response probabilities in eccentricity and social avoidance dimensions, and high solitude type performed best in positive solitude, eccentricity and social avoidance dimensions. (3) According to LTA, individuals of positive solitude type and moderate solitude type had stronger stability. The probabilities of maintaining original classes were 56% and 60% during T1 to T2, 84% and 86% during T2 to T3. Individuals of high solitude type had 47% and 35% probabilities turned into moderate solitude type during T1 to T2 and T2 to T3. (4) The incidence and transition probability under different gender groups were calculated. The results showed that there were gender differences in the incidence of latent classes and the transition probability of each class. This study reveals the latent classes and changes of individual's solitude behaviors, and examines the influence of gender differences, which provides some enlightenment and suggestions for future research in related fields.

精神分裂症患者家属照料负担与患者生活质量的关系： 家属情绪表达与患者感知到的情绪表达的链式中介效应

通讯作者 E-mail: jzxi@psy.ecnu.edu.cn

摘要 背景: 精神分裂症作为常见的精神障碍一直受到临床实践与学术研究的关注。随着研究的不断推进, 有两个趋势值得讨论, 第一, 越来越多的临床工作者不再把症状改善作为唯一的目标, 而是将患者视为基本的人去关心他们的生活质量; 第二, 研究的视角不再局限于患者本身, 更多去关注患者所处的系统。对于稳定期的患者来说, 他们大多与家人同住, 由家人照料, 家庭系统是影响患者愈后的重要因素。家属的情绪表达作为一个重要的家庭因素已被不少研究发现与精神分裂症患者的复发率密切相关, 但目前少有研究探讨其与患者生活质量的关系, 也较少有研究从患者方出发, 探索其感受到的情绪表达与其愈后的关系。此外, 照料精神分裂症患者是一项耗费心力的工作, 这往往会让家属有较大的照料负担。当家属主观感受的照料负担水平更高时, 家属可能会对患者有更高的情绪表达, 从而影响患者的生活质量。基于以上, 本研究尝试探索家属照料负担与患者生活质量的关系, 并检验家属情绪表达、患者感知到的情绪表达在其中的链式中介作用。方法: 采用调查法收集数据。被试为处于恢复期的精神分裂症患者(能够理解施测内容并回答)及其家属(与患者同住, 并且是患者的主要照料者)。家属自我报告内容为照料负担、情绪表达(包含批评和情绪过度卷入两个维度); 患者自我报告内容为感知到的情绪表达、生活质量(包含生理、心理、社会关系三个维度)。最终共 135 份数据纳入分析, 患者平均年龄为 42.78 岁($SD = 8.06$), 家属平均年龄为 66.28 岁($SD = 11.19$)。使用 SPSS25.0 和 Mplus7.0 对数据进行整理与分析。结果: 1) 在控制了患者的性别、年龄、受教育程度、是否有工作、是否服药之后, 家属的照料负担能够显著地负向预测患者生活质量的生理维度($\beta = -0.39, p < 0.001$)、心理维度($\beta = -0.35, p < 0.001$)、社会关系维度($\beta = -0.18, p = 0.046$)。2) 以家属的批评和患者感知到的批评作为中介变量进行链式中介分析, 结果发现: 批评和患者感知到的批评在家属照料负担与生活质量三个维度之间的链式中介作用均不成立, 家属照料负担能够正向地预测批评($\beta = 0.60, p < 0.001$), 批评能够正向预测患者感知到的批评($\beta = 0.64, p < 0.001$), 但患者感知到的批评对生活质量的预测不显著。3) 以家属的情绪过度卷入和患者感知到的情绪过度卷入作为中介变量进行链式中介分析, 结果发现: 情绪过度卷入和患者感知到的情绪过度卷入在家属照料负担与生活质量生理维度之间的中介作用成立; 情绪过度卷入和患者感知到的情绪过度卷入在家属照料负担与生活质量心理维度之间的中介作用成立; 情绪过度卷入和患者感知到的情绪过度卷入在家属照料负担与生活质量社会关系维度之间的中介作用不成立。结论与启示: 当家属的照料负担越重时, 家属的情绪表达水平也越高(包括情绪过度卷入和批评), 患者的生活质量也会受到一定影响。这提示, 促进患者的生活质量可从减轻家属照料负担入手, 例如通过构建社区心理服务体系, 为精神分裂症患者家庭提供其所需要的服务。此外, 相比批评, 家属的情绪过度卷入(过分担心患者)似乎更值得关注, 未来研究可进一步区分情绪表达的不同侧面对学生的影响。

Care Burden and Schizophrenia Patients' Quality of Life: Chain Mediating Effects of Expressed emotion and Perceived Expressed Emotion

PENG Yanan¹, WEI Yicheng¹, LI Yan¹, SONG Lanjun², XI Juzhe¹

¹ Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, China, 200062

² Shanghai Changning Mental Health Center, Shanghai, China, 200335

Abstract: Background: As a typical mental disorder, schizophrenia has gotten much attention from clinical practice and academic research. Nowadays, symptom elimination is no longer the only goal of schizophrenia treatment. The social adaptation of patients and their quality of life have also become the focus of intervention. The concentrate also broadens from the individual-level factors to their multi-level factors, especially their living systems. Most schizophrenia outpatients are taken care of by their family members after discharge. Thus, the family system has a significant impact on their recovery. Expressed emotion, as a crucial family-level factor, is closely related to schizophrenia patients' relapse. However, less study paid attention to its relationship with patients' quality of life, and not much study included patients' perceived expressed emotion as a worth variable. Meanwhile, take care of people with schizophrenia is not effortless work. Their caregivers may suffer from their care burden. A high level of care burden may bring a high level of expressed emotion, which results in poor quality of life of patients. Based on the above, the current study aimed to explore the relationship between caregivers' care burden and patients' quality of life and the chain mediating effect of expressed emotion and perceived expressed emotion. Methods: Participants were outpatients and patients' primary caregivers. The caregiver finished questionnaires that measured their care burden and expressed emotion (two subscales: emotion over-involvement, criticism), while the patient answered questionnaires that measured their perceived expressed emotion and quality of life (three subscales: physical domain, psychological domain, and social relationship domain). Finally, 135 pair data were analyzed. The average age of patients was 42.78 years (SD = 8.06), and the average age of family members was 66.28 years (SD = 11.19). Data were analyzed with SPSS 25.0 and Mplus 7.0.

Results: Care burden was negatively related to patients quality of life, including physical domain ($\beta = -0.39$, $p < 0.001$), psychological domain ($\beta = -0.35$, $p < 0.001$), and social relationship domain ($\beta = -0.18$, $p = 0.046$), with patients' sex, age, educational level, employ, and medication-taking as covariates. The chain mediating effect of criticism and perceived criticism between care burden and quality of life was not significant. However, care burden was positively related to criticism ($\beta = 0.60$, $p < 0.001$) and criticism was positively related to patients' perceived criticism ($\beta = 0.64$, $p < 0.001$). The chain mediating effect of emotion over-involvement and perceived emotion over-involvement between care burden and the physical domain was significant; the chain effect of expressed emotion and perceived expressed emotion between care burden and the psychological domain was significant; the chain effect of expressed emotion and perceived expressed emotion between care burden and social relationship domain was not significant. Conclusion and implication: In schizophrenia families, caregivers' high burden was related to a high level of expressed emotion (including emotion over-involvement and criticism), which resulted in patients' poor quality of life. It indicated that releasing caregivers' burden could be an effective way to improve patients' quality of life. Specific services should be available in the community to help schizophrenia families. Besides, the emotion overinvolvement domain seemed to be more impactful on patients' quality of life. Future studies could distinguish the different impacts of expressed emotions' sub-domains.

疫情期间流动人口个体抗逆力对家庭抗逆力的影响： 基于纵向的主客体互倚模型

冯丽¹ 安媛媛¹ (通讯作者)

南京师范大学心理学院, 南京, 210097, anran220@163.com

摘要 新冠肺炎疫情爆发期间, 居家隔离对流动家庭的心理健康状况带来极大挑战, 流动家庭除了父母与孩子朝夕相处的亲子压力之外, 还面临着家庭收入减少、再就业难等现实压力, 目前大多研究多以问题视角关注流动家庭的困境。本研究从积极和系统的视角出发, 基于家庭抗逆力结构特征, 探讨疫情期间流动家庭(父母和子女)个体抗逆力及其家庭抗逆力的关系。采用纵向的主客体互倚模型对 136 户江苏流动家庭父母及其子女, 应用疫情媒体暴露问卷、个体抗逆力量表(CD-RISC)、家庭抗逆力量表(FRAS)于 2020 年 2 月中旬(T1)、3 月上旬(T2)两个时间点进行线上的问卷调查。结果发现: (1) 子女家庭抗逆力得分显著高于其父母的家庭抗逆力得分; (2) 控制疫情媒体暴露后, T1 父母和孩子自身的个体抗逆力对其 T2 家庭抗逆力的主体效应显著, T1 孩子个体抗逆力对 T2 父母家庭抗逆力的客体效应显著。研究结果揭示了在流动家庭内部, 父母和孩子对家庭抗逆力的感知存在显著差异; 孩子个体抗逆力对家庭抗逆力有积极作用, 父母家庭抗逆力既受自身个体抗逆力影响, 也受孩子个体抗逆力的影响。因此, 在家庭教育和相关实践活动中, 关注和开发儿童积极特质和抗逆力对于促进流动家庭(父母和子女)的适应将会是更为有效的途径。

The Relationships of Individual Resilience and Family Resilience of Migrant Families during COVID-19 in China: A Longitudinal Actor-partner Interdependence Model

Li Feng¹, Yuanyuan An¹

School of Psychology, Nanjing Normal University, Nanjing, China.

Abstract: During the peak period of COVID-19 in China, children and parents were self-isolating at home. With factory shutdowns and school closures, migrant families which lay in a relatively disadvantageous situation in society had been facing with great challenges. Spending too much time together to some extent brought parent-child pressure to the family. Besides, migrant families also faced the problems of reduced income, difficulties in reemployment and other family stress. Previous study had mainly focused on problems in the adaptive process of migrant families in adversity. Based on the key attributes of Family Resilience Theory (FRT), family resilience was affected by individual traits such as individual resilience. Therefore, this current study explored the relationships between individual resilience and family resilience of parents and children in migrant families during COVID-19 from a positive and systematic perspective. 136 migrant families in Jiangsu province were recruited to participate this survey. A parent and a child in the family were asked to complete the epidemic media exposure questionnaire and the Connor-Davidson Resilience Scale (CD-RISC) in mid-February, 2020 (the peak of the outbreak, T1), and the shortened Chinese version of the Family Resilience Assessment Scale (FRAS) in early March (the outbreak started to ease, T2). Using the approach of the longitudinal actor-partner interdependence model, the results showed that: (1) The family resilience of children was significantly higher than that of their parents; (2) After controlling the epidemic media exposure, the individual resilience of parents and children had a significant actor effect on their own family resilience, and the individual resilience of children had a significant partner effect on their parents' family resilience. These findings revealed that, within the migrant family, there were differences in the perception of family resilience between parents and children. What's more, parents' family resilience was not only affected by their own individual resilience, but also affected by their children' individual resilience. This study provided targeted implication for migrant family intervention programs to improve children's individual resilience to enhance the whole family resilience.

Keywords: migrant family, individual resilience, family resilience, the longitudinal actor-partner interdependence

Flight or Fight? The Effects of Entitativity on Strategies of Individual Mobility and Social Competition

Li Jinfeng, Liu Li (corresponding author)

Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

Abstract: Group members often take different identity enhancement strategies to improve their unfavorable situations and achieve positive image. Previous research on determinants of identity enhancement strategies has been conducted mainly from intergroup perspective, and overlooked the role of the fundamental group characteristic. To fill this gap, three studies (two pre-registered) were conducted to examine the effects of entitativity, namely the extent to which a group has a real existence rather than is merely a collection of individuals, on the strategies of individual mobility and social competition. Across three studies, we manipulated the level of ingroup entitativity and measured self-reported intention of (Studies 1-2) and behavioral choices of (Study 3) individual mobility and social competition. The results indicated that members of groups with high (versus low) entitativity were less likely to adopt the strategy of individual mobility and more likely to adopt the strategy of social competition. More importantly, these effects were observed under both intergroup (Studies 1 and 3) and non-intergroup contexts (Studies 2 and 3). The current research not only advances research on identity enhancement strategies but also provides practical implications for group improvement and intergroup relations.

Keywords: entitativity, individual mobility, social competition, devaluation context, pre-registered

基于复杂网络的重大突发事件公众情绪与政府形象研究 ——以新冠肺炎疫情微博大数据为例

杨光 王志丹（通讯作者）

江苏师范大学教育与科学学院，徐州，221116, zzwang19@jsnu.edu.cn

摘要 微博作为一种重要的信息传播媒介，对重大突发事件中信息的发布和传播起着至关重要的作用。官方微博信息公开的及时性和透明性可以降低公众对疫情风险的感知，从而增加公众的积极情绪体验，提高公众对政府的认可度。但是政府和媒体公示的信息内容复杂多样，尚不明确哪些信息对民众的情绪和政府认可度会产生显著影响。基于此，本研究以新冠肺炎疫情为例，使用大数据和网络分析的方法探究影响民众情绪和对政府评价的话题指标，并建构微博话题的网络模型，探究影响公众情绪和政府认可度的中心性话题，以利于政府未来在重大突发事件中有效调控公众情绪，提高公众对政府的积极评价。本研究利用 Python 爬虫，以“疫情”、“确诊”、“肺炎”等为关键词，爬取武汉、石家庄疫情“封城”期间相关微博共 20 万条。首先，对数据进行人工清洗，删除重复内容和商业广告；其次，对剩余数据进行人工标记，删除所研究的 11 个话题指标外的微博，最终得到 69098 条微博。再将 11 个话题指标分别归入政府、民众、媒体三个维度。以分布在政府、民众、媒体中的 11 个话题指标为对象，建立 Lasso 偏相关网络来研究政府、民众、媒体的网络特征。结果发现：（1）在强度中心性上突出的指标有疫情动态、科普答疑，说明这两个指标对周围局部网络话题指标的影响能力较强；（2）在接近中心性上突出的话题指标是疫情动态、国外对比和科普答疑，说明这三个指标是话题网络最中心的指标，在整个网络中影响的话题指标最多，“控制”其他话题的能力最强；（3）在介数中心性上突出的指标有疫情动态、科普答疑，说明这两个指标处于许多其他两点之间的路径上，是调节其他话题之间的“桥梁”；④“疫情动态”是政府通过媒体联结公众的主要“枢纽”，也是影响和控制整个话题网络最中心的指标。“国外对比”次之。总体上，直接影响民众情绪的话题指标有：疫情动态、国外对比、线上求助；直接影响对政府评价的话题指标有：辟谣、科普答疑。因此，未来在重大突发事件中政府从五个方面可以提升公众积极情绪：①政府多及时、透明地通过官媒发布事件动态；②媒体多进行国内外动态和举措的报道的对比，让公众感受到党和政府真真切切的执政为民；③政府开辟便民有效的直通公众的倡议求助渠道，在把握网民的诉求的同时，防止公众因在公共网络上宣泄不满从而将负面情绪相互传染，引爆

舆情；④提升公众对政府的信任度和满意度，才能减少公众对政府工作的对抗和负性情绪。同时政府可以从三个方面提升政府形象：①重视以“三权合作”为机制的应急科普；②政府及时、科学的通过官媒开展辟谣工作，缓解公众负性情绪；③政府减少政务失误率并且重视网络舆论战场。摒弃捂、瞒、压的社会治理方法。

强制隔离戒毒人员情感体验对毒品渴求的影响：学历水平的调节作用

刘灵娇¹ 陈振彩¹（通讯作者）

¹ 江西中医药大学人文学院，南昌，330004，zhencaichen@163.com

摘要 研究目的：本研究旨在探索强制隔离戒毒人员（以下简称强戒人员）在接受强制隔离戒毒期间的情感体验与毒品渴求之间的关系，并在此基础上提出调节模型，考察学历水平对该关系的调节效应。研究方法：使用采用问卷法调查南昌市强戒所 221 名强戒人员，首先对其学历水平进行调查，再使用《强迫性毒品使用量表》、《焦虑自评量表》、《抑郁自评量表》及《心理韧性量表》对其在强制隔离戒毒过程中的毒品渴求和情感体验进行调查。研究结果：（1）不同学历水平的强戒人员在焦虑、抑郁及心理韧性情感体验上的得分均存在显著差异；（2）不同学历的强戒人员对焦虑情感和毒品渴求的调节效应具有统计学意义；数据表明，抑郁情感和毒品渴求的条件主效应显著，且学历水平对抑郁情感和毒品渴求的调节效应具有统计学意义；心理韧性和毒品渴求的条件主效应显著，且学历水平对心理韧性和毒品渴求的调节效应具有统计学意义。研究结论：（1）高学历强戒人员在焦虑和抑郁情感体验对毒品渴求均存在显著的预测作用；（2）低学历强戒人员在心理韧性情感体验维度对于毒品渴求有显著的预测作用。

关键词 强制隔离戒毒人员，情感体验，毒品渴求，学历水平，调节作用

The effect of emotional experience on drug craving among drug addicts in mandatory segregation: the moderating effect of educational level

Liu Lingjiao¹, Chen Zhencai¹ (Corresponding author)

College of Humanities, Jiangxi University of Chinese Medicine, Nanchang, 330004

Abstract: Study purpose: The purpose of this study was to explore the relationship between the emotional experience and drug craving of forced isolation drug addicts (hereafter referred to as forced isolation drug addicts) while undergoing forced isolation drug addiction treatment, and on this basis, to propose a moderating model to examine the moderating effect of educational level on this relationship. Methodology: A questionnaire was used to investigate 221 ex-prisoners in the Nanchang City Rehabilitation Center, and their educational level was investigated first, and then their drug craving and emotional experience during compulsory isolation withdrawal were investigated using the Compulsive Drug Use Scale, Anxiety Self-Rating Scale, Depression Self-Rating Scale, and Mental Toughness Scale. The results of the study showed that (1) there were significant differences in the scores of anxiety, depression and mental toughness among the ex-prisoners with different education levels; (2) the moderating effects of different education levels on anxiety and drug craving were statistically significant; the data indicated that the main effects of depression and drug craving were significant, and the moderating effects of education levels on depression and drug craving were statistically significant; the moderating effects of mental toughness and drug craving were statistically significant; the moderating effects of anxiety and drug craving were statistically significant. The data showed that the conditional main effects of mental toughness and drug craving were significant, and the moderating effects of education level on mental toughness and drug craving were statistically significant. The study concludes that (1) there is a significant predictive effect of anxiety and depression on drug craving among the highly educated rehabilitants, and (2) there is a significant predictive effect of mental toughness on drug craving among the low educated rehabilitants.

网络谣言辟谣方式及其辟谣效果关系的元分析研究

王碧涵¹, 姚愉², 宋嘉怡³, 周晔⁴, 王俭勤⁵

复旦大学, 上海, 200000

摘要 本研究利用元分析的方法, 梳理国内外已有研究, 分析网络谣言辟谣方式在辟谣效果影响中的主效应, 并考察各调节变量在辟谣方式与辟谣效果关系中产生的作用, 为将来制定合适的辟谣方法提供实证依据。通过国内外文献检索, 纳入符合要求的文献 24 篇, 包含 93 个效应量。调节效应分析表明, 网络谣言辟谣方式与辟谣效果的关系受到辟谣时间、辟谣方式、谣言材料类型的调节。未来研究可以进一步探讨认知接种方式对辟谣效果影响研究, 开发生态效度更高、相关性更高的认知接种工具, 并且重点考察年龄、性别等内部因素对网络谣言辟谣方式与辟谣效果关系的影响。

A Meta-Analysis on the Efficacy of Countering Online-misinformation

Abstract: This meta-analysis investigated the factors underlying different ways to counter online misinformation. Since misinformation can have a huge impact on people's lives such as leading to biased decisions, countering online misinformation serves as an important goal in misinformation research. This meta-analysis ($n = 24$, $k = 93$). The analysis of the moderating effect shows that the relationship between the ways of countering misinformation and their effects is moderated by the time, the ways and the types of rumor materials. Future research can further explore the impact of cognitive vaccination on the effect of misinformation denial, develop mental vaccination tools with higher ecological validity, and focus on the impact of age on the relationship between online misinformation denial modes and effect.

Keywords: online misinformation, continued influence, debunking, inoculation, efficacy.

首次心理咨询中的动作同步与工作同盟的关系研究 ——基于动作同步的分析

戴晓妍¹ 张亚² (通讯作者)

¹ 华东师范大学应用心理学系, 上海, 200062

² 华东师范大学应用心理学系, 上海, 200062, yzhang@psy.ecnu.edu.cn

摘要 动作同步的研究是一个新兴的研究领域, 基于视频的动作能量分析为测量心理咨询过程中的动作同步提供了高效、客观的工具。本研究以动作能量分析为分析软件, 以工作同盟量表简版修订版和常规临床咨询效果评估表为研究量表, 旨在探讨心理咨询过程和闲聊过程、新手咨询师的咨询过程和有经验咨询师的咨询过程以及新手咨询师的咨询过程和有经验咨询师的闲聊过程中的工作同盟、咨询效果和动作同步的差异以及三者之间的关系。通过相关、独立样本 t 检验、配对样本 t 检验、回归分析等统计检验方法, 结果表明: (1) 咨询组在工作同盟总分上和目标维度上显著高于闲聊组; (2) 有经验咨询组在工作同盟总分上和任务维度上显著高于新手咨询组; (3) 新手咨询组在工作同盟目标维度上显著高于有经验闲聊组; (4) 有经验咨询组在 15-35 分钟咨询师带领条件的动作同步上显著低于新手咨询组; (5) 新手咨询组在 0-15 分钟咨询师带领条件的动作同步上显著高于有经验闲聊组; (6) 15-35 分钟咨询师带领条件的动作同步对咨询效果的症状维度得分变化具有正向预测作用; (7) 0-15 分钟咨询师带领条件的动作同步对工作同盟的目标维度具有正向预测作用。研究证实了动作同步与工作同盟之间的相关性, 发现了高水平动作同步对更好的工作同盟以及症状恶化的预测作用, 为更好地理解心理咨询过程、指导心理咨询实践做出了贡献。

The association between behavioral synchronization and working alliance during the first psychological counselling session: A study based on Motion Energy Analysis

Xiaoyan Dai¹, Ya Zhang²

1 Department of Applied Psychology, East China Normal University, Shanghai

2 Department of Applied Psychology, East China Normal University, Shanghai

Abstract: Behavioral synchronization is an emerging research field in which video-based motion energy analysis provides an efficient and objective tool for measuring behavioral synchrony in the process of psychological counselling. This study uses motion energy analysis as analyzing tools and Working Alliance Inventory-Short Form Revised (WAI-SR) and Clinical Outcomes in Routine Evaluation-Outcome Measure (CORE-OM) as questionnaires. This study aims to find out the differences in working alliance, therapeutic outcome and behavioral synchrony between psychological counselling process and chatting process, novice psychological counselling process and experienced psychological counselling process, and novice counselling process and experienced chatting process, as well as the relationships between the three variables. Using statistical testing methods like correlation test, independent-samples T test, dependent-samples T test and regression analysis, this study finds: (1) Counselling group ranks higher in the total score of working alliance and the goal dimension of working alliance than chatting group; (2) Experienced counselling group ranks higher in the total score of working alliance and the task dimension of working alliance than novice counselling group; (3) Novice counselling group ranks higher in the goal dimension of working alliance than experienced chatting group; (4) Experienced counselling group ranks lower in the 15-35 minute therapist-lead synchrony than novice counselling group; (5) Novice counselling group ranks higher in the 0-15 minute therapist-lead synchrony than experienced chatting group; (6) The 15-35 minute therapist-lead synchrony can positively predict the change of scores in the symptom dimension of therapeutic outcome; (7) The 0-15 minute therapist-lead synchrony can positively predict the goal dimension of working alliance. This study confirms the association between behavioral synchrony and working alliance. It also finds that higher levels of behavioral synchrony can predict better working alliance and the deterioration of symptoms. Therefore, this study makes contributions to the better understanding of psychological counselling process and offers guidance to psychological counselling practice.

Keywords: behavioral synchrony, motion energy analysis, working alliance, therapeutic outcome

初中生体育锻炼与主观幸福感的关系：一个链式中介模型

姚淑君 马起率 刘超 郭可雷

淮北师范大学体育学院, 1535831147@qq.com

摘要 目的：探讨体育锻炼、领悟社会支持、身体锻炼自我效能感和主观幸福感之间的关系。方法：采用《体育锻炼等级量表》《领悟社会支持量表》《身体锻炼自我效能感量表》《主观幸福感量表》对初中生 1510 人进行团体心理测量。结果：1) 体育锻炼与领悟社会支持、身体锻炼自我效能感及主观幸福感之间存在正相关；2) 领悟社会支持和身体锻炼自我效能感在体育锻炼和主观幸福感之间起显著的中介作用。结论：1) 体育锻炼显著正向预测初中生主观幸福感；2) 体育锻炼通过领悟社会支持和身体锻炼自我效能感的中介作用间接影响初中生主观幸福感，含三条路径：领悟社会支持、身体锻炼自我效能感的单独中介作用及领悟社会支持-身体锻炼自我效能感的链式中介作用。

基于群组视角观点采择的认知机制 ——来自视觉观点采择范式的证据

何晓燕^{1,2} 杨滢巧¹ 杨丰伊¹ 林静¹ 尹军^{1*}

¹ 宁波大学心理学系暨研究所, 宁波大学群体行为与社会心理服务研究中心, 宁波, 315211

² 北京师范大学心理学部, 北京, 100088

摘要 本研究采用视觉观点采择范式, 通过 5 项实验探讨了人们是否及如何在群组视角进行观点采择。结果发现: (1) 只有在目标对象为虚拟人物时, 在自我视角信息与群组视角信息不一致条件下, 被试对自我视角信息判断速度显著慢于一致条件, 即表现出自动采择群组视角的观点过程; (2) 仅当群组被视为一个有机的实体(高群组实体性)时, 人们才自动采择群组视角的观点, 且对群组某个成员的观点采择不受群组实体性的影响。以上结果表明, 人们可基于群组视角自动采择其观点。研究所揭示的结果不仅有利于理解人们采择群组视角信息的加工机制, 且对深入理解个体心智和群组心智的关系具有重要的启发意义。

² Department of Psychology, Beijing Normal University, Beijing, 100088

Abstract: Since the surroundings seen by others during social interaction is usually different from what the self sees, it is important to understand the information from the perspective of others. A large number of studies had shown that since the early childhood, people already have the ability to taking other's perspective, and the process of perspective taking is suggested to be automatic. However, in previous studies, an isolated person was widely emphasized as the computed entity in visual perspective taking, and the groups are everywhere, hence people also need to engage in social interactions with groups. When interacting with different groups, it is also necessary to be able to perceive the problem from the group's perspective. Nevertheless, few studies have explored whether and how people taking group's perspective from a group level. In view of the fact that either a group or an individual can be seen as a cognitive unit, and taking perspective from the individual's level can be automatic, this study hypothesized that people can automatically take group's perspective. Based on the adapted version of a visual perspective-taking task, this study explored whether people would automatically take group's perspective from the group level, through five experiments. The main results are as follows: (1) People only automatically took group's perspective when the computed entity consists of social individuals, and it cannot be explained by the physical orientation of head. (2) Group entitativity influenced the automatic computation of taking group's perspective, and only when the group was perceived as an unified entity (i.e., high group entitativity), people automatically take group's perspective. (3) Taking group member's perspective at the individual level was not modulated by the group entitativity. Hence, what we can conclude is that people can automatically take group's perspective at the group level. This finding is not only helpful for understanding the processing mechanism about how people compute what the group sees, but also have an important role in understanding the relationship between individual's mind and group's mind.

Keywords: visual perspective taking, groups, entitativity, automatic process

特质焦虑与无法容忍不确定性的神经相关分离： 来自静息状态脑电图的证据

杨诗言¹ 雷旭¹（通讯作者）

¹ 西南大学心理学部，重庆，400715

摘要 目的:以特质焦虑(TA)和无法容忍不确定性(IU)为中心的框架对理解焦虑有重要意义。我们进行了两个实验来探讨 TA 和 IU 的行为-神经科学联系。方法:首先收集大样本受试者的状态-特质焦虑量表-特制版(STAI-T)、无法容忍不确定性量表-简版(IUS-12)和贝克焦虑量表(BAI)得分,并探讨它们之间的关系。随后,我们选择高 TA (HTA)个体、高 IU (HIU)个体和对照组(CG)来比较他们静息状态的脑电图微状态特征。结果:在行为上,TA 和 IU 均与 BAI 显著相关,但它们彼此相关关系不显著。此外,HTA 中微状态类 B 的出现率和贡献率以及微状态 B 类与 C 类之间的转移概率都小于 CG; HIU 中的微状态类 A 的贡献率、微状态类 A 的持续时间和微状态 A 类与 C 类转换概率均高于 CG。结论:TA 和 IU 是两个与焦虑相关但相对独立的特征,HTA 的神经基础主要表现为视觉网络和 aDMN,而 HIU 的神经基础主要表现在语言网络和 aDMN。意义:在神经水平分离 TA 和 IU 的初步努力可以为更好地理解焦虑的发展提供证据。

Neural Correlation Dissociation of Trait Anxiety and Intolerance of Uncertainty: Insights from Resting-state EEG

Shiyan Yang¹, Lei Xu¹

¹ Southwest University Faculty of Psychology, Chong qing, 400715

Abstract: Objective: The framework centered on trait anxiety (TA) and intolerance of uncertainty (IU) is of significance for understanding anxiety. We conducted two experiments to explore the behavior-neuroscience association of TA and IU. Methods: We first collected the TA scores, IU scores, and Beck Anxiety Inventory (BAI) scores of a large sample of subjects and explored their relationships. Subsequently, we selected high TA (HTA) individuals, high IU (HIU) individuals, and a control group (CG) to compare their resting-state EEG microstates characteristics. Results: Behaviorally, both TA and IU were significantly correlated with BAI, but they were relatively separate. Furthermore, the occurrence and contribution of class B and the transition probability between class B and class C in HTA were smaller than in CG; the contribution and duration of class A and the transition probability between class A and class C in HIU were higher than in CG. Conclusions: TA and IU are two anxiety-related but relatively independent traits, which are mainly reflected in the visual network and aDMN as the neural underpinning of HTA, while the neural basis of HIU is mainly manifested in the language network and aDMN. Significance: Initial efforts to dissociate TA and IU at the neural level could provide evidence for a better understanding of the development of anxiety.

基于题组的计算机化多阶段自适应测验

徐玲玲¹ 张敏强¹（通讯作者）

¹ 华南师范大学心理学院，广州，510631

摘要 许多教育测试程序要求测验在统计约束上保持平行并满足一定的内容属性。计算机化多阶段自适应测验(MST)作为纸笔测验和计算机化自适应测验(CAT)的“折中”,基于自动组卷算法(ATA)可以组装平行的测验形式。MST因其自身的优势受到许多大规模测验的青睐,如美国注册会计师考试(CPA)、美国研究生入学考试中(GRE)等。MST同CAT一致,也依赖于模型假设。但在心理或教育测验中,经常出现局部项目依赖性(LID)。若直接使用标准项目反应理论(IRT)模型去拟合存在局部项目依赖性的反应数据会导

致诸多问题。因此, 本文将题组反应模型 (TRM) 和双因子模型 (BM) 应用到题组测验的 MST 中, 通过模拟研究和应用研究探究 TRM 和 BM 在 MST 中的准确性和影响因素, 并与忽略题组效应的标准 IRT 模型进行对比。本研究的主要思路是: 先假设被试在 MST 施测过程中的作答受 LID 影响, 后续采用考虑/不考虑 LID 的 IRT 模型对作答数据进行分析, 最后再根据参数估计值与“真值”之间的差异来呈现和探讨 LID 对测验结果所带来的影响。具体而言: 采用 TRM 作为真实模型生成作答数据, 分别采用标准 IRT 模型、TRM、BM 分析被试的作答数据。为简化研究且不失一般性, 假设每个模块中的 LID 方差大小相同, 考察 LID 的大小为小、中、大三种情况。本研究将两类自动组卷算法的代表性算法用于组卷平行面板, 即: 标准化加权绝对离差启发法 (NWADH)、混合整数编程 (MIP)。本研究采用三个常用的路由规则将被试路由到下一阶段的合适的模块, 即: 最大 Fisher 信息量 (MFI) 法、人数平均分配 (DPI) 法、临近 (proximity) 法。通过上述实验设计以期探究 MST 在不同条件下受 LID 的影响情况。研究的评价指标包括组卷质量和参数返真性两方面。组卷质量方面, 采用非统计约束违背率 ($\bar{v}$) 作为面板非统计约束管理的评价指标; 采用均方差 (MSD) 作为面板平行性的评价指标。均方误差 (MSE)、偏差 (Bias) 作为被试能力参数返真性的评价指标。结果表明: (1) 采用 MIP 进行平行面板的组卷效果优于 NWADH; (2) 采用 TRM、BM 分析被试的作答数据相较于标准 IRT 模型更能处理 LID 对 MST 的影响; (3) MST 中, 路由规则为 proximity 法的被试能力参数返真性结果优于 DPI 法、MFI 法; (4) 随着 LID 的增大, 被试能力参数返真性变得越差。综上所述, 使用 TRM、BM 分析数据可以在一定程度上缓解 LID 对 MST 的危害。本研究对于提高测验分析结果的准确性和科学性具有一定的指导意义。

Testlet-Based Multistage Testing

Xu Lingling¹, Zhang Minqiang¹ (Corresponding Author)

¹ School of Psychology, South China Normal University, Guangzhou, 510631

Abstract: Many educational testing programs require that different test forms should be parallel in terms of their statistical and content-related properties. As module level adaptive testing designs, Multistage testing (MST) can assemble parallel test forms based on the automated test assembly (ATA) algorithms. Due to its advantages, MST is receiving increasingly popularity and is used by several major testing programs (e.g., CPA and GRE) as an alternative adaptive test design. Consistent with CAT, MST also relies on item response theory (IRT) model assumptions. Whereas local item dependence (LID) usually exists in several psychological or educational tests. Failure to meet local independence assumption could produce many problems. Thus, the purpose of this study is that using testlet response model (TRM) and bifactor model (BM) to relieve the perniciousness of LID in testlet-based MST. A simulation study based on simulated-data was conducted to investigate the performance of the testlet-based MST under different conditions, with manipulation of the four factors: the magnitudes of LID (low, moderate, and high), the ATA (normalized weighted absolute deviation heuristic [NWADH] and mixed-integer programming [MIP]), the routing rule (approximate maximum information [AMI], defined population intervals [DPI], and proximity method) and the parameter estimation model (two-parameter logistic model [2PLM], TRM, and BM). In addition, a simulation study based on real-data was conducted to discuss the practicality of TRM and BM in testlet-based MST with English assessment data. Both the simulation-data and real-data analysis were compared with the testlet-based MST when analyzing the response data based on the 2PLM, which ignored the testlet effects. In this study, some evaluation criteria were calculated to evaluate the test assembly quality and parameter recovery. Specifically, constraint management and panels parallelism were used to check the test assembly quality. Besides, bias, mean squared error (MSE), and correlation between truth and estimates were used to test the recovery of person parameters. Results indicated that (1) the MIP had a better performance than the NWADH in the non-statistical constraints for testlet-based MST; (2) the overall performance of using TRM and BM to analyze the response data of test takers were better than that of 2PLM; (3) the measurement accuracy of using the proximity method as routing rule in MST was better than that of DPI method and AMI method; (4) as the increase of the magnitudes of LID, the recovery of person

parameters is worse. In conclusion, using TRM and BM can relieve a part of perniciousness of LID in testlet-based MST. This study has some significance for improving the accuracy of test results.

摘要 背景:家庭社会经济地位 (socioeconomic status, SES) 是由个体或父母的收入及受教育水平等社会因素的综合,是影响个体认知神经发展的重要环境因素。相较于来自高 SES 家庭的个体,来自低 SES 家庭的个体会面临更多的物质与非物质资源的不确定性因素,比如食物匮乏、父母教养质量差、家庭混乱等。而作为突发的公共卫生事件,新型冠状病毒 (COVID-19) 具有快速传播及一定的死亡率等特点。面对此次疫情,群众不可避免地会产生威胁感与不确定性。因此,本研究旨在探索家庭社会经济地位如何影响个体面对疫情时的信心水平。**方法** 本研究的数据采集于两个不同的时间点。首先在疫情爆发之前 (2019 年 9 月 17 日-2020 年 1 月 11 日), 606 名 (年龄, 19.36 ± 0.82) 大一新生接受结构像扫描,同时收集其人口统计学信息,包括 SES。其次在中国疫情爆发的高峰期 (2020 年 2 月 1 日-2020 年 2 月 28 日), 对同一批被试进行疫情信心的追踪调查。**结果** 调节效应分析发现,家庭社会经济地位和性别的交互作用可以显著预测个体的疫情信心水平。具体而言,在男性群体中,个体的疫情信心程度会随着 SES 的提升而提升;而在女性群体中,SES 无法显著预测疫情信心。此外,基于体素的形态学分析 (voxel-based morphometry, VBM) 技术发现,SES 水平更高的个体,其皮上区域的灰质体积越低,包括左侧额中回、左侧楔叶、双侧顶叶。而皮下脑区却呈现出更高的灰质体积,包括左侧小脑、右侧颞中回、左侧旁海马。更重要的是,进一步的调节效应分析发现:和行为结果类似,与 SES 相关的大脑形态学特征和性别之间的交互作用会显著预测疫情信心。即,左侧旁海马的灰质体积会提升男性的信心水平,但是这一关系在女性中并不显著。值得注意的是,其他与 SES 相关的大脑灰质体积与性别之间无显著的调节作用。**结论** 本研究揭示了家庭社会经济地位在预测个体面对疫情时信心水平的性别差异,及其潜在神经基础。在疫情防控过程中,需要针对不同人群的心理健康进行干预,尤其是来自于低 SES 家庭的个体和女性,以增强其应对疫情的信心水平。

Technology, Chengdu, China

Abstract: Socioeconomic status (SES) has a large impact on the way individuals respond to the environmental threats. However, less is known about how SES links to personal confidence in confronting COVID-19 and the underlying neural mechanisms. To this end, we assessed self-confidence in coping with this pandemic on 606 participants during its peak in China (Feb. 21, 2020 – Feb. 28, 2020), who underwent magnetic resonance imaging (MRI) scanning before the outbreak (Sept. 17, 2019 – Jan. 11, 2020). We found that males, rather than females, showed heightened confidence levels as SES increased. Furthermore, a moderation analysis showed a similar interaction effect: greater gray matter volumes in parahippocampus predicted higher confidence for males but not for females. Overall, current

study revealed the deficient psychological resources for specific population (i.e., women) to cope with pandemic.

摘要 我们生活在一个充满矛盾的世界里, 每天需要面对各种各样的矛盾。文化心理学研究发现, 东方人更能容忍矛盾的存在, 并通过中庸、妥协等方式整合矛盾的方面。在自我领域, 东方人的自我概念中包含了更多矛盾的内容(如既外向又内向)。目前已有大量行为研究支持了自我矛盾现象的存在, 并揭示了其对心理适应等重要变量的影响, 但对于其神经机制的研究仍然十分有限。本文利用脑电技术, 结合自主开发的自我参照范式, 探索自我矛盾加工是否具有独特的神经表征。基于线性混合模型的事件相关电位分析显示, 自我矛盾加工的效应主要体现在晚成分(N2、N450、P3)上, 而中线脑区的 N450 在自我矛盾加工中的激活程度与辩证自我量表得分呈显著正相关。本研究首次揭示了自我矛盾加工在脑电完成成分上的独特表征, 并进一步印证了皮质中线在自我矛盾加工中的作用。

⁴ Laboratory of Brain and Intelligence, Tsinghua University

Abstract: We live in a world full of contradictions, and dealing with conflicting information is a task we face every day. Oriental people are more tolerant of contradictions and integrate the contradictory aspects by means of middle ground and compromise. In the self domain, the Oriental self-concept contains more contradictory elements (e.g., both extroverted and introverted). A large body of behavioral research has supported the existence of the self-ambivalence phenomenon and revealed its influence on important variables such as psychological adaptation, but research on its neural mechanisms is still limited. This paper explores whether self-ambivalence processing has a unique neural representation using EEG techniques in conjunction with an independently developed self reference paradigm. Analysis of event-related potentials based on a linear mixed model showed that the effects of self-ambivalence processing were mainly on the late components (N2, N450, P3), and the activation of N450 in the midline brain regions in self-ambivalence processing was significantly and positively correlated with dialectical self scale scores. The present study reveals for the first time a unique representation of self-ambivalence processing on the EEG completion score and further corroborates the role of the cortical midline in self-ambivalence.

Keywords: self-ambivalence, Self-reference effect, Event-related potential, late components, DSS

金钱拟人化对个体捐赠意愿的影响

于文环¹ 何琳¹ Thomas Freudenreich¹ 刘涛^{1,2}

1 浙江大学市场营销系, 杭州, 310058, liu_tao@zju.edu.cn

2 浙江大学市场营销系, 杭州, 310058

摘要 目的: 本研究旨在探讨金钱拟人化如何影响个人捐赠意愿的问题, 特别是捐赠受益人类型对于金钱

拟人化捐赠的具体影响。方法：实验 1 采用 2（货币拟人化：拟人化 vs. 非拟人化）×2（捐赠受益人：儿童 vs. 成人）的组间设计，调查了金钱拟人化和同理心对慈善捐赠的影响、机制及受益者类型的调节作用。被试在观看有（或无）拟人化特征的金钱图片后，观看一则儿童（或成人）听障患者的捐赠广告并表明其捐赠意愿。此外，实验 1 还测量了被试对金钱的感知温暖和能力以及被试的共情水平。实验 2 旨在探讨受试者的经验类型（残疾或疾病）对金钱拟人化效应的影响。实验 2 使用单因素组间设计（金钱拟人化组 vs. 非金钱拟人化组）。操纵程序与实验 1 完全相同，之后所有被试阅读一则帮助患尘肺病的成年人的捐赠广告并表明自己的捐赠意愿。实验 2 还测量了被试对捐赠行为的感知影响力。实验 3 使用功能性近红外光谱(fNIRS)证实了实验 1 的结果，并进一步区分金钱和拟人化二者各自的作用。采用了 2（拟人化：存在 vs. 不存在）×2（刺激类型：金钱 vs. 产品）的组间设计。在观看不同的刺激图片后，被试阅读儿童捐赠材料并回答与实验 1 相同的捐赠问题。在实验 3 全程，被试均佩戴 fNIRS 设备以检测其额下回和眶额叶皮层的激活情况。结果：实验 1 的结果发现，金钱拟人化组的被试捐赠意愿显著高于非金钱拟人化组，并且该过程由幻想共情中介。此外，这种金钱拟人化效应在受益人是儿童时更显著。实验 2 的结果发现，当受益人是患病的成年人时，金钱拟人化并没有增强人们的同情心和捐赠意愿。实验 2 还证实感知影响力对成年受益人的捐赠意愿的显著正向影响。实验 3 的结果表明，在金钱拟人化的条件下，左侧额下回的激活显著高于其他三组，说明只有金钱和拟人化结合才能显著增强共情。结论：本研究表明，金钱拟人化促进了个人的捐赠意愿，这是由幻想的移情反应中介的。捐赠受益人（儿童与成人）会调节这种影响。将行为测量与 fNIRS 相结合，本研究丰富了货币和拟人化的相关文献及研究方法。研究结果对慈善事业有实际意义。

Donation Beneficiary Matters: Effect of Money Anthropomorphism on Donation Intention

Wenhuan Yu¹, Lin He¹, Thomas Freudenreich¹, Tao Liu^{1,2}

¹ Department of Marketing, School of Management, Zhejiang University

² Zhejiang University, Hangzhou 310058, China

Abstract: Objects: This research aims to explore how money anthropomorphism affects donate intention, especially the specific influence of the type of donation beneficiaries on the money anthropomorphism donations. Method: Study 1 adopts a 2 (currency personification: personification vs. non-personification) × 2 (donation beneficiaries: children vs. adults) between-subject design of to investigate the influence and mechanism of money anthropomorphism and empathy on donate intention, and the moderating role of beneficiary types in this process. Participants saw a donation advertisement for hearing-impaired children (or adults) after watching pictures of money with (or without) anthropomorphic features and indicated their donate intention. In addition, Study 1 also measured perceived warmth and competence to money and the subjects' empathy. Study 2 aims to explore the influence of the beneficiary's experience type (disability or illness) on the money anthropomorphism effect. Study 2 used a one-factor between-subject design (money anthropomorphism group vs. non-money anthropomorphism group). The manipulation was the same as Study 1. Then, all subjects read a donation advertisement which aimed to help adults suffering from pneumoconiosis and indicated their donate intention. Study 2 also measured participants' perceived influence on the donation. Study 3 used functional near-infrared spectroscopy (fNIRS) to confirm the results of Study 1, and further distinguished the respective roles of money and anthropomorphism. A 2 (anthropomorphism: existence vs. non-existence) × 2 (stimulus type: money vs. product) between-subject design was adopted. After watching different stimulus pictures, the participants read the donated materials aimed to help children and answered the same donation questions as in Study 1. Throughout Study 3, the participants wore the fNIRS device to detect the activation of their inferior frontal gyrus and orbitofrontal cortex. Results: The results of Study 1 found that donate intention in the money anthropomorphism group was significantly higher than that in the non-money anthropomorphism group, and the process was mediated by fantasy empathy. In addition, the money anthropomorphism effect is more pronounced when the beneficiary is a child. The results of Study 2 showed that when the beneficiary is an adult with

illness, the money anthropomorphism did not enhance empathy and donate intention significantly. Study 2 also confirmed the significant positive impact of perceived impact on the donation intention for adult beneficiaries. The results of Study 3 show that under the condition of money anthropomorphism, the activation in the left inferior frontal gyrus is significantly higher than the other three groups, indicating that only the combination of money and anthropomorphism can significantly enhance empathy. Conclusion: This research shows that the money anthropomorphism promotes donate intention, which is mediated by the fantasy empathy. Donation beneficiaries (children vs. adults) can moderate this impact. Combining behavioral measurement with fNIRS, this research enriches the literature and research methods related to currency and personification. Findings of this research have great practical implications for charity.

第二语言词汇习得年龄效应及其与母语词汇习得年龄的关系

王珏 陈宝国^{1*}

1 北京师范大学心理学部, 北京, 100875

摘要 词汇的习得年龄(age of acquisition, AoA)效应是指早期习得的词汇比晚期习得的词汇加工速度更快, 正确率更高。该效应在第一语言(first language, 一语, L1)上已经得到了广泛地验证, 但在第二语言(second language, 二语, L2)当中的研究较少, L2AoA 效应是否存在及其与 L1AoA 是什么关系尚不清楚。本研究旨在考察中国英语学习者, 英语词汇习得的年龄效应及其与汉语翻译对等词习得年龄的关系。实验 1 和实验 2 正交地操纵了 L2AoA (早和晚) 和 L1AoA (早和晚), 均采用词汇判断任务, 记录被试的反应时和正确率。实验 1 和 2 的不同之处在于填充词: 实验 1 的填充词为正字法不合法、不能发音的非词, 被试仅通过浅层的正字法加工就能做出判断; 实验 2 的填充词为正字法合法、能发音的非词, 被试需要较多的语义加工才能做出真假词的判断, 填充词的变换能让我们考察在语义和正字法加工阶段下的 L2AoA 效应。实验 1 发现存在早习得词语正确率高于晚习得词语的数据趋势。实验 2 发现早习得词语的反应时短于、正确率高于晚习得词语。在两个实验中, L1AoA 的主效应以及二者的交互作用均不显著。这表明 L2AoA 独立于 L1AoA 影响二语词汇的加工, 该效应不仅来源于正字法加工阶段, 还来源于语义加工阶段。但是根据 Dirix 和 Duyck (2017), 实验 1 和 2 没有发现 L1AoA 对 L2AoA 效应的影响可能是因为实验材料的词长较短(约 5.7 个字母)。为此, 实验 3 采用大样本的词语材料结合词汇判断任务, 在包含更多的实验材料和变量的情况下考察 L2 AoA 效应。实验结果发现, L2AoA 的主效应显著, 更重要的是 L2AoA, L1AoA 和词长的三重交互作用显著: 在长词上(至少 10 个字母), L2AoA 的效应仅在 L1AoA 较早时显著, 即只有当汉语翻译对等词是早习得时, 英语词汇的 AoA 才会影响被试的词汇判断; 在短词上, L2AoA 的显著效应不受到 L1AoA 的影响。综合三个实验的结果, 第二语言的词汇习得年龄效应影响词形和语义加工阶段。当二语词汇为长词时, 该效应会受到母语词汇习得年龄的影响, 在语义加工水平上。语义假设和任意映射假设的观点均不能单独解释本研究的结果, 我们认为在解释二语词汇习得年龄效应时, 不仅要综合这两种假设, 还需要考虑二语词汇通达和表征的特征。

关键词 习得年龄, 第二语言, 词汇加工, 词长

The second language age of acquisition effect and its relationship with the first language age of acquisition

Abstract: The age of acquisition (AoA) effect refers to that words acquired earlier are processed more quickly and correctly than words acquired later, and this AoA effect in the first language (L1) has been widely accepted. However, the role of AoA in the second language (L2) and its relationship with L1 AoA remains controversial. In the present study, we aimed to examine the AoA effect of English words and its relationship with the AoA of Chinese equivalent words among Chinese English learners. In Experiments 1 and 2, L2 AoA and L1 AoA were manipulated, and a lexical decision task was adopted. The filler words in the lexical decision task were orthographically illegal in Experiment 1, where more word form processing was required. However, legal fillers were chosen in Experiment 2, where more

semantic activation was needed to make lexical decision. In Experiment 1, there was a tendency that early acquired L2 words were processed more accurately than late acquired L2 words. In Experiment 2, early acquired L2 words were identified faster and more accurately than late acquired L2 words. In both experiments, the L2 AoA effect was not influenced by L1 AoA. These results showed that the L2 AoA effect can be independently observed at the semantic and orthographic representational levels. However, according to the evidence of Dirix and Duyck (2017), the lack of influence of L1 AoA on the L2 AoA effect might be caused by the short word length (about 5.7 letters). Consequently, in Experiment 3 we adopted a mega study and lexical decision task, including a large amount of stimuli and multiple variables. We found a significant main effect of L2 AoA and a marginally significant main effect of L1 AoA. More importantly, a significant three-way interaction of L2 AoA, L1 AoA, and word length was obtained, i.e., for long words, the L2 AoA effect was significant only when L1 AoA was early, that is, the AoA of English words affected the word judgment only when Chinese equivalent words were acquired earlier; however, for short words, the significant L2 AoA effect was not influenced by L1 AoA. Taken together, L2 AoA affects both word form and semantic processing levels. L2 AoA effect was influenced by L1 AoA when the word length was long at the semantic processing level. Regarding the mechanism of L2 AoA effect, the results indicate an integration of Semantic and Arbitrary Mapping Hypotheses, as well as the characteristics of L2 lexical representation and access.

Keywords: age of acquisition, second language, word processing, word length

神经功能连接组编码新型冠状病毒引发的肺炎疫情中的创伤后应激压力障碍转化风险

摘要 新型冠状病毒引发的肺炎大流行病在袭击了全球, 并给全球人类造成了空前的损失和压力。而另一方面, 新冠疫情大流行病造成的精神健康障碍, 尤其是创伤后应激压力障碍, 正日益受到更多的关注。因此, 如果提前预测暴露在新冠疫情这场应激事件中个体产生创伤后应激压力障碍的高风险是目前亟待解决的核心问题。在新冠疫情爆发前(2019年9月-2020年1月), 本研究扫描了1211名健康成年人的静息态神经影像, 并在中国疫情的高峰期(2020年2月21-28日)对这些被试的创伤后应激压力障碍症状进行了后测。因此, 本研究基于伪前瞻性队列设计, 尝试利用疫情前的神经功能连接组特征预测个体在疫情中创伤后应激压力障碍产生转化的风险。本研究流行病学调查的结果发现, 5.60%的被试满足创伤后应激压力障碍的临床标准, 而12.00%的被试被发现存在较严重的创伤后应激压力障碍症状。基于深度学习模型, 本研究发现, 被试疫情前的神经功能连接组状态能够准确地预测性识别被试是否会在疫情中转化创伤后应激压力障碍(准确率=76.19%; 敏感性=71.43%; 特异性=80.95%)。本研究进一步的构建了基于神经连接组的预测模型, 结果发现, 疫情前的神经连接组状态还能够同时预测创伤后应激压力障碍患者症状的严重程度。因此, 本研究首先证实了新冠疫情的确造成了被试的创伤后应激压力障碍的转化, 并且第一次揭示了, 我们可以通过个体的神经连接组预备状态预测个体在新冠疫情中转化创伤后应激压力障碍的风险。

伴童年创伤抑郁症患者中枢执行系统损害 与氢质子磁共振波谱研究苗

苗浩飞^{1,2} 贾艳滨²

1 暨南大学附属第一医院（广州华侨医院），广州，510630

2 北京体育大学心理学院，北京，100091

摘要 目的：童年创伤是抑郁症的重要风险因子。伴与不伴童年创伤的抑郁症发病机制可能有所不同。童年创伤和抑郁症独立造成的认知损害交集于工作记忆，而工作记忆的核心为中枢执行系统。中枢执行系统损害与额叶、基底节等脑区异常密切相关。因此，本研究比较伴与不伴童年创伤抑郁症患者中枢执行系统，检测前额叶白质、前扣带回皮质、壳核和小脑的生化代谢指标，探索童年创伤对抑郁症患者中枢执行系统功能和脑生化代谢的影响，为揭示抑郁症发病机制提供新证据。方法：根据 DSM-5 诊断标准，共入组 107 例未经治疗的 18-50 岁抑郁症患者，招募 55 名不伴童年创伤的健康对照（HC）。研究的第一部分入组 62 例抑郁症患者，根据童年创伤问卷，分为 32 例伴童年创伤组（CT）、30 例不伴童年创伤组（NCT），招募 30 名 HC，采用 Stroop 范式、2-back 范式、任务转换范式检测中枢执行系统的抑制、刷新和转换功能。第二部分入组 CT 组 37 例，NCT 组 35 例，HC 组 30 名，通过氢质子磁共振波谱（Hydrogen Proton Magnetic Resonance Spectroscopy, MRS）检测前额叶白质、前扣带回皮质、壳核和小脑的 N-乙酰天门冬氨酸（NAA），胆碱（Cho），肌酸（Cr），比较组间的 NAA/Cr 和 Cho/Cr 比值。第一、二部分中，有 11 例 CT 组患者共同完成了中枢执行系统与 MRS 检测，以分析二者的相关。结果：CT 组抑制正确率低于 HC 组（ $p=0.035$ ）；CT 组刷新正确率低于 NCT 组与 HC 组（ $p=0.028$, $p<0.001$ ）。CT 组与 NCT 差异在于左侧前扣带回皮质的 Cho/Cr：NCT 组在左侧前扣带回皮质的 Cho/Cr 高于 CT 组与 HC 组，而 CT 组高于 HC 组（ $p=0.044$, $p<0.001$, $p=0.014$ ）。病例组（NCT 和 CT 组）与 HC 组差异在于双侧 ACC、双侧壳核、双侧小脑的 NAA/Cr 和 Cho/Cr（均 $p<0.05$ ）。刷新反应时与左侧 ACC、左侧小脑的 NAA/Cr 呈显著负相关（ $r=-0.779$; $r=-0.707$ ）。结论：伴童年创伤抑郁症患者的中枢执行系统损害更为严重，表现在抑制和刷新功能。童年创伤可能抑制了抑郁症患者左侧前扣带回皮质神经元的膜磷脂代谢而加重抑郁。前扣带回皮质-壳核-小脑环路的脑代谢异常与抑郁症发病和中枢执行系统损害密切相关。

Central Executive System impairing and Hydrogen Proton Magnetic Resonance Spectroscopy in Major Depressive Disorder patients with childhood trauma

Miao Haoifei¹, Jia Yanbin², Chi Lizhong¹

¹Beijing Sport University, Beijing, 100091, chilzh3804@163.com

²The First Affiliated Hospital of Jinan University, Guangzhou, 510630

Abstract: Objective: Childhood trauma (CT) is closely related to the onset of Major Depressive Disorder (MDD). In recent years, studies have found that patients with MDD have extensive cognitive impairment. Working memory impairment is an important clinical feature. It is closely related to abnormal structure and function of frontal lobe, basal ganglia and other brain regions. However, the effect of childhood trauma on the working memory system and brain metabolism of MDD patients is still unclear. Therefore, this study analyzed and compared the Central Executive System (CES) function in MDD patients with and without childhood trauma at prefrontal white matter (PWM), anterior cingulate cortex (ACC), putamen and cerebellum to explore the effects of childhood trauma on the function of CES and brain biochemical metabolism in patients with MDD. Methods: According to the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition: (DSM-5), 107 untreated MDD patients and 55 healthy controls were recruited. In the first part, 62 MDD patients were enrolled and screened for childhood trauma according to Childhood Trauma Questionnaire (CTQ), and were eventually divided into 32 patients in the group with Childhood Trauma (CT group) and 30 patients in the group without Childhood Trauma (NCT group). During the same period, 30

healthy controls without childhood trauma were recruited as healthy control group (HC group). Stroop paradigm, 2-back paradigm and task-switching paradigm were used to evaluate the CES functions, including inhibitory function, refresh function and switching function. In the second part, 72 MDD patients were included, including 37 in the CT group, 35 in the NCT group, and 30 in the HC group. Detection N-acetylaspartate(NAA), choline (Choline, Cho), creatine (Cr) of PWM, ACC, putamen and cerebellum by Hydrogen Proton Magnetic Resonance Spectroscopy (¹H-MRS) technology, calculate and compare the NAA/Cr and Cho/Cr ratios among the three groups. Last, 11 patients with childhood trauma who completed the CES test and ¹H-MRS were analyzed to explore the correlation between CES and brain biochemical metabolic indexes. Results: The incidence of childhood trauma in MDD patients was 54.2%, 45.2% in males and 57.9% in females. Emotional neglect was the most common childhood trauma (41.1%). For CES, the inhibition accuracy of CT group was 91.58%, lower than that of HC group (94.54%)($p=0.035$). The updating accuracy of CT group was 62.86%, which was lower than that of NCT group (73.06%) and HC group (80.78%) ($p=0.028$, $p<0.001$). There were no significant differences among the other groups. In the aspect of brain metabolism, the differences between the three groups were concentrated in ACC, putamen and cerebellum. The difference between the CT and the NCT group was reflected in ACC. Notable results are the NAA/Cr of the CT and the NCT group were both lower in bilateral ACC than HC group (all $p<0.001$); The Cho/Cr in left ACC of NCT group was higher than CT and HC group, and CT group was higher than HC group ($p=0.044$, $p<0.001$, $p=0.014$). The Cho/Cr of right ACC in CT and NCT groups was higher than HC group ($p=0.042$, $p=0.001$). Third, the NAA/Cr in the CT group and the NCT group were both lower than HC group (all $p<0.05$). Cho/Cr in both CT and NCT groups was higher than HC group (all $p<0.05$). Last, the NAA/Cr in bilateral cerebellum of CT and NCT group was higher than that of HC group (all $p<0.001$); The bilateral cerebellum Cho/Cr in CT and NCT groups was lower than that in HC group (all $p<0.05$). In the CT group, the inhibition accuracy was negatively correlated with the Cho/Cr of left PWM ($r=-0.764$, $p=0.017$); Refreshing response time was negatively correlated with left ACC and left cerebellum NAA/Cr ($r=-0.779$, $p=0.013$; $r=-0.707$, $p=0.033$), significantly negatively correlated with Cho/Cr of left PWM ($r=-0.746$, $p=0.021$). Switching accuracy was negatively correlated with the NAA/Cr ratio in the right putamen ($r=-0.695$, $p=0.038$). Switching response time was significantly positively correlated with the Cho/Cr of right ACC and negatively correlated with the Cho/Cr of left putamen ($r=0.738$, $p=0.023$; $r=-0.733$, $p=0.025$). Conclusion: The detection rate of childhood trauma is higher in the patients with MDD, and the CES impairment of the MDD patients is more serious than that of the patients without childhood trauma, which is manifested in the inhibitory function and refresh function. The abnormal brain metabolism in patients with MDD mainly exists in the anterior cingulate gyrus cortex-putamen-cerebellar circuit. Childhood trauma has a long-lasting and significant impact, causing an abnormal decrease in the membrane choline metabolism of the left anterior cingulate cortex in patients with MDD. Abnormal metabolism of the ACC-putamen-cerebellar circuit plays an important role in the pathogenesis of MDD, and the abnormal metabolism of this circuit is closely related to the impairment of CES.

享乐目标唤起影响食物信息加工的 ERP 研究：基于双系统模型

侯晓旭¹ 胡金生¹

1 辽宁师范大学心理学院, 辽宁, 大连, 116029

摘 要 个体在进食过程中可以获得快感, 满足自身享乐需求。当享乐目标唤起时, 个体往往容易产生冲动进食行为。饮食对人类的生存具有重要意义, 除了满足能量需求, 个体还可以在进食过程中获得快感, 满足自身享乐需求。当享乐目标唤起时, 个体往往容易产生冲动进食行为。以往研究大多探讨肥胖个体对食物信息的认知加工, 而较少从体重正常个体的角度关注享乐目标的唤起对食物信息的认知加工机制。本研究基于双系统模型, 从自动系统的注意偏向和自我调节系统的抑制控制两方面, 探究享乐目标的唤起对食物信息认知加工的影响。研究采用点探测范式、双选择 oddball 任务范式, 结合事件相关电位(ERP)技术, 构建 2(享乐

目标唤起状态：唤起、未唤起)×2(图片类型：高热量食物图片、非食物图片)被试内实验设计，通过两个 ERP 实验考察享乐目标驱动冲动进食行为背后的神经机制。实验一使用点探测范式，具体探究享乐目标唤起对食物信息注意偏向的影响。结果发现，在享乐目标唤起条件下，高热量食物图片比非食物图片诱发了更大的 N1 波幅。实验二使用双选择 oddball 范式，具体探究享乐目标唤起对食物信息抑制控制的影响。结果发现，在享乐目标唤起条件下，高热量食物图片比非食物图片诱发了更大的 P3 波幅。这表明当唤起享乐目标时，个体对高热量食物图片表现出早期注意偏向的增强，且对高热量食物图片存在反应抑制缺陷。本研究从神经层面证明了享乐性进食行为是冲动系统和反应系统共同作用的结果，从享乐性进食行为的角度支持了双系统模型在饮食中的应用。

An ERP study on the impact of hedonistic goal arousal on food information processing: Based on a two-system model

Hou Xiaoxu¹, Hu Jinsheng¹

¹School of Psychology, Liaoning Normal University, Dalian 116029, China

Abstract: Individuals can get pleasure in the process of eating to meet their enjoyment needs. When the hedonistic goal is aroused, individuals tend to have impulsive eating behavior. Most of the previous studies focused on the cognitive processing of food information in obese individuals, but few focused on the cognitive processing mechanism of food information in hedonistic goal arousal from the perspective of normal weight individuals. Based on a two-system model, this study explored the effect of hedonistic goal arousal on the cognitive processing of food information from two aspects: the attentional bias of the automatic system and the inhibitory control of the self-regulating system. This research used a point-detection task and a two-choice oddball task, combined the technique of event related potential (ERP) to build two 2 (pleasure arousal state goals: Arouse, Not arouse) × 2 (picture type: High calorie food pictures, Non-food pictures) within-subjects design. Two ERP experiments were conducted to investigate the neural mechanisms behind hedonic goal-driven impulsive eating behavior. In experiment 1, the effect of hedonistic goal arousal on attentional bias of food information was explored using point detection paradigm. The results showed that under the hedonistic goal arousal condition, the high-calorie food pictures evoked greater N1 amplitude than the non-food pictures. Experiment 2 used two-choice oddball paradigm to investigate the effect of hedonic goal arousal on inhibitory control of food cues. The results showed that under the hedonistic goal arousal condition, the high-calorie food pictures evoked greater P3 amplitude than the non-food pictures. The results showed that when the hedonistic goal was evoked, the individuals showed an early attentional bias enhanced to the high-calorie food pictures, and had a response inhibition defect to the high-calorie food pictures. This study proves that hedonic eating behavior is the result of the interaction between the impulsive system and the reactive system from the neurologic level, and supports the application of the two-system model in eating behavior from the perspective of hedonic eating behavior.

基于脑功能连接组的健康老年人信任倾向预测

陈毅琦^{1,2} 陶伍海¹ 关青¹ (通讯作者) Frank Krueger^{2,3}

3 乔治梅森大学系统生物学学院, 美国费尔法克斯, 22032

摘要 信任倾向是一项重要的社会功能。与常规认知功能的老化模式不同, 它并没有呈现出随年龄增长而下降的趋势; 相反地, 随着年龄的增长, 老年人表现出更积极的信任倾向, 并且在特定脑区上也有更强的激活。然而健康老年人在非任务态下的信任倾向脑网络及其与认知和非认知表现之间的关系尚不清楚。本研究收集了 83 名健康老年人 (64.51 ± 6.86) 的静息态功能磁共振影像, 以及他们在一轮信任游戏和神经心理学测试 (如认知测试, 睡眠问卷, 情绪测量) 上的测试成绩。本研究采用 268 节点的脑图谱模板构建个体的全脑功能连接 (Functional connectivity, FC) 矩阵, 基于脑功能连接组的预测建模 (Connectome-based prediction modeling, CPM) 对健康老年人的信任倾向进行预测。CPM 能识别与信任倾向相关的正性和负性脑网络, 其中正性和负性网络分别由与信任倾向存在正相关或负相关的功能连接构成, 同时计算各个网络的总连接强度对信任倾向的预测能力。此外本研究采用模拟损伤的方法来考察特定脑区的功能连接缺失对行为预测的影响。最后为了探讨信任倾向与认知和非认知表现的关系, 本研究使用回归分析分别考察信任倾向及其总网络强度与神经心理学测试成绩的关联。CPM 的结果表明, 只有负性网络能显著预测老年人的信任倾向。而在负性网络中, 顶叶的节点特别是颞顶联合区存在最多的相关连接。模拟损伤分析表明, 顶叶和颞叶的功能连接缺失会显著降低模型的预测力。最后回归分析表明, 信任倾向及其负性网络的总连接强度仅与睡眠质量有相关, 与认知能力测试无关。上诉结果表明, 顶叶和颞叶的功能连接在预测老年人的信任倾向中有着重要的作用, 而这与既往研究中发现的年轻人信任倾向的神经机制存在差异。相较于认知功能, 信任倾向可能与非认知特征特别是睡眠的关系更密切。综上所述, 本研究支持前人的观点, 亲社会行为例如信任倾向及其潜在的神经机制可能具有与一般认知功能不同的老化模式。

Connectome-based prediction of trust propensity in healthy older adults

Yiqi Chen^{1,2}, Wuhai Tao¹, Qing Guan¹, Frank Krueger^{2,3}

2. Department of Psychology, University of Mannheim, Mannheim, Germany

3. School of Systems Biology, George Mason University, Fairfax, VA, USA

Abstract: As a crucial social function, trust propensity does not decrease with age like general cognitive functions; it exhibits a positive bias with age and often enhances neural activity in specific brain areas. However, the task-free network of trust propensity and its relationship with cognitive and non-cognitive characteristics in healthy older adults is still unknown. In this study, we tested 83 healthy older adults (64.51 ± 6.86) who completed a resting-state functional magnetic resonance imaging (rs-fMRI) scan, a one-round trust game, and psychological control measures (e.g., cognitive tests, sleep questionnaire, and emotional measurements). We applied connectome-based prediction modeling (CPM) to predict trust propensity in healthy older adults based on whole-brain functional connectivity (FC), implementing a 268-node. CPM identifies the positive and negative network consisting of the FC that positively/negatively correlates with trust propensity and examines the prediction power of their total strength. Further, we performed a simulated lesion analysis to investigate the contribution on FC of specific lobes. Finally, we conducted a regression analysis separately between trust propensity and its total network strength to other

questionnaires' scores to investigate their relationship with cognitive/non-cognitive characteristics. Our CPM results showed that only the negative network significantly predicted the trust propensity in healthy older adults. The nodes of the parietal lobe, especially the temporal-parietal junction, provided the greatest amount of connectivity in this network. Our lesion analysis indicated that the loss on FC of the parietal and temporal lobes significantly decreased the prediction power. Finally, the regression analysis revealed that trust propensity and the total strength of its negative network were only significantly associated with sleep quality but not with cognitive ability measures. These findings indicated that the prediction of trust propensity in healthy older adults with high contribution of FC in parietal and temporal lobe represented different neural patterns to younger adults as reported in previous studies. Trust as a social function might be independent of cognitive decline and non-cognitive problems —especially sleep quality might more be associated with trust in healthy older adults. In conclusion, our study supports that a prosocial behavior such as trust propensity and its underlying neural mechanism might have a different aging pattern to general cognitive function.

定向线索在孤独症者生命知觉中的作用：基于眼动的研究

¹ 刘佳 胡金生（通讯作者）

1 辽宁师范大学心理学院，大连，116029, hu_jinsheng@126.com

摘 要 生命知觉(perception of animacy)指人们通过各种线索将环境中即使没有生命的客体识别为具有自我意识以及交互行为的生命体的过程。有研究者发现了一种定向优势现象，即当物体朝向与其运动方向保持恒定关系时会显著提高个体的生命知觉，在本研究中我们将这种恒定关系称为定向线索。有关孤独症谱系障碍者(Autism Spectrum Disorder, ASD)的研究表明，他们与典型发展(Typical Development, TD)个体相似，在定向线索条件中时有较好的表现。这一结果与以往研究相矛盾。因此本文在追逐检测范式的刺激材料上稍作更改，通过两个实验来探讨定向线索在 ASD 者生命知觉中的作用。另外，我们通过使用眼动技术探究了定向优势效应对两类被试的低水平视觉加工过程与高水平的行为判断过程是否存在相同的影响。实验一采用 2(被试类型：TD 被试、ASD 被试)×3(追逐精度：15°、45°、75°)×3(方向线索：无方向、定向、非定向)的三因素混合实验设计，其中被试类型为被试间变量。通过比较三种方向线索，考察了定向线索是否在 ASD 者的生命知觉中存在优势作用。实验二采用 2(被试类型：TD 被试、ASD 被试)×3(追逐精度：15°、45°、75°)×3(定向线索：正向、逆向、垂直)的三因素混合实验设计。考察了不同定向线索对 ASD 者生命知觉的影响。结果表明，在追逐精度较高的情况下，两组均存在定向优势效应。ASD 者具有局部加工的视觉搜索策略，且在追逐检测过程中缺乏注意力。不同定向线索对 ASD 被试的任务表现没有显著影响，但 TD 组在正向的定向线索条件下的追逐检测正确率显著高于其他两个条件。本研究初步证明了定向线索在 ASD 者生命知觉中的作用与 TD 个体存在差异。ASD 者可能存在物理化的加工方式，使得其难以利用定向线索中所包含的社会信息提升追逐检测正确率。

The Role of Oriented Cues in Animacy Perception of Individuals with Autism Spectrum Disorder: Research Based on Eye Movement

Jia Liu¹, Jinsheng Hu¹

¹ Department of Psychology, Liaoning Normal University, Dalian 116029, China

Abstract: The automatic and effortless perception of shapes as interacting in social relationships is termed animacy perception. Some researchers have found an oriented advantage, that is, when the object orientation and its motion direction maintain a constant relationship, it will significantly improve the individual's animacy perception. In this study, we call this constant relationship as oriented cues. Studies of autistic spectrum disorder (ASD) have shown that they are similar to individuals with typical development (TD) and perform better in oriented conditions. This result

contradict previous studies. Therefore, our research made a slight change on the stimulus material of the chase detection paradigm and conducted two experiments to explore the role of directional cues in the animacy perception of individuals of ASD. In addition, through the use of eye movement technology, we explored whether oriented advantage has the same influence on the low-level visual processing and the high-level behavioral judgment process of two groups. Experiment 1 used a three-factor mixed experimental design of 2(group: TD, ASD)×3(chasing subtlety: 15°, 45°, 75°)×3(directional cues: no-cues, oriented and non-directional), in which group was an inter-subject variable. By comparing three kinds of directional cues, we investigated whether oriented cues have a dominant role in the animacy perception of individuals with ASD. In experiment 2, the effects of different oriented cues on animacy perception of ASD were investigated by using a three-factor mixed experimental design of 2(group: TD, ASD)×3(chasing subtlety: 15°, 45°, 75°)×3(oriented cues: front, reverse and vertical). The results showed that when the chasing subtlety was high, there was an oriented advantage effect in both groups. Individuals with ASD had a locally processed visual search strategy, and they lacked attention during the chase detection process. Different oriented cues had no significant effect on ASD group. However, the accuracy of TD group in the front cues condition was significantly higher than that in the other two conditions. This study initially proved that the role of oriented cues in animacy perception of individuals with ASD was different from that of TD individuals. Individuals with ASD may have physical processing methods, which makes it difficult for them to use social information contained in oriented cues to improve the accuracy of chase detection.

条件推理中不同前提呈现顺序相关的脑功能网络： 一项动态因果模型研究

王莉¹ 张猛² 陈俊¹ (通讯作者)

¹ 华南师范大学心理学院, 广州, 510630

² 新乡医学院心理学院, 新乡, 453003

摘要 条件推理是指人们将给定的条件规则（大前提）与相关信息（小前提）相结合进行演绎推断。以往的研究发现反转前提可以有效地促进否定后件式推理（条件推理的一种形式），这也被称为前提顺序效应。然而，后续的实验研究却并未发现这种效应。因此，为了检验前提顺序效应，并且进一步揭示条件推理的认知机制，我们招募了健康的志愿者作为实验被试，并将其随机分配为传统/反转前提顺序组，使用功能磁共振成像（fMRI）评估被试完成视觉呈现的条件推理任务（MP/MT）时的大脑血氧水平的变化。结果发现，反转条件激活了更多与工作记忆相关的脑区，包括角回（Angular, BA39）、楔前叶（Precuneus, BA7）、顶下小叶（Inferior Parietal Lobule, IPL）和额中回（Middle Frontal Gyrus, MFG）。此外，我们使用两组被试在完成条件推理任务下的共同激活的脑图谱来定义感兴趣区域（ROI），包括右半球的内侧额叶（medial frontal gyrus, MeFG）、颞区的海马回（hippocampus）、小脑（cerebellum）、枕中回（middle occipital gyrus, MOG）和左半球的枕下回（inferior occipital gyrus, IOG），并建立动态因果模型（DCM）用于有效连接分析，由贝叶斯模型选择得到最优化模型的内在连接结果显示，在IOG→MOG、海马回→IOG、海马回→小脑这些连接中，反转组的连接强度比传统组更强。这些结果似乎表明，反转组被试在前提呈现阶段投入了更多的努力和注意资源，而反转组中与工作记忆相关的大脑区域活动的增加也反映了个体推理过程是社会适应的结果。根据心理模型理论，前提信息的呈现顺序将决定构建心理模型的信息输入顺序，反转前提会导致两种条件下结果的分离。根据我们的结果，在两个条件下，被试可能以不同的模式整合信息，这在一定程度上支持心理模型理论。

Brain Functional Networks Involved in Different Premise Order in Conditional Reasoning: A Dynamic Causal Model Study

Li Wang¹, Meng Zhang², Jun Chen¹

¹ Department of Psychology, South China Normal University, Guangzhou, 510630

² Department of Psychology, Xinxiang Medical University, Xinxiang, 453003

Abstract: Conditional reasoning is defined as the reasoner combining a given conditional rule (major premise) and the relevant information (minor premise) to make a deduction. Previous studies have reported that reversing the premises can effectively promote modus tollens (MT) reasoning (a form of conditional reasoning), but subsequent experimental studies have found no such effect. Therefore, to further examine this premise order effect and reveal the cognitive mechanism of conditional reasoning, we asked two groups of healthy volunteers (traditional and inverted premise order groups) to evaluate a set of visually presented conditional tasks (MP/MT) under fMRI. The results indicated that the inverted condition activated more brain regions associated with working memory, including the angular gyrus (BA39), precuneus (BA7), IPL, and MFG. The resulting common activation map was used to define the regions of interest (ROI) and perform dynamic causal modeling (DCM) for the effective connectivity analysis, containing the medial frontal gyrus (MeFG), hippocampus of the temporal gyrus, cerebellum, and middle occipital gyrus (MOG) in the right hemisphere and inferior occipital gyrus (IOG) in the left hemisphere. The results of intrinsic connections in the optimal model selected by Bayesian model selection showed that the connection strength was stronger in inverted group rather than in traditional group under the connection IOG → MOG, hippocampus in temporal gyrus → IOG, and hippocampus in temporal gyrus → cerebellum. These results indicated that the participants in inverted group are likely to put in more effort and attention resources in the stage of premise presentation. The increase in the activity of brain regions related to working memory in the inverted group also reflects that the individual reasoning process is the result of social adaptation. According to the mental model theory, the order in which the premise information is presented determines the order in which the information is input to construct the mental model. Reversing the premise will lead to the separation of the results under the two conditions. According to our results, the subjects may integrate information in different patterns under the two conditions, which supports the mental model theory to a certain extent.

摘要 中国肥胖人口较多, 同时很多人存在饮食问题, 因此关于食物奖赏、食物抑制和营养相关的研究成为热点, 但是国内目前没有食物奖赏测量的相关范式。然而, 利兹食物偏好问卷已经在海外广泛应用, 并且已经被十几个国家翻译推广。因此, 本研究的目的就是对利兹食物偏好问卷进行本土化的改编, 翻译及验证。同时利用近红外手段, 探究食物奖赏行为指标与食物奖赏脑区激活的关系。招募 80 名参与者: 年龄从 18 岁到 40 岁, 不吸烟和饮酒, 没有心血管和代谢疾病。我们整理分类了 4 类 (高脂咸, 高脂甜, 低脂咸, 低脂甜) 共 40 种中国特色食物的营养信息, 拍摄了标准化的食物图片, 制作了评分问卷筛选出每组 4 张, 共 16 张食物图片作为实验材料, 分别应用于利兹食物偏好问卷和食物图片线索范式。我们在基线完成了身体活动量问卷和荷兰饮食问卷的测量, 分别在午/晚饭前后通过利兹食物偏好问卷测量四类食物的四种食物奖赏值以及利用近红外监测在完成视觉食物线索范式时前额脑区激活变化。结果表明: 进食过后食欲降低, 对高脂甜食, 高脂咸食, 低脂咸食外显喜欢和外显渴望降低, 对高脂甜食和高脂咸食相对偏好和内隐渴望降低, 对低脂甜食相对偏好和内隐渴望升高。同时在观看高脂咸食时背外侧前额叶激活增加, 也发现了在观看不同类别时前额叶脑区与对应食物类别奖赏得分的相关。因此本实验通过替换中国本土化特色的食物图片, 改编翻译了利

兹食物偏好问卷，并且通过实验进行了验证了该实验范式的有效性，同时借助近红外仪器也进一步探究了行为背后的大脑激活特征变化，为国内食物营养领域相关研究者提供了一个新的研究手段。

Adaptation and validation of the Leeds Food Preference Questionnaire to Chinese culture _ a behavior and fNIRS study

Zhou Yu¹, Zhou Chenglin¹

¹ School of Psychology, Shanghai University of Sports, Shanghai, 200438

Abstract: There is a large number of obese people in China and many people have dietary problems, so the research on food reward, food suppression and nutrition has become a hot topic, but there is no relevant paradigm of food reward measurement in China. However, the Leeds Food Preference Questionnaire (LFPQ) is widely used abroad and has been translated and promoted in more than a dozen countries. Therefore, the purpose of this study is to localize, translate and verify the Leeds Food Preference Questionnaire. At the same time, the Functional Near-Infrared Spectroscopy (fNIRS) method was used to explore the relationship between food reward behavior indicators and food reward brain activation. Eighty participants were recruited: ages 18 to 40, no smoking and drinking, and free of cardiovascular and metabolic diseases. We sort out the 4 categories (high-fat savoury, low-fat savoury, high-fat sweet and low-fat sweet), a total of 40 kinds of Chinese characteristics food nutrition information, The standardized food pictures were taken, the scoring questionnaire was made, and 4 pictures in each group were selected, a total of 16 food pictures were used as experimental materials respectively applied to Leeds food preference questionnaire and visual food cues paradigm. We completed the Ohysical Activity questionnaire and the Dutch Eating Behavior Questionnaire at baseline. The Leeds Food Preference Questionnaire measured four food reward values for four food categories and the changes of prefrontal brain activation when completing the visual food cue paradigm were monitored by fNIRS before and after lunch/dinner. The results showed that: after food consumption, subjective sensation of appetite decreased, explicit preference and explicit wanting for high-fat sweet food, high-fat savoury food and low-fat savoury food decreased, relative preference and implicit wanting for high-fat sweet food and high-fat savoury food decreased, while relative preference and implicit wanting for low-fat sweet food increased. At the same time, dorsolateral prefrontal activation was increased when viewing high-fat savoury foods, and the prefrontal region was also found to be associated with reward values for different food categories. This experiment by replacing Chinese localization characteristics of food pictures, adapted to translate the Leeds Food Preference Questionnaire, At the same time, the changes of brain activation characteristics behind behavior are further explored with the help of fNIRS, which provides a new research means for domestic researchers in the field of food and nutrition.

Keywords: Food reward, LFPQ, fNIRS, nutrition

情绪调节惊吓范式的时域及频域加工特征

摘要 情绪调节惊吓范式(The emotion-modulated startle paradigm, EMS)作为测量情绪加工的重要方法，了解其神经指标所表征的心理过程对于情绪测量意义重大。本研究通过在 EMS 范式中对比惊吓声音刺激出现之后的 Probe P300 指标与被动观看图片时 EPN、P300、LPP 指标的关系，表明 Probe P300 表征动机性注意加工过程。而施加惊吓声音后的神经振荡分析表明，Beta 频段的神经振荡能量在情绪性前景和中性前景之间差异显著，这提示 EMS 范式下的 Beta 振荡可作为区分情绪唤醒度的一个重要指标。我们的研究还发现，在 Beta 频段的神经振荡体现为 ERS，这表明在该范式下进行情绪加工时，大脑处于抑制的神经状态。总的来说，本实验研究结果有助于明确 EMS 范式下的各指标作为情绪加工的衡量标准。

关键词: EMS 范式，Probe P300，Beta 振荡，ERS

Time-domain and frequency-domain processing characteristics of the emotion-modulated startle paradigm

Abstract: The emotion-modulated startle paradigm (EMS) is an important method for measuring emotion processing, and understanding the mental processes characterized by its neural indicators is significant for emotion measurement. In this study, by comparing Probe P300 indicators after the appearance of startle sound stimuli with EPN, P300, and LPP indicators during passive picture viewing in the EMS paradigm, we showed that Probe P300 characterizes motivated attentional processing. And the analysis of neural oscillations after the application of startle sounds showed that the energy of neural oscillations in the Beta band differed significantly between emotional and neutral prospects, suggesting that Beta oscillations in the EMS paradigm could be an important indicator for differentiating the degree of emotional arousal. Our study also found that neural oscillations in the Beta band were reflected as ERS, suggesting that the brain is in an inhibited neural state when emotional processing is performed in this paradigm. Overall, the results of the present experimental study help to clarify each indicator in the EMS paradigm as a measure of emotional processing.

Keywords: EMS Paradigm, Probe P300, Beta Oscillation, ERS

操作动作表征对孤独症者动觉运动想象的影响

刘莹¹ 胡金生^{1,2} (通讯作者) 刘佳¹

¹ 辽宁师范大学, 大连, 116000

² 辽宁师范大学心理学系, 大连, 116000

摘要 孤独症谱系障碍者通常表现出社交障碍, 但是运动障碍可能是未来孤独症谱系障碍诊断最有用的预测指标。动觉运动想象可以反映实际的运动表现, 并激活与操作动作表征加工相同的脑区。但是, 操作动作表征是否会影响动觉运动想象还不清楚。本研究采用偏侧判断任务测量个体的动觉运动想象能力, 并通过眼动指标对两组被试加工策略的差异进行探索。研究对象包括 22 名 16-38 岁的孤独症谱系障碍者和 22 名 16-25 岁年龄、性别和智力相匹配的典型发展个体。实验一以正确和不正确的功能性动作图片为材料, 为 2 (组别: ASD 组、TD 组) × 2 (条件: 正确功能动作、错误功能动作) × 4 (角度: 0°、60°、120°、180°) 三因素混合实验设计。实验二通过设置结构性和功能性动作条件增加动作异常程度, 为 2 (组别: ASD 组、TD 组) × 2 (条件: 正确动作、错误动作) × 4 (角度: 0°、60°、120°、180°) 三因素混合实验设计。反应时间和总注视时间的数据分析表明孤独症谱系障碍者存在促进效应和生物力学效应, 其动觉运动想象可以通过加工错误操作动作表征得到改善。除此之外, 孤独症谱系障碍者的物体注视比率更大, 表明其是物体中心加工策略, 而典型发展个体是手部中心加工策略。本研究结果建议制定孤独症谱系障碍者运动障碍的干预方案时, 应考虑教具的操作性和功能性, 还要注意生动性和真实性。最后, 使用双通路模型并结合具身理论和定制思维假设对研究结果进行了解释。

Effect of Action Representation on Kinesthetic Motor Imagery in Autism Spectrum Disorder

¹ Ying Liu, Jinsheng Hu^{1,2}, Jia Liu¹

² Liaoning Normal University, Dalian

Abstract: Individuals with autism spectrum disorder (ASD) show impairments in reciprocal social communication, and motor deficits may be the most useful predictors of a future ASD diagnosis. Kinesthetic motor imagery (KMI) can reflect the actual motor performance and activate the same brain area as action representation. However, whether the action representation can affect KMI is still unclear. We adopted laterality judgment tasks to measure the KMI ability and investigate the difference between the two groups processing strategy. The current study included 22 participants with ASD aged 16-38 and 22 typical developing (TD) participants aged 16-25 matched for age, gender,

and intelligence. Experiment 1 used correct and incorrect functional action pictures as material, the experiment used a 2×2×4 factorial design with group (ASD vs. TD)×condition (correct functional-based action, incorrect functional-based action; experiment 2: correct action, incorrect action)×angle (0°, 60°, 120°, and 180°). In Experiment 2, changes in the abnormal degree of action by adding the structural- and functional action condition, the experiment used a 2×2×4 factorial design with group (ASD vs. TD)×condition (correct action, incorrect action)×angle (0°, 60°, 120°, and 180°). The reaction time and fixation duration data revealed both promoting effect and biomechanical effect. KMI in people with ASD can be improved by perceiving the incorrect action representation. Further more, the object fixation index was more extensive in individuals with ASD, the results established that people with ASD are object-centered in laterality judgment tasks while the people with TD are hand-centered. The results of this study suggest that when developing interventional teaching aids for the KMI ability, the perception of action representation should be considered. Particular attention should be paid to the materials' authenticity and biological nature as stimuli. Intervention plans should involve both structural and functional actions. Finally, the results of the study are explained by the dual-route theory, the embodied cognition theory and the enactive mind theory.

新冠疫情背景下人们如何采纳信息：信息源的作用

王馨悦¹ 栾墨² 李虹¹

¹ 清华大学, 北京, 100000

² 对外经贸大学 100029

摘要 本研究旨在探索人们在新冠疫情背景下如何采纳信息。2020年,世界各地的人们都经受了新冠疫情的巨大灾难。无论在疫情抑或是其他突发危机事件中,人们所面对的很多信息都是不准确、不完整,以及不断变化的。然而,人们需要做出快速而准确的决策,一些日常的简单决策此时甚至可能直接威胁到人们的生命。那么在这种情境下,人们如何采纳信息并做出决策呢?我们通过3个实验来回答这一问题。在实验1中,我们发现人们在新冠疫情相关决策中偏好向专家寻求信息,在非新冠疫情相关决策中偏好向朋友寻求信息。在实验2中,我们在信息内容和信息源同时出现的情况下探索了人们的信息采纳偏好,其结果显示信息源的效应具有稳定性。并且我们还发现,危险程度是决策背景(新冠疫情相关,非新冠疫情相关)影响信息源偏好(专家,朋友)的内在机制。在实验3中,我们证明了无论决策重要性高或低,决策背景对信息源偏好的影响都保持稳定。这些实验稳定地证明了信息源在信息采纳中的关键作用。具体而言,人们在新冠疫情相关决策中偏好来自专家的信息,在非新冠疫情相关决策中偏好来自朋友的信息。我们的发现为理解新冠疫情背景下人们如何采纳信息做出了重要贡献,即人是有限理性的决策者,我们在进行信息采纳时更多依赖信息源而非信息内容本身。

How Do People Prefer to Take Information in the Context of COVID-19?

Xinyue Wang¹, Hong Li²

¹ Tsinghua University, Beijing, 100000

² University of International Business and Economics, 100029

Abstract: This article aims to explore how people prefer to take information in the context of COVID-19. People worldwide have been suffering from the COVID-19 in 2020. No matter in this pandemic or other emergency crises, much of information that people face may be inaccurate, incomplete, and changeable. However, fast and sound decisions are required, and even ordinary decisions may threaten people's lives. In such circumstances, how do people take information to make their decisions? We report the results of 3 studies to answer this question. In Study 1,

we found that people preferred to seek information from experts for COVID-19-related decisions and information from friends for non-COVID-19-related decisions. In Study 2, we examined the preference for taking information when the information content and source were presented concurrently, suggesting stability of the effect of the information source, and found that danger functioned as the mechanism underlying the effect of decision context on preferences for the information source. In Study 3, we demonstrated that the effect of decision context was stable regardless of decision importance was high or low. The present studies steadily demonstrated that information source played a core role in information taking. In particular, people prefer to take information from experts for COVID-19-related decisions, while prefer to take information from friends for non-COVID-19-related decisions. Our findings present an important contribution to the understanding of how people take information in the context of COVID-19, namely that people are indeed bounded-rational choosers and we rely more on the information source rather than the information content per se in information taking.

Keywords: information source, COVID-19, information taking, danger, decision

最优化决策者的记忆容量与低估决策时间之间的关系

黄荷¹ 李虹² (通讯作者)

¹ 清华大学心理学系, 北京, 100089

² 清华大学心理学系, 北京, 100089, lhong@mail.tsinghua.edu.cn

摘要 时间估计对于决策效率而言至关重要。过量的时间投入会显著地影响决策的效率, 而决策的效率又是决策中“最优”的重要组成部分。但最优化者在追求“最优”的过程中, 往往倾向于在决策中投入更多的时间。为探讨出现这种悖论的原因, 本研究旨在探讨决策过程中最优化倾向对时间估计的影响, 并进一步研究这种影响的产生机理, 即记忆容量在其中的中介作用。本研究共包含三个实验: 实验 1A 探究了日常真实决策情境中最优化者与满意化者的时间估计差异; 实验 1B 排除了真实时长这一实验 1A 中的额外变量, 设置了低负荷决策情境, 并探究了低负荷决策情境中最优化者与满意化者的时间估计差异, 进一步分析最优化倾向对时间估计的影响; 实验 2 引入了记忆容量一变量, 并探究了其在最优化倾向对时间估计的影响中的中介作用; 实验 3 通过启动最优化心态与满意化心态, 再一次验证了实验 2 得出的中介模型的稳定性, 并进一步分析最优化心态对记忆的影响模式。主要研究结果: (1) 在日常真实决策情境中, 相较于满意化决策者, 最优化决策者更倾向于低估自己决策投入的时间; (2) 在低负荷决策情境中, 当控制决策时长不存在显著差异时, 最优化决策者仍更倾向于低估自己决策投入的时间。 (3) 记忆容量中介了最优化倾向对决策中时间估计的影响。具体而言, 最优化决策者记忆容量更小, 所以低估时间。此中介作用不仅存在于拥有更高最优化倾向的最优化决策者中, 同样存在于仅被启动最优化心态的参与者中, 反映了最优化倾向影响记忆容量的因果关系。本研究的结果揭示了最优化倾向对时间估计的影响机制, 为最优化悖论提供了一个新的解释视角。所谓的最优化悖论并不是真正的悖论, 而是因为最优化决策者低估了他们在决策上投入的时间, 其根源是他们对于决策信息的记忆容量比满意化决策者小。因此, 最优化决策者在决策上花费的时间总是比他们预期的要多, 这可能就是为什么最优化决策者无论得到怎样的决策结果都会感到消极的深层原因。

² Tsinghua University, Department of Psychology, Beijing, China, 100089, Email:

lhong@mail.tsinghua.edu.cn

Abstract : This study aims to explore how maximization operates in time estimation in decision-making. We conducted three studies to examine the difference between maximizers' and satisficers' time estimation and explored

the mechanism underlying the effect of maximization on time estimation. We found that maximizers underestimate the time spent in the present decision tasks. Regarding the mechanism, we demonstrated that memory storage-size serves as the mediator between maximization and time estimation. More specifically, maximizers' memory storage-size of special attributes of decision alternatives becomes smaller than satisficers' in the decision process, which leads to their underestimation of decision time. The findings of this research contribute to the maximization literature by demonstrating how maximizers estimate the time spent in the decision process and provide a new perspective on why maximizers always invest more time but feel negatively regarding their decision outcomes, that is because they underestimate the time used in decision-making rather than they do not care about the time.

Keywords: maximization, time estimation, memory storage-size, mediating effect, decision-making

公平规范遵守的性别差异及其神经机制

陈婉婷¹ 肖治兵¹ 何清华¹

西南大学心理学部, 重庆, 400015

摘要 社会规范作为社会对个体行为的期望,影响着人们的决策行为。公平规范可以内化为个人意识表现出自愿公平遵守行为,同时惩罚威胁也会使人们执行公平规范。前人研究发现,不同情境下的公平规范遵守行为有不同的神经基础,但以往的研究并未关注到性别差异。在本研究中,我们采用独裁者范式与最后通牒变式,结合功能磁共振成像(fMRI)去探索不同公平规范遵守中的神经性别差异。我们招募了55名被试(27名女性),采用2(性别:女,男)*3(情境:自愿情境,惩罚情境,惩罚后自愿情境)混合设计,在被试进行分配任务的同时进行功能核磁共振成像扫描。结果发现,尽管男性和女性表现出相同的行为模式,但在不同规范遵守条件下,神经激活模式存在性别差异。具体表现在:与女性相比,男性在自愿情境下表现出更强的颞顶联合区、楔前叶、后侧扣带回皮质、眶额皮层和颞中皮层的激活,而这种神经差异在惩罚后自愿情境下消失了。有趣的是,采用广义心理生理交互分析(gPPI)发现,右侧背外侧前额叶皮层(rDLPFC)和右侧背侧前岛叶(rdAI)的功能连接可能反映了直觉公平规范的遵守,并且其连接强度在不同情境下的变化受性别因素的调节。研究结果表明,对于女性而言,自愿遵守公平规范似乎更偏向于直觉性行为,而对于男性而言,在不同条件下均会对情境信息进行加工从而做出决策。此外,惩罚使得人们的决策都倾向于策略计算,但这种转变在女性中更为明显。我们的研究结果使得我们对公平规范遵守行为的神经回路及性别差异有了更深入的理解。这些结果对表现出异常规范遵守行为的精神或神经疾病的理解具有重要意义。

Sex-based Difference in Fairness Norm Compliance and Its Neural Mechanisms

Wanting Chen, Zhibing Xiao, Qinghua He

Faculty of Psychology, Southwest University, Chongqing, China, 400015

Abstract: As a social expectation of individual behavior, social norms affect people's decision-making behavior. Humans often comply with fairness norms, either voluntarily, or through external threats, such as sanctions. The literature has demonstrated that there is a unique neural activity for voluntary and sanction-based compliance with fairness norms. Nevertheless, it overlooked potential sex-based differences. Biological sex can be a salient factor in this context, given sex-based differences in functions of brain regions involved in social compliance and decision-making. Here, we combined the dictator game and ultimatum game with functional magnetic resonance imaging (fMRI) to bridge this gap and identify how males' neural activity differs from females' in response to different norm compliance conditions (voluntary, sanction-based, and voluntary post-sanctions). Fifty-five adults (27 females) were examined. We found between sexes differences in neural activation in different norm compliance conditions, although men and women showed the same behavioral pattern. Compared to females, males showed stronger activation in TPJ, precuneus, PCC, OFC and mid temporal cortex while in the voluntary fairness compliance

condition. This neural difference disappeared in the voluntary post-punishment condition. The generalized psychophysiological interaction analysis suggested that the connection of right dorsolateral prefrontal cortex (rDLPFC) and right dorsal anterior insular (rdAI) may mediate intuitive fairness norm compliance; it differed between the norm compliance conditions and between the sexes. Specifically, for females, voluntary fairness norm compliance seemed to be motivated intrinsically, and for males, it was more pragmatic. Moreover, punishment tilted the decisions toward strategic calculations in both sexes, but this shift was stronger in females. Our findings provide a better understanding of the neural circuitry of fairness norm compliance, and how it differs between males and females. They have important implications for future investigations of psychiatric and neurological disorders that manifest in abnormal norm compliance.

Keywords: Fairness norm compliance, Punishment, Sex-based difference, Neural mechanisms, Neural circuitry

表征方式偏好对晚期双语者二语词汇通达的影响

徐庆宏^{1,2} 李敏¹ 李杰¹

1 内蒙古师范大学心理学院, 呼和浩特, 010022, healthlj2004@163.com

2 榆林学院外国语学院, 榆林, 719000

摘要 词汇习得贯穿二语学习过程始终, 处于整个二语习得的基础和中心位置。目前, 二语词汇习得应用研究结论仍存在诸多矛盾, 语言学习本身和学习者心理加工方面尚未得到公认的理论模型。国内外相关研究的不足之处在于注重心理词库与概念系统关联方式的静态描绘, 而忽视了二语词汇语义联结母语中介到概念中介的动态发展机制解读(如, BIA 模型), 同时也忽视了学习者个体差异的重要作用(如, RHM 模型)。根据双重编码理论(DCT)的观点, 不同个体具有明确且稳定的表征方式偏好。晚期双语者二语词汇学习的母语中介特点使得学习者中表象与言语偏好者之间可能存在通达路径和相应效率差异。本研究通过 4 个实验, 检验表征方式偏好与传统研究中惯用的二语熟练度、认知风格因素相比较对于晚期双语者二语词汇通达研究的重要性, 验证表征方式偏好对晚期双语者二语词汇通达的影响, 并验证不同表征方式偏好的晚期双语者二语词汇通达母语中介到概念中介发展的差异。实验 1-4 的结果证实了不同二语通达模式的存在和表征方式偏好对晚期双语者二语词汇通达效率和中介路径转换的影响。

The Effect of Representational Preference on Second Language Lexical Access in Late Bilinguals

Qinghong Xu^{1,2}, Min Li¹, Jie Li¹

¹ School of Psychology, Inner Mongolia Normal University, Hohhot, 010022

² School of Foreign Languages, Yulin University, Yulin, 719000

Abstract: At present, there are still many contradictions in the research results of second language vocabulary acquisition studies, and there is no commonly accepted theoretical model for language learning and learners' psychological processing. The shortcoming of relevant researches at home and abroad is that they focus on the static description of the relation between mental lexicon and conceptual system while ignoring the dynamic development mechanism of the semantic connection between first and second language vocabulary (e.g., BIA model), as well as the important role of individual differences in learners (e.g., RHM model). According to the dual coding theory (DCT), different individuals have clear and stable representational preferences (i.e., verbal or visual). Because of the L1-mediation feature of L2 vocabulary learning in late bilinguals, there may be differences in access paths and corresponding efficiency between learners of verbal or visual preferences. In this study, four experiments were conducted to examine the importance of representational preference, compared with traditional factors such as second language proficiency and cognitive style, in the study of second language lexical access in late bilinguals to verify the effect of representational preference on second language lexical access in late bilinguals. We also examined the

different pathways of lexical access to L1- and concept-mediated development in late bilinguals with visual or verbal preference. The results of experiments 1-4 confirmed the effect of representational preference on lexical access and L1- to concept-mediation conversion differences in late bilinguals.

Keywords: representational preference, L1-mediation, concept-mediation, second language vocabulary access, L1- to concept-mediation conversion

4 宾夕法尼亚大学教育学院

5 上海市教育科学研究院, 上海, 200000

摘 要 独处偏好 (preference for solitude) 指的是, 个体主动独处的积极意愿和态度, 伴随着较低的社会趋近动机和较低的社交回避动机, 而社会互动对于个体的心理适应以及心理健康具有重要的作用, 尤其儿童青少年阶段, 因此在该阶段独处偏好水平越高的个体的心理健康和心理适应水平越低, 且这一现象在青少年早期阶段达到顶峰。据此, 了解早期青少年的独处偏好特点有利于更好的促进个体的心理适应, 但以往研究多数采用横向研究, 并没有从纵向视角对独处偏好的特点进行探究。因此本研究目的探究早期青少年独处偏好的发展轨迹特点以及不同发展模式对心理适应的影响。本研究调查 1247 人 (M 年龄 = 13.07 岁, 男生 641 名), 从 7 年级追踪到 9 年级。采用混合增长模型 (Growth Mixture Model) 进行数据分析, 结果显示: (1) 早期青少年的独处偏好的发展轨迹可以分为三组: 高初始—稳定组 (56 人, 4.5%)、低初始—快增长组 (14 人, 1.1%) 和中初始—慢增长组 (1177 人, 94.5%); (2) 较高初始—稳定组和低初始—快增长组, 中初始—慢增长组更显著的负向预测九年级的孤独感、抑郁和社交焦虑。据了解, 该研究是当前首次对早期青少年独处偏好的发展轨迹异质性及其对心理适应影响的探索, 为不同独处偏好水平的早期青少年的心理适应提供理论指导。

b Carleton University

c Shanghai Normal University

d University of Pennsylvania

e Shanghai Academy of Educational Science, Shanghai, China

Abstract: This study examined trajectories of preference for solitude (PFS) and their associations with psychological adjustment (loneliness, depression and social anxiety) in Chinese adolescents. Participants were 1, 247 adolescents (641 boys), initially in 7th grade (Mage=13.70 years) in China. Participants provided self-reports of PFS once a year

for three years. Additionally, participants reported their loneliness, depression and social anxiety at Time 3 (in the last year). Among the results, three distinct groups of PFS trajectories were identified: High-Stable, Moderate-Increasing, Low-Increasing. Moreover, participants in the different trajectory groups were at differential risk for psychological adjustment, such as depressive symptoms, loneliness and social anxiety at Time 3. These results highlight the benefits and costs of examining the development of PFS and the unique ways that PFS develop among Chinese youth as they progress through early adolescence.

Keywords: preference for solitude, loneliness, depressive symptom, social anxiety, developmental trajectories

亲隔代协同抚养者教养压力与儿童消极情绪的关系： 严厉管教的中介

何婷 蔺秀云（通讯作者）

北京师范大学发展心理研究院，北京，100875，linxy@bnu.edu.cn

摘要 亲隔代协同抚养在现今中国家庭抚养方式中的比例已接近 80%，逐渐成为儿童的主流抚养形式，探究此种抚养方式对儿童发展的影响势在必行。研究立足中国特色的亲隔代协同抚养家庭，探讨亲隔代协同抚养者教养压力、严厉管教和儿童消极情绪的关系。选取北京市 4 所小学 8-11 岁亲隔代协同抚养儿童共 219 例，采用教养压力问卷、严厉管教问卷和消极情绪量表对母亲、（外）祖母和儿童进行施测。结果发现：（1）母亲比祖母体验到更多的亲职愁苦和困难儿童压力，采用更加严厉的管教，但母亲与外祖母的教养压力和严厉管教水平均没有显著差异。父系和母系隔代抚养者参与抚养儿童的消极情绪没有显著差异；（2）亲隔代协同抚养者教养压力对儿童消极情绪均无显著预测；（3）母亲教养压力的作用会溢出到祖母的严厉管教，进而正向预测儿童消极情绪。但母亲与外祖母的教养压力对彼此的严厉管教均无显著预测作用。研究针对两类家庭中互动模式的不同提出了内外祖母角色差异性假说。研究可为发展亲隔代协同抚养家庭教育方案提供依据，针对性地为该类家庭提供帮助。

关键词 亲隔代协同抚养，教养压力，严厉管教，儿童消极情绪

The Parental and Grandparental Caregivers' Parenting Stress and Child Negative Emotion: The Mediating Role of Harsh Discipline

HE Ting, LIN Xiu-yun

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: Nearly 80% of families have grandparents involved in raising children and it has gradually become the mainstream parenting model in China. Therefore, it is imperative to explore the influence of this parenting model on children's development. This study, based on the Chinese parent-grandparent co-parenting families, examined the linkage between parenting stress, harsh discipline and children's negative emotions. Participants comprised 219 children aged 8-11 of 4 primary schools in Beijing, China. Children's mother and grandmother were included as well. Results revealed that mothers experienced more stress of parental distress as well as difficult child and adopted more harsh discipline than paternal grandmothers. Yet, mothers and maternal grandmothers reported similar intensity of parenting stress and harsh discipline in all dimensions. There was no significant difference in child negative emotion in the families in which paternal and maternal grandmothers were involved. Additionally, caregivers' parenting stress had no significant effect on child negative emotion. Furthermore, the effect of mothers' parenting stress spilled over to paternal grandmothers' harsh discipline, which in turn predicted child negative emotion. However, neither mothers' nor maternal grandmothers' parenting stress associated with their own or partners' harsh discipline. Based on the results, the study proposed the Paternal and Maternal Grandmother-Role-Difference Hypothesis. The current study was beneficial to develop future family-based education guidance for parents-grandparents co-parenting families and provided targeted assistance to such families.

Keywords: Parent-grandparent co-parenting, Parenting stress, Harsh discipline, Child negative emotion.

认知重评对消极情绪记忆定向遗忘的影响

摘要 本研究采用项目法定向遗忘范式, 探讨了认知重评对消极情绪图片定向遗忘的影响。行为结果发现, TBF-r 的比率显著高于 TBR-r 的比率, 即出现了与定向遗忘效应相反的结果。ERP 的结果显示, 编码阶段 250-350ms, 认知重评组忘记指令比自由观看组的波幅更正。再认阶段, 认知重评组 TBR-r 项目比正确拒绝新项目(CR)的波幅更正, 诱发了额区(P200, 160-240ms)和顶区(LPC, 500-800ms)的新旧效应。同时, TBF-r 比 CR 波幅更正, 引发了顶区与回忆相关的新旧效应。但自由观看组只有 TBF-r 项目比 CR 的波幅更正, 表现出了额区 P200 和顶区的 LPC 新旧效应。以上结果表明, 认知重评不仅使忘记指令的项目投入更多资源进行抑制, 而且通过增强与熟悉(P200)和回忆(LPC)有关的提取过程提升了记住和忘记项目的记忆表现, 消除了消极情绪图片的定向遗忘效应。

关键词 认知重评, 消极情绪记忆, 定向遗忘, 新旧效应

Effects of cognitive reappraisal on the directed forgetting of negative emotion memory

Abstract : This study adopts the item-method directed forgetting paradigm to explore the effects of cognitive reappraisal on the intentional forgetting of negative emotion pictures. Behavioral results showed that the recognition of TBF-r (to-be-forgotten but remembered) was significantly greater than TBR-r (to-be-remembered and remembered) in recognition test, which is the opposite of the directed forgetting effect. Event-related potential (ERP) results showed that in the 250–350 ms of cue presentation, the F-cue of the cognitive reappraisal condition elicited more positive activity than passive viewing. In the test phase, TBR-r items of the cognitive reappraisal condition evoked more positive ERP than CR (correctly rejected unseen items in the study phase) items, which induced the old/new effect of the frontal (P200, 160–240 ms) and parietal regions (LPC (late positive component), 500–800 ms). At the same time, the mean amplitudes of TBF-r items are more positive than those of CR items, which triggers the old/new effects related to recall in the parietal scalp. However, in the passive viewing condition, only the TBF-r items had more positive activity than the CR items, showing the old/new effects of P200 in the frontal scalp and the LPC old/new effects in the parietal scalp. The above results show that cognitive reappraisal not only makes the items that forget cues invest more resources to suppress them, but also improves the memory performance of remembering and forgetting items by enhancing the retrieval process related to familiarity (P200) and recall (LPC), and eliminates the directed forgetting effect of negative emotion pictures.

How do bystanders react to Cyberbullying? The Influence of Family Emotional Expressiveness on Cyberbullying Bystander's behavior: Mediating Roles of Empathy and Rural-Urban Differences

Zhou HanFang, Geng XiaoMin, Jiang HuiZhu, Fang XiaoYi, HuMengQi

Beijing Normal University, Beijing 100000, China, ZHF1532@163.com

Abstract : Studies in the traditional bullying field have proved the important role of bystanders in solving bullying incidents. However, few studies have explored what factors influence bystander behavior in cyberbullying and the process of influence. The Broaden-and Build Theory and Water Pressure Model proposes that family emotional expression creates the overall emotional atmosphere of the family, and plays an important role in the individual's

ability to empathize, prosocial behavior or problem behavior. This study used two time points data based on emotional socialization theory to investigate the direct impact of family positive and negative emotional expressiveness on the bystander behaviors in cyberbullying, as well as the mediating role of empathy and rural-urban differences. 769 students ($M = 17.85$, $SD = 1.46$) from 7 middle and high schools in Hunan province were investigated by using the Family Emotional Expression Questionnaire (FEQ), Basic Empathy Scale (BES) and Cyberbullying Bystander Inventory. The results showed that: (1) On the one hand, family positive emotional expressiveness directly and positively predicted middle school students' positive bystander behavior, and negatively predicted assistant's behavior. On the other hand, family negative emotional expressiveness directly and negatively predicted middle school students' protect behaviors; (2) Empathy played a mediating role in the family emotional expressiveness and bystander behavior. Specifically, family positive emotional expressiveness predicted observer's behavior through cognitive empathy; (3) There were significant differences in the influence mechanism between urban and rural areas. In the urban sample, family positive emotional expression negatively predicted observer's behavior through the mediating role of cognitive empathy. In the rural sample, family positive emotional expression positively predicted protective behavior through the mediating role of emotional empathy. The research is helpful to understand the influence mechanism of the emotional expression of important family members on the behavior of middle school students' cyberbullying bystander, which has some practical significance to reduce the spread and harm of cyberbullying.

Keywords: family emotional expressiveness, empathy, cyberbullying, bystander behavior, middle school students

汉语发展性阅读障碍儿童的预测模型 ——基于遗传算法优化的误差反向传递神经网络

王润洲 毕鸿燕

中国科学院心理研究所, 北京, 100000, wangrz@psych.ac.cn

摘要 对发展性阅读障碍的识别或诊断一直是个困难的问题, 并且传统的逻辑回归预测模型存在一定的缺陷。本研究基于 399 名儿童(187 名儿童发展性阅读障碍和 212 名正常发展儿童, 7~13 岁)的数据, 构建了一个经遗传算法优化的误差反向传递神经网络模型, 用来预测中国儿童是否患有阅读障碍。结果发现, 模型的总体预测准确率约为 94%, 并且各项预测指标均优于基础的误差反向传递神经网络和逻辑回归模型。其中, 阅读准确性对预测汉语发展性阅读障碍的贡献最大, 语音意识、拒绝假字正确率、语素意识、阅读流畅性、数字快速命名和拒绝非字反应时对预测汉语发展性阅读障碍也具有重要的贡献。

工作记忆对儿童和成人观点采择过程的影响

贺桂芬 宋威 张琼*

浙江大学心理与行为科学系

摘要 观点采择是社会认知的核心能力之一, 在个体社会化过程中有着重要作用。视觉观点采择的完成涉及计算过程(对他人观点的加工过程)和选择过程(区分自己和他人观点并做出正确反应的过程)。以往研究发现, 在成人被试中, 言语工作记忆对计算过程和选择过程都有影响, 且对计算过程影响更显著。但儿童的视觉观点采择能力和工作记忆都处在发展过程中, 他们在完成观点采择任务时是否受言语工作记忆的影响却不得而知。另一方面, 由于观点采择能力与空间能力相关, 个体在完成视觉观点采择任务时对空间工作记忆的依赖情况也需证据支持。因此, 本研究选取 9 岁左右儿童和大学生两组被试, 通过考察他们在单任务条件下和双任务条件下的观点采择能力, 探讨在不同年龄阶段下言语和空间工作记忆对视觉观点采择任务的影响。

关键词 观点采择, 计算过程, 选择过程, 言语工作记忆, 空间工作记忆

情绪觉察能力对情绪性时间知觉的影响——来自 ERP 的证据

马佳 卢家楣

上海师范大学教育学院心理学系, 上海, 568846205@qq.com

摘要 情绪觉察是识别与描述自己和他人的情绪的能力, 是引发情绪体验的生理心理过程: 情绪觉察者识别情绪时会无意识模仿情绪, 模仿通过生理反馈导致觉察者产生与诱发者相同的情绪体验。在此过程中, 情绪的无意识模仿起关键作用, 情绪觉察能力反映个体的模仿水平, 模仿直接影响个体的情绪体验。在情绪体验中, 个体对时间估计产生的影响称为情绪性时间知觉, 以往研究发现, 模仿是影响情绪性时间知觉的重要影响因素。因此, 本研究直接考察高、低情绪觉察能力对情绪性时间知觉的影响。实验采用 2 (情绪觉察能力: 高/低) × 3 (时距: 490ms/700ms/910ms) 的混合实验设计。以 42 名大学生为被试, 从电生理角度探讨了高低情绪觉察能力对时间知觉的影响。研究采用时间泛化法, 先让被试学习标准刺激的呈现时间, 随后判断情绪性面孔呈现的时间与标准刺激比是长于、短于还是等于, 记录整个实验过程的 EEG。ERP 数据发现: 面孔识别早期 N100 和 P200 成分上, 高情绪觉察能力个体的平均波幅显著大于低情绪觉察能力; 在长时距 (700ms 和 910ms) 的判断中, 高情绪觉察比低情绪觉察能力个体引发的 LPP 波幅更大。实验的行为结果也表明, 低情绪觉察能力个体比高情绪觉察能力个体更容易高估时距, 对时距判断的正确率低于高情绪觉察能力个体。这些结果表明, 高低情绪觉察能力对情绪性时间知觉的影响不仅在情绪识别的早期存在差异, 并且在晚期加工阶段差异也显著, 也就是说情绪觉察能力对情绪性时间知觉产生了影响。

关键词 情绪觉察, 情绪体验, 模仿, 情绪性时间知觉

The influence of emotional awareness on time perception: Evidence from Event-related Potentials

Ma Jia, Lu JiaMei

Shanghai Normal University, Shanghai, 200062, 568846205@qq.com

Abstract: Previous studies have found participants overestimated the emotional stimulus(negative/positive) compared with the neutral emotion, which can be explained by the arousal mechanism. The participants have individual differences on perceiving emotion, that is, the high emotional awareness with high emotion arousal, vice versa. This study extended existing findings by exploring the influence of emotional awareness on time perception in a temporal generalization task, and recorded electroencephalographic (EEG) signals. The behavior result showed that in the positive emotion, the high group made more overestimation than the low group, but had no difference on the neutral or negative emotion. ERP results showed that on the positive emotion, the high group elicited larger VPP amplitudes than the low, but they had no difference on neutral and negative emotion; the contingent negative variation (CNV) component showed that on the positive emotion pictures(positive/negative), the amplitudes of the high group was larger than the low, however, they had no difference on the neutral emotion. This study has suggested that the high emotional awareness would produced a higher physiological arousal when they estimated the time duration of emotional pictures, and then they made a greater time overestimation. This result had provide evidence in support of the relationship between emotional awareness and time perception.

Keyword: overestimated, emotional stimulus, arousal mechanism, emotional awareness, time perception

有无意识状态下分心、认知重评和表达抑制策略的效果比较

3 江西师范大学心理学院, 南昌, 330027, xionghongxing@126.com

摘要 情绪调节是指当情绪调节的目标被激活后, 对正性和负性的情绪强度以及情绪的持续时间进行调整的过程。为达到情绪调节的目的, 人们必须有效地使用情绪调节策略。情绪调节策略是指在情绪产生的不同

阶段,个体为了调控自己产生何种情绪、如何体验和表达这些情绪而采取的一些惯用方式。以往研究多关注于有意识地使用某种情绪调节策略是否可以有效地调控情绪,但情绪调节也可以在无意识的状态下进行。将情绪进行动态划分,可分为三部分:生理唤醒、情绪体验和情绪表达。以往研究通常将被试自我报告的主观情绪体验作为情绪调节效果的测量指标,缺少对情绪的全面测量。因此,本研究旨在有意识和无意识两种状态下探讨分心、认知重评和表达抑制三种典型的情绪调节策略在调节负性情绪的生理反应、主观体验和行为反应三方面上的调节效果。本研究选取了140名大学生作为被试,采用2(意识状态:有意识、无意识)×3(情绪调节策略:分心、认知重评、表达抑制)的被试间设计,用句子整理任务范式启动被试无意识状态下的认知重评和表达抑制策略,用白噪音干扰的方式启动被试无意识状态下的分心策略,用指导语启动被试有意识状态下的三种调节策略,考察意识状态对情绪策略调节效果的影响。结果发现:(1)分心策略在有意识状态下均能有效降低个体由负性情绪所引发的生理反应、主观体验和行为反应。(2)认知重评策略在无意识状态下仅能有效降低个体的生理反应,但在有意识状态下,可以有效下调情绪的三个方面。(3)表达抑制策略在无意识状态下仅能有效降低个体的生理反应,在有意识状态下可以有效降低个体的生理反应和行为反应。结果表明,无意识状态下,分心策略的调节效果要优于认知重评和表达抑制策略。有意识状态下,分心和认知重评策略的调节效果要优于表达抑制策略。

Abstract: Emotion regulation refers to the process of adjusting the emotional intensity and duration of positive and negative emotions after the target of emotion regulation is activated. In order to achieve the goal successfully, people must effectively use emotion regulation strategies. Emotion regulation strategy refers to some idiomatic ways that individuals adopt in order to regulate what kind of emotions they produce, how to experience and express these emotions in different stages of emotional production. Previous studies have focused on using emotional regulation strategies consciously can effectively regulate emotions, but emotional regulation can also be carried out in an unconscious state. The dynamic division of emotions can be divided into three parts: physiological arousal, emotional experience and emotional expression. In previous studies, subjects' self-reported emotional experience was usually used as a measurement index of the effect of emotion regulation, which lacks a comprehensive measure of emotion. Therefore, we investigated the emotion regulation effects of distraction, cognitive reappraisal and expression suppression on negative emotional physiological response, subjective experience and external behavioral response in two states of consciousness. 140 college students were selected as the subject to participate in this study. The design of the study is 2(conscious state: conscious, unconscious) × 3(emotion regulation strategy: distraction, cognitive reappraisal, expression suppression) between-subject design. In order to find the impact of conscious state on emotion regulation strategy, a scrambled sentence task was used to activate the subjects' unconscious cognitive reappraisal and expression suppression, while white noise interference was used to activate unconscious distraction. On the other hand, instructions were used to activate conscious emotion regulation strategies. The main findings were: (1) Distraction can effectively down-regulate the negative physiological reaction, subjective experience and behavioral response under the unconscious and conscious state. (2) Under the unconscious state, cognitive reappraisal can only effectively reduce the negative physiological response of individuals, but under the conscious state, it can effectively

lower three indicators. (3) The expression suppression can only effectively reduce the negative physiological responses of individuals in the unconscious state, and can effectively reduce the negative physiological and behavioral responses of individuals in the conscious state. The results show that under the unconscious state, distraction is more effective than cognitive reappraisal and expression suppression, while under the conscious state, distraction and cognitive reappraisal are more effective than expression suppression.

“真与美”微笑真实性对面孔吸引力评价的影响

董天天¹ 孙俊才²

1 上海师范大学教育学院, 上海, 200234, 2360158505@qq.com

2 曲阜师范大学心理学院, 山东曲阜, 273165

摘 要 面孔吸引力是指目标面孔所能诱发出他人积极情绪体验的程度以及驱使他人产生接近的意愿, 是非常重要的人际交往信息。吸引力加强反应理论提出微笑的表情可以增加面孔的吸引力。然而, 表情具有真实和伪装之分, 那么微笑表情的真实性是否会影响人们对他人面孔吸引力的评价呢? 本研究首先收集制作个体真实微笑状态与伪装微笑状态下的表情图片, 以此作为实验刺激材料。然后采用图片感知任务范式, 考察表情真实性对面孔吸引力评价的影响, 同时结合眼动追踪技术, 进一步探讨表情真实性对面孔吸引力评价影响的视觉加工情况。结果发现, 表情的真实性会影响个体对面孔吸引力的评价。具体表现为: 个体对面孔吸引力的评价中, 真实微笑与伪装微笑的评分差异显著, 被试对真实微笑的评分显著高于伪装微笑。对鼻子、眼睛、嘴巴三个区域的眼动数据进行分析, 结果发现被试对三个区域注视总时间从长到短依次为眼睛、鼻子和嘴巴。被试在真实微笑的嘴巴区域的总注视时间显著低于伪装微笑的嘴巴区域; 被试在真实微笑的嘴巴区域的注视点百分比显著低于伪装微笑的嘴巴区域。结论: 人们对面孔吸引力的评价会受到对方表情真实性的影响, 相比于有着伪装微笑的面孔人们倾向于认为有着真实微笑的面孔更具有吸引力。这与中国文化的价值追求具有一致性, 正所谓“不精不诚, 不能动人”。而嘴巴在真实与伪装微笑面孔吸引力评价中有关键作用, 与真实表情相比伪装表情需要消耗更多的注意资源。

The Influence of Smile Expressions Authenticity on Facial Attractiveness

Dong Tiantian¹, Sunjuncai²

1Department of Psychology, Shanghai Normal University, ShangHai, 200234, 2360158505@qq.com

2Department of Psychology, Qufu Normal University, Shandong Qufu, 273165

Abstract: Background: Facial attractiveness refers to the extent to which a target face induces positive feelings in others and the willingness that drive others to approach. It is an important indicator of social intercourse. The theory of attraction enhancement response suggests that smiling expressions could increase the facial attractiveness. However, the expressions could be classified into genuine and fake. The authenticity of expressions maybe have an effect on facial attractiveness. Purpose: Therefore, we aim to investigate the effects of genuine and fake smiles on the judgement of facial attractiveness. Methods: In this study, we first collected and produced genuine and fake smiles pictures and they were used as stimulus materials. Then, we used picture perception task paradigm and eye movements technology to explore the question. Results: The main effect of the authenticity of facial expressions was significant, and the score of genuine expressions was significantly higher than that of fake expressions. In the analysis of the eye movement data, the three areas for a total fixation time from long to short were eyes, nose and mouth. The total fixation time and the fixation rate in the mouth area of the genuine smile was significantly lower than that in the mouth area of the fake smile. Conclusion: These findings suggest that the facial attractiveness was influenced by the expressions authenticity, and the genuine smiles were perceived as more attractive than fake smiles. This is consistent

with the value pursuit of Chinese culture, which is “neither refined nor sincere, nor moving”. The mouth plays a key role in judging the attractiveness of genuine and fake smiling faces, and fake expression require more attention than genuine ones.

Keywords: genuine, fake, facial attractiveness

4-6 年级数困儿童表象旋转的眼动机制

叶华奇^{1,2} 杨伊生¹

1 内蒙古师范大学心理学院, 呼和浩特 010022

2 广西开放大学文理学院, 南宁 530022

摘要 以 4-6 年级的数困儿童和数学学习正常儿童为研究对象, 比较两类儿童表象旋转的反应时及眼动特点, 探讨数困儿童在几何图形表象旋转中的眼动机制。结果发现: (1) 数困儿童具有正常的表象旋转能力, 但差于数学学习正常儿童。(2) 数困儿童的表象旋转出现偏离正位效应。(3) 数困儿童能够提取符号线索促进表象旋转的认知加工, 表明他们具备从事物本身提取、归纳总结、概括信息的能力。(4) 数困儿童的眼动区域矩形面积更大、注视点持续时间更长、眼跳时间更长、眼跳距离更大、眼动轨迹更为杂乱, 表明数困儿童对认知加工资源缺乏良好的控制能力, 付出了更多的认知加工资源。研究结果为数困儿童的几何图形教育提供借鉴。

关键词 数困儿童; 表象; 表象旋转; 眼动机制

The Mechanism of Image Rotation Eye Movement in Children with Mathematics Learning Difficulties in 4th to 6th Grades

YE Huaqi^{1,2}, YANG Yisheng¹

1.College of Psychology, Inner Mongolia Normal University, Hohhot, China, 010022;

2.College of Arts and Sciences, Guangxi Open University, Nanning, China, 530022

Abstract: 180 children with math learning difficulties and normal children in grade 4-6 were selected. To compare the reaction time and eye movement characteristics of two kinds of children in the image rotation. The results show that: (1) the children with mathematical learning difficulties have normal image rotation ability, but it is worse than that of the children with mathematical learning difficulties. (2) Deviation from positive effect appears in the representation rotation of children with mathematical learning difficulties. (3) Children with learning difficulties in mathematics can extract symbolic clues to promote the cognitive processing of imagery rotation, indicating that they have the ability to extract, summarize and summarize information from things themselves. (4) The rectangles of the eye movement area of the children with difficulty in learning mathematics were larger, the fixation point duration was longer, the saccade duration was longer, the saccade distance was larger, and the eye movement trajectory was more chaotic, indicating that the children with difficulty in learning mathematics lacked good control over the cognitive processing resources and paid more cognitive processing resources. The results of this study provide a reference for the geometry education of children with mathematical learning difficulties.

Keywords: mathematical learning difficulties children, imagery, imagery rotation, eye movement mechanism

无意识的内隐记忆是否自动化？ ——对提取干扰对内隐记忆影响的元分析

黄发杰 孟迎芳

福建师范大学心理学院，福州，350000，hfj0519@aliyun.com

摘 要 采用元分析方法考察提取干扰是否会影响内隐记忆，通过文献搜索，共纳入 18 篇文献和 34 个独立效应量，总样本量 1247 人。结果发现：(1) 提取干扰对内隐记忆影响的总体效应量 $d=0.56$, $95\%CI=[0.47, 0.65]$, $Z=13.26$, $p<0.001$ ，说明提取干扰对内隐记忆有中等程度且显著的影响。(2) 分组异质性检验结果显示，将效应量分为知觉启动和概念启动、识别式和产生式这四类都可以分别共享一个独立的效应量， Q 知觉 (19)=28.09, $p=0.07$, $I^2=32.37$, $\sigma^2=0.04$, Q 概念 (6)=10.82, $p=0.09$, $I^2=44.56$, $\sigma^2=0.07$; QW 识别式 (15)=13.57, $p=0.56$, $I^2=3.78$, $\sigma^2=0.003$; QW 产生式 (10)=16.61, $p=0.09$, $I^2=39.80$, $\sigma^2=0.06$ 。(3) 亚组分析显示，识别式测验的效应量明显大于产生式测验， $Q(1)=10.61$, $p=0.001$, d 识别=0.63, d 产生=0.26。综上，提取干扰对内隐记忆的影响的总体效应量中等且显著大于 0，因此，无意识的内隐记忆是并非完全自动化的加工。但是，提取干扰对不同类型内隐记忆的影响还是存在差异，主要表现在识别式和产生式之间。

关键词 提取干扰，知觉启动，概念启动，识别式启动，产生式启动，元分析

Is unconscious implicit memory automated?

-- A meta-analysis of retrieval interference on implicit memory

Abstract: The method of meta-analysis was used to investigate whether the retrieval interference would affect implicit memory. Through literature search, a total of 18 literatures and 34 independent effects were included, with a total sample size of 1247 people. The results showed that: (1) the total amount of effect of retrieval interference on implicit memory was $d=0.56$, $95\%CI=[0.47, 0.65]$, $Z=13.26$, $p<0.001$, indicating that retrieval interference had a moderate and significant effect on implicit memory. (2) The results of grouping heterogeneity test show that the four types of effect size can share an independent effect size, $Q_{\text{perception}}(19)=28.09$, $p=0.07$, $I^2=32.37$, $\sigma^2=0.04$, $Q_{\text{concept}}(6)=10.82$, $p=0.09$, $I^2=44.56$, $\sigma^2=0.07$; $Q_{\text{identification}}(15)=13.57$, $p=0.56$, $I^2=3.78$, $\sigma^2=0.003$; $Q_{\text{production}}(10)=16.61$, $p=0.09$, $I^2=39.80$, $\sigma^2=0.06$. (3) Subgroup analysis showed that the effect size of recognition test was significantly larger than that of production test, $Q(1)=10.61$, $p=0.001$, $d_{\text{identification}}=0.63$, $d_{\text{production}}=0.26$. In conclusion, the overall effect size of the influence of retrieval interference on implicit memory was moderate and significantly greater than zero. Therefore, unconscious implicit memory is not completely automatic processing. However, the effects of retrieval interference on different types of implicit memory are different, mainly between recognition and generation.

中国大学生网络利他行为变迁的横断历史研究

张璐 乌云特娜（通讯作者） 金童林

内蒙古师范大学心理学院，呼和浩特，010022

摘 要 为探讨我国大学生网络利他行为水平随年代变化的趋势及性别差异，运用横断历史研究法对 2008 至 2018 年间的 48 篇测量我国大学生网络利他行为的有关文献（共 31241 名大学生）进行元分析。结果表明：

(1) 网络利他行为水平在这 11 年间有缓慢的上升趋势；(2) 网络利他行为整体的性别差异显著，男大学生网络利他行为水平上升更快；(3) 我国大学生网络利他行为水平与互联网现状、社会威胁和经济状况三方面的 9 项社会指标的相关系数显著，社会变迁可有效预测大学生网络利他行为。

关键词 大学生, 网络利他行为, 横断历史研究, 变迁, 社会指标。

A Cross-temporal Meta-analysis of Changes in Chinese College Students' Internet Altruistic Behavior

Abstract : To explore the changes in Chinese college students' internet altruistic behavior level and its gender difference, we used the cross-temporal meta-analysis to analyze 48 papers (31241 Chinese college students) measuring the internet altruistic behavior from 2008 to 2018. The results showed as following: (1) In the past 11 years, the overall level of internet altruistic behavior had slow upward trend; (2) The overall scores of internet altruistic behavior has obvious gender differences, and the increasing trend was more salient with male students than with their female counterparts; (3) Correlations between internet altruistic behavior and nine social indices of Internet status, social threats and economic states were positive, suggesting that social changes can effectively predict college students' online altruistic behavior.

Keywords: college students; internet altruistic behavior; cross-temporal meta-analysis; social change; social indices.

小学生学业拖延易感性的认知因素及其作用机制

王雪珂

西南大学心理学部, 重庆, 400715, 1123234236@qq.com

摘 要 学业拖延具有明显的个体差异性, 在面临相同学业任务时, 一些个体产生拖延, 而一些个体则不会产生拖延。本研究以拖延的时间决策模型为理论基础, 采用行为量表和任务范式考察了 5048 名 3-6 年级小学生的学业拖延及相关变量, 探究影响小学生学业拖延行为的认知易感性因素以及其在拖延决策中的作用。研究结果发现, 小学生学业拖延的认知易感性因素包括: 自我控制、情绪调节、时间管理, 具体表现在自我控制能力差、情绪调节困难、时间管理不足的个体在面对学业任务时更容易选择拖延行为; 不同年级主导学业拖延形成的认知易感性因素是不同的, 情绪调节在小学低年级中起主导作用, 自我控制在小学中年级中起主导作用, 时间管理在小学高年级中起主导作用; 学业拖延易感性高的个体在拖延决策过程中有着更多的负性情绪体验和更少的正性结果价值, 使其在拖延决策中更倾向于选择拖延行为; 认知易感性因素通过影响拖延决策的任务效用和结果效用进而影响个体的拖延倾向, 具体表现在自我控制可以通过降低任务的负性情绪体验, 增加正性结果价值来减少学业拖延行为; 情绪调节困难的个体更容易在面对负性情绪体验时选择拖延。本研究一方面较为系统考察了小学生学业拖延的认知易感性因素, 对于解释拖延所存在的个体差异、探明拖延形成及其发展认知机制具有较高的科学价值; 另一方面从拖延的时间决策模型出发探究认知易感性因素在学业拖延决策上的作用机制, 对于学业拖延行为的早期预防和干预也具有直接的现实意义。

关键词 学业拖延, 易感性, 时间决策模型, 认知因素。

Cognitive Factors and its Mechanism of Elementary Student's Vulnerability to Academic Procrastination

Abstract : Academic procrastination has individual differences. When faced with the same academic task, some individuals procrastinate, while some individuals do not. Based on the temporal decision model of procrastination (TDM), the study explored the vulnerability cognitive factors influencing academic procrastination behavior, and its role in procrastination decision-making by using scale to measure academic procrastination behavior and other ability in 5048 primary students. The results show that: (1) Self-control, emotion regulation and time management is the cognitive vulnerability factors of student's academic procrastination. Specifically, individuals with poor ability of self-control, difficulty in emotion regulation and insufficient time management are more likely to choose to procrastinate; (2) The cognitive vulnerability factors leading to academic procrastination are different in different grades. Among them, emotional regulation plays a leading role in the formation of academic procrastination in the lower grade of primary school, self-control plays a leading role in the middle grade, and time management plays a

leading role in the higher grade; (3) Individuals with high vulnerability to academic procrastination have more negative emotional experience and less positive outcome value in the process of decision-making, which makes them to choose procrastination; (4) Cognitive vulnerability factors affect procrastination tendency by influencing task utility and outcome utility. Specifically, self-control can reduce academic procrastination behavior by reducing negative emotional experience of the task and increasing positive outcome value. Individuals with difficulty in emotion regulation are more likely to procrastinate in the negative emotional experience. On the one hand, this study investigates the cognitive vulnerability factors of academic procrastination in primary student, which has important scientific value for explaining the individual differences of procrastination and exploring the cognitive mechanism of procrastination development. On the other hand, based on the time decision-making model of procrastination, it is of direct practical significance for the prevention and intervention of procrastination to explore the mechanism of cognitive factors in procrastination.

Keywords: Academic procrastination, Vulnerability, Cognitive factors, Temporal decision model.

摘要 电子游戏是人青睐的娱乐方式之一。研究者发现电子游戏中的亲社会属性影响玩家游戏后的亲社会行为。电子游戏中的虚拟化身是能被自己和其他玩家实时看到的自我呈现方式, 能通过化身线索(化身形象和化身行为)影响个体的自我概念和行为, 但目前关于虚拟化身对亲社会行为影响的研究较少, 研究结论也存在着争议。本文基于一般学习模型和普罗透斯效应, 通过两个研究探讨了电子游戏的虚拟化身对个体亲社会行为的影响及心理机制。研究一以 501 名《英雄联盟》或《王者荣耀》游戏玩家进行了问卷调查。结果发现, 在控制了性别、年龄、电子游戏经验、宜人性的前提下, 合作化身使用经验与个体的亲社会行为倾向呈显著正相关, 化身认同和特质同理心在合作化身使用经验和亲社会行为倾向之间起并行中介作用。研究二以 156 名无《守望先锋》游戏经验的女大学生为被试, 采用 2(化身形象: 邪恶/正义)×2(化身行为: 攻击对手/治疗队友)的两因素组间实验设计, 探讨了虚拟化身对亲社会行为(求助任务)、状态同理心(故事情境任务)和化身认同的影响。结果发现: (1) 化身形象对化身认同的主效应显著, 使用正义化身形象的被试比使用邪恶形象化身的被试具有更高水平的化身认同; (2) 化身行为对化身认同、状态同理心和亲社会行为的主效应显著, 与操作化身攻击对手的被试相比, 操作化身治疗队友的被试具有更高水平的化身认同、状态同理心和亲社会行为; (3) 化身认同在化身行为和亲社会行为之间的中介作用呈边缘显著。本研究发现电子游戏中的虚拟化身会对个体的亲社会行为造成影响, 并通过特质同理心和化身认同的中介作用来实现。但在严格控制材料短时实验研究中, 中介效应并不显著。本研究对电子游戏中的虚拟化身对个体亲社会行为的影响及其内在机制进行了深度探讨, 并对今后的研究提出合理的展望。

The Impact of Virtual Avatars on Individuals' Prosocial Behaviors in Video Games

Xu Fang^{1,2}, Cao Ming^{1,2}, Yang Chen^{1,2}, Zhou Zongkui^{1,2}

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University), Ministry of Education, Wuhan, 430079

2 School of Psychology, Central China Normal University, Wuhan, 430079

Abstract: video games have become one of the most popular entertainment activities for young people now. Previous research found that prosocial characteristics of the video games can influence individuals' prosocial behaviors. Virtual avatar in video games refers to the way of self-presentation that can be seen by oneself and other players in

real-time. Virtual avatars can influence the self-concept and behavior of individuals through avatar clues (avatar appearance and avatar behavior). However, there are few researches on the impact of virtual avatars on prosocial behaviors. Based on the General Learning Model and Proteus Effects, this article explores the impact of virtual avatars of video games on individuals' prosocial behaviors and psychological mechanisms through two studies. Study 1 used a questionnaire survey was conducted among 501 gamers of "League of Legends" or "Honor of Kings". The results showed that: under the premise of controlling gender, age, video game experience, and agreeableness, the cooperative avatar experience positively predicts the prosocial behavior tendency of individuals, and avatar identity and trait empathy was a mediator in the relationship between them. Study 2 designed a two-factor experimental design of 2 (avatar image: evil/justice) $\times$ 2 (avatar behavior: attacking opponents/healing teammates) to investigate virtual avatar on the inclusion of aggression in prosocial behaviors (help-seeking tasks), state empathy (story-situation tasks), and avatar identification. 156 subjects were randomly assigned to use avatars representing justice or evil to attack opponents or heal teammates. The results showed that: (1) Compared with the justice appearance, evil appearance had a more significant effect on the avatar identity. (2) Compared with attacking opponents, healing teammates had a more significant effect on the avatar identity, state empathy, and prosocial behavior. (3) The mediating role of avatar identity between avatar behavior and prosocial behavior is marginal significance, while state empathy is not significant. The present research found that virtual avatars will effect individuals' prosocial behaviors and this is achieved through the mediating role of trait empathy and avatar identification. However, under strict control of the experimental materials, the short-term effects' underlying mechanisms is unclear. Finally, this research has conducted an in-depth discussion on the impact of virtual avatars in video games on individual prosocial behaviors and their internal mechanisms and put forward reasonable prospects for future research.

留守儿童心理健康水平变迁的横断历史研究

张孝义^{1,2} 任俊¹ (通讯作者) 戴洲道²

1 浙江师范大学教师教育学院, 金华, 321004, renj@zjnu.cn

2 黄山学院教育科学学院, 黄山, 245041

摘要 目的: 为了探讨我国留守儿童心理健康水平随年代的变迁, 以及相关的影响因素是什么? 方法: 在知网、万方、维普三个中文数据库中分别以“留守儿童”“留守孩”与“心理健康”“心理健康诊断测验”“MHT”任意字段匹配进行检索, 共检索到 10031 篇文献, 根据筛选标准, 最终纳入文献 102 篇。采用横断历史研究方法对 102 篇使用心理健康诊断标准化量表的研究数据进行元分析。结果: (1) 留守儿童与非留守儿童的心理健康水平随年代变化不大但有差异, 且留守儿童较非留守儿童心理健康水平更差, 其中最为明显的就是学习焦虑: 非留守儿童的学习焦虑随年代明显下降, 而留守儿童的心理焦虑却随着年代有上升的趋势; 无论是留守儿童还是非留守儿童他们的孤独感都在随年代不断增加。(2) 留守男生、女生的心理健康水平随年代呈下降趋势, 其中留守男生下降的幅度较为明显, 但是留守男生的心理健康水平仍较高; 时代变化所产生的不良环境对留守男生的影响更大, (3) 留守小学生的心理健康水平随年代明显下降, 而留守初中生则变化不大, 且留守小学生与留守初中生心理健康水平差异不大; (4) 其他监护类型 (缺乏有效的双亲监护) 的留守儿童心理健康水平随年代明显下降, 而单亲监护的留守儿童心理健康水平随年代变化不大, 但是两种监护类型的留守儿童心理健康水平均低于双亲监护的非留守儿童, 两种类型的留守儿童之间不存在显著差异。

A cross-sectional historical study on the Change of mental health level of left-behind children

Zhang xiaoyi^{1,2}, Ren Jun¹, Dai Zhoudao²

College of Teacher Education, Zhejiang Normal University, 321004

School of Education Science, Huangshan University, Huangshan, 245041

Abstract: A cross-sectional historical study was conducted on 102 articles from 2004 to 2017 that used the Mental Health Test (MHT) to measure the mental health level of left-behind children and non-left-behind children in China (a total of 82,169 subjects). The results showed that: (1) The mental health level of left-behind children and non-left-behind children does not change much with age, but there is a difference, and the mental health level of left-behind children is worse than that of non-left-behind children. The most obvious one is learning anxiety. The learning anxiety of non-left-behind children decreases obviously with the age, while the psychological anxiety of left-behind children tends to rise with the age. No matter left-behind children or non-left-behind children, their loneliness is increasing with The Times; (2) The mental health level of both left-behind boys and left-behind girls has decreased significantly with age, among which left-behind boys have decreased significantly. Meta-analysis results show that left-behind boys have a higher mental health level. (3) The mental health level of left-behind primary school students decreases with age, and the mental health level of left-behind junior high school students does not change much with age. The results of the meta-analysis show that there is little difference in the mental health level between left-behind primary school students and left-behind junior high school students. (4) single guardianship of left-behind children's mental health s changed little, other types of guardianship left-behind children's mental health obviously drops, s component analysis results show that the two types of guardianship of left-behind children's psychological health level is lower than parents care left-behind children, soldiers do not exist significant differences between two kinds of left-behind children.

摘要 积极效价偏向表明在熟悉情绪词中说话者对积极词反应更快。但很少研究者关注情绪词在学习阶段是否也会出现积极效价偏向。在本研究中，我们报告了两个正式实验，研究汉语为二语的双语者在学习汉语情感成语时是否表现出积极效价偏向，以及语义对积极效价偏向和情感信息的影响。在正式实验之前，汉语为二语的双语者需要学习汉语情感成语并以较高的正确率通过了汉语情感成语测试，之后参加正式实验。实验一采用效价判断任务探究在学习阶段，双语者对情感成语是否表现出积极效价偏向。实验二采用语义相关判断任务，进一步探讨语义对积极效价偏向和情绪信息的影响。实验结果表明，情感成语的学习过程中存在着积极效价偏向，语义调节着积极效价偏向和积极的信息加工。综上所述，在汉语情感成语的学习过程中积极的效价偏向被习得，并受到语义信息的调节。

Abstract: Positive valence bias indicates speakers respond faster to positive than negative information in emotion words they had learned and used in the natural context for a long time. Few researchers paid attention to which phase when positive valence bias was acquired in the learning process or used in real context for emotion words. In this study, we reported two formal experiments on speakers learning Chinese as a second language (CSL) to investigate positive valence bias in the learning process of new Chinese emotion idioms and the effect of semantics on positive valence bias and emotion information. CSL speakers, who had acquired new Chinese emotion idioms and passed the test for learned Chinese idioms with a high accuracy rate before formal experiments, could participate in Experiment 1 later and Experiment 2. In Experiment 1, target materials were new Chinese idioms with positive and negative information. Positive valence bias in the learning process of new Chinese idioms was investigated in valence judgments. Experiment 2 used a semantic relatedness decision task to explore further semantics' effect on positive valence bias and emotion information. Results of two experiments showed that positive valence bias appeared in the learning process of emotion idioms, and semantics conditionally influenced positive valence bias and positive information processing. In summary, positive valence bias has been acquired in the learning process of new Chinese idioms and modulated by semantic information.

Keywords: Chinese as second language learners, positive valence bias, Chinese emotion idioms, semantic information

学龄儿童心理行为问题与执行功能不同成分关系的追踪研究： 基于双因子模型的交叉滞后模型分析

赵改 胡铭铭 李珊 王瑶 田娟 陶沙（通讯作者）

北京师范大学认知神经科学与学习国家重点实验室, 北京, 100875, 陶沙, taosha@bnu.edu.cn

摘要 心理行为问题, 如内化和外化行为问题, 在学龄儿童中普遍存在, 其与执行功能的关系是儿童心理健康领域的重要研究问题。已有研究多将内化和外化问题视为两种分离的概念结构, 而忽略了内外化问题的内在联系。基于双因子模型提出的心理健康一般病理因子 (General p) 假设为认识这一问题提供了崭新视角。为深入探索儿童心理行为问题的一般病理因子和内外化问题与抑制控制、工作记忆和认知灵活性等执行功能不同成分的发展关联, 本研究采用间隔一年的追踪设计, 对 1639 名 6 - 13 岁儿童进行两个时间点的测量, 儿童的内外化问题由家长报告困难与长处问卷 (SDQ) 父母版 (基线: Cronbach' s α 系数 0.778, 第二年: Cronbach' s α 系数 0.792) 来评估, 执行功能由儿童完成执行功能任务来评估。研究结果显示, 1) 在基线和第二年的追踪测量中, 双因子模型 (general p、独特内化和外化因子) 的拟合均优于单因子 (精神病理因子) 和两因子 (内化和外化因子) 模型, 且该双因子结构具有跨时间测量一致性。这表明双因子模型比传统的两因子模型或单因子模型能更好地表征学龄儿童心理行为问题的结构。2) 在整体和不同年龄组中, 儿童在基线期更强的抑制控制功能显著预测一年后更少的外化问题, 但基线期外化问题并不能预测一年后的抑制控制功能。3) 在整体和大多数年龄组中, 儿童在基线期更高水平的认知灵活性显著预测一年后更低水平的 general p, 反之也成立。4) 在整体和不同年龄组中, 儿童的工作记忆与外化问题和 general p 均不存在显著的相互预测。5) 执行功能 3 个成分和双因子模型中的独特内化问题均不存在互相预测关系。本研究不仅在学龄儿童中验证了双因子模型可较表征心理行为问题的内在结构, 而且第一次揭示出学龄儿童认知灵活性与 general p 的关系。本研究为理解儿童心理行为问题的发展机制及其预防和干预提供了新证据。

The Longitudinal Associations between Psychiatric Problems and Different Components of Executive Function in School-age Children: Cross-Lagged Analysis Based on Bifactor Model

Gai Zhao, Mingming Hu, Shan Li, Yao Wang, Juan Tian, Sha Tao

State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875

Abstract: Psychiatric problems, such as internalizing and externalizing behavioral problems, are prevalent in school-age children. The association with executive function and psychological behavioral is an important research issue. Most previous studies treated externalizing and internalizing problems as two separate structures, ignoring the co-occurrence between them. The general psychopathological (general p) based on the bifactor model provides a new perspective to understand this problem. The aim of this study is to examine the association with general p, internalizing and externalizing problems and the different components of executive function, such as inhibitory control, working memory and cognitive flexibility. This study used cross-lagged modeling to examine the dynamic relations between general and specific factors and executive functions. This study used one-year longitudinal design and 1639 children aged 6–13 years were measured at two time points, children internalizing and externalizing problems were assessed by their parents completed the Strengths and Difficulties Questionnaire (SDQ) (baseline: Cronbach's α coefficient = 0.778, follow-up: Cronbach's α coefficient = 0.792), while the executive functions (inhibitory control, working memory and cognitive flexibility) were self-reported by participants. Results showed that 1) At both the baseline and the second year of measurement, the bifactor model was better than the traditional two-factor model or general-factor model. And measurement invariance of the bi-factor structure was established across one year, which indicates that the bifactor model can better characterize the structure of the psychological behavioral problems than the traditional two-factor model general-factor model. 2) Inhibitory control at baseline significantly negatively predicted the externalizing problem one year later for the whole sample and across various age groups, not vice versa. 3) Cognitive flexibility and general p mutually predict each other for the whole sample and most of age bands after controlling gender and parental education. 4) In contrast, working memory at baseline did not significantly predict the externalized problem one year later or the general p, nor did the psychopathological factors at baseline significantly predict working memory one year later. 5) There was no significant correlation between the three components of executive function and the unique internalization problems. This study not only supported the validity of the bi-factor model in capturing the structure of psychiatric problems in children, but initially revealed the relations between poor cognitive flexibility and general p. This study provided emerging evidence for understanding the development mechanism of mental behavior problems in children as well as its prevention and intervention.

理解阅读困难与数学困难的共患：工作记忆不同成分缺陷特征比较

陈睿¹ 王筋力¹ 陶沙¹ (通讯作者)

¹ 北京师范大学, 认知神经科学与学习国家重点实验室, 北京, 100875, taosha@bnu.edu.cn

摘要 阅读困难和数学困难是学龄儿童常见的神经发育问题, 且高频共患。已有研究很少关注阅读-数学困难的共发、分离相关的认知技能缺陷模式。工作记忆是对信息进行加工和储存的能力, 包括语音储存、复杂记忆广度和抑制、更新和转换等中央执行功能的多种成分, 在阅读和数学等高级认知活动中具有重要作用。阅读困难和数学困难均可能存在工作记忆缺陷, 然而阅读困难和数学困难共发及分离与不同领域、不同成分的工作记忆有何关联模式, 目前尚不清楚。为此, 本研究拟系统比较阅读困难及数学困难共发及分离的3类

儿童在工作记忆不同领域和成分上的缺陷特征,通过系统检验广泛性、严重性和独立性缺陷等重要假设,探讨阅读和数学困难共发与分离的认知机制。我们结合教师提名、学校成绩与成就测验,通过对 811 名小学五年级儿童(平均年龄 11.02 岁, $SD = .52$)阅读及数学能力的两轮筛查,识别出 23 名阅读数学困难共患儿童,单纯阅读或数学困难的儿童各 15 及 21 名,另有 36 名儿童为正常对照组,不同组别儿童年龄和一般认知能力差异不显著。研究所使用阅读、数学、工作记忆任务的信息系数(Cronbach's α)均高于 0.76。结果表明,阅读和数学困难共患儿童语音储存、复杂工作记忆、抑制、更新和转换表现显著低于正常同龄儿童,且与语言和数字材料无关。同时,阅读和数学困难共患儿童语义抑制、转移和转换表现显著差于同龄单纯阅读或数学困难儿童。个体缺陷分析显示,转换缺陷为阅读和数学困难共患儿童所独有。我们结合共享与分离病因模型和共患假说,讨论了阅读和数学困难共患与分离的认知机制及对阅读、数学困难诊断与干预的启示。

Understanding the Comorbidity of Reading and Mathematics Learning Difficulties: The Working Memory Deficit Profiles

Chen Rui¹, Wang Jiali¹, Tao Sha¹

State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875

Abstract: Reading difficulties and mathematics learning difficulties are common neurodevelopmental problems, that often co-occurred in school-age children. Previous studies have paid little attention to the patterns of cognitive skill deficits associated with the comorbidity and dissociation of reading and mathematics difficulties. Working memory refers to the capacity to process and store information, including phonological storage, complex memory span and central executive function such as inhibition, update, and shifting. Working memory plays an important role in reading, mathematics and other advanced cognitive activities. Both reading and mathematics difficulties show working memory deficits. However, the relationship between the comorbidity and dissociation of reading and mathematics difficulties within different domains and components of working memory is still unclear. Therefore, this study aims to systematically compare the deficit characteristics of different domains and components of working memory among three types of children with reading and mathematics difficulties. By testing the broader, severe, and specific deficits hypotheses, we explored the cognitive mechanism of the coexistence and separation of reading and mathematics difficulties. Eight hundred and eleven children at Grade 5 (mean age 11.02 years, $SD = .52$) in Beijing completed the screening tests, including two times' assessments in reading and mathematics achievement and teacher nomination. 23 children were classified as co-occurred reading and mathematics difficulties (RDMD), 15 children were reading difficulties (RD) alone and 21 children were mathematics difficulties (MD) alone. 36 children were selected as the typical controlled group (TD). There was no significant difference in age and general cognitive ability among different groups. The Cronbach's α of reading, mathematics and working memory tasks were all higher than 0.76. The comorbid RDMD group showed significantly lower performances than the TC group in phonological storage, complex memory span, inhibition, update and shifting, irrespective of language and numerical materials. Moreover, the comorbid RDMD group performed the poorest semantic inhibition, update and shifting when comparing with the RD alone and MD alone groups. Individual deficit analysis indicated a unique shift deficit for the comorbid RDMD group while neither the RD alone group nor the MD alone group showed such a deficit. Based on the correlated liabilities model and the hypothesis of comorbidity, this paper explores the cognitive mechanism of comorbidity and dissociation of reading and mathematics difficulties and its implications on the diagnosis and intervention.

家庭功能与儿童品行问题关系的一项纵向研究： 以个体内反应时变异为指标的注意控制的调节作用

曾思瑶 王振宏* 张润竹 杨晓辉*

陕西师范大学心理学院，陕西省儿童青少年心理与行为健康哲学社会科学重点研究基地，西安，710062

通讯作者：王振宏，E-mail: wangzhenhong@snnu.edu.cn；杨晓辉，E-mail: yangxiaohui@snnu.edu.cn

摘要 以往研究主要从个体间水平上探究家庭环境，以个体内反应时变异（intraindividual response time variability, IIRTV）为指标的注意控制和儿童外化问题间的关系，很少关注从个体内水平来探讨家庭环境、IIRTV 和儿童外化问题之间的关系，尤其是品行问题。基于家庭系统理论与个体-环境交互作用理论，本研究采用多水平模型进行分析，探讨以 IIRTV 为指标的注意控制和家庭功能如何共同预测 6-9 岁儿童品行问题。研究选取 236 名一年级学生为被试，对其进行为期三年的追踪研究。采用 go/no-go 任务测量儿童的注意控制。采用父母报告的家庭适应性与亲密度量表中文版（FACES II-CV）和长处与困难问卷（SDQ-CV）测量家庭功能及儿童品行问题。结果发现：（1）在儿童个体内变化水平上，儿童品行问题随家庭功能的变化而变化，家庭功能能够负向预测儿童品行问题；（2）在儿童个体间变化水平上，IIRTV 与家庭功能能够显著交互预测儿童品行问题发展的个体差异；（3）只有在那些较低水平家庭功能的儿童中，较大的 IIRTV 能够显著预测儿童在一到三年级之间更多的品行问题，而当家庭功能较好时，IIRTV 和品行问题之间不存在显著相关。此外，表现出较大 IIRTV 水平的儿童对家庭功能的负面影响更加敏感，符合素质压力模型。研究结果表明较差的家庭功能和较低水平的注意控制（较大的 IIRTV）对品行问题有较强的预测作用，而较高水平的注意控制（较小的 IIRTV）能缓冲较差的家庭环境给儿童带来的不良影响。

关键词 品行问题，注意控制，家庭功能，多水平分析，IIRTV

The Longitudinal Relationships between Family Functioning and Children's Conduct Problems: The Moderating Role of Attentional Control Indexed by Intraindividual Response Time Variability

Siyao Zeng, Zhenhong Wang*, Runzhu Zhang, Xiaohui Yang*

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062

Corresponding authors: wangzhenhong@snnu.edu.cn; yangxiaohui@snnu.edu.cn

Abstract: Previous studies have examined the association among family environment, children's attentional control indexed by intraindividual reaction time variability (IIRTV), and externalizing problems, which mainly focused on between-child comparisons. There are few studies exploring within-child associations among the family environment, IIRTV, and children's externalizing problems, especially for conduct problems. The present study examined how children's attentional control indexed by IIRTV, and family functioning jointly predict children's conduct problems from ages 6 to 9 years old at the within- and between-child levels. Data came from 236 children who participated in a longitudinal study and collected at Grade 1, Grade 2, and Grade 3. Children completed the Go/No-go task to assess their IIRTV. Children's parents completed the Chinese version of the Family Adaptability and Cohesion Scale (FACES II-CV) and the Strengths and Difficulties Questionnaire (SDQ-CV) to assess family functioning and children's conduct problems, respectively. The results indicated that (1) within-child changes in conduct problems were negatively correlated with within-child changes in family functioning, and the improvement of family functioning would predict the decrease in children's conduct problems; (2) on the between-child level, IIRTV and its interaction with family functioning significantly predict individual differences in the development of conduct problems; (3) the association between conduct problems and IIRTV was significant at lower values of family functioning. Children who showed greater levels of IIRTV were particularly sensitive to the negative effects of family functioning, which was consistent with the diathesis-stress model. The present study exhibited that poor family functioning and attentional control indexed by greater IIRTV are stronger predictors of conduct problems while better

attentional control indexed by lower IIRTV could buffer the adverse effects of poor family environment.

一般认知能力、批判性思维与学业成就的关系:交叉滞后的研究

吕晓晶¹ 周家璧¹ 任学柱² (通讯作者)

¹ 华中科技大学, 武汉, 430074

² 华中科技大学, 武汉, 430074, renxz@hust.edu.cn

摘要 批判性思维与学业成就是学生学习的两大重要方面, 两者之间不仅存在横断的相关关系, 同时也可能存在动态的相互影响。而五、六年级的学生面临小学升初中的关键时期, 其认知发展阶段也正处在具体运算阶段到形式运算阶段的转折期, 思维水平和学业成就的动态作用强度也可能发生一定的变化, 基于此, 本研究旨在探讨批判性思维在四到六年级小学生中的发展变化, 以及批判性思维与学业成就之间的动态相互影响。此外, 现有研究表明无论是批判性思维还是学业成就, 都与基础性的一般认知能力有关, 因此, 在探讨两者的相互作用关系时, 一般认知能力是不可忽视的因素。本研究同时考虑把一般认知能力纳入了研究框架中, 探讨批判性思维、学业成就和一般认知能力之间的动态相互影响。研究对象来自华中科技大学附属小学学生, 对 160 名小学生 (男生 81 人, 女生 79 人) 从四年级 ($M_{age} = 9.37$, $SD = 0.484$) 到六年级, 每年 12 月进行一次追踪测量, 在各时间点上, 对学生的批判性思维和一般认知能力进行了测量, 并获取每学期学生的期末考试成绩作为学业成就指标, 最后采用 SPSS26.0 进行描述统计和相关分析, 运用 Mplus8.0 进行潜增长模型(LGCM)、自回归交叉滞后模型(CLPM)和随机截距交叉滞后模型(RI-CLPM)的构建。本研究主要发现如下: (1) 附小四~六年级小学生批判性思维的发展趋势总体呈现出向上增长的线性趋势, 且批判性思维总分处于中等偏上水平。(2) 学业成就和批判性思维之间的动态影响表现为学业成就显著预测批判性思维的单向、滞后影响, 然而, 这种影响随时间减弱。(3) 控制被试间稳定性后, 学业成就和批判性思维在第二年和第三年存在交叉滞后作用, 即使在加入了一般认知能力之后, 结果依然稳定。

关键词 批判性思维, 学业成就, 一般认知能力, 小学生

The relationship between general cognitive ability, critical thinking, and academic achievement: A Cross-Lagged study

Xiaoqing Lv¹, Jiabi Zhou, Xuezhu Ren²

¹ Huazhong University of Science & Technology, Wuhan, 430074

² Huazhong University of Science & Technology, Wuhan, 430074, renxz@hust.edu.cn

Abstract: Critical thinking and academic achievement are two important aspects of students' learning. There is not only a cross-sectional correlation between them, but also a dynamic interaction between them. However, the fifth and sixth graders are in the transition stage from primary school to middle school, and their cognitive development stage is in the transition period from concrete operation to formal operation. The intensity of the dynamic effect of thinking level and academic achievement may also change to some extent. Based on this, the purpose of this study is to explore the development and change of critical thinking among students in fourth grade to sixth grade, and the dynamic interaction between critical thinking and academic achievement. In addition, it has been proved that both critical thinking and academic achievement are related to basic general cognitive ability. Therefore, general cognitive ability cannot be ignored when discussing the interaction between the two variables. This study also considered the general cognitive ability into the research framework, to explore the dynamic interaction between critical thinking, academic achievement and general cognitive ability.

The data of this study were collected from the primary school students affiliated to Huazhong University of Science and Technology. From fourth grade ($M_{age} = 9.37$, $SD = 0.484$) to sixth grade, 160 primary school students (81 boys and 79 girls) were tracked and measured in December every year. At each time point, the final exam scores of students in this semester were obtained as the academic achievement indicators. Finally, SPSS26.0 was used for

descriptive statistics and correlation analysis. The Latent Growth Curve Modeling (LGCM), The Autoregressive Cross-Lagged Panel Model (CLPM) and The Random Intercept Cross-Lagged Panel Model (RI-CLPM) were constructed by MPLUS 8.0. The main findings of this study are as follows : (1) The development trend of critical thinking of students from fourth grade to sixth grade of affiliated primary school shows a linear upward trend, and the total score of critical thinking is above the average level. (2) The dynamic influence between academic achievement and school shows a linear upward trend, and the total score of critical thinking is above the average level. (2) The dynamic influence between academic achievement and critical thinking is manifested as that academic achievement significantly predicts the one-way and delayed influence of critical thinking, however, this influence decreases with time. (3) After controlling for interparticipant stability, there is an cross-lagged interaction between academic achievement and critical thinking in the second and third years, the results remained stable even after accounting for general cognitive abilities.

摘 要 校园欺凌是发生在同伴群体间的故意地、反复地、有针对性地身体、言语、关系和心理攻击 (Olweus, 1993)。校园欺凌在全球广泛存在, 联合国教科文组织发布的数据显示, 全球有 32% 的学生近一个月内, 至少一次被学校的同龄人欺凌, 每 3 个学生中就有 1 个曾遭受过同学的欺凌。而在国内, 基于 2018 年北京-上海-江苏-浙江的四省市 PISA 数据显示中国约有 48.2% 的学生经历过校园欺凌, 约有 17.7% 的学生在近一年内频繁遭受校园欺凌 (申燕妮, 辛涛, 张佳慧, & 林喆, 2020), 受欺凌是导致包括自杀、精神障碍等一系列身心健康问题的重要风险因素 (Danese & Tan, 2014)。减少校园欺凌不仅关系到青少年的健康发展, 也关系到国家未来的人力资本。因此, 如何准确识别预测个体是否会受欺凌、是否成为欺凌者就成为一个重要研究课题。本研究基于 2543 名中学生的两次追踪数据, 首先使用潜类别分析基于欺凌/受欺凌同伴提名对青少年进行欺凌角色分类, 然后使用卡方自动交互检测 (CHAID) 决策树方法识别预测不同校园欺凌角色的因素。研究结果显示: (1) 基于潜类别分析可以将校园欺凌角色分为四类: 欺凌者、受欺凌者、欺凌-受欺凌者和未参与者; (2) 决策树分析显示, 在是否会成为欺凌者中, 偏差同伴、受欢迎度和父母参与是主要预测变量, 训练集正确率为 83.4%, 检验集正确率为 83.3%; 在是否会成为受欺凌者中, 外貌、抑郁状态、公正世界信念和问题行为是主要测验变量, 训练集正确率为 85.7%, 检验集正确率为 84.8%; 在是否会成为欺凌-受欺凌者中, 个体是学业成绩、父母参与、外貌和问题行为是主要预测变量, 训练集正确率为 91.3%, 检验集正确率为 92.9%。确定不同校园欺凌角色的预测因素有助于提前预测个体未来的欺凌/受欺凌情况, 提前做出保护性措施, 防止和降低校园欺凌的发生, 促进青少年健康成长。

网络游戏化身面孔的注意偏向研究

曹敏 周宗奎（通讯作者）

青少年网络心理与行为教育部重点实验室暨华中师范大学心理学院, 武汉, 430079, zhouzk@mail.ccnu.edu.cn

摘 要 基于自我扩展理论和化身-自我关联性模型, 通过两项行为实验分别考察网络游戏化身面孔的注意加工特点和影响因素。实验一采用点探测任务同时考察了注意定向和注意维持两种可能导致注意偏向的加工成分, 通过比较 32 名游戏玩家的反应时和正确率发现: 当出现在有效线索位置时, 化身面孔、自我面孔、名人面孔和中性图片的任务反应时差异不显著; 当出现在无效线索位置时, 化身面孔和自我面孔的任务反应时要显著慢于中性图片。这表明网络游戏化身面孔与自我面孔都表现出注意转移困难这一注意偏向, 但未表现出

注意定向加速。实验二采用视觉搜索任务考察了网络游戏化身面孔注意偏向的影响因素,通过比较 37 名网络游戏玩家对熟悉化身面孔、不熟悉化身面孔、有吸引力化身面孔和没有吸引力化身面孔的搜索速度来判断网络游戏化身面孔的熟悉度和吸引力对其注意偏向的影响。结果发现:玩家在搜索熟悉化身面孔时的速度要显著快于不熟悉化身面孔,搜索有吸引力化身面孔与没有吸引力化身面孔时的反应时差异不显著。这表明,化身面孔的熟悉度会影响个体的注意偏向,玩家对自己更加熟悉的化身具有注意偏向。本研究将自我相关信息的注意加工优势从现实生活中的面孔、人名等拓展到了网络虚拟环境中,证实网络游戏化身作为虚拟自我相关信息和现实生活中的高自我相关信息一样具有注意加工优势的同时,还比较了具有不同属性的化身面孔的注意加工特点,这对帮助个体理解虚拟自我相关信息对自我建构和认知加工的影响具有重要作用。

Attentional Bias towards Avatar Face in Online Games

Cao Min, Zhou Zongkui

Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education;
School of Psychology, Central China Normal University, Wuhan 430079, China

Abstract: Based on the self-expansion theory and avatar-self-relevance model, this study investigated the attention processing characteristics and influencing factors of avatars in online games through two behavioral experiments. In experiment 1, the spatial cue task was used to compare the difference of 32 players between the attentional processing results of avatar-face, self-face and famous-face and the neutral picture, and the four types of pictures will appear in the effective clue position and the invalid clue position respectively. Through the spatial cue task paradigm, attention orientation and attention transfer were also investigated. Results showed that there was no significant difference in the response of avatar-face, self-face and famous-face and neutral picture under the condition of effective clues. In the null cue condition, the response time of the avatar-face and the self-face was significantly slower than that of the neutral picture. This indicates that the online game avatar-face shows the same attention bias as the self-face, and the mechanism leading to the occurrence of attention bias is impaired attentional disengagement rather than attention orientation. In experiment 2, visual search task was used to investigate the effects of familiarity and attractiveness on the attentional bias of avatars, through comparing the search speed of 37 players to familiar, not familiar, attractive and unattractive avatar face. The results showed that search response of familiar avatars was significantly faster than that of unfamiliar avatars. However, there was no significant difference between the response of attractive avatars and that of unattractive avatars. This indicates that the familiarity of the avatar-face will affect the attention processing speed of the individual, and the more familiar the avatar is, the closer it is to the self. This study expands the attention processing advantage on self-related information from real life self-related information to virtual self-related information. The spatial cue task is used to distinguish two components of attention processing, and the mechanism of attention bias between avatar-face and self-face is clarified. Avatar-face attention bias in online games is reflected in that once noticed, it is difficult to remove, and this attention processing is affected by players' familiarity with the avatar-face. This study not only provides evidence for avatar-self-relevance model and self-extension theory, but also plays an important role in helping individuals understand the influence of self-awareness and self-construction on individuals' social information processing.

Keywords: Online games avatars, Self, Attentional bias, Familiarity, Attractiveness

A Parallel Latent Growth Model of Preference for Solitude and Depressive Symptoms among Chinese Early Adolescents

Na Hu¹, Gangmin Xu¹, Xi Chen¹, Muzi Yuan¹, Junsheng Liu^{1*}, Biao Sang²

¹ School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

² Shanghai Academy of Educational Science, Shanghai, China

Abstract: The goal of this study was to explore longitudinal and parallel associations between preference for solitude and symptoms of depression among Chinese early adolescents. Participants were 853 adolescents (48.4 % female; Mage= 14.65 years, SD =0.54) from mainland China, who completed self-report assessments of preference for solitude and depressive symptoms at three time-points (from grade 7 through grade 9). Among the findings, results from parallel latent growth modelling suggested that higher initial levels of preference for solitude at Grade7 negatively predicted the slope of adolescents' depressive symptoms. This indicates that higher levels of preference for solitude at Grade 7 predicted a slower increase in adolescents' depressive symptoms levels over three years. Implications are discussed that consider the adaptive mechanism of preference for solitude among Chinese adolescents in the development of depressive symptoms.

Keywords: preference for solitude, depressive symptoms, parallel changes, early adolescence

BDNF 基因 rs6265 多态性与父母严厉管教对学前儿童工作记忆的交互影响

张悦文¹ 王振宏¹ (通讯作者)

¹ 陕西师范大学心理学院, 西安, 710062, wangzhenhong@snnu.edu.cn

摘要 工作记忆是执行功能的重要组成部分, 已有研究分别探讨了基因与家庭环境因素对儿童工作记忆发展的影响, 但基因与家庭环境因素如何交互影响儿童的工作记忆发展, 目前尚缺少研究。本研究以 632 名学前儿童 (平均年龄 = 5.11 岁, SD = 0.97) 为被试, 通过家长报告的《亲子冲突解决策略量表》测量学前儿童父母的严厉管教水平, 通过儿童完成科斯基木任务考察儿童的工作记忆能力, 从唾液样本中提取 DNA 进行分型, 获得 BDNF 基因 rs6265 位点多态性, 从而考察 BDNF 基因 rs6265 多态性与父母严厉管教对学前儿童工作记忆的交互影响。研究结果显示, 性别与 BDNF 基因 rs6265 多态性对学前儿童工作记忆的交互作用显著, BDNF 基因 rs6265 多态性可显著预测男孩工作记忆水平, 对女孩工作记忆预测不显著 (携带 CC 基因型的男孩其工作记忆成绩显著好于 TT/TC 基因型男孩, 携带不同基因型的女孩其工作记忆成绩没有显著差异)。尤其是研究发现, 在控制了年龄、社会经济地位后, BDNF 基因 rs6265 多态性与父母严厉管教对学前儿童工作记忆的交互作用显著。具体而言, 携带 CC 基因型儿童的工作记忆成绩在高父母严厉管教条件下显著降低, 而低父母严厉管教条件下其工作记忆没有受影响。对于携带 TT/TC 基因型儿童, 其工作记忆成绩在不同父母严厉管教条件下没有显著差异。研究结果支持了素质-压力模型假设, 表明 CC 型基因是一个消极环境脆弱性因子。

Interaction effects between BDNF gene rs6265 polymorphism and parental harsh discipline on preschoolers' working memory performance

Yuewen Zhang¹, Zhenhong Wang^{1*}

¹School of Psychology, Shaanxi Normal University, Xi'an, China

*Corresponding author, mail address: wangzhenhong@snnu.edu.cn

Abstract: Working memory (WM) is one of the main components of executive functions that allows to process, store and update information, to accomplish a task. It has been shown that WM is affected both by genetic polymorphisms

and by environmental factors. However, less is known about how genes interact with family environment to affect children's WM performance. To address this question, the current study examined how BDNF gene rs6265 polymorphisms interacted with parental harsh discipline to impact on preschoolers' WM performance. Six hundred and thirty two preschool children (Mage = 5.11, SD = 0.97) completed the Digits Corsi Blocks Task to assess their WM performance. Their parents were asked to fill out the Parent-Child Conflict Tactics Scale (CTSPC) to assess parental harsh discipline. The genomic DNA of preschoolers was extracted from their saliva samples, PCR primers were designed using MassARRAY Assay Design Suite V2.0. Results showed that gender significantly interacted with BDNF gene rs6265 polymorphism to predict preschoolers' working memory. Specifically, BDNF gene rs6265 polymorphism could significantly predict boys' but not girls' working memory performance (The performance of boys with CC genotype was significantly better than that of boys with other genotypes, while there was no significant difference of girls with different genotypes). Moreover, After controlling for age, socioeconomic status (SES), results showed that the BDNF rs6265 polymorphism significantly interacted with parental harsh discipline to impact on preschoolers' WM performance, and CC genotype is a sensitivity factor to the environmental influence. The results support the hypothesis of diathesis-stress model, and indicating that CC genotype is a vulnerability factor to the negative environmental influence. The findings of the present study enrich the literature on the association between BDNF rs6265 polymorphism and parental harsh discipline in preschoolers' WM performance, and expands our knowledge about the G×E underpinnings of children's executive function.

Keywords: rs6265 polymorphism, parental harsh discipline, working memory, gene-environment

孤独症儿童阅读能力不平衡假说： 中文阅读能力发展的不同特征及其影响因素

刘娟¹ 王莹¹（通讯作者）

¹ 清华大学心理学系，北京，100084, yingwang@mail.tsinghua.edu.cn

摘要 阅读能够有效提高孤独症儿童的独立性，增加社交词汇量，扩大兴趣范围，并让他们更好地理解 and 参与社会活动。以往关于孤独症儿童阅读能力水平的研究表明其阅读技能发展存在很大的异质性。为了解中文孤独症儿童的阅读能力发展特征及其影响因素，本研究对 157 名 3-11 岁的孤独症儿童 ($M = 6.68, SD = 1.54$) 的中文阅读能力以及与阅读相关的语言和认知技能进行测查。研究结果发现，孤独症儿童的中文阅读能力发展存在 4 种类别：第 1 类“善读者” ($N = 33$) 表现为字词解码及相关的语言和认知技能均表现良好；第 2 类“善解码者” ($N = 61$) 表现为字词解码能力、语音意识和语素意识较好，但语言理解相对较弱；第 3 类“弱解码者” ($N = 43$) 表现为字词解码能力较弱，语言理解处于平均水平；第 4 类“弱读者” ($N = 20$) 表现为字词解码及相关的语言和认知技能上均表现较弱。尤其值得注意的是，“善解码者”和“弱解码者”在阅读技能的发展上存在能力间的不平衡状态。研究进一步分析了不同类别下影响孤独症儿童阅读能力的关键因素，结果显示：在控制年龄和非言语智力后，正字法意识能够显著预测第 1 类孤独症儿童词汇阅读，语素结构意识显著预测第 2 类孤独症儿童的词汇阅读能力，第 3 类孤独症儿童的词汇阅读无显著预测因素，而语音意识是第 4 类孤独症儿童词汇阅读的唯一显著预测因素。本研究清晰地识别出孤独症儿童在中文阅读发展上呈现四种不同的类别，并且在字词解码、语言理解和与阅读相关的能力上表现出不平衡的发展特征。对于不同阅读能力特征的孤独症儿童，其阅读能力的影响因素存在差异。这些发现有助于深入了解影响孤独症儿童的阅读发展的特异性因素，进而提供对不同孤独症亚群体更有针对性的早期阅读干预。

The Reading Imbalance hypothesis of Autism: Distinct Reading Profiles in Chinese Children with Autism and the Early Correlates

Juan Liu¹, Ying Wang¹(corresponding author)

¹ Department of Psychology, Tsinghua University, Beijing, 100084

yingwang@mail.tsinghua.edu.cn

Abstract: Literacy provides a whole world of possibilities and greater understanding. Better reading skills could improve autistic children's independence, increase vocabulary for social communication, expand interests, and also allow them greater understanding and participation in society. This study aims to identify the profiles of autistic children's reading ability and examine the variability in cognitive and linguistic skills among different profiles. 157 children with autism spectrum disorder (ASD) aged 3-11 ($M = 6.68$, $SD = 1.54$) were tested on Chinese reading ability and reading-related language and cognitive skills. Results showed that there were four reading profiles among Chinese ASD children: Profile 1 "good reader" ($N = 33$) performed well in all reading skills; Profile 2 "good decoder" ($N = 61$) showed intact word decoding ability, but relatively weak language comprehension; Profile 3 "poor decoder" ($N = 43$) performed weak in word decoding, but their language comprehension was at the average level; Profile 4 "poor reader" ($N = 20$) performed poor in all the skills. It is worth noting that there was an imbalance in the development of reading skills in Profile 2 and Profile 3. Further analyzed showed different key factors affecting the reading ability of ASD children under different profiles. Specifically, after controlling age and nonverbal intelligence, orthographic awareness significantly predicted word reading in Profile 1; morphological awareness significantly predicted word reading in Profile 2; In Profile 3, nothing significantly predicted word reading ability, and phonological awareness emerged as the only predictor of word reading in Profile 4. The findings clearly identified four different Chinese reading profiles in children with ASD, and further demonstrated reading imbalance in word decoding, language comprehension, and reading-related abilities. It is valuable for clinicians and educators to be able to understand children with ASD could be categorized into different profiles before examining the influencing factors so that more targeted intervention can be implemented.

Keywords: word decoding, language comprehension, orthographic awareness, morphological awareness, phonological awareness

依附歧义和动名兼类词歧义的句法解歧过程：来自眼动的证据

李芳 张慢慢 白学军（通讯作者）

教育部人文社会科学重点研究基地天津师范大学心理与行为研究院；天津师范大学心理学部，天津，300374，
bxuejun@126.com

摘 要 暂时句法歧义的句法解歧的核心问题是读者在遇到歧义时是否即时构建初始句法分析。策略性粗浅加工假说认为读者是否构建初始句法分析取决于阅读理解任务：如果歧义影响阅读理解任务，读者则即时构建一个最简单的初始句法分析；如果歧义不影响阅读理解任务，读者则不构建初始句法分析直至出现解歧信息。随机性多通道模型认为读者即时构建初始句法分析，但初始句法分析的数量受阅读理解任务影响：如果歧义影响阅读理解任务，读者只构建一个初始句法分析；如果歧义不影响阅读理解任务，读者则构建所有可能的初始句法分析。本研究考察依附歧义和动名兼类词歧义的句法解歧过程，探讨此问题。其中，依附歧义影响阅读理解任务，动名兼类词歧义不影响阅读理解任务。实验为 2 （依附歧义：有、无） $\times 2$ （动名兼类词词性：动词、名词）被试内设计，共 24 组实验材料，用 EyeLink1000 车载式眼动仪记录 48 名大学生阅读句子的眼动过程。结果发现：（1）在动词区域的首次注视时间和凝视时间，有依附歧义条件短于无依附歧义条件；在动词区域的第二遍阅读时间和解歧区 1、2 的凝视时间和回视路径时间，有依附歧义条件长于无依附歧义条件，表明歧义影响阅读理解任务时读者构建了一个初始句法分析。（2）在解歧区 1、2 的各眼动指标，兼类词作动词条件和作名词条件无差异，表明歧义不影响阅读理解任务时读者没有构建初始句法分析。（3）

在解歧区 2 的第二遍阅读时间,有依附歧义条件下,兼类词作名词条件短于作动词条件;无依附歧义条件下,兼类词作名词条件和作动词条件无差异,表明读者是否构建初始句法分析取决于阅读理解任务。结果支持策略性粗浅加工假说。

Syntactic Ambiguity Resolution of Attachment Ambiguity and Noun-Verb Ambiguity: Evidence from Eye Movements

LI Fang, ZHANG Manman, BAI Xuejun

Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University; Faculty of Psychology, Tianjin Normal University, Tianjin 300374, China

Abstract: In syntactic ambiguity resolution of sentences with temporary syntactic ambiguities, an important question is whether readers adopt an initial syntactic analysis when faced with ambiguities. The strategic underspecification account suggests that whether readers adopt an initial syntactic analysis depends on the comprehension task: the comprehenders adopt an initial syntactic analysis if the comprehension task force the parser to disambiguate; while they underspecify the ambiguity without an initial syntactic analysis if the comprehension task does not require ambiguity resolution. The stochastic multiple-channel model suggests that the comprehenders immediately establish one or more initial syntactic analyses in separate processing channels and the number of initial analyses vary with the comprehension task: the parser stops after one initial syntactic analysis has been built if the comprehension task does not require more than one interpretation; while the parser may choose to wait for all permissible structure to be built when faced with ambiguities. In order to investigate whether the initial syntactic analysis is adopted selectively or obligatorily, the present study examined both attachment ambiguity interfering the comprehension task and noun-verb ambiguity with little relation to the comprehension task. To be specific, a 2 (attachment ambiguity: with, without) $\times 2$ (noun-verb ambiguity: verb, noun) within-subject design was adopted. Eye movements of 48 native Chinese speakers were recorded by the Eyelink 1000 eye tracker. Each participant read 24 experimental sentences, followed by a comprehension question. The results showed that sentences with attachment ambiguity caused shorter first fixation duration and gaze duration than sentences without attachment ambiguity in the verb region, but longer second-pass reading time in the verb region and more gaze duration and regression path duration in the disambiguation regions, which suggests the adoption of an initial syntactic analysis when the comprehension task requires ambiguity resolution. There was no main effect of noun-verb ambiguity in the disambiguation regions, indicating a underspecified processing without an initial syntactic analysis when the comprehension task does not require ambiguity resolution. In addition, an interaction between attachment ambiguity and noun-verb ambiguity was also observed in second-pass reading time in the disambiguation region. In sentences with attachment ambiguity, there was shorter second-pass reading time when noun-verb ambiguity was disambiguated as noun than when disambiguated as verb. However, in sentences without attachment ambiguity, there was no significant difference in second-pass reading time between them. This interaction suggests a dependency on the comprehension task when readers make the decision of whether adopt an initial syntactic analysis. In conclusion, these findings are in line with the strategic underspecification account and suggest that readers selectively adopt an initial syntactic analysis.

Keywords: syntactic ambiguity resolution, the strategic underspecification account, the stochastic multiple-channel model, attachment ambiguity, noun-verb ambiguity

媒体多任务经验影响内隐记忆：基于限制眼动范式的研究

谢岩枫 李士一（通讯作者） 赵光 白学军

天津师范大学心理学部，天津，300387, lishiyi@tjnu.edu.cn

摘要 已有研究发现重度媒体多任务者（Heavy Media Multitaskers, HMMs）的注意力、外显记忆等认知功能受损，但其对内隐记忆的影响尚不明确。本研究采用背景线索效应这一内隐记忆范式，结合限制眼动技术，考察聚焦式注意和分布式注意条件下不同媒体多任务经验者的内隐记忆特点。实验1招募33名大学生，采用《媒体使用问卷》将其分为重度媒体多任务经验者（HMMs）和轻度媒体多任务经验（light media multitaskers, LMMs）两组。学习阶段，被试自由观看场景并搜索目标（聚焦式注意）；测试阶段，被试的注视点被限制在场景中心，只能使用外周视野搜索目标（分布式注意）。结果发现，学习阶段两组被试均习得了背景线索效应；测试阶段仅HMMs组保持了背景线索效应。实验2重新招募35名大学生，分为HMMs和LMMs两组。与实验1相反，学习阶段限制眼动，测试阶段自由观看。结果发现，学习阶段只有HMMs组习得了背景线索效应，测试阶段两组均表现出了背景线索效应。综合以上结果，在分布式注意条件下，HMMs在学习和测试阶段均表现出背景线索效应，LMMs均不能表现出背景线索效应；在聚焦式注意条件下，两者的表现没有差异。结果证明媒体多任务经验并未损害个体的内隐记忆，且HMMs在分布式注意任务中有更好的内隐记忆表现。

关键词 媒体多任务，内隐记忆，眼动，分布式注意

Effects of media multitasking experience on implicit memory: based on a restricted eye movement study

Yanfeng Xie, Shiyi Li*, Guang Zhao, Xuejun Bai

Faculty of Psychology, Tianjin Normal University, Tianjin, China

Abstract: Previous studies found that heavy media multitaskers (HMMs) had worse interference filtering and explicit memory performance but the relationship between media multitasking and implicit memory is unclear. This study adopts the contextual cueing effect paradigm, combined with the restricted eye movement paradigm to investigate whether there are differences in implicit memory performance of subjects with different media multitasking experience under different attentional conditions. In Experiment 1, 33 college students were recruited and divided into two groups: heavy media multitaskers and light media multitaskers (LMMs) by using the media use questionnaire. In the learning stage, subjects were allowed to observe the scene and search for the target freely (focused attention); In the testing stage, subjects were asked to maintain fixation on the central cross while performing the visual search task using peripheral vision (distributed attention). The results showed that both groups showed contextual cueing effect in the learning stage. But in the testing stage, only HMMs group maintained the contextual cueing effect. In Experiment 2, 35 college students were recruited and grouped according to the media multitasking experience. In contrast to experiment 1, in the learning stage, subjects were asked to maintain fixation on the central cross; In the testing stage, subjects were allowed observe the scene freely. The results showed that only HMMs group showed contextual cueing effect in the learning stage, while both groups showed contextual cueing effect in the testing stage. In sum, under the condition of distributed attention, heavy media multitaskers showed contextual cueing effect in both the learning and testing stages, while light media multitaskers could not show contextual cueing effect; Under the condition of focused attention, there was no difference between the two groups. The results show that media multitasking experience does not impair implicit memory, and heavy media multitaskers have better implicit memory performance under distributed attention condition.

Keywords: Media multitasking, implicit memory, eye movement, distributed attention

汉语作为第二语言阅读习得的认知影响因素研究：一项元分析

陈希^{1,2} 赵晶晶¹ (通讯作者)

1 陕西师范大学, 西安, 710062, jingjing.zhao@snnu.edu.cn

2 成都大学, 成都, 610106

摘要 汉语作为第二语言 (Chinese as a second/foreign language, CSL/CFL) 不管是在国内还是在国际上的地位都越来越重要。已有研究发现语音意识、语素意识、正字法意识、快速命名等认知因素对字母语言和汉语阅读均有重要的作用,但在不同母语背景的被试中,不同的认知因素对阅读的作用仍存在争议。此外,之前的元分析主要针对英语母语或者汉语母语者被试,多从语音意识、语素意识方面考察它们对阅读的影响,而对正字法意识和快速命名则鲜有研究。本研究全面考察了在 CSL/CFL 学习者中,四种认知因素对汉语阅读能力的影响,并检验了年龄和学习时长两个调节变量的作用。通过对中英文数据库进行检索,共获得 989 篇文献,后经摘要筛查、全文筛查,最后纳入元分析 42 项研究。异质性检验显示,在语音意识、语素意识和正字法意识与阅读的关系中采用随机效应模型,快速命名与阅读的关系中采用固定效应模型,结果发现: (1) CSL/CFL 学习者的语音意识、语素意识、正字法意识与汉字阅读之间均呈显著正相关,快速命名与汉字阅读之间呈显著负相关; (2) 在语音意识与汉字阅读的关系中,年龄的调节作用边缘显著,成年学习者语音意识与汉字阅读的相关性高于儿童学习者; (3) 在语音意识与汉字阅读的关系中,学习时间的调节作用显著,初学者语音意识与汉字阅读的相关性显著高于长时学习者。研究表明,汉语二语学习者的汉语认知因素与汉语阅读关系密切,且年龄和暴露于汉语环境的时间会对语音意识与阅读产生影响。研究结果帮助我们对 CSL/CFL 学习有更好的理解,并且可以提出有针对性的语言训练。

Influencing Cognitive factors of reading acquisition of Chinese as a second/foreign language: A meta-analysis

CHEN Xi^{1,2}, ZHAO Jingjing^{1*}

1 Shaanxi Normal University, 710062; 2 Chengdu University, 610106

Abstract: Chinese has been more important as a second or foreign language (CSL/CFL) both inside and outside China. Previous studies have found the effect of cognitive factors (e.g. phonological awareness, morphological awareness, orthographic awareness and rapid automatized naming) on reading ability both in alphabetic language and Chinese, but the role of different cognitive factors in reading acquisition of Chinese as a second/foreign language remains unexplored. Prior meta-analyses on the relationship between cognitive factors and reading have been conducted primarily in native English-speaking or Mandarin-speaking children. The purpose of the present meta-analysis was to examine the relationship between four cognitive factors and Chinese word reading in learners of Chinese as a second/foreign language. We searched in computerized databases for studies published both in English and Chinese. A total of 989 articles, 42 independent samples met the criteria for meta-analysis and were included in the final meta-analysis. Results revealed that (a) three random-effects model analyses (PA, MA, OA) and a fixed effects model (RAN) revealed a moderate relationship between PA, MA, OA, RAN and Chinese word reading in L2 Chinese learners; (b) in the correlation analysis of PA and Chinese word reading, the moderating effect of age on both was marginally significant. The correlation between PA and Chinese word reading was slightly stronger in the CSL/CFL adults learning group than in the children group; (c) a moderating effect of learning time on the relationship between PA and Chinese word reading: PA and Chinese word reading correlated more strongly for beginning learners than for advanced learners. These results suggest the importance of cognitive factors in the acquisition of Chinese word reading as a second language. Results also shed lights on the impact of age and learning time on the influence from phonological awareness to CSL/CFL reading.

Keywords: Chinese as a second/foreign language, cognitive factors, Chinese word reading, meta-analysis

依恋与择偶-养育权衡中资源分配的静态和动态关系

丁芳媛¹ 程刚² Omri Gillath³ 贾云丞¹ 张大均¹ (通讯作者)

¹ 西南大学心理学部, 重庆, 400715, zhangdj@swu.edu.cn

³ 堪萨斯大学心理学系, 美国堪萨斯州劳伦斯市

摘要 目的: 本研究以依恋理论和生活史理论为基础, 考察依恋是否预测择偶-养育权衡中的资源分配。方法: 本研究分别开展了一个横向研究和一个纵向研究。在研究 1 中, 通过滚雪球的方式在网络上共招募到 1086 名成年人完成了依恋状态、短期择偶态度和婴儿照料态度(代表择偶和养育的投入)的测量。在研究 2 中, 对 945 名大学新生在入学转折期的过程中, 进行了每月一次共四次追踪测试。测试量表同研究 1。然后采用潜增长模型衡量个体内和个体间的不同纵向变化, 以及不同变量之间不同纵向变化的关系。结果: 路径模型结果显示, 安全依恋状态同时负向预测短期择偶态度且正向预测婴儿照料态度, 同时短期择偶态度和婴儿照料态度呈负相关。群组分析结果显示上述依恋对择偶-养育权衡中的作用在父母群体和非父母群体中没有差异(研究 1)。纵向研究中发现, 在大学入学转折期中, 安全依恋水平和婴儿照料态度呈线性下降趋势, 回避依恋状态和短期择偶态度线性增长。此外多元潜增长模型显示, 安全依恋和回避依恋的变化速率能同时预测短期择偶态度和婴儿照料态度的变化速率, 但这两个因变量的变化速率之间不相关(研究 2)。结论: 本研究结果揭示了依恋在择偶-养育权衡资源分配上的预测能力, 支持了依恋理论和生活史理论的整合观点(即安全依恋的个体更多采取慢生活史策略, 反之亦然)。此外, 纵向研究强调了这种整合观点的动态本质, 即依恋状态会随着环境变化而快速产生变化, 进而带来个体资源配置的变化。

Abstract: Objective: Building on existing work associating attachment theory and Life History Theory (LHT), we examined whether attachment predicts the allocation of resources in the mating-parenting trade-off. Method: We tested this in two studies, one cross-sectional and one longitudinal. In Study 1, 1086 adults recruited via snowball sampling online, completed measures of state attachment, short-term mating attitude, and baby-nurturance attitude (representing investment in mating vs. parenting efforts). In study 2, 945 freshmen students were assessed four times during their transition to college, once a month. Latent growth models were employed to capture within-individual changes across time and between-individual different changes. Results: The path model showed that attachment security negatively predicted short-term mating attitudes and positively predicted baby-nurturance attitudes simultaneously while short-term mating attitudes and baby-nurturance attitudes were negatively correlated. The role of attachment was similar across parents and non-parents (Study 1). Longitudinal results showed a decrease in attachment security levels and baby-nurturance attitudes and an increase in attachment avoidance and short-term mating attitudes during the transition to college, which is known to be a stressful period. Multivariate latent growth model showed that change rates of short-term mating attitudes and baby-nurturance attitudes were simultaneously predicted by the change rates of security and avoidance but the change rates of the two dependent variables were not related to each other (Study 2). Conclusions: Our findings shed light on attachment's utility to predict resource allocation in the mating-parenting trade-off, supporting an integrated view of attachment and LHT (i.e., secure attachment facilitates endorsement of slow LHS and vice versa). Our longitudinal study highlights the dynamical nature of this integration, with rapid changes in attachment in response to changes in the environment, being followed

by changes in the allocation of resources.

同伴侵害和青少年抑郁： 公正世界信念的中介作用与班级侵害水平的调节作用

熊昱可 汪悦 任萍（通讯作者）

北京师范大学中国基础教育质量监测协同创新中心，北京，100875，renping@bnu.edu.cn

摘要 大量研究表明同伴侵害是青少年抑郁的重要风险因素，但是同伴侵害对抑郁起作用的中介和调节机制较少有研究涉及。本研究基于“破碎假设理论（shattered assumptions theory）”和“生态系统理论”，对来自 47 个班级的 2551 青少年（初测年龄为 12.99 ± 0.61 ，52.2%男生）进行了为期半年的追踪调查，考察公正世界信念在同伴侵害与抑郁之间的中介作用，以及班级侵害水平对该中介机制的调节作用。多水平模型分析表明：（1）在控制了性别、班级规模和基线抑郁水平后，同伴侵害对抑郁有显著的正向预测作用；（2）个人公正世界信念在同伴侵害和抑郁之间起部分中介作用，而一般公正世界信念的中介作用不显著；（3）虽然同伴侵害和班级侵害的交互作用均能显著预测青少年的一般公正世界信念和个人公正世界信念，但班级侵害水平调节了“同伴侵害→个人公正世界信念→抑郁”这一中介机制的前半段路径。具体表现为，当班级侵害水平低时，同伴侵害显著负向预测个人公正世界信念，进而增加青少年的抑郁症状，而当班级侵害水平高时，这一中介效应不显著。研究结果揭示了同伴侵害“如何”以及“何时”影响青少年的抑郁。这启示相关的教育实践工作者要特别关注处于健康班级环境（班级侵害水平低）中受侵害青少年的个人公正世界信念，通过相应的措施对这些青少年的公正世界信念进行干预，从而降低他们的抑郁水平。

关键词 同伴侵害，抑郁，公正世界信念，班级侵害水平，健康环境悖论

The relationship between peer victimization and adolescent depressive symptoms: The mediating role of belief in a just world and the moderating role of the classroom-level victimization

Xiong Yuke, Wang Yue, Ren Ping*

Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing

Abstract: A large number of studies have shown that peer victimization is an important risk factor for depression among adolescents, but the mechanisms behind the association between peer victimization and depressive symptoms are rarely studied. Based on shattered assumptions theory and person-context fit theoretical theory, the present study aimed to extend previous studies on the relationship between peer victimization and depressive symptoms by examining the mediating role of belief in a just world and the moderating role of the classroom-level victimization. Using a short-term longitudinal design, two-wave data were obtained from 2551 adolescents (initial age 12.99 ± 0.61 , 52.2% boys) from 47 classes over six-months. Multi-level model analysis showed that: (1) after controlling for gender, class size, and baseline depressive symptom level, peer victimization had a significant positive effect on depressive symptoms; (2) personal belief in a just world mediated the relationship between peer victimization and depression, while the mediating role of the general belief in a just world was not significant; (3) the mediation was moderated by the classroom-level victimization, when the classroom-level victimization was low, peer victimization was negatively related to personal belief in a just world, which in turn increased the depressive symptoms of adolescents. However, this mediation effect was not significant when the classroom-level victimization was high. The findings contribute to our understanding of how and when peer victimization impacts youth depressive symptoms, which suggested that relevant education practitioners should pay additional attention to the victimized adolescents' personal belief in a just world especially when the classroom-level victimization is low.

Keywords: peer victimization, depressive symptoms, belief in a just world, classroom-level victimization, healthy context paradox

基于增长混合模型的胃肠道肿瘤患者围术期 心理压力变化轨迹及与恢复质量的关系

吕高荣¹ 厉萍¹

¹ 山东大学护理与康复学院, 济南, 250012

摘要 目的: 了解胃肠道肿瘤患者围术期心理压力的不同亚组的变化轨迹, 并探讨恢复质量在不同亚组间的差异。方法: 本研究为纵向随访研究, 主要收集了在山东省某三级甲等医院拟行手术的 203 例胃肠道肿瘤患者。于术前 1-3 日, 术后 1-3 日, 术后 3-5 日, 术后 7-9 日及出院前这五个时间点收集患者的心理压力及恢复质量得分。采用增长混合模型分析围术期心理压力变化的不同亚组, 单因素方差分析探讨不同亚组的围术期恢复质量的差异及 LSD 进行事后检验。结果: 本研究共识别 3 个亚组, 分别是低压力下降组, 中压力平稳组及中压力上升组。恢复质量在三个亚组间存在差异; 中压力上升组和平稳组的恢复质量均比低压力下降组差, 且中压力上升组于术后 7-9 日及出院前的恢复质量比中压力平稳组的更差。**结论:** 胃肠道肿瘤患者的围术期心理压力变化轨迹存在异质性, 心理压力低的个体围术期恢复质量更好。本研究提示我们尽早识别压力较高的个体并对其进行适当的心理护理可能是提高围术期恢复质量一个行之有效的方法。

Association between trajectories of psychological stress and quality of recovery in patients with gastrointestinal cancer during perioperative period: A latent growth mixture modeling approach

Gaorong Lv¹, Ping Li¹

¹ School of Nursing and rehabilitation, Shandong University, Jinan, 250012

Abstract: Objective: to investigate trajectories of the potential subgroups of psychological stress in patients with gastrointestinal cancer, and to explore the difference of recovery quality in different subgroups. Methods: This study was a longitudinal follow-up study and 203 patients with gastrointestinal cancer who were to undergo surgery in a tertiary hospital in Shandong province, China were recruited. The scores of psychological stress and recovery quality of the patients were collected at the 1-3 days before surgery, 1-3 days after surgery, 3-5 days after surgery, 7-9 days after surgery and before discharge. The growth mixture model was used to analyze the trajectories of the potential subgroups of psychological stress during perioperative period. One-way analysis of variance was used to investigate the difference of recovery quality in different subgroups and LSD test was used to perform post hoc tests. Results: There were 3 subgroups are identified: low-decreasing stress group, moderate-stable stress group and moderate-increasing stress group. The recovery quality was different among the three subgroups. Specifically, recovery quality of the low-decreasing stress group was the best, and that of the moderate-stable stress group and increasing group were bad. In addition, the recovery quality of the moderate-increasing stress group was worse than that of the moderate-stable stress group at the 7-9 days after surgery and before discharge. Conclusion: The trajectory of psychological stress is heterogeneous among patients with gastrointestinal cancer during perioperative period, and individuals with low psychological stress have better recovery quality. This study suggests that early identification of

individuals with high stress and appropriate psychological care may be an effective way to improve the quality of recovery during perioperative period.

Keywords: Gastrointestinal cancer, Perioperative period, Psychological stress, Quality of recovery, Growth mixture model

心理战“疫”：风险认知对乐观的影响

程凯琳 廖江群

清华大学心理学系，北京，100084，liaojq@tsinghua.edu.cn

摘要 面对席卷全球的新冠肺炎疫情，如何进行心态调控是常态化疫情防控背景下的重要问题。通过四个研究探讨了在新冠肺炎疫情爆发及常态化疫情防控的背景下，疫情风险认知对乐观和幸福感的影響，并进一步考察这一影响的机制及控制感和负性情绪在其中的作用。研究1对国内疫情爆发后一周内的599个横断面数据样本进行结构方程模型分析，发现疫情风险认知通过控制感-情绪的链式中介作用影响幸福感；研究2通过文字启动对流行病不同高、低风险的感知，发现高风险认知会降低乐观程度；研究3在控制了当前的健康状态、离疫情中心距离、最近的确诊病例等因素后，进一步验证了控制感的中介作用；研究4在疫情进入稳定趋势的一年后重复了研究3的实验并加入了负性情绪的测量，验证了控制感-情绪的链式中介模型：高风险认知通过降低控制感，进而引发更强的消极情绪从而降低乐观和幸福感。本研究有助于深入理解应对疫情时的心理变化及机制，并对如何在后疫情时代中维持心理幸福感具有较强的实践启示，对通过加强信息公开度、增强信任等措施降低风险认知的措施提供了干预指导。

Coping with the Coronavirus Pandemic: Risk Perception Predicts Life Optimism

CHENG Kailin¹, LIAO Jiangqun¹

¹ Department of Psychology, Tsinghua University, Beijing 100084, China

Abstract: Given that the coronavirus pandemic has become a serious concern around the world, how can optimism be maintained in an outbreak of a collective pandemic? We proposed that perceived control and negative affect could contribute to explaining optimism in the face of the pandemic. In Study 1, a large-scale cross-sectional design ($N = 599$) showed the effect of risk perception on life optimism and the serial mediating effect of perceived control-negative affect through structural equation modeling. Then, Study 2 ($N = 191$) ascertained the causality between risk perception for an epidemic and life optimism with experimental manipulations. Finally, Study 3 ($N = 186$) and Study 4 ($N = 217$) further revealed that the effect of risk perception on optimism could be extended to overall subjective well-being and confirmed the serial mediation model of perceived control and negative affect. Together, these findings indicated that during an influenza epidemic, risk perception could affect life optimism. Moreover, perceived control and negative affect were notable factors contributing to this link. Measures strengthening publicity and transparency regarding recovery rates and boosting trust among citizens should be taken to reduce public perceptions of risk and promote an optimistic attitude about life.

正念和心理资本对乳腺癌患者心理健康的影响 —基于多项式回归与响应面分析

赵迪¹ 李媛媛^{2,1} 厉萍¹

1 山东大学护理与康复学院, 济南, 250012

2 武汉大学健康学院, 武汉, 430072

摘要 目的: 基于情绪调节的双加工模型, 探讨正念(外显情绪调节)和心理资本(内隐情绪调节)的一致性对乳腺癌患者化疗期心理健康的作用, 并探明正性情绪在其关系间的中介效应。方法: 以方便抽样的方法, 选取2020年5月—2020年11月在山东省某三级甲等肿瘤专科医院行化疗的522例乳腺癌患者作为研究对象, 使用一般资料调查表、生活质量(SF-8)-心理健康分量表、积极心理资本量表(PPQ)、正念注意觉知量表(MAAS)和正性情绪量表(PAS)进行问卷调查。采用SPSS 22.0及插件RSA 3.0.30进行多项式回归和响应面分析。结果: 化疗期乳腺癌患者正念-心理资本为一致性匹配时, 高正念-高心理资本对个体心理健康的正向作用更强(一致性线的斜率为0.540, $P < 0.001$); 当正念-心理资本为差异性匹配时, 低心理资本-高正念对心理健康的负向作用更明显(不一致性线的斜率为-0.338, $P < 0.001$), 不一致线的曲率未达显著水平, 说明心理健康并未随着正念-心理资本一致性程度的增加而升高, 即正念-心理资本一致并不一定比不一致好。另外, 正性情绪在正念-心理资本匹配对心理健康的关系中起中介作用, 效应为0.131, 其95%的置信区间为(0.085, 0.169), 不包含0。结论: 医务人员在化疗期乳腺癌患者进行心理干预时, 要适时进行评估和调整, 以最大程度实现积极心理资源的一致性匹配, 促进其更好的心理健康。

The effect of mindfulness and psychological capital on the mental health of breast cancer patients —based on polynomial regression and response surface analysis

ZHAO Di¹, LI Yuan-yuan^{2,1}, LI Ping¹(Corresponding author)

1 School of Nursing and Rehabilitation, Shandong University, Jinan 250012

2 School of Health Sciences, Wuhan University, Wuhan 430072

Abstract: Objective: Based on the dual-process model of emotion regulation, this study explored the effect of the congruence between mindfulness (explicit emotion regulation) and psychological capital (implicit emotion regulation) on the mental health of breast cancer patients undergoing chemotherapy, and examined the mediating effect of positive emotion in their relationship. Methods: A convenient sampling method was used, and 522 breast cancer patients receiving chemotherapy in a tertiary A cancer hospital in Shandong province from May 2020 to November 2020 were enrolled. The measurements included the general questionnaire, Short Form-8 (SF-8) Health Survey-Mental Subscale, Mindful Attention Awareness Scale (MAAS), Positive Psychological Capital (PPQ), and Positive Affect Scale (PAS). Statistical analysis was performed using SPSS 22.0 and RSA 3.0.30 software. Polynomial regression and response surface analysis were mainly conducted to explore the relationship between variables. Results: In the cases of congruence, mental health was better when mindfulness and psychological capital were both high instead of being both low (The slope of the congruence was 0.540, $P < 0.001$); In the cases of incongruence, poorer mental health was found in breast cancer patients with low psychological capital-high mindfulness, compared with those who had high psychological capital-low mindfulness among breast cancer patients undergoing chemotherapy (The slope of the incongruence was -0.338, $P < 0.001$). The curvature of the incongruence did not reach a significant level, indicating that mental health did not increase with the increase of the degree of congruence between mindfulness and psychological capital, that is, congruence between mindfulness and psychological capital was not necessarily better than incongruence. In addition, positive emotion played a mediating role in the relationship between mindfulness-psychological capital and mental health among breast cancer patients during chemotherapy. The indirect effect was 0.131, and the bootstrapped 95% CI did not include zero (0.085, 0.169). Conclusions: Medical

professionals should evaluate the breast cancer patients appropriately, and then conduct psychological intervention for them, so as to achieve the maximum use of positive psychological resources and promote their better mental health.

最优化择偶：职业女性的择偶标准、最优化倾向和关系满意度

李慕轼¹ 贾汇源² 谢晓非¹

1 北京大学心理与认知科学学院, 北京, 100871

2 首都经济贸易大学, 北京, 100070

摘要 择偶是一种复杂决策, 择偶的结果直接影响到其亲密关系的满意度, 一个人的决策风格对其择偶标准和择偶质量都会产生影响。过往研究基于性别、年龄、城乡等不同群体对择偶标准做了较多的探讨, 但基于最优化决策风格的差异, 探究职业女性的择偶标准及其关系质量是一个全新的视角。本研究通过当地妇联, 调查了国内某一线城市分布在不同行业的 849 名职业女性。我们采用问卷法收集了长期择偶标准、最优化倾向、对其配偶在择偶标准上的实际评分、其配偶的最优化倾向、工作家庭平衡和职业成就等信息。择偶标准分为能力、性格、人品、外貌、经济地位、家庭背景、健康状况和教育水平八个维度, 基本概括了当今我国主流的择偶关键词。结果发现: 最优化倾向高的职业女性与其伴侣的关系满意度更高, 对其伴侣最优化倾向评价也越高。相对于最优化倾向评分较低的女性群体, 评分较高的群体在配偶实际评分与其择偶标准之间的差异较小, 差异显著的维度较少, 并能够正向预测其关系满意度。研究说明了不同决策风格的女性在择偶标准中关注不同的维度, 高最优化倾向的职业女性在择偶过程中妥协更少, 也对关系质量更为满意。此外, 高最优化倾向的职业女性在工作家庭平衡和职业成就感上的得分也比最优化倾向较低的女性群体更高。本研究的结论为长期择偶和决策风格相关的工作提供了一种新颖的女性视角。

Maximizing the Mating Selection: Mating Preference, Maximizing Tendencies and Relationship Satisfaction of Professional Women

LI Mushi¹, JIA Huiyuan², XIE Xiaofei^{1*}

1 Peking University, Department of Psychology and Cognitive Sciences

2 Capital University of Economics and Business, College of Business Administrations

Abstract: This study explored the influence of maximizing decision-making style on female mating preferences and long-term relationship satisfaction. Mating selection is an important decision in life. Decision-making styles divide people into two groups based on their maximizing tendency, and it may influence mating preferences, long-term relationship satisfaction of women. This study examined mating preferences and relationship satisfaction from the perspective of decision-making style. A three-wave study investigated 849 female participants from Women's Federation in China about their maximizing tendency, relationship quality, mating preferences, and the actual ratings on partners. The mating preferences conclude eight aspects: ability, personality, moral quality, appearance, economic status, family background, health, and education. The results showed that the higher maximizing tendency, the smaller difference between the actual score of the partner and ideal mating preferences, as well the fewer aspects with significant differences. Besides, maximizing tendency can positively predict the relationship satisfaction. Thus, female maximizers have less compromises in the process of mate selection and are more satisfied with the quality of the relationship. Female maximizers in long-term mating behavior could be more adaptive and lead to better relationship satisfaction. This study provided a novel perspective from female's view for long-term mate selection and decision-making style.

群体中的亲环境行为：基于社会认同过程视角

白晓丽¹ 七十三¹（通讯作者）

1.内蒙古师范大学心理学院，呼和浩特，010022

摘要 亲环境行为是个体以一定的环境价值观为基础而表现出来的对环境有利的行为。以往有关亲环境行为的理论大多以个体的视角来分析亲环境行为产生的原因及心理机制。亲环境行为如何生成不仅要从个体的认知视角去解读，也要从群体认知的视角去阐释。社会认同是人类以“我们”而不是“我”来定义自我的能力，使人们以集体的方式去思考和行动，社会认同理论强调社会认同对群体行为的解释作用。亲环境行为的社会认同模型运用社会认同的方法，从集体的层面来分析亲环境行为发生的原因，深入探讨了社会认同过程如何影响大规模环境危机的评估和行为反应，通过对社会认同过程中内群体认同、内群体规范与目标、集体效能感、情感与动机等与亲环境行为关系的深入探讨，提高了对亲环境行为的理论解释框架。亲环境的社会认同理论提供了一条从群体层面探究亲环境行为生成机制的新路径。文章介绍了亲环境的社会认同理论提出的依据，对该理论中社会认同各核心变量与亲环境行为间的关系进行了深入分析，从社会认同过程的视角揭示了亲环境行为的形成机制，并基于理论提出促进人们亲环境行为的具体措施，为全球性环境治理提供了新的治理路径。

Pro-environmental behavior in groups: The perspective of social identity process

Bai Xiaoli¹, Qi ShiSan¹(corresponding author)

1 Inner Mongolia Normal University, No.81 Zhaowuda Road, Saihan District, Hohhot city

Abstract: Pro-environment behavior is an individual's behavior which is beneficial to the environment based on certain environmental values. In the past, most of the previous theories on Pro-environmental behavior analyzed the causes and psychological mechanism of Pro-environmental behavior from the perspective of individual. How to generate Pro-environmental behavior should be interpreted not only from the perspective of individual cognition, but also from the perspective of group cognition. Social identity is the ability of human beings to define themselves by "we" instead of "I", which makes people think and act in a collective way. Social identity theory emphasizes the explanatory role of social identity on group behavior. The social identity model of Pro-environmental behavior uses the method of social identity to analyze the causes of Pro-environmental behavior from the collective level, and discusses how the process of social identification affects the assessment and behavior response of large-scale environmental crisis. The paper analyzes the relationship between the process of social identity and pro-environment behavior, such as inner group identity, internal group norms and objectives, collective efficacy, emotion and motivation. The further study of the relationship improves the theoretical framework for the interpretation of Pro-environmental behavior. This paper introduces the basis of Pro-environmental social identity theory, analyzes the relationship between the core variables of social identity and pro-environmental behavior, reveals the formation mechanism of Pro-environmental behavior from the perspective of social identity process, and puts forward specific measures to promote people's Pro-environmental behavior based on the theory, which provides a new governance path for global environmental governance.

keyword: Pro-environment behavior, environmental problems, social identity, group norms

志愿动机对工作旺盛感的影响：工作倦怠和心理资本的中介作用

李君¹ 杨海波¹

1 天津师范大学心理学部，天津，300000

摘要 工作旺盛感是一种个体在工作中感到精力充沛，同时又能学习的心理状态。已有研究表明，个体内部动机对工作旺盛感和志愿动机有重要影响，但动机的作用有待进一步探索。本研究以自我决定理论为基础，

考察了工作倦怠和心理资本对志愿动机和工作旺盛感的中介作用。采用志愿功能动机量表、Maslach 倦怠量表、PsyCap 问卷和工作旺盛感量表对 349 名新冠肺炎疫情期间参加心理援助志愿活动的志愿者进行测试。研究结果支持工作倦怠和心理资本在志愿动机与工作旺盛感的关系中起中介作用。研究结果对志愿活动的开展具有重要意义。

The Effect of Volunteer Motivation on Thriving at Work: The Mediating Roles of Job Burnout and Psychological Capital

Jun Li¹, Haibo Yang¹

¹ Faculty of Psychology, Tianjin Normal University, Tianjing, 300000

Abstract: Thriving at work is a type of psychological state in which an individual feels vigor and learning at the same time in work. Previous studies have shown that individual internal motivation has an important effect on thriving at work and volunteer motivation, but the role of motivation remain to be further explored. Based self-determination theory, this study tested the mediating effects of job burnout and psychological capital on volunteer motivation and thriving at work. A total of 349 volunteers who participated in psychological assistance volunteer activities during the COVID-19 pandemic were tested using the Volunteer Function Motivation Inventory, Maslach Burnout Inventory, PsyCap Questionnaire and Thriving at work scale. Results support a mediating relationship of job burnout and psychological capital in the relationship between volunteer motivation and thriving at work. The results have significance for the development of voluntary activities.

Keywords: volunteer motivation, thriving at work, job burnout, psychological capital, volunteer.

老年人与青年人的共情差异

庞芳芳¹ 陈玮¹ 苏英¹ 官锐园¹

1. 北京大学医学人文学院医学心理学系, 北京 100191

摘要 目的: 从青年期到老年期, 有关共情能力发展的研究结果并不统一。本研究尝试从自评问卷的共情测量与基于行为任务表现的共情测量 2 种角度, 对比研究老年人和青年人在认知共情和情绪共情上的差异, 并且进一步探索了对于积极情绪和消极情绪老年人和青年人的共情差异。方法: 研究一采用人际反应指数量表 (IRI), 以 280 名老年人和 304 名青年人为研究对象, 探究了两个年龄组被试基于自评问卷的共情差异。研究二使用多维共情测试 (MET) 中文版, 以 51 名老年人和 58 名青年人为研究对象, 比较了两个年龄组被试基于图片刺激任务的共情差异。结果: 研究显示, ①与青年人相比, 无论是基于自评问卷还是行为任务, 老年人的认知共情均出现显著下降 ($t_{PI} = -3.42, p < 0.001$; $t = -7.51, p < 0.001$); ②与青年人相比, 老年人对消极情绪刺激的情绪共情也出现显著下降 ($t = -3.91, p < 0.001$), 但老年人对积极情绪刺激的情绪共情并无显著变化 ($t = -0.55, p = 0.584$); ③老年人对积极情绪的情绪共情要显著高于对消极情绪的情绪共情 ($t = 5.47, p < 0.001$), 而青年人对积极与消极 2 种效价的情绪共情则无显著差异 ($t = 0.04, p = 0.607$; $t = 0.04, p = 0.281$)。

关键词 共情, 积极情绪, 消极情绪, 老年人, 青年人

Empathy Differences Between the Elderly and the Young

PANG Fangfang¹, CHEN Wei¹, SU Ying¹, GUAN Ruiyuan^{1*}

1 Department of Medical Psychology, The School of Health Humanities, Peking University, Beijing, 100191

Abstract: Objective: From adolescence to old age, research results on the development of empathy are not consistent. This study attempted to compare the differences in cognitive empathy and emotional empathy between the elderly and young people from perspectives of self-assessment questionnaire and behavioral task performance. Furthermore, this study explored the empathy differences between the elderly and the young for positive emotions and negative

emotions. Method: In study 1, we recruited 280 older participants and 304 younger participants using the Interpersonal Reaction Index Scale to characterize the empathy differences between the two age groups based on self-assessment questionnaire. In study 2, we recruited 51 older participants and 58 younger participants using Chinese version of the Multifaceted Empathy Test (MET) to explore the empathy differences between the two age groups based on behavioral task performance. Results: The study showed that: ① compared with the young group, whether it is based on self-assessment questionnaire or behavioral task performance, the cognitive empathy of the elderly decreased significantly ($t_{PI} = -3.42, p < 0.001$; $t = -7.51, p < 0.001$), ② compared with the young group, the emotional empathy for negative emotional stimuli of the elderly also decreased significantly ($t = -3.91, p < 0.001$), however, the emotional empathy for positive emotional stimuli of the elderly did not change significantly ($t = -0.55, p = 0.584$), ③ the emotional empathy for positive emotions of the elderly was significantly higher than negative emotions ($t = 5.47, p < 0.001$), while there was no significant difference between emotional empathy for positive and negative valences of the young group ($t = 0.04, p = 0.607$; $t = 0.04, p = 0.281$).

Keywords: empathy, positive emotion, negative emotion, the elderly, the young

个体动机和认知因素对电信诈骗受害易感性的影响

温馨¹ 钱秀莹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310028

摘要 迅速发展的互联网技术,尤其在移动端技术,在给用户带来便利的同时,也增大了受骗的可能性。电信诈骗的非接触性使其不受时空限制,涉及地域范围广,被害人数众多。截至2020年,全国已有6省,电信诈骗案件率占比超过50%,直接经济损失巨大,2020年疫情席卷全球,线上生活方式常态化,多样化,这同时,也提供了较之以往更强、更大的线上诈骗的暴露环境,反欺诈更成为一个重要议题。人是欺诈环节中最为薄弱而又最为关键的一环,了解个体在欺诈场景中的决策过程是反欺诈的重要切入点。近期有关欺诈的心理学研究多关注于个体和情景因素如何影响欺诈应答(例如,钓鱼邮件的回复),但群体特性的研究较难应用于个体受骗易感性(人们过往的受骗经历和对即时性骗局的参与意图)的识别。本研究中通过计算建模的方式,探索了个体心理特征、社会人口学特征与受骗易感性的关系;同时把个体特征作为模型输入,构筑了个体受骗易感性预测模型。本研究旨在提供一个受骗易感性影响因素的解释框架,从心理学的角度对为什么特定群体更易落入骗局陷阱提供更加全面的理解。研究结果显示,心理特征(例如认知特点、人格、自我控制等)能有效预测个体受骗易感性(二分类模型F1值为0.89),而人口学特征对个体受骗易感性的预测效果较差(二分类模型F1值为0.69)。整合人口学特征和心理特征作为模型输入,采用支持向量机(SVM)算法的预测模型表现最好,F1值达到了0.91。随后,我们通过特征重要性分析对预测模型进行解释。结果显示认知特征在个体受骗易感性识别中占据主导地位,而其它个体特征对个体受骗易感性存在不同程度的影响。综上,本研究通过机器学习建模方法探索了不同个体特征与受骗易感性之间的关系;同时构筑和优化了受骗易感性识别模型,用以预测个体是否容易受骗。本研究也为未来个性化的欺诈干预方案形成和公众教育措施提供了重要参考。

关键词 受骗易感性, 风险感知收益, 批判性思维, 机器学习

The effects of individual's motivation and cognitive factors on internet fraud victimization: Based on machine learning methods

Xin Wen¹, Xiuying Qian¹

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028

Abstract: The rapid expansion of Internet technology, especially in mobile terminal, facilitated great convenience to social communication, however, this expansion also increased the possibility of being deceived. The non-contact nature of the online communication makes online scam free from time and space restrictions, involving a large number of crossing geographical victims and caused it difficult to trail. As of 2020, there have been already 6

provinces in the country, with a telecommunication fraud case rate accounting for more than 50%, and caused a huge direct financial loss. Human are the most critical but weakest link in fraud. Understanding the decision-making process of individuals in fraud scenarios is an important entry point for anti-fraud. Recent psychological research on fraud has mostly focused on how individual and contextual factors affect fraud responses (for example, responses to phishing emails), but the results on group characteristics detection is difficult to apply to the identification of individuals' susceptibility to fraud. In this study, we explored the relationship between individual psychological characteristics, sociodemographic characteristics, and susceptibility to fraud (people's past deception experience and immediate participation intention of the scam) through computational modeling. At the same time, individual characteristics were used as model input to construct individual susceptibility to fraud prediction model. This study aimed to provide an explanatory framework for the factors affecting the susceptibility to fraud, and to provide a more comprehensive understanding of why certain groups are more likely to fall into deception traps from a psychological perspective. The results indicated that psychological characteristics (such as cognitive characteristics, personality, self-control, compliance with fraud strategies, etc.) effectively predicted the individual's susceptibility to fraud (F1 value of the binary classification model was 0.89), while demographic characteristics had a poor prediction effect on the individual's susceptibility to fraud (the F1 value of the two-class model is 0.69). Integrating demographic and psychological characteristics as input to the model, the prediction model performed best using the support vector machine (SVM) algorithm, with an F1 value of 0.91. Then, we explained the prediction model through feature importance analysis. The results suggested that cognitive characteristics occupied a dominant position in the identification of individuals' susceptibility to fraud, while other individual characteristics had varying degrees of influence on individuals' susceptibility to fraud. In summary, this study explored the relationship between different individual characteristics and susceptibility to fraud through machine learning modeling methods. At the same time, it constructed and optimized the identification model of susceptibility to fraud to predict whether an individual is vulnerable to being deceived. This study also provided an important reference for the formation of personalized fraud intervention programs and public education measures in the future.

短暂的药物相关线索暴露提升海洛因戒断者的主动性控制

苏波波 郑美红（通讯作者）

清华大学心理学系，北京，100084，Email: zhengmh@mail.tsinghua.edu.cn

摘要 药物使用通常由对药物的接近动机所驱动（即，用药欲望），这种动机会被环境中的药物相关刺激所诱发。越来越多研究者开始认可情绪和动机状态会调控认知控制。一些研究者发现暴露于药物相关线索会降低药物使用者随后的反应抑制。然而，认知控制的双机制理论区分了主动性控制和反应性控制两个不同的模块。当前研究想考察药物相关线索对海洛因戒断者主动性控制的影响。33名男性海洛因戒断者完成了一个AX-CPT任务的调整版本，通过在每个试次之前呈现一张中性或海洛因相关图片。结果显示：相比中性图片，海洛因相关图片条件下海洛因戒断者的主动性控制表现更好。这些结果表明药物相关接近动机上调药物使用者的认知控制功能，这与药物寻求和使用的可能性增加有关。

关键词 海洛因，药物相关线索，主动性控制，反应性控制，认知控制

Transient exposure to drug-related cues enhances proactive control in heroin abstiners

Su Bobo, Zheng Meihong

Department of Psychology, Tsinghua University, Beijing 100084

Abstract : Drug use is often driven by approach motivation for drugs (i.e. drug desire), which is triggered by drug-related stimuli in the environment. It is becoming increasingly appreciated that emotional and motivational

states can modulate cognitive control. Some researchers have found that exposure to drug-related cues can reduce subsequent response inhibition. However, the dual mechanisms of control framework differentiates proactive and reactive control modes. The present study aimed to investigate how drug-related cues modulate proactive control in heroin abstiners (HAs). Thirty-three male HAs completed a modified version of the AX-Continuous Performance Task (AX-CPT), in which a neutral or a heroin-related picture was randomly and briefly presented before each trial. The results showed that the HAs had improved proactive control following exposure to heroin-related pictures compared to neutral pictures. The findings suggest that drug-related approach motivation can up-regulate cognitive control function of drug users.

Keywords: heroin, drug-related cues, proactive control, reactive control, cognitive control

PTSD 青少年对威胁信息的注意偏向：一项眼动研究

白玉¹ 赵欣¹ 杨海波^{1,2}（通讯作者）

1 天津师范大学心理学部，天津，300074

2 天津师范大学心理与行为研究院，天津，300074

摘要 注意偏向是指个体在面临真实的或实验诱发的威胁刺激时，对其持续地分配更多的注意资源，具体包含注意警觉、注意脱离困难和注意回避三个成分。本研究利用眼动追踪技术，选取负性图片、中性图片、正性图片、轻度地震图片和高度地震图片为实验材料，在点探测任务中探讨了 61 名 13~17 岁震后 PTSD 青少年对威胁图片的注意偏向。结果发现，在首次注视时间上，相比负性图片，震后 PTSD 青少年对高度地震图片的首次注视时间更长；在总注视时间指标或总注视时间百分比上，相比中性图片，震后 PTSD 青少年对负性图片的总注视时间更短或总注视时间百分比更小。研究结果表明，（1）震后 PTSD 青少年对高度地震信息的注意偏向存在特异性加工；（2）震后 PTSD 青少年对创伤刺激的注意偏向特异性发生了泛化。

关键词 注意偏向，创伤后应激障碍，眼动追踪，威胁刺激

Attentional bias of PTSD teenagers to threat information: an eye movement study

Yu Bai¹, Xin Zhao¹, Haibo Yang^{1,2}

1 Faculty of Psychology, Tianjin Normal University, 300074

2 Academy of Psychology and Behavior, Tianjin Normal University, 300074

Abstract: Attentional bias, which contains facilitated attention, difficulty in attention disengagement and attentional avoidance, refers to the situation that individuals continuously allocate attentional resources to threats. This study utilized eye tracking technology to record the eye movements of sixty-one PTSD teenagers (age: 13~17) after the earthquake in the dot probe task, and delineated their attention bias towards threatening pictures. Participants viewed paired pictures for 500ms, which are threat related pictures and neutral pictures. The results showed that teenagers with PTSD had a longer first fixation duration on high-lever earthquake pictures when comparing with negative pictures. Furthermore, compared with neutral pictures, they have shorter total fixation time or smaller percentage of total fixation time on negative pictures. These results showed that (1) PTSD adolescents after earthquake have specific processing of the attentional bias to high-level earthquake information; (2) The attentional bias specific to traumatic stimuli has generalized in PTSD adolescents after earthquake.

Keywords: attentional bias, PTSD, eye tracking, threat stimuli.

为什么大家不想打疫苗？

新冠疫苗接种意图的调查及随机对照干预研究

摘要 由于当前全球新冠肺炎大流行, 数百万人的健康和生活条件受到损害。根据 WHO 的数据, 截止至北京时间 6 月 9 日 19 时 08 分, 全球累计新冠肺炎确诊病例 1.7360 亿例, 累计死亡病例 374.2653 万例。因此, 各国都在竞相开发并接种对抗冠状病毒的疫苗, 以限制其传播。接种新型冠状病毒疫苗可有效提高个体免疫力, 控制新型冠状病毒的传播, 且副作用相对较轻。因此, 了解后疫情时代个体的接种意愿对政府制定促进接种行为的政策具有重要意义。本研究首先调查中国公众的疫苗接种意图情况, 其次使用文本分析探究人们拒绝接种疫苗的原因, 同时本研究也调查阴谋论是否会影响公众的接种意愿。最后, 本研究进行随机对照实验 (Randomized Controlled Trial) 研究, 拟检验基于健康行为过程模型 (Health Action Process Approach, HAPA) 的干预能否有效提高个体接种疫苗意愿。研究发现: (1) 在中国, 67.8% 的人想接种新冠疫苗, 17.5% 的人不想接种, 人们不想接种疫苗的原因包括: 1) 接种疫苗是不必要的, 2) 担心副作用, 3) 担心安全性, 4) 担心有效性, 5) 疫苗在病毒变异时不起作用, 6) 疫苗不够成熟; 对新冠疫苗成熟度的担忧首次成为不愿接种其他疫苗的原因。(2) 阴谋论无法预测个体的新冠疫苗接种意图。(3) 基于 HAPA 的意图干预可以有效改善个体新冠疫苗接种意愿, 但对其疫苗计划和行为的影响有限, 符合 HAPA 模型。

4 Department of Psychology, Beijing Forestry University, Beijing, 100091

Abstract: As a result of the current global COVID-19 pandemic, the health and living conditions of millions of people have been compromised. According to the World Health Organization (WHO), a total of 173.6 million COVID-19 cases and 3,742,653 deaths have been confirmed globally as of 19:08 on June 9, Beijing time. As a result, countries are racing to develop and vaccinate against the COVID-19 to limit its spread. The COVID-19 vaccine can effectively improve individual immunity and control the transmission of COVID-19 with relatively mild side effects. Therefore, it is of great significance to understand individuals' willingness to vaccinate in the post-epidemic era for governments to formulate policies to promote vaccination behavior. This study first investigated the vaccination intentions of the Chinese public, then used text analysis to explore the reasons why people refused to be vaccinated, and the study also investigated whether conspiracy theory could affect the public's vaccination intentions. Finally, a Randomized Controlled Trial was conducted in this study to test whether the intervention based on Health Action Process Approach (HAPA) could effectively improve individuals' willingness to be vaccinated. This study found several results. (1) In China, 67.8% individuals wanted to vaccinate COVID-19 vaccine, and 17.5% individuals did not want to vaccinate. The reasons for individuals not wanting to be vaccinated included 1) vaccinations are unnecessary, 2) concern about side effects, 3) concern about safety, 4) concern about effectiveness, 5) the vaccine does not work if the virus mutates, 6) lack of maturity. Concerns about the maturity for COVID-19 vaccine have emerged for the first time

as a reason not willing to vaccinate against other vaccines. (2) Conspiracy brief did not predict individual's COVID-19 vaccination intentions. (3) HAPA-based intentional interventions can effectively improve individuals' COVID-19 vaccination intentions, but the effects on their planning and behavior for vaccine are limited.

上场前的“强迫动作”有用吗？仪式化行为提升自我控制

员东婷 张力为（通讯作者） 仇悦

北京体育大学心理学院，北京，100084

摘要 研究背景：赛场上，观众不但可以看到运动员精彩纷呈的运动动作，还可以看到形形色色的仪式化行为。心理学研究者一般将仪式化行为看作以僵化、刻板和重复为特征的行为(Foster et al., 2006; Rossano, 2012)，包含 3 个核心成分(Brooks et al., 2016; Hobson, Schroeder, et al., 2017)：物理属性的流程式动作、心理属性的符号象征意义以及区别于习惯行为的非功能化。综合以往研究发现仪式化行为影响自我控制证据不一致，最重要的原因是仪式化行为对不同领域不同类型的自我控制影响可能存在差异，而与运动项目的分类更为契合的是坚持性和抑制性自我控制的划分方式(李丹阳, 2019; 李丹阳, 张力为, 2020; 张烨, 张力为, 2017)。为检验表现前的仪式化行为是否对自我控制有用、对何种类型的自我控制作用更大以及仪式化行为的物理和心理属性何者发挥着重要作用？研究方法：通过 3 项系列研究来检验上述科学问题，研究 1 和研究 2 为平行研究，分别选用了坚持性自我控制的靠墙静蹲任务和抑制性自我控制的冲刺跑任务，采用二因素混合 3(行为类型：仪式化行为 vs. 随机行为 vs. 控制组)*2(测量次序：前测 vs. 后测)的实验设计；研究 3 对这一问题进行重复检验并对仪式化行为的核心成分进行操纵，采用三因素混合 2(物理属性：有结构化 vs. 无结构化)*2(心理属性：有符号意义 vs. 无符号意义)*2(测量次序：前测 vs. 后测)实验设计。研究结果：研究 1 发现仪式化行为对坚持性自我控制无显著影响($F(2, 116)=1.87, p=.159, \eta_p^2=0.031$)；研究 2 发现仪式化行为对抑制性自我控制任务中的抢跑次数的降低有用($F(2, 117)=5.02, p=.008, \eta_p^2=0.079$)；研究 3 得到相似结果，并支持了仪式化行为的心理属性在提升抑制性自我控制中扮演着重要作用($F(1, 101)=7.43, p=.008, \eta_p^2=0.069$)。研究结论：仪式化行为是真实存在的“赛前强心剂”而非单纯的“强迫动作”。仪式化行为对自我控制的提高作用因类别而异，其对抑制性自我控制的提升作用较稳健。仪式化行为的心理属性可作为其提升抑制性自我控制作用的重要解释机制。本研究对自我控制的力量模型和仪式化行为的有关理论进行了检验和整合，可帮助我们更好地理解运动员仪式化行为背后的心理功能。

Does pregame “compulsive action” really help athletes? Ritualized behavior enhances self-control

YUN Dongting, ZHANG Liwei, QIU Yue

Beijing Sport University, Beijing, 100084, China

Abstract: Background: Spectators at sporting events see not only skills displayed but also various forms of ritualized behavior exhibited by athletes. Psychology researchers generally view ritualized behavior as behavior characterized by rigidity, stereotyping, and repetition (Foster, Weigand, & Baines, 2006; Rossano, 2012), researchers have identified three core components of ritualized behavior (Brooks et al., 2016; Hobson et al., 2017): process-like actions (physical feature), symbolic expression (psychological feature) and lack direct instrumental purpose, which distinguishes it from habitual behavior. The most important reason for the inconsistency in the evidence for the impact of ritualized behavior on self-control is the possible difference in the effects of ritualized behavior on different types of self-control in different domains. The classification of self-control into persistent and inhibitory types is more compatible with sports than are other classifications (Li, 2019; Li & Zhang, 2020; Zhang & Zhang, 2017). To test whether the ritualized behavior before performance is useful for self-control, what type of self-control is more

effective, and which physical and psychological attributes of the ritualized behavior play an important role? Method: Three series of studies were conducted to test the above-mentioned scientific issues. Study 1 and Study 2 are parallel studies, the wall-sit task with persistent self-control and the task of sprinting with inhibitory self-control were selected respectively, using a two-factor mixed design 2 (measurement order: pretest vs. posttest) $\times$ 3 (behavior type: ritualized behavior vs. random behavior vs. control group) experimental design; Study 3 repeated tests on this question and the core of ritualized behavior. A three-factor mixed 2 (measurement order: pretest vs. posttest) $\times$ 2 (physical feature: structured vs. unstructured) $\times$ 2 (psychological feature: symbolic meaning vs. no symbolic meaning) design was used. Results: Research 1 found that ritualized behaviors had no significant effect on persistent self-control ($F(2, 116)=1.87, p=.159, \eta_p^2=0.031$); Research 2 found that ritualized behaviors played an important role in inhibitory self-control tasks The reduction in the number of start-ups is useful ($F(2, 117) = 5.02, p = .008, \eta_p^2 = 0.079$); Study 3 has similar results, ritualized behavior enhanced inhibitory self-control, and this effect was mainly reflected in the feature of symbolic meaning ($F(1,101) = 7.43, p = .008, \eta_p^2 = 0.069$). Conclusion: Ritualized behavior is a real “pregame booster” rather than a mere “compulsive action.” The enhancing effect of ritualized behavior on self-control varies depending on the type of self-control, with a robust effect on inhibitory self-control. The psychological feature of ritualized behavior may serve as an important explanatory mechanism for its enhancing effect on inhibitory self-control. The present study also verified and integrated the theories related to the strength model of self-control and ritualized behavior, which can help us better understand the psychological functions behind the ritualized behaviors of athletes.

摘要 目的: 自悯 (self-compassion) 是一种健康的自我观念, 指当面临个人失败和面对心理或生理痛苦时, 对自己的一种宽容、友善的态度倾向。自悯训练对治疗创伤后应激障碍 (PTSD) 有极大的潜力和临床价值。然而由于干预方式、样本等差异, 前人研究出现了不一致的结果。本研究采用元分析的方式系统性回顾并量化自悯训练对 PTSD 的作用。方法 对数据库进行系统地搜索后, 纳入了 12 篇符合条件的文献。提取文献中 PTSD 症状水平作为因变量。结果 自悯训练对 PTSD 有中等程度的保护作用 ($SMD = -0.65$), 而且这个结果中的大部分研究是临床样本 (8/12 个)。更重要的是, 自悯训练次数越多, 它对 PTSD 的缓解效果越好 ($p < 0.001$)。自悯的基线水平以及训练前后的自悯水平改变量与训练后的 PTSD 没有关系。结论 元分析结果细化了自悯训练对 PTSD 的作用, 为优化训练方式提供了思路。

Abstract: Objectives Self-compassion focused interventions may be able to decrease posttraumatic stress symptoms. However, previous studies demonstrated mixed effects in which a series of confounders were not systematically quantified. In this study, a systematic review with meta-analysis was conducted to quantify the effects of self-compassion focused therapies on posttraumatic stress disorder. Methods Twelve eligible studies were included after a systematic search of databases. Outcome measures were extracted for posttraumatic stress disorder. Results Our data indicated a medium protective effect on posttraumatic stress symptoms ($SMD = -0.65$), with most of the studies (8/12) coming from clinical settings. More importantly, longer interventions were associated with better posttraumatic stress outcomes ($p < 0.001$). Baseline or changes in self-compassion scores were not associated with posttraumatic stress outcomes post interventions. Conclusions Overall, findings from this meta-analysis quantified the complex influence of self-compassion focused interventions on posttraumatic stress symptoms and may provide insights for optimizing intervention strategies. ⁴ 华南师范大学广东省心理健康与认知科学重点实验室, 广州, 510631

摘要 目的: 老年人口的不断增加已成为当今社会发展中的一个突出的问题。作为一项重要的健康指标, 老年人的日常生活活动 (Activities of Daily Living, ADL) 功能的发展趋势引起了科研工作者、政策制定者以及政府部门的兴趣。考虑到前人不同研究中对老年人 ADL 缺失的发展趋势的研究结果存在不一致的现象, 我们在一个历时 12 年的研究中探讨 ADL 缺失的潜在发展模式以及影响这些轨迹的因素。方法: 本研究采用中国纵向健康长寿调查 (Chinese Longitudinal Healthy Longevity Survey, CLHLS) 五个波次的纵向数据集 (2002—2014 年), 其中包括 1,654 名 65 岁及以上的中国老年人。在本研究中, 我们统一使用 Katz 指数量表测量老年人的 ADL 失能情况, 该量表可以反应 ADL 失能的程度, 在量表中洗澡被认为是最困难的 ADL, 吃饭是最容易的 ADL。我们使用纳入非时变协变量的混合增长模型 (Growth Mixture Model, GMM) 来识别老年人 ADL 失能的潜在发展轨迹以及影响这些轨迹的风险因素和保护因素。结果: 我们把在 12 年间保持各项 ADL 功能都正常的老年人 ($N = 1,140$) 视为 ADL 功能健全的老年人。在剩余的 ADL 失能老年人样本 ($N = 514$) 中, 我们识别了两个潜在的增长类型: 轻微增长组和快速增长组。进一步的研究结果表明, 快速增长组中较少做家务、患有中风或痴呆的老年人比例显著大于轻度增长组。结论: 在一定程度上, 做家务有助于老年人

保持正常的 ADL 功能。而中风或痴呆，或者两者共病可能加速老年人晚年 ADL 失能的恶化。

The Potential Different Development Patterns of Disability among Elderly People in China: A Nationwide Longitudinal Study

Xitong Huang¹, Minqiang Zhang^{*1,2,3,4}, Junyan Fang¹

1 School of Psychology, South China Normal University, 510631 Guangzhou, China

2 Key Laboratory of Brain, Cognition and Education Sciences (South China Normal University), Ministry of Education, South China Normal University, 510631 Guangzhou, China

3 Center for Studies of Psychological Application, South China Normal University, 510631 Guangzhou, China

4 Guangdong Key Laboratory of Mental Health and Cognitive Science, South China Normal University, 510631 Guangzhou, China

Abstract: Background: The acceleration of population aging has brought a lot of attention to the disability among older populations, but existing results about the development patterns of disability were largely mixed. The current study aimed to identify the potential different development patterns of disability and the influential factors using a large, nationally representative sample of the Chinese elderly. Methods: We adopted a five-wave longitudinal dataset from the Chinese Longitudinal Healthy Longevity Survey (CLHLS), and a total of 1,654 elderly aged 65 and over were obtained. Disability was measured using the Katz index scale which graded individuals on a scale of difficulty to carry out the activities of daily living (ADL). We utilized the conditional growth mixture model (GMM) with time-invariant covariates to identify various development patterns and associated factors.

Results: Compared with those without disability ($n=1,140$), individuals living with ADL disability ($n=514$) were more likely to be old, female, or Han ethnic, eat more healthy food and suffer from chronic disease. Two groups with distinct developmental trajectories of ADL disability were identified among those with ADL disability, including the Slightly Increasing and the Quickly Increasing groups. People who did less housework ($OR=0.33$, 95% CI: 0.12–0.90; $p=0.030$), suffered from stroke ($OR=5.39$, 95% CI: 1.43 – 20.35; $p=0.013$) or dementia ($OR=10.29$, 95% CI: 1.01–104.44; $p=0.049$) were more likely to be classified into the Quickly Increasing group. Conclusion: There existed two development patterns of ADL disability among the Chinese elderly. Besides, doing housework could help prevent the deterioration of disability to some extent, and suffering from stroke or dementia may accelerate the deterioration of ADL ability in later years. The findings provided implications for public health interventions.

视觉搜索中风味引发对关联颜色的注意偏向

彭宇彬¹ 宛小昂¹

清华大学心理学系，北京，100084

摘要 人们常将特定的颜色与风味联系起来形成色味联结，并可根据食物或饮料的颜色而对其风味产生预期。最近的研究表明，人们也可对具有某种风味标签的食品包装的颜色产生预期并由这种预期引导对这种风味标签进行视觉搜索。但是，真实风味对颜色信息加工的调控作用尚不清楚，本研究通过两个视觉搜索实验对此进行探究。实验 1 探究了真实的风味对视觉搜索的影响。任务要求被试先品尝饮料再对具有特定形状的靶子进行视觉搜索，而风味线索会提示靶子的颜色。当风味线索所提示的靶子颜色是与该风味关联的颜色时，被试的视觉搜索速度变快。如果风味线索所提示的靶子颜色与该风味不关联，而与该风味关联的颜色也没有出现在画面中，那么风味线索可以加速视觉搜索。但是，如果与该风味关联的颜色出现在干扰项上，那么风味线索就无法促进视觉搜索，体现了被试对该颜色的注意偏向。实验 2 则探究了想象的风味对视觉搜索的影响。任务要求被试在看到水果名称后想象其风味，再对具有特定形状特征的靶子进行视觉搜索。结果表明，

被试对形状靶子的视觉搜索在靶子颜色与他们想象的风味关联时比不关联时更快,说明想象的风味也可以通过有关联的靶子颜色而促进视觉搜索。总之,两个实验的结果一致表明,无论是真实的还是想象的风味,都会引发个体对关联颜色的注意偏向,体现了风味信息对颜色信息加工的调控。本研究揭示了味觉刺激对视觉注意的影响,为色味交互提供了新的实验证据,也为进一步探讨跨通道影响的心理与神经机制奠定了基础。

关键词 色味联结,跨通道影响,风味,想象,注意偏向

Flavors Bias Attention towards Associated Colors in Visual Search

Yubin Peng¹, Xiaolang Wan¹

¹ Department of Psychology, School of Social Science, Tsinghua University, Beijing

Abstract: People tend to associate a color with a certain flavor to establish color-flavor associations, and generate flavor expectations about a food or beverage based on its color. Recent research has shown that people can generate color expectations about a food packaging based on its flavor label to guide visual search for this flavor label. However, it remains unclear how flavors modulate color processing. Therefore, we conducted two visual search experiments to address this issue. Experiment 1 was designed to test the influence of an actual flavor. We used a peristaltic pump to deliver a certain amount of fruit-flavored beverage or tasteless purified water to the participants' mouths, followed by a shape-based visual search task. Half of the participants were informed that the strawberry and pineapple flavors were always followed by targets in the associated colors; whereas the rest of them were informed that the strawberry and pineapple flavors were always followed by targets in the non-associated colors; and the tasteless purified water was not predictive of the color of the shape target. Consequently, their search times were speeded when the target appeared in a flavor-associated color, or when the target appeared in a non-associated color but the flavor-associated color was absent from the display. However, the flavor cue did not facilitate visual search if the distractor was presented in the flavor-associated color, thus indicative of prioritized attention to this associated color. Experiment 2 was designed to test the influence of an imagined flavor on visual search. The participants were instructed asked to imagine the flavor of a fruit upon seeing its name, followed by a shape-based visual search task. When they were searching for the shape target, the color associated with the imagined flavor might appear on the target or the distractor, or was absent from the display. In the latter two cases, the shape target had a color that was not associated with the imagined flavor. Consequently, searching for a shape-defined target was faster when its color was associated with the imagined flavor than otherwise. These results suggest that an imagined flavor could facilitate visual search when it was associated with the target color. Collectively, the results of both experiments consistently revealed attentional bias towards flavor-associated colors in shape-based visual search, regardless of whether the flavor was actually experienced or only imagined. These findings demonstrate how flavor cues could modulate visual information processing. Our findings provide empirical evidence regarding color-flavor interactions by showing the influence of gustatory cues on visual attention, which allows us to further investigate the underlying mechanisms and neural basis of crossmodal influence in follow-up research.

Keywords: color-flavor associations, crossmodal influence, flavor; imagination, attentional bias

反复想象消费食物对感官特异性厌腻的影响

邱林波 宛小昂

清华大学心理学系, 北京, 100084, wanxa@mail.tsinghua.edu.cn

摘要 在短时间内反复食用某种食物会使人们对它的喜爱和想吃程度下降,这种现象被称为感官特异性厌腻。本研究通过三个实验探讨个体在反复想象食用不同的食物后,是否会影响其他具有相似特征的食物喜爱或想吃程度。实验一中,被试被随机分为两组,他们分别需要反复想象食用薯片和青苹果,并在想象三次和想象三十次后评价对其他食物的喜爱和想吃程度。结果表明,反复想象食用薯片使得被试对其他金黄色食物的喜爱程度和想吃程度也显著下降,但是他们对绿色食物的喜爱和想吃程度并没有显著改变;而反复想象食用青苹果使被试对于金黄色和绿色食物的喜爱程度均显著降低。实验二中,被试需要反复想象食用菠萝,

结果发现反复想象食用菠萝使被试对金黄色和绿色食物的喜爱程度都显著降低,这与实验一中想象食用青苹果的结果模式一致。实验三中,被试需要反复想象食用金黄色的蛋糕,结果发现反复想象食用蛋糕使被试对金黄色食物的喜欢和想吃程度显著降低,但是他们对于绿色食物的喜欢和想吃程度并没有显著改变,这与实验一中想象薯片的结果模式一致。总的来说,本研究的结果说明反复想象食用某种食物会导致对于其他食物的厌腻,而食物热量可能是影响不同厌腻结果模式的原因,这一结果对于助推个体做出更健康的食物选择具有启发意义。。

The influence of repeated imagined consumption on sensory-specific satiety

Linbo Qiu, Xiaoang Wan

Psychology Department, Tsinghua University, Beijing

Abstract: Compared to uneaten foods, repeated consumption of a certain food within a short period of time can reduce people's liking of and wanting for this food, a phenomenon referred to as sensory-specific satiety. We conducted three behavioral experiments to examine whether repeatedly imagining consuming a certain food would influence people's liking of and wanting for other foods. In Experiment 1, two groups of participants were asked to repeatedly imagine consuming potato chips and green apples, and to rate their liking of and wanting for other golden yellow- or green-colored foods after 3 and 30 rounds of imagined consumption. Consequently, repeatedly imagining eating potato chips decreased the participants' liking of and wanting for other foods in the golden yellow color, whereas no such results were observed for green-colored foods. By contrast, repeatedly imagining eating green apples decreased the participants' liking of the foods in both golden yellow and green colors. Considering that the potato chips and green apples differed in color, basic taste, and energy-density, we conducted two more experiments. In Experiment 2, the participants were asked to repeatedly imagine consuming pineapples, and they showed similar results with the apple group of Experiment 1. In Experiment 3, the participants were asked to repeatedly imagine eating cakes in the golden yellow color, and they showed similar result patterns with the potato chip group of Experiment 1. Collectively, the findings of the present study suggest that repeatedly imagining consuming energy-dense foods might decrease an individual's liking of and wanting for other energy-dense foods, but would not change their desire to eat healthy foods. These findings have direct implications in the practice of nudging consumers towards healthier food choices.

个体短时记忆水平对选择过载效应的影响及其材料特异性

吕晨钰¹ 何清华^{1,2}

1 西南大学心理学部, 重庆, 400715

2 认知与人格重点教育部实验室, 重庆, 400715

摘要 本研究旨在探讨个体短时记忆水平对选择过载效应的影响。实验1招募了193名被试,采用不同的薯片口味作为实验材料,通过问卷调查的方式考察了不同大小选择集下个体情绪体验的差异。结果发现与面对较小选择集的被试相比,面对较大选择集的被试经历了更多的负面情绪。实验2以风景图片作为实验材料,使用风景图片再认任务来测量其短时记忆水平。结果进一步证实了选择过载效应的存在,并发现了图片再认水平对选择过载效应的影响,即与高图片再认水平的个体相比,低图片再认水平的个体表现出更明显的选择过载效应。实验3采用了相同的风景图片作为材料,使用经典的数字记忆任务测查了个体的数字短时记忆水平。结果虽然发现了选择过载效应,然而并没有发现数字短时记忆水平对风景图片的选择过载效应有与实验2中相似的影响。因此,个体短时记忆水平对选择过载效应的影响可能具有材料的特异性。

The influence of individual short-term memory level on choice overload effect and its material specificity

Lu Chenyu¹, He Qinghua^{1,2}

1 Faculty of Psychology, Southwest University, Chongqing 400715, China

2 Key Laboratory of Cognition and Personality, Ministry of Education, Chongqing 400715, China

Abstract: In every field of modern society, people are faced with a wealth of choices. Too many choices may have strong negative consequences, such as decreased satisfaction, increased regret, reduced purchase behavior, and so on, which is called the choice overload effect. At present, researchers generally believe that cognitive load is the main reason for the choice overload effect of individuals, and individuals' short-term memory level, as an important manifestation of cognitive load, will have a certain influence on the choice overload effect. Therefore, this study aims to explore the influence of individual short-term memory level on the choice overload effect. In Study 1, 193 subjects were recruited and different potato chip tastes were used as experimental materials. The differences of individual emotional experience under different choice sets were investigated by questionnaire. The results showed that the subjects who were presented with a larger set of choices experienced more negative emotions, especially difficulty and frustrating, than those who were presented with a smaller set of choices. In Study 2, landscape images were used as the experimental material, and short-term memory was measured by landscape image recognition task. The results further confirmed the existence of the choice overload effect and found the effect of image recognition level on the choice overload effect, that is, the individuals with low image recognition level exhibited more obvious choice overload effect than those with high image recognition level. Study 3 used the same landscape images as the material, using the classic number memory task to measure the individual's numerical short-term memory level. Results showed that, although the choice overload effect was found, the effect of digital short-term memory level on the choice overload effect of landscape images was not similar to that in Study 2. Therefore, the influence of individual short-term memory level on the choice overload effect may be material specific.

Keywords: choice overload effect, cognitive load, short-term memory

广泛性焦虑症状的动态网络

摘 要 近年来新兴的网络理论认为精神障碍产生于症状间直接的相互作用。探究广泛性焦虑(GAD) 症状间动态关系对我们理解 GAD 的发生和维持以及实施更精准有效的预防和干预具有重要意义。然而, GAD 症状间的动态关系目前尚未见报道。本研究纳入广泛性焦虑障碍量表(GAD-7) 评分 ≥ 10 分且自我报告无精神障碍病史者共 115 人(60 名男性)。使用完整的精神障碍诊断与统计手册第五版(DSM-5) 中 GAD 症状诊断标准项目(共 8 项) 评估被试每天的 GAD 症状, 持续 50 天。使用 mlVAR (multilevel VAR) 模型来获得 GAD 症状间的时间网络(temporal network) 和同时期网络(contemporaneous network)。尤其关注时间网络中每个症状的外强度(out-strength) 以及同时期网络中每个症状的强度中心性(strength)。在时间网络中, 症状间的关联较为密切且所有关联都是正性的。“睡眠问题”、“不安或激动或紧张”和“容易疲倦”分别在两个时间网络中展现出了最高的外强度。在同时期网络中, 症状间的关联较为密切且所有关联都是正性的。“不能控制担忧”在两个同时期网络中均展现出最高的强度中心性, “睡眠问题”均展现出最低的强度中心性。另外, 时间网络中出现了一些有趣的症状间恶性循环, 如“不安或激动或紧张”、“容易疲倦”和“注意力不能集中或头脑一片空白”之间的反馈回路。本研究揭示了 GAD 症状之间的动态相互作用以及对整个症状网络起重要作用的症状, 并发现了“睡眠问题”与其他症状之间的关系以及一些有趣的症状间恶性循环。本研究表明网络模型可以加深我们对 GAD 症状间动态关系的理解, 并为发展和完善 GAD 预防和干预手段提供

了一定依据。

3 Department of Methodology and Statistics, Tilburg University, Tilburg, 5037 AB

Abstract: In recent years, the emerging network theory holds that mental disorders arise from the direct interaction between symptoms. Exploring the dynamic relationship between symptoms of generalized anxiety (GAD) is of great significance for us to understand the occurrence and maintenance of GAD and to carry out more accurate and effective prevention and intervention. However, the dynamic relationship between GAD symptoms have not been reported. A sample of participants ($n = 115$, male = 60) with elevated GAD-7 scores ($GAD-7 \geq 10$) and without previous history of mental disorder participated in an online daily diary study in which they reported their GAD symptoms (eight symptoms) based on DSM-5 diagnostic criteria for 50 consecutive days. We used a multilevel VAR model to obtain temporal and contemporaneous networks. We pay special attention to the out-strength of each symptom in temporal networks and the strength of each symptom in contemporaneous networks. In temporal networks, all of the edges are positive. "Sleep disturbance", "restlessness" and "fatigue" had the highest out-strength in the two temporal networks respectively. In contemporaneous networks, all of the edges are positive. "Uncontrollable worry" had the highest strength in the both two contemporaneous networks and "sleep disturbance" had the lowest strength in the both two contemporaneous networks. In addition, there are some interesting vicious cycles in the temporal networks, such as the vicious cycles between "restlessness", "fatigue" and "difficulty concentrating". The present study reveals the dynamic interaction between GAD symptoms and the symptoms that play important roles in the entire symptoms network, and finds the relationship between "sleep disturbance" and other symptoms as well as some interesting symptomatic vicious cycles. This study indicates that the network model can deepen our understanding of dynamic relationship between GAD symptoms, and provides some references for the development and improvement of GAD prevention and intervention methods.

关系对政府职员受贿决策的影响

牛冰钰¹ 田慧溢¹ 范昭¹ 程晓荣¹ 李晔¹ 定险峰¹

1 华中师范大学心理学院, 武汉 430079

摘要 腐败是影响全球各国政治和经济的重大现实问题。尽管已有大量研究考察了腐败的影响因素和心理机制, 但很少有研究从受贿和行贿双方关系的角度出发探讨受贿决策过程和心理机制, 尤其在人情关系文化比较突出的中国和东亚社会, 这个问题更重要。本研究通过 4 个行为实验, 首次从行/受贿双方关系出发, 考察了关系(直接关系和间接关系)对政府职员受贿决策影响及其内在心理机制。实验 1 探讨直接关系对政府职员受贿决策的影响; 实验 2 进一步考察信任、道德、责任义务和感情四种因素在其中的中介效应; 实验 3 和 4 则进一步探讨间接关系对受贿决策的影响及其内在心理机制。实验结果表明, 无论直接关系还是间接关系, 关系越近, 政府职员受贿概率越大; 风险和数额越大, 关系效应越弱。更进一步, 直接关系和间接关系影响受贿决策的心理机制存在差异。在直接关系条件下, 关系越近, 政府职员对行贿者越信任, 同时感觉越有责任和义务帮助他们, 导致受贿概率越高; 然而, 间接关系条件下, 接受贿赂的原因则仅仅由信任驱动。道德和感情机制在关系对政府职员受贿决策的影响中则没有显著作用。总之, 关系对政府职员受贿决策有重要影响, 而且不同类型关系的影响机制存在差异。以上结果不仅对于腐败的心理机制探索有一定的理论意义, 而且对于中国现实反腐有较为重要的参考价值。

How Guanxi influences government employees' bribe-taking decisions

Bing-Yu Niu¹, Hui-Yi Tian¹, Zhao-Fan¹, Xiao-Rong Cheng¹, Ye Li¹, Xian-Feng Ding¹

¹ School of Psychology, Central China Normal University (CCNU), Wuhan, 430079

Abstract: Corruption is a major issue impairing the politics and economy of countries around the world. Although a large number of studies have examined the influencing factors and psychological mechanisms of corruption, few studies investigated the bribery decision-making process from the perspective of the relationship between bribe-takers and bribe-givers (Guanxi). Especially in East Asian societies (represented by China) where the culture of Guanxi is deep-rooted, Guanxi may have an important impact on bribe-taking decisions. We used 4 studies to examine how direct and indirect Guanxi influence government employees' bribe-taking decisions and explore the underlying psychological mechanisms for the first time. Experiment 1 and 2 explored how the direct Guanxi influenced the government employees' bribery decisions and investigated the mediating effects of four factors: trust, morality, responsibility-obligation and affection; Experiment 3 and 4 further investigated the influence and the psychological mechanisms of indirect Guanxi on bribery decisions. Results showed that the closer the Guanxi, the higher the probability of receiving a bribe; and as the risk and amount increased, the effect of Guanxi decreased. More importantly, the results showed that although direct and indirect Guanxi affected the bribe-taking probability similarly, the underlying mechanisms were different. Specifically, government employees accepted more bribes from those who had closer direct Guanxi because they trusted them more, and felt more responsible and obligated to help them; however, the reason for accepting more bribes from those who had closer indirect Guanxi was only driven by trust. The role of morality and affection in the relationship between Guanxi and bribery was not significant. Taken together, Guanxi has a significant impact on government employees' bribe-taking decisions, and the psychological mechanisms vary across different types of Guanxi. These results not only have a theoretical significance for understanding the psychological mechanisms of corruption, but also have important practical values for anti-corruption in China.

指定的和显现的领导者对团体创造力的影响： 一项近红外超扫描研究

何映瑶 郝宁

上海市心理健康与危机干预重点实验室，心理与认知科学学院，华东师范大学，上海

摘要 本研究采用基于近红外的超扫描技术，探讨了事先指定和自由显现的领导者对团体创造力、团体成员互动及脑间同步性（IBS）的影响。被试被随机分入三人讨论小组完成一个现实情境相关的创造性问题解决任务，同时记录其大脑活动。行为结果发现，显现领导者比指定领导者有更高的领导角色认同感。显现领导者条件下的团体新颖性和团体观点聚合度显著高于指定领导者条件。显现领导者条件下领导者的流畅性和灵活性得分显著均高于追随者，且显现领导者在上述指标得分均显著高于指定领导者。显现领导者条件下领导者-追随者（LF）配对的观点采择度显著高于追随者-追随者（FF）。脑成像结果表明，显现领导者条件下 LF 配对在右侧颞叶及右侧顶叶的 IBS 增量均显著高于指定领导者，且 LF 的 IBS 与创造性任务表现呈显著正相关。上述结果表明，显现领导者能生成更多数量和种类的观点，有助于促进团体成员间的观点交换和利用，继而帮助提升团体创造力。

The Effects of Appointed and Emerging Leader on Group Creativity: A fNIRS-based Hyperscanning Study

Yingyao He¹, Ning Hao¹

¹ Shanghai Key Laboratory of Mental Health and Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200000

Abstract: Using the fNIRS-based hyperscanning technology, the current study explored how appointed (Condition A) and emerging (Condition E) leaders affect leader-follower creative performance, interaction pattern, and interpersonal brain synchronization (IBS) during group creative discussion. Participants were randomly assigned into three-person discussion groups to complete a real-world related creative problem-solving task. In the meantime, the fNIRS equipment was used to record the brain activity in the right temporal-parietal region of three subjects simultaneously. The behavioral results indicated that emerging leaders had a higher level of leader role identity than the appointed leader. The group originality and group convergence were significantly higher on Condition E than the Condition A. Only on Condition E, leaders' fluency and flexibility scores were significantly higher than the followers. Further, emerging leaders' fluency and flexibility scores were significantly higher than the appointed leaders. What's more, the perspective-taking between leader-followers (LF) was significantly higher than that between follower-follower (FF) only on Condition E. The neuroimaging results showed that significantly higher IBS increment of LF evoked in the right temporal cortex and right parietal cortex on Condition E than Condition A. The IBS increment of LF in those regions is also positively correlated with multiple creative performance indexes. Our findings suggested that emerging leaders could produce more quantities and categories of ideas, which was beneficial to the idea exchange between group members, leading to higher group creative performance.

Keywords: group creativity, leader-follower relationship, social interaction, fNIRS-based hyperscanning, interpersonal brain synchronization

Upward social comparison sensitivity on teachers' emotional exhaustion: A moderated moderation model of self-esteem and gender

Abstract: Drawing on the conservation of resources theory, the present study aimed to extend the work on individual differences in the relationship between upward social comparison sensitivity and emotional exhaustion in a sample of teachers, by examining the interaction effects of self-esteem and gender difference. 681 teachers completed a self-reported questionnaire including the Upward Social Comparison Sensitivity scale, the Self-Esteem Scale, and the Maslach Burnout Inventory-Educators Survey (MBI-ES) sub-scale. Results based on a moderated moderation model indicated that (1) upward social comparison sensitivity was positively correlated to emotional exhaustion, (2) self-esteem moderate the relationship between upward social comparative sensitivity and emotional exhaustion, (3) there is a significant gender difference in self-esteem of moderating effect the relationship between upward social comparative sensitivity and emotional exhaustion. These findings contribute to the understanding of how upward social comparison sensitivity predicts teachers' emotional exhaustion, and provide practical implications for prevention and intervention programs to protect teachers' mental health in the school setting.

不同正念练习方式对射击运动中的自我控制的影响 ——以虚拟现实下的十米气手枪比赛为例

高倩¹ 张力为¹ (通讯作者) 徐守森²

1 北京体育大学心理学院, 北京市, 100084

2 首都体育学院心理学教研室, 北京市, 100191

摘要 射击运动是一项对运动员自我控制能力要求极高的项目, 尤其对气手枪项目来讲, 在高压下重复完成高质量规范技术动作的专项能力以及保持稳定情绪和坚强意志力的自我控制能力是制胜的两大关键。

目的 本研究旨在通过一项随机对照实验, 探究一次短时不同方式的正念练习对射击运动过程中被试的情绪控制和行为控制的不同影响, 为设计具有运动项目特异性的正念训练提供科学依据。**方法** 采用 2×4 的混合实验设计, 被试内因素: 2 水平(前测、后测), 被试间因素: 4 水平(10 分钟正念观呼吸、开放觉察练习、正念慈心练习、对照组)。采用 G*Power3.1 计算样本量为 136 名, 实验共招募被试 162 名, 随机分配到四个不同的组别, 最终纳入分析的样本为 139。实验采用虚拟现实模拟真实的十米气手枪决赛, 收集被试在基线和前后测比赛过程中的心理准备李克特量(MRF-3)得分、心率变异性(HRV)的时域和频域指标以及被试的持枪坚持时长和射击总环数。**结果** 本研究的虚拟现实射击比赛场景有效的诱发了被试的比赛压力, 与基线相比被试在进入比赛场景后的认知焦虑($F_{(1, 138)} = 104.872, p = .000, \eta_p^2 = 0.275$)、躯体焦虑($F_{(1, 138)} = 90.508, p = .000, \eta_p^2 = 0.247$)均显著上升, 状态自信心($F_{(1, 138)} = 41.495, p = .000, \eta_p^2 = 0.131$)显著下降; 以平均心率为因变量, 两因素交互效应显著($F_{(3, 135)} = 8.996, p = .000, \eta_p^2 = 0.167$), 简单效应检验发现, 开放觉察组的后测平均心率显著低于对照组 $p = .003$, 95% CI [2.506, 17.290], 其余无显著差异; 而在 LF/HF 上的简单效应分析显示, 在后测的 LF/HF 指标上, 观呼吸组和开放觉察组均显著低于对照组, 前者 $p = .020$, 95% CI [0.403, 7.099], 后者 $p = .000$, 95% CI [1.935, 8.952]; 同样, 在持枪时长上两阶交互作用显著($F_{(3, 135)} = 4.262, p = .007, \eta_p^2 = 0.087$), 简单效应检验结果显示, 在后测举枪坚持总时长上, 观呼吸组显著长于对照组 $p = .000$, 95% CI [-211.023, -50.933], 正念慈心组也发现了相同结果 $p = .016$, 95% CI [-176.615, -11.683]; 最后, 在射击总环数上, 两阶交互作用不显著($F_{(3, 135)} = 1.361, p = .257, \eta_p^2 = 0.029$)。**结论** 对于十米气手枪项目, 开放监控的正念练习更有利于情绪控制; 聚焦注意的正念练习更有利于行为控制。

Influence of different mindfulness exercises on self-control in shooting —Taking the 10-meter air pistol competition under virtual reality as an example

Qian Gao¹, Liwei Zhang¹, Shousen Xu²

1. Beijing Sport University, Beijing, 100084, China

2. Capital University of Physical Education And Sports, Beijing, 100191, China

Abstract: Shooting is an event that requires high self-control ability of athletes. The excellent performance of shooting requires two key factors: (1) the special technical ability to repeatedly complete high-quality and standardized technical actions under high-intensity load, (2) the self-control ability to maintain stable emotion and strong willpower. Objective To explore the different effects of a short-term mindfulness exercise in different ways on the subjects' emotional control and behavior control in the process of shooting through a RCT experiment. Therefore, provides a reference for the shooting team to design a scientific and effective mindfulness training and also an evidence for the mechanism of mindfulness in improving shooting performance. Methods A mixed experimental design of 2×4, the within-subjects factor: 2 levels (pre-test and post-test), and the between-subjects factor: 4 levels (10 minutes mindfulness breathing, sound awareness practice, mindfulness compassion practice, control group). The

sample size was 136 calculated by Gpower3.1, So we finally recruited 140 subjects and randomly assigned to four different groups. Participants were asked to complete two 10 meter air pistol shooting finals under virtual reality, and we collected the Self-assessment score of subjects on Mental Readiness Form-Likert (MRF-3) , and also time and frequency domain indexes of heart rate variability (HRV), as well as the subjects' gun holding duration and the shooting rings at baseline and during the competition. Results The virtual reality shooting competition scene in this study effectively induced the competition pressure of the subjects. Compared with the baseline, the subjects' cognitive anxiety after entering the competition scene($F_{(1, 138)} = 104.872, p = .000, \eta_p^2 = 0.275$), physical anxiety($F_{(1, 138)} = 90.508, p = .000, \eta_p^2 = 0.247$), state self-confidence($F_{(1, 138)} = 41.495, p = .000, \eta_p^2 = 0.131$) decreased significantly; Taking the average heart rate as the dependent variable, the interaction effect of the two factors was significant ($F_{(3, 135)} = 8.996, p = .000, \eta_p^2 = 0.167$), the simple effect test found that the post test average heart rate in the open awareness group was significantly lower than that in the control group $p = .003$, 95% CI [2.506, 17.290], and there was no significant difference in the rest; The simple effect analysis on LF / HF showed that in the post-test LF / HF index, the respiratory observation group and open awareness group were significantly lower than the control group, the former $p = .020$, 95% CI [0.403, 7.099], and the latter $p = .000$, 95% CI [1.935, 8.952]; Similarly, the two-order interaction is significant in the gun holding duration ($F_{(3, 135)} = 4.262, p = .007, \eta_p^2 = 0.087$), the results of simple effect test showed that the total duration of gun lifting in the post-test group was significantly longer than that in the control group, $p = .000$, 95% CI [-211.023, -50.933], and the same results were also found in the mindfulness compassion group, $p = .016$, 95% CI [-176.615, -11.683]; Finally, on the total number of firing rings, the two-order interaction is not significant ($F_{(3, 135)} = 1.361, p = .257, \eta_p^2 = 0.029$). Conclusion For 10-meter air pistol, open monitoring mindfulness practice is more conducive to improve emotional control; Attention focused mindfulness practice is more effective for improving behavior control.

中国式幽默的结构及其在组织中的应用

曹毅¹ 侯玉波¹

1 北京大学心理与认知科学学院, 北京, 100871

摘 要 立足于中国本土文化, 本文通过四个研究探索了中国人的幽默人格结构及其在组织管理领域中的应用价值。研究一按照人格词汇学假设, 通过现代汉语词典与开放式问卷获得有关中国人幽默的人格词汇 41 个。研究二通过探索性因素分析 ($N = 330$) 和验证性因素分析 ($N = 330$), 发现中国人的幽默人格具体包括 27 个词汇, 分为 5 个因子: 平易近人、生动活泼、聪明才智、心思灵敏、诙谐逗趣, 并且中国人幽默人格及其 5 个因子的内部一致性系数均达到了心理学统计中的基本要求。另外, 相关性分析显示, 中国人的幽默人格与大五人格中的外倾性、宜人性、尽责性、开放性显著正相关, 与神经质负相关, 与幽默气质基础中的高兴正相关、坏心情负相关、与严肃无显著相关, 说明中国人的幽默人格量表具有良好的效标关联效度。研究三对比了中($N = 657$)美($N = 604$)两国被试对幽默人格的认知差异, 发现中国被试在平易近人、生动活泼、聪明才智、心思灵敏上的得分显著高于美国被试, 美国被试在诙谐逗趣上的得分显著高于中国被试, 说明两国被试对幽默的理解存在文化差异。研究四探索了中国人的幽默人格在组织管理中的实际应用, 收集的数据来自中国的本土化企业, 分两个时间点完成 ($N = 430$), 结果表明领导的幽默人格可以正向预测下属的工作绩效、创造力、工作幸福感, 负向预测下属的离职倾向。本研究既可以有效补充中国人的幽默人格方面的相关理论, 同时还具备一定的实际应用价值, 可以为进一步理解中国人的幽默提供参考。

The Chinese Humor Personality Structure and its Application in Organization

Cao Yi¹, Hou Yubo¹

¹ School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871

Abstract: Based on Chinese traditional culture, this research explored the Chinese humor personality structure and its application in organization through four studies. According to the hypothesis of personality lexicology, Study 1 obtained 41 personality vocabularies related to Chinese humor through Modern Chinese Dictionary and open-ended questionnaires. Study 2 conducted the exploratory factor analysis ($N = 330$) and confirmatory factor analysis ($N = 330$) and found that the Chinese humor personality structure includes 27 vocabularies and 5 factors: Approachable, Lively, Intelligent, Nimble, Jocular. Moreover, the internal consistency coefficients of Chinese humor personality and its five factors reached the basic requirements in psychological statistics and correlation analysis showed that Chinese humor personality is significantly positively correlated with extraversion, agreeableness, conscientiousness, openness, and happiness, negatively correlated with neuroticism and bad mood, indicating that the Chinese Humor Personality Scale has good criterion-related validity. Study 3 compared the differences in the perception of humor personality between Chinese ($N = 657$) and American ($N = 604$) participants and found that there are cultural differences in the understanding of humor between the two cultures. Study 4 explored the application of Chinese humorous personality in organizational, data was collected from localized companies in China and was completed in two time points. The results showed that the leader humor personality can positively predict employees' work performance, creativity, and job well-being, and negatively predict employees' turnover tendency. This research not only supplement the relevant theories of Chinese humor personality, but also has certain practical implication.

Keywords: humor, personality, leader, culture

外显和内隐公正世界信念对亲社会行为的影响 ——共有取向的中介作用

郭禹辰¹ 陈学芳¹ 马剑虹¹ (通讯作者)

¹ 浙江大学心理与行为科学系, 杭州, 310012

摘要 公正世界信念是人们普遍持有的一种信念, 即人们相信自己生活在一个公正的世界里, 在这个世界里人们得其所应得, 所得即应得。已有研究多聚焦于公正世界信念在个体层面上的功能, 指出有较高公正世界信念的人们常常会归咎和责备不公正的受害者, 从而应对不公正带来的威胁并保持心理健康。然而, 已有研究却很少从社会层面考虑公正世界信念的作用, 对公正世界信念与亲社会行为的关系的探讨也未能获得一致的结论。因此, 本研究试图发掘公正世界信念的积极社会功能, 探讨了公正世界信念对个体亲社会行为的影响及其内部机制。本研究构建了以公共取向为中介的亲社会行为与个人/一般公正世界信念关系模型。研究一采用线上问卷调查的方式 ($n=203$), 使用 Dalbert 等人编制的公正世界信念量表和 Rushton 等人编制的利他精神自陈量表, 分别测量了被试的个人/一般公正世界信念水平与其过去的亲社会行为水平; 还使用了 Clark 等人的共有关系取向量表考察了被试的共有取向水平。研究结果显示个体的个人公正世界信念和一般公正世界信念水平都能够正向预测其亲社会行为, 并且共有取向起到了中介作用。考虑到许多研究者曾指出公正世界信念应是一种内隐构念, 并且主观报告的公正世界信念可能会受到社会赞许性的影响。因此研究二招募被试到实验室 ($n=159$), 采用了内隐联想测验 (IAT) 范式测量了被试内隐的个人/一般公正世界信念, 并考察了被试的内隐信念对其实际捐款行为的影响。结果发现个体的内隐个人公正世界信念和内隐一般公正世界信念也能够通过公共取向正向预测其捐款行为, 即人们越相信世界是公平的, 他们的共有取向就越高, 随后他们就越愿意向抗战老兵捐款给。被试的内隐公正世界信念也能够正向预测亲社会行为, 被试的公正世界信念越高, 越有可能向退伍老兵的捐款行为。综合两个研究的结果, 我们认为公正世界信念确实具有积极社会功能, 它可以通过提高人们的共有取向来促使人们做出更多的亲社会行为。

关键词 个人公正世界信念, 一般公正世界信念, 亲社会行为, 共有取向, 内隐联想测验

The Effect of Explicit and Implicit Just World Belief on Prosocial Behavior via Communal Orientation

Guo Yuchen¹, Chen Xuefang¹, Ma Jianhong¹ (Corresponding author)

¹ Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou 310012, jhma@zju.edu.cn

Abstract: Belief in a Just World (BJW) is a belief widely held by people who tend to believe that the world is fair and individuals get what they deserve and deserve what they get. The previous studies mostly focused on the function of BJW at the individual level, pointed out that individuals with high BJW often blamed and belittled the victims, so that they could effectively respond to the threats and maintain their mental health. However, previous studies rarely considered the function of BJW at the social level, for instance, the discussion on the relationship between BJW and prosocial behavior has still failed to reach a consistent conclusion. Therefore, the present research attempted to find out the positive social functions of BJW by exploring the effect of BJW on prosocial behaviors, and its internal mechanisms. This research investigated the mediating role of communal orientation in the relation between prosocial behavior and personal BJW (PBJW) as well as general BJW (GBJW). In Study 1 (n=203), an online questionnaire was used to measure participants' explicit BJW, prosocial behavior and communal orientation. The results showed that the explicit PBJW and GBJW positively affected prosocial behavior, and communal orientation played a mediating role. Considering that BJW was often conceptualized as an implicit construct, in Study 2 (n=159), the Implicit Association Test (IAT) was used to measure the implicit PBJW and GBJW, and examine the effect of them on actual donation behavior. The results showed that the implicit PBJW and GBJW positively predicted prosocial behavior via communal orientation. The more people believed in a just world, the higher their communal orientation, and subsequently, the more willing they were to donate to veterans. Based on the results of two studies, this research suggests that PBJW and GBJW should have a positive social function to some extent.

Keywords: PBJW, GBJW, Prosocial behavior, Communal Orientation, Implicit Association Test

女性甲基苯丙胺依赖者药物渴求与食物奖赏的关系

周宇¹ 周成林¹ (通讯作者)

¹ 上海体育学院心理学院, 上海, 200438, Chenglin_600@126.com

摘要 食物奖赏和药物依赖有共通的神经基础, 药物依赖人群其奖赏功能受损, 表现在吸食阶段对于食物奖赏的敏感性降低和药物奖赏的敏感性增加, 然而依赖者在戒断期间进食量增加, 存在肥胖风险。同时在动物实验中发现, 甜食具有相较成瘾性药物更高的奖赏效应。因此, 本研究的目的是探讨女性甲基苯丙胺依赖者药物渴求与食物奖赏、食欲及身体成分的关系, 并且初步探讨了甜食对药物渴求的影响。通过问卷从 150 名被试筛选出 33 名符合 DSM-5 甲基苯丙胺 (MA) 依赖标准的女性被试, 在饥饿状态下测量包括瘦素、胃饥饿素、内源性大麻素的食欲激素, 通过视觉模拟量表 (VAS) 测量其食欲状态及药物渴求, 通过利兹食物偏好问卷测量食物奖赏得分, 通过问卷测量其药物依赖相关数据, 通过身体成分仪测量其身体成分指标, 并且在饱腹状态下再次测量除食欲激素外的各项指标, 探究药物依赖相关信息与食物奖赏、食欲、身体成分之间的关系。基于探究的结果进一步通过甜食巧克力干预探究食物奖赏及药物渴求的变化及之间的联系。相关分析发现自主报告的药物渴求与第一次接触毒品年龄、接触毒品频率以及每次用量呈正相关; 同时药物渴求与 BMI、体脂率、基础代谢呈正相关。巧克力干预发现, 在进食巧克力后, MA 渴求降低, 饱腹感增加, 而且对高脂甜食的食物奖赏得分降低。同时食用巧克力后对于高脂肪甜食的隐渴与进食巧克力前后 MA 渴求均呈正相关。因此, 本研究发现了甲基苯丙胺依赖者药物渴求与身体成分的关系, 表明 MA 戒断人群因为药物依赖存在肥胖风险; 同时发现了药物渴求与甜食渴求的正相关关系, 对于甜食的渴望一方面可以作为侧面反映药物渴求程度的指标, 另外同时也可以作为 MA 依赖者甜食干预的依据, 可能是 MA 药物依赖的一种创新的治疗干预手段。

Association between drug craving and food reward in women with methamphetamine dependence

Zhou Yu¹, Zhou Chenglin¹

¹ School of Psychology, Shanghai University of Sports, Shanghai, 200438

Abstract: Food reward and drug dependence share a common neural basis. The reward function of drug dependent people is impaired, which is manifested in the decrease of sensitivity to food reward and the increase of sensitivity to drug reward in the dependence stage. However, the consumption of foods increases during withdrawal, which is at the risk of obesity. In animal studies, sweets have been found to be more rewarding than addictive drugs. Therefore, the purpose of this study was to explore the relationship between drug craving and food reward, appetite and body composition in female with methamphetamine dependence, and to explore the effect of sweets on drug craving. 33 female subjects who met the DSM-5 methamphetamine (MA) dependence criteria were selected from 150 subjects through the questionnaire. The appetite hormones including leptin, ghrelin and endogenous cannabinoid were measured in the hungry state, their appetite state and drug craving were measured by visual analogue scale (VAS), and the food reward values were measured by Leeds Food Preference Questionnaire, the data related to drug dependence were measured by questionnaire, the body composition indexes were measured by body composition instrument, and the indexes other than appetite hormone and body composition were measured again in the state of satiety, so as to explore the relationship between drug dependence related information and food reward, appetite and body composition. Based on the results of the study, we further explored the changes and relationship between food reward and drug craving through sweet food of chocolate intervention. Correlation analysis showed that self-reported drug craving was positively correlated with the age of first drug exposure, frequency of drug exposure and dosage used each time; At the same time, drug craving was positively correlated with BMI, body fat rate and basic metabolism. Chocolate intervention found that after eating chocolate, MA craving decreased, satiety increased, and food reward values for high-fat sweet food decreased. At the same time, the implicit wanting for high-fat sweets after eating chocolate was positively correlated with MA craving before and after eating chocolate. Therefore, this study found the positive relationship between drug craving and body composition of methamphetamine dependent people, indicating that MA withdrawal people are at risk of obesity because of drug dependence; At the same time, we found a positive correlation between drug craving and sweet food craving. On the one hand, sweet food craving can be used as an indicator to reflect the degree of drug craving, on the other hand, it can also be used as a basis for sweet food intervention for MA addicts, which may be an innovative therapeutic intervention for MA drug dependence.

摘要 自2019年末至今, 一场全球性的公共卫生安全突发事件——新型冠状病毒肺炎(COVID-19)因它的传染性和严重性给人们的生活带来了巨大的改变, 人们的健康相关行为也在发生潜在的变化。佩戴口罩、保持社交距离、注意清洁及消毒和注射疫苗等预防性的健康行为被强调是降低COVID-19传染性的最重要策略之一。老年人描述为特别易受冠状病毒感染的同质群体, 因此对老年人在疫情期间的健康防疫行为进行探究至关重要。老年人更高水平的生命意义感与更好的健康、更少参与健康风险行为和更多参与健康促进行为有关。许多认知因素有助于在疾病爆发期间采取健康保护行为, 其中感知风险已经成为此类行为的预测指标。

高龄者倾向于对权威他人如医生有更强的信任，年龄越高则健康控制点为权威他人的得分越高。本研究旨在探讨老年人在疫情中的生命意义感对疫情爆发后健康行为的影响，并探讨疫情风险感知的中介作用和健康权威他人控制点的调节作用。本研究招募了 273 位 55 岁以上老年人，以疫情中的生命意义感问卷、疫情风险感知问卷、多维度健康心理控制点问卷和疫情前后健康行为问卷为研究工具，前后间隔一个月重复施测以上问卷。使用 SPSS 中的 PROCESS macro 进行分析发现：当控制了 T1 疫情前健康行为习惯、性别、年龄和受教育程度后，T2 的疫情风险感知对 T1 的生命意义感和 T2 的健康防疫行为有显著的中介作用。T1 的健康权威他人控制对中介效应的后半段有显著的调节作用，简单斜率分析发现，相较低健康权威他人控制的个体而言，高健康权威他人控制的老年个体具有较大的疫情风险感知-疫情爆发后健康行为的斜率。本研究揭示了在突发性公共卫生事件下老年群体的生命意义感与健康行为的关系及其内在机制，拓展了健康信念模型，对于在重大突发性公共卫生事件下如何更好地预防和干预老年群体的健康行为具有一定的实践指导意义。

The Mechanism of Meaning in Life and Prevention Health Behaviors during COVID-19 Pandemic among Older Adults: The Mediating Role of Risk Perception and the Moderating Role of Powerful Others Health Locus of Control

Shu Nie¹, Huini Peng¹, Qianqian Ju¹, Qi Liang², Cong Zhang¹, Xiaowei Qiang¹, Yiqun Gan¹

¹ School of Psychological and Cognitive Sciences, Peking University, Beijing, 100101

² Institute of Psychiatry, Psychology & Neuroscience, King's College London, London

Abstract: Since late 2019, COVID-19, a global public health security emergency, has been dramatically changing people's lives and potentially changing health-related behaviors due to its infectivity and severity. Preventive health behaviours such as wearing masks, social distancing, cleaning and disinfection, and vaccination were highlighted as one of the most important strategies to reduce the infectivity of COVID-19. The older adults have been described as a homogenous group particularly vulnerable to coronavirus infection, so it is important to explore their health prevention behavior during the outbreak. Higher levels of meaning in life in older adults are associated with better health, less participation in health-risk behaviours and more participation in health-promoting behaviours. Many cognitive factors contribute to health protective behaviour during disease outbreaks, where perceived risk has become a predictor of such behaviour. Older people tend to have stronger trust in powerful others, such as doctors, and the older the age, the higher the score of health locus controlled by powerful others. The purpose of this study was to explore the impact of the older adults' meaning in life during the outbreak on post-outbreak health behavior, and to explore the mediating role of the epidemic risk perception and the moderating role of the control points of others in health authority. In this study, 273 older adults over 55 years old were recruited. The questionnaire on meaning in life in the epidemic, epidemic risk perception, multidimensional health locus of control questionnaire and health behavior questionnaire before and after the epidemic were used as research tools. The above questionnaires were repeated one month after the epidemic. PROCESS Macro in SPSS was used to analyze the data and it was found that the epidemic risk perception in T2 had a significant mediating effect on meaning in life at T1 and health prevention behavior at T2 after controlling for health behavior habits before the outbreak, gender, age and education level. Health locus of control by powerful others had a significant moderating effect on the second half of the mediating effect. Simple slope analysis showed that the older adults with high health locus of control by powerful others had a larger slope of the epidemic risk perception and post-outbreak health behavior than the individuals with low health locus of control by powerful others. This study revealed the relationship between the meaning in life and health behavior of the older adults and its internal mechanism under the emergency public health events, and expanded the health belief model, which has a certain practical guiding significance for how to better prevent and intervene the health behavior of the older adults under the emergency public health events.

后疫情时代酒店员工的情绪劳动对旅客歧视知觉及再住意愿的影响

赵丹¹ 傅安国¹

¹ 海南大学管理学院, 海口, 570100

摘要 虽然国内新冠疫情得到良好的控制,但是多地疫情的散点爆发持续地影响到酒店行业的复苏,来自疫区的旅客难免在服务场所遭受到歧视,最常见的是酒店将来自疫区和非疫区的旅客差别对待,这有可能会增加疫区旅客的歧视知觉,还会降低其对酒店的再住意愿。另一方面,已有研究发现服务人员的情绪劳动策略会对旅客的情绪和态度产生影响,具体来说,深层表演策略会带给旅客积极情绪,浅层表演策略则会给旅客带来消极情绪,但这两种情绪劳动策略究竟会对旅客的歧视知觉及再住意愿产生何种影响却有待探究。据此,本文的两个研究分别采用问卷调查和行为实验,来探究酒店员工的情绪劳动策略对旅客歧视知觉及再住意愿的影响,两个研究均为组间实验设计。研究1以疫情中高风险区的205名经常旅行的个体为样本,采用文字剧本先后呈现歧视刺激与不同情绪劳动干预,并通过问卷调查歧视知觉和再住意愿,结果发现深层表演情绪劳动策略会降低歧视知觉并提高再住意愿,浅层表演情绪劳动策略则会提高歧视知觉并降低再住意愿。研究2进一步采用现场实验来探究不同情绪劳动策略对48名来自中高风险疫区旅客歧视知觉的干预效果。呈现歧视刺激的同时,采用心理旋转的反应时作为判断歧视知觉唤醒的指标。接着,酒店前台员工分别采用两种情绪劳动策略干预成功诱发歧视知觉后的旅客,并测量不同情绪劳动策略对旅客的歧视知觉与再住意愿的影响,结果同样验证了研究1的结论。最后,本研究为酒店行业培训与促进员工进行深层情绪劳动服务提出了若干切实可行的建议,以提升疫情风险区旅客的再住意愿并降低其歧视知觉。

The Impact of Emotional Labor of Hotel Employees on Perceived Discrimination and Revisit Intention of Guests in the Post COVID-19 Era

ZHAO Dan¹, FU Anguo¹

¹ School of Management, Hainan University, Haikou 570100, China,

Abstract: Although COVID-19 in China has been controlled well, many new COVID-19 cases emerge in different areas which continually delays the hospitality industry recovery. On one hand, it is common to see that hotels treat tourists from affected and non-affected areas differently, which may increase the perception of discrimination among tourists in affected areas and reduce their revisit intention of the hotel. On the other hand, it has been found that the emotional labor strategy has an impact on the emotion and attitudes of tourists. Specifically, deep acting of the frontline employee will lead to the positive emotion of tourists and vice versa, surface acting will lead to negative emotion. However, it has not been revealed how emotional labor strategy influences tourists' perceived discrimination and revisit intention. We tested it using survey data and behavioral experiments in two studies which both are between-subjects designs. In study1, survey data were collected from 205 frequent travelers in high or middle-risk areas using an online survey platform. Next, we used text scripts to stimulate perceived discrimination and employed two emotional labor strategy interventions. And the respondents assessed their perceived discrimination and revisit intention through questionnaires. Results show that the deep acting of frontline employees will reduce perceived discrimination and boost the revisit intention of tourists. And the surface acting of frontline employees will boost the perceived discrimination and reduce the revisit intention of tourists. In study 2, 48 participants were from high-risk or middle-risk areas and took part in a field experiment to explore the two emotional labor strategy intervention effects on perceived discrimination of tourists. First, a two-step mental rotation task combining mental rotation trials and perceived discrimination sentences was conducted. And reaction time is used as an indicator to judge the awakening

of perceived discrimination. Next, frontline employees used two emotional labor strategies to intervene with participants who were successfully awakened by the perception of discrimination and measured their perceived discrimination and revisit intention. Moreover, the result of study 2 is the same as that of study 1. Finally, the study puts forward some practical implications for training and promoting deep acting strategy to enhance revisit intention and reduce perceived discrimination of tourists from high-risk or middle-risk areas.

新冠疫情心理援助团体督导中的重要议题与督导焦点

崔佳¹ 洪建中¹ 吴珂¹ 方勇¹

¹ 华中师范大学 上海, 200062

摘要 目的: 探究新冠疫情下心理援助团体督导的重要议题和督导焦点。方法: 对教育部华中师范大学心理援助热线平台的 21 名咨询师进行访谈, 搜集重要督导片段, 分析重要督导片段的议题和督导焦点。结果: ①新冠疫情心理援助团体督导的议题主要分为 3 类, 分别为应对疑难个案(危机个案、疑病个案、性骚扰个案等)、处理咨询师个人议题和讨论心理援助基本设置; ②督导中最关注的督导焦点是历程化技能; ③不同议题下督导焦点不同, 应对疑难个案的督导更关注历程化技能和概念化技能, 处理咨询师个人议题的督导更关注个人化技能, 而讨论心理援助设置的督导对三个督导焦点的关注较平均。结论: 团体督导对于咨询师开展心理援助具有重要价值, 需要在后续心理援助中继续得到重视。

Important Issues and Focus of the Group Supervision in COVID-19 Psychological Assistance

Jia Cui¹, Jianzhong hong¹, Ke Wu¹, Yong Fang¹

¹ Central China Normal University, shanghai, 200062

Abstract: This study explores the issues and focus of group supervision in COVID-19 psychological assistance. Interviews were conducted with 21 counselors from the psychological assistance hotline platform of Central China Normal University, Ministry of Education, to collect important supervisory episodes and analyze the issues and focus of the important supervisory episodes. The results showed that the topics for the supervision of COVID-19 psychological assistance groups were divided into three categories: dealing with difficult cases (crisis cases, hypochondria cases, sexual harassment cases, etc.), dealing with personal issues of counselors, and discussing basic psychological assistance Settings. The focus of supervision is procedural skills. The supervisors dealing with difficult cases paid more attention to the process skills and conceptualization skills, the supervisors dealing with the personal issues of consultants paid more attention to the personal skills, while the supervisors discussing the setting of psychological assistance paid more attention to the three focus on the average. The conclusion is that group supervision is of great value to counselors in carrying out psychological assistance and should be paid more attention to in the follow-up psychological assistance.

太极拳对执行功能的积极作用解释了流体智力的改善: 来自横向研究和纵向干预的证据

吕晓晶¹ 任学柱¹

华中科技大学, 武汉, 430000

摘要 执行功能和流体智力是两个重要的额叶功能, 容易受衰老影响。太极拳作为一种身心锻炼被认为可以预防认知老化。然而, 太极拳是否对老年人执行功能的基本组成部分(抑制、刷新和转换)也有类似的积极作

用并不确定。此外,目前尚不清楚太极对基本执行功能成分的改善是否能够解释高阶流体智力的改善。研究 1 包括基于大样本健康老年人的横断面设计。模型结果表明,在控制年龄和受教育程度后,太极拳练习体验对流体智力、更新和抑制有显著的正向影响。此外,太极拳对流体智力的抑制和更新均有中介作用。研究 2 对一组新手和一组有经验的人进行了为期 12 个月的太极干预。结果表明,只有新手组在抑制和流体智力方面表现出显著的改善。然而,在控制抑制改善后,流体智力的改善不再显著。这些结果揭示了身心锻炼预防老年人流动智力下降的潜在路径。

Executive function benefits of Tai Chi explain improvements in fluid intelligence: Cross-sectional evaluation and longitudinal intervention

Xiaojing Lv¹, Xuezhu Ren¹

¹ Huazhong University of Science and Technology, Wuhan, 430000

Abstract: Executive function and fluid intelligence are two of the crucial frontal lobe functions susceptible to aging. Tai Chi as a mind-body exercise has been proposed for preventing cognitive aging. However, whether Tai Chi has similarly beneficial effects on basic components of executive function (inhibition, updating and shifting) in older adults remains underspecified. Moreover, it is not currently known whether Tai Chi-induced improvements in basic executive function components are able to explain improvements in higher-order fluid intelligence. Study 1 included a cross-sectional design based on a large sample of healthy older adults. Modeling results showed that experience of Tai Chi exercises exerted significantly positive effects on fluid intelligence, updating and inhibition after controlling for age and education. Furthermore, both inhibition and updating mediated effects of Tai Chi on fluid intelligence. Study 2 carried out a 12-month Tai Chi intervention on a novice group and an experienced group. Results indicated that only the novice group exhibited significant improvements in inhibition and fluid intelligence. However, improvements in fluid intelligence were no longer significant after controlling for improvements in inhibition. These results shed lights into the underlying path of mind-body exercises in preventing declines of older adults' fluid intelligence.

Keywords: fluid intelligence, executive function, mind-body training

社会拒绝敏感性对急性应激反应的预测

彭惠妮¹ 甘怡群¹ 吴健辉² (通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100080

² 深圳大学脑疾病与认知科学研究中心, 深圳 518060, wujh8@szu.edu.cn

摘要 对环境中的急性应激源做出适应性反应对个体的健康甚至生存至关重要。适当的急性应激反应可以帮助个体快速调动生理心理资源应对应激源, 恢复内稳态。而过度的急性应激反应会影响个体的认知绩效, 甚至造成病理性后果如创伤后应激障碍、焦虑症和心血管疾病等。本研究结合主观的问卷和客观的事件相关电位(event-related potentials, ERP)技术, 通过测量个体的社会拒绝敏感性特质和非应激状态下的拒绝情绪加工作为预测指标; 采用经典的特里尔社会应激测试(Trier Social Stress Test, TSST)作为实验室应激源, 诱发主观情绪反应、交感神经-肾上腺髓质系统反应(比如心率反应)和下丘脑-脑垂体-肾上腺皮质轴反应(皮质醇反应)作为被预测指标, 来考察社会拒绝敏感性对急性应激反应的预测作用。本研究首先采用社会拒绝敏感性问卷评估社会拒绝敏感性特质, 结果显示: 主观报告社会拒绝敏感性水平越高的个体, 在 TSST 情景下的主观控制感越小、状态焦虑和负性情绪反应程度越大。并进一步在非应激状态下通过 ERP 技术记录社会拒绝词语诱发的认知神经效应, 结果显示, 在非应激状态下社会拒绝词语与中性词语 P3 差异波波幅越大, 急性应激下的心率反应程度和皮质醇反应程度越大。研究结果表明, 社会拒绝敏感性越高的个体, 其急性应激反应越大。社会拒绝敏感性可能是应激相关心理障碍早期识别的指标和干预的靶点。

Social Rejection Sensitivity Predicts Acute Stress Responses

Peng Huini¹, Gan Yiqun¹, Wu Jianhui²

¹ School of Psychological and Cognitive Sciences, Peking University, Beijing

² Center for Brain Disorder and Cognitive Science, Shenzhen University, Shenzhen

Abstract: The adaptive response to acute stressors in the environment is critical to individuals' health and even survival. Appropriate responses to acute stressors can help individuals quickly mobilize physiological and psychological resources to cope with stressors and recover homeostasis. The present study measured individuals' indices of trait social rejection sensitivity and rejection emotion processing in a non-stressful state with a combination of self-reported questionnaire and electrophysiological (event-related potentials, ERP) approach as predictors; subjective affect, sympathetic adrenal medulla (heart rate) and hypothalamus pituitary-adrenal (cortisol) responses to the standardized laboratory acute stressor (Trier Social Stress Test, TSST) as outcome, to investigate the predictive effects of social rejection sensitivity, on reactivity to the acute stressor. This study used the social rejection sensitivity questionnaire to assess trait social rejection sensitivity. The results showed that individuals with higher level of social rejection sensitivity showed lower subjective controllability, less increase of state anxiety and negative affect induced by TSST. Furthermore, neurocognitive effect induced by rejecting emotional stimulus (rejecting words) was recorded with ERP approach. The results showed that individuals with larger amplitude of P3 towards rejecting words relative to neutral words performed higher heart rate and cortisol reactivity induced by the acute stressor. It suggested that individuals with higher sensitivity to social rejection show higher reactivity to acute stress. Social rejection sensitivity could possibly be used as an indicator of early identification of stress-related mental disorders and a target for their intervention.

Effect of Fixed Mindset: How does Motivational Climate at Work Influence Employee's Knowledge Hiding?

Yufan Zhou¹, Jianwei Zhang¹, Weijun Hua¹, Wenfeng Zheng¹, Bumeng Liu¹

¹ School of Humanities and Social Sciences, Beijing Institute of Technology, Beijing 100081, China

Abstract: Previous research suggests that a fixed mindset is positively related to knowledge hiding. However, we argue that this relationship depends on the motivational climate, which reverses the effect of a fixed mindset. Specifically, we explore two motivational climates, namely performance and mastery climate, moderate the relationship between fixed mindset and knowledge hiding, such that under the condition of high-performance climate and high-mastery climate, fixed mindset would have contrary effects on knowledge hiding. Drawing on the social learning theory, we explore the opposite signs of the relationship between fixed mindset and knowledge hiding by examining the boundary condition of two-dimensional motivational climate. We conducted a field study of 461 R&D personnel from 8 enterprises and research institutes in China to test our hypothesized model. The results showed that performance climate negatively moderated the relationship between a fixed mindset and knowledge hiding, and mastery climate positively moderated a fixed mindset and knowledge hiding. Furthermore, we include creativity as an essential outcome of knowledge hiding and explore the distal consequence of the moderation effect of a fixed mindset. The results also demonstrated that performance climate negatively moderated the indirect influence of a fixed mindset on creativity via knowledge hiding, and mastery climate positively moderated the indirect effect of fixed mindset on creativity through knowledge hiding. Such results highlight that the perception of the motivational climate affects the direct relationship between a fixed mindset and knowledge hiding and the indirect relationship between a fixed mindset and creativity. Theoretical and practical implications are also discussed.

Keywords: fixed mindset, knowledge hiding, performance climate, mastery climate, creativity

教学视频中教师注视和手势对学习效果的影響：来自眼动的证据

匡子翌¹ 王福兴¹ (通讯作者) 胡祥恩^{1,2} (通讯作者)

1 华中师范大学心理学院, 武汉 430079

2 Department of Psychology, The University of Memphis, Tennessee, USA, 38152

摘要 为了进一步提高教学视频中教师对学生学习的增强和促进作用, 越来越多的研究者开始关注影响视频学习效果的因素 (Mayer, 2020)。研究者开始关注教师的哪些社会线索 (眼神注视, 手势, 面部表情) 可以提高学生的学习成绩和知识掌握。本研究以眼动追踪技术为支持, 并结合学习者的主观体验 (准社会交往, 感知难度, 心理努力, 认知负荷等) 以探究视频学习中不同类型手势和引导注视对学习成绩和学习体验的影响。实验采用 2 (引导注视, 无引导注视) × 3 (具体引导手势, 一般引导手势, 无手势) 被试间实验设计, 共招募 138 名大学生被试。结果表明, 在保持测验和迁移测验上, 手势的主效应显著, 具体手势 (即手指向具体的知识点) 的测验成绩要好于一般手势 (即手指向整个学习材料) 和无手势。眼神注视的主效应不显著, 眼神注视与手势交互作用不显著。眼动的结果也表明, 具体手势组的学生对关键材料区域的注意要多于一般手势和无手势, 一般手势和无手势没有差异, 引导注视和无注视没有差异。而在主观体验上本研究各组差异均不显著。该研究与 Li 等人 (2019) 研究一致, 即具体引导手势才可以促进学生的学习成绩, 支持了多媒体学习的社会代理理论。未来研究应探讨更多类型的手势对学习的作用, 以验证上述结果的发现。同时, 教师在使用社会线索时应尽可能地突出关键知识的内容 (如使用具体引导手势), 这样才能提升学生的学习成绩。

Effect of teacher gaze and gesture on learning effect in teaching videos: evidence from eye movement

Kuang Ziyi¹, Wang Fuxing¹, Hu xiangen^{1,2}

1 School of Psychology, Central China Normal University, Wuhan 430079;

2 Department of Psychology, The University of Memphis, Tennessee 38152, USA

Abstract: In order to further improve the role of teachers in teaching video in the enhancement and promotion of students' learning, more and more researchers began to pay attention to the factors that affect the effectiveness of video learning (Mayer, 2020). Researchers began to explore which social cues (eye gaze, gesture, facial expression) teachers can use to improve students' academic performance and knowledge. This study is supported by eye tracking technology and combines the subjective experiences of learners (parasocial interaction, perceived difficulty, mental effort, cognitive load, etc.) to explore the effects of different types of gestures and guide gaze on learning achievement and learning experience in video learning. Experiments using 2 (guide gaze, no guide gaze) × 3 (specific guide gesture, general guide gesture, no gesture) by the between-subject experimental design, a total of 138 college students were recruited. The results showed that the main effect of gestures was significant in the retention test and transfer test, and the test results of specific gestures (i.e., finger to specific knowledge points) were better than that of general gestures (i.e., fingers to the entire learning material) and no gestures. The main effect of eye gaze is not significant, and the interaction between eye gaze and gesture is not significant. Eye movement results also showed

that students in specific gesture groups paid more attention to key material areas than general gestures and no gestures, there was no difference between general gestures and no gestures, and no difference between guided and no gaze. On the subjective experience, the differences between the groups in this study were not significant. The study is consistent with li et al. (2019) research, that is, specific guide gestures can promote students' academic performance, supporting social agent theory in multimedia learning. Future studies should explore the role of more types of gestures in learning to validate the findings of these results. At the same time, teachers should use social cues to highlight as much as possible the content of key knowledge (such as the use of specific guidance gestures) in order to improve students' academic performance.

不同学习策略对小学生学习动机的影响: AR 多媒体学习与传统文本学习是一致的吗?

赵小军 刘苗粧 刘亚青 (通讯作者)

河北大学教育学院, 保定, 071002, 329032524@qq.com

摘 要 近年来对于小学生学习情况的研究重点聚焦在非智力因素上, 如对学习动机、学习策略、教学环境等的研究, 这些非智力因素确实都对学习效果产生了影响, 并彼此之间具有相互影响。小学阶段是培养学生形成积极学习动机的重要阶段, 激发学生的学习动机是教学的重要任务之一。另外, AR 多媒体技术应用到学习科学领域, 形成了新颖、有效的 AR 多媒体学习方式。本研究探索了不同学习材料与学习策略对学习动机的影响, 探讨了重复学习、提取练习和自我生成绘图三种学习策略在 AR 多媒体与传统文本两种不同学习材料的呈现下对学习动机起到的作用。实验选取河北省 60 名小学生, 采用 2(学习材料: AR 材料、文本材料)×3(学习策略: 重复学习、提取练习、自我生成绘图)的被试间设计。学习动机为因变量, 采用小学生学习动机问卷进行测量, 该问卷包括表层动机、深层动机及成就动机 3 个维度。研究结果发现: (1) 在表层动机上, 年龄主效应显著, 9 岁学生比 8 岁学生具有更高的表层动机; (2) 不同学习策略对深层动机的影响差异显著, 其中使用提取练习策略的学生深层动机最高, 重复学习策略次之, 自我生成绘图策略最低; (3) 对于成就动机来说, 不同性别之间差异显著, 女生成就目标显著高于男生; 学习材料与学习策略的交互作用显著, 以 AR 材料进行学习时, 重复学习策略组的学生成就动机最高, 提取练习策略最低; 以文本材料进行学习时, 提取练习策略组成就动机最高, 重复学习策略最低, 自我生成绘图策略居中。可以看出, 随年龄增长应付检查或考试等表层学习动机有增强的趋势, 提取练习策略引发学生思考回忆促使学生保有较高的深层学习动机, AR 多媒体材料和文本材料学习分别与不同的学习策略相结合会对学生的成就动机产生不同的影响。

关键词 AR 多媒体学习, 文本学习, 学习策略, 学习动机

The Influence of Different Learning Strategies on Primary School Students' Learning Motivation: Is AR Multimedia Learning Consistent with Traditional Text Learning?

Zhao Xiaojun, Liu Miao Zhuang, Liu Yaqing

School of education, Heibei University, Baoding, 071002, 329032524@qq.com

Abstract: In recent years, the research on primary school students' learning focuses on non-intellectual factors, such as learning motivation, learning strategies, teaching environment, etc. These non-intellectual factors do have an impact on learning, and interact with each other. Primary school stage is a key period to cultivate students' positive learning motivation, and stimulating students' learning motivation is one of the important tasks of teaching. In addition, the application of AR multimedia technology to the field of learning science has formed a novel and effective AR multimedia learning mode. This study explored the effects of different learning materials and learning strategies on learning motivation, to assess the roles of restudying strategy, retrieval practicing strategy and self-generated drawing strategy on learning motivation under the presentation of two different learning materials, AR

multimedia and traditional text. In this experiment, 60 students in Hebei Province were selected, and a 2(learning material: AR material, text material)×3(learning strategy: restudying strategy, retrieval practicing strategy, self-generated drawing strategy)between-subjects design was adopted. The elementary school students' learning motivation questionnaire is used to measure the dependent variable, learning motivation, and it includes three dimensions: surface motivation, deep motivation and achievement motivation. The results showed that: (1) the main effect of age on surface motivation was significant, and the 9-year-old students had higher surface motivation than the 8-year-old students; (2) There were significant differences in the effects of different learning strategies on deep motivation, among which the retrieval practicing strategy has aroused the highest deep motivation, the restudying strategy was the second, and the self-generated drawing strategy was the lowest. (3) In terms of achievement motivation, there are significant differences between genders, and girls' achievement goals are significantly higher than boys'; The interaction between learning materials and learning strategies was significant. When learning with AR materials, the achievement motivation of students in the restudying strategy group was the highest, and the retrieval practicing strategy was the lowest. When learning with text materials, the retrieval practicing strategy has inspired the highest achievement motivation, the restudying strategy was the lowest, and the self-generated drawing strategy was in the middle. It can be seen that, along with the age growth, students' surface motivation to deal with inspection or examination has a tendency to increase; the retrieval practicing strategy causes students to think and recall, and promotes students to maintain higher deep motivation for learning; in addition, learning by AR multimedia material and text material combined with different learning strategies will have different effects on students' achievement motivation.

触屏对幼儿词语学习的影响：交互性的作用

曹馨允，高春颖，王福兴（通讯作者）

华中师范大学心理学院，武汉，430079，fxwang@ccnu.edu.cn

摘要 随着近年来网络技术的不断发展，触屏媒体已经成为家庭必不可少的通讯和娱乐设备(Rideout & Robb, 2020)。触屏媒体是一种新兴的交互式技术媒体，使用者通过手指操作屏幕内容达到控制的目的。然而，在新冠病毒肆虐的背景下，线下教育遭遇前所未有的挑战，这在一定程度上推动了触屏媒体作为教育设备的应用，并已经逐步渗透到幼儿的日常生活和学习中，成为幼儿非常重要的学习工具。为了探究触屏媒体是否真的能够帮助幼儿学习，本研究采用单因素三水平被试间设计，以“布布识字”App为学习材料，将76名5-6岁幼儿($M = 68.21$ 月, $SD = 3.57$)随机分配到触屏教学组、面对面教学组和视频观看组三个条件下学习“马、象”等8个汉字，以此来考察触屏媒体对幼儿学习的有效性。在触屏组中，使用“布布识字”App教幼儿认识汉字，观看组使用触屏组的录屏版学习相同内容，而面对面组则采用将触屏组app的关键场景截取制成字卡由教学者现场对幼儿进行教学。结果发现，触屏交互教学组幼儿的回忆效率和再认效率显著好于视频观看组，面对面教学组幼儿的回忆效率和再认效率显著好于触屏交互教学组和视频观看教学组。对幼儿在汉字学习过程中的跟读行为分析发现，面对面教学组的总跟读次数显著多于触屏教学组和视频教学组；即面对面组幼儿的教学互动水平最高。结论认为，触屏媒体的交互性有助于幼儿学习汉字，且触屏交互教学的效果好于视频观看教学；但相较于具备社会性交互的面对面教学而言，触屏媒体所具备技术性交互在对幼儿学习效果与总体教学互动上仍有差距。

关键词 触屏，交互性，幼儿，学习

Touchscreen and children's word learning: The role of interaction

Xinyun Cao, Chunying Gao, Fuxing Wang

School of Psychology, Central China Normal University, Wuhan, Hubei 430079, China

Abstract: With the continuous development of network technology in recent years, touch screen media has become an indispensable communication and entertainment device for families (Rideout & Robb, 2020). Touchscreen is an

emerging interactive technology media, users could control the screen through their fingers. However, under the outbreak of the COVID-2019, traditional offline education has encountered unprecedented challenges, which promotes touchscreen as educational devices. Touchscreen has gradually penetrated into children's daily life and learning. In order to explore whether touchscreen could really help children to learn, this study adopted a between-subject design. Using "BuBu Literacy" App as the learning material, 76 children aged 5-6 ($M = 68.21$ months, $SD = 3.57$) were randomly assigned to touchscreen interactive teaching group, face-to-face teaching group and video teaching group to learn eight Chinese characters, so as to investigate the effectiveness of touch screen media on children's learning and whether it still has advantages over video teaching and face to face teaching. For the touchscreen interaction group, children used an App "BuBu Literacy", while the video watching group used the recorded version of the touchscreen group. What's more, for the face-to-face teaching group, children were taught by using the same word cards which were captured from the screen. Results showed that children's recall efficiency and recognition efficiency in the touchscreen interactive teaching group were better than those in the video watching group, Children's recall efficiency and recognition efficiency in the face-to-face teaching group were better than those in the touchscreen teaching group and the video watching group. As for the total number of repeat reading, results showed that the total number of repeat reading in the face-to-face teaching group was significantly more than the touchscreen interactive group and the video watching group. The face-to-face group had the highest level of teaching interaction. Our conclusion was that touchscreen media was helpful for children to learn Chinese characters. The effect of touchscreen interactive teaching is better than that of video viewing teaching. However, compared with face-to-face teaching with social interaction, there is still a gap between the technical interaction of touchscreen on children's learning.

触屏媒体中交互类型对幼儿字词学习的影响

程杏茹 高春颖 王福兴(通讯作者)

华中师范大学心理学院, 武汉 430079, fxwang@ccnu.edu.cn

摘要 触屏媒体(如: iPad)作为一种新兴的媒体形式具有巨大的教育潜力, 幼儿可以使用简单的动作直观地对屏幕内容进行操作, 这种直接交互性是触屏媒体区别于传统媒体的最突出的特征。在以往的研究中已经证明交互性对幼儿学习的促进作用, 但是对交互的类型关注较少。本研究主要探讨触屏交互性的不同类型(点击、拖拽)对幼儿词汇学习的影响, 实验采用单因素三水平(拖拽交互、点击交互、观看无交互)被试间设计, 采用自主设计的 app 教授 10 个具有连续意义的英文单词, 被试为 74 名 5-6 岁的幼儿 ($M = 68.27$ 月, $SD = 4.21$)。实验流程分为先前知识测验、干预阶段、学习结果测验(包括自由回忆任务、线索回忆任务、再认任务)三个阶段, 整个实验过程大约持续 15 分钟。结果发现, 在自由回忆成绩上, 拖拽组幼儿的表现要好于点击组和观看组, 点击组和观看组没有显著差异; 在线索回忆成绩上, 拖拽组幼儿的表现要好于观看无交互组, 拖拽组和点击组没有显著差异; 在再认任务上, 拖拽组和点击组的成绩都好于观看无交互组的成绩, 拖拽组和点击组在再认任务的成绩不存在显著差异, 但是都要高于随机概率水平; 在任务总得分(回忆+再认)上, 拖拽组的成绩要好于点击组和观看组。研究证明在幼儿学习具有连续意义的单词时, 与触屏媒体的交互(点击、拖拽)都可以帮助儿童单词知识的习得, 但拖拽交互的学习效果更优于点击交互。

Touch screen media on children's word learning:

The role of interactivity

Xingru Cheng, Chunying Gao, Fuxing Wang

School of Psychology, Central China Normal University, Wuhan, Hubei 430079, China

Abstract: Touch-screen media, as a new media form, has great educational potential. Children can use simple actions

to intuitively operate the content of the screen, this kind of direct interaction is the most prominent characteristic that distinguishes touchscreen media from traditional media. Previous studies have proved the promoting effect of interactivity on children's learning, but less attention has been paid to the type of interactivity. The experiment mainly investigated different interaction types such as click and drag would have an impact on children's vocabulary learning. Using one-factor, between-subject three-level design, with an app that teach children word knowledge for learning materials, seventy-four 5 to 6 years old children ($M = 68.27$ months, $SD = 4.21$) were randomly assigned to drag interaction group, click interaction group, watch no interaction group, children were expected to learn ten words that have a continuous meaning. The experiment lasted about 15 minutes and was divided into three stages: the prior knowledge phase, the intervention phase, the learning outcome test (including free recall task, cue recall task, recognition task). The results showed that children in the drag group performed better than those in the click group and the watch group on free recall task, there was no significant difference between the click group and the watch group. In cue recall task, children in the drag group performed better than those in the non-interaction group, there was no significant difference between the drag group and the click group. In recognition task, the scores of drag and click group were better than those of non-interaction group. There was no significant difference in the scores of drag and click group in recognition task, but both of them were higher than random probability level. The drag group scored better than the click group and the watch group on the total score of the task (recall + recognition). The study proves that when learning words with continuous meaning, interaction with touchscreen media (click and drag) can help children acquire word knowledge, but using drag interaction that matches words is more conducive to the acquisition of word knowledge for children.

摘要 由于在线教育的快速发展和广泛应用, 参加网络在线学习课程的学生人数大幅增长, 如何确保学生在线学习的质量引起了越来越多人的关注。基于在线学习环境, 本研究通过 HTML 设计的在线学习网页来模拟真实的学习环境, 采用问卷法和实验法的方式在自我决定理论的框架下探讨在线学习目标和教师人际行为对学习投入的影响, 以及学习动机在其中的作用。研究发现: (1) 课程目标指导语能够启动学生对内部目标和外部目标的重要性, 但并未发现内部目标条件下的大学生比外部目标条件下有更高的在线学习的内部动机、学习投入和学业成绩; (2) 课程评价指导语能够启动学生对教师人际行为的感知, 教师支持条件下大学生的在线学习内部动机比教师阻碍条件下更高; (3) 内部动机在大学生在线学习内部目标对学习投入的正向预测作用中起完全中介作用; (4) 内部动机在大学生在线学习内部目标对迁移成绩的负向预测作用中起完全中介作用; (5) 教师阻碍在内部目标到学习投入的直接路径中起调节作用。教师阻碍程度越强, 内部目标对学习投入的预测作用随之增强。上述发现为认识在线学习过程中教学目标内容和教师行为因素对学习投入的影响, 并在此基础上优化在线教学设计、提升在线学习质量提供了新的思路和证据。

The Effects of Online Learning Goals on Learning Engagement of College Students:

The Role of Interpersonal Behaviors and Learning Motivation

Xi Zhang¹, Junyi Liao¹, Yun Tang^{1,2}

1 School of Psychology, Central China Normal University, Wuhan, 430079

2 Key Laboratory of Adolescent Cyberpsychology and Behavior(CCNU), Ministry of Education, Wuhan, 430079

Abstract: Due to the rapid development and wide application of online education, the number of students participating in online learning courses has increased significantly, and how to ensure the quality of students' online learning has attracted more and more people's attention. Based on the online learning environment, this study simulated the real learning environment by using the HTML designed online learning web page, and explored the influence of online learning goals and teachers' interpersonal behavior on learning engagement under the framework of self-determination theory, as well as the role of learning motivation. The results showed that: (1) the course objective instruction can initiate the importance of internal and external goals, but it did not show that the internal motivation, learning engagement and academic performance of the students under the condition of internal goal were higher than those under the condition of external goal. (2) Curriculum evaluation guidelines can activate students' perception of teachers' interpersonal behavior, and the internal motivation of online learning of college students under teacher support condition was higher than that under teacher obstruction condition; (3) Internal motivation played a fully mediating role in predicting the positive effect of online learning internal goals on learning engagement; (4) Internal motivation played a fully mediating role in predicting the negative effect of college students' online learning internal goals on their migration performance; (5) Teacher obstruction played a moderating role in the direct path from internal goals to learning engagement. The stronger the degree of teacher obstruction, the stronger the predictive effect of internal goals on learning engagement. These findings provided new ideas and evidence for understanding the influence of teaching objectives and teachers' behavioral factors on learning engagement in online learning, and on this basis, to optimize online teaching design and improve the quality of online learning.

摘要 本研究的目的是探讨在线多媒体课程中教学代理的情绪(快乐或中性)是否会影响学习过程和学习结果, 以及情绪代理的影响是否取决于学习者的情绪调节策略和他们的先验知识。在3个实验中, 大学生被要求观看与突触传递相关的教学动画, 其中包括积极代理(微笑表情和热情的声音)或中性代理(中性表情和平静的声音), 然后进行情绪、动机、学习结果的测试。在三个实验中, 积极代理组比中性代理组报告了更多的积极情绪($d = 0.70, 0.46 \& 0.60$)和更高的动机水平($d = 0.76, 0.49 \& 0.51$)。然而, 在屏幕上添加一个积极代理并没有提高学习表现, 一个可能的原因可能是即时测验不够灵敏, 无法检测出学习表现的提高。此外, 在实验2中, 学习者的情绪调节策略调节了情绪代理对学习者的积极情绪的促进作用。具体来说, 积极代理增加了使用表达抑制策略的学生的积极情绪($d = 0.99$), 但没有增加使用认知重评策略的学生的积极情绪($d = 0.13$)。在实验3中, 情绪代理的效果不受学习者先验知识的影响, 即具有高先验知识的学习者报告了更多的积极情绪($d = 0.56$)、更高的动机水平($d = 0.66$), 并且在保持($d = 2.3$)和迁移($d = 1.29$)的学习结果测试中优于低先验知识的学习者。研究结果支持多媒体学习的认知情感理论(CATLM), 即学生从积极代理中学习会有更多的快乐和动机, 比之于中性代理。

¹ Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Wuhan, China

² School of Psychology, Central China Normal University, Wuhan, China

Abstract: The goal of the present study is to explore whether the affective state (happy or neutral) of a pedagogical agent (PA) in an online multimedia lesson yields different learning processes and outcomes, and whether the effects of affective PAs depend on the learner's emotion regulation strategy and their prior knowledge. In 3 experiments, college students were asked to view a narrated animation about synaptic transmission that included either a happy PA (smiling expression and enthusiastic voice) or a neutral PA (neutral expression and calm voice) and subsequently took emotions, motivation, cognitive outcomes tests. Across three experiments, the happy PA group reported more positive emotions ($d = 0.70, 0.46$ and 0.60) and higher levels of motivation ($d = 0.76, 0.49$ and 0.51) than the neutral PA group. However, adding a happy PA to the screen did not improve performance, one possible reason might be that an immediate test was not sensitive enough to detect the improvement in performance. In addition, in Experiment 2, learners' emotion regulation strategy moderated the effectiveness of affective PA on positive emotions in learners. Specifically, happy PA increased the positive emotions of students who used expressive suppression strategy ($d = 0.99$) but not those who used cognitive reappraisal strategy ($d = 0.13$). In Experiment 3, the effectiveness of affective PA was not moderated by learner's prior knowledge. And learners with high prior knowledge reported more positive emotions ($d = 0.56$), higher levels of motivation ($d = 0.66$) and performed better on learning outcome tests of retention ($d = 2.3$) and transfer ($d = 1.29$) than those with low prior knowledge. Results support the cognitive affective theory of learning with media (CATLM) that students are happier and more motivated when they learn from happy PA than from neutral PA.

摘要 父母卷入对儿童学业、行为和认知的发展发挥着极其重要的作用。父母卷入是一个多维的概念, 父母卷入在儿童成长过程中不是单一、静态的结构, 而是由多种父母卷入方式共同形成的动态结构。因此, 不同的父母卷入方式的发展轨迹可能存在异质性。另外, 有研究表明父母卷入是儿童学业、行为和情感问题的保护因素, 不同父母卷入方式对儿童的学业、行为和情感问题的影响可能存在差异。基于此, 本研究探讨小学生七种父母卷入方式(信息技巧、时间精力、父母信念、父母效能感、学校邀请、教师邀请和孩子邀请)的协同发展轨迹, 以及父母卷入轨迹对小学生学业成绩、行为问题(网络欺负行为和违纪行为)和情绪问题(焦虑和抑郁)的影响。本研究对广东省 13 所小学的 3553 名 3 年级和 4 年级的小学生($M_{age}=9.90, SD=0.72$; 男生 53.9%)进行了为期两年 4 波段的纵向追踪研究, 使用平行过程潜在类别增长曲线模型(PP-LCGM)对数据进行分析。结果显示, (1)小学生父母卷入协同发展轨迹共有 4 种亚组: 分别为中等偏低稳定组(16.83%)、低稳定组(9.97%)、中等偏高增长组(43.89%)和高增长组(29.32%); (2)多元 logistic 回归分析发现, 相比于其他三个组, 高增长组的学生学业、行为和情绪问题最少, 具体表现为更好的学业成绩、更少的网络欺负行为和违纪行为, 更低的焦虑和抑郁水平。中等偏高增长组的学生其学业、行为和情绪的表现仅次于高

增长组的学生。相比与其他两个组，中等偏低稳定组的学生和低稳定组的学生们的学业成绩更差，表现出更多的违纪行为和更高的焦虑和抑郁水平，但是网络欺负行为与中等偏高增长组学生的表现没有显著差异。本研究结果揭示了小学生父母卷入的发展轨迹及其亚组群体，同时考察了父母卷入的不同亚组对学生学业成绩、行为问题和情绪问题的影响，为预防儿童出现学业、行为和情绪问题提供依据和有效的指导。

关键词 父母卷入轨迹，学业成绩，行为问题，情绪问题，小学生

Co-Development Trajectories of Parental Involvement as Predictors of Academic Achievement, Behavioral and Emotional Problems in Elementary School Children

Nan Guo¹, Lili Tian¹(Corresponding author), Wang Liu², Xue Gong¹, Zheng Zhou¹, Minjia Liu¹, Yuling Liu¹, Jiangying Zhou¹, Jingyi Huang¹, Zhenghao Deng¹, Meidan Wang¹, Xiaoyu Li¹, Rao Fu¹, Xuling Liang¹, Yiting Liang¹

² School of Philosophy and Social Development, South China Normal University, Guangzhou, 510631

Abstract: Parental involvement plays an extremely important role in children's academic, behavioral and cognitive development. Parental involvement has been proved to be a multidimensional concept. And different parental involvement are not single and static in the process of children's growth, but multiple patterns of parental involvement jointly participate to form a dynamic structure. Therefore, there may be heterogeneity in developmental trajectories of different parental involvement patterns. In addition, studies have shown that parental involvement is an important protective factor for children's academic, behavioral and emotional problems, and different patterns of parental involvement may have different effects on children's academic, behavioral and emotional problems. This study explored the co-development trajectories of seven parental involvement patterns (skills and knowledge, time and energy, parent beliefs, parental efficacy, school invitations, child invitations and teacher invitations) in elementary school children, and the impact of these trajectories on elementary school children's academic achievement, behavioral problems (delinquent behavior and cyberbullying behavior) and emotional problems (anxiety and depression). A total of 3553 schoolchildren ($M_{age}=9.90$, $SD=0.72$; Male = 53.9%) were surveyed from 13 elementary schools in Guangdong province tracking over 2 years to get 4-wave data. The data were analyzed by parallel process latent class growth model (PP-LCGM). The results showed that there were 4 co-development trajectories of parental involvement: Incongruent-Moderately low (16.83%), Incongruent-Low (9.97%), Incongruent-Moderately high (43.89%) and Congruent-High (29.32%). Multiple logistic regression analysis found that, compared with the other three classes, schoolchildren in Congruent-High class had the fewest academic, behavioral and emotional problems, which were specifically manifested by better academic achievement, less delinquent behaviors and cyberbullying behaviors, and lower levels of anxiety and depression. The academic, behavioral and emotional performance of schoolchildren in Incongruent-Moderately high class was second only to Congruent-High class. Schoolchildren in Incongruent-Moderately low and Incongruent-Low showed more academic, behavioral and emotional problems. Specifically, compared with the other two classes, their academic achievement was worse and showed more delinquent behaviors and higher levels of anxiety and depression, but there is no significant difference in cyberbullying behavior from Incongruent-Moderately high class. The results of this study revealed co-development parental involvement trajectories of elementary schoolchildren, and examined the influence of these trajectories on elementary school children's academic achievement, behavioral problems, so as to provide evidence and effective guidance for the prevention of children's academic, behavioral and emotional problems.

情绪智力与生涯适应力：心理韧性和特质正念的作用

王欢 姜媛（通讯作者）

北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘要 生涯适应力作为一种社会心理资源，是个体为适应职场环境变化而改变自身的能力，受个体特征的影响。生涯建构理论认为，生涯适应力不仅是个体应对职场工作任务和自身角色转变的重要心理资源，还是个体取得职业成功的核心因素。情绪智力同生涯适应力一样，是个体成功适应职场的关键社会心理资源。尽管以往研究发现情绪智力能正向预测个体的生涯适应力，但情绪智力与生涯适应力之间的中介机制和调节机制却仍未明确。因此，本研究构建了一个有调节的中介模型，既考察心理韧性在情绪智力与生涯适应力关系间的中介作用，也考察该过程是否受特质正念的调节。采用问卷调查法，以 730 名大学生（男 171 人，女 559 人，平均年龄为 19.77±1.52 岁）为研究对象，探讨情绪智力影响大学生生涯适应力的作用机制。结果发现：

（1）各变量之间不存在共同方法偏差，且情绪智力、心理韧性、特质正念与生涯适应力两两呈正相关；（2）控制性别和年龄后，情绪智力能正向预测大学生的生涯适应力，且心理韧性在情绪智力和生涯适应力的关系之间起部分中介作用；（3）上述中介过程受特质正念的调节。在特质正念的高、低水平下，情绪智力对心理韧性的正向预测作用均显著。在高特质正念的大学生中，情绪智力对心理韧性的预测作用更强。研究结果表明，我们既可以通过提高情绪智力提高大学生的心理韧性，进而改善其生涯适应力，也可以通过提高大学生的特质正念水平来增强其情绪智力对自身心理韧性的积极影响。研究结果揭示了情绪智力影响生涯适应力的内在机制，为提高大学生生涯适应力提供实证依据。

Emotional Intelligence and Career Adaptability: The Role of Resilience and Trait Mindfulness

WANG Huan, JIANG Yuan(corresponding author)

School of Psychology, Beijing Sport University, Beijing 100084, jiangyuan97@sina.cn

Abstract: Career adaptation refers to the social psychological resources that individuals change themselves to adapt to the workplace environment, which is influenced by individual characteristics. In the light of Career Construction Theory, career adaptability is not only an important psychological resource for an individual to cope with the job tasks and change his role, but also a core factor for an individual to achieve career success. Emotional intelligence, like career adaptability, is the key social psychological resource for an individual to successfully adapt to the workplace. Although previous studies have found that emotional intelligence can positively predict an individual's career adaptability, the mediating and regulating mechanisms between emotional intelligence and career adaptability are still unclear. Therefore, this study constructs a moderating mediating model to examine the mediating role of resilience in the relationship between emotional intelligence and career adaptability, as well as whether the process is regulated by trait mindfulness. A total of 730 college students (171 males and 559 females, with an average age of 19.77%) were investigated by questionnaire (± 52 years old) as the research object, to explore the effect mechanism of emotional intelligence on College Students' career adaptability. The results show that: (1) there is no common method bias among the variables, and emotional intelligence, resilience, trait mindfulness are positively correlated with career adaptability; (2) After controlling gender and age, emotional intelligence positively predicted college students' career adaptability; resilience partially mediated the relationship between emotional intelligence and career adaptability; (3) The mediating effect of resilience was moderated by trait mindfulness. Compared with the college students who with low mindfulness, the resilience of the college students that with high trait mindfulness has a closer relationship with their career adaptability. The results show that we can not only improve the psychological resilience of college students by improving their emotional intelligence, and then improve their career adaptability, but also enhance the positive impact of their emotional intelligence on their psychological resilience by improving their trait mindfulness. These results are beneficial to reveal the mechanisms of college students' career adaptability, and have and provide

empirical evidence for developing programs to improve college students' career adaptability.

Keywords: college student, emotional intelligence, resilience, trait mindfulness, career adaptability

学生问题行为必然会加剧教师倦怠吗? ERI 调节学生感恩对教师倦怠的保护作用

李西营¹ 高铭¹ 任闯² 马晓慧³ (通讯作者) 皮忠玲¹ (通讯作者)

1 陕西师范大学现代教学技术教育部重点实验室, 陕西西安, 710062, pizl@snnu.edu.cn

2 齐齐哈尔实验中学, 黑龙江齐齐哈尔, 16100

3 中国科学院心理研究所, 北京, 100101, 34184233@qq.com

摘要 教师是一个充满压力的工作, 国内外的研究发现教师倦怠的发生率很高。教师倦怠是影响教师和学生身心发展的重要因素, 因此研究教师倦怠的成因和机制具有重要的现实意义。本研究基于缓冲效应模型 (buffer effect model) 和付出-回报失衡模型 (the effort-reward imbalance model, 简称 ERI), 构建了一个有调节的中介模型, 考察了学生问题行为对教师倦怠的影响, 以及学生感恩的中介作用和 ERI 的调节作用。以 441 名教师为被试, 采用问卷法对其职业倦怠、付出-回报失衡、观察到的学生问题行为和学生感恩进行调查。结果发现: (1) 在控制了性别、年龄和所教阶段后, 学生问题行为正向预测教师倦怠及其各维度 (情绪耗竭、去个性化和低个人成就感)。(2) 学生感恩在学生问题行为和教师倦怠之间起部分中介作用, 尤其是在教师倦怠的情绪耗竭和去个性化维度。(3) ERI 在学生感恩与教师倦怠 (去个性化维度) 的关系中起到调节作用, 具体表现为: 当教师的付出-回报失衡严重时 ($ERI \geq 2$), 学生感恩对教师倦怠的影响不显著。而当教师付出-回报失衡不严重时 ($ERI < 2$), 学生感恩对教师倦怠的保护作用更大。只有教师的 ERI 较低时, 学生感恩才能显著降低教师的倦怠水平。这一结果有利于从理论上进一步阐明教师倦怠的影响机制, 对改善教师职业倦怠以及促进其健康发展具有启示意义。

Abstract: Teacher is a stressful job. Studies at home and abroad show that teachers have a high incidence of suffering job burnout. Teacher burnout is an important factor affecting the physical and mental development of teachers and students, so it is of great practical significance to study the causes and mechanisms of teacher burnout. Based on the buffer effect model and effort-reward imbalance (ERI) model, the present study was to test the impact of student problem behavior on teacher burnout, the mediating effect of student gratitude, and the moderating effect of ERI using a moderated mediation analysis. A sample of 441 teachers completed measures of teacher burnout, student problem behavior, student gratitude, and ERI. Results showed that (1) After controlling for gender, age and type of school, student problem behavior positively predicted teacher burnout. (2) student gratitude significantly partially mediated the association between student problem behavior and job burnout, especially their emotional exhaustion and depersonalization. (3) ERI moderated the mediated effect of student gratitude. Specifically, for teachers with low ERI ($ERI < 2$), student gratitude can significantly reduce their teacher burnout/depersonalization; on the contrary, for teachers with high ERI ($ERI \geq 2$), student gratitude has no significant protective effect on teacher burnout/depersonalization. In particular, for teachers with low ERI ($ERI < 2$), the protecting effect of student gratitude on job burnout is enhanced. The findings contribute to the further clarification of the influence mechanism

of teacher burnout in theory and provide directions for improving teacher burnout and promoting the healthy development of teachers.

Keywords: teacher burnout, ERI, student gratitude, student problem behavior, moderated mediation

摘 要 随迁儿童作为城市化进程中涌现出的特殊群体, 在城市融入的过程中需面对许多困难和挑战, 其中同伴关系对于随迁儿童来说尤为重要, 是帮助他们更好地融入城市的重要突破点。但目前随迁儿童与城市儿童同伴关系的现状却不乐观, 以往研究大多将随迁儿童与城市儿童同伴关系较差的原因归结于随迁儿童对城市儿童的歧视知觉水平较高以及消极的元刻板印象。然而, 人际关系是一个双向交互的过程, 互动双方的人际态度都会对二者的关系产生影响。基于此, 本研究基于群际情绪-刻板印象-行为趋向系统模型, 从随迁儿童和城市儿童的交互视角出发, 通过两项研究探讨随迁儿童与城市儿童对彼此的人际态度(认知、情感和行为)特性, 寻找影响二者关系不佳的态度原因, 并探索改善两群体对彼此态度的有效方法。研究获得如下主要结果: (1)对于城市儿童来说, 他们对内外群体在认知和情感层面均无差异, 但在行为上表现出了对内群体同伴更高的交往意愿; 对于随迁儿童来说, 他们在认知评价、情感反应和行为倾向上均表现出了内群体偏好, 对内群体同伴胜任力和热情度评分更高, 情绪更积极, 并且更愿意和与其具有相同身份的随迁儿童互动。(2)直接接触方法干预有效, 可提升城市儿童和随迁儿童对彼此的人际态度。就随迁儿童而言, 与城市儿童直接接触可提升对城市儿童的积极认知评价、情感反应以及行为倾向, 起到改善人际态度的目的; 对于城市儿童来说, 与随迁儿童直接接触可提升其对随迁儿童的人际态度。该研究提示, 学校可从随迁儿童和城市儿童双视角制定有利于人际态度改善的活动和管理措施, 为随迁儿童和城市儿童创造可积极互动的活动和校园氛围, 以帮助随迁儿童更好地融入城市。

The Interpersonal Attitudes of Migrant Children and Urban Children in the Context of Peer Interaction: Intervention Effect of Intergroup Contact

Zhou Yanyan^{1,2}, Chen Yan^{1,2}, Zhang Feng^{1,2}, Yin Jun^{1,2*}

1 Department of Psychology, Ningbo University, Ningbo, 315000

2 Center of Group Behavior and Social Psychological Service, Ningbo University, Ningbo, 315000

Abstract: As a special group emerging in the process of urbanization, migrant children face much difficulties and challenges in the process of urban integration. Among them, companionship is particularly important for migrant children, and it is important points to help them better integrate into the city. However, the current status of the companion relationship between migrant children and urban children is not optimistic. Previous studies have often attributed the poorer companionship between migrant children and urban children to their higher level of discrimination against urban children and negative meta-stereotypes. However, interpersonal relationships are a two-way interactive process. The interpersonal attitude of both parties will have an impact on the relationship between them. Based on this, this research uses the Behaviors from Intergroup Affect and Stereotypes Map as the theoretical basis, starting from the interactive perspective of the migrant children and urban children, and through two studies exploring the characteristics of the interpersonal attitudes (cognition, emotion and behavior) of the migrant children and urban children towards each other, looking for the reasons for the poor relationship between them, and exploring effective ways to improve the attitudes of the two groups towards each other, in order to promote their

friendly interactions, help migrant children to better integrate into the city life. The main results of the research were as follows: (1) For urban children, they had no difference in cognition and affection between the inner and outer groups, but they showed a higher willingness to communicate with their peers in the inner group in behavior; for migrant children, they showed in-group preferences in cognitive evaluation, emotional response and behavioral tendencies. They had higher scores of competence and enthusiasm for in-group peers, were more emotional, and were more willing to interact with migrant children with the same identity. (2) As a method of direct inter-group contact, the intervention effect of the fast friends procedure was effective, and it could improve the interpersonal attitude of urban children and migrant children towards each other. As far as migrant children were concerned, direct contact with urban children could improve their positive cognitive evaluation, emotional response, and behavioral tendencies to improve interpersonal attitudes; for urban children, direct contact with migrant children could improve their interpersonal attitude towards migrant children, and in the sub-dimension of interpersonal attitude, in addition to disgusting emotions, intervention effects existed. According to the research conclusions obtained in this study, it is suggested that schools should formulate activities and management measures that are conducive to the improvement of interpersonal attitudes from the dual perspectives of migrant children and urban children, and create positive interaction activities and campus atmosphere for migrant children and urban children to improve the interpersonal attitude and relationship between them, so as to help the migrant children to better integrate into the city.

Keywords: migrant children, urban children, interpersonal attitude, intergroup contact

教师消极情绪表达对学习者的反馈寻求动机的影响 ——教师印象评价的中介作用

谢涵 程雪姣 洪建中（通讯作者）

华中师范大学心理学院，湖北武汉，430079, jhong@mail.ccnu.edu.cn

摘要 以培养学生的核心素养为导向，在教师的合理指导下激发学生的主动性，让学生成为知识的主动寻求者而非被动接收者，是当前学校教育的重心。研究者认为，学习者的反馈寻求行为是学习主动性的具体表现，指个体在学习活动中不断寻求评价的过程，有助于调整错误行为，巩固正确行为，提升学习效果。研究发现，教师在互动过程中表达出的情绪，会对学习者反馈寻求行为产生重要影响，但该结论在不同文化中存在差异，且这一结果可能与互动过程中学生对教师的印象评价有关。例如，与美国学生相比，俄罗斯学生在接受到教师消极情绪表达的反馈后，会更倾向于向该教师寻求反馈。为探究中国文化背景下教师情绪表达对学习者的反馈寻求动机的影响，并探究教师印象评价（热情、能力）在这一关系中的作用，本研究设立了两个实验对该问题进行探究。实验1考察了教师情绪效价对学生反馈寻求动机的影响，结果发现，接受教师消极情绪表达的被试，反馈寻求动机显著低于积极组和控制组。实验2进一步考察教师印象评价（热情、能力）两维度在教师情绪影响学生反馈寻求中的作用，结果发现，教师印象评价（热情、能力）在消极情绪表达影响反馈寻求中起完全中介作用。本研究结果表明，当教师在互动过程中向学生表现出消极情绪时，学生对该教师的印象评价降低，进而减少向该教师寻求反馈的动机。研究揭示了教师情绪表达影响学习者反馈寻求的模式，为理解师生交互的作用机制提供了新的研究思路。

The Influence of Teachers' Negative Expression of Emotions on Learners' Feedback-seeking Motivation ——The Mediating Role of Teachers' Impression Evaluation

Xie Han, Cheng Xue-jiao, Hong Jian-zhong

School of Psychology, Central China Normal University, Wuhan 430079, China

Abstract: Oriented by cultivating students' core competencies, stimulating students' initiative under the reasonable guidance of teachers, and making students become active seekers of knowledge rather than passive receivers,

becoming the focus of current school education. Researchers believe that the feedback-seeking behavior of learners is a concrete manifestation of learning initiative, which refers to the process of individuals seeking evaluation in learning activities. Feedback seeking behavior helps to adjust wrong behaviors, consolidate correct behaviors, and enhance learning performance. Current studies have found that the emotions expressed by teachers during the interaction process have an important impact on learners' feedback seeking behavior, but the conclusion vary in different cultures, and this result may be related to students' impression evaluation of teachers during the interaction process. For example, compared with American students, Russian students are more inclined to seek feedback from the teacher after receiving feedback with the teacher's negative emotions. In order to explore the influence of teachers' emotional expression on learners' feedback seeking motivation in the context of Chinese culture, and to explore the role of teachers' impression evaluation (warmth and competence) in this relationship, this study set up two experiments to explore this issue. In experiment 1, we investigated the influence of teachers' emotional valence on students' feedback seeking motivation. The results showed that the feedback seeking motivation of the participants receiving negative emotional expression was significantly lower than that of the positive group and the control group. In experiment 2, the influence of teacher's impression evaluation (warmth and competence) on students' feedback seeking was further investigated. The results showed that teacher's impression evaluation (warmth and competence) played a fully mediating role in the influence of negative emotional expression on feedback seeking. The results of this study show that when teachers show negative emotions to students in the process of interaction, student' impression evaluation of the teacher is worse, thereby reducing the motivation to seek feedback from the teacher. The research reveals the mode that teachers' emotional expression affects learners' feedback seeking motivation and provides new research ideas for understanding the mechanism of teacher-student interaction.

职业认同对教师职业幸福感的影响： 工作投入与社会支持的链式中介作用

李樱楠 刘梓艳 廖瑜 李东斌（通讯作者）

赣南师范大学教育科学学院，江西赣州，341000，443021490@qq.com

摘 要 随着时代与科技的迅猛发展与教师职业的特点，教师的职业幸福感面临着巨大的挑战，大量研究证实，职业认同是维持教师职业幸福感的保护性因素，但这种关系背后的内部机制却众说纷纭，主要集中在个体主观能动性 with 客观现实条件两方面，因此，探索教师职业幸福感的潜在机制，设计有效的改善方案是十分必要的。本研究引入工作投入和社会支持两个变量来研究教师职业认同与职业幸福感的关系以及之间可能存在的内在关系，相关研究表明，工作投入与社会支持对教师职业幸福感有促进作用，因此，本研究旨在探讨工作投入和社会支持是否对职业认同与职业幸福感的关系起中介作用。本研究采用魏淑华等人(2013)编制的教师职业认同量表、Schaufell 和 Bakker(2004)编制的简版工作投入量表(UWES-9)、肖水源等人(1994)编制的社会支持评定量表(SSRS)、赵斌等人（2012）编制的教师职业幸福感量表对来自江西、浙江、四川、上海、青海、湖北、湖南、辽宁、福建等省份的 6772 名教师（包括中学、小学及幼儿园）进行问卷测量。剔除无效数据后，共收集到 6114 份有效数据。研究采用 SPSS24.0 结合 Hayes 最新编制的 SPSS 宏(PROCESS)和 Mplus8.3 统计软件对数据进行统计分析和模型检验。各量表的信度良好，本研究不存在严重的共同方法偏差。研究结果发现：（1）职业认同与工作投入（ $r=0.52, p<0.001$ ）、社会支持（ $r=0.31, p<0.001$ ）、职业幸福感（ $r=0.55, p<0.001$ ）均呈显著正相关，职业幸福感与工作投入（ $r=0.75, p<0.001$ ）、社会支持（ $r=0.50, p<0.001$ ）呈显著正相关，工作投入与社会支持（ $r=0.44, p<0.001$ ）呈显著正相关；（2）职业认同对教师职业幸福感有正向预测作用（ $\beta=0.682, p<0.001$ ）。（3）工作投入是职业认同与职业幸福感的中介变量（ $0.347<\text{BootCI}<0.460$ ），工作投入的中介效应值为 $0.408(p<0.001)$ ；社会支持是职业认同与职业幸福感的中介变量（ $0.008<\text{BootCI}<0.016$ ），社会支持中介效应值为 $0.013(p<0.001)$ 。（4）职业认同还能通过工作投入和社会支持的链式中介作用对教师的职业幸福感产生影响（ $0.005<\text{BootCI}<0.009$ ），其中介效应值为 $0.007(p<0.001)$ 。研究结果进一步解释了教师职业认同对职业幸福感的内部机制，为通过提教师工作投入和提高社会支持干预教师职业幸福感提供了实证研究的

依据。

The Effects of Professional Identity on Teachers' Occupational well-being: The chain mediating effect of Work Engagement and Social Support

LI Yingnan, LIU Ziyang, LIAO Yu, LI Dongbin

Educational Science School, Gannan Normal University, Ganzhou, 341000, e-mail:

443021490@qq.com

Abstract: With the rapid development of the times and technology, and the characteristics of teachers' profession, teachers' occupational well-being is facing great challenges. A large number of studies have confirmed that professional identity is a protective factor to maintain teachers' occupational well-being, but there are different opinions on the internal mechanism behind this relationship, which mainly focuses on individual subjective initiative and objective realistic conditions. It is very necessary to explore the potential mechanism of teachers' occupational well-being and design effective improvement schemes. This study introduces two variables, work engagement and social support, to study the relationship between teachers' professional identity and occupational well-being and the possible internal relationship between them. Relevant studies show that work engagement and social support can promote teachers' occupational well-being, the purpose of this study is to explore whether work engagement and social support play a mediating role in the relationship between professional identity and occupational well-being. In this study, 6772 teachers (including primary schools, middle schools and kindergartens) from Jiangxi, Zhejiang, Sichuan, Shanghai, Qinghai, Hubei, Hunan, Liaoning, Fujian, China were assessed with the teacher's professional identity scale compiled by Wei Shuhua et al. (2013), the simplified work engagement scale (UWES-9) compiled by Schaufeli and Bakker (2004), the social support rating scale (SSRS) compiled by Xiao Shuiyuan et al. (1994) and the teacher's occupational well-being scale compiled by Zhao Bin et al. (2012). After excluding the invalid data, a total of 6114 valid data were collected to investigate the effect of teachers' professional identity on occupational well-being, as well as the intermediary role of work engagement and social support. SPSS 24.0 and Mplus 8.3 statistical software were used for data analysis and model validation. There was no serious common method biases and all questionnaires have adequate reliability and validity. The results show that: (1) teachers' professional identity was significantly positively correlated with work engagement ($r=0.52, p<0.001$), social support ($r=0.31, p<0.001$) and occupational well-being ($r=0.55, p<0.001$); teachers' work engagement was positively correlated with social support ($r=0.75, p<0.001$) and occupational well-being ($r=0.50, p<0.001$); social support was significantly positively correlated with occupational well-being ($r=0.44, p<0.001$). (2) professional identity can significantly positively predict teachers' occupational well-being ($\beta=0.682, p<0.001$). (3) work engagement mediated the relationship between professional identity and occupational well-being ($0.347 < \text{bootci} < 0.460$), the mediating effect of work engagement was $0.408 (p<0.001)$; social support mediated the relationship between professional identity and occupational well-being ($0.008 < \text{bootci} < 0.016$), the mediating effect of social support was $0.013 (p<0.001)$. (4) professional identity can also have an impact on teachers' occupational well-being through the chain intermediary of work engagement and social support ($0.005 < \text{bootci} < 0.009$), the mediating effect was $0.007 (p<0.001)$. The results further explain the internal mechanism of the influence of teachers' professional identity on occupational well-being, and provided a reference of empirical research for intervention of teachers' occupational well-being by improving teachers' work engagement and social support.

测试策略元认知错觉产生的机制

李新伟 王倩儿 姚静静 李伟健（通讯作者）

浙江师范大学心理系，金华，321000，xlxh@zjnu.cn

摘要 背景：学习策略与元认知错觉均为国内外心理学研究的重点领域。关于元认知错觉，已有研究大多关注知觉信息对元认知错觉的影响，而较少探讨学习策略与元认知错觉之间的关系。测试策略作为教学活动中常用的学习策略，已有上百年的研究历史。以往研究表明测试策略是一种有效的学习策略，但是学习者却往往认为测试（相对于重学）并不能带来更好的学习效果。该现象出现的可能原因是学习者产生了测试策略元认知错觉。目的：本研究通过三个实验探讨（1）学习者是否存在测试策略元认知错觉；（2）测试策略元认知错觉产生的机制。方法：实验一招募 40 名被试，采用被试内设计，以逐项学习判断为因变量，探讨学习者是否存在测试策略元认知错觉；实验二采用观察者范式考察信念在测试策略元认知错觉产生中的作用；实验三探讨流畅性在测试策略元认知错觉产生中的作用。实验二招募被试 120 名，实验三招募被试 48 名。结果：实验一发现测试策略的逐项学习判断成绩显著低于重学策略，而回忆成绩显著高于重学策略，表明被试存在测试策略元认知错觉。实验二发现，在测试策略条件下，学习者的预计回忆个数显著多于重学策略条件下，表明学习者拥有正确的信念，即测试优于重学。实验三发现，被试报告的测试策略困难程度显著高于重学策略，但是，在测试策略条件下，被试的回忆成绩显著好于重学策略条件下，表明学习过程中的不流畅可能是学习者测试策略元认知错觉产生的原因。结论：学习者存在测试策略元认知错觉；测试策略应用过程中的不流畅性可能是测试策略元认知错觉产生的机制。

The Mechanism of Testing Strategy's Metacognitive Illusion

Xinwei Li, Qianer Wang, Jingjing Yao, Weijian Li

Zhejiang Normal University, Jinhua, China

Abstract: *Rationale:* Learning strategies and metacognitive illusions are the focus of psychological research at home and abroad. As for metacognitive illusion, most of the existing studies focus on the effect of perceptual information on metacognitive illusion, but seldom discuss the relationship between learning strategies and metacognitive illusion. As a common learning strategy in teaching activities, testing strategy has been studied for more than one hundred years. Previous studies have shown that testing strategy is an effective learning strategy. But learners often believe that testing (compared to restudy) has not a better effect. The possible reason for this result is that learners have the metacognitive illusion of testing strategy. *Objective:* Three experiments were conducted to investigate (1) whether learners had metacognitive illusions of testing strategy; (2) to test the mechanism of testing strategy metacognitive illusion. *Methods:* Forty participants were recruited in experiment 1. And the within-subject design was used to investigate whether learners had metacognitive illusions of testing strategies. In experiment 2, the observer paradigm was used to investigate the role of belief in the mechanism of strategic metacognitive illusion. Experiment 3 explored the effect of fluency on the metacognitive illusion of test strategy. 120 subjects were recruited for experiment 2 and 48 subjects were recruited for experiment 3. *Results:* Experiment 1 found that the performance of the test strategy was significantly lower than that of the relearning strategy, while the performance of recall was significantly higher than that of the relearning strategy, indicating that participants had metacognitive illusion of the test strategy. Experiment 2 found that under the condition of testing strategy, learners' expected recall number was significantly higher than that under the relearning strategy, indicating that learners had the right belief, that is, testing was better than relearning. Experiment 3 found that the difficulty of the testing strategy was significantly higher than that of the relearning strategy. However, the recall performance of the participants under the testing strategy condition was significantly better than that under the relearning strategy condition, suggesting that the fluency in the learning

process may be the cause of the metacognitive illusion of the learners during the testing strategy. *Conclusion:* Learners have the testing strategy metacognitive illusion; The fluency in the application of testing strategies may be the mechanism of the metacognitive illusion of testing strategies.

不同视知觉特征的抑制控制对儿童和成人非符号数量加工的影响

马媛媛¹ 张译允^{1*}

¹ 辽宁师范大学心理学院, 大连

*通讯作者: 辽宁师范大学心理学院, 大连, 116000, psyzyun@163.com

摘要 点阵数量比较任务常被用来考察个体的非符号数量加工能力,点阵的视知觉特征会影响被试对非符号数量的加工。以往研究在非符号数量比较任务中发现了数量和视知觉特征之间的一致性效应,这种一致性效应的出现是由于被试需要抑制与数量信息无关的视知觉特征。但有研究未能观察到一致性效应,这让人们对抑制控制在非符号数量加工能力中的关键作用产生了质疑。我们以70名小学1至2年级儿童(7~9岁)和60名成人(19~25岁)为研究对象,采用负启动范式,探讨儿童和成人在进行点阵数量判断时是否受到点阵的视知觉特征,包括点阵的凸包、累积表面积的影响。结果发现,不论儿童还是成人在控制了点阵凸包或累积表面积的非符号数量比较任务中都出现了负启动效应:即与中性条件的点阵数量比较任务相比,不一致条件的点阵数量比较任务的反应时更长、正确率更低。并且,相对于成人,儿童产生的负启动效应更大。这些结果表明,在儿童和成人的点阵数量判断任务中都需要抑制与数量不相关的凸包和累积表面积等点阵的视知觉信息。并且儿童比成人更容易受到点阵的视知觉特征的影响,这可能是因为儿童的抑制控制能力尚未发展完全。本研究首次采用负启动范式揭示点阵凸包和累积表面积等视知觉特征对点阵数量比较的影响,为抑制控制在非符号数量加工中的作用提供依据,并揭示了抑制控制能力的年龄发展特征,表明非符号数量认知发展在一定程度上依赖于抑制控制能力的提高。

Effects of inhibitory control of different visual properties on non-symbolic numerosity processing in children and adults

Yuanyuan Ma¹, Yiyun Zhang^{1*}

¹ School of Psychology, Liaoning Normal University

*Corresponding author: School of Psychology, Liaoning Normal University, Dalian, 116000, psyzyun@163.com

Abstract: The non-symbolic numerosity comparison task is often used to investigate individuals' ability to process non-symbolic numbers. The visual properties of dot arrays will affect the processing of non-symbolic numbers. Previous studies have found congruency effect between numerosity and visual properties in non-symbolic numerosity comparison task. This congruency effect occurs because participants need to inhibit visual properties unrelated to numerosity information. However, some studies failed to observe the congruency effect, which cast doubt on the key role of inhibitory control in the processing ability of non-symbolic numbers. Seventy primary school children in grades 1 to 2 (ages 7 to 9) and 60 adults (ages 19 to 25) participated in the current study. The negative priming paradigm was used to investigate whether children and adults were affected by the visual properties of dot arrays, including the convex hull and total surface area of dot arrays. The results showed that both children and adults had negative priming effect when the convex hull and total surface area were controlled in the non-symbolic numerosity comparison task, that is, the reaction time and accuracy of the non-symbolic numerosity task under the incongruent condition were longer and lower than that under neutral condition. In addition, the negative priming effect was greater in children than in adults. These results suggested that both children and adults need to inhibit numbers-independent visual properties (such as convex hull and total surface area) in non-symbolic numerosity

comparison task. Moreover, children are more likely to be affected by the visual properties of dot arrays than adults, which may be because children's inhibitory control ability has not been fully developed. In this study, the negative priming paradigm was used for the first time to reveal the effects of visual properties such as convex hull and total surface area on non-symbolic numerosity comparison task. This study provides evidence for the role of inhibitory control in non-symbolic numerosity processing, and reveals the age-related developmental characteristics of inhibitory control ability, which indicates that the cognitive development of non-symbolic numerosity depends on the improvement of inhibitory control ability to some extent.

Keywords: Non-symbolic numerosity process, Inhibition control, Negative priming paradigm, Non-symbolic numerosity comparison

生成性绘图与合作对高中生科学知识学习的影响

张洋, 张婉莹, 王福兴 (通讯作者)

华中师范大学心理学院, 武汉, 430000, fxwang@ccnu.edu.cn

摘要 学习者生成性绘图是在学习一些较为复杂的科学知识时, 学习者将学习内容以图画的形式表达出来, 以提高对学习内容的理解从而提升学习效果的一种学习策略, 能够促进学习者对科学文本知识的表征和深层理解。合作学习是为了达成共同的学习目标而进行的互助式学习活动, 小组成员间的互动可以帮助个体理解和重组信息, 有利于学习的同时也能使同伴关系更加积极。目前关于学习者生成性绘图的研究主要集中在个体学习领域, 本研究将合作学习与学习者生成性绘图相结合, 探讨生成性绘图和合作对高中生科学知识学习的影响。实验1以52名高一年级学生为被试, 采用单因素(绘图组、阅读组)被试间设计来验证生成性绘图对学习效果以及认知负荷等主观体验的影响。结果表明, 绘图组学习者的保持和迁移测验成绩均显著高于阅读组, 且绘图组学习者的内在认知负荷更低。实验2以113名高一年级学生为被试, 采用2(绘图、阅读)×2(合作、个体)被试间设计来探讨生成性绘图与合作对学习效果和学习者主观体验的影响。结果发现, 在保持和迁移测验上, 绘图的主效应均显著, 绘图组学习者的保持和迁移测验成绩均显著高于阅读组; 合作的主效应均显著, 合作组学习者的保持和迁移测验成绩均显著高于个体组; 绘图和合作的交互作用均不显著。表明生成性绘图和合作都可以有效促进高中生科学知识的学习效果。此外, 在主观体验上, 绘图和合作都能够显著降低学习者的内在认知负荷, 合作还能显著降低学习者的外在认知负荷并提高学习者的相关认知负荷和学习兴趣。未来的研究可以拓宽研究对象的范围和研究材料的类型。例如, 探讨生成性绘图和合作两种学习策略对不同年级学习者和不同科目学习内容的作用, 深入挖掘两种学习策略的优势。

The Effects of Learner-Generated Drawing and Cooperative Learning on Scientific Knowledge Learning of High School Students

Yang Zhang, Wanying Zhang, Fuxing Wang

School of Psychology, Central China Normal University, Wuhan, Hubei, China

Abstract: Learner-generated drawing is a learning strategy for learners to express the learning content in the form of pictures in order to improve their understanding of the learning content and improve their learning effect when they are learning some complex scientific knowledge. It can promote learners' representation and deep understanding of scientific text knowledge. Cooperative learning is a mutual learning activity for the purpose of achieving common learning goals, the interaction between group members can help individuals understand and reorganize information, which is conducive to learning and can also make the partner relationship more positive. Most of the research about learner-generated drawing focused on individual learning settings, this study combines cooperative learning with learner-generated drawing to explore the impact of generative drawing and cooperation on high school students' scientific knowledge learning. In Experiment 1, 52 senior high school students were selected as subjects, and a single factor (drawing group vs. reading group) between-subjects design was employed to investigate whether

learner-generated drawing can facilitate learning and the influence on subjective experience such as cognitive load and interest. The results showed that learners in the drawing group had significantly higher retention and transfer test scores than those in the reading group, and learners in the drawing group reported lower internal cognitive load. In Experiment 2, 113 senior high school students were selected as subjects, and a 2 (drawing vs. reading) $\times$ 2 (individual learning vs. collaborative learning) between-subjects design was employed to investigate the effects of generative drawing and cooperation on scientific knowledge learning of high school students. The results showed that the main effects of drawing were significant on retention and transfer tests, and the scores of the drawing group were significantly higher than those of the reading group. The main effect of cooperation was significant. The retention and transfer test scores of cooperative learners were significantly higher than those of individual learners. The interaction between drawing and cooperation was not significant. The results show that both learner-generated drawing and cooperation can effectively promote the learning effect of high school students. In addition, in terms of subjective experience, both drawing and cooperation can significantly reduce learners' internal cognitive load, while cooperation can also reduce learners' external cognitive load and improve learners' relevant cognitive load and learning interest. Future research could broaden the range of subjects and the types of materials studied. For example, future research can explore the effects of generative mapping and cooperative learning strategies on learning content of learners at different grades and different subjects, and dig into the advantages of the two learning strategies.

小学生基于分数测量子概念的数字线表征研究

马红斐¹ 杨伊生² (通讯作者)

1 内蒙古师范大学教育学院, 呼和浩特, 010022

2 内蒙古师范大学心理学院, 呼和浩特, 010022, yangys1965@163.com

摘要 分数数字线表征不仅是儿童分数数量理解的衡量依据, 更深层反映了儿童分数“测量”子概念的形成过程。研究以分数测量概念为背景, 主要探讨数字线类型及年级对分数数字线表征的影响。实验选取了 287 名 4-6 年级儿童在 0-1、0-2 和 0-1/3 三种数字线上对常见分数 (含等值分数) 进行位置标注。结果表明: (1) 年级是影响不同类型数字线上分数表征精确性的重要因素, 4 年级学生分数数字线表征精确性不稳定, 5 年级是表征精确性的变化发展阶段, 6 年级学生分数表征精确性的差异减少, 趋于完善水平。(2) 分子分母大小是等值分数识别的外部干扰因素, 共同单位建构是内部认知要素。(3) 单位是影响分数数字线表征的核心要素, 其次是数字线的范围, “分率分数概念”导致了不适宜数字线范围的存在。

Research on The Number Line Representation of Pupils Based on The Measure Sub-construct of Fraction

Ma Hongfei¹, Yang Yisheng²

1 College of Education, Inner Mongolia Normal University, Hohhot, 010022

2 School of psychology, Inner Mongolia Normal University, Hohhot, 010022 yangys1965@163.com

Abstract: The representation of mental number line is not only the measurement of children's fraction magnitude understanding, but also the process of forming the measure sub-construct of fraction. Based on the measure interpretation of fraction, the research mainly discusses the influence of number line type and grade on the representation of fraction. This study examined the performance of 287 fourth to sixth graders signing the common fraction (including equivalent fractions) on 0-1, 0-2 and 0-1 / 3 number lines. The results show that: (a) The grade is an important factor affecting the accuracy of fraction representation on different types of number line. The accuracy of the fourth grade students' fraction representation is not stable, the accuracy of the fifth grade students' fraction representation has changed dramatically, and the difference of the accuracy of the sixth grade students' fraction

representation decreases and tends to be accurate. (b) The magnitude of numerator and denominator is the external interference factor of equivalent fractions recognition, and the construction of common unit fraction is the internal cognitive factor. (c) The unit is the key factor that affects the representation of fractional number line, followed by the range of number line. The concept of ratio fraction leads to the existence of unsuitable range of number line.

摘要 课堂对话 (classroom discourse) 塑造了学生的学习经验与结果。在师生对话之外, 由同伴主导的小组讨论已被证实能够促进学生的阅读理解和批判性思维, 并提升学习成绩。然而, 学界在探讨小组讨论对学生认知发展的影响之外, 少有关同伴对话的社交属性, 更鲜有研究讨论在同伴对话的互动过程中认知与社交两个发展维度之间的交互作用。对该交互作用的研究将有助于教育研究者和实践者进一步了解小组讨论对青少年综合发展的影响, 为在学科教学过程中实现德育和认知发展的双重教育目的提供参考和借鉴。基于小组讨论实践, 本研究改编了 ICAP 理论框架 (Chi, 2009), 将学生之间的对话依据认知水平界定了四种认知对话模式: 被动 (passive), 积极倾听 (active listening) 主动 (active) 和交互 (interactive)。针对学生在讨论中采取的社交策略, 借鉴 CSR 合作社交推理 (Collaborative Social Reasoning, Lin et al., 2021) 的设计理念, 本研究提出三种社交对话模式: 同伴支持 (social support), 彼此尊重 (mutual respect), 以及平等参与 (equal participation)。研究样本为 120 名美国中部地区的五年级学生。他们组成 20 个小组, 每组 5-7 人, 经过三次小组讨论, 共产生 8673 个学生对话。小组讨论的每一个议题都改编自一个包含社交冲突的适龄读物, 可从多条线索和视角进行开放式讨论。小组内学生两两之间的对话基于每一种认知或社交对话模式分别构建出一个对话网络。推断性社交网络分析 (即随机指数模型, ERGMs) 的结果显示说话者的认知水平不仅与其所运用的社交策略相关, 还受到同伴对其运用的社交策略的影响。即说话者社交策略的运用与其高阶认知对话模式呈显著正相关; 被同伴支持仅与较低水平的认知对话模式相关; 而收到彼此尊重 (在尊重的前提下提出异见) 或平等参与 (邀请同学发言) 的社交对话模式是一把双刃剑——虽然可能促进高阶认知对话模式, 但也与最低水平的认知对话模式相关。本研究以微观的视角展示了小组讨论过程中认知和社会性两个维度的动态交互, 证实了以认知发展为导向的课堂对话可对学生全面发展所发挥的重要意义。

Interweaving Relations between Cognitive and Social Dialogue Patterns during Small Group Discussions

Jing Chen

School of Education, Shanghai Jiao Tong University

800 Dongchuan Road, Shanghai, China 200240

chenj.chenjing@sjtu.edu.cn

Abstract: Classroom discourse has been known for shaping students' learning experiences and outcomes. Small group discussions are known for their potential to promote reading comprehension, critical thinking, and argumentative skills. As a social activity, however, less study has examined the social processes of dialogues besides the cognitive aspect of reasoning. Addressing this gap is important to deepen scholarly understandings and to optimize educational practices in promoting adolescents' socio-emotional development alongside their cognitive skills and academic achievement. This study took a fine-grained approach to understand students' levels of cognitive engagement (i.e., cognitive dialogue patterns) and their use of social strategies (i.e., social dialogue patterns) turn-by-turn during collaborative small group discussions. Based on dialogues students initiated to and received from peers, four types of cognitive dialogue patterns (i.e., passive, listening, active, and interactive) were identified

adapted from Chi's ICAP framework (Chi, 2009) and three types of social dialogue patterns (i.e., social support, mutual respect, and equal participation) were identified based on social norms of Collaborative Social Reasonings (Lin et al., 2021). Participants were 120 fifth graders in a public elementary school serving middle-class families in the Midwest of the U.S. These students formed 20 discussion groups. Their three discussions generated 8,673 speaking turns, each of which was coded as one type of cognitive dialogue pattern and one type of social dialogue pattern. A dialogic network was constructed for each group based on each type of the cognitive and the social dialogue patterns. Results of exponential random graph models (ERGMs) showed that speakers' cognitive dialogue patterns were associated with social dialogue patterns they initiated as speakers and social dialogue patterns they received from group members as addressees. Our findings provided suggestions to the practice that teachers might foster students' cognitive engagement by encouraging them to explicitly acknowledge peers' ideas, and that teachers should be cautious when students uncritically agree with each other. This study demonstrated the interweaving relations between cognitive and social processes during dialogues between peers, which evidenced the multi-faced roles of instructional practices in promoting socio-emotional skills along with facilitating cognitive development.

数学焦虑个体的负性注意偏向：电生理学证据

高亚茹¹ 徐艳丽¹ 黄碧娟¹ 王阳阳¹ 司继伟¹ (通讯作者)

¹ 山东师范大学心理学院, 济南, 250358, 通讯作者 E-mail: sijiwei1974@126.com

摘要 数学焦虑 (math anxiety) 指个体处理数字或数学相关情境时的一种消极情绪反应。注意偏向 (attentional bias) 指相对于中性刺激, 人们能够更快且更准确地将注意锁定到环境中的威胁刺激。虽然前人初步证据表明数学焦虑个体存在着对数学有关信息的负性注意偏向, 但目前的国内外相关研究却发现高数学焦虑 (HMA) 个体在注意偏向上的表现有所不同, 在数学相关信息提示条件下, HMA 个体反应更快或更慢。这些不同的结果很可能反映了注意偏向的不同成分: 注意易化、注意脱离困难和注意回避。本研究结合了行为和 ERP 指标, 通过两个实验探究数学焦虑成人负性注意偏向的具体表现特征。研究选取 830 名非数学专业在校大学生, 根据数学焦虑得分选取 HMA 组 (32 人, 其中男生 8 名) 和 LMA 组 (低数学焦虑, 29 人, 其中男生 9 名)。实验一通过情绪启动任务, 设置四种不同提示条件 (积极、中性、消极、数学相关), 探究 HMA 个体对数学有关信息是否存在注意偏向; 实验二通过点探测任务, 设置中性、一致、不一致三种条件, 并将目标刺激的呈现时间设置长、短两种条件, 探究数学焦虑个体所表现出的注意偏向特征。结果发现: (1) HMA 组对情绪启动词语的评分显著低于 LMA 组, 且 HMA 组对数学相关词语的评分与消极词语无差异, LMA 组对数学相关词语的评分与中性词语无差异; (2) HMA 组的反应时更短; (3) HMA 组与 LMA 组之间的 N2pc 成分幅值无显著差异; HMA 组的 LPP 成分峰值显著更大; HMA 组的 SPCN 成分幅值显著更小, 且刺激呈现时间较长条件下, 两组间的幅值无显著差异。上述结果表明: (1) HMA 个体存在对数学相关词语、数字的注意偏向, 总体表现为注意回避; (2) HMA 个体倾向于将数学相关词语归类为消极词语, 而 LMA 个体倾向于将其归类为中性词语; (3) 在目标刺激呈现中期, HAM 个体存在对数字的注意脱离困难, 晚期则表现为注意回避, 显示其可能将数学相关信息视为威胁性刺激。

Negative Attentional Bias in Math Anxiety Individuals: Electrophysiological Evidence

GAO Yaru¹, XU Yanli¹, HUANG Bijuan¹, WANG Yangyang¹, SI Jiwei¹ (Corresponding Author)

¹ School of Psychology, Shandong Normal University, Jinan, 250358

Abstract: Math anxiety is the negative emotional response to math stimuli and situations. Attentional bias refers to a high level of attentional allocation to threatening stimuli compared to neutral ones. Whereas some evidence exists that

math anxiety individuals have a negative attentional bias towards math-related information, no research has attempted to investigate why individuals with high math anxiety (HMA) have different performances in attentional bias. These different results are likely to correlated with different components of attentional bias: attention facilitation, attention disengagement difficulty and attention avoidance. Across 2 experiments, the current study explored math anxiety individuals' performance characteristics of negative attention bias. A total of 830 non-mathematics college students participated in these experiments. They were selected into HMA group (N=32, 8 boys) and LMA group (individuals with low math anxiety, N=29, 9 boys) according to math anxiety scores. In experiment 1, participants completed an emotional priming task. Positive, neutral, negative and math-related words were presented as primes to test whether HMA individuals show attentional bias towards math-related information. In experiment 2, subjects were required to perform dot-probe tasks which including neutral, consistent and inconsistent conditions. The presentation time of the target stimuli was set to be shorter and longer to examine attention bias characteristics shown by math anxiety individuals under different presentation time. The results showed that: (1) HMA participants had lower ratings across all priming words than their LMA peers. HMA subjects showed no difference in rating the math-related words and the negative words and LMA subjects showed no difference in rating the math-related and neutral words. (2) HMA participates were faster to respond than their LMA counterparts. (3) There was no significant difference in N2pc amplitudes between HMA and LMA groups. Participates with HMA showed greater amplitudes of LPP relative to their counterparts with LMA. HMA group showed smaller SPCN compared with LMA and there was no significant difference in SPCN amplitudes between the two groups when the presentation time was longer. Together, these findings demonstrate that: (1) HMA individuals have attentional bias towards math-related words and numbers, and their overall performance is attention avoidance.(2) HMA individuals tend to classify math-related words as negative words, while LMA individuals tend to classify them as neutral words.(3) HMA individuals have difficulty in detaching their attention from numbers in the middle stage of the target stimulus presenting period and they show attention avoidance in the late stage, suggesting that they may regard the math-related information as threatening stimuli.

家师关系与小学生学校态度：师生关系的中介作用及父母差异

李妍¹ 梁丽婵¹ 周欣然¹ 边玉芳¹（通讯作者）

¹ 北京师范大学中国基础教育质量监测协同创新中心，北京，100875，bianyufang66@163.com

摘 要 家庭和学校是小学生成长的重要环境，家校合作能够改进学校教育质量、提升家庭教育水平、帮助儿童获取教育成果，已成为国内外教育改革的重要举措。良好的家师关系是家校合作的基础，有利于形成教育合力、促进学生全面发展。家师关系包含主观的家师关系质量和客观的家师联系频率，根据社会资本理论，家师关系对小学生的学校态度具有重要影响。学校态度指学生对学校所持的评价和行为倾向，包括学校喜欢和学校回避两方面。根据生态系统理论，由于家师关系与小学生学校态度属于不同子系统，因此师生关系可能在其间起到中介作用。本研究采用家师关系量表、师生关系量表和学校态度量表，对北京 1366 名小学四年级学生及其父母进行连续两年的调查，旨在探讨父母报告的家师关系对小学生学校态度的影响，以及师生关系的中介作用，并探讨父母差异。结果发现：（1）父亲和母亲报告的家师关系质量均能负向预测学校回避，家师联系频率均能负向预测学校喜欢。（2）母亲报告的家师关系质量能正向预测学校喜欢、家师联系频率能正向预测学校回避，而父亲报告的这两条路径均不显著，存在父母差异。（3）父亲和母亲报告的家师关系质量能够通过师生关系正向预测学校喜欢，负向预测学校回避。研究提示：（1）家师良好关系的建立比客观的联系频率更具意义，因此学校和教师不能只着眼于家师联系频率是否满足学校的要求，更要注重良好关系的建立；（2）教师与家长的联系频率要适度，避免“有问题才联系”和“过度侵扰”；（3）师生关系对学生的学

校喜欢等积极发展具有重要意义,教师要关注与学生良好关系的建立。

Influence of parent-teacher partnership on students' school attitude in the primary school: The mediating role of student-teacher relationship and the difference between parents

Yan Li, Lichan Liang, Xinran Zhou, Yufang Bian

Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing

Abstract: School-home collaboration can improve the quality of both school and family education, and help children obtain educational achievement, which makes it become a vital measure in education reform. The parent-teacher partnership is the basis of school-home cooperation, including both subjective relationships and objective contacts between families and teachers. The parent-teacher partnership contributes to a joint educational force and all-round developed students. According to Social capital theory, the parent-teacher partnership has an important influence on students' school attitudes, the evaluation and behavioral tendencies to schools, which include school preference and school avoidance. Since parent-teacher partnership and school attitude belong to different sub-systems in terms of Systems-ecological theory, the student-teacher relationship may play a role between them. This study is to examine how parent-teacher partnership and student-teacher relationships are related to student's school attitudes in primary school and distinguish the difference between parents. 1366 four-grade students and their parents of Beijing were recruited to filled in scales at two points, the results indicated that: (1) the quality of parent-teacher relationship reported by parents had a negative influence on school avoidance, while the frequency of parent-teacher contact negatively affected school preference. (2) The quality of the parent-teacher relationship reported by mothers negatively predicted school preference, and their frequency of parent-teacher contact positively predicted school avoidance. However, these two pathways reported by fathers were not significant. (3) For both parents, the student-teacher relationship played a mediated role in parent-teacher relationship quality and school attitude. The results provide some suggestions: (1) Compared with objective contacts, the subjective relationship quality is more meaningful, and educators should pay more attention to it. (2) The frequency of contacts between teachers and parents should be appropriate to avoid "contact only when there is a problem" or "excessive intrusion". (3) The student-teacher relationship makes a significant impact on student's development, such as school preference, so teachers are supposed to involve themselves in establishing good relationships with students.

通过合作推理讨论促进中学生创造性问题解决

周茜楠¹ 马淑凤² (通讯作者)

¹ 华东师范大学心理与认知科学学院, 上海, 200062

² 华东师范大学教育学部教育心理学系, 上海, 200062, sfma@dep.ecnu.edu.cn

摘要 随着机器学习、人工智能等领域的发展,现代社会对高创造力人才的需求剧增,在中小学阶段培养学生的创造力是当代教育的迫切要求。然而,在应试教育背景之下,如何在常规的课程设置中通过有效的教学干预手段来提高学生的创造性思维仍然是一个很大的挑战。合作推理讨论 (Anderson et al., 1998) 是一种以学生为中心的互动式教学法,在课堂上教师引导学生就争议性话题进行开放式讨论,学生结合阅读材料和自身经验形成观点并论证,倾听彼此并挑战同学的观点,形成对问题多角度的思考 (马淑凤等, 2016)。虽然合作推理讨论并非专门针对创造力培养,但是越来越多的创造力研究表明:“创造力是一个复杂的动态系统,在这个系统中创造性的想法通过个人和社会环境之间的持续互动涌现出来”(Kupers, Lehmann-Wermser,

McPherson &, van Geert, 2019), 合作推理论正是提供了这样一个有利于创造力发展的社会学习情境。因此, 本研究考察了合作推理论对学生创造性问题解决的影响, 从流畅性、灵活性、新颖性和适用性四个方面探讨了合作推理论对儿童在不同类型(社交类、工具类、应急类)的问题解决任务中的创造力表现。本研究以河北一所县级中学 8 个班的 474 名七年级学生为研究对象, 将班级随机分配到实验组与对照组中(各 4 个班), 并在实验组班级中开展了 8 次合作推理论。研究结果发现, 参与了合作推理论的中学生与对照组的中学生相比在创造性问题解决中表现更好。具体表现为参与了合作推理论的学生相较于对照组的学生提出了更多的方案(流畅性), 而且他们提出的方案种类更丰富(灵活性)、想法更独特(新颖性), 以及对现实情境更加实用(适用性)。此外, 在问题解决的类型方面, 参与了合作推理论的中学生在社交类问题情境中的表现最佳。这些研究结果表明合作推理论对中学生的创造性问题解决有明显促进作用。本研究为创造力培养领域提供了一种新思路, 即通过构建有助于儿童社会互动的合作学习情境来促进创新性想法的涌现, 从而培养学生在真实社交情境下的创造性思维。

Promoting Creative Problem-Solving through Collaborative Reasoning

Abstract: Learning engagement refers to a mental state of hard work, enthusiasm, and progress shown by students. This positive learning statement is conducive to stimulating students' learning potential, enhancing learning happiness, and improving learning achievement. Studies have found that perceived class climate was closely related to primary school students' learning engagement, but the specific mechanism and conditions of perceived class climate need to be explored. Under the guidance of the child development system theory, this study proposes a moderated mediation model to test the mediating role of psychological capital between perceived class climate and primary school students' learning engagement, and the moderator role of class cadres status in the process. This study used a self-report method to survey 818 (432 boys) primary school students from fifth to sixth grade by the Learning Engagement Scale, My Class Questionnaire and the Psychological Capital Questionnaire. The results showed that: (1) after controlling for grade and gender, perceived class climate significantly predicted primary school students' learning engagement ($\beta = 0.42, p < 0.001$); (2) psychological capital played a partial mediating role in the relationship between perceived class climate and primary school students' learning engagement; (3) class cadres status significantly moderated the first half of the mediation path ($\beta = -0.10, 95\% \text{ CI} = [-0.29, -0.01]$). Specifically, compared to primary school students who were class cadres ($\beta = 0.21, 95\% \text{ CI} = [0.14, 0.29]$), the mediating effect played a greater part on primary school students who were not class cadres ($\beta = 0.32, 95\% \text{ CI} = [0.26, 0.37]$). According to the ecosystem theory, the present study reveals the multiple influencing factors of primary school students' learning engagement from the individual level (psychological capital, class cadres status) and micro-system level (perceived class climate), which provides insights into the improvement of primary school students' learning engagement.

Keywords: primary school students' learning engagement, perceived class climate, psychological capital, class cadres status

学困生的学业发展：刻板印象威胁的视角

赵凤青¹ 俞国良²

¹ 郑州大学教育学院, 郑州, 450001

² 中国人民大学心理研究所, 北京, 100872, yugllxl@sina.com

摘要 自上世纪 80 年代以来, 对学困生的“标签化”现象得到了广泛探讨, 它内在包含着对学困生的消极刻板印象。基于刻板印象威胁的动机经验模型, 消极刻板印象会以刻板印象威胁的形式对学困生的表现产生

消极影响。因此,本研究试图探讨以下问题:(1)对学习困难青少年的消极刻板印象有什么特点?这些消极刻板印象是否会对学困生的学业表现产生刻板印象威胁?(2)日常性学业弹性作为积极学业适应的重要指标,是否会受到刻板印象威胁的影响?(3)成就目标定向在刻板印象威胁与日常性学业弹性的关系中是否起到中介作用?(4)个体特征和情境线索是否对刻板印象威胁与日常性学业弹性的关系起到调节作用?针对以上问题,本研究结合通过5个研究探讨了学困生刻板印象威胁的现象、作用机制和作用条件,并得出以下结果:研究1探讨了青少年对学困生的消极刻板印象的特点。结果表明,高中生对学困生存在显著的消极刻板印象,它表现在学习能力、意志品质、学习态度、学习方法、情绪体验、行为表现六个方面。研究2以120名学困生为被试,检验刻板印象威胁对学困生学业表现的影响,结果表明,刻板印象威胁对学困生随后的学习表现具有显著的负向预测作用,且这一效应主要存在于学业认同程度较高的学困生中。研究3~5以305名学困生为被试,探讨刻板印象威胁与日常性学业弹性的关系、作用机制和作用条件。结果表明,学困生知觉到的刻板印象威胁对其日常性学业弹性具有负向预测作用,且这一作用可以通过掌握目标的中介作用来实现。任务难度和学业认同水平会调节刻板印象威胁对学困生日常性学业弹性的影响。总之,本研究验证了刻板印象威胁对学困生学业表现的消极影响、作用机制和作用条件。这一研究强调环境对于学困生学业发展的重要作用以及动机在其中的中介作用。凸显学生的积极社会身份、提供多元的评价体系、开设针对性的心理健康课程,这些途径可能有利于减少学困生遭遇的刻板印象威胁。

Academic performance of students with learning disabilities: From the perspective of stereotype threat

Fengqing Zhao¹, Guoliang Yu²

¹School of Education, Zhengzhou University, No. 100 Science Street, Zhengzhou 450001

²Institute of Psychology, Renmin University of China, No. 59 Zhongguancun Street, Haidian District, Beijing 100872

Abstract: Since 1980s, the labeling of learning disabled students has been widely discussed, which inherently contains negative stereotypes toward learning disabled students. Based on motivational experience model of stereotype threat, negative stereotypes take effect on learning disabled students' performance via stereotype threat. Thus, the present study tried to discuss the following questions. First, what are the characters of negative stereotypes to learning disabled students among high school students? Second, can these negative stereotypes influence learning disabled students' academic performance via stereotype threat? Third, what is the role of achievement motivation in the relation between stereotype threat and academic performance? Fourth, what is the role of academic identity in the mediation model of stereotype threat effect? Targeted at these questions, this study used 5 studies to investigate the phenomenon of stereotype threat among learning disabled students and its mediators and moderators. The present study found the following results: Study 1 investigated the negative stereotypes among learning disabled adolescents. The results showed that negative stereotypes toward learning disabled students were common among high school students, which was reflected on the dimensions of learning ability, willpower and motivation, learning attitudes, learning methods, emotional experience, and behavioral performance. Study 2 examined the influence of stereotype threat on learning disabled students' academic performance using a sample of 120 learning disabled students. Results showed that negative stereotype can take effect on learning disabled students' academic performance via stereotype threat in a self-fulfilling way. Academic identity moderated the effect of stereotype threat on later academic performance, that is, stereotype threat impaired students' academic performance among high academically identified students while it did not significantly predict academic performance among low academically identified students. Study 3~5 investigated the relation between stereotype threat and everyday academic resilience as well as the mediators and moderators between this relation using a sample of 305 participants. The results showed that stereotype threat is negatively predictive of students' everyday academic resilience and their relationship is mediated by mastery goal. Task difficulty and academic identity moderated the relationship between stereotype threat and everyday

academic resilience. To sum up, the present study put forward an integrative motivational model of stereotype threat effect on learning disabled students. This study emphasizes the significant role of positive environment on the academic development of learning disabled students. Creating a good school and class atmosphere, providing a pluralistic evaluation system, and highlighting students' positive social identity may be effective routes to reduce stereotype threat among learning disabled students.

Keywords: learning disability, stereotype threat, academic achievement, everyday academic resilience, achievement goal orientation

父母学业支持与学业心理控制对初中生学业动机及学业情绪的影响： 一项短期纵向研究

陈子怡 王晨 李丹黎（通讯作者）

陕西师范大学心理学院，西安，710062, dlli@snnu.edu.cn

摘要 学业动机和学业情绪是青少年在学业领域的两个重要发展指标，不仅影响他们对学业任务的努力和坚持性，更与青少年的心理健康紧密联系。大量研究发现，父母学业投入对儿童的学业发展具有重要影响。然而，这些研究多以学业成就为发展指标，较少关注青少年的学业动机和学业情绪。其次，现有研究多在西方文化背景下开展，较少在中国文化背景下探讨父母学业投入。基于此，本研究聚焦于中国家庭中父母的学业支持与学业心理控制，探究其对青少年学业动机和学业情绪的影响。本研究对西安市某中学八年级学生进行问卷调查（ $N=474$ ），分别于学期初（T1）和学期中（T2）追踪测量父母学业支持和学业心理控制、学业动机（表现趋近目标、表现回避目标、掌握目标、学业效能感）和学业情绪（愉悦、自信、自豪、愤怒、焦虑、羞愧、无助、厌烦）。分层回归结果显示：1）控制了学生性别、T1 成绩排名和 T1 学业动机后，T1 的父母学业支持正向预测 T2 的掌握目标（ $\beta = 0.127, p < 0.01$ ）和学业效能感（ $\beta = 0.128, p < 0.001$ ），而 T1 的父母学业心理控制正向预测 T2 的表现趋近目标（ $\beta = 0.137, p < 0.001$ ）和表现回避目标（ $\beta = 0.139, p < 0.01$ ）；2）控制了学生性别、T1 成绩排名和 T1 学业情绪后，T1 的父母学业支持正向预测愉悦（ $\beta = 0.135, p < 0.001$ ）、自信（ $\beta = 0.152, p < 0.001$ ）、自豪（ $\beta = 0.134, p < 0.001$ ）这三种积极学业情绪，负向预测愤怒（ $\beta = -0.109, p < 0.01$ ）、焦虑（ $\beta = -0.128, p < 0.01$ ）、无助（ $\beta = -0.102, p < 0.01$ ）、厌烦（ $\beta = -0.109, p < 0.01$ ）这四种消极学业情绪，父母学业心理控制则正向预测自豪（ $\beta = 0.094, p < 0.01$ ）和羞愧（ $\beta = 0.076, p < 0.05$ ）这两种学业情绪。以上研究结果表明，父母学业支持能够促进青少年内在学业动机，同时增加青少年的积极学业情绪，减少消极学业情绪。此外，尽管父母学业心理控制水平会激发青少年的羞愧学业情绪，但同时也会引发他们的自豪学业情绪，并增强外在学业动机，从而说明父母学业心理控制对青少年学业动机和学业情绪这两个方面仍具有较积极的影响。

The Influences of Parental Academic Help and Psychological Control on Middle-School Students' Academic Motivations and Emotions: A Short-Term Longitudinal Study

Ziyi Chen, Chen Wang, Danli Li (corresponding author)

School of Psychology, Shaanxi Normal University, Xian 710062

Abstract: Academic motivations and academic emotions are two important indicators of adolescents' academic development, which not only influence adolescents' effort and persistence on academic tasks, but are also closely related to their mental health. A number of studies have demonstrated that parental academic involvement plays an important role in children's academic development. Most of these studies, however, paid attention to adolescents' academic achievement, while academic motivations and academic emotions were almost ignored. In addition, most of existing research were carried out in the context of Western culture, but seldom explored parental academic involvement in the Chinese culture. To fill these gaps, the current research focused on parental academic help and

academic psychological control in Chinese families, and aimed to investigate their impacts on adolescents' *academic motivations* and *academic emotions*. Students in Grade 8 of a middle school in Xi'an, Shaanxi Province ($N = 474$) participated in the research. Students' *perceived parental academic help* and *academic psychological control*, *academic motivations* (performance-approach goal orientation, performance-avoid goal orientation, mastery goal orientation, academic efficacy) and *academic emotions* (enjoy, hope, pride, anger, anxiety, shame, helplessness, boredom) were tracked and measured at the beginning of the semester (T1) and the middle of the semester (T2) respectively. The hierarchical regression results showed that: 1) With gender, ranking (T1) and *academic motivations* (T1) controlled, *perceived parental academic help* at T1 positively predicted adolescents' mastery goal ($\beta = 0.127, p < 0.01$) and academic efficacy ($\beta = 0.128, p < 0.001$) at T2, and *perceived parental psychological control* at T1 positively predicted performance-approach goal ($\beta = 0.137, p < 0.001$) and performance-avoidance goal ($\beta = 0.139, p < 0.01$) at T2. 2) With gender, ranking (T1) and *academic emotions* (T1) controlled, *perceived parental academic help* at T1 positively predicted positive *academic emotions* at T2 listed as enjoy ($\beta = 0.135, p < 0.001$), hope ($\beta = 0.152, p < 0.001$) and pride ($\beta = 0.134, p < 0.001$), while negatively predicted negative *academic emotions* at T2 listed as anger ($\beta = -0.109, p < 0.01$), anxiety ($\beta = -0.128, p < 0.01$), helplessness ($\beta = -0.102, p < 0.01$) and boredom ($\beta = -0.109, p < 0.01$), and *perceived parental psychological control* at T1 positively predicted pride ($\beta = 0.094, p < 0.01$) and shame ($\beta = 0.076, p < 0.05$) at T2. These findings indicate that *parental academic help* can promote adolescents' internal *academic motivations*, increase the positive *academic emotions*, and reduce the negative *academic emotions*. Meanwhile, though *parental academic psychological control* can inspire adolescents' *academic emotions* of shame, it also activate their positive *academic emotions* and external *academic motivations*, thus indicating that *parental academic psychological control* generally have positive effects on adolescents' *academic motivations* and *academic emotions*.

摘 要 学习投入是学生表现出来的为学习努力付出、热情饱满、奋进向上的心理状态，这一积极学习状态有利于激发学生的学习潜力，提升学习幸福感，促进学习成就。研究发现，感知班级氛围与小学生学习投入存在密切联系，但感知班级氛围发挥作用的具体机制及作用条件有待探讨。本研究基于儿童发展系统理论，构建了一个有调节的中介效应模型，检验心理资本在感知班级氛围与小学生学习投入之间的中介作用，以及班干部身份对上述中介路径的调节作用。本研究采用自我报告的方式，运用学习投入量表、我的班级问卷及中小学心理资本问卷调查了 818（男生 432）名五年级至六年级的小学生。研究结果表明：（1）在控制了年级、性别后，感知班级氛围能够显著正向预测小学生的学习投入 ($\beta = 0.42, p < 0.001$)，即小学生感知班级氛围水平越高，其学习投入也会提高；（2）心理资本在感知班级氛围和小学生学习投入之间起部分中介作用；（3）班干部身份显著调节中介路径的前半段 ($\beta = -0.10, 95\% CI = [-0.29, -0.01]$)，即相对于担任班干部的小学生 ($\beta = 0.21, 95\% CI = [0.14, 0.29]$)，该中介效应对非班干部的小学生作用更大 ($\beta = 0.32, 95\% CI = [0.26, 0.37]$)。基于生态系统理论，本研究从个体层面（心理资本、班干部身份）与微系统层面（感知班级氛围）揭示了小学生的学习投入的多重影响因素，对提高小学生的学习投入具有一定现实指导意义。

关键词 小学生的学习投入，感知班级氛围，心理资本，班干部身份

Perceived Class Climate and Learning Engagement of Primary School Students: A Moderated Mediation Model

3 Provincial Key Laboratory of Behavioral and Cognitive Neuroscience, Xi'an, 710062

Abstract: Learning engagement refers to a mental state of hard work, enthusiasm, and progress shown by students. This positive learning statement is conducive to stimulating students' learning potential, enhancing learning happiness, and improving learning achievement. Studies have found that perceived class climate was closely related to primary school students' learning engagement, but the specific mechanism and conditions of perceived class climate need to be explored. Under the guidance of the child development system theory, this study proposes a moderated mediation model to test the mediating role of psychological capital between perceived class climate and primary school students' learning engagement, and the moderator role of class cadres status in the process. This study used a self-report method to survey 818 (432 boys) primary school students from fifth to sixth grade by the Learning Engagement Scale, My Class Questionnaire and the Psychological Capital Questionnaire. The results showed that: (1) after controlling for grade and gender, perceived class climate significantly predicted primary school students' learning engagement ($\beta = 0.42, p < 0.001$); (2) psychological capital played a partial mediating role in the relationship between perceived class climate and primary school students' learning engagement; (3) class cadres status significantly moderated the first half of the mediation path ($\beta = -0.10, 95\% \text{ CI} = [-0.29, -0.01]$). Specifically, compared to primary school students who were class cadres ($\beta = 0.21, 95\% \text{ CI} = [0.14, 0.29]$), the mediating effect played a greater part on primary school students who were not class cadres ($\beta = 0.32, 95\% \text{ CI} = [0.26, 0.37]$). According to the ecosystem theory, the present study reveals the multiple influencing factors of primary school students' learning engagement from the individual level (psychological capital, class cadres status) and micro-system level (perceived class climate), which provides insights into the improvement of primary school students' learning engagement.

Keywords: primary school students' learning engagement, perceived class climate, psychological capital, class cadres status

小学高年级学业情绪对学业成绩的影响：一项交叉滞后研究

熊建萍¹ 邱岩¹（通讯作者） 胡亚萍²

1 河南师范大学教育学部，新乡，453007, qiuyan2010283112@163.com

2 河南师范大学教育学部，新乡，453007

摘要 学业情绪几乎存在于学习的全过程，且对个体的学业成绩和心理健康起重要影响。以往研究发现学业情绪对学业成绩起显著的预测作用，积极的学业情绪对学业成绩产生积极的促进作用，而消极的学业情绪对学业成绩产生着复杂的、双重的作用。另外，根据控制-价值理论，学业情绪的产生主要来源于对学习任务的评估和控制评估。个体学业成绩的好坏又作为评估的重要因素，使个体评估后产生相对应的学业情绪，这一点也符合认知-动机模型的支持。那么，学业情绪和学业成绩之间的作用 and 影响机制究竟为何？此外，根据控制-价值理论，个体的学业情绪和学业成绩之间除直接的影响外，还存在如学习动机和学习策略等其他因素的影响，这些因素是否在学业情绪和学业成绩之间存在着稳定的影响作用？以往研究多集中在中学阶段，而小学高年级阶段的个体由于大脑皮层和神经系统发育还不成熟，情绪的自我调节能力不强，情绪对其产生的影响更大，更需给予关注和指导。基于此，本研究为探讨小学高年级学生的学业情绪与学业成绩之间的纵向联系及内在作用机制，综合考虑学习动机和学习策略两个因素为自我调节学习，将其作为中介变量。从河南省郑州市某小学抽取 401 名五、六年级学生，对其进行为期半年的追踪研究。结果发现：（1）T1 高兴和 T2 学业成绩存在显著的纵向联系，T1 焦虑与 T2 学业成绩不存在显著的纵向联系；（2）在同一时间上，自

我调节学习在积极的学业情绪和学业成绩之间发挥部分中介作用，而自我调节学习在消极的学业情绪和学业成绩之间发挥完全中介作用；（3）在不同时间点上，自我调节学习的中介作用机制仍然成立，表明自我调节学习的中介作用具有跨时间的稳定性。该结果强调了学业情绪对学业成绩变化具有重要作用，也为从学业情绪和自我调节学习角度来促进学习者的学业成绩提供了初步证据。

关键词 学业情绪，自我调节学习，学业成绩

The Effect of Academic Emotion on Academic Achievement among High-grade Students in Primary School: A Cross-lag Study

Jianping Xiong¹, Yan Qiu¹, Yaping Hu²

1 Faculty of Education, Henan Normal University, Xinxiang Henan, 453007,

qiuyan2010283112@163.com

2 Faculty of Education, Henan Normal University, Xinxiang Henan, 453007

Abstract : Academic emotion almost exists in the whole process of learning, and has an important impact on individual's academic performance and mental health. Previous studies have found that academic emotion plays a significant role in predicting academic achievement, positive academic emotion plays a positive role in promoting academic achievement, and negative academic emotion plays a complex and dual role in academic achievement. What's more, according to the control-value theory, academic emotion mainly comes from the value assessment and control assessment of learning tasks. As an important factor in the evaluation, the individual's academic performance produces the corresponding academic emotion after the evaluation, which is also consistent with the support of the cognitive-motivation model. Then, what is the effect and influencing mechanism between academic emotion and academic achievement? In addition, according to the control-value theory, apart from the direct influence, there are also other factors such as learning motivation and learning strategies. Do these factors have a stable influence on the relationship between academic emotion and academic achievement? Most previous studies focused on the middle school stage, but individuals in the upper primary school stage are not mature in the development of cerebral cortex and nervous system, and their emotional self-regulation ability is not strong. Emotions have a greater impact on them, so more attention and guidance are needed. Based on this, in order to explore the longitudinal connection and internal mechanism between academic emotion and academic achievement of senior primary school students, this study comprehensively considered the two factors of learning motivation and learning strategy as self-regulating learning, and took them as the mediating variables. 401 students in grade five and six were selected from a primary school in Zhengzhou, Henan province, and the follow-up study was conducted for half a year. The results showed that : (1) there was a significant longitudinal association between T1 happiness and T2 academic achievement, but there was no significant longitudinal association between T1 anxiety and T2 academic achievement; (2) At the same time, self-regulated learning played a partial mediating role between positive academic emotion and academic achievement, while self-regulated learning played a full mediating role between negative academic emotion and academic achievement; (3) The mediating effect of self-regulated learning remained valid at different time points, indicating that the mediating effect of self-regulated learning was stable across time. The results emphasize that academic emotion plays an important role in the change of academic achievement, and provide preliminary evidence for the improvement of academic achievement from the perspective of academic emotion and self-regulating learning.

歧视知觉对易地扶贫搬迁青少年自伤的影响： 同伴侵害与体验回避的链式中介作用

朱海^{1,2*} 宋香^{1,2}

1 遵义师范学院教师教育学院, 贵州 遵义, 563006

2 贵州师范大学心理学院, 贵阳, 550001, 347920981@qq.com

摘 要 自伤 (self-injury) 是指个体在没有自杀意图的情况下, 故意对自己身体的各个部位进行伤害, 致使身体出现流血或疼痛的行为。易地扶贫搬迁青少年脱离了原来熟悉的生活和社会环境, 很可能在新环境下产生不安全感, 进而发生自伤行为。已有研究发现, 歧视知觉与青少年产生自伤行为有密切关系, 但歧视知觉通过何种路径对青少年的自伤产生影响? 鲜有研究探讨。经文献分析发现, 同伴侵害和体验回避可能在歧视知觉与青少年自伤之间发挥重要的作用。基于此, 本研究的主要目的在于探究歧视知觉对易地扶贫搬迁青少年自伤行为产生的影响, 并考察同伴侵害与体验回避在二者之间的作用机制。本研究采用青少年自我伤害行为问卷、歧视知觉问卷、多维同伴侵害量表以及接纳与行动问卷 (第二版) 对 356 名易地扶贫搬迁青少年进行调查, 并运用 SPSS24.0 和 Mplus7.4 对数据进行统计分析。研究结果发现: (1) 歧视知觉、同伴侵害、体验回避、青少年自伤两两之间均呈显著正相关; (2) 歧视知觉对易地扶贫搬迁青少年自伤的直接预测作用显著 ($\beta=0.31, P<0.001$); (3) 加入同伴侵害和体验回避两个中介变量后, 同伴侵害、体验回避能正向预测易地扶贫搬迁青少年自伤 ($\beta=0.25, P<0.001$; $\beta=0.33, P<0.001$), 歧视知觉、同伴侵害正向预测体验回避 ($\beta=0.43, P<0.001$; $\beta=0.19, P<0.001$), 歧视知觉正向预测同伴侵害 ($\beta=0.45, P<0.001$), 而歧视知觉对易地扶贫搬迁青少年自伤的直接效应不显著 ($P>0.05$)。同伴侵害在歧视知觉与易地扶贫搬迁青少年自伤之间的中介效果量为 0.35, 体验回避在歧视知觉与易地扶贫搬迁青少年自伤之间的中介效果量为 0.45, 同伴侵害和体验回避在歧视知觉与易地扶贫搬迁青少年自伤之间的中介效果量为 0.10, 结论: 歧视知觉对易地扶贫搬迁青少年自伤有直接影响; 歧视知觉还能通过同伴侵害和体验回避各自的中介效益及二者的链式中介效应对易地扶贫搬迁青少年自伤产生间接影响。

The impact of discrimination perception on self injury of relocated youths for poverty alleviation: the chain mediating role of peer aggression and experience avoidance

Zhu Hai^{1,2}, Song Xiang^{1,2}

1 School of Education, Zunyi Normal College, Zunyi Guizhou, 563006, China

2 School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract: Self injury refers to the behavior that an individual intentionally injures each part of his body without suicidal intention, resulting in bleeding or pain. Relocated youths for poverty alleviation are divorced from the familiar life and social environment, and are likely to have a sense of insecurity in the new environment, resulting in self injury. Previous studies have found that there is a close relationship between discrimination perception and adolescents' self injury behavior, but what path does discrimination perception affect adolescents' self injury? There are few studies. Through literature analysis, it is found that peer aggression and experience avoidance may play an important role in the relationship between discrimination perception and adolescent self injury. Based on this, the main purpose of this study is to explore the impact of discrimination perception on self injury behavior of relocated youths for poverty alleviation, and to investigate the mechanism between peer aggression and experience avoidance. In this study, 356 relocated youths for poverty alleviation were investigated by adolescent self injury behavior questionnaire, discrimination perception questionnaire, multidimensional peer aggression scale and acceptance and

action questionnaire (Second Edition), and the data were statistically analyzed by spss24.0 and mplus7.4. The results show that:(1) There is a significant positive correlation between discrimination perception, peer aggression, experience avoidance and adolescents' self injury; (2) Discrimination perception has a significant direct predictive effect on self-injury of relocated youths for poverty alleviation($\beta=0.31, P<0.001$); (3) After adding the two mediating variables of peer aggression and experience avoidance, peer aggression and experience avoidance can positively predict the self injury of relocated youths for poverty alleviation($\beta=0.25, P<0.001$; $\beta=0.33, P<0.001$), discrimination perception and peer aggression positively predicted experience avoidance($\beta=0.43, P<0.001$; $\beta=0.19, P<0.001$), discrimination perception positively predicted peer aggression($\beta=0.45, P<0.001$), while the direct effect of discrimination perception on relocated youths for poverty alleviation was not significant($P>0.05$). The mediating effect of peer aggression on discrimination perception and self injury of relocated youths for poverty alleviation is 0.35, the mediating effect of experience avoidance on discrimination perception and self injury of relocated youths for poverty alleviation is 0.45, and the mediating effect of peer aggression and experience avoidance on discrimination perception and self injury of relocated youths for poverty alleviation is 0.10, Conclusion: the perception of discrimination has a direct impact on the self injury of relocated adolescents; Discrimination perception can also have an indirect impact on the self injury behavior of relocated youths for poverty alleviation through their respective intermediary benefits of peer aggression and experience avoidance and their chain intermediary effect.

Keywords: relocated youths for poverty alleviation, discrimination perception, peer aggression, experience avoidance, self injury

压力与青少年抑郁、自伤：自我批评与自我同情的调节作用

高叶淼 刘霞（通讯作者） 刘金梦

北京师范大学发展心理研究院，北京，100875, liuxia@bnu.edu.cn

摘要 青少年时期是抑郁和非自杀性自伤（non-suicidal self-injury）行为的高发时期，其中非自杀性自伤行为（简称“自伤”）指个体在无自杀意图的情况下直接、故意地伤害自己身体组织的行为。抑郁和自伤均为个体因素与环境因素共同作用的结果，并且二者具有相近的产生机制，但鲜有研究对二者共同影响因素发挥作用的差异性进行研究。本研究以 959 名青少年（ $M_{age}=13.46, SD=0.57$ ）为研究对象，考察了压力性生活事件与青少年抑郁及自伤行为的关系，并探究了自我批评与自我同情在压力与抑郁以及压力与自伤之间的关系中是否发挥不同的调节作用。研究使用青少年生活事件量表、自我批评与自我肯定形式量表（The Forms of Self-Criticism/Self-Reassuring Scale, FSCSR）中的自我不足和自我憎恨自量表、自我同情量表（the Self-compassion Scale, SCS）、流调中心抑郁量表（the Center for Epidemiologic Studies Depression Scale for Children, CES-DC）及青少年自我伤害问卷分别对青少年的生活压力事件、自我批评、自我同情、抑郁与自伤行为进行测量。结果显示：（1）在控制年龄、性别和主观社会经济地位后，压力性生活事件、自我批评与自我同情对青少年抑郁和自伤行为均有显著的直接预测作用；（2）压力性生活事件与自我批评交互作用于青少年抑郁和自伤，个体自我批评水平越高，压力生活事件对抑郁和自伤的预测作用越强；（3）自我同情在压力生活事件与自我批评对青少年抑郁的不利影响中无显著调节作用，但是在压力生活事件与自我批评对自伤的影响中发挥了显著的缓冲作用。无论自我批评水平高低，自我同情水平较低的青少年均易受压力生活事件的影响而产生自伤行为；而当青少年自我同情水平较高时，压力生活事件仅对高自我批评个体的自伤行为有预测作用，对低自我批评个体的自伤无显著预测作用。研究结论：抑郁和自伤行为均受生活压力和自我批评的消极影响，并且自我同情对青少年抑郁和自伤的保护作用不同。具体而言，自我同情对压力和自我批评对抑郁的不利影响未发挥显著的缓冲作用，而仅对自伤行为具有有效的保护作用。

关键词 压力性生活事件，自我批评，自我同情，抑郁，自伤行为

Self-compassion buffers the negative effect of stressful life events on adolescent non-suicidal self-injury, but not on depression

Yemiao Gao, Xia Liu, Jinmeng Liu

Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: Symptoms of depression increase during adolescence as do non-suicidal self-injurious behaviors (NSSI). NSSI refers to the direct, deliberate destruction of one's body tissue in the absence of intent to die. Both individual and environmental factors have been involved in depression and NSSI. A comprehensive body of research has identified depressive symptoms as a typical correlate of NSSI, however, there is a lack of clarity about the common and differential pathways to NSSI and depressive symptoms. The present study investigated the main and interacted effects of stressful life events, self-criticism, self-compassion on depressive symptoms and NSSI in 959 adolescents ($M_{age} = 13.46$, $SD = 0.57$). Stressful life events, self-criticism, self-compassion, depressive symptoms, and NSSI were evaluated by Adolescent Self-Rating Life Events Check List (ASLEC), the Hated Self and Inadequate Self subscales of the Forms of Self-Criticism/ Self-reassuring Scale (FSCSR), the Self-Compassion Scale (SCS), the Center for Epidemiologic Studies Depression Scale for Children (CES-DC) and the modified version of the Adolescents Self-Harm Scale (DSHS), respectively. The results showed that: (1) After controlling for adolescents' age, gender, and subjective socioeconomic status, stressed life events, self-criticism, and self-compassion all had significant direct predictive effects on depressive symptoms and NSSI; (2) There were significant two-way interaction effects of stressful life events and self-criticism on depression, as well as NSSI. The higher the level of self-criticism, the stronger the predictive effect of stressful life events on depression and NSSI; (3) Self-compassion showed no significant moderating effect on the negative effects of stressful life events and self-criticism on depression, but played a significant buffering effect on the negative effects of stress and self-criticism on NSSI. For adolescents with low self-compassion, stressful life events were significantly and positively related to NSSI in both the lower and higher self-criticism groups. In the case of adolescents with higher self-compassion, the association between stressful life events and NSSI was significant only for those with high self-criticism, but not for those with low self-criticism. Conclusion: Both depression and NSSI are negatively associated with life stress and self-criticism, but the protective roles of self-compassion in these associations were different. These findings highlight the buffering role of self-compassion in the associations between stressful life events, self-criticism, and NSSI, and suggest the different protective mechanisms of depression and NSSI.

Keywords: stressful life events, self-criticism, self-compassion, adolescent NSSI, depressive symptoms

中学生校园欺凌与睡眠质量： 社交焦虑的中介作用及留守经历的调节作用

吴家钰¹ 张珊珊²（通讯作者） 刘致宏¹

1 沈阳师范大学教育科学学院，沈阳，110034

2 沈阳师范大学教育科学学院，沈阳，110034, zhangxiaobai2@163.com

摘要 近年来，青少年睡眠问题已成为家-校-社共同关注的热点，睡眠质量下滑也是存在于青少年群体中较为普遍的现象。长期的压力和消极情绪不仅直接地影响青少年的身心发展，还会通过降低睡眠质量、减损心理资源等方式间接地影响青少年。中学阶段的学习与生活主要在学校及家庭环境中，校园欺凌和留守家庭经历是中学生群体中较为常见的人际压力源，故而成为研究影响青少年睡眠质量问题的重要因素。本研究采用中学生校园欺凌问卷、匹兹堡睡眠质量指数量表以及社交焦虑量表，选取辽宁省共 758 名中学生进行调查研究。运用 SPSS 22.0 和 AMOS 24.0 软件对收集到的数据进行统计处理及分析。研究得出，（1）传统欺凌、网络欺凌、睡眠质量与社交焦虑两两之间均存在显著的正相关（ $p < 0.01$ ）；（2）传统/网络欺凌能显著正向预测睡眠质量；（3）社交焦虑在传统/网络欺凌与睡眠质量的关系中起部分中介作用；（4）在网络欺凌模型中，社交焦虑的中介作用存在留守经历的差异，而在传统欺凌模型中，留守经历的差异不显著。研究结果表明，

校园欺凌是中学生心理及行为问题的重要风险因素，不仅对中学生产生直接的影响，还可以通过社交焦虑这一中介因素影响睡眠质量。所以促进中学生睡眠质量的提升，既要重视校园欺凌伤害的疏导，也要重视中学生社交焦虑的缓解，有效区分不同类型欺凌对不同群体的伤害差异，为中学生校园欺凌及其危害性的预防和干预提供了参考。

关键词 传统欺凌，网络欺凌，睡眠质量，社交焦虑，留守经历

School bullying and sleep quality among middle school students: the mediating role of social anxiety and the moderating role of left-behind experiences

WU Jiayu¹, ZHANG Shanshan², LIU Zhihong¹

1 College of Education Science, Shenyang Normal University, Shenyang, 110034

2 College of Education Science, Shenyang Normal University, Shenyang, 110034

Abstract: In recent years, sleep problems in adolescents have caused the attention of parents, schools and society. At the same time, the decline of sleep quality is a common phenomenon among adolescents. Long-term stress and negative emotions not only directly affect the physical and mental development of adolescents, but also indirectly affect them by reducing sleep quality and mental resources. The study and life of middle school students are mainly in the school and family environment, school bullying and left-behind experiences are common interpersonal stressors. Therefore, they have become important factors affecting adolescents' sleep quality problems. A total of 758 middle school students in Liaoning Province were investigated by using the School Bullying Questionnaires, Pittsburgh Sleep Quality Index and Social Anxiety Scale. SPSS 22.0 and AMOS 24.0 software were used for statistical processing and analysis of the collected data. The results showed that: (1) Traditional bullying, cyberbullying, sleep quality and social anxiety had significant positive correlations ($p < 0.01$); (2) Traditional bullying/Cyberbullying significantly positively predicted sleep quality; (3) Social anxiety played a partially mediating role in the relationship between traditional bullying/cyberbullying and sleep quality; (4) In the cyberbullying model, the mediating effect of social anxiety is different from that of left-behind experiences, while in the traditional bullying model, the difference of left-behind experiences is not significant. The results reveal that school bullying is an important risk factor for high school students' psychological and behavioral problems. It not only has a direct impact on high school students, but also affects sleep quality through social anxiety as a mediating factor. Therefore, to promote the improvement of sleep quality of middle school students, we should not only pay attention to the treatment of school bullying injury, but also focus on the alleviation of social anxiety of middle school students. We should effectively distinguish the difference of different types of bullying injury to different groups. In this way, we can provide reference for the prevention and intervention of school bullying.

Keywords: Traditional bullying, Cyberbullying, Sleep Quality, Social Anxiety, Left-behind experience

初中生感知压力对网络成瘾的影响： 互联网使用预期和抑制控制的链式中介作用

范晨婷¹ 刘丽源¹ 桂如卓¹ 刘嵩晗¹（通讯作者）

1 辽宁师范大学，辽宁，116029

1 辽宁师范大学心理学院，大连，116029, hua9han@126.com

摘要 目的：随着互联网技术高速发展，线上教学平台的使用增加，使得青少年更容易自由接触到网络。网络成瘾，是个体无法控制自己对互联网的使用，导致在日常生活中出现一系列负面结果，如学习成绩差、人际关系差、焦虑、抑郁。当个体感知到的压力过大时，个体会寻求压力的释放。而网络便利性和可得性成了步入青春期的初中生释放和缓解压力的第一选择。本研究旨在探讨初中生感知压力对网络成瘾影响的作用机制，即互联网使用预期（回避期待、正强化期待）和抑制控制在初中生感知压力与网络成瘾中的链式中介

作用,探讨青少年中网络成瘾的作用机制。方法:采用《压力知觉量表》、《S-IAT 量表》、《互联网使用预期量表(IUES)》、《儿童执行功能评定量表》对 480 名初中生进行调查。结果表明:(1)感知压力对网络成瘾的直接作用显著,即压力越大,初中生网络成瘾情况越严重;(2)互联网使用预期(回避期待、正强化期待)在初中生感知压力与网络成瘾中间起中介作用;(3)互联网使用预期(回避期待、正强化期待)和抑制控制在初中生感知压力和网络成瘾中间起链式中介作用。结论:感知压力不仅可以直接影响初中生的网络成瘾,也可以通过互联网使用预期(回避期待、正强化期待)和抑制控制对网络成瘾产生间接影响。研究揭示了初中生感知压力与网络成瘾的关系及其作用机制,对如何预防青少年网络成瘾有一定指导意义。

关键词 感知压力,互联网使用预期,抑制控制,网络成瘾

The Effect of Perceived Stress on Internet Addiction among Junior Middle School Students: The Chain Mediating Role of Internet Use expectation and Inhibition Control

Chenting Fan, Liyuan Liu, Ruzhuo Gui, Songhan Liu

Liaoning Normal University, Dalian

Abstract: PURPOSE: With the rapid development of Internet technology, the use of online teaching platforms has increased, making it easier for teenagers to have free access to the Internet. Internet addiction refers to an individual's inability to control his or her use of the Internet, which leads to a series of negative outcomes in daily life, such as poor academic performance, poor interpersonal relationship, anxiety and depression. When the individual feels too much pressure, the individual will seek to release the pressure. The convenience and availability of the Internet has become the first choice for junior high school students to release and relieve stress as they enter adolescence. The purpose of this study was to explore the mechanism of the effect of perceived pressure on Internet addiction among junior high school students, namely, the chain mediating effect of Internet use expectation (avoidance expectation, positive reinforcement expectation) and inhibitory control on perceived pressure and Internet addiction among junior high school students, and to explore the mechanism of Internet addiction among adolescents. METHODS: The Stress Perception Scale, S-IAT scale, Internet Use Expectancy Scale (IUES), and Child Executive Functioning Rating Scale were used to investigate 480 middle school students. RESULTS: (1) The direct effect of perceived pressure on Internet addiction is significant, that is, the greater the pressure, the more serious the Internet addiction of junior high school students; (2) Internet use expectation (avoidance expectation and positive reinforcement expectation) mediated the perceived stress and Internet addiction among junior middle school students; (3) Internet use expectation (avoidance expectation, positive reinforcement expectation) and inhibitory control play a chain mediation role between perceived stress and Internet addiction among junior middle school students. CONCLUSION: Perceived pressure can not only directly affect Internet addiction in junior middle school students, but also indirectly through Internet use expectations (avoidance expectations, positive reinforcement expectations) and inhibitory control. This study reveals the relationship between perceived pressure and Internet addiction and its mechanism, which has certain guiding significance on how to prevent Internet addiction among teenagers.

Keywords: Internet Addiction, Perceived stress, Internet use expectancies, inhibition control

早期亲子分离与大学生抑郁的发展轨迹：副交感神经活动的作用

赵景欣（通讯作者） 敖成明

山东师范大学心理学院, 济南, 250014, jingxinzao@126.com

摘要 父母外出务工带来的早期亲子分离经历会对个体身心发展的多个方面产生消极影响,且这种影响会持续到个体步入大学阶段。有研究表明,与无亲子分离经历大学生相比,有亲子分离经历大学生的抑郁水平更高。在这一背景下,揭示早期亲子分离对个体抑郁发展的持续影响,探究能够降低早期亲子分离消极影响的因素及作用机制就成为亟待解决的重要科学问题。然而,已有研究主要采用横断设计,难以探明先前的亲子分

离对个体抑郁发展轨迹的影响,并且对于早期亲子分离影响个体发展的生物-环境作用机制还缺少系统深入的实证研究。本研究以 251 名大一学生为被试,采用个别访谈法确定大学生的早期亲子分离经历,运用 Biopac MP160 型生理多导仪采集大学生在静息状态和压力任务下的副交感神经活动水平(以窦性心率不齐为指标, RSA),并分别在其入学第一学期、新冠肺炎疫情居家隔离期间、疫情结束后返校复学和学期期末对其抑郁水平进行了历时 1 年的 4 次追踪测试。采用潜变量增长模型考察早期亲子分离(分离形式和分离时长)、副交感神经活动对大学生抑郁发展轨迹的预测作用及其性别差异。结果发现:(1)大学生抑郁呈递减趋势,起始水平存在显著的个体差异,而变化速度不存在显著个体差异,且起始水平和变化速度不存在显著关联;(2)早期经历亲子分离大学生的抑郁初始水平显著高于无亲子分离经历的大学生,这种关联存在于具有中等 RSA 反应性和较高 RSA 反应性的女生,以及具有中等 RSA 反应性和较低 RSA 反应性的男生群体之中;(3)早期的亲子分离时长显著正向预测大学生抑郁的初始水平,但是这种关联仅存在于具有中等 RSA 反应性和较高 RSA 反应性的女生群体之中。这表明,早期的亲子分离经历与大学生抑郁的初始水平存在关联,这种关联因副交感神经活动水平和性别的不同而有所差异。

Early Parent-child Separation and the Trajectories of Depressive Symptoms of College Students: The Moderating Role of Parasympathetic Activity

Jingxin Zhao, Chengming Ao

School of Psychology, Shandong Normal University, Jinan 250014

Abstract: The early experience of parent-child separation, caused by parents' rural-to-urban migrations has a negative impact on many aspects of individual psychosocial adaptation. In addition, this harm will continue to the university stage. Some studies have shown that, compared with college students without parent-child separation experience, college students with parent-child separation experience reported higher level of depression. In this context, it has become an important science research issue to reveal the continuous impact of early parent-child separation on the individual depression development. Besides, exploring the factors and mechanisms that can reduce the negative impact of early parent-child separation experience is also necessary. However, previous studies mainly used cross-sectional research, which was difficult to reveal the impact of early parent-child separation on the development trajectory of individual depression. Meanwhile, there is still a lack of systematic and profound empirical research on the biological-environmental mechanisms of the effect of parent-child separation on the development of depression in college students. A total of 251 college students participated in the current study. We determined the early parent-child separation experience of college students by individual interview. Parasympathetic nervous system activity (measured by sinus arrhythmia, RSA) was assessed during baseline and reactivity to a challenging task using a Biopac system (MP 160, Biopac System) in laboratory. In their first semester in college, home quarantine during the epidemic of coronavirus pneumonia, first return to school after the outbreak, at the end of term, We conducted four follow-up tests on their depression level over a year. The purpose of this study was to use Latent growth curve modeling (LGCM) to examine the predictive effects of early parent-child separation (separation form and separation duration) and parasympathetic nerve activity on the development trajectories of depression in college students and the gender differences. The results indicated that: (1) The depression of college students showed a decreasing trend, there were significant individual differences in the initial level, but there was no significant individual difference in the change speed, and there was no significant correlation between the initial level of depression and the change speed; (2) The initial level of depression of college students who experienced early parent-child separation was significantly higher than that of college students without parent-child separation, but this association existed in girls with moderate and higher RSA reactivity and boys with moderate and lower RSA reactivity. (2) Parent-child separation duration significantly positively predicted the initial level of depression of

college students, but this association only existed in girls with moderate and higher RSA reactivity. These results indicate that the early parent-child separation experience is associated with the initial level of depression in college students, and this association varies with the level of parasympathetic nerve activity and gender.

Keywords: parent-child separation, separation duration, parasympathetic nervous system activity, college students depression, Latent growth curve modeling

2 孟菲斯大学心理系, 孟菲斯, 38152

摘 要 空间邻近效应指的是图文信息邻近呈现会比远离呈现更有助于学习。但以往研究对于图文位置的操作缺少量化指标, 导致不同研究之间操作不一致(e.g. Beege et al., 2019; de Koning et al., 2020), 这可能会对研究结果产生影响。此外, 阅读的研究发现, 学习者能够从副中央凹视觉区提取信息并利用该信息提前加工后面的文本信息, 但不能从边缘视觉区中提取有效信息(Rayner, 1998; 2009; 张慢慢 等, 2020), 因此本研究结合人类阅读中的视觉加工特点, 将图文距离划分为副中央凹距离和边缘视觉区距离, 结合眼动追踪技术和多种测量认知负荷的方法, 考察图文距离对图文信息加工过程、认知负荷、效果及图文加工策略的影响。实验 1 以简单的图文卡片判断任务作为图文加工任务, 要求被试判断图文卡片在哪个维度上相同, 采用 2(图文距离: 副中央凹距离、边缘视觉区距离)×2(图文相同维度数: 0、1)被试内设计; 实验 2 以复杂的闪电形成原理为图文学习材料, 采用单因素两水平(图文距离: 副中央凹距离、边缘视觉区距离)被试间设计。结果发现, 在实验 1 中, 副中央凹距离条件下的卡片判断任务表现好于边缘视觉区条件, 图文整合眼跳次数显著高于边缘视觉区条件; 但两组在认知负荷上差异不显著。实验 2 同样发现副中央凹组的保持测验和迁移测验得分更高, 图文整合眼跳次数更高, 认知负荷更低; 中介效应分析发现, 图文整合眼跳次数在图文距离对保持测验的影响中起着中介作用。结论认为: (1) 基于人类视觉区信息加工特点划分的图文距离(副中央凹距离和边缘视觉区距离)会对图文加工过程产生影响, 副中央凹距离条件下引起更多的图文间眼跳。(2) 图文距离影响图文加工策略及效果。在副中央凹距离条件下, 被试更多地通过眼跳获取信息, 认知负荷更低, 图文加工效果更好; 在边缘视觉区条件下, 被试更多地从大脑中提取信息, 认知负荷更高, 图文加工效果更差。本研究结合简单和复杂的图文加工任务验证了空间邻近效应, 为未来研究提供了参考。

The effect of text-picture distance on text-picture process: Evidence from eye-movement

Xiaomeng Yang¹, Fuxing Wang¹, Xiangen Hu^{1,2}, Chuanhua Gu¹

1 School of Psychology, Central China Normal University, Wuhan China, 430079

2 Department of Psychology, Institute for Intelligent Systems, Electrical & Computer Engineering, and Computer Sciences, The University of Memphis, Memphis, TN 38152

Abstract: Spatial contiguity effect refers that people learn more deeply from a multimedia material when corresponding text and picture are presented near rather than far from each other. However, most of the previous studies lacked quantitative definition for the distance between text and picture, leading to inconsistent operations among different studies, which may confuse the results (e.g. Beege et al., 2019; de Koning et al., 2020). In addition, studies on reading have found that learners can extract information from the parafoveal visual area and use this information to pre-process subsequent text information, but they cannot extract relevant information from the

peripheral visual area (Rayner, 1998, 2009; Zhang et al., 2020). Based on this, our research divided the text-picture distance into the parafoveal visual distance and the peripheral visual distance. We used the eye tracking technology and different kinds of methods for measuring the cognitive load, to explore the effect of distance on the text-picture process, including the eye-movement, cognitive load, performance and the trade-off between the perceptually intensive strategy and the memory intensive strategy while processing the text-picture information. In Experiment 1, a basic paradigm wherein participants made similarity judgments of one text card and one picture card was used as a simple text-picture process task, and we adopted a 2(text-picture distance: parafoveal visual distance, peripheral visual distance) $\times$ 2(card similarity: no similarity, one similarity) within-subject design. In Experiment 2, the more complex learning material (lightning formation lesson) was used as a text-picture learning material, and we adopted a one-way between-subject design which varied the text-picture distance into the parafoveal visual distance and the peripheral visual distance. Both of the experiments measured the eye-movements, cognitive load and the process performance. In Experiment 1, we found that, participant in the parafoveal distance condition got higher score and responded quicker than those in the peripheral vision area condition, and their eye-movement (i.e. integrative transitions between text and picture card) was significantly higher than the peripheral vision area group. But there was no significant difference in cognitive load between the two groups. Similarly, Experiment 2 found that the parafoveal group scored higher on the retention test and the transfer test, and have more integrative transitions and lower cognitive load than another group. In addition, the mediating effect analysis showed that the integrative transitions between text and picture played a mediating role in the effect of text-picture distance on retention test. The results show that: (1) The text-picture distance based on the characteristics of different visual areas (parafoveal distance and peripheral visual area distance) has an effect on the text-picture processing, information in the parafoveal distance lead to more text-picture integrative transitions. (2) The text-picture distance affects the trade-off between gaze and working memory use, which further influences the performance of the text-picture process. To be specific, when text and picture are presented in the parafoveal visual area, subjects prefer the perceptually intensive strategy to perform better, that is, they acquired more information through saccades. On the contrary, in the peripheral visual distance condition, subjects prefer the memory intensive strategy, they used “knowledge-in-the-head” to replace “knowledge-in-the-world”, so the cognitive load was higher, which may harm to their performance. Our results replicate and extend existing findings of the spatial contiguity effect, and provide reference for future research.

Keywords: spatial contiguity effect; text-picture distance; text-picture processing; integrative transitions; cognitive load

记忆的垂直空间隐喻表征及其对词汇学习的影响

金雨薇 孙潇 宋耀武（通讯作者）

河北大学教育学院，保定，071002, syw@hbu.edu.cn

摘要 随着具身思潮的发展，越来越多的理论方法已经认可了身体可能是塑造诸如记忆等高级认知功能的关键。目前，记忆的具身效应研究往往是借助情感效应概念的隐喻表征，较少有实验脱离情感背景探讨长时记忆中更直接简单的隐喻联结。本研究从语言文化中垂直空间方位与记忆遗忘概念的隐喻表达出发，采用实验法在 236 名大学生中，考察了中性条件下长时记忆的垂直空间隐喻表征，探讨了垂直空间知觉对词汇学习的影响。实验 1 采用迫选法，在明确要求被试将置于垂直空间方位上下的希腊词选入或剔除出记忆清单时，发现被试倾向于将垂直空间上方位的词选入记忆列表，而将垂直空间下方位的词剔除出记忆列表，以上选择均显著高于随机选择概率。实验 2 加入记忆指令，对实验材料做垂直空间方位呈现，结果发现，在自然记忆条件下，当单字呈现在屏幕上方时更容易记忆，当单字呈现在屏幕下方时更容易遗忘。实验 3、4 引入有意遗忘范式，在编码与提取阶段操纵与隐喻一致或不一致的材料呈现与反应方式，结果发现，在编码阶段，针对指示记忆的单字执行与隐喻一致的行为，可以提升词汇学习效果，而执行不一致的行为，将导致回忆结果变差；在提取阶段，针对指示遗忘的单字执行与隐喻一致的行为，可以促进词汇检索，执行不一致的行为，则会加剧反应时长。四个实验的结果已经从两个角度：记忆与遗忘的抽象概念和加工过程；两种情境：自然记

忆和指令记忆；三个阶段：记忆前的选择阶段、记忆编码阶段和记忆提取阶段证明了语言中使用的“上空间方位对应记忆，下空间方位对应遗忘”的隐喻联结具有心理现实性，并且这种隐喻联结会受到记忆指令和记忆确定程度的影响，作用于词汇学习结果。未来应进一步探究该隐喻联结背后的机制与影响因素，以便在日常教学中，有效利用记忆的垂直空间隐喻以提升学生的词汇记忆效果。

The Vertical Spatial Metaphor Representation of Memory and Its Influence on Word learning

Yuwei Jin, Xiao Sun, Yaowu Song

School of Education, Hebei University, Baoding, 071002

Abstract: With the development of embodied thought, an ever-increasing number of different theoretical approaches have endorsed the view that the body is key to shaping higher level cognitive functions such as memory. At present, studies on embodied effects of memory often rely on the metaphorical representation of the concept of affective valence, and few studies have explored more direct and simple metaphorical associations in long-term memory without emotional context. Starting from the metaphorical representation of vertical spatial orientation and memory forgetting concepts in language culture, the vertical spatial metaphor representation of long-term memory in neutral condition was investigated in 236 college students by experimental method, and this study further explores the influence of vertical spatial perception on word learning. Study 1 was a forced-choice task in which participants were asked to select or remove Greek words above or below the vertical spatial orientation from a memory list. The results showed that the subjects tended to select the words in the upper vertical space into the memory list, while the words in the lower vertical space were excluded from the memory list, and the above choices were significantly higher than the random selection probability. Experiment 2 added memory instructions and the experimental materials were presented in vertical spatial orientation. The results showed that under the natural memory condition, the words were easier to be remembered when they were presented at the top of the screen, and easier to be forgotten when they were presented at the bottom of the screen. Introduced deliberately forgotten paradigm in experiment 3, 4, Manipulating the presentation of materials and response mode that are consistent with or inconsistent with metaphors in the encoding and extraction stages. The results showed that, in the encoding stage, the performance of vocabulary learning was improved by performing the behavior consistent with the metaphor, while the performance of inconsistent behavior was worse for the word indicating memory. In the extraction stage, word retrieval was enhanced by performing the behavior consistent with the metaphor for the forgetting word, while the behavior inconsistent with the metaphor would increase the response time. The results of the four experiments have proved that there is psychological reality of “Memory is up, forgetting is down”, and this metaphorical association can be influenced by memory instruction and the degree of memory certainty, which affects the vocabulary learning results from two perspectives: abstract concepts and processing of memory and forgetting; Two situations: natural memory and instruction memory and three stages: the selection stage before memory, the encoding stage and the retrieving stage. In the future, it is necessary to further explore the mechanism and influencing factors behind the metaphorical connection, so as to effectively use the vertical spatial metaphor in memory in daily teaching to improve students' vocabulary memory effect.

工作记忆对知识整合加工过程的影响

靳伟琼 赵笑梅（通讯作者）

河北师范大学教育学院，石家庄，050024，zhaoxiaomei@139.com

摘要 知识整合是指个体把从两个或多个分离但相关的情节中习得的信息结合起来生成新的知识。目前，关于工作记忆是否会影响知识整合尚无清晰的认识。如果工作记忆影响整合表现，那么它在知识整合加工过程的哪个阶段发挥作用？据此，本研究将通过三个实验，从行为和脑电两个层面探索这些问题。实验一采用分离句子范式，从行为层面考察高、低广度组被试通过整合分离但相关的主干事实对，自我生成新知识的表现。结果发现，高广度组被试整合事实生成成绩显著好于低广度组被试，表明工作记忆差异会影响被试的知识整合表现。此外，相对于低广度组被试，高广度组被试对主干事实的加工时间更长、回忆成绩更好；且被试的整合表现与主干事实回忆成绩、加工时间呈显著正相关。表明工作记忆广度影响被试编码主干事实，进而影响整合表现。实验二和实验三结合事件相关电位（ERP）技术，试图从认知机制角度探讨工作记忆在知识整合具体加工过程中的作用。实验二采用再认探测法，考察了工作记忆对重新激活加工进程的影响。结果显示，在词组 1 位置处，高、低广度组被试均在主干事实 2 后呈现探测句比主干事实 2 前呈现条件下的反应时更快、诱发的 N400 更小，表明被试在学习主干事实 2 后确实重新激活了先前习得的相关主干事实 1，且重新激活是基于主干事实间的共同元素迅速发生的。高广度组被试相对于低广度组被试，对探测句的正确率更高、反应时更快、诱发的 N400 更小，表明工作记忆广度会影响重新激活阶段。实验三采用整合事实判断任务，结合 ERP 技术，探讨高、低广度组被试自我生成新知识的加工进程。结果发现，工作记忆广度与整合事实陈述类型交互作用显著。高广度组被试，错误陈述整合事实比正确陈述整合事实条件诱发了更大的 P600，而对于低广度组被试，两种陈述条件下诱发的 P600 没有显著差异。表明高广度组被试能迅速将整合事实纳入语义知识库，并更好地检测到错误陈述整合事实句子中不一致词。

The Influence of Working Memory on the Process of Knowledge Integration

Jin Weiqiong, Zhao Xiaomei

College of Education, Hebei Normal University, Shijiazhuang, 050024

Abstract: Knowledge integration means self-generation of new knowledge through integration of information acquired in two (or more) separate but related learning episodes. Whether working memory will affect the performance of knowledge integration and its role on the process of knowledge integration is worthy of further investigation. Therefore, this study will explore these issues through three experiments from two levels of behavior and EEG. Experiment 1 adopted the separated sentence paradigm to investigate whether there were significant differences in the performance of self-derivation of the high and low span group participants. The results found that self-derived the integration fact performance in the high span group were significantly better than those in the low span group, indicating that working memory does affect the knowledge integration performance. Further the stem facts recall performance in the high span participants were significantly better than those in the low span group, and the processing time of the stem fact were more longer. The self-derivation performance through integration were significantly correlated to the level of stem facts memory and the processing time of the stem fact. It shows that working memory affect encoding the stem facts, and affect the self-derivation through integration. Experiment 2 and Experiment 3 use event-related potential (ERP) technology to explore the role of working memory in the processing of knowledge integration. Experiment 2 investigated whether there were differences in the reactivation processing activities of the participants in different working memory span by manipulating the position of the stem fact 1 as the probe sentence. Since the time course of reactivation is not yet clear, the probe sentence is divided into four phrases (phrase 1, phrase 2, phrase 3, and phrase 4) to explore the time course of probe sentence. The results show that at the position of phrase 1, the participants presented the probing sentence after the stem fact 2 compared with the probing

sentence before the stem fact 2 induced a smaller N400, suggesting that the participants were indeed reactivated after learning the stem fact 2. Compared with the participants in the low span, the high span response to the probe sentence showed a smaller N400, indicating that working memory will affect the reactivation stage. Experiment 3 uses integrated fact-judgment tasks, combined with ERP technology, to explore the time course of integrating. It was found that the working memory had a significant interaction with the statement type. In the high span participants, the misrepresentation of the integrated facts induced a greater P600 than the correct statement of the facts. For the low span participants, there was no significant difference in P600 induced by the statement of integrated facts. The high span participants can quickly incorporate the integrated facts into the semantic knowledge base, and better detect the abnormal words in the misstatement integrated fact sentences.

摘要 神经元征用假说认为, 阅读是人类演化过程中新近产生的文化产物, 因此大脑皮层需要征用原用于其他功能(如加工面孔)的脑区处理视觉文字系统。神经影像学及电生理学的证据表明, 阅读经验的获得能重塑人类加工与语言刺激(如文字)及非语言刺激(如面孔)相关的脑结构及功能。整体加工是理解客体识别机制的重要窗口, 而已有的行为研究也发现, 阅读经验获得将影响面孔的整体加工。例如 Ventura 等人(2013)采用完整组合面孔范式发现, 阅读经验增加能够降低面孔的整体加工; Cao 等人(2019)采用空间距离范式发现, 阅读经验的获得能促进个体对面孔特征之间空间距离的再认绩效。迄今为止关于阅读经验如何影响面孔整体加工的研究仍然较少; 这些有限的研究使用了不同的实验范式, 而这些范式可能揭示客体整体加工的不同机制(Richler & Gauthier, 2014)。因此, 在客体加工领域内其他重要的研究范式(如面孔倒置范式)中是否仍然能够观察到相似的阅读经验效应, 仍然是需要探讨的问题。本研究采用两个实验先后探讨阅读经验习得对客体倒置效应的影响(实验一), 以及空间频率信息在其中的调制作用(实验二)。面孔倒置效应是指, 个体在识别倒立面孔时的绩效显著低于识别正立面孔的绩效, 且面孔的倒置效应比非面孔刺激的倒置效应更大(Yin & Robert, K., 1969)。实验一采用 2 (被试类别: 文盲 / 非文盲) * 2 (刺激类别: 面孔 / 房屋) * 2 (方向: 正立/倒立)混合实验设计。其中被试类别为组间变量, 刺激类别和方向为组内变量。招募文盲被试 15 人(14 名女性, 平均年龄=64.4 岁)及与其年龄匹配的非文盲 15 人(14 名女性, 平均年龄=61.0 岁)。结果发现: (1) 在正确率上, 被试类别和刺激类别的交互作用显著, 非文盲面孔识别的正确率显著高于文盲, 而两组被试在房屋刺激的识别正确率上不存在显著差异; 被试类别和方向的交互作用显著, 总的看来, 非文盲对正立刺激的识别正确率显著高于文盲, 但对倒立刺激的识别正确率与文盲无显著差异; 三因素间的交互效应不显著。(2) 在反应时上, 仅发现刺激类别和方向的主效应。这表明, 阅读经验会调制面孔的整体加工。实验二采用类似实验一的实验设计(除将刺激类别更换为空间频率: 高空间频率 / 低空间频率, 组内变量)。招募文盲被试 11 人(10 名女性, 平均年龄=63.3 岁)及非文盲 11 人(11 名女性, 平均年龄=61.0 岁)。结果发现: (1) 在正确率上, 被试类型与方向的交互作用显著, 即正立条件下, 非文盲的正确率显著高于文盲, 而倒立条件下, 被试类型差异不显著。(2) 在反应时上, 被试类别和空间频率的交互作用显著, 即高空间频率下, 非文盲反应速度显著慢于文盲(边缘性显著: $p = 0.057$), 低空间频率上, 被试类型差异不显著。这表明, 阅读经验能够促进面孔的倒置效应程度, 且不受空间频率的调制。总之, 两项实验发现共同支持学习汉字促进面孔的整体加工的观点。

Learning Chinese characters promotes face processing: Evidence from illiterate and illiterate adults

Lina Zhang^{1*}, Qi Yang^{2*}, Haidan Duan³, Xiaohua Cao^{1**}

Department of Psychology, Zhejiang Normal University, Zhejiang, Jinhua, 321004, caoxh@zjnu.cn;

Department of Philosophy, Tongji University, Shanghai, 200092;

School of Education, Xinyang University, Henan, Xinyang, 464000

Abstract: Neural recycling hypothesis holds that our brain requires to recycle these neural infrastructures dedicated originally to different, but available and similar functions (such as faces) to deal with scripts system, a newly cultural invention of human beings, over evolutionary history. Converging evidence from neuroimaging and electrophysiological studies suggests that literacy acquisition can reshape the structures and functions of human brain in processing linguistic stimuli (such as words) and even non-linguistic stimuli (such as faces). Configural processing is an important window to understand the mechanism of object recognition, and a few existing behavioral research also found that learning to read affects configural processing of faces. For instance, using the complete composite-face paradigm, Ventura et al. (2013) found that the increase in reading experience could automatically reduce configural processing of faces; Cao et al. (2019) used the spatial distance paradigm to manipulate the spaces between facial features and find that literacy acquisition could promote the recognition performance of configural processing when faces had the same key facial features but different spacing distance between them. However, there are still few studies on how literacy affects the composite face processing, in which different experimental paradigms may tap into different mechanisms underlying configural objects processing (Richler & Gauthier, 2014). Therefore, whether similar literacy effects on objects processing could still be observed in other important experimental paradigms (e.g., face inversion paradigm) is still unexplored. In the present study, two experiments were conducted to investigate the effect of literacy on object inversion effect (Experiment 1) and the modulating effect of spatial frequency (Experiment 2). Face inversion effect refers to the fact that the performance of an individual in recognizing an inverted face is significantly lower than that of an upright face, and the face inversion effect is greater than that of other stimuli (Yin & Robert, 1969). In Experiment 1, 2 (Subject group: illiterate / literate) * 2 (Stimuli category: face / house) * 2 (Orientation: upright / inverted) mixed experimental design was used with the Stimuli category and Orientation as within-subjects factors, and Subject group as one between-subjects factor. Fifteen illiterates (14 females, $M_{age} = 64.4$ years) and 15 literates (14 females, $M_{age} = 61.0$ years) were recruited. The results showed that: (1) On accuracy, the interaction between Subject group and Stimuli category was present, that is, the accuracy of literates was significantly higher than that of illiterates for faces, however there was no distinction between Subject group for houses. The interaction between Subject group and Orientation was significant, that is, the accuracy is significantly higher for literates than for illiterates in upright orientation, while no significant difference was observed between both groups in inverted orientation. A triple interaction among these variables was not observed. (2) On response time, the main effects of Stimuli category and Orientation were found. This suggests literacy could modulate configural-face processing. In Experiment 2, the design was similar to experiment 1 (except that Stimulus category was changed into Spatial frequency with within-subjects variable: high spatial frequency / low spatial frequency). Eleven illiterates (10 females, $M_{age} = 63.3$ years) and 11 literates (11 females, $M_{age} = 61.0$ years) were recruited. The results showed that: (1) On accuracy, the main effects of Subject group, Orientation and Spatial frequency were found. In addition, the interaction between Subject group and Orientation was significant, that is, the accuracy of literates was significantly higher than that of illiterates for upright condition, while no significant difference between both groups for inverted condition was observed. (2) On response time, there was a significant interaction between Subject group and Spatial frequency, that is, for high spatial frequency condition, the response time was marginally significantly slower for literates than for illiterate; there was no significant difference between both groups for low spatial frequency condition. This shows that literacy could promote the degree of face inversion effect regardless of spatial frequencies. In conclusion, the findings of two experiments together support the view that literacy promotes

configural-face processing.

词汇阅读中视觉干扰效应及影响因素

顾啦啦¹ 孙悦¹ 梅磊磊¹ (通讯作者)

¹ 华南师范大学心理学院, 广州, 510631, mll830925@126.com

摘要 日常生活中个体阅读孤立词汇的情境较为少见, 视觉词汇大多伴随其它文字材料(如文本阅读)或其它视觉材料同时出现, 涉及多个刺激的同时加工。以往关于多视觉刺激同时加工的研究主要集中在工作记忆领域, 发现视野内呈现材料的数量及材料间的视觉相似性均会对个体的工作记忆产生影响。尽管过往研究对多刺激呈现条件下材料数量和材料间视觉相似性对视觉材料工作记忆的影响进行了较多探讨, 但与工作记忆不同, 文字阅读是对目标文字的即时性加工, 无需在工作记忆系统中对信息进行长时间的保持。因此, 词汇阅读如何受到视野内刺激的影响尚不清楚。为了探讨该问题, 本研究通过三个实验, 分别以中文词语、面孔图片和韩文假词为干扰材料, 采用词汇判断任务, 探讨了词汇阅读中视觉干扰效应及影响因素。结果发现, 干扰刺激的数量和干扰刺激与目标词汇的类别一致性均会对词汇阅读产生影响。具体而言, 在中文词语的干扰条件下, 干扰材料的数量会对词汇阅读产生显著影响, 有干扰条件下的词汇判断速度显著慢于无干扰条件。此外, 干扰材料与目标材料的类别一致性也会对词汇阅读产生显著影响。相比于不同类别的干扰材料, 同类别的干扰材料会对词汇阅读速度产生更强的干扰效应。进一步研究发现, 干扰材料与目标材料的类别一致性效应不会受到干扰材料与目标材料视觉相似性的影响。这些结果可能反映了同类别多个刺激的加工需要在该类别的特异性脑区内竞争加工资源, 说明干扰材料与目标材料的类别一致性对目标词汇的阅读具有重要影响。

Visual Interference and its Influencing Factors in Word Reading

Lala Gu¹, Yue Sun¹, Leilei Mei^{1*}

¹School of Psychology, South China Normal University, Guangzhou, China

Abstract: In daily life, it is rare for individuals to read isolated words, while most visual words appear together with other text materials (such as text reading) or other visual materials, which involves the simultaneous processing of multiple stimuli. Previous studies on simultaneous processing of multiple visual stimuli have focused on working memory. It has been found that the number of materials presented in the visual field and the visual similarity between the materials have an impact on individual working memory. However, unlike working memory, text reading is a real-time processing of the target text and does not need to maintain the information in the working memory system for a long time. Therefore, it is not clear how vocabulary reading is affected by intraocular stimuli. In order to investigate this problem, this study conducted three experiments, using Chinese words, face pictures and Korean false words as interference materials, respectively, using a lexical decision task to explore the visual interference effects and influencing factors in word reading. The results showed that both the number of stimuli and the consistency between the stimuli and target words had an effect on word reading. Specifically, in the condition of interference of Chinese words, the amount of interference material has a significant impact on word reading, and the speed of lexical decision in the condition of interference is significantly slower than that in the condition of no interference. In addition, the category consistency between the interference material and the target material also has a significant impact on word reading. Compared with different types of interference materials, the same type of interference materials have a stronger interference effect on word reading speed. Furthermore, it is found that the category consistency effect of the interfering material and the target material is not affected by the visual similarity between the interfering material and the target material. These results may reflect that the processing of multiple stimuli of the same category needs to compete for processing resources in the brain region specific to the same category, indicating that the category consistency of the interference material and the target material has an important effect on the reading of target words.

母婴的生理共同调节预测学步儿的恐惧调节

兰起丽¹ 王莉¹ (通讯作者)

¹ 北京大学心理与认知科学学院, 北京, 100871, liwang@pku.edu.cn

摘要 情绪调节能力对儿童的发展和适应具有重要意义, 其中对恐惧情绪的调节能够有效预测儿童的社会退缩、焦虑等。然而, 儿童在早期尚未具有独立的自我调节能力, 依赖来自抚养者的外在的调节。根据亲子相互调节模型和生物行为同步性模型, 亲子互动过程中, 母婴在行为、生理状态上存在相互调节、相互影响、相互预测的关系, 即亲子共同调节; 通过亲子互动中的共同调节, 儿童逐步锻炼、发展出更好的自我调节能力。本研究探究了母婴互动中的生理共同调节能否预测学步儿的恐惧调节。研究采用追踪设计, 6 个月时, 母婴参与冻脸范式 (120 个母子对), 母婴的生理指标 RSA 呼吸性窦性心率不齐 (一个常用的生理调节指标) 通过心电信号测量; 2 岁时, 儿童参与一系列诱发儿童恐惧情绪的情境例如男陌生人接近、小丑, 儿童的恐惧调节能力由观察编码得到 (恐惧的表情和肢体动作, 情绪调节行为)。采用多水平模型估计亲子对在冻脸范式恢复阶段的生理共同调节, 即在亲子对对内水平, 母婴的生理指标随着时间变化在多大程度上是可以相互预测的。通过贝叶斯方法得到母婴生理共同调节的系数。采用路径分析, 检验母婴生理共调对学步儿的恐惧调节的预测作用。结果显示: (1) 总体上, 母婴对的呼吸性窦性心率不齐存在显著的相互预测的关系, 共同调节系数显著; (2) 母婴生理共同调节能够显著地负向预测恐惧诱发情境中儿童的恐惧情绪水平, 显著地预测儿童更多的注意力导向的情绪调节行为, 更少的抚养者导向的情绪调节行为。母婴生理共同调节能够预测学步儿更好的恐惧调节能力。研究结果支持了早期亲子共同调节对儿童自我调节的促进作用, 亲子在生理状态上的相互调节和影响能够锻炼儿童的情绪调节能力。

Mother-infant physiological coregulation predicts toddler' fear regulation

Qili Lan, Li Wang

School of Psychological and Cognitive Sciences, Peking University, Beijing 100871, China

Abstract: Emotion regulation is important for children's development and adjustment, among which fear regulation ability can effectively predict children's social withdrawal and anxiety. However, children can't self-regulate independently in the early stage, and they rely on the external regulation from caregivers. According to the parent-child mutual regulation model and the bio-behavioral synchrony model, during mother-child interaction, the mother and child regulate, influence and predict each other at the behavioral and physiological levels, that is mother-child co-regulation; through this co-regulation, children gradually exercise and develop self-regulation ability. This study examined whether the physiological co-regulation during the mother-infant interaction can predict toddlers' fear regulation. The study adopted a longitudinal design. At 6 months, mothers and infants participated in the still-face paradigm (120 mother-infant dyads), while the mother and infant's RSA (respiratory sinus arrhythmia, a commonly used physiological regulation index) was measured by ECG signals. At 2 years old, children engaged in a series of fear-eliciting episodes like stranger approach and clown episodes, while children's fear regulation was obtained by observation coding (fear expressions, body movements, and emotion regulation behaviors). A multi-level

model was used to estimate the mother-infant physiological co-regulation at the recovery phase of the still-face paradigm. Coregulation measured the degree to which the physiological states of the mother and the infants could predict each other at the within-dyad level. A Bayesian method was used to obtain the mother-infant co-regulation coefficient. Path analysis was used to test the predictive effect of mother-infant physiological co-regulation on toddlers' fear regulation. The results showed that: (1) On average, mother-infant respiratory sinus arrhythmia during interaction could predict each other significantly; (2) mother-infant physiological co-regulation can significantly negatively predict toddlers' fear levels during fear-eliciting episodes, significantly predicts toddlers' more attention-oriented emotion regulation behaviors and fewer caregiver-oriented emotion regulation behaviors. The mother-infant physiological co-regulation can predict more effective fear regulation of toddlers. These findings support the benefits of early mother-child co-regulation on self-regulation of children. Children's emotion regulation ability could be developed during mother-child interaction, through the mutual regulation and influence of physiological states.

4~6 岁儿童第三方惩罚行为的发展及其与情绪的关系

张雪 杜文静 刘一沛 刘文（通讯作者）

辽宁师范大学心理学院，大连，116029，wenliu703@126.com

摘要 第三方惩罚行为是指给予违反社会规范的人一个消极结果，尽管惩罚者自身没有直接地被违反社会规范的行为所影响。进行惩罚的个体自身没有受到不公平的对待，自身利益并未受到来自他人的所害，是非利益相关的第三方，这种惩罚不是考虑自身的利益，并且有时候还需要付出一定的代价，这种形式即为第三方惩罚。研究从不公平规避理论出发考察 4~6 岁学前儿童第三方惩罚行为的发展特点，采用最后通牒博弈范式变式，由提议者提出不公平或公平的分配提议，儿童作为第三方代替接受者做出决策，儿童对分配提议的拒绝作为第三方惩罚的外显指标，考察不利不公平($N=180$)与有利不公平情境下($N=180$)第三方惩罚的年龄发展特点，关注有无代价及分配结果对儿童第三方惩罚行为的影响，对比两种情境下第三方惩罚的发展轨迹及快速发展期，考察儿童在两种情境下对不公平分配的情绪与惩罚决策的关系。研究结果显示：4 岁儿童已经具有第三方惩罚行为，随着年龄的发展呈现显著上升的趋势，5~6 岁儿童第三方惩罚行为发展较为稳定，儿童的第三方惩罚主要是针对不公平的分配结果，并在一定程度上受到自身代价的影响。不利不公平情境下的第三方惩罚行为和消极情绪高于有利不公平情境下的惩罚行为和情绪得分。不公平分配结果会引发儿童更多的消极情绪，不利不公平下情绪均高于有利不公平条件下的得分，惩罚行为能够有效的减少儿童的消极情绪。

The Development of Third Party Punishment and Its Relationship with Emotion in Children Aged 4-6 Years

Xue Zhang, Wenjing Du, Yipei Liu, Wen Liu (Corresponding Author)

School of psychology, Liaoning Normal University, Dalian 116029, wenliu703@126.com

Abstract: Third-party punishment refers to actions that inflict harm against an individual and that are motivated by that individual's violation of social norms. when punishers are not personally affected by the unfair behavior and when punishment is costly. One striking feature of human social behavior is third-party punishment. Based on the theory of unfair circumvention, this paper investigates the development characteristics of the third-party punishment behavior of preschool children aged 4-6 years. The ultimatum game paradigm is used. The proposer puts forward unfair or fair distribution proposals. Children as the third party make decisions instead of the recipients. Children's rejection of distribution proposals is taken as the explicit index of third-party punishment, An investigation of the age development of third party penalties between advantageous unfair ($N=180$) and disadvantageous unfair situations

($N=180$). we manipulated whether punishment required subjects to pay personal costs, comparison of the development trajectory and rapid development period of the three party punishment under the two situations. The relationship between emotional caused by unfair distribution of children and punishment decisions in two situations. Finally, we investigated whether children would be equally likely to punish any unequal resource allocations, or whether they would show more sensitivity to inequity when it resulted from selfishness than generosity. Our results show that children aged 4 to 6 have developed a willingness to punish unequal allocations in a third-party context. A sensitivity to cost is present in 4-year-olds and appears to be stable across 5 to 6 year old. Children are sensitive to costs, as they punish less when punishment entails personal sacrifice. Importantly, despite the personal sacrifice, 5 to 6 years old children systematically punish unfair behavior. Moreover, these children are sensitive to the direction of inequity: they are more likely to reject selfish unequal allocations compared to generous unequal allocations. There are significant differences in emotion induced by different distribution results. Punishment can effectively reduce the negative emotions of children, third party punishment and emotion scores in disadvantage unfair situation higher than advantage unfair.

摘要 儿童亲社会行为（如分享、助人等）的发展一直是儿童道德发展的重要话题。以往研究发现选择自由（自主做选择，或他人做选择）对儿童亲社会行为有重要影响，但少有研究考虑为儿童做选择的成人与儿童的情感亲密程度、以及成人选择的合理性等对儿童亲社会行为的影响。本研究以 4-5 岁学龄前儿童为对象，探究选择自由及做选择的人物与儿童之间的关系以及选择的合理性对儿童亲社会行为的影响。实验一招募 70 名 4-5 岁儿童及其母亲，实验二招募 84 名 4-5 岁儿童。实验一中，所有儿童均面临一个要不要给玩偶（小猴）分享贴纸的选择，我们将儿童随机分配到三个条件中，面临三种不同的选择情境：在自主选择情境中，儿童自己决定是否将贴纸分享给玩偶；在母亲选择情境和主试选择情境中，儿童的母亲或主试要求儿童必须分享。接下来，主试测量儿童分享时的心情，并测量儿童在一个新的分享情境（即，面对一个新的玩偶小象时）的分享行为（分享的贴纸数量，0-3 个）。除此之外，自主选择组和母亲选择组的儿童母亲填写测量母子关系的问卷。结果发现，虽然三组中儿童分享行为没有明显差异，但母子关系亲密程度显著影响儿童分享时的心情（ $\beta=-0.54, SE=0.02, t=-2.49, p<.05$ ）：母子关系亲密的儿童在母亲选择条件下跟自主选择条件下一样快乐，而关系疏远的儿童在母亲选择条件下的快乐体验降低。实验二与实验一的方法基本一致，但选择条件改为，自主选择、母亲合理选择（母亲解释分享的理由）及母亲不合理选择（强制分享，不解释分享的理由）三种条件。结果发现，在初次（与小猴玩偶）分享中，母亲合理选择和不合理选择下的分享人数均显著高于自主选择的分享人数（ $F(2, 80)=8.47, p<.05$ ），然而，在面对新的分享对象（小象）时，母亲合理选择组的儿童给新玩偶（小象）的分享数量最多，而自主选择组和母亲不合理选择组的儿童分享数量则较低。综上所述，拥有选择的自由与遵从关系亲密的成人的选择都会让儿童的分享心情更积极；选择自由不会促进儿童的后续分享行为，而成人合理的选择和指导会促进儿童后续表现出更慷慨的分享行为。本研究对培养学龄前儿童的亲社会行为具有重要意义。

Abstract : The development of children's prosocial behaviors (e.g., helping, sharing) is an important topic in children's moral development. Previous studies have revealed that the freedom to make choices (whether children make choices for themselves or other people make choices for them) has important influence on children's prosocial behaviours. However, few studies have investigated the impacts of the relatedness between the child and the adult who makes choices for them, and the rationality of adult choice on children's prosocial behaviors. Across two studies, we investigated how the freedom of making choices, the relatedness between children and the adults who make choices for them and the rationality of choices influenced children's prosocial behaviours. In study 1, 70 children aged 4-5 and their mothers were recruited, and in Study 2, 84 children aged 4-5 were recruited. In Study 1, children faced a decision of whether to share a sticker with a puppet (monkey). Children were randomly assigned to one of three conditions: In self-choice condition, child could decide for themselves whether to share or not; in mother-choice condition, the child's mother instructed the child to share, and in the experimenter-choice condition, the experimenter instructed the child to share. After this, we measured children's feelings in the sharing task, and measured children's sharing behaviours in a novel sharing context where children needed to decide how many stickers (0-3) to share with a new puppet (elephant). Meanwhile, mothers in self-choice condition and mother-choice condition were asked to fill out questionnaires about child-mother relatedness. Results showed that although there was no significant difference on children's sharing behaviours in three conditions, the strength of relatedness between children and mothers had a significant influence on children's sharing feelings($\beta=-0.54$, $SE=0.016$, $t=-2.488$, $p<.05$): children who felt closely related to their mother in the mother-choice condition demonstrated as positive feelings when sharing as those in the self-choice condition, but children who felt distant to their mother had more negative feelings after sharing in mother-choice condition than in the self-choice condition. In Study 2, we employed similar methods in addition to changing the three conditions to self-choice condition, mother reasonable-choice condition (mother explained the reason for the sharing choice) and mother unreasonable-choice condition (mother forced the child to make choice without explaining the reason). Results demonstrated that when asked to share with the first puppet, children were significantly more likely to share in the mother reasonable-choice condition and the mother unreasonable-choice condition than those in the self-choice condition($F(2, 80)=8.47$, $p<.05$). Nevertheless, when asked to share with a new puppet (elephant), children in mother reasonable-choice condition shared more stickers with the puppet (elephant) than children in the self-choice condition and the mother unreasonable-choice condition. In summary, having the freedom to make choices and following choices made by adults who have high relatedness with children can both lead to more positive feelings in sharing. The freedom to make choices does not improve subsequent prosocial behaviours, while adults' reasonable choices and guidance are helpful to facilitate subsequent sharing behaviours. This research is of great significance to the development of preschoolers' prosocial behaviours.

3-7 岁幼儿气质类型新探：基于潜在剖面分析

蒋鑫钰¹ 刘文¹ 车翰博²

1 辽宁师范大学心理学系, 大连, 116000

2 辽宁师范大学教育学系, 大连, 116000

摘 要 气质是个体出生后最早表现出来的一种比较明显而稳定的个性特征, 是儿童的行为表现方式, 与儿

童问题行为等密切相关。张雨青等人通过对托马斯、切斯的问卷修订,将我国儿童气质划分为难养型,启动缓慢型,中间偏易型,易养型,中间偏难型五个类型。经典的气质类型虽然被广泛应用,但其分类依据还有待探讨。近年来,潜在剖面分析被认为是最可靠的分类方式,可以通过拟合指数更科学的对变量进行划分。因此,为进一步考察幼儿不同分类方法下的气质类型与问题行为的关系,本研究采用了《NYLS3-7岁儿童气质问卷》对大连市区内811名正常幼儿的气质类型进行了测查,并采用潜在剖面分析的方法对其进行分析。结果发现:幼儿气质可分为三个潜在类别:非适应型、中间型、适应型,所占比例分别为38.96%、46.24%、14.80%。非适应型幼儿在品行问题、学习问题、心身问题、冲动多动、焦虑问题以及多动指数上得分均高于中间型幼儿和适应型幼儿。而在经典气质类型下,易养型幼儿与中间偏易养型幼儿在各问题行为维度上均无显著差异,难养型幼儿、中间偏难养型幼儿以及启动缓慢型幼儿在问题行为不同维度上也无显著差异。结论:幼儿气质类型可分为三类:非适应型、中间型、适应型,且在问题行为水平表现出差异。

Temperament types of 3-7-Year-old children: Based on potential profile analysis

Xinyu Jiang¹, Wen Liu¹, Hanbo Che²

Abstract: Temperament is one of the most obvious and stable personality characteristics after birth, which is closely related to children's problem behavior. According to the revision of Thomas and Chess' questionnaire, domestic scholars divide Chinese children's temperament into five types: difficult, slow to warm up, intermediate low types, easy and intermediate high types. Although classical temperament types are widely used, their classification basis remains to be explored. In recent years, the latent profile analysis is considered to be the most reliable classification method, and the variables can be divided more scientifically by fitting index. Therefore, in order to further investigate the relationship between temperament types and problem behaviors under different classification methods, The New York Longitudinal Study Parent Temperament Questionnaire was used to investigate the characteristics and type distribution of temperament in 811 3-7years old children in Dalian China. And the latent profile analysis method is used to analyze it. The results showed that children's temperament can be divided into three potential categories: non adaptive, intermediate and adaptive, accounting for 38.96%, 46.24% and 14.80% respectively. Non adaptive children have higher scores in behavior problems, learning problems, psychosomatic problems, impulsive hyperactivity, anxiety problems and hyperactivity index than intermediate children and adaptive children. In the classic temperament type, there is no significant difference in the dimensions of problem behavior between easy and intermediate low types, and there is no significant difference in the dimensions of problem behavior between difficult, intermediate high types and slow to warm up. Conclusion: Children's temperament can be divided into three types: non adaptive, intermediate and adaptive, and there are differences in the level of problem behavior.

幼儿攻击者的懊悔表现对受害者宽恕的影响：旁观者的调节作用

李一涵 陈静 陈光辉（通讯作者）

山东师范大学心理学院，济南，250014, chengh2100@126.com

摘要 宽恕作为一种积极心理品质,不仅有利于减少人际冲突,而且有助于缓解受害者所遭受的心理伤害。在攻击或欺凌事件中,促成受害者对攻击者的宽恕是一种有效的冲突处理策略。已有研究表明,成人或青少年攻击者的懊悔表现是促成受害者宽恕的重要因素,且其中关键的认知能力基础是正确解读攻击者悔意的心理理论能力。心理理论能力发展的敏感期是幼儿期,然而,鲜有研究尝试在幼儿群体中揭示攻击者懊悔表现与受害者宽恕的关系。此外,在集体主义文化的人际互动中,旁观者通常发挥着重要的影响作用。受害者对旁观者看待自己宽恕攻击者与否的行为过程,可能是对幼儿心理理论能力的更高要求。鉴于此,本研究尝试在幼儿群体中探究攻击者的懊悔表现对受害者宽恕的影响,并考察不同类型旁观者的可能调节作用。整群选

取 120 名 4.5-5.5 岁的幼儿被试, 采用经典的懊悔与宽恕行为实验范式: “撕图画”游戏、理解“懊悔”、资源分配任务。整个研究包含四组实验, 每组实验由 30 名被试参与。实验一在无旁观者条件下, 以分配“花朵”的数量作为宽恕的衡量标准, 考察懊悔对幼儿宽恕的影响; 实验二、三、四分别在教师旁观、好朋友旁观、陌生人旁观条件下, 考察旁观者身份对宽恕水平的影响作用结果表明: (1) 我国 4 岁半至 5 岁半的幼儿能够分辨、理解攻击者的懊悔表现, 对懊悔者的宽恕水平显著高于对不懊悔者。(2) 当有旁观者在场时, 幼儿同样能够分辨、理解攻击者的懊悔表现, 对懊悔者的宽恕水平显著高于对不懊悔者。(3) 旁观者类型的不同会引发幼儿宽恕行为的显著差异: 教师旁观时, 幼儿对无懊悔攻击者的宽恕水平增加, 但与无旁观者条件下差异不显著; 好朋友旁观时, 幼儿对不懊悔者的宽恕水平最高, 且与无旁观者条件下存在显著差异; 陌生人旁观时, 幼儿对不懊悔者的宽恕水平最低, 但无旁观者条件下的宽恕水平差异不显著。本文结合幼儿特点与集体主义文化特点对以上结果进行了讨论与反思。

The effect of aggressor remorse on victim forgiveness in young children: the moderating role of bystanders

LI Yihan, CHEN Jing, CHEN Guanghui

School of Psychology, Shandong Normal University, Jinan 250014

Abstract: As a positive psychological quality, forgiveness not only helps to reduce interpersonal conflict, but also helps to alleviate the psychological damage suffered by the victims. Facilitating forgiveness of the victim towards the aggressor is an effective conflict management strategy in an aggressive or bullying incident. Studies have shown that remorse in adult or adolescent aggressor is an important factor in facilitating forgiveness by victims. And the key cognitive basis is the ability to correctly interpret aggressor's remorse in theory of mind. The sensitive period of theory of mind development is early childhood. However, few studies have attempted to reveal the relationship between aggressor remorse and victim forgiveness in young children. In addition, bystanders played an important role in interpersonal interactions in the context of collectivism culture. The process by which the victim perceives whether he or she forgives the aggressor to the bystanders may be a higher requirement for children's theoretical ability of mind. In view of this, this study attempted to explore the effect of aggressor remorse on victim forgiveness. Moreover, this study investigated the possible moderating effects of different types of bystanders in a group of young children. A total of 120 children aged 4.5 to 5.5 years were enrolled in this study. A classic paradigm of remorse and forgiveness was used: including "tear picture" game, the process of understanding "remorse" and resource distribution task. The study consisted of four sets of experiments, each with 30 participants. In experiment 1, when bystanders were watching, the number of distributed "flowers" was used as a measure of forgiveness, and the effect of remorse on forgiveness was investigated. In experiment 2-4, the effects of bystander types on forgiveness level were investigated under the conditions of bystanders are teachers, friends and strangers. The results showed that: (1) Chinese children aged 4 and a half to 5 and a half years could distinguish and understand the remorse of the aggressor, and the level of forgiveness for the remorseful aggressor was significantly higher than neutral aggressor. (2) In the presence of bystanders, the children were also able to distinguish and understand the remorse of the aggressor, and the level of forgiveness for the remorseful aggressor was significantly higher than that for the non-remorseful aggressor. (3) Different types of bystanders could lead to significant differences in children's forgiveness behavior: when the teacher was watching, children's forgiveness level to the non-remorseful aggressor increased, but the difference was not significant compared with the condition of no bystanders; When the friend was watching, children showed the highest level of forgiveness to the non-remorseful person, which was significantly different from the condition of no bystanders. When the stranger was watching, children showed the lowest forgiveness level to the non-remorseful aggressor, but the difference was not significant compared with the condition of no bystanders. This paper discussed and reflected on the above results based on the characteristics of children and collectivism culture.

摘要 尽管大多数人都体验过害羞情绪, 但人群中仅有 10-16% 的人属于害羞气质。本研究主要关注的是害羞气质。先前研究表明害羞与认知偏差 (如, 判断偏差和解释偏差) 具有密切联系, 但是这些研究基本都是通过横断研究在西方人群或中国大学生群体中开展的, 得到的研究结果可能不具有很好的稳定性, 也不具有较强的准因果关系, 而且不能推广到中国儿童群体中。因此, 本研究旨在通过纵向调查考察儿童害羞与其对社会事件的判断和解释偏差之间的稳定性和准因果关系。采用儿童害羞问卷、消极社会事件可能性与代价问卷和模糊社会情境问卷追踪调查河南省固始县 1112 名四五年级小学生, 每半年调查一次, 共追踪调查三次 (T1、T2、T3)。在 T1 时, 四年级 485 人, 五年级 627 人, 男生 681 人 (61.24%), 女生 431 人 (38.76%), 被试年龄在 8-14 岁之间 ($M = 10.29$, $SD = 0.87$)。本研究对所得数据进行交叉滞后分析, 结果发现: (1) 儿童的害羞、对消极社会事件的可能性判断和代价判断以及对模糊社会情境的威胁解释在三次测量中都具有中等程度稳定性; (2) 儿童害羞可以显著正向预测其随后每次测量的可能性和代价判断; 可能性和代价判断只能显著正向预测最后一次测量的害羞, 且预测作用小于害羞对它们的预测作用。即, 儿童害羞与判断偏差存在相互预测的关系, 但害羞对可能性与代价判断的预测作用占主导地位; (3) 儿童害羞可以显著正向预测其随后每次测量的威胁解释, 但威胁解释对随后害羞无显著预测作用。
