Abstract: Suicide is a serious global health problem. Childhood trauma is thought to be an important factor in adult suicidal ideation. Although many studies have explored this relationship, the results have varied widely, and it is unclear whether the phenomenon has cultural differences. This meta-analysis was to estimate the association between adult suicidal ideation and different types of childhood trauma (emotional abuse and neglect, physical abuse and neglect, sexual abuse) and find their factors affecting. Medline, Embase, Web of Science, CINAHL, WangFang Data, CNKI, and CQVIP databases were searched until December 30, 2022. The present study obtained 46 studies (124811 participants;180 effect sizes). There were 28,455 participants in the East and 118,855 participants in the West. The results showed that the more severe the trauma in childhood, the more intense the suicidal ideation in adulthood (r = 0.19[0.17,0.21]). The phenomenon is culturally universal overall (Eastern r = 0.18[0.16,0.18], Western r = 0.21[0.19,0.24]), but the relationship between sexual abuse and suicidal ideation in adult life may be weaker in Eastern culture than in Western culture (Eastern r = 0.11[0.07,0.16], Western r = 0.17[0.13,0.21]). This phenomenon varied among different types of trauma, with emotional abuse being the highest (r = 0.25[0.19,0.30]) and sexual abuse the lowest (r = 0.14[0.11,0.18]). Emotional neglect (r = 0.25[0.19,0.29]), physical neglect (r = 0.19[0.14,0.24]) and physical abuse (r = 0.17[0.13,0.22]) were in the middle. In addition, the moderating effect test found that the positive correlation between the five types of childhood trauma and adult suicidal ideation was not affected by the age of the subjects, male proportion, whether the clinical sample was used or not, and the measurement instrument. These results suggest that childhood trauma is a risk factor for adult suicidal ideation across cultures. This study suggests that future studies should pay more attention to the potential mechanism of suicide in childhood traumatic experiences, further explore the moderating variables of the relationship between the two, and find protective factors affecting suicide ideation in childhood traumatic experiences, to guide the development of more effective intervention measures.

中学生友谊质量与基本心理需要满足：社交网站自我呈现和社会比较的链式中介

摘 要 基本心理需要的满足是个体寻求心理上的成长、内化和幸福的重要途径。根据自我决定理论，青少年基本心理需要的满足能否顺利实现受制于外部环境提供的支持。友谊质量是交往双方提供陪伴交流的亲密程度以及解决冲突矛盾的水平，反映了个体与朋友之间关系的亲密程度，与他人之间良好的关系为个体基本心理需要的满足提供了支持性的环境。随着社交网站的广泛使用，社交网站为中学生人际交往、自我呈现提供新的平台，社交网站的一系列特性，也使得个体在社交网站中都能够寻找到满足其基本心理需要的方式。此外，个体在社交网站中不同的自我呈现策略可能会引起不同的社会比较倾向，进而导致不同的情感体验，最终影响到中学生基本心理需要的满足。基于此，本研究以 769 名中学生为研究对象，考察中学生社交网站自我呈现和社会比较在友谊质量与基本心理需要满足间的中介作用以及中介作用的年级差异。研究采用友谊质量量表、一般基本心理需要满足量表、社交网站自我呈现量表和社会比较倾向量表进行问卷调查。结果发现：（1）友谊质量、社交网站真实自我呈现、社交网站积极自我呈现与基本心理需要满足均呈显著正相关；社会比较与基本心理需要满足呈显著负相关。（2）社交网站真实自我呈现、社会比较的独立中介作用及链式中介作用均显著。（3）社交网站真实自我呈现和社会比较的独立中介作用和链式中介作用仅在高中生中显著。具体而言，中学生基本心理需要的满足既通过友谊质量的直接影响，也通过

社交网站真实自我呈现和社会比较的独立中介作用和链式中介起作用，同时这种中介作用在年级上存在显著差异。
关键词　中学生，友谊质量，基本心理需要满足，社交网站自我呈现，社会比较

The Relationship Between Friendship Quality and satifaction of Basic Psychological Needs Among Middle-school Students:The Chain Mediating Role of Self-presentation on SNSs and Social comparison

Abstract:The satisfaction of basic psychological needs is an important way for individuals to seek psychological growth, internalization and happiness. According to the self-determination theory, whether the satisfaction of teenagers' basic psychological needs can be successfully realized is subject to the support provided by the external environment. Friendship quality refers to the intimacy of companionship and communication and the level of conflict resolution, which reflects the intimacy of the relationship between individuals and friends. A good relationship with others provides a supportive environment for the satisfaction of individual basic psychological needs. With the wide use of social networking sites, social networking sites provide a new platform for middle school students' interpersonal communication and self-presentation. A series of characteristics of social networking sites also enable individuals to find ways to satisfy their basic psychological needs in social networking sites. In addition, different self-presentation strategies of individuals in social networking sites may lead to different social comparative tendencies, and then lead to different emotional experiences, which ultimately affects the satisfaction of basic psychological needs of middle school students. Based on this, this study investigated the mediating role of self-presentation on SNSs and social comparison between friendship quality and satisfaction of basic psychological needs of middle school students, and the grade differences of mediating role. Friendship Quality Scale, General Basic Psychological Needs Satisfaction Scale, Self-Presentation on SNSs Scale and Social Comparative Tendency Scale were used in the study. The results showed that: (1) Friendship quality, authentic self-presentation on SNSs, positive self-presentation on SNSs were significantly positively correlated with the satisfaction of basic psychological needs; Social comparison is negatively correlated with the satisfaction of basic psychological needs. (2) The independent mediating role and chain mediating role of authentic self-presentation and social comparison are significant (3) The independent mediating role and chain mediating role of authentic self-presentation on SNSs and social comparison are significant only among senior high school students. Specifically, the satisfaction of middle school students' basic psychological needs is not only directly affected by friendship quality, but also through the independent mediating role and chain mediating role of authentic self-presentation on SNSs and social comparison. At the same time, there are significant differences in grades.
Key words: middle-school students, friendship quality, satisfaction of basic psychology needs, self-presentation on SNSs, social comparison

体育锻炼与大学生领悟社会支持的关系：社会情感能力的中介作用及其性别差异

舒俊文[1]，颜军[2]（通讯作者）
1.　扬州大学体育学院，江苏扬州　225100

2. 扬州大学体育学院，江苏扬州，225100，

摘 要 体育锻炼是以增强身体健康增进体质为目的，以身体运动、关节活动、骨骼肌收缩为主要内容和手段，由强度、频率和持续时间的身体活动。领悟社会支持是社会支持中的一个子类型，是指个体对外界给予自身支持、理解、尊重的主观感受和评价，是对可能得到的社会支持的信念。社会情感能力被定义为认识和管理与自我、与他人、与集体关系的能力，以及做出负责任决策能力。为探究体育锻炼、社会情感能力、性别和大学生领悟社会支持的关系。采用体育锻炼等级量表（PARS-3）、领悟社会支持量表（PSSS）、中国大学生社会情感能力量表（SECS）对江苏、山东、湖北 408 名在校大学生进行调查。结果发现:（1）在控制了学历、专业类别等人口统计学变量之后，体育锻炼量显著正向预测大学生领悟社会支持（β=0.11，t=3.99，P＜0.001）; (2) 社会情感能力在体育锻炼与大学生领悟社会支持中起中介作用，中介效应量占比54.33%，95%*CI* 为[0.101,0.180]; (3) 性别在体育锻炼与大学生领悟社会支持之间起调节作用（t=2.01，P＜0.05）。本研究的结果表明体育锻炼不仅会直接影响大学生的领悟社会支持，还会通过社会情感能力间接地影响大学生的领悟社会支持；性别对体育锻炼影响大学生领悟社会的直接效应具有显著的调节作用。具体而言，相对于男生，女生对领悟社会支持的正向预测作用更显著。

The relationship between physical activity and college students' appreciation of social support: The Mediating Role of Socioemotional Competence and Its Gender Differences

Junwen Shu

College of Physical Education, Yangzhou University, Yangzhou, Jiangsu, China

Abstract： Physical exercise is to enhance physical health to improve physical fitness for the purpose of physical movement, joint activity, skeletal muscle contraction as the main content and means, by the intensity, frequency and duration of physical activity. Comprehending social support is a subtype of social support, which refers to an individual's subjective feelings and evaluations of the support, understanding, and respect given to him or her by the outside world, and is a belief in the social support that may be available to him or her. Social-emotional competence is defined as the ability to recognise and manage relationships with self, with others, and with the collective, as well as the ability to make responsible decisions. To explore the relationship between physical activity, social-emotional competence, gender, and college students' perceptions of social support. The Physical Activity Rating Scale (PARS-3), Perceived Social Support Scale (PSSS), and Social-Emotional Competence Scale for Chinese College Students (SECS) were used to investigate 408 college students in Jiangsu, Shandong, and Hubei. The results found that: (1) the amount of physical activity significantly and positively predicted college students' comprehension of social support after controlling for demographic variables such as education and professional category (β = 0.11, t = 3.99, P < 0.001); (2) socio-emotional competence mediated the role of physical activity and college students' comprehension of social support, with a mediating effect size of 54.33%, and a 95% CI of [0.101, 0.180]; (3) Gender plays a moderating role between physical activity and college students' comprehension of social support (t = 2.01, P < 0.05). The results of this study indicate that physical activity not only directly affects college students' perceptual social support, but also indirectly affects college students'

perceptual social support through socio-emotional competence; gender has a significant moderating effect on the direct effect of physical activity on college students' perceptual social support. Specifically, female students had a more significant positive predictive effect on perceptual social support than male students.

被动干扰会引发主动行为吗？科技干扰对青少年手机冷落行为的影响

詹永吉[1]　何安明[1](通讯作者)
1 信阳师范大学教育科学学院，信阳，464000，anming.he@163.com

摘 要　随着智能手机和社交网络的不断普及，手机冷落行为已经蔓延至世界各地，该行为正逐渐成为一种社会常态，在青少年群体中已经非常普遍。手机冷落行为是指个体在与他人交流时全神贯注于自己的智能手机，避免与他人进行沟通交流的现象。而手机冷落行为作为一种普遍的社会现象，现有研究缺乏社会环境层面对其影响的探讨和解释。研究科技干扰（社会环境因素）对其的影响作用和其中的作用机制具有一定理论和现实意义。本研究主要基于社会交换理论，探讨科技干扰与青少年手机冷落行为的关系，并在此基础上建构了有调节的中介模型，考察无手机恐惧的中介作用和环境敏感性、社会比较倾向的调节作用。研究采用科技干扰量表、环境敏感性量表、社会比较倾向量表中文版、无手机恐惧量表中文版和手机冷落行为量表中文版对 5070 名青少年进行调查。结果显示：（1）在控制性别和年龄之后，科技干扰显著正向影响青少年手机冷落行为；（2）无手机恐惧在科技干扰与青少年手机冷落行为之间起到部分中介的作用；（3）环境敏感性和社会比较倾向分别调节“科技干扰→无手机恐惧→手机冷落行为”这一中介作用的前半段路径和后半段路径。简而言之，科技干扰与无手机恐惧之间既存在中介效应，又存在调节效应。该研究揭示了科技干扰与手机冷落行为的关系及其个体差异，为降低青少年的手机冷落行为提供实证支持和理论依据。

Does Passive Interference Induce Active Behavior？The Influence of Technoference on Phubbing among Adolescents

Zhan Yongji, He Anming
School of Education Science, Xinyang Normal University, Xinyang 464000, China

Abstract: With the increasing popularity of smartphones and social networks, phubbing has spread all over the world, and it is gradually becoming a social norm, which has become very common among adolescents. Phubbing refers to the phenomenon that individuals focus on their smart phones when communicating with others and avoid communicating with others. However, as a common social phenomenon, the existing researches lack the discussion and explanation on the influence of social environment. It is of theoretical and practical significance to study the influence of technoference (social environmental factors) on it and its mechanism. Based on the social exchange theory this study explores the relationship between technoference and adolescents' phubbing. On this basis, a moderated mediation model is constructed to investigate the mediating effect of nomophobia and the moderating effect of environmental sensitivity and social comparison orientation. This study used the Technoference Scale, Environmental Sensitivity Scale, Social Comparative Orientation Scale, Chinese Version of

Nomophobia Scale and Phubbing Scale to survey 5070 teenagers study. The results showed that: (1) At the control of gender, age, technoference significantly negatively predicted adolescents' phubbing; (2) Nomophobia partially mediated the relationship between technoference and phubbing; (3) The direct and second half of the mediating pathways of technoference, nomophobia, and adolescents' phubbing were moderated by environmental sensitivity and social comparison orientation. In short, there are both mediating and moderating effects between technoference and adolescents' phubbing. This study revealed the relationship between technoference and the adolescents' phubbing and the individual differences, provided an empirical basis for improving the adolescents' phubbing.
Key words: technoference, environmental sensitivity, nomophobia, phubbing; adolescents

大五人格与错失恐惧：一项系统评价与元分析

张万双[1]　贺璐佳[1]　陈雨舟[1]　高雪梅[2]（通讯作者）
1 西南大学心理学部，重庆，400700
2 西南大学心理学部，重庆，400700，38153531@qq.com

摘 要　**背景**：错失恐惧是一种普遍的忧虑，即担心错过当自己不在场时的有益经历。在当今数字媒体时代，错失恐惧已成为一种常见现象，特别是在社交媒体的普及之下，错失恐惧现象引起了心理学领域的广泛研究。基于 I-PACE 模型，人格特质被理解为个体的个人特征，而错失恐惧则可被视为在人格特质的影响下产生的情感和认知变量，因此有助于更好地探索错失恐惧对问题性行为的影响。然而，关于大五人格与错失恐惧之间的关系，目前的研究结果存在较大差异，并且缺乏系统评价来验证二者之间的关联。**目的**：本研究旨在通过元分析方法探索大五人格特征与错失恐惧之间的关联强度，并探讨可能的调节因素。**方法**：本研究基于 21 项实证研究（N=13453），采用元分析方法进行定量分析。方法遵循系统审查和元分析（PRISMA）声明的指南，并将研究方案预先注册在国际系统评价前瞻性登记册（PROSPERO）上。**结果**：利用随机效应模型进行分析，结果显示尽责性与错失恐惧呈显著的负相关（r = -0.119，95% CI [-0.200, -0.036]），神经质与错失恐惧呈显著的正相关（r = 0.295，95% CI [0.146, 0.431]）。然而，宜人性、外向性和开放性与错失恐惧之间没有显著相关性。此外，发展阶段、文化构建和大五人格量表类型在调节大五人格与错失恐惧之间关联的过程中发挥着显著作用。**结论**：本元分析的结果表明尽责性可被视为错失恐惧的保护因素，而神经质可被视为错失恐惧的危险因素。这些发现提示，培养个体的自控能力、减少社交焦虑可能有助于减轻错失恐惧现象。

Big Five Personality and Fear of Missing Out: A Systematic Review and Meta-Analysis

Wanshuang Zhang[1]　Lujia He[1]　Yuzhou Chen[1]　Xuemei Gao[2] (Corresponding author)
1 Faculty of Psychology, Southwest University, Chongqing, 400700
2 Faculty of Psychology, Southwest University, Chongqing, 400700, 38153531@qq.com

Abstract **：** BACKGROUND: Fear of missing out is a generalized concern about missing out on beneficial experiences when one is not present. In today's digital media age, fear of missing out has become a common phenomenon, especially with the popularity of social media, and the phenomenon of fear of missing out has

attracted extensive research in the field of psychology. Based on the I-PACE model, personality traits are understood as personal characteristics of an individual, whereas fear of missing can be viewed as an affective and cognitive variable that arises under the influence of a personality trait, thus helping to better explore the impact of fear of missing out on problematic behaviors. However, there is a large discrepancy in the current findings regarding the relationship between Big Five personality and fear of missing out and a lack of systematic evaluations to validate the association between the two. OBJECTIVE: The aim of this study was to explore the strength of the association between Big Five personality traits and fear of missing out through a meta-analytic approach and to explore possible moderating factors. METHODS: This study was based on 21 empirical studies (N = 13,453) that were quantitatively analyzed using meta-analytic methods. The methodology followed the guidelines of the systematic review and meta-analysis (PRISMA) statement and the study protocol was pre-registered in the Prospective International Registry for Systematic Evaluation (PROSPERO). RESULTS: Analyses using a random-effects model showed that due conscientiousness was significantly and negatively associated with fear of missing out (r = -0.119, 95% CI [-0.200, -0.036]) and neuroticism was significantly and positively associated with fear of missing out (r = 0.295, 95% CI [0.146, 0.431]). However, there was no significant correlation between agreeableness, extraversion, and openness and fear of missing out. Furthermore, developmental stage, cultural constructs, and the Big Five personality scale types played a significant role in moderating the association between Big Five personality and fear of missing out. CONCLUSION: The results of this meta-analysis suggest that conscientiousness can be considered a protective factor for fear of missing out, whereas neuroticism can be considered a risk factor for fear of missing out. These findings suggest that developing self-control and reducing social anxiety in individuals may help to reduce the phenomenon of fear of missing out.

学龄前校外培训参与时间对儿童入学准备的影响：自我效能感的中介作用

鞠亦南[1]　史瑾[2]（通讯作者）

1 首都师范大学学前教育学院，北京，100048

2 首都师范大学学前教育学院，北京，100048，shijin365@aliyun.com

摘 要　“双减”政策颁布后，校外培训得到一定的治理，但在学前阶段，仍有许多家长基于“帮助孩子做好入学准备”的初衷，让儿童花较多时间参加各类校外培训。在影响儿童入学准备的因素中，校外培训究竟起到多少作用？是否参与校外培训时间越长，儿童入学准备效果越好？已有对儿童入学准备影响的研究较多关注的是外界的因素，如家庭、学校等，较少关注儿童发展的内在机制。儿童的自我效能感即是处于不同环境中，儿童对自己行为组织和坚持能力的一种信心。自我决定理论认为幼儿主动学习的内部动机得益于其心理需求的满足，包括自主感、能力感和归属感等。因此，儿童的自我效能感是否也会影响其入学准备？基于这些问题，本研究采用问卷调查法对 998 名学前儿童及其家庭进行调查，旨在探明校外培训参与时间与儿童入学准备之间的作用机制。结果发现：（1）学龄前校外培训参与时间对儿童入学准备有正向预测作用，但对入学准备中的生活准备没有显著影响。（2）校外培训参与时间、自我效能感与儿童入学准备有显著的正相关关系，儿童自我效能感越高，入学准备水平越好，其作用机制效应量大于校外培训参与时间的作用。（3）自我效能感在学龄前校外培训参与时间与儿童入学准备间起到部分中介作用。且在身心准备、社会准备和学习准备间都存在部分中介作用。研究结果启示：在影响儿童入学准备的相关因素中，儿童内

部心理机制可能是影响儿童各方面能力发展的重要途径，研究结果也启示家长要理性选择校外培训，合理安排儿童的各类活动时间。

The Effect of Participation Time in Preschool Extracurricular Activities on School Readiness: The Mediating Role of Self-efficacy

Ju Yinan[1]　Shi Jin[1]（Corresponding author）

1 College of Preschool Education, Capital Normal University, Beijing, 100048

Abstract：After the promulgation of the "double reduction" policy, extracurricular activities has been effectively governed, but in the preschool stage, there are still many parents based on the original intention of "helping children get ready for school", so that children spend more time to participate in various extracurricular activities. How much of the role does extracurricular activities play in influencing children's school readiness? Does the longer the children participate in extracurricular activities, the better their readiness for school? Existing studies on the influence of children's school readiness focus more on external factors, such as family and school, and less on the internal mechanism of children's development. Children's self-efficacy is a kind of confidence in their ability to organize and persist their behavior in different environments. According to the self-determination theory, the internal motivation of children's active learning benefits from the satisfaction of their psychological needs, including the sense of autonomy, competence and belonging. So does a child's self-efficacy also affect their readiness for school? Based on these questions, this study investigated 998 preschool children and their families by using a questionnaire to explore the mechanism of the relationship between extracurricular activities participation time and children's school readiness. The results showed that: (1) The participation time of preschool extracurricular activities had a positive predictive effect on school readiness, but had no significant effect on life readiness. (2) There is a significant positive correlation between extracurricular activities participation time and self-efficacy and children's school readiness. The higher children's self-efficacy is, the better their school readiness level is, and its effect is larger than the extracurricular activities participation time. (3) Self-efficacy plays a partial mediating role in the relationship between the participation time of preschool extracurricular activities and children's school readiness. It also plays a partial mediating role between physical and mental readiness, social readiness and learning readiness. The research results suggest that among the factors affecting children's school readiness, children's internal psychological mechanism may be an important way to affect children's ability development in all aspects. The research results also suggest that parents should rationally choose extracurricular activities and reasonably arrange children's various activities.

粗暴养育与青少年消极社会适应的关系：自我厌恶和友谊质量的作用

耿影慧　张野（通讯作者）刘致宏　张安鸽

沈阳师范大学教育科学学院，沈阳，110034，zhangye_psy@163.com

摘 要 儿童青少年的社会适应一直是心理学重点关注的方向。社会适应是衡量个体生存质量与社会化发展程度的重要指标，也是反映个体身心健康的重要表现。青少年时期是适应不良的高发期，社会适应不良则更容易使青少年罹患焦虑、抑郁等情绪障碍及问题行为；因此探究青少年消极社会适应的产生机制，寻求促进青少年社会适应的积极因素便显得尤为重要。本研究通过整群抽样方式，采用粗暴养育问卷、自我厌恶量表、友谊质量量表和消极社会适应问卷表对 925 名中学生进行问卷调查。通过 SPSS25.0 和 Mplus8.0 软件对数据进行处理和分析，探讨粗暴养育对青少年消极社会适应的影响，以及自我厌恶和友谊质量的作用。在控制性别和年龄后，结果表明：(1)粗暴养育正向预测青少年的消极社会适应；(2)自我厌恶在粗暴养育与消极社会适应之间起部分中介作用；(3)友谊质量调节了粗暴养育通过自我厌恶影响消极社会适应中介过程的前半段路径和后半段路径。研究最终梳理出一条“消极父母养育→不良人格发展→负性适应结果”的理论作用机制，同时揭示了高质量同伴关系的正向缓冲作用。该结果提示家长应重点关注青少年的社会适应问题，营造良好的家庭氛围，降低青少年家庭风险因素；同时家校一体从实践出发为青少年消极社会适应制定有效干预方案，共同关注青少年的学习和成长。

The Relationship between Harsh Parenting and Adolescents' Social Maladjustment: the Role of Self-disgust and Friendship Quality

GENG Yinghui, ZHANG Ye, LIU Zhihong, ZHANG Ange

College of Education Science, Shenyang Normal University, Shenyang, 110034, zhangye_psy@163.com

Abstract: Social adaptation of children and adolescents has always been the direction of psychological focus. Social adaptation is an important indicator of an individual's quality of life and socialization, and also an important manifestation of an individual's physical and mental health. Adolescence is a period of high incidence of maladjustment, and social maladjustment is more likely to cause adolescents to suffer from emotional disorders and problematic behaviors such as anxiety, depression, etc. Therefore, it is particularly important to explore the mechanism of adolescents' social maladjustment and to seek for positive factors to promote adolescents' social adaptation. In this study, 925 secondary school students were surveyed by using the Rough Parenting Questionnaire, the Self-Absorption Scale, the Friendship Quality Scale and the Negative Social Adaptation Questionnaire in a whole group sampling method. Data were processed and analyzed through SPSS 25.0 and Mplus 8.0 software to explore the effects of rough parenting on adolescents' social maladjustment and the role of self-disgust and friendship quality. After controlling for gender and age, the results indicated that: (1) Harsh parenting significantly positively predicted social maladjustment among adolescents; (2) Self-disgust was the mediator between harsh parenting and social maladjustment; (3) Friendship quality moderated the relation between harsh parenting and self-disgust.The study combs out a theoretical mechanism of "negative parenting→adverse personality development→negative adaptive outcome" and the positive moderating effect of high friendship quality. The results suggest that parents should pay more attention to adolescents' social adjustment problems, create a good family atmosphere, and reduce adolescents' family risk factors; meanwhile, home and school should work together to formulate an effective intervention program for adolescents' negative social adjustment from the perspective of practice, and pay attention to adolescents' learning and growth together.

***Keywords*:** Harsh parenting, Social maladjustment, Self-disgust, Friendship quality, Adolescents

校园欺凌受害对青少年恶意创造力的影响：愤怒反刍的中介作用和社

会善念的调节作用

杨薇静 田鑫 胡东 郭英（通讯作者）
四川师范大学心理学院，成都，610066，E-mail：guoying517@163.com

摘 要 恶意创造力是个体以蓄意伤害他人为目的而产生的新颖想法，其行为表现包括恐怖袭击、电信诈骗、恶意中伤和撒谎等。研究表明，童年期创伤与恶意创造力显著正相关，而同样作为个体早期创伤经历的校园欺凌受害与恶意创造力的关系尚不清楚。同时鉴于青少年兼具高创造和高叛逆双重特性，本研究将青少年作为研究对象。基于影响创造力的 4P 模型、一般压力理论和挫折-攻击理论，考察校园欺凌受害与恶意创造力的关系，以及愤怒反刍和社会善念在其中的作用机制。采用《特拉华欺凌受害量表（学生卷）》、《愤怒反刍思维量表》、《社会善念自陈量表》和《恶意创造性行为量表》对 1019 名青少年进行问卷调查。通过构建一个有调节的中介效应模型,检验愤怒反刍在校园欺凌受害和恶意创造力之间的中介作用,以及社会善念对上述中介路径的调节作用。研究发现，青少年校园欺凌受害与恶意创造力显著正相关；愤怒反刍在校园欺凌受害和恶意创造力之间起部分中介作用，中介效应占总效应的 65.68%；有调节的中介检验进一步表明，社会善念调节中介模型的后半段路径，社会善念水平越高，愤怒反刍对恶意创造力的影响越弱。即校园欺凌受害可以直接预测恶意创造力，也可以通过愤怒反刍的中介作用间接预测恶意创造力；愤怒反刍影响恶意创造力的路径受到社会善念的调节。通过了解校园欺凌受害对恶意创造力的影响机制，对阻止校园欺凌事件进入恶行循环模式，以及未来对促进校园欺凌中受害者身心健康发展提出更有效的措施具有重要现实意义。

关键词 校园欺凌受害，恶意创造力，愤怒反刍，社会善念

The relationship between school bullying victimization and malevolent creativity：a moderated mediation

Yang Weijing Tian Xin Hu Dong Guo Ying
College of Psychology, Sichuan Normal University, Chengdu 610066

Abstract: Malevolent creativity refers to novel ideas generated by individuals with the intent to deliberately harm others, manifested through behaviors including terrorist attacks, Telecom fraud, malicious slander, and lying etc. Researches show that childhood trauma is significantly positively correlated with Malevolent creativity. However, the relationship between school bullying victimization, also an early trauma experience, and Malevolent creativity remains unclear. Given that adolescents possess dual characteristics of high creativity and high rebelliousness, this study focused on adolescents as research subjects. Based on the 4P's model of creativity, A General Strain Theory, and the Frustration-Aggression Theory, this study examined the relationship between school bullying victimization and Malevolent creativity, as well as the mediating roles of anger rumination and social mindfulness. Questionnaire surveys using the Chinese Version of Delaware Bullying Victimization Scale-student in Adolescents, Anger Rumination Scale, Social Mindfulness Self-Report Scale, and Malevolent Creativity Behavior Scale were conducted with 1019 adolescents. A moderated mediation model was constructed to test the mediating effect of anger rumination between school bullying victimization and Malevolent creativity, and the moderating effect of social mindfulness on this mediation pathway. Results showed school bullying victimization was significantly positively correlated with Malevolent creativity. Anger rumination partially mediated the relationship between school bullying victimization and malicious creativity, accounting for 65.68% of the total effect. The moderated mediation analysis further indicated that social mindfulness moderated the latter half of the

mediation model's pathway, such that higher social mindfulness weakened the influence of anger rumination on Malevolent creativity. In summary, school bullying victimization could directly and indirectly through anger rumination predict malicious creativity; the pathway from anger rumination to Malevolent creativity was moderated by social mindfulness. Understanding the mechanisms linking school bullying victimization and Malevolent creativity has important practical implications for interrupting the vicious cycle of school bullying and developing more effective interventions to promote the well-being of victims.
Keywords: School Bullying Victimization, Malevolent Creativity, Anger Rumination, Social Mindfulness

亲子情绪对话在父母元情绪理念与儿童情绪调节关系中的作用

摘 要　近年来，幼儿的情绪健康发展成为社会关注的焦点。情绪调节作为帮助个体调节自身情绪状态的能力，对幼儿的情绪社会性发展具有重要影响。已有研究表明，父母的情绪理念可以影响幼儿情绪调节的发展，而亲子情绪对话作为父母关键的情绪社会化行为，又在元情绪理念和情绪调节发展之间发挥重要作用。基于此，本研究从亲子情绪对话入手，探究对话频率、内容和类型在父母元情绪理念与儿童情绪调节中的作用。

研究一测查了亲子情绪对话的频率在父母元情绪理念与儿童情绪调节中的作用，通过网络向 228 名 2-7 岁儿童的父母发放问卷。研究结果表明：父母情绪紊乱理念能够显著负向预测亲子情绪对话的频率和儿童情绪调节性，亲子情绪对话的频率能够显著正向预测儿童情绪调节性。亲子情绪对话的频率在父母情绪紊乱理念与儿童情绪调节关系中的中介作用显著。研究二测查了亲子情绪对话的内容在父母元情绪理念与儿童情绪调节中的作用，线下招募了 52 名 2-7 岁儿童及其家长进行游戏，并对亲子对话内容进行录像编码。研究结果表明：父母情绪词汇在情绪摒除理念与儿童中性调节策略中存在显著的调节效应。当父母表达的情绪词汇越多时，情绪摒除理念对儿童中性调节策略的正向预测作用显著。但父母表达的情绪词汇较少时，情绪摒除理念对儿童中性调节策略不具有预测作用。儿童情绪因果在父母情绪摒除理念与消极调节策略中起调节作用，父母情绪词汇在情绪摒除理念与儿童中性调节策略中起调节作用。研究三对亲子对话中的心理状态话语（愿望语言、知觉语言和认知语言）进行编码，更系统地研究了情绪对话在父母元情绪理念与儿童情绪调节关系中的作用。研究结果表明：亲子间陈述·不当回应对话类型在父母情绪教导理念与儿童积极调节策略关系中起调节作用。亲子使用的陈述·不当回应类型较多时，情绪教导理念对儿童积极调节策略具有显著的正向预测作用，亲子使用的陈述·不当回应类型少时，情绪教导理念对儿童积极调节策略不具有预测作用。

The Role of Parent-Child Emotional Dialogue in the Relationship Between Parental Meta-Emotional Concepts and Children's Emotion Regulation

Chengxiang Pei[1]　Yingyu Sun[2]　Yifang Wang*

College of Preschool Education, Capital Normal University, Beijing, 100048
School of Psychology, Capital Normal University, Beijing, 100048

Abstract：In recent years, the emotionally healthy development of young children has become a focus of social concern. Emotion regulation, as the ability to help individuals regulate their own emotional states, has an important impact on young children's emotional social development. It has been shown that parents' emotional philosophy can influence the development of emotion regulation in young children, and parent-child emotion dialogue, as a key emotional socialisation behaviour of parents, plays an important role between meta-emotional philosophy and emotion regulation development. Based on this, the present study began with parent-child emotion dialogue to investigate the role of dialogue frequency, content, and type in parental meta-emotional philosophy and children's emotion regulation.

Study 1 measured the role of frequency of parent-child emotion dialogue in parental meta-emotional concepts and children's emotion regulation by distributing a questionnaire via the Internet to 228 parents of children aged 2-7 years. The results of the study showed that parental emotion disorder philosophy significantly negatively predicted the frequency of parent-child emotion dialogue and children's emotion regulation, and the frequency of parent-child emotion dialogue significantly positively predicted children's emotion regulation. The frequency of parent-child emotion dialogue mediated the relationship between parental emotion disturbance concepts and children's emotion regulation. Study 2 measured the role of the content of parent-child emotion dialogues in the relationship between parental meta-emotional concepts and children's emotion regulation. 52 children aged 2-7 years and their parents were recruited offline to play the game and the content of parent-child dialogues was video-coded. The results of the study showed that there was a significant moderating effect of parental emotional vocabulary in the emotional dismissal concept and children's neutral regulation strategies. When parents expressed more emotional vocabulary, emotional dismissal concepts positively predicted children's neutral regulatory strategies. However, when parents expressed less emotional vocabulary, emotion exclusion concepts were not predictive of children's neutral regulatory strategies. Children's emotional causation moderated parental emotion dismissal concepts and negative regulation strategies, and parental emotion vocabulary moderated emotion dismissal concepts and children's neutral regulation strategies. Study 3 coded mental state discourse (wish language, perceptual language, and cognitive language) in parent-child dialogues to more systematically examine the role of emotional dialogue in the relationship between parental meta-emotional ideas and children's emotion regulation. Findings suggest that the type of parent-child stated-inappropriate response dialogue plays a moderating role in the relationship between parental emotion teaching concepts and children's positive regulation strategies. Emotion teaching concepts were significant positive predictors of children's positive regulation strategies when parents and children used more types of stated-inappropriate responses, and emotion teaching concepts were not predictive of children's positive regulation strategies when parents and children used fewer types of stated-inappropriate responses.

父母冲突对高中生网络欺凌的影响：一个有调节的中介模型

王晨 张野（通讯作者）原筱婷
沈阳师范大学教育科学学院，沈阳 110034，zhangye_psy@163.com

摘 要 随着互联网技术的快速发展，传统欺凌已悄然向网络空间转移。近几年来，网络欺凌所引发的内外化问题备受关注，其产生机制也逐渐成为重要议题。已有研究从家庭教养方式、道德推脱等探寻其对网

络欺凌的影响，而少有研究涉及不良父母关系、网络道德、学校支持与网络欺凌的关系。本研究探讨父母冲突与网络欺凌间的关系及网络道德与学校支持的作用。采用父母婚姻冲突子女感知量表、网络欺凌量表、网络道德问卷、学校支持问卷，通过整群抽样法对辽宁省 1025 名高中生进行问卷调查，使用 SPSS25.0 和 AMOS24.0 软件对数据进行录入和分析。结果表明：(1)父母冲突、网络道德、学校支持与网络欺凌两两间均呈显著相关；(2)父母冲突正向预测网络欺凌，网络道德在父母冲突与网络欺凌间起中介作用；(3)学校支持在中介后半段路径上以及直接效应上均起到调节作用。研究最终梳理出一条学校支持在“负面家庭关系→负面网络道德→网络欺凌行为”中调节作用的理论机制，该结果提示要重视学校内部人际关系支持在青少年网络欺凌防御中的积极作用。此外，还需进一步关注青少年网络人际关系及其家庭内部关系，并通过家校联合塑造培养青少年网络道德，深化德育教育并针对青少年网络欺凌行为进行有效的干预计划，构建良好的学校教育生态。

The Impact of Parental Conflict on Cyberbullying Among High School Students: A Moderated Mediation Model

WANG Chen, ZHANG Ye, YUAN Xiaoting

College of Education Science, Shenyang Normal University, Shenyang, 110034, zhangye_psy@163.com

Abstract: With the rapid development of Internet technology, traditional bullying has quietly shifted to cyberspace. In recent years, the internalization and externalization problems caused by cyberbullying have attracted much attention, and its generating mechanism has gradually become an important topic. Some studies have explored the effects of family parenting styles and moral excuses on cyberbullying, while few studies have addressed the relationship between poor parental relationships, internet morality, school support and cyberbullying. This study explores the relationship between parental conflict and cyberbullying and the role of internet morality and school support. The Children's Perception of Parental Marital Conflict Scale, Cyberbullying Scale, Internet Morality Questionnaire, and School Support Questionnaire were used to conduct a questionnaire survey on 1025 high school students in Liaoning Province through the whole cluster sampling method, and the data were entered and analyzed using SPSS25.0 and AMOS24.0 software. The results showed that (1) parental conflict, internet morality, school support and cyberbullying were significantly correlated with each other; (2) parental conflict positively predicted cyberbullying, and internet morality mediated the relationship between parental conflict and cyberbullying; (3) school support moderated the second half of the path of the mediator as well as the direct effect. The study finally identified a theoretical mechanism for the moderating role of school support in "negative family relationships → negative internet morality → cyberbullying", which suggests that it is important to pay attention to the positive role of interpersonal support within the school in adolescents' defense against cyberbullying. In addition, it is also necessary to pay more attention to adolescents' interpersonal relationships on the Internet and their intra-family relationships, and to shape and cultivate adolescents' internet morality through the joint efforts of home and school, deepen moral education and carry out effective intervention programs for adolescents' cyberbullying behaviors, so as to build up a good ecology of school education.

道家人格与大学生婚恋焦虑的关系：情绪调节与身体自尊的链式中介作用

邓皖潼[1]　王磊[1]（通讯作者）
1 武汉体育学院心理学系，武汉，430079，378299706@qq.com

摘 要　根据埃里克森人格发展理论，个体在大学阶段的主要任务是获得亲密感,避免孤独感,体验爱情的实现。婚恋焦虑是大学生焦虑的重要来源，长期的持续性的婚恋焦虑对大学生的身心健康造成不利影响。道家人格是指在道家思想文化的影响下形成的一种人格特质,这种人格特质强调不过分要求与责备自己, 为人大度、处世豁达。拥有高水平道家人格的个体往往对自己的身形更不苛刻，情绪调节能力更强，焦虑水平更低，在面临婚恋焦虑时更容易平和对待、解决冲突。道家人格与大学生婚恋焦虑之间的关系目前仍缺乏深入分析。鉴于此，本研究采用问卷法，试图从心理层面着手探究道家人格影响大学生婚恋焦虑的具体作用机制，以期为大学生婚恋焦虑问题的实际干预提供科学的理论依据。

选取两所高校的在校大学生和硕士生进行问卷调查，最终获得有效问卷 611 份，其中文化生 224 名，体育生 387 名。采用《道家人格量表》、《应对方式量表》、《身体自尊量表》和《婚恋焦虑量表》,要求调查对象进行自我报告。使用 SPSS 和 PROCESS 宏程序进行数据的整理与分析，先进行信效度检验、描述性统计、相关分析、回归分析，再采用 Bootstrap 检验中介效应模型。

相关分析发现，道家人格、情绪调节、身体自尊、婚恋焦虑均两两相关。回归分析表明，道家人格可以负向预测婚恋焦虑。中介效应检验结果表明，其中道家人格对婚恋焦虑的总效应为-0.302，在模型引入情绪调节和身体自尊之后，直接效应变为-0.150；情绪调节和身体自尊在道家人格对婚恋焦虑的间接效应为-0.152，效应量（即中介效应占总效应的百分比）为：50.3%。以上结果表明，道家人格对大学生婚恋焦虑的影响是通过情绪调节和身体自尊的中介作用,以及两者间的链式中介作用得以实现的。

关键词　大学生，道家人格，婚恋焦虑，情绪调节，身体自尊

The Relationship between Daoist Personality and Marriage Anxiety: Chain Mediation of Emotional Regulation and Body Esteem

Wantong Deng[1]　Lei Wang[1] (Corresponding Author)
1 Department of Psychology, Wuhan Sports University, Wuhan, 430079

Abstract：According to the Erik Erikson's Theory of Psychosocial Development, college students are in the sixth stage of development. During this stage, the major conflict centers on forming intimate, loving relationships with other people. Marriage anxiety is the main type of anxiety among college students, and long-term marriage anxiety will have adverse effects on the physical and mental health of college students. Daoist personality is a personality trait originating from Taoist philosophy which is emphasized that we should living life kindly, compassionately, gracefully, never striving to be first. Individuals with higher levels of Daoist personality tend to be less strict with their body shape, have stronger ability to regulate emotions, and are more likely to handle and resolve conflicts peacefully when facing marriage anxiety. The relationship between Daoist personality and college students' marriage anxiety is currently lacking in-depth research. Therefore, this study tried to explore the mechanism of the influence of Daoist personality on college students' marriage anxiety from a psychological perspective by

questionnaire method, in order to provide a scientific theoretical basis for practical intervention in college students' marriage anxiety.

Questionnaire surveys were conducted among undergraduate students and master's students from two universities. In the end, 611 valid questionnaires were obtained, including 224 normal students and 387 students with PE specialty. Daoist Personality Scale, Abbrieviated Self-reported Coping Scale, Body Esteem Scale and Marriage Anxiety Scale were used to require respondents to conduct self reporting. SPSS 26.0 and PROCESS macro programs were used for data analysis includes evaluation on reliability and validity, descriptive statistics, correlation analysis, regression analysis and mediating effect test.

Correlation analysis showed that all correlations between the four variables are significant. Regression analysis showed that Daoist personality can negatively predict marital anxiety. By means of analysis of mesomeric effect, it can be found that Daoist personality have indirect effects on marriage anxiety through emotional regulation and body esteem respectively and sequentially. In the serial mediation model, the total effect of Daoist personality on marriage and love anxiety is -0.302, the direct effect is -0.150, the indirect effect is -0.152, and the amount of effect (that is, the percentage of mesomeric effect in the total effect) is 50.3%.

师生关系与学龄儿童学业适应的双向关系：基于随机截距交叉滞后模型的分析

邢秀，邢晓沛（通讯作者）

首都师范大学心理学院，北京，100048，xingxiaopei2006@126.com

摘 要 师生关系对学生学业适应的重要作用已得到众多研究的支持，但相关研究主要从个体间层面对两者间的关系进行了揭示，尚未有研究从个体内水平对师生关系与学龄儿童学业适应的双向关系进行探讨。基于生态系统理论，个体和环境因素是相互影响的。基于此，本研究采用追踪研究设计和随机截距交叉滞后模型（RI-CLPM）从个体间和个体内层面上揭示师生关系与学龄儿童学业适应之间的双向互动关系，并进一步考察了个体内层面的动态性双向互动效应是否会因师生关系维度和儿童性别而不同。本研究对 519 名中国学龄儿童（$M_{年龄}$ = 10.35, 51.6% 为男生）进行为期半年（共 3 个时间点）的追踪测查，采用师生关系量表测查师生关系，采用小学生心理素质量表测查学生学业适应。采用 RI-CLPM 分别建构师生冲突或亲密和学生学业适应的模型。结果发现：在个体间水平上，师生冲突和师生亲密与学生学业适应均显著相关。在个体内水平上，前一个时间点师生冲突的减少和师生亲密的增加可以显著预测后一个时间点学生学业适应的增加，但前一个时间点学生学业适应的增加只能显著预测后一个时间点师生冲突的减少。此外，师生冲突和师生亲密在三个时间点内相对稳定。最后，多群组分析结果发现上述关系中无明显的性别差异。总之，本研究创新性地从个体内水平揭示了师生关系与学龄儿童学业适应之间存在双向关系，并且双向关系在师生亲密与师生冲突维度上存在不同模式。研究结果表明，师生关系质量的提高有助于促进学龄儿童学业适应，进而减少后续的师生冲突，但并不必然会增强师生亲密。

Reciprocal Relations between Teacher-student Relationships and School-aged Children's Learning Adaptation: Based on the Random Intercept Cross-Lagged Panel Model Analysis

Xing Xiu, Xing Xiaopei (corresponding author)
School of Psychology, Capital Normal University, Beijing 100048, China

***Abstract*:** Previous studies have supported the important roles of teacher-student relationships in student's learning adaptation, but most of them examined this issue at the between-person level. To date, few studies separated within-person variance from between-person variance to explore the dynamic reciprocal relations between the above two constructs. Given individual and contextual factors are influenced reciprocally based on ecological system theory, we conducted a short-term longitudinal study (three waves, 3 months apart) to explore whether the relations between teacher-student relationships and school-aged children's learning adaptation were reciprocal and whether the relations would differ by teacher-student relationships dimensions and child gender. Random-intercept cross-lagged panel model (RI-CLPM) was used to investigate the hypothesized reciprocal relations. Five hundred and nineteen Chinese elementary school students (*M*age = 10.35, 51.6% boys) participated in the survey. Student's perceptions of the quality of their relationship with teachers was assessed by the Teacher-Student Relationship Questionnaire (STRQ) and learning adaptation was assessed by the learning adaptation subscale from Pupils' Psychological Suzhi Scale (PPSS). Several main results are obtained: (1) At the between-person level, teacher-student conflict and closeness were significantly related to student's learning adaptation; (2) At the within-person level, when teacher-student conflict decreased or teacher-student closeness increased beyond their own average levels, children tended to display subsequent increases in their own average level of learning adaptation; However, changes in learning adaptation only predicted subsequent changes in teacher-student conflict, rather than changes in teacher-student closeness; (3) Positive carry-over stability effects were observed for teacher-student closeness and conflict, but not for learning adaptation; (4) No gender differences existed in the above relations. In conclusion, our findings make an important contribution to our understanding of how teacher-student relationships and children's learning adaptation dynamically related across time periods at intra-individual level and how reciprocal patterns vary according to teacher-student relationship dimensions. A practical implication of this study is that improving the teacher-student relationship quality would help to promote children's learning adaptation, which in turn would reduce the subsequent teacher-student conflict, but not necessarily strengthen the closeness between them.

初中生自尊与负面身体自我的关系：坚韧人格的中介作用

赵娟 丁芳（通讯作者）
苏州大学教育学院心理学系，苏州，215123，dingfang@suda.edu.cn

摘 要 负面身体自我是指对自我消极的身体意向，包括消极的认知、情感体验和相应的行为控制。近几年由负面身体自我引起的心理行为障碍和身心疾病的案例越来越多，并表现出明显的低龄化。因此，对初中生负面身体自我的影响因素及内在机制进行探讨对于提高其心理健康水平具有重要意义。研究发现，自尊是负面身体自我的影响因素之一，两者之间的关系非常密切。低自尊个体可能更易受到外界环境的影响，从而引发对自我身体的不满。虽然国内外对自尊与负面身体自我的相关研究较多，但自尊与负面身体自我之间作用机制的探讨仍需进一步深入。坚韧人格是能够保护个体自身免受各种应激伤害的一种积极人格特质。研究发现，自尊与坚韧人格之间存在显著的正相关。虽然坚韧人格与负面身体自我之间的相关实证研究较少，但根据坚韧人格的含义，可以推测当个体面对体重增加、容貌焦虑等应激事件时，坚韧人格能够使个体保持积极乐观的心态，并及时调整自身心理或行为状态，转变对身体自我的消极认知。本研究做出

假设：坚韧人格在自尊与负面身体自我之间起中介作用。因此，本研究以 590 名初中生为研究对象，采用自尊量表、坚韧人格量表、以及负面身体自我量表探讨初中生自尊、坚韧人格和负面身体自我的关系以及坚韧人格在自尊与负面身体自我之间的中介作用。研究结果表明：（1）初中生自尊、坚韧人格与负面身体自我呈显著负相关，自尊与坚韧人格呈显著正相关；（2）坚韧人格在自尊与负面身体自我之间起部分中介作用。由此得出，自尊不仅直接影响初中生负面身体自我，还可以通过坚韧人格对其产生影响。本研究启示我们，在初中生发展过程中，学校及家庭可通过丰富教育内容或加强体育锻炼来提高学生自尊与坚韧人格水平，引导他们增强积极应对困境和挫折的能力，提高心理健康水平和积极的心理素质。另外，学校也可以开展相关讲座对学生身体自我的负面认知给予正确的引导和干预，使学生形成积极的身体自我。

The Relationship between Self-esteem and Negative Physical Self of Junior School Students: The Mediating Role of Hardiness Personality

Zhao Juan, Ding Fang
Department of Psychology, School of Education, Soochow University, Suzhou

Abstract: Negative physical self refers to the negative physical intention towards self, including negative cognition, emotional experience and corresponding behavior control. In recent years, there are more and more cases of mental behavior disorders and physical and mental diseases caused by negative physical self, and they have shown obvious younger age. Therefore, it is of great significance to explore the influencing factors and internal mechanism of negative physical self for improving the mental health level of junior school students. Research has found that self-esteem is one of the predictors of body dissatisfaction, and the relationship between the two is very close. Individuals with low self-esteem may be more susceptible to external influences, which may lead to body dissatisfaction. Although there are many researches on self-esteem and negative physical self , the mechanism of action between self-esteem and negative physical self still needs to be further explored. Hardiness personality is a positive personality trait that can protect an individual from various kinds of stress. The study found that there is a significant positive correlation between self-esteem and hardiness personality. Although there are few empirical studies on the correlation between hardiness personality and negative physical self, according to the meaning of hardiness personality, it can be inferred that when individuals face stressful events such as weight gain and appearance anxiety, hardiness personality can make individuals maintain a positive and optimistic attitude, timely adjust their psychological or behavioral states, and change their negative cognition of physical self. This study hypothesized that hardiness personality plays a mediating role between self-esteem and negative physical self. Therefore, this study took 590 junior high school students as the research objects, and used Self-esteem Scale, Hardiness Personality Scale, and Negative Physical Self Scale to explore the relationship between self-esteem, hardiness personality and negative physical self of junior school students, as well as the mediating role of hardiness personality between self-esteem and negative physical self. The results showed that: (1) Self-esteem and hardiness personality were significantly negatively correlated with negative physical self, self-esteem was significantly positively correlated with hardiness personality; (2)

Hardiness personality played a partial mediating role between self-esteem and negative physical self. It can be concluded that self-esteem not only directly affects the negative physical self of junior school students, but also has an impact on negative physical self through hardiness personality. This study reveals that schools and families can improve their self-esteem and hardiness personality level by enriching educational content or strengthening physical exercise, guide them to enhance their ability to actively deal with difficulties and setbacks, and improve their mental health and positive psychological quality in the development process of junior school students. In addition, the school can also arrange relevant lectures to give correct guidance and intervention to students' negative cognition of physical self, so that students can form a positive physical self.

Keywords: self-esteem, negative physical self, hardiness personality, mediating role, junior school students

父母婚姻质量与儿童焦虑的关系：儿童拒绝敏感性的中介作用

郑文杰　钱靖轩　刘文雪　刘莉（通讯作者）

山东师范大学心理学院，济南，250014，liuli3514@126.com

摘 要　家庭系统理论指出儿童适应问题往往与家庭因素相关，其中，父母婚姻关系对儿童适应尤为重要。情绪安全理论强调，父母低婚姻质量会削弱儿童在家庭中的情绪安全感，增加儿童脆弱性，极易导致儿童产生焦虑等心理健康问题。拒绝敏感性模型和认知-情感处理系统理论认为，拒绝敏感性源于个体早期被拒绝的经历，父母低婚姻质量的负面后果可能会产生溢出效应，使儿童感知到拒绝，从而使儿童拒绝敏感性升高，而这可能损害儿童社会情感功能并激活其回避和退缩的防御机制，导致儿童产生更多的焦虑情绪。既有研究大多只关注父母报告的婚姻质量或儿童感知的婚姻质量与儿童焦虑的关系，鲜有研究同时考察父母报告的婚姻质量与儿童感知的父母婚姻质量对儿童焦虑的影响。从父母和儿童的角度同时考察，有助于更全面的了解婚姻质量与儿童焦虑的关系，这也部分支持主客体相互作用的观点。因此，本研究以 526 名小学儿童及其父母为被试，进行连续三次（间隔半年）的追踪测查，同时揭示父母报告的婚姻质量与儿童感知的父母婚姻质量与儿童焦虑之间的关系，以及拒绝敏感性在其中的中介作用。结果发现：（1）父亲和母亲报告的婚姻质量均能显著负向预测儿童焦虑，而儿童感知的婚姻质量对儿童焦虑无直接预测作用；（2）儿童拒绝敏感性在儿童感知的婚姻质量与儿童焦虑的关系中起中介作用，而在父母报告的婚姻质量与儿童焦虑的关系中不起中介作用；（3）多群组分析表明该中介关系不存在显著的儿童性别差异。这一结果提示了同时考察父母报告的婚姻质量与儿童感知的父母婚姻质量对儿童焦虑影响的重要性，并在一定程度上揭示了父母婚姻质量与儿童焦虑之间关系的认知情感作用机制，对于儿童焦虑的预防和干预工作具有重要的实践意义。

Interparental marital quality and children's anxiety: The mediating role of children's rejection sensitivity

Li Liu[1], Wenjie Zheng[1], Jingxuan Qian[1], Wenxue Liu[1]
[1]Department of Psychology, Shandong Normal University, Jinan, China

Abstract: Family systems theory indicates that children's adjustment problems are often associated with family factors, in which the marital relationship is particularly important. The emotional security theory emphasizes that low interparental marital quality undermines children's sense of emotional security in the family relationship. Children's emotional insecurity increases children's vulnerability to internalizing symptoms and takes a variety of forms including anxiety. The rejection sensitivity model and cognitive-affective processing systems theory indicate that rejection sensitivity is considered to stem from an individual's experience of rejection. The negative consequences of low marital quality may have a spill-over effect, which may result in child perceived parental rejection and higher rejection sensitivity. Rejection sensitivity is a defensive motivational system in children, which may dispose the children toward active avoidance and withdrawal, and thus result in increased children's anxiety. Prior research focused on the relations among parent-report marital quality or children perception of interparental marital quality and child anxiety separately. However, less research examined the relations among parent-report marital quality and children perception of interparental marital quality and child anxiety simultaneously. And the current study simultaneously explored the effects of both parent-report marital quality and children's perception of interparental marital quality on children's anxiety to facilitate a more comprehensive understanding of the effects of marital relationship on child anxiety, which partially supports the idea of objective-subjective interaction interactions. Accordingly, the longitudinal data of 526 elementary school-aged children and both their mothers and fathers to explore the relations between interparental marital quality and children's anxiety as well as the mediating role of child rejection sensitivity. The results showed that (1) Both mother-report and father-report marital quality negatively predicted children's anxiety directly, while children's perception of interparental marital quality had no direct effects on child anxiety; (2) Children's perception of interparental marital quality had indirect effects on children's anxiety through their rejection sensitivity, while parent-report marital quality had no indirect effects; (3) The results of the multi-group analysis of child gender differences showed that there is no significant child gender difference in the mediating effects of child rejection sensitivity among parent-report marital quality and children perception of interparental marital quality and child anxiety. These findings not only shed light on the importance of exploring the effects of both mothers' and fathers' self-reported marital quality and children's perception of interparental marital quality on children's anxiety simultaneously, but also provide support for the mediating role of synthetical cognitive-affective state (e.g., rejection sensitivity) in these relations. Some valuable information and practical implications can be originated from the current study for reducing children's anxiety.

Keywords: parent-report marital quality, children perception of interparental marital quality, children's anxiety, children's rejection sensitivity

父母教养压力与协同教养的关系：基于纵向主客体互倚模型的分析

刘文雪　郑文杰　钱靖轩　刘莉（通讯作者）
1 山东师范大学心理学院，济南，250014，liuli3514@126.com

摘 要　教养压力是一种普遍存在的现象，然而高水平的教养压力会对父母的教养行为产生不利影响。已有研究表明，父母教养压力与协同教养关系密切。虽然研究者对父母教养压力与协同教养之间的关系进行了一系列理论探讨和实证研究并获得了一些有价值的研究结论。然而，关于二者间关系的研究大多只关注父母一方或考察二者的单向关系，鲜有研究在中国文化背景下同时考察父母教养压力与协同教养间的主客体效应和双向关系。基于家庭系统理论和溢出交叉假说，个体的情感和行为在影响自身的同时也会影响到伴侣，并且个体子系统（教养压力）与三元子系统（协同教养）间会相互影响，父母高水平的教养压力可能导致其消极协同教养行为的增多，而消极协同教养行为也会加剧父母的教养压力。本研究以 522 名小学儿童的父母为被试进行了连续两次（间隔半年）的追踪调查，在同一模型中考察父母教养压力与协同教养间的主客体效应及双向关系。通过建构纵向主客体互倚模型，本研究得到如下结果：（1）父亲和母亲的教养压力显著负向预测配偶的协同教养（客体效应），母亲的协同教养显著负向预测配偶的教养压力（客体效应），但父母教养压力与协同教养间的主体效应均不显著；（2）父亲教养压力与母亲协同教养在 T1、T2 两个时间点上存在双向关系。具体来说，T1 父亲的教养压力显著负向预测 T2 母亲协同教养；同时，T1 母亲协同教养显著负向预测 T2 父亲教养压力。研究结果揭示了父母教养压力与协同教养间的复杂的关系动态，对于减少父母教养压力以及提高协同教养质量具有重要的实践意义。

Parenting Stress and Coparenting: The Actor-Partner Interdependence Model

Li Liu[1], Wenxue Liu[1], Wenjie Zheng[1], Jingxuan Qian[1]
[1]Department of Psychology, Shandong Normal University, Jinan, China

Abstract：Parenting stress is a prevalent phenomenon; however, high levels of parenting stress have negative influences on parenting behavior for parents. Although parents' parenting stress has been found to be related to coparenting, existing research has mostly focused only on one parent or examined the unidirectional effects between the two factors. There is a lack of studies that simultaneously investigate the actor and partner effects as well as the bidirectional association between parenting stress and coparenting in the context of Chinese culture. Based on the family systems theory, individual emotions and behaviors affect not only themselves but also their partners. Furthermore, the individual subsystem (parenting stress) and the triadic subsystem (coparenting) are mutually influential. High levels of parenting stress between parents may lead to an increase in negative coparenting behaviors, which, in turn, exacerbate their parenting stress. Given above, 522 mother-father dyads with elementary school children were followed for two measurement occasions (half a year apart), and a cross-lagged model in combination with an actor-partner interdependent model (APIM) was used to simultaneously examine the actor and partner effects as well as the bidirectional association between parenting stress and coparenting within the same model. The results showed that: (1) Both fathers' and mothers' parenting stress significantly negatively predicted their spouses' coparenting (partner effects), and mothers' coparenting significantly negatively predicted their spouses' parenting stress (partner effects). However, the actor effects between parents' parenting stress and coparenting were not significant; (2) Fathers' parenting stress at T1 significantly negatively predicted mothers' coparenting at T2, at the same time, mothers' coparenting at T1 also significantly negatively predicted fathers' parenting stress at T2, which indicated a bidirectional pattern. The findings from the current study reveal the complex family dynamics between parenting stress and coparenting.

Some valuable information and practical implications can be derived from the present study for reducing parenting stress and enhancing the quality of coparenting.

Keywords：parenting stress, coparenting, bidirectional association, APIM

情节模拟对助人意愿的双刃剑效应

摘 要　情节模拟(episodic simulation)是一种生动地想象特定时间和空间经历的心理能力。研究发现，想象帮助他人的场景可以提高一个人的助人意愿。前人的大部分研究都聚焦在情节模拟对亲社会行为的促进作用上，对其在不道德行为方面的作用知之甚少。本研究测试了情节模拟帮助行为或旁观者行为是否会对被试的助人意愿产生不同影响。实验 1 采用单因素被试内实验设计，选取在校大学生 29 名（Mage = 19.65, SD = 1.54）。被试阅读一个故事情境后，需要在 40 秒内完成想象帮助他人、想象自己是旁观者、想象故事结局或者撰写故事标题的任务，随后让被试回答问题考察想象场景的生动性、情绪感受（高兴、自豪、难过、内疚）以及助人意愿。通过比较几种条件下被试助人意愿的差异，初步推断情节模拟的不同作用效果，并检验想象场景生动性和情绪感受在情节模拟影响助人意愿的过程中是否存在中介效应。结果发现，与撰写标题任务相比，想象帮助行为促进了帮助意愿（p<0.001），该效果由想象生动性和自豪感中介；想象旁观者行为之后的帮助意愿有所降低，边缘显著（p=0.097）；单纯想象故事结局并不会影响帮助意愿（p=0.509）。实验 2 采用不同的实验范式对实验一的结果进行检验，被试（41 人，Mage = 20.15, SD = 1.74）分三次参与实验，每次完成以下三个任务中的一个：撰写标题、想象帮助行为、想象旁观者行为。想象帮助行为的结果复制了实验 1 的发现；想象旁观者行为之后的助人意愿显著下降（p<0.001），场景生动性通过中介作用削弱了想象旁观者行为带来的负面影响。本研究的结果揭示出情节模拟存在双刃剑效应——想象帮助和旁观者行为会对帮助意愿产生相反的影响。而想象场景的生动性在情节模拟中是一个关键因素。

关键词　情节模拟，助人意愿，帮助行为，旁观者行为

The Double-Edged Sword Effect of Episodic Simulation on Willingness to Help

Jie Che Lili Bai

School of Psychology, Fujian Normal University, Fujian, 350108

Abstract：Episodic simulation is the mental ability to vividly visualize specific experiences in time and space. Previous research has shown that imagining scenarios where one helps others can increase willingness to help. However, most research has focused on the positive effects of episodic simulation on prosocial behavior, and little is known about its role in unethical behavior. This study aimed to test whether episodic simulation of helping or bystander behaviors would differentially affect willingness to help.

For experiment 1, a within-subjects experimental design was utilized with 29 college students (Mage = 19.65, SD = 1.54). After reading a story situation, subjects completed the task of imagining helping others, imagining themselves as bystanders, imagining the end of the story, or writing a story headline within 40 seconds. They were then asked questions examining the vividness of the imagined scenario, their emotional feelings (happiness, pride, sadness, and guilt), and their willingness to help. Linear mixed models were used to compare differences in willingness to help across conditions. We also tested whether scene vividness and emotional feeling mediated the

effects of episodic simulation on willingness to help. The results found that imagining helping behaviors facilitated willingness to help compared to the headline-writing task ($p < 0.001$）, the effect mediated by vividness and pride. Willingness to help decreased after imagining bystander behaviors. This effect is marginally significant ($p = 0.097$）. Imagining the end of the story did not affect willingness to help（$p=0.509$）.

Experiment 2 replicated the findings of experiment 1 using a different experimental paradigm. In this paradigm, subjects (n=41, Mage = 20.15, SD = 1.74) participated in the experiment on three separate occasions, completing one of the following tasks each time: writing a headline, imagining helping behaviors, and imagining bystander behaviors. The results of "imagining helping behaviors" replicated the findings of experiment 1. Willingness to help decreased significantly after imagining bystander behavior ($p<0.001$). Scene vividness attenuated the negative effect of imagining bystander behavior through mediation. These results reveal a previously unexplored double-edged effect of episodic simulation: imagining helping behaviors and bystander behaviors can have opposite effects on willingness to help. Furthermore, the vividness of the imagined scenario is a key factor in episodic simulation.

Keywords：episodic simulation, willingness to help, helping behavior, bystander behavior

父母物质惩罚与农村青少年主观幸福感：链式中介效应

范甜甜[1]　刘博文[1]　耿捷[1]　项锦晶[1]（通讯作者）

1 北京林业大学人文社会科学学院，北京，100083，通讯作者 E-mail：xiangjj@bjfu.edu.cn

摘 要　青春期是个体主观幸福感发展的重要时期。已有研究发现青春期个体的主观幸福感在 10 岁左右开始持续下降。其中，家庭是影响青少年主观幸福感的重要因素。受中国传统文化影响，父母惩罚常被视为恰当且必要的管教孩子方式，现有研究表明中国父母对青少年主要采用限制的惩罚方式，即剥夺孩子某些权利。物质惩罚（Material Punishments）作为一种限制性教养行为，指当孩子遭遇失败或做出不良行为时对孩子珍爱的物品采取暂时或永久的剥夺，在中国家庭中应用广泛。同时，物质惩罚是儿童物质主义价值观社会化的重要机制之一。研究发现个体经历的物质惩罚越多，越倾向将物质财富看作是衡量成功的标准。此外，不确定感管理模型指出物质主义可以满足个体控制感，进而对幸福感产生影响。由此看来，物质惩罚、物质主义、控制感和主观幸福感之间可能存在密切联系。然而，当下较少有研究对此进行探讨。基于此，为探究父母物质惩罚与农村青少年主观幸福感的关系及物质主义和控制感在其中的中介作用，本研究采用父母物质惩罚量表、控制感量表、物质主义价值观量表和幸福感指数量表对河南省某农村地区 1081 名青少年施测。结果发现：父母物质惩罚、物质主义、控制感和主观幸福感存在显著的两两相关；父母物质惩罚显著负向预测主观幸福感，控制感在父母物质惩罚与主观幸福感之间的中介效应显著，并且物质主义与控制感的链式中介作用也显著。由此得出结论，父母物质惩罚既可以负向预测农村青少年主观幸福感，还可以通过控制感的单独中介作用和物质主义与控制感的链式中介作用预测农村青少年主观幸福感。本研究发现父母经常对孩子实施物质惩罚会加强孩子的物质主义，进而不利于控制感的满足，使得幸福感下降。这一发现不仅扩展和丰富了现有研究，同时为提高青少年幸福感、促进心理健康发展提供了理论指导。

Parental Material Punishment and Subjective Well-being among Rural Adolescents : A Chain Mediation Effect

Fan Tiantian[1], Liu Bowen[1], Geng Jie[1], Xiang Jinjing[1]

(1 Beijing Forestry University, Beijing)

***Abstract*:** Adolescence is an important period for the development of individual subjective well-being. Previous studies have found that the subjective well-being of adolescents begins to decline continuously at around the age of 10. Among them, family is an important factor affecting adolescents' subjective well-being. Under the influence of traditional Chinese culture, parental punishment is often regarded as an appropriate and necessary way to discipline children. Existing research showed that Chinese parents mainly use restrictive punishment for teenagers, that is, depriving children of certain rights. Material Punishments, as a restrictive parenting behavior, which refers to the temporary or permanent deprivation of a child's prized possessions when the child fails or misbehaves, are widely used in Chinese families. At the same time, material punishment is one of the important mechanisms of children's materialistic values socialization. The study found that the more material punishment individuals experienced, the more likely they were to view material wealth as a measure of success. In addition, the uncertainty management model suggests that materialism can satisfy an individual's sense of control, thus affecting happiness. Therefore, there may be a close relationship between material punishment, materialism, sense of control and subjective well-being. However, few studies have explored this. Based on this, in order to explore the relationship between parental material punishment and rural adolescents' subjective well-being, as well as the mediating role of materialism and sense of control, this study used the parental material punishment scale, sense of control scale, materialistic values scale and index of well-being to measure 1081 adolescents in a rural area of Henan Province. The results showed that parental material punishment, materialism, sense of control and subjective well-being were significantly correlated. Parental material punishment had a significant negative effect on subjective well-being, and sense of control had a significant mediating effect between parental material punishment and subjective well-being, and the chain mediating effect between materialism and sense of control was also significant. It is concluded that parental material punishment can not only negatively predict the subjective well-being of rural adolescents, but also can predict the subjective well-being of rural adolescents through the independent mediating effect of the sense of control and the chain mediating effect of materialism and the sense of control. This study found that parents often impose material punishment on children will strengthen children's materialism, which is not conducive to the satisfaction of the sense of control, resulting in the decline of happiness. These findings not only expand and enrich the existing research, but also provide theoretical guidance for improving adolescent happiness and promoting mental health development.

摘 要　随着经济社会的快速发展，国家和社会越来越关注幼儿教育在儿童全面健康发展中的奠基性作用。在幼儿教师被赋予更多责任和期待的同时，他们的职业压力也与日俱增。根据压力过程理论，个体压力知觉会影响其心理健康状态，同时，个体如何应对工作所带来的压力也对心理健康有着重要影响。已有研究表明，幼儿教师的心理健康问题堪忧，他们的心理健康问题需要得到更多的关注和重视。基于此，本研究将考察幼儿教师压力知觉、压力应对方式与心理健康问题之间的关系。

本研究采用方便抽样的方法，使用压力知觉量表（PSS）、应对方式问卷（CSQ）、症状自评量表（SCL-90）对北京市和鄂尔多斯市的 714 名幼儿教师进行问卷调查。结果表明：幼儿教师压力知觉对心理健康问题的正向预测作用显著（β=3.15,t=14.42,p<0.001）；当消极应对方式做为中介变量加入后，幼儿教师压力知觉对心理健康问题的直接预测作用依然显著（β=2.13,t=9.66,p< 0.001），压力知觉对消极应对方式的正向预测作用显著（β=0.50,t=11.97,p< 0.001），消极应对方式对心理健康问题的正向预测作用也显著（β=2.04,t=11.28,p< 0.001）；当积极应对方式做为中介变量加入后，幼儿教师压力知觉对心理健康问题的直接预测作用依然显著（β=2.75,t=11.66,p< 0.001），压力知觉对积极应对方式的负向预测作用显著（β=-0.20,t=-11.85,p< 0.001），积极应对方式对心理健康问题的负向预测作用也显著（β=-1.93,t=-4.11,p< 0.001）。幼儿教师消极应对方式和积极应对方式在压力知觉与心理健康问题之间的中介效应系数均有统计学意义(β=1.02,SE=0.13,p<0.001,95%CI=[0.18,0.66],β=0.39,SE=0.17,p<,95%CI=[0.70,1.37])，中介效应分别占总效应的 32%、12%。研究结果表明，幼儿教师压力知觉不仅能预测心理健康问题，而且受到压力应对方式的部分中介作用，其中消极应对方式对心理健康问题有正向预测作用，积极应对方式对心理健康问题有负向预测作用。

***Abstract*：** With the rapid development of economy and society, the country and society pay more and more attention to the foundational role of early childhood education in the comprehensive and healthy development of children. At the same time that preschool teachers are given more responsibilities and expectations, their professional pressure is also increasing. According to the stress process theory, an individual's perception of stress can affect his mental health, and how an individual copes with the stress brought by work also has an important impact on his mental health. Studies have shown that preschool teachers' mental health problems are worrying, and their mental health problems need to be paid more attention and attention. Based on this, this study will investigate the relationship between preschool teachers' stress perception, stress coping style and mental health problems.

In this study, 714 preschool teachers in Beijing and Ordos were investigated by means of Stress Perception Scale (PSS), Coping Style Questionnaire (CSQ) and Symptom Self-rating Scale (SCL-90). The results showed that the preschoolers' perceived stress had a significant positive predictive effect on mental health problems (β=3.15,t=14.42,p<0.001). When the negative coping style was added as an intermediary variable, the direct prediction effect of preschool teachers' perceived stress on mental health problems was still significant (β=2.13,t=9.66,p< 0.001), and the positive prediction effect of perceived stress on negative coping style was significant (β=0.50,t=11.97,p< 0.001). Negative coping style also had a significant positive predictive effect on mental health problems (β=2.04,t=11.28,p< 0.001). When the positive coping style was added as the mediating variable, the direct prediction effect of stress perception on mental health problems was still significant (β=2.75,t=11.66,p< 0.001), and the negative prediction effect of stress perception on positive coping style was significant (β=-0.20,t=-11.85,p< 0.001). Positive coping style also had a significant negative predictive effect on mental health problems (β=-1.93,t=-4.11,p< 0.001). The mediating effect coefficients of negative coping styles and

positive coping styles between stress perception and mental health problems were statistically significant (β=1.02,*SE*=0.13,*p*<0.001,95%*CI*=[0.18,0.66],β=0.39,*SE*=0.17,*p*<,95%*CI*=[0.70,1.37]), the intermediate effect accounted for 32% and 12% of the total effect, respectively. The results show that preschool teachers' perceived stress can not only predict mental health problems, but also be partially mediated by stress coping styles. Negative coping styles have a positive predictive effect on mental health problems, while positive coping styles have a negative predictive effect on mental health problems.

童年期创伤对离婚者的婚姻满意度的影响：解决冲突方式的中介作用

瞿振[1] 杨玲[1] 申张晓[2] 曹华[3]（通讯作者）

1 西北师范大学心理学院，兰州，730070

2 西北师范大学心理学院，兰州，730070，caohua360083915@163.com

摘 要 近年来，离婚率呈现出明显的上升趋势，离婚问题已经成为我国的一个社会问题。如何提高夫妻间的婚姻满意度进而减少离婚率，受到研究者的广泛关注。个体早期的创伤经历，会削弱个体成年期建立和维持亲密关系的能力，并对其亲密关系产生持续的消极影响，其具体的作用机制还有待进一步探讨。因此本研究基于家庭系统理论、婚姻危机理论与社会学习理论构建了一个中介模型，以探讨童年创伤对离婚者婚姻满意度的影响，并进一步探讨解决冲突方式在二者间的中介作用。采用儿童期创伤问卷、解决冲突方式问卷、婚姻满意度问卷对 205 名处于离婚冷静期的个体进行问卷调查。结果发现: (1)童年创伤、解决冲突方式与婚姻满意度之间均存在显著的相关关系; (2)童年创伤可以显著的负向预测婚姻满意度，负向预测解决冲突方式，而解决冲突方式可以正向预测婚姻满意度。解决冲突方式在童年创伤对婚姻满意度起完全中介作用。具体来说，离婚群体其较低的婚姻满意度受到早期的创伤经历的影响，而这种影响是直接通过影响婚姻中冲突的解决方式起作用。本研究不仅探讨了离婚群体的童年创伤、解决冲突方式、婚姻满意度之间的关系，也启示我们在预防和干预个体的童年创伤经历时，应特别关注解决冲突能力的提高，从而增加婚姻满意度减少离婚率。

The Impact of Childhood Trauma on Marital Satisfaction Among Divorcees: Mediating Role of Conflict Resolution Styles

Qu Zhen[1] Yang Ling[1] Shen Zhangxiao[2] Cao Hua[3]

1 school of Psychology, Northwest Normal University,Lanzhou, 730070

2 school of Psychology, Northwest Normal University,Lanzhou, 730070,

caohua360083915@163.com

Abstract: In recent years, the divorce rate has shown a clear upward trend, and divorce has become a social problem in China. How to improve marital satisfaction between couples and thus reduce the divorce rate has received extensive attention from researchers. Early traumatic experiences can weaken an individual's ability to establish and maintain intimate relationships in adulthood and have a lasting negative impact on intimate relationships, and its specific mechanism of action needs to be further explored. Therefore, this study constructed a mediation model based on Family Systems Theory, Marital Crisis Theory, and Social Learning Theory in order to explore the effects of childhood trauma on divorcees' marital satisfaction, and to further explore the mediating role

of conflict resolution styles between the two. The Childhood Trauma Questionnaire, the Conflict Resolution Style Questionnaire, and the Marital Satisfaction Questionnaire were used to survey 205 individuals in the cooling-off period of divorce. The results revealed that: (1) significant correlations existed between childhood trauma, conflict resolution styles, and marital satisfaction; (2) childhood trauma could significantly negatively predict marital satisfaction and negatively predict conflict resolution styles, while conflict resolution styles could positively predict marital satisfaction. Conflict resolution style plays a fully mediating role in childhood trauma on marital satisfaction. Specifically, lower marital satisfaction in the divorced group was influenced by early traumatic experiences that worked directly by influencing conflict resolution styles in the marriage. This study not only explored the relationship between childhood trauma, conflict resolution styles, and marital satisfaction in a divorced group, but also revealed that when preventing and intervening in an individual's childhood traumatic experiences, special attention should be given to improving conflict resolution skills, which can lead to an increase in marital satisfaction and a decrease in divorce rates.

母亲控制的潜在类别及其与儿童问题行为的关系：以个体为中心的视角

张洁[1] 杜巧金[1] 马东乐[1] 王健楠[1] 周楠[1]（通讯作者）

1 首都师范大学学前教育学院，北京，100048

通讯作者 E-mail：nanzhou@cnu.edu.cn

摘 要 新冠疫情发生之后，多地学前儿童问题行为发生率不断攀高（邓延峰，2019；任妍，2023；余敏，2023）。母亲经常使用消极行为控制和侵入性心理控制策略都会使儿童产生各种内外化问题行为，如焦虑（Rostami & Saadati，2018）、社会退缩（Park，2013）、同伴交往不良（Liu et al.，2015）。当前研究大多以变量为中心关注不同控制行为的群体水平，而忽略了不同控制行为的组合模式及其对儿童问题行为的影响（Cho et al.，2019；Thanh et al.，2022）。本研究采用以个体为中心的视角，使用潜在剖面分析探究母亲不同的行为控制和心理控制的潜在剖面特征，并考察潜在母亲控制模式在学前儿童问题行为上的差异作用。

采用亲子互动观察编码测量北京市城区 84 对学前儿童及其母亲行为控制水平(Seo, Cheah, & Hart , 2017)，通过问卷测量母亲心理控制水平（Porter et al., 2005），并由教师评价儿童问题行为水平（Goodman, 1997）。

结果发现：（1）根据母亲积极控制与引导、消极控制、严厉侵入型的心理控制和关系诱导型的心理控制可以将母亲控制行为分成两种亚型：高心理侵入型（90.9%）、高行为管控型（9.1%）。高心理侵入型母亲采用较多的爱的撤回、引发羞愧、个人攻击和社会比较行为，而在行为引导上水平较低；但高行为管控型母亲则更注重行为规则、规范和说理，较少使用严厉侵入型的心理控制。（2）在情绪问题和多动问题上，高心理侵入型母亲的子女比高行为管控型母亲的子女更容易表现出较高的上述问题行为；在儿童同伴交往和品行问题上，高心理侵入型母亲和高行为管控型母亲不存在差异性。

本研究以个体为中心的视角，通过对母亲控制行为的潜在剖面分析，初步揭示了我国母亲在学前期的潜在控制行为类型及其对学前儿童问题行为的影响。此研究结果有助于改善母亲控制行为，助力母亲更好地进行家庭教育，促进学前儿童健康发展。

Latent profiles of maternal control and their associations with

children's problem behaviors: An person-centered perspective

Jie Zhang [1] Qiaojin Du [1] Dongle Ma [1] Jiannan Wang [1] Nan Zhou [1]
Capital normal university， Beijing，100048

Abstract ： After the outbreak of COVID-19, the incidence of problem behaviors among preschool children in many places has been increasing (Deng, 2019; Ren, 2023; Yu, 2023). Mothers' frequent use of negative behavioral control and intrusive psychological control strategies tend to lead to a variety of internal and external problem behaviors, such as anxiety (Rostami & Saadati, 2018), social withdrawal (Park, 2013) and poor peer communication (Liu et al., 2015). Most of the current studies focus on the group-level of different control behaviors based on variable-centered perspective, while ignoring the potential combination patterns of different controlling behaviors and their effects on children's problem behavior (Cho et al., 2019; Thanh et al., 2022). Based on an person-centered perspective, our study utilized latent profile analysis to explore the potential profile characteristics of mother's different behavioral control and psychological control, and to investigate the different effects of potential controlling patterns on preschool children's problem behaviors.

Parent-child interaction observation was coded to measure the behavioral control levels of 84 pairs of preschool children and their mothers in Beijing urban area (Seo, Cheah, & Hart, 2017). Maternal psychological control was measured by questionnaire (Porter et al., 2005), and children's problem behaviors was evaluated by preschool teachers (Goodman, 1997).

The results showed that: (1) Based on maternal positive control and guidance, negative control, hostile psychological control and relational induction forms of psychological control, maternal controlling behaviors can be divided into two profiles: high psychological invasion profile (90.9%) and high behavioral control profile (9.1%). Mothers with high psychological invasion used more shaming, personal attack and social comparison, but implemented a lower level of behavioral guidance, while mothers with high behavioral control pay more attention to setting up rules and norms, as well as the use of reasoning. (2) In terms of emotional problems and hyperactivity problems, the children with high psychological invasion mothers were more likely to show emotional and hyperactivity problem behaviors than those with high behavioral control mothers. However, there is no difference on peer communication and conduct problems between children with two profiles of maternal controlling behaviors.

From the person-centered perspective, our study utilized the latent profile analysis and revealed the different patterns of mother's controlling behaviors during preschool period and their influences on preschool children's problem behaviors. The results of this study are helpful to improve Chinese mother's controlling behaviors in their parenting strategies and to promote the healthy development of preschool children.

Keywords ： maternal control behavior, child problem behavior, latent profile analysis, preschool children

家庭社会经济地位对高中生职业生涯规划能力的影响：家庭文化资本和父母生涯社会支持的作用

张宇雯[1] 游双艳[1] 戴艳[1]（通讯作者）
四川师范大学心理学系，成都, 610066，通讯作者 E-mail：daiyanch@163.com

摘 要　职业发展贯穿个体终生,高中阶段是培养个体职业生涯规划能力的关键期。考察高中生职业生涯规划能力的影响因素和边界条件可以为后续提升其职业生涯规划能力提供可操作的干预策略，因此具有一定的实践意义。以往研究表明，相比于学校和同伴因素，家庭对于个体职业生涯发展的影响更大，其中家庭社会经济地位是高中生职业生涯规划能力的重要因素，并且家庭文化资本可能在其中发挥桥梁作用。同时,由于父母在高中生群体中扮演着重要角色,其生涯社会支持可能对上述中介效应进行调节,进而提升其职业生涯规划能力。鉴于此，本研究构建一个有调节的中介模型对家庭社会经济地位与高中生职业生涯规划能力内在机制进行考察。采用由家长受教育程度，家长职业以及家庭所有物三个指标测量的《家庭社会经济地位指数》,《家庭文化资本量表》,《生涯社会支持量表》和《高中生职业生涯规划能力量表》对四川省内成都、崇州、德阳、眉山、泸州、都江堰 6 个地区的 9 所中学共 2068 名高中生进行调查。结果显示：（1）家庭社会经济地位正向预测高中生职业生涯规划能力；（2）家庭文化资本在家庭社会经济地位和高中生职业生涯规划能力间起完全中介作用；（3）来自于父母的生涯社会支持调节了家庭社会经济地位通过家庭文化资本影响高中生职业生涯规划能力中介过程的前半路径、后半路径。具体而言，在高父母生涯社会支持的条件下，家庭社会经济地位对家庭文化资本的预测作用更强；家庭文化资本对高中生职业生涯规划能力预测作用更强。这一结果表明，家长和学校应当重视当前教育背景下家庭各层面因素对高中生职业生涯规划能力的培养的重要作用。

The influence of family socioeconomic status on high school students' career planning ability: The role of family cultural capital and parents' social support for career

Zhang Yuwen[1] You Shuangyan[1] Dai Yan[1]
1.Sichuan Normal University, Lion Mountain Campus, Sichuan Normal University, Jing'an Road, Jinjiang District, Chengdu, Sichuan Province

Abstract: Career development runs through an individual's whole life. High school is the key period to cultivate the individual's career planning ability. Investigating the influencing factors and boundary conditions of high school students' career planning ability can provide operable intervention strategies for the subsequent improvement of their career planning ability, so it has certain practical significance.Previous studies have shown that family has a greater impact on individual career development than school and peer factors. Family socioeconomic status is an important factor in high school students' career planning ability, and family cultural capital may play a bridging role in it.At the same time, because parents play an important role in the group of high school students, their career social support may regulate the above mediating effect, and thus improve their career planning ability.Based on this, this study constructs a moderated mediation model to investigate the internal mechanism between family socioeconomic status and high school students' career planning ability.In this study, I

used some scales about family socioeconomic status index which were measured by parents' education level, parents' occupation and family possessions,family cultural capital questionnaire, career social support questionnaire, and career planning ability questionnaire for high school students.In this study,A total of 2068 high school students from nine middle schools in Chengdu,Chong zhou, Deyang, Meishan, Luzhou and Dujiangyan in Sichuan Province were investigated.The results showed that: (1) family socioeconomic status positively predicted the career planning ability of high school students; (2) Family cultural capital plays a completely mediating role in family socioeconomic status and senior high school students' career planning ability; (3) The career social support from parents moderates the family socioeconomic status through family cultural capital influences the first and second half paths of the mediating process of high school students' career planning ability. Specifically, under the condition of high parental social support, family socioeconomic status has a stronger predictive effect on family cultural capital. Family cultural capital plays a stronger role in predicting the career planning ability of senior high school students. The result shows that parents and schools should pay attention to the important role of family factors in the cultivation of high school students' career planning ability under the current educational background.
Key words: family socioeconomic status, family cultural capital, career social support, high school students' career planning ability

初中生学业压力、学习中心理疲劳、游戏障碍的关系：一项交叉滞后研究

张愉蕙[1] 蔡定均[2] 马鹏[1] 余洁玉[3] 温忠麟[1]（指导老师）

1 华南师范大学心理学院，广州，510000，2022023800@m.scnu.edu.cn

2 南方医科大学口腔医院（口腔医学院），广州，510000

3 深圳市南山区教育科学研究院，深圳，518052

摘 要 青少年的游戏障碍（gaming disorder）已成为国内外成为无法忽视的社会问题，对青少年身心发展产生不利影响。在高学业压力和高心理疲劳的背景下，初中生很容易将注意力转向游戏以缓解学习带来的压力和心理疲劳，因此有必要考察两者与游戏障碍的关系。本研究采取追踪设计对 453 名初中生进行 3 次测量，采用交叉滞后模型考察了学业压力、学习中心理疲劳、游戏障碍之间的预测关系。结果发现：（1）学习中心理疲劳、游戏障碍的得分有随着时间变化逐渐增加的趋势。（2）初中生的学业压力与学习中心理疲劳呈同时性和继时性的正相关，学习中心理疲劳与游戏障碍呈同时性和继时性的正相关。（3）T1 和 T2 的学习中心理疲劳正向预测 T2 和 T3 的学业压力，并正向预测 T2 和 T3 的游戏障碍；T1 的学业压力正向预测 T2 的学习中心理疲劳；T2 的学业压力正向预测 T3 的学习中心理疲劳；T2 的游戏障碍正向预测 T3 的学习中心理疲劳。**结论：**（1）初中生的学业压力、学习中心理疲劳、游戏障碍具有横向稳定性；（2）初中生的学业压力、学习中心理疲劳、游戏障碍具有高跨时间稳定性；（3）学业压力和学习中心理疲劳可以相互预测；（4）学习中心理疲劳和游戏障碍可以相互预测。本研究结果对干预青少年游戏障碍具有实践指导意义。

The relationship between academic stress, mental fatigue and gaming disorder in junior middle school students: a cross-lag study

Zhang Yuhui[1] Cai Dingjun[2] Ma Peng[1] Yu Jieyu[3] Wen Zhonglin[1]

1 School of Psychology, South China Normal University，Guangzhou，510000，2022023800@m.scnu.edu.cn
2 Stomatological Hospital, School of Stomatology, Southern Medical University，Guangzhou，510000
3 Nanshan Educational Science Research Institute of Shenzhen，Shenzhen，518052

Abstract: The gaming disorder of teenagers has become an undeniable social problem both domestically and internationally, which has a negative impact on their physical and mental development. In the context of high academic pressure and high mental fatigue, junior high school students are prone to turning to games to alleviate the pressure and mental fatigue brought about by learning. Therefore, it is necessary to examine the relationship between the two and gaming disorders.This study used a tracking design to measure 453 junior high school students three times, and used a cross lagged model to examine the predictive relationship between academic stress, mental fatigue during learning, and gaming disorders. **Result:**(1) The scores of mental fatigue and gaming disorders in learning gradually increase over time.(2) The academic pressure of junior high school students is positively correlated with both simultaneity and metachronism in learning mental fatigue, while learning mental fatigue is positively correlated with gaming disorders.(3) mental fatigue in T1 and T2 learning positively predicts academic stress in T2 and T3, and positively predicts gaming disorders in T2 and T3; T1's academic stress positively predicts T2's mental fatigue during learning; T2's academic pressure positively predicts T3's mental fatigue during learning; T2's gaming disorder positively predicts T3's mental fatigue during learning.**Conclusion:** (1) Junior high school students' academic pressure, psychological fatigue during learning, and gaming disorders have lateral stability; (2) The academic pressure, psychological fatigue during learning, and game barriers of junior high school students have high cross time stability; (3) Academic pressure and psychological fatigue during learning can predict each other; (4) Psychological fatigue and gaming disorders in learning can be mutually predicted. The results of this study have practical guiding significance for intervening in adolescent gaming disorders.

Keywords: junior high school students, academic pressure, mental fatigue in learning, gaming disorder, cross lag analysis

学生学业负担对学业成绩影响的大样本多层线性模型分析

路博文[1]　盖笑松[1]（通讯作者）
1 东北师范大学心理学院，长春，130024，gaixiaosong@126.com

摘 要　在国家“双减”改革背景下，青少年的过度学习和学业负担影响学生心理健康的问题日益受到重视。以往研究发现，学生的学业负担对学业成绩有消极影响，该影响因素通常具有个人和学校两方面的层次性。多层线性模型（HLM）能够同时考虑多个层次因素，对个体层面和学校层面的学业负担因素全面探索和分析，提供与实际情况更加吻合的结果。本研究使用一项大型研究项目数据库中某省会城市所有小学的六年级学生的调研数据，有效数据共 35182 名学生。以学生的语文、数学、英语三科的加权合并成绩为因变量，以学生个体和学校层面的学业负担因素为自变量，使用多层线性模型分析的方法分析对学生学业成绩有影响的个体层面和学校层面的学业负担因素。结果发现：六年级学生的学业成绩具有显著的校际差异。(1)在学生个体层面，学生个人家教次数、家教时长和写作业时长对六年级学生学业成绩的影响达到负向显著，学生个人课外班时长、自由时长和睡眠时长对六年级学生学业成绩的影响达到正向显著；(2)在学校层面，学校平均家教时长、写作业时长和睡眠时长对学校平均六年级学生学业成绩的影响达到负向显著，学校平均课外班数量、课外班时长和自由时长对学校平均六年级学生学业成绩的影响正向显著；(3)课外班数量、课外班时长和写作业时长的跨层级的交互作用正向显著。结果解释：在个体层面上，随着上家教和课后作

业的学业负担增加，学生成绩有所下降。在学校层面上，学校层次越差的学校，其课外班学业负担越轻。而学校层次较好学校的课外班学业负担呈现两级分化的趋势，其学生平均学业成绩较好，这导致了分析结果上课外班越多成绩越好的假象。学校层次越差的学校，其平均学业负担水平越低，其学生平均睡眠时间较长，导致分析结果上学生平均学业成绩越低。

A Large-Sample Hierarchical Linear Modeling Analysis of the Effect of Students' Academic Burden on Academic Performance

Bowen Lu, Xiaosong Gai
Department of Psychology, Northeast Normal University, Changchun, Jilin

Abstract：Under the background of the Chinese "Double Reduction" reform, the issue of excessive learning and academic burden among adolescents and its impact on students' mental health has received increasing attention. Previous research has found that academic burden negatively affects academic performance and is influenced by factors at both the individual and school levels. Hierarchical Linear Modeling (HLM) allows for the simultaneous consideration of multiple hierarchical factors, enabling a comprehensive exploration and analysis of individual and school-level factors related to academic burden, thus providing results that align more closely with the actual situation. The study comprises valid data from 35,182 sixth-grade students in primary schools. The data was collected from a large-scale research project database, encompassing all survey data from a provincial capital city. The weighted combined scores of students in three subjects, Chinese, Mathematics, and English, were taken as the dependent variable, while students' individual- and school-level academic burden factors as the independent variables. The HLM method was employed to analyze the impact of students' individual- and school-level academic burden factors on students' academic performance. Results showed that there were significant inter-school differences in sixth-grade students' academic performance. (1) At the individual level, the effects of individual student tutoring frequency, tutoring hours, and homework writing hours had a negative significant impact on the academic performance of sixth-grade students. Conversely, the effects of individual student extracurricular classes hours, free time, and sleep hours had a positive significant impact on their academic performance. (2) At the school level, the effects of school-averaged tutoring hours, homework writing hours, and sleep hours had a negative significant impact on the average academic performance of sixth-grade students in schools. On the other hand, the effects of school average number of extracurricular classes, extracurricular class hours, free time had a positive significant impact on the average academic performance of sixth-grade students in schools. (3) There was a positive significant cross-level interaction effect between the number of extracurricular classes, extracurricular class hours, and homework hours. The results were interpreted as follows: At the individual level, as the burden of private tutoring and after-school homework increases, students' academic performance declines. At the school level, schools with lower hierarchical levels had lighter extracurricular class academic burdens. On the other hand, schools with relatively higher levels exhibited a two-level differentiation trend in extracurricular class academic burdens, with better average academic performance among students, leading to the illusion that more extracurricular classes resulted in better grades. Schools with lower levels had lower average academic burden levels and longer average sleep hours, resulting in lower average academic performance among students.

孤独特质影响视觉刺激的可联想性和情绪性信息加工

陈晴[1] 王迪[1] 周颖文[1] 王增建[1,2]（通讯作者）
1 华南师范大学心理学院，广州，510000
2 华南师范大学心理学院，广州，510000，zengjianw@m.scnu.edu.cn

摘 要 联想是由一个事物联想到另一个事物的过程，视觉刺激的可联想性和情绪效价是大脑可自动加工的重要信息，能够促进对视觉刺激的识别。孤独特质是一种广泛存在于正常人群中的连续性人格特质，影响个体对视觉刺激的识别加工。本研究旨在探讨孤独特质是否影响个体对视觉刺激的可联想性和情绪性信息的知觉加工。

实验一招募了 10 名被试对 276 张实验图片的情绪效价进行评分，评分越高，情绪效价越高。同时完成孤独特质量表、焦虑自评量表和抑郁自评量表。根据情绪效价评分，276 张图片被分为 69 张积极刺激，69 张消极刺激，69 张高联想性的中性刺激以及 69 张低联想性的中性刺激。将图片效价评分与焦虑总分、抑郁总分、AQ 量表总分及 AQ 的五个维度（社交技巧、注意力的转换、对细节的注意力、沟通及想象力）进行 Pearson 相关分析，结果显示，个体的孤独特质影响他们对视觉刺激的情绪效价评分。个体的注意力转换能力越差，对高联想性的中性视觉刺激的消极评分越高；个体的想象力越差，对积极视觉刺激的情绪效价评分越低。实验二另外招募了 42 名独立被试对 276 张图片进行联想性测试,并完成 AQ 量表。每张图片被呈现给平均 14 个评分者(年龄范围:18-28;42 人每人观看了三分之一的总图像集)。结果分析显示，个体对细节的注意力越强，其对强联想中性图片的联想性越强。

结论：个体的孤独特质得分越高，其注意力转换越差，想象力越差，对视觉刺激的消极评分越高；个体对细节的注意力越强，其对强联想中性图片的联想性越强。这些结果可能进一步指出孤独特质影响个体对视觉刺激的联想性以及情绪效价的知觉加工。

Autistic Like Traits Affect the Associability and Emotional Information Processing of Visual Stimulation

Qing Chen Di Wang Yingwen Zhou Zengjian Wang
South China Normal University of Psychology

Abstract： Association is the process of associating one thing with another. The associability and emotional valence of visual stimuli are important information that can be processed automatically by the brain, which can promote the recognition of visual stimuli. Autistic Like Traits is a kind of continuous personality trait widely existing in normal population, which affects the recognition and processing of visual stimuli. The purpose of this study was to investigate whether loneliness affects individuals' perceptual processing of associative and emotional information to visual stimuli.

In experiment 1, 10 subjects were recruited to score the emotional valance of 276 experimental pictures. The higher the score, the higher the emotional valance. Autism Quotient(AQ), Self-Rating Anxiety Scale(SAS) and Self-rating Depression Scale(SDS) were also completed. According to the emotional valance score, 276 images were classified as 69 positive stimuli, 69 negative stimuli, 69 strongly associative neutral stimuli, and 69 weakly associative neutral stimuli. Pearson correlation analysis was conducted between the picture valence score and the

total score of anxiety, depression, AQ scale and the five dimensions of AQ (social, communication, imagination, attention to detail, and attention switching).The results showed that individuals' autistic like traits affected their emotional valance score of visual stimuli. The worse the attention switching ability of the individual, the higher the negative score of the strongly associative neutral stimuli. The worse the individual's imagination, the lower the emotional valance score for positive visual stimuli.In experiment 2, an additional 42 independent subjects were recruited to conduct association tests on 276 images and complete the AQ scale. Each image was presented to an average of 14 raters (age range: 18-28; 42 people each viewed one-third of the total image set). The result analysis shows that the stronger an individual's attention to detail, the stronger their association with strongly associative neutral stimuli.

Conclusion: The higher the autistic like trait score, the worse the attention switch, the worse the imagination, and the higher the negative score for visual stimuli. The stronger an individual's attention to detail, the stronger their association with strongly associative neutral stimuli. These results may further indicate that autistic like traits affect individuals' association with visual stimuli and perceptual processing of emotional valence.

统计学习效能感量表在中国大学生群体中的信效度检验

傅芃[1] 黄发杰[1] 田千峰[1] 陈叶[1] 廖美玲[2]（通讯作者）

1 福建医科大学健康学院，福州，350122

2 福建医科大学应用心理系，福州，350122，E-mail：Liaoml@fjmu.edu.cn

摘 要 **目的：**对统计学习效能感量表在大学生群体中进行修订并检验其效度和信度。**方法：**采用方便取样法选取 1951 名大学生为研究对象，进行问卷测评，并对数据进行项目分析、结构效度、聚合效度、校标关联效度、内部一致性信度和测量等值性等统计检验，选取统计学焦虑等级量表、统计学课程成绩和学习投入量表作为校标指标。半个月后，对初测样本随机抽取 70 人进行重测信度分析。**结果：**统计学习效能感量表的所有条目鉴别力良好，探索性因素分析和验证性因素分析均表明，修订后的量表因子结构与原量表一致，表现为单因子结构，解释总变异的 86.51%，验证性因子模型拟合度良好（$\chi^2 = 411.402$，$df = 77$, $\chi^2/df = 5.34$, $p < 0.001$，RMSEA = 0.083，SRMR = 0.028，CFI = 0.912，TLI = 0.896）；量表的 AVE 和 CR 均达到测量学标准（AVE=0.89,CR=0.99）；统计学习效能感与统计学课程成绩和学习投入呈显著正相关（r=0.21，r=0.45，p＜0.01），与统计焦虑呈显著负相关（r=-0.36，p＜0.001）；量表的内部一致性信度为 0.99，重测信度为 0.82（p＜0.001）；在大学生性别上具有较好的测量等值性（△CFI<0.01, △RESEA<0.01）。**结论：**中文版统计学习效能感量表修订无逻辑错误，在大学生群体中的信效度较好，符合量表修订的要求，是一个信效度较好，结构合理的测量工具，能比较科学地测量出我国大学生统计学习效能感水平。

Reliability and Validity of Statistical Learning Self-Efficacy Scale in Chinese College Students

Fu Peng[1] Huang Fajie[1] Tian Qianfeng[1] Chen Ye[1] Liao Meiling[2]

1College of health, Fujian Medical University, Fuzhou, 350122

2Department of Psychology, Fujian Medical University，Fuzhou, 350122，E-mail：Liaoml@fjmu.edu.cn

Abstract： **Objective:** To test the validity and reliability of Statistical Learning Self-Efficacy Scale (SLS) in college students. Methods: A total of 1951 college students were selected by convenience sampling, and the data were analyzed by item analysis, construct validity, convergent validity, criterion-related validity, internal consistency reliability, test-retest reliability and measurement equivalence. **Results:** All items of the scale were well discriminated.The exploratory factor analysis and confirmatory factor analysis showed that the factor structure of the scale was consistent with the original scale, showing a single factor structure, and the confirmatory factor model fitted well ($\chi^2 = 411.402$，$df = 77$, $\chi^2/df = 5.34$, $p < 0.001$，RMSEA = 0.08，SRMR = 0.03，CFI = 0.91，TLI = 0.90), AVE and CR of the scale reached the measurement standard (AVE=0.89, CR=0.99); Statistical learning self-efficacy was positively correlated with statistical course achievement and learning engagement（r_1=0.21，p=0.002；r_2=0.45，p＜0.001）, and negatively correlated with statistical anxiety (r=-0.36, p＜0.001); The internal consistency reliability of the scale was 0.99 and the test-retest reliability was 0.82 (p <0.001); There was a good equivalence of measurement in the gender of college students (△CFI<0.01, △RESEA<0.01. **Conclusion**: The Chinese version of Statistical Learning Self-efficacy Scale had good reliability and validity in college students, and it was a measurement tool with good reliability and validity and reasonable structure, which was suitable for measuring the level of statistical learning self-efficacy of college students in China.

初中生感恩与情绪弹性的关系：社会支持的中介作用与亲子亲合的调节作用

严心怡[1]　谯力萍[1]　杨晓[1]　吴鹏[1]

1.湖北大学师范学院　武汉　430062 reavenwp@hubu.edu.cn

摘　要　青少年正处于身心发展的关键时期，但生理发育与心理发育不一致。与成年人相比，青少年的情绪常常起伏不定。随着成长环境的变化或扩大，青少年面临的负性生活事件也显著增加。情绪弹性是心理弹性的重要组成部分，能够帮助个体有效应对挫折环境。感恩作为一种积极情绪，有助于个体获得心理资源，以更积极的心态面对挫折。此外，感恩还有助于个体获得社会资源，更容易觉察和接纳社会支持资源。情绪弹性同时具有社会性，根据压力缓冲模型，社会支持能够有效缓解消极情绪带来的压力。因此，社会支持可能是感恩和情绪弹性的中间环节。最后，家庭作为影响青少年情绪弹性的重要社会环境之一，亲子亲合是影响青少年积极情绪的重要外部因素。亲子关系良好的家庭能够帮助孩子培养积极情绪并提供情感支持，孩子能够更好地应对挫折和压力事件，从而更容易从负性情绪中恢复。因此，亲子亲合可能会调节感恩对情绪弹性的影响路径。本研究采用问卷法对来自陕西省西安市的 921 名初一学生进行了调查，采用感恩量表、青少年情绪弹性量表、社会支持量表和亲子亲合量表，探究青少年感恩与情绪弹性之间的关系，以及社会支持的中介作用和亲子亲合的调节作用。结果显示：（1）感恩正向预测情绪弹性水平；（2）社会支持在感恩与情绪弹性之间起中介作用；（3）亲子亲合能显著调节感恩对情绪弹性的影响路径。这一结果支持了压力缓冲模型，为今后情绪弹性的研究提供了新的理论视角。此外，本研究的结论也为实际德育工作提供了一定的指导与贡献，道德教育及培养需要兼顾认知与情绪、学校与家庭两个层面的心理因素。

The Relationship Between Gratitude and Emotional Resilience in Middle School Students: The Mediating Effect of Social Support And

The Moderating Effect of Parental Cohesion

Yan Xinyi Qiao Liping Yang Xiao Wu Peng
Hubei University

Abstract：Teenagers are in a critical period of physical and mental development, but their physiological and psychological development are not consistent. Compared to adults, teenagers often have fluctuating emotions. As the growth environment changes or expands, the negative life events faced by teenagers also significantly increase. Emotional resilience is an important part of psychological resilience, which can help individuals cope with frustration effectively. As a positive emotion,gratitude helps individuals gain psychological resources and face setbacks with a more positive attitude.In addition, gratitude also helps individuals gain access to social resources, making it easier to perceive and accept social support resources. Emotional resilience also has a social nature, and according to the stress-buffering model, social support can effectively alleviate the pressure caused by negative emotions. Therefore, social support may be an intermediate link between gratitude and emotional resilience. Finally, as one of the important social environments that affect the emotional resilience of adolescents, parental cohesion is an important external factor that affects their positive emotions. Families with good parent-child relationships can help children cultivate positive emotions and provide emotional support, enabling them to better cope with setbacks and stressful events, making it easier for them to recover from negative emotions. Therefore, parental cohesion may regulate the impact pathway of gratitude on emotional resilience. This study used a questionnaire method to investigate 921 first year middle school students from Xi'an, Shanxi Province. The gratitude scale, adolescent emotional resilience scale, social support scale, and parental cohesion scale were used to explore the relationship between gratitude and emotional resilience in adolescents, as well as the mediating role of social support and the moderating role of parental cohesion. The results show that: (1) gratitude positively predicts the level of emotional resilience; (2) Social support plays a mediating role between gratitude and emotional resilience; (3) Parental cohesion can significantly regulate the impact pathway of gratitude on emotional resilience. This result supports the stress-buffering model and provides a new theoretical perspective for future research on emotional resilience. In addition, the conclusions of this study also provide certain guidance and contributions for practical moral education work. Moral education and cultivation need to balance cognitive and emotional factors, as well as psychological factors at the school and family levels.

高中生生涯未来时间洞察力对职业生涯规划能力的影响：未来工作自我清晰度和职业决策自我效能感的链式中介作用

赵钦瑞[1] 戴艳[2]（通讯作者）
1 四川师范大学心理学院，成都，610066
2 四川师范大学心理学院，成都，610066，daiyanch@163.com

摘 要 四川省部分高中生已经开始选科走班，提早面临专业和职业的选择，但是许多高一学生自我认识不足，职业规划没有头绪，选科或选专业存在盲目性，而较低的职业生涯规划能力不利于高中生对专业和未来职业的选择。根据人格发展的社会投资模型，未来工作自我清晰度越高的个体，职业角色越明确，越会对自己的职业生涯负责，倾向于提前做职业准备；未来取向的个体，倾向于积极职业规划，主动规划未来。本文采用《生涯未来时间洞察力量表》、《未来工作自我清晰度量表》、《职业决策自我效能感量表》、

《高中生职业生涯规划能力问卷》对四川省成都市某中学高一年级和高二年级的 719 名普通高中生进行问卷调查，探讨生涯未来时间洞察力、未来工作自我清晰度、职业决策自我效能感和高中生职业生涯规划能力的关系以及高中生职业生涯规划能力的影响因素和作用机制，得出如下研究结论：

（1）高中生生涯未来时间洞察力、未来工作自我清晰度、职业决策自我效能感、职业生涯规划能力之间两两相关；

（2）高中生未来工作自我清晰度在生涯未来时间洞察力与职业生涯规划能力之间起中介作用；

（3）高中生职业决策自我效能感在生涯未来时间洞察力与职业生涯规划能力之间起中介作用；

（4）高中生未来工作自我清晰度、职业决策自我效能感在生涯未来时间洞察力与职业生涯规划能力之间起链式中介作用。

The effect of high school students' career future time insight on career planning ability: the chain-mediated effects of future job self-clarity and career decision self-efficacy

Zhao Qinrui[1]　Qai Yan[2]（corresponding author）

Sichuan Normal University , No.5 Jing'an Road, Jinjiang District, Chengdu, Sichuan, China

Abstract： Some high school students in Sichuan Province have already started to select subjects and go to classes, and face the choice of majors and careers earlier, but many first-year high school students do not have enough self-knowledge, have no clues about career planning, and have blindness in selecting subjects or choosing majors, and lower career planning ability is not conducive to high school students' choices of majors and future careers. According to the social investment model of personality development, individuals with higher future work self-clarity have clearer career roles, are more responsible for their own careers, and tend to make career preparations in advance; future-oriented individuals tend to make positive career planning and take the initiative to plan for the future. In this paper, we used the Career Future Time Insight Scale, the Future Work Self-Clarity Scale, the Career Decision Self-Efficacy Scale, and the Questionnaire on High School Students' Career Planning Ability to conduct a questionnaire survey on 719 general high school students in the freshman and sophomore grades of a senior high school in Chengdu City, Sichuan Province, to explore the relationship between career future time insight, future work self-clearness, career decision self-efficacy, and high school students' To explore the relationship between career future time insight, future job self clarity, career decision self-efficacy and high school students' career planning ability, as well as the influencing factors and mechanisms of high school students' career planning ability, the following research conclusions were drawn:

(1) There is a two-by-two correlation between high school students' career future time insight, future work self-clarity, career decision self-efficacy, and career career planning ability;

(2) High school students' future work self-clarity mediates the relationship between career future time insight and career career planning ability;

(3) High school students' career decision-making self-efficacy mediates between career future time insight and career career planning ability;

(4) High school students' future work self-clarity and career decision-making self-efficacy mediate the chain between career future time insight and career career planning competence.

执行功能与幼儿社会退缩的关系：一个有调节的中介模型

吕晋晋 刘彤 肖伊兰 黄嚞青（通讯作者）
首都师范大学，北京，100048，aivita@126.com

摘 要 社会退缩是指个体独自游戏、消磨时光的孤单行为，具有跨情境、跨时间的一致性。社会退缩的形成受到认知因素和情感因素的共同作用。其中，执行功能作为一种高级的认知功能，广泛参与到社会适应的各个环节中，和幼儿社会性的发展有密切的关系。此外，共情和情绪调节能力作为一种社会情绪反应，在个体的社会化发展进程中也发挥着重要的作用。为了探索幼儿共情在执行功能与社会退缩关系中的中介作用,以及情绪调节对上述中介效应的调节作用，本研究共选取 283 名（男孩 144 名，女孩 139 名）3-6 岁幼儿作为研究对象进行测查。使用《社会退缩教师问卷》考察幼儿社会退缩程度，包括沉默害羞、主动退缩和被动退缩三个维度；使用《执行功能量表》(CHEXI)考察幼儿执行功能的发展状况；通过早期儿童共情量表（EmQue）考察幼儿的共情能力；以及通过《儿童情绪调节检核表》考察幼儿的情绪调节能力。使用 SPSS 及其 process 插件进行数据处理。结果表明，在控制了性别和年龄后：（1）执行功能显著负向预测幼儿的社会退缩；（2）共情在执行功能和社会退缩的关系中起部分中介的作用；（3）共情中介作用的前半段受到情绪调节能力的调节，对于情绪调节能力低的个体，共情起到的中介效应更强。研究结果有助于揭示执行功能对幼儿社会退缩行为的影响及其作用机制，对幼儿社会退缩的预防和干预有积极的意义。
关键词 执行功能，社会退缩，共情，情绪调节

The relationship between executive function and social withdrawal in young children: a moderated mediation model

Lv JinJin, LiuTong, Xiao Yilan, Huang Heqing（Correspondence author）
The Capital Normal University, BeiJing, 100048, aivita@126.com

***Abstract*：** Social withdrawal is the lonely behavior of individuals who play and spend time alone, with consistency across situations and time. Social withdrawal is shaped by a combination of cognitive and affective factors. Among them, executive function, as an advanced cognitive function, is widely involved in all aspects of social adaptation and is closely related to the development of sociality in young children. In addition, empathy and emotion regulation, as a kind of social-emotional response, also play an important role in the developmental process of individual socialization.In order to explore the mediating role of young children's empathy in the relationship between executive functioning and social withdrawal, as well as the moderating role of emotion regulation on the above mediating effects, a total of 283 (144 boys and 139 girls) 3-6 year old children were selected to be measured in this study.The degree of social withdrawal was examined using the Social Withdrawal Teacher's Questionnaire, which includes three dimensions: silent-shyness, active withdrawal, and passive withdrawal; the development of executive functioning was examined using the Executive Functioning Inventory (CHEXI); empathy was examined through the Early Childhood Empathy Scale (EmQue); and emotional regulation was examined through the Children's Emotion Regulation Checklist. Data were processed using SPSS and its process plug-in.The results showed that after controlling for gender and age: (1) executive functioning significantly and negatively predicted social withdrawal in young children; (2) empathy partially mediated the

relationship between executive functioning and social withdrawal; (3) the first half of the mediating role of empathy was moderated by emotion regulation ability, and empathy played a stronger mediating effect for individuals with low emotion regulation ability. The findings help to reveal the influence of executive function on young children's social withdrawal behavior and its mechanism of action, which has positive implications for the prevention and intervention of young children's social withdrawal.

父母对儿童消极情绪反应方式和家庭情绪表露的关系：夫妻婚姻满意度的中介作用

肖伊兰　吕晋晋　刘彤　黄嚞青　（通讯作者）
首都师范大学，北京，100048，aivita@126.com

摘 要　家庭情绪表露是指家庭成员间言语或非言语的情绪表达风格，分为积极情绪表露和消极情绪表露两个维度。生活在积极情绪表露家庭中的个体更能理解他人，也会表现出更多积极的社会适应行为，生活在消极情绪表露家庭中的成员间缺乏爱与安全感，进而会产生一系列不良的情绪行为。父母对儿童消极情绪反应方式在家庭情绪氛围的构建中发挥着重要作用。由父母非支持性反应导致的亲子冲突会使整个家庭产生更加消极的情绪表露风格，而父母支持性反应则会使幼儿以及父母自身产生更加积极的情绪体验，因此，不同的父母反应方式和家庭情绪表露之间可能存在某种关系。此外，夫妻婚姻满意度参与到家庭系统互动的各个环节中，可能在不同的父母对儿童消极情绪的反应方式和不同的家庭情绪表露风格的关系中产生某种作用。为了考察父母对儿童消极情绪反应方式与家庭情绪表露的关系，以及夫妻婚姻满意度在其中的作用，本研究共选取 263 名 3-6 岁幼儿的家长 (父亲 56 名，母亲 206 名)作为研究对象进行测查，使用《家庭情绪表露问卷》考察家庭情绪表达风格，包括积极情绪表露与消极情绪表露两个维度；使用《父母应对幼儿消极情绪反应方式量表》考察父母对幼儿消极情绪反应方式，包括支持性反应：鼓励表达、问题关注、情感关注，以及非支持性反应：惩罚反应、忽视反应、苦恼反应，通过婚姻满意度考察父母婚姻关系的和谐与满意程度。使用 SPSS 及其 process 插件进行数据处理。结果表明，在控制了父母性别后：(1)问题关注反应显著正向预测夫妻婚姻满意度；(2)情感关注反应显著正向预测夫妻婚姻满意度；(3)夫妻婚姻满意度显著负向预测家庭消极情绪表露；(4)夫妻婚姻质量在问题关注反应和家庭情绪氛围中起中介作用 ；(5)夫妻婚姻质量在情感关注反应和家庭情绪氛围中起中介作用。本研究揭示了父母应对幼儿消极情绪反应方式对于家庭情绪表露的影响及其内在的作用机制，对家庭情绪氛围的构建具有积极的意义。

The Relations between Parental Reactions to Children's Negative Emotions and Family Emotional Expression : The Mediating Role of Marital Satisfaction

Xiao Yilan　Lv Jinjin　Liu Tong　Huang Heqing (Correspondence author)
The Capital Normal University, Beijing, 100048

Abstract：Family emotional expression refers to the verbal or nonverbal style of emotional expression among

family members and includes two dimensions: positive and negative emotional expression. Individuals living in positive emotional expression families are more understanding of others and will show more positive social adaptive behaviors, while members living in negative emotional expression families lack a sense of love and security, which in turn leads to a range of undesirable emotional behaviors. Parental reactions to children's negative emotions play an important role in the construction of the family's emotional climate. Parent-child conflict resulting from non-supportive parental reactions produces a more negative style of emotional expression in the family, whereas supportive parental responses produce a more positive emotional experience for the child as well as for the parents themselves. Thus, there may be a relationship between different parental reactions and family emotional expressions. In addition, couples' marital satisfaction is involved in various aspects of family system interactions and may play some role in the relationship between different parental reactions to children's negative emotions and different styles of family emotional expression. In order to examine the relationship between parental reactions to children's negative emotions and family emotional expression, as well as the role of couples' marital satisfaction, a total of 263 parents (56 fathers and 206 mothers) of 3-6 year old children were selected for this study, and the Family Emotional Expression Questionnaire was used to examine the family's emotional expression styles, which included two dimensions: positive emotional expression and negative emotional expression. The Parental Reactions to Children's Negative Emotions Questionnaire was used to examine parental response styles to children's negative emotions, including supportive responses: encouragement to express, problematic concerns, and emotional concerns, as well as non-supportive responses: punitive, neglectful, and distressing responses. The Marital Satisfaction Questionnaire was used to examine the degree of harmony and satisfaction in parents' marital relationship. Data were processed using SPSS and its process plug-in. Results indicated that after controlling for parental gender: (1) problem concern responses significantly and positively predicted couple marital satisfaction. (2) Emotional concern responses significantly positively predicted couple marital satisfaction. (3) Couple marital satisfaction significantly and negatively predicted negative family emotional expressions. (4) Couple marital quality mediated problematic attention responses and family emotional climate . (5) Couple marital quality mediated affective concern response and family emotional climate. The present study reveals the impact of parental reactions to children's negative emotions on family emotional expressions and their intrinsic mechanisms of action, which have positive implications for the construction of a family emotional climate.

家庭功能对中学生学习投入的影响：自我同情和心理韧性的链式中介作用

宋明燚[1]　曾练平[1]（通讯作者）

1 贵州师范大学心理学院，贵阳，550001，zenglianping@163.com

摘 要　“双减”是一项系统教育工程，本质在于减轻学生学业负担，认清教育性质，厘清教育评价模式。在减轻学业负担之后，如何保证学生的学习质量，有效提升学习效率，以转变重结果轻过程的教育评价模式？我们可以将目光投向积极心理视角的学习投入。学习投入是一种与学习相关的、持久的、完整的积极心理状态，可分为活力、奉献、专注三个主成分。立足于如何提高学生的学习投入水平的角度，探讨学生学业质量和教育教学质量更为直接和有效。学习投入的动力形成受到环境和个人的双重影响，在以往研究中，已发现家庭和社会支持性因素会影响学习投入，也发现一些影响学习投入的个人心理保健因素，例如

自我效能感、个人成长主动性等。为了进一步探讨学习投入具体的影响机制，本研究采用家庭功能量表、自我同情量表、心理韧性量表和学习投入量表对贵州省 883 名中学生进行问卷调查分析，探讨家庭功能对学生学习投入的影响，及自我同情和心理韧性在二者之间的链式中介作用。结果发现：（1）中学生家庭功能、自我同情、心理韧性与学习投入两两呈显著正相关，家庭功能显著正向预测学习投入。（2）家庭功能可通过自我同情的中介作用、心理韧性的中介作用、自我同情——心理韧性的链式中介作用对中学生学习投入产生间接效应。研究结果揭示了家庭功能对中学生学习投入的影响及作用机制，为更有效地提高中学生学习投入水平提供了一些启示。

The influence of family functioning on middle school students' investment in learning: the chain-mediated role of self-compassion and psychological resilience

Song Mingyi[1]　Zeng Lianping[1]（Corresponding author）
1 School of Psychology, Guizhou Normal University，Guiyang，550001，zenglianping@163.com

Abstract: "Double reduction" is a systematic education project, the essence of which is to reduce students' academic burden, recognize the nature of education, and clarify the mode of education evaluation. After reducing the academic burden, how to ensure the quality of students' learning, effectively improve the efficiency of learning, and transform the educational evaluation mode that emphasizes the result but not the process? We can focus on learning engagement from a positive psychological perspective. Learning engagement is a kind of persistent and complete positive mental state related to learning, which can be divided into three main components: vitality, dedication and concentration. Based on how to improve the level of students' learning involvement, it is more direct and effective to discuss the quality of students' learning and teaching. The motivation formation of learning engagement is influenced by both environment and individual. In previous studies, it has been found that family and social supportive factors affect learning engagement, and some personal mental health factors, such as self-efficacy and personal growth initiative, have been found to affect learning engagement. In order to further explore the specific influence mechanism of learning investment, 883 students from three high schools in Guizhou Province were investigated by the author, self- compassion scale, psychological resilience scale, family function scale and learning investment scale were adopted in this investigation. The results were as follows: (1) There were significant correlations among high school students' family function, self-compassion, psychological resilience and learning investment, and family function could significantly positively predict learning investment.(2) Family function not only has a direct effect on middle school students' learning investment, but also has an indirect effect on middle school students' learning investment through the mediating effect of self-sympathy and psychological resilience, through the chain mediating effect of self-sympathy-psychological resilience. The author reveal the influence and mechanism of family function on middle school students' learning investment, and provide some enlightenment for improving middle school students' learning investment more effectively by analyzing the results.

Key words: family function, learning investment, self-compassion, psychological resilience

统计焦虑量表的结构：一项基于中国大学生群体的验证性因子分析

田千峰[1] 黄发杰[1] 傅芃[1] 陈叶[1] 廖美玲[2]（通讯作者）
1 福建医科大学健康学院应用心理学系，福州，350108
2 福建医科大学健康学院应用心理学系，福州，350108，Liaoml@fjmu.edu.cn

摘 要 本研究以中国大学生群体为样本探讨统计焦虑量表的心理测量特性和结构。选取 2687 名中国大学生填写量表，得到 1617 份有效数据。对 575 名大学生（样本 1）进行项目分析、探索性因子分析，对 575 名大学生（样本 2）进行验证性因子分析、内部一致性信度分析、聚合效度分析、区分效度分析，对 70 名（样本 3）大学生进行重测信度分析。选取统计自我效能感量表、状态——特质焦虑问卷、学习投入量表作为校标量表，对 397 名大学生（样本 4）进行校标效度分析。结果显示本量表的心理测量特性与该量表其他国家版本得到的结果非常相似。本量表的探索性因子分析得到统计焦虑量表包括 51 个项目，由解释焦虑、考试焦虑、提问焦虑、统计学价值、自我认同及对教师的恐惧 6 个维度组成，累积解释量表总变异量的 73.62%；量表的 *AVE*、*CR* 均达到测量学标准；验证性因子分析显示模型拟合良好(χ^2 = 4257.14，*df* = 859，χ^2/df =4.96，*CFI* = 0.84，*TLI* = 0.83)；量表总分与总量表的内部一致性系数为 0.979，重测信度为 0.890。统计焦虑与状态焦虑呈显著正相关。统计焦虑与统计自我效能感、统计学课程成绩、学习投入水平呈现显著负相关；中国版量表在大学生性别上具有较好的测量等值性（△*CFI*<0.01,△*RESEA*<0.01）。因而统计焦虑在中国大学生群体中信效度较好，测量结果在不同性别人群间具有可比性，适用于测量大学生群体的统计焦虑水平。

The Structure of the Statistical Anxiety Scale: A Confirmatory Factor Analysis Based on the Chinese College Student Population

Qianfeng Tian[1] Fajie Huang[1] Peng Fu[1] Ye Chen[1] Meiling Liao[2] (Corresponding author)
1 Department of Applied psychology,School of Health,Fujian Medical University,Fuzhou,350108
2 Department of Applied psychology,School of Health,Fuzhou,350108,Liaoml@fjmu.edu.cn

***Abstract*:** To explore the psychological measurement characteristics and structure of the Statistics Anxiety Rating Scale(STARS) using a sample of Chinese college students. 2687 Chinese college students were selected to fill out the scale and 1617 valid data were obtained. Project analysis and exploratory factor analysis were conducted on 575 college students (Sample 1), confirmatory factor analysis, internal consistency reliability analysis, aggregated validity analysis, and discriminant validity analysis were conducted on 575 college students (Sample 2), and retest reliability analysis was conducted on 70 college students (Sample 3). Selecting the Statistical Self Efficacy Scale, State Trait Anxiety Questionnaire, and Learning Engagement Scale as the school scale, the school scale validity analysis was conducted on 397 college students (sample 4).The psychological measurement characteristics of this scale are very similar to the results obtained from other national versions of the scale. The exploratory factor analysis of this scale showed that the Statistics Anxiety Rating Scale included 51 items, which was composed of six dimensions, namely, explanatory anxiety, Test anxiety, questioning anxiety, statistical value, self-identity and fear of teachers. The cumulative variance of the explanatory scale was 73.62%; *AVE* and *CR* of the scale reached the Surveying standard; Confirmatory factor analysis shows that the model fits well（χ^2=4257.14, *df*=859, χ^2/df=4.96, *CFI*=0.84, *TLI*=0.83); The internal consistency coefficient between the total score of the scale and the total scale is 0.979, and the retest reliability is 0.890. There is a significant positive correlation between statistical

anxiety and state anxiety. Statistical anxiety is significantly negatively correlated with statistical self-efficacy, statistical course performance, and level of learning engagement; The Chinese version of the scale has good measurement equivalence in terms of gender among college students (△*CFI*<0.01, △*RESEA*<0.01). Statistical anxiety has good reliability and validity among Chinese college students, and the measurement results are comparable among different groups of people of the same sex. It is suitable for measuring the level of statistical anxiety among college students.

职前与在职学前教师对幼儿社会性行为信念的差异研究

马东乐[1] 杜巧金[1] 王健楠[1] 张洁[1] 周楠[1]（通讯作者）

1 首都师范大学学前教育学院，北京，100048

通讯作者 E-mail：nanzhou@cnu.edu.cn

摘 要 幼儿教师对幼儿社会化行为的信念包括对行为的反应、情绪体验、认知和评价（Rusher et al.，1992）。教师对于幼儿问题行为的信念直接决定了教师与幼儿的互动及教学行为，进而影响幼儿的社会化发展（Coplan et al., 2011; Nelson et al., 2019）。教师在面对幼儿攻击性、社会退缩等问题行为的信念的研究大多基于西方文化背景，对于我国文化背景下幼儿教师的信念所知甚少（Li et al., 2015）。另外，职前教师正处于教师信念形成的重要阶段，了解他们与在职教师的信念异同将有助于理解教师信念发展的历程和影响因素（王英杰，2016）。因此，本研究探究职前与在职幼儿教师面对幼儿不同社会性问题行为所表现出的信念的差异。

本研究以 378 名（职前教师 261 名，在职教师 117 名）职前与在职教师为被试，对攻击性行为（身体攻击、关系攻击）、退缩行为（害羞、不合群）、精力旺盛和打闹游戏共 6 种学前儿童经常出现的行为情境所反应出的行为反应、评价以及情绪反应进行报告。采用 SPSS 22.0 进行多元重复测量方差分析职前与在职教师对不同性别幼儿社会性行为信念的差异。

结果发现：（1）相较于职前教师，在职教师对于男孩关系攻击行为的宽容、顺其自然的反应以及被同伴喜欢的可能性评价显著高于女孩，但对于男孩孤僻行为的阻止反应显著高于女孩；（2）相较于职前教师，在职教师对于男孩害羞行为的生气反应显著高于女孩，但对于男孩打闹游戏行为的担心程度和被同伴喜欢的可能性评价显著高于女孩；（3）在职教师对孤僻男孩、精力旺盛男孩的社会性发展评价显著高于女孩，而职前教师对精力旺盛女孩的社会性发展评价显著高于在职教师。

本研究初步揭示了职前教师与在职教师对不同性别幼儿的社会性问题行为的信念的差异，结果将为我国职前的培养和在职教师的培训提供科学合理的指导，以促进幼儿教师的科学的师幼互动和幼儿的发展。

关键词 职前教师，在职教师，社会性行为信念

A Study of Differences in Pre-service and In-service Preschool Teachers' Beliefs about Young Children's Social Behavioral Behaviors

Dongle Ma Qiaojin Du Jie Zhang Jiannan Wang Nan Zhou

Capital Normal University，Beijing，100048

Abstract：Early childhood teachers' beliefs about young children's socialization behaviors include reactions to the

behavior, emotional experiences, cognitions, and evaluations (Rusher et al., 1992). Teachers' beliefs about young children's problematic behaviors directly determine teachers' interactions with young children and teaching behaviors, which in turn influence young children's socialization development (Coplan et al., 2011; Nelson et al., 2019). Most of the research on teachers' beliefs in confronting problematic behaviors such as aggression and social withdrawal in young children is based on the Western cultural context, and little is known about the beliefs of early childhood teachers in our cultural context (Li et al., 2015). In addition, pre-service teachers are at an important stage in the formation of teachers' beliefs, and understanding the similarities and differences between their beliefs and those of in-service teachers will help to understand the course of teachers' belief development and the factors influencing it (Wang, Y., 2016); therefore, this study explored the differences in beliefs between pre-service and in-service early childhood teachers' beliefs when faced with different socially problematic behaviors of young children.

In this study, 378 (261 pre-service teachers and 117 in-service teachers) in-service and pre-service teachers were used as subjects to report behavioral responses, appraisals, and emotional reactions reacting to a total of six frequent behavioral situations in preschool children, including aggressive behavior (physical aggression, relational aggression), withdrawn behavior (shyness, nonconformity), energetic, and playful play. Differences in pre-service and in-service teachers' beliefs about young children's social and behavioral behaviors across genders were analyzed using multivariate repeated measures ANOVA with SPSS 22.0.

Results found that (1) compared to preservice teachers, in-service teachers rated boys' relational aggression, go-with-the-flow responses, and likelihood of being liked by peers as significantly higher than girls', but rated boys' discouragement of withdrawn behaviors as significantly higher than girls'; (2) compared to preservice teachers, in-service teachers rated boys' shyness behaviors as significantly higher than girls' anger responses, but rated boys' disruptive play behaviors as significantly higher than boys' worry and likelihood of being liked by peers were rated significantly higher than those of girls; (3) in-service teachers rated the social development of withdrawn and energetic boys significantly higher than that of girls, while pre-service teachers rated the social development of energetic girls significantly higher than that of in-service teachers.

This study preliminarily revealed the differences between pre-service teachers' and in-service teachers' beliefs about the socially problematic behaviors of young children of different genders, and the results will provide scientifically sound guidance for the training of pre-service and in-service teachers in China in order to promote scientific teacher-child interactions and young children's development among early childhood teachers.

情绪调节策略与幼儿教师心理健康的关系：认知灵活性的中介作用

郭梦欣 代佳 高甜雯 杜思奇 吕怡晴 曲方炳（通讯作者）

首都师范大学学前教育学院，北京，100048

Email:qufangbing@cnu.edu.cn

摘 要 目的：幼儿教师心理健康是社会多方广泛关注的话题。作为日常情绪劳动较高的群体，能够有效使用不同的情绪调节策略对幼儿教师心理健康发展具有重要促进作用。本研究从情绪调节策略入手，探究情绪调节策略与幼儿教师心理健康之间的关系以及认知灵活性在二者之间的作用机制，为提升幼儿园教师心理健康提供理论与实证依据。方法：本研究聚焦认知重评和表达抑制两种情绪调节策略的使用情况对幼儿教师心理健康的影响，从焦虑和抑郁两个负性情绪方面进行探讨，以 121 名幼儿教师作为研究对象，采用情绪调节策略问卷、认知灵活性问卷、焦虑自评量表、抑郁自评量表分别测量幼儿教师情绪调节策略、认

知灵活性、焦虑及抑郁情绪水平。结果：（1）幼儿教师情绪调节策略的使用存在显著差异，幼儿教师使用认知重评情绪调节策略的频率显著高于使用表达抑制情绪调节策略的频率（2）认知重评情绪调节策略与幼儿教师心理健康水平呈现正相关，表达抑制情绪调节策略与幼儿教师心理健康水平呈现负相关（3）认知灵活性与幼儿教师心理健康水平呈现正相关，认知重评情绪调节策略与认知灵活性水平之间存在显著正相关，表达抑制情绪调节策略与认知灵活性水平存在显著负相关，认知灵活性在情绪调节策略与幼儿教师心理健康之间起部分中介作用。结果表明，情绪调节策略既可以直接影响幼儿教师心理健康，又可以间接通过认知灵活性影响幼儿教师心理健康，提示教育工作者可以从提高认知灵活性角度入手，促进幼儿教师心理健康发展。

The relationship between emotional regulation strategies and preschool teachers' mental health: The mediating role of cognitive flexibility

Guo Mengxin　Dai Jia　Gao Tianwen　Du Siqi　Lv Yiqing　Qu Fangbing(Corresponding author)
College of Preschool Education, Capital Normal University, Beijing, 100048

***Abstract*：Purpose**: The mental health of early childhood teachers is a topic of widespread concern in many parts of society. As a group with a high level of daily emotional labour, the ability to effectively use different emotion regulation strategies has an important role to play in the development of early childhood teachers' mental health. This study explored the relationship between emotion regulation strategies and the psychological health of kindergarten teachers, and the role of cognitive flexibility in the relationship, in order to provide theoretical and empirical evidence for improving the psychological health of kindergarten teachers. **Methods**: This study focused on the effects of the use of two emotion regulation strategies, cognitive reappraisal and expressive inhibition, on the mental health of kindergarten teachers, and explored the two negative emotions, anxiety and depression, with 121 kindergarten teachers as the subjects of the study, and used the Emotion Regulation Strategies Questionnaire, the Anxiety Self-Assessment Inventory, the Depression Self-Assessment Inventory, and the Cognitive Flexibility Questionnaire to measure the emotion regulation strategies, cognitive flexibility, anxiety and depressive mood levels of the kindergarten teachers, respectively. and anxiety and depression levels, respectively. **Results**: (1) There was a significant difference in the use of emotion regulation strategies among kindergarten teachers, with kindergarten teachers using cognitive reappraisal of emotion regulation strategies significantly more often than expressing inhibition of emotion regulation strategies. (2) Cognitive reappraisal of emotion regulation strategies was positively correlated with kindergarten teachers' mental health, and expressing inhibition of emotion regulation strategies was negatively correlated with kindergarten teachers' mental health. (3) Cognitive flexibility was positively correlated with kindergarten teachers' mental health. (3) Cognitive flexibility was positively correlated with ECE teachers' mental health; there was a significant positive correlation between cognitive reappraisal of emotion regulation strategies and cognitive flexibility; there was a significant negative correlation between expressive inhibition of emotion regulation strategies and cognitive flexibility; and cognitive flexibility was partially mediating the relationship between emotion regulation strategies and ECE teachers' mental health. The results suggest that emotion regulation strategies can directly affect the mental health of early childhood teachers and indirectly affect the mental health of early childhood teachers through cognitive flexibility, suggesting that educators can start from the perspective of improving cognitive flexibility to promote the development of the mental health of early childhood teachers.

青少年感恩与社会支持的关系：一项短期交叉滞后分析

谯力萍 严心怡 杨晓 吴鹏(通讯作者）
湖北大学心理学系，武汉，430062，reavenwp@hubu.edu.cn

摘 要 感恩和社会支持可以有效维护青少年的心理健康，是青少年社会适应与发展的重要保护性因素。以往研究指出，在高水平社会支持情境下，个体更容易获得感恩的体验和情绪，社会支持正向预测感恩。此外，积极情绪的扩展建构理论和感恩的道德情绪假说认为，感恩有助于个体获得更多的社会资源和心理资源，使得个体建立具有支持性的社会系统，能够促进社会支持的获得。综上，感恩与社会支持可能存在双向关系。目前研究较多采用横断设计对二者间的单向关系进行探究，尚缺乏考察两者间双向关系的纵向研究。本研究采用交叉滞后设计来探讨青少年感恩与社会支持之间的关系，试图阐明二者之间具体的作用机制，采用中文版感恩问卷与青少年社会支持量表对 968 名青少年（平均年龄 13.13±1.33 岁，男生 497 人）进行了相隔 6 个月的前后两次追踪调查。采用 SPSS25.0 进行统计分析之后，采用 Mplus7.0 软件建立了感恩与社会支持的交叉滞后路径分析的结构方程模型，结果表明：（1）感恩与社会支持间的同时性相关和继时性相关均显著；（2）社会支持显著预测下一个时间点的感恩，但感恩不能显著预测随后的社会支持。本研究结果提示我们，学校和家庭应积极发挥社会支持的增益作用，重视培养青少年的感恩特质，帮助他们获得积极的发展结果。

关键词 感恩，社会支持，交叉滞后分析

The relationship between gratitude and social support in adolescents: a short-term cross lagged analysis

Qiao Liping ,Yan Xinyi ,Yang Xiao ,Wu peng
Department of Psychology,Hubei University,Wuhan,China

Abstract:Gratitude and social support can effectively maintain the mental health of adolescents and are important protective factors for their social adaptation and development. Previous studies have shown that individuals are more likely to feel gratitude in high-level social support situations, and social support positively predict gratitude. In addition, the broaden-and-build theory of positive emotion and the moral emotion hypothesis of gratitude suggest that gratitude helps individuals gain more social and psychological resources, enabling them to establish a supportive social system and promoting the acquisition of social support. In summary, there may be a two-way relationship between gratitude and social support. At present, most studies use cross-sectional design to explore the one-way relationship between the two, but there is still a lack of Longitudinal study to investigate the two-way relationship between the two. This study used a cross lagged design to explore the relationship between gratitude and social support in adolescents, attempting to elucidate the specific mechanism of their interaction. A total of 968 adolescents (with an average age of 13.13 ± 1.33 years and 497 males) were tracked for 6 months using the Chinese version of the gratitude questionnaire and the adolescent social support rating scale . After conducting statistical analysis using SPSS 25.0, a structural equation model for the cross lagged path analysis of gratitude and social support was established using Mplus7.0 software. The results showed that: (1) there was a significant correlation between gratitude and social support in both synchronicity and duration; (2) Social support significantly predicts gratitude at the next point in time, but gratitude cannot significantly predict subsequent social support. The results of this study suggest that schools and families should provide sufficient social support, attach importance to cultivating gratitude among adolescents, and help them grow up healthy.

Keywords: Gratitude,Social Support,A cross-lagged regression analysis

纵向视角下批判性思维与学业自我概念对学习投入的影响研究

江润杰[1] 叶海谋[1] 张克顺[1]（通讯作者）

1 青岛大学师范学院心理系，青岛，266071，keshun.zhang@qdu.edu.cn

摘 要　已有研究证实，大学生的批判性思维和自我概念间存在相互影响，且二者共同作用于大学生的学习投入水平，但尚未有研究厘清变量间作用机制，既往研究证实，学科对于大学生的批判性思维、学业自我概念以及学习投入水平均存在重要影响。目前国内外基于不同学科视角对于批判性思维和学业自我概念与学习投入间关系的研究较少，且多基于单学科的数据得出结论，对于不同学科之间的差异未进行对比分析。本研究采用问卷法对 3437 名大学新生进行为期 1 年的追踪研究，考察不同学科中批判性思维、学业自我概念和学习投入的特点及三者之间的动态关系。结果显示，（1）批判性思维和学业自我概念与学习投入间存在交叉滞后效应，T1 的批判性思维正向预测 T2 的学习投入，T1 的学业自我概念负向预测 T2 的学习投入。（2）批判性思维和学业自我概念间存在显著的双向预测关系，T1 的批判性思维负向预测 T2 的学业自我概念，T1 的学业自我概念正向预测 T2 的批判性思维。（3）数学/英语学科中批判性思维、学业自我概念与大学生学习投入间存在稳健的路径关系，即该影响机制不存在学科差异。这一结果支持了批判性思维、学业自我概念和学习投入的交叉滞后模型，发展了批判性思维、学业自我概念和学习投入的理论和研究，对于揭示其具体影响机制具有积极作用。

A longitudinal study on the between critical thinking and academic self-concept and student engagement

Jiang Runjie Ye Haimou ZhangKeshun

Department of Psychology, Normal College, Qingdao University, Qingdao, China,

keshun.zhang@qdu.edu.cn

Abstract： Research has confirmed that there is a mutual influence between critical thinking and self-concept among college students. Both factors jointly affect the level of students' learning engagement. However, the mechanisms of interaction between variables have not been clarified in previous studies. Previous research has demonstrated the significant impact of discipline on college students' critical thinking, academic self-concept, and level of learning engagement. Currently, there is limited research both domestically and internationally that examines the relationship between critical thinking, academic self-concept, and learning engagement from different disciplinary perspectives. Moreover, most studies draw conclusions based on data from a single discipline, without conducting comparative analyses to identify differences between different disciplines. There is a significant interaction between critical thinking and academic self-concept, and both of them have a protective effect on students' learning involvement. More and more studies have examined students' critical thinking and academic self-concept, but how they affect college students' learning input has not been determined. This study hypothesizes that there is a cross-lag effect between critical thinking and academic self-concept, and can longitudinally predict the level of students' learning involvement. To test this hypothesis, 2 follow-up surveys were conducted on 1,782 college students from all over the country. The results show that: (1) critical thinking and

academic self-concept increase significantly with time; (2) critical thinking and academic self-concept have a two-way predictive relationship; (3) critical thinking at the first time point positively predicts learning input at the second time point and academic self-concept negatively predicts learning input at the second time point; (4) critical thinking and academic self-concept at the first time point can pass critical thinking at the second time point and academic self-concept predicts learning input at the second time point; this result supports the cross-lag model of critical thinking, academic self-concept and learning input and develops the theory and research of critical thinking, academic self-concept and learning input, which has a positive effect on revealing its specific influence mechanism.

Keywords：critical thinking, academic self-concept, learning engagement, longitudinal study

青少年父母关爱相对剥夺感对学习倦怠的影响：生活满意度的中介作用

郭雅霖[1] 陈顺森[2]（通讯作者）

1 闽南师范大学教育与心理学院，漳州，363000

2 闽南师范大学教育与心理学院，漳州，363000，shunsen@163.com

摘 要　在“三胎”政策出台的背景下，部分青少年在心理认知、健康等方面发生变化。选取福建省和广东省共 1211 名青少年为被试，采用调查法来探究青少年的父母关爱相对剥夺感、学习倦怠和生活满意度三者间的关系。调查工具包括：青少年父母关爱相对剥夺感量表、青少年学习倦怠量表和生活满意度量表。结果发现：（1）青少年的父母关爱相对剥夺感和学习倦怠呈显著正相关（r=0.44），父母关爱相对剥夺感对生活满意度呈显著负相关（r=－0.51），生活满意度和学习倦怠呈显著负相关（r=－0.48）；（2）青少年的父母关爱相对剥夺感对生活满意度具有负向预测作用（β=－0.511），生活满意度对学习倦怠具有负向预测作用（β=－0.348），父母关爱相对剥夺感在生活满意度的中介作用影响下，对学习倦怠起间接作用（ c '=0.267）。

综上所述可以认为，青少年的父母关爱相对剥夺感对学习倦怠和生活满意度都有显著的预测作用，生活满意度能显著预测学习倦怠。生活满意度对父母关爱相对剥夺感与学习倦怠的关系起部分中介作用。针对三者之间的关系并结合研究结果，提出以下的建议：作为父母，采用积极地教养方式来降低孩子的学习倦怠，避免消极的教养方式；父母生育选择应考虑全面，家庭资源能够较好分配给子女。在日后的心理健康教育工作或日常教学中，应给予父母关爱相对剥夺感水平高的学生更多的关心，设置合理教学目标，适时鼓励和引导，增进师生互动与感情，提高其生活满意度，以期降低学习倦怠水平。

关键词　父母关爱相对剥夺感，学习倦怠，生活满意度，青少年

The effect of relative deprivation of parental care on learning burnout in teenagers: the mediating role of life satisfaction

Yalin　GUO，Shunsen Chen

Minnan Normal University, Zhangzhou, China

Abstract：Under the background of Three-child policy, some teenagers had undergone changes in psychological cognition and other aspects. A total of 1211 teenagers from Fujian and Guangdong provinces were selected to

explore the relationship among relative deprivation of parental care, learning burnout and life satisfaction. The survey tools included: teenagers' relative deprivation of parental care scale, teenagers learning burnout scale and life satisfaction scale. The results showed that:（1）There was a significant positive correlation between the relative deprivation of parental care and learning burnout (r= 0.44), a negative correlation between the relative deprivation of parental care and life satisfaction (r=－0.51), and a negative correlation between life satisfaction and learning burnout (r=－0.48);（2）The relative deprivation of parental care had a negative predictive effect on life satisfaction (β=－0.511) and life satisfaction had a negative predictive effect on learning burnout (β=－0.348). Under the mediating effect of life satisfaction, the relative deprivation of parental care had an indirect effect on learning burnout (c'=0.267).

According to the relationship between the three and the research results, the following suggestions are put forward: as parents, adopt positive parenting methods to reduce children's learning burnout and avoid negative parenting methods; Parents' reproductive choice should be considered comprehensively, and family resources can be better allocated to their children. In the future mental health education or daily teaching, parents should show more concern for students with relatively high deprivation, set reasonable teaching objectives, encourage and guide them in time, enhance teacher-student interaction and feelings, and improve their life satisfaction, so as to reduce the level of learning burnout.

乡村支教对职前教师生涯发展的影响及其模式

姜刻文[1] 陈宁[2]（通讯作者）

1 上海师范大学，上海，200030

2 上海师范大学心理系，上海，200030，chenning323@163.com

摘 要 教师的培养始终是教育领域中不可忽视的重要议题，也是提升教育质量的重要抓手。但当前的教育实习存在实践要素不足的现状，“轻实践，重理论”的问题也一直为人诟病。相比之下，顶岗式的教育实习有助于帮助职前教师体验更接近现实的教学环节，从而有利于个人成长与学术研究。因此，为了更好地探索职前教师在教育实习中如何发展，本研究选取了西部计划研究生支教团项目的成员作为被试，基于扎根理论，以质性访谈的方式进行研究，试图对职前教师在顶岗式教育实习中的成长模式进行探索与理论建构。结果发现：本研究通过对 12 名被试总计 17.2 万字的访谈文本进行整理与分析，总结了 8 个互相关联的类属，即“阻力感知”、“机遇挑战”、“支持经历”、“投入满足”、“从教感受”、“人格成熟”、“信念变化”、“技术改善”等。最终形成了以“投入满足”为核心类属的类属关联。基于类属关联得出的教师成长路径以及核心类属的维度分类，我们总结出了三种不同的成长模式，包括高投入高满足的 A 模式、高投入低满足的 B 模式以及低投入低满足的 C 模式。我们更进一步总结归纳了在教育环境中会促进或阻碍职前教师成长的不同因素，深入探讨了教师投入满足背后的深层原理，以及实际实习中可能促成教师成长的不同路径与方式，由此对改良教育实习模式提供理论支持。

The influence of rural volunteer teaching on the career development of pre-service teachers and its model

Jiang Kewen[1] and Chen Ning[1] (corresponding author)

1 Shanghai Normal University, Shanghai 200030, China
2 Department of Psychology, Shanghai Normal University, Shanghai 200030

Abstract：Teacher training has always been an important issue that cannot be ignored in the field of education, but also an important starting point to improve the quality of education. However, the current educational practice is lack of practical elements. In contrast, on-the-job educational practice helps pre-service teachers to experience more realistic teaching links, which is conducive to personal growth and academic research. Therefore, in order to better explore the development of pre-service teachers in educational practice, this study selected members of the China's Far West Program as subjects, based on Grounded theory, conducted qualitative interview research, and attempted to explore and theoretically construct the growth mode of pre-service teachers in on-the-job educational practice. The results are as follows: Through the collation and analysis of a total of 172,000 words of interview texts of 12 subjects, eight interrelated categories are summarized, namely, "resistance perception", "opportunity and challenge", "support experience", "input satisfaction", "teaching experience", "personality maturity", "belief change", "technology improvement" and so on. Finally, a generic association with "input satisfaction" as the core category is formed. Based on the teacher growth path and the dimension classification of the core categories, we summarized three different growth models, including model A with high input and high satisfaction, model B with high input and low satisfaction, and model C with low input and low satisfaction. We further summarized the different factors that can promote or hinder the growth of pre-service teachers in the educational environment, and deeply discussed the deep principle behind teacher engagement satisfaction, as well as the different paths and ways that may contribute to teacher growth in practical practice, thus providing theoretical support for improving the model of educational practice.

Keywords：Rural volunteer teaching, pre-service teacher, educational practice, Grounded theory

学前儿童执行功能与视觉观点采择的发展及其关系研究：城乡的调节作用

杜巧金[1]　孙晗月[1]　周楠[1]（通讯作者）
1 首都师范大学学前教育学院，北京，100048
通讯作者 E-mail：nanzhou@cnu.edu.cn

摘 要　儿童从自我中心迈向社会化的进程中，观点采择发挥着举足轻重的作用。执行功能作为在个体高级认知能力，在儿童进行观点采择时扮演了储存、抑制、转换等角色。学龄前期是执行功能与视觉观点采择发展的关键阶段，是儿童生理和心理发展的重要时期。统筹教育发展是民心所向、政之所行，性别和城乡因素是不容忽视的人口学变量。以往研究中已经证明了影响视觉观点采择发展的城乡差异，为进一步探究执行功能与视觉观点采择的关系，本研究假设城乡在执行功能与视觉观点采择中起调节作用。

本研究选取北京市城乡共 380 名幼儿为研究对象，其中城市儿童 145 人，农村幼儿 235 人；男生 190 人，女生 190 人；小班幼儿 118 人，中班幼儿 135 人，大班幼儿 127 人。采用早期儿童执行功能测量工具包考察学前儿童执行功能三成分（抑制控制、认知灵活性、工作记忆）的发展特点及水平，使用透视拍摄法考察儿童视觉观点采择的发展特点及水平。

研究结果表明（1）执行功能各子成分均存在显著的年龄班差异，即大班幼儿执行功能各子成分的发展显著好于中班和小班幼儿，中班幼儿执行功能各子成分的发展显著好于小班幼儿，而抑制控制存在显著的性别差异，女孩的抑制控制显著好于男孩；工作记忆和认知灵活性存在显著的城乡差异，城市幼儿工作记忆和认知灵活性的发展水平显著好于农村幼儿；（2）工作记忆的年龄班、性别和城乡的三者交互作用显著，

即城市中班女生的工作记忆的得分显著高于城市中班女生工作记忆得分，农村中班男生工作记忆得分显著高于城市中班男生工作记忆得分；（3）抑制控制和认知灵活性可以显著预测视觉观点采择的发展；城乡在工作记忆和视觉观点采择的关系中起调节作用。对于城市儿童来说，工作记忆得分随视觉观点采择的得分增加而增加；对于农村儿童来说，儿童工作记忆得分不能显著预测儿童视觉观点采择的得分。

本研究为促进城乡幼儿执行功能与观点采择的发展提供了实证研究支持。

The development and relationship between executive function and visual perspective taking in preschool children：The moderating role of urban and rural areas

Qiaojin Du　Hanyue Sun　Nan Zhou
Capital Normal University, Beijing, 100048

Abstract：As children move from self-centeredness to socialization, point of visual perspective taking plays a pivotal role. Executive function, as an individual's advanced cognitive ability, plays a role in storing, inhibiting, and switching children's point of view. Preschool age is a critical stage in the development of executive function and visual perspective taking, and is an important period for children's physical and psychological development. Coordinating the development of education is the aspiration of the people and the action of the government, and gender and urban-rural factors are demographic variables that cannot be ignored. In order to further explore the relationship between executive function and visual perspective taking, this study hypothesizes that urban and rural areas play a moderating role in executive function and visual perspective taking.

In this study, a total of 380 children in urban and rural areas of Beijing were selected as the research subjects, including 145 urban children and 235 rural children. 190 boys and 190 girls; There are 118 children in kindergarten, 135 children in kindergarten and 127 children in kindergarten. The Early Childhood Executive Function Measurement Toolkit was used to investigate the developmental characteristics and levels of the three components of executive function (inhibitory control, cognitive flexibility, and working memory) in preschool children, and the developmental characteristics and levels of children's visual viewpoint selection were investigated by perspective photography.

The results showed that: (1) there were significant age class differences in each sub-component of executive function, that is, the development of each sub-component of executive function in kindergarten children was significantly better than that of kindergarten and kindergarten children, the development of each sub-component of executive function in middle class children was significantly better than that of kindergarten children, while there were significant gender differences in inhibition control, and the inhibitory control of girls was significantly better than that of boys. There were significant differences between urban and rural areas in working memory and cognitive flexibility, and the development level of working memory and cognitive flexibility of urban children was significantly better than that of rural children. (2) The interaction between age class, gender and urban and rural areas of working memory was significant, that is, the working memory score of urban middle school girls was significantly higher than that of urban middle school girls, and the working memory score of rural middle school boys was significantly higher than that of urban middle school boys. (3) inhibitory control and cognitive flexibility can significantly predict the development of visual perspective taking; Urban and rural play a regulating role in the

relationship between working memory and visual perspective taking. For urban children, working memory scores increased with scores on visual perspective taking; For rural children, children's working memory scores do not significantly predict children's visual perspective taking scores.

This study provides empirical research support for promoting the development of executive function and perspective taking in urban and rural children.

流动的焦虑：我国城市中小学家长教育焦虑生成与维持机制的质性研究

唐逸文[1] 邓林园[1]（通讯作者） 王婧怡[1] 田宏杰[2] 李蓓蕾[1]

1 北京师范大学教育学部，北京，100875

2 中国青少年研究中心少年儿童研究所，北京，100089，09036@bnu.edu.cn

摘 要 家长教育焦虑是目前我国教育语境下的热点话题，但关于其生成与维持机制还缺乏动态深入的研究，因而家长教育焦虑难以得到有效缓解。本研究运用程序化扎根理论的策略分析了 20 位城市中小学家长的访谈资料，得到了我国城市中小学家长教育焦虑生成与维持的机制模型——环境-认知-行为反馈-历时模型，这说明教育焦虑的产生是一个流动而非静止的动态过程。具体来说，影响我国城市中小学家长教育焦虑的因素包括认知因素（期望评估与教育效能感）、环境因素（教育体制、社会环境、同辈影响、学校环境、家庭氛围）、历时因素（个人经历与社会变迁）与行为反馈因素（积极反馈与消极反馈）四种。其中认知、环境与行为反馈因素对家长教育焦虑有直接影响，环境、历时与行为反馈因素会通过影响家长个体的认知因素影响其教育焦虑程度，而认知因素在环境因素和行为反馈因素与教育焦虑关系之间又发挥着调节作用。基于这一模型，本文认为应从改善家长认知、创设良好教育氛围和制度环境等方面入手，多角度缓解家长过高的教育焦虑情绪。

The Flow of Educational Anxiety: A qualitative study on the generation and maintenance mechanism of educational anxiety of parents of urban primary and secondary schools in China

Yiwen Tang[1], Linyuan Deng[1], Jingyi Wang[1], Hongjie Tian[2], Beilei Li[1]

1. Faculty of Education, Beijing Normal University, Beijing 100875;

2. Institute of Children and Adolescents, China Youth & Children Research Center, Beijing, 100089

Abstract：Parental educational anxiety is a hot topic in the context of China at present, but there is still a lack of in-depth research on its generation and maintenance mechanisms, which makes it difficult to promote a deep understanding of this concept. This study adopted the strategy of procedural grounded theory to analyze the interview data of 20 urban primary and secondary school parents, which, in the end, generated the mechanism model of the generation and maintenance of educational anxiety among urban primary and secondary school parents in my country: the environment-cognition-behavioral feedback-diachronic model, which indicates that the

generation of educational anxiety is a dynamic process of flow rather than static. Specifically, the factors that affect parental education anxiety of urban primary and secondary schools include cognitive factors (expectation evaluation and educational efficacy), environmental factors (educational system, social environment, peer influence, school environment, family atmosphere), diachronic factors (personal experience and social change) and behavioral feedback factors. Among them, cognitive, environmental and behavioral feedback factors have a direct impact on parental education anxiety, and environmental, diachronic and behavioral feedback factors will affect the degree of educational anxiety by affecting individual parents' cognitive factors, while cognitive factors plays a moderating role in the relationship between environmental factors and parental educational anxiety, as well as that between behavioral feedback factors and parental educational anxiety. This model has a brilliant echo with the PPCT model proposed by Bronfenbrenner, which also proves the effectiveness of the PPCT model in explaining the phenomena generated by the interaction between people and contexts. Based on this model, parents' excessive education anxiety should be alleviated from the paths of improving parents' cognition ability, creating a healthy educational atmosphere, and improving the vocational education system.

马基雅维利主义对中小学生宽恕的影响：内控归因与移情的中介作用

刘静茹 1　彭文波 2

1 重庆师范大学教育科学学院，重庆，401331

2 重庆师范大学应用心理学重点实验室，重庆，401331

摘 要　目的：新时代课程标准改革指出，要坚持德育为先，培养学生适应发展的必备品格。宽恕作为改善被伤害后的攻击性状态的有效资源，改善不良情绪与行为的积极正向品质，能够减少对他人行为的负面反应，青少年的宽恕水平受认知、情感等因素的影响，不同的因素决定宽恕的不同水平，探讨中小学生宽恕的影响因素及作用机制尤为重要。探讨移情对中小学生宽恕影响，并进一步考察了内控归因与认知移情在其中的影响机制。方法：采用 Hearland 宽恕量表、儿童马氏量表中文版（KMS-C）、基本移情量表（BES）、归因方式量表(MMCS)对 2138 名中小学生进行集体施测。结果：马基雅维利主义、认知移情、内控归因对宽恕均有直接效应，且认知共情、内控归因能够正向预测中小学生宽恕水平，马基雅维利主义则负向预测宽恕。内控归因与认知移情在马基雅维利主义与中小学生宽恕之间起平行中介作用。研究以 8-16 周岁的中小学生为研究对象，旨在更深层次探讨中小学生马基雅维利主义与宽恕水平的关系以及内控归因与移情在其中的作用机制，为学校宽恕的培育研究提供更全面的心理依据，在宽恕现状及其影响因素的基础上，针对中小学生的宽恕特点，提出更科学、更合理的宽恕教育建议，以期提升中小学生的宽恕意识，促进其人际关系、身心健康的全面改善。

关键词　宽恕心理，中小学生，马基雅维利主义

The Influence of Machiavellianism on Forgiveness Among Primary and Secondary School Students: The Mediating Role of Internal Attribution and Empathy

LIU Jingru1　PENG Wenbo2
1 College of Educational Sciences，Chongqing Normal University，Chongqing　401331
2 Key Laboratory of Applied Psychology, Chongqing　Normal University，Chongqing　401331

Abstract：Objective: The reform of the new era curriculum standards emphasizes the priority of moral education and the cultivation of essential qualities for students to adapt to development. Forgiveness, as an effective resource for improving aggressive states after being hurt, positively enhances emotions and behaviors, reduces negative reactions towards others' actions. The forgiveness level of adolescents is influenced by cognitive, emotional, and other factors, with various determinants affecting forgiveness at different levels. Therefore, exploring the influencing factors and mechanisms of forgiveness among primary and secondary school students is of great importance. This study investigates the impact of empathy on forgiveness among primary and secondary school students, and further examines the mediating role of internal attribution and cognitive empathy in this relationship.Methods: A collective survey was conducted on 2138 primary and secondary school students using the Hearland Forgiveness Scale, the Chinese version of the Children's Manifest Anxiety Scale (KMS-C), the Basic Empathy Scale (BES), and the Multidimensional Multiattributional Causality Scale (MMCS).Results: Machiavellianism, cognitive empathy, and internal attribution all have direct effects on forgiveness, with cognitive empathy and internal attribution positively predicting forgiveness among primary and secondary school students, while Machiavellianism negatively predicts forgiveness. Internal attribution and cognitive empathy play parallel mediating roles between Machiavellianism and forgiveness among primary and secondary school students. The research focuses on primary and secondary school students aged 8 to 16, aiming to explore in-depth the relationship between Machiavellianism and forgiveness levels among them, as well as the role of internal attribution and empathy in this relationship. This study provides a more comprehensive psychological basis for researching forgiveness cultivation in schools. Based on the current status of forgiveness and its influencing factors, it proposes more scientific and rational forgiveness education suggestions tailored to the characteristics of primary and secondary school students, with the hope of enhancing their forgiveness awareness and promoting comprehensive improvements in their interpersonal relationships and mental health.

急性应激对情感灵活性和认知情绪调节的影响:皮质醇反应性和性别差异的视角

郝秀荣[1]　李世佳[2]（通讯作者）
1,2 华东师范大学心理与认知科学学院，上海，200062，sjli@psy.ecnu.edu.cn

摘 要　应激源对个体身心的影响一直是健康心理学的关注重点，其中应激对认知灵活性的影响对于个体适应环境至关重要。大量研究显示，在经历急性应激的过程中和之后，情绪调节都发挥着重要作用，而情感灵活性也会相应受到影响，但目前暂没有相关实验室研究证据。本研究旨在探究急性应激影响情感灵活性和认知情绪调节的行为机理，并首次同时使用特质情绪调节和状态情绪调节的方法。研究共招募 74 名健康大学生，使用特里尔社会应激测试(TSST)进行急性应激诱导，使用情绪-中性规则转换任务测量情感灵活性，并完成认知情绪调节问卷和认知情绪调节任务。在应激诱导前后和任务后三个时间点采集唾液皮质醇且记录心率、血压和多维心理状态问卷(MDBF)。研究结果表明（1）生理指标和问卷均证明 TSST 成功诱导了被试的应激反应。（2）急性应激降低了被试从中性到消极情绪信息的转换成本。在女性被试中，皮质

醇响应者从消极情绪性信息到中性信息的转换成本高于非响应者。（3）皮质醇响应者在应激下使用重评进行情绪调节的效果比非响应者更差。本研究首次验证了急性应激对情感灵活性和情绪调节能力产生影响，而皮质醇响应性和性别可能造成这种影响的个体差异；此外，本研究首次提供了特质情绪调节和状态情绪调节能力与急性应激下的情感灵活性之间的关系。研究结果为考察个体在应激下相关能力表现和鉴别应激相关精神障碍发展的风险提供了重要参考。

Effects of Acute Stress on Affective Flexibility and Cognitive Emotion Regulation: Insights from Cortisol Reactivity and Gender Differences

Xiurong Hao[1] Shijia Li[2]（Corresponding author）
1,2 School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, sjli@psy.ecnu.edu.cn

***Abstract*:** The influence of stressors on physical and psychological well-being of individuals has long been a major focus in the field of Health Psychology, among which the impact of stress on cognitive flexibility is crucial for individuals to adapt to the environment. A large body of research has demonstrated that emotion regulation plays an important role during and after acute stress, and affective flexibility is correspondingly affected, while there is currently a lack of laboratory research evidence. The present study aims to investigate the behavioural mechanisms underlying the effects of acute stress on affective flexibility and cognitive emotion regulation, utilizing both trait and state emotion regulation measures for the first time. A total of 74 healthy university students were recruited and underwent acute stress induction using the Trier Social Stress Test (TSST), measured affective flexibility using an affective-neutral rule switch task, and completed Cognitive Emotion Regulation Questionnaire and Cognitive Emotion Regulation Task. Salivary cortisol was collected at three time points: before and after the stress induction and after the task, during which heart rate, blood pressure and Mehrdimensionale Befindlichkeitsfragebogen (MDBF) were also recorded. The results revealed the following findings: (1) Both physiological indicators and questionnaires proved the successful induction of stress response through TSST. (2) Acute stress reduced the switch cost from neutral to negative affective information. Among female participants, cortisol responders exhibited higher switch cost from negative to neutral affective information compared to non-responders. (3) Cortisol responders demonstrated poorer effectiveness in downregulating negative emotions using reappraisal under stress compared to non-responders. This study provides the first empirical evidence of the influence of acute stress on affective flexibility and emotion regulation abilities, with individual differences potentially attributed to cortisol reactivity and gender. Additionally, it offers novel insights into the relationship between trait and state emotion regulation abilities and affective flexibility under acute stress. The findings provide important implications for investigating individuals' relevant task performance under stress and identifying risks associated with the development of stress-related mental disorders.
***Keywords*:** acute stress, affective flexibility, cognitive emotion regulation, cortisol response, gender differences

人际感恩预测亲密关系满意度：亲密关系权力感的调节作用

金璐瑶　王艳梅*

华东师范大学心理与认知科学学院，上海，200062，ymwang@psy.ecnu.edu.cn

摘 要　感恩对良好的亲密关系质量至关重要，但二者之间也会受其他因素干扰而出现动态变化。亲密关系权力感，即个体在亲密关系中对自身权力的大小的感知，被指出可能存在潜在影响。为明确亲密关系权力感在人际感恩与亲密关系满意度中的影响机制，本研究构建了有调节的中介模型，考察了感知伴侣回应性在其中的中介作用以及亲密关系权力感的调节作用。利用网络平台数字化问卷调查，最终收集了 825 名处于亲密关系中且亲密关系时长超过六个月的被试（平均年龄：27.21±10.60 岁，女性占 46.9%，男性占 53.1%）的人际感恩、感知伴侣回应性、亲密关系权力感及亲密关系满意度。研究结果发现：（1）人际感恩可以显著正向预测亲密关系满意度（B=0.44, t=11.9, p<0.001）；（2）人际感恩能通过感知伴侣回应性的中介作用正向预测亲密关系满意度（B=0.21, t=6.17, p<0.001）；（3）人际感恩对亲密关系满意度的直接预测作用（B=-0.02, t=-2.41, p<0.05）及感知伴侣回应性在两者关系中的中介作用（B=-0.02, t=-2.20, p<0.05）均会收到亲密关系权力感的调节。随着亲密关系权力感水平的提高，人际感恩对亲密关系满意度的预测作用呈降低趋势，同时感知伴侣回应性对亲密关系满意度的预测作用也呈降低趋势。该结果揭示了亲密关系权力感在亲密关系中的特殊调节机制，总的来说，通过亲密关系权力感的相对高低水平，我们可以更深入了解感恩对亲密关系质量影响的个体差异。本研究对深化人际感恩在积极心理学的发展以及其对亲密关系影响的研究有理论意义，且对从以亲密关系权力感的创新性视角来干预亲密关系质量的心理健康服务领域有现实意义。

关键词　人际感恩，亲密关系满意度，感知伴侣回应性，亲密关系权力感

Interpersonal Gratitude Predicts Intimacy Relationship Satisfaction: The Moderating Role of Intimacy Power

Luyao Jin, Yanmei Wang*

School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

***Abstract*:** Gratitude is positively related to good intimacy quality, but other factors also can moderate the relationship between gratitude and intimacy quality. Intimacy power, individuals' perceptions of the magnitude of their power in intimate relationships, were noted to have potential implications. To clarify the mechanism of sense of intimacy power in the influence of interpersonal gratitude on intimacy relationship satisfaction, this study constructed a moderated mediation model, examined the mediating role of perceived partner responsiveness and the moderating role of intimacy power. Using a digital questionnaire on a web-based platform, interpersonal gratitude, intimacy relationship satisfaction, perceived partner responsiveness and intimacy power were finally collected from 825 subjects who were in an intimate relationship which had been for more than six months (Mean age: 27.21 ± 10.60 years, 46.9% female, 53.1% male). The study found that: (1) interpersonal gratitude positively predicted intimacy relationship satisfaction(B=0.44, t=11.9, p<0.001); (2) interpersonal gratitude positively predicted intimacy satisfaction through the mediating effect of perceived partner responsiveness(B=0.21, t=6.17, p<0.001); and (3) both the direct predictive effect of interpersonal gratitude on intimacy relationship satisfaction(B=-0.02, t=-2.41, p<0.05) and the mediating effect of perceived partner responsiveness on intimacy relationship satisfaction(B=-0.02, t=-2.20, p<0.05) were moderated by the intimacy power. The predictive effect of interpersonal gratitude on intimacy relationship satisfaction tended to decrease as the level of intimacy power increased, as well as the predictive effect of perceived partner responsiveness on intimacy satisfaction. The results reveal a special moderation mechanism of the intimacy power in intimate relationships, and in general, the relative high and low levels of the intimacy power allow us to gain more insight into individual differences in the impact of gratitude on the quality of intimate relationships. This study has theoretical implications for deepening research on

the influential effect of interpersonal gratitude in positive psychology and its impact on intimate relationships, and has practical implications for intervening in the field of mental health services in intimate relationship quality from the innovative perspective of intimacy power.

Key words: Interpersonal gratitude, Intimacy relationship satisfaction, Perceived partner responsiveness, Intimacy Power

急性心理社会应激和应对方式对年轻女性不公平感决策的影响：一项 fNIRS 研究

王光亚[1] 唐珺[1] 尹周乾[1] 余思雨[1] 潘亚峰[3] 李世佳[1,2]（通讯作者）

1 华东师范大学心理与认知科学学院，上海，200062，sjli@psy.ecnu.edu.cn

2 上海市长宁区精神卫生中心，上海，200335

3 浙江大学心理与行为科学系，浙江，310058

摘 要 急性心理社会应激影响女性不公平感决策行为的结果尚未统一，在以往有限的研究中忽略了对其脑机制的探索和压力应对个体差异的影响。本研究招募 44 名女性健康大学生被试（20.98 ± 2.89 岁），随机分配到应激组（$n = 21$）和控制组（$n = 23$）。被试首先休息 30 分钟并填写特质应对方式问卷（TCSQ）。随后，采用特里尔社会应激测试（TSST）诱发急性应激或进行控制程序，并要求被试作为接受者完成最后通牒博弈（UG），每个试次分配者不同。分配总金额为 50 元，5 种分配被分为 3 种条件：公平（25 元）、低不公平（20 或 15 元）、高不公平（10 或 5 元）。采用功能性近红外光谱技术（fNIRS）记录额叶、颞叶活动。在 TSST 前、后及 UG 后，测量血压、心率，并要求被试填写多维情绪状态问卷（MDMQ）。基于不公平厌恶模型在 R 中对接受率进行计算建模，生成劣势不公平敏感性（α）、行为随机性（τ）、公平适应性（ε）三个行为学指标。计算三种公平条件下的 HbO 峰值作为脑激活指标。

主观与生理指标表明 TSST 操作有效。曼-惠特尼 *U* 检验未发现各条件下接受率的组间差异。独立样本 *t* 检验显示，应激组的行为随机性提升（$p = 0.005$），公平适应性下降（$p < 0.001$）。应激条件下，MDMQ 各维度与ε均呈显著正相关（$ps < 0.05$），平静-紧张维度与α呈显著负相关（$p = 0.039$），即主观应激水平越高，对劣势不公平越敏感，公平适应性越差。混合设计 ANOVA 显示，相比于控制组，应激组在低不公平条件下右侧颞顶联合区（rTPJ）的 HbO 峰值显著升高（$p = 0.002$），左侧颞中回（lMTG）峰值显著降低（$p = 0.008$），表明急性应激导致的心智化过程以及对道德加工的抑制。控制组中，α与 rTPJ 在低不公平条件下的峰值呈显著正相关（$p = 0.023$），应激组中则不显著。消极应对方式与τ在控制组中相关不显著，应激组中则呈显著正相关（$p = 0.001$）。综上，本研究首次采用计算模型探究急性应激对女性不公平感决策行为的影响，基于认知神经科学视角解释女性应激下的“照料与结盟”，并提供应对方式影响应激下决策随机性的证据。

Acute psychosocial stress increased activation in the right temporoparietal junction when the healthy young females make decisions for the unfair offers

Guangya Wang[1] Jun Tang[1] Zhouqian Yin[1] Siyu Yu[1] Yafeng Pan[3] Shijia Li[1, 2, *]
1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062
2 Shanghai Changning Mental Health Center, Shanghai, 200335
3 Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310058

***Abstract*:** Decision-making in social interactions is often accompanied by stress. While numerous studies have examined the impact of acute psychosocial stress on decision, its effect on unfairness decision-making behavior remains inconclusive, particularly among females. This could be attributed to the oversimplification of behavioral indicators used in the prior researches. In addition, it is crucial to emphasize the exploration based on cognitive neuroscience in this complex decision-making situation to gain a more profound understanding of the underlying process. Therefore, this study aimed to investigate how the acute psychosocial stress influence women's unfairness decision-making behavior, using computational modeling to generate behavioral indicators that can reflect the intricate process of decision-making. Furthermore, using the functional near-infrared spectroscopy (fNIRS), we explored how stress may affect the final decision-making behavior through brain activation.

In the present study, 44 young women participants (20.98 ± 2.89 years) were randomly assigned to a control group (n = 23) or a stress group (n = 21). Upon arrival the laboratory, participants were asked to take a rest for 30 minutes and complete the Trait Coping Style Questionnaire (TCSQ). Subsequently, acute psychosocial Stress was induced by Trier Social Stress Test (TSST), and participants were then required to complete the Ultimatum Game (UG), which is a classical paradigm of unfairness decision-making, as responder. In UG, the participant divided 50 yuan with an anonymous proposer, and could accept or reject the proposer's proposal. There were five distribution schemes defined as three fairness conditions: fair (F; offer = 25 yuan), moderately unfair (MU; offer = 20 or 15 yuan), and very unfair (VU; offer = 10 or 5 yuan). Subjective stress was measured with the Multidimensional Mood State Questionnaire (MDMQ) before, after TSST and after UG, and blood pressure and heart rate were collected as stress-related physiological indicators. During UG, fNIRS was used to record the frontal, temporal, and part of parietal cortex activations continuously. In R, we construct the computational model based on the inequality aversion model for the acceptance rate in UG, and three behavioral indicators, α (sensitivity to disadvantageous unfairness), τ (behavioral randomness) and ε (fairness norm adaptation), were generated. For fNIRS, the left and right hemisphere were divided into 7 regions of interest (ROI), and oxy-hemoglobin (HbO) peak under 3 fairness conditions within each ROI was calculated as the analysis indicator of brain activation.

Subjective and physiological indicators showed that TSST successfully induced acute psychosocial stress in the stress group. Although there was no significant difference between groups in the acceptance rate under all fairness conditions, the independent sample t-test showed that ε (t = -38.43, p < 0.001) and τ (t = -3.02, p = 0.005) were lower in the stress group, which indicated lower fairness adaptation and more random decision-making behavior. Pearson correlation analysis revealed that the stronger the subjective feeling of stress, the higher the sensitivity to disadvantageous unfairness, and the stronger the randomness of decision behavior (ps < 0.05). Mixed design analysis of variance (ANOVA) showed that in the MU condition, the activation of the left medial temporal gyrus (lMTG) was decreased in the stress group (p = 0.008), while the activation of the right temporoparietal junction (rTPJ) was enhanced (p = 0.002), suggesting that stress inhibited the processing of fairness and moral, while promoting mentalization in women, in another word, mobilized more cognitive resources trying to understand proposer's intentions, which can be interpreted as an indication of prosocial behavior in brain activation. There was a significant positive correlation between α and rTPJ activation under MU condition in the control group (r = 0.47, p = 0.023), but not significant in the stress group. The negative coping style was not

significantly correlated with τ in the control group, but showed a significant positive correlation in the stress group ($r = 0.66$, $p = 0.001$).

To sum up, our study found that acute psychosocial stress is not conducive to young women's adaptation to the social fairness norm in unfair decision-making and leads to more random decision behaviors. Nevertheless, the final decision-making process is still complex, potentially involving the inhibition of moral and fairness information processing, as well as heightened cognitive resource utilization to comprehend the partner's allocation intention. Using computational modeling, our study delved into the mechanism of stress's impact on women's decision-making behavior associated with unfairness, revealing the influence of trait coping style at the same time. Meanwhile, we provided cognitive neuroscience evidence for the "tend and befriend" pattern in young women under acute psychosocial stress with the fNRIS. These results facilitate a more comprehensive comprehension of how psychosocial stress and distributional inequality impact the economic decision-making process in social contexts, enabling us to better manage potential conflicts between economic benefits and social norms in decision-making.

幼儿注意部署能力与内外倾倾向的关系：基于眼动的研究

朱泽鹏[1] 邓欢[2]（通讯作者）

1 淮北师范大学教育学院，淮北，235000

2 淮北师范大学教育学院特殊教育系，淮北，235000，zx10847@126.com

摘 要 幼儿会频繁使用生而知之的注意部署策略，帮助他们在无法有效使用高级情绪调节策略时调节情绪。为有效衡量幼儿注意部署能力以及了解内外倾人格倾向与其之间的关系，本研究招募 36 名 6 岁幼儿（男女各半），采用任务转换范式，借助眼动追踪技术，采集幼儿在完成不同任务类型的过程中获得的行为与眼动数据。研究采用 2(被试人格倾向：内倾、外倾)×4(任务类型：开心情绪识别、生气情绪识别、圆形形状识别、方形形状识别)两因素混合设计，通过两种数据层面探究幼儿人格倾向与注意部署能力之间的关系。

结果表明：(1)幼儿性别与注意部署能力之间在两种数据层面上都没有关系。(2)行为数据分析表明，在四种任务中，具有内倾倾向的幼儿更多的关注情绪任务，因此对情绪的判断反应时更短，正确率更高；具有外倾倾向的幼儿更多关注中性任务，对形状的判断反应时更短，正确率更高。因此外倾幼儿从情绪任务转换到中性任务的反应时更短，即相比于内倾幼儿，外倾幼儿的注意部署能力更好。(3)从眼动数据来看，内倾幼儿对于情绪兴趣区的注视相对更多，外倾幼儿对于形状兴趣区的注视相对更多。外倾幼儿从情绪任务脱离到进入中性任务的平均注视时间比内倾幼儿短，这说明外倾幼儿注意部署的速度更快；从情绪任务转换到中性任务时，外倾幼儿对于中性兴趣区的注视次数比例和注视时间比例都比内倾幼儿更大，这说明注意部署的有效性更好。

The relationship between children's ability of attention deployment and their introverted and extroverted personality tendencies: An Eye-tracking study

Zhu Zepeng[1] Deng Huan[2]

Huaibei Normal University, Faculty of Education, Huaibei

Abstract：Children make frequent use of birthright attention deployment strategies to help them regulate their emotions when they are unable to use advanced emotion regulation strategies effectively. To effectively measure the ability of children to attention deployment and to understand the relationship between introverted and extroverted personality tendencies, 36 six years old children (half of each sex) were recruited to collect behavioural and Eye-tracking data during the completion of different task types using an task switch paradigm with the aid of Eye- tracking technology. The study used a two-factor mixed design of 2 (subjects' personality disposition: introverted, extroverted) x 4 (task type: happy emotion recognition, angry emotion recognition, round shape recognition, square shape recognition) to explore the relationship between children's personality disposition and their ability to attention deployment through two data dimensions.

The results showed that (1) there was no relationship between gender and attentional deployment ability at either data level; (2) among the four tasks, children with an introverted orientation focused more on the emotion task and therefore had shorter reaction times and higher correctness rates for judgments of emotion and relatively more attention to emotional interest areas; the opposite was true for children with an extroverted orientation; (3) In terms of behavioural data, extroverted children had shorter reaction times to switch from emotional to neutral tasks, i.e., they were better ability of attention deployment than introverted children. In terms of eye-movement data, the average gaze time from the emotional task to the neutral task was shorter for extroverted children than for introverted children; when switching from the emotional task to the neutral task, extroverted children had a greater proportion of gaze to the neutral area of interest and a greater proportion of gaze time than introverted children, indicating better attentional deployment.

These results indicate that both the behavioural and eye-movement data analysed show that extroverted children have better attention deployment ability than introverted children.

Keywords：children, attention deployment, introverted and extroverted, Eye-tracking

性别平等态度量表的编制与信效度检验

陈娇[1]　贡喆[2]（通讯作者）

1 2 四川师范大学心理学院，成都，610048，zhegong@sicnu.edu.cn

摘 要　党的二十大报告中，又一次写入了“坚持男女平等基本国策，保障妇女儿童合法权益”。当前，与性别平等相关的议题日益成为社会大众特别是年轻一代极度关注的热点领域。更重要的是，随着性别平等事业的不断推进，人们的性别角色观念正逐渐发生转变。因此，开展新时代的性别平等研究具备重要的理论与现实意义。回顾性别平等领域的研究发现，其可用的测量工具十分匮乏，现有的测量工具主要以间接测量法为主，即从其它相近变量的角度如性别角色、社会角色和女权主义等去测评个体的性别平等态度，这可能不利于精准表征个体对性别平等的态度。此外，现有的测量工具大部分是基于欧美国家文化背景下编制的，并非立足于我国社会文化背景编制，存在部分题目不适用的情况。为此，本研究拟编制适用于我国的性别平等态度量表(Gender Equality Attitude Scale, GEAS)，检验其信度和效度。首先，将发放性别平等开放式问卷，收集特征词后归类，编制初始量表题目，再邀请 5 名专家提出修改意见，最后确定量表题目；随后，将选取 666 名被试用于项目分析和探索性因子分析；另选取 664 名被试用于验证性因子分析；对 1330 名被试进行效标效度分析、信度分析等。使用矛盾性别偏见量表(Ambivalent Sexism Inventory, ASI)和女权主义信念量表(Liberal Feminist Attitude and Ideology Questions, LFAIS)为效标工具。最后，在探索性因子分析中，综合考虑了多方面因素，共删除 31 个条目；性别平等态度量表(GEAS)共 26 个条目，包括法律法规、

经济、教育、个性特质和两性关系 5 个因子；验证性因子分析在比较了 17 个假设模型后，得出 5 因子模型拟合最好(χ^2/df=2.473，IFI = 0.957，CFI = 0.956，GFI = 0.920，TLI = 0.951，RMSEA = 0.047)；效标效度检验显示，量表总分及各因子得分与 ASI 呈显著负相关，与 LFAIS 呈显著正相关；量表的内部一致性系数和分半信度分别为 0.936 和 0.822。综上来看，本研究编制的性别平等态度量表具有较好的信效度，是测量性别平等态度的有效工具。

Development and Validation of Gender Equality Attitude Scale

Chen Jiao, Gong Zhe
School of Psychology, Sichuan Normal University, Chengdu , China

Abstract：In the report of the 20th Party Congress, it is once again written that "we adhere to the basic state policy of gender equality and protect the legitimate rights and interests of women and children". Currently, issues related to gender equality are increasingly becoming hot areas of concern for society in general and the younger generation in particular. More importantly, as the cause of gender equality continues to advance, people's perceptions of gender roles are gradually changing. Therefore, it is of great theoretical and practical significance to conduct research on gender equality in the new era. A review of research in the field of gender equality reveals that there is a lack of available measurement tools, and the existing measurement tools are mainly based on indirect measures that measuring individuals' attitudes toward gender equality from the perspective of other similar variables such as gender roles, social roles, and feminism, which may not be conducive to accurately characterizing individuals' attitudes toward gender equality.In addition, most of the existing measurement tools were developed based on the cultural context of European and American countries, not based on the socio-cultural context of China, and there are cases that some of the questions are not applicable.To this end, this study proposes to develop a Gender Equality Attitude Scale (GEAS) applicable to China to test its reliability and validity. First, we will distribute the open-ended gender equality questionnaire, collect the characteristic words and categorize them, compile the initial scale questions, then invite five experts to propose modifications, and finalize the scale questions; subsequently, 666 participants will be selected for item analysis and exploratory factor analysis; 664 participants will be selected for validation factor analysis; and 1330 participants will be analyzed for validity and reliability. The Ambivalent Sexism Inventory (ASI) and the Liberal Feminist Attitude and Ideology Questions (LFAIS) were used as validity instruments. Finally, in the exploratory factor analysis, a total of 31 items were removed by considering various factors; the Gender Equality Attitude Scale (GEAS) had 26 items, including 5 factors of laws and regulations, economy, education, personality traits and gender relations; The validated factor analysis, after comparing 17 hypothetical models, resulted in the best fitting 5-factor model (χ^2/df= 2.473, IFI = 0.957, CFI = 0.956, GFI = 0.920, TLI = 0.951, RMSEA = 0.047); the validity scale validity test showed that the total scale score and each factor score were significantly negatively correlated with ASI and significantly positively correlated with LFAIS; the internal consistency coefficient and split-half reliability of the scale were 0.936 and 0.822, respectively. In conclusion, the present study The Gender Equality Attitude Scale developed in this study has good reliability and validity, and is a valid instrument for measuring gender equality attitudes.

外显自尊与内隐自尊对青少年评价恐惧的影响

薛雅慧　邓欢

淮北师范大学教育学院，安徽淮北，235000

摘 要　评价恐惧是指个体对来自他人的评价感到紧张不适，甚至恐惧，分为负面评价恐惧和正面评价恐惧两种类型。评价恐惧是社交焦虑症状认知-行为模型的重要组成部分，而个体自尊水平是社交焦虑的主要影响因素，已有诸多研究证明评价恐惧与自尊之间存在显著负相关，具体表现为个体的自尊水平越低对外界的负面评价或者正面评价越容易感到恐惧。但很少有研究探讨内隐自尊对评价恐惧的影响，且处于社交焦虑症易发期的青少年群体的关注也不足。鉴于此，为研究外显自尊与内隐自尊对青少年评价恐惧的影响，本研究采用自尊量表和内隐联想测验筛选出 104 名被试，分为 4 种自尊类型（高外显-高内隐自尊组 26 人、高外显-低内隐自尊组 26 人、低外显-高内隐自尊组 26 人、低外显-低内隐自尊组 26 人），接着采用简版负面评价恐惧量表和正面评价恐惧量表测量其评价恐惧水平。结果发现：不同自尊类型的青少年在负面评价恐惧上存在显著差异，低外显-低内隐自尊的个体相比于其他三组个体对负面评价的恐惧程度更高；不同自尊类型的青少年在正面评价恐惧上也存在显著差异，低外显-高内隐自尊的个体相比于其他三组个体对外界正面评价更容易感到恐惧。因此，了解青少年的自尊对外界评价恐惧的影响机制并开展预防性研究十分重要。针对不同自尊类型的青少年，要使用恰当的评价方式，合理运用批评与表扬，能够降低青少年社交焦虑症发病的概率，这对促进青少年心理健康具有特殊的意义。

The Effects of Explicit and Implicit Self-Esteem on Adolescents' Fears of Evaluation

Xue Yahui, Deng Huan
College of Education, Huaibei Normal University, Huaibei 23500

Abstract：Fears of evaluation refer to the individual's nervousness, discomfort, or even fear of evaluation from others, which are divided into two types: fear of negative evaluation and fear of positive evaluation. Fears of evaluation are important parts of the cognitive-behavioral model of social anxiety symptoms, and self-esteem is the main factor of social anxiety, and many studies have proved that there is a significant negative correlation between fears of evaluation and self-esteem, which is manifested as the lower the individual's self-esteem level, the easier it is to feel fear of negative or positive evaluation. However, few studies have investigated the effect of implicit self-esteem on fears of evaluation, and there is also insufficient attention paid to adolescents who are prone to social anxiety disorder. In order to examine the effects of explicit self-esteem and implicit self-esteem on adolescents' fears of evaluation, 104 participants were screened by self-esteem scale and implicit association test, divided into four self-esteem types (26 in the high explicit-high implicit self-esteem group, 26 in the high explicit-low implicit self-esteem group, 26 in the low explicit-high implicit self-esteem group, and 26 in the low explicit-low implicit self-esteem group), and then the simplified fear of negative evaluation scale and the fear of positive evaluation scale were used to measure their fears of evaluation levels. The results showed that adolescents with different self-esteem types had significant differences in fear of negative evaluation, and individuals with low explicit-low implicit self-esteem had a higher degree of fear of negative evaluation than the other three groups; Adolescents with different self-esteem types also had significant differences in fear of positive evaluations, and individuals with low explicit-high implicit self-esteem were more likely to be afraid of positive comments than the other three groups. Therefore, it is important to understand the mechanism by which adolescent self-esteem affects the evaluation of external fears and to conduct preventive research. For adolescents with different types of self-esteem, appropriate evaluation methods and reasonable use of criticism and praise can reduce the probability

of social anxiety disorder in adolescents, which is of special significance for promoting adolescent mental health.

运动推断中客体特征对运动特征加工干扰的眼动研究

杨天奇[1] 郭亚宁[1] 毋琳[2] 武圣君[2] 王秀超[3] 王卉[1] 刘旭峰[1]（通讯作者）
1 空军军医大学军事医学心理学系基础心理学教研室，西安，710032
2 空军军医大学军事医学心理学系教学实验中心，西安，710032
3 空军军医大学军事医学心理学系航空航天心理学教研室，西安，710032
通讯作者：刘旭峰，E-mail: lxf_fmmu@126.com

摘 要 飞行中需要处理大量复杂信息，信息处理能力是飞行安全技术的重要组成部分。尽管运动客体的客体特征信息和运动特征信息分别由两条不同的神经通路进行加工，个体难以分离客体特征对运动特征加工的干扰，之前的研究发现，运动推断中运动客体的大小会影响运动时间估计的精确度。然而，被试对客体着眼位置的不同会导致运动距离的估计偏差，这可能会对客体大小对运动时间估计影响的研究产生干扰。眼动技术可用于解决这一问题，通过客体开始运动到被试按键的眼动位置可以确定被试实际运动推断距离。此外，运动推断的眼动研究有助于揭示其认知加工过程。本研究基于运动推断生成任务（motion extrapolation production task）范式，招募某大学 31 名本科学员参加实验，考查运动客体和目标客体相对大小（直径比为 3：1，1：1 或 1：3）对运动时间估计的精确度以及眼动指标（眼动距离、瞳孔大小、扫视次数、注视次数、扫视幅度和注视时长）的影响。结果发现，运动客体和目标客体直径比为 3：1 时，相对于直径比 1：1 或 1：3 时，个体估计的运动时间显著更长，且瞳孔大小显著更大；运动客体和目标客体直径比为 3：1 或 1：3 时，相对于直径比 1：1 时，注视次数和扫视次数显著更少，注视时长显著更长；三种条件下眼动距离指标没有显著差异。因此，在运动推断中，普通群体难以分离客体特征对运动特征加工的干扰，这种干扰可能是由于客体特征与运动特征加工占用了共同的认知资源，实际运动推断距离的相同保证了结论的可靠性。飞行活动中多种类、高负荷信息处理给飞行员提出了更高要求，在飞行选拔中，注重客体特征对运动特征加工干扰的考查，并结合眼动指标，以期进一步提高选拔预测效力。

3Department of Aviation Psychology, Department of Military Medical Psychology, Air Force Medical University, Xi’an 710032, China

Abstract: A large amount of information needs to be processed during flight, and information processing capability is an important factor of flight safety. Although the object property and motion property are processed by two different neural pathways, it is difficult for individuals to separate the interference of object property on motion property processing. Previous studies of motion extrapolation found that the size of the moving object affected the accuracy of motion time estimation. However, object property may affect the motion distance estimation, which challenges the conclusion that object property interfere with motion property processing. Eye movement technology can help solve this problem and reveal the cognitive processing process of motion extrapolation. Based on the motion extrapolation production task paradigm, 31 undergraduate students from a university were recruited to participate in the experiment. The effects of the relative size of the moving object and target object (diameter ratio 3: 1, 1: 1, and 1:3) on the accuracy of motion time estimation and eye movement indices (eye movement distance, pupil size, saccade count, fixation count, saccade amplitude and fixation duration) were examined. As the results revealed, the estimated motion time was significantly longer when the diameter ratio was 3:1 than those when the diameter ratio was 1: 1 and 1: 3; the pupil size was significantly larger when the diameter ratio was 3: 1 than those when the diameter ratio was 1: 1 and 1: 3; the saccade count and fixation count was larger, and the fixation duration was shorter when the diameter ratio was 1:1 than those under the other two conditions; and there was no significant difference in eye movement distance under the three conditions. In conclusion, college students can hardly separate the interference of object property processing on motion property processing in motion extrapolation, these two processing may require the consumption of common cognitive resources, and the same motion extrapolation distance ensures the reliability of the conclusion. In flight selection, attention should be paid to the ability to resist the interference of object property on motion property processing, and the use of eye movement technology is expected to further improve the efficiency of selection.

摘 要 根据当前的言语信息，对将要出现的信息进行预测是人类重要的认知能力。在语言交流与语言理解中，同样存在着预测。人们对未看到的词语的语义信息进行提前预激活，被称为语义预测。近期研究者将表征相似性分析(RSA）的方法与语义预测研究相结合，尝试通过分析脑神经活动相似性的差异，在目标词前置词上发现预测的神经证据。大多数的研究证据来自于高限定性的语境，在这类语境中，读者可以预测到某一具体词汇（喝咖啡时，我喜欢加点糖和…）。那么，语言预测是否仅发生在可预测到具体词汇的高限定性语境？在低限定性语境下，预测是否会发生？对该问题的澄清具有重要的理论价值，因为低限定性语境更符合大部分自然语言理解的情境。另外，前人研究大多通过句子语境研究语言预测，句子语境通常会对目标词汇产生较高的限定，而相比句子，短语的限定性较低，且能够更好地控制复杂因素的影响。本研究考察在短语语境下，当语境仅提供有限的语义信息时，大脑是否基于有限的信息进行语义特征预测。研究采用脑电技术、结合表征相似性分析（RSA），利用形容词对随后名词的生命性进行限定，考察生命性语义特征的预测加工。另外，影响语言预测加工的变量尚不清楚，本研究还将初步探讨阅读能力与预测加工的关系。研究以形容词-名词短语为实验材料，设置了形容词的生命性条件（有生命-无生命）和短语的匹配性条件（匹配-不匹配），在被试阅读词语并完成合理性判断的过程中记录被试的脑电(EEG）数据。

研究关注名词呈现前被试脑神经活动的时间模式，结果发现形容词呈现后 400-500 毫秒时间窗口内，有生命条件的时间表征相似性显著大于无生命条件，这种差异无法用形容词本身的加工所解释，该效应反映了被试对未出现名词生命性语义信息的预测，为语义预测加工提供了证据。综上所述，本研究为低限定性语境情况下的语义预测提供了神经证据，并发现生命性语义信息的预测加工在时间表征模式上更稳定。

3 Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101

Abstract：According to current linguistic information, predicting upcoming information is an important cognitive ability of humans. Prediction also exists in language communication and comprehension. People pre-activate the semantic information of unseen words, which is called semantic prediction. Recent studies have combined the method of representational similarity analysis (RSA) with research on semantic prediction, attempting to discover neural evidence of prediction on preverbal cues by analyzing differences in neural activity similarity. Most of the research evidence comes from highly constraining contexts, where readers can predict specific vocabulary (e.g., "I like to add some sugar when I drink coffee..."). So, does language prediction only occur in highly constraining contexts where specific vocabulary can be predicted? Does prediction occur in less constraining contexts? Clarifying this question is of great theoretical value because less constraining contexts better align with most natural language understanding situations. Additionally, previous studies have mostly examined language prediction through sentence contexts, which usually provide high constraints on target vocabulary. Comparatively, phrases have lower constraints and can better control the influence of complex factors. This study explores whether the brain makes semantic feature predictions based on limited information in phrase contexts. The study utilizes electroencephalography (EEG) technique combined with RSA to examine the prediction process of semantic features of animacy by using adjectives to constrain subsequent nouns. Furthermore, the variables that influence language prediction processing are still unclear, so this study also conducts a preliminary exploration of the relationship between reading ability and prediction processing. The study uses adjective-noun phrases as experimental materials and sets the animacy condition of adjectives (animate vs. inanimate) and the matching condition of phrases (matching vs. non-matching). The participants read the words and made plausibility judgments while their EEG data were recorded. The study focuses on the temporal pattern of the participants' brain activity before noun presentation and finds that within the time window of 400-500 milliseconds after adjective presentation, the representational similarity of animacy conditions is significantly higher than that of the inanimate condition. This difference cannot be explained by the processing of the adjective itself. The effect reflects the participants' prediction of animacy semantic information of the noun that has not yet appeared, providing evidence for semantic prediction processing. In summary, this study provides neural evidence for semantic prediction in low-constraining contexts and reveals that the prediction processing of animacy semantic information is more stable in temporal representation patterns.

经颅直流电刺激左背外侧前额叶减少对自然界情绪性声音的注意偏向

王麟子[1, 2]　王爱君[2]　王艳梅[1]

1 华东师范大学心理与认知科学学院，上海，200062

2 苏州大学心理学系，心理与行为科学研究中心，苏州，215123

摘 要　以往研究发现左侧背外侧前额叶(left dorsolateral prefrontal cortex，L-DLPFC)会影响视觉情绪刺激的注意偏向，但听觉也是获取情绪信息的重要通道，而 L-DLPFC 对听觉情绪刺激注意偏向的影响则尚未得到关注。由于视、听觉早期加工存在差异，因此 L-DLPFC 在视觉和听觉情绪刺激中的作用可能不同。因此，本研究采用情绪空间线索范式，选取生态效度高的自然情绪声音作为听觉线索，并结合高精度经颅直流电刺激(high-definition transcranial Direct Current Stimulation，HD-tDCS)技术探究 L-DLPFC 对自然界听觉情绪刺激的注意偏向的注意投入和注意脱离两个子成分的影响。实验为 3(HD-tDCS 刺激：阳极 vs. 阴极 vs. 伪刺激) ×3(效价：积极 vs. 消极 vs. 中性)×2(有效性：有效 vs. 无效)的被试内实验设计，并以注意投入效应和注意脱离效应为主要因变量（注意投入分数=$RT_{有效中性}$-$RT_{有效积极/消极}$，注意脱离分数=$RT_{无效积极/消极}$-$RT_{无效中性}$）。结果发现，(1) 在伪刺激条件下，与以往研究结果一致，出现了对积极声音和消极声音的注意偏向；(2) 在阳极刺激条件下增强 L-DLPFC 的激活水平时，对积极声音和消极声音的注意投入减小，但不影响对情绪性声音的注意脱离成分；(3)在阴极刺激条件下抑制 L-DLPFC 的激活水平时，并不影响对情绪性声音的注意偏向。研究表明，L-DLPFC 的自上而下的调节功能仅在听觉情绪的注意投入中起作用，进一步扩展了 L-DLPFC 对不同感觉通道下情绪性刺激的注意偏向研究。

Transcranial direct current stimulation (tDCS) targeting the left dorsolateral prefrontal cortex reduces positive and negative attentional bias

Linzi Wang[1, 2]　Aijun Wang[2]　Yanmei Wang[1]

1 School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

2 Department of Psychology, Research Center for Psychology and Behavioral Sciences, Soochow University, Suzhou, China

Abstract：Previous studies have found that the left dorsolateral prefrontal cortex (L-DLPFC) influences attentional bias for visual emotional stimulus, but auditory modality also plays an important role in accessing emotional information, while the effect of L-DLPFC on the attentional bias toward auditory emotional stimuli has not been paid attention to. Due to the differences in early visual and auditory processing, the role of L-DLPFC in visual and auditory emotional stimuli may be different. Therefore, the present study used the emotional spatial cueing paradigm, selects natural emotional sounds with high ecological validity as auditory cues, and combines high-definition transcranial direct current stimulation (HD-tDCS) to explore the effect of L-DLPFC on the attention engagement and disengagement effect of natural auditory emotional stimuli, which are the subcomponents of the attention bias. The experiment was a 3 (tDCS stimulation: anodal vs. cathodal vs. sham) × 3 (valence: positive vs. negative vs. neutral) ×2(cue validity: valid vs. invalid) within-subject design. The attention

engagement effect and the attention disengagement effect were the main dependent variables (attentional engagement effect = $RT_{valid\ neutral\ cue}$ - $RT_{valid\ positive/negative\ cue}$, and the attentional disengagement effect = $RT_{invalid\ positive/negative\ cue}$ - $RT_{invalid\ neutral\ cue}$). The results showed that (1) in the sham condition, consistent with the previous study, individuals exhibit an attentional bias toward positive and negative natural sounds; (2) when the activation level of L-DLPFC was enhanced under the condition of anodal HD-tDCS, the attentional engagement toward positive and negative sounds decreased, but the attentional disengagement away from emotional sounds was not affected. (3) When the activation level of L-DLPFC was inhibited under the condition of cathodal HD-tDCS, it does not affect the attention bias toward emotional sounds. The present study have shown that the top-down regulatory function of L-DLPFC only plays a role in the auditory emotional attentional engagement, which further expands the researches on the effects the L-DLPFC have to emotional attentional bias in different sensory modalities.

Keywords： emotional attentional bias, dorsolateral prefrontal cortex, transcranial direct current stimulation; emotional spacing cue paradigm; natural emotional sounds

急性应激与催产素对社会情绪和亲社会决策行为的影响

石昕笛[1] 李世佳[1,2,*]（通讯作者）

1 上海市心理健康与心理危机干预重点实验室，华东师范大学附属精神卫生中心，华东师范大学心理与认知科学学院脑与教育创新研究所，上海，200062

2 上海市长宁区精神卫生中心，上海 200335，E-mail: sjli@psy.ecnu.edu.cn

摘 要 先前的研究已广泛探索了应激与亲社会行为的相互关系，但急性应激对亲社会行为的影响并未达成一致，并且急性应激如何通过影响社会情绪进而影响亲社会行为的机理尚不明确。此外，催产素和皮质醇这两种和社会情绪、应激高度相关的激素在其中的作用机理也需要更多研究证据。

本研究采用急性应激诱导和鼻喷催产素双变量设计，招募 94 名健康男性大学生，最终纳入数据分析的被试控制组中 22 人鼻喷安慰剂，23 人鼻喷催产素；应激组中 23 人鼻喷安慰剂，23 人鼻喷催产素。使用马斯特里赫特应激刺激范式诱导应激反应，并通过改良的独裁者游戏测量被试在任务失败导致队友受到不同程度的伤害以及队友反馈态度差异情境下对队友的金钱分配和社会情绪反应。

结果显示，急性应激和催产素都没有直接改变被试的金钱分配，但应激组被试的感激和愤怒情绪程度显著低于控制组。混合线性模型分析表明，感激情绪正向预测金钱分配数量，而愤怒情绪负向预测金钱分配数量，且应激加强了感激情绪对金钱分配的正向预测。积极的预期违反（队友态度评分高于被试预期态度评分）增强感激情绪，降低愤怒情绪，并提高金钱分配数量；而催产素组的感激情绪低于安慰剂组，且催产素降低了预期违反对于感激情绪的正向影响。最后，预期违反、催产素以及应激三者的交互作用表明，同时接受应激诱导和鼻喷催产素的被试在相同预期违反情境下的金钱分配更少。

本研究表明，急性应激显著地改变了决策过程中被试的社会情绪，增强了社会情绪对金钱分配的影响；而催产素和急性应激对社会情绪的影响相似。此外，催产素和急性应激的作用叠加后导致更少的金钱分配，证明了实验室操纵的双激素（催产素和皮质醇）相互作用带来了更保守的决策行为。我们的结果验证了应激应对的资源保护理论和“照料与结盟”模型中的双激素理论，为应激的内分泌机理提供了更多理论证据。

The Impact of Acute Stress and Oxytocin on Social Emotions and Prosocial Decision-making Behavior

Xindi Shi[a], Shijia Li[a,b,*]

a. Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062 , China

b. Shanghai Changning Mental Health Center, Shanghai, 200335, China, E-mail: sjli@psy.ecnu.edu.cn

Abstract：Previous research has extensively explored the relationship between stress and prosocial behavior, but there is no consensus on the effect of acute stress. The mechanism of how acute stress affects prosocial behavior by influencing social emotions remains unclear. Furthermore, the roles of oxytocin and cortisol, two hormones highly correlated with social emotions and stress, require more empirical evidence.

In this study, we implemented a dual-variable design involving acute stress induction and intranasal oxytocin administration, recruiting 94 healthy male university students. Among the participants finally included in the data analysis, 22 individuals in the control group received intranasal placebo, and 23 received intranasal oxytocin. Similarly, in the stress group, 23 participants received intranasal placebo, and 23 received intranasal oxytocin. The Maastricht Acute Stress Task was used to induce stress responses, and a modified dictator game was utilized to measure the participants' monetary distribution and social emotional responses under varying scenarios of teammate injury severity and feedback attitude differences due to task failure.

Our results showed that neither acute stress nor oxytocin directly altered participants' monetary distribution. However, the gratitude and anger levels of the stress group were significantly lower than the control group. Further mixed linear model analysis revealed that gratitude positively predicted the amount of money distributed, while anger negatively predicted it, and stress enhanced the positive prediction of gratitude on monetary distribution. Positive expectancy violation (teammate attitude rating higher than expected by the participant) enhanced gratitude, reduced anger, and increased monetary distribution. However, oxytocin reduced the positive effect of expectancy violation on gratitude, which is consistent with the oxytocin group's lower gratitude levels than the placebo group (marginally significant). Primarily, this is because xxx. Finally, the interaction of expectancy violation, oxytocin, and stress revealed that participants who received both stress induction and intranasal oxytocin distributed less money under the same expectancy violation conditions.

This study demonstrated that stress significantly altered participants' social emotions during decision-making and amplified the effect of social emotions on monetary distribution. However, oxytocin reduced the positive emotional feedback in the decision-making process. Additionally, the combined effects of oxytocin and acute stress resulted in less monetary distribution, proving the conservative decision-making behavior brought by the interaction of two experimentally manipulated hormones (oxytocin and cortisol). Our findings validate the resource conservation theory of stress coping and the dual-hormone theory in the "Tend and Befriend" model, providing more theoretical evidence for pharmacological interventions of stress.

数字、尺寸和空间联结共享和分离的加工机制

苏圳伟[1]　林海都[1]　李富洪[1]　曹碧华[2]（通讯作者）

江西师范大学心理学院，南昌，330022，caobihua@jxnu.edu.cn

摘 要 空间数字联合反应编码效应（Spatial-Numerical Association of Response Codes effect,简称 SNARC 效应）指在完成数字大小比较和奇偶判断任务时，被试左手对小数字反应更快，右手对大数字反应更快的现象。尺寸一致性效应（size congruity effect，简称 SCE）指当数字大小与物理尺寸大小一致时（如小数字小尺寸和大数字大尺寸），被试的反应快于不一致条件（如小数字大尺寸和大数字小尺寸）的现象。使用数字 Stroop 范式，以往研究要求被试分别完成数字大小比较和物理尺寸大小比较任务时，SNARC 效应和 SCE 彼此独立，相互分离。本研究将采用内隐的奇偶判断任务探究两者的关系。实验采用数字 1、2、8 和 9，每个数字均有大小两个物理尺寸。结果表明存在显著的 SNARC 效应和 SCE，并且 SNARC 效应和 SCE 之间存在显著的交互作用。回归分析的结果发现，SNARC 效应在 SCE 一致条件的强度大于 SCE 不一致条件。另外，SNARC 一致条件下存在 SCE，而在 SNARC 不一致条件下 SCE 消失。同时，物理尺寸和空间存在交互作用，左手对小尺寸反应更快，右手对大尺寸反应更快，即类 SNARC 效应，这为数字、物理尺寸和空间的共享机制提供证据，支持了 ATOM 理论。为探究数字大小和物理尺寸在与空间上映射的强度差异，我们分析了反应手对 SCE 两种不一致条件的反应时差异。结果表明左手对小数字大尺寸的反应快于大数字小尺寸,而右手对大数字小尺寸的反应快于左手。这表明数字-空间的联结要强于物理尺寸-空间的联结，提供了数字、物理尺寸和空间分离的证据。

综上所述，由于数字、物理尺寸和空间信息在相同的顶叶皮层进行加工，SNARC 效应和 SCE 之间会产生交互。然而，SNARC 和 SCE 的交互作用是有条件的，需要数字大小，物理尺寸和反应手处于同一加工水平。另外，数字-空间的联结要强于物理尺寸-空间的联结，这些结果表明数字、物理尺寸和空间的表征既相互共享，又存在分离，可能与生物进化和任务需要有关，支持了 ATOM 理论。

Shared and distinct mechanism of the association among number, size and space

Zhenwei Su[1] Haidu Lin[1] Fuhong Li[1] Bihua Cao[2]
School of Psychology, Jiangxi Normal University, Nanchang

Abstract: The Spatial-Numerical Association of Response Codes effect (SNARC effect) refers to the phenomenon that participants respond faster to small numbers with the left hand and faster to large numbers with the right hand in number comparison task and parity comparison task. The size congruity effect (SCE) refers to the fact that when the numbers are congruent with the physical size (i.e., the numeral was larger/smaller having a larger/smaller size), participants respond faster to it than incongruent condition (i.e., the numeral was smaller/larger having a larger/smaller size). Using the numerical Stroop paradigm, previous research has shown that the SNARC effect and the SCE are independent of each other when participants are asked to complete a number comparison task and a physical size comparison task, respectively. This study will explore the relationship using an implicit parity judgement task. Experiment were conducted using digits 1, 2, 8, and 9, each with two sizes, large and small. The results show that the significant SNARC effect and SCE and a significant interaction between SCE and SNARC effect. The results of the regression analysis found that the SNARC effect in the SCE-congruent condition was larger than the SCE-incongruent condition and the SCE emerged in the SNARC compatible trials whereas was absent in the SNARC incompatible trials. At the same time, there was an interaction between physical size and space, with the left hand responding faster to small size and the right hand responding faster to large size, i.e. a SNARC-like effect. These findings provided the evidence of the shared mechanism among number, physical

size and space which support the ATOM. To explore differences in the strength of the mapping of number and physical size on vs. space, we analyzed differences in the RT of response hands to two SCE-inconsistent conditions. The result showed left-hand response was faster for small numbers-large size than large numbers-small size; while right-hand responded to large numbers-small size was faster than left-hand response. It suggested number-spatial association was stronger than the physical size-spatial association and provided the evidence of the distinct mechanism among number, physical size and space.

In summary, since numerical, physical size, and space are processed in the same parietal cortex, an interaction between the SNARC effect and SCE can occur. However, this interaction is conditional, requiring that the number, physical size and response hand are at the same level of processing, and the number-spatial association is stronger than the physical size-spatial association. These results of the study provide new evidence for the ATOM. These results suggest that representations of numerical, physical size, and space are both shared and distinct from each other, possibly related to biological evolution and task needs, supporting the ATOM theory.

催产素改变急性应激对趋近回避认知灵活性相关奖惩敏感性的影响

尹周乾[1] 李世佳[1,2,*]（通讯作者）

1 上海市心理健康与心理危机干预重点实验室，华东师范大学附属精神卫生中心，华东师范大学心理与认知科学学院脑与教育创新研究所，上海，200062

2 上海市长宁区精神卫生中心，上海 200335，E-mail: sjli@psy.ecnu.edu.cn

摘 要 许多心理疾病与对厌恶刺激趋近回避认知灵活性异常有关，了解这种异常的影响因素有助于理解这类疾病。应激通常被认为会损害认知灵活性。以往研究提出催产素具有改善被应激损害的认知灵活性的潜力。但其结果是否具有可重复性以及潜在机制尚不清楚。逆转学习是研究认知灵活性的常用范式，其中奖励和惩罚敏感性起到中心作用。在本研究中我们采用对厌恶刺激进行趋近和回避行动规则转换的逆转学习范式，通过双盲实验考察应激和鼻喷催产素对厌恶刺激趋近回避认知灵活性的影响，通过计算建模的方式验证奖励和惩罚敏感性是否为其潜在机制之一。本实验共招募 94 名健康男性被试：控制组催产素给药 24 人，安慰剂条件 24 人；压力组催产素给药 23 人，安慰剂条件 23 人。对相关历史研究中涉及的 7 个模型进行比较后选择最优模型并进一步分析。结果发现：1）在总体任务正确率上并未发现应激和催产素的效应，但应激和催产素都降低了个体对逆转的敏感性。2）当没有应激存在时，催产素组相比于安慰剂组的奖励敏感性更高；在安慰剂条件下，应激降低了惩罚敏感性，提高了奖励敏感性；而在催产素给药条件下，应激组惩罚敏感性和控制组没有显著差异，而奖励敏感性显著低于控制组。3）应激增加了对厌恶刺激的回避倾向，而催产素减少了这种倾向。上述结果表明，应激在本实验中对奖励和惩罚敏感性分别有着相反的影响且增加了避害倾向，但催产素减弱甚至逆转了应激的这些效果。本研究验证了催产素可能同时影响社会线索和非社会线索的信息加工，进而降低应激的影响，为催产素的减压作用提供了新证据。

Oxytocin alters the effects of acute stress on reward-punishment sensitivity in approach-avoidance cognitive flexibility

Zhouqian Yin[a], Shijia Li[a,b,*]

a. Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062 , China
b. Shanghai Changning Mental Health Center, Shanghai, 200335, China, E-mail: sjli@psy.ecnu.edu.cn

Abstract：Many mental disorders are related to aberrant cognitive flexibility of approach-avoidance behavior to aversive stimuli. Therefore to study this kind of aberrant behaviors is helpful to understand those mental disorders. Stress is commonly thought to impair cognitive flexibility. Prior researches demonstrated that oxytocin has the potential to improve cognitive flexibility impaired by acute stress. However whether this effect is repeatable or the underlying mechanism is not clear yet. Reversal learning is a widely used paradigm to study cognitive flexibility, in which reward and punishment sensitivity plays the central role. In current research, we used a reversal learning task in which participants were asked to approach or avoid aversive stimuli and the double-blind design to study the influence of stress and intranasal oxytocin in cognitive flexibility of approach-avoidance behavior to aversive stimuli. Moreover the computational modeling was used to verify whether reward and punishment sensitivity was one of the potential mechanisms. We recruited 94 participants: in stress group, 24 participants under oxytocin administration, 24 participants under placebo; in control group, 23 participants under oxytocin administration, 23 participants with placebo.The results showed that there was no main effect of acute stress or oxytocin on overall correctness; acute stress and oxytocin both decreased behavioral sensitivity to reversals of reward contingencies; under placebo condition, acute stress decreased punishment sensitivity and increased reward sensitivity; however under oxytocin condition, there was no difference of the punishment sensitivity between stress group and control group, and the reward sensitivity of stress group was lower than control group. In unstressed group, oxytocin increased reward sensitivity compared to placebo condition. Moreover stress increased the avoidance tendency to aversive stimuli but oxytocin decreased this tendency. Those results suggested that acute stress had opposite effects on reward and punishment sensitivity and induced stronger avoidance tendency to aversive stimuli; but oxytocin weakened, even reversed, those effects. Our findings verified that oxytocin may weaken the effects of acute stress by influencing the information processing of both social and non-social cues and showed more evidences of the stress-buffering effects of oxytocin.

学习判断反应性：对熟悉性和回想的影响

高景[1]　王佳莹[2]（通讯作者）
1 东北师范大学心理学院，长春，130024
2 东北师范大学心理学院，长春，130024，wangjy675@nenu.edu.cn

摘 要　近来研究发现，进行元认知监测：学习判断(Judgments of learning)，会对学习者的记忆产生影响，这被称为学习判断的反应性效应。在最近采用词汇材料的研究中出现了相互矛盾结果：Senkova(2021)等人的研究中发现做出学习判断促进了自由回忆的记忆，但 Zhao(2022)的研究中却发现学习判断对自由回忆的记忆并没有产生影响，相反却促进了再认测验的记忆成绩。基于该矛盾本研究通过两个实验探讨了学习判断对词汇材料记忆成绩的影响，实验一分别使用再认测验和自由回忆测验，结果发现学习判断的反应性会受到测验类型的影响：在再认测验中表现出积极反应性；在自由回忆中则表现出消极反应性。基于实验一的结果，实验二采用 R/K 范式探索了学习判断对熟悉性和回想的影响，结果发现做出学习判断仅仅促进了

基于熟悉性的再认成绩，而对基于回想的再认成绩没有产生影响。这些结果表明，学习判断会对学习者的记忆成绩产生影响，但这种影响的程度并不牢靠：仅促进了基于熟悉性的记忆成绩，相反，当学习者进行较高要求的记忆任务时(如自由回忆)，进行学习判断可能会占用学习者的认知资源而产生相反的效果。

Reactivity of judgments of learning: Effects on familiarity and recollection

Jing Gao[1], Jiaying Wang[2]
([1 2] School of Psychology, Northeast Normal University, Changchun 130024, China)

Abstract: Recent research has revealed that metacognitive monitoring, specifically Judgments of Learning (JOL), can have an impact on learners' memory, known as the reactivity effect of Judgments of Learning. Contradictory findings have emerged from recent studies using vocabulary materials: Senkova et al. (2021) found that making JOLs enhanced free recall memory, while Zhao et al. (2022) found no effect of JOLs on free recall memory but instead improved performance on recognition tests. To address this contradiction, the present study conducted two experiments to examine the influence of JOLs on memory performance with vocabulary materials.

Experiment 1 utilized both recognition tests and free recall tests. The results demonstrated that the reactivity of JOLs was influenced by the test type: positive reactivity was observed in recognition tests, whereas negative reactivity was observed in free recall tests. Building on the findings of Experiment 1, Experiment 2 employed the R/K judgment to investigate the effects of JOLs on familiarity and recollection. The results indicated that making JOLs only provided benefits for familiarity and had no impact on recollection. These findings imply that JOLs can affect learners' memory performance, although the magnitude of this effect is not reliable. They solely enhance memory performance based on familiarity. Conversely, when learners engage in more demanding memory tasks like free recall, engaging in JOLs may deplete learners' cognitive resources and result in negative effects.

摘 要　关于前一晚睡眠与次日皮质醇昼夜节律之间的关系，以往的研究结果并不一致。本研究旨在探讨这种关系是否受皮质醇采样期和睡眠测量的影响。大学生（N = 79）连续三天每天提供七份皮质醇样本（起床、+30 分钟、+45 分钟、+1 小时、午餐前、晚餐前和入睡前），同时佩戴腕表测量前一晚的睡眠情况。建立了一个多层次模型来研究主观和客观睡眠对次日皮质醇昼夜节律的影响，使用了三个不同的皮质醇采样期：清晨、早晨至傍晚和下午至傍晚。逐日分析表明，较低的客观睡眠效率和较短的总睡眠时间与较低的皮质醇觉醒反应（CAR）有关，无论是在清晨还是从清晨到傍晚这段时间。参与者之间的分析表明，较低的客观睡眠效率和较短的总睡眠时间与较低的皮质醇觉醒水平有关，并且在清晨至傍晚和清晨采样期间，

皮质醇下降斜率较平。同时，较短的主观总睡眠时间与清晨和清晨至傍晚期间较高的皮质醇水平有关。总之，我们的研究结果表明，在探索睡眠与次日皮质醇昼夜节律之间的关系时，应采集清晨至下午的唾液样本。

Abstract：Concerning the relationships between previous night's sleep and the following day's diurnal cortisol rhythm, previous studies have revealed inconsistent results. The current study was designed to investigate whether such a relationship is influenced by cortisol sampling periods and sleep measurement. College students (N =79) provided seven cortisol samples each day (wakeup, +30 minutes, +45 minutes, +1 hour, before lunch, before dinner, and bedtime) on three consecutive days while wearing an actigraph to measure previous nighttime sleep. A multilevel model was created to examine the impact of both subjective and objective sleep on the diurnal cortisol rhythm of the following day, using three different cortisol sampling periods: early morning, morning to evening, and afternoon to evening. Day-to-day analysis showed that lower objective sleep efficiency and shorter total sleep time were linked to lower cortisol awakening response (CAR) both in the morning and the period from early morning to evening. Between-participant analysis indicated that lower objective sleep efficiency and shorter total sleep time were linked to lower waking cortisol levels and a flatter cortisol decline slope during the sampling periods from early morning to evening and in the morning. Meanwhile, the shorter subjective total sleep time was linked to higher waking cortisol levels during the morning and the period from early morning to evening. In conclusion, our findings suggested to collect salivary samples from early morning to afternoon in exploring relationships between sleep and the following day's diurnal cortisol rhythm.

信心判断的两阶段模型：来自 ERP 的证据

李兆岚[1]　代文武[1]　贾宁[2]（通讯作者）
1 河北师范大学教育学院，石家庄，050024
2 河北师范大学教育学院，石家庄，050024，jnajh@126.com

摘 要　信心判断（judgment of confidence，JOC）是指在对学习过的内容进行提取后，对提取内容正确性的自信心判断。在经典的信心判断研究范式中，信心判断发生在再认/回忆任务之后。以往关于信心判断的研究将其视为一个仅涉及监测的单阶段过程。然而，随着对信心判断研究的深入，有研究提出信心判断过程可能并非是单阶段的，而是一个涉及提取和监测的两阶段过程。为明确信心判断的内部过程，本研究使用信心判断的经典实验范式，借助事件相关电位技术，从时间加工进程的角度对信心判断的内在机制进行

探讨。行为结果显示：信心判断反应时和信心判断等级之间存在倒 U 型曲线关系，低等级信心判断的反应时显著长于高等级信心判断且在测验阶段的再认成绩更差。ERP 结果显示：在 N400（300~500ms）时间窗口，与高等级信心判断相比，低等级信心判断在右侧额叶和右侧中央区上，诱发了更负的平均波幅；在晚期慢波时间窗口（500~700ms），与低等级信心判断相比，高等级信心判断在右侧额叶上诱发了更正的平均波幅。基于以上研究结果，本研究认为信心判断包含了不止一个加工过程，N400 反映了对线索进行提取的过程，而晚期慢波成分则反映了应用线索进行监测的过程。本研究支持了两阶段模型，丰富了元认知监测的机制研究，有助于理解回溯性元认知监测的加工机制。

The two-stage model of judgment of confidence: evidence from ERP

Zhaolan Li[1], Wenwu Dai[1], Ning Jia[2] (Corresponding author)
Department of Education, Hebei Normal University, Shijiazhuang

Abstract：The judgment of confidence (JOC) refers to the confidence in the accuracy of the target item they have just retrieved. In the classical paradigm of JOC research, JOC occurs after the recognition/recall task. Previous studies primarily considered JOC as a single-stage process involving only monitoring. However， as research on JOC deepens, some studies suggest that the process of JOC may not be a one-stage, but a two-stage process involving extraction and monitoring. To better elucidate the internal process of JOC, this study uses the classic experimental paradigm of JOC and the event-related potential technique (ERP) to explore the internal mechanism of JOC from the perspective of time processing. The results show that there is an inverted U-shaped relationship between JOC reaction time and JOC judgment ratings. The reaction time is significantly longer in the low JOC condition compared to the high JOC condition, and individuals exhibit poorer recognition performance in the low JOC condition during the test stage. ERP results showed that in the N400 (300~500ms) time window, the low JOC condition elicits a more negative average amplitude in the right frontal lobe and right central region compared to the high JOC condition. Additionally, in the slow-wave time window (500~700ms), the high JOC condition induces a higher average amplitude in the right frontal lobe relative to the low JOC condition. Based on these research findings, this study proposes that JOC encompasses multiple processing stages, with the N400 reflecting the cue extraction process and the slow-wave component indicating the monitoring of cue utilization. Overall, this study provides support for the two-stage model, enhances the understanding of metacognitive monitoring mechanisms, and contributes to a deeper comprehension of the processes underlying retrospective metacognitive monitoring.
Keywords： Judgment of confidence, Two-stage model, Metacognitive monitoring, Event-related potential technique

汉语阅读中中央凹负荷对副中央凹预视加工程度的影响

张蕾[1]，陈婉莹[1]，谢芳[1]（通讯作者）
1 浙江师范大学心理学院，金华，321000
通讯作者 E-mail: xftjsf@126.com

摘 要　自然阅读中，读者不仅能加工中央凹注视词（词 N）的信息，还能对副中央凹词进行预视加工。已有研究分别从预视加工范围和预视加工程度两个维度对副中央凹预视加工进行了探讨。研究发现，在预视加工范围上，读者可以获取副中央词 N+1 和 N+2（词 N+1 为单字词时）的信息；预视加工程度上，读者可以从副中央凹获取不同类型的预视信息，如正字法信息，语音信息以及语义信息。根据中央凹负荷假说，副中央凹信息的获取受中央凹加工难度的影响，大量关于拼音文字的研究对此进行了探讨。汉语阅读中副中央凹的预视加工是否受到中央凹加工难度的影响仍需要进一步探讨。已有的两项研究考察了中央凹加工难度对副中央凹加工范围的影响，结果并未支持中央凹负荷假说。然而，副中央凹信息的预视加工程度是否会受中央凹加工负荷的调节尚不明确。因此，本研究采用边界范式通过两个实验考察中央凹加工负荷是否影响副中央凹预视加工程度。实验一操纵中央凹词的加工负荷和副中央凹词 N+1 的预视类型，实验二操纵中央凹负荷和副中央凹词 N+2 的预视类型,均采用 2(中央凹负荷：高频、低频)×5(预视类型：相同、正字法相关、语音相关、语义相关、假字)的被试内实验设计。结果发现：中央凹词频的主效应显著，实验 1 和 2 均表现为低频词的注视时间明显长于高频词；预视类型的主效应均显著，实验 1 表现为无关预视条件下的注视时间分别长于相同预视、正字法相关预视以及语音相关预视，实验 2 表现为无关预视条件下的注视时间分别长于相同预视及正字法相关预视，表明读者能够从副中央凹词 N+1 上获取正字法信息和语音信息，从副中央凹词 N+2 上仅能获取正字法信息。更重要的是，两实验均发现中央凹负荷和预视类型的交互作用不显著。这说明，汉语阅读过程中，中央凹加工负荷不会影响副中央凹预视加工的程度。

The Influence of Foveal Load on the Depth of Parafoveal Processing in Chinese reading

Lei Zhang[1], Wanying Chen[1], Fang Xie[1]
[1]School of Psychology, Zhejiang Normal University, Jinhua

Abstract: It is well-established that readers can obtain lexical information not only from the currently foveal words (word N), but also from upcoming parafoveal words during natural reading. Previous studies provided some evidence for the extent and depth of parafoveal processing. Readers could access the information of parafoveal word N+1 and N+2 (when N+1 is a single word) in terms of the spatial extent of parafoveal processing, and in terms of the depth of parafoveal processing, readers could obtain different types of preview information, such as orthographic, phonological and semantic information. According to the foveal load hypothesis, parafoveal processing is influenced by the difficulty of current foveal processing, which has been confirmed by numerous studies in alphabetic language.

The issue whether foveal load may affect parafoveal processing in Chinese reading still need to be further explored. Recently, two studies have examined whether foveal load affects the spatial extent of parafoveal processing, neither supports the foveal load hypothesis. However, it remains unclear whether foveal load could affect the depth of parafoveal processing. Accordingly, the present study using boundary paradigm to investigate this issue in two experiments. Parafoveal preview of the parafoveal target word N+1 (Experiment 1) and word N+2 (Experiment 2) were manipulated under high foveal load (low-frequency word N) compared with low foveal load (high-frequency word N) conditions. Both experiments adopted a 2 (foveal load: high-frequency, low-frequency)×5 (preview type: identical, orthographically related, phonologically related, semantically related, and pseudo-character unrelated) within-subject design. The results showed that main effect of foveal load was significant in Experiment 1 and Experiment 2, with longer fixations for low frequency words than for high

frequency words; Main effect of preview type was also found, with longer fixations for pseudo-character unrelated preview type compared to identical, orthographically related and phonologically related preview type in Experiment 1 and longer fixations for pseudo-character unrelated preview type in comparison with identical and orthographically related preview in Experiment 2. These findings showed that readers can obtain both orthographic and phonological information from parafoveal in Experiment 1, while in Experiment 2, they can only obtain orthographic information. More importantly, there was no interaction between foveal load and preview types in both Experiments, indicating that foveal load did not affect the depth of parafoveal processing during Chinese reading.

“只见森林，不见树木”：知觉加工中的整体优先性

皇甫秉哲[1] 龚明亮[1]（通讯作者）
江西师范大学心理学院，南昌，330022，gongml@jxnu.edu.cn

摘 要 人类的视觉系统可以在短时间内获取大量的信息，但是人脑能够同时处理的信息是有限的，这是由认知资源的有限性所决定的。幸运的是，面对这种情况人们似乎进化出了一种在视觉加工的初始阶段就能对大量而复杂的信息优先进行快速整体加工的能力，这就是知觉加工中的整体优先性。本文主要通过回顾三个方面的证据对整体加工的优先性进行了论证。当同时呈现全局层面的特征和局部层面的特征时，人们倾向于优先加工全局结构层面的特征，这就是全局优先效应（global precedence effect）。此外，人们在面对一组相似的刺激时，能够迅速而准确地提取它们的结构或语义上的平均属性，这被称为整体知觉（ensemble perception）。最后，在场景主旨（scene gist）加工时，人们能在一瞥中对自然场景迅速进行整体上的感知和分类，这能够帮助人们快速获取环境信息，即便此时还未对细节特征进行加工。这些证据都表明，在知觉加工过程中存在整体优先性，使我们可以“只见森林，不见树木”。这种对知觉信息的整体加工在人类认知加工过程中起着重要作用，它可以帮助人们快速获取信息并迅速做出适应性的反应。整体优先性为人们快速而准确地处理大量信息提供了有效策略，但关于整体优先性的研究还有很多领域值得探索。未来的研究可以从增加实验材料、创新实验范式、结合更多设备设施等方式，深入探讨整体加工的神经机制，为整体优先的应用提供更多的理论依据。

“Seeing the forest but not the trees”: Holistic priority in perceptual processing

Bingzhe Huangfu, Mingliang Gong (Corresponding author)
School of Psychology, Jiangxi Normal University, Jiangxi

Abstract：The human visual system is capable of acquiring a vast amount of information within a short period of time. However, the brain has a limited capacity to process information simultaneously, which is determined by the limited cognitive resources. Fortunately, humans seem to have evolved a capacity to prioritize the rapid holistic processing of a large and complex amount of information in the initial stages of visual processing, known as perceptual processing of global precedence. This article mainly provides supporting evidence for the precedence of holistic processing by reviewing three aspects. When global-level features and local-level features are presented

simultaneously, people tend to prioritize the processing of global-level features, which is known as the global precedence effect. In addition, when faced with a group of similar stimuli, people can rapidly and accurately extract their structural or semantic average attributes, referred to as ensemble perception. In the processing of scene gist, people can rapidly perceive and categorize natural scenes as a whole in a glance. This helps individuals quickly acquire environmental information, even before processing the detailed features. These pieces of evidence all indicate the existence of a global precedence in perceptual processing, allowing us to "see the forest, not the trees". This holistic processing of perceptual information plays a crucial role in human cognitive processing, enabling individuals to rapidly gather information and swiftly respond adaptively. The precedence of holistic processing provides an effective strategy for individuals to process a large amount of information quickly and accurately. However, there are still many areas to explore regarding the research on holistic precedence. Future studies can delve deeper into the neural mechanisms of holistic processing by increasing experimental materials, innovating experimental paradigms, and incorporating more equipment and facilities, providing a more robust theoretical basis for the applications of holistic precedence.

摘　要 在网络发展十分迅速的情况下，网络游戏与人们的生活密切相关，成为人们社交的一个重要的方式。当个体在观看电子竞技赛事时，看到自己支持的战队会产生与战队联结在一起的感受，支持的战队的各种局势变化，观众的注意力和情绪都会因此而产生相关变化。化身作为个体表达自我一种重要方式，目前越来越多的研究者开始关注其领域的研究。本研究主要从认知加工的角度来探讨战队化身参照的加工优势，借助脑电仪器来探讨对战队化身参照在时间进程上的加工优势，通过个体的认知加工系统中已经存在的与战队化身参照的相关信息，内隐地探讨化身参照的加工优势。本研究选取招募了 20 名被试，自愿参加实验，每一位被试都有自己支持的战队，并且在最近半年内观看支持的战队的比赛不低于 10 场比赛，平均年龄 21.86±1.127；女性 2 人，平均年龄 21.23±1.278，均为高中及以上学历。参加实验的个体均为右利手，无视力问题，无精神疾病或者精神疾病史。所有被试在参加此实验之前，均未参加过类似实验。利用本研究使用 Oddball 实验范式，通过脑电内隐地考察了电竞赛事中的战队化身参照加工在时间进程上的优势以及相关的神经机制。研究结果表明：战队的化身参照名称相对于其他熟悉的组织名称能够诱发更大的 P2（150-270ms）和 P3（360-600ms）波幅，战队化身参照的名称比其他相关熟悉组织名称的 N2（260-360ms）和 P3 潜伏期更短。这表明，在对待其他相关信息时，个体不仅可以快速注意到与化身有关的信息，还可以对该信息进行更深入、更精细的加工。综上表明，时间进程的加工神经机制层面，电竞赛事中的化身参照具有显著加工优势。

Abstract In the case of rapid development of the Internet, online games are closely related to people's lives and have become an important way for people to socialize. When individuals watch esports events, they see the team they support and feel connected to the team, and the various situations of the supported team change, and the audience's attention and emotions will change accordingly. As an important way for individuals to express themselves, more and more researchers are now paying attention to research in their field. This study mainly discusses the processing advantages of team avatar reference from the perspective of cognitive processing, explores the processing advantage of team avatar reference in time course with the help of EEG instruments, and implicitly discusses the processing advantage of avatar reference through the relevant information that already exists in the individual's cognitive processing system and the team avatar reference. In this study, 20 participants were recruited and voluntarily participated in the experiment, each participant had his own supported team, and watched no less than 10 matches of the supported team in the past six months, with an average age of 21.86±1.127; 2 women, with an average age of 21.23±1.278, all of whom had high school education or above. The individuals who participated in the experiment were all right-handed, had no vision problems, no mental illness, or a history of mental illness. None of the participants had participated in a similar experiment prior to participating in this experiment. Using the Oddball experimental paradigm in this study, EEG instruments were used to implicitly investigate the advantages of team avatar reference processing in esports events in terms of time course and related neural mechanisms. Results: The results showed that the avatar reference names of the clan induced greater P2 (150-270ms) and P3 (360-600ms) amplitudes than other familiar organization names, and the incarnation reference names of the clan avatars had shorter incubation periods than N2 (260-360ms) and P3 of other familiar tissues. This suggests that when dealing with other relevant information, individuals can not only quickly notice information related to the avatar, but also perform deeper and more refined processing of this information. In summary, it is shown that at the level of processing neural mechanism of time process, the avatar reference in e-sports events has significant processing advantages.

早期同伴虐待影响下个体的韧性与涉及情绪调节的大脑区域皮层厚度有关

杨梦纯[1]　王郑昕玥[2]　曹新育[2]　朱键军[1]（通讯作者）

1 广州大学教育学院早期环境与脑发展研究中心，广州，510000，jianjunzhu722@gmail.com

2 杭州师范大学附属医院认知和脑障碍中心，杭州，310000

摘 要

目的：早期同伴虐待经历会对个体的心理健康产生负面影响，然而，有一些遭受过同伴虐待的个体能够抵抗这种影响，表现出韧性。我们尚不清楚早期同伴虐待影响下个体韧性与大脑结构的关系。因此，本研究将采用问卷调查和磁共振成像技术（MRI）来探讨早期同伴虐待影响下个体韧性的脑结构机制。

方法：217 名参与者接受了 MRI 扫描，以测量前额叶皮层不同区域的皮层厚度。采用虐待年报量表（MACE）和焦虑-抑郁-压力量表（DASS-21）来评估个体的同伴虐待经历和心理健康问题。以同伴虐待经历和心理健康问题将参与者分为韧性组（有同伴虐待经历但没有心理健康问题的参与者）、易感组（有同伴虐待经历和心理健康问题的参与者）和健康对照组（既没有同伴虐待经历也没有心理健康问题的参与

者）。分别在焦虑、抑郁、压力三种症状下，采用协方差分析和事后检验比较三组参与者前额叶区域皮层厚度的差异。

结果：在焦虑症状下，与易感组（$p \leq 0.035$）和健康对照组（$p \leq 0.042$）相比，韧性组的双侧额下回皮层厚度较小。与易感组（$p = 0.036$）相比，韧性组的右内侧眶额叶皮层厚度较大。在压力症状下，与易感组（$p < 0.01$）和健康对照组（$p < 0.01$）相比，韧性组的双侧额下回和双侧额中回的厚度较小。然而，在抑郁症状下，三组参与者的前额叶区域皮层厚度没有显著差异。

结论：这些结果表明，早期同伴虐待影响下个体的韧性与涉及情绪调节的前额叶区域皮层厚度有关。本研究首次探讨了早期同伴虐待影响下，个体的韧性与大脑结构之间的关系。研究结果可以加深我们对韧性神经机制的理解，从而为预防和干预同伴虐待经历所带来的心理健康问题提供更有针对性的建议和参考。

ABSTRACT

Background: Experiencing peer abuse in childhood can have negative impacts on mental health, but some people who have been abused exhibit resilience to this negative outcome. However, it remains uncertain which specific changes in brain structures are associated with this type of resilience. This study utilized questionnaire surveys and magnetic resonance imaging (MRI) techniques to investigate the neurostructural mechanisms that underlie individual resilience in relation to childhood peer abuse.

Methods: 217 participants underwent MRI scans to measure cortical thickness in various brain regions in the prefrontal cortex. The Maltreatment and Abuse Chronology of Exposure (MACE) Scale and the Depression Anxiety and Stress Scales (DASS-21) were used to assess individuals' experiences of peer abuse and mental health problems. This allowed for the creation of three groups: resilient, susceptible and health controls. Resilient individuals were those who had experienced peer abuse but did not show mental health problems, while susceptible individuals were those who had experienced peer abuse and currently exhibited mental health problems. The healthy control group consisted of participants who neither experienced peer abuse nor exhibited mental health problems. We used covariance analysis and post hoc tests to analyze the differences in cortical thickness among three groups of participants on three measures of mental health problems: anxiety, depression, and stress.

Results: In terms of anxiety symptoms, resilient individuals exhibited smaller cortical thickness in the bilateral inferior frontal gyrus (IFG) than both the control group ($p \leq 0.035$) and susceptible group ($p \leq 0.042$). Additionally, they showed larger thickness in the right medial orbitofrontal cortex (mOFC) compared to the susceptible group ($p = 0.036$). Regarding stress symptoms, compared to the vulnerable group ($p < 0.01$) and healthy control group ($p < 0.01$), resilient group exhibited smaller thickness in the bilateral IFG and bilateral middle frontal gyrus. When the groups were defined based on the level of depression, there was no significant group difference in cortical thickness in any of the ROIs.

Conclusions: These findings suggest that resilience to the effects of peer abuse is linked to cortical thickness in prefrontal brain regions related to emotion regulation. It is noteworthy that this is the first study to explore the relationship between resilience and brain structure in relation to peer abuse. These research findings can deepen our understanding of the neural mechanisms underlying resilience to peer abuse, thereby providing a conceptual foundation for future interventions aimed at preventing mental health problems.

人物和题跋对中国山水画审美心理的影响

瞿萌[1] 康廷虎[2]（通讯作者） 唐庭豪[1] 刘子馨[1]

1 西北师范大学心理学院，甘肃兰州，730070

2 西北师范大学心理学院，甘肃兰州，730070，kangyan313@126.com

摘 要 中国山水画的山水形态气势磅礴，人物形象小巧灵动，题跋与画作相辅相成，代表了人与自然和谐相融的处世之道，也表达出画者在山水自然中的审美趣味。人物和题跋作为山水画中不可或缺的元素，究竟对山水画审美过程起着怎样的作用？本研究选用国画家黄宾虹的 30 幅山水画作品，应用眼动追踪技术。实验一采用目标搜索范式和审美评价任务，探讨人物在山水画审美欣赏中的重要性；实验二采用自由浏览范式，通过判断任务和审美评价任务，试图发现题跋信息对山水画审美欣赏的作用。实验一和实验二均为单因素两水平（有人物、无人物条件）的被试内实验设计，并都对山水画作品的审美理解（完整、了解、熟悉）和审美感受（流畅、好看、喜欢）进行李克特 1~9 点计分。使用 Eyelink 1000 Plus 眼动仪追踪 83 名（实验一 40 名，实验二 43 名）在校大学生欣赏山水画过程时的眼动模式，参与者均不知道实验目的。结果发现，实验一在有人物条件下的平均注视时长和注视点个数显著多于无人物条件下，而平均眼跳幅度显著小于无人物条件。实验二在有人物条件下的平均眼跳幅度、注视点个数、瞳孔大小和眼跳个数均显著小于无人物条件。实验一和实验二的审美评分上，人物和题跋的主效应显著，有人物、有题跋时的审美评分均高于无人物、无题跋条件。此外，将实验一和实验二的审美评分进行对比，实验二（有题跋）比实验一在“了解”和“熟悉”程度上的得分显著更高。综上，实验一和实验二的结果均表明人物影响山水画审美欣赏过程的注意分配，而题跋信息可以让审美理解过程更加全面。有人物条件下，参与者较少对山水画进行大幅度的眼跳搜索，注意力更集中于人物形象上，并且审美评价得分更高，表明审美体验更佳。此外，题跋信息作为画作的相关背景信息，可以提高参与者对画作理解的程度。当人物和题跋信息均呈现时，可以显著提升参与者对山水画整体的审美体验。

The Influence of Figures and Inscriptions on the Aesthetic Psychology of Chinese Landscape Paintings

Qu Meng[1], Kang Tinghu[2] (Correspondent), Tang Tinghao[1], Liu Zixin[1]

1 Visual Cognition Laboratory, School of Psychology, Northwest Normal University, Lanzhou, 730070, Gansu, China

2 Visual Cognition Laboratory, School of Psychology, Northwest Normal University, Lanzhou, 730070, Gansu, China; kangyan313@126.com

***Abstract*:** The majestic and grandiose forms of Chinese landscape paintings, along with the delicate and agile

portrayal of figures, complemented by inscriptions, represent the harmonious integration of humans and nature and reflect the painter's aesthetic taste in natural landscapes. As indispensable elements in landscape paintings, how do figures and inscriptions exactly influence the process of aesthetic appreciation in Chinese landscape art? This study selected 30 landscape paintings by Chinese artist Huang Binhong and applied eye-tracking technology. Experiment 1 employed a target search paradigm and aesthetic evaluation tasks to explore the importance of figures in the aesthetic appreciation of Chinese landscape paintings. Experiment 2 utilized a free viewing paradigm and judgment tasks, aiming to investigate the role of inscription information in the aesthetic appreciation of landscape paintings. Both Experiment 1 and Experiment 2 adopted a within-subject design with a single-factor two-level condition (with figures, without figures) and rated the aesthetic understanding (completeness, comprehension, familiarity) and aesthetic perception (flow, attractiveness, liking) of the landscape artworks on a Likert scale ranging from 1 to 9. Using the Eyelink 1000 Plus eye tracker, eye movement patterns of 83 university students (40 participants in Experiment 1 and 43 participants in Experiment 2) were tracked during the process of appreciating landscape paintings. Participants were unaware of the experimental purpose. The results showed that in Experiment 1, the average gaze duration and fixation counts were significantly higher under the condition with figures compared to the condition without figures, while the average saccade amplitude was significantly smaller in the condition with figures. In Experiment 2, the average saccade amplitude, fixation counts, pupil size, and the number of saccades were all significantly smaller under the condition with figures compared to the condition without figures. In both Experiment 1 and Experiment 2, the main effects of figures and inscriptions on aesthetic ratings were significant, with higher aesthetic scores observed when there were figures and inscriptions present, compared to the conditions without figures and inscriptions. Additionally, when comparing the aesthetic ratings of Experiment 1 and Experiment 2, the scores for "comprehension" and "familiarity" were significantly higher in Experiment 2 (with inscriptions). Overall, the results of both Experiment 1 and Experiment 2 indicated that figures influence the allocation of attention during the aesthetic appreciation of landscape paintings, while inscription information can enhance the comprehensive understanding of the aesthetic appreciation process. Under the condition with figures, participants engaged in fewer large-scale eye movement searches of the landscape and focused more on the figures, resulting in higher aesthetic evaluation scores and a more enhanced aesthetic experience. Moreover, inscription information, as relevant background information, improved participants' understanding of the paintings. When both figures and inscriptions were present, participants' overall aesthetic experience of the landscape paintings was significantly enhanced.

通过前额叶-边缘回路功能连接在恐惧学习过程中的间接效应，探索早期物质困难与心理病理症状之间的关联

陈诚[1]，王郑昕玥[2]，曹新育[2]，朱键军[1]（通讯作者）

1 广州大学教育学院早期环境与脑发展研究中心，广州，510006

2 杭州师范大学附属医院认知与脑疾病研究中心，杭州，311121，Jianjunzhu722@gmail.com

摘 要 早期经历家庭物质困难已被证明与身体和心理发展的紊乱相关。然而，至今仍不清楚物质困难与恐惧学习过程中前额叶-边缘回路的功能连接之间的关联。因此，本研究招募了 160 名年龄在 17 至 28 岁之间的健康年轻成年人，进行了脑成像研究。本研究使用功能性磁共振成像（fMRI）技术并运用恐惧学习范式来探索物质困难与前额-边缘回路连接以及心理病理学之间的关系。

研究结果显示，家庭物质困难与左侧杏仁核和双侧背侧前扣带回皮层之间的正连接较高有关，同时与左侧海马和右侧前扣带前额叶皮层之间的负连接较高有关。这些发现表明，在经历家庭物质困难的个体中，特定脑区之间的连接模式发生了变化。此外，中介分析揭示了物质困难通过杏仁核功能连接间接影响抑郁症症状（间接效应 = 0.228，$p = 0.016$），以及通过海马连接间接影响攻击性和敌对症状（攻击性：间接效应 = 0.057，$p = 0.001$；敌对性：间接效应 = 0.169，$p = 0.048$）。

这些研究结果强调了家庭物质困难对前额-边缘回路的影响，并进一步说明了家庭物质困难会以不同的方式影响前边缘回路，从而可能导致特定的心理病理症状。我们的研究结果对于针对心理病理学症状的发展敏感性干预措施具有重要意义。通过针对这些特定的脑区连接模式的干预，我们可能能够缓解由家庭物质困难引起的心理健康问题的发生和发展。

总之，本研究为我们理解家庭物质困难对大脑功能和心理发展的影响提供了新的见解，并强调了前额-边缘回路在这一过程中的重要作用。这些发现对于发展预防和干预策略，以促进青少年和年轻成年人的心理健康具有重要的临床和社会意义。

Exploring the Association between Early Exposure to Material Hardship and Psychopathology through Indirect Effects of Fronto-limbic Functional Connectivity during fear learning

Cheng Chen[1], Wang Zhengxinyue [2], Xinyu Cao [2], Jianjun Zhu[1]*

1 Center for Early Environment and Brain Development, School of Education, Guangzhou University, Guangzhou, China

2 Center for Cognition and Brain Disorders of Affiliated Hospital, Hangzhou Normal University, Hangzhou, China

Abstract：Experiencing family material hardship has been shown to be associated with disruptions in physical and psychological development. However, the association between material hardship and functional connectivity in the fronto-limbic circuit during fear learning is unclear. A total of 161 healthy young adults aged 17–28 were recruited in our brain imaging study, using the Fear Conditioning Task to test the associations between material hardhship and connectivity in fronto-limbic circuit and psychopathology. The results showed that family material hardship was linked to higher positive connectivity between the left amygdala and bilateral dorsal anterior cingulate cortex, as well as higher negative connectivity between the left hippocampus and right ventromedial prefrontal cortex. A mediation analysis showed that material hardship was associated with depression via amygdala functional connectivity (indirect effect = 0.228, p=0.016), and also indirectly associated with aggression and anger-hostility symptoms through hippocampal connections (aggression: indirect effect = 0.057, p = 0.001; anger-hostility: indirect effect = 0.169, p = 0.048). This is, family material hardship appears to affect frontolimbic circuits through changes in specific connectivity, and these specific changes in turn could lead to specific psychological symptoms. The findings have implications for designing developmentally sensitive interventions to mitigate the emergence of psychopathological symptoms.

Keywords：functional connectivity, fear learning, material hardship, psychopathology, mediation

执行功能三个子成分的神经认知加工过程——一项 ERP 研究

张弛[1]，王一峰[1]（通讯作者）
1 四川师范大学脑与心理科学研究院，成都，610066，通讯作者 E-mail:wyf@sicnu.edu.cn

摘 要 执行功能是指与执行目标导向行为有关的一组认知过程，它包括三个核心的子成分：抑制、更新和转换。执行功能作为一项重要的认知功能对人的认知和行为的调节是必不可少的，同时，执行功能受损也是多种精神障碍的一个突出表现，因此阐明执行功能的神经心理过程至关重要。然而，由于当前研究所使用的执行功能的任务不统一、信效度不高且存在任务杂质，导致对执行功能生理机制的研究结果和解释不一致。因此，本研究试图提供一个统一的高信效度的执行功能测量工具，并基于此采用脑电技术来探讨执行功能的神经心理加工过程。研究基于降低任务杂质，提高任务信效度，和提高任务敏感性的基本准则选择并改进任务范式。执行功能的测量包括三个组成部分：(1)抑制成分选用稳态组块设计的侧翼任务；(2)更新成分选择 0-back 和 1-back 任务；(3)转换成分使用颜色-形状规则转换任务，有两种规则（对形状或颜色进行反应）构成两种条件（重复条件：当前试次的反应规则与上一个试次相同；转换条件：当前试次的反应规则与上一个试次不相同），且设置转换概率为 25%。首先招募 99 名成人参与行为实验，结果表明三个任务的信度均大于 0.85，且任务间相关度低而任务内相关度高。其次，从中收集 39 名被试的脑电数据，ERP 结果表明：在抑制任务中，后部的 P3 为抑制的核心神经心理成分，不一致条件 P3 振幅更大且潜伏期较晚；在更新任务中，后部的 P3 反映了更新的操作过程，1-back 条件比 0-back 条件诱发更大的 P3 成分，左侧前部的 N500 反映了项目被更新为新项目的过程，1-back 不匹配条件相较于其他三个条件诱发更大的 N500；在转换任务中，中后部的 P3 成分与转换过程有关，转换条件相较于重复条件诱发更大的 P3 且潜伏期更长。因此，本研究改进后的 EF 测量范式表现出较好的信效度，有助于研究与 EF 相关的正常和异常人的认知和行为表现。执行功能三个子成分抑制、更新和转换相关的核心神经心理成分分别是后部的 P3、后部 P3 和左侧前部 N500、以及中后部 P3。
关键词 执行功能，抑制，更新，转换，ERP

The neuropsychological processes of the three core components of executive function: An ERP study

Chi Zhang[1], Yifeng Wang[1*]
Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, China, 610066.
* Corresponding author's E-mail address: wyf@sicnu.edu.cn.

***Abstract*：** Executive function (EF) refers to a set of neurocognitive processes involved in the execution of goal-directed actions, it involves three core components: inhibition, updating, and shifting. As an important cognitive function, EF is essential for the regulation of human cognition and behavior, and impaired EF is a prominent attribute of multiple mental disorders. So, it is crucial to elucidate the neuropsychological process of executive function. However, due to the inconsistency, low reliability and validity of tasks, and task impurities, the results and explanations of the physiological mechanisms of EF are inconsistent. Therefore, this study attempts to provide a unified measurement tool of EF with high reliability and validity, and based on this, to explore the neuropsychological processing of EF using ERP technology. The study selected and improved the task paradigm based on the basic criteria of reducing task impurities, improving task reliability and validity, and improving task sensitivity. The measurement of EF included three tasks: (1) Inhibition: using a steady-state block design of flanker task; (2) Updating: the experiment selects 0-back and 1-back task (0-back: compare each trial to the first one; 1-back: compare current trial to the previous one); (3) Shifting: select the color-shape rule switch task, there were

two rules (reaction to shape or reaction to color) to form two conditions (repetition condition: the response rule of the current trial was the same as that of the previous trial; shifting condition: the response rule of the current trial is different from that of the previous trial), and the switching probability is 25%. Firstly, 99 adults were recruited to participate in the behavioral experiments. The results showed that the reliability of the three tasks was greater than 0.85. The inter-task correlation was low and the intra-task correlation was high. Secondly, the results of ERP of 39 subjects showed that: the posterior P3 was the core neuropsychological component of inhibition, P3 amplitude was larger and latency was later in the incongruent condition compared to the congruent condition; in the updating, the posterior P3 reflects the updating process, the 1-back condition evoked a larger P3 component than the 0-back condition, and left anterior N500 reflects the process by which item was updated to a new item, the 1-back mismatch condition elicited a larger N500 than the other three conditions; in the shifting, the central-posterior P3 component is related to the shifting process, and the shifting condition induces larger P3 and later latency than the repetition condition. Therefore, the revised paradigms for the measurement of EF exhibited a high degree of reliability and validity, facilitating the investigation of typical and atypical human behaviors associated with EF. The core neuropsychological components for inhibition, updating, and shifting are distinctively expressed by the posterior P3, left anterior N500 and posterior P3, and central-posterior P3, respectively.

未来情景模拟对亲社会行为的影响：内部细节的作用

陈书玥 王俭勤 周楚（通讯作者）

复旦大学心理学系，上海，200433，zhouchu@fudan.edu.cn

摘　要　未来情景模拟(Episodic future simulation) 指人们基于当前时刻或过去经历来想象、模拟未来的自传体事件。未来情景模拟能够通过情景生动性、情绪、心智化等增加个体帮助他人的意愿，进而影响个体的亲社会行为。在情景生动性方面，以往研究主要关注了主观生动性，并发现场景熟悉性可以影响被试对未来情景模拟的主观生动性评价，但缺少对被试想象生动性的客观指标分析，而未来情景模拟过程中的内部细节丰富性可以视为反映想象生动性的重要指标，更是建构性情景模拟假说的关键因素，因此可以引入内部细节数量作为客观指标来进一步考察其在未来情景模拟对亲社会行为影响中可能起到的关键作用。基于此，本研究通过对未来情景模拟的操纵来让被试模拟帮助他人的情景，并引入情景特异性诱导技术来进一步提升模拟时的内部细节数量，以考察内部细节在未来情景模拟对亲社会行为影响中的可能作用。实验采用 3(帮助条件：无帮助条件、想象在不熟悉场景的帮助行为条件、想象在熟悉场景的帮助行为条件)×2(诱导条件：情景特异性诱导、控制性诱导)完全被试内设计，因变量为被试在这些事件中的帮助意愿、愿意捐赠的数额、心智化程度和帮助行为的能动性。结果发现：(1) 当想象在熟悉场景下帮助他人时，个体的帮助意愿要显著高于想象事件来自的社交平台条件；(2) 想象未来在熟悉的场景下帮助他人时，个体的帮助主观能动性要显著高于想象不熟悉场景条件和社交平台条件；(3) 未来情景模拟中的内部细节数量与帮助意愿存在显著的正相关，即内部细节数量越多，帮助意愿越强烈，但在控制了心智化与帮助主观能动性后，内部细节数量与帮助意愿不再相关，而心智化及帮助主观能动性与帮助意愿存在显著正相关。当前研究结果表明，未来情景模拟能够提升个体的帮助意愿，这种帮助意愿的提升与内部细节数量有关，但这一效应可能受到心智化、帮助主观能动性等更多因素影响，未来研究可以进一步考察未来情景模拟中的内部细节与帮助意愿及行为之间的关系。

关键词　未来情景模拟，亲社会行为，内部细节，情景特异性诱导

The Impact of Episodic Future Simulation on Pro-social Behavior: The Role of Internal Details

Shuyue Chen, Jianqin Wang, Chu Zhou
Department of Psychology, Fudan University, Shanghai, China, 200433, zhouchu@fudan.edu.cn

Abstract： Episodic future simulation refers to people's ability to imagine and simulate future autobiographical events based on current moments or past experience. Episodic future simulation can increase people's willingness to help others through episodic vividness, emotion and mentalizing, and this process is also moderated by moral beliefs. In terms of episodic vividness, previous studies have focused on subjective vividness, controlling the subjective vividness of subjects' episodic future simulations through scenario familiarity, lacking analysis of other indicators of vividness, while the abundance of internal (episodic) details is an important factor in reflecting subjective vividness, and it is a key element of the constructive episodic simulation hypothesis, so the amounts of internal details can be introduced as an objective indicator to further examine the key role it may play in the effect of episodic future simulation on pro-social behavior. Therefore, this study plans to conduct episodic future simulation to simulate a situation in which subjects help others and introduce episodic specificity induction to increase the amounts of internal details when simulating and examine the possible role of internal details in the influence of episodic future simulation on pro-social behavior. The study used 3 (Helping condition: no helping condition, imagining helping behavior in unfamiliar location, and imagining helping behavior in familiar location) × 2 (Induction conditions: episodic specificity induction, control induction) complete within-subject design. The dependent variables were subjects' willingness to help, the amount they were willing to donate, mentalizing, and their ability to help. The results found that (1) individuals' willingness to help others were significantly higher for imagining helping others in familiar locations in the future than for imagining the social media platform from which the event came; (2) the abilities of individuals to help is significantly higher when they imagine helping others in familiar locations than other conditions; and (3) there was a significant correlation between the amounts of internal details and willingness to help, but the correlation were no longer significant after controlling for mentalizing and helping ability. The results show that episodic future simulation can increase an individual's willingness to help, and this increase in willingness to help is related to the amounts of internal details, but this effect may be influenced by more relevant factors such as mentalizing and helping ability. Future research could further examine the relationship between internal details in episodic future simulation and help willingness and behavior.

双任务条件下词表属性对词汇工作记忆保持过程的影响

陶布迪　郭晶晶*（通讯作者）
陕西师范大学心理学院，陕西省行为与认知神经科学重点实验室，西安，710062，guojjok@snnu.edu.cn

摘 要　言语工作记忆是个体对于外界输入的言语信息进行暂时存储、加工且容量有限的记忆系统，具有编码、保持和检索三个过程。以往研究发现言语工作记忆的信息保持依赖发音复述、注意刷新和巩固等机制，然而随着学习条件的变化，记忆保持机制如何发生适应性变化并不清楚。本研究操纵记忆词汇表单词间的音、义相似性及词汇频率并结合双任务研究范式，考察词表属性、词频以及干扰因素对言语工作记忆信息保持的效应，揭示记忆保持机制的适应性变化。本研究采用 3（词表类型：语音相似、语义相似和控

制词表）*2（词频：高频和低频）*3（干扰类型：无干扰、发音抑制和认知负荷）的混合设计，其中词频和词表类型为被试内变量，干扰类型为被试间变量。实验包括记忆、延迟保持期与回忆三个阶段。被试首先需记忆匹配记忆跨度的汉字词表，随后在延迟保持期完成干扰任务，同时保持此前看到的汉字，最后书面填写延迟保持期记住的汉字，记录被试的汉字保持量。统计结果显示词频主效应、词表类型主效应以及干扰类型与词类类型的交互作用显著。首先，高频词表的记忆成绩显著高于低频词表，且词频效应在所有词表记忆中都出现；其次，语义相似词表的记忆成绩显著优于控制词表和语音相似词表，同时这种记忆优势不受发音抑制及认知负荷干扰任务的影响。这可能由于语义相似词表词汇间语义关联度高，词汇概念间存在自动化的交叉激活扩散，从而促进了对记忆词汇信息的保持。此外，这种激活扩散机制独立于发音复述和注意资源的影响。最后，语音相似词表的记忆成绩在无干扰条件下显著低于控制词表，但在两种任务干扰下该劣势消失。这表明与控制词表相比，语音相似词表词汇发音相似对词汇记忆造成干扰，但该效应受发音复述和注意刷新状态的调节。总之，研究结果表明，个体的记忆保持机制会随着学习词表属性的不同而发生适应性变化，在词表词汇语义关联度高时可以通过概念自动化激活扩散保持信息，在词表包含语音线索时使用发音复述和注意刷新机制保持信息。

***Abstract*:** Verbal working memory is a limited-capacity memory system that temporarily stores, processes, and retrieves verbal information. It involves three processes: encoding, maintenance, and retrieval. Previous studies has shown that the maintenance of information in verbal working memory relies on mechanisms such as phonological rehearsal, attentional refreshing, and consolidation. However, how memory maintenance mechanisms adapt to changes in learning conditions remains unclear. This study manipulated the phonological and semantic similarity, as well as word frequency, of a memory word list and employed a dual-task paradigm to examine the effects of word list property, word frequency, and interference on verbal working memory maintenance, revealing the adaptive changes in memory maintenance mechanisms. This study adopted a mixed experimental design of 3 (Word List Type: Phonologic Similarity, Semantic Similarity, and Control) * 2 (Word Frequency: High and Low) * 3 (Interference Type: No Interference, Phonological Suppression, and Cognitive Load), with word frequency and word list type as within-subject variables and interference type as a between-subject variable. The experiment comprised three stages: memory encoding, delay retention, and recall. Participants were first required to memorize a list of words of Chinese characters that matched their memory span. During the delay retention phase, they completed interference task while holding the previously seen Chinese characters in memory. Finally, participants provided written recall of the Chinese characters remembered during the delay retention phase, and the quantity of retained characters was recorded. Statistical results revealed significant main effects of word frequency and word list type, and an interaction between interference type and word list type. Firstly, high-frequency word lists demonstrated significantly better memory performance than low-frequency word lists, and this word frequency effect was consistent across all word lists. Secondly, semantically similar word lists exhibited significantly higher memory scores compared to control word lists and phonologically similar word lists, and this memory advantage remained unaffected by the interference tasks of phonological suppression and cognitive load. This may be

attributed to the high semantic associations between words in the semantically similar lists, facilitating automated spreading activation between lexical concepts and promoting memory maintenance. Additionally, this spreading activation mechanism was independent of the effects of phonological rehearsal and attentional resources. Lastly, the memory performance for phonologically similar word lists was significantly lower than control word lists under no interference conditions, but this disadvantage disappeared under both interference tasks. This suggests that phonological similarity among words in the list interfered with lexical memory, but this effect was modulated by the phonological rehearsal and attentional refreshing states. In conclusion, the study results indicate that individuals' memory maintenance mechanisms adapt flexibly to different word list properties. High semantic associations among words in a list can facilitate memory maintenance through automated concept activation spreading, while phonological cues in a word list are maintained using phonological rehearsal and attentional refreshing mechanisms.

基于精细加工可能性模型的微博信息可信度研究：来自自我报告和眼动的证据

乔冰堰[1]　郭嘉[2]　贾小雯[1]　周蔚[1]（通讯作者）

1 首都师范大学心理学院，北京，100048，通讯作者 zhouwei@cnu.edu.cn

2 北京市朝阳外国语学校，北京，100012

摘 要　数字化时代下，新浪微博这一社交媒体上充斥着海量真假难辨的信息，信息的可信度成为大众关注的重要问题。本研究基于心理说服领域经典的精细加工可能性模型，从行为和认知水平上探索信源、信息呈现形式、转评赞、个体认知需求对可信度感知的影响。实验 1 采用 2（信源：官媒/普通网友）×2（信息呈现形式：文本/图文）×2（转评赞数：高/低）的混合设计，通过问卷调查在行为水平上发现（1）官媒的信源可信度、信息质量和信息可信度显著高于普通网友，图文的信息质量和信息可信度显著高于文本，高转评赞的信息可信度显著高于低转评赞（2）转评赞与信源共同影响信息质量，信息接收者的认知需求在可信度评估中起调节作用。实验 2 使用图文形式的微博作为实验材料，将认知需求作为自变量,借助眼动追踪技术采用 2（信源：官媒/普通网友）×2（转评赞数：高/低）×2（认知需求：高/低）的混合设计从认知水平上探索对这些因素对可信度的影响以及可信度、眼动指标、转发行为的关系。结果发现（1）官媒的信息可信度显著高于普通网友（2）从首次注视前时间和注视次数等眼动指标来看，转评赞影响用户对博主身份的关注，且与信源共同影响对文字的认知加工；认知需求影响用户加工图片和转评赞栏的优先顺序（3）可信度和图片、转评赞栏兴趣区的眼动指标正相关，和转发行为呈正相关，图片兴趣区的访问次数和转评赞栏兴趣区的首次注视时间可以有效预测转发行为。两实验的结果表明，信源和转评赞不仅从边缘路线影响微博用户对博主身份的关注与认知，还从中心路线共同影响对文字内容的精细加工。信息呈现形式从中心路线发挥作用，图片能增加用户对信息精细加工的可能性。不同认知需求的人在信源、信息和转评赞线索的关注程度上存在差异。本研究优化了在新浪微博情境下的精细加工可能性模型，丰富了社交媒体平台上信息可信度的研究。

The study of information credibility on social media platform based on the Elaboration Likelihood Model: Evidence from Self-report and

Eye-tracking technology

Bingyan Qiao[1] Jia Guo[2] Xiaowen Jia[1] Wei Zhou[1] (corresponding author)
1 School of Psychology, Capital Normal University, Beijing, 100048, zhouwei@cnu.edu.cn
2 Beijing Chaoyang Foreign Language School, Beijing, 100012

***Abstract*:** The credibility of the information has become a significant matter of public concern in the digital era because Sina Weibo, a new social media platform, is filled with a vast amount of information that is difficult to identify from real ones. The current study examined the influence of information source, presentation form, forward, comment, and like, as well as the need for cognition on the credibility perception from the behavioral and cognitive levels based on the Elaboration Likelihood Model (ELM) in the psychological persuasion field. Experiment 1 adopted a mixed experimental design of 2 (information source: official media/ordinary netizen) × 2 (presentation form: text/picture-plus-text) × 2 (forward, comment, and like: high/low), and found that (1) official media was significantly higher than ordinary netizen on source credibility, information quality, and information credibility, and picture-plus-text was significantly higher than text on information quality and information credibility, and high forward, comment and like was significantly higher than low forward, comment and like on information credibility (2) information source and forward, comment and like jointly influenced information quality, and need for cognition played a moderating role in credibility assessment from the behavioral level through the questionnaire survey. Microblogs in picture-plus-text form were employed as the experimental material in experiment 2, with the need for cognition as one of the independent variables. A mixed experimental design of 2 (information source: official media/ordinary netizen) × 2 (forward, comment, and like: high/low) × 2 (need for cognition: high/low) was used to explore the influence of these factors and relationship among credibility, eye-tracking indicators, and forwarding behavior from the cognitive level using eye-tracking technology. Experiment 2 found that (1) official media was significantly higher than ordinary netizen (2) from eye-movement indicators (e.g., time to first duration (TFF), visit count(VC)), forward, comment, and like affected users' attention to the blogger's identity, and together with information source influenced cognitive processing of text; need for cognition played a moderating role in users' prioritization of the processing of the picture and the forward, comment and like column (3) credibility was positively correlated with the eye movement indicators of the picture and the forward, comment, and like column, and positively correlated with the forwarding behavior, and the more important was that the visit count (VC) to the picture and the first fixation duration (FFD) to the forward, comment, and like column could jointly accurately predict the forwarding behavior. The findings of the two experiments showed that information source and forward, comment and like not only influence attention and cognition of blogger identity from the peripheral route but also jointly affect the elaborate processing of text content from the central route. The presentation form works from the central route, and the picture can boost the potential of elaborate processing. Attention to source, information, and forward, comment and like of individuals with different levels of need for cognition is different. Individuals with varying levels of need for cognition show diverse attention to sources, information, forward, comment, and like. The present study optimized Elaboration Likelihood Model (ELM) under the Sina Weibo situation and enriched the study of information credibility on social media platforms.

面孔和颜色分心物的相对显著性对注意捕获与抑制的影响——来自

ERP 的证据

张悦[1] 付世敏[1]（通讯作者）
1 广州大学教育学院心理系/脑与认知科学中心，广州，510006，
通讯作者 E-mail：fusm@gzhu.edu.cn

摘 要 注意捕获是指视野中突显的刺激会迅速且不自觉地吸引我们的注意。当前研究尚未完全阐明目标与分心刺激的相对显著性变化对注意捕获及抑制的影响。特别地，关于社会信息（如面孔）与知觉信息（如颜色）互为目标和显著分心物时，两者的相对显著性对注意捕获和抑制的影响及神经机制尚无相关研究。本研究采用奇异干扰项范式，让面孔和颜色奇异项在视觉搜索中互相竞争，以探讨相对显著性对颜色和面孔分心物注意捕获和抑制的影响及其神经机制。行为上用反应时测量注意捕获效应，ERP 上用 N2pc 和 P_D 成分分别作为注意捕获与抑制的指标。实验一结果显示，相对显著性较高的面孔分心物先诱发 N2pc，随后诱发 P_D 成分，而相对显著性较低的颜色分心物并未诱发任何成分。这说明当分心物相比于目标的相对显著性较高时，其注意捕获效应更强；反之，其注意捕获效应较弱甚至消失。实验二在实验一的基础上仅通过加粗色环提高颜色物理显著性，结果显示，对颜色、面孔分心物的注意过程都发生了变化。其中颜色分心物诱发了 P_D 成分，且其潜伏期稍晚于 N2pc 成分，这说明颜色分心物的相对显著性提高之后，对其注意过程相应增强；而相对显著性降低的面孔分心物不再诱发 P_D 成分，但仍引起较大的注意捕获效应并诱发 N2pc 成分，这可能是由于面孔分心物作为重要的社会信息具有加工特异性。实验三在实验二的基础上通过模糊化降低面孔的物理显著性，结果显示，相对显著性提高后的颜色分心物引起了更大的注意捕获效应，在 ERP 上先诱发 N2pc 成分，后诱发 P_D 成分，说明相对显著性的提高进一步增强对其的注意捕获和抑制过程；而相对显著性降低后的面孔分心物不存在注意捕获效应且未诱发任何成分，说明面孔分心物的相对显著性降低，对其注意程度也随之减弱。综上所述，面孔分心物的注意捕获和抑制有其特异性；对显著分心物的注意捕获和抑制过程受到其与目标之间相对显著性的影响，分心物的相对显著性越高，对其注意捕获和抑制的程度越强；反之注意捕获和抑制程度越弱甚至不存在。

Relative saliency affects attentional capture and suppression of color and face singleton distractors: evidence from event-related potential studies

Yue Zhang[1], Shimin Fu[1]*
1 Department of Psychology and Center for Brain and Cognitive Sciences, School of Education, Guangzhou University, Guangzhou 510006, China

Abstract：Attentional capture refers to the rapid and involuntary attraction of our attention by salient stimuli in the visual field. The current research has not fully elucidated the effects of changes in relative saliency between targets and distractors on attentional capture and suppression as well as the underlying neural mechanisms, specifically when social information (such as faces) and perceptual information (such as colors) serve as targets and salient distractors interchangeably. In this study, we employed the additional singleton paradigm to investigate the effects of relative salience on attentional capture (indexed by N2pc) and suppression (indexed by P_D) of color and face distractors in visual search, as well as their underlying neural mechanisms. Experiment 1 revealed that face distractors with higher relative salience elicited the N2pc followed by the P_D, while color distractors did not

elicit components. This finding suggests that when distractors have higher relative salience compared to the targets, their attentional capture effects are stronger. Conversely, when the relative salience of distractors is lower, their attentional capture effects are weaker or even absent. Experiment 2 aimed to enhance the physical salience of colors by using bold color rings based on Experiment 1. The results showed that the attentional processes toward both color and face distractors were affected. Specifically, color distractors elicited the P_D component, with a slightly delayed latency compared to the N2pc component. This finding suggests that the attentional processes toward color distractors are enhanced when their relative salience is increased. While face distractors with decreased relative salience no longer elicited the P_D component. However, they still induced a substantial attentional capture effect and elicited the N2pc component. This may be attributed to the fact that face distractors, as important social information, have specific processing characteristics. Experiment 3 utilized blurring techniques to decrease the physical salience of face distractors based on Experiment 2. The results revealed that color distractors with increased relative salience induced a larger attentional capture effect. In terms of ERP components, the N2pc component was observed first, followed by the P_D component. This finding indicates that the enhancement of relative salience further strengthens the attentional capture and suppression processes toward color distractors. While the face distractors with decreased relative salience did not elicit any attentional capture effects and did not induce any observable components. This suggests that the decrease in relative salience of face distractors reduces the level of attention toward them. In conclusion, attentional capture and suppression of face distractors exhibit specificity; The attentional capture and suppression processes toward salient distractors are influenced by their relative salience compared to the targets. The higher the relative salience of the distractors, the stronger the attentional capture and suppression. Conversely, when the relative salience is lower, the attentional capture and suppression effects are weaker or even non-existent.

公正世界信念与无辜受害者责备：未来取向的调节作用

蒋紫卉[1]，施霞[2]

1 天津职业技术师范大学职业教育学院学院，天津，300222

2 天津职业技术师范大学职业教育学院学院，天津，300222，shix@tute.edu.cn

摘 要　无辜受害者责备是指人们倾向于将责任归咎于受害者，而不是施害者的一种现象。Lerner 的公正世界信念理论（Believe in a Just World，BJW）为这个现象提出了一种解释，即人们希望并且必须相信他们生活在一个公正的世界中，人们可以得到他们应得的，这样才能使人们在日常生活中对自己的未来充满信任、希望和信心。而无辜受害者的出现威胁到了人们心中普遍存在的“善有善报，恶有恶报”的公正世界信念。为了维持这一信念，人们会采取不同的策略，如责备无辜受害者。未来取向（Future Orientation）作为一种个人特质，是指个体对于未来的期望和计划，包括对于个人能力、机会和成功的信念。过去的实验多集中于通过使用不同的实验材料创建对公正世界信念造成不同威胁程度的场景，以探究人们对受害者的责备。但是对于个人特质在公正世界信念与无辜受害者责备中的作用机制的探究还相对较少。本实验以公正世界信念理论为基础，将未来取向作为一种个人特质，采用根据真实案例改编的实验材料，探究了公正世界信念、未来取向、无辜受害者责备程度三者之间的作用机制，实验共保留 119 名有效被试，结果表明：（1）公正世界信念对无辜受害者责备程度有显著正向预测作用。（2）未来取向在公正世界信念对受害者责备程度中起到显著调节作用，具体体现在：未来取向水平较低时，公正世界信念程度越高，对无辜受害者的责备程度越高，未来取向较高时，公正世界信念对无辜受害者责备无显著影响。本研究选择了基于虚拟世界的网络暴力场景作为实验材料，有较好的时代意义，且案例由真实新闻改编而成，同时采用了较为

成熟的量表进行测量，具有较高的情境性和真实性；研究结果有助于对当今国内网络暴力案例与无辜受害者责备案例进行探讨，具有一定现实意义。

Believe in a Just World and innocent-victim blaming: the moderating role of future orientation

JIANG Zihui[1],SHI Xia[1]

(1 Institute of Vocational Education, Tianjin University of Technology and Education，Tianjin，300222)

Abstract：Innocent victim blaming is a phenomenon in which people tend to blame the victim rather than the perpetrator. Lerner's Believe in a Just World (BJW) theory proposes an explanation for this phenomenon in which people want to, and must, believe that they live in a just world, and that people can get what they deserve, so that in order for people to have trust, hope and confidence in their future in their daily lives. The presence of innocent victims threatens the BJW that " good will be rewarded, and evil will be rewarded ", and in order to maintain this belief, people adopt different strategies, such as blaming innocent victims. Future Orientation, as a personal trait, refers to an individual's expectations and plans for the future, including beliefs about personal capabilities, opportunities, and success. Past experiments have focused on exploring victim blaming by creating scenarios with different levels of threat to BJWs using different experimental materials. However, there has been relatively little exploration of the mechanisms by which personal traits play a role in BJW and innocent victim blaming. Based on the theory of just-world beliefs and taking future orientation as a personal trait, this experiment explored the mechanism of action between just-world beliefs, future orientation, and the level of blame of innocent victims, the experimental materials was adapted from real cases. A total of 119 valid subjects were retained in the experiment, and the results showed that (1) BJW has a significant positive predictive effect on the degree of blame of innocent victims. (2) Future orientation plays a significant moderating role in the degree of victim blaming by BJW, which is reflected in the following: the higher the degree of BJW, the higher the degree of blaming of innocent victims when the level of future orientation is low, and the higher the future orientation, the BJW has no significant effect on innocent victim blaming. This study chose the virtual world-based cyber violence scene as the experimental material, which has a better significance of the times, and the case was adapted from real news, while a more mature scale was used for measurement, which has a high degree of contextuality and authenticity; the results of the study help to explore the cases of cyber violence and the cases of innocent victim blaming in today's domestic, which has a certain degree of practical significance.

噪音诱发的焦虑促进了双模板搜索

于清玥　任衍具

山东师范大学心理学院，济南，250358，renyanju@163.com

摘 要　当视觉工作记忆中保持两个目标模板，而搜索任务仅需要一个目标模板时，需要进行模板切换。关于焦虑影响视觉搜索中模板切换的研究还存在争议。本研究采用 2（噪音，安静）× 2（单模板，双模板）的实验设计，要求被试搜索特定颜色的线条并对线条的朝向（水平/竖直）做反应。在单模板区块中，被试

只需要搜索某一特定颜色（如绿色）的线条，不需要进行模板切换；而在双模板区块中，被试需要搜索的线条颜色是两种可能颜色中的一种颜色（如蓝色或者绿色），需要进行模板切换。结果发现，相比于安静区块，噪音区块的搜索反应时更短，单模板的搜索反应时显著短于双模板；将双模板区块分为四种情况：前后两个试次的目标只有颜色不同、前后两个试次的目标只有方向不同、前后两个试次的目标颜色和方向都不同、前后两个试次的目标颜色和方向都相同，进一步的分析发现，无论噪音条件还是安静条件，当前后试次的目标颜色和方向都相同时，其反应速度显著快于仅颜色相同或仅方向相同的情况。通过自我报告问卷收集了被试的焦虑水平，发现在噪音区块中，被试感受到更多的焦虑和压力情绪。上述结果表明，随机出现的噪音可以诱导个体产生焦虑情绪，加快个体的反应。单模板区块中不存在噪音带来的收益，在双模板区块中存在噪音带来的收益，不仅加速了模板切换时的反应，也加速了不需要模板切换时的反应。

Noise-induced anxiety improves dual-template search

Qingyue YU, Yanju REN
School of Psychology, Shandong Normal University, Jinan

Abstract：When two target templates are maintained in visual working memory and only one template is required for search task, template switching becomes necessary. There are still some controversies regarding the impacts of anxiety on template switching during visual search. A two (noise, quiet) by two (single template, dual template) experimental design was adopted in the present study and participants were asked to search for the lines of a specific color and respond to their orientations (horizontal/vertical). In the single-template condition, participants searched for lines of a specific color (e.g., green) without the need for template switching. In the dual template condition, participants were required to search for lines of one of two possible colors (e.g., blue or green), necessitating template switching. The results showed that, compared to the quiet block, search reaction times were shorter in the noise blocks, and search reaction times were significantly shorter in the single-template condition compared to the dual-template condition. Within the dual-template blocks, we categorized trials into four types: only colors of targets of the two consecutive trials changed, only orientations changed, both color and orientation changed, and neither of them changed. The results revealed that search for the targets was significantly faster when both color and orientation changed compared to only color or orientation changed regardless of whether the blocks were quiet or noisy. Participants' anxiety levels were assessed through self-report questionnaires, and it was found that they experienced higher levels of anxiety and stress in the noise block. These findings suggest that randomly occurring noise can induce anxiety and improve individual reactions. Additionally, noise-induced benefits were observed in the dual-template condition rather than single-template condition, and it not only facilitated reaction times during template switch but also enhanced reaction times when template switch was unnecessary.

不同情绪调节策略对高自我相关负性社会反馈遗忘的影响

成欣[1]　范梦瑶[1]　黄志超[1]　刘鹏[1]（通讯作者）
1　山西师范大学教育科学学院，太原，030031，shk1985@126.com

摘　要　负性社会反馈会引发社会疼痛，难以忘记的负性社会反馈会给人带来持久的精神压力，从而增加

精神疾病的风险。因此合理调节负性社会反馈带来的负性情绪和记忆、保护人们心理健康非常重要。以往研究都是以陌生人对被试的“第一印象评价”作为负性社会反馈发送给被试，在生态效度和自我相关性方面还有待提高。相较于陌生人，个体可能会更在意熟人对他们的评价，来自熟人的负性社会反馈引起的负面情绪可能更强烈更难遗忘。因此，本研究旨在探讨熟人发送的社会反馈会引发更强烈的负性情绪且更难以忘记，在此基础上进一步研究认知重评对陌生人发送的负性社会反馈的调节效果更好，而分心对熟人发送的负性社会反馈的调节效果更好。本研究采用社会评价范式，以具有高自我相关性的被试自传体记忆作为实验材料，通过两个实验进行研究。实验一采用单因素两水平（发送者：熟人 vs 陌生人）被试内设计，考察当社会反馈发送者不同时，引发的负性情绪反应和记忆的差别。实验二采用 3（情绪调节策略：认知重评 vs 分心 vs 观看）×2（发送者：熟人 vs 陌生人）被试内设计，考察不同的情绪调节策略对陌生人和熟人发送的负性社会反馈的调节作用。同时结合脑电指标，事件相关电位(event-related potential, ERP)中的晚正电位(late positive potential, LPP)作为情绪调节效果的神经指标，在神经层面考察不同情绪调节策略分别对熟人和陌生人发送的负性社会反馈的情绪反应和记忆的潜在益处和神经机制。结果显示：（1）熟人发送的负性社会反馈引发的情绪反应更强烈，更难忘记；（2）认知重评对陌生人发送的负性社会反馈调节效果更好；（3）分心对熟人发送的负性社会反馈调节效果更好。研究结果表明，针对不同的社会反馈发送者，人们需要采取不同的情绪调节策略更高效地缓解负面情绪，应对精神压力，保障心理健康。

Effects of different emotion regulation strategies on high self-related negative social feedback forgetting

Cheng Xin, Fan Mengyao,Huang Zhichao,Liu Peng (corresponding author)
College of Educational Sciences, Shanxi Normal University, Taiyuan，030031

Abstract：Negative social feedback can cause social pain, and unforgettable negative social feedback can bring lasting mental stress to people, thereby increasing the risk of mental illness. Therefore, it is very important to reasonably regulate the negative emotions and memories brought by negative social feedback and protect people's mental health. Previous studies have used strangers' "first impression ratings" as negative social feedback sent to subjects, which could be improved in terms of ecological validity and self-relevance.Compared with strangers, individuals may be more concerned about the evaluation of their acquaintances, and the negative emotions caused by negative social feedback from acquaintances may be stronger and harder to forget. Therefore, the purpose of this study is to explore social feedback sent by acquaintances will lead to stronger negative emotions and more difficult to forget, on this basis, it was further investigated that cognitive reappraisal moderated negative social feedback sent by strangers better, while distraction moderated negative social feedback sent by acquaintances better. In this study, the social evaluation paradigm was used, and the autobiographical memory of subjects with high self correlation was used as the experimental material in two experiments. Experiment 1 utilized a one-way two-level (sender: acquaintance vs. stranger) within-subjects design to examine the differences in negative emotional responses and memories triggered when social feedback senders were different. Experiment 2 used a 3 (emotion regulation strategy: cognitive reappraisal vs. distraction vs. viewing) × 2 (sender: acquaintance vs. stranger) within-subjects design to examine the moderating effects of different emotion regulation strategies on negative social feedback sent by strangers and acquaintances.We also combined with EEG indicators,late positive potential (LPP) in event-related potential (ERP), as a neural indicator of emotion regulation effect,to investigate the potential benefits and neural mechanisms of different emotion regulation strategies on emotional response and memory of negative social feedback sent by acquaintances and strangers at the neural level. The results showed

that: (1) The emotional response caused by negative social feedback sent by acquaintances was stronger and harder to forget; (2) Cognitive reappraisal has a better moderating effect on negative social feedback sent by strangers; (3) Distraction has a better moderating effect on negative social feedback sent by acquaintances. The findings suggest that for different social feedback senders, people need to adopt different emotion regulation strategies to more efficiently alleviate negative emotions, cope with mental stress, and safeguard mental health.

父母婚姻高冲突个体对婚姻刺激的注意偏向研究

李云[1] 来思奇[1] 吴文峰[2]

1 贵州师范大学心理学院,贵阳,550025

2 贵州师范大学心理学院,贵阳,550025,wwfhsd@aliyun.com

摘 要　未婚群体婚姻相关研究是近年研究的热点，已有研究表明父母婚姻冲突是导致个体产生婚姻恐惧的重要影响因素。然而，尽管有研究发现父母婚姻冲突会使得个体降低婚恋意愿，但是尚不清楚父母婚姻冲突是如何影响个体的认知加工过程的。因此，本研究随机选取 700 名大学生为研究对象采用《子女感知父母冲突量表》筛选出 33 名父母婚姻高冲突个体，并以 33 名父母婚姻低冲突个体为对照组进行实验。实验采用 2（被试类型：父母婚姻高冲突个体、父母婚姻低冲突个体)x2(刺激类型：婚姻积极-中性、婚姻消极-中性)x2（探测位置：一致、不一致)三因素混合实验，被试间变量是被试类型，被试内变量是刺激类型和探测位置，通过点探测范式探索父母婚姻高冲突个体对婚姻刺激的注意偏向情况。对实验数据采用传统注意偏向分数计算法结合基于注意过程动态变化的 TL-BS 法进行计算，结果如下：(1)传统指标显示：父母婚姻高冲突组对消极刺激的注意偏向分数达到显著 $t(32)=-2.52, p<0.05$，说明父母婚姻高冲突组对婚姻消极刺激存在注意偏向，其余均未达到显著。(2)动态指标显示：在平均朝向分数上，被试类型与刺激类型交互作用显著，$F(1,64)=6.76, p=0.012, \eta^2 p= 0.096$。简单效应分析显示，父母婚姻高冲突组对不同刺激类型反应时存在显著差异，对积极婚姻刺激的反应时显著高于消极刺激($p<0.05$)，其余效应皆不显著。结论：父母婚姻高冲突个体对婚姻消极刺激存在注意偏向。

A Study on Attention Bias of Individuals with High Conflict in Parental Marriage towards Marriage Stimulus

Li,Y., Lai,S.,Wu,W.

Guizhou Normal University,Guiyang City

Abstract:The attitude of unmarried individuals towards marriage has been a hot topic of research in recent years, and studies have shown that parental marital conflict is an important influencing factor that leads to individual fear of marriage. However, although some studies have found that parental marital conflict can reduce individuals' willingness to engage in marriage, it is still unclear how parental marital conflict affects individuals' cognitive processing. Therefore, this study randomly selected 700 college students as the research subjects and used the "Children Perceived Parental Conflict Scale" to screen out 33 individuals with high parental marital conflict, and conducted the experiment with 33 individuals with low parental marital conflict as the control group. The experiment used a three factor mixed experiment of 2 (subject type: high conflict individuals in parental marriage, low conflict individuals in parental marriage) x2 (stimulus type: positive neutral in marriage, negative neutral in

marriage) x2 (detection position: consistent or inconsistent). The inter subject variable was the subject type, and the intra subject variable was the stimulus type and detection position. The point detection paradigm was used to explore the attention bias of high conflict individuals in parental marriage towards marriage stimuli. The experimental data was calculated using the traditional attention bias score calculation method combined with the TL-BS method based on dynamic changes in the attention process. The results are as follows: (1) Traditional indicators show that the attention bias score of the high conflict group of parents' marriage towards negative stimuli is significant $t(32)=-2.52$, $p<0.05$,It indicates that the high conflict group of parents' marriage has a attentional bias towards negative marital stimuli. The rest did not reach significant levels. (2) Dynamic indicators show that in terms of average orientation score, the interaction between subject type and stimulus type is significant,$F(1,64)=6.76$,$p=0.012$,$\eta^2p = 0.096$ 。 Simple effect analysis showed that there were significant differences in the response time of the high conflict group in parental marriage to different types of stimuli, and the response time to positive marital stimuli was significantly higher than that to negative stimuli ($p<0.05$). The other effects are not significant. Conclusion: Individuals with high levels of parental marital conflict tend to pay attention to negative marital stimuli.

摘 要 以往研究在工作记忆任务中发现情绪记忆增强效应，即与工作记忆任务无关的情绪性图片的记忆效果更差。基于“记忆增强效应”和认知资源理论，情绪性信息优先得到注意进行加工，进而阻碍工作记忆表现，而不同的线索会引导个体做出不同的注意选择，减弱负性情绪对工作记忆的阻碍效应。目前从线索的角度探讨负性情绪对工作记忆影响的研究较少，因此，本研究拟探讨不同类型的线索对工作记忆中情绪记忆增强效应的调控作用。本研究分成两个部分，第一部分采用 N-back 范式进行 2（记忆负荷：0vs2）×2（面孔效价:中性 vs 负性）的实验，验证工作记忆中的情绪记忆增强效应；第二部分采用延迟再认任务在第一部分的基础上进行 2（记忆负荷：0vs2）×2（面孔效价:中性 vs 负性）×2（提示类型：图片 vs 语义）的实验，并结合事件相关电位验证不同类型的线索是否会影响工作记忆中的情绪记忆增强效应。结果显示，1)低记忆负荷下，被试对负性面孔的记忆效果和反应速度均优于中性面孔，高记忆负荷下，被试对中性面孔的记忆效果优于负性面孔，但反应速度比负性面孔较差；2)低记忆负荷下，对于负性面孔的识别，被试在图片线索提示下的反应速度和记忆效果均优于语义线索提示，而对于中性面孔，两种线索提示下的反应速度和记忆效果没有显著差异。高记忆负荷下，相比于语义线索提示，图片线索提示下被试对负性面孔的记忆效果和反应时均较低，而对中性面孔，这种差异不显著；3)无论负性还是中性面孔的识别，高记忆负荷下会诱发更大的 CDA 波幅。不同记忆负荷下，对于负性面孔的识别，不同类型线索诱发的 N2pc 波幅有显著差异，而对于中性面孔的识别，不同线索诱发的 N2pc 波幅差异不显著。以上结果揭示了相比语义线索，图片线索对工作记忆中情绪记忆增强效应的削弱效果更明显。本研究从线索这一新颖的角度探讨了其对工作记忆中情绪记忆增强效应的调控效果，丰富了负性情绪对工作记忆影响的相关研究。

The regulatory effect of endogenous and exogenous cues on the enhancement of emotional memory in working memory

Fan Mengyao, Cheng Xin, Huang Zhichao, Liu Peng
College of Educational Sciences, Shanxi Normal University, Taiyuan,030031

***Abstract*:** Previous studies have found that emotional memory enhancement effect in working memory tasks, That is, emotional images that are not related to working memory tasks are worse remembered. Based on the "memory enhancement effect" and cognitive resources theory, emotional information is preferentially processed for attention, thus hindering the performance of working memory, while different cues will guide individuals to make different attention choices, weakening the hindering effect of negative emotions on working memory. So far, there are few researches on the influence of negative emotions on working memory from the perspective of cues, therefore, this study aims to explore the regulatory effects of different types of cues on the enhancement of emotional memory in working memory.

This study is divided into two parts, in the first part, the experiment of 2 (memory load: 0vs2) ×2 (face valence: neutral vs negative) was conducted using N-back paradigm to verify the enhancement effect of emotional memory in working memory. In the second part, on the basis of the first part, a 2 (memory load: 0vs2) ×2 (face valence: neutral vs negative) ×2 (cue type: picture vs semantic) experiment was conducted using the delayed recognition task, and the event-related potentials were combined to verify whether different types of cues would affect the enhancement effect of emotional memory in working memory.

It was found that, under low memory load, the memory effect and reaction speed of negative faces were better than that of neutral faces, and under high memory load, the memory effect of neutral faces was better than that of negative faces, but the reaction speed was worse than that of negative faces. It was showed that in experiment two, under low memory load, for the recognition of negative faces, the response speed and memory effect of the picture cue were better than those of the semantic cue, while for the neutral face, the response speed and memory effect were not significantly different under the two cues. And under high memory load, compared with semantic cue, the memory effect and reaction time of negative faces were lower under picture cue, but the difference was not significant for neutral faces. Besides, regardless of negative or neutral face recognition, high memory load induced greater CDA amplitude. Under different memory loads, the N2pc amplitude induced by different types of cues was significantly different for negative face recognition, while the N2pc amplitude induced by different cues was not significantly different for neutral face recognition.

These results suggest that picture cues have a more significant weakening effect on emotion enhancement in working memory than semantic cues. In this study, the regulation effect of cue on the enhancement of emotional memory in working memory was explored from the novel perspective of cue, which enriches the relevant research on the influence of negative emotion on working memory.

自闭症谱系障碍对人类与非人类面孔的情绪识别

陆梦楠　邓欢（通讯作者）
淮北师范大学教育学院，淮北，235025，zxl0847@126.com

摘 要　社会沟通与交往障碍是自闭症谱系障碍（Autism spectrum disorder，ASD）的常见特征。梳理相关研究发现，人类面孔对于 ASD 个体似乎有着不一样的意义。有研究报告称，与正常发展（Typically developing，TD）组相比，ASD 组在人类面孔情绪识别方面存在缺陷；但对非人类面孔的情绪识别，两组并无显著差异。这是因为 ASD 在处理情绪面孔时，采用的是不同于 TD 个体的“特异性”策略，即非典型面部处理策略。它

的“特异性”就在于 ASD 只有处理人类情绪面孔时才会使用。目前解释 ASD 对人类面孔的“特异性”的理论主要包括杏仁核理论和社会动机理论。

这种策略主要表现为 ASD 采用的非典型眼神注视模式。有研究结果显示，与 TD 组相比，ASD 组对人类面孔的眼睛关注较少；而对于非人类情绪面孔的眼睛，两组并无显著差异。针对眼神注视减少这一现象有两个假说：凝视厌恶与凝视冷漠。也有研究者从自闭症的杏仁核理论延伸，提出了杏仁核的两种唤醒模型，杏仁核的低激活模型与过度唤醒模型。

目前研究对于 ASD 处理人类面孔的内在机制并没有一个明确的解释。有关干预 ASD 面部情绪问题大多都是借助非人类面孔来进行，这并不能从根本上解决人类面孔对于 ASD 的难题。未来研究可在综合考虑人类面孔与非人类面孔之间的联系及任务类型的基础上，进一步探究其加工特征，明确其内在机制并对其做出更适宜的干预措施。

Emotion recognition toward human and nonhuman faces in individuals with autism spectrum disorder

Lu Mengnan，Deng huan

Faculty of Education，Huaibei Normal University；Huaibei 23502

Abstract：Social communication and interaction disorder is a common feature of Autism spectrum disorder (ASD). According to relevant research, human faces seem to be differently meaningful for individuals with ASD. Researches found that compared to the Typically Developing (TD) group, ASD group has deficiencies in human facial emotion recognition. However, there was no significant difference in the emotional recognition of nonhuman faces between the two groups. This is because ASD uses a "specific" strategy different from TD individuals when dealing with emotional faces, which is an atypical facial processing strategy. Its specificity lies in the fact that ASD is only used during dealing with human emotional faces. The current theories explaining the "specificity" of ASD to human faces mainly include the amygdala theory and social motivation theory.

This strategy is mainly manifested in the atypical eye gaze pattern adopted by ASD. Researches showed that compared to the TD group, the ASD group pays less attention to the eyes of human faces. For the eyes of nonhuman emotional faces, there was no significant difference between the two groups. There are two hypotheses regarding the phenomenon of reduced eye gaze: gaze aversion and gaze indifference. Some authors also extended the theory of amygdala of autism and proposed two arousal models of Amygdala, low activation model and excessive arousal model of amygdala.

There is no clear explanation for the intrinsic mechanism of ASD processing human faces in research. Most interventions related to facial emotional issues in ASD are carried out utilizing nonhuman faces, which cannot fundamentally solve the problem of human faces facing ASD. Future research can further explore the processing characteristics of human and nonhuman faces, clarify their underlying mechanisms, and make more appropriate interventions based on a comprehensive consideration of the connection between human and nonhuman faces and task types.

汉语阅读中词类信息对情绪负载词加工影响的眼动研究

李秦宇　李 烨　李世菊　吴汶君　仝 文（通讯作者）

山西师范大学教育科学学院心理系，太原，030031
E-mail：twaaa@126.com

摘 要　情绪负载词是指不直接表达或描述情绪状态，而是通过其情感内涵间接表达或唤起个体情绪反应的一种情绪词，如“礼物”为积极情绪负载词，“眼泪”为消极情绪负载词。词类信息指词的用法和功能，主要包括动词、名词、形容词等。以往一系列研究表明，相比中性词，情绪负载词存在加工优势，但有关情绪负载词加工机制及其影响因素的研究仍处在初级探索阶段，词类信息影响情绪负载词加工的特点尚不清楚。本研究采用眼动追踪技术，以情绪负载词为研究材料，探讨汉语阅读中词类信息对情绪负载词加工的影响模式随时间进程的变化特点，从而探索汉语阅读中情绪负载词的加工规律，实验一采用 2（目标词情绪性：积极情绪负载词、消极情绪负载词）×3（目标词词类：名词、动词、形容词）的两因素被试内设计，考察不同词类信息情绪负载词在自然阅读中的加工特点。实验二包括两项子实验，目标词分别为积极/消极情绪负载词，利用消失文本范式，采用 2（目标词消失时间：40ms、80ms、120ms、不消失）×3（词类：名词、动词、形容词）的两因素被试内设计，通过比较不同消失时间下不同词类情绪负载词的加工差异，来考察词类信息对情绪负载词加工的影响特点。结果发现：在自然阅读中，在积极情绪负载词条件下，名词在凝视时间和总注视时间上显著小于动词和形容词，而在消极情绪负载词中不存在这一现象；积极、消极情绪负载词在 40ms 消失条件下，形容词在首次注视时间和凝视时间上显著小于名词和动词；而总注视时间上名词表现出更大优势，这种优势在 80ms 的消失条件下依然存在；在不消失的条件下，仅形容词积极情绪负载词在首次注视时间和凝视时间上表现出加工优势。实验结果说明词类信息会影响情绪负载词的加工，且这种影响随时间进程变化，并受到情绪效价调节。实验结果能帮助我们深入了解汉语阅读过程中词类信息对情绪负载词加工影响的眼动特点，更好地考察认知和情绪加工共同作用的机制。

The influence of word class information on emotion-laden words processing in Chinese reading: An eye movement study

Qinyu Li　Ye Li　Shiju Li　Wenjun Wu　Wen Tong
Department of Psychology, Shanxi Normal University, Taiyuan, 030031
E-mail：twaaa@126.com

Abstract：Emotion-laden words refer to a type of emotional word that indirectly expresses or evokes individual emotional responses through their emotional connotations, rather than directly stating or describing emotional states. For example, "gift" is a positive emotion-laden word, while "tears" is a negative emotion-laden word. Word class information refers to the usage and function of words, including verbs, nouns, adjectives, etc. Previous studies have shown that emotion-laden words have processing advantages compared to neutral words. However, research on the processing mechanisms and influencing factors of emotion-laden words is still in its early stages, and the characteristics of how word class information affects the processing of emotion-laden words are not yet clear.This study used eye-tracking technology and emotion-laden words as research materials to explore the changing patterns of the influence of word class information on the processing of emotion-laden words during Chinese reading. The aim was to investigate the processing patterns of emotion-laden words in Chinese reading. Experiment 1 adopted a 2 (Emotionality of target word: positive emotion-laden words,negative emotion-laden words,) × 3 (Word class of target word: noun, verb, adjective) within-subject design to examine the processing

characteristics of emotion-laden words with different parts of speech during natural reading.Experiment 2 also comprised two sub-experiments with target words being positive/negative emotion-laden words. Using the disappearing text paradigm, it employed a 2 (Disappearance time of target word: 40ms, 80ms, 120ms, non-disappearing) × 3 (Word class: noun, verb, adjective) within-subject design to compare the processing differences of emotion-laden words with different word class under various disappearance times and investigate the characteristics of word class information's influence on emotion-laden word processing.The results revealed that for natural reading， under positive emotion-laden words conditions, nouns had significantly shorter gaze duration and total fixation duration than verbs and adjectives, but no such phenomenon was observed for negative emotion-laden words. For positive and negative emotion-laden words under the 40ms disappearance condition, adjectives had significantly shorter first fixation duration and gaze duration than nouns and verbs. However, nouns exhibited greater advantages in total fixation duration, which persisted even under the 80ms disappearance condition. Under the non-disappearance condition, only positive emotion-laden adjectives demonstrated processing advantages in first fixation duration and gaze duration. The experimental results indicated that word class information influences emotion-laden word processing and this influence varies over time, being modulated by emotional valence. The findings can help us gain a deeper understanding of the eye movement characteristics of word class information's influence on emotion-laden word processing during Chinese reading process, and better investigate the joint mechanisms of cognition and emotional processing.

短视频过度使用与大学生认知控制能力关系——走神的中介作用

谭佳英 吴国来（通讯作者）
天津师范大学心理学部，天津，300382，wuguolai@tjnu.edu.cn

摘 要　随着移动互联网技术的发展，移动短视频越来越受大众欢迎，特别是喜爱追赶潮流的大学生，但是短视频过度使用会带来一系列的负面影响，相关研究发现短视频过度使用显著降低了大学生的主观幸福感，还导致了成绩降低、注意力分散以及时间管理不善等问题。认知控制（Cognitive Control）指的是一系列具有挑战性的自上而下的心理过程。认知控制有三个主要组成部分，分别为抑制控制、工作记忆和认知灵活性。但以往研究却未探讨短视频过度使用与认知控制的关系及其作用机制。为了更全面地了解短视频过度使用对大学生认知控制功能的影响及其作用机制，本研究探讨短视频过度使用与认知控制的关系，以及在两者关系中走神的中介作用。走神（Mind Wandering，MW）是指注意从当前任务或者外部事件转移到内部自发思维和情感的一种现象。研究中采用了短视频过度使用量表、执行控制自评量表以及白日梦量表对 180 名在校大学生进行调查，研究结果表明：（1）短视频过度使用与认知控制之间存在显著相关，短视频使用越频繁，认知控制能力越差。（2）短视频过度使用与认知控制的三个子成分，抑制控制、工作记忆以及认知灵活性也存在显著正相关。（3）走神在短视频过度使用与认知控制之间起部分中介作用。本研究证实了过度使用短视频的确对大学生的认知控制能力有负面影响，有利于让用户合理安排短视频使用时间，防止沉迷。也能够为短视频应用防沉迷体系的后续优化措施提供新的思路，同时对网络监管部门规范短视频平台的运行提供一定的依据。

The Relationship Between Excessive Use of Short-form Video and College Students' Cognitive Control Ability-The Mediating Role of Mind wandering

Tan Jiaying Wu Guolai
Tianjin Normal University, Tianjin, 300381, wuguolai@tjnu.edu.cn

Abstract：With the development of mobile Internet technology, mobile Short-form Video are becoming more and more popular with the public, especially college students who like to catch up with the trend, but the excessive use of Short-form Video will bring a series of negative effects, and relevant studies have found that excessive use of Short-form Video significantly reduces the subjective well-being of college students, and also leads to problems such as reduced grades, distraction and poor time management. Cognitive control refers to a series of challenging top-down mental processes. Cognitive control has three main components, namely inhibitory control, working memory, and cognitive flexibility. However, previous studies have not explored the relationship between Short-form Video overuse and cognitive control and its mechanism. In order to understand the impact of Short-form Video overuse on college students' cognitive control function, this study explores the relationship between Short-form Video overuse and cognitive control, and the mediating role of mind wandering in the relationship between the two. Mind Wandering (MW) refers to a phenomenon in which attention shifts from the current task or external event to internal spontaneous thinking and emotion. In this study, the Short-form Video overuse scale and the executive control self-rating scale were used to survey 180 college students, and the results showed that: (1) there was a significant correlation between Short-form Video overuse and cognitive control, and the more frequent the use of Short-form Video, the worse the cognitive control ability. (2) There was also a significant positive correlation between the overuse of Short-form Video and the three subcomponents of cognitive control, inhibition control, working memory and cognitive flexibility. (3) Mind wandering plays a partial mediating role between overuse of Short-form Video and cognitive control. This study confirms that excessive use of Short-form Videos does have a negative impact on the cognitive control ability of college students, which is conducive to allowing users to reasonably arrange the use of Short-form Video and prevent addiction. It can also provide new ideas for the subsequent optimization measures of the anti-addiction system for Short-form Video applications, and provide a certain basis for network regulatory authorities to standardize the operation of Short-form Video platforms.

婴幼儿的大脑偏侧化

王庭栋[1] 于文汶[2] 张丹丹[1,2]
1 四川师范大学脑与心理科学研究院，成都，610066
2 深圳大学心理学院，深圳，518060，zhangdd05@gmail.com

摘 要　在大多数神经系统健康的成年人中，都存在大脑功能偏侧化的现象。其实早从胎儿时期开始，大脑的结构和功能就开始展现出偏侧化的趋势。偏侧化涉及到婴幼儿语言和情绪的加工与学习，对一个人的成长至关重要。而且当大脑出现非正常偏侧化时，婴幼儿还会患上自闭症、强迫症等神经或精神障碍疾病。本文主从婴幼儿大脑的结构及静息态研究、语言加工、情绪加工几个方面，论述了婴幼儿大脑偏侧化的认

知神经科学研究进展，希望能对大脑偏侧化产生和发展提供汇聚性的证据。目前发现，就婴幼儿大脑结构来说，一些脑区体积、皮层厚度、皮层面积、皮层褶皱均存在不对称的现象。静息态研究也发现了左右半球功能网络效率存在偏侧化。学者们对于婴幼儿语言加工偏侧化的研究结果较为一致，普遍认为是左偏化。相反，对于情绪加工的偏侧化则有着很多不一样的理论与研究结果同时存在，但如果将所有的情绪种类综合起来看，大多数实验结果仍旧支持情绪加工右偏化这一观点。另外，言语加工和情绪加工是两个非常复杂的认知功能，婴幼儿可能在多种情况下同时进行了言语加工和情绪加工，它们之间的发展可能存在着相互影响。未来也可以从语言和情绪加工的相互作用上入手，来探讨大脑的偏侧化以及大脑整体的发育和发展。

Infant and young children's brain lateralization

Tingdong Wang[1] Wenwen Yu[2] Dandan Zhang[1,2]
1 Institute of Brain and Psychological Science, Sichuan Normal University, Chengdu, 610066
2 School of Psychology, Shenzhen University, Shenzhen,518060, zhangdd05@gmail.com

Abstract：In most neurologically healthy adults, there exists a phenomenon of brain lateralization, which actually begins to manifest during the fetal stage. Lateralization not only involves the development of crucial cognitive abilities such as language and emotions in infants and young children but also plays a role in the occurrence of neurological or psychiatric disorders when abnormal lateralization occurs in the brain. Studies focusing on the brain structure and resting state of infants and young children have paid close attention to certain brain regions responsible for dominant functional lateralization. Regarding the brain structure of infants and young children, various brain regions exhibit asymmetry in terms of volume, cortical thickness, cortical area, and cortical folding. Resting state studies have also found lateralization in the efficiency of functional networks between the left and right hemispheres. Research results regarding the lateralization of language processing in infants and young children are quite consistent, consistently favoring left lateralization. Conversely, there are various theories and research results regarding the lateralization of emotion processing, but when considering all emotion types together, most experimental findings still support the view of right lateralization in emotion processing. This article focuses on several aspects of infant brain development, including structural and resting-state studies, language processing, and emotion processing. It discusses the progress in cognitive neuroscience research on infant brain lateralization, aiming to provide comprehensive evidence for the emergence and development of brain lateralization. Moreover, language processing and emotion processing are two highly complex cognitive functions, and infants and young children may engage in both language and emotion processing simultaneously under various circumstances. There could be mutual influences between these processes during their development. In the future, exploring the interaction between language and emotion processing could provide insights into brain lateralization and the overall development of the brain.

奖赏加工对问题性手机使用的影响：压力的中介作用

宋迪[1]　罗扬眉[1]（通讯作者）
1 陕西师范大学心理学院，西安，710061，通讯作者 Email: yangmeiluo@snnu.edu.cn

摘 要　随着移动通信设备的快速发展，智能手机已经成为人们生活中不可或缺的一部分，人们不仅利用它维持日常活动，还会使用它进行娱乐活动或缓解压力。然而，花费太多时间使用智能手机可能会产生一系列负面影响，这可能伴随着意志控制感的减弱，并诱发持续的智能手机使用行为，甚至会导致问题性手机使用。人-情感-认知-执行模型认为互联网使用障碍是诱发因素（如神经生物学和心理特征）、中介因素（例如对情境触发因素的情感和认知反应，以及执行功能下降）之间相互作用的结果。奖赏加工的异常可能会引发个体对外界压力过度敏感，从而促使个体更多地使用手机来缓解消极情绪，进而增加成瘾的风险。以往研究主要从单一维度探究问题性手机使用的产生机制，而本研究将神经指标与测量相结合，关注问题性手机使用潜在的神经生物学机制和外界影响因素，以对手机成瘾的形成原因有更加深刻的了解。

本研究招募 106 名健康大学生完成金钱激励延迟任务，采用事件相关电位技术来探究线索提示和结果反馈阶段对奖赏的神经反应。同时，使用压力知觉量表、智能手机成瘾量表对被试的特质进行测量，并根据 I-PACE 模型构建一个中介模型来研究奖赏相关的神经指标影响问题性手机使用的作用机制。预期结果为：（1）在线索呈现阶段，奖赏条件下的反应时显著低于无奖赏条件的反应时，且诱发更大的 N2、cue-P3；（2）在结果反馈阶段，与无奖赏条件相比，得到金钱和损失金钱时诱发更大的 RewP。（3）奖赏敏感性（以 RewP 为指标）可以正向预测问题性手机使用的严重程度，以感知到的压力为中介因素。本研究不仅有助于拓宽对问题性手机使用形成机制方面研究的理论意义，而且能为改善手机成瘾问题使用提供指导，充满现实意义。

The impact of reward processing on problematic smartphone use: the mediating effect of stress

Song Di，Luo Yangmei
Shaanxi Normal University, Xi’an, 710062

***Abstract*：** With the rapid development of mobile communication devices, smartphones have become an indispensable part of people's lives. People not only use them to maintain daily activities, but also for entertainment activities or relieve stress. However, spending too much time using smartphones may have a series of negative effects, which may be accompanied by a decrease in willpower control and trigger sustained smartphone usage behavior, and even lead to problematic smartphone use (PSU). The Interaction of Person-Affect-Cognition-Execution(I-PACE) model suggests that internet use disorders are the result of the interaction between triggering factors (such as neurobiological and psychological characteristics), mediating factors (such as emotional and cognitive responses to situational triggers, and decreased executive function). Abnormalities in reward processing may trigger individuals to be overly sensitive to external pressure, prompting them to use mobile phones more to alleviate negative emotions, thereby increasing the risk of addiction. Previous studies mainly explored the mechanism of problematic mobile phone use from a single dimension, while this study combines neural indicators with measurements to focus on the potential neurobiological mechanisms and external influencing factors of problematic mobile phone use, in order to gain a deeper understanding of the causes of smartphone addiction.

In this study, 106 healthy college students were recruited to complete the monetary incentive delay task, and event-related potentials (ERPs) was recorded to explore the neural response to reward in the cue and feedback stages. At the same time, the Chinese perceived stress scale, smartphone addiction scale were used to measure the characteristics of the participants, and an intermediary model was constructed based on the I-PACE model to study the impact mechanism of reward-related neural indicators on PSU. The expected results are: (1) In the cue

presentation stage, the reaction time under reward condition is significantly lower than that no-reward condition, and larger N2 and cue-P3 are induced; (2) In the feedback stage, compared to the no-reward condition, receiving money and losing money induce greater RewP; (3) Reward sensitivity (measured by RewP) can positively predict the severity of PSU, with perceived stress as a mediating factor. This study not only helps to broaden the theoretical significance of studying the formation mechanism of PSU, but also provides guidance for improving the use of mobile phone addiction, full of practical significance.

甜味体验对于女性亲密关系感知的影响：一项 ERP 研究

郑家兴　陈亚楠（通讯作者）
河南大学教育学部，开封，475000，chenyn@henu.edu.cn

摘 要　已有研究表明，甜味体验可能会影响到女性对亲密关系的感知与判断。尽管现有研究已经从行为层面上证明了甜味体验可以影响女性对亲密关系的感知。然而，现有的研究主要是关注女性在第一人称视角下对自身及他人关系的感知与评价，较少有研究去关注甜味是否会影响女性在第三方视角下对他人的亲密关系的感知与评价。因此，本研究拟以正常女性大学生为被试，来研究甜味体验是否以及如何对女大学生群体的亲密关系感知的行为及电生理反应产生影响。为了做到这一点，我们对被试的味觉进行了操纵，对被试施加甜味及无味两种味觉条件，并将图片评分任务和事件相关电位（ERP）技术相结合，来探讨甜味是否以及如何会对两种类型的亲密关系感知（异性情侣关系、同性同伴关系）产生不同的影响。

在本实验中，被试经历了甜味及无味两种味觉体验，在此期间，他们需要观看两种类型的亲密关系图片，并被要求对两种图片的愉悦度和唤醒度维度进行评分。行为结果显示，甜味体验显著提高了被试对两种关系类型图片的愉悦度及唤醒度评分。脑电结果显示，被试在甜味条件下的观看情侣关系图片时诱发的 N2 成分显著高于同伴关系图片。同时，在观看情侣关系图片的过程中，甜味体验下的被试诱发的 P3 成分显著高于无味体验。此外，在无味条件下，情侣关系图片比同伴关系图片诱发了更大的 LPP 振幅，而在甜味体验下，两种类型图片的 LPP 不存在显著差异。当前结果表明，甜味可以跨模态地影响女性对于亲密关系的感知。这一发现为甜味体验影响女性的亲密关系感知提供了生理层面的证据，也为相关研究者开展后续的研究提供了新的思路。

The effect of sweet taste on women's perception of intimacy: an ERP study

Zheng Jiaxing　Chen Yanan
Henan University, Department of Education, Kaifeng City

Abstract：Research has shown that sweet experiences may affect women's perception and judgment of intimacy. This is despite the fact that existing research has demonstrated at a behavioral level that sweet experiences can affect women's perception of intimacy. However, existing studies mainly focus on women's perception and evaluation of the relationship between themselves and others from the first-person perspective, and few studies focus on whether sweetness affects women's perception and evaluation of the intimate relationship between others from the third-party perspective. Therefore, this study intends to take normal female college students as subjects to

study whether and how sweet taste has an impact on the behavior and electrophysiological response of female college students' intimate relationship perception. To do this, we manipulated the taste of our subjects by subjuring them to both sweet and tasteless taste conditions, and combined the picture scoring task with event related potential (ERP) technology to explore whether and how sweetness affects the perception of two types of intimate relationships (heterosexual couple and same-sex partner) differently.

In this experiment, participants had both sweet and tasteless taste experiences, during which they viewed two types of intimate relationship pictures and were asked to rate the pleasantness and arousal dimensions of both images. The behavioral results showed that sweet taste significantly improved the pleasure and arousal ratings of the two relationship types. ERP results showed that N2 was significantly higher in the heterosexual couple pictures than in the same-sex partner pictures. At the same time, in the process of viewing the relationship pictures, the participants in the sweet experience induced significantly higher P3 composition than the tasteless experience. In addition, in the tasteless condition, the heterosexual couple pictures induced a larger LPP amplitude than the same-sex partner pictures, while in the sweet experience, there was no significant difference in the LPP of the two types of pictures. The current results suggest that sweetness can affect women's perception of intimacy across modes. This finding provides physiological evidence for the effect of sweet taste on women's intimate relationship perception, and also provides new ideas for relevant researchers to carry out follow-up research.

社会和情绪反馈对第三方惩罚的影响

杜创一[1] 李泽清[2] 李琳[1] 伍珍[1]（通讯作者）

1 清华大学心理学系，北京，100084

2 清华大学交叉信息研究院，北京，100084，通讯作者 E-maill: zhen-wu@mail.tsinghua.edu.cn

摘 要 个体会作为自身利益没有受损的旁观者，对一系列不公平行为做出惩罚，这就是第三方惩罚(TPP)。作为一种亲社会行为，TPP 对社会个体间的合作与秩序的维护十分重要。为探讨这一行为是否会受到社会反馈和情绪自我强化的影响，本研究利用经济决策范式对大学生样本($N = 90$)进行了测试。实验为被试间设计，参与者被平均随机分配到三种情景(社会鼓励惩罚，社会态度模糊和无社会观察)，观看分配者对接受者实施的不公平分配，然后决定是否对分配者进行有代价的 TPP。我们共记录 15 轮决策，并使用强化学习建模描述特定社会情境下的参与者在其中对个人情绪反馈的学习率和探索率，并采用人际敏感性量表和倾向性道德敏感性量表从特质方面解释可能结果。

研究发现：1）行为结果表明，当受到社会鼓励时，被试更倾向于做出 TPP 行为；当社会态度模糊时，其约束效力反而较之无社会观察更差，被试更少做出 TPP 行为。并且更消极更强烈的初始情绪(得知不公平方案时的情绪)，以及更强烈的真实情绪(做出决策之后的情绪)显著正向预测 TPP 行为；从量表特质来看，被试的人际敏感性越高，倾向性道德敏感性越强，越有可能做出 TPP 行为，这从侧面印证了道德情景和人际感知方面的特质对 TPP 的影响。2）强化学习结果表明，对 TPP 决策的学习和组别的交互作用显著，具体而言，当存在社会观察时，相较于“社会态度模糊”，在“社会鼓励惩罚”情景下的被试对情绪的学习率和探索率更低；另外，相较于“社会态度模糊”的情景，被试在无社会观察时探索率更低，惩罚行为更稳定，受情绪影响更小(时间维度上近期情绪影响更大，学习率更高)。

研究结果支持负面情绪是促使有代价惩罚的主要原因；明确的社会认同有助于个体清晰的价值判断，并且其对 TPP 的促进作用来源于长期的社会化学习，被试也会在社会压力小时进一步依据短时情绪刺激更新 TPP 决策。这揭示了社会和情绪反馈对于 TPP 行为复杂的强化作用，提示我们可以从认知干预和社会政策方面促进 TPP 这一亲社会行为。

The Effect of Social and Emotional Feedback on Third-party Punishment

Chuangyi Du, Zeqing Li, Lin Li, Zhen Wu
Department of Psychology, Tsinghua University, Beijing, 100084
Institute for Interdisciplinary Information Sciences, Tsinghua University, Beijing, 100084

***Abstract*:** As a bystander whose own interests are not harmed, individuals will punish a series of unfair behaviors, which is third-party punishment (TPP). As a pro-social behavior, TPP is of great importance to the cooperation between individuals and the maintenance of social order. To explore whether this behavior is influenced by social feedback and emotional self-reinforcement, this study tested a sample of college students (N = 90) using an economic decision-making paradigm. The experiment was a between-subjects design. Participants were randomly assigned to three groups (social encouragement of punishment, social attitude ambiguity, and no social observation), watched the unfair distribution of the distributor to the recipient, and then decided whether to carry out the TPP at own cost. A total of 15 trials were recorded, and reinforcement learning was used to describe the learning rate and exploration rate of individual emotional feedback in specific social scenarios, and Interpersonal Sensitivity Measure (IPSM) and Dispositional Moral Sensitivity Questionnaires (DMSQ) were used to explain potential outcomes from a trait perspective.

The study found that: 1) Behavioral outcomes indicated that participants were more inclined to engage in TPP when they received social encouragement. However, in situations with social attitude ambiguity, the constraining effect was weaker compared to situations with no social observation, leading to fewer TPP actions of the participants. Moreover, more negative and intense initial emotions (emotions upon learning about the unfair distribution) and stronger real emotions (emotions after making decisions) significantly positively predicted TPP behavior. From the perspective of traits, higher levels of interpersonal sensitivity and dispositional moral sensitivity were associated with a higher likelihood of engaging in TPP. This indirectly confirms the impact of moral scenarios and interpersonal perception traits on TPP. 2)The reinforcement learning results revealed significant interactions between the learning of TPP decisions and the group conditions. Specifically, when social observation was present, participants in the "social encouragement of punishment" scenario exhibited lower learning rates and exploration rates of emotions compared to those in the "social attitude ambiguity" scenario. Furthermore, in the absence of social observation, participants showed lower exploration rates and more stable punishment behavior, and were less influenced by emotions (with recent emotions having a greater impact over time, leading to higher learning rates) compared to the "social attitude ambiguity" scenario.

The results of the study support that negative emotions are the primary driver behind costly punishment. Clear social encouragement aids individuals in making decisive value judgments, and its promoting effect on TPP comes from long-term social learning. Moreover, participants also update their TPP decisions based on short-term emotional stimuli, particularly when social pressure is reduced. This highlights the complex reinforcing effects of social and emotional feedback on TPP behavior, suggesting that cognitive interventions and social policies can promote this prosocial behavior.

无聊倾向与时间态度的关系：基于神经振荡的证据

陈蕾　张明明（通讯作者）
辽宁师范大学脑与认知神经科学研究中心，大连，116029
通讯作者 E-mail：zmm1001psy@lnnu.edu.cn

摘 要　无聊是一种常见的认知-情感体验，几乎影响着生活的所有领域。而时间态度（time attitude）是指个人对过去、现在和未来的态度或情绪体验。神经振荡则是一种可以被 EEG 记录的神经元活动的普遍特征，已经被发现是时间感知的潜在机制。本研究将考察时间态度与无聊倾向的关系，并使用静息态脑电技术，探索其背后的脑机制。从一所大学中招募了 38 名（24 名女性）右利手学生作为有偿志愿者，平均年龄为 21.7 岁。实验收集了他们的五分钟闭眼静息态 EEG，并施测了大学生无聊倾向问卷和时间态度量表。静息态数据用 EEGLAB 预处理，然后使用 RECOR 工具箱计算每个脑区的神经振荡，最后用 SPSS 对数据进行皮尔逊相关分析和 PROCESS 对中介效应进行检验。用 Bootstrap 法计算结果发现，中央区 Delta 对现在消极的总路径系数 c (β = 0.35，p = 0.018)显著，中央区 Delta 显著正向预测外部刺激 (β = 0.38，p = 0.022)，外部刺激显著正向预测现在消极 (β = 0.37，p = 0.011)，但 c’ (β = 0.21，p = 0.144) 不显著，其 95%的 Bootstrap 置信区间为[0.005，0.387]；中央区 Delta 对未来积极的总路径系数 c (β = -0.35，p = 0.035)显著，中央区 Delta 显著正向预测外部刺激 (β = 0.38，p = 0.022)，外部刺激显著负向预测未来积极 (β = -0.35，p = 0.036)，但 c’ (β = -0.22，p = 0.191) 不显著，其 95%的 Bootstrap 置信区间为[-0.386，-0.002]；枕叶 Gamma 对过去消极的总路径系数 c (β = 0.38，p = 0.037)显著，枕叶 Gamma 显著正向预测外部刺激 (β = 0.39，p =0.032)，外部刺激显著正向预测过去消极 (β = 0.38，p = 0.022)，但 c’ (β = 0.23，p = 0.195) 不显著，其 95%的 Bootstrap 置信区间为[0.006，0.376]，说明个体对于外部刺激的无聊感在中央区 Delta 振荡和现在消极、中央区 Delta 振荡和未来积极，以及枕叶 Gamma 振荡和过去消极的关系中发挥了完全中介作用。结果表明，个体无聊倾向越高，其时间态度越消极；并且，中央区 Delta 振荡和枕叶 Gamma 振荡在不同的时间指向上发挥了重要作用。

The relationship between boredom proneness and time attitude: evidence based on neural oscillations

Chen Lei　Zhang Mingming
Research Center of Brain and Cognitive Neuroscience, Liaoning Normal University, Dalian, Liaoning, 116029

Abstract : Boredom is a common cognitive-emotional experience that affects almost all areas of life. Time attitude refers to an individual's attitude or emotional experience of the past, present, and future. Neural oscillations, a universal feature of neuronal activity that can be recorded by EEG, have been identified as an underlying mechanism of time perception. This study will examine the relationship between time attitude and boredom proneness, and use resting-state EEG technology to explore the brain mechanisms behind it. Thirty-eight (24 females) right-handed students were recruited from a university as paid volunteers, with an average age of 21.7 years. The five-minute resting-state EEG with closed eyes was collected, and the Boredom Proneness Scale and the Adolescent Time Attitude Inventory were tested. The resting-state data were preprocessed with EEGLAB, and then the RECOR toolbox was used to calculate the neural oscillations in each brain region. Finally, Pearson correlation analysis was performed on the data with SPSS and the PROCESS was used to test the mediating effect. Bootstrap method was used to calculate the results. the total path coefficient c (β = 0.35, p = 0.018) of central Delta

was significant for present negative, the central Delta significantly positively predicted external stimulation (β = 0.38, p = 0.022). External stimulation significantly positively predicted present negative (β = 0.37, p = 0.011), but c '(β = 0.21, p = 0.144) was not significant, and its 95% Bootstrap confidence interval was [0.005, 0.387]. The total path coefficient c (β = -0.35, p = 0.035) of central Delta was significant for future positive, the central Delta was significantly positive in predicting external stimulus (β = 0.38, p = 0.022), and external stimulus was significantly negative in predicting future positive (β = -0.35, P = 0.035). p = 0.036), but c '(β = -0.22, p = 0.191) was not significant, and the 95% Bootstrap confidence interval was [-0.386, -0.002]. The total path coefficient c (β = 0.38, p = 0.037) of occipital Gamma for past negative was significant. Occipital Gamma was significantly positive in predicting external stimulus (β = 0.39, p =0.032), and external stimulus was significantly positive in predicting past negative (β = 0.38, p = 0.022). However, c '(β = 0.23, p = 0.195) was not significant, and its 95% Bootstrap confidence interval is [0.006, 0.376]. It shows that the external stimuli of individual boredom play a complete mediating role in the relationship between central Delta oscillation and present negative, central Delta oscillation and future positive, and occipital Gamma oscillation and past negative. The results show that the higher the boredom proneness, the more negative the time attitude; Moreover, the central Delta oscillation and occipital Gamma oscillation play an important role in the different time orientation.

个体特质趋近动机对决策的影响——性别的调节作用

李晓毅[1]　何清华[2]（通讯作者）

1 西南大学心理学部，重庆，400015

2 西南大学心理学部，重庆，400015，heqinghua@swu.edu.cn

摘 要　特质趋近动机反映了个体对奖励刺激的敏感程度或接近倾向。先前的研究已经发现，特质趋近动机对个体决策水平有着显著影响。高特质趋近动机的个体往往有着较高的奖励敏感性并表现出更多趋近奖励的风险行为。然而，目前的研究结果并不一致，且大部分研究未考虑性别差异的影响。爱荷华赌博任务是用于评估个体决策能力的常用任务，可以将其看作由模糊决策阶段（前 40 个试次）和风险决策阶段（后 60 个试次）组成的任务。本研究旨在应用爱荷华赌博任务和静息态功能磁共振成像（rs-fMRI）技术，探索不同水平特质趋近动机的个体在决策任务中表现出的性别差异，以及可能与之相关的神经底物。最终共 325 人纳入分析（229 名女性），采用 2（性别：男，女） * 2（特质动机水平：高组，低组）的被试间设计，所有参与者均完成了 8 分钟睁眼静息态扫描。研究结果显示：不同特质趋近动机水平的男性和女性在 IGT 任务中的表现存在差异，且存在与行为相关的神经影像结果。具体结果显示：特质趋近动机水平对 IGT 表现的影响仅存在于男性参与者中。相较于特质趋近动机水平较低的男生，高趋近动机水平的男生在不确定决策，尤其是风险决策阶段表现的更差。在 IGT 任务中，高特质趋近动机的男性更倾向于选择坏牌，这最终会导致更大的损失。同样，静息态功能连接结果显示，与奖励和抑制控制相关的左侧腹外侧前额叶皮层（VLPFC）和左侧枕上回（SOG）之间的功能连接强度与男性在 IGT 中的表现，尤其是 IGT 风险决策阶段的表现呈正相关。我们的研究结果暗示着性别可能在特质趋近动机对决策行为的影响方面扮演着重要的调节角色，并为理解个体决策水平的差异提供了行为和神经方面的支持证据。

The Effect of Trait Approach Motivation on Decision-making: The Moderating Role of Sex

Xiaoyi Li, Qinghua He
Faculty of Psychology, Southwest University, Chongqing, China, 400015

Abstract: Trait approach motivation reflects an individual's sensitivity or tendency to approach rewarding stimuli. Previous research has discovered that trait approach motivation has a significant impact on a person's capacity for decision-making. Individuals with high trait approach motivation tend to have higher reward sensitivity and exhibit more reward-approaching behaviors. However, the results of the current studies are inconsistent, and most of them do not consider the impact of sex. The Iowa Gambling Task is a common task used to test an individual's decision-making ability. It is divided into two stages: decision-making under ambiguity (the first 40 trials) and decision-making under risk (the last 60 trials). The aim of this study was to investigate sex differences among individuals with different level of trait approach motivation in decision-making tasks, utilizing the Iowa Gambling Task and resting-state functional magnetic resonance imaging (rs-fMRI). Additionally, we also aimed to explore potential neural substrates. 325 adults (229 females) were examined, and all participants underwent an 8-minute eyes-open resting-state scan. Results show that males and females with different level of trait approach motivation perform differently on the IGT. Specifically, the results revealed that trait approach motivation level has a significant impact on IGT performance only in males. Compared to males with lower approach motivation, those with higher approach motivation performed poorer in IGT, especially during the last 60 trials. In the IGT task, males with higher trait approach motivation tend to favor more disadvantageous decks, leading to larger losses. Moreover, the resting-state functional connectivity analysis showed that the strength of functional connectivity between the left ventrolateral prefrontal cortex (VLPFC) and the left supraoccipital gyrus (SOG) was positively correlated with the performance of the males in IGT, especially during the last 60 trials. Our results suggest that sex may play a significant moderating role in the influence of trait approach motivation on decision-making behavior.

时间背景调节跨模态主观标准时间表征的电生理证据

庞舒方[1]　丁劭凡[1]　陈有国[1]（通讯作者）
1 西南大学心理学部，重庆，400715
1 西南大学心理学部，重庆，400715，cyg1001@swu.edu.cn

摘 要　人类能够从不同感觉通道中提取时间信息，进行整合形成新的主观标准时间，并作为后续决策的依据，个体这种整合多感觉通道时间信息的能力是人们日常生活中各种学习、决策等活动的基础，也是各种计时模型如经典标量计时模型跨通道属性与贝叶斯推理超模态表征的重要表现，但其神经机制尚不清楚。本研究采用时距比较任务，结合时间背景效应，被试需要比较一个恒定的听觉标准刺激（1.1s）和两种背景下（短时间背景：0.6s,0.8s,1s,1.2s 和长时间背景：1s,1.2s,1.4s,1.6s）的视觉比较刺激，判断哪一时间间隔更长并按键作出反应，同时记录脑电数据。行为结果显示，长背景下的主观相等点和标准差都大于短背景。脑电方面，我们重点考察了重叠区域 1s 和 1.2s 的 CNV 的动态变化过程，结果表明，时间背景并没有对听觉标准时距阶段的 CNV 产生影响，但在视觉比较时距阶段，短背景下的 CNV 在发展的中间阶段时间窗内（1s：550ms-750ms 和 1.2s：550ms-850ms）负于长背景。此外，在比较刺激呈现阶段，长背景下的 CNV 比短背景更晚出现下降趋势。具体来说，在短背景条件下，标准听觉间隔会和比较视觉间隔混合，恒定的听觉时间与较短的视觉时间的平均值等统计信息整合，形成一个新的较短的主观标准时间，当刺激呈现超过这一阈值时，CNV 会出现下降趋势；在长背景条件下，同样的听觉时间会与较长的视觉时间进行整合，形成一个更长的主观标准时间，进而导致 CNV 下降的时间点晚于短背景。该结果表明人类具有跨通道提取

刺激环境统计信息并进行整合的能力，能够结合视觉和听觉的时间信息形成新的主观时间表征，以此为依据作出决策。我们的研究为这种跨通道时间信息的整合提供了电生理方面的证据，也为增强各种时间加工理论模型的跨通道解释力提供了一定支持。

Electrophysiological evidence for the temporal context modulation of subjective standard time representations across sensory modality

Shufang Pang[1]　Shaofan Ding[1]　Youguo Chen[1] (Corresponding Author)

1 Faculty of Psychology, Southwest University, Chongqing 400715, cyg1001@swu.edu.cn

Abstract：Humans are able to extract time information from different sensory channels, integrate it to form a new subjective standard time, and use it as the basis for subsequent decision-making. This ability of individuals to integrate information from multiple sensory channels is also the basis for various learning and decision-making activities in people's daily life, and is also an important manifestation of the cross-channel attributes of various timing models such as the classical scalar timing models and the supramodal representation of Bayesian inference, but the neural mechanism of which is still not clear. In the present study, we used a temporal comparison task combined with the temporal context effect, in which subjects were required to compare a constant auditory standard stimulus (1.1s) with a visual comparison stimulus in two contexts (short time context: 0.6s,0.8s,1s,1.2s and long time context: 1s,1.2s,1.4s,1.6s), judge which time interval was longer and respond by pressing a key, and simultaneously record the electroencephalogram(EEG). Behavioral results showed that point of subjective equality (PSE) and standard deviations(SD) were greater in the long context than in the short context. For EEG, we focused on the dynamic process of CNV in the overlap regions for 1s and 1.2s, and the results showed that the temporal context did not affect CNV in the auditory standard interval phase, but in the visual comparison interval phase, CNV in the short context in the intermediate time windows (1s: 550ms-750ms and 1.2s: 550ms-850ms) was more negative than the long background. In addition, CNV in the long background showed a downward trend later than in the short background during the comparative stimulus presentation phase. Specifically, in the short background condition, the standard auditory interval would be mixed with the comparative visual interval, and statistical information such as the average of the constant auditory time and the shorter visual time would be integrated to form a new shorter subjective standard time, and when the stimulus presentation exceeded this threshold, the CNV would show a decreasing trend; in the long background condition, the same auditory time would be integrated with the longer visual time to form a longer subjective criterion time, which in turn leads to a later time point of CNV decline than the short background. These results suggest that humans have the ability to extract and integrate statistical information about the stimulus environment across channels, and are able to combine visual and auditory temporal information to form new subjective temporal representations on which to base decisions. Our study provides electrophysiological evidence for this integration of cross-channel temporal information and provides some support for enhancing the cross-channel explanatory power of various theoretical models of temporal processing.

***Abstract*：Objective** By studying the prevalence of post-traumatic stress disorder among healthcare workers during COVID-19 and the factors affecting it, we provide a scientific and theoretical basis for exploring intervention methods to improve such psychological conditions. **Methods** A systematic search of PubMed, EMBase, Web of Science, Medline, China Knowledge Network, Wanfang and Vipshop databases was conducted to screen cross-sectional studies on the prevalence and factors influencing post-traumatic stress disorder among healthcare workers during COVID-19, searched from 2019 to February 2023.Literature quality was evaluated based on the American Institutes for Health Care and Research assessment criteria were used to evaluate the quality of the literature.Meta-analysis was performed using Stata 14.0 software. **Results** Finally, 22 papers were included, all of medium to high quality. meta-analysis results showed that the overall prevalence of PTSD among health care workers during the COVID-19 pandemic was 33.8% 〔95% CI（22.2%，46.6%）〕, female〔OR=1.71，

95%CI（1.58，1.95）〕、age >40 〔OR=1.74，95%CI（1.19，2.56）〕、nurse〔OR=2.25，95%CI（1.62，3.11）〕、married 〔OR=1.49，95%CI（1.23，1.80）〕、with children 〔OR=1.41，95%CI（1.07，1.84）〕、 first-line work 〔OR=2.17，95%CI（1.58，2.98）〕、history of chronic illness 〔OR=1.54，95%CI（1.32，1.81）〕、history of mental disorder 〔OR=2.37，95%CI（1.35，4.18）〕、history of COVID-19 infection 〔OR=1.98，95%CI（1.71，2.28）〕、fear of passing infection to others 〔OR=2.34，95%CI（1.33，4.11）〕、problems with personal protective equipment〔OR=1.63，95%CI（1.33，2.00）〕、and fear of COVID-19〔OR=3.39，95%CI（1.52，7.57）〕were risk factors for PTSD among health care workers during COVID-19 (P<0.05); social support〔OR=0.41，95%CI（0.31，0.54）〕was a protective factor for PTSD in healthcare workers during COVID-19 (P<0.05). The results of the sensitivity analysis showed that all factors, except social support, suggested that the analysis was robust and reliable. **Conclusion** The prevalence of PTSD among healthcare workers is higher during COVID-19 and it is associated with a variety of influencing factors. Women, age >40, nurses, married, having children, front-line work, history of chronic illness, history of mental disorders, history of COVID-19 infection, fear of passing the infection to others, PPE issues, and fear of COVID-19 are more likely to trigger PTSD in healthcare workers.

儿童期虐待与忽视、拒绝敏感性、网络约会暴力受害的关系：主-客体互倚模型分析

张雪　徐伟（通讯作者）　吴柔　张敏

滨州医学院人文与社会科学学院，烟台，264003，通讯作者 E-mail：xuwei1379@163.com

摘 要　基于主-客体互倚模型探究大学生情侣的儿童期虐待与忽视和网络约会暴力受害的关系，以及拒绝敏感性在其中所起到的中介作用。采用中文版儿童期虐待问卷（CTQ-SF）、拒绝敏感性量表（RSQ）、数字亲密伴侣暴力问卷（DIPVQ）对 405 对（910 人）异性恋情侣进行问卷调查，恋爱时长为 13.975±14.617 月，有 29.4%的情侣处于异地恋状态。结果表明：①男女双方的儿童期虐待与忽视、拒绝敏感性、网络约会暴力受害两两之间呈显著正相关(r=0.183~0.527, P<0.001)；②无论是男生还是女生，儿童期虐待与忽视能够显著正向预测自身（主体效应。$\beta_{男}$=0.489，P<0.001； $\beta_{女}$=0.363，P<0.001）及对方（客体效应。$\beta_{男}$=0.169，P<0.01； $\beta_{女}$=0.102，P<0.05）网络约会暴力受害；③中介效应检验中，拒绝敏感性在男生的主体效应和客体效应中均起到中介作用，即无论是男生还是女生的拒绝敏感性不仅在男生的儿童期虐待与忽视和男生的网络约会暴力受害的关系中起到中介作用，而且还在女生的儿童期虐待与忽视和男生的网络约会暴力受害的关系中起到中介作用；但拒绝敏感性在女生的主体效应和客体效应中部分起中介作用，即女生的儿童期虐待与忽视通过自身的拒绝敏感性对影响自身的网络约会暴力受害，男生的儿童期虐待与忽视也通过女生的拒绝敏感性影响女生的网络约会暴力受害。研究结果有助于从成对数据视角出发理解大学生情侣间的相互作用，对今后的网络约会暴力受害的相关研究提供理论和实践指导。

The relation between Child Abuse and Neglect、Rejection Sensitivity and Cyber Dating Violence Victimization: The Actor-Partner Interdependence Model

Zhang Xue, Xu Wei, Wu Rou, Zhang Min
School of Humanity and Social Science, Binzhou Medical University, Yantai, 264003

***Abstract*:** Based on the actor-partner interdependence model, the relationship between child abuse and neglect and cyber dating violence victimization in college couples was explored, and the mediating role of rejection sensitivity. The Chinese version of the Childhood Trauma Questionnaire (CTQ-SF), Rejection Sensitivity Questionnaire (RSQ), and Digital Intimate Partner Violence Questionnaire (DIPVQ) were used to survey 405 pairs (910 people) of heterosexual couples with a relationship duration of 13.975±14.617 months, and 29.4% of couples were in long-distance relationship. The results showed that: ① There were significant positive associations between child abuse and neglect, rejection sensitivity, and cyber dating violence victimization between males and females (r=0.183~0.527, P<0.001); ② Whether males or females, child abuse and neglect can positively predict themselves (actor effect. β_{males}=0.489, P<0.001; $\beta_{females}$=0.363, P<0.001) and the other party (partner effect. β_{males}=0.169, P<0.01; $\beta_{females}$=0.102, P<0.05) cyber dating violence victimization; ③ In the test for mediation effects, rejection sensitivity plays a mediating role in both actor and partner effect of males, in other words, the rejection sensitivity of both males and females is not only mediating the relationship between child abuse and neglect and cyber dating violence victimization in males; It also plays mediating role in the relationship between child abuse and neglect in females and cyber dating violence victimization in males; But rejection sensitivity partially mediated the partner effect and actor effect of females, in other words, females' child abuse and neglect can affect the cyber dating violence victimization through their own rejection sensitivity, males' child abuse and neglect can affect the females' cyber dating violence victimization through females' rejection sensitivity. The results of the study are helpful to understand the interaction between college couples from the perspective of dyadic data, and provide theoretical and practical guidance for future research on cyber dating violence victimization.

中文版持续性思维问卷在新兵中的信效度检验和最佳界值研究

陈功金[1] 彭李[1] 许辰[1] 赵爱军[2] 李敏[1*]
1 陆军军医大学医学心理系，重庆，400038
2 95275 部队，广西柳州，545000
* 通信作者，limin52267@tmmu.edu.cn

摘 要 重复性消极思维（Repetitive Negative Thinking，RNT）是一种跨诊断的精神病理风险因素，与焦虑和抑郁症状显著相关。持续性思维问卷（the Perseverative Thinking Questionnaire，PTQ）是德国学者开发用来测量与疾病内容无关的 RNT 的工具。最近有中国学者在两个网络样本中翻译并验证了 PTQ 的中文版本，但是当前中文版 PTQ 还未在我国新兵中进行验证，并且通过 PTQ 评分预测抑郁和焦虑症状还缺乏界值标准。因此，本研究旨在验证中文版 PTQ 在新兵群体的信度和效度，并探讨其最佳界值。采用自编的人口统计学调查问卷、持续性思维问卷（PTQ）、反刍反应量表简版（RRS-10）、宾州担忧问卷（PSWQ）、抑郁自评量表（SDS）、焦虑自评量表（SAS）对某训练基地 2023 年春季入伍新兵进行调查，回收有效问卷 1675 份。采用 SPSS26.0 和 Amos26.0 软件分析中文版 PTQ 的信度和效度，应用受试者工作特征曲线（Receiver operating characteristic curve，ROC）确定 PTQ 预测抑郁和焦虑症状的最佳界值。结果发现中文版 PTQ 及其子量表的 Cronbach'α系数在 0.742~0.935；分半系数在 0.632~0.940；重测系数在 0.605~0.720（P

＜0.01）。中文版 PTQ 总分和子量表分数与反刍（*r*=0.442~0.549, *P*＜0.001）、担忧（*r*=0.568~0.678, *P*＜0.001）、抑郁（*r*=0.530~0.612, *P*＜0.001）、焦虑（*r*=0.547~0.632, *P*＜0.001）均呈正相关。验证性因素分析支持 PTQ 的二阶单因子模型(RMSEA=0.087,CFI=0.922，TLI=0.905,GFI=0.900,NFI=0.916)。此外，中文版 PTQ 预测抑郁和焦虑症状的最佳界值均为 15 分，此时 ROC 曲线下面积分别为 0.800、0.836（*P*＜0.01，*P*＜0.01），敏感度分别为 76.2%、85.3%，特异度分别为 71.7%、68.0%.研究结果说明中文版 PTQ 在我国新兵中具有较好的信效度，可用作新兵 RNT 的跨诊断测量工具，PTQ 预测抑郁和焦虑症状的推荐最佳界值为 15 分，提示我们在给新兵做心理筛查时应重视对 RNT 的测量，并及时对高 RNT（PTQ≥15 分）新兵进行针对性干预，进而降低心理问题的发生率。

***Abstract*：** Repetitive negative thinking (RNT) is a transdiagnostic psychopathological risk factor that has a significant impact on anxiety and depression. The *Perseverative Thinking Questionnaire* (PTQ) is a content-independent self-report questionnaire to measure RNT. Recently, Chinese scholars have translated and verified the Chinese version of PTQ in two online samples. However, the current Chinese version of PTQ has not been verified in Chinese recruits, and there is still a lack of critical value standards for predicting depression and anxiety symptoms through PTQ scores. Therefore, this study aims to verify the reliability and validity of the Chinese version of PTQ among new recruits, and explore its optimal critical value. The self-designed Demographics questionnaire, PTQ, Ruminative Response Scale-10 (RRS-10), Penn State Worry Questionnaire (PSWQ), Self-Rating Depression Scale (SDS), Self-Rating Anxiety Scale (SAS), were used to investigate the recruits from a new training institution who joined the air force in the spring of 2023, and 1675 valid questionnaires were recovered. The reliability and validity of the Chinese version of PTQ were analyzed using SPSS 26.0 and Amos 26.0 software, and the receiver operating characteristic curve (ROC) was used to determine the optimal critical value for predicting depression and anxiety symptoms using PTQ. The results showed that the Cronbach'α coefficients of the Chinese version of PTQ and its subscales ranged from 0.742 to 0.935; the split-half coefficients ranged from 0.632 to 0.940; the test-retest coefficient ranged from 0.605 to 0.720 (*P*<0.01). The total score and subscale scores of the Chinese version of PTQ were positively correlated with rumination (*r*=0.442~0.549, *P*<0.001), worry (*r*=0.568~0.678, *P*<0.001), depression (*r*=0.530~0.612, *P*<0.001), and anxiety (r=0.547~0.632, P<0.001). Confirmatory factor analysis supports the second-order single-factor model with three lower-order factors of PTQ (RMSEA=0.087, CFI=0.922, TLI=0.905, GFI=0.900, NFI=0.916). In addition, the best cut-off value of the Chinese version of PTQ for predicting depression and anxiety symptoms is 15, the area under the ROC is 0.800, 0.836 (*P*<0.01, *P*<0.01), the sensitivity is 76.2%, 85.3%, and the specificity is 71.7%, 68.0%, respectively. The results indicate that the Chinese version of PTQ shows good reliability and validity among new recruits in China, and can be used as a transdiagnostic measure for RNT in new recruits. The recommended optimal critical value for predicting depression and anxiety symptoms with PTQ is 15 points. This suggests that we should pay attention to measuring RNT when conducting psychological screening for new recruits, and promptly intervene in high RNT (PTQ ≥ 15 points) recruits to reduce the incidence of psychological problems.

青少年短视频使用与物质主义：角色认同与沉浸感的中介作用

王思懿 王玉慧（通讯作者）
北京工业大学文法学部，北京，100124，yuhui2020@bjut.edu.cn

摘 要 随着互联网技术、移动手持设备的迅速发展和广泛应用，短视频使用在青少年群体中已经成为一种非常常见的现象。短视频的应用和普及让许多研究者开始关注短视频使用对青少年群体的影响，但目前关于短视频使用与青少年物质主义之间关系的研究相对缺乏。因此，本研究的首要目的是探讨短视频使用与青少年物质主义的关系及内在机制。此外，研究将考察角色认同和沉浸感在短视频使用与物质主义之间的中介作用。研究采用问卷法调查了 626 名中学生（平均年龄 14.62 ± 0.93 岁）的短视频使用强度、角色认同、沉浸感和物质主义。结果发现：①短视频使用与物质主义之间呈现显著正相关；②采用偏差矫正百分位的 bootstrap 法分析中介效应结果表明，角色认同在短视频使用与物质主义之间的中介效应不显著 (indirect effect = -.02, SE = .03, 95%CI = [-.078, .033])，沉浸感在短视频使用与物质主义之间的中介效应显著 (indirect effect = .10, SE = .03, 95%CI = [.053, .160])；③序列中介效应分析表明，短视频使用能够通过角色认同和沉浸感的序列中介作用间接导致物质主义的提升 (indirect effect = .05, SE = .01, 95% CI =[.025, .072])。研究结果有助于揭示青少年短视频使用对物质主义的影响及作用机制，为短视频使用和物质主义之间的关系提供了新的见解。同时，本研究对引导青少年正确进行短视频使用，减少数字时代青少年短视频使用的负面影响具有重要意义。

Short Video Use and Materialism among Adolescents: The Mediating Roles of Character Identification and Flow Experience

Siyi Wang Yuhui Wang (corresponding author)
Faculty of Humanities and Social Sciences, Beijing University of Technology, Beijing, 100124, yuhui2020@bjut.edu.cn

Abstract: With the rapid development and widespread use of Internet technology and mobile handheld devices, short video use has become a very common phenomenon among the adolescent population. The application and popularity of short videos has led many researchers to focus on the impact of short video use on the adolescent population. However, there is a relative lack of research on the relationship between short video use and adolescent materialism. Therefore, the primary aim of this study is to explore the relationship between short video use and adolescent materialism and the underlying mechanisms. In addition, the study will examine the mediating role of character identification and flow experience in the relationship between short video use and materialism. The study used a questionnaire to investigate the intensity of short video use, character identification, flow experience and materialism among 626 secondary school students (mean age = 14.62 years, *SD* = 0.93). The results found that ① there was a significant positive correlation between short video use and materialism. ② The results of the mediation effect analysis using the bootstrap method with bias correction percentile showed a significant mediation effect of flow experience between short video use and materialism (indirect effect = .10, SE = .03,

95%CI = [.053, .160]) and the character identification between short video use and materialism was not significant (indirect effect = -.02, SE = .03, 95%CI = [-.078, .033]). ③ The analysis of serial mediating effects indicated that short video use could indirectly lead to materialism through the serial mediating effects of character identification and flow experience (indirect effect = .05, SE = .01, 95% CI = [.025, .072]). The findings of the study will help to reveal the effects and mechanisms of adolescent short video use on materialism and provide a new insight into the relationship between short video use and materialism. It also has important implications for guiding adolescents to use short videos properly and for reducing the negative effects of adolescent use of short videos in this digital age.
Keywords**:** adolescents, short video use, character identification, flow experience, materialism

青少年网络真实自我呈现与社交外表焦虑的关系：同伴外貌嘲笑与外表拒绝敏感性的链式中介作用

刘恒[1]　周天梅[2]（通讯作者）　周朝林[3]

1 四川师范大学心理学院，成都，610068

2 四川师范大学心理学院，成都，610068，zhtm6566@sicnu.edu.cn

3　四川天府新区教育科学研究院，成都 610225

摘 要　青春期身体上的迅速发育、心理上的自我意识高涨，使得青少年的关注对象从外部世界转向自己，并且对自己的身体发育、外貌特征非常关心(林崇德，李庆安，2005)。加之未成熟的价值观，青少年极易受外界不良外表信息的影响，造成社交外表焦虑。社外表焦虑会导致饮食失调症、躯体变形障碍、社交不适、注意力不集中、外观安全检查行为（如反复照镜子）等问题(Alcaraz-Ibáñez et al., 2020; Mastro et al., 2016; 甘海英 等, 2020)，所以了解青少年社交外表焦虑的影响因素和形成机制十分必要。研究普遍发现网络真实自我呈现能够增加有益于心理健康的品质，如积极反馈(崔曦曦 等, 2016)。却从未探讨过网络真实自我呈现能否减少不良心理症状的影响，如缓解青少年的社交外表焦虑。并且，同伴在青少年生活中的影响日益重要，如学者发现同伴外貌嘲笑是导致青少年外表拒绝敏感性升高的重要因素(Webb et al., 2017)，且进一步还可能导致社交外表焦虑(Hawes et al., 2020)。而相关研究显示，网络真实自我呈现能够减少人际困扰问题(覃江霞，姜永志，2020; 严番 等， 2021)，降低个体的拒绝敏感性(Hance et al., 2018)。因此，为了探讨青少年网络真实自我呈现能否通过减少同伴外貌嘲笑与降低外表拒绝敏感性来缓解社交外表焦虑。采用量表与回忆启动法对 1200 名青少年（*M*=16.51,*SD*=2.73）进行调查，PROCESS 和结构方程的结果均表明：网络真实自我呈现不仅能直接负向预测青少年的社交外表焦虑，还能分别通过同伴外貌嘲笑、外表拒绝敏感性以及二者的链式中介作用影响社交外表焦虑。即网络真实自我呈现可通过减少同伴外貌嘲笑，从而降低外表拒绝敏感性，进而缓解青少年的社交外表焦虑。

The relationship between adolescents' online honest self-presentation and social appearance anxiety: peer appearance teasing Chain mediating effects with appearance-based rejection sensitivity

LIU Heng[1]　ZHOU Tianmei[2]　ZHOU Chaolin[3]

（1 *Sichuan Normal University, Chengdu , 610068*）

（*2 Sichuan Normal University, Chengdu , 610068,* zhtm6566@sicnu.edu.cn）

（3 *Sichuan Tianfu New District Educational Science Research Institute, Chengdu 610225*）

Abstract： The rapid physical development and high psychological self-awareness during adolescence make adolescents' objects of concern shift from the external world to themselves, and they are very concerned about their physical development and appearance characteristics (Chongde Lin, Qingan Li, 2005). Coupled with immature values, adolescents are highly susceptible to the influence of adverse external appearance information, resulting in social appearance anxiety. Social appearance anxiety can lead to problems such as eating disorders, somatoform disorders, social discomfort, inattention, and appearance safety-checking behaviors (eg: repeatedly looking in the mirror) (Alcaraz-Ibáñez et al., 2020; Mastro et al., 2016; Gan, H. et al., 2020), so understanding the influencing factors and formation mechanisms of social appearance anxiety in adolescents it is essential to understand the factor and mechanisms that influence adolescents' social appearance anxiety. Research has generally found that online honest self-presentation can increase beneficial mental health qualities, such as positive feedback (Xixi Cui et al., 2016). However, it has never been explore whether online honest self-presentation can reduce the effects of adverse psychological symptoms, such as social appearance anxiety . Moreover, the influence of peers in adolescents' lives is becoming increasingly important, as scholars have found that peer appearance teasing is an important factor contributing to adolescents' heightened susceptibility to appearance-based rejection sensitivity (Webb et al., 2017) and may further contribute to social appearance anxiety (Hawes et al., 2020). In contrast, related studies have shown that online honest self-presentation can reduce interpersonal distress problems (Jiangxia Qin, Yongzhi Jiang, 2020; Fan Yan et al., 2021) and decrease individuals' rejection sensitivity (Hance et al., 2018). Therefore, to explore whether adolescents' online honest self-presentation can alleviate social appearance anxiety by reducing peer appearance teasing and decreasing appearance-based rejection sensitivity. Using a scale and recall priming method with 1200 adolescents (M=16.51, SD=2.73), the results of both PROCESS and structural equations indicated that online honest self-presentation not only directly and negatively predicted adolescents' social appearance anxiety, but also influenced social appearance anxiety through peer appearance teasing, appearance-based rejection sensitivity, and the chain-mediated effects of both, respectively. That is, online honest self-presentation can reduce appearance-based rejection sensitivity by decreasing peer appearance teasing, which reduces adolescents' social appearance anxiety.

社交媒体使用与自尊的关系：关系亲密度感知的调节作用

汉洋[1]　杨峰[2]（通讯作者）

1 北京体育大学心理学院，北京，100084

2 泰山学院教师教育学院，泰安，271000，sdnuyangfeng@hotmail.com

摘 要　社交媒体是对一类允许用户自主创作并发布内容的网络平台或者手机软件的统称（如微信、QQ）。有研究发现，社交媒体使用会诱发个体的上行社会比较，从而损害个体自尊；也有研究发现，社交媒体能够使个体更容易获得社会支持，从而保护个体自尊。为了给上述不一致的研究结果提供一个可行的解释，本研究提出社交媒体使用与自尊的关系可能受到关系亲密度感知（relational-closeness）的调节。为检验该假设，我们开展了两个子研究。研究 1 是一个准实验研究，我们采用问卷调查的方式，依次让被试报告抖音（低亲密度感知条件）或者微信（高亲密度感知条件）的使用频率、社会支持感知、上行社会比较以及

状态自尊。结果发现，与假设一致，低亲密度感知条件下社交媒体使用频率与个体自尊存在显著负相关，β = -0.34, p < 0.001，但高亲密度感知条件下社交媒体使用频率与个体自尊存在显著正相关，β = 0.36, p < 0.001。进一步的分析发现，在低亲密度感知的条件下，上行社会比较在社交媒体使用与自尊之间起中介作用，95% CI [-0.18, -0.06]；在高亲密度感知的条件下，上行社会比较和社会支持感知均在二者之间起中介作用，95% CI [-0.09, -0.01], [0.06, 0.21]，但社会支持在中介效应中起主导作用。研究 2 是一个真实验设计，我们在实验室给被试呈现一段考研经验分享的文字材料，然后告诉他们想象自己在 Bilibili（低亲密度感知条件）或者 QQ（高亲密度感知条件）上看到了这个经验分享，随后让他们报告上行社会比较、社会支持感知和自尊水平。结果发现，即使呈现相同的文字材料，高亲密度感知条件下的被试仍然报告了更高水平的自尊和社会支持，t(180) = 7.57, p < 0.001，t(180) = 4.45, p < 0.001，但两种条件下社会比较水平不存在显著差异，t(180) = 0.58, p = 0.56。两个子研究的结果一致表明，社交媒体使用对自尊的影响受到关系亲密度感知的调节：使用低亲密度感知的社交媒体会使个体频繁经历上行社会比较，从而损害个体自尊，但使用高亲密度感知的社交媒体能使个体感受到较多的社会支持，从而抵消上行社会比较带来的消极影响，保护个体的自尊。

Will using social media benefit or harm users' self-esteem? It depends on perceived relational-closeness

Yang Han[1], Feng Yang[2] (Corresponding author)
1 Department of Psychology, Beijing Sport University
2 Department of Teacher Education, Taishan University

Abstract: Social media refers to any websites or cellphone applications that allow users to autonomously create and publish their content (e.g., WeChat, QQ), which has a profound impact on individuals' physical and mental health. Prior literature suggests that social media will make users engage in upward social comparison, thus harming self-esteem, whereas other research reveals that social media makes users readily perceive social support, resulting in elevating self-esteem. For such mixed findings, the current research hypothesized that perceived relational-closeness would moderate the relationship between social media use and self-esteem, which was tested in two studies. In Study 1, a quasi-experimental study, by using a questionnaire survey, we asked participants to report their TikTok (weak relational-closeness condition) or WeChat (strong relational-closeness condition) use intensity, perceived social support, upward social comparison, and state self-esteem. The results showed that, consistent with our prediction, there was a significantly negative correlation between social media use and self-esteem in the weak relational-closeness condition, β = -0.34, p < 0.001, while there was a significantly positive correlation between social media use and self-esteem in the strong relational-closeness condition, β = 0.36, p < 0.001. Further analyses showed that upward social comparison partially mediated the relationship between social media use and self-esteem in the weak relational-closeness condition, 95% CI [-0.18, -0.06], and upward social comparison and perceived social support both mediated the relationship between social media use and self-esteem, 95% CI [-0.09, -0.01], [0.06, 0.21], but the latter played a dominant role in the mediating effects. In Study 2, an utterly experimental design, we presented the same examination experiences-sharing for all participants, then we asked participants to imagine that they read this content on Bilibili (weak relational-closeness condition) or QQ (strong relational-closeness condition). Following that, participants successively reported their upward social comparison, perceived social support, and state self-esteem. The results showed that despite the same content exposure, participants in the strong relational-closeness condition still reported higher social support

perception and self-esteem than participants in the weak relational-closeness condition, $t(180) = 7.57$, $p < 0.001$, $t(180) = 4.45$, $p < 0.001$, but there were no significant differences for upward social comparison between the two conditions, $t(180) = 0.58$, $p = 0.56$. The results of two studies consistently demonstrated that perceived relational-closeness moderated the relationship between social media use and self-esteem. When individuals use social media with weak relational-closeness perception, they will engage in upward social comparison, thus harming their self-esteem; in contrast, when using social media with strong relational-closeness, they will readily perceive social support on social media, resulting in counteracting the negative consequences of upward social comparison and protecting their self-esteem.

短视频过度使用对大学生睡眠质量的影响：就寝延迟和自我控制的作用

崔爱琳　张珊珊（通讯作者）　王泓懿

1 沈阳师范大学，沈阳，110034

2 沈阳师范大学教育科学学院，沈阳，110034，　zhangxiaobai2@163.com

摘 要　睡眠问题一直是全球共同关注的公共卫生问题，近年来，睡眠质量下滑俨然成为威胁大学生心理健康的重要问题之一。然而睡眠质量不仅影响着大学生的学业发展，而且还与其身心健康发展密切相联。因此，有必要揭示大学生睡眠质量产生的影响及其内在作用机制，便于帮助大学生有效地缓解因睡眠问题而带来的负面后效，以期为改善该群体睡眠质量提供一定的理论依据与实践指导。本研究采用匹兹堡睡眠质量指数问卷、大学生手机短视频过度使用行为影响因素研究量表、就寝延迟量表和自我控制量表对 1020 名大学生进行问卷调查。运用 SPSS 27.0 和 AMOS 24.0 软件对收集到的数据进行统计处理及分析。研究得出，（1）短视频过度使用与大学生睡眠质量呈显著正相关（r=0.20，P＜0.01），与就寝延迟呈显著正相关（r=0.25，P＜0.01），而与自我控制呈显著负相关（r=-0.35，P＜0.01）；（2）就寝延迟在短视频过度使用和睡眠质量之间起中介作用；（3）自我控制在模型的前半段路径起调节作用。研究结果表明，短视频过度使用是导致大学生出现睡眠质量问题的关键风险因素，不仅对大学生睡眠质量产生直接的影响，还可以通过就寝延迟这一中介因素和自我控制这一调节因素间接影响睡眠质量。所以对于提升大学生的睡眠质量，一方面，要有意识地引导大学生科学、合理及适度地使用手机短视频，避免因过度沉迷于短视频使用而造成有损于身心健康的行为发生；另一方面，提示高校心理健康工作者在对大学生引导合理利用网络的同时，主动发掘大学生的积极心理资源，可以通过主题辅导活动有意识地提高大学生的自我控制力，增加他们应对各类风险的自身抵御能力。

关键词　短视频过度使用，睡眠质量，就寝延迟，自我控制

The effect of short video overuse on college student's sleep quality: The role of bedtime delay and self-control

CUI Ailin , ZHANG Shanshan, WAGN Hongyi

1 College of Education Science, Shenyang Normal University, Shenyang, 110034

2 College of Education Science, Shenyang Normal University, Shenyang, 110034

Abstract：Sleep problem has always been a public health problem of global concern. In recent years, the decline in sleep quality has become one of the important problems that threaten the mental health of college students. However, sleep quality not only affects the academic development of college students, but also is closely related to their physical and mental health development. Therefore, it is necessary to reveal the influence of college students ' sleep quality and its internal mechanism, so as to help college students effectively alleviate the negative aftereffect caused by sleep problems, so as to provide certain theoretical basis and practical guidance for improving the sleep quality of this group. In this study, 1020 college students were investigated by Pittsburgh sleep quality index questionnaire, college student's mobile phone short video overuse behavior influencing factors scale, bedtime delay scale and self-control scale. SPSS 27.0 and AMOS 24.0 software were used to process and analyze the collected data. The results showed that: (1) There was a significant positive correlation between short video overuse and sleep quality of college students ($r = 0.20$, $P < 0.01$), a significant positive correlation with bedtime delay ($r = 0.25$, $P < 0.01$), and a significant negative correlation with self-control ($r = -0.35$, $P < 0.01$). (2) Bedtime delay plays a mediating role between short video overuse and sleep quality. (3) Self-control plays a moderating role in the first half of the model. The results show that short video overuse is a key risk factor for college students ' sleep quality problems. It not only has a direct impact on college student's sleep quality, but also indirectly affects sleep quality through the mediating factor of bedtime delay and the moderating factor of self-control. Therefore, in order to improve the sleep quality of college students, on the one hand, we should consciously guide college students to use mobile phone short video scientifically, reasonably and moderately, so as to avoid the occurrence of behaviors that are detrimental to physical and mental health due to excessive addiction to short video use. On the other hand, it is suggested that mental health workers in colleges and universities should actively explore the positive psychological resources of college students while guiding college students to make rational use of the network. They can consciously improve the self-control of college students through thematic counseling activities and increase their self-resistance to various risks.

马基雅维利主义与公正敏感性：静息态神经活动的证据

谢宜骏[1] 杨忠静[1] 杨潇[1] 吴燕[2]（通讯作者）

1 杭州师范大学心理学系，杭州市，311121

2 杭州师范大学心理学系，杭州市，311121,20100054@hznu.edu.cn

摘 要 马基雅维利主义源于16世纪意大利政治论著作《君主论》，该著作主张君主应该具备对现实利益与风险的敏感性、非自我中心的思考、公正等特点。而当前研究则更聚焦于马基雅维利主义的暗黑属性，忽略了其积极意义。本研究招募74名健康被试（年龄为22.23±2.54岁，男性36人，女性41人），采用马氏人格量表（Mach-IV Scale）和公正敏感性量表（Justice Sensitivity Scale），考察了马氏人格和公正敏感性四个不同维度（受害者敏感性、观察者敏感性、得益者敏感性和犯过者敏感性）之间的关系。同时，采用静息态功能磁共振成像技术（resting-state fMRI），以低频振荡振幅（Amplitude of Low Frequency Fluctuation，ALFF）作为指标探讨了马氏人格的神经基础。量表数据结果显示，马氏人格与受害者敏感性显著正相关，与得益者敏感性、犯过者敏感性显著负相关；脑影像数据和量表数据的相关结果显示，马氏人格与眶额回、额极的神经自发活动强度（ALFF值）显著正相关；回归分析结果显示，眶额回、额极的神经自发活动强度（ALFF值）均能显著地预测马基雅维利主义人格特质，并受到公正敏感性的部分中介。本研究揭示了马基雅维利主义人格可能与非自我中心的思考有关，体现了马氏人格的积极方面，丰富了马基雅维利主义的内涵，为更加客观、全面地评价马基雅维利主义在实践中的作用提供了启示。

关键词 马基雅维利主义，公正敏感性，静息态功能磁共振成像，非自我中心的思考

Machiavellianism and Justice Sensitivity: A resting-state fMRI study

Yijun Xie[1] Zhongjing Yang[1] Yan Wu[2] Xiao Yang[1]
1,2 Department of Psychology,College of Education,Hangzhou Normal University,Hangzhou,China.

Abstract：Machiavellianism originates from the 16th century Italian political theory work "Monarchy", which advocates that monarchs should have characteristics such as sensitivity to benefits and risks, non-egocentric thinking, and justice. Previous research paid more attention on the dark attributes of Machiavellism, ignoring its positive facets. The present study used the Mach-IV Scale and the Justice Sensitivity Scale to investigate the relationship between Machiavellian personality and four different dimensions of justice sensitivity (victim sensitivity, observer sensitivity, beneficiary sensitivity, and perpetrator sensitivity) on 74 healthy participants (mean age 22.23±2.54 years old, 36 males and 41 females). by using .The Amplitude of Low Frequency Fluctuation (ALFF) as an index in resting-state fMRI (rs-fMRI) was used to identify brain regions correlated with individual differences in Machiavellianism. Results showed that Machiavellian personality was positively correlated with victim sensitivity, and negatively correlated with beneficiary sensitivity and perpetrator sensitivity. The brain imaging data showed that Machiavellian personality was positively correlated with the intensity of neural spontaneous activity (ALFF values) in the orbitofrontal cortex (OFC) and frontal pole. Regression analysis confirmed that the intrinsic brain activity in the orbitofrontal cortex and frontal pole both significantly predicted Machiavellian personality scores. This prediction was partially mediated by scores on justice sensitivity. The present study suggested that Machiavellian personality may be related to non-egocentric thinking, providing insight for the positive aspects of Machiavellianism.

Keywords：Machiavellianism, Justice Sensitivity, resting-state fMRI, non-egocentric thinking

歧视知觉对青少年孤独感的影响——一个有调节的中介作用

蒋凌玮[1] 王挺[1](通讯作者) E-mail：125323611@qq.com

1. 江西中医药大学人文学院，南昌， 330031

摘 要 青少年正处于身心成长和发展的关键时期。孤独感是衡量青少年社会适应能力的一个重要指标，歧视作为一种慢性压力源，其长期存在会使个体处于一种应激状态并损耗其心理社会资源，容易体验到孤独等消极情绪，产生不适应性反应,进而危害青少年身心健康。本研究拟构建一个创新性有调节的中介模型，以检验青少年的歧视感知和孤独感现状，校园受欺凌和自杀自伤意念在其中的链式中介作用，以及师生关系的调节作用。本研究对江西省 1732 名初中生采用青少年歧视知觉量表、孤独感量表（UCLA）、校园受欺凌问卷、自杀自伤意念问卷和师生关系量表进行调查。结果表明：①歧视知觉与孤独感（β=0.797，p＜0.001）呈正相关。校园受欺凌在歧视知觉与孤独感（β=0.115，95%CI[0.031 0.195]）之间起部分中介作用，自杀自伤意念在歧视知觉与孤独感（β=0.044，95%CI[0.011 0.076]）之间起部分中介作用；②校园欺凌和自杀自伤意念在歧视知觉与孤独感（β=0.009，95% CI[0.002 0.018]）之间起链式中介作用；③师生关系通过自杀自伤意念（β=-0.003，t=-8.280，p＜0.001）调节了歧视知觉对孤独感影响的前半段。本研究发现歧视知觉对青少年孤独感有负向作用，且校园受欺凌和自杀自伤意念会增加青少年的心理负担，积极的师生关系可以起到保护作用，未来的研究可以帮助心理健康教育工作实践中通过发挥人民教师的优良风范，以及

提升青少年自身生命意义感、自我效能感、坚毅等积极心理品质以促进其身心健康发展。

关键词 歧视知觉，孤独感，校园受欺凌，自杀自伤意念，师生关系

The Relationship Between Discrimination Perception and Loneliness in Chinese Adolescents——A Moderated Mediating Role

Jiang Lingwei [1] Wang Ting [1](corresponding author)E-mail：125323611@qq.com

1. School of Humanities, Jiangxi University of Traditional Chinese Medicine, Nanchang, city, China, 330031

***Abstract*:** Adolescents are in a critical period of physical and mental growth and development. Loneliness is an important indicator to measure the social adaptability of adolescents. As a chronic source of stress, the long-term existence of discrimination will put individuals in a state of stress and deplete their psychosocial resources. It is easy to experience negative emotions such as loneliness, produce maladaptive reactions, and then endanger the physical and mental health of adolescents. This study intends to construct an innovative moderated mediation model to test the status quo of discrimination perception and loneliness of adolescents, the chain mediating role of school bullying and suicidal self-injury, and the moderating role of teacher-student relationship. In this study, a total of 1732 junior high school students in Jiangxi Province were surveyed using the Adolescent Discrimination Perception Scale, the Loneliness Scale (UCLA), the School Bullying Questionnaire, the Suicide Self-injury Ideation Questionnaire, and the Teacher-student Relationship Scale. The results showed that: ①Discrimination perception was positively correlated with loneliness (β= 0.797, p< 0.001). School bullying played a partial mediating role between discrimination perception and loneliness (β= 0.115, 95 % CI [0.031 0.195]), and suicide self-injury ideation played a partial mediating role between discrimination perception and loneliness (β= 0.044, 95 % CI [0.011 0.076]). ②School bullying and suicide self-injury ideation played a chain mediating role between perceived discrimination and loneliness (β= 0.009, 95 % CI [0.002,0.018]). ③Teacher-student relationship moderated the first half of the effect of perceived discrimination on loneliness through suicide self-injury ideation (β= -0.003, t = -8.280, p< 0.001). This study found that discrimination perception has a negative effect on adolescent loneliness, school bullying and suicide self-injury ideation will increase the psychological burden of adolescents. Positive teacher-student relationships can play a protective role. Future research can help the practice of mental health education work by giving full play to the fine style of the people 's teachers, and enhance the positive psychological quality of young people 's sense of meaning in life, self-efficacy, perseverance and so on to promote their physical and mental health development.

***Keywords*:** discrimination perception, loneliness, school bullying, suicide self-injury ideation, teacher-student relationship

正念干预缓解心理困扰的机制：认知灵活性的中介作用

彭玉霞 [1] 刘玟汐 [1] 张彬 [1] 窦楚敏 [1] 邹颖敏 [1]（通讯作者）

1 中山大学心理学系，广州，510006，zouym7@mail.sysu.edu.cn

摘 要 大量研究表明，正念干预能够有效缓解心理困扰，然而，其背后的起效机制尚未明确。认知灵活性是一种潜在的机制，它指的是个体在遇到压力性的生活事件时，重构适应不良的思维的能力，包括认为

当前情况是可控的，以及能够为生活事件寻找替代解释两个方面。理论上，正念干预可以促进认知灵活性，当个体能够灵活地将想法与事实区分开来，就更倾向于认为当前的情况总体可控，并愿意为压力事件找到其他可能的解释和解决方案，因此能够降低心理困扰水平。目前尚未有研究直接考察，认知灵活性是否是正念干预的起效机制。

本研究旨在探讨正念干预对心理困扰的缓解效果，并检验认知灵活性在正念干预缓解心理困扰关系中起到的中介作用。本研究招募 71 名高心理困扰成人被试，随机分配至正念干预组(n = 35)和等待对照组(n = 36)。正念干预组参加八周正念干预，等待对照组同期不接受任何干预。被试在干预前、后填写自我报告的心理困扰问卷，在干预期间，每周完成自我报告的认知灵活性问卷。

重复测量方差分析结果显示，在心理困扰水平上，发现了显著的时间主效应、组别主效应以及时间和组别交互作用。简单效应检验发现，在后测时，正念干预组的心理困扰得分显著低于等待对照组。对于认知灵活性水平，重复测量方差分析结果，发现了显著的时间主效应、组别主效应以及时间和组别交互作用。简单效应检验显示，从第 2 周到第 8 周，正念干预组在认知灵活性方面的得分，均显著高于等待对照组。中介分析结果表明，从基线到第 8 周时认知灵活性的提升，显著中介了干预类别和干预后心理困扰水平的降低，中介效应占总效应的 46.03%。

本研究揭示了认知灵活性作为正念干预的潜在机制，表明正念干预在一定程度上，是通过认知灵活性来缓解心理困扰的。正念干预既能直接提高认知灵活性，减少心理困扰，又能通过认知灵活性间接影响心理困扰。本研究为认知灵活性作为正念干预的重要机制，提供了实证证据支持，有助于丰富正念理论、进一步提高正念干预的效果。

关键词　正念干预，机制，认知灵活性，心理困扰，中介分析

Mechanisms of Mindfulness Intervention on Psychological Distress: the Mediating Role of Cognitive Flexibility

PENG Yuxia, LIU Wenxi, ZHANG Bin, DOU Chumin, ZOU Yingmin
Department of Psychology, Sun Yat-sen University, Guangzhou 510006, China

***Abstract*：** A number of studies have shown that mindfulness-based intervention was effective in relieving psychological distress. However, the mechanism of mindfulness-based intervention still needs to be further explored. Cognitive flexibility, which refers to the tendency to see current situations as controllable and to find alternative explanations for life events, is a potential mechanism. Theoretically, mindfulness-based intervention may foster cognitive flexibility. When individuals are able to flexibly distinguish thoughts from facts and treat thoughts as thoughts, they are more likely to feel that the current situation is under control and find other possible explanations and solutions for stressful events, and therefore less susceptible to be affected by psychological distress. Until now, no studies have directly examined whether cognitive flexibility is a mechanism of mindfulness-based intervention.

The current study aims to explore the effect of mindfulness-based intervention on psychological distress and to test whether this effect is mediated by cognitive flexibility. We recruited 71 participants with high psychological distress and randomly allocated them to mindfulness-based intervention group (n = 35) and waitlist control group (n = 36). The mindfulness-based intervention group attended an eight-week online Mindfulness Intervention for Emotional Distress (MIED) course, and the waitlist control group received no intervention during the waiting period. During the eight-week mindfulness intervention, participants in both groups completed a self-reported assessment of cognitive flexibility on a weekly basis and finished a self-reported measurement of psychological distress before and after the intervention.

For psychological distress, mixed-model repeated-measure analysis of variance (mixed-model ANOVA) showed that there was a significant main effect of Time, a significant main effect of Group, and a significant Time-by-Group interaction. Simple effect test found that the score on psychological distress for the mindfulness intervention group was significantly lower than that for the waitlist control group at post-intervention. For cognitive flexibility, the mixed-model ANOVA results indicated that there was a significant main effect of Time, a significant main effect of Group and a significant Time-by-Group interaction. Follow-up simple effect analysis found that from week 2 to week 8, the mindfulness intervention group consistently scored higher on cognitive flexibility than the waitlist control group did. Mediation analysis results showed that increase of cognitive flexibility from baseline to week 8 significantly mediated the reduction of psychological distress from baseline to the week after intervention. This significant mediating effect accounted for 46.03 % of the total effect.

The present study revealed cognitive flexibility as a potential mechanism of mindfulness-based intervention, indicating that the effect of mindfulness-based intervention on psychological distress relief was, to a certain extent, through cognitive flexibility. Mindfulness-based intervention could not only directly improve cognitive flexibility and reduce psychological distress, but also indirectly affect psychological distress through cognitive flexibility. This study provides empirical evidences on supporting that cognitive flexibility may be an important mechanism of mindfulness-based intervention. These findings help to further improve the effect of mindfulness-based intervention.

青年护士工作绩效、感知组织公正、组织氛围以及工作嵌入之间的关系研究

郑晓嘉 [1]

1 河南大学护理与健康学院，开封，475000，Zxiaojia0326@126.com

摘 要 **目的：**作为护理队伍中的主力军，青年护士的工作绩效一直以来是学术界的研究热点。虽然以往已有学者研究感知组织公正对护士工作绩效的影响，但尚无研究探讨组织氛围、工作嵌入是如何在二者之间产生影响的。因此，为了给公众提供更好的健康服务及应对全球人口老龄化，我们必须要增强对青年护士群体工作绩效的关注。本研究旨在探究青年护士感知组织公平与工作绩效的关系，并探讨组织氛围和工作嵌入在年轻护士感知组织公平与工作绩效关系中的中介作用。**方法：**采用纵向追踪问卷调研法于 2023 年 3 月至 4 月对中国河南省的 1136 名青年护士进行调查。使用工作绩效量表、组织公平感评估量表、护理组织氛围量表以及工作嵌入量表进行数据收集，并使用 SPSS 26.0 和 AMOS 26.0 对获得数据进行分析。**结果：**研究结果显示青年护士的感知组织公正、组织氛围、工作嵌入和工作绩效两两之间存在正相关关系。不仅组织氛围和工作嵌入分别在青年护士感知组织公正和工作绩效之间起到部分中介作用，组织氛围和工作嵌入也在感知组织公正与青年护士工作绩效之间起到显著的链式中介作用，间接效应值分别为 0.123，0.020，0.062，占总效应(0.518)的 39.58%。**结论：**组织氛围和工作嵌入在感知组织公正与工作绩效间起链式中介作用，因此，医院管理者应该正视青年护士的需求，从护士的角度出发，以感知组织公正、组织氛围及工作嵌入为切入点，制定一系列有针对性的措施以提高青年护士的工作绩效。

A study of the relationship between job performance, perceived

organizational justice, organizational climate, and job embeddedness among young nurses

Xiaojia Zheng
School of Nursing and Health, Henan University, Kai Feng, Zxiaojia0326@126.com

Abstract: **Objective:** As the mainstay of the nursing workforce, the job performance of young nurses has long been a hot topic of academic research. Although previous scholars have studied the impact of perceived organizational justice on nurses' job performance, no study has explored how organizational climate and job embeddedness have an impact between them. Therefore, in order to provide better health services to the public and cope with the aging of the global population, we must pay more attention to the job performance of young nurses. The purpose of this study was to explore the relationship between perceived organizational justice and job performance of young nurses, and to explore the mediating role of organizational climate and job embedment in the relationship between perceived organizational justice and job performance of young nurses. **Methods:** A longitudinal follow-up questionnaire research method was used to survey 1136 young nurses in Henan Province, China, from March to April 2023. Data were collected using the Job Performance Scale, the Sense of Organizational Fairness Assessment Scale, the Nursing Organizational Climate Scale, and the Job Embeddedness Scale, and the obtained data were analyzed using SPSS 26.0 and AMOS 26.0. **Results:** The results of the study revealed a positive correlation between perceived organizational justice, organizational climate, job embeddedness, and job performance among young nurses. Not only did organizational climate and job embeddedness partially mediate the relationship between young nurse's perceived organizational justice and job performance, respectively, but organizational climate and job embeddedness also played significant chain mediating roles between perceived organizational justice and young nurses' job performance, with indirect effect values of 0.123, 0.020, and 0.062, respectively, accounting for 39.58% of the total effect (0.518). **Conclusion:** Organizational climate and job embeddedness play a chain mediating role between perceived organizational justice and job performance. Therefore, hospital administrators should face up to the needs of young nurses and develop a series of targeted measures to improve the job performance of young nurses from the nurses' perspectives, using perceived organizational justice, organizational climate, and job embeddedness as an entry point.

新入职护士职业认同、心理资本、员工幸福感与工作绩效的关系研究

宋佳美[1]（通讯作者）
1 河南大学护理学院，开封，475000，sjm_990619@126.com

摘 要 **目的:**护理人力资源的严重短缺和高流动率是全球医疗保健系统面临的一个重大挑战，新入职护士由于社会角色的改变，在面对复杂工作情境时，容易因为临床经验不足，心理耐力差等原因造成工作绩效不佳，产生负面情绪，从而增加潜在的离职率和高流动率，因此，调动新入职护士工作积极性，提高其工作绩效十分重要。为了探讨职业认同与新入职护士工作绩效的关系,分析这种关联背后的潜在机制,本研究检验了心理资本和员工幸福感在两者之间的中介作用。**方法：**采用职业认同量表、心理资本量表、员工幸福感量表和工作绩效量表于2023年3月至5月对来自河南省5所三级甲等医院的520名新入职护士进行调查。采用皮尔逊相关分析、结构方程模型和描述性统计对数据对数据进行分析，探讨新入职护士职业认同、心

理资本、员工幸福感和工作绩效之间的关系。**结果：**职业认同与员工幸福感（r = 0.374，p< 0.01）、心理资本（r = 0.327，p< 0.01）和工作绩效（r = 0.678，p< 0.01）呈显著正相关。心理资本与员工幸福感（r = 0.564，p< 0.01）和工作绩效（r = 0.496，p< 0.01）呈显著正相关。此外，员工幸福感与工作绩效之间存在显著正相关关系（r = 0.574，p< 0.01）。职业认同对新入职护士工作绩效的总效应为 0.529，心理资本和员工幸福感的总间接中介效应为 0.126，占总效应的 23.82%。新入职护士的职业认同对工作绩效有正向预测作用。心理资本和员工幸福感都是新入职护士职业认同与工作绩效的中介变量，心理资本和员工幸福感在新入职护士的职业认同和工作绩效之间起到连锁中介作用。**结论：**这一结果为护理管理者激励新入职护士的工作绩效提供了新的研究视角和实证支持，对进一步提高护理工作绩效，确保护理团队的稳定性具有重要意义。

Study on the relationship between professional identity, psychological capital, well-being and job performance of new nurses

Jiamei Song[1]

[1]School of Nursing and Health, Henan University, Kaifeng, 475000，sjm_990619@126.com

Abstract: **Objective** The serious shortage and high turnover rate of nursing human resources is a major challenge facing the global healthcare system. Due to the change of social roles, new nurses are prone to poor job performance and negative emotions due to insufficient clinical experience, poor psychological endurance and other reasons in the face of complex work situations, thus increasing the potential turnover rate and high turnover rate. Therefore, it is very important to mobilize the enthusiasm of new nurses and improve their job performance. In order to explore the relationship between professional identity and job performance of new nurses, and analyze the potential mechanism behind this correlation, this study examined the mediating role of psychological capital and employee well-being between them. **Methods** 520 new nurses from 5 hospitals in Henan province were investigated by professional identity scale, psychological capital scale, employee well-being scale and job performance scale from March to May 2023. Pearson correlation analysis, structural equation model and descriptive statistics were used to analyze the data, and the relationship among professional identity, psychological capital, employee well-being and job performance of new nurses was discussed. **Results** Correlation analysis showed that professional identity was positively correlated with employee well-being (r = 0.374, p< 0.01), psychological capital (r = 0.327, p< 0.01) and job performance (r = 0.678, p< 0.01). Psychological capital was positively correlated with employee well-being (r = 0.564, p< 0.01) and job performance (r = 0.496, p< 0.01). In addition, there was a positive correlation between employee well-being and job performance (r = 0.574, p< 0.01). The total effect of professional identity on job performance of new nurses was 0.529, and the total indirect mediating effect of psychological capital and employee well-being was 0.126, accounting for 23.82% of the total effect. The professional identity of new nurses had a positive predictive effect on job performance. Both psychological capital and employee well-being are mediating variables between new nurses' professional identity and job performance. Psychological capital and employee well-being play a chain mediating role between new nurses' professional identity and job performance. **Conclusions** This result provides a new research perspective and empirical support for nursing managers to motivate the job performance of new nurses, which is of great significance for further improving nursing performance and ensuring the stability of nursing teams.

元认知问卷（MCQ-30）在中国青少年中的效度和信度

黎帆[1] 袁丹颜[1] 高畅[1] 熊开鑫[1] 耿富磊[1] 张岚[2]
1 江西师范大学心理学院，南昌，330022
2 江西师范大学心理学院，南昌，330022，zhanglan_8194@163.com

摘 要 **背景：**元认知问卷(MCQ-30)是一种广泛用于评估元认知信念的自我报告工具。虽然中文版的MCQ-30 已在大学生中进行了修订，但其在中国青少年中的有效性尚未得到证实。本研究的目的是检验MCQ-30 在青少年样本中的心理测量特性，重点考查其因子结构在不同青少年人群中的稳定性状况。**方法：**被试是从江西省的两所初中和贵州省的一所高中里招募的 2827 名青少年（48.9%为男性；平均年龄为 14.57，年龄范围从 11 岁到 18 岁，标准差为 1.69；41.9%为少数民族)。根据年龄我们还将总样本分为了青少年早期（11-14 岁）和青少年晚期（15-18 岁）两个子样本。自我报告问卷评估被试的元认知信念、焦虑、抑郁和易激惹症状、以及积极的童年经历和生活满意度，间隔一个多月后随机选取 311 名学生进行元认知信念重测。采用 Mplus 8.3 进行验证性因子分析评估 MCQ-30 的因子结构，进一步考查不同人口统计学组和临床症状组的测量不变性；同时采用 SPSS 21.0 进行信度和效度分析。**结果：**首先，在总样本中，验证性因子分析结果支持原问卷的五因素模型，CFI=0.918, TLI=0.909, RMSEA (90%CI)=0.068(0.066-0.070)。其次，五因素模型的形态、单位和度量不变性均在不同性别（男、女）、年龄（青少年早期、青少年晚期）、民族（汉族、少数民族）、居住地（城镇、农村）、父母受教育程度（高中以下、高中及以上）、抑郁（是、否）和焦虑（是、否）状态等人群中得到支持。再次，MCQ-30 的五个子量表均表现出良好的内部一致性(Cronbach alphas > 0.75)和重测信度(intra-class correlation coefficients > 0.45)。最后，相关分析显示这五个因素与抑郁、焦虑、易怒症状呈正相关，与积极的童年经历和生活满意度呈负相关，表明 MCQ-30 在中国青少年中具有极好的效度。**结论：**MCQ-30 五因素模型适用于不同特征的青少年人群，且具有较好的信度和效度，该量表可用于评估青少年元认知信念紊乱状况。

Validity and reliability of the Metacognitions Questionnaire-30 (MCQ-30) among Chinese adolescents

Fan Li, Danyan Yuan, Chang Gao, Kaixin Xiong, Fulei Geng, Lan Zhang*
School of Psychology, Jiangxi Normal University, Nanchang, China
Corresponding author: Lan Zhang, School of Psychology, Jiangxi Normal University, 99 Ziyang Ave, Nanchang, Jiangxi 330022, China

***Abstract*: Background:** The Metacognitions Questionnaire-30 (MCQ-30) is a widely used self-report instrument to assess metacognitive beliefs. Although the Chinese version of MCQ-30 has been revised in college students, the validation of the scale has yet been confirmed among Chinese adolescents. In this study, we examined the psychometric properties of the MCQ-30 in a large sample of adolescents.

Methods: Participants were 2827 adolescents (48.9% male; mean age = 14.57, SD = 1.69) recruited from Jiangxi and Guizhou provinces of China. Participants' metacognitive beliefs, symptoms of anxiety, depression, and irritability, positive childhood experiences and life satisfaction were measured by self-report questionnaires. Confirmatory factor analysis was performed to assess factor structure, as well as, measurement invariance across demographic groups and clinical symptoms.

Results: In the total sample, confirmatory factor analyses supported the original five-factor model: CFI = 0.918, TLI = 0.909, RMSEA (90%CI) = 0.068 (0.066-0.070). Furthermore, configural, metric and scalar invariance the five-factor model were supported by gender, age, ethnicity, residence, parental education level, depression and

anxiety status. Furthermore, all five subscales demonstrated good internal consistency (Cronbach alphas > 0.75) and test-retest reliability (intra-class correlation coefficients > 0.45). Finally, correlation analysis showed that the five factors were positively related to symptoms of depression, anxiety, and irritability and negatively related to positive childhood experiences and life satisfaction, indicating excellent validity.

Conclusions: The findings provide initial evidence that the MCQ-30 is a valid measure for use in Chinese adolescents.

Keywords: MCQ-30, MCQ-A, metacognitive beliefs, adolescents, factor structure, psychometrics

童年期父母教养方式与成年期失眠和攻击性的关系：基于生命全程发展视角的横断面研究

秦琴[1] 熊开鑫[1] 耿富磊[1] 张岚[2]

1 江西师范大学心理学院，南昌，330022

2 江西师范大学心理学院，南昌，330022，zhanglan_8194@163.com

摘 要 **背景：**不良的父母教养方式，如过度保护、缺乏温暖与支持等，与行为问题（如攻击行为、自杀自伤行为等）和精神障碍（如睡眠障碍、人格障碍等）的产生和发展密切相关。大量研究证实不良的父母教养方式能预测儿童青少年和成年早期人群的失眠与攻击性，但目前很少有研究从生命全程发展视角出发，探讨童年期父母教养方式对失眠和攻击性的影响是否随年龄增长而变化。父母教养方式对个体生命全程发展的影响较为复杂，在不同的理论框架下，其影响可能会随着时间的推移而下降、保持稳定或在老年阶段变得更加显著。因此，本研究旨在考察童年期父母教养方式是否与成年个体的攻击性和失眠情况有关，并进一步探究性别与年龄在三者关系中的调节作用。**方法：**被试为社区招募的 4462 名成年人（$M_{年龄}$ = 37.75 岁，SD = 7.61，年龄范围从 18 岁到 81 岁；男性占总体样本的 32.7%）。采用自我报告问卷，分别评估被试的父亲教养方式、母亲教养方式、睡眠状况和攻击行为。应用结构方程模型分别独立检验父亲不同类型教育方式、母亲不同类型教育方式对攻击性和失眠的影响，分析失眠在教养方式和攻击性的中介效应，多组比较检验教养方式影响攻击性和失眠的差异状况。**结果：**①童年期父母教养方式的情绪温暖与成年期攻击性和失眠呈显著负相关，拒绝和过度保护与攻击性和失眠呈显著正相关；②父母拒绝直接影响攻击性，失眠在父母温暖和过度保护与攻击性之间起完全中介作用；③父母教养方式与失眠和攻击性之间的关系在不同年龄和性别群组中差异不显著。**结论：**童年期父母教养方式对成年期失眠和攻击性有持久且稳定的影响，并且这种影响持续作用于个体的生命全程。

Remembered parenting styles in childhood and adulthood insomnia and aggression: A cross-sectional study across life span

Qin Qin, Kaixin Xiong, Fulei Geng, Lan Zhang*

School of Psychology, Jiangxi Normal University, Nanchang, China

Corresponding author: Lan Zhang, School of Psychology, Jiangxi Normal University, 99 Ziyang Ave, Nanchang, Jiangxi 330022, China

***Abstract*：Background:** Detrimental parenting styles with overprotection, lack of warmth and support have been demonstrated to positively associate with conduct problems (such as aggressive behaviors, and suicide and

self-injurious behaviors) and mental disorders (like personality disorders and sleep disorders). Such detrimental parenting styles in childhood predict aggression and bad sleep quality in childhood and early adulthood. Several recent studies suggest that childhood parenting also plays important roles in adulthood mental health. However, studies using life-span design to examine the changes of parenting influences with age are scarce. Theatrically, the effects of childhood parenting may be decline, persistent and stable, or particularly high in later stage of life. This study aimed to test whether childhood parenting styles were associated with insomnia and aggressive behaviors in a sample of Chinese community-dwelling adults and further explore the moderations of age and sex. **Methods:** Data are from a cohort study of intergenerational transmission of psychopathology. Participants were 4462 adults (mean age = 37.75 years, SD = 7.61, range from 18 to 81) who completed self-report questionnaires that measuring maternal and paternal parenting styles, insomnia and aggressive behaviors. Among them, there were 1460 male and 3002 female which occupied 32.7% and 67.3% of the total sample separately. Structural equation model (SEM) was performed to examine our hypothesis. **Results:** Correlation analyses showed that parental warmth were negatively related to aggression and insomnia, and that parental rejection and overprotection were positively related to aggression and insomnia. When different parental styles were modeled together, SEMs found that parental rejection have direct influence on aggression but not insomnia and that the effects of parental warmth and overprotection on aggression were totally mediated by insomnia. Multi-group comparisons suggested that the relationships of parenting styles, insomnia, and aggression were similar across age and sex groups. **Conclusions:** Childhood parenting styles have persistent and stable influences on adulthood insomnia and aggressive behaviors across the whole life stages, but the effects may somewhat vary in different parenting styles. It indicates that early detection of detrimental parenting practices and then appropriately intervening can significantly help children foster good behaviors and sleep habits, finally altering the trajectories of their lives. This study reinforces the importance of parenting styles in improving population health and well-being.

摘 要 诚实守信是中华民族的传统美德，也是现行道德教育体系的核心内容之一，因此探寻如何促进儿童的诚实行为具有重要的意义。讲道德故事是被大众广泛应用、教导儿童诚实途径之一，但目前关于道德故事是否能够有效促进幼儿的诚实行为的实证证据较少，并且已有的研究结果也存在不一致。针对这一问题，本研究拟通过两个实验研究考察道德故事对幼儿诚实行为的影响。

实验 1 选取 108 名学前儿童参与实验（M = 5.82 岁 , range = 4.96-6.73 岁），采取抵制诱惑范式测量儿童的诚实行为。结果发现，积极的道德故事（例如主人公诚实并得到表扬）相比控制条件能显著促进儿童的诚实行为，而消极道德故事（例如主人公说谎并受到惩罚）不能有效地促进儿童的诚实行为。实验 1 表明了积极的道德故事能有效地促进儿童的诚实行为。实验 2 在实验 1 的基础上继续考察道德故事促进幼儿诚实行为的长期效应。选取四个中班的小朋友 74 名（M = 5.52 岁 , range = 4.93-6.53 岁）随机分配到积极道德故事组和控制组。其中积极道德故事组实施为期 3 周每周一节的积极道德故事课程，而控制组的被试参加其他故事课程。同样采用抵制诱惑范式来测量儿童的诚实水平。结果发现，积极道德故事组的儿童相

比控制组的诚实水平显著上升。这些研究结果表明给幼儿讲积极道德故事对其诚实水平的促进具有即时和长期的效应。

3 Hangzhou Normal University, Hangzhou, 311121, E-mail：liyangsai@hznu.edu.cn

Abstract：Honesty and trustworthiness are traditional virtues of the Chinese nation and one of the core contents of the current moral education system. Therefore, exploring how to promote children's honest behavior is of great significance. Telling moral stories is one of the widely used ways to teach children honesty, but there is currently limited empirical evidence on whether moral stories can effectively promote children's honest behavior, and existing research results are inconsistent. In response to this issue, this study aims to investigate the impact of moral stories on children's honest behavior through two experimental studies.

Experiment 1 selected 108 preschool children (M=5.82 years old, range=4.96-6.73 years old) to participate in the experiment, and used the anti temptation paradigm to measure children's honest behavior. The results showed that positive moral stories (such as the protagonist being honest and praised) significantly promoted children's honest behavior compared to control conditions, while negative moral stories (such as the protagonist lying and being punished) did not effectively promote children's honest behavior. Experiment 1 shows that positive moral stories can effectively promote children's honest behavior. On the basis of Experiment 1, Experiment 2 continued to examine the long-term effect of moral stories on promoting honest behavior in young children. 74 children from four middle classes (M=5.52 years old, range=4.93-6.53 years old) were randomly assigned to the positive moral story group and the control group. The positive moral story group implemented a 3-week weekly positive moral story course, while the control group participants participated in other story courses. Similarly, the anti temptation paradigm is used to measure children's level of honesty. The results showed that the children in the positive moral story group had a significant increase in their level of honesty compared to the control group. These research results indicate that telling positive moral stories to young children has both immediate and long-term effects on their level of honesty.

Keywords：Positive moral stories, negative moral stories, honest behavior, resisting temptation paradigms

探索基于智能手机的酒精使用数字干预小程序在解决中国本土饮酒者戒酒困难中的作用：一项混合方法研究

唐瑀蓁[1]　杜江[1]（通讯作者）　张大鹏[2]　吴萧俊[1]　龙艳[1]　张蕾[1]　陈天真[1]

1 上海交通大学医学院附属精神卫生中心，上海，200030，Dujiangdou@163.com

2 安徽医科大学精神卫生与心理学系，安徽合肥，230032

摘 要 **背景：**第三次科技革命后，融合数字技术与心理疾病的研究在近年来逐渐成为热点，国外的随机对照试验已证实数字干预能有效减少问题性饮酒。中国有着特殊的“酒文化”，影响人们对酒的态度，相关研究较少。本研究则旨在探索酒精使用数字干预本土化小程序应具备的主要特征，以解决本地饮酒者戒酒的困难，进而为酒精使用障碍患者的长期康复管理提供一种有前景的手段。本研究采用混合方法在中国文化背景下探讨：(a)本土饮酒者在戒酒过程中可能会遇到哪些困难，哪些困难的影响更大；(b)一个酒精使用数字干预小程序应该具有哪些功能，哪些功能更有必要；(c)哪些因素可能影响饮酒者使用小程序。**方法：**自评定量问卷招募了三组参与者，89 名饮酒者，67 名饮酒者亲属和 30 名成瘾领域医务人员，调查收集包括人口学特征、戒酒经历、戒酒态度以及对数字干预酒精使用小程序的态度。焦点小组质性访谈调查了 36 名参与者对两个核心主题的看法，即(a)在戒酒过程中可能遇到的困难以及(b)对数字饮酒干预小程序功能的期望，包括 21 名饮酒者，4 名饮酒者亲属，以及成瘾领域医务人员 11 名。**结果：**结合定量研究和定性研究的结果，本地饮酒者在戒酒过程中最大的困难是：(a)来自内部的强烈渴求，(b)环境的影响，(c)心理健康状态。相应地，最期望酒精使用数字干预小程序具备的主要功能是：(a)每日跟踪饮酒情况和渴求程度，(b)可以与他人分享的定期反馈报告，(c)情绪改善训练。此外，影响本土饮酒者使用工具意愿的首要因素是：(a)工具是否有效，(b)使用体验是否良好，(c)工具能否补充目前酒精治疗的不足。**讨论：**未来的工作需要平衡患者的需求和外界他人的期望，以便中国文化背景下的潜在用户能更多地从数字干预工具中获益。

Exploring the functions of a smartphone-based digital alcohol consumption intervention mini-program to address the difficulties of abstinence for native drinkers in China: a mixed methods approach

TANG Yuzhen[1], DU Jiang[1]*, ZHANG Dapeng[2], WU Xiaojun[1], LONG Yan[1], ZHANG Lei[1], CHEN Tianzhen[1]

(1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, 200030, China, Dujiangdou@163.com; 2. Department of Mental Health and Psychological Science, Anhui Medical University, Hefei, 230032, China)

***Abstract*：** **Background:** Integrating digital technology into mental diseases has become a hot research topic in recent years with the third revolution of science and technology. Digital interventions for reducing problematic drinking have been proven to be effective by randomized controlled trials (RCTs). Chinese Wine Culture influences people’s attitudes toward alcohol, and less research has been done there in China. The current study focuses on exploring the main features of a localized digital alcohol consumption intervention mini-program to address the difficulties of abstinence for native drinkers, as a promising way for long-term management of rehabilitation from alcohol use disorder. The research uses mixed methods to explore in the context of Chinese culture, (a) what difficulties a drinker might encounter during abstinence, which ones have bigger impacts, (b) what functions a digital alcohol consumption intervention mini-program should have, which ones are more necessary, and (c) what factors might influence drinkers’ use of the mini-program, how do they determine the details of the design. **Methods:** Three groups of participants (89 drinkers, 67 relatives of drinkers, and 30 addiction healthcare professionals) were recruited using a self-rating quantitative questionnaire. The quantitative study investigated demographic characteristics, previous abstinence experience, perspectives on abstinence, and perspectives on digital alcohol consumption intervention mini-program. The focus group qualitative interview

inspected 36 participants' perspectives on the core topics, including 21 drinkers, 4 drinkers' relatives, and 11 medical staff. The interview covered seven open questions around two core topics: (a) the difficulties one might have during abstinence and (b) the expectations for functions of digital alcohol consumption intervention mini-program. **Results:** Combining the results from the quantitative study and qualitative study, the top difficulties of abstinence for native drinkers are (a) the strong craving from the inside, (b) the environmental influence, and (c) the psychological states. Correspondingly, the most desired main features in an alcohol consumption digital intervention tool are (a) the daily track of drinking conditions and craving level, (b) periodic feedback reports that can share with others, and (c) mood improvement training. Moreover, the top factors that influence participants' intention to use/recommend the tool are (a) whether the tool is effective, (b) whether the user experience is good, and (c) whether the tool can replenish the deficiency of the current alcohol treatment. **Discussion:** Future work needs to balance what patients want and what the world expects so that potential users can benefit best from the digital intervention tool in the context of Chinese culture.

丧子中老年人抑郁现状及影响因素的性别差异研究

王越[1]　陈晴[1]　刘鲁蓉[2]（通讯作者）

1 成都中医药大学管理学院，成都，611137

2 成都中医药大学基础医学院，成都，611137，liulurong68@163.com

摘 要　背景：中国传统文化中，子女在家庭扮演着重要的角色，为父母提供情感与物质上的支持，履行赡养义务。由于我国人口基数大，虽仅有少数人群经历过丧子，但其数量仍是巨大的，预计到 2035 年我国将有 1000 万个丧子家庭。丧子会引发负面情绪反应，从而影响个体心理健康，丧子女性抑郁的发生率普遍高于男性，但是尚缺乏对抑郁性别差异特征及差异影响因素的进一步探究，且目前国内关于丧子中老年人抑郁的相关研究较少。目的：分析我国丧子中老年人的抑郁现状及其影响因素，并进行性别差异比较，为降低丧子中老年人抑郁发生率和促进健康老龄化提供参考依据。方法：采用 2018 年中国健康与养老追踪调查（China Health and Retirement Longitudinal Study，CHARLS）数据，剔除非丧子者以及变量有缺失值的数据，纳入 1032 名丧子中老年人作为研究对象，运用χ^2 检验和二元 logistic 回归分析不同性别丧子中老年人抑郁状况及影响因素的差异。结果：（1）丧子中老年人抑郁发生率较高（49.1%），相较于男性，女性丧子中老年人抑郁发生率更高（39.7%vs56.7%，χ^2=29.656，P<0.001）；（2）自评健康状况不好、躯体生活自理能力（Basic Activities of Daily Living，BADL）受损、睡眠时间过短是男女丧子中老年人抑郁的共同危险因素；（3）工具性日常生活活动能力（Instrumental Activities of Daily Living，IADL）受损（OR=1.696，95%CI：1.120~2.569）是女性丧子中老年人抑郁特有的危险因素，年龄≥75 岁（OR=0.286，95%CI：0.161~0.507）是女性丧子中老年人抑郁特有的保护因素。结论：我国丧子中老年人的抑郁发生率较高，抑郁发生率及影响因素存在着明显的性别差异，女性丧子中老年人的抑郁发生率更高，且影响因素更复杂，应为不同性别的丧子中老年人提供有针对性的和可持续的心理和社会支持服务。

Gender difference of depression status and influencing factors among middle-aged and elderly people of child bereavement

Wang Yue[1], Chen Qing[1], LIU Lurong[2]（corresponding author）

1 School of Management, Chengdu University of Traditional Chinese Medicine, Chengdu, 611137
2 School of Basic Medical Sciences, Chengdu University of Traditional Chinese Medicine, Chengdu,611137

Abstract：Background: In traditional Chinese culture, children play an important role in the family, providing emotional and material support to parents and fulfilling their obligations of support. Due to the large population base in China, although only a small number of people have experienced bereavement, the number is still huge, and it is expected that by 2035, there will be 10 million bereaved families in China. Childlessness can trigger negative emotional reactions, thereby affecting individual mental health. The incidence of depression in women with childlessness is generally higher than that in men. However, there is still a lack of further exploration of gender differences in the characteristics and influencing factors of depression, and there is currently little research on depression in middle-aged and elderly people with childlessness in China. Objective: To analyze the current situation and influencing factors of depression among middle-aged and elderly people who have lost their children in China, and compare gender differences, in order to provide reference for reducing the incidence of depression among middle-aged and elderly people who have lost their children and promoting healthy aging. Method: Using the 2018 China Health and Retirement Longitudinal Study (CHARLS) data, excluding non bereaved individuals and data with missing variables, 1032 middle-aged and elderly bereaved individuals were included as the study subjects χ^2-test and binary logistic regression analysis were used to investigate the differences in depression status and influencing factors among middle-aged and elderly people who lost their children of different genders. Result: (1) The incidence of depression in middle-aged and elderly people who have lost their children is higher (49.1%), and compared to men, the incidence of depression in middle-aged and elderly people who have lost their children in women is higher (39.7%vs56.7%, χ^2=29.656, P<0.001); (2) Poor self rated health status, impaired BADL, and short sleep time are common risk factors for depression in middle-aged and elderly men and women who have lost their children; (3) Impaired IADL (OR=1.696, 95%CI: 1.120~2.569) is a unique risk factor for depression in middle-aged and elderly women who have lost their children, and age ≥ 75 years old (OR=0.286, 95%CI: 0.161~0.507) is a unique protective factor for depression in middle-aged and elderly women who have lost their children. Conclusion: The incidence of depression among middle-aged and elderly people who have lost their children in China is relatively high, and there are significant gender differences in the incidence and influencing factors of depression. Female middle-aged and elderly people who have lost their children have a higher incidence of depression, and the influencing factors are more complex. Targeted and sustainable psychological and social support services should be provided for middle-aged and elderly people who have lost their children of different genders.

同伴依恋对高中生性适应的影响：学校归属感与自尊的链式中介作用

兰婷[1]　王挺[1]　（通讯作者）
1 江西中医药大学，南昌，330031，
2 江西中医药大学人文学院，南昌，330031，125323611@qq.com

摘 要　目的：考察同伴依恋、学校归属感、自尊与高中生性适应之间的关系，并探讨学校归属感与自尊在同伴依恋与性适应间的中介作用。方法：采用方便取样的方法，使用青少年同伴依恋量表、性适应量表、学校归属感量表以及自尊量表作为测量工具对 1492 名高中生进行数据调查，通过 SPSS27.0 和

PROCESS4.1 插件对数据进行处理和分析。结果：（1）同伴依恋与性适应、学校归属感和自尊均呈显著正相关（r=0.27、0.44、0.41，p＜0.001）;性适应与学校归属感和自尊均呈显著正相关（r=0.30、0.30，p＜0.001）;学校归属感和自尊呈显著正相关（r=0.49，p＜0.001）。（2）同伴依恋正向预测性适应。（3）学校归属感在同伴依恋与性适应之间起中介作用（95%CI=[0.019,0.046],中介作用显著，中介效应值 0.033）；自尊在同伴依恋与性适应之间起中介作用（95%CI=[0.010,0.026],中介作用显著，中介效应值 0.017）。（4）学校归属感和自尊在同伴依恋与性适应之间起链式中介作用（95%CI=[0.007,0.018],中介作用显著，中介效应值 0.012）。结论：同伴依恋对性适应具有正向预测作用;同伴依恋分别通过学校归属感和自尊的单独中介作用预测高中生性适应能力，也能通过学校归属感和自尊的链式中介作用间接预测高中生性适应能力。

The effect of peer attachment on sexual adjustment in high school: the chain mediating role of school belonging and self-esteem

LAN Ting　WANG Ting
Jiangxi University of Traditional Chinese Medicine，Nanchang，330031
School of Humanities, Jiangxi University of Chinese Medicine，Nanchang，330031

Abstract：Objective: To investigate the relationship between peer attachment, school belonging, self-esteem and sexual adjustment in high school, and to explore the mediating effect of school belonging and self-esteem on peer attachment and sexual adjustment. Methods: The data of 1492 high school students were investigated by using adolescent peer attachment scale, Sexual adjustment Scale, school belonging scale and self-esteem scale as measuring tools. The data were processed and analyzed by SPSS27.0 and PROCESS4.1. Results: (1) Peer attachment was positively correlated with sexual adaptation, school belonging and self-esteem (r=0.27, 0.44, 0.41, p < 0.001)；Sexual adaptation was positively correlated with school belonging and self-esteem (r=0.30, 0.30, p < 0.001)；There was a significant positive correlation between school belonging and self-esteem (r=0.49, p < 0.001). (2) Positive predictive adaptation of peer attachment. (3) School belonging played a mediating role between peer attachment and sexual adaptation (95%CI=[0.019,0.046], significant mediating role, mediating effect size 0.033);Self-esteem played a mediating role between peer attachment and sexual adaptation (95%CI=[0.010,0.026], significant mediating role, mediating effect size 0.017). (4) School belonging and self-esteem played a chain mediating role between peer attachment and sexual adaptation (95%CI=[0.007,0.018], significant mediating role, mediating effect size 0.012). Conclusion: Peer attachment has positive predictive effect on sexual adaptation；Peer attachment can predict high school adaptive ability through the mediating effects of school belonging and self-esteem separately, and can also predict high school adaptive ability indirectly through the mediating effects of school belonging and self-esteem.

网络使用动机对青少年网络成瘾的影响：同伴关系及家庭教育模式研究

杜青雨 [1]　王挺 [1] (通讯作者) E-mail：125323611@qq.com

1. 江西中医药大学人文学院，南昌， 330031

摘 要　网络成瘾会对中学生的生理、心理及社会适应问题产生严重影响，随着移动互联网技术的快速发展，多媒体工具和对网络的使用同样影响着中学生的日常学习和生活。然而，网络使用动机对网络成瘾的影响机制还有待深入探究。目的：本研究拟构建一个多重中介模型，以检验父母教养方式与同伴关系在网络使用动机与网络成瘾之间的中介作用。方法：采用网络使用动机问卷、网络成瘾量表、同伴关系量表及简式父母教养方式量表进行测试，以 340 名中学生为被试，通过 SPSS25.0 和 PROCESS4.0 插件对数据进行处理和分析，考察网络使用动机与网络成瘾的关系。结果表明：（1）193 名（56.8%）中学生最常使用沟通交流类的网络社群，其次是学习类 83 名（24.4%），休闲娱乐类 40 名（11.8%）；（2）网络使用动机可以显著正向预测网络成瘾，同伴关系和父母消极教养方式可以显著正向预测网络成瘾，父母积极教养方式可以显著负向预测网络成瘾；（3）同伴关系在网络使用动机对网络成瘾的影响间起中介作用，父母积极教养方式在网络使用动机对网络成瘾的影响间起中介作用，父母消极教养方式在网络使用动机对网络成瘾的影响间起中介作用；（4）父母消极教养方式和同伴关系在网络使用动机对网络成瘾的影响间起链式中介作用。结论：研究启示家庭教育中父母应采用积极的教养方式，建立温暖的家庭氛围，引导孩子积极正向的网络使用动机以及正确的同伴交往，对预防网络成瘾具有一定干预作用。

The influence of Internet use motivation on adolescent Internet addiction: a study of peer relationship and family education model

Du QingYu [1]　　Wang Ting [1](corresponding author)E-mail：125323611@qq.com

1. School of Humanities, Jiangxi University of Traditional Chinese Medicine, Nanchang, city, China, 330031

Abstract：Internet addiction will have a serious impact on the physiological, psychological and social adaptation problems of middle school students. With the rapid development of mobile Internet technology, multimedia tools and the use of the Internet also affect the daily learning and life of middle school students.However, the mechanism of the influence of Internet use motivation on Internet addiction remains to be further explored.Objective: This study aims to construct a multi-mediating model to examine the mediating role of parenting style and peer relationship between Internet use motivation and Internet addiction.Methods: Using the questionnaire of Internet use motivation, Internet addiction Scale, peer relationship scale and simplified parenting style scale, 340 middle school students were taken as subjects, and the data were processed and analyzed by SPSS25.0 and PROCESS4.0 plug-ins to investigate the relationship between Internet use motivation and Internet addiction.The results showed that: (1) 193 middle school students (56.8%) most often used communication online community, followed by 83 students (24.4%) in learning, 40 students (11.8%) in leisure and entertainment;(2) Internet use motivation can significantly positively predict Internet addiction, peer relationship and negative parenting style can significantly positively predict Internet addiction, and positive parenting style can significantly negatively predict Internet addiction;(3) Peer relationship plays a mediating role in the influence of Internet use motivation on Internet addiction, positive parenting style plays a mediating role in the influence of Internet use motivation on Internet addiction, and negative parenting style plays a mediating role in the influence of Internet use motivation on Internet addiction;(4) Parents' negative parenting style and peer relationship play a chain mediating role in the influence of Internet use motivation on Internet addiction.Conclusion: The study suggests that parents should adopt positive parenting style, establish warm family atmosphere, guide children's positive motivation of using the Internet and correct peer communication in family education, which has a certain intervention effect on the prevention of Internet addiction.

工作重塑与乡村教师工作投入的关系：有调节的链式中介模型

安伯森[1]　孙思玉[1]（通讯作者）
1 天津职业技术师范大学职业教育学院，天津，300222

摘 要　工作投入是一种积极的情感和被激励的状态, 即个体充满能量、高度奉献、并且沉浸于工作中。工作投入不仅会影响工作行为的稳定性，而且对职业认同和职业生涯发展有着重要的意义。高工作投入的个体总是全力以赴地投入工作，进而提升组织的整体效能和影响力。工作重塑、工作获得感、工作满意度和职业使命感是工作投入的重要影响因素，然而在乡村教师群体中，这五者关系尚不明确。为了探究工作重塑对乡村教师工作投入的作用机制，本研究结合了有调节的链式中介模型统计分析方法，采用问卷法对657 名乡村教师的工作重塑、工作获得感、工作满意度和职业使命感以及工作投入进行研究。结果发现: (1) 工作重塑对工作投入具有显著的正向预测作用; (2) 工作获得感和工作满意度在工作重塑和工作投入间起独立中介作用，工作获得感和工作满意度在其间发挥链式中介作用; (3) 职业使命感能够调节工作重塑对工作投入的影响，职业使命感能够调节工作获得感对工作满意度的影响，同时，对具有高职业使命感的乡村教师而言，工作获得感和工作满意度的链式中介作用更强。本研究揭示了乡村教师工作投入的产生机制，可以通过增强工作重塑、工作获得感和工作满意度的方式来提升乡村教师的工作投入水平，同时较高的职业使命感，也有利于提高乡村教师的工作投入水平。

The relationship between job reshaping and rural teachers' work engagement: a moderated chain mediation model

An Bosen[1]　Sun Siyu[1]
Tianjin University of Technology and Education, Tianjin, 300222

Abstract：Work engagement is a positive emotional and motivational state in which an individual is energized, highly committed, and immersed in his or her job engagement not only affects the stability of work behavior, but also has important implications for professional identity and career development. Individuals who are highly engaged in their work are always fully committed to their work, which in turn enhances the overall effectiveness and impact of the organization. Job reshaping, job acquisition, job satisfaction and sense of professional mission are important influences on job engagement, however, the relationship between these five is not clear in the rural teacher group. In order to investigate the mechanism of job remodeling on rural teachers' work engagement, this study combined the statistical analysis method of moderated chain mediation model and used the questionnaire method to study 657 rural teachers' job remodeling, job access, job satisfaction and sense of professional mission, as well as work engagement. The results found that: (1) job remodeling has a significant positive predictive effect on job engagement; (2) the sense of job acquisition and job satisfaction play independent mediating roles between job remodeling and job engagement, and the sense of job acquisition and job satisfaction play chain mediating roles between them; (3) the sense of vocational mission can modulate the effect of job remodeling on job engagement, and the sense of vocational mission can modulate the effect of the sense of job acquisition on job satisfaction; at the same time, the sense of job acquisition can modulate the effect of the sense of job satisfaction on job engagement for rural teachers with a high level of job satisfaction. Meanwhile, for rural teachers with a high

sense of professional mission, the chain mediating role of job acquisition and job satisfaction is stronger. This study reveals the generating mechanism of rural teachers' work engagement, which can enhance the level of rural teachers' work engagement through the enhancement of job remodeling, job acquisition and job satisfaction, while a higher sense of professional mission is also conducive to the enhancement of rural teachers' work engagement.
Keywords Job reshaping, sense of gain at work, job satisfaction, sense of professional mission, work engagement

24h 动作行为对学龄前儿童社会情感能力影响的等时替代效益研究

徐秦豫[1] 张士臣[1] 朱昭红[2] （通讯作者）毛俊茜[1] 陈圆圆[1]
1 西安体育学院研究生部，西安，710000
2 西安体育学院运动与健康科学学院，西安，710000，1341680896@qq.com

摘 要 社会情感能力是个体适应社会的一个重要指标，前人研究证明 24h 动作行为中身体活动，久坐行为和睡眠均是影响社会情感能力的重要因素。然而 24h 动作行为对社会情感能力的综合效应如何在学龄前阶段发生发展，目前尚不明晰。本研究使用问卷测量探究学龄前儿童 24h 动作行为对社会情感能力的影响。研究 1 翻译并修订适合我国学龄前儿童社会情感能力的问卷。选取 Howard 等人（2016）编制的学龄前儿童社会情感能力问卷进行翻译，回译并进行文化调适后发放 820 份问卷，采用 SPSS26.0 和 AMOS26.0 软件分析数据，进行信效度检验。结果：修订后的学龄前儿童社会情感能力问卷具有良好的信效度，可适用于我国学龄前儿童的社会情感能力的测量，并可用于本研究的后续分析。研究 2 采用修订后的问卷测量学龄前儿童（n=80）社会情感能力，采用学龄前儿童体力活动特征及影响因素调查问卷和儿童休闲活动调整问卷测量学龄前儿童的 24h 动作行为情况。结果发现：（1）相关分析结果表明，中等强度身体活动（moderate physical activity，MPA）、高等强度身体活动（vigorous physical activity，VPA）和睡眠（sleep duration，SLP）与人际交往技能，自我调节呈正相关，低等强度身体活动（light physical activity，LPA）和久坐行为（sedentary behavior，SB）与人际交往技能,自我调节呈负相关；SB 与情绪认知,外化问题呈正相关，LPA 与情绪认知,外化问题呈负相关；LPA 与社会适应维度呈负相关;（2）在 10 分钟的等时替代模型中，用 MPA 和 VPA 替代 SB 能使人际交往技能显著增加 0.24-0.35 个单位，用 LPA 替代 SLP 能使人际交往技能显著降低 0.08 个单位，用 MPA 和 VPA 替代 SLP 能使人际交往技能显著增加 0.20-0.31 个单位；用 LPA 和 VPA 替代 SB 能使情绪认知显著降低 0.14-0.18 个单位，用 LPA 替代 SLP 能使情绪认知显著降低 0.08 个单位；用 LPA,MPA,VPA 和 SLP 替代 SB 能使外化问题显著降低 0.39-0.70 个单位，用 LPA 替代 SLP 能使外化问题显著降低 0.31 个单位，用 SB 替代 SLP 能使外化问题显著增加 0.39 个单位。结论：在学龄前阶段，社会情感能力受到 24h 动作行为的影响，且这一影响因动作行为的不同组合而产生不同。

Isochronous substitution effect of 24h movement behavior on preschool children's social-emotional ability

Xu Qinyu[1]Zhang Shichen[1] Zhu Zhaohong[2]（Correspondence author）Mao Junxi[1] Chen Yuanyuan[1]
1 Graduate School, Xi'an Physical Education University, Xi'an, 710000
2 School of Exercise and Health Sciences, Xi'an Physical Education University, Xi'an, 710000

Abstract： Social-emotional ability serves as a crucial indicator of social adaptation. Prior investigations have established the significant impact of physical activity, sedentary behavior, and sleep on the 24-hour movement patterns, influencing social-emotional ability. However, the developmental trajectory of how the combined effects

of 24-hour movement behavior influence social-emotional ability during the preschool years remains unclear. To address this gap, the present study employed a questionnaire to assess the impact of 24-hour movement behavior on social-emotional ability in preschool children. In study 1 involved the translation and refinement of a questionnaire suitable for assessing the social-emotional ability of Chinese preschoolers. The questionnaire compiled by Howard et al. (2016) pertaining to the social-emotional ability of preschool children was selected for translation. Following the translation and cultural adaptation process, 820 questionnaires were distributed. Results: The refined questionnaire demonstrated favorable reliability and validity, enabling its utilization in assessing the social-emotional ability of preschool children in China, and for subsequent analysis in this study. In study 2, the revised questionnaire was employed to measure the social-emotional ability of a sample of preschool children (n=80), while the physical activity characteristics, factors influencing preschool children, and the Adjusted Leisure Activities Questionnaire were utilized to evaluate the 24-hour movement behavior of the preschoolers. The findings indicated the following: (1) Correlation analyses revealed that moderate physical activity (MPA), vigorous physical activity (VPA), and sleep duration (SLP) exhibited positive associations with interpersonal skills and self-regulation. Conversely, light physical activity (LPA) and sedentary behavior (SB) displayed negative associations with interpersonal skills and self-regulation. Furthermore, SB demonstrated positive associations with emotional cognition and externalization problems, whereas LPA displayed negative associations with emotional cognition and externalization problems. Lastly, LPA exhibited negative associations with the Social adaptation dimension.(2) Within the 10-minute isochronous substitution model, the replacement of sedentary behavior (SB) with moderate physical activity (MPA) and vigorous physical activity (VPA) yields a notable increase in interpersonal skills, ranging from 0.24 to 0.35 units. Conversely, substituting sleep duration (SLP) with light physical activity (LPA) leads to a significant decrease in interpersonal skills by 0.08 units. Replacing SLP with MPA and VPA results in a substantial improvement in interpersonal skills, ranging from 0.20 to 0.31 units. Moreover, the substitution of SB with LPA and VPA significantly reduces emotional cognitionby 0.14 to 0.18 units, while replacing SLP with LPA leads to a significant reduction of 0.08 units in emotional cognition. Substituting SB with LPA, MPA, VPA, and SLP leads to a considerable decrease in externalization problems by 0.39 to 0.70 units, and replacing SLP with LPA results in a reduction of 0.31 units in externalization problems. Conversely, replacing SLP with SB significantly increases externalization problems by 0.39 units. In conclusion, during the preschool years, social-emotional ability is influenced by 24-hour motor behavior, with the specific effects varying based on different combinations of motor behavior.

错失恐惧对大学生社交网络成瘾倾向的影响

刘珂彤[1] 张士臣[1] 李靖[2]（通讯作者）

1 西安体育学院研究生部，西安，710000

2 西安体育学院运动与健康科学学院，西安，710000，870073988@qq.com

摘 要 随着互联网的发展，越来越多的大学生在日常学习生活中通过 QQ、微信、微博等社交网络软件进行交流，丰富、便利了生活和学习，但是一部分大学生也会出现过度使用社交网络的情况，引发社交网络成瘾倾向等问题，并在一定程度上影响其心理健康和学业成绩。根据认知－行为模型，个体的非适应性认知是影响物质成瘾的核心因素。而作为一种非适应性认知，错失恐惧是指个体因担心错失他人的新奇经历或正性事件而产生的一种弥散性焦虑，容易导致个体在特定情况中出现偏差行为。因此本研究采用错失恐惧量表、大学生社交网络成瘾倾向量表，对 538 名大学生进行调查，拟考察错失恐惧与大学生社交网站

成瘾之间的关系。结果表明：（1）男生的错失恐惧和社交网络成瘾倾向显著低于女生，高年级学生的错失恐惧显著高于低年级学生的错失恐惧，且随着每天使用社交软件时长的增加，大学生的错失恐惧和社交网络成瘾倾向也在显著增加；（2）大学生的错失恐惧与其社交网络成瘾倾向呈显著正相关；（3）在控制性别、年级、使用社交软件时长等协变量之后，错失恐惧能够显著正向的预测大学生的社交网络成瘾倾向。结论：本研究证实了错失恐惧能够导致大学生社交网络成瘾倾向的产生，同时检验了错失恐惧和社交网络成瘾倾向在性别、年级和社交软件使用时长等人口学变量上的差异，为对社交网络成瘾倾向易感群体进行有效的预防和控制提供了理论和实践启示。

The influence of fear of missing out on college students' social network addiction tendency

Liu Ketong[1] Zhang Shichen[1] Li Jing[2]（Correspondence author）
1 Graduate School, Xi'an Physical Education University, Xi'an, 710000
2 School of Exercise and Health Sciences, Xi'an Physical Education University, Xi'an, 710000

Abstract：With the development of the Internet, more and more college students use social network software such as QQ, wechat and Weibo to communicate with each other in their daily study and life, enriching and facilitating their life and study. However, some college students may overuse social networks, leading to problems such as social network addiction, and affecting their mental health and academic performance to a certain extent. According to the cognitive-behavior model, the non-adaptive cognition of individuals is the core factor affecting substance addiction. As a kind of non-adaptive cognition, the fear of missing out is a kind of diffuse anxiety caused by the fear of missing the novel experience or positive event of others, which can easily lead to deviant behaviors in specific situations. Therefore, this study used the Fear of Missing out scale and the social network Addiction Tendency Scale of college students to investigate the relationship between fear of missing out and addiction of college students to social network websites. The results show that: (1) Male students have significantly lower fear of missing out and social network addiction tendency than female students, senior students have significantly higher fear of missing out than junior students, and with the increase of daily use of social software, college students' fear of missing out and social network addiction tendency also increase significantly; (2) There is a significant positive correlation between college students' fear of missing out and their tendency of social network addiction; (3) After controlling for covariates such as gender, grade and duration of using social software, the fear of missing out can significantly and positively predict college students' tendency of social network addiction. Conclusion: This study confirmed that the fear of missing out can lead to the emergence of college students' social network addiction tendency, and examined the differences between the fear of missing out and social network addiction tendency in demographic variables such as gender, grade and social software use time, providing theoretical and practical enlightenment for effective prevention and control of social network addiction tendency susceptible groups.

儿童期情感忽视对冰毒依赖女性复吸倾向的影响
—冲动性和生活质量的链式中介作用

侯思敏[1] 何伊柔[1] 景璐石[1] 代彤[2] 吴昱锡[2]
[1]成都医学院心理学院，四川成都，610500
[2]四川省女子强制隔离戒毒所，四川德阳，618000
通讯作者：景璐石 fengjingqianhui@163.com

摘 要 目的:探讨儿童期情感忽视对冰毒依赖女性复吸倾向的影响以及冲动性和生命质量在其中的链式中介作用。方法：在四川省某女子强制隔离戒毒所选取冰毒依赖青年女性 160 名，采用儿童期虐待量表、巴瑞特冲动性量表 BIS-11 中文版问卷、药物成瘾者生命质量测定量表、复吸倾向问卷进行横断面调查。运用 SPSS21.0 进行共同方法偏差检验、Pearson 相关分析,采用 PROCESS 3.4 宏程序进行中介效应检验。结果：（1）冰毒依赖女性儿童期情感忽视、冲动性、生命质量和复吸倾向两两之间存在显著相关，儿童期情感忽视与复吸倾向（r= 0.174,P<0. 05）、冲动性（ r=0.223,P<0. 01）均呈正相关，与生命质量（r=-0.208,P<0.01）呈负相关；冲动性与生命质量（r=-0.519，p<0.01）呈负相关,冲动性与复吸倾向（r=0.396，p<0.01）呈正相关；生命质量与复吸倾向（r=-0.362，p<0.01）呈负相关。（2）冲动性在冰毒依赖女性儿童期情感忽视与复吸倾向间起部分中介作用，效应值 0.094（95%CI＝0.028~0.189），生命质量在冰毒依赖女性儿童期情感忽视和复吸倾向之间中介效应不显著；冲动性和生命质量在儿童期情感忽视与复吸倾向间起链式中介作用，效应值为 0. 031（95%CI=-0.014~0.095），分别占总间接效应（效应值= 0.160）的 58.75%、19.37%。结论：儿童期情感忽视可以正向预测冰毒依赖女性的复吸倾向,也可以通过冲动性与生命质量的链式中介作用间接影响其复吸倾向。

The effect of childhood emotional neglect on the propensity to relapse in methamphetamine-dependent women

-Chain mediation of impulsivity and quality of life

Hou Simin[1] He Yirou[1] Jing Lushi[1] Dai Tong[2] Wu Yuxi[2]
[1]School of Psychology, Chengdu Medical College, Chengdu, Sichuan 610500, China
[2]Sichuan Women's Compulsory Isolation Drug Rehabilitation Centre, Deyang, Sichuan 618000, China
Corresponding author:Jing Lushi,fengjingqianhui@163.com

Abstract: Objective:To explore the effects of childhood emotional neglect on methamphetamine-dependent women's tendency to relapse and the chain-mediated roles of impulsivity and quality of life in this context. Methods:160 methamphetamine-dependent young women were selected from a women's compulsory isolation drug rehabilitation centre in Sichuan province, and a cross-sectional survey was conducted using the Childhood Abuse Scale, the Chinese version of the Barrett Impulsivity Scale BIS-11 questionnaire, the Quality of Life Measurement Scale for Drug Addicts, and the Questionnaire on the Propensity to Relapse to Drug Abuse. Common method bias test and Pearson correlation analysis were conducted using SPSS 21.0, and mediation effect test was conducted using PROCESS 3.4 macro program. Results: (1) There were significant correlations between childhood emotional neglect, impulsivity, quality of life and relapse tendency in methamphetamine-dependent females. Childhood emotional neglect was positively correlated with relapse tendency (r= 0.174,P<0. 05) and impulsivity (r=0.223,P<0. 01), and negatively correlated with quality of life (r= -0.208,P<0.01). quality of life (r=-0.519,p<0.01) were negatively correlated, impulsivity was positively correlated with the tendency to relapse

(r=0.396,p<0.01); quality of life was negatively correlated with the tendency to relapse (r=-0.362,p<0.01). (2) Impulsivity partially mediated the relationship between emotional neglect in childhood and relapse propensity in methamphetamine-dependent females, with an effect value of 0.094 (95% CI = 0.028-0.189), and quality of life had a non-significant mediating effect between emotional neglect in childhood and relapse propensity in methamphetamine-dependent females; impulsivity and quality of life chained mediating the relationship between emotional neglect in childhood and relapse propensity, with an effect value of 0 . 031 (95% CI = -0.014 to 0.095), accounting for 58.75% and 19.37% of the total indirect effect (effect value = 0.160), respectively. Conclusion: Emotional neglect in childhood positively predicts relapse tendency among methamphetamine-dependent females, and also indirectly affects their relapse tendency through the chain-mediated effects of impulsivity and quality of life.

空军军医大学军事医学心理学系,西安，710032，fangpeng@fmmu.edu.cn

摘 要　目的：探讨个体心理训练对军校大学生情绪、睡眠及生理的干预效果。方法：选取军校大学生 56 人，采用随机数表法分为干预组和空白对照组，每组 28 人。干预组采取笔者设计的个体 5-5 呼吸训练法进行训练，训练时长每次 12 分钟，做三天休息一天，共训练 4 周，训练时需要录制视频确保完成。空白对照组在 4 周内不做任何干预。比较两组人员干预前后的焦虑自评量表(GAD-7)、抑郁自评量表（PHQ-9）、睡眠指数量表（ISI）、压力知觉量表（CPSS-14）的得分。同时采用美国 biopac 多导（16 道）电生理仪对干预组和空白对照组人员的心率指数、皮温及心率变异性等数值在干预前后进行对比分析。结果：干预 4 周后，干预组焦虑自评量表(GAD-7)、抑郁自评量表（PHQ-9）、睡眠指数量表（ISI）、压力知觉量表（CPSS-14）的得分分别为（0.897±0.433）分、（1.966±0.462）分、（1.345±0.612）分及（27.97±7.858）分，显著低于空白对照组的（2.143±0.440）分、（1.966±0.462）分、（1.345±0.612）分及（30.82±7.958）分，差异均具有统计学意义（P<0.05）。同时，干预组在干预后心率最大值为（87.081±10.650）次/分，显著低于空白对照组（98.416±23.591）次/分；低频高频比 LF/HF 比值为（1.176±1.520），显著低于空白对照组（2.084±2.607），差异均具有统计学意义（P<0.05）。皮温最大值为（91.325±5.286）°F，高于空白对照组皮温最大值为（89.284±2.269）°F，差异边缘显著（P=0.058）。结论：设计的个体 5-5 呼吸训练法简单易行，对于对军校大学生的心理健康有较好的调节作用，在有效降低军校大学生的焦虑、抑郁指数，提升军校大学生睡眠质量，改善压力知觉等方面具有积极意义。

The Intervention Effect of Individual Psychological Training on Emotion, Sleep, and Physiology of Military College Students

ZHANG Yuanbei[1]　PU Zhaojun[1]　YANG Mengyuan[1]　（WU Shengjun[1]　FANG Peng[1]）

[1]Department of Military Medical Psychology, Air Force Medical University, Xi’an 710032

Abstract: Objective: To explore the intervention effect of individual psychological training on emotions, sleep,

and physiology of military college students. Method: 56 military college students were selected and randomly divided into an intervention group and a blank control group using a random number table method, with 28 people in each group. The intervention group adopted the individual 5-5 breathing training method designed by the author for training, with a duration of 12 minutes each time and a three-day rest for a total of 4 weeks. During the training, video recordings are required to ensure completion. The blank control group did not receive any intervention within 4 weeks. Compare the scores of the Self Rating Anxiety Scale (GAD-7), Self Rating Depression Scale (PHQ-9), Sleep Index Scale (ISI), and Stress Perception Scale (CPSS-14) before and after intervention between two groups of personnel. At the same time, the American Biopac multi-channel (16 channel) electrophysiological instrument was used to compare and analyze the values of heart rate index, skin temperature, and heart rate variability between the intervention group and the blank control group before and after the intervention. Result: After 4 weeks of intervention, the scores of GAD-7, PHQ-9, ISI, and CPSS-14 in the intervention group were (0.897 ± 0.433), (1.966 ± 0.462), (1.345 ± 0.612), and (27.97 ± 7.858), respectively, significantly lower than those in the blank control group (2.143 ± 0.440), (1.966 ± 0.462), (1.345 ± 0.612), and (30.82 ± 7.958), The differences were statistically significant (P<0.05). Meanwhile, the maximum heart rate of the intervention group after intervention was (87.081 ± 10.650) beats/min, significantly lower than that of the blank control group (98.416 ± 23.591) beats/min; The LF/HF ratio was (1.176 ± 1.520), significantly lower than the blank control group (2.084 ± 2.607), and the differences were statistically significant (P<0.05). The maximum skin temperature was (91.325 ± 5.286) °F, which was higher than the maximum skin temperature of the blank control group (89.284 ± 2.269) °F, with a significant margin of difference (P=0.058). Conclusion: The designed individual 5-5 breathing training method is simple and feasible, and has a good regulatory effect on the psychological health of military college students. It has positive significance in effectively reducing anxiety and depression index, improving sleep quality, and improving stress perception among military college students.

优势使用对高校教师工作幸福感的影响：基本需求满足的中介作用

魏仓丕 苏佳合 赵晶晶 孔风（通讯作者）

陕西师范大学心理学院，西安，710062，kongfeng87@126.com

摘 要 教师的工作幸福感是衡量教师心理健康的一个重要指标，高的工作幸福感有利于教师更好的投入教学生活。优势使用是积极心理学的一个重要概念，是指人们在工作生活中通过发挥自己的优势来获得成功经验，带来愉快的体验。已经有很多的研究证实优势使用对于工作幸福感的提升具有显著的预测作用，然而，很少有研究探讨教师的优势使用和工作幸福感之间的关系及其潜在的心理机制。自我决定理论认为，基本需求满足是影响幸福感的重要因素，并常被认为是潜在的中介变量。因此本研究旨在探讨教师的优势使用和工作幸福感之间的关系，以及基本需求满足的中介作用。我们招募了 374 名大学教师，请他们填写了一系列问卷，包括优势使用量表、工作中基本需求满足量表、享乐论幸福感量表和实现论幸福感量表。对数据进行描述性统计之后，通过测量模型和结构模型的两步法对得到的数据进行进一步的分析。结果显示，优势使用分别与工作幸福感幸的两个维度（即享乐论幸福感与实现论幸福感）之间存在着正相关。此外，基本需求的满足在优势使用和工作幸福感之间起着中介作用。因此，学校应注重提高教师的优势使用水平，创造优势使用的氛围，让教师更好的发挥自己工作中的优势，以此改善教师的工作幸福感，让教师能够更好的开展教学工作。最后，我们讨论了本研究的局限性和未来研究的前景。

Strengths use and well-being at work among teachers: The mediating role of basic needs satisfaction

Cangpi Wei [1],Jiahe Su [1], Jingjing Zhao [1] and Feng Kong [1]
1 School of Psychology, Shaanxi Normal University, China
School of Psychology, Shaanxi Normal University, Xi'an, 710062, kongfeng87@126.com

Abstract： Teachers' well-being at work is an important indicator of teachers' psychological health, and high well-being at work is conducive to teachers' better engagement in teaching life. Strengths use is an important conception in positive psychology, which refers to the fact that people gain successful experiences and bring pleasant experiences by utilizing their strengths in their working life. There have been many studies confirming the significant predictive effect that strengths use on the enhancement of well-being at work. However, few studies have explored the relationship between teachers' strengths use and well-being at work and its underlying psychological mechanisms. The self-determination theory believed that basic needs satisfaction was an important factor to affect well-being, is often considered as a potential mediating variable. Therefore, this study aimed to explore the relationship between teachers' strengths use and well-being at work and the mediating role of basic needs satisfaction. A total of 374 university teachers were assembled and asked to complete a series of questionnaires, including the Strengths Use Scale, the Basic Needs Satisfaction at Work Scale, the hedonic well-being Scale, and the eudaimonic well-being Scale. After descriptive statistics were performed on the data, the data obtained were further analyzed using a two-step method of measurement model and structural model. The results showed that there was a positive correlation between strengths use and hedonic well-being and eudaimonic well-being, respectively. In addition, the satisfaction of basic needs mediates the relationship between strengths use and well-being at work. Therefore, schools should focus on improving teachers' strengths use and creating an atmosphere of strengths use, so that teachers can better utilize their strengths at work, and in this way, improve their well-being at work, so that they can better carry out their teaching work. Finally, we discuss the limitations of this study and the prospects for future research.

Keywords： Strengths use, well-being at work, basic needs satisfaction, teachers

当代男性气质"脆弱"的条件以及新发展方向

景冰洁
四川师范大学心理学院，成都市，610066

摘 要　男性气质具有不稳定性和脆弱性。在感知到的性别认同威胁下，男性更有可能做出某些与刻板印象一致的反应，如攻击，以维持自己的性别地位。然而，人们对男性在性别认同威胁下的个体差异反应知之甚少，即男性气质"脆弱"的心理条件。我们结合自我差异理论和自我决定理论提出了一个新的男性气质模型：对于男性气质规范的期望会在自我内部产生差异，这种僵化的规范被内化为义务型（实际与应该的差异）和愿望型（实际与理想的差异），这分别预测了减少这些差异的外在动机和内在动机。因此，在性别认同威胁下，外在动机预测外化反应（如攻击），而内在动机引发内化反应（如焦虑、羞耻、自残）。我们还考虑了男性气质不"脆弱"的条件——在期望不强烈或者拒绝遵守男性气质规范的情况下，有利于减轻与男性气质威胁相关的不良影响。最后，我们提出在数字化时代下，重建（试图修改或创造）更多亲社会意义的男性气质的重要性。新型男性气质通过围绕养育子女（居家度），真实度，整体关注度，对男性

传统规范的质疑度和对男性特权的敏感度建立新的规范，使男性性别社会化的过程不再是创伤性或强制性的，从而减少性别角色压力，努力使男性气质规范与现代社会经济和社会主义文化价值观相一致。从更广泛的角度来看，男性气质的变化对于心理健康有着启发性的意义，为未来的发展提供方向。

The conditions for the "fragility" of contemporary masculinity and new developments

Bingjie Jing

Sichuan Normal University, No. 5, Jing'an Road, Shishan Street, Jinjiang District

Abstract：Masculinity is unstable and fragile. When perceived threats of gender identity, men are more likely to make certain responses consistent with stereotypes, such as aggression, in order to maintain their gender status. However, little is known about men's individual differential responses to the threat of gender identity, the psychological condition in which masculinity is "fragile." We combine the theory of self-difference and the theory of self-determination to propose a new model of masculinity: expectations of masculinity norms produce differences within the self, and this rigid norm is internalized as obligatory (the difference between actual and should) and expectation (the difference between actual and ideal), which predicts extrinsic and intrinsic motivation to reduce these differences, respectively. Thus, under the threat of gender identity, extrinsic motivation predicts externalized responses (e.g., aggression), while intrinsic motivation triggers internalized responses (e.g., anxiety, shame, self-harm). We also considered the condition that masculinity is not "fragile" – that it is beneficial to mitigate the adverse effects associated with the threat of masculinity when expectations are not strong or there is a refusal to comply with masculinity norms. Finally, we raise the importance of reconstructing (trying to modify or create) more prosocial masculinity in the digital age. The new masculinity reduces gender role pressures by establishing new norms around parenting (at-home), authenticity, overall attention, questioning of traditional male norms and sensitivity to male privileges, thereby reducing gender role pressures and striving to bring masculinity norms into line with modern economy and socialist cultural values. More broadly, changes in masculinity are illuminating for mental health, providing direction for future developments.

整合编码可以减少提取前应激对联结记忆的损害

全美容[1] 薛玲玲[1] 刘贵雄[1,2]（通讯作者）

1 新疆师范大学心智发展与学习科学重点实验室，乌鲁木齐，830017

2 新疆师范大学心理学院，乌鲁木齐，830017，lgx_2001@126.com

摘　要　“一朝被蛇咬，十年怕井绳”，应激会引发项目和背景的错误联结，个体错误地将“井绳”与之前的应激背景联结进而错误地预测当前安全情境是危险的，如何减少这种错误联结一直是联结记忆研究领域的热点。以往研究结果表明，当两个或两个以上项目被加工成一个新的整体表征时（整合编码），熟悉性能够支持并促进联结再认。本研究旨在探明整合编码能否减少提取前应激对联结记忆的损害，以望为减缓应激下的记忆受损提供新的途径和认知神经科学依据。实验包括编码、休息（2 小时）和提取三个阶段。在编码阶段，应激组和控制组被试均学习混合呈现的不同整合程度的图片。在提取阶段，应激组先完成马斯特里赫特急性应激测试(MAST)，被试依次进行 5 轮冰水任务和 4 轮心算任务，然后判断“旧”、“重组”和“新”图

片；控制组依次进行 5 轮温水任务和 4 轮数数任务后完成“旧”、“重组”和“新”图片判断。结果显示，在高整合条件下应激组和控制组在正确率、反应时无显著差异，而在低整合条件下，应激组的正确率低于控制组。此外，在两组被试中高整合图片的正确率高于低整合图片，反应时比低整合图片快。上述结果表明，提取前应激引发了基于熟悉性的项目和背景错误联结，而整合编码可以促进熟悉性支持联结再认，减少提取前应激对项目和背景的错误联结。

Unitization can reduce the adverse effect of associative memory caused by preretrieval stress

Meirong Quan, Lingling Xue, Guixiong Liu
Department of Psychology, Xinjiang Normal University, The Key Laboratory of Mental Development and Learning Science, Xinjiang Normal University, Urumqi, China

Abstract：“Once bitten by a snake, twice afraid of the well rope", as stress can lead to a wrong connection between the item and the context, people who were bitten by a snake will mistakenly connect the "well rope" with the previous stress context and then wrongly predict the current safe situation is dangerous. How to reduce this wrong connection has been a hot topic in the field of associative memory research. Previous findings have shown that when two or more items are processed into a new integral representation (unitization), familiarity can support and promote associative recognition. The purpose of this study is to investigate whether unitization can reduce the damage of associative memory caused by preretrieval stress, in order to provide a new approach and cognitive neuroscience basis for alleviating memory impairment under stress. The experiment consisted of three phases: coding, rest (2 hours) and retrieval. During the coding phase, both the stress group and the control group learned the pictures with different levels of unitization mixly. During the retrieval phase, the stress group firstly completed the Maastricht Acute Stress Test (MAST)which needs the subjects successively perform 5 rounds of ice-water task and 4 rounds of mental arithmetic task, after the MAST, the subjects judged the "old", "rearrangement" and "new" pictures; for the control group, the subjects successively performed 5 rounds of warm water task and 4 rounds of counting task, and then completed the judgment of "old", "rearrangement" and "new" pictures. The results showed that there was no significant difference between the stress group and the control group in accuracy and reaction time under high-unitized condition, while the stress group's accuracy was lower than the control group under low-unitized condition. In addition, in the two groups of subjects, the accuracy of the high-unitized picture was higher than the low-unitized picture’s, and the reaction time was faster than the low-unitized picture’s. The above results show that preretrieval stress induces familiarity based item and context misassociation, and unitization can promote association recognition that supported by familiarity and reduce the misassociation of preretrieval stress to item and context.

广告偏向与记忆的年龄差异：产品类型的作用

陈婉莹[1]　张蕾[1]　杨思雨[1]　沈紫絮[1]　谢芳[1]（通讯作者）
1 浙江师范大学心理学院，金华，321000，通讯作者 E-mail：xftjsf@126.com

摘 要　人口老龄化是一个全球性现象。繁杂的广告信息影响老年消费者的态度与行为。研究指出除了认知资源与成熟经验，与年龄相关的目标差异也会影响老年人对广告信息的偏向与处理。社会情绪选择理论(SST)认为，随着个体年龄增长，老年人会优先考虑追求情感有意义的目标,而不是与知识相关的目标。以往基于 SST 的广告研究将与年龄相关的目标操纵为情感有意义和与知识相关两种广告类型，结果发现老年人比青年人更喜爱和倾向回忆情感有意义的广告。然而，这一问题的研究结果仍存在争议且需要更多跨文化研究证据。以往广告研究还发现，无论产品类型如何，老年人都表现出情感有意义的广告偏向与记忆。随着人们健康意识的加强以及对健康产品需求的增加，有益的保健食品是否影响中国老年人的广告偏向与记忆还有待进一步探讨。因此，本研究考察了产品类型对广告偏向与记忆的年龄差异影响。实验采用 2（年龄：青年人、老年人）× 2（广告类型：情感有意义广告、与知识相关广告）× 2（产品类型：保健食品、普通食品）的混合设计。实验要求 115 名青年人（平均年龄 21.94±1.63 岁）和 113 名老年人（平均年龄 69.75±6.45 岁）观看 16 个广告并回答产品购买意愿、广告喜爱程度以及自由回忆等问题。结果发现：年龄、广告类型与产品类型的三向交互作用在所有测量指标上均显著，表现为对于保健食品，老年人与青年人都更喜爱、更愿意购买以及更多回忆与知识相关的广告，而对于普通食品，老年人比青年人更喜爱、更愿意购买以及更偏向回忆情感有意义的广告。结果表明，产品类型会影响广告偏向与记忆的年龄差异，老年人对普通食品表现出情感有意义偏向，对保健食品表现出与知识相关偏向，即前者支持 SST，而后者与 SST 的观点相反。

Age Differences in Preference and Memory for Advertisements: The Role of Product Type

Wanying Chen[1], Lei Zhang[1], Siyu Yang[1], Zixu Shen[1], Fang Xie[1]

1 School of Psychology, Zhejiang Normal University, Jinhua, E-mail: xftjsf@126.com

Abstract：Population aging is a world-wide phenomenon. Complicated advertisements affect older consumers' attitude and behavior. Researches have revealed that in addition to age-related cognitive resources and mature experiences, age-related differences in goals influence the preference and information processing of ads for the elderly. Socioemotional selectivity theory (SST) suggests that as people age, older adults attach greater importance to goals that are emotionally-meaningful relative to knowledge-related. Prior studies based on SST manipulated the ad type (emotionally-meaningful ad, knowledge-related ad) to examine the influence of age-related differences in goals, and found that older consumers did favor and recall emotionally-meaningful ads than younger counterparts. However, this issue is still controversial and needed much more cross-cultural evidences. Additionally, some studies showed that older adults preferred and recalled emotionally-meaningful ads regardless of product type. Due to the increasing health consciousness and growing demand for health products, whether beneficial health food products affect advertising preference and memory for elderly people in Chinese context deserves to be further explored. Accordingly, the current study investigated that the influence of product type on age differences in preference and memory for advertisements. This experiment was a 2 (age group: younger adult, older adult) × 2 (ad type: emotionally-meaningful ad, knowledge-related ad) × 2 (product type: health food product, general food product) mixed design. Specifically, 115 young adults (M_{age} = 21.94±1.63 years) and 113 older adults (M_{age} = 69.75±6.45 years) were asked to read 16 ads and answer questions about product purchase intention, ad liking and recall. The results found a significant three-way interaction effect between age group, ad type and product type on all measurement indicators, showing that both age groups increased liking, purchase intentions and recall of knowledge-related ads for health food products, while older adults were more likely to prefer, buy and

remember emotionally-meaningful ads of general food products than younger adults. Findings indicated that age differences in preference and memory for ads were influenced by product type. The elderly showed emotionally-meaningful preference for general food product, which did support SST. However, older adults showed knowledge-related preference for health food product that challenged SST.
Keywords：Age differences, Health food product, Emotionally-meaningful ads, Knowledge-related ads, SST

供精人工授精女性患者病耻感对心理困扰的影响：社会支持的调节效应

申晓娜[1] 何旭东[1] 赵迪[1] 贾冬梅[2] 王清[1] 厉萍[1]（通讯作者）
1 山东大学护理与康复学院，济南，250012，pingli12@sdu.edu.cn

摘 要 **目的** 探讨接受供精人工授精（artificial insemination by donor, AID）治疗的女性患者社会支持、病耻感和心理困扰的关系，并分析社会支持在病耻感与心理困扰之间的调节效应。**方法** 采用方便抽样，于2023 年 1 月至 2023 年 7 月在山东省某生殖中心选取接受 AID 治疗的 198 例女性患者作为研究对象。采用一般资料调查表、病耻感量表、领悟社会支持量表、凯斯勒心理困扰量表进行调查。采用 SPSS26.0 进行数据分析，主要统计方法包括单因素分析、线性回归分析、二元 Logistic 回归分析、简单斜率分析和 Johnson-Neyman 分析。**结果** 本研究纳入的 198 名接受 AID 治疗的女性患者中无或轻度心理困扰 164 名，中重度心理困扰 34 名，分别占比 82.8%和 17.2%。两组女性患者在一般人口学和疾病资料上差异均无统计学意义（均 $P>0.05$），中重度心理困扰组病耻感得分高于无或轻度心理困扰组，社会支持得分低于无或轻度心理困扰组（均 $P<0.001$）。使用 Logistic 回归探索病耻感和社会支持与心理困扰的关系，分析显示，病耻感是心理困扰的危险因素(OR=1.158)；社会支持是其保护因素（OR=0.887）。使用分层回归和简单斜率分析探究社会支持的调节效应，分析显示，社会支持及家庭支持和朋友支持分维度在病耻感与心理困扰之间起调节作用。进一步通过 Johnson-Neyman 分析发现，社会支持及家庭支持和朋友支持分维度在病耻感与心理困扰之间的调节作用存在截断值。 **结论** 接受 AID 治疗的女性患者 17.2%存在中重度心理困扰，社会支持作为其保护因素，在病耻感与心理困扰之间具有调节作用，可缓冲病耻感对心理困扰的不良影响，本结果为改善接受 AID 治疗的女性患者心理困扰提供理论依据。

Effects of stigma on psychological distress in women undergoing artificial insemination by donor: the moderating effect of social support

SHEN Xiaona[1] HE Xudong[1] ZHAO Di[1] JIA Dongmei[2] WANG Qing[1] LI Ping[1]
1. School of Nursing and Rehabilitation, Shandong University, Jinan, 250012，pingli12@sdu.edu.cn
2. Hospital for Reproductive Medicine Affiliated to Shandong University, Jinan, 250021

***Abstract*：Objective** To analyse the moderating effect of social support on stigma and psychological distress in female patients receiving artificial insemination by donor (AID). **Methods** Convenience sampling was used to select 198 female patients receiving AID treatment in a reproductive center in Shandong Province from January to July 2021. The investigation was carried out with the General Information Questionnaire, Stigma Scale, Perceived Social Support Scale and Kessler Psychological Distress Scale. Data were described and analyzed using SPSS26.0 and Johnson-Neyman analysis. **Results** Among 198 female patients receiving AID included in this study, 164 had no or mild psychological distress and 34 had moderate or severe psychological distress. The stigma score of moderate to severe psychological distress group was higher than that of no or mild psychological distress group, and the social support score was lower than that of no or mild psychological distress group (all $P < 0.001$). Stigma was a risk factor for psychological distress ($OR = 1.16$), and social support was a protective factor ($OR = 0.89$). Social support, family support and friend support played a moderating role in the relationship between stigma and psychological distress, and the moderating role had a cut-off value. **Conclusion** Social support plays a moderating role in the relationship between stigma and psychological distress, and can cushion the negative impact of stigma on psychological distress. This result provides a theoretical basis for improving the psychological distress of female patients receiving AID treatment.

群体身份和年龄对儿童公平规范执行的影响：认知控制的作用

苏涵丽　刘启云　蔡霞　张振（通讯作者）

河南师范大学，新乡，453000，zhangzhenpsy@126.com

摘 要　为明确第二方规范执行中内群体偏爱的发生发展规律，本研究将分析儿童公平规范执行中存在的年龄差异和影响机制，并构建中介效应模型，考察认知控制的中介效应。研究采用最后通牒博弈范式、Go/Nogo 实验范式，在 6～8 岁、10～12 岁和 14～16 岁三个年龄段分别选取 30 名中小学生进行施测。结果发现：(1) 提议类型的主效应显著，$F(4, 348) = 219.83$，$p < 0.001$，$\eta^2 = 0.72$，儿童对高度不公平提议的接受率要显著低于模糊不公平提议的接受率。群体身份的主效应显著，$F(1, 87) = 12.11$，$p < 0.001$，$\eta^2 = 0.12$，在面对内群体时的接受率要显著高于与外群体互动的接受率；(2) 提议类型和年龄的交互效应显著，$F(8, 348) = 3.74$，$p < 0.001$，$\eta^2 = 0.08$，在高度不公平提议的情景下，6～8 岁比其他年龄组表现出更高的接受率，而在模糊不公平提议下，年龄组之间并无显著差异；(3) 提议类型与群体身份的交互效应显著，$F(4, 348) = 6.39$，$p < 0.001$，$\eta^2 = 0.07$，只有在面对模糊不公平提议时，儿童更倾向于接受内群体成员提出的不公平方案，而在高度不公平的情景下，内外群体之间的接受率并无显著差异；(4) 以 6～8 岁为控制组，认知控制部分中介了年龄和内群体偏爱的关系。这表明儿童的公平规范执行随年龄增长表现出明显的不公平厌恶和内群体偏爱现象，同时也证实了儿童年龄发展与内群体偏爱之间认知控制的中介效应，为培养儿童的公平意识提供了一定参考价值。

The Effect of Group Identity and Age on Fair Norm Enforcement for Children: The Role of Cognitive Control

Hanli Su, Qiyun Liu, Xia Cai, Zhen Zhang

Henan Normal University, Xinxiang, 453000, zhangzhenpsy@126.com

Abstract：To clarify the second-party norms used to implement domestic group preferences development laws, the study will analyze the age differences and influence mechanisms that exist in the implementation of children's fair norm enforcement, build an intermediary effect model, and investigate the intermediary effects of cognitive control. The study used the Ultimate Game paradigm and the Go/Nogo experiment paradigm to select 30 primary and secondary students from the age groups of 6-8, 10-12 and 14-16. Result found: (1) The main effect of the proposed type is significant, F (4, 348) = 219.83, p < 0.001, η^2 = 0.72, and children accept highly unfair proposals at significantly lower rates than ambiguous unfair offers. The main effect of group identity is significant, F (1, 87) = 12.11, p < 0.001, η^2 = 0.12, the acceptance rate in the face of the internal group background is significantly higher than the reception rate of the external group interaction; (2) The interaction effect of proposed type and age is significant, F (8, 348) = 3.74, p < 0.001, η^2 = 0.08, in the situation of highly unfair proposed, 6 to 8 years of age than other age groups show higher acceptance rates, but there was no significant difference between age groups for vaguely unfair proposals; (3) The interaction of proposed type and group identity is significant, F (4, 348) = 6.39, p < 0.001, η^2 = 0.07, only in the case of highly unfair proposed, 6 to 8 years of age than other age groups show higher acceptance rates, whereas in highly unfair situations, there is no significant difference in acceptance between groups within and outside the group; (4) In the 6-8 year old control group, the cognitive control part mediates the effect of age and introspective preferences. This demonstrates that the implementation of fair norm enforcement for domestic children with age demonstrates a clear phenomenon of unfair aversion and preference within the group, confirms the mediation effect of cognitive control in the process of implementing the fair norm enforcement for children, and provides a certain reference value for the cultivation of the child's sense of fairness.

食物热量判断的大小隐喻效应：来自内隐和外显测量的证据

曹彤彤[1]　陈欧童[1*]

1 青岛大学心理系，青岛，266071，1269822125@qq.com

摘 要　目前肥胖成为影响人们身体健康的影响因素之一，随着民众相关意识的提升，减肥也越来越成为当下追求健康的迫切需要。减肥在于“管住嘴”与“迈开腿”的结合，在“管住嘴”的环节，个体在饮食前要先对食物所含热量进行判断。本研究采用 3 个实验，在概念隐喻理论视角下探讨食物热量判断与食物体积大小这一物理属性之间的关系。实验一采用内隐联想测验（Implicit Association Test，IAT），测量食物热量与食物体积大小的联结程度。实验一为单因素被试内设计，自变量为 IAT 的试次类型（相容/不相容），因变量为被试的反应时以及利用反应时计算的内隐效应值。实验二采用内隐关系评估程序（Implicit Relational Assessment Procedure, IRAP)来测量二者的关系。结果显示，被试在高热量食物与大方块匹配，低热量食物与小方块匹配这一类任务中的反应时要显著短于被试在高热量食物与小方块匹配，低热量食物与大方块匹配这一类任务上的反应时。同时，被试的内隐效应值与 0 存在显著差异，说明在内隐层面，食物热量判断存在大小隐喻效应。实验三采用 2×2 的两因素被试内设计，在外显层面测量食物热量判断的大小隐喻效应，自变量为食物图片的大小和食物图片所代表食物的热量高低，因变量为被试对食物图片所代表食物的热量评分。结果显示两因素存在交互作用，即：高热量食物使用大尺寸图片呈现时被试对其热量的主观评分较高，同时低热量食物用小尺寸图片呈现时被试对其热量判断主观评分显著较低。综合 3 个实验的结果，本研究揭示了食物热量判断过程中的大小隐喻效应，并且这种效应在内隐和外显水平上都存在。研究结果有助于辅助肥胖患者调整饮食，学会合理饮食，培养健康饮食习惯，从而保持身体健康。

The size metaphorical effect of food calorie estimation: evidence from implicit and explicit measurements

Cao Tongtong[1] Chen Outong[1*]
1 Department of Psychology,Normal College,Qingdao University,Qingdao,266071

Abstract: At present, obesity has become one of the factors affecting people's health. With the improvement of people's awareness, losing weight has become more and more urgent need for the pursuit of health. Weight loss lies in the combination of "controlling the mouth" and "stepping on the leg", in the "controlling the mouth" link, the individual must first judge the calories contained in the food before eating. In this study, three experiments were conducted to explore the relationship between food caloric estimation and food size from the perspective of conceptual metaphor theory. In the first experiment, the Implicit Association Test (IAT) was used to measure the degree of connection between the calories of food and the size of food. Experiment 1 was a single-factor in-subject design, the independent variable was the type of IAT trial (compatible/incompatible), and the dependent variable was the subject's response time and the implicit effect value calculated by using the response time. In experiment 2, Implicit Relational Assessment Procedure (IRAP) was used to measure the relationship between the two. The results showed that the participants' reaction time was significantly shorter in tasks such as matching high-calorie food with large squares and low-calorie food with small squares than in tasks such as matching high-calorie food with small squares and low-calorie food with large squares. At the same time, the implicit effect value of the subjects was significantly different from 0, indicating that there was a size metaphor effect in the judgment of food calories at the implicit level. In experiment 3, a 2×2 two-factor in-subject design was used to measure the size metaphor effect of food calorie judgment at the exo-level. The independent variable was the size of the food picture and the level of the food calorie represented by the food picture, and the dependent variable was the subjects' caloric score of the food represented by the food picture. The results showed that there was an interaction between the two factors, that is, when the high-calorie food was presented with large-size pictures, the subjects had a higher subjective score on their calories, while when the low-calorie food was presented with small-size pictures, the subjects' subjective score on their calories was significantly lower. Combining the results of the three experiments, this study reveals the size metaphor effect in the process of judging food calories, and this effect exists at both implicit and explicit levels. The results of the study are helpful to assist obese patients to adjust their diet, learn to eat rationally, and cultivate healthy eating habits, so as to maintain good health.

城乡老年人社会支持对抑郁的影响：心理弹性的中介作用

陈鹏[1] 李彦章[2]（通讯作者）
1 成都医学院心理学院，成都，610000
2 成都医学院四川应用心理研究中心，成都，610000，lyz@cmc.edu.cn

摘 要 社会支持对老年人抑郁影响的研究多将老年人看作一个整体进行讨论，忽视了城乡因素等老年人本身存在的差异。基于积极老龄化的视角，探讨城乡老年人社会支持对抑郁的影响，同时考察心理弹性在这关系中的作用。采用问卷法对城乡老年人进行调查，共收取数据 745 份。结果显示：（1）城乡老年人在社会支持、心理弹性、抑郁等方面均存在差异（p<0.01），城市老年人在社会支持、心理弹性、抑郁三个方面（38.33、86.67、2.97）均优于农村老年人（36.26、82.57、3.82）；（2）社会支持与抑郁呈负相关(-0.223,

p<0.01)，与心理弹性呈正相关(0.334, p<0.01)，心理弹性与抑郁之间呈负相关(-0.355, p<0.01)；（3）城市老年人的社会支持对于抑郁水平的预测结果均显著（t=-4.195，p＜0.01），加入心理弹性这个中介变量之后预测结果依然显著（t=-5.157，p＜0.01），且社会支持对抑郁的直接效应显著（t=-2.364，p＜0.05），心理弹性在其中起部分中介作用；（4）农村老年人的社会支持对于抑郁水平的预测结果均显著（t=-3.197，p＜0.01），加入心理弹性这个中介变量之后预测结果任显著（t=-4.970，p＜0.01），但社会支持对抑郁的直接效应不显著，心理弹性起完全中介作用。结论： 城市老年人在社会支持、心理弹性、抑郁上均优于农村，社会支持能有效负向预测抑郁水平，心理弹性在其中起缓冲作用，但作用机制不同，在城市组中起部分中介作用，农村组则为完全中介。希望能够引起对老年人，特别是农村老人心理健康的重视，并且针对城乡之间不同的中介模型，采取不同的干预方式，为积极老龄化的实践与科研提供一定的理论参考。

The effect of social support on depression in urban and rural elderly: the mediating role of Psychological resilience

ChenPeng[1]　LiYanZhang[2]
1 School of Psychology, Chengdu Medical College，Chengdu
2 Sichuan Applied psychology Research Middle School，Chengdu

abstract ：Research on the impact of social support on depression in the elderly often considers the elderly as a whole and ignores the differences in urban and rural factors among the elderly themselves. Based on the perspective of active aging, this paper explores the impact of social support on depression in urban and rural elderly, and examines the role of Psychological resilience in this relationship. A questionnaire survey was conducted on elderly people in urban and rural areas, with a total of 745 data collected. The results showed that: (1) there were differences in social support, Psychological resilience and depression between urban and rural elderly (p<0.01). Urban elderly were better than rural elderly in social support, Psychological resilience and depression (38.33, 86.67, 2.97) (82.57, 82.57, 3.82); (2) Social support was negatively correlated with depression (-0.223, p<0.01), positively correlated with Psychological resilience (0.334, p<0.01), and negatively correlated with Psychological resilience and depression (-0.355, p<0.01); (3) The social support of the urban elderly predicted the level of depression significantly (t=-4.195, p<0.01), and after adding Psychological resilience as the intermediary variable, the prediction result was still significant (t=-2.364, p<0.01). At the same time, the direct effect of social support on depression was significant (t=-2.364, p<0.05), and Psychological resilience played a partial mediating role in it; (4) The social support of the elderly in rural areas predicted the level of depression significantly (t=-3.197, p<0.01). When Psychological resilience was added, the prediction was still significant (t=-4.970, p<0.01). The direct effect of social support on depression was not significant, and Psychological resilience played a completely mediating role. Conclusion: The urban elderly are better than the rural elderly in social support, Psychological resilience and depression. Social support can effectively predict the level of depression negatively. Psychological resilience plays a buffering role in it, but the mechanism is different. It plays a partial mediating role in the urban group and a complete mediating role in the rural group. I hope to draw attention to the mental health of the elderly, especially those in rural areas, and adopt different intervention methods based on different mediation models between urban and rural areas, providing a certain theoretical reference for the practice and research of active aging.

未完成的事务与丧亲高校学生的延长哀伤症状：持续性联结与意义建构的中介作用

黄晶菁[1] 钱文丽[1] 蒋宛月[1] 于心怡[1] 唐任之慧[1] 符仲芳[2] 王建平[1*]（通讯作者）

1 北京师范大学心理学部，应用实验心理北京市重点实验室，心理学国家级实验教学示范中心（北京师范大学），北京，100875，wjphh@bnu.edu.cn

2 北京大学心理与认知科学学院，行为与心理健康北京市重点实验室，北京，100871

摘 要 丧失关系亲密之人（简称“丧亲”）对个体来说是一种负性生活事件。受生理、心理和环境特点的影响，高校学生可能会感到难以适应丧亲后的生活。延长哀伤症状是适应不良的丧亲者典型的消极心理反应之一，而未完成的事务可能是丧亲高校学生出现延长哀伤症状的一种重要风险因素，但目前少有研究关注未完成的事务对延长哀伤症状影响的内在机制。基于预测丧亲后果的综合风险因素框架，本研究构建了一个链式中介模型，旨在考察未完成的事务与丧亲高校学生延长哀伤症状的关系，并进一步探究持续性联结和意义建构的中介作用。采用基本信息调查表、丧亲中未完成的事务量表(UBBS)、持续性联结量表(CBS)、压力生活体验整合量表(ISLES)和延长哀伤问卷修订版(PG-13-R)，对丧亲时长超过 6 个月(M_{month}=18.42，SD=7.35)的 364 名丧亲高校学生(M_{age}=21.32，SD=1.65，男性 172 人)进行线上调查。结果表明：控制人口学和丧亲相关变量后，（1）未完成的事务对丧亲高校学生的延长哀伤症状有直接正向预测作用；（2）未完成的事务可以分别通过内化联结和外化联结正向预测延长哀伤症状；（3）未完成的事务可以通过降低意义建构水平，从而正向预测延长哀伤症状；（4）未完成的事务还可以通过内化联结-意义建构、外化联结-意义建构的两条链式中介正向预测延长哀伤症状。本研究结果进一步揭示了未完成的事务对延长哀伤症状影响的心理机制，验证和扩展了预测丧亲后果的综合风险因素框架。此外，本研究还可以为高校心理健康工作者发展对丧亲高校学生的心理干预方案提供依据，以便帮助该群体获得良好的丧亲后适应。

Unfinished business and prolonged grief symptoms among bereaved college students: The Mediating Role of Continuing bonds and Meaning making

Jingjing Huang[1] Wenli Qian[1] Wanyue Jiang[1] Xinyi Yu[1] Renzhihui Tang[1]

Zhongfang Fu[2] Jianping Wang[1]

1 Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing 100875, China

2 School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871, China

Abstract: The loss of a close relationship (abbreviated as “bereavement”) is a kind of negative life events for any one. Affected by physiological, psychological, and environmental characteristics, college students may find it difficult to adapt to their life after bereavement. Prolonged grief symptoms are one of the typical negative psychological reactions of maladaptive bereaved individuals, and unfinished business may be an important risk factor for prolonged grief symptoms among bereaved college students. However, few studies have focused on the

internal mechanism of the impact of unfinished business on prolonged grief symptoms. Based on the integrative risk factor framework for the prediction of bereavement outcome, this study constructed a chain mediated model to examine the relationship between unfinished business and prolonged grief symptoms among bereaved college students, and further explore the mediating role of continuing bonds and meaning making. An online survey was conducted on 364 bereaved college students (M_{age}=21.32, SD=1.65, 172 males) who had been bereaved for more than 6 months (M_{month}=18.42, SD=7.35) using the basic information questionnaire, Unfinished Business in Bereavement Scale (UBBS), Continuing Bonds Scale (CBS), Integration of Stressful Life Experiences Scale (ISLES), and Prolonged Grief Questionnaire-13-Revised (PG-13-R). The results showed that: after controlling demographic and bereavement related variables, (1) unfinished business had a direct and positive predictive effect on the prolonged grief symptoms of bereaved college students; (2) unfinished business positively predicted prolong grief symptoms through internalized and externalized connections, respectively; (3) unfinished business positively predicted prolong grief symptoms by reducing the level of meaning making; (4) unfinished business also positively predicted prolong grief symptoms through the two chain mediation of internalized continuing bonds and meaning making, and externalized continuing bonds and meaning making. These findings further reveal the psychological mechanism by which unfinished business affects the prolonged grief symptoms, validate and expand the integrative risk factor framework for the prediction of bereavement outcome. In addition, the current study can also provide a basis for university mental health workers to develop psychological intervention plans for bereaved university students, in order to help this group achieve good post bereavement adaptation.

特定乐器训练对音色识别和多感觉整合的影响

刘恬恬[1]　刘文彬[2]　方乐乐[3]

1 辽宁师范大学心理学院，大连，116029

2 大连工业大学艺术与信息工程学院，大连，116034

3 辽宁师范大学心理学院，大连，116029，lilianfang367@163.com

摘 要　近年来，音乐训练对个体在多感觉整合上的影响越来越受到广泛关注。本研究主要探究特定的乐器训练对视听整合的影响。实验 1 选取中西方具有代表性的乐器，通过强制选择性的音色辨别任务测量钢琴训练者与非音乐训练者在识别乐器听觉感知上的阈限，探究特定的乐器训练对音色识别能力的影响。实验 2 采用声音诱发闪光错觉实验，考察非错觉条件下钢琴训练者与非音乐训练者的闪光个数辨别能力。实验 3 在前两个实验的基础上，探究钢琴训练者与非音乐训练者在闪光错觉效应上产生的差异，并进一步探究声音刺激不同时，特定乐器学习者在声音诱发闪光错觉的特异性。结果发现：(1)钢琴训练者在识别钢琴音色上的阈值与其他乐器相比最低，且显著低于非音乐训练者；(2)在视听刺激个数一致情况下，钢琴训练者与非音乐训练者的正确率均较高且在各个 SOA 下都无显著差异，但钢琴训练者的反应时小于非音乐训练者，差异不显著；(3)在裂变错觉中，25ms 条件下，钢琴训练者在两种听觉刺激下的正确率均小于非音乐训练者；75ms 条件下，钢琴训练者与非音乐训练者相比在两种听觉刺激下的正确率更高；125ms 条件下，钢琴训练者在钢琴音为听觉刺激时的正确率高于非音乐训练者；非音乐训练者在钢琴音作为听觉刺激时的正确率低于普通纯音为听觉刺激时的正确率；在所有 SOA 条件下，钢琴训练者在钢琴音为听觉刺激时的正确率小于普通纯音为听觉刺激时的正确率；(4)融合错觉中，SOA 与听觉刺激类型都对闪光错觉有影响。25ms 条件下，钢琴训练者的正确率大于非音乐训练者，钢琴音作为听觉刺激时的正确率更低；75ms 条件下，钢琴音为听觉刺激时的正确率低于普通纯音下的正确率；125ms 条件下，钢琴训练者的正确率小于非音乐训练者，钢琴音作为听觉刺激时正确率更高。上述结果表明，钢琴训练者的钢琴音色识别能力优于非音乐训练者，

说明特定乐器训练会使对应乐器的音色识别能力更强。特定的乐器训练会影响乐器音色感知，进而对音乐家在多感觉整合方面有一定的影响。

Effects of instrument-specific training on timbre recognition and multisensory integration

Tiantian Liu[1] Wenbin Liu[2] Lele Fang[3]
1 School of Psychology, Liaoning Normal University, Dalian, China
2 School of Arts and Information Engineering, Dalian Polytechnic University, Dalian, China
3 School of Psychology, Liaoning Normal University, Dalian, China, lilianfang367@163.com

Abstract： In recent years, the impact of music training on individual multi-sensory integration has received increasing attention. The purpose of this study was to explore the effects of specific musical instrument training on audiovisual integration. Experiment 1 selected representative musical instruments from both China and the West, and measured the threshold of auditory perception of piano trainers and non-music trainers in identifying musical instruments through mandatory and selective timbre recognition tasks, exploring the impact of specific instrument training on timbre recognition ability. Experiment 2 used the sound induced flash illusion experiment to investigate the ability of piano trainers and non-music trainers to distinguish the number of flashes under non illusion conditions. On the basis of the first two experiments, Experiment 3 explores the differences in the flash illusion effect between piano trainers and non-music trainers, and further explores the specificity of specific instrument learners in sound induced flash illusion under different sound stimuli. The results showed that: (1) Piano trainers had the lowest threshold for recognizing piano timbre compared with other instruments and significantly lower than non-music trainers; (2) Under the condition of the same number of audiovisual stimuli, the correct rates of both piano trainers and non-music trainers are higher and there is no significant difference in each SOA, but the response time of piano trainers is less than that of non-music trainers, the difference is not significant; (3) In the fission illusion, under 25ms condition, the pianist's accuracy under the two kinds of auditory stimulus was smaller than that of non-music trainers. Under 75ms condition, piano trainers were more accurate than non-music trainers in both auditory stimuli. Under 125ms condition, the pianist's accuracy rate was higher than that of non-music trainers when the piano sound was the auditory stimulus. The accuracy of non-music trainers when piano tone is used as auditory stimulus is lower than that when ordinary pure tone is used as auditory stimulus. Under all SOA conditions, the accuracy of piano tone as auditory stimulus is less than that of ordinary pure tone as auditory stimulus. (4) In the fusion illusion, both SOA and the type of auditory stimulus had an effect on the illusion of flashing light. Under 25ms condition, the pianist's accuracy was higher than that of non-music trainers, and the accuracy of piano sound as auditory stimulus was lower. Under the condition of 75ms, the accuracy of piano tone as auditory stimulus is lower than that of ordinary pure tone. Under 125ms condition, the accuracy of pianist was lower than that of non-musician, and the accuracy of piano sound was higher when it was used as auditory stimulus. The above results show that the piano timbre recognition ability of piano trainers is better than that of non-music trainers, indicating that specific instrument training will make the timbre recognition ability of corresponding instruments stronger. Specific instrument training affects instrument timbre perception, which in turn has an impact on musicians' multisensory integration.

摘 要

目的：探讨亲子疏离在高海拔作业人员职业压力与失眠关系中的潜在中介作用，并分析情绪调节在上述过程中是否存在调节作用。**方法：**选取平均海拔 4200 米左右的 2 个单位 2065 名作业人员，采用自编一般情况调查表、高原人群职业压力源量表、失眠严重程度指数量表（ISI）、亲子疏离感问卷（IAP）、Gross 编制的情绪调节量表进行问卷调查。采用 SPSS 26.0 进行数据分析，用 Pearson 进行各变量间的相关性分析，纳入人口学变量对亲子疏离和失眠严重程度的预测因素进行分层线性回归分析，用 PROCESS 插件检验高海拔作业人员亲子疏离在职业压力与失眠关系中的中介作用，以及情绪调节策略在其中的调节作用，并绘制简单斜率图。**结果：**高海拔作业人员职业压力得分为(3.16±7.251)分、ISI 得分为(1.95±3.392)分、IAP 得分为(24.46±8.449)分。相关性分析显示，职业压力与亲子疏离($r = 0.393$，$p < 0.001$)、失眠($r = 0.576$，$p < 0.01$)均成正相关，此外，亲子疏离也与失眠成正相关($r = 0.312$，$p < 0.01$)；多元线性回归分析发现，职业压力($\beta = 0.485$，$p < 0.001$)、亲子疏离($\beta = 0.092$，$p < 0.001$)是失眠的显著正向预测因子；结构方程模型表明亲子疏离在职业压力正向预测失眠的过程中起到部分中介作用($\beta = 0.019$，$p < 0.001$，图 1)，表达抑制在职业压力与亲子疏离关系中存在显著的正向调节作用（$\beta = 0.110$，$p < 0.001$)，在职业压力与失眠关系中存在显著的负向调节作用（$\beta = 0.073$，$p < 0.001$)；认知重评在职业压力与亲子疏离关系中存在显著的正向调节作用（$\beta = 0.035$，$p < 0.001$)，在职业压力与失眠关系中存在显著的负向调节作用（$\beta = -0.002$，$p < 0.001$)（图 2-3）。**结论：**职业压力与亲子疏离和失眠呈正相关；亲子疏离和失眠也呈正相关。此外，职业压力不仅直接预测失眠，亲子疏离还在职业压力正向预测失眠的过程中起到部分中介作用，同时，认知重评对职业压力和亲子疏离之间的关系有积极贡献，但在职业压力和失眠之间的关系中可以被视为负面因素。另一方面，情绪抑制对职业压力和亲子疏离之间的关系有负面影响，它也可以被视为职业压力和失眠之间的正向因素。这些结论凸显了在改善失眠时考虑职业压力、亲子关系和情绪调节策略的重要性，为后续深入研究和建立干预机制提供了理论支持。

The Impact of Occupational Stress on Insomnia among Plateau Workers: The Mediating Role of Alienation towards Parents and the Moderating Role of Emotion Regulation Strategies

Qiaoning Zhou, Zongpei Dai, Li Hou, Qin Dai (corresponding author)
Department of Medical Psychology, Army Medical University, Chongqing, 400038, China

Abstract: **Objective** This study investigates the mediating role of alienation towards parents in the relationship between occupational stress and insomnia among plateau workers. It also examines whether emotion regulation moderates this process. **Methods** The study includes 2065 workers from two units with an average altitude of around 4200 meters. Data was collected using self-developed questionnaires, including the General Information Questionnaire, Occupational Stressors Scale for Plateau Population, Insomnia Severity Index (ISI), Inventory of Parent and Peer Attachment (IAP), and Gross' Emotion Regulation Questionnaire. Data analysis was performed using SPSS 26.0, including Pearson correlation analysis, hierarchical linear regression analysis, and the PROCESS plug-in to test mediation and moderation effects. **Results** The occupational stress score of plateau workers was (3.16 ± 7.251) points, ISI was (1.95 ± 3.392) points, and IAP was (24.46 ± 8.449) points. Correlation analysis showed positive relationships between occupational stress and alienation towards parents (r = 0.393, p < 0.001), occupational stress and insomnia (r = 0.576, p < 0.01), as well as alienation towards parents and insomnia (r = 0.312, p < 0.01). Multiple linear regression analysis revealed that occupational stress (β = 0.485, p < 0.001) and alienation towards parents (β = 0.092, p < 0.001) significantly predicted insomnia. Structural equation modeling indicated that alienation towards parents partially mediated the relationship between occupational stress and insomnia (β = 0.019, p < 0.001, Fig.1). Expressive suppression had a positive moderating effect on the relationship between occupational stress and alienation towards parents (β = 0.110, p < 0.001), as well as a negative moderating effect on the relationship between occupational stress and insomnia (β = 0.073, p < 0.001). Cognitive reappraisal showed a positive moderating effect on the relationship between occupational stress and alienation towards parents (β = 0.035, p < 0.001), as well as a negative moderating effect on the relationship between occupational stress and insomnia (β = -0.002, p < 0.001)(Fig.2-3). **Conclusion** Occupational stress is positively correlated with alienation towards parents and insomnia. Alienation towards parents partially mediates the relationship between occupational stress and insomnia. Expressive suppression and cognitive reappraisal have distinct effects on the relationships between occupational stress, alienation towards parents, and insomnia. These findings emphasize the importance of considering occupational stress, alienation towards parents, and emotion regulation strategies in addressing insomnia among plateau workers.

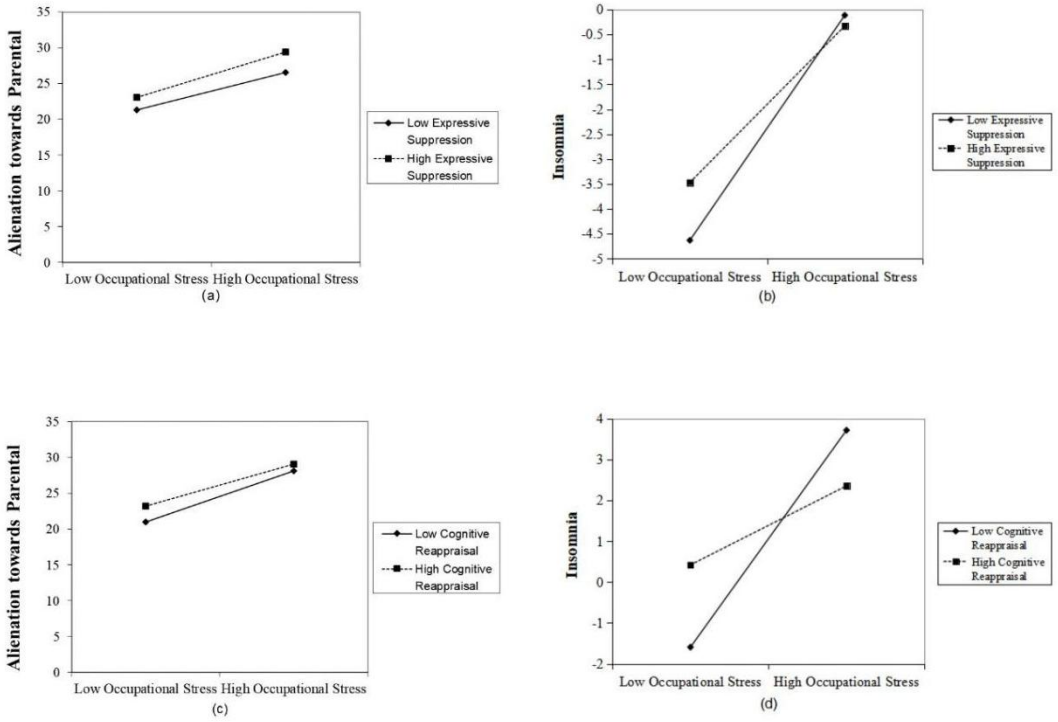

Fig. 3 Simple effect analysis: (a) The moderating effect of expressive suppression on the relationship between occupational stress and alienation towards parents; (b) The moderating effect of expressive suppression on the relationship between occupational stress and insomnia; (c) The moderating effect of cognitive reappraisal on the relationship between occupational stress and alienation towards parents; (d) The moderating effect of cognitive reappraisal on the relationship between occupational stress and insomnia.

提议意图和年龄对公平规范执行的影响：一个有调节的链式中介

刘启云　苏涵丽　张增彤　张振（通讯作者）
河南师范大学，新乡，453000，zhangzhenpsy@126.com

摘 要　为研究提议意图对公平规范执行的影响和内在作用机制，引入公平感知和愤怒情绪作为中介变量，年龄组作为调节变量，构建一个有调节的链式中介效应模型。研究采用最后通牒博弈范式，呈现 2 种分配情境：匿名者和计算机分配情境来操纵有无提议意图，在 6～8 岁、10～12 岁和 14～16 岁三个年龄段共选取 237 名中小学生进行施测。结果发现：(1) 分配情境的主效应显著，$F(1, 231)=31.50, p < 0.001$，对匿名者分配情境的拒绝程度远高于计算机分配情境。年龄组的主效应显著，$F(2, 231)=9.68, p < 0.001$，年长儿童(10～12 岁)和青少年(14～16 岁)会比年幼儿童(6～8 岁)更频繁地拒绝不公平方案；(2) 分配情境通过公平感知和愤怒情绪的中介作用对公平规范执行产生影响，且中介作用包含以下三条路径，公平感知的独立中介，$\beta = 0.31$, 95%CI = [0.16, 0.50]，愤怒情绪的独立中介，$\beta = 0.13$, 95%CI = [0.03, 0.26]，公平感知→愤怒情绪的链式中介，$\beta = 0.22$, 95%CI = [0.13, 0.34]；(3)年龄组调节了分配情境和公平感知之间的关系，在匿名情境下，年长儿童和青少年的不公平感知显著高于年幼儿童，$\beta = 0.80, p < 0.001$，在计算机情境下的公平感知与年幼儿童没有显著差异。结果表明：意图对公平规范执行的重要性随年龄增加呈线性发展，分配情境可以

通过公平感知和愤怒情绪的中介作用及其链式中介作用影响公平规范执行，且年龄组在链式中介路径中起调节作用，为引导和培养中小学生的公平感知和正义行为提供理论依据。

The Effect of Proposed Intention and Age on Fairness Norm Enforcement: A Moderated Chain Mediation Model

Qiyun Liu, Hanli Su, Zengtong Zhang, Zhen Zhang
Henan Normal University, Xinxiang, 453000,zhangzhenpsy@126.com

Abstract: The study proposes the intention to influence the implementation of fair norms and the intrinsic mechanism of action, introducing fair perception and anger as intermediate variables, age groups as regulating variables and building a regulated chain intermediate effect model. The study used the ultimate general game paradigm, presenting two distribution scenarios: anonymous and computer assigned scenarios to manipulate the unintentional, and selected a total of 237 primary and secondary students in the age groups 6-8, 10-12 and 14-16. Result found: (1) The main effect of allocation scenario is significant, $F(1, 231) = 31.50$, $p < 0.001$, and the degree of rejection of the anonymous allocation situation was much higher than that of computer allocation.The main effects of age group were notable, $F(2, 231) = 9.68$, $p < 0.001$, with older children (10-12) and adolescents (14-16) rejecting unfair schemes more frequently than younger children (6-8); (2)The distribution situation influences the implementation of fairness norms through the mediating role of fairness perception and anger emotions, and the mediation involves the following three pathways, the independent mediator of fair perception, $\beta = 0.31$, 95%CI = [0.16, 0.50], the independent mediator of anger emotions, $\beta = 0.13$, 95%CI = [0.03, 0.26], the chain mediator of fairness perceptions to anger emotions, $\beta = 0.22$, 95%CI = [0.13, 0.34]; (3) The age group moderated the relationship between distribution situation and fairness perception, with older children and adolescents having significantly higher unfairness perception than young children in an anonymous situation, $\beta = 0.80$, $p < 0.001$, and the fairness perception in computer situations with young children did not differ significantly. The results showed that the importance of the intention to implement fairness norms devolved linearly with age, and confirmed the chain mediating role of fairness perception and anger between distributional situations and the implementation of fairness norms, as well as the regulatory role of age development in distributional situations and fairness perceptions, providing a theoretical basis for guiding and nurturing the sense of justice and justice behaviour in primary and secondary school students.

同伴类型对信任的影响：一个有调节的中介模型

马欣宇　邓文庆　王玉新　张振（通讯作者）
河南师范大学，新乡，453000，zhangzhenpsy@126.com

摘 要　信任通常指在不能确定互动对方的信息和意图的情景下，自愿承担风险，预期他人积极互动的行为，是人类交往的重要桥梁。在数智时代，所有形式的社会互动都涉及信任。为探讨互动同伴类型对信任的影响，以信任的三个指标(可信度、情感信任和信任行为)为结果变量，构建了一个有调节的中介模型，旨在考察拟人化在互动同伴和信任之间的中介作用以及接受度的调节作用。实验 1 采用拟人化量表及购物

情境下的建议接受任务，招募 187 名大学生，实验 2 采用招聘情景下的建议接受任务，招募 159 名大学生，考察三种同伴类型(人工智能、随机机器和人类伙伴)下的信任差异。结果发现：(1) 互动同伴类型的主效应显著，相比随机机器，参与者认为人类伙伴和人工智能的可信度更高，且更愿意表现出信任行为；(2) 在互动同伴类型对信任的影响中，拟人化具有部分中介作用；(3) 接受度在互动同伴类型和拟人化之间起调节作用，在接受度较高的参与者中，人工智能和人类伙伴的拟人化都高于随机机器，但是在接受度较低的参与者中，只有人类伙伴的拟人化高于随机机器。这些结果从多种社会互动的视角，揭示了互动类型和信任之间的复杂关系，强调了拟人化和接受度的作用机制，为数智时代提高人类的信任行为提供一定的理论依据。

Companion Types' Effects on Trust: A Moderated Mediating Model

Xinyu Ma, Wenqing Deng, Yuxin Wang, Zhen Zhang
Henan Normal University, Xinxiang, 453000, zhangzhenpsy@126.com

Abstract：An essential component of human interaction is trust, which can be defined as the act of willingly taking risks and expecting others to engage in active communication in circumstances where the knowledge and intentions of the other party are unknown. Every type of social interaction today requires trust in the age of mathematics. A regulated intermediate model was developed to investigate the function of personification in mediating and regulating the degree of acceptance between interacting peer and trust, using the three indicators of trust (trustworthiness, emotional trust, and trust behavior) as the result variables. In Experiment 1, 187 college students were recruited using a customized scale and suggested tasks in a shopping environment. In Experiment 2, 159 college students were recruited using a recruitment scenario for a proposed task, and the confidence levels of three different types of partners (artificial intelligence, random machines, and human partners) were compared. The findings revealed that: (1) Participants felt that human partners and artificial intelligence were more credible and more willing to display trust behavior when compared to random machines; the main effects of the interactive companion type were significant; (2) In the influence of interactive fellow types on trust, anthropomorphism played a partial intermediary role; (3) Acceptance plays a regulatory role between the type of interactive companion and the personification, with AI and human partners being more personified than random machines among participants with higher acceptance rates, but with lower acceptance, only human partners are more personalized than random machinery. These findings, which highlight the mechanisms of anthropomorphism and acceptance, illustrate the complicated relationship between interaction kinds and trust from the perspective of various social encounters. They also offer a theoretical foundation for increasing human trust behavior in the age of mathematics.

生育动机与孕妇主观幸福感、母胎依恋的关系：基于潜在类别分析

张新涵[1]　陈新霞[1]（通讯作者）
1 山东大学齐鲁医学院护理与康复学院，济南，250012，chenxxsdu@163.com

摘 要　良好的母胎依恋关系有利于提高妊娠质量并促进子代远期身心健康。生育动机是影响亲子依恋的重要因素，但其潜在类别及在妊娠期间的作用仍鲜有报道。根据母胎关系模型，孕妇的心理健康状态正向预

测母胎依恋，而更自主的动机可以提升幸福感。基于此，我们推测生育动机可能通过孕妇主观幸福感影响母胎依恋，且根据动机类型可能有所不同。本研究运用母胎依恋关系量表、总体幸福感量表和生育动机量表对 413 名妊娠中晚期孕妇进行调查，分析孕妇生育动机潜在类别，并探讨生育动机与母胎依恋的关系以及主观幸福感的中介作用，为提高母胎依恋水平提供依据。结果发现：（1）孕妇的生育动机可以分为双导向型生育动机（26.5%）、内化型生育动机（23.8%）、外化型生育动机（24.2%）和消极型生育动机（25.5%）4 个潜在类别。（2）生育动机、主观幸福感和母胎依恋间两两显著相关（r=0.128-0.414，均 p＜0.01），且主观幸福感与母胎依恋在不同类型生育动机上的得分有显著差异（均 p＜0.001）。（3）多分类中介效应分析发现，与消极型生育动机组相比，双导向型生育动机组（β=0.788，p＜0.001）和内化型生育动机组（β=0.612，p＜0.001）对母胎依恋的相对直接效应显著，主观幸福感的相对间接效应也显著（双导向型生育动机组：β=0.045，p＜0.05；内化型生育动机组：β=0.094，p＜0.001），而在外化型生育动机组，相对直接效应（β=0.093，p=0.460）和主观幸福感的相对间接效应（β=-0.018，p=0.332）均不显著。结论：妊娠中晚期孕妇生育动机具有明显的分类特征，可以显著预测母胎依恋，主观幸福感在生育动机和母胎依恋关系中起到了中介作用。应针对不同人群进行精准干预。

Relationship between fertility motivation, women's subjective well-being and maternal-fetal attachment: A Latent Class Analysis

Zhang Xinhan[1], Chen Xinxia[1] (Corresponding author)
1 School of Nursing and Rehabilitation, Shandong University, Jinan 250012, chenxxsdu@163.com ）

Abstract： Healthy maternal-fetal attachment facilitates the quality of pregnancy and promotes the offspring's physical and mental health in the long term. Fertility motivation is an important factor influencing parent-child attachment, but its categories and effects during pregnancy have rarely been reported. According to the maternal-fetal relationship model, maternal mental health positively predicts mother-child attachment, whereas more autonomous motivation enhances subjective well-being among mothers. Based on this, we speculated that fertility motivation may influence maternal subjective well-being, which in turn influences maternal-fetal attachment, and this association might vary between types of motivation. In this study, a survey was conducted in 413 pregnant women during the mid-to-late second trimester using the Maternal-Fetal Attachment Scale, the General Well-Being Scale, and the Fertility Motivation Scale. We investigated the potential categories of fertility motivations of pregnant women and examined the relationship between fertility motivations and maternal-fetal attachment, as well as the mediating role of subjective well-being. The results found that (1) the motivations of pregnant women can be divided into four potential categories: autonomous-controlled (26.5%), autonomous (23.8%), controlled (24.2%) and unconscious fertility motivation (25.5%). (2) Significant correlations were found between fertility motivation, subjective well-being and maternal-fetal attachment (r = 0.128-0.414, all p < 0.01). There were significant differences between scores of the subjective well-being and maternal-fetal attachment scores between women with different types of fertility motivation (p < 0.001). (3) Using the group of unconscious pregnancy as the reference, mediation analysis revealed that there were significant relative direct effects of autonomous-controlled motivation (β= 0.788, p < 0.001), and autonomous motivation (β= 0.612, p < 0.001) on maternal-fetal attachment, and significant relative mediating effects of subjective well-being in this association (autonomous-controlled motivation: β= 0.045, p < 0.05; autonomous motivation: β= 0.094, p < 0.001). In contrast, for controlled motivation the relative direct effects (β=0.093, p=0.460) on maternal-fetal attachment, as well as the

mediating effects of subjective well-being in this association were not statistically significant (β=-0.018, p=0.332). In conclusion, four distinct latent categories were revealed for fertility motivation among pregnant women. Autonomous-controlled, and autonomous fertility motivation could significantly predict maternal-fetal attachment, with subjective well-being playing a mediating role in this relationship, while for controlled fertility motivation either the direct effects or the mediating effects were non-significant. These findings provide evidence on factors influencing maternal-fetal attachment and have implications for precise interventions.

持枪民警心理选拔的理论与应用研究

杨金辉

中国人民警察大学公安政治学院， 廊坊 065000

E-mail：1587812501@qq.com

摘 要 [目的]探究持枪民警心理素质影响维度，拟编制持枪民警心理选拔量表。[意义]心理素质的强弱对持枪民警能否顺利完成射击任务有着一定的影响，持枪民警在开枪射击目标时应保持良好稳定的心理状态，才能将平时的射击技能训练、战术训练等充分发挥，在持枪证考核中加入心理选拔方面的考核，既是完善持枪证考核制度的需要，也是提高持枪民警整体射击能力的紧迫需要，有着重要的研究意义。[研究方法]总结国内外持枪民警心理选拔现状，参考其他领域已成熟应用的心理量表，确定影响持枪民警的一级心理维度即情绪稳定性、积极态度、注意焦点、射击自信、注意疲劳和恐惧，在一级维度中划分二级维度并从二级维度中编选 30 道题目作为条目池形成初测问卷，采用分层整群随机抽样方法，对 991 名 A 省持枪民警进行初测问卷调查已检验初测问卷信效度。[结论]一级维度中情绪稳定性、积极态度、注意焦点、射击自信、注意疲劳、恐惧，Cronbach's Alpha 分别为 0.843、0.861、0.814、0.829、0.805、0.887，Cronbach's Alpha 系数符合大于 0.7 的基本标准,此初测问卷具有良好信度；调查数据的 KMO 检验值为 0.923，大于 0.70，说明该问卷适合进行因子分析。Bartlett 球度检验结果显示，近似卡方值为 15525.837，显著性概率为 0.000（P<0.01），因此拒绝 Bartlett 球度检验的零假设，认为量表适合做因子分析，效度结构较好；在因子分析过程中，采用主成分分析法（Principal Factor Analysis），抽取 6 个特征值大于 1 的公因子，结果发现 6 个因子的总方差解释率为 63.606%，大于 60%，所以认为量表的效度良好；以最大方差法正交旋转进行因子旋转，可将 30 个问题选项归类为 6 类因子，每个测量题项的负荷均高于 0.5，且不存在双重因子负荷均高的情况，且每个维度下的测量题项均按照理论分布聚合到一起，说明该问卷有很好的内容效度；将每个题项中的平均差异性进行独立样本 t 检验，经临界比项目分析可得 A26、A30 题项的 P 值均＞0.05，不存在显著的差异性，可从问卷中予以删除；其余题项 P 值均＜0.05，说明存在显著的差异性，小于临界值，可予以保留。

关键词 持枪；民警；心理选拔

Theoretical and applied research on psychological selection of gun-bearing police

Yang Jinhui

Police Political College, China People’s Police University

Abstract: [Objective]To explore the influence dimension of the psychological quality of armed police, and to compile a psychological selection scale for armed police. [Significance] The strength of psychological quality has a certain impact on whether the gun-bearing police can successfully complete the shooting task, and the gun-bearing police should maintain a good and stable psychological state when shooting at the target, in order to give full play to the usual shooting skills training and tactical training, and add psychological selection assessment to the assessment of the gun license, which is not only the need to improve the gun license assessment system, but also the urgent need to improve the overall shooting ability of the gun-bearing police, which has important research significance. [Research Methods] Summarize the current situation of psychological selection of gun-bearing police at home and abroad, refer to the psychological scales that have been maturely applied in other fields, determine the first-level psychological dimensions that affect gun-bearing police, namely emotional stability, positive attitude, attention focus, shooting confidence, attention fatigue and fear, divide the second-level dimension in the first-level dimension and compile 30 questions from the second-level dimension as the entry pool to form a preliminary test questionnaire, and use the hierarchical cluster random sampling method to conduct a preliminary test questionnaire survey on 991 gun-bearing police officers in Province A to test the reliability and validity of the preliminary test questionnaire. [Conclusion] Cronbach's alpha in the primary dimension of emotional stability, positive attitude, attention focus, shooting confidence, attention fatigue and fear, Cronbach's alpha was 0.843, 0.861, 0.814, 0.829, 0.805 and 0.887, respectively, and Cronbach's alpha coefficient met the basic criteria greater than 0.7, and this preliminary questionnaire had good reliability. The KMO test value of the survey data is 0.923, which is greater than 0.70, indicating that the questionnaire is suitable for factor analysis. The results of the Bartlett sphericity test show that the approximate chi-square value is 15525.837, and the significance probability is 0.000 (P<0.01), so the null hypothesis of the Bartlett sphericity test is rejected, and the scale is suitable for factor analysis and has a good validity structure. In the process of factor analysis, the principal component analysis method was used to extract six common factors with characteristic values greater than 1, and it was found that the total variance interpretation rate of the six factors was 63.606%, which was greater than 60%, so the validity of the scale was considered to be good. Factor rotation by orthogonal rotation of the maximum variance method can classify 30 question options into 6 types of factors, the load of each measurement item is higher than 0.5, and there is no situation where the double factor load is high, and the measurement items in each dimension are aggregated together according to the theoretical distribution, indicating that the questionnaire has good content validity; the average difference in each question item is tested for independent sample t, and A26 can be obtained by critical ratio item analysis. The P value of A30 items > 0.05, and there is no significant difference, which can be deleted from the questionnaire; the P value of the remaining questions < 0.05, indicating that there is a significant difference, which is less than the critical value and can be retained.

汉语阅读障碍儿童对不同心理旋转材料的加工特点

赵峰[1]　买合甫来提·坎吉[1]（通讯作者）

1 新疆师范大学心理学院，乌鲁木齐，830017，mkanji@163.com

摘 要　多项研究表明,阅读障碍儿童由于存在视空间认知能力上的缺陷,导致无法使用有效的视觉加工策略,从而表现为阅读上的困难。视空间认知能力可以从可视化、方向和心理旋转(MR)三个方面考察,其中,心

理旋转与阅读障碍的关系以及阅读障碍儿童在不同材料上的心理旋转特点是以往研究关注不多且存在争议的问题。因此,本研究采用标准瑞文智力测验、识字量测验和注意缺陷多动障碍 SNAP-IV 教师评估量表,从新疆乌鲁木齐四所小学三、四、五年级 1680 名小学生中筛选出了阅读障碍组儿童(检出率为 3.9%)和年龄匹配组儿童,并比较两组儿童在字母、汉字、图形三种不同材料上的心理旋转特点,以此考察汉语阅读障碍儿童在不同材料上的心理旋转特点。

研究为三个部分:

研究一考察了汉语阅读障碍儿童在字母材料上心理旋转的特点及加工策略。结果表明,旋转角度为 0°、60°和 120°时,阅读障碍组和对照组均呈现整体加工条件下的反应时小于局部加工条件下的反应时,即两组儿童都出现了整体加工优势。在整体加工条件下,旋转角度为 0°、60°、120°时,阅读障碍组和对照组的反应时随着旋转角度的增加而增大,即两组儿童在整体加工条件下都出现了心理旋转效应,但阅读障碍组的反应时明显比对照组长。在局部加工条件下,阅读障碍组和对照组的反应时随着旋转角度的增加没有产生明显的差异,两组儿童的反应时在各旋转角度下也没有明显差异。此外,180°旋转角度整体加工条件下对照组的反应时长于局部加工条件下的反应时,即出现了局部加工优势。而两种加工条件下阅读障碍组的反应时无明显差别。在正确率方面,组别的主效应显著,阅读障碍组的正确率明显低于对照组。

研究二考察了阅读障碍儿童在汉字材料上心理旋转的特点及加工策略。结果表明,在反应时方面,在汉字条件下,旋转角度为 0°、60°、180°时,阅读障碍组和对照组整体旋转的反应时显著小于局部旋转的反应时,出现了整体加工优势。在整体旋转条件下,阅读障碍组和对照组都表现为旋转角度为 0°、60°的反应时均显著小于 120°、180°,两组儿童在整体加工条件下都出现了心理旋转效应,且旋转角度为 0°、180°时,阅读障碍组的反应时显著小于对照组。在局部旋转条件下,无论何种旋转角度,阅读障碍组和对照组的反应时随各旋转角度的增加无显著差异,且阅读障碍组的反应时显著小于对照组。在正确率方面,阅读障碍组的正确率显著低于对照组。

研究三考察了阅读障碍儿童在图形材料上心理旋转的特点及加工策略。结果表明,在反应时上,图形材料整体旋转的反应时随着旋转角度的增加而显著增加,图形材料局部旋转在旋转角度上无显著差异;对照组整体加工的反应时小于局部加工的反应时,即出现整体加工优势,而阅读障碍组的整体加工的反应时与局部加工的反应时没有显著差异。在正确率上,旋转角度、旋转类型和组别的交互作用显著。在旋转角度为 0°、60°的条件下,对照组和阅读障碍组儿童都表现出整体旋转的正确率显著大于局部旋转的正确率,出现了整体加工优势,但是阅读障碍组在旋转角度为 180°条件下,表现为整体旋转的正确率显著小于局部旋转的正确率。在整体旋转条件下,当旋转角度为 0°、60°、120°、180°时,两组儿童的正确率也随旋转角度的增加而降低,即出现了心理旋转效应,且阅读障碍组的正确率均显著低于对照组。在局部旋转条件下,当旋转角度为 0°、60°、120°、180°时,旋转角度的正确率不随旋转角度的增加而变化,且无论哪个旋转角度,阅读障碍组的正确率均显著低于对照组。

根据上述实验结果,可得出以下结论:(1)汉语阅读障碍儿童在字母、汉字、图形中都表现出心理旋转加工的落后,而且这种落后在知觉编码阶段时就存在。(2)汉语阅读障碍儿童心理旋转的落后在不同文字材料上也表现出了一定的差异,即在更依赖于字形加工的表意文字——汉字中表现为整体加工和局部加工都落后;更加依赖于语音加工的拼音文字——字母中仅表现为整体加工上的落后。(3)汉语阅读障碍儿童在图形心理旋转时与正常儿童一样,对字母、汉字和图形三种材料中都出现了整体加工优先效应,并且在整体加工时,产生了心理旋转效应,即:对表象进行了操作。在局部加工时,没有产生心理旋转效应,即没有对表象进行操作。

Study on the Mental Rotation Characteristics of Children with Chinese Dyslexia in Different Materials

ZhaoFeng　Maihefulaiti·Kanji (Corresponding author)

School of Psychology, Xinjiang Normal University, Urumqi,830017, mkanji@163.com

***Abstract*:** Several studies have indicated that children with dyslexia have so far failed to develop effective visual processing strategies, and that some dyslexia are associated with visual-spatial deficits. Some dyslexia are associated with deficits of visual-spatial ability. Visual-spatial ability is divided into three main aspects: visualization, orientation and mental rotation (MR). However, the relationship between visual-spatial ability and reading ability is still a controversial issue. In this study, we selected children with Chinese dyslexia (n=66， the detection rate was 3.9%) and children with the age matching group (n=73) from 1680 primary school students in grade 3, grade 4 and grade 5 in four primary schools in Urumqi, Xinjiang. Using the standard Ruiwen Intelligence Test, Literacy Test and The Attention Deficit Hyperactivity Disorder (ADHD) SNAP-IV Teacher Assessment Scale. We carried out the mental rotation tests of letters, Chinese characters and graphics to investigate the visual spatial cognitive ability of children with Chinese dyslexia and Normal children.

The research is divided into three parts:

The first study investigated on the characteristics and processing strategies of mental rotation of dyslexic children in alphabetic materials. These results indicated that the interaction of rotation angle, rotation type and group is remarkable. When the rotation angles were，， and , both the dyslexia group and the control group showed that the speed of the global processing condition was faster than that the speed of the local processing condition, that is, the global processing advantage appeared. Under the global processing condition, when the rotation Angle was,, and ，the speed of the dyslexia group and the control group decreased with the increase of the rotation Angle, that is, both groups showed mental rotation effect under the global processing condition, but the responses of the dyslexia group were significantly longer than those of the control group.Under the condition of local processing, there was no found significant difference in the response of the dyslexia group and the control group with the increase of rotation Angle, and there was no significant difference in the response of the children in the two groups with the increase of rotation Angle.In addition, the speed of the control group on the global processing condition of ,was slower than the local processing, that is, the local processing advantage appeared. However, there was no significant difference in the response of the dyslexia group under the two processing conditions. In terms of accuracy, the main effect of the group was significant, and the accuracy of the dyslexia group was significantly lower than that of the control group.

The second study investigated on the characteristics and processing strategies of mental rotation of dyslexic children in Chinese character materials. The results presented that the interaction between angle of rotation and group was remarkable in terms of speed time,and Angle×group interaction was found.when the rotation Angle was ,and, the speed of global rotation of two groups were significantly faster than that of local rotation, showing global processing advantage.3Under the global rotation condition, both the dyslexia group and the control group showed that the rotation Angle of 0° and 60° were significantly less than and,and both groups showed mental rotation effect under the condition of overall processing. Moreover, when the rotation Angle wasand, the response time of the dyslexia group was significantly lower than that of the control group.Under the condition of local rotation, no matter what rotation Angle, the response time of the dyslexia group and the control group showed no significant difference with the increase of each rotation Angle , and the speed of the dyslexia group was significantly lower than that of the control group. In terms of accuracy, the main effect of the group was significant, and the accuracy of the dyslexia group was significantly lower than that of the control group.

The third study investigated on the characteristics and processing strategies of mental rotation of dyslexic children in graphic materials. The results revealed that the main effect of rotation Angle was significant in dyslexic children. The main effect of rotation type was significant. The interaction between rotation Angle and rotation type was significant. The simple effect test found that the global rotation of the graphic material increased significantly

with the increase of the rotation Angle, while the local rotation of the graphic material showed no significant difference in the rotation Angle. The interaction between groups and rotation types has significant edges. The simple effect test found that the response time of global processing in the control group was less than that of local processing, that is, the global processing advantage appeared, while the response time of global processing in the dyslexia group was not significantly different from that of local processing.The main effect of the group was not significant , while other interactions were not significant . In terms of accuracy, the interaction between rotation Angle, rotation type and group was significant. When the rotation Angle wasand, both groups showed that the accuracy rate of global rotation was significantly higher than that of local rotation, showing the advantage of overall processing. However, When the rotation Angle was 180°, the accuracy rate of global rotation in the dyslexic group was significantly lower than that of local rotation. Under the global rotation condition, when the rotation Angle was、、、and , the accuracy rate of children in the two groups also decreased with the increase of the rotation Angle, that is, the mental rotation effect appeared, and the accuracy rate of the dyslexia group was significantly lower than that of the control group. Under the condition of local rotation, when the rotation Angle is、、、and, the accuracy of the rotation Angle does not change with the increase of the rotation Angle, and no matter which rotation Angle, the accuracy of the dyslexia group is significantly lower than that of the control group.

According to the above experimental results, the conclusions can be drawn: (1) Chinese dyslexic children show a general lag in visuospatial cognition in all mental rotation of materials, which occurs in the perceptual coding stage and is not affected by mental rotation.(2) Chinese dyslexic children generally have backwarded mental rotation in all materials, but they have certain specificity in different writing materials. The ideographic characters, Chinese characters, which put more emphasis on the processing of glyphs, are the most backward. The second is more dependent on phonetic processing of pinyin characters - letters, only in the global processing there is backward.(3)Chinese dyslexic children, like normal children, have the global processing priority effect on the three materials of letters, Chinese characters and graphics, and the mental rotation effect is generated during the global processing, that is, the image is operated. In the local processing, there is no mental rotation effect, that is, there is no operation on the image.

贫困经历对青少年经济冒险行为的影响：COMT 基因多态性的作用

叶婉玉[1]　　窦凯[1]（通讯作者）　　陈丽羽[1]

1 广州大学教育学院青少年心理与行为研究中心， 广州， 510006

摘 要　贫困经历是指个体在成长过程中与贫困相关的不良生活经历。虽然全国脱贫攻坚任务已取得全面胜利，但我们仍然需要警惕脱贫人口再度返贫，并关注贫困经历对个体身心发展所带来的不利影响。本研究旨在探讨贫困经历是否以及为何影响青少年的经济冒险行为。经济冒险行为指个体在涉及货币风险时产生的偏好或行为。然而，贫困经历导致个体风险寻求还是规避尚未得出一致结论。研究 1a 采用中国综合社会调查(CGSS)数据库初步检验家庭经济状况与风险偏好的关系，结果表明贫困经历水平越高，个体风险寻求水平越低。此外，研究 1b 基于冷、热系统的视角，通过行为实验考察高、低贫困经历者（各 26 名大学生）在哥伦比亚卡片任务中的经济冒险行为。采用 2 (贫困经历：高、低) ×2 (决策环境：冷、热)的混合实验设计，其中决策环境为组内变量。在哥伦比亚卡牌任务的“热”版本中，被试选择纸牌后立即得到反馈，以诱发情绪加工过程；而在“冷”版本中，被试在任务结束前不会收到反馈，以避免情绪加工并激活理性分析过程。将被试在两个任务版本中翻牌的平均次数作为风险偏好的指标。结果显示：贫困经历与决策环境之间交互作用显著，在“热”版本中，高贫困经历者更倾向于风险寻求；而在“冷”版本中两组被试的风险决策无显著性差异。研究 2 从“基因×环境”交互视角，通过对 648 名青少年进行三次纵向追踪（间隔 6 个月）并采

集唾液进行基因检测，探讨贫困经历与COMT基因rs4680多态性交互影响青少年经济冒险行为的内在机制。结果显示：贫困经历通过削弱自我控制间接影响经济冒险行为；在携带 A 等位基因和 GG 基因的个体中，贫困经历均能显著预测自我控制，但携带 A 等位基因的青少年更容易受到贫困经历的影响。在高贫困经历下，携带 A 等位基因的个体自我控制能力较低，从而导致经济冒险行为增加。本研究有助于认识贫困经历对青少年经济冒险行为的影响及 COMT 基因 rs4680 多态性的调节作用，并为助推贫困个体的理性决策提供了理论和实践指导。

The impact of poverty experience on adolescent economic risk-taking behavior: The role of COMT gene polymorphism

Wanyu Ye[1]　Kai Dou[1]　Liyu Chen[1]

1 Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

***Abstract*：** Poverty experience refers to adverse life experiences related to poverty that individuals encounter during their developmental years. Despite achieving comprehensive victory in the national poverty alleviation campaign, there remains a need to remain vigilant against poverty relapse among formerly impoverished individuals and to address the detrimental effects of poverty experiences on individual psychosocial development. This research aims to explore whether and why poverty experiences influence economic risk-taking behavior in adolescents. Economic risk-taking behavior refers to an individual's preference or behavior concerning monetary risks. However, there is still no consensus on whether poverty experiences lead individuals to seek or avoid risks. In Study 1a, the relationship between family economic status and risk preference was preliminarily examined using data from the China General Social Survey (CGSS) database, and the results showed that higher levels of poverty experiences were associated with lower levels of risk-seeking behavior in individuals. Additionally, Study 1b, based on the perspective of the dual-process theory, conducted a behavioral experiment involving 26 university students with high and low poverty experiences each, to investigate their economic risk-taking behavior in the Columbia Card Task. A 2 (poverty experience: high, low) × 2 (decision context: hot, cold) mixed experimental design was utilized, with the decision context as a within-subject variable. In the "hot" version of the Columbia Card Task, participants received immediate feedback after choosing a card to induce emotional processing. In contrast, in the "cold" version, participants did not receive feedback until the end of the task to avoid emotional processing and activate rational analysis. The average number of card selections in both task versions served as an indicator of risk preference. The results indicated a significant interaction between poverty experience and decision context. In the "hot" version, individuals with high poverty experiences showed a greater tendency toward risk-seeking behavior, whereas there was no significant difference in risk decision-making between the two groups in the "cold" version. Study 2, adopting a gene-environment interaction perspective, conducted three longitudinal follow-ups (with a 6-month interval) on 648 adolescents and collected saliva samples for genetic testing to explore the underlying mechanism through which poverty experiences and the COMT gene rs4680 polymorphism interactively influence economic risk-taking behavior in adolescents. The results revealed that poverty experiences indirectly impacted economic risk-taking behavior by weakening self-control. Among individuals carrying the A

allele and the GG genotype, poverty experiences significantly predicted self-control, but adolescents with the A allele were more susceptible to the influence of poverty experiences. Under conditions of high poverty experiences, individuals with the A allele displayed lower self-control, leading to increased economic risk-taking behavior. This research contributes to the understanding of how poverty experiences affect economic risk-taking behavior in adolescents and the moderating effect of the COMT gene rs4680 polymorphism, providing theoretical and practical guidance to promote rational decision-making for individuals living in poverty.

成人 ADHD 症状与短视频问题使用的关系:结构方程模型分析

徐楚闲[1]　　庄乾[2]（通讯作者）

1 杭州师范大学认知与脑疾病研究中心，杭州，310000

2 杭州师范大学认知与脑疾病研究中心，杭州，310000，zq19910362@126.com

摘要　成人注意缺陷/多动障碍（ADHD）个体通常伴随严重的情绪失调，且其与个体的焦虑、抑郁等内化症状以及问题行为等外化症状密切相关。同时，大量的研究发现个体的 ADHD 症状水平和网络成瘾密切相关，其中，短视频的问题使用正在引发越来越多的关注。虽然已有的成瘾 I-PACE（the Interaction of Person-Affect-Cognition-Execution）模型提出,个体的病理性特质水平会影响情绪和认知反应，进而影响成瘾行为的发展，但是情绪失调及其相关的内化症状是否可以解释个体的 ADHD 症状水平和短视频问题使用之间的关系，目前尚不清楚。因此，本研究基于成瘾的 I-PACE 模型，纳入认知重评、情绪困扰(包括抑郁和焦虑)和无聊倾向等相关因素，运用结构方程模型来考察成人的 ADHD 症状和短视频使用之间的关系。我们通过在线调查平台招募了 563 名中国大学生（Male=283；Mean±SD=19.85±1.56），对他们的成人 ADHD 症状、情绪调节能力、情绪困扰、无聊倾向和短视频问题使用进行了评估。结果发现，个体的 ADHD 症状水平可以显著正向预测短视频问题使用(β=0.34,p=0.000)。并且，认知重评、情绪困扰和无聊倾向在个体的 ADHD 症状水平和短视频问题使用之间存在显著的链式中介作用(Estimate=0.005,95%CI=[0.001, 0.014])（图 1）。另外，我们分别以 ADHD 症状的两个分维度（多动-冲动和注意缺陷）为自变量进行探索性分析，发现认知重评、情绪困扰和无聊倾向仅在个体的多动-冲动水平和短视频的问题使用之间存在显著的链式中介效应(Estimate=0.009,95%CI=[0.004,0.020])（图 2）；但是，这一效应在个体的注意缺陷程度和短视频问题使用之间不显著(Estimate=0.003,95%CI=[-0.001,0.010])（图 3）。综上，该研究表明，成人的 ADHD 症状水平，尤其是多重-冲动维度，可以通过影响认知重评、情绪困扰和无聊进而影响短视频问题使用。本研究不仅有助于理解个体的 ADHD 症状水平与短视频问题使用之间的关系，而且对于临床上 ADHD 个体短视频成瘾的干预和治疗有着非常重要的意义。

Adult ADHD Symptoms and Short-video Problematic Use: a Structural Equation Modeling Analysis

Chuxian Xu[1],　Qian Zhuang[*]

Cognitive Center of Brain Disease, Hangzhou Normal University, Hangzhou, China

Abstract: Adult attention deficit/hyperactivity disorder (ADHD) is usually accompanied by severe emotion dysregulation, which is closely related to the internalizing symptoms such as anxiety and depression and external

symptoms such as behavior problem. At the same time, a large number of studies found that ADHD symptoms are linked to internet addiction, among which short-video problematic use is attracting more and more attention. The I-PACE(The Interaction of Person-Affect-Cognition-Execution) model proposes that individual's psychopathology symptoms will affect the emotional and cognitive responses, thus affecting the development of addictive behaviors. However, it is so far unclear whether emotion dysregulation and the associated internalizing symptoms can explain the relationship between ADHD symptoms and short-video problematic use. This study use structural equation modeling to examine the associations between adult ADHD symptoms and problematic short-video use through cognitive reappraisal, emotion distress (consisted of depression and anxiety) and boredom proneness. We recruited 563 college students from China through online survey platform and assessed their adult ADHD symptoms, emotion regulation, emotion distress, boredom tendency and problematic short-video use. Results showed that adult ADHD symptoms positively predicted short-video problematic use (β= 0.34, p= 0.000) and revealed a serial mediating effect of cognitive reappraisal, emotion distress and boredom proneness (Estimate=0.005, 95%CI=[0.001, 0.014])(Figure1). In the further exploratory analysis, we took sub-dimensions of ADHD symptoms (hyperactivity-impulsivity and inattention) as independent variables respectively and found that the serial mediating effect of cognitive reappraisal, emotional distress and boredom proneness only existed between hyperactivity-impulsivity and short-video problematic (Estimate=0.005, 95%CI=[0.001, 0.014])(Figure2). The effect was not significant between inattention and short-video problematic use (Estimate=0.003, 95%CI=[-0.001,0.010])(Figure3). Together these findings suggest that ADHD symptoms, especially hyperactivity-impulsivity, are associated with low cognitive reappraisal, high emotion distress and boredom proneness, and thus contribute to the development of short-video problematic. This study not only helps to understand the relationship between the adult ADHD symptoms and the problematic use of short-video, but also has important influence on the intervention and treatment of short-video addiction in ADHD individuals.

解释水平对他人记忆再认的影响：行为学与 fNIRS 的证据

何潇雯[1] 田紫晴[1] 张雅婷[1] 马伟军[2]（通讯作者）

1 华东师范大学心理与认知科学学院，上海，200062

2 华东师范大学心理系，上海，200062，wjma@psy.ecnu.edu.cn

摘 要 解释水平指个体对认知对象的心理表征的抽象程度。按照解释水平理论，不同解释水平引起的表征差异会影响记忆再认。本研究预测解释水平越低，个体对他人的加工则越具体，加工难度小因而大脑额叶激活更小，记忆再认效果更好。但以往研究缺少相关的行为学证据以及对其中神经机制的探讨。本研究旨在分别通过两个实验以直接和间接两种方式操纵解释水平，利用行为学和 fNIRS 手段探讨解释水平对他人相关记忆的影响机制。

实验一通过社会距离直接操纵解释水平，采用自变量为社会距离远近（亲友、生人）的单因素被试内设计，以语义参照为对照。要求被试完成自我参照效应的行为学实验。在学习阶段向被试呈现不同参照条件下的形容词，同时使用 fNIRS 记录额叶皮层血氧水平变化数据。再认阶段被试对学习阶段出现过的形容

词进行再认。结果表明：相较于社会距离较远的生人参照（高解释水平），社会距离较近的亲友参照（低解释水平）条件下，记忆再认效果更好，同时背外侧前额叶皮层激活更低，且左侧背外侧前额叶区域的差异更显著。

实验二则采用 How/Why 任务间接操纵解释水平，采用 2（解释水平：高、低）×2（参照条件：鲁迅、语义）的双因素混合设计，其中，解释水平为被试间变量，参照条件为被试内变量。首先通过 How/Why 任务分别启动两组被试自身的解释水平为高或低。行为学实验和 fNIRS 记录流程与实验一相同。结果表明：相较于 Why 任务条件（高解释水平），How 任务（低解释水平）条件下记忆再认效果更好，同时背外侧前额叶皮层激活更低、且左侧差异更显著。

总体而言，本研究发现通过直接和间接方法均可操纵解释水平来影响个体对他人的记忆效果,且效果一致。相比于高解释水平，当个体处于低解释水平时，倾向于采用更加具体化的表征方式、进行更精细化加工，认知加工难度较低，记忆效果更好，神经层面则表现在背外侧前额叶皮层的激活程度较低（特别是左侧背外侧前额叶），该结果也提示左侧背外侧前额叶的激活与解释水平对他人认知加工的影响有关。

The Effect of Construal Level on Others' Memory Recognition: Evidence from Behavioral and fNIRS

Xiaowen He[1] Ziqing Tian[1] Yating Zhang[1] Weijun Ma[2]
College of Psychology and Cognitive Science, East China Normal University, Shanghai

***Abstract*:** The construal level(CL) refers to the degree of abstraction of an individual's mental representation of objects, and different levels of representation of others may affect an individual's memory recollection of others. In this study, we hypothesized that the lower the CL, the more concrete the individual's processing of the other person is, and the less difficult it is to process the others-reference information, and thus the frontal lobe is less activated, resulting in a better memory recollection. However, there is a lack of behavioural evidence and exploration of the neural mechanisms involved. Therefore, the present study aimed to manipulate the CL both directly and indirectly, and to explore the mechanism of CL on others' memory from behavioural and fNIRS evidence.

Experiment 1 directly manipulated the CL by setting different social distances. It adopted a within-subjects design in which the independent variable was social distance (relatives and friends, strangers) and added a semantic reference condition as control. Participants were required to complete the self-reference effect paradigm's behavioural experiment in which adjectives in different reference conditions were presented in the learning phase and appeared to be recognized in the next; data on changes in prefrontal cortex (PFC) blood oxygen levels during the learning phase were also recorded using fNIRS. The results showed that dorsolateral prefrontal cortex(dlPFC) activation was lower (the difference was more significant in the left dorsolateral prefrontal region) and memory recognition was better under the condition of friends and relatives (low CL) than strangers (high CL).

Experiment 2 indirectly manipulated the CL using the How/Why task. It adopted a 2 (CL: high, low) × 2 (reference condition: Lun Xun, semantics) mixed design, in which the CL was a between-subjects variable and the reference condition was a within-subjects variable. The How task was used to control the CL of one group of participants to be high, and the Why task was used to control the CL of the other group to be low. Behavioural experiments and fNIRS recording procedures were the same as in Experiment 1. The results showed that memory recapture was better in the How task (low CL) condition compared to the Why task condition (high CL), while dlPFC activation was lower and the left side difference was more significant.

In conclusion, the present study found that the experimental results obtained by directly and indirectly

manipulating the CL were consistent: compared to the high CL, when individuals are at low CL, they tended to adopt a more specific representation, to fine-tune the processing of others' associative information, which resulted in a lower difficulty in processing and a better memory effect, while at the neural level, the activation of the dlPFC was lower, especially in the left dlPFC, suggesting the relation between this functional brain area and the effect of CL on the cognitive processing of others.

同伴侵害与青少年自伤行为：心理痛苦的中介作用和情绪调节自我效能感的调节作用

李明远 鲁婷（通讯作者）柯美灵

湖北大学心理学系，武汉，430062，tinglu@hubu.edu.cn

摘 要 非自杀性自伤(non-suicidal self-injury，简称“自伤”)是指个体在没有自杀意图的情况下，故意对自己的身体组织造成伤害或疼痛的行为，青少年自伤行为在各国都已经成为了严重的公共卫生问题。由于同伴群体是青少年成长环境中的重要组成部分，而来自同伴的侵害又是导致青少年自伤的重要风险因素，因此，本研究将聚焦于同伴侵害对青少年自伤行为的影响作用。根据社会疼痛理论的观点，被同伴侵害的个体会感知到来自同伴群体的贬低与排斥，会使个体体验到一种由心理需要受阻而引起的被羞辱、内疚、愤怒等包围的精神痛苦状态（即心理痛苦）。而情绪调节是自伤的主要功能，个体可以通过自伤来减轻自己无法排解的愤怒、焦虑和感知到自己被同伴侵害引起的心理痛苦。此外，根据自伤的认知-情感模型，自我效能预期会影响个体的自伤行为，个体在低水平情绪调节自我效能感的情况下，很难抵制使用自伤手段来缓解负性情绪，即情绪调节自我效能感可能对青少年自伤行为有保护作用，可以调节心理痛苦与自伤行为之间的关系。本研究在社会痛苦理论和自伤的认知-情感模型的指导下，构建一个有调节的中介模型，检验心理痛苦在同伴侵害和青少年自伤行为之间的中介作用，以及情绪调节自我效能感对中介路径的调节作用。采用多维同伴侵害量表、心理痛苦量表、情绪调节自我效能感量表和青少年自我伤害行为量表对 528 名青少年进行调查,探讨同伴侵害对青少年自伤行为的影响及作用机制。结果表明:(1)同伴侵害可以显著正向预测青少年的自伤行为,心理痛苦在二者的关系中起中介作用;(2)情绪调节自我效能感调节了心理痛苦在同伴侵害和自伤行为之间的中介效应,调节作用在中介效应的后半段路径“心理痛苦→青少年自伤行为”中起调节作用,情绪调节自我效能感水平较高时,心理痛苦对自伤行为的正向预测作用有所减弱，本研究的结果为青少年自伤行为的预防和干预提供了理论依据，即提升青少年的情绪调节自我效能感，能有效减少其自伤行为的发生。

关键词 同伴侵害，心理痛苦，情绪调节自我效能感，自伤行为

Peer victimization and adolescent non-suicidal self-injury behavior: the mediating role of psychache and the moderating role of emotion regulation self-efficacy

Li Mingyuan, Lu Ting*, Ke Meiling

Faculty of Education, Hubei University, Wuhan

Abstract: Non-suicidal self-injury (NSSI) refers to the intentional act of causing harm or pain to

one's own body tissue without suicidal intent. Adolescent NSSI behavior has become a serious public health issue in many countries. As peer groups are an important part of the adolescent developmental environment, and peer victimization is a significant risk factor for adolescent NSSI, this study focuses on the impact of peer victimization on adolescent NSSI behavior. According to the perspective of the social pain theory, individuals who experience peer victimization perceive derogation and rejection from their peer group, leading to a state of psychological distress characterized by feelings of humiliation, guilt, anger, and other negative emotions resulting from thwarted psychological needs (i.e., psychache). Emotion regulation serves as the primary function of NSSI, as individuals can engage in NSSI to alleviate the anger, anxiety, and perceived psychological pain caused by peer victimization that cannot be resolved. Additionally, according to the cognitive-affective model of NSSI, self-efficacy expectations can influence an individual's NSSI behavior. When individuals have low levels of self-efficacy in emotion regulation, it becomes difficult for them to resist using NSSI as a means to alleviate negative emotions. The emotional regulation self-efficacy may potentially serve as a protective factor on adolescent self-harm behavior, as it can modulate the relationship between psychache and NSSI behavior. Guided by the cognitive-affective model of NSSI and the theory of social pain, this study constructs a moderated mediation model to examine the mediating role of psychache in the relationship between peer victimization and adolescent NSSI behavior, as well as the moderating role of emotion regulation self-efficacy in the mediating pathway. A survey was conducted with 528 adolescents using the Multidimensional Peer Victimization Scale, the Psychache Scale, the Emotion Regulation Self-Efficacy Scale, and the Adolescent NSSI Behavior Scale, to explore the impact of peer victimization on adolescent NSSI behavior and its underlying mechanisms. Results show that: (1) Peer victimization significantly positively predicts adolescent NSSI behavior, and psychache plays a mediating role in their relationship; (2) Emotion regulation self-efficacy moderates the mediating effect of psychache between peer victimization and NSSI behavior. The moderating effect is observed in the second half of the mediation path " psychache → adolescent NSSI behavior". When emotion regulation self-efficacy is higher, the positive predictive effect of psychache on NSSI behavior is weakened. The results of this study provide a theoretical basis for the prevention and intervention of adolescent NSSI behavior, suggesting that enhancing adolescent emotion regulation self-efficacy can effectively reduce the occurrence of NSSI behavior.

Keywords: Peer victimization, psychache, emotion regulation self-efficacy, non-suicidal self-injury behavior

摘 要　金钱奖赏加工系统的改变已被证实在药物成瘾的发展和维持中起着至关重要的作用。然而，聚焦海洛因使用者在金钱奖赏反馈加工的电生理机制研究还相对匮乏。为填补该空缺，本研究旨在探讨海洛因使用者在金钱奖赏反馈加工的电生理机制上是否存在异常。为此，本研究共招募了 57 名参与者（包括 29 名海洛因戒断者和 28 名健康对照组）。我们采用了 MIDT 任务结合 ERP 技术，以探讨海洛因使用者和健

康对照组在金钱奖赏反馈处理上的电生理差异。结果发现，与本研究的假设相反，所有参与者在奖赏任务上的反应速度和准确性都优于非奖赏任务。电生理结果则与实验预期一致。对反馈相关负波（FRN）的分析显示，在健康对照组中，金钱损失条件下诱发的 FRN 波幅更大，而在金钱获得条件下没有显著差异。然而，在海洛因使用者组中，金钱获得和损失条件下诱发的 FRN 波幅均没有显著差异。本研究结果表明，海洛因使用者的金钱奖赏反馈加工存在异常，具体表现为对金钱损失的敏感性降低。这种敏感性下降可能致使海洛因使用者忽略物质使用引发的消极结果而一味地沉湎于海洛因带来的奖赏体验。此外，金钱获得和损失结果引发的 FRN 异常可能源自前扣带回皮质(ACC)功能异常，未来研究可以结合功能性磁共振成像来考察海洛因使用者在金钱奖赏加工反馈中 ACC 的激活状况是否正常，从而进一步的揭示海洛因戒断者金钱损失敏感性降低的脑神经机制。

2School of Education, Henan Normal University, Xinxiang City, Henan Province, 453007

Abstract: This study aimed to investigate the electrophysiological mechanisms underlying the processing of monetary reward feedback among individuals experiencing heroin withdrawal. Previous research has shown the importance of alterations in the monetary reward system in drug addiction, but there is a lack of research specifically focusing on heroin users. To address this gap, we conducted a study with 57 participants, including 29 male inpatients currently abstinent from heroin addiction and 28 healthy controls. We utilized the MIDT task along with ERP technology to examine any differences in electrophysiological responses to monetary reward feedback between the two groups. Contrary to our initial hypothesis, all participants performed faster and more accurately in the reward task compared to the non-reward task. The electrophysiological findings aligned with our expectations, as analysis of feedback-related negativity (FRN) showed that the healthy control group exhibited a significantly more negative amplitude of FRN in response to monetary loss outcomes, with no significant difference in response to monetary gain conditions. However, the heroin user group displayed no significant differences in FRN amplitudes for monetary gain and loss outcomes. These results suggest that heroin users have abnormalities in processing feedback related to monetary rewards, resulting in reduced sensitivity to monetary loss. This diminished sensitivity may lead heroin users to overlook the negative consequences of substance use and become excessively indulged in the rewarding experience brought by heroin. Moreover, the abnormal FRN triggered by monetary gain and loss outcomes may originate from functional abnormalities in the ACC region. Future research could incorporate fMRI technology to examine whether the activation status in heroin users during monetary reward processing feedback is normal. This would provide a deeper understanding of the neural mechanisms underlying the reduced sensitivity to monetary loss in individuals undergoing heroin withdrawal.

城中村居民典型梦与心理健康的关系

李宇航[1]、邹学[2]、解缤[1]（通讯作者）
1 西安体育学院，陕西西安，710068，xiebin0320@163.com
2 西安国际医学中心，陕西西安，710119

摘 要　精神分析理论认为梦是研究个体潜意识的最直接材料，而意识与潜意识的是否存在冲突是影响着个体心理健康水平的重要因素。Lamis 等人发现，噩梦造成的损害与抑郁呈显著的正相关关系。城中村居民由于其特殊的生活环境，使得这一样本的研究具有特殊意义。本论文通过对城中村居民典型梦与心理健康的调查，旨在探索梦与心理健康之间的关系，并为进一步探查心理健康的内在潜意识机制以及更好地为城中村居民提供心理服务提供理论依据。

方法：采用典型梦的问卷中文版和 SCL-90 自评量表，通过随机取样的方式对西安市 1190 名城中村居民的心理健康状况和典型梦的主题进行了调查，采用 t 检验、相关分析和 Logistic 回归分析。

结果：（1）城中村居民出现频率最高的五个梦的主题是“坠落”48.10%，“学校、老师、学习”46.40%，“被追赶但是身体没有受伤”44.39%，“享用美食”41.08%，“反复尝试做某事”40.34% 。（2）SCL-90 中的人际关系敏感、强迫症状因子和总分为阴性的时候，出现频率最高的梦为“学校、老师、学习”；而这两个因子阳性情况下出现概率最高的梦为“坠落”。“坠落”代表恐惧情绪。（3）城中村居民 SCL-90 总分与主题为“享用美食”不存在显著性相关（r=0.044，p>0.05），与“被追赶”、“被攻击”“反复做某事”“被锁起来”存在显著正相关（r=0.350,r=0.387,r=0.380,r=0.405，p<0.01），这些主题的梦象征外界伤害，说明 SCL-90 总分与被伤害的潜意识情绪相关。（4）以 SCL-90 各因子为自变量，典型梦的主题为因变量做回归分析发现，强迫因子对“坠落”主题存在预测作用（b=0.827,p=0.002<0.01），即强迫因子可以预测潜意识中的恐惧情绪；偏执因子对“飞翔”主题存在预测(b=0.698,p=0.004<0.01)，即偏执因子可以预测潜意识中的自恋情结，；抑郁因子对“学校、老师”主题存在预测(b=-0.669,p=0.039<0.05)，即抑郁因子可以预测被教育和被限制的情绪；躯体化因子对“考试失败”主题存在预测（b=0.557,p=0.029<0.05）即躯体化因子可以预测挫败无助的情绪。

结论：SCL-90 各个因子及总分与不同主题典型梦存在着显著性相关。SCL-90 中强迫、偏执、躯体化等因子可以预测主题带有恐惧、自恋、被教育、挫败的梦。

The Relationship between Typical Dreams and Mental Health of Residents in Village-in-city

LI Yuhang[1], ZOU Xue[2], XIE Bin[1] (corresponding author)
1 Xi'an Institute of Physical Education, Xi'an, Shaanxi, 710068, xiebin0320@163.com
2 Xi'an International Medical Center, Xi'an, Shaanxi, 710119

Abstract:

Psychoanalytic theory believes that dreams are the most direct material for studying an individual's subconscious, and whether there is a conflict between consciousness and subconscious is an important factor affecting the individual's mental health. Lamis et al. found that the damage caused by nightmares was significantly positively correlated with depression. The study of this sample is of special significance due to the special living environment of urban village residents. By investigating the typical dreams and mental health of urban village residents, this paper aims to explore the relationship between dreams and mental health, and provide a theoretical basis for

further exploring the inner subconscious mechanism of mental health and better providing psychological services for urban village residents.

Aim: Following the relatively small number of studies on the dreams of urban village residents, this study hopes to understand the content of typical dreams of urban village residents, and explore the relationship between typical dreams of urban village residents and mental health, so as to help them later.

Methods: This study used the Chinese version of the Typical Dreams Questionnaire and Symptom Checklist 90 (SCL-90) to investigate the mental health status and typical dream themes of 1,190 residents in a village-in-city in Xi'an recruited by random sampling. Correlation analysis, t-test, and binary regression analysis were performed on the data using SPSS 24.0.

Results: (1) The themes of the five dreams that occur most frequently among urban village residents are "falling" 48.10%, "school, teachers, study" 46.40%, "being chased but not physically injured" 44.39%, "enjoying food" 41.08%, and "repeatedly trying to do something" 40.34%. (2) When the interpersonal sensitivity, obsessive-compulsive symptom factor and total score in SCL-90 were negative, the dream with the highest frequency was "school, teacher, study"; The dream with the highest probability of occurrence when these two factors are positive is "falling". "Falling" represents fear. (3) The total score of SCL-90 for urban village residents was not significantly correlated with the theme of "enjoying food" ($r=0.044$, $p>0.05$).There was a significant positive correlation with "being chased", "attacked", "doing something repeatedly", and "locked up" ($r=0.350$, $r=0.387$, $r=0.380$, $r=0.405$, $p<0.01$), and the dreams of these themes symbolized external damage, indicating that the total score of SCL-90 was related to the injured subconscious emotions. (4) Taking the SCL-90 factors as the independent variables and the theme of typical dreams as the dependent variable, regression analysis showed that the obsessive-compulsive factors had a predictive effect on the "falling" theme ($b=0.827$, $p=0.002<0.01$), that is, the obsessive-compulsive factors could predict the fear in the subconscious; The paranoid factor predicted the theme of "flying" ($b=0.698$, $p=0.004<0.01$), that is, the paranoid factor could predict the narcissistic complex in the subconscious. Depressive factors predicted the theme of "school, teacher" ($b=-0.669$, $p=0.039<0.05$), that is, depressive factors could predict the mood of education and limitation; Somatization factors predict the topic of "exam failure" ($b=0.557$, $p=0.029<0.05$), that is, somatization factors can predict frustration and helplessness.

Conclusion: The SCL-90 factors and total scores were significantly correlated with typical dreams of different themes. Factors such as obsessive-compulsive, paranoid, and somatization in SCL-90 can predict dreams with fearful emotions.

同源词与同形异义词在汉日二语者阅读中的激活

郭紫璐　刘道一　王永胜

天津师范大学心理学部，天津，300387，wangyongsheng@tjnu.edu.cn

摘 要　二语者在识别二语词汇时，母语词汇的意义和二语词汇的意义是否会被同时激活是研究者关注的一个焦点问题。以往有研究者以双语同源词和同形异义词为实验材料对该问题进行了探讨。发现了二语者在识别二语词汇时，词汇的母语意义与二语意义均被非选择性激活，既表现出同源词效应和同形异义词效应，但有研究发现了同源词的促进效应，而有研究则发现了同源词的干扰效应，研究结果并不一致。这可能与不同研究所采用的研究任务不同所造成。为此，我们首先在实验一采用词汇判断任务，由 30 名汉日二语者判断呈现的汉-日同源词、汉-日同形异义词、日语词是否为日语词汇，结果发现汉-日同源词、汉-日同形异义词词汇判断的正确率低于日语词，且汉-日同源词的反应时相较于日语单词更长，表现为同源词干扰效应。为进一步探讨二语词汇意义的激活是否受语境的影响，实验二将汉-日同源词、汉-日同形异义词和汉语词

嵌入汉语句子中，使用眼动仪记录 25 名汉日二语者的阅读过程。结果并未发现显著的同源词效应或同形异义词效应，没有证据表明在阅读汉语句子时，目标词的二语意义得到了激活。实验三将汉-日同源词、汉-日同形异义词和日语词嵌入到日语句子中，使用眼动仪记录他们的阅读过程。结果发现汉-日同源词的首次注视时间、凝视时间、回视路径时间和总注视时间均显著短于日语词汇，跳读率显著高于日语词汇，在总注视时间上显著短于同形异义词，既表现出了同源词促进效应；同形异义词的凝视时间和回视路径时间显著短于日语词汇，既表现出了同形异义词促进效应。

本研究结果表明，汉日二语者在识别汉日同源词和同形异义词时表现出语言非选择性激活，即识别正字法相同的词汇时，母语词汇知识与二语词汇知识均激活，符合 BIA+模型的预期。

Activation of Cognates and Interlingual Homographs in the Reading of Chinese-Japanese Bilinguals

Guo Zilu[1]; Liu Daoyi[1]; Wang Yongsheng[1]
(1 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387)
E-mail: wangyongsheng@tjnu.edu.cn

Abstract: In the recognition of second language vocabulary, whether the meanings of native language words and second language words are simultaneously activated has been a focal point of investigation for researchers. Researchers have previously investigated this issue using bilingual cognates and interlingual homographs as experimental materials. It has been found that second language learners exhibit non-selective activation of both native language lexical meanings and second language lexical meanings during the recognition of second language words, showing both cognate effects and interlingual homograph effects. However, research findings have been inconsistent, with some studies demonstrating a facilitation effect of cognates while others revealing interference effects. This variation in results could be attributed to the different research tasks employed in various studies. To address this, we initially utilized a lexical decision task in Experiment 1, where 30 Chinese-Japanese bilinguals were asked to determine whether presented Chinese-Japanese cognates, Chinese-Japanese interlingual homographs, and Japanese words were actual L2 vocabulary. The results revealed that the accuracy of Chinese-Japanese cognates and Chinese-Japanese interlingual homographs was lower compared to L2 words, and the reaction time for Chinese-Japanese cognates was longer than that for L2 words, indicating the presence of a cognate interference effect.

To further explore whether the activation of second language lexical meanings is influenced by context, Experiment 2 involved embedding Chinese-Japanese cognates, Chinese-Japanese interlingual homographs, and L1 words within L1 sentences, and eye-tracking technology was used to record the reading processes of 25 Chinese-Japanese bilinguals. The results did not reveal significant cognate effects or interlingual homograph effects, providing no evidence that the second language meanings of target words were activated during the reading of Chinese sentences. In Experiment 3, Chinese-Japanese cognates, Chinese-Japanese interlingual homographs, and L2 words were embedded within L2 sentences, and eye-tracking technology was employed to record bilinguals' reading processes. The results indicated that the first fixation duration, gaze duration, regression path duration, and total fixation duration on Chinese-Japanese cognates were significantly shorter compared to L2 words, and the skipping rate was significantly higher than that for L2 words. Additionally, the total fixation duration was significantly shorter compared to interlingual homographs, demonstrating the presence of a cognate facilitation effect. The gaze duration and regression path duration on interlingual homographs were significantly

shorter compared to L2 words, thus demonstrating the presence of interlingual homograph facilitation effect.

The findings of this study suggest that Chinese-Japanese bilinguals exhibit language non-selective activation during the recognition of Chinese-Japanese cognates and interlingual homographs. This means that both L1 and L2 lexical knowledge are activated when identifying words that share the same orthography, consistent with the predictions of the Bilingual Interactive Activation Plus (BIA+) model.

阈上和阈下情感性启动对运动情感反应的影响

邵韵如[1]　郭璐[2]（通讯作者）

1 北京体育大学心理学院，北京，100084

2 北京体育大学心理学院，北京，100084，guol@bsu.edu.cn

摘 要　背景：对运动的情感反应是后续身体活动的预测因素之一，通过情感性启动改善对运动的情感反应是促进身体活动的有效方法。运动强度影响对运动的情感反应，在不同强度的运动中，阈上和阈下启动可能产生不同的效果。本研究基于双过程模型，探讨情感性启动对中等和高强度运动的情感反应的影响。方法：49 名无锻炼习惯的大学生(女：40 人)参与了本研究。采用 2 (组间因素为运动强度：中等强度，高强度) × 4 (组内因素为启动类型：阈上启动，阈下启动，分心对照，空白对照)的混合实验设计。启动任务为改编后的词汇决定范式，参与者在跑步的同时完成包括 3 个 block 的启动任务，每个 block 结束时测量其情感效价及唤醒程度，在运动结束后测量参与者回忆及预期的愉悦感，并且在运动前后分别测量瞬时心境状态。中等和高强度运动中参与者的平均心率分别为 149.27 ± 5.43 次/分钟和 166.14 ± 6.47 次/分钟。结果：1) 测量时间点和启动类型对运动中情感效价的交互作用显著($F(9, 45) = 3.56$, $p < .001$, 偏$\eta^2 = 0.19$)，在 block3 结束时，阈上和阈下启动组的情感效价高于分心对照组，其他时间点无显著差异。测量时间点和启动类型对运动中唤醒程度的主效应及交互作用不显著。 2) 强度和启动类型对回忆愉悦感的主效应和交互作用不显著，二者对预期愉悦感的交互作用显著($F(3, 45)= 5.07$, $p = 0.004$, 偏$\eta^2 = 0.25$)，中等强度运动中，阈上启动组的预期愉悦感显著高于空白对照组；高强度的运动中，阈下启动组的预期愉悦感显著高于分心和空白对照组。3) 强度、测量时间点和启动类型对瞬时心境状态的愉悦感维度的交互作用边缘显著($F(3, 45) = 2.523$, $p = .070$, 偏$\eta^2 = 0.14$)，中等强度运动中，阈上启动组运动后的愉悦感显著高于运动前；在高强度运动中，仅阈下启动组在运动后的愉悦感高于运动前(边缘显著)。结论：1) 阈上和阈下启动有效提升了对中等和高强度运动的情感效价。2) 中等强度的运动中，阈上启动对于提升预期愉悦感、改善心境状态更有效；在高强度运动中，阈下启动对于提升预期愉悦感、改善心境状态的作用更大。

The effect of supraliminal and subliminal affective priming on affective responses to exercise

SHAO YunRu, GUO Lu

School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract：Background: Affective responses to exercise is a key predictor of future exercise, and improving affective responses to exercise through affective priming is an effective way to increase exercise. Intensity is another important variable affecting the affective response to exercise, and in different intensity of exercise, supraliminal and subliminal priming may have different effects. The current study was based on the dual-process

model to investigate the effects of affective priming on affective responses to exercise of moderate and high intensity. Methods: Participants in the current study were 49 undergraduates with no exercise habits. A mixed experimental design of 2 (exercise intensity: moderate intensity, high intensity) × 4 (affective priming type: supraliminal priming, subliminal priming, distraction control, blank control) was adopted, with exercise intensity as the within-subject factor and affective priming type as the between-subject factor. The modified lexical decision task was used as the priming task. Participants were asked to complete the priming task while running. The priming task consisted of three blocks and affect valence and feeling arousal were measured at the end of each block. Moreover, recalled and anticipated pleasure were measured at the end of the exercise. And momentary mood states were measured before and after the exercise. The average heart rate of during moderate- and high-intensity exercise was 149.27 ± 5.43 beats/min and 166.14 ± 6.47 beats/min, respectively. Results: 1) The interaction of measured time point and priming type on affective valence during exercise was significant (F(9, 45) = 3.56, p <.001, partial η^2 = 0.19). At the end of block3, the affective valence of supraliminal and subliminal priming groups was higher than that of the distracted control group, but there was no significant difference at other time points. There was no significant difference in feeling arousal among different groups. 2) Intensity and group had no significant interaction or main effect on recalled pleasure (F(3, 45)= 1.36, p = 0.267), but had a significant interaction on anticipated pleasure (F(3, 45)= 5.07, p = 0.004, partial η^2 = 0.25). The anticipated pleasure of supraliminal priming group was significantly higher than that of blank control group, and the anticipated pleasure of subliminal priming group was significantly higher than that of the distracted and blank control group during high-intensity exercise. 3) Intensity, measured time point and group had a marginally significant interaction on the pleasure dimension of instantaneous mood state (F(3, 45) = 2.52, p =.070, partial η^2 = 0.14). In moderate-intensity exercise, the pleasure measured after exercise was significantly higher compared with before exercise in supraliminal priming group. In high-intensity exercise, only the subliminal priming group showed higher pleasure after exercise (marginally significant). Conclusions: 1) Supraliminal and subliminal priming can improve the affect valence during moderate- and high-intensity running. 2) In moderate-intensity exercise, supraliminal priming is more effective in improving anticipated pleasure and mood states, while in high-intensity exercise, subliminal priming is more effective in improving anticipated pleasure and mood states.

青少年创伤后应激障碍和抑郁症贸然定论状况及心理机制研究

陈晓丽[1] 曹亚维[1] 黎亚琳[1] 耿富磊[2]

1 江西师范大学心理学院，南昌，330022

2 江西师范大学心理学院，南昌，330022，fl-geng@163.com

摘 要 **背景：**大量研究报道创伤后应激障碍（PTSD）和抑郁症个体存在注意、记忆、执行功能等认知加工的异常，但是有关其推理加工状况的研究较少。基于贝叶斯理论模型，本研究采用两个版本的珠子任务评估青少年 PTSD 个体和抑郁个体贸然定论状况、探讨贸然定论产生的可能心理机制，进一步检验临床症状、工作记忆、执行功能与贸然定论的关系。**方法：**采用简明国际神经精神访谈（MINI 6.0）筛查入组 23 名青少年 PTSD 个体、30 名青少年抑郁个体和 32 名健康对照组，选取经典珠子任务范式和带有情绪效价的珠子范式的变式评估贸然定论，字符数字广度和计算机版本 Stroop 测验评估工作记忆和执行功能，创伤后应激障碍筛查量表、抑郁-焦虑-压力量表和容忍不确定性问卷测量临床症状和不确定容忍性。**结果：**首先，PTSD 组、抑郁组和对照组被试贸然定论比例分别约为 26%、28%和 18%,无显著性差异，同时三组被试抽取信息的次数无显著差异。其次，决策的确定性水平分析表明，在情绪珠子任务的低难度水平上 PTSD 组和抑郁组的平均决策阈限显著高于对照组，同时在所有版本任务和所有难度水平上，对照组决策前的确定

性水平均高于其余两组，但统计学上不显著。第三，反应时分析结果表明，经典珠子任务低难度水平上，PTSD 组和抑郁症组反应时显著高于对照组。再有，抑郁组中抽取信息次数与各种临床症状显著负相关，决策前的确定性水平与临床症状和无法容忍不确定性负相关，PTSD 组中决策前的确定水平与 PTSD 症状显著负相关；最后，所有结果在控制了工作记忆和执行功能后均无显著变化。**结论：**独立于工作记忆和执行功能状况，青少年中 PTSD 个体和抑郁个体决策阈限较低。尽管 PTSD 和抑郁贸然定论比例无明显升高，但贸然定论与临床症状严重程度相关。无法容忍不确定性和较低的决策阈限可能是情感障碍个体贸然定论的机制。未来的研究需要大样本被试用维度的测试方法重复验证 PTSD 和抑郁贸然定论状况。

Jumping to conclusion and its related psychological mechanisms in adolescent PTSD and Major Depressive Disorder

Xiaoli Chen, Yawei Cao, Yalin Li, Fulei Geng*

School of Psychology, Jiangxi Normal University, Nanchang, China

Corresponding author: Fulei Geng, School of Psychology, Jiangxi Normal University, 99 Ziyang Ave, Nanchang, Jiangxi 330022, China

Abstract **Background:** A large number of studies have reported abnormalities in cognitive processing such as attention, memory, and executive function in individuals with post-traumatic stress disorder and depression, but there is less research on the status of their reasoning processing. Based on Bayesian theoretical modeling, this study used two versions of the bead task to assess the status of jumping to conclusion(JTC) in adolescents in PTSD and Major Depressive Disorder(MDD), to explore possible psychological mechanisms of JTC production, and to further examine the relationship between clinical symptoms, working memory, executive function, and jumping to conclusion. **Method:** The International Neuropsychiatric Interview (MINI 6.0) was used to screen into group of 23 adolescent with PTSD, 30 adolescent with MDD, and 32 healthy controls. Then the classical bead task paradigm and a variant of the bead paradigm with emotional valence were selected to assess JTC, the Letter-Number Span Test and computerized versions of the Stroop test to evaluate working memory and executive function, and the Posttraumatic Stress Disorder Checklist for DSM-5(PCL-5) the Depression Anxiety Stress Scale, and the Intolerance of Uncertainty Scale to measure clinical symptoms and intolerance of uncertainty. **Result:** Firstly, people with JTC were present in the PTSD group (26%), the MDD group (28%), and the control group (18%), but the difference in the proportion of subjects in the three groups was not significant, while there was no significant difference in the draw to conclusion (DTD) among the three groups of participants. Secondly, the analysis of the level of certainty in decision making showed that the average decision threshold was significantly higher in the PTSD and MDD groups than in the control group at the low difficulty level of the emotional bead task, while the level of certainty prior to final decision making was higher in the control group than in the other two groups at all versions of the task and all levels of difficulty, but not statistically significant. Thirdly, the results of the analysis of the reaction time revealed that the groups of PTSD and MDD had a significantly higher reaction time than the control group at the low difficulty level of the classic bead task. Furthermore, in the MDD group, DTD was significantly negatively correlated with various clinical symptoms, the level of certainty before decision making was negatively associated with clinical symptoms and intolerance of uncertainty, and in the PTSD group, the level of certainty prior to decision making was significantly negatively related to PTSD symptoms. Finally, all results did not show significant changes after controlling for working memory and executive function. **Conclusion:** Independent of working memory and executive functioning status, adolescents with PTSD and adolescents with

MDD have lower decision-making thresholds. Although the proportion of PTSD and MDD in jumping to conclusion was not significantly increased, jumping to conclusion was associated with the severity of clinical symptoms. Intolerance of uncertainty and lower decision thresholds may be potential mechanisms for jumping to conclusions in individuals with affective disorders. It is necessary for future studies to replicate the verification of status of jumping to conclusion in PTSD and MDD with a large-sample and a method of examining by dimension.

工作感恩对工作投入的影响：基本心理需求满足的中介作用

苏佳合　魏仓丕 赵晶晶 孔风（通讯作者）
陕西师范大学心理学院，西安，710062，kongfeng87@126.com

摘 要　工作投入对幸福感有显著的预测作用，是衡量员工幸福感的重要指标。但以往关于工作投入的研究主要集中在员工的心理状态这一主题上，很少有研究在积极心理学的框架下关注积极情绪对其的影响，如工作中的感恩。而根据自我决定理论，基本心理需求的满足可以决定个人的动机状态，促进个人的幸福感（如工作满意度和工作投入）以及工作绩效。因此，本研究通过构建一个中介模型，考察员工的工作感恩对工作投入的影响以及基本心理需求满足的中介作用。研究共有 536 名中国企业员工参与，采用了感恩量表、工作投入量表(UWE-9)和工作中的基本心理需求满足量表作为测量工具。结果表明：（1）工作感恩与工作投入有显著的正向相关关系；（2）基本心理需求满足在工作感恩和工作投入之间起部分中介作用，中介效应值为 0.451(95%CI = [0.343 , 0.542])；（3）多群组分析结果表明，中介效应不存在显著的性别差异，模型稳定。本研究发现，工作中的感恩对工作投入有积极影响，且基本心理需求满足在其中起中介作用。这给我们的启示是，组织管理者可以创造一个有利于满足员工基本心理需求的环境，从而提高员工的工作投入水平。

Gratitude at work and work engagement: The mediating role of basic psychological needs satisfaction

Jiahe Su [1], Cangpi Wei [1], Jingjing Zhao [1] and Feng Kong [1*]
[1] School of Psychology, Shaanxi Normal University, China
[*] School of Psychology, Shaanxi Normal University, Xi'an 710062, China. E-mail address: kongfeng87@126.com

Abstract： Work engagement is a significant predictor of well-being and an important indicator of employee happiness. Previous research on work engagement has mainly focused on the topic of employees' psychological states, but few studies are concerned about positive emotions such as gratitude at work within the framework of positive psychology. Furthermore, according to the self-determination theory, basic psychological needs satisfaction can determine an individual's motivational state and promote individual well-being (e.g. job satisfaction and work engagement) as well as high-quality performance. Therefore, by constructing a mediation model, the present study aimed to examine the impact of employees' gratitude at work on work engagement as well as the mediating role of basic psychological needs satisfaction. A total of 536 employees in China took part in the study and were asked to respond to a series of questionnaires consisting of the Gratitude Questionnaire, Utrecht

Work Engagement Scale, and Basic Need Satisfaction at Work Scale. The results show that: (1) Gratitude at work was significantly and positively associated with work engagement. (2) Basic psychological needs satisfaction partially mediated the influence of gratitude at work on work engagement with standardized effect value of 0.451 (95%CI = [0.343 , 0.542]). (3) The results of the multi-group analysis showed that there is no significant gender difference in the mediating effects and the model to be stable. The present study has discovered that gratitude at work have a positive impact on the work engagement with the mediating role of basic psychological needs satisfaction. This gave us the insight that organizational managers should create an environment conducive to meeting employees' basic psychological needs, thereby increasing their work engagement.

摘 要　**目的** 探讨动态血糖监测系统联合心理干预对 2 型糖尿病患者血糖控制、依从及焦虑情绪的影响。**方法** 便利选取我院 2023 年 2 月至 2023 年 6 月收治的 50 例住院 2 型糖尿病患者为研究对象,按照随机数字表法将其分为对照组（n=25)和试验组（n=25)，对照组采用常规健康教育，进行自我血糖监测。试验组患者出院前 1 日，专科护士为其佩戴 14 天动态血糖监测系统（continuous glucose monitoring system,CGMS），向患者介绍 CGMS 官方 APP 界面及使用方法，指导患者 APP 内规律饮食、运动拍照打卡记录并告知患者记录的重要性及意义。佩戴 CGMS1 周后，专科护士微信联系患者，个性化为其分析血糖图谱，引导患者及时调整自身行为。分析比较试验组干预前后 14 天平均血糖目标范围时间（TIR）及变异系数（CV）、依从性用 APP 打卡率表示（每日 4 次打卡（3 餐及 1 次运动记录），1 日内 2 次未拍照记录或 14 天期间 2 天以上未记录视为未打卡）、焦虑自评量表(Self-rating anxiety scale,SAS)评分。**结果** 干预后,25 名试验组患者 14 天平均 TIR 为 96.9%、平均变异系数为 20.2%；APP 打卡率（56%的患者按时拍照打卡 14 天（n=14)，44%人 2 天以上未打卡或者日内 2 次未拍照打卡(n=11))；试验组患者 SAS 评分降低程度较干预前高,差异有统计学意义(P<0.05)。**结论** 动态血糖监测系统联合心理干预患者血糖得以有效控制，依从性高，可改善 2 型糖尿病患者焦虑水平，临床应用效果较好。

Abstract: Objective To investigate the effects of dynamic blood glucose monitoring system combined with psychological intervention on blood glucose control, compliance and anxiety in patients with type 2 diabetes. **Methods** Fifty patients with type 2 diabetes admitted to our hospital from February 2023 to June 2023 were conveniently selected as the study objects, and were divided into control group (n=25) and experimental group (n=25) according to random number table method. The control group was given routine health education and self-glucose monitoring. On the day before discharge, the patients of the experimental group were given 14-day continuous glucose monitoring system (CGMS) by a specialist nurse, and the official APP interface and usage methods of CGMS were introduced to the patients. Guide patients to take photos of regular diet and exercise in the APP, and inform patients of the importance and significance of the record. After wearing CGMS1 for a week, the specialist nurse contacted the patient on wechat to analyze the blood glucose profile for him and guide him to adjust his behavior in time. The mean blood glucose target range time (TIR) and coefficient of variation (CV) for 14 days before and after intervention were analyzed and compared, and the compliance was expressed by APP punching rate (punching 4 times a day (3 meals and 1 exercise record). If no photo is taken twice within 1 day or no photo is recorded for more than 2 days within 14 days, it is regarded as no cD-in and Self-rating anxiety scale (SAS) score. **Results** After intervention, the average 14-day TIR of 25 experimental group patients was 96.9% and the average coefficient of variation was 20.2%. APP clocking rate (56% of patients took photos on time and clocking for 14 days (n= 14), 44% did not clocking for more than 2 days or 2 times within a day without taking photos (n=11)); SAS score of experimental group was lower than that before intervention, and the difference was statistically significant (P<0.05). **Conclusion** The dynamic blood glucose monitoring system combined with psychological intervention can effectively control the blood glucose of patients with high compliance, improve the anxiety level of patients with type 2 diabetes, and the clinical application effect is good.

Key words: Dynamic blood glucose monitoring systems, anxiety, Type 2 diabetes, blood glucose control, compliance, nursing interventions

两种注意模式的双任务训练的有效性与迁移性

郭雅馨[1] 管丽珍[1] 范少霞[1] 张佳[1] 查垚佳[1] 张浩波[1]（通讯作者）

1 深圳大学心理学院，广东深圳，518060，haobozh@foxmail.com

摘 要 **目的：**双任务（dual task）是指个体在同一时间执行两种不同性质的任务操作，涉及到认知控制、注意分配、双任务协调等认知功能。由于认知资源的竞争，在执行双任务时会出现心理不应期(Psychological Refractory Period)现象。但经过训练，双任务的表现可以通过认知资源的分配、整合以及自动化而得到提高。以往的双任务训练多采用双 N-back 任务范式或感觉运动等双任务范式。然而，日常生活中多出现的双任务情形是，在自上而下的注意控制过程中，突然出现一个自下而上的外界刺激需要给与注意。本研究基于这两种注意模式，设计出结合了 N-back 与 Oddball 任务的双任务训练程序，两个任务分别由视觉和听觉两个通道呈现刺激，并要求被试对两个任务均做出反应。通过与主动对照组的比较，本研究期望探究两种注意模式下的双任务训练程序的有效性与迁移性。**方法：**在深圳大学招募 70 名健康大学生，采用随机匹配的方法将被试分为双任务训练组与主动对照组（每组 *N*=35）。训练前后所有被试均使用 N-back、Oddball、双任务（Dual-task）和分配注意（Divided attention）任务进行认知功能评估。两组被试在训练前的认知功能表现均无显著差异。训练组每天进行双任务训练，对照组每天进行包括健康生活的科普知识学习，共 10 天（40 min/d）。本研究使用重复测量方差分析的统计方法检验两组在训练前后的行为改变上的差异。**结果：**与对照组相比，训练组在双任务成本、双任务试次的正确率、双任务试次的反应时的训练前后改变量上均存在显著差异，表现为成本降低（F=7.143，p=0.01），正确率提高（F =16.121，p<0.001），反应时缩短（F=14.071，

p<0.001）。与对照组相比，训练组在 N-back 任务行为的训练前后改变量上存在显著差异，表现为 2-back 的反应时缩短（F=14.660，p<0.001），3-back 的正确率提高（F =11.047，p =0.002），3-back 的反应时缩短（F =7.874，p=0.007）。与对照组相比，训练组的分配注意任务的混合成本在训练前后存在显著降低（F=4.166，p=0.046）。 **结论：**与主动对照组相比，本研究的双任务训练程序能提高自上而下注意任务的行为表现、降低双任务成本，其训练效果可以迁移到分配注意中。

Training effects and transfer effects of dual-task training in two attention modes

Guo Yaxin[1], Guan Lizhen[1], Fan Shaoxia[1], Zhang Jia[1], Zha Yaojia[1], Zhang Haobo[1]*
1 School of Psychology, Shenzhen University, Shenzhen, 518060

***Abstract*：** **Purpose:**Dual task refers to an individual performing two different tasks at the same time,involving cognitive functions such as cognitive control,attention allocation,and dual-task coordination.Due to the competition for cognitive resources,the phenomenon of Psychological Refractory will appear when performing dual tasks.But with training,dual-task performance can be improved through the allocation,integration,and automation of cognitive resources.In the past,dual-task training mostly used dual-task paradigms such as dual N-back tasks or sensorimotor dual tasks.However,the dual-task situation that often occurs in daily life is that in the process of top-down attentional control,a bottom-up external stimulus suddenly appears and requires attention.Based on these two attention modes,this study designed a dual-task training program that combined N-back and Oddball tasks.The two tasks presented stimuli through the visual and auditory channels respectively,and the subjects were asked to respond to both tasks.The purpose of this study was to investigate the training effect and transfer effect of a dual-task training program in two attentional modes by comparing it with an active control group.

Methods:70 healthy college students were recruited from Shenzhen University,and they were randomly divided into a dual-task training group and an active control group (N=35 in each group). Before and after training,all subjects were evaluated with N-back,Oddball,Dual-task and Divided attention tasks.There was no significant difference in cognitive function performance between the two groups before training.The training group received dual-task training every day,and the control group received popular science knowledge learning including healthy living every day for a total of 10 days (40 min/d).This study used the statistical method of repeated-measures analysis of variance to examine the differences in behavioral changes between the two groups before and after training.

Results: Compared with the control group,there were significant differences in the dual-task cost, the accuracy rate of the dual-task trials, and the change in the response time of the dual-task trials before and after training in the training group, which showed that the cost decreased (F=7.143, p=0.01), the accuracy rate increased (F=16.121, p<0.001), and the reaction time shortened (F=14.071, p<0.001). Compared with the control group, there was a significant difference in the amount of change in the N-back task behavior before and after training in the training group, which was manifested as a shortened reaction time of 2-back (F=14.660, p<0.001), and an increase in the accuracy rate of 3-back (F=11.047, p=0.002), and the reaction time of 3-back was shortened (F=7.874, p=0.007). Compared with the control group, there was a significant reduction in the mixed cost of divided attention tasks in the training group before and after training (F=4.166, p=0.046).

Conclusions: Compared with the active control group, the dual-task training procedure of this study can improve the behavioral performance of the top-down attention task and reduce the dual-task cost, and its training effect can be transferred to the distribution of attention.

Keywords： dual task training, cognitive training, attention mode

青少年欲望思维、渴求与问题性手机使用关系的网络分析

朱晓茹[1]， 高崚峰[1]， 李伟健[2]

[1]浙江师范大学心理学院，金华，321000

[2]浙江师范大学心理学院，金华，321000，xlxh@zjnu.cn

摘 要 背景和目标：在成瘾行为的背景下，欲望思维是指一种自发的认知过程，它涉及到与目标对象有关的口头和想象的阐述，该过程包括言语坚持和表象预设两个成分。以往研究表明，欲望思维和渴求在问题性手机使用的维持中具有重要作用。然而，不同类型的渴求与欲望思维的不同成分之间的关系在问题性手机使用领域并不明确。因此，本研究采用网络分析方法，进一步探讨青少年渴求、欲望思维与问题性手机使用之间的关系。方法：本研究选取 281 名存在问题性手机使用的青少年作为研究对象。采用中文版的欲望思维量表、行为成瘾的渴求评估量表和基于智能手机应用的成瘾量表，分别评估了渴求、欲望思维和问题性手机使用。通过构建网络模型，探究不同变量网络之间的桥梁成分和连接路径。结果：网络分析结果表明，“情绪改变”在问题性手机使用网络中具有核心作用。言语坚持与问题性手机使用的复发症状存在正相关关系，舒缓性渴求和情绪改变症状存在正相关关系。言语坚持和复发症状、言语坚持和强迫性渴求、舒缓性渴求和情绪改变在欲望思维-渴求-问题手机使用网络中具有桥梁作用。网络结构和全局边线强度没有显著的性别差异。结论：问题性手机使用的核心症状是“情绪改变”。舒缓性渴求和言语坚持对问题性手机使用具有直接促进作用。欲望思维和渴求会相互促进，进而共同导致问题性手机使用。这些发现为问题性手机使用的干预带来了启发。

A Network Analysis on the Relationship between Desire Thinking, Craving and Problematic Mobile Phone Use among Adolescents

Xiaoru Zhu[1], Lingfeng Gao[1], Weijian Li[2]

[1]School of psychology, Zhejiang Normal University, Jinhua, 321000

[2]School of psychology, Zhejiang Normal University, Jinhua, 321000, xlxh@zjnu.cn

Abstract Background and aims: In the context of addiction behavior, desire thinking is defined as a deliberate and conscious cognitive process involving verbal and imaginal elaboration of a desired target. This process encompasses two distinct components namely imaginal prefiguration and verbal perseveration. Previous studies have shown that desire thinking and craving play an important role in the maintenance of problematic mobile phone use. However, the relationships between different types of craving and different components of desire thinking is not clear in problematic mobile phone use field. Therefore, the present study used network analysis to further investigate the relationship between craving, desire thinking and problematic mobile phone use among

adolescent mobile phone users. Methods: A total of 281 adolescents with problematic mobile phone use participated in the study. Craving, desire thinking and problematic mobile phone use were assessed by using the Chinese version of the Desire Thinking Questionnaire, craving assessment scale for behavioral addictions and smartphone application-based addiction scale, respectively. A network analysis was performed to explore the network pathways and the “bridge” components between three communities. Results: The network analysis showed that “mood modification” in the problematic mobile phone use community. Verbal perseveration is positively associated with relapse. Relief craving is positively associated with mood modification. Edge between verbal perseveration and relapse symptom, edge between verbal perseveration and obsessive craving and edge between relief craving and mood modification bridge the desire thinking-craving-problematic mobile phone use network. There were no significant gender differences in the network structure and the global edge strength. Conclusions: The results highlighted the prominent role of relief craving and verbal perseveration in the maintenance of PMPU. Desire thinking and craving may reciprocally exacerbate each other and jointly lead to problematic behaviors like problematic mobile phone use. These findings inspire component-based intervention for problematic mobile phone use.

工作表现的前因及预测因素的新解释

—基于工作需求-资源理论和压力交互理论视角

王镨仪 [1]

四川师范大学心理学院，成都，610000,1027624041@qq.com

摘 要　由于技术的快速发展，我们目前正在经历第四次工业革命。它正在对组织的运作方式和人们生活和工作的方式都带来了变化。因此出现了许多关于这些转变如何影响员工福祉的研究。本研究旨在讨论工作需求如何导致不良的工作表现，如工作倦怠。我们在工作需求—资源理论中整合了压力交互理论的观点，提出了一个多层次模型工作倦怠资源模型，该模型描述了工作倦怠的前因和预测因素。并且表明工作需求之所以导致不良工作表现，除了取决于个体对情境做出的直接评价外，还受到个体是否有相应的资源影响。事实上当工作需求增加，个人工作压力变得更大的情况下，稳定的资源变得更加重要。该模型认为个体在面对工作需求导致的压力增加时，可以通过启动一系列工作资源进行应对，从而将压力转换为良好的工作表现。组织资源，如人力资源实践（如在线监控系统、工作技能培训以及根据关键的个人资源选择新员工等）和领导者。再者，提高工作与家庭的平衡，从而增加家庭资源。此外，员工的个人资源也是十分重要的，个人资源是指便于选择、改变和实施其他资源的管理资源，能够更好的促进积极有效应对方式的稳定的个性特征和能力。如情绪智力，积极主动的性格，正念等。本文提出了一个整合工作需求—资源理论和压力交互模型，在预防和减少工作倦怠的发展方面起着至关重要的作用。

关键词　工作倦怠，工作需求-资源理论，压力交互模型

New explanations for the antecedents and predictors of job performance

- -Based on work demand-resource theory and pressure interaction

theory perspective

Wang Puyi[1]
School of Psychology, Sichuan Normal University, Chengdu, 610000,1027624041@qq.com

Abstract： Due to the rapid development of technology, we are currently experiencing the fourth industrial revolution. It is bringing about changes in the way organizations operate and in the way people live and work. Numerous studies have therefore emerged on how these transitions affect employee well-being. This study aims to discuss how job demands can lead to poor work performance, such as job burnout. We integrate the perspective of stress interaction theory in the job demand-resource theory to propose a multi-level model resource model of job burnout that describes the antecedents and predictors of job burnout. It also shows that the poor work performance depends not only on the individual's direct evaluation of the situation, but also is influenced by whether the individual has corresponding resources. In fact, when job demands increase and individual work pressures become greater, stable resources become more important. The model believes that individuals can respond by initiating a range of work resources to convert stress into good work performance. Organize resources such as HR practices (ie, online monitoring systems, job skills training, and selecting new employees based on key personal resources, etc.) and leaders. Moreover, improve the balance between work and family, thus increasing family resources. In addition, the personal resources of employees are also very important. Personal resources refer to the management resources that are convenient for the selection, change and implementation of other resources, which can better promote the stable personality characteristics and ability of the positive and effective response methods. Such as emotional intelligence, active personality, mindfulness, etc. This paper presents an integrated job requirements-resource theory and stress interaction model that plays a crucial role in preventing and reducing the development of job burnout.

不同性别视角下家庭教养方式对大学生网络成瘾的影响：生活满意度的中介作用

刘紫欣[1]　程汇[1]　官何旭[1]　杨曦[1]　陈孜[1](通讯作者)
1 成都医学院心理学院，成都，610500
通讯作者：陈孜　320613@qq.com

摘 要　目的：了解大学生网络使用行为现状并探讨不同性别大学生的家庭教养方式、生活满意度水平对网络成瘾的影响。方法：对 967 名四川省某大学的大学生进行问卷调查，主要工具包括《家庭教养方式量表》、《生活满意度量表》以及《中文网络成瘾量表》。结果：1.男女大学生在网络游戏、网络阅读以及网络购物时间上存在差异（P<0.05）；在观看视频、在线学习、浏览资讯以及沟通交流时间中不存在显著差异。2.除父亲过分干涉和父亲偏爱维度以外，其余父母双方教养方式与生活满意度水平存在显著相关（P<0.01）。除父母双方偏爱被试以外，父母双方其余教养方式维度与网络成瘾存在显著相关（P<0.05）。生活满意度水平与大学生网络成瘾总分呈负相关（P<0.01）。3.生活满意度水平在家庭教养方式对大学生网络成瘾行为中起到部分中介作用；在男大学生中，生活满意度在父亲情感温暖理解、父亲过度保护与网络成瘾中起完全

中介作用；母亲情感温暖理解直接影响男大学生网络成瘾行为。在女大学生中，生活满意度在父亲情感温暖理解、母亲过度干涉保护中起部分中介作用；父亲惩罚严厉直接影响女大学生网络成瘾行为。结论：生活满意度在大学生家庭教养方式与网络成瘾关系中存在部分中介作用。不同性别的大学生生活满意度的中介作用完全不同，父母影响维度也不同。未来对于男女大学生网络成瘾的预防与干预应该各有着重点。

Effect of family parenting style on college students' internet addiction from different gender perspectives: The mediating role of life satisfaction

Zixin Liu[1] Hui Cheng[1] Hexu Guan[1] Xi Yang[1] Zi Chen[1]
1 School of Psychology, the Chengdu Medical College, Chengdu

Abstract: Objective: To understand the current situation of college students' Internet use behavior and explore the influence of different gender college students' family Parenting styles and life satisfaction on Internet addiction. Methods: the Egma Minnen av Bardndosnauppfostran, the Life Satisfaction With Life Scale and the Chinese Internet Addition Scale were used to investigate 967 college students in a college in Sichuan Province. Results：1. There were significant differences in online games, online reading and online shopping time between male and female college students ($P<0.05$); There were no significant differences in time spent watching videos, online learning, browsing information, and communicating. 2. In addition to father's over-involvement and father's preference, other parents' parenting styles were significantly correlated with life satisfaction ($P<0.01$). In addition to the parents' preference, the other parenting styles dimensions of both parents were significantly correlated with internet addiction ($P<0.05$). The level of life satisfaction is negatively correlated with the total score of internet addiction among college students ($P<0.01$).3. Life satisfaction partially mediated the effect of the family parenting style on the internet addiction behavior among college students; for male college students, it completely mediated the effect of the father's emotional warmth, the father's overprotection, and the internet addiction; the mother's emotional warmth had a direct impact on the internet addiction behavior of male college students. Life satisfaction among female college students served as a partial mediating factor between father's emotional warmth, mother's interference and protection, and internet addiction. The father's punitiveness also had a direct impact on female students' internet addiction. Conclusion：This study reveals that life satisfaction partially mediated the relationship between college students' family parenting style and internet addiction, however, this mediating role completely varied by gender, and the dimensions of parental influence also had different effects. Prevention and intervention should be treated differently for male and female students.

Keywords: Parenting style, internet addiction, life satisfaction, college student, gender difference

同情恐惧对大学生睡眠质量的影响：自我认同和自尊的链式中介作用

张雨陌[1] 付利婷[1] 门瑞雪[1]（通讯作者）
1 长春中医药大学马克思主义学院，长春，130117，通讯作者 E-mail：ccmrx@163.com

摘 要　目的：睡眠质量问题在大学生群体中普遍存在，对大学生的学习生活以及身心健康造成了严重影响。本研究主要探讨同情恐惧对大学生睡眠质量的影响，以及自我认同和自尊的链式中介作用。方法：采用同情恐惧量表（Fears of Compassion Scales，FCS）、阿森斯失眠量表（Athens Insomnia Scale，AIS）、自我认同感量表、以及自尊量表（Rosenberg Self Esteem Scale，RSES）对 1002 名大学生进行问卷调查。结果：相关分析显示，（1）大学生同情恐惧水平越高（r=0.333，P<0.01），则睡眠质量越差；（2）自我认同感水平越高（r=-0.286，P<0.01），则睡眠质量越好；（3）自尊水平越高（r=-0.326，P<0.01），越有利于睡眠质量的提升。中介作用分析显示，（1）自我认同、自尊在同情恐惧与大学生睡眠质量间起部分中介作用，其中，同情恐惧→自我认同→睡眠质量的中介效应为 0.0314，占总效应（0.3328）的 9.44%，同情恐惧→自尊→睡眠质量的中介效应为 0.0300，占总效应（0.3328）的 9.01%；（2）同情恐惧可以通过自我认同和自尊的链式中介作用对大学生的睡眠质量产生影响，同情恐惧→自我认同→自尊→睡眠质量的链式中介效应为 0.0365，占总效应（0.3328）的 10.97%。结论：降低大学生同情恐惧的水平，有利于提高大学生的自我认同水平，保持高水平的自尊，进而改善大学生群体的睡眠质量。本研究揭示了同情恐惧对大学生睡眠质量的作用机制，对于改善大学生睡眠质量和提升心理健康具有一定的理论和实践意义。
关键词　同情恐惧，睡眠质量，自我认同，自尊，大学生

The effect of compassion fear on sleep quality in college students: a chain mediating role of self-identity and self-esteem

Zhang Yu-Mo[1],Fu Li-ting[1],MEN Rui-xue[1],*

1. School of Marxism, Changchun University of Traditional Chinese Medicine, Changchun

Abstract：objective: Sleep quality problems are prevalent in the college student population and have a serious impact on their academic life as well as their physical and mental health. This study focuses on the effects of fear of compassion on college students' sleep quality and the chain-mediated role of self-identity and self-esteem. METHODS: Fears of Compassion Scales (FCS), Athens Insomnia Scale (AIS), Self-Identity Scale, and Rosenberg Self Esteem Scale (RSES) were used to conduct a questionnaire survey on 1002 college students. questionnaire survey. RESULTS: Correlation analysis showed that (1) the higher the level of sympathetic fear (r=0.333, P<0.01), the worse the quality of sleep; (2) the higher the level of self-identity (r=-0.286, P<0.01), the better the quality of sleep; and (3) the higher the level of self-esteem (r=-0.326, P<0.01), the more favorable the quality of sleep. The mediating role analysis showed that (1) self-identity and self-esteem play a partial mediating role between sympathetic fear and college students' sleep quality, in which the mediating effect of sympathetic fear→self-identity→sleep quality is 0.0314, accounting for 9.44% of the total effect (0.3328), and the mediating effect of sympathetic fear→self-esteem→sleep quality is 0.0300, accounting for 9.01%; (2) sympathetic fear can have an effect on college students' sleep quality through the chain mediating effect of self-identity and self-esteem, and the chain mediating effect of sympathetic fear→self-identity→self-esteem→sleep quality is 0.0365, accounting for 10.97% of the total effect (0.3328). CONCLUSION: Reducing the level of sympathetic fear among college students is conducive to increasing the level of self-identity and maintaining a high level of self-esteem, which in turn improves the sleep quality of the college population. This study reveals the mechanism of sympathetic fear's effect on college students' sleep quality, which has certain theoretical and practical significance for improving college students' sleep quality and enhancing mental health.

乐静茹[1]　姜媛[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘 要　社会排斥是指个体被某一社会团体或他人排斥，归属需求与关系需求受到阻碍的现象和过程，表现为排斥、拒绝、孤立、无视等。社会排斥会在认知、情感、健康、消费行为等多个方面对个体产生影响。以往研究发现，遭受社会排除的个体会根据自己同伴的喜好而改变消费偏好，倾向于购买象征团体会员资格的产品，并为了与社会建立更多的联系增加了奢侈品的消费；社会排斥增加了人们的身份消费需求以及对炫耀性的新奢侈产品的消费；遭遇社会排斥的个体表现出更高的冲动消费倾向，更愿意购买享乐型商品。不同性别的个体在社会需求的敏感程度上存在差异，这可能导致他们在遭受社会排斥时会产生不同的应对反应。根据消费者购买时的意图，可以将消费类型分为体验购买和实物购买。体验购买是指为了获得生活经历或经验而产生的购买行为，实物购买是指为了拥有物质类商品而进行的消费行为。本研究为探讨社会排斥对人们购买倾向的影响，采用问卷法和实验法，以《拒绝感量表》和《体验购买倾向量表》为测量工具，采用 2（排斥条件：社会排斥组、非社会排斥组）×2（性别：男性、女性）的二因素被试间设计，招募了 100 名被试，随机分为社会排斥组和非社会排斥组，采用回忆范式诱发社会排斥。结果显示：社会排斥和性别对购买倾向的影响存在交互作用，遭受社会排斥的个体更倾向体验购买，相比男性，女性遭受社会排斥后的体验购买倾向水平更高。结论：社会排斥会影响个体的体验购买倾向，并且这种影响存在性别差异。研究促进了个体对社会排斥如何影响自身购买行为倾向的理解，有助于个体树立理性的消费观。
关键词　购买倾向，体验购买，实物购买，社会排斥

Gender differences in purchasing tendency in social exclusion contexts

Jingru Le, Yuan Jiang
School of Psychology, Beijing Sport University, Beijing, 100084

Abstract：Social exclusion refers to the phenomenon and process in which an individual is excluded by a social group or others, and the needs of ownership and relationship are hindered, such as exclusion, rejection, isolation, disregard and so on. Social exclusion will affect individuals in many aspects, such as cognition, emotion, health, consumer behavior and so on. The study found that individuals subject to social exclusion will change their consumption preferences according to the preferences of their peers, tend to buy products that symbolize group membership, and increase the consumption of luxury goods in order to establish more ties with society; social exclusion increases people's consumption demand for identity and consumption of conspicuous new luxury products. Individuals who encounter social exclusion show a higher propensity to consume on impulse and are more willing to buy hedonistic goods. There are differences in the sensitivity of social needs among individuals of different genders, which may lead to different responses to social exclusion. According to the intention of consumers, the type of consumption can be divided into experiential purchases and material purchases. Experience purchase refers to the purchase behavior produced in order to gain life experience or experience, and physical purchase refers to the consumption behavior in order to own material goods. In order to explore the influence of social exclusion on people's purchase tendency, using questionnaire and experimental methods, using "rejection scale" and "experiential buying tendency scale" as measuring tools, using 2 (exclusion conditions: social exclusion group, non-social exclusion group) ×2 (gender: male, female) two-factor design, 100 subjects were randomly divided into social exclusion group and non-social exclusion group, and recall paradigm was used to induce social exclusion. The results show that there is an interaction between social exclusion and gender on purchase propensity. Individuals who suffer from social exclusion are more likely to experiential purchases. Compared with

men, women have a higher level of experience purchase tendency after social exclusion. Conclusion: social exclusion can affect people's propensity to experiential purchases, and there are gender differences in this effect. The study promotes individuals' understanding of how social exclusion affects their purchase behavior, and helps individuals to establish a rational concept of consumption.

Research progress in implicit learning aging

Yu-hua Weng[1]
1Department of Applied Psychology, School of Health, Fujian Medical University, Fuzhou, China

Abstract：This paper reviews and summarizes the general situation of implicit learning research, and explores the general factors that affect the research process of implicit learning aging, including implicit learning types, research paradigms, research structures, measurement methods, and subjects' characteristics through the differences in experimental Settings in different studies. It is still uncertain whether implicit learning is affected by age. The meta-analysis method is proposed to systematically collate all literatures on relevant topics to more accurately investigate whether the aging of implicit learning is affected by aging and its effect size.
Keywords：Implicit learning, age differences, aging, Influencing factors, meta-analysis

体育文化氛围对青少年非自杀性自伤行为的影响：体育锻炼与情绪调节灵活性的链式中介作用

摘 要　青少年非自杀性自伤行为是指青少年刻意对自己身体造成损伤，但并不是出于自杀意图的行为，这种行为问题在青少年群体中日益突出。本研究采用整群随机抽样的方法，利用体育文化氛围量表、非自杀性自伤行为量表、体育活动等级量表和情绪调节灵活性量表，对 850 名中学生开展问卷调查，回收有效问卷 791 份,有效回收率为 93.05%。采用 SPSS26.0 和 Process3.3 宏程序统计软件对数据进行处理与分析。

研究结果：1.体育文化氛围与青少年自杀性自伤行为之间存在负相关，对青少年自杀性自伤行为的直接预测作用显著（P＜0.05）；2.体育文化氛围可以正向预测体育锻炼（P＜0.05），体育锻炼可以正向预测情绪调节灵活性（P＜0.05）和青少年非自杀性自伤行为（P＜0.05），情绪调节灵活性可以正向预测青少年非自杀性自伤行为；3.体育锻炼和情绪调节灵活性在体育文化氛围与青少年自杀性自伤行为起显著的中介作用（P＜0.05）。中介效应由 3 条路径产生的间接效应组成，一是体育文化氛围通过影响体育锻炼间接影响青少年自杀性自伤行为，二是体育文化氛围能通过情绪调节灵活性间接影响青少年自杀性自伤行为，三是体育文化氛围通过体育锻炼和情绪调节灵活性的链式中介效应进一步作用于青少年自杀性自伤行为。研究结果揭示了体育文化氛围对青少年非自杀性自伤行为影响的作用机制：体育文化氛围可通过体育锻炼与情绪调节灵活性的链式中介作用来减少青少年的非自杀性自伤行为，对预防和治疗青少年非自杀性自伤行为提供一定的理论指导和实践建议。

The influence of sports culture on adolescents' non-suicidal self-injury behavior: the chain mediation role of physical exercise and emotional regulation flexibility

Hu Longbiao[1]　Fu Zihao[1](corresponding author)

1. Graduate Student, School of Physical Education, Zhengzhou University, Correspondence Address: West Fourth Ring Road, Zhengzhou 450044, Henan Province, Email:13213080473@163.com.

Abstract: Adolescent non-suicidal self-injury refers to the behavior that teenagers intentionally cause damage to their own bodies, but not out of suicide intention. This behavior problem is increasingly prominent in the adolescent group. In this study, a cluster random sampling method was used to conduct a questionnaire survey on 850 middle school students using sports culture scale, non-suicidal self-injury behavior scale, physical activity rating scale and emotional regulation flexibility scale. 791 valid questionnaires were collected, with an effective recovery rate of 93.05%. SPSS26.0 and Process3.3 macro statistical software were used to process and analyze the data. The results were as follows: 1. There was a negative correlation between sports culture atmosphere and suicidal NSSI of adolescents, and the direct prediction effect on suicidal NSSI of adolescents was significant (P < 0.05); 2. Sports cultural atmosphere can positively predict physical exercise (P < 0.05), physical exercise can positively predict emotional regulation flexibility (P < 0.05) and adolescents' non-suicidal self-injury behavior (P < 0.05), and emotional regulation flexibility can positively predict adolescents' non-suicidal self-injury behavior; 3. Physical exercise and emotional regulation flexibility play a significant mediating role between sports culture atmosphere and adolescent suicidal NSSI (P < 0.05). The mediating effect is composed of indirect effects produced by three paths: first, sports culture atmosphere indirectly affects adolescents' suicidal NSSI by influencing physical exercise; second, sports culture atmosphere indirectly affects adolescents' suicidal NSSI by influencing emotional regulation flexibility. Thirdly, the physical culture atmosphere further influences the suicidal self-injury behavior of adolescents through the chain mediation effect of physical exercise and emotional regulation flexibility. The research results reveal the mechanism of the influence of sports culture atmosphere on adolescents' non-suicidal NSSI: Sports culture atmosphere can reduce adolescents' non-suicidal NSSI through the chain mediation effect of physical exercise and emotional regulation flexibility, and provide

certain theoretical guidance and practical suggestions for the prevention and treatment of adolescents' non-suicidal NSSI.

Key words: non-suicidal self-injury behavior, Sports culture atmosphere, Emotional regulation flexibility, Physical exercise

社会性体格焦虑对女大学生锻炼意向的影响：关于外表的社会文化态度的中介作用

范维　王莉（通讯作者）

北京体育大学心理学院，北京，100084，wanglili0801@163.com

摘 要　因更容易受到社会评价的影响，女大学生存在较高的社会性体格焦虑，进而可能降低她们的锻炼意向，出现锻炼回避。关于外表的社会文化态度指主要来自家庭、同伴和媒体的压力,在这些压力的共同作用下，个体会接受所谓的“社会理想外貌”——比如对女性而言需要特别瘦，对男性而言需要有肌肉。基于此，本研究旨在明确社会性体格焦虑对女大学生锻炼意向的影响，并考察了关于外表的社会文化态度在其中的中介作用。选取某高校 311 名女大学生（有效数据 310 份），采用社会性体格焦虑问卷、锻炼态度量表-锻炼行为意向分量表、关于外表的社会文化态度量表施测，将 BMI 作为协变量进行控制。结果显示：（1）社会性体格焦虑与锻炼意向之间呈负相关（r=-0.452, P<0.001），与 BMI 值、关于外表的社会文化态度之间呈正相关（r=0.296, P<0.001; r=0.238, P<0.001）。（2）社会性体格焦虑负向预测锻炼意象（B=-0.204, SE=0.023, t=-8.896, P<0.001），且当纳入对外表的社会文化态度后，其预测作用依然显著（B=-0.229, SE=0.024, t=-9.375, P<0.001）。(3)对外表的社会文化态度在社会性体格焦虑与锻炼意向之间起部分中介作用(B=0.028, SE=0.010, t=-9.375, P<0.001），中介效应占比 13.93%。这表明社会性体格焦虑不仅能够直接预测锻炼意向，而且可以通过关于外表的社会文化态度的中介作用预测锻炼意向。结论：社会性体格焦虑对锻炼意向有负向预测作用，关于外表的社会文化态度在社会性体格焦虑与锻炼意向之间起部分中介作用，后续可以此为切入点进行干预从而增加高社会性体格焦虑女大学生的锻炼意向。

The effect of social physical anxiety on female college students' exercise intentions: the mediating role of sociocultural attitudes about appearance

Wei Fan, Li Wang*

School of Psychology, Beijing Sport University, beijing, 100084, wanglili0801@163.com

Abstract: Due to their greater susceptibility to social evaluations, female college students have higher levels of societal body image anxiety, which in turn may reduce their intention to exercise and lead to exercise avoidance. Sociocultural attitudes about appearance refer to pressures from family, peers, and the media, which together lead individuals to accept so-called "socially desirable appearances"-e.g., thinness for women and muscularity for men. Based on this, the present study aimed to identify the effects of social anxiety on female college students' intention

to exercise, and to examine the mediating role of sociocultural attitudes toward appearance. A total of 311 female college students (310 valid data) from a university were selected and administered the Social Physical Anxiety Questionnaire, the Exercise Attitude Scale-Intention to Exercise Behavior subscale, and the Sociocultural Attitudes about Appearance Scale, with BMI as a covariate to control. The results showed that (1) there was a negative correlation between social physical anxiety and intention to exercise (r=-0.452, P<0.001) and a positive correlation with BMI and socio-cultural attitudes about appearance (r=0.296, P<0.001; r=0.238, P<0.001). (2) Social physical anxiety negatively predicted exercise imagery (B=-0.204, SE=0.023, t=-8.896, P<0.001) and remained significant when sociocultural attitudes toward appearance were included (B=-0.229, SE=0.024, t=-9.375, P<0.001). (3) Sociocultural attitudes toward appearance partially mediated the relationship between social physical anxiety and exercise intention (B=0.028, SE=0.010, t=-9.375, P<0.001), with a mediating effect of 13.93%. This suggests that social physical anxiety not only directly predicts exercise intention, but also predicts exercise intention through the mediating effect of sociocultural attitudes about appearance. CONCLUSION: Social physical anxiety negatively predicted exercise intention, and sociocultural attitudes about appearance partially mediated the relationship between social physical anxiety and exercise intention, which can be used as an entry point for subsequent interventions to increase exercise intention among female college students with high social physical anxiety.

Keywords： social physical anxiety, female college students, exercise intention, sociocultural attitudes about appearance

事件及其强度对大学生职业探索的影响

裴沁雪　余超群　裴丹丹　刘晓冰　徐碧波（通讯作者）
湖北大学心理学系，武汉，430062，185246290@qq.com

摘 要　人的一生会经历许多重要事件。事件系统理论认为，事件触发个体受控的信息处理和后续行为的程度取决于对其强度的评估，同时，事件发生的时间也会使个体对事件的心理构建产生不同。职业不安全感是个体不能确定自己未来的职业生涯能否按理想中的方式发展。未来工作自我则代表了与个体对未来工作生活的希望和愿望相关的自我概念的一个方面。根据资源保存理论，当个体的资源耗尽时更有可能出现回避行为，未来工作自我作为一种激励资源，或许缓解个体资源稀缺的不利影响，为职业探索行为提供动力，而这种动力提供机制或许会随着时间的变化继而发生改变。

基于此，本研究选用全民参与过的新冠疫情事件作为背景，探讨事件强度对大学生职业探索行为的影响机制，探寻职业不安全感在其中的中介作用、未来工作自我的调节作用以及时间在其中的调节作用。研究采用改编的新冠疫情事件强度量表、职业不安全感量表、未来工作自我量表和职业探索量表分别在 2022 年 11 月末(T1)与 2022 年 12 月末-2023 年 2 月(T2)对大三大四的大学生进行施测。结果表明：(1)事件强度与职业不安全感显著正相关，与职业探索、未来工作自我和时间显著负相关，职业不安全感与职业探索和未来工作自我显著负相关，未来工作自我与职业探索显著正相关，职业探索与时间显著正相关；(2)职业不安全感在事件强度与大学生职业探索之间起完全中介作用，显示出跨时间的一致性；(3)未来工作自我的调节作用不显著，职业不安全感、未来工作自我和时间对职业探索的三项交互作用显著。在 T1，低未来工作自我大学生的职业不安全感对他们的职业探索行为存在显著的负向影响，对于高未来工作自我的大学生，这种负向影响被削弱；在 T2，低未来工作自我大学生的职业不安全感对他们的职业探索行为则存在显著的正向影响，而高未来工作自我大学生的职业不安全感与职业探索的负向影响不显著。结果验证了时间是治愈伤痛最好的良药，重大事件的负面影响并非伴随人的一生，而是会随着时间的推移逐渐减弱。

The Impact of Events and Their Strength on College

Students' Career Exploration

Pei Qinxue Yu Chaoqun Pei Dandan Xu Bibo
Department of Psychology, Hubei University, Wuhan, 430062, 185246290@qq.com

Abstract： A person's life will experience many important events. The event system theory believes that the degree to which an event triggers controlled information processing and subsequent behavior of an individual depends on the evaluation of its strength. At the same time, the timing of the event also affects the individual's psychological construction of the event. Career insecurity is the inability of individuals to determine whether their future career can develop in the desired way. The future work self represents an aspect of the self-concept related to an individual's hopes and desires for future work and life. According to the conservation of resource theory, individuals are more likely to engage in avoidance behavior when their resources are depleted, and future work selves, as a motivational resource, may alleviate the adverse effects of individual resource scarcity and provide motivation for career exploration behavior, and this mechanism of motivation may change over time.

Based on this, this study selected the COVID-19 epidemic event that all the people participated in as the background to explore the impact mechanism of event intensity on college students' career exploration behavior, and explore the mediating role of career insecurity, the moderating role of future work self, and the moderating role of time in it. The study used the adapted COVID-19 Event Strength Scale, Career Insecurity Scale, Future Work Self Scale and Career Exploration Scale to test college students in their third and fourth year of college from the end of November 2022 (T1) and December 2022 to February 2023 (T2) respectively. The results indicate that: (1) event strength is significantly positively correlated with career occupational insecurity, and is significantly negatively correlated with career exploration, future work self, and time. Career insecurity is significantly negatively correlated with career exploration and future work self. Future work self is significantly positively correlated with career exploration, and career exploration is significantly positively correlated with time. (2) Career insecurity plays a complete mediating role between event strength and college students' career exploration, showing consistency across time. (3) The moderating effect of future work self is not significant, while the three interactions of career insecurity, future work self, and time on career exploration are significant. In T1, the career insecurity of college students with low future work self has a significant negative impact on their career exploration behavior. For college students with high future work self, this negative impact is weakened. In T2, the career insecurity of college students with low future work self has a significant positive impact on their career exploration behavior, while the negative impact of career insecurity and career exploration of college students with high future work self is not significant. The results confirmed that time is the best medicine for healing pain, and the negative effects of major events do not accompany people throughout their lives, but gradually weaken over time.

大学生统计学焦虑、学习投入和统计学习效能感的关系：一个有调节的中介作用

陈叶[1] 黄发杰[1] 翁誉华[1] 傅芃[1] 田千峰[1] 廖美玲[2]（通讯作者）
1 福建医科大学健康学院应用心理学系，福州，350108
2 福建医科大学健康学院应用心理学系，福州，350108，Liaoml@fjmu.edu.cn

摘 要 统计学焦虑指当个人面临与统计相关的环境、任务或评估时开始，产生的一种消极的情绪状态，包括行为和认知症状，现存在很大一部分学生认为统计学课程是他们学习中最容易引起焦虑的课程，特别是心理学、社会科学等专业的学生。**目的** 本研究旨在探讨三个问题：（1）统计学焦虑和统计学习效能感之间的关系；（2）学习投入在统计学焦虑和统计学习效能感之间的中介作用；（3）性别和教师教学水平在统计学焦虑通过学习投入影响大学生统计学习效能感这一中介过程中的调节作用。**方法** 采用统计学焦虑等级量表、学习投入量表、统计学习效能量表以及自编教师教学水平问卷，以 397 名大学生为研究对象，探讨统计学焦虑对统计学习效能感的影响，检验学习投入对二者的中介作用，以及性别与教师教学水平在路径中的调节作用。**结果** （1）统计学焦虑可以负向预测统计学习效能感($r=-0.355$，$\beta=-0.112$，$p<0.001$)；（2）学习投入在统计学焦虑对统计学习效能感的影响中起中介作用（$\beta=0.307$，$p<0.01$）；（3）性别调节统计学焦虑对统计学习效能感直接作用路径（$\beta=-0.062$，$p<0.05$），教师教学水平调节统计学焦虑对学习投入的作用路径（$\beta=-0.006$，$p<0.05$）。**结论** 研究全面揭示了大学生统计学焦虑与统计学习效能感的关系机制，这为如何降低大学生统计学焦虑带来的负面影响，设置针对性的教育策略具有重要的参考价值。

Relations among Statistics Anxiety, Learning Engagement and Statistics Self-efficacy: A Moderated Mediation Effect

Chen Ye, Huang Fajie, Weng Yuhua, Fu Peng, Tian Qianfeng, Liao Meiling
School of Health, Fujian Medical University,
No. 1, Xuefu North Road, University New Area, Fuzhou, Fujian

***Abstract*:** Statistical anxiety refers to a negative emotional state, including behavioral and cognitive symptoms, that arose when an individual faces an environment, task, or assessment related to statistics. Currently, a large number of students believe that statistics courses are the most anxiety inducing courses in their studies, especially those majoring in psychology, social sciences, and other fields. **Purpose** This study explores three issues: (1) the relationship between statistical anxiety and statistical learning efficacy; (2) The mediating effect of learning engagement between statistical anxiety and statistical learning efficacy; (3) The moderating role of gender and teacher teaching level in the mediating process of statistical anxiety affecting college students' statistical learning efficacy through learning engagement. **Method** Using the Statistics Anxiety Rating Scale, Utrecht Work Engagement Scale for Students, Current Statistics Self-efficacy, and a self-designed Teacher Teaching Level Questionnaire, 397 college students were selected as research subjects to explore the impact of statistical anxiety on statistical learning efficacy, examine the mediating effect of learning engagement on the two, and examine the moderating effect of gender and teacher teaching level in the pathway. **Result** (1) Statistical anxiety can negatively predict statistical learning efficacy (r=-0.355, β=- 0.112, p<0.001); (2) Learning engagement plays a mediating role in the impact of statistical anxiety on statistical learning efficacy（β= 0.307, p<0.01); (3) The direct pathway of gender regulated statistical anxiety on statistical learning efficacy（β=- 0.062, p<0.05), the role pathway of teacher teaching level in regulating statistical anxiety on learning engagement（β=- 0.006, p<0.05). C**onclusions** Study comprehensively reveals the relationship mechanism between statistical anxiety and statistical learning efficacy among college students, which has important reference value for how to reduce the negative impact of statistical anxiety among college students and establish targeted educational strategies.

父母职业期望对高中生职业生涯规划能力的影响：一个有调节的中介模型

游双艳[1] 张宇雯[1] 戴艳[1]（通信作者）
1. 四川师范大学心理学院，成都，610066，通讯作者 E-mail：daiyanch@163.com

摘 要 高中阶段是个人生涯规划能力发展的关键时期，而在高中生的职业生涯规划中，家庭因素起着举足轻重的作用，探究家庭因素对高中生职业生涯规划能力的作用机制，是极具理论和现实意义的。因此，探究高中生职业生涯规划能力的影响因素，已成为当下较为关注的话题。父母职业期望作为家庭因素中的核心变量，对子女的职业生涯规划和探索具有积极作用，但是父母心理控制以及子女与父母在职业生涯上的一致性在其中起着何种作用有待探讨。本研究基于社会认知职业理论以及自我决定理论构建一个有调节的中介模型考察父母职业期望与高中生职业生涯规划能力关系的内在机制，以期能够对提高高中生职业生涯规划能力提出建设性意见。采用《父母职业期望量表》、《父母心理控制量表》、《亲子生涯一致性量表》和《高中生职业生涯规划能力问卷》。在四川省内成都市、南充市、达州市 3 个地区的 7 所高中学校进行调查，共收集 1634 份问卷，其中有效问卷 1577 份。结果表明:(1)父母职业期望、与亲子生涯一致性、高中生职业生涯规划能力呈正相关，父母心理控制与亲子生涯一致性呈负相关；(2)控制额外变量后，亲子生涯一致性是父母职业期望与高中生的职业规划能力的中介变量；(3)父母心理控制调节了亲子生涯一致性与高中生职业生涯一致性的关系，即随着父母心理控制的提高，亲子生涯一致性较低的高中生的职业生涯规划能力更低。本研究结果从父母职业期望、亲子生涯一致性、父母心理控制方面扩展了对高中生职业生涯规划能力的培养和干预提供了理论依据。

关键词 高中生，父母职业期望，亲子生涯一致性，职业生涯规划能力，父母心理控制

The Influence of Parents' Career Expectations on High School Students' Career Planning Ability: A Moderated Mediation Model

You Shuangyan[1] Zhang Yuwen[1] Dai Yan[1]
1. Sichuan Normal University, Lion Mountain Campus, Sichuan Normal University, Jing'an Road, Jinjiang District, Chengdu, Sichuan Province

Abstract: High school is a key period for the development of personal life planning ability, and in the career planning of high school students, family factors play a pivotal role, and it is of great theoretical and practical significance to explore the mechanism of family factors on high school students' career planning ability. Therefore, exploring the influencing factors of high school students' career planning ability has become a topic of great concern. As the core pivotal of family factors, parents' professional expectations have a positive effect on children's career planning and exploration, but what role parental psychological control and the consistency between children and parents in their careers play in it remains to be explored. Based on social cognitive career theory and self-determination theory, this study constructs a moderated mediation model to examine the internal mechanism of the relationship between parents' career expectations and high school students' career planning ability, in order to put forward constructive suggestions for improving high school students' career planning ability. The Parental Career Expectation Scale, Parental Psychological Control Scale, Parent-Child Career Consistency Scale and High School Students' Career Planning Ability Questionnaire were used. A total of 1634 questionnaires were collected in 7 high schools in 3 districts of Chengdu, Nanchong and Dazhou in Sichuan Province, of which

1577 were valid. The results showed that: (1) parents' career expectations were positively correlated with parent-child career consistency and high school students' career planning ability, while parents' psychological control was negatively correlated with parent-child career consistency. (2) After controlling for additional variables, parent-child career consistency was the mediating variable between parents' career expectations and high school students' career planning ability; (3) Parental psychological control modulates the relationship between parent-child career consistency and high school students' career consistency, that is, with the improvement of parental psychological control, high school students with low parent-child career consistency had lower career planning ability. The results of this study provide a theoretical basis for expanding the cultivation and intervention of high school students' career planning ability from the aspects of parents' career expectations, parent-child career consistency, and parental psychological control.

Keywords**:** high school students, parents' career expectations, parent-child career consistency, career planning ability, parental psychological control

真实场景下工作记忆表征对注意引导的效应：一项眼动研究

古力拜尔·阿力木[1]，李凌[1]（通讯作者）

1 电子科技大学生命科学与技术学院，成都，611731，liling@uestc.edu.cn

摘 要　目的：对工作记忆中项目的主动维护会使注意力偏向于环境中匹配的项目（Downing,2000），这被称为工作记忆的注意引导效应，这样的引导有时甚至会牺牲当前任务目标。记忆驱动的注意力捕获效应已经在简化且高度控制的实验室环境中得到了验证，但少有研究探讨真实场景下的视觉搜索。因此，本研究使用真实场景图为刺激材料，探究在现实场景中是否工作记忆仍然能够驱动注意进行视觉搜索，并记录视觉搜索过程中的眼动数据。

方法：本研究选取 18 名被试，每个被试都使用 Eyelink1000 眼动仪记录其眼动数据。采用 3（搜索条件：匹配；中性；不匹配）×（位置条件：左边；右边）的混合设计，被试需记忆真实物品并在记忆的保持过程中完成视觉搜索任务。为检验记忆物品是否在搜索过程中吸引注意力，对具有正确搜索和记忆反应的试次数据进行重复测量方差分析和事后检验，并根据眼动数据探究搜索场景中的注意力分配情况。

结果：行为结果表明，不同搜索条件下被试的搜索性能有差异，事后检验发现与目标匹配条件相比目标不匹配条件左（$t=4.96, p<0.001$）右（$t=4.21, p<0.001$）位置下平均反应时都明显更长；目标匹配条件下被试左（$t=2.46, p<0.05$）右（$t=4.21, p<0.001$）位置搜索正确率都显著高于目标不匹配条件，场景搜索成绩提高。平均注视时长上目标匹配条件下左（$t=10.14, p<0.001$）右（$t=9.50, p<0.001$）位置注视时长显著高于目标不匹配条件，平均注视次数下左（$t=4.52, p<0.001$）右（$t=9.125, p<0.001$）位置也显著高于目标不匹配条件的注视次数。

结论：整个研究表明在真实场景下工作记忆仍然能够驱动注意进行视觉搜索。当记忆项目与搜索目标在空间上重叠时会提高搜索性能；当记忆项与搜索目标在空间上不重叠时会损害搜索性能。眼动结果表明，在目标匹配时被试更倾向于将注意力集中在与记忆物重叠的区域上，以寻找可能的目标，导致了更长的注视时间和更多的注视次数。

关键词　工作记忆，视觉注意，真实场景，视觉搜索

实验范式：

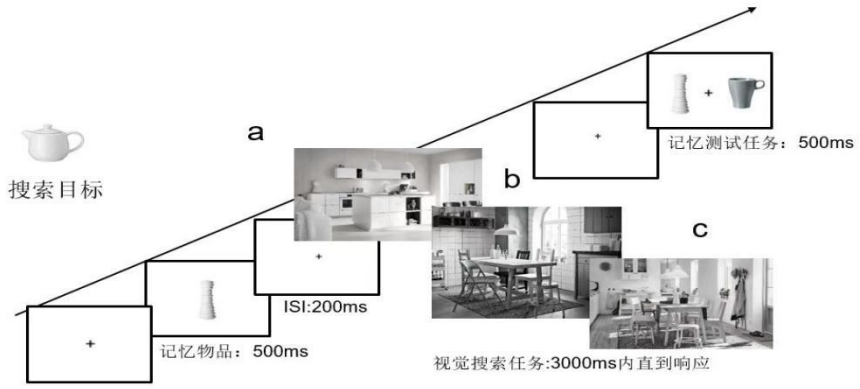

图 1-研究实验范式。每个试次中，被试都执行记忆—注意双任务，包括工作记忆任务和视觉搜索任务；被试需记忆真实物品并在记忆的保持过程中在随后的真实场景里搜索茶壶并进行按键，最后进行记忆测试。根据记忆项目与视觉搜索目标的关系可以分为三种匹配类型：当记忆项目与搜索目标在空间上重叠时，称为目标匹配条件；当记忆项与搜索目标在空间上不重叠时称为目标不匹配条件；当记忆项目不出现在搜索过程中则称为中性条件。

行为学结果：

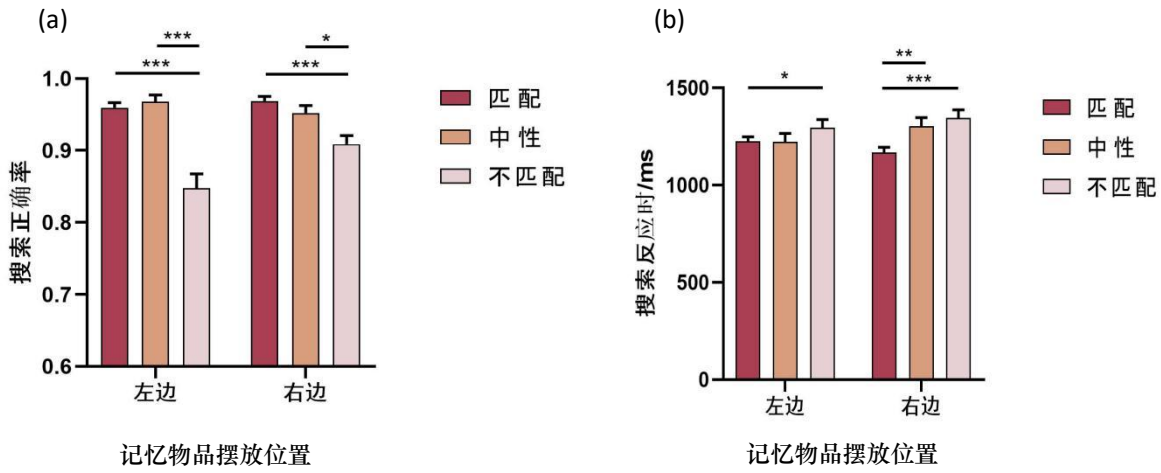

图 2-行为实验结果。（a）视觉搜索任务的准确率。（b）视觉搜索任务的反应时。（误差线为标准误， *p < .05, **p < .01, ***p < .001）

眼动结果：

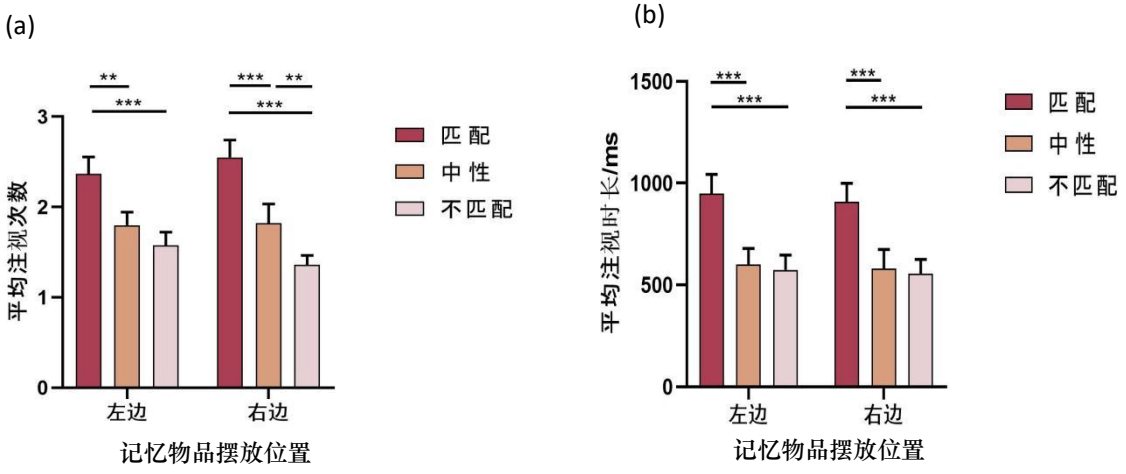

图 3-眼动实验结果。（a）视觉搜索任务平均注视次数。（b）视觉搜索任务平均注视时长。（误差线为标准误， *p < .05, **p < .01, ***p < .001）

资源受限和经济压力对父母情绪及亲子关系的影响：基于不同受教育水平家庭的比较

居婧雯　陈侃（通讯作者）
复旦大学社会发展与公共政策学院心理系，上海，200433，chenkan@fudan.edu.cn

摘 要　新冠肺炎作为近年来影响最大的突发公共卫生事件，造成的收入压力、失业、基本生活物资供应受限等生存不确定性给家庭带来了一系列挑战。父母不仅要处理个人情绪问题，还要承担起更多的养育责任。目前对于长期处于外部压力环境下的家庭关注仍较少。本研究基于家庭压力模型、情绪外溢假说和资源保存理论，旨在探究严格的封控环境下，资源受限和经济压力对父母情绪及亲子关系的影响，并检验这种影响在不同受教育水平的父母中是否存在差异。选取上海市 1210 名至少有一个 18 岁以下的孩子，且处于封控状态的父亲或母亲作为被试，采用亲子关系量表、正性负性情绪量表、资源受限和经济压力自编题项进行线上施测。结果表明：(1)封控期间，资源受限和经济压力对亲子关系无直接影响，而是通过父母情绪的完全中介作用对亲子关系产生间接影响；(2)在不同受教育水平家庭中，资源受限对父母情绪和亲子关系的影响模式无显著差异；(3)经济压力对不同受教育水平父母的情绪和亲子关系的影响模式不同。对于受教育水平较低的父母，经济压力主要通过增加负性情绪影响亲子关系；对于受教育水平较高的父母，经济压力主要通过降低正性情绪影响亲子关系；(4)对于受教育水平较低的父母，负性情绪更多地外溢至亲子关系中。本研究丰富了外部压力对家庭关系的影响机制研究，为可能发生的公共卫生事件或经济危机背景下，增强父母情绪管理、关注低社会经济地位家庭的实践工作提供依据。

Effects of Resource Limitations and Financial Constraints on Parental Affect and Parent–child Relationships: A Comparison of Families by Parental Education Level

Jingwen JU, Kan CHEN
Department of Psychology, School of Social Development and Public Policy, Fudan University, Shanghai, 200433

Abstract：COVID-19, the most influential public health emergency in recent years, created a series of challenges for families as a result of existential uncertainties such as income stress, job loss, and limited supply of basic living goods. Parents not only have to deal with personal emotional problems, but also have to take on additional parenting responsibilities. Based on the family stress model, the emotional spillover hypothesis, and conservation of resources theory, this study aimed to examine the relationships among resource limitations, financial constraints, parental affect and parent–child relationships during the quarantine and examine the differences in these relationships based on parental education level. Participants comprised 1,210 parents with at least one child under

the age of 18 during a prolonged social isolation policy in Shanghai, China. The Child–Parent Relationship Scale, Positive and Negative Affect Scale, and self-administered items of Resource Limitations and Financial Constraints were used for the online survey. Results revealed that: (1) Resource limitations and financial constraints did not directly predict parent–child relationships but did so indirectly through parental affect. (2) No significant difference based on education level was found in the pathways through which resource limitations influence parent–child relationships through parental affect. (3) Among the less educated parents, financial constraints affected parent–child relationships mainly by increasing negative affect, whereas for the parents with higher education, financial constraints affected parent–child relationships by decreasing positive affect. (4) More negative affect spilled over to the parent–child relationships of the parents with less education.

Keywords： Resource limitations, Financial constraints, Parent–child relationships, Parental affect, Education level

劳务派遣员工工作不安全感与工作投入关系：工作自我效能感和组织支持感的作用

邹雨蓓[1,2]（通讯作者） 苏春华[1] 韩宗义[1] 刘益萍[1]

1 天津师范大学，天津，300387

2 天津师范大学心理学部，天津，300387，1158575918@qq.com

摘 要 近年来，企业发展竞争日趋激烈，随时面临被淘汰的风险，为了更好地生存和发展，企业尽可能的采取措施来降低成本，由此，劳务派遣模式应运而生。随着劳务派遣员工在企业员工中所占比重日趋增大，劳务派遣员工在企业发展中发挥的作用也越来越大。但是，由于劳务派遣本身存在的“同工不同酬”、缺乏培训和晋升渠道以及随时面临被裁撤等弊端，使得劳务派遣员工的工作不安全感程度加大，而这种工作不安全感会降低员工的工作自我效能感，进而影响其工作投入，不利于影响企业发展。

工作自我效能感的高低可以有效影响员工在面对工作中的困难时的坚持程度。在当前的工作环境中，降低劳务派遣员工的工作不安全感对员工的身心健康以及企业的发展壮大有至关重要的意义，因而如何采取有效措施来降低劳务派遣员工的工作不安全感成为企业当前亟待解决的问题。组织支持感则是关注员工的福利待遇和幸福感，因此，企业采取有效措施，让劳务派遣员工拥有更高程度的组织支持感，可以有效缓解劳务派遣员工工作不安全感对工作投入的负面影响，有利于企业的发展壮大。

本研究试图研究在当前经济发展受阻和企业发展困难的大环境下，劳务派遣员工的工作自我效能感和组织的支持感如何影响劳务派遣员工的工作不安全感来对工作投入的影响，以及变量之间存在的关系，从而为企业的发展提供建设性的意见和建议。在研究过程中，选取劳务派遣员工为研究对象，利用工作不安全感量表、工作投入量表、工作自我效能感量表和组织支持感量表进行问卷调查，收到有效样本 303 份，利用 SPSS22.0 和 Mplus8.3 对数据进行分析研究。结果表明，工作不安全感对工作投入具有显著正向预测作用，工作自我效能感分别在数量性工作不安全感和质量性工作不安全感与工作投入的关系之间起到完全中介作用和部分中介作用，组织支持感调节了工作不安全感和工作自我效能感之间的关系，并调节了工作自我效能感对工作不安全感和工作投入之间关系的中介作用。

关键词 劳务派遣员工，工作不安全感，工作自我效能感，工作投入，组织支持感

社交媒介对大学生抑郁情绪的影响：上行社会比较和认知负载的链式中介作用

闫讷[1] 潘寒秋[1] 龙滢[1] 周晓斐[2] 苑会羚[3] 王莹[3]（通讯作者）
1 西安体育学院，西安，710068
2 西北大学，西安，710127
3 西安国际医学中心医院，西安，710119，fgx995@163.com

摘要　2023 年发布的《国民心理健康蓝皮书》显示，18-24 岁群体的抑郁风险检出率显著高于其他年龄段，而且这一年龄段群体在社交媒介使用群体中占比最大。社交媒介使用强度与抑郁情绪之间关系的研究结果并不一致，有研究认为社交媒介的使用有利于缓解抑郁情绪，也有研究证明社交媒介的使用会增加抑郁情绪出现的可能。社交媒介使用强度与抑郁情绪之间作用机制也尚不明确。在本研究中使用社交媒介使用强度量表，社交网站上行社会比较量表，社交网站认知负载量表，简单自测抑郁量表对 568 名大学生进行施测。探讨大学生群体中社交媒介使用强度、上行社会比较、认知负载与抑郁情绪之间的关系及其作用机制。**结果：**（1）社交媒介使用强度、社交网站上行社会比较、社交网站认知负载，抑郁情绪两两之间均呈显著正相关；（2）社交媒介的使用强度对抑郁情绪有正向的预测作用，社交网站上行社会比较和社交网站认知负载对抑郁情绪具有显著的正向预测作用；（3）社交网站上行社会比较和社交网站认知负载在社交媒介使用强度和抑郁情绪之间发挥完全中介作用。具体而言，社交媒介使用强度通过三条路径影响大学生抑郁情绪：一是上行社会比较的单独中介作用；二是认知负载的单独中介作用；三是上行社会比较→认知负载的链式中介作用。

The Effect of Social Media Use on College Students' Depressive Mood: The Chain Mediating Role of Upward Social Comparison and Cognitive Overload

YAN Ne[1] Pan Hanqiu[1] Long Ying[1] Zhou Xiaofei[2] Yuan Huiling[3] WANG Ying[3]
1 Xi'an Physical Education University, Xi'an, 710068
2 Northwest University, Xi'an, 710127
3 Xi'an International Medical Center Hospital, Xi'an, 710119

Abstract: The 18-24 age group has a much higher rate of depression risk than other age groups, according to the 2023 "National Mental Health Blue Book". Additionally, this age group has the highest proportion among users of mobile social media. The link between mobile social media use and depression is unclear. Some studies suggest mobile social media can help with depression, while others suggest it may worsen it. It related the precise mechanism behind how the intensity of mobile social media use to depressive mood is still not fully understood. In this research, a sample of 568 college students was recruited to complete the questionnaires about the intensity of social media use, social networking site upward social comparison, and social networking site cognitive overload. To explore the relationship among the intensity of social media use, upward social comparison, cognitive overload and depressive mood. **Results**: (1) The intensity of mobile social media use, social networking site upward social comparison, and social networking site cognitive overload are all positively correlated with depressive mood. (2) The intensity of mobile social media use has a positive predictive effect on depressive mood, and social comparison and cognitive overload have significant positive predictive effects on depressive mood. (3) Social comparison and cognitive overload play a complete mediating role between the intensity of mobile social media use and the depressive mood. In particular， the intensity of social media use affected depressive mood through

three paths: one was the mediating role of upward social comparison; the second was the mediating role of cognitive overload; the third was the chain-mediated role of both upward social comparison and cognitive overload.
Keywords: intensity of mobile social media use, upward social comparison, cognitive overload, depressive mood, undergraduates

消极情绪下不同月经周期女性对食物线索的注意偏向

顾桑田

复旦大学心理学系，上海，200433，21210730114@m.fuda.edu.cn

摘 要　情绪影响进食行为有可能进一步发展为情绪性进食。情绪性进食过量引发的超重，肥胖及心血管疾病等会给人们的健康带来隐患。情绪性进食者在消极情绪的影响下增加食物摄入量并且产生对食物线索的注意偏向，这提示了情绪性进食背后的心理机制所在。女性在月经周期的不同阶段存在情绪状态和食物渴求上的差异，但是未知处于不同月经周期的女性在消极情绪下对食物线索的注意偏向和模式。本文采用基于食物图片的点探测范式，考察消极情绪下，处于黄体晚期和卵泡早期女性对高热量食物线索的注意偏向。实验 1 选取月经周期规律的女性被试 49 名，分别在黄体晚期和卵泡早期使用音频材料结合书写的方式诱发中性或消极情绪。结果发现在诱发消极情绪状态的条件下，处于卵泡早期的被试对食物图片的注意警觉指数显著高于处于黄体期的被试。实验 2 继续选取 38 名月经规律的女性被试，同样在她们月经周期的两个阶段分别实施实验。结果发现，在诱发消极情绪的条件下，处于卵泡期的被试在工作记忆(WM)任务中对食物线索的注意偏向显著大于其在启动任务中的。研究结论如下：卵泡早期女性在消极情绪的影响下，会对食物线索产生更大的注意。且这种注意是通过自上而下的工作记忆完成的，该场景贴近现实生活中食物几乎随处可得的情境。

关键词　情绪，月经周期，食物线索，注意偏向

Attention Bias to Food Cues in Menstrual Cycle under Negative Emotion Among Females

Sangtian Gu

Fudan University, 220Handan Road, shanghai, China, 21210730114@m.fuda.edu.cn

Abstract：　Emotional influence on eating behavior may further develop into Emotional eating. Overweight, obesity and cardiovascular diseases caused by excessive Emotional eating will bring hidden dangers to people's health. Emotional eating increases food intake under the influence of negative emotions and produces attention bias to food clues, which indicates the psychological mechanism behind Emotional eating. Female have different emotional states and food cravings at different stages of the Menstrual cycle, but the attention bias and pattern of female in different Menstrual cycle to food cues under negative emotion are unknown.

This article adopts a point detection paradigm based on food images to investigate the attentional bias of women in late luteal phase and early follicular phase towards high-calorie food cues under negative emotion. In experiment 1, 49 female subjects with regular Menstrual cycle were selected to use audio materials combined with writing to induce neutral or negative emotions in the late luteal phase and early follicular phase respectively. The results showed that under the condition of inducing negative emotional state, the attention and alertness index of the subjects in the early follicular stage was significantly higher than that of the subjects in the Luteal phase. In

experiment 2, 38 female subjects with regular menstruation were selected, and the experiment was also conducted in two stages of their Menstrual cycle. The results showed that under the condition of inducing negative emotions, the Follicular phase subjects' attentional bias to food cues in Working memory (WM) tasks was significantly greater than that in priming tasks.

The research conclusion is as follows: Early follicular women tend to pay more attention to food cues under the influence of negative emotions. And this attention is achieved through top-down Working memory, which is close to the situation where food is almost available everywhere in real life.

Keywords：emotion, menstrual cycle, food cues, attention bias

基于双过程理论视角下自动情感评价和锻炼关系的研究进展

赵舒菁[1] 郭璐[2]

1 北京体育大学心理学院，北京，100084，zsjydl126.com

摘 要 背景：近年来，随着双过程理论的发展，研究者越来越重视影响健康行为的自动过程。自动情感评价(Automatic Affective Evaluation, AEE）作为影响锻炼行为的自动过程，也受到了更多的关注，AEE 与锻炼行为的研究迅速增长。因此，本研究旨在分析 2017 年以来的相关研究，基于双过程理论视角，对 AEE 与锻炼行为的关系的最新进展和未来发展方向进行述评。

研究方法：在 web of science 数据库和 CNKI、万方数据库中检索 2017-2023 年发表的 AEE 和锻炼的相关文献。检索获得中英文文献共 969 篇，排除重复、无关、不符合标准的文献后，最终纳入 17 篇文献，其中只有 1 项是随机对照实验，8 项前后测准实验，10 篇为横断调查。

研究结果：

(1) 整体而言，AEE 对锻炼行为具有预测作用。这种作用在儿童、青少年、老年人群体以及肥胖、久坐、积极锻炼群体均得到了验证。

(2) 通过改善 AEE 可以促进锻炼行为，这在唯一的随机对照研究实验中得到验证，该实验通过评价性条件反射改善参与者的自动情感评价，进而促进了当天的锻炼行为。

(3) AEE 受到锻炼类型和锻炼量的影响。个体对锻炼类型的偏好以及锻炼量都会影响整体 AEE 的测量结果，同一锻炼水平、不同偏好锻炼类型的个体间 AEE 存在差异，不同锻炼水平、同一偏好锻炼类型的个体间 AEE 也存在差异，且偏好锻炼类型的影响大于锻炼量的影响。因此具体的、个体偏好的锻炼类型的 AEE 对个体的锻炼行为可能有更好的预测作用。

(4) 另外，也有研究发现 AEE 和反思情感评价的差异与锻炼时间相关，当 AEE 小于反思情感评价时，二者差值越大，锻炼时间越短。同时，自我控制可以调节这种相关，自我控制能力越低，两种评价的差对锻炼行为的影响越消极。

AEE 在锻炼心理领域方兴未艾，现在尚不足以对 AEE 和锻炼行为的关系下结论。因此，未来对 AEE 的研究可以考虑以下 3 点：

(1) 需要更多的随机对照实验来探讨 AEE 与锻炼行为之间的因果关系。

(2) 开展更多的对 AEE 的干预研究，以寻求有效的锻炼行为促进手段。

(3) 进一步探索 AEE 和反思评价之差与锻炼行为之间的关系及其调节因素。

关键词 自动情感评价，双过程理论，体育锻炼

Research Progress On The Relationship Between Automatic Emotion Evaluation And Exercise From The Perspective Of Dual-Process

Theory

ZHAO Shujing[1], GUO Lu[2]
School Of Psychology, Beijing Sport University, Beijing 100084, China

Abstract： Background: In recent years, with the development of dual-process theory, researchers have paid more and more attention to automatic processes that affect health behavior. Automatic Affective Evaluation (AEE), as an automatic process affecting exercise behavior, has also received more attention, and the research on AEE and exercise behavior has increased rapidly. Therefore, the purpose of this study is to analyze relevant studies since 2017 and review the latest progress and future development direction of the relationship between AEE and exercise behavior based on the perspective of dual-process theory.

Methods: Literature search method was used to search the related literature on AEE and exercise published from 2017 to 2023 in the web of science database, CNKI and Wanfang database. A total of 969 Chinese and English literatures were retrieved, and 17 literatures were finally included after excluding duplicate, irrelevant and unqualified literatures. Among them, there was only 1 randomized controlled trial study, 8 pre - and post-measurement experimental studies, and the rest were cross-sectional surveys.

Results:

(1) In general, AEE could predict exercise behavior. This effect was validated in children, adolescents, and older age groups, as well as obese, sedentary, and physically active populations.

(2) Exercise behavior may be promoted by improving AEE. This was tested in the only randomized controlled trial study that improved participants' automatic emotion evaluation through EC, which in turn facilitated physical activity on the day.

(3) AEE was affected by the type and amount of exercise. There were differences in AEE among individuals with the same exercise level and different preferred types of exercise, and there were differences in AEE among individuals with different exercise levels and the same preferred type of exercise, and the effect of preferred exercise type was greater than that of exercise amount. Therefore, the AEE of specific and individual preferred exercise type may have a better predictive effect on individual exercise behavior.

(4) In addition, some studies have found that the difference of AEE and reflective emotional evaluation is related to exercise time, and the larger the negative difference, the shorter the exercise time. And self-control can moderate this correlation, the lower the self-control ability, the more negative difference of the two evaluations has on exercise behavior.

AEE in the field of physical exercise is in the ascendancy, with the present experience, it is not possible to draw conclusions about the relationship between AEE and exercise behavior. Therefore, future research on AEE can consider the following three points:

(1) More RCTS are needed to explore the causal relationship between AEE and exercise behavior.

(2) More intervention studies on AEE should be carried out to find effective ways to promote exercise behavior.

(3) explore the relationship between the difference between AEE and reflective appraisal and exercise behavior and its moderating factors.

在线视频学习中教师呈现对学习者学习感受与知识建构的影响：材料难度和面孔熟悉度的作用

郑奂舟 罗覃僮欣 陈卓 徐碧波（通讯作者）
湖北大学心理学系，武汉，430062，185146290@qq.com

摘　要　在教育数字化转型的时代背景下，在线视频学习的广泛应用为学习者的自主性、个性化学习提供了有力支撑。教师呈现作为在线视频学习中的重要环境信息，对学习者的学习过程有重要的影响。基于社会存在感理论和认知负荷理论，2 项实验探讨了在线视频学习中，相比于无教师呈现，教师呈现是否以及如何影响学习者学习者的学习感受（包括认知负荷、学习满意度、学习体验、学习投入和社会存在感）与学习效果（包括保持测验成绩、迁移测验成绩和总测验成绩）。实验 1 探讨了教师呈现和材料难度的影响，采用 2（教师呈现：有教师呈现/无教师呈现）× 2（材料难度：低难度/高难度）组间设计，共 182 名大学生参与实验，结果表明，教师呈现改善了学习者的学习感受，无教师呈现条件下学习者的迁移成绩更好，并且低材料难度条件下学习者的认知负荷更低和迁移测验成绩更好。实验 2 通过操纵教师面孔熟悉度来考察影响教师呈现有效性的潜在机制，采用 2（面孔熟悉度：低面孔熟悉度/高面孔熟悉度）× 2（材料难度：低难度/高难度）组间设计，共 173 名大学生参与实验，结果表明，低面孔熟悉度条件下，学习材料难度的简单效应显著，低学习材料难度条件下学习者的认知负荷更低。同时，低面孔熟悉度条件下，学习者的迁移测验成绩更好。研究结果显示，教师呈现改善了在线视频学习中学习者的学习感受，但其促进学习效果的有效性还需要进一步的探索。本研究探讨了影响教师呈现有效性的边界条件，有助于从实践角度分析在线视频学习中教师呈现发挥效果的影响因素，为教育研究者设计和开发有效的在线视频课程提供数据支持。

The effect of instructor presence on learners' perception of learning and knowledge construction in online video learning: the role of material difficulty and face familiarity

Zheng Huanzhou; Luo Qintongxin; Chen Zhuo; Xu Bibo(Corresponding Author)
Department of Psychology, Hubei University, Wuhan, 430062, 185146290@qq.com

Abstract：In the context of the era of digital transformation of education, the wide application of online video learning provides strong support for learners' independent and personalized learning. Instructor presence, as an important environmental information in online video learning, has a significant impact on learners' learning process. Based on Social Presence Theory and Cognitive Load Theory, two experiments were conducted to investigate whether and how instructor presence affects learners' learning experience (including cognitive load, learning satisfaction, learning experience, learning engagement, and social presence) and learning outcomes (including retention test scores, transfer test scores, and total test scores) compared with no instructor presence in online video learning. Experiment 1 explored the effects of instructor presence and material difficulty, using a 2 (Instructor presence: with instructor presence/without instructor presence) × 2 (material difficulty: low difficulty/high difficulty) between-groups design, with a total of 182 undergraduates participating in the experiment. The results showed that the instructor presence improved the learning experience of the learners, and the learners' transfer scores were better in the no-teacher-presentation condition, as well as their cognitive load was lower and their transfer test scores were better in the low-material-difficulty condition. lower cognitive load and better transfer test scores in the low material difficulty condition. Experiment 2 examined the potential mechanisms affecting the effectiveness of instructor presence by manipulating teacher face familiarity, using a 2 (face familiarity: low face familiarity/high face familiarity) × 2 (material difficulty: low difficulty/high difficulty)

between-groups design, with a total of 173 undergraduates participating in the experiment, and the results showed that there was a significant simplicity effect of the difficulty of the learning materials in the low-face familiarity condition, and learners' cognitive load was lower in the low material difficulty condition. Learners' cognitive load was lower. Meanwhile, learners' performance on the transfer test was better in the low face familiarity condition. The findings suggest that instructor presence improves learners' learning experience in online video learning, but its effectiveness in promoting learning outcomes needs to be further explored. This study examines the boundary conditions affecting the effectiveness of instructor presence, which helps to analyze the factors affecting the effectiveness of teacher presentation play in online video learning from a practical perspective, and provides data support for educational researchers to design and develop effective online video courses

Keywords：instructor presence, online video learning, face familiarity, material difficulty

创造性特质评估量表的汉化及其信效度检验研究

范醒宇[1]　李洁[2]　（通讯作者）

1 东北师范大学心理学院，长春，130024

2 江西师范大学心理学院，南昌，330022，598389101@qq.com

摘 要　**目的**：本研究探讨创造性特质评估量表 TCPQ-12 在中国文化背景下的因素划分是否一致，是否存在跨文化差异，并检验量表的信效度。　**方法**：先对 TCPQ-12 量表进行翻译，并选取政治技能量表-社交机敏因素和五因素人格问卷-开放性因素作为汉化 TCPQ-12 量表的校标量表，再组合编排成一套问卷。采用问卷调查法，以国内大学生为研究对象，正式测验对大学生共发放问卷 562 份，回收有效问卷 533 份。　**结果**：探索性因素分析结果表明：原量表越轨意愿维度第 10 题、接受挑战的意愿维度第 11 题因子载荷度较低，需要进一步的修改或删减，原量表探索意愿维度的各项题目在汉化量表的探索性因子分析中并未聚合；验证性因素分析结果表明原量表的三维结构在中文版中的结构效度欠佳(x^2/df=2.884, *CFI*=0.894, *TLI*=0.86, *RMSEA*=0.084, *SRMR*=0.057)；总量表及其下的越轨意愿、接受挑战的意愿、探索意愿维度内部一致性信度分别为 0.846、0.776、0.709、0.546，分半信度分别为 0.806、0.772、0.734、0.469；总量表与两效标量表的效标关联效度效度分别为 0.423、0.499，均达到显著水平。　**结论**：(1)创造性特质评估量表 TCPQ-12 的汉化版本在国内大学生群体中应用效果尚可，具有良好的信度和效标关联效度。(2)TCPQ-12 量表不具备跨文化的测量不变性，且汉化量表的结构效度不太理想，国内外对量表内部各维度的划分和维度内项目的理解上存在跨文化差异。

A Sinicization Stduy of TCPQ-12 and its Reliability and Validity test

FAN XINGYU[1]　LI JIE[2](Corresponding Author)

1 School of Psychology, Northeast Normal University, Changchun, 130024

2 School of Psychology, Jiangxi Normal University, Nanchang, 330022, 598389101@qq.com

Abstract：Purposes: In this study, we examined the reliability and validity of TCPQ-12 in the Chinese cultural context, and determined whether factors were consistent and whether there were cross-cultural differences. Methods: Translated the TCPQ-12 scale first, and the political skill scale - social alertness factor and the five-factor personality questionnaire - openness factor were selected as the calibration scales of the TCPQ-12 scale, and then combined them into a set of questionnaires. A total of 562 questionnaires were issued to college students

in China and 533 valid questionnaires were collected. Results: The exploratory factor analysis results showed that the factor loading degree of item 10 of the original scale's deviant intention dimension and item 11 of the original scale's willingness to accept challenges were low and needed to be further modified or deleted. The items of the original scale's exploration intention dimension did not converge in the exploratory factor analysis of the Chinese scale. The results of confirmatory factor analysis showed that the 3d structure of the original scale had poor structural validity in Chinese version (x^2/df=2.884, *CFI*=0.894, *TLI*=0.86, *RMSEA*=0.084, *SRMR*=0.057). The internal consistency reliability of total scale and deviant intention, willingness to accept challenges and willingness to explore were 0.846, 0.776, 0.709 and 0.546, and the split reliability was 0.806, 0.772, 0.734 and 0.469. The scale correlation validity of the total scale and the two-scale scale were 0.423 and 0.499, respectively, which were both significant. Conclusion: The Chinese version of TCPQ-12 has a good application effect in college students in China, with considerable reliability and criterion correlation validity. (2) The TCPQ-12 scale has no cross-cultural measurement invariance, and the structure validity of the Chinese scale is not ideal. There are cross-cultural differences in the division of dimensions in the scale and the understanding of items within the dimensions at home and abroad.

Keywords：creativity, reliability, validity, sinicization, measurement invariance

运动心理健康连续体简表中文版修订

李梦茜[1] 杨寅[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，yangyin@bsu.edu.cn

摘 要 目的：修订中文版运动心理健康连续体简表（Sport Mental Health Continuum – Short Form），并检验其心理测量学指标及在中国运动员中的适用性。方法：用翻译后的运动心理健康连续体简表、抑郁自评量表和运动员倦怠问卷对 657 名北京某高校大学生运动员进行施测，随机抽取 330 名被试作为样本 1 用于项目分析和探索性因素分析；另外 327 名被试作为样本 2 用于验证性因素分析和信度检验。结果：中文运动心理健康连续体简表包括 12 个项目，各项目与总分的相关均显著（rs=0.673～0.815，*ps*<0.001）。探索性因素分析共提取 3 个因子,累积方差贡献率为 76.485%，3 个因子分别为运动主观幸福感、运动社交幸福感、运动心理幸福感，支持原问卷的维度划分。验证性因素分析表明该问卷结构效度良好（χ^2/df==3.413,RMSEA=0.086,NFI=0.935,IFI=0.953,TLI=0.939,CFI=0.953）。运动心理健康连续体简表总分及运动主观幸福感、运动社交幸福感、运动心理幸福感的 Cronbach's α 系数为 0.855~0.919。各维度及总分与低成就感、运动负面评价、运动倦怠总分、抑郁自评总分显著负相关（rs=﹣0.528～﹣0.152，ps<0.001）；运动心理健康连续体简表总分及运动主观幸福感、运动心理幸福感与情绪/体力耗竭显著负相关（rs=﹣0.179～﹣0.277,ps<0.001）。结论：中文版运动心理健康连续体简表在中国大学生运动员群体中均具有良好的信效度,适于考察我国大学生运动员的心理健康水平。修订该量表为中国运动员适应取向心理健康的测量，以及为研究运动员心理健康对运动表现心理的影响提供了科学有效的工具。

关键词 运动心理健康连续体量表，抑郁，运动员倦怠，大学生运动员

The Revised Chinese Version of Sports Mental Health Scale - Short Form

Li Mengxi Yang Yin

(School of psychology, Beijing Sport University, Beijing 100084, China)

Abstract：Objective: To revise the Chinese version of the Sport Mental Health Continuum - Short Form and to

examine its psychometric indicators and applicability among Chinese athletes. Methods:The translated Sports Mental Health Continuum Short Form, Self-Rating Depression Scale, and Athlete Burnout Questionnaire were administered to 657 college athletes from a university in Beijing, and 330 subjects were randomly selected as Sample 1 for item analysis and exploratory factor analysis; the other 327 subjects were used as Sample 2 for confirmatory factor analysis and reliability analysis. Results: The Chinese Sports Mental Health Continuum Short Form included 12 items, and the correlation between each item and the total score was significant (rs=0.673～0.815, *ps*<0.001). Exploratory factor analysis extracted three factors,and the cumulative variance contribution rate was 76.485%.The three factors were sport subjective well-being, sport social well-being, and sport psychological well-being, which supported the dimensional division of the original questionnaire. Confirmatory factor analysis showed good structural validity of the questionnaire (χ^2/df==3.413, RMSEA=0.086, NFI=0.935, IFI=0.953, TLI=0.939, CFI=0.953). The Cronbach's alpha coefficients for the total score of the Sports Mental Health Continuum Short Form and for sport subjective well-being, sport social well-being, and sport psychological well-being ranged from 0.855 to 0.919. The dimensions and the total score of the Sports Mental Health Continuum Short Form were significantly negatively correlated with the total scores of low-achievement, negative appraisal of sports, total scores of burnout in sports, and total scores of self-assessment of depression (rs= - 0.528 to -0.152, *ps*<0.001); the total score of the Sports Mental Health Continuum Short Form and the score of sport subjective well-being and sport psychological well-being were significantly negatively correlated with emotional/physical exhaustion (rs= -0.179 to -0.277, *ps*<0.001).Conclusion: The Chinese version of the Sports Mental Health Continuum Short Form has good reliability and validity in Chinese college athletes, and is suitable for examining the mental health of college athletes in China. The revision of this scale provides a scientific and effective tool for the measurement of adaptive-oriented mental health in Chinese athletes, as well as for the study of the effects of athletes' mental health on the psychology of sports performance.

社会排斥对知识隐藏行为的影响：基于认知-情感人格系统理论

管圆圆[1] 杨琴[2]（通讯作者）

1 中国地质大学（武汉）教育研究院，武汉，430074

2 中国地质大学（武汉）教育研究院，武汉，430074，qinyang@cug.edu.cn

摘 要 **目的：**基于认知-情感人格系统理论，个体在接受到情境信息刺激后会激活其人格系统中的认知−情感单元，个体据此调整其后续的行为反应，文章探讨了社会排斥对知识隐藏行为的影响，即社会排斥这一消极信息会激活消极回避的情感和行为，本文还研究表面顺从和焦虑的在社会排斥对知识隐藏行为之间的中介作用，表面顺从的“表面”意味着个体行为停留在外表的动作层面，但个体内心的价值观不会改变，因此可能为了保护自我假装知识共享，实际表现知识隐藏行为。焦虑也是面对社会排斥这一威胁时的正常情绪状态，焦虑也会影响个体对排斥事件做出负面的应对策略和行为反应，即出现回避他人的行为。同时该理论还认为文化背景会影响不同个体在特定情境的不同行为，因此本研究还选取了集体主义作为调节变量。**方法：**研究采用社会排斥量表、集体主义取向量表、表面顺从量表、焦虑情绪量表和知识隐藏行为量表，分三次对 141 名大学生进行多时点问卷调查。**结果：**研究发现社会排斥正向预测知识隐藏行为，并且表面顺从在社会排斥和知识隐藏行为之间的中介作用显著，集体主义在社会排斥-表面顺从-自杀意念的影响中起调节作用。**结论：** 社会排斥对知识隐藏行为的影响是通过表面顺从实现的；集体主义调节社会排斥-表面顺从-知识隐藏行为的这一路径的影响，高集体主义的个体，在遭受社会排斥时更容易出现表面顺从进而产生知识隐藏行为。

关键词　社会排斥，知识隐藏行为，集体主义，表面顺从，认知-情感人格系统理论

The effect of social exclusion on knowledge hiding behavior: based on cognitive-affective personality systems theory

Yuanyuan Guan
China University of Geosciences(Wuhan)

Abstract： Purpose: Based on the cognitive-affective personality system theory, individuals will activate the cognitive-affective unit in their personality system after receiving contextual information stimuli, and individuals will adjust their subsequent behavioral responses accordingly, this article explores the effect of social exclusion on knowledge hiding behavior, that is, the negative information of social exclusion will activate the negative avoidance emotions and behaviors, and this article also investigates the mediating role of surface compliance and anxiety in the relationship between social exclusion and knowledge hiding behavior. This article also examines the mediating role of surface conformity and anxiety in the relationship between social exclusion and knowledge hiding behavior. The "surface" of surface conformity implies that an individual's behavior stays at the level of outward gestures, but the individual's inner values do not change, and thus he or she may pretend to share knowledge in order to protect himself or herself, and may actually display knowledge hiding behavior. Anxiety is also a normal emotional state when faced with the threat of social exclusion, and it can also affect individuals' negative coping strategies and behavioral responses to exclusion, i.e., avoidance of others. The theory also suggests that cultural context affects different individuals' different behaviors in a given situation, so collectivism was also selected as a moderating variable in this study. METHODS: The study used the Social Exclusion Scale, the Collectivism Orientation Scale, the Apparent Conformity Scale, the Anxiety Emotions Scale, and the Knowledge Concealment Behavior Scale to conduct a multi-temporal questionnaire survey on 141 college students in three separate sessions. RESULTS: It was found that social exclusion positively predicted knowledge-hiding behavior, and that surface conformity mediated significantly between social exclusion and knowledge-hiding behavior, and collectivism moderated the effects of social exclusion-surface conformity-suicidal ideation. CONCLUSIONS: The effect of social exclusion on knowledge-hiding behavior is mediated through surface conformity; collectivism moderates the effect of this pathway of social exclusion-surface conformity-knowledge-hiding behavior, and individuals who are high in collectivism are more likely to engage in surface conformity and thus knowledge-hiding behaviors when they are socially excluded.

Keywords： Social exclusion, knowledge-hiding behavior, collectivism, apparent conformity, cognitive-affective personality systems theory

后疫情时代性少数和性多数群体的核心信念挑战对创伤后应激障碍和创伤后成长的影响：有调节的中介效应模型

杨晨啸[1]　朱文臻[1](通讯作者)
[1]华中师范大学心理学院，武汉，430079，wenzhenzhu@ccnu.edu.cn

摘 要　为持续追踪新冠疫情高峰期后，该创伤事件对人们心理健康造成的结果及其影响因素，比较不同群体的优势及挑战，本研究采用核心信念问卷、创伤后应激障碍简易检查表(PCL8-5)、有帮助的和没有帮

助的自我表露问卷、创伤后成长简易量表(PTGDI-X-SF)、领悟社会支持量表，以网络招募的 183 名性少数群体和 255 名性多数群体为被试，了解和比较后疫情时代性少数群体与性多数群体的核心信念挑战(CBC)对创伤后应激障碍(PTSD)和创伤后成长(PTG)的影响，并考察有帮助的自我表露(HSD)和没有帮助的自我表露(UHSD)的中介作用，以及领悟社会支持(PSS)和性少数身份隐藏的调节作用。结果表明：(1)对于所有群体，PTSD、UHSD、感知到的创伤严重性与 PTG 呈二次曲线相关，即当它们在中等水平时，PTG 最高。路径分析显示，对于所有群体，CBC 正向预测 PTSD 和 PTG；UHSD 在 CBC 对 PTSD 起到部分中介作用，即 CBC 增加了 UHSD，导致 PTSD 水平更高；HSD 在 CBC 对 PTG 起到部分中介作用，即 CBC 增加了 HSD，导致 PTG 水平更高；对于性少数群体，HSD 也部分中介 CBC 到 PTSD，即 CBC 增加了 HSD，导致 PTSD 水平更高。(2)多组分析显示，相比性少数群体，性多数群体在面对 CBC 时获得了更多 HSD。(3)对于性多数群体，领悟社会支持(PSS)调节 CBC 到 PTSD，同时调节 UHSD 到 PTSD，具体来说，PSS 削弱了它们对 PTSD 的正向预测作用。PSS 在 CBC 到 HSD 再到 PTG 中调节 CBC 到 PTG 的部分，PSS 越高，CBC 对 PTG 的正向预测作用越强。(4)对于性少数群体，其性少数身份的隐藏程度调节 HSD 到 PTG 的部分，具体而言，身份隐藏越高，HSD 对 PTG 的预测效应越强，尽管高身份隐藏的性少数群体的 PTG 在 HSD 较低时更低，但他们更可能通过 HSD 而发展出更高的 PTG。PTG 的发展离不开适度的消极心理因素。核心信念受到挑战的人们经历 HSD 后，会发展更多的 PTG，而经历 UHSD 后，会导致更多的 PTSD。然而，相比性多数，性少数获得的 HSD 更少，即使经历了 HSD，仍然会导致更多的 PTSD。此外，PSS 在削弱 PTSD 和促进 PTG 的作用在他们身上也消失了。不过他们的潜在优势是，高身份隐藏使其更容易从 HSD 中获得更多的 PTG。

Effects of Core Beliefs Challenge in Sexual Minorities and Sexual Majorities on Post-traumatic Stress Disorder and Post-traumatic Growth in the Post COVID-19 Pandemic Era: a Moderated Mediating Effect Model

YANG Chen-xiao[1],ZHU Wen-zhen[1]
[1]School of Psychology, Central China Normal University, Wuhan 430079, China

Abstract：In order to continuously track the results and influencing factors of the traumatic event on people's mental health after the peak of the COVID-19 epidemic, and compare the advantages and challenges of different groups, We used Core Belief Questionnaire, Post-traumatic Stress Disorder Checklist (PCL8-5), Helpful and Unhelpful Self-disclosure Questionnaire, Post-Traumatic Growth Checklist (PTGDI-X-SF), and Perceived Social Support Scale. 183 sexual minorities and 255 sexual majority groups were recruited online to understand and compare the effects of core belief challenges (CBC) between sexual minorities and sexual majority groups in the post-pandemic era on post-traumatic stress disorder (PTSD) and post-traumatic growth (PTG), and to examine the mediating role of helpful self-disclosure(HSD) and unhelpful self-disclosure (UHSD), and understand the moderating effects of perceived social support (PSS) and sexual minority identity concealment. The results showed that: (1) For all groups, PTSD, UHSD, and perceived trauma severity were conically correlated with PTG, that is, PTG was highest when they were at moderate levels. Path analysis showed that CBC positively predicted PTSD and PTG for all groups. UHSD plays a partial mediating role in CBC, that is, CBC increases UHSD, resulting in higher PTSD level. HSD partially mediates PTG in CBC, that is, CBC increases HSD, resulting in higher PTG level. For sexual minorities, HSD also partially mediates CBC to PTSD, i.e. CBC increases HSD, leading to higher

PTSD levels. (2) Multi-group analysis showed that sexual majority groups obtained more HSD when confronted with CBC than sexual minority groups. (3) For sexual majority groups, perceived social support (PSS) moderates CBC to PTSD and UHSD to PTSD, specifically, PSS weakens their positive predictive effect on PTSD. PSS moderates the direct effects of CBC to PTG within from CBC to HSD to PTG. The higher the PSS, the stronger the positive prediction effect of CBC on PTG. (4) For sexual minorities, the degree of sexual minority identity concealment moderates HSD to PTG. Specifically, the higher the identity concealment, the stronger the predictive effect of HSD on PTG. Although the PTG of sexual minorities with high identity concealment is lower when HSD is lower, they are more likely to develop higher PTG through HSD. The development of PTG is inseparable from moderate negative psychological factors. People whose core beliefs are challenged develop more PTG after experiencing HSD, and more PTSD after experiencing UHSD. However, sexual minorities acquire less HSD than sexual majority, and even experiencing HSD still leads to more PTSD. In addition, the role of PSS in weakening PTSD and promoting PTG was also lost in them. Their potential advantage, though, is that high identity concealment makes it easier to get more PTG through HSD.

错误记忆对恐惧泛化的影响及其时间持续性

赵润吉　王俭勤（通讯作者）

复旦大学心理学系，上海，200433，wjq@fudan.edu.cn

摘 要 恐惧泛化是焦虑障碍的典型特征与病理基础，研究恐惧泛化的形成机制对解释焦虑障碍等疾病的病理机制以及开发相应临床干预手段具有重要意义。已有研究发现了恐惧习得过程中人们会形成错误记忆，但鲜有研究考察了错误记忆对恐惧泛化的影响及其时间持续性。本研究引入负性情绪材料以及时间变量，探究由情绪材料引发的基于错误记忆的恐惧泛化随时间变化的机制。并将错误记忆的经典范式 DRM 范式与恐惧学习任务相结合，形成基于错误记忆的恐惧泛化研究范式展开实验。实验为 2（词表效价：中性、负性）×3（再认时间间隔：间隔十分钟、间隔一天、间隔一周）的混合设计，其中词表效价为被试内变量，再认时间间隔为被试间变量。选取 123 名在校大学生（男性 48 名）作为被试，每位被试需完成实验的三个阶段，分别为恐惧学习阶段、记忆测试阶段以及恐惧回避阶段。结果发现：（1）与中性关键诱饵相比，被试对于消极关键诱饵产生了更多的错误恐惧记忆；（2）被试对未出现过的关键诱饵词语（CL+）产生了错误的恐惧记忆后，在随后的回避阶段中也会对这些词语产生更多的回避行为，说明错误记忆可引发恐惧泛化；（3）随时间的增加，对学过词语（CS+）的正确恐惧记忆显著降低，并在回避阶段中对于 CS+的回避率显著降低；随时间的增加，虽然对关键诱饵（CL+）的错误恐惧记忆显著降低，但一周后被试对于错误记忆的诱饵项目仍存在恐惧泛化行为。最后，回归分析的结果表明错误恐惧记忆对恐惧泛化有正向预测作用，即当被试产生的错误恐惧记忆越多，在回避阶段就会对此类词语产生更多的回避行为。以上结果表明，错误记忆是导致恐惧泛化的机制之一，并且，错误记忆对恐惧泛化的影响可持续一周。

The impact of false memory on fear generalization in a long term

Runji Zhao, Jianqin Wang

Fudan University, 220 Handan Road, Shanghai, China, wjq@fudan.edu.cn

Abstract：Fear generalization is a typical feature and pathological basis of anxiety disorders, and the study of the formation mechanism of fear generalization is of great significance in explaining the pathological mechanisms of anxiety disorders and other diseases as well as in developing corresponding clinical interventions. False memories have been found to be formed during fear acquisition, but few studies have examined the effects of false memories on fear generalization and its temporal persistence. In this study, we introduced negative emotional materials as well as temporal variables to investigate the mechanism of false memory-based fear generalization triggered by emotional materials over time. And the classical paradigm of the DRM paradigm of false memory was combined with the fear learning task to form a research paradigm of fear generalization based on false memory to carry out experiments. The experiment was a 2 (emotional valence of word lists: neutral, negative) ×3 (recognition interval: ten minutes interval, one day interval, one week interval) mixed design, in which the emotional valence of word lists was the within-subjects variable and recognition interval was the between-subjects variable. One hundred and twenty-three college students (48 males) were selected as subjects, and each subject was required to complete three phases of the experiment, namely, the fear learning phase, the memory test phase, and the fear avoidance phase. It was found that (1) subjects produced more false fear memories for negative critical lures than for neutral critical lures; (2) after producing false fear memories for critical lure words that had not appeared (CL+), subjects also produced more avoidance behaviors for these words in the subsequent avoidance phase, suggesting that false memories can trigger fear generalization; and (3) with the increase of time, the correct fear memories for the learned word (CS+) correct fear memory significantly decreased, and the avoidance rate for CS+ was significantly lower in the avoidance phase; and with time, although false fear memory for the critical lure (CL+) significantly decreased, subjects still showed fear generalization behaviors for the incorrectly remembered lure items one week later. Finally, the results of the regression analysis indicated that false fear memories had a positive predictive effect on fear generalization, i.e., when subjects produced more false fear memories, they produced more avoidance behaviors for such words in the avoidance phase. The above results suggest that false memories are one of the mechanisms leading to fear generalization and that the effect of false memories on fear generalization can last up to one week.

Keywords：False memory, fear generalization, time effect,valence of emotion

焦虑情绪对网络谣言相信程度和分享意愿的影响

陆辰　徐珍珍　王碧涵　丁雷　梅嘉靖　王俭勤（通讯作者）

复旦大学心理学系，上海，200433，wjq@fudan.edu.cn

摘 要　网络谣言在全球范围内持续蔓延，对社会稳定和个体心理健康造成严重威胁。在这个信息爆炸的时代，焦虑情绪作为现代社会普遍存在的情绪体验，考察焦虑情绪对网络谣言传播的影响具有重要意义。对此，本研究旨在深入探讨焦虑情绪在网络谣言相信程度和分享意愿方面的作用。实验采用 2(情绪状态：焦虑、中性) ×2(信息类型：谣言、真信息) ×（信息主题：病毒类，普通科学类）三因素混合设计，其中情绪状态为被试间变量，信息类型和信息主题为被试内变量。参照众多国内外学者的研究，本研究采用视频诱导的方式诱导被试的情绪。谣言和真信息均选取自腾讯较真平台、中国互联网联合辟谣平台等官方媒体。研究选取了大学生 102 名，2 名被试因曾看过情绪诱导视频被剔除，最终样本量为 100 名被试。被试被随机分为两组: 焦虑组(n=50)和中性组(n=50)。结果发现：（1）在控制前测对谣言的相信程度影响后，两组对后测谣言的相信程度存在显著差异，$F(1,97) = 4.37$, $p = .04$, 偏$\eta^2 = 0.04$，焦虑组被试更容易相信谣言；（2）

在控制前测对真信息的相信程度影响后，两组对后测真信息的相信程度无显著差异，$F(1,97) = 3.02$, $p = .09$, 偏$\eta^2 = 0.02$；（3）在控制前测对病毒类谣言的相信程度影响后，两组对后测病毒类谣言的相信程度存在显著差异，$F(1,97) = 4.48$, $p = .04$, 偏$\eta^2 = 0.04$，焦虑组被试容易相信病毒类谣言（4）在控制前测对普通科学类谣言的相信程度影响后，两组对后测普通科学类谣言的相信程度无显著差异，$F(1,97) = 2.62$, $p = .11$, 偏$\eta^2 = 0.03$。以上结果表明，相比于真信息，焦虑情绪对谣言存在特异性，即更容易相信谣言，且对病毒类谣言的相信程度高于普通科学类谣言。当前的研究结果有助于我们理解焦虑情绪在信息传播过程中的作用。这能够揭示个体在信息传播过程中受到焦虑情绪影响的心理机制，从而为对抗谣言和错误信息提供更有效的策略和干预措施。

The Effect of Anxiety on Rumor Belief and Sharing Behavior

Chen Lu, Zhenzhen Xu, Bihan Wang, Lei Ding, Jiajing Mei, Jianqin Wang
Department of psychology, Fudan University, Shanghai

Abstract： Rumors, as a global phenomenon, present a significant threat to both social stability and individual psychological well-being in today's information-explosion era. Understanding the impact of anxiety on the spread of internet rumors is crucial due to its prevalence as a common emotional experience in modern society. This study aimed to thoroughly investigate the influence of anxiety on individuals' belief in and willingness to share internet rumors. The experiment utilized a 2(emotional state: anxiety, neutral) × 2(information type: rumor, true information) × (information topic: viral, general science) three-factor mixed design, with emotional state as the between-subjects variable, and information type and information topic as the within-subjects variables. Subjects' emotions were induced using video induction based on previous studies conducted by both domestic and international scholars. Rumors and true information were selected from credible media sources such as Tencent's truthful platform and China Internet Joint Rumor Dispelling Platform. The study involved 102 college students, with 2 subjects being excluded due to exposure to the emotion-inducing video, resulting in a final sample size of 100 subjects. Subjects were randomly assigned to either the anxious group (n=50) or the neutral group (n=50).

The findings revealed that (1) after controlling for the effect of pretest belief in rumors, the anxious group displayed a significantly higher belief in posttest rumors compared to the neutral group, $F(1,97) = 4.37$, $p = .04$, partial $\eta^2 = 0.04$; (2) after controlling for the effect of pretest belief in true information, there was no significant difference between the two groups in their belief in posttest true information, $F(1,97) = 3.02$, $p = .09$, partial $\eta^2 = 0.02$; (3) after controlling for the effect of pretest belief in viral rumors, the anxious group exhibited a significantly higher belief in posttest viral rumors than the neutral group, $F(1,97) = 4.48$, $p = .04$, partial $\eta^2 = 0.04$; (4) after controlling for the effect of pretest belief in general science rumors, there was no significant difference between the two groups in their belief in posttest general science rumors, $F(1,97) = 2.62$, $p = .11$, partial $\eta^2 = 0.03$. These results suggest that anxiety is specifically associated with a higher degree of belief in misinformation compared to truthful information, and that individuals experiencing anxiety are more prone to believe in viral rumors than in general scientific rumors.

The study's outcomes shed light on the role of anxiety in the process of information dissemination, revealing psychological mechanisms by which individuals' decision-making during

information sharing is influenced by anxiety. Consequently, the findings offer valuable insights for developing more effective strategies and interventions to combat rumors and misinformation.

5 De Montfort University, Leicester, UK

摘 要 背景：大学生中普遍存在饮酒行为，并且自新冠疫情爆发以来其流行率有所增加。然而，关于中国大学生酒精使用障碍的准确流行率和相关人格风险因素的认识仍非常有限。本研究旨在探究中国北京地区大学生过去 12 个月内危险和有害饮酒的流行率和人格风险因素。方法：从 2022 年 7 月 2 日至 11 月 5 日，对北京地区 2534 名大学生进行了横断面调查，使用一系列结构化问卷测量心理结果和人格特征，包括抑郁、焦虑和压力量表（DASS-21）、失眠严重指数（ISI）、视觉模拟量表-焦虑（VAS-A）、感知社会支持量表（PSSS）、感知同伴饮酒压力量表（PPPDS）、寻求刺激性格量表（ESPS）和酒精使用障碍筛查量表（AUDIT）。进行多变量 logistic 回归分析，以确定过去 12 个月内危险和有害饮酒的相关因素。结果：参与者中过去 12 个月内危险和有害饮酒的流行率为 17.25%。随着寻求刺激人格特质、过去 30 天内吸烟频率和感知同伴饮酒压力程度的增加，过去 12 个月内危险和有害饮酒的风险也增加。结论：中国北京地区大学生过去 12 个月内危险和有害饮酒的流行率较高。寻求刺激人格特质可能是过去 12 个月内大学生发生危险和有害饮酒的独立风险因素。使用 NEO 人格问卷（NEO-PI-R）对这种特质进行筛查可能有助于降低发展酒精使用障碍的可能性。

5De Montfort University, Leicester, UK

Abstract：Background: Alcohol use is prevalent among college students, and its prevalence has increased since the outbreak of the coronavirus disease (COVID-19). However, there is limited knowledge regarding the exact prevalence and associated personality factors of alcohol use disorder (AUD) among Chinese college students. This study aims to identify the prevalence and personality risk factors of hazardous and harmful drinking in the last twelve months among college students in Beijing, China. Methods: From July 2nd to November 5th, 2022, a cross-sectional survey was conducted among 2,534 college students in Beijing using a series of structured questionnaires measuring psychological outcomes and personality traits including Depression, Anxiety and Stress Scale (DASS-21), Insomnia Severity Index (ISI), Visual Analog Scales-Anxiety (VAS-A), Perceived Social Support Scale (PSSS), Perceived Peer Pressure for Drinking Scale (PPPDS), Excitement Seeking Personality Scale (ESPS), and Alcohol Users Disorders Identification Test (AUDIT). Multivariable logistic regression was performed to identify the correlative factors of hazardous and harmful drinking in the past twelve months. Results: The prevalence of hazardous and harmful drinking in the last twelve months among participants was 17.25%. As levels of excitement seeking trait, the frequency of smoking in the past 30 days, PPPDS increased, so did the risk of hazardous and harmful drinking in the past twelve months. Conclusions: The prevalence of hazardous and harmful drinking in the last twelve months among college students in Beijing, China has been relatively high. The trait of excitement seeking appears to be an independent risk factor for engaging in hazardous and harmful drinking in the past twelve months among college students. Conducting screenings for this trait using the NEO Personality Inventory (NEO-PI-R) could be beneficial in reducing the likelihood of developing an AUD.

社交焦虑障碍认知行为治疗技术的德尔菲法研究

刘萌萌[1] 王鹏翀[1] 俞婧[1]李占江[1] 罗佳[1]（通讯作者）

1 首都医科大学附属北京安定医院，国家精神心理疾病临床医学研究中心，北京市精神疾病诊断与治疗重点实验室,北京 100088

通讯作者 E-mail： luojia_0210@163.com

摘 要 目的：本研究拟用德尔菲法（Delphi）调查社交焦虑障碍(Social anxiety disorder, SAD) 认知行为治疗（Cognitive Behavioral Therapy, CBT）技术在国内的应用情况，为进一步优化 CBT 技术，提高其文化适应性奠定基础。方法：复习国内外关于社交焦虑障碍 CBT 的文献及书籍，筛选出 49 项 CBT 技术并制定专家咨询表。邀请国内 26 名 CBT 专家从使用频率、治疗效果贡献度和来访者接受度三个维度进行两轮评估，最后计算各技术得分并进行排序。结果：（1）两轮专家咨询的积极性为 100%，专家权威系数均值为 0.955。技术各维度评分的肯德尔协调系数范围 0.31-0.51（P＜0.01）；（2）排序前五位的技术为建立治疗联盟，心理教育，识别自动思维，微观案例概念化，资料收集；（3）综合秩次排序靠后，但已证实有效性的技术包括意象重构、录像反馈、现场暴露、想象暴露、正念呼吸和身体扫描。（4）专家一致性程度高的技术如下，第一，基本技术如心理教育，治疗联盟建立，资料收集等；第二，认知技术如识别自动思维，识别中间信念，可替代性思维；第三，行为技术如问题解决、社交技能训练、角色扮演。结论：大部分 SAD 的 CBT 技术专家评分一致性较高，在国内适宜性良好，但仍有部分高阶技术的应用存在争议，如动机访谈、意象重构、录像反馈等。另外，相比于行为技术，优先推荐使用基本技术与认知技术。未来可结合中国文化背景进一步调整并优化治疗技术，提高 CBT 技术的文化适应性。

Cognitive behavior therapy techniques for social anxiety disorder: A Delphi study

Liu Mengmeng[1] Wang pengchong [1]Yujing [1] Li Zhanjiang [1], Luo jia [1]
Corresponding author: luo jia, E-mail：luojia_0210@163.com
Department of clinical psychology, Beijing Anding hospital affiliated to Capital Medical University ＆ National Clinical Research Center for Mental Disorders ＆Beijing key laboratory of diagnosis and treatment of mental disorders，Beijing，100088，China

Abstract：Objective: To investigate the application of Cognitive Behavioral Therapy (CBT) techniques for social anxiety disorder (SAD) domestically by the Delphi method. It is helpful for the further study about the optimizing CBT techniques and improving cultural adaptability.

Methods: Domestic and foreign literature and books on CBT for SAD were reviewed, then 49 CBT techniques were screened and expert questionnaires were built. In two rounds of consultation, each technique was scored by 26 CBT experts on three dimensions including frequency, the contribution of efficacy, and acceptability. Finally, CBT techniques were ranked by the scores. Results: (1) The positivity of the two rounds of consultation was 100%, and the mean value of the coefficient of authority was 0.955. The Kendall's W value for each dimension of CBT techniques ranged from 0.31 to 0.51(P< 0.01). (2) The top 5 techniques were establishing therapeutic alliance, psychoeducation, identifying automatic thoughts, micro-case conceptualization, and data collection. (3) Although some techniques are proven to be effective, they rank low on the list. For example, imagery rescripting, video feedback, in-vivo exposure, imaginal exposure, mindfulness of breathing, and body scanning. (4) Technologies with a high degree of expert consistency. First, basic techniques such as psychoeducation, establishing therapeutic alliance, data collection, etc.; Second, thinking techniques such as identifying of automatic thinking, identifying of intermediate beliefs, alternative thinking, etc.; Third, behavioral techniques such as problem solving, social skills training, role playing, etc.

Conclusions: Most of the CBT techniques for SAD have been evaluated by experts with high consistency and suitability for use in China. However, the use of advanced CBT techniques is still controversial, such as motivational interviewing, imagery rescripting, video feedback, and so on. In addition, basic techniques and cognitive techniques were recommended in preference of behavioral techniques. In future studies, the CBT techniques for SAD should be optimized and customized for the Chinese culture.

反社会媒体接触与网络引战：敌意归因偏向的中介作用与共情的调节作用

邱越冬[1] 李放[1]（通讯作者）
1 四川师范大学，成都，610066，lifang_sicnu@126.com

摘 要 随着网络与通信技术发展，社交媒体渗入人们生活的方方面面，网络引战作为一种典型的网络恶意行为，其最常见的一种特征是虐待性攻击行为。由于网络引战对受害者造成的巨大伤害以及对网络环境的破坏，引起了很多研究者的广泛关注。前人研究表明，个体经常暴露于反社会媒体内容（包括暴力、酗酒和鲁莽驾驶等），可能会导致其参与攻击性行为频次更高。国内外对网络引战的研究成果较少，且大多研

究着重考察个人特质与网络引战的关系，关于外部环境因素（反社会媒体接触）与网络引战的关系与内部机制尚未明确。因此，本研究基于 I^3 模型、社会认知理论等，采用网络引战问卷、反社会媒体接触问卷、敌意归因偏差问卷以及基本共情问卷对四川、广州等高校共 1322 名大学生进行调查，为探讨反社会媒体接触与网络引战的关系及其作用机制，建构了一个有调节的中介效应模型，检验敌意归因偏差的中介作用以及共情的调节作用。结果表明：（1）网络引战、反社会媒体接触与敌意归因偏向两两显著正相关；（2）反社会媒体接触显著正向预测网络引战；（3）敌意归因偏差在反社会媒体接触与网络引战关系中起部分中介作用；（4）共情调节了“反社会媒体接触→敌意归因偏差→网络引战”的前后半段路径以及间接路径。当共情能力较强时：反社会媒体接触对网络引战、反社会媒体接触对敌意归因偏差、敌意归因偏差对网络引战的预测作用减弱。因此，大学生接触过多的反社会媒体内容会加重敌意归因偏向，进而产生网络引战行为，但是较强的共情能力能减弱反社会媒体接触与敌意归因偏向对于网络引战的消极影响。本研究验证了环境因素、认知因素与个体因素对网络引战行为的共同作用，对大学生网络引战行为的干预提供一定的策略，为加强网络空间道德建设、网络空间行为规范、网络空间生态治理做出贡献。

Antisocial media contact and online trolling: The mediating role of hostile attribution bias and the moderating role of empathy

Yuedong Qiu[a], Fang Li[a](corresponding author)
[a] School of Psychology, Sichuan Normal University, China

Abstract：With the development of network and communication technology and the penetration of social media into every aspect of people's lives, one of the most common features of online trolling as a typical malicious behaviour on the Internet is abusive aggressive behaviour. Due to the great harm caused by online trolling to the victims and the damage to the cyber environment, it has attracted extensive attention from many researchers. Previous studies have shown that individuals' frequent exposure to antisocial media content (including violence, alcohol abuse, and reckless driving) may lead to a higher frequency of participation in aggressive behaviours. There are fewer domestic and international studies on online trolling, and most of them focus on the relationship between personal traits and online trolling, while the relationship between external environmental factors (antisocial media contact) and online trolling and the internal mechanisms have not yet been clarified. Therefore, based on the I^3 model, social cognitive theory, etc., this study used the online trolling questionnaire, antisocial media contact qestionnaire, hostile attribution bias questionnaire, and basic empathy questionnaire to survey a total of 1,322 college students in universities in Sichuan, Guangzhou, etc., and in order to explore the relationship between antisocial media contact and online trolling and its mechanism of action, a moderated mediation effect model was constructed to test the hostile attribution bias's mediating effect and the moderating effect of empathy. The results showed that (1) online trolling, antisocial media contact, and hostile attribution bias were both significantly and positively correlated; (2) antisocial media contact significantly and positively predicted online trolling; and (3) hostile attribution bias partially mediated the relationship between antisocial media contact and online trolling; (4) Empathy moderated the first and second half of the path "antisocial media contact → hostile attribution bias → online trolling" as well as the indirect path. When empathy was strong, the predictive effects of antisocial media contact on online trolling, antisocial media contact on hostile attribution bias, and hostile attribution bias on online trolling were weakened. Thus, college students' exposure to excessive antisocial media

content increases hostile attribution bias, which in turn leads to online trolling behaviours, but stronger empathy attenuates the negative effects of antisocial media contact and hostile attribution bias on online trolling behaviours. This study verifies the joint role of environmental factors, cognitive factors and individual factors on online trolling behaviours, and provides certain strategies for the intervention of college students' online trolling behaviours, contributing to the enhancement of the construction of cyberspace morality, cyberspace behavioural norms, and cyberspace ecological governance.

摘 要 目的：抑郁症是一种常见的慢性精神障碍疾病，其致病原因复杂且康复率较低。目前，抑郁症的临床诊断主要根据患者主观报告及医生诊断结果，存在较强的主观性和高漏诊、误诊率。本研究使用脑电图（EEG）技术测量脑电生理指标，旨在寻找更精确的抑郁症检测和诊断生物标志物，并探究抑郁症脑功能结构变化和发病机制。方法：在某综合性三甲医院招募了 79 名经过 DSM-5 确诊且未服药的抑郁症患者以及来自社区的 54 名健康对照组被试。采用 Neuroscan 公司的 64 导脑电检测仪收集两组被试的 6 分钟静息态脑电数据，对预处理后的数据进行功率谱分析，计算了δ（1-3Hz）、θ（4-7Hz）、α（8-13Hz）、β（14-30Hz）四个频段的绝对功率值，以及左右脑半球的不对称性指数，并对比了两组间的差异。此外，使用流调中心用抑郁量表、状态特质焦虑量表、情感强度量表分别对被试的抑郁水平、焦虑水平以及情感强度进行数据采集，并使用相关分析探究生理指标与量表得分之间的关系。结果：(1)抑郁组被试在δ、θ、α和β四个频段上的绝对功率值均显著高于对照组。(2)其中δ、θ和α频段上的差异在前额叶、中央区、顶叶及枕叶区均有体现，而β频段的差异仅集中在中线区附近的额叶、中央区及顶叶区。(3)两组均未发现额叶α的左右半球不对称，但发现了两组被试均存在δ波在额区的右侧不对称及颞区的左侧不对称。(4)两组被试在抑郁及特质焦虑量表得分上有显著差异（$t = -14.05$, $p < 0.001$; $t = -3.593$, $p < 0.001$）。(5)四个频段的功率值与两组被试的抑郁水平之间均不存在显著相关。α与θ功率值与抑郁被试的特质焦虑水平呈显著正相关（$r = 0.31$, $p < 0.01$; $r = 0.29$, $p < 0.05$），而对照组被试中未发现显著相关结果。结论：脑电功率值差异有望成为可靠的抑郁症识别生物标志物，但额区的半球不对称性在抑郁症诊断中的潜在作用仍有待进一步探索。

Abstract： Objective: Depression is a prevalent and chronic mental disorder with complex etiology and low

recovery rates. Currently, the clinical diagnosis of depression still relies heavily on patients' subjective reports and doctors' assessments, leading to considerable subjectivity and high rates of misdiagnosis. Therefore, this study aimed to employ electroencephalogram (EEG) technology to measure electrophysiological indicators of brain activity, with the goal of identifying more precise biomarkers for depression detection and diagnosis. Moreover, this study aimed to investigate in brain function structure and unravel the pathophysiological mechanisms underlying depression. Methods: A total of 79 medication-naïve patients with major depressive disorder (MDD) diagnosed according to DSM-5 criteria were recruited from a comprehensive tertiary hospital, along with 54 healthy control subjects from a community. Resting-state EEG data were collected using a 64-channel Neuroscan system for both groups during a 6-minute recording. Preprocessed data were subjected to power spectrum analysis, calculating absolute power values for four frequency bands: δ (1-3Hz), θ (4-7Hz), α (8-13Hz), and β (14-30Hz). Asymmetry indices for the left and right hemispheres were also computed, and differences between the two groups were compared. Additionally, depression levels, anxiety levels, and emotional intensity were assessed using the Center for Epidemiological Studies Depression Scale (CES-D), State-Trait Anxiety Inventory (STAI), and State Affect Intensity Scale (SAIS), respectively. Correlation analysis was conducted to explore the relationships between physiological indicators and scale scores. Results: (1) The MDD group exhibited significantly higher absolute power values in the δ, θ, α, and β frequency bands compared to the control group. (2) The group differences in δ, θ, and α frequency bands were significant in the frontal, central, parietal, and occipital regions, while the group differences in the β frequency band were only localized in the frontal lobe, central region, and parietal lobe near the midline region. (3) No significant hemisphere asymmetry in α activity was found in either group, however, both groups exhibited right-sided asymmetry in δ activity in the frontal region and left-sided asymmetry in the temporal region. (4) There were significant differences between the two groups of subjects in terms of scores on the depression and trait anxiety scales ($t = -14.05$, $p < 0.001$; $t = -3.593$, $p < 0.001$). (5) No significant correlation were observed between power values in the four frequency bands and depression levels in either group. The power values of α and θ were significantly positively correlated with trait anxiety levels in MDD group ($r = 0.31$, $p < 0.01$; $r = 0.29$, $p < 0.05$), while no significant correlations were found in the control group. Conclusion: The EEG power differences hold promise as reliable biomarkers for depression identification, while the diagnostic utility of frontal alpha asymmetry in depression needs to be further explored.

社交媒体多任务行为相关研究综述与展望

李佳徽[1] 杜捷[2]（通讯作者）

1 重庆工商大学工商管理学院，重庆，400000

2 重庆工商大学工商管理学院，重庆，400000，通讯作者 jdu@ctbu.edu.cn

摘 要 媒体多任务行为是指同时对多个电子或非电子媒体任务进行处理或做出反应。本文整合了国内外相关研究，主要提炼以下四点内容：（1）媒体多任务行为的概念辨析：主要分析了媒体多任务、任务转换、多媒体任务三个概念的联系与区别；（2）媒体多任务行为的测量工具：主要包括问卷调查法（Media Use Questionnaire, MUQ）、实验法；（3）媒体多任务行为的理论基础：使用满足理论（Use & Gratifications Theory）、社会学习理论（Social Learning Theory）、自我决定理论（Self-Determination Theory）、认知资源限制理论（The Limited Capacity Theory）、沉浸理论和自我调节理论、媒介生态理论（Media Ecology Theory）、有界广义互惠理论（Bounded Generalized Reciprocity Theory）和无界间接互惠理论（Unbounded Indirect Reciprocity

Theory）；（4）媒体多任务行为的相关研究：1)对认知控制影响：一个是注意训练假设，是指认知控制的切换功能因在频繁的媒体多任务处理过程中得到训练而提高。另一个是注意分散假设，是指经常进行媒体多任务行为处理会损害个体认知控制中的持续注意力；2)对情绪的影响：目前学术界大部分学者认为媒体多任务行为对个体的情绪呈负向影响；3)对创造力的影响：无论媒体多任务与创造性思维还是创造性行为表现,研究结果都更多呈现非负性关系；4)“前因后效”式影响：引起媒体多任务行为的动机可能有错失恐惧、享受与联系、无聊、信息、习惯性使用，造成的效果可能存在认知分心、学业下降、问题性使用手机。

A review and prospect of research on social media multitasking behavior

Li Jiahui[1], DU Jie[1]
[1] School of Business Administration, Chongqing Technology and Business University, Chongqing 400000, China

Abstract: Media multitasking refers to processing or reacting to multiple electronic or non-electronic media tasks at the same time. This paper integrates relevant research at home and abroad, and mainly extracts the following four points: (1) Conceptual analysis of media multitasking behavior: it mainly analyzes the connection and difference between the three concepts of media multitasking, task conversion and multimedia tasking; (2) Measurement tools for media multitasking behavior: mainly including Media Use Questionnaire (MUQ) and experimental methods; (3) Theoretical basis of media multitasking behavior: Use & Gratifications Theory, Social Learning Theory, Self-Determination Theory, The Limited Capacity Theory, Immersion Theory and Self-Regulation Theory, Media Ecology Theory, Bounded Generalized Reciprocity Theory and Unbounded Indirect Reciprocity Theory; (4) Research on media multitasking behavior: (1) Impact on cognitive control: One is the attention training hypothesis, which means that the switching function of cognitive control is improved by being trained in the process of frequent media multitasking. The other is the attention distraction hypothesis, which means that frequent media multitasking behavior processing can impair sustained attention in individual cognitive control; (2) Impact on emotions: At present, most scholars in academia believe that media multitasking behavior has a negative impact on individual emotions; (3) Impact on creativity: Whether media multitasking and creative thinking or creative behavior performance, the results of the study show more non-negative relationships; (4) "anteced ent and post" effects: The motivation that causes media multitasking behavior may be missed fear, enjoyment and connection, boredom, information, habitual use, and the effects may be cognitive distraction, academic decline, and problem use of mobile phones.
Keywords: social media, media multitasking, cognitive control

跨文化视角下父母家庭功能、二元应对与养育倦怠关系探究

库都尼戈·库尔班[1]　斯琢然[1]　王广新[1]（通讯作者）
1 北京林业大学，北京，100091，wgx8868@163.com

摘 要　养育倦怠(Parental burnout)是个体因为其父母角色长时间暴露在家庭需要和育儿压力中而导致的慢性疲劳和情绪失调。过去研究中提出家庭功能，即婚姻满意度和共同养育关系可能是养育倦怠的重要预测因素。二元应对既指个体试图帮助减轻他(她)的伴侣感受到的外部压力，又指两人应对压力的共同努力，二元应对可能是出现养育倦怠的重要影响因素。养育倦怠易导致夫妻冲突，对儿童的忽视和暴力行为等负性后果，因此探究其影响因素及作用机制是至关重要的。本研究基于家庭系统理论、风险-资源平衡理论以及家庭危机和适应的双 ABC-X 模型，以 995 个来自汉族和维族家庭的家长为研究对象，在跨文化视角下考察二元应对和家庭功能(婚姻满意度、共同养育关系)与养育倦怠的关系，探究养育倦怠发展的影响因素和机制。结果发现：(1)汉族家庭和维族家庭在二元应对、共同养育关系、婚姻满意度和养育倦怠均有显著差异。(2)养育倦怠受民族、孩子性别、家庭孩子数量、主观经济压力水平的影响。(3)二元应对、婚姻满意度、共同养育关系与养育倦怠之间存在显著负相关。(4)在汉族家庭中,以婚姻满意度和共同养育关系为中介变量的链式中介模型成立($X^2/df=0.49$, RMSEA=0.00, NFI=0.99 , CFI=1.00, TLI=0.99)，夫妻间更好的二元应对会提升他们的婚姻满意度和共同养育关系，从而减少父母养育倦怠。在维族家庭中，二元应对仍能够显著预测养育倦怠，但婚姻满意度及共同养育的中介效应不显著。结论：二元应对对于养育倦怠具有预测效应，其中对于汉族家庭来讲，当夫妻的二元应对水平较高时，更可能具有较强的婚姻满意度和共同养育关系，从而表现出更少的养育倦怠。

Research on the relationship between family function, dyadic coping and parenting burnout of Uyghur and Han parents from a cross-cultural perspective

Kudunige Kuerban　Zhuoran Si　Guangxin Wang
Beijing Forestry University, Beijing, China

Abstract：Parental burnout is a chronic stress-related disorder experienced in the parental role. Previous studies have suggested that family functioning (marital satisfaction and co-parenting relationships), is important predictors of parenting burnout. Dyadic coping refers to both the individual's attempt to help alleviate the external pressure felt by his or her partner and the joint efforts of the two to cope with the pressure. Dyadic coping may be an important factor in the emergence of parenting burnout. Parenting burnout can easily lead to conflict between couples, neglect of children, violence and other negative consequences, so it is very important to explore its influencing factors and mechanism.. Based on the family system theory, risk-resource balance theory, and the dual ABC-X model of family crisis and adaptation, this study examined the relationship between dyadic coping and family functioning (marital satisfaction, co-parenting relationship) and parental burnout from a cross-cultural perspective, taking 995 parents from Han and Uyghur families as research objects. To explore the influencing factors and mechanisms of the development of parenting burnout. The results show that: (1) There are significant differences between Han and Uyghur families in dyadic coping, co-parenting relationship, marital satisfaction and parental burnout. (2) Parental burnout was affected by ethnicity, child gender, number of children in the family, and subjective economic pressure level. (3) There is a significant negative correlation between dyadic coping, marital satisfaction, co-parenting relationship with parental burnout. (4) In Han families, the chain mediating model with marital satisfaction and co-parenting relationship as mediating variables was established ($X^2/df=0.49$,

RMSEA=0.00, NFI=0.99, CFI=1.00, TLI=0.99). Better dyadic coping between couples will increase their marital satisfaction and co-parenting relationship, thereby reducing parental burnout. In Uyghur families, dyadic coping can still significantly predict parental burnout, but the mediating effect of marital satisfaction and co-parenting is not significant. Conclusion: Dyadic coping has predictive effect on parental burnout. For Han families, couples with higher dyadic coping level are more likely to have stronger marital satisfaction and co-parenting relationship, and thus show less parenting burnout.

Keywords：parental burnout，dyadic coping，marital satisfaction，coparenting relationship

基于古代动物雅称学习的睡眠巩固效应

孙文涛，高乾程，刘妮娜（通讯作者）

摘要　睡眠在知识学习和记忆巩固中扮演重要角色。来自新词学习的研究发现，睡眠有助于增强新词表征及其语义网络整合，即新词睡眠巩固效应。然而，现有研究主要基于拼音规则的文字（如英语）使用或学习者，缺乏来自汉语这一独特拼义文字的证据；同时研究中常使用人工假词作为学习材料，对结果的生态效度产生一定影响。因此，本研究旨在在汉语为母语的人群中，采用具有中国文化底蕴的古代动物雅称作为新词材料（如，因为兔子双目通红，古人认为其视力超群，祭祀后人们可以获得洞穿鬼魅的能力，所以用“明视”指代“兔子”），进一步探究新词学习中的睡眠巩固效应。研究采用经典的睡眠巩固范式（见附件图 1），将 40 名大学生被试随机分为睡眠-清醒组和清醒-睡眠组。被试在充分学习 9 个动物雅称后，在 0 小时(T1)，12 小时(T2)和 24 小时(T3)后进行三次测试。每次测验包括反映新词形-音-义表征的概念回忆和快速命名任务，以及反映新词语义整合的大小判断任务。同时，在所有测试之前通过警觉性任务来严格控制昼夜节律对结果的影响。研究结果显示，在新词形-音-义表征和语义整合任务中均发现显著的睡眠巩固效应，表现为两组被试在夜间睡眠后概念回忆率更高和命名速度更快，以及更强的语义距离效应。更重要的是,睡眠-清醒组的睡眠巩固效应（T2）显著大于清醒-睡眠组(T3)，这表明学习后短时间内进入睡眠对新词的巩固更为有利。本研究的发现进一步丰富了新词学习中的睡眠巩固证据，并对记忆互补学习系统模型（complementary learning systems models of memory）提供了一定的启示。

The Sleeping Consolidation Effect on Learning of Animal Nicknames in Ancient Chinese

Wentao Sun, Qiancheng Gao, Nina Liu
Faculty of psychology, Tianjin Normal University, Tianjin, China

Abstract：Sleep plays an important role in knowledge learning and memory consolidation. Research from new word learning finds that sleep helps to enhance the representation of new words and their Semantic network integration, that is, the sleep consolidation effect of new words. However, the existing research is mainly based on the users or learners of pinyin rule characters, and the lack of evidence from Chinese, a unique group of spelling characters; At the same time, artificial pseudowords are often used as learning materials in research, which has a certain impact on the ecological validity of the results. Therefore, this study aims to use ancient animal nicknames with Chinese cultural heritage as new word materials among Chinese native speakers (for example, because rabbits

have bright red eyes, the ancients believed that their vision was superior, and people can obtain the ability to penetrate ghosts after sacrificial ceremonies, so "ming shi" is used to refer to "rabbit"), in order to further explore the sleep consolidation effect in new word learning. The study used the classic sleep consolidation paradigm (see Figure 1 in the attachment) and randomly divided 40 college students into a sleep-awake group and a awake-sleep group. After fully learning 9 animal names, the subjects underwent three tests after 0 hours (T1), 12 hours (T2), and 24 hours(T3). Each test includes conceptual recall and rapid naming tasks that reflect the form-sound-meaning representation of new words, as well as size judgment tasks that reflect the semantic integration of new words. At the same time, the influence of Circadian rhythm on the results was strictly controlled by vigilance task before all tests. The research results showed that significant sleep consolidation effects were found in both new word form-sound-semantic representation and semantic integration tasks, manifested as higher concept recall rate and faster naming speed after nighttime sleep in both groups of participants, as well as stronger semantic distance effects. More importantly, the sleep consolidation effect (T2) of the sleep-awake group was significantly greater than that of the awake-sleep group (T3), indicating that entering sleep for a short period of time after learning is more beneficial for the consolidation of new words. The findings of this study further enrich the evidence of sleep consolidation in new word learning and provide some insights into the complementary learning systems models of memory.

通讯作者邮箱：huyongdong@bjcyh.com

摘 要　目的：行为激活和自我同情干预是两种有助于减少抑郁症状的治疗方式。行为激活因其更简洁方便的治疗元素而被认为是认知行为治疗的有效替代手段；自我同情是一种以善意和非判断性理解来开放和减轻自己痛苦的能力，在减轻抑郁症状、焦虑和压力方面也发挥重要作用。自我同情的培养可以通过正念和冥想来实现。近年来，这两种治疗方式也发展出了基于网络的新的治疗形式，但目前基于网络形式实施的治疗有效性仍不清楚。该研究旨在通过检查基于互联网的行为激活和自我同情干预的现有证据，比较两种线上干预方式在改善抑郁症状伤的疗效。

方法：遵循了系统综述和荟萃分析的首选报告项目（PRISMA）报告指南。根据 PICOS（人群、干预、比较、结局、研究设计）模型设计入选标准。研究人员检索了 PubMed，MEDLINE，Embase，PsycINFO 和科克伦系统评价数据库，以获得 2000 年至 2023 年 7 月 1 日发表的相关研究。还检索了收集结果中引用的参考文献，以补充文献。纳入标准为：（1）随机对照试验；（2）以基于网络的行为激活干预/基于网络的自我同情干预作为主要治疗成分；（3）结果报告抑郁症状，并采用定量结果测量。由 2 名独立审查员进行标题和摘要筛选以及全文筛选、信息提取。采用偏倚风险工具（RoB 2）对研究的偏倚风险进行评估。采用综合荟萃分析第 3 版（Comprehensive Meta-Analysis Version 3）对数据进行汇总分析，并对实验组的干预类型进行了亚组分析。

结果：共纳入 20 篇文献，共 4111 例受试者。结果显示基于网络的行为激活和基于网络的自我同情干预在降低治疗后抑郁症状严重程度方面不存在差异（P=0.075>0.05）。偏倚风险评估显示，所有研究至少存在一些问题，并且有证据表明存在轻微的出版偏倚。

结论：基于网络的行为激活和基于网络的自我同情干预在抑郁症状的缓解上没有显著差异，都可以作为抑郁减少抑郁的有效手段。

4 Beijing Chao-Yang Hospital, Capital Medical University, Beijing,100069

email:huyongdong@bjcyh.com

Abstract: OBJECTIVE: Behavioural activation and self-compassion interventions are two therapeutic modalities that can help reduce depressive symptoms. Behavioral activation is considered an effective alternative to cognitive-behavioral therapy due to its more concise and convenient therapeutic elements; self-compassion, the ability to open up and alleviate one's suffering with kindness and non-judgemental understanding, also plays an important role in the reduction of depressive symptoms, anxiety, and stress. Self-compassion can be cultivated through positive thinking and meditation. In recent years, new forms of web-based therapy have also been

developed for both of these modalities, but the effectiveness of web-based forms of therapy implemented at this time remains unclear. This study aimed to compare the efficacy of two online interventions in improving depressive symptomatic injuries by examining the available evidence for internet-based behavioral activation and self-compassion interventions.

METHODS: The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) reporting guidelines were followed. Inclusion criteria were designed according to the PICOS (Population, Intervention, Comparison, Outcome, Study Design) model. The researchers searched PubMed, MEDLINE, Embase, PsycINFO, and Cochrane Systematic Evaluation databases for relevant studies published between 2000 and 1 July 2023. References cited in the collection of results were also searched to supplement the literature. Inclusion criteria were (1) randomized controlled trials; (2) web-based behavioral activation interventions/web-based self-compassion interventions as the primary treatment component; and (3) outcome reporting of depressive symptoms with quantitative outcome measures. Title and abstract screening, as well as full-text screening, and information extraction, were performed by 2 independent reviewers. The risk of bias in the studies was assessed using the risk of bias tool (RoB 2). Data were pooled and analyzed using Comprehensive Meta-Analysis Version 3 (CMA 3.0), and subgroup analyses were conducted for the type of intervention in the experimental group.

RESULTS: A total of 20 papers with 4111 subjects were included. Results showed no difference between web-based behavioral activation and web-based self-compassion interventions in reducing the severity of post-treatment depressive symptoms (p=0.075>0.05). Risk of bias assessments showed at least some problems in all studies and evidence of slight publication bias.

CONCLUSION: Internet-based behavioral activation and Internet-based self-compassion interventions did not differ significantly in the alleviation of depressive symptoms, and both can be effective means of depression reduction.

家庭环境因素和抑制控制与学前儿童体质健康的关系：差别易感性假说的应用

王健楠[1] 郝翠荣[1] 翟相颖[1] 周楠[1]（通讯作者）

1 首都师范大学学前教育学院，北京，100048

通讯作者 E-mail：nanzhou@cnu.edu.cn

摘 要 差别易感性假说提出，具有易感性特质的儿童对积极或消极的教养环境更加敏感，也可以用来解释遗传与环境影响儿童肥胖风险的复杂方式（Belsky, 1997；Molle, et al., 2017）。我国学前儿童超重和肥胖问题日趋严峻，而学前儿童体质健康更是个体特质与家庭环境交互作用的结果（史欣然，2020；Martin-Biggers et al., 2018）。家庭环境中的家庭社会经济地位与家庭嘈杂度都能直接预测儿童体质健康（Leung, 2014），而儿童饮食行为则可能是介导家庭环境与儿童体质指数的重要因素（张晶晶，2022；Lumeng，2014）。近期研究指出，抑制控制很可能是个体体质健康重要的“易感性”特质，从而调节家庭环境对体重的作用（Grammer, 2022）。因此，本研究拟通过建立有调节的链式中介模型，探究家庭环境、抑制控制与学前儿童体质健康间的作用机制。

本研究选取北京市城乡幼儿园 227 名学前儿童（M_{age} = 4.65, SD = 0.84；男生 116 名）为研究对象。根据 WHO《学龄前儿童生长发育标准》评估学前儿童体质指数，通过 EYT GO/NO GO 任务（Howard, et al., 2016）与礼物诱惑任务（Carlson, et al., 2001）测查学前儿童的冷、热抑制控制。采用问卷对家庭社会经济地位（潘

月娟，2019）、家庭嘈杂度（Matheny, et al., 1995）以及学前儿童饮食行为（Wardle, et al., 2001）进行测量。

结果发现：（1）家庭嘈杂度与学前儿童过饱响应、进食缓慢、食物响应、食物喜好等饮食行为在家庭社会经济地位与儿童体质指数间的链式中介效应显著。（2）冷抑制控制在家庭嘈杂度与学前儿童食物喜好饮食行为间的调节效应显著，$F(6, 220) = 2.73$, $p < 0.05$, $R^2 = 0.07$，家庭社会经济地位→家庭嘈杂度→食物喜好→儿童体质指数的链式中介模型受到冷抑制控制的调节作用，β = -0.10, 95% CI = [-0.22, -0.01]，即有调节的链式中介模型成立。冷抑制控制得分为中（*M*）、低水平（*M*-1*SD*）时，增强了家庭嘈杂度对学前儿童食物喜好的负向预测作用。

本研究考察了家庭环境因素与学前儿童体质健康间的链式中介关系，首次在家庭环境与饮食行为关系中引入抑制控制作为调节变量，并验证了差别易感性假说。本研究结果不仅为儿童超重肥胖的研究提供了新的理论视角，而且对于通过重视儿童个体易感特质和家庭环境中的积极因素以促进学前儿童体质健康水平提供了实证支持。

The Association Between Family Environmental Factors and Inhibitory Control and Physical Health in Preschool Children: Application of The Differential Susceptibility Model

Jiannan Wang　Cuirong Hao　Xiangying Zhai　Nan Zhou
Capital Normal University，Beijing，100048

Abstract：Differential susceptibility hypothesis, which proposes that children with susceptibility traits are more sensitive to positive or negative parenting environments, can also be used to explain the complex mechanism in which genetics and environment interact to influence childhood obesity risk (Belsky, 1997; Molle, et al., 2017). The problem of childhood overweight and obesity in China is becoming increasingly serious, and preschool children's physical health is the result of the interaction between individual traits and the family environment (Shi, 2020; Martin-Biggers et al., 2018). Both family socioeconomic status and chaos in the family environment directly predict children's physical health (Leung, 2014), while children's eating behaviors may be an important factor mediating family environment and children's body mass index (Zhang, 2022; Lumeng, 2014). Recent studies have suggested that inhibitory control is likely to be an important "susceptibility" trait for individual physical health, moderating the role of family environment on body weight (Grammer, 2022). Therefore, the present study was designed to investigate the underlying mechanisms of family environment, inhibitory control, and preschool children's physical health through the establishment of a moderated chain-mediated model.

In this study, 227 preschool children (M_{age} = 4.65, *SD* = 0.84; 116 boys) from urban and rural kindergartens in Beijing were selected. The preschoolers' body mass index was assessed according to the WHO Standard for Growth and Development of Preschool Children, and the preschoolers' level of cold and heat inhibition control was measured by the EYT GO/NO GO task (Howard, et al., 2016) and the Gift Temptation Task (Carlson, et al., 2001). Questionnaires were used to measure family socioeconomic status (Pan, 2019), Chaos (Matheny, et al., 1995), and children's eating behaviors (Wardle, et al., 2001).

The results found that: (1) Family chaos was significantly associated with the preschool children's eating behaviors such as satiety responsiveness, slowness in eating, food responsiveness, and enjoyment of food in terms

of the chain-mediated effects between socioeconomic status and children's body mass index. (2) The moderating effect of cold inhibitory control between family chaos and preschool children's enjoyment of food eating was significant, $F(6, 220) = 2.73$, $p < 0.05$, $R^2 = 0.07$, and the chain-mediated model of socioeconomic status→chaos→enjoyment of food→BMI was moderated by cold inhibitory control, $\beta = -0.10$, 95% CI = [-0.22,-0.01], and the chain-mediated model with moderation held. Cold inhibition control scores enhanced the negative predictive effect of family chaos on preschoolers' enjoyment of food at low to moderate levels.

This study examined the chain-mediated associations between family environment factors and preschool children's physical health, introduced inhibitory control as a moderating variable in the associations between family environment and eating behaviors, and proved the differential susceptibility model. This study not only provided new research perspectives for childhood obesity in China, but also has important value for paying particular attention to child individual susceptibility trait and family environment in order to promote the improvement of preschool children's physical health.

摘 要 学习沉浸体验是学习任务表现的重要影响因素，数字化时代下医学生的学习存在着学习方式的多样性。为考察不同学习方式下医学生的学习沉浸体验，采用深度访谈法收集资料，使用扎根理论资料分析法分析资料。选取北京某医科院校共 15 名医学生，其中男生 5 名，女生 10 名；精神医学 2 名，基础医学 7 名，助产学 1 名，口腔医学 1 名，预防医学 2 名，卫生法学 2 名。选取 3 种常见的学习方式：线上课堂、线下课堂以及自习。发现：（1）在自主报告时，线上课堂中的学习沉浸体验明显低于线下课堂中的学习沉浸体验，甚至有的个体在线上课堂中的学习沉浸体验为零，自习时的学习沉浸体验远高于其他两种学习形式；（2）影响个体的学习沉浸体验的因素主要有：成就动机、对学习内容的兴趣、老师的授课风格、上课的时间、个体的身体状态等因素；（3）在三种学习方式下，成就动机和学习内容的兴趣对个体的学习沉浸体验均有较大影响；（4）不论是线上课堂还是线下课堂，老师的讲课风格对于学生的学习沉浸体验的作用较大；（5）在自习时，个体所处的环境以及自习的时间会对学习沉浸体验产生影响；（6）当个体过于焦虑（不论是学业压力还是其他压力）均会对个体的学习沉浸体验产生影响；（7）在学习沉浸体验过程中，个体的身体状态的表现为：注意力集中、思维活跃、情绪趋近于平静或产生愉悦感。

An interview study of medical students' learning flow experience in different learning styles

Xie Jinying, Hou Xiaoting, Wang Jingqian, Yu Liling

Department of Applied Psychology, School of Medical Humanities, Capital Medical University, Beijing 100101, China

Abstract: Learning flow experience is an important influence on the performance of learning, and there exists a diversity of learning styles in medical students' learning in the digital era. In order to examine the learning flow experience of medical students under different learning styles, interview was used to collect data, and data were analyzed by using the rooted theory. A total of 15 medical students were selected from a medical university in Beijing, including 5 male and 10 female students; 2 in psychiatry, 7 in basic medicine, 1 in midwifery, 1 in stomatology, 2 in preventive medicine, and 2 in health law. Three common learning modes were selected: online classroom, offline classroom, and self-study. It was found that: (1) in self-reporting, the learning flow experience in the online classroom was significantly lower than that in the offline classroom, and some individuals even had no learning flow experience in the online classroom, and the learning flow experience in self-study was much higher than that of the other two forms of learning; (2) the factors that affected the individual's learning flow experience mainly included: achievement motivation, interest in the content of the study, the instructor's style of teaching, class time, and individual's physical condition; (3) under the three learning modes, achievement motivation and interest in learning content have a greater impact on individual's learning immersion experience; (4) no matter whether it is an online classroom or an offline classroom, the teaching style has a greater impact on student's learning flow experience; (5) during self-study, the environment and time have an impact on the learning flow experience; (6) when the individual is too anxious (whether it is academic pressure or other pressures), it will have an impact on the individual's learning flow experience; (7) In the process of learning, the individual's physical state is manifested as concentration, active thinking, calmness or a sense of pleasure.

Keywords: learning flow experience, rooted theory, interview

焦虑与体育高考生考试表现的关系研究现状与展望

刘青[1]　钟建伟[1]

1 江西师范大学体育学院，江西，330046

摘 要　长期以来情绪在生活中的作用收到了广泛的关注，而焦虑属于情绪的一种，焦虑作为一种普遍存在于生活各个情境的负性心理，国内外对于焦虑的研究和干预已经有不少研究。在不同的情境中对象中，焦虑会有不同，以体育高考生为对象，国内研究焦虑对体育高考生考试表现的关系及其影响的研究不断而出。然而，体育高考作为中国本土特色化考试，还包含着本土特征。首先，仅有文章并未对在体育高考这一特殊的背景环境下，对其体育高考焦虑做出定义，本研究总结前人焦虑观点，基于扎根理论的研究方法，提出需要对体育高考焦虑的内涵与结构进行重构;其次，在体育高考焦虑测量上，仅有的文章在测量体育高考焦虑上与现实融合度不够，没有充分考虑到体育高考生这个群体的特殊性，本研究在分析成熟焦虑量表上，提出需再结合中国本土化体考情境下，进行量表改良，使其更加能够准确测量体育高考焦虑水平；最后，在焦虑影响体育高考生考试表现的作用机制研究上，国内研究者多数从焦虑、考试焦虑、竞赛焦虑来分析与体育高考生考试表现关系，且较少涉及多个变量。但影响体育考生考试表现的心理机制是复杂、必然受到多个变量的共同影响。且大部分研究的体育高考生考生表现主要是从考试成绩来评定，需将进一步立足于体育高考生特殊对象实际，探讨焦虑与体育高考生考试表现的相关作用机制研究。本研究将增进学术界对体育高考焦虑的本土洞见，并进一步启发学校和教师教练对潜在的体育高考焦虑进行观察，以及如何对其进行有效干预。

Research Status and Prospects on the Relationship between Anxiety and Exam Performance of Sports College Entrance Examination Students

Liu Qing
Physical Education College of Jiangxi Normal University, No. 99 Ziyang Avenue, Nanchang County, Nanchang, Jiangxi Province

Abstract： The role of emotions in daily life has received widespread attention for a long time, and anxiety belongs to a type of emotion. Anxiety, as a negative psychology commonly present in various situations of life, has been extensively studied and intervened in both domestic and international research on anxiety. Anxiety can vary among objects in different contexts. Empirical research on the relationship and impact of anxiety on exam performance of sports college entrance examination students has been continuously emerging in China, with sports college entrance examination students as the object. However, as a localized examination in China, the sports college entrance examination also contains local characteristics. First of all, only the article has not defined its anxiety in the college entrance examination of physical education under the special background of the college entrance examination of physical education. Based on the Grounded theory research method, this study summarized the previous anxiety views, and proposed the need to reconstruct the connotation and structure of the anxiety in the college entrance examination of physical education; Secondly, in terms of measuring anxiety in the sports college entrance examination, only a few articles have insufficient integration with reality in measuring anxiety in the sports college entrance examination, and have not fully taken into account the special characteristics of the sports college entrance examination group. In analyzing the mature anxiety scale, this study proposes the need to further improve the scale in combination with the localized Chinese physical examination situation, so that it can more accurately measure the level of anxiety in the sports college entrance examination; Finally, on the research of the mechanism of anxiety affecting the test performance of college sports examinees, most domestic researchers analyze the relationship between anxiety, Test anxiety, and competition anxiety and the test performance of college sports examinees, and rarely involve multiple variables. However, the psychological mechanisms that affect the performance of physical education candidates in exams are complex and inevitably influenced by multiple variables. Moreover, most of the research on the performance of sports college entrance examination students is mainly evaluated based on their exam scores. It is necessary to further explore the relevant mechanism of anxiety and exam performance of sports college entrance examination students based on their specific target audience. This study will enhance the academic community's local insights into anxiety in the sports college entrance examination, and further inspire schools, teachers, and coaches to observe potential anxiety in the sports college entrance examination, and how to effectively intervene in it.

摘 要 目的 基于旋律形态理论对大学生进行音乐干预，观察其对焦虑、抑郁、等情绪的影响。方法 选取

大学生 153 名纳入该研究，采用随机分组法将被试分为上行旋律组、下行旋律组、对照组 3 组，对照组不给予任何形式的音乐干预，上行旋律组、下行旋律组分别给予 7 天的不同旋律模式的音乐干预。比较 3 组被试干预前后的焦虑、抑郁、正负情绪得分。根据继往研究，选取 23 首古典音乐曲目作为干预材料。 结果 与对照组相比，试验组在年龄、性别、音乐素养、所学专业方面无统计学差异；与对照组相比，试验组 SAS、SDS 得分显著降低，具有统计学意义（p＜0.01）；上行旋律组与下行旋律组在正负情绪得分上存在差异，在“备受鼓舞”、“坐立不安”、“注意力集中”这三种情感维度种，试验组与对照组相比，均存在差异，具有统计学意义（p＜0.01）；在“热情的”、“警觉度高的”、“紧张的”这三种情绪维度中，上行旋律组、下行旋律组与对照组相比存在差异，具有统计学意义（p＜0.05）；在“害羞的”这一维度较为特殊，上行旋律组与对照组相比，存在差异，具有统计学意义（p＜0.01）。 结论 基于旋律形态理论对大学生进行音乐干预可降低焦虑、抑郁情绪，不同旋律形态的音乐对大学生情绪具有不同影响。

The influence and characteristics of different melody forms on college students' emotions

Zeng Yue[1] Li Ping[2]
1Shandong University School of Nursing and Rehabilitation
2Shandong University School of Nursing and Rehabilitation Jinan 250102 pingli12@sdu.edu.cn

Abstract：Objective To conduct the music intervention for college students and observe their influence on anxiety, depression and other emotions. Methods 153 college students were selected and included in the study, and the subjects were divided into three groups: ascending melody group, descending melody group and control group. The control group did not give any form of music intervention, and the ascending melody group and descending melody group gave the music intervention of different melody patterns for 7 days respectively. The anxiety, depression, and positive and negative emotions scores of the three groups of participants before and after the intervention were compared. According to previous studies, 23 classical music tracks were selected as the intervention materials. Results as compared with the control group, There was no statistical difference in the test group in terms of age, gender, music literacy and major; Compared with the control group, SAS and SDS scores in the test group, Statistically significant value (p <0.01); There were differences in the positive and negative mood scores between the ascending and descending melody groups, In the three emotional dimensions of "encouraged", "restless" and "concentration", Test group, when compared with the control group, Both have differences, Statistically significant value (p <0.01); Among the three emotional dimensions: "enthusiastic", "high alert" and "nervous", There were differences between the ascending and descending melody groups compared with the control group, Statistically significant value (p <0.05); In the "shy" dimension is more special, The ascending melody group, as compared to the control group, There are differences present, Statistically significant value (p <0.01). Conclusion Music intervention based on college students can reduce anxiety and depression, and music with different melodic forms have different effects on college students' emotions.

城中村居民心理健康对梦强度的影响研究

李宇航[1]、邹学[2]、解缤[1]（通讯作者）
1 西安体育学院，陕西西安，710068，xiebin0320@163.com

2 西安国际医学中心，陕西西安，710119

摘 要　不同个体对梦的体验有所不同，有的人的梦境栩栩如生，有的人一晚可以做好几个梦，有的人却几乎不做梦。已有研究证明了梦与心理健康之间存在着相关关系，该研究是从梦的频率这一角度分析，噩梦频率的增高更加能够反应心理应激的强度。还有研究探讨了典型梦与心理健康的关系，不同主题的典型梦可以预测被试的心理健康状况，在个体或团体心理咨询中可以作为一项参考指标。目前针对城中村居民梦强度的研究国内外很少，本文通过研究城中村居民梦的强度，探索心理健康与梦强度的关系以及心理健康对梦强度的预测作用，有利于更好的探索他们的心理状况，提供更好的指导。

目的：为了探究城中村居民心理健康与梦强度的关系。

方法：本文采用了 SCL-90 自评量表和梦强度量表通过随机取样的方式对西安市 1190 名城中村居民的心理健康状况和梦强度进行了调查，运用 spss24.0 对数据进行了 t 检验、相关分析和一元回归分析。

结果：（1）城中村居民梦强度较低且主要表现为可意识到的做梦次数(7.60 次/月)和噩梦次数(0.22 次/月)都较低。（2）梦生动性方面出现频率最多的是颜色视觉和听觉，而出现频率较少的是嗅觉和味觉。在梦中视觉和听觉皮层是构成梦境情景表现的基本器官。（3）男女在梦强度上存在显著差异($p=0.000<0.05$)，各维度上女性得分均值均大于男性，女性梦强度更高。（4）SCL-90 总分均与梦强度进行相关分析后发现二者存在显著正相关(r=.382**)，SCL-90 各维度与梦强度各维度也均存在显著正相关。（5）将 SCL 总分为自变量，梦强度为因变量，进行一元线性回归后发现回归方程显著 $F=202.754$，$p<0.001$，SCL 总分（$\beta=0.382$，$P<0.001$）能显著负向预测梦强度，调整后 R^2=0.145,即 SCL 总分可以解释梦强度 14.5%的变异。

结论：男女性别在梦强度上存在显著差异，心理健康与梦强度存在显著正相关，心理健康一定程度上可以负向预测梦强度。通过回归分析发现个体 SCL 得分越高梦强度越弱，即心理健康水平越差梦强度越弱。

A study on the effect of mental health on dream intensity among urban village residents

LI Yuhang[1], ZOU Xue[2], XIE Bin[1] (corresponding author)
1 Xi'an Institute of Physical Education, Xi'an, Shaanxi, 710068, xiebin0320@163.com
2 Xi'an International Medical Center, Xi'an, Shaanxi, 710119

***Abstract*:** Different individuals experience dreams differently, some people's dreams are lifelike, some people can dream several times a night, and some people hardly dream. Studies have proved a correlation between dreams and mental health, and the study analyzes from the perspective of dream frequency, and the increase in the frequency of nightmares can better reflect the intensity of psychological stress. There are also studies that explore the relationship between typical dreams and mental health, and typical dreams on different topics can predict the mental health of participants, and can be used as a reference indicator in individual or group psychological counseling. At present, there are few studies on the dream intensity of urban village residents at home and abroad, and this paper explores the relationship between mental health and dream intensity and the predictive effect of mental health on dream intensity by studying the dream intensity of urban village residents, which is conducive to better exploring their psychological conditions and providing better guidance.

Aim: To investigate the relationship between mental health and dream intensity among residents of urban villages.

Methods: The symptom checklist-90 (SCL-90) self-rating scale and the dream intensity scale were used to investigate the mental health status and dream intensity of 1,190 urban village residents recruited by random

sampling in the Xi'an City of China. T-test, correlation analysis, and one-dimensional regression analysis were conducted using SPSS 24.0.

Results: (1) The intensity of dreams of urban village residents was low, and it was mainly manifested as lower number of conscious dreams (7.60 times/month) and nightmares (0.22 times/month). (2) The most frequent occurrence of dream vividness is color vision and hearing, while the less frequent occurrence is smell and taste.In dreams, the visual and auditory cortex are the basic organs that make up the performance of dream situations. (3) There was a significant difference in dream intensity between men and women ($p=0.000<0.05$), and the average score of women in all dimensions was greater than that of men, and the intensity of female dreams was higher. (4) After the correlation analysis of SCL-90 total scores and dream intensity, it was found that there was a significant positive correlation between the two (r=.382**), and there was also a significant positive correlation between SCL-90 and dream intensity. (5) The total SCL was divided into independent variables, dream intensity was the dependent variable, and after unary linear regression, it was found that the regression equation was significantly $F=202.754$, $p<0.001$, SCL total score ($\beta=0.382$, $P<0.001$) could significantly predict dream intensity negatively, and the adjusted $R^2=0.145$, that is, the total SCL score could explain the variation of dream intensity by 14.5%.

Conclusion: There are significant differences in dream intensity between men and women, mental health and dream intensity are significantly positively correlated, and mental health can negatively predict dream intensity to a certain extent. Through regression analysis, it was found that the higher the SCL score of the individual, the weaker the dream intensity, that is, the worse the mental health level, the weaker the dream intensity.

精神分裂症患者的自我与关系自我参照效应缺失：与正常人群的比较

田紫晴[1]　杜佳璐[1]　田雨[1]　李梦盈[1]　马伟军[1]（通讯作者）

1 上海市心理健康与心理危机干预重点实验室，华东师范大学附属精神卫生中心，华东师范大学心理与认知科学学院，上海，200062，wjma@psy.ecnu.edu.cn

摘 要　自我参照效应 (self-reference effect, SRE) 与关系自我参照效应分别指个体对自我、或关系自我中的亲密他人相关材料的记忆效果显著优于其他编码条件的现象，后者是由自我参照的记忆优势及其扩展至亲密他人所致。根据心理距离与解释水平理论，关系自我参照对象的社会距离 (即个体对他人亲疏远近的感知) 影响个体的信息加工与记忆，社会距离越接近自我，对象他人所获的注意资源越多、加工越精细，记忆效果越好。但目前鲜有研究关注精神分裂症患者的自我与关系自我参照效应，及其与正常群体的差异。由于自我与关系自我构念缺损，精分患者的自我与关系自我记忆参照任务表现可能与常人不同，能否表现出自我与关系自我参照效应尚未得到验证。本研究假设：1.精神分裂症患者的自我与关系自我参照记忆优势缺失，即对自我与不同社会距离他人的记忆效果无显著差异；2.正常人表现出自我与关系自我参照效应。

本研究通过一个自我参照范式实验探究精神分裂症患者与正常人的自我与关系自我参照记忆。实验分为学习阶段与再认阶段。学习阶段要求被试在亲人、熟人、远亲、生人中各提名一人进行亲密度评价，并以此四人及自我为参照对象进行人格形容词学习。而后再认阶段进行学习阶段形容词的再认任务，同时测量再认率、R(记得)/K(知道)判断率。结果表明：(1)精神分裂症患者对熟人与远亲的亲密度相近，对自我以及不同社会距离他人的再认率与 R 判断率无显著差异。精分患者的自我和关系自我参照记忆优势缺失，未表现出自我和关系自我参照效应，验证了假设 1。该结果可解释为是由精分患者的自我与关系自我构念缺损所致；(2)正常人与关系他人的亲密度由近及远依次递减，再认率与 R 判断率呈现由高往低递减的自我、亲人与熟人、远亲与生人的三个圈层，表现出自我与关系自我参照效应，验证了假设 2。

本研究加深了对精神分裂症患者的自我与关系自我参照记忆优势缺损的认识，并从自我与关系自我参照效应的视角进一步揭示了精分患者与常人的差异。

The Deficit in Relational Self-Reference Effect in Schizophrenia Patients: A Comparison with the Healthy Population

Ziqing Tian[1], Jialu Du[1], Yu Tian[1], Mengying Li[1], Weijun Ma [1,*]
1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, China; wjma@psy.ecnu.edu.cn

***Abstract*:** The self-reference effect (SRE) and the relational self-reference effect (RSRE) refer to the phenomena where memory performance for materials related to oneself or significant others in the relational self is significantly better than other encoding conditions. The latter is attributed to the memory advantage of self-reference and its extension to intimate others. According to the theory of psychological distance and the theory of construal level, the social distance of relational reference objects (individuals' perception of closeness or distance between themselves and others) influences one's information processing and memory performance. The closer the social distance to the self, the more attention resources are allocated to the object others, leading to more detailed processing and better memory performance. However, there has been limited research focusing on the self-reference and relational self-reference effects in schizophrenia patients, as well as the differences between this population and the healthy population. Due to deficits in self and relational self-construal, the social relationship and memory reference task performance of the schizophrenia patients may differ from that of the normals, and whether they can exhibit the relational self-reference effect has not been verified. The present study hypothesizes: 1. The schizophrenia patients lack the self-reference and relational self-reference memory advantages, leading to no significant difference in memory performance between themselves and individuals with different social distances; 2. The healthy population exhibits both the self-reference and relational self-reference effects.

The research utilized a behavioral experiment employing the self-reference paradigm to investigate the influence of social distance on the relationship self-reference memory of schizophrenia patients compared to the healthy population. The experiment consisted of a learning phase and a recognition phase. In the learning phase, the participants were asked to rate the intimacy level of a person from each category: close relatives, acquaintances, distant relatives, and strangers. They then learned personality adjectives with these four individuals and themselves as reference objects. In the recognition phase, the participants performed a recognition task with the learned adjectives and measured recognition rates and R (remember)/ K (know) judgment rates. The results indicated: (1) The schizophrenia patients' intimacy levels for acquaintances and distant relatives are similar, and no significant differences in recognition rates and R judgment rates between themselves and individuals with different social distances. The deficit in self-reference and relational self-reference memory strengths in schizophrenia patients is evident, as they do not exhibit the self-reference effect and relational self-reference effect, supporting hypothesis 1. This result can be attributed to deficits in the relational self-construal of them. (2) In contrast, the healthy population displays a gradual decrease in intimacy levels with relational others from near to far, namely the close relatives to the acquaintances, the distant relatives, and the strangers. Moreover, the recognition rates and R judgment rates exhibited a three-tiered pattern of decreasing order: the self, the close relatives and the acquaintances, the distant relatives and the strangers. This demonstrates the self-reference effect and relational self-reference effect of the normal population, confirming hypothesis 2.

This study deepens the understanding of the deficit in self-reference and relational self-reference memory

strengths of the schizophrenia patients, and sheds further light on the differences between the schizophrenia patients and the normals from the perspective of self and relational self-reference memory.

父母婚姻态度与亲子关系：对有调节的中介作用的成对分析

杨培滢 贾依凡 邝颖茵 曾加慧 刘学兰（通讯作者）
“儿童青少年阅读与发展”教育部哲学社会科学实验室(华南师范大学)/心理应用研究中心/华南师范大学心理学院，广州，510631，liuxuelan@m.scnu.edu.cn

摘 要 依据家庭系统理论，婚姻子系统和亲子子系统是两个相互影响的重要子系统，父母的认知或行为可能会同时影响自身和伴侣的亲子关系。婚姻态度是指个体对于婚姻生活和关系的主观评价和反应倾向。前人在探究婚姻关系与亲子关系的联系时，大多着眼于父母在其所处的特定夫妻关系中的行为与感受，鲜有研究考察父母对婚姻这一客体的总体态度是否以及如何影响其亲子关系。共同教养生态理论认为，父母个体层面和婚姻关系层面的特征均会影响他们的共同教养关系，这又会进一步影响父母与孩子之间的互动与关系，父母间的共同教养可能在婚姻态度与亲子关系之间起中介作用。此外，自我扩张是指个体将伴侣的观点、资源和身份纳入到自我中，是家庭关系中的一个重要影响变量。因此，本研究旨在探究父母的婚姻态度与亲子关系质量间的联系，以及共同教养的中介作用和自我扩张的调节作用。研究对 551 对小学儿童的父母（父亲 M_{age}=37.95，SD = 4.76；母亲 M_{age}=35.39，SD = 4.60）进行了问卷调查，并采用主客体互倚模型对数据进行了分析。结果发现：（1）父母的婚姻态度与自己和伴侣的亲子关系质量均存在正向联系。（2）父母的共同教养部分中介父母婚姻态度对自身亲子关系的影响。（3）父母的共同教养完全中介父母婚姻态度对伴侣亲子关系的影响。（4）父母在婚姻关系中的自我扩张调节自身和伴侣婚姻态度对自身共同教养的正向影响，自我扩张水平越高，该影响越强。（5）父母在婚姻关系中体验到的自我扩张水平越高，其共同教养在自身及伴侣的婚姻态度与自身的亲子关系之间的中介作用越大。本研究发现不仅有助于深化人们对于婚姻子系统与亲子子系统间联系的理解，而且可以为家庭干预实践提供一定的启示：从帮助父母树立积极的婚姻态度着手，来改善家庭系统的功能，进而促进父母与孩子的心理健康和主观幸福。在此基础上，重视父母对养育孩子的合作程度，以及关注父母的自我扩张水平，进而强化婚姻态度干预所带来的积极影响。
关键词 父母婚姻态度，亲子关系，共同教养，自我扩张，主客体互倚模型

Parental Attitudes Toward Marriage and Parent–Child Relationship: Dyadic Analyses of Moderated Mediation

YANG Peiying; JIA Yifan; KUANG Yingyin; ZENG Jiahui; LIU Xuelan
"Reading and Development of Children and Adolescents" Philosophy and Social Science Laboratory of the Ministry of Education (South China Normal University) / Centre for Applied Psychological Research / School of Psychology, South China Normal University, Guangzhou, 510631

Abstract：According to family systems theory, the marriage subsystem and the parent-child subsystem are two

significant subsystems that interact with each other, and parents' perceptions or behaviours may affect both their own and their partner's parent-child relationships. Marital attitudes refer to an individual's subjective evaluation of and tendency to respond to marital life and relationships. Much of the previous research exploring the link between marital relationships and parent-child relationships has focused on parents' behaviours and feelings in the particular couple relationship in which they are involved, and few studies have examined whether and how parents' overall attitudes towards marriage affect their parent-child relationships. The ecological theory of co-parenting suggests that both individual-level and marital-relationship-level characteristics of parents influence their co-parenting relationship, which in turn further influences parent-child interactions and relationships, and that co-parenting between parents may mediate the relationship between marital attitudes and parent-child relationships. In addition, self-expansion, which refers to an individual's incorporation of a partner's perspectives, resources, and identity into the self, is an important influence variable in family relationships. Therefore, the present study aimed to investigate the link between parents' marital attitudes and the quality of parent-child relationships, as well as the mediating role of co-parenting and the moderating role of self-expansion. The study administered a questionnaire to 551 pairs of parents of primary school children (fathers M_{age} = 37.95, SD = 4.76; mothers M_{age} = 35.39, SD = 4.60) and analyzed the data using the actor-partner interdependence model. The results found that (1) parents' marital attitudes were positively associated with the quality of both their own and their partner's parent-child relationships. (2) Parental co-parenting partially mediated the effect of parental marital attitudes on one's own parent-child relationship. (3) Parental co-parenting fully mediates the effect of parental marital attitudes on partner's parent-child relationship. (4) Parental self-expansion in the marital relationship moderates the positive effect of own and partner's marital attitudes on own co-parenting, which is stronger at higher levels of self-expansion. (5) The higher the level of self-expansion experienced by parents in the marital relationship, the greater the mediating effect of their co-parenting between their own and their partner's marital attitudes and their own parent-child relationship. The findings of this study not only help to deepen the understanding of the link between the marital subsystem and the parenting subsystem, but also may provide some insights into family intervention practices: one can start by helping parents to develop positive attitudes toward marriage in order to improve the functioning of the family system, which in turn promotes the psychological well-being and subjective well-being of both parents and children. On this basis, the positive impact of marital attitude interventions can be reinforced by focusing on the level of parental co-operation in parenting and on the level of parental self-expansion.

威胁性刺激对近身空间的影响——一项基于虚拟现实的研究

陈庆兰[1] 李宜伟[2] 王小桃[1]（通讯作者）

1 江西师范大学心理学院，南昌，330022

2 四川师范大学脑与心理科学院，成都，610066

摘 要

研究背景：防御性近身空间（Defensive peripersonal space, DPPS)是身体周围的防御性缓冲区，有助于保持我们远离潜在威胁。DPPS 的边界测量一直是该领域的核心问题，目前主要采用两种测量范式：多感官反应时间任务和停止距离任务。DPPS 的特征表现在对靠近身体的物体进行加强的多感官整合以及更快的反应时间。因此，多感官任务可以用于估计 DPPS 的边界。相比之下，停止距离任务则更加主观，当刺激物靠近时，被试会选择一个他们认为适合逃离的距离。**研究目的：**我们希望通过比较这两种范式测量 DPPS 的异同，进一步加深对 DPPS 的理解。**研究方法：**我们设计了四个实验，其中实验 1a 和 1b 采用了多感官

任务，分别测量被试面对突然出现的刺激和逐渐靠近的威胁性动物（如蜘蛛）时的触觉刺激反应时间。实验 2a 使用停止距离任务，测量被试在威胁性动物逐渐靠近时的逃离时间。实验 2b 在同一批被试下复现了实验 1b 和实验 2a。实验 1b 通过计算触觉反应时间下降最快的空间范围的中点（xc）来估算 DPPS 的边界参数。而在实验 2a 中，我们则是直接使用被试的逃离时间来估算这个边界。所有实验均采用虚拟现实技术以提高生态效度。**研究结果：**1、实验 1a 结果显示，被试在突然出现的刺激下，无法有效地建立 DPPS，即距离对反应时没有显著影响。2、实验 1b 发现，在威胁性动物逐渐靠近时，被试的 DPPS 边界（xc）显著扩大。3、实验 2a 显示，被试对威胁性动物刺激的逃离距离显著增大，这表明 DPPS 边界在威胁性动物刺激下会变大。4、实验 2b 发现，两种范式测量的 DPPS 边界（xc 和逃离距离）之间并没有显著关联。**研究结论：**我们的研究表明，面对逐渐靠近的威胁性刺激，DPPS 会扩大，以应对可能的威胁。虽然当前的两种测量范式都能有效地描绘 DPPS 的边界，但它们之间并没有显著关联。

***Abstract*：** **Research Background:** The concept of defensive peripersonal space (DPPS) refers to a defensive buffer zone around our bodies that aids in keeping us distant from potential threats. Measuring the boundaries of DPPS remains a focal point within this field of study, primarily utilizing two paradigms: multisensory reaction time tasks and stop-distance tasks. DPPS is characterized by enhanced multisensory integration and quicker RTs for objects approaching the body, thereby making multisensory tasks suitable for estimating DPPS boundaries. Conversely, stop-distance tasks are more subjective, with participants choosing a distance they deem appropriate for evasion when the stimulus approaches. **Research Objectives:** By comparing these two paradigms in measuring DPPS, we aim to further deepen our understanding of the DPPS. **Research Method:** We designed four experiments. Experiments 1a and 1b employed multisensory tasks, measuring the tactile RTs of participants in response to sudden stimuli and gradually approaching threatening creatures like spiders. Experiment 2a utilized the stop-distance task, measuring the evasion time of participants when threatened by gradually approaching creatures. Experiment 2b replicated Experiments 1b and 2a with the same cohort of participants. In Experiment 1b, we estimated the boundary parameters of the DPPS by calculating the midpoint (xc) of the spatial range where the tactile RT fell most rapidly. In Experiment 2a, we directly used participants' evasion time to estimate this boundary. To enhance ecological validity, all experiments were conducted using virtual reality technology. **Research Results:** 1. Experiment 1a revealed that participants were unable to effectively establish a DPPS in response to sudden stimuli, i.e., distance had no significant effect on RT. 2. Experiment 1b found that the DPPS boundaries (xc) of participants significantly expanded when faced with gradually approaching threats. 3. Experiment 2a demonstrated that participants significantly increased their evasion distance in response to threatening stimuli, indicating an enlargement of DPPS boundaries under such conditions. 4. Experiment 2b revealed no significant correlation between the DPPS boundaries measured by the two paradigms (xc and evasion distance). **Research Conclusion:** Our study suggests that DPPS expands in the face of gradually approaching threats to cope with potential danger. While both currently employed measurement paradigms effectively depict the boundaries of the DPPS, they lack

significant correlation with each other.

不同框架下权力对道德判断取向偏好的影响:谦逊的调节作用

徐艳　王书婷　林闻正（通讯作者）

江西师范大学心理学院，南昌，330022，通讯作者 E-mail: lin.wenzheng@live.com

摘 要　心理学对道德判断的研究很大程度上试图揭示影响道德的不同因素。例如，以往研究分别证实了权力或框架效应对道德判断的影响。一般来说，高权力水平或积极框架会预测更多功利主义取向。作为道德行为的发起者，个体本身的性格特质同样对道德行为有影响。例如其中一项研究证明，诚实-谦逊水平负向预测剥削行为，而剥削行为通常被认为是不道德的，因为它是损害他人权益的一种表现。此外，STOA（Situation-Trait-Outcome-Activation model）模型认为人格特质的差异往往使得情境对个体的行为表现展示出不同影响，这也提示我们在行为类的实验设计中忽略人格特质对于实验结果稳定性的潜在危害。因此，本研究意在探索人格（即谦逊）与情境（即情境权力与不同描述方式）对道德行为的共同影响。基于 STOA 模型，本文假设谦逊作为一种稳定的性格特质，可以让个体更加关注他人的需求和感受，从而降低权力对个体在不同框架下做出功利主义道德行为的影响。

本研究在高校共招募 316 名学生参与实验，最终有 303 名被试纳入数据分析。首先，被试需要完成一份特质谦逊量表。随后，他们将随机分配至高权力组与低权力组并分别扮演经理与下属，实验者通过角色扮演的方式对被试的权力进行操纵，操纵检验结果表明实验者对于权力的操纵是有效的。在任务完成后，六道经典的道德困境被作为情境背景，分别用积极框架和消极框架呈现给被试，并使用六点计分记录被试对每个情境的功利主义倾向。

多层线性模型的分析发现在积极框架下，谦逊能够调节权力对于道德判断的影响，即低谦逊个体的权力正向影响功利主义得分，高谦逊个体的道德判断不受权力的影响；在消极框架下，道德判断不受权力和谦逊的影响。研究结果表明，谦逊能有效抑制权力促使个体在不同框架下进行功利主义判断的倾向。本研究揭示了谦逊在道德判断中的重要角色，即相比于低权力水平情境，谦逊水平低的个体在高权力水平情境下更易做出功利性的道德行为，这提示我们在选拔和培养领导者时，应该重视他们的谦逊品质，以促进更好的道德决策和行为。

Power increases the utilitarian orientation: the moderating role of humility and framing effects

Yan XU　Shuting WANG　Wenzheng LIN(Corresponding author)

School of Psychology, Jiangxi Normal University, Nanchang, 330022，Corresponding author

lin.wenzheng@live.com

Abstract: Psychological research on moral judgment largely attempts to reveal the different factors that influence morality. For example, previous studies have separately confirmed the effects of power or framing on moral judgment. Generally speaking, high levels of power or positive framing predict more utilitarianism. As the initiator

of moral behavior, the individual's own personality traits also have an impact on moral behavior. For example, one study found that honesty-humility levels negatively predicted exploitative behavior, which is generally considered immoral because it is a manifestation of harming the rights and interests of others. In addition, the STOA (Situation-Trait-Outcome-Activation model) model suggests that differences in personality traits often cause situations to have different effects on individual behavior, which also alerts us to the potential harm of ignoring personality traits on the stability of experimental results in behavioral experimental design. Therefore, this study aims to explore the joint influence of personality (i.e., humility) and situation (i.e., situational power and different descriptions) on moral behavior. Based on the STOA model, this paper hypothesizes that humility, as a stable personality trait, can make individuals more attentive to the needs and feelings of others, thereby reducing the influence of power on individuals' utilitarian moral behavior under different frames.

This study recruited 316 students from universities to participate in the experiment, and finally 303 participants were included in the data analysis. First, subjects were required to complete expressed humility scale (Ou et al.,2014). Subsequently, they were randomly assigned to high-power and low-power conditions in which they played the roles of managers and subordinates respectively. The manipulation check results showed that the experimenter's manipulation of power was successful After completing the task, six classic moral dilemmas were used as situational backgrounds and presented to subjects in positive and negative frames respectively, using a six-point scoring method to record subjects' utilitarian tendencies for each situation.

Multilevel linear modeling analysis found that under positive framing, humility can moderate the influence of power on moral judgment, i.e., low humility individuals' power positively affects utilitarian scores, the moral judgment of the highly humble individual is not influenced by power; under negative framing, moral judgment is not affected by power and humility. The results of this study indicated that humility can effectively suppress the tendency for power to induce individuals to make utilitarian judgments under different frames. This study reveals the important role of humility in moral judgment, i.e., compared to low-power situations, individuals with low levels of humility are more likely to engage in utilitarian moral behavior in high-power situations. This suggests that when selecting and training leaders, we should pay attention to their humility quality to promote better moral decision-making and behavior.

自适应注意控制训练对情境意识和飞行模拟绩效的影响：一项眼动研究

邱化珂[1] 朱霞[1]（通讯作者）

1 空军军医大学军事医学心理学系，陕西西安，710000，zhuxia@fmmu.edu.cn

摘 要　基于机组决策模型和过程重叠理论，注意控制是一种一般性认知能力，被认为是高阶认知的基石，而飞行员的情境意识会受到基本认知能力的调节进而对飞行绩效具有重要影响。因此，注意控制训练可能有效提升情境意识和飞行绩效。本研究采用反眼跳任务测量注意控制，情境意识全面评估技术（SAGAT）和情境意识评定技术（3D - SART）用于评估情境意识，通过 JL-8 飞行训练模拟器检测飞行模拟绩效，采

用 Tobbi Glasses 2 便携式眼动仪测量被试飞行过程中的注意模式。基于已有研究，本研究设计自适应注意控制训练，并考察训练在注意控制、情境意识和飞行绩效中的提升效果。结果发现：（1）在注意控制提升上，自适应反眼跳注意控制训练和自适应混合注意控制训练均能有效提升被试注意控制；（2）在情境意识和飞行绩效提升上，相比于自适应反眼跳注意控制训练，自适应混合注意控制训练的提升效果更好；（3）不同组间以及训练组前后的注意模式存在显著差异，训练后相比于训练前更频繁的关注仪器仪表变化。通过眼动追踪技术，发现训练后各组间的注意模式差异，为未来开展基于眼动反馈的飞行训练提供研究支持。本研究设计有效的自适应注意控制训练，并直接选择飞行绩效作为训练校标，通过飞行模拟检验了训练在绩效提升中的效果，进而为飞行员飞行训练提供有效的心理训练辅助手段。

The Influence of Adaptive Attention Control Training on Situational Awareness and Flight Simulation Performance: An Eye-Tracking Study

Huake Qiu[1], Xia Zhu[1]
1 Department of Military Medical Psychology, Air Force Military Medical University, Xi 'an 710000, zhuxia@fmmu.edu.cn

Abstract： Based on aircrew decision model and process overlap theory, attention control is a general cognitive ability which is considered as the cornerstone of higher-order cognition. The situational awareness of pilots will be affected by cognitive ability, and then has an important impact on flight performance. Therefore, attention control training may effectively improve situational awareness and flight performance. In this study, using anti-saccade task to measure attention control. SAGAT and 3D - SART are used to assess situational awareness. Evaluate flight simulator performance through JL-8 flight simulator. During flight simulation., the Tobbi Glasses 2 was used to measure the eye movement. Based on the previous researches, this study used adaptive attention control training and examined the promotion effect of training. The results show that adaptive anti-saccade attention control training and adaptive medley attention control training can effectively improve attention control. Compared with adaptive anti-saccade attention control training, adaptive medley attention control training has a better effect on improving situational awareness and flight simulator performance. There are significant differences in eye movement between before and after training and different groups. More frequent observation of instruments and meters after training. Through eye tracking, the difference of eye movement patterns among each group was discovered, which provided research support for future flight training based on eye movement feedback. This study designs an effective adaptive attention control training, and the flight performance is directly selected as the training criterion validity. Through flight simulation, the effect of training in performance improvement is tested, so as to provide effective psychological training aids for flight training.

坚持锻炼对大学生在校手机成瘾的影响：自我控制的中介作用和特质正念的调节作用

汪海宁[1]（通讯作者） 郭玉江[2]

1.郑州大学体育学院（校本部），郑州市，450001，573073242@qq.com
2.郑州大学体育学院，郑州市，450044

摘 要 **目的：**大学时代智能手机的广泛普及对大学生活带来便利的同时，也伴随着许多潜在的问题。手机成瘾作为其中的一个主要问题，会对大学生的学业成绩、学习动机、社交能力等产生负面的影响。而坚持体育锻炼对个体戒除各种成瘾机制具有良好效果。因此，本论文旨在探讨在校大学生坚持体育锻炼对手机成瘾的影响机制，并着重关注两个潜在因素：自我控制和特质正念。自我控制是人们对诱惑和冲动的调控能力，对于抵制手机使用的冲动和保持理性、有序的生活方式至关重要。除了自我控制，特质正念强调对当下经验的关注和接受，有助于个体更加理性地认识手机使用对自身的影响，并减少因手机使用带来的消极情绪和情绪调节不良所导致的成瘾倾向。所以，特质正念在手机成瘾的影响机制中起到调节作用。

方法：采用《手机依赖量表简版(SAS-SV)》《锻炼坚持性量表》《自我控制量表（简版）》和《正念注意觉知量表（MAAS）》在某省以东西南北中为方位选取 5 个城市的在校大学生为研究对象，并采用整群随机取样方式设计并发放 1000 份问卷，最终获取有效问卷 902 份。运用 Hayes 编制的 SPSS 宏中 Model 59 进行有调节的中介模型检验。

结果：（1）直接效应分析：锻炼坚持对手机成瘾负向预测作用显著；（2）中介效应分析：放入中介变量自我控制后，锻炼坚持对手机成瘾的直接预测作用仍然显著。自我控制在锻炼坚持与手机成瘾的关系中起部分中介作用；（3）有调节的中介效应分析："锻炼坚持→自我控制"的直接路径受特质正念的调节。"自我控制→手机成瘾"路径受特质正念的调节。即特质正念在中介模型的前半段和后半段路径的影响机制中起到调节作用。

结论：（1）锻炼坚持对手机成瘾具有显著负向预测作用；（2）自我控制在锻炼坚持与手机成瘾间起部分中介作用；（3）"锻炼坚持→自我控制→手机成瘾"中介路径的前半段和后半段均受特质正念的调节，即锻炼坚持在高特质正念下的自我控制影响作用更显著，自我控制也在高特质正念下对手机成瘾的影响作用更显著。

The Influence of Persistent Exercise on Smartphone Addiction among College Students: The Mediating Role of Self-Control and the Moderating Role of Trait Mindfulness

***Abstract*：Purpose:** The widespread prevalence of smartphones during college years has brought convenience to students' lives but also accompanied several potential issues. Smartphone addiction, as a major concern, can negatively impact college students' academic performance, study motivation, and social skills. On the other hand, consistent engagement in physical exercise has shown positive effects in combating various addictions. Therefore, this paper aims to explore the mechanisms through which persistent exercise during college influences smartphone addiction, with a specific focus on two potential factors: self-control and trait mindfulness. Self-control refers to individuals' ability to regulate impulses and temptations, which is crucial in resisting the urge to use smartphones excessively and maintaining a rational and orderly lifestyle. In addition to self-control, trait mindfulness emphasizes the acceptance and non-judgmental awareness of present experiences, aiding individuals in understanding the effects of smartphone usage more objectively and reducing negative emotions and addictive tendencies caused by smartphone use. Hence, trait mindfulness may play a moderating role in the mechanisms underlying smartphone addiction.

Methods: We administered the Short Version of Smartphone Addiction Scale (SAS-SV), Exercise Adherence Scale, Brief Self-Control Scale, and Mindful Attention Awareness Scale (MAAS) to college students from five cities in different regions (east, west, south, north, and central) of a certain province. A total of 1000 questionnaires were distributed using a cluster random sampling method, and 902 valid responses were collected. We employed Hayes' Model 59 in SPSS macro to test the moderated mediation model.

Results: (1) Direct effects analysis: Exercise adherence significantly negatively predicted smartphone addiction. (2) Mediation analysis: After introducing the mediator self-control, the direct predictive effect of exercise adherence on smartphone addiction remained significant. Self-control partially mediated the relationship between exercise adherence and smartphone addiction. (3) Moderated mediation analysis: The direct path "exercise adherence → self-control" was moderated by trait mindfulness. The path "self-control → smartphone addiction" was also moderated by trait mindfulness. In other words, trait mindfulness played a moderating role in both the pre- and post-mediation paths of the model.

Conclusion: (1) Exercise adherence significantly negatively predicted smartphone addiction. (2) Self-control partially mediated the relationship between exercise adherence and smartphone addiction. (3) The mediation paths "exercise adherence → self-control → smartphone addiction" were both moderated by trait mindfulness. This implies that exercise adherence has a more significant impact on self-control under high trait mindfulness, and self-control also has a more prominent effect on smartphone addiction under high trait mindfulness.

他人聚焦的广告设计提高消费者的购买意愿：谦逊的调节作用

王书婷　徐艳　林闻正（通讯作者）

江西师范大学心理学院，南昌，330022，通讯作者 E-mail: lin.wenzheng@live.com

摘 要　以往人格和广告的研究中发现针对不同人格特质制作个性化广告可以增强广告的吸引力，那么是否存在一种非个性化定制的广告类型能增强所有人的购买意愿呢？我们知道包括个性化广告在内的所有广告都有一个直接的宣传目标（为自己买或者为他人买），所以我们猜测不同宣传目标类型（自我聚焦，他人聚焦）的广告对消费者产生的影响也是不同的。谦逊人格和广告的研究表明，谦逊人格的个体更容易接受和信任广告信息，因此我们推测谦逊个体更容易被广告语言所影响，进而增加广告对他们购买意愿的影响力，即我们认为谦逊会对消费者的购买意愿起到调节作用。之前有研究发现，积极的情感体验可以提高个体的购买意愿，而亲密关系可以促进这种积极情感的产生，因此我们认为亲密关系可能会影响购买意愿，所以本研究还测量了被试为不同亲密程度的人（自己，家人，普通朋友）的购买意愿。

通过对 65 名被试进行的预实验确定了两种类型的广告材料（自我聚焦 vs.他人聚焦）能有效操纵被试对应感知。正式研究共招募 231 名本科生参与实验，实验程序要求被试首先完成谦逊量表，然后随机抽取广告呈现给被试，要求被试对不同亲密度的人的购买意愿进行七点计分。

研究使用了多层线性模型分析结果显示，亲密度的主效应显著，不同类型的广告对购买意愿的影响由谦逊所调节。具体而言，为家人的购买意愿要显著高于为自己的购买意愿，为自己的购买意愿要显著高于为普通朋友的购买意愿；高谦逊水平的被试相比于低谦逊水平的被试购买意愿更高，被试在他人聚焦广告的购买意愿上比自我聚焦广告的购买意愿更强，并且此效应受到谦逊水平的调节， 在低谦逊水平的个体上这种购买意愿的差异更加明显。这一发现支持了本研究的假设，即谦逊能够调节自我聚焦和他人聚焦的广告对购买意愿的影响。本研究揭示了谦逊可以调节不同广告类型对购买意愿的影响，启示了在之后产品广告的制作上更多的使用能够唤起谦逊的他人聚焦的广告设计会增加消费者的购买意愿。

Other-focused advertising design enhances consumer purchase intention: the moderating effect of humility

Shuting WANG Yan XU Wenzheng LIN(Corresponding author)
School of Psychology, Jiangxi Normal University, Nanchang, 330022，Corresponding author
lin.wenzheng@live.com

Abstract: In previous research on personality and advertising, it has been found that personalized advertising tailored to different personality traits can enhance the attractiveness of advertisements. So is there a type of non-personalized customized advertising that can enhance everyone's willingness to buy? We know that all advertisements, including personalized advertisements, have a direct promotional goal (buying for oneself or for others), so we speculate that advertisements with different promotional goal types (self-focus, other-focus) also have different effects on consumers. Research on humble personality and advertising shows that individuals with humble personalities are more likely to accept and trust advertising information. Therefore, we speculate that humble individuals are more easily influenced by advertising language, thereby increasing the influence of advertising on their willingness to buy. That is, we believe that humility plays a moderating role in consumers' willingness to buy. Previous research has found that positive emotional experiences can increase individuals' willingness to buy, and intimate relationships can promote the generation of such positive emotions. Therefore, we believe that intimate relationships may affect willingness to buy. Therefore, this study also measured the willingness to buy of subjects with different degrees of intimacy (oneself, family members, ordinary friends).

A pilot study was conducted on 65 subjects to determine that two types of advertising materials (self-focus vs. other-focus) could effectively manipulate corresponding perceptions. A total of 231 undergraduate students participated in the formal study. The experimental procedure required subjects to complete the humility scale first and then randomly select an advertisement to present to the subjects. The subjects were asked to score the purchase willingness of people with different degrees of intimacy on a seven-point scale.

The study used multilevel linear models to analyze the results, which showed that the main effect of intimacy was significant, and the effect of different types of advertisements on purchase willingness was moderated by humility. Specifically, the purchase willingness for family members was significantly higher than for oneself, and the purchase willingness for oneself was significantly higher than for ordinary friends; subjects with high humility levels had higher purchase willingness than those with low humility levels; subjects had stronger purchase willingness for other-focus advertisements than for self-focus advertisements, and this effect was moderated by humility level. This difference in purchase willingness was more pronounced in individuals with low humility levels. This finding supports our hypothesis that humility can regulate the effect of self-focus and other-focus advertisements on purchase willingness. This study reveals that humility can regulate the effect of different types of advertisements on purchase willingness and suggests that using more other-focus advertising designs that can evoke humility will increase consumers' willingness to buy in future product advertising.

大学生社交焦虑对自杀意念的影响：一个有调节的中介模型

武海叶
四川师范大学心理系，成都，610000，2465308197@qq.com

摘 要　我国近八成的大学生都表示自己有轻微“社恐”，疫情期间一系列封闭隔离的措施也使得大学生减少了更多与现实社会交往的机会，因此大学生的社交焦虑问题日益突出。社交焦虑通常会导致许多消极影响，而社交焦虑高的个体常常也会有更高的抑郁水平，从而更容易产生自杀意念。根据自杀行为的“动机—意志”整合模型（IMV），生命意义感可能成为 IMV 中的动机调节因素对自杀意念具有保护作用。根据自杀的缓冲假设，有必要将研究角度从心理困扰的危险因素转移到逆境中精神障碍的保护因素当中。因此，本研究探讨了社交焦虑对大学生自杀意念的影响以及生命意义感和乐观在二者之间的作用机制。本研究采用交往焦虑量表、生命意义感量表、生活定向测验以及自杀意念量表对 927 名大学生进行调查，探讨生命意义感是否在社交焦虑和自杀意念之间起中介作用以及该过程是否受到乐观的调节。结果发现：（1）社交焦虑正向预测大学生的自杀意念；（2）生命意义感在社交焦虑和自杀意念之间起部分中介作用；（3）社交焦虑对自杀意念的作用以及生命意义感对自杀意念的作用受到了乐观的调节。本研究的结果表明社交焦虑会通过生命意义感来降低自杀意念的形成，且乐观会降低社交焦虑对自杀意念以及生命意义感对自杀意念的影响。

The Effect of Social Anxiety on Suicidal Ideation in College Students: A Moderated Mediating Model

Haiye Wu
Department of Psychology, Sichuan Normal University, Chengdu 610000, 2465308197@qq.com

Abstract: Nearly 80% of college students in China say they have mild "social terrorism", and a series of isolation measures during the epidemic have also reduced the opportunities for college students to interact with real society, so the problem of social anxiety among college students has become increasingly prominent. Social anxiety often leads to many negative effects, and individuals with high social anxiety often also have higher levels of depression, making them more prone to suicidal ideation. According to the "motivation-will" integrated model (IMV) of suicidal behavior, the sense of life meaning may be a motivational modulator in IMV and have a protective effect on suicidal ideation. According to the buffer hypothesis of suicide, it is necessary to shift the research perspective from the risk factors of psychological distress to the protective factors of mental disorders in adversity. Therefore, this study explored the influence of social anxiety on college students' suicidal ideation and the mechanism between sense of life meaning and optimism. In this study, 927 college students were investigated by using the communication anxiety scale, sense of life Meaning Scale, life orientation test and suicide Ideation Scale to explore whether sense of life meaning plays a mediating role between social anxiety and suicide ideation and whether the process is moderated by optimism. The results showed that: (1) Social anxiety positively predicted college students' suicidal ideation; (2) The sense of life meaning plays a partial mediating role between social anxiety and suicidal ideation; (3) The effect of social anxiety on suicidal ideation and the effect of meaning of life on suicidal ideation were moderated by optimism. The results of this study suggest that social anxiety can reduce the formation of suicidal ideation through sense of life meaning, and optimism can reduce the impact of social anxiety on suicidal ideation and sense of life meaning on suicidal ideation.
Keywords: social anxiety, suicidal ideation, sense of meaning in life, optimism

瑜伽锻炼对女大学生自我客体化及注意控制的影响研究

潘寒秋[1] 龙滢[1] 闫讷[1] 解缤[2]（通讯作者）
1 西安体育学院研究生部，西安，710068
2 西安体育学院，西安，710068，E-mail：xiebin0320@163.com

摘 要 目的：女大学生一直深受社会“推崇”的审美标准影响，“筷子腿”等外界信息的输入使她们更多关注外表，并不自觉将其作为自我的主要价值，这便是自我客体化。自我客体化是将观察者的观点内化在自己身体上的心理过程，包括对身体的看法更注重外貌特征而非能力属性。客体化理论指出自我客体化会对身心健康产生负面影响。注意控制是个体在面对冲突性信息时，主动将注意资源分配给目标，并抑制习惯化、自动化和优势反应的加工过程。低注意控制个体易关注消极信息并难以逃离，从而影响心理健康。而瑜伽在改善自我认知、提高认知功能等方面发挥积极作用。因此，本文以瑜伽锻炼为干预手段，探究其对女大学生自我客体化和注意控制的影响。

方法：本研究以瑜伽锻炼为干预手段，选取 74 名女大学生，随机分成瑜伽组和对照组各 37 人。瑜伽组进行 8 周、每周 3 次，每次 90 分钟的瑜伽锻炼，对照组继续按照之前的生活习惯进行生活。在练习瑜伽前及八周后，采用自我客体化问卷和注意控制量表进行测量，并使用相关分析、t 检验及中介效应检验等统计方法。

结果：（1）瑜伽锻炼与自我客体化呈显著负相关（r=-0.423，p＜0.001），与注意控制呈显著正相关（r=0.379，p＜0.01）,自我客体化与注意控制呈显著负相关（r=-0.373，p＜0.01）；（2）干预前，瑜伽组和对照组自我客体化（t=-1.30，p＞0.05）和注意控制（t=1.47，p＞0.05）无显著差异；（3）干预后，瑜伽组较对照组自我客体化显著降低（t=-3.96，p＜0.001），注意控制显著提高（t=3.47，p＜0.01）；（4）瑜伽组干预前后，自我客体化显著降低（t=-3.16，p＜0.01），注意控制显著提高（t=2.21，p＜0.05）；（5）对照组前后测自我客体化和注意控制无显著差异（t=0.76，t=0.35，p＞0.05）；（6）注意控制在瑜伽锻炼和自我客体化的关系中发挥部分中介作用，中介效应值为-2.339（95% CI=[-5.519, -0.376]），中介效应占总效应的 22.19%。

结论：（1）8 周的瑜伽锻炼可以显著降低女大学生自我客体化以及增强注意控制能力；（2）注意控制在瑜伽锻炼和自我客体化的关系中起部分中介作用。

关键词 瑜伽锻炼，自我客体化，注意控制，女大学生

Study on the Influence of Yoga Exercise on Self-objectification and Attentional Control of Female College Students

PAN Hanqiu[1], LONG Ying[1], YAN Ne[1], XIE Bin[2] (Corresponding author)
1 Graduate Department, Xi’an Physical Education University, Xi’an Shaanxi, 710068
2 Department of Psychology, Xi’an Physical Education University, Xi’an Shaanxi, 710068
Corresponding author: xiebin0320@163.com

Abstract：Objective: Female college students have been deeply influenced by the aesthetic standards "respected" by the society, and the input of external information such as "chopstick legs" makes them pay more attention to appearance, and unconsciously regard it as the main value of self, which is self-objectification. Self-objectification is the mental process of internalizing an observer's view of one's own body, including a view of the body that focuses more on physical features than on ability attributes. The objectification theory points out that

self-objectification can have negative effects on physical and mental health. Attentional control is a process in which individuals actively allocate attention resources to the target and inhibit habituation, automation and dominance response when confronted with conflicting information. Low attentional control individuals tend to pay attention to negative information and find it difficult to escape, thus affecting their mental health. Yoga plays a positive role in improving self-cognition and cognitive function. Therefore, this paper takes yoga exercise as an intervention method to explore its influence on female college students' self-objectification and attentional control.

Methods: In this study, 74 female college students were randomly divided into yoga group and control group, 37 in each group. The yoga group received 90 minutes of yoga exercise intervention 3 times a week for 8 weeks, and the control group continued to live according to the previous lifestyle. Before and after 8 weeks of yoga practice, the Self-Objectification Questionnaire and Attention Control Scale (ACS) were used for measurement, and statistical methods such as correlation analysis, T-test and mediating effect test were used.

Results: (1) Yoga exercise was negatively correlated with self-objectification ($r=-0.423$, $p < 0.001$), positively correlated with attentional control ($r=0.379$, $p < 0.01$), and negatively correlated with self-objectification and attentional control ($r=-0.373$, $p < 0.01$); (2) Before intervention, there were no significant differences in self-objectification ($t=-1.30$, $p > 0.05$) and attentional control ($t=1.47$, $p > 0.05$) between yoga group and control group; (3) After intervention, self-objectification in yoga group was significantly lower than that in control group ($t=-3.96$, $p < 0.001$), attentional control was significantly increased ($t=3.47$, $p < 0.01$); (4) Before and after intervention, self-objectification was significantly decreased in yoga group ($t=-3.16$, $p < 0.01$), attentional control was significantly increased ($t=2.21$, $p < 0.05$); (5) There was no significant difference between self-objectification and attentional control in control group ($t=0.76$, $t=0.35$, $p > 0.05$); (6) Attentional control played a partial mediating role in the relationship between yoga exercise and self-objectification. The mediating effect was -2.339 (95%CI = [-5.519, -0.376]), and the mediating effect accounted for 22.19% of the total effect.

Conclusion: (1) 8-week intervention can significantly reduce self-objectification and enhance attentional control ability of female college students; (2) Attentional control plays a partial mediating role in the relationship between yoga exercise and self-objectification.

自尊与自我建构的中日韩美法五国的跨文化比较

李婉竹[1]　曹启昕[1]　何潇雯[1]　马伟军[2]（通讯作者）

1 华东师范大学心理与认知科学学院，上海，200062，wjma@psy.ecnu.edu.cn

摘 要　自我建构指个体对于自身个性、行为、价值观等方面的认知和塑造过程，包含独立性与依存性两维度。东亚人与西方人在自我建构上存在差异，分别强调人际间的依存性与独立性。自尊指个体对自我核心价值的整体性评价。个体的整体自尊包含一般自尊和特质自尊，而特质自尊又包含“个人能力与独立”、“人际关系和人缘”、“家人情感与互动”三个维度。西方人比东亚人更重视自我独特价值与直接自尊表达。但目前先行研究缺乏东西方不同文化圈自我建构及自尊的直接比较。

本研究的目的在于对东西方不同文化圈自我建构及自尊进行直接比较，以求揭示其各自特点与差异。本研究采用罗森伯格自尊量表、华人多元自尊量表和自我建构量表分别测量了日本、法国、美国、韩国和中国（日本 132 人、法国 90 人、美国 117 人、韩国 123 份、中国 496 人，共 958 人）这五个国家个体的一般自尊、特质自尊与自我建构。

结果发现：（1）在自我建构方面，东亚人（中国、日本和韩国）的依存性显著高于西方人（美国和法国），而独立性显著低于西方人。从东西方不同文化圈的角度验证了自我建构东西方文化差异的观点。（2）特质自尊方面，西方人在“个人能力与独立”维度与“人际关系和人缘”维度得分比东亚人高，说明西方人比

东亚人更为重视个人能力、独立性与人际关系；但在“家人情感与互动”维度人东亚人比西方人高，说明东亚人比西方人更为重视家庭的情感与互动。（3）在一般自尊方面，东亚人与西方人之间无显著差异。本研究揭示了东西方不同文化圈自尊、自我建构的特点与差异，为东西方不同文化圈的自尊和自我建构的跨文化比较提供了实证依据。

Self-Esteem and Self-Construction: A Cross-Cultural Comparative Study Among Five Countries

Wanzhu Li
East China Normal University, China, Shang Hai Shi, Pu Tuo Qu, Zhongshan Rd 3663, 200062

***Abstract*：** Self-construction refers to the individual's process of recognizing and shaping aspects of their personality, behavior, values, and more, including two dimensions: independence and interdependence. There are differences in self-construction between East Asians and Westerners, with emphasis placed on interdependence and independence in interpersonal relationships, respectively. Self-esteem refers to the overall evaluation of an individual's core self-worth. Overall self-esteem encompasses general self-esteem and trait self-esteem, where trait self-esteem includes three dimensions: "personal abilities and independence," "interpersonal relationships and popularity," and "family emotions and interactions." Westerners tend to place more importance on their unique self-worth and direct self-esteem expression compared to East Asians. However, existing research lacks a direct comparison of self-construction and self-esteem between Eastern and Western cultural circles.

The purpose of this study is to directly compare self-construction and self-esteem between Eastern and Western cultural circles to reveal their respective characteristics and differences. The study used the Rosenberg Self-Esteem Scale, Chinese Multidimensional Self-Esteem Scale, and Self-Construction Scale to measure general self-esteem, trait self-esteem, and self-construction among individuals from Japan, France, the United States, South Korea, and China (132 participants from Japan, 90 from France, 117 from the US, 123 from South Korea, and 496 from China, totaling 958 participants).

The results revealed that: (1) in terms of self-construction, East Asians (China, Japan, and South Korea) scored significantly higher in interdependence and significantly lower in independence compared to Westerners (the US and France), validating the viewpoint of cultural differences in self-construction between Eastern and Western cultural circles. (2) Regarding trait self-esteem, Westerners scored higher than East Asians in the dimensions of "personal abilities and independence" and "interpersonal relationships and popularity," indicating that Westerners place more importance on personal abilities, independence, and interpersonal relationships. However, in the dimension of "family emotions and interactions," East Asians scored higher than Westerners, indicating that East Asians place more importance on family emotions and interactions. (3) There were no significant differences in general self-esteem between East Asians and Westerners. This study reveals the characteristics and differences in self-esteem and self-construction between Eastern and Western cultural circles, providing empirical evidence for cross-cultural comparisons

of self-esteem and self-construction.

Keywords ： Self-construction, overall self-esteem, general self-esteem, trait self-esteem, cross-cultural comparison

城市与农村社区弹性影响因素的共性与差异：一项系统综述

朱仕林[1]（通讯作者）

1 中国地质大学（武汉）教育研究院，心理科学与健康研究中心，武汉，430074，2229359829@qq.com

摘 要 背景：随着社会的发展，“社区弹性”一词被提及的越来越多，国内外的专家学者也对其进行了很多的研究。由于社区有着不同的类型，有的研究侧重城市和农村，但不同的研究者对于城市和农村社区的社区弹性得出的结论存在分歧，因而探讨城市与农村之间社区弹性影响因素的共性与差异对于提高社区应对灾害的能力具有重要的指导意义。目的：本文旨在通过系统文献回顾分析城市和农村社区这两种社区之间社区弹性的共性与差异，探究影响其社区弹性的因素，为促进社区的防灾减灾提供借鉴。方法：按照预定检索策略在中国知网、维普、万方、Pubmed、Web of Science、PsycINFO、PsycARTICLES、PsycBooks、PsycEXTRA 等数据库中检索到 2603 篇文献，经阅读标题和摘要排除不相关和重复文献，排除无法获取全文及与研究目的无关的全文，最终纳入 16 篇文献，并对其进行质量评价。结果：所有纳入文献都涉及城市社区或农村社区的社区弹性，分别属于中国、波斯尼亚-黑塞哥维那、挪威、加拿大、以色列、韩国、尼泊尔 7 个国家。城市社区和农村社区的社区弹性的影响因素存在着共性和差异。其中城市和农村社区社区弹性都涉及的影响因素包括三个层面，分别是政府，如政府的管理和公平；社区，如社区网络、社区的领导力、社区应对灾害的准备、社区的社会资本等等；以及最后的居民层面，如积极响应社区号召、与社区的联系、积极参与和社会认同等因素。除了共性，城市和农村社区在社区弹性的影响因素方面也存在着差异。农村社区居民的共有意识形态以及居民关系影响着其社区弹性，这是城市社区社区弹性所不具备的；而城市社区其基础设施和生活方式等方面则与农村社区有着不小的区别，也造成了二者社区弹性的差异。结论：城市社区与农村社区的社区弹性在以往的研究中存在分歧，是因为社区弹性在两类社区中各有其影响因素，既有相同点，又存在差异。在政府制定相关政策时，需考虑社区的类型，具体问题具体分析，帮助社区提高社区弹性，建设具有弹性的社区，以提高社区应对灾害的能力，促进和谐社会的构建。

The commonality and differences between the influence factors of urban and rural community resilience: a system review

Zhu Shilin(Corresponding author)[1]

1 China University Of Geosciences, Research Center for Psychological Science and Health, Wu Han, 430074, Corresponding author: 2229359829@qq.com

Abstract：Background: With the development of society, the term "community resilience" has been mentioned more and more, and experts and scholars at home and abroad have conducted a lot of research on it. Because the community has different types and some research focuses on cities and

rural areas, different researchers have different conclusions on the conclusions of community resilience in urban and rural communities. Therefore, the commonality and differences in community resilience factors between cities and rural areas have important guiding significance for improving the ability of communities to deal with disasters. Objective: This article aims to analyze the commonality and differences between community resilience between the two communities of cities and rural communities through system literature, explore the factors that affect the resilience of their community, and provide a reference for promoting disaster prevention and mitigation of the community. Methods: According to the scheduled retrieval strategy, 2603 documents were retrieved in Database of China, Weipu, Wanfang, PUBMED, Web of Science, Psycinfo, Psycarticles, PsyCBooks, Psycextra, etc., and unrelated and repeated documents were excluded by reading title and summary. The full text that has nothing to do with research purposes is finally included in 16 documents and evaluated it for quality. Results: All the enlightenment of the literature involved the resilience of the urban or rural communities, and belongs to 7 countries in China, Persia-Hezonovina, Norway, Canada, Israel, South Korea, and Nepal. The influencing factors of community resilience in urban communities and rural communities have commonality and differences. Among them, the resilience of urban and rural communities involves three levels of influencing factors, including government management and fairness; community, such as community networks, community leadership, community preparations for disasters, community social capital, etc., and the final resident level, such as actively responding to community calls, contact with the community, active participation and social identity. In addition to commonality, there are also differences in the influencing factors of cities and rural communities in community resilience. The co -ideological and residents' relationship between residents of rural communities affects its community resilience, which is not available in the resilience of the urban community community. The infrastructure and lifestyle of urban communities are not small from the rural community, and it also causes the resilience of the community of the two. Conclusion: The resilience of the community in the urban community and the rural community has differences in previous research. It is because the resilience of the community has its own influencing factors in the two types of communities, which are both the same and different. When the government formulates relevant policies, it is necessary to consider the type of community. Specific analysis of specific problems to help the community improve the resilience of the community and build a flexible community to improve the community's ability to deal with disasters and promote the construction of a harmonious society.

医患信息不对称影响患方信任——场景工具的开发与检验

崔杨　廖美玲　林国斌（通讯作者）

福建医科大学健康学院，福州，350122，838400402@qq.com

摘 要 医患信任危机是导致医患关系失谐的社会心态根源。基于信息不对称理论，医患间信息不对称是影响医患信任的主要因素之一。目前国内外对医患信息不对称的测量工具较少，难以开展更为深入的研究。本研究基于以往文献，开发医患信息对称性场景工具并使用此工具探究医患信息不对称对患方信任的影响。

研究 1 开发医患信息对称性场景工具。通过方便取样法（*n*=156）对初始条目进行项目分析，剔除 20 项条目；随后通过 *Delphi* 专家咨询法（*n*=9）评估专家权威系数与一致性程度，剔除 27 项条目；最后将剩

余的 25 项条目结合场景模板与条目文字内容开发医患信息对称性场景工具，向医院病人（n=40）进行实验施测，从效价、唤醒度、认同度、现实度四个维度对场景工具进行有效性评价。结果表明纳入场景工具的 25 个条目可采信程度较高（Cr=0.83，W=0.742，p＜0.001），所有场景图片在唤醒度、认同度、熟悉度与效价上的评分均在中值 5 以上，有效性良好。

研究 2 考察不同医患信息对称性水平下的患方信任差异。招募患者 30 名，采用自行开发的医患信息对称性场景工具，结合改编的信任游戏范式，采用单因素两水平（信息对称水平：对称 *VS* 不对称）被试内设计开展行为实验，考察相同被试在不同医患信息对称性水平下的患方信任差异。结果显示，在医患信息对称场景工具构建的实验条件下，被试在对称水平下的信任行为率显著高于不对称水平（t=5.919, p＜0.001），表明被试在医患信息对称条件下对医方角色具备更高的信任水平。

综上，本研究以信息不对称理论为研究视角，开发了信效度良好的医患信息对称性场景工具；并将信任游戏范式引进医患研究领域，结果发现医患信息对称水平下的患方信任水平更高。

Doctor-patient information asymmetry affects patient trust--development and testing of a scenario tool

Yang Cui　Meiling Liao　Guobin Lin

School of health，Fujian medical university, Fuzhou，350122

Abstract：Doctor-patient trust crisis is the root of social mentality that leads to the disharmony of doctor-patient relationship. Based on the information asymmetry theory, information asymmetry between doctors and patients is one of the main factors affecting doctor-patient trust. At present, there are fewer measurement tools for doctor-patient information asymmetry at home and abroad, which makes it difficult to conduct more in-depth research. Based on previous literature, this study develops the doctor-patient information symmetry scenario tool and uses this tool to explore the impact of doctor-patient information asymmetry on patient trust.

Study 1 Development of a physician-patient information symmetry scenario tool. The initial items were analysed by the convenience sampling method (n=156), and 20 items were excluded; then the expert authority coefficient and consistency degree were assessed by the Delphi expert consultation method (n=9), and 27 items were excluded; finally, the remaining 25 items were combined with the scenario template and the textual content of the entries to develop the Symmetry of Doctor-Patient Information Scenario Tool, which was administered to the patients in the hospital (n=40) for the purpose of experimental testing. Finally, the remaining 25 items were combined with the scenario template and item text content to develop a scenario tool for doctor-patient information symmetry, which was experimentally administered to hospital patients (n=40). The results showed that the 25 items included in the scenario tool had a high degree of admissibility (Cr=0.83, W=0.742, p<0.001), and all scenarios were rated above the median of 5 for arousal, identity, familiarity, and validity, which is a good validity.

Study 2 examined differences in patient trust at different levels of doctor-patient information symmetry. Thirty patients were recruited to conduct a behavioural experiment using a self-developed doctor-patient information symmetry scenario tool combined with an adapted trust game paradigm in a one-factor, two-level (information symmetry level: symmetry vs. asymmetry) within-subjects design, to examine the differences in patient-side trust among the same subjects at different levels of doctor-patient information symmetry. The results showed that under the experimental conditions constructed by the Doctor-Patient Information Symmetry Scenario Tool, the rate of trusting behaviours of subjects under symmetrical level was significantly higher than that of

asymmetrical level (t=5.919, p<0.001), indicating that subjects possessed a higher level of trust in the role of the doctor under the condition of symmetrical doctor-patient information.

In summary, this study took the information asymmetry theory as the research perspective and developed the doctor-patient information symmetry scenario tool with good reliability and validity; and introduced the trust game paradigm into the field of doctor-patient research, and the results found that the patient's trust level was higher at the symmetry level of doctor-patient information.

青少年快感缺失量表在中国一般青少年中的验证

关志顺[1] 马丽萍[1] 迟新丽[2] 严超[1]

1 华东师范大学心理与认知科学学院，上海，200062

2 深圳大学心理学院，深圳，518060

通讯作者：严超，cyan@psy.ecnu.edu.cn

摘 要 快感缺失作为症状和跨诊断特征，广泛存在于精神疾病患者中。同时，作为青少年时期高发的抑郁症核心症状之一，其出现往往代表后续治疗困难和糟糕预后的风险提高。在行为表现上，过往有研究发现青少年抑郁症与成人患者相比在即时性快感缺失方面有所不同。由此可见，为达到更好的筛查和预防效果，有必要采用在青少年快感缺失问题上具效度的工具。然而，过往所开发的快感缺失自评量表大多以成人群体为蓝本。为此，本研究对基于青少年临床群体开发和验证的青少年快感缺失量表（ASA）进行翻译，在中国一般青少年群体中作验证以拓展其适用性。我们招募了 1443 名中学生参与此项研究调查，在半年后，其中 976 人继续参加第二轮调查。前测数据随机分成两组分别进行探索性/验证性因子分析以及信效度分析，并采用动机与情緒自评量表（MAP-SR，分数越低快感缺失程度愈高）、认知情緒调节问卷（CERQ，其分量表中，接受、自我责备、沉思、灾难化、责备他人和抑郁症状呈显着正相关，而积极重新关注、重新关注计划、积极重新评价、理性分析和抑郁症状呈显着负相关）作校标效度分析。儿童愤怒量表（AESC）、儿童愤怒表达量表（ChIA）作区分效度分析。同时采用儿童抑郁量表（CDI）进行预测效度分析。因子分析结果发现，2 因子结构要优于原量表的 3 因子结构（$\chi2$ / df＝3.736、TLI＝0.938，CFI＝0.948，SRMR=0.034，RMSEA＝0.62, 90%CI =0.054 ～ 0.069）。在两样本群体中，ASA 总分的克隆巴赫系数为 0.876-0.889。重测信度 ICC=0.587。分量表一（愉快体验、刺激、动机和努力，负向计分）和分量表二（热情、联系和意义感，正向计分）的克隆巴赫系数分别为 0.875 ～ 0.898，0.729 ～ 0.738，重测信度 ICC=0.439，0.542。校标效度分析结果显示，ASA 各分量表和 MAP-SR 各分量表在两样本群体中均具显着负相关（r=-.338 ～ -.589, 均 p<0.001）。同時，ASA 各分量表和 CERQ 中的积极重新关注、重新关注计划、积极重新评价分量表呈显着负相关（r=-.167 ～ -.436, 均 p<0.001），和灾难化具显着正相关（r=0.248 ～ 0.548, 均 p<0.001）。但分量表一和二在自我责备、接受、理性分析、责备他人的相关关系方向上各有不一致。区分效度分析结果显示，ASA 各分量表和 ChIA 均具显着低相关（r=0.097 ～ 0.232, 均 p<0.001），而和 AESC 则呈现低至中等相关（r=-.165 ～ -.288, 均 p<0.001），。预测效度上，ASA 总分和各分量表均在控制性别、年龄和焦虑程度的基础上显着预测半年后的抑郁水平。研究结果表明 ASA 在中国青少年中具一定文化差异性，具有良好的信效度。但其中的热情、联系和意义感分量表则需要更多的探索。后续将在临床群体中开展进一步的验证工作，拓展其适用性以达到更好的筛查和预防青少年抑郁症和快感缺失问题。

Chao Yan: cyan@psy.ecnu.edu.cn; Room 413, Building Junxiu, 3663 North Zhongshan Road, Shanghai, China, 200062

Abstract：Anhedonia is highly prevalent as a symptom and transdiagnostic features mental disorders. Adolescents are at high risk of develop depression which anhedonia acted as a core symptom. The presence of anhedonia is relevant to risk of subsequent treatment difficulties and poor prognosis. Previous studies have discovered that adolescent depression patients differ from adult patients in terms of consummatory pleasure deficit, suggesting a need for instruments with high validity on adolescents' anhedonia in order to achieve better screening and prevention outcomes. However, most of the scales have been developed based on adult. The Adolescent Pleasure Deficit Scale (ASA) was the only self-reported scale developed and validated based on clinical and general adolescent population. The aim of current study is to translate and validate it in a general Chinese adolescent population to expand its applicability. We recruited 1,443 secondary school students to participate in this study, 976 of them continued to participate six months later. The pre-test data were randomly divided into two groups for exploratory/confirmatory factor analysis and reliability tests. For validity test, we applied the Motivation and Emotion Self-Rating Scale (MAP-SR, lower score indicate a higher degree of anhedonia), the Cognitive Emotion Regulation Questionnaire (CERQ, subscales of acceptance, self-blame, contemplation, catastrophizing, blaming others were positively correlated with depressive symptoms; positive refocusing, refocus on planning, positive reappraisal, putting into perspective were negatively correlated with depressive symptoms) were analyzed for concurrent validity. The Anger Scale for Children (AESC) and the Children's Expression of Anger Inventory (ChIA) were analyzed for discriminant validity. The Child Depression Inventory (CDI) was also used for predictive validity analysis. Factor analysis revealed a 2-factor structure was superior to the origin 3-factor structure ($\chi 2/df = 3.736$, TLI = 0.938, CFI = 0.948, SRMR = 0.034, RMSEA = 0.62, 90% CI = 0.054 to 0.069). For reliability tests, the Cronbach's Alpha coefficients for total ASA score ranged from 0.876 to 0.889. Test - retest reliability ICC = 0.587. Cronbach's Alpha coefficients for ASA subscale 1 (enjoyment, excitment, motivation, and effort, negatively framed) and subscale 2 (enthusiasm, connection, and purpose, positively framed) ranged from 0.875 to 0.898, and from 0.729 to 0.738, and the test-retest reliability ICC =0.439, 0.542, respectively. The results of concurrent validity analyses showed significant negative correlations between the ASA subscales and the MAP-SR subscales in both groups of samples (r=-.338 to -.589, $p<0.001$), and the positive refocusing, refocusing on planning, and positive reappraisal subscales of the CERQ (r=-.167 to -. 436, $p<0.001$), and significant positive correlation with catastrophizing (r=0.248 to 0.548, $p<0.001$). However, inconsistent results in the relationship between two subscales of ASA and self-blame, acceptance, putting into perspective, and blaming others of CERQ were observed. Discriminant validity analyses showed that each of the ASA subscales had a low level of correlation with the ChIA subscales (r=0.097 to 0.232, $p<0.001$), and AESC subscales (r=-.165 to -.288, $p<0.001$). In terms of predictive validity, the ASA total score and its subscales significantly predicted the level of depression six months later, after controlling the effect of gender, age, and anxiety level. These findings suggest that the ASA

has good reliability and validity. ASA is also culturally diverse among Chinese adolescents compare to the British samples in the original article. However, the enthusiasm, connection and purpose subscale of ASA needs more exploration. Further validation in clinical populations will follow, to expand of applicability of ASA for a better screening of adolescent depression and anhedonia problems.

风险决策框架效应的跨文化差异

曹婉郡　管苡辰　江润杰　张克顺（通讯作者）

青岛大学心理系，青岛，266071，通讯作者 keshun.zhang@qdu.edu.cn

摘 要　框架效应作为一种经典的非理性决策偏差，是指同一问题的不同描述框架会导致个体偏好变化的现象。以往研究发现，集体主义-个人主义文化特征会对框架效应产生影响，然而研究结果存在分歧。现有研究多数通过两个国家文化对比得出结论，样本广度不够，这可能是导致研究结果不一致的原因。因此，本研究通过分析疫情期间全球 54 个国家 80586 名受访者“亚洲疾病”问题决策数据，以澄清文化对风险决策及其框架效应的影响。研究共由两部分组成，研究一通过倾向性得分匹配构建假想随机测验，验证在跨国大样本中国家个体主义-集体主义文化背景与风险决策的关系，研究二在全球范围内使用边际效应分析探讨框架效应的跨文化差异。结果表明：1.个体主义国家的个体普遍风险规避，集体主义国家的个体普遍风险寻求；2.框架效应在全球国家普遍存在。个人主义集体主义指数与框架效应呈倒 U 型关系。高个体主义和高集体主义国民的框架效应都比较小。研究一证实了缓冲假说，个体主义国家文化背景的个体普遍风险规避，集体主义国家文化背景的个体普遍风险寻求，集体主义国家更倾向于承担风险采取防疫措施以改善集体福祉、减轻他人损失；研究二得出国家个体主义/集体主义文化特征鲜明程度（个体主义/集体主义得分绝对值相对高低）影响框架效应，文化背景特征鲜明的国家受框架效应影响更弱。本研究表明风险决策中框架效应受到文化背景的塑造，文化特征和框架效应的倒 U 型关系也澄清了以往研究的分歧，为研究重大突发事件下框架效应的跨文化差异提供一定的参考价值。

Cross-cultural differences in risk decision framing effects

Wanjun Cao,　Yichen Guan,　Runjie Jiang,　Keshun Zhang (Correspondence)

Department of Psychology, Qingdao University, Qingdao，266071

Abstract：The framing effect, a classic irrational decision bias, is a phenomenon in which different descriptive frames of the same problem lead to changes in individual preferences. Previous studies have found that collectivist-individualist cultural characteristics influence the framing effect, but the results are mixed. Most of the existing studies draw their conclusions by comparing the cultures of two countries with insufficient sample breadth, which may be the reason for the inconsistent findings. Therefore, this study analyses decision data on 'Asian disease' issues from 80,586 respondents in 54 countries during the epidemic to clarify the influence of culture on risk decision-making and its framing effects. The study consists of two parts, Study 1, which constructs a hypothetical randomized trial using propensity score matching to examine the relationship between national individualistic-collectivist cultural contexts and risk decision-making in a large cross-national sample, and Study 2, which explores cross-cultural differences in framing effects globally using marginal effects analysis. The results show that 1. individuals in individualistic countries are generally risk-averse and individuals in collectivist countries are generally risk-seeking; and 2. the framing effect is prevalent in countries around the world. The

individualism-collectivism index has an inverted U-shaped relationship with the framing effect. The framing effect is smaller for both high individualism and high collectivism nationals. Study 1 confirms the buffering hypothesis that individuals from individualistic national cultural backgrounds are generally risk-averse, individuals from collectivistic national cultural backgrounds are generally risk-seeking, and collectivistic countries are more inclined to take risks in order to take precautionary measures to improve collective welfare and mitigate the losses of others; Study 2 concludes that the degree of national individualism/collectivism (the relative absolute individualism/collectivism score) influences the framing effect, and that countries with distinctive cultural characteristics are less affected by the framing effect. This study shows that the framing effect in risk decision-making is influenced by cultural background, and the inverted U-shaped relationship between cultural characteristics and the framing effect also clarifies the inconsistency of previous studies, which provides a certain reference value for the study of cross-cultural differences in the framing effect in major emergencies.

基于审美研究的“丑萌”模因对情绪的影响及神经机制探究

安易　夏天生（通讯作者）
广东工业大学，广州，510000，xiatiansheng@gdut.edu.cn

摘 要　“丑萌”作为一种模因文化，可以解释为“奇怪的令人快乐的图像”。不同与传统审美，“丑萌”模因并不以“美观性”作为吸引力的主要来源，目前尚不清楚这一现象出现的原因及“丑萌”审美体验的神经机制。本研究利用 oddball 范式，结合脑电图和情绪面孔识别技术考察了“丑萌”审美体验对情绪的影响及其认知神经机制。参与者被分为 A、B 两组（n=30），通过对出现的新异刺激进行吸引力判断，比较参与者在进行不同类型的审美体验（丑型、萌型与丑萌型）所引发的情绪上及神经机制上的异同。在 A 组中，标准刺激为“萌”的图片，新异刺激为“丑萌”的图片；在 B 组中，标准刺激为“丑”的图片，新异刺激为“丑萌”的图片。实验结果显示，在 A 组中，与“萌”型的标准刺激相比，“丑萌”型的新异刺激在引发愉悦情绪的同时还引发了惊讶的情绪。事件相关电位显示，两种刺激都引发了与“快乐”相关的事件相关电位 LPP，而“丑萌”型的图片还引发了与“惊讶”相关的 P300。在 B 组中，“丑”型的标准刺激所引发的情绪多为“厌恶”、“恐惧”等负面情绪，而“丑萌”型的新异刺激引发的情绪则主要为积极的正向情绪；“丑”型和“丑萌”型的两种刺激均引发了与惊讶相关的 P300 电位，“丑”型刺激还引发了与负面认知相关的 N2 电位，而“丑萌”型刺激同时引发了与“愉悦”情绪相关的 LPP 电位；此外，通过对比两组实验发现，与“萌”型图像相比，“丑”型及“丑萌”型在审美体验中出现了更多的 N1 成分，这意味着丑萌模因在审美过程中可能需要更多的注意力投入。研究结果表明，除了“愉悦”的情绪外，丑萌模因还引发了“惊讶”等积极情绪和更多注意力，本研究为探究新的审美现象“丑萌模因”的心理及神经机制提供了经验证据。

The Influence of the "Ugly-Cute" Memes Based on Aesthetic Research on Emotions and Investigation of Neural Mechanisms

Yi An, Tiansheng Xia (Corresponding Author)
Guangdong University of Technology, Guangzhou, 510000, xiatiansheng@gdut.edu.cn

Abstract："Ugly-cute" as a meme culture can be explained as "strange and delightfully amusing images". Unlike

traditional aesthetics, the appeal of "ugly-cute" memes does not primarily rely on "beauty". The reasons for the emergence of this phenomenon and the neural mechanisms underlying the aesthetic experience of "ugly-cute" are still unclear. In our study, we employed the oddball paradigm, combining electroencephalography (EEG) and emotion face recognition technology, to investigate the impact of the aesthetic experience of "ugly-cute" on emotions and its cognitive neural mechanisms. Participants were divided into two groups, A and B (n=30), and their emotional and neural responses to different types of aesthetic experiences (ugly, cute, and ugly-cute) were compared by judging the attractiveness of novel stimuli. In Group A, the standard stimuli were "cute" images, and the novel stimuli were "ugly-cute" images. In Group B, the standard stimuli were "ugly" images, and the novel stimuli were "ugly-cute" images. The results showed that in Group A, compared to the "cute" standard stimuli, the "ugly-cute" novel stimuli elicited both pleasant and surprised emotions. Event-related potentials (ERPs) showed that both types of stimuli elicited a late positive potential (LPP) associated with "happiness", while the "ugly-cute" images also elicited a P300 component associated with "surprise". In Group B, the emotions elicited by the "ugly" standard stimuli were mostly negative, such as "disgust" and "fear", while the emotions elicited by the "ugly-cute" novel stimuli were mainly positive. Both the "ugly" and "ugly-cute" stimuli elicited a P300 component associated with "surprise", and the "ugly" stimuli also elicited an N2 component associated with negative cognition, while the "ugly-cute" stimuli elicited an LPP component associated with "pleasure". Furthermore, by comparing the two groups, it was found that compared to the "cute" images, both the "ugly" and "ugly-cute" images had more N1 components in the aesthetic experience, indicating that the "ugly-cute" memes may require more attentional resources during the aesthetic process. The results of our study suggest that besides the emotion of "pleasure", the "ugly-cute" memes also elicit positive emotions such as "surprise" and require more attentional resources. Our study provides empirical evidence for exploring the psychological and neural mechanisms of the new aesthetic phenomenon of "ugly-cute" memes.

Keywords：Ugly-cute, Aesthetics, Neural mechanisms, Emotions

谦逊降低刻板印象威胁：以女性空间认知能力为例

燕丰羽 赵诗韵 滕鑫 林闻正（通讯作者）

江西师范大学心理学院，南昌，330022，通讯作者 E-mail: lin.wenzheng@live.com

摘 要 刻板印象威胁是指污名群体的成员因担心自己的表现会证实消极刻板印象而导致表现下降的一种现象。刻板印象威胁已被证实会损害个体在许多领域的能力，如女性的空间认知能力。因此，消解这种威胁给个体带来的负面影响，是研究者普遍关注的问题。过往的研究表明，个体某种程度对自我表现的关注会减弱刻板印象带来的威胁效应。这一研究结果暗示了自我关注对刻板印象威胁的影响；而谦逊作为一种积极品质，表现为个体较低的自我关注。因此，本研究以女性空间认知能力为例，旨在探讨谦逊与刻板印象威胁的关系。该研究假设谦逊可以缓解刻板印象威胁对女性空间认知能力的负面影响。

为此，本研究采用实验法，将 387 名女性学生随机分为威胁组（n = 152）和对照组（n = 235）。首先进行刻板印象威胁操纵。威胁组阅读了一段强调男性在空间任务上优于女性的信息，而对照组阅读了一段表明男性和女性在空间任务上表现相近的信息。然后要求被试进行空间旋转任务来测量其空间认知能力。最后要求被试自我报告其情绪体验、刻板印象威胁水平和特质性谦逊水平。

方差分析结果显示，特质性谦逊可以调节刻板印象威胁对女性空间认知能力的影响，即更谦逊的女性会受到更少的刻板印象威胁的影响。这一结果支持了本研究的假设，并揭示了谦逊作为一种积极的人格特质，可以减少女性受到刻板印象威胁的影响。未来研究还需要进一步探讨谦逊是如何通过影响个体的认知、情绪和动机等心理过程来降低刻板印象威胁的内在机制。

Humility Reduces Stereotype threat: A case study of women's spatial cognition

Fengyu YAN　Shiyun ZHAO　Xin TENG　Wenzheng LIN(Corresponding author)
School of Psychology, Jiangxi Normal University, Nanchang, 330022，Corresponding author
lin.wenzheng@live.com

Abstract： Stereotype threat refers to the phenomenon that members of stigmatized groups perform worse in related tasks confirming to their group stereotypes. Stereotype threat has been shown to impair individuals' abilities in many domains (e.g., women's spatial cognition). Therefore, alleviating those negative effects on individuals has become the focus of this research field. Previous studies suggested that a certain degree of self-concern can weaken the threat effect of stereotypes. This finding implies that the influence of self-focus on stereotype threat; and humility as a positive quality is characterized by low self-concern. Therefore, this study aims to explore the relationship between humility and stereotype threat by examining its effects on women's spatial cognition. This study hypothesizes that humility can mitigate the negative impact of stereotype threat on women's spatial cognition.

To this end, this study adopts an experimental design and randomly assigned 387 female students to a threat group (n = 152) and a control group (n = 235). Stereotype threat was manipulated by having the threat group and the control group read information emphasizing male superiority and male-female similarity in spatial tasks, respectively. Then, the subjects were asked to perform a spatial rotation task to measure their spatial cognition scores. Finally, the subjects were asked to complete some questionnaires to measure their emotional experience, stereotype threat level and trait humility.

The ANOVA results show that trait humility could moderate the effect of stereotype threat on women's spatial cognition. In particular, more humble women were less affected by stereotype threat. This finding supports the hypothesis of this study and reveals that humility could reduce the impact of stereotype threat on women. Future research needs to further explore how humility reduces stereotype threat by influencing individuals through cognitive, emotional and motivational processes.

Keywords： Humility, Stereotype threat, Spatial cognitive ability

个体资源组织资源协同影响职业行为的机制分析及设计 EAP 的启示

张济英　宋国萍（通讯作者）
陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室，西安，710061
gpsong@126.com

摘　要　本文基于职业动机理论和工作需要-资源理论，探讨不同事件背景下员工职业生涯投入行为的形成机制。分别在极端公共卫生事件爆发期和生产生活常态化时期，采用职业生涯韧性、家庭支持、职业生涯

投入行为量表对在职员工进行测量。职业生涯投入行为能正向预测员工的工作满意度和职业生涯满意度。本文通过中介调节模型分析，探究不同时期下职业韧性对职业生涯投入行为的影响机制，以期为企业设计EAP提升员工职业生涯投入行为提供具体路径。结果发现，在极端公共卫生事件爆发期，职业韧性在组织承诺的中介下正向预测职业生涯投入行为，组织支持氛围在组织承诺对职业生涯投入行为的关系中起调节作用。在生产生活常态化时期，组织支持氛围对组织承诺和职业生涯投入行为的关系中的调节作用不显著，且心理可得性在职业韧性和组织承诺的关系中起调节作用。该研究结果说明不同背景下，影响职业动机和投入行为的因素不同，对资源的感知程度也影响着具体的职场行为，提醒我们要善于在动态发展的环境中把握关键变量，从而为更好的改善职业环境提供参考路径。基于此，我们得到了企业设计EAP的启示：从资源视角出发，助力个体内部资源和外部资源协同提升，为组织赋能，从而促进员工职业生涯投入行为。一方面，本文通过路径分析发现个体资源组织资源在工作场所中相互影响，协同作用于员工职业生涯投入行为，另一方面，从提升资源的视角入手，丰富了传统EAP聚焦问题解决的服务模式。

Mechanism analysis of individual resource organization resource synergistic influence on professional behavior and implications for EAP design

Jiying Zhang　Guoping Song (corresponding author)
School of Psychology and Shaanxi Provincial Key Laboratory of Behavioral and Cognitive Neuroscience, Shaanxi Normal University, Xi 'an 710061, China
gpsong@126.com

Abstract:Based on occupational motivation theory and work needs-resource theory, this paper discusses the formation mechanism of employees' career engagement behavior under different event backgrounds. In the outbreak period of extreme public health events and the normal period of production and life, the career resilience, family support and career engagement behavior scale were used to measure the on-the-job employees. Career engagement behavior can positively predict employees' job satisfaction and career satisfaction. Through the mediation model analysis, this paper explores the influence mechanism of career resilience on career engagement behavior in different periods, in order to provide specific ways for enterprises to design EAP to improve employees' career engagement behavior. The results showed that during the outbreak of extreme public health events, occupational resilience positively predicted career engagement behavior under the mediation of organizational commitment, and organizational support atmosphere played a moderating role in the relationship between organizational commitment and career engagement behavior. In the normalized period of production and life, the moderating effect of organizational support atmosphere on the relationship between organizational commitment and career engagement behavior was not significant, and psychological availability played a moderating role in the relationship between occupational resilience and organizational commitment. The results of this study show that the factors affecting occupational motivation and engagement behavior are different under different backgrounds, and the degree of perception of resources also affects specific workplace behaviors. It reminds us that we should be good at grasping key variables in the dynamic development environment, so as to provide a reference path for better improving the occupational environment. Based on this, we get the enlightenment of enterprise design EAP: From the perspective of resources, help the internal and external resources of individuals to collaborate and improve the organization, so as to promote the career engagement

behavior of employees. On the one hand, through path analysis, this paper finds that individual resources and organizational resources interact with each other in the workplace and synergistically affect employees' career engagement behavior. On the other hand, from the perspective of resource enhancement, this paper enricfies the traditional EAP problem-focused service model.
Key words: career resilience, career engagement behavior, mediation model, implications for EAP

新冠疫情下公众心理健康水平变化研究——基于新浪微博数据

王璐瑶[1]　康春花[1]　曾平飞[2]（通讯作者）

1 浙江师范大学心理学院，浙江金华，321004

2 浙江师范大学教育学院，浙江金华，321004 通讯作者 E-mail：zpf@zjnu.cn

摘 要　新冠疫情爆发，给公众生活、工作和学习造成巨大冲击。为探讨其对公众心理健康的影响，本文抓取疫情前后及疫情期间发布的含有“心理咨询”关键词的新浪微博内容，运用应激适应、心理韧性以及社会支持等心理学理论，对数据进行分析，探究疫情不同阶段公众心理健康水平的变化。

根据已有研究对疫情阶段的划分，本文进一步将其划分为五阶段：无疫情期、疫情爆发期、常态化防控期、疫情反复期、后疫情期。本文使用 Python 作为主要分析工具，清洗后数据共包括 78044 条微博。首先使用 WordCloud 词云图和词频统计，对比公众在疫情不同阶段讨论心理咨询话题时的词频情况；再进一步利用 SnowNLP 进行情感分析，探究各阶段公众的情感趋势变化；最后在讨论部分探讨了疫情前后影响公众心理健康的因素。

研究结果如下：(1)词频结果显示，在全部阶段中，总占比高于 10%的高频词包括“问题”“情绪”“工作”“需要”“老师”“孩子”；各阶段次高频词存在差异，大多数次关键词主要集中于学习、朋友等日常方面，然而在疫情爆发期，对疫情相关词汇的讨论激增，且词频表内容与其他阶段明显不同。(2)情感分析结果显示，疫情前后文本内容总体上是积极的，但仍存在焦虑；疫情不同阶段人们的情感倾向不同，疫情爆发期公众的负面情绪最突出，负性文本达到 39.27%，远高于无疫情期的 22.14%，疫情中后期负性文本随疫情形势变化有相应波动，如在疫情反复期负性文本有所上升，疫情结束后比例有所下降但依旧高于无疫情期；疫情期间的正性文本普遍低于无疫情期，但在疫情结束后相对回升。

公众面临突发事件时，需要适应性的心理应对机制来自我调节，故疫情期间公众心理健康水平存在波动，尤其是在疫情爆发期间，公众的负性情绪显著增加，而各方面的社会支持增强了公众的心理韧性，对稳定公众心理健康水平有一定帮助。本研究以新冠肺炎疫情为背景，揭示重大生活事件对公众身心健康的影响。对未来类似重大生活事件对心理健康的影响提供一定的预测和启示。

Research on the change of public mental health level under the COVID-19—based on Sina Weibo data

Wang Luyao[1], Kang Chunhua[2], Zeng Pingfei[3]

School of Psychology, Zhejiang Normal University, Jinhua, 321004, China

College of Education, Zhejiang Normal University, Jinhua, 321004, China

Abstract：The outbreak of the COVID-19 epidemic has had a huge impact on public life, work and learning. To explore its impact on public mental health, this article captures Sina Weibo content containing the keyword "psychological counseling" published before and during the epidemic, and uses psychological theories such as

stress adaptation, psychological resilience, and social support to analyze the data and explore the changes in public mental health levels at different stages of the epidemic.

Based on existing research on the classification of epidemic stages, this article further divides them into five stages: no epidemic period, epidemic outbreak period, normalized prevention and control period, epidemic recurrence period, and post epidemic period. This article uses Python as the main analysis tool, and the cleaned data includes a total of 78044 Weibo posts. Firstly, use WordCloud word cloud images and word frequency statistics to compare the frequency of public discussions on psychological counseling topics at different stages of the epidemic; Further use SnowNLP for sentiment analysis to explore the changes in public sentiment trends at various stages; Finally, in the discussion section, the factors affecting public mental health before and after the epidemic were explored.

The research results are as follows: (1) Word frequency results show that in all stages, high-frequency words with a total proportion of more than 10% include "problems", "emotions", "work", "needs", "teachers", and "children"; There are differences in high-frequency words at different stages, with most of the secondary keywords mainly focused on daily aspects such as learning and friends. However, during the outbreak of the epidemic, discussions on epidemic related vocabulary have surged, and the content of the word frequency table is significantly different from other stages. (2) The emotional analysis results show that the text content before and after the epidemic is generally positive, but there is still anxiety; People's emotional tendencies vary at different stages of the epidemic, with the most prominent negative emotions among the public during the outbreak period, with negative texts reaching 39.27%, much higher than the 22.14% during the non epidemic period. Negative texts in the middle and later stages of the epidemic fluctuate accordingly with changes in the epidemic situation. For example, negative texts increase during the recurrence period of the epidemic, and the proportion decreases after the end of the epidemic but is still higher than during the non epidemic period; The positive text during the epidemic period is generally lower than that during the non epidemic period, but it relatively rebounds after the end of the epidemic.

When the public faces unexpected events, they need adaptive psychological coping mechanisms that come from self regulation. Therefore, there are fluctuations in the public's mental health level during the epidemic, especially during the outbreak of the epidemic, the negative emotions of the public significantly increase, and various social support enhances the public's psychological resilience, which is helpful for stabilizing the public's mental health level. This study takes the COVID-19 as the background to reveal the impact of major life events on the physical and mental health of the public. Provide certain predictions and insights on the impact of similar major life events on mental health in the future.

初中生数学焦虑的特征分析——以甘肃省四所学校为例

王姗[1]　李宁[1]　赵峰[1]　买合甫来提·坎吉[1]（通讯作者）

1 新疆师范大学心理学院，乌鲁木齐市，830017，通讯作者 mkanji@163.com

摘 要 前期研究已证实较高水平数学焦虑与较低数学成绩之间存在关联。本研究采用二阶聚类分析和网络分析方法，探究初中生数学焦虑的自然分组并分析高数学焦虑组网络的特征及其潜在干预靶点。以甘肃省1382名初中生为研究对象，对其数学焦虑水平进行测量。二阶聚类分析结果显示，甘肃省初中生数学焦虑水平分三组，分析其特征后，将其命名为高数学焦虑组（27%），中数学焦虑组（48%）和低数学焦虑组（25%）。对高数学焦虑组进行网络分析，结果显示“我最害怕上数学课”是网络中最核心的条目。节点预期影响结果显示，“我最害怕上数学课”，“我担心父母对我的数学成绩感到失望”，“临近数学考试，我会担心数学题出

的是不是很难”和“写数学作业是一件难受的事”四个条目的中心性程度较高。结果表明了高数学焦虑在初中生群体中有较高的发生率；以及父母在孩子数学焦虑发展中的独特作用；同时揭示了“我最害怕上数学课”为高数学焦虑组的最核心的条目，以其为干预靶点制定干预方案，可能在更大程度上降低初中生的数学焦虑水平。考虑到条目“临近数学考试，我会担心数学题出的是不是很难”和“写数学作业是一件难受的事”对高数学焦虑的重要作用，本研究也为中小学双减政策提供了一定的理论依据和支撑。
关键词 数学焦虑，初中生，二阶聚类分析，网络分析

Characteristics Analysis of Math Anxiety Among Junior High School Students: A Case Study of Four Schools in Gansu Province, China

WANG Shan[1], LI Ning[1], ZHAO Feng[1], Mahpiret·KANJI[1]
（1.College of Psychology, Xinjiang Normal University, Urumqi, 830017, China）

Abstract：Previous research has confirmed the association between higher levels of math anxiety and lower math achievement. In this study, we employed second-order cluster analysis and network analysis methods to explore the natural grouping of math anxiety among junior high school students and analyze the characteristics of the high math anxiety group and its potential intervention targets. A total of 1382 junior high school students from Gansu Province were selected as the research subjects, and their levels of math anxiety were measured.The results of the second-order cluster analysis revealed three groups of math anxiety levels among junior high school students in Gansu Province. After analyzing their characteristics, we identified them as the high math anxiety group (27%), the moderate math anxiety group (48%), and the low math anxiety group (25%). Network analysis was conducted on the high math anxiety group, and the results indicated that "I am most afraid of attending math classes" was the central node in the network. The node expected influence results revealed that "I am most afraid of attending math classes," "I worry that my parents will be disappointed with my math grades," "I get anxious about whether math questions in exams will be too difficult," and "Doing math homework is an uncomfortable task" had relatively high centrality levels.These findings indicate a higher prevalence of high math anxiety among junior high school students and highlight the unique role of parents in the development of their children's math anxiety. Moreover, the identification of "I am most afraid of attending math classes" as the core node in the high math anxiety group suggests that developing intervention strategies targeting this specific aspect may significantly reduce math anxiety levels among junior high school students. Considering the importance of the items "I get anxious about whether math questions in exams will be too difficult" and "Doing math homework is an uncomfortable task" in high math anxiety, this research also provides theoretical support for educational policies aimed at reducing academic burdens in primary and secondary schools.In conclusion, our study contributes to a better understanding of math anxiety among junior high school students in Gansu Province and offers potential intervention targets to alleviate high math anxiety. It also provides a theoretical basis and support for educational policies promoting workload reduction in primary and secondary schools.
Key words：Math anxiety, junior high school students, second-order cluster analysis, network analysis

亲子疏离对赴高原工作人员创伤后应激障碍的影响：社会功能的中介作用

郝维红[1] 谭洁滢[1,2] 戴琴[1*]（通讯作者）

1 陆军军医大学士官学校，石家庄，050081
2 重庆大学公共管理学院，重庆，400044
1* 陆军军医大学医学心理系，重庆，400038，E-mail: daiqin101@hotmail.com

摘 要 **背景**：研究证实恶劣自然灾害和亲子疏离都对个体心理健康有害。但较少研究关注恶劣自然环境（如高海拔）和亲子疏离对心理健康，尤其是对创伤后应激障碍的影响。本研究的目的是了解赴高海拔地区工作人员创伤后应激障碍的现状，检验亲子疏离与创伤后应激障碍之间的关系，以及社会功能缺陷在亲子疏离和创伤后应激障碍之间的中介作用。**方法**：采用整群抽样法选择完成高海拔工作 6 个月后的 3642 名工作人员进行人口统计信息、亲子疏离问卷、社会功能缺陷筛查时间表和创伤后应激障碍检查表的问卷调查。**结果**：本研究中，高原工作人员创伤后应激障碍症状的检出率为 3.3%。亲子疏离、社会功能缺陷、创伤后应激障碍症状相互之间都呈正相关关系。年龄（B=0.103，t=2.25，p＜0.05）、亲子疏离感（B=0.214，t=13.833，p＜0.01）和社会功能缺陷（B=1.528，t=21.029，p＜0.01）都显著正向预测创伤后应激障碍症状。此外，社会功能缺陷在亲子疏离对创伤后应激障碍的影响有部分中介作用，效应值为 0.11。**结论**：赴高原工作人员创伤后应激障碍症状的检出率要高于普通人群。亲子疏离不仅直接影响创伤后应激障碍，还会通过社会功能障碍间接影响其严重程度。对于高海拔地区的工作人员，应及时评估其亲子疏离和社会功能情况。对于高海拔环境中的亲子疏离感较高的个体来说，工作团队可以从重塑社会功能方面对亲子疏离感较高的个体进行心理辅导，降低创伤后应激障碍的发生，缓解创伤后应激障碍的症状。
关键词 亲子疏离，社会功能障碍，创伤后应激障碍，高海拔

The Effect of Parent-child Alienation on Post-traumatic Stress Disorder for Workers at High Altitude: the Role of Social Function

Hao Weihong[1], Tan JieYing[1,2], Dai Qin[3*]
1 Faculty of Medical Psychology, Army Medical University, Gaotan Yan Zheng Street, Shapingba District, Chongqing
2 Chongqing University, School of Public Policy and Administration, Shazhong Street, Shapingba District, Chongqing
1* Army Medical University Non-commissioned Officer School, Zhongshan West Road, Shijiazhuang City, Hebei Province

Abstract: **Background:** Research suggests that harsh natural disasters and parent-child alienation are detrimental to individual mental health. However, few studies have focused on the effects of harsh natural environments (e.g., high altitude) and parent-child alienation on post-traumatic stress disorder, especially on post-traumatic stress disorder. The purpose of this study was to understand the current status of post-traumatic stress disorder among workers at high altitude, to examine the relationship between parent-child alienation and post-traumatic stress disorder, and the mediating role of social disability between parent-child alienation and post-traumatic stress disorder. **Method:** Cluster sampling was employed to select 3642 workers six months after completing the work at high altitude for questionnaires on demographic information, inventor of Alienation toward Parents, social disability screening schedule, and post-traumatic stress disorder checklist. **Results:** In this study, the prevalence rate of post-traumatic stress disorder symptoms among workers at high altitude was 3.3%. Parent-child alienation,

social disability, and post-traumatic stress disorder symptoms were all positively associated with each other. Age (B=0.103，t=2.25，p＜0.05), parent-child alienation (B=0.214，t=13.833，p＜0.01), and social disability (B=1.528，t=21.029，p＜0.01) significant positively predicted post-traumatic stress disorder symptoms. Moreover, social disability has a partial mediating effect on the effect of parent-child alienation on post-traumatic stress disorder, the mediating effect size was 0.11. **Conclusion:** The prevalence rate of PTSD-positive symptoms among the workers at high altitude is higher than that among general Chinese adults. Parent-child alienation can not only directly affect the severity of PTSD symptoms, but also indirectly affect it by social disability. For workers at high altitude, parent-child alienation and social function should be assessed in time. For individuals with higher sense of parent-child alienation at high altitude, the team could strengthen the psychological counseling in terms of reshaping social function, reducing the prevalence of PTSD, and relieving PTSD symptoms.

大学生上行社会比较与错失焦虑的关系：反刍思维的中介作用及自悯的调节作用

刘舒琦[1]　林祯秀[1]（通讯作者）　杨甜甜[1]

1 福建医科大学应用心理学系，福州，350122，907438581@qq.com

摘　要：目的：错失焦虑是指因担心错过他人的新奇经历或有意义事件而产生的一种弥散型焦虑。错失焦虑可能由上行社会比较引起，即个体将自己与比自己优秀的人进行比较，由于高社会比较倾向的个体具有更高的社会比较需求，更关注他人的感受，对他人的信息敏感，因而可能引发更高的错失焦虑水平。以往研究多基于线上网络背景视角下进行上行社会比较与错失焦虑之间的关系，较少在日常生活的背景下考察二者之间的关系。为明确在日常生活背景下，上行社会比较对错失焦虑的作用机制，本研究修订了错失焦虑量表使其更贴近日常生活背景，同时构建了一个有调节的中介模型，重点考察反刍思维在二者关系中的中介作用以及自悯的调节作用。方法：以 300 名大学生为被试，采用上行社会比较量表、反刍思维量表、自悯量表及错失焦虑量表进行调查。结果显示：（1）在控制性别、年龄、年级后，上行社会比较对反刍思维和错失焦虑均有显著的正向预测作用；（2）中介效应分析结果表明，反刍思维能够在上行社会比较与错失焦虑的关系之间起部分中介作用，中介效应量为 0.14，中介效应占总效应的 27.45%；（3）有调节的中介模型检验表明，自悯调节了“上行社会比较—反刍思维—错失焦虑”这一中介效应的前半路径(R^2=0.36, F=27.36, P＜0.01)和后半路径(R^2=0.64, F=29.24, P＜0.01)，具体而言，上行社会比较对反刍思维的影响随着大学生自悯水平的升高而减弱，反刍思维对错失焦虑的影响随着大学生自悯水平的升高而升高。此外，随着自悯水平的提升，反刍思维在上行社会比较与错失焦虑关系中的中介效应也呈降低趋势。结论：在日常生活中，上行社会比较同样也会引起错失焦虑，并且上行社会比较通过反刍思维进一步加重错失焦虑，而自悯对于减少反刍思维和降低错失焦虑水平皆有益处。可见，反刍思维在上行社会比较与错失焦虑之间具有重要的作用，因此，提高自悯水平有助于减少个体的反刍思维和错失焦虑水平，为早期明确心理干预目标，帮助大学生调节不良思维倾向和应对方式具有一定的现实意义。
关键词：错失焦虑，上行社会比较，反刍思维，自悯

Upward Social Comparison and College Students' Fear of Missing Out: Mediating Effect of Rumination and Moderating Effect of Self-Compassion

LIU Shuqi，LIN Zhenxiu，YANG Tiantian
Fujian Medical University , Fuzhou, 350122, China

Absrtact: Objective: Fear of missing out refers to a kind of diffuse anxiety caused by the fear of missing out on other people's novel experiences or meaningful events. Fear of missing out may be caused by upward social comparison, in which individuals compare themselves with people who are better than them, and by individuals with a high social comparison tendency who have higher social comparison needs and are more concerned about the feelings of others, being sensitive to other people's information may lead to higher levels of fear of missing out. Previous studies have focused on the relationship between upward social comparison and fear of missing out in the context of online networks, but rarely in the context of daily life. In order to clarify the mechanism of upward social comparison on fear of missing out in the context of daily life, this study revised the fear of missing out scale to make it more close to the context of daily life, and constructed a moderated mediation model, the mediating role of rumination and the moderating role of self-compassion in the relationship between them were investigated. Methods: A total of 300 college students were investigated with the scale of upward social comparison, rumination thinking, self-compassion and fear of missing out. The results showed that: (1) After controlling for sex, age and grade, upward social comparison had significant positive predictive effect on both rumination and fear of missing out; (2) mediation effect analysis showed that upward social comparison had significant positive predictive effect on both rumination and fear of missing out, the mediating effect of rumination was 0.14, and the mediating effect was 27.45% of the total effect. (3) the mediating model test showed that the mediating effect of rumination was 0.14% , and the mediating effect of rumination was 27.45% of the total effect, self-compassion moderated the first half of the mediating effect of"Upward social comparison-ruminating thought-fear of missing out"(R^2= 0.36, F= 27.36, p < 0.01) and the second half of the mediating effect (R^2= 0.64, F= 29.24, p < 0.01) , the effect of upward social comparison on rumination decreased with the increase of college students' self-compassion level, while the effect of rumination on fear of missing out increased with the increase of college students' self-compassion level. In addition, the mediating effect of rumination on the relationship between upward social comparison and fear of missing out also decreased with the increase of self-compassion level. Conclusion:In daily life, upward social comparison also causes fear of missing out, and upward social comparison exacerbates fear of missing out by ruminating, and self-compassion is beneficial for reducing rumination and fear of missing out levels. Therefore, improving the level of self-compassion can help to reduce the level of ruminating thinking and fear of missing out, and make the goal of psychological intervention clear in the early stage, it is of practical significance to help college students adjust their unhealthy thinking tendency and coping style.

Keywords: fear of missing out, upward social comparison,rumination,self-compassion

零工经济时代下感知算法控制对网约车司机离职倾向的影响机制研究

金致君[1] 边晓宁[1] 管圆圆[1] 杨琴[1]（通讯作者）
1 中国地质大学（武汉）应用心理学研究所，武汉，430000，通讯作者 qinyang@cug.edu.cn

摘 要　随着在线劳动平台的出现，零工经济为全民就业探索了新方向，愈来愈多零工劳动者的需求受到社会的广泛关注。作为平台有效监控、管理劳动者的关键手段，算法控制能够辅助零工劳动者更高效迅捷地达成工作目标。但目前学界鲜少有研究从劳动者的角度出发去研究如何利用算法控制去提升他们的工作感受。根据有关数据显示，到 2024 年零工群体数量预计达到 4 亿。因此，如何研究如何降低算法控制下零工劳动者离职意向，对稳定我国就业市场、推动社会经济繁荣发展至关重要。在系统回顾和梳理过往研究的基础上，本文选取零工经济平台中最具代表性的劳动者——网约车司机作为研究对象，以认知交互理为

基础，从工作要求—资源模型出发，引入中介变量阻碍性评估和工作满意度，以及调节变量工作投入，探讨感知算法控制对网约车司机离职倾向的影响路径。研究结果发现：（1）感知算法控制负向预测网约车司机离职倾向；（2）阻碍性评估和工作满意度在感知算法控制与网约车司机离职倾向之间存在链式中介作用；（3）工作投入通过调节感知算法控制对阻碍性评估的负向影响，进而调节阻碍性评估与工作满意度的链式中介作用。通过本文研究可知，从算法管理角度出发，零工劳动平台可以拓宽劳动者与平台互动空间，强化零工劳动者与算法平台的积极联结，引导他们对算法机制形成正向认知，逐步实现从“管控和被管控”到“合作共赢”的良性发展；从组织管理来看，平台合理利用算法控制将提升劳动者工作积极性，增强平台黏性。此外，传统企业也可以通过引入算法控制技术，拓宽劳动者资源平台，充分释放其潜能并为企业创造更大的价值。
关键词　零工经济，算法控制技术，感知算法控制，工作满意度，阻碍性评估

Research on the influence mechanism of perceived algorithmic control on the turnover intention of online car-hailing drivers in the era of gig economy ——A moderated chain mediation model

Jin Zhijun[1]　Bian Xiaoning[2]　Guan Yuanyuan[2]　Yang Qin[2]
Institute of Applied Psychology, China University of Geosciences (Wuhan), No. 388 Lumo Road, Hongshan District, Wuhan City

***Abstract*：** With the emergence of online labor platforms, the gig economy has explored a new direction for national employment, and the needs of more and more gig workers have received extensive attention from the society. As a key means for the platform to effectively monitor and manage workers, algorithmic control can assist gig workers to achieve their work goals more efficiently and quickly. However, there are few studies in the academic community to study how to use algorithmic control to improve their work experience from the perspective of workers. According to relevant data, the number of gig workers is expected to reach 400 million by 2024. Therefore, how to study how to reduce the turnover intention of gig workers under the control of the algorithm is very important to stabilize China 's employment market and promote the prosperity and development of social economy. On the basis of systematic review and combing of previous studies, this paper selects the most representative laborer in the gig economy platform, the online ride-hailing driver, as the research object. Based on the cognitive interaction theory, starting from the job requirement-resource model, this paper introduces the mediating variables hindrance assessment and job satisfaction, as well as the moderating variable work engagement, and discusses the influence path of perceived algorithm control on the turnover intention of online ride-hailing drivers. The research results show that : (1) the perception algorithm controls the negative prediction of the turnover intention of the online ride-hailing drivers ; (2) Hindrance assessment and job satisfaction have a chain mediating effect between perceived algorithm control and turnover intention of ride-hailing drivers. (3) Work engagement moderates the chain mediating effect of hindrance assessment and job satisfaction by adjusting the negative impact of perceived algorithmic control on hindrance assessment. Through research, it can be seen that from the perspective of algorithm management, the gig labor platform can broaden the interaction space

between workers and the platform, strengthen the positive connection between gig workers and the algorithm platform, guide them to form a positive cognition of the algorithm mechanism, and gradually realize the benign development from ' control and controlled ' to ' win-win cooperation ' ; from the perspective of organizational management, the rational use of algorithm control by the platform will enhance the enthusiasm of workers and enhance the stickiness of the platform. In addition, traditional enterprises can also broaden the resource platform of workers by introducing algorithm control technology, fully release their potential and create greater value for enterprises.
Keywords：Gig economy, algorithm control technology, perceptual algorithm control, job satisfaction, hindrance assessment

低权力贪功，高权力避责：权力对自我-他人归因差异的影响及其神经机制

胡文星　俞宗火（通讯作者）
（江西师范大学心理学院，南昌，330022，yuzonghuo@126.com）

摘 要　在社会合作中，领导者和下属的责任归因对于个体的利益和团体的和谐都至关重要，责任归因出现偏差是导致团队冲突的重要原因。已经有大量的研究表明人们在进行责任归因时会表现出自我-他人的差异，如基本归因错误和自我服务偏差。然而权力的高低是否会导致人们在对自我和对他人进行归因时出现差异，目前还缺乏相关证据。本研究共招募 36 个被试，采用近红外光学脑成像技术（fNIRS），考察参与合作任务时，高、低权力者在成功与失败情景下对自己和他人归因差异的影响及大脑皮层的神经活动。结果表明，高、低权力者都表现出强烈的自我服务偏差和基本归因错误，并伴随与自动过程（腹内侧前额叶皮层）和受控过程（内侧前额叶和背内侧前额叶）有关脑区的激活，右侧颞顶联合区也参与这一加工过程。具体来说，对自己进行归因时，相比于任务失败，任务成功时会进行更多的内部归因。对他人进行归因时，无论任务成功与失败，都倾向于进行特质推断。进一步比较对自我和他人的归因差异，相比于他人，低权力者在任务成功时进行更多的自我归因，而高权力者在任务失败时进行更多的外部归因，表现出低权力贪功、高权力避责的现象，此时伴随着受控过程有关脑区的激活。本研究阐述了权力对自我-他人归因差异的影响，以及额顶颞神经网络的关键作用，还讨论了这种偏差现象对团队管理与社会合作的启发。
关键词　权力，自我服务偏差，基本归因错误，归因差异，功能性近红外光学脑成像技术（fNIRS）

The low-power greed for more success, while the high-power take on less responsibility: the effect of power on self-other attribution differences and its neural mechanisms

Hu wenxing　Yu zonghuo
(School of Psychology, Jiangxi Normal University, Nanchang, 330022)

Abstract: The attribution of responsibility by leaders and subordinates matters to both individual interests and group harmony during social cooperation, and biased attribution of responsibility is an important cause of team conflict. Self-other attribution differences, such as fundamental attribution error and self-serving bias, have been widely discussed in attribution research; however, it remains unclear whether and how individuals' sense of power,

such as a high/low level of power, influences their subsequent responsibility attribution to self and others. A total of 36 subjects were recruited for this study, and functional near-infrared spectroscopy methodology (fNIRS) was used to examine the effects of differences in attributions to self and others and neural activity in the cerebral cortex of high- and low-powered individuals in success and failure scenarios when engaged in a cooperative task. The results showed that individuals with high and low power exhibited a strong self-serving bias and fundamental attribution error, accompanied by activation of brain regions associated with automatic (ventral medial prefrontal cortex, VMPFC) and controlled processes (medial prefrontal and dorsal medial prefrontal, MPFC, DMPFC) and that the right temporoparietal joint area (TPJ) was also involved in this processing. Specifically, when making attributions to oneself, more internal attributions are made for task success than for task failure. When making attributions to others, trait inferences tend to be made regardless of task success or failure. Further analysis revealed that power affected self-other attribution difference, compared to others, low-powered individuals made more self-attributions when they succeeded in a task, whereas high-powered individuals made more external attributions when they failed in a task, showing the low-power greed for more success and the high-power take on less responsibility, which was accompanied by activation of brain regions related to controlled processes. Our findings elucidate the influence of power on self-other attribution differences and the critical role of the fronto-temporoparietal network in these processes. Implications of this attribution bias phenomenon for team management and social cooperation are discussed.

Keywords: power, self-serving bias, fundamental attribution error, attribution difference, fNIRS

探究危机情境下的语言能力机制：基于眼动研究的证据

摘 要 语言能力是日常工作和生活中必不可少的能力。前人研究大多考察安静环境或者单一背景声音下的语言加工过程，尚不清楚危机情境下语言能力的机制。危机情境是一种以“高压力”、“强噪音”为特点的特殊情境，是消防员、武警、医生等特殊职业从业者工作中的典型场景。相关从业者需要在这类场景中，快速且准确地捕获重要的语言信息，并在此基础上进行快速精准的推理，以完成任务目标。本研究创设一个火灾救援任务场景的危机情境，招募 110 名大学生被试，从信息捕获、信息推理两个维度考查被试在危机情境和非危机情境下的行为指标和眼动指标的差异，以及他们的行为和眼动模式与个体的执行功能、人格等因素之间的联系。结果表明：（1）相对于非危机情境，危机情境下被试的阅读速度更快、注视次数和回视次数更多、瞳孔直径更大；（2）危机情境调节着个体执行功能与信息推理之间的关系强度。（3）瞳孔直径在情境对注视次数的影响中起部分中介的作用；（4）在人格特征方面与危机情境下表现优秀的被试越相似的个体，其在危机情境下的行为表现越好。这些结果表明，危机情境下高效的阅读过程依赖个体的执行功能、认知卷入和特定的人格特质，本研究拓展了我们对复杂现实场景下的语言能力机制的认识。

Abstract: Language competence is an essential skill in daily life. Previous studies have predominantly focused on language processing in quiet environments or with single background sounds, leaving the mechanisms of language ability in emergencies still need to be clarified. Emergencies present 'high-pressure' and 'strong noise' situations for professionals like firefighters, armed police, and doctors. In such situations, these professionals need to accurately capture important information while reading and inferencing to fulfill their tasks. In the present study, we simulated an emergency fire rescue scenario and recruited 110 college students to participant the experiment. We examined the differences in behavioral and eye movement indicators between participants in emergency and non-emergency situations, focusing on information capture and inference. Additionally, we also explored the relationships between their behavior, eye movement patterns, and individual factors such as executive functions and personality traits. The results revealed the following key findings: (1) compared with the non-emergency situation, participants in the emergency situation had shorter total reading time, more fixation times, more regression times, and larger pupil diameter; (2) the emergency situation modulated the relationship between individual executive functions and information inference; (3) pupil diameter played a partial mediating role in the effect of the situation on fixation times; (4) participants who performed better in the emergency situation showed more similar in personality traits to those individuals who achieved good performance. These results indicate that individuals' reading comprehension in emergency situations depends on their executive functions, cognitive involvement, and certain personality traits. Our study expands our understanding of the mechanisms of language competence in complex real-life scenarios.

焦虑情绪与整体思维对跨期决策的影响

吴琪[1]　毕翠华[2]（通讯作者）

1 四川师范大学心理学院，四川，610066

2 四川师范大学心理学院，成都，610066，cuihuabi@sicnu.edu.cn

摘 要　跨期决策是指对发生在不同时间点上的成本与收益进行权衡进而做出选择的过程。人们在进行决策时，易受到焦虑情绪的影响。焦虑会使人们存在注意偏向、解释偏向和记忆偏向等认知加工特点，也会缩小人们认知活动的范围和过程，为个体的认知加工过程与决策行为的发生提供相应的动机背景。这意味着高焦虑个体在处理信息时存在局部性加工的特点，而跨期决策需要权衡不同时间点上的成本与收益，整合不同时间点的信息进行整体加工和思考，因此整体思维方式可能在其中起到重要作用。基于此，本研究根据决策的双系统理论和信息加工模型，从情绪与认知的相互作用去理解决策行为，试图考察焦虑情绪影响跨期决策中的时间焦点这一心理时间认知的作用，以及焦虑情绪与整体思维对跨期决策的交互影响。实验招募大学生被试 124 名（平均年龄为 20.58 ± 2.09 岁）。所有的被试被随机分配到焦虑组与平静组。焦虑启动组通过视频诱发和写作两项任务去诱发被试焦虑情绪,控制任务下的被试则看一段相对平静的视频。之后被试又被随机分配到能启动不同思维方式的 Navon 任务下，接下来，被试需要完成《时间焦点量表》和跨期决策任务，最后对时间洞察力和特质焦虑水平这两个控制变量进行测量。结果显示：（1）与控制组被试（$M \pm SD = 5.04 \pm 1.23$）相比，焦虑启动组被试（$M \pm SD = 5.68 \pm 1.11$）在现在时间焦点的得分更高($t = 3.02$, $p = 0.003$)；（2）焦虑与整体思维的交互作用显著（$F(1, 120) = 4.08$, $p = 0.046$)。对于采用局部思维方式的个体，焦虑启动组被试的跨期决策延迟折扣率显著高于控制组被试的跨期决策延迟折扣率($F(1, 120) = 6.82$, $p = 0.010$)，而对于启动整体思维的个体，焦虑启动组被试与控制组被试的跨期决策延迟折扣率没有显著差异($F(1, 120) = 2.36$, $p = 0.13$)。（3）时间焦点在焦虑对跨期决策的影响中起完全中介作用。总的来说，焦虑会使个体的时间焦点集中于现在，而较少考虑未来的结果，进而使人们在跨期决策中偏好于即时结果。而当个体采用整体的思维方式去认知事物时，能减少焦虑情绪带来的短视行为。

The Effects of Anxiety and Holistic Thinking on Intertemporal Decision-Making

Wu Qi[1]　Bi Cuihua[2] (Corresponding Author)

[1]School of Psychology, Sichuan Normal University, Chengdu, China

[2]School of Psychology, Sichuan Normal University, Chengdu, 610066, cuihuabi@sicnu.edu.cn

***Abstract*:** Intertemporal decision-making refers to the process of weighing costs and benefits that occur at different points in time and then making choices. People are vulnerable to anxiety when making decisions. Anxiety leads to cognitive processing features such as attentional bias, interpretive bias and memory bias, and also narrows the scope and process of cognitive activity, providing the appropriate motivational context for the individual's cognitive processing and decision-making behaviour to occur. This implies that high anxiety individuals are characterised by localised processing of information, whereas intertemporal decision-making requires weighing up costs and benefits at different points in time and integrating information from different points in time for holistic processing and thinking, and thus holistic ways of thinking may play an important role in this. Based on this, this study understands decision-making behaviour in terms of the interaction between emotion and cognition according to the dual systems theory of decision-making and the information processing model, and tries to examine the role of psychotemporal cognition, in which anxiety affects the temporal focus in intertemporal decision-making, and the interaction between anxiety and holistic thinking on intertemporal decision-making. One hundred and twenty-four college student participants were recruited for the experiment (mean age 20.58 ± 2.09 years). All subjects were randomly assigned to the anxiety group and the calm group. In the anxiety-initiated group, the subjects were given two tasks to induce anxiety through video elicitation and writing, while the participants in the control task watched a relatively calm video. Afterwards, participants were randomly assigned to the Navon task,

which activates different thinking styles. Next, subjects were required to complete the Time Focus Scale and the Intertemporal Decision Making task, and finally, two control variables, temporal insight and trait anxiety level, were measured. The results showed that (1) subjects in the anxiety-initiated group ($M \pm SD = 5.68 \pm 1.11$) scored higher in the present time focus ($t = 3.02$, $p = 0.003$) compared to subjects in the control group ($M \pm SD = 5.04 \pm 1.23$); (2) the interaction between anxiety and global thinking was significant ($F(1, 120) = 4.08$, $p = 0.046$). For individuals who adopted a local thinking style, the inter-period decision delay discount rate of subjects in the anxiety-initiated group was significantly higher than that of subjects in the control group ($F(1, 120) = 6.82$, $p = 0.010$), whereas for individuals who initiated a holistic thinking style, there was no significant difference between the inter-period decision delay discount rate of subjects in the anxiety-initiated group and those in the control group ($F(1, 120) = 2.36$, $p = 0.13$). (3) Temporal focus plays a fully mediating role in the effect of anxiety on intertemporal decision making. Overall, anxiety causes individuals to focus their temporal focus on the present and less on future outcomes, which in turn leads to a preference for immediate outcomes in intertemporal decision making. Whereas, when individuals adopt a holistic way of thinking to perceive things, it can reduce the immediate preference brought about by anxiety.

Keywords：anxiety, time focus, holistic thinking, intertemporal decision making

观看唐宋仕女图与 AI 生成仕女图对身材焦虑者的情绪调节效应

赵月萌[1]　郭嘉跃（通讯作者）

广东工业大学，广州，510000，guojiayue@gdut.edu.cn

摘 要 数字时代网络信息及图片处理技术不断迭代发展为人们调整图片及视频中的外貌提供无限可能，社交媒体中的信息内容良莠不齐，人们常常在无意识状态下受到他人在社交平台上展示的生活和外貌的影响，试图模仿和追求这些看似完美的形象。在此过程中审美偏好及审美判断的变化以及自我映射与对比易导致身材焦虑。传统唐宋仕女图反映了丰满与清瘦差异较大的时代独特审美特点，对应了身材焦虑的两个端点，观看传统艺术作品对情绪调节有积极作用。在数字化时代利用传统画作合理调节由负性社会反馈引发的身材焦虑具有活化传统画作及保护心理健康的双重意义。因此本研究关注身材焦虑问题，探讨观看中国唐宋仕女画和 AI 生成画作对焦虑情绪的调节作用。本研究通过身体形象-负性情绪量表 (Body Image-Negative Affect Scale, BIAS-NAS)筛选高、低焦虑组被试各 16 人，参加 ERP 脑电实验。采用视觉异构对比范式（Visual Oddball Paradigm），考察传统唐代仕女画与 AI 生成仕女画两种实验材料对不同身材焦虑水平被试情绪调节的差异，特别关注数据中的 P300 成分，评估被试对两种视觉刺激的注意和情感处理。观看中国传统国画和 AI 生成画作显著降低了高焦虑组的身材焦虑水平，脑电数据反馈 AI 生成仕女图诱发了 LPC。在高焦虑组中，共情和移情现象均显著增加。在低焦虑组中，观赏中国传统国画和 AI 生成画作均未引起明显情绪变化，脑电数据反馈高焦虑组的 LPC 波幅显著高于低焦虑组。证明中国传统唐宋仕女图和 AI 生成画作在数字化时代下作为情绪调节工具具有潜在价值，对减轻身材焦虑有一定帮助。共情和移情在情绪调节中扮演重要角色，可能进一步促进这种效应。本研究初步探讨了唐代仕女图和 AI 生成画作对身材焦虑情绪的影响，在数字化时代下的心理健康服务和艺术创作实践领域进行初步研究。

Emotion-moderating effects of viewing Tang and Song dynasty ladies' drawings versus AI-generated ladies' drawings in body image anxious individuals

Yuemeng Zhao，Jiayue Guo(Corresponding Author)
Guangdong University of Technology, Guangzhou, 510000，guojiayue@gdut.edu.cn

Abstract：The continuous iterative development of network information and image processing technology in the digital age provides infinite possibilities for people to adjust their appearance in pictures and videos. With the mixed information content in social media, people are often unconsciously influenced by the lives and appearances of others displayed on social media platforms, and they try to imitate and pursue these seemingly perfect images. Traditional Tang and Song Dynasty paintings of ladies reflect the unique aesthetic characteristics of the era with a large difference between plumpness and thinness, which corresponds to the two endpoints of body anxiety, and viewing traditional artworks has a positive effect on emotional regulation. In the digital era, using traditional paintings to reasonably regulate body anxiety triggered by negative social feedback has the dual significance of revitalizing traditional paintings and protecting mental health. Therefore, this study focuses on the issue of body anxiety and explores the effects of viewing Chinese Tang and Song dynasty ladies' paintings and AI-generated paintings on anxiety regulation. In this study, 16 subjects in each of the high and low anxiety groups were screened by the Body Image-Negative Affect Scale (BIAS-NAS) and participated in the ERP EEG experiment. The Visual Oddball Paradigm (VOP) was used to examine the differences between the two experimental materials, the traditional Tang Dynasty painting of a lady and the AI-generated painting of a lady, on the emotion regulation of subjects with different levels of body anxiety, with a special focus on the P300 component in the data, and to assess the subjects' attentional and emotional processing of the two types of visual stimuli. Viewing traditional Chinese paintings and AI-generated paintings significantly reduced the level of figure anxiety in the high-anxiety group, and the EEG data fed back that the AI-generated painting of a lady induced LPC. in the high-anxiety group, both empathy and empathizing phenomena were significantly increased. In the low anxiety group, viewing both traditional Chinese paintings and AI-generated paintings did not induce significant mood changes, and the EEG data feedback that the LPC amplitude of the high anxiety group was significantly higher than that of the low anxiety group. It proves that Chinese traditional Tang and Song dynasty ladies' paintings and AI-generated paintings have potential value as emotion regulation tools in the digital era, and are helpful in reducing body anxiety. Empathy and empathy play an important role in emotion regulation and may further contribute to this effect. This study preliminarily investigates the effects of Tang Dynasty ladies' drawings and AI-generated paintings on body image anxiety, and conducts preliminary research in the field of mental health services and art creation practices in the digital age.

Emoji 对后续文字语句的情绪影响：基于启动效应的探索

戴元富[1]　高晓妍[1]　黄辰[1]　蒋长好[2]（通讯作者）
1 首都体育学院运动科学与健康学院，北京，100191
2 首都体育学院运动脑成像研究中心，北京，100191，jiangchanghao@cupes.edu.cn

摘 要 Emoji 作为一种全球广泛使用的日式图形符号，在网络交流中具有强大的情绪功能，能够填补缺失的情绪线索。然而在多样的网络交流中，除了 emoji 具有情绪线索外，文字语句本身也可能带有情绪线索。本研究旨在探究 emoji 对于后续文字语句的情绪影响，并分析不同情绪效价的 emoji 和文字语句的相互作用效果。研究招募了 30 名每天使用社交软件超过 2 小时的大学生，并采用间接启动范式，进行了两个递进的行为实验。两个实验均采用 2（emoji 效价：积极、消极）×3（文字句效价：积极、中性、消极）被试内设计，其中实验 1 以 emoji 为启动刺激，对文字语句进行反应，收集反应时和正确率；实验 2 以 emoji 和文字语句为启动刺激，对 emoji 和文字语句形成的组合语句进行反应，收集反应时和效价程度。结果显示在实验 1 中，emoji 和文字句效价一致时正确率最高，而不论 emoji 刺激是积极还是消极，中性文字句正确率最低；emoji 效价为积极时，反应时间快于效价为消极时。在实验 2 中，emoji 与文字句效价一致的反应时间快于效价冲突时，积极 emoji 与中性文字句的组合反应时间快于消极 emoji 与中性文字句的组合；含积极 emoji 的组合句效价程度均高于含消极 emoji 的组合句，不论 emoji 是积极还是消极，由积极文字句构成的组合句效价程度总是高于中性文字句构成的组合句，最低的是消极文字句构成的组合句。上述结果表明：（1）emoji 对于后续文字语句存在情绪启动效应；（2）emoji 的情绪影响起辅助作用，文字句效价起决定作用；(3) emoji 与文字句情绪线索的差异会导致加工速度不同，且这一过程带有积极偏好。

Emotional impact of Emoji on subsequent textual sentences: an exploration based on priming effects

Yuanfu DAI[1] Xiaoyan GAO[1] Chen HUANG[1] Changhao JIANG[2]

1 School of Kinesiology and Health, Capital University of Physical Education and Sports, Beijing

2 The Center of Neuroscience and Sports, Capital University of Physical Education and Sports, Beijing

Abstract：Emoji, a Japanese graphic symbol widely used worldwide, has a powerful emotional function in online communication, filling in missing emotional cues. However, in diverse online communication, in addition to emoji having emotional cues, textual sentences themselves may also carry emotional cues. This study aimed to investigate the emotional impact of emoji on subsequent textual sentences and to analyse the interaction effects of emoji and sentences with different emotional valence. The study recruited 30 college students who used social software for more than 2 hours per day and conducted two progressive behavioural experiments using an indirect priming paradigm. Both experiments used a 2 (emoji valence: positive, negative) × 3 (textual sentence valence: positive, neutral, negative) within-subjects design, in which Experiment 1 used emoji as the initiating stimulus and responded to textual sentences to collect response times and correct rates, and Experiment 2 used emoji and textual sentences as the initiating stimuli, and responded to combined sentences formed by emoji and textual sentences to collect reaction time and the degree of valence. The results showed that in Experiment 1, the highest correct rates were found when the emoji and textual sentences were of the same valence, whereas neutral textual sentences had the lowest correct rates regardless of whether the emoji stimulus was positive or negative. Response times were faster when the emoji valence was positive than when the valence was negative. In Experiment 2, emoji and textual sentences are faster when valence is congruent than when validity is conflicting. The reaction time for the combination of positive emoji with neutral textual sentences was faster than the combination of negative emoji with neutral textual sentences. The combination of sentences containing positive emoji had a higher degree of valence than that of negative emoji, and the combination of positive textual sentences always had a higher degree of valence than that of neutral textual sentences, irrespective of the emoji's positive or negative valence. The

lowest is the one composed of negative emoji. The above results suggest that: (1) emoji has an emotional priming effect on subsequent textual sentences; (2) the emotional impact of emoji plays a secondary role, while the textual sentence valence plays a decisive role; (3) the difference between the emotional cues of emoji and textual sentences leads to different processing speeds, and this process has a positive preference.
Keywords：emoji; emotional priming effect; emotional cues; congruent effect

青年孤独感对抑郁的影响研究：一个链式中介模型

刘耀娜[1]　王挺[2]（通讯作者）
1 江西中医药大学，南昌，330004
2 江西中医药大学人文学院，南昌，330004，2935126547@qq.com

摘 要　青年是个体走向成人世界，迈入社会生活的准备时期，其标志性事件主要有离开家庭告别父母，升学接受更高教育，进入求职就业阶段，走入恋爱婚姻关系等等。这些事件都会给青年人的内心造成冲击和压力。近年来，青年的抑郁症状检出率显著高于其他年龄段成人，且易感性呈逐年上升的趋势，提示青年的心理健康问题的预防和干预需要得到重视。本研究立足于帮助青年更好地度过这一过渡阶段，对青年心理健康问题中的抑郁症状进行研究。青年普遍面临着旧链接的断裂与新联系的缺乏，因此十分容易体验到孤独感。研究表明，孤独感与抑郁之间存在明显的正相关关系，并且孤独感是抑郁的一个前因变量。生命意义寻求和生命意义存在是生命意义感的两个维度。研究证明，生命意义存在是一个心理健康的保护性因素，与孤独感和抑郁均存在密切关联，而生命意义存在可被看作是通过生命意义寻求转移的一种认知资源，即进行生命意义寻求可以获得生命意义存在。本文在前人研究的基础上，探究孤独感、生命意义寻求、生命意义存在对抑郁的影响机制。本研究使用孤独感量表(UCLA)、生命意义寻求量表(MLQ-S)、生命意义存在量表(MLQ-P)、流行病学研究中心抑郁量表(CES-D)进行调查研究，通过网络问卷调查法收集了 646 份问卷，通过筛查，最终得到了有效的 608 份。选用 spss26.0 软件及 process3.5 插件对回收数据进行处理和分析，统计方法包括信度检验、描述性统计分析、独立样本 t 检验、单因素方差分析、相关分析、回归分析、中介效应检验等。结果如下：农村的青年群体和城市青年群体的孤独感（$p<0.01$），抑郁（$p<0.05$）水平上存在显著差异。生命意义寻求与孤独感显著负相关（$r=-0.212$），生命意义寻求与抑郁显著负相关（$r=-0.176$）。生命意义寻求和生命意义存在在孤独与抑郁的关系中链式中介效应显著。本研究的结论是生命意义寻求与生命意义存在在孤独感与抑郁的关系中存在链式中介效应。青年的孤独感既可以直接影响抑郁症状，还可以通过影响生命意义寻求进而影响生命意义存在，最终对抑郁产生影响。

Research on the impact of loneliness on depression depression in youth: a chain mediated model

Yaona Liu[1]　Ting Wang[2]
1Jiangxi University of Chinese Medicine,NanChang,330004
2Jiangxi University of Chinese Medicine, Faculty of Humanities,NanChang,330004

Abstract：Youth is the preparation period for individuals to go to the adult world and enter the social life. Its symbolic events mainly include leaving the family and saying goodbye to their parents, going to school to receive

higher education, entering the stage of job hunting and employment, entering into love and marriage, and so on. These events will bring shock and pressure to the hearts of young people. In recent years, the detection rate of depressive symptoms in young people is significantly higher than that in adults of other ages, and the susceptibility is increasing year by year, suggesting that the prevention and intervention of mental health problems in young people should be paid attention to. This study is based on helping young people better through this transition stage, to study the depressive symptoms of young people's mental health problems. Young people are generally faced with the breaking of old links and the lack of new connections, so it is very easy to experience loneliness. Studies have shown that there is a significant positive correlation between loneliness and depression, and loneliness is an andextral variable of depression. Life meaning seeking and life meaning existence are two dimensions of life meaning sense. Studies have proved that the existence of meaning of life is a protective factor for mental health, which is closely related to loneliness and depression, and the existence of meaning of life can be regarded as a cognitive resource transferred through the meaning of life seeking, that is, the existence of meaning of life can be obtained through the meaning of life seeking. On the basis of previous studies, this paper explores the mechanism of loneliness, the search for meaning of life and the existence of meaning of life on depression. In this study, we used University of California Loneliness at Los angels (UCLA), The search for meaning subscale (MLQ-S), The presence of meaning subscale (MLQ-P), and The Center for Epidemiological Studies Depression Scale(CES-D) for investigation and research. A total of 646 questionnaires were collected through online questionnaire survey method, and effective 608 were ultimately obtained through screening. The spss 26.0 software and the process3.5 plug-in process and analyze the collected questionnaire data. The statistical methods include reliability test, descriptive statistical analysis, independent sample t-test, one-way anova, correlation analysis, regression analysis, mesomeric effect test, etc. The results were as follows: There were significant differences in loneliness ($p < 0.01$) and depression ($p < 0.05$) between rural youth and urban youth.Meaning seeking was negatively correlated with loneliness ($r=-0.212$), and meaning seeking was negatively correlated with depression ($r=-0.176$). The relationship between loneliness and depression is significantly mediated by the link between life meaning seeking and life meaning existence.The conclusion of this study is that the relationship between loneliness and depression is mediated by a chain between life meaning seeking and life meaning existence. Young people's loneliness can not only directly affect the symptoms of depression, but also affect the existence of meaning of life through affecting the meaning of life, and finally affect depression.

Keywords：loneliness, depression, the search for meaning, the presence of meaning, chain intermediary

摘 要 目的：暴露在应激事件下的医学生会产生一定的心理应激反应，造成心理健康损害。疫情常态化防控开始阶段对医学生心理应激反应带来极大影响，本研究旨在采用机器学习模型探究新冠疫情全面常态化管理的初始阶段医学生的心理应激反应情况，并识别与分析导致负性情绪反应的风险因素。方法：利用问卷星平台对某省 979 名医学生开展问卷调查，收集人口学与新冠病毒防护行为、控制感、社会支持等心理量表数据。利用动态聚类分析区别医学生是否存在负性情绪应激反应，并建立不同机器学习模型，评价其对负性情绪的预测能力。在此基础上，选择较优模型探索疫情常态化管理下医学生负性情绪反应的风险因素。结果：（1）结果发现，随机森林模型预测医学生负性情绪上表现最佳（通过 10 折交叉验证生成的随机森林模型准确率为 97.1%，Kappa 系数为 0.942）。（2）30.8%医学生存在负性情绪应激反应，进一步通过随机森林模型预测，发现负性情绪的预测准确率为 81.3%、灵敏度为 78.4%、特异度为 84.3%、阳性

预测值为 83.3%、阴性预测值为 79.6%，表明随机森林模型具有较高的稳定性与准确度。（3）通过随机森林模型分别预测负性情绪中抑郁、焦虑、压力三个子维度分类的正确性，准确率分别为 85.2%、87%和 90.3%，表明随机森林模型可以对负性情绪及其子维度进行准确有效的分类。（4）在此基础上，进一步以人口学特征、新冠病毒防护行为、新冠疫情应对方式、控制感、社会支持及恐慌情绪为自变量，负性情绪为因变量，分析其对负性情绪应激反应产生影响的因素，结果发现消极应对方式、和恐慌情绪是影响负面情绪应激反应产生的重要风险因素，而控制感、社会支持为是心理应激反应的保护因素。结论：基于大量的人口学与心理特征调查，通过使用不同机器学习训练模型分析，识别医学生在应激下的心理反应，其中消极的应对与恐慌情绪是导致负性情绪反应升高的危险因素，个体的控制感与社会支持对负性情绪反应具有较强的保护作用。可见，随机森林模型可作为医学生在公共卫生事件下应激下负性情绪的预测工具，因此，可以根据研究结果明确对医学生的早期干预目标，提高干预的效果是具有重要意义的。

Identification of Risk Factors for Predicting Psychological Stress in Medical Students Based on Machine Learning Models

YANG Tiantian，LIN Zhenxiu，LIU Shuqi
Fujian Medical University , Fuzhou, 350122, China

Absrtact: Objective: Medical students exposed to stressful events can develop certain psychological stress responses that cause mental health damage. The beginning stage of normalized epidemic prevention and control brings great impact on the psychological stress reaction of medical students, and this study aims to explore the psychological stress reaction of medical students in the initial stage of the full-scale normalized management of the new crown epidemic by using a machine learning model, and to identify and analyze the risk factors that lead to negative emotional reactions. Methods: A questionnaire survey was conducted on 979 medical students in a province using the Questionnaire Star platform to collect data on demographic and neocoronavirus protective behaviors, sense of control, social support, and other psychological scales. Dynamic cluster analysis was utilized to distinguish whether medical students had negative emotional stress reactions, and different machine learning models were established to evaluate their predictive ability for negative emotions. On this basis, the better model was selected to explore the risk factors of negative emotional reactions of medical students under the normalized management of the epidemic. Results: (1) It was found that the random forest model performed the best on predicting negative emotions of medical students (the accuracy of the random forest model generated by 10-fold cross-validation was 97.1%, and the Kappa coefficient was 0.942). (2) 30.8% of medical students survived negative emotional stress reactions, which were further predicted by the random forest model, and found that the prediction accuracy of negative emotions was 81.3%, sensitivity was 78.4%, specificity was 84.3%, positive predictive value was 83.3%, and negative predictive value was 79.6%, which indicated that the random forest model had a high degree of stability and accuracy. (3) The accuracy of predicting the correctness of the classification of the three sub-dimensions of depression, anxiety and stress in negative emotions through the random forest model was 85.2%, 87% and 90.3%, respectively, indicating that the random forest model can accurately and effectively classify negative emotions and their sub-dimensions. (4) On this basis, demographic characteristics, neocoronavirus protective behaviors, neocoronavirus outbreak coping styles, sense of control, social support, and panic as independent variables, and negative emotions as dependent variables, were further

analyzed for the factors that influence the generation of negative emotional stress response, and it was found that negative coping styles, and panic are important risk factors that influence the generation of negative emotional stress response, while sense of control, social support for are protective factors for psychological stress reactions. Conclusion: Based on a large number of demographic and psychological characteristics investigations, the psychological responses of medical students under stress were identified by analyzing them using different machine learning training models, in which negative coping and panic were risk factors for elevated negative emotional responses, and the individual's sense of control and social support had a strong protective effect on negative emotional responses. It can be seen that the random forest model can be used as a predictive tool for negative emotions under stress in medical students under public health events, so it is of great significance that early intervention goals for medical students can be clarified based on the results of the study to improve the effectiveness of the intervention.

脑电神经反馈训练对运动表现的影响：元分析研究

安心[1]，郑名扬[1]，邵永聪[1](通讯作者）

1 北京体育大学心理学院，北京，100084，budeshao@bsu.edu.cn

摘 要 卓越的运动表现总是令运动员心向往之。如何提高运动表现不可避免地成为运动心理学工作者的重要研究课题。神经反馈训练（Neurofeedback Training，NFT）作为一种生物反馈方法，通过向参与者实时反馈大脑信号引导其自主调节大脑皮层的激活模式，从而达到治疗精神疾病、提升运动表现、促进睡眠质量等目标。然而，过往实证研究对 NFT 对运动表现影响的结果并不一致，且并未在大样本中系统性探讨影响 NFT 有效性的因素。基于以上问题，本研究选取采用 NFT 的随机对照实验进行元分析，以评估其促进运动表现的有效性。此外，通过亚组分析，评估 NFT 对运动表现的影响是否受到受试者运动经验和 NFT 指导语类型的影响，并为 NFT 的实际应用提供更有针对性的建议。在 Web of Science, PubMed, PsycINFO, Science Direct 平台上检索 1991 年 1 月至 2023 年 3 月 31 日发表的相关研究后，从 804 篇研究中筛选因变量为运动表现且为 NFT 随机对照实验的研究纳入。由两名作者共同确定纳入标准并筛选文章和提取数据。随后，采用 Cochrane 偏倚风险工具评估纳入研究的质量。使用随机效应模型计算 Hedge’s g 和 95%置信区间 (CI)。最终共有 8 项随机对照实验 (178 名参与者) 符合纳入标准，没有一项研究在所有方面具有低偏倚风险。元分析结果显示，NFT 对运动表现无显著影响 (Hedges’s g = 0.13, 95% *CI* [-0.44-0.70], $p = 0.67$)。以运动经验和指导语类型进行亚组分析，各组在 NFT 效果上也均无显著差异 (知识经验：$p = 0.73$；指导语类型：$p = 0.44$)。本研究未发现 NFT 对运动表现的促进作用，同时运动经验和指导语类型并非调节因素。此外，结合漏斗图和 Egger 检验评估发表偏倚，结果表明存在发表偏倚可能性较低（$t = 0.86$, $p = .41$）。未来相关实证研究需格外注意安慰剂效应的排除，并结合训练次数、训练内容和参与者基本情况对最佳 NFT 训练方案加以探索。

The effect of electroencephalographic neurofeedback training on sports performance: A meta-analysis study

Xin An[1], Ming-Yang Cheng[1], Yongcong Shao[1*]

1 School of Psychology, Beijing Sport University, Beijing, 100084, China, budeshao@bsu.edu.cn

Abstract: Optimal athletic performance is a constant pursuit for athletes. Consequently, enhancing athletic performance has emerged as a significant research area within the field of sport psychology. Neurofeedback Training (NFT), guides participants to independently regulate the activation pattern of the cerebral cortex through real-time feedback of brain signals, so as to achieve the goals of treating psychiatric disorders, improving athletic performance, and promoting the quality of sleep, etc. Nonetheless, the findings from prior empirical studies investigating the impact of NFT on exercise performance have yielded inconsistent results, while factors influencing the efficacy of NFT in larger sample sizes remain unexplored. Based on the above issues, this study selected randomized controlled trials using NFT for meta-analysis to assess its effectiveness in promoting athletic performance. In addition, subgroup analyses were conducted to assess whether the effect of NFT on athletic performance was influenced by subjects' sport experience and the type of NFT instruction. After searching for relevant studies published from January 1991 to March 31, 2023 on Web of Science, PubMed, PsycINFO, and Science Direct platforms, studies whose dependent variable was sport performance and were randomized controlled trials of NFT were screened for inclusion from 804 studies. Two authors worked together to determine the inclusion criteria and screen articles and extract data. Subsequently, the Cochrane Risk of Bias tool was used to assess the quality of the included studies. Hedge's g and 95% confidence intervals (CI) were calculated using a random effects model. A total of eight randomized controlled trials (178 participants) ultimately met the inclusion criteria, and none of the studies had a low risk of bias in all aspects. Results of the meta-analysis showed no significant effect of NFT on athletic performance (Hedges' g = 0.13, 95% CI [-0.44-0.70], p = 0.67). Subgroup analyses with sport experience and type of instruction also showed no significant differences in the NFT effect in any of the groups (sport experience: p = 0.73; type of instruction: p = 0.44). The present study did not observe a facilitating effect of NFT on athletic performance. Furthermore, the variables of sport experience and type of instruction were not identified as moderators in this context. In addition, the combination of funnel plot and Egger's test to assess publication bias indicated a low likelihood of publication bias (t = 0.86, p = .41). Future studies should focus on excluding the placebo effect and optimizing the NFT training regimen by considering the number of sessions, training content, and participant profiles.

基于模糊数学方法评价自动驾驶接管绩效

朱圆圆[1]　杨艳群[2]　王越[1]　郑新夷[1]（通讯作者）

1 福州大学人文社会科学学院，福州，350108，zhengxinyi@fzu.edu.cn

2 福州大学土木工程学院，福州，350108

摘 要　在有条件自动驾驶条件下，驾驶员接管性能一直是一个潜在的安全问题。影响接管性能的因素有系统和人为因素，并且由于接管是由认知、识别和判断一系列过程组成的复杂行为过程，需要多个指标去衡量它。因此，本研究基于模糊数学的综合评价方法，探讨接管前置时间、驾驶信任、情绪唤醒和性别因素对接管绩效的综合影响。研究过程采用问卷调查与实验相结合的方法，问卷采用《自动驾驶车辆信任态度量表》，实验部分采用 E-Prime 软件设计实验方案。使用接管反应时、判断反应时和判断准确率这 3 个指标对接管绩效进行评价，运用模糊数学理论对这三个指标进行赋值并计算接管绩效总分，同时比较各条件下接管绩效的差异。

本研究评价了 131 名参与者的表现，发现情绪唤起对接管反应时和判断反应时的主效应显著，性别因素对判断反应时的主效应显著;在交互效应方面，情绪唤起与性别因素对接管反应时的交互作用显著，前置

时间与情绪唤醒对判断准确率的交互作用显著。整合三项指标后，对接管绩效差异显著的变量进行模糊综合评价，结果发现：首先，3s 前置时间（F=86.2625）的接管绩效最好，8S 前置时间（F=85.0575）的接管绩效最差，但在唤起中性情绪时，5S 的接管绩效最好，3S 的接管绩效最差;其次，低驾驶信任度的参与者接管绩效优于高信任度的参与者;再次，男性驾驶员的接管绩效优于女性驾驶员;最后，驾驶员在唤起中性情绪时的接管绩效优于积极情绪时的接管绩效，在性别与情绪的交互中，表现为男性驾驶员在唤起中性情绪后表现最好，但在唤起积极情绪后接管的绩效最差。

这些结果表明，前置时间会影响驾驶员接管性能;对自动驾驶系统高度信任的驾驶员接管的风险更大;情绪对驾驶员接管绩效的影响较大，在中性情绪下，适当延长前置时间有助于提高驾驶员接管绩效，男性驾驶员比女性驾驶员更容易受到情绪的影响。因此，这项研究的主要结论是，驾驶员的情绪稳定性有利于男性驾驶员在紧急情况下接管车辆。

Evaluate the performance of autonomous driving takeover based on fuzzy mathematical methods

Zhu YuanYuan[1]　Yang YanQun[2]　Wang Yue[1]　Zheng XinYi[1]

1 School of Humanities and Social Sciences, Fuzhou University, Fuzhou

2 College of Civil Engineering, Fuzhou University, Fuzhou

Abstract：Driver takeover performance has always been a potential safety issue under conditional autonomous driving conditions. The factors that affect the performance of takeover are systemic and human factors, and because takeover is a complex behavioral process composed of a series of processes of cognition, recognition, and judgment, multiple indicators are needed to measure it. Therefore, based on the comprehensive evaluation method of fuzzy mathematics, this study explores the comprehensive effects of takeover lead time, driving trust, emotional arousal and gender factors on takeover performance.The research process adopts a combination of questionnaire survey and experiment, the questionnaire adopts the "Autonomous Vehicle Trust Attitude Scale", and the experimental part adopts E-Prime software to design the experimental protocol. The takeover performance was evaluated by using the three indicators of takeover response, judgment reaction and judgment accuracy, and fuzzy mathematical theory was used to assign the values of these three indicators and calculate the total score of takeover performance, and the differences in takeover performance under various conditions were compared.

This study evaluated the performance of 131 participants and found that emotional arousal had a significant main effect on takeover response and judgment response, and gender factors had a significant main effect on judgment response. In terms of interaction effects, the interaction between emotional arousal and gender factors on takeover response was significant, and the interaction between lead time and emotional arousal on judgment accuracy was significant.After integrating the three indicators, a fuzzy comprehensive evaluation of the variables with significant differences in takeover performance shows that:Firstly, the takeover performance of 3S lead time (F=86.2625) was the best, and the takeover performance of 8S lead time (F=85.0575) was the worst, but when it evoked neutral emotions, the takeover performance of 5S was the best and the takeover performance of 3S was the worst. Second, participants with low driving trust took over better performance than participants with high confidence; Again, male drivers outperformed female drivers in takeover; Finally, the driver's takeover performance when evoking neutral emotions was better than when positive emotions were taken over, and in the interaction between gender and emotion, male drivers performed best after evoking neutral emotions, but took over the worst performance after evoking positive emotions.

These results suggest that lead time affects driver takeover performance; Drivers who have a high degree of trust in the autonomous driving system are at greater risk of taking over; Emotions have a greater impact on driver takeover performance, and under neutral emotions, appropriately extending the lead time can help improve driver takeover performance, and male drivers are more susceptible to emotions than female drivers. Therefore, the main conclusion of this study is that the emotional stability of the driver favors male drivers taking over the vehicle in an emergency.

焦虑在公交车驾驶员心理健康中的独特作用：一项网络分析研究

罗晓红[1] 陈婷婷[1] 杨珍芝[12] 曾红[1]

1 广州大学教育学院，广州，510006

2 北京师范大学–香港浸会大学联合国际学院，珠海，519087

通信作者：曾红，E-mail：zhh0791@163.com

摘 要 公交车驾驶员心理健康状况是公共交通安全运行的基础与保障。掌握驾驶员的心理健康水平及分布规律，可及早发现潜藏的问题和风险因素，为日后开展驾驶员心理健康干预、减少违法事故提供参考依据。目的：本研究旨在评估公交车驾驶员心理健康状况，并利用网络分析的方法探讨其不同心理症状之间的相互关系。方法：采用中文版症状自查量表(Symptom Check List-90, SCL-90)测量广东某市公交车驾驶员的心理健康状况，共有 1007 名驾驶员的数据纳入本研究。心理症状网络分析采用中心性指标预期影响(Expected Influence, EI)来考察中心成分，并将桥接期望影响值(Bridge Expected Influence, BEI)的最高点作为桥接成分，探索公交车驾驶员心理症状网络的维持和发展机制。结果：本研究发现，公交车驾驶员心理症状检出率为 8.44%。其中，焦虑因子得分在公交车驾驶员心理症状网络中的预期影响最高，其次分别是抑郁因子和精神病症因子。通过三个因子上各条目的得分构建焦虑、抑郁和精神病症的桥接网络，桥预期影响的稳定性良好(CS=0.60)，其中，焦虑因子中的“感到熟悉的东西变陌生或不像是真的”桥预期影响值最高，其次是焦虑因子中的“感到要赶快把事情做完”。结论：本研究结果表明，焦虑是公交车驾驶员心理症状网络的关键成分，提示焦虑在激活其他节点间发挥着重要作用，并对整个心理症状网络的维持有重要影响，以焦虑因子为靶点的干预措施可能会更大程度上提升公交车驾驶员整体的心理健康水平。

The unique role of anxiety in mental health of bus drivers: A network analysis

LUO Xiaohong[1], CHEN Tingting[1], YANG Zhenzhi[12], ZENG Hong[1]

1. Department of Psychology, Guangzhou University, Guangzhou 510006, China
2. Beijing Normal University-Hong Kong Baptist University United International College, Zhuhai 519087, China

Abstract: The psychological well-being of bus drivers is the foundation and guarantee for the safe operation of public transportation. Understanding the psychological health level and distribution patterns of drivers can help

identify hidden problems and risk factors in a timely manner, providing a reference for future interventions to improve driver's psychological health and reduce traffic violations. Objective: This study aims to assess the psychological well-being of bus drivers and explore the relationships between different psychological symptoms using network analysis. Methods: The Chinese version of the Symptom Check List-90 (SCL-90) was used to measure the psychological well-being of bus drivers in a city in Guangdong Province. Data from 1007 drivers were included in this study. Network analysis of psychological symptoms was conducted using the centrality index of Expected Influence (EI) to examine central components, and the highest point of Bridge Expected Influence (BEI) was identified as the bridging component to explore the maintenance and development mechanisms of the psychological symptom network among bus drivers. Results: The study found that the detection rate of psychological symptoms among bus drivers was 8.44%. Among them, the anxiety factor had the highest expected influence in the psychological symptom network of bus drivers, followed by the depression factor and the psychotic symptom factor. Anxiety, depression, and psychosis bridge networks were constructed based on the scores of items in the three factors. The stability of bridge expected influence was good (CS=0.60). Among them, the item "Feeling that familiar things are strange or not real" had the highest bridge expected influence in the anxiety factor, followed by the item "Feeling pushed to get things done." Conclusion: The results of this study indicate that anxiety is a key component of the psychological symptom network among bus drivers. It suggests that anxiety plays an important role in activating other nodes and has a significant impact on the maintenance of the entire psychological symptom network. Interventions targeting anxiety may have a greater impact on improving the overall psychological well-being of bus drivers.

大学生应激生活事件与睡眠问题及抑郁体验的关系：情绪调节的中介作用及其性别差异

李庆一[1]，叶学鉴[1]，李葆明[1]，王春杰[1*]
1 杭州师范大学脑科学研究所，杭州，3311121

摘 要　本研究的目的是调查大学生应激生活事件与睡眠问题和抑郁体验的关系，并探讨情绪调节策略和性别在这种关系中的作用。本研究在杭州市某大学招募 1451 名在校大学生（899 名女性和 552 名男性，平均年龄 19.68 岁，标准差为 1.61）。对所有被试，应用青少年生活事件自评量表测量应激生活事件，应用匹兹堡睡眠质量指数量表测量睡眠质量，应用抑郁体验问卷测量两种常见的抑郁体验（自我批评和无助），应用情绪调节问卷测量两种常见的情绪调节策略（表达抑制和认知重评）。研究结果：1）应激生活事件与自我批评和无助呈正相关，与睡眠质量呈负相关；2）对于男性被试，表达抑制在应激生活事件对自我批评和无助的影响中起部分中介作用，但在女性被试中没有发现类似的中介作用；3）对于女性被试，认知重评在应激生活事件与睡眠质量之间的关系中起到部分中介作用，但在男性被试中没有发现类似的中介作用。以上结果表明，应激生活事件与睡眠质量及心理健康之间的关系非常复杂，受情绪调节策略和性别的影响。本研究结果对如何有效预防和减少青年高危群体的睡眠障碍和心理健康问题具有指导意义。

Relationships of stressful life events with sleep problems and

depressive experience in university students: the mediating role of emotion regulation and its gender difference

Qingyi Li[1], Xuejian Ye[1], Bao-ming Li[1], Chunjie Wang[1*]
[1] Institute of Brain Science, Hangzhou Normal University, Hangzhou 311121, China

Abstract： The present study investigated the relationships between stressful life events with sleep quality and depressive experience in Chinese university students and to probe the potential mediating role of emotion regulation. A total of 1451 university students (552 males and 899 females, mean age = 19.68, SD = 1.61) were recruited. For all the participants, the Adolescent Self-Rating Life Events Checklist was used to measure the experience of stressful life events, the Pittsburgh Sleep Quality Index to measure sleep quality, the Depressive Experience Questionnaire to measure two commonly-seen depressive experience (self-criticism and dependency), and the Emotion Regulation Questionnaire to measure two commonly-used emotion regulation strategies (cognitive reappraisal and expressive suppression). The results show that, 1) experience of stressful life events was positively associated with self-criticism and dependency but negatively with sleep quality; 2) cognitive reappraisal partially mediated the relationship between stressful life events and sleep quality in female but not male subjects; 3) expressive suppression partially mediated the relationships of stressful life events with both self-criticism and dependency in male and female subjects. Taken together, the present results indicate that stressful life events not only directly affect the sleep quality and depressive experience of university students, but also indirectly affect sleep quality and depressive experience through affecting the use of different emotion regulation strategies. These results provide enlightenment for designing interventions aimed at reducing sleep disturbances and mental health problems for at-risk young adults.

创伤经历者的失眠困扰与社会支持：一项静息态脑功能磁共振 ReHo 特征初步比较

刘奕浓[1]　郭云霄[1]　赵子仪[1]　阮君[1]　刘斯君[1]　任志洪[1]（通讯作者）
[1]青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘 要　**背景：**创伤经历者是指经历或目睹异乎寻常的灾难性威胁事件后的个体，部分个体会出现再体验、回避、认知和情绪的负性改变、唤起和反应的改变以及入睡困难、失眠等症状。但尚未有研究探究创伤经历者的失眠困扰与社会支持相关脑机制。**目的：**通过静息态脑功能磁共振成像采集脑功能数据进行脑局部一致性 ReHo (regional homogeniety)分析，探讨有失眠困扰的创伤经历者与睡眠正常的创伤经历者的脑功能差异及其与临床症状以及社会支持的相关性。**材料与方法：**招募 15 例有失眠困扰的的创伤经历者和睡眠正常的创伤经历者 32 例，31 例健康对照组(Healthy Control，HC）,评估创伤后应激障碍症状、解离等临床症状以及社会支持得分。其中所有创伤经历者，应经历过创伤性事件且创伤后应激障碍症状筛查量表得分不低于 31 分。失眠困扰创伤组被试失眠严重程度指数量表得分高于 15 分，且自我报告存在失眠困扰。使用量表评估创伤后应激障碍症状、解离等临床症状以及社会支持得分。采用 DPARSF 5.0 处理核磁数据,SPSS 软件包检验三组 ReHo 差异脑区与临床量症状与社会支持的相关性。**结果：**两组创伤经历者的人口统计学

资料和临床症状评分无显著差异。相对睡眠正常组，失眠困扰组右侧小脑前叶，右侧额中回，左侧海马旁回的 ReHo 值更高，左侧颞上回、右侧颞上回 ReHo 值更低。相对健康对照，失眠困扰组右侧颞叶梭状回、脑干、前扣带回 ReHo 值更低，左侧叶下核外、颞上回 ReHo 值降低，右侧额上回、额中回半球间 ReHo 值更高。此外，睡眠正常组相对于 HC 组，右侧枕叶、颞中回 ReHo 值降低，右侧顶叶，后扣带 ReHo 值升高。相关性分析显示,失眠困扰组左侧海马旁回、左侧颞上回 ReHo 值与医疗社会支持量表 (Medical Outcomes Study Social Support Survey,MOS-SSS)社会互动性合作分量表评分负相关(p = 0.039,r= -0.54), (p = 0.025,r= -0.57)，左侧左叶下核外 ReHo 值与 MOS-SSS 实际性支持分量表评分正相关(p = 0.018,r= 0.60)。睡眠正常组右侧颞中回 ReHo 值与解离得分 (Somatoform Dissociation Questionnaire, SDQ-5) 负相关(p = 0.044,r= -0.36)。**结论：**存在失眠困扰的创伤经历者与睡眠正常的创伤经历者脑功能 ReHo 值有显著差异，失眠困扰创伤组累及更多脑区，涉及情感认知中枢，且与社会支持相关。

Insomnia distress and social support in trauma-experienced individuals: a preliminary comparison of a resting-state fMRI ReHo feature

Yinong Liu[1], Yunxiao Guo[1], Ziyi Zhao[1], Jun Ruan, Sijun Liu, Zhihong Ren[1]

[1] Key Laboratory of Adolescent Cyberpsychology And Behavior (CCNU), Ministry Of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health Of Hubei Province, Wuhan, China

Abstract: **Background:** Trauma survivors refer to individuals who have experienced or witnessed unusual catastrophic threats. Some individuals will experience symptoms such as re-experiencing, avoidance, negative changes in cognition and emotion, changes in arousal and response, difficulty in falling asleep, and insomnia. However, no research has explored the brain mechanisms related to insomnia and social support in traumatic individuals. **Objective:** To collect brain function data by resting-state functional magnetic resonance imaging, and conduct regional homogeneity (ReHo) analysis of the brain, to explore the differences in brain function between trauma patients with insomnia and normal sleep, and their correlation with clinical symptoms and social support. **Materials and methods:** 15 trauma experiencers with insomnia, 32 trauma experiencers with normal sleep, and 31 healthy controls (Healthy Control, HC) were recruited, and clinical symptoms such as post-traumatic stress disorder symptoms, anxiety, depression, dissociation, and social support scores were evaluated. All those with trauma experience should have experienced traumatic events and the score of PTSD Symptom Screening Scale should be higher than 31 points. The score of the insomnia severity index scale should be higher than 15 points in the insomnia distress trauma group, and self-reported insomnia distress. Posttraumatic stress disorder symptoms, clinical symptoms such as anxiety, depression, and dissociation, and social support scores were assessed using scales. All subjects underwent resting-state MRI brain function scans. DPARSF 5.0 was used to process the MRI data, and the SPSS software package was used to test the correlation of ReHo differences between the three groups of brain regions with clinical symptoms and social support. **Results:** There were no significant differences in demographic data and clinical symptom scores between the two groups of trauma experiencers. Compared with the

normal sleep group, the ReHo values of the right anterior lobe of the cerebellum, the right middle frontal gyrus, and the left parahippocampal gyrus of the insomnia-disturbed trauma group were higher, and the ReHo values of the left superior temporal gyrus and the right superior temporal gyrus were lower. Compared with the healthy control group, the ReHo values of the right temporal lobe fusiform gyrus, brainstem, and anterior cingulate gyrus were lower in the insomnia-disturbed trauma group; In addition, compared with the HC group, the normal sleep group had lower ReHo values in the right occipital lobe and middle temporal gyrus, and higher ReHo values in the right parietal lobe and posterior cingulate. Correlation analysis showed that the ReHo values of the left parahippocampal gyrus and left superior temporal in the insomnia distress trauma group were negatively correlated with the scores of the social interaction cooperation subscale of the Medical Outcomes Study Social Support Survey (MOS-SSS) (p = 0.039, r = -0.54), (p = 0.025, r = -0.57), and the ReHo values outside the left inferior lobe were correlated with the actual MOS-SSS scores. Sexual support subscale scores were positively correlated (p = 0.018, r = 0.60). In the trauma group with normal sleep, the ReHo value of the right middle temporal gyrus was negatively correlated with the dissociation score (Somatoform Dissociation Questionnaire, SDQ-5) (p = 0.044, r = -0.36). **Conclusion:** There is a significant difference in the ReHo value of brain function between trauma experiencers with insomnia and normal sleep. More brain regions are involved in the trauma group with insomnia, involving emotional cognition centers, and related to social support.

摘 要 **背景：**当个体具有某些抑郁症状但不符合《美国精神障碍诊断统计手册第五版》（DSM-V）中抑郁症的诊断标准时，则称为阈下抑郁。阈下抑郁与抑郁症相比有更高的患病率，且所造成的负面影响与抑郁症相当。但是阈下抑郁与其他精神疾病，尤其与抑郁症的关系尚不明确。本研究通过功能性近红外光谱(functional near-infrared spectroscopy，fNIRS)成像技术探讨阈下抑郁和抑郁症个体在言语流畅性任务下（verbal fluency test，VFT）前额叶氧合血红蛋白水平的变化特点，为二者关系研究提供客观依据。**方法：**本研究于 2023 年 3 月至 6 月纳入 108 名受试者，包括 36 名阈下抑郁个体，35 名抑郁症患者，36 名健康个体，采用 24 项汉密尔顿抑郁量表和流调用抑郁量表评分评估受试者抑郁严重程度并进行分组；应用 53 通道的 fNIRS 仪器，在 VFT 下测量前额叶各区域氧合血红蛋白相对浓度的变化。使用 SPSS 23.0 统计学软件进行数据分析。**结果：**在 VFT 表现方面，阈下抑郁组、抑郁症组和健康对照组比较差异无统计学意义（P＞0.05）。三组的氧合血红蛋白平均值差异有统计学意义，差异主要位于额极（F=39.83，P＜0.001）和背外侧前额叶皮质（F=13.03，P＜0.001）。事后分析结果显示，阈下抑郁组在额极（P＜0.001）和背外侧前额叶皮质（P＜0.05）的氧合血红蛋白平均值均低于抑郁症组。**结论：**阈下抑郁个体在执行 VFT 期间额极和背外侧前额叶区域功能下降，但是与抑郁症患者相比，阈下抑郁个体的功能下降程度较低。阈下抑郁与抑郁症在在背外侧前额叶和额极区域有着相似的受损模式，且阈下抑郁的受损程度低于抑郁症，因此阈下抑郁与抑郁症可能性质相同，只是严重程度不同。

关键词 阈下抑郁；抑郁症；功能性近红外光谱成像；言语流畅性任务；氧合血红蛋白

Changes in prefrontal oxyhemoglobin levels in individuals with subthreshold depression and depression under verbal fluency task

Lan Jinying[1,2] Zou Xiaowei[1,2] Wan Ailan[2]

1 School of Public Policy and Administration，Nanchang University，Nanchang 330031

2 Department of Psychosomatic Medicine，The First Affiliated Hospital of Nanchang University，Nanchang 330006

***Abstract*：Background**：When an individual has certain depressive symptoms but does not meet the diagnostic criteria for depression in the Diagnostic Statistical Manual of Mental Disorders, Fifth Edition (DSM-V), it is called subthreshold depression. Subthreshold depression has a higher prevalence than depression and has comparable negative consequences to depression. However, the relationship between subthreshold depression and other psychiatric disorders, especially depression, is unclear. In this study, we explored the characteristics of changes in prefrontal oxyhemoglobin levels in subthreshold depressed and depressed individuals under the verbal fluency task (VFT) by functional near-infrared spectroscopy (fNIRS) imaging to provide an objective basis for the study of the relationship between subthreshold depression and depression. **Methods**：From March to June 2023, 108 subjects were enrolled, including 36 individuals with subthreshold depression , 35 patients with depression , and 36 healthy individuals. Subjects were assessed for depression severity and grouped using Centre for Epidemiological Studies Depression Scale (CES-D) and 24 items Hamilton Depression Rating Scale (HAMD-24) . A 53-channel functional near-infrared spectroscopy was applied to measure changes in relative oxyhemoglobin concentrations in various prefrontal lobe regions under a verbal fluency task. SPSS 23.0 statistical software was used to data analysis. **Results**：In terms of VFT performance, there was no statistically significant difference between the subthreshold depression group, the depression group and the healthy control group ($P > 0.05$). The differences in mean oxyhemoglobin values between the three groups were statistically significant, with the differences located mainly in the frontal pole (F=39.83, P<0.001) and dorsolateral prefrontal cortex (F=13.03, P<0.001). Post hoc analysis showed that the subthreshold depression group had lower mean oxyhemoglobin values in both the frontal pole ($P <$ 0.001) and dorsolateral prefrontal cortex ($P < 0.05$) than the depression group. **Conclusions**： Subthreshold depresssion individuals had reduced function in frontopolar and dorsolateral prefrontal regions during the performance of a verbal fluency task, but to a lesser extent compared to depressed patients. Subthreshold depression and depression share a similar pattern of impairment in the dorsolateral prefrontal and frontal pole regions, and subthreshold depression is less impaired than depression; therefore, subthreshold depression and depression may be of the same nature, but differ only in severity.

累积情境风险与农村留守儿童的社会情绪能力：个体保护因子的链式中介作用

陈丹[1] 黄月胜[2]

1 天津中医药大学管理学院，天津，301617

2 湖南第一师范学院教育学院/儿童心理发育与脑认知科学湖南省重点实验室，长沙，410205，

huangys@hnfnu.edu.cn

摘 要 我国农村留守儿童人数为 697 万人，其中由(外)祖父母隔代照料者占 96%。由于家庭监护功能不足、缺乏来自父母的情感关爱与物质支持，会经历更多的情境风险。在面对情境风险时，留守儿童的认知态度相对消极，自我管理和情绪调整的能力较弱，人际交往问题更为严重，概括起来，这些问题突出表现为社会情绪能力较低。社会情绪能力的重要性不言而喻，但目前研究主要集中在其重要性、现状、培养模式的分析，缺乏多个情境风险视角，和积极保护特质视角对社会情绪能力影响机制的研究。而此类研究对于深入理解累积风险怎样影响留守儿童社会情绪能力以及如何帮助暴露于多重风险之下的留守儿童提高社会情绪能力均具有重要意义。本研究为了减少不同情境风险因子的差别效应被掩盖，更好辨别出对社会情绪能力更为敏感的风险来源，把风险因素进行分类，比较不同情境风险对社会情绪能力的作用机制，并探讨情境风险对留守儿童社会情绪能力的累积效应、函数关系。采用父母教养方式问卷、学校氛围知觉问卷、家庭社会经济地位评估问卷、特拉华社会情绪能力量表、自尊量表、心理弹性量表，对 807 名留守儿童和 357 名非留守儿童进行施测。结果发现：（1）相较与非留守儿童，留守儿童面临更多情境风险且保护因子、社会情绪能力显著更低；（2）家庭关系情境风险对留守儿童社会情绪能力的预测作用，大于学校情境风险和家庭 SES 情境风险；（3）在家庭关系、学校和家庭 SES 情境风险中，自尊和心理弹性在累积风险和社会情绪能力之间起链式中介作用；（4）累积风险因子与留守儿童社会情绪能力之间呈“负加速模式”；（5）随着情境风险增多，保护因子会减少，两者呈“此消彼长”关系，导致社会情绪能力降低。
关键词 累积情境风险；留守儿童；社会情绪能力；自尊；心理弹性

Cumulative Contextual Risk and and social emotional competency of left-behind children: The Chain Mediation Effect of Individual Protective Factors

CHEN Dan[1], HUANG Yue-sheng[2]

1 School of Management, Tianjin University of Traditional Chinese Medicine, Tianjin 301617, China

2 School of Education/ Hunan Key Laboratory of Children’s Psychological Development and Brain Cognitive Science, Hunan First Normal University, Changsha 410205, China

Abstract: The number of left-behind children in rural China is 6.97 million, of which 96% are taken care of by grandparents. Due to the lack of family monitoring function and the lack of emotional care and material support from parents, they will experience more contextual risks. In the face of contextual risks, the cognitive attitude of left-behind children is relatively negative, the ability of self-management and emotional adjustment is weak, and the interpersonal communication problems are more serious. In summary, these problems are highlighted by the low social emotional competency. The importance of social emotional competency is self-evident, but the current research mainly focuses on the analysis of its importance, current situation and cultivation mode, and lacks the research of the mechanism of multiple contextual risk perspectives and positive protective trait perspectives on social emotional competency. This kind of research is of great significance for in-depth understanding of how cumulative risk affects the social-emotional ability of left-behind children and how to help left-behind children exposed to multiple risks improve their social-emotional competency. In order to reduce the masking of the

differential effects of risk factors in different contexts, this study better identifies risk sources that are more sensitive to social emotional ability, classifies risk factors, compares the mechanism of action of different situational risks on social emotional ability, and explores the cumulative effect and functional relationship of situational risks on social emotional competency of left-behind children. A total of 807 left-behind children and 357 non-left-behind children were tested by parental bonding instrument, school climate perception questionnaire, Delaware Social and Emotional Competency Scale, self-esteem scale, resilience scale and personal information questionnaire. The results showed that: (1) Compared with non-left-behind children, left-behind children faced more contextual risks and had significantly lower protective factors and social-emotional competency; (2) The predictive effect of family relationship contextual risk on left-behind children's social emotional competency was greater than that of school contextual risk and family SES contextual risk; (3) In family relationship, school and family SES contextual risk, self-esteem and psychological resilience play a chain mediation role between cumulative risk and social emotional competency; (4) There is a "negative acceleration pattern" between cumulative risk factors and left-behind children's social emotional competency; (5) With the increase of contextual risk, the protective factors will decrease, showing a "trade-off" relationship between the two, resulting in a decrease in social-emotional competency.

Key Word: Cumulative contextual risk, Left-behind children, Social emotional competency, Self-esteem, resilience

生命意义感影响网络游戏成瘾：社交焦虑与感觉寻求的中介作用

马少勇[1]　桑青松[1]

安徽师范大学教育科学学院，安徽 芜湖 241002

摘要　青少年期是个体需要应对众多矛盾和冲突的阶段，容易产生多种问题行为，在个体的多种问题行为中，大学生的行为成瘾问题因其群体的广泛性和影响的日益严重性而受到人们的广泛关注，在世界范围内已经成为又一个世界瞩目的社会与健康问题。生命意义感作为个体系统中反映个体态度、价值观的重要组成部分，对网络游戏成瘾的发生、发展产生作用。随着大学生出现以“生命意义感缺失”为核心特征的“空心病”现象，这些缺乏生命意义感的个体可能会因为自身没有足够的动力去追寻生命目标和意义，缺乏目标感和价值感，进而陷入迷茫、无所适从的生活状态。他们因此倾向于通过成瘾活动填补自己内在的空虚，从而更容易表现出成瘾的行为。研究基于 I-PACE 理论模型和强化学习理论探讨生命意义感对大学生网络游戏成瘾影响及社交焦虑和感觉寻求在其中的作用；试图建立生命意义感影响网络游戏成瘾的社交焦虑与感觉寻求的中介模型，探析模型中各变量之间的关系，揭示生命意义感影响网络游戏成瘾的心理机制。采用生命意义感量表、网络游戏成瘾量表、社交焦虑量表以及感觉寻求量表对 1150 名研究对象进行问卷调查；结果表明生命意义感与大学生网络游戏成瘾呈显著负相关，社交焦虑与感觉寻求在生命意义感与大学生网络游戏成瘾之间起平行中介作用；高生命意义感是大学网络游戏成瘾的保护性因素，负向预测网络游戏成瘾行为；研究结果利于揭示生命意义感影响网络游戏成瘾的内在机制，为验证相关理论提供实证依据，为网络游戏成瘾的预防与干预提供新的思路和理论依据。

关键词　生命意义感，网络游戏成瘾，社交焦虑，感觉寻求，大学生

The influence of sense of meaning on online game addiction: the mediating role of social anxiety and sensation seeking

Ma Shaoyong Sang Qingsong
The college of Education Science, Anhui Normal University, Wuhu 241002, China

Abstract: Adolescence is a stage in which individuals need to deal with many contradictions and conflicts, and it is easy to produce a variety of problematic behaviors. Among the various problematic behaviors of individuals, behavioral addiction of college students has been widely concerned by people because of its universality and the increasing severity of its influence, and has become another social and health problem attracting worldwide attention. The sense of meaning of life, as an important part of the individual system reflecting the individual attitude and values, plays an important role in the occurrence and development of online game addiction. With the phenomenon of "hollow disease" in college students, which is characterized by "lack of sense of meaning of life", these individuals lacking sense of meaning of life may fall into a confused and confused state of life because they do not have enough motivation to pursue life goals and meanings and lack a sense of purpose and value. They therefore tend to fill their inner void through addictive activities, which makes them more likely to exhibit addictive behaviors. Based on I-PACE theory and reinforcement learning theory, this study explores the influence of meaning of life on online game addiction and the role of social anxiety and sensation seeking among college students. This paper attempts to establish a mediating model between social anxiety and sensation seeking in which sense of meaning of life affects online game addiction, explore the relationship between the variables in the model, and reveal the psychological mechanism of meaning of life affecting online game addiction. The meaning of life scale, online game addiction scale, social anxiety scale and sensation seeking scale were used to investigate 1150 subjects. The results show that there is a significant negative correlation between sense of meaning of life and online game addiction. Social anxiety and sensation seeking play a parallel mediating role between sense of meaning of life and online game addiction of college students. High sense of life meaning is the protective factor of college online game addiction, and negatively predicts online game addiction behavior. The research results help to reveal the internal mechanism of the influence of the sense of meaning of life on online game addiction, provide an empirical basis for the verification of relevant theories, and provide a new idea and theoretical basis for the prevention and intervention of online game addiction.

Keywords: Sense of life meaning, online game addiction, social anxiety, sensation seeking, college students

3~5 岁幼儿家庭教育生活刺激的类型及影响因素——基于 CFPS 的潜在剖面分析

郭俊俏[1]　赵必华[1]（通讯作者）　潘俊星[2]
1 安徽师范大学 教育科学学院，安徽芜湖，241000，通讯作者 E-mail: zhaobihua1@sina.com
2 淮北师范大学 学生工作处大学生心理健康教育中心，安徽淮北，235000

摘　要 家庭是儿童社会化的第一场所，家庭教育是儿童社会化的主要手段，识别家庭教育生活刺激的类型是提升家庭教育质量、促进儿童社会化的重要基础。为探究 3~5 岁幼儿家庭教育生活刺激的类型及影响因素，本研究基于中国家庭追踪调查（China Family Panel Studies，CFPS）2018 少儿家长代答问卷和 2018 个

人自答问卷，以 1716 名 3~5 岁幼儿为被试（匹配 2018 个人自答问卷中幼儿的父亲或母亲信息后样本量为 1548 人），采用家庭环境观察量表中的 4 个题项测量幼儿的家庭教育生活刺激。1716 名 3~5 岁幼儿的平均年龄为 4.03 岁（*SD* = 0.80），其中 3 岁、4 岁和 5 岁的幼儿人数分别是 530 人（30.9%）、609 人（35.5%）和 577 人（33.6%）；男生 920 人，女生 796 人；乡村 904 人，城镇 794 人，18 人未填答此信息。1548 名幼儿父母的平均年龄为 31.30 岁（*SD* = 5.16），其中，男性 396 人，女性 1152 人；初中及以下、高中和大学及以上的人数分别为 920 人（59.4%）、307 人（19.8%）和 321 人（20.7%）。采用潜在剖面分析和多项 logistic 回归分析进行数据处理，结果表明，3~5 岁幼儿家庭教育生活刺激的类型可分为“高识字低讲故事组”（13.40%）、“低识字高讲故事组”（12.94%）、“全低组”（23.02%）与“全高组”（50.64%）四种；父亲或母亲受教育水平对 3~5 岁幼儿家庭生活教育刺激的类型具有显著影响，具体表现为随着父母受教育水平的提升，3~5 岁幼儿的家庭教育生活刺激表现为“高识字低讲故事组”、“低识字高讲故事组”和“全高组”的概率越高；城乡类型对 3~5 岁幼儿家庭生活教育刺激的类型具有显著影响，具体表现为城镇幼儿的家庭教育生活刺激表现为“高识字低讲故事组”、“低识字高讲故事组”和“全高组”的概率高于乡村幼儿。总之，3~5 岁幼儿的家庭教育生活刺激可分为 4 种类型，而且幼儿父母的受教育水平和幼儿的城乡类型影响家庭教育生活刺激不同类型的发生率。

关键词 3~5 岁幼儿，家庭教育生活刺激，潜在剖面分析，父母受教育水平，城乡类型

The Types of Life Stimulation in Family Education among Preschoolers Aged 3 to 5 Years and It's Influences: A Latent Profile Analysis Based on CFPS

Guo Junqiao[1], Zhao Bihua[1], Pan Junxing[2]

1. School of Educational Science, Anhui Normal University, Anhui Wuhu 241000, China;
2. Student Affairs Department, Huaibei Normal University, Anhui Huaibei 235000, China

***Abstract*:** Family is the first place for children's socialization, and family education is the main means of children's socialization. Identifying the life stimulation types in family education is an important basis for improving the quality of family education and promoting children's socialization. In order to explore the types and influences of life stimulation in family education among preschools aged 3 to 5 years in China, based on the data of 2018 Child Proxy Questionnaire and 2018 Individual Self-report Questionnaire of China Family Panel Studies, participants were 1716 preschoolers aged 3 to 5 years (the sample of parents of the preschoolers was 1548 in 2018 Individual Self-report Questionnaire of China Family Panel Studies), and the life stimulation in family education was measured with four items in the Home Observation for Measurement of the Environment. The mean age of 1716 children aged 3 to 5 years was 4.03 years (*SD* = 0.80), and the number of children aged 3 years, 4 years, and 5 years was 530 (30.9%), 609 (35.5%) and 577 (33.6%), respectively. Among 1716 preschoolers, the number of male and female preschoolers was 920 and 796, respectively; and the number of preschoolers in rural and urban areas was 904 and 794, respectively, and 18 people did not report this information. The mean age of preschoolers' parents (1548) was 31.30 years old (*SD* = 5.16), and 396 were males and 1152 were females. The number of middle school and below, high school and university and above among preschooler's parents was 920 (59.4%), 307 (19.8%) and 321 (20.7%), respectively. Latent profile analysis and logistic regression were utilized to analyze the data. The results showed that the types of life stimulation in family education among preschoolers aged 3 to 5 years could be classified as "high literacy and low storytelling group" (13.40%), "low literacy and high storytelling group" (12.94%), "all low group" (23.02%) and "all high group" (50.64%). There was a significant difference in

the level of highest education among parents for the types of life stimulation in family education. Specifically, with the improvement of the highest education level of parents, the life stimulation in family education for preschoolers aged 3 to 5 is more likely to be in the range of “high literacy and low storytelling group”, “low literacy and high storytelling group” and “all high group”. There was a significant difference in urban or rural types among preschoolers for the types of life stimulation in family education. Specifically, preschoolers who live in urban families were more likely to be in the range of “high literacy and low storytelling group”, “high storytelling and low literacy group” and “all high group” than preschoolers who live in rural families. In conclusion, life stimulation in family education among preschoolers aged 3 to 5 years can be divided into four types, and the different types are influenced by the level of highest education of children’s parents and children’s urban or rural types.

***Keywords*:** preschoolers aged 3 to 5 years, life stimulation in family education, latent profile analysis, the highest educational level of parents, urban or rural types

Are “night owls” or “morning larks” more likely to delay sleep due to problematic smartphone use? A cross-lagged study among undergraduates

***Abstract*:** Sleep is an important physiological process in life, but "staying up late" has become a "world problem" for contemporary people, particularly among university students. Sleep procrastination is associated with a wide variety of indicators, such as sleep biorhythms and problematic smartphone use. The current study examined the longitudinal reciprocal relationships between problematic smartphone use and sleep procrastination. Furthermore, the research examined sleep biorhythms differences in relationships between those two variables. A total of 1423 Chinese university students participated in the two-wave study. The results found there were reciprocal relationships between problematic smartphone use and sleep procrastination. Additionally, sleep biorhythms moderated the relationships between problematic smartphone use and sleep procrastination (i.e., problematic smartphone use at T1 can significantly predict sleep procrastination at T2 for the morning larks group, whereas

problematic smartphone use at T1 cannot significantly predict sleep procrastination at T2 for the night owls group). The problematic smartphone use and the difference in sleep biorhythms should be taken into account while developing interventions for sleep procrastination

Keywords： problematic smartphone use; sleep procrastination; sleep biorhythms; Chinese university students; cross-lagged study

学龄前儿童近似数量加工和数学能力的关系：加工速度的作用

沈施巧　李可玥　卫薇（通讯作者）

浙江大学心理与行为科学系，杭州，310028，weiwei820@zju.edu.cn

摘 要　近似数量加工和数学能力之间存在着紧密的联系，但是这一关系背后的机制一直未明确。根据加工速度理论，加工速度是驱动更高阶认知能力发展的核心能力。并且，已有研究证明近似数量加工和数学能力均与加工速度存在相关关系。因此，我们假设加工速度作为近似数量加工与数学能力的基础，是二者产生相关的原因。本研究采用横向和纵向两种方法来验证该假设。研究一采用横断研究，测量了 89 名 3～5 岁学龄前儿童的近似数量加工能力、数学能力、加工速度、以及智力和家庭社会经济地位等控制变量。结果发现，在控制了年龄、家庭社会经济地位和智力因素后，近似数量加工能力、数学能力和加工速度三者之间存在显著的相关关系，并且加工速度与数学能力之间的相关程度比近似数量加工与数学能力之间的相关程度更高。但是在控制了加工速度后，近似数量加工和数学能力之间的相关关系不再显著；而在控制了近似数量加工能力后，加工速度与数学能力依然显著相关。研究二采用纵向研究，对研究一中的被试进行追踪，测量了 74 名儿童 6 个月后的数学能力。结果发现，在控制了年龄、家庭社会经济地位和智力因素后，儿童的近似数量加工能力和加工速度可以显著地预测其 6 个月后的数学能力，并且加工速度的预测作用更强。但是在控制了加工速度后，近似数量加工能力对数学能力的预测作用不再显著；而在控制了近似数量加工能力后，加工速度对数学能力的预测作用依然显著。这说明学龄前儿童的加工速度可以解释近似数量加工和数学能力之间的相关关系。并且，相较于近似数量加工能力，学龄前儿童的加工速度对数学能力的作用更重要。

The association between approximate number system and math abilities in preschoolers: The role of processing speed

Shiqiao Shen　Keyue Li　Wei Wei*

Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou

Abstract: Research has shown a close association between approximate number system (ANS) and math abilities; however, the underlying mechanism of the association remains unclear. According to the processing speed theory, processing speed is a central mental capacity that drives changes in higher-order cognition. Meanwhile, processing speed has been observed to be significantly correlated with both ANS and math abilities. Therefore, we proposed that ANS ability correlates with math ability because they both rely on processing speed. This study adopted both cross-sectional and longitudinal designs to examine the hypothesis. Using a cross-sectional design, Study 1 measured ANS ability, math ability, processing speed, and controlled variables including intelligence and family

socioeconomic status in 89 preschoolers aged 3 to 5 years. It was found that after controlling for age, family socioeconomic status, and intelligence, there were significant correlations between ANS ability, math ability, and processing speed, and the correlation between processing speed and math ability was higher than that between ANS and math abilities. However, the correlation between ANS and math abilities was no longer significant after controlling for processing speed, whereas the correlation between processing speed and math ability remained significant after controlling for ANS ability. Study 2 used a longitudinal design to follow the subjects in Study 1, measuring the math ability of 74 preschoolers after 6 months. Results showed that after controlling for age, family socioeconomic status, and intelligence, ANS ability and processing speed significantly predicted math ability 6 months later, and the predicting role of processing speed was more important. However, ANS ability was no longer significant in predicting math ability after controlling for processing speed, whereas processing speed still significantly predicted math ability after controlling for ANS ability. These suggest that preschoolers' processing speed can explain the correlation between ANS and math abilities. Moreover, preschoolers' processing speed may play a more important role than ANS ability in math ability.
Keywords：approximate number system ability, math ability, processing speed, preschoolers

儿童期虐待会在纵向上影响探索吗？一个有调节的中介效应模型

申曦　王金良（通讯作者）
西南大学心理学部，重庆，400715，通讯作者：wjl200789@163.com

摘 要　探索，关注信息寻求但伴随着潜在的负面可能性，在青少年的心理健康和社会适应中发挥着重要作用。鉴于儿童期虐待会对个体产生广泛而持久的影响，人们对这些早期生活中的不良经历与这种适应性行为间的纵向关系知之甚少。因此，本研究旨在考察儿童期虐待是否会阻碍以后的探索，以及不确定性压力的中介作用和不确定性不容忍的调节作用。采用两个时间点的纵向设计，被试为 685 名青少年（$M_{年龄}$ = 15.99, $SD_{年龄}$ = 0.92, 43.5% 女性），测量的时间跨度为 6 个月。相关分析结果表明，儿童期虐待与探索仅在横向水平上呈显著正相关，却在纵向水平上不相关。在控制年龄和性别后，T2 的不确定性压力在 T1 儿童期虐待与 T2 探索间起完全中介作用。T1 的不确定性不容忍除了负向调节 T1 儿童期虐待与 T2 探索间的直接效应外，也正向调节 T2 不确定性压力中介 T1 儿童期虐待与 T2 探索这一中介路径的第一阶段。由于不确定性压力的关键作用，为促进这些受虐待青少年进行更多的积极探索，需要相应的认知和行为干预来调整他们对不确定性的感知和认知。
关键词　儿童期虐待，探索，不确定性压力，不确定不容忍，纵向有调节的中介效应模型

Does childhood maltreatment longitudinally impede exploration? A moderated mediation model

Xi Shen　Jin-Liang Wang
Faculty of Psychology, Southwest University, Chongqing, 400715, China

Abstract：Exploration, focused on information seeking but accompanied underlying negative possibilities exert

an essential function in the psychological and social adaptation of adolescents. As childhood maltreatment would have wide-ranging and long-lasting impacts on individuals, little was known about the longitudinal relationship between these early life adverse experiences and this adaptive behavior. Therefore, the present study aimed to examine whether childhood maltreatment would impede later exploration, and the mediating role of uncertainty stress and the moderating role of intolerance of uncertainty. Participants were 685 adolescents from a longitudinal design with two- time waves spanning six months (M age = 15.99, SD age = 0.92, 43.5% female). Correlation analysis indicated that childhood maltreatment was negatively correlated with exploration only simultaneously, but not longitudinally. After controlling age and gender, uncertainty stress fully mediated the relationship between childhood maltreatment and subsequent exploration. Besides negatively moderated this direct association, intolerance of uncertainty also positively moderated the first-stage of uncertainty stress mediating the relationship between childhood maltreatment and subsequent exploration. Given the critical role of uncertainty stress, promoting more exploration among these maltreated adolescents requires corresponding cognitive and behavioral interventions to adjust their perception and cognition of uncertainty.

Keywords： childhood maltreatment, exploration, uncertainty stress, intolerance of uncertainty, a longitudinal moderated mediation model

青少年孤独感和社交焦虑的共发：一项网络分析

陈嘉慧[1]　任萍[1]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

通讯作者 E-mail：renping@bnu.edu.cn

摘 要　**背景：**研究发现，孤独感和社交焦虑之间存在共病关系。然而，大多数研究都依赖于潜在变量模型（即计算症状得分来代表孤独感和社交焦虑），忽视了不同障碍的症状之间的相互关系。网络分析认为心理障碍的症状之间存在复杂的交互作用,将心理障碍看作症状之间相互作用的结果,为理解孤独感和社交焦虑共病提供了新的视角。本研究拟采用网络分析的方法，考察青少年孤独感和社交焦虑的共发网络以及同伴关系（互选友谊数量、友谊质量、同伴侵害）对其网络的影响。**方法：**本研究采用自我报告的儿童孤独感问卷、青少年社交焦虑问卷、修订的 Olweus 受欺凌问卷、友谊质量问卷以及同伴提名的友谊数量，对中国中部省份某城市 2601 名中学生进行了问卷调查。**结果：**结果表明认知相关的症状（如，担心见新朋友、认为交朋友很难、害怕被拒绝、害怕被朋友取笑在孤独感和社交焦虑共发网络中有高桥梁中心性。此外，友谊质量与孤独感症状之间呈现负相关；同伴侵害与社交焦虑之间呈现正相关；而互选友谊数量与社交焦虑之间呈现负相关。**结论：**研究结果为青少年孤独感和社交焦虑症状的共病提供了初步证据。研究结果还强调了针对同伴关系的措施对于预防和干预孤独和社交焦虑症状的共发具有重要作用。

Comorbidity Between Loneliness and Social Anxiety in Adolescents: Bridge Symptoms and Peer Relations

Jiahui Chen[1]　Ping Ren[1] *

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, 100875

***Abstract*:**

Background: Loneliness and social anxiety often co-occurs during adolescence. However, previous research investigating the comorbidity between loneliness and social anxiety symptoms in population samples has relied on latent variable modeling in which averaged scores representing dimensions were derived from observed symptoms. The network approach provided a novel perspective to explore loneliness and social anxiety symptoms as a causal system of interacting symptoms. Therefore, this study extended beyond prior work to explore the comorbidity between loneliness and social anxiety and its relations to peer relations (i.e., bullying victimization and friendship quality and the number of reciprocated friends), using network analysis. **Methods:** We aimed to address this gap by performing a network analysis in a sample of Chinese adolescents (N=2601, 51.6% male). Participants completed the self-report measures of Children's Loneliness Scale, Social Anxiety Scale for Adolescents, the Bully/Victim Questionnaire and Friendship Quality Questionnaire as well as peer nomination measures of the number of reciprocated friends. Results: Network analysis revealed that cognitive-related symptoms (i.e., worry about meeting new friends, hard to making new friends, fear of being made fun, fear of being rejected) were bridge symptoms in the co-occurrence between loneliness and social anxiety. Bullying victimization had positive associations and friendship quality had negative associations with symptoms of loneliness and social anxiety. Conclusions: Findings provide preliminary evidence of the comorbidity between loneliness and social anxiety symptoms in adolescents. The results also highlight the potential importance of targeting peer relations in preventing and intervening the comorbidity of loneliness and social anxiety symptoms.

考试焦虑青少年的威胁解释偏差：气质的调节作用

白舒靓[1]　刘沛兵[1]　周仁来[1,2]（通讯作者）

1 南京大学心理系，南京，210023

2 媒体融合生产技术与系统国家重点实验室，北京，100803

摘 要　威胁解释偏差是指个体在面对不确定的情境时倾向于以威胁或负面方式解释其含义的倾向。这种偏差与焦虑症状的形成密切相关，然而对于威胁解释偏差在考试焦虑产生中的作用的研究相对较少。本研究的目标是探究考试焦虑的青少年中威胁解释偏差的存在，并研究气质对其的调节作用。研究采用了 1210 名年龄在 10 至 14 岁之间的青少年作为研究样本，并使用了模糊情境问卷来测量威胁解释偏差、预期负性情绪和控制感。研究结果显示，相较于低考试焦虑的青少年，高考试焦虑的青少年在考试相关和无关情境下更容易出现威胁解释偏差，并表现出更多的负性情绪和较低的控制感。此外，消极情绪和意志控制在考试焦虑水平和威胁解释偏差之间起到调节作用。具体来说，意志控制水平能够预测低考试焦虑的青少年在考试相关情境中的威胁解释偏差和负性情绪，但却无法预测高考试焦虑的青少年中的这些变量。另一方面，消极情绪对于低考试焦虑的青少年在考试相关情境中威胁解释偏差的影响更为显著。这些研究结果对于进一步研究如何干预考试焦虑提供了重要的启示。它们有助于我们更深入地了解威胁解释偏差在考试焦虑中的作用，并为开展干预措施提供了指导。

关键词　考试焦虑，威胁解释，意志控制，消极情绪

Threat Interpretation Bias in Adolescents with Test Anxiety: The Moderating Role of Temperament

Shuliang Bai[1], Peibing Liu[1], Renlai Zhou[1,2]

1 Department of Psychology, Nanjing University, Nanjing 210023, China.
2 State Key Laboratory of Media Convergence Production Technology and Systems, Beijing 100803, China.

Abstract：Threat interpretation bias refers to the tendency of individuals to interpret ambiguous situations in a threatening or negative manner. This bias is closely associated with the development of anxiety symptoms; however, research on the role of threat interpretation bias in the formation of test anxiety is relatively limited. The aim of this study was to investigate the presence of threat interpretation bias in adolescents with test anxiety and examine the moderating effect of temperament. A sample of 1210 adolescents aged 10 to 14 years was recruited, and a questionnaire on ambiguous situations was used to measure threat interpretation bias, anticipated negative emotions, and perceived control. The results revealed that compared to adolescents with low test anxiety, those with high test anxiety were more prone to exhibit threat interpretation bias and display higher levels of negative emotions and lower levels of perceived control in both test-related and unrelated situations. Additionally, negative emotions and effortful control played a moderating role in the relationship between test anxiety level and threat interpretation bias. Specifically, effortful control predicted threat interpretation bias and negative emotions in adolescents with low test anxiety in test-related situations, but not in those with high test anxiety. Conversely, negative affectivity had a more significant impact on threat interpretation bias in adolescents with low test anxiety in test-related situations. These findings provide important insights for further understanding the role of threat interpretation bias in test anxiety and offer guidance for the development of intervention strategies.

Keywords：test anxiety, threat interpretation, effortful control, negative affectivity

大学生童年创伤经历与非自杀性自伤的关系：表达抑制与奖赏敏感性的作用

孙晨哲[1,2] 曹华[1] 杨玲[3]（通讯作者）
1 西北师范大学心理学院，兰州，730070
2 郑州铁路职业技术学院学生工作部，郑州，450000
3 西北师范大学心理学院，兰州，730070，yangling@nwnu.edu.cn

摘 要 非自杀性自伤(NSSI)是导致年轻人死亡的主要原因，已成为一个重要的公共卫生问题。以往研究发现，20 岁左右是 NSSI 问题出现的高峰年龄之一，我国大学生中 NSSI 的检出率处于较高水平，近年来备受研究者关注。本研究基于 NSSI 整合模型与人格生物理论构建有调节的中介模型，以探讨大学生童年创伤经历对 NSSI 的影响，并进一步检验表达抑制的中介作用与奖赏敏感性的调节作用。采用童年创伤问卷、非自杀性自伤行为问卷、情绪调节量表与行为抑制/激活系统量表对 630 名大学生进行问卷调查。结果发现：(1)大学生童年创伤经历对 NSSI 具有正向预测作用，表达抑制在童年创伤经历与 NSSI 见起中介作用；(2)

奖赏敏感性在中介模型中起到了调节作用，但其不同过程所产生的调节作用效果不同，奖赏反应削弱了童年创伤对 NSSI 的直接正向影响与表达抑制对 NSSI 正向影响(中介模型后半段)，而奖赏愉悦寻求加强了表达抑制对 NSSI 的正向影响(中介模型后半段)。具体而言，童年不良经历不仅能够直接影响大学生 NSSI，还可以通过促进其情绪的表达抑制策略对 NSSI 产生间接影响；但仅在低奖赏反应大学生中存在童年创伤对 NSSI 的直接与间接影响，而高奖赏反应大学生中这种影响并不显著；且仅在高奖赏愉悦寻求大学生中存在童年创伤对 NSSI 的间接影响，而低奖赏愉悦寻求大学生中间接影响不显著。本研究不仅进一步探索了导致大学生 NSSI 的心理因素与形成路径，明确了路径的起效条件，同时推进了对以往奖赏敏感性在这一过程中矛盾作用结果的深入理解。基于此，本研究启示我们在进行 NSSI 干预时需要关注童年创伤的重要作用，同时针对奖赏反应低、奖赏愉悦寻求高的童年创伤大学生：一方面，改善其情绪调节方式，鼓励其情绪表达；另一方面，开展积极心理训练以改善奖赏系统失衡，从而降低其 NSSI 行为风险，预防校园心理危机事件的发生。

Relationship Between Childhood Trauma and Non-Suicidal Self-Injury in College Students: The Role of Expressive Suppression and Reward Sensitivity

Sun Chenzhe[1,2] Cao Hua[1] Yang Ling[3]

1 school of Psychology, Northwest Normal University,Lanzhou, 730070

2 Students' Affairs Office, Zhengzhou Railway Vocational & Technical College, Zhengzhou, 450000

3 school of Psychology, Northwest Normal University,Lanzhou, 730070, yangling@nwnu.edu.cn

Abstract: Non-suicidal self-injury (NSSI) is one of the leading causes of death in young people and has become a major public health problem. Previous studies have found that around 20 is one of the peak ages for the emergence of NSSI problems, and the detection rate of NSSI among college students in China is at a high level, so it has received much attention from researchers in recent years. This study constructs a mediated moderation model based on the NSSI integration model and the biological theory of personality, to explore the effect of childhood trauma on NSSI in college students and test the mediating effect of expression suppression and the moderating effect of reward sensitivity. A total of 630 college students were surveyed using the Childhood Trauma Questionnaire, the NSSI Behavior Questionnaire, the Emotion Regulation Scale and the Behavior Inhibition / Activation System Scale. The results showed that: (1) College students' childhood trauma positively predicted NSSI, and expression inhibition mediated the relationship between childhood trauma and NSSI; (2) The different processes in reward sensitivity played different moderated roles in the mediation model, reward response impaired the direct positive effect of childhood trauma on NSSI and the positive effect of expression suppression on NSSI (the second half of the mediation model), reward pleasure seeking strengthened the positive effect of expression suppression on NSSI (the second half of the mediation model). Specifically, Childhood trauma not only directly positive predicted NSSI, and had indirect predict NSSI via expression suppression; however, the direct and indirect effects of childhood trauma on the NSSI were only present in low reward-responsive college students, not high reward-responsive college students; and the indirect effects of childhood trauma on the NSSI were only present in high reward pleasure seeking college students, not low reward pleasure seeking college students. The present study

not only further explored the psychological factors and formative pathways that lead to college students' NSSI, but also clarified the conditions under which the pathways take effect, while advancing a deeper understanding of the previous conflicting results of reward sensitivity in this process. Based on this, the present study reveals college students' NSSI interventions need focus on the important role of childhood trauma. For college students who experienced childhood trauma with low reward response and high reward pleasure seeking: on the one hand, improve their emotion regulation, encourage their emotion expression; on the other hand, carry out positive psychology training to improve the imbalance of the reward system, so as to reduce the risk of their NSSI behaviors, and to prevent the occurrence of campus psychological crisis events.

基于 CNKI 的我国高校心理辅导研究可视化分析

李楠

西北师范大学　教育科学学院，甘肃 兰州 730070，linan@lzu.edu.cn

摘 要　高校心理辅导工作关乎青年学生健康成长，是心理辅导工作的重要组成部分，高校培养人才更加为高校心理辅导工作赋予了特殊的意义。本文利用 SATI3.2、UCINET6、SPSS20.0 等软件对中国知网中有关高校心理辅导的研究论文进行了分析和解读，采用数学与统计学方法，通过绘制知识图谱和聚类树状图来显示高校心理辅导相关研究的知识特征、结构和研究前沿领域。学者们分别从高校心理辅导的对象、方式、效果、对策等不同角度开展了研究，对进一步做好新时期高校心理辅导工作提供了理论支持。但研究也存在一些不足，一方面，较少有学者将新时代新形势和学生的新特点与高校心理辅导工作相结合进行研究；另一方面，高校心理辅导的形式有待创新，效果有待检验。高校心理辅导相关研究热点概况为五个：一是大学生朋辈心理辅导；二是思想政治教育与心理辅导；三是就业心理辅导；四是团体心理辅导；五是贫困生心理辅导。本文还对高校心理辅导的研究趋势进行了讨论，归纳出三类研究方向，未来可以进行深入研究。随着“互联网+”时代的到来，高校心理辅导工作面临着新的挑战，如何更好地利用网络资源开展心理辅导？如何充分利用信息通信技术和互联网平台，将高校心理辅导工作与互联网进行深度融合，努力提升高校心理辅导工作水平，是一项亟待研究的重要课题。

Visualization analysis of psychological counseling research in Chinese universities based on CNKI

Nan Li

School of Education Science, Northwest Normal University, Lanzhou 730070, Gansu, linan@lzu.edu.cn

Abstract：Psychological counseling work in universities is related to the healthy growth of young students and is an important component of psychological counseling work. Cultivating talents in universities has given special significance to psychological counseling work in universities. In this paper, SATI3.2, UCINET6, SPSS20.0 and

other software are used to analyze and interpret the research papers on college psychological counseling in CNKI. Using mathematical and statistical methods, Knowledge graph and cluster tree graph are drawn to show the knowledge characteristics, structure and research frontiers of college psychological counseling related research. Scholars have conducted research from different perspectives such as the objects, methods, effects, and strategies of psychological counseling in universities, providing theoretical support for further improving the work of psychological counseling in universities in the new era. However, there are also some shortcomings in the research. On the one hand, few scholars have combined the new situation of the new era and the new characteristics of students with the psychological counseling work in universities for research; On the other hand, the forms of psychological counseling in universities need to be innovated, and the effectiveness needs to be tested. There are five research hotspots related to psychological counseling in universities: firstly, peer psychological counseling for college students; Secondly, ideological and political education and psychological counseling; Thirdly, employment psychological counseling; Fourth, group psychological counseling; The fifth is psychological counseling for impoverished students. This article also discusses the research trends of psychological counseling in universities and summarizes three types of research directions, which can be further studied in the future. With the arrival of the "Internet plus" era, college psychological counseling is facing new challenges. How can we make better use of network resources to carry out psychological counseling? How to fully utilize information and communication technology and internet platforms, deeply integrate college psychological counseling work with the internet, and strive to improve the level of college psychological counseling work is an important issue that urgently needs to be studied.

多维度视角下的父母心理控制与学前儿童问题行为：儿童外倾性和性别的调节作用

程雪林 邢淑芬（通讯作者）

首都师范大学心理学院，北京，100048，E-mail:xsf2986@163.com

摘 要　大量研究表明父母心理控制是儿童问题行为的重要风险因素。然而，相关研究忽视了心理控制的多维性，混淆了心理控制不同维度对儿童问题行为的独特影响。近年来，爱的撤回和引发内疚两种典型的心理控制策略与儿童问题行为的关系得到关注，但相关研究仍存在一些局限性。一是集体主义文化背景下的研究较少，同时缺乏对学前儿童群体的关注；二是儿童特征在父母爱的撤回、引发内疚与儿童问题行为之间的调节作用尚不清楚。解决以上两项问题将有助于提高儿童问题行为早期干预的针对性。因此，本研究在中国集体主义文化背景下，基于心理控制的多维度视角，深入考察父母爱的撤回、引发内疚与学前儿童问题行为的独特关系，并进一步探究儿童外倾性和性别对上述关系的共同调节作用。

研究采用方便取样的方式选取 480 名学前儿童（男孩 267 名，M_{age} = 4.54 岁）及其父母为研究对象。使用问卷法收集变量数据。在数据分析阶段，采用 SPSS 25.0 对研究的主要变量进行描述性统计分析，采用 M*plus* 8.0 进行结构方程模型分析、简单斜率分析和 Johnson-Neyman 分析。研究结果显示：（1）母亲爱的撤回显著正向预测儿童内、外化问题，父亲爱的撤回显著正向预测儿童内化问题。外倾性和母亲爱的撤回的交互项显著预测儿童外化问题，当儿童的外倾性得分高于–1.13*SD* 时，母亲爱的撤回显著正向预测儿童外化问题，儿童的外倾性越高，预测作用越强；（2）父亲、母亲引发内疚对儿童内、外化问题的主效应均不显著，但外倾性和父亲引发内疚的交互项显著预测儿童外化问题，当儿童外倾性得分高于 0.45*SD* 时，父亲引发内疚显著负向预测儿童外化问题，儿童外倾性越高，预测作用越强；（3）上述结果均不存在儿童性别差异。研究结果表明，在中国集体主义文化背景下，爱的撤回相较于引发内疚是更需要被规避的教养

方式，高外倾性儿童更易受到母亲爱的撤回的消极影响和父亲引发内疚的积极影响。

The relationship between parental psychological control and preschoolers' problem behaviors based on a multidimensional perspective: The moderating role of preschooler's surgency and gender

CHENG Xuelin　XING Shufen (Corresponding author)
College of Psychology, Capital Normal University, Beijing, 100048, E-mail: xsf2986@163.com

Abstract: A large number of studies have demonstrated that parental psychological control is a significant risk factor for children's problem behaviors. However, these studies focus on unidimensional psychological control, confusing the different effects of different dimensions of psychological control on children's problem behaviors. In recent years, love withdrawal and guilt induction, as typical strategies of psychological control, have received attention in their association with children's problem behaviors. Nevertheless, there are still several limitations in the existing research. On the one hand, research conducted in collectivism culture and in preschoolers is limited. On the other hand, it is still unclear how child characteristics moderate the relationship between parental love withdrawal (and guilt induction) and children's problem behaviors. Addressing these two issues will greatly contribute to the targeted early intervention for children's problem behaviors. Therefore, the current study was aimed to take a dimensional approach to examine whether parental love withdrawal and guilt induction were related to preschoolers' problem behaviors. And then, the joint moderating effects of preschoolers' surgency and gender on the above associations were further explored.

In this study, 480 preschoolers (267 boys, *M*age = 4.54 years old) and their parents were selected by convenient sampling method. The data were collected using questionnaires. In the data analysis, descriptive statistical analyses of the main variables were performed using SPSS 25.0. Structural equation model analyses, simple slope analyses, and Johnson-Neyman analyses were conducted by M*plus* 8.0. The results showed that (1) maternal love withdrawal significantly and positively predicted preschoolers' internalizing and externalizing problems, while paternal love withdrawal significantly and positively predicted preschoolers' internalizing problems. What's more, the interaction item (maternal love withdrawal × surgency) significantly predicted preschoolers' externalizing problems. Specifically, when the score of preschoolers' surgency was higher than –1.13*SD*, maternal love withdrawal significantly and positively predicted preschoolers' externalizing problems. And the higher the preschoolers' surgency, the stronger this association. (2) The main effects of paternal and maternal guilt induction on preschoolers' internalizing and externalizing problems were not significant. However, the interaction term of surgency and paternal guilt induction significantly predicted preschoolers' externalizing problems. When the score of preschoolers' surgency was higher than 0.45*SD*, paternal guilt induction significantly and negatively predicted preschoolers' externalizing problems. And the higher the preschoolers' surgency, the stronger this association. (3) There was no gender difference in the above results. The findings of this study indicate that, in the context of collectivism culture in China, love withdrawal should be avoided compared to guilt

induction. Furthermore, children with high surgency are more susceptible to the negative impact of maternal love withdrawal and the positive impact of paternal guilt induction.
Keywords: love withdrawal, guilt induction, problem behavior, surgency, gender

亲子关系凌驾于夫妻关系之上？父母离间行为对青少年内化问题行为的影响

王堃炎 张天羽 刘明东 张向葵（通讯作者）
东北师范大学心理学院，长春，130024，zhangxiangkui@126.com

摘 要 目的：父母离间行为是指离间父母通过思想灌输、行为控制等方式，诱导孩子对目标父母无理由的恐惧、憎恨及排斥，具体而言就是一方父母（离间父母）以孤立另一方父母（目标父母）为目的，而对孩子进行的心理操纵。父母离间行为是父母婚姻冲突的方式，其结果是影响青少年心理健康和人格的正常发展。以往研究结果表明，父母离间行为是青少年内化问题行为的风险因素，但是对其两者之间的潜在作用机制及其在中国文化背景下是否一致尚不清楚。本研究将探讨父母离间行为对青少年内化问题行为的影响，以及亲子依恋的中介作用和社会支持的调节作用之间的关系。方法：研究采用父母离间行为量表、亲子依恋量表、社会支持量表和青少年内化问题行为量表对 629 名中学生进行调查研究。结果：（1）父母离间行为显著正向预测青少年内化问题行为；（2）亲子依恋在父母离间行为与青少年内化问题行为之间起中介作用；（3）社会支持在父母离间行为影响青少年内化问题行为的直接路径中起调节作用，即在社会支持水平较低的个体中，父母离间行为对青少年内化问题行为的影响更大。结论：父母离间行为通过影响青少年亲子依恋进而影响其内化问题行为，父母离间行为对低社会支持青少年的内化问题行为影响更大。保护儿童不受伤害不仅是儿童自身的发展任务，而且是整个家庭、社会系统的责任。任何形式的儿童虐待都是不可接受的，父母离间行为也不例外。对此，我们建议父母应当树立家庭教育的责任主体，提高共同抚养意识，改变家庭教育游离于受教育权范围之外，同时充分发挥社会支持在化解家庭危机的积极作用。
关键词 父母离间行为，亲子依恋，社会支持，内化问题行为，青少年

音段内和超音段语音意识对单词阅读的影响——汉语母语者和英语母语者的对比研究

姜莹[1]，盖笑松[1,2]（通讯作者）,Jenny Thomson[3]
1 东北师范大学心理学院，长春，130024
2 吉林省普通高等学校人文社会科学重点研究基地东北师范大学心理健康教育研究中心，长春，130024
通讯作者 Email: gaixs669@nenu.edu.cn
3 谢菲尔德大学人类语言交际科学学院，谢菲尔德 S10 2TS, 英国

摘 要 语音意识是指人们感知和操纵口语声音结构的能力。大量证据表明，以拼音文字为母语的人，音段内语音意识和超音段语音意识水平与其阅读技能密切相关。然而，这些关系是否存在于以英语为第二语言的汉语母语者中尚不清楚。此外，音段内和超音段语音意识对于汉语母语者在英语单词阅读中的相对贡献尚未明确。本研究旨在考察英语母语成人和汉语母语成人中，英语音段内和超音段语音意识与单词阅读

和假词阅读之间的联系。在英国和中国招募了年龄匹配的参与者共 150 人，让他们在一个时间点完成了音段内和超音段英语语音意识测试、假词重复测试、快速命名测试以及英语词汇测试。本研究有三个主要发现。首先，音段内语音意识（删除和假词分割）和超音段语音意识（听觉后缀判断和书面后缀判断）与汉语母语成年人的英语真词和假词阅读有显著的相关关系，但这些关系在英国母语成年人中未被发现。在英语母语者中，只有假词分割和假词阅读之间显著相关。其次，在控制了假词重复、快速命名和词汇能力的影响后，超音段语音意识对中国成年人真词阅读的发展影响大于音段内语音意识。第三，在控制了假词重复、快速命名和词汇能力的影响后，汉语母语成人的音段内语音意识对假词阅读的影响大于超音段语音意识。以上结果表明，在汉语母语成人的单词阅读和假词阅读发展中，音段和超音段语音意识起着不同的作用。过去，超音段语音意识的影响在很大程度上被忽视了。本研究解释了汉语母语背景对英语学习的潜在影响，其结果对以象形文字为母语的成人在第二语言读写能力的提升方面具有重要的教育启示。

The Influence of Segmental and Suprasegmental Phonological Awareness on Word Reading—A Comparison Between Native English Speakers and Native Chinese Speakers of English

Ying Jiang[1] Xiaosong Gai[1,2*] Jenny Thomson[3]

1 School of Psychology, Northeast Normal University, Changchun 110024, China

2 Key Research Base of Humanities and Social Sciences of Higher Education in Jilin Province, Center of Mental Health Education and Research, Northeast Normal University, Changchun 110024, China

3 Department of Human Communication Sciences, University of Sheffield, Sheffield S10 2TS, UK

Abstract: Phonological awareness (PA) refers to people's ability to perceive and manipulate the sound structure of a spoken word. Extensive evidence has revealed that segmental PA and suprasegmental PA are closely related to reading skills in native speakers learning to read an alphabetic script such as English. However, whether these relations exist among native Chinese speakers (NCS) of English is less clear. Moreover, the relevant contributions of segmental and suprasegmental PA to word reading are as yet uncharacterized in NCS. This study examined the links between English segmental/suprasegmental PA and word reading/pseudoword reading in native English and Chinese adults. Age-matched participants recruited in the UK and China completed both segmental and suprasegmental English PA assessments along with non-word repetition, rapid naming, and English vocabulary assessments at a single time point. There are three main findings. First, both segmental PA (elision and segmenting nonword) and suprasegmental PA (aural suffix judgment and written suffix judgment) were found to be significantly related to native Chinese adults' English real word and pseudoword reading, but these relations were found in native British adults'. Only segmenting nonwords and pseudoword reading correlated significantly in NES. Second, suprasegmental PA affected Chinese adults' real word reading development more than segmental PA, independent of non-word repetition, rapid naming, and vocabulary. Third, NCS's segmental PA ability had a greater impact than suprasegmental PA on pseudoword reading after controlling for non-word repetition, rapid naming, and vocabulary. The results suggest that segmental PA and suprasegmental PA play different roles in NCS's word reading and pseudoword reading development. The impact of suprasegmental PA has been largely

ignored in the past. This study explains the potential impact of a native language background in Chinese characters on English learning, and the findings may have significant educational implications for enhancing second language literacy skills in adults within a logographic setting.

父母教育期望如何影响青少年学业成绩？--基于 CFPS 数据的实证分析

王芳[1]（通讯作者）
[1]西安交通大学人文社会科学学院，西安，710049

摘 要　本研究探讨了父母教育期望对子女学业成绩的影响及其中的内在机制（父母教育投资和子女学习参与）。研究结论表明，父母教育投资和子女学习投入是父母教育期望影响子女学业成绩的两个重要中介变量。父母教育期望越高，他们为子女支付的直接和间接学费和补习费用就越高。更为重要的是本研究结果表明，父母对青少年的学业辅导和青少年自身的学习参与对其学业成绩有显著的正向影响，而课外补习则对青少年学业成绩的提高没有显著影响。对中介效应的 Bootstrap 估计结果也表明，与父母教育投资相比，父母教育期望对子女学习投入的中介效应相对更高。研究局限、影响及政策建议也进行了讨论。
关键词　父母教育期望，青少年学业成绩，学习参与，教育投资

How do parental education expectations influence youth academic achievement?

-------Evidence from China Education Panel Survey

Wang Fang[1]

[1]School of Humanities and Social Sciences, Xi'an Jiaotong University, No.28 Xianning W. Rd, Beilin District, Xi'an City, Shaanxi, Peoples R China. 710049

Abstract: This study examined the impact of parental education expectation on children's academic achievements, and the internal mechanisms (parents' educational investment and children's learning engagement) involved. We found that parents' educational investment and children's learning engagement are two important mediating variables through which parents' educational expectations affect their children's academic achievements. The higher the expectations, the higher the direct and indirect tuition and training costs parents must pay for their children. Academic counselling for parents and children's learning engagement was found to have a significant positive effect on academic achievement, while no significant improvement was found from tutoring. Bootstrap estimations of the mediation effects also showed that parental education expectations had a relatively higher mediating effect on children's learning input than did parental education investment. Limitations and implications are discussed.

Keywords：Parental education expectation, Children's academic achievement, Learning engagement, Education investment

孰因孰果？ 青少年身体不满意和限制性饮食的纵向追踪

张天羽[1]，王堃炎[1]，顾婷玉[1]，张亚利[2]，刘明东[1]，张向葵[1]（通讯作者）

1 东北师范大学心理学院，长春，130024，通讯作者 E-mail：zhangxiangkui@126.com

2 河北师范大学教育学院，石家庄，050024

摘 要 **背景：**身体不满意和限制性饮食是肥胖心理学及饮食失调研究领域中的热点问题之一。两者在青少年群体中经常同时出现，但它们之间的时间关系尚不明晰。已有研究大多是通过横断取样在西方文化背景下开展的,所得到的研究结果可能不具有良好的稳定性,也不具有较强的准因果关系,而且不能推广到中国青少年群体中。**目的：**基于三重影响模型和目标矛盾理论，考察中国青少年身体不满意与限制性饮食的准因果关系。**方法：**采用身体不满意量表、限制性饮食量表对 672 名青少年（358 名女孩，平均年龄=14.33±0.94）进行 3 个时间点的追踪测量，每次间隔 5 个月。**结果：**（1）方差分析结果显示，身体不满意的时间主效应、性别主效应以及交互效应均不显著；限制性饮食的时间主效应、性别主效应显著，交互效应不显著；（2）相关分析表明，身体不满意与限制性饮食的同时性和继时性相关显著；（3）交叉滞后分析发现，前期的身体不满意均能显著预测后期的限制性饮食行为，反之亦然。**结论和意义：**青少年的身体不满意和限制性饮食行为互为因果。这一发现不仅为在中国背景关于身体不满意和限制性饮食方面的研究提供了参考，而且对减少青少年身体不满意和限制性饮食提供了实证性依据和支持：一方面，心理健康和临床工作者可通过专业的心理训练来改善青少年对自身身体的病态认知、情感和评价。另一方面，学校和相关教育部门也要警示青少年莫要乐此不疲地通过控制饮食来减肥塑性，由此获得的可能并非是一劳永逸的美丽，而是走进了"限制性饮食—身体不满意—限制性饮食"这一相互缠绕、难解难分的"怪圈"。

自我损耗对个体欺骗行为的影响：共情的调节作用

王蔚晨[1] 王静[2] 王海英[1]（通讯作者）

1 东北师范大学心理学院，长春，130024

2 成都市第十二中学初中部，成都，610000

1 东北师范大学心理学院，长春，130024，wanghy178@nenu.edu.cn

摘 要 欺骗行为是指个体有意图通过言语或非言语的方式操纵他人错误信念的行为，包括利他欺骗行为与利己欺骗行为两类。已有研究表明个体在不同情境中做出这两种欺骗行为的倾向性不同。自我控制是个体的重要品质，其水平影响个体道德行为，如欺骗行为。自我控制资源模型认为自我控制过程需要消耗心理资源。自我损耗则是指在自我控制活动后，由于能量耗竭而引起的执行功能下降的状态。但是自我损耗的不良后效可通过所诱导的积极情绪或个体的亲社会人格特征等得到缓解。已有研究表明自我损耗促进个体利己欺骗行为并抑制利他欺骗行为产生。根据共情—利他主义假设，共情抑制个体利己动机激活利他动机。因此本研究推测，共情可缓解自我损耗对欺骗行为的影响，并设计了两个行为实验对这一推测进行探索。研究一首先采用《人际关系指针量表》测量被试特质共情水平，而后采用改编的划"e"任务操纵被试自我损耗水平，并采用"找不同"任务测量被试在高低自我损耗状态下产生的利他和利己欺骗行为次数，考察

特质共情在自我损耗与个体欺骗行为间的缓解作用。研究二在自我损耗任务（同研究一）后利用视频诱发被试状态共情，并对其产生的利他和利己欺骗行为次数进行测量，考察状态共情在自我损耗与个体欺骗行为间的缓解作用。结果表明：(1)高自我损耗状态下的个体产生的利己欺骗行为显著高于利他欺骗行为，低自我损耗状态下个体做出的利己欺骗行为显著低于利他欺骗行为;(2)自我损耗负向预测个体利他欺骗行为，正向预测个体利己欺骗行为，具体而言，高自我损耗组的被试比低自我损耗组的被试做出更多的利己欺骗行为和更少的利他欺骗行为；(3)状态共情在自我损耗与个体欺骗行为间起到调节作用，特质共情调节作用不显著。
关键词　自我损耗，利他欺骗行为，利己欺骗行为，特质共情，状态共情

The Effects of Ego Depletion on Individuals' Deception: the Moderating Role of Empathy

Wang Weichen[1], Wang Jing[2], Wang Haiying[1*]

wanghy178@nenu.edu.cn

Abstract：Deception refers to the behavior that individuals have the intention to manipulate the false beliefs of others through verbal or non-verbal means, including altruistic deception and self-interested deception, and previous studies have shown that individuals have different tendencies to engage in these two deception in different situations. Self-control is an individual's important quality and ability, and its level affects moral behavior of individual, such as deception. The Self-control strength model believes that the process of self-control needs to consume psychological resources, while ego depletion refers to the state of energy exhausted which reduce the performance of executive function after self-control. However, the adverse aftereffects of ego depletion can be alleviated by positive emotions or individual prosocial personality. Previous studies have shown that ego depletion promotes self-interested deception and suppresses altruistic deception. According to the empathy-altruistic hypothesis, empathy suppresses individual self-interested motivation and activates altruistic motivation. Therefore, this study speculated that empathy could alleviate the effect of ego depletion on deception, and designs two behavioral experiments to explore the inference. In study 1, to examine the relationship between ego depletion and deception and the moderated effect of trait empathy, first using Interpersonal Reactivity Index to measure subject trait empathy level, and then adopt adapted "e" task manipulation subject ego depletion level, and using "different task" to measure all subjects' altruistic and self-interested deception. In study 2, to explore the moderated effect of state empathy between ego depletion and deception, using video to induce subjects' state empathy after ego depletion task(the same as study 1), and then measured the number of altruistic and self-interested deception. The results shows that: individuals with high ego depletion had more self-interested deception than altruistic one and individuals with low ego-depletion had more altruistic deception than self-interested one; (2) ego depletion negatively predicts individuals' altruistic deception and positively predicts self-interested deception; (3) state empathy plays an mediated role between the relationship between ego depletion and deception but trait empathy doesn't.
Keywords：ego depletion, altruistic deception, self-interested deception, trait empathy, state empathy

情以何堪：情商心智模式及其对学业投入和学业倦怠的影响*

姜蕴珊　张建卫（通讯作者）　郑文峰　赵正佳
北京理工大学人文与社会科学学院，北京 100081，通讯作者 E-mail：jianweizhang@bit.edu.cn

摘 要 现有研究已经证实情商对学生学业表现具有显著影响，但情商心智模式的内涵结构及其对学业投入和学业倦怠的影响亟需实证厘清。本研究基于自我决定理论，在实证验证情商心智模式的基础上构建了链式中介模型，以考察成长型情商心智模式和固定型情商心智模式对学业投入和学业倦怠的关系及和谐激情、情绪耗竭和乐观悲观主义的中介作用。本研究以 504 名大学生为被试，采用问卷调查法进行调查发现：（1）成长型情商心智模式和固定型情商心智模式分别能够显著正向预测学业投入及学业倦怠。（2）和谐激情和乐观主义在成长型情商心智模式与学业投入的关系中起中介作用，且该中介作用包含三条路径：和谐激情的单独中介作用、乐观主义的单独中介作用以及和谐激情-乐观主义的链式中介作用。（3）情绪耗竭和悲观主义在固定型情商心智模式与学业倦怠的关系中起中介作用，该中介作用包含两条路径：情绪耗竭的单独中介作用及情绪耗竭-悲观主义的链式中介作用。本研究从理论上提出情商心智模式并实证探索了情商心智模式影响学生学业表现的作用机制，有助于深化对情商及学业表现的认识，为大学生学业投入的培养提供了实践启示。

Emotional Quotient is too heavy to bear：EQ Mindset and their Impact on Academic Engagement and Burnout*

Yunshan Jiang, Jianwei Zhang (Corresponding Author), Wenfeng Zheng, Zhengjia Zhao
School of Humanities and Social Sciences, Beijing Institute of Technology, Beijing 100081,
jianweizhang@bit.edu.cn

Abstract: Previous studies have indicated a significant impact of emotional intelligence (hereinafter EQ) on students' academic performance. However, it is still unclear the internal structure of the EQ mindset and its effects on academic engagement and burnout. Based on the self-determination theory, the current study constructed a serial mediating model to examine the relationship between EQ mindset (i.e., the growth EQ mindset and the fixed EQ mindset) on academic engagement and burnout. Furthermore, we examined the mechanisms of which EQ mindset might function. Across an empirical study of 504 college students, we found that the growth EQ mindset and the fixed EQ mindset models significantly and positively predicted academic engagement and academic burnout. Further, student's academic engagement was affected by the growth EQ mindset support partly through 3 different pathways: a) the separate mediation of harmonizing passion, b) the separate mediation of optimism, c) the chained mediation of harmonizing passion-optimism; and the accumulative mediating effects of emotional exhaustion and pessimism on the relationship between the fixed EQ mindset and academic burnout, while only the independent effects of emotional exhaustion. This study theoretically proposed the EQ mindset and empirically explored the mechanism by which the EQ mindset affects students' academic performance. Moreover, the results of this study deepen our understanding of the relationship between EQ and academic performance. Finally, this study provided practical insights into the cultivation of college students' commitment to learning.

助力还是阻力？压力心智模式影响大学生亲环境行为的双路径机制*

杨文亚　张建卫（通讯作者）　付萌萌　许亚楠

北京理工大学人文与社会科学学院，北京 100081，通讯作者 E-mail：jianweizhang@bit.edu.cn

摘 要 亲环境行为是个体在生态方面道德决策的结果。已有研究表明压力反应与道德决策结果显著相关。作为塑造压力反应的源头，压力心智模式是否也会对个体道德决策结果（如亲环境行为）产生影响？本研究认为压力心智模式（压力促进心智模式与压力损害心智模式）与亲环境行为之间呈现出较为复杂的关系。具体来说，压力促进心智模式通过道德想象会对大学生亲环境行为产生促进作用，而压力损害心智模式通过道德解脱会对大学生亲环境行为产生抑制作用。此外，研究基于社会认知理论，认为道德认同可正向调节压力促进心智模式对大学生亲环境行为的间接作用，并负向调节压力损害心智模式对大学生亲环境行为的间接作用。由此本研究采用问卷法对 523 名学生被试进行调查发现：(1) 压力损害心智模式会诱发更多的道德解脱，进而对大学生亲环境行为产生负面影响。(2) 压力促进心智模式会诱发更多的道德想象，进而对大学生亲环境行为产生正向影响。(3) 道德认同负向调节了压力损害心智模式通过道德解脱对大学生亲环境行为的间接效应，即当道德认同水平较低时，这种效应越强。(4) 道德认同不会调节压力促进心智模式通过道德想象对大学生亲环境行为的间接效应。本研究有助于深化压力情境下大学生亲环境行为形成机制的认识，更全面了解其压力心智模式对亲环境行为的作用机制，对优化大学生亲环境行为的培养实践有一定的指导意义。

Assistance or Resistance? A Dual Pathway Mechanism of a Stress Mindset and University Students' Pro-Environmental Behaviors*

Wenya Yang, Jianwei Zhang (corresponding author), Mengmeng Fu, Yanan Xu

School of Humanities and Social Sciences, Beijing Institute of Technology, Beijing 100081, jianweizhang@bit.edu.cn

Abstract: Pro-environmental behavior is the result of moral decision-making in ecology. Previous research has documented that stress responses are significantly associated with moral decision-making. As the source, do stress mindsets shaping individual stress responses impact moral decision-making (e.g., pro-environmental behavior)? We argued that the relationship between a stress mindset (Stress-is-enhancing mindset and Stress-is-debilitating mindset) and pro-environmental behavior is complex. Specifically, the stress-is-enhancing mindset has a positive indirect effect on students' pro-environmental behaviors via moral imagination. Yet, a stress-is-debilitating mindset has a negative indirect effect on students' pro-environmental behaviors via moral disengagement. Additionally, drawing on social-cognitive theory, moral identity positively moderates the indirect relationship between the stress-is-enhancing mindset and pro-environmental behaviors and negatively moderates the indirect relationship between the stress-is-debilitating mindset and pro-environmental behaviors, respectively. A total of 523 students were recruited to participate in this study and completed self-report measures of stress mindset, moral identity,

* 基金项目：国家社会科学基金重点项目 (22AZD026)

* The research was supported by the Key Project of National Social Science Foundation of China (22AZD026)

moral imagination, moral disengagement, and pro-environmental behavior. The results suggest that a) stress-is-enhancing mindset has a positive indirect influence on students' pro-environmental behaviors through moral imagination, b) stress-is-debilitating mindset has a negative indirect influence on students' pro-environmental behaviors through moral disengagement, c) moral identity negatively moderated the indirect influence of stress-is-debilitating mindset on students' pro-environmental behaviors through moral disengagement, such that this relationship is stronger under conditions of lower level moral identity, and d) moral identity has no significant moderator effect on the indirect influence of stress-is-enhancing mindset on students' pro-environmental behaviors through moral imagination. The current study benefits more comprehensive insight into the mechanism of university students' pro-environmental behaviors in stress conditions. Theoretical and practical implications are also discussed.
Keywords**:** stress mindset, pro-environmental behavior, moral identity, moral imagination, moral disengagement

关系质量与儿童共情能力关系的三水平元分析

赵雪融[1] 张向葵[1]（通讯作者） 闫亚昕[1] 程浩[2]

[2]赣南师范大学教育科学学院，赣州， 341000

摘 要 共情是关心他人的火花，是社交生活的粘合剂。大量研究发现，儿童期是共情发展的关键阶段，在此期间，儿童共情能力在高质量的亲子和同伴关系中快速发展。关于亲子和同伴关系质量与儿童共情的研究，不同研究采用了不同维度和指标评估关系质量和共情,导致已有研究结果存在亲子和同伴关系质量与儿童共情能力的关系仍不完全明晰的问题，因此亟需进一步研究。本元分析研究纳入 57 项研究、274 个效应量、16916 名被试，采用三水平元分析，分别考察了亲子和同伴关系质量与儿童共情能力的关系。主效应检验结果显示，亲子关系质量和儿童共情能力呈中度显著正相关关系(r = 0.21, 95%CI = [0.16, 0.25])，同伴关系质量和儿童共情能力呈中高度显著正相关关系(r = 0.25, 95%CI = [0.18, 0.32])。此外，调节效应检验发现，亲子关系质量和儿童共情能力的关系受到关系质量维度、关系质量指标、共情维度和共情指标的调节，但不受关系对象和性别的调节。与亲子关系质量的消极维度相比，积极维度与共情之间的相关性更强。在亲子关系质量指标方面，亲子依恋与儿童共情能力存在较强的正相关关系；而父母消极养育与儿童共情能力具有较强的负相关关系。关于共情维度，相较于情绪和行为共情，亲子关系质量与儿童认知共情的相关性更强。在共情指标中，亲子关系质量与心理理论之间的相关性较强。然而，同伴关系质量和儿童共情能力的关系仅受到关系质量指标的调节。具体而言，与同伴拒绝相比，同伴消极冲突与儿童共情能力的相关性更强。上述结果表明，亲子和同伴关系质量均与儿童共情能力密切相关。未来研究应重点关注亲子依恋对儿童共情的积极影响，以及父母消极养育和同伴消极冲突对儿童共情的消极影响。

[1]School of Psychology, Northeast Normal University, Changchun 130024

[2]School of Education Science, Gannan Normal University, Ganzhou, 341000

Abstract: Empathy is the spark of human concern for others, and the glue that makes social life possible. Many studies have found that childhood is the critical stage for the empathy development, during which children's empathy develops rapidly in the high-quality parent-child and peer relationships. For the relevance investigations between the children's empathy and the qualities of the parent-child as well as peer relationships, various dimensions and indicators are used in different studies to evaluate the relationship quality and the empathy, leading the relevance between the children's empathy and the qualities of the parent-child and peer relationships not sufficiently clear. Therefore, it is urgent to perform further investigations. In this study, the meta-analysis adopts 57 studies, 274 effect sizes, and 16,916 participants, a three-level meta-analysis is then used to investigate the relevance between the children's empathy and the qualities of the parent-child as well as peer relationships. The results reveal a moderately significant positive correlation between the children's empathy and the parent-child relationship quality (r = 0.21, 95%CI = [0.16, 0.25]), and a moderate-to-large positive correlation between the children's empathy and the peer relationship quality (r = 0.25, 95%CI = [0.18, 0.32]). In addition, the moderation analyses show that the relationship between the children's empathy and the parent-child relationship quality can be moderated by the relationship quality dimensions, indicators, the empathy dimensions, and indicators, but not by the relationship objects and the gender. Compared with the negative dimension of the parent-child relationship quality, the association between the positive dimension and the empathy is stronger. Regarding the indicators of the parent-child relationship quality, there is a strong positive correlation between the parent-child attachment and the children's empathy, while the negative parenting has a strong negative relevance with the children's empathy. As for the empathy dimension, children's cognitive empathy is more strongly associated with the parent-child relationship quality when compared with the emotional and behavioral empathy. Among the empathy indicators, the parent-child relationship quality has a strong correlation with the mind theory. However, the relationship between the children's empathy and the peer relationship quality is only moderated by the relationship quality indicators. In particular, compared with the peer rejection, the negative peer conflict has a stronger relevance with the children's empathy. The meta-analysis results in this study indicate that the qualities of the parent-child and peer relationships are closely related to the children's empathy. Future research should focus on the positive influence of the parent-child attachment on the children's empathy, and the negative influence of the negative parenting and peer conflict on the children's empathy.

Key words: children; empathy; parent-child relationship quality; peer relationship quality; three-level meta-analysis

社会情感能力对学习投入的影响：师生关系和学校归属感的链式中介作用

黄鑫[1,2]　王丽娟[1]（通讯作者）　李铭秀[2]
（1.东北师范大学心理学院，长春　130000；2.四川省成都市树德中学，成都 610000）
通讯作者：王丽娟，Email: wanglj699@nenu.edu.cn

摘 要　社会情感能力对中学生的认知发展、主观幸福感、学业成就，减少问题行为等方面有显著影响。然而，社会情感能力影响学生学习投入的具体机制尚不明确。研究初三学生的学习投入对于促进学生的学业发展具有不可忽视的重要作用。本研究以《社会情感能力量表》、《师生关系问卷》、《学习投入问卷》，《学校归属感问卷》为研究工具，采用方便取样法对西南地区某中学 323 名初三学生（女生 52%）进行问卷调查，考察社会情感能力、师生关系和学校归属感对学习投入的影响。结果显示：（1）社会情感能力、师生关系、学校归属感与学习投入及其各维度之间均存在显著正相关；（2）社会情感能力能够直接预测学习投入，直接效应值为 0.169；（3）师生关系在社会情感能力与学生的学习投入之间起独立中介作用，其中介效应值为 0.233；（4）学校归属感在社会情感能力与学习投入之间起独立中介作用，其中介效应值为 0.145；（5）师生关系和学校归属感在社会情感能力与学习投入之间起链式中介作用，其中介效应值为 0.068。研究建议，学校应重视中学生社会情感能力的培养，开展社会情感能力学习项目；教师注重在支持的环境中建立良好的师生关系，增强学生的学校归属感，进而促进学生的学习投入。本研究结果丰富了现阶段关于社会情感能力与学习投入的研究，为培养中学生的学习投入提供了新途径。

The Effect of Social and Emotional skills on Learning Engagement: The Chain Mediating Role of Teacher-Student Relationship and Sence of School Belonging

HUANG Xi[1,2]　WANG Lijuan[1]　LI Mingxiu[2]
（1.Faculty of Psychology,Northeast Normal University,Changchun 130000;2.Chengdu Shude High School,Chengdu　610000 ）

Abstract： Social and Emotional skills has a significant impact on promoting cognitive development, subjective well-being, academic achievement, and reducing problem behaviors in middle school students.However, the specific mechanisms on social and emotional skills influences students' learning engagement are unclear.The study of junior high school students' learning engagement plays an important role that cannot be ignored in promoting students' academic development.Using the Social Emotional Skills Scale, Teacher-Student Relationship Questionnaire, Learning Engagement Questionnaire, and Sense of School Belonging Questionnaire as the research tools, this study used the convenience sampling method to administer a questionnaire survey to 323 junior high school students (52% girls) in a middle school in southwest china to examine the effects of social and emotional skills, teacher-student relationship, and sense of school belonging on learning engagement.The results show that (1) there was a significant positive correlation between social and emotional skills, teacher-student relationship, sense of school belonging and learning engagement and its dimensions;(2) Social and emotional skills directly predicted learning engagement with a direct effect value of 0.169;(3) Teacher-student relationship acts as an independent mediator between social and emotional skills and students' learning engagement with a mediation effect value of 0.233;(4)Sence of school belonging acts as an independent mediator between social and emotional skills and learning engagement with a mediation effect value of 0.145;(5) Teacher-student relationship and sense of school belonging acted as chain mediators between social and emotional skills and learning engagement with a mediation effect value of 0.068.This study recommend that schools should emphasize the development of social and

emotional skills in secondary school students by conducting social and emotional skills learning programs; and that teachers should focus on building good teacher-student relationship in supportive environments to enhance students' sense of school belonging which in turn promotes students' learning engagement .The results of this study enrich the research on social and emotional skills and learning engagement and provide a new way to cultivate middle school students' learning engagement .

Keywords： Social and Emotional skills,Learning Engagement,Teacher-Student Relationship,Sence of School Belonging

指导家庭教育如何预防小学生网络沉迷：基于一项实证研究

龙春兰 [1] 刘思扬 [2]

1 华中师范大学心理学院 武汉 430070

2 华中师范大学心理学院 武汉 430070 Liusiyang015@outlook.com

摘 要 随着网络使用低龄化的影响，预防小学生网络沉迷是教育面临的困境之一。基于家校协同育人理念，提升家庭教育质量是学校的重要职责。通过实证研究了解影响小学生网络沉迷的因素将有利于学校针对性地进行家庭教育指导。基于家庭系统理论提出研究假设，采用智能手机依赖量表、焦虑量表、亲子冲突量表、网络沉迷量表对湖南省的 501 名小学家长展开研究。结果发现：①家长手机依赖与小学生网络沉迷呈显著正相关（r=0.60，P <0.001)，与家长焦虑和亲子冲突分别呈显著正相关（r =0.44,0.38,P <0.001)；②通过链式中介模型检验，家长手机依赖对小学生网络沉迷直接效应显著，效应值为 0.48；家长焦虑和亲子冲突在家长手机依赖与小学生网络沉迷之间均单独起中介作用，中介效应值分别是 0.04、0.08；并且它们构成的链式中介效应也显著，效应值为 0.03。因此，学校可以通过展示实证研究结果让家长意识到自己行为对于小学生网络沉迷的重要性，同时可以从帮助家长减少手机依赖、缓解焦虑以及建立良好的亲子关系的角度提出家庭教育具体指导建议，形成积极和谐的家庭氛围，预防小学生网络沉迷。

Guidance on Family Education to Prevent Elementary School Students' Internet Addiction: Based on an Empirical Study

1 School of Psychology, Central China Normal University, Wuhan 430070

2 School of Psychology, Central China Normal University, Wuhan 430070

Email: Liusiyang015@outlook.com

Abstract With the increasing trend of younger children using the internet, preventing internet addiction among elementary school students has become a significant challenge in education. Based on the concept of collaborative parenting between families and schools, improving the quality of family education becomes an important responsibility of schools. Conducting empirical research to understand the factors influencing internet addiction among elementary school students will help schools provide targeted guidance on family education. Using the Family Systems Theory, this study proposes research hypotheses and conducts research on 501 elementary school parents in Hunan Province, using the Smartphone Dependency Scale, Anxiety

Scale, Parent-Child Conflict Scale, and Internet Addiction Scale. The results revealed the following findings: ①There is a significant positive correlation between parents' smartphone dependency and elementary school students' internet addiction ($r = 0.60$, $P < 0.001$). Parental anxiety and parent-child conflict also show significant positive correlations with internet addiction ($r = 0.44, 0.38$, $P < 0.001$), respectively. ②Through the examination of a chain mediation model, it was found that parents' smartphone dependency has a direct and significant effect on elementary school students' internet addiction, with an effect size of 0.48. Parental anxiety and parent-child conflict individually play mediating roles between parents' smartphone dependency and internet addiction, with mediation effect sizes of 0.04 and 0.08, respectively. Additionally, the chain mediation effect formed by these factors is also significant, with an effect size of 0.03. Therefore, schools can use the results of this empirical research to raise parents' awareness of the importance of their behaviors in preventing internet addiction among elementary school students. Furthermore, specific family education guidance can be provided to help parents reduce smartphone dependency, alleviate anxiety, and foster a positive parent-child relationship, thereby creating a harmonious family atmosphere and effectively preventing internet addiction among elementary school students.

Keywords family education; smartphone dependency; anxiety; parent-child relationship; internet addiction

消极老年刻板印象与老年人目标追求的日记研究

麻雨婷　张宝山（通讯作者）
陕西师范大学心理学院，西安，710062，zhangbs@snnu.edu.cn

摘 要　消极老年刻板印象在老年人的日常生活中普遍存在。以往研究发现，刻板印象威胁与目标取向密切相关，但现实生活中老年人的消极老年刻板印象经历与目标追求之间的关系尚不明确。本研究通过一项为期 7 天的日记研究设计，探讨了消极老年刻板印象经历与老年人日常目标追求的关系，以及威胁、挑战反应的中介作用和自我完整性的调节作用。100 名老年人连续七天参与问卷调查，评估他们每日的消极老年刻板印象经历、威胁和挑战反应、目标追求和自我完整性。结果表明，消极老年刻板印象通过两条不同的中介路径影响老年人的日常目标追求，即消极老年刻板印象经历一方面通过威胁反应与目标追求中回避责任的倾向正相关，另一方面通过挑战反应与每日目标进展负相关。此外，自我完整性在两个中介过程中发挥不同的调节作用。具体而言，自我完整性缓解了威胁反应与回避责任之间的正相关关系，以及消极老年刻板印象经历与挑战反应之间的负相关关系。研究结果揭示了现实生活中老年人的刻板印象经历与目标追求之间的关系及其机制，不仅丰富了老年刻板印象理论，而且为老年人目标追求的干预研究提供了理论借鉴，有助于促进老年人健康老龄化。

关键词　消极老年刻板印象，威胁和挑战反应，目标追求，老年人

A Daily Diary Study of Negative Aging Stereotypes and Goal Pursuit in Older Adults

MA Yuting, ZHANG Baoshan
School of Psychology, Shaanxi Normal University, Xi'an, 710062

Abstract: Aging stereotypes are ubiquitous in the lives of older adults and are closely related to goal orientation, but few studies have examined the relationship between negative aging stereotype experiences and goal pursuit in older adults in real life. Through a seven-day diary study design, this study examined the relationship between negative aging stereotype experiences and daily goal pursuit as well as the intervening roles of threat and challenge reaction and self-integrity. One hundred older adults completed measures assessing their daily experiences of negative aging stereotypes, threat and challenge reaction, goal pursuit and self-integrity for one week. The results showed that negative aging stereotypes are associated with daily goal pursuit in older adults through two separate pathways, namely, negative aging stereotype experiences are positively related to avoidance of responsibilities in goal pursuit through threat reaction, and negatively associated with progress toward goals through challenge reaction. Moreover, self-integrity played different moderating roles on the two mediating processes. That is, self-integrity weakens the positive relationship between threat reaction and avoidance of responsibility, and weakened the negative association between negative aging stereotype experiences and challenge reaction. This study is the first to reveal the relationship between aging stereotypes and goal pursuit of older adults in real life. Our findings not only enrich the literature on aging stereotypes, but also offer theoretical guidance for future interventions of goal pursuit and contributes to promoting healthy aging in older adults.

Keywords: negative aging stereotype, threat and challenge reaction, goal pursuit, older adults

父母媒介干预、影响因素及与儿童问题性媒介使用的关系：基于潜在剖面分析

李娟[1] 赵雅男[1] 李燕[1]（通讯作者）
1 上海师范大学学前教育学院，上海，200234，liyan@shnu.edu.cn

摘 要 在数字时代，儿童被各种数字媒介（如手机、电脑）所包围，要降低儿童过度暴露或依赖于屏幕媒介的风险及其对儿童发展功能的消极影响（即问题性媒介使用），父母的媒介干预至关重要。父母媒介干预是家长理解、支持和规范儿童媒介相关的行为或活动的一系列措施，主要包括积极干预、限制干预、共同观看以及监督。本研究通过对 1415 名儿童及其父母进行了调查，对父母的媒介干预进行潜在剖面分析，采用父母媒介干预量表、夫妻关系量表以及儿童问题性的媒介使用量表，以探讨父母媒介干预的类型特点及其影响因素，以及不同类型的媒介干预与儿童问题性媒介使用之间的关系。结果表明：（1）学前儿童父母的媒介干预可以分为四种潜在类别：母亲主导的干预（母亲高水平父亲低水平，28.20%）、父亲主导的干预（父亲高水平母亲低水平，24.88%）、一致的高水平干预（母亲和父亲均高水平，26.99%）及一致的低水平干预（母亲和父亲均低水平，19.93%）。（2）父母子系统、儿童子系统以及更广泛的社会环境（如夫妻关系）均会影响父母媒介干预。首先，孩子年龄越小，父母越可能属于一致的高水平干预；孩子的性别与媒介干预的类型不存在显著关系。其次，父亲年龄越小，他们越有可能被分到一致的高水平干预，而母亲年龄与媒介干预类型之间的关系不显著；父母学历越高更可能属于一致的高水平干预。最后，父母报告的婚姻冲突越多，越有可能属于一致的低水平干预；反之，他们更有可能是一致的高水平干预；父亲感知的婚姻冲突越少，则越可能属于父亲主导干预；母亲感知的婚姻冲突越少，则越可能属于母亲主导干预。（3）在不同的媒介干预类型上，儿童问题性的媒介使用存在显著差异。一致的高水平干预下儿童出现媒体使用问题的可能性最低，而一致的低水平干预下则最高；相比父亲主导干预类型，母亲主导干预类型下儿童问题性媒介使用的可能性更低。研究结果有助于父母调节其媒介干预行为，形成最佳的、适宜的媒介干

预模式，并促进数字时代的儿童获得更好发展。

关键词 父母媒介干预，影响因素，儿童问题性的媒介使用，潜在剖面分析

Chinese Parental Mediation, Predictors, and Associations with Child Problematic Media Use: A Latent Profile Analysis

Li Juan[1] Zhao Yanan[1] Li Yan[1](corresponding author)
1 Shanghai Institute of Early Childhood Education, Shanghai Normal University, Shanghai, 200234, liyan@shnu.edu.cn

***Abstract*:** In the digital age, children are surrounded by various digital media such as smartphones and computers. Parental mediation is crucial to prevent children from excessive exposure or reliance on screen media and its negative impact on their development (i.e., problematic media use). Parental mediation refers to a series of measures taken by parents to understand, support, and regulate children's media-related behaviors or activities, including active mediation, restrictive mediation, co-viewing, and monitoring. In this study, 1415 children and their parents were investigated. Parental mediation was analyzed by the method of latent profile analysis. The parental mediation scale, the couple relationship scale, and the children's problematic media use scale were measured. The purpose of this study was to examine the characteristics of the mediation profiles and their influencing factors, as well as the association between the mediation profiles and children's problematic media use. The results indicated that: (1) Parental mediation for parents of preschool children can be classified into four latent profiles: mother-dominated mediation (high-mother and low-father mediation, 28.20%), father-dominated mediation (high-father and low-mother mediation, 24.88%), consistent high-level mediation (high level of fathers and mothers, 26.99%), and coordinated low-level mediation (low level of fathers and mothers, 19.93%). (2) The parental-child subsystem, child subsystem, and broader social environment (such as marital relationship) all influenced parental mediation. Firstly, the younger the child, the more likely parents belonged to consistent high-level mediation group; child's gender had no significant relationship with mediation profiles. Secondly, the younger the father's age, the more likely they were classified into consistent high-level mediation group, while there was no significant relationship between mother's age and mediation profiles; parents with higher education were more likely to belong to consistent high-level mediation group. Finally, the more marital conflict reported by parents, the more likely they were classified into consistent low-level mediation group; conversely, they were more likely to be classified into consistent high-level mediation group; the fewer perceived marital conflicts by the father, the more likely they belonged to father-dominated mediation group, and the fewer perceived marital conflicts by the mother, the more likely they belonged to mother-dominated mediation group. (3) Based on the different mediation profiles, there were significant differences in problematic media use in children. The likelihood of children having media use problems was lowest in the consistent high-level mediation group, while it was highest under consistent low-level mediation group; the likelihood of problematic media use was lower under mother-dominated mediation group compared to father-dominated mediation group. These findings can help parents to regulate their mediation behaviors, develop optimal and appropriate mediation patterns, and promote better development of children in the digital age.

Keywords: parental mediation, influencing factors, children's problematic media use, latent profile analysis

水下特种作业对认知能力的影响研究

摘 要 **目的** 随着人类海洋探索任务的不断增加，水下特种作业越来越普遍。水下特种作业需要在特殊的高压环境中进行体力劳动。除了良好的体能，完整的认知能力对于顺利且安全地完成作业至关重要。水下特种作业因其特殊性可能会引起认知能力的变化。本研究旨在探索水下特种作业对认知能力的影响及其可能的机制。**方法** 本研究首先利用认知能力测量系统，在特种作业潜水员水下特种作业前后进行加工速度和记忆力的测试，并收集其唾液测量作业前后的应激激素水平的变化，利用问卷评估作业前后焦虑情绪的变化。本研究收集了 30min 和 3h 两种作业时长作业前后的数据。然后利用 2.0ATA 环境下大鼠游泳的方式构建模拟水下特种作业动物模型。75 只雄性 SD 大鼠随机分为 5 组，空白对照组（NC 组），2.0ATA 环境中不同时长游泳组（AS0.5h 组，AS1h 组，AS2h 组及 AS3h 组）。各组大鼠首先进行 5 天的 Morris 水迷宫定位航行训练。第 6 天，除 NC 组外，其余各组大鼠在模拟加压舱 2.0ATA 环境中游泳。造模后每组 6 只恢复 30min 后进行行为学测试，利用水迷宫空间探索测试检测认知能力，利用旷场试验检测情绪及应激状态。每组 3 只取全脑组织固定于多聚甲醛溶液中进行 HE 染色和尼氏染色检测海马结构。每组剩余的 6 只取血清和海马标本进行生化检测，利用 ELISA 检测血清中 CORT 的水平；QRT-PCR 检测海马中 IL1-β mRNA, IL6 mRNA, TNF-α mRNA, BDNF mRNA 和 TRKB mRNA 的相对表达水平。 **结果** 进行 30min 水下特种作业的特种作业潜水员作业结束后，加工速度和记忆力显著提升（$P<0.001$），应激水平与焦虑情绪无明显变化；而进行 3h 水下特种作业的特种作业潜水员作业结束后，加工速度和记忆力显著下降（$P<0.05$），应激水平和焦虑情绪显著增加。动物实验发现短时间的模拟水下特种作业并不会对认知能力造成影响，但是时长超过 2h 的模拟水下特种作业会造成显著的认知能力下降、急性应激反应、焦虑情绪、海马结构和功能的损伤以及神经炎症反应。具体表现为，与 NC 组相比，水迷宫空间探索测试时，AS3h 组平台穿越次数（$P<0.01$）和目标象限时间百分比（$P<0.01$）显著减少；旷场实验时，AS3h 组运动总距离（$P<0.01$）和中央区域活动时间（$P<0.05$）显著减少；AS3h 组血清中 CORT 显著升高（$P<0.01$）；病理检查提示 AS3h 组出现明显海马神经元固缩、细胞肿胀，尼氏体数量减少；AS3h 组 BDNF/TRKB 基因及蛋白表达均显著下降；AS3h 组炎症因子基因表达显著升高。**结论** 我们的研究发现水下特种作业对认知能力的影响具有时长依赖性，长时间的水下特种作业作为一种强烈的急性应激源会引起认知能力的显著下降，神经炎症反应可能是长时间水下特种作业至认知损伤的关键机制之一。我们的研究结果对水下特种作业人员的认知功能保护具有一定的参考意义。

Navy Special Medical Center，Naval Medical University，Shanghai 200433 China

***Abstract*：Objective** In the context of ongoing human ocean exploration missions, underwater special operation is increasingly common. Underwater special operation requires physical effort in a special high-pressure environment. Besides physical fitness, intact cognitive functions are essential for the successful and safe completion of underwater special operations. Underwater special operation may induce changes in cognitive functions. The aim of this study was to explore the impact of underwater special operation on cognitive functions and possible mechanism. **Methods** We first tested the processing speed and memory ability of special operations

divers before and after underwater special operations and collected saliva to measure changes in CORT levels and evaluated changes in anxiety levels using a questionnaire. In this study, data were collected before and after operations of both 30min and 3h operational duration. A simulated underwater special operation animal model was then constructed by letting rats swimming in a 2.0 ATA environment. 75 male SD rats were randomly divided into 5 groups, a normal control group (NC group), and different duration swimming groups in a 2.0 ATA environment (AS0.5h, AS1h, AS2h and AS3h groups). Each group included 15 rats. After 7 days' acclimatization, the rats in each group first underwent 5 days of Morris Water Maze (MWM) training. On day 6, all groups of rats, except the NC group, swam in a simulated 2.0 ATA hyperbaric environment. Behavioral tests were performed after 30 min of rest for 6 rats in each group after modelling. The MWM test was conducted to evaluate the cognitive performance of the rats and the Open Field Test (OFT) was used to evaluate their emotional and stress states. The whole brain tissue of 3 rats in each group was fixed in paraformaldehyde solution for HE staining and Nissl staining to evaluate hippocampal structure. The remaining 6 rats in each group were subjected to biochemical analysis using serum and hippocampal specimens. The level of CORT was measured by ELISA. The relative expression levels of IL1-β mRNA, IL6 mRNA, TNF-α mRNA, BDNF mRNA and TRKB mRNA in the hippocampus was measured by QRT-PCR. **Results** After 30 min of underwater special operation, the special operations divers showed a significant increase in processing speed and memory, and no significant changes in stress and anxiety. Whereas after 3 h of underwater special operation, the special operations divers showed a significant decrease in processing speed and memory, and a significant increase in stress and anxiety. Short duration of simulated underwater special operation did not affect cognitive performance but simulated underwater special operation lasting longer than 2h caused significant cognitive decline, acute stress response, anxiety, damage to hippocampal structure and function, and neuroinflammatory responses. Compared to the NC group, the AS3h group showed a significant reduction in the number of platform crossings (P<0.01) and percentage of time in the target quadrant (P<0.01) during the MWM test; a significant reduction in the total distance of movement (P<0.01) and central area activity time (P<0.05) during the OFT; a significant increase in the level of CORT (P <0.01); significant hippocampal neuronal consolidation, cell swelling and reduced number of nissl bodies; a significant decrease in the expression of BDNF/TRKB and a significant increase in the relative expression of inflammatory factor. **Conclusion** The effects of underwater special operation on cognitive performance are time-dependent. Long duration underwater special operation, working as a strong acute stressor, can cause significant cognitive decline, and the neuroinflammation may be one of the key mechanisms. Our findings have implications for the protection of cognitive functions in underwater workers.

Keywords：underwater special operations, cognitive ability, neuroinflammation

中-英双语者二语键入过程中的语音和正字法加工

刘月月[1]　张德阳[1] 傅永丽[1] 何文广[2]（通讯作者）

摘　要　书写产生领域关注两个基本问题，一是认知编码阶段的正字法通达是否存在语音中介，二是认知编码阶段的语言信息是否影响书写的动作执行。以往研究主要集中在母语手写领域，而对二语以及键入方式的关注不够。本研究采用图-词干扰范式，以熟练和非熟练中-英双语者为被试，通过两个实验系统探讨了二语键入过程中认知编码阶段和动作执行阶段的语音效应和正字法效应。实验设计为 5（SOA：－200 ms，－100 ms，0 ms，100 ms，200 ms）×3（干扰词类型：仅正字法高相关，仅语音高相关，无关）两因素被

试内设计，因变量为认知编码阶段上键入图片名称的反应时（response times，RTs），动作执行阶段上整词键入的持续时间（whole response duration，WRD）和按键间隔时间（interkeystroke intervals，IKIs）。实验 1 探讨熟练双语者键入二语时语音在正字法通达中的作用以及语言信息对动作执行的影响。结果发现，认知编码阶段，SOA 为－200 ms 时，RTs 指标上同时出现了正字法促进效应和语音促进效应，表明正字法和语音可同时激活；动作执行阶段，SOA 为 0 ms 时，WRD 指标上出现语音促进效应，表明语音促进了整词键入速度。实验 2 探讨非熟练双语者键入二语时语音在正字法通达中的作用以及语言信息对动作执行的影响。结果发现，认知编码阶段，RTs 指标上正字法促进效应出现在 SOA 为－200 ms，而语音促进效应出现在 SOA 为 0 ms，表明正字法激活早于语音；动作执行阶段，SOA 为－200 ms 时 WRD 指标上出现正字法促进效应，SOA 为－100 ms 时 IKIs 指标上出现语音抑制效应且 WRD 指标上出现边缘显著的语音抑制效应，SOA 为 100 ms 时 WRD 指标上出现语音抑制效应，表明正字法在较早期（SOA=－200 ms）促进了整词键入速度，语音随后（SOA=－100 ms）延迟了按键间隔时间并出现延迟整词键入速度的趋势，并最终在较晚期（SOA=100 ms）延迟了整词键入速度。结论：（1）熟练和非熟练中-英双语者键入二语时，正字法激活均不晚于语音，支持正字法自主假说；（2）语音和正字法信息对动作执行的影响受二语熟练度的调节，这可能源于动作执行阶段不同熟练水平双语者的语音和正字法的表征质量与可及性不同。

Phonological and orthographic processing during second language typing production of Chinese-English bilinguals

***Abstract*:** Two basic issues in the field of written production concern whether phonology influences the output of orthography and how language processes affect the action execution. Previous studies conducted in the native language have provided evidence for handwriting production, less is known about how phonology and orthography work in second language(L2) typing production, and whether their work would be mediated by second language proficiency. In the current study, the picture-word interference paradigm was adopted, in which proficient and non-proficient Chinese-English bilinguals were required to typewrite the English names of pictures while attempting to ignore written distractor words. The distractor was either orthographically highly related only(*near-bear*), phonologically highly related only(*chair-bear*), or unrelated (*cloud-bear*) to the picture name(e.g., *bear*). The response times (RTs) for the phase of cognitive coding, as well as the whole response duration (WRD) and the mean length of inter-keystroke intervals (IKIs) for the phase of action execution, were recorded. Experiment 1 examined the influence of phonology on the output of orthography and the effects of phonological and orthographic processes on typing action execution for proficient bilinguals. Results showed that both orthographic and phonological representations were activated simultaneously when SOA was－200 ms in the phase of cognitive coding. In the phase of action execution, phonology shortened the WRD when SOA was 0 ms. Experiment 2 explored the influence of phonology on the output of orthography and the effects of phonological and orthographic processes on typing action execution for non-proficient bilinguals. Results found that in the phase of cognitive coding, the orthographic priming effect appeared when SOA was －200 ms, and the phonological priming effect appeared when SOA was 0 ms, indicating that the activation of orthography was earlier than that of phonology. In the phase of action execution, orthography shortened the WRD when SOA was －200 ms, and phonology then prolonged the IKIs and had a tendency to slow down the WRD when SOA was －

100 ms, which eventually delayed the WRD when SOA was 100 ms. The overall results suggested that the activation of orthography was no later than phonology during second language typing production for both proficient and non-proficient bilinguals, which supported the orthographic autonomy hypothesis. In addition, the effects of phonological and orthographic processes on typing action execution were modulated by second language proficiency, which might be due to the difference in the quality and accessibility of phonological and orthographic representations in the phase of action execution for bilinguals with different proficiency.

二语书写可直接通达正字法：来自不同书写方式的证据

刘月月[1] 何文广[2] 沈国晴[2]
1 曲阜师范大学教育学院，曲阜，273165
2 曲阜师范大学心理学院，曲阜，273165，通讯作者 Email：hewg@qfnu.edu.cn

摘 要 书写产生中语音在正字法通达中的作用以及语言信息对动作执行的影响是书写产生领域的两个基本问题，围绕这两个问题的争论分别形成了语音中介假说和正字法自主假说，以及序列模型和级联模型。为比较以手写和键入方式书写二语时，语音在正字法通达中的作用以及语言信息对动作执行的影响，本研究以中-英双语者为被试，采用图-词干扰范式，通过两个实验系统探讨了以不同方式书写二语时，认知编码阶段和动作执行阶段上的语音效应和正字法效应。实验设计为 5（SOA：－200 ms，－100 ms，0 ms，100 ms，200 ms）×3（干扰词类型：仅正字法高相关，仅语音高相关，无关）两因素被试内设计，因变量为认知编码阶段上书写图片名称的反应时（response times，RTs）和动作执行阶段上整词书写的持续时间（whole response duration，WRD）。实验 1 考察手写二语时，语音在正字法通达中的作用以及语言信息对动作执行的影响。结果发现，认知编码阶段，RTs 指标上正字法促进效应最早出现在 SOA 为－200 ms，而语音促进效应最早出现在 SOA 为 0 ms，表明正字法激活早于语音；动作执行阶段，SOA 为－200ms 时 WRD 指标上出现了正字法促进效应，表明正字法促进了整词书写速度。实验 2 考察键入二语时，语音在正字法通达中的作用以及语言信息对动作执行的影响。结果发现，认知编码阶段，RTs 指标上正字法促进效应最早出现在 SOA 为－200 ms，而语音促进效应最早出现在 SOA 为 0 ms，表明正字法激活早于语音；动作执行阶段，各效应均未出现。结论认为：（1）手写和键入二语时，语义均可直接通达正字法，不需要以语音为中介，支持正字法自主假说。（2）手写二语时，正字法加工可以级联到动作执行，符合级联模型；键入二语时，语言信息的加工在动作执行之前已经完成，符合序列模型。

Direct access to orthography in second language written production: Evidence from different writing modes

LIU Yueyue[1] HE Wenguang[2] SHEN Guoqing[2]
1 School of Education, Qufu Normal University, Qufu 273165
2 School of Psychology, Qufu Normal University, Qufu 273165

Abstract: Two basic issues in the field of written production concern whether phonology influences the output of orthography and how language processes affect the action execution. Debates on these two issues have led to the phonological mediation hypothesis and the orthographic autonomy hypothesis, as well as the serial model and the

cascaded model, respectively. To compare the role of phonology in orthographic access and the influence of language processes on action execution during Chinese-English bilinguals handwrote or typed second language(L2) words, the picture-word interference paradigm was adopted to explore the phonological and orthographic effects on the cognitive coding and action execution of the two different writing modes. Experiment 1 found that during handwriting, the orthographic priming effect appeared earlier than the phonological one in the phase of cognitive coding, and the former was still active in the phase of action execution. Experiment 2 found that during typing, the orthographic priming effect was also earlier than the phonological one in the phase of cognitive coding, nevertheless, no effects arose in the phase of action execution. In conclusion, these findings demonstrated that: (1) Semantic could access the orthographic representation directly in the phase of cognitive coding for both handwriting and typing, which supported the orthographic autonomy hypothesis. (2) For handwriting, the orthographic process could be cascaded to the action execution, providing evidence for the cascaded model; however, linguistic processes were completed before action execution for typing, which was consistent with the serial model.

中文社会评价词表

李璐璐　陈庆荣　胡传鹏（通讯作者）
南京师范大学心理学院，中国南京，210097

摘 要　社会评价是人们日常生活中不可分割的部分，是理解人类心理与行为规律的重要窗口，也是心理学多个分支领域的长期话题。然而，目前还没有一个标准化的中文社会评价词表，这给社会评价的相关研究带来了障碍。为解决这一问题，我们通过两项研究从外貌、社会经济地位、社交能力、能力和道德五个维度建立了中文社会评价词表。在研究一中，通过小规模实验对五个社会评价维度的可行性进行验证，主要包括收集词汇以及对五个维度的 71 个词进行评分。研究二中，来自全国七个分区（华北、东北、西北、华东、华中、西南和华南）的被试（n = 1270, 50%为女性）对 1911 个词汇进行了 6 个维度（五个社会评价维度和一个效价维度）的评分。研究采用 JsPsych 编写程序进行在线实验。所有词汇被随机分成 6 组，每组 318 或 319 个词汇，人均评价次数为 1908 次或 1914 次，人均完成实验时间 2 个小时左右。最终选择被明确评定为属于五个维度之一的词汇，包括 256 个外貌维度词汇（158 个积极词，98 个消极词），113 个社会经济地位维度词汇（41 个积极词，72 个消极词），111 个社交能力维度词汇（64 个积极词，47 个消极词），284 个能力维度词汇（206 个积极词，78 个消极词）和 369 个道德维度词汇（176 个积极词，193 个消极词）。本研究提供了一个全面的汉语社会评价词表，为社会心理学、语言学、社会学、计算社会科学的研究者提供了一个坚实的基础和有用的资源。

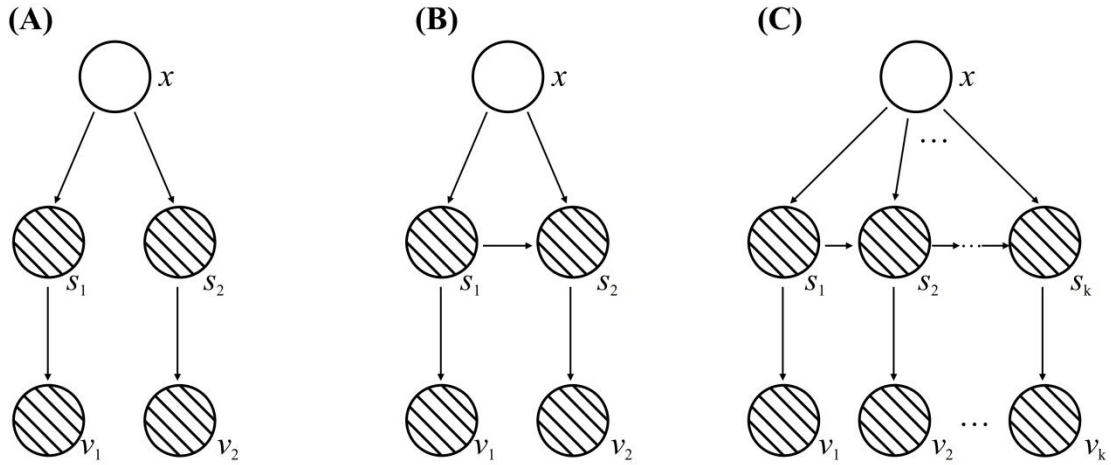
The Chinese Social Evaluative Word List

Lulu Li, Qingrong Chen, Hu Chuan-Peng
School of Psychology, Nanjing Normal University, Nanjing, China, 210097

***Abstract*:** Social evaluation is an integral part of people's daily lives, serving as a significant window for understanding human psychological and behavioral patterns. It is also a long-last topic in multiple subfields of psychology. However, there is no standardized Chinese social evaluative word list, which create obstacle for social evaluation related research. To fill the gap, we developed a Chinese Social Evaluative Word List from five

dimensions, appearance, socioeconomic status, sociability, competence, and morality, in two studies. In study 1, we conducted a small-scale experiment to verify the feasibility of the five social evaluation dimensions by collected words and rated 71 words from these five dimensions. In study 2, a large sample of participants (n = 1270, 50% female) from seven regions in China rated 1911 words on six dimensions (five social evaluation dimensions and one valence dimension). The study employed JsPsych to design the online experiment. All the words were randomly divided into six groups, with each group consisting of 318 or 319 words. Each participant rated the words a total of 1908 or 1914 times, and the average completion time for the experiment was approximately 2 hours. We selected those words that were unambiguously rated as belonging to one of five dimensions, including 256 words for appearance (158 positive, 98 negative), 113 words for socioeconomic status (41 positive, 72 negative), 111 words for sociability (64 positive, 47 negative), 284 words for competence (206 positive, 78 negative), and 369 words for morality (176 positive, 193 negative). This study provides a comprehensive Chinese social evaluative word list, serving as a solid foundation and a useful resource for researchers from social psychology, linguistics, sociology, and computational social science.

Keywords：Social evaluation, Chinese word list, Morality, Competence



基于贝叶斯网络的人格评估方法

臧鑫磊 杨娟（通讯作者）

认知与人格教育部重点实验室，西南大学心理学部，重庆，400715

通讯作者 E-mail：valleyqq@swu.edu.cn

摘 要 传统人格评估是通过个体内省的方式，但主观报告的得分可能存在偏差，如社会赞许。如何客观地刻画人格是心理学界的关键问题。为了解决这个问题，我们基于贝叶斯网络提出了一种新型人格评估方法。贝叶斯网络（有向无环图）是贝叶斯视角下的一种机器学习模型。它提供了一种可视化的结构来描述概率模型，还能清楚地表达随机变量之间的因果关系；它可将联合概率简单地进行因子分解为条件概率和边缘概率的乘积形式。此外，我们引入了两个直观假设：1.“真实人格”是不能被直接观测的隐变量；2.问卷捕获的是“状态人格”，它是“真实人格”和填写问卷时的“状态”的交互作用。图 A 先考虑只有 2 个状态变量；图 B 加入时间序列；图 C 扩展到一般状态。

图(A)中x表示“真实人格”的隐变量；S_1和S_2分别表示在状态1和状态2下由基于x的概率分布所生成的“状态人格”，即人格量表分数；本模型假设S_1和S_2是相互独立的；V_1和V_2分别表示所对应的状态1和状态2下由S_1和S_2分别生成两种可观测到的某种行为，即特征向量。(B)在(A)的基础上增加了状态1到状态2的时间序列(概率依赖关系)，其直观解释为S_2是在S_1后发生的且依赖于前一时刻S_1；即S_2与S_1存在依赖关系、非独立的；V_1和V_2之间没有这种时间依赖关系，只受到其所对应的“状态人格”S_1和S_2分的影响。(C)将(B)的2个时间状态依赖关系扩展至K个。

*注：本文重点不在介绍贝叶斯网络的学习与预测问题，因此没有显式地写出参数以简化模型的复杂度。

图 A 中，我们的目标是基于可观测的行为 V_1 和 V_2 以及通过问卷捕获的“状态人格”S_1 和 S_2 求得无法直

接观测的“真实人格”的条件概率$p(x|S_1,S_2,V_1,V_2)$。根据贝叶斯网络的因子分解易得联合概率

$$p(x,S_1,S_2,V_1,V_2)=p(x)p(S_1|x)p(S_2|x)p(V_1|S_1)p(V_2|S_2)$$

基于概率乘积法则

$$p(x|S_1,S_2,V_1,V_2)=\frac{p(x,S_1,S_2,V_1,V_2)}{p(S_1,S_2,V_1,V_2)}=\frac{p(x)p(S_1|x)p(S_2|x)p(V_1|S_1)p(V_2|S_2)}{p(S_1)p(V_1|S_1)p(S_2)p(V_2|S_2)}=\frac{p(x)p(S_1|x)p(S_2|x)}{p(S_1)p(S_2)}$$

显然，“真实人格”独立于观测到的行为。也就是说，观测的行为是“真实人格”在 S_1 和 S_2 的状态下交互作用的结果，而非“真实人格”可以直接作用产生的可观测行为。此外，利用所学模型，在给定 V_1 的条件下，推断 S_1 的条件概率$p(S_1|V_1)$，即观测到 V_1 行为时推断在状态 1 下的“状态人格”S_1。基于贝叶斯定理易得

$$p(S_1|V_1)=\frac{p(V_1|S_1)p(S_1)}{p(V_1)}=\frac{p(V_1|S_1)p(S_1)}{\int p(V_1|S_1)p(S_1)\,\mathrm{d}S_1}\propto p(V_1|S_1)p(S_1)$$

其中，可将$p(S_1)$看作先验概率，$p(V_1|S_1)$是似然函数，$\int p(V_1|S_1)p(S_1)\,\mathrm{d}S_1$是归一化因子。因此，后验概率$p(S_1|V_1)$正比于$p(V_1|S_1)p(S_1)$。极大似然估计，求$p(V_1|S_1)$极值来估计$p(S_1|V_1)$。同理可求$p(S_2|V_2)$。

图 B 表示的是，“状态人格”S_2 是 S_1 后发生且受到 S_1 的影响。更直观的解释是：基于某种实验操纵，让个体从 S_1 到 S_2 发生了状态转移。与图 A 模型不同的是联合概率分布

$$p(x,S_1,S_2,V_1,V_2)=p(x)p(S_1|x)p(S_2|x,S_1)p(V_1|S_1)p(V_2|S_2)$$

图 C 将 2 个状态扩展至更一般的 K 个状态，其联合概率分布

$$p(x,S_1,\ldots,S_k,V_1,\ldots,V_k)=\prod_{i=1}^{K-1}p(x)p(S_1|x)p(V_1|S_1)p(S_{i+1}|x,S_i)p(V_{i+1}|S_{i+1})$$

上述模型为心理学人格评估的通用方法。其核心是如何基于待评估的人格特质，设计有效的实验操纵，以扰动样本数据集（即操纵改变“状态人格”和可观测的行为），进而生成有差异的序列$\{S_1,\ldots,S_K\}$及与之对应的行为序列$\{V_1,\ldots,V_K\}$。

A Bayesian network-based approach to personality assessment

Zang XinLei, Yang Juan
Key Laboratory of Cognition and Personality (SWU), Ministry of Education;
Faculty of Psychology, Southwest University, Chongqing 400715, China

Abstract：Traditional personality assessment is by means of intra-individual introspection, but subjectively reported scores may be biased, such as social approval. How to assess personality objectively is a key issue in psychology. To address this issue, we propose a novel personality assessment method based on Bayesian networks. Bayesian network (directed acyclic graph) is a machine learning model in Bayesian perspective. It provides a visual structure to describe probabilistic models and also clearly expresses causal relationships between random variables; it also allows for a simple factorization of the joint probability distribution into the form of a product of conditional and marginal probabilities. In addition, we introduce two intuitive assumptions: 1. The "real personality" is a hidden variable that cannot be directly observed; 2. The questionnaire captures the "state personality", which is an interaction between the "real personality" and the "state" at the time of completing the questionnaire. Figure A starts by considering only 2 state variables; Figure B adds time series; Figure C extends to general states.

In the framework of Figure A, our goal is to find the conditional probability of the "real personality", which is not directly observable, based on the observable behaviors V1 and V2 as well as the "state personalities" S1 and S2 captured by the questionnaire. According to the factorization of Bayesian network, the joint probability is easily obtained: $p(x,S_1,S_2,V_1,V_2)=p(x)p(S_1|x)p(S_2|x)p(V_1|S_1)p(V_2|S_2)$

Based on the probability product rule:

$$p(x|S_1,S_2,V_1,V_2)=\frac{p(x)p(S_1|x)p(S_2|x)}{p(S_1,S_2)}$$

Clearly, the "real personality" is independent of the observed behavior. That is, the observed behavior is the result of the interaction of the "real personality" in the states of S1 and S2, rather than the observable behavior that the "real personality" can directly act to produce. In addition, we can use the learned model to infer the conditional probability of S1 given V1, i.e., to infer the "state personality" S1 in state 1 when observing the behavior of V1. Based on Bayes' theorem, it is easy to get:

$$p(S_1|V_1)\propto p(V_1|S_1)p(S_1)$$

where $p(S_1)$ can be thought of as the prior probability and $p(V_1|S_1)$ as the likelihood function. Thus, the posterior probability $p(S_1)$ is proportional to $p(V_1|S_1)$. Estimate $p(S_1|V_1)$ by solving for $p(V_1|S_1)$ extremes.

Represented in Figure B, the "state personality" S2 occurs after S1 and is influenced by S1. A more intuitive interpretation is that the state transfer from S1 to S2 occurs based on some experimental manipulation of the individual. In contrast to the model in Figure A, the joint probability distribution:

$$p(x,S_1,S_2,V_1,V_2)=p(x)p(S_1|x)p(S_2|x,S_1)p(V_1|S_1)p(V_2|S_2)$$

Figure C extends such states to a more general K states with joint probability distribution:

$$p(x,S_1,...,S_k,V_1,...,V_k)=\prod_{i=1}^{K-1}p(x)p(S_1|x)p(V_1|S_1)p(S_{i+1}|x,S_i)p(V_{i+1}|S_{i+1})$$

The above model is a generalized approach to personality assessment in psychology. It centers on how to design effective experimental manipulations to perturb the sample dataset (i.e., manipulations that change the "state personality" and observable behaviors) based on the personality traits to be assessed, thereby generating differentiated $\{S_1,...,S_K\}$ versus corresponding $\{V_1,...,V_K\}$.

空间 Simon 效应对面孔-词 Stroop 任务中返回抑制的影响

孙佳禾[1]　韦红浪[2]　何文广[2]（通讯作者）

1 上海体育大学心理学院，上海，200438

2 曲阜师范大学心理学院，曲阜，273165，hewg@qfnu.edu.cn

摘 要　返回抑制(inhibition of return, IOR)与情绪刺激是否存在交互作用是为 IOR 研究中所关注的热点问题。为了深入探究情绪认知加工是否与返回抑制过程存在交互，本研究联合线索-目标范式与面孔-词 Stroop 任务，通过操纵范式中刺激呈现的水平和垂直空间位置分别进行了 2(线索有效性：有效、无效)×2(面孔-词效价一致性：一致、不一致)的组内设计。实验 1 使用经典的线索-目标范式考察水平空间范式中返回抑制效应对面孔-词 Stroop 效应的影响，结果发现面孔-词 Stroop 效应和返回抑制效应之间不存在交互作用。为了探究水平空间运动所产生的 Simon 效应是否影响返回抑制效应，实验 2 将范式改为垂直空间，结果发现面孔-词 Stroop 效应显著，且与返回抑制效应的交互作用显著，仅在效价不一致条件下得到线索有效试次的反应速度显著慢于线索无效试次。结果表明水平空间 Simon 效应影响了返回抑制过程，而排除这一因素的影响后，返回抑制和情绪刺激在抑制冲突过程中对信息的加工方式存在交互。在面孔-词效价一致的条件下，对统一效价信息的加工使得返回抑制效应受到面孔-词情绪 Stroop 效应的压制。为了进一步探索情绪效价信息对返回抑制效应存在怎样的影响，研究对不同条件下的返回抑制效应量进行分析，结果得到积极不一致试次的返回抑制效应量显著大于消极不一致试次。这说明面孔-词 Stroop 范式中，处理消极信息所占用的认知资源与返回抑制认知加工过程存在竞争关系，从而减弱返回抑制效应。研究结果支持了返回抑制加工与情绪认知过程并不分离，二者存在交互作用。

The effect of spatial Simon effect on inhibition of return in face-word Stroop task

Sun Jiahe[1]　Wei Honglang[2]　He Wenguang[2](corresponding author)
1 Shanghai University of Sport, School of psychology, Shanghai 200438
2 Qufu Normal University, School of psychology, Qufu 273165

Abstract：The interaction between inhibition of return (IOR) and emotional stimuli is a hot issue of concern in IOR research. In order to further explore whether emotional cognitive processing interacts with the process of IOR, the study combined the cue-target paradigm with the face-word Stroop task and conducted a within-group design of 2 (cue validity: cued, uncued)×2 (face-word valence consistency: consistent, inconsistent) by manipulating the horizontal and vertical spatial positions of stimulus presentation in the paradigm. Experiment 1 used the classic cue-target paradigm to examine the IOR effect in horizontal space paradigm, and found that there was no interaction between face-word Stroop effect and IOR effect. In order to explore whether the Simon effect produced by horizontal spatial position would affect the IOR effect, experiment 2 changed the paradigm to vertical space. The results showed that face-word Stroop effect was significant, and there was a significant interaction between it and IOR effect. The reaction time of cued trials was significantly slower than that of uncued trials only under inconsistent valence conditions. The results showed that horizontal spatial Simon effect affected the IOR process, and after excluding this factor's influence, there was an interaction between IOR and emotional stimuli in the process of inhibiting conflict. Under the condition of face-word valence consistency, processing unified valence information made the IOR effect suppressed by face-word emotional Stroop effect. In order to further explore how emotional valence information affects the IOR effect, this study analyzed the amount of IOR effect under different conditions. The results showed that the amount of IOR effect in positive inconsistent trials was significantly greater than that in negative inconsistent trials. This indicates that cognitive resources occupied by processing negative information in face-word Stroop paradigm compete with cognitive processing of IOR, thereby weakening its effect. The results further supported that IOR processing and emotional cognitive processes were not separated but interacted with each other.

三至五年级学生汉语阅读过程中整字水平和部件水平的语音预视收益

罗杰飞[1]　钦锐琦[2]　吴岩[1]（通讯作者）
1 东北师范大学心理学院，长春，130024
2 东北师范大学教育学部，长春，130024，通讯作者 E-mail：wuy399@nenu.edu.cn

摘 要　本研究利用眼动技术中的边界范式，探究了中国 3-5 年级儿童在汉语阅读过程中对于副中央凹语音信息的加工。选择占汉字总数 80%的形声字作为关键字，研究目标形声字在部件水平上的语音规则性的效应。孩子们阅读由规则形声字(如："惜")、不规则形声字(如："借")、同音字(如："稀")或正字法不同的非同音字(如"沐")作为目标预视字来代替正常简单字的句子。规则形声字和不规则形声字都包含正常的简单字(如："昔")作为声旁，规则形声字与其声旁具有相同的发音(发音为"xi1")。同音条件的设置可以检验在没

有正字法相似性的情况下，在整字水平上的语音预视收益。同时，对规则形声字和不规则形声字的预视收益进行比较，可以进一步揭示部件水平的语音加工，而将不规则形声字条件与无关的对照条件进行比较，可以探索正字法信息的预视收益。本研究从发展的角度探讨了儿童在阅读过程中对不同层次的副中央凹语音信息的依赖，结果表明，汉字语音信息在句子阅读过程中具有显著的预视收益，整字水平的语音信息可以在早期被激活，为语音中介模型提供了证据。而在五年级学生中，部件水平语音信息的副中央凹预视收益只出现在加工后期。这些发现强调了语音信息在儿童汉语阅读中的重要性，对于不同年龄组的儿童而言语音效应的表现不尽相同。不仅如此，正字法信息的预视收益因年级而异，五年级的孩子激活得更早。

Parafoveal preview effects of character-level and radical-level phonology in reading of Chinese among third to fifth graders

Jiefei Luo, Ruiqi Qin, Yan Wu
School of Psychology, Northeast Normal University, Changchun, Jilin Province, P.R.China

Abstract：This eye-movement study utilizing the boundary paradigm investigated the processing of phonological information in the parafoveal during reading among Chinese children in grades 3 to 5. In the experiment, children were required to read sentences with either regular, irregular, homophone, or unrelated control phonograms as the replaced characters for the normal simple characters. Both regular and irregular characters contained a consistent simple character as the phonetic radical, with the regular character sharing the identical pronunciation with its target phonetic radical. The character-level phonological preview benefit was revealed when visually dissimilar homophones were compared to the unrelated control condition, while the radical-level phonological preview benefit was obtained by comparing regular and irregular characters. The results showed a significant preview benefit of character-level phonological information across all grades and processing indicators during sentence reading. By contrast, the parafoveal preview effects of radical-level phonological information only emerged during the later processing period among the fifth graders. These findings highlight the significance of phonological information in Chinese reading among children, with varying effects observed across different age groups.

Keywords：Chinese character, Character-level phonology, Radical-level phonology, Preview benefit

自我矛盾性对认知灵活性影响的研究

李继文[1]　杨娟[1]（通讯作者）
1 西南大学心理学部，重庆，400700

摘　要　自我矛盾性（self-ambivalence）指人们对自我持有冲突的看法（Bhar et al., 2007；Tisher et al., 2014）。Bhar 等人认为自我矛盾性存在两个维度，分别是自我价值矛盾性和道德矛盾性，自我价值矛盾性涉及到个体对自我价值存在不一致的看法，而道德矛盾性指个体对自己是好人还是坏人比较纠结。矛盾性的 ABC 理论（Van et al., 2015）认为矛盾性会对我们的信息加工方式产生影响，当一个人对其他物体持有比较高的矛盾性态度时，他会采取系统加工的方式处理随后的信息。比如有研究者让被试同时经历冲突的情绪，接着让他们完成 Remote Associates Task（RAT），结果发现混合情绪启动下的个体在 RAT 任务联想能力越强（Fong, 2006），RAT 可以有效反应个体的发散思维和创造力。有研究者认为

这是由于情绪上的矛盾性通过促进个体的认知灵活性进一步影响人们的信息加工方式（Rotheman et al., 2015）。然而值得注意的是，以往研究主要针对的是情绪矛盾性，作为矛盾性的一种，不清楚自我矛盾性是否也会促进个体的认知灵活性。围绕这个问题，我们设计了两个实验进行探究。研究 1 收集了 45 名个体的自我矛盾性问卷以及认知灵活性数据（数字字母转换任务），结果发现自我价值矛盾性与反应时和转换代价没有关系，而道德矛盾性与转换/重复试次的反应时负相关，即道德矛盾性水平越高，个体在转换/重复试次上的反应时越小。实验 2 探究自我矛盾性与认知灵活性之间是否存在因果关系，以及这种关系背后的机制，即道德矛盾性是否通过积极情绪或者观点采择促进认知灵活性。我们采用 3（被试间，自我价值和道德矛盾性启动、控制组）×2（重复和转换试次）的混合实验设计，共招募 135 名被试，删除未成功启动的被试，共有 126 人进入数据分析。结果发现，相较于自我价值矛盾性和控制组，道德矛盾性启动组在重复和转换试次上有更快的反应时，同时反应时的转换代价和 Bin 值也最小（基于错误率和反应时计算得到，类似于转换代价）。我们随后做了中介分析，中介变量为积极情绪和观点采择，然而却没有发现中介效应的存在。总之，我们的研究发现了道德矛盾性会促进个体的认知灵活性，而自我价值矛盾性与认知灵活性没有关系，未来的研究需要进一步探究这种关系背后的原因。

The effect of self-ambivalence on cognitive flexibility

Jiwen Li[1], and Juan Yang[1*]

[1]Faculty of Psychology, Southwest University, Chongqing, China, 400700

Abstract: Self-ambivalence is conceptualised as the holding of conflicting views of the self simultaneously（Bhar et al., 2007； Tisher et al., 2014）. They identified subscales that are consistent with two of three aspects of self-ambivalence theorised: self-worth ambivalence holding conflicted evaluations of the self and confusion about self-worth, and moral ambivalence holding dichotomous views of the self as good or bad. The ABC (Affect, Behavior, Cognition) model of ambivalence have shown that ambivalence is associated with increased systematic processing (Van et al., 2015). For example, research found the experience of emotional ambivalence causes an increased sensitivity to associations, as reflected by higher scores on the Remote Associates Task (RAT). RAT can effectively reflect the individual's divergent thinking and creativity. It was explained that emotional ambivalence affects people's information processing styles by promoting individual cognitive flexibility. It was worth noting that previous studies mainly focused on emotional ambivalence. As a kind of ambivalence, it was not clear whether self-ambivalence could also promote cognitive flexibility. We designed two experiments to answer this question. We recruited 45 samples from students to finish Self-Ambivalence Measure (SAM) and number-letter change tasks. The results found that self-worth ambivalence was not related to reaction time and switching costs, while moral ambivalence was negatively associated with reaction time on switching/repetition trials. That is, the higher the level of moral ambivalence, the faster the individual's response time on switching/repetition trials. We continued to explore the causal relationship between self-ambivalence and cognitive flexibility, and the mechanism behind this relationship. In specific, whether moral ambivalence promotes cognitive flexibility through positive emotions or perspective taking. We adopted a mixed experimental design of 3 (between subjects, priming of self-worth and moral ambivalence, control group) × 2 (within subject, repetition and switching trials). We have recruited 135 subjects in study 2, and deleted the subjects who failed to prime, leaving 126 subjects into the final analysis. It was found that compared with the self-worth ambivalence and control groups, the moral ambivalence priming responded faster on repetitions and switching trials, and the switching cost and Bin value were also the smallest (based on error rate and response, which is similar to the switching cost). Further mediation analysis did

not found that emotion or perspective taking could mediate the relationship between moral ambivalence and cognitive flexibility. In conclusion, our study found that moral ambivalence could promote individuals' cognitive flexibility, while self-worth ambivalence has no effect on cognitive flexibility. Future research needs to further explore the mechanism behind these effect.

摘 要　典型类别作为前提会比不典型类别引发更快更强的属性泛化，这被称作前提典型性效应。该效应深刻的影响人们的学习和推理。有研究认为前提典型性效应是前提和结论类别特征之间的相似性，即前提典型性效应等同前提-结论相似性。这忽略了典型性在类别结构表征中的作用。在对类别结构进行表征来形成类别概念时，典型性会影响类别成员之间的关系。因此，为了探究前提典型性效应的发生机制，本研究控制了典型、不典型前提与结论的相似性以排除前提-结论相似性的影响，借助事件相关电位（ERPs）和时频分析揭示了前提典型性效应的认知过程。34 名被试完成了一项归纳任务，根据前提判断结论成立的可能性大小。研究发现，在排除了前提-结论相似性的影响后，典型前提仍比不典型前提有更快的反应时。同时，ERP 和时频分析的结果显示前提典型性效应的认知过程分为两个阶段。**早期阶段**与心理熟悉度评估和语义加工过程有关：典型前提比不典型前提有更高的心理熟悉度、更困难的语义检索过程（前提和结论类别概念之间的语义距离较远），表现为更小的 FN400 波幅及更大的 theta 功率。**晚期阶段**与认知监控有关：典型前提比不典型前提引发了更少的认知监控，表现为典型前提有更小的晚期负波（SN）波幅和 theta 功率。这些发现表明，前提典型性不同与前提-结论相似性，即在排除了相似性的影响后，典型性还与类别概念的语义加工过程有关。

Abstract： Typical categories as premises are more likely to generate faster and more definitely induction compared to atypical categories, which is the premise typicality effect. Some studies suggested that the premise typicality effect was equivalent to premise-conclusion similarity. However, this opinion ignored the role of typicality in the representation of category concepts. To figure out how the premise typicality effect occurs during induction, we revealed cognitive processes of the premise typicality effect by measuring event-related potentials and neural oscillations. In a category-based induction task, we excluding the influence of premise-conclusion similarity by ensuring the similarity between typical premises and conclusions as low as the similarity between atypical premises and conclusions. Participants were required to rate how likely premises support conclusions. Results showed that typical premises still had faster induction than atypical premises after excluding the influence of premise-conclusion similarity. Moreover, we found that the cognitive processes of the premise typicality effect consisted of two stages. **The early stage** was related to familiarity assessment and semantic processing. In specific, typical premises had higher psychological familiarity and a more difficult semantic retrieval process which was related to the semantic distance between categories, revealed by less FN400 amplitudes and larger early theta power. **The late stage** of the cognitive process of the premise typical effects was cognitive monitoring. Typical premises had less cognitive monitoring than atypical premises, revealed by less SN amplitudes and late theta power. These findings showed that the premise typicality effect was distinct from the premise-conclusion similarity. Typicality involved semantic processing related to category concepts after excluding the influence of premise-conclusion similarity.

生命意义感影响大学生网络游戏成瘾：社交焦虑的中介作用和性别的调节效应

马少勇[1]　桑青松[1]

安徽师范大学教育科学学院，安徽 芜湖 241002

摘 要　大学阶段是个体需要应对众多矛盾和冲突的阶段，容易产生多种问题行为，在个体的多种问题行为中，大学生的行为成瘾问题因其群体的广泛性和影响的日益严重性而受到人们的广泛关注，在世界范围内已经成为又一个世界瞩目的社会与健康问题。相较于物质成瘾，网络游戏成瘾是一种单纯的行为成瘾，心理特征是造成网络游戏成瘾的主要原因，根据“失补偿”假说，部分大学生由于自我察觉功能受损，不能主动修复阻碍因素，会通过不适当的“心理补偿”（如网络游戏）方式得到满足，继而引发“病理性代偿”过程，这种状况如果不能得到改善并持续恶化会造成发展的中断，以致网络游戏成瘾的发生。依据问题行为理论模型，生命意义感作为个体系统中反映个体态度、价值观的重要组成部分，对网络游戏成瘾的发生、发展产生作用。为探讨生命意义感与大学生网络游戏成瘾的关系以及社交焦虑和性别的作用，研究基于问题行为理论模型及病态网络使用的认知—行为理论，采用网络游戏成瘾量表、生命意义感量表及社交焦虑量表对 1544 名研究对象进行调查，结果表明生命意义感与大学生网络游戏成瘾显著相关，社交焦虑在生命意义感与大学生网络游戏成瘾之间起中介作用；性别调节了“生命意义感→社交焦虑→网络游戏成瘾”的后半段路径。高生命意义感是大学网络游戏成瘾的保护性因素，负向预测网络游戏成瘾行为，研究结果利于揭示生命意义感对网络游戏成瘾影响的内在机制，将为网络游戏成瘾的预防与干预提供新的思路和理论依据。

关键词　生命意义感，网络游戏成瘾，社交焦虑，性别，大学生

The Meaning of life influences online game addiction in college students:

social anxiety Mediating role and the moderating effect of sex

Ma Shaoyong Sang Qingsong

The college of Education Science, Anhui Normal University, Wuhu 241002, China

***Abstract*:** The university stage is a stage in which individuals need to deal with many contradictions and conflicts, which is prone to produce a variety of problematic behaviors. Among the various problematic behaviors of individuals, the behavioral addiction of college students has been widely concerned by people because of its universality and the increasing severity of its influence, and has become another social and health problem attracting worldwide attention. Compared with substance addiction, online game addiction is a simple behavioral addiction, and psychological characteristics are the main cause of online game addiction. According to the "loss compensation" hypothesis, some college students are unable to take the initiative to repair the obstructive factors due to their impaired self-perception function, and will be satisfied through inappropriate "psychological compensation" (such as online games). This leads to the "pathological compensation" process, if this situation can not be improved and continue to deteriorate will cause the interruption of development, resulting in the occurrence of online game addiction. According to the problem behavior theory model, the sense of meaning of life, as an important part of the individual system reflecting the individual attitude and values, plays a role in the occurrence and development of online game addiction. In order to explore the relationship between the sense of meaning of life and online game addiction of college students, as well as the role of social anxiety and gender, based on the problem behavior theory model and the cognitive-behavioral theory of pathological Internet use, 1544 subjects were investigated by using the online game addiction scale, sense of life scale and social anxiety scale. The results show that sense of meaning of life is significantly related to online game addiction, and social anxiety plays an intermediary role between sense of meaning of life and online game addiction. Gender regulates the second half of the path of "sense of life meaning → social anxiety → online game addiction". High sense of life meaning is a protective factor for college online game addiction, and negatively predicts online game addiction behavior. The research results are conducive to revealing the internal mechanism of the influence of sense of life meaning on online game addiction, and will provide new ideas and theoretical basis for the prevention and intervention of online game addiction.

***Keywords*:** Sense of life meaning, online game addiction, social anxiety, gender, college students

健康焦虑的网络化解释偏向矫正效果及机制

杜夏雨[1] 赖丽足[1] 史从戎[1] 张涛[1] 郭子涵[1] 韩菁[1] 任志洪[1]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘 要　**背景：**适应不良的健康焦虑是指个体对自身健康状况的不恰当或过度关注而引起的恐惧和担心。根据健康焦虑的综合模型，个体的灾难化解释与健康焦虑的发展和维持紧密相关，如能减轻其灾难化解释

将有助于缓解健康焦虑症状。因此，本研究旨在探究网络化解释偏向矫正(internet-based cognitive bias modification-interpretation, iCBM-I)对健康焦虑的干预效果，并检验灾难化解释在干预起效中的机制作用。**方法：**采用随机对照试验，将符合适应不良健康焦虑标准(简式健康焦虑量表得分≥15)的被试(N = 228)随机分配到 iCBM-I 干预组(100%积极反馈，N = 76)、注意控制组(50%积极 50%消极反馈，N = 76)以及等待组(N = 76)。干预组和注意控制组进行为期 12 天的在线任务训练(每 3 天 1 个单元，共 4 单元)，等待组不做训练。在干预前、干预后及干预后一个月对被试的健康焦虑、灾难化解释、一般焦虑和抑郁进行测量。基于意向治疗原则，使用广义线性混合模型分析 iCBM-I 的干预效果，使用两因素方差分析和层次回归分析考察人口学变量和症状变量基线水平的调节作用，使用平行发展模式的潜在增长曲线模型分析灾难化解释的纵向中介效应。**结果：**与等待组相比，iCBM-I 干预对健康焦虑个体的灾难化解释(d = -0.83, p < 0.001)、一般焦虑(d = -0.62, p < 0.001)和抑郁(d = -0.94, p < 0.001)症状存在显著的中到大即时干预效果，且一个月后的追踪效果仍显著(健康焦虑：d = -0.59, p < 0.001；灾难化解释：d = -0.76, p < 0.001；一般焦虑：d = -0.56, p < 0.01；抑郁：d = -0.77, p < 0.001)。与注意控制组相比，iCBM-I 干预对健康焦虑个体的健康焦虑(d = -0.50, p < 0.01)、灾难化解释(d = -0.56, p < 0.01)和一般焦虑(d = -0.38, p = 0.021)症状存在显著的中等即时干预效果，且一个月后对灾难化解释(d = -0.49, p < 0.01)的追踪效果显著。健康焦虑个体的婚姻状况、健康焦虑基线症状水平和灾难化解释基线水平在 iCBM-I 干预健康焦虑症状中起到调节作用，灾难化解释在 iCBM-I 干预健康焦虑症状中起到纵向中介作用。**结论：**本研究为健康焦虑的网络化干预提供了新视角。未来研究可以考虑联合“自上而下”和“自下而上”的干预方法，以提高健康焦虑的干预效果。

The effect and mechanism of internet-based cognitive bias modification-interpretation in health anxiety

Xiayu Du[1], Lizu Lai[1], Congrong Shi[1], Tao Zhang[1], Zihan Guo[1], Jing Han[1], Zhihong Ren[1]

[1]Key Laboratory of Adolescent Cyberpsychology And Behavior (CCNU), Ministry Of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health Of Hubei Province, Wuhan, China

***Abstract*：** **Background:** Maladaptive Health anxiety refers to the fear and worry caused by inappropriate or excessive attention to one's own health condition. Based on the comprehensive model of health anxiety, the development and maintenance of health anxiety is closely related to an individual's catastrophizing interpretation, and alleviating catastrophizing interpretation can help reduce the symptoms of health anxiety. Therefore, the current study aims to investigate the effect of internet-based cognitive bias modification-interpretation (iCBM-I) on health anxiety and the longitudinal mediating mechanism of catastrophizing interpretation. **Methods:** A randomized controlled trial was conducted, in which eligible participants (N = 228) with maladaptive health anxiety (Short Health Anxiety Inventory [SHAI] scores ≥ 15) were randomly assigned to an iCBM-I group (100% positive feedback, N = 76) , an attention control group (50% positive and 50% negative feedback, N = 76), and a wait-list control group (N = 76). Participants in iCBM-I group and attention control group finished internet-based tasks for 12 days (one session every 3 days, a total of four sessions). The health anxiety, catastrophizing interpretation, general anxiety, and depression were measured at pre-treatment, post-treatment and 1-month follow-up. The generalized linear mixture model was used to analyze the effect of the iCBM-I. Two-factor analysis of variance and hierarchical regression were used to analyze the moderating effect of demographic and symptom variables at baseline, and the latent growth curve model of the parallel development was used to analyze the longitudinal mediating effect of catastrophizing interpretation. **Results:** Compared with the wait-list control

group, iCBM-I group had significant immediate moderate to large effects on the catastrophizing interpretation (d = -0.83, p < 0.001), general anxiety (d = -0.62, p < 0.001) and depression (d = -0.94, p < 0.001) for participants with health anxiety. At 1-month follow-up, iCBM-I group still showed significant effects (Health anxiety: d = -0.59, p < 0.001; catastrophizing interpretation: d = -0.76, p < 0.01; general anxiety: d = -0.56, p < 0.01; depression: d = -0.77, p < 0.001). Compared with the attention control group, iCBM-I group had significant immediate moderate effects on the health anxiety (d = -0.50, p < 0.01), catastrophizing interpretation (d = -0.56, p < 0.01), and general anxiety (d = -0.38, p = 0.021) for participants with health anxiety. At 1-month follow-up, iCBM-I group showed a significant effect on the catastrophizing interpretation (d = -0.49, p < 0.01). The marital status, baseline level of health anxiety symptoms and catastrophizing interpretation played a moderating role in the effects of iCBM-I for health anxiety, and catastrophizing interpretation played a longitudinal mediating role. **Conclusions:** The current study provided new perspective for the networked intervention for health anxiety. In the future, researchers may consider the combination of "top-down" and "bottom-up" therapy, to improve the intervention effects for health anxiety.

Keywords：Health anxiety, cognitive bias modification-interpretation, randomized controlled trials, latent growth curve model

正念还是转移注意力？运动中情感调节策略的使用效果因人而异

刘娇　毛志雄（通讯作者）

北京体育大学心理学院，北京，100084，zhxmao@bsu.edu.cn

摘 要 当运动锻炼达到一定强度时，不可避免的消极情感反应极可能导致锻炼中断和退出。锻炼者将注意力从身体内部感受转移至外部环境（即外部焦点策略）以缓解消极情感、增加积极情感，是常用的心理调节策略。但是，近来有研究发现正念，即专注当下身体感觉并保持开放接受的态度，也是一种调节情感的有效策略。本研究旨在比较正念和外部焦点两种策略改善中等强度急性有氧运动情感反应的有效性。采用2*3 的混合实验设计，通过身体活动量将参与者分为身体活动不足组（n = 14）和身体活动充足组（n = 15），并要求两组参与者以随机顺序在三种不同的实验条件下完成 20 分钟的中等强度运动（心率储备的 55-65%）。在正念条件下，参与者在跑步过程中听一段 20 分钟的正念跑步的音频；在外部焦点的条件下，参与者在跑步过程中听一段 20 分钟的播客；在控制条件下，参与者在跑步时则不听任何内容。在运动过程中每隔五分钟记录一次参与者的情感反应，并在运动后记录其回忆情感、预期情感以及运动后愉悦感。线性混合效应模型的结果显示，与外部焦点和控制条件相比，只有身体活动充足组的个体在正念条件下报告了更积极的运动中情感反应。然而，与控制条件相比，身体活动不足的参与者在外部焦点条件下报告了更积极的运动中情感反应。最后，探索性分析表明，在正念和外部焦点条件下，所有参与者都报告了对未来锻炼的更积极的预期情感，而只有身体活动充足组在正念条件下报告了更高的运动后愉悦感。综上，对身体活动充足的个体而言，在中等强度的运动中使用正念，即充分感受由运动带来的身体感觉，将会是一种新的提高运动积极情感、降低消极情感的有效策略，有利于锻炼行为的坚持性并减少锻炼退出；而对于身体活动不足的个体而言，将注意力从身体感觉上转移开来才是提高锻炼积极体验的有效策略。

Beijing Sport University, Beijing, 100084, zhxmao@bsu.edu.cn

Abstract: When exercise reaches a certain intensity, it is inevitable that the individual will have negative affective response which will lead to exercise interruption and drop out. Shifting attention from internal bodily sensations to external environmental factors (dissociation focus) is one of the most common regulation strategies. However, recent studies have found that mindfulness, which is directing attention to present moment experiences with intention, and above all with an accepting, openness, and non-judgmental attitude, can also be effective in improving positive affective responses. The purpose of this study was to investigate the effectiveness of mindfulness in promoting affective responses to moderate-intensity acute aerobic exercise and to further explore whether the use of mindfulness strategies in exercise differs depending on the level of physical activity (PA). We conducted a 2 (higher level of PA vs. lower level of PA) *3 (mindfulness vs. attention distraction vs. control) experimental design in present study. Two groups, one including sufficiently and one insufficiently active participants, completed a 20-min moderate-intensity exercise (based on 55-65% of heart rate reserve) on treadmill in three different experimental conditions (mindfulness, attention distraction, and control) in a randomized order. Core affective valence was measured repeatedly during exercise. Linear mixed effects modeling (MEM) showed that, as expected, a more positive affective response in the mindfulness condition, compared to the attention distraction and control conditions, emerged only in the group of sufficiently active individuals. We also found that participants in the insufficiently active group experienced more pleasant feelings with the attention distraction condition compared to the control condition. Additional exploratory analysis suggested that all participants reported more positive forecasted affect for exercising in the future in the mindfulness and the attention distraction condition, whereas only in the sufficiently active group, greater post-exercise enjoyment was reported after mindfulness than in either of the other conditions. We interpret these findings as evidence that non-regular exercisers should be advised to rather divert their attention away from their bodily sensations during moderate-intensity physical activity.

计算机安全警告信息加工及其影响因素的研究综述

王洁[1] 钱秀莹[1]（通讯作者）
1 浙江大学心理与行为科学系，杭州，310058，xqian@zju.edu.cn

摘 要 随着计算机和通信技术的普及，越来越多的人开始使用计算机完成各项任务。尽管计算机技术为人类带来了很多便利，但它也在无形中为不法分子提供了犯罪机会。在计算机的使用中存在各种各样的威胁，例如恶意软件攻击、网络钓鱼等等，给用户（尤其是非专业的用户）带来了巨大的安全隐患。警告作为防止用户受到伤害的关键环节，引起了学界广泛的关注，目前已有大量研究关注用户与计算机安全警告的交互问题。本论文回顾了以往针对计算机安全警告的研究，总结了相关的研究进展，并在此基础上，提出了该领域未来的研究方向。计算机安全警告是告知用户计算机系统中可能存在的问题的通信媒介，按其特征、感觉模式和传达的安全威胁可以分为不同的警告类型。通信-人类信息加工模型和人在环路模型作为计算机安全警告领域的两种基本理论模型，涵盖了警告信息加工的各个阶段及其影响因素，被广泛用于指导计算机安全警告的设计和改善。以往研究者针对计算机安全警告效果的影响因素开展了大量的研究，总的来说，这些研究的发现可以分为警告特征相关的因素与接收者相关的因素，其中警告特征相关的因素主要集中在警告的视觉特征（如颜色、图标、布局等）和警告内容（如关于危险、后果、说明的信息）方面；

接收者相关的因素主要包括习惯化效应及个体差异。基于此，未来的计算机安全警告的相关研究可以重点关注多通道的计算机安全警告的设计与研究、探究个性化的计算机安全警告以及结合心理学的研究发现，从用户的心理角度出发，改善已有计算机安全警告的效果，同时形成一个更加系统的理论框架，用以指导未来的研究和警告设计实践。

A Review of Computer Security Warning Information Processing and Its Influencing Factors

WANG Jie[1], QIAN Xiuying[1]
1 Department of Psychology and Behavioral Sciences, Zhejiang University, HangZhou 310058

Abstract：With the popularization of computer and communication technology, more and more people are using computers to complete various tasks. Although computer technology has brought a lot of convenience to human beings, it has also invisibly provided opportunities for criminals. There are various threats in the use of computers, such as malicious software attacks, phishing, etc., which have brought huge security risks to users (especially non-professional users). As a key link to prevent users from being harmed, warnings have attracted extensive attention from academia. At present, a large amount of research has focused on the interaction between users and computer security warnings. This paper reviews previous research on computer security warnings, summarizes relevant research progress, and proposes future research directions in this field. Computer security warnings are communication media that inform users of possible problems in the computer system. According to their characteristics, perceptual patterns and conveyed security threats, they can be divided into different types. The communication-human information processing model and the human-in-the-loop security framework are two basic theoretical models in the field of computer security warnings, covering various stages of warning information processing and their influencing factors, and are widely used to guide the design and improvement of computer security warnings. Previous researchers have conducted a lot of research on the factors affecting the effectiveness of computer security warnings. Generally speaking, the findings of these studies can be divided into warning feature-related factors and receiver-related factors. Among them, warning feature-related factors mainly focus on the visual features (such as color, icon, layout, etc.) and warning content (such as information about danger, consequences, explanations); receiver-related factors mainly include habituation effects and individual differences. Based on this, future research on computer security warnings can focus on the design and research of multi-channel computer security warnings, explore personalized computer security warnings, and combine psychological research findings to improve the effectiveness of existing computer security warnings from the user's psychological perspective. In addition, a more systematic theoretical framework needs to be formed to guide future research and warning design practices.

活动参与限制和结直肠癌永久性肠造口患者总体生活质量的关系：心理困扰的中介作用和家庭功能的调节作用

李国鹏　覃瑞　赵香玉　厉萍（通讯作者）
山东大学护理与康复学院，济南，250012，pingli12@sdu.edu.cn

摘　要　**目的:**虽然癌症诊断和造口使结直肠癌患者存在活动参与限制，从而影响其生活质量，但其潜在的机制尚未得到充分研究。因此，本研究拟探讨心理困扰是否中介活动参与限制与总体生活质量的关系，以及家庭功能是否通过调节了活动参与限制通过心理困扰影响总体生活质量的间接路径。

方法：便利选取山东省肿瘤医院造口门诊的 282 例结直肠癌永久性肠造口患者为被试，采用欧洲癌症研究与治疗组织生活质量问卷的 3 个维度、2 条目的患者健康问卷和广泛性焦虑问卷以及家庭关怀指数分别调查患者的总体生活质量、活动参与限制、心理困扰和家庭功能。采用 SPSS26.0 和 PROCESS4.0 插件对数据进行分析。

结果:中介分析显示，心理困扰部分中介(间接效应= -0.087,95% CI = -0.135- -0.041)活动参与限制与总体生活质量的关系；有调节的中介分析表明，家庭功能（交互项β＝－0.137, P＝0.027）显著调节了活动参与限制通过心理困扰对总体生活质量的间接路径。具体而言，随着家庭功能的提高，间接路径的效应显著降低。

结论:结直肠癌永久性肠造口患者总体生活质量较差。有调节的中介模型为理解活动参与限制、心理困扰和家庭功能如何影响总体生活质量提供了思路。旨在改善结直肠癌永久性肠造口幸存者生活质量的干预措施应考虑针对这些方面。

关键词　参与限制，心理困扰，家庭功能，生活质量，结肠直肠癌

Limitations on participation and global quality of life among CRC survivors with permanent stomas: Moderated mediation analysis of psychological distress and family functioning

Guopeng Li, Rui Qin, Xiangyu Zhao, Ping Li
School of Nursing and Rehabilitation, Shandong University, Jinan 250012,
pingli12@sdu.edu.cn

Abstract **Objective:** Although a cancer diagnosis and stoma creation leave colorectal cancer (CRC) survivors with significant limitations on participation in life activities that would impair their global quality of life (QoL), the underlying psychological mechanisms are understudied. The aim of this cross-section study was to examine whether psychological distress mediates the association of limitations on participation in life activity with global QoL, and whether family functioning moderated the indirect effects of limitations on participation in life activities with global QoL through psychological distress.

Methods: CRC survivors with permanent stomas (n = 282) completed questionnaires assessing socio-demographic and clinical characteristics, limitations on participation in life activities, psychological distress, family functioning and global QoL. The mediation model and moderated mediation model were conducted using the PROCESS macro for SPSS.

Results: Mediation analysis showed that the association of limitations on participation in life activities with global QoL was partially mediated by psychological distress (indirect effect = -0.087, 95% CI = -0.135 to -0.041). Moderated mediation analysis indicated that the indirect effects of limitations on participation in life activities on global QoL through psychological distress were significantly moderated by family functioning (β = − 0.137, P = 0.027). Specifically, the indirect effects decreased were significant as family functioning levels increased.

Conclusion: CRC survivors with permanent stomas experienced poor global QoL. The moderated mediation model provides a better understanding of how limitations on participation in life activities, psychological distress, and family functioning work together to affect global QoL. Interventions aiming to improve QoL among CRC survivors with permanent stomas should consider targeting these aspects.

监控与接纳，还是仅仅监控？拆解正念训练对情绪反应效果的一项随机对照研究

魏艳萍[1] 孙丽敏[1] 薛 将[1] 陈树林[1]（通讯作者）
[1]浙江大学心理与行为科学系，杭州，310030
通讯作者 E-mail: chenshulin@zju.edu.cn

摘 要 **引言：**过往基于监控与接纳理论(Monitor and Acceptance Theory, MAT)的研究未能发现监控和接纳对消极情绪的效果差异。本研究希望通过评估正念水平和情绪反应性来阐明它们的效果差异。**方法：**392 名被试随机分为 3 组(监控与接纳组，MA；只有监控组，MO；等待对照组，WL)。MA 和 MO 组的被试需要完成 14 天的线上正念训练，内容分别为同时练习监控与接纳，或者仅进行监控练习。研究在干预前(T1)、干预后(T2)和 2 周后的随访(T3)中使用正念五因素量表(短版)、积极消极情绪量表和情绪反应性量表进行了测量。**结果：**除了不判断维度以外，MA 和 MO 在 T2 时的各维度正念水平均有提升，与 WL 的差异显著($ps < 0.05$)。MA 和 MO 之间比较，MA 的不反应水平在 T2($F = 9.595$, $df = 1$, $p = 0.002$, $\eta_p^2 = 0.034$)和 T3($F = 8.146$, $df = 1$, $p = 0.005$, $\eta_p^2 = 0.029$)均更高；MO 的观察水平在 T3 时更高($F = 6.210$, $df = 1$, $p = 0.013$, $\eta_p^2 = 0.022$)。与 WL 相比，MO 和 MA 均提升了积极情绪、降低消极情绪和情绪反应性($ps < 0.05$)。在 T2 时，MA 和 MO 在积极消极情绪和情绪反应性上的效果没有显著差异($ps > 0.05$)，但是在 T3 时，MO 在情绪反应性上的得分低于 MA，组间差异显著($F = 11.171$, $df = 1$, $p < 0.001$, $\eta_p^2 = 0.039$)。**讨论：**本研究表明两周的监控与接纳训练和单独监控训练均能够提升监控和接纳的正念水平，提升积极情绪，减少消极情绪和情绪反应性。在 2 周的随访阶段，单独的监控训练在提升正念水平和降低情绪反应性上表现出更好的效果。

Monitor and acceptance, or monitor only? A randomized controlled study on the effect of dismantling mindfulness training on emotion reactivity

Yanping Wei[1] Limin Sun[1] Jiang Xue[1] and Shulin Chen[1]
[1] Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, China

***Abstract*：** **Introduction:** Previous studies based on the Monitor and Acceptance Theory (MAT) failed to find the different effects of monitoring and acceptance on negative affect. This study wanted to explore it by assessing the mindfulness and emotion reactivity. **Methods:** 392 participants were divided into three groups (Monitor and Acceptance, MA; Monitor Only, MO; Waiting List, WL) randomly. Participants in MA and MO groups had a

14-day online mindfulness training focused on monitoring skills and acceptance, or only monitoring skills respectively. Five Facet Mindfulness Questionnaire (short version), Positive and Negative Affect Scale, and Emotional Reactivity Scale were used to assess the outcomes before (T1), after the intervention (T2), and in the two-week follow-up (T3). **Results:** The results showed significant improvements on all facets of mindfulness except nonjudgment in T2 for both MA and MO compared to WL (*ps* < 0.05). Compared between MA and MO, MA showed higher score on nonreactivity in both T2 (F = 9.595, df = 1, p = 0.002, η_p^2 = 0.034) and T3 (F = 8.146, df = 1, p = 0.005, η_p^2 = 0.029), while MO had higher score in observing in T3 (F = 6.210, df = 1, p = 0.013, η_p^2 = 0.022). Both MA and MO increased positive affect, decreased negative affect and emotion reactivity compared to WL (*ps* < 0.05). There were no significant differences between MA and MO on affects and emotion reactivity in T2 (*ps* > 0.05). However, MO showed better effect on emotion reactivity in T3 compared to MA (F = 11.171, df = 1, p < 0.001, η_p^2 = 0.039). **Discussion:** This study demonstrated that both MA and MO could improve monitoring and acceptance and had positive effects on positive and negative affect and emotion reactivity in two weeks. MO showed better effects on mindfulness and emotion reactivity in the follow-up.

马基雅维利主义员工如何维持与领导的关系能量—基于特质激活理论

孙毅聪[1]　颜爱民[1]　胡馨芳[1]　臧志梅[1]（通讯作者）
1 中南大学，长沙，430018，sunyicong123@126.com

摘 要　马基雅维利主义的员工通常被视为“怀疑他人，渴望控制和地位，并擅长操纵的黑暗个体”，但最近的研究表明马基雅维利主义也具备一些优势，比如更强的适应能力和灵活性，并在提升绩效和关系构建方面有独特的作用机制。本研究基于特质激活理论探讨了马基雅维利主义如何维持与领导的关系能量，并厘清了其中介机制和调节边界。研究以 275 名有效员工为研究对象，分别在三个时间点(每个时间点间隔一个月)，收集了马基雅维利主义（T1）,领导-成员交换矛盾（T1）,表面顺从（T2）,关系能量（T3）的量表，运用 Mplus 进行了路径分析。结果发现表面顺从是马基雅维利主义员工维持与领导关系能量的重要中介机制，马基雅维利主义员工通过采用表面顺从的策略，在维持与领导友好关系的同时并没有改变内心秉承的价值观，这有助于维持与领导的关系能量并保持心理资源；领导成员交换矛盾会进一步激活马基雅维利主义的特质，增加他们采用表面顺从策略的可能性，进而维持了领导之间的关系能量。这些研究结果表面，马基雅维利主义员工特质的“另一面”，他们具有独特的维持与领导关系能量的中介机制和边界条件，响应了学者们提出的探讨黑暗人格特质的独特性的号召，具有一定的理论意义和管理实践意义。

How do Machiavellianism Employees Maintain Relationship Energy with Leaders–Based on Trait Activation Theory

Yicong Sun[1], Aimin Yan[1], Xinfang Hu[1], Zhimei, Zang[1*]
1 Business School, Central South University, Changsha, China

Abstract：Machiavellianism employees are often viewed as "dark individuals who are suspicious of others,

crave control and status, and excel at manipulation," but recent research suggests that Machiavellianism also offers strengths, such as greater adaptability and flexibility, and unique mechanisms for performance enhancement and relationship building. Based on trait activation theory, this study explores how Machiavellianism sustains relational energy with leaders and clarifies its mediating mechanisms and moderating boundaries. The study collected the scales of Machiavellianism (T1), Leader-Member Exchange ambivalence (T1), facades of conformity (T2), and relational energy (T3) at three-time points (one-month intervals between each time point) with 275 employees as participants and conducted a path analysis using Mplus. The results found that facades of conformity is an important mediating mechanism for Machiavellian employees to maintain their relational energy with their leaders, and Machiavellian employees, by adopting the strategy of facades of conformity, maintain a friendly relationship with their leaders without changing their internal adherence to their values, which helps to maintain relational energy with their leaders and keep their psychological resources; the leader-member exchange ambivalence further activates the trait of Machiavellianism and increases the likelihood that they will employ facades of conformity strategies, which in turn maintains the relational energy between leaders. These findings suggest that the "other side" of Machiavellianism employee traits, with their unique mediating mechanisms and boundary conditions for maintaining relational energy with leaders, responds to scholars' call for exploring the uniqueness of darker personality traits, and has both theoretical and managerial practical implications.
Keywords： Machiavellianism, trait activation theory, relational energy, facades of conformity

本土化情绪调节的测量及应用模式的检验

唐凯晴[1,2] 黄敏儿[1]（通讯作者）

1 中山大学心理学系，广州，510006，edshme@mail.sysu.edu.cn

2 广州中医药大学医学信息工程学院，广州，510006

摘 要 国内以往较为常用的情绪调节测量工具所评估的调节策略具有一定的局限性，一方面没有考虑到个体在实际生活中可能会采用不止一种策略来调节情绪；另一方面缺乏华人价值观的融入，没有考虑到文化因素对情绪应对的影响，如华人文化非常推崇策略性的忍耐。有研究者对此提出了“适当表达”情绪调节策略，并编制了测量量表，但研究对象局限在台湾地区的青少年群体。本研究旨在面向大陆地区大学生群体，进一步检验基于情绪精炼理论发展的本土化情绪调节量表的测量学属性及其应用模式。方法：412 名大学生参与了问卷测量，问卷包括本土化情绪调节量表、人际关系适应量表、安适幸福感量表以及领悟社会支持量表。结果：①本土化情绪调节量表具有稳定的三因素结构（$\chi 2/df$ =4.04，RMSEA=0.087，CFI=0.952，TLI=0.941，SRMR=0.050），即认知重评、表达抑制和适当表达，总量表和各分量表的内部一致性系数在 0.854-0.946 之间。②认知重评和适当表达均能正向预测人际关系适应、安适幸福感以及领悟社会支持，而且适当表达对女性人际关系适应的正面效果优于认知重评。③表达抑制负向预测人际关系适应，而且男性的表达抑制显著高于女性。结论：本土化情绪调节量表具有较好的信效度，适当表达是切合华人文化的有助于提升个体身心适应的情绪调节策略。

关键词 情绪精炼；认知重评；表达抑制；适当表达；信效度

Validation and Application of Indigenizing Emotion Regulation Questionnaire

TANG Kai-qing[1 2], Huang Min-er[1]
[1] Department of Psychology, Sun Yat-Sen University, Guangzhou 510006
[2] School of Medical Information Engineering, Guangzhou University of Chinese Medicine, Guangzhou 510006

Abstract：Objective: This study aimed to test the factor structure and psychometric properties of Indigenizing Emotion Regulation Questionnaire in Chinese mainland college students. Methods: 412 college students were recruited to complete a series of scales, including Indigenizing Emotion Regulation Questionnaire, Chinese College Student Adjustment Scale, Peace of Mind Scale and Perceived Social Support Scale. Results: ①Indigenizing Emotion Regulation Questionnaire had a stable three-factor structure($\chi 2/df$ =4.04, RMSEA=0.087, CFI=0.952, TLI=0.941, SRMR=0.050), including reappraisal, suppression and proper voicing, and the internal consistency coefficient of the total scale and each subscale was between 0.854 and 0.946. ②Reappraisal and Proper voicing could positively predict interpersonal adaptation, peace of mind and perceived social support. Moreover, the positive effect of proper voicing on the female interpersonal adaptation was better than reappraisal. ③Suppression could negatively predict their interpersonal adaptation，and the male scores in Suppression were significantly higher than the female. Conclusion: Indigenizing Emotion Regulation Questionnaire is a suitable instrument to assess the strategies of emotion regulation in Chinese mainland college students. And proper voicing is an emotion regulation strategy suitable for Chinese culture and conducive to improving individual physical and mental adaptation.

Keywords：Emotion refinement; Reappraisal; Suppression; Proper voicing; Psychometric properties

自我概念清晰性对网络喷子行为的影响：有调节的中介模型

田佳旭[1](通讯作者)
1 贵州师范大学心理学院，贵阳，550025，2407887300@qq.com

摘 要　网络喷子行为是指个体故意破坏网络正常交流，从而引发其他网络用户的消极情绪反应，进而体验到愉悦感的一种行为方式。先前研究大多探讨个体因素(如，性别、年龄、人格特质等)对网络喷子行为的预测作用，缺乏环境因素及其交互效应对网络喷子行为的影响研究。根据一般压力理论的观点，自我概念清晰性与网络反社会行为密切相关。此外，孤独感不仅显著预测网络喷子行为，也是衡量自我概念清晰性所影响个体社会适应的指标之一。而去个性化则是匿名网络环境中影响个体采取反社会行为的关键因素之一。因此，本研究依据个体–环境交互作用模型，考察了自我概念清晰性对网络喷子行为的影响及其作用机制。以 1014 名大学生为被试，采用自我概念清晰性量表、孤独感量表、去个性化量表、网络喷子行为量表进行施测，结果发现：(1) 自我概念清晰性与孤独感、去个性化、网络喷子行为均呈显著负相关；孤独感、去个性化、网络喷子行为两两呈显著正相关。(2) 孤独感在自我概念清晰性与网络喷子行为之间起中介作用。(3) “自我概念清晰性–孤独感–网络喷子行为”这一中介路径的后半段受到去个性化的调节。这表明，低自我概念清晰性通过增强孤独感影响网络喷子行为的产生，但低去个性化会削弱自我概念清晰性与孤独感对网络喷子行为的促进作用。

关键词　大学生，网络喷子行为，自我概念清晰性，孤独感，去个性化

The Effect of Self-Concept Clarity on Internet Trolling: Moderated Mediating Effect

Jia-Xu Tian[1*]

School of psychology, Guizhou Normal University, Guiyang 550025, China

***Abstract*：** Internet trolling refers to a behavior pattern in which individuals deliberately disrupt normal communication on the Internet to trigger negative emotional reactions of other Internet users, and then experience the pleasure. Most previous studies have explored the predictive effects of individual factors (such as sex, age, personality, etc.) on Internet Trolling, but lack the impacts of environmental factors and their interactive effects on Internet Trolling. According to the General Strain Theory, self-concept clarity is closely related to antisocial behaviors. In addition, loneliness not only significantly predicts Internet Trolling, but also is one of the indicators that measured the impact of self-concept clarity on individual's social adaption. Deindividuation is one of the key factors that influence individuals to adopt antisocial behaviors in an anonymous network environment. Therefore, based on the individual-environment interaction model, this study examines the influence of self-concept clarity on Internet Trolling and its mechanism. A sample of 1014 college students were assessed with Self-Concept Clarity Scale, Loneliness Scale, Deindividuation Scale and Internet Trolling Scale. The results showed that: (1) Self-concept clarity was significantly negatively correlated with loneliness, deindividuation and Internet Trolling. But there was also a significant negative correlation between deindividuation and Internet Trolling. (2) Loneliness partially mediated the relationship between self-concept clarity and Internet Trolling. (3) Deindividuation moderated the effects of self-concept clarity and loneliness on Internet Trolling. It indicates that Low self-concept clarity can affect the generation of Internet Trolling by enhancing loneliness, but low deindividuation can weaken the promoting effects of self-concept clarity and loneliness on Internet Trolling.

社会比较倾向和多维竞争特质的关系以及它们对多领域冒险行为的预测作用

王羽茜[1] Andrew J. Elliot[3]，李岩松[1,2]（通讯作者）

1 南京大学社会学院心理系，南京，210023

2 南京大学脑科学研究院，南京，210023

3 Department of Psychology, University of Rochester, United States

摘 要 近年来，社会比较取向与竞争特质之间的关系以及它们对个体风险行为的预测引起了广泛关注。然而，仍有一些问题需要进一步澄清。本研究在前人研究的基础上更新和扩展了相关内容。社会比较被定义为个体倾向于将自身的能力和观点与他人进行比较，这可能导致竞争态度和竞争行为的产生。尽管有关社会比较的研究很多，但对社会比较与竞争之间的关联了解仍然有限。竞争特质可能在社会比较与风险行为之间起到中介作用，但需要注意的是，竞争特质并非单一维度概念，不同的竞争维度（如超竞争倾向和自我发展竞争倾向）可能在社会比较与风险行为的关系中起到不同作用。

本研究旨在探索超竞争倾向和自我发展竞争倾向与社会比较倾向和风险承担之间的关系。超竞争倾向是指个体总是努力超越他人的倾向，这表明个体具有强烈的比较动机。而自我发展竞争倾向则侧重于个人

的发展和成长，同时关注他人的福祉，相对而言对心理健康的风险较低。

本研究通过两个相关研究对以上关系进行了实证检验，分别使用了大学生样本（N = 622）和成年工作人群样本（N = 717）。研究结果显示，社会比较-能力与超竞争倾向和自我发展竞争倾向呈正相关。社会比较-能力正向预测了总体风险行为以及其他领域的风险行为。两个研究结果在大体上一致，但在超竞争倾向和自我发展竞争倾向对风险行为的预测中存在一些差异。

具体而言，在研究一中，超竞争倾向对整体冒险行为以及娱乐、伦理和赌博领域的冒险行为产生显著的间接效应，而自我发展竞争倾向对娱乐和健康/安全领域的冒险行为产生显著的间接效应。研究二发现，超竞争倾向对整体冒险行为和伦理领域的冒险行为产生显著的间接效应，而自我发展竞争倾向对整体冒险行为和娱乐领域的冒险行为产生显著的间接效应。

综上所述，本研究在整合社会比较和竞争特质文献的基础上，扩展了风险行为的前因研究，对我们理解社会比较、竞争特质和风险行为之间的关系具有重要的学术和实践意义。

Social comparison orientation and multidimensional competitiveness: their influence on overall and domain-specific risk-taking

, Yuqian Wang, Andrew J. Elliot, Yansong Li[1, 2]

1 Institute for Brain Sciences, Nanjing University, China

2 Reward, Competition and Social Neuroscience Lab, Department of Psychology, School of Social and Behavioral Sciences, Nanjing University, China

3 Department of Psychology, University of Rochester, United States

Abstract： The relation between social comparison orientation and trait competitiveness, and how they predict individuals' risk-taking behavior is receiving growing attention. However, there are still a few issues that remain to be clarified. The present study provided an update and extension of previous research by examining how two types of social comparison orientation (SCO-ability and SCO-opinion) predicted two dimensions of trait competitiveness (hypercompetitive orientation (HCO) and self-development competitive orientation (SDCO)) and further investigating their utility in predicting both overall and domain-specific risk-taking in two correlational studies using college student (N = 622) and adult worker (N = 717) samples. The results revealed that SCO-ability positively predicted HCO and SDCO. SCO-ability positively predicted overall risk-taking and risk-taking in social investment and ethical risk-taking domains,

The findings were largely consistent across studies, with some variation within risk-taking domain. SCO-ability positively predicted HCO and SDCO, but the reciprocal relation was not observed. SCO-ability positively predicted overall risk-taking and risk-taking in the recreational, ethical, gambling, and health/safety domains across studies. Specifically, in Study 1, hypercompetitive orientation had significant indirect effects on overall risk-taking, as well as risk-taking in the domains of recreational, ethics, and gambling. Self-development competitive orientation had significant indirect effects on risk-taking in the domains of recreational and health/safety. In Study 2, hypercompetitive orientation had significant indirect effects on overall risk-taking and risk-taking in the ethics domain. Self-development competitive orientation had significant indirect effects on overall risk-taking and risk-taking in the recreational domain. This research furthers integration of the social

comparison and competition literatures, and expands the literature on antecedents of risk-taking behavior.

Keywords：Social comparison, Competitiveness, Multidimensional competitiveness, Domain-specific risk-taking

探究自我损耗状态下自我谈话的注意效应

——一项飞镖运动的眼动研究

耿璐[1] 洪晓彬[2]

1 武汉体育学院运动医学院，武汉，430070

2 武汉体育学院心理学系，武汉，430070，471780693@qq.com

摘 要　以往研究发现，在自我损耗状态下自我谈话可以提升注意并促进运动表现。正式比赛中阻碍运动表现的因素错综复杂，当人们的资源耗尽时运动表现将受到极大影响。如果在自我损耗状态下抵御分心干扰，此时的自我谈话是否依然可以提高被试注意功能和运动表现呢？为此，本研究注重生态学效度，在真实的运动场景中引入听觉分心刺激，尝试使用便携式眼动仪来考察运动员自我损耗状态下自我谈话的注意效应。

本研究选取 43 名体育专业学生，均为右利手，视力正常，无任何飞镖经验。采用单因素随机分组前后测设计。被试在前测阶段佩戴眼动仪进行飞镖任务，随后被随机分到自我谈话组和控制组；为期三天的干预阶段只有自我谈话组接受自我谈话训练；后测阶段，两组被试佩戴眼动仪在自我损耗状态下抵御听觉分心刺激进行飞镖任务。将特质自我控制和前测结果作为协变量加以控制。

结果如下：（1）自我谈话组被试在飞镖任务中注意力更集中。相比控制组被试，自我谈话组被试在飞镖盘近中心区域的眼动指标，例如：注视时长、访问时长、首注视时长更长，而在飞镖盘外区域的注视时长、访问时长和首注视时长更短；同时，自我谈话组被试在飞镖盘上的注视次数和访问次数也更多；（2）自我谈话组被试在飞镖投掷过程中注意力更稳定更集中，表现在热点图上飞镖盘的近中心区域的红色分布更多。并且，自我谈话组被试的眼动轨迹更集中分布于飞镖盘区域，而控制组被试的眼动轨迹显得更杂乱、更分散；（3）自我谈话干预未能对被试的飞镖成绩产生显著的提升作用。但相比控制组被试，自我谈话组被试的飞镖成绩发挥较为稳定。

综上，本研究结论为：（1）自我谈话作为一种心理训练技术，可能需要对被试进行长时间的干预才会达到提升运动表现的明显效果；（2）自我谈话有利于被试在自我损耗状态下抵制分心干扰，并提高对任务目标的注意程度。

Abstract: Previous research found that self-talk can improve attention and athletic performance in a state of ego depletion. The factors hindering the race are intricate while people's resources are insufficient, their physical

performance will be significantly effected. If people resist distractions in a state of ego depletion, self-talk at this time still can improve the subjects' attention and performance? Therefore, the research focuses on ecological validity, incorporating auditory distractions into real sports situations, and attempting to use a portable eye tracker to investigate the attention effect of self-talk in athletes under self-depletion. The study selected 43 students majoring in sports, all of whom were right-handed, had normal vision, and had no experience with darts. Adopting a single-factor randomized pre-posttest design. During the pre-test phase, participants wore an eye tracker for dart tasks, and were then randomly assigned to a self-talk group and a control group; During the three-day intervention phase, only the self-talk group received self-talk training; In the post-test stage, two groups of participants wore eye trackers to resist auditory distractions and engage in dart missions in a state of ego depletion. Control trait self-control and pre-test results as covariates.

The results are as follows:(1)The self-talk group in the dart mission was more focused than the control group. Compared with the control group, the self-talk group had eye movement indicators in the near center area of the dart disk, such as longer gaze duration, interview duration, and first gaze duration, while the gaze duration, interview duration, and first gaze duration outside the dart disk were shorter; At the same time, the self-talk group also had more fixations and visits on the dart board; (2) The self-talk group showed more stable and focused attention during the dart throwing process, with more red distribution in the near center area of the dart disk on the hot spot map. Moreover, the eye movement trajectories of the self-talk group were more concentrated in the dart disk area, while the eye movement trajectories of the control group were more chaotic and dispersed; (3) Self-talk intervention did not significantly improve the subjects' dart performance. However, the self-talk group exhibited more stable dart performance compared to the control group.

In summary, the conclusions of the study are: (1) Self-talk, as a psychological training technique, may require long-term intervention on the subjects to achieve a significant effect on improving exercise performance; (2) Self-talk is beneficial for participants to resist distractions and increase their attention to task goals in a state of self depletion.

消费者自主选择情境中服务机器人拟人化对消费者社会评价的影响

钱一铭 宛小昂（通讯作者）

清华大学社会科学学院心理学系，北京，100084，wanxa@mail.tsinghua.edu.cn

摘 要　服务机器人已广泛应用于各类服务领域，而在应用场景中，采用拟人化设计的机器人变得越来越常见。拟人化是指将类似于人类的特征、特性和行为赋予非人类的主体。以往研究表明拟人化设计虽然具有一定优势，但需要考虑的是消费者并不总是需要拟人化的机器人。本研究探讨了服务机器人的拟人化程度对消费者使用意愿和社会评价的影响，并进一步确定了该效应的边界条件。由于机器人已逐渐具有社会角色属性，以及消费者的自主性会影响其消费行为和评价，因此本研究考虑了机器人社会角色和消费者自主性的影响。在本研究中，我们通过机器人的外观特征来操纵其拟人化程度，被试被随机分配到机器人的社会角色是伙伴或助手的组别中。每组中一半的被试具有高自主性，即可以选择先接受高拟人化还是低拟人化机器人的服务，而另一半被试具有低自主性，即不能选择机器人的类型。所有被试都需要对高拟人化和低拟人化机器人的使用意愿、能力感知和温暖感知进行评分。结果显示，与低拟人化服务机器人相比，被试对高拟人化服务机器人表现出了更高的使用意愿以及能力和温暖感知。同时，拟人化的效果会受到社会角色的调节，即在助手角色组中，高拟人化和低拟人化机器人之间的差异比在伙伴角色组中的差异更为显著。此外，这种调节作用只在被试可以自由选择机器人类型的情境中显著。总的来说，本研究揭示了拟人化设计能够提高消费者对服务机器人的使用意愿和社会评价，但这种积极作用会受到机器人所扮演的社

会角色和消费者自主性的影响。本研究的结果确定了机器人拟人化设计的影响的边界条件，也为机器人外观设计和角色定义方面提供了实践启示，在增强服务环境中的人机交互方面具有较好的理论意义。

The Influence of Anthropomorphism of Service Robots on Consumers' Social Evaluation in the Context of Providing Consumers with Choice

Yiming Qian, Xiaoang Wan*
Department of Psychology, School of Social Sciences, Tsinghua University, Beijing, 100084

Abstract： Service robots have been widely used in various service fields, and robots with anthropomorphic designs are becoming more and more common in application scenarios. Anthropomorphism refers to the process of attributing humanlike features, traits, and behaviors to non-human agents. Previous research has shown that despite anthropomorphism offers several advantages, it is important to consider that consumers do not always need robots with anthropomorphic characteristics. Here we report a study designed to investigate the influence of anthropomorphism of service robots on consumers' usage intentions and social evaluations, and to determine its boundary conditions. Participants were randomly assigned to the group receiving service from either companion-role robots or assistant-role robots. Within each group, half of the participants had high autonomy, that is, they were given the choice to determine whether to receive service from a high or low anthropomorphism robot first, whereas the others had low autonomy, that is, they could not choose the type of robot. All participants were asked to rate their intention to use and the competence and warmth perception of the high and low anthropomorphism robots. The results revealed that participants showed higher intention to use and higher perception of competence and warmth for high anthropomorphism service robots than for low anthropomorphism service robots. The results also revealed that the effects of anthropomorphism were moderated by social role, with the difference between high and low anthropomorphism being more significant in the assistant-role group than in the companion-role group. Moreover, this moderating effect was significant only when participants had free choices. In conclusion, the findings of the present study revealed that anthropomorphic design can increase consumers' intention to use and social evaluation of service robots, whereas the positive effect can be influenced by the social role played by the robot and consumer autonomy. These findings demonstrate the boundary conditions for the influence of anthropomorphic design of service robots, and provide practical insights in terms of robot appearance design and role definition. The findings also provide valuable insight to enhance human–robot interaction in service settings.

Keywords： service robot, anthropomorphism, social role, consumer autonomy, social evaluations

网络分析技术下地域认同对心理应激的影响：适应性的中介作用和人际关系的调节作用

张磊[1,2]，汪洋[1]，杨海波[1]（通讯作者）
（1 天津师范大学心理学部，天津市 300074,通讯作者邮箱 yanghaibo@tjnu.edu.cn）
（2.青岛中学，山东青岛 266000）

摘 要　已有研究证明，过高的应激水平会造成个体适应性降低，并且容易引发人际关系困扰。社会身份是个体应对应激状态的重要因素，社会认同是社会身份的重要方面，为了探讨社会认同中地域认同与心理应激的关系，本研究以地域认同量表、大学生心理应激感量表、适应性量表、人际关系综合诊断量表作为测量工具，对来山东省某市 6 所大学的 1145 名学生数据（平均年龄为 20.2，其中男性 525 人，女性 620 人）进行调查，并通过网络分析技术探讨地域认同和心理应激的核心内容。通过数据分析，研究结果如下：（1）相关分析：地域认同与心理应激、人际关系困扰程度存在负相关，与适应性存在正相关；心理应激与适应性存在负相关，与人际关系困扰程度存在正相关；适应性与人际关系困扰程度存在负相关。（2）有调节的中介模型：在结构方程模型分析中，地域认同能够显著负向预测心理应激；适应性在模型中起到部分中介作用，人际关系困扰程度在模型中起到调节作用。（3）网络分析：通过网络分析技术发现，地域认同量表中，最核心的内容为项目 3（我非常关心家乡的发展）；心理应激量表中，最核心的内容为项目 17（受到城市同学的歧视感到愤怒和自卑）；合并网络分析中，心理应激量表中的项目 17（受到城市同学的歧视感到愤怒和自卑）是个体心理应激最大的来源，这在一定程度上解释了地域认同对于个体心理应激的影响作用。研究结果说明了大学生个体的地域认同对于心理应激的影响作用，同伴关系与适应性也成为影响大学生心理应激的重要因素，在维护大学生心理健康状态时需要充分考虑以上多种影响因素。

The effects of geographical identity on psychological stress under network analysis techniques: the mediating role of adaptation and the moderating role of interpersonal relationships

Lei Zhang[1,2], Yang Wang[1], Haibo Yang[1] (Corresponding author)
(1Faculty of Psychology, Tianjin Normal University, Tianjin 300074, China)
(2 Qingdao Academy, Shandong, 266000, China)

Abstract: It has been proven that high stress levels reduce individuals' adaptability and often lead to interpersonal relationship difficulties. Social identity is a crucial factor in coping with stress, and one important aspect of social identity is geographic identity, which comprises five types: group, cultural, geographical, occupational, and status identity. To investigate the relationship between geographic identity and psychological stress within social identity, this study utilized the Geographic Identity Scale, the Psychological Stress Scale for College Students, the Adaptability Scale, and the Comprehensive Diagnostic Scale for Interpersonal Relationships as measurement tools. The data from 1,145 students (average age: 20.2) from six universities in China were analyzed, including 525 males and 620 females. The study employed network analysis techniques to explore the core components of geographic identity and psychological stress. The results of the study are as follows:1 Correlation analysis: Geographical identity exhibits a negative correlation with the degree of psychological stress and interpersonal relationship distress, and a positive correlation with adaptability. Psychological stress demonstrates a negative correlation with adaptability and a positive correlation with the degree of interpersonal relationship distress. Adaptability exhibits a negative correlation with the degree of interpersonal relationship distress.2 Moderated mediation model: In the structural equation model analysis, geographic identity significantly predicts psychological stress in a negative manner. Adaptability partially mediates the relationship in the model, while the degree of interpersonal relationship distress moderates the relationship.3 Network analysis: Through network analysis techniques, it was observed that item 3 ("I care a lot about the development of my hometown") is the most

central element in the geographic identity scale, whereas item 17 ("Feeling angry and experiencing low self-esteem after being discriminated against by urban classmates") is the most central element in the psychological stress scale. In the merged network analysis, item 17 of the psychological stress scale is identified as the primary source of psychological stress for individuals. This finding partially explains the influence of geographic identity on individual psychological stress.The results of this study demonstrate that geographic identity among college students impacts psychological stress. Peer relationships and adaptability are also significant factors influencing the psychological stress experienced by college students. These findings highlight the importance of considering these factors in maintaining the psychological health of college students.

孤独感对青少年问题性手机使用的影响：上行社会比较和错失恐惧的链式中介作用以及自我认同感的调节作用

邵思洋　崔丽霞（通讯作者）
首都师范大学心理学院，北京市“学习与认知”重点实验室，北京，100048，clx668@163.com

摘 要　青少年问题性手机使用现象广泛存在，严重影响其身心健康和未来发展，这引起了研究者们的广泛关注。在青少年所面临的主要情绪问题中，孤独感已被发现是问题性手机使用的重要影响因素之一，然而其内在机制尚不明确。因此，本研究基于负强化情绪加工模型、补偿性互联网使用理论、自我决定理论以及人-影响-认知-执行模型等，构建了一个有调节的链式中介模型，探讨上行社会比较和错失恐惧在孤独感和问题性手机使用之间的链式中介作用，以及自我认同感在其中的调节作用。本研究采用孤独感量表、上行社会比较量表、错失恐惧量表、青少年自我认同感量表和青少年问题性手机使用量表-中国版。在北京市三所中学，以随机整群抽取的方式选择 466 名青少年（M_{age}=14.94±1.88；男生 208 人，女生 258 人）施测上述五种问卷，通过路径分析对该假设模型进行检验。结果表明：该模型拟合度较好，X^2/df = 2.35，CFI = 0.98，NFI = 0.97，TLI = 0.95，RMSEA = 0.05。进一步的路径分析表明：（1）孤独感显著正向预测青少年问题性手机使用（β= 0.23, p < 0.001）；（2）上行社会比较与错失恐惧在孤独感和青少年问题性手机使用间发挥链式中介作用（β= 0.11， p < 0.001，95%CI = [0.06, 0.16]）；（3）自我认同感在其中发挥调节作用，自我认同感水平较高时，上行社会比较和错失恐惧之间呈显著负相关（β= -0.35， p < 0.001），自我认同感水平较低时，上行社会比较和错失恐惧之间呈显著正相关（β= 0.20， p < 0.001）。以上结果表明，孤独感影响青少年问题性手机使用，上行社会比较与错失恐惧在二者间具有链式中介作用，自我认同在其中发挥调节作用。本研究根据情绪、认知和行为间的互相影响，不仅揭示了青少年问题性手机使用的内在心理机制，而且强调了关注青少年自我认同感的发展是帮助其适应数字化时代的关键，对青少年问题性手机使用的预防和干预具有重要的指导意义。
关键词　问题性手机使用，孤独感，上行社会比较，错失恐惧，自我认同

Adolescents' Loneliness and Problematic Smartphone Use: The Sequential Mediating Role of Upward Social Comparison and Fear of Missing Out and the Moderating Role of Self-identity

Siyang Shao, Lixia Cui
Department of Psychology, Key Laboratory of Learning and Cognition, Capital Normal University, Beijing, 100048

***Abstract*：** The widespread phenomenon of problematic smartphone use among adolescents, which seriously affects their physical and mental health and future development, has attracted extensive attention from researchers. Among the prominent emotional issues faced by adolescents, loneliness has been identified as a crucial contributing factor to problematic smartphone use; however, its underlying mechanisms remain unclear. Therefore, based on the Affective Processing Model of Negative Reinforcement, Self Determination Theory, Compensatory Internet Use Theory, and Interaction of Person-Affect-Cognition-Execution, this study constructed a moderated serial mediation model to explore the sequential mediating role of upward social comparison (USC) and fear of missing out (FOMO) on the relationship between loneliness and problematic smartphone use, as well as the moderating role of self-identity. This study used the Loneliness Scale, the Upward Social Comparison Scale, the Fear of Missing Out Scale, the Self-Identity Scale, and the Problematic Smartphone Use Scale for Chinese Adolescents. In three middle schools in Beijing, 466 adolescents were selected by random cluster sampling to test the above five questionnaires (M_{age}=14.94±1.88; 208 males and 258 females), and path analysis was used to test the hypothesis. Analysis yielded a good fit, X^2/df = 2.35, CFI = 0.98, NFI = 0.97, TLI = 0.95, and RMSEA = 0.05. Further path analysis showed that: (1) loneliness significantly positively predicted adolescents' problematic smartphone use (β= 0.23, p < 0.001); (2) upward social comparison and fear of missing out served as sequential mediating factors in the relationship between loneliness and problematic smartphone use (β= 0.11, p < 0.001, 95%CI = [0.06, 0.16]), and (3) self-identity played as a moderating role between upward social comparison and fear of missing out. The simple slope tests revealed a negative correlation between USC and FOMO at high levels of self-identity (β= -.35, p < .001). At low levels of self-identity, there was a positive correlation between USC and FOMO (β= .20, p < .001). The above results suggest that loneliness affects adolescents' problematic smartphone use and that upward social comparison and fear of missing out have a sequential mediating role between them, in which self-identity plays a moderating role. Based on the reciprocal influence between emotions, cognition, and behavior, this study not only reveals the underlying psychological mechanisms of problematic smartphone use among adolescents but also highlights the importance of focusing on self-identity development as a key factor in helping adolescents adapt to the digital age. These findings have significant implications for the prevention and intervention of problematic smartphone use among adolescents, providing important guidance in this area.

感恩对网络人际行为的影响：一项为期 10 天的干预研究*

郑文峰　张建卫（通讯作者）　姜蕴珊　刘入瑗
北京理工大学人文与社会科学学院，北京　100081，通讯作者 E-mail：jianweizhang@bit.edu.cn

摘　要　互联网已经成为大学生生活和学习不可或缺的一部分，其引发了不同的网络人际行为（即网络偏差行为和网络亲社会行为）。随着积极心理学的兴起，研究者开始关注感恩干预与一系列积极结果（如亲社会行为）之间的关系，忽视了对偏差行为等消极结果的影响。更鲜见有研究致力于寻找一种可操作的机制来减少消极的网络偏差行为，同时增加网络亲社会行为。此外，以往大多数研究忽视了感恩干预如何影响个体行为及影响时效的关键问题。因此，本研究基于发现-提醒-联结理论，旨在开发和验证一种整合式感

* 基金项目：国家社会科学基金重点项目 (22AZD026)

恩干预方法（感恩日志、感恩表达及感恩沉思），探索其既可以作为网络亲社会行为的心理助推器，也可以作为网络偏差行为阻抑剂的有效途径。具体来说，本研究通过为期 10 天的整合式干预考察了感恩干预何以减少网络偏差行为并促进网络亲社会行为，以及关系能量在上述关系间的中介作用，并进一步考察了这种影响的即时和延时效应（一个月后）是否有差异。结果表明：（1）感恩干预对网络亲社会行为有即时与延时正向预测效应；（2）感恩干预对网络偏差行为具有即时与延时负向预测效应；（3）关系能量在感恩干预与网络亲社会行为的即时与延时关系中均起中介作用；（4）关系能量仅在感恩干预与网络偏差行为的延时关系中起中介作用。研究发现为学校教育工作者提供了一条简单而有益的实践途径，即通过整合式感恩干预促进网络亲社会行为，预防或减少网络偏差行为。

What Happened Online When College Students Become More Grateful? A 10-day Integrative Study*

Wenfeng Zheng, Jianwei Zhang (Corresponding Author)[9], Yunshan Jiang, Ruyuan Liu
School of Humanities and Social Sciences, Beijing Institute of Technology, Beijing 100081,
jianweizhang@bit.edu.cn

Abstract: The Internet has become indispensable to the life and learning of college students, eliciting different online behaviors (i.e., online deviant and prosocial behaviors). Previous studies associated gratitude interventions with a host of positive outcomes. However, there is little research regarding the impact of such interventions on both online behavior, or with a specific focus on online deviant behavior. In addition, most studies on gratitude interventions have overlooked the key issues of how gratitude intervention affects behavior and the impact of timeliness. When students purposefully cultivate feelings of gratitude, interpersonal energy is strengthened and online prosocial behaviors are more frequent while online deviant behaviors are more sporadic. In this study, we examined the effectiveness of a 10-day integrative online gratitude intervention in decreasing online deviant behavior and increasing online prosocial behavior among university students. Additionally, we propose and test a mediator model with relational energy based on the find-remind-and-bind theory. We then discussed the implications of theoretical contributions for future research and suggested a simple and helpful path for university educators, whereby gratitude interventions foster online prosocial behavior and prevent or attenuate online deviant behavior. We encourage further investigation to enrich our understanding of how gratitude can benefit the development of online interpersonal behavior among college students.

Keywords: gratitude intervention, relational energy, online deviant behavior, online prosocial behavior, find-remind-and-bind theory

失智患者家庭照护者的社会网络及其对照护体验的影响研究—基于混合社会网络分析视角

摘 要　社会网络对个体健康至关重要，在照顾失智患者的家庭照护者中更是如此。本研究旨在探讨失智患者家庭照护者的社会网络类型、影响因素以及对照护体验的影响。本研究采用混合研究设计，定量部分对 237 名失智患者及家庭照护者进行问卷调查：(a)个人和情境信息；(b)社会网络，使用 Lubben 社交网络量表；(c)照护体验采用 Zarit 负担访谈简表评估照护负担，照护者积极感受量表评估获益感。定性部分采用最大差异化抽样对 12 名家庭照护者进行半结构化访谈。定量部分采用潜在类别分析和多元回归分析，定性部分进行混合社会网络分析和归纳内容分析法。三种社会网络类型——家庭限制型网络（n=39，16.46%）、家庭主导型网络（n=99，41.77%）和多样型网络（n=99，41.77%）——在失智患者和家庭照护者的年龄和性别、失智程度和每周照护时间上差异有统计学意义（P<0.05）。家庭主导型网络中的照护者比家庭限制型网络中的照护者的照护负担更轻（β= -0.299，P= 0.003）、获益感程度更高（β= 0.228，P= 0.021）。家庭照护者在社会网络可及性（时间空间限制、无用的帮助、在线社交媒体的便捷）、互惠性（害怕麻烦、病耻感、社会参与）和信任性（失智照护的不信任、良好的关系质量）方面存在获取支持的障碍因素和促进因素，感知到社会支持包括经济支持、工具性支持、情感支持和正式支持。失智患者家庭护理者有不同的社会网络类型，在社会文化背景中有很大的差异，从社交网络中感知到各种类型的支持。稳固的家庭网络和多元化的社会网络在改善照护体验上至关重要。

Research on the Social Networks of Family Caregivers for Individuals with Dementia and Its Impact on Caregiving Experience - From the Perspective of Mixed-methods Social Network Analysis

Wang Jun[1]　Liu Weichu[1] Li Xuelian[1] Ma Yingzhuo[1] Zhao Qinghua[1] Lü Yang[1]　Xiao Mingzhao[1]
1The First Affiliated Hospital of Chongqing Medical University，Chongqing，400016

Abstract：Social networks (SNs) are crucial to personal health, particularly among caregivers of individuals with dementia (IWD). This study aims to depict dementia caregivers' SN types, related factors, and impact on the caregiving experiences. A Mixed-methods study was designed. A questionnaire-based survey was conducted with a total of 237 family caregivers of IWD: (a) personal and situational information; (b)SN, using the Lubben Social Network Scale; (c) caregiver burden, using the short-form Zarit Burden Interview; (d) positive aspects of caregiving (PAC), using nine-item Positive Aspects of Caregiving Scale. Additional semi-structured interviews was conducted with 12 caregivers. A quantitative analysis was performed using latent class analysis (LCA), and multivariate regression analysis. A mixed-methods social network analysis (MMSNA) and an inductive content analysis were performed on the qualitative data. The three SN types—family-limited (n=39, 16.46%), family-dominant (n=99, 41.77%) and diverse network (n=99, 41.77%)—differed in age and sex of caregivers and IWD, stage of dementia, and caregiving intensity. Caregivers in family-dominant networks had a lower caregiver burden (β= -0.299, P= 0.003) and greater PAC (β= 0.228, P= 0.021) than those in family-limited networks. Three themes, including accessibility (i.e., time-and-space restriction, useless help, convenience of online social media), reciprocity (i.e., fear of troubling, stigma, social participation), and reliance (i.e., distrust in providing dementia care, good relationship quality), emerged as facilitators and barriers when asking for support. Caregivers mentioned the objective, subjective, and formal support provided by SNs. Family caregivers of IWD have different

SN types that vary considerably among socio-cultural contexts and perceive various types of support from SN. Solid family network and diverse SNs play vital roles in improving the caregiving experience.

教师成长型思维对中学生学业投入的影响：学生成长型思维的中介作用及其干预研究

方作之[1,2] 罗扬眉[2]（通讯作者）

1 北京大学心理与认知科学学院，北京，100871

2 陕西师范大学心理学院，西安，710062，yangmeiluo@snnu.edu.cn

摘 要 教育是一个国家和民族最为重要的事业，教师作为教育的主体在教育过程中 扮演着重要角色。教师的成长型思维影响着教师自身是否有自己的教学能力可以 通过努力提高的信念。青少年是未来国家和社会的主体与创造者，他们所处的人 生阶段是自我发展的关键期。在这个关键时期，教师在青少年阶段的发展中有着 举足轻重的作用。那么，教师的思维模式在教室文化环境下是否通过影响青少年 的思维模式从而影响其学业投入呢？

本研究从科学实证地角度，研究教师的成长 型思维影响中学生学习投入的内部机制，对该问题的研究，不仅有利于促进中学 生的学习投入，也能为教师如何促进学生学习投入提供理论指导和实践支持。 鉴于此，本研究基于成长型思维理论，开展了如下三个研究，研究一使用公共数据库《中国家庭追踪调查》，进行学生成长型思维与学业投入的纵向追踪的交叉滞后研究设计，考察中学生成长型思维与学业投 入的因果关系。研究二对中学生的成长型思维进行短时程干预训练，使用配对样本 t 检验的前后测量方法检验干预效果。研究三采用问卷调查方式，选取初一至高二 51 个班级的班主任教师及学生，以教师成长型思维、教师固定型思维分别为自变量，学生成长型思维为中介变量，学生学习投入为因变量，使用跨水平模型分析，探讨教师成长型思维对学生学习投入的影响及其内部机制。三个研究结果表明：

1. 成长型思维正向预测学业投入；
2. 成长型思维可以通过短时程干预得到提升，学业投入也随之提升；
3. 教师成长型思维总体处于中等偏上水平；
4. 教师成长型思维显著正向预测学生成长型思维与学习投入；
5. 学生成长型思维在教师成长型思维与中学生学习投入的关系中起到完全中介作用。

本研究结果揭示了教师成长型思维会影响学生成长型思维，进而提升学生学 业投入，该研究为成长型思维与学业投入之间的因果关系提供了较为充分的实证 研究的支持，丰富了成长型思维和学业投入的相关研究，也为教师和学生的成长 型思维的干预研究提供了思路。

***Abstract*:** Education is the most important cause of a country and a nation, and teachers, as the main body of education, play an important role in the education process. Teachers' growth mindset affects whether teachers have their own beliefs that their teaching ability can be improved through hard work. Adolescents are the subjects and creators of the future country and society, and their life stage is a critical period for self-development. During this critical period, teachers play a pivotal role in the development of adolescents. So, does the teacher's thinking mode affect the academic engagement of adolescents by influencing the thinking mode of adolescents in the classroom culture environment?

From the perspective of scientific evidence, this research studies the internal mechanism of teachers' growth mindset affecting middle school students' learning engagement. The research on this issue will not only help to promote middle school students' learning engagement, but also provide theoretical guidance and guidance for teachers on how to promote students' learning engagement. Practice support. In view of this, this study carried out the following three studies based on the growth mindset theory. Study 1 used the public database "Chinese Family Tracking Survey" to conduct a cross-lag research design of longitudinal tracking of students' growth mindset and learning engagement, and investigated the growth of middle school students. The causal relationship between growth mindset and academic engagement. Study 2 conducted a short-term intervention training on the growth mindset of middle school students, and used t test to test the intervention effect. Research 3 used questionnaires to select head teachers and students from 51 classes from junior one to senior two . Teachers' growth mindset and teachers' fixed mindset were used as independent variables, students' growth mindset as an intermediary variable, and students' learning engagement as a dependent variable. , using a cross-level model analysis to explore the impact of teachers' growth mindset on students' learning engagement and its internal mechanism. The results of three studies found:

1. A growth mindset positively predicts learning engagement;

2. Growth mindset can be improved through short-term intervention, and learning engagement will also increase accordingly;

3. Teachers' growth mindset is generally at the upper-middle level;

4. Teachers' growth mindset significantly positively predicts students' growth mindset and learning engagement;

5. Students' growth mindset plays a completely mediating role in the relationship between teachers' growth mindset and middle school students' learning engagement.

The results of this study reveal that teachers' growth mindset will affect students' growth mindset, thereby enhancing students' learning engagement. This study provides sufficient empirical research support for the causal relationship between growth mindset and learning engagement, enriching the The relevant research on mindset and learning engagement also provides ideas for the intervention research of growth mindset of teachers and students.

摘要　社交网络应用中的“抑郁症社区”是一种为社区成员提供信息发布和社交互动的平台。成员活动产生的大量媒体信息及成员间的互动痕迹为网络社会中抑郁倾向的检测与识别提供机遇。基于机器学习技术构建的分类模型，采用有监督学习（Supervised Learning）的方法，以人工标注的方式实现对社交网络中与抑郁症症状、情绪等相关的帖子进行分类、识别。本研究主要工作：（1）抽取新浪微博在 2018-2022 年公开发布在“抑郁症社区”的帖子 285826 条，编制了一个全新的社交网络抑郁倾向标注方案，为社交网络中存在抑郁倾向的帖子提供更好的匹配。（2）由两名心理咨询领域研究者根据标注方案标注部分数据集，采用深度学习（Deep Learning）训练，对已标注数据构建文本分类模型，实现了抑郁倾向帖子的检测、识别，最后对其识别准确率做出评估。（3）采用文本分析（Text Analysis）技术，统计发帖频率及对应时间区间的词频，以时间为单位呈现了抑郁症社区中发帖数量随时间波动的变化。结果发现，深度学习模型具有较高的检测准确率；抑郁症社区近五年的帖子发布频率呈先增长后下降的趋势，并于 2020、2021 年间趋于平稳，继而在 2022 年初极速增长并达到高峰，此外，研究还发现除了自我情绪表达相关词汇以外，“别人”、“大家”和“朋友”等词汇出现频率较高。结论：基于深度学习的分类模型具有较好的预测效果，社交媒体数据可以对个体的抑郁倾向进行有效预测；人际关系是抑郁症社区成员活动痕迹中较为重要的一个因素；抑郁症社区成员的活动随时间节点具有特定变化规律，未来需要进一步探索与其结果的关系和背后的机制。

Research on Depression Tendency Detection Based on Weibo Text Data

Yi Mu[1]　　Qiang Li[1*]

1 School of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin, 300350.

Abstract：The "Depression Community" in social networking applications is a platform that provides community members with information sharing and social interaction. The abundance of media information generated by member activities and the traces of interactions among members present opportunities for detecting and identifying depression tendencies in the online social network. A classification model based on machine learning techniques is constructed, using supervised learning to achieve classification and identification of posts related to depression symptoms and emotions in the social network through manual annotation. The main work of this research includes: (1) Extracting 285,826 posts publicly published in the "Depression Community" on Sina Weibo from 2018 to 2022 and devising a new social network depression tendency annotation scheme to better match posts with depression tendencies. (2) Two psychological counseling researchers annotated a portion of the dataset according to the annotation scheme and trained a deep learning model to achieve the detection and identification of posts with depression tendencies, evaluating its recognition accuracy. (3) Using Text Analysis technology, the frequency of

posts and corresponding word frequencies within specific time intervals were analyzed. The study presents the fluctuation of the number of posts in the depression community over time.The results showed that the deep learning model had a high detection accuracy. The posting frequency in the depression community showed an increasing trend in the past five years, then decreased and stabilized during 2020 and 2021， and rapidly increased to a peak at the beginning of 2022. Furthermore, the study found that in addition to vocabulary related to self-expression of emotions, words such as "others," "everyone," and "friends" appeared frequently. In conclusion, the deep learning-based classification model has a good predictive effect, and social media data can effectively predict individuals' depression tendencies. Interpersonal relationships are an important factor in the activity traces of depression community members. The activities of depression community members exhibit specific patterns over time, and further exploration is needed to understand the relationship and mechanisms behind these results.

Keywords：Depression tendency detection, Weibo depression community, Deep learning, Text analysis

家庭复原力与心理健康问题的关系：一项多水平元分析

李睿[1] 李莹[1]（共同第一作者） 米亭霓[1] 吴东宏[1] 任志洪[1]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘 要 心理健康问题在日常生活中普遍存在，尤其是焦虑和抑郁，对个人、家庭和整个社会产生深远影响。家庭复原力指一个家庭在逆境中适应和发展的能力，以及促进家庭功能积极发展的力量。过去的一些研究表明家庭复原力与焦虑、抑郁之间存在一定的关系，但研究结果却存在差异，而且，尚不完全清楚调节效应对其关系的影响。目前缺乏元分析分析来探讨家庭复原力与这两类心理健康问题之间的关系。因此，当前研究采用多水平元分析方法检验效应量的可靠性，并通过调节效应分析考察性别、年龄阶段、教育程度、文章发表年份、文章发表类型、东西方地区、心理健康问题类型、心理健康问题和家庭复原力测量工具的调节作用。在系统地搜索了 2023 年 7 月之前发表的文献后，当前元分析确定了 11 项初始研究，包括 10213 名被试，共计 89 个效应量。结果发现：(1)家庭复原力与心理健康问题存在显著负相关(主效应: $r = -0.308$， $p < 0.001$)；(2)心理健康问题量表存在显著调节作用。与其他心理健康问题量表($r = 0.353$)相比，广泛性焦虑量表(GAD-7)与家庭复原力($r = -0.369$)之间的负相关更强；(3)调节效应检验发现年龄阶段具有显著的调节作用。与青少年($r = 0.164$)相比，成人($r = 0.320$)与家庭复原力和心理健康问题之间的相关更强；(4)教育程度(大学及以上)($r = -0.286$)也会调节家庭复原力和心理健康问题之间的关系。但性别、文章发表年份、文章发表类型、东西方地区、心理健康问题类型和家庭复原力测量工具的调节作用不显著。研究结果表明家庭复原力与心理健康问题的关系密切，以往研究结果的不一致可能源于心理健康测量工具、年龄阶段和教育程度的影响。

The relationship between family resilience and mental health issues: a multilevel meta-analysis

Li Rui[1], Li Ying[1] (Co-first author), Mi Tingni[1], Wu Donghong[1], Ren Zhihong[1] (Corresponding author)

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education;

School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan, China

Abstract： Mental health issues, particularly anxiety and depression, are pervasive in everyday life and have a profound impact on individuals, families and society as a whole. Family resilience refers to a family's ability to adapt and grow in adversity, as well as the strengths that promote positive family functioning. Previous research has indicated a certain relationship between family resilience and anxiety and depression, but the findings have been inconsistent, and the influence of moderating effects on this relationship remains unclear. Currently, there is a lack of meta-analytic analysis exploring the relationship between family resilience and the two mental health issues. Therefore, the present study adopted a multilevel meta-analytic approach to examine the reliability of effect sizes and investigate the moderating effects of gender, age stage, education level, year of article publication, type of article publication, region, category of mental health issues, and the moderating effects of measurement instruments of mental health issues and family resilience. After systematically searching literature published before July 2023, the current meta-analysis identified 11 initial studies comprising 10,213 participants and a total of 89 effect sizes. The results revealed the following: (1) There was a significant negative correlation between family resilience and mental health issues (main effect: $r = -0.308$, $p < 0.001$); (2) The measurement for mental health issues had a significant moderating effect, with a stronger negative correlation observed between the Generalised Anxiety Scale (GAD-7) and family resilience ($r = -0.369$) compared to other mental health scales ($r = 0.353$); (3) Age stage was found to have a significant moderating effect. Adults ($r = 0.320$) showed a stronger association between family resilience and mental health issues compared to adolescents ($r = 0.164$); (4) Education level (college and above) ($r = -0.286$) also moderated the relationship between family resilience and mental health issues. However, gender, year of article publication, type of article publication, region, type of mental health issues, and the measurement related to family resilience did not show significant moderating effects. The study's findings suggest a close relationship between family resilience and mental health issues. The inconsistency in previous research results may be attributed to the effects of mental health issues scale, age stage, and education level.

Keywords： family resilience, mental health issues, multilevel meta-analysis, anxiety, depression

英语背景乐对汉语母语大学生持续性注意的影响

董梦瑶[1] 李峰[1] 王学森[1] 姚玉洁[1] 宋爽[2]（通讯作者）

1 沈阳城市学院 应用心理系，辽宁 沈阳，110112

2 辽宁教育学院，辽宁 沈阳 110032 通讯作者 E-mail:song555777@126.com

摘 要 现如今在各个大学的图书馆和自习室，学生一边听音乐一边学习习以为常。已有研究表明，背景音乐对阅读起干扰作用。而其作用机理，是否为背景乐影响个体的持续性注意还知之甚少。因此，本研究采用 AX-CPT 实验范式，目的在于考察汉语和英语这两种不同语种音乐背景下，母语为汉语的大学生在 AX-CPT 任务上的正确率和反应时是否存在差异，进一步探讨中英语背景乐对母语为汉语的大学生持续性注意的影响。实验采用单因素被试间实验设计,将 60 名被试随机均分为两组(英语背景乐组、汉语背景乐组), 并基于 AX-CPT 范式设计持续性注意测验任务作为实验任务,考察不同组被试实验成绩的差异。

研究结果表明：(1) 不同音乐背景下的持续性注意实验正确率差异显著，英语背景乐的正确率显著高于汉语背景乐的正确率。(2) 不同音乐背景下的持续性注意实验反应时差异显著，英语背景乐的反应时显

著快于汉语背景乐和无背景乐的反应时。(3) 英语背景乐下不同性别被试的持续性注意实验正确率差异显著，男生正确率显著高于女生正确率。(4) 英语背景乐下不同性别被试的持续性注意实验反应时差异显著，男生反应时显著快于女生反应时。结果表明，汉语母语大学生的持续性注意，相比于英语背景乐，更容易受到汉语背景乐的影响。性别差异方面，相比于男生，英语背景乐更能影响女生的的持续性注意。

The influence of Chinese and English background music on the sustained attention of Chinese college students

DONG Mengyao[1]　LI Feng[1]　WANG Xuesen[1]　YAO Yujie[1]　SONG Shuang[2]
1 Shenyang City University, Shenyang 110112,China
2 Liaoning Institute of Education, Shenyang 110032 , China

Abstract：Nowadays, in libraries and study rooms of various universities, students often listen to music while studying. Previous studies have shown that background music has an interfering effect on reading. It is unclear whether the mechanism of its action is due to the influence of background music on individuals' sustained attention. Therefore, this study adopts the AX-CPT experimental paradigm to investigate whether there are differences in the accuracy and reaction time of native Chinese college students on the AX-CPT task under the music backgrounds of Chinese and English, and further explore the impact of Chinese and English background music on the sustained attention of native Chinese college students. The experiment adopts a single factor inter subject experimental design, with 60 participants randomly divided into two groups (English background music group and Chinese background music group). Based on the AX-CPT paradigm, a sustained attention test task is designed as the experimental task to investigate the differences in experimental results among different groups of participants.

The research results show that: (1) There are significant differences in the accuracy of continuous attention experiments under different musical backgrounds, and the accuracy of English background music is significantly higher than that of Chinese background music; (2) There are significant differences in the response time of the continuous attention experiment under different music backgrounds. The reaction time of English background music is significantly faster than that of Chinese background music and no background music; (3) There is a significant difference in the accuracy of continuous attention experiment of subjects of different genders in English background music. The correct rate of boys is significantly higher than that of girls; (4) There is a significant difference in the response time of sustained attention experiments between genders under English background music, with male students responding significantly faster than female students. The results indicate that the sustained attention of Chinese native language college students is more susceptible to the influence of Chinese background music compared to English background music. Compared to boys, English background music can more affect girls' sustained attention.

Keywords：continuous attention, background music, AX-CPT task

累积生态风险对留守高中生自杀意念的影响：生命意义感和心理痛楚的链式中介作用

崔爱琳　张珊珊（通讯作者）　王泓懿
1 沈阳师范大学，沈阳，110034

2 沈阳师范大学教育科学学院，沈阳，110034， zhangxiaobai2@163.com

摘 要 高中阶段是个体心理问题的频发期，自杀意念是其中的一种典型表现。在自杀发生之前，自杀意念是其早期的预警信号，也是预测个体自杀实施的最重要的风险变量。根据累积情境风险模型观点，经历越多的风险事件，个体就越可能迸发自杀意念，而留守高中生多数寄养在亲属家或寄宿在学校，他们体验到更加强烈的心理冲突，出现各类问题行为的可能性会更高，因而关注留守高中生自杀意念在当下显得尤为重要。为了探究留守高中生累积生态风险与自杀意念的关系，以及生命意义感和心理痛楚在其中的作用，本研究使用累积生态风险问卷、心理痛楚量表、生命意义感量表以及自杀意念自评量表对 444 名留守高中生进行问卷调查。运用 SPSS 27.0 和 Mplus8.3 软件对收集到的数据进行统计处理及分析。结果显示：累积生态风险对留守高中生自杀意念的直接效应和间接效应均显著。间接效应包括三条路径：一是生命意义感的单独中介作用；二是心理痛楚的单独中介作用；三是生命意义感和心理痛楚的序列中介作用。研究最终梳理出一条“累积生态风险→生命意义感→心理痛楚→自杀意念”的理论作用机制。因此，教师可以通过主题团体心理辅导，生命教育讲座等相关活动来增强留守高中生积极心理品质成长，以此用积极因素去缓冲留守高中生所面对的风险因素的侵蚀。

The effect of cumulative ecological risk on suicidal ideation of left-behind high school students: sense of life meaning: The chain mediating effect of and psychological pain

CUI Ailin , ZHANG Shanshan, WAGN Hongyi

1 College of Education Science, Shenyang Normal University, Shenyang, 110034

2 College of Education Science, Shenyang Normal University, Shenyang, 110034

Abstract：High school is a period of frequent individual psychological problems, and suicidal ideation is one of the typical manifestations. Prior to suicide, suicidal ideation is an early warning signal and the most important risk variable for predicting individual suicide. According to the cumulative situational risk model, the more risk events experienced, the more likely the individual is to burst out suicidal ideation. Most of the left-behind high school students are fostered in relatives ' homes or boarding in schools. They experience more intense psychological conflicts and are more likely to have various types of problem behaviors. Therefore, it is particularly important to pay attention to the suicidal ideation of left-behind high school students at present. In order to explore the relationship between cumulative ecological risk and suicidal ideation of left-behind high school students, and the role of meaning in life and psychological pain in it, this study used the cumulative ecological risk questionnaire, psychological pain scale, meaning in life scale and suicidal ideation self-rating scale to conduct a questionnaire survey on 444 left-behind high school students. SPSS 27.0 and Mplus8.3 software were used for statistical processing and analysis of the collected data. The results showed that the direct and indirect effects of cumulative ecological risk on suicidal ideation of left-behind high school students were significant. The indirect effect includes three paths: one is the independent mediating role of the sense of life meaning; the second is the separate mediating role of psychological pain; the third is the sequence mediating effect of life meaning and psychological pain. The research finally sorted out a theoretical mechanism of ' accumulating ecological risk, meaning of life, psychological pain, suicidal ideation. Therefore, teachers can enhance the positive psychological quality growth of left-behind high school students through thematic group psychological counseling, life education lectures and

other related activities, so as to buffer the erosion of risk factors faced by left-behind high school students with positive factors.

校园人际谣言与高中生相对剥夺感、心理僵化的关系：一项追踪研究

王泓懿　张珊珊（通讯作者）　崔爱琳
沈阳师范大学教育科学学院，沈阳，110034，E-mail:zhangxiaobai2@163.com。

摘 要　近年来，校园欺凌引发公众广泛的关注与思考，防治校园欺凌已成为学校教育的重心，校园人际谣言也属于校园关系欺凌的一种，然而这种方式具有隐蔽性，往往在校园生活中被解读成是学生互相交流的形式，所以欺凌的实质容易在这种“交流”的掩盖下被忽视。个体因校园人际谣言遭受到负面评价的攻击的同时，他们的人际关系也可能受到破坏，受到同学与教师的远离、甚至孤立。同时校园环境是青少年关系框架形成的重要语境，在校园人际谣言环境下高中生很难对当下经验保持灵活、自发的注意。相对剥夺感并非客观上的绝对缺乏，而是一种主观体验，而心理僵化也是主体在认知上对客观事实的回避、混淆，据此可以推测两者之间具有一定的内在联系，两者间可能存在相互影响的关系。本研究采用追踪研究，考察校园人际谣言对高中生相对剥夺感、心理僵化的影响及其性别差异。采用校园人际谣言量表、相对剥夺感问卷、青少年回避与融合问卷以沈阳市 322 名高中生为被试，进行间隔半年的两次测查。结果发现：（1）校园人际谣言能够正向预测 T1 相对剥夺感和 T1、T2 的心理僵化；（2）控制性别后，T1 相对剥夺感显著正向预测 T2 心理僵化，T1 心理僵化也能够显著正向预测 T2 相对剥夺感；（3）校园人际谣言对相对剥夺感、心理僵化的相互作用具有跨性别一致性。研究结果对干预校园人际谣言和促进高中生心理健康具有启示意义。

The relationship of Negative school gossip, relative deprivation, psychological inflexibility in highschool students: A longitudinal study

Hongyi Wang, Shanshan Zhang, Ailin Cui
College of Education Science, Shenyang Normal University, Shenyang

Abstract：In recent years, campus bullying has aroused extensive public concern and thinking, and the prevention and control of campus bullying has become the focus of school education. In the campus life, Negative school gossip is often interpreted as a form of communication between students, so the essence of bullying is easy to be ignored under the cover of “Communication”. While individuals are attacked by negative school gossip, their interpersonal relationships may be damaged, and they may be isolated from their classmates and teachers. At the same time, the campus environment is an important context for the formation of the adolescent relationship framework, it is difficult for high school students to keep flexible and spontaneous attention to current experiences in negative school gossip. In addition, the sense of relative deprivation is not an objective absolute lack, but a

subjective experience, and psychological inflexibility is also the subject's cognitive avoidance of objective facts, confusion, it can be inferred that there are certain internal relations between the two, and there may be a relationship of mutual influence. The study used a longitudinal design to investigate the associations among negative school gossip, relative deprivation and psychological inflexibility of high school students, and examine whether there existed gender differences. A total sample of 322 high school students were recruited from Shenyang province using the Negative School Gossip Questionnaire (NSGQ), the Relative Deprivation Scale (RDS),the Avoidance and Fusion Questionnaire for Youth (AFQ-Y8). Two waves of data collections were conducted with an interval of half a year. Results showed that: (1) Negative school gossip significantly and positively predict relative deprivation at wave 1 and psychological inflexibility at wave 1 and wave 2; (2) Relative deprivation in wave 1 significantly positive predicted psychological inflexibility in wave 2, and psychological inflexibility in wave 1 also significantly positive predicted relative deprivation in wave 2 when controlling for gender; (3) There was cross-gender consistency in associations among negative school gossip, relative deprivation and psychological inflexibility. The results of the study have implications for the intervention of negative school gossip and the promotion of high school students' mental health.

Keywords ： Negative school gossip, relative deprivation, psychological inflexibility, high school students, longitudinal study

粗暴养育对高中生抑郁的影响：

侵入性反刍和情绪调节自我效能感的作用

张靖淇[1]　张珊珊[2]（通讯作者）　王泓懿[2]

1 沈阳师范大学教育硕士研究生院，辽宁沈阳，110034；

2 沈阳师范大学 教育科学学院，辽宁沈阳，110034，zhangxiaobai2@163.com

摘 要　高中生处于身心迅猛发展阶段，在面对学业、人际等多方压力，容易产生一系列心理困扰，其中抑郁就是高中生比较普遍产生的内化问题，抑郁不仅会消极地影响正常生活，甚至会危机身心健康。根据以往研究，粗暴养育是引起高中生抑郁的重要诱因，然而，探讨粗暴养育如何影响高中生抑郁的研究目前尚少，仍需更深入探讨。其中侵入性反刍和情绪调节自我效能感都是极易被粗暴养育影响且对抑郁具有重要影响作用的变量，极有可能构成粗暴养育与抑郁的影响机制。因此，本文采用粗暴养育量表、事件相关反刍沉思量表、情绪调节自我效能感量表和流调中心用抑郁量表对 575 名高中生进行问卷调查。基于生态系统理论、控制理论和自我效能感理论，以探讨粗暴养育与抑郁的关系以及侵入性反刍的中介作用、情绪调节自我效能感的中介作用和侵入性反刍与情绪调节自我效能感的链式中介作用。研究结果发现：（1）粗暴养育对抑郁有显著的正向预测作用；（2）侵入性反刍和情绪调节自我效能感分别在粗暴养育与抑郁关系间起中介作用；（3）侵入性反刍和情绪调节自我效能感在粗暴养育和抑郁的关系间起链式中介作用。该结果揭示了父母粗暴养育对高中生抑郁的重要作用以及其中的作用机制，为预防高中生抑郁提供了参考。

关键词 高中生，粗暴养育，侵入性反刍，情绪调节自我效能感，抑郁

The Effect of Harsh Parenting on Depression among High School Students:

The Role of Invasive Rumination and Regulatory Emotional

Self-efficacy

ZHANG Jing-Qi[1], ZHANG Shan-Shan[2], WANG Hong-Yi[2]
1 Master of Education Graduate School,Shenyang Normal University, Shenyang110034
2 School of Education Science, Shenyang Normal University,Shenyang, 110034,
zhangxiaobai2@163.com

Abstract **：** High school students are in the stage of rapid physical and mental development. Faced with academic and interpersonal pressures, they are prone to a series of psychological troubles, among which depression is a common emotional disorder of high school students. Depression will not only negatively affect normal life, but even endanger physical and mental health. According to previous studies, harsh parenting have an negative impact on high school students' depression.However, there are limited research on how harsh parenting affects high school students' depression, which still need further discussion.Invasive rumination and regulatory emotional self-efficacy, which are highly susceptible to harsh parenting and often have a significant impact on depression.Thus, 575 high school students were invited to finish the Harsh Parenting Scale, the Event Related Rumination Scale, the Regulatory Emotional Self-efficacy Scale and the Center for Epidemiologic Studies Depression Scale. The survey studied the influence of the harsh parenting on high school students' depression and the mediating effort of invasive rumination and regulatory emotional self-efficacy based on ecological system theory, control theory and self-efficacy theory. The results showed that: (1)harsh parenting has a significant and positive predictive effect on depression; (2)invasive rumination and regulatory emotional self-efficacy separately mediated the relationship between harsh parenting and depression; (3) invasive rumination and regulatory emotional self-efficacy mediated the relationship between harsh parenting and depression sequentially.
Keywords **：** high school students; harsh parenting; invasive rumination; regulatory emotional self-efficacy; depression

师生冒犯在课堂上对学生共情的影响：宽恕的中介作用和师生关系的调节作用

于美琪[1] 王淑茵[2] 葛琼[2] 卢家楣[2]（通讯作者）
1 中国计量大学现代科技学院，金华，322002
2 上海师范大学教育学院，上海，200234，lujiamei@vip.163.com

摘 要 共情作为一种重要的人际情感现象，一直以来都备受研究者们的关注。重视“以情优教”的情感教学理论特别强调了共情在教学领域中的独特作用。该理论认为教师在将教材中带有情感的内容传递给学生的过程中，会涉及到学生对其中所包含的情绪情感的理解与共鸣。因此学生在课堂上对教师的共情是情感教学顺利开展和实施的必要条件，也是培养学生情感素质的关键。然而由于师生之间交往频繁，冒犯事件时有发生。以往研究发现人际冒犯的出现不仅会阻碍双方的人际交往，还会破坏双方的情感交流。因此，有必要重视师生冒犯对学生在课堂上的情绪情感，特别是对共情所造成的不良影响。然而这方面的研究却相

对匮乏。师生冒犯发生后，学生在课堂上对教师的共情会如何变化？造成这种变化的潜在机制是什么？这种不良变化又该如何被消除？针对这些问题，本研究从认知和情感两个方面来全面考察师生冒犯会如何影响课堂上学生对教师的共情，并通过构建有调节的中介模型来进一步探讨其内在影响机制。

本研究以 60 名初中生为被试（M = 13.05 岁，SD = 0.68；女性 36 名），采用 2（冒犯强度：低，高）×2（师生关系：好，差）的被试内实验设计。被试需要将自己代入到不同强度的师生冒犯情景中，在这些情景中被试作为受害者，受到了来自与他们有着不同师生关系的教师的冒犯。随后被试需要自我报告对教师的宽恕意愿，以及在教师授课时对教师的共情水平。结果显示：（1）宽恕在冒犯强度与学生对教师的认知和情感共情间起到中介作用；（2）师生关系在学生对教师进行积极共情时，在冒犯强度与认知共情间起到调节作用。这表明较强的宽恕意愿和良好的师生关系能够有效缓解师生冒犯对学生共情所造成的不良影响。本研究不仅丰富了师生冒犯、宽恕与共情的相关研究，为情感教学的相关理论提供了实证依据，还为学生不良共情变化的妥善干预提供了实际指导方向。

关键词 共情；宽恕；师生冒犯；师生关系

The Effect of Teacher-student Offense on Students' Empathy in Class: The Mediating Role of Forgiveness and the Moderating Role of Teacher-student Relationship

Meiqi Yu[1], Shuyin Wang[2], Qiong Ge[2], Jiamei Lu[2] (Corresponding author)

1 China Jiliang University College of Modern Science and Technology, Jinhua, 322000

2 Shanghai Normal University Education School, Shanghai, 200234, lujiamei@vip.163.com

Abstract: As an important interpersonal emotion phenomenon, empathy has long been of great interest to researchers. The theory of affective teaching, which emphasizes 'teaching with emotion,' particularly emphasizes the unique role of empathy in the field of teaching. The theory suggests that teachers' delivery of emotionally charged content contained in the teaching materials to students involves students' understanding and sharing of those emotions. Therefore, students' empathy for teachers in class is essential for the successful development and implementation of affective teaching and learning, as well as for the development of students' emotional qualities. However, due to the frequent interactions between teachers and students, incidents of offense occur from time to time. Previous research has found that the presence of interpersonal offense not only hinders interpersonal interactions between the two parties, but also disrupts their emotional communication. Thus, it is necessary to pay attention to the negative effect of teacher-student offense on students' emotions in class, especially on their empathy. However, there is a lack of relevant research. How do students' empathy toward teachers change in class after teacher-student offense occurs? What are the underlying mechanisms that cause such changes? And how should such negative changes be eliminated? To address these questions, the present study examined how teacher-student offense affects students' empathy toward teachers in class from both cognitive and affective aspects, and further explored the underlying mechanisms by constructing a moderated mediation model.

The present study recruited sixty middle school students as participants (M_{age} = 13.05, SD = 0.68; 36 females), and used a 2 (offense intensity: low, high) × 2 (teacher-student relationship: good, bad) within-subjects experimental design. Participants were required to substitute themselves into teacher-student offense scenarios with different intensities. In these scenarios, they acted as victims who were offended by their teachers with whom they had different relationships. Then, participants were asked to self-report their willingness to forgive the teacher and their level of empathy for the teacher in class. Results showed that: (1) forgiveness mediated the relationship

between offense intensity and students' cognitive and emotional empathy for the teacher; (2) the teacher-student relationship mediated the relationship between offense intensity and cognitive empathy when students were positively empathizing with the teacher. This suggests that a strong willingness to forgive and a good teacher-student relationship can effectively mitigate the negative effects of teacher-student offense on students' empathy. The present study not only enriches the research on teacher-student offense, forgiveness, and empathy, provides an empirical basis for theories of affective teaching, but also provides practical guidance for appropriate interventions for changes in students' poor empathy changes.
Keywords：Empathy; Forgiveness; Teacher-student offense; Teacher-student relationship

观察他人执行与思维一致的动作可以促进思维：物体呈现和观察方式的影响

岳亚奇[1]　王丽娟[1]

1 东北师范大学心理学院，长春，130024，通讯作者 wanglj699@nenu.edu.cn

摘 要　身体的感觉或行为会影响思维，这种现象被广泛地称为“具身认知”。尽管之前的研究显示与思维一致的动作可以促进个体的思考，但批评者认为这也可能被解释为参与者因执行动作而提升了他们的动机或兴趣导致他们有着更好的任务表现。因此，本研究在参与者实际执行与思维一致的动作的基础上增加了观察他人执行动作的条件。这么做的目的是为了避免个体产生实际的运动，同时又能通过对动作的观察在个体的头脑中保留动作的图式或表征。实验 1 对比了观察组和实际执行动作组两组儿童在一致和较少一致动作的条件下完成加法任务的正确率和反应时，结果发现两组儿童都在使用与对象数量匹配的离散一对一动作时，比使用与相加的和数量匹配的离散动作时表现得更好。观察组儿童的成绩要略好于实际执行动作组的儿童。在实验 1 的基础上，实验 2 进一步探究了观察方式的改变（直接观察或间接观察）和观察他人操作的过程中是否呈现物体对个体思维表现的影响，结果发现参与者在有物体条件下的任务表现要好于无物体的情况。直接观察的效果要好于间接观察。这些结果表明身体的感觉运动系统对高级认知过程的形成有着因果和构成作用，并且，这些因果和构成角色也可以由他人的身体所扮演。本研究的结果支持了具身认知理论。
关键词　动作，思维，具身认知

Observing Others Performing Thought-Consistent Actions Promotes Thinking: The Effects of Object Presentation and Observation Mode

Yue Yaqi[1] Wang Lijuan[1]

1 School of Psychology, Northeast Normal University, No.5268 Renmin Street, Changchun 130024, China

Abstract：Every day, it seems there is yet another demonstration of yet another surprising way that sensations or actions of the body affect thinking, phenomena broadly known as embodied cognition. Although previous studies

have shown that individual execution of actions consistent with thinking can promote thinking, there is no research exploring the impact of observing others' actions on thinking. Experiment 1 used a 2 (grouping: operation group vs observation group) x2 (consistency of action: consistent vs less consistent) mixed experimental design to examine this issue. We found that the two groups of children performed better when performing actions consistent with thinking than when performing fewer consistent actions. This shows that the higher the consistency of action and thinking, the more thinking is promoted. The observation group of children performance slightly better than the operation group. Experiment 2 used a 2 (observation method: direct or indirect) x2 (object: present or absent) mixed experimental design to explore the influence of observation modes and observing whether the object was presented in others' operation on thinking. The results showed that direct observation and object presentation had stronger effects. These results suggest that the sensorimotor system of the body has causal and constitutive effects on the formation of higher cognitive processes, and that these causal and constitutive roles can also be played by the bodies of others. These results support embodied cognition theory.
Keywords：Action, Thinking, Embodied cognition

敬畏对大学生抑郁的影响：自我超越和生命意义感的中介作用

丁亚童 张海 姜温君 桑明磊 陈英敏（通讯作者）

山东师范大学心理学院，济南，250399，通讯作者 cc8030306@163.com

摘 要 《2022 国民抑郁症蓝皮书》显示，我国 18-24 岁抑郁症患者占总人数的 35.32%。与此同时，新型冠状病毒肺炎的爆发使人们经历着严重的心理困扰。Meta 分析对疫情前后大学生抑郁症状进行调查发现，疫情后大学生抑郁症状的检出率为 35.7%，高于疫情前的 30.9%。可见，当前大学生抑郁问题凸显，因此探究影响大学生抑郁的因素以及有效降低大学生抑郁风险是当前极具现实意义且亟待解决的问题。近年来关于敬畏的研究方兴未艾，研究指出敬畏对抑郁的改善有潜在治疗作用，但相关证据不足；且以往研究大多将敬畏作为整体进行考察，更多关注其积极效应（如主观幸福感……等），得出的结果不够全面细致。本研究拟以中国大学生为被试，结合敬畏的不同分类（特质敬畏；积极/消极敬畏），全面细致考察敬畏与抑郁的关系，并进一步探讨自我超越和生命意义感在其中的可能机制作用。具体包括两个研究：研究一采用问卷法初步探讨特质敬畏和抑郁的关系，以及自我超越和生命意义感的中介作用，结果发现：特质敬畏显著负向预测大学生抑郁，自我超越和生命意义感在其中起多重中介作用。研究二采用实验设计，具体采用视频诱发方式探讨不同效价（积极/消极）的状态性敬畏对抑郁的影响及其中介机制。结果表明（1）积极敬畏体验下个体抑郁水平更低；而消极敬畏体验下产生更高的抑郁情绪；（2）自我超越和生命意义感在积极敬畏和抑郁的关系中发挥链式中介作用，即积极的敬畏体验有助于提升个体的自我超越能力与生命意义感从而有助于抑郁缓解；（3）生命意义感在消极敬畏和抑郁的关系中起中介作用，即消极敬畏通过削弱个体的生命意义感，进而增加了个体的抑郁体验。本研究结果为降低大学生抑郁风险提供了新思路，通过培育大学生的积极敬畏体验，可以增强其自我超越与生命意义感，进而降低或减少大学生抑郁的发生，维护其心理健康。

The Impact of Awe on College Students' Depression: The Mediating Role of Self-Transcendence and Sense of Meaning in Life

Ding Yatong Zhang Hai Jiang Wenjun Sang Minglei Chen Yingmin

School of Psychology, Shandong Normal University, Jinan, 250399,

Corresponding Author cc8030306@163.com

Abstract:《the 2022 Blue Book of National Depression》 indicated that，patients with depression aged 18-24 in China account for 35.32% of the total number. At the same time, the outbreak of the novel coronavirus pneumonia has caused people to experience serious psychological distress. The meta-analysis investigated the depressive symptoms of college students before and after the epidemic, and found that the detection rate of depressive symptoms in college students after the epidemic was 35.7%, higher than that before the epidemic was 30.9%. It can be seen that the depression problem of college students is prominent at present, so exploring the factors affecting depression of college students and effectively reducing the risk of depression of college students is a problem of great practical significance and urgent solution. In recent years, the research on awe is on the rise, and the research points out that awe has a potential therapeutic effect on depression, but the relevant evidence is insufficient. And most of the previous studies examined awe as a whole, paying more attention to its positive effects (such as subjective well-being... Etc.), the results obtained are not comprehensive and detailed. In this study, Chinese college students were selected as subjects, and different categories of awe (trait awe; Positive/negative awe), comprehensively and carefully examine the relationship between awe and depression, and further explore the possible mechanisms of self-transcendence and sense of meaning in life. Specifically, two studies are included: Study 1 uses questionnaire method to preliminarily explore the relationship between trait awe and depression, as well as the mediating role of self-transcendence and sense of meaning of life. The results show that trait awe significantly negatively predicts depression among college students, and self-transcendence and sense of meaning of life play multiple mediating roles. In the second study, an experimental design was used to explore the effects of different titers (positive/negative) of state awe on depression and its mediating mechanism. The results showed that (1) the depression level was lower under the positive awe experience; The negative awe experience resulted in higher depression. (2) Self-transcendence and sense of life meaning play a chain mediating role in the relationship between positive awe and depression, that is, positive awe experience helps to enhance individual self-transcendence ability and sense of life meaning, thus contributing to depression relief; (3) Sense of meaning of life plays a mediating role in the relationship between negative awe and depression, that is, negative awe increases the depression experience of individuals by weakening their sense of meaning of life. The results of this study provide a new way to reduce the risk of depression in college students. By cultivating the positive awe experience of college students, it can enhance their sense of self-transcendence and life meaning, thus reducing or reducing the occurrence of depression in college students and maintaining their mental health.

追踪手势对学习的影响：来自两项三水平元分析的证据

冷晓雪 匡子翌 王福兴（通讯作者） 乔沛桦

华中师范大学心理学院，武汉，430079，通讯作者 Email: fxwang@ccnu.edu.cn

摘 要 追踪手势是指学习者在学习过程中使用手指或者鼠标等追踪学习材料的动态过程。以往研究探究了追踪手势对学习效果和认知负荷的影响，但尚未得出一致结论；同时，追踪手势效应的边界条件尚不清晰。本研究采用两项三水平元分析，将抽样方差、研究内方差和研究间方差共同作为方差来源，探究学习者追踪手势对学习效果和认知负荷的影响，并考察潜在的调节变量。本研究在学习效果和认知负荷上分别生成63 个和 53 个效应量。剔除异常值和离群值后，元分析共纳入 55 个效应量(学习效果)和 51 个效应量(认知负荷)。结果发现，学习者追踪手势显著促进了学习表现(g = 0.382)，同时也降低了认知负荷(g = -0.296)。本研究将被试年龄段、文化背景、材料类型、学习测验类型和测验阶段作为调节变量进行调节效应检验。在学习效果上，调节效应分析发现：材料类型调节了追踪手势对学习效果的影响(F(1, 53) =4.09, p = .048)，相

比于非空间材料，被试在学习空间材料时追踪手势的效果更强；学习测验类型具有显著调节效应($F(1, 53) =7.7430, p = .008$)，即追踪手势在迁移测验中的效果更强；测验阶段的调节效应显著($F(1, 53) = 19.7135, p < .001$)，即相比于掌握阶段，追踪手势更多地影响后测阶段的学习成绩；被试年龄段与文化背景没有显著调节效应，ps>.05。在认知负荷上，无任何显著调节效应，ps>.05。结论认为，追踪手势可以促进学习者学习表现，同时降低认知负荷；追踪手势对学习效果的影响受到材料类型、测验类型和测验阶段的调节。

The effects of tracing gesture on learning outcomes and cognitive load: Evidence from two three-level meta-analyses

Leng Xiaoxue, Kuang Ziyi, Wang Fuxing, Qiao Peihua
School of Psychology, Central China Normal University, Wuhan

***Abstract*:** The tracing gesture refers to the dynamic process in which learners use their fingers or mouse to trace on learning materials during the learning process. Previous studies have explored the effects of tracing gesture on learning outcomes and cognitive load, but no consistent conclusions have been drawn; meanwhile, the boundary conditions of the tracking gesture effect remain unclear. The present study used two three-level meta-analyses, in which sampling variance, within-study variance, and between-study variance were jointly used as sources of variance, to explore the effects of learners' tracing gestures on learning outcomes and cognitive load, and to examine potential moderate variables. This study generated 63 and 53 effect sizes on learning outcomes and cognitive load, respectively. After removing outliers, a total of 55 effect sizes (learning outcomes) and 51 effect sizes (cognitive load) were included in the meta-analysis. The results found that tracing gestures significantly facilitated learning performance ($g = 0.382$) and also reduced cognitive load ($g = -0.296$). In this study, subjects' age, culture, material type, test type, and test phase were tested as moderate variables. In terms of learning outcomes, moderation effect analyses revealed that: material type moderated the effect of tracing gestures ($F(1, 53) = 4.09, p = .048$), indicating that tracing gesture was more effective when learning spatial materials compared to non-spatial materials. There was a significant moderating effect of test type ($F(1, 53) = 7.7430, p = .008$), which means that the tracking gesture was stronger in the transfer test; there was a significant moderating effect of test phase ($F(1, 53) = 19.7135, p < .001$), which means tracking gestures affected learning performance more in the test phase than in the acquisition phase. There was no significant moderating effect of subjects' age and culture, ps > .05. There was no significant moderating effect on cognitive load, ps > .05. It was concluded that that tracing gestures can promote learner performance while reducing cognitive load; the effects of tracing gestures on learning outcomes were moderated by material type, test type, and test phase.
***Keywords*:** tracing gesture, cognitive load, three-level meta-analysis

加工指令和项目价值对词对学习中情境效应及其元认知监测影响

周皓文俊[1]　马慧慧[1]　王勋[2]（通讯作者）
浙江师范大学心理学院，金华，321000，wangx@zjnu.cn

摘　要　情境效应是指当编码时的情境和检索时的情境相同或相似时，情境信息将有利于记忆的检索。情

境效应的稳定性受到情境类型和情境内容等因素的影响，这在认知领域已经得到大量研究的支持。当前的研究关注更高水平的认知加工过程——元认知，并进一步探究元认知领域中情境效应。本研究将自然场景图片作为情境信息，单词对作为目标信息，探究情境信息能否作为元认知判断的线索进而影响元认知监测效果和情境效应产生的内部机制问题。

本研究由 3 个实验组成。实验 1 为 2(词对类型：具体、抽象)×4(情境类型：重复、重新匹配、新异、无)两因素被试内设计，考察了词对学习中不同情境类型对学习判断的影响过程。实验 2 采用 2(被试间：加工编码：有、无)×3(情境类型：重复、重新匹配、新异)两因素混合设计，重点考察了抽象词对中编码指令对不同情境类型中学习判断的影响。实验 3 在实验 2 的基础上采用价值线索进一步探究情境信息和项目信息的整合效果，采用 3(项目价值：高、中、低)×3(情境类型：重复、重新匹配、新异)两因素被试内设计。

综合本研究结果，可得出以下结论：

（1）在自然场景图片中学习词对，同样存在学习判断的情境效应和回忆上的情境效应，且抽象词对中更加显著；

（2）加工指令对情境信息和项目信息绑定具有影响，表现为学习判断间差异，但这一效果会受到项目中额外信息的干扰。

（3）相比较加工指令，项目价值通过特定性增加情境信息和项目信息整合中的熟悉度，有选择的使用情境信息，从而产生情境效应。

CONTEXT EFFECTS OF PROCESSING INSTRUCTIONS AND ITEM VALUES ON WORD PAIR LEARING AND ITS METACOGNITIVE MONITIORING EFFECTS

Abstract：Context effect means that contextual information will facilitate memory retrieval when the context at the time of encoding and the context at the time of retrieval are the same or similar. However, the stability of the context effect is influenced by factors such as the type of context and contextual content, which has been supported by a large body of research in the cognitive domain. Current research focuses on higher-level cognitive processing, metacognition, and further explores context effects in the metacognitive domain. In this study, pictures of natural scenes were used as contextual information and word pairs were used as target information to investigate the question of whether contextual information can serve as a cue for metacognitive judgments and thus influence the effect of metacognitive monitoring and the internal mechanism of context effects.

This study consisted of three experiments. The experiment 1 used a 2 (word pair type: concrete, abstract)×4 (context type: repetition, re-match, novel, none) Two-factor- within-subjects design. The process of the influence of different context types on learning judgments in word pair learning was examined in Experiment 1. Experiment 2 used a 2 (between-subjects: processing coding: yes, no)×3 (context type: repetition, re-match, novel) Two-factor-mixed design, focused on the effect of coding instructions on learning judgments in different context types. Experiment 3 further explored the effect of integration of contextual and item information by using value cues on the basis of Experiment 2. A 3 (item value: high, medium, low)×3 (context type: repetition, re-match, novel) Two-factor-within-subject design was used.

Based on the results of this study, the following conclusions can be drawn:

(1) The same context effects on learning judgments and context effects on recall were present for learning word pairs in natural scene pictures, and they were more significant in abstract word pairs.

(2) Processing instructions have an effect on contextual and item information binding, but this effect is disturbed by additional information in the items.

(3) Compared to processing instructions, item value increases familiarity in the binding of contextual and item information through specificity and selective use of contextual information.

学习困难学生执行功能的抑制控制研究

梅新新[1] 向友余[2]

1 无锡市新吴区特殊教育学校，无锡，214000

2 重庆师范大学特殊教育系，重庆，401331，1405538119@qq.com

摘 要　在我国，学习困难学生的数量巨大，面临的学业困扰颇深，学习困难学生的学业发展需要自身、教师及家长共同的努力。数学困难和阅读障碍作为学习困难学生占比最大的两种亚型，具有不同的表现。数学困难学生主要表现为数学能力的缺损，在数量关系、计算、空间能力、问题解决等方面存在缺陷。阅读障碍学生在阅读成绩方面显著落后于其年龄和智力所应该达到的水平。执行功能与人的高级心理功能密切相关，是个体生理、心理健康、工作、学习、生活成功的必备技能，影响着个体在语言、行为、认知、社会情感、社会适应等多方面的发展，对个体未来的发展影响重大。抑制控制作为执行功能的主要成分之一，对学生的学业发展具有很好的预测作用。抑制控制缺陷是造成学生学习困难的重要原因。本研究以数学困难和阅读障碍学生为研究对象，以数字、汉字和图形为实验材料，探究两类学习困难学生的抑制控制特点和差异。

实验一采用视觉搜索中的预览搜索实验，通过多因素混合实验设计，探究普通学生和两类学习困难学生的干扰抑制控制特点和差异。结果表明，普通学生与两类学习困难学生均不存在对汉字的干扰抑制缺陷；阅读障碍学生存在对汉字的干扰抑制缺陷，且对汉字的干扰抑制能力显著差于其他两种实验材料。在三种实验材料下，阅读障碍学生的障碍主要表现在汉字上，数学困难学生的障碍主要表现在数字上。

实验二采用 GNG 范式探究两类学习困难学生的反应抑制特点和差异。结果表明，两类学习困难学生均存在反应抑制控制缺陷；与普通学生相比，数学困难学生对数字的反应抑制控制能力最弱，阅读障碍学生对汉字的反应抑制控制能力最弱。

综上，两类学习困难学生均存在抑制控制缺陷，数学困难学生表现在对数字的抑制控制上，阅读障碍学生表现在对汉字的抑制控制上。

Inhibitory control of executive function in students with learning difficulties

Xinxin Mei[1] Youyu Xiang[2]

1Wuxi Xinwu District special education school，Wuxi City

2Chongqing Normal University，Chongqing Municipality

Abstract： In our country, the number of students with learning difficulties is huge, and they are faced with profound academic troubles. The academic development of students with learning difficulties needs the joint efforts of themselves, teachers and parents. Mathematics difficulty and dyslexia, as the two subtypes with the largest proportion of students with learning difficulties, have different performances. The students with

mathematical difficulties mainly show the defects of mathematical ability, and there are defects in quantitative relation, calculation, spatial ability and problem solving. Students with dyslexia lag significantly behind their age and intelligence in reading achievement. Executive function is closely related to people's higher psychological function, and is a necessary skill for individual's physiological and mental health, work, study and life success. It affects individual's development in language, behavior, cognition, social emotion, social adaptation and other aspects, and has a significant impact on individual's future development. As one of the main components of executive function, inhibitory control has a good predictive effect on students' academic development. The inhibition control defect is an important cause of students' learning difficulties. In this study, students with mathematical difficulties and dyslexia were selected as the research objects, and numbers, Chinese characters and graphics were used as experimental materials to explore the characteristics and differences of inhibitory control in students with two kinds of learning difficulties.

In experiment 1, the preview search experiment in visual search was used to explore the characteristics and differences of interference suppression control between ordinary students and two kinds of students with learning difficulties through multi-factor mixed experimental design. The results show that neither the ordinary students nor the two kinds of students with learning difficulties have the defects of interference suppression of Chinese characters; The dyslexic students have the defect of inhibiting the interference of Chinese characters, and the ability of inhibiting the interference of Chinese characters is significantly worse than that of the other two experimental materials. Under the three experimental materials, the dyslexic students' obstacles were mainly manifested in Chinese characters, and the math students' obstacles were mainly manifested in numbers.

In experiment 2, GNG paradigm was used to explore the characteristics and differences of response inhibition in two kinds of students with learning difficulties. The results show that both kinds of students with learning difficulties have response inhibition control defects; Compared with ordinary students, students with math difficulty had the weakest inhibitory control ability for numbers, and students with dyslexia had the weakest inhibitory control ability for Chinese characters.

To sum up, both kinds of students with learning difficulties have inhibition control defects. Students with math difficulties are manifested in the inhibition control of numbers, and students with reading disabilities are manifested in the inhibition control of Chinese characters.

父母养育倦怠与初中生学业倦怠的关系：基于变量为中心和个体为中心的分析

张涵[1] 胡青[1] 毛艳婷[2] 赵金霞[1]（通讯作者）

1 临沂大学教育学院心理系，临沂，276000

2 临沂实验中学心理健康教育中心，临沂，276007

E-mail：zhaojinxia@lyu.edu.cn

摘 要 在生育支持政策体系尚未有效形成背景下，养育精细化和教育内卷化又同时对父母提出更高要求。然而，个体资源的有限性决定了他们在高要求与低精力的矛盾中极易出现失衡并被动陷入倦怠的境地，也让养育倦怠成为生育政策优化背景下的重要现实问题。养育倦怠不仅引发个体自身出现心理与行为障碍，其溢出效应还会蔓延至子女的身心及学业。现有相关研究侧重于采用变量为中心的研究思路考察父母养育倦怠对子女学业的影响，缺乏以个体为中心的视角。为弥补上述不足，本研究在家庭系统理论和社会学习

理论指导下，采用养育倦怠评估量表、父母低头行为量表、意向性自我调节问卷和学业倦怠量表对 871 名初中生及其主要照顾人（仅限父亲或母亲）开展问卷调查。为达到研究目的，本研究将以变量为中心和个体为中心的分析思路相结合。一方面，通过链式中介模型考察父母养育倦怠与初中生学业倦怠的关系及作用路径。另一方面，根据父母养育倦怠和低头行为两个指标，通过潜在剖面分析探究潜在类别，并应用方差分析比较不同潜在类别在对意向性自我调节和学业倦怠影响上的差异。研究结果发现：（1）父母养育倦怠不仅能直接预测初中生学业倦怠，还通过父母低头行为和意向性自我调节的链式中介作用预测初中生学业倦怠（中介效应占 44.7%）；（2）对父母养育倦怠和低头行为的得分进行潜在剖面分析，可将父母分为低倦怠-低低头型（69.3%）、中倦怠-高低头型（18.4%）和高倦怠-中低头型（12.3%）。（3）在低倦怠-低低头型父母养育下的初中生意向性自我调节得分显著高于其他两种类型，学业倦怠得分显著低于其他两种类型，而中倦怠-高低头型和高倦怠-中低头型父母养育下的初中生在意向性自我调节和学业倦怠得分上的差异不显著。上述研究结果表明父母养育倦怠、父母低头行为和意向性自我调节在预防和干预初中生学业倦怠中的重要作用，为从父母和个体角度开展相关工作提供了理论依据。

Relationship between Parental Burnout and Secondary School Students' Academic Burnout: Evidence from Variable-oriented and Person-oriented Analyses

Han Zhang[1] Qing Hu[1] Yanting Mao[2] Jinxia Zhao[1]
1 Department of Psychology, School of Education, Linyi University, Linyi, 276000, zhaojinxia@lyu.edu.cn
2 Center for Mental Health Education, Linyi Experimental Middle School, Linyi, 276007

Abstract： In the context of fertility support policy system has not been effectively formed, the refinement of parenting and the internalization of education place higher demands on parents. However, the limited resources determine that parents are prone to imbalance and passively fall into burnout in the contradiction between high demands and low energy, which also makes the coexistence of parental burnout an important reality in the context of fertility policy optimization. Parental burnout not only triggers psychological and behavioral disorders in individuals, but also has spillover effects on children's physical, mental health and academic performance. Existing studies have focused on the impact of parental burnout on children's academic performance using a variable-centered approach, lacking an individual-centered perspective. To fill in this gap, based on family system theory and social learning theory, this study used the Parental Burnout Assessment Scale, the Parental Phubbing Scale, the Intentional Self-Regulation Questionnaire, and the Academic Burnout Scale to survey 871 secondary school students and their primary caregivers (only father or mother). To achieve the research objectives, this study combined variable-centered and individual-centered analyses to examine the relationship between parental burnout and academic burnout. A chain-mediation model was used to study the pathways from parental burnout to academic burnout. We also explored patterns using Latent Profile Analysis (LPA) based on parental burnout and phubbing, and applied ANOVA to compare the differences between potential categories on their effects on intentional self-regulation and academic burnout. The findings revealed that (1) parental burnout not only directly predicted secondary school students' academic burnout, but also predicted their academic burnout through the chain-mediating effect of parental phubbing and intentional self-regulation (mediating effect accounted for 44.7%);

(2) According to the LPA of parental burnout and phubbing, we identified three latent profiles: low parental burnout-low phubbing type (69.3%), medium parental burnout-high phubbing (18.4%), and high parental burnout-medium phubbing type (12.3%). (3) The intentional self-regulation scores of middle school students under low parental burnout-low phubbing parenting were significantly higher than the other two types, and their academic burnout scores were significantly lower than the other two types, while the differences between medium parental burnout-high phubbing and high parental burnout-medium phubbing type on intentional self-regulation and academic burnout scores of secondary school students were not significant. These findings suggest the important roles of parental burnout, parental phubbing, and intentional self-regulation in preventing and intervening with academic burnout in secondary school students, and provide a theoretical reference for related work from both parental and individual perspectives.

Keywords：parental burnout, academic burnout, phubbing, intentional self-regulation, secondary school student

小学生同伴依恋与学校适应的关系：变量为中心和个体为中心的分析

朱琳[1] 邓小平[12]（通讯作者）

[1]赣南师范大学教育科学学院，赣州，341000

[2]赣南师范大学教育科学学院，赣州，341000，dxp1984@gmail.com

摘 要 2021年“双减”政策的出台合旨在减轻义务教育阶段学生的作业负担以及校外培训的负担，“双减”政策不仅意味着教育模式发生了重大的调整，也意味着教育理念发生了重大的变革。小学生生活节奏也因此发生了巨大变化，同时,考虑到学校是小学生主要的活动场所,本研究选择学校适应作为心理社会发展的指标。学校适应主要表现为学生对学校生活适应的焦虑、与同龄人人际关系的压力、自我展示和表达时的恐惧等。生态系统理论指出，同伴是微观系统的重要组成部分，同伴依恋的质量是影响其学校适应的重要因素。自我概念清晰性指的是自我概念清晰性的整合，以及社会个体对自己有相对清晰、内部一致和稳定的自我意识的程度，以往研究表明在对小学生的自我认知描述进行研究时发现，适应状态较好的小学生自我概念清晰性水平也较高。本研究旨在考察同伴依恋，自我概念清晰性与小学生学校适应的关系。采用同伴依恋量表、自我概念清晰性量表以及学校态度调查问卷对1246名小学生进行调查，采用变量中心和个体中心的方法进行分析。结果发现：（1）结构方程模型分析表明，自我概念清晰性在同伴依恋与小学生学校适应之间起部分中介作用，即，同伴依恋可以通过自我概念清晰性这个中介变量对学校适应发生作用;（2）对同伴依恋—自我概念清晰性得分进行潜在剖面分析，可分为4种类别:低同伴依恋—低自我概念清晰性、低同伴依恋—高自我概念清晰性、高同伴依恋—低自我概念清晰性、高同伴依恋—高自我概念清晰性;（3）不同潜在类别小学生学校适应水平得分差异具有统计学意义。结论:同伴依恋可以通过自我概念清晰性间接影响小学生学校适应能力;小学生同伴依恋—自我概念清晰性水平的得分可以分为具有异质性的4种亚组，同伴依恋可以通过自我概念清晰性这个中介变量对学校适应发生作用。

The relationship between peer attachment and school adaptation in

primary school students: Evidence from variable-oriented and person-oriented analyses

Zhu Lin[1] Deng xiaoping[1](Corresponding author)
[1] School of Educational Science,Gannan Normal University,Ganzhou,341000

Abstract： The introduction of the "double reduction" policy in 2021 aims to reduce the homework burden of students in the compulsory education stage and the burden of off-campus training. The "double reduction" policy not only means that the education model has undergone a major adjustment, but also means that the education concept has undergone a major change. Therefore, the pace of life of primary school students has also changed greatly. At the same time, considering that school is the main activity place of primary school students, this study chooses school adaptation as an indicator of psychosocial development. School adaptation is mainly manifested as students' anxiety about school life adaptation, the pressure of interpersonal relationship with peers, and the fear of self-presentation and expression. The ecosystem theory points out that peer is an important part of the microsystem, and the quality of peer attachment is an important factor affecting their school adaptation. Self-concept clarity refers to the integration of self-concept clarity and the degree to which social individuals have a relatively clear, internally consistent and stable self-awareness of themselves. Previous studies have shown that when studying the self-cognitive description of primary school students, it is found that primary school students with a better adaptive state also have a higher level of self-concept clarity. The purpose of this study was to investigate the relationship between peer attachment, self-concept clarity and school adjustment. The peer attachment scale, self-concept clarity scale and school attitude questionnaire were used.A variable-oriented and individual-oriented approach was used to analyze 1246 primary school students. The results show that: (1) Structural equation modeling analysis showed that self-concept clarity plays a partial mediating role between peer attachment and school adaptation, that is, peer attachment can have an effect on school adaptation through the mediating variable self-concept clarity; (2) The potential profile analysis of peer attachment-self-concept clarity score can be divided into four categories: low peer attachment-low self-concept clarity, low peer attachment-high self-concept clarity, high peer attachment-low self-concept clarity, high peer attachment-high self-concept clarity; (3) The scores of school adaptation level of primary school students in different potential categories were statistically significant. Conclusion: Peer attachment can indirectly affect primary school students' school adaptation through self-concept clarity; The scores of peer attachment and self-concept clarity can be divided into four sub-groups with heterogeneity. Peer attachment can have an effect on school adaptation through the mediating variable of self-concept clarity.

提取形式和问题类型对阅读成绩和元理解监测的影响

王树康[1] 王双[2] 王勋（通讯作者）
浙江师范大学心理系，金华，321000，wangx@zjnu.cn

摘要

要想学生能够有效地完成阅读任务，记忆、理解阅读材料的内容，教师需要引导学生采用恰当的学习策略对阅读理解过程实行有效的学习和监测。那么，哪种策略有助于学生阅读理解的学习与监测呢？提取练习效应表明对所学内容进行提取练习比再次学习更有助于长时记忆保持，不仅如此，提取练习还有助于监测阅读理解的过程，即能提高元理解监测的准确性。因此，提取练习可能是一种更为有效的学习策略。

然而，如今对提取练习的研究已不局限于低阶学习层面，提取练习效应已拓展到高阶学习中。长时记忆主要有回忆和再认两种提取形式，提取形式的不同往往时影响提取练习效应的重要变量。因此，本文旨在探讨提取形式对不同层次学习的阅读成绩及元理解监测的影响。

本研究由三个实验组成，均采用提取练习研究范式。实验 1a 为单因素被试内实验设计，在采用口头汇报作答的前提下，探讨记忆学习上不同学习策略对阅读成绩及元理解监测的影响，验证记忆学习上的提取练习效应及提取的元认知优势。实验 1b 为单因素被试内实验设计，在初始提取就呈现高阶问题的前提下，探讨推理学习上不同学习策略对阅读成绩及元理解监测的影响，考察推理学习上的提取练习效应及提取的元认知优势。根据长时记忆提取形式的不同，在真实的教育情境中往往采取选择题、简答题的形式，因此，实验 2 采用 2(提取形式：选择题式、简答式)×2(问题类型：记忆、推理)的两因素被试内实验设计，探讨不同提取形式对不同层次学习的阅读成绩及元理解监测的影响。本研究结论如下：

（1） 提取策略适用于高、低阶学习，在不同层次学习的元认知层面上也具有优势。

（2） 高阶推理学习上，简答式提取相对于选择题式提取的学习保持优势才能体现。但不论哪种学习，简答式提取的元认知优势更大。

The Inflence of Reitrieval Formal and Question Type on Reading Performance and Meta-comprehention Monitoring

Wang Shukang, Wang Shuang, Wang Xun (corresponding author)

wangx@zjnu.cn

***Abstract*:**

For students to be able to effectively complete reading tasks, memorize, and comprehend the content of reading materials, teachers need to guide students to use appropriate learning strategies to implement effective learning and monitoring of the reading comprehension process. So, which strategies help students learn and monitor reading comprehension? The Retrieval Practice Effect suggests that extracting what has been learned is more useful for long-term memory retention than relearning it, and not only that, retrieval practice also helps to monitor the process of reading comprehension, i.e., it can improve the accuracy of metacomprehension monitoring. Therefore, retrieval practice may be a more effective learning strategy. However, today's research on extraction practice is not limited to the lower-order learning level; the retrieval practice effect has been expanded to higher-order learning. Long-term memory has two main forms of retrieval: recall and recollection. Different forms of retrieval are often important variables affecting the Retrieval Practice Effect. Therefore, the purpose of this paper is to investigate the effect of retrieval form on reading performance and metacomprehension monitoring at different levels of learning.

The present study consisted of three experiments, all of which utilized the Retrieval Practice Effect Paradigm. Experiment 1a was a one-factor within-subjects experimental design, which explored the effects of different learning strategies on memory learning on reading performance and metacomprehension monitoring under the premise of using verbal debriefing responses, and verified the effect of extraction practice on memory learning and the metacognitive advantage of extraction. Experiment 1b was a one-factor within-subjects experimental design to explore the effects of different learning strategies on inferential learning on reading performance and metacomprehension monitoring under the premise of presenting higher-order problems at initial extraction, and to examine the retrieval practice effect on inferential learning and the metacognitive advantage of

extraction. According to the different forms of long-term memory extraction, which often take the form of multiple-choice and short-answer questions in real educational contexts, Experiment 2 adopts a two-factor within-subjects experimental design of 2 (extraction form: multiple-choice style, short-answer style) × 2 (question type: memorization, inference) to explore the effects of different extraction forms on reading achievement and metacomprehension monitoring at different levels of learning. The findings of this study are as follows:

(1) Retrieval strategies are applicable to both higher and lower order learning, and are also advantageous at the metacognitive level of different levels of learning.

(2) The learning retention advantage of short-answer extraction over multiple-choice extraction can only be realized on higher-order reasoning learning. Regardless of the type of learning, however, the

metacognitive advantage of short-answer extraction is greater.

时空背景变化对情景记忆结构组织的影响——一项眼动研究

秦楠[12]　高媛[12]　莫雷[12*]（通讯作者）

1 华南师范大学心理应用研究中心，广州，510631, molei@scnu.edu.cn

2 华南师范大学心理学院，广州，510631, molei@scnu.edu.cn

摘 要　情景记忆分离一直以来是学术界研究的热点问题。大量研究表明，背景变化（事件边界）损害时间方面的情景记忆，直接促进了连续的记忆经验被提取为有意义且离散的情节或事件。然而，时空信息作为情景记忆中的经验构建的重要维度，是否能够影响情景记忆分离仍然未有定论。需要采用时间背景与空间背景变化作为事件边界来体现人类情景记忆在时空情境中时间与非时间结构的关系，以进一步考察时空背景变化对情景记忆结构组织的影响，以及情景记忆分离的神经机制。据此，本研究基于事件边界范式共设计 3 个实验进行研究。结果发现：（1）时间背景变化会损害情景记忆的时间记忆：跨边界项目对的时间顺序记忆更差，且时间距离被主观夸大；（2）空间背景变化对情景记忆的时间与非时间方面记忆影响存在权衡现象：损害情景记忆的时间方面记忆，增强源记忆；（3）背景变化对情景记忆的非时间方面记忆影响存在权衡现象：增强项目来源记忆，损害项目本身的内容记忆；（4）背景变化能够引发生理唤醒反应，即边界处的瞳孔直径更大，情景记忆的时间记忆和项目记忆也与瞳孔扩张的不同时间特征以及唤醒状态的时间稳定性有关。综合而言，时空背景稳定性在情景记忆的结构组织中起到关键作用，是情景记忆分离效应的主要原因；而生理唤醒可能是情景记忆整合和分割的重要生理指标。

The influence of spatio-temporal background changes on the structure organizations of episodic memory: An Eye-tracking Study

Nan Qin, Yuan Gao, Lei Mo

Center for Studies of Psychological Application, South China Normal University, Guangzhou, 510631

School of Psychology, South China Normal University, Guangzhou, 510631

Abstract：There has been intense interest in the separation of episodic memory. Increasing research suggests that

contextual changes, that is, event boundaries impair the temporal memory of episodic memory, directly facilitating the extraction of continuous experiences into meaningful and discrete episodes or events. However, as an important dimension of experiences construction in episodic memory, whether spatiotemporal information can affect the separation of episodic memory remains unknown. It is necessary to use the change of temporal background and spatial background as the event boundaries to reflect the relationship between the temporal and non-temporal structure of human episodic memory in the spatio-temporal context, so as to further investigate the influence of spatio-temporal background changes on the organizational structure of episodic memory and the neuromechanisms of episodic memory separation.

Therefore, three experiments were conducted based on the event boundary paradigm. The results showed that: (1) temporal background changes can impair temporal memory of episodic memory: temporal order memory was significantly impaired for boundary-spanning pairs relative to same-context pairs, and boundaries elicited a subjective time expansion effect in memory. (2) The influence of spatial background changes on temporal and non-temporal features of episodic memory is trade off: boundaries impaired the temporal structure of memory but enhanced source memory. (3) There was mnemonic trade-off effect between source memory and item memory: event boundaries enhanced source memory but damaged the content memory of the item itself. (4) Changes in context, or event boundaries, elicited a burst of autonomic arousal: pupil dilation was significantly greater for boundary items than for same-context items. The temporal and item memory of episodic memory are also related to the distinct temporal characteristics of pupil dilations as well as the temporal stability of arousal states. In addition, spatiotemporal background stability which plays a key role in the structure organizations of episodic memory is the main reason for the separation effect of episodic memory. Physiological arousal may be a crucial physiological index of episodic memory integration and segmentation.

摘 要 职业教育是与经济社会联系最为紧密的一类教育，它不仅可以推动教育改革的创新，而且还能够促进经济社会的可持续发展，中等职业教育则是其中重要的组成部分。研究表明，大部分中职生学习成绩较差，学习效率较低，究其原因主要是中职生的学习投入不足。因此，本研究深入调查中职生学习投入水平，并探究其影响因素，颇具重要意义。研究一采用《学习投入量表》、《成就目标定向量表》和《坚毅自评量表（中文版）》调查 1744 名中职生，结果发现：（1）中职生学习投入、成就目标定向与坚毅品质均略低于中等水平；中职生成就目标定向、坚毅品质与学习投入在性别、专业上均存在显著差异；在年级上，成就目标定向与坚毅品质存在显著差异。（2）中职生成就目标定向、坚毅品质与学习投入两两相关，成就目标定向与坚毅品质都能够显著预测学习投入。（3）坚毅品质在成就目标定向与学习投入之间起部分中介作用。研究二选取所调查的其中一所中职学校得分较低的两个班级为研究对象，设计科学系统的心理健康教育干预方案。运用课程干预的形式进行干预。通过前后测调查数据对比分析结果表明：实验组后测得分相较于前侧得分在学习投入、成就目标定向与坚毅品质三方面均有显著性提高，心理健康教育课程干预对提升中职生学习投入水平具有一定的效果。

Abstract：Vocational education is the type of education that is most closely linked to the economy and society, which can not only promote the innovation of education reform, but also promote the sustainable development of the economy and society, and secondary vocational education is an important part of it. Research shows that most professional students have poor academic performance and low learning efficiency, which is mainly due to the lack of learning input of secondary students. Therefore, it is of great significance for this study to investigate in-depth the level of professional students' academic engagement and to explore its influencing factors. Study 1 used the academic engagement Scale, Achievement Goal Orientation Scale and grit Self-Assessment Scale (Chinese version) to investigate 1,744 professional students, and found that: (1) professional students ' academic engagement, achievement goal orientation and grit were all slightly lower than the intermediate level; there were significant differences between professional students' achievement goal orientation, grit and academic engagement in terms of gender and major; and there was a significant difference between achievement goal orientation and grit in terms of grade level. There is a significant difference between Achievement Goal Orientation and grit. (2) Achievement goal orientation, grit and academic engagement are significantly related, and both achievement goal orientation and grit can significantly predict academic engagement. (3) The grit partially mediated the relationship between achievement goal orientation and academic engagement. On the one hand, this study provides a theoretical basis for the achievement goal orientation, grit and academic engagement of professional students, which helps to further improve and develop the theoretical and empirical research on adolescents' academic engagement, so as to better guide the educational practice, and on the other hand, it provides a certain revelation for the educational and teaching work of the schools, and at the same time, it provides empirical bases and strategic suggestions for promoting the academic engagement of professional students, which has a positive practical significance.In Study 2, two lower-scoring classes in one of the schools were selected to design a scientific and systematic mental health education intervention programme. The intervention was carried out in the form of curriculum intervention. Comparative analysis of the pre- and post-test data showed that the experimental group's post-test scores were significantly higher than the pre-test scores in terms of academic engagement, achievement goal orientation and grit, and that the mental health education curriculum intervention had a certain effect on improving the level of academic engagement of the professional students.

新生代教师职业认同、职业使命感对工作投入的影响：基于聚类分析的实证研究

章诗毓[1] 李云霞[1] 王菲[1] 李东斌[1](通讯作者)
1 赣南师范大学教育科学学院，赣州，341000，lidongbin@gnnu.edu.cn

摘 要 习近平总书记在全国政协十三届四次会议中指出：“教师是教育工作的中坚力量。有高质量的教师，才有高质量的教育。”而 80 后、90 后的年轻教师作为新生代教师，更应该以在教育工作中“挑大梁，担大任”为自己的行动指南和正确奋斗方向。近来出现一些现象，新生代教师在工作几年后，工作的热情呈现下降的趋势，对职业的认同不高，职业使命感不强。因此，对新生代教师的高质量培养就显得格外重要，提高新生代教师队伍的认同感、使命感以及工作投入，成为亟待解决的现实问题。且以往关于新生代教师的研究多为把其视为整体进行探究，关注的是其整体性问题，并未对新生代教师之间的异质性进行探究。因此，本研究试图区分和识别新生代教师潜在群体类型，探究不同类型职业认同-职业使命感新生代教师对其工作投入的影响。

本研究采用随机抽样的方式在全国各省市抽取 5657 名新生代教师进行问卷调查，通过以 K-means 聚类分析方法对新生代教师职业认同以及职业使命感进行分类，之后采用方差分析以及事后比较的方法探讨不同类别的职业认同—职业使命感教师与其工作投入的关系。研究结果表明：(1)新生代教师的职业认同的聚类可为高层次职业认同组(48.21%)、中层次职业认同组(37.92%)以及低层次认同组(13.88%)；(2)新生代教师职业使命感的聚类可为高层次职业使命感(51.79%)、中层次职业使命感(38.73%)、低层次职业使命感(9.47%)；(3)把新生代教师的职业认同和职业使命感根据组间的差异显著性检验进行组合得到四种类型的聚类分别为：类型 1 双高组(46.33%)，类型 2 次高组(32.03%)，类型 3 次低组(16.85%)，类型 4 双低组(4.79%)；(4)不同职业认同—职业使命感聚类在工作投入上的得分差异均具有统计学意义。研究结果揭示了新生代教师职业认同和职业使命感存在共同发展路线且职业认同和职业使命感共同对新生代教师的工作投入产生影响。本研究区分和识别新生代教师潜在群体类型，有利于优化教师培养机制、分类施策，是提升教师工作投入的重要突破口。

The Effects of new generation teachers ' Professional Identity and Professional Mission on Work Engagement : An empirical research based on Cluster Analysis

Zhang Shiyv[1] , Li Yunxia[1], Wang Fei[1] , Li Dongbing[1](correspondence)
1 Educational Science School, Gannan Normal University, Ganzhou, Jiangxi China

***Abstract*:** Only with high-quality teachers can we have high-quality education. As the new generation of teachers, the young teachers of the post-80 s and post-90 s should take ' picking the big beams and taking the big responsibilities ' in the education work as their own action guide and correct direction of struggle. Recently, there have been some phenomena. After working for several years, the enthusiasm of the new generation of teachers has shown a downward trend, their professional identity is not high, and their sense of professional mission is not strong. Therefore, it is particularly important to cultivate the high quality of the new generation of teachers. Improving the sense of identity, mission and work engagement of the new generation of teachers has become an urgent problem to be solved. In the past, most of the research on the new generation of teachers regarded it as a whole to explore, focusing on its integrity, and did not explore the heterogeneity between the new generation of

teachers. Therefore, this study attempts to distinguish and identify the potential group types of the new generation of teachers, and explore the influence of different types of professional identity-professional mission of the new generation of teachers on their work engagement.

In this study, a random sampling method was used to select 5657 new generation teachers in various provinces and cities across the country to conduct a questionnaire survey. The K-means clustering analysis method was used to classify the new generation teachers ' professional identity and professional mission. After that, variance analysis and post-hoc comparison methods were used to explore the relationship between different types of professional identity-professional mission teachers and their work engagement. The results show that : (1) The clustering of professional identity of the new generation of teachers can be divided into high-level professional identity group (48.21 %), middle-level professional identity group (37.92 %) and low-level identity group (13.88 %) ; (2) The clustering of the new generation of teachers ' professional mission can be divided into high-level professional mission (51.79 %), middle-level professional mission (38.73 %) and low-level professional mission (9.47 %). (3) Combining the professional identity and professional mission of the new generation of teachers according to the significance test of the differences between the groups, four types of clusters are obtained : type 1 double high group (46.33 %), type 2 high group (32.03 %), type 3 low group (16.85 %), type 4 double low group (4.79 %) ; (4) The scores of different occupational identity-occupational mission clustering in work engagement were statistically significant. The research results reveal that the new generation of teachers ' professional identity and professional mission have a common development path, and professional identity and professional mission have an impact on the work engagement of the new generation of teachers. This study distinguishes and identifies the types of potential groups of the new generation of teachers, which is conducive to optimizing the teacher training mechanism and classifying policies, and is an important breakthrough to improve teachers ' work engagement.

The relationship between parenting styles and positive adolescent development: a series of meta-analytic studies

Tian Tang, Wang Yu, Ning Chen*
Shanghai Normal University, Education

***Abstract*：** Research Purpose: The concept of positive adolescent development is one of the most influential concepts in adolescent development research, which focuses on the potential strengths of adolescent development and the plasticity of developmental trajectories, and emphasizes the important role of individual-environmental interactions on adolescent development. Previous meta-analytic studies have examined the effects of family parenting styles on single variables in the structure of positive adolescent development, and no study has explored the effects of family parenting styles on the holistic conceptualization of positive adolescent development. It is proposed to conduct a series of meta-analyses on the holistic conceptualization of positive adolescent development in order to reveal the specifics of the effects of family parenting styles on positive adolescent development. Research methods: Based on the perspective of positive adolescent development, this study included four variables: academic achievement, self-esteem, resilience, and mental health in a series of meta-analyses, and the academic achievement variable was searched for by including the keywords "family upbringing/family parenting style/parenting style/parenting styles "+ "academic achievement/academic achievement/academic achievement" + "academic achievement/academic achievement/academic achievement". "Academic achievement/academic performance"; self-esteem with the keywords "family upbringing/family rearing/parenting/parenting style" + "self-esteem"; resilience The variable of self-esteem should contain the keywords "self-esteem"; resilience should contain the keywords "family upbringing/family upbringing/upbringing/parenting" + "resilience/mental resilience/mental toughness/endurance"; mental health should contain the keywords "family upbringing/family upbringing/upbringing/parenting"; and mental health should contain the keywords "family upbringing/family upbringing/parenting/parenting". Parenting styles/family parenting styles/parenting styles/nurturing styles" + "mental health/psychological problems", were searched and screened in Chinese databases, and a total of 276 pieces of original literature were included, containing 2503 effect sizes, and the total number of subjects amounted to 155,683. The results of the study were summarized as follows: Different types of family parenting styles were significantly correlated with the four core constructs of positive adolescent development in general, and positive family parenting styles were moderately correlated with positive adolescent development in general (r = 0.188, of which, $r_{\text{Academic Achievement}}$ = 0.182, $r_{\text{Self-esteem}}$ = 0.317, $r_{\text{Resilience}}$ = 0.432, and $r_{\text{mental health}}$ = -0.156). The overall correlation between negative family parenting styles and positive adolescent development was low (r = -0.041, of which, $r_{\text{academic achievement}}$ = -0.095, $r_{\text{self-esteem}}$ = -0.156, $r_{\text{resilience}}$ = -0.168, and $r_{\text{mental health}}$ = 0.22), and the moderating effects of gender and age stage were significant. The above results have important implications for a comprehensive and profound understanding of the developmental resource value of family parenting styles and the promotion of positive adolescent development.

社会支持对青少年创伤后应激障碍的影响：反刍思维的中介作用

姚本先[1,2]（通讯作者） 梁筱宇[1]

1 合肥师范学院教师教育学院，合肥，230061，通讯作者 E-mail:ybx7756@126.com

2 安徽省学生心理健康教育指导中心

摘 要 在创伤心理学领域，创伤后应激障碍（PTSD）被视为最常见和最具代表性的创伤后心理反应。创伤后应激障碍是一种创伤后病理性反应，具体表现为侵入性症状、回避性症状、警觉性增高症状、负性认知和情绪改变症状，在新冠疫情这一突发公共卫生事件下的青少年群体中具有较高的发生率。以往研究发现，社会支持与创伤后应激障碍显著相关，但是社会支持和创伤后应激障碍之间的潜在机制仍不清楚。基于个体—环境交互作用理论，社会支持可能会提高青少年的反刍思维，进而促使其能更好的应对创伤后应激障碍。本研究将通过反刍思维来研究社会支持对青少年创伤后应激障碍的影响机制。研究采用领悟社会支持量表（PSSS）、反刍反应量表（RRS）、创伤后应激障碍症状核查表（PCL-5）对 687 名青少年进行问卷调查。采用相关分析和 Hayes（2013）开发的 PROCESS 程序进行中介效应检验。结果显示：（1）社会支持与创伤后应激障碍呈显著负相关；（2）社会支持与反刍思维呈显著负相关；（3）反刍思维与创伤后应激障碍呈显著正相关；（4）反刍思维在社会支持与创伤后应激障碍的关系中起部分中介作用。结论：社会支持可以直接对青少年创伤后应激障碍产生影响，也可以通过反刍思维的中介作用对青少年的创伤后应激障碍产生影响。本研究可以为青少年的心理危机干预提供一定的启示，一定要注重社会支持对青少年心理的影响，为其提供温暖有力的支持系统,帮助其建立良好的心理弹性，降低疫情对学生心理健康的影响。

The Impact of Social Support on Post-traumatic Stress Disorder in Adolescents : The Mediating Role of Ruminant Thinking

Yao BenXian[1,2] (Corresponding author) Liang XiaoYu[1]
1 Hefei Normal University, HeFei, AnHui, 230061, China
2 Anhui Mental Health Education and Guidance Center for Student

***Abstract*:** In the field of trauma psychology, post-traumatic stress disorder (PTSD) is regarded as the most common and representative post-traumatic psychological response. PTSD is a post-traumatic pathological response manifested by intrusive symptoms, avoidance symptoms, heightened alertness symptoms, negative cognitions and mood altering symptoms, and has a high prevalence in the adolescent population . Previous studies have found that social support significantly affects PTSD, but little is known about the potential underlying mechanisms. Based on the theory of individual-environment interaction, we propose that social support may increase the ruminant thinking of adolescents, and thus help them to better cope with PTSD. A total of 687 adolescents completed the Perceived Social Support Scale (PSSS), the Ruminative Responese Scale (RRS) and the Post-Traumatic Stress Disorder Symptom Checklist (PCL-5). Correlation analyses and the PROCESS procedure developed by Hayes (2013) were used to test for mediating effect. The results showed that (1) social support was negatively related to PTSD; (2) social support was negatively related to ruminant thinking; (3) ruminant thinking was positively related to PTSD; and (4) ruminant thinking partially mediated the negative relationship between social support and PTSD. Conclusion: Social support can have a direct impact on adolescents' PTSD, and affect the PTSD indirectly through ruminant thinking. These finding can provide some insights into the psychological crisis intervention of adolescents under the pandemic. For example, we need to provide adolescents with a warm and strong support system, help them to build up good ruminant thinking, and thus reduce the negative impact of pandemic on their mental health.

大学生目标感问卷的编制及信效度检验

蔡景雪[1]，连 榕[2]（通讯作者）
1 福建技术师范学院，福州，350300）
2 福建师范大学，福州，350117，lianrong1122@126.com

摘 要 目标感是指个体对要达到的目标的自我感受与调控，反映的是个体对目标的自我意识程度。为了测评大学生对自身目标的感受水平，本研究编制大学生目标感问卷并检验其信效度。研究一采用质性研究构建大学生目标感结构模型。首先，采用目的性抽样，在网络上搜索自 2018 年以来以“国奖风采”、“国奖优秀事迹”、“国奖专访”、“国奖获得者”为关键词，有关优秀本科大学生获得国奖后的相关报道及自述文本作为质性分析原始资料，根据扎根理论三阶段编码程序对这些原始资料进行开放式登录、关联式登录和核心式登录形成初步理论模型；然后，对 12 名大学生进行半结构化访谈，审查其是否达到“理论饱和”。研究二编制大学生目标感问卷并检验其信效度。首先，在质性研究的基础上，编制初始问卷；然后，以 504 名大学生为被试进行项目分析和探索性因素分析；以 1390 名大学生为被试进行验证性因素分析。结果获得的大学生目标感问卷共有 14 个题项，包括目标意识、目标认同和目标策略三个维度。验证性因素分析各项拟合

指标良好（χ^2/df = 3.743，*CFI* = 0.942，*TLI* = 0.929，*RMSEA* = 0.044，*SRMR* = 0.035），问卷及维度得分与校标问卷分数显著相关，问卷的内部一致性系数为 0.85，重测信度为 0.98。大学生目标感问卷具有良好的信效度，适用于我国大学生目标感的调查及相关研究。

Development and Validation of the College Students' Sense of Purpose Questionnaire

Cai Jingxue[1], LianRong[2]
1Fujian Polytechnic Normal University，Fuzhou，350300
2 Fujian Normal University, Fuzhou, 350117, lianrong1122@126.com

Abstract：The sense of purpose refers to the individual's self-perception and regulation of the purpose to be achieved, which reflects the individual's self-awareness of the purpose. In order to evaluate the perception level of college students on their purposes, this study compiled a questionnaire of college students' sense of purposes and tested its validity. In study 1, quality research was used to construct the structure model of college students' sense of purpose. First of all, using purpose sampling, search on the Internet since 2018 with "national award style", "national award", "national award interview", "national award winner" as the key words, and the qualitative analysis of the original data, according to the open login, correlation login and core login to form the preliminary theory model; then, the 12 college students semi-structured interview, to review whether it reached "theoretical saturation". In study 2, prepare the questionnaire of college students' sense of purpose and test its reliability and validity. Firstly, the initial questionnaire was prepared based on the qualitative research; item analysis and exploratory factor analysis for 504 college students and 1390 college students. There were 14 questionnaire items, including three dimensions of purpose awareness, purpose identification and purpose strategy. For the good fitting indicators（χ^2/df = 3.743，*CFI* = 0.942，*TLI* = 0.929，*RMSEA* = 0.044，*SRMR* = 0.035）, the questionnaire and dimension scores were significantly correlated with the calibration questionnaire scores. The internal consistency coefficient of the questionnaire was 0.85 and the test-retest reliability was 0.98. The questionnaire of college students has good reliability and validity, and is suitable for the survey and related research of college students in China.
Keywords：qualitative research, sense of purpose, reliability, validity, college students

阅读策略训练对小学生阅读理解能力的作用：一项基于阅读障碍风险儿童的干预研究

孙婷婷[1] 于金琦[1] 李璐[1] 黄亚[1] 刘荣[2]（通讯作者）
1 首都师范大学初等教育学院，北京，100101
2 首都师范大学初等教育学院，北京，100037，cnu_liurong@126.com

摘 要 阅读障碍风险（Reading disability at risk，下文简称“RD”）是指儿童已经表现出明显的句法困难，阅读及拼写能力落后于同龄儿童，但还未发展成真正的阅读障碍。研究者提出应该在儿童还未发展成真正的阅读障碍之前（即阅读障碍风险儿童）对其进行早期诊断并提前干预。研究者发现“RD”儿童的阅读理解水平低，阅读理解监控存在缺陷，但是进行教学干预后，他们的阅读理解水平有显著提高。本研究基于前人研究，从小学五年级学生中筛选“RD”儿童，考察他们阅读策略的使用特点，并考察对其进行阅读策略训练是否能够提升其阅读理解能力（即字面性理解、推论性理解、理解监控能力）。结果显示，“RD”儿童在四种阅读策略（即预测、澄清、提问、总结）使用上的成绩均显著差于对照组（*ps*<0.05）；在记叙文与说明文两种文体中，“RD”儿童在澄清、提问、总结策略上成绩显著差于对照组（*ps*<0.05），但预测策略无显著差异（*p*>0.05）。本研究对“RD”儿童进行阅读策略训练的干预后，发现“RD”儿童的阅读理解成绩显著高于干预前（*p*<0.05)，尤其在字面性理解和理解监控上的干预效果最佳，推论性理解成绩次之；并且，对记叙文的干预效果（成绩增长率 109%）优于说明文（成绩增长率 79%）。本研究结果表明，阅读障碍风险儿童对阅读策略的使用普遍弱于同龄儿童，但是经过阅读策略训练干预后，他们的阅读理解能力能够获得显著提升，其中对记叙文理解的提升效果更佳。

2 College of Elementary Education, Capital Normal University, Beijing, 100048, cnu_liurong@126.com

***Abstract*：** Reading disability at risk (hereafter referred to as "RD") is a condition in which a child has demonstrated significant syntactic difficulties and lags behind peers in reading and spelling skills, but has not yet developed true dyslexia. Researchers have proposed that early diagnosis and intervention should be made before a child develops true dyslexia (i.e., child of reading disability at risk). The researchers found that the "RD" children had low levels of reading comprehension and deficits in reading comprehension monitoring, but their reading comprehension levels improved significantly after instructional intervention. Based on previous research, this study screened "RD" children from fifth graders, examined the characteristics of their reading strategy use, and examined whether training them in reading strategies improved their reading comprehension (i.e., literal comprehension, inferential comprehension, and comprehension monitoring). The results showed that "RD" children performed significantly worse than the control group in all four reading strategies (i.e., predicting, clarifying, questioning, and summarizing) (ps<0.05); in both narrative and expository texts, "RD" children performed significantly worse than the control group in the strategies of clarifying, questioning, and summarizing (ps<0.05); and in the strategies of clarifying, questioning, and summarizing, they performed significantly worse than the control group in both narrative and expository texts. and summarization strategies (ps<0.05), but there was no significant difference in prediction strategies (p>0.05). After the intervention of reading strategy training for the "RD" children, it was found that the "RD" children's reading comprehension scores were significantly higher than those before the intervention (p<0.05), especially in literal comprehension and comprehension monitoring, with

inferential comprehension being the best, followed by inferential comprehension ($p<0.05$) scores were the next highest; and the intervention effect was better for narrative text (109% growth in scores) than for expository text (79% growth in scores). The results of this study indicate that child of reading disability at risk are generally weaker than their peers in the use of reading strategies, but their reading comprehension improves significantly after the intervention of reading strategy training, with a better improvement in comprehension of narrative text.

高中生焦虑抑郁问题核心症状的时间特异性探索：基于交叉滞后网络分析模型

刘东禹[1] 俞美硕[2] 张馨予[1] 杨海波[1,3]（通讯作者）

1 天津师范大学心理学部，天津，300387

2 首都师范大学心理学院，北京，100048

3 天津师范大学心理与行为研究院，天津，300387，yanghaibo@tjnu.edu.cn

摘 要 **引言：**焦虑和抑郁问题存在较高共病，且随着时间的推移表现出不断发展变化的趋势。本研究基于网络分析（Network Models, NM）和交叉滞后网络分析（Cross-lagged Panel Network Models, CLPN），分别探讨焦虑抑郁问题的核心症状，以及焦虑抑郁问题核心症状随时间变化的特点，从而深入理解焦虑抑郁问题的发展过程。方法：本研究以山东省济宁市某高中 606 名非毕业年级学生为研究对象，分别在 2022 年 3 月（T1）、6 月（T2）和 9 月（T3）进行三次施测。采用最小绝对值收敛和选择算子（LASSO）计算回归系数。使用 R qgraph 以及 bootnet 程序包进行 NM 以及 CLPN 建立。通过 bootnet 程序包进行模型准确性和节点稳定性分析。在本研究中 NM 及 CLPN 均呈中等准确性，节点中心性的估计稳定。**结果：**（1）NM 结果表明，各模型两两之间边线系数均显著正相关，其中 NM_{T2} 的全局强度最高。（2）不同时间点呈现出不同的核心症状：在 NM_{T1}-NM_{T3} 中 GAD-7 的“不可控制的担忧”症状均具有较高的中心性；在 NM_{T1}、NM_{T3} 中 PHQ-9 的“无价值感”症状的中心性最高；在 NM_{T2} 中 GAD-7 的“广泛焦虑”症状具有较高中心性，且其他症状强度也相对较高。（3）CLPN 结果表明，$CLPN_{T1\text{-}T2}$ 与 $CLPN_{T2\text{-}T3}$ 网络的边线系数总体呈负相关，$CLPN_{T1\text{-}T2}$ 中“无价值感”症状的接受影响最高，PHQ-9 的“自杀意念”症状的发出影响最高。在 $CLPN_{T2\text{-}T3}$ 中，“不可控制的担忧”症状的接受影响最高，“无价值”症状的发出影响最高。**结论：**本研究结果表明焦虑抑郁问题网络具有较高稳定性，其中“不可控制的担忧”、“无价值感”和“广泛焦虑”是高中生焦虑抑郁问题的核心症状，且前两者的中心性在时间上保持相对稳定。根据交叉滞后网络分析的结果，“无价值感”症状对于前一时间点焦虑抑郁症状的影响敏感，同时对于之后的焦虑抑郁症状也有较高的预测作用。综上，本研究从横向和纵向的角度分别探索了焦虑抑郁问题的核心症状和不同症状之间相互影响的方向性，为高中生焦虑抑郁问题的预防和干预提供了理论干预靶点。

Time-specific exploration of core symptoms of anxiety and depression in high school students: A cross-lagged panel network

analysis

Dongyu Liu[1] Meishuo Yu[2] Xinyu Zhang[1] Haibo Yang [1,3](corresponding author)
1 Faculty of Psychology Tianjin Normal University Tianjin, 300387
2 School of Psychology, Capital Normal University, Beijing, China, 100048
3 Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, 300387,
yanghaibo@tjnu.edu.cn

Abstract: This study aims to investigate the central symptoms of anxiety and depression and their developmental patterns over time using Network Models (NM) and Cross-lagged Panel Network Models (CLPN). By examining these processes, the objective is to gain a deeper understanding of the developmental trajectory of anxiety and depression. The study involved 606 non-graduating high school students from Jining City, Shandong Province, who participated in three assessments conducted in March (T1), June (T2), and September (T3) of 2022.

To analyze the data, regression coefficients were calculated using the Least Absolute Shrinkage and Selection Operator (LASSO). The R packages *glmnet* and *qgraph* were utilized to establish the NM and CLPN, respectively. Model accuracy and node stability were analyzed using the *bootnet* package. Both NM and CLPN demonstrated moderate accuracy and stable estimates of node centrality in this study. The results revealed several key findings. Firstly, the NM results indicated significant positive correlations in edge coefficients across different models, with the NM_{T2} model showing the highest global strength. Secondly, different core symptoms were observed at different time points. For instance, the "Uncontrollable worry" symptom of the GAD-7 exhibited high centrality in NM_{T1}-NM_{T3}, while the "Worthlessness" symptom of the PHQ-9 had the highest centrality in NM_{T1} and NM_{T3}. Additionally, the "Generalized worry" symptom of the GAD-7 displayed high centrality in NM_{T2}, along with relatively high intensity in other symptoms. Thirdly, the CLPN results indicated negative correlations in general edge coefficients between the $CLPN_{T1\text{-}T2}$ and $CLPN_{T2\text{-}T3}$. In the $CLPN_{T1\text{-}T2}$, the "Worthlessness" symptom had the highest in-expected influence, while the "Suicidal Ideation" symptom of the PHQ-9 had the highest out-expected influence. In the $CLPN_{T2\text{-}T3}$, the "Uncontrollable Worry" symptom had the highest in-expected influence, and the "Worthlessness" symptom had the highest out-expected influence. In conclusion, the findings suggest that the anxiety and depression network exhibit high stability. "Uncontrollable worry", "Worthlessness", and "Generalized worry" were identified as core symptoms of anxiety and depression in high school students, with the centrality of the first two symptoms remaining relatively stable over time. Furthermore, according to the results of the cross-lagged panel network analysis, the "Worthlessness" symptom is sensitive to the impact of the symptoms at previous time point and has a high predictive effect on subsequent symptoms. Overall, this study provides insights into the central symptoms of anxiety and depression and the directional effects between different symptoms from both a horizontal and vertical perspective, offering theoretical intervention targets for the prevention and treatment of anxiety and depression among high school students.

家庭功能与中学生抑郁的关系：

总体自我价值感与行为自主决策的链式中介作用

罗静[1] 曾练平[2]（通讯作者）
贵州师范大学心理学院，贵阳，55001，E-mail：zenglianping@163.com

摘 要 探索中学生抑郁的影响因素，对学校发展和教学质量的提升有较大的现实意义，对基础教育的发展和进步也具有一定的促进作用。研究主要探讨家庭功能对中学生抑郁的影响，以及总体自我价值感、行为自主决策在家庭功能与中学生抑郁两者关系中的作用。采用家庭功能问卷、总体自我价值感问卷、青少年行为自主决策问卷、流调中心抑郁问卷，对贵州省某中学的中学生进行调查，删除未做完和规律作答的问卷，最终得到有效问卷 814 份。其中，男生 435 人，占比 53.4%；女生 375 人，占比 46.1%；初一有 329 人，占比 40.4%；初二有 281 人，占比 34.5%；初三有 204 人，占比 25.1%。结果表明：家庭功能与总体自我价值观、行为自主决策、抑郁呈显著正相关；总体自我价值观与行为自主决策、抑郁呈显著正相关；行为自主决策与抑郁呈显著正相关，总体自我价值感和行为自主决策在家庭功能和中学生抑郁之间的单独中介作用均显著；且总体自我价值感、行为自主决策的链式中介作用也显著。由此可知，总体自我价值感及行为自主决策会影响中学生的抑郁情况。家庭功能与中学生抑郁息息相关，培养中学生良好的自我价值感，以及拥有一定行为自主决策权，对中学生的身心健康发展至关重要。因此，中学可以通过促进家庭功能和培养中学生自我价值感和行为自主决策，不仅可以改善中学生的抑郁，还有助于身心健康的发展。

The relationship between family function and depression in middle school students: The chain mediating role of overall self-worth and behavioral autonomy

Jing Luo[1], Lianping Zeng[2] (Corresponding author)
Guizhou Normal University, Guizhou, China.

Abstract: Exploring the influencing factors of depression among middle school students has great practical significance for school development and the improvement of teaching quality, and also has a certain role in promoting the development and progress of basic education. This study mainly explores the influence of family function on depression in middle school students, and the role of overall self-worth and behavioral autonomy in the relationship between family function and depression in middle school students. A questionnaire on family functioning, a questionnaire on overall self-worth, a questionnaire on autonomous decision-making on adolescent behavior, and a questionnaire on depression in a center were used to survey middle school students in a middle school in Guizhou Province, and the questionnaires that were not completed and answered regularly were deleted, and 814 valid questionnaires were finally obtained. Among them, 435 were boys, accounting for 53.4%; 375 were girls, accounting for 46.1%; There were 329 people in the first year of junior high school, accounting for 40.4%; There were 281 people in the second year of junior high school, accounting for 34.5%; There were 204 students in the third year of junior high school, accounting for 25.1%. The results showed that family function was significantly positively correlated with overall self-worth, behavioral autonomy and depression. Overall self-worth was significantly positively correlated with behavioral autonomy and depression. Behavioral autonomy was positively correlated with depression, and overall self-worth and behavioral autonomy played a significant role in the separate mediating roles between family function and depression in middle school students. Moreover, the chain mediating role of overall self-worth and behavioral autonomous decision-making is also significant. It can be seen that overall self-worth and behavioral autonomy affect the depression of middle school students. Family function is closely related to depression in middle school students, and cultivating a good sense of self-worth and having certain behavioral autonomy is crucial to the healthy development of middle school students. Therefore, secondary schools can not only improve depression in middle school students, but also contribute to the

development of physical and mental health by promoting family function and cultivating middle school students' sense of self-worth and behavioral autonomy.

Keywords: family functioning, depression, overall sense of self-worth, behavioral autonomy, middle school students

父母监控与青少年亲社会行为的关系：有调节的中介模型

利振华　吴煜琪　何嘉杰　陈佳榕　陈沛　聂衍刚（通讯作者）

广州大学教育学院青少年心理与行为研究中心，广州，510006，

nie-yangang@gzhu.edu.cn

摘　要　亲社会行为是(prosocial behavior)是指人们在社会交往中展现出自愿、有益于他人和社会的行为，包括帮助、分享、捐赠、合作等。以往研究表明，亲社会行为与积极的发展结果密切相关，例如更高的学业成就、更强的幸福感以及更好的人际关系。家庭环境是影响青少年行为发展的重要因素之一，父母对孩子的有效监督和管教有助于孩子形成良好的行为品质。本研究从生态系统理论的角度出发，探讨父母监控与青少年亲社会行为的关系，并且考察自我控制的中介作用和同伴关系的调节作用。本研究选取3686名初高中学生进行测查，分别完成父母监控量表、自我控制量表、同伴关系量表以及亲社会行为量表。结果发现：（1）父母监控与自我控制、亲社会行为、同伴关系两两呈显著正相关。（2）在控制性别、年龄后，父母监控显著正向预测亲社会行为，自我控制显著中介了父母监控与亲社会行为的关系 (effect = 0.05, 95% CI = [0.04, 0.06])。（3）有调节的中介效应显示，同伴关系显著调节了父母监控与自我控制的关系以及自我控制与亲社会行为的关系。简单斜率分析发现，在高水平的同伴关系下，父母监控对自我控制以及自我控制对亲社会行为的作用更强。研究表明，父母对孩子的监督能够预测青少年良好的自我控制，而高自我控制的青少年倾向于表现出更多的亲社会行为。积极的同伴关系增强了父母监控对自我控制以及自我控制对亲社会行为的积极影响。本研究揭示了父母监控影响青少年亲社会行为的心理机制，对于培养青少年的亲社会行为具有重要参考价值。

The Effect of Parental Monitoring on Adolescent Prosocial Behavior: A Moderated Mediation Model

Li Zhenhua　Wu Yuqi　He jiajie　Chen jiarong　Chen Pei　Nie Yangang*

Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

Abstract: Prosocial behavior refers to people's behaviors that are voluntary and beneficial to others and society in social interactions, including help, sharing, donation, cooperation, etc. Previous research has shown that prosocial behavior is strongly associated with positive developmental outcomes, such as higher academic achievement, greater happiness, and better interpersonal relationships. The family environment is one of the important factors that affect the development of adolescent behavior. The effective supervision and discipline of parents help children to form good behavior quality. This study explores the relationship between parental monitoring and adolescent prosocial behavior from the perspective of ecosystem theory, and examines the mediating role of self-control and the moderating role of peer relationship. In this study, 3686 middle and high school students were selected to complete the parental monitoring scale, self-control scale, peer relationship scale and prosocial behavior scale. The results showed that: (1) Parental monitoring was positively correlated with self-control, prosocial behavior and peer relationship. (2) After controlling for gender and age, parental monitoring significantly positively predicted prosocial behavior, and self-control significantly mediated the relationship between parental monitoring and prosocial behavior (effect = 0.05, 95%CI = [0.04, 0.06]). (3) Moderated mediating effect showed that peer relationship significantly moderated the relationship between parental monitoring and self-control and the relationship between self-control and prosocial behavior. Simple slope analysis found that parental monitoring had a stronger effect on self-control and self-control on prosocial behavior at high levels of peer relationships. Studies have shown that parental supervision of children is able to predict good self-control in adolescents, and that adolescents with high self-control tend to exhibit more prosocial behaviors. Positive peer relationships enhance the positive effects of parental monitoring on self-control and self-control on prosocial behavior. This study reveals the psychological mechanism of parental monitoring affecting adolescents' prosocial behavior, which has important reference value for cultivating adolescents' prosocial behavior.

教养方式对幼儿心理健康的影响——电子产品使用和性别的中介调节机制

李世菊 吴汶君 李秦宇 李 烨 仝 文（通讯作者）
山西师范大学教育科学学院心理学系，山西，030031，
E-mail：twaaa@126.com

摘 要 背景：俞国良等学者的调查结果显示我国幼儿心理健康总体状况不容乐观，幼儿心理健康相关问题检出率多在 11%以上；新时代下父母教养方式的转变、电子产品使用的普及和低龄化等因素对幼儿的心理健康产生了多重影响。目的：本研究通过分析 3-6 岁幼儿电子产品使用现状和心理健康状况及发展特点，探讨父母教养方式和电子产品使用在 3-6 岁幼儿与他们的心理健康问题之间的中介作用，以及性别的调节作用。从而分析父母教养方式对 3-6 岁幼儿心理健康的影响机制，并进一步寻找可行方案，为促进幼儿心理健康提出良好的建议。方法：综合运用文献资料和问卷调查等方法，使用父母教养方式问卷、电子产品使用量表、儿童行为问卷等工具，采取分层抽样法，以山西省两所幼儿园学生为研究对象，共发放 600 份问卷，回收有效问卷 510 份，有效回收率为 85%，其中年龄和性别比例大致平衡。采用 IBM SPSS26.0 统计软件分析父母教养方式、电子产品使用、幼儿心理健康相关系数，使用 SPSS 宏插件 PROCESS 相应的模型进行检验相关假设。结果：①权威型教养方式正向预测中幼儿心理健康问题；专制型教养方式负向预

测中幼儿心理健康问题；②父母教养方式在电子产品使用和幼儿心理健康问题之间起部分中介作用；③性别调节了父母教养方式影响电子产品使用的路径。结论：父母在教育孩子的过程中应尽可能多采用权威型的教养方式，给予幼儿足够的情感关注和进行合理的行为管控，同时要关注和规范幼儿使用电子产品间、频率和内容等，让不同幼儿都拥有良好的心理健康水平。

The Influence of Parenting Styles on young Children's Mental Health - Mediating Moderating Mechanisms of Electronics Use and Gender

Li Shiju　Wu Wenjun　Li Qinyu　Li Ye　Tong Wen
Department of Psychology, Shanxi Normal University, Taiyuan, 030031
E-mail：twaaa@126.com

Abstract： Background: The survey results of scholars such as Yu Guoliang show that the overall condition of children's mental health in China is not optimistic, and the detection rate of relevant problems in children's mental health is mostly above 11%. Factors such as changes in parenting styles in the new era, the prevalence and younger age of electronic product use have multiple effects on the mental health of young children. Objective: This study aims to explore the mediating effects of parenting styles and electronic product use on the mental health problems of 3-6 year old children, as well as the moderating effect of gender, by analyzing the current status and developmental characteristics of electronic product use and mental health problems in 3-6 year old children. Therefore, it analyzes the impact mechanism of parenting styles on the mental health of 3-6 year old children and further seeks feasible solutions to provide good suggestions for promoting children's mental health. Methods: Comprehensive methods were used, such as literature and questionnaire surveys, parenting style questionnaire, electronic product use scale, child behavior questionnaire, etc., adopting a stratified sampling method. 600 questionnaires were distributed to students in two kindergartens in Shanxi Province, and 510 valid questionnaires were collected, with an effective recovery rate of 85%, and the age and gender ratios were roughly balanced. IBM SPSS26.0 statistical software was used to analyze the correlation between parenting styles, electronic product use, and children's mental health, and the corresponding models were tested with the SPSS macro plugin PROCESS. Results: ① Authoritative parenting styles positively predicted children's mental health problems, while authoritarian parenting styles negatively predicted children's mental health problems; ② Parenting styles played a partial mediating role between electronic product use and children's mental health problems; ③ Gender moderated the path between parenting styles and electronic product use. Conclusion: Parents should adopt authoritative parenting styles as much as possible in the process of educating their children, giving children sufficient emotional attention and reasonable behavior management. At the same time, they should pay attention to and regulate the time, frequency, and content of children's electronic product use, so that children of different ages can have a good level of mental health.

摘　要　弹幕是一种新型的视频交互技术，已在部分在线教育平台得以使用，其在视频学习中的作用仍存在争议。基于多媒体学习认知理论和认知负荷理论，认知风格个体差异可能影响着弹幕视频的学习结果。因此，研究采用 2（学习视频中弹幕有无：有弹幕，无弹幕）×2（认知风格：场独立型，场依存型）被试间设计，以“人体体温与调节”视频课程（时长 4 分 44 秒）作为实验材料，结合眼动技术，对 84 名非生理学专业学生的视频学习结果（包括学习满意度，主观认知负荷和保持测验成绩）进行考察，来探讨弹幕对不同认知风格学习者视频学习的影响及机制。结果发现：（1）弹幕不影响两种认知风格者的视频学习满意度；（2）弹幕分散学习者的注意力，提高了场依存型学习者的认知负荷；（3）弹幕对场依存型学习者的视频学习保持测验成绩更具消极作用，弹幕视频条件下场依存型学习者的保持测验成绩显著低于无弹幕视频条件，场独立型学习者没有表现出显著差异。结果表明：弹幕不影响场独立型学习者的视频学习结果，但可能会使场依存型学习者出现认知负荷超载并降低其视频学习结果。研究结果支持了视频学习的认知负荷理论。

关键词　弹幕，认知风格，视频学习，眼动，认知负荷

The Effects of Bullet Screen on Video-based Learning for Learners with Different Cognitive Styles

4. Institute of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract　Bullet screen is a new video interactive technology, and its effectiveness in video-based learning is controversial. This study used eye-tracking technology to investigate the effects and mechanisms of bullet screen on video-based learning for learners with two different cognitive styles. Participants (*N*=84) were required to complete a post-test after watching the video course "Human Body Temperature and Regulation" under a 2 (bullet-screen: bullet-screen, bullet-screen-free) × 2 (cognitive style: field-independent, field-dependent) between-subjects design. The study found that the bullet screens did distract learners' attention and increased the cognitive load of field-dependent learners. As a result, the learning outcomes of field-dependent learners with bullet screens was significantly lower than those of learners with bullet-screen-free condition, while field-independent learners did not exhibit any significant differences. These results revealed that bullet screen has a negative impact on video learning outcomes for field-dependent learners, causing cognitive overload and reducing their learning outcomes.

Key words　bullet screen, cognitive style, video learning, eye movements, cognitive load

多巴胺系统基因与父母教养方式对青少年自我控制双系统的神经机

制——一项 fMRI 研究

陈沛　李瑞菁　聂衍刚（通讯作者）　李盛楠　窦凯
广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn

摘 要　为了解多基因分数与家庭环境影响青少年自我控制发展的神经机制，本研究选取广东省广州市某高校的 68 名大学生作为研究对象（$Mean_{age}$=19.84 岁，*SD*=1.38），采用功能磁共振（fMRI）技术考察多巴胺系统多基因累加分数（*DRD1*rs907094、*DRD2* rs1800497、*DRD2* rs6277、*DRD2* rs1799732、*DRD3* rs6280、*DRD4* rs1800955、*DAT1* rs27027、*COMT* Val158Met）与父母教养行为作用于青少年自我控制的神经机制。结果显示：（1）自我控制冲动系统与小脑灰质体积有关，冲动系统得分越高，其右侧小脑 4、5 区的灰质体积越小（Peak T=-3.73, cluster sizes = 4610, p<0.05），而控制系统与全脑灰质体积不存在显著相关；（2）冲动系统得分与右侧眶部额上回的大脑静息态低频振幅显著正相关（Peak T=3.87, cluster sizes =125, p<0.05）；控制系统得分与左侧小脑脚 1 区的大静息态低频振幅显著正相关（Peak T=3.76, cluster sizes =250, p<0.05），与右侧枕中回的大脑静息态低频振幅显著负相关（Peak T=-3.98, cluster sizes =273, p<0.05）；（3）多基因累加得分与父母消极教养交互共同预测右侧小脑 4、5 区的灰质体积，在具有高遗传和环境风险的人群中，右侧小脑 4、5 区的灰质体积越小，个体更有可能表现出冲动行为。本研究有助于深入理解青少年自我控制发展的神经机制并为教育干预提供参考价值。

关键词　多巴胺系统基因，父母教养方式，自我控制双系统，功能性磁共振成像（fMRI），青少年

Interaction between Dopaminergic Genetic and Parenting Styles on Neural Mechanisms of Adolescent Dual-Mode of Self-Control: An fMRI Study

Pei Chen　Ruijing Li　Yangang Nie　Shengnan Li　Kai Dou
Department of Psychology/Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

Abstract: The aim of this study was to uncover the underlying neural mechanisms of dopaminergic genetic and parenting styles in the dual system of self-control. The current study recruited 68 teenagers ($Mean_{age}$=19.84 years, *SD*=1.38) in Guangzhou, Dongguan city. Functional magnetic resonance imaging (fMRI) was used to investigate the neural mechanism of the effects of polygenic accumulation scores of dopamine system (*DRD1*rs907094、*DRD2* rs1800497、*DRD2* rs6277、*DRD2* rs1799732、*DRD3* rs6280、*DRD4* rs1800955、*DAT1* rs27027、*COMT* Val158Met) and parenting styles on adolescent self-control. The results showed that: (1) The self-control impulse system is related to the volume of cerebellar grey matter; the higher the impulse system score, the smaller the volume of grey matter in the right cerebellar regions 4 and 5 (Peak T=-3.73, cluster sizes = 4610, p<0.05). (2) The score of the impulsive system was positively correlated with the low-frequency amplitude of the resting state of the brain in the right orbital superior frontal gyrus (Peak T=3.87, cluster sizes =125, p<0.05). The score of the control system was positively correlated with the large resting state low-frequency amplitude in the left cerebellar region 1 (Peak T=3.76, cluster sizes =250, p<0.05), and negatively correlated with the resting state low-frequency amplitude in the right middle occipital gyrus (Peak T=-3.98, cluster sizes =273, p<0.05). (3) Multi-gene cumulative scores and negative parenting interaction co-predicted the volume of gray matter in right cerebellar areas 4 and 5. In people

with high genetic and environmental risk, the smaller the volume of gray matter in right cerebellar areas 4 and 5, the more likely an individual was to exhibit impulsive behavior. This study is helpful to further understand the neural mechanism of adolescent self-control development and to provide reference for educational interferences.
Key words: dopaminergic genetic, parenting styles, the dual system of self-control, functional magnetic resonance imaging (fMRI), adolescent

认知卸载与项目难度对元认知监测的影响

刘昕悦　张振新　王勋（通讯作者）
浙江师范大学心理学院，金华，321000，wangx@zjnu.cn

摘 要 长期以来，人们一直试图通过认知卸载来减轻我们自身的认知负担，尤其在科技与生活不断融合的今天，认知卸载已成为帮助我们实现记忆目标的一种重要的方法和手段。在探究认知卸载的机制的过程中，研究者们发现元认知在其中起到了举足轻重的作用。Risko 等人在 2016 年提出了认知卸载的元认知模型，此后的许多研究也检验并证实了元认知在认知卸载决策中的作用。然而，做出认知卸载行为反过来会对我们本身的认知及元认知过程产生什么影响仍不够清楚。因此，本研究主要探讨在词对学习中做出认知卸载行为会如何影响人们的记忆及元认知监测过程，并结合不同难度的学习项目，来进一步探究认知卸载对元认知的影响的边界条件。本研究包括两个实验，实验 1 为单因素被试间设计，以非卸载组为对照组，采用认知卸载的多列表学习范式，来探究认知卸载行为对个体元认知监测的影响。结果发现：卸载组的被试在前三个列表上的自信心判断值显著高于控制组，即认知卸载会使个体对自己的记忆能力产生高估。实验 2 通过控制词对相关性以操控项目难度，采用 2（记忆方式：卸载，非卸载）×2（项目难度：高难度，低难度）混合设计，其中记忆方式作为被试间自变量，项目难度作为被试内自变量，主要探讨对不同难度的项目进行认知卸载时个体的记忆及元认知表现。结果发现：在高难度和低难度的条件下，卸载组的被试自信心判断值均显著高于非卸载组，然而相比于低难度项目来说，被试在学习高难度项目时的元认知监测的准确性更高。本研究的结果表明：（1）认知卸载容易致使学习者模糊自我记忆与外部储存工具之间的界限，对自己的记忆产生高估。（2）无论项目难度高低，认知卸载所导致的元认知偏差均存在。（3）难度影响认知卸载时的元认知监测准确性，高项目难度条件下个体的元认知监测的准确性更高。
关键词 认知卸载，项目难度，元认知监测，记忆

The Effects of Cognitive Offloading and Item Difficulty on Metacognitive Monitoring

Xinyue Liu, Zhenxin Zhang, Wang Xun (corresponding author)）
School of Psychology，Zhejiang Normal University, Jin Hua321000，
wangx@zjnu.cn

***Abstract*：** People have long tried to reduce our own cognitive load through cognitive offloading, which has become an important method and tool to help us achieve our memory goals, especially in today's world where technology is constantly merging with life. Risko et al. (2016) proposed a metacognitive model of cognitive offloading, and many studies since then have tested and confirmed the role of metacognition in cognitive offloading decisions. However, it is still not clear enough how making cognitive offloading behaviors in turn

affects our own cognitive and metacognitive processes. Therefore, the present study focuses on how making cognitive offloading behaviors in word pair learning affects people's memory and metacognitive monitoring processes, and incorporates learning items of different levels of difficulty to further investigate the boundary conditions for the effects of cognitive offloading on metacognition. The present study consisted of two experiments. memory type (offloaded, non-offloaded) was manipulated between participants as the only independent variable in Experiment 1. A multiple-list learning paradigm of cognitive offloading was used to investigate the effects of cognitive offloading behaviors on individual metacognitive monitoring. The results showed that subjects in the offloading group had significantly higher confidence judgment scores on the first three lists than those in the control group, i.e., cognitive offloading causes individuals to overestimate their memory capacity. Experiment 2 employed a 2 (memory type: offloading vs. Non-offloading) × 2 (Item difficulty: high vs. low) mixed design, with memory type used as a between-subjects variable and item difficulty as a within-subjects variable, to explore the memory and metacognitive performances of individuals when cognitively unloading on items of varying levels of difficulty. The results showed that subjects' confidence judgment values were significantly higher in the offloaded group than in the non-offloaded group in both the high and low difficulty conditions, yet the accuracy of metacognitive monitoring was higher when subjects were learning the high difficulty items compared to the low difficulty items. The results of this study suggest that (1) cognitive offloading tends to cause learners to blur the boundaries between self-memory and external cognitive tools and to overestimate their own memory. (2) The metacognitive bias caused by cognitive offloading exists regardless of item difficulty. (3) Difficulty affects the accuracy of metacognitive monitoring during cognitive offloading, and the accuracy of metacognitive monitoring is higher for individuals in the high item difficulty condition.

Keywords：Cognitive offloading, Item difficulty, Metacognitive monitoring, Memory

父母情绪智力与高中生主观幸福感的关系：自尊的中介作用

连培琴[1]　郭玉丹[2]　张佳琪[3]　冯喜珍[1]（通讯作者）

摘 要　随着经济的发展，GDP 指数的提高，人们已不仅仅满足于解决温饱问题，而是更在意内在情感体验与生活质量，主观幸福感也成为多领域关注的话题。高中阶段，学生面临学业、生活、人际等众多问题，且是由青少年到成人的过渡期，也是自我发展的重要阶段，因此研究高中生的主观幸福感及其形成机制具有特殊意义。研究表明，高情绪智力的父母能够通过识别并指导孩子的情绪，促使孩子形成良好的情绪管理策略，进而获得更多积极情绪，具有较高的幸福感。自尊作为个体在社会化过程中获得的有关自我价值的积极评价与体验，会受到父母情绪智力的影响，即拥有较高/较低情绪智力的父母会增加孩子的积极情绪/消极情绪，导致孩子进行自我肯定/自我否定，从而提高/降低自尊水平；而高自尊的个体往往具有较高的主观幸福感，因此自尊可能在父母情绪智力与主观幸福感之间起到中介作用。基于此，本研究使用《情绪智力量表（EIS）》、《主观幸福感量表》以及《自尊量表》对 249 名高中生及其父母（290 名）进行问卷调查。结果显示：（1）父母情绪智力与自尊呈显著正相关，与主观幸福感各维度相关不显著；自尊与主观幸福感三个维度中的积极情感、生活满意度呈显著正相关，与消极情感呈显著负相关；（2）自尊在父母情绪智力与高中生主观幸福感之间起完全中介作用。研究表明：父母情绪智力无法直接影响高中生的主观幸福感，但是可以通过自尊的完全中介作用间接影响高中生的主观幸福感。研究启示，提升个体主观幸福感，不仅要注重诸如自尊等内部因素的加强，还要注重诸如父母情绪智力等外部因素的提高。

关键词　父母情绪智力，主观幸福感，自尊，高中生

The relationship between emotional intelligence of parents and subjective well-being of high school students: the mediating effect of self-esteem

Abstract： With the development of economy and the improvement of GDP index, people are not only satisfied with food and clothing, but also pay more attention to their inner emotional experience and quality of life, Subjective well-being has also become a topic of concern in many fields. At the stage of senior high school, students are faced with many problems in their studies, life and interpersonal relations,and it is a transition period from adolescence to adulthood, and it is also an important stage of self-development,therefore, the study of high school students' subjective well-being and its formation mechanism has a special significance. Research shows that parents with high emotional intelligence can help their children develop good emotion management strategies by recognizing and guiding their children's emotions, which in turn can lead to more positive emotions and higher levels of well-being. Self-esteem, as a positive evaluation and experience of self-worth acquired by individuals in the process of socialization, is influenced by parents' emotional intelligence, that is, parents with higher/lower emotional intelligence will increase their children's positive/negative emotions, leading to their children's self-affirmation/self-denial, thus raising/lowering the level of self-esteem; individuals with high self-esteem tend to have higher subjective well-being, so self-esteem may play a mediating role between parents' emotional intelligence and subjective well-being. Based on this, 249 high school students and their parents (290) were investigated with the emotional intelligence scale , subjective well-being scale and self-esteem scale. The results showed that: (1) there was a significant positive correlation between parents' emotional intelligence and self-esteem, but no significant correlation between parents' emotional intelligence and subjective well-being; (2) self-esteem completely mediates the relationship between emotional intelligence of parents and subjective well-being of high school students. The results show that the emotional intelligence of parents can not directly affect the subjective well-being of high school students, but it can indirectly affect the subjective well-being of high school students through the full mediation of self-esteem. The research suggests that the enhancement of subjective well-being should not only focus on internal factors such as self-esteem, but also on external factors such as emotional intelligence of parents.

大学生成就目标和课堂目标结构对学业求助的影响：

自我呈现成本的中介作用

张婷宜　马静薇　王恺芃　刘红瑞（通讯作者）
北京师范大学心理学部，北京，100875，hrliu@bnu.edu.cn

摘 要　学业求助对大学生学业表现和能力发展至关重要，探究影响大学生学业求助的内外因素具有重要价值。研究表明，个人成就目标（掌握趋近、表现趋近、表现回避）及其“外在情境对应物”即课堂目标结构对学业求助行为有预测作用，求助回避通常受到求助成本的影响。但至今为止，鲜有研究探讨自我呈现成本在成就目标发挥作用中的潜在角色，更少有研究基于表现趋近目标的混合结果而对其加以细化和区分。本研究同时考虑个人成就目标与课堂目标结构，探讨两者对大学生学业求助意向的影响以及自我呈现成本在其中的中介作用，并细化表现趋近目标的子类型。共包含 3 项子研究，其中研究 1a 采用问卷法测量了 280 名中国大学生的个人成就目标、自我呈现成本以及日常学业求助意向，以初步确定自我呈现成本在个人成就目标与学业求助间的中介作用；研究 1b 进一步将表现趋近目标分为规范型和表面型，通过 295 份自我报告数据探究两种表现趋近目标的分化效果；研究 2 对 212 名大学生的课堂目标结构进行实验操纵并测量个人成就目标与自我呈现成本，以验证控制个人成就目标后自我呈现成本在课堂目标结构与学业求助之间的中介作用。构建结构方程模型对数据进行分析。结果表明：（1）自我呈现成本部分中介个人成就目标和学业求助意向关系，即掌握趋近目标通过负向预测自我呈现成本而正向预测学业求助意向，表现回避目标则反之。（2）当重点关注规范型和表面型两种不同的表现趋近目标时，前者表现出与掌握趋近目标相似的特点，而后者则与表现回避目标相似。（3）在控制了个人成就目标后，课堂目标结构能够影响个体在求助前的自我呈现成本，进而影响个体的学业求助意向和求助行为。研究结果从动机与环境两个视角探究了学业求助的潜在影响因素，有助于深入了解学业求助困难背后的原因，并据此为后续教学实践与干预方案的设计提供科学依据。

关键词　学业求助，成就目标，课堂目标结构，自我呈现成本

The effects of achievement goals and classroom goal structures on academic help-seeking in college students: Mediating role of self-presentation costs

Tingyi Zhang, Jingwei Ma, Kaipeng Wang, Hongrui Liu*
Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

Abstract：Academic help-seeking plays a crucial role in college students' academic performance and ability development. It is important to explore the internal and external factors influencing academic help-seeking. Previous studies have shown that achievement goals (mastery-approach, performance-approach, and performance-avoidance), and their external contextual counterpart, classroom goal structures, were predictive of academic help-seeking behaviors. In addition, help-seeking behaviors were also influenced by the cost of help-seeking. However, few studies have examined the potential role of self-presentation costs in the effects of achievement goals, and even fewer have refined and differentiated performance-approach goals, based on the mixed results of them. The present study considered both achievement goals and classroom goal structures,

explored their effects on academic help-seeking of college students, and the mediating role of self-presentation costs, as well as refined the subtypes of performance-convergent goals. Three sub-studies were included: Study 1a measured achievement goals, self-presentation costs, and daily academic help-seeking of 280 Chinese college students, to examine the mediating role of self-presentation costs between achievement goals and academic help-seeking; Study 1b collected 295 self-reported data, further distinguished normative and appearance performance approach goals, and explored the divergent effects of them; Study 2 experimentally manipulated the classroom goal structures of 212 Chinese college students, and measured achievement goals and self-presentation costs, to validated the mediating role of self-presentation costs between classroom goal structure and academic help-seeking after controlling achievement goals. Structural equation modeling was used to analyze the data. The results showed that (1) self-presentation cost partially mediated the effect of achievement goals on academic help-seeking. Specifically, mastery-approach goals negatively predicted self-presentation costs and positively predicted academic help-seeking through it, and vice versa for performance avoidance goals. (2) When focusing on two different performance-approach goals, normative goals showed similar characteristics with mastery-approach goals, while the appearance goals were similar to performance-avoidance goals. (3) After controlling achievement goals, classroom goal structures could influence individuals' self-presentation costs before help-seeking, which further affected the academic help-seeking. The results revealed the potential influences on academic help-seeking from the perspectives of motivation and environment, which helped to understand the reasons behind help-seeking difficulties, and provided empirical support for teaching practice and intervention programs.

Keywords：Academic help-seeking, Achievement goals, Classroom goal structures, Self-presentation costs

父母教育焦虑现状及其对父母教育行为的影响:一项城乡对比研究

黄传斌 李彤 刘尹婕 任菲菲 魏星（通讯作者）

青岛大学师范学院心理学系，青岛，266071，通讯作者 E-mail（weixing@qdu.edu.cn）

摘 要 在我国优质教育资源分布不均和阶层固化日益凸显的背景下，父母的教育焦虑成为社会的热点问题。为缓和父母教育焦虑，国家实施“双减”政策，但父母的焦虑情绪不减反增，仍有大量的父母在面临子女的教育问题时感到焦虑。目前有关父母教育焦虑的研究多集中于城市与中产阶级，难以反映我国城乡二元结构背景下父母教育焦虑的本质特征，且少有研究考察父母教育焦虑对父母教育行为的影响。基于资源保存理论和家庭压力模型，本研究采用自编父母报告的教育焦虑量表、父母学业压力量表、父母学业参与量表、心理控制和行为控制量表、父母严厉管教方式量表等测量工具，对青岛市 5 所学校的 3252 名父母及 736 对父母与儿童进行问卷调查。研究结果如下：(1)父母教育焦虑与焦虑症状呈显著正相关。教育焦虑与父母学业参与、行为控制存在显著负相关；教育焦虑与父母学业压力、体罚、心理控制、心理攻击呈显著正相关。(2)父母教育焦虑在父母性别与儿童性别、教育阶段和家庭社会经济地位等人口学变量上存在显著差异，特别是在城乡上存在显著差异。(3)城乡在父母教育焦虑与父母学业参与的关系中起调节作用，具体而言，城市父母的教育焦虑与父母的学业参与间存在显著的负向联系，而农村父母的教育焦虑与父母的学业参与关系不显著。本研究的结果丰富了父母教育焦虑的相关研究，同时也提示我们要关注农村父母教育焦虑现状及其背后的教育资源分配不均的问题。上述结果对于精准把握父母教育焦虑现状、推动教育政策有效实施具有重要意义。

The current situation of parental educational anxiety and the effect of parental educational anxiety on parental educational behaviour: a urban-rural comparative study

Chuanbin Huang, Tong Li, Yinjie Liu, Feifei Ren, Xing Wei (Correspondence author)
Department of Psychology, Normal College, Qingdao University, Qingdao, China

Abstract: Under maldistribution of high-quality education resources and the increasing trend of class solidification, educational anxiety become a social hot issue. In order to relieve parent's anxiety, the state introduced the "double reduction" policy but parents' anxiety increased rather than decreased. There are still plenty of parents feeling anxiety when they face with the educational problems of children. Existing researches on parental educational anxiety have been primarily focused on urban and middle-class parents which means the essential characteristics of parental educational anxiety, under China's Dual Urban-Rural Structure, has not been reflected and few studies explored the effects of parental educational anxiety on parental educational behaviour.

Based on conservation of resources theory and family stress model, the present study attempted to explore the present characteristics of parental educational anxiety in urban and rural areas and the relationship between parental educational anxiety and parental educational behavior. A sample of 3252 parents and 736 students and their parents in five primary and secondary schools in Qingdao completed the Education Anxiety Scale reported by parents, Self-rating Anxiety Scale, Parental Academic involvement Scale, Parental Academic Pressure Scale, Psychological Control and Behavioral Control Scale, Parent-Child Conflict Tactics Scale.

The results showed that: (1) parental educational anxiety was positively related to anxiety symptoms, parental academic pressure, physical assault, psychological control and psychological aggression and was negatively related to parental academic involvement and behavioral control. (2) parental educational anxiety showed significant difference regarding parents' gender and children's gender, educational stages and socioeconomic status and specially showed urban-rural differences. (3) Urban-rural moderated the relationships between parental educational anxiety and parental academic involvement behavior. Specifically, parental educational anxiety had negatively significant impact on parental academic involvement in urban while the relation between parental educational anxiety and parental academic involvement became non-significant in rural.

This study riches the related research on parental educational anxiety and this study also suggest that pay attention to the current situation of rural parents' educational anxiety and the problem of education resources' maldistribution behind it. The results have important significance for precisely grasping the current situation of parental educational anxiety and effectively promoting the implementation of the educational policy.

中学生亲子冲突、自我概念和生命意义感的关系及其干预研究

姚本先[1,2]（通讯作者）　李俊仪[2]
1 安徽师范大学心理学系，芜湖，241000，ybx7756@126.com
2 合肥师范学院教育与心理科学学院，合肥，230601

摘 要　生命意义感是个体基于自身经历对个体本身的存在价值和人生意义的理解和感知，是衡量个体心理健康的基本要素之一。中学阶段是生命意义感形成的黄金期，中学生体验到的生命意义感的高低与其适应社会及迈向成熟密切相关。同时该阶段的学生正处于青春期，身心发展不平衡，与父母的冲突增多。本研究包括两部分：研究一使用《生命意义量表》、《亲子冲突量表》和《自我概念量表》对安徽省和山西省共1203名中学生进行调查，探讨亲子冲突、自我概念与生命意义感三者之间的关系。研究二以40名中学生为研究对象，采用团体心理辅导对其生命意义感进行干预，研究结果如下：

（1）中学生生命意义感总体水平处于中等偏上，在是否独生上差异显著，在性别、年级、所处地区上差异不显著。

（2）中学生亲子冲突频率、强度总体处于中等偏下水平，在性别上男生的亲子冲突略高于女生；随着年级的升高，亲子冲突有先升高后下降的趋势。

（3）中学生自我概念处于中等水平，在性别、是否独生上无显著差异；在年级、所在地上差异显著。

（4）中学生亲子冲突、自我概念与生命意义感两两间均存在相关。亲子冲突能负向预测生命意义感，自我概念在亲子冲突和生命意义感间起部分中介作用。

（5）团体心理辅导能够有效提高中学生的自我概念及生命意义感。

The relationship between parent-child conflict, self-concept and sense of life meaning of middle school students and its intervention

Yao Benxian (Corresponding author) [1, 2],Li Junyi [2]

1 Department of Psychology, Anhui Normal University, Wuhu 241000, China

2 School of Education and Psychological Sciences, Hefei Normal University, Hefei 230601, China

Abstract: The sense of meaning of life is an individual's understanding and perception of his own existence value and life meaning based on his own experience, and is one of the basic elements to measure individual mental health. Middle school is the golden period for the formation of the sense of meaning of life. The level of the sense of meaning of life experienced by middle school students is closely related to their adaptation to society and their maturation. At the same time, students at this stage are in adolescence, and the imbalance of physical and mental development and the conflict between parents are increasing. This study consists of two parts: Study 1:1203 middle school students in Anhui and Shanxi provinces were investigated by means of the Meaning of Life Scale, Parent-Child Conflict Scale and Self-concept Scale to explore the relationship between parent-child conflict, self-concept and sense of meaning of life. In the second study, 40 middle school students were selected as research objects, and group psychological counseling was used to intervene their sense of life meaning. The research results are as follows:

(1) The overall level of middle school students' sense of meaning of life is above the medium level, with significant differences in whether they are the only child, but no significant differences in gender, grade and region.

(2) The frequency and intensity of parent-child conflict of middle school students are generally at a lower level, and the parent-child conflict of boys is slightly higher than that of girls in terms of gender; With the increase of grade, parent-child conflict has a trend of increasing first and then decreasing.

(3) The self-concept of middle school students is in the middle level, and there is no significant difference in gender and whether they are only children. There were significant differences in grade and location.

(4) There is a significant positive correlation between parent-child communication, gratitude and interpersonal adaptation of left-behind children in rural areas. Parent-child conflict can negatively predict the sense of life meaning, and self-concept plays a partial mediating role between parent-child conflict and sense of life meaning.

(5) Group psychological counseling can effectively improve the self-concept and sense of life meaning of middle school students.

摘 要　背景：自杀是一个全球性的公共健康问题。据世界卫生组织调查数据，每年约有 70 万人死于自杀；对 15-29 岁年龄阶段人群而言，自杀是第四大死亡原因。运用系统评价和元分析方法探究以家庭为基础的疗法干预青少年自杀预防的效果。方法：通过检索 Web of Science、Pubmed、APA、the Cochrane Library 等多个数据库中所有以家庭为基础干预青少年自杀的随机对照试验。文献纳入标准为：（1）研究类型为随机对照试验（randomized controlled trial, RCT），排除非随机对照试验的研究 （2）语言为英文，排除非英文书写的文献（3）研究对象是有自杀意向或自杀尝试的 25 岁以下青少年（4）干预措施是以家庭为基础（5）出版时间在 2013 年-2022 年（6）纳入经同行评审的期刊论文，排除综述、研究报告、学位论文等。共纳入符合标准的文献 15 篇，总样本量 N=2541，运用 Comprehensive Meta-Analysis Version 3.3.070（CMA 3.3.070）软件进行效应量合并及调节效应分析。结果：以家庭为基础疗法干预青少年自杀的合并效应量 g=-0.424（95%CI=-0.761~-0.087,P ＜ 0.05），其中对青少年自杀意念干预的效应量 SMD=-0.770（95%CI=-1.311~-0.229,P＜0.05），对青少年自杀尝试干预的效应量 OR=0.871（95%CI=0.681~1.114,P＞0.05）；调节效应分析结果显示，当仅考虑单因素的调节作用时，干预效果受到干预持续时间、干预方式、对照组的控制方式、脱落率 4 个因素的影响；多元回归结果中，干预持续时间、干预方式、脱落率显著调节干预效果。结论：以家庭为基础的疗法对青少年自杀预防的总体干预效果中等，对青少年自杀意念的疗效显著较好，未来可以探索以家庭为基础疗法在国内青少年自杀预防工作中的具体应用。

Family-based Suicide Prevention Interventions for Adolescents: a Systematic Review and Meta-analysis

Wang Shiqi[1], Liu Quzhi[2], Wang Xiaohang[3]

1 Institute of education and psychology, Hohai University, Nanjing, 210098, China

2 Mental Health Education and Research Center, Hohai University, Nanjing, 210098, China

3 Institute of education and psychology, Hohai University, Nanjing, 210098, China

***Abstract*:** Background: Suicide is a global public health problem. According to World Health Organization survey data, approximately 700,000 people die by suicide each year; suicide is the fourth leading cause of death for

people in the 15-29 age group. Systematic review and meta-analytic methods were used to explore the effectiveness of family-based therapy interventions for adolescent suicide prevention. Methods: All randomized controlled trials of family-based interventions for adolescent suicide were searched through multiple databases including Web of Science, Pubmed, APA, and the Cochrane Library. The inclusion criteria of the literature are (1) the type of study should be a randomized controlled experimental design (RCT), excluding studies that are not randomized controlled trials; (2) the language should be English, excluding literature written in non-English; (3) the subjects should be adolescents under 25 years of age with suicidal intent or attempts at suicide (4) the interventions are family-based; (5) the publication dates should be between 2013-2022; (6) peer-reviewed journal articles are included, excluding reviews, research papers, dissertations, etc. A total of 15 papers that met the criteria were included, with a total sample size of N=2541, and effect sizes were combined and moderated effects analyzed using Comprehensive Meta-Analysis Version 3.3.070 (CMA 3.3.070) software. Results: The combined effect sizes of family-based therapy interventions for adolescent suicide were g=-0.424 (95% CI=-0.761~-0.087,P<0.05), of which the effect size of the intervention for adolescent suicidal ideation was SMD=-0.770 (95% CI=-1.311~-0.229,P<0.05), and that for adolescent suicide attempts was OR=0.871 (95% CI=-1.311~-0.229,P<0.05), and that for adolescent suicide attempts was OR=0.871 (95% CI=-1.311~-0.229,P<0.05). OR=0.871 (95%CI=0.681~1.114,P>0.05); the results of moderated effect analysis showed that when only the moderating effect of single factor was considered, the intervention effect was influenced by four factors: intervention duration, intervention mode, control mode of the control group, and the rate of dislodgement; and in the results of multiple regression, intervention duration, intervention mode, and the rate of dislodgement significantly moderated the intervention effect. Conclusion: The overall intervention effect of family-based therapy on adolescent suicide prevention was moderate, and the efficacy on adolescent suicidal ideation was significantly better, and the specific application of family-based therapy in domestic adolescent suicide prevention can be explored in the future.

家长多重教养行为对儿童发展的影响 ：协同而非单一

胡悠悠　杨宇涵　刘红瑞　吴心玥　肖露霞　姚梅林（通讯作者）
北京师范大学心理学部，北京，100875，mlyao@bnu.edu.cn

摘 要　已有研究显示，多重而非单一的家庭特征决定着儿童的发展，家长投入的作用效果依赖于其实施的具体方式。本研究同时关注家长投入、家长失败取向反应、家长社会比较倾向这三个在中国家庭中具有现实研究意义的教养行为，来深入探究它们对儿童发展的共同影响，并选取学业（自我设障、学业自我概念、成就目标、学业投入）、心理（生活满意度、控制感、自我调控）与社会化（社会比较方式、学业亲社会行为、社交焦虑）三个维度内的多个指标来综合反映儿童发展的现状。采用变量中心与个体中心法对744 名儿童数据进行分析，结果发现（1）家长投入与家长失败取向反应和家长社会比较倾向的预测作用基本相反，且家长投入对儿童学业自我设障、表现趋近目标和学业亲社会行为的预测作用依赖于家长失败取向反应或社会比较倾向；（2）存在 5 类家长教养行为剖面，即积极卷入组（高投入、较低失败取向反应和低社会比较倾向，30.2%）、平均组（高投入、中等的失败取向反应和社会比较倾向，23.5%）、相对脱离组（投入中等但相对最低、中等失败取向反应和低社会比较倾向，4.2%）、消极卷入组（均高组，18.8%）以及轻消极卷入组（高投入但失败取向反应与社会比较倾向稍低于消极卷入组，23.3%）；（3）积极卷入组儿童在学业、心理与社会化适应指标上表现最佳，相对脱离组儿童虽在大多数指标上表现欠佳但自我设

障与社交焦虑得分最低，消极卷入组与轻消极卷入组儿童在拥有高学业自我概念的同时，在非适应性指标上得分较高。研究显示，一味地增加家长投入可能并不总能起到预期的理想效果，家长在家庭教育中应注重给予子女积极、正向的反馈并避免将儿童与他人进行社会比较，从而更好地发挥家长投入的作用，促进儿童的全面发展。

Parents' Multiple Parenting Behaviors and Child Development: Synergistic Rather than Single

Youyou Hu, Yuhan Yang, Hongrui Liu, Xinyue Wu, Luxia Xiao, Meilin Yao
Faculty of Psychology, Beijing Normal University, Beijing, 100875

***Abstract*：** It has been shown that multiple, rather than single, family characteristics determine children's development, and that the effects of parental involvement are dependent on the specific ways in which it is implemented. The present study focused on three parenting behaviors of relevance to Chinese families, namely, parental involvement, parental failure-oriented responses, and parental social comparison tendencies, to explore their common effects on children's development. Indicators from three dimensions, including academic (self-handicapping, academic self-concept, achievement goals, and academic engagement), psychological (life satisfaction, sense of control, and self-regulation), and socialization (social comparison style, academic prosocial behaviors, and social anxiety), were selected to reflect the current state of children's development. Analysis of data from 744 children using variable-centered versus person-centered methods revealed that (1) parental involvement was generally opposite to the predictive effects of parental failure-oriented responses and parental social comparison tendencies, and that the predictive effects of parental involvement on children's academic self-handicapping, performance-approach goals, and academic prosocial behaviors depended on either parental failure-oriented responses or parental social comparison tendencies.（2）There were five types of parenting behavior profiles, including Positively Involved Families (high involvement, low failure-oriented responses and low social comparison tendency, 30.2%), Average Families (high involvement, moderate failure-oriented responses and moderate social comparison tendency, 23.5%), Relatively Disengaged Families (parental involvement was moderate but lowest, moderate failure-oriented responses and low social comparison tendency,4.2%), Negatively Involved Families (high on all three indicators, 18.8%), Mlidly Negatively Involved Families (high involvement, failure-oriented response and social comparison tendency were slightly lower than that of the Negatively Involved Families, but higher than that of the other groups, 23.3%).（3）Children in the Positively Involved Families performed best on academic, psychological, and social adjustment indicators; and children in the Relatively Disengaged Families underperformed on most indicators but had the lowest scores on self-handicapping and social anxiety; and children in the Negatively Involved Families and Mlidly Negatively Involved Families scored higher on nonadaptive indicators while possessing high academic self-concepts. Research has shown that increasing parental involvement may not always have the desired effect, and that parents should focus on giving their children positive feedback and avoiding social comparisons in family education in order to better utilize parental involvement for the holistic development of the child.

摘 要　手机依赖已成为当代大学生最主要的健康问题之一，不仅引发各种生理疾病，还会增加各类心理问题发生的频率。大学生作为国家发展的重要资源，手机依赖已成为其成长成才的主要障碍之一，对其开展相应研究刻不容缓。然而目前对于手机依赖大学生心理机制（如抑制控制和情绪加工等）等因素的研究尚需进一步完善。为探寻具有手机依赖行为大学生的内在心理机制及运动干预效果，在探索手机依赖大学生抑制控制和情绪加工特点的基础上构建手机依赖的心理机制模型，并设计相关运动干预方案，降低其手机依赖水平。首先进行预研究，在湖州市某高校选取 200 名大学生对其手机依赖情况进行调查并访谈，在随机条件下，将筛选出的手机依赖大学生 78 人（MAPI＞40）分成有氧运动干预组和对照组，并在干预前后分别施测，考察 18 周有氧运动对手机依赖大学生抑制控制和情绪加工的影响，并与非手机依赖组的大学生 78 人进行对比。结果显示 ：手机依赖大学生在手机振动铃声干扰下的抑制控制能力最差；相比较非依赖组，手机依赖大学生对悲伤情绪面孔觉察更快，在悲伤情绪启动后，手机依赖组将更多的中性刺激判断为消极情绪；经过 18 周的运动干预，大学生的手机依赖水平、抑制控制和情绪加工均有了不同程度的改善（$P<0.05$）。本研究在已有理论和实证基础上提出了手机依赖行为的维持模式，分析了手机依赖大学生抑制控制和情绪加工之间的相互关系。18 周的有氧运动有效提高了手机依赖大学生的抑制控制能力、减少手机依赖大学生对极度负性情绪和手机相关刺激的注意偏向，降低了手机依赖程度，提升其心理健康水平。

The Construction of a Psychological Mechanism Model for Mobile Phone Dependence among College Students and the Study of Exercise Intervention Pathways

Wang Meifang
Huzhou Normal University，Huzhou Zhejiang,300073

***Abstract*：** Mobile phone dependence has become one of the main health problems for contemporary college students, not only causing various physiological diseases, but also increasing the frequency of various psychological problems. As an important resource for national development, college students' dependence on mobile phones has become one of the main obstacles to their growth and success, and corresponding research on them is urgent. However, the research on the psychological mechanism (such as Inhibitory control and emotional processing) of college students who rely on mobile phones still needs to be further explored. In order to explore the internal psychological mechanism of college students with mobile phone dependence and the effect of sports intervention, the psychological mechanism model of mobile phone dependence was constructed on the basis of exploring the characteristics of Inhibitory control and emotional processing of college students with mobile phone dependence, and relevant sports intervention programs were designed to reduce their mobile phone dependence. First of all, a pre study was carried out. 200 college students were selected from a university in Huzhou City to investigate and interview their mobile phone dependence. Under random conditions, 78 college students (MAPI>40) who were screened out to be mobile phone dependent were divided into an aerobic exercise intervention group and a control group. Before and after the intervention, tests were conducted separately to investigate the impact of 18 weeks of aerobic exercise on Inhibitory control and emotional processing of mobile phone dependent college students, And compared with 78 college students in the non mobile phone dependent

group. The results show that the ability of Inhibitory control of mobile phone dependent college students is the worst under the interference of mobile phone ringing vibration; Compared to the non dependent group, college students who rely on mobile phones perceive sad emotions more quickly. After sadness is activated, the mobile phone dependent group judges more neutral stimuli as negative emotions; After 18 weeks of exercise intervention, college students' mobile phone dependence, Inhibitory control and emotional processing have been improved to varying degrees (P<0.05). Based on the existing theories and empirical research, this study proposed a maintenance model of mobile phone dependence behavior, and analyzed the relationship between Inhibitory control and emotional processing of mobile phone dependent college students. The 18 week aerobic exercise effectively improved the Inhibitory control ability of college students with mobile phone dependence, reduced their attention bias to extreme negative emotions and mobile phone related stimuli, and thus improved their mental health.

校外实习指导老师支持与师范生教师职业认同的关系：一个有调节的中介模型

王青春[1]（通讯作者） 李风云[1] 冯李彤[1] 张婉如[1] 蔡筱萱[1]

1 河南师范大学教育学部心理学院，新乡，453007,111101@htu.edu.cn

摘 要 教师专业化是当前我国教师教育改革的重点问题，职业认同对教师专业化发展有着不可替代的作用，而教育实习是培养并构建教师职业认同的最主要途径之一。根据生态系统理论，实习指导教师作为微观环境中的重要他人，影响着师范生教师职业认同的形成与发展。基于此，本研究探讨校外实习指导老师的支持对师范生教师职业认同的影响，并提出一个有调节的中介模型，考察实习获得感的中介作用和实习态度的调节作用。方法：采用校外实习指导老师支持量表、实习获得感量表和师范生教师职业认同量表对 478 名参与教育实习的大三师范生进行问卷调查。结果：（1）普通本科生实习期间获得的教师支持及实习获得感均显著高于专升本大学生；在幼儿园的师范生获得的教师支持和实习获得感均显著低于在中小学实习的师范生；实习院校所在地为城市的师范生获得的教师支持显著高于县城；校外实习导师的教龄会影响师范生的教师支持，表现为 1-5 年、6-10 年教龄＜11 年及以上教龄。（2）校外实习指导老师支持与师范生教师职业认同、实习态度、实习获得感均呈显著正相关，实习获得感与师范生实习态度、教师职业认同均呈显著正相关。（3）校外实习指导老师支持既可以直接正向预测师范生教师职业认同，也可以通过实习获得感来间接正向预测师范生教师职业认同。（4）实习获得感在教师支持和教师职业认同之间的中介作用受到实习态度的调节。结论：（1）实习获得感在校外实习指导老师支持与师范生教师职业认同之间起到部分中介作用。（2）实习获得感在教师支持和教师职业认同之间的中介作用受到实习态度的调节。研究结果有利于教师教育工作者和实习导师更好的指导职前教师以及实习导师队伍的建设。

The relationship between the support of off-campus internship instructors and teachers' professional identity of normal students: A

Moderated Mediation Model

Qingchun Wang[1] (corresponding author), Fengyun Li[1], Litong Feng[1], Wanru Zhang[1], Xiaoxuan Cai[1]

1 School of Psychology, Faculty of Education, Henan Normal University, Xinxiang 453007, 111101@htu.edu.cn

***Abstract*：** Teacher professionalization is a key issue in the current reform of teacher education in China. Professional identity plays an irreplaceable role in the development of teacher professionalization, and educational internship is one of the most important ways to cultivate and construct teachers' professional identity. According to the Ecological systems theory, as the Significant others in the micro environment, internship instructors affect the formation and development of normal students' professional identity. Based on these, this study explores the impact of off-campus internship instructors' support on teachers' professional identity among normal students, and proposes a moderated mediation model to examine the mediating effect of internship acquisition and the moderating effect of internship attitude. Method: A questionnaire survey was conducted on 478 junior normal students participating in educational internships using the Off-campus Internship Instructors Support Scale, Internship Acquisition Scale, and Teachers' Professional Identity Scale for Normal Students. Result: (1) During the internship period, undergraduate students received significantly higher levels of teachers' support and internship acquisition compared to university students upgraded from college; Normal students in kindergartens received significantly lower levels of teacher support and internship acquisition than those who interned in primary and secondary schools; Normal students with internship institutions located in cities receive significantly higher teacher support than those in county towns; The length of service as a teacher of off-campus internship instructors can affect the teachers' support of normal students, manifested as 1-5 years of the length of service as a teacher, 6-10 years<11 years or more. (2) The support of off-campus internship instructors is significantly positively correlated with the teachers' professional identity, internship attitude, and internship acquisition of normal students. Internship acquisition is significantly positively correlated with the teachers' professional identity and internship attitude of normal students. (3) The support of off-campus internship instructors can directly and positively predict the teachers' professional identity of normal students, or indirectly and positively predict the teachers' professional identity of normal students through internship acquisition. (4) The mediating effect of internship acquisition between teacher support and teachers' professional identity is moderated by internship attitude. Conclusion: (1) Internship acquisition plays a partial mediating role between the support of off-campus internship instructors and the teachers' professional identity of normal students. (2) The mediating effect of internship acquisition between teachers' support and teachers' professional identity is moderated by internship attitude. The research results are beneficial for teacher educators and internship instructors to better guide the construction of pre-service teachers and internship instructors.

提示对学习者自我生成教学过程和学习效果的作用

黄宇　张洋　祝婉玲　冷晓雪　王福兴（通讯作者）

华中师范大学心理学院，武汉，430079，fxwang@ccnu.edu.cn

摘 要　自我生成教学是教育心理学中一种重要的生成性学习策略，能够促进学习者主动进行知识建构。它是指学习者在理解所学内容之后，以教师的角色把自己所学的知识讲给其他人听。然而，在自我生成教学过程，学习者并不能完整地检索到学习材料中所包含的所有概念单元，这会阻碍学习者的主动生成和最终的学习成绩。根据检索练习理论和生成学习理论，提示可以作为一种线索，激活学习者的检索和生成活动。因此，本研究旨在探讨不同类型的提示对自我生成教学过程和学习效果的影响。研究采用三个实验探讨了自我生成教学中不同类型的提示对学习效果和学习感知的影响。实验 1 设置了自我生成教学组和重复学习组(控制组)，发现自我生成教学组的学习效果好于重复学习组。实验 2 设置了图片提示组、文字提示组、关键词提示组和无提示组。结果发现图片和关键词提示均能促进学习者的知识保持，并且关键词提示还能促进知识迁移。实验 3 设置了关键词提示组、生成提示组和无提示组。结果发现，关键词提示组和生成提示组的保持测验成绩好于无提示组，生成提示组的迁移测验成绩好于无提示组。此外，实验 2 和实验 3 均发现关键词提示和生成提示可以促进学习者产生更多的概念单元，概念单元的数量在提示影响学习效果中起中介作用。结论认为：(1)在自我生成教学时提供图片提示能促进知识的保持，提供关键词提示能促进知识的保持和迁移；(2)相比于被动获得提示，学习者主动生成提示更有利于知识的迁移。(3)学习者产生的概念单元数量在提示影响学习效果中起中介作用。

Prompts Affect Learning-by-Teaching Process and Learning Outcome in Multimedia Learning

HUANG Yu　ZHANG Yang　ZHU Wanling　LENG Xiaoxue　WANG Fuxing

(School of Psychology，Central China Normal University，Wuhan 430079)

Abstract：Learning by teaching is an important generative learning strategy which mainly promotes learners' knowledge building in educational psychology. It refers to learners teach others what they have learned as the role of a teacher after learning the materials. However, learners cannot fully retrieve all concept units contained in learning materials in the retrieval activities of learning by teaching, which hinders learners' active generation and final learning performance. According to the Retrieval Practice Theory (RPT) and Generative learning Theory (GLT), prompts can serve as a cue and activates learners' retrieval and generating activity. Therefore, the aim of current study was to explore the effects of different types of prompts on learning outcomes and subjective perceptions in learning by teaching.

In Experiment 1, fifty-six college students were randomly assigned to teaching group and control group. Participants in teaching group were told to explain the learning materials by making a lecture video, then complete a final exam. The control condition didn't include teaching process. In Experiment 2, Participants were one hundred and fourteen college students that were randomly assigned to picture-prompt group、text-prompt group、keyword-prompt group and non-prompt group. Four conditions all include teaching process. The difference between conditions is whether there is a prompt when learners are teaching. In Experiment 3, to compare the effects of learners' passive reception and active generation of prompts, eighty-seven college students were randomly assigned to keyword-prompt group, generated-prompt group and non-prompt group.

The results showed that: (1) the retention and transfer test performance of the teaching group were better than that of the control group; (2) picture and keyword prompts could effectively improve learners' retention test scores, while keyword prompts could also improve learners' transfer test scores; (3) the retention test performance of the

keyword-prompt group and the generated-prompt group were better than those of the non-prompt group, while the transfer test performance of the generated-prompt group were better than those of the non-prompt group; (4) Experiment 2 and Experiment 3 both found that the number of concept units plays a mediating role in the effect of prompts on learning performance.

The conclusions are as follows: (1) Providing picture prompts in the process of learning by teaching can promote knowledge retention, while providing keyword prompts can promote knowledge retention and transfer; (2) Compared to passively obtaining prompts, learners' active generation of prompts is more conducive to knowledge transfer. (3) The number of idea units generated by learners plays a mediating role in the effect of prompts on learning. Above all, the study verified the effectiveness of RPT and GLT in the process of learning by teaching in multimedia learning environment.

线上学习的媒体多任务与学业成绩：自我调节策略和心流体验的链式中介作用

樊利芳[1]　李士一[1,2]（通讯作者）

[1]天津师范大学心理学部，天津，300387

[2]天津师范大学心理与行为研究院，教育部人文社会科学重点研究基地，天津，300387，lishiyi@tinu.edu.cn

摘 要　随着“互联网+教学”的持续推进，线上教学以其便利性和灵活性展示出了独特的优势。与此同时，线上教学模式也面临着一些挑战，如缺乏有效监管会导致学生常在上网课过程中查看或回复手机消息，媒体多任务行为相较于线下教学时明显增加。媒体多任务是指个体同时进行两种或两种以上媒体活动或者在多种媒体活动之间快速切换。本研究基于自我控制的双系统理论，试图探究媒体多任务影响学习绩效的作用机制。另外，有研究认为任务相关性会影响多任务感知和任务绩效，因此可以将在线课堂中媒体多任务行为划分为学习有关媒体多任务和学习无关媒体多任务，分别探讨这两种类型的媒体多任务与学习绩效的关系。采用问卷法对 557 名连续 8 周以上进行在线学习的大学生进行调查。结果发现：1）学习有关媒体多任务与自我调节策略、心流体验、学习绩效呈显著正相关关系，学习无关媒体多任务与自我调节策略、心流体验、学习绩效的相关均不显著；2）自我调节策略和心流体验在学习有关媒体多任务与学习绩效的关系中起链式中介作用，但在学习无关媒体多任务与学习绩效的关系中链式中介作用不成立。以上研究结果表明经常进行与学习有关的媒体多任务的个体更能采取有效的措施调节自己的多任务行为，使注意力更加集中，从而带来更沉浸的学习体验，导致更佳的学习绩效。本研究分别探究了学习有关和无关媒体多任务与学习绩效的关系，发现两个维度与学习绩效的关系并不一致，为系统地理解媒体多任务行为的不同维度，抑制媒体多任务的负面后果提供了启发。

media multitasking of online teaching and academic performance: the series mediating role of self-regulation strategies and flow experiences

Fan Lifang[2], Li Shiyi[1,2]

[1]Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, China
[2] Faculty of Psychology, Tianjin Normal University, Tianjin, China

Abstract： As the online teaching model of "Internet Plus Teaching" continues to advance, online teaching has demonstrated its unique advantages in terms of convenience and flexibility. At the same time, there are also some challenges, such as the lack of effective supervision students often check or reply to social messages during online classes, and this media multitasking behavior in online classrooms has increased significantly compared with that in offline teaching. Media multitasking is typically known as simultaneously engaging in multiple media tasks or switching quickly between multiple media activities. Based on the dual systems theory of self-control, this study investigates the mechanism of action by which media multitasking affects academic performance. In addition, it has been suggested that task relevance affects multitasking perception and task performance, so media multitasking behaviors in the online classroom can be divided into on-task media multitasking and off-task media multitasking, and the relationship between the two different kinds of media multitasking and academic performance can be investigated separately. A questionnaire method was used to survey 557 college students who were engaged in online learning for more than 8 consecutive weeks. The results found that 1) learning-related media multitasking was significantly and positively correlated with self-regulation strategy, flow experience, and academic performance, and the correlations of off-task media multitasking with self-regulation strategy, flow experience, and academic performance were all non-significant; and 2) self-regulation strategy and flow experience acted as serial mediators in the relationship between on-task media multitasking and academic performance, but in the relationship between off-task media multitasking and academic performance the serial mediating role does not hold. The findings suggest that individuals who frequently engage in on-task media multitasking are better able to take effective measures to regulate their multitasking behaviors, resulting in more focused attention, a more immersive learning experience, and therefore better academic performance. The present study classified media multitasking into two dimensions, on-task/off-task media multitasking, and explored their relationships with learning performance separately. It was found that the relationships between the two dimensions and academic performance were inconsistent, providing inspiration for a systematic understanding of the different dimensions of media multitasking behaviors and inhibiting the negative consequences of media multitasking.

青少年依恋系统类别及其对焦虑的影响

谢晓莹 李嘉琪 彭小凡（通讯作者）
贵州师范大学心理学院，贵州贵阳，550025，pengxf@gznu.edu.cn

摘 要 依恋是个体在成长过程中和重要他人(e.g., 父母)建立的一种特殊的亲密关系，它具有深层性、稳固性和持续性，是个体最为重要的人际支持。青少年并非生活在单一对象的依恋关系当中，而是父亲、母亲和同伴三者构成的依恋系统当中。现有研究都是分别探索父母或同伴，很少将两（三）者视为一个系统进行整体分析，因此也缺少清晰的类别划分。焦虑指的是个体在应对刺激事件时所产生的一系列主观且不愉

快的情绪体验，如紧张、忧虑、恐惧等负性情绪。青少年处在身心发展的过渡期，学业和人际压力显著增加，焦虑问题普遍且明显。为了解青少年三种依恋关系构成的系统类别及其与焦虑的关系，使用亲密关系体验-关系结构量表(ECR-RS)和广泛性焦虑量表(GAD-7)，对 2879 名中学生进行施测和潜在剖面分析。结果：(1)总体上，依恋可分为安全型(34.9%)、过渡型(19.2%)、亚健康型(15.8%)、焦虑型(6.4%)、回避型(23.9%)；男生中，依恋可分为安全型(44.8%)、亚健康型(22.3%)、焦虑型(6.4%)、回避型(23.9%)；女生中，依恋可分为安全型(37.7%)、父母矛盾型(5.5%)、亚健康型(17.8%)、焦虑型(11.5%)、回避型(27.6%)；(2) 各类别在焦虑上存在显著差异（χ^2 =309.59，P<0.001）；安全型焦虑水平最低，并显著低于其他非安全型；回避型焦虑水平最高；男生回避型的焦虑显著高于亚健康型和焦虑型；女生该型的焦虑只显著高于安全型。结论：(1) 青少年依恋类别存在 5 类，男生有 4 类，女生有 5 类；(2) 依恋各潜在类别与焦虑存在显著相关，在焦虑得分上存在显著差异。本研究发现了青少年三种新的依恋系统类别，即父母矛盾型、过渡型和亚健康型，丰富了当前的依恋研究，同时，当青少年面临人际冲突和亲子冲突时，教育工作者可以从依恋角度思考并干预。

The Adolescents' Attachment System Styles and its Effect on Anxiety

Xie Xiao Ying　Li Jia Qi　Peng Xiao Fan

Gui Zhou Normal University, Gui Zhou Gui Yang

Abstract：Attachment is a special kind of intimate relationship that individuals establish with significant others (e.g., parents) as they grow up, and it is deep, strong and continuous, and is the most important interpersonal support for individuals. Adolescents do not live in a single-object attachment relationship, but in an attachment system consisting of father, mother, and peers. Existing studies have explored parents or peers separately, rarely analyzing the two (three) as a system as a whole, and therefore lacking clear category delineation.Anxiety refers to a range of subjective and unpleasant emotional experiences such as nervousness, apprehension, fear, and other negative emotions that individuals experience in response to stimulus events. Adolescents are in a transitional period of physical and mental development, with significant increases in academic and interpersonal stress, and anxiety problems are common and pronounced.To understand the system styles of the three attachment relationship components in adolescents and their relationship with anxiety. To understand the systematic categories of the three attachment components in adolescents and their relationship with anxiety, the Intimacy Experience-Relationship Structure Scale (ECR-RS) and the Generalized Anxiety Scale (GAD-7) were administered and potentially profiled to 2879 secondary school students. Results: (1) Overall, attachment system can be categorized into secure (34.9%), transition (19.2%), subhealthy (15.8%), anxious (6.4%), and avoidant (23.9%) styles. For male adolesents, it can be categorized into secure (44.8%), subhealthy (22.3%), anxious (5.6%), and avoidant (27.3) styles. For female adolesents, attachment can be categorized into secure (37.7%), parental inconsistency (5.5%), subhealthy (17.8%), anxious (11.5%), and avoidant (27.6%) styles. (2) Style differences were found on messures of general anxiety（χ^2 =309.59，P<0.001）, validating the LPA classification. Secure style adolescents reported the lowest level of general anxiety, avoidant style reported the highest, male adolesents' avoidant style's anxiety was higher than the subhealthy and anxious styles, and female adolesents' avoidant style's anxiety was only higher than the secure style. Conclusion: Adolescent attachment can be categorized into five styles, while males exhibit four styles and females exhibit five styles. Moreover, there is a significant correlation between each latent attachment style and anxiety, with significant differences observed in anxiety scores between styles.This study identified three new categories of attachment systems for adolescents, namely parental

ambivalence, transition, and subhealth, which enriches current attachment research and also allows educators to think about and intervene from an attachment perspective when adolescents face interpersonal and parent-child conflicts.

中国中学生和大学生人生观发展状况调查

王宏[1]　盖笑松[1]（通讯作者）　李松靓[1]

1 东北师范大学心理学院，长春，130024

1 东北师范大学心理学院，长春，130024，通讯作者 gaixs669@nenu.edu.cn

摘 要　中学生和大学生是人生观形成的关键时期，它决定着其努力的方向。拥有正确的人生观有助于中学生和大学生的积极发展和心理健康，同时可以降低中学生和大学生心理问题的出现。为了了解当今中学生和大学生的人生观发展状况。本研究采用生命意义感发展状态量表、人生目的取向量表、人生态度量表对全国 31 个省份的约 10 万中学生和大学生的人生观进行调查，最终有效被试为 94219 人，其中初中 36844 人（39.1%），高中 29828 人（31.7%），大学 27547 人（29.2%）；男生 27547 人（43.4%），女生 53336 人（56.6%）；年龄在 13~23 岁。运用描述统计、方差分析以及自我中心的方法对数据进行分析。结果发现：（1）在生命意义感方面，大部分的中学生和大学生处在寻求和建立的阶段，少部分处于过度寻求和扩散的阶段，极少的部分处在前思和早闭阶段。各阶段的比例并没有表现随年龄增长而变化的趋势。（2）在人生目的取向方面，中学生和大学生更重视的是家庭福祉和个人成长，其次是对个人福祉的追求较低，对社会促进的追求程度相对最低，这符合中国传统文化中以家为集体的观念，但是同时也提醒我们要重视对社会促进追求的培养。（3）在人生态度方面，中学生和大学生的人生态度整体上较为积极。具体表现在大部分认为应该自主掌控未来而不依赖环境和命运，要为自己的未来负责；能够以接纳之心面对人生中可能出现的各种挫折和困难，而不是过于固执；更关注人生过程的体验，而不是只在乎结果；能以积极乐观的态度面对生活。（4）16 岁是中学生和大学生人生观发展的重要转折点，需要教育工作者和家长的重视。

Development of Chinese secondary school and college students' outlook on life

Hong Wang[1], Xiaosong Gai[1],　Songliang Li[1]

1 School of Psychology, Northeast Normal College, Changchun, Jilin Province, China

Correspondence: Xiaosong Gai, School of Psychology, Northeast Normal College, No. 5268, Renmin Street, Changchun, Jilin Province, China. E-mail: gaixs669@nenu.edu.cn

Abstract：Secondary school and college students are at a critical time in the formation of their outlook on life, which determines the direction of their efforts. The right outlook on life contributes to the positive development and psychological well-being of secondary school and college students, and at the same time reduces the occurrence of psychological problems in secondary school and college students. In order to understand the development of the outlook on life of today's secondary school and college students. In this study, the State of Development of Sense of Meaning in Life Scale, Purpose Orientation Scale, and Attitudes toward Life Scale were

used to assess the outlook on life of approximately 100,000 secondary school and college students in 31 provinces across China. The final number of valid subjects was 94,219, including 36,844 (39.1%) in junior high school, 29,828 (31.7%) in senior high school and 27,547 (29.2%) in college; there were 27,547 (43.4%) males and 53,336 (56.6%) females; their ages ranged from 13 to 23 years. The data were analyzed using descriptive statistics, analysis of variance and person center methods. The results showed that: (1) In terms of meaning in life, the majority of secondary school and college students were in the "search" or "presence" stage, a small number were in the "ruminative exploration" or "diffusion" stage, and a very fewer number were in the "precontemplation" or "foreclosure" stages. The proportions of each stage show no tendency to change with age. (2) In terms of purpose orientation, secondary school and college students attach more importance to family well-being and personal growth, followed by a lower level of personal well-being pursuit, and a relatively lower level of social promotion pursuit, which is in line with the traditional Chinese cultural concept of the family as a collective, but at the same time reminds us to pay attention to cultivating the pursuit of social promotion. (3) In terms of attitudes toward life, secondary school and college students generally have more positive attitudes. This is reflected in the fact that most of them believe that they should be in charge of their own future rather than relying on their environment and fate and that they are responsible for their own future; that they are able to face the various setbacks and difficulties that may arise in life with acceptance rather than being overly stubborn; that they are more concerned with experiencing the process of life rather than just the outcome; and that they are able to face life with a positive and optimistic attitude. (4) The age of 16 is an important turning point in the development of secondary school and college students' attitudes to life and requires the attention of educators and parents.

高中生心理健康素养的发展现状及其影响因素

董存梅[1]　苗欣荣[2]

1 河北师范大学教育学院，石家庄，050024

2 天津市西青区天易园小学，天津，300385

摘 要　研究一为了考察高中生心理健康素养的发展现状，首先采用李丹琳（2021）编制的《青少年心理健康素养评定量表》对河北省石家庄市 329 名高中生进行了问卷调查，因素分析的结果表明，高中生的心理健康素养包括知识、识别、态度和行为习惯、能力四个因子，然后采用由四个因子组成的问卷对 600 名高中生进行了测量。结果表明：（1）高中生心理健康素养水平存在性别差异，女生在识别、态度和行为习惯上的得分显著高于男生，而男生在能力上的得分显著高于女生；（2）高中生心理健康素养水平存在年级差异，高二年级学生的心理健康素养总体水平显著高于高一年级学生。

研究二依据生态系统理论，通过《系统家庭动力学自评问卷》、《特拉华校园氛围量表》探讨了家庭动力、学校氛围对高中生心理健康素养的影响，并通过《处理心理问题的自我效能量表》测量、分析了高中生处理心理问题的自我效能在其中的作用机制。结果表明：（1）高中生的家庭动力、学校氛围、处理心理问题的自我效能与其心理健康素养均存在显著正相关，家庭动力、学校氛围、处理心理问题的自我效能均能显著正向预测其心理健康素养水平。（2）高中生处理心理问题的自我效能在家庭动力和心理健康素养之间起到部分中介作用。具体表现为，家庭气氛、个性化既可以直接影响高中生的心理健康素养，也可以通过处理心理问题的自我效能来间接影响其心理健康素养。（3）高中生处理心理问题的自我效能在学校氛围和心理健康素养之间亦起到部分中介作用。具体表现为，师生关系、同学关系既可以直接影响高中生的心理健康素养，也可以通过处理心理问题的自我效能来间接影响其心理健康素养。

The Development Status and Influencing Factors of High School Students' mental health literacy

Dong Cunmei Miao Xinrong
College of Education, Hebei Normal University, Shijiazhuang 050024
Tianyiyuan Primary School, Xiqing District, Tianjin 300385

Abstract: The purpose of study 1 was to investigate the development status of high school students' mental health literacy, 329 high school students in Shijiazhuang of Hebei were investigated by using the Questionnaire of Adolescent' mental health literacy by Li Danlin (2021). The results of factor analysis showed that the mental health literacy of high school students included four factors: knowledge, recognition, attitude and behavior habits, and ability, Then a questionnaire consisting of four factors was used to measure 600 high school students. The results were as follows: (1) There are gender differences in the level of mental health literacy of high school students. Girls' scores in recognition, attitude and behavior habits are significantly higher than boys', while boys' scores in ability are significantly higher than girls'; (2) There are grade differences in the level of mental health literacy of senior high school students, and the overall level of mental health literacy of senior high school students is significantly high.

Based on the Ecological systems theory, The purpose of study 2 was to investigate the impact of family dynamics and school climate on high school students' mental health literacy, by using the Questionnaire of System Family Dynamics and the Delaware school climate, and investigate the mechanism of high school students' self-efficacy in dealing with psychological problems by using Questionnaire of self-efficacy in dealing with psychological problems. The results were as follows: (1) High school students' family dynamics, school climate, self-efficacy in dealing with psychological problems and their mental health literacy were significantly positively correlated, and family dynamics, school climate, self-efficacy in dealing with psychological problems could significantly and positively predict their mental health literacy level. (2) The self-efficacy of high school students in dealing with psychological problems plays a partial mediating role between family dynamics and mental health literacy. Specifically, family atmosphere and individuation can not only directly affect high school students' mental health literacy, but also indirectly affect their mental health literacy through self-efficacy in dealing with psychological problems. (3) The self-efficacy of high school students in dealing with psychological problems also plays a partial mediating role between school climate and mental health literacy. Specifically, teacher-student relationship and classmate relationship can not only directly affect the mental health literacy of high school students, but also indirectly affect their mental health literacy through self-efficacy in dealing with psychological problems.

Keywords: High school students, mental health literacy, family dynamics, school climate, self-efficacy in dealing with psychological problems

幼儿在社会类别归纳推理中的选择偏好：基于类别信息还是相似性信息

江燕娟 刘婷（通讯作者）刘万伦

浙江师范大学心理学院，金华，321004，13551853471@163.com

摘 要 幼儿归纳推理研究常聚焦于幼儿归纳推理是依赖于类别信息还是相似性信息。有研究认为，幼儿归纳推理可能存在一个发展过程，即由基于相似性信息进行归纳推理逐渐过渡到基于类别信息。但这一结论在社会类别领域还缺乏探究，幼儿在这一领域的归纳推理，是更依赖于类别信息还是相似性信息以及这种偏好如何随年龄发生变化还尚不清楚。此外，由于社会类别的复杂性，除了由自然线索划分的社会类别外，还存在由社会线索划分的社会类别，研究需要对不同线索下的社会类别均进行考察。因此，本研究设计了两个实验，探究在社会类别领域中，幼儿归纳推理的发展特征及选择偏好，幼儿由相似性推理向类别推理发展的过渡年龄和影响幼儿归纳推理的认知因素。实验一分为实验 1A 和 1B，以 4-6 岁幼儿为被试，使用改良三角范式，采用 3(年龄:4 岁、5 岁、6 岁)*2(信息:类别标签、视觉相似性)的被试间设计，分别探究幼儿关于性别类别(自然线索)和贫富类别(社会线索)归纳推理的发展特征、选择偏好及两者之间的异同。实验二分为实验 2A 与 2B。其中，实验 2A 以 5 岁幼儿为被试，采用单因素(社会类别类型:性别类别，贫富类别)被试间设计，设计信息冲突情景，即目标刺激与推理刺激 A 视觉相似，而与推理刺激 B 属同一类别标签，要求幼儿做出推理判断,以探究幼儿由相似性推理向类别推理发展的过渡年龄。实验 2B 采用“白天黑夜 stroop 测试”对实验 2A 的被试进行测查，探究影响幼儿归纳推理的认知因素。总体实验结果表明：（1）4-6 岁幼儿既依赖于相似性信息也依赖于类别信息进行归纳推理。仅 4 岁幼儿受到知识经验的影响，对性别类别和贫富类别的推理偏好不同，在性别类别上更依赖于类别标签，在贫富类别上更依赖于视觉相似性；5 岁幼儿在两种类别上都更依赖于类别标签；6 岁幼儿已经能够灵活地利用两种信息进行归纳推理。（2）5 岁可能是幼儿由相似性推理向类别推理发展的过渡年龄，其归纳推理的发展与认知抑制有关。认知抑制功能发展越好，越倾向于类别推理。

CHILDREN’S CHOICE PREFERENCE IN SOCIAL CATEGORY INDUCTIVE REASONING: CATEGORY-BASED INFORMATION OR VISUAL SIMILARITY INFORMATION

Jiang Yanjuan,Liu Ting,Liu Wanlun
Department of Psychology, Zhejiang Normal University, Jinhua

***Abstract*：** Research on young children's inductive reasoning frequently focuses on whether young children's inductive reasoning relies on category or similarity information. The previous studies concluded that there may be a developmental process in which young children's inductive reasoning gradually transitions from inductive reasoning based on similarity information to inductive reasoning based on category information. However, the findings were only for the natural or artifact categories, and there is a lack of exploration of the social categories, that is, in the field of social categories, it is not clear whether children's inductive reasoning depends more on category information or similarity information and how this preference changes with age. In addition, due to the complexity of social categories, in addition to social categories divided by natural cues, there are also social categories divided by social cues. Therefore, the research in the field of social categories needs to investigate the social categories under different cues, so as to answer whether there are differences in the developmental characteristics of children's social category inductive reasoning under different cues. Thus, this study designed two experiments to explore the development characteristics and preferences of young children's inductive reasoning in

the field of social categories, the transition age of young children's development from similarity reasoning to category reasoning, and the cognitive factors that affect children's inductive reasoning. In Experiment 1 (divided into Experiment 1A and Experiment 1B) , children aged 4-6 years were used as participants, using a modified triangular paradigm, using a 3 (age: 4, 5, 6) X 2 (information: category label, visual similarity) between-subjects design to explored the development characteristics and preferences of young children's inductive reasoning about gender categories (natural cues) and rich-poor categories (social cues), and the similarities and differences between them. Experiment 2 was conducted, which was divided into Experiment 2A and Experiment 2B. Experiment 2A used 5-year-old children as participants and adopted a single-factor (social category type: gender category, rich-poor category) between-subjects design. Experiment 2A designed an information conflict scenario, that is, the target stimulus was visually similar to reasoning stimulus A, but belonged to the same category label as reasoning stimulus B, requiring children to make reasoning judgments. Experiment 2A explored the transition age of children's development from similarity reasoning to category reasoning. In Experiment 2B, the "day-night stroop test" was used to measure the participants in Experiment 2A to explore the cognitive factors that affect children's inductive reasoning. The following conclusions were drawn from this study: (1) Children aged 4-6 years old rely on both similarity information and category information for inductive reasoning. Under the influence of knowledge and experience, 4-year-old children have different reasoning preferences for gender categories and rich-poor categories, relying more on category labels for gender categories and visual similarity for rich-poor categories. Fiveyear-old relied more on category labels for both categories. By the age of six, children have reached the point where they have the flexibility to use both types of information for inductive reasoning. (2) 5 years old may be the transition age of children's development from similarity reasoning to category reasoning. The development of inductive reasoning is related to cognitive inhibition.

类别标签、知觉特征和功能特征对 4-6 岁幼儿归纳推理的影响

巩玉萍 万欣 刘万伦（通讯作者）

浙江师范大学心理学院，金华，321004，wlliu2008@zjnu.cn

摘要　归纳推理是从特定的事件、事实向一般的事件、事实推论的过程，它是幼儿产生新知识的有效工具。过去关于幼儿归纳推理的研究一直存在争议：幼儿基于类别的归纳推理是一种原始偏好还是逐渐发展的，以及在幼儿的归纳推理中是类别标签还是知觉特征占据主导地位。此外，幼儿在真实物品的环境中长大，真实物品的功能特征可能是幼儿对其形成表征的关键线索，但目前仍不清楚功能特征是如何影响幼儿归纳推理的。因此本研究旨在探讨幼儿归纳推理的发展特征及其背后的机制。

为了探究上述问题，本研究设计了两个实验。实验一采用 3（年龄：4 岁、5 岁、6 岁）x4（标签和特征类型：无标签、类别标签、知觉特征、功能特征）的被试间设计，考察了 4-6 岁幼儿归纳推理的发展特征，以及类别标签、知觉特征和功能特征对幼儿归纳推理的影响。实验一结果显示，4 岁幼儿难以基于类别归纳推理，前人研究证明，增加目标样例可以帮助幼儿基于类别分类，所以，实验二采用 2（目标样例数量：1 个、2 个）x3（标签和特征类型：无标签、类别标签、功能特征）的被试间设计，进一步探究目标样例数量对 4 岁幼儿基于类别归纳推理的影响。

本研究得出以下结论：（1）幼儿基于类别的归纳推理是逐渐发展的。4 岁幼儿主要基于相似性归纳推理，5-6 岁幼儿主要基于类别归纳推理。（2）知觉特征有利于 4-6 岁幼儿基于相似性归纳推理；类别标签有利于 4-6 岁幼儿基于类别归纳推理；功能特征有利于 6 岁幼儿基于类别归纳推理，但对 4-5 岁幼儿的影响不大。（3）当类别标签和知觉相似性相冲突时，4-6 岁幼儿都能够基于类别归纳推理；当功能特征和知觉相似性相冲突时，只有 6 岁幼儿能够基于类别归纳推理。（4）相比于知觉特征和功能特征，类别标签更

有利于幼儿基于类别归纳推理。（5）对于 4-5 岁幼儿，类别标签比功能特征更有利于幼儿基于类别归纳推理，而对于 6 岁幼儿，两者差异不大。（6）增加一个目标样例可以帮助 4 岁幼儿基于类别归纳推理。

The Influence of Category Labels、Perceptual Features and Functional Features on Inductive Reasoning in Children Aged 4-6 Years

Gong Yuping ,Wan Xin, Liu Wanlun
Department of Psychology, Zhejiang Normal University, Jinhua

Abstract：Inductive reasoning is a process that extend knowledge from known to novel instances, it is a effective tool for children to produce new knowledge. In the past, there has been a controversy about children's inductive reasoning: whether children's category-based inductive reasoning is a primitive preference or a gradual development, and whether category labels or perceptual features dominate children's inductive reasoning. Moreover, children grow up in the environment of real objects. Functional features of real objects may be the key clues for children to form the representation of real objects. However, how functional features affect children's inductive reasoning is still unclear. Therefore, this study aims to explore the developmental characteristics of inductive reasoning in young children and the mechanisms behind it.

In order to explore the above questions more fully, we designed two experiments. The experiment 1 was designed by using 3 (age: 4, 5, 6) ×4 (label and feature type: no label, category label, perceptual feature, functional feature) to examine the development trend of children's inductive reasoning, and the effects of category labels, perceptual features and functional features on children's inductive reasoning. The results of Experiment 1 show that it is difficult for 4-year-old children to make inductive reasoning based on categories. Previous studies have proved that adding target samples can help children classify based on categories. So, the experiment 2 was designed by using 2 (target sample number: 1, 2) ×3 (label and feature type: no label, category label, functional feature) to examine the effect of the number of target samples on category-based inductive reasoning in 4-year-old children.

This study draws the following conclusions:(1) Children's category-based inductive reasoning is gradually developing. 4-year-olds were mainly based on similarity to inductive reasoning, while 5-6-year-olds were mainly based on category to inductive reasoning.(2) Perceptual features are beneficial to the inductive reasoning based on similarity for children aged 4-6 years; category labels are beneficial to the inductive reasoning based on category for children aged 4-6 years; functional features are beneficial to the inductive reasoning based on category for children aged 6 years, but have little effect on children aged 4-5 years.(3) When category labels and perceptual similarities conflict, 4-6-year-olds can make inductive reasoning based on category; when functional features and perceptual similarities conflict, only 6-year-olds can make inductive reasoning based on category.(4) Compared with perceptual and functional features, category labels are more conducive to children's category-based inductive reasoning.(5) For 4-5-year-olds, category labels are more conducive to children's category-based inductive reasoning than functional features, while for 6-year-olds, there is little difference between them.(6) Adding a target example can help 4-year-old children to use category-based inductive reasoning.

Keywords：Inductive Reasoning, Category Labels, Perceptual Features, Functional Features

概念距离与操作物体移动对幼儿关系类别学习的影响

陈可琛　黄江峡　刘万伦（通讯作者）
浙江师范大学心理学院，金华，321004，wlliu2008@zjnu.cn

摘 要 关系类别是由实体或实体间的关系所定义的类别。以往研究发现，概念距离对幼儿关系类别学习具有一定影响。概念距离是指两组概念之间语义的强度，强度越大概念间距离越近。已有研究虽有涉及概念距离对幼儿关系类别学习的影响，然而所得结论并不一致，并且不同年龄段幼儿的掌握情况也尚不清楚。同时也有研究发现，静态的图片启动对幼儿位置关系类别学习具有一定促进作用，然而是否有更好的方法能够促进幼儿在概念距离下掌握关系类别也是一个值得探究的问题。因此，探讨关系类别学习以及概念距离的作用对于幼儿教育来说具有一定的重要意义。

本研究包含两个实验，共涉及五种关系类别：刀具、居住处、婴儿、食物和容器。实验一采用 2(概念距离：近、远)×3(年龄：4 岁、5 岁、6 岁)的混合实验设计，考察幼儿在概念距离条件下关系类别学习的发展特征。实验二增加操作物体移动，采用 2(概念距离：近、远)×2(操作物体移动：有、无) 的混合实验设计，进一步考察在概念距离条件下，操作物体的移动能否有助于 4 岁幼儿提高在关系类别学习中的表现。

本研究得出以下结论：（1）幼儿近远概念距离条件下关系类别学习存在差异，4-6 岁幼儿在近概念距离条件下关系类别学习效果好于远概念距离。（2）近概念距离条件下，5、6 岁幼儿都能掌握关系类别，4 岁幼儿不能掌握；远概念距离条件下，6 岁幼儿能够掌握关系类别，5 岁幼儿学习效果低于 6 岁幼儿，4 岁幼儿还无法掌握关系类别，5 岁幼儿可能处于转折期。(3)近远概念距离条件下的关系类别学习中，操作物体移动组中 4 岁幼儿学习效果好于无操作物体移动组。

The impact of conceptual distance and manipulated object movement on young children's learning of relational categories

Chen Kechen, Huang Jiangxia, Liu Wanlun (Corresponding author)
College of Psychology, Zhejiang Normal University, Jinhua, 321004

Abstract: Relational categories are categories defined by entities or by relationships between entities. Previous research has found that conceptual distance has an impact on young children's learning of relational categories. Conceptual distance refers to the semantic strength of the relationship between two sets of concepts, with the greater the strength the closer the distance between the concepts. Although some studies have addressed the effect of conceptual distance on children's learning of relational categories, the findings are inconsistent and mastery by age group is unclear. It has also been found that static picture activation facilitates the learning of positional relational categories, but it is worth investigating whether there are better ways to facilitate the acquisition of relational categories at conceptual distance. Therefore, it is important to explore the role of relational category learning and conceptual distance in early childhood education.

This study comprised two experiments involving a total of five relational categories: knife, dwelling place, baby, food and container. Experiment one used a mixed experimental design of 2 (conceptual distance: near, far) x 3 (age: 4, 5, 6 years) to examine the developmental characteristics of young children's relational category learning in the conceptual distance condition. Experiment 2 added manipulated object movement using a mixed experimental design of 2 (conceptual distance: near, far) × 2 (manipulated object movement: yes, no) to further examine whether manipulated object movement could help 4-year-olds improve their performance in relational

category learning under the conceptual distance condition.

The following conclusions were drawn: (1) There were differences in children's learning of relational categories in the near and far conceptual distance conditions, with 4-6 year olds learning relational categories better in the near conceptual distance condition than in the far conceptual distance condition. (2) In the near-conceptual distance condition, both 5- and 6-year-olds were able to master relational categories, while 4-year-olds could not; in the far-conceptual distance condition, 6-year-olds were able to master relational categories, while 5-year-olds learned less than 6-year-olds, 4-year-olds were not yet able to master relational categories, and 5-year-olds may be in a transitional period. (3) In the near and far conceptual distance condition, 4-year-olds in the manipulative object movement group learned better than those in the no manipulative object movement group.

幼儿轴对称关系类别学习的发展特征及线索提示的作用

吴宝敏（通讯作者）陈可琛 刘万伦

浙江师范大学心理学院，金华，321004，wubaomin1998m@163.com

摘 要　关系类别指的是有共同关系的成员所组成的类别。轴对称关系类别是指以轴对称关系这一共同特征作为分类标准，将对称事物归在一起形成的类别，属于感知关系类别的一种。首先，研究幼儿轴对称关系类别学习的发展特征能够揭示幼儿的认知发展过程；其次，轴对称属于几何知识的一种，本研究有助于揭示幼儿的几何能力发展状况；最后，探究线索提示在幼儿轴对称关系类别学习中的作用能够为线索提示效应的相关理论提供实验数据的支持。因此，本研究采用对称样本匹配范式（SMTS），通过两个实验探讨幼儿轴对称关系类别学习的发展特征以及线索提示的作用。实验一以 3 岁、4 岁、5 岁幼儿为被试，采用 3（年龄：3 岁、4 岁、5 岁）×3（轴对称类型：垂直、水平、倾斜）的混合实验设计，探究幼儿的轴对称关系类别学习的发展特征。实验二选取 3 岁、4 岁幼儿为被试，采用 2（年龄：3 岁、4 岁）×2（线索提示：有，无）×3（轴对称类型：垂直、水平、倾斜）的混合实验设计，探究线索提示的作用。实验研究结果表明：（1）幼儿的轴对称关系类别学习是个逐渐发展的过程，3 岁幼儿无法选择轴对称关系匹配，处于随机水平。5 岁幼儿已经能够掌握轴对称关系类别。4 岁处于基于相似性匹配到基于轴对称关系分类发展的关键期。（2）幼儿轴对称知觉的发展顺序是：垂直轴对称、水平轴对称、倾斜轴对称。（3）线索提示能够促进 3 岁、4 岁幼儿轴对称关系类别学习。（4）对于垂直轴对称关系类别学习和水平轴对称关系类别学习，线索提示能够促进 3 岁、4 岁幼儿较好掌握。对于倾斜轴对称关系类别学习，在线索提示条件下，4 岁幼儿能够较好掌握，3 岁幼儿的成绩显著高于随机水平。（5）幼儿的分类策略由基于相似性向基于类别转变。3 岁幼儿主要关注形状相似性，4 岁幼儿处于由基于相似性匹配到基于关系类别匹配发展的过渡期，5 岁幼儿能够克服形状相似性的诱惑，基于关系类别匹配。

Developmental characteristics and the role of cue in children's category learning of axisymmetric relationships

Wu Baomin, Chen Kechen, Liu Wanliu

School of Psychology, Zhejiang Normal University, Jinhua 321001

Abstract： A relational category is a category of members who have a common relationship. The category of axisymmetric relation refers to the category formed by grouping symmetric things together with the common feature of axisymmetric relation as the classification standard, which belongs to the category of perceptual relation. Firstly, the study of the developmental characteristics of the category learning of axisymmetric relationships can reveal the cognitive development process of young children. Secondly, axial symmetry is a kind of geometric knowledge, and this study is helpful to reveal the development of children's geometric ability. Finally, exploring the role of cueing in children's learning of axisymmetric relationship categories can provide experimental data support for the theory of cueing effect. Therefore, this study adopts the Symmetry-Match-to-Sample task (SMTS) to explore the developmental characteristics of children's categorical learning of axisymmetric relationships and the role of cuing through two experiments. In experiment 1, children aged 3, 4 and 5 were selected as subjects, and a mixed experimental design of 3 (age: 3, 4 and 5 years old) ×3 (axisymmetric type: vertical, horizontal and oblique) was adopted to explore the developmental characteristics of children's axisymmetric relationship category learning. In experiment 2, children aged 3 and 4 years old were selected as subjects, and a mixed experimental design of 2 (age: 3 years old, 4 years old) ×2 (cue cue: yes, no) ×3 (axisymmetric type: vertical, horizontal, oblique) was adopted to explore the role of cue cue. The experimental results show that: (1) Children's axisymmetric relationship category learning is a gradual development process, and 3-year-old children are unable to choose axisymmetric relationship matching and are at a random level. Children as young as 5 are already able to master the axisymmetric relationship categories. 4 years old is in the critical period of development based on similarity matching to axisymmetric relationship classification. (2) The developmental order of children's perception of axial symmetry is: vertical axial symmetry, horizontal axial symmetry, and oblique axial symmetry. (3) Cues can promote the learning of axisymmetric relationship categories in 3-and 4-year-old children. (4) For vertical axisymmetric relationship category learning and horizontal axisymmetric relationship category learning, cues can promote 3 - and 4-year-old children to better grasp. For the category learning of oblique axisymmetric relation, under the condition of cue cue, 4-year-old children can master it well, and 3-year-old children's achievement is significantly higher than random level. (5) Children's classification strategy has changed from similarity based to category based. Three-year-old children mainly focus on shape similarity, four-year-old children are in the transition from similarity-based matching to relationship-based matching, and five-year-old children can overcome the temptation of shape similarity and relationship-based matching.

数字化时代背景下难度和价值对认知负载转移的影响：发展模式与机制探索

董肖肖[1] 刘岩[2](通讯作者) 胡亚欣[3]

1 广州大学教育学院，广州，510006

2 辽宁师范大学心理学院，大连，116029,psysabrina@126.com

3 惠济区艺术小学，郑州，450053

摘 要 随着数字化的发展和智能化时代的到来，将信息储存在外部媒介的行为越来越普遍，有研究者将这种行为定义为认知负载转移。已有研究表明，随着年龄增长，儿童能够根据任务难度使用认知负载转移，然而在日常学习过程中往往会存在难度和价值这两种调控方式，因此，只关注任务难度对使用认知负载转移的影响不足以全面地探讨认知负载转移的现象和机制。基于此，本研究从发展的角度通过三个实验探讨学习项目的难度和价值对认知负载转移策略的影响及其机制。实验 1 探讨难度和价值对儿童、青少年和成

年人使用认知负载转移的影响，其中，通过控制词对的相关性和不同的星值分别去操纵学习项目的难度和价值。结果表明，当难度线索和价值线索同时出现时，儿童只能根据难度线索使用认知负载转移，青少年可以同时利用难度线索和价值线索进行认知负载转移，而成年人则会使用价值线索进行认知负载转移。那么成年人在实验 1 中表现出来的策略选择模式是否是最优解呢？实验 2 通过改变呈现词对和星值的顺序增强成年人对难度的感知，考察当成年人利用难度和价值进行认知负载转移时，回忆成绩和最后得分与实验 1 的差异，以探索哪种模式是更优的选择。结果表明，相对于难度和价值两种线索下的认知负载转移，成年人只根据价值线索下的回忆成绩更好、得分更高；实验 3 在实验 1 的基础上进一步考察 10-12 岁儿童在认知负载转移过程中线索利用能力不成熟（如在两个线索同时呈现的时候，只能利用难度信息，忽视价值线索）背后的原因。实验 3 采用混合实验设计，分别在简单和困难条件下考察价值对儿童认知负载转移的影响。研究发现，在简单条件下，价值的高低并没有影响儿童使用认知负载转移；而在困难条件下，儿童在高价值的项目上选择认知负载转移的比例要显著高于低价值项目。

Abstract: With the development of digitization and the arrival of the intelligent era, the behavior of storing information in external media has become increasingly common. Researchers have defined this behavior as cognitive offloading. Previous studies have shown that as children grow older, they can use cognitive offloading based on task difficulty. However, in everyday learning, there are often two regulatory modes, difficulty and value. Therefore, focusing only on the influence of task difficulty on the use of cognitive offloading is not sufficient to comprehensively explore the phenomenon and mechanism of cognitive offloading. Based on this, this study explores the influences and mechanisms of difficulty and value on cognitive offloading strategies from a developmental perspective through three experiments. Experiment 1 investigated the effects of difficulty and value on cognitive offloading in children, adolescents, and adults. The difficulty and value of learning tasks are manipulated by controlling the relevance of word pairs and different star number. The results show that when both difficulty and value cues were presented, children could only use cognitive offloading transfer based on difficulty cues, adolescents could use both difficulty and value cues simultaneously for cognitive offloading, while adults use value cues for cognitive offloading. Is the optimal strategy chosen by adults in Experiment1 ? In Experiment 2, adults' perception of difficulty was enhanced by changing the order of difficulty and value cues, and explored the differences in recall performance and final scores when adults use difficulty and value for cognitive offloading, to determined which mode was the better choice. The results showed that compared to cognitive offloading under both difficulty and value cues, adults have better recall performance and higher scores when using value cues only. Experiment 3 further investigated the reasons behind the immature clue utilization ability of 10-12-year-old children in the process of cognitive offloading (such as being able to use only difficulty information and ignore

value cues when both are presented simultaneously). In Experiment 3, a mixed experimental design was adopted to examine the influence of value on children's cognitive offloading under both easy and difficult conditions. The study found that under easy conditions, the value does not affect children's use of cognitive offloading, while under difficult conditions, children have a significantly higher proportion of choosing cognitive offloading for high-value items compared to low-value items.

摘 要　对情绪面孔的注意偏向指个体会更多地看有情绪色彩的面孔刺激，是早期社会情感发展的重要预测因素，受家庭环境的影响。因此，探究儿童对情绪面孔的注意偏向特征及其与父母教养方式的关系有助于进一步理解儿童情绪的社会化过程，实现高风险儿童的早期识别与干预。目前关于情绪注意偏向的研究结果并不一致，可能的原因是前期研究主要关注反应时或眼动的整体指标，忽视了注意在时间上的动态变化。本研究结合眼动仪与点探测任务，记录儿童在观看配对呈现的情绪面孔和中性面孔时的眼动特征（图1），基于时程分析和聚类的方法试图揭示儿童情绪注意偏向在时间进程上的变化特征，并识别出具有不同模式的亚型。另外，我们通过问卷及行为编码分别测量主观和客观的父母教养方式，并进一步使用机器学习的方法以不同情绪注意偏向的时程特征解码家长的教养方式来揭示两者的关系。本研究发现三个主要结果：首先，使用传统的总注视时间分析发现儿童加工生气和高兴面孔时的注视时间显著高于中性面孔，但悲伤面孔的注视时间与中性面孔没有显著差异（图 2）。时程分析发现对情绪性面孔的注意偏向（包括悲伤面孔）只在刺激呈现的前期(400 毫秒之前)出现，并非持续整个刺激呈现过程。只有对高兴面孔的注意偏向在刺激呈现的后期再次出现（图 3）。这种时程分析帮助聚焦情绪注意偏向出现的具体时间，分离出不同情绪注意偏向的微观特征。其次，数据驱动的聚类方法揭示了动态情绪注意偏向的三类亚型：单峰-维持型和单峰-下降型主要表现为早期注意偏向，但单峰-维持型的偏向幅度更大；双峰型同时表现早期和晚期注意偏向（图 4）。不同情绪注意的亚型可能与个体的情绪调节有关。最后，机器学习结果提示父母的积极教养方式（包括家长主观报告和客观行为编码）与儿童对悲伤面孔注意的时间动态特征有关（图 5）。本研究强调时程分析在揭示儿童情绪面孔注意偏向方面的重要作用，区分出注意偏向的微观特征，对进一步了解儿童情绪面孔注意偏向的影响因素具有重要的指导意义。

Dynamic Patterns of Affect-biased Attention in Children and Its Relationship with Parenting

Waxun Su, Tak Kwan Lam, Zhennan Yi, Nigela Ahemaitijiang, Zhuo Rachel Han, & Qiandong Wang.

Faculty of Psychology, Beijing Normal University, Beijing, China

***Abstract*:** The affect-biased attention, which means prioritizing emotionally or motivationally salient stimuli, is

an important predictive factor of early socioemotional development and isshaped by early family environment.. Exploring the characteristics of children's affect-biased attention and its relationship with the early family environment is helpful to further understand the socialization process of children's emotional perception and identify children at risk of developing emotion related mental issues. The results of previous studies on affect-biased attention are inconsistent. The possible reason is that they focused on the reaction time or overall looking time, ignoring the temporal dynamics of attention. In this study, children completed a dot-probe task and we recorded children's eye-movement during the processing of emotional-neutral face pairs (Figure 1). We used temporal-course analysis and a data-driven-based cluster approach to analyze the data, aiming to identify the temporal characteristics of children's affect-biased attention. Furthermore, we measured parenting practices through questionnaires and third-party coding, and used the machine learning method to decode parenting practices through temporal characteristics of different affect-biased attention, to reveal the relationship between affect-biased attention and parenting practices. We found three main results. First, using the traditional indicator (overall looking time), we found that children looked more at angry and happy faces than neutral faces. However, the difference in looking time between sad and neutral faces was insignificant (Figure 2). Our temporal course analysis found that attention bias to emotional faces emerged early after the stimuli onset (before 400 ms), even for the sad faces. This bias did not hold for the entire stimuli presenting time, and only the attention bias to happy faces appeared again in the late stage (Figure 3). This temporal analysis helped to reveal the micromechanism of affect-biased attention and clarify its subtle differences across different encoding phases. Second, we applied a data-driven-based cluster approach to the temporal course of attention to emotional faces and revealed three subtypes of dynamic affect-biased attention. Single-peak Sustained subtype and Single-peak Declining subtype mainly showed early attention bias; Single-peak Sustained subtype had a higher early attention bias than Single-peak Declining subtype; Double-peak subtype showed both early and late attention biases (Figure 4). Different subtypes may be related to different emotional regulation abilities. Finally, the machine learning method revealed that parents' positive parenting was related to the temporal dynamic characteristics of children's attention to sad faces (Figure 5). Our study highlights the specific utility of temporal-course analyses to characterize the micromechanism of children's dynamic attention bias to emotional faces, which may further our understanding of the influence factors of children's affect-biased attention.

小学生隔代教养方式量表编制及适用性检验

于泽满[1]，范会勇[2]

渤海大学，辽宁锦州，121000,981721949@qq.com

摘 要 目的：编制小学生隔代教养方式量表(IPSS)，并检验其信度、效度与适用性。方法：研究一在父母教养方式的整体框架下，结合开放式访谈所收集的内容进行小学生隔代教养方式量表的初稿编制。对共计2135 名中高年级小学生施测后，使用 SPSS22.0 以及 AMOS24.0 进行项目分析、因素分析、信效度检验。研究二在研究一的基础上对样本二进行适用性检验，主要包括人口学差异检验与回归分析。结果：研究一结果表明小学生隔代教养方式量表共 16 道题目，包括 4 个维度，分别为情感支持、控制、偏爱以及过分保护。累计方差解释率在 50%以上；验证性因素分析显示各因子模型拟合效果良好，删除第 5 题和第 8 题后，模型拟合达到最佳。量表总分与父母教养方式问卷（EMBU）的总分以及六个维度呈显著正相关，GFI 值为 0.947、IFI 值为 0.922、CFI 值为 0.921；量表内部一致性信度为 0.803；本量表在不同的年级和性别水平上具有测量等值性；研究二结果证明小学生隔代教养方式量表存在显著的性别效应与年级效应，且男生得分显著高于女生，低年级学生得分高于高年级学生。结论：小学生隔代教养量表的信效度良好，能够有效预测学生接受隔代教养影响程度，是测量小学生隔代教养方式的有效工具。

A Study of the validity and reliability of Primary School Intergenerational Parenting styles Scale:A psychometric evaluation and application

Yu Zeman,Fan Huiyong

Bohai University，981721949@qq.com

Abstract：Objective：To develop primary school students' Intergenerational Parenting Styles Scale(IPSS) and test its reliability, validity and applicability. Method： In study 1: under the overall framework of parents' Parenting styles, combined with the result of open-ended survey ,our study compile the first draft of IPSS.After conducting the test on a total of 2135 middle and high grade primary school students in sample 1 and sample 2, SPSS 22.0 and AMOS 24.0 were used for item analysis, factor analysis, and reliability and validity testing.Study 2 carried out the applicability test of sample 2 on the basis of study 1, which mainly including demography difference test and regression analysis. Results： The results of study 1 showed that the IPSS for primary school students had 16 questions, including four dimensions, including emotional support, control, preference and overprotection.The cumulative variance explanation rate was above 50%; The confirmatory factor analysis showed that the each factor model fits well. After deleting questions 5 and 8, the model fitting reached the best.The total score of the scale was significantly positively correlated with the total score of EMBU and the six dimensions. The GFI value was 0.947, the IFI value was 0.922, and the CFI value was 0.921;The internal consistency reliability of the scale is 0.803; This IPSS has measurement equivalence at different grades and gender levels; The results of study 2 prove that there are significant gender and grade effects in the IPSS, and boys' scores are significantly higher than girls', and lower grade students' scores are higher than higher grade students. conclusion： The the IPSS has good reliability and validity. IPSS as an effective tool to measure the intergenerational Parenting styles of primary school students, can effectively predict the impact of intergenerational parenting on students.

不同运算类型下的“减法”问题：影响学龄前儿童减法和未知加数运算发展的认知因素

任童颜[1]　王计悦意[1]　李明欣[1]　丁雪辰[1]　程琛[2]（通讯作者）

1 上海师范大学心理学系，上海，200234

2 香港科技大学社会科学部，香港，999077，通讯作者 E-mail：chencheng@ust.hk

摘 要　儿童可以使用近似数量系统表征项目集合的近似数量，并可使用近似数量系统进行近似算数的运算。一般认知能力与非符号算术技能的早期习得有关，但一般认知能力的不同成分在不同类型的算术问题上的表现之间的关系尚未得到探索。具体而言，非符号减法是基于两个已知的数量直接进行差值计算，而求解未知加数运算本质上需要儿童以先进行反向转换再作差。鉴于非符号减法和求解未知加数运算之间的异同，本研究对上海某幼儿园 88 名 4~5 岁学龄前儿童（平均年龄=4.9 岁）测量了非符号减法和求解未知加数运算中运算精度的发展，并检验可能导致这两种算术发展差异的因素。本研究测量了儿童两种不同的非符号减法运算，即一般减法和求解未知加数运算，以及儿童近似数量系统敏锐度和五种认知功能，包括工作记忆存储、言语工作记忆更新、空间工作记忆更新、抑制控制和计数能力。结果表明：（1）在所有条件下，儿童的表现都会随着工作记忆中存储的数组与比较数组之间的比率的降低而下降，这证实了儿童使用近似数量系统来进行运算；（2）学龄前儿童在近似数量系统敏锐度和非符号运算上的表现会随着年龄的增长而提高;（3）儿童的近似数量系统敏锐度可以显著预测非符号减法的表现，而抑制控制能力和工作记忆更新可以显著预测未知加数运算的表现。总体而言，儿童使用近似数量系统进行近似运算的能力在学龄前阶段有所发展,而在不同类型的非符号运算中的表现分别由不同认知能力所驱动。因此，本研究可以为学龄前儿童非符号运算和一般认知能力不同成分存在潜在关系提供解释，并为理解学龄前儿童近似数量系统和数学能力的发展提供了新的教育实践启示。

Approaching 'difference' differently: different factors underlie the development of Subtraction and Unknown-addend computations in pre-schoolers

Tongyan Ren [1], Jiyueyi Wang[1], Mingxin Li[1], Xuechen Ding [1], Chen Cheng[2]

1 Department of Psychology, Shanghai Normal University, Shanghai 200234, China
2 Division of Social Science, The Hong Kong University of Science and Technology, Hong Kong 999077, China

Abstract： Children can represent the approximate quantity of sets of items using the Approximate Number System (ANS), and can perform arithmetic-like operations over ANS representations. General cognitive ability is associated with the early acquisition of non-symbolic arithmetic skills, but the relationship between the performance and development of different components of general cognitive ability, on different types of arithmetic problems, has not been explored. Specifically, Subtraction is based on the direct computation of the difference between two known quantities, whereas Unknown-addend essentially require children to perform the reverse substitution before making the difference. Given the similarities and differences between Subtraction and Unknown-addend, we examined the development of computational precision in preschool children aged 4~5 years in Shanghai within non-symbolic subtraction and unknown-addend operations and identified factors that may contribute to differences in the development of these two arithmetic. We measured children two different non-symbolic arithmetic operations including Subtraction and Unknown-addend, as well as ANS acuity and five cognitive skills including Working memory storage, Verbal working memory updating, Spatial working memory updating, Inhibitory control and Counting knowledge. Results demonstrated that: (a) in all conditions, children's performance declined as the ratio between arrays stored in working memory and comparison arrays decreased, confirming that children were using the ANS, (b) children's performance in both ANS acuity and arithmetic increased with age when they were asked to perform non-symbolic operations, and (c) children performed better with Unknown-addend condition than with Subtraction. In particular, children's ANS acuity predicted performance in non-symbolic subtraction, and that Inhibitory control and Working memory updating effectively predicted performance in Unknown-addend. Overall, research has shown that children's ability to use the ANS for approximate arithmetic develops during the preschool years, and their performance in different types of non-symbolic arithmetic is driven by different cognitive abilities. Our findings provide insight into the relationship between general cognitive ability and non-symbolic approximate numerosities arithmetic in preschool children.

青少年同伴依恋类型及其转变：潜在转变分析

谢晓莹 李嘉琪 朱蕾蕾 彭小凡（通讯作者）
贵州师范大学心理学院，贵州贵阳，550025，pengxf@gznu.edu.cn

摘 要 同伴依恋是指个体与亲密同伴建立起彼此支持与安慰的情感联结，它是个体从父母依恋向成人依恋拓展时的中间阶段。依恋理论包含焦虑和回避两个基本维度，反映在同伴依恋中也是截然不同的行为风格。孤独感是个体无法与重要他人建立良好情感纽带时所产生的消极情感，它是评价人际关系状况的重要指标之一，越低的孤独感证明青少年持有越安全的同伴依恋。此外，个体的依恋并非一成不变，曾有研究发现恋爱对象的变化可能导致依恋风格转变。相比于父母和恋人，青少年的同伴关系无疑更容易发生变化，一方面是因为择友空间有限，另一方面是因为交友对象容易更替。研究表明父母关系的好坏影响孩子的依恋质量，父母冲突是存在于父母之间的公开敌对关系，频繁的父母冲突会增加孩子的不安全感。以往研究大都从维度的角度描述依恋的特点，但无法确定个体整体的依恋类别特征，各类别青少年的社交状态仍有待考察，目前也缺乏具体的实证研究对同伴依恋的稳定性和转变情况加以确认，父母冲突对类别的形成和转变所施加的影响也尚未可知。综上，本研究以山东和贵州省三所中学的 1039 名中学生为被试($M_{年龄}$ = 14.52, SD = 1.67)，进行 6 个月的追踪研究。采用潜在剖面分析（LPA）和转变分析（LTA），探究青少年同伴依恋的类别及其转化规律，采用方差分析和多项式逻辑回归，考察不同类别间孤独感的差异和父母冲突及性别影响类别形成及转变的发生概率。结果发现：同伴依恋可分为三种类别，安全型占 44.6-55.3%、焦虑型占 34.1-38.8%和回避型占 10.6-20%；安全型稳定率在 57.3-59.2%，有中等概率向焦虑（21.9-23.3%）和回避型（18.9-19.4%）转变，焦虑型稳定率在 68-74.6%，有中等概率向安全型（16.9-21.3%）转变，回避型稳定率在 49.8-63.3%，有中等概率向安全型（22.5-27.5%）和焦虑型（14.2-22.7%）转变；回避型青少年的孤独感最高，安全型相反，焦虑型介乎中间；父母冲突越多，青少年越可能形成和转向不安全依恋，更难以转变为安全型；女生更大概率类属焦虑型，回避型男生比女生更难发生转变。研究结果丰富了依恋理论，同时为青少年的心理健康工作提供一定启示，如通过有意的安排，让不同依恋类型的青少年得到正向匹配，促进彼此向安全型转变。

The Adolescents' Peer Attachment Style and its Transition：A Latent Transition Analysis

Xie Xiao Ying Li Jia Qi Zhu Lei Lei Peng Xiao Fan
Gui Zhou Normal University, Gui Zhou Gui Yang

Abstract：Peer attachment is the emotional bond that individuals form with close peers, providing mutual support and comfort. It represents a transitional stage between parental attachment and adult attachment. Attachment theory encompasses two fundamental dimensions: anxiety and avoidance, which manifest in distinct behavioral styles within peer attachments. Loneliness, a negative emotion resulting from the inability to establish strong emotional bonds with significant others, stands as a critical indicator of interpersonal relationships. Lower levels of loneliness indicate stronger, more secure peer attachments among adolescents. Furthermore, attachment styles are not fixed. It has been found that changes in romantic partners can lead to shifts in attachment styles. Compared to their parents and romantic partners, adolescents experience more fluctuation in their peer relationships. This is partly due to limited friend selection opportunities and the inherent fluidity of friendships. Numerous studies reveal that the quality of parental relationships directly influences the quality of children's attachments. Frequent parental conflict, characterized by open hostility between parents, heightens children's feelings of insecurity. Prior research predominantly examined attachment from a dimensional perspective. However, it failed to determine

comprehensive characteristics of attachment categories for individuals as a whole. The social status of adolescents within each attachment category also remains unexplored. Moreover, there is a dearth of specific empirical studies confirming the stability and transition of peer attachment. Additionally, the influence exerted by parental conflict on category formation and transition has yet to be established. To bridge these gaps, this study was conducted with 1039 middle school students from three schools in Shandong and Guizhou provinces. Over a 6-month period, latent profile analysis (LPA) and transformation analysis (LTA) were employed to explore adolescent peer attachment categories and patterns of transformation. Analysis of variance (ANOVA) and polynomial logistic regression were utilized to examine differences in loneliness between attachment profiles and the impact of gender and parental conflict on category formation and transformation. The findings revealed that peer attachment could be profiled into three styles: secure (44.6-55.3%), anxious (34.1-38.8%), and avoidant (10.6-20%). The secure style displayed a stabilization rate ranging from 57.3% to 59.2%, with a moderate probability of transitioning to anxious (21.9-23.3%) or avoidant (18.9-19.4%) style. The anxious style exhibited a stabilization rate ranging from 68% to 74.6% and a moderate likelihood of shifting to secure (16.9-21.3%) style. The avoidant style demonstrated a stabilization rate ranging from 49.8% to 63.3%, with a moderate probability of transitioning to secure (22.5-27.5%) or anxious (14.2-22.7%) style. Adolescents exhibiting avoidant attachment style displayed the highest levels of loneliness, whereas those with secure attachment style showed the opposite, with anxious attachment style falling in between. Increased parental conflict heightened the likelihood of adolescents forming and transitioning towards insecure attachment styles, thereby rendering the transition to secure attachment style more challenging. Females had a higher propensity for belonging to the anxious attachment style, while males with avoidant attachment style faced heightened difficulties in transitioning compared to females. These research findings not only contribute to the advancement of attachment theory but also offer valuable insights for psychological interventions targeting adolescent mental well-being. For instance, intentional arrangements can be implemented to facilitate positive matching between adolescents of different attachment styles, thereby promoting the transition towards secure attachment style.

毕生发展视角下独处的适应功能：益处与代价的五轮博弈

阿尔升·海达别克[1]　周同[2]　喻洁[1]　丁雪辰[1]（通讯作者）

1 上海师范大学心理学系，上海，200234，通讯作者 E-mail：dingxuechen_psy@163.com

2 华东师范大学心理与认知科学学院，上海，200062

摘 要　独处是一种在真实和虚拟环境中个体与他人没有交流的开放状态，其普遍存在于人的一生之中，会在个体不同发展阶段带来不同的影响。因此，以毕生发展的视角探讨个体一生不同年龄阶段独处的益处（即积极影响）与代价（即消极影响）的博弈，可以更好地理解独处的长期动态变化与发展，解释独处对个体的意义所在，并能为提出发挥其积极作用的干预措施提供科学依据。本文通过梳理独处领域相关研究成果，提出毕生发展视角下独处益处与代价的博弈模型，发现独处的确是一把双刃剑，对于个体的发展同时具有益处与代价，且从童年期至老年期，呈现出一定的变化特点与不同的适应功能。具体而言，在童年期，儿童进行独自游戏是发展其社会交往功能的桥梁，但与此同时这也直接导致个体错失与同伴交往的机会，独处的代价崭露头角；在青少年期，尽管个体有更大的社交自主性，但其所面临的社会期许与规范增加，这时独处易产生多种内化行为问题且面临着同伴的压力，独处的代价达到顶峰；在成年早期，自我决定的独处有助于自我接纳和个人成长，独处的益处开始占据上风，但是因动机与态度的不一致，个体也可能会产生一些负面情绪；在成年中期，随着个体身份转变，对于独处有更高的需求和自主动机，但也面临不同的社会情感得失，此时独处的益处和代价难分胜负；到了老年期，个体对于独处具有很高的自主性并

且开始享受独处，但是这一阶段老年人可能会面对社交孤立，这会对个体认知、情感、生活带来极大的威胁，独处的代价又重新抬头。未来研究可以更多关注以个体为中心的研究，整合独处多维性，以毕生发展视角收集横纵向数据直接对比，丰富独处益处与代价的发展机制，结合文化背景理解独处的内涵，关注当代数字技术发展背景对于个体独处的影响，并思考独处在不同年龄段的实践意义。

Understanding The Adjustment Functions of Solitude from Lifespan Development Perspective: A Five-Round Battle of Benefits and Costs

Aersheng Haidabieke[1], Tong Zhou[2], Jie Yu[1], Xuechen Ding[1]

1. Department of Psychology, Shanghai Normal University, Shanghai, 200234
2. School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

Abstract： Solitude is an open state in which individuals have noncommunication with others in a real or virtual environment. It is as common throughout life, and will bring different effects at different stages of individual development. Therefore, exploring the battle between the benefits (positive impact) and costs (negative impact) of solitude in different age stages of an individual's life from the lifespan perspective can better understand the long-term dynamic change and development of solitude and explain its significance to individuals. In addition, it can provide scientific basis for the intervention measures to play its positive role. By combing the relevant research results in the field of solitude, this paper puts forward a battle model of the benefits and costs of solitude from lifespan perspective and finds that solitude is a double-edged sword, which has both benefits and costs for individual development, and shows certain characteristics and different adaptive functions from childhood to old age. Specifically, in childhood, children's solitary play is a bridge to develop their social interaction function, but at the same time, it directly leads to individuals missing the opportunity to interact with peers, and the cost of solitude comes to the forefront. In adolescence, although individuals have greater social autonomy, they are faced with increased social expectations and norms. At this time, solitude is prone to a variety of internalizing problems and peer pressure, and the cost of solitude reaches its peak. In early adulthood, self-determined solitude is conducive to self-acceptance and personal growth. The benefits of solitude begin to take hold, but individuals may also have some negative emotions due to inconsistent motives and attitudes. In the middle of adulthood, with the change of individual identity, there is a higher need for solitude and autonomous motivation, but they also face different social emotional gains and losses. At this time, the benefits and costs of solitude are difficult to determine. In the old age, individuals have a high degree of autonomy and begin to enjoy solitude. However, at this stage, the elderly may face social isolation, which will bring great threats to individual cognition, emotion and life, and the cost of solitude will rise again. To further develop our understanding of solitude, future studies could: 1) From a personal-oriented perspective, integrate the multi-dimensional and dynamic development of solitude. 2) Collect large amounts of horizontal and longitudinal data from a lifespan perspective. 3) Interpret the development process of solitude based on cultural background. 4) Pay attention to the impact of contemporary digital technology on the individual experience of solitude. 5) Think about the practical implications of solitude at different developmental stages.

学习步调和装饰性材料相关性对学习成绩及元理解监测的影响

汪玉婷[1] 陈瑶鲜[1] 王勋[2]（通讯作者）
浙江师范大学心理学系，金华，321000，wangx@zjnu.cn

摘 要 在多媒体教学中，通常以有趣的装饰性材料来吸引学生注意力和激发学生的学习动机。然而，大多数研究表明，在教学材料中添加此类装饰性材料非但没有促进学习，反而阻碍学习并产生了装饰性材料效应。本研究以学习步调和装饰性材料相关性作为切入点，探讨二者对装饰性材料效应的影响。此外，在多媒体学习过程中学习者对文本的掌握情况以及阅读策略对学习的影响也是至关重要的。基于此，本研究首先考察了学习步调对装饰性材料效应的调节作用，并进一步从元认知角度探究在系统步调下，装饰性材料相关性和使用元认知策略对学习成绩及元理解监测的影响。

本研究共设计了 2 个实验。实验 1 为 2(学习步调：系统步调，学习者步调)×2(装饰性材料：有，无)两因素被试间设计，探究学习步调和装饰性材料对学习成绩及元理解监测的影响，考察学习步调在具有装饰材料的多媒体学习中的作用。实验 2 为 2(相关性：高，低)×2(相关性评定：评价组，非评价组)两因素被试间设计，采用经典的 JLR(learning-judgment-recall)范式，探究系统步调下相关性和元认知评价策略对学习成绩和元理解监测的影响。

综合本研究结果，可得出以下结论：

（1） 学习步调作为装饰材料效应的边界条件影响学习者的学习成绩，装饰材料对学习的影响主要体现在学生对知识点的识记方面，在具有装饰材料的条件下进行学习，学习者会感知到更大的认知负荷，由此掩蔽了多媒体优势信念。

(2) 在系统步调下，学习高相关性装饰材料的学习者取得了更差的学习成绩，相关性作为一种边界条件对学习者的学习成绩产生影响。

(3) 相关性评定作为一种元认知策略，对装饰材料效应有一定的缓解作用，并在一定程度上提升元理解监测能力。

关键词 元认知；元理解监测准确性；装饰性材料；装饰材料效应；多媒体学习。

THE IMPACET OF LEARNING PACE AND SEDUCTIVE DETAILS RELEVANCE ON LEARNING ACHIEVEMENT AND METACOMPREHESION MONITORING

Abstract： In multimedia teaching, textbooks and various learning materials usually use interesting seductive details to stimulate students' learning motivation. However, most studies show that adding such seductive details to teaching materials does not promote learning, but rather hinders learning and produces seductive details effects. This study takes the learning pace and the relevance of seductive details as the starting point to explore the impact

of the two on the effect of seductive details. In addition, in the process of multimedia learning, learners' mastery of the text and the impact of reading strategies on learning are also crucial. Based on this, this study first examined the regulatory role of learning pace on the effect of seductive details, and further explored the impact of the relevance of seductive details and the use of metacognitive strategies on learning achievement and metacognitive monitoring under the system pace from the perspective of metacognition.

Two experiments were designed in this study. Experiment 1 is 2 (learning pace: system pace, learner pace) × 2 (seductive details: yes, no) Two-factor inter-test design, to explore the impact of learning pace and seductive details on learning performance and metaunderstanding monitoring. Experiment 2 uses the classic JLR (learning-judgment-recall) paradigm to explore the impact of correlation and metacognitive evaluation strategies on learning performance and metacognition monitoring at a systematic pace. Experiment 2 is 2 (correlation: high, low) × 2 (correlation evaluation: evaluation group, non-evaluation group) two-factor inter-test design.

Based on the results of this study, the following conclusions can be drawn:

(1) The learning pace, as the boundary condition of the decorative material effect, affects the learning performance of learners. The influence of seductive details on learning is mainly reflected in the students' memorization of knowledge points. When learning with seductive details, learners will perceive greater cognitive load, thus masking the belief of multimedia superiority.

(2) At a systematic pace, learners who learn highly correlated seductive details have achieved worse learning results. Relevance, as a boundary condition, has an impact on learners' learning results.

(3) As a metacognitive strategy, correlation assessment can alleviate the effect of seductive details to a certain extent, and improve the ability of metacognitive monitoring to a certain extent.

权力感和他人存在对青少年合作行为的影响

安彦东 张梦璇 马向真（通讯作者）

东南大学人文学院医学人文系，南京，211102，mxznj@hotmail.com

摘 要 合作行为是指个体为实现共同目标而进行的社会活动。作为常见的利他性行为之一，它是评估个体亲社会倾向的的重要指标。进入青春期后，青少年自我意识不断增强并表现出一定的权力感。如何引导青少年权力感发展，促进其对合作行为的影响，成为教育和研究关注的话题之一。与此同时，青春期的另一个重要特征是重视他人对自己的看法，他人存在会影响青少年的合作行为。据此，本研究旨在探讨权力感（状态权力感和特质权力感）和他人存在对青少年合作行为的影响。研究采用被试间设计，实验一以 137 名中学生（女性 71 名）为被试，首先，被试扮演老板（高权力感）或雇员（低权力感）角色并通过阅读相关实验材料来启动其状态权力感，完成操作性检验后给被试呈现眼睛线索（他人存在）或花朵线索（无他人存在）图片来创造他人存在情境，最后被试完成公共物品博弈任务，在该任务中被试投资到公共账户的金额被用来评估其合作行为水平。实验二招募了 138 名中学生（女性 62 名），采用一般权力感量表测量被试的特质权力感，实验过程和变量测量方法同实验一。研究发现：（1）两种权力感处于较高水平的青少年，其合作行为水平较高；（2）当他人存在时，青少年会表现出更高水平的合作行为；（3）无论是特质权力感还是状态权力感，在他人存在时，高权力感被试表现出更高水平的合作行为；在无他人存在时，不同权力感被试的合作行为水平无显著差异。本研究丰富了青少年权力感的研究，特质权力感和状态权力感可以被视作促进个体亲社会倾向的积极品质。此外，将权力感和他人存在有效结合能更好的培养青少年的合作行为，本研究为青少年合作教育提供了实践指导。未来还应进一步探究该影响的作用机制。

The Effect of Sense of Power and Presence of Others on Adolescents' cooperative Behaviors

Yandong An, Mengxuan Zhang, Xiangzhen Ma (corresponding author)
Department of Medical Humanities, College of Humanities, Southeast University, Nanjing, 211102, mxznj@hotmail.com

Abstract: Cooperative behavior refers to social activities performed by individuals to achieve common goals. As one of the common altruistic behaviors, it is an important indicator for assessing an individual's pro-social tendency. After entering adolescence, adolescents' sense of self is increasing and shows a certain sense of power. How to guide the development of adolescents' sense of power and promote its influence on cooperative behavior has become one of the topics of concern in education and research. At the same time, another important feature of adolescence is the importance of others' perceptions of oneself, and the presence of others can affect adolescents' cooperative behavior. Accordingly, this study aimed to investigate the effects of sense of power (state power and trait power) and presence of others on adolescents' cooperative behavior. The study utilized a between-participants experimental design. In Experiment 1, 137 middle school students (71 females) was recruited as participants. First, participants played the roles of boss (high sense of power) or employee (low sense of power) and initiated their sense of state power by reading relevant experimental materials, and then after completing the operant test, participants were presented with pictures of either eye cues (presence of other people) or flower cues (absence of other people's presence) to create the presence of other people context. Finally, the participants completed a public goods gaming task in which the amount of money participants invested into a public account was used to assess their level of cooperative behavior. Experiment 2 recruited 138 middle school students (62 females) and used the General Sense of Power Scale to measure the participants' trait sense of power, and the experimental process and variable measurement methods were the same as in Experiment 1. It was found that (1) adolescents with both types of power senses at a higher level have higher levels of cooperative behavior; (2) adolescents show higher levels of cooperative behavior when others are present; (3) whether it is trait or state power sense, high power sense participants show higher levels of cooperative behavior when others are present; in the absence of others, the level of cooperative behavior of participants with different power senses has no significant differences. The present study enriches the research on adolescents' sense of power in that trait and state sense of power can be viewed as positive qualities that promote individuals' pro-social tendencies. In addition, the effective combination of sense of power and presence of others can better cultivate adolescents' cooperative behaviors, and the present study provides practical guidance for adolescents' cooperative education. The mechanism of the effect should be further explored in the future.

汉语声调敏感性对英语词汇学习的影响

邢玉荣　时蒙　罗丽　辛紫菡　程冬阳　侯峥榕　李利平(通讯作者)
山西师范大学教育科学学院，太原，030031，liliping2092@163.com

摘 要　汉语中声调可以用来表达韵律信息，汉语声调包含阴平、阳平、上声和去声这四种类型，具有区别语义的作用。韵律结构有助于从心理词典中检索信息，为获取词汇表征提供线索，从而促进词汇识别、拓宽词汇广度。Goad 和 White（2004）提出的韵律迁移假说指出二语学习的水平会受到母语韵律表征的制约。依此可知，母语为汉语者的汉语声调敏感性可能会影响到其英语词汇的学习。在学习第二语言时，成年人可能也会使用基于母语节奏或韵律特征的策略来分割语音促进词汇学习，因此本研究欲探讨汉语声调敏感性对英语词汇的影响。对 139 名母语为汉语的大学生进行测查，其中包含语音意识测验、汉语声调测验、英语重音测验、英语词汇深度测验和英语词汇广度测验，结果显示：（1）汉语声调敏感性分别与英语重音敏感性（r=.303）、英语词汇深度（r=.260）、英语词汇广度（r=.330）相关显著；（2）在控制语音意识后，汉语声调敏感性对英语词汇广度的直接效应显著，β=.355，p=.0015，95% *CI* 为[.138～.571]；汉语声调敏感性通过英语重音敏感性对英语词汇广度的间接效应不显著β=.003，p＞.005，95% *CI* 为[-.048～.065]；（3）在控制语音意识后，汉语声调敏感性对英语词汇深度的直接效应不显著β=.376，p=.2651，95% *CI* 为[-.289～1.042]；汉语声调敏感性通过英语重音敏感性对英语词汇深度的间接效应也不显著β=-.042，p＞.05，95% *CI* 为[-.217～.173]。研究表明，汉语声调的韵律感知能促进英语词汇表层的识别，但对深度意义的区分影响甚微，汉语声调敏感性对英语词汇广度学习具有重要意义。

The Influence of Chinese Tone Sensitivity on English Vocabulary

Yurong Xing　Meng Shi　Li Lou　Zihan Xin
Dongyang Cheng　Zhengrong Hou　Liping Li(Corresponding author)
School of Education Science, Shanxi Normal University, Taiyuan, 030031

***Abstract*:** Tone in Chinese can be used to express prosodic information. There are four types of Chinese tones, namely Yin ping, Yang ping, upper tone and removed tone, which have the function of distinguishing semantic meaning. Prosodic awareness can help to retrieve information from psychological dictionaries, provide clues for lexical representation, and thus promote lexical recognition and broaden lexical breadth. The prosodic transfer hypothesis proposed by Goad and White (2004) points out that the level of second language learning is restricted by the prosodic representation of the native language. According to the prosodic transfer hypothesis, Chinese tone sensitivity may have an impact on English vocabulary learning. When learning a second language, adults may also use strategies based on the rhythmic or prosodic features of the native language to segment sounds to facilitate vocabulary learning. Therefore, this study aims to explore the influence of Chinese tone sensitivity on English vocabulary. 139 Colleges who are native Chinese were administered a battery of tests including phonological awareness, Chinese tone sensitivity, English stress sensitivity, English vocabulary depth and English vocabulary breadth. The results demonstrated: (1) Chinese tone sensitivity was significantly correlated with English stress sensitivity (r=.303), English vocabulary depth(r=.260) and English vocabulary breadth(r=.330); (2) After controlling phonological awareness, the direct effect of Chinese tone sensitivity on English vocabulary breadth was significant, β=.355, p=.0015， 95% *CI* =[.138～.571]; The indirect effect of Chinese tone sensitivity on English vocabulary breadth through English stress sensitivity was not significant, β=.003, p＞.005, 95% *CI*=[-.048～.065]; (3) After controlling phonological awareness, both the direct effect of Chinese tone sensitivity on English vocabulary depth (β=.376, p=.2651, 95% *CI*= [-.289～1.042]) and the indirect effect through English stress sensitivity (β=-.042, p＞.05, 95% *CI*= [-.217～.173]) were not significant. The research indicates that the Chinese tone sensitivity can promote the initial recognition of English vocabulary, and has a subtle impact on the meaning of English vocabulary. This study reveals the significance of the Chinese tone sensitivity on English vocabulary breadth.

摘 要　父母低头行为是指父母低头玩手机而无暇顾及或冷落孩子的行为现象，这种现象广泛存在于婴幼儿的养育过程中，并会对家庭关系质量和儿童的发展适应带来广泛影响。父母在养育过程中过度使用手机会给婴幼儿的心理发展带来许多不可逆的消极影响。例如：父母低头族阻碍了亲子沟通，减少了身体接触及互动游戏，让婴幼儿感受到忽视甚至拒绝，进而产生愤怒、悲伤、孤独等消极情绪，不利于良好依恋风格和亲子关系的建立。父母低头行为可能导致婴幼儿超前接触、过度使用

电子媒介。一方面，低头行为使父母的情绪更加易怒缺乏耐心，一些父母会为婴幼儿提供电子媒介以减少孩子对自己的干扰；另一方面，父母低头行为对孩子造成了不良示范，婴幼儿模仿父母行为的同时缺乏自控能力，易出现过度使用、成瘾等问题。在父母低头行为产生的原因中，父母冲突是重要的风险因素。幼儿时期是个体成长发展的奠基期，是个体生理发育和心理发展最迅速的时期,这一阶段的个体发展结果对儿童期、青少年期乃至一生都有着重要且深远的影响。为探讨父母冲突对幼儿电子媒体过度使用的影响及其作用机制，研究采用父母关系量表、父母低头行为问卷、亲子依恋问卷和幼儿电子媒介使用程度问卷对 758 名幼儿家长进行调查。结果发现：（1） 父母冲突、父母低头行为、亲子依恋和幼儿电子媒体过度使用之间两两显著相关；（2）父母冲突对幼儿电子媒体过度使用不仅有直接预测作用，还能通过三条间接路径影响幼儿电子媒体过度使用：父母低头行为的中介作用；亲子依恋的中介作用；父母低头行为和亲子依恋的链式中介作用。结论：父母冲突不仅对幼儿电子媒体过度使用有直接影响，还能通过父母低头行为和亲子依恋的序列中介作用影响幼儿电子媒体过度使用。

Abstract Parental phubbing behavior refers to the behavioral phenomenon of parents phubbing to play mobile phones and have no time to take care of or neglect their children. This phenomenon widely exists in the raising process of infants and young children, and will have a wide impact on the quality of family relations and children's development and adaptation. Excessive use of mobile phones by parents in the process of rearing will bring many irreversible negative effects on the psychological development of infants and young children. For example, the parent-child phubs hinder parent-child communication, reduce physical contact and interactive games, and make infants feel neglected or even rejected, resulting in anger, sadness, loneliness and other negative emotions, which is not conducive to a good attachment style and the establishment of parent-child relationship. Parents' lower head behavior may lead to premature exposure and excessive use of electronic media. On the one hand, the lower head behavior makes parents more irritable and make infants feel neglected or even rejected, resulting in anger, sadness, loneliness and other negative emotions, which is not conducive to a good attachment style and the establishment of parent-child relationship. Parents' lower head behavior may lead to premature exposure and excessive use of electronic media. On the one hand, the lower head behavior makes parents more irritable and impatient. Some parents will provide electronic media for infants to reduce their children's interference; On the other hand, parents' lower head behavior has caused a bad model for children, and infants and young children lack self-control while imitating their parents' behavior, and are prone to overuse, addiction and other problems. Parental conflict is an important risk factor among the causes of parental phubbing behavior. Early childhood is the foundation period of individual growth and development, and it is the period of the most rapid physical and psychological development of individuals. The results of individual development at this stage have important and far-reaching influences on childhood, adolescence and even the whole life. In order to investigate the impact of parental conflict on children's excessive use of electronic media and its mechanism, 758 parents of young children were investigated by using parent relationship scale, parent phubbing behavior questionnaire, parent-child attachment questionnaire and children's electronic media use questionnaire. The results indicated: 1) There were significant pairwise correlations between parental conflict, parental phubbing behavior, parent-child attachment and children's overuse of electronic media; 2) Parental conflict not only directly predicts children's overuse of electronic media, but also influences children's overuse of electronic media through three indirect paths: the mediating role of phubbing behavior; The mediating role of parent-child attachment; The chain mediating effect of parental phubbing behavior and parent-child attachment. Conclusion: Parental conflict not only has a direct impact on children's overuse of electronic media, but also can affect children's overuse of electronic media through the serial mediating effect of phubbing behavior and parent-child attachment.

成人对不同表情婴儿面孔注意偏向加工的时间进程特点

陈加[1] 邹燕[1] 七十三[2] 潘运[1]（通讯作者）
1 贵州师范大学心理学院，贵阳，550025，panyun126@163.com
2 内蒙古师范大学心理系，呼和浩特，010010

摘 要 研究采用自由观看任务并结合眼动技术，在严格控制面孔刺激面孔结构的条件下，对不同表情（开心、悲伤、中性）

婴儿面孔注意偏向加工的时间进程特点进行研究。研究共招募 183 名大学生（男 93 名，女 90 名），要求被试自由观看配对的面孔图片，包括三种表情共 96 对图片，每对图片由同性别同表情的婴儿面孔和成人面孔组成，呈现时间为 5000ms。本研究在分析总时程 5000ms 的基础上，还以 500ms 为单位将其切分为 10 个时程以更好地观察注意加工的变化特征。总时程分析结果发现，相较于开心和悲伤的婴儿面孔，中性婴儿面孔注意偏向值最大，表现出最大化的效应。切分时程的分析结果发现，三种表情的注意偏向轨迹随着时间的增加分别呈现出不同的趋势。首先，在中性表情条件下，在注意加工初始阶段（0-500ms，500-1000ms）表现出对中性成人面孔的注意偏向，但在 1000ms 到 3000ms 之间注意偏向转向中性婴儿面孔，且在 1500-2000ms 下注意偏向值最大，表现出中性婴儿面孔注意偏向最大化效应。第二，在快乐表情条件下，注意偏向仅在 1500-2000ms 阶段偏向婴儿面孔，其余时程上均偏向成人面孔。第三，在悲伤表情条件下，注意偏向仅在 0-500 ms 阶段偏向婴儿面孔，其余时程中均偏向成人面孔。同时，女性对婴儿面孔的注意偏向更大，但女性和男性在表情上无显著差异。本研究结果表明，在注意加工的不同阶段，成人对婴儿面孔的注意偏向受表情的调节。具体来说，在早期的注意加工中会对悲伤婴儿面孔产生注意偏向；而在晚期注意维持的加工阶段对开心和中性婴儿面孔都存在注意偏向。但相较于其他表情，中性婴儿面孔注意偏向值最大，表现出最大化效应。本研究结果提示，成人对不同表情婴儿面孔注意偏向的加工是动态的，且在晚期注意加工中会出现中性婴儿面孔注意偏向最大化效应。

The Characteristics of Time Course Processing of Adults' Attentional Bias Toward Infant Face with Different Expressions

Chen Jia[1], Zou Yan[1], ShiSan Qi[2], Pan Yun[1]
[1]School of Psychology, Guizhou Normal University, Guiyang, China, 550025
[2]School of Psychology，Inner Mongolia Normal University，Hohhot，010010

Abstract: The study investigated the characteristics of time course processing of attentional bias toward infant faces with different expressions (happy, sad, and neutral) using a free-viewing task combined with an eye-movement technique, under the condition of strictly controlling the face structure of the face stimuli. A total of 183 university students (93 males and 90 females) were recruited to the study, and were asked to freely view paired face pictures, including 96 pairs of pictures of three expressions, each pair of pictures consisted of an infant face and an adult face of the same sex and with the same expression, with a presentation time of 5,000 ms. In addition to analyze the total time course of 5,000 ms, the total time course of 5,000 ms was divided into 10 time courses by units of 500 ms in order to better observe the changing characteristics of attentional processing. The results of the total time course have found that attentional bias toward the neutral infant faces showed the strongest values of attentional bias compared to happy and sad infant faces, showing the strongest attentional bias effect of neutral infant facial expression. The results of the split time courses have found that the trajectories of attention bias of the three expressions showed different trends with the increase of time respectively. First, in the neutral expression condition, an attentional bias toward adult faces was shown in the initial stages of attentional processing (0-500ms, 500-1000ms), but the attentional bias was toward infant faces from 1000ms to 3000ms, and the value of the attentional bias was the strongest at 1500-2000ms, showing the strongest effect of attentional bias toward neutral infant faces. Second, in the happy expression condition, the attentional bias was toward infant faces only during the 1500-2000ms phase, and toward adult faces on the rest of the time courses. Third, in the sad expression condition, attentional bias toward infant faces was only in the 0-500 ms, but toward adult faces for the rest of the time course. Meanwhile, females showed a greater attentional bias toward infant faces, but there was no significant difference between females and males on expressions. The results of the present study suggest that adult attentional bias toward infant faces is moderated by expressions at different stages of attentional processing. Specifically, an attentional bias toward sad infant faces was observed during the early attentional processing; while an attentional bias toward both happy and neutral infant faces were showed during the late attentional maintenance stage of processing. However, compared to the other expressions, the neutral infant face had the strongest value of attentional bias, showing the strongest effect of neutral infant facial expression. The results of the present study suggest that the processing of adults' attentional bias toward infant faces with different expressions is dynamic and that the strongest effect of attentional bias toward neutral infant faces occurs in the late attentional processing.

向死而生：死亡提醒对炫耀性亲社会行为的影响

文倩[1] 彭雪映[1] 张溶坤[1] 马金良[1] 尹忠泽[1]
1 山西师范大学教育科学学院，太原，030000，1059328061@qq.com

摘 要　基于恐惧管理理论，当个体感受到死亡威胁时便会启动心理防御机制（文化世界观、自尊和亲密关系等）以减轻或消除由死亡威胁产生的焦虑感。以往研究中发现亲社会行为能有效缓解死亡焦虑，个体在经历死亡提醒后会更愿意从事亲社会行为，更加愿意参与有助于塑造个体在他人心目中的形象、能够向他人公开展示的炫耀性亲社会行为。本研究欲探讨死亡提醒对炫耀性亲社会行为有何影响。选取炫耀性亲社会行为中具有代表性的炫耀性捐赠行为来探讨死亡提醒对炫耀性亲社会具体行为的影响。实验采用 2（死亡提醒、牙痛提醒）×2（公开承认、不公开承认）的被试间实验设计，选取 18-30 岁之间的成人被试 130 名，自变量为死亡提醒启动情况和是否公开承认，因变量为被试的捐赠意愿和捐赠金额等。实验结果表明，在死亡提醒启动情况下，公开承认组被试的捐赠金额

(M=63.74,SD=23.98)高于不公开承认组(M=43.50, SD=21.89),且具有显著差异(F(1,123)=12.215, p=0.001)。死亡提醒使个体更愿意从事炫耀性捐赠行为，并且在捐赠行为被公开承认（具有炫耀性）时，经历死亡提醒的个体捐赠意愿更高且捐的钱更多。本研究结果表明，死亡提醒对个体的炫耀性亲社会行为有促进作用，死亡提醒会让个体经历痛苦，但也提供了可以重新审视自己行为和内心的机会，正确的面对生活中重大事故带来的死亡威胁。

Being Towards Death: The Influence of Mortality Salience on Conspicuous Prosocial Behavior

Wen Qian[1]　Xueying Peng[1]　Rongkun Zhang[1]　Jinliang Ma[1] Zhongze Yin[1]
1 College of Education Science, Shanxi Normal University, Taiyuan, 030000, 1059328061@qq.com

Abstract: According to terror management theory, people are anxious because they realize that death is inevitable, so they construct a series of defense mechanisms (cultural worldview, self-esteem, intimate relationships, etc.) to deal with death anxiety. These defense mechanisms are activated when individuals feel threatened by death in order to reduce or eliminate the resulting anxiety. The study found that prosocial behavior can effectively alleviate death anxiety, so experiencing mortality salience will affect individual prosocial behavior. We think that the prosocial behavior that helps to shape the image of the individual in the eyes of others and can be publicly displayed to others is conspicuous, and it is called conspicuous prosocial behavior. The purpose of this study is to explore the influence of mortality salience on conspicuous prosocial behavior. This study designed the experiment about conspicuous donation to study the influence of death reminder on conspicuous prosocial behavior , and to explore the influence of death reminder on conspicuous prosocial behavior.The experiment is a 2 (mortality salience vs control group) ×2 (public admission vs non-public admission) inter-subject experimental design,The independent variables were the activation of the death reminder and whether it was publicly acknowledged or not, and the dependent variables were the willingness to donate and the amount of donation.The experimental results showed that the donation amount of the public acknowledgment group(M=63.74, SD=23.98) was higher than that of the non-public acknowledgment group(M=43.50, SD=21.89) when the death reminder was initiated, and there was a significant difference(F (1, 123)=12.215, p=0.001).Death reminders make individuals more willing to engage in ostentatious donation behavior, and individuals who experience death reminders are more willing to donate and donate more money when the donation behavior is publicly acknowledged . The results of this study suggest that death reminders can promote individuals' conspicuous prosocial behavior. Death reminders can cause individuals to experience pain, but also provide an opportunity to re-examine their behavior and heart.

家庭环境对研究生抑郁的纵向影响：家庭支持的调节作用与心理弹性的中介作用

任泯璇[1,2] 宋静静[1,2] 李林[1,2]（通讯作者）
1 中国地质大学（武汉）教育研究院心理学系，武汉，430074
2 中国地质大学（武汉）心理科学健康研究中心，武汉，430074，lilin@cug.edu.cn

摘 要 研究表明研究生群体的抑郁水平是普通人群的六倍之多，抑郁情绪不仅会影响研究生个体的生活质量，还会损害其社会认知功能。生态系统理论认为在微系统中，家庭对个体的影响力最大，持续时间较长，良好的家庭环境能对个体产生更多积极影响和较低的抑郁水平。在家庭环境对研究生群体抑郁情绪的影响过程中，以往的研究认为家庭支持和心理弹性或许可以分别作为一种保护因素和积极品质起缓冲作用，并具有一定的稳定性。基于此，本研究选取纵向追踪设计，以研究生群体为研究对象，采用家庭环境量表、抑郁自评量表、领悟社会支持量表和心理弹性量表收集两次间隔一年的数据，系统考察研究生家庭环境与抑郁之间的纵向联系、家庭支持在其中的潜在调节作用和心理弹性的潜在中介作用以及其作用是否存在跨时间的稳定性，有效的研究对象 1223 名（Mage=22.95,SDage=1.93,女性 593 人，博士研究生 136 人）。以两个时间点得到的数据分别检验家庭支持的调节作用和构建心理弹性的半纵向中介模型，结果显示：（1）研究生抑郁情绪随时间显著增加，家庭支持和心理弹性则显著降低；（2）家庭环境、家庭支持和心理弹性三者间显著正相关，分别与抑郁显著负相关；（3）家庭支持的调节作用在两个时间点上均显著，具体为 T1 家庭环境×T1 家庭支持对抑郁的负向预测作用显著(β=-0.056，p＜0.05)，T1 家庭环境×T2 家庭支持对抑郁的负向预测作用同样显著(β=-0.080，p＜0.01)，说明家庭支持的调节作用具有跨时间的稳定性；（4）半纵向中介模型拟合良好（χ^2 /df=12.321，CFI=0.98，TLI=0.93，RMSEA=0.096，SRMR=0.029），具体来说 T1 心理弹性的中介效应为 69.49%，T2 心理弹性的中介效应为 74.14%。研究结果说明对于研究生而言，良好的家庭环境能缓解个体抑郁水平，不良的家庭环境则会加重个体抑郁，同时家庭支持在其中起调节作用，心理弹性起中介作用。研究生个体通过发掘或培养自己的积极心理品质——心理弹性，能够提高积极情绪，增加个体内部资源和对自我的积极认知，缩短心理应激期，从而削弱不良家庭环境对抑郁情绪的消极影响。
关键词 家庭环境，研究生，抑郁，心理弹性，家庭支持

The longitudinal influence of family environment on depression in graduate students: the moderating role of family support and the mediating role of mental resilience

Ren M.[1,2] ,Song J.[1,2], Li L.[1,2(corresponding author)]
1 Department of Psychology, China University of Geosciences, Wuhan , China
2 Health Research Center of Psychological Sciences, China University of Geosciences, Wuhan, China

Abstract：Research shows that the level of depression in graduate students is six times higher than that in the general population. Depression not only affects the quality of life of graduate students, but also damages their social cognitive function. The Ecological Systems Theory holds that family has the greatest influence on individuals and lasts for a long time in Microsystems. A good family environment can produce more positive

influences on individuals and lower depression. In the process of the influence of family environment on the depression of graduate students, previous studies suggested that family support and psychological resilience may act as a protective factor and a buffer of positive qualities, respectively, and have a certain stability. Based on this, the longitudinal tracking design was selected in this study. The Family Environment Scale, Self-rating Depression Scale, Perceived Social Support Scale and The Connor-Davidson Resilience Scale were used to collect data one year apart for two times. The longitudinal relationship between family environment and depression of graduate students, the potential moderating role of family support and the potential mediating role of mental resilience, as well as whether its effects are stable across time, were systematically investigated. 1223 effective research objects (Mage=22.95,SDage=1.93, 593 women, and 136 doctoral students) were investigated. The data obtained at two time points were used to test the moderating effect of family support and construct a semi-longitudinal mediation model of mental resilience. The results showed that: 1) Depression increased significantly over time, while family support and mental resilience decreased significantly; 2) Family environment, family support and mental resilience were positively correlated with depression, and negatively correlated with depression; 3) The moderating effect of family support was significant at both time points, T1 family environment ×T1 family support (β=-0.056, $p < 0.05$) and T1 family environment ×T2 family support (β=-0.080, $p < 0.01$) both had a significant negative predictive effect on depression. It shows that the moderating effect of family support is stable across time; 4) The semi-longitudinal mediating model was well fitted ($\chi2$ /df=12.321, CFI=0.98, TLI=0.93, RMSEA=0.096, SRMR=0.029). Specifically, the mediating effect of T1 mental resilience was 69.49%, and that of T2 mental resilience was 74.14%. The results show that for postgraduates, a good family environment can alleviate the level of individual depression, while a bad family environment will aggravate the level of individual depression. Meanwhile, family support plays a moderating role and psychological resilience plays an intermediary role. By exploring or cultivating their own positive psychological quality -- psychological resilience, graduate students can improve their positive emotions, increase their internal resources and positive self-cognition, shorten the psychological stress period, and weaken the negative impact of bad family environment on depression.

Psychological distress among initial disabled elderly patients with stroke based on the society ecosystems theory: a qualitative study

YU Hao-ru [1] ZHANG Ling-ling [2]（Corresponding author） SUN Niu-niu [1] YU Xue-jiao[1]

1. School of Nursing, Henan University of Science and Technology, Luoyang Henan 471000, China;

2. Nursing Department of the First Affiliated Hospital of Henan University of Science and Technology, Luoyang henan 471003, China，lingling7010@126.com

***Abstract*：** **Objective** To explore the experience and influencing factors of psychological distress among initial disabled elderly patients with stroke during hospitalization based on the society ecosystems theory and to provide reference for targeted interventions. **Methods** Using phenomenological research method, Questions were set based on the society ecosystems theory before the interview，then a semi-structured interview was conducted on 17 initial disabled elderly patients with stroke. Data were transcribed and analyzed using Colaizzi's method. **Results** Three major themes and fifteen sub-themes were identified: microsystem-psychological stress and personal adjustment, mesosystem-the two-way role of support, macrosystem-a contrast between support and demand. **Conclusion** The initial disabled elderly patients with stroke have psychological distress and are affected by many aspects，In the future, systematic intervention strategies can be developed based on social ecosystem theory to promote psychological adjustment of patients.

自闭症谱系障碍儿童的奖赏加工机制探索

赵雅倩 [1]

1.福建医科大学健康学院应用心理学系，福州 350108，zhaoyaqian@126.com

摘 要 自闭症谱系障碍(Autism Spectrum Disorder，ASD)是一种在婴幼儿时期就有所表现、以社会交往障碍为主要特征的神经发育障碍 ，主要表现为社会交往缺陷和刻板重复行为以及狭窄的兴趣、活动。社会动机假说认为，ASD 个体在社会动机方面存在早期缺陷，阻碍了他们关注和学习社会信息，导致无法获得社会经验，进一步破坏社会认知和社会技能的发展。关于 ASD 个体的奖赏加工缺陷是具有特异性，即奖赏加工缺陷仅仅表现在社会性刺激上；还是具有广泛性，即无论是对社会刺激还是非社会刺激均存在奖赏加工缺陷，存在一定的争论。无论是选择不同的年龄阶段的被试、不同认知需求的范式还是不同的奖赏材料，都可能会使结果存在差异。因此研究拟采用社会、金钱激励延迟范式结合近红外光谱成像（fNIRS）技术，探究学龄期 ASD 儿童奖励处理的大脑功能机制。基于前人研究，实验的创新点有：1.实验材料为动态视频，击中时社会性刺激为一个人表现出快乐的面部表情、竖起大拇指和口头表扬的视频。2.进一步检验奖赏加工的两个阶段，即预期和结果处理阶段是否在 ASD 个体中都存在缺陷。3.相较于其他脑成像研究技术，fNIRS 是一种非侵入式脑功能成像技术，且对运动噪声的容忍性强，更合 ASD 群体，且后期可以在真实社交情景下探讨 ASD 儿童对社会和非社会刺激的奖赏加工。4.有研究发现对金钱和社会奖励的预期对男性和女性大脑中边缘结构的激活是不同的，因此研究会注意对比 ASD 男孩和女孩的大脑激活情况。

关键词 自闭症谱系障碍，近红外光谱成像，激励延迟

Exploring reward processing mechanisms in children with autism spectrum disorders

Zhao Yaqian[1]
1. Department of Applied Psychology, School of Health,
Fujian Medical University, Fuzhou, 350108

Abstract：Autism Spectrum Disorder (ASD) is a neurodevelopmental disorder that manifests itself in infancy and early childhood and is characterized by impairments in social interaction, which are characterized by deficits in social interaction and stereotyped repetitive behaviors, as well as a narrow range of interests and activities. The social motivation hypothesis suggests that individuals with ASD have early deficits in social motivation that prevent them from attending to and learning from social information, resulting in a failure to acquire social experiences that further undermine the development of social cognition and social skills. There is some debate as to whether reward processing deficits in individuals with ASD are specific, i.e., reward processing deficits are manifested only with social stimuli, or generalized, i.e., reward processing deficits are present for both social and nonsocial stimuli. Both the choice of subjects of different ages, paradigms with different cognitive demands, and different reward materials may make a difference in the results. Therefore, the study proposes to use a social and monetary incentive delay paradigm combined with near-infrared spectroscopic imaging (fNIRS) technology to investigate the functional brain mechanisms of reward processing in school-aged children with ASD. Based on previous studies, the innovations of the experiment include:1. The experimental material is a dynamic video with social stimuli at the time of hitting as a video of a person showing a happy facial expression, thumbs up, and verbal praise.2. To further test whether both stages of reward processing, i.e., the anticipation and the outcome processing stages, are deficient in ASD individuals.3. Compared to other brain imaging research techniques, fNIRS is a non invasive functional brain imaging technique compared to other brain imaging research techniques and is more tolerant of motion noise, making it more suitable for the ASD population and allowing for later exploration of reward processing of social and non-social stimuli in children with ASD in real social situations.4. It has been found that anticipation of monetary and social rewards activates limbic structures in the brains of males and females differently, and therefore attention will be paid to comparing the activation of the brains of boys and girls with ASD in the study.

自闭症损害面孔知觉？自闭特质的不同子维度与类面孔错觉的关系

王珂瑜[1]　阮泳华[1]　石昕昱[1]　温喜云[1]　周柳芳[2]（通讯作者）　孟明[1]（通讯作者）
1 华南师范大学心理学院，广州，510631，mingmeng@m.scnu.edu.cn
2 上海外国语大学大学国际工商管理学院，上海，201620，liufang2022@shisu.edu.cn

摘 要　尽管自闭症人群存在面孔加工缺陷的这一问题被广泛讨论，但许多面孔加工相关的研究并未发现自闭症和正常人群在面孔加工能力上的显著差异。自闭症的异质性可能是导致这些冲突结果的一个关键混

淆因素，也是近年来备受关注和研究的话题。自闭症谱系问卷（Autism Spectrum Quotient，AQ）是最常使用的自闭特质自评量表，其二分性在临床和亚临床人群的心理测量学研究中得到了重复验证，具体表现为：使用 AQ 所测得的自闭特质可以被聚类或因子分析为社交特质（AQ-social）和刻板特质（AQ-rigidity）两部分，这为使用大样本研究自闭症不同子维度对面孔加工的影响机制提供了机会和工具。本研究创新性地使用面孔空想性错视，即在非面孔的物体中看到面孔的错觉，来研究不同自闭特质是如何影响面孔知觉的。研究结果表明，自闭特质的两个子维度与类面孔错觉之间的关系是相反的（N = 503）。在社会特质子维度得分较高的个体（在社交沟通方面自闭程度更高）更难看到虚幻的面孔（r = -.127, p < .001），而在刻板特质子维度得分较高的个体（在刻板性和模式化方面自闭程度更高）更容易受到面孔错觉的影响（r = .136, p < .001）。进一步地，中介模型分析结果表明，视觉表象这一高水平的认知能力在自闭特质和面孔知觉中起到中介作用，这表明自闭症在面孔加工相关过程中的不一致表现可能与一些潜在基础认知功能的失调有关。本研究暗示了自闭症异质性研究的重要意义，对自闭症亚型更为深入的分类研究将能够启发并推动自闭症的临床诊断和干预。

Autism impairs face perception? Opposite associations between different subclusters of autistic traits and illusory face recognition

Wang Keyu[1]　Ruan Yonghua[1]　Shi Xinyu[1]　Wen Xiyun[1]　Meng Ming[1]　Zhou Liu-Fang[2]

1 School of Psychology, South China Normal University, Guangzhou, China, 510631

2 School of Business and Management, Shanghai International Studies University, Shanghai, China, 201620

Abstract：Despite the widely discussed notion that facial processing deficits are present in autism, many studies have failed to provide evidence for qualitative impairments. Individual differences within the autistic population are likely to be a key confounding factor. As the most commonly used self-report measure of autistic traits, the Autism Spectrum Quotient (AQ) has been repeatedly validated in psychometric studies among clinical and subclinical populations. The dichotomy of the AQ specifically manifests as two clusters or factors: social traits (AQ-social) and rigidity traits (AQ-rigidity), providing an opportunity to conduct large-sample research on how heterogeneous autistic factors affect face perception. In this study, we innovatively used face pareidolia, the illusion of seeing faces in non-face objects or places, to investigate how different autistic traits affect face perception. Our results showed that the relationship between two AQ subclusters and illusory face detection were in opposite directions (N = 503). Individuals with higher scores on AQ-social trait (more autistic in social and communication aspects) were less likely to see illusory faces (r = -.127, p < .001), whereas those with higher scores on AQ-rigidity trait (more autistic in rigidity and pattern aspects) were more susceptible to the face pareidolia illusion (r = .136, p < .001). Further model analysis showed that high-level cognitive abilities such as imagination could mediate the relationship between autistic personality and face perception, indicating that there are comprehensive mechanisms underlying the inconsistent manifestations of autism in face-related processes. This research highlights the significance of studying heterogeneity in autism. Further studies on subtypes of autism can inspire and advance clinical diagnosis and interventions for autism.

家庭累积风险与初中生自伤行为：一个有调节的中介模型

赵晗序 齐冰（通讯作者）
河北大学教育学院，保定，071002，qibing@hbu.edu.cn

摘 要：目的：自伤作为自杀行为的重要预测因素之一，对个体发展具有较大的威胁性，且多发于初中阶段。基于人际风险模型，家庭因素在自伤行为发展中扮演重要角色，但其潜在机制还有待深入探讨。本研究基于累积风险模型和体验回避模型构建了有调节的中介模型，以探讨家庭累积风险与初中生自伤行为的关系，体验回避的中介作用及认知灵活性的调节作用。方法：采用累积家庭风险量表、接纳与行动问卷第二版、青少年自我伤害行为问卷及认知灵活性量表对 684 名初中生进行测查。结果：（1）自伤行为的性别差异显著，女生得分显著高于男生；（2）家庭累积风险与自伤行为、体验回避显著正相关,与认知灵活性显著负相关；（3）在控制性别和年级条件后，家庭累积风险对初中生自伤行为有显著的正向预测作用，体验回避在二者中间起中介作用；(4)认知灵活性调节了体验回避在家庭累积风险和自伤行为之间的中介效应，且前后半路径均有发生，即低认知灵活性群体中，这两种效应都更为显著。结论：家庭累积风险可通过体验回避影响初中生自伤行为，且认知灵活性对中介模型起到了调节作用。本研究证实了认知灵活性对体验回避和自伤行为干预的重要作用，研究结果为自伤行为的预防和干预提供新的视角。

The Effect of Cumulative Family Risk on Junior Middle School Students' Self-injury: A Moderated Mediating Model

ZHAO Han-xu, QI Bing
Hebei University, Baoding, 071002，China

Abstract: Self injury, as one of the important predictive factors for suicide behavior, poses a significant threat to individual development and is more common in middle school. Based on the Interpersonal risk model, Family factors play an important role in self-injury, but its potential mechanism still needs to be explore. Based on the cumulative family risk model and experiential avoidance model, this study designed a moderated mediation model to explore the relationship between cumulative family risk and self-injury in junior middle school students. Methods: 684 junior middle school students were investigated with the Cumulative Family Risk Scale, Acceptance and Action Questionnaire- II, Adolescent Self-Rating Life Events Check List and Cognitive Flexibility Inventory. Results:(1) self-injury scores had significant gender differences, girls scored significantly higher than boys.(2) Cumulative family risk was positively correlated with self-injury and experiential avoidance, negatively correlated with cognitive flexibility; (3) After controlling the gender and grade, cumulative family risk positively predicted self-injury among junior middle school students, experiential avoidance played a mediating role in the relationship between cumulative family risk and self-injury. (4) Cognitive flexibility moderated the mediating process of experiential avoidance between cumulative family risk and self-injury, and both front and back paths occurred. In the group with low cognitive flexibility, both effects are more significant. Conclusion: cumulative family risk affects self-injury through experiential avoidance, and cognitive flexibility moderated the the mediating effect.This study confirmed the important role of cognitive flexibility in intervening in experiential avoidance and self-injury. The results provide new ideas for the prevention and intervention of self-injury.

江西省社会科学“十四五”（2021 年）基金项目（编号：21JY48）

摘 要 网络受欺凌是在网络上受到他人恶意伤害的重大压力事件，会使受害者产生焦虑、孤独和适应不良等问题。由于网络具有匿名性和间接性的特点，网络欺凌造成的负面后果相比实际欺凌更加严重。前人研究大多关注网络欺凌对个体情绪及认知的负面影响，但较少研究关注在欺凌情境中的角色转变。亲欺凌行为是指个体在目睹他人受欺凌时，煽风点火、协助欺凌和冷眼旁观等行为的总称，这直接增加欺凌的强度和持续时间。本研究基于挫折攻击理论，认为遭受网络欺凌的个体，会显著增加个体现实的攻击行为。而根据认知—情感路径和社会学习理论，遭受网络欺凌的个体会显著提升焦虑抑郁水平，同时会认为欺凌在道德上是正确的，从而降低自身道德水平，并在目睹欺凌事件时更多地做出亲欺凌行为。因此本研究纳入情感因素（焦虑抑郁）和认知因素（道德推脱），探讨网络受欺凌者向消极欺凌旁观者的转变机制。

本研究使用网络受欺凌问卷、焦虑抑郁量表、道德推脱问卷和亲欺凌行为问卷对安徽、江西等地 35 个班级 1233 名青少年（男生 571 人，占比 46.3%，M_{age} = 15.25，SD = 1.31）进行施测。结果显示：（1）网络受欺凌显著正向预测亲欺凌行为（$\beta = 0.291$，$p < 0.001$）；（2）焦虑抑郁和道德推脱在网络受欺凌和亲欺凌行为中起完全中介作用，具体路径为：（a）高网络受欺凌显著正向预测焦虑抑郁（$\beta = 0.601$，$p < 0.001$），而高焦虑抑郁显著正向预测亲欺凌行为（$\beta = 0.085$，$p = 0.006$），中介效应为 0.051，占总效应 18.3%；（b）高网络受欺凌显著正向预测道德推脱（$\beta = 0.622$，$p < 0.001$），高道德推脱显著正向预测亲欺凌行为（$\beta = 0.302$，$p < 0.001$），中介效应为 0.188，占总效应 67.6%；（c）高焦虑抑郁显著正向预测道德推脱水平（$\beta = 0.151$，$p = 0.008$），且焦虑抑郁与道德推脱在网络受欺凌和亲欺凌行为之间起链式中介作用，中介效应为 0.027，占总效应 9.8%。本研究探讨了网络受欺凌者向欺凌消极旁观者转变的潜在机制，对未来介入、预防欺凌事件，减少亲欺凌行为有一定参考意义。
关键词 网络受欺凌，焦虑抑郁，道德推脱，亲欺凌行为

The Relationship between Cyber-victimization on Adolescents' Pro-bullying Bystander Behavior: Multiple Mediating Effects of Anxiety Depression and Moral Disengagement

Xu Ziwei[1] Yu Mingshen[1] Yang Lingqing[1] Bao Zhenzhou[1] (Corresponding author)
School of Educational Science, Gannan Normal University, Ganzhou, 341000

Abstract Cyber-victimization is a significant stressful event of being maliciously victimized by another person on the Internet, which can cause anxiety, loneliness and maladjustment in the victim. Due to the anonymity and

indirectness of the Internet, the negative consequences of cyber-victimization are more serious compared to actual victimization. Most previous studies have focused on the negative emotional and cognitive effects of cyber-victimization on individuals, but fewer studies have focused on role change in bullying situations. Pro-bullying behavior is a general term for joining the bully, supporting the bully through cheering or laughing, and remaining uninvolved when individuals witness others being bullied, which directly increases the intensity and duration of bullying. Based on the frustration-aggression theory, this study proposed that individuals who are subjected to cyber-victimization significantly increase individual realistic aggressive behaviors. And based on the cognitive-affective pathway and social learning theory, individuals who suffer from cyber-victimization significantly increase their anxiety and depression, as well as perceive bullying as morally right, thus lowering their own morality, which in turn engaging in more pro-bullying behaviors when witnessing bullying incidents. Therefore, this study incorporated affective (anxiety-depression) and cognitive (moral disengagement) factors to explore the mechanism of cyber-victimization individuals' transition to negative bullying bystanders.

In this study, a questionnaire was administered to 1233 adolescents (571 boys, 46.3%, M_{age} = 15.25, SD = 1.31) in 35 classes in Anhui and Jiangxi. Cyber-victimization questionnaire, anxiety-depression scale, moral disengagement questionnaire, and pro-bullying behavior questionnaire were selected. Data was analyzed using SPSS 26.0 and Mplus 8.0. The results showed that: (1) cyber-victimization have insignificant direct effects on pro-bullying behaviors, but significant indirect effect; (2) anxiety-depression and moral disengagement mediated the association between cyber-victimization and pro-bullying behaviors, which contained three significant mediating pathways: the separate mediating effects of (a) anxiety-depression and (b) moral disengagement, and the chain mediating effect of (c) anxiety-depression and moral disengagement. The total effect of the model is 0.278 and the mediation effects were 0.051, 0.188, and 0.027 respectively. These indirect effects accounted for 95.68% of the total effect. Conclusion: The present study reveals the potential mechanisms of cyber-victimization individuals' shift to bullying passive bystanders, which is informative for future intervention and prevention of bullying incidents and reduction of pro-bullying behaviors.

Keywords: cyber-victimization, anxiety-depression, moral disengagement, pro-bullying behavior

儿童路线学习中的前向测试效应作用

李甜甜　马小凤（通讯作者）

甘肃省行为与心理健康重点实验室，西北师范大学心理学院，兰州，730070，psymaxiaofeng@126.com

摘 要　前向测试效应是指与学习后重复学习或未做任何事情相比，对先前学过的信息进行测试有助于新信息的编码和提取。相对于目标信息,对非目标信息的测试被称为前置测试。为检验前置测试是否可以促进儿童对新路线信息的学习，将 209 名一、三、五年级儿童随机分为有前置测试的实验组（测试组）和无前置测试的对照组（重复学习组）。采用 Sketchup 专业作图软件建模，Lumion 软件进行渲染和编辑，搭建三维视觉空间背景中的游乐园场景，场景包含 8 个游乐项目地标形成 4 条不同方向的路线信息。儿童分别学习场景中的 4 条路线信息，最终进行目标信息即路线 4 的地标序列测试。结果发现，相比重复学习，对路线 1-3 进行前置测试能够提高儿童对路线 4（新路线信息）的学习。非目标信息正确回忆率的趋势发现，前置测试不断提高儿童的正确回忆率，表明儿童路线学习中前向测试效应的作用。中介分析结果表明对五年级儿童而言，前置测试可能是通过减少前摄干扰和心智游移而增强对路线 4 学习的记忆。对一、三年级儿童而言，测试更有可能是通过减少心智游移而不是抑制前摄干扰来促进对路线 4 的学习，即心智游移在儿童的路线学习中作用更大。这与先前在词单信息材料的研究结果不同，表明路线学习中抑制前摄干扰的能力发展相对较晚。结果揭示了在不同发展阶段，前向测试效应在路线学习中存在不同的起效机制。

关键词　路线学习，前置测试，儿童，心智游移，前摄干扰

The forward testing effect in children's route learning

LI Tiantian, MA Xiaofeng
(*Key Laboratory of Behavioral and Mental Health of Gansu province, Lanzhou 730070, China*)
（*School of Psychology, Northwest Normal University, Lanzhou 730070, China*)

Abstract：The forward testing effect refers to the fact that testing previously learned information facilitates the encoding and extraction of new information, compared to relearning or doing nothing after learning. Testing of non-target information relative to target information is called interpolated testing. To test whether interpolated testing can promote children's learning of new route information, 209 children in grades 1, 3, and 5 were randomly divided into an experimental group with interpolated testing (test group) and a control group without interpolated testing (repeated learning group). Sketchup professional mapping software was used for modeling, and Lumion software was used for rendering and editing to build the amusement park scene in the three-dimensional visual space background. The scene contains 8 amusement project landmarks to form 4 routes in different directions. Children learn the four routes information in the scene respectively, and finally carry out the landmark sequence test of the target information route 4. It was found that interpolated testing routes 1-3 improved children's learning of route 4 (new route information) compared to repeated learning. The results of non-target information recall show that the interpolated testing can continuously improve the correct recall rate of children, indicating the role of forward test effect in children's route learning. The results of mediation analysis suggest that for fifth graders, interpolated testing may enhance the memory of Route 4 learning by reducing proactive interference and mind wandering. For first and third graders, the test is more likely to promote route 4 learning by reducing mind wandering than by suppressing proactive interference, i.e. mind wandering plays a greater role in children's route learning. This is different from previous learning results in the vocabulary information materials, suggesting that the ability to suppress proactive interference in route learning develops is a relatively late-maturing phenomenon. The results show that there are different mechanisms of forward testing effect in route learning at different developmental stages.

Keywords：Route learning, Interpolated testing, Children, Mind wandering, Proactive interference

摘 要

本综述旨在分析间歇性爆发障碍（IED）、注意力缺陷多动障碍（ADHD）和行为障碍（CD）之间的关联，尤其是共同风险因素在这些障碍发展过程中的相对重要性。按照《系统综述和元分析首选报告项目》的指导原则，我们从多个数据库中获取了至少研究了其中两种障碍的研究。在获得的 564 篇文献中，有 31 篇被保留下来进行深入分析。从每项研究中提取了研究特点、样本、目的和主要发现。总体而言，研究结果表明：(1)共同的风险因素包括一系列不良童年经历，包括童年时期遭受暴力、早期养育质量差、家庭结构混乱、社会经济背景不利以及教育环境中的问题行为；(2)IED 的发病和维持更多与环境因素而非遗传因素有关，尽管后者的重要性已得到认可；(3)与多动症和儿童发育迟缓症相比，有关 IED 的研究相对有限，留下了许多重大的研究空白。因此，必须倡导对 IED 进行更多的研究，提高人们对 IED 的认识，以弥补现有的差距，为患有这种疾病的人提供更好的支持。

Abstract

This review aims to analyse the associations between Intermittent Explosive Disorder (IED), Attention-Deficit

Hyperactivity Disorder (ADHD), and Conduct Disorder (CD), particularly regarding the relative importance of shared risk factors in the development of these disorders. Studies that examined at least two of these disorders were obtained from multiple databases, following the guidelines of Preferred Reporting Items for Systematic Review and Meta-Analysis. Of the 564 documents obtained, 31 were retained for in-depth analysis. The study characteristics, samples, objectives and main findings were extracted from each study. Overall, the results suggest that (1) the shared risk factors encompass a range of adverse childhood experiences, including childhood exposure to violence, poor quality early parenting, disrupted family structure, socioeconomically disadvantaged backgrounds, and problematic behaviours within educational settings, (2) the causes for the onset and maintenance of IED are more associated with environmental factors than genetic factors, although the importance of the latter is recognised and (3) compared to ADHD and CD, research studies on IED is relatively limited, leave a lot of significant research gaps. It is crucial to advocate for more research and awareness of IED to bridge the existing gaps and provide better support for individuals with this disorder.

基于网络分析的精神疾病症状与行为抑制/激活系统敏感性的关系研究

杨学钧[1]，蔡新璐[1]（通讯作者）

[1]杭州师范大学基础医学院脑科学研究所，杭州，310012

Email: caixinlu@hznu.edu.cn

摘 要　随着社会压力和生活压力的增加，精神疾病和心理障碍已成为一个重大的公共卫生问题。目前，由于客观评估标准不足和发病机制不清等问题，还存在许多的共病精神疾病患者，因此，探究共病患者中不同精神症状之间的关系仍是一个亟待解决的问题。近年来，较多研究表明行为抑制/激活系统（Behavioral Inhibition/Activation System，BIS/BAS）敏感性是许多心理障碍和精神疾病的有效预测指标。同时，网络分析（Network analysis, NA）作为一种新兴的统计测量学方法在心理、社会等学科领域得到广泛应用，它具有通过构建网络模型来探讨症状之间的相互激活关系，并以可视化的方式呈现这些关系的优势。因此，本研究旨在通过网络分析的方法探究 BIS/BAS 与各类精神疾病症状之间的关系。本研究共招募了 963 名大学生，所有被试均完成了 BIS/BAS 敏感性、自闭特质、强迫特质、抑郁症状、焦虑症状和分裂型特质的测量。采用高斯图形模型（Gaussian graphical model, GGM）和扩展贝叶斯信息准则（Extended Bayesian Information Criterion, EBIC）来构建网络模型，共有 21 个网络节点。结果显示，BIS/BAS 敏感性与上述自闭特质问卷、强迫特质问卷、抑郁症状问卷和焦虑症状问卷的各个分量表之间都存在相关关系，在网络中，BIS 和 BAS 分别与焦虑症状分量表“特质焦虑”和自闭特质分量表“对细节的注意力”相关性最强，自助法得到的边权估计值的准确性较好，相关稳定系数为 0.75 以上；特质焦虑症状具有最大的节点强度，是行为抑制/激活系统敏感性和抑郁症状的桥梁节点，两者之间存在间接的联系；在分裂型特质方面，没有发现与 BIS/BAS 有显著的相关性。综上所述，BIS/BAS 敏感性在不同精神疾病症状评估量表的子维度上都有着直接的联系，可以作为未来研究和有效的靶向干预目标，同时，在针对共病精神疾病患者的治疗上具有潜在的临床价值和实践意义。

Explore the relationship between behavioural inhibition activation system sensitivity and psychiatric symptoms using network analysis

Xue-Jun Yang [1], Xin-Lu Cai[1,*]

[1] *Institute of Brain Science, School of Basic Medicine, Hangzhou Normal University, 310012, Hangzhou*

Abstract:

With the increase in social and life pressures, mental disorders and psychological disorders have become major public health problems. Currently, due to the lack of objective assessment criteria and unclear pathogenesis, many patients still experience co-occurring symptoms of psychiatric disorders. Therefore, exploring the relationship between psychiatric symptoms in comorbid patients remains an urgent issue to be addressed. In recent years, numerous studies have shown that Behavioral Inhibition/Activation System (BIS/BAS) sensitivity is an effective predictor of various psychological disorders and psychiatric diseases, such as anxiety and depression. Meanwhile, network analysis (NA), as an emerging statistical measurement method, has been widely applied in disciplines such as psychology and social sciences. It has the advantage of exploring the mutual activation relationships between symptoms by constructing network models and presenting these relationships in a visualized manner. Therefore, this study aims to investigate the relationship between BIS/BAS and various types of psychiatric symptoms using the method of network analysis. A total of 963 college students were recruited for this study. All subjects completed measures of BIS/BAS sensitivity, autistic traits, obsessive-compulsive traits, depressive symptoms, anxiety symptoms, and schizotypal traits. Gaussian graphical model (GGM) and Extended Bayesian Information Criterion (EBIC) were used to construct the network model with 21 network nodes. The findings revealed significant correlations between BIS/BAS sensitivity and each subscale of the Autistic Traits Questionnaire, Obsessive-Compulsive Traits Questionnaire, Depressive Symptoms Questionnaire, and Anxiety Symptoms Questionnaire mentioned earlier. In the network, BIS and BAS are significantly correlated with the anxiety symptoms subscale "Trait Anxiety" and the autistic traits subscale "Attention to detail", respectively. Additionally, the self-help method demonstrated accurate estimation of marginal weights, with correlation stability coefficients of 0.75 and above. Trait anxiety symptoms were identified as a bridge node between the behavioural inhibition/activation system sensitivity and depressive symptoms, indicating an indirect link between the two. However, no significant correlations were found between BIS/BAS and schizotypal personality. In summary, BIS/BAS sensitivity exhibits direct associations across various sub-dimensions of different symptoms of psychiatric disorders assessment scales. These findings highlight the potential for BIS/BAS sensitivity to serve as a focal point for future research and targeted interventions, offering clinical value and practical relevance in addressing patients with co-morbid psychiatric disorders.

大学生社交网站自我呈现对错失恐惧的影响：基于潜增长模型和交叉滞后模型

井玉汝 [1] 王树青 [2]（通讯作者）

[12] 济南大学教育与心理科学学院，山东济南，250022，jingyr961211@163.com

摘 要　数字化时代，虚拟社交网站成为大学生人际互动交往的主阵地，社交网站的匿名性、便利性等特

点为大学生进行自我形象展示和自我形象塑造提供了契机，但也为身心发展尚未成熟的大学生带来了诸多问题，错失恐惧便是常见之一。错失恐惧(Fear of Missing Out, FoMO)是指个体因害怕错过他人的新奇经历或正性经验而产生的一种普遍焦虑。大量研究发现，错失恐惧会导致问题性社交网站使用(Boustead & Flack, 2021; Müller et al., 2020)，降低大学生的自尊、自我评价(Barry et al., 2020)，因此探讨错失恐惧的发展趋势及其影响因素对于维护大学生身心健康发展具有重要意义。自我呈现是大学生使用社交网站的主要动机之一（姚琦，2014），是指个体为了建立或维护自己的形象，通过在社交网站中发布文字、图片、视频等信息的方式，有意或无意改变他人对自己的印象的过程，大学生常用的自我呈现策略包括积极自我呈现和真实自我呈现。根据使用与满足理论、社会支持的主效应模型以及以往研究，积极自我呈现可以正向预测错失恐惧（李静，2020），但是关于真实自我呈现对错失恐惧的影响目前少有研究者探讨。

本研究运用整群抽样的方法选取山东省三所普通高校的 743 名大学生，采用错失恐惧问卷、社交网站自我呈现问卷进行了三次追踪，每次间隔半年，采用 SPSS 26.0 和 Mplus 8.4 进行数据处理。研究一建立潜增长模型，考察大学生错失恐惧在一年内的发展趋势；研究二建立交叉滞后模型，考察大学生社交网站自我呈现与错失恐惧之间的关系，并通过平行发展的潜增长模型进行验证，主要得出以下结论：

（1）大学生的错失恐惧水平在一年之内呈整体下降发展趋势，且存在两种不同的发展轨迹，分别为快速下降轨迹（错失恐惧的初始水平更高，且下降速率更快）和缓慢下降轨迹（错失恐惧的初始水平相对较高，且下降速率较慢）；

（2）交叉滞后模型发现，大学生前一时间点的社交网站积极自我呈现可以显著正向预测后一时间点的错失恐惧，但前一时间点的社交网站真实自我呈现对后一时间点的错失恐惧的预测作用不显著，即积极自我呈现可以正向影响错失恐惧，真实自我呈现对错失恐惧的影响不显著；

（3）平行发展的潜增长模型发现，大学生的积极自我呈现可以显著预测错失恐惧的初始水平和发展速率，但真实自我呈现只能预测错失恐惧的初始水平，对发展速率的预测不显著。即大学生积极自我呈现的发展轨迹可以显著正向影响错失恐惧，真实自我呈现的发展轨迹对错失恐惧的影响不显著。

The impact of self-presentation on college students' fear of Missing out on social networking Sites: Based on latent growth model and cross-lagged model

Yuru Jing[1]　Shuqing Wang[2]

[12]School of Education and Psychological Science, University of Jinan, Jinan 250022, China

Abstract：With the advent of the digital age, virtual social networking sites have become the main places for college students to communicate with each other. The anonymity and convenience of social networking sites provide more opportunities for college students to show and build their self-image freely. However, it also brings a lot of problems to college students who are not mature physically and mentally. Fear of missing out is one of the common problems.Fear of missing out is characterized by the desire to stay continually connected with what others are doing. A large number of studies have found that the fear of missing out can lead to problematic use of social networking sites, and lower college students' self-esteem and self-evaluation.Therefore, it is of great significance to explore the development trend and influencing factors of the fear of missing out for maintaining the healthy development of college students. Self-presentation is one of the main motivations for college students to use social networking sites. It refers to the process in which an individual intentionally or unintentionally changes

others' impression of himself by publishing text, pictures, videos and other information on social networking sites in order to establish or maintain his own image. The commonly used self-presentation strategies of college students include positive self-presentation and true self-presentation. According to the use and gratification theory, the main effect model of social support, and previous studies, positive self-presentation can positively predict the fear of missing out . However, few researchers have explored the impact of true self-presentation on the fear of missing out.

In this study, we use the method of cluster sampling, taking the students of three universities in Shandong Province as the research objects.We used the Fear of Missing questionnaire and the social network self-presentation Strategy Questionnaire to measure these college students.The questionnaire was measured every six months and tested three times in total. Then SPSS 26.0 and Mplus 8.4 were used for data processing. First, a potential growth model was established to investigate the development trend of college students' fear of missing out in one year. In study 2, a cross-lagged model was established to investigate the relationship between college students' self-presentation and fear of missing out on social networking sites, and the following conclusions were drawn through the verification of the parallel development potential growth model.

(1) The level of college students' fear of missing out shows an overall downward trend within one year, and there are two different trajectrajectory, namely, the rapid downward trajectory (the initial level of fear of missing out is higher, and the decline rate is faster) and the slow downward trajectory (the initial level of fear of missing out is relatively high, and the decline rate is slower);

(2) The cross-lagged model finds that positive self-presentation on social networking sites at the pre-college time point can significantly and positively predict the fear of missing out at the post-college time point, but the real self-presentation on social networking sites at the pre-college time point has no significant predictive effect on the fear of missing out at the post-college time point, that is, positive self-presentation can positively affect the fear of missing out. The effect of true self-presentation on the fear of missing out was not significant;

(3) The parallel development potential growth model found that the positive self-presentation of college students could significantly predict the initial level and development rate of the fear of missing out, but the true self-presentation could only predict the initial level of the fear of missing out, and the development rate was not significant. That is, the development trajectory of positive self-presentation can significantly positively affect the fear of missing, while the development trajectory of true self-presentation has no significant impact on the fear of missing.

2-4 岁儿童数字映射发展研究

朱俊[1,2] 杨环瑜[1] 王淳[1] 蔡雪姣[1] 潘运[1]（通讯作者）

1 贵州师范大学，贵阳，550025, 通讯作者 E-mail：panyun129@163.com

2 西昌学院，西昌，615000

摘 要 人们传递数字信息通常有三种形式，一种是非符号阵列(arrays)，另外两种是符号数，即言语数词(verbal number words)和书面阿拉伯数字(written digits)。Dehaene(1992)提出了“三重编码模型”与之一一对应，即类比编码、听觉言语数词编码和视觉阿拉伯数字编码。值得注意的是，目前数词与阿拉伯数字(假定为映射路径 1)、阵列与数词(路径 2)、阵列与阿拉伯数字(路径 3)之间映射路径的发展顺序仍存在争议。前人的研究主要得出了三种潜在的发展顺序：路径 1 和 2 先于路径 3，路径 2 和 3 先于路径 1，或路径 2 先于路径

1 和 3。然而，研究者在探讨学前儿童数字映射路径的发展顺序时未考虑到数字大小的影响。因此在这项研究中，我们从五所幼儿园招募了 128 名 2-4 岁的儿童参与了所有六项数字映射任务来探究数字映射路径的发展顺序，其中每项任务均区分了小数(1-3)和大数(4-6)。结果表明：（1）在小数范围内，2 岁儿童中大多数已经开始学习了路径 1 和 2 的映射，然二者无显著差异；到了 3 岁，儿童在映射路径 2 上表现最优，其次是路径 1，最后是路径 3；到了 4 岁，三种映射表现几乎到达顶峰，均无显著差异。（2）在大数范围内，儿童到了 3 岁才学到了路径 1 的映射，路径 2 和 3 几乎还未发展；而到了 4 岁，路径 2 和 3 得到了发展，表现为路径 1 优于路径 2，最后是路径 3。这些结果或许印证了数量表征的两种机制:“感数”（subitizing）和近似数量表征机制。在感数范围内(1-3 或 4)，3 岁儿童更容易学习阵列和数词之间的映射（路径 2），而在学习大于数字 3 的路径 2 映射时，要映射准确往往需要用到计数策略，这对他们来说相对较难。相反，中国大多数儿童从 3 岁开始就在幼儿园学习 10 以内数词和阿拉伯数字之间的映射（路径 1）。因此，在大数范围内，儿童到 4 岁时路径 1 的发展反而超越了路径 2。总之，这些结果提供了新的见解，即数字大小和阿拉伯数字教育的开始时间均会影响数字映射的发展顺序。

Research on the development of numerical mapping for children aged 2-4

Jun Zhu[1,2], Huanyu Yang[1], Chun Wang[1], Xuejiao Cai[1] , Yun Pan[1,*]
1 Guizhou Normal University, Guiyang, China, Email: panyun129@163.com
2 Xi Chang University, Xi Chang, China

***Abstract*：** People usually transmit numerical information in three formats: one non-symbolic arrays and two symbolic formats (i.e., verbal number words and written digits). Correspondingly, Dehaene (1992) proposed a Triple-Code Model, which includes the analogical code, the auditory verbal number word code, and the visual Arabic digit code. It is worth noting that the developmental order of mapping between number words and digits (hypothesized mapping pathway 1), arrays and number words (pathway 2), arrays and digits (pathway 3) is still controversial. The results of previous studies have shown three potential developmental sequences: pathways 1 and 2 before pathway 3, pathways 2 and 3 before pathway 1, or pathway 2 before pathways 1 and 3. However, all of these studies focused on the developmental order of numerical mapping pathways for preschool children without considering the influence of number size. In the current study, we recruited 128 children aged 2-4 from five preschools to participate in all the six numerical mapping tasks distinguishing between small numbers (1-3) and large numbers (4-6) to explore the developmental order of numerical mapping pathways. The results suggest the following: (1) For small numbers, most of 2-year-old children began to learn mapping of pathways 1 and 2 without significant difference. By the age of 3, children performed best on pathway 2, followed by pathway 1, and finally pathway 3. By the age of 4, all three kinds of mapping almost met the ceiling without significant difference. (2) For large numbers, children didn't learn mapping of pathway 1 until 3 years old, and pathways 2 and 3 hardly developed. By the age of 4, children began to develop pathways 2 and 3, and pathway 1 was better than pathway 2, finally pathway 3. The results may confirm two mechanisms of number representation: subitizing and approximate magnitude representation. Within subitizing rage (1-3 or 4), it was easier for children aged 3 to learn mapping between arrays and number words (pathway 2). However, it was difficult for them to learn to map pathway 2 for numbers beyond 3, which needed a counting strategy to meet accuracy. On the contrary, most children from 3 years old have already begun to learn mapping between number words and digits (pathway 1) within 10 in

kindergartens in China. Therefore, when children reached the age of 4, the mapping development of pathway 1 went beyond pathway 2. Together, the results provide new insight that number size and the start time of Arabic digit education would influence the development of numerical mapping.

情绪效价和一体化对年轻人和老年人联结记忆的影响

臧佩瑶[1] 刘鹏[2]（通讯作者）

山西师范大学心理学系，山西，030024，通讯作者 E-mail：shk1985@126.com

摘 要　联结记忆是对项目与项目、项目与其背景之间关系的记忆。以往研究发现情绪会影响年轻人的联结记忆并且一体化能够促进联结记忆并改善联结记忆损伤，但情绪对老年人联结记忆的影响尚无定论。本研究选取情绪项目-场景材料，探究情绪效价和一体化对年轻人和老年人联结记忆的影响。实验 1 采用 3（项目效价：负性、中性、正性）×2（年龄：年轻人、老年人）的混合实验设计，因变量为联结记忆校正正确率，探究情绪效价对年轻人和老年人联结记忆的影响。实验 2 和实验 3 采用 2（语义相关性：相关、不相关）×2（空间距离：远、近）×2（年龄：年轻人、老年人）混合实验设计，实验操纵语义相关性和空间距离远近来控制概念一体化和知觉一体化水平，实验材料为负性和正性情绪项目-场景图片对，探究一体化对不同年龄群体的情绪项目-场景联结记忆的影响。结果发现：（1）情绪效价主效应显著，相比中性项目材料，负性情绪损害联结记忆，正性情绪促进联结记忆。（2）年龄主效应显著，老年人的联结记忆较差；情绪效价和年龄的交互作用显著，负性情绪损害年轻人的联结记忆但促进老年人的联结记忆。（3）语义相关性和空间距离主效应显著，语义相关和空间距离近促进年轻人和老年人的联结记忆并且两者交互作用显著，对于负性材料，语义相关在空间距离较远时对联结记忆的促进作用更为显著。以上结果表明情绪效价影响年轻人和老年人的联结记忆并且存在年龄差异，概念一体化和知觉一体化能够促进年轻人和老年人的联结记忆并调节情绪效价对联结记忆的影响。

Effects of emotional valence and unitization on associative memory in young and old adults

Zang peiyao[1]　Liu peng[2]

Shanxi Normal University, Shanxi, 030024

Abstract: Associative memory is the memory of the relationship between items and items, items and their context. Previous studies have found that emotion affects young people's associative memory. Unitization can promote associative memory and improve associative memory impairment, but the impact of emotion on associative memory in the elderly is still inconclusive. This study selected emotional item-scene materials to explore the effects of emotional valence and unitization on the associative memory of young and old people. In experiment 1, a mixed experimental design of 3(valence of items: negative, neutral, positive) ×2 (age: young, old) was adopted, and the dependent variable was the correct correction rate of associative memory. This study explored the influence of emotional valence on the associative memory of young and old people. In experiment 2 and experiment 3, 2 (semantic correlation: relevant, irrelevant)×2 (spatial distance: far, near)×2 (age: young, old) . The experiment manipulated semantic correlation and spatial distance to control the level of conceptual unitization and perceptual unitization. The experimental materials were negative and positive emotional item-scene pictures.

These experiments explored the effect of unitization on the associative memory of emotional item-scene in different age groups. The results showed that: (1) the main effect of emotional valence was significant. Compared with neutral item material, negative valence impaired the association memory, and positive valence promoted the association memory. (2) The main effect of age was significant, and the associative memory of the elderly was poor; The interaction between emotional valence and age was significant. Negative valence damaged the associative memory of young people and preserved the associative memory of old people. (3) The main effect of semantic correlation and spatial distance were significant. Semantic correlation and spatial distance almost improved the associative memory of young and old people, and their interaction was significant. For negative materials, semantic correlation had a more significant effect on associative memory when the spatial distance is far. These results indicate that emotional valence affects the associative memory of young and old people. Valence affects young and old people differently. Conceptual unitization and perceptual unitization can promote the associative memory of young and old people, and they regulate the effect of emotional valence on associative memory.
Key words: associative memory, emotional valence, unitization, the elderly

汉语阅读中高低工作记忆群体的预测加工机制

李卓尔[1]　鲍凌珊[1]　刘静仪[1]　王嫔[1]　李琳（通讯作者）[1]

1 心理与行为研究院，天津师范大学心理学部，天津，300387，linpsy@outlook.com

摘 要　预测加工是大脑的基本工作模式，大脑通过不断地预测编码、计算预测误差来进行正确的信息推断(Wei Wei et al., 2023)。阅读过程中的语义的加工会受到工作记忆的影响，个体存储语境信息的不同容量，转换、更新信息的不同速度，可能会影响阅读中的预测加工。要从机制层面探讨工作记忆对预测加工的影响，就要考察被试在工作记忆等认知资源充足或贫乏的条件下，是否会存在预测误差成本。当前研究目的：考察高低工作记忆能力群体在限制性和非限制性语境下加重或保持正常的工作记忆负荷，是否会产生预测误差成本，采用不同的预测加工机制。

当前实验测量了 79 名大学生被试的工作记忆，取得分前 20 人和得分后 20 人进行工作记忆高低分组。实验设置三种条件：限制性语境可预测目标词条件(CP)、限制性语境不可预测目标词条件(CU)和非限制性语境不可预测目标词条件(NU)(见附件，实验材料举例)。采用随注视点变化的掩蔽文本范式的变式，在掩蔽条件下读者看过的内容会被※掩蔽阻碍注意焦点的重新锁定，从而增加被试的工作记忆负荷。得到的数据采用 R 语言进行成对比较，限制性语境可预测目标词(CP)和限制性语境不可预测目标词(CU)条件比较得到预测性效应，而限制性语境不可预测目标词(CU)和非限制性语境不可预测目标词(NU)条件的比较可以得到预测误差成本是否存在。

结果发现，不管是工作记忆高分组还是低分组的被试，都没有出现预测误差成本，这表明两组被试均采用了等级扩散激活方式。另外，高工作记忆组被试在限制性语境条件下加工不可预测词的时间短于非限制性语境条件下加工同一个词的时间，体现在早期眼动指标上。这表明，在工作记忆能力较强的情况下，进行等级扩散式的预测加工会促进词汇识别，即便是低预测词，进一步证实了工作记忆在预测加工中的作用。
关键词　工作记忆，汉语阅读，预测加工，预测误差成本

Predictive processing mechanism of high and low working memory groups in Chinese reading

Zhuoer Li[1] Lingshan Bao[1] Jingyi Liu[1] Pin Wang[1] Lin Li[1]
1 Academy of Psychology and Behavior, Faculty of Psychology, Tianjin Normal University, Tianjin, China, 300387, linpsy@outlook.com

***Abstract*：** The processing and retention of semantic information during reading is affected by the capacity of working memory. Individuals with different cognitive abilities have different capacities of storing contextual information and different speeds of converting and updating information, which may show different degrees of predictive processing. In order to explore the effect of working memory on prediction processing from the mechanism level, it is necessary to investigate whether there will be prediction error cost under the condition of sufficient or poor cognitive resources such as working memory. The purpose of the current study: To investigate whether increasing or maintaining normal working memory load in restricted and unrestricted contexts will produce prediction error costs for groups with high or low working memory ability, and to adopt different prediction processing mechanisms.

The experiment measured the working memory of 79 college students, and the first 20 people and the last 20 people were divided into the working memory level. Three conditions were set in the experiment: The constraining context–predictable target word (CP), the constraining context–unpredictable target word condition (CU) and the neutral context– unpredictable target word (NU) adopt the variation of the masked text paradigm with the change of fixation point. Under the masked condition, the content read by the reader will be masked and thus hinder the relocking of the focus of attention. Thus, the working memory load of the subjects was increased. The obtained data are compared in pairs using R language. The predictive effect can be obtained by comparing the conditions of the constraining context– predictable target word (CP) and the constraining context–unpredictable target word condition (CU) in constrained context, while the existence of prediction error cost can be obtained by comparing the conditions of the constraining context–unpredictable target word (CU) and the neutral context–unpredictable target word (NU). Preliminary results are being analyzed.

The results showed that no prediction error cost occurred in either the high or low working memory group, suggesting that both groups adopted the graded prediction. In addition, the processing time of unpredictable words in the high working memory group was shorter than the processing time of the same word in the constraining context, which was reflected in the early eye movement index. Suggesting that graded prediction processing can promote word recognition in the case of strong working memory ability, even for low prediction words, further confirming the role of working memory in prediction processing.

***Key words*:** working memory, Chinese reading, predictive processing, prediction error cost

学龄儿童汉字识别能力的研究：基于视觉拥挤理论

盛晗 龚明亮 （通讯作者）
江西师范大学，南昌，330022
江西师范大学心理学院，南昌，330022，gongml@jxnu.edu.cn

摘 要 汉字识别是一项极为重要的能力，对汉字识别能力的训练也是学校学习的重要组成部分。国内外研究均表明，视觉拥挤是影响字体识别和阅读的重要因素，而文字本身的属性会影响文本间的视觉拥挤。然而，目前的研究仍集中在拼音文字，对视觉拥挤如何影响汉字识别和阅读还知之甚少。另外，这些研究大多关注的是阅读障碍这一特殊群体，对于处于从“阅读初学者”到“阅读熟练者”转变关键期的正常学龄儿童研究反而较少。本研究以小学生低年级（二年级）和高年级（五年级）儿童为研究对象，探讨汉字属性如

何影响汉字间的视觉拥挤，进而影响阅读。实验一通过操纵目标汉字和干扰汉字的距离验证小学生在识别汉字时是否受视觉拥挤的影响，并对两个年级学生的拥挤特点进行初步了解；实验二三分别考察了字体类型、字体大小和字体复杂度、字体粗细等文字本身的属性对学龄儿童对汉字识别的影响。结果发现：（1）小学生在识别汉字时显著地受视觉拥挤的影响；（2）三个实验中，高年级儿童汉字识别的正确率都显著高于比低年级儿童；（3）字体类型、大小、复杂度和粗细主效应都显著。无论是高年级还是低年级学龄儿童，对黑体字的识别最好，宋体次之，楷体再次之，仿宋最低；随着字体的增大，识别的准确率也会更高；对加粗的和复杂度较低的字体的识别也比常规和复杂度较高的字体的识别更准确；（4）字体大小和字体类型交互作用显著，儿童在字体较小的情况下对宋体字的识别准确率较高，但在较大汉字的识别中，对于仿宋和楷体字的识别都比宋体字更加精确。本研究表明，相比于高年级儿童，低年级儿童受视觉拥挤的影响更大，这种差异不受汉字本身属性的影响；无论是高年级还是低年级儿童，对黑体字的识别都比其他字体更准确，对更大、更粗、更简单的字体识别得也更准确。

Chinese character recognition ability in school-age children: A study based on the visual crowding theory

Han Sheng, Mingliang Gong (Corresponding author)
School of Psychology, Jiangxi Normal University, Jiangxi

Abstract：The ability to recognize Chinese characters holds immense importance aand training Chinese character recognition ability is also an integral part of school education. Extensive study, both domestically and internationally, has demonstrated that visual crowding is an important factor affecting text recognition and reading,and that the properties of the text itself affect the visual crowding between texts. However, previous studies have primarily focused on alphabetic scripts, leaving a notable gap in understanding the effects of visual crowding on Chinese character recognition and reading. Furthermore, most studies have concentrated on dyslexic children, while there is a dearth of research on school-age children who are in a critical period of transitioning from “beginning readers” to “proficient readers”. This study aims to investigate how the properties of Chinese characters affect visual crowding among Chinese characters, which in turn affects reading ,from low grades (second grade) to high grades (fifth grade). Experiment 1 validates the existence of visual crowding in Chinese characters and preliminarily explores the crowding characteristics of students in both grades by manipulating the distance between target characters and interfering characters. Experiments 2 and 3 respectively investigate the influence of character attributes, such as font type, font size, font complexity, and font thickness, on Chinese character recognition in school-age children. he results show that: (1) Elementary school students are significantly affected by visual crowding when recognizing Chinese characters. (2) Across all three experiments, high-grade children consistently exhibited significantly higher accuracy in Chinese character recognition compared to low-grade children. (3) The main effects of font type, font size, font complexity, and font thickness were all significant. School-age children recognized Hei fonts significantly better than Song font, followed by Kai font, and then FangSong font. As the font size increases, the recognition accuracy also improves. The recognition of bold and low complexity fonts is more accurate than that of regular and high complexity fonts. (4) The interaction between font size and font type was significant. Children displayed higher accuracy in recognizing Song font when the font was smaller, but when it came to larger Chinese characters, the recognition of FangSong font and Kai font was more accurate than Song font. This study indicates that low-grade children are more affected by visual crowding compared to high-grade children Both high-grade and low-grade children demonstrate greater accuracy

in recognizing Hei fonts compared to other fonts. Additionally, they exhibit greater accuracy in recognizing larger, bolder, and simpler fonts.

师生关系与留守初中生学校适应的关系：心理弹性的中介作用及干预研究

马婉[1]　刘鹏[2]（通讯作者）

山西师范大学教育科学学院，太原，030000，631572060@qq.com

摘 要　学校适应是学生与学校环境交互作用的过程中，在学业和人际关系等领域所表现出的行为方式或能力。以往的研究主要关注了个体内部特质和外部环境对学校适应的影响，却忽视了留守初中生内外部因素的共同作用。研究发现，心理弹性和师生关系对留守初中生的学校适应起着重要作用。因此，本研究旨在从内外因素的交叉影响角度，探讨留守初中生的师生关系、心理弹性与学校适应之间的关系，并通过提升心理弹性水平来增强学生的学校适应能力。研究一以 510 名留守初中生为被试，填写了师生关系量表、青少年心理弹性量表和初中生学校适应量表。结果表明：(1)留守初中生师生关系、心理弹性和学校适应在性别、年级、是否班干部、是否独生子女和生源地上存在显著差异。(2)留守初中生师生关系、心理弹性和学校适应之间存在显著正相关，师生关系和心理弹性对学校适应具有正向预测作用。(3)留守初中生的心理弹性在师生关系和学校适应之间起到部分中介作用。研究二为干预研究，对心理弹性较低的 32 名留守初中生进行为期 8 次的团辅活动干预。其中 16 名参与了心理弹性团辅干预，而另外 16 名参与了非心理弹性团辅干预。结果显示，在团体心理辅导干预后，实验组和对照组的心理弹性水平存在显著差异，说明提升心理弹性的团体心理辅导能够有效改善留守初中生的学校适应。本研究探讨了留守初中生师生关系、心理弹性和学校适应的作用机制，并通过提升心理弹性水平来增强学生的学校适应能力。启示一线心理健康教育工作者，当学生个体的自变量不易调节时，可以直接作用于中介变量，进而影响因变量，即当留守初中生的师生关系不易直接影响时，也可以通过心理健康课程或团体心理辅导活动间接提升学生的心理弹性水平，从而增强留守初中生的学校适应能力。

关键词　留守初中生，心理弹性，师生关系，学校适应，团体心理辅导

The Relationship among Teacher-Student Relationship and School Adaptation of Left-Behind Middle School Students: the Mediating Role of Resilience and Intervention

MaWan[1],Liu Peng[2](Corresponding Author)

School of Educational Science, Shanxi normal University, TaiYuan,030000

Abstract：School adaptation is the behavior or ability of students in areas such as academic and interpersonal relationships in the process of interacting with the school environment. Previous studies mainly focused on the influence of individual internal characteristics and external environment on school adaptation but ignored the combined effect of internal and external factors on left-behind junior high school students. Studies found that resilience and teacher-student relationship play an important role in the school adaptation of left-behind junior high school students. Therefore, this study aims to explore the relationship between teacher-student relationship,

psychological resilience, and school adaptation of left-behind junior high school students from the perspective of cross-influence of internal and external factors, and to enhance students' school adaptability by improving their resilience level. Study 1 took 510 left-behind junior middle school students as the subjects, and filled in the teacher-student relationship scale, the adolescent resilience scale, and the school adaptation scale of junior middle school students. The results found that: (1) there are significant differences in the teacher-student relationship, resilience, and school adaptation in gender, grade, the class cadre, whether the only child and the source of students. (2) There is a significant positive correlation between the teacher-student relationship, resilience, and school adaptation of left-behind junior middle school students. The teacher-student relationship and resilience have a positive predictive effect on school adaptation. (3) The resilience of left-behind junior high school students plays a partial mediating role between the teacher-student relationship and school adaptation. The second study was an intervention study, which intervened for 32 left-behind junior high school students with low resilience 8 times. Sixteen participated in the resilience group intervention, while the other 16 participated in the nonpsychological resilience intervention. The results found that after the group psychological counseling intervention, the level of resilience was significantly different between the experimental group and the control group, indicating that the group psychological counseling to improve resilience can effectively improve the school adaptation of left-behind junior middle school students. The significance of this study is to explore the teacher-student relationship, resilience, and school adaptability of left-behind junior high school students, and to enhance students' school resilience by improving the level of resilience. For a line of mental health education workers, when the student's independent variable is not easy to adjust, can directly act on the intermediary variables, thus affecting the dependent variable, namely when the relationship between teachers and students is not easy to directly influence, can also be through mental health courses or group psychological counseling activities indirectly improve the students' psychological toughness level, to enhance the school of junior high school students.

Keywords：Left-behind junior high school students, Resilience, Teacher-student relationship, School adaptation, Group psychological counseling

道德认同对听力受损青少年面部情绪加工的影响：一项 ERP 研究

胡友松[1, 2] 夏骁凯[1, 2] 陈 俊[2]（通讯作者）徐光泉[3]

3 屏山县锦屏镇富荣九年一贯制学校，宜宾，645350

摘　要　个体根据其道德观选择接近或回避他人，而道德观是影响人们在社交场合中如何相互交往的重要因素。在青少年时期，听力受损显著影响人们在社交环境中的沟通，而这个阶段对于情感和社交发展至关重要。当前研究关注的重要问题是，他人的道德水平是否会影响听力受损青少年对面部情绪表达的识别，而这种影响是否同样存在于听力正常的青少年身上。本研究通过道德启动范式，研究了道德水平（高道德、低道德）对听力受损青少年对面部情绪（快乐、中性和愤怒）认知的脑机制。研究结果显示，听力正常的青少年在判断面部表情的情绪效价时与面孔的道德水平无关，而听力受损的青少年对低道德面孔的情绪效价评价低于高道德面孔。进一步的 ERP 分析显示，对于听力正常的青少年，道德水平信息的处理在面部情绪信息处理的早期阶段（N1、P1）有所反映，但在听力受损的青少年中，并未在这个阶段反映出来。然而，道德效应在听力受损的青少年面部情绪处理的中期（N2）和后期（LPP）显著，但在早期阶段没有显现出来。

The effect of moral identity on facial emotion processing in

Adolescents with hearing loss: An ERP study

Yousong Hu[1] Xiaokai Xia[2] Jun Chen[2] (corresponding author) Guangquan Xu[3]

***Abstract*:** Individuals choose to approach or avoid others depending on their morality, and morality is a significant component that influences how people engage with one another in a social situation. Hearing impairments significantly affect how people communicate in social settings during adolescence, a vital period for people's emotional and social development. Significant issues of concern in the current study are whether the moral level of others influences the recognition of facial emotion expressions in adolescents with hearing loss and whether this effect is the same for the adolescents with typical hearing. The brain mechanisms underlying the impact of different moral levels (high moral, low moral) on the perception of facial emotions (happy, neutral, and angry) in adolescents with hearing loss have been studied using the moral priming paradigm. The findings showed that while adolescents with typical hearing judged the emotional valence of facial expression independent of the moral level of faces, adolescents with hearing loss rated the emotional valence of low moral faces lower than that of the high moral faces. Further ERP analysis revealed that the processing of moral level information was reflected in the early stage of facial emotion information processing (N1, P1) for adolescents with typical hearing, but it was not reflected in this stage for adolescents with hearing loss. However, the moral effect was significant in the middle (N2) and late stage (LPP) of the facial emotion processing for adolescents with hearing loss, but not in the early stage.

不同未来时间洞察力手机使用者的抑制控制特点

赵思琦[1] 杨海波[1,2]

1 天津师范大学心理学部，天津，300387

2 天津师范大学心理与行为研究院，天津，300387，yanghaibo@tjnu.edu.cn

摘 要 随着技术发展，智能手机拥有量在全球范围内持续增加，手机使用给现代生活带来巨大的便利，同时也给个体和社会带来了严重的危害。已有研究发现，未来时间洞察力是影响手机使用行为的重要因素，并且手机成瘾个体通常具有较低的抑制控制能力。本研究旨在通过实验的方法探讨不同未来时间洞察力手机使用群体的抑制控制特点。研究选取大学生群体，采用未来时间洞察力量表和智能手机成瘾量表，将被试分为四组，即，高时间洞察力手机成瘾组、高时间洞察力非手机成瘾组、低时间洞察力手机成瘾组和低时间洞察力非手机成瘾组。实验采用 2（未来时间洞察力：高、低）*2（手机使用：成瘾组、非成瘾组）*2（任务：朝向眼跳、反向眼跳）的被试间设计，使用眼动追踪技术与眼跳任务相结合。结果分析发现:（1）在朝向眼跳任务中，未来时间洞察力和手机使用的主效应和交互效应均不显著；（2）在反向眼跳任务中，未来时间洞察力的主效应不显著，手机使用的主效应显著，具体表现为成瘾组具有较高的错误率且潜伏期长；（3）未来时间洞察力和手机使用的交互作用显著。进一步简单效应分析发现，在高未来时间洞察力条件下，成瘾组和非成瘾组的均具有较低的错误率，且潜伏期较短；在低未来时间洞察力条件下，相比非成瘾组，成瘾组具有更高的错误率和更长的潜伏期。这一结果表明，在高未来时间洞察力条件下，成瘾和非

成瘾群体均具有较好的抑制控制能力；但是当个体的未来时间洞察力较低时，抑制控制能力较差，其中成瘾组的抑制控制能力最差。

The Features of inhibitory control of Smartphone users with different future time perspectives

Siqi Zhao[1] Haibo Yang[1,2]
1 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387
2 Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, 300387,
yanghaibo@tjnu.edu.cn

***Abstract*:** With the development of technology, smartphone ownership continues to increase globally, and while smartphone use brings great convenience to modern life, it also leads to serious harm to individuals and society. Future time perspective has been found to be an important factor influencing smartphone use behavior and that individuals with smartphone addiction typically have poor inhibitory control. The purpose of this study was to explore the inhibitory control features of smartphone users with different future time perspectives through an experimental approach. College students were selected for the study and the subjects were categorized into four groups using Future Time perspective Scale and Smartphone Addiction Scale, i.e., High time perspective-Addiction Group, High time perspective-Non Addiction Group, Low time perspective-Addiction Group and Low time perspective-Non Addiction Group. The experimental design was a between-subjects design with 2 (future time perspective: high, low) * 2 (smartphone use: addicted group, non-addicted group) * 2 (task: pro-saccade, anti-saccade). Using eye tracking technology in conjunction with a saccade task. The analysis of the results revealed that:(1) The main and interaction effects of future time perspective and smartphone use were not significant in the pro-saccade;(2)in the anti-saccade, the main effect of future time perspective was not significant, the main effect of smartphone use was significant, and post hoc comparisons revealed that the addicted group had higher error rates and longer latency. (3)The interaction between future time insights and cell phone use is significant, simple effects analyses revealed that both the addicted and non-addicted group's had lower error rates and shorter latency in the high future time perspective condition; However, in the low future time perspective condition, the addicted group had higher error rates and longer latency compared to the non-addicted group. This result suggests that under high future time perspective conditions, both addicted and non-addicted groups had better inhibitory control ; however, inhibitory control was poorer when individuals had low future time insight, with the addicted group having the worst inhibitory control.

***Keywords*:** future time perspective, smartphone use, inhibitory control

小学儿童的道德提升感对社会善念的影响——心理理论的中介作用

叶舒瑶[1]　孙美荣[1]（通讯作者）

1 北京体育大学心理学院，北京，100091，leer@bsu.edu.cn

摘 要　社会善念是一种个体有意识地去关注、尊重并保护他人选择的需要和权利的亲社会行为。道德提升感是指个体由于看到或了解到他人积极的道德行为，欣赏、称赞他人的美德并引起个体对他人利益的关注，使个体产生亲社会认知变化及行为倾向的一种积极道德情绪。前人研究发现道德提升感的诱发能有效提升个体亲社会行为的倾向，而 9-12 岁的儿童的道德观正处于“服从权威者”向“关注该道德行为是否利人”转变的重要阶段，处于道德提升感培养的重要阶段，我们猜想，道德提升感会对该年龄段儿童的社会善念产生重要影响。此外，我们引入了前人研究中与二者均有显著正相关的心理理论这一变量，探索其在道德提升感与社会善念的关系中的作用。

本研究采用道德提升感问卷、社会善念的 SoMi 范式和卡通插画心理理论范式对 43 名小学儿童（10.5 ± 0.78 岁，男 22 人）进行了研究。结果发现，道德提升感问卷中“对自己的认知” ($p = 0.032$) 和“对他人的认知” ($p = 0.041$)两个维度，在性别上存在显著差异，女生比男生的道德提升感更强。在心理理论测试中，在情感心理理论维度上 4、5 年级之间呈现出了显著的差异($p = 0.043$)。相关分析结果显示，小学儿童道德提升感与社会善念呈显著正相关($r = 0.61$, $p = 0.004$)；心理理论与社会善念($r = 0.25$, $p = 0.028$)和道德提升感($r = 0.22$, $p = 0.008$)均呈显著正相关。此外，我们发现，小学儿童道德提升感、社会善念及心理理论三者的中介模型拟合较好：总效应显著($c = 0.476$, $t = 5.136$, $p = 0.006$)，中介效应占比达 29.83%。道德提升感对社会善念的直接效应显著($c = 0.334$，$t = 8.948$, $p = 0.004$)，心理理论的间接效应显著($c = 0.142$，$t = 1.222$, $p = 0.030$)。

总体而言，研究结果表明，小学儿童在道德提升感上存在性别和年龄差异，且年龄越大，心理理论能力越强。小学儿童的道德提升感对社会善念存在显著的正向预测作用，而心理理论在小学儿童道德提升感和社会善念间起部分中介作用。我们的研究提示，通过提高儿童的道德提升感和心理理论水平，可以培养儿童的社会善念，从而促进儿童的亲社会行为。

The Influence of Primary School Children's Sense of Moral Elevation on Social Mindfulness: The Mediating Role of Mind Theory

Shuyao Ye[1]　Meirong Sun[1](corresponding author)

1 School of Psychology, Beijing Sport University, Beijing 10091, China

Abstract：Social mindfulness refers to the behavior that an individual consciously and actively considers the needs of others or leaves options for others when making a choice. The sense of moral elevation refers to a positive moral emotion in which an individual sees or understands the positive moral behavior of others, appreciates and praises the virtues of others, and arouses the individual's attention to the interests of others, resulting in prosocial cognitive changes and behavioral tendencies. Previous studies have found that the induction of the sense of moral elevation can effectively improve the tendency of individual prosocial behavior, and the moral view of children aged 9-12 is in an important transformation stage from "obeying authority" to "paying attention to whether the moral behavior is beneficial to others", which is also an important stage of the cultivation of the sense of moral elevation. We suspected that the sense of moral elevation has an important impact on the social mindfulness of children in this age group. In addition, we introduced a variable of mind theory, which has a significant positive

correlation with both of them in previous studies, to explore its role in the relationship between moral enhancement and social mindfulness.

A total of 43 primary school children (10.5 ± 0.78 years old, 22 males) were recruited using the moral enhancement questionnaire, the SoMi paradigm of social mindfulness and the cartoon illustration mind theory paradigm. The significant gender difference was showed in two dimensions of "self-awareness" ($p = 0.032$) and "awareness of others" ($p = 0.041$) in the sense of moral enhancement questionnaire. Girls had stronger sense of moral enhancement than boys. In the test of mind theory, grades 4 and 5 showed significant difference in the dimension of affective mind theory ($p = 0.043$). The results of correlation analysis showed that there was a significant positive correlation between primary school children's sense of moral improvement and social mindfulness ($r = 0.61$, $p = 0.004$). There was significant positive correlation between mind theory and social mindfulness ($r = 0.25$, $p = 0.028$) and moral enhancement ($r = 0.22$, $p = 0.008$). In addition, we found that the mediating model of primary school children's sense of moral enhancement, social benevolence and mind theory was well fitted: the total effect was significant ($c = 0.476$, $t = 5.136$, $p = 0.006$), and the mediating effect accounted for 29.83%. The direct effect of sense of moral elevation on social mindfulness was significant ($c = 0.334$, $t = 8.948$, $p = 0.004$), and the indirect effect of mind theory was significant ($c = 0.142$, $t = 1.222$, $p = 0.030$).

Overall, the results showed that there were gender difference in elementary school children's sense of moral enhancement, and the older the age, the stronger the mind theory ability. The sense of moral elevation of Elementary school children had a significant positive predictive effect on social mindfulness, and psychological theory played a partial mediating role between elementary school children's sense of moral elevation and social mindfulness. Our research suggested that by improving children's sense of moral elevation and mind theory, children's social mindfulness and children's prosocial behavior may be promoted.

父母关爱、父母鼓励自主与青少年物质主义价值观的关系：感恩和自我控制的并行中介作用

耿影慧 张野（通讯作者）
沈阳师范大学教育科学学院，沈阳，110034，zhangye_psy@163.com

摘 要 近年来，物质主义逐渐成为青少年群体的一种突出意识形态，财富经常在年轻人的生活愿望中名列前茅，盲目攀比、冲动消费、崇尚奢侈品的现象也屡见不鲜。物质主义(materialism)是一种个人价值观，它强调获取物质财富的重要性。从长远来看，物质主义价值观给青少年的身心健康带来诸多不良影响。研究发现，高物质主义青少年对学校持消极态度，学业成绩不佳，出现吸烟、喝酒、强迫性购买等问题行为以及因对物质财富的永不满足的追求而产生的环境枯竭。同时，物质主义价值观也是引发焦虑、抑郁等消极情绪重要因素之一。鉴于物质主义价值观导致的一系列负面结果，深入挖掘青少年物质主义价值观形成机制，对于引导青少年客观认识物质主义价值观，养成健康理性的消费心理和行为具有较重要的现实意义。本研究以广州、珠海 6 所高校共 1097 名青少年为研究对象，采用父母教养方式问卷、 感恩问卷、自我控制问卷以及物质主义量表考察父母教养方式(包括关爱、鼓励自主)与青少年物质主义价值观的关系，以及感恩、自我控制的中介作用。结果表明：(1)父母关爱、父母鼓励自主显著负向预测青少年物质主义价值观；(2)感恩和自我控制在父母关爱、父母鼓励自主与青少年物质主义价值观之间具有并行中介作用。研究结果提示积极教养方式的重要作用，提示父母要学会看见并接纳子女的情绪表达，及时提供信息反馈，减少控制策略，给予子女更多的情感支持等；同时学校应多举办实践活动，加强家校联系，根据学生的情况设计并举办公益活动，为青少年健康成长创造良好的学习生活环境。

关键词 父母关爱，父母鼓励自主，物质主义，感恩，自我控制

The Relationship Between Parental Care, Parental Encouragement of Autonomy and Adolescent Materialistic Values: The Parallel Mediating Role of Gratitude and Self-Control

Yinghui Geng, Ye Zhang
College of Education Science, Shenyang Normal University, Shenyang, 110034,
zhangye_psy@163.com

Abstract: In recent years, materialism has gradually become a prominent ideology among the youth population, with wealth often topping the list of young people's life aspirations, and the phenomenon of blind comparison, impulsive consumption, and reverence for luxury goods is not uncommon. Materialism (materialism) is a personal value that emphasizes the importance of acquiring material wealth. In the long run, materialistic values bring many adverse effects to the physical and mental health of adolescents. Studies have found that highly materialistic adolescents have negative attitudes toward school, poor academic performance, problematic behaviors such as smoking, drinking, and compulsive buying, as well as environmental depletion due to the insatiable pursuit of material possessions. At the same time, materialistic values are one of the important factors that trigger negative emotions such as anxiety and depression. In view of the series of negative outcomes caused by materialistic values, it is of greater practical significance to dig deeper into the formation mechanism of adolescents' materialistic values in order to guide adolescents to objectively understand materialistic values and to develop healthy and rational consumption psychology and behavior. In this study, a total of 1,097 adolescents from six universities in Guangzhou and Zhuhai were studied, and the relationship between parenting styles (including caring and encouraging autonomy) a

nd adolescents' materialistic values was examined by using the Parenting Styles Questionnaire, the Gratitude Questionnaire, the Self-Control Questionnaire, and the Materialism Scale, as well as the mediating roles of Gratitude and Self-Control. The results indicated that: (1) Parental care and parental encouragement of autonomy significantly and negatively predicted adolescents' materialistic values; (2) Gratitude and self-control had parallel mediating roles between parental care, parental encouragement of autonomy, and adolescents' materialistic values. The findings suggest the important role of positive parenting styles, suggesting that parents should learn to see and accept their children's emotional expressions, provide timely feedback, reduce control strategies, and give more emotional support to their children, etc. Meanwhile, schools should organize more practical activities, strengthen home-school contact, and design and organize public welfare activities according to the students' situations to create a good learning and living environment for adolescents to grow up healthily.

Keywords：Parental care, Parental encouragement of autonomy, Materialism, Gratitude, Self-control

延迟奖赏预期对青少年的激励效应消失

荣亚朝 1,2　董佳瑞 1　孙怡彤 1　魏萍 1（通讯作者）

1 首都师范大学心理学院，北京，100048
2 河南师范大学心理学院，新乡，453006
通讯作者 E-mail：aweiping@gmail.com

摘 要　奖赏预期对行为的激励效应随着奖赏交付时间延迟而减弱。根据可能获得的奖赏预期线索，投入认知努力从而获得期待的奖赏，需要脑内奖赏系统和认知控制系统的共同参与。这两个系统的交互作用如何受到年龄发展阶段和奖赏类型（例如初级奖赏 vs.次级奖赏）的影响仍不清楚。我们假设，青春期阶段奖赏加工系统的超前发展和认知控制系统的滞后发展可能导致个体偏向即时奖赏（vs.延迟奖赏），从而影响不同奖赏条件下的认知努力投入。本研究招募 160 名有效被试，采用 3×2×3 混合设计，通过操纵金钱激励延迟任务（monetary incentive delay，MID）的奖赏预期线索，探索了不同交付时间的初级奖赏和次级奖赏对不同年龄群体被试的行为激励效应。第一个因素是年龄：儿童（10.71 ± 0.61 岁）、青少年（13.93 ± 0.67 岁）和成人（22.67 ± 2.49 岁）；第二个因素是奖赏类型：初级奖赏和次级奖赏，是被试间变量，分别采用糖果和金钱（价值匹配）作为额外奖赏；第三个因素是交付时间：即时奖赏、延迟奖赏和无奖赏条件，是被试内变量，通过任务前线索进行操纵，该线索分别提示被试当前试次的额外奖赏是即时交付，还是延迟三个月后交付，或者是没有额外奖赏。对单试次数据进行线性混合模型分析显示，奖赏预期的激励效应（有奖赏条件减无奖赏条件的反应时）随交付时间的延迟而减弱、随年龄的增长而增强、次级奖赏强于初级奖赏。重要的是，结果表现出年龄和交付时间的交互效应：即时奖赏预期（相比于无奖赏和延迟奖赏条件）可以促进所有年龄群体被试的行为表现，然而，延迟奖赏预期（相比于无奖赏条件）仅能促进儿童和成人被试的行为表现，没有促进青少年被试的行为表现。这些结果表明延迟奖赏预期对青春期个体的动机激励效应减弱，甚至消失。青春期个体对延迟奖赏预期不敏感，较难对延迟奖赏的价值表征进行有效地自上而下认知控制，从而较少促进任务表现。该研究首次从发展角度探究交付时间对奖赏预期激励效应的影响，并从奖赏预期影响任务表现角度提供了青少年对延迟奖赏不敏感的证据。

关键词　青春期，延迟奖赏，奖赏预期，次级奖赏，金钱激励延迟任务

The incentive effect of delayed-reward expectation disappears in adolescents

Yachao Rong[1,2]　Jiarui Dong[1]　Yitong Sun[1]　Ping Wei[1*]
1 School of Psychology, Capital Normal University, Beijing 100048, China
2 School of Psychology, Henan Normal University, Xinxiang 453006, China

***Abstract*:** The incentive effect of reward expectations on behavior weakens as the reward delivery time is delayed. The engagement of cognitive effort to gain the expected rewards signaled by reward cues relies on the collaboration of the reward processing system and the cognitive control system. However, the influence of developmental stages and reward types (e.g., primary rewards vs. secondary rewards) on the interplay between these two systems remains unclear. We hypothesized that adolescents exhibit a stronger preference for immediate rewards over delayed rewards due to the advanced development of their reward processing system compared to

their cognitive control system, in turn, this preference may influence the cognitive effort invested by adolescents under different reward conditions. We manipulated the reward-expectation cues in the Monetary Incentive Delay (MID) task and employed a 3 × 2 × 3 mixed design in a sample size of 160 valid participants to investigate the behavioral incentive effects of primary and secondary rewards with different delivery time across various age groups, focusing particularly on adolescents. The first factor was age, included three groups: children (10.71 ± 0.61 years old), adolescents (13.93 ± 0.67 years old), and adults (22.67 ± 2.49 years old). The second factor was reward type, included primary and secondary rewards, which was a between-subject variable. Candy and Money (value matched) served as primary and secondary rewards, respectively. The third factor was delivery time, included immediate reward, delayed reward, and no reward conditions, which was a within-subject variable. The delivery time was manipulated with the pre-target cue for each trial, indicating whether participants would receive an additional reward immediately, after a delay of three months, or no additional reward. Based on the single-trial data, the linear mixed-effects model results revealed that the incentive effect of reward expectation (measured by the reaction time difference between reward and no-reward conditions) decreased with delivery time delays, increased with age, and was stronger for secondary than primary rewards. Importantly, the interaction effect between age and delivery time was observed: the incentive effects of the immediate reward condition (vs. delayed-, and vs. no-reward condition) were evident across all age groups. However, the incentive effect of the delayed reward condition (vs. no reward condition) was only evident in children and adults, not in adolescents. These findings suggested that the motivational effect from the expectation of delayed reward was weakened or even absent in adolescents. It is difficult for adolescents to exert effective top-down cognitive control over the value representation of delayed rewards, due to their lower sensitivity to the expectation of delayed rewards, resulting in fewer improvements in task performance. Our study was the first to explore the influence of delivery time on the incentive effects of reward expectation from a developmental perspective, and to provide evidence for the insensitivity of adolescents to delayed rewards with respect to the influence of reward expectation on task performance.

控制欲的悲伤：小学高年级学生的内化问题何以产生？

黄雅芬[1] 毕劲竹[1] 张榕岩[1] 桑青松[1]（通讯作者）

1 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn

摘 要 内化问题是指向个体内部，表现出的情绪或情感紊乱为主，包括抑郁、焦虑和孤独等问题。内化问题的持续发展会对小学高年级学生的身心发展、学业成就和人际交往产生较大的负面影响，揭示内化问题的影响机制有助于促进小学高年级学生全面健康发展。依据生态系统理论、情绪调节理论和自我决定理论，父母采用心理控制的教养方式使小学高年级学生与父母的情感疏离，面对负性情绪事件小学高年级学生采用不适当的情绪调节策略如认知重评和表达抑制，压抑自身的情绪表达，自主性被破坏，基本心理需要得不到满足，进而引发焦虑、抑郁等内化问题。综上，本研究考察情绪调节策略和基本心理需要在父母心理控制和内化问题中的链式中介作用。本研究以 1014 名小学高年级学生为被试（平均年龄为 12.48±0.67 岁），使用父母心理控制问卷、内化问题量表、儿童青少年情绪调节问卷、基本心理需要量表，并通过 SPSS26.0、PROCESS 宏程序对中介模型进行检验。研究结果表明：（1）父母心理控制与小学高年级学生的表达抑制和内化问题呈显著负相关、与基本心理需要显著正相关；（2）认知重评与基本心理需要显著正相关，与内化问题显著负相关；表达抑制与基本心理需要显著负相关，与内化问题显著正相关；基本心理需要与内化问题显著负相关；（3）表达抑制、基本心理需要在父母心理控制影响小学高年级学生的内化问题中具有链式中介作用。研究提示，家庭环境中的父母心理控制，个体的情绪调节策略和基本心理需要都是影响小学高年级学生内化问题的重要因素。未来的家庭教育应关注父母教养方式对小学高年级学生发展的影响，个体在面对压力情境时要学会主动调节自身的情绪，努力提升个人的胜任感和自我效能感。

Controlling Sadness: How does the internalization problem of senior primary school students arise?

Huang yafen[1] Bi jinzhu[1] Zhang rongyan[1] Sang qingsong[*1]

1Anhui Normal University School of Education Science，Wuhu，241000

*Correspondence：Sang qingsong，s7210qs1@ahnu.edu.cn

Abstract： Internalization problems refer to internal, emotional or emotional disorders, including depression, anxiety and loneliness. The continuous development of internalization problems will have a great negative impact on the physical and mental development, academic achievement and interpersonal communication of senior primary school students. Revealing the influence mechanism of internalization problems will help promote the comprehensive and healthy development of senior primary school students. According to the ecosystem theory, emotion regulation theory and self-determination theory, parents adopt psychological control parenting to alienate senior primary school students from their parents. In the face of negative emotional events, senior primary school students adopt inappropriate emotion regulation strategies such as cognitive reappraisal and expression inhibition, repress their emotional expression, destroys their autonomy, and fails to meet their basic psychological needs. This leads to internal problems such as anxiety and depression. In conclusion, this study examines the chain-mediating role of emotion regulation strategies and basic psychological needs in parental psychological control and internalization problems. In this study, 1014 senior primary school students (average age 12.48±0.67 years old) were used as subjects, using parental psychological control questionnaire, internalization problem scale, Children

and adolescents Emotional regulation questionnaire, basic psychological needs scale, and using SPSS26.0 and PROCESS macro program to test the mediation model. The research results found that: (1) parental psychological control was significantly negatively correlated with expression inhibition and internalization problems of upper primary school students,and significantly positively correlated with basic psychological needs； (2) cognitive reappraisal was significantly positively correlated with basic psychological needs and significantly negatively correlated with internalization problems; expression inhibition was significantly negatively correlated with basic psychological needs and significantly positively correlated with internalization problems; and basic psychological needs were significantly negatively correlated with internalization problems； (3) expression inhibition and basic psychology need to have a chain mediation role in the internalization problems of parental psychological control affecting upper primary school students. The study suggests that parental psychological control in the family environment, individual emotional regulation strategies and basic psychological needs are all important factors affecting the internalization problems of senior primary school students. In the future, family education should pay attention to the influence of parenting styles on the development of senior primary school students. Individuals should learn to proactively adjust their emotions in the face of stressful situations, and strive to improve their sense of competence and self-efficacy.

Development of the Developmental Tasks Scale for Chinese Newlywed Couples

Qingyin Li1, Jiahe Li2, Ziyuan Chen1, Xiaoyi Fang1
1 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875, fangxy@bnu.edu.cn
2 School of Foreign Languages and Literature, Beijing Normal University, Beijing, 100875

Abstract： Objective: The current study aimed to develop a scale for measuring the developmental tasks of

Chinese newlyweds couples. Method: The initial scale with 40 items was formed through literature analysis, theoretical construction, individual interviews, and expert discussions; item analysis and exploratory factor analyses were conducted with 662 couples, and validity and reliability tests were conducted with 620 couples to form the formal scale. Moreover, test-retest reliability was examined with 80 couples at two-week intervals. Results: The Chinese Newlywed Couples Developmental Tasks Scale consisted of 23 items, scored on a Likert scale of 1 to 5, including five factors: honing differences, forming a whole, integrating into each other's families, establishing rules, and transforming family roles. Internal consistency reliabilities for the total scale and dimensions ranged from 0.62 to 0.85, and retest reliabilities ranged from 0.56 to 0.91. Confirmatory factor analysis indicated a good fit of the five-factor structural model ($\chi 2/df = 2.626$, CFI = 0.916, TLI = 0.902, RMESA = 0.051, SRMR = 0.051). The total score was significantly correlated with each factor score ($r = 0.45 \sim 0.82$). The total score and each factor score were significantly and positively correlated with marital satisfaction ($r = 0.10 \sim 0.60$) and marital stability ($r = 0.08 \sim 0.45$), respectively. Conclusion: The Chinese Newlywed Couples Developmental Tasks Scale developed in this study has good reliability and validity and it can be used as a valid instrument to measure the developmental tasks of newlywed couples in China.

不同视角下自闭症谱系障碍儿童对情绪面孔的注意偏向

李友媛[1] 王怡帆[1] 张晓玉[1] 魏玲[1]（通讯作者）

1 福建医科大学应用心理学系，福州，350108，ysyang-78@163.com

摘 要 人类对威胁性刺激的注意被认为具有重要的适应价值。典型的“威胁优势效应”在人类婴儿早期就会出现，即面对复杂的环境刺激，个体倾向于尽快识别和加工威胁性刺激，存在对威胁性刺激的注意偏向，这有利于我们灵活应对威胁和避免伤害，具有重要的生物意义和社会意义。研究表明自闭症谱系障碍(Autism Spectrum Disorder, ASD)儿童在面孔加工和情绪识别方面存在困难，关于 ASD 儿童是否进化保存了和正常人一样对威胁性面孔的注意偏向，结果仍具有争议。并且有研究表明视角因素会影响 ASD 儿童对情绪面孔的注视，比起第一视角，ASD 儿童对第三视角下面孔的回避有所减少（第一视角指的是模特的面孔和视线都朝向前方，这时候 ASD 儿童处于当事人的视角，社会性和威胁感更强；第三视角指的是模特的面孔和视线方向都朝向侧面，这时 ASD 儿童处于旁观者的视角，社会性和威胁感减弱）。**目的：**本研究选用 ASD 儿童尝试探讨其是否进化保存了和正常个体一样的“威胁优势效应”以及视角（第一视角/第三视角）对其注视情绪面孔的影响。**方法：**本研究选取了 ASD 儿童和与 ASD 儿童言语智力相匹配的 TD 儿童各 32 名，给被试随机呈现愤怒（威胁性）、悲伤、快乐、中性的情绪面孔图片，结合自由观看范式和眼动追踪技术，收集记录被试的眼动数据。**结果：**1.ASD 儿童对情绪面孔的总注视时间（p<0.001）和首次注视时间（p<0.05）显著少于 TD 儿童；2.被试对愤怒情绪面孔的总注视时间显著多于开心（p<0.001）、中性（p<0.001）和悲伤（p<0.05）的情绪面孔，不存在组别差异；3.在第一视角下，ASD 儿童对所有情绪面孔的注视潜伏期均长于 TD 儿童（p<0.05），在第三视角下，ASD 儿童仅对中性面孔的注视潜伏期长于 ASD 儿童（p<0.05）。**结论：**ASD 儿童对面孔的加工存在异常；ASD 儿童存在对威胁性情绪面孔的注意偏向，进化保存了和正常人一样的“威胁优势效应”；视角会影响 ASD 儿童对情绪面孔的注视，第三视角促进了 ASD 儿童对情绪面孔的觉察。

Attentional bias toward emotional faces in children with autism spectrum disorders from different perspectives

Li Youyuan[1], Wei Ling[1]
1 Department of Applied Psychology, School of Health,
Fujian Medical University, Fuzhou, 350108, ysyang-78@163.com

***Abstract*:** Attention to threatening stimuli is thought to have important adaptive value in humans. Typically, the "threat superiority effect" occurs in early infancy, in which individuals tend to recognise and process threatening stimuli as quickly as possible in the face of complex environmental stimuli, and there is an attentional bias towards threatening stimuli, which is biologically and socially important for us to flexibly cope with threats and to avoid harm. Studies have shown that children with Autism Spectrum Disorder (ASD) have difficulties in face processing and emotion recognition, and the results are still controversial as to whether children with ASD have evolved to preserve the same attentional bias towards threatening faces as normal individuals. And it has been shown that the perspective factor influences ASD children's attention to emotional faces, with ASD children showing reduced avoidance of faces in the third-person perspective than in the first-person perspective (the first-person perspective refers to the model's face and line of sight being directed to the front, when the ASD child is in the person's perspective and is more social and threatening, and the third-person perspective refers to the model's face and the direction of the line of sight being directed to the side, when the (children with ASD are in the bystander's perspective, with a reduced sense of sociability and threat). **Objective**: In this study, children with ASD were selected in an attempt to examine whether they have evolved to retain the same "threat superiority effect" as normal individuals, and the effect of perspective (the first/third-person perspective) on their ability to look at emotional faces. **Methods**: Thirty-two children with ASD and 32 children with TD matched for verbal intelligence with ASD were randomly presented with pictures of angry (threatening), sad, happy, and neutral emotional faces, and eye-movement data were collected and recorded using a free-viewing paradigm and eye-tracking techniques. **Results**: 1. Children with ASD spent significantly less dwell time (p<0.001) and first fixation duration (p<0.05) on emotional faces than children with TD; 2. Subjects spent significantly more dwell time on angry emotional faces than on happy (p<0.001), neutral (p<0.001), and sad (p<0.05) emotional faces, with no group differences; 3. In the first-person perspective, children with ASD had longer gaze latencies than children with TD for all emotional faces (p<0.05), and in the third-person perspective, children with ASD had longer gaze latencies than children with ASD for neutral faces only (p<0.05). **Conclusion**: Children with ASD have abnormal processing of faces; children with ASD have an attentional bias towards threatening emotional faces and have evolved to preserve the same "threat superiority effect" as normal people; perspective affects children with ASD's attention to emotional faces, and the third-person perspective facilitates children with ASD's awareness of emotional faces.

大学生拖延行为与焦虑的动态关系：基于日志法的研究

凌冬莲[1] 吴旻[2]（通讯作者）

1 赣南师范大学教育科学学院，赣州，341000

2 赣南师范大学学报编辑部，赣州，341000，gnsywm@126.com

摘 要 拖延行为在大学生群体中广泛存在，长期拖延对其身心健康、学习表现存在诸多消极影响，并形成负性结果与拖延之间的恶性循环，危害到个体的身心健康。焦虑常被视为拖延行为的前因或后果，两者间可能存在恶性循环。然而以往有关拖延行为和焦虑的研究几乎基于横断设计，能够在一定程度上解释个体间拖延行为与焦虑的关系，但对于两者的作用方向和因果结论具有局限性，也难以揭示短时间内个体内拖延行为与焦虑的动态变化。而密集追踪中的日志法调查不仅可以较好地捕捉短期内焦虑与拖延行为的动态变化，而且可以同时考察变量在个体内(within-person)、个体间(between-person)不同水平上的关系。综上，本研究从动态视角出发，基于三“A”理论和恶性循环模型，探究大学生拖延行为和焦虑在短期内的双向预测作用及其复杂的动态关系。研究采用一般拖延行为问卷和焦虑问卷对 294 名大学生进行连续 10 天、每天一次的日志问卷追踪调查，建立动态结构方程模型(DSEM)同时考察个体内、个体间两水平上拖延行为与焦虑的动态变化关系。结果发现：(1) 在个体内水平上，自回归表明前一天的焦虑(AN_{t-1})显著正向预测后一天的焦虑(AN_t)，前一天的拖延行为(PRB_{t-1})显著正向预测后一天的拖延行为(PRB_t)，同时，时间滞后分析发现前一天的焦虑(AN_{t-1})显著正向预测后一天的拖延行为(PRB_t)，前一天的拖延行为(PRB_{t-1})也能正向预测后一天的焦虑(AN_t)；(2) 在个体间水平上，前一天的焦虑水平(AN_{t-1})与后一天的焦虑水平(AN_t)存在正向预测作用，前一天的拖延行为(PRB_{t-1})对后一天的拖延行为(PRB_t)存在正向预测作用，前一天的焦虑水平(AN_{t-1})对后一天的拖延行为(PRB_t)存在显著正向预测作用，但前一天的拖延行为(PRB_{t-1})对后一天的焦虑(AN_t)没有影响。研究表明，大学生焦虑与拖延行为在个体内水平上之间存在双向互动，在个体间水平上不存在。本研究从动态视角揭示了大学生拖延行为与焦虑在短期内的动态关系，发现了打破焦虑与拖延行为之间的恶性循环可从个案着手，可通过团体辅导来降低大学生焦虑水平进而改善其拖延行为，对缓解大学生焦虑水平，改善其拖延行为具有一定启发。

The Dynamic Relationship between Procrastination Behavior and Anxiety in College Students: Research on Diary Method

Ling Donglian[1], Wu Min[2] (Corresponding author)

1 School of Educational Science, Gannan Normal University, Ganzhou, 341000

2 Editorial Department of Journal of Gannan Normal University, Ganzhou, 341000

Abstract: Procrastination behavior is widely present among college students. Long term procrastination has many negative effects on college students' physical and mental health, academic performance. And forms a vicious cycle between negative outcomes and procrastination, endangering individual physical and mental health. Anxiety is often seen as a precursor or consequence of procrastination behavior, and there may be a vicious cycle between them. However, previous studies on procrastination behavior and anxiety were almost based on cross-sectional design. To some extent, it can explain the relationship between procrastination behavior and anxiety between individuals. However, there are limitations to the direction and causal conclusions of them, and it is also difficult to reveal the dynamic changes in procrastination behavior and anxiety within individuals in a short period of time. The diary method in intensive longitudinal data can not only capture the dynamic changes of

anxiety and procrastination behavior in the short term, but also simultaneously examine the relationships between variables at different levels, such as within-person and between-person. In summary, based on the Three "A" Theory and the vicious cycle model, this study explored the bidirectional predictive effect and complex dynamic relationship between procrastination behavior and anxiety among college students in the short term from a dynamic perspective. 294 college students were investigated for 10 consecutive days, once a day by diary questionnaire, including the general procrastination behavior and anxiety. The dynamic structural equation model (DSEM) was established to investigate the dynamic relationship between procrastination behavior and anxiety, including within-person and between-person level.

A Dynamic Structural Equation Model (DSEM) was established to examine the dynamic changes in procrastination behavior and anxiety at both within-person and between-person. The results showed that: (1) At the within-person level, autoregressive analysis showed that anxiety from the previous day (AN_{t-1}) positively predicted anxiety from the following day (AN_t), and procrastination behavior from the previous day (PRB_{t-1}) positively predicted procrastination behavior from the following day (PRB_t). At the same time, time lag analysis found that anxiety from the previous day (AN_{t-1}) positively predicted procrastination behavior from the following day (PRB_{t-1}), and procrastination behavior from the previous day (PRB_{t-1}) also positively predicted anxiety from the following day (AN_t); (2) At the between-person level, there was a positive predictive effect between the anxiety of the previous day (AN_{t-1}) and the anxiety of the following day (AN_t). Procrastination behavior of the previous day (PRB_{t-1}) had a positive predictive effect on procrastination behavior of the following day (PRB_t). Anxiety of the previous day (AN_{t-1}) had a significant positive predictive effect on procrastination behavior of the following day (PRB_t), but procrastination behavior of the previous day (PRB_{t-1}) had no effect on anxiety of the following day (AN_t). Research showed that that there is a bidirectional predictive effect between anxiety and procrastination behavior among college students at the within-person level, while there is no bidirectional predictive effect at the between-person level. This study revealed that the dynamic relationship between procrastination behavior and anxiety among college students in the short term from a dynamic perspective. Research found that breaking the vicious cycle between anxiety and procrastination behavior can be started from individual cases, and group counseling can be used to reduce college students' anxiety and improve their procrastination behavior. This provided some inspiration for alleviating college students' anxiety and improving their procrastination behavior.

特质焦虑对青少年冒险行为的影响

张柯[1]　邓茂婷[1]　朱海东[2]（通讯作者）
1 石河子大学，新疆维吾尔族自治区，832000
2 石河子大学师范学院，石河子市，832000，86775709@qq.com

摘　要　有的研究认为焦虑是个体高冒险行为的预测因素，有的研究认为焦虑的个体会为了避免冒险的不确定性而减少冒险行为。这可能是因为焦虑影响了不同类型的冒险行为，即积极冒险行为和消极冒险行为。然而,已有的研究主要关注焦虑对青少年消极冒险行为的影响，相对忽视了焦虑对青少年积极冒险行为的影响。青少年社会情绪系统和认知控制系统发展的不平衡是其高冒险行为高发的重要因素，比起低自我控制的青少年来说，自我控制水平较高的青少年表现出更少的消极冒险行为和更多的积极冒险行为。鉴于此,本研究以新疆维吾尔族自治区的 1275 名青少年为被试，在分别考察特质焦虑、自我控制、积极冒险行为和消极冒险行为关系的基础上，进一步揭示了学校氛围在其中的调节作用。结果表明:(1)特质焦虑显著正向预测青少年消极冒险行为；特质焦虑对青少年积极冒险行为的直接预测作用不显著；(2)自我控制在特质焦虑对青少年消极冒险行为的影响中起中介作用；(3)学校氛围能够调节特质焦虑与青少年积极冒险行为之间的关系，在良好的学校氛围中，青少年焦虑能够显著正向预测其积极冒险行为。研究结果说明了特质焦虑对青少年不同类型冒险行为的重要影响以及自我控制的中介作用机制和学校氛围的调节作用机制，为增加青少年的积极冒险行为以满足其社会情绪发展的需求，提高青少年的认知控制能力以减少其消极冒险行为的发生提供实证支持，并进一步完善冒险行为理论，尤其是积极冒险行为的相关理论。

The influence of trait anxiety on risk-taking behavior in adolescents

Zhang Ke, Deng Maoting, Zhu Haidong
Normal college, Shihezi University, Xinjiang Uygur Autonomous Region, China, 832000

***Abstract*:** Some studies suggest that anxiety is a predictor of high risk behavior, while others suggest that anxious individuals reduce risk taking in order to avoid the uncertainty of risk taking. This may be because anxiety affects different types of risk-taking, namely positive risk-taking and negative risk-taking. However, existing studies mainly focus on the impact of anxiety on adolescents' negative risk-taking behavior, but relatively ignore the impact of anxiety on adolescents' positive risk-taking behavior. The imbalance between the development of adolescents' social-emotional system and cognitive control system is an important factor for their high risk behavior. Compared with adolescents with low self-control, adolescents with high self-control level show less negative risk behavior and more positive risk behavior. In view of this, this study took 1275 adolescents in Xinjiang Uygur Autonomous Region as subjects, and further revealed the moderating effect of school atmosphere on trait anxiety, self-control, positive risk-taking behavior and negative risk-taking behavior on the basis of examining the relationship between trait anxiety, self-control, positive risk-taking behavior and negative risk-taking behavior. The results showed that :(1) trait anxiety positively predicted adolescents' negative risk-taking behavior; The direct prediction effect of trait anxiety on adolescents' positive risk-taking behavior is not

significant; (2) Self-control plays a mediating role in the influence of trait anxiety on adolescents' negative risk-taking behavior; (3) School atmosphere can regulate the relationship between trait anxiety and adolescents' positive risk-taking behaviors. In a good school atmosphere, adolescents' anxiety can significantly and positively predict their positive risk-taking behaviors. The results demonstrate the important influence of trait anxiety on different types of risk-taking behaviors of adolescents, as well as the mediating mechanism of self-control and the regulating mechanism of school atmosphere, which provide empirical support for increasing adolescents' positive risk-taking behaviors to meet their needs of social emotional development and improving their cognitive control ability to reduce the occurrence of negative risk-taking behaviors. And further improve the theory of risk-taking behavior, especially the theory of positive risk-taking behavior.

Keywords：trait anxiety, risk-taking behavior, self-control, school climate, adolescents

夫妻压力感知与婚姻不稳定性的关系：不同沟通模式的中介作用及其跨婚龄一致性

王宵悦[1]　李清银[1]　陈子源[1]　方晓义[1]（通讯作者）
1 北京师范大学发展心理研究院，北京，100101，fangxy@bnu.edu.cn

摘 要　根据中国民政部调查，我国当前结婚率持续跌落，粗离婚率也持续出现下降趋势。考察婚姻不稳定的影响因素对维护婚姻和谐至关重要。随着生活节奏加快，生活中遭受的压力容易成为夫妻婚姻不稳定的导火索。本研究旨在考察痛苦压力情况和应对压力情况与婚姻不稳定性之间的关系，并进一步探索夫妻之间言语沟通和非言语沟通在该过程中的中介作用，同时探究该机制的跨婚龄一致性。采用压力感知问卷、日常沟通问卷、婚姻不稳定指数量表对新婚至空巢阶段的 668 对夫妻进行调查。研究结果显示：（1）丈夫感知到的痛苦压力在各个婚龄段都没有影响夫妻沟通质量；（2）除新婚时期外，其他婚龄丈夫的痛苦压力对婚姻稳定性没有影响，存在跨婚龄一致性；（3）与丈夫相反，新婚妻子的痛苦压力没有影响到婚姻稳定性。但在有子女后，开始产生作用并逐步通过影响夫妻沟通质量影响婚姻稳定；（4）除新婚时期外，丈夫的应对压力通过降低夫妻沟通质量进而使婚姻不稳定，该机制具有跨婚龄一致性；（5）妻子的应对压力主要通过降低夫妻言语沟通质量使婚姻不稳定，该机制具有跨婚龄一致性。本研究发现，夫妻在感知到痛苦和应对方面的压力时，很可能会通过影响夫妻之间的言语沟通或非言语沟通质量进而使婚姻不稳定，且该过程中存在跨婚龄一致性。研究提示各婚龄阶段夫妻尤其是在拥有子女之后，在面对生活中的压力时，都应该增加夫妻之间的沟通交流，互相扶持支撑，从而有助于婚姻稳定和关系和谐。本研究为探究婚姻不稳定性的影响因素及机制提供了理论支撑和实证基础，有利于未来对婚姻不稳定的有效干预以促进婚姻和谐。

The relationship between marital stress perception and marital instability: the mediating effect of different communication modes and their consistency across marital ages

Xiaoyue Wang[1]　Qingyin Li[1]　Ziyuan Chen[1]　Xiaoyi Fang[1]（corresponding author）
1 Institute of Developmental Psychology, Beijing Normal University, Beijing, China

Abstract：According to the Ministry of Civil Affairs of the People's Republic of China survey, the marriage rate in our country is continuing to fall, and the crude divorce rate is also continuing to decline. It is very important to study the influencing factors of marital instability to maintain marital harmony. With the quickening pace of life, the pressure in life can easily become the fuse of marital instability. The purpose of this study was to examine the relationship between distressing stressful situations/coping with stressful situations and marital instability, and to further explore the mediating role of verbal and non-verbal communication between couples in this process, as well as to explore the consistency of this mechanism across marital age. A stress perception questionnaire, a daily communication questionnaire, and an index of marital instability scale were used to survey 668 couples in the

newly married to empty nest stage. The results of the study showed that (1) the husband's perceived distressing stress did not affect the quality of couples' communication at all ages of marriage; (2) there is no effect of distress pressure from husbands at marriage age on marital stability, except during the newlywed period. There was cross-marital age consistency in the mechanism; (3) in contrast to husbands, the stress of distress in new wives did not affect marital stability. However, after having children, it begins to take effect and gradually affects marital stability by influencing the quality of the couple's communication; (4) except during the newlywed period, the husband's coping stress destabilizes the marriage by reducing the quality of spousal communication, and the mechanism is consistent across marital age; (5) Wives' coping stress destabilizes marriages mainly by reducing the quality of the couple's verbal communication, and the mechanism is consistent across marital age. This study found that couples who perceive stress in terms of distress and coping are likely to destabilize their marriages by affecting the quality of verbal or non-verbal communication between the couples and thus the marriage. Moreover, this process is consistent across couples at different stages of marriage. The study suggests that couples of all marital ages, especially after having children, should increase their communication and support each other in the face of life's pressures, thus contributing to marital stability and relationship harmony. This study provides theoretical support and an empirical basis for exploring the influencing factors and mechanisms of marital instability, which is conducive to the effective intervention of marital instability to promote marital harmony in the future.

概念结构研究的 ERAI 四阶梯框架模型的建构

王阳茜[1] 钱扬义[2]（通讯作者）

1 华南师范大学心理学院，广州，510631

2 华南师范大学化学学院，广州，510006，通讯作者 E-mail：qianyy@scnu.edu.cnqianyy@scnu.edu.cn

摘 要 概念及概念结构研究一直以来都是认知心理学和教育心理学研究的重点课题，此类研究旨在深入探究概念结构内部由哪些子概念构成，以及这些概念之间的组织规律和结构关系，以了解人类对事物的认知和知识组织方式。然而，在对国内外以往的概念结构研究进行系统性回顾后发现，由于概念结构具体表现形式的多元化（体现概念间中心、集聚、层级、方向、强度关系等多角度的表现形式），再加之形式研究方法的复杂性（体现概念结构不同形式及不同阶段下探究方法的各异），这两个特征均使得概念结构的研究仍然缺乏统一的研究框架和方法论。因此，为深化对社会性概念、逻辑性概念及学科概念等不同种类概念及其结构在探究框架上的一致性，需要在方法论上寻求更加综合和统一的研究路径，并在不同情景下灵活运用合理方法探究不同的形式表征。综上所述，本文从概念的引出（eliciting）、概念结构的表征（representing）、评价（assessing）及改善（improving）四个方面着手，首次提出概念结构研究的方法框架模型，即引出-表征-评价-改善的 ERAI 四阶梯框架模型；同时，将概念结构的不同表现形式及形式的探究方法集成于该模型下，对不同形式在该框架下的探究方法及其差异进行不同角度的阐述。文章旨在为未来概念结构研究提供系统的、科学的和完善的方法论框架模型，在此基础上理清概念结构的具体形式和探究方法，并对当前概念结构仍存在的研究问题及创新等方面的发展方向进行思考。

Constructing the ERAI four-step framework model for conceptual structure research

Yangqian Wang[1], Yangyi Qian[2]
[1] School of Psychology, South China Normal University, Guangzhou, 510631
[2] School of Chemistry, South China Normal University, Guangzhou, 510006

Abstract：Concepts and their concept structure research has been a prominent focus in the fields of cognitive psychology and educational psychology. Researchers seek to delve into the sub-concepts comprising the conceptual structure and the organizational principles between these concepts, thereby gaining insights into human cognition and knowledge organization about things. However, a systematic review of previous conceptual structure research, both domestically and internationally, has revealed that due to the diversity in the specific manifestations of concept structures and the complexity of research methods for studying these manifestations, both of these characteristics have resulted in a continued lack of a unified research framework and methodology for concept structure research. Therefore, in order to deepen our understanding of the consistency in exploring different types of concepts and their structures within a research framework, it is imperative to seek a more comprehensive and unified methodological approach. In summary, to address this gap, this paper presents the ERAI four-step framework model, which consists of four stages: inspiring, articulating, evaluating, and improving concepts. By integrating different forms of inquiry methods within this model, we aim to explore various manifestations and forms of conceptual structure in a comprehensive and unified manner. The aim of this article is to provide a systematic, scientific, and comprehensive methodological framework model for future concept structure research. Based on this foundation, it seeks to clarify the specific manifestations of concept structures and research methods, as well as contemplate the directions for development in current concept structure research, including existing research challenges and innovations.

古诗词情景模拟对缓解大学生心理焦虑的作用

马涛（通讯作者）
1 山西师范大学教育科学学院，太原，030000，838361718@qq.com

摘 要　古诗词作为中华文化之瑰宝，凝结了千年来中国文人墨客的智慧，表达了诗人们对所处时代的各种情绪态度。从小到大接受大量传统文化洗礼的当代大学生，头脑中都具备一定的古诗词文化储备，但古诗词中背后的文化内涵和创作背景理解较浅。在这个后疫情时代，不确定的、未知的明天带给大学生面对生活的恐惧，产生心理焦虑，影响了他们正确面对作为学生和社会过渡期的大学生活，这也对之后步入社会产生了影响，需要全社会关注。而古诗词作为联结古今五千年的精神纽带，能够给予当代大学生精神支持，因此可以把古诗词作为一种缓解心理焦虑的情景模拟治疗手段，通过让大学生搭配背景音乐朗诵古诗词，播放古诗词创作背景故事视频，讲述古诗词作者人物生平，多角度调动大学生情绪感官，将存在于大学生脑海里的古诗词与身体中流淌的中华血脉产生共鸣，最大程度上激发出古诗词背后的情绪情感，身临其境地领略古诗词所表达的慷慨激昂，进一步使得大学生能够与作者共情，代入到古诗词创作情景，和古诗词人对话，领略古诗词人智慧，提升自身看待问题的方式方法，理解个人在时代洪流中的渺小，将目光放在当下，从而提高自身心理承受能力，缓解心理焦虑的影响，更加积极乐观地面对大学生活，拥抱未来的工作生活。

The Effect of Scene Simulation of Ancient Poetry on Alleviating Psychological Anxiety of College Students

Ma Tao
Institute of Education Science of Shanxi Normal University, Taiyuan, 030000, China

Abstract：As a treasure of Chinese culture, ancient poetry embodies the wisdom of Chinese literati and poets for thousands of years, expressing various emotional attitudes of poets towards their time. Contemporary college students who have been baptized by a large amount of traditional culture from childhood to adulthood have a certain cultural reserve in their minds, but their understanding of the cultural connotations and creative backgrounds behind ancient poetry is relatively shallow. In this post pandemic era, the uncertain and unknown tomorrow has brought fear and psychological anxiety to college students in the face of life, which has affected their ability to correctly face university life as students and the transitional period of society. This has also had an impact on entering society in the future and requires the attention of the whole society. As a spiritual bond connecting ancient and modern times for five thousand years, ancient poetry can provide contemporary college students with spiritual support. Therefore, ancient poetry can be used as a situational simulation therapy to alleviate psychological anxiety. By allowing college students to recite ancient poetry with background music, playing videos of the background story of the creation of ancient poetry, telling the life of the characters who wrote ancient poetry, and mobilizing college students' emotional senses from multiple perspectives, By resonating with the ancient poetry that exists in the minds of college students and the Chinese blood flowing in their bodies,

the emotional emotions behind ancient poetry can be stimulated to the greatest extent. By experiencing the impassioned expression of ancient poetry in person, college students can further empathize with the author, immerse themselves in the scene of ancient poetry creation, have conversations with ancient poetry poets, appreciate the wisdom of ancient poetry poets, and improve their own ways of viewing problems, Understanding an individual's insignificance in the current tide of the times, focusing on the present, in order to improve their psychological resilience, alleviate the impact of psychological anxiety, and have a more positive and optimistic attitude towards university life, embracing future work and life.

害群之马效应和群际敏感效应的本土化检验：群体认同的调节作用

宋柯柯（通讯作者） 李娜 黄亚博
山西师范大学教育科学学院心理系，太原，030031，1981151826@qq.com

摘 要 害群之马效应指对越轨的内群体成员的反应比对同样越轨外群体成员的反应更消极。群际敏感效应指当群外成员对群内成员提出批评时，群内成员的反应是消极的，而群内成员提出的相同批评则会得到更积极的回应。本研究旨在检验在我国一般群体条件下和最简单群体条件下的害群之马效应和群间敏感性效应。实验 1 采用 2(评价者身份：内群体、外群体)×2(评价目标：内群体、外群体)的被试间设计。采用学校作为现实形成的群体分类，以消极评价故事情境作为实验材料，通过测量被试对违规成员的积极态度和消极态度，来考察在一般群体条件下，被试对不同群体身份的消极评价的态度是否具有差异。预期结果：评价目标的主效应显著，人们对消极评价内群体的成员态度更消极。评价者身份和评价目标交互作用显著，被试对内群体成员评价内群体的态度比外群体成员评价外群体的态度更消极，呈害群之马效应；对内群体成员评价内群体的态度比外群体成员评价内群体更积极，呈群际敏感效应。实验 2 纳入变量群体认同，采用 2(评价者身份：内群体、外群体)×2(评价目标：内群体、外群体) ×2(群体认同：高、低)的被试间设计。运用最简群体范式中的颜色方块估计任务将被试随机分为不同群体，以想象的群际互动情境为实验材料，通过测量被试对违规成员的积极态度和消极态度，来探究在最简群体条件下，群体认同在其中的调节作用。预期结果：评价者身份和评价目标交互作用显著，同实验 1；害群之马效应在群体认同水平高的被试中效应更强。研究发现在集体主义文化中，群体间互动依旧存在害群之马效应和群际敏感效应，对相关研究具有一定的理论意义。

关键词 内/外群体，害群之马效应，群际敏感效应，群体认同

Indigenization of the black sheep effect and the intergroup sensitization effect: the moderating role of group identification

Song Keke, Li Na , Huang Yabo
Shanxi Normal University,Taiyuan,030031, 1981151826@qq.com

Abstract： The black sheep effect refers to a more negative reaction to an errant in-group member than to an equally errant out-group member. The intergroup sensitivity effect refers to the fact that when an outgroup member criticizes an in-group member, the in-group member will react negatively, while the same criticism from an in-group member will receive a more positive response. The aim of this study was to examine the black sheep effect and the intergroup sensitivity effect under the general population condition and the simplest population condition in China. In experiment 1, The inter-subject design of 2(identity of evaluator: in-group, out-group) × 2(evaluation objective: in-group, out-group) was adopted. The study uses the school as the group classification formed by reality, and the negative evaluation story situation as the experimental material. By measuring the positive attitude and negative attitude of the subjects to the offending members, it investigates whether the negative evaluation attitude of the subjects to different group identities is different under the general group condition. Expected result: The main effect of the evaluation goal was significant, and people had more negative attitudes toward the members of the negative evaluation group. There is a significant interaction between the

evaluator's identity and the evaluation goal. The subjects' attitude toward evaluation of in-group members is more negative than that of out-group members, showing a black sheep effect. The attitude of in-group evaluation by in-group members was more positive than that by out-group members, showing an intergroup sensitivity effect. In experiment 2, the variables group identity were included, and the inter-subject design of 2(evaluator identity: in-group, out-group)×2(evaluation objective: in-group, out-group)×2(group identity: high, low) was adopted. The color block estimation task in the minimalist group paradigm was used to randomly divide the subjects into different groups. The imaginary intergroup interaction situation was used as the experimental material, and the moderating effect of group identification was explored by measuring the positive and negative attitudes of the subjects towards the offending members under the minimalist group condition. Expected results: The interaction between evaluator identity and evaluation goal was significant, similar to experiment 1; The black sheep effect was stronger in subjects with higher group identification levels. It is found that in collectivist culture, there are still black sheep effect and intergroup sensitivity effect, which has certain theoretical significance for related research.

数字健康技术助力心理服务

夏秀娟（通讯作者）

渭南师范学院心理系 渭南 714099 2278879448@qq.com

摘 要 随着信息技术的高度发展，人类已经进入了数字化时代。数字健康是数字化时代之下产生的新概念，关于数字健康目前没有达成共识，但有学者将其描述为：使用信息技术或电子通信工具，提供医疗保健服务或促进更好的健康的服务或模式，其本质是根植于信息和通信技术在健康领域的应用。数字健康技术的引入呈爆炸式增长，如大数据、个性化医疗等领域都有体现。国内数字健康技术倾向于服务老年群体健康，在心理健康领域的应用尚有欠缺。当前国内心理健康问题形势愈加严重，从《2022 年国民抑郁症蓝皮书》可见一斑，数字健康技术能否为心理问题治理带来契机，可以从如下几点展开。

心理健康问题低龄化。从蓝皮书可见 50%的抑郁症患者为学生群体，所以青少年群体的心理问题急需关注。作为数字原住民，青少年群体对数字技术带有天然的亲昵感，数字健康技术在青少年群体中应用推广具有优势

心理问题污名化。污名化致使有心理服务需求的群体只能获得有限的帮助，调查表明个体寻求心理服务的概率很低，且在线服务高于校内服务。心理问题的早发性普遍性。数字健康技术可以减少寻求帮助的耻辱感，于学生而言具有易获得性、熟悉性、廉价性、保密性。

当前已有的数字健康技术更多体现为可穿戴设备和手机应用程序，然而具备心理服务能力的设备较少，数字健康技术在心理健康领域极大应用空间。提供简便的心理状况监测设备或程序，精准且私密的有效策略推送，以便个体进行初步自我管理。强化互动，很多心理问题的发生受所处时代和环境的影响，提供数字健康技术时同步同龄人相关症状的信息，给患者“我不是孤独的”感受以增强其疗愈信心。

数字健康技术为个体获得更多的医疗保健、心理服务的机会，但风险也同时存在。大数据或人工智能驱动的数字健康方案是否适合，不受监管的数字健康工具的扩散，个人健康信息隐私和安全的威胁也需要及时规范和防范。

关键词 数字健康技术，心理服务，污名化，信息健康

Digital Health Technology Helps Psychological Services

XIA Xiu Juan

WeiNan Normal university WeiNan city

Abstract：With the rapid development of information technology, humanity has entered the digital age. Digital health is a new concept emerging in the digital era. At present, there is no consensus on Digital health, but some scholars describe it as a service or model that uses information technology or electronic communication tools to provide medical care services or promote better health. Its essence is rooted in the application of information and communication technology in the health field. The introduction of Digital health technology has grown explosively, such as Big data, personalized medicine and other fields. Domestic Digital health technology tends to serve the health of the elderly, and its application in the field of mental health is still lacking. At present, the situation of mental health problems in China is becoming more and more serious. As can be seen from the Bluebook of National Depression in 2022, whether Digital health technology can bring opportunities for the treatment of mental problems can be launched from the following points.

Mental health issues are becoming younger. It can be seen from the Bluebook that 50% of depression patients are students, so the psychological problems of the adolescent group need urgent attention. As digital aborigines, young people have a natural affinity for digital technology, and Digital health technology has advantages in its application and promotion among young people

The stigmatization of psychological problems. The stigmatization results in groups with psychological service needs only receiving limited assistance. Surveys have shown that individuals have a low probability of seeking psychological services, and online services are higher than campus services. The early onset and universality of psychological problems. Digital health technology can reduce the stigma of seeking help, and it is easy to obtain, familiar, cheap and confidential for students.

At present, the existing Digital health technology is more embodied in wearable devices and mobile phone applications. However, there are few devices with psychological service capabilities. Digital health technology has great application space in the field of mental health. Provide simple psychological monitoring devices or programs, precise and private effective strategy push, for individuals to conduct initial self-management. Strengthen interaction. The occurrence of many psychological problems is affected by the era and environment. Provide information about synchronization of peer related symptoms when using Digital health technology, and give patients the feeling of "I'm not alone" to enhance their confidence in healing.

Digital health technology provides individuals with more opportunities for medical care and psychological services, but risks also exist. Whether Big data or AI driven Digital health solutions are suitable, the proliferation of unregulated Digital health tools, and threats to the privacy and security of personal health information also need to be regulated and prevented in a timely manner.

动作抑制对危险物体动作干扰效应的作用——基于启动目标抓握一致性判断任务的脑电实验证据

刘鹏[1]（通讯作者） 王永春[2] 王勇慧[2]

1 西北大学公共管理学院（应急管理学院），西安，710127，liupeng@nwu.edu.cn

2 陕西师范大学心理学院，西安，710062

摘 要 人类对危险物体具有回避本能。危险物体会干扰个体的动作执行，从而延迟个体对危险物体的反应。这种现象被称为危险物体引发的动作干扰效应。前人研究对动作抑制是否作用于动作干扰效应是有争议的。已有研究选用形状匹配的危险（如长方形或圆形锯片）和安全（如尺子或圆盘）物体作为目标刺激，并采用动作启动范式结合 Go/NoGo 任务或形状辨别任务对目标刺激进行按键反应。结果显示，反应时结果中动作干扰效应仅伴随危险条件下更正的 P2 和 P3 成分而出现，在动作抑制相关的额叶 N2 成分上并未发现危险和安全条件间的差异。另有研究发现动作抑制的出现可能受到任务类型的调节。与安全物体相比，危险物体在可及性判断任务（判断能否够着物体）中能增强动作抑制相关的 N2 成分波幅，但在属性辨别任务（判断目标刺激是人造还是自然物体）中则未发现 N2 效应。然而，目前仍不清楚任务类型为何会调节动作抑制的产生。我们推测，目标刺激承载动作信息（affordance）的激活强度可能是不同任务类型调节动作抑制产生的原因。为了验证这一假设，本研究设计了启动目标抓握一致性判断任务，启动刺激包括力量抓握和精细抓握的手势，目标刺激包括需要力量抓握和精细抓握的危险与安全物体，任务要求被试根据启动和目标刺激抓握方式是否匹配进行反应，如二者匹配被试需根据启动刺激出现位置按键反应，反之则不按键。结果显示，在高激活强度条件下（即目标刺激为力量抓握的物体），与安全目标相比，处理危险目标会引发更强的动作抑制（表现为额叶 N2 成分波幅增加），并在反应时指标中产生动作干扰效应；相反，在低激活强度条件下（即目标刺激为精确抓握的物体），与安全目标相比，处理危险目标反而加快了反应时间，且额叶 N2 成分在危险和安全条件下并未出现显著差异。综上，本研究通过设计启动目标抓握一致性判断任务，验证了目标刺激承载动作信息的激活强度是动作干扰效应中动作抑制能否产生的重要因素，研究推进了对动作干扰效应加工机制的认识。

Motor Inhibition Impacts the Motor Interference Effect of Dangerous Objects: EEG Evidence Based on a Prime-Target Grasping Consistency Judgment Task

Peng Liu[1] (corresponding author) Yongchun Wang[2] Yonghui Wang[2]

1 School of Public Administration/School of Emergency Management, Northwest University, Xi’an, 710127, liupeng@nwu.edu.cn

2 School of Psychology, Shaanxi Normal University, Xi’an, China, 710062

Abstract: Humans have an instinct to avoid dangerous objects, which can interfere with their actions and cause a delay in their response, known as the motor interference effect of dangerous objects. However, previous research

on whether motor-inhibitory processing affects this effect has been controversial. Studies have used shape-matched dangerous (e.g., rectangular or circular saw blade) and safe (e.g., ruler or disc) objects as target stimuli, adopting a motor priming paradigm combined with a Go/NoGo task or a shape discrimination task for keystroke responses to the target stimuli. Results showed that motor interference effects in response times (RTs) only occurred with more positive P2 and P3 components in the dangerous condition. No differences between the dangerous and safe conditions were found for the frontal N2 component associated with motor inhibition. Other studies found that task type may modulate the emergence of motor inhibition. Dangerous objects enhanced the N2 component in a reachability judgment task (judging whether an object could be reached), but not in an attribute discrimination task (judging whether the targets were natural or man-made). However, it remains unclear why task type modulates the emergence of motor inhibition. We hypothesized that the affordance activation strength of the target stimulus might be responsible. To test this hypothesis, the present study designed a prime-target grasping consistency judgment task, where the prime stimuli included power grip and precision grip gestures, and the target stimuli included dangerous and safe objects afforded power and precision grasping. Subjects were required to respond based on whether the prime and target stimulus grasps matched. If they did match, subjects were required to press a key corresponding to the location where the prime stimulus appeared. Otherwise, no key press was necessary. The results showed that under the condition of high activation strength of the target affordance (i.e., power grip targets), processing dangerous targets evoked increased motor inhibition (reflected by a more negative frontal N2 component) compared to safe targets and produced a motor interference effect in RT. In contrast, under the condition of low target affordance activation strength (i.e., precision grip targets), processing dangerous targets facilitated RT compared to safe targets, with no difference found between the dangerous and safe conditions in the frontal N2 component. In summary, the present study verified that the affordance activation strength of the target stimulus is an important factor in whether motor inhibition can take effect in the motor interference effect. This study advanced the understanding of the mechanism of the motor interference effect by designing a prime-target grasping consistency judgment task.

单次有氧运动对于不同特质焦虑个体错失焦虑影响

周子安[1] 张晓雨[1]（通讯作者）

[1]北京体育大学心理学院，北京，100084

通讯作者 E-mail：zxy0335@126.com

摘 要 错失焦虑是指个体因担心错失他人的新奇经历或正性事件而产生的一种弥散性焦虑。近年来随着居家办公学习频率的增高，个体对于手机或网络信息的依赖程度增加，表现为频繁地刷新手机或网络社交媒体，因担心自己错过于他人的精彩活动而感到恐惧和紧张,错失焦虑愈加明显。在此现象是背后，又存在个体间的差异。本研究拟使用有氧运动干预个体错失焦虑，且试图在高、低两种特质焦虑中探讨有氧运动对错失焦虑的干预效果。本研究选取大学生被试 61 名，采用两因素完全被试间设计，先对被试进行了错失焦虑的前测，后将被试分为高低特质运动组，高低特质非运动组，低特质运动组，低特质非运动组。运动组在跑步机上进行 30 分钟中等强度有氧运动，非运动组保持静息状态 30 分钟，随后进行错失焦虑后测。研究结果表明：有氧运动干预的主效应显著：有氧运动可以显著降低的错失焦虑；有氧运动与特质焦虑交互作用显著，并且错失焦虑仅在高特质焦虑下，运动干预效果显著，在其他组别不明显。对被试错失焦虑与本特质焦虑进行相关分析，研究结果表明：错失焦虑与特质焦虑呈现显著正相关，符合前人研究结果。研究为错失焦虑的干预提供了实证证据，也为拟定干预焦虑人群的运动处方提供了基础。

The effect of a single aerobic exercise on Fear of Missing out in individuals with different trait anxiety

ZHOU Zian[1] ZHANG Xiaoyu[1]

Beijing Sport University,No. 48 Information Road, Haidian District, Beijing

***Abstract*:** Fear of Missing out is a kind of disseminated anxiety caused by an individual for fear of missing novel experiences or positive events of others. In recent years, with the increase of the frequency of home working and learning, individuals have increased their dependence on mobile phones or Internet information, which is manifested in frequently refreshing mobile phones or Internet social media, and feel fear and tension because of their mistakes over others' wonderful activities, and missing anxiety is more and more obvious. Behind this phenomenon, there are differences between individuals. This study intends to use aerobic exercise intervention for individual miss anxiety, and tries to explore the intervention effect of aerobic exercise on missed anxiety in both high and low trait anxiety. In this study, 61 college students were selected to adopt the two-subject design. The participants first had a pre-test of missed anxiety, and then divided them into high and low trait exercise group, high and low trait non-exercise group, low trait exercise group and low trait non-exercise group. The exercise group performed 30 min of moderate-intensity aerobic exercise on a treadmill, while the non-exercise group remained in a resting state for 30 min, followed by a missed anxiety post-test. The results show that the main effects of aerobic exercise intervention are significant: aerobic exercise can significantly reduce missed anxiety; aerobic exercise and trait anxiety interact significantly, and missed anxiety is significant only in high trait anxiety, but not in other groups.The correlation between miss anxiety and trait anxiety was analyzed, and the results showed that miss anxiety and trait anxiety showed a significant positive correlation, which is in line with the results of previous studies. This study provides empirical evidence for an intervention to miss anxiety and also provides a basis for the proposed exercise prescription for the intervention in anxious populations.

项目难度和学习方式对学习判断反应性的影响

陈璐瑶[1]　张振新[1]　王勋[2]（通讯作者）
1 浙江师范大学心理学院，金华，321000
2 浙江师范大学心理学院，金华，321000，wangx@zjnu.cn

摘 要　学习判断是元认知监测性判断的一种重要形式，通常被定义为在后续测试中对已经学习过的项目的预见性判断(Dunlosky & Metcalfe, 2009)。研究者发现要求被试判断他们的学习情况会改变正在进行的学习过程，使其随后的记忆成绩发生变化(Roediger & Karpicke, 2006; Spellman & Bjork, 1992)。这种变化被称为学习判断反应性（judgment of learning reactivity），即做出学习判断的行为在一定程度上影响了随后的记忆成绩，使学习判断组被试的记忆成绩和无学习判断组被试的记忆成绩之间出现了显著差异(Dougherty et al., 2005; Witherby & Tauber, 2017)。目前关于学习判断是否直接影响学习者的记忆表现仍存在争议。为贴近现实学习环境，本研究采用新颖的“英文单词—中文释义”形式的词对材料来探究学习判断对学习者记忆的影响及其发生条件。本研究共设计了两个实验。实验一采用 2（判断条件：有学习判断/无学习判断）×2（项目难度：容易/困难）的两因素混合实验设计。实验一发现仅在容易项目中产生了学习判断的反应性。鉴于 Ariel 等人（2021）发现做出学习判断可以增强对科学文本的理解，但前提是在 JOL 之前提示学习者进行公开提取。本研究在实验二中引入学习方式这一条件，探讨采取其他辅助学习策略（如提取练习）来引导学习者进行公开提取，更改学习方式是否会影响困难项目中学习判断反应性的产生。实验二采用 2（判断条件：有学习判断/无学习判断）×2（学习方式：持续学习/提取练习）的两因素混合实验设计。两个实验得出的结论如下：（1）在容易项目上出现了学习判断的反应性，即做出学习判断的容易项目的回忆成绩显著优于未做出学习判断的容易项目的回忆成绩；然而在困难项目上不存在学习判断的反应性，即无论是否做学习判断，不影响被试在困难项目上的记忆表现。（2）在提取练习的学习方式中，困难项目出现了学习判断的反应性，即在学习阶段使用了提取练习策略并做出学习判断的被试，其记忆成绩显著高于仅使用提取练习策略的被试；然而在持续学习条件中，困难项目不存在学习判断的反应性。

Effects of item difficulty and learning mode on judgment of learning reactivity

Chen Luyao[1], Zhang Zhenxin[1], Wang Xun[2]（corresponding author）
1 School of Psychology, Zhejiang Normal University, Jinhua, 321000
2 School of Psychology, Zhejiang Normal University, Jinhua, 321000, wangx@zjnu.cn

Abstract：Judgment of learning is an important form of metacognitive monitoring judgment, which is typically defined as the prospective judgment of previously learned items during subsequent testing (Dunlosky & Metcalfe, 2009). Researchers have found that requiring participants to make judgments about their learning can influence the ongoing learning process and subsequently affect their memory performance (Roediger & Karpicke, 2006; Spellman & Bjork, 1992). This phenomenon is referred to as judgment of learning reactivity, wherein the act of making learning judgments partially influences subsequent memory performance, leading to significant differences

between the performance of participants who made learning judgments and those who did not (Dougherty et al., 2005; Witherby & Tauber, 2017). Currently, there is still some controversy regarding whether learning judgments directly affect learners' memory performance. To simulate real-life learning environments, this study employed a novel "English word—Chinese translation" paired materials to investigate the impact of learning judgments on learners' memory and the conditions under which it occurs. Two experiments were conducted in this study. Experiment 1 utilized a 2 (judgment condition: with learning judgments/without learning judgments) × 2 (task difficulty: easy/difficult) mixed factorial design. Experiment 1 revealed that learning judgment reactivity only occurred for easy items. Considering Ariel et al.'s (2021) finding that making learning judgments can enhance comprehension of scientific texts but requires prior retrieval practice before judgment of learning (JOL), Experiment 2 introduced the condition of learning mode to examine whether changing the learning mode by employing additional learning strategies (such as retrieval practice) to encourage learners' retrieval prior to making learning judgments would influence the occurrence of learning judgment reactivity for difficult items. Experiment 2 utilized a 2 (judgment condition: with learning judgments/without learning judgments) × 2 (learning mode: continuous study/retrieval practice) mixed factorial design. The conclusions drawn from the two experiments are as follows: (1) Judgment of learning reactivity was observed for easy items, with significantly better recall performance for easy items with learning judgments compared to those without learning judgments. However, no judgment of leaning reactivity was found for difficult items, indicating that making learning judgments did not affect participants' memory performance for difficult items, regardless of whether judgments were made. (2) In the retrieval practice learning mode, learning judgment reactivity occurred for difficult items, with significantly higher recall performance for participants who employed retrieval practice and made learning judgments compared to those who only used retrieval practice. However, in the continuous study condition, no learning judgment reactivity was observed for difficult items.

失眠障碍者的抑制控制功能受损：来自 ERPs 的证据

丁小斌[1]　何亮[1]（通讯作者）

1 西北师范大学心理学院，甘肃兰州，730070，18450052500@163.com

摘　要　失眠障碍(Insomnia disorder, ID)是最普遍和最常见的心理生理障碍之一，对个体的工作、学习都会造成严重负担。失眠障碍者常常伴随认知功能障碍，严重影响患者的生活质量。抑制控制(Inhibitory Control, IC)作为一种非常重要的认知功能，可以使个体抑制与任务无关的注意、行为或想法，以灵活适应当前的目标。然而，以往考察失眠障碍者抑制控制的研究仍存在许多不足之处，如多采用主观量表评估，客观评估较少。因此，本文将抑制控制细分为反应抑制和冲突抑制来探究失眠障碍者的抑制控制功能。通过双选择 Oddball 任务和颜色-词 Stroop 任务来探查失眠障碍者的反应抑制能力和冲突抑制能力，考察了失眠障碍与抑制控制能力的关系及其认知神经机制。行为结果发现，相比于健康睡眠者，失眠障碍者在执行双选择 Oddball 任务和颜色-词 Stroop 任务时的正确率更低、反应时更慢。ERP 结果发现，相比于健康睡眠者，失眠障碍者在执行双选择 Oddball 任务时的 P3 波幅显著更低，但两组被试的 N2 波幅差异不显著；失眠障碍者在执行颜色-词 Stroop 任务时的 N450 波幅显著低于健康睡眠者。上述研究结果表明，与健康睡眠者相比，失眠障碍者的抑制控制功能受损。失眠障碍者在反应抑制任务中可能具有更弱的冲突监控和运动抑制能力，在冲突控制任务中也具有弱的冲突监控能力。本研究从电生理的层面反映了失眠障碍与抑制控制能力的改善有一定的关联。改善失眠障碍者的抑制控制功能作为辅助治疗失眠的一种方式，是一项具有临床意义且值得探究的领域。

关键词　失眠障碍，抑制控制，事件相关电位

Impaired inhibitory control in insomniacs: evidence from ERPs

Ding Xiaobin[1] He Liang[1]
1 School of Psychology, Northwest Normal University, Lanzhou, China, 730070

***Abstract*：** Insomnia disorder (ID) is one of the most common and common psychophysiological disorders, which will cause a serious burden on the individual's work and study. Patients with insomnia are often accompanied by cognitive dysfunction, which seriously affects the quality of life of patients. As a very important cognitive function, inhibitory control (IC) can enable individuals to suppress attention, behavior or thoughts that are irrelevant to the task, so as to flexibly adapt to the current goal. However, there are still many deficiencies in the previous research on inhibitory control of insomnia patients, such as mostly using subjective scales for evaluation, and less objective evaluation. Therefore, this paper subdivides inhibitory control into response inhibition and conflict inhibition to explore the inhibitory control function of insomniacs. The double-choice Oddball task and the color-word Stroop task were used to explore the response inhibition ability and conflict inhibition ability of insomnia patients, and the relationship between insomnia disorder and inhibitory control ability and its cognitive neural mechanism were investigated. Behavioral results found that, compared with healthy sleepers, insomniacs performed the double-choice Oddball task and the color-word Stroop task with lower accuracy and slower reaction times. The ERP results found that compared with healthy sleepers, the P3 amplitude of the insomniacs was significantly lower when performing the double-choice Oddball task, but the difference in the N2 amplitude of the two groups was not significant; the insomniacs performed the color-word Stroop task The amplitude of N450 of sleepers was significantly lower than that of healthy sleepers. The above findings suggest that inhibitory control is impaired in insomniacs compared to healthy sleepers. Insomniacs may have weaker conflict monitoring and motor inhibition abilities in response inhibition tasks, and weaker conflict monitoring abilities in conflict control tasks. This study reflects from the electrophysiological level that there is a certain relationship between insomnia and the improvement of inhibitory control ability. Improving the inhibitory control function of patients with insomnia, as a way of adjuvant treatment of insomnia, is a field of clinical significance and worthy of exploration.

走神导致积极消极作用：影响因素及其机制

邵红涛　李蕊妍　任桂琴（通讯作者）
辽宁师范大学心理学院，大连，116029，renguiqin@126.com

摘 要　走神是我们在日常生活中经常遇到的一种现象。它指的是我们将注意力从当前的主要任务或外部任务中分散开来，而转向内部生成的思考和想法。近年来，对走神进行的研究逐渐增多。先前的研究表明，走神可能带来积极的影响，比如增强创造力和促进问题解决能力，但也可能带来消极的影响，比如增加车祸发生率和影响学业成绩。通过对以往研究的系统回顾，本研究首先整理了不同类型的走神、不同任务类型以及情绪状态等因素，以分析它们对走神产生积极和消极影响的作用。其次，结合走神的相关理论如感知解耦理论及执行控制失败理论等，探讨了走神导致积极和消极作用的机制。感知解耦理论认为，当心理过程开始与外部事件不直接相关时，心理过程被描述为解耦。感知解耦理论是指走神与对外部环境的注意力减少有关。执行控制失败理论则认为，走神可能是由于执行控制能力不足导致的，这可能与个体的认知负荷和任务难度有关。未来的研究可以进一步探索走神的机制，并开发出针对不同任务和个体的干预措施和工具。例如，针对那些容易走神的个体，可以使用注意力训练和工作记忆训练等干预方法，帮助增强注意力和执行控制能力。此外，针对不同任务类型，可以设计个性化的干预策略如正念，以提高个体在特定任务中的表现。

The Effects of Mind Wandering on Positive and Negative Outcomes: Influencing Factors and Mechanisms

Hongtao Shao, Ruiyan Li, Guiqin Ren
College of psychology, Liaoning Normal University, Dalian 116029, China

Abstract：Mind wandering is a common phenomenon that we often encounter in our daily lives. It refers to the diversion of our attention from the current main task or external task towards internally generated thoughts and ideas. In recent years, there has been an increasing amount of research on mind wandering. Previous studies have shown that mind wandering can have positive effects, such as enhancing creativity and facilitating problem-solving abilities. However, it can also have negative effects, such as increasing the occurrence of accidents and impacting academic performance. This study first categorizes different types of mind wandering, different types of tasks, and emotional states through a systematic review of previous research to analyze their effects on mind wandering in terms of positive and negative outcomes. Secondly, it explores the mechanisms behind the positive and negative effects of mind wandering by combining relevant theories such as the mind-wandering and executive control failure theories. The mind-wandering theory suggests that mind wandering is related to a decreased focus on the external environment when mental processes become unrelated to external events. On the other hand, the executive control failure theory posits that mind wandering may be due to insufficient executive control, which could be influenced by cognitive load and task difficulty. Future research can further investigate the mechanisms of mind wandering and develop interventions and tools tailored to different tasks and individuals. For example, interventions such as attention training and working memory training can be used to enhance attention and executive control abilities for individuals who are prone to mind wandering.

Additionally, personalized intervention strategies, such as mindfulness, can be designed for different task types to improve individuals' performance in specific tasks.

Keywords：Mind wandering, positive effects, negative effects

警觉水平对错误后调整不同加工阶段的差异化调节

胡娜[1] 王晓曦[1] 马瑞敏[1] 龙泉杉[2]（通讯作者）

1 昆明学院学前与特殊教育学院，昆明，650500

2 云南师范大学教育学部，昆明，6502154,longquanshan33@163.com

摘 要 警觉 (Alertness)是指对个体外部刺激的唤醒和准备状态，是个体及时响应外部刺激变化以实现目标行为的重要基础。错误是一种典型的突显信号，它会引起个体的警觉和行为变化。最常见的错误后行为表现是错误后减慢 (Post-error slowing)，即个体犯错后行为反应速度减慢。研究者们认为错误后减慢是由个人在探测到错误信号后放慢反应速度以提高反应准确性导致，最近的研究显示错误后减慢可划分为不同的加工阶段。为探索个体的警觉水平对错误后调整的影响，本研究招募了 89 名大学生实验参与者 (年龄：20.48 ± 1.68 岁)，使用注意网络任务(Attention network test, ANT)和四选择 Flanker 任务考察个体的警觉水平和错误后反应，并使用三种反应刺激间隔 (Response stimulus interval, RSI)来考察个体错误后早期 (200 ms)，中期 (700 ms)和后期 (1200 ms)阶段的加工特征。本研究通过 ANT 计算出了个体的相位性警觉水平 ($RT_{alerting} = RT_{no\ cue} - RT_{double\ cue}$)，以 Flanker 任务内不同 RSI 下错误后试次的反应减去正确后试次的反应计算出错误后反应时和正确率的调整量。研究结果显示个体的警觉水平 (范围: 0.50 ~ 115.05)与 PES 呈现负相关 ($r = -0.25, p = 0.02$)，与 200ms-RSI 下的 PES 呈现负相关($r = -0.39, p < 0.001$)。此外，警觉水平与错误后正确率调整呈现负相关 ($r = -0.24, p = 0.02$)，与 700 ms- RSI 下 ($r = -0.32, p < 0.01$)和 1200 ms-RSI 下的错误后正确率调整 ($r = -0.38, p = 0.001$)呈现负相关。进一步地，本研究根据警觉水平将研究对象分为低警觉组 (30 人: 0.5 ~ 43.64)，中警觉组 (29 人: 43.53 ~ 59.14)和高警觉组 (30 人: 59.82 ~ 115.06)，并对不同组在错误后反应调整上的差异进行了分析。结果显示仅在 200 ms-RSI 下，组间效应显著 ($p < 0.01, \eta^2 = 0.12$)，并且低警觉组在 200 ms-RSI 下的 PES 显著大于中警觉组 ($p = 0.064$)和高警觉组 ($p = 0.01$)。在错误后正确率调整上，组间效应仅在 1200 ms-RSI 下显著($p < 0.01, \eta^2 = 0.13$)，并且高警觉组的错误后正确率调整显著低于其他两组。研究结果显示，个体的相位性警觉水平越低，在错误后加工早期非适应性行为越显著；而高警觉水平的个体则在错误后加工后期适应性调节不足。本研究表明警觉水平影响错误后调整，其调节方式受到错误后加工阶段的适应性的影响。

关键词 错误，错误后减慢，警觉，加工阶段

The various regulation of alertness level to different processing stages of post-error adjustment

Na Hu[1] Xiaoxi Wang[1] Ruimin Ma[1] Quanshan Long[2] (Corresponding author)

1 School of Preschool and Special Education, Kunming University, Kunming 650500, China

2 Department of Education, Yunnan Normal University, Kunming 6502154, China,longquanshan33@163.com

Abstract：Alertness refers to the state of arousal and preparation for external stimuli, and it is an essential basis for the individual to respond to the change of the external stimulus in time to achieve the goal behavior. Error is a typical salient signal that can cause individual alertness and behavioral changes. Post-error slowing (PES) is the most common behavior observed after error responses, which means the individual's behavioral response speed slows down after an error response. It is proposed that PES is caused by individuals slowing down their reaction

speed to improve reaction accuracy after detecting erroneous signals, and recent studies have shown different processing stages of post-error slowing. In order to explore the influence of alertness levels on post-error adjustment, 89 college students (age: 20.48 ± 1.68) were recruited in this study. An attention network test (ANT) and four-choice Flanker task were used to examine alertness level and post-error response in individuals. Three response stimulus intervals (RSIs) were used in the Flanker task to examine the characteristics of the early (200 ms), mid (700 ms), and late (1200 ms) processing stages after error responses. This study calculated the phase alertness level (RT alerting = RT no cue - RT double cue) through ANT. This study calculated the post-error adjustment in response time and accuracy by subtracting the response following the correct response from the response following the error response under different RSIs within the Flanker task. The results showed that the alerting score (Range: 0.50 ~ 115.05) was negatively correlated with PES (r = - 0.25, p = 0.02) and negatively correlated with PES at 200 ms-RSI (r = - 0.39, p < 0.001). In addition, the alerting score was negatively correlated with post-error accuracy adjustment (r = - 0.24, p = 0.02) and negatively correlated with post-error accuracy adjustment (r = - 0.32, p < 0.01) at 700 ms-RSI and 1200 ms-RSI (r = - 0.38, p = 0.001). Furthermore, this study divided the participants into a low alertness group (n = 30: 0.5 ~ 43.64), a medium alertness group (n = 29: 43.53 ~ 59.14), and a high alertness group (n = 30: 59.82 ~ 115.06) based on the alerting score, and analyzed the differences in post-error adjustment among these groups. The results showed that the Group effect was significant only at 200 ms-RSI (p < 0.01, η^2 = 0.12), and the PES of the low alert group at 200 ms-RSI was significantly larger than that of the medium alert group (p = 0.064) and the high alert group (p = 0.01). Regarding post-error adjustment in accuracy, the Group effect was only significant at 1200 ms-RSI (p < 0.01, η^2 = 0.13), and the post-error adjustment in accuracy of the high alert group was significantly lower than the other two groups. The results show that individuals with lower levels of phase alertness have slower responses in the early non-adaptive stages of post-error processing. At the same time, individuals with higher levels of alertness lack adaptive regulation in the late adaptive stages of post-error processing. The study manifests that the level of alertness affects post-error adjustment and is influenced by the characteristics of adaptation of the post-error adjustment stage.

匹配比较法测量视觉瞬时记忆的精度：一种“全或无”的保持形式

郑宇洁[1] 余依岚[1] 忻可云[1] 李峙[1*]（通讯作者）

1 浙江大学心理与科学行为系，杭州，310058, zli1@zju.edu.cn

摘 要 在物理刺激消失约半秒后，我们依靠视觉瞬时记忆来保留大量可用于后续处理的信息。然而，自视觉瞬时记忆的发现以来，文献对其描述通常模糊不清，如“逐渐衰减的残像”，而少有直接验证。直到最近Pratte（2018）将回溯线索（retro-cue）和色环连续报告法结合起来，支持了视觉瞬时记忆的“全或无”离散消失表征，与工作记忆“插槽模型”一致，但该结果与直觉相悖。此外，用连续报告法来探测瞬时记忆的可行性有待验证，因为测量过程难免受到工作记忆瓶颈的限制：回溯线索到报告时间间隔远超过瞬时记忆的保留时间，提取阶段很可能会受到色环中其他颜色的干扰，因此需要将信息巩固到工作记忆中。基于此，本研究创新了新测量方法，匹配比较法，直接测量视觉瞬时记忆的时间变化特性。该方法源自最近的一项研究（Li et al., 2019）发现，当搜索目标物在瞬时记忆中可供检查时，被试往往会回扫比较干扰项和目标，而不是花时间将目标巩固到记忆中；这一“再识别”假设表明，比较过程不一定需要将信息巩固到记忆中，还可以依赖于瞬时记忆中的表征。具体而言，实验 1 采用了与 Pratte（2018）类似的流程，发现增加视觉掩蔽（使被试只能依赖当前工作记忆表征）并不会影响测得的颜色记忆精度，这提示精度测量可能受到工作记忆瓶颈的限制。实验 2 在不同延迟时间下依次呈现一对匹配色块（具有不同的色环距离，即颜色相似度），要求被试将其与已经从屏幕消失、仅存在于瞬时记忆表征中的色块进行比较（该方法依赖知觉和视觉瞬时记忆，在反应阶段仅需判断是否相同，任务要求较小）。对判断色块是否相同的错误频率进行高斯拟合，我们获得了可觉察最小颜色差异（JND）作为精度指标。结果发现，在视觉瞬时记忆时间内（约 500 毫秒），颜色的记忆精度保持不变；而 500 毫秒后 JND 的下降与增加视觉掩蔽条件（需要使用工作记忆）一致（实验 3），这表明精度在工作记忆表征中衰减。总体上，我们的结果发现视觉瞬时记忆的精度在持续时间内保持稳定，支持了“全或无”离散型形式。

Assessing the precision of iconic memory through the matching comparison method: An "all-or-none" maintenance representation

Yujie Zheng, Yilan Yu, Keyun Xin, Zhi Li

Department of Psychology and Behavioral Sciences, Zhejiang University

Abstract: After the physical stimuli disappear, iconic memory enables us to retain a substantial amount of information that can be utilized for subsequent processing within approximately half a second. Despite the long-known existence of iconic memory, the literature has provided vague descriptions, often referring to it as "fading traces," with limited direct validation. It was only recently that Pratte (2018)[10] made a novel contribution by combining retro-cues and the continuous reporting method employing a color wheel, which serves as a paradigm to assess the capacity and precision of visual working memory. Their findings unexpectedly supported the discrete "all-or-none" disappearance of iconic memory, aligning with the conceptual framework of the "slot model" in working memory. However, the viability of utilizing the continuous reporting method to detect iconic memory necessitates further investigation. This is due to the substantial time interval between cues and recall, exceeding the duration of iconic memory retention and thereby requiring consolidation into working memory. Moreover, the retrieval phase's representation is susceptible to interference from the color wheel, constraining

[10] Pratte, M. S. (2018). Iconic memories die a sudden death. *Psychological Science*, 29(6), 877–887. https://doi.org/10.1177/0956797617747118

measurements within the confines of working memory's limitations. Accordingly, our study introduced an innovative paradigm employing the matching comparison method to circumvent the reporting bottleneck of working memory and directly assess the temporal characteristics of iconic memory. This approach builds upon a recent study conducted by Li et al. (2019)[11], which discovered that participants, when the visual search target was accessible for inspection in iconic memory, compared it to the distractors without the need for consolidation into working memory or long-term memory. This "reidentification" hypothesis suggests that the comparison process may not rely on memory consolidation but rather depends on representations within iconic memory. To investigate further, Experiment 1 followed a similar procedure as Pratte (2018) and revealed that augmenting visual masking, which compelled participants to rely solely on current working memory representations, did not impact the capacity of color memory. This finding suggests that accuracy measurements may be constrained by the working memory bottleneck. In Experiment 2, pairs of matching color blocks were sequentially presented with varying intervals, and each pair of blocks had different color wheel distances (indicating different levels of similarity). Participants were required to compare the latter block with the one that had disappeared from the screen, existing solely in iconic memory representation. This matching comparison method relied on perceptual and iconic memory representations during the initial stages, with minimal task demands restricted to judging similarity during the response phase. To measure accuracy, the frequency of errors in determining whether the color blocks were identical was fitted with a Gaussian function to derive the just noticeable difference (JND). Results revealed a consistent color accuracy throughout the duration of iconic memory (approximately 500 milliseconds). However, the decrease in JND after 500 milliseconds aligned with increased visual masking condition (must use the representation in working memory), indicating a decline in accuracy associated with working memory (Experiment 3). These findings support the concept of an "all-or-none" discrete representation of iconic memory and emphasize its enduring accuracy over duration.

工作记忆中汉字识别、刷新和保持的神经机制

李红利[2]　赵鑫[1,2]（通讯作者）

1 甘肃省行为与心理健康重点实验室，甘肃，兰州，730070

2 西北师范大学心理学院，甘肃 兰州，730070，通讯作者 E-mail：psyzhaoxin@nwnu.edu.cn

摘 要　汉字是由不同笔画组成的方框文字，加工起来具有高度的非线性视觉复杂性，汉字的复杂性也增加了表征信息所需的工作记忆资源。然而，对于汉字在工作记忆中是如何被识别、刷新和保持的了解还很匮乏，尤其对这一系列操作中大脑神经活动的模式知之甚少。因此，本研究主要考察工作记忆在汉字信息加工进程中的作用。通过采用汉字 N-back 任务范式，结合脑电技术，记录了 27 名 18–25 岁被试的脑电数据，并对数据进行了时域分析和频域分析，考察不同记忆负荷下汉字的识别、刷新和保持加工进程中的神经激活特征。结果发现，随着 N 值的增加，正确率降低，反应时增加。在时域 ERP 分析结果中发现，随着记忆负荷的增加，N2pc 和 P300 波幅减小，SW 波幅增加，这表明，更大的记忆负荷往往伴随着刷新阶段认知资源分配的减少，记忆保持阶段认知资源需求的增加。此外，在记忆保持阶段，额叶区域显示出的正慢波可能反映了对下一个刺激的准备过程，而在顶枕区域观察到的负慢波则与刺激存储的神经活动有关。在时频分析结果中发现，随着记忆负荷的增加，刺激呈现阶段的 delta 波的 ERD 增加，alpha 波的 ERD 增加，表明随着记忆负荷增加抑制无关刺激的能力减弱。而在信息保持阶段，额叶区域 delta 波和 theta 波的 ERS 减小，额顶叶区域 alpha 波的 ERS 增大，这可能反映了额顶区域神经活动的补偿机制，即当需要保持更多的记忆内容时，额顶叶区域 alpha 波的激活会不断增强，以帮助工作记忆保持更复杂的内容。相关分析结果显示，汉字 N-back 任务中各阶段的神经指标之间存在显著相关性，这表明，汉字刷新加工过程的神经激活模式可能符合“级联效应”，当用于汉字保持的认知资源越多，用于汉字刷新和注意分配的认知资源越少。脑-行为结构方程模型分析结果表明，刷新阶段的 P300 波幅以及保持阶段的 SW 波幅均显著预测了个体的反应时间，由此可见，刷新和保持阶段的 ERPs 指标能够显著预测个体的行为表现。

Neural Mechanisms of Recognition, Updating, and Maintenance of Chinese Character in Working Memory

Hongli Li[2], Xin Zhao[1,2]

1 Key Laboratory of Behavioral and Mental Health of Gansu province, Northwest Normal University, Lanzhou, Gansu, 730070; 2 School of Psychology, Northwest Normal University, Lanzhou, Gansu, 730070

Abstract：Chinese characters are boxed characters composed of different strokes and processed with a high degree of nonlinear visual complexity, and this complexity of Chinese characters also increases the working memory resources required to characterize the object. However, there is a paucity of knowledge about how Chinese characters are continuously recognized, updated, and maintained in working memory. In particular, little is known about the patterns of neural activity during this sequence of operations. Therefore, the role of working memory in processing complex Chinese character information is the focus of this paper. Using the N-back task, we investigated how memory load influences the neural activity of the Chinese character cognitive subprocesses (recognition, updating, and maintenance) under different memory loads. Twenty-seven participants, aged 18–25

years old, completed the Chinese character N-back paradigm while having their event-related potentials were recorded. The study used time and frequency domain analyses of the EEG data. Results showed that accuracy decreased and response times increased with larger N values. For ERPs, the amplitude of N2pc and P300 decreased, and the amplitude of SW increased with greater memory load. This suggests that greater memory load is associated with a decrease in the allocation of cognitive resources during updating and an increase in cognitive resources during information recognition and maintenance. In addition, In the maintenance phase, the PSW in frontal regions may reflect the preparation process for the next stimulus, whereas the NSW in parieto-occipital regions may be related to the neural activity of the stimulus memory. For TFA, the ERD of the delta and the ERD of the alpha wave after stimulus onset increased with increasing memory load. This suggests a reduced ability to inhibit irrelevant stimuli as memory load increases. During the information maintenance phase, the ERS of delta and theta in frontal regions decreased and the ERS of alpha in frontoparietal regions increased as the memory load increased. This finding may be suggest a compensatory mechanism of neural activity in frontoparietal regions, i.e., the activation of alpha oscillations in frontoparietal regions is enhanced when more memory content must to be retained to help working memory retain more complex content. Correlations between neural activation during the Chinese character N-back task suggest that the Chinese character updating sub-process may be consistent with a "cascade effect": the more cognitive resources are used for Chinese character maintenance, the less cognitive resources are used for Chinese character attentional allocation and updating. Results of a brain-behavioral structural equation modeling analysis showed that P300 in the updating phase and SW in the maintenance phase predicted individuals' reaction times. For this, the ERP indicators in the updating and maintenance phases predicted behavioral performance.

摘 要　面孔相对其他物体的感知优势在人类和部分动物物种中已经得到充分证明。然而，小鼠是否表现出与灵长类动物相似的面孔识别能力尚不清楚。为此，本研究开展了视觉行为实验对小鼠面孔识别的能力进行了测试。具体而言，实验将 16 只野生型（WT）小鼠随机分入人脸组和鼠脸组分别接受行为训练和测试，每组各 8 只。人脸组小鼠需要辨别真实的人脸和物体照片；鼠脸组需要辨别自行拍摄的野生型小鼠脸的照片和物体照片。原始图像通过灰度变换转化为黑白图像，所有黑白图像在进一步的处理后具有相同的亮度、对比度和空间频率。小鼠被置入斯金纳箱内完成实验，箱内放置一块触摸屏，并通过隔板将屏幕一分为二。小鼠按键启动实验后，两边屏幕分别会呈现人脸/鼠脸图像和物体图像，当小鼠触摸了人脸/鼠脸图像，即可到斯金纳箱另一侧的奖励托盘领取食物颗粒；选择物体图像则给予亮灯提示，并以无食物奖励作为惩罚。所有小鼠每天均接受一次训练，持续 30 分钟。它们需在 30 分钟内完成尽可能多的试次，最多共 60 个试次。在训练阶段中连续两天选择人脸/鼠脸的正确率超过 75%的小鼠将进入测试阶段。在实验的测验阶段，在原有训练图像的基础上加入了与训练阶段在物理属性上等同的新的人脸、鼠脸和物体图像，新旧图像交替进行试验，评估小鼠对于面孔学习的泛化能力。实验过程中新加入的图像的试次将不再有奖励和亮灯提示。结果显示，所有小鼠在新图像的平均正确率均高于随机水平（50%），表明小鼠能够区分人脸/鼠脸图像和物体图像。通过研究小鼠面孔识别的行为表现，可以帮助理解面孔识别的基本机制，并为进一步的电生理实验打下基础，对于心理学和生物学具有重要的意义。

***Abstract*:** The perceptual advantage of faces over other objects has been extensively established in humans and certain animal species. However, it remains unclear whether mice demonstrate face recognition abilities similar to primates. The current study conducted visual behavioral experiments to assess face recognition in mice. Specifically, 16 wild-type (WT) mice were randomly assigned to either the human face group or the mouse face group for behavioral training and testing, with 8 mice in each group. The mice in the human face group were required to discriminate between real human faces and object images, while the mice in the mouse face group were required to discriminate between photographs of wild-type mouse faces taken in-house and object images. The original images were transformed into grayscale and further processed to ensure equal brightness, contrast, and spatial frequency. In the training stage, the mice were placed inside Skinner boxes, where a touch-sensitive screen

was installed and divided into two sections by a partition. After the mice initiated a trial by pressing a key, the screens presented face (human/mouse) images and object images on each side. When the mice touched the face image, a food pellet reward in a tray on the opposite side of the Skinner box was delivered, whereas selecting an object image resulted in a light cue and no food reward as punishment. All mice underwent daily training sessions, each lasting 30 minutes, during which they should complete as many trials as possible with a maximum of 60 trials. Mice that achieved a correct response rate exceeding 75% for two consecutive days during the training phase proceeded to the testing phase. In the testing phase of the experiment, new face (human/mouse) and object images, identical in low-level physical properties to those used in the training phase, were presented alternately with the original images to evaluate the mice's generalization ability in face learning. The new images presented during the testing phase were no longer accompanied by rewards or light cues. The results showed that the average correct response rates of all mice for the new images were above the chance level (50%). Our findings indicate that mice were able to discriminate between face (human/mouse) images and object images, which may shed lights on revealing face recognition mechanisms, laying the foundation for further electrophysiological experiments and holding significant implications for psychology and biology.

外源性定向和内源性定向对多感觉冗余信号效应的不同影响：颞上回与运动皮层的功能连接

吴英楠[1] 孙佳影[1] 高敏[1] 于洪涛[1] 唐晓雨[1]（通讯作者）

1 辽宁师范大学心理学院，大连，116029，tangyu-2006@163.com

摘 要 在现实生活中，我们的大脑每时每刻都在接收来自不同感觉通道的大量信息，包括视觉信息、听觉信息和触觉信息等等。为了形成一个可靠的感知，大脑需要将来自不同感觉通道的信息进行绑定。相比于单通道刺激(例如：视觉、听觉)，双通道刺激(例如：视听觉)可以触发更快、更准确的反应，即所谓的“多感觉冗余信号效应”。本研究使用功能性磁共振成像技术，通过正交诱导外源性和内源性空间注意定向探讨两种空间注意定向调节多感觉冗余信号效应的神经机制。行为学结果发现，外源性定向减弱冗余信号效应，而内源性定向增强冗余信号效应。神经学结果发现，在外源性和内源性定向过程中，与单通道视觉试次相比，双通道视听觉试次条件下双侧颞上回的神经活动显著增强。此外，心理生理交互作用分析发现，对于外源性定向，在外源性注意位置和非注意位置，相较于视觉加工在视听觉加工过程中双侧颞上回与中央前回和辅助运动区的神经耦合增加。然而，对于内源性定向，只有在内源性注意位置才发现，相较于视觉加工在视听觉加工过程中双侧颞上回与中央前回和辅助运动区的神经耦合增加。结果表明，颞上回和运动皮层之间的相互作用参与空间注意定向调节多感觉冗余信号效应。当前研究为探索大脑如何处理空间注意定向和多感觉信息之间的关系提供了一个新的视角。

Different effects of exogenous and endogenous orienting on multisensory redundant signals effect: The functional connectivity of the superior temporal gyrus with the motor cortex

Yingnan Wu[1] Jiaying Sun[1] Min Gao[1] Hongtao Yu[1] Xiaoyu Tang[1*]

1 School of Psychology, Liaoning Normal University, Dalian, 116029, tangyu-2006@163.com

Abstract： In real life, our brains receive large amounts of information from different sensory modalities every moment, including visual, auditory, and tactile information and so on. To form a reliable perception, the brain needs to bind information from different sensory modalities. Multisensory stimuli (e.g., audiovisual) can trigger a speed-up in response times compared to a unimodal target (e.g., visual, auditory), the so-called “redundant signals effect (RSE)”. The present study used functional magnetic resonance imaging (fMRI) to investigate the neural networks of exogenous and endogenous spatial orienting modulating RSE by orthogonally inducing the two orientations. Behavioral results showed that exogenous orienting decreased RSE, whereas endogenous orienting enhanced RSE. Neurally, the bilateral superior temporal gyrus (STG) showed significantly enhanced neural activity in the audiovisual trials compared with the visual trials for both exogenous and endogenous orienting. Psychophysiological interaction analysis found that in both exogenously attended and unattended conditions, the

bilateral STG showed significantly enhanced functional connectivity with the precentral gyrus and supplementary motor area in the audiovisual trials compared with the visual trials. However, only in the endogenously attended condition did the bilateral STG show significantly enhanced functional connectivity with the precentral gyrus and supplementary motor area in the audiovisual trials than in the visual trials. These results suggested that the interaction between the STG and motor cortex is involved in the spatial attention modulation of RSE. The current study provides a new perspective for exploring how the brain processes the relationship between spatial orienting and multisensory information.

Keywords**:** endogenous orienting, exogenous orienting, psychophysiological interaction, redundant signals effect, superior temporal gyrus

工作记忆中的空闲时间效应：来自单间隙范式的证据

陆若宇 徐一诺 徐继裕 王腾飞 李峙（通讯作者）
浙江大学心理与行为科学系，杭州，310007，zli1@zju.edu.cn

摘 要 工作记忆任务中，空闲时间常常能被用于提升记忆绩效。例如，对序列呈现的记忆项，增加各个项目间的空闲时间，能够提升回忆任务的正确率。但是，这种空闲时间效应到底是前摄的（即只影响后续的记忆项），还是回溯的（即只影响之前的记忆项），还是两者兼有？目前的研究仍未得出一致的结论。前人研究主要采用多间隙范式考察空闲时间效应，即同时改变所有记忆项之间的空闲时间。这种范式很难分别考察空闲时间效应的前摄成分和回溯成分。因此，本研究中，我们采用了单间隙范式，即在序列呈现的记忆项中，只改变其中两个项目之间的时间间隙，观察间隙长度对间隙之前/之后项目回忆绩效的影响。实验 1 中，我们测量了三种长短间隙组合（2500 ms / 100 ms，2500 ms / 500 ms，2500 ms/1000 ms）下的间隙长度效应（即间隙长度差异引起的记忆绩效差异）。结果发现，所有三种组合下，都存在前摄效应；但仅有两种组合（2500 ms / 100 ms，2500 ms / 500 ms）下，存在回溯效应。可见，空闲时间既能产生前摄效应，也能产生回溯效应。这一结果对一些采用单间隙范式的前人研究提出了挑战，这些研究中只发现了空闲时间的前摄效应。前摄、回溯效应并存的现象，可能是多种机制共同作用的结果，也可能是时间分组效应的结果。为了区分这两种假设，实验 2 中，我们再次考察了 2500 ms / 500 ms 的时间组合，并将记忆材料从字母（实验 1 中的记忆材料）变为单词。结果表明，记忆材料变为单词后，回溯效应的范围（即间隙前受到影响的记忆项的数量）增加。这一效应不能用时间分组来解释。综上，两个实验提供了汇聚性证据，表明工作记忆中的空闲时间可以产生独立于时间分组效应的前摄效应和回溯效应，空闲时间效应是由多种机制共同作用而成的。本研究也为工作记忆保持过程的机制提供了新视角：与部分研究者所反对的不同（如 Oberauer, 2019），本研究认为人们能够利用复述机制提升间隙前项目的记忆绩效；此外，人们可能还会利用空闲时间恢复被记忆编码所消耗的注意资源，以提升对间隙之后项目的记忆绩效。

Free Time Effects in Working Memory: Evidence from the Single-gap Paradigm

LU Ruoyu; XU Yinuo; XU Jiyu; WANG Tengfei; LI Zhi
Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou 310007, China

Abstract： Free time in a working memory task has been shown to enhance memory performance. For instance, in an immediate serial recall task, increasing the free time between memory items can improve recall accuracy. However, it remains unclear whether this free time effect is purely proactive (i.e., affecting only subsequent memory items), purely retroactive (i.e., affecting only preceding items), or a combination of both. Previous studies have examined free time effects using a multiple-gap paradigm, where free time is manipulated simultaneously in all inter-item intervals. However, this paradigm does not allow for a separate examination of retroactive and proactive effects. Therefore, in the present study, we used a single-gap paradigm, in which the length of a single

inter-item interval is manipulated, while the other inter-item intervals are fixed. This paradigm allowed us to directly examine the retroactive and proactive components of the free time effect. In Experiment 1, we measured the gap-length effect (i.e., the difference in memory performance elicited by the gap-length difference) under three long-short gap combinations (i.e., 2500 ms / 100 ms, 2500 ms / 500 ms, 2500 ms / 1000 ms). Proactive effects have been observed in all the three combinations whereas retroactive effects have only been found in two of them (i.e., 2500 ms / 100 ms, 2500 ms / 500 ms). These results indicated the presence of both retroactive and proactive components in the free time effect. This challenged some previous studies using the single-gap paradigm, where only the proactive component was found in the free time effect. The coexistence of retroactive and proactive effects may result from a joint effect of multiple mechanisms, and can also be explained by temporal grouping effects. To distinguish these two hypotheses, in Experiment 2, the 2500 ms / 500 ms combination was re-tested, with the memory materials being changed from letters (the material used in Experiment 1) to words. The results showed that the range of the retroactive effect (i.e., the number of affected memory items prior to the gap) increased when the memory material changed from letters to words, which cannot be explained by temporal grouping. Taken together, the two experiments provided convergent evidence that free time in a working memory task can induce both retroactive and proactive effects independent of temporal grouping effects, and that the free time effects is a joint effect of multiple mechanisms. These findings also provided insight to the underlying mechanism of working memory maintenance. It is suggested that rehearsal can be used to improve memory performance of the preceding items, contrary to some researches that have argued against the benefit of rehearsal (e.g., Oberauer, 2019). Moreover, people may also use the free time to recover the attentional resources depleted by memory encoding, in order to enhance memory performance of the subsequent items.

动作能力与动作序列学习效果的关系：性别的调节作用

姚雨蓝[1] 吴迪[1] 丁黎亚[1] 刘莉蓉[1] 王杨[1] 张斌[2]（通讯作者）

1 上海体育大学心理学院，上海，200438

2 上海体育大学心理学院，上海，200438，suszhangbin@126.com

摘 要 动作序列学习是指通过练习将一系列动作元素组成一个毫不费力的整体来完成的过程，是日常活动的重要组成部分。Doyon 等人 2009 年提出动作序列学习功能可塑性的模型，认为皮质纹状体和皮质小脑回路在序列学习中发挥作用。在以动作障碍为主要特征的疾病，例如帕金森氏症、亨廷顿舞蹈症和肌张力障碍等中发现存在动作序列学习问题。本研究拟在更广泛的被试群体上验证动作能力与动作序列学习之间的相关性，为进一步探究二者之间神经结构相关性提供行为数据支持。研究共招募 19-21 岁的大学生 55 名(女生 n=33)。采用布尼氏动作熟练度测试-第二版(Bruininks-Oseretsky Test of Motor Proficiency-Second Edition，BOT-2)考察个体动作能力。BOT-2 是用于评估一般动作技能的常模参照测验，是目前最常用的成人动作能力与协调性测试。采用经典序列反应时间任务（serial reaction time task，SRTT）考察个体的动作序列学习能力，该实验范式涉及双手协调、手眼协调等与身体协调相关的元素。记录反应时和正确率，并将随机序列与最后一个规律序列的平均反应时之差作为序列学习效果的指标(SL)，将第一组规则序列的与最后一个规则序列的平均反应时之差作为一般动作技能学习指标（GL）。使用 SPSS26.0 对数据进行整理分析。结果表明，对于全部被试，BOT-2 总分与 SL 之间存在显著中等强度正相关，r=0.280，p=0.038*。以 SL 为因变量，BOT-2 总分为预测变量进行一元线性回归，结果显示回归系数 R^2=0.061，方差分析结果显示，R^2值显著大于 0，p=0.038*，提示 BOT-2 总分与 SL 之间存在显著线性关系，回归模型具有统计学意义，并由此建立回归方程：y=-64.438+0.466x。进一步分析发现，男女生动作能力与动作序列学习二者间相关模式不同。对于男生，年龄和 GL 相关显著，r=0.430，p=0.011*，BOT-2 总分和 GL 相关显著 r=0.305，p=0.048*，手部协调维度和 GL 相关显著，r=0.417，p=0.008**，手部协调维度和 SL 相关显著，r=0.381，p=0.016*；对于女生，仅年龄与身体协调维度得分显著相关，r=0.363，p=0.038*。该结果证明原假设：个体动作协调能力与动作序列学习之间存在显著的相关性，而这种相关性存在男女性别差异，未来研究可就这一问题及其原因进一步探讨。

Abstract：Motor sequence learning, the process of completing a series of movement elements into an effortless whole through practice, is an important part of everyday activities. Doyon et al. 2009 proposed a model of functional plasticity in motor sequence learning, suggesting that cortical-striatum and cortico-cerebellar circuits play a role in sequence learning. Problems with motor sequence learning have been found in disorders characterised predominantly by movement disorders, such as Parkinson's disease, Huntington's chorea and dystonia. The present study intends to validate the correlation between motor performance and motor sequence learning on a wider group of subjects, and to provide behavioural data to support further investigation of the neurostructural correlation between the two. A total of 55 university students aged 19-21 (female n=33) were recruited for the study. Individual motor performance were tested using the Bruininks-Oseretsky Test of Motor Proficiency-Second Edition (BOT-2), a norm-referenced test for assessing general motor skills, which is the most commonly used test of motor performance and coordination in adults. The classical serial reaction time task (SRTT)

was used to examine the individual's ability to learn motor sequences, an experimental paradigm that involves elements related to physical coordination such as two-hand coordination and hand-eye coordination. Reaction time and correctness were recorded, and the difference between the average reaction time of the random sequence and the last regular sequence was used as an indicator of sequence specific learning (SL), and the difference between the average reaction time of the first set of regular sequences and the last regular sequence was used as an indicator of general motor learning (GL). The data were analysed using SPSS 26.0. The results showed that for all subjects, there was a significant moderate positive correlation between the BOT-2 total score and SL, r = 0.280, p = 0.038*. One-way linear regression with SL as the dependent variable and BOT-2 total score as the predictor variable showed that the regression coefficient R^2=0.061, and the ANOVA results showed that the value of R^2 was significantly greater than 0, *p*=0.038*, suggesting that there was a significant linear relationship between the BOT-2 total score and SL, and that the regression model was statistically significant, and the regression equation was established: y=-64.438+ 0.466x. Further analyses revealed that the pattern of correlation between the two was different for male and female. For male, age was significantly correlated with GL, r=0.430, *p*=0.011*, BOT-2 total score was significantly correlated with GL, r=0.305, *p*=0.048*, hand coordination dimensions were significantly correlated with GL, r=0.417, *p*=0.008**, and hand coordination dimensions score were significantly correlated with SL, r=0.381, p=0.016*; for female, only age was significantly correlated with the physical coordination dimension score, r=0.363, *p*=0.038*. This result supports the original hypothesis that there is a significant correlation between an individual's motor performance and motor sequence learning, and that there are gender differences in this correlation, which can be further explored in future research.

跨通道知觉训练对老年人视听整合的影响

任艳娜　李燕　周振华　张莹　平航　段杰萍
贵州中医药大学人文与管理学院心理学专业，贵阳，550025，yanna052267213@163.com

摘 要　老年人的视力和听力随年龄增加而显著下降，视力和听力的逐渐衰退严重影响着老年人的健康和生活质量，甚至引发老年性痴呆。研究发现，老年人对单独视觉信息或听觉信息的感知能力显著低于年轻人，但其对视觉信息和听觉信息的整合能力却显著高于年轻人，是老年人构建的适应性代偿机制，是未来老年人认知干预的窗口。为探讨老年人视听整合代偿效率和效应大小是否能够通过特异性的知觉训练得到提升，本研究招募 40 名老年被试和 40 名年轻被试，并随机分为对照组和实验组，采用跨通道视听知觉训练对实验组被试进行连续 5 天干预。视听知觉训练第 1 天，训练开始前，要求训练组和对照组被试均完成视听辨别任务，即训练前评估（前测）。第 2~4 天，要求训练组被试完成他们个性化的训练计划，不与对照组接触。第 5 天，训练结束后，要求实验组和对照组被试均完成与第 1 天相同的训练评估任务，即训练后评估（后测）。结果发现，老年训练组后测对跨通道视听刺激的反应显著快于前测（$p = 0.008$），而年轻训练组后测对单通道视觉刺激和单通道听觉刺激的反应显著快于前测（$ps < 0.05$）。竞争模型分析显示，老年对照组、年轻对照组和年轻实验组被试在知觉训练前测和后测的视听整合没有明显差异，但老年训练组后测的视听整合高于前测。研究结果提示，跨通道知觉训练可以显著提高被试对信息的敏感性，但对于老年人和年轻人的神经机制存在显著差异，老年人主要通过提高对跨通道信息的敏感性而年轻人主要通过提高对单通道信息的敏感性实现。此外，跨通道知觉训练可以有效提升老年人视听整合能力。

Effect of cross-modal perceptual training on audiovisual integration in older adults

Yanna Ren, Yan Li, Zhenhua Zhou, Ying Zhang, Hang Ping, Jieping Duan
Department of Psychology, College of Humanities and Management, Guizhou University of Traditional Chinese Medicine, Guiyang, 550025, yanna052267213@163.com

***Abstract*:** The vision and hearing of the older adults decrease significantly with the increasing of age, and the gradual decline of vision and hearing seriously affects their health and life quality, and even leads to senile dementia. The recent researches found that the perceptual ability of the older adults is significantly lower to unimodal visual information and unimodal auditory information, but the ability of audiovisual integration (AVI) was higher comparing with that of younger adults, which is regarded as adaptive compensation mechanism and a time widow for future cognitive intervention. To probe whether the compensatory effective and effect size of AVI was enhanced through cross-modal perceptual training, 40 older and 40 younger adults were recruited and divided into control and experiment groups to conducted 5-continuous interventions. In the 1^{th} day, before training, all participants were instructed to conduct an auditory/visual discrimination task (Pre-test). In the 2^{th}~4^{th} day, the experimental groups were instructed to complete their individual-schedule training but keep non-touch with control groups. In the 5^{th} day, after training, all participants were instructed to conduct the same task as pre-test (Post-test). The analysis for response time found that for older adults, the response to bimodal audiovisual stimulus was faster in post-test than pre-test ($p = 0.008$), however, the response to unimodal visual stimulus and unimodal auditory stimulus was faster in post-test than pre-test ($ps < 0.05$) for younger adults. The analysis for race model found that there was no significant difference between pre-test and post-test for all control groups and younger

experimental group, but higher in post-test than pre-test for older experimental group. These results suggested that the cross-modal perceptual training could improve the perceptual sensitivity, but there are some differences between older and younger adults, improving sensitivity to bimodal information for older adults but to unimodal information for younger adults. Additionally, the AVI ability was enhanced through cross-modal perceptual training.

律他如律己：自我利益对道德决策与道德评价的同向调节——道德敏感性与共情特质的中介效应

宋　茹[1,2] 刘　洁[1,2] 崔　芳[1,2]

([1]深圳大学心理学院; [2] 深圳大学脑疾病与认知科学研究中心, 深圳 518060,
E-mail:cuifang0826@gmail.com)

摘 要　道德情境中，个体在道德决策中获取的利益是影响个体道德标准的重要因素。探讨个体的自身利益如何影响其道德决策和道德判断具有重要的理论和现实意义。然而，目前对于在不同获利水平下道德决策与道德判断之间的关系尚不明确。本研究采用一个涉及电击伤害与金钱收益的道德两难范式对此进行探讨，并探究了个体道德敏感性和共情特质在其中的作用。实验中，被试总是作为“决策者”，与另一名“接受者”（实际上为假被试）共同完成实验。被试需要完成（1）道德决策任务：被试担任决策者，在不同的获利水平下决定是否愿意让“接受者”受到电击伤害以获得收益，被试被告知系统将会随机抽取一个试次真实执行；（2）道德判断任务：被试担任判断者，对其他决策者在同类道德决策任务中的行为进行道德水平评分。除决策者的选择（接受/拒绝）外，同时呈现决策是否被系统抽中执行（执行/未执行）。被试完成两个实验任务的顺序进行平衡。通过操纵赋予“决策者”的代币数量，以及系统执行情况，实验包括了获利水平（高、中、低）和决策执行（接受且执行、接受未执行、拒绝）的九种条件，并比较了三种获利水平下被试做出不道德决策的行为比例和九种实验条件下的道德水平评分。结果发现，当个体获利水平越高，作为决策者时，就越倾向于做出不道德决策；作为判断者时，对他人同类行为的道德评价越高（越宽容）。研究还发现，个体作为决策者做出不道德决策时受到自我利益影响的程度，可以正向预测其作为判断者对他人同类决策进行判断时受到自我利益影响的程度，即自我决策越不道德，对他人道德评价却越高，而道德敏感性和共情特质中介了二者之间的相关。此外，为进一步验证实验效度，我们利用心理学线上实验平台招募更多被试，对实验室的结果进行验证。结果显示，线上实验结果与线下实验基本一致。本研究表明，决策者通过不道德行为获利越高，其作为判断者时，倾向于采择决策者视角，更加理解利己选择，因而对他人同样的不道德行为的评价越宽松。这一发现为解释社会互动中个体的道德灵活性提供了思路。

The Co-directional Regulation of Personal Interests on Moral Decision-making and Moral Evaluation: The Mediating Effect of Moral Sensitivity and Empathy

Song Ru[1,2] Liu Jie[1,2] Cui Fang[1,2]

([1]School of Psychology, Shenzhen University; [2]Brain Disease and Cognitive Science Research Center, Shenzhen University)

***Abstract*：** Personal interests are an important factor that affects individuals' moral standards in moral situations. This study employed a moral dilemma paradigm that integrated gains and harms to investigate the bidirectional moderating effects of personal interests on moral decision-making and moral evaluation, as well as the roles of moral sensitivity and empathy. The study consisted of two experiments, Experiment 1 was an offline laboratory and Experiment 2 was an online study conducted through an online experiment platform. Each comprising two tasks: In the moral decision task, participants acted as "decision-makers" and were instructed to decide whether they were willing to allow others to receive electric shocks to increase their own interests under different profit levels. They were informed that their decisions could potentially be implemented. In the moral judgment task, participants assumed the role of "judges" and were required to evaluate the moral behavior of others in the same type of decision-making scenarios they encountered as "decision-makers," using a scale ranging from -4 to 4. The order in which participants completed the two tasks was balanced. Additionally, participants were asked to complete two questionnaires: the Interpersonal Reactivity Index-C and the Dispositional Moral Sensitivity Questionnaire.

The results of Experiments 1 and 2 revealed that personal interests significantly influenced moral decision-making and moral judgments and the relationship between the two. Additionally, the impact of decision outcomes on moral judgment was found to be significant. When the decision schemes were actually implemented, judges evaluated the decision-makers more critically, and vice versa. Furthermore, under the influence of personal interests, individuals' unethical decisions positively predicted their moral evaluations of others in the same decision-making context. Lastly, the study identified that one sub-component of empathy (i.e., personal distress) and two sub-components of moral sensitivity (i.e., perceived frequency and synesthetic imagination) played mediating roles in this effect. These findings shed light on the reciprocal relationship between individual unethical decision-making and moral judgment under the influence of personal interests. They provide valuable insights into individuals' moral flexibility during social interactions, especially when personal interests are at stake.

线索信息影响估算策略运用的认知机制

赵昕仪[1]　朱传林[1]

扬州大学教育科学学院，扬州，225002，psyxyzhao@163.com

摘 要 大量研究考察了年龄、执行功能、数学焦虑等因素对个体完成估算任务的影响，鲜有研究考察背景线索信息在个体完成估算任务时所起的作用。本研究结合 Flanker 范式，通过两个实验，分别考察在单一箭头线索（实验 1）和多箭头线索（实验 2）情况下被试完成估算任务的表现，并希望合理利用线索信息，为改善个体估算策略执行的表现提供思路。

实验一为 2（箭头朝向：左&右）×2（策略类型：DU 策略&UD 策略）的被试内实验设计。要求被试使用 DU 或者 UD 策略完成两位数乘法估算任务，并判断箭头的朝向。考察了单一箭头线索对个体使用 DU 策略(Down-Up 策略，即把前一个数下调、后一个数上调为整十的策略，例如，21×47≈20×50) 和 UD 策略(Up-Down 策略，即把前一个数上调、后一个数下调为整十的策略，例如，29×41≈30×40)完成乘法估算任务的影响。在实验一的基础上，实验二为 2 (中间箭头和另外四个箭头的朝向是否一致:一致&不一致) ×2 (最中间箭头的朝向:左&右)×2 (策略类型:DU 策略&UD 策略)的被试内实验设计。要求被试使用 DU 或者 UD 策略完成两位数乘法估算任务，并判断最中间箭头的朝向。结合 Flanker 范式考察了多箭头线索条件下个体使用 DU 策略和 UD 策略完成估算任务的表现。上述两个实验中的因变量均为被试完成估算任务的正确率和反应时。结果发现：（1）单箭头朝向和策略类型并不影响被试估算任务执行的正确率和反应时，但单箭头朝右时，无论使用 DU 还是 UD 策略，被试执行估算任务的反应时都更短（实验一）。（2）多箭头朝向和策略类型并不影响被试估算任务执行的正确率和反应时，但中间箭头和另外四个箭头朝向一致时，被试执行估算任务反应时更短且箭头朝向为右边且中间箭头和另外四个箭头朝向一致的时候被试执行估算任务的反应时更短（实验二）。本研究表明单一箭头线索和多箭头线索对个体完成估算任务造成了不同影响，完成估算任务时应充分重视不同线索信息的作用。

The cognitive mechanism of environmental cues affecting estimation strategy

XinyiZhao[1]　ChuanlinZhu[1]

School of Educational Science, Yangzhou University, Yangzhou , 225002

Abstract：A large number of studies have studied the influence of age, executive function and math anxiety on an individual's estimation performance, but the influence of environmental cues is still un- known. In this study, combined with the Flanker paradigm, the performance of participants in completing estimation tasks under single arrow cues (experiment 1) and multiple arrow cues (experiment 2) was examined through two experiments, and it was hoped that the clue information should be used reasonably to provide ideas for improving the performance of individual estimation strategies.

Experiment 1 is the within-subject design of 2 (arrow pointed: left &right) × 2 (strategy type: DU strategy &UD strategy). Participants were asked to use the DU or UD strategy to complete the two-digit multiplication estimation task and tell the direction of the arrow. The impact of using the DU strategy (Down-Up strategy, i.e., the strategy of lowering the multiplicand and up-regulating the multiplier to the nearest decades, e.g., 21×47≈20×50)

and UD strategy (Up-Down strategy, i.e., the strategy of up-regulating the multiplicand and lowering the multiplier to the nearest decades, e.g., 29×41≈30×40) to complete the multiplication estimation task is examined. On the basis of experiment 1, experiment 2 (whether the orientation of the middle arrow and the other four arrows is consistent: consistent & inconsistent) ×2 (the direction of the middle arrow: left & right) ×2 (strategy type: DU strategy & UD strategy) is the within-subject design. Participants were asked to use the DU or UD strategy to complete the two-digit multiplication estimation task and tell the direction of the middle arrow. Combined with the Flanker paradigm, the performance of individuals using DU strategy and UD strategy to complete estimation tasks under multi-arrow cue conditions is investigated. The dependent variables in both experiments were the correct rate and response of the participant when completing the estimation task. The results showed that: (1) The direction of the single arrow and the type of strategy did not affect the correct rate and response of the participant's estimation task, but when the single arrow was facing to the right, the respondent's response to the estimation task was shorter regardless of whether the DU or UD strategy was used (Experiment 1). (2) When the direction of multiple arrows and the type of strategy did not affect the correct rate and response of the participant's estimation task, but when the middle arrow and the other four arrows were facing the same direction, the participant's response to the estimation task was shorter and the arrow's orientation was to the right and the middle arrow and the other four arrows were aligned (experiment 2). This study shows that single arrow clues and multi-arrow clues have different effects on individuals' completion of estimation tasks, and full attention should be paid to the role of environmental cues when completing estimation tasks.

表征精度对多记忆表征引导注意的影响

车晓玮　连浩敏　李寿欣（通讯作者）
山东师范大学心理学院，济南，250014，shouxinli@sdnu.edu.cn

摘 要　保存在记忆系统的目标表征可以引导注意朝向目标匹配刺激，促进视觉搜索。但是，当记忆系统内存储多个表征时，与存储单个记忆表征相比，记忆表征对视觉搜索的促进作用减弱，即产生多目标搜索代价。研究者认为，多目标搜索代价的产生原因可能在于：（1）存储多个记忆表征时，表征之间相互干扰，使得表征精度下降，阻碍记忆表征与搜索项目的匹配；（2）记忆表征数量增加，用于记忆存储的资源增加，使得用于视觉搜索的资源减少，从而降低搜索效率。本研究采用事件相关脑电位（event-related potentials, ERP）技术，通过改变记忆表征精度加工需求操纵记忆表征精度，通过改变记忆表征在不同试次间变化操纵记忆资源投入，分析视觉搜索过程反映注意资源分配的 N2pc 和反映记忆表征匹配的 SPCN 成分，利用神经信号解码技术分析神经表征激活的时间动态，探讨表征精度对多记忆表征引导注意的影响。

实验 1 采用 ERP 技术，探讨搜索目标在试次中变化时，表征精度加工需求对多目标搜索代价的影响。结果发现，在高精度加工需求条件下的多目标搜索代价小于低精度加工需求条件；高精度加工需求条件下，搜索 1 个目标和 2 个目标时，诱发的 N2pc 和 SPCN 没有差异；低精度加工需求条件下，搜索 1 个目标和 2 个目标诱发的 N2pc 没有差异，但搜索 2 个目标时诱发的 SPCN 小于搜索 1 个目标。实验 2 和实验 3 采用神经信号解码技术，分别探讨搜索目标在试次间变化和不变时，记忆表征激活的时间动态。结果发现，无论搜索目标在试次间变化与否，高精度加工需求条件下，两个记忆表征同步激活；而低精度加工需求条件下，同一时间内只激活一个记忆表征。

我们的研究表明，提高表征精度促进多记忆表征对注意的引导。多目标搜索代价的产生原因可能在于存储多个记忆表征时表征精度损耗,阻碍记忆表征与搜索项目的匹配。提高记忆表征精度加工需求，可以促进两个记忆表征同步激活，维持较高的表征精度，从而促进视觉搜索，降低多目标搜索代价。研究结果支持记忆表征引导注意的多模板假设。

Memory Precision Affects the Attentional Guidance of Multiple Targets

Che Xiaowei　Lian Haomin　Li Shouxin
Department of Psychology, Shandong Normal University, Jinan, 250014, shouxinli@sdnu.edu.cn

Abstract：The target representation maintained in the human memory system can direct attention towards the target-matching item, and thus promote visual search. However, when multiple target representations are maintained in the memory system, the promotion effect of memory representation on visual search is reduced compared with single-target search. This reduction in search guidance is defined as the multi-target cost of visual search. The multi-target cost may be caused by: (1) the decreased precision of memory representations caused by representations interference; (2) the decreased resources for visual search due to the increased resource consumption for memory storage. In this study, three experiments were conducted to explore the effect of memory precision on multi-target visual search by using event-related potentials (ERP) technology. The memory precision was manipulated by changing the precision requirement of the memory representation and the resource consumption was manipulated by changing the targets constant or variable between trials. The recorded ERP

signals were analyzed and decoded to explore the temporal dynamics of neural representations and reveal the mechanism of the multi-target cost in visual search.

In Experiment 1, ERP technology was used to explore the influence of the precision requirement on the multi-target cost when the search targets changed between trials. We measured electrophysiological markers of attentional selection (N2pc) and memory matching (SPCN) in visual search. The results showed that the multi-target cost under high precision requirement was smaller than that under low precision requirement. The evoked N2pc and SPCN when searching for 1 or 2 targets were comparable under high precision requirement. Under low precision requirement, the N2pcs showed no difference between searching for 1 target and 2 targets, but the SPCN evoked by searching for 2 targets was smaller than that evoked by searching for 1 target. In Experiments 2 and 3, neural signal decoding was used to investigate the temporal dynamics of the memory representations when the search targets changed or remained constant between trials. The results showed that, regardless of whether the search target changed between trials, the two memory representations were reactivated synchronously under high-precision requirement. However, under low-precision requirement, only one memory representation was reactivated at any given time.

The results indicate that increasing the precision of the target representation promotes the attentional guidance of multiple memory representations. The multi-target cost of visual search might be caused by the decreased precision of memory representations which hindered the matching of the target representations to input items. Increasing the precision requirements of the target representations could promote synchronous reactivation of multiple memory representations and improve the precision of representations, and thus promoting visual search. The results support the multi-template hypothesis that multiple memory representations can guide attention simultaneously.

三维空间中深度对视觉注意的影响

潘星羽[1] 李杰[2]（通讯作者） 张禹[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，btzy1973@126.com
2 杭州师范大学心理科学研究院，杭州，311121，lijie.psy@hznu.edu.cn

摘 要 随着计算机和虚拟现实技术的发展，人们开始在以往二维研究的基础上探索三维空间中深度对注意的影响及其背后的原理。本文在 PubMed、Web of science 和中国知网进行检索，使用以下检索词：“depth/3D/three-dimensional/attention”和“深度、三维、注意”。从 1262 篇中筛选出 53 篇有关研究纳入分析。结果显示在静态和动态注意领域的研究均有涉及到三维空间中深度对注意的影响，主要采用的研究范式有视觉搜索范式、空间线索范式和多目标追踪范式等。研究主要集中在注意在深度上的分配规律和深度对注意表现的促进两个方面：首先，注意可以在不同深度上分配，但这取决于任务的知觉负载，当知觉负载足够高时注意资源从距离观察者较近的位置向远处位置逐渐递减，这被解释为以观察者为中心的注意梯度模型。而当知觉负载较低时，则没有观察到这一分布规律。其次，在深度维度上分离目标与非目标可以促进视觉搜索和动态追踪的表现，但以观察者预先了解目标所在深度为前提条件。因此深度对注意的影响可能不同于二维特征（如颜色），它对注意的引导并非自动化的。对于深度对注意表现的促进作用有两种可能的解释：一是三维中的空间分离使注意资源在多个深度上分配比在同一深度内分配更容易；二是遮挡、相对大小等深度线索促进了对客体位置的感知，进而促进注意表现。但客体跨越不同深度的运动是否同样能够促进搜索或动态追踪任务的表现存在不一致的结论，这提示我们动态注意中深度的促进作用可能同样具有一定的前提条件。分析发现以往研究更多探讨深度对注意的影响，少有关注自上而下的注意引导的影响及与深度的交互作用；三维空间中动态注意的研究更多探讨不同平面内的多目标追踪，少有关注客体跨越不同深度平面的运动对追踪表现的影响；现有研究更多探讨行为层面的结果，少有关注结合眼动、脑电、脑成像等技术共同探索三维空间中深度对注意影响的原理与神经机制。未来可以从多模态技术融合的角度，从自上而下加工的注意引导和动态注意入手，进行更深入的探讨。

The Influence of Depth on Visual Attention in 3D Space

Pan Xingyu[1], Li Jie[2], Zhang Yu[1]
1 School of Psychology, Beijing Sport University, Beijing, 10084, btzy1973@126.com
2 Institutes of Psychological Sciences, Hangzhou Normal University, Hangzhou, 311121, lijie.psy@hznu.edu.cn

***Abstract*:** With the development of computer and virtual reality technology, people have begun to explore the effect of depth on attention in three-dimensional space and the underlying principles based on previous two-dimensional research. This article was searched on PubMed, Web of Science, and CNKI using the following search terms: "depth/3D/three-dimensional/attention". 53 relevant studies were selected from 1262 papers and included in the analysis. The results showed that studies in both static and dynamic attention fields involve the influence of depth on attention in three-dimensional space, and the main research paradigms used were the visual search paradigm, spatial cueing paradigm, and multiple object tracking paradigm. Researches have focused on both the distributional patterns of attention over depth and the facilitation of attentional performance by depth: Firstly, attention can be distributed at different depths, but this depends on the perceptual load of the task; when the perceptual load is high enough, attentional resources taper off from positions closer to the observer to distant positions, which is interpreted as an egocentric attentional gradient model. In contrast, this distribution pattern is

not observed when the perceptual load was low. Second, separating targets from non-targets in the depth dimension can facilitate performance in visual search and dynamic tracking, but presupposes that the observer has prior knowledge of the depth at which the target is located. Thus the effect of depth on attention may differ from that of 2D features (e.g., color) in that its guidance of attention is not automatic. There are two possible explanations for the facilitating effect of depth on attentional performance: Firstly, spatial separation in three-dimensional space makes it easier to distribute attention across multiple depths than within the same depth; Second, depth cues such as occlusion and relative size promote the perception of object location and hence attentional performance. However, there were inconsistent conclusions on whether the movement of objects across different depths can also promote the performance of search or dynamic tracking tasks, suggesting that the benefits of depth in dynamic attention may also have certain prerequisites. Previous static and dynamic studies mainly focused on the impact of depth on attention, with little attention paid to the top-down process of directing attention to a specific depth. Studies on dynamic attention in 3D space have explored multiple object tracking in different planes, but paid little attention to the effect of object movement across different depth planes on tracking performance; Existing research explored more behavior indicators and few have focused on combining eye movement, EEG, brain imaging and other techniques to jointly explore the neural mechanisms of the effects of depth on attention in 3D space. In the future, more in-depth researches can be conducted from the perspective of multimodal fusion, starting with top-down attention guidance and dynamic attention.
Keywords**:** three-dimensional space, depth, allocation of attention

基于位置的统计学习对威胁分心刺激注意抑制的影响

1 贵州师范大学心理学院，贵阳，550025

2 贵州师范大学心理学院应激与注意实验室，贵阳，550025，yuluo@gznu.edu.cn

3 山西师范大学教育科学学院，太原，030031

摘 要 研究发现具有威胁性的刺激更容易获得更多的注意资源分配，从而被优先关注和进一步加工。当威胁刺激作为分心物时，个体对目标的搜索速度更慢；此外，基于分心物位置的统计学习会影响个体对分心物的抑制效果。当个体可能学习到视觉搜索序列中的某个位置出现分心物的概率更高时，个体对分心物的抑制效果更好，对目标的反应时更快。但基于分心物位置的统计学习是否会影响威胁分心物的注意抑制尚不清楚。本研究采用 2（分心物位置概率：高概率（65%）/低概率（5%））×3（分心物属性：无分心物/威胁分心/无威胁分心物）的被试内实验设计。在威胁联结学习任务，随机从绿色（RGB：[0 73 0]）和青色（RGB：[0 71 71]）两种颜色（Luminance niveau = 35 cd/m2）中随机选取一种颜色作为与电击联结的 CS+条件或无电击的 CS-条件，并将两种颜色用于视觉搜索任务中的分心物颜色；在视觉搜索任务中，我们随机选取一个位置作为高概率位置，以 65%的概率呈现分心刺激；其余的位置为低概率位置，以 5%的概率呈现分心刺激。结果发现，与低概率位置相比，当分心物呈现在高概率位置时，个体对目标的反应时更短。但威胁分心和无威胁分心条件下个体对目标的反应时无显著差异。同时，在不同分心物位置概率条件下，个体对威胁分心刺激和无威胁分心刺激呈现时的目标反应时也无显著差异。结果表明，基于分心物位置的统计学习会动态调节个体的注意优先；但分心物的威胁性没有影响个体的注意优先，原因可能是在视觉搜索任务中，分心物的颜色为低物理突显的颜色且只有分心物为颜色单子，可能会导致个体只需投入较少的注意资源就能实现对分心物的注意抑制过程。

Abstract： Research has found that threatening stimuli are more likely to gain greater allocation of attentional resources, leading to being prioritized for attention and further processing. When threatening stimuli act as distractors, individuals exhibit slower search speeds for the target. Additionally, statistical learning based on the distractor's location affects the individual's ability to inhibit the distractor. When individuals are more likely to learn the probability of a distractor appearing at a specific location in a visual search sequence, they demonstrate better inhibitory effects on the distractor and faster reaction times to the target. However, it remains unclear whether location-based statistical learning affects attentional inhibition of threatening distractors. The study employed a 2 (distractor location probability: high probability (65%) / low probability (5%)) × 3 (distractor type: no distractor / threatening distractor / non-threatening distractor) within-subject experimental design. In the threat-conditioning task, one color was randomly selected from green (RGB: [0 73 0]) and cyan (RGB: [0 71 71]) with a luminance level of 35 cd/m2 to be associated with the CS+ condition (electric shock paired) or the CS- condition (no electric shock) and used as the distractor color in the visual search task. In the visual search task, a

high probability location (65% probability) was randomly chosen, where the distractor stimulus appeared, while the remaining locations were low probability locations (5% probability) for the distractor stimulus presentation.The results revealed that compared to the low probability locations, individuals had shorter reaction times to the target when the distractor was presented at high probability locations. However, there was no significant difference in reaction times to the target between the threatening distractor and non-threatening distractor conditions. Moreover, there were no significant differences in target reaction times when threatening distractors and non-threatening distractors were presented under different distractor location probability conditions.These findings indicate that location-based statistical learning dynamically modulates individual attentional priority. However, the threat level of the distractor did not influence attentional priority, possibly because the distractor's color was not highly salient and the distractor was a single feature distractor in the visual search task, allowing individuals to allocate fewer attentional resources for the process of inhibiting the distractor.

摘 要　背景：错误信息持续影响效应（CIE）指最初呈现为真但后来被界定是错误的信息会继续影响推理和行为的现象。如信息“口罩中的残留物环氧乙烷是一级致癌物，大家在佩戴前把口罩在空气中甩一甩”虽然被辟谣了，但还是有人会在使用口罩前甩一甩。目前，警告被网络媒体广泛应用以对抗错误信息的传播(如加注“该内容疑似使用 AI 合成，请谨慎甄别”的文字)，但它是否能有效降低错误信息的 CIE 尚缺少有力的实验数据支撑。本研究探讨了一般警告和替代解释对减少错误信息 CIE 的作用。方法：实验 1 为线上实验。262 名大学生被随机分入有警告简单更正组（警告组）、无警告的简单更正组（简单组）和替代解释组（替代组）。被试被要求认真阅读随机呈现的 6 个实验故事和 4 个填充故事并在每个故事阅读结束后完成 3 个推理/事实问题。每个实验故事由 6 个句子组成，第 2 句呈现错误信息，第 5 句呈现更正信息，其余句子为过渡句。实验故事据第 5 句的内容分为简单更正和替代解释两个版本，简单更正仅对原始的错误信息进行简单的否定，替代解释在简单否定的基础上增加了替代的解释原因。推理问题围绕错误信息句描述的情况发生后可能采取的措施提出。对推理问题的评分（9 点评分，1=完全不同意，9=完全同意）越高, 说明越依赖之前的错误信息, 即 CIE 越大。实验操纵如下：警告组在实验开始前会看到如“信息可能不实请谨慎识别”的提示，警告组和简单组阅读实验故事的简单更正版本，替代组阅读替代解释版本。实验 2 新招 210 名大学生在实验室环境下通过个别施测重复了实验 1 以检验实验 1 结果的可重复性和稳定性。数据的线性混合模型分析采用基于 R 语言环境的 lme4 包，事后比较用 lsmeans 包。结果：实验 1 发现，组别主效应显著，且警告组和简单组的推理分无显著差异，替代组的推理分显著低于警告组和简单组。实验 2 完全复制了实验 1 的结果。结果提示，一般性的警告不能有效降低错误信息的 CIE；实践中应该重视辟谣的内容，应该在否定谣言的同时，给出详细的解释。

4 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

Abstract: Background: The continued influence effect (CIE) refers to the phenomenon for information that is initially presented as true, but later revealed to be false, to continue to affect our reasoning and behavior. For

example, although the message "ethylene oxide residue in masks is a first-class carcinogen, a mask should be shaken in the air a few times before use" is defined as misinformation, there are still some people who shake it before using a mask. The fast development of social media promotes the rapid spread of misinformation, and how to minimize the CIE of misinformation has become one of the research focuses in the new media era. At present, warnings are widely used by online media to combat the spread of misinformation （For example, add the text "This content is suspected to be synthesized using AI, please be careful to screen"）, but whether it can effectively reduce the CIE of misinformation is still lacking strong support from experimental data. This study explored the role of general warnings and alternative explanations in reducing misinformation CIE in college students. Method: Experiment 1 was an online experiment. The 262 college students were randomly assigned in the group of general warning + simple retraction (referred to as the warning group), the group of simple retraction only (the retraction group), and the group of simple retraction + alternative interpretation (the alternative group). Participants were instructed to carefully read 6 experimental stories and 4 filler stories, and to complete 3 reasoning/factual questions at the end of each story reading. Each experimental story consists of 6 sentences, with misinformation in sentence 2, misinformation retraction in sentence 5, and transitional sentences in the remaining sentences. According to the content of sentence 5, the experimental story was divided into two versions: the simple correction version and the alternative explanation version. Simple retraction only made a simple negation of the original misinformation, and the alternative interpretation added the alternative explanation reason to the simple negative. Reasoning questions are around possible actions after the situation described by the misinformation sentence occurred. The higher the score for the reasoning problem (9 points, 1 = strongly disagree, 9 = strongly agree), the more dependent it is on the previous misinformation, i.e., the larger the CIE. The experiment was manipulated as follows: the warning group was presented a prompt such as "Please be cautious about information that may be false" before the experiment started, the warning group and the retraction group read a simple retraction version of the experiment story, and the alternative group read the alternative explanation version. Experiment 2 repeated Experiment 1 with individual tests in a laboratory environment to verify the reproducibility and stability of the results of Experiment 1. The 210 newly recruited college students were randomly divided into three groups mentioned above and completed the same tasks as the participants in Experiment 1. The linear mixed model analysis of the data used the Lme4 package based on the R language, and the Lsmeans package was used for post-hoc comparison. Results: Experiment 1 found a significant main effect of the group, and there was no significant difference in the inference score between the warning group and the retraction group, and the inference score of the alternative group was significantly lower than that of the warning group and the retraction group. Moreover, Experiment 2 completely replicated the results of Experiment 1. The results indicate that general warnings cannot effectively reduce the CIE of misinformation, which suggests that attention should be paid to the content of debunking rumors in practice, and a detailed explanation should be given to explain why rumors are wrong while denying them.

发育性协调障碍成人的程序性学习缺陷

姚雨蓝[1] 赵明明[1] 张斌[2](通讯作者)
1 上海体育大学心理学院，上海，200438
2 上海体育大学心理学院，上海，200438，suszhangbin@126.com

摘 要 发育性协调障碍(Developmental Coordination Disorder, DCD)是一种以动作协调能力受损为特征的发育性疾病。5-11 岁儿童中的患病率为 5%-6%，且运动困难可能会持续到成年期。程序性学习缺陷假说认为程序性学习缺陷是造成 DCD 人群动作协调能力受损的原因，但 Gheysen 等人 2013 年的研究不支持该结论。**研究目的**：①探索成人 DCD 程序性学习特征；②从内部模型缺陷理论(Internal Modeling Deficit, IMD)角度探索 DCD 程序性学习缺陷的发生机制。IMD 理论认为，在实际感觉反馈可用之前，内部模型会对动作结果进行预测，提供快速在线纠正手段。DCD 个体存在内部模型缺陷，无法对动作进行修正，具体表现为动作表象能力下降。**研究假设**：DCD 组在程序性学习上的表现差于对照组；与动作执行条件相比，动作表象条件下 DCD 组表现出更大程度的缺陷。**方法**：研究纳入 18-21 岁的 18 名对照组(女生 12 名)被试和 19 名 DCD 组(女生 10 名)被试。实验程序改编自连续反应时间任务(Serial reaction time task, SRTT)，设置按键执行和动作表象两种条件，记录反应时和正确率。**结果**：进行 2(组别：对照组、DCD 组，组间变量)*2(序列类型：熟悉序列、不熟悉序列，组内变量)*2(反应方式：动作执行、动作表象,组内变量)的三因素重复测量方差分析。对于假设 1：组别和序列类型的交互作用不显著，F=（1，35）=1.781，p=0.191，序列类型的主效应不显著，F（1，35）=3.428，p=0.073。组别的主效应显著，F（1，35）=6.323，p=0.017*，偏η^2=0.153。事后检验显示，DCD 组平均反应时比 TD 组慢 37.40ms，p=0.017*。对于假设 2，当需要对不熟悉序列进行按键时，组别和反应方式的交互作用显著，F(1.35)=8.142, p=0.007**,偏η^2=0.132；对照组中反应方式的简单效应不显著 F（1，17）=0.247，p=0.626；DCD 组中反应方式的简单效应显著，F（1，18）=9.848，p=0.006**，偏η^2=0.354，表象条件下的平均反应时比在执行条件下快 36.18ms， p=0.001**。**结论**：DCD 组在程序性学习上反应时比对照组更长，验证假设一；DCD 表象条件下的学习效果显著差于按键执行条件下，验证假设二。本研究从 IMD 理论角度解释了 DCD 的程序性学习问题：DCD 中动作表象能力存在缺陷，导致无法对动作进行及时修正，进而出现程序性学习问题。

Procedural learning deficits in adults with developmental coordination disorders

Yulan YAO[1] Mingming ZHAO[1] Binn ZHANG[2*]
1School of Psychology, Shanghai University of Sport, Shanghai, 200438
2School of Psychology, Shanghai University of Sport, Shanghai, 200438, suszhangbin@126.com

Abstract： Developmental Coordination Disorder (DCD) is a developmental disorder characterized by impaired motor coordination ability. The prevalence rate among children aged 5-11 is 5% -6%, and such difficulty may persist into adulthood. The hypothesis of procedural learning deficits suggests that procedural learning deficit is the cause of impaired motor coordination in DCD populations, but Gheysen et al.'s 2013 study does not support this conclusion. **Aim**: ① Exploring the characteristics of procedural learning in adult DCD; ② Exploring the

mechanism of procedural learning defect of DCD from the perspective of Internal Modeling Deficit (IMD). The IMD suggests that before actual sensory feedback is available, the internal model will predict the action results and provide fast online correction methods. DCD individuals have internal model deficit that prevents them from correcting their actions, specifically manifested as a decrease in their ability to represent their actions. **Hypothesis**: The DCD group performed worse in procedural learning than the control group; Compared to action execution, the DCD group showed a greater degree of defects under the condition of action representation. **Method**: The study included 18 control group (12 girls) participants and 19 DCD group (10 girls) participants aged 18-21. The experimental program is adapted from the Serial reaction time task (SRTT), setting two conditions: motor execution and motor imagery, reaction time and accuracy were recorded. **Results**: A three factor repeated measurement analysis of variance was conducted for 2 (group: control group, DCD group, inter group variable) * 2 (sequence type: familiar sequence, unfamiliar sequence, intra group variable) * 2 (reaction mode: motor execution, motor imagery, intra group variable). For hypothesis 1: the interaction between group and sequence type is not significant, F=(1,35)=1.781, p=0.191, the main effect of sequence type is not significant, F (1,35)=3.428, p=0.073. The main effect of the group is significant, F (1, 35)=6.323, p=0.017*, partial η^2= 0.153. Post hoc testing showed that the average reaction time of the DCD group was 37.40ms slower than that of the TD group, p=0.017 *. For hypothesis 2, as for unfamiliar sequences, the interaction between group and reaction mode is significant, F (1.35)=8.142, p=0.007**, partial η^2= 0.132; The simple effect of reaction mode in the control group was not significant F (1,17)=0.247, p=0.626; The simple effect of reaction mode in the DCD group is significant, with F (1,18)=9.848, p=0.006**, partial η^2= 0.354, the average reaction time under motor imagery is 36.18 ms faster than under motor execution , p=0.001**. **Conclusion**: The response time of the DCD group in procedural learning is longer than that of the control group, verifying hypothesis 1; The learning effect under motor imagery of the DCD group is significantly worse than that under motor execution, verifying hypothesis 2. This study explains the procedural learning problem of DCD from the perspective of IMD: there is a deficit in the motor imagery in DCD, which leads to the inability to timely correct actions, leading to procedural learning problems.

工作记忆表征优先级的形成机制

张亚亚　丁锦红（通讯作者）
首都师范大学心理学院，北京，100037，dingjh@cnu.edu.cnu

摘 要 近年来，人们对大脑中的多重和分布式记忆表征有了更深入理解并构建了一种从低级视觉表征到高层次概念表征的客体表征体系，具体包括感觉表征、具体和抽象语义表征、时空表征、图式以及认知地图等。多层次表征模型也进一步提出真实物体表征是由底层知觉特征、中层长时记忆经验信息（类别信息）以及顶层完整客体构成。然而，上述理论主要关注记忆表征与编码的动态性和转换性等特征，而未充分考虑客体多层次表征提取的优先级以及各表征层次间的相互关系。

本研究以真实物体图片为材料，采用眼动技术和延迟匹配任务，考察真实物体再认过程中的类别表征与知觉表征之间的相互作用机制。在学习阶段，要求被试记住同时呈现（实验一）和序列呈现（实验二）的 4 个物体；测验阶段在屏幕中央呈现一个探测刺激，要求被试判断是否在学习阶段出现过。探测刺激有三种类型：类别与物体都相同（完全相同）、类别相同而物体不同（部分相同）以及类别和物体都不同（完全不同）。实验过程中被试通过按键反应，眼动仪记录被试的眼动数据。

研究结果表明，（1）个体再认真实物体时，更多依赖类别表征而非知觉表征，且类别表征的优先提取会抑制物体知觉表征，降低对物体的提取成绩。（2）再认时的微眼跳率、转移熵及静息熵证明，基于类别的内部注意可以主动将资源分配阶段与决策阶段分开。300~500ms 内在类别表征层次上分配注意；500-1000ms 中在知觉表征层次上分配注意且做出决策。（3）类别-知觉表征间的资源竞争受到类别-物体间语义关系强度的影响，与部分相同物体（类别-物体语义关系弱）相比，提取完全相同物体（类别-物体语义关系强）时，基于类别的注意会调整个体更快地匹配到关注客体。总之，在工作记忆不同阶段表征发生快速而实质性的转换，不断调整表征的优先级，从而实现新旧知识整合，保证信息能够成功储存与提取。

Mechanisms of Prioritization of Working Memory Representations

Yaya Zhang Jinhong Ding (corresponding author)
School of psychology, Capital Normal University, Beijing, 100037, dingjh@cnu.edu.cnu

***Abstract*：** In recent years, multiple and distributed memory representations in the brain have been better understood and a system of object representations has been constructed that ranges from low-level visual representations to high-level conceptual representations, including sensory representations, concrete and abstract semantic representations, spatio-temporal representations, schemas, and cognitive maps. The multilevel representation model further proposes that real object representations are composed of bottom-level perceptual features, middle-level long-term memory experience information (category information), and top-level complete objects. However, the above theories mainly focus on features such as the dynamics and transformations of memory representation and encoding, and do not fully consider the priority of object multilevel representation extraction and the interrelationships among the representation levels.

In this study, we used pictures of real objects as materials, eye-movement technology and a delayed matching task to examine the interaction mechanism between category representations and perceptual representations in the process of real object rerecognition. In the learning phase, subjects were asked to memorize four objects presented simultaneously (Experiment 1) and sequentially (Experiment 2); in the quiz phase, a probe stimulus was presented in the center of the screen and subjects were asked to determine whether it had appeared in the learning phase. There were three types of probe stimuli: categories and objects were the same (identical), categories were the same and objects were different (partially identical), and categories and objects were different (completely different). Subjects responded by pressing keys during the experiment, and an eye-tracker recorded the subjects' eye-movement data.

The results of the study showed that (1) individuals relied more on category representations than perceptual representations when re-recognizing real objects, and that the preferential extraction of category representations inhibited object perceptual representations and reduced the extraction performance for objects. (2) Microsaccade rate, translational entropy, and stationary entropy during re-recognition demonstrated that category-based internal attention can actively separate the resource allocation phase from the decision-making phase. 300-500ms allocated attention at the category representation level; 500-1000ms allocated attention at the perceptual representation level and made a decision. (3) Resource competition between category-perceptual representations was influenced by the strength of the category-object semantic relationship, with category-based attention adjusting individuals to match to the object of attention faster when extracting identical objects (strong category-object semantic relationship) compared to partially identical objects (weak category-object semantic relationship). In summary, rapid and substantial shifts in representations occur at different stages of working memory, continuously adjusting the prioritization of representations, thus enabling the integration of old and new knowledge and ensuring that information can be successfully stored and extracted.

情绪如何影响道德困境中的判断？一项基于情绪启动的实证研究

杨佳闻[1] 闫孜佳[1] 杨伊静[1] 吴琳倩[1] 张馥雅[1] 王亚兰[1] 许施扬[1]（通讯作者）
1 山西师范大学教育科学学院心理系，太原，030031，xushiyang@sxnu.edu.cn

摘 要 道德判断是一个交织了情感与推理的复杂社会认知过程，受到情绪影响的同时，又对其做出反馈。情绪既可以引发道德直觉，也可能干预道德推理，其在道德判断中的作用不可忽视。在此背景下，本研究采用 CNI 模型来剖析道德判断的过程。该模型主要包括个体对结果(Consequences)的敏感性、对道德规范(moral Norms)的敏感性以及个体的行为反应偏好(Inaction versus action)。而情绪或许会调整对后果和规范的感知度，从而改变道德判断的反应时。情绪的种类不同也会有不同的影响，先前研究证明消极情绪会增加个体对规则的敏感性。为此，我们提出以下假设：（1）情绪启动下的道德判断时间高于无情绪启动；（2）消极情绪下的道德判断的道义倾向性高于对照组和积极情绪。

为了验证这些假设，我们设计了一个单因素被试间实验，通过启动积极情绪（开心）、消极情绪（厌恶）和无情绪（对照），让被试在这三种情绪状态下对道德两难困境问题进行回答，并记录其反应时间和道德判断的倾向性。实验对象为 99 名 19-23 岁的大学生，按情绪状态随机分为三组，每组 33 人。首先，被试需观看与启动情绪相符合的图片，然后对十个道德两难困境问题做出判断。实验结果揭示，情绪启动下的道德判断时间明显高于无情绪启动（$F(2,96) = 6.07, p < 0.01$，$\eta^2_p=0.112$），说明情绪会增加道德判断的认知负担。然而，积极情绪和消极情绪对道德判断的倾向性并无显著影响（$F(2,96) = 0.83, p > 0.05$,$\eta^2_p=0.017$）。

这些发现强调了情绪在道德判断中的影响。它们可能增加道德判断的认知负担，从而延长反应时间。我们推测，情绪可能激活与道德困境相关的情感直觉，增加了冲突维度的权重，使得在做出道德判断时需要更多时间和精力。然而，第二个假设并未得到验证，即积极情绪和消极情绪对道德判断的倾向性没有显著影响。这可能是由于道德困境问题涉及到不同的规范和直觉维度，而不同类型和强度的情绪对这些维度的影响可能有所不同。因此，不能简单地将情绪分为积极和消极，而需要详细考察情绪的具体内容和特点，以及其与道德困境问题的匹配程度。

关键词 道德判断,情绪,CNI 模型

How Do Emotions Influence Judgment in Moral Dilemmas? An Empirical Study Based on Emotional Priming

Jiawen Yang[1], Zijia Yan[1], Yijing Yang[1], Linqian Wu[1], Fuya Zhang[1], Yalan Wang[1], Shiyang Xu[1] (Corresponding Author)
[1] Department of Psychology, Faculty of Education Sciences, Shanxi Normal University, Taiyuan, 030031

***Abstract*：** Moral judgment is a complex social cognitive process intertwined with emotions and reasoning, influenced by emotions while also responding to them. Emotions can evoke moral intuitions and may interfere with moral reasoning, their role in moral judgment is undeniable. The model includes the individual's sensitivity to Consequences, the individual's sensitivity to moral Norms, and the individual's Inaction versus action. And emotions may adjust the perception of consequences and norms, thereby altering the response to moral judgments. Different types of emotions also have different effects, and previous research has shown that negative emotions can increase an individual's sensitivity to rules. Hence, we propose the following hypotheses: (1) The time of moral judgment under emotional priming is higher than without emotional priming; (2) The moral tendency of

moral judgment under negative emotions is higher than the control group and positive emotions.

a single-factor between-subjects experiment was designed to verify these hypotheses. We primed positive emotions (happiness), negative emotions (disgust), and no emotions (control), and had subjects answer moral dilemma questions under these three emotional states, recording their response times and moral judgment tendencies. The subjects were 99 university students aged 19-23, randomly divided into three groups of 33 each. First, the subjects needed to view pictures that corresponded to the primed emotions, then make judgments on ten moral dilemma questions. The experimental results revealed that the time of moral judgment under emotional priming was significantly higher than without emotional priming（$F(2,96) = 6.07$, $p < 0.01$，$\eta^2_p = 0.112$）, indicating that emotions increase the cognitive load of moral judgment. However, positive and negative emotions had no significant effect on the tendency of moral judgment （$F(2,96) = 0.83$, $p > 0.05$,$\eta^2_p = 0.017$）。

These findings emphasize the impact of emotions on moral judgment. They may increase the cognitive load of moral judgment, thereby extending response times. We speculate that emotions may activate emotional intuitions related to moral dilemmas, increasing the weight of the conflict dimension, necessitating more time and effort in making a moral judgment. However, our second hypothesis was not confirmed, that is, positive and negative emotions had no significant effect on the tendency of moral judgment. This may be because moral dilemma questions involve different norms and intuition dimensions, and different types and intensities of emotions may have varying effects on these dimensions. Therefore, we should not simply categorize emotions as positive or negative but need to examine in detail the specific content and characteristics of the emotions, as well as their match with the moral dilemma questions.

数值比较范式对感数机制的影响

刘炜[1] 赵小可[2] 王春辉[1] 田静琳[1] Guido Marco Cicchini[3]（通讯作者）
1 云南民族大学，教育学院，昆明，650000
2 大理大学，教师教育学院，大理，671000
3 意大利国家研究理事会认知神经科学研究所，比萨，56124，cicchini@in.cnr.it

摘 要 在感数机制（Subitizing）的作用下，小数值（1-4）可以被快速且精确地识别。然而感数机制容易被影响，例如与目标刺激同时呈现的干扰刺激就会干扰感数机制。为了进一步分析上述影响是发生在知觉阶段还是反应选择阶段，我们考察了数值比较范式对感数机制的影响。被试需要比较呈现在屏幕左、右侧刺激的数量多少，在保证正确的前提下尽快反应。在不同任务组中，两侧刺激可以同时呈现（同时任务）也可以相继呈现（继时任务）。相对于继时比较范式来说，同时比较范式在知觉阶段会引发更高的注意负荷，而两种范式在反应阶段的认知负荷相同。实验结果表明，在比较中等数量（6-32 点）的刺激时，两种任务下都观测到了数值比率效应，即比较的错误率和反应时随着被比较数值比率升高（被比较的数值逐渐接近）而线性上升。形成对比的是，小数值加工会受比较范式影响：在比较小数值（1-4）的刺激时，继时比较任务的错误率不随数值比率而变化，始终维持在极低水平；在继时任务中，小数和中数比较的逆效率分数（IES）无显著相关。这些结果提示精确的感数机制可以在继时比较中发挥作用。在同时任务中，小数比较的数值比率效应与中数比较相似，即比较的错误率和反应时随被比较数值的比率接近而线性上升，且两种数值范围内的 IES 显著相关，这些结果提示，此时感数机制不再是上述小数值加工的基础；在同时比较范式下，数量比较建立在数量机制（Numerosity）活动的基础上。感数机制会因为知觉阶段产生的注意负荷而受到破坏，此时，小数值（1-4）的加工依赖数量机制完成。

Subitizing Endures in Sequential rather than Simultaneous Comparison Tasks

Abstract: The number of small quantities (up to four) can be appraised rapidly and errorlessly, a phenomenon dubbed subitizing. This system, however, can be impaired by distractors presented along with targets to be enumerated. To better understand whether this limitation arises in perceptual circuits or in the response selection stage we investigated whether subitizing can endure in simultaneous comparison tasks. Participants were asked to compare the number of dots in two sets on the left and right sides of the screen, presented either simultaneously or sequentially. For comparing within the numerosity range (6-32 dots), both the error rate and reaction time increase steadily as the ratio between the two numbers to be compared approaches '1'. Namely, a phenomenon labeled the ratio effect was revealed. For comparison with small numbers (<5), the sequential comparison task is errorless

despite the ratio, suggesting the feature of subitizing. Individual efficiency (measured by the inverse efficiency score, IES) does not correlate between number ranges in sequential comparison, suggesting that two mechanisms are involved. However, we found that in simultaneous tasks, error rate and efficiency show an increase as the ratios of the two numbers to be compared approach '1'. This is similar to the ratio effect revealed in the comparison for moderate numbers. Individual efficiency within these two ranges correlates, indicating that the enumeration within these two ranges is based on a single mechanism. These results suggest that subitizing cannot process sets in parallel, and numerosity takes the job whenever subitizing fails.

摘 要 内隐记忆(implicit memory)指在无需刻意回忆的情况下，个体已有的知识经验无意识地影响当下行为表现的现象。研究发现，呈现在编码阶段的干扰任务不会对内隐记忆产生影响，但呈现在提取阶段的干扰任务却会影响内隐记忆，由此将后者成为内隐记忆的提取干扰效应。内隐记忆提取干扰效应的发现似乎挑战了传统观点中内隐记忆是自动化加工过程的观点，因此为了进一步揭示内隐记忆的加工机制，许多研究对提取干扰效应的产生机制进行探讨。有意思的是，近期研究发现，内隐记忆的提取干扰效应会受测验类型的不同影响，表现为提取干扰在产生式测验中对内隐记忆的影响显著小于识别式测验。由于相比于快速作答的识别式测验，产生式测验的回答主要基于自行激活，其测得的内隐记忆可能更容易混合外显意识成分，而研究表明，提取阶段的干扰任务不会影响有意识的外显记忆。因此，有理由怀疑，提取意识可能是内隐记忆提取干扰效应产生的一个重要机制，即内隐记忆的提取干扰效应之所以在不同的内隐测验中出现差异，可能主要源于提取意识对内隐记忆起到了保护作用。为此，本研究在前人研究的基础上，设置 2 个实验，通过操纵测验阶段的指导语和设置事后意识问卷对意识条件进行控制和检验，考察提取意识对不同类型内隐记忆提取干扰效应的影响。结果发现，提取意识既不会对识别式知觉内隐记忆的提取干扰效应产生影响（实验 1），也不会对识别式概念内隐记忆的提取干扰效应产生影响（实验 2）。表明，提取意识的差异并非引发内隐记忆的提取干扰效应产生的主要原因，只要被试在提取阶段进行双任务，内隐记忆的启动效应就会受损，提取意识并未对内隐记忆起到保护作用。

Abstract：Implicit memory does not require the intentional retrieval of the information presented during the study phase and is typically measured via repetition priming—a facilitation in the processing of previously encoded stimuli, relative to new stimuli.This study adopted a dual-task paradigm and manipulated the instructions to form awareness and the unawareness conditions in the test phase. We set up different test tasks in the three experiments to discuss the impact of awareness respectively when the implicit memory test was an identifiable-perceptual test(Experiment 1), an identifiable-conceptual test(Experiment 2). The results showed that the retrieval-DA effect is a relatively stable phenomenon, and the awareness at retrieval isn't a main result that causing the retrieval-DA effect of implicit memory.

Keywords：awareness at retrieval; the retrieval-DA effect; implicit memory

负性情绪诱发对个体不同热量食物注意偏向动态特征的影响

朱晓芸[1]　张剑[1]（通讯作者）

1 上海体育大学心理学院，上海，200438，通讯作者 E-mail：Zhangjian@sus.edu.cn

摘　要　情绪状态对人的饮食活动具有影响，情绪化进食（Emotional Eating）常发生在个体体验到消极情绪（如悲伤、焦虑等）时，通过饮食缓解“心理饥饿”，因此会增加过度饮食的可能性，带来肥胖、心脑血管疾病等方面的问题，在很大程度上损害心理健康。研究表明，个体对线索的注意偏向（Attentional Bias）是影响后续行为发生的主要因素，但是以往研究中将注意偏向概念化为个体稳定或静态的特征样信号，忽略了注意偏向的动态性特征，而时间动态理论的提出可以弥补以往研究的不足。因此，本研究基于时间动态理论，探究在消极情绪状态下，高、低情绪化进食程度个体对高、低热量食物注意偏向的动态特征。实验通过视频片段诱发被试的悲伤情绪，之后完成食物点探测任务，记录被试对高热量和低热量食物的注意偏向动态特征。结果显示，在悲伤情绪下，（1）对于高热量食物，无论情绪化进食程度高或低，被试的注意偏向峰值参数、均值参数之间没有显著差异；（2）对于低热量食物，注意偏向峰值参数、均值参数中，峰值偏向参数（即试次水平最大正值）上存在显著差异，也就是说情绪化进食程度高的被试在注意偏向低热量食物的最大程度上小于情绪化进食程度低的被试。这些结果表明，情绪化进食程度不影响个体对高热量食物的注意偏向波动，但是情绪化进食程度高的个体在悲伤情绪下可能更容易从低热量食物中脱离注意。

Negative mood induction affects the dynamic characterization of food attentional bias

Zhu xiaoyun, Zhang jian

School of psychology, Shanghai University of Sport, Shanghai 200438

Abstract：Emotional states have an impact on eating activities. Emotional eating often occurs when individuals experience negative emotions (e.g., sadness, anxiety, etc.) and eat to alleviate their "psychological hunger," thus increasing the likelihood of overeating, which can lead to obesity, cardiovascular and cerebrovascular diseases, and to a large extent, impair mental health. Research has shown that individuals' attentional bias toward cues is a major factor influencing the occurrence of subsequent behaviors, but previous studies have conceptualized attentional bias as a stable or static feature-like signal of individuals, ignoring the dynamic characteristics of attentional bias, and therefore, the proposal of temporal dynamics theory is to make up for the shortcomings of previous studies. Therefore, based on the temporal dynamics theory, the present study investigated the dynamic features of attentional bias toward high and low calorie foods in individuals with high and low emotional eating levels under negative emotional states. The experiment was conducted by inducing sadness in subjects through video clips, after which a food dot probe task was completed to record the dynamic features of subjects' attentional bias toward high and low calorie foods. The results showed that under sadness, (1) for high-calorie foods, there was no significant difference between the peak and mean attentional bias parameters of the subjects, regardless of whether they had high or low levels of emotional eating, and (2) for low-calorie foods, there was a significant difference in the peak bias parameter (i.e., the maximum positive value of the trial-level) among the peak and mean attentional bias parameters. It means that the subjects who had a high level of emotional eating showed great significant difference in the maximum positive value of attentional bias for low-calorie foods. These results suggest that emotional eating does not affect fluctuations in the attentional bias toward high-calorie foods, but that individuals

who are high in emotional eating may be more likely to disengage their attention from low-calorie foods when they are sad.
Keywords：emotional eating, food attentional bias, temporal dynamics theory

背景预期对前瞻记忆动态加工的影响：ERPs 研究

任智

宁波大学心理学系暨研究所，宁波，315211,renzhi@nbu.edu.cn

摘 要 前瞻记忆(prospective memory, PM)是指形成意图并记住在将来某一时间或特定情景下成功执行这一意图的能力。动态多重加工理论指出，前瞻记忆的策略监控是一个灵活变化的加工，与自发提取加工动态交互作用，共同支持前瞻记忆过程。另外，一些研究表明背景预期是调节策略监控加工的一个关键因素，它可以影响注意资源分配策略。而且，被试往往只会在可预期的任务背景下对前瞻记忆进行 监控。然而，在不同背景预期条件下的前瞻记忆的认知和神经机制仍然不清楚。因此，本研究结合 ERPs 技术，通过操纵执行前瞻记忆任务的背景预期水平，探究不同背景预期条件下前瞻记忆的动态加工特征及其认知神经机制。结果表明，在行为上，相比于非预期和低预期背景，高预期背景下前瞻记忆表现更好。而且，而线索聚焦和背景预期之间交互作显著用，表明背景预期对前瞻记忆表现的作用受到前瞻记忆聚焦特征的制约，高预期背景减小了聚焦和非聚焦前瞻记忆任务表现差异，因此更有利于提高非聚焦性前瞻记忆任务表现。此外，基于逐个试次的监控消耗分析发现，高预期背景条件下，从线索出现之前到之后，关联试次的监控消耗逐渐降低，从而导致总体消耗降低。因此，当线索背景可以预期时，个体会投入策略监控。前瞻记忆任务的背景预期越高，这种策略监控也就越高，而当线索尚未出现时则取消监控，采取自发提取。在 ERPs 结果模式上，高预期背景条件下前瞻记忆试次和线索关联试次诱发更大 N300（200~400 ms），而进行中试次诱发更多的前瞻正波（400~600 ms）。这种差异反映了在前瞻记忆线索探测和提取过程中注意资源的重新分配或提取模式的促进作用，甚至两者相互结合。总之，这些结果共同支持了前瞻记忆的动态多重加工理论，背景预期调节前瞻记忆的策略监控和自发提取的动态交互作用。

The Effect of Context Expectation on the Dynamic Process of Prospective Memory: ERPs Study

Zhi Ren

Department and Institute of Psychology, Ningbo University, Ningbo, 315211, renzhi@nbu.edu.cn

Abstract： Prospective memory (PM) refers to the ability to form an intention and remember to successfully execute that intention at a specific time or in a particular situation in the future. The dynamic multiprocess theory of PM suggests that the strategy monitoring in prospective memory is a flexible process that dynamically interacts with spontaneous retrieval processes, both supporting the PM processes. Additionally, some studies indicate that context expectation plays a crucial role in regulating the strategy monitoring process, influencing the allocation of attentional resources. Moreover, participants often only engage in monitoring PM in predictable contexts. However, it remains unclear that the cognitive and neural mechanisms of PM under different context expectation conditions. Therefore, in this study, we employed ERP (Event-Related Potentials) techniques to manipulate the levels of contexts expectation during PM tasks, investigating the dynamic processes and cognitive neural mechanisms of PM under different context expectation conditions.

Behaviorally, the results revealed that PM performance was better in the high expectation contexts compared to the non-expectation and low-expectation contexts. Furthermore, there was a significant interaction between cue focusing and context expectation, indicating that the effect of context expectation on PM performance was constrained by the focusing characteristics of prospective memory. The high-expectation contexts reduced the performance differences between focused and non-focused prospective memory tasks, thus favoring non-focused prospective memory tasks. Additionally, based on the analysis of monitoring consumption on a trial-by-trial basis, it was found that under the high-expectation context condition, the consumption of monitoring gradually decreased from before to after cue appearance, leading to an overall reduction in consumption. Therefore, when the cue context is predictable, individuals engage in strategy monitoring. The higher context expectation, the more strategy monitoring; while monitoring is canceled when the cue has not yet appeared, and spontaneous retrieval is adopted.

Regarding the ERP results, in the high-expectation context condition, PM trials and cue-associated trials elicited larger N300 (200-400 ms), while ongoing trials elicited more prospective positivity (400-600 ms). These differences reflect the reallocation of attentional resources or the facilitation of retrieval patterns during cue detection and retrieval in PM. These patterns may even combine with each other. In conclusion, these results collectively support the dynamic multiprocess theory of PM, indicating context expectation regulation the dynamic interplay between the strategy monitoring and spontaneous retrieval processes of PM.

基于动作形式对群体成员的一致性预期：来自行为和事件相关电位的证据

周文莹 王思敏 段继鹏 尹军（通讯作者）
宁波大学心理学系暨研究所，宁波大学群体行为与社会心理服务研究中心，浙江 宁波，315211，
yinjun1@nbu.edu.cn

摘 要 人们总是预期群体成员的行为具有一致性，但是行为可以被细分为行动目标和动作形式。多数情况下，人们预期同一群体的成员具有相同的目标。然而，个体趋近目标的具体动作形式是否经济有效(即是否符合合理性原则)，也影响着人们对行为的理解。当行为不符合合理性原则时，动作形式的重要性会凸显，此时，个体能否依据动作形式建立群体行为一致性预期呢？本研究采用动画模拟群体情景范式，并借助能够间接体现被试预期与当前刺激是否一致的反应时和能够直接体现被试预期强度的晚期正成分(late positive potential, LPP)，对该问题进行了探究。研究 1 发现，当群体成员以不符合合理性原则的行为(无障碍跳跃)趋近外部目标时，若同群体的新成员在趋近目标过程中表现出相同动作形式，被试识别该成员行为的速度显著更快，而且此时被试在预期阶段会产生振幅更高的 LPP 成分，与之相对，当新成员来自不同群体时，上述效应则不存在。该结果表明，人们能够基于动作形式建立群体成员行为一致的预期。为了进一步确定人们建立该预期的前提条件，研究 2 对群体成员行为是否符合合理性原则进行了区分，结果发现，当群体成员行为不符合合理性原则(无障碍跳跃)时，若同群体新成员表现出相同动作形式，被试识别该行为时显著更快，且预期阶段所产生的 LPP 成分的振幅显著更高，而在群体成员行为符合合理性的条件(有障碍跳跃)则不存在该效应。该结果进一步表明，行为不符合合理性原则时，人们会依据动作形式建立群体行为一致性预期。总之，本研究所获得行为和事件相关电位证据一致表明，当行为不符合合理性原则时，人们能够依据动作形式建立群体行为一致性预期，该结论可以为理解社会文化中某些不经济甚至无意义的习俗行为的传承提供启发。

Consensus Expectations of Group Members based on Action Means: Evidence from Behavioral and Event-Related Potentials

Zhou Wenying Wang Simin Duan Jipeng Yin Jun（Corresponding author）
Department of Psychology, Center of Group Behavior and Social Psychological Service, Ningbo University, Ningbo, 315211, China

***Abstract*：** Consistency in the behavior of group members is a common expectation, with behavior being categorized into action goals and action means. Typically, individuals anticipate that members of the same group will share the same goals. However, the perceived rationality and effectiveness of an individual's actions towards a goal also play a significant role in shaping how behavior is understood. When behavior deviates from rational principles, the importance of action means becomes more pronounced. Under such circumstances, can individuals establish expectations of group behavior consistency based on action means? This study employed animated depictions to simulate group interaction scenarios and utilized response time as an indirect measure of subject expectation alignment with stimuli. Additionally, the study used the late positive potential (LPP) to directly gauge

the intensity of subject expectations. Study 1 findings revealed that when a group member approached an external goal using an action means that deviated from rationality (e.g., jumping without barriers), the subjects recognized the behavior of a new group member who adopted the same action means to reach the goal significantly faster. In this situation, the subjects also exhibited a higher amplitude LPP during the anticipation stage. However, this effect disappeared when the new member belonged to a different group. These findings suggest that individuals can establish expectations of group members' consistent behavior based on action means. To further validate the preconditions for this expectation, Study 2 distinguished between group members' behaviors conforming and not conforming to rational principles. The results demonstrated that when group members' behavior did not adhere to rationality (e.g., jumping without obstacles), the subjects recognized the behavior of new group members who used the same action means significantly faster, and the amplitude of the LPP component during the anticipation stage was notably higher. However, this effect was not observed when group members' behavior adhered to rationality (e.g., jumping with obstacles). These findings further underscore that when behavior does not conform to rational principles, people establish group behavior consistency expectations based on action means. In conclusion, the behavioral and event-related potentials evidence from this study consistently indicates that when behavior deviates from rationality, individuals form group behavioral consistency expectations based on action means. This insight provides inspiration for understanding the perpetuation of uneconomical or seemingly meaningless customary behaviors in social culture.

面孔大小对面孔倒置效应的影响

肖宜清[1]　王金辉[1]　鲁虹宇[1]　韩超[2]　黄婉怡[1]（通讯作者）

摘 要　面孔识别通常被认为依赖整体加工或构型加工，一旦面孔倒置，人们无法加工面部特征间的空间关系，从而很难识别倒立面孔。有理论认为，这是由于人们对倒立面孔的知觉野（perceptual field）相比正立面孔变小，无法将多个特征进行空间整合（如 Rossion，2009；Poltoratski 等，2021）。然而，关于面孔知觉野的特点，目前的了解仍然非常有限。例如，正立面孔的知觉野范围为多大，是否当正立面孔超过特定的大小时，就难以对其进行整体加工，从而识别能力下降？前人的研究结果并不一致。另外，将倒立面孔缩小是否可以匹配较小的倒立面孔知觉野，从而有助于对其进行特征整合，提高识别能力？针对这两个问题，本研究探讨了面孔大小（1°到 10°）对正立和倒立面孔识别的影响。实验 1 采用面孔延时匹配任务（6 项迫选），发现对正立和倒立面孔的识别准确率在大多数面孔大小下均较为稳定，面孔倒置效应广泛存在于各种大小的面孔中（正立面孔的识别准确率显著高于倒立面孔），且效应大小不受面孔大小的影响。实验 2 采用奇异面孔奇怪性评分任务，发现无论哪种面孔大小均存在显著的倒置效应（即“撒切尔夫人面孔效应”）：人们能够轻易识别正立面孔中的特征改变，对于面部特征（眼睛和嘴巴）180 度反转的正立面孔会感到很奇怪（奇怪性评分高），而一旦面孔倒置，则不会感到奇怪（奇怪性评分低）。实验 2 同样发现，对正立和倒立面孔的识别（对奇异面孔的奇怪性评分）随面孔大小的波动不大，面孔倒置效应不受面孔大小的影响。本研究的结果提示，对正立面孔的整体加工窗口可以扩大到至少 10°，而倒立面孔即使小至 1°，人们也难以对其进行类似正立面孔的整体加工。我们推测，一种可能是倒立面孔的知觉野总是相对刺激大小本身变小（1°时知觉野小于 1°），另一种可能是“将多个特征涵盖在知觉野内”并非整体加工的充分条件，对于倒立面孔，人们并不能把知觉野内的特征有效整合到一起。面孔知觉野的特点，以及它和整体加工的关系仍有待进一步理清。

The influence of face size on the face inversion effect

Abstract：Face recognition is often thought to rely on holistic/configural processing. Once faces are inverted, people cannot process the spatial relations between facial features, and thus hard to recognize inverted faces. It has been hypothesized that the face inversion effect (FIE) is due to a smaller perceptual field (PF) for inverted relative to upright faces. People cannot spatially integrate multiple features with a small PF (e.g., Rossion, 2009; Poltoratski et al., 2021). However, the current understanding of the characteristics of the PF for faces is still very

limited. For example, how large can the PF be for upright faces? Does the holistic processing fail for upright faces when the face size exceeds a certain visual angle? The results were inconsistent in previous studies. By contrast, can the holistic integration of features become easier for inverted faces at small sizes that better match the smaller PF for inverted faces? Here, the present study investigated the effect of face size (1° to 10°) on upright and inverted face recognition. In Experiment 1, participants performed a 6AFC delayed face-matching task. The results showed that the recognition accuracies for both upright and inverted faces were relatively stable across face sizes. The FIE (i.e., higher accuracies for upright relative to inverted faces) was significant for all face sizes, and its magnitude was not influenced by face size. In Experiment 2, participants rated the scores of the grotesqueness of the distorted faces (with inverted eyes and mouths). Significant FIEs (i.e., the classic Thatcher illusions) were found regardless of face size: people could easily recognize the distorted features in upright faces and thus readily feel the grotesqueness (the scores were high). Once faces were inverted, the grotesqueness disappeared (the scores were low). Similar to Experiment 1, the recognition (the rating scores here) for both upright and inverted faces was stable across most face sizes, and the magnitude of FIE did not change with face size. The present results suggest that the holistic processing window for upright faces can be up to at least 10°. By contrast, people cannot apply similar holistic processing to inverted faces even at a small size as 1°. One explanation is that the PF for inverted faces is always smaller relative to the stimulus size (i.e., the PF was smaller than 1° at 1° size). Another explanation is that the coverage of features within the PF is insufficient for successful spatial integration of features. The characteristics of PF for faces and the relation between PF and holistic face processing needs further clarification.

大学生主客体心理旋转的差异：主体心理旋转中的身体效应

巩昕昕 邵永聪（通讯作者）

北京体育大学心理学院，北京，100084，budeshao@aliyun.com

摘 要 心理旋转是空间能力的重要成分。根据旋转参考系的不同可以分为客体心理旋转和主体心理旋转。心理旋转中会出现空间性的具身效应，指的是身体动作经验会对个体的心理旋转等空间表征能力产生促进作用。已有研究表明刺激材料的不同或者操纵任务类型均可以实现对主体和客体心理旋转差异的研究。因此本研究通过字母 R 和身体动作摆出的姿势 R 作为刺激材料，在此基础上通过任务类型实现对主体和客体心理旋转的操纵，探讨刺激材料的类型和表征方式对心理旋转的差异。本研究选取 50 名右利手大学生作为研究对象，实验采用 2（刺激类型：字母 R，身体姿势 R） × 2（表征方式：客体心理旋转，主体心理旋转）两因素被试内设计，实验采用经典的心理旋转范式，旋转角度为 0°，60°，120°，180°，240°和 300°。在客体心理旋转中，每次向被试呈现两幅图片，被试需要判断两图是否相同。在主体心理旋转中，每次只呈现一幅图片，被试需要对指定部分在参考轴的左右侧进行判断。通过剔除缺失值和极端值，在保证正确率的前提下，对 43 名被试的反应时进行分析。重复测量方差分析显示：（1）刺激材料的主效应显著（$F(1,42) = 160.64$, $p < 0.001$）；（2）刺激材料和表征方式的交互作用显著($F(1,42) = 21.39$, $p < 0.001$)。进一步简单效应分析发现，在刺激材料是字母 R 时，主客体心理旋转差异不显著；当刺激材料是身体姿势 R 时，主客体心理旋转差异显著，当进行客体心理旋转时，被试的反应时更长($t = 13.18$, $p = 0.001$)。研究结果表明，个体主体表征的心理旋转能力优于客体表征的旋转能力，并且在以身体姿势作为刺激材料时，这种差异更加显著。具身认知认为，主体表征的过程是个体对身体旋转的模仿，这种模仿只发生在个体能够完成的动作中，因此本研究中在以身体姿势作为刺激材料时，由于与个体经验相关使得心理旋转任务获得具身化效应进而提升了绩效。这为后期进一步探究这种具身化过程背后的机制提供了基础。

The difference of mental rotation with egocentric and object-based transformations in college students: the physical effect in egocentric transformations

Xinxin Gong, Yongcong Shao

School of psychology, Beijing Sport University, Beijing 100084, China

Abstract：Mental rotation is an important component of spatial ability. It can be categorized into object mental rotation and subject mental rotation based on the rotational frame of reference. A spatial embodiment effect occurs in mental rotation, which refers to the fact that the experience of bodily movements contributes to an individual's spatial representational abilities such as mental rotation. It has been shown that differences in stimulus materials or types of manipulation tasks can enable the study of differences in mental rotation with egocentric and object-based transformations. Therefore, in this study, we used the letter R and the body movement pose R as stimulus materials, and based on this, we realized the manipulation of subject and object mental rotation by the type of task, and explored the differences between the type of stimulus materials and the way of representation on mental rotation. In this study, 50 right-handed college students were selected as research subjects, and the experiment used a 2 (stimulus type: letter R, body pose R) × 2 (representation type: mental rotation with egocentric, mental rotation with object-based transformations) two-factor within-subjects design, and the experiment used the classical mental rotation paradigm with rotation angles of 0°, 60°, 120°, 180°, 240°, and 300°. In object mental rotation, two

pictures were presented to subjects at a time, and subjects were required to judge whether the two pictures were the same. In subject mental rotation, only one picture was presented at a time, and subjects were required to make judgments about the specified portion on the left and right sides of the reference axis. The response times of 43 subjects were analyzed by eliminating missing and extreme values, while ensuring correctness. A repeated measures ANOVA revealed (1) a significant main effect of stimulus material ($F(1,42) = 160.64$, $p < 0.001$), and (2) a significant interaction between stimulus material and representation type ($F(1,42) = 21.39$, $p < 0.001$). Further simple effects analyses revealed that the subject-object mental rotation difference was not significant when the stimulus material was the letter R. The subject-object mental rotation difference was significant when the stimulus material was the body posture R. Subjects' response times were longer when object mental rotation was performed ($t = 13.18$, $p = 0.001$). The findings suggest that the ability to mentally rotate an individual's subject representation is superior to the ability to rotate an object representation, and that this difference is even more pronounced when body posture is used as the stimulus material. Embodied cognition suggests that the process of subject representation is the individual's imitation of body rotation, which only occurs in movements that the individual is able to perform, and thus the mental rotation task in the present study gained an embodied effect and improved performance when body posture was used as the stimulus material due to its relevance to the individual's experience. This provides a basis for further investigation of the mechanisms behind this embodiment process at a later stage.

Simon 转换任务中抑制控制过程的动态：一项基于鼠标跟踪技术的研究

叶文婷[1] 邱江[1]（通讯作者）

1 西南大学心理学部，重庆，400715，qiuj318@swu.edu.cn

摘 要 抑制控制过程及其机制已经被探索了几十年。本研究旨在研究短时间内（即试次内）响应复杂冲突类型时的抑制控制过程。本研究提出了一项新颖的任务，称为 Simon 转换任务，将 Simon 任务与颜色-形状任务转换范式相结合。在此基础上，本研究采用鼠标跟踪技术记录反应，并引入了经典的双色 Simon 任务和困难的四色 Simon 任务作为对比实验，检验新范式的可靠性和有效性。通过常规分析和时间过程分析，本研究检查了这些任务中是否出现经典的 Simon 一致性效应（Simon congruency effect）和任务一致性效应（task-rule congruency effect）。结果显示，Simon 一致性效应和任务一致性效应的经典发现在按键和鼠标跟踪反应中得到复制，但这两种一致性效应并无交互作用。然而，鼠标追踪反应的时程分析结果显示，即使这两种一致性效应在效应量上不存在交互，其触发抑制机制的启动时间存在一定的相互影响。进一步而言，在一系列冲突事件中，不同冲突事件会先后触发抑制控制机制，先触发的抑制控制过程起到一个“预热”作用，可为后触发的抑制机制的启动加速，但后触发的抑制机制启动后的抑制过程并不受先触发的抑制影响（即在反应时等变量上不体现交互作用）。这些发现支持假设：在短时间内可以通过不同任务中的不同冲突事件灵活且独立地调动抑制控制系统，而鼠标跟踪的时程分析结果还表明任务中的抑制控制的启动过程可能存在交互。

关键词 抑制控制，认知控制，执行功能，鼠标跟踪技术

Dynamics of inhibitory control processes in Simon-switching task: a mousetracking study

Wenting Ye[1], Jiang Qiu[1]

[1]Faculty of Psychology, Southwest University (SWU), Chongqing 400715, China

Abstract：The processes and mechanisms underlying inhibitory control have been explored for decades. The current study aimed to investigate the inhibitory control processes in response to complex conflict types within trials. A novel task, called the Simon-switching task, was proposed, which integrated the Simon task with the colour-shape task switching paradigm, in conjunction with a simple Simon task and a difficult Simon task, using a mousetracking technique. Simon congruency effects and task-rule congruency effects were examined among these tasks, via conventional analyses and a time course analysis. The results showed that classic findings of Simon congruency effects and task-rule congruency effects replicated empirical key-press and mousetracking findings. These findings supported the hypothesis that inhibition could be flexibly and independently evoked by different conflict events within a short time, but mousetracking technique suggested that the initiations of inhibitory processes were interacted between congruency effects in the tasks.

Keywords：inhibitory control, cognitive control, executive functions, mousetracking

摘　要　运算动量效应(Operational Momentum, OM effect)指的是个体在心算中表现出高估加法答案和低估减法答案的现象。该效应反映了数字的空间属性对个体算术加工的影响。新近研究发现，OM 效应不仅存在于数量维度与空间维度，还存在于在时间维度。然而尚不明确不同维度中的 OM 效应是否反映了一致的心理过程。实验为 2(维度：时间/空间)×2(探针一致性：OM 一致/OM 不一致)被试内设计，招募被试 40 名(平均 21.76 ± 2.58 岁)，采用算术验证范式，使用事件相关电位(ERPs)技术，考察空间维度与时间维度中 OM 效应的行为表现与电生理机制。在空间维度，实验以不同面积的矩形为材料，要求被试计算两矩形相加减的面积是否与探针刺激的面积一致；在时间维度，实验以不同持续时间的“＃”为材料要求被试判断两“＃”相加减的持续时间是否与探针的持续时间一致。行为结果显示，在空间维度，被试倾向于在加法中接受面积较大的探针并在减法中接受面积较小的探针；在时间维度，被试倾向于在加法中接受持续时间较长的探针并在减法中接受持续时间较短的探针。ERP 结果显示，在空间维度，OM 一致探针(加/减法中呈现面积较大/小的探针)在双侧顶叶诱发了更大的 P300 波幅(250-350ms)且 OM 不一致探针(加/减法中呈现面积较小/大的探针)在双侧顶叶的诱发了更大的 N2 波幅(150-250ms)；在时间维度，OM 不一致探针在额叶诱发了更大的 LPC 波幅(400-500ms)。综上，研究发现，尽管在时间维度与空间维度都存在 OM 效应，然而不同维度中 OM 效应的认知神经机制却不相同，反映了不同的心理过程。以上结果表明时间与空间不存在相同的运算术加工系统。

Cognitive Neurological Mechanisms of the Operational momentun in Spatial and Temporal Arithmetic: Evidence from ERP

Jian Zhang [1] Yun Pan[1] (correspondent)
1 School of Psychology, Guizhou Normal University, Huaxi University Town, Guian New District,Guiyang, 550025
E-mail:panyun129@163.com

***Abstract*：Objective** The Operational Momentum (OM) effect refers to the phenomenon in mental calculation where individuals tend to overestimate addition results and underestimate subtraction results. This effect reflects the influence of spatial properties of numbers on arithmetic processing. Recent research has revealed that the OM effect exists not only in the quantity dimension and spatial dimension but also in the temporal dimension. However, it remains unclear whether the OM effect in different dimensions reflects consistent cognitive processes. Therefore, this study employed an arithmetic verification paradigm and utilized the Event-Related Potentials (ERPs) technique to investigate behavioral performance and electrophysiological mechanisms of the OM effect in both spatial and temporal dimensions. **Method** The present study included 40 university student participants (mean age: 21.76 ± 2.58 years), with a gender distribution of 22 males and 18 females. In the spatial dimension, the experiment utilized rectangles of varying sizes, and participants were asked to determine whether the sum or difference of two rectangles matched the size of the probe stimulus. In the temporal dimension, the experiment used "#" symbols with different durations, and participants were required to judge whether the sum or difference of two "#" symbols matched the duration of the probe stimulus. **Result** Behavioral results demonstrated that, in the spatial dimension, participants tended to accept probes with larger areas in addition trials and probes with smaller areas in subtraction trials. In the temporal dimension, participants tended to accept probes with longer durations in addition trials and probes with shorter durations in subtraction trials. ERP results showed that in the spatial dimension, OM-consistent probes (probes with larger/smaller areas in addition/subtraction trials) induced larger P300 amplitudes in bilateral parietal lobes (250-350ms), while OM-inconsistent probes (probes with smaller/larger areas in addition/subtraction trials) induced larger N2 amplitudes in bilateral parietal lobes (150-250ms). In the temporal dimension, OM-inconsistent probes induced larger Late Positive Component (LPC) amplitudes in the frontal lobe (400-500ms). **conclusion** although the OM effect exists in both temporal and spatial dimensions, the cognitive neurological mechanisms underlying the OM effect differ between these dimensions, reflecting distinct psychological processes. These findings suggest that time and space operate within different arithmetic processing systems.

后疫情时代餐饮从业者主观幸福感与焦虑的调查研究

吴纤芸　贲思瑶　杜嘉鸿（通讯作者）
南京特殊教育师范学院教育科学学院，南京，210000，398354541@qq.com

摘 要　新冠疫情的爆发对餐饮业带来了许多挑战，包括人员流动性的减少、顾客需求的变化、成本上升以及营业时间限制等。在此背景下，本研究调查了后疫情时代餐饮从业者主观幸福感与焦虑间的关系，调查时间设定在 2023 年初。本研究共有 100 名江苏省内餐饮从业者参与问卷与访谈调查，包括 56 名小微餐饮和 44 名连锁餐饮业从业者。通过问卷调查，发现主观幸福感和焦虑呈现负相关（$r = -0.59$，$p < 0.01$）。整体调查结果显示，餐饮从业者的主观幸福感中等偏低，平均得分为 3.58（满分为 5）；焦虑程度处于中等水平，平均得分为 27.7（总分 25-35 为中等焦虑）。尤其表现在小微餐饮从业者，与连锁餐饮业相比存在差异（$t = 2.89$，$p < 0.01$），表明小微餐饮从业者在后疫情时代面临更大的困境。通过访谈了解到疫情后对餐饮从业者的影响仍在持续，导致其焦虑的原因包括：经济压力增加、工作时间不稳定、工作环境恶劣、人际关系紧张以及缺乏职业发展机会等因素。基于研究结果，从员工援助计划的角度提出以下建议：提供心理健康支持和咨询服务（87%的调查对象表示需要心理支持），加强员工培训和技能提升（70%的调查对象希望获得更多培训机会），改善工作环境和福利待遇（64%的调查对象认为工作环境需要改善），鼓励员工参与团队活动和社交交流（55%的调查对象认为与同事间的互动有助于提升幸福感），以促进餐饮从业者主观幸福感的提升，减轻焦虑程度，进而增加工作满意度。

A Survey on Subjective Well-being and Anxiety among Catering Industry Workers in the Post-Pandemic Era

WU, Xianyun　Ben,Siyao　Du, Jiahong

Department of Educational Science, Nanjing Normal University of Special Education, 1 Shennong Road, Qixia District, Nanjing, 210000, China

Abstract：The outbreak of the COVID-19 pandemic has posed numerous challenges to the catering industry, including reduced workforce mobility, changes in customer demands, rising costs, and limitations on operating hours. In this context, this study investigated the subjective well-being and anxiety of catering industry workers in the post-pandemic era, which was set at the beginning of 2023. A total of 100 catering professionals from Jiangsu Province participated in the survey and interview, including 56 individuals from small and micro-sized catering businesses and 44 from chain restaurants. The survey findings revealed a significant negative correlation between the subjective well-being and anxiety ($r = -0.59$, $p < 0.01$). The overall results indicated relatively low levels of subjective well-being among catering industry workers, with an average score of 3.58 (on a 5-point scale) and the anxiety level was at a moderate level, with an average score of 27.7 (a total score of 25-35 indicates moderate anxiety). This trend was particularly pronounced among small and micro-sized catering businesses, exhibiting significant differences compared to chain restaurants ($t = 2.89$, $p < 0.01$), indicating greater challenges faced by small and micro-sized operators in the post-pandemic era. Through interviews, it was found that the effects of the pandemic continued to impact catering industry workers, leading to job anxiety. Factors contributing to it included increased economic pressure, unstable work hours, unfavorable work environments, strained interpersonal relationships, and limited career development opportunities. Based on the research findings, the following recommendations are proposed from the perspective of employee assistance programs: providing psychological support and counseling services (87% of respondents expressed a need for psychological support), enhancing employee training and skill development opportunities (70% of respondents desired more training opportunities),

improving working conditions and benefits (64% of respondents believed that the work environment needed improvement), encouraging employee participation in team activities and social interactions (55% of respondents considered interaction with colleagues beneficial for enhancing well-being), in order to enhance the subjective well-being among catering industry workers, and reduce anxiety levels, thereby increasing job satisfaction.
Keywords：catering industry workers, subjective well-being, anxiety, employee mental health

不确定性规避对累积疫情防控效果的影响

严致昊 陈淼 王瑞瑞

(浙江大学，杭州，310058)

摘 要 新冠病毒流行 4 年，纵观全球数据，一些国家的防治效果不佳，但另一些国家却能较好地控制疫情蔓延。除了医疗资源、人口密度等基础条件以外，跨文化价值观差异是心理学文献讨论疫情防控行为效果的热点（Cho et al. 2021; Lu et al., 2021; 黄丽芹 et al., 2021）。现有文献多数考察文化价值观对于戴口罩、保持社交距离等疫情管制规范的遵守行为，很少有文献关注文化对于防疫效果的影响。尽管少数研究者呼吁对效果进行研究（Liu, 2021; 王然，2020），探索人类应对重大疾病传播的防控策略，截止目前并没有文章对此进行实证研究。本文回应了 Liu 等人（2021）的呼吁，基于 Hofstede 跨文化理论，研究者构建并验证了“疫情防控效果影响模型”，实证检验跨文化价值观如何影响 4 年以来的累积疫情防控效果。研究者收集了 Hofstede（2001）跨文化数据、世界卫生组织跨国疫情防控数据，并且控制了 GDP、人口密度等基础条件，研究发现，不确定性规避文化价值观正向预测 COVID-19 每十万感染人数、每十万死亡人数；并且对于疫苗接种率没有显著影响。相比与个体/集体主义价值观（e.g., Lu et al., 2021; 黄丽芹 et al., 2021），不确定性规避更好地预测了 4 年以来的累积疫情防控效果。研究者认为，面对重大传染性疾病事件，不确定性规避影响了人们对于新冠疫情防控措施新规范的群体接受程度。在不确定性规避低的国家，政府能够更快地出台管控响应措施，人们也更容易接受这些措施；在不确定规避高的国家，管控措施制定更慢，人们也不愿意接受新管控措施带来的不确定个性。本研究尝试了实证研究跨文化价值观对于 4 年累计疫情防控效果的影响，提出了不同于以往文献的新角度，为不同文化背景下针对重大传染性疾病实施管控、取得良好效果提出了新角度。

Uncertainty Avoidance Influences Covid-19 Infection Rate and Death Rate

Zhihao Yan,Miao Chen,Ruirui Wang

(Zhejiang University，Hangzhou，310058)

Abstract： The COVID-19 pandemic has lasted for four years, looking at the global data, the effectiveness in controlling the pandemic of countries differs. In addition to basic conditions such as medical resources and population density, cross-cultural value differences is a hot topic in psychological literature discussing the effectiveness of epidemic prevention and control behaviors (Cho et al. 2021; Lu et al., 2021; Huang et al., 2021). In response to Liu et al. (2021)'s call, we proposed and empirical tested the Epidemic Death-rate Impact Model based on Hofstede's cross-cultural theory. We collected Hofstede (2001) cross-cultural data, World Health Organization (WHO) cross-national pandemic data, and controlled for background variables such as GDP, population density, etc. The study found that uncertainty avoidance positively influecnced COVID-19 per 100,000 infections and per 100,000 deaths; and had no significant impact on vaccination rates. Compared with individualism-collectivism (e.g., Lu et al., 2021; Huang et al., 2021), uncertainty avoidance better predicted the cumulative epidemic death rates over the past four years. We believe that in the face of major infectious disease events, uncertainty avoidance affects the group acceptance level of new regulations for COVID-19 prevention and control. In countries with low uncertainty avoidance, the government can quickly introduce coping strategies and policies, and people are more willing to accept these new policies; in countries with high uncertainty avoidance, policies are developed more slowly and people were reluctant to accept the pandemic preventing policies. This study proposes a new perspective different from previous literature, and provides a new perspective for implementing control and achieving good results in different cultural backgrounds in response to the pandemic.

Keywords： Cross-cultural values, uncertainty avoidance, Covid-19; Death rate

为何在职场“躺平”？：挑战性压力与工作退缩行为的关系

张晶[1]

1 河南农业大学文法学院，郑州，450046，zhangjingvip98@163.com

摘 要 “躺平”是从2021年出现的一种日益普遍的国内民众应对压力的新姿态。表现为当面对生活和工作中巨大而不可抗拒的压力时，有些人不再为成功而奋斗，而是主动降低精神驱动力，退出各种竞争，甚至逃离自己的工作。有学者提出，职场“躺平”的表现与工作退缩行为的内涵相近。为了分析面对工作中的挑战，人们为什么没有化压力为动力而是表现为“躺平”这一问题。本研究选取工作退缩行为代表职场“躺平”行为，分析工作中的挑战是如何与其建立连结的。依据持续性认知理论，面对工作压力时员工会产生情感反刍与问题解决反刍两种类型的工作反刍。而且已有研究显示两类工作反刍分别对工作退缩行为有不同的作用。基于此，本研究分析工作反刍在挑战性工作压力与工作退缩行为间的中介作用。并进一步分析个体的主动性人格在其中的调节作用。研究选取各行业的全职员工进行间隔一个月的两时点测量，对486份有效数据的回归分析结果显示：挑战性压力通过问题解决反刍负向预测工作退缩行为，通过情感反刍正向预测工作退缩行为。主动性人格可以有效缓解挑战性压力与情感反刍间的连结。这一结果说明，在面对工作挑战时，人们是否采取“躺平”的应对方式关键在于个体以何种方式反复思考压力。

关键词 “躺平”，工作反刍，主动性人格

Why “Lying flat” at Work?: The Relationship Between Challenging Stress and Work-withdrawal behavior

Zhang Jing

Henan Agricultural University, School of Humanity and Law, Zhengzhou

Abstract："Lying flat" is an increasingly common new attitude for domestic people to cope with pressure that has emerged in 2021. When facing the huge and irresistible pressure in life and work, some people no longer struggle for success, but to reduce the spiritual driving force, withdraw from various competitions, and even escape from their own work. Some scholars have proposed that the performance of "lying flat" in the workplace is similar to the connotation of work withdrawal behavior. In order to analyze the problem of why people do not turn stress into motivation but "lying flat" in the face of challenges at work. This study selected work withdrawal behavior as the representative of workplace "lying flat" behavior, and analyzed how challenges in work are linked to it. According to the persistent cognitive theory, employees may experience two types of work rumination when facing work stress: affective rumination and problem-solving rumination. Moreover, previous studies have shown that two types of work rumination have different effects on work withdrawal behavior. Based on this, this study analyzed the mediating role of work rumination in the relationship between challenging stress and work withdrawal behavior. And further analyzed the moderating role of proactive personality. The study selected full-time employees in various industries for two-time point measurement one month apart. The regression analysis of 486 valid data shows that challenging stress reduces work withdrawal behavior through problem solving rumination, and increases work withdrawal behavior through affective rumination. Proactive personality can effectively alleviate the link between challenging stress and affective rumination. The results suggest that whether people "lying down" in the face of work challenges depends on how individuals ruminate about stress.

Keywords："lying down", work rumination, proactive personality

人际好奇心对新员工职场适应的影响——团队信息交换的中介作用

邹丽萍[1]　陈晓曦[2]（通讯作者）文艳君[3]

1 暨南大学，广州，510632

2 暨南大学企业管理系，广州，510632，txiaoxi@jnu.edu.cn

摘 要 好奇心作为一种人格特质，在以往的研究中已有部分证据证明其可以帮助人们适应新的角色和情况、预测工作表现和创造性思维。近年来，在企业实践中涌现出组织重组、员工频繁变动工作等趋势，新生代员工开始接受“无边界”的职业理念。新生代员工的职场新人适应问题比以往任何时候都更加重要。好奇心作为一种人格特质在职场新员工的适应性问题中发挥着重要作用，好奇心提出了一种重要的元能力，即学习如何适应的能力，从而实现“探索和实践”的能力，并利用各种经验来了解自己的处境。学术界对好奇心的划分方式众多，其中一种分类中提出了人际好奇心，指的是对获取有关他人如何思考、感受和行为的信息的兴趣——已被证明可以预测八卦倾向以及对陌生人的人际感知的准确性。本文探讨了人际好奇心是如何通过影响新员工在职场中进行团队信息交换行为进而促进新员工的职场适应结果。同时还探讨了支持性组织氛围、团队心理安全感分别在前端和后端作用机制中的调节作用。本文通过对收集到的 435 份样本数据进行中介和调节作用分析，结果发现，新员工的人际好奇心特质通过促使新员工进行团队信息交换行为而对新员工的职场适应结果有正向影响，支持性组织氛围与团队心理安全感在该机制中调节作用显著。具体而言，支持性组织氛围对人际好奇心与新员工团队信息交换行为之间的关系起正向调节作用，即支持性组织氛围越高，人际好奇心对新员工团队信息交换行为的正向影响越强；团队心理安全感对新员工团队信息交换行为与新员工职场适应之间的关系起正向调节作用，即员工的团队心理安全感越高，新员工团队信息交换行为对新员工职场适应的正向影响越强。

关键词 人际好奇心，团队信息交换，支持性组织氛围，团队心理安全感

The Effect of Social Curiosity on New Comers' Workplace Adaptation - The Mediating Role of Information Exchange

Liping Zou

Jinan University, Guangzhou

Abstract： Curiosity, as a personality trait, has been partially documented in previous research to help people adapt to new roles and situations, predict performance, and think creatively. In recent years, there has been a trend towards organizational restructuring, frequent job changes, and a new generation of employees embracing the idea of "boundaryless" careers. It is more important than ever for this new generation of employees to adapt to the new workplace. Curiosity, as a personality trait, plays an important role in the adaptation of new comers in the workplace. Curiosity suggests an important meta-competency, i.e., the ability to learn how to adapt, thereby realizing the ability to "explore and practice" and to use various experiences to understand one's own situation. One of the many ways in which curiosity has been categorized by academics proposes social curiosity, which refers to an interest in obtaining information about how others think, feel, and behave-which has been shown to predict gossiping tendencies, as well as the accuracy of interpersonal perceptions of strangers. This paper explores how social curiosity contributes to new comers' workplace adaptation outcomes by influencing their information exchange behaviors in the workplace. It also explores the moderating roles of supportive organizational climate and team psychological security in the front-end and back-end mechanisms of action, respectively. This paper conducted mediation and moderation analyses on the collected data from 435 samples, and found that the social curiosity trait of new comers had a positive effect on new comers' workplace adaptation outcomes by prompting

them to engage in information exchange behaviors, and that the supportive organizational climate and team psychological security had significant moderating roles in this mechanism. Specifically, supportive organizational climate positively moderates the relationship between social curiosity and new comers' information exchange behavior, i.e., the higher the supportive organizational climate, the stronger the positive influence of social curiosity on new comers' information exchange behavior; team psychological security positively moderates the relationship between information exchange behavior and workplace adaptation, i.e., the higher the new comers' team psychological security, the stronger the positive influence of new comers' information exchange behavior; team psychological security positively moderates the relationship between information exchange behavior and workplace adaptation. The higher the new comers' sense of team psychological security, the stronger the positive influence of new comers' information exchange behavior on new comers' workplace adaptation.

Keywords **:** Social curiosity, Information exchange, Supportive organizational climate, Team psychological security

自我管理策略对网络闲逛行为的影响

海曼[1,2] 周兵平[3] 吴旭瑶[1,2] 宫剑[1,2] 李晔[1,2][13]

（1 华中师范大学心理学院，武汉 430079）

（2 华中师范大学心理学院暨青少年网络心理与行为教育部重点实验室，武汉 430079）

（3 温州大学教育学院，温州 325035）

摘 要 网络闲逛行为是组织中的管理难题。在工作中，如何使用自我管理策略帮助员工减少网络闲逛，目前尚未可知。基于资源保存理论，本研究通过两个全职员工样本对该问题进行了探索。研究 1 旨在解决哪些特定的自我管理策略会影响网络闲逛以及如何影响。基于以变量为中心的方法，探讨了四种常用自我管理策略（自我观察、目标设定、自我奖励、自我惩罚）对网络闲逛行为的影响（$N_{样本1}$=506，$N_{样本2}$=499），及情绪耗竭（资源损耗路径）和工作投入（资源获取路径）的并列中介作用（$N_{样本2}$=499）；研究 2 旨在解决自我管理策略间的配合使用对网络闲逛的影响如何。基于以人为中心的方法，使用潜在特征分析（LPA）探索了自我管理策略的组合类型，及其在情绪耗竭、工作投入和网络闲逛行为上的表现（$N_{样本1}$=506，$N_{样本2}$=499）。

基于以变量为中心的结果显示：1）自我惩罚对网络闲逛有显著正向影响，且结果稳定。自我奖励对网络闲逛有显著正向影响，目标设定、自我观察分别对网络闲逛也有显著负向影响，但这些自我管理策略对网络闲逛的作用并不稳定；2）自我惩罚策略主要通过增加情绪耗竭导致更频繁的网络闲逛行为。

基于以人为中心的结果显示：1）两个样本的 LPA 分析均得到了五类有效的自我管理策略组合，其中四类组合具有稳定性，即低水平管理者（11.1%、16.7%）、中等水平管理者（44.3%、46.5%）、高水平管理者（26.2%、20.1%）以及高水平低惩罚型管理者（9.3%、14.5%）；2）高水平低惩罚型管理者工作投入水平最高、情绪耗竭最低、网络闲逛行为最少，而低水平管理者工作投入最少、情绪耗竭最高、网络闲逛行为最多；这一结果反映出自我惩罚策略带来的不利影响无法被其他自我管理策略的有效使用而抵消。

结论：合理选择、正确使用自我管理策略可以最大化地利用个人资源，降低网络闲逛的频率。然而，目前能做到这一点的人不足总体人数的五分之一。本研究为干预网络闲逛行为提供了新的思路。

The impact of self-management strategies on cyberloafing

Hai Man[a,b] Zhou Bingping[c] Wu Xuyao[a,b] Gong Jian[a,b] Li Ye[a,b14]
（a School of Psychology, Central China Normal University, Wuhan，430079）
（b Key Laboratory of Adolescent Cyber psychology and Behavior, Ministry of Education，Wuhan，430079）
(c School of Education, Wenzhou University, Wenzhou 325035)

Abstract: The management of cyberloafing behavior poses a significant challenge within organizations. It is currently unknown how self-management strategies can be employed to aid employees in mitigating cyberloafing within the workplace. This study, which is based on Resource Conservation Theory, analyzed this matter with two samples of full-time employees. Study 1 aimed to examine the specific self-management strategies that have an impact on cyberloafing and their effects. Using a variable-centered approach, the effects of four commonly employed self-management strategies, namely self-observation, goal-setting, self-reward, and self-punishment, on cyberloafing behaviors were examined(Nsample1=506， Nsample2=499). The mediating roles of emotional depletion (a resource depletion pathway) and work engagement (a resource acquisition pathway) were compared. Study 2 was designed to examine the effects of the use of fit between management strategies on cyberloafing behaviors. Based on a person-centered approach, the types of combinations of self-management strategies and their performance on emotional exhaustion, work engagement and cyberloafing behaviors were explored using latent profile analysis (LPA) (Nsample1=506，Nsample2=499).

A variable-centered approach demonstrated that 1) self-punishment had a significant positive effect on cyberloafing, with stable results. Self-reward had a significant positive effect on cyberloafing, and goal setting and self-observation had a significant negative effect on cyberloafing, respectively. These self-management strategies had unstable effects on cyberloafing. 2) self-punishment strategies are primarily responsible for the escalating frequency of cyberloafing, primarily due to the heightened emotional exhaustion.

The results based on the person-centered approach indicated that: 1) 5 unique profiles of self-management strategies were identified, with four of them being stable, namely low-level managers (11.1%, 16.7%), medium-level managers (44.3%, 46.5%), high-level managers (26.2%, 20.1%), and high-level low-punitive managers (.3%, 14.5%). 2) High-level low-punishment managers have the highest level of work engagement, the lowest level of emotional exhaustion, and the least amount of cyberloafing, while low-level managers have the lowest level of work engagement, the highest level of emotional exhaustion, and the most amount of cyberloafing. This result indicates that the negative effects of self-punishment strategies cannot be offset by the effective use of other self-management strategies.

Conclusion: The prudent selection and appropriate application of self-management strategies can optimize personal resources and reduce the frequency of cyberloafing. Nonetheless, less than one-fifth of the entire populace is currently capable of doing so. This study provides new ideas for addressing cyberloafing behavior.

经颅磁刺激治疗强迫症前后的脑电变化：系统综述

黄彬芯[1]，李伟[1]，王振[1,2,3]（通讯作者）

1. 上海交通大学医学院附属精神卫生中心，上海，200030，wangzhen@smhc.org.cn

2. 上海交通大学心理与行为科学研究院,上海，200030，wangzhen@smhc.org.cn

3. 上海市重性精神病重点实验室，上海，200030，wangzhen@smhc.org.cn

摘 要 **目的：**本研究旨在对经颅磁刺激治疗强迫症前后脑电图变化进行系统评价，并对现有相关研究进行全面分析，以了解常用脑电图指标在评估经颅磁刺激治疗强迫症疗效方面的有效性。通过系统介绍治疗强迫症的经颅磁刺激干预类型和有效性，以及它们的电生理指标，为未来强迫症治疗提供新思路和更全面的评估标准。**方法：**通过系统检索 PubMed、Web of Science、APA PsycINFO 和 APA PsycArticles 数据库收集有关经颅磁刺激治疗强迫症前后脑电图变化的相关文章。选择符合标准的研究进行分析。**结果：**本研究纳入了符合标准的 6 个研究。四项研究使用重复经颅磁刺激治疗强迫症，两项研究使用深部经颅磁刺激。干预靶点包括眶额叶皮层、双侧背外侧前额叶皮层、右侧辅助运动区和前扣带回。在经颅磁刺激治疗组中，有 88 名强迫症患者对经颅磁刺激治疗有反应（75.21%）。在对照组中，有 5 名患者有反应（12.5%）。在经颅磁刺激治疗强迫症后，不同频段的电生理指标出现不同的变化。在 delta 频段，经过经颅磁刺激治疗后 delta 频段功率显著增加。在 theta 频段，经过经颅磁刺激治疗后 theta 频段功率既有增加也有减少，大脑功能连接性和 ERN 也显著增加。在 alpha 频段，经过经颅磁刺激治疗后 alpha 频段功率既有增加也有减少，大脑功能连接性显著增加。在 beta 频段，经过经颅磁刺激治疗后频段的功率和波幅均显著降低，但是大脑功能连接性显著增加。这些结果表明，经颅磁刺激治疗强迫症可以在一定程度上调节大脑的神经活动。**结论：**经颅磁刺激治疗可以显著调节患者的脑电活动，尤其是在 theta 频段、alpha 频段和 beta 频段。经过经颅磁刺激治疗后，强迫症患者在额叶出现 theta 频段活动增强，在顶叶和枕叶出现 alpha 频段活动减少，在双侧中央-顶-枕区出现 beta 频段活动减少。这些变化可能与认知控制、注意力和反应抑制的改善相关，从而改善强迫症的症状。这为我们深入了解经颅磁刺激治疗强迫症的神经机制提供了重要线索。

EEG Changes before and after Transcranial Magnetic Stimulation Treatment for Obsessive-Compulsive Disorder: A Systematic Review

Binxin Huang[1]，Wei Li[1]，Zhen Wang[1,2,3]

1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, P.R. China

2. Institute of Psychological and Behavioral Science, Shanghai Jiao Tong University, Shanghai, P.R. China

3. Shanghai Key Laboratory of Psychotic Disorders, Shanghai, P.R. China

Abstract:**Objective** This study aims to systematically evaluate the changes in electroencephalography (EEG) before and after transcranial magnetic stimulation (TMS) treatment for obsessive-compulsive disorder (OCD) and comprehensively analyze the existing relevant research to understand the effectiveness of commonly used EEG indices in assessing the efficacy of TMS for OCD treatment. By introducing the types and effectiveness of TMS interventions for OCD and their EEG indices, it provides new insights and more comprehensive evaluation criteria for future OCD treatment. **Methods** Relevant articles on changes in EEG following TMS treatment for OCD were comprehensively searched in databases including PubMed, Web of Science, APA PsycINFO, and APA PsycArticles. Studies that met the inclusion criteria were selected for analysis. **Results** Six studies met the inclusion criteria. Four studies used repetitive TMS (rTMS) for OCD treatment, while two studies used deep TMS (dTMS). The intervention targets included the orbitofrontal cortex, bilateral dorsolateral prefrontal cortex, right supplementary motor area, and medial prefrontal cortex-anterior cingulate cortex. In the TMS treatment group, 88 OCD patients responded to TMS treatment (75.21%), while in the control group, 5 patients responded (12.5%). After TMS treatment for OCD, different changes in EEG indicators were observed in different frequency bands. In the delta band, the power significantly increased after TMS treatment. In the theta band, the power could increase or decrease after TMS treatment, and there was a significant increase in functional connectivity and ERN. In the alpha band, the power could also increase or decrease after TMS treatment, and there was a significant increase in functional connectivity. In the beta band, the power, wave amplitude, and Z-score of the beta wave significantly decreased after TMS treatment, while there was a significant increase in brain functional connectivity. These findings suggest that TMS treatment for OCD can modulate brain activity to a certain extent. **Conclusion** TMS treatment can significantly adjust patients' brain waves, especially in the theta, alpha, and beta frequency bands. Following TMS treatment, OCD patients showed enhanced theta band activity in the frontal lobe, decreased alpha band activity in the parietal and occipital lobes, and decreased beta band activity in the bilateral central-parietal-occipital areas. These changes are likely associated with improvements in cognitive control, attention, and response inhibition, leading to a reduction in OCD symptoms. This provides important clues for deepening our understanding of the neural mechanisms of TMS treatment for OCD.

摘 要 目的：情绪冲突加工缺陷是抑郁症患者常见的认知损害，可能受到个体负性认知偏向、认知情绪调节方式、早期不良经历等多种因素的共同影响。以往研究发现，在抑郁症患者中情绪冲突认知加工功能的缺陷也可能导致患者的自杀风险增加，但其相关神经机制尚未阐明。本研究联合情绪 stroop 任务与功能磁共振技术，分析重性抑郁障碍（MDD）患者的情绪冲突认知损害，即情绪冲突加工过程中的脑功能网络连接异常，并进一步探究这一损害与童年创伤、自杀意念等临床特征的关系。

方法：31 名 HC 被试及 34 名 MDD 患者均完成认知情绪调节问卷（CERQ）、负性认知加工偏向问卷（NCPBQ）、童年创伤经历问卷（CTQ）、贝克抑郁问卷（BDI）、汉密尔顿焦虑量表（HAMA）、汉密尔顿抑郁量表（HAMD）以及贝克自杀意念量表（BSI）等评估；并在完成情绪 stroop 任务的过程中采集脑功能图像。对量表评估、情绪 stroop 任务中的大脑激活区域，以及一致和冲突条件下脑功能连接分别进行组间比较，并对量表评估—脑功能连接进行相关分析和中介效应分析。

结果：MDD 组在 HAMD、HAMA、BDI、BSI、NCPBQ 上得分均显著高于 HC（$p<0.001$），以及在 CTQ 上得分显著高于 HC（$p<0.01$）。大脑激活结果表明，HC 和 MDD 在情绪冲突认知加工中脑部激活的组间差异不显著（$p>0.05$）。功能连接分析结果表明，在冲突条件下，与 HC 相比，MDD 患者的杏仁核-眶额叶功能连接减弱($p=0.03$,FDR corrected)，而海马旁回-颞极和海马旁回-梭状回功能连接增强($p=0.042$;$p=0.044$;FDR corrected)。相关分析表明，MDD 患者中杏仁核-眶额叶功能连接强度与其童年创伤经历得分及最近一周自杀意念得分均呈显著负相关($r=-0.37$,$p<0.05$;$r=-0.44$,$p<0.01$)，进一步中介分析发现，杏仁核-眶额叶功能连接强度在童年情感虐待对自杀意念的影响中起完全中介作用($R^2=13.8\%$)。

结论：重性抑郁障碍患者的情绪冲突加工缺陷涉及杏仁核-眶额叶、海马旁回-颞极以及海马旁回-梭状回等神经生理异常。在有童年情感虐待经历的 MDD 患者中，与情绪冲突加工有关的杏仁核-眶额叶功能连接异常可能是介导其自杀意念形成的重要神经生理基础。（本研究得到国家自然科学基金 31671144 资助）

Research on the Neural Mechanisms of Emotional Conflict Processing Deficits and Suicide Risk in Major Depression Disorder

Liu Yang　Wang Chengfang　Kong Xinyuan　Wang Xiang　Lin Pan
School of Psychology , Hunan Normal University
Medical Psychological Center, The Second Xiangya Hospital, Central South University

Abstract：Objective: Emotional conflict processing deficits are common cognitive impairments in patients with depression and may be influenced by various factors such as individual negative cognitive bias, cognitive emotion regulation strategies, and early adverse experiences. Previous studies have found that deficits in emotional conflict cognitive processing in depression patients may also increase their suicide risk, but the underlying neural mechanisms remain unclear. This study combined the emotional Stroop task with functional magnetic resonance technology to analyze the cognitive impairment of emotional conflict in patients with major depressive disorder (MDD), specifically examining the abnormal brain functional network connectivity during the emotional conflict processing. Furthermore, we explored the relationship between this impairment and childhood trauma , suicidal ideation and other clinical features.

Methods: A total of 31 healthy controls (HC) and 34 MDD patients completed assessments, including the Cognitive Emotion Regulation Questionnaire (CERQ), Negative Cognitive Processing Bias Questionnaire (NCPBQ), Childhood Trauma Questionnaire (CTQ), Beck Depression Inventory (BDI), Hamilton Anxiety Scale (HAMA), Hamilton Depression Scale (HAMD), and Beck Scale for Suicide Ideation (BSI). Brain functional images were collected from the participants while they completed the emotion Stroop task. Between-group comparisons were conducted on the scale assessments, brain activated regions during the emotional Stroop task, as well as brain functional connectivity under both congruent and conflict conditions. Correlation analysis and mediation analysis were performed between the assessments and brain functional connectivity.

Results: The MDD group scored significantly higher than the HC group on HAMD, HAMA, BDI, BSI, and NCPBQ ($p<0.001$), as well as on CTQ ($p<0.01$). Brain activation results indicated that there was no significant differences between HC and MDD group in brain activation during emotional conflict cognitive processing ($p>0.05$). Functional connectivity analysis revealed that under conflict conditions,compared to HC, MDD patients had weakened functional network connection between the amygdala and orbitofrontal cortex ($p=0.03$, FDR corrected), but strengthened functional network connections between the parahippocampal gyrus and temporal pole, and the parahippocampal gyrus and the fusiform gyrus ($p=0.042$, $p=0.044$, FDR corrected). The correlation analysis indicated a significant negative correlation between the strength of functional connectivity between the amygdala and the orbitofrontal cortex in MDD and their scores of childhood trauma experience and recent suicidal ideation ($r=-0.37$, $p<0.05$; $r=-0.44$, $p<0.01$). Further mediation analysis revealed that the strength of amygdala-orbitofrontal cortex functional connectivity fully mediated the impact of childhood emotional abuse on suicidal ideation ($R2=13.8\%$) in MDD.

Conclusion: Emotional conflict processing deficits in patients with major depressive disorder involve neural physiological abnormalities in the amygdala-orbitofrontal cortex, parahippocampal gyrus-temporal pole, and parahippocampal gyrus-fusiform gyrus. In MDD patients with a history of childhood emotional abuse, the dysfunctional connectivity between the amygdala and orbitofrontal cortex, which is related to emotional conflict processing, may serve as a crucial neurophysiological foundation that mediates the formation of suicidal ideation.

童年创伤与冲动行为:神经质、压力知觉和抑郁的链式多重中介作用

杨会会[1,2]，苗正淼[1,2]，蚁金瑶[1,2]（通讯作者）
1 中南大学湘雅二医院医学心理中心，长沙，410011；
2 中南大学湘雅二医院医学心理研究所，长沙，410011，jinyaoyi@csu.edu.cn

摘 要 目的：冲动行为（如自残行为和药物滥用）常见于临床多种心理障碍，可能产生恶性后果。先前研究提示，童年创伤、神经质、日常应激、抑郁均是冲动行为的严重危险因素，且神经质、日常应激及抑郁情绪影响了童年创伤对冲动行为的效应。本研究拟进一步阐明神经质人格、压力知觉和抑郁症状对童年创伤和冲动行为关系的影响，并探讨情感创伤和躯体创伤对冲动行为是否存在不同的作用机制。方法：637名心理障碍患者完成了童年创伤问卷（CTQ）、边缘性症状清单（BSL-23）-冲动行为分量表、NEO 人格量表（NEO-PI-R）的神经质分量表、压力知觉量表（PSS）和流调中心用抑郁量表（CES-D）。采用相关分析考察变量间的关联，以童年创伤为自变量，冲动行为为因变量，神经质、压力知觉和抑郁症状为中间变量，建立结构方程模型（SEM）检验各变量之间的因果关系。分别纳入情感创伤和躯体创伤作为自变量，构建情感创伤与躯体创伤对冲动行为的作用模型。结果：相关分析结果显示，各个变量间的相关系数为 0.284 - 0.785。通过 SEM 得到的最优解释模型与数据拟合良好（$\chi 2 = 517.987$, df = 109, CFI = 0.940, TLI = 0.926, GFI = 0.913, RMSEA = 0.077, RMSEA 90% CI= 0.070 - 0.084）。模型的具体路径表现为童年创伤可直接预测冲动行为（直接效应为 0.213），也可通过抑郁症状预测冲动行为，还可通过神经质→ 抑郁症状和神经质→ 感知压力→ 抑郁症状的链式中介效应影响冲动行为（总间接效应值为 0.224）。情感创伤和躯体创伤均能直接和间接预测冲动行为，其中直接效应分别占总效应的 43.94%和 64.38%，间接效应分别占总效应的 56.06%和 35.62%。结论：童年创伤既可直接导致心理障碍患者的冲动行为，也可通过高神经质人格、高压力感知和高水平抑郁症状间接导致冲动行为。情感创伤主要通过高神经质、高压力知觉和高水平抑郁症状间接影响冲动行为，而躯体创伤则主要通过直接效应影响冲动行为。

Childhood trauma and impulsive behavior: the multiple chain mediating effects of neuroticism, stress perception and depression

Huihui Yang[1,2], Zhengmiao Miao[1,2], Jinyao Yi[1,2](corresponding author)
1 Medical Psychological Center, the Second Xiangya Hospital, Central South University, Changsha, 410011;
2 Medical Psychological Institute, Central South University, Changsha, 410011, jinyaoyi@csu.edu.cn

Abstract：Purpose: Impulsive behaviors (such as self mutilation and substance abuse), which may cause adverse outcomes, are common in psychological disorders. Previous studies suggested that childhood trauma, neuroticism, daily life stress and depression were all serious risk factors for impulsive behaviors. Also, neuroticism, daily life stress and depression might affect the relationship between childhood trauma and impulsive behaviors. This study aims to further clarify the influence of Neuroticism personality, stress perception and depressive symptoms on the relationship between childhood trauma and impulsive behaviors, and to explore whether emotional trauma and physical trauma have different mechanisms on impulsive behaviors. Method: A total of 637 clinical patients with psychiatric disorders completed childhood trauma questionnaire (CTQ), impulsive behavior subscale of borderline symptom list (BSL-23), neuroticism subscale of the NEO Personality Inventory Revised (NEO-PI-R), perceived stress scale (PSS), and center for epidemiologic studies depression scale (CES-D). Correlation analysis was

conducted to investigate the associations among all the variables mentioned above. Structural equation modeling (SEM) was performed to examine the causal relationship among all the variables with childhood trauma as independent variable, impulsive behaviors as dependent variable, neuroticism, perceived stress, and depressive symptoms as intermediate variables. Additionally, to separately examine the impacts of emotional and physical traumatic experiences on impulsive behaviors, emotional trauma and physical trauma were involved in the SEM as independent variable, respectively. Results: The correlation coefficients among all the variables ranged from 0.284 to 0.785. The optimal model obtained by SEM fitted the data well ($\chi 2$ = 517.987, df = 109, CFI = 0.940, TLI = 0.926, GFI = 0.913, RMSEA = 0.077, RMSEA 90% CI= 0.070-0.084). The specific pathways of the model showed that childhood trauma could not only directly predict impulsive behaviors (direct effect was 0.213), but also indirectly predict impulsive behaviors through depressive symptoms and two chain pathways neuroticism → depressive symptoms, neuroticism→ perceived stress → depressive symptoms, with total indirect effect being 0.224. Moreover, both emotional trauma and physical trauma could directly and indirectly predict impulsive behaviors, of which the direct effects accounted for 43.94% and 64.38% of total effects, and indirect effects accounted for 56.06% and 35.62% of total effects, respectively. Conclusion: Childhood trauma is a direct contributing factor to impulsive behaviors in patients with psychiatric disorders. Childhood trauma can also indirectly result in impulsive behaviors through high levels of neuroticism, perceived stress, depressive symptoms. Besides, emotional trauma mainly produces impacts on impulsive behaviors through high levels of neuroticism, perceived stress, depressive symptoms, while physical trauma mostly takes one direct effect on impulsive behaviors.

太极拳运动对 2 型糖尿病患者心理健康效益：基于 ICF 的系统综述

曾琪淋 [1]　　王艳 [2]（通讯作者）
北京体育大学，北京，100084，Email:wyweiwei@126.com

摘 要　目的：运用世界卫生组织（WHO）《国际功能、残疾和健康分类》（ICF）构建太极拳干预 2 型糖尿病患者的心理健康效益，系统综述太极拳对 2 型糖尿病患者生活质量、焦虑、抑郁、睡眠质量的改善效果。

方法：采用主题词检索方式，中文检索词包括：太极拳、2 型糖尿病、心理健康、睡眠质量。英文检索词包括：TaiChi、Mental health、Type 2 diabetes 、sleep quality。

检索知网（CNKI)、万方数据库（WAN-Fang）、Web of Science、PubMed、Medline 数据库建库至 2023 年 6 月 20 日公开发表的 2 型糖尿病患者接受太极拳运动干预及其心理健康效益的随机对照试验（RCT）的相关文献，并采用物理治疗证据数据库（PEDro）量表对纳入文献方法学质量评价，进行系统综述。

结果：纳入文献 11 篇，来自中国、澳大利亚、韩国，包括 423 例参与者（7 岁~82 岁），主要来源于医学、体育、护理等相关领域期刊，发表时间集中于 2008 年至 2021 年。本研究基于 ICF 构建了 2 型糖尿病患者进行太极拳干预的心理健康效益的 PICO 研究架构，主要的干预内容为 24 式太极拳，干预方案为每次锻炼时间 20~60min，每天 1~3 遍，每周 3~7 次，连续锻炼 6~12 周。太极拳对 2 型糖尿病患者心理健康的改善主要体现在 ICF 的能量和驱力功能（b130)和睡眠功能（b134)情感功能(b152)。

结论：2 型糖尿病患者进行太极拳干预后，其焦虑、抑郁、低生活质量、低睡眠质量等心理健康问题得到改善，可作为 2 型糖尿病患者康复中的常规锻炼方法进行推广。

Mental health benefits of Tai Chi in patients with type 2 diabetes: a systematic review based on ICF

ZENG qilin[1] WANG yan[2]
Beijing Sport University,Beijing,

Abstract：Objective: To construct the effect of Tai Chi on the mental health of patients with type 2 diabetes by using the International Classification of Functioning, Disability and Health (ICF) of World Health Organization (WHO), and to systematically review the effect of Tai Chi on the quality of life, anxiety, depression and sleep quality of patients with type 2 diabetes.

Methods:The relevant literatures on the randomized controlled trial (RCT) of Tai Chi exercise intervention and its mental health benefits in type 2 diabetes patients were retrieved from CNKI, WAN-Fang, Web of Science, PubMed and Medline databases until June 20, 2023. Subject term search was used. Chinese search terms included Tai Chi, type 2 diabetes, mental health and sleep quality. English search terms included: Tai Chi, Mental health, Type 2 diabetes mellitus, sleep quality. The physical therapy Evidence Database (PEDro) scale was used to evaluate the methodological quality of the included literatures. Results: Eleven literatures were included, from China, Australia, and South Korea, including 423 participants (aged 7-82 years), mainly from medical, sports,

nursing and other related fields of journals, published from 2008 to 2021. Based on ICF, this study constructed a PICO research framework on the mental health benefits of Tai Chi intervention in patients with type 2 diabetes. The main intervention content was 24 simplified Tai Chi, and the intervention plan was to exercise for 20 to 60min each time, 1 to 3 times a day, 3 to 7 times a week, and continuously exercise for 6 to 12 weeks. The improvement of Tai Chi on the mental health of type 2 diabetes patients was mainly reflected in the energy and drive function (b130) and sleep function (b134) and emotional function (b152) of ICF.

Conclusion: After Tai Chi intervention, mental health problems such as anxiety, depression, low quality of life and low sleep quality can be improved in patients with type 2 diabetes, which can be promoted as a routine exercise method in the rehabilitation of patients with type 2 diabetes.

Keywords：Tai Chi, type 2 diabetes, mental health, depression, sleep quality

首发抑郁症患者的奖惩加工特征及脑电生理机制：一项纵向追踪研究

孔鑫媛[1] 廖静怡[1] 吕秋雨[2] 王成芳[2] 王湘[1]

1 中南大学湘雅二医院医学心理中心，长沙，410011，wangxiang0916@csu.edu.cn

2 湖南师范大学教育科学学院，长沙，410081

摘 要 目的：重性抑郁障碍（MDD）患者表现出一系列与奖励及惩罚敏感性损害有关的症状特点，如与正性奖赏异常相关的快感缺失、动机缺乏；以及因对负性反馈敏感性增强而导致的焦虑及损失回避等。但是，目前对于抑郁症患者在奖、惩不同效价刺激加工进程中的特异性脑电生理异常，以及相关损害是否会随症状缓解而恢复，均缺乏深入研究。本研究为纵向追踪研究，结合金钱激励延迟任务（Monetary incentive delay, MID）与事件相关电位（Event-related potentials, ERP）技术，明确 MDD 患者在奖惩期待与反馈加工进程中的脑电生理指标在发作期与缓解期等不同疾病发展阶段的变化规律。

方法：研究采用自身前后对照设计，对 25 名首发未服药 MDD 患者在接受序贯治疗（艾司西酞普兰/舍曲林治疗 8 周，若无效，则换药 SNRI 类药物，如文拉法辛）前、以及抗抑郁治疗一年内达缓解后分别进行 MID 任务的 EEG 数据采集，选取以往奖惩研究中 MDD 表现异常的成分进行分析，比较其在期待阶段的奖励、惩罚和中性条件下的 cueP2 与 cueP3，以及在反馈阶段正、负反馈条件下 FRN 和 LPP 等脑电生理指标差异，并对缓解期和基线 LPP 波幅差值与缓解期和基线 HAMD 得分的差值进行相关分析。

结果：行为学结果表明，奖励条件下的反应时显著小于中性条件和惩罚条件（p=0.009；p=0.001），惩罚条件下的反应时显著小于中性条件（p=0.005），MDD 缓解前后的反应时没有显著差异。ERP 结果表明，在期待阶段，奖励与惩罚条件下的 cueP2 波幅均显著大于中性条件（p<0.001；p=0.004），奖励条件下的 cueP3 波幅显著大于惩罚和中性条件下的波幅（p=0.016；p=0.006），缓解期 MDD 与基线时的 cueP2 和 cueP3 波幅没有显著差异。在奖惩反馈阶段，缓解前后的 FRN 波幅在正反馈与负反馈条件下均没有显著差异；缓解期 MDD 患者在负反馈下的 LPP 波幅显著大于基线（F=7.95, p=0.009）。相关分析结果显示缓解前后 MDD 患者在惩罚预期下负反馈 LPP 变化与 HAMD 变化有显著负相关。

结论：首发 MDD 患者奖惩期待动机及奖惩反馈早期与情绪动机评价相关的脑电指标未随症状缓解而发生改变；而首发 MDD 患者在奖惩反馈后期对负性反馈的敏感性下降可能为抑郁状态依赖性特征。（本研究得到国家自然科学基金 31671144 资助）

Neuroelectrophysiological Mechanisms of Reward and Punishment Processing in Patients with First Episode Major Depressive Disorder: A longitudinal Follow-up Study

Xinyuan Kong[1], Jingyi Liao[1], Qiuyu Lv[2], Chengfang Wang[2], Xiang Wang[1]
1 Medical Psychological Center, The Second Xiangya Hospital, Central South University, Changsha, Hunan, China
2 Department of Psychology, Hunan Normal University, Changsha, Hunan, China

***Abstract*：** **Objective:** Patients with major depressive disorder (MDD) exhibit a range of symptoms related to abnormal sensitivity to reward and punishment, such as anhedonia and reduced motivation associated with abnormal responses to reward, as well as increased sensitivity to negative feedback leading to anxiety and loss avoidance. However, there is a lack of in-depth research regarding the specific electrophysiological abnormalities during reward and punishment processing in MDD patients and whether these impairments recover with symptom remission. In this longitudinal follow-up study, the Monetary Incentive Delay (MID) task and Event-Related Potentials (ERPs) technology were employed to elucidate changes in the electrophysiological markers during reward and punishment anticipation and feedback processing in MDD patients across different disease stages, including the acute phase and the remission phase.

Methods: The present study adopted a within-subjects pre-post design in 25 first episode drug-naive MDD patients. Participants underwent sequential treatments with SSRI antidepressants (escitalopram or sertraline) for 8 weeks, and non-responders were switched to SNRI such as venlafaxine after 8 weeks. ERP data were collected before treatment and after achieving remission through antidepressant treatment within one year. Abnormal ERP components of reward and punishment processing in MDD reported in previous studies were selected for analysis. Specifically, cueP2 and cueP3 during the anticipation phase under reward, punishment, and neutral conditions were compared. Additionally, differences in feedback-related negativity (FRN) and late positive potential (LPP) during the feedback phase under positive and negative feedback conditions were examined. Furthermore, correlation analysis was conducted between the changes in LPP amplitude from baseline to the remission and the changes in Hamilton Depression Rating Scale (HAMD) scores from baseline to the remission.

Results: Behavioral results showed that reaction times were significantly shorter in the reward condition compared to neutral and punishment conditions (p=0.009; p=0.001). Punishment condition were also significantly shorter than in the neutral condition (p=0.005). There were no significant differences between the remission and baseline in MDD patients. ERP results during the anticipation phase indicated that cueP2 amplitudes were significantly larger in the reward and punishment conditions than in the neutral condition (p<0.001; p=0.004). CueP3 was significantly larger in the reward condition compared to punishment and neutral conditions (p=0.016; p=0.006). There were no significant differences in cueP2 and cueP3 amplitudes between the remission and baseline. During the feedback phase, no significant differences in FRN amplitudes between the remission phase and baseline under both positive and negative feedback conditions. However, under negative feedback, remitted MDD exhibited significantly larger LPP amplitudes compared to baseline (F=7.95, p=0.009). Correlation analysis showed a significant negative correlation between changes in negative feedback LPP and changes in HAMD scores in MDD patients before and after remission, under the punishment expectation condition.

Conclusion: First-episode MDD patients' electrophysiological indices related to reward anticipation and early

emotion evaluation associated with punishment did not change with symptom remission. However, a decreased sensitivity to negative feedback in the later phase of feedback in first-episode MDD may represent a state-dependent depression characteristic.

抑郁症患者动态静息脑网络特征的性别差异

董戴凤 姚树桥（通讯作者）

中南大学医学心理学研究所，长沙，410000，shuqiaoyao@csu.edu.cn

摘 要 抑郁症的流行病学和临床特征存在明显性别差异，这提示不同性别抑郁症患者的脑功能损伤可能存在差异。根据三重网络模型，默认网络（Default Mode Network, DMN）、额顶网络（Frontoparietal Network, FPN）和突显网络（Salience Network, SN）的交互异常是抑郁症等精神疾病的核心脑机制；然而，抑郁症患者在默认网络、执行网络和突显网络的脑网络特征的性别差异仍不明确。基于时间维度的脑网络动态特征是脑网络的关键属性。因此，本研究采用共激活模式分析的动态脑网络分析方法，揭示抑郁症患者动态脑网络特征的性别差异。本研究共招募 138 名首发未服药抑郁症患者（55 男）和 243 名正常对照组被试（106 男），所有被试均完成了静息态功能磁共振扫描。对停留在特定脑网络的总时间长度的重复测量方差分析结果显示：与相应性别的正常对照组相比，男性抑郁症患者组在涉及 SN 和 DMN 的共激活模式（包括 SN 增强 DMN 抑制；SN 增强 DMN 激活）上停留的时间显著增加。对停留在特定脑网络的平均持续时间的重复测量方差分析结果显示：与相应性别的正常对照组相比，女性抑郁症患者组在 SN 增强 DMN 抑制共激活模式上的平均持续时间显著降低；此外，与正常对照组相比，抑郁症患者组在 DMN 增强 FPN 抑制共激活模式的平均持续时间显著增加。本研究表明 SN 和 DMN 交互的失衡可能是抑郁症性别差异的关键神经生物学特征；伴随 FPN 活动抑制的 DMN 活动优势可能是独立于性别存在抑郁症的核心神经生物学特征。

Sex-specific Resting State Brain Network Dynamics in Patients with Major Depressive Disorder

Daifeng Dong and Shuqiao Yao

Medical Psychological Institute of Central South University, Changsha, Hunan.

Abstract： Sex differences in epidemiological and clinical characteristics in major depressive disorder (MDD) may implicate the sex differences in the brain function of MDD. As suggested by the triple network model, atypical interaction between default mode network (DMN), salience network (SN) and frontoparietal network (FPN) could be the critical neurobiological mechanism of MDD. However, sex differences in the SN, FPN and DMN in MDD are still unclear. Dynamic network analytical techniques capture changes in functional coordination among distributed brain regions over time, which is likely important for understanding functional network alterations in MDD. Hence, in the current study, we tested sex differences in resting dynamic functional network properties in a relatively large sample of male and female (sex assigned at birth) healthy controls and first-episode unmedicated MDD patients using a coactivation pattern analysis. Resting-state functional magnetic resonance imaging (fMRI) data were collected from 138 unmedicated patients with first-episode MDD (55 males) and 243 healthy controls (HCs; 106 males). For the time spent in each coactivation pattern, our results showed that, relative to the sex-matched HCs, the male MDD group spent more time in two CAPs involving the SN and DMN (i.e., DMN+SN- and DMN-SN+) relative to the male HC group. For the persistence in each coactivation pattern, the female MDD group showed less persistence in the DMN+SN- CAP relative to the female HC group; MDD patients exhibited greater persistence in a CAP involving activation of the DMN and deactivation of the FPN (DMN+FPN-). Our findings highlight that the imbalance between SN and DMN could be a neurobiological marker supporting sex differences in MDD. Moreover, the dominance of DMN accompanied by the deactivation of FPN could be a sex-independent neurobiological correlate related to depression.

Keywords： major depressive disorder, sex, network dynamics, coactivation pattern analysis

精神分裂症、抑郁症及双相障碍患者的持续性注意的跨诊断研究

通讯作者 E-mail：wangyanyu@wfmc.edu.cn

摘 要　持续性注意能力是指将认知焦点保持在给定的刺激源和任务上的能力。作为认知功能的重要组成部分，持续注意力缺损通常被当作精神障碍的内表型特征。已有的研究结果显示，精神分裂症、抑郁症、双相障碍患者均存在不同程度的持续注意力的缺损。然而，对于三类疾病患者持续注意力缺损的相似性及独特性的阐述尚不清晰。本研究采用计算机持续注意反应任务（the Sustained Attention to Response Task，SART）对年龄、性别相匹配的 58 名精神分裂症患者（SCZ）、57 名抑郁症患者（MDD）、44 名双相障碍患者（BD）以及 43 名健康对照（HC）志愿者的持续注意能力和反应抑制能力进行了测量，并且完成阳性与阴性症状量表（PANSS），查普曼社会快感缺失（CSAS）和躯体快感缺失（CPAS）量表，对 SART 任务指标与临床症状的关系进行探索。单因素方差分析结果显示，四组参与者在反应时（$F=10.791$，$p<0.001$）、效率估计值（$F=14.604$，$p<0.001$）、反应偏差（$F=20.428$，$p<0.001$）、灵敏度（$F=9.186$，$p<0.001$）以及漏报率（$F=14.052$，$p<0.001$）存在显著差异，在虚报率（$F=0.673$，$p=0.57$）上的对比未见显著差异。事后检验发现，三组患者在“SART”任务上的表现显著差于 HC 组。在反应时上，SCZ 和 BD 患者组显著高于 HC 组，但 MDD 组的反应时表现与 HC 组无显著差异（$p=0.385$）。在效率估计值上，三个患者组均显著低于 HC 组，其中，SCZ 组显著低于 MDD 组。三个患者组的灵敏度及反应偏差均显著差于 HC 组，但三组患者间的差异不显著。在漏报率上，三患者组均显著大于 HC 组，其中 SCZ 组显著大于 MDD 组。Pearson 相关显示，三组患者在 SART 任务中的漏报率和反应偏差与阴性症状（PANSS_N）、CSAS 及 CPAS 呈显著正相关，灵敏度与 PANSS_N、CSAS 及 CPAS 呈显著负相关。本研究揭示了精神分裂症、抑郁症及双相障碍患者的持续注意能力缺损，发现患者组区分目标和非目标的能力更差，反映风格偏向谨慎，但是在反应抑制能力方面未见显著缺损，并且持续注意能力的缺损与临床症状显著相关。未来有关精神疾病患者的持续注意力的研究应该更多朝向于大样本、跨诊断的研究,从而有利于持续注意力缺损机制的阐释以及有效干预措施的制定。

***Abstract*：** Sustained attention is the ability to keep cognitive focus on a given stimulus or task. As an important component of cognitive function, sustained attention deficit is often regarded as an endophenotypic feature of mental disorders. Previous studies have shown that patients with schizophrenia, depression and bipolar disorder all have varying degrees of sustained attention deficit. However, the similarity and uniqueness of sustained attention deficit in patients with these three diseases are unclear. This research adopts the computer sustained attention response task (theSustainedAttentiontoResponseTask, SART measured sustained attention and response inhibition in 58 age - and sex-matched patients with schizophrenia (SCZ), 57 patients with major depressive disorder (MDD), 44 patients with bipolar disorder (BD), and 43 healthy control (HC) volunteers, and completed the Positive and Negative Symptom Scale (PANSS). Chapman Social anhedonia (CSAS) and somatic anhedonia (CPAS) scales were used to explore the relationship between SART task indicators and clinical symptoms. The results of one-way ANOVA showed that the response time ($F=10.791$, $p<0.001$), efficiency estimate ($F=14.604$, $p<0.001$), response deviation ($F=20.428$, $p<0.001$), sensitivity ($F=9.186$, $p<0.001$) and false report rate ($F=14.052$, $p<0.001$) showed significant difference, while false report rate ($F=0.673$, $p=0.57$) showed no significant difference. Post-examination found that the three groups performed significantly worse on the "SART" task than the HC group. The response time of SCZ and BD patients was significantly higher than that of HC group, but the response time performance of MDD group was not significantly different from HC group ($p=0.385$). In terms of efficiency estimates, the three patient groups were significantly lower than the HC group, and the SCZ group was significantly lower than the MDD group. The sensitivity and response deviation of the three patient groups were significantly lower than that of the HC group, but the differences among the three groups were not significant. In terms of false negatives, the three patient groups were significantly higher than the HC group, and the SCZ group was significantly higher than the MDD group. Pearson correlation showed that the missing report rate and response bias in SART tasks in the three groups were significantly positively correlated with negative symptoms (PANSS_N), CSAS and CPAS, while the sensitivity was significantly negatively correlated with PANSS_N, CSAS and CPAS. This study revealed the sustained attention deficit in patients with schizophrenia, depression and bipolar disorder, and found that the patient group had worse ability to distinguish between targets and non-targets, and tended to reflect a cautious style, but no significant deficit in response inhibition ability was found, and the deficit of sustained attention ability was significantly correlated with clinical symptoms. Future research on sustained attention in patients with mental illness should focus more on large sample and cross-diagnosis research, which is conducive to elucidating the mechanism of sustained attention deficit and formulating effective intervention measures.

神经元外泌体介导小胶质细胞极化在应激诱发大鼠抑郁中的作用

李善斯[1]　张逸[1]（通讯作者）

1 中南大学湘雅二医院医学心理中心，长沙，410011

通讯作者邮箱：zhangyipsy@csu.edu.cn

摘 要　目的：研究慢性应激致抑郁的大鼠海马小胶质细胞极化和神经元外泌体的变化，探究海马神经元外泌体是否介导了小胶质细胞极化参与慢性应激诱发抑郁的病理过程。

方法：1、动物实验：成年雄性 SD 大鼠随机分为 2 组：慢性不可预知性应激（Chronic Unpredictable Stress，CUS）组（N=37）和对照（Control，Ctrl）组（N=27）。CUS 组大鼠接受 5 周的慢性不可预知性应激，Ctrl 组大鼠不接受任何实验性处理。采用糖水偏爱实验、旷场实验、强迫游泳实验和三箱社交实验评估大鼠行为；采用实时荧光定量 PCR 检测大鼠海马组织小胶质细胞极化标志物 CD86 和 CD206、炎症因子的 mRNA 的相对表达水平；采用蛋白免疫印迹检测大鼠血浆中神经元外泌体浓度和海马组织内 CD86 和 CD206 的蛋白相对表达水平；使用酶联免疫吸附实验检测大鼠血浆中的皮质酮和炎症因子 IL-1β、IL-6、IL-10 的水平。2、体外细胞实验：使用皮质酮（CORT）干预海马神经元细胞系 HT22 后收集外泌体（HT22-Exo），再用 HT22-Exo 干预小胶质细胞系 BV2。使用 Western blot 检测干预后 BV2 的极化标志物 CD86 和 CD206 蛋白相对表达水平； qRT-PCR 检测干预后 BV2 细胞的 IL-1β、IL-6 和 IL-10 的 mRNA 的相对表达水平；ELISA 检测干预后 BV2 细胞上清 IL-1β、IL-6 和 IL-10 浓度。

结果：1、动物行为：糖水偏爱实验中 CUS 组大鼠的糖水偏爱率显著低于 Ctrl 组（$p<0.05$）；旷场实验中 CUS 组大鼠爬行总路程显著少于 Ctrl 组（$p<0.05$）、直立次数显著低于 Ctrl 组（$p<0.05$）；强迫游泳实验中 CUS 组大鼠的不动时间显著长于 Ctrl 组（$p<0.01$），而攀爬时间显著短于 Ctrl 组（$p<0.01$）；三箱社交实验中，CUS 组大鼠的社交能力指数和社交新颖性偏好指数显著低于 Ctrl 组（均 $p<0.05$）。2、生物指标的结果：CUS 组大鼠海马组织 CD86、IL-1β的 mRNA 相对表达水平显著高于 Ctrl 组（均 $p<0.05$）；CUS 组大鼠海马组织 CD86 的蛋白相对表达水平显著高于 Ctrl 组（$p<0.05$）；CUS 组大鼠的血浆皮质酮浓度显著高于 Ctrl 组（$p<0.05$）；CUS 组大鼠血浆中的促炎因子 IL-1β和 IL-6 均显著高于 Ctrl 组（均 $p<0.05$），而抗炎因子 IL-10 显著低于 Ctrl 组（$p<0.05$）。3、相关分析：大鼠社交能力指数与海马小胶质细胞 M1 型极化标志物 CD86 蛋白相对水平和 mRNA 相对表达水平呈显著负相关（均 $p<0.05$）；大鼠社交新颖性偏好指数与海马小胶质细胞 M1 型极化标志物 CD86 蛋白相对水平和 mRNA 相对表达水平呈显著负相关（均 $p<0.05$）。4、体外细胞实验：HT22-Exo 干预组 BV2 细胞的 CD86 的蛋白表达水平、IL-1β和 IL-6 的 mRNA 显著高于 PBS 组（$p<0.01$），而 CD206 的蛋白表达水平显著低于 PBS 组（$p<0.01$）；HT22-Exo 干预组 BV2 细胞上清中的 IL-6 的浓度显著高于 PBS 组（$p<0.05$）。

结论：1、慢性不可预知应激促进了抑郁大鼠海马小胶质细胞 M1 促炎型极化，增加促炎因子的表达和分泌；2、海马神经元外泌体可调节小胶质细胞极化，而小胶质细胞极化异常可能参与慢性应激诱发抑郁的病理过程。

Abstract： Objective: To study the effect of chronic stress on behaviors, microglia polarization, and neuronal exosomes in the hippocampal of rats. To explore whether neuronal exosomes mediate the microglia polarization in the hippocampal, which may involve in the pathological process of chronic stress-induced depression.

Method: 1. Animal experiments: adult male SD rats were randomly divided into 2 groups: Chronic unpredictable stress (CUS) group (N=37) and Control (Ctrl) group (N=27). Rats in CUS group received chronic unpredictable stress for 5 weeks, while rats in Ctrl group did not receive any experimental treatments. After the stress, all the rats were evaluated by sucrose preference test, open field test, forced swimming test, and three-box social test. After the behavioral assessment, peripheral blood and the hippocampal tissues were collected from all rats. qRT-PCR was used to detect the mRNA expression of microglia polarization markers CD86 and CD206, pro-inflammatory factor IL-1β, IL-6 and anti-inflammatory factor IL-10 in the hippocampus. The concentration of neuronal exosomes in plasma, the levels of CD86 and CD206 protein expression in the hippocampus were detected by Western blot. ELISA was used to measure corticosterone (CORT) and inflammatory cytokines IL-1β, IL-6 and IL-10 in rat plasma.

2. In vitro experiments: HT22 cells were treated with CORT, and then exosomes (HT22-Exo) were harvested, BV2 was treated with HT22-Exo. The levels of CD86 and CD206 protein expression in BV2 cells were detected by Western blot. The relative expression levels of IL-1β, IL-6 and IL-10 mRNA in BV2 cells after intervention were detected by qRT-PCR. The concentrations of IL-1β, IL-6 and IL-10 in the supernatant of BV2 cells after intervention were determined by ELISA.

Results: 1. Behavioral results: The sucrose preference rate of rats in CUS group was significantly lower than that in Ctrl group (p<0.05); In open field test, the total distance and vertical times in rats of CUS group was significantly lower than that in rats of Ctrl group (ps<0.05); The immobility time of CUS group was significantly longer than that of Ctrl group in forced swimming test (p<0.01). In the three-box social experiment, the social competence index and social novelty preference index in CUS rats were significantly lower than those in Ctrl rats(ps<0.05). 2. Results of biomarkers in rats: The mRNA expressions of CD86 and IL-1β in the hippocampus of CUS rats were significantly higher than those in Ctrl rats (ps<0.05); The protein expression of CD86 in the hippocampus of the CUS rats was significantly higher than that in the Ctrl rats (p<0.05), and the protein expression of CD206 was not significantly different between two groups (p>0.05); Concentration of CORT in CUS rats was significantly higher than that in Ctrl rats (p<0.05); The levels of pro-inflammatory factor IL-1β and IL-6 were significantly higher in CUS group than Ctrl group (ps<0.05), while the levels of anti-inflammatory factor IL-10 were significantly lower in CUS group than Ctrl group (p<0.05). 3. Correlation analysis results of biological indicators and behavior: The sociability index of rats was significantly negative correlation with the mRNA and protein level of CD86 (ps<0.05). The social novelty preference index was negatively correlated with the mRNA and protein level of CD86 (ps<0.05). 4. In vitro cell experiment results: The protein expression level of CD86 in BV2 cells treated with HT22-Exo was significantly higher than that PBS treatment (p<0.01), while the protein

expression level of CD206 was significantly lower in BV2 cells treated with HT22-Exo than PBS treatment (p<0.01). (2) The expression level of IL-1β and IL-6 mRNA in BV2 cells treated with HT22-Exo were significantly higher than those in PBS treatment (ps<0.05). (3) The concentration of IL-6 in the supernatant of BV2 cells treated with HT22-Exo was significantly higher than PBS treatment (p<0.05).

Conclusions: 1. Chronic unpredictable stress promoted the M1 pro-inflammatory polarization in the hippocampal microglial of rats, and increased the expression and secretion of pro-inflammatory factors.

2. Neuronal exosomes would mediate the polarization of hippocampal microglial, and the abnormal polarization of microglial may be involved in the pathological process of chronic stress-induced depression.

3 Medical Psychological Center, The Second Xiangya Hospital, Central South University, Changsha, 410011, China

Abstract **: OBJECTIVE:** Obsessive-compulsive Disorder (OCD) is a common psychiatri disease

characterized by Obsessive thinking or Compulsive behavior. There is a high comorbidity between OCD and depression, and the lifetime incidence of depression in patients with OCD is as high as 67.2%. Previous studies have suggested that impaired cognitive flexibility may be one of the important pathological basis of OCD comorbidity depression. Therefore, this study aimed to clarify the impaired characteristics of cognitive flexibility of patients with obsessive-compulsive disorder and depression (OCD+D) by analyzing their performance in the task switching paradigm. **Methods:** With demographic veriables matched, 43 OCD+D patients, 63 OCD patients without comorbidity and 63 healthy controls completed the task-switching paradigm and several psychological scales, including the Center for Epidemiologic Studies Depression Scale (CES-D) and State Anxiety Inventory (SAI). The OCD+D group and the OCD group also completed the Yale-Brown Obsessive-Compulsive Scale-Symptom Checklist (Y-BOCS-SC), which was used to assess the severity of obsessive-compulsive symptoms. The behavioral and psychological data of task-switching paradigm were analyzed by SPSS 26.0 version: (1) The scale scores of the two / three groups were compared by independent two-sample t-test and one-way ANOVA; (2) The 3 (Group: OCD+D group, OCD group, HC group) × 2 (Task type: conversion task, repeat task) Repeated measures ANOVA was used to examine the differences in response time and error rate of the three groups of subjects on the Switch task. **RESULTS:** (1) The independent two-sample t-test results showed that the Y-BCS-SC scores of OCD+D group were significantly higher than those of OCD group (*ps*<0.05); one-way ANOVA showed that the group differences were significant (F_{CES-D}=164.277, p<0.001; F_{SAI}=26.320, p<0.001), the OCD+D and OCD groups had significantly higher CES-D scores and SAI scores than the HC group (all p<0.001), and the OCD+D group had significantly higher scores than the OCD group (*p*s<0.001). (2) The results of repeated measures ANOVA for task-switching paradigm response time and error rate of the three groups showed that the group differences were significant (Response time: F=9.004, p<0.001, partial η^2=0.098; Error rate: F=8.206, p<0.001, partial η^2=0.090). The reaction time of OCD+D group and OCD group was significantly longer than that of HC group (*p*s<0.05), and the error rate was significantly higher than that of HC group (*p*s<0.05), while there were no significant differences in response time and error rate between OCD+D group and OCD group (*p*s>0.05). The main effects were significant (Reaction time: F=177.223, p<0.001, partial η^2=0.516; Error rate: F=37.416, p<0.001, partial η^2=0.184). The response time in the conversion task was significantly longer than that in the repetitive task (p<0.001), and the error rate in the conversion task was significantly higher than that in the repetitive task (p<0.001). And the interaction effect between group and task in response time and error rate were both not significant (*p*s>0.05). **Conclusion:** Patient with OCD have impaired cognitive flexibility no matter whether they are comorbided with depression . Impaired cognitive flexibility might be one of endophenotypes of obsessive-compulsive disorder.

摘 要 **背景：**抑郁症是损害人类身心健康的重要公共卫生问题。既往研究提示，童年创伤是导致抑郁的高危因素，神经质则是抑郁易感性人格特质之一，童年创伤与神经质共同影响抑郁。此外，抑郁可能也反作用于神经质。本研究拟采用纵向设计，基于网络分析探究童年创伤、神经质人格、抑郁在维度水平上的相互影响关系，推测网络中可能存在的因果路径及重要节点，以助于识别出具有临床意义的抑郁干预靶点。

方法：共有 582 名本科生(M_{age} = 20.57，SD = 1.40)完成童年创伤量表简式(CTQ-SF)、大五人格量表修订版神经质分量表(NEO-FI-R-N)、流调中心用抑郁量表(CES-D)和状态焦虑量表(SAI)，一个月后对被试进行追踪测量。采用 SPSS 26.0 对样本数据进行描述性统计和相关分析。以第一次评估(T1)的各变量作为预测变量，第二次评估(T2)的各变量作为结果变量，将童年创伤(情绪虐待 C1、躯体虐待 C2、性虐待 C3、情绪忽视 C4、躯体忽视 C5)、神经质(焦虑 N1、愤怒性敌意 N2、抑郁 N3、自我意识 N4、冲动性 N5、脆弱性 N6)和抑郁(躯体症状 D1、抑郁情绪 D2、积极情绪 D3、人际问题 D4)的不同维度作为节点纳入分析，并将焦虑症状作为协变量。使用基于 R 4.3.1 的 *glmnet*、*qgraph* 和 *lavaan* 程序包，构建 T1→T2 的交叉滞后网络(CLPN)，重点关注各变量的预测能力和被预测程度。

结果：(1)童年创伤、神经质、抑郁和焦虑呈两两显著正相关(r：0.302~0.861，$p < 0.01$)。(2)交叉滞后网络分析结果显示，关联最强的路径是 T1 的人际问题(D4)、抑郁情绪(D2)与积极情绪(D3)显著作用于 T2 的抑郁(N3) (β = -0.33, 0.21, -0.16)，此外，T1 的抑郁、童年创伤与神经质均显著作用于 T2 的协变量(焦虑)。(3)CLPN 的中心性估计结果显示，抑郁情绪(D2)、躯体症状(D1)和焦虑(N1)的发出预期影响最高(out-EI = 0.73, 0.67, 0.63)；协变量(焦虑)、神经质-焦虑(N1)、冲动性(N5)和愤怒性敌意(N2)的接受预期影响最高(in-EI = 0.67, 0.41, 0.34, 0.34)。

结论：本研究发现童年创伤、神经质人格、抑郁在维度水平上存在广泛的相互影响。抑郁情绪、躯体症状、焦虑等情绪症状对后续的症状与特征具有最强影响效应，识别情绪并尽早实施有针对性的情绪干预极具意义。

***Abstract*:**

Background: As one significant public health issue, depression adversely affects physical and mental health. For depression, childhood trauma is considered a high-risk factor, and neuroticism is recognized as a vulnerability trait for depression. Furthermore, childhood trauma and neuroticism jointly influence the development of depression. Using network analysis, this longitudinal study aimed to explore the relationships among childhood

trauma, neuroticism, and depression at a dimensional level, identify possible causal pathways and essential nodes in the network, and identify clinically significant targets for the intervention of depression.

Methods: A total of 582 undergraduate students (M_{age} = 20.57, SD = 1.40) completed the Childhood Trauma Questionnaire Short-Form (CTQ-SF), the Neuroticism subscale of Neuroticism-Extraversion-Openness Personality Inventory-Revised (NEO-FI-R-N), the Center for Epidemiological Studies Depression Scales (CES-D), and the State Anxiety Inventory (SAI). Follow-up measures were administered one month later. Descriptive statistics and correlation analysis were conducted using SPSS 26.0. A T1→T2 cross-lagged network (CLPN) was constructed using the *glmnet*, *qgraph*, and *lavaan* packages of R 4.3.1. In the network analysis, variables in the first assessment (T1) were used as predictors, while variables in the second (T2) were used as outcomes. Additionally, dimensions of childhood trauma [Emotional Abuse(C1), Physical Abuse(C2), Sexual Abuse(C3), Emotional Neglect (C4), Physical Neglect (C5)], neuroticism [Anxiety (N1), Angry-hostility (N2), Depression(N3), Self-consciousness (N4), Impulsiveness (N5), Vulnerability(N6)], and depression [Somatic Symptoms(D1), Depressed Affect(D2), Positive Affect (D3), Interpersonal Difficulties (D4)] were included as nodes in the analysis, with anxiety symptoms serving as covariates. The predictive ability of each variable on other nodes and the extent to which other nodes predict it was determined.

Results: (1) The results showed positive correlations among childhood trauma, neuroticism, depression, and anxiety (r: 0.302 to 0.861, $p < 0.01$). (2) The cross-lagged panel network analyses revealed that interpersonal difficulties (D4), depressed affect (D2), and positive affect (D3) in T1 significantly contributed to depression (N3) in T2 (β = -0.33, 0.21, -0.16). Furthermore, depression, childhood trauma, and neuroticism in T1 significantly affected the covariate (anxiety) in T2. (3) The centrality estimates of the CLPN demonstrated that depressed affect (D2), somatic symptoms (D1), and anxiety(N1) had the highest out-expected influence (out-EI = 0.73, 0.67, 0.63). Conversely, the covariate (anxiety), anxiety (N1), impulsiveness (N5), and angry-hostility (N2) had the highest in-expected influence (in-EI = 0.67, 0.41, 0.34, 0.34).

Conclusion: Extensive interactions exist among childhood trauma, neuroticism, and depression at the dimensional level. Emotional symptoms, specifically depressed affect, somatic symptoms, and anxiety, have the strongest predicting effect. Early identification and targeted emotional interventions for emotional distress are paramount.

抑郁症患者外部转换和反向抑制功能障碍：一般性或情绪特异性？

黄赛[1]　陆晓兵[2]　张豹[1]（通讯作者）

1 广州大学教育学院，广州，510006

2 广州医科大学附属脑科医院心理健康中心，广州，510006，zhangbao@gzhu.edu.cn（小五号宋体）

摘 要　抑郁症存在广泛的认知功能障碍，许多研究认为这些障碍主要反映的是高级执行功能的障碍。执行功能在控制和调节认知和行为选择过程中扮演着重要角色，它包括三个子成分：抑制（抑制优势反应的能力）、更新（从工作记忆中删除不再相关的信息并更新新信息的能力）和转换（在任务或心理状态之间切换的能力）。越来越多的实证证据显示，抑郁症在这些执行功能的子成分都存在障碍。抑郁症患者在任务转换过程中是否存在转换和/或抑制功能障碍，以及这种功能障碍是否具有一般性，还是具有情绪特异性，目前仍存在争议。为探讨这些问题，本研究采用改进的任务切换任务，测量并比较了临床抑郁症患者和非抑郁对照组个体的转换代价（从一个任务集切换到另一个任务集的能力）和反向抑制（抑制不再相关的任务集的能力）。结果显示，抑郁患者的外部转换功能障碍主要出现在情绪领域。与对照组相比，抑郁症患者在外部转换方面表现出一般性和情绪特异性的功能障碍，尤其在从情绪任务切换到非情绪任务时存在困难，而且这种功能障碍与反刍的程度无关。相反，在反向抑制中观察到的情绪功能障碍与抑郁症的症状密切相关，尤其与反刍分数升高有关。研究结果表明，抑郁患者存在转换功能障碍，而且这种障碍具有一般性，同时也具有情绪特异性，抑郁症的不同症状与不同的认知功能障碍相关。

Dysfunction of External Switching and Backward Inhibition in Major Depressive Disorder：General or Emotional Specific？

Sai Huang[1], Xiaobing Lu[2], Bao Zhang[1]

1. School of Education and Center of Attentional Control and Cognitive Development, Guangzhou University, Guangzhou, China. 510006

2. Guangzhou Mental Health Center, The Affiliated Brain Hospital of Guangzhou Medical University (Guangzhou Huiai Hospital), Guangzhou, China. 510370 体）

Abstract：Cognitive impairments are now widely acknowledged as an important aspect of major depressive disorder (MDD). Most of these impairments are considered to reflect fundamental problems in executive function (EF). Vital to the control and regulation of cognitive processes and response selection, EF includes three subcomponents: inhibition (e.g., inhibiting prepotent responses), updating (e.g., removing no longer relevant information from working memory), and switching (shifting between tasks or mental sets). Mounting empirical evidence has demonstrated depression-related executive dysfunctions. It remains controversial whether MDD has dysfunctions in switching and/or inhibition and whether such dysfunctions, if present, are general or specific to emotional content. In the present study, we investigated these questions with a modified task-switching task to

measure the switch cost (the ability to activate a new set) and backward inhibition (the ability to inhibit a task set no longer relevant) in both clinical MDD patients and non-depressive control (NDC) individuals. The dysfunctions were identified to be in the emotional domain. Compared with NDCs, MDDs showed general and emotion-specific dysfunctions in external switching, especially difficulty switching attention from an emotional task to a non-emotional task. Further, this dysfunction was independent of rumination. In contrast, although emotional dysfunction in backward inhibition was also observed in MDD, it was closely related to elevated rumination scores. The results suggest that different symptoms of MDD were associated with different cognitive dysfunctions.

Keywords **：** major depressive disorder, task switch, dysfunction of executive control, backward inhibition, rumination

摘 要：抑郁症是一种常见的情感性精神障碍，严重影响大学生的心理健康水平。降低大学生抑郁发生率的关键环节是准确识别出潜在的抑郁患者。基于功能性近红外光谱技术（functional Near-infrared Spectroscopy, fNIRS）寻找客观的抑郁症生物学标记将辅助抑郁症的科学识别。为此，本研究收集了由医院提供的抑郁大学生及健康对照组在静息态和言语流畅性任务下的 fNIRS 数据，以及对应的抑郁自评量表数据。一方面，通过皮尔逊相关在个体水平上构建了抑郁大学生与对照组的前额脑网络，计算两组脑网络的全局拓扑属性，并进行组间差异比较，明确抑郁大学生脑网络的特异性；另一方面，构建了脑网络拓扑属性与量表得分的关系。结果表明：（1）静息态下，抑郁组脑网络连接密度、特征路径长度以及网络同配性显著低于健康组；（2）在言语流畅性任务中，抑郁组脑网络的特征路径长度、网络直径以及聚类系数显著高于健康组；（3）静息态下的抑郁症状与脑网络拓扑属性有一定的相关性，抑郁程度与症状表现均与部分拓扑属性，如特征路径长度、加权平均度以及同配系数存在负相关关系。本研究结果表明，部分脑网络全局拓扑属性可以作为区分抑郁大学生的客观指标，症状表现与脑网络拓扑属性的相关性进一步说明了脑网络拓扑属性的异常可以作为抑郁症状表现的潜在因素。

2 Department of Physical Education, Northwestern Polytechnical University, Xian, China

Abstract: Depression is a common affective mental disorder that significantly impacts the mental health of university students. The key to reducing the incidence of depression among university students is the accurate identification of potential depressed individuals. Finding objective biological markers of depression using functional Near-infrared Spectroscopy (fNIRS) technology can aid in the scientific identification of depression. In this study, fNIRS data during resting-state and verbal fluency tasks, as well as corresponding self-rating depression scale data, were collected from depressed university students provided by hospitals and a healthy control group. On one hand, using Pearson correlation, frontal brain networks of depressed university students and the control group were constructed at the individual level. The global topological properties of the two groups' brain networks were calculated, and intergroup differences were compared to determine the specificity of the brain networks of depressed university students. On the other hand, the relationship between brain network topological properties and scale scores was established. The results showed that: (1) During resting-state, the depressed group exhibited significantly lower network connectivity density, characteristic path length, and network assortativity compared to the healthy group. (2) During the verbal fluency task, the depressed group had significantly higher characteristic path length, network diameter, and clustering coefficient compared to the healthy group. (3) There was a certain correlation between depression symptoms during resting-state and brain network topological properties. The severity and symptom manifestations of depression were negatively correlated with certain topological properties such as characteristic path length, weighted average degree, and assortativity coefficient. These findings indicate that certain global topological properties of brain networks can serve as objective indicators for distinguishing depressed university students, and the correlation between symptom manifestations and brain network topological properties further suggests that abnormal brain network topological properties may be underlying factors in depressive symptomatology.

Keywords: depressed college students, fNIRS, brain network, topological characteristics

神经质与急性心理应激反应的关系：自主神经系统的证据

殷梦馨　尉怀怀　刘旭峰　王秀超（通讯作者）
空军军医大学军事医学心理学系，西安，710032，通讯作者 E-mail：Wangxiuchao1984@163.com

摘 要　神经质是一种应激易感性人格特质，是导致应激反应形式存在个体差异的重要因素，但它们之间的关系尚不明确。此外，由于神经质始终与不良的心血管健康相关，其中对心理应激的非典型心血管反应模式被认为是探讨神经质与心血管疾病之间联系的潜在机制。因此，本研究采用标准化的心算任务诱发急性心理应激状态，选取 30 名健康男性（M =21.43，SD =1.10）参与这项观察性研究。实验包括基线阶段（8 分钟）、心算任务（10 分钟）以及恢复阶段（8 分钟）。采用大五人格量表评估神经质，自我报告应激水平量表评估心理压力。全程监测收集基线阶段、应激阶段以及恢复阶段的心率（HR）和心率变异性（HRV）指标。广义估计方程表明神经质可以预测急性心理应激引起的生理反应，具体表现为，神经质水平较高的个体表现出 HRV 的高频成分（HF）反应减弱，低频成分（LF）、低频高频比（LF/HF）以及 HR 反应增强。多元线性回归分析表明，神经质与较高的生理反应性和恢复性相关。此外，本研究并未发现神经质与主观情绪压力体验存在显著相关。这些发现可能表明，高水平神经质个体对急性心理应激存在非适应性的生理反应模式，从而进一步导致不良的健康结果。

The relationship between neuroticism and acute psychological stress response: evidence from the autonomic nervous system

YIN Mengxin,YU Huaihuai, LIU Xufeng, WANG Xuchao
Department of Military Medical Psychology, Air Force Medical University, Xi'an 710032,China

***Abstract*:** Neuroticism, a stress susceptibility personality trait, is an important factor contributing to individual differences in the form of stress responses, but the relationship between them is unclear. In addition, because neuroticism has consistently been associated with poor cardiovascular health, in which atypical patterns of cardiovascular responses to psychological stress have been suggested as a potential mechanism for exploring the link between neuroticism and cardiovascular disease. Therefore, in the present study, a standardized mental arithmetic task was used to induce an acute state of psychological stress, and 30 healthy men (M = 21.43, SD = 1.10) were selected to participate in this observational study. The experiment consisted of a baseline phase (8 min), a mental arithmetic task (10 min), and a recovery phase (8 min). Neuroticism was assessed using the Big Five Personality Inventory and psychological stress was assessed using the Self-Report Stress Level Scale. Heart rate (HR) and heart rate variability (HRV) metrics were collected throughout the monitoring for the baseline, stress, and recovery phases. Generalized estimating equations indicated that neuroticism predicted physiological responses induced by acute psychological stress, as evidenced by the fact that individuals with higher levels of neuroticism exhibited attenuated responses to the high-frequency component (HF) and enhanced responses to the low-frequency component (LF), low-frequency to high-frequency ratio (LF/HF), and HR of HRV. Multiple linear regression analysis indicated that neuroticism was associated with higher physiologic reactivity and recovery. In

addition, the present study did not find a significant correlation between neuroticism and the experience of subjective emotional stress. These findings may suggest that individuals with high levels of neuroticism have a non-adaptive physiological response pattern to acute psychological stress, which further contributes to poor health outcomes.

***Keywords*:** Neuroticism, Heart rate variability, Heart rate, Stress, Response pattern

恐惧从条件音频向语义相关图片的泛化

周洁仪[1] 陈迪[1] 陈一冉[1] 刘玉昕[1] 王璇[1] 谈欣[1] 陈文惠[1] 王士祺[1] 赵珂冰[1] 许筑媛[1] 郑希付[2]

摘 要 恐惧泛化被广泛地认可为是焦虑症的重要病因之一。先前的研究已证实恐惧在单一感觉通道中的泛化，主要为视觉通道内的泛化。恐惧网络理论是解释恐惧泛化的理论之一，由于恐惧网络的存在，我们才能快速识别和应对潜在威胁。已有证据表明，情绪信息的处理不只发生在同一种感觉通道中，同一种语义类别的抽象刺激之间也会发生泛化，提供了研究跨通道泛化的可能性。

本研究基于恐惧网络理论和信息的多感官处理提出假设，从听觉刺激向视觉刺激泛化的角度探究恐惧泛化的潜在机制。实验采用经典条件反射范式，25 名被试被随机分配到单通道组与交叉通道组。两组均会在习得阶段通过被施以电击习得对于听觉刺激的恐惧，单通道组在泛化阶段完成的是传统的恐惧消退，而双通道组在此阶段采用与听觉刺激语义相关的视觉刺激，完成泛化测试。我们将记录被试的皮肤电导反应与对非条件刺激（US）的主观预期评级，通过比较探究跨通道间的泛化与消退效果。

结果发现，在恐惧习得过程中，被试在主观预期和皮肤电导反应指标上均习得了恐惧。在恐惧泛化阶段，我们发现 US 主观预期评级从条件音频泛化至语义相关的图片。但在消退结果上，当原条件听觉刺激在消退过程中出现时，被试对于对泛化刺激的恐惧最终消失，而使用泛化刺激的消退训练对原始刺激的效果较差。本研究的结果为跨通道的恐惧泛化提供了新的证据，对跨通道恐惧习得机制的研究和暴露疗法的程序设置具有启发意义。

***Abstract*：** Fear generalization is widely recognized as an important etiological factor in anxiety disorders. Previous studies have confirmed the generalization of fear in single sensory channels, mainly within the visual channel. Fear network theory is one of the theories that explains fear generalization, and it is due to the existence of fear networks that we are able to quickly identify and respond to potential threats. It has been shown that processing of emotional information does not only occur in the same sensory channel, but that generalization also occurs between abstract stimuli of the same semantic category, offering the possibility of studying cross-channel generalization.

The present study proposes hypotheses based on fear network theory and multisensory processing of information to explore the potential mechanisms of fear generalization from the perspective of generalization from auditory to visual stimuli. The experiment was conducted using a classical conditioned reflex paradigm, and 25

subjects were randomly assigned to a single-channel group and a cross-channel group. Both groups acquired fear of auditory stimuli by administering electric shocks during the acquisition phase. The single-channel group completed the generalization phase with conventional fear extinction, whereas the two-channel group completed the generalization test by using visual stimuli semantically related to the auditory stimuli during this phase. We will record subjects' skin conductance responses with subjective expectancy ratings to unconditioned stimuli (US) to explore the generalization and extinction effects across channels by comparison.

It was found that during fear acquisition, subjects acquired fear on both subjective expectancy and skin conductance response metrics. In the fear generalization phase, we found that US subjective expectancy ratings generalized from conditioned audio to semantically related pictures. However, in the extinction result, when the original conditioned auditory stimulus appeared during extinction, subjects' fear of the generalized stimulus eventually disappeared, whereas extinction training using the generalized stimulus was less effective with the original stimulus. The results of the present study provide new evidence for fear generalization across channels, and are instructive for the study of cross-channel fear acquisition mechanisms and the programming of exposure therapy.

通讯作者 E-mail：kangguanlan@bsu.edu.cn

摘 要 情绪性注意捕获是指与任务无关的情绪性刺激能够不自觉吸引个体注意的现象。大量研究指出运动能够增强个体执行功能并能提高积极情绪降低消极情绪，改变大脑额叶、杏仁核及其边缘区域功能，情绪性刺激的加工同样会受到这些脑区调节，但目前尚不清楚运动如何影响情绪性刺激的注意捕获。因此，本研究主要探讨急性有氧运动对情绪性注意捕获的影响及可能存在的情绪体验的作用。采用 2(干预方式：运动 vs.静坐阅读)×3(情绪干扰类别：积极 vs.消极 vs.中性) ×2(目标存在与否：存在 vs.不存在)被试内设计。随机招募 26 名大学生(男生 9 名，年龄 19.5±1.6 岁)参与到研究中，均纳入最终统计分析。被试在中等强度急性运动(以 60%-69%最大心率强度蹬功率自行车)干预后和静坐阅读干预后进行视觉搜索任务，情绪面孔干扰刺激(快乐/愤怒)在搜索集中随机出现，被试需判断搜索集中是否存在面孔性别奇异项。每种干预时间持续 30 分钟，两次干预间隔至少五天，使用正性负性情绪量表(PANAS)测量干预前后情绪变化。结果显示：目标存在与否和情绪干扰类别交互作用显著，目标不存在时，愤怒面孔条件下的反应时显著高于快乐面孔和无干扰条件下的反应时，快乐面孔与无干扰条件之间无显著差异；目标存在时，仅发现愤怒面孔条件下的反应时显著高于快乐面孔条件下的反应时。未观察到干预方式的主效应，及其与其他因素的交互效应。以 PANAS 正性情绪得分为因变量分析发现干预方式与测量时间交互作用显著，运动干预对个体正性情绪有积极作用。考虑到运动、情绪和注意三者之间作用的复杂性，且本研究只探讨了 30 分钟中等强度有氧运动干预的影响，未来可从改变运动设置、任务难度以及结合相关认知神经技术进一步探究背后可能的内在机制。

***Abstract*：** Emotional attention capture refers to the phenomenon that irrelevant emotional stimuli can unconsciously attract an individual's attention. Numerous studies have shown that exercise enhances executive function and increases positive emotions and decreases negative emotions, altering the function of the frontal lobe, amygdala, and limbic regions of the brain, where the processing of emotional stimuli is also regulated, but it is unclear how exercise affects the attentional capture of emotional stimuli. Therefore, the present study focused on the effects of acute aerobic exercise on emotional attention capture and the possible role of emotional experience. A 2 (intervention: exercise vs. reading) × 3 (emotional distractor: positive vs. negative vs. neutral) × 2 (target presence: presence vs. absence) within-subjects design was used. Twenty-six university students (9 male, 19.5±1.6 years old) were randomly recruited to participate in the study and all were included in the final statistical analysis. Participants performed a visual search task after a moderate-intensity acute exercise (pedaling a power bicycle at 60%-69% of maximum heart rate intensity) intervention and after a sedentary reading intervention, in which emotional face-disturbing stimuli (happy/angry) appeared randomly in the search set, and participants were required to judge the presence or absence of a face-gender singleton in the search set. Each intervention lasted 30 minutes, with at least five days between interventions, and feeling changes were measured before and after the intervention using the Positive and Negative Affect Scale (PANAS). The results showed that there was a significant interaction between target presence and emotional distractor. The response time in the angry face condition was significantly higher than those in the happy face and no interference conditions when the goal was not present, but there was no significant difference between the happy face and no interference conditions; when the goal was present, the response time was only found to be significantly higher in the angry face condition than in the happy face condition. There were no main effects of intervention or interaction effects with other factors. Analyses of the PANAS-positive emotional score showed a significant interaction between intervention and time. The exercise intervention improved positive emotions. Considering the complexity of the interaction between exercise, emotion, and attention, and that the present study only explored the effects of 30 minutes of moderate-intensity aerobic exercise, the underlying mechanisms could be further explored in the future by changing exercise settings, task difficulty, and combining relevant cognitive neurotechnologies.

不同时长中等强度跑步运动下 7-11 岁儿童的时间知觉变化特点

沈行行[1]　郑玮琦[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，weiqi71@126.com

摘 要　为进一步探讨不同年龄儿童在运动时的时间知觉变化特点，本研究通过操纵不同任务类型和任务时长探究运动对儿童时间知觉的影响。研究采用 4(年龄：7、9、11 岁儿童及成人)×2(任务类型：运动(中等强度跑步)，不运动(静止站立))×2(任务时长：短时(1 分 58 秒)，长时(5 分 3 秒))的混合设计，以预期时间估计范式为基础，结合神经心理学测验(测量短期记忆、工作记忆和注意力)招募 7、9、11 岁儿童及成人(18-25 岁)各 30 人。结果表明，自变量主效应均显著，任务类型 $F(1, 106) = 105.23, p < 0.001, \eta^2_p = 0.50$；任务时长（$F(1, 106) = 64.57, p < 0.001, \eta^2_p = 0.38$；年龄 $F(1, 106) = 80.2, p < 0.001, \eta^2_p = 0.19$。任务类型和年龄的交互作用显著（$F(3, 106)= 4.01, p = 0.009 , \eta^2_p = 0.10$），简单效应检验发现，在运动任务中，7 岁与 11 岁儿童及成人时距估计的差异显著，与 9 岁儿童没有显著差异；在不运动任务中，成人仅与 7 岁儿童差异显著，儿童之间差异均不显著。任务类型和任务时长交互作用显著（$F(3, 106)= 7.60, p = 0.007, \eta^2_p = 0.07$），简单效应检验发现，在短时任务中，对比不运动，参与者在运动中的时距高估现象更明显；在长时任务中，对比不运动，参与者在运动中的时距高估比率更大，但和短时任务相比，高估比率下降。任务时长和年龄的交互作用不显著，年龄、任务类型和任务时长三者交互作用不显著。结合神经心理学测验结果进行回归分析表明，参与者年龄越小，神经心理学测验得分越低，认知能力越差。分层回归结果显示，在长时任务中，年龄和注意力可以显著的预测时间估计的准确性。在短时不运动任务中，年龄和短期记忆可以显著的预测时间估计的准确性；短时运动任务中，除了年龄和短期记忆，注意力也可以预测时间估计的变化。综上可知：(1)对比成人，儿童在运动中时间估计准确性较差。11 岁儿童和成人的时间估计没有明显差异，但稳定性差，时间估计波动较大。 (2)与不运动相比，儿童和成人在运动时会高估客观时长；长时间运动时的高估比率下降。 (3)注意力可能是影响不同年龄儿童时间估计差异的主要因素。

关键词　时间知觉，儿童，注意力，中等强度运动

The characteristics of time perception changes in children aged 7-11 years under moderate intensity running of different durations

Hanghang Shen[1], Weiqi Zheng[1] (Corresponding Author)
School of Psychology, Beijing Sport University, No. 48, Xinxi Road, Haidian District, Beijing

Abstract: In order to further explore the changes and characteristics of time perception of different ages' children during exercise, this study explored the influence of exercise on children's time perception by manipulating different task types and task durations. In this study, a 4 (age: 7, 9, 11 years old and adults) × 2 (task type: exercise (moderate intensity running), no exercise (standing still)) × 2 (task duration: short-term (1 minute 58 seconds) and long-term (5 minutes 3 seconds)) mixed design was adopted, which was based on the prospective time estimation paradigm and combined with neuropsychological tests (measuring short-term memory, working memory, and attention). This study recruited 30 7-year-old children, 30 9-year-old children, 30 11-year-old children, and 30 adults aged 18-25 years. The results showed that the main effect of independent variables was significant: task type $F(1, 106) = 105.23, p < 0.001, \eta^2_p = 0.50$; task duration ($F(1, 106) = 64.57, p < 0.001, \eta^2_p = 0.38$; age $F(1, 106) = 80.2, p < 0.001, \eta^2 p = 0.19$. The interaction between task type and age was significant ($F(3, 106) = 4.01, p = 0.009, \eta^2_p = 0.10$). The simple effect test found that there were significant differences in the estimation of time intervals

between 7-year-old children to 11-year-old children and adults, but no significant differences between 11-year-old children and 7-year-old children in exercise tasks. In the exercise task, the difference between adults and 7-year-old children was significant. However, the difference between children was not significant. The interaction between task type and task duration was significant ($F(3, 106)= 7.60$, $p = 0.007$, $\eta^2_p = 0.07$). The simple effect test found that participants in the short-term tasks had a more obvious overestimation of the time intervals during exercise compared with no exercise task. During the long-term tasks, participants had a bigger rate of overestimation of the time interval during exercise compared with no exercise, but the rate of overestimation decreased compared with the short-term tasks. The interaction between task duration and age was not significant, and the interaction between age, task type, and task duration was not significant either. Regression analysis combined with neuropsychological test results showed that the younger the participants were, the lower the neuropsychological test score and the worse the cognitive ability. Hierarchical regression results showed that age and attention significantly predict the accuracy of time estimates in long-term tasks. Age and short-term memory can significantly predict the accuracy of time estimation in short-term no exercise tasks. In addition to age and short-term memory, attention can also predict changes in time estimates for short-term exercise tasks. In summary, the study shows that: (1) Compared with adults, children's time estimation accuracy during exercise is worse. There is no significant difference in time estimates between 11-year-old children and adults, but children's stability is poor and time estimates fluctuate considerably. (2) Children and adults overestimate objective time when they exercise compared to when they do not exercise; the overestimation rate decreases with long-term exercise. (3) Attention may be the main factor affecting the difference in time estimates of different ages' children.

Keywords: time perception, children, attention, moderate intensity exercise

正念训练对职业运动员备赛期间心理健康的干预研究

班亚东[1] 陈高伊[1] 刘安琪[1] 陈梦雪[1] 张丹[2] *杨明[3]（通讯作者）
1 四川体育职业学院，成都，610043
2 四川省体育科学研究所，四川省反兴奋剂中心，成都，610000
3 四川体育职业学院，成都 610043，441606584@qq.com

摘 要：本研究探讨正念训练对职业运动员大赛前心理健康干预效果，运动员通过练习正念—接受为基础干预方式的心理训练，以期帮助运动员调整负性情绪、适应压力降低焦虑。本研究采用单被试设计评估心理干预效果，选取四川省运动队 10 名不同专项的健将级职业运动员，在备战第十四届全运会期间，进行为期大约 10 个月干预，每人每天进行 16 分钟的正念身体扫描练习。所有心理学变量均评估 2 次：评估量表为《症状自评量表 SCL90》，进行干预前测试和比赛结束后 1 个月跟踪测试，量表测试后运动员对心理健康状态进行自评。结果：干预前，对 10 名运动员进行量表测试，运动员自评在全运会的比赛压力与运动员承担的比赛任务，引发状态焦虑，同时长时间、高强度的训练导致身体伤病和慢性疲劳，影响心理健康状态。经过 10 个月的正念训练干预后，在结束后 1 个月跟踪测试，对比干预前运动员除恐怖症状外，其余症状 $P<0.05$，均得到显著性改善。人际敏感、抑郁症状 $P\leq0.01$，得到显著性的改善。运动员自评通过正念训练，在适应压力、焦虑等方面有了显著提高，有效提高了运动员备战备赛时的心理健康水平。研究结论：通过为期 10 个月的正念训练，可以显著改善职业运动员在备赛期间的人际敏感、抑郁症状水平。本研究为正念训练改善运动员心理健康方面提供了初步的支持。

The Research on the Intervention of Mindfulness Training on the Mental Health of Professional Athletes During Competition Preparation

Ban yadong[1] Chen gaoyi[1] Liu anqi[1] Chen mengxue[1] Zhang Dan[2] *Yang Ming[3]
1 Sichuan Sports college, Chengdu, 610043
2 Sichuan Research Institute Of Sports Science, Sichuan Anti-doping Agency, Chengdu, 610000
3 Sichuan Sports college, Chengdu, 610043, 441606584@qq.com

Abstract ： This research explores the effect of mindfulness training on the mental health intervention of professional athletes before competition. Athletes practice mindfulness-based psychological training to help athletes adjust negative emotions and adapt to the reduction of stress. In this research, a single-subject design was used to evaluate the effect of psychological intervention. 10 professional athletes from Sichuan provincial sports teams with different disciplines were selected to conduct an intervention for about 10 months during the preparation for the 14th National Games, and each person performed 16 minutes of mindful body scanning

exercises every day. All psychological variables were evaluated twice: the assessment scale was "Symptom Self-rating Scale SCL90", pre-intervention test and one-month follow-up test after the competition were conducted, and athletes were self-rated on mental health status after the scale test. Results: Before the intervention, 10 athletes were tested on the scale. The athletes' self-rated competition pressure and competition tasks in the National Games caused state anxiety, while the long-term and high-intensity training led to physical injury and chronic fatigue, which affected the mental health state. After 10 months of mindfulness training intervention, the follow-up test one month after the end of the intervention, compared with the athletes before the intervention, the remaining symptoms except for terror symptoms, $P < 0.05$, were significantly improved. Interpersonal sensitivity and depressive symptoms $P \leq 0.01$ were significantly improved. Through mindfulness training, athletes' self-evaluation has significantly improved in the aspects of adapting to pressure and anxiety, and effectively improved the mental health level of athletes preparing for the competition. Conclusion: 10 months of mindfulness training can significantly improve the interpersonal sensitivity and depressive symptoms of professional athletes during the preparation period. This study provides preliminary support for the improvement of mental health of athletes through mindfulness training.

3 四川体育职业学院，成都，610043，441606584@qq.com

摘 要 心理健康对运动员来说是核心要素之一，前人研究发现心理健康问题和心理疾病在运动员群体中广泛存在。心理健康素养的缺失会导致对待心理问题消极、向外界寻求帮助的意愿不足，心理健康素养是运用心理健康知识、技能和态度，保持和促进心理健康的能力。课程干预是帮助运动员提升认知水平、传播心理健康知识的有效手段，为了验证心理健康课程的干预效果，研究选取四川省运动队 60 名一级运动员为研究对象，其中男运动员 33 名，女运动员 27 名，平均年龄 21.4±2.6 岁。随机分为实验组（n=30）和对照组（n=30）,实验组设置 8 周心理健康课程，对照组不接受任何干预。心理健康素养课程每周一次课，课程时间 60 分钟，课程内容包括对心理健康和心理健康素养的基本认识、压力与心理健康、焦虑与抑郁、饮食与睡眠、运动员群体心理健康问题的特殊性、对待心理健康问题的态度、如何寻求帮助、总结与测评。在课程前后设置《多元心理健康素养问卷》、《寻求专业心理帮助态度问卷》对相关指标进行评估，旨在帮助运动员提高心理健康素养和求助态度。研究结果：心理健康课程可以提高运动员的心理健康素养水平，包括心理健康知识、信念和资源；心理健康课程可以提高心理求助态度。该研究证实了对我国运动员进行心理健康课程的有效性，对提高运动员心理健康素养水平和改善求助态度方面的研究提供一定参考依据。

The Research on Intervention of Athletes' Mental Health Literacy based on Mental Health Courses

Liu Anqi[1] Ban Yadong[1] Ye Shu[1] Zhang Dan[2] *Yang Ming[3]
1 Sichuan Sports College, Chengdu, 610043
2 Sichuan Research Institute Of Sports Science, Sichuan Anti-doping Agency, Chengdu, 610000
3 Sichuan Sports College, Chengdu, 610043, 441606584@qq.com

Abstract： Mental health is one of the core factors for athletes. Previous studies have found that mental health problems and mental diseases exist widely in athletes. The lack of mental health literacy, which is the ability to use mental health knowledge, skills and attitudes to maintain and promote mental health, can lead to a negative attitude towards mental problems and a lack of willingness to seek help. Course intervention is an effective means to help athletes improve their cognitive level and disseminate mental health knowledge. In order to verify the intervention effect of mental health courses, 60 athletes from Sichuan provincial team were selected as the research objects, including 33 male athletes and 27 female athletes, with an average age of 21.4±2.6 years. They were randomly divided into an experimental group (n=30) and a control group (n=30). The experimental group received an 8-week mental health course, while the control group received no intervention. The Mental Health Literacy course is held once a week and lasts 60 minutes. The course covers the basic understanding of mental health and mental

health literacy, stress and mental health, anxiety and depression, diet and sleep, the particularity of mental health problems in athletes, attitudes towards mental health problems, how to seek help, summary and assessment. Multiple Mental health Literacy Questionnaire and Attitude towards Seeking Professional Psychological Help Questionnaire were set up before and after the course to evaluate the relevant indicators, aiming at helping athletes improve their mental health literacy and attitude towards seeking help. Results: Mental health courses can improve athletes' mental health literacy, including mental health knowledge, belief and resources; Mental health course can improve psychological help attitude. This study confirms the effectiveness of mental health courses for athletes in China, and provides some reference for improving athletes' mental health literacy and help seeking attitude.

摘 要　近年来，国内外校园欺凌事件频登热搜并愈演愈烈，成为当今社会最严重的问题之一。而体育运动本身具有竞技性和对抗性，加之大多初中生身心尚未成熟，使得体育欺凌成为校园中最常见但又难以界定责任的校园欺凌行为。针对校园体育欺凌行为，过度关注其本身而不深入分析其产生的根本原因，会使得对此行为的预防和干预不能起到预期的效果。因此有必要将研究问题锁定为校园体育欺凌者的行为、为什么要欺凌以及欺凌行为的目的是什么三个问题，从中探讨校园体育欺凌行为机制。本研究采用参与式观察法与访谈法，深入到初中生校园体育活动中，对其校园体育欺凌行为进行细致观察，并对欺凌者进行访谈，采用质性研究法紧密围绕以上三个问题而推进，分析其欺凌行为背后存在的机制。研究发现：1）初中生校园体育欺凌行为主要体现为欺凌者在体育情境中如体育教学、运动训练及课外体育活动等对被欺凌者实施物理性、言语性、社交关系性等的欺负、侮辱，并给被欺凌者带来身体、财产或精神伤害的行为；2）由于欺凌者人格特质、资源优势、较高的冲动性和对体育规则的忽视、外界“裁判”的支持、个人或群体间的利益冲突、安全与情感的缺失等，加之体育攻击行为的隐蔽性，使其产生欺凌行为；3）欺凌者认为欺凌行为相较其他合理行为更能带来积极有益的后果且更易实施，如增强其体育圈关系网、拥有更多体育资源、获得安全感、心理满足和重视等，但较少能够认识到这种行为带给被欺凌者的伤害性；4）欺凌者态度（对被欺凌者的情感态度及行为倾向性）、主观准则（对他们而言认为什么是好的、能从中获得什么）和主观行为控制（即自我效能感）都能增强其意图从而间接促进欺凌行为的出现。通过了解欺凌者的想法，后续将着手探索如何减少其体育欺凌行为，甚至使他们降低欺凌别人的心理需要。

A qualitative study on the mechanism of school sports bullying behavior in junior high school students: based on the bully's perspective

Pei-pei Chen
Institute of Physical Education,Shanxi university,Taiyuan in Shanxi Province

Abstract：In recent years, school bullying at home and abroad has become one of the most serious problems in today's society. Due to the competitive and antagonistic nature of sports itself, coupled with the immature body and mind of most junior high school students, sports bullying has become the most common campus bullying behavior which is difficult to define the responsibility. However, focusing too much on the bullying behavior of school sports without in-depth analysis of its root causes will make the prevention and intervention of this behavior can not play the expected effect. Therefore, it is necessary to focus the research on three questions: the behavior of school sports bullies, why they bully and what is the purpose of bullying behavior, and explore the mechanism of school sports bullying behavior. This study uses the participatory observation method and interview method to go deep into the campus sports activities of junior high school students, carefully observe their campus sports bullying behavior, and interview the bully, and adopts the qualitative research method to closely focus on the above three

questions and analyze the mechanism behind their bullying behavior. The findings are as follows: 1) The bullying behavior of junior high school students is mainly embodied in physical, verbal and social bullying and insults to the bullied in sports situations such as sports teaching, sports training and extra-curricular sports activities, and brings physical, property or mental damage to the bullied; 2) Bullying behavior is caused by the bully's personality traits, resource advantages, high impulsiveness and neglect of sports rules, the support of external "referees", the conflict of interest between individuals or groups, the lack of safety and emotion, and the concealment of sports aggression; 3) Compared with other reasonable behaviors, bullies believe that bullying behavior can bring more positive and beneficial consequences and is easier to implement, such as enhancing their sports network, having more sports resources, gaining a sense of security, psychological satisfaction and attention, but they are less able to recognize the harm that this behavior brings to the bullied; 4) The bully's attitude (emotional attitude and behavioral tendency toward the bullied), subjective norms (what they think is good and what they can gain from it) and subjective behavioral control (i.e. self-efficacy) can enhance their intention and indirectly promote the emergence of bullying. By understanding what bullies think, the next step will be to explore how to reduce their sports bullying behavior and even reduce their psychological need to bully others.

主动式休闲体育锻炼对大学生应对压力和心理健康的研究

印明辉

绵阳师范学院体育与健康教育学院，绵阳，621000，ymhblue@qq.com

摘 要 目的：研究主动式休闲体育锻炼对大学生应对压力和心理健康的影响。方法：采用访谈法进行的质性研究，以归纳的方式得出结论。对 3 所大学共 12 名大学生（N=12）进行半结构化的访谈，访谈包括 6 个结构化主题：积极情绪、身心合一、自尊、休闲、以问题为中心的应对和健康行为的改善，以及关于定期体育锻炼效益的 10 个开放式问题。结果：1.积极情绪。所有受访的大学生都回答说，他们在参加体育锻炼后感受到了积极的情绪。这种积极的情绪给他们带来了一种幸福感和舒适感。2.身心合一。所有受访者都回答说，通过体育锻炼等主动休闲活动，他们的幸福感和生活满意度得到了更大的改善。受访者还提到，当对一项体育项目产生兴趣时,就会对这项体育运动表现出极强的主动性和自觉性,从而做到身心合一。3.自尊。所有受访的大学生都回答说，当达到设定的体育锻炼的目标时，增强了自信心、获得的成就感。并且在体育锻炼的社会交往中建立了密切的人际关系和社会支持，形成了安全、稳定的高自尊。4.休闲。多名受访者将体育锻炼当作一种主动休闲活动，这种自主选择的活动使得他们对休闲时间的管理和健康行为的控制更强。5.以问题为中心的应对。多名受访者提到，体育锻炼不仅可以强身健体,还能够消除消极情绪,培养积极情绪。6.健康行为的改善。多名受访者回答说，从事体育锻炼改善了其它健康行为，改善了睡眠质量，改善了生理指标。结论：1.主动式休闲体育锻炼有助于提高积极情绪，有利于建立良好的社会关系，应对问题时更为注意力更为集中，从而提高有效应对能力。2.主动式休闲的体育锻炼有着更强主动性和自觉性,达到身心合一。3.通过体育锻炼增强了自信心、获得的成就感，从而提升了自尊。4.采用主动式休闲体育锻炼后恢复精力，可以更有效地应对问题，会增强压力应对能力。5.体育锻炼产生了积极情绪，从而培养了以问题为中心的应对方式。6.从事体育锻炼改善了其它健康行为并且改善和提高了身体各系统的机能水平。

A Study on the Effects of Active Leisure Physical Exercise on Coping with Stress and Mental Health of College Students

Minghui Yin

School of Physical and Health education, Mianyang Normal University, Mianyang, 621000

Abstract：Objective: To study the impact of proactive leisure physical exercise on college students' coping with stress and mental health. Method: A qualitative study was conducted using interview methods, and conclusions were drawn through induction. A semi-structured interview was conducted on 12 college students (N=12) from 3 universities, covering 6 structured themes: positive emotions, physical and mental integration, self-esteem, leisure, problem-centered coping, and improvement of healthy behavior. Additionally, 10 open-ended questions were asked about the benefits of regular physical exercise. Result: 1. Positive emotions. All interviewed college students responded that they experienced positive emotions after participating in physical exercise. This positive emotion brings them a sense of happiness and comfort. 2. Integration of body and mind. All respondents responded that their sense of happiness and life satisfaction have been greatly improved through active leisure activities such as physical exercise. The interviewees also mentioned that when they are interested in a sports event, they will show

strong initiative and self-awareness towards it, thus achieving physical and mental integration. 3. Self respect. All interviewed college students responded that achieving the set goal of physical exercise enhances self-confidence and a sense of achievement. And in the social interaction of physical exercise, close interpersonal relationships and social support have been established, forming a safe and stable high self-esteem. 4. Leisure. Multiple respondents view physical exercise as an active leisure activity, which allows them to have stronger control over leisure time management and healthy behavior. 5. Problem centered response. Multiple interviewees mentioned that physical exercise not only enhances physical fitness, but also eliminates negative emotions and cultivates positive emotions. 6. Improvement of healthy behavior. Multiple respondents responded that engaging in physical exercise improved other health behaviors, improved sleep quality, and improved physiological indicators. Conclusion: 1. Active leisure physical exercise can help improve positive emotions, establish good social relationships, and focus more when dealing with problems, thereby improving effective coping abilities. 2. Active leisure sports exercise has stronger initiative and consciousness, achieving physical and mental integration. 3. Through physical exercise, self-confidence and a sense of achievement are enhanced, thereby enhancing self-esteem. 4. Adopting proactive leisure physical exercise to restore energy can more effectively cope with problems and enhance stress response ability. 5. Physical exercise generates positive emotions, thus cultivating a problem-centered coping style. Engaging in physical exercise improves other healthy behaviors and improves the functional levels of various systems in the body.

不同唤醒水平对中长跑运动员后程运动决策能力的影响研究

施伟[1]（通讯作者）　盖子墨[2]

1 沈阳体育学院，辽宁沈阳，110102（sy36102@163.com）

2 沈阳体育学院，辽宁沈阳，110102

摘 要 **目的：**通过研究不同运动成绩的中长跑运动员后程心率差异变化反映其唤醒水平，进一步探究不同唤醒水平对中长跑运动员在竞赛中后程运动决策能力的影响，进而为中长跑运动员训练竞赛提供理论与实践依据。方法：选取体育学院中长跑专项男运动员 20 名作为实验对象，运动等级均为二级运动员。主要运用实验法，利用生物反馈仪监控运动员心率差异变化，使用运动决策测试程序测量运动员的决策能力，进而探究不同唤醒水平对中长跑运动员后程运动决策能力的影响。

结果:低唤醒水平运动员与高唤醒水平运动员相比，后程运动决策准确性具有较显著性差异(p<0.05），高成绩运动员在高唤醒水平时的后程决策准确性要高于低唤醒水平，低成绩运动员在低唤醒水平的后程决策准确性要高于高唤醒水平；高成绩运动员的后程运动决策准确性明显高于低成绩运动员具有极其显著性差异（p<0.01）；高成绩运动员在高唤醒水平下后程运动决策准确性要明显高于低成绩运动员具有极其显著差异（p<0.01），在低唤醒水平下差异性并不显著（p>0.05）。

结论:高成绩运动员在高唤醒水平下，后程运动决策准确性较高，适宜的唤醒水平可以使运动员处于较高的警觉状态，更有利于进行决策加工；低成绩运动员在高唤醒水平下，后程运动决策准确性较差，神经肌肉系统处于相对较弱的状态不利于运动决策的发挥；高成绩运动员后程运动决策加工速度快于低成绩运动员，运动员只有在最佳唤醒状态中才能保持最佳竞技状态取得佳绩。

Study on the Influence of Different Arousal Levels on decision making - distance Runners

SHIWei[1]（corresponding author） GaiZimo[2]
1 Shenyang Sport University, Shenyang, Liaoning, 110102(sy36102@163.com)
2 Shenyang Sport University, Shenyang, Liaoning, 110102

***Abstract*：Objective:** This study aims to investigate the differences in post-exercise heart rate variability of middle and long-distance runners with different performance levels as an indicator of arousal levels. Furthermore, it seeks to explore the impact of different arousal levels on the decision-making ability of middle and long-distance runners during competition, providing theoretical and practical guidance for their training and competition.

Methods: Twenty male middle and long-distance runners from the Sports College, all of whom were second-level athletes, were selected as the subjects. Experimental methods were primarily used to monitor the changes in heart rate variability of the runners using a biofeedback device. The decision-making ability of the runners was measured using a sports decision-making testing program, which aimed to investigate the impact of different arousal levels on the decision-making ability of middle and long-distance runners during the later stages of exercise.

Results: Compared to runners with low arousal levels, those with high arousal levels demonstrated significantly higher accuracy in post-exercise decision-making (p<0.05). High-performance runners showed higher decision-making accuracy during the later stages of exercise with high arousal levels compared to low arousal levels. Conversely, low-performing runners showed higher decision-making accuracy during the later stages of exercise with low arousal levels compared to high arousal levels. There was a significant difference between high-performance and low-performance runners in terms of decision-making accuracy during the later stages of exercise (p<0.01). The decision-making accuracy of high-performance runners was significantly higher in high arousal conditions compared to low-performance runners (p<0.01), while the difference was not significant in low arousal conditions (p>0.05).

Conclusion: High-performance runners exhibit higher decision-making accuracy during the later stages of exercise under high arousal conditions. An appropriate arousal level can help athletes maintain a higher state of alertness and facilitate decision-making processes. In contrast, low-performance runners show poorer decision-making accuracy during the later stages of exercise under high arousal conditions, as the neuromuscular system is relatively weaker, hindering effective decision-making. Additionally, high-performance runners demonstrate faster decision-making processing than low-performance runners. Athletes can only achieve optimal performance by maintaining their best competitive state under the optimal arousal level.

大学生体育参与与社会适应能力的关系：自我效能感中介作用

杨益成[1] 张春林[2]（通讯作者） 陈栋[2]

1 上海体育大学体育教育学院，上海，200438

2 江西师范大学体育学院，江西南昌，330022，通讯作者 E-mail:769585976@qq.com

摘 要 **目的：**研究大学生体育参与与社会适应能力的关系，探究自我效能感的中介作用，以期为体育参与促进大学生社会适应能力提供理论依据。**方法：**运用方差分析、相关性检验、多元回归分析和 Bootstrap 检验法以江西省 5 所大学 582 名大学生为调查对象对其体育参与、社会适应能力和自我效能感的调查数据进行分析。**结果:**1）方差分析显示大学生体育参与和自我效能感在性别上存在显著差异，其中男生的体育参与和自我效能感明显高于女性。在不同专业上，理工类和艺体类的体育参与程度明显高于文史类。2）相关性分析显示，大学生体育参与、社会适应能力和自我效能感三个变量之间显著相关（P<0.001）。3）回归分析表明，在控制性别和专业的情况下，大学生体育参与能显著正向预测社会适应能力（β=0.57，P<0.001）和自我效能感（β=0.30，P<0.001）；大学生自我效能感能显著正向预测社会适应能力（β=0.69，P<0.001）；引入自我效能感后，体育参与对社会适应能力的效应量下降（β=0.31，P<0.001），同时自我效能感显著预测社会适应能力（β=0.60，P<0.001）。因此，自我效能感在体育参与和社会适应能力中起部分中介作用。4）Boostrap 检验结果显示，体育参与、社会适应能力和心理资本的总效应显著，总效应值为 0.56。体育参与与大学生的社会适应能力直接效应显著，直接效应值为 0.39，直接效应占比 69.64%。自我效能感在在体育参与和社会适应能力中间接效应显著，间接效应值为 0.17，间接效应占比为 30.36%。**结论：**体育参与可以通过自我效能感间接提升大学生的社会适应能力，在体育教学中，注重提升大学生的自我效能感可以有效地提升大学生的社会适应能力。

The relationship between college students' sports participation and social adaptability: the mediating role of self-efficacy

Yicheng Yang[1] Chunlin Zhang[2] (Corresponding author) Dong Chen[2]

1School of Physical Education, Shanghai University of Physical Education, Shanghai, 200438, China

2College of Physical Education, Jiangxi Normal University, Nanchang, Jiangxi, 330022, China

通讯作者 E-mail:769585976@qq.com

***Abstract*：Purpose:** To study the relationship between college students' sports participation and social adaptability, and to investigate the mediating role of self-efficacy, with a view to providing a theoretical basis for sports participation to promote college students' social adaptability. **Methods:** ANOVA, correlation test, multiple regression analysis and Bootstrap test were used to analyze the survey data on sports participation, social adaptability and self-efficacy of 582 college students from five universities in Jiangxi Province. **Results:**1) Analysis of variance (ANOVA) showed that there was a significant difference between college students' sports participation and self-efficacy in terms of gender, with male students' sports participation and self-efficacy significantly higher than that of females. Across majors, sports participation was significantly higher in science and engineering and arts and sports than in literature and history.2) Correlation analysis showed significant correlation between the three variables of college students' sports participation, social adaptability and self-efficacy (P<0.001).3) Regression analysis showed that college students' sports participation significantly and positively predicted social adaptability (β=0.57, P <0.001) and self-efficacy (β=0.30, P<0.001); college students' self-efficacy significantly and positively predicted social adaptability (β=0.69, P<0.001); and the introduction of self-efficacy resulted in a decrease in the amount of the effect of sports participation on social adaptability (β=0.31, P<0.001),

while self-efficacy significantly predicted social adaptability (β = 0.60, P<0.001). Therefore, self-efficacy played a partial mediating role in sports participation and social adaptive ability.4) Boostrap test results showed that the total effect of sports participation, social adaptive ability and psychological capital was significant, with a total effect value of 0.56. The direct effect of sports participation and social adaptive ability of college students was significant, with a direct effect value of 0.39, and the direct effect accounted for 69.64% of the total effect. The indirect effect of self-efficacy in in sports participation and social adaptability is significant, the indirect effect value is 0.17, and the proportion of indirect effect is 30.36%. **Conclusion**: Sports participation can indirectly improve college students' social adaptive ability through self-efficacy, and in sports teaching, focusing on improving college students' self-efficacy can effectively improve college students' social adaptive ability.

中职生孤独感对人生意义感的影响：领悟社会支持的中介作用和身体活动量的调节作用

陈楚玉[1] 张悦[2] 郝明增[3] 张鐘文[1] 王英春[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，13521531556@163.com

2 石家庄工程技术学校，河北石家庄，050061

3 江苏省东海中等专业学校，江苏连云港，222300

摘 要 **目的：**近年来职业教育的重要程度逐年加深，但相比高中生，中职院校学生的心理健康问题发生更多却甚少得到关注，因而对于中职生的心理健康应该给予重视。孤独感是当个体缺乏社会支持或者社会互动不足时产生的消极主观体验，研究表明，持续的孤独感会影响个体的身心健康，会产生更多的焦虑、抑郁症状和睡眠问题，甚至会有更大的自杀和早期死亡风险。中职院校学生所处年龄为心理健康形成发展的重要时期，此期间中职生处于多重压力之下，生活、升学压力以及面向社会就业的多重选择，很容易导致心理冲突的产生。有研究表明，领悟社会支持与自尊、自我效能、正性情感等呈正相关，与负性情感、焦虑、抑郁等呈负相关，而身体活动量又会对心理状态造成影响。因此本研究旨在探讨领悟社会支持在中职生孤独感与人生意义感之间的中介作用和身体活动量的调节作用，为提高中职生人生意义感，缓解负面情绪提供科学依据。**方法：**本研究采用中文版人生意义感量表、孤独感量表、领悟社会支持量表和身体活动量问卷对随机抽取的全国各地 430 名在读中职学生进行调查。**结果：**（1）采用 Harman 单因素检验法对共同方法偏差进行检验，结果发现未经旋转的第一个因子的解释率为 23.12%，小于临界值 40%，因此本研究不存在明显的共同方法偏差；（2）中职生孤独感能显著负向预测人生意义感（$\beta = -0.173$，$t = -3.625$，$p < 0.001$）；（3）领悟社会支持在中职生孤独感和人生意义感的关系中起中介作用（$\beta = 0.370$，$t = 10.347$，$p < 0.001$）；（4）领悟社会支持在中职生孤独感和人生意义感的中介作用受到身体活动量的调节（F（1,426） = 3.909，$p = 0.049$），进一步简单斜率分析表明，无论中职生具有高身体活动量还是低身体活动量，领悟社会支持都可以显著正向影响人生意义感。**结论：**研究结果支持中职生孤独感和人生意义感的关系是一个有调节的中介模型，应寻求降低中职生孤独感的干预方案，这样不仅可以提高其领悟社会支持，并且可以提高人生意义感，该研究对于帮助提高中职生人生意义感具有重要意义。

关键词 孤独感，人生意义感，领悟社会支持，身体活动量，中职生

The influence of loneliness on the sense of life meaning of secondary vocational college students: the mediating effect of perceived social support and the moderating effect of physical activity

Chuyu Chen[1] Yue Zhang[2] Hao Mingzeng[3] Zhongwen Zhang[1] Yingchun Wang[1]（Corresponding Author）

1 Beijing Sport University, Beijing, 100084

2 Shijiangzhuang Engineering & Technology School, 050061

3Jiangsu Donghai Specialized Secondary School, 222300

Abstract： **Objective:** In recent years, the importance of secondary vocational education has been increasing year by year. However, compared with high school students, the mental health problems of secondary vocational

college students occur more often, but they have received little attention. Therefore, attention should be paid to the mental health of secondary vocational college students. Loneliness is a negative subjective experience that occurs when an individual lacks social support or social interaction, and research has shown that persistent loneliness can affect an individual's physical and mental health, resulting in more anxiety, depressive symptoms, sleep problems, and even a greater risk of suicide and early death. The age of secondary vocational college students is an important period for the formation and development of mental health. During this period, secondary vocational college students are under multiple pressures. Life, study pressure and multiple choices for social employment are easy to lead to psychological conflicts. Studies have shown that perceived social support is positively correlated with self-esteem, self-efficacy and positive emotion, and negatively correlated with negative emotion, anxiety and depression, and the amount of physical activity will affect the psychological state. Therefore, this study aims to explore the mediating effect of social support on loneliness and sense of meaning in life of secondary vocational students and the regulating effect of physical activity, so as to provide scientific basis for improving the sense of meaning in life of secondary vocational students and alleviating negative emotions. **Methods:** In this study, the Chinese version of the meaning of life scale, loneliness scale, perceptive social support scale and physical activity questionnaire were used to investigate 430 secondary vocational students randomly selected across the country. **Results:** (1) Harman single factor test was used to test the common method deviation, and it was found that the explanation rate of the first factor without rotation was 23.12%, which was less than the critical value of 40%, so there was no obvious common method deviation in this study. (2) Loneliness of secondary vocational students could negatively predict the sense of life meaning (β = -0.173, t = -3.625, $p < 0.001$). (3) Perceived social support played a mediating role in the relationship between loneliness and sense of meaning in life (β = 0.370, t = 10.347, $p < 0.001$); (4) The mediating effect of perceptive social support on loneliness and sense of meaning in life of secondary vocational students was regulated by the amount of physical activity (F (1,426) = 3.909, p = 0.049). A further simple slope analysis showed that whether secondary vocational students had high or low level of physical activity, perceptive social support could significantly positively affect sense of meaning in life. **Conclusion:** The research results support that the relationship between loneliness and sense of life meaning of secondary vocational students is a moderated mediation model, and intervention programs should be sought to reduce loneliness of secondary vocational students, which can not only improve their understanding of social support, but also improve their sense of life meaning. This study is of great significance to help improve the sense of life meaning of secondary vocational students.

大学生足球运动员的情绪、心智游移与创造力的关系

李悦铭[1]，李洁玲[1,2,3]（通讯作者）

1 河北师范大学体育学院，石家庄，050024

2 河北省人体运动生物信息测评重点实验室，石家庄，050024

3 河北师范大学体育学博士后流动站，石家庄，050024，lijieling@hebtu.edu.cn

摘 要 目的：心智游移指的是个体的注意从主要任务转向至内部信息。在普遍认知中，运动员发生心智游移会对运动表现造成消极影响。但研究者发现，心智游移也具有提高个体创造力的积极功能。研究认为青年是创造力发展的关键时期，体育课是发展创造力的关键环境。因此高校的体育教学需要重视提高学生的创造力。此外，足球场地空间较大，具有高创造力的球员才能充分运用场地空间，提高运动表现。因此在运动竞技中，需要重视球员的创造力。先前发现，积极情绪会降低运动员心智游移频率，消极情绪会提高运动员心智游移频率；同时，双通道模型认为，积极与消极情绪都会提高个体的创造力。那么，心智游移是否可以调节情绪与创造力的关系？综上，本研究从体育教学和运动竞技的双重角度，探究三者的关系。方法：研究采用《积极与消极情绪量表》、《心智游移频率量表》、《大学生创造力量表》，通过方便抽样的方法，涉及部分省市的高校，利用线上线下相结合的方式发放问卷。总共收取问卷 586 份，通过三项测谎题及规律性作答筛除问卷，获得有效问卷 302 份，有效率 51.536％。利用 SPSS25.0 和 MPlus7.0 对数据进行分析及构建结构方程模型等。结果:本研究不存在明显的共同方法偏差。相关结果显示，积极情绪与创造力呈显著正相关（r=0.364, p＜0.01），消极情绪与创造力的相关性不显著（r=0.030, p＞0.05）；消极情绪与心智游移呈显著正相关（r=0.286, p＜0.01），积极情绪与心智游移的相关性不显著（r=-0.059, p＞0.05）；心智游移与创造力的相关性不显著（r=0.106, p＞0.05）。调节效应结果显示，心智游移在积极情绪与创造力之间的调节效应不显著（β=0.030, p＞0.05）；心智游移在消极情绪与创造力之间的调节效应显著（β=0.133, p＜0.05）。结论：大学生足球运动员的心智游移可以在消极情绪与创造力之间起到调节作用，但无法在积极情绪与创造力之间起到调节作用。本研究结果具有双重实践意义，有利于促进有效的体育教学，并提高学生创造力；也为在竞技训练中提升球员的运动表现提供干预思路。

The Relationship between Emotion, Mind Wandering and Creativity among College Soccer Players

Li Yueming[1], Li Jieling[1,2,3*]

1 School of Physical Education, Hebei Normal University, Shijiazhuang, 050024

2 Key Laboratory of Measurement and Evaluation in Exercise Bioinformation of Hebei Province, Shijiazhuang, 050024

3 Postdoctoral Station of Physical Education, Hebei Normal University, Shijiazhuang, 050024

Abstract： Objective: Mind wandering refers to the shift of attention from the primary task to the internal information. In general cognition, mind wandering can have a negative impact on athletic performance. However, researchers have found that mind wandering also has a positive function of improving individual creativity. Studies suggest that youth is a critical period for creativity development, and physical education is a key environment for developing creativity. Therefore, physical education in colleges needs to pay attention to improving students' creativity. In addition, soccer has more space on the field, and players with high creativity can make full use of the

field space and improve their athletic performance. Therefore, in sports competition, we need to pay attention to the players' creativity. Previous studies have found that positive emotion can reduce the frequency of mind wandering in athletes, while negative emotion can increase the frequency of mind wandering in athletes; Meanwhile, the dual pathway model suggests that both positive and negative emotions can improve individual creativity. Then, can mind wandering moderate the relationship between emotion and creativity? Based on this, this study explores the relationship among the three from the dual perspectives of physical education and sports competition. Methods: The study used the "Positive Affect and Negative Affect Scale", the "Mind Wandering Frequency Scale", and the "College Students' Creativity Scale". Through convenience sampling method, it involved some colleges in some provinces and cities, and used online and offline methods to distribute questionnaires. A total of 586 questionnaires were collected, and 302 valid questionnaires were obtained by screening out questionnaires through three lie detection questions and regularity answering, with an effective rate of 51.536%. SPSS25.0 and MPlus7.0 were used to analyze the data and construct structural equation models. Results: There was no obvious common method bias in this study. The correlation results showed that positive emotion was significantly positively correlated with creativity (r=0.364, p<0.01), and the correlation between negative emotion and creativity was not significant (r=0.030, p>0.05); negative emotion was significantly positively correlated with mind wandering (r=0.286, p<0.01), and the correlation between positive emotion and mind wandering was not significant (r=-0.059, p>0.05); the correlation between mind wandering and creativity was not significant (r=0.106, p>0.05). The moderating effect results showed that the moderating effect of mind wandering between positive emotion and creativity was not significant (β=0.030, p>0.05); the moderating effect of mind wandering between negative emotion and creativity was significant (β=0.133, p<0.05). Conclusion: Mind wandering can play a moderating role between negative emotion and creativity among college soccer players, but it cannot play a moderating role between positive emotion and creativity. The results of this study have dual practical significance, which is conducive to promoting effective physical education and improving students' creativity; it also provides intervention ideas for improving players' athletic performance in competitive training.

摘　要　愤怒是运动场上运动员产生的典型情绪，运动员的最佳运动表现需要运动员能够有效地调节情绪状态。认知重评和表达抑制是最为常用且有效的两种情绪调节策略，比赛中情绪调节策略的选择与使用至关重要。工作记忆刷新是对暂时存储的信息进行不断更新的加工过程，是中央执行系统的核心功能，也是运动员体育比赛中成功表现的重要因素之一，与情绪和情绪调节有着密切联系。运动表象是人脑对客观事物的编码，涉及个体的记忆功能，能够帮助运动员进行技能练习，可能是工作记忆刷新的影响因素之一。本研究探讨在愤怒情绪下，认知重评与表达抑制策略对不同运动表象能力运动员工作记忆刷新的影响，采用2（情绪调节策略：认知重评组、表达抑制组）×2（运动表象能力：高、低）的二因素组间设计，使用2-back任务测量运动员的工作记忆刷新功能，自变量是情绪调节策略和运动表象能力，因变量是工作记忆刷新功能，因变量的观测指标是完成2-back任务的反应时。使用《运动表象能力问卷》测量运动员的运动表象能力，依据问卷总分上下27%的标准将运动员分为高运动表象能力组和低运动表象能力组，共筛选出40名运动员，并随机分到表达抑制组和认知重评组。结果显示：情绪调节策略的主效应显著，使用认知重评策略的运动员比使用表达抑制策略的运动员反应时更短；运动表象能力主效应显著，运动表象能力高的运动员比运动表现能力低的运动员反应时更短；情绪调节策略与运动表象能力的交互作用不显著。结论：在愤怒情绪下，不同的情绪调节策略会影响不同运动表象能力运动员的工作记忆刷新功能，使用认知重评策略能够有效调节愤怒情绪对运动员工作记忆刷新的影响。

Effect of emotion Regulation Strategy on working memory Refresh of athletes with different Motor imagery ability

Jingru Le, Yuan Jiang
School of Psychology, Beijing Sport University, Beijing, 100084

Abstract：Anger is a typical emotion produced by athletes in the sports field. the best sports performance of athletes requires athletes to be able to adjust their emotional state effectively. Cognitive reappraisal and expressive suppression are the two most commonly used and effective emotion regulation strategies, and the selection and use of emotion regulation strategies in the competition is very important. Working memory refresh is a process of constantly updating temporarily stored information, which is the core function of the central executive system and one of the important factors for athletes' successful performance in sports competitions. It is closely related to emotion and emotion regulation. Motor Imagery is the coding of objective things by human brain, which involves individual memory function. Individual motor imagery ability may be one of the influencing factors of working memory refresh. The purpose of this study was to explore the effects of cognitive reappraisal and expressive suppression strategies on working memory refresh of athletes with different motor imagery ability under anger. The two-factor intergroup design of 2 (emotion regulation strategy: cognitive reappraisal group, expressive suppression group)×2 (motor imagery ability: high and low) was adopted. The 2-back task was used to measure the working memory refresh function of athletes. The independent variables were emotion regulation strategy and motor imagery ability. The dependent variable is the working memory refresh function, and the observation index

of the dependent variable is the reaction time to complete the 2-back task. The motor imagery ability questionnaire was used to measure athletes' motor imagery ability. According to the standard of 27% of the total score of the questionnaire, athletes were divided into high motor imagery ability group and low motor imagery ability group. A total of 40 athletes were selected and randomly divided into expressive suppression group and cognitive reappraisal group. The results show that the main effect of emotion regulation strategy is significant, the reaction time of athletes using cognitive reappraisal strategy is shorter than that of athletes using expressive suppression strategy, and the main effect of motor imagery ability is significant. athletes with high motor imagery ability have shorter reaction time than athletes with low motor imagery ability, and the interaction between emotion regulation strategies and motor imagery ability is not significant. Conclusion: under the condition of anger, different emotion regulation strategies will affect the working memory refresh function of athletes with different motor imagery ability, and the use of cognitive reappraisal strategy can effectively regulate the effect of anger on athletes' working memory refresh.

情绪调节策略对不同特质自我控制运动员基于不同冲突认知控制的影响

崔怡洋　姜媛（通讯作者）
北京体育大学，北京，100084，jiangyuan97@sina.cn

摘 要 运动员在日常的训练与比赛的过程中，良好的认知控制能力是其获得优异成绩的保证。情绪与情绪调节策略是影响运动员认知控制水平的重要因素。认知控制是自我控制的基础，但鲜有研究从人格层面探究运动员自我控制的一贯性行为特点。本研究采用实验法，实验 1 以 flanker 任务作为基于刺激冲突认知控制指标，采用 2（刺激冲突：冲突、无冲突）×2（情绪调节策略：表达抑制、认知重评）×2（特质自我控制：高、低）三因素混合实验设计，结果表明，（1）刺激冲突的主效应显著，有刺激冲突的反应时显著长于无刺激冲突的反应时。(2)特质自我控制主效应显著，高特质自我控制运动员的反应时显著长于低特质自我控制运动员。实验 2 以 simon 任务作为基于反应冲突认知控制指标，采用 2（反应冲突：无冲突、有冲突）×2（情绪调节策略：表达抑制、认知重评）×2（特质自我控制：高、低）三因素混合实验设计，结果表明，（1）反应冲突的主效应显著，有反应冲突的反应时显著长于无冲突的反应时。（1）自我控制的主效应显著，高特质自我控制运动员的反应时显著长于低特质自我控制运动员。（2）反应冲突与情绪调节策略的交互作用显著，在冲突条件下，使用认知重评策略的个体反应时显著短于使用表达抑制的个体，但在无冲突条件下，二者不存在显著差异。（3）反应冲突与特质自我控制的交互作用边缘显著，相较于低特质自我控制运动员，高特质自我控制运动员冲突与无冲突条件的反应时差异更大。结论：高特质自我控制运动员在刺激冲突与反应冲突解决的过程中表现更差，运动员面临反应冲突时，认知重评策略能够有效促进其认知控制。

The effects of emotion regulation strategies on cognitive control based on different conflicts in athletes with different traits of self-control

Cui Yiyang, Jiang Yuan (corresponding author)
School of Psychology, Beijing Sport University, Beijing, 100084, jiangyuan97@sina.cn

Abstract : In the process of daily training and competition, good cognitive control ability is the guarantee of excellent results. Emotion and emotion regulation strategies are important factors affecting the cognitive control level of athletes. Cognitive control is the basis of self-control, but few studies have explored the consistent behavioral characteristics of athletes' self-control at the personality level. In this study, the experimental method was adopted, and the experimental 1 took the Flanker task as the cognitive control index based on stimulus conflict, and used 2 (stimulus conflict: conflict, no conflict), × 2 (emotion regulation strategy: expression inhibition, cognitive reevaluation) × 2 (trait self-control: high, low) three-factor mixed experimental design, the results showed that (1) the main effect of stimulus conflict was significant, and the response with stimulus conflict was significantly longer than the response without stimulus conflict. (2) The main effect of trait self-control was significant, and the response of athletes with high trait self-control was significantly longer than that of athletes with low trait self-control. Experiment 2 uses the Simon task as the cognitive control index based on response conflict, and adopts 2 (response conflict: no conflict, conflict), × 2 (emotion regulation strategy: expression inhibition, cognitive reevaluation) × 2 (trait self-control: high and low) three-factor mixed experimental design, the

results show that (1) the main effect of response conflict is significant, and the response with response conflict is significantly longer than when there is no conflict. (1) The main effect of self-control was significant, and the response of high-trait self-control athletes was significantly longer than that of low-trait self-control athletes. (2) The interaction between response conflict and emotion regulation strategy was significant, and under conflict conditions, the response of individuals using cognitive reevaluation strategies was significantly shorter than that of individuals using expression inhibition, but there was no significant difference between the two under conflict-free conditions. (3) The interaction between response conflict and trait self-control was significant, and compared with athletes with low trait self-control, the response of high-trait self-control athletes to conflict and non-conflict conditions was greater. Conclusion: Athletes with high self-control perform worse in the process of stimulus conflict and response conflict resolution, and cognitive reassessment strategies can effectively promote the cognitive control of athletes when faced with response conflict.

Keywords: athletes, emotion regulation strategy, trait self-control，cognitive control

不同指导语类型对动作的表象学习与记忆的影响

刘心云[1] 郑玮琦[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，weiqi71@126.com

摘 要 动作学习与记忆是人类活动的基础，以往研究表明在动作学习时采取不同的指导语和记忆方法会对学习和记忆效果产生不同的影响。本研究将指导语类型与表象学习结合，使用动作姿势作为记忆材料，通过对动作姿势学习记忆效果的测试来探究不同指导语类型是否可以对动作的表象学习和记忆的效果产生不同的影响。实验采用单因素被试间设计，指导语类型为组间自变量，动作姿势的学习记忆效果为因变量，并将动作姿势自由回忆的成绩作为因变量的行为学测量指标。招募无瑜伽武术等难美类运动项目经验的普通大学生共 76 人。其中类比指导语组 26 人，外显指导语组 25 人，联合指导语组 25 人。通过表象能力问卷对三组被试的表象能力进行平衡。首先向被试呈现 15 张动作姿势图片，每张图片呈现 6s，分别给三组被试在图片上方提示外显、类比或联合指导语并要求被试在图片和指导语呈现的 6s 内通过表象学习对动作姿势进行记忆和学习。之后进行自由回忆测试，要求参与者在学习之后的 10 分钟内尽可能多和准确地重现所学习的动作姿势，测试阶段全程录像，事后由专家进行评定，记录自由回忆正确率并且对每个回忆出来的动作根据指导语的内容进行共计 5 分评分。结果表明，三组之间自由回忆正确率差异显著（$F(2, 75)=5.207$, $p=0.008$），其中联合指导语组和类比指导语组显著优于外显指导语组，而联合指导语组和类比指导语组之间无显著差异。自由回忆评分三组之间差异显著（$F(2, 75)=17.860$, $p<.001$），其中外显组和联合指导语组评分显著高于类比指导语组，而外显组和联合组之间无显著差异。综上可知，在动作的表象学习和记忆中，类比指导语可以帮助学习者在短时间内记住更多的动作，外显指导语可以帮助学习者更好地记住动作的细节，而联合指导语可以让学习者在记住更多动作的同时尽可能多的保留细节，实现最好的学习效果，在今后的研究中可以可以借助脑科学技术进一步探讨表象学习背后的机制。

关键词 动作学习与记忆，指导语类型，表象

The effects of instructions on the motor imagery learning and memory

Xinyun Liu[1], Weiqi Zheng[1] (Corresponding Author)
School of Psychology, Beijing Sport University, No. 48, Xinxi Road, Haidian District, Beijing

Abstract： Action learning and memory are the basis of human activities, and previous studies have shown that different instructions and memorization methods during action learning have different effects. In this study, the type of instruction was combined with motor imagery, and action postures were used as memory materials to investigate whether different types of instruction could have different effects on motor learning. The experiment used a one-way between-subjects design, with the type of instruction as the between-group independent variable. A total of 76 general college students with no experience in yoga martial arts and other difficult-pretty events were recruited. First, 15 pictures of the target stimulus action postures were presented to the participants, and each picture was presented for 6 s. Three groups of participants were prompted with different instructions and were asked to memorize and learn the action postures within 6s during motor imagery. Afterwards, a free recall test was conducted, in which participants were asked to reproduce as many of the learned postures as possible and as accurately as possible within 10 minutes after learning, and the test was videotaped in its entirety, and was

evaluated by an expert afterward, who recorded the percentage of correct free recalls and rated each recalled movement on a total of 5 points according to the content of the instructions. The results showed a significant difference in correct free recall scores among the three groups ($F(2, 75)=5.207$, $p=0.008$), with the joint and analogy instruction groups significantly outperforming the explicit group, and no significant difference between the joint and analogy instruction groups. Free recall scores differed significantly among the three groups ($F(2, 75) = 17.860$, $p < .001$), with the explicit and joint groups scoring significantly better than the analogy group, while there was no significant difference between the explicit and joint groups. In summary, it can be seen that, analogy instructions can help learners remember more actions in a short period of time, whereas explicit instructions can help learners remember the details of the actions better, and joint guides can help learners memorize more actions while retaining as many details as possible to achieve the best learning effect. In future research, the mechanisms behind motor imagery can be further explored with the help of brain science and technology.

虚拟现实体感运动对执行功能的影响

李春铖[1]　杨寅[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，yangyin@bsu.edu.cn

摘 要　执行功能对个体身心发展及成长有非常重要的意义。运动锻炼已经被证实可以提高个体的执行功能水平，同时有研究发现视频游戏对大学生的执行功能，尤其是抑制控制有促进作用。而体感运动结合了运动和游戏属性，其中虚拟现实技术（virtual reality）的应用更进一步加深了娱乐性和沉浸性，这有助于执行功能训练的长期保持。但在此之前，虚拟现实体感运动对执行功能的影响需要进一步探索。本研究旨在考查虚拟现实体感运动对执行功能影响的程度，并以传统单车运动为对照。方法：在正式开始对照实验之前收集了 40 名从未玩过 VR 运动游戏的参与者，VR 运动后的心率数据，确定了心率参考范围。然后选取 22 名普通大学生并将其随机分为 VR 运动组和单车运动组，单车组要求心率需要尽量保持在参考范围内。在运动前收集 go-nogo 任务、odd-shifting 任务和 2-back 任务的正确率和反应时数据作为基线，间隔一周开始正式实验，在运动结束后再次收集 3 个任务范式的数据。结果：未发现被试在 VR 运动和单车运动后的平均心率中存在差异；未发现被试在两种运动后在三项范式中正确率指标上存在差异。发现被试在三个范式的反应时中均存在时间和运动类型的交互作用，进一步简单效应分析发现，单车组和 VR 组在前测反应时上未发现存在显著差异，但后测的反应时中单车组比 VR 组的反应更快。结论：本研究发现传统有氧运动在促进执行功能上的作用好于 VR 体感游戏，这一结果提示传统有氧运动和 VR 体感游戏带来的心理效益可能各有侧重，新的运动方式并不能完全替代传统运动方式。本研究对这一结果的可能解释，以及该结果所反映的运动对执行功能的复杂效益，进行了讨论。

Effects of Virtual Reality Exercise on Executive Functioning

LI Chuncheng[1],YAN Yin[1]
1 Beijing Sport University, Beijing, 100084, yangyin@bsu.edu.cn

Abstract：　Executive function is of great importance to an individual's physical and mental development and growth. Exercise has been shown to improve executive functioning, and video games have been found to promote executive functioning, especially inhibitory control, in college students. Exergame combines the attributes of exercise and gaming, with the use of virtual reality technology (VRT) further deepening the entertainment and immersion, which contributes to the long-term retention of executive function training. However, before that, the effects of virtual reality exercise on executive function need to be further explored. This study aimed to examine the extent to which virtual reality exercise affects executive function, with traditional cycling as a control. METHODS: Heart rate data were collected from 40 participants who had never played a VR exergame before the formal start of the control experiment, and the heart rate reference range was determined after the VR exercise. Then 22 general college students were selected and randomly divided into a VR exercise group and a cycling exercise group, with the cycling group requiring that the heart rate needed to be kept within the reference range as much as possible. Correct rate and reaction time data of the go-nogo task, odd-shifting task, and 2-back task were collected as a baseline before exercise, and the formal experiment was started at a week interval, and the data of the 3 task paradigms were collected again at the end of the exercise. RESULTS: No differences were found in

subjects' mean heart rates after VR exercise and cycling; no differences were found in subjects' correct rate metrics in the three paradigms after the two types of exercise. An interaction between time and type of exercise was found for subjects' reaction times in all three paradigms, and further simple effects analyses revealed that no significant differences were found between the cycling and VR groups in the pre-test reaction times, but that the cycling group responded faster than the VR group in the post-test reaction times. CONCLUSION: The present study found that traditional aerobic exercise was better than VR exercise in promoting executive function, a result that suggests that the psychological benefits of traditional aerobic exercise and VR exercise may be focused on each other and that new exercise modalities are not a complete substitute for traditional exercise modalities. Possible explanations for this result, as well as the complex benefits of exercise on executive function as reflected in this result, are discussed in this study.

成功/失败限制性饮食者和非限制性饮食者的食物线索记忆抑制差异

高丽娟[1]　孙美荣[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，sunmeirong_870702@126.com

摘 要　限制性饮食指为了减肥或保持体重而节食的倾向，限制性饮食者(Restrained eaters, REs)的抑制控制能力相比非限制性饮食者(NREs)更差。REs 可分为成功限制性饮食者(SREs)和失败限制性饮食者(UREs)，两者在记忆抑制控制任务中有不同的行为表现和脑电活动模式。前人研究发现，记忆抑制在抑制饮食行为方面至关重要。

为探究不同类型限制性饮食者食物线索记忆抑制的差异，本研究招募了女大学生 SREs、UREs 和 NREs 各 12 名，使用思考/不思考(Think/No-Think, TNT)范式考察不同记忆条件下被试对食物线索的回忆正确率。以回忆正确率为因变量，进行 3(被试类型：SREs, UREs, NREs)×3(记忆条件：Think, No-Think, 基线)的两因素重复测量方差分析，结果表明，记忆条件主效应显著，Wilks' Lambda = 0.654，$F(2,32) = 8.464$，$p = 0.001$，$\eta_p^2 = 0.346$。被试类型主效应不显著，$F(2,33) = 1.641$，$p = 0.209$，记忆条件和被试类型交互作用不显著，Wilks' Lambda = 0.954，$F(4,64) = 0.381$，$p = 0.821$。成对比较结果显示，No-Think 条件回忆正确率显著低于 Think 条件的回忆正确率，说明主动抑制诱导了遗忘。抑制诱导遗忘(Suppression-induced forgetting, SIF)得分越高，表明记忆抑制能力越强，在被试类型的 SIF 均值图中呈现出 UREs 的得分低于 SREs 和 NREs 的趋势，UREs 的记忆抑制能力相对较弱，导致限制饮食失败。

本研究结果表明，被试的确对食物线索进行了有效的记忆抑制，这种主动抑制导致了被试的遗忘效应。抑制诱导遗忘效应可能会影响被试对食物线索的关注度，从而提高限制性饮食的成功率。然而本研究样本量较小，后续研究将增加样本量、控制情绪变量，并结合事件相关电位技术来进一步探究限制性饮食者不同亚型与记忆抑制的关系。

Differences in Memory Suppression of Food Cues among Successful/Unsuccessful Restrained Eaters and Non-restrained Eaters

Lijuan GAO[1], Meirong SUN[1]

1 School of Psychology, Beijing Sport University, Beijing, 100084

Abstract：Restrained eating refers to the tendency to diet in order to lose or maintain weight. Restrained eaters (REs) have worse inhibitory control ability than non-restrained eaters (NREs). REs can be divided into successful restrained eaters (SREs) and unsuccessful restrained eaters (UREs), which have different behavioral performances and brain electrical activity patterns in memory inhibition control tasks. Previous studies have found that memory suppression is crucial in inhibiting dietary behavior.

In order to explore the differences in memory suppression of food cues among different types of restrained eaters, this study recruited 12 female college students from SREs, UREs and NREs respectively, and used the Think/No-Think(TNT) paradigm to investigate the recall accuracy of food cues under different memory conditions. A 3 (group: SREs, UREs, NREs)×3 (condition: Think, No-think, baseline) repeated measures ANOVA on recall

accuracy was conducted, with condition as the within-subjects factor and group as the between-subjects factor. The results showed that the main effect of memory condition was significant, Wilks' Lambda = 0.654, $F(2,32) = 8.464$, $p = 0.001$, $\eta_p^2 = 0.346$, the main effect of group was not significant, $F(2,33) = 1.641$, $p = 0.209$, and the interaction between group and memory condition was not significant, Wilks' Lambda = 0.954, $F(4,64) = 0.381$, $p = 0.821$. Pairwise comparison results showed that the recall accuracy of No-Think condition was significantly lower than that of Think condition, indicating that active suppression induced forgetting. The higher the score of Suppression-induced forgetting (SIF), the stronger the memory inhibition ability. The SIF mean plots of the subject type showed a tendency that the SIF score of UREs was lower than that of SREs and NREs, and relatively weaker memory suppression in UREs, leading to failure of the restricted diet.

The results of this study showed that the subjects did have effective memory suppression of food cues, and this active suppression led to a forgetting effect in subjects. The suppression-induced forgetting effect may affect the subjects' attention to food cues, thereby increasing the success of the restrictive diet. However, the sample size of this study was small. Subsequent studies will increase the sample size, control emotional variables, and incorporate event-related potential techniques to further investigate the relationship between different subtypes of restrained eaters and memory suppression.

冲突情境下的篮球动作预期

王丹蕾[1]　栾梦恺[2]（通讯作者）

1 上海体育大学，上海，200438

2 上海体育大学心理学院，上海，200438，luanmengkai@sus.edu.cn

摘 要　研究目的：本研究旨在探究竞赛情境中情境先验信息和运动学信息对运动员动作预期的影响。前人研究发现情境先验信息的提供会增强运动员动作预期过程中额叶 theta 振荡能量，反映了认知负荷的增加。然而，前人研究仅对比了有、无情境先验信息条件下的大脑活动。实际运动中，情境先验信息和运动学信息可能存在一致或不一致的情况。额叶 theta 频段参与与冲突相关的认知过程。因此，我们推测不一致的冲突加工可能引起额叶 theta 频段能量增加，而不仅是简单增加了认知负荷。本研究以篮球动作预期为对象，探讨一致性提示和不一致性提示对动作预期和额叶 theta 频段能量的影响，揭示高水平运动员动作预期的认知加工机制和大脑活动特征。

实验方法：3（信息提示：无情境先验信息、一致情境先验信息、不一致情境先验信息）*2（运动经验：高水平运动员、新手）的实验设计。被试包括 24 名高水平篮球运动员和 24 名无球类运动经验的新手。被试需观看投篮视频后预期投篮结果。记录被试行为和脑电数据。

实验结果：行为数据分析结果显示，运动经验和信息提示的主效应显著，运动经验和信息提示间的交互作用显著，运动经验效应在不一致情境先验信息条件相比于其他信息提示条件下更小。

脑电数据分析结果显示，运动经验的主效应显著，运动员额叶 theta 振荡能量显著高于新手被试。信息提示的主效应显著。事后比较结果显示，被试额叶 theta 振荡能量在不一致情境先验条件下显著高于其他信息提示条件，而在无情境先验信息与一致情境先验信息之间无显著差异。运动经验和信息提示的交互作用显著，运动经验效应在不一致情境先验信息条件相比于其他信息提示条件下更大。

研究结论：在不一致条件下，运动员需要对冲突信息进行加工，需要投入相对更多的认知资源，动作预期表现也会相应的下降。theta 振荡能量的增强特异性地反映了对冲突情境的加工而不仅是非简单地对情境先验信息的加工。本研究进一步提高和丰富了对运动员动作预期认知加工机制和神经基础的理解。

Action Anticipation of Basketball under Conflict Situation

Danlei Wang,Mengkai Luan

Abstract：Objective: This study aims to investigate the influence of contextual prior information and kinematic information on athletes' action anticipation in competitive scenarios. Previous research has indicated that providing contextual prior information enhances frontal theta oscillatory power, reflecting increased cognitive load during action anticipation. However, previous studies only compared brain activity under conditions with and without contextual prior information. In real sports situations, there may be consistent or inconsistent information provided by contextual prior and kinematic cues. Frontal theta oscillations are involved in cognitive processes related to conflict. Therefore, we hypothesize that processing inconsistent conflicts may lead to an increase in frontal theta oscillatory power, indicating more than just an increase in cognitive load. This study focuses on basketball action anticipation to explore the effects of consistent and inconsistent cues on action anticipation and frontal theta oscillatory power, thus revealing the cognitive processing mechanisms and brain activity characteristics in high-level athletes' action anticipation.

Method: The experimental design consists of a 3 (cue condition: no contextual prior information, consistent contextual prior information, inconsistent contextual prior information) * 2 (sports expertise: high-level athletes, novices) design. The participants include 24 high-level basketball players and 24 novices with no experience in ball sports. The experiment uses self-recorded and produced videos of basketball players performing free throw actions as stimuli. Prior to the appearance of the stimuli, contextual prior information cues (words: none/short/medium/long) are presented. In conditions with contextual prior information, the information provided may be consistent or inconsistent with the action outcome indicated by the kinematic information. Participants are required to anticipate the final outcome of the free throw after observing the stimuli, and both behavioral and electroencephalogram (EEG) data are collected.

Results: The analysis of behavioral data shows significant main effects of sports expertise and cue condition. The interaction effect between sports expertise and cue condition is also significant, with the effect of sports expertise being smaller in the condition with inconsistent contextual prior information compared to other cue conditions. The analysis of EEG data indicates a significant main effect of sports expertise, with athletes displaying significantly higher frontal theta oscillatory power than novices. There is also a significant main effect of cue condition. Post-hoc comparisons reveal that participants' frontal theta oscillatory power is significantly higher in the condition with inconsistent contextual prior information compared to other cue conditions, but there is no significant difference between the conditions with no contextual prior information and consistent contextual prior information. Additionally, a significant interaction effect between sports expertise and cue condition is found, indicating that the effect of sports expertise is larger in the condition with inconsistent contextual prior information compared to other cue conditions.

Conclusion: In inconsistent conditions, athletes need to process conflicting information, requiring the allocation of relatively more cognitive resources, leading to a decline in action anticipation performance. The enhanced frontal theta oscillatory power specifically reflects the processing of conflict scenarios rather than a simple processing of contextual prior information. This study further advances our understanding of the cognitive processing mechanisms and neural basis of action anticipation in athletes.

动作识别与运动经验对假动作情景下预判表现的影响

刘艳艳[1] 任鹏飞[2] 苗秀影[1] 王经晖[1] 张鑫[1] 迟立忠[1](通讯作者)

1 北京体育大学心理学院，北京，100084，chilizh3804@163.com

2 延安大学体育学院，陕西，710000

摘 要 运动员在预测行为及其结果时面临的一个关键挑战是预判对手表达的意图是真是假。以往研究发现，无论是运动专家还是新手，均受到假动作的影响，降低预判表现。研究者分别探讨了专家和新手对假动作的识别及对假动作情景下的预判表现差异。无论是对假动作的识别还是对假动作情景下的预判表现，专家均较新手具有优势。那么对动作类型的识别是否是提高假动作情景下预判表现的原因。选取足球运动员与足球爱好者各 22 名被试。研究采用 2 (动作类型：真动作，假动作) × 2 (识别与否：识别，未识别)×2 (运动经验：运动员，爱好者)的混合实验设计。识别与否的主效应显著，$F(1, 42) = 77.244$，$p < .001$, $\eta^2_p = .648$，动作识别时预判的正确率高于未识别时预判的正确率(0.85 vs. 0.54)；动作类型的主效应显著，$F(1, 42) = 43.820$，$p < .001$, $\eta^2_p = .511$，假动作情景下预判的正确率低于真动作情景下预判的正确率(0.54 vs. 0.84)；运动经验的主效应显著，$F(1, 42) = 14.511$，$p < .001$, $\eta^2_p = .257$，专家的预判正确率高于新手(0.78 vs. 0.62)；动作类型×运动经验的交互作用显著，$F(1, 42) = 12.541$，$p = .001$, $\eta^2_p = .230$，简单效应分析显示，在假动作条件下，专家预判正确率高于新手(0.70 vs. 0.39, $p < .001$)；非假动作条件下，专家的预判正确率与新手差异不显著(0.84 vs. 0.85, $p = .865$)。结果表明，无论是假动作还是真动作，动作类型的识别有利于预判表现。专家的预判表现好于新手。

The Effects of Action Recognition and Experience on Anticipation Performance in Deception

Liu yanyan[1] Ren pengfei[2] Miao xiuying[1] Wang jignhui[1] Zhang xin[1]

Chi lizhong[1](corresponding author)

1 School of Psychology, Beijing Sprot University, Beijing, 100084, chilizh3804@163.com

2 School of Psysical, Yan an University, Shang xi, 710000

Abstract：A key challenge for performers when anticipating actions and their outcomes is to judge whether the intent conveyed by their opponent is genuine or deception. Previous research has found that both expert and novice are affected by deception that interfere with anticipation performance. The researchers explored the differences between experts and novices in their recognition of deception and their anticipation performance in deception scenarios, respectively. Experts had an advantage over novices in both the recognition of deception movements and the performance of anticipation. So is the recognition of movement types responsible for improving the performance of anticipation in deception. Twenty-two subjects each of soccer players and soccer enthusiasts were selected. The study used a mixed experimental design of 2 (action type:genuine, deception) × 2 (recognition: recognition, non-recognition) × 2 (sport experience: athlete, enthusiast). There was a significant main effect of recognition vs. non-recognition, $F(1, 42) = 77.244$, $p < .001$, $\eta^2_p = .648$, and the accurate of anticipation was higher in the recognition than in the non-recognition (0.85 vs. 0.54). There was a significant main effect of action type, $F(1, 42) = 43.820$, $p < .001$, $\eta^2_p = .511$, and the accurate of anticipation was lower in the deception than in the genuine (0.54 vs. 0.84). The main effect of experience was significant, $F(1, 42) = 14.511$, $p < .001$, $\eta^2_p = .257$,

with experts having a higher accurate of anticipation than novices (0.78 vs. 0.62). The interaction of action type × sport experience was significant, F (1, 42) = 12.541 , p = .001, η^2_p = .230. The simple effects analyses revealed that experts had higher accurate of anticipation than novices (0.70 vs. 0.39, p < .001). The accurate of anticipation between experts and novices was not significant (0.84 vs. 0.85, p = .865). The results suggest that the recognition of action type facilitates anticipation performance in both genuine and deception. Experts had better anticipation performance than novices.

Keywords： motion recognition, deception, anticipation, soccer

自主性身体活动对于高中生久坐行为的影响——心理弹性的中介作用

刘明阳[1] 薛欣[1] 刘元国[2]（通讯作者）

1 沈阳体育学院，沈阳，110102

2 沈阳体育学院，沈阳，110102，zhenguo1717@sina.com

摘 要 自主性身体活动是指群体主动地由骨骼肌收缩引起的能量消耗，分为组织性与非组织性。非组织性身体活动（AP）更为强调是参与活动的动机源于自身动机，相对于组织性身体活动，非组织性对于青少年的后续发展作用更高。然而，目前有关自主性身体活动的实证研究较少，针对青少年身体和心理健康问题指导性不强。有研究表明：高中生因学习压力较大，导致久坐行为较为严重。本研究将基于心理弹性的中介作用，用于探究心理弹性对久坐行为的改善作用。研究方法：对沈阳市 3 所高中的高中生进行调查，通过问卷测量自身的自主性身体活动水平、心理弹性及久坐行为情况，回收 556 份有效问卷，随后运用 SPSS 26 与 AMOS 24.0 进行方差分析、相关分析、回归分析及中介效应检验($P < 0.01$)，构建以自主性身体活动、久坐行为以及心理弹性为基础的纵向中介模型，结果显示模型拟合良好。得到如下结论：（1）高中生久坐时间均大于 9.5h（2）自主性身体活动对于久坐行为呈显著负相关($r = -0.490$, $p < 0.01$)；心理弹性与自主性身体活动呈显著正相关($r = 0.271$, $p < 0.01$)；心理弹性与久坐行为呈显著负相关($r = -0.253$, $p < 0.01$)（3）自主性身体活动可以正向预测心理弹性；自主性身体活动可以负向预测高中生的久坐行为；心理弹性可以负向预测高中生久坐行为；心理弹性在自主性身体活动和高中生久坐行为之间其部分中介作用，中介效应占总效应 18.5%。研究结果显示心理弹性可以通过增强高中生参与自主性身体活动的频率从而缓解久坐问题，从而保障高中生心理健康和生理健康。本研究通过探索三者之间的作用机制以及验证心理弹性的中介作用，为提高青少年体质健康发展以及后续研究提供实证参考。

关键词 自主性身体活动，久坐行为，心理弹性，高中生

The Effect of Voluntary Physical Activity on Sedentary Behavior of High School Students: The Mediating Role of Psychological Resilience

Mingyang Liu[1] Xin Xue[1] Yuanguo Liu[2]

Shenyang Institute of Physical Education,Shenyang,**110102**

Shenyang Institute of Physical Education,Shenyang,110102,zhenguo1717@sina.com

***Abstract*：** Voluntary physical activity refers to the energy expenditure caused by the contraction of skeletal muscles in the group, which is divided into organizational and non-organized. Non-organized physical activity (AP) emphasizes that the motivation to participate in activities stems from self-motivation, and non-organizational activity has a higher effect on the subsequent development of adolescents than organizational physical activity. However, there are few empirical studies on voluntary physical activity, and there is little guidance for adolescents' physical and mental health problems. Studies have shown that high school students have more serious sedentary behavior due to greater study pressure. This study will explore the effect of resilience on sedentary behavior based on the mediating role of psychological resilience. Research Methods: A survey of high school students in three high schools in Shenyang was conducted to measure their autonomous physical activity level, psychological resilience and sedentary behavior through questionnaires, and 556 valid questionnaires were collected, and then SPSS 26 and AMOS were used to analyze variance, correlation analysis, regression analysis and mediation effect test ($P < 0.01$), and a longitudinal mediation model based on voluntary physical activity, sedentary behavior and psychological resilience was constructed, and the results showed that the model fit well. The following conclusions were obtained: (1) the sedentary time of high school students was greater than 9.5 h, and (2) voluntary physical activity was significantly negatively correlated with sedentary behavior ($r = -0.490$, $p < 0.01$); Mental resilience was positively correlated with voluntary physical activity ($r = 0.271$, $p < 0.01$). Psychological resilience was significantly negatively correlated with sedentary behavior ($r = -0.253$, $p < 0.01$) (3) Voluntary physical activity can positively predict psychological resilience. Voluntary physical activity can negatively predict sedentary behavior in high school students; Psychological resilience can negatively predict sedentary behavior in high school students; Psychological resilience played a partial mediating role between voluntary physical activity and sedentary behavior of high school students, and the mediating effect accounted for 18.5% of the total effect. The results showed that resilience could alleviate sedentary problems by increasing the frequency with which high school students participated in autonomous physical activity, thereby safeguarding the mental and physical health of high school students. By exploring the mechanism of action between the three and verifying the mediating role of psychological resilience, this study provides an empirical reference for improving the healthy development of adolescents' physical fitness and subsequent research.

邱晨（通讯作者）E-mail：cqiu@scu.edu.cn

摘 要 目的：多项研究表明，运动与睡眠质量密切相关，运动过少可能导致睡眠质量下降，从而影响高校学生的日常学习生活。然而，运动与睡眠质量关系中的心理机制尚不清楚。因此，本研究以多所高校不同专业学生为研究对象，问卷调查其运动情况、睡眠状况，以及焦虑抑郁水平，来探讨精神心理因素与运动、睡眠的关系，为有效预防和减轻高校学生焦虑抑郁，提高其睡眠质量提供参考依据。方法：本研究使用日常运动评估量表、匹兹堡睡眠质量指数量表(PSQI) 、抑郁量表(SDS) 和焦虑量表(SAS) 对多所高校各专业学生进行问卷调查。采用 SPSS 和 AMOS 统计软件和 Bootstarp 技术进行数据分析和模型验证，建立信效度良好的平行中介模型。结果：共 3324 名高校学生参与调查，回收有效问卷 3041 份。（1）轻度及以上焦虑、抑郁检出率分别为 292 例（9.60%）、614 例（20.19%），睡眠障碍检出率 305 例（10.03%）。（2）一周内有效运动次数与睡眠障碍（β=-0.125，p<0,05）、焦虑(β=-0.246，p<0.001)、抑郁(β=-0.307,p<0.001)均呈现负相关。睡眠障碍与焦虑（β=0.265，p<0.001）、抑郁（β=0.02，p<0.001）呈显著正相关。（3）大学生可以通过增加每周的有效运动次数对睡眠质量起到改善作用。（4）平行中介分析结果显示焦虑（95%Cl：[-0.018--0.112]）和抑郁(95%Cl:[-0.0—0.02])在近一周有效运动次数对睡眠质量影响中其完全中介作用，故良好的精神心理状态可以有效促进运动对睡眠的积极影响。结论：对于高校的大学生，运动是睡眠质量的保护因素，焦虑与抑郁状态在运动对睡眠质量的影响中起平行中介作用。通过提高每周有效运动次数，可以有效缓解焦虑抑郁，也能进一步改善睡眠质量。

1 West China College of Clinical Medicine, Sichuan University(West China Hospital), Sichuan, 610041
2 West China College of Nursing, Sichuan University, Chengdu, 610041
Chen Qiu* E-mail：cqiu@scu.edu.cn

***Abstract*： Objective**: Several studies have shown that exercise is highly related to sleep quality, and lack of exercise may lead to poor sleep quality, which affect the daily academic life among college students. However, the psychological mechanisms in the relationship between exercise and sleep quality remain unclear. Therefore, the current study used questionnaire to investigate colleges students' exercise, sleep, anxeity and depression status, to analyses the role of psychological factors on the relation between exercise and sleep, to provide evidence on preventing colleges students' anxiety and depression, as well as improving their sleep quality. **Methods:** This study used the Daily Exercise Assessment Scale, the Pittsburgh Sleep Quality Index (PSQI), the Depression Scale (SDS) and the Anxiety Scale (SAS) to investigate college students from various majors. SPSS and AMOS statistical software and Bootstarp technology were used for data analysis, and a parallel mediation model with good

reliability and validity was established . **Results:** A total of 3324 college students participated in the current study, and 3041 valid questionnaires were recovered. (1) The detection rates of mild and above anxiety and depression were 292 cases (9.60%) and 614 cases (20.19%) respectively, and the detection rate of sleep disorder was 305 cases (10.03%). (2) The number of effective exercises in a week showed a significant negative correlation with sleep disorder (β=-0.125, p<0,05), anxiety (β=-0.246, p<0.001) and depression (β=-0.307,p<0.001). Sleep disorders showed a significant positive correlation with anxiety (β=0.265, p<0.001) and depression (β=0.02, p<0.001). (3) Increasing the number of effective exercise sessions per week was shown to be a effective way to improve sleep quality for college students. (4) The results of parallel mediation analysis showed that anxiety (95% Cl: [-0.018-0.112]) and depression (95% Cl: [-0.0-0.02]) fully mediated the relation from the number of effective exercise sessions per week to the quality of sleep, so that a good mental state can effectively promote the positive effects of exercise on sleep. **Conclusion**: For college students, exercise is a protective factor for sleep quality, and anxiety and depression status play parallel mediating roles in the effects of exercise on sleep quality. By increasing the number of effective exercise sessions per week, anxiety and depression can be effectively alleviated, and sleep quality can also be further improved.

高校体育教师领导行为对学生锻炼行为影响—运动友谊质量的中介作用

薛欣[1] 刘明阳[1] 刘元国[2]（通讯作者）

1 沈阳体育学院，沈阳，110102

2 沈阳体育学院，沈阳，110102，zhenguo1717@sina.com

摘 要 **研究目的：**近年来，大学生体质逐年下降，尽管国家陆续出台相关政策，但下降的趋势并没有得到缓解。体育锻炼是提高体质学生的必然要求，而体育教师的领导行为是提高学生的体育锻炼行为的重要因素之一。高校体育教师是促进学生体质健康的指导者，体育教师的语言行为对学生锻炼造成巨大的影响，其领导行为是在课堂上与学生互动所表现出来的。运动友谊质量是在运动情景中一类独特的交往状态，前人研究表明，学生自己选择是否参加体育锻炼与比赛，参加过程中确立的友谊是学生坚持体育锻炼的原因。因此，本研究力求高校体育教师领导行为对学生锻炼行为的影响，以及运动友谊质量的中介作用，进而有效的带动和促进学生积极参加体育锻炼，养成终身体育锻炼的习惯，为我国体育事业添砖加瓦。**研究方法：**本文运用文献资料法、问卷调查法及数理统计法为主要研究方法。选择 476 名在校大学生为调查对象，向调查对象发放体育教师领导行为调查问卷、学生体育锻炼量表、青年运动友谊质量量表并回收，回收有效问卷 447 份，问卷回收有效率 93.90%，运用 SPSS26.0 与 AMOS24.0 进行方差分析、相关分析、回归分析及中介效应检验($P<0.01$)，各量表信效度良好。**研究结果：**1.高校体育教师领导行为对学生锻炼行为、高校体育领导行为运动友谊质量、运动友谊质量对学生锻炼行为两两变量间具有显著相关性。2.高校体育教师领导行为能够正向预测学生锻炼行为($r = 0.372, p < 0.01$)，学生体育锻炼行为能够正向预测运动友谊质量($r = 0.296, p < 0.01$)，运动友谊质量能够正向预测体育锻炼行为($r = 0.278, p < 0.01$)。3.运动友谊质量对高校体育教师领导行为和学生锻炼行为占中介总效应的 17%。**研究结论：**高校体育教师领导行为对学生锻炼行为起到正向影响作用，且运动友谊质量在高校体育教师领导行为对学生锻炼行为起到中介作用。本研究通过探索三者之间的关系，为提高学生体质健康发展以及后续研究提供实证参考。

The influence of college physical education teachers' leadership behavior on students' exercise behavior—the mediating role of sports friendship quality

Xin Xue[1] Mingyang Liu[1] Yuanguo Liu[2]

Shenyang Sport University, No.36 jinqiansong east road, sujiatun district, Shenyang

***Abstract*:** In recent years, the physical fitness of college students has declined year by year, and although the state has successively introduced relevant policies, the downward trend has not been alleviated. Physical exercise is an inevitable requirement for improving physical fitness students, and the leadership behavior of physical education teachers is one of the important factors to improve students' physical exercise behavior. College physical education teachers are the instructors to promote students' physical health, and the language behavior of physical education teachers has a huge impact on students' exercise, and their leadership behavior is expressed in the interaction with students in the classroom. The quality of sports friendship is a unique type of communication state in sports situations, and previous studies have shown that students choose whether to participate in physical exercise and competitions, and the friendship established in the process of participation is the reason why students insist on physical exercise. Therefore, this study seeks to focus on the influence of the leadership behavior of college physical education teachers on students' exercise behavior, as well as the mediating role of sports friendship quality, so as to effectively drive and promote students to actively participate in physical exercise, develop the habit of lifelong physical exercise, and contribute to China's sports cause. Research Methods: This paper uses literature

method, questionnaire survey method and mathematical statistics method as the main research methods. A total of 476 college students were selected as the survey subjects, and the physical education teacher leadership behavior questionnaire, student physical exercise scale, youth sports friendship quality scale were distributed to the survey subjects and collected, 447 valid questionnaires were collected, and the questionnaire recovery efficiency was 93.90%, and SPSS26.0 and AMOS24.0 were used for ANOVA, correlation analysis, regression analysis and mediation effect test ($P < 0.01$), the reliability and validity of each scale is good. The results showed that: 1. There was a significant correlation between the leadership behavior of college physical education teachers on students' exercise behavior, the sports leadership behavior of college sports leadership behavior, the quality of sports friendship, and the quality of sports friendship on students' exercise behavior. 2. The leadership behavior of college physical education teachers can positively predict students' exercise behavior ($r = 0.372$, $p < 0.01$), students' physical exercise behavior can positively predict the quality of sports friendship ($r = 0.296$, $p < 0.01$), and the quality of sports friendship can positively predict physical exercise behavior ($r = 0.278$, $p < 0.01$). 3. The quality of sports friendship accounted for 17% of the total mediating effect on the leadership behavior of college physical education teachers and students' exercise behavior. The study concluded that the leadership behavior of college physical education teachers has a positive influence on students' exercise behavior, and the quality of sports friendship plays a mediating role in the leadership behavior of college physical education teachers on students' exercise behavior. By exploring the relationship between the three, this study provides an empirical reference for improving students' physical health development and subsequent research..

促进身体活动和锻炼行为的心理因素研究进展（2020-2023）

张仲昊[1]　王俞卜[1]　郭璐[2]（通讯作者）
1 北京体育大学心理学系，北京，100084
2 北京体育大学心理学系，北京，100084，guolu2000@163.com

摘 要　促进身体活动/锻炼对改善人们的身心健康至关重要。为梳理总结近几年促进身体活动/锻炼行为心理因素的研究，本文通过主题词在中国知网和 Web of Science 数据库中检索了近三年的有关实证研究，筛选出 2546 篇符合主题词的国外学者研究和 193 篇国内学者研究（中文文献 80 篇、英文文献 113 篇）。结果表明，第一，国外 10%的研究基于理论模型，基于社会认知理论和维持理论的研究数量逐渐减少，基于人本主义理论的研究占据主流。目前没有单一、最佳的理论模型来预测身体活动/锻炼的动机或行为的改变，研究者逐渐认识到身体活动/锻炼行为不仅是出于认知决策，因此未来要加强对注重情感过程的双过程理论的验证。相比之下，国内研究将弥补身体活动/锻炼意向和行为之间的鸿沟作为共识，更注重沿着成熟理论积累证据(例如计划行为理论和自我决定理论)，有 18%的研究基于成熟的理论模型，这使该领域预测身体活动/锻炼的水平较稳定。第二，注重探讨针对不同群体的身体活动/锻炼促进因素，国外 34%的研究针对儿童青少年，39%的研究针对临床患者，18%的研究针对老年人，29%的研究针对成年人，国内研究也有相似的趋势，但国外学者更重视细分不同群体，针对人群特点进行研究，例如幼儿的父母，少数族裔等。第三，国内研究者更重视个人因素（48%）对身体活动/锻炼的促进作用，例如信念和动机，而国外研究者更重视环境因素（34%）对身体活动/锻炼的促进作用，例如设施，天气等。第四，从久坐行为的角度理解身体活动/锻炼促进因素的研究仍需加强，国外有 17%的研究关注了久坐行为，国内则更少，仅 8%的研究关注了久坐行为。影响人们是否参加身体活动/锻炼的心理因素复杂多样，未来研究应该拓展理论模型外的心理因素，例如运动障碍感知和同伴示范行为；注意在行为近端而不是远端增加心理因素；深入探讨针对身体活动/锻炼行为，而非所有行为的心理因素；进一步增强对促进身体活动/锻炼的情感系统的研究；重视使用加速度计等客观评定工具测量身体活动/锻炼。

关键词　身体活动，锻炼行为促进，动机，双过程理论

A review of psychological factors promoting exercise and physical activity: Progress and prospects from 2020 to 2023

Zhonghao Zhang　Yubu Wang　Lu Guo
Beijing Sport University, Beijing, 100084

Abstract：Physical activity/exercise is very important for physical and mental health. To sort out the research on psychological factors that promote physical activity/exercise behavior in recent years, our study used subject words to search the relevant empirical research in China National Knowledge Infrastructure and Web of Science databases from 2020 to 2023. A total of 2546 foreign scholars' studies and 193 China scholars' studies (80 in Chinese and 113 in English) were screened out. The results show that, firstly, ten percent of foreign studies are based on theories or models. Among them, the number of studies based on social cognitive theory and maintenance theory is gradually decreasing, and the researches based on humanistic theory are the mainstream. At

present, there is no single and the best theoretical model to predict the change of motivation or behavior of physical activity/exercise. Researchers gradually realize that physical activity/exercise is not only caused by cognitive decision-making, but also by affective process. Therefore, it is necessary to strengthen the research on the dual-process theory in the future. In contrast, domestic researches pay more attention to accumulating evidence based on mature theories, such as theory of planned behavior and self-determination theory. Eighteen percent of these studies are based on mature theoretical models, which makes the level of predicting physical activity/exercise in this field more stable. Secondly, there are many studies focusing on the factors that promote physical activity/exercise for different groups. In foreign countries, Thirty-four percent of these studies are aimed at children and adolescents, Thirty-nine percent at clinical patients, eighteen percent at the elderly, and Twenty-nine percent at adults. There is a similar trend in domestic researches. But foreign scholars pay more attention to subdividing different groups, such as new parents and ethnic minorities. Thirdly, domestic researchers pay more attention to the promotion of personal factors (48%) on physical activity/exercise, such as belief and motivation, while foreign researchers pay more attention to the promotion of environmental factors (34%) on physical activity/exercise, such as built environment and weather. Fourthly, it is necessary to emphasize sedentary behavior to understand the physical activity/exercise promotion factors from the perspective of sedentary behavior. Seventeen percent of foreign studies pay attention to sedentary behavior, while there are even fewer in China, with only eight percent paying attention to sedentary behavior. The psychological factors that affect whether people participate in physical activities/exercises are complex and diverse. Future research should pay attention to the following points: (1) Future studies should expand the psychological factors that are not included in the theoretical model. (2) Researchers should increase psychological factors at the near end of behavior rather than at the far end. (3) Investigators should specially discuss the psychological factors for physical activity/exercise behavior rather than all behaviors. (4) Researchers should strengthen the affective system to promote physical activity/exercise. (5) Investigators should use objective tools such as accelerometers to measure physical activity/exercise.

不同运动专项大学生视觉工作记忆的差异比较---一项 ERP 研究

余力[1]

1 武昌工学院，武汉，430007,1345504830@qq.com

摘 要　视觉系统作为“心灵的窗户”,对人们感知外部信息,了解客观世界起到了不可或缺的作用，然而人脑无法一次性加工海量的信息,需要视觉工作记忆暂时的存储和操纵环境中的视觉信息,让大脑对外界离散动态、变幻莫测的视觉刺激形成统一、清晰的认识。以往学者认为视觉工作记忆存储容量有限,且其编码和加工为单一过程。近年来学者提出了“视知觉与视觉工作记忆交互模型”,打破了将视觉工作记忆作为视知觉后续阶段的传统认知,认为视知觉和视觉工作记忆动态交互,在线完成客体信息表征,视知觉的表征可以并行进入到视觉工作记忆中。运动领域研究表明,长期的运动经验可以提高视知觉的表现,也有研究证明运动经验可以提高视觉工作记忆表现,但运动经验类别以及其原因并不明晰。本研究基于前人研究采用时空相关理论设计的两种知觉材料,使用变化察觉范式,结合 ERP 技术进行了 3(从事开放性运动专项大学生、从事闭锁性运动专项大学生、普通大学生)×2(有知觉组织、无知觉组织)的混合实验设计。得到了如下结果:1.行为学结果上知觉组织类别和运动专项类别的交互作用显著,篮球组和高尔夫组在有知觉组织的条件下视觉工作记忆的正确率显著高于无知觉组织的条件,而普通大学生在有无知觉组织条件上无显著差异。2.脑电结果上运动专项类别在后顶叶 P7 电极点的 P1、N1 潜伏期差异显著,篮球组的潜伏期大于高尔夫组与普通大学生组;运动专项类别与知觉组织的交互作用在枕颞叶 PO8 电极点 P1 成分的潜伏期上差异显著,篮球组在有知觉组织的条件下潜伏期小于无知觉组织条件;知觉组织在 O2、PO8、P8 电极点 N1 的波峰上差异显著,有知觉组织的波峰显著小于无知觉组织的波峰。

Comparison of Visual Working Memory of College Students with Different Sports Specialities: An ERP Study

Yu Li

Wuchang Institute of Technology, Wuhan

Abstract：As the "window of the soul", the visual system plays an indispensable role in people's perception of external information and understanding of the objective world. At least 80%-90% of information is input to the brain from the visual system every day.However, the human brain cannot process massive information at one time, which requires the visual working memory to temporarily store and manipulate the visual information in the environment, so that the human brain can form a unified and clear understanding of the external discrete, dynamic and unpredictable visual stimuli.Visual working memory is the basis of higher cognition, but its storage capacity is

limited, which requires it to effectively encode and process visual information in the environment.In recent years, scholars have put forward the "visual perception and visual working memory interaction model", broke the traditional cognition that visual working memory is the later stage of visual perception, think there have a dynamic interaction that visual perception and visual working memory object information process online, so the characterization of visual perception can be parallel to the visual working memory.Sports field studies have shown that long-term experience in sports can promote the performance of visual perception, there are also some studies have shown that exercise can improve visual working memory performance, so this study wanted to base the visual working memory and visual perception interactive model to explore the difference that sport category effects on visual working memory, special college students more engaged in open movement and atresia type sports special visual working memory of the differences between college students, enrich the cognitive studies of sport-specific skills, but also provides new thought of exercise for visual cognitive aging.

In this study, we used two perceptual materials designed by predecessors based on spatial-temporal correlation theory, adopted change detection paradigm and combined with ERP technology to carry out a mixed experimental design of 3 (college students engaged in open sports, college students engaged in locked-in sports, and ordinary college students) ×2 (perceptual organization, non-perceptual organization).The results are as follows:

1. The interaction between perceptual organization category and sport-specific category was significant in behavioral result. The accuracy of visual working memory in the basketball group and the golf group was significantly higher in the perceptual organization condition than in the non-perceptual organization condition, while there was no significant difference in the non-perceptual organization condition among ordinary college students.

2. As for the EEG results, there were significant differences in the P1 and N1 latency of the P7 electrode point in the posterior parietal lobe of the sports category, and the latency of the basketball group was longer than that of the golf group and the ordinary college students group. In the occipitotemporal lobe PO8 electrode point, there was a significant difference in P1, because the interaction of sports category and perceptual organization. The latency of basketball group in the perceptual organized condition was smaller than in that no perceptual organized condition.The difference of perceived tissue on the peak of O2, PO8 and P8 electrode point N1 was significant, and the peak of perceptive tissue was significantly smaller than that of non-perceptive tissue.

运用催眠技术对青少年运动员心理健康的干预 —— 一项个案研究

班亚东[1] *张丹[2]
1 四川体育职业学院，成都，610043
2 四川省体育科学研究所，四川省反兴奋剂中心，成都，610000，178750231@qq.com

摘 要 “青少年运动员”群体是当今社会中较少关注的，却具代表性的一类特殊群体，他们大多在儿童时期选拔进入专业运动队，开启职业运动员生涯，离开原生家庭开始集体生活和职业竞争，承受了举国体质下竞技体育为国争光的责任与压力，运动员群体心理健康问题日益凸显。诸多临床研究和案例报告显示,催眠可以应用于治疗儿童青少年的焦虑、行为障碍、疼痛以及其他适应症。本研究以探讨催眠对青少年运动员心理健康的干预效果为主要目的，采用个案研究法来评估干预效果，选取四川省羽毛球队青少年组女性运动员 1 名，年龄 14 岁，专业受训 5 年。采用共计 8 周，每周 2 次进行约 45 分钟的身体扫描催眠干预。研究结论：干预后 1 周，运动员进行自我评估，认为自己在训练中注意力有了明显的提高，在与队友的人际关系方面有了明显的提升，失眠、肠胃胀气明显缓解；教练员评估，运动员在表达沟通方面更加大胆，训练有效时间增长；咨询师评估，运动员在控制情绪、焦虑等方面有提升，纠正了过往在训练、集体生活中的不良行为模式，改善了与队友之间的关系，现实检验能力增强。运用催眠技术，可以改善青少年运动员在注意力、人际关系、不良行为和身心症状等方面的问题，帮助青少年运动员对自身和他人有了更客观、深刻的认知，人格进一步得到完善。

The application of hypnosis technology to the mental health intervention of young athletes: a case study

Ban yadong[1] *Zhang Dan[2]
1 Sichuan Sports college, Chengdu, 610043
2 Sichuan Research Institute Of Sports Science, Sichuan Anti-doping Agency, Chengdu, 610000，
178750231@qq.com

Abstract："Young athletes" are a special group that is less concerned in modern society, but they are representative. Most of them are selected into professional sports teams when they are children, start their career as professional athletes, leave their native families to start collective life and professional competition, and bear the responsibility and pressure of competitive sports to win honor for the country under the national constitution. The mental health problems of athletes have become increasingly prominent. Many clinical studies and case reports have shown that hypnosis can be used to treat anxiety, behavioral disorders, pain, and other indications in children and adolescents. The purpose of this study is to explore the intervention effect of hypnosis on the mental health of young athletes. The case study method was used to evaluate the intervention effect. A 14-year-old female athlete from the adolescent group of Sichuan Provincial badminton team was selected, who had been trained professionally for 5 years. The body scan hypnosis

intervention was conducted for about 45 minutes twice weekly for 8 weeks.Conclusions: One week after the intervention, the athletes self-evaluated that they had significantly improved their attention during training, had significantly improved their interpersonal relationship with teammates, and had significantly relieved insomnia and flatulation. The coaches evaluated that the athletes were bolder in expression and communication, and the effective training time increased. Counselors evaluated that athletes had improved emotional control and anxiety, corrected past bad behavior patterns in training and group life, improved relationships with teammates, and enhanced reality checking ability. The application of hypnosis technology can improve the attention, interpersonal relationship, bad behavior and psychosomatic symptoms of young athletes, help young athletes to have a more objective and profound cognition of themselves and others, and further improve their personality.

摘 要　时限性自我调节理论(Temporal Self-regulation Theory, TST)指出，在“意图-行为”模型基础上，行为优势和自我调节能力调节“意图-行为”联系的强度或直接影响行为。行为优势是人类做出某种优先于其他行为的反应，如个体过去的锻炼习惯；自我调节通常包含三个主要因素：标准、监控和操作，而自我控制是自我调节中的操作部分。近年来，研究者认为自我控制同时包含抑制性自我控制(inhibitory self-control)和启动性自我控制(initiatory self-control)，前者强调抑制冲动而不被短期利益所诱惑，后者强调人们要为实现长远目标而积极主动地执行控制行为。本研究旨在检验锻炼习惯和自我控制是否在体育锻炼的意向-行为鸿沟中起到调节作用，且重点探讨究竟是哪种自我控制影响人们参与体育锻炼。采用自编的人口统计学调查问卷、锻炼态度量表的行为意向和行为习惯分量表、多维自我控制量表(MSCS)以及体育活动等级量表(PARS-3)对成年人群进行施测，回收有效问卷 657 份(M_{age} = 26, SD = 9.27; 男性 187 人, 女性 470 人)。运用 SPSS 26.0 软件的 PROCESS 插件进行中心化的调节效应分析。结果发现，在控制性别、年龄、BMI 等人口统计学变量后，锻炼意向显著正向预测锻炼行为，且锻炼习惯、自我控制在锻炼意向与锻炼行为之间的调节效应存在；分别对启动性自我控制和抑制性自我控制进行检验发现，只有启动性自我控制显著调节锻炼意向和锻炼行为之间的关系。进一步简单斜率检验发现，无论锻炼习惯和启动性自我控制高于或低于平均水平，锻炼意向均显著正向预测锻炼行为；但当锻炼习惯和启动性自我控制处于较低水平时，锻炼意向对锻炼行为的正向预测作用相对减弱。研究结果表明，锻炼意向是锻炼行为重要的预测因素，体育锻炼作为一种短期可能不那么具有吸引力但长期有积极结果的行为，需要个体更多的主动发起行为并长期坚持形成锻炼习惯，而不仅仅是抑制其他诱惑或冲动，提示进行针对性的自我控制干预的重要性。

The intention-behavior gap in physical exercise: the moderating role of exercise habits and initiatory self-control

XIAO Minglan, YANG Yin
School of Psychology, Beijing Sport University, Beijing, 100084

***Abstract*：** According to Temporal Self-regulation Theory (TST), based on the intention-behavior model, behavioral dominance and self-regulation ability regulate the intensity of the intention-behavior connection or directly affect behavior. The behavioral dominance is a human response that takes precedence over other behaviors, such as an individual's past exercise habits. Self-regulation usually consists of three main elements: standards, monitoring and operation, and self-control is the operational part of self-regulation. In recent years, researchers believe that self-control includes both inhibitory self-control and initiatory self-control. The former emphasizes the need to restrain impulses and not be tempted by short-term interests, while the latter emphasizes the need to actively perform control behaviors to achieve long-term goals. The purpose of this study is to examine whether exercise habits and self-control play a moderating role in the intention-behavior gap of physical exercise, and to

explore what kind of self-control influences people's participation in physical exercise. Self-designed demographic questionnaire, behavioral intention and behavior habit subscale of Exercise attitude Scale, Multidimensional Self-control Scale (MSCS) and Physical activity rating Scale (PARS-3) were used to test the adult population. 657 valid questionnaires were collected (M_{age} = 26, SD = 9.27; 187 men and 470 women). The PROCESS of SPSS 26.0 software was used to analyze the moderating effect of centralization. The results showed that after controlling for gender, age, BMI and other demographic variables, exercise intention significantly positively predicted exercise behavior, and exercise habits and self-control had a moderating effect between exercise intention and exercise behavior. It was found that only the initiatory self-control significantly regulated the relationship between exercise intention and exercise behavior. A simple slope test showed that exercise intention positively predicted exercise behavior regardless of whether exercise habits and initiatory self-control were above or below the average level. However, when exercise habits and initiatory self-control are at a low level, the positive predictive effect of exercise intention on exercise behavior is relatively weakened. The results show that exercise intention is an important predictor of exercise behavior. Physical exercise, as a behavior that may not be attractive in the short term but has positive results in the long term, requires individuals to initiate more active behaviors and adhere to the formation of exercise habits in the long term, rather than just resisting other temptations or impulses. This study suggests the importance of targeted self-control interventions.

Keywords：intention-behavior gap, habit, initiatory self-control, temporal self-regulation theory

动作倾向与判断效用对运动预判的影响

王君瑜[1] 任鹏飞[2] 迟立忠[1]（通讯作者）
1 北京体育大学心理学院，北京，100084
2 延安大学体育学院，陕西，716000
1 北京体育大学心理学院，北京，100084，chilizh3804@163.com

摘 要 运动预判是指运动员在过去经验的基础上形成的对对手动作、比赛趋势、比赛结果等的预测，是通过对运动情境中信息的有效加工产生的。前人研究多集中在真动作条件下非运动学信息（如动作倾向）与运动预判之间的关系，但鲜有研究者考虑假动作条件下两者的关系，及判断效用在其中的调节作用。本研究拟以足球运球方向判断任务为载体，探究动作倾向对足球运动员运动预判的影响，以及判断效用在其中的调节作用。该研究可帮助运动员、教练员和运动领域心理学工作者更深入地了解运动预判过程中的信息动态加工，从而更有效地开展运动预判训练。本研究共招募 72 名参与者人，并将其随机分配到有动作诱发组和无动作诱发组。两组被试均先采用“学习-反馈”方式进行动作诱发。诱发组的比例为 80/20，即在诱发任务中更大比例偏向左侧；无诱发组的比例为 50/50，即诱发任务中左右倾向各为 50/50，左右并无方向偏差。随后，两组均进行高低判断效用诱发。判断效用采用结合足球比赛实际的图片进行诱发。低判断效用条件下，左右两侧无显著差异，高判断效用条件下对个体右侧的错误反应给予更高的惩罚。最后进行正式实验，每组被试都要完成一致性条件 80/20、中性条件 50/50 以及真假动作的全部实验任务。以动作倾向诱发（有、无)、一致性条件（一致、中性)、动作类型（真、假)和判断效用（高、低)为自变量，将判断的左侧反应比例作为因变量，进行重复测量方差分析。研究发现判断效用、一致性和动作类型三者之间存在显著交互作用($F(1,70) = 30.853, p < .001, \eta^2_p = .306$)。进一步简单效应分析表明，在高判断效用时，呈现真动作视频后，一致性条件下的左侧反应比率高于中性条件；呈现假动作视频后，一致性条件下的左侧反应比例高于中性条件；而低判断效用时，呈现真动作视频后，一致性条件的左侧反应比率高于中性条件；呈现假动作视频后，一致性条件下的左侧反应比例低于中性条件。本研究发现，运动员可同时依据运动学信息和非运动学信息（情景先验）进行动作预判，且优先处理可靠性更高的信息；在两类信息的利用方式上符合贝叶斯统计模型；判断效用会影响运动学信息和非运动学信息的整合，但信息整合方式尚需进一步探讨。

关键词 运动预判，动作倾向，判断效用，假动作，贝叶斯模型

The influence of action preference and judgment utility on anticipation

***Abstract*：** Sports anticipation refers to the prediction that athletes make based on past experiences regarding their opponents' movements, game tendencies, and game outcomes. It is generated through effective processing of information in sports contexts. Previous studies have mainly focused on the relationship between non-kinematic information (such as action tendencies) and sports anticipation under real-action conditions, while there is little research considering the relationship between the two under fake-action conditions, as well as the moderating role of judgment utility. This study aims to investigate the influence of action tendencies on sports anticipation among soccer players, as well as the moderating effect of judgment utility. This research can help athletes, coaches, and sports psychologists gain a deeper understanding of the dynamic processing of information in the process of sports anticipation and thus conduct more effective sports anticipation training. A total of 72 participants will be recruited for this study and randomly assigned to the action-induced group and the non-action-induced group. Both groups will undergo action induction through a "learning-feedback" paradigm. In the action-induced group, the ratio is set as 80/20, indicating a greater tendency towards the left side in the induction task. In the non-action-induced group, the ratio is set as 50/50, indicating equal left and right tendencies with no directional bias. Subsequently, both groups will undergo high and low judgment utility induction. Judgment utility will be induced using pictures that combine with actual soccer matches. Under the low judgment utility condition, there will be no significant difference between the left and right sides, while under the high judgment utility condition, higher punishment will be given for incorrect responses on the right side. Finally, the formal experiment will be conducted, in which each group of participants will complete all experimental tasks under consistency conditions of 80/20 and 50/50, as well as with real and fake actions. Using action tendency induction (with or without), consistency condition (consistent or neutral), action type (real or fake), and judgment utility (high or low) as independent variables, the percentage of left responses in judgment will be used as the dependent variable, and a repeated measures analysis of variance will be conducted. The study found a significant interaction effect among judgment utility, consistency, and action type ($F(1,70) = 30.853$, $p < .001$, $\eta^2_p = .306$). Further simple effect analysis showed that under high judgment utility, the left response rate under the consistent condition was higher than that under the neutral condition when real action videos were presented, and the left response rate under the consistent condition was also higher than that under the neutral condition when fake action videos were presented. However, under low judgment utility, the left response rate under the consistent condition was higher than that under the neutral condition when real action videos were presented, and the left response rate under the consistent condition was lower than that under the neutral condition when fake action videos were presented. This study found that athletes can make anticipatory judgments based on both kinematic information and non-kinematic information (contextual priors), and they prioritize the processing of more reliable information. The utilization of these two types of information conforms to the Bayesian statistical model. Judgment utility affects the integration of kinematic and non-kinematic information, but the integration process still requires further exploration.

The Influence of Physical Exercise on Sleep disorder of College Students: The Chain Mesomeric effect of Psychological Capital and Psychological Fatigue

Dong Yaqi 1, Zhou Qiong 2, Chen Weiqin 3

1 Gongqingcheng Middle School, Jiujiang, Jiangxi, 332020

2 College of Science and Technology, Jiangxi Normal University, Jiujiang, Jiangxi, 332020, 1445330089@qq.com

3 Jiangxi University of Applied Science and Technology, Xinyu, Jiangxi, 330100

Abstract: Objective: To study the influence mechanism of physical exercise on college students' Sleep disorder, and analyze the chain Mesomeric effect of psychological resilience and mental fatigue, so as to provide empirical reference for improving college students' sleep quality through physical exercise. **Method:** Correlation analysis, multiple regression analysis, and Bootstrap test were used to analyze the relevant data of 757 college students in Jiangxi Gongqing Science and Education City. **Results:** (1) Physical exercise, mental capital, mental fatigue and Sleep disorder of college students were significantly correlated (P<0.001); Regression analysis results show that physical exercise can significantly positively predict the level of psychological capital of college students（β= 0.258, P<0.01), which can also significantly negatively predict the level of psychological fatigue（β=-0.332,

P<0.01), physical exercise can significantly predict college students' Sleep disorder （β=-0.162, P<0.01). Psychological capital of college students can significantly negatively predict the level of psychological fatigue among college students（ β=-0.327, P<0.01); Psychological capital can significantly negatively predict college students' Sleep disorder（ β=-0.300, P<0.01), mental fatigue can significantly and positively predict college students' Sleep disorder（β= 0.457, P<0.01). In addition, the Bootstrap test results show that physical exercise can directly alleviate college students' Sleep disorder, the direct effect is -0.1622, and the direct effect accounts for 37.7%. It can also indirectly affect college students' Sleep disorder through the role of psychological capital and mental fatigue, with an indirect effect of -0.2677, accounting for 62.3%. **Conclusion:** Physical exercise can directly reduce college students' Sleep disorder, but also indirectly affect college students' Sleep disorder through psychological capital and mental fatigue. Therefore, fully understanding the value and function of physical exercise, in physical education teaching, we encourage college students to actively form healthy exercise habits and lifestyles, improve their psychological capital level through regular and personalized physical exercise, effectively alleviate their psychological fatigue, and thus improve their sleep quality.

神经质人格对运动员精力的影响：焦虑和心智游移的链式中介作用

李洁玲[1, 2] 李创业[1]

1 河北师范大学体育学院，石家庄，050024

2 河北省人体运动生物信息测评重点实验室，石家庄，050024,lijieling@hebtu.edu.cn

摘 要 目的：精力在体育运动中扮演着重要角色并且与运动表现息息相关。已有研究证明神经质人格会影响个体的精力等相关情绪，但其内在机制尚不清楚。焦虑和心智游移也同样被证明会影响运动员的情绪状态，并且多以神经质人格研究为主。因此本研究旨在考察神经质人格与精力之间的关系，并探讨赛前焦虑和心智游移在两者关系中的作用。方法：采用《中文形容词大五人格量表简式版》、《心境状态量表》、《运动员心智游移量表》和《赛前情绪量表-T 简版》收集 591 名运动员的数据。使用 SPSS 22.0 对各相关变量进行相关分析。使用 Mplus 7.0 进行验证性因素分析检验所使用量表的信度、收敛效度、模型的拟合度以及远程中介效应。结果：运动员神经质人格与精力呈显著负相关，与心智游移和赛前焦虑呈显著正相关；精力与心智游移和赛前焦虑呈显著负相关；心智游移和赛前焦虑呈显著正相关。各量表的信、效度及其各模型拟合度良好。神经质人格对精力产生的直接效应显著（β= -0.511, $p < 0.001$）。“神经质人格→焦虑→精力”存在显著的间接效应（β=-0.056,BC 95% CI=[-0.091，-0.028]）。“神经质人格→心智游移→精力”存在显著的间接效应（β=-0.030,BC 95% CI=[-0.054，-0.014]）。由“神经质人格→焦虑→心智游移→精力”产生的链式中介效应显著（β=-0.010,BC 95% CI=[-0.023，-0.002]）。结论：神经质人格对运动员精力具有预测效应，这种效应的机制包括神经质人格的直接效应以及通过焦虑、心智游移的间接效应。该研究结果为系统考察神经质人格与精力的关系提供了参考依据，为保证运动员精力而提升运动表现提供了理论依据。

The Effect of Neuroticism on Athletes' Vigor: The Serial Mediating Roles of Anxiety and Mind Wandering

Jieling LI[1,2], Chuangye LI [1]

1 School of Physical Education, Hebei Normal University, Shijiazhuang, 050024

2 Key Laboratory of Measurement and Evaluation in Exercise Bioinformation of Hebei Province, Shijiazhuang, 050024

Abstract: Objective: Vigor plays an important role in sports and is closely related to sports performance. It has been proved that neuroticism can affect individual vigor and other related emotions, but its internal mechanism is still unclear. Anxiety and mind wandering have also been shown to affect the emotional of athletes, and most about the neuroticism. Therefore, this study aims to examine the relationship between neuroticism and vigor, and the role of anxiety and mind wandering between them. Methods: The data of 591 athletes were collected using the "Chinese Adjective Scale of Big Five Personality Brief version", the "Profile of Mood States", the "Athletes' Mind Wandering Scale"and the "Pre-Competition Emotion Scale-T Brief version". SPSS 22.0 was used to conduct correlation analysis of all relevant variables. Mplus 7.0 was used for confirmatory factor analysis to check the reliability, convergence validity, model fit and remote mediation effect of the scale used. Results: Neuroticism was negatively correlated with vigor and positively correlated with mind wandering and anxiety, vigor was significantly negatively correlated with mind wandering and anxiety, mind wandering was significantly positively

correlated with competition anxiety. The reliability and validity of each scale and the fit of each model were good. Neuroticism had a significant direct effect on vigor (β= -0.511, $p < 0.001$). There was a significant indirect effect on neuroticism → anxiety → vigor (β=-0.056, BC 95% CI=[-0.091, -0.028]). There was a significant indirect effect on neuroticism → mind wandering → vigor (β=-0.030, BC 95% CI=[-0.054, -0.014]). The serial mediation effect was significant (β=-0.010, BC 95%CI =[-0.023, -0.002]) from neurotic personality → anxiety → mind wandering → vigor. Conclusion: Neuroticism has a predictive effect on athletes' vigor. The mechanism of this effect includes the direct effect of neuroticism and the indirect effect through anxiety and mind wandering. The results of this study provide a reference for the systematic investigation of the relationship between neuroticism and vigor, it also provides a theoretical basis for ensuring athletes' vigor and improving sports performance.

The influence of sports tourism leisure involvement on tourists' willingness to revisit: the intermediary effect of smooth experience and satisfaction

DONG Ya qi[1]　ZHOU Qiong[2]　RAO Fang[3]

1.GongQingCheng Middle school,Jiujiuang,Jiangxi332020

2. College of Science and Technology, Jiangxi Normal University, Jiujiang, Jiangxi, 332020

3. College of Science and Technology, Nanchang Aviation University,Jiujiang332020, 384902281@qq.com

Abstract:**Objective:** This paper discusses the influence mechanism of leisure involvement on the willingness to revisit sports tourism, analyzes the chain intermediary effect of smooth experience and satisfaction, with a view to providing a theoretical basis for promoting tourists' willingness to revisit through leisure involvement. **Methods:** Using correlation analysis, multiple regression analysis and Bootstrap test, this paper analyzes the survey data of 1592 tourists from three sports tourist attractions in Jiangxi Province. **Results:** (1) There was a significant positive correlation between leisure involvement, smooth experience, satisfaction and willingness to revisit (P<0.001); Regression analysis shows that leisure involvement can significantly and positively predict the flow experience of tourists（ β= 0.738, P<0.01) and satisfaction level（ β= 0.570, t=, P<0.01), which can also significantly predict tourists' willingness to revisit（ β= 0.087，P<0.01）。Smooth experience can significantly and positively predict the

satisfaction level of large tourists（ β= 0.210，P<0.01）； Both fluency experience and satisfaction have a positive impact on tourists' willingness to revisit（ β= 0.629，P<0.01； β= 0.194，P<0.01）。 In addition, the results of Bootstrap test show that leisure involvement can directly and significantly affect tourists' willingness to revisit, with a direct effect of 0.087 and a direct effect of 12.6%. In addition, leisure involvement can also improve the smooth experience and satisfaction level of tourists, which indirectly affects tourists' willingness to revisit, with an indirect effect of 0.6049 and an indirect effect of 87.4%. **Conclusion:** Leisure involvement can indirectly affect tourists' willingness to revisit through smooth experience and satisfaction. In sports tourism, we should pay attention to improving the leisure facilities and service level of sports tourism scenic spots, and pay attention to the improvement of tourists' smooth experience and satisfaction level, so as to stimulate tourists' willingness to revisit to a greater extent.

欺骗的非言语线索以及性别和社会经济地位的影响——一项基于中国样本的研究

李贺 [1]

1 西北大学公共管理学院，西安，710127，lih@nwu.edu.cn

摘 要 识别欺骗行为对于维护人们的日常生活秩序以及临床、司法、国家安全等专门领域的工作均具有重要价值。而非言语线索在识别欺骗行为中发挥着至关重要的作用。但是，以往关于非言语欺骗线索的研究主要集中在西方国家，忽视了文化的差异。此外，以往研究大多以大学生为被试，难以代表社会群体在欺骗行为中的非言语表达。

本研究旨在考察中国文化背景下的社会群体在欺骗时的非言语行为线索，以及人际差异因素如性别、社会经济地位的影响。实验招募 50 名社会被试，男性 25 人，低社会经济地位 24 人，在平衡性别和社会经济地位的基础上，将被试随机分配到说谎组和说真话组。说谎组被试完成模拟犯罪活动；说真话组被试不参与模拟犯罪活动，而是阅读一段描述说谎组被试的模拟犯罪过程的文字。两组被试在完成上述活动之后接受模拟审讯，并需要在讯问中尽力证明自己是无辜的。

通过编码、分析被试的非言语线索，结果发现：说谎者相比于说真话者更频繁地表现出适应性动作；男性说谎者比男性说真话者表现出更多的阐述性动作，而女性说谎者则相对减少了使用阐述性动作；社会经济地位较高的男性说谎者比说真话者表现出更多的头部动作。这些发现加深了对中国文化中的非言语欺骗线索的认识，并表明非言语欺骗线索受到诸如性别、社会经济地位等人际差异因素的影响。

Nonverbal Cues to Deception in a Chinese Sample and the Influence of Gender and Socioeconomic Status

He Li
School of Public Administration, Northwest University, Xi'an, China

Abstract：Detecting deception is of significant importance in maintaining order in people's daily lives and in specialized fields such as clinical practice, legal proceedings, and national security. Nonverbal cues play a crucial role in detecting deception. However, previous research on nonverbal deception cues has predominantly centered on Western countries, disregarding cultural differences. Moreover, most past studies have relied on university students as participants, which restricts the representation of nonverbal expressions of deception in more diverse social groups.

This study aimed to investigate the nonverbal cues displayed by social groups within the context of Chinese culture, along with the influence of interpersonal factors such as gender and socioeconomic status. The experiment recruited 50 social participants, with 25 males and 24 from lower socioeconomic backgrounds. Participants were randomly assigned to either a lying group or a truth-telling group, with an equal distribution of gender and socioeconomic status. The lying group engaged in a mock crime event, while the truth-telling group read a description of the mock crime process of the lying group. After these activities, both groups underwent a mock interrogation and had to prove their innocence to the best of their abilities.

The analysis of the participants' nonverbal cues revealed that liars exhibited a higher frequency of self-adaptors compared to truth tellers. Male liars displayed a greater frequency of illustrators than male truth tellers, while female liars showed a decrease in the use of illustrators compared to truth tellers. Additionally, male liars with higher SES exhibited more head movements than their counterparts who told the truth. These findings deepen our understanding of nonverbal deception cues within Chinese culture and underscore the influence of interpersonal factors such as gender and socioeconomic status on these cues.

Keywords：Deception cues, interpersonal differences, culture, gender, socioeconomic status

亲疏有别：愤怒情绪对欺骗行为的影响

黄朝政 周爱保（通讯作者）
甘肃政法大学犯罪心理测试技术研究中心，甘肃兰州，730070
通讯作者 E-mail：zhoulabpapers@163.com

摘 要　现实生活中最常见欺骗形式是利己欺骗，当对自我的好处大于对他人的伤害，个人更有可能撒谎。然而，当个人认为对他人的伤害超过了对自我的利益时，他们更有可能选择诚实。但在实际情境下有诸多因素影响了个体的欺骗行为，例如情绪。愤怒情绪会降低了个体对他人的同情心和增强自身利益来促进欺骗，致使个体更多的直觉处理，做出不理智的欺骗行为。同时，欺骗者和接受者之间的社会距离会在一定程度上影响欺骗行为，并且在不同社会距离下，欺骗者会有不同表现。已有研究发现双方关系越亲密，个体做出利他行为越多，当对象是陌生人时，个体做出的损己利他行为相对关系亲密者较少。同时有研究证实了愤怒情绪能够影响自我与他人社会距离的感知。因此，愤怒情绪和社会距离对欺骗行为都有一定的影响。虽然已有研究探索了不同社会距离在欺骗行为的作用，但大量研究还未将愤怒情绪和社会距离两者结合起来研究对欺骗行为的影响，对两者共同作用下的欺骗行为背后的原因也没有明确的定论。本研究采用2（情绪效价：愤怒情绪，中性情绪）×3（社会距离：朋友，陌生人，熟人）×2（欺骗类型：基线，自我受益-他人受益）混合实验设计，探讨了不同社会距离下愤怒情绪对欺骗行为的影响。实验结果发现中性情绪组在面对陌生人、朋友和熟人时做出了有利于双方的欺骗行为，双方均有获益。而愤怒情绪组做出了有损双方利益的欺骗行为，双方获益降低。通过本研究发现人们在愤怒状态下会降低对收益的期望以及对他人的同理心，更可能做出有损于双方的欺骗行为，尤其是在面对熟人的时候，被试相比陌生人和朋友，更倾向于损害熟人的利益。这可能说明了，人们对于社会距离较近的朋友和社会距离较远的陌生人，可以做出较为理性的欺骗决策，而对于社会距离适中的他人则是容易做出不理性的欺骗决策，出现“杀熟”行为。

Closeness makes a difference: the effect of anger on deceptive behaviour

Chaozheng Huang,　Aibao Zhou
Psychological Testing Technology Research Center,Gansu University of Political Science and Law Criminal，Lanzhou 730070

Abstract：The most common form of deception in real life is self-interested deception, where individuals are more likely to lie when the benefit to the self outweighs the harm to others. However, when individuals perceive that the harm to others outweighs the benefit to the self, they are more likely to choose honesty. However, there are a number of factors that influence an individual's deceptive behaviour in practical situations, such as emotions. The emotion of anger reduces the individual's empathy for others and enhances self-interest to promote deception, causing the individual to process more intuitively and engage in irrational deceptive behaviour. At the same time, the social distance between the deceiver and the receiver affects deceptive behaviour to a certain extent, and the deceiver will behave differently under different social distances. It has been found that the closer the relationship between the two parties, the more altruistic behaviours the individual makes, and when the target is a stranger, the

基金资助：甘肃省大学生创新创业计划训练项目（S202311406020），甘肃政法大学研究生科研创新项目（2023019）

individual makes less self-injurious and altruistic behaviours compared to those who are close to each other. Meanwhile, studies have confirmed that anger affects the perception of social distance between the self and others. Thus, both anger emotion and social distance have an effect on deceptive behaviour. Although studies have explored the role of different social distances in deceptive behaviours, a large number of studies have yet to combine both anger and social distance to investigate the effects on deceptive behaviours, and there is no clear and definitive conclusion on the reasons behind deceptive behaviours under the combined effect of the two. In this study, we used a mixed experimental design of 2 (emotional potency: angry emotion, neutral emotion) × 3 (social distance: friends, strangers, acquaintances) × 2 (type of deception: baseline, self-benefit-others' benefit) to investigate the effects of angry emotion on deceptive behaviour under different social distances. The results of the experiment found that the neutral mood group made deceptive behaviours that benefited both parties when confronted with strangers, friends and acquaintances, and both parties benefited. While the angry mood group made deceptive behaviours that were detrimental to both parties and both parties benefited less. Through this study, it was found that people in the state of anger reduce their expectation of gain and empathy towards others and are more likely to engage in deceptive behaviours that are detrimental to both parties, especially when confronted with acquaintances, where subjects were more inclined to compromise the interests of acquaintances compared to strangers and friends. This may indicate that people can make more rational deception decisions for socially close friends and socially distant strangers, while they are more likely to make irrational deception decisions for moderately socially distant others, and to engage in "familiarity-killing" behaviours.

摘 要 作为目前国际上影响广泛的心理治疗的方法和技术，沙盘游戏经过中西文化的结合，在心理教育层面发挥着重要作用。目的：探索团体沙盘干预对大学生积极自我的影响。方法：被试共 18 人，采用实验组控制组前后测设计，实验组、控制组被试各 9 人，对自我满意度较低的实验组被试进行五周的团体沙盘干预，同时采用田纳西自我概念量表（TSCS）对实验组和对照组被试干预前后进行测量，并使用沙盘内容记录表、沙盘主题特征分析表和沙盘反馈表进行实验过程记录。结果：团体沙盘的干预过程可以分为自我开放、情绪表达、转化与成长、回馈与告别 4 个阶段，随着干预的推进，沙盘作品的创伤主题减少，治愈主题增多，沙盘也渐渐呈现“趋中”和“整合”。从数据处理结果来看，干预前，实验组被试的生理自我（t=2.56，p＜0.05）、道德自我（t=3.38，p＜0.01）、社会自我（t=2.84，p＜0.05）、自我满意（t=2.87，p＜0.05）、自我行动（t=4.66，p＜0.001）以及 TSCS 总分显著低于对照组（t_{TOT}=4.02，p_{TOT}＜0.01），经过五周的团体沙盘干预，实验组与对照组被试的 TSCS 各项因子均不存在显著差异（p＞0.05），且实验组被试在生理自我、

道德自我、社会自我、自我认同、自我满意、自我行动以及总分上均有显著提高。结论：团体沙盘干预能够有效提升大学生积极自我概念和自我满意度，并且能够传递道德关怀，促进大学生心育与德育的有机统一。

A study on the effect of group sandplay therapy on enhancing positive self-concept of college students

CHEN Xi[1, 2*], LIU Fang[3], XIANG Bingbing[1],

[1] Chengdu University, Chengdu, China; [2] Shaanxi Normal University, Xi'an, China; [3] Sichuan Technology and Business University, Meishan, China

***Abstract*：** Sandplay therapy is an internationally influential method and technique of psychotherapy, which plays an important role in psycho-educational level through the combination of Chinese and Western cultures and localized research with Chinese characteristics. Objective: exploring the effects of a group sandplay intervention on college students' positive self-concept. Methods: a five-week group sandplay intervention was conducted for college students with low self-satisfaction using an experimental and control group pre- and post-test design, while the Tennessee Self-Concept Scale (TSCS) was used to measure the experimental and control group subjects before and after the intervention. The experimental process was recorded using a sandplay content recording form, a thematic feature analysis form, and a feedback form. Results: the intervention process of group sandplay can be divided into four stages: self-opening, emotional expression, transformation and growth, and feedback and farewell. As the intervention progressed, the trauma theme of the sandplay decreased and the healing theme increased, and the sandplay gradually showed "neutralization" and "integration". Before the intervention, the PH(t=2.56，p＜0.05), ME(t=3.38，p＜0.01), SO(t=2.84，p＜0.05), SA(t=2.87，p＜0.05), B(t=4.66，p＜0.001), TOT(t_{TOT}=4.02，p_{TOT}＜0.01) scores of the subjects in the experimental group were significantly lower than those in the control group, and after the five-week intervention, there was no significant difference between the TSCS factors of the experimental and control subjects(p＞0.05). Conclusion: results shed light on the impact of the group sandplay on moral and mental education of college students.

幼儿教师关怀行为的问卷编制与现状分析

韩 娟

新疆师范大学心智发展与学习科学重点实验室、新疆师范大学心理学院， 乌鲁木齐 830017

摘 要 **目的** 编制“幼儿教师关怀行为问卷”，验证该问卷信效度，为幼儿教师心理健康工作提供心理测量工具。**方法** 2022 年 3 月～2022 年 7 月，根据标准化问卷开发程序，在文献分析、访谈法和专家评估的基础上，对幼儿教师关怀行为问卷的结构进行了探索， 形成条目池；随机选取 245 名幼儿教师为对象，进行探索性因素分析；再随机选取 260 名幼儿教师为对象，对该问卷进行验证性因素分析；最后随机选取 500 名幼儿教师为对象，对该问卷进行初步运用，运用描述性统计、独立样本 T 检验等方法探究幼儿教师关怀行为的发展现状。**结果** 探索性因子分析将问卷划分为理解与支持、班级管理、沟通、尊重与信任和反思与提升五个维度，经过筛选，共有 19 个条目入选，该问卷的 Cronbach's α系数为 0.940，各维度的 Cronbach’s α 系数为 0.741~0855；所有条目累计贡献率 57.72%，具有较好的信效度。验证性因子分析结果显示，问卷中各题项的因素符合量在 0.600~0.843 之间，信度在 0.360~0.711 之间，表明问卷的各个题项具有较高的信度和解释能力。问卷中各个构面的组成信度在 0.721~0.856 之间，表明问卷具有良好的结构效度。各个构面的收敛效度在 0.466~0.612 之间，表明问卷的各个构面对所包括的题项具有较高的解释能力。符合测量学的指标要求，可以作为幼儿教师关怀行为的测量工具。运用正式幼儿教师关怀行为问卷调研发现：幼儿教师的关怀行为整体上达到了中等程度以上的水平。在学历方面，幼儿教师关怀行为差异不显著，在教龄、婚姻状况、学校所在地、学校性质方面幼儿教师关怀行为的差异显著。教龄 5 年以上的幼儿教师的关怀行为显著多于 5 年以下的幼儿教师，已婚的幼儿教师的关怀行为显著多于未婚的幼儿教师，城市幼儿教师的关怀行为显著高于农村幼儿教师，公立学校的幼儿教师的关怀行为显著高于私立幼儿园教师。**结论** 幼儿教师关怀行为问卷信效度良好，可作为评定幼儿教师关怀行为的工具。

Development of the Caring Behavior Questionnaire and Status Analysis for Preschool Teachers

Han Juan

The Key Laboratory of Mental Development and Learning Science of Xinjiang; School of Psychology, Xinjiang Normal University, Urumqi 830017,China.

Abstract： **Objective** To verify the reliability and validity of the caring behavior questionnaire for preschool teachers, and to provide a psychological measurement tool for preschool teachers' mental health work. **Methods** From March 2022 to July 2022, according to the standardized questionnaire development procedure, on the basis of literature analysis, interview and expert evaluation, the structure of the questionnaire on kindergarten teachers' caring behavior was explored and a pool of items was formed; A total of 245 preschool teachers were randomly selected for exploratory factor analysis. Then, 260 preschool teachers were randomly selected to carry out confirmatory factor analysis on the questionnaire. Finally, 500 preschool teachers were randomly selected to make preliminary use of the questionnaire, and descriptive statistics and independent sample T test were used to explore the development status of preschool teachers' caring behavior. **Results** Exploratory factor analysis divided the questionnaire into five dimensions: understanding and support, class management, communication, respect and trust, and reflection and improvement. After screening, a total of 19 items were selected. Cronbach's α coefficient of this questionnaire was 0.940, and Cronbach's α coefficient of each dimension was 0.741~0855. The cumulative contribution rate of all items is 57.72%, which has good reliability and validity. The results of confirmatory factor analysis showed that the factor coincidence quantity of each item in the questionnaire ranged from 0.600 to 0.843, and the reliability ranged from 0.360 to 0.711, indicating that each item in the questionnaire had high reliability

and explanatory ability. The constitutive reliability of each dimension of the questionnaire ranged from 0.721 to 0.856, indicating that the questionnaire had good structural validity. The convergence validity of each dimension ranges from 0.466 to 0.612, indicating that each dimension of the questionnaire has a high explanatory ability for the included items. It can be used as a measuring tool for preschool teachers' caring behavior.Using formal kindergarten teachers' caring behavior questionnaire survey, it is found that kindergarten teachers' caring behavior as a whole has reached a level above the medium level. In terms of educational background, there is no significant difference in caring behavior of preschool teachers, but there is significant difference in teaching age, marital status, school location and school nature. The caring behavior of preschool teachers with more than 5 years of teaching experience is significantly more than that of preschool teachers with less than 5 years of teaching experience, that of married preschool teachers is significantly more than that of unmarried preschool teachers, that of urban preschool teachers is significantly higher than that of rural preschool teachers, and that of preschool teachers in public schools is significantly higher than that of private kindergarten teachers. **Conclusion** The questionnaire has good reliability and validity and can be used as a tool to evaluate the caring behavior of preschool teachers.

校园受欺凌对 4-9 年级学生生活满意度的影响：一个有调节的中介模型

李泱巾　陆增颜 郭俊俏 赵必华（通讯作者）
安徽师范大学教育科学学院，芜湖 241000，zhaobihua1@sina.com

摘 要　背景：生活满意度指个体以自己的标准对生活总体的评价，对其认知和心理健康水平都有着非常重要的影响。然而，近年来校园欺凌现象屡见不鲜，遭受欺凌的学生对生活产生无力和无意义感，生活满意度水平降低，身心发展受到严重影响。基于马斯洛需要层次理论，当学生受到欺凌时，其安全的需要得不到满足，更高层次的爱与归属的需要就会受到影响，从而生活满意度水平较低。但是如果受欺凌学生有高水平的父母情感支持，虽然遭受到了校园欺凌，父母提供的情感支持有利于学生积极与同伴老师建立良好的人际关系，从而更好地融入学校，可能能够弥补学生归属的需求，那么由校园受欺凌造成的负面影响可能就会减小。因此,本研究构建了一个有调节的中介模型,检验学校归属感在校园受欺凌与 4-9 年级学生生活满意度之间的中介作用,以及父母情感支持在其中的调节作用。方法：采用《校园受欺凌问卷》《生活满意度量表》《学校归属感量表》以及《父母情感支持问卷》对 4-9 年级学生进行问卷调查,共收集到有效数据 2364 份。采用 SPSS 的 process 插件进行数据处理。在控制性别、学段等人口统计学变量后结果表明:(1)校园受欺凌与生活满意度、学校归属感之间存在着显著负相关，学校归属感与生活满意度之间存在显著正相关;(2)学校归属感在校园受欺凌对生活满意度的影响中起部分中介作用;(3)父母情感支持在校园受欺凌与生活满意度之间的直接路径以及学校归属感间接作用的前后两条路径均起调节作用。具体来说,相对于父母情感支持水平低的个体,遭受到校园欺凌对父母情感支持水平高的个体的学校归属感和生活满意度负向预测作用更强。建议：探究减少校园欺凌现象和提高学生学校归属感的方法和措施,并指导学生家长给予适当和正确的的情感支持,从而提高 4-9 年级学生生活满意度,促进其身心健康发展。

关键词　生活满意度，校园受欺凌，学校归属感，父母情感支持

The Impact of Campus Bullying on Life Satisfaction of Students in Grades 4-9: A Mediated Model with Regulation

LI Yangjin, LU Zengyan, GUO Junqiao, ZHAO Bihua*
School of Education Science, Anhui Normal University, Wuhu 241000, zhaobihua1@sina.com

***Abstract*:** Background: Life satisfaction refers to an individual's overall evaluation of their life based on their own standards, which has a significant impact on their cognitive and mental health levels. However, in recent years, School bullying has become a common phenomenon. The bullied students have a sense of powerlessness and meaninglessness in life, and their life satisfaction level has decreased, which has seriously affected their physical and mental development. Based on Maslow's hierarchy of needs theory, when students are bullied, their safety needs are not met, and higher-level needs for love and belonging are affected, resulting in lower levels of life satisfaction. However, if the bullied students have a high level of parental emotional support, although they have suffered from School bullying, the emotional support provided by parents will help students actively establish good interpersonal relationships with peer teachers, so as to better integrate into the school, which may be able to make up for the needs of students' belonging, then the negative impact caused by campus bullying may be reduced. Therefore, this study constructed a moderated mediation model to examine the mediating role of school belonging in the relationship between campus bullying and life satisfaction of students in grades 4-9, as well as the

moderating role of parental emotional support. Method: A questionnaire survey was conducted on students in grades 4 to 9 using the "Campus Bullying Questionnaire", "Life Satisfaction Scale", "School Belonging Scale", and "Parent Emotional Support Questionnaire". A total of 2364 valid data were collected. Use the process plugin of SPSS for data processing. After controlling for Demographics variables such as gender and school period, the results show that: (1) there is a significant negative correlation between campus bullying and life satisfaction, school belonging, and there is a significant positive correlation between school belonging and life satisfaction; (2) School belonging plays a partial mediating role in the impact of bullying on life satisfaction on campus; (3) Both the direct path between parental emotional support and campus bullying and life satisfaction, as well as the indirect effect of school belonging, play a moderating role. Specifically, compared with individuals with low parental emotional support, School bullying has a stronger negative predictive effect on school belonging and life satisfaction of individuals with high parental emotional support. Suggestions: explore ways and measures to reduce School bullying and improve students' sense of belonging to school, and guide students' parents to give appropriate and correct emotional support, so as to improve the life satisfaction of students in grades 4-9 and promote their physical and mental health development.

习美立新：高中生体像烦恼的概念复探

余习德[1] 刘嘉帆[2]（通讯作者） 林耀辉[1] 吴佳炫[1] 刘欢[3] 余学梅[4]

1 广东技术师范大学应用心理学系，广州，510665

2 香港教育大学心理学系，香港，999077，liujiafan2022@qq.com

3 华南师范大学附属广梅园小学，梅州，5144589

4 云南省曲靖市第一中学，曲靖，655000

摘 要 “人人皆是自媒体”的时代背景下，体像信息的传播已达到了前所未有的高度，对身体美的关注在“自我追求”的进程中占比加重。高中生处于自我意识第二次飞跃的青春期，其对身体形象与身体自我的关注尤甚，体像烦恼则是身体关注的典型表征。体像烦恼(body image depression)是指一种由于自我审美观或审美能力偏差导致自我体像失望而引起的心理烦恼，它包括形体、容貌、性器官与性别四类烦恼。作为一个本土心理学概念，其概念提出、工具开发及相关研究已有近二十年的历史。以往研究确定了“中学生普遍存在体像烦恼”的事实，也证实了由高亚兵等人(2005)编制的《青少年体像烦恼问卷》具有较高的信度。然而，鉴于：第一，以往研究较少报告《青少年体像烦恼问卷》的结构效度；第二，时代变化必然赋予青少年发展新特点，因此，本研究拟对高亚兵等人(2005)编制的研究工具及对应的概念结构予以重探。在广东与云南两省共 5 所中学高一至高三学生进行整群方便抽样，采用高亚兵等人(2005)编制的《青少年体像烦恼问卷》，对 932 名(样本一)与 716 名(样本二)学生进行探索性因素分析(EFA)、验证性因素分析(CFA)与效标关联效度分析。结果表明：第一，EFA 剔除原量表 7 题，保留 18 题(KMO = 0.84，Bartlett 球形检验 χ^2/df =46.24，P＜0.001)。第二，EFA 抽取 5 个特征根大于 1 的因子，累积方差贡献率 67.64%。第三，五个维度可命名为**容貌烦恼**(4 题)、**性器官烦恼**(4 题)、**身型烦恼**(4 题)、**身高烦恼**(3 题)与**性别烦恼**(3 题)。**原“形体烦恼”被分解为“身型烦恼”与“身高烦恼”。**第四，CFA 结果拟合良好(χ^2/df=3.19, RMSEA = 0.062, CFI = 0.942, SRMR = 0.044)。第五，修订量表及各维度的内部一致性 Cronbach’s α系数在 0.78-0.86 之间。第六，修订量表总分与自尊总分呈显著负相关(r = -0.31, P＜0.001)。可见，修缮的概念结构更具体，适切时代发展；修订的研究工具兼顾了信效度，更易推广使用。

关键词 体像烦恼；高中生；身体；自我

A further discussion on body beauty: Re-exploration of the concept of body image depression in high school students

Yu Xide[1] Liu Jiafan[2] Lin Yaohui[1] Wu Jiaxuan[1] Liu Huan[3] Yu Xuemei[4]

1 Department of Applied Psychology, Guangdong Polytechnic Normal University, Guangzhou, 510665

2 Department of Psychology, Education University of Hong Kong, Hong Kong, 999077

3 Guangmeiyuan Primary School, South China Normal University, Meizhou, 5144589

4 Yunnan Qujing No.1 Middle School, Qujing, 655000

Abstract: Under the background of "everyone is self-media", the dissemination of body image information has reached an unprecedented height. Attention to "body beauty" has also become an important part of "self-pursuit". High school students are in the adolescence of the second leap of self-consciousness, and they are especially concerned about body image and body self, while body image depression is a typical manifestation of body concerns. Body image depression (BID) refers to a kind of psychological distress caused by the disappointment of self-body image due to the deviation of individual self-aesthetic view or aesthetic ability, which includes four types of depressions: body shape, feature, sex organ, and gender identity depression. As a native psychological concept, the history of its conceptualization, development of research tool and related research is nearly 20 years. Previous studies have generally verified the fact that "body image depression is occurred in middle school students", and also confirmed the high reliability of the "body image depression questionnaire for teenagers" compiled by Gao et al. (2005). However, considering that: First, in previous studies, the structural validity of the "body image depression questionnaire for teenagers" has rarely been reported; second, that changes in the times inevitably bring new developmental characteristics to adolescents, therefore, the present study intends to re-explore the research instrument and corresponding conceptual structures developed by Gao et al. (2005). A total of 5 secondary schools in Guangdong and Yunnan provinces were used for cluster convenience sampling, and 932 (Sample 1) and 716 (Sample 2) students were subjected to Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), and criterion correlation validity using the "body image depression questionnaire for teenagers" developed by Gao et al. (2005). The results showed that: First, EFA excluded 7 items from the original scale and retained 18 items (KMO = 0.84, Bartlett's sphericity test χ^2/df = 46.24, $P < 0.001$). Secondly, EFA extracted five factors with eigenvalue greater than 1, with the cumulative variance contribution rate of 67.64%. Third, the five dimensions can be named appearance depression (4 items), sexual organ depression (4 items), body type depression (4 items), height depression (3 items), and gender depression (3 items). The original "body shape depression" was divided into "body type depression" and "height depression". Fourth, the CFA results were well-fitted (χ^2 / df = 3.19, RMSEA = 0.062, CFI = 0.942, SRMR = 0.044). Fifth, the internal consistency Cronbach's α coefficients for the revised scale and dimensions ranged from 0.78 to 0.86. Sixth, the total score of the revised scale was significantly negatively correlated with the total score of self-esteem (r = -0.31, $P < 0.001$). It can be seen that the revised conceptual structure is more specific and suitable to the development of the times; the revised research tool takes into account the reliability and validity, and is easier to popularize and use.

大学新生心理健康现状：社会支持的保护作用和留守经历的调节效应

王歆睿[1] 韩布新[2]（通讯作者）
1 成都工业学院，成都，611730
2 中国科学院心理健康重点实验室（心理研究所），北京，100101，hanbx@psych.ac.cn

摘 要 城镇化建设进程下留守经历学生心理健康问题不容忽视。留守经历大学新生面临新生活、新学习环境适应等多重挑战，而社会支持的积极心理健康功能有利于大学生提升社会适应能力。本研究于 2022 年 11 月，在大学生心理健康课程中调研了四川某高校 1515 名大学新生的心理健康与社会支持，重点关注城镇化建设影响下的留守经历学生，探索大学新生留守经历、社会支持对大学新生心理健康状况的影响。结果表明，有留守经历大学新生社会支持总分、家庭支持、朋友支持和其他支持显著低于无留守经历者（P ＜0.05），其心理症状总分、焦虑、抑郁和躯体化症状得分更高；回归分析发现大学新生社会支持三维度（家庭支持、朋友支持、他人支持）均显著负向预测其心理症状；简单调节效应也发现了社会支持三维度心理健康功能及留守经历的调节效应，留守经历者社会支持显著负向预测其心理症状；无留守经历者社会支持也显著负向预测其心理症状，但效应量相对较小。综上所述，留守经历大学生的社会支持系统影响其心理健康，利用地方社会心理服务体系建设、优化社会资源是大学生心理健康干预的重要路径。留守学生现状源于城镇化、家庭核心化和少子化、高等教育普及化等问题，高校需重视留守经历大学生心理健康，尤其是家校共育要重视父母对子女的家庭教育、陪伴时间。社会、学校、社区可多举措提高父母对孩子能力可塑性信念，增加父母亲子投入时间，缓解父母缺位现状。

Current Situation of College Freshman Mental Health: The Protective Role of Social Support and the Moderating Effect of Left-behind Experiences

Wang Xinrui [1] Han Buxin[2*]
1.Student Affairs Department of Chengdu Technological University, Chengdu, 611730
2. CAS Key Laboratory of Mental Health, Chinese Academy of Sciences (Institute of Psychology), Beijing, 100101

***Abstract*:** Under the process of urbanization, the mental health problems of left-behind students cannot be ignored. Left-behind college freshmen face multiple challenges such as adapting to a new life and a new learning environment, and the positive mental health function of social support is conducive to improving college students' social adaptability. In November 2022, this study investigated the mental health and social support of 1515 freshmen in a university in Sichuan province, focusing on the left-behind students under the influence of urbanization, explore the influence of Freshmen's left-behind experience and social support on freshmen's mental health. The results showed that the total scores of perceived social support, family support, friend support and other support of freshmen with left-behind experience were significantly lower than those without left-behind experience ($p < 0.05$), and their total scores of psychological symptoms, anxiety, depression and somatization

symptoms were higher. Regression analysis found that the three dimensions of perceived social support (family support, friends support, others support) significantly negatively predicted the psychological symptoms of freshmen. The simple moderation effect also found the moderating effect of the three-dimensional mental health function of perceived social support and the left-behind experience, and the perceived social support of the left-behind experience significantly negatively predicted their psychological symptoms. Perceived social support also significantly negatively predicted psychological symptoms in people without left-behind experience, but the effect size was relatively small. To sum up, the social support system of the left-behind college students affects their mental health, and it is an important way to make use of the local social psychological service system to construct and optimize social resources. The present situation of the left-behind students stems from the problems of urbanization, family nucleus, fewer children and popularization of higher education, in particular, home-school co-education should pay more attention to time spent with parents and children. Society, School and community can take many measures to improve parents' belief in the plasticity of children ability, increase parents with children's engagement time, and alleviate the status quo of parent absence.

疫情防控常态化背景下大学生心理健康的影响因素分析及对策研究

王歆睿[1]

1 成都工业学院学生工作部（处），成都，611730

摘 要 影响大学生心理健康的因素包括性别、年级、生源地、留守经历、独生子女、恋爱状况、社会支持等。本研究以四川某理工院校大学生为研究对象，于 2022 年 11 月问卷调查了 2234 名大学生心理健康的影响因素和心理症状（焦虑、抑郁和躯体化症状），重点分析不同人口学特征和社会支持对大学生心理健康的影响。结果显示：疫情防控常态化时期男大学生心理健康水平高于女大学生，大一新生心理健康水平显著高于高年级学生，农村学生心理症状比城镇学生严重，有留守经历学生心理症状多于无留守经历学生，独生子女心理症状少于非独生子女（$P<0.05$）。线性回归分析结果显示，性别、年级、生源地、留守经历、是否独生子女、恋爱状况、社会支持（家庭支持、朋友支持、其他支持）影响大学生心理症状（焦虑、抑郁、躯体化症状）（$P<0.05$）。可见，学校应该有针对性的关注不同影响因素下压力对大学生心理健康的影响，并提供相应的心理健康支持服务。后疫情时期大学生心理健康素养有待加强，不同类别的大学生心理健康素养水平不同，对女生、高年级学生、农村学生、留守经历、非独生子女、低社会支持学生开展针对性干预，积极开展心理学类课程、重视大学生社会支持系统、加强家校共育，提升大学生主动求助意识，提高新时期大学生的心理健康素养水平，促进大学生心理健康发展。

Influencing factors analysis of college students' mental health and suggestions under the background of regular epidemic prevention and control

Wang Xinrui 1

1.Student Affairs Department of Chengdu Technological University, Chengdu, 611730

***Abstract*:** The factors affecting the mental health of college freshmen include gender, grade, place of origin, left-behind experience, only child, love status, social support and so on. In this study, 2234 college students from a technical college in Sichuan Province were investigated by questionnaire in November, 2022. The main influencing factors and psychological symptoms were anxiety, depression and somatization, this paper focuses on the effects of different demographic characteristics and social support on college students' mental health. The results showed that the mental health level of male college students was higher than that of female college students, the mental health level of freshmen was significantly higher than that of senior students, and the mental symptoms

of rural students were more serious than those of urban students, the psychological symptoms of the students with left-behind experience were more than those of the students without left-behind experience. The psychological symptoms of the only child were less than those of the non-only children (p <0.05). The Regression analysis results showed that, gender, grade, place of origin, left-behind experience, only-child status, love status, social support (family support, friends support, other support) affected the psychological symptoms of college students (anxiety, depression, somatization symptoms) (p < 0.05). Therefore, schools should pay attention to the influence of college students' mental health under different influencing factors and provide corresponding mental health support services. In the period of Regular epidemic prevention and control , the mental health literacy of college students needs to be strengthened, and different types of college students have different levels of mental health literacy, to carry out targeted intervention for female students, senior students, rural students, left-behind students, non-only children and students with low social support, we should actively develop psychological courses, attach importance to the social support system for college students, strengthen home-school co-education, promote the awareness of college students to seek help actively, and improve the level of college students' mental health literacy in the new era, promote the development of psychological health of college students.

心理控制源对高职生就业压力的影响与心理机制研究

徐明杰

四川文化产业职业学院大学生心理健康中心，成都，610000，aaaapy@vip.qq.com

摘 要 **目的：**据 2022 年中国大学生心理健康状况调查报告披露，大学生列举的十大压力源中，“学业负担重”和“不知道自己适合什么工作”这两项与就业压力有重要相关性的指标在分别位居第一和第三位。长期的就业压力可能导致焦虑、抑郁、失眠等心理问题，以及高血压、心脏病等生理问题，因此了解影响大学生就业压力的因素及探索其心理机制对于促进大学生心理健康和提升就业竞争力具有重要意义。本研究考察了大学生心理控制源对就业压力的影响，并探究在这一影响过程中生涯适应力的中介效应和专业认同的调节效应。**方法：**在四川省某高职院校中收集有效数据 574 份，对其进行描述统计、相关分析和有调节的中介模型分析。**结果：**①内控型心理控制源和就业压力显著负相关；生涯适应力和就业压力显著负相；专业认同度和就业压力显著负相关。②生涯适应力部分中介心理控制源对就业压力的影响。③专业认同度能够对中介模型的后半段进行调节，对于高专业认同度的个体，心理控制源通过生涯适应力对就业压力产生影响的中介路径显著，而对于低专业认同的个体，中介路径不显著。**结论：**①心理控制源对就业压力的影响可以通过生涯适应力进行解释。内控的个体具备较高的生涯适应力，感知就业压力更轻。可能的解释是内部控制源的个体相信自己能够通过努力和行动来影响事物，因此更倾向于主动寻求成长和支持，提升自我的生涯适应力，更能以有建设性的方式去处理就业问题。②专业认同可以对中介模型的后半段进行调节，根据 Savickas 的理论，认同感为个体提供了明确的职业发展方向，生涯适应力为实现职业目标提供动力，因此对于认同感很低的个体，即使在以往的人生经验中已经积累了一定的生涯适应力，但是由于低专业认同的影响，对自己的价值观和职业愿景缺乏清晰的认识，在面临就业问题时也会感到压力，缺乏方向和动力。

关键词 大学生就业压力,生涯适应力,心理控制源,专业认同度

The Effect of locus of control on the employment pressure and psychological mechanism study

Xu Mingjie

Sichuan Vocational College of Cultural Industries, Chengdu

***Abstract*：** **Objective:** According to the 2022 Mental Health Survey Report of Chinese College Students, among the ten stress sources listed by college students, "heavy academic burden" and "do not know what they are suitable for", two indicators with important correlation with employment pressure, ranked first and third respectively. Long-term employment pressure may lead to anxiety, depression, insomnia and other psychological problems, as well as physiological problems such as hypertension and heart disease. Therefore, it is of great significance to understand the factors affecting the employment pressure of college students and explore their psychological mechanism to promote the mental health of college students and enhance their employment competitiveness. This study examined the influence of locus of control on employment stress, and explored the mediating effect of career adaptability and the regulatory effect of professional identity during this influence. **Methods:** Collect 574 valid data from a vocational college in Sichuan Province, and conduct descriptive statistics, correlation analysis, and

moderated mediation model analysis on them. **Results:** ① Internal control type were significantly negatively correlated with employment pressure; career adaptability and employment pressure were significantly negative; professional identity and employment pressure were significantly negatively correlated.② In the influence path of psychological control sources on employment pressure, career adaptability plays a part-mediating role.③ Professional identity can adjust the second half of the mediation model. For individuals with high professional identity, the mediation path of locus of control on employment pressure through career adaptability is significant, while for individuals with low professional identity, the mediation path is not significant. **Conclusion:** ① The influence of locus of control on employment stress can be explained by career adaptability. Individuals with internal control have higher career adaptability and perceive employment with lighter pressure. The possible explanation is that the individuals with internal control sources believe that they can influence things through efforts and actions, so they are more inclined to actively seek growth and support, improve their career adaptability, and are more able to deal with employment problems in a constructive way.② Professional identity can adjust the second half of the mediation model, according to Savickas's theory, identity provides a clear career development direction for the individual,the career adaptability provides motivation for achieving professional goals.Therefore, for individuals with a low sense of recognition, even if they have accumulated a certain career adaptability in the past life experience, due to the influence of low professional identity, they lack a clear understanding of their own values and professional vision. It will also feel pressure, lack direction and motivation.

教师自主支持、基本心理需求与初中生创造力的关系研究

吴桂翎[1, 2]（通讯作者） 余厚石[1]

1 合肥师范学院教育与心理科学学院，合肥，230601

2 安徽省学生心理健康教育指导和发展中心，合肥，230601，979130741@qq.com

摘 要 创造力是指由个体知识、动机、智力与个性特征共同作用，完成具有创新性、合适性与价值性活动的能力。初中阶段是创造力发展的关键时期，环境与人相互作用，发挥学校教育环境的优势，培养初中生的创造力、激发其创新的动机和行为，对于培养具有创新意识和创新能力、适应现代信息社会的人才，促进数字化时代社会主义现代化建设具有全局性、基础性和先导性的作用。已有研究表明，基本心理需求的满足有赖于社会环境的支持，在环境与个体行为之间起中介作用，而教师自主支持是学生社会支持系统重要来源，是学生基本心理需求满足和创造力培养的重要影响因素。本研究采用创造力自我报告量表、学习气氛问卷和基本心理需求量表对安徽、广东两省的 1972 名初中生进行问卷调查,探究其创造力的发展水平及影响机制。研究发现：（1）初中生创造力、教师自主支持与基本心理需求在性别与年级上存在显著差异；（2）初中生创造力、教师自主支持与基本心理需求两两之间正相关，教师自主支持对初中生创造力有显著正向预测作用；（3）基本心理需求在教师自主支持与创造力之间起部分中介作用。本研究一方面丰富了教师自主支持对初中生创造力影响的内在机制的理论研究，另一方面也为数字化时代下初中生创造力培养中学校创设良好的创新氛围、增强初中生创新动力的重要性和必要性提供了实证依据。

A Study of the Relationship Between Teacher Autonomy Support, Basic Psychological Needs, and Creativity in Junior High School Students

Wu Guiling[1,2], Yu Houshi[1]

1 School of Education and Psychological Science, Hefei Normal University, Hefei, 230601

2 Anhui Mental Health Education and Guidance Center for Student, Hefei, 230601,979130741@qq.com

Abstract：Creativity refers to the ability to complete innovative, appropriate and valuable activities by the joint action of individual knowledge, motivation, intelligence and personality characteristics. The junior high school stage is a key period for the development of creativity, and the interaction between the environment and human beings, giving full play to the advantages of the school education environment, cultivating the creativity of junior high school students, and stimulating their motives and behaviours of innovation, have an overall, fundamental and pioneering role in fostering talents with a sense of creativity and innovation, adapted to the modern information society, and in promoting the construction of socialist modernisation in the digital age. It has been shown that the satisfaction of basic psychological needs depends on the support of the social environment, which plays a mediating role between the environment and individual behaviours, while teacher autonomy support is an important source of students' social support system, which is an important influence on the satisfaction of students' basic psychological needs and the development of creativity. In this study, 1972 junior high school students in Anhui and Guangdong provinces were surveyed using the Creativity Self-Report Scale, the Learning Atmosphere Questionnaire, and the Basic Psychological Needs Scale to investigate the developmental level of creativity and

the influencing mechanisms. The study found that: (1) there are significant differences among junior high school students' creativity, teacher autonomy support and basic psychological needs in terms of gender and grade; (2) junior high school students' creativity, teacher autonomy support and basic psychological needs are positively correlated with each other, and teacher autonomy support has a significant positive predictive effect on junior high school students' creativity; and (3) basic psychological needs partially mediate the relationship between teacher autonomy support and creativity.On the one hand, this study enriches the theoretical research on the intrinsic mechanism of the influence of teacher autonomy support on junior high school students' creativity, and on the other hand, it also provides empirical evidence for the importance and necessity for schools to create a good innovation atmosphere and enhance junior high school students' innovation motivation in the cultivation of junior high school students' creativity in the digital era.

职业理想问卷的修订及在幼儿教师群体中的信效度检验

张晓丹[1,2,3] 高婷婷[1] 余杰[1] 姚本先[1,2]（通讯作者）

1 合肥师范学院教育与心理科学学院，合肥，230601

2 安徽省学生心理健康教育指导和发展中心，合肥，230601 通讯作者 E-mail：ybx7756@126.com

3 青少年心理健康与危机智能干预安徽省哲学社会科学重点实验室，合肥，230601

摘 要 教师的职业理想是教师渴望达到的职业境界，也是对所确立目标的向往和追求。幼儿教师作为幼儿健康成长的启蒙者和引路人，对我国学前教育发展有着至关重要的作用。近年来，幼儿教师的职业理想在幼教活动中发挥了重要作用。《幼儿教师职业标准》中提出作为幼儿教师要热爱学前教育事业，具有职业理想。职业理想作为理想的重要组成部分成为当前教师教育研究领域的热点。本研究目的：修订《中小学教师职业理想问卷》并检验其在幼儿群体中的信效度。方法：采用方便抽样法对两个样本共 540 名幼儿教师进行施测，其中第一次以 283 名幼儿教师为被试对问卷进行项目分析、探索性因素分析、内部一致性分析和结构效度分析，第二次以 257 名幼儿教师为被试对问卷对其进行验证性因素分析，间隔 3 周从第二批被试中选取 62 人进行重测。结果：修订的职业心理问卷包括 12 个题项，划分为职业认同、职业追求、职业素养 3 个维度，方差的总解释率为 64.11%；总问卷的内部一致性信度为 0.87，各维度的内部一致性信度为 0.67~0.84 之间，间隔 3 周后总问卷的重测信度为 0.76，各维度重测系数均在 0.5 以上。验证性因素分析显示，模型的各个拟合指数均达到了统计学的要求；修订的职业理想问卷总分和各维度之间存在高相关，各维度之间存在中相关，问卷具有较好的结构效度。结论：修订的职业理想问卷具有良好的信效度，可以作为测量幼儿教师职业理想的有效工具。

3 Key Laboratory of Philosophy and Social Sciences of Anhui Province for Adolescent Mental Health and Crisis Intelligent Intervention，Heifei，230601

Abstract：The professional ideal of teachers is the professional realm that teachers desire to achieve, and also the yearning and pursuit of the established goal. Preschool teachers, as the enlighteners and guides for the healthy growth of children, play a vital role in the development of preschool education in China. In recent years, the professional ideal of preschool teachers has played an important role in preschool education activities. "Professional Standards for preschool teachers" put forward that preschool teachers should love preschool education and have professional ideals. As an important part of ideal, professional ideal has become a hot spot in the field of teacher education research.The purpose of this study is to revise the Vocational Ideal Questionnaire for primary and secondary school teachers and test its reliability and validity in children.method:A total of 540 preschool teachers in two samples were tested by convenient sampling method. In the first instance, 283 preschool

teachers were used as subjects for questionnaire item analysis, exploratory factor analysis, internal consistency analysis and structural validity analysis. In the second instance, 257 preschool teachers were used as subjects for questionnaire validation factor analysis. A total of 62 participants were selected from the second batch for retesting at an interval of 3 weeks.Results: The revised occupational psychology questionnaire included 12 items, which were divided into three dimensions: occupational identity, occupational pursuit and professional accomplishment. The total interpretation rate of variance was 64.11%. The internal consistency reliability of the total questionnaire was 0.87, and the internal consistency reliability of each dimension was between 0.67 and 0.84. After the interval of 3 weeks, the retest reliability of the total questionnaire was 0.76, and the retest coefficient of each dimension was above 0.5. Confirmatory factor analysis showed that each fitting index of the model met the requirements of statistics. There is a high correlation between the total score of the revised career ideal questionnaire and each dimension, and there is a moderate correlation between each dimension, and the questionnaire has a good structural validity.Conclusion: The revised professional ideal questionnaire has good reliability and validity, and can be used as an effective tool to measure the professional ideal of preschool teachers.

我国近二十年心理健康教育课程热点与反思

——基于 CiteSpace 的分析

蔡若男[1] 郑显亮[1]（通讯作者）

1 赣南师范大学教育科学学院，赣州, 341000, zxl2004@sina.com

摘 要 近年来，我国心理健康教育课程发展迅速，并取得了显著成就，但学界对于课程研究热点演进的文章撰写较少，且少有运用量化分析的方法对其进行分析总结。据此，本研究运用信息可视化软件 CiteSpace，对 2003—2023 年中国知网数据库中，有关心理健康教育课程的 2596 篇中文期刊文献进行转化分析，并基于作者、机构、关键词进行制图，发现二十年来我国心理健康教育课程的热点呈现如下特点：（1）2003 年到 2023 年对心理健康教育课程的研究呈现持续上升的趋势，大量文献出现于 2007 年之后。（2）根据作者图谱发现，马红霞、张艳霞、张丽娜、张林和俞国良是统计范围内发文数量最多的五位作者，但从整体来看大多数研究者之间的合作较少。（3）根据机构图谱发现，该领域的发文量机构排名前 5 的是湖南商务职业技术学院、广西师范大学、华中师范大学、中国人民大学和广西财经学院。（5）根据关键词图谱发现，从内容上看，研究热点高频词可以归为 8 大类——大学生、心理健康、对策、高校、课程改革、课程思政、课程建设、学生。（6）从时间上看，2003-2010 年为前期探索阶段，出现词频或中心性较高的关键词有课程、教育、心理健康、高职院校等；2011-2018 年为初步发展阶段，出现词频或中心性较高的关键词有课程建设、教学内容、教学方法、心理教育等；2019-2023 年为快速发展阶段，出现词频或中心性较高的关键词有翻转课堂、课程思政、思政教育、核心素养、思政元素、线上教学等。（7）从类型上看，稳健型热点包括课程建设、心理健康、课程改革；渐强型热点包括核心素养、课程思政、教学设计。2003-2023 年心理健康教育课程在心理教学中的实际应用越来越广泛，本文旨在通过科学知识图谱来客观地揭示近年来我国心理健康教育课程的热点，对于深入了解心理健康教育课程在实际教学过程中的知识基础与演化进程具有一定的价值，并对此进行反思，进而为完善此类研究提供启示。

Hot Spots and Reflections of Mental Health Education Curriculum in China in the Past Two Decades — Based on Analysis of the Data of CiteSpace

Cai Ruonan[1] Zheng Xianliang[1]

1 School of Education Science, Gannan Normal University, Ganzhou, 34100, zxl2004@sina.com

***Abstract*：** In recent years, China's mental health education curriculum has developed rapidly and achieved remarkable achievements, but few articles have been written on the evolution of curriculum research hot spots, and few articles have used quantitative analysis to analyze and summarize them. Based on this, this study uses the information visualization software CiteSpace to translate and analyze 2596 Chinese journal literature on mental health education curriculum in CNKI database from 2003 to 2023, and maps based on authors, institutions and keywords, and finds that the hot spots of mental health education curriculum in China in the past two decades have shown the following characteristics: (1) The research on mental health education curriculum from 2003 to 2023 showed a continuous upward trend. A large body of literature appeared after 2007. (2) According to the author's

atlas, Ma Hongxia, Zhang Yanxia, Zhang Lina, Zhang Lin and Yu Guoliang are the five authors with the largest number of articles within the statistical range, but on the whole, most researchers cooperated less. (3) According to the institutional map, the top 5 institutions in this field are Hunan Vocational College of Commerce, Guangxi Normal University, Central China Normal University, Renmin University of China and Guangxi University of Finance and Economics. (5) According to the keyword map, from the content point of view, the research hot spots and high-frequency words can be classified into 8 categories: college students, mental health, countermeasures, colleges and universities, curriculum reform, curriculum ideology and politics, curriculum construction, and students. (6) From the perspective of time, 2003-2010 is the early exploration stage, and keywords with high word frequency or centrality include curriculum, education, mental health, vocational colleges, etc.; From 2011 to 2018, as the initial development stage, keywords with high word frequency or centrality included curriculum construction, teaching content, teaching methods, psychological education, etc.; From 2019 to 2023, the keywords with high word frequency or centrality include flipped classroom, curriculum ideology and politics, ideological and political education, core literacy, ideological and political elements, online teaching, etc. (7) From the perspective of type, stable hot spots include curriculum construction, mental health, and curriculum reform; Crescendo hot spots include core literacy, curriculum ideology and politics, and teaching design. From 2003 to 2023, the practical application of mental health education curriculum in psychological teaching is becoming more and more extensive, this paper aims to objectively reveal the hot spots of mental health education curriculum in China in recent years through scientific knowledge map, which has certain value for in-depth understanding of the knowledge base and evolution process of mental health education curriculum in the actual teaching process, and reflects on this, and then provides enlightenment for improving such research.

Keywords：Mental health education curriculum, knowledge graph, CiteSpace, visual analytics

感知压力与乡镇中学生的短视频成瘾：自我控制的中介作用与父母积极干涉/共用教养行为的调节作用

刘星畅[1] 邹佳晨[1] 张宇驰[1,2]（通讯作者） 蒋鑫睿[1] 王海悦[1] 张龄月[1]

1 江苏师范大学智慧教育学院教育技术系，江苏徐州 211116

2 江苏师范大学江苏省教育信息化工程研究中心，江苏徐州，211116，6020200039@jsnu.edu.cn

摘 要 近年，短视频已成为国内外青少年普遍使用的新型手机应用程序。由于短视频具有个性化算法推送等特性，导致青少年更容易对其上瘾。然而，目前对青少年短视频成瘾的研究非常有限。个别研究表明，短视频成瘾对青少年学业发展和心理健康发展具有消极作用。探讨影响青少年短视频成瘾的因素及其机制，不但有助于未来构建更全面系统的短视频成瘾理论，并且将为设计干预方案提供实证依据。与以往研究大多关注单一自身因素不同，本研究将综合考察多个生态系统水平因素的综合作用，以加深我们对短视频成瘾的理解。基于一般张力理论与社会生态系统理论，本研究建构了一个有调节的中介模型，旨在探讨学生自我控制在感知压力与短视频成瘾间的中介作用，以及父母积极干涉/共用教养行为（父母手机使用特定教养行为策略的一种）在后半段路径上的调节作用。与大多数研究采用中心城市样本与方便取样法不同，本研究采用整群随机取样法，通过招募我国江苏省某地三所高中（一所来自农村，两所来自县城）10 至 12 年级的 807 名高中生以获得更具有代表性的样本。研究采用抑郁-焦虑-压力量表中文版压力分量表、简明多维自我控制量表、父母中介（父母）分量表的自适应版本和 Facebook 成瘾量表的改编版本，并使用 SPSS23.0 软件及其 PROCESS 插件进行分析。结果发现:（1）自我控制在感知压力与短视频成瘾的正向关系间起显著的部分中介作用;（2）父母积极干涉/共用教养行为在自我控制与短视频成瘾之间起调节作用。具体来说：感知其父母采用高水平的积极干涉/共用教养行为对待自己的手机使用的学生，他们的自我控制与短视频成瘾之间的负相关程度更高;（3）有调节的中介效应模型成立。本研究采用更有代表性的取样方法，探讨了以往被忽视的中国乡镇高中生的短视频成瘾的影响因素与作用机制，加深了我们对于短视频成瘾影响因素及其作用机制的理解，并为设计基于家校合作的短视频成瘾干预方案提供了科学依据。

关键词 感知压力，自我控制，父母积极干涉/共用教养行为，短视频成瘾，手机成瘾

Perceived stress and short-form video addiction among rural Chinese high school students: the mediating role of self-control and the moderating effect of active mediation/co-use

Xingchang Liu[1] Jiachen Zou[1] Yuchi Zhang[1,2] Xinrui Jiang[1] Haiyue Wang[1] Lingyue Zhang[1]

[1] Department of Educational Technology, School of Smart Education, Jiangsu Normal University, Xuzhou, China

[2] Jiangsu Engineering Research Center of Educational Informatization, Jiangsu Normal University, Xuzhou, China

***Abstract*:** In recent years, Short-form video applications (apps) have been thriving among adolescents worldwide. Short-form video addiction (SVA) is a type of mobile phone addiction, and its algorithm-driven tailored patterns and convenient video capture functions provide adolescents with exciting and highly attractive entertainment. A growing body of research has become concerned about the negative effects of SVA on teens' academic and mental health development. Exploring the factors and mechanisms that affect adolescents' SVA not only contributes to the future theoretical construction of SVA, but also provides evidence for schools to develop culture-sensitive programs to prevent SVA. Unlike previous studies that mostly focused on a single self-level factor, this study will comprehensively examine the combined effects of multiple ecological system-level factors to obtain more profound, comprehensive, and enlightening results. According to the general strain theory and the social-ecological system theory, we constructed a moderated mediation model with students' self-control as a mediating factor and parental active mediation/co-use as moderating factors in the latter part of the mediation pathway in the association between stress and Chinese adolescents' SVA. Unlike most studies that used central city samples and convenience sampling, we use a convenience sampling method, 807 participants (45.0% male, N =807) in grades 10 to 12 from three high schools (one rural and two from the county) in Yancheng City. The stress subscale of the Chinese version of the Depression-Anxiety-Stress Scale, the Brief Multidimensional Self-Control Scale, the parental mediation subscale (parents) and the Facebook Addiction Scale were used to assess, and analyze by using SPSS 23.0 and PROCESS. The results show that (1) Self-control mediated the positive link between students' stress and SVA; (2) Active mediation/co-use significantly moderated the link between self-control and SVA. Specifically, negative association between self-control and SVA was stronger for participants with high parental active mediatio n/co-use levels; (3)A moderated mediation model was established. This empirical study is the first to examine the complex mechanism of stress related to SVA among high school students, and the implications of the findings for school practitioners and recommendations for future research are discussed.

***Keywords*:** Perceived stress, Self-control, Active mediation/co-use, Short-form video addiction, Mobile phone addiction

视听觉统合训练对 6-8 岁 ADHD 儿童注意力稳定性的干预效果

杨夕淳 [1]
1 成都市沙堰小学，成都，610045，770837417@qq.com

摘 要　注意缺陷多动障碍（ADHD）作为一种神经发育行为障碍性疾病，目前我国小学生注意缺陷多动障碍的患病率逐年攀升。近年来注意缺陷多动障碍的治疗研究主要有行为干预、物理干预和药物干预等。而这些中的大多数方法因需要场地、器材以及高专业水平而难以在小学教学中形成周密的教育方案及大范围的教学实践，视听觉统合训练相对而言更容易实施和推广。注意力稳定性作为注意功能的基础，决定了注意较为高级的方面（选择性注意、注意转移）和一般认知能力的效力，对低学龄段儿童的规范化学习效果影响较大。因而本研究探讨视听觉统合训练对 6-8 岁注意缺陷多动障碍儿童注意力稳定性的干预效果。实验招募 60 名注意缺陷多动障碍儿童为研究对象，随机分至实验组和对照组。实验一采用单因素被试间设计，以划消测验和舒尔特方格测验前后差异作为指标考察视听觉统合训练对 6-8 岁注意缺陷多动障碍儿童注意力稳定性的干预效果。实验二采用 2（视听觉统合训练/不训练）╳2（家长关注高/低）的混合实验设计以划消测验和舒尔特方格测验前后差异作为指标考察干预效果。研究重点探究视听觉统合训练对注意缺陷多动障碍儿童注意力稳定性的影响，为采用视听觉统合训练改善注意缺陷多动障碍儿童的注意功能的课程提供实验依据和参考。

关键词　视听觉统合训练，注意缺陷多动障碍，注意力稳定性

Intervention of visual and auditory integration training on attention stability of 6-8 year old children with ADHD

Xiting Yang
Chengdu Shayan primary School，No.96 Shayan Street, Wuhou District, Chengdu

Abstract：Attention deficit hyperactivity disorder (ADHD) is a neurodevelopmental behavioral disorder, and the prevalence rate of ADHD in primary school students is increasing year by year. In recent years, the treatment of attention deficit hyperactivity disorder mainly includes behavioral intervention, physical intervention and drug intervention. However, due to the need of sites, equipment and high professional level, most of these methods are difficult to form a thorough education program and a wide range of teaching practices in primary school teaching, and visual and auditory integration training is relatively easier to implement and promote. As the basis of attention function, attention stability determines the effectiveness of higher aspects of attention (selective attention, attention transfer) and general cognitive ability, and has a great influence on the standardized learning effect of children at low school age. Therefore, this study investigated the effect of visual and auditory integration training on attention stability of 6-8 year old children with attention deficit hyperactivity disorder. Sixty children with attention deficit hyperactivity disorder were recruited and randomly divided into experimental group and control group. In experiment 1, the effects of visual and auditory integration training on attention stability in children with attention

deficit hyperactivity disorder (ADHD) aged 6-8 years were investigated by using the difference between elimination test and Schulte grid test. In experiment 2, the mixed experimental design of 2 (integrated visual and auditory training/no training) based on the difference before and after the cancellation test and the Schulte square test was used as an indicator to investigate the intervention effect. This study focuses on the influence of visual auditory integration training on attention stability of children with attention deficit hyperactivity disorder, and provides experimental basis and reference for the course of improving attention function of children with attention deficit hyperactivity disorder by visual auditory integration training.

Keywords：visual and auditory integration training, attention deficit hyperactivity disorder, attention stability

大学生就业压力对心理健康的影响：孤独感和家庭功能的作用

温馨[1]　高洁[2]（通讯作者）

1 仲恺农业工程学院心理健康教育与咨询中心，广州，510225；

2 华南师范大学心理学院，广州，510631，jiegao@m.scnu.edu.cn

摘　要　就业是最大的民生，受到疫情的冲击，高校毕业生就业形势严峻，应届毕业生的就业压力也较以往更大。以往研究表明就业压力是损害应届毕业生心理健康最重要的因素之一。压力事件会引发孤独感，而家庭的支持可以补偿这种孤独感。因此，本研究想要探讨就业压力是否会通过孤独感损害应届毕业生的心理健康，以及家庭功能是否能够帮助抵御这种负性影响。

本研究采用就业压力问卷、世界卫生组织心理健康自评问卷、孤独量表和家庭功能问卷对某高校2347名大四毕业生施测，结果发现：（1）就业压力对心理健康有负向预测作用，压力感越强，对心理健康的破坏程度越大；（2）孤独感在就业压力和心理健康之间起中介作用，就业压力的增加会诱发孤独感，进而对心理健康产生不良影响；（3）家庭功能在就业压力和心理健康之间起中介作用，家庭功能良好者能利用家庭支持有效降低压力对心理健康的损害作用（4）孤独感和家庭功能在就业压力和心理健康之间起链式中介作用，就业压力和孤独感水平的增加会使个体积极寻求社会支持来做压力应对，家庭功能良好的个体能有效地应对压力感和孤独感，从而维护心理健康平衡。

本研究表明，应届毕业生的就业压力会导致个体更多的封闭自我，从而更容易导致心理健康问题，而来自家庭的关心和支持则能够帮助个体提高应对水平，最大程度地减小就业压力对心理健康的危害。

The influence of employment pressure on mental health of college students——The role of loneliness and family function

Xin Wen[1]　Jie Gao[2]

1 Mental Health Education and Counseling Center,Zhongkai University of Agriculture and Engineering,　Guangzhou, 510225；

2 School of Psychology, South China Normal University, Guangzhou,510631，

jiegao@m.scnu.edu.cn

Abstract：Employment is the biggest livelihood, affected by the COVID-19, the employment situation of college graduates is grim, and the employment pressure of graduates is greater than ever. Previous studies have shown that employment pressure is one of the most important factors that damage the mental health of graduates. Stressful events can trigger feelings of loneliness, which can be compensated for by family support. Therefore, this study explored whether employment stress can damage the mental health of graduates through loneliness, and whether family function can help counter this negative effect.

Employment Stress Questionnaire, World Health Organization Mental Health Self-assessment Questionnaire, Loneliness Scale and Family Function Questionnaire were used to measure 2347 senior college graduates. The results showed that: (1) Employment stress has a negative predictive effect on mental health. The stronger the sense of stress, the greater the degree of damage to mental health; (2) Loneliness plays a mediating role between employment pressure and mental health, and the increase of employment pressure will induce loneliness, which will have a negative impact on mental health; (3) Family function plays a mediating role between employment stress and mental health, and family function can effectively reduce the damaging effect of employment stress on

mental health by using family support. (4) Loneliness and family function play a chain mediating role between employment stress and mental health. The increase of employment stress and loneliness will lead individuals to seek social support to cope with stress. And family function can effectively cope with feelings of stress and loneliness, thereby maintaining a mental health.

This study shows that the employment pressure of graduates will lead to isolation, and therefore induce mental health problems, and the care and support from families can help individuals improve their coping ability and decrease the harm of employment pressure on mental health.

课后三点半亲子沟通心理健康教育课程对小学生主观幸福感的干预研究

吴桂翎[1,2]（通讯作者）王颜瑞[1]
1 合肥师范学院教育与心理科学学院，合肥，230601
2 安徽省学生心理健康教育指导和发展中心，合肥，230601，979130741@qq.com

摘 要 现阶段小学心理健康教育课程主要以班级为单位，面向全体学生，旨在提升全体学生的心理素质，在实践中很难针对个别学生心理状况进行深入干预。在“双减”政策背景下，“课后三点半课堂”尝试针对学生的实际心理需求提供心理健康教育“个性化课程”对小学减负赋能具有重要意义。主观幸福感是指自身对生活的总体性评价，是儿童心理健康的重要指标。已有研究证实亲子沟通对儿童主观幸福感有显著的正向预测作用，但尚未有研究通过提高亲子沟通水平对儿童主观幸福感进行干预。本研究在“课后三点半课堂”中通过开展以亲子沟通为教学内容的心理健康教育课程干预，旨在考察亲子沟通心理健康教育课程是否能够有效提升小学生的主观幸福感。研究在某小学 5 年级学生中通过招募方式选取 30 名学生，随机分为实验组和对照组，对实验组进行每周一次、为期十周的亲子沟通心理健康教育课程干预，对照组不进行任何干预。采用幸福感指数量表以及亲子沟通问卷对实验组和对照组实施前测和后测，以检验心理健康教育课程干预的有效性。结果表明：（1）实验组亲子沟通后测得分显著高于前测，并显著高于对照组后测得分；（2）实验组主观幸福感后测得分显著高于前测，并显著高于对照组后测得分。研究验证了基于亲子沟通的心理健康教育课程对小学生的主观幸福感干预的有效性，为完善小学“课后三点半”心理健康教育课程建设提供了实证依据。

An intervention study on subjective well-being of primary school students in an after-school 3:30 parent-child communication mental health education programme

Guiling Wu[1,2] (Corresponding author)Yanrui Wang[1]
1College of Education and Psychological Science, Hefei Normal University, Hefei, 230601
2Anhui Student Mental Health Education Guidance and Development Centre, Hefei, 230601，
979130741@qq.com

Abstract： At the present stage, primary school mental health education programmes are mainly class-based and oriented to all students, aiming to improve the psychological quality of all students, and in practice, it is difficult to carry out in-depth interventions for the psychological conditions of individual students. Under the background of the "Double Reduction" policy, the "After-school Three-and-a-half Points Classroom" attempts to provide a "personalised curriculum" for mental health education according to the actual psychological needs of students,

which is of great significance to reduce the burden of primary schools and empower them. The subjective sense of well-being refers to one's perception of one's own well-being. Subjective well-being refers to the overall evaluation of one's own life, and is an important indicator of children's mental health. Parent-child communication has been shown to have a significant positive predictive effect on children's subjective well-being, but no studies have been conducted on interventions to improve children's subjective well-being through parent-child communication. In this study, we examined whether a mental health education programme on parent-child communication was effective in improving the subjective well-being of primary school students in an after-school three-and-a-half hour classroom. Thirty primary school students were recruited and randomly divided into an experimental group and a control group. The experimental group was given a 10-week weekly intervention in parent-child communication and the control group was not given any intervention. A pre-test and a post-test were administered to the experimental and control groups using the Index of Happiness scale and the Parent-Child Communication Questionnaire to test the effectiveness of the mental health education programme intervention. The results showed that (1) the experimental group's scores on the parent-child communication posttest were significantly higher than those on the pretest and significantly higher than those on the control group's posttest; (2) the experimental group's scores on the subjective well-being posttest were significantly higher than those on the pretest and significantly higher than those on the control group's posttest. The study verified the effectiveness of the parent-child communication-based mental health education programme on the subjective well-being of primary school students, and provided empirical evidence for the improvement of the construction of the "three and a half minutes after school" mental health education programme in primary schools.

初一学生感知教师情感支持与学校适应的关系研究

汤彩云[1]　王阳茜[2]（通讯作者）

1 南宁市天桃实验学校教育集团，南宁，530000

2 华南师范大学心理学院，广州，510631，通讯作者 E-mail: wangyangqian718@163.com

摘 要 以小升初为代表的学校转变是青少年早期须面临的重要转折事件，往往伴随着更大的学业压力与诸多陌生环境挑战，学校适应问题也就尤为凸显。在这一过程中，感知教师情感支持可能是初一学生顺利适应环境变化的支持性资源。在对其他群体的研究表明，感知教师情感支持可以显著影响学校适应，但具体到初一学生群体的研究较少，且当前研究多为横向研究。本研究采用学校适应量表和感知教师情感支持量表，对初一学生进行三次追踪，每次追踪间隔两个月，经整理最终收集有效被试 984 人（男生占比 40.04%）。交叉滞后分析结果发现：（1）T1 时间点的感知教师情感支持可以显著正向预测 T2 时间点的学校适应（$\beta = 0.199$，$p < 0.001$），T2 时间点的感知教师情感支持可以显著正向预测 T3 时间点的学校适应（$\beta = 0.057$，$p < 0.05$）；（2）T1 时间点的学校适应也可以预测 T2 时间点的感知教师情感支持（$\beta = 0.141$，$p < 0.001$），T2 时间点的学校适应也可以预测 T3 时间点的感知教师情感支持（$\beta = 0.168$，$p < 0.001$）。从交叉滞后的回归系数来看，两个方向的交叉滞后回归系数均显著，推断感知教师情支持和学校适应之间存在相互作用关系。即学生感知教师情感支持水平越高，其后的学校适应水平也越高；反之，适应结果也会影响到感知教师情感支持，即学生学校适应得越好，其后感知到的教师情感支持也越多。研究结果支持动态相互作用模型，因此在后续研究中，可以通过提升初一学生的感知教师情感支持，以促进其学校适应水平。

Study on the Relationship between Perceived Teacher's Emotional Support and School Adjustment of Junior School Freshmen

Caiyun Tang[1], Yangqian Wang[2] (Corresponding author)

[1] Nanning Tiantao Experimental School Education Group, Nanning, 530000

[2] School of Psychology, Southo China Normal University, Guangzhou, 510631

Abstract: The transition from primary to junior school represents a crucial turning point for early adolescents, as they encounter increased academic pressure and navigate unfamiliar environments. The problem of school adaptation is particularly prominent. In this process, perceived teacher emotional support may be a supportive resource for junior school students in adjust to environmental changes. Previous studies have shown that perceived teacher's emotional support can significantly influence school adjustment, but there are few studies on junior school freshmen groups, and most of them are horizontal studies. School Adjustment Scale and Perceived Teacher's Emotional Support Scale were used to track junior school freshmen for three times, each tracking interval of two months, and finally collected 984 effective questionnaires after sorting (boys accounted for 40.04%). Cross-lag model analysis showed that: (1) T1 perceived teacher's emotional support could significantly positively predict T2 school adjustment(β=0.199, p<0.001), T2 perceived teacher's emotional support could significantly positively predict T3 school adjustment(β=0.057, p<0.05).(2) School adjustment in T1 could significantly positively predict perceived teacher's emotional support in T2(β=0.141, p<0.001), and School adjustment in T2 could significantly positively predict perceived teacher's emotional support in T3(β=0.168, p<0.001). From the cross-lag regression coefficients, the both directions were significant, it can be inferred that there is an interactive relationship between perceived teacher's emotional support and school adjustment. In other

words, a high level of perceived teacher's emotional support may lead to a high level of school adjustment, while a high level of school adjustment may lead to a high level of perceived teacher's emotional support. The research results supports the dynamic interaction model, the perceived teacher's emotional support of junior school freshmen can be improved to promote their school adjustment in the follow-up studies.

近十年重庆地区大学新生心理健康变迁的纵向研究

李小鹏　黄炼旗

重庆三峡学院，重庆·万州，404100，1004143896@qq.com

摘 要　近年来大学生心理健康问题日益受到社会各方的关注，然而大学生的心理健康水平是否得到改善呢？这是值得探讨的问题。以往大多研究聚焦于横向研究，对于心理健康水平是否改变缺乏数据支持。为考察重庆地区大学新生心理健康水平随年代的变迁趋势，本研究采用纵向研究的方法对重庆某高校2013-2022年间大一新生（47009人）入学时90项症状自评量表（SCL-90）的测评数据进行综合分析。研究发现：（1）“强迫”、“人际关系敏感”、“焦虑”、“敌对”、“偏执”、“精神病性”6个因子与年代呈显著负相关（P<0.001），表明在这6个维度上大学新生心理健康状况逐年变好。“抑郁”、“恐怖”因子与年代呈显著正相关（P<0.001），表明在这2个因子上，大学新生心理健康状况逐年恶化，此外，“躯体化”与年代不相关（P>0.05）；（2）不同性别学生在9个因子上的得分女性显著高于男性（P<0.001），分别对不同性别学生与年代之间的相关分析发现，在“躯体化”和“焦虑”因子上出现分化，男性随着年代变化因子得分逐渐下降，但女性呈上升趋势，表明男性在这两个维度心理健康状况在逐年变好，而女性有下降趋势；（3）文理科学生在9个因子上得分文科学生显著高于理科学生（P<0.001），与年代进行相关分析发现文科学生在“人际关系敏感”、“焦虑”、“精神病性”因子上与年代相关不显著（P>0.05），而理科学生在这些因子上均显著负相关（P<0.001）。总体来说，近十年来大学生心理健康状况逐渐在好转，但是在部分维度仍然呈现恶化趋势，比如抑郁、焦虑等心理问题。此外，不同群体心理健康状况变化趋势呈现差异性，这也为我们进一步提供干预支持提供了方向。

A longitudinal study on the mental health changes of freshmen in Chongqing in recent ten years

Li Xiaopeng　Huang Lianqi

Chongqing Three Gorges University, Wanzhou, Chongqing

Abstract：In recent years, the mental health problems of college students have attracted increasing attention from all sectors of society. However, has the mental health level of college students been improved ? This is a question worth discussing. In the past, most studies focused on horizontal research, and there was no data support for whether the mental health level changed. In order to investigate the changing trend of freshmen's mental health level in Chongqing with the years, this study used a longitudinal research method to comprehensively analyze the evaluation data of 90 symptom checklist-90 (SCL-90) of freshmen (47,009 students) in a university in Chongqing from 2013 to 2022. The findings are as follows: (1) The six factors of compulsion, interpersonal sensitivity, anxiety, hostility, paranoia and psychosis are negatively correlated with years (P<0.001), which indicates that the mental health status of freshmen in these six dimensions is getting better year by year. The factors of "depression" and "terror" were positively correlated with the age (P<0.001), which indicated that the mental health status of freshmen was deteriorating year by year, and "somatization" was not related to the age (P > 0.05). (2) The scores of female students of different sexes in nine factors are significantly higher than those of male students (P<0.001).

The correlation analysis between students of different sexes and years shows that there is differentiation in the factors of "somatization" and "anxiety", and the scores of male students gradually decrease with the change of years, but the scores of female students show an upward trend, indicating that the mental health status of male students in these two dimensions is getting better year by year, while that of female students has a downward trend; (3) The scores of liberal arts students in nine factors are significantly higher than those of science students (P<0.001), and the correlation analysis with years shows that liberal arts students are not significantly correlated with years in interpersonal sensitivity, anxiety and psychosis (P>0.05), while science students are significantly negatively correlated with these factors (P<0.001). Generally speaking, the mental health status of college students has gradually improved in recent ten years, but it is still deteriorating in some dimensions, such as depression, anxiety and other psychological problems. In addition, the changing trend of mental health status of different groups is different, which also provides a direction for us to further provide intervention support.

初中生负性生活事件与生命意义感的关系研究：自尊和应对方式的链式中介作用

荆效闫[1]　姚本先[1,2]（通讯作者）
1.合肥师范学院教育与心理科学学院，合肥，230601
2.安徽省学生心理健康教育指导中心，合肥，230601，ybx7756@126.com

摘 要　生命意义感是心理健康的保护因素，对学生的心理以及身体都会产生一定的影响。它的缺失不仅会损害个体的心理健康,还会导致其社会功能适应不良。根据生态系统理论，个体周围的环境会影响个体的身体和心理，负性生活生活事件作为外部的环境，经研究发现会对初中生的生命意义感产生影响。本研究包括两个部分，研究一使用生命意义感问卷（MLQ）、青少年生活事件量表（ASLEC）、罗森伯格自尊量表（SES）以及简单应对方式问卷(SCSQ)对安徽省内的 1556 名初中生进行调查，探讨负性生活事件、生命意义感、自尊以及应对方式四者之间的关系。研究二以 40 名生命意义感较低的初中生作为研究对象，采用团体辅导的形式对应对方式和生命意义感进行干预，对有效数据进行分析，研究结果如下:（1）负性生活事件负向预测生命意义感。（2）负性生活事件不仅可以通过自尊、应对方式的中介作用预测生命意义感，而且还可以通过自尊和应对方式的链式中介作用预测生命意义感。（3）团体辅导显著提升初中生的积极应对方式以及生命意义感的水平。本研究着重探讨初中生负性生事件对生命意义感的影响及其内在机制，为提升初中生生命意义感的水平提供了实证依据。
关键词　生命意义感，负性生活事件，自尊，应对方式

A study of the relationship between negative life events and sense of meaning in life among middle school students: the chain mediating role of self-esteem and coping styles

Jing Xiaoyan[1], Yao Benxian[1,2] (Corresponding author)
1 Faculty of Education and Psychological Sciences, Hefei Normal University, Hefei 230601, China
2 Anhui Student Mental Health Education Guidance Center, Hefei 230601, China

Abstract: A sense of meaning in life is a protective factor for mental health and can have an impact on students' psychological as well as physical well-being. Its absence not only damages the psychological health of individuals, but also leads to maladaptation of their social functions. According to the ecosystem theory, the environment around an individual affects the individual physically and psychologically, and negative life events, as the external environment, have been found to affect middle school students' sense of meaning in life. This study consists of two parts. Study 1 used the Meaning of Life Questionnaire (MLQ), the Adolescent Life Events Scale (ASLEC), the Rosenberg Self-Esteem Scale (SES), and the Simple Coping Style Questionnaire (SCSQ) to survey 1,556 junior high school students in Anhui Province to explore the relationship between the four components of negative life

events, sense of meaning of life, self-esteem, and coping styles. In Study 2, 40 junior high school students with a low sense of meaning in life were used as research subjects, and group counseling was used to intervene in coping styles and sense of meaning in life, and the valid data were analyzed, and the results of the study were as follows: (1) Negative life events negatively predicted the sense of meaning in life. (2) Negative life events not only predicted sense of meaning of life through the mediating role of self-esteem and coping styles, but also predicted sense of meaning of life through the chain mediating role of self-esteem and coping styles. (3) Group counseling significantly enhanced middle school students' positive coping styles, as well as their sense of meaning in life. This study focuses on the effects of negative life events on junior high school students' sense of meaning of life and their internal mechanisms, and provides empirical evidence to enhance the level of junior high school students' sense of meaning of life.

中学生校园氛围感知与学习心流体验的关系：影响模型及其干预研究

许亚男[1]　姚琼[1,2]（通讯作者）
1 合肥师范学院教育与心理科学学院，合肥，230601
2 安徽省学生心理健康教育指导中心，合肥，230601，120400298@qq.com

摘 要　心流体验（Flow）也称沉浸体验，是个体将精力完全投入于一项活动时的心理状态，学习心流体验是指当学生在进行学习活动时，个体的学习兴趣被激发，并能够持续地全身心投入于当前的活动中，有利于促进个体学业成绩的提高和身心健康发展。中学生主要的活动场所为学校，良好的校园氛围有利于调动学生的积极性，提高学习效率。本研究将心流体验与中学生的校园氛围感知相结合，研究中学生学习心流体验的影响因素，增强中学生的学习心流体验，以《青少年学习沉醉感量表》、《积极心理资本问卷》、《校园氛围问卷》为研究工具，选取安徽省合肥市初中、高中学校各一所共 1022 名学生进行问卷调查，探究二者之间的影响关系以及心理资本的中介作用。研究的主要结果如下：
1.中学生校园氛围感知水平处于中等；中学生心理资本的整体状况较好，高中生较初中生具有更高的韧性和自我效能水平； 初中生学习心流体验得分中等，高中生学习心流体验得分低于理论中值，沉浸体验状况一般。
2.中学生学校氛围感知、心理资本和学习心流体验两两之间存在显著正相关。
3.心理资本是中介变量，在学校氛围与学习心流体验之间起部分中介作用。
4.心理资本团体心理辅导能有效提升高中生自心理资本水平并增强中学生学习心流体验。
关键词　中学生，学校氛围，心理资本，学习心流体验，干预研究

The relationship between middle school students' campus atmosphere perception and learning flow experience: an influence model and its intervention

Xu Yanan[1], Yao Qiong[1,2] (Corresponding author)
1 Faculty of Education and Psychological Sciences, Hefei Normal University, Hefei 230601, China
2 Anhui Student Mental Health Education Guidance Center, Hefei 230601, China

Abstract: Flow experience, also known as immersion experience, is a psychological state when an individual fully invests his or her energy in an activity. Learning flow experience means that when students are engaged in learning activities, they can arouse the individual's interest in learning and continuously devote themselves to the current activities, which can promote the improvement of individual academic performance and physical and mental health development. The main activity place for middle school students is the school, and a good campus atmosphere is conducive to mobilizing students' enthusiasm and improving learning efficiency.This study combines flow experience with middle school students' perception of campus atmosphere, studies the influencing factors of middle school students' learning flow experience, and enhances the middle school students' learning flow experience. The research tools are "Adolescent Learning Immersion Scale", "Positive Psychological Capital Questionnaire" and "Campus Atmosphere Questionnaire". A total of 1022 students from one middle school and one high school in Hefei, Anhui province were selected to conduct a questionnaire survey to explore the

relationship between them and the mediating role of psychological capital. The main findings of the study are as follows:

1. Middle school students' perception level of campus atmosphere is medium; The overall psychological capital of middle school students is better, and high school students have higher resilience and self-efficacy than middle school students. Middle school students' learning flow experience score was medium, high school students' learning flow experience score was lower than the theoretical median, and the immersion experience status was average.

2. There is a significant positive correlation between middle school students' perception of school atmosphere, psychological capital and learning flow experience.

3. Psychological capital is a mediating variable, which plays a partial mediating role between school atmosphere and learning flow experience.

4. Psychological capital group counseling can effectively improve the level of high school students' self-psychological capital and enhance the learning flow experience of middle school students.

初中生家庭环境、自我概念与学校适应的关系研究

姚本先[1,2]　荆效闫[1]

1 合肥师范学院教育与心理科学学院，合肥，230601，ybx7756@126.com

2 安徽省学生心理健康教育指导和发展中心，合肥，230601

摘 要　学校适应是学生在参与学校环境过程中的综合表现，主要包含学生的学业行为、同伴关系、情绪情感等等，是学生与学校环境相互作用的结果。经研究发现学校适应与家庭环境、自我概念分别存在相关关系。为调查我国初中生家庭环境、自我概念和学校适应的状况，并探讨初中生家庭环境、自我概念和学校适应三者之间的关系。本研究采用家庭环境量表中文版(FES-CV)、自我描述量表（SDQII）、初中生学校适应问卷，对合肥市的三所初中学校的 754 名初中生进行调查，选用 SPSS25.0 和 SPSS 宏程序 Process 进行数据统计分析，通过对数据的分析得出如下结论：（1）初中生的学校适应整体处于中等水平，九年级学生的学校适应要整体好于七、八年级。（2）初中生家庭环境和学校适应之间存在显著相关。（3）自我概念在家庭环境与学校适应之间起中介作用。据研究结论提出以下建议:（1）要培养七、八年级学生良好的学习习惯、鼓励他们积极参与课堂活动、促进社交交往。（2）要建立有效的家庭沟通模式，家庭成员之间要注重倾听和交流，在生活中互相支持、关心和鼓励，学会正确表达和处理情绪，避免矛盾的产生。（3）教师、家长在教育过程中应以赞赏的眼光发现学生的优秀之处，让优秀点成为学生良好自我概念的发展立足点。

A study of the relationship between home environment, self-concept and school adjustment among middle school students

Yao Benxian[1,2], Jing Xiaoyan[1]

1 Faculty of Education and Psychological Sciences, Hefei Normal University, Hefei 230601, China

2 Anhui Student Mental Health Education Guidance Center, Hefei 230601, China

Abstract:School adjustment is the comprehensive performance of students in the process of participating in the school environment, which mainly includes students' academic behavior, peer relationships, emotions and feelings, etc., and is the result of the interaction between students and the school environment. It has been found that school adjustment is related to family environment and self-concept respectively. In order to investigate the status of family environment, self-concept and school adjustment of junior high school students in China, and to explore the relationship between family environment, self-concept and school adjustment of junior high school students, this study used the Family Environment Scale (FES) in Chinese. In this study, 754 junior high school students from three junior high schools in Hefei City were surveyed using the Family Environment Scale Chinese Version (FES-CV), Self-Description Inventory (SDQII), and Junior High School Adaptation Questionnaire, and SPSS 25.0 and the SPSS macro program Process were selected for statistical analysis of the data, which led to the following conclusions through the analysis of the data: (1) Junior high school students' school Adaptation as a whole is at a moderate level, and the school adaptation of ninth grade students is better than that of seventh and eighth grades as

a whole. (2) There is a significant correlation between middle school students' home environment and school adjustment. (3) Self-concept mediates the relationship between home environment and school adjustment. Based on the findings, the following recommendations were made: (1) Cultivate good study habits, encourage active participation in classroom activities, and promote social interactions among students in grades 7 and 8; (2) Establish an effective home environment for middle school students; and (3) Establish an effective home environment for middle school students. (2) An effective family communication model should be established. Family members should emphasize listening and communication, support, care and encourage each other in life, and learn to express and deal with emotions correctly to avoid conflicts. (3) Teachers and parents should discover students' excellence with appreciation in the process of education, so that the excellence point can become a foothold for the development of students' good self-concept.

摘 要　学校适应对初中生的成长发展具有重要的影响，学校生活适应的良好与否不仅影响初中学生的心理健康发展，也会影响其成年后的社会适应。因此，对于初中生来说，适应学校生活是非常重要的发展任务，以往研究表明成长型思维、心理弹性以及父母情感温暖与中学生学校适应密切相关，为探明其内在心理机制，本研究使用成长思维量表、学校适应问卷、心理韧性量表和父母情感温暖量表通过整群抽样对 820 名初中生进行问卷调查，使用 SPSS 25.0、PROCESS 和 AMOS21.0 进行结构方程模型分析。结果显示：（1）初中生的成长型思维与心理弹性、学校适应均呈显著正相关（r=0.41，p<0.01；r=0.44，p<0.01），心理弹性与学校适应也呈显著正相关关系（r=0.58，p<0.01）。父母情感温暖与成长型思维、心理弹性和学校适应之间均呈显著正相关关系（r=0.24，p<0.01；r=0.52，p<0.01；r=0.35，p<0.01）（2）初中生的成长型思维可以直接显著正向预测学校适应（B=0.25，95%CI[0.19，0.31]），也可以通过心理弹性间接影响学校适应（B=0.20，95%CI[0.15，0.25]）。（3）心理弹性在成长型思维与初中生学校适应间的中介路径的前半段受到父母情感温暖的调节，相对于父母情感温暖水平低的初中生（β=0.43，t=9.81，p<0.001），高父母情感温暖水平的初中生的心理弹性在成长型思维对学校适应预测关系中的中介效应更强（β=0.25，t=5.29，p<0.001）。结论：成长型思维会直接影响初中生学校适应，也通过心理弹性间接影响学校适应；心理弹性在成长型思维与学校适应间的中介路径的前半段受到父母情感温暖的调节。因此，提高初中生的心理弹性水平、给予初中生更多的关心与理解、父母采用积极的养育方式能更好地促进初中生适应学校生活。

关键词　成长型思维，心理弹性，父母情感温暖，学校适应

The Effect of Growth Mindset on Junior High School Students' School adjustment: The Mediating Effect of Psychological Resilience and the Moderating Effect of Parents' Emotional Warmth

Xu Beibei[1], Liu Yinxue[1], Sang Qingsong[1]

College of Education Sciences, Anhui Normal University, Wuhu, 241000

Abstract: School adjustment has an important impact on the growth and development of junior high school students, and the good adjustment of school life not only affects the mental health development of junior high school students, but also affects their social adjustment in adulthood. Therefore, for junior high school students, adapting to school life is a very important developmental task, and previous studies have shown that growth mindset, psychological resilience and parental emotional warmth are closely related to school adjustment of junior high school students. In order to explore their internal psychological mechanisms, this study used the Growth Mindset Scale, School Adjustment Questionnaire, Psychological Resilience Scale and Parental Emotional Warmth Scale to survey 820 junior high school students through a cluster sample, and structural equation model analysis using SPSS 25.0, PROCESS and AMOS21.0. The results showed that: (1) Junior high school students' growth mindset was positively correlated with psychological resilience and school adjustment (r=0.41, p<0.01; r=0.44, p<0.01). Psychological resilience and school adjustment were also positively correlated ($r=0.58$, $p<0.01$). There

was a significant positive correlation between parents' emotional warmth and growth mindset, psychological resilience and school adjustment (r=0.24, p<0.01; r=0.52, p<0.01; r=0.35, p<0.01) (2) The growth mindset of junior high school students can directly predict school adjustment significantly positively (B=0.25, 95% CI [0.19, 0.31]) or indirectly affect school adjustment through psychological resilience (B=0.20, 95% CI [0.15, 0.25]). (3) Psychological resilience was regulated by parental emotional warmth in the first half of the mediating path between growth mindset and junior high school students' school adjustment, and compared with junior high school students with low parental emotional warmth level (β=0.43, t=9.81, p<0.001), the psychological resilience of junior high school students with high parental emotional warmth level had a stronger mediating effect on the school adjustment prediction relationship (β=0.25, t=5.29, p<0.001). Conclusion: Growth mindset directly affects the school adjustment of junior high school students, and also indirectly affects school adjustment through psychological flexibility. Psychological resilience is moderated by the parental emotional warmth in the first half of the mediating path between growth mindset and school adjustment. Therefore, improving the psychological resilience level of junior high school students, giving them more care and understanding, and parents adopting positive parenting styles can better promote junior high school students to adapt to school life.

Keywords: Growth mindset; Psychological resilience; Emotional warmth of parents; School adjustment

贫困生心理健康影响因素及其研究启示

杨众望

南京中医药大学医学院，南京，210046

摘 要 贫困生一直是高校重点关注的学生群体，同时备受学界的关注。新时代的中国，尤其是在全面建成小康社会后、全面建设社会主义现代化国家新征程的时代背景下，高校贫困生不再是物质层面的匮乏，更多倾向于心理健康层面的不足。近年来，诸多研究学者从心理健康角度入手探究了贫困生受污名化、歧视知觉等诸多影响以及干预措施。污名化的贫困生在人际情境中颇受阻碍，常体验到受排斥而自我退缩，极易产生消极自我预期，不利于心理健康；长期受排异的知觉具有长期性，产生的歧视知觉更具有损害心理健康的泛化性。有研究表明，歧视知觉高的贫困生其孤独感愈高，这阻碍贫困生接纳社会提供支持性帮助。新近的研究成果如集体仪式、自然体验等为改善贫困生心理健康提供助益。大学环境对贫困生进行仪式行为塑造，利于增强其与更广泛大学生群体认同及提升群体凝聚力，仪式行为促进群体凝聚力和情绪感染，使贫困生产生积极情感体验，主观社会支持也会增多，个体幸福感就会增加，进而提升心理健康。这与自然体验能减少消极行为有类似助益。基于此，本文分别从贫困生心理健康影响因素、影响机制、干预措施等方面进行了总结梳理。未来研究可以从研究方式、干预措施、神经生物机制等方面做进一步探究并概念化贫困生心理健康成长框架。

关键词 贫困生，心理健康，消极影响，集体仪式，自然体验

Factors influencing the mental health of Impoverished undergraduates and research implications

YANG Zhong-wang

School of Medicine,Nanjing University of Chinese Medicine,Nanjing210046,China

Abstract： Impoverished undergraduates have been a key focus of attention in colleges and universities, and have also received much attention from academics. In recent years, many researchers have explored the effects of stigma, perceptions of discrimination, and interventions for impoverished undergraduates from a mental health perspective. Recent research findings, such as collective rituals and nature experiences, can be useful for improving the mental health of impoverished undergraduates. Based on this, this paper summarizes and compares the factors influencing the mental health of impoverished undergraduates, the influencing mechanisms, and the interventions, respectively. Future research can further explore and conceptualize the framework of impoverished undergraduates' psychological growth in terms of research approaches, interventions, and neurobiological mechanisms.

Keywords：Impoverished undergraduates，Mental health，Negative effects，Collective rituals，Nature experience

课程思政视域下高职院校学生心理健康教育服务需求分析

林楠[1] 范亭亭[1] 李春春[1] 陈瑶[1] 葛飘[1] 程刚[1]（通讯作者）

1 贵州师范大学心理学院，贵阳，550025，通讯作者 E-mail:chenggang314@163.com

摘 要：背景：新时代思想政治教育与心理健康教育的协同发展是落实与推进立德树人根本任务的重要内容之一。高职院校肩负着为国家培养复合型技术技能人才的重任，其学生因群体的特殊性和教育的职业化，导致学生的心理发展与心理健康教育具有鲜明特色。而目前的心理健康教育课程更多针对的是普通高等院校的大学生，并不能很好的适用于生源和学情都更为复杂的高等职业院校。因此，需要从课程思政的视角出发，对高职院校学生心理健康发展现状进行有针对性、本土化的研究。方法：本研究以高职学生为研究对象，采用目的性抽样的方式选取了贵州航天职业技术学院（简称“航职院”）的 182 名学生进行一对一的半结构式访谈，了解高职学生的心理健康服务需求。访谈录音经过讯飞软件转换成文字，随机选择其中 121 份访谈资料，运用质性研究软件 NVIVO12，将其按照开放性编码、主轴性编码和选择性编码依次递进的方式进行编码。此外，根据理论饱和度原则，采用剩余的 61 份资料进行了理论饱和度检验。结果：首先，航职院学生在自我意识、情绪管理、人际关系发展、学业、适应、生涯规划、婚恋观和危机应对这 8 个主要方面的心理发展过程中存在问题；其次，大部分学生对学校史（9.09%）、航天工业史（5.79%）和三线建设史（4.96%）的了解不多，对学校杰出人物、学校发展历程的整体了解程度不高；最后，航职院的校址所在地——遵义，是历史名城，拥有浓厚的历史底蕴，在红色教育中具有一定的优势，但航职院的学生对于红色文化及历史知识了解不够深入，对红色人物故事的认识也不足。结论：本研究通过扎根研究，了解了航职院学生的心理健康服务需求，对于将来在课程思政视域下进行校本课程开发，构建契合学生实际的职业院校心理健康教育课程具有重要意义。

Analysis of students' mental health service needs in higher vocational colleges from the perspective of curriculum ideology and politics

LIN nan[1] FAN tingting[1] LI chunchun[1] CHEN yao[1] GE piao[1] CHENG gang[1] (Corresponding author)

1 School of Psychology, Guizhou Normal University, Guiyang 550001, Correspondence: chenggang314@163.com

Abstract：Background: The coordinated development of ideological and political education and psychological health education in the new era is one of the important contents of implementing and promoting the fundamental task of cultivating students' morality. Higher vocational colleges shoulder the important task of training compound technical and skilled personnel for the country. Due to the special characteristics of the group and the vocational education, the psychological development and psychological health education of higher vocational college students have distinctive features. However, the current psychological health education curriculum is mostly aimed at ordinary college students and cannot be well adapted to the more complex student sources and learning situations of higher vocational colleges. Therefore, it is necessary to start from the perspective of curriculum ideological and political education and conduct targeted and

localized research on the current situation of psychological health development of higher vocational college students.

Methods: In this study, higher vocational college students were selected as the research objects. A total of 182 students from Guizhou Aerospace Vocational and Technical College (referred to as "Aerospace College") were selected by purposive sampling for one-on-one semi-structured interviews to understand the psychological health service needs of higher vocational college students. The interview recordings were converted into text using iFlytek software, and 121 interview data were randomly selected. Qualitative research software NVIVO12 was used to code them in the order of open coding, axial coding, and selective coding. In addition, according to the principle of theoretical saturation, the remaining 61 pieces of data were used to test theoretical saturation.

Results: Firstly, Aerospace College students have problems in the psychological development process of self-awareness, emotion management, interpersonal relationship development, academic performance, adaptation, career planning, marriage and love concept, and crisis response. Secondly, most students do not know much about the school history (9.09%), aerospace industry history (5.79%), and the history of the third line construction (4.96%), and their overall understanding of outstanding figures and the development process of the school is not high. Finally, Zunyi, where the Aerospace College is located, is a historic city with a rich historical heritage and has certain advantages in red education, but students of the Aerospace College have insufficient understanding of red culture and historical knowledge, and their understanding of red figures and stories is insufficient.

Conclusion: This study uses grounded research to understand the psychological health service needs of Aerospace College students. It is of great significance to develop school-based courses in the perspective of curriculum ideological and political education in the future and to construct vocational college psychological health education courses that are in line with students' actual needs.

新课标下心理健康教育初中 SSI 教学初探

张而畅 姚本先（通讯作者）
安徽师范大学心理学系，芜湖，241000，ybx7756@126.com

摘 要 2022 版《义务教育课程方案和标准》强调了学科实践和对学生核心素养的培养。核心素养是学生在接受相应学段教育过程中，逐步形成的适应个人终身发展和社会发展需要的必备品格与关键能力，包含文化基础、自主发展、社会参与三方面人文底蕴、科学精神、学会学习、健康生活、责任担当、实践创新六因素。对于心理健康教育，其核心素养体现在培养学生的自我效能感、社会适应能力、学会学习。心理健康教育课程无对应课程标准的学科科目，具有较高的自由度与可操作性，可以根据地区经济发展特点学生特点因地制宜因材施教。社会性科学议题内容（Socioscientific Issue ，SSI）是指因科学技术的发展与应用，而对社会产生冲击和影响的科学问题相关的争议性问题。SSI 能够有效地契合 2022 新课改方案要求和学科教学特点，可基于该议题开发出相应的心理健康教育教学内容，未来有进一步发展的空间和成长性。本文将从引入的可行性及必要性方面进行论证，指出心理健康课的特点与 SSI 教育的契合之处及在当前时代下引入 SSI 的必要性，并阐述 SSI 在初中心理健康课中能够发挥的作用，如提高学生的非形式推理能力，进一步提升综合学习能力和道德情操。以 Pedretti 的一般课程的六个步骤为基础，以“智能手机发展对人类的影响”为例给出心理健康教育 SSI 教学的基本模式和实践路径。

An Initial Exploration of SSI Teaching in Junior High School Psychological Health Education under the Compulsory Education Curriculum

Zhang Erchang, Yao BenXian(Corresponding author)
Department of Psychology, Anhui Normal University, Wuhu 241000, China

Abstract: The 2022 edition of the "Compulsory Education Curriculum Plan and Standards" emphasizes subject practice and the cultivation of students' core competencies. Core competencies refer to the essential qualities and key abilities gradually developed by students during the corresponding educational stages, which are necessary for personal lifelong development and societal progress. They encompass three aspects: cultural foundation, self-directed development, and social participation, including humanistic heritage, scientific spirit, learning to learn, healthy living, responsibility and commitment, and practical innovation, comprising six factors. Regarding mental health education, its core competencies are reflected in cultivating students' self-efficacy, social adaptability, and learning skills.The curriculum for mental health education lacks corresponding subject standards, providing a higher degree of freedom and adaptability. It allows for tailoring to regional economic development and the characteristics of students. Socioscientific Issues (SSI) pertain to controversial problems related to the impact and influence of scientific and technological developments on society. SSI can effectively align with the requirements and characteristics of the 2022 curriculum reform, making it possible to develop corresponding content for mental

health education. There is potential for further development and growth in this field.This paper will argue from the perspectives of feasibility and necessity, indicating the compatibility between the characteristics of mental health education and SSI education. It will emphasize the significance of introducing SSI in the current era, as well as the role SSI can play in middle school mental health classes. For instance, it can enhance students' informal reasoning skills, further improve their comprehensive learning abilities, and cultivate moral character. Building upon Pedretti's six steps of general curriculum, the paper will use the example of "The Impact of Smartphone Development on Humanity" to present the basic model and practical approach for mental health education with SSI integration.

自我同情对青少年体像烦恼的影响及书写表达干预

张芹 张信勇（通讯作者）

广东外语外贸大学社会与公共管理学院，广州，510006，zhangxinyong@gdufs.edu.cn

摘 要 体像烦恼是个体由于审美水平偏下或自我审美出现社会偏差，导致对于自己的身体形象产生了负面消极想法，是一种不健康的心理状态。青少年的身体和心理尚未发育完全，无法做出客观的自我评价和自我接纳。加之网络时代媒体和影视作品对于“瘦为美”观念的传播，青少年学生会以外界的审美标准来要求自己，未能达到则容易产生体像烦恼。前人研究表明，自我同情能够对身体满意度产生影响，那么自我同情与青少年体像烦恼问题是否具有关联，自我同情又是如何影响身体意象的，对于生活中青少年出现的体像烦恼，应该如何进行干预缓解。本文以青少年初高中学生为被试，开展了两个研究。研究一采用问卷法，以 12-18 岁的初高中学生为研究对象，采用自陈式量表测量青少年群体的自我同情、体像烦恼、社会比较倾向、核心自我评价水平，考察了社会比较倾向的中介作用和核心自我评价的调节作用。结果发现：（1）自我同情能够负向预测体像烦恼和社会比较倾向，社会比较倾向能够正向预测体像烦恼；（2）社会比较倾向在自我同情对体像烦恼的影响中起部分中介作用，核心自我评价在社会比较倾向与体像烦恼之间起负向调节作用。基于研究一的理论模型，研究二进一步探讨了自我同情书写和书写表达能否降低青少年体像烦恼，采用 2（时间：前测、后测）×3（组别：自我同情书写组、书写表达组、对照组）混合实验设计，以初高中学生为研究对象，随机分配至自我同情书写组、书写表达组、对照组分别进行不同主题的书写，每周进行一次，共进行四次书写，每次 20 分钟，至少书写 300 字，在干预前和干预后完成问卷测量。结果发现：（1）自我同情书写能够提高青少年自我同情水平，降低体像烦恼和容貌烦恼水平，提高核心自我评价水平；（2）书写表达能够降低青少年体像烦恼和性别烦恼水平。

The Influence of Self-compassion on Adolescent Body Image Depression and Expressive Writing Intervention

ZHANG Qin, ZHANG Xin-yong(Corresponding author)

School of Public Administration, Guangdong University of Foreign Studies, Guangdong 510006, China

***Abstract*:** Body image depression is an unhealthy mental state in which individuals have negative thoughts about their body image due to their lower aesthetic level or social deviation in self-aesthetic. The physical and psychological development of adolescents is not complete, unable to make objective self-evaluation and self-acceptance. Coupled with the spread of the concept of "thin is beautiful" by media and film and television works in the Internet era, young students will demand their own aesthetic standards from the outside world, and if they fail to meet them, they are prone to body image depressions. Previous studies have shown that self-compassion can have an impact on body satisfaction, so is there any correlation between self-compassion and adolescent body image depression? How does self-compassion affect body image? How should we intervene to alleviate adolescent body image depressions in daily life? In this paper, two studies are designed with adolescent middle and high school students as subjects. In the first study, a questionnaire was used to measure the self-reported scale of adolescents' self-compassion, body image depressions, social comparison orientation and core self-evaluation. The mediating effect of social comparison orientation and the moderating effect of core self-evaluation were analyzed. The results showed that: (1) Self-compassion could negatively predict body image depression and social comparison orientation, and social comparison orientation could positively predict body

image depression; (2) Social comparison orientation partially mediates the influence of self-compassion on body image depression, and core self-evaluation negatively moderates the relationship between social comparison orientation and body image depression. Based on the theoretical model of study 1, Study 2 further explores whether self-compassion writing and written expression can reduce the body image depression of adolescents. In Study 2, 2 (time: pre-test and post-test) ×3 (Group: Self-compassion writing group, writing expression group, control group) mixed experimental design. Middle and high school students were randomly assigned to self-compassion writing group, writing expression group and control group to write on different topics, once a week, a total of four times, 20 minutes each time, at least 300 words. Questionnaire measurement was completed before and after intervention. The results showed that: (1) Self-compassion writing could improve the level of self-compassion, reduce the level of body and appearance depression, and improve the level of core self-evaluation; (2) Written expression can reduce the level of adolescent body image depression and gender depression.

Keywords **:** self-compassion, adolescent body image depression, social comparison orientation, core self-evaluation, written expression

青少年同伴友谊发展中父母的作用：友谊质量的预测机制

4 西南科技大学社会心理服务与危机干预研究中心，绵阳，62100

通讯作者邮箱：wangbin@swust.edu.cn

摘 要 步入青春期，个体与朋友的交往愈发频繁，友谊关系对青少年的身心健康发展的作用日益突出。友谊质量是个体与朋友之间的亲密情感联系，包括友谊的特征和个体对友谊状态的主观评价。以往研究发现，高质量的友谊可以为个体提供社会支持，减少孤独感，促进心理健康。鉴于友谊质量的积极作用，自然要探究其影响因素，根据生态系统理论，家庭、个体、同伴作为微观系统彼此之间会有相互影响，已有研究也为此提供了实证支持。然而，针对友谊质量的预测因素的研究仍比较少且其机制不明，故本研究基于生态系统理论，从“家庭-个体-同伴”三方综合的角度出发，探究父母教养方式对青少年友谊质量的影响及其内部心理机制。采用父母教养方式问卷、青少年特质情绪智力量表、积极应对方式量表和友谊质量问卷，调查了绵阳市五所学校的 2789 名中学生。结果显示，父母情感温暖与青少年友谊质量、特质情绪智力和积极应对方式分别呈显著正相关(r=0.39,0.54,0.48，P＜0.01)，父母过度保护和拒绝与青少年友谊质量、特质情绪智力、积极应对方式分别呈显著负相关（r=-0.10,-0.33,-0.12, P＜0.01; r=-0.20,-0.42,-0.19, P＜0.01）；中介效应检验表明，父母情感温暖对青少年友谊质量的直接效应显著，效应值为 0.13，特质情绪智力和积极应对方式在父母情感温暖与青少年友谊质量之间的单独中介作用显著，二者的链式中介作用也显著，效应值分别是 0.09、0.05、0.05；在父母过度保护与青少年友谊质量的关系中，直接效应不显著，但特质情绪智力和积极应对方式的单独中介作用以及二者的链式中介作用均显著，效应值分别是-0.10、0.03、-0.07；在父母拒绝与青少年友谊质量的关系中，直接效应不显著，但特质情绪智力和积极应对方式的单独中介作用以及二者的链式中介作用均显著，效应值分别是-0.11、0.02、-0.08。总之，父母情感温暖水平越高，青少年的友谊质量越好，过度保护和拒绝水平越高，青少年的友谊质量越差，特质情绪智力和积极应对在这一影响中发挥了链式中介作用。

关键词 父母教养方式，特质情绪智力，积极应对方式，友谊质量，青少年

The role of parents in adolescent peer friendship development: a predictive mechanism for friendship quality

XIONG Bolin，ZHONG Xiao，FU Haojie，WANG Bin

Department of Psychology, Southwest University of Science and Technology, Mianyang 621000, China

Department of Psychology, Beijing Sports University, Beijing 100101, China

Department of Psychology, Tongji University, Shanghai 200092, China

Corresponding Author's Email：wangbin@swust.edu.cn

***Abstract*:** Entering adolescence, individuals interact with friends more and more frequently, and friendship plays an increasingly prominent role in the healthy development of adolescents' physical and mental health. Friendship quality is the intimate emotional connection between individuals and friends, including the characteristics of friendship and the individual's subjective evaluation of friendship status. Previous research has found that

high-quality friendships can provide individuals with social support, reduce loneliness and promote mental health. In view of the positive effect of friendship quality, it is natural to explore its influencing factors. According to the ecosystem theory, family, individuals and peers as micro-systems will affect each other, and existing studies have provided empirical support for this. However, there are still few researches on the predictors of friendship quality and its mechanism is unknown. Therefore, based on the ecosystem theory, this study explores the influence of parental rearing styles on adolescent friendship quality and its internal psychological mechanism from the perspective of "family-individual-peer" synthesis. 2789 middle school students from five schools in Mianyang City were investigated by parental rearing style questionnaire, adolescent Trait Emotional Intelligence Scale, positive coping style Scale and friendship quality questionnaire. According to the results, parental emotional warmth was positively correlated with adolescents' friendship quality, trait emotional intelligence and positive coping style (r=0.39,0.54,0.48, P<0.01), while parental overprotection and rejection were negatively correlated with adolescents' friendship quality, trait emotional intelligence and positive coping style (r=-0.10,-0.33,-0.12, P< 0.01; r=-0.20,-0.42,-0.19, P<0.01); The mediation effect test showed that the direct effect of parental emotional warmth on adolescent friendship quality was significant, with an effect value of 0.13. Trait emotional intelligence and positive coping style had significant independent mediating effect between parental emotional warmth and adolescent friendship quality, and their chain mediating effect was also significant, with effect values of 0.09, 0.05 and 0.05, respectively. In the relationship between parental overprotection and adolescent friendship quality, the direct effect was not significant, but the single mediating effect and the chain mediating effect of trait emotional intelligence and positive coping style were significant, and the effect values were -0.10, 0.03, and -0.07, respectively. In the relationship between parental rejection and adolescent friendship quality, the direct effect was not significant, but the single mediating effect of trait emotional intelligence and positive coping style and the chain mediating effect of both were significant, with effect values of -0.11, 0.02 and -0.08, respectively. In conclusion, the higher the level of parental emotional warmth, the better the quality of adolescent friendship, the higher the level of overprotection and rejection, the worse the quality of adolescent friendship. Trait emotional intelligence and positive coping play a chain mediating role in this effect.

自我调节学习对学业表现的影响:学业投入的中介作用和感知社会支持的调节作用

潘晨晨[1,2] 方平[1] 姜媛[2]（通讯作者）

[1] 北京理工大学人文与社会科学学院，北京，100048

[2] 首都师范大学心理学院，北京，100048

[3] 北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘 要 学业表现是教育的结果，是指学生、教师或机构实现其教育目标的程度，通常通过考试或持续性的评估来衡量。学业成绩与青少年和儿童的自尊有关，甚至关系到与同伴关系、亲子关系和师生关系的发展，是决定一个人未来发展和成年后事业成功的关键因素。学业表现通常受到学生自主学习能力等内部因素及学习环境等外部要素的影响，其中自我调节学习便是重要的内部要素，其主要是指自我调节学习是学习者主动调节元认知、情绪动机和行为，以促进学习成功，提高学习效果，实现学习目标的过程。已有研究表明，自我调节学习能促进学业表现的提升，但其具体影响的潜在机制还需要进一步探讨。为了阐明初中生自主学习与学业成绩关系的内在机制。本研究采用自主学习量表、学业投入量表和感知社会支持量表对北京市初三年级 451 名 11～15 岁学生 (M=13.66, SD=0.87) 进行调查，检验学业投入在自我调节学习与学业表现之间的中介作用，以及组织支持对上述中介路径的调节作用。结果表明: (1)自主学习与学业投入、学业成绩、感知社会支持呈显著正相关；学业成绩与学业投入、感知社会支持呈正相关； (2)学业投入在自主学习与初中生学业成绩之间起中介作用； (3)感知社会支持在自我调节学习与初中生学业投入之间起调节作用。与高感知社会支持个体相比，低感知社会支持个体的自我调节学习对学业投入的影响更大。本研究基于自我调节学理论及社会支持理论，共同考察了内外部因素对学业表现的作用，厘清学业表现的内在影响机制和条件，对促学生未来成长及教育事业发展有着重大意义。

Abstract： Academic achievement (performance) is the result of education, which refers to the

degree to which students, teachers or institutions have achieved their educational goals, usually measured by examination or continuous assessment. Academic achievement is related to the self-esteem of adolescents and children, and even relates to the development of peer relationships, parent-child relationships and teacher-student relationships, and is a key factor in determining a person's future development and career success as an adult. Academic performance is usually affected by internal factors such as students' autonomous learning ability and external factors such as learning environment, among which self-regulated learning is an important internal factor, which mainly means that self-regulated learning is a process in which learners actively adjust metacognition, emotional motivation and behavior to promote learning success, improve learning results and achieve learning goals. In order to clarify the internal mechanism of the relationship between self-regulated learning and academic performance of junior high school student. This study investigated 451 students aged 11 to 15 years old (M=13.66, SD=0.87) in the third grade of junior middle school in Beijing using the self-regulated learning scale, academic engagement scale and perceived social support scale to examine the mediating effect of academic engagement on self-regulated learning and academic performance, as well as the mediating effect of organizational support on the above mediating path. The results are as follows: (1) Self-regulated learning is positively correlated with academic engagement, academic performance and perceived social support; Academic performance is positively correlated with academic engagement and perceived social support; (2) Academic engagement plays a mediating role between self-regulated learning and academic performance of junior high school students; (3) Perceived social support plays a moderating role between self-regulated learning and junior high school students' academic engagement. Compared with individuals with high perceived social support, self-regulated learning has a greater impact on the academic engagement of individuals with low perceived social support. Based on self-regulation theory and social support theory, this study jointly examines the effects of internal and external factors on academic performance, clarifies the internal influencing mechanism and conditions of academic performance, and has great significance for promoting students' future growth and educational development.

Keywords：self-regulated learning; academic engagement; perceived social support; academic performace

摘 要　处于青春期的高中生们具有较强的可塑性，培养良好的学业品质能促使个体获得积极的学业发展。作为良好学业品质的重要指标之一，学业复原力的影响因素受到了学者们的广泛关注。在众多影响因素中，学业乐观对高中生学业复原力产生了深远影响，但是学业乐观是如何影响学业复原力的研究尚少，仍有待于进一步探究。本研究旨在探讨高中生学业乐观和学业复原力的关系，以及自我效能感和认知灵活性在其中的中介作用。本研究采用学业乐观量表、自我效能感问卷、认知灵活性量表和日常性学业复原力问卷，对 730 名高中生进行了问卷调查。结果发现：（1）学业乐观、自我效能感、认知灵活性和学业复原力之间存在着显著的正相关关系；（2）学业乐观分别通过自我效能感和认知灵活性对学业复原力产生影响；（3）自我效能感和认知灵活性在高中生学业乐观和学业复原力间起链式中介作用。本研究揭示了高中生学业乐观影响学业复原力的作用机制，对学校开展提升高中生学业复原力的干预工作具有一定的参考价值。

关键词　学业乐观，自我效能感，认知灵活性，学业复原力，高中生

The Relationship between High School Students' Academic Optimism and Academic Resilience: The Chain Mediation of Self efficacy and Cognitive Flexibility

Wei Xiuchao[1] DaiWenwu[2] JiaNing[1]

1 College of Education, Hebei Normal University ,Shijiazhuang Hebei, 050091

2 School of Humanities and Social Sciences, Beijing Forestry University,Beijing, 100083

Abstract：High school students in adolescence have strong plasticity, and cultivating good academic qualities can promote individuals to achieve positive academic development. As one of the important indicators of good academic quality, the influencing factors of academic resilience have received widespread attention from scholars. Among numerous influencing factors, academic optimism has a profound impact on high school students' academic resilience. However, there is still little research on how academic optimism affects academic resilience and further exploration is needed. The aim of this study is to explore the relationship between academic optimism and academic resilience among high school students, as well as the mediating role of self-efficacy and cognitive flexibility in it. This study conducted a questionnaire survey on 730 high school students using the Academic Optimism Scale, Self Efficacy Scale, Cognitive Flexibility Scale, and Daily Academic Resilience Scale. The results showed that: (1) there was a significant positive correlation between academic optimism, self-efficacy, cognitive flexibility, and academic resilience; (2) Academic optimism has an impact on academic resilience through self-efficacy and cognitive flexibility, respectively; (3) Self efficacy and cognitive flexibility play a chain mediating role between academic optimism and academic resilience in high school students. This study reveals the mechanism by which high school students' academic optimism affects their academic resilience, and has certain reference value for schools to carry out intervention work to enhance their academic resilience

Keywords：Academic optimism, self-efficacy, cognitive flexibility, academic resilience, high school students

家庭功能与青少年心理健康：

特质情绪智力和亲子依恋的作用

刘海延[1] 钟潇[2] 付浩杰[3] 陆心怡[1] 王斌[1,4,5]（通讯作者）

摘 要 家庭微观系统是个体身心健康发展的港湾，为青少年的生理、认知、心理和社会性等方面的健康发展提供条件和支持功能。家庭功能作为家庭生态系统的运行质量的衡量标准要变量,也是影响青少年心理健康发展的重要因素。特质情绪智力是指个体对自我情绪意识、感知和情感沟通能力的主观理解，相关研究发现特质情绪智力是预测个体心理健康的重要人格因素。为了更全面地了解青少年心理健康的影响因素，本研究基于家庭生态系统理论和人-境交互作用论，探讨了青少年家庭功能与心理健康的关系，并检验二者之间的内在作用机制和影响因素。研究采用家庭功能评定量表、亲子依恋量表、中国特质情商问卷简写表和心理健康量表对 624 名青少年进行施测。结果显示:(1)家庭功能、特质情绪智力、亲子依恋、心理健康四个变量两两显著正相关;(2)家庭功能能显著预测青少年心理健康(b＝0.22，p＜0.001)，特质情绪智力也能显著预测青少年心理健康(b＝0.62，p＜0.001); (3)特质情绪智力在家庭功能与青少年心理健康之间起中介作用(b＝0.36，95% bootCI =[0.29,0.43]); (4)亲子依恋对家庭功能与青少年特质情绪智力的中介过程存在调节作用，与低亲子依恋水平的青少年相比，高亲子依恋水平青少年的家庭功能对特质情绪智力的预测效果更显著。具体表现为：家庭功能对特质情绪智力的正向预测作用在低父子依恋水平的学生中显著(b=0.27，t=5.89，p<0.001)，当父子依恋水平较高时，家庭功能对特质情商的正向预测作用增强(b=0.39，t=7.01，p<0.001)；家庭功能对特质情商的正向预测作用在低母子依恋水平的学生中显著(b=0.24，t=5.09，p<0.001)，当母子依恋水平较高时，家庭功能对特质情商的正向预测作用增强(b=0.43，t=8.10，p<0.001)。本研究揭示了家庭功能不仅能直接预测也可以通过特质情绪智力间接预测青少年心理健康水平，但是这一中介预测模型会因为亲子依恋程度不同而不同。这一结果不仅有助于深入理解青少年心理健康的影响因素和作用机制，还对在家庭环境中培养青少年特质情绪智力具有一定启发意义。

关键词 家庭功能，特质情绪智力，心理健康，青少年，亲子依恋

Family functioning and adolescent mental health:

The role of trait emotional intelligence and parent-child attachment

Abstract：The family microsystem is a harbor for the healthy development of the individual's body and mind, providing conditions and supportive functions for the healthy development of adolescents' physiological, cognitive, psychological and social aspects. Family functioning, as a measure of the quality of the family ecosystem, is also an important factor affecting adolescents' healthy psychological development. Trait Emotional Intelligence (TEI) refers to an individual's subjective understanding of his/her emotional awareness, perception, and ability to communicate emotionally, and related studies have found that TEI is an important personality factor in predicting an individual's mental health. In order to gain a more comprehensive understanding of the factors influencing adolescent mental health, this study explored the relationship between adolescent family functioning and mental health based on the family ecosystem theory and the person-situation interaction theory, and examined the intrinsic mechanisms and influencing factors between the two. The study utilized the Family Assessment Device-6(FAD-6), the Inventory of Parent and Peer Attachment（IPPA）, the Chinese Trait Emotional Intelligence Questionnaire Short Form (TEIQue-SF), and the five-item version of the Mental Health Inventory(MHI-5) on 624 adolescents.The results showed that:(1) the four variables of family functioning, trait emotional intelligence, parent-child attachment, and mental health were significantly positively correlated two-by-two; (2) family functioning significantly predicted adolescent mental health ($b = 0.22$, $p < 0.001$), as did trait emotional intelligence ($b = 0.62$, $p < 0.001$); (3) trait emotional intelligence played a significant role in mediating the relationship between family functioning and adolescent mental health ($b = 0.36$, 95% bootCI = [0.29,0.43]); (4) There was a moderating effect of parent-child attachment on the mediating process between family functioning and adolescents' trait emotional intelligence, and family functioning was a more significant predictor of trait emotional intelligence in adolescents with high levels of parent-child attachment than in those with low levels of parent-child attachment.Specifically, the positive predictive effect of family functioning on trait emotional intelligence was significant among students with low levels of parent-child attachment ($b=0.27$, $t=5.89$, $p<0.001$), and was enhanced when the level of parent-child attachment was high ($b=0.39$, $t=7.01$, $p<0.001$); the positive predictive effect was significant in students with low levels of mother-child attachment ($b=0.24$, $t=5.09$, $p<0.001$), and the positive predictive effect of family functioning on trait emotional intelligence was enhanced when the level of mother-child attachment was high ($b=0.43$, $t=8.10$, $p<0.001$).This study reveals that family functioning not only directly predicts but also indirectly predicts adolescent mental health through trait emotional intelligence, but this mediated prediction model varies depending on the degree of parent-child attachment. This result not only contributes to a deeper understanding of the influencing factors and mechanisms of adolescent mental health, but also sheds light on the development of adolescent trait emotional intelligence in the family environment.

摘 要 自杀，是一个重要的公共卫生问题，也是大学生非正常死亡的主要原因。准确识别和预测大学生的自杀倾向，对于自杀干预和预防工作有十分重要的意义。机器学习是一种使用算法和统计模型寻找大数据中隐含模式的方法，能较好的处理高维数据与非线性数据，越来越多的研究者将其应用于风险的识别与预测中。本研究采集了绵阳地区一万五千多名大学生的心理普查数据，纳入人口学变量、成长经历、人格特质、生活事件、抑郁、社会支持等 15 个特征。分层抽样选取 70%的被试作为训练集，30%的被试作为测试集。采用 SVM、LR、KNN、XGBoost、LightGBM、CatBoost 六种算法，利用网格搜索寻找最佳参数，5 折交叉检验平衡抽样误差，建立自杀倾向的识别和预测模型。因自杀为高风险因素，因此首先关注查全率（Recall）指标，其中 XGBoost 表现最佳，在测试集上准确率为 0.951，查全率为 0.761，F1 分数为 0.748，AUC 为 0.866。基于可解释的机器学习，利用 SHAP 进行模型事后解释的方法，最终找出了识别自杀倾向最重要的 5 个特征，依次为抑郁、成长经历、社会支持、人格特质和生活事件。综上所述，本研究表明极致梯度提升算法（XGBOOST）可用于自杀倾向的识别，有较好的查全率的结果，有助于简化并提高大学生自杀倾向识别和预测的有效性。可解释的机器学习，寻找风险因素，为进一步理解大学生自杀的发生因素提供了重要的方向，同时也为更有针对性地开展自杀预防和干预工作提供帮助。

Application of machine learning to the identification and prediction of college students' suicidal tendencies

Yang Yingqian Yang Huiqin Guo Wen Fu Haojie

Psychological education and counseling center, Southwest University of Science and Technology, Mian Yang, China

Shanghai Research Institute for Intelligent Autonomous Systems, Tongji University, Shang Hai, China

Abstract：Suicide is not only an important public health problem, but also the main cause of abnormal death of college students. It is of great significance for suicide intervention and prevention to accurately identify and predict the suicidal tendency of college students. Machine learning is a method that uses algorithms and statistical models to find hidden patterns in big data. It can better deal with high-dimensional data and nonlinear data. More and more researchers have applied it to risk identification and prediction. This study collected the psychological survey data of more than 15,000 college students in Mianyang area, including 15 characteristics such as demographic variables, growth experience, personality traits, life events, depression and social support. Stratified sampling selected 70% of the subjects as the training set, 30% of the subjects as the test set. Six algorithms, SVM, LR, KNN, XGBoost, LightGBM and CatBoost, were used to search for the best parameters by using grid search, and the balanced sampling error of 5-fold cross-check was used to establish the identification and prediction model of

suicide tendency. Among them, XGBoost performed best, with an accuracy of 0.951 on the test set. The Recall rate was 0.761, the F1 score was 0.748, and the AUC was 0.866. Since suicide was a high risk factor, we first focused on the recall index. Based on explicable machine learning, using SHAP to model post-hoc interpretation, we finally found the five most important characteristics for identifying suicidal tendencies, in order of depression, growing experiences, social support, personality traits and life events. In summary, this study shows that XGBOOST algorithm can be used to identify suicide intention, and has a better recall rate, which helps simplify and improve the effectiveness of college students' suicide intention recognition and prediction. Explainable machine learning, searching for risk factors, provides an important direction for further understanding the occurrence factors of college student suicide, and also provides help for more targeted suicide prevention and intervention efforts.

中文版《过度教养量表(大学生版）》的信效度检验

陈晓 [1,2]（通讯作者） 杜浩荣 [3]

1 广东白云学院 应用心理学系，广州，510450

2 北京师范大学 未来教育学院，珠海，519087 psychenxiao@126.com

3 北京师范大学珠海分校 教育学院，珠海，519087

摘 要 本研究对 Segrin 等人（2012）的《过度教养量表》（Overparenting Scale, OPS）进行中文孩子版修订并检验其信效度。英文版《过度教养量表》包含期待问题解决、建议/情感管理、具体的帮助和孩子自我导向四个维度，共 39 个题目，采用李克特 5 点计分法。中文版《过度教养量表》采用中英文回译法，由心理学专业教师翻译成中文，并依照原文对个别语句进行修改，尽可能保障题目表述符合中文语言习惯。再由 1 名英语专业人士对量表中文稿进行回译，回译结果与原量表基本一致。原始量表是父母版，中文版改为孩子版本，把量表中的“我的孩子”表述转化为 “我的父母”，并在尽量不影响题目原意的情况下对语句进行修改，使其符合中文语言习惯。对 370 名大学生施测中文版《过度教养量表》、《父母自主支持量表》、《父母心理控制量表》、《自我控制问卷》、《Ryff 心理幸福感量表》中的自主维度、《自我同一性过程量表》检验量表的效度。其中 199 名大学生 2 周后进行量表重测。结果：1）修订后的中文版《过度教养量表》包含 36 个项目，并保持原量表期待问题解决、建议/情感管理、孩子自我导向和具体的帮助四个维度；2）验证性因素显示四因子模型 4 因子结构模型在大学生群体上拟合良好，不同模型比较显示四因子一阶模型的拟合都要优于其他模型；3)过度教养量表总分与父母心理控制呈显著正相关，与孩子的自主性呈显著负相关；期待问题解决与父母心理控制、父母自主支持呈显著正相关；建议/情感管理与父母心理控制呈显著负相关，与父母自主支持，孩子自我控制，自我同一性的探索和承诺呈显著正相关；具体的帮助与父母自主支持呈显著正相关；孩子自我导向与父母心理控制呈显著负相关，与父母自主支持，孩子的自我控制、孩子的自主性、自我同一性的探索和承诺均呈显著正相关；4）过度教养量表的内部一致性信度为.83，四个维度的信度介于.67-.85，两周后量表的重测信度为.76。结论：中文版《过度教养量表（大学生版）》具有良好的信效度，适用于评估中国大学生的过度教养研究。

The Validity and Reliability of the Chinese College Student version of Overparenting Scale(CS-OPS)

Chen Xiao[1,2] Du haorong[3]

1. Department of Applied Psychology, Guangdong Baiyun University, Guangzhou, 510450
2. College of Education for the Future, Beijing Normal University, Zhuhai, 519087, Email: psychenxiao@126.com
3. School of Education, Beijing Normal University, Zhuhai campus, Zhuhai, 519087

Abstract: This study examined the validity and reliability of the Chinese child version of the Overparenting Scale (Cc-OPS) developed by Segrin et al. (2012). The original OPS consisted of four sub-scales: Anticipatory Problem Solving, Advice/Affect Management, Tangible Assistance, and Child Self-direction. The original OPS was translated into Chinese by a psychological professor. The Chinese version was back-translated by an English professional. The original Scale was administered to parents. The phrase "my child" was modified to "my parents". Three hundred and seventy college students were administered with OPS, Parental Autonomy Support Scale, Parental Psychological Control Scale, Self-Control Questionnaire, the he autonomy sub-scale of the Ryff Psychological Well-Being Scale and the Ego Identity Process Questionnaire. One hundred and ninety-nine college students were re-administered the OPS two weeks later to examine the test-retest reliability.Results showed that: 1) the Chinese child version of OPS included 36 items and consisted of the same four sub-scales as the original scale. Confirmatory factor analysis(CFA) showed that, compared with other possible models, the four-factor model fitted best with college students data. 2)The total score of CC-OPS correlated significantly with parental psychological control positively and correlated with child autonomy negatively. Anticipatory Problem Solving correlated significantly with parental psychological control and parental autonomy support positively. Advice/Emotion management correlated significantly with parental psychological control negatively and correlated significantly with parental autonomy support, child self-control, exploration and commitment of self-identity positively of self-identity; Tangible Assistance correlated significantly with parental autonomy support positively; Child Self-direction correlated significantly with parental psychological control negatively and positively correlated with parental autonomy support, child self-control, child autonomy, exploration and commitment of self-identity; 4)The internal consistency reliability of the CC-OPS was .83, and the reliability of the four sub-scales ranged from .67 to .85. The test-retest reliability of the was .76. The Chinese college student version of the Overparenting Questionnaire Scale was with acceptable reliability and validity and was suitable for assessing overparenting in Chinese college students.

线上办公如何影响情绪敏感性：

控制感和睡眠质量的作用

但宗怡[1] 张翕然[1] 王滢[2] 严子洋[2] 徐建平（通讯作者）

北京师范大学心理学院，北京，100875

北京师范大学心理学院，北京，100875，xujp@bnu.edu.cn

摘 要 此前我国针对新冠疫情的常态化防控使得远程办公模式愈发受到各界的广泛关注，并得到进一步发展和完善。新型工作方式的流行既为个体的工作生活带来了便利，同时也表现出了一些局限。本研究基于持续 3 年的新冠疫情时代背景，针对这期间出现并有可能在未来广泛使用的线上办公形式，以改善并促进个体身心健康与工作表现为出发点，探索并讨论了线上办公对个体情绪敏感性的影响机制、控制感的中介作用以及睡眠质量的调节作用。基于理论研究结果，对个体如何改善线上办公可能对控制感、情绪敏感性造成的不良影响提供策略和方法借鉴。通过对 120 名被试进行为期 10 个工作日的纵向追踪研究，本研究主要得出以下结论：线上办公对情绪敏感性的直接效应显著，其中工作环境与工作场所人际压力因素的效应量更大；以控制感为中介的全模型检验不显著，但线上办公的工作环境和人际压力因素会显著负向影响控制感；睡眠质量能够显著负向影响控制感，即高睡眠质量能够显著缓解个体的控制感缺失。

关键词 线上办公，控制感，睡眠质量，情绪敏感性，纵向追踪研究

How online office affects emotional sensitivity :

The Role of Sense of Control and Sleep Quality

Dan zongyi[1], Zhang yiran[1], Wang ying [2], Yan ziyang [2], Xu jianping
School of Psychology, Beijing Normal University，No. 19, Xinjiekouwai Street, Haidian District, Beijing

Abstract： The normalization of COVID-19 prevention and control measures in China has led to increased attention, further development, and improvement of the remote work model. While the popularity of this new working style has brought convenience to individuals' work-life balance, it has also revealed certain limitations. This study, conducted against the backdrop of the COVID-19 era spanning three years, focuses on the online work format that emerged during this period and is likely to be widely used in the future. The study aims to explore and discuss the impact mechanisms of online work on individuals' emotional sensitivity, the mediating role of perceived control, and the moderating effect of sleep quality. The study takes into consideration the improvement and promotion of individuals' mental and physical well-being and work performance. Based on theoretical research findings, the study provides strategies and methods for individuals to mitigate the adverse effects of online work on perceived control and emotional sensitivity. Through a longitudinal tracking study involving 120 participants over a period of 10 workdays, the study draws the following conclusions: Online work has a significant direct effect on emotional sensitivity, with the work environment and interpersonal pressure in the workplace having a greater impact. The full model test with perceived control as a mediator is not significant, but the work environment and interpersonal pressure factors of online work significantly negatively affect perceived control. Sleep quality has a significant negative impact on perceived control, indicating that higher sleep quality can significantly alleviate individuals' sense of control loss.

Keywords： Online office, sense of control, sleep quality, emotional sensitivity, longitudinal follow-up study

机器学习重抽样方法在潜在剖面分析模型选择中的适用性探究

倪雨菡[1]（通讯作者） 张敏强[2]

1 安徽师范大学教育科学学院，芜湖，241000

2 华南师范大学心理学院，广州，510631

摘 要 潜在剖面分析(Latent Profile Analysis，LPA)是根据外显的行为指标对个体的潜在特征进行分类的统计方法，广泛应用于人格、心理健康等领域。在 LPA 中，研究者通常需要综合考量拟合指数、模型简约性与模型可解释性三大准则进行模型评估与选择。然而，现在还没有被广泛接受的最佳指数，拟合指数的表现依赖于模拟研究创设的条件(Grimm, Mazza, & Davoudzadeh, 2017)，且基于拟合指数的模型选择会导致结果的可重复性不高(Preacher & Merkle, 2012)。基于以上问题，有研究者提出将机器学习重抽样方法——*K* 折交叉验证法，作为混合模型分析中模型选择的替代策略(Grimm et al., 2017)。

综述发现，目前尚无研究将 *K* 折交叉验证法引入 LPA，其他改进的交叉验证法在混合模型中的研究亦为空白，交叉验证法的性能与效度均有待进一步考证；另一种重抽样方法 Bootstrap 法仅探究了拟合指数的不确定性 (e.g., Lubke et al., 2017)，对模型选择的改善可能性仍待挖掘。因此，有必要系统评估机器学习重抽样方法在潜在剖面分析中的适用性，为实际使用者提供应用参考。

本研究通过三个蒙特卡洛模拟研究和一个实证研究，对传统拟合指数、Bootstrap 法及交叉验证法（5 折、10 折、重复 5×2、组块 3×2）下模型选择指标在 LPA 中的适用性进行探究和验证。模拟因素组合包括：①外显指标数 (*I*=4, 8)、②潜在类别比例 ($p(x = k)$ = 0.33/0.33/0.34, 0.15/0.40/0.45)、③类间距 (*MD* = 0.5, 1.2, 3) 、④样本容量 (*N*=100, 300, 900, 1500)，共 2×2×3×4=48 种组合水平，每种组合模拟 500 次。使用 Mplus 7.0、Rstudio 的 MplusAutomation 软件包、rpart 软件包自编程序完成数据模拟与分析，采用二分类 Logistic 回归分析探究因素的主效应，采用分类回归树(Classification and Regression Trees, CART)探索因素的影响程度与交互效应。

模拟研究结果表明：1）机器学习重抽样方法在 LPA 模型选择中的绝对表现不佳，但相较于传统拟合指数，Bootstrap 法和 *K* 折交叉验证法的表现均有一定提升，其中 10 折交叉验证法下的-2LL$_{CV_1}$ 指标表现相对最好，增幅比约为 14%，其次是 Bootstrap 法下的-2LL$_{boot_2}$ 指标；2）类间距是各模型选择指标最重要的影响因素，其次是样本容量，且二者存在显著的交互效应。这两种因素反映了数据集信息量的大小，因此，模型选择指标的表现可能更取决于 LPA 模型本身的参数估计及拟合，而惩罚项与机器学习重抽样方法选择策略的比重较小。实证研究结果表明：1）相较于传统拟合指数，Bootstrap 法和 10 折交叉验证法均选择了相对简单的模型，有效平衡了模型拟合优度与简约性；2）使用 Bootstrap 法能够观察到拟合指数在进行模型选择时的易变性，如，指数会选择不同类别作为结果，实证研究者应当避免对传统拟合指数以及“最佳拟合模型”的过度信任。

建议将 LPA 的实证研究划分为研究设计和数据分析两个阶段，首先在研究设计阶段，因 LPA 模型对数据集信息量的要求较高，研究者需要在有相关理论支撑、适合分类的基础上，尽可能多地抽取有代表性的样本；在数据分析阶段，若样本容量较小(≤300)，使用 Bootstrap 法下的-2LL$_{boot_2}$ 指标作为模型选择的首要策略，样本容量较大(≥900)时，考虑使用 Bootstrap 法下的-2LL$_{boot_2}$ 指标或 10 折交叉验证法下的-2LL$_{CV_1}$ 指标。

关键词 潜在剖面分析，模型选择，机器学习，Bootstrap，交叉验证

Evaluating Machine Learning Resampling Approaches to Model Selection in Latent Profile Analysis

Yuhan Ni[1] Minqiang Zhang[2]

1 School of Education Science, Anhui Normal University, Wuhu, 241000

2 School of Psychology, South China Normal University, Guangzhou, 510631

***Abstract*:** Latent profiles analysis (LPA) has been applied to psychological research for modeling heterogeneity in cross-sectionally sampled data by grouping participants into latent categories based on similarities in their response scores. Researchers usually determine the number of latent classes with a set of fit indices, parsimony and interpretability. However, there is no widely certificated optimal index, and the performance of fitting indices depends on specific conditions in specific simulation studies (Grimm, Mazza, & Davoudzadeh, 2017). In addition, according to Preacher and Merkle (2012), the current use of fit indices for model selection, which assumes that fit indicators are error free, is problematic and renders the replicability of the best-fitting models. Based on the above challenges, *K*-fold Cross Validation method, a typical resampling method in the field of machine learning, was putted forward as an alternative strategy for model selection in finite mixture model (Grimm, et al, 2017).

However, there is no study to apply *K*-fold Cross Validation method into LPA, and there is no any research of improved Cross Validation method in finite mixed model. The performance and validity of Cross Validation method need to be further verified. Besides, Bootstrap method is only applied to explore the uncertainty of fitting indices (e.g. Lubke et al., 2017), that is, its possibility of improving model selection remains to be explored. Therefore, it is necessary to systematically evaluate the applicability of these machine learning methods in LPA.

Three Monte Carlo simulation studies and one empirical study were conducted for traditional fitting indices, Bootstrap method, and Cross Validation method (5-fold, 10-fold, repeated 5×2, and Blocked 3×2). Monte Carlo simulation used to examine the ability of several classes of enumeration indices to correctly identify the number of latent population profiles present under four different research design conditions: ①the number of observed indicators used for LPA (I = 4, 8), ②latent class size ($p(x = k)$ = 0.33/0.33/0.34, 0.15/0.40/0.45), ③class distance (MD = 0.5, 1.2, 3), and ④sample size (N = 100, 300, 900, 1500), totally 2×2×3×4 = 48 conditions. All data are generated and analyzed using Mplus 7.0, MplusAutomation and rpart package via Rstudio. The binary logistic regression analysis was used to explore the main effects of design factors, and Classification and Regression Trees (CART) were used to explore the effect size and interaction effects of factors.

The simulation results showed: 1) The performance of fitting index of machine learning resampling methods in LPA model selection are generally unsatisfactory, but better than traditional methods. Of the two machine learning resampling methods, the $-2LL_{CV_1}$ under the 10-fold CV method performs best relatively, with almost 14% growth ratio, followed by the $-2LL_{boot_2}$ under the Bootstrap method. 2) Class distance is the most important factor affecting the model fitting indices, followed by the sample size, with a significant interaction effect between class distance and sample size. These two factors reflect the amount of information in the data set. Therefore, the performance of model fitting indices may depend more on the parameter estimation and fitting of the LPA model, while the proportion of penalty item and machine learning strategy is smaller. The empirical results showed: 1) Compared with the traditional fitting indices, the indices under Bootstrap method and 10-fold CV method choose relatively simple models in the empirical study, which effectively balances the model fit and the simplicity. 2) The variability of fitting indices can be observed by using Bootstrap method (e.g., selecting model with different latent classes as *best fit model*). Empirical researchers should prevent excessive trust in fitting indices and *best fit model* when using traditional indices.

It is suggested that the empirical study of LPA can be divided into two stages. Firstly, in the research design stage, researchers need to obtain as many representative samples as possible on the basis of relevant theoretical literature review due to the high demand for dataset information in LPA model. Secondly, in the data analysis stage, if the sample size is small (300 or below), use $-2LL_{boot_2}$ under Bootstrap method as the primary index for model selection; if the sample size is large (900 or above), the $-2LL_{boot_2}$ under Bootstrap method and $-2LL_{CV_1}$ under 10-fold Cross Validation method can be both good references.

摘 要 背景：特质顺从性是指人们在不同情境下对他人提出的要求或请求做出被期待的反应的倾向。它可能导致个体容易受到外部压力、剥削和操纵。古德琼森顺从性量表（Gudjonsson Compliance Scale，GCS）是在西方背景下评估个人特质顺从性的有效工具。迄今为止，还没有研究验证过 GCS 在中国人群中的心理测量学特性。

方法：本研究招募了两个不同的中国成年人样本。第一个样本（n=4276）用于进行探索性因素分析。第二个样本（n=4356）用于进行验证性因素分析。对这两个样本进行了信度、测量等价性和效标效度检验。

结果：中文版 GCS 在删除了其中两个项目后呈现出三因素结构。三个因子量表具有中度到良好的内部一致性(α = 0.67 ~ 0.87)，全量表也具有良好的内部一致性(α = 0.88)，从而证明了其信度。在不同性别、种族和招募组别中，强测量等价性都得到了支持。总量表和因子量表的效标效度得到了与人格特质和若干心理健康问题的显著关联的支持。具体来说，GCS 总分及三个因子分与焦虑、抑郁、消极情绪、症状自评量表（Symptom Checklist-90，SCL-90）总分和神经质呈显著正相关；而与积极情绪、自尊、外向性、宜人性、尽责性和开放性呈显著负相关。在三个因子中，因子 1 与这些变量有最强的相关。

结论：中文版 GCS 被证明是一种有效且可靠的特质顺从性测量工具，可以促进对中国人群特质顺从性的评估和研究。

4 Mental Health Center, Central University of Finance and Economics, Beijing, China

Abstract：Background: Trait Compliance involves people reacting favourably to the demands or requests made by others across different situations. It may lead to individuals' susceptibility to external pressures, exploitation, and manipulation. The Gudjonsson Compliance Scale (GCS) is an efficient tool for assessing individuals' trait compliance in Western contexts. To date, no study has validated the psychometric properties of the GCS in Chinese populations.

Methods: Two different samples of young adults from China were recruited in this study. The first sample (N

= 4,276) was used to conduct exploratory factor analysis. The second sample (N = 4,356) was used to perform confirmatory factor analysis. Tests of reliability, measurement invariance and criterion validity were conducted in the combined two samples.

Results: The Chinese GCS showed a 3-factor structure, with two items deleted. Reliability was supported by moderate to good internal consistencies of the three factor scales (α = 0.67 ~ 0.87) and good internal consistency of the full scale (α = 0.88). Strong measurement invariance across gender, ethnicity and groups recruitment was supported. The criterion validity of the total scale and the factor scales was supported by significant associations with personality traits and several mental health problems. Specifically, the GCS total scores and scores of all three factors were positively correlated with anxiety, depression, negative affect, SCL-90 total scores and neuroticism, while negatively correlated with positive affect, self-esteem, extraversion, agreeableness, conscientiousness and openness. Among factor scores, factor 1 had the strongest relationship with all these variables.

Conclusion: The Chinese version of the GCS appears to be a valid and reliable instrument for measuring trait compliance, which could promote both the assessment and research of compliance in Chinese populations.

中文版马里兰州特质状态抑郁量表：在中国大学生群体中的心理测量特征

张曼琪[1] 彭君[1] 廖洁洁[1] 高媛[1] 莫雷[1]（通讯作者）
1 华南师范大学心理学院 /华南师范大学心理应用研究中心， 广州, 510631
通讯作者莫雷 molei@scnu.edu.cn

摘 要 个体的抑郁特质被认为是人格的一部分，抑郁特质更高的个体会更频繁陷入抑郁状态，目前学界对抑郁特质和状态的关系机制探索尚不成熟，而使用可靠有效的工具是关键前提。本研究旨在修订马里兰州特质状态抑郁量表中文版（Maryland Trait and State Depression Scale – Chinese Version, MTSD-C），包括抑郁状态（MTSD-C-S）和抑郁特质（MTSD-C-T）两个子量表，并检验了其在中国大学生群体中的心理测量学特征。样本一纳入 412 人填写 MTSD 的最初修订版本供条目删改修订，得到 16 条目版 MTSD-C-S 和 15 条目版 MTSD-C-T 供正式施测。样本二纳入 1677 人填写 MTSD-C 正式版及相关校标问卷，包括抑郁自评问卷、9 项版一般患者健康问卷和大五人格量表-抑郁分量表，其中 150 人在 4 周后完成 MTSD-C 的重测。对于 MTSD-C-S 和 MTSD-C-T 均采用验证性因子分析和探索性结构方程模型进行模型比较，结果表明，两个子量表均支持核心症状-认知症状-躯体症状三因子结构（MTSD-C-S: $\chi^2 = 645.95$, df = 101, TLI = 0.916, CFI = 0.929, SRMR = 0.04, MTSD-C-T: $\chi^2 = 791.651$, df = 87, TLI = 0.905, CFI = 0.921, SRMR = 0.043）。MTSD-C-S 和 MTSD-C-T 的α系数分别为 0.93 和 0.94，同质性系数ρ_{hom}分别为 0.89 和 0.90，四周内的重测信度 ICC 均为 0.85。另外，MTSD-C-S 和 MTSD-C-T 在性别、教育类型、家庭来源上均表现出严格的测量等值性（ΔCFI < 0.01, ΔRMSEA < 0.01）。综上所述，中文版 MTSD 在中国大学生群体中信效度良好，能作为促进本土化抑郁相关临床心理研究的可靠工具之一。

Chinese version of the Maryland Trait and State Depression Scale: Psychometric characteristics among Chinese college student

Manqi Zhang[1] Jun Peng[1] Jiejie Liao[1] Yuan Gao[1] Lei Mo[1] (Corresponding author)
1 School of Psychology and Center for Studies of Psychological Application，South China Normal University，Guangzhou, 510631
Corresponding author Lei Mo molei@m.scnu.edu.cn

Abstract：Depressive trait is viewed as part of personality, and individuals with higher depressive trait would fall into depression more frequently. Until now, the lack of reliable and effective tools to measure depressive trait limits our exploration on both relationship between depressive trait and state and their mechanism. The aim of this study was to revise the Maryland Trait and State Depression Scale - Chinese Version (MTSD-C), including depressive state scale (MTSD-C-S) and depressive trait scale (MTSD-C-T), and we also examined their

psychometric characteristics in Chinese college students. Sample 1 included 412 students to fill in the original revised version of the MTSD for primally revision, we got 16-item MTSD-C-S and 15-item MTSD-C-T for following test. Sample 2 included 1677 people who completed the MTSD-C official version and related calibration questionnaires, including the self-rating depression scale, the 9-item Patient Health Questionnaire, and the Big Five Personality Inventory - Depression subscale. One hundred fifty of them completed the MTSD-C retest 4 weeks later. Both MTSD-C-S and MTSD-C-T were analysis using confirmatory factor analysis and exploratory structural equation model. The results showed that both MTSD-C-S and MTSD-C-T supported the three-factor structure (core symptoms-cognitive symptoms-somatic symptoms (MTSD-C-S: $\chi^2 = 645.95$, df = 101, TLI = 0.916, CFI = 0.929, SRMR = 0.04, MTSD-C-T: $\chi^2 = 791.651$, df = 87, TLI = 0.905, CFI = 0.921, SRMR = 0.043). The α coefficients of MTSD-C-S and MTSD-C-T are 0.93 and 0.94, the homogeneity coefficients ρ_{hom} are 0.89 and 0.90, respectively, and the retest reliabilities ICC within four weeks is 0.85. In addition, MTSD-C-S and MTSD-C-T showed strict equivalence in gender, education type and family origin (ΔCFI < 0.01, ΔRMSEA < 0.01). In a word, the MTSD-C has good reliability and validity in Chinese college students and can be used as one of the reliable tools to promote localized depression-related clinical psychological research.

摘 要 背景：研究发现，认知闭合需要（Need for closure, NFC）与不同形式的心理病理症状有关。在西方背景下，15 项认知闭合需要量表（NFCS）是评估个体认知闭合需要的有效而简便的工具。然而，15 项 NFCS 的心理测量学特性尚未在中国人群中得到验证。

方法：本研究招募了两个不同的中国大学生样本。第一个样本（n=5080，49.9%为女性）用于进行探索性因素分析（EFA）和信度分析。第二个样本（n=3968，女性占 64.2%）用于进行验证性因素分析（CFA）和探索性结构方程模型（ESEM），然后进行测量等价性和效标效度测试。

结果：全量表显示出良好的内部一致性(ω =0.83)。四因素 ESEM 结果被选为我们的最终模型，四个子量表（结构偏好、决断性、模糊不适和心理封闭）均显示出中等至良好的内部一致性(ω =0.60 ~ 0.81)。在不同性别和种族组别中，强测量等价性都得到了支持。总量表和各因子量表的效标效度得到了与若干心理健康问题存在显著相关性的支持。具体来说，NFCS 总分、模糊不适及心理封闭分量表得分与焦虑、抑郁、消极情绪、孤独感和症状自评量表（Symptom Checklist-90，SCL-90）总分呈显著正相关，其中心理封闭得分与这些变量有最强的相关。心理封闭也与积极情绪呈显著负相关，而结构偏好得分与积极情绪和生活满意度呈显著正相关。

结论：中文版 NFCS 是一种有效且可靠的 NFC 测量工具，可促进对中国人群 NFC 的评估和研究。

Psychometric properties of the Chinese version of the 15-item Need for Closure Scale: scale validation and associations with mental health

Yaming Hang[1], Ziyi Wang[1], Arne Roets[2], Min Zong[3,1], Yi Feng[4,1*] and Zhihong Qiao[1*]

1 Faculty of Psychology, Beijing Normal University, Beijing, China

2 Faculty of Psychology and Educational Sciences, Ghent University, Ghent, Belgium

3 Mental Health Center, Foreign Affairs University, Beijing, China

4 Mental Health Center, Central University of Finance and Economics, Beijing, China

Abstract ： Background: Need for closure (NFC) has been found to be implicated in different forms of psychopathology. The 15-item Need for Closure Scale (NFCS) is an efficient and easy tool for assessing individuals' NFC in Western contexts. However, the psychometric properties of the 15-item NFCS have not yet

been validated in Chinese populations.

Methods: Two different samples of university students from China were recruited in this study. The first sample (N = 5,080, 49.9% females) was used to conduct exploratory factor analysis (EFA) and reliability analysis. The second sample (N = 3,968, 64.2% females) was used to perform confirmatory factor analysis (CFA) and exploratory structural equation modeling (ESEM), followed by tests of measurement invariance and criterion validity.

Results: The full scale showed good internal consistency (ω =0.83). The four-factor ESEM result was chosen as our final model, with each of the four subscales (Preference for order, Decisiveness, Discomfort with ambiguity and Closed-mindedness) showing moderate to good internal consistency (ω =0.60 ~ 0.81). Strong measurement invariance across sex and ethnicity groups was supported. The criterion validity of the total scale and the factor scales was supported by significant associations with several mental health problems. Specifically, the NFCS total scores, Ambiguity and Closed-mindedness were positively correlated with anxiety, depression, negative affect, loneliness and SCL-90 total scores. Among these measures, Closed-mindedness had the strongest relationship with these variables, as revealed by the largest correlation coefficients. Closed-mindedness was also negatively correlated with positive affect. In contrast, Order was positively correlated with positive affect and life satisfaction.

Conclusion: The Chinese NFCS appears to be a valid and reliable instrument for measuring the NFC, which could promote both the assessment and research of the NFC in Chinese populations.

主观社会经济地位与睡眠拖延行为：压力知觉与问题性社交媒体使用的链式中介作用

柯慧慧[1]　杨潇[1]
1 贵州师范大学心理学院，贵阳，550025

摘 要　目的：《中国睡眠研究报告（2022）》报告指出我国民众睡眠时长不足，影响睡眠时长的因素分别是看手机或上网导致睡眠拖延。在询问“每天睡觉前看一会儿手机”的情况时，超过一般的调查者选择了“总是”。睡眠拖延是指个体在没有外部原因阻碍的情况下，习惯性地推迟其预定就寝时间的行为。研究发现，睡眠拖延不仅会导致个体出现睡眠不足、入睡困难、负性情绪增多，长此以往还会诱发睡眠节律紊乱、焦虑、抑郁以及免疫功能低下等身心障碍。由此，本研究旨在探讨主观社会经济地位对个体睡眠拖延行为的影响，以及压力知觉、问题性社交媒体使用在其中的作用机制。方法：采用《压力知觉量表》、《主观社会经济地位量表》、《问题性社交媒体使用量表》、《睡眠拖延行为量表》对 417 名在校大学生进行调查。结果表明：（1）压力知觉、主观社会经济地位、问题性社交媒体和睡眠拖延行为之间均存在显著的相关；（2）压力知觉在主观社会经济地位和睡眠拖延行为中间起中介作用；（3）压力知觉和问题性社交媒体使用在主观社会经济地位和睡眠拖延行为中间起链式中介作用。结论：主观社会经济地位不仅可以直接影响个体的睡眠拖延行为，也可以通过压力知觉和问题性社交媒体使用对个体的睡眠拖延行为产生间接影响。研究揭示了个体主观社会经济地位与睡眠拖延行为的关系及其作用机制，对于帮助个体减少睡眠拖延行为、提高睡眠质量有一定指导意义。

Subjective Socioeconomic Status and Bedtime Procrastination: The Chain Mediating Effect of Perceived Stress and Problematic Social Media Use

Ke Huihui[1], Yang Xiao[1]
1. School of Psychology, Guizhou Normal University

Abstract：Objective: The report "China Sleep Research Report (2022)" points out that the Chinese people lack sufficient sleep duration, and the factors that affect sleep duration are sleep delays caused by watching mobile phones or the Internet. When asked about 'checking your phone for a while before going to bed every day', more than half of the respondents chose 'always'. Bedtime procrastination refers to the behavior of individuals habitually delaying their scheduled bedtime without external obstacles. Studies have found that sleep delay will not only lead to insufficient sleep, difficulty in falling asleep and increase of negative emotions, but also lead to sleep rhythm disorder, anxiety, depression, immune dysfunction and other disability in the long run. Therefore, this study aims to explore the impact of subjective socioeconomic status on individual bedtime procrastination behavior, and the mechanism of perceived stress and problematic social media use. Methods: 417 college students were investigated

with the Perceived Stress Scale, Subjective Socioeconomic Status Scale, Problem Social Media Use Scale, and Bedtime Procrastination Scale. The results showed that: (1) There were significant correlations between perceived stress, subjective socioeconomic status, problematic social media and bedtime procrastination; (2) Perceived stress plays a mediating role between subjective Socioeconomic status and bedtime procrastination; (3) Perceived stress and problematic social media use play a chain mediating role between subjective Socioeconomic status and bedtime procrastination. Conclusion: Subjective Socioeconomic status can not only directly affect individuals' bedtime procrastination behavior, but also indirectly affect individuals' bedtime procrastination behavior through perceived stress and problematic social media use. The research reveals the relationship between individual subjective Socioeconomic status and bedtime procrastination and its mechanism, which has certain guiding significance for helping individuals reduce bedtime procrastination and improve sleep quality.

Keywords：subjective socioeconomic status, bedtime procrastination, perceived stress, social media

不执着简版量表(NAS-7)的中文版及其信效度检验

朱筠[1]　何相材[1]　杨潇[1]　罗禹[1]　张禹[1]（通讯作者）
1 贵州师范大学心理学院，贵阳，550025，yuzhang331@163.com

摘 要　**背景：**不执着是与正念相关但不同的概念，并且是正念最突出的机制之一。它是个体积极融入当下环境，接纳生命的短暂和变化无常，并且自主地做出选择的心理特性，具体表现为不固着于想法、情绪或外在事物，对成就、得失等一切经验保持开放与灵活。多项研究表明，冥想研究和干预的重点应放在类似不执着这样的概念上。

目的：不执着简版量表(Brief Version of Nonattachment Scale, NAS-7)相较于完整版有更优的模型拟合并可减少受试者负担，然而国内尚无该量表的中文版本，这在一定程度上阻碍了该领域研究的深入开展。本研究旨在将 NAS-7 翻译为中文版本，检验其信效度，为开展不执着相关研究提供有效的测量工具。

方法：通过翻译、回译、文化调适等过程完成 NAS-7 的中文版后，在网络平台随机发放问卷，获得有效问卷 1023 份（男生 265 人，年龄 18~60 岁）。选用抑郁-焦虑-压力自评量表简版(Depression Anxiety and Stress Scale，DASS-21)和中文版五因素正念问卷简版(Five Facet Mindfulness Questionnaire-Short Form, FFMQ-SF)作为效标。使用总样本进行项目分析、内部一致性分析、分半信度分析以及效标效度分析，并将总样本随机分半分别进行探索性因素分析和验证性因素分析，另外选取 156 人在 20~30 天后第二次完成 NAS-7 以评价重测信度。

结果：NAS-7 中文版具有较高的信度：Cronbach's α系数为 0.849，分半信度为 0.825，重测信度为 0.729；相关系数法显示各条目均与量表总分显著相关，*t* 检验显示各条目区分度良好；探索性因素分析表明量表为单维结构，累计方差贡献率为 53.21%；验证性因素分析表明，模型拟合指标为χ^2/df=2.567、GFI=0.982、NFI=0.971、CFI=0.982、TLI=0.973、RMSEM=0.055、RMR=0.035；效标效度分析表明，不执着水平与正念正相关(r=0.532, P<0.001)，与抑郁(r=-0.407, P<0.001)、焦虑(r=-0.333, P<0.001)、压力(r=-0.491, P<0.001)负相关；对人口学变量进行分析显示，不执着水平在个体正念经验(P<0.001)、婚姻状况(P<0.01)、年龄(P<0.01)上存在差异，在性别上不存在差异(P＞0.05)。

结论：NAS-7 中文版在中国成年人样本中具有较好的信效度指标，可以作为进一步研究的可靠的测量工具。

关键词　不执着，中文版，正念，信度，效度

Chinese version of brief version of Nonattachment Scale(NAS-7): Reliability and Validity

Jun Zhu[1]　Xiangcai He[1]　Xiao Yang[1]　Yu Luo[1]　Yu Zhang[1](corresponding author)
1 School of Psychology, Guizhou Normal University, Guiyang, 550025, yuzhang331@163.com

Abstract*: *Background: Nonattachment is a construct related to mindfulness but distinct from it, and it is one of the prominent mechanisms of mindfulness. It refers to the psychological characteristic of individuals actively integrating into the present environment, accepting the transience and unpredictability of life, and autonomously making choices. Specifically, it entails not clinging to thoughts, emotions, or external things, and maintaining openness and flexibility towards all experiences such as achievements and gains. Multiple studies have indicated

that research and interventions of meditation should focus on concepts similar to nonattachment.

Objective: The brief version of the Nonattachment Scale (NAS-7) has better model fit and reduces participants burden compared to the full version. However, there is currently no Chinese version of this scale, which hinders further research in this field. This study aims to translate NAS-7 into Chinese, examine its reliability and validity, and provide an effective measurement tool for nonattachment-related research.

Methods: Through processes such as translation, back-translation, and cultural adaptation, the Chinese version of the NAS-7 was developed. A total of 1023 valid questionnaires were collected through online platforms, with 265 males and participants ranging in age from 18 to 60. The Depression Anxiety Stress Scale - Short Form (DASS-21) and the Chinese version of the Five Facet Mindfulness Questionnaire - Short Form (FFMQ-SF) were used as criterion measures. Item analysis, internal consistency analysis, split-half reliability analysis, and criterion validity analysis were conducted on the total sample. Exploratory factor analysis and confirmatory factor analysis were performed on randomly divided halves of the sample. Additionally, a subset of 156 participants completed the NAS-7 for a second time after 20 to 30 days to assess test-retest reliability.

Results: The Chinese version of NAS-7 demonstrated good reliability: Cronbach's alpha coefficient was 0.849, split-half reliability was 0.825, and test-retest reliability was 0.729. The correlation coefficient method showed significant correlations between each item and the total score of the scale, and the t-tests indicated good discriminant validity for each item. Exploratory factor analysis revealed a unidimensional structure of the scale with a cumulative variance contribution rate of 53.21%. Confirmatory factor analysis showed satisfactory model fit indices: χ^2/df=2.567, GFI=0.982, NFI=0.971, CFI=0.982, TLI=0.973, RMSEM=0.055, RMR=0.035. Criterion validity analysis revealed positive correlations between nonattachment and mindfulness (r=0.532, P<0.001), and negative correlations with depression (r=-0.407, P<0.001), anxiety (r=-0.333, P<0.001), and stress (r=-0.491, P<0.001). Demographic analysis showed differences in nonattachment levels concerning individual mindfulness experience (P<0.001), marital status (P<0.01), and age (P<0.01), but not gender (P>0.05).

Conclusion: The Chinese version of NAS-7 demonstrated good reliability and validity among Chinese adult samples and can serve as a reliable measurement tool for further research.

珀斯情绪反应性量表在中国的跨文化验证与临床效用研究

张茜[1]，蔡新璐[1]（通讯作者）
1 杭州师范大学脑科学研究所，杭州，311121
Email: caixinlu@hznu.edu.cn

摘 要 背景：珀斯情绪反应性量表（Perth Emotional Reactivity Scale, PERS）可以用于测量个体情绪反应的易激活程度、强度和持续时间，具有将个体的积极和消极情绪反应分别进行测量的优点。然而，此量表尚未在中国样本群体中得到验证。因此，本研究旨在检验中文版 PERS 的跨文化心理测量特性与临床效用。方法：在研究一中，我们对中国大学生样本群体（n = 814）施测中文版 PERS，并对其因子结构、内部一致性、重测信度和同时效度进行检验。在研究二中，我们对抑郁症患者组（n = 50）、抑郁症匹配健康对照组（n = 50）、亚临床抑郁症状组（n = 50）和亚临床抑郁症状匹配健康对照组（n = 50）进行组间差异比较，以评估 PERS 的临床效用。结果：在研究一中，通过验证性因子分析（Confirmatory Factor Analyses, CFA）发现,六因子模型的拟合结果最优(拟合指标值和因子负荷)。此外，PERS 具有良好的内部一致性，重测信度和同时效度。在研究二中，独立样本 t 检验（Independent *t*-tests）和多因素方差分析(Multivariate Analysis of Variance, MANOVA)结果显示，抑郁症患者组与健康对照组之间在 PERS 得分上存在显著差异(t_{98} = - 4.73, p < .001；*Wilks' Lambda* = .58, F (6,93) = 11.03, p < *.001*)，在亚临床抑郁症状组与其健康对照组中也发现了相似的结果，提示 PERS 具有良好的临床效用。结论：中文版的情绪反应性量表是一种可靠有效的情绪反应测量工具，可用于后续研究和临床实践。

Cross-cultural validation and clinical application of the Perth Emotional Reactivity Scale in China

Qian Zhang[1], Xinlu Cai[1*]
1 Hangzhou Normal University, Institute of Brain Science, Hangzhou, 311121
Email: caixinlu@hznu.edu.cn

Abstract: **Background:** The emotional reactivity construct is of significant interest to psychiatry. The Perth Emotional Reactivity Scale (PERS) measures the typical ease of activation, intensity, and duration of one' s emotional reactivity. Moreover, it assesses emotional reactivity across negative and positive emotion valence. However, it has not been validated in the Chinese context. In this paper, we aimed to examine the psychometric properties and clinical utility of the Chinese version of the PERS. **Methods:** In study 1, the Chinese version of the PERS was administered to a large Chinese sample (n = 814). The factor structure, internal consistency, and test-retest reliability of the PERS were examined. In study 2, we compared the group differences among a major depressive disorder (MDD) group (n = 50), a matched healthy control group for MDD (n = 50), a subclinical depression group (n = 50), and a matched healthy control group for subclinical depression (n = 50), to assess the clinical relevance of the PERS. **Results:** In study 1, confirmatory factor analyses (CFA) supported a six-factor correlated model was the best solutions (for fit index values and factor loading). The PERS showed good internal consistency and test-retest reliability, as well as good concurrent validity. In study 2, independent *t*-tests and multivariate analysis of variance (MANOVA) showed significantly differences in PERS total and subscales scores between patients with MDD and healthy controls (t_{98} = - 4.73, $p < .001$; *Wilks' Lambda* = .58, F (6, 93) = 11.03, $p < .001$). It indicated that the PERS was able to distinguish the MDD group from their matched healthy controls. The similar results were found in the subclinical depression group and their matched healthy controls. **Conclusions:** Our findings indicated that the Chinese version of the PERS is a reliable and valid instrument to measure emotional reactivity and could be used in both research and clinical practice.

摘 要　如何准确、有效地测量恶意创造力，是该研究领域重要的基础性问题。恶意创造力(Malevolent Creativity)现有的实验测量方法中，不论是要求被试在负面情境中想出新颖方案的问题解决任务(Problem-Solving Tasks)，或是要求被试汇报常用物品不同用途的发散思维测验(Divergent Thinking Test)，又或是在这二者基础上改进而成的恶意创造力解决任务(Malevolent Creativity Test, MCT)，都仅要求被试汇报想法，而不做出真实的恶意创造力行为。但头脑中的想法与真实的行为是有本质区别的。作为创造力的子概念，具体的、可观察的行为才是恶意创造力的最终“产品”。研究者们无法测量“真正”的恶意创造力，这极大威胁着已有研究的有效性，并制约着未来研究的发展。恶意创造力又可以看作一种特殊的攻击行为。本研究从攻击领域的实验室涂鸦(Experimental Graffiti)范式中获得启发，设计了恶意创造力涂鸦测验(Malevolent Creativity Graffiti Test, MCGT)。该测验利用涂鸦兼具创造性与破坏性的特点，允许被试在实验情景中，完整地经过准备、酝酿、豁然、验证 4 个阶段，真实地做出恶意创造力行为，并生成恶意创造力产品。通过两个研究对 MCGT 进行效度检验。分别将恶意创造力行为量表(Malevolent Creativity Behavior Scale, MCBS)、MCT，以及愤怒反刍量表(Anger Rumination Scale, ARS)作为校标。分别抽取 82 名大学生(女生 54 人，男生 28 人，M_{age}=21.62±2.29)和 53 名大学生被试(女生 33 人，男生 20 人，M_{age}=19.11±1.03)作为样本。三位评分者对 MCGT1、MCT 和 MCGT2 进行独立评分，α分别为 0.92、0.91 和 0.74。其中 MCGT 需要对涂鸦作品的新颖性、恶意度、涂鸦程度和精致性进行 7 点评分，将新颖性×恶意度作为恶意创造力的指标。偏相关分析显示，控制了性别、年龄和学历的情况下，MCT 与 MCBS 显著正相关(r=0.25, p=0.028)；ARS 与 MCBS 显著正相关(r=0.57, p<0.001)；MCGT1 中的新颖性(r=0.252, p=0.025)、恶意度(r=0.26, p=0.019)、涂鸦程度(r=0.25, p=0.025)、新颖性×恶意度(r=0.27, p=0.018)与 MCT 显著正相关；MCGT2 中的新颖性(r=0.28, p=0.045)、恶意度(r=0.36, p=0.011)、新颖性×恶意度(r=0.39, p=0.005)与 ARS 显著正相关；MCGT1、MCGT2 与 MCBS 的相关均不显著。结论：初步验证了 MCGT 作为恶意创造力行为指标的有效性，但其信效度仍需进一步的检验。

The Malevolent Creativity Graffiti Test – Development of Paradigm Based on Malevolent Creativity Behavioral Measurement

Ruiyi Tang[1], Zhe Gong[1]*

[1] College of Psychology, Sichuan Normal University, E-mail zhegong@sicnu.edu.cn

Abstract: How to measure malevolent creativity accurately and effectively is an important fundamental question in this research field. In the existing experimental measurement methods of malevolent creativity, whether it is asking subjects to come up with novel solutions in a negative context (Problem-Solving Tasks), or requesting subjects to report the different uses of common items (Divergent Thinking Test), or the method derived from these two (Malevolent Creativity Test, MCT), all only require subjects to report their thoughts in the mind, without actually engaging in malevolent creative behaviors. However, there are fundamental differences between thoughts in the mind and behaviors in reality. As a sub-concept of creativity, specific and observable behavior is the

ultimate "product" of malevolent creativity. Researchers cannot measure the "real" malevolent creativity, which greatly threatens the validity of existing researches, and hinders the development of researches in the future. Malevolent creativity can also be seen as a special type of aggressive behaviors. This study was inspired by the Experimental Graffiti paradigm in the aggression field, and designed the Malevolent Creativity Graffiti Test (MCGT). This test utilizes both the creative and destructive characteristics of graffiti, allowing subjects to engage in malevolent creative behavior in the laboratory setting with intact four stages: preparation, immersion, incubation and verification, and generate the malevolent creative product. The validity of MCGT was tested by two studies. The Malevolent Creativity Behavior Scale (MCBS), MCT, and the Anger Rumination Scale (ARS) were used as benchmarks. 82 (54 females, 28 males, *M*age=21.62±2.29) and 53 college students (33 females, 20 males, *M*age=19.11±1.03) were randomly selected as participants respectively. Three raters scored MCGT1, MCT, and MCGT2 independently, with α=0.92, 0.91, and 0.74. MCGT requires a 7-point rating of novelty, maliciousness, graffiti extent, and refinement of the graffiti artwork, with novelty × maliciousness serving as the indicator of malevolent creativity. Partial correlation analysis showed that, with controlling gender, age, and educational degree, MCT was positively correlated with MCBS significantly (r=0.25, p=0.028); ARS was positively correlated with MCBS significantly (r=0.57, p<0.001); novelty (r=0.252, p=0.025), maliciousness (r=0.26, p=0.019), graffiti extent (r=0.25, p=0.025), and novelty × maliciousness (r=0.27, p=0.018) in MCGT1 were positively correlated with MCT significantly; novelty (r=0.28, p=0.045), maliciousness (r=0.36, p=0.011), and novelty × maliciousness (r=0.39, p=0.005) in MCGT2 were positively correlated with ARS significantly; the correlations between MCBS and MCGT1, MCGT2, were not significant. Conclusion: The effectiveness of MCGT as an indicator of malevolent creative behavior was preliminarily validated, but its reliability and validity need more examinations in the future.

“从面对面欺凌到键对键攻击”：基于线上游戏对校园欺凌生态化识别的初步探索

张宇暄[1] 于丽含[2] 何思思[1] 周海波[1]（通讯作者）

1 湖南科技大学教育学院，湖南湘潭 ，411201，hbzhou@hnust.edu.cn

2 西南大学心理学部，重庆，400715

摘要 当前网络已广泛普及，成为人们交流、信息传递以及社会互动的重要平台，校园欺凌也逐步由传统的校园欺凌演变为网络欺凌，然而网络是一把双刃剑，如何在心理学领域利用好网络这一工具是当前研究热点。本研究以在线对战游戏“王者荣耀”为例，拟探究一种生态化识别方法来测量校园欺凌，旨在弥补自我报告法的缺陷。研究 1 拟采用聚合交叉设计，对比某高校同属教育学范畴内的电子竞技专业与其他专业大一到大三的学生，进行历时一年半共四个时间点的追踪，依据欺凌者/受害者/旁观者、欺凌者的角色（头目/助手/加强者）、欺凌形式、各节点斜率变化趋势分组，探讨使用在线游戏时长与网络欺凌的关系和发展轨迹。研究 2 拟依据“王者荣耀”游戏指标，例如输出伤害、承受伤害、常用位置、信誉积分等，结合以往校园欺凌量表，采用机器学习的方法建构游戏数据指标与校园欺凌的关系。研究 3 拟收集被试在游戏对局中系统提供的各种快捷消息的使用频率，结合访谈法收集被试最近的局内发言，采用 AI 神经网络模型提取基于词向量的文本特征，不断扩充数据集以深度学习调整各文本信息对应不同欺凌方式的权重，并最终结合历史游戏指标和近期在线时长有效地提高对校园欺凌识别的准确率。我们预期该研究结果可以对校园欺凌提供一个相对客观的生态数据获取方法，一定程度上规避校园欺凌作为敏感问题对学生的影响，更客观的预测欺凌行为的发生与识别遭受欺凌的学生，为进一步教育和干预提供科学依据。

压力反应的时间动力性：神经恢复作为心理韧性的指标

于佳露[1] 伍珍[1]（通讯作者）
1 清华大学心理学系，北京，100084，zhen-wu@mail.tsinghua.edu.cn

摘 要 心理韧性指的是个体在逆境中积极适应和恢复的能力，良好的心理韧性有助于个体经历逆境或压力后恢复良好的心理健康水平。如何在逆境发生之前，得到较为客观的对于心理韧性的测量，对于预防逆境后的创伤，以及创伤后的恢复，都具有重要意义。然而已有研究对心理韧性的测量大多依赖自我报告，或通过逆境后的心理健康水平来间接反应。近年来，已有研究者关注到了个体压力反应的时间动力性。他们从神经生理学角度出发，将心理韧性定义为压力事件后个体在自主神经系统、心血管系统等层面恢复稳态的能力，并认为神经恢复速度可能是潜在的心理韧性的良好指标。为了验证这一假设，本研究拟建立自然压力事件中个体自主神经系统反应的时间动力性特征与心理韧性之间的联系。本研究收集了 65 名本科生在多场期末考试过程中的皮肤电和心率数据，并让他们完成了 Connor-Davidson 心理韧性量表（CD-RISC）和简版心理韧性量表（BRS）。通过对皮肤电和心率的时序数据进行自回归系统辨识，我们提取了个体压力反应的时间动力性特征，包括上升时间，峰值，恢复时间等。结果显示：个体皮肤电恢复稳态的时间与个体通过两个量表报告的心理韧性得分显著负相关。说明个体在自主神经系统层面恢复稳态需要的时间越长，个体自我报告的心理韧性水平越低。本研究的结果支持了神经恢复性作为心理韧性指标的假设，丰富了已有的关于心理韧性在生理层面的测量指标，有助于研究者从神经和心理两个层面理解心理韧性的本质。

Temporal dynamics of stress response: Neural recovery as an indicator of psychological resilience

Jialu Yu[1], Zhen Wu[1] (Corresponding author)
1 Department of psychology, Tsinghua University, Beijing 100084, China

***Abstract*:** Resilience refers to an individual's capacity to positively adapt and recover from adversity, aiding in the restoration of mental health following adversities or stress. Obtaining objective measures of resilience before encountering adversities is crucial for preventing and recovering from the subsequent trauma. However, existing studies heavily relies on self-report measures or retrospective evaluations of mental health following adversities. In recent years, an increasing number of researchers have focused on the temporal dynamics of stress responses. From a neurophysiological perspective, resilience is defined as the ability of an organism to regain homeostasis after stressful events. They propose that neural recovery could potentially serve as an indicator of resilience. To test this hypothesis, this study aims to establish a relation between the temporal dynamic features of stress responses during real-life stressful situations and psychological resilience. We recorded the physiological data of heart rate (HR) and galvanic skin response (GSR) from 65 undergraduates during their final exams. Participants were also required to complete the Connor-Davidson Resilience Scale (CD-RISC) and the Brief Resilience Scale (BRS). By employing an autoregressive system identification method on the time-series recordings, we extracted temporal dynamic features of individual stress responses, such as rise time, peak value,

and recovery time. The results show a significant negative correlation between the recovery time of GSR and participants' self-reported scores of CD-RISC and BRS. This suggests that individuals who take longer time to restore autonomic nervous system homeostasis are more likely to report lower levels of resilience. Our findings provide evidence for the hypothesis that neural recovery can serve as an indicator of psychological resilience, thereby expanding the repertoire of physiological indicators for psychological resilience. This contributes to a more comprehensive understanding of resilience from both physiological and psychological perspectives, offering valuable insights into the mechanism under resilience.

竞争背景下亲密关系调节女性大脑活动：来自 EEG 及功能连通性证据

贾淑钰[1]　孟雨佳[1]　刘映杰[1]

1 华北理工大学，河北，唐山，063210

华北理工大学，河北，唐山，063210，psyliuyingjie@163.com

摘 要　竞争作为重要的社会互动方式之一，本研究通过脑电技术手段，从事件相关电位分析、时频分析以及功能连接分析的视角，探究了亲密恋人陪伴状态以及竞争对手性别对女性个体竞争调控的神经机制。本研究共招募了 52 名在校女性大学生，采用了 2（陪伴状态：在身边、不在身边）×2（对手性别：同性、异性）的被试间实验设计。被试被分为四组：一组是 15 个伴侣在身边与同性竞争组合，另一组是 15 个伴侣在身边与异性竞争组合，还有一组是 13 个伴侣不在身边与同性竞争组合，最后一组是 14 个伴侣不在身边与异性竞争组合。要求被试完成视觉提示-目标任务，通过按键竞争的方式模拟真实竞争场景，同时记录反应时与脑电信号，以评估其在竞争情境下的状态。结果发现，当恋人不在身边时，女性与陌生异性竞争时候的 P3 平均波幅更高。与同性竞争相比，女性个体在与陌生异性竞争时，大脑的 theta 频段活动显著增加。此外，研究还发现，个体脑内中央顶叶区域的连接同步与个体预测结果监测和行为适应性呈正相关。换句话说，当个体能够更好地掌握局势并预测行为时，连接同步程度也更高。研究结果表明，当女性的伴侣不在身边时，她们在竞争任务中表现出更高的投入度。此外，与陌生同性竞争相比，与异性竞争会给女性个体带来更大的心理负荷，竞争任务的复杂性也更高。在这种情况下，女性个体在结果预测和行为调整方面表现得更好。本研究基于社会比较理论，证明了亲密关系恋人的陪伴状态以及对手性别对女性竞争的影响，对女性更好的适应社会良性竞争以及维护亲密关系稳定发展具有重要意义。

Intimate relationships weaken female competition: Evidence from phase-amplitude coupling and functional connectivity

Shuyu Jia[1], Yujia Meng[1], Yingjie Liu[1]

1 North China University of Science and Technology, Hebei, Tangshan

Abstract：Competition is one of the important ways of social interaction. Through EEG technology, this study

explored the neural mechanism of the intimate partner's companionship status and competitor's gender on female individual competition regulation from the perspective of Evoked potential analysis, Time–frequency analysis, and functional connectivity analysis. A total of 52 female college students were recruited in this study, and 2 (companionship status: nearby or not nearby) were used × Design of inter-subject experiments for 2 (opponent gender: same-sex or opposite sex). The subjects were divided into four groups: one group consisted of 15 partners competing with the same sex while they were around, the other group consisted of 15 partners competing with the opposite sex when they were around, the other group consisted of 13 partners competing with the same sex when they were not around, and the last group consisted of 14 partners competing with the opposite sex when they were not around. Participants are required to complete the visual cue-target task, simulate real competitive scenarios through button competition, and record reaction time and EEG signals to evaluate their state in competitive situations. The results showed that when the lover was not around, the average amplitude of P3 was higher when women competed with strangers of the opposite sex. Compared to the same-sex competition, female individuals significantly increase their theta frequency band activity when competing with the unfamiliar opposite sex. In addition, the study also found that the synchronization of connections in the central parietal lobe region of an individual's brain is positively correlated with the monitoring of individual prediction results and behavioral adaptability. In other words, when individuals are better able to grasp the situation and predict behavior, the degree of connection synchronization is also higher. The research results indicate that women exhibit higher engagement in competitive tasks when their partners are not around. In addition, compared to unfamiliar same-sex competition, competition with the opposite sex can bring a greater psychological burden to female individuals, and the complexity of competitive tasks is also higher. In this situation, female individuals perform better in predicting outcomes and adjusting behavior. Based on the Social comparison theory, this study proves that the companionship status of intimate relationship lovers and the influence of rival gender on female competition are of great significance for women to better adapt to social benign competition and maintain the stable development of intimate relations.

来源记忆新旧效应对自我参照编码和情绪效价的敏感性

聂爱青

山西师范大学教育科学学院，太原，031100，nieaiq@126.com

摘 要　在情节记忆中，旧/新效应是对正确识别的学习项目和正确拒绝的新项目引发的波形对比。然而，自我参照编码对源记忆中的旧/新效应（即源-SRE）的贡献远未明确；此外，尚不清楚这种贡献是否受刺激情绪性因素的影响。为解决这些问题，本研究采用了事件相关电位（ERP）技术，在自我关注和外部关注编码任务中应用了三种类型的情绪价值词（积极、中性和消极）。在测试过程中，发现了四种 ERP 新旧效应：（a）熟悉度和回忆程度的中央额区效应（FN400）和晚期正性成分（LPC）与源-SRE 和刺激情绪性无关；（b）重建驱动的晚期后部负性成分（LPN）表现出与源-SRE 相反的模式，并受到编码焦点的情绪价值影响；以及（c）右前额新旧效应效应（RFE）反映出检索后的过程，显示出情绪性词汇中的源-SRE。这些效应为刺激效价和编码焦点对源记忆中的 SRE 的影响提供有力证据。

关键词　来源记忆，情绪效价，自我参照，新旧效应，LPN

Sensitivity of late ERP old/new effects in source memory to self-referential encoding focus and stimulus emotionality

Aiqing Nie

[1]Department of Psychology, College of Educational Sciences, Shanxi Normal University, Taiyuan, Shanxi Province, China, 030031. Email: nieaiq@126.com

Abstract： In episodic memory, the old/new effect, the contrast of the waveforms elicited by the correctly recognized studied items and the correctly rejected novel items, has been broadly concerned. However, the contribution of self-referential encoding to the old/new effect in source memory (i.e., source-SRE), is far from clarification; further, it remains unclear whether the contribution is susceptible to the factor of stimulus emotionality. To address these issues, adopting the event-related potential (ERP) technique, this study applied words of three types of emotional valences (positive, neutral, *vs.* negative) in the self-focus *vs*. external-focus encoding tasks. In the course of the test, four ERP old/new effects were identified: (a) the familiarity- and recollection-reflected mid-frontal effect (FN400) and late positive component (LPC) were both independent of source-SRE and stimulus emotionality; (b) the reconstruction-driven late posterior negativity (LPN) exhibited an adverse pattern of source-SRE and was susceptible to the emotional valence by encoding focus; and (c) the right frontal old/new effect (RFE), reflecting post-retrieval process, exhibited a source-SRE in emotional words. These effects provide compelling evidence for the influences of both stimulus valence and encoding focus on SRE in source memory, especially during the late processes. Further directions considering more perspectives are put forward.

Keywords： Source memory, emotional valence, self-reference, old/new effect, LPN

大学生对口音说话者的社会评价：社会阶层和道德水平的边际效用

李云霞

赣南师范大学教育科学学院，江西赣州，341000，liyxlily@163.com

摘 要 口音属于个体的发音方式，可以通过第一印象轻易引起听者的关注和评价，而广西夹壮普通话以其独特的腔调和喜感的口音特点在网上颇为流行。基于此，本研究关注地方特色口音（夹壮普通话）是否会影响他人对其的社会评价。此外，研究进一步探究社会阶层和道德水平是否能给口音说话者的社会评价带来减弱或改善的边际效用。

研究方法与结果：前期使用设备录制浓重夹壮和标准普通话的节选段落录音作为口音变量材料。研究 1 采用单因素（口音水平：浓重口音、标准普通话）被试间实验设计，被试通过听取录音并填写言语态度量表对所呈现人物进行评价。研究 2 和 3 进一步探究口音社会评价的边际效应，首先采用 2（口音水平：浓重口音、标准普通话）×2（社会阶层水平：高社会阶层、低社会阶层）被试间实验设计。接着，研究 3 采用 2（口音水平：浓重口音、标准普通话）×2（社会阶层水平：高社会阶层、低社会阶层）×2（道德水平：高道德水平、低道德水平）被试间实验设计。结果表明：（1）口音、社会阶层和道德水平的主效应显著，相比非标准口音者、低阶层者和低道德水平者，被试对标准口音说话者、高阶层说话者和高道德水平说话者的评价更积极；（2）口音和社会阶层的交互作用显著，相比低社会阶层的浓重口音说话者，听者对高阶层的浓重口音说话者的评价更积极；（3）社会阶层和道德水平的交互作用显著，相比低道德低阶层说话者，听者对高道德低阶层说话者的评价更积极；（4）三者的交互作用并不显著。

研究结论：个体口音会消极影响他人对说话者的社会评价，而社会阶层和道德水平可以在一定程度上削弱这些负面评价。对此，有必要增强人们学习普通话的动机，鼓励人们更好地发展自我，提高个人能力和地位，发展积极品德，修养自身，展现更好的自己。

College Students' Social Evaluation of Accent Speakers: Marginal utility of Social Class and Moral Level

Yunxia Li

Education Science School, Gannan Normal University, Ganzhou, Jiangxi China

***Abstract*:** Accents belong to individual pronunciation methods and can easily attract the attention and evaluation of listeners through first impressions, and Guangxi Jiazhuang Mandarin is quite popular online due to its unique tone and pleasant accent characteristics. Based on this, this study focuses on whether local distinctive accents (including Zhuang Mandarin) will affect others' social evaluations of them. In addition, the study further explores whether social class and moral level can bring about weakened or improved Marginal utility to the social evaluation of accent speakers.

Research methods and results: This study used equipment to record strong and standard Mandarin excerpts as accent variable materials. Study 1 adopts a single factor (accent level: strong accent, standard Mandarin) inter subject experimental design, where participants evaluate the presented characters by listening to recordings and filling out a speech attitude scale. Studies 2 and 3 further explore the marginal effects of accent social evaluation, starting with 2 (accent level: strong accent, standard Mandarin) × 2 (Social class level: high social class, low social class) Intersubject experimental design. Next, Study 3 adopted 2 (accent level: strong accent, standard Mandarin) × 2 (Social class level: high social class, low social class) × 2 (Moral level: high moral level, low moral level)

Intersubject experimental design. The results showed that: (1) the main effects of accent, social class, and moral level were significant. Compared with non standard accent speakers, lower class speakers, and lower moral level speakers, participants had more positive evaluations of standard accent speakers, higher class speakers, and higher moral level speakers; (2) The interaction between accent and social class is significant, and compared to speakers with strong accents from lower social classes, listeners have a more positive evaluation of speakers with strong accents from higher social classes; (3) The interaction between social class and moral level is significant, and compared to low moral and lower class speakers, listeners have a more positive evaluation of high moral and lower class speakers; (4) The interaction between the three is not significant.

Research conclusion: Individual accents can negatively affect others' social evaluations of the speaker, and social class and moral level can to some extent weaken these negative evaluations. In this regard, it is necessary to enhance people's motivation to learn Mandarin, encourage them to better develop themselves, improve personal abilities and status, develop positive moral character, cultivate themselves, and showcase a better self.

Keywords: Zhuang accent, social class, moral level, marginal effects, social evaluation

Physical health status and psychological distress among frontline and non-frontline prison officers during the prevention and control of a major emerging infectious diseases: A case-control study from China

Yong Tian
Sichuan Judicial and Police Officers Professional College, Deyang 618000,
People's Republic of China

Abstract*: *Background and objective The spread of major emerging infectious diseases (MEIDs), including SARS, H7N9 avian influenza, and Coronavirus disease 2019 (COVID-19), had put prisons across the globe into an emergency state where extraordinary measures have been taken. Chinese prison system contained the spread of MEIDs inside its walls by demanding officers work on lockdown shifts inside for an extended and indefinite period of time. This strategy had proved effective markedly in terminating the prevention and control of COVID-19 epidemic recently, but placed a heavy burden on the personal physical and mental health of the officers. To further explore the physical and psychological impact of a MEIDs outbreak, this study compared the mental health status and psychological distress between frontline and non-frontline prison officers in China. ***Methods*** This case-control study recruited 818 frontline and 818 non-frontline prison officers during the prevention and control of COVID-19 epidemic (November 22 to 30, 2022). A set of online questionnaires were used to measure physical health (i.e., self-assessment of physical fitness, loss of appetite, stomach pain, hemorrhoids, insomnia, oral ulcers and other physiological diseases), and psychological distress including perceived pressure, perceived organizational support, and emotional exhaustion for prison officers. ***Results*** Frontline prison officers had higher rates of any physical problem, that was self-assessment of poor health (28.95% *vs*. 16.63%, $\chi^2 = 40.53$, $P < 0.001$), loss of appetite (60.02% *vs*. 28.24%, $\chi^2 = 248.65$, $P < 0.001$), stomach pain (29.79% *vs*. 24.33%, $\chi^2 = 7.26$, $P = 0.007$), hemorrhoids (25.44% *vs*. 16.63%, $\chi^2 = 22.08$, $P < 0.001$), insomnia (13.14% *vs*.7.70%, $\chi^2 = 14.74$, $P < 0.001$) and oral ulcers (52.64% *vs*. 32.03%, $\chi^2 = 83.58$, $P < 0.001$), than non-frontline prison officers. The main perceived pressures of frontline prison officers were work and family life can't be balanced (94.73%), overloaded work (77.24%), and being inspected and held accountable (76.32%), and non-frontline prison officers were heavy work responsibilities (79.46%), work and family life can't be balanced (71.76%), and being inspected and held accountable (52.57%). In comparison with non-frontline prison officers, frontline officers had higher rates and score of emotional exhaustion (39.50% *vs*. 23.11%, $\chi^2 = 59.17$, $P < 0.001$; 15.18 ± 7.94 *vs*. 12.32 ± 7.69, $t = 2.48$, $P = 0.014$), and lower rates and score of perceived organizational support (63.10% *vs*. 78.24%, $\chi^2 = 52.30$; 9.52 ± 3.14 *vs*. 10.64 ± 2.82, $t = -2.53$, $P = 0.011$). ***Conclusion*** Frontline prison officers had more physical problems and psychological distress with perceived pressure and emotional exhaustion but less perceived organizational support than non-frontline prison officers. These findings highlight timely strengthen physical and mental health support and intervention, improve organizational support, and reduce work pressure for prison officers, especially for those on the frontline.

从心理和谐到人际和谐：宽恕的个体效应与人际效应

姜温君 邓秋月 丁亚童 宿飞扬 陈英敏（通讯作者）

山东师范大学心理学院，济南，250399，通讯作者 cc8030306@163.com

摘 要 和谐自古以来就是中华文明遵循的核心价值理念，它贯穿于个人修为、家庭管理、社会治理等各个层面。党的十六届四中全会第一次提出“和谐社会”概念至今，建构和谐社会成为国家和人民不断为之奋斗的理想目标。但无论个体还是社会的发展总伴随着矛盾与冲突，因此，构建和谐社会其中非常重要的一项任务就是要处理好这些不断出现的纷争。宽恕是中华民族的传统美德，也是指导人们为人处事的基本准则，其在化解冲突、维系和谐方面具有独特的价值。由此，本研究以宽恕为自变量，分别从宽恕者、被宽恕者的视角探讨了宽恕的个体心理和谐效应，与当事人双方的人际和谐以及推及他人的泛人际（社会）和谐效应，并分别考察了情绪的中介作用，具体包括 3 个研究：研究 1 从宽恕者角度出发，采用问卷法探讨宽恕与自身心理和谐的关系以及情绪的中介作用，以揭示宽恕的个体心理和谐效应。结果显示： 宽恕与个体的心理和谐、积极情绪均显著正相关，与消极情绪显著负相关；情绪在宽恕和心理和谐的关系中起中介作用，宽恕水平越高的个体能够体验到更多的积极情绪从而促进其心理和谐水平的提高。研究 2 从被宽恕者角度出发，采用实验法，在情景故事中探讨宽恕对当事人双方人际和谐的影响，以及情绪（感恩、内疚、敌意以及愤怒）的中介作用，结果发现宽恕组比非宽恕组有更高水平的人际和谐，且情绪（感恩、内疚、敌意以及愤怒）在其中起中介作用。研究 3 从被宽恕者角度出发，采用实验法，在情景故事中探讨宽恕对被宽恕者个体与第三方人际和谐的影响以及情绪的（感恩、内疚、敌意以及愤怒）的中介作用，结果发现宽恕组比非宽恕组与第三方有更高水平的人际和谐，且感恩在其中的中介作用显著，揭示了宽恕的“涟漪效应”。研究结果对化解心灵与社会的危机，构建和谐社会具有深远的意义。

From Psychological Harmony to Interpersonal Harmony : The Individual And Interpersonal Effects of Forgiveness

Jiang Wenjun, Deng Qiuyue, Ding Yatong, Su Feiyang, Chen Yingmin（Corresponding Author）
Department of Psychology, Shandong Normal University, Jinan, 250399,
Corresponding Author cc8030306@163.com

Abstract： Since ancient times, harmony has been the core value concept followed by Chinese civilization, running through various aspects such as personal cultivation, family management, and social governance. The concept of "harmonious society" was first proposed at the Fourth Plenary Session of the 16th Central Committee, and constructing a harmonious society has since become an ideal goal for the country and its people to strive for continuously. However, whether it is individual or social development, it always accompanies contradictions and conflicts. Therefore, one important task in building a harmonious society is to handle these constantly emerging disputes. Forgiveness is a traditional virtue of the Chinese nation and also a basic criterion for guiding people's conduct. It has unique value in resolving conflicts and maintaining harmony. Based on this, this study takes forgiveness as the independent variable and discusses the individual psychological and harmonious effects of forgiveness from the perspectives of the forgiver and the forgiven. It also explores the interpersonal harmony between the parties involved and the general interpersonal (social) harmony effects that extend to others. The study examines the mediating role of emotions, including three specific researches: Research 1, starting from the perspective of the forgiver, uses questionnaires to explore the relationship between forgiveness and individual psychological harmony, as well as the mediating role of emotions, revealing the individual psychological harmony effect of forgiveness. The results show that forgiveness is significantly positively correlated with individual psychological harmony and positive emotions, and significantly negatively correlated with negative emotions; emotions play a mediating role in the relationship between forgiveness and psychological harmony, and individuals with higher levels of forgiveness are more likely to experience more positive emotions, thus promoting an improvement in their psychological harmony levels. Research 2, starting from the perspective of the forgiven, uses experimental methods to explore the impact of forgiveness on interpersonal harmony between the parties involved in scenario stories, as well as the mediating role of emotions (gratitude, guilt, hostility, and anger). The results show that the forgiveness group has a higher level of interpersonal harmony compared to the non-forgiveness group, and emotions (gratitude, guilt, hostility, and anger) play a mediating role in this relationship. Research 3, starting from the perspective of the forgiven, uses experimental methods to explore the impact of forgiveness on interpersonal harmony between the forgiven individuals and third parties in scenario stories, as well as the mediating role of emotions (gratitude, guilt, hostility, and anger). The results show that the forgiveness group has a higher level of interpersonal harmony with third parties compared to the non-forgiveness group, and gratitude plays a significant mediating role in this relationship, revealing the "ripple effect" of forgiveness. The study is of profound significance for resolving crises in individuals' minds and society and building a harmonious society.

死亡凸显对网络强迫性购买的影响：物质主义的中介作用

李玥[1] 黄春梅[2] 范卡敏[3]（通讯作者）
四川师范大学心理学院，成都，610068
通讯作者 E-mail：1151957785@qq.com

摘要 死亡凸显是指通过人为的方法将个体暴露在死亡信息下，来强迫唤起个体的死亡意识，引发其对于死亡的思考。根据恐惧管理理论，当人们暴露在死亡信息之下时，会采用不同的心理防御机制来应对死亡威胁，维护文化世界观和自尊追求是两种基本的恐惧管理机制。而财富和物质消费是成功的指标和自尊的来源 ，因此，当个体面对死亡凸显时，消费者会通过增加他们的物质主义进行消费以此来减缓死亡的威胁。但如果过度，可能就会导致不良消费行为，例如强迫性购买。但随着 5G 时代的到来，人们也越来越依赖互联网和社交媒体来购物和满足其他消费需求，即网络强迫性购买，指个体难以抑制网络购物冲动，无法控制网络购物行为。尽管网络购物给个体造成了诸多负性影响，个体仍持续过度地进行网络购物。本研究旨在探究死亡凸显对网络强迫性购买的影响及心理机制。实验以 128 名高校大学生作为被试，采用死亡凸显(死亡凸显组 vs 非死亡凸显组)单因素被试间实验设计。通过回忆书写任务诱发两种情绪,随后被试随机分配到不同的组别进行死亡凸显的启动或者非死亡凸显的启动，然后被试依次完成死亡想法操纵性检验、PANAS 情绪量表、分心任务、网络强迫性购买量表、物质主义价值观量表以及人口统计学变量，如性别、年龄、月均可支配收入等的测量。

结果表明：（1)死亡凸显组相对于非死亡凸显组会增加网络强迫性购买,即死亡凸显对网络强迫性购买具有正向的预测作用,进行死亡提醒后的个体更可能表现出较高的网络强迫性购买倾向;(2)物质主义在死亡凸显与网络强迫性购买起部分中介作用。本研究为消费者在面临重大危机性事件时，他们可以掌握正确的应对方式缓冲死亡凸显带来的威胁，进行合理消费。

The Influence of Mortality Salience on online compulsive-buying: the mediating role of materialism

Li Yue [1] Huang Chunmei[2]Fan Kamin [3] (corresponding author)
School of Psychology, Sichuan Normal University, 5 Jing'an Road, Chengdu 610068, PR China.

Abstract: Mortality Salience refers to exposing individuals to death information to arouse the awareness of death and arouse their thinking about death. According to fear management theory, when people are exposed to death information, they will adopt different psychological defense mechanisms to deal with death threat. Maintaining the cultural worldview and self-esteem pursuit are two basic fear management mechanisms. Wealth and material consumption are indicators of success and sources of self-esteem, so when individuals face death, consumers will consume by increasing their materialism to mitigate the threat of death. But if excessive, it may lead to bad consumption behavior, such as compulsive purchases. However, with the advent of the 5G era, people are becoming more and more dependent on the Internet and social media to shop and meet other consumer needs, that is, online compulsive purchase, which means that individuals are difficult to restrain the online shopping impulse and cannot control the online shopping behavior. Although there are many negative effects of online shopping on individuals, individuals continue to excessive online shopping. This study aims to explore the impact of death and the psychological mechanism of its prominence on online compulsive buying. The experiment took 128 college students as the subjects, and adopted the single-factor experiment design of Mortality Salience (Mortality Salience

group vs non-Mortality Salience group). By recall writing task induced two emotions, then subjects randomly assigned to different groups for the start or the death, and then the death idea manipulative test, PANAS emotional scale, distraction task, network compulsive purchase scale, materialism values scale and demographic variables, such as gender, age, monthly disposable income, etc.

The results show that: (1) the Mortality Salience group will increase the non-Mortality Salience group of online compulsive-buying, online compulsive-buying has a positive prediction effect on online compulsive-buying, and the individuals after death reminder are more likely to show a high network compulsive purchase tendency; (2) materialism plays a partial intermediary role in Mortality Salience and online compulsive-buying . This study shows that when consumers face a major crisis event, they can master the right way to deal with the threat brought by death and make reasonable consumption.

忙碌感对地位消费的影响及其机制

李权升[1] 崔锦圣[1] 王咏尔[1] 钟建安[1]（通讯作者）
1 浙江大学心理与行为科学系，杭州，310058，通讯作者 E-mail：jiananzhong@zju.edu.cn

摘 要 忙碌感是个体对自己近期或预期的客观忙碌状态进行评估后产生的一种被很多任务占据的主观心理感知。当下，忙碌成为了中国人的主要特征和标签。而随着对忙碌生活的讨论愈发热烈，越来越多的品牌广告中出现忙碌的相关因素，描绘消费者不断提高的忙碌感。因此，有必要关注忙碌感如何影响消费者的购买决策。本文通过三个研究探讨了忙碌感对地位消费的影响，同时探索其内在的心理机制和边界条件：心理特权的中介作用和品牌显著性、公众自我意识的调节作用。通过 3 项实验得出结果：1）心理特权在忙碌感和地位消费之间起部分中介作用，高心理特权的个体为了维持和证明膨胀的自我形象，会积极寻求地位提升，提高对地位产品的购买意愿；2）高忙碌感个体的心理特权对地位消费的积极影响只对低品牌显著性的地位产品显著；3）公众自我意识起到调节作用，高公众自我意识的个体在忙碌感导致高心理特权时，会更倾向于进行地位消费；而在低公众自我意识下，削弱了心理特权对地位消费的促进作用。本研究拓展了忙碌感和心理特权在消费行为学领域内的研究，丰富了自我一致性理论的应用证据，同时为商家制定地位产品营销策略提供了一些思路。

关键词 忙碌感，心理特权，地位消费，品牌显著性，公众自我意识

The Effects of Busyness on Status Consumption and Its Underlying Mechanism

Li Quansheng[1] Cui Jinsheng[1] Wang Yonger[1] Zhong Jianan[1]（Corresponding author）
1 Department of Psychology and Behavioral Science, Zhejiang University; 866 Yuhangtang Rd., Hangzhou, 310058, China. E-mail：jiananzhong@zju.edu.cn

Abstract：Busyness is a subjective psychological perception of being occupied by many tasks that arises from an individual's assessment of his or her recent or expected objective state of busyness. Nowadays, busyness has become the main characteristic and label of Chinese people. And as the discussion of busy life becomes more popular, and more brand advertisements feature busyness-related factors, to depict ever-increasing busyness sense of consumers. Therefore, it is necessary to focus on how busyness influences consumers' purchase decisions. This paper examines the impact of busyness on status consumption through three studies while exploring its underlying psychological mechanisms and boundary conditions: the mediating role of psychological privilege and the moderating role of brand salience and public self-consciousness. The results from the three experiments were: 1) psychological privilege partially mediates the relationship between busyness and status consumption, and individuals with high psychological privilege will actively seek status advancement and increase their willingness to purchase status products in order to maintain and justify an inflated self-image; 2) the positive effect of psychological privilege on status consumption for individuals with high busyness is only significant for status products with low brand salience; 3) public self-consciousness plays a moderating role, and individuals with high public self-consciousness will be more inclined to engage in status consumption when their sense of busyness leads to high psychological privilege, while under low public self-consciousness, it weakens the facilitating effect of psychological privilege on Status consumption. This study expands the research on busyness and psychological

privilege within the field of consumer behavior, enriches the evidence for the application of self-consistency theory, and provides some ideas for merchants to develop marketing strategies for status products.

摘 要 择偶复制被认为是个体通过观察同性别榜样的配偶选择收集关于潜在配偶的社会信息进而指导自身择偶的一种社会学习。既有研究表明，同性别榜样的个体属性会影响这一择偶领域的社会学习行为（择偶复制），然而，同性别榜样的群体属性是否同样影响以及如何影响择偶复制还尚未可知。本研究旨在借助行为研究和功能性磁共振成像研究探讨这一问题。研究中，女性被试需要在观察群体内或群体外同性别榜样对潜在配偶表示出接受、拒绝或未表达意愿态度的前后，分别对她们选择潜在配偶作为男朋友的意愿进行评分。行为结果表明，女性被试在观察同性别榜样对潜在配偶的接受和拒绝态度后都发生了复制行为，与对拒绝态度的复制效应相比，女性被试对接受态度的复制效应更强；同时，对接受态度的复制受到了榜样群体属性的调控。功能性磁共振结果表明，对接受态度的复制过程中，相对于内群体榜样，当同性别榜样属于外群体时，颞顶联合区表现出更强地激活，并且颞顶联合区与前内侧前额叶皮层之间存在更强地功能连接；同时，在此条件下，颞顶联合区和前内侧前额叶皮层之间的功能连接强度与女性被试的评分变化呈显著正相关。这些结果表明，个体在学习群体外榜样决策过程中，尤其是复制榜样的接受态度时，可能需要更多的资源加工来推断外群体成员的意图，并克服学习过程中的内群体偏见。

Abstract： Mate copying refers to a social learning process in which individuals gather public information about

potential mates by observing models' choices. Previous studies have reported that individual attributes of observed female models affect human mate copying; yet little is known about whether and how the group attributes of models influence mate copying. In the current behavioral and fMRI studies, female participants were asked to rate their willingness to choose the depicted males as potential romantic partners before and after observing in-group or out-group female models accepting, rejecting, or being undecided (baseline) about the males. Behavioral results showed that participants changed their ratings to align with the models' acceptance or rejection choices. Compared to rejection copying, the effect of acceptance copying was stronger and regulated by in- and out-group models. At the neural level, stronger activity of the temporo-parietal junction (TPJ) and connectivity between the TPJ and anterior medial prefrontal cortex (amPFC) were observed during acceptance copying when female models belonged to the out-group. Meanwhile, the strength of the functional connection between the TPJ and amPFC was positively correlated with changes in ratings when participants learned from out-group models. These findings suggest that participants might require more resources to infer out-group members' intentions and overcome the in-group bias during acceptance copying.

面孔相似性对择偶复制的影响：基于深度学习算法的评估

徐思元（通讯作者） 冯喜珍 邸美琴 连培琴

山西师范大学教育科学学院，太原，030000，xusiyuan19971206@126.com

摘 要 择偶复制是一种非独立的择偶现象，指的是当个体选择配偶时，通过了解同性个体对潜在配偶的择偶意愿，会倾向于选择被其它同性个体喜好的潜在配偶。以往研究发现，个体与同性榜样的面孔相似性作为一种亲缘线索影响择偶复制并存在性别差异。然而，由于定量评估面孔相似性存在困难，因此，在以往的研究中，研究者通常采用软件合成法，通过合成被试与榜样人物的“合成脸”来控制面孔相似性。而在自然面孔条件下，面孔相似性对择偶复制的影响目前仍不清楚。本研究通过深度学习算法“Arcface”定量评估自然面孔条件下的面孔相似性，并考察面孔相似性在榜样人物不同态度下对择偶复制效应的影响及性别差异。研究采用 2（面孔相似性：高相似组/低相似组）×2（榜样人物对择偶目标的态度：感兴趣/不感兴趣）×2（性别：男/女）的混合实验设计，使用择偶复制的经典范式，以后测与前测的差值（即择偶复制效应量）为因变量。结果发现：（1）榜样人物态度主效应显著，表明存在择偶复制效应。（2）面孔相似性与性别交互作用显著，具体而言，男性被试在高面孔相似性条件下具有更高的择偶复制效应；面孔相似性在女性被试中对择偶复制效应的影响不显著。研究结果为理解择偶复制这一复杂的非独立择偶现象提供了更多依据。此外，本研究使用的深度学习算法也在技术层面为评估面孔相似性提供了新的思路。

The Influence of Facial Resemblance on Mate Choice Copying: Based on Deep Learning Algorithms

Xu Siyuan, Feng Xizhen, Di Meiqin, Lian Peiqin

Institute of Education Science of Shanxi Normal University, Taiyuan 030000, China

***Abstract*:** Mate choice copying is a kind of non-independent mate choice phenomenon, which means that when an individual chooses a mate, by understanding the mate selection intention of the same sex individual to the potential mate, he will tend to choose the potential mate who is favored by other same sex individuals. Previous studies have found that facial resemblance between individuals and same-sex role models, as a kinship cue, affects mate choice copying and has gender differences. However, due to the difficulty of quantitative assessment of facial resemblance, in previous studies, researchers usually used software synthesis method to control face similarity by synthesizing "synthetic faces" of subjects and role models. However, the effect of facial similarity on mate selection replication under natural face conditions remains unclear. In this study, the deep learning algorithm “Arcface” was used to quantitatively assess the facial resemblance under the condition of natural face, and the influence of facial resemblance under different attitudes of role models on the replication effect of mate choice copying and gender differences were investigated. The study adopted a mixed experimental design of 2 (facial resemblance: high similarity group/low similarity group) ×2 (role model's attitude towards mate selection goal: interested/not interested) ×2 (gender: male/female). The classical paradigm of mate selection replication was used, and the difference between post-test and pre-test (i.e. mate selection replication effect size) was used as the dependent variable. The results showed that: (1) the main effect of role model attitude was significant, indicating the existence of mate choice copying effect. (2) The interaction between face similarity and gender is significant. Specifically, male subjects with high facial resemblance have higher mate choice copying effect; The effect of facial resemblance on mate choice copying effect was not significant in female subjects. The results provide more evidence for understanding the complex phenomenon of mate choice copying. In addition, the deep learning algorithms used in this study also provides a new way to evaluate facial resemblance at the technical level.

社交排斥与短视频成瘾的关系:无聊和自我控制的中介作用

朱文倩[1] 张亚利[2]

1 河北师范大学教育学院，石家庄，050000

2 河北师范大学教育学院，石家庄，050000，zhangyali531@sina.com

摘 要 继网络游戏障碍之后，短视频成瘾成为研究者关注的新现象。短视频成瘾是个体反复、频繁、不受控制地使用短视频的一种强迫性状态。短视频成瘾引起了家长、学校和社会的关注，并成为心理学、教育学和社会学等许多学科的重要话题。因此，探索短视频成瘾的危险因素，科学预防短视频成瘾，保护用户身心健康是十分必要的。本研究旨在探讨无聊感和自我控制在社交排斥与短视频成瘾之间的中介作用。本研究采用多阶段调查法，对 532 名大学生进行调查，其中男性 39%;平均年龄 19.32±1.23 岁)，包括社会排斥量表、无聊倾向量表、自我控制量表和短视频成瘾量表。使用 Hayes 开发的 SPSS 22.0 和 Process 3.2 进行数据分析，检验其中介效应。结果表明，社交排斥与无聊、短视频成瘾显著正相关，与自我控制显著负相关。无聊与自我控制呈显著负相关，与短视频成瘾呈显著正相关。自我控制与短视频成瘾呈显著负相关。结果还表明，社交排斥对短视频成瘾有直接影响。无聊在社交排斥与短视频成瘾之间起着显著的中介作用。此外，自我控制在社交排斥与短视频成瘾之间起着重要的中介作用。无聊和自我控制在社交排斥与短视频成瘾之间的连锁中介效应也显著。另外，无聊和自我控制可以依次中介社交排斥与短视频成瘾之间的关系。理论上，本研究对 I-PACE 模型进行了修正。在实践中，研究结果提示学校应减少同伴排斥，提高学生心理健康素养，减少无聊感，增强自我控制能力，从而有效预防短视频成瘾。本文首次从中国短视频成瘾的普遍问题出发进行了探讨。并且从人际关系的角度，首次分析了社会排斥对短视频成瘾的诱导作用，以及无聊和自我控制在两者关系中的中介作用。本研究不仅丰富了国内短视频成瘾的相关研究，而且有助于与其他国家的类似研究形成对比，更全面地了解短视频成瘾的形成机制和跨文化差异。

The association between social exclusion and short video addiction: the mediating role of boredom and self-control

Wenqian Zhu

Hebei Normal University，Shijiazhuang

Abstract:Following internet gaming disorder, short video addiction has become a new phenomenon concerned by researchers. Short video addiction is an obsessive state in which individuals repeatedly, frequently, and uncontrollably use short videos. Short video addiction has attracted the attention of parents, schools, and society and has become an important topic in many disciplines, including psychology, pedagogy, and sociology. Therefore, exploring the risk factors of short video addiction to prevent it scientifically and protect users' physical and mental health is necessary.This study aimed to explore the mediating role of boredom and self-control between social exclusion and short video addiction. This study adopted a Multi-stage investigation and investigated 532 college students (39% males; mean age 19.32 ± 1.23 years) with social exclusion scale, boredom tendency scale, self-control scale, and short video addiction scale.SPSS 22.0 and Process 3.2, developed by Hayes, were used for

data analysis and tested mediating effect..The results showed that social exclusion was significantly positively correlated with boredom and short video addiction and significantly negatively correlated with self-control. Boredom was significantly negatively associated with self-control and positively correlated with short video addiction. Self-control was significantly negatively correlated with short video addiction.The results also showed that social exclusion could directly affect short video addiction.boredom played a significant mediating role between social exclusion and short video addiction. In addition, self-control played an important mediating role between social exclusion and short video addiction. The chain mediating effect of boredom and self-control between social exclusion and short video addiction was also significant. Theoretically, this study modified the I-PACE model. Practically, the results suggested that schools should reduce peer rejection and improve students' mental health literacy to reduce boredom and enhance self-control, thus effectively preventing short video addiction. This study discusses for the first time based on the common problem of short video addiction in China. From the perspective of interpersonal relationships,and analyzed for the first time the inducing effect of social exclusion on short video addiction and the mediating effect of boredom and self-control in the relationship between them.This study not only enriches the relevant research on short video addiction in China but also helps to form a comparison with similar studies in other countries to have a more comprehensive understanding of the formation mechanism and cross-cultural differences of short video addiction.

Keywords: social exclusion; boredom; self-control; short video addiction

人在做，“天”在看：公共服务动机与社会存在对亲社会行为的影响

贺晓玲 那琳娜

南昌大学公共政策与管理学院心理学系 江西南昌 330031

摘 要 公共服务动机作为公共管理领域的重点研究概念，近年来在心理学领域也逐渐受到关注。本研究从行为公共管理学视角出发，通过心理学实验方法详细探讨公共服务动机与社会存在对亲社会行为的影响。研究一与研究二采用独裁者博弈与志愿者困境博弈两种任务范式，操纵内隐、外显两种社会存在线索，以此探讨公共服务动机与社会存在对捐赠行为和自我牺牲行为的影响，即考察在不同线索类型与情境类型下，不同水平公共服务动机者的亲社会行为是否发生变化以及社会存在是否会与个体的特质(公共服务动机)交互作用影响个体的行为。结果显示，公共服务动机与眼睛线索、他人在场存在交互作用，内隐社会存在线索(眼睛线索)与外显社会存在情境(他人在场)能够显著促进个体的亲社会行为，但对低公共服务动机者的影响更为明显。上述结果对于在实际应用中提升不同水平公共服务动机个体的亲社会行为表现具有现实意义，体现了行为公共管理学“用心求理”的特色。

关键词 公共服务动机；眼睛线索；他人在场；亲社会行为；捐赠；自我牺牲

Man is doing, heaven is watching: the influence of public service motivation and social presence on prosocial behavior

He Xiaoling, Na Linna

School of Public Policy and Administration,Nanchang University,Nanchang 330031

Abstract: As a key research concept in the field of public management, public service motivation has gradually attracted attention in the field of psychology in recent years. From the perspective of behavioral public management, this study explores the influence of public service motivation and social existence on prosocial behavior in detail through psychological experimental methods. In study 1 and study 2, two task paradigms of dictator game and volunteer dilemma game were used to manipulate implicit and explicit social existence cues, so as to explore the influence of public service motivation and social existence on donation behavior and self-sacrifice behavior, that is, to investigate whether the prosocial behavior of people with different levels of public service motivation changes under different cue types and situation types, and whether social existence will interact with individual characteristics (public service motivation) to affect individual behavior. The results show that there is an interaction between public service motivation and eye cues and the presence of others. Implicit social presence cues (eye cues) and explicit social presence situations (the presence of others) can significantly promote individual prosocial behavior, but the impact on people with low public service motivation is more obvious. The above results are of practical significance for improving the prosocial behavior of individuals with different levels of public service motivation in practical application, reflecting the characteristics of " seeking reason with heart " in behavioral public management.

亲社会水平与公平性对第三方道德判断的影响：

来自行为与 ERPs 的证据

吴珺[1]　崔芳[1]（通讯作者）

1 深圳大学心理学院，深圳，518060，通讯作者 E-mail：cuifang0826@gmail.com

摘 要　道德判断指人们根据一定的道德标准对他人做出判断，评价他人品质并衡量是否与其进行交往，是具有进化价值的。第三方旁观者与第一方决策者的关系有亲有疏，个体对他人行为的评判也容易受到社会距离的影响。在进行道德判断时，被评价者表现出的亲社会水平和公平性则是关于行为本身的重要参考信息。然而，在实际生活中，两者并不常常保持一致，乐于助人的人未必是公平的人。

本研究采用改编自独裁者博弈范式结合事件相关电位技术，考察了社会距离、亲社会水平与公平性如何交互影响第三方旁观者对决策者进行的道德评价及其神经反应。本研究为 2 社会距离（群体内、群体外）×2 亲社会水平（高、低）×2 公平性（高、低）三因素被试内设计。实验情境设置为：陌生人 A 和 B 都将接受一段令人感到不愉悦的强噪音。在前测中，系统赋予来自群体内/外的被试人均 100 枚代币，既可分给 A 或 B 以帮助他们消除噪音，也可留给自己换取金钱。本次实验中，被试将看到系统从前测实验中抽取的分配方案，并对提出该方案的分配者进行道德评分或合作意愿评分。

行为结果发现：(1)高亲社会条件下两种公平程度的道德评分之差大于低亲社会条件下的二者之差，合作意愿评分的结果与其一致；(2)当分配方案处于高亲社会水平时，不公平的提议下，相较于社会距离近的分配者，社会距离远的分配者会得到更高的道德评分，但在该条件下，被试更倾向于跟社会距离近的分配者进行合作。事件相关电位结果进一步发现：(1)高亲社会条件下高低公平性的分配方案诱发的 FRN 波幅之差大于低亲社会条件下的二者之差，P3 的结果也与其一致；(2)当分配方案处于公平却低亲社会的情况下，相较于社会距离远的分配者，社会距离近的分配者所诱发的 FRN 波幅显著更小。

本研究揭示了亲社会水平、公平性和社会距离如何影响第三方对决策方的道德判断及后续合作意愿，并在分配方案呈现后的早期和晚期，三个变量交互调节了反应结果评价过程的 FRN 和 P3 波幅。

关键词　道德判断，社会距离，亲社会，公平，事件相关电位

Influence of prosociality and fairness on third-party moral judgments:Evidnece from behavior and ERPs study

Jun Wu[1], Fang Cui[1]
1 School of Psychology, Shenzhen University, Shenzhen 518060, China

Abstract： Moral judgment refers to the process in which individuals evaluate others based on specific moral standards, aiming to assess their qualities and determine whether to engage in interactions with them, which holds evolutionary significance. The relationship between third-party observers of social decisions and first-party decision-maker varies in closeness in real-life situations, leading individuals' judgments of others' behavior to be susceptible to the influence of social distance. When engaging in moral judgments, prosociality and fairness demonstrated by the evaluated individual act as critical reference information concerning the nature of the behavior. However, these two factors are not always align consistently in actual life, individuals who exhibit a propensity for helping others may not necessarily demonstrate fairness in their actions.

This study employed a modified version of the dictator game paradigm combined with event-related potentials (ERPs) technology to investigate how social distance, prosociality, and fairness interactively affect third-party observers' moral evaluations and their neural responses to decision-makers. It was a three factor within-subject experimental desigh of 2 social distance (ingroup/outgroup member), 2 prosociality (high, low), and 2 fairness (high, low). Specifically, two strangers labeled as A and B, served as recipients and were exposed to a certain duration of strong and unpleasant noise. The system allocated 100 tokens per person to two groups of allocators during the pre-test experiment. These tokens could be utilized in two ways: either kept for oneself to exchange for money after the task or distributed to either A or B to help them eliminate the noise. In current experiment, participants were presented with allocation schemes randomly selected from the pre-test experiment and asked to provide moral evaluations and cooperative intention ratings for the allocators who proposed that specific allocation.

Behavioral results revealed that: (1) Compared to low prosocial, the difference in moral ratings between the two levels of fairness was greater under high prosocial conditions. The results of cooperative intention ratings aligned with this pattern as well. (2) When the allocation exhibited high prosocial but was unfair, allocators who are socially distant received higher moral ratings compared to socially close allocators. However, under this condition, participants showed a greater inclination to cooperate with socially close allocators, despite the higher moral ratings given to socially distant allocators. ERP results revealed that: (1) Compared to low prosocial, the difference in FRN amplitudes between the two levels of fairness was greater under high prosocial conditions. The results of P3 amplitudes aligned with this pattern as well. (2) The fair but low prosocial allocation of distant allocator induced a larger FRN.

This study revealed how prosociality, fairness, and social distance impact third-party observers' moral judgments and subsequent cooperative intentions. Moreover, these three variables interactively modulate the FRN and P3 amplitudes, which reflect the evaluation process of the outcomes, during early and late stages following the presentation of allocations.

Keywords： moral judgment, social distance, prosocial, fair, event-related potentials

英雄才能救美？性别偏见场景中旁观者性别对受害者对抗意愿的影响：有调节的中介模型

摘 要　性别偏见潜伏在人们的日常生活中，它不仅给女性受害者造成了许多身心上的负面影响，而且还限制了她们的个人成长与发展。研究者们认为旁观者干预能使偏见情境朝着更积极的方向发展，并进一步激发女性受害者的对抗意愿，从而形成反性别偏见同盟。本研究进一步构建了两个有调节的中介模型，旨在分别探究旁观者干预（实验一）和旁观者忽视（实验二）的条件下，女性受害者应对性别偏见的具体心理机制，以及旁观者性别的影响。实验一共招募了 81 名被试，被试在观看了一段以第一人称视角拍摄的性别偏见经历的视频后，填写了有关情绪、权力感以及对抗意愿的测量问卷。结果显示:在旁观者干预的条件下，受害者的权力感在愤怒与对抗意愿之间起显著的完全中介作用，而旁观者性别调节了中介模型的前半段路径。即只有在旁观者是男性的情况下，女性受害者的愤怒程度才能正向预测其权力感知；而在旁观者是女性时，并未发现类似效应。实验二共招募了 127 名被试，整体流程基本与实验一相同，中间增加了对施害者的负面评价测量。结果显示:在旁观者忽视的条件下，受害者对施害者的负面评价在愤怒与对抗意愿之间起显著的部分中介作用，而旁观者性别分别调节了中介模型的前半段和后半段路径。即只有在旁观者是男性的情况下，女性受害者的愤怒程度才能正向预测其对施害者的负面评价。更进一步，只有在旁观者是男性时，女性对施害者的负面评价才能正向预测其对抗意愿。而当旁观者为女性时，并未发现类似效应。本研究进一步丰富了前人的性别偏见研究理论，深入探究了旁观者行为及性别的影响，对帮助偏见情境中的女性受害者有重要意义。

Only heroes can save beauty? The effect of bystander gender on victim's willingness to confront in gender-biased scenarios: two moderated mediation models

Wanting Yang　　Zongqing Liao*
College of Psychology, Sichuan Normal University, Chengdu

***Abstract*:** Gender bias is lurking in People's Daily life. It not only causes many negative physical and mental effects on female victims but also limits their personal growth and development. Researchers believe that bystander intervention can change the bias situation in a more positive direction, and further stimulate the willingness of female victims to fight, so as to form an anti-gender bias alliance. This study further constructed two moderated mediation models to explore the specific psychological mechanisms of female victims coping with gender bias in bystander intervention (Study 1) and bystander neglect (Study 2), as well as the influence of

bystander gender. Study 1 involved 81 participants who, after watching a first-person video of their experience of gender bias, filled out questionnaires measuring emotions, feelings of power and willingness to confront. The results showed that in the bystander intervention condition, the victim's sense of power played a significant role in mediating the relationship between anger and confrontation intention, and the bystander gender moderated the first half of the path of the mediation model. In other words, only when the bystander is male, the female victim's anger can positively predict her power perception. No similar effect was found when the bystanders were women. A total of 127 subjects were recruited in Study 2, and the overall process was basically the same as in Study 1, with the addition of bad evaluation measurement of the perpetrator in the middle. The results show that: in the condition of bystander neglect, the victim's bad evaluation of the perpetrator plays a significant partial mediating role between anger and confrontation intention, and the bystander gender moderates the first half and the second half of the mediating model, respectively. That is, only when the bystander is male, the anger level of the female victim can positively predict her bad evaluation of the perpetrator. Furthermore, women's bad evaluation of the perpetrator positively predicted their willingness to confront only when the bystander was male. No similar effect was found when the bystanders were women. This study contributes to the existing body of research on gender bias by providing additional insights and delving into the impact of bystander behavior and gender. The findings of this study hold significant implications for effectively supporting female individuals who find themselves in biased circumstances.

社会阶层对利他惩罚的影响——分与受的双重视角

罗丽丽[1]于春梅[2]聂爱青[2]（通讯作者）

山西师范大学教育科学学院，太原，030031，nieaiq@126.com

摘 要 公平是人类社会的基本社会规范，利他惩罚的对象往往是不公平的分配者，一般认为在最后通牒博弈中拒绝不公分配的行为称之为第二方利他惩罚。以往研究表明个体主观社会阶层可以正向预测往利他惩罚，但是，现有研究只关注到了利他惩罚发出者（接受者）的社会阶层，并未意识到分配者的社会阶层在影响人们利他惩罚决策中所扮演的重要角色。同时，社会认知理论认为不同社会阶层会影响人们的自我建构，而不同自我建构倾向在维护社会公平中具有显著差异。因此本研究采用问卷法和实验法相结合，同时考虑分配者、接受者社会阶层与自我建构，探究双重视角下利他惩罚的阶层差异。研究一采用 2（分配者社会阶层：高、低）×2（接受者社会阶层：高、低）×2（分配方案：相对不公平、绝对不公平）的混合实验设计，考察人们在面对不同社会阶层的不公分配者时的利他惩罚。首先，测量被试的主、客观社会阶层；其次，被试根据所给材料对分配者阶层进行判定；然后基于最后通牒改编情景材料，对不同阶层的不公分配方案进行道德判断,决定是否进行利他惩罚。研究二采用 2（分配者社会阶层：高、低）×2（自我建构类型：独立型、依存型）×2（接受者社会阶层：高、低）×2（分配方案：相对不公平、绝对不公平）的混合实验设计。采用经典十级梯子范式启动被试对自我高低阶层的感知，并测量自我建构，后续研究流程同研究一。研究一表明：分配者社会阶层、接受者主观社会阶层及分配水平的主效应显著。即高社会阶层的被试做出更多的利他惩罚；无论自身社会阶层高低，人们在面对低社会阶层不公分配时会做出更少的利他惩罚。研究二表明：分配者与接受者社会阶层的主效应显著，自我建构能够调节接受者社会阶层对利他惩罚的影响。即高阶层独立型自我建构的被试做出更多的利他惩罚。本研究表明分配者和接受者的社会阶层与自我建构会共同影响个体的利他惩罚，对于揭示利他惩罚的内在机制具有一定的启示意义。

关键词 社会阶层，利他惩罚，双重视角，自我建构

The Impact of Social Class on Altruistic Punishment ——A Dual Perspective of Distributors and Recipients

Lili Luo[1]，Chunmei Yu[2]，Aiqing Nie[2]

Department of Psychology, College of Educational Sciences, Shanxi Normal University,Taiyuan, 030031

Abstract：Fairness is a basic social norm in human society, and the target of altruistic punishment is often the unfair distributor. The behavior of rejecting unfair allocation in the ultimatum game is generally considered to be called second-party altruistic punishment. Previous studies have shown that individuals' subjective social class can positively predict forward altruistic punishment, but existing studies have only focused on the social class of the sender (receiver) of altruistic punishment, and have not realized the important role that the social class of the distributor plays in influencing people's altruistic punishment decisions. Meanwhile, social cognitive theory suggests that different social classes affect people's self-construal, and different self-construal tendencies have significant differences in maintaining social justice. Therefore, this study used a combination of questionnaire and experimental methods to explore the class differences in altruistic punishment from a dual perspective by considering both allocator and recipient social classes and self-construal. Study 1 used a mixed experimental design of 2 (allocators social class: high/ low) × 2 (recipients social class: high/ low) × 2 (allocation scheme: relative unfairness, absolute unfairness) to examine people's altruistic punishment of the face of unfair allocators from different social classes. First, the subjects' subjective and objective social classes were measured; second, the subjects judged the distributor class based on the given materials; and then based on the ultimatum adapted situational materials, they made moral judgments and decided whether to punish altruistically when confronted with unfair distribution schemes for different classes. Study 2 used a mixed experimental design of 2 (distributors social class: high, low) × 2 (self-construal type: independent, dependent) × 2 (recipients social class: high, low) × 2 (distribution scheme: relatively unfair, absolutely unfair). The classical ten-step ladder paradigm was used to initiate subjects' perception of high and low Self-social class and measured self-construal, and the subsequent research processes were the same as that of Study 1. Study 1 showed that the main effects of allocator social class, recipient subjective social class, and allocation level were significant. That is, subjects of high social class made more altruistic punishments; regardless of their own social class, people would make less altruistic punishments in the face of unfair distribution of low social class. Study 2 showed that there was a significant main effect of allocator and recipient social class, and that the self-construal moderated the effect of recipient social class of altruistic punishment. That is, subjects with high class-independent self-construals made more altruistic punishments. This study suggests that the social class and self-construal of the distributor and the recipient jointly affect individuals' altruistic punishment, which is revealing for the inner mechanism of altruistic punishment.

Keywords：Social class, altruistic punishment, dual perspective, self-construal

计算式思维与道德妥协：一项被调节的中介模型

王士祺[1] 陈迪[1] 刘玉昕[1] 王璇[1] 谈欣[1] 陈文惠[1] 周洁仪[1] 赵珂冰[1] 许筑媛[1] 吴明证[1] （通讯作者）

通讯作者 E-mail：psywu@zju.edu.cn

摘 要 计算式思维(calculative mindset)作为一种无意识的认知倾向，指个体以数学方式分析(非定量)问题。根据古典经济学的理性选择理论，计算式思维倾向强的个体会对周围的事物进行成本效益分析，并进行计算，寻求并做出利益最大化的选项。这类个体会对经济、财务方面遇到的事情进行计算，以谋求最大利润，也会对不可计算的社会关系等社会价值进行计算，比如在选择朋友、职业、配偶时会先计算成本以及收益，再进行选择。已有研究表明，计算式思维对人们的社会交往和人格形成都有着不良的影响，但较少有研究探讨计算式思维与道德决策的关系。基于此，本研究拟探讨计算式思维是否影响人们的道德妥协倾向。道德妥协指的是个体在道德价值观与世俗价值观的选择上选择世俗价值观，从而在道德价值观上做出让步与妥协的行为倾向。因此，当个体对道德价值观与世俗价值观进行计算权衡时，更有可能进行道德妥协。

本研究包括三项子研究，研究一通过问卷法与实验法，探究计算式思维与道德妥协之间的关系。问卷研究结果表明，计算式思维能够有效预测个体的道德妥协倾向；实验研究结果表明，启动被试的计算式思维能够导致个体表现出更强的道德妥协倾向，验证了计算式思维与道德妥协的因果关系。

研究二通过问卷法与实验法，探究道德推脱在计算式思维与道德妥协中的中介作用。问卷研究结果表明，计算式思维与个体的道德推脱倾向呈正相关，且道德推脱在计算式思维与道德妥协之间发挥着中介作用。实验结果表明，启动被试的计算式思维会提升被试的道德推脱倾向，并由此导致个体做出更多的道德妥协行为。

研究三通过问卷法，探究道德注意性在计算式思维与道德妥协关系中的调节作用。研究发现，道德注意性在计算式思维与道德妥协的关系中发挥着调节作用，道德注意性会减弱道德推脱对道德妥协的影响。

综上，计算式思维能够导致个体的道德妥协，道德推脱在其中起到中介作用，且道德推脱的中介作用受到道德注意性的调节。

关键词 计算式思维 道德妥协 道德推脱 道德注意性

Calculative mindset and ethic compromise: A Moderated Mediation Model

WANG Shiqi[1], CHEN Di[1], LIU Yuxin[1], WANG Xuan[1], TAN Xin[1], CHEN Wenhui[1], ZHOU Jieyi[1], ZHAO Kebing[1], XU Zhuyuan[1], WU Mingzheng[1]

Department of psychology and behavioral science, ZheJiang University

Abstract ： Calculative mindset is an unconscious cognitive tendency in which an individual analyzes (non-quantitative) problems mathematically. According to the rational choice theory of classical economics, individuals with a strong tendency of calculative mindset will conduct cost-benefit analysis of the things around them, and make calculations to seek and make options to maximize benefits. These individuals will calculate economic and financial events in order to maximize profits, and will also calculate social values such as non-calculable social relationships, such as the cost and benefit of choosing friends, careers, and spouses. Previous

studies have shown that calculative mindset has a negative impact on people's social interaction and personality formation, but few studies have explored the relationship between calculative mindset and moral decision-making. Based on this, this study aims to explore whether calculative mindset affects people's ethical compromise tendency. Ethical compromise refers to the behavior tendency of an individual to choose the secular values between the moral values and the secular values, so as to make concessions and compromises on the moral values. As a result, individuals are more likely to make ethical compromises when they make calculated trade-offs between moral values and secular values.

This study includes three sub-studies. Study 1 explores the relationship between calculative mindset and ethical compromise by questionnaire and experiment. The results of the questionnaire show that calculative mindset can effectively predict the individual's ethical compromise tendency. The experimental results show that the initiation of calculative mindset can lead to a stronger tendency of ethical compromise, which verifies the causal relationship between calculative mindset and ethical compromise.

The second study explores the mediating role of moral disengagement in calculative mindset and ethical compromise through questionnaire and experiment. The results of the questionnaire show that calculative mindset is positively correlated with the tendency of moral disengagement, and moral disengagement plays a mediating role between calculative mindset and ethical compromise. The experimental results show that activating the subjects' calculative mindset can enhance the subjects' moral disengagement tendency and lead to more ethical compromise behavior.

Study 3 explores the moderating effect of moral attentiveness on the relationship between calculative mindset and ethical compromise by means of questionnaire. It is found that moral attentiveness plays a moderating role in the relationship between calculative mindset and ethical compromise, and moral attentiveness weakens the influence of moral disengagement on ethical compromise.

To sum up, calculative mindset can lead to individual ethical compromise, in which moral disengagement plays a mediating role, and the mediating role of moral disengagement is regulated by moral attentiveness.

客体化媒体信息形式对女性自我客体化的影响

黄亚博 （通讯作者） 李娜 宋柯柯
山西师范大学教育科学学院，太原，030000，hebeauty00@163.com

摘 要 客体化理论指出，女性倾向于从第三视角看待自己，更注意自己的外表。相关研究表明客体化媒体信息形式对女性自我客体化产生不同影响。国外研究发现自我认同女权主义者和非自我认同的女权主义者在女性自我客体化没有差异。但由于文化背景不同，本研究将探讨客体化媒体信息形式对女性自我客体化的影响以及自我认同女权主义在客体化媒体信息对女性自我客体化的影响的保护作用。研究 1 采用单因素实验设计，236 名被试为两组分别观看客体化媒体信息和天气媒体信息，之后完成自我客体化的测量。研究结果表明客体化媒体信息条件相较于控制条件下女性自我客体化水平更高。研究 2 采用 128 名女大学生进行 2（客体化图片、客体化视频）×2（自我认同女权主义、非自我认同女权主义）实验设计检验客体化媒体信息形式对女性自我客体化的不同影响以及自我认同女权主义的调节作用。研究结果表明客体化视频条件下的自我客体化水平显著高于客体化图片条件，并且客体化视频条件下的自我认同女权主义者比非自我认同女权主义者表现出更低水平的自我客体化。本研究发现视频比图片更易使个体受到客体化媒体信息影响，导致自我客体化程度升高；自我认同女权主义者自我客体化水平较低，在客体化媒体信息对自我客体化水平的影响中女权主义起到保护作用。

关键词 客体化媒体信息，自我客体化，女权主义

The influence of objectified media information forms on women's self-objectification

Huang Yabo,Li Na,Song Keke
Shanxi Normal University,Taiyuan,030000,hebeauty00@163.com

Abstract：Objectification theory states that women tend to see themselves from a third perspective and pay more attention to their appearance. Relevant studies show that objectified media information forms have different effects on female self-objectification. Foreign studies have found that there is no difference between self-identified feminists and non-self-identified feminists in female self-objectification. However, due to different cultural backgrounds, this study will explore the impact of objectified media information forms on women's self-objectification and the protective role of self-identity feminism in the impact of objectified media information on women's self-objectification. In study 1, a single-factor experimental design was adopted. 236 subjects watched objectifying media information and weather media information respectively for two groups, and then completed self-objectifying measurements. The results show that women's self-objectification level is higher under the condition of objectified media information than under the control condition. In study 2, 128 female college students were selected to conduct 2 (objectifying pictures, objectifying videos) ×2 (self-identified feminism and non-self-identified feminism) experimental design to examine the different influences of objectifying media information forms on female self-objectifying and the moderating effects of self-identified feminism. The results show that the level of self-objectification in the objectification video condition is significantly higher than that in

the objectification picture condition, and the self-identified feminists in the objectification video condition show a lower level of self-objectification than non-self-identified feminists. This study found that video is more likely than pictures to make individuals affected by objectified media information, resulting in an increased degree of self-objectification. Self-identified feminists have a low level of self-objectification, and feminism plays a protective role in the influence of objectified media information on the level of self-objectification.

自主选择权对学龄前儿童社会善念的影响

殷馨宇[1]（通讯作者） 于航[2] 郑欣[1]
1 青岛滨海学院教育学部，青岛，266555，psyyinxinyu@163.com
2 江苏省龙潭监狱，南京，211313

摘 要 社会善念是指个体与他人沟通和交往过程中，有意识关注并保护他人自主需要、选择权力的行为。这有助于良好人际关系的建立。已有研究证实高社会善念水平的个体拥有更积极开放的社交姿态，更容易得到对方的信任，达成合作。学龄前期是社会性发展的关键时期，其中人际交往是幼儿社会学习的重要内容。本文探究，学前儿童的自主选择权（被保留或被剥夺）对其后续表现出社会善念行为的影响，并且，关注学前儿童做出社会善念行为与否所付出的心理成本是否存在差异。研究以 75 名 5-6 岁儿童为研究对象，采用社会善念范式，采用单因素被试间实验设计，自变量为自主选择权（剥夺 vs. 保留 vs. 不需要），因变量为社会善念行为。实验分为两个阶段，在第一阶段通过控制虚拟玩家 A 的选择，使被试进入自主选择权的三种情境。在不需要自主选择权条件下，各试次不存在唯一物品，设置虚拟玩家 A 选择任意物品；自主选择权被保留条件下，设置虚拟玩家 A 选择非唯一物品；自主选择权被剥夺条件下，设置虚拟玩家 A 选择唯一物品；然后被试剩下的物品中进行选择。在第二阶段，被试作为优先选择者，进行物品选择，该过程每种材料包含两种组合形式，被试在同种实验材料下的两种组合形式中均选择非唯一物品，计 1 分。研究结果发现，（1）被保留自主选择的学前儿童，后续社会善念行为显著高于被剥夺自主选择权的学前儿童；不需要自主选择权情境下，学前儿童后续做出社会善念行为与前期被保留、被剥夺自主选择权的学前儿童均无显著差异；（2）学前儿童做出社会善念行为与否，付出的心理成本无显著差异。综上所述，自主选择权影响学前儿童社会善念行为的发生，但不是唯一因素。本研究对探究学龄前儿童社会善念的发生机制及发展水平具有重要意义。

***Abstract*：** Social Mindfulness refers to the behavior of an individual who consciously pays attention to and protects the autonomous needs and power of choice of others in the process of communicating and interacting with them. It contributes to the establishment of good interpersonal relationships. Individuals with high levels of social mindfulness have been shown to have a more positive and open social stance, and are more likely to gain the other party's trust and easier cooperation. Preschool is a critical period for social development, in which interpersonal interactions are an important part of social learning. So, in this study, we explored whether the autonomy of choice (deprived vs. retained) affects preschoolers' subsequent socially mindful behaviors. And, focused on whether there are differences in the psychological costs to preschoolers of performing socially mindful behaviors or not. We adopted the social mindfulness paradigm, using a one-way between-subjects experimental design, with the independent variable being autonomy of choice (deprived vs. retained vs. unwanted) We recruited 75 5-to-6-year-old children to participate in the study. The experiment was divided into two phases, in the first phase, the virtual player A made different choices, and the subjects entered three autonomous choice situations. In the "unwanted" condition, there was no unique item in each trial, and virtual player A was set to choose any item; in

the "retained" condition, virtual player A was set to choose a non-unique item; in the "deprived" condition, virtual player A was set to choose a unique item. Then the subjects were left to choose among the remaining items. In the second phase, subjects acted as preferred choosers. The process contained two combination forms per material, and subjects were scored 1 point for choosing non-unique items in both combination forms under the same experimental material. Our findings are as follows. First, preschoolers who were preserved autonomous choice had significantly higher subsequent socially mindful behaviors than preschoolers who were denied autonomous choice. The preschoolers' social mindfulness scores in the context of not needing the right to make autonomous choices were not significantly different from those in the deprivation and retention contexts. Second, There was no significant difference in the psychological cost to preschoolers of performing socially mindful behaviors or not. In conclusion. The autonomy of choice affects the occurrence of preschoolers' socially mindful behaviors, but it is not the only factor. Our research makes great contributions to the investigation of the occurrence mechanism and developmental level of social mindfulness in preschoolers.

社会排斥对社会善念的影响：

道德认同的中介作用以及感恩的调节作用

连培琴　柴彩霞　邸美琴　徐思元　冯喜珍（通讯作者）

山西师范大学教育科学学院，太原，030000，517824719@qq.com

摘 要　社会善念作为一种低成本的亲社会行为，契合“勿以善小而不为”的理念，也符合社会主义核心价值观中“友善”的价值遵循，近年来受到研究者的广泛关注。研究显示，社会善念会受到情境的影响，而社会排斥是一种常见的社会现象，小到同学间的忽视，大到校园霸凌，屡见不鲜。研究表明，遭受社会排斥个体的归属需求、关系需求受损，社会善念会减少，但也有学者指出遭受社会排斥的个体会为了重新寻求社会连接而增加社会善念。社会排斥与社会善念之间的关系如何有待探究。需要一威胁时间模型指出，遭受社会排斥会影响个体的认知、情绪及行为，社会排斥作为一种不公正现象，可能会通过降低个体的道德认同进而减少社会善念，而感恩作为一种情感变量，可以引发个体的亲社会行为。基于此，本研究采用《大学生社会排斥问卷》、《道德认同问卷》、《大学生感恩量表》以及《社会善念量表》，以 466 名大学生为研究对象，考察了社会排斥对社会善念的影响以及道德认同和感恩在其间的作用机制。结果显示：（1）社会排斥与道德认同、感恩、社会善念呈显著负相关，道德认同与感恩、社会善念呈显著正相关，感恩与社会善念呈显著正相关；（2）道德认同在社会排斥对社会善念的影响中起到中介作用；（3）感恩调节了“社会排斥→道德认同→社会善念”的后半段，即当大学生的感恩水平较高时，道德认同对社会善念的促进作用增强。本研究从“小善”角度关注遭受社会排斥的大学生的社会善念情况，可为培养大学生的社会善念，特别是遭受社会排斥的大学生的社会善念提供研究证据。同时也启示学校培养学生品德，不仅要重视道德认知的提高，也应加强道德情感的培养，知、情、意协同联动，共同促进学生道德行为的增加。

The impact of social exclusion on social mindfulness: the mediating role of moral identity and the moderating role of gratitude

Lian Peiqin,Chai Caixia,Di Meiqin,Xu Siyuan,Feng Xizhen (Corresponding author)

Institute of Education Science, Shanxi Normal University, TaiYuan

Abstract：As a kind of low-cost prosocial behavior, social mindfulness accords with the idea of “Don't to small and not for good, it is a sin to steal a pin” and the value of “Kindness” in the core values of Chinese socialism, in recent years, researchers have paid much attention to it. Research shows that social mindfulness is influenced by context, and social exclusion is a common social phenomenon, ranging from neglect among classmates to bullying on campus. The research shows that social mindfulness will decrease when the need of belonging and relationship is impaired, but others point out that socially excluded individuals increase social mindfulness in order to reconnect. The relationship between social exclusion and social mindfulness remains to be explored. Temporal Need-threat Model shows that social exclusion, as an unjust phenomenon, may reduce the moral identity of the individual and thus the social mindfulness will be reduced, gratitude, as an emotional variable, can lead to prosocial behavior. Based on this, 466 college students were investigated with the questionnaire of social exclusion, the questionnaire of moral identity, the scale of gratitude for college students and the scale of social mindfulness,

this paper examines the impact of social exclusion on social mindfulness and the mechanism of moral identity and gratitude. The results show that: (1) social exclusion has a significant negative correlation with moral identity, gratitude and social mindfulness, while moral identity has a significant positive correlation with gratitude and social mindfulness, and gratitude has a significant positive correlation with social mindfulness; (2) moral identity plays a mediating role in the influence of social exclusion on social mindfulness; (3) Gratitude regulates the latter part of "Social exclusion → moral identity → social mindfulness", that is, when the level of gratitude of college students is high, the role of moral identity in promoting social mindfulness is enhanced. This study focuses on the social mindfulness of college students who suffer from social exclusion from the angle of"Small kindness", it can provide research evidence for the cultivation of social mindfulness of college students, especially the social mindfulness of those who suffer from social exclusion. At the same time, in order to foster the moral character of the students, educators should not only pay attention to the improvement of moral cognition, but also strengthen the cultivation of moral emotion, knowledge, emotion and will act together to promote the increase of students' moral behavior.

Keywords：social exclusion,moral identity,gratitude,social kindness

谦逊能够降低集体自恋吗？自尊的中介作用

赵国军[1]（通讯作者） 杨松滨[1] 慕沛[1] 郭晓晓[1] 杨环[1]

1 西北师范大学心理学院，兰州，730000, zhaogj@nwnu.edu.cn

摘 要 集体自恋指的是个体认为自身所属内群体是卓越的并且值得优待，但却并未充分得到他人承认的一种信念。研究表明集体自恋者会表现出更多的消极群际态度或行为，例如对外群体的偏见和敌意情绪。如何降低集体自恋成为亟待解决的问题。谦逊作为一种积极的特质，具有多种特征，例如低自我关注、承认自身的不足和对其他观点持开放态度等。谦逊不仅能够促使个体对自身有着更加准确的认识，还能够促使个体克制自我提升的倾向。因此我们假设谦逊能够降低集体自恋。但关于谦逊的本土研究表明，谦逊也会促使个体进行自我贬低，降低个体的自尊水平。而自尊正是集体自恋的一个重要前因变量，低自尊的个体会通过夸大内群体的价值来补偿自尊的缺失。研究发现在排除内群体满意度的干扰后，个体的自尊水平能够负向预测集体自恋。因此我们假设谦逊能够负向影响自尊，自尊又会负向影响集体自恋，进而产生与直接效应符号相反的间接效应。研究一中，采用测验法，在网络平台上招募了 388 名被试，使用诚实—谦逊量表中的谦虚分量表、罗森博格自尊量表和集体自恋量表等进行调查，结果发现，在控制年龄、性别、年龄、受教育水平和内群体满意度后，谦逊的直接效应负向预测集体自恋，但通过自尊正向预测了集体自恋，该结果验证了自尊所产生的与直接效应相反的中介作用。研究二中我们采用实验法，从网络平台共招募了 217 名被试，随机分配至谦逊组（n=113）和控制组（n=104），谦逊组被要求回忆并写下一次让自己感到谦逊的经历，控制组则写一次体验到中性情绪的日常经历。最后被试填写状态自尊量表和集体自恋量表等量表。研究二进一步验证了研究一中的结果，谦逊的直接效应负向预测集体自恋，自尊产生了相反的中介效应。两项研究从特质谦逊和状态谦逊两个层面揭示了虽然谦逊能够直接降低集体自恋，但通过自尊却能够提升集体自恋。未来研究可以进一步探讨在何种情况下谦逊能够促进自尊，从而降低集体自恋。

关键词 谦逊，自尊，集体自恋

Can Humility Reduce Collective Narcissism? The Mediating Role of Self-Esteem

Guojun Zhao[1](Corresponding Author), Songbin Yang[1], Pei Mu[1], Xiaoxiao Guo[1], Huan Yang[1]

1 School of Psychology, Northwest Normal University, Lanzhou 730000, China, zhaogj@nwnu.edu.cn

Abstract： Collective narcissism refers to a belief that one's in-group is exceptional and entitled to privileged treatment, but it's not sufficiently recognized by others. Previous researches have shown that collective narcissists exhibit more negative intergroup attitudes or behaviors, such as prejudice and hostility towards out-groups. Therefore, how to reduce collective narcissism is necessary. Humility, as a positive trait, characterized by low self-focus, acknowledgment of one's limitations, and openness to other viewpoints, could potentially reduce collective narcissism. Humility not only leads to a more accurate self-assessment but also resist the tendency towards self-enhancement. We hypothesize that humility can reduce collective narcissism. However, Chinese researches on humility indicate that humility may lead individuals to self-deprecation, and further reduce their self-esteem. Since self-esteem is a crucial antecedent of collective narcissism, individuals with low self-esteem may exaggerate the worth of their in-group to compensate for their lacking self-esteem. It has been found that individual self-esteem can negatively predict collective narcissism after excluding the influence of in-group satisfaction. Thus, we propose that humility can negatively affect self-esteem, which in turn negatively impacts

collective narcissism, resulting in a indirect effect that is opposite in sign to the direct effect. In Study 1, we recruited 388 participants via an online platform and conducted a survey using the modest subscale of the Honesty-Humility Scale, the Rosenberg Self-Esteem Scale, and the Collective Narcissism Scale. The results show that, after controlling for age, gender, education level, and in-group satisfaction, humility directly and negatively predicted collective narcissism, but self-esteem positively predicted collective narcissism, confirming the opposite indirect effect by self-esteem. In Study 2, we employed an experimental method, recruiting 217 participants from an online platform. They were randomly assigned to either a humility group (n=113), who were asked to recall and write about an experience that made them feel humble, or a control group (n=104), who wrote about a daily experience with neutral emotions. Finally, all participants completed the State Self-Esteem Scale and the Collective Narcissism Scale. The results further confirmed the findings of Study 1: humility directly and negatively predicted collective narcissism, while self-esteem showed a opposite indirect effect. These two studies have revealed that although humility can reduce collective narcissism directly, it can enhance collective narcissism through self-esteem. Future research should further explore the mechanism that humility can promote self-esteem, and thereby reduce collective narcissism.

Keywords：humility, self-esteem, collective narcissism

经济不平等感知减弱国家认同对控制感的促进作用：一个有中介的调节模型

赵国军 1（通讯作者） 杨松滨 1 曹杪 1 李丹 1 王蕊 1

1 西北师范大学心理学院，兰州，730000, zhaogj@nwnu.edu.cn

摘 要 国家认同不仅能够提升个体的自尊水平和促进个体间的合作行为，同时也能够提升个体的控制感，满足个体自主的需要。而经济不平等作为严重的社会问题，也在影响着个体如何看待整个国家群体。随着经济不平等感知的提升，个体会倾向于认为整个社会氛围是竞争性的，对他人的社会警觉升高，并且认为大多数人都更加的自我，更加强调个人目标而不是社会目标。我们认为感知到的经济不平等造成的消极影响能够干扰到国家认同提升控制感的效应。本研究假设当个体的经济不平等感知调节国家认同对控制感的积极影响。并且根据群体控制理论，仅当群体主体性较高时，群体认同才能促进控制感。群体主体性是指个体感知到的群体内是否有共同目标和为了达成目标的协调行动。我们假设群体主体性中介了经济不平等感知的调节作用，经济不平等感知高时，群体主体性降低，国家认同不能够积极影响控制感。研究一(n=213)为测验法，检验不平等感知对国家认同和控制感关系的直接调节作用。使用改编的国家认同量表、经济不平等感知量表和控制感量表等进行测量。结果显示，经济不平等感知的调节作用显著，只有经济不平等感知低时，国家认同能够正向预测控制感。在研究二与研究三中使用了不同的方式操纵国家认同，旨在验证国家认同对控制感的因果效应，但两个研究中的操纵方式都没有达到显著结果，所以在两个研究中仍然使用量表测得的国家认同作为自变量。研究二（n=255）操纵经济不平等感知检验其直接调节作用。结果显示仅在低经济不平等感知组中，国家认同正向预测了控制感。研究三(n=266)操纵不平等感知检验群体主体性的中介作用。结果显示首先经济不平等感知的直接调节效应显著；其次经济不平等感知能够负向预测群体主体性；最后群体主体性对国家认同和控制感的调节作用显著，仅当群体主体性高时，国家认同能够正向预测控制感。结果说明经济不平等感知高时，群体主体性降低，进而促使国家认同不能够提升控制感。上述结果说明经济不平等感知调节了国家认同对控制感的积极影响，而群体主体性中介了这一调节作用。

关键词 经济不平等感知，国家认同，控制感，群体主体性

Perceived Economic Inequality Weaken the Promoting Role of National Identification on Perceived Control: A Mediated Moderation Model

Guojun Zhao[1], Songbin Yang[1], Miao Cao[1], Dan Li[1], Rui wang[1]

1 School of Psychology, Northwest Normal University， Lanzhou 730000, China , zhaogj@nwnu.edu.cn

Abstract： National identification not only elevates individuals' self-esteem and promotes cooperative behavior, but enhances individuals' perceived control, and further satisfies the need for autonomy. Economic inequality, as a serious societal issue, affects how individuals perceive their national group. Higher perceived economic inequality may lead individuals to perceive the social climate as competitive, elevate social vigilance toward others, and perceive that most people as individualistic placing more emphasis on personal goals than social goals. We argue that the negative effects of perceived economic inequality can interfere with the effects of national identification

on promoting the perceived control. We hypothesized that individuals' perceived economic inequality moderates the positive effect of national identification on the perceived control; the higher inequality perception, the weaker this facilitating effect. And according to the group-based control theory, group identification promotes the perceived control only when group is agentic. Group agency refers to whether individuals can perceive a common goal within the group and coordinated actions to achieve it. We hypothesized that group agency could mediate the moderating effect of perceived economic inequality, and with the high perception of inequality, group agency decreases and national identification would fail to enhance the perceived control. In Study 1 (n=213), a survey method was used to examine the direct moderating effect of perceived economic inequality on the relationship between national identification and perceived control. The adapted version of the national identification scale, perceived economic inequality scale, and perceived control scale were used. The results showed that the moderating effect of perceived economic inequality was significant; specifically national identification could positively predict the perceived control only when perceived economic inequality was low. In study 2 and 3 we used different methods to manipulate national identification, aiming to verify its causal effect on the perceived control. However, both manipulations did not achieve a expected effect, thus measured national identification were still used as independent variables. In Study 2 (n=255), perceived economic inequality was manipulated to test its direct moderating effect. The results showed that only in the low perceived economic inequality group, national identification positively predicted the perceived control. In Study 3 (n=266), perceived economic inequality was manipulated to test the mediating effect of collective agency. The results firstly showed a significant direct moderating effect of perceived economic inequality. Secondly, economic inequality perception could negatively predict collective agency. Lastly, the moderating effect of group agency on national identification and perceived control was significant; only when collective agency was high, could national identification positively predict perceived control. The results indicate that when perceived economic inequality is high, group agency decreases, which in turn contributes to the failure of national identity to enhance perceptions of control. These results demonstrate that perceived economic inequality moderates the positive effect of national identification on perceived control, and this moderating effect is mediated by group agency.

超自然信念性别刻板印象基于不同冲突水平的表达及对人物评价的影响

戴东源[1]　孙美荣[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，leer@bsu.edu.cn

摘 要　超自然信念是一种非理性信念，即人们认为逻辑上不相关的物体、行为等会影响事件进程的结果。本研究首先探索了外显与内隐超自然信念性别刻板印象是否存在，然后进一步探寻两者在不同冲突水平下的表达是否存在差异，及其对人物评价的影响如何。

研究 1 首先采用问卷法检验了外显超自然信念性别刻板印象的存在；其次采用 2(语义一致性：一致 vs. 不一致) x 2(被试性别：男性 vs.女性) 的混合实验设计，通过语义启动范式探究内隐超自然信念性别刻板印象的存在；最后通过操控冲突水平，采用 2(被试性别：男性 vs.女性) x 2(语义一致性：一致 vs.不一致) x 3(冲突水平：高 vs 中 vs 低) 的混合实验设计，观察该内隐刻板印象表达过程中的抑制情况。结果表明，被试均持有“女性比男性更偏好超自然信念”的外显和内隐的超自然信念性别刻板印象。当冲突水平增高时(语义不一致试次比例为 80%)，内隐超自然信念性别刻板印象的表达会被抑制；而当冲突水平较低时，刻板印象的表达没有被抑制。

研究 2 进一步从外显和内隐两层面探究超自然信念性别刻板印象对人们在热情和能力维度的人物评价的影响。首先采用问卷法，记录被试在外显层面上对是否符合刻板印象的个体的人物评价分数。结果表明，刻板印象一致的个体在热情水平的评价较高，而能力水平无显著差异。其次，采用 2(被试性别：男性 vs. 女性) x 2(刻板化：一致 vs. 不一致)混合设计，通过内隐关系评估程序记录被试的人物评价得分。结果发现，在内隐层面,人们对不同性别的超自然信念性别刻板印象一致个体持有不同的评价,符合超自然信念刻板印象的女性被评价为更热情，而不符合超自然信念刻板印象的男性被评价为能力较低。综上所述，我们的研究印证了人们普遍认为女性更偏好超自然信念，较高的冲突水平会抑制内隐超自然信念性别刻板印象的表达。此外，人们倾向于认为符合刻板印象的女性更热情，不符合刻板印象男性则被认为能力偏低。这些结果对于我们更好地了解和调节超自然信念提供了一定的实证依据。

Supernatural beliefs: gender stereotypes are based on the expression of different levels of conflict and their influence on character evaluation

Dongyuan Dai　Meirong Sun

School of Psychology, Beijing Sport University, Beijing 10091, China

Abstract： A supernatural belief is an irrational belief that logically unrelated objects, actions, etc., affect the outcome of the course of events. This study first explores whether explicit and implicit supernatural belief gender

stereotypes exist, and then further explores whether there are differences in their expression at different conflict levels and how they affect character evaluation.

In study 1, the existence of gender stereotypes of explicit supernatural beliefs was tested by questionnaire method. Second, 2(semantic consistency: consistent vs. inconsistent) x 2(subject gender: male vs. The mixed experimental design of female) explores the existence of gender stereotypes of implicit supernatural beliefs through semantic priming paradigm; Finally, by manipulating the conflict level, 2(subject gender: male vs. female) x 2(semantic consistency: consensus vs. Inconsistent) x 3(conflict level: high vs medium vs low) mixed experimental design to observe the suppression of the implicit stereotype expression. The results showed that all subjects held the explicit and implicit gender stereotype of supernatural belief that "women prefer supernatural belief more than men". When the level of conflict increased (80% of semantic inconsistencies), the expression of implicit supernatural belief gender stereotypes was suppressed. When the level of conflict was low, the expression of stereotypes was not suppressed.

Study 2 further explores the influence of gender stereotypes of supernatural beliefs on people's character evaluation in the dimensions of warmth and competence from both explicit and implicit levels. Firstly, a questionnaire method was used to record the scores of the subjects' evaluation of the individuals who conform to the stereotypes on the explicit level. The results showed that the stereotyped individuals were rated higher in the level of warmth, but there was no significant difference in the level of competence. Second, use 2(subject gender: male vs. female) x 2(Stereotyping: consistent vs. In a hybrid design, subjects' character evaluation scores were recorded through an implicit relationship evaluation procedure. The results showed that, at the implicit level, people had different evaluations of the supernatural belief gender stereotyped individuals of different genders. Women who conform to the supernatural belief stereotype were evaluated as more enthusiastic, while men who did not conform to the supernatural belief stereotype were evaluated as less competent. In summary, our study supports the common belief that women prefer supernatural beliefs and that higher conflict levels inhibit the expression of implicit supernatural belief gender stereotypes. In addition, women who fit the stereotype tend to be perceived as more enthusiastic, while men who don't fit the stereotype are perceived as less competent. These results provide a certain empirical basis for us to better understand and regulate the supernatural belief.

不确定无法忍受性和环境不确定性对自我损耗的影响：一个有调节的中介模型

李箫 [1,2] 宋静静 [1,2,3]（通讯作者）

1 中国地质大学（武汉）教育研究院心理学系，武汉，430074

2 中国地质大学（武汉）心理科学健康研究中心，武汉，430074

3 中国地质大学（武汉）心理学系，武汉，430072，jingsong321@126.com

摘 要 我们生活在一个充满各种不确定性的环境中，对不确定性的认知和感受会直接影响人们情绪和行为的适应性反应。不确定性减少理论指出，环境不确定性作为一种压力和威胁条件，会降低个体的生活满意度，损害人际关系及心理健康，人们倾向于通过寻求更多的信息来减少不确定性。自我损耗是指人们在完成一项需要付出自我控制努力的任务后，面对新的任务时，往往会表现较差的心理现象。本研究旨在探讨不确定无法忍受性和环境不确定性对自我损耗的交互作用及其机制。采用不确定无法忍受性量表、环境不确定性量表、消极应对方式量表和自我损耗量表对 292 名大学生（Mage=18.23, SD age=0.593,男生 173 人、女生 119 人）进行调查。结果显示：（1）不确定无法忍受性直接预测自我损耗（(B=0.24,p＜0.001），不确定无法忍受性通过消极应对方式对自我损耗产生间接影响（B=0.18, p＜0.01；B=0.17, p＜0.01）；（2）环境不确定性在不确定无法忍受性通过消极应对方式影响自我损耗的前半段路径中起到调节作用（B=0.09, p＜0.05）。具体来看，在低环境不确定性条件下，消极应对方式在不确定性不容忍与自我损耗之间的中介作用不显著（simple slope=0.08，t=1.08，p＞0.05）。在高环境不确定性条件下，消极应对方式在不确定性不容忍与自我损耗之间的中介作用显著（simple slope=0.07，t=3.78，p＜0.001）。总体而言，不确定无法忍受性与自我损耗关系中的条件过程模型得到了验证，为反推应对不确定无法忍受性和环境不确定性的积极方式创造了理论基础，在一定程度上为减少不确定无法忍受性和环境不确定性对个体或群体产生的负面影响提供了理论启示。

The Effect of Uncertainty Intolerance and Environmental Uncertainty on Ego Depletion: A moderated mediating model

Li X[1,2], Song J [1,2] (Corresponding author)

1 Department of Psychology, School of Education, China University of Geosciences, Wuhan 430074

2 Health Research Center of Psychological Sciences , China University of Geosciences, Wuhan, 430074 jingsong321@126.com

Abstract: We have been living an environment full of various uncertainties, and the cognition and feeling of uncertainty will directly affect people's adaptive responses to emotions and behaviors. The uncertainty reduction theory pointed out that environmental uncertainty, as a kind of pressure and threat condition, would reduce individual life satisfaction and damage interpersonal relationship and mental health. People tend to seek more information to reduce uncertainty. Ego depletion refers to completing a task expanding self-control, leads to psychological exhaustion and poor performance. The purpose of current study is to explore the interaction of uncertainty intolerance and environmental uncertainty on ego depletion and its mechanism. A total of 292 college students voluntarily participated in the research though internet survey, including 173 male and 119 female (Mage=18.23, SD age=0.593). They were investigated by uncertainty intolerance scale, environmental uncertainty scale, negative coping style scale and ego depletion scale. The results showed that: (1) Uncertainty intolerance directly predicted ego depletion (B=0.24, $p< 0.001$), and uncertainty intolerance indirectly affected ego depletion through negative coping styles (B=0.18, $p<0.01$; B=0.17, $p<0.01$); (2) Environmental uncertainty played a moderating role in the first half of the pathway in which uncertainty intolerance affected ego depletion through negative coping styles (B=0.09, $p<0.05$). Specifically, under conditions of low environmental uncertainty, negative coping styles had no significant mediating effect between uncertainty intolerance and ego depletion (simple slope=0.08, t=1.08, $p>0.05$). Under the condition of high environmental uncertainty, negative coping style had a significant mediating effect between uncertainty intolerance and ego depletion (simple slope=0.07, t=3.78, $p<0.001$). In general, the conditional process model of the relationship between uncertainty intolerance and ego depletion has been verified, which created a theoretical basis for the positive response to uncertainty intolerance and environmental uncertainty, and provided theoretical enlightenment for reducing the negative impact of uncertainty intolerance and environmental uncertainty on individuals or groups to a certain extent.

摘 要 匹配效应是一种能够有效提升消费者品牌态度的传播策略，以往的研究多集中于消费者和具体的品牌、产品之间，而忽略了国家形象对于品牌形象的影响。本文基于图式一致性理论，通过 3 个研究探索匹配效应对国内外乳制品品牌的影响及边界条件。研究 1 通过自编问卷的方式明晰了中国消费者对中外乳制品的类别国家形象现状。结果表明中国消费者认为国产乳制品品牌更热情、可信任，而进口乳制品品牌更富有竞争力、能力强。在此基础上，研究 2 探明了类别国家形象与品牌定位的匹配效应能够有效提升消费者的品牌态度。研究 3 分析了品牌犯错对类别国家形象与品牌定位的匹配效应是否具有调节作用，结果表明，在低犯错情景下，与类别国家形象一致的品牌定位比不一致的品牌定位对消费者品牌态度起到更加积极的作用。相比之下，在高犯错情景下，与类别国家形象不一致的品牌定位比一致的品牌定位将更能引起消费者的积极品牌感知，高品牌犯错能够压倒匹配效应的积极作用。本研究丰富了匹配效应在国家形象微观层面的相关研究，充实了匹配效应的理论框架，为中国国产乳制品品牌摆脱“三鹿”事件的阴影，重构良好的品牌形象提供新思路。

The Matching Effect of Category Country Image and Brand Positioning: Moderating Effect of Brand Mistakes

Li Chen[1], Shuaishuai Fan[1], Yitong Wang[1], Tong Li[2]，Shengtao Wu
[1] School of Psychology, Northwest Normal University, Lanzhou, China;
[2]Institute of Social Studies, Sichuan Academy of Social Sciences, China;
[3]School of Sociology and Anthropology, Xiamen University, China;

***Abstract*：** The matching effect is a communication strategy that can effectively enhance consumers' brand attitudes, and previous studies have mostly focused on the relationship between consumers and specific brands and products, while ignoring the impact of national image on brand image. This paper explores the impact of the matching effect on domestic and international dairy brands and boundary conditions through three studies based on the theory of graphical consistency. Study 1 clarified the current status of Chinese consumers' category national images of Chinese and foreign dairy products by means of a self-administered questionnaire. The results show that Chinese consumers perceive domestic dairy brands as more enthusiastic and trustworthy, while imported dairy brands are more competitive and capable. Study 3 analyzed whether brand faults moderated the matching effect of category country image and brand positioning, and showed that in low fault scenarios, brand positioning that is consistent with category country image plays a more positive role in consumer brand attitudes than inconsistent brand positioning. In contrast, in a high-fault scenario, a brand positioning that is inconsistent with the category's country image will elicit more positive brand perceptions from consumers than a consistent one, and a high brand fault can overwhelm the positive effects of the matching effect. This study enriches the research on the matching effect at the micro level of national image, enriches the theoretical framework of the matching effect, and provides new ideas for China's domestic dairy brands to get rid of the shadow of the "Sanlu" incident and rebuild a good

brand image.

垂直方向定位和距离对他人和自我领导力知觉的具身实验

陈晓[1,2]（通讯作者） 苏嘉琪[3]

1 广东白云学院 应用心理学系，广州，510450

2 北京师范大学 未来教育学院，珠海，519087 psychenxiao@126.com

3 北京师范大学珠海分校 教育学院，珠海，519087

摘 要 本研究通过两个实验考察不同垂直方向（上 VS.下）和不同距离（长 VS.短）是否影响目标领导者（他人和自我）的权力感知判断。实验一（n=70）采用 2*2 实验设计，采用掩盖目实验，给被试呈现 A 经理所在公司的简短信息及组织框架图，不同方向的条件下，被试被随机分配到上方（A 经理处于组织框架图的上方）或下方（A 经理处于组织框架图的下方）；不同距离条件下，在短距离情况下，被试看到 A 经理和下属之间的距离只有 2cm,在长距离情况下，A 经理和下属之间的距离有 7cm 有七厘米，随后被试进行对 A 经理的领导力知觉判断。结果显示：1）当 A 经理处于组织框架图上方，与下属距离长的领导力显著高于与下属距离短的领导力；2）经理处于组织结构图下方，距离的长短对领导力知觉无显著影响。实验二（n=74）与实验一实验设计相似，不同的是要求被试把 A 经理想象是自己。结果显示：1）处于组织框架图中的上方时，垂直距离长短在自我领导力的感知上无显著差异；2）处于组织框架图中的下方时，垂直距离短的条件下的被试所感知到的自己的领导力显著大于垂直距离长的被试。领导力知觉既受到目标对象的垂直方向影响，同时也受到目标与下属的距离影响，对他人的领导力知觉与自我的领导知觉呈现相反的模式。

关键词 领导力，权力感知，具身理论

The Influences of Vertical Position and Distance on the Perception of Leadership in others and self

Chen Xiao[1,2] Su Jiaqi[3]

4. Department of Applied Psychology, Guangdong Baiyun University, Guangzhou, 510450
5. College of Education for the Future, Beijing Normal University, Zhuhai, 519087, Email: psychenxiao@126.com

Abstract：This study conducted two experiments to investigate the influences of different vertical directions (up vs. down) and different distances (long vs. short) on perception of leadership in target leaders (others vs. oneself). Experiment 1 (n=70) used a 2x2 experimental design with a cover story paradigm. Participants were presented with brief information about manager A and an organizational framework. Participants were randomly assigned to the upper (with the manager positioned above in the organizational framework diagram) or lower (with the manager positioned below in the organizational framework diagram) condition. Under different distance conditions, in the short distance condition, participants saw a distance of only 2cm between the manager and subordinates, while in the long distance condition, the distance between the manager and subordinates was 7cm. Participants

made judgments about the leadership of the manager. Results showed that: 1) When the manager was positioned above in the organizational framework diagram, he was perceived more powerful in the long distance than that in the short distance; 2) When the manager was positioned below in the organizational framework diagram, the length of the distance did not significantly influence leadership perception. Experiment 2 (n=74) was similar to Experiment 1, except that participants were required to imagine themselves as the manager. The results showed that: 1) When positioned above in the organizational framework diagram, there was no significant difference in self-leadership perception between long and short vertical distances; 2) When positioned below in the organizational framework diagram, participants perceived significantly greater self-leadership under the condition of short vertical distance compared to long vertical distance. The perception of leadership is influenced both by the vertical direction of the target leader and the distance between the target and subordinates. Different patterns of leadership perception were observed for others' leadership perception and self-leadership perception.

工作负荷对工作满意度的影响：工作权变自尊的调节作用

周文欣 詹芷怡 刘亚辉 梁娟（通讯作者）
湖北大学心理学系，武汉，430062，liangjuan@hubu.edu.com

摘　要　近年来，组织生产模式的转型使组织内部的工作更加复杂，要求更高，这进而导致员工的工作负荷逐渐增加。以往的研究中多在资源保存理论框架下认为工作负荷会损耗个体资源，带来消极影响，降低员工的工作满意度。然而根据自我决定理论，当个体从事活动是为了活动本身时，将会使个体感受到幸福，提高满意度。工作权变自尊是指个体将工作上的成功看作是自我价值的来源，相比于低工作权变自尊的个体，高工作权变自尊的个体更容易享受工作本身。因此，工作权变自尊可能会缓冲工作负荷对工作满意度的负面影响。

基于此，本研究拟探究工作负荷与工作满意度的关系及工作权变自尊的调节作用。研究采用工作负荷量表、工作满意度量表和工作权变自尊量表，分别在 2023 年 5 月中旬(时间点 1)和 2023 年 6 月初(时间点 2)对 42 名在职企业员工进行测量。结果表明：(1)工作负荷与工作满意度呈负相关；(2)工作权变自尊的调节作用显著，对于低工作权变自尊的个体而言，工作负荷与工作满意度之间存在显著的负相关；对于高工作权变自尊的个体而言，工作负荷与工作满意度之间的相关不显著。结果验证了工作权变自尊对工作负荷与工作满意度关系的调节作用，丰富了工作负荷和工作权变自尊领域的研究，并为企业管理者提供了一定的实践启示。

The effect of workload on job satisfaction: The moderating role of work contingent self-esteem

Zhou Wenxin; Zhan Zhiyi; Liu Yahui; Liang Juan(Corresponding Author)
Department of Psychology, Hubei University, Wuhan, 430062, liangjuan@hubu.edu.com

***Abstract*:** In recent years, the transformation of the organization's production model has made the work within the organization more complex and more demanding, which in turn has led to a gradual increase in the workload of employees. In the previous studies, under the framework of resource conservation theory, most of them believed that workload would consume individual resources, bring negative effects, and reduce employees' job satisfaction. However, according to self-determination theory, when an individual engages in an activity for the sake of the activity itself, it will make the individual feel happy and improve satisfaction. Work contingent self-esteem means that individuals regard success at work as the source of self-worth. Compared with individuals with low work contingent self-esteem, individuals with high work contingent self-esteem are more likely to enjoy work itself. Therefore, work contingent self-esteem may buffer the negative impact of workload on job satisfaction.

Based on this, this study intends to explore the relationship between workload and job satisfaction and the moderating effect of work contingent self-esteem. The workload scale, job satisfaction scale and job discretionary self-esteem scale were used to measure 42 employees in mid-May 2023 (time point 1) and early June 2023 (time point 2), respectively. The results show that: (1) Workload is negatively correlated with job satisfaction; (2) work contingent self-esteem has a significant moderating effect. For individuals with low work contingent self-esteem, there is a significant negative correlation between workload and job satisfaction; For individuals with high work contingent self-esteem, there is no significant correlation between workload and job satisfaction. The results verify the moderating effect of work contingent self-esteem on the relationship between workload and job satisfaction, enrich the research in the field of workload and work contingent self-esteem, and provide some practical enlightenment for enterprise managers.

***Keywords*:** workload, job satisfaction, work contingent self-esteem, self-determination theory

农民工焦虑情绪与其城乡流动意愿有关：来自网络分析的证据

摘 要 城乡流动是中国经济社会转型时期的一个重大变革，农民流动是城市化发展的产物，相比于老一代农民工，新生代农民工的流动更加频繁。以往研究很少将农民工的焦虑情绪以及其城乡流动意愿相联系，故本研究主要目的是探讨引发农民工焦虑情绪的相关因素，并探索农民工焦虑情绪与其城乡流动意愿的关系。对来自中国西部地区的 250 名农民工进行调查，采用焦虑自评量表（SAS）评估焦虑情绪，生活满意度量表（SWLS）评估城乡流动意愿，使用网络分析方法分析变量之间的相关关系。结果表明，养老问题、子女教育问题以及家庭收入问题是焦虑情绪的主要诱发因素；焦虑题项内部之间有较强的正相关，生活满意度得分与焦虑部分题项显著负相关；在整个网络中，焦虑自评问卷第 1 题，“我觉得比平常更容易紧张或着急”，为强度中心性最高的题项，是网络分析中最重要的节点。本研究揭示了农民工焦虑情绪和城乡流动意愿之间的相关关系，研究结果对于理解农民城乡流动意愿的情绪性相关因素有一定参考价值。
关键词 农民工，焦虑，城乡流动意愿，网络分析

Migrant workers' anxiety is linked to their willingness to move between urban and rural areas: Evidence from network analysis

Xuzhu Zhou, Huihui Wang, Shaohong Yong, Xiaojuan Sha, Jin'en Zhou, Ruixian Wang, Xiaohong Ma
College of Teacher Education, Ningxia University, Yinchuan, 750021

Abstract: The movement of people between urban and rural areas, known as urban-rural mobility, is a significant aspect of China's economic and social transition. Within this context, the mobility of farmers is a consequence of urbanization, with the younger generation of migrant workers exhibiting higher levels of mobility compared to their older counterparts. Previous studies have rarely explored the connection between the anxiety experienced by migrant workers and their willingness to move between urban and rural areas. Therefore, the primary objective of this study is to investigate the factors that contribute to the anxiety experienced by migrant workers and to examine the relationship between this anxiety and their willingness to relocate. To achieve this, a survey was conducted involving 250 migrant workers from western China. The Self-Assessment Scale for Anxiety (SAS) was employed to assess levels of anxiety, while the Satisfaction with Life Scale (SWLS) was used to measure the willingness to move between urban and rural areas. Network analysis techniques were applied to analyze the correlations between the variables. The findings revealed that issues related to old age, children's education, and family income were the main triggers of anxiety. Additionally, there were strong positive correlations among the various anxiety items, and the scores indicating satisfaction with life were significantly negatively correlated with the anxiety component of the questions. In terms of network analysis, question 1 of the Self-Assessment of Anxiety Questionnaire (SAS), namely "I feel more likely to be nervous or anxious than usual," emerged as the most important node in the network analysis, exhibiting the highest intensity centrality. This study sheds light on the relationship between anxiety and the intention of migrant workers to move between rural and urban areas, providing valuable insights into the emotional factors influencing farmers' decisions regarding rural-urban

mobility.

Keywords: Migrant workers, Anxiety, Urban-rural mobility behaviour, Network analysis

不同群体条件下内外群体对道德判断的影响：群体认同的调节作用

摘 要 本研究基于社会认同理论和害群之马效应，旨在探讨一般社会群体和最简单群体条件下人们对内外群体成员的道德判断是否具有差异。实验 1 采用单因素两水平(群体身份：内群体、外群体)的被试间实验设计，来探究在一般社会群体条件下，个体对内外群体成员违规行为的道德判断。分别测量两组被试对内外群体违规行为的惩罚意向及惩罚严重程度。预期结果：被试对内群体成员的惩罚程度高于外群体成员。实验 2 采用 2(群体身份：内群体、外群体)×2(社会规范：违规、符合)的被试间设计，运用最简群体范式中的点估计任务将被试随机分为不同群体，采用 Cyberball 范式来操纵群体成员的行为是否符合规范，排斥行为即可视为违规行为，通过测量被试作为观察者对内外群体违规行为的第三方惩罚程度，来探究最简单群体条件下，人们对不同群体成员的道德判断是否具有差异。预期结果：群体身份和社会规范的交互作用显著，人们对内群体成员出现违规行为的第三方惩罚程度高于外群体，呈现害群之马效应。实验 3 纳入变量群体认同，采用 2(群体身份：内群体、外群体) ×2(社会规范：违规、符合)×2(群体认同：高、低)的被试间设计，通过测量被试对群体成员积极态度和消极态度，来探究群体认同在道德判断过程中的调节作用。预期结果：群体身份和社会违规的交互作用显著，同实验 2；社会规范和群体认同的交互作用显著，在符合规范条件下，相比群体认同低的被试，群体认同高的被试对群体成员的态度更积极；在违反规范条件下，群体认同高的被试对群体成员的态度更消极；群体身份和群体认同的交互作用显著，群体认同高的被试对内群体成员的态度更积极。研究发现不同群体身份对道德判断过程会产生影响，因此对不道德行为进行惩罚决策时要考虑群体身份这一因素。

关键词 内/外群体，道德判断，群体认同

The influence of internal and external groups on moral judgments under different group conditions: the moderating role of group identity

Song Keke,Huang Yabo,Li Na
Shanxi Normal University,Taiyuan,030031, 1981151826@qq.com

Abstract： Based on the theory of social identity and the black sheep effect, this study aims to explore whether people's moral judgments of the members of the internal and external groups differ between the general social group and the simplest group conditions. In experiment 1, a single-factor, two-level (group identity: in-group, out-group) inter-subject experimental design was used to explore the moral judgment of individuals on violations of internal and external group members under the conditions of general social groups. The punishment intention and punishment severity of the two groups were measured respectively. Expected result: Subjects punished in-group members more than out-group members. Experiment 2 adopts 2(group identity: in-group, out-group) × 2(social norm: violation, conformity). By using the point estimation task in the simplest group paradigm, the subjects were randomly divided into different groups, and the Cyberball paradigm was used to manipulate whether

the behaviors of group members were in line with the norms, and the exclusion behavior could be regarded as the violation behavior. By measuring the degree of third-party punishment of the subjects as observers for the internal and external group violations, to explore whether people's moral judgments of different group members are different under the simplest group conditions. Expected results: The interaction between group identity and social norms is significant, and the degree of third-party punishment for violations of in-group members is higher than that of out-group members, showing a black sheep effect. Experiment 3 included variables of group identity. The inter-subject design of 2(group identity: in-group, out-group) × 2(social norm: violation, conformity) × 2(group identity: high, low) was adopted to explore the moderating role of group identity in the process of moral judgment by measuring subjects' positive and negative attitudes towards group members. Expected results: The interaction between group identity and social transgression was significant, same as experiment 2; The interaction between social norms and group identity is significant. Under the condition of conforming to norms, subjects with high group identity have more positive attitudes towards group members than those with low group identity. Under the norm violation condition, the subjects with high group identification had more negative attitude towards group members; The interaction between group identity and group identity is significant, and the subjects with high group identity have more positive attitudes towards internal group members. It is found that different group identities have an impact on the process of moral judgment, so it is necessary to consider the factor of group identity when making punishment decisions for immoral behaviors.

金钱和情绪反馈对第三方惩罚中群体偏差的影响

杜创一 伍珍（通讯作者）
清华大学心理学系，北京，100084，通讯作者 E-mail: zhen-wu@mail.tsinghua.edu.cn

摘 要 个体会对一系列不公平行为做出惩罚，包括自身利益没有受损的旁观者，即第三方惩罚(TPP)。作为一种亲社会行为，在既往的社会实践中大多采用金钱奖励进行强化。但是这一措施是否切实有效，以及个人情绪偏差在其中是否存在自我强化作用，都还尚未可知。围绕以上问题，本研究采用经济决策范式对大学生样本($N = 51$)进行了测试，同时也进一步考虑了群体偏差对于 TPP 行为带来的影响。参与者观看内群或外群分配者对接受者实施的不公平分配，然后决定是否进行有代价的 TPP，惩罚行为将有 80%的概率得到金钱奖励。参与者将持续决策 40 轮，逐试次学习社会的金钱奖励以及个人的情绪反馈，并依此调整惩罚行为。

主要结果如下：1）TPP 行为上表现出内群偏好，惩罚内群少于外群。2）对于试次内部的学习来看，无论何种情境，被试得知不公平分配方案的初始情绪越负面，越可能会产生惩罚行为；在外群情境中，预期做出惩罚后的情绪唤醒越强，被试越可能产生惩罚行为，但是在内群情境中则为初始情绪的唤醒越弱，被试越可能产生惩罚行为；另外在外群情境中，预期做出惩罚后的情绪唤醒相比于得知方案的初始情绪越强，被试越可能产生惩罚行为，但是在内群情境中，预期情绪比初始情绪越积极，被试越可能产生惩罚行为。3）对于跨试次的学习来看，金钱的激励作用只存在于外群体情境；并且对于内群情境而言，被试得知不公平分配方案的初始情绪越积极，预期做出惩罚行为的情绪越消极，以及真正做出选择之后的情绪相较于初始情绪更消极，被试在下一轮更倾向于选择惩罚行为；对于外群情境而言，被试做出选择之后的真实情绪较为消极和微弱，并且相较于初始情绪更消极，被试在下一轮更倾向于选择惩罚行为。

研究有助于揭示 TPP 行为背后有关金钱和情绪的复杂强化机制，也为制定有效的干预措施和社会奖励政策提供了参考。除了对于“见义勇为”行为的金钱鼓励外，也可以从认知的角度进一步干预个体对不公平行为的情绪体验，从而利于促进 TPP 这一亲社会行为。

The Effect of Money and Emotional Feedback on Group Bias in Third-party Punishment

Chuangyi Du, Zhen Wu
Department of Psychology, Tsinghua University, Beijing 100084

***Abstract*:** Individuals, including bystanders whose self-interest is not compromised, may mete out punishment for a series of unfair behaviors, which is referred to as third-party punishment (TPP). As a prosocial behavior, TPP has mostly been reinforced through monetary rewards in previous practices. However, the effectiveness of this method and whether individual emotional prediction error play a role in self-reinforcement remains unknown. To address these questions, this study used an economic decision-making paradigm to test a sample of college students ($N = 51$), while also considering the influence of group bias on TPP behavior. Participants observed unfair allocations made by in-group or out-group allocators to recipients and then decided whether to engage in costly TPP, where the punitive action had an 80% chance of receiving a monetary reward. Participants made continuous decisions for 40 trials, learning from social monetary rewards and personal emotional feedback to adjust their punishment

behavior.

The main findings are as follows: 1) TPP behavior exhibited an in-group preference, with less punishment towards the in-group compared to the out-group. 2) Regarding within-trial learning, regardless of the scenario, participants who experienced more negative initial emotions upon learning about the unfair allocation scheme were more likely to engage in punishment. In the out-group scenario, the stronger the anticipated emotional arousal after deciding on the punishment, the more likely participants were to engage in punishment. However, in the in-group scenario, the weaker the initial emotional arousal, the more likely participants were to engage in punishment. Furthermore, in the out-group context, the stronger the emotional arousal after anticipating punishment, compared to the initial emotional arousal upon learning about the scheme, the more likely participants were to engage in punishment. In the in-group scenario, the more positive anticipated emotions compared to the initial emotions, the more likely participants were to engage in punishment. 3) Concerning cross-trial learning, the incentive effect of money was only present in the out-group context. For the in-group context, the more positive the initial emotions upon learning about the unfair allocation scheme, the more negative the emotional arousal when anticipating punishment, and the more negative the emotions after making the actual choice compared to the initial emotions, the more likely participants were to choose punishment in the next trial. In the out-group scenario, the emotions after making the actual choice were more negative and weaker compared to the initial emotions, and the more negative the emotions after making the actual choice, the more likely participants were to choose punishment in the next trial.

This research helps uncover the complex reinforcement mechanisms of money and emotions underlying TPP behavior, providing insights for the development of effective intervention measures and social policies. Apart from monetary incentives for "doing the right thing", interventions could also be directed at individuals' emotional perception of unfair behavior, thereby promoting TPP as a pro-social behavior from a cognitive perspective.

心理特权和情绪的动机强度对大学生道德决策的影响：基于 CAN 算法的分析

杨霄楠[1] 陆增颜[2] 桑青松[2]（通讯作者）

1 安徽商贸职业技术学院学生工作处，芜湖，241002

2 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn

摘 要 万物莫不尊道而贵德，随着人工智能的迅猛发展，衍生出了一系列有关责权划分以及道德决策等方面的问题。双加工理论认为，道德决策是推理反应与直觉反应并存的一种信息加工过程。心理特权作为一种人格特质，常表现出对自身福祉、权利与地位等方面的过度关注和认知不明。情绪的动机维度模型指出，高动机强度（趋近/回避）情绪易使个体发生注意力窄化，已有研究根据该模型证实了高动机强度情绪会导致功利主义道德决策，但情绪的动机强度对道德决策的影响是否存在适应性变化尚未明晰。因此，本研究以双加工理论为基础，借助 CAN 算法探讨了心理特权水平和情绪的动机强度对大学生道德决策的影响。以安徽省某高校 224 名大学生(*Mage*=19.28, *SD*=1.78)为研究对象，采用心理特权量表、情绪启动材料以及道德两难情境材料，运用 E-prime 软件设计情绪启动实验，对大学生道德决策进行探索。结果显示，无论在趋近情绪还是回避情绪中，心理特权水平与情绪的动机强度在道德决策部分参数上均呈现显著交互作用。具体而言，在趋近情绪中，高动机强度情绪使高心理特权水平大学生表现出了更高的结果敏感性，总体行动倾向以及道德规范与后果原则遵循度；而在回避情绪中，高动机强度情绪使低心理特权水平大学生表现出了更高的规范敏感性，以及道德规范与后果原则遵循度，即不同心理特权水平的大学生关注点的差异，导致情绪的动机强度对大学生道德决策的影响在心理特权水平上出现了适应性变化。本研究的发现有助于拓宽情绪对道德决策的影响研究，并且强调心理特权这一特质在道德教育中的重要作用。

1 Department of Student Affairs, Anhui Business College, Wuhu, 241002
2 College of Education Sciences, Anhui Normal University, Wuhu, 241000,
s7210qs1@mail.ahnu.edu.cn

Abstract **:** All things and beings revere Dao and cherish virtue, with the rapid development of artificial intelligence, a series of problems related to the division of responsibilities and rights and moral decision-making have arisen. According to the double processing theory, moral decision-making is a kind of information processing process in which reasoning response and intuitive response coexist. Psychological entitlement, as a personality trait, often shows excessive concern and confusion about one's own well-being, rights and status. The motivational dimension model of emotion points out that emotions of high motivational intensity (approach/avoidance) tend to narrow individuals' attention. According to this model, some studies have confirmed that emotions of high motivational intensity will lead to utilitarian moral decision-making, but whether there is an adaptive change in the impact of motivational intensity of emotion on moral decision-making is not clear. Therefore, based on the double processing theory and CAN algorithm, this study explores the influence of psychological entitlement level and motivational intensity of emotion on college students' moral decision-making. A total of 224 college students (*Mage*=19.28, *SD*=1.78) in a university in Anhui Province were selected as the research objects. By using psychological entitlement scale, emotional priming materials and moral dilemma materials, E-prime software was used to design an emotional priming experiment to explore the moral decision-making of college students. The results show that psychological entitlement level and motivational intensity of emotion have significant interaction on some parameters of moral decision-making in both approach and avoidance emotions. Specifically, in the approach emotion, the emotion of high motivational intensity makes the college students witn high psychological entitlement level show a higher consequence sensitivity, the overall action preference and the degree of adherence to moral norms and consequence principles; However, in avoidance emotion, high motivational intensity makes college students with low psychological entitlement level show higher norm sensitivity, and the degree of adherence to moral norms and consequence principles, that is, the differences in the concerns of college students with different levels of psychological entitlement, resulting in adaptive changes in the impact of motivational intensity of emotion on college students' moral decision-making at the level of psychological entitlement. The findings of this study help to broaden the study of the influence of emotion on moral decision-making and emphasize the important role of psychological entitlement in moral education.

摘 要　幸福感意为人们积极生活的侧面反映，主要体现在与他人建立良好的人际关系、对生命意义的体会以及追逐目标时获得的成就感等方面，它既是构成积极心理品质的重要部分，也与人们的心理健康息息相关。当前社会不确定性丛生，由此易滋生重大风险事件，从而对民众心理及幸福感产生负面影响。通过不确定性-认同理论和社会认同理论，处于不确定性环境中的个体倾向于对某一群体产生认同，以此来掌控或降低不确定性，重构幸福感，因此民族认同可能是应对此心理危机的重要潜在机制，但其具体作用仍停留于理论猜想层面，缺乏实证支撑。此外，现有的相关研究仅限于讨论民族认同和幸福感之间的关系，基于此，本研究针对更符合我国社会背景的中华民族认同这一概念进行深入探索，并尝试引入社会支持以构建中介模型进行检验。因此，本研究以双重态度理论为方法论指导，从外显和内隐角度探究不确定性背景下中华民族认同对个体的幸福感的影响机制。研究 1 通过问卷调查(N=1082)发现，中华民族认同与幸福感之间存在显著正相关，且社会支持在中华民族认同和幸福感之间起中介作用。研究 2(N=80)设计了一个双因素前后测混合实验，启动内隐中华民族认同和风险事件的负面心理，结果表明风险事件造成的负面心理会降低个体的幸福感，而中华民族认同能有效缓冲风险事件带来的负面心理，重建个体的幸福感。本研究从双重态度理论视角交互验证了中华民族认同对幸福感的影响，为不确定性环境中风险事件影响下的民众心理健康干预提供了参考。

The influence mechanism of Chinese national identity on well-being: The mediating role of social support

Jielin Shen[1]　Tengwei Sun[2]　Yuchang Jin[1](corresponding author)
1 School of Psychology, Sichuan Normal University, 5 Jing'an Road, Chengdu 610068, PR China.
2 Department of Developmental Psychology, Utrecht University, Utrecht, 3584CS

Abstract：Well-being is a reflection of people's positive life, which is mainly reflected in the establishment of good interpersonal relationships with others, the experience of the meaning of life, and the sense of fulfillment when pursuing goals, etc. It is an important part of positive psychological qualities, and is also closely related to people's mental health. Uncertainty in the current society is prone to major risk events, which negatively affects people's psychology and well-being. According to the uncertainty-identity theory and social identity theory, individuals in an uncertain environment tend to identify with a certain group to control or reduce uncertainty and reconstruct their well-being. Therefore, national identity may be an important potential mechanism to cope with this psychological crisis, but its specific role remains at the level of theoretical conjecture and lacks empirical evidence to support it. In addition, existing related studies are limited to discussing the relationship between national identity and well-being. Based on this, this study explores the concept of Chinese national identity, which is more in line with the social context of China, and tries to introduce social support to construct a mediation

model for testing. Therefore, this study takes dual attitude theory as a methodological guide to examine the mechanism of Chinese national identity's influence on individuals' well-being in the context of uncertainty from both explicit and implicit perspectives. Study 1 found that there was a significant positive correlation between Chinese national identity and well-being through a questionnaire survey (N=1082), and that social support mediated the relationship between Chinese national identity and well-being. Study 2 (N=80) designed a two-factor pre- and post-test mixed experiment to initiate the negative psychology of risky events and implicit Chinese national identity, and the results showed that the negative psychology caused by risky events would reduce individuals' well-being, whereas Chinese national identity could effectively buffer the negative psychology caused by risky events and rebuild individuals' well-being. This study interactively verifies the effect of Chinese national identity on well-being from the dual attitude theory perspective, which provides a reference for the intervention of people's mental health under the influence of risky events in an uncertain environment.

社交网站使用强度对相对剥夺感的影响：一个有调节的链式中介模型

王洪阳[1] 于佳[2]

1 成都市第四人民医院，成都，610036

2 陕西中医药大学陕西中药资源产业化省部共建协同创新中心，咸阳，712000

摘 要 随着互联网的快速普及，社交网站给人们带来了极大的便利，但过度依赖社交媒体，会给人们的身心带来负面影响。研究发现，人们倾向于在社交媒体上呈现经过整饬而形成的积极、正面的信息，从而导致社交网站信息展示存在一定的偏向性，加剧了人们的社会比较现象。社会比较的其中一个结果就是相对剥夺感。所谓相对剥夺感就是指个体或群体通过与参照群体比较而感知到自身出于不利地位，进而体验到愤怒和不满等负性情绪的一种主观认知和情绪体验，中国古人“不患寡而患不均”正是此心理的写照。社交网站中的信息呈现更易诱发上行社会比较，而上行社会比较会降低个体的自我评价水平，影响个体的自尊水平。因此，本研究通过梳理前人研究假设，社交网站使用强度通过上行社会比较和自尊的中介作用影响相对剥夺感。此外，有研究发现不同特质正念水平的个体面对冲突和压力时的表现存在差异，因此本研究构建了一个有调节的链式中介模型。本研究采用社交网站使用强度量表、上行社会比较量表、自尊量表、相对剥夺感量表和正念觉知注意量表对四川成都、南充、绵阳、江西九江、广西等几所大学的 1100 余名大学生进行测量，最终回收问卷 880 份，剔除无效作答、存在缺失值的样本后，共获得有效问卷 817 份(N=817, M_{age}=18.81±1.79, 男性占比 297 人)。结果发现：(1)社交网站使用强度与相对剥夺感显著正相关(0.14, p<0.01)，自尊与相对剥夺感显著负相关(-0.30，p<0.01)，特质正念与自尊显著正相关(0.52, p<0.01)；(2)中介效应检验表明，上行社会比较和自尊的链式中介作用显著(Ind3=0.02, CI=[0.02,0.07]，占比 20%)，且上行社会比较(Ind3=0.02, CI=[0.02,0.07]，占比 20%)和自尊(Ind2=-0.02, CI=[-0.04,-0.01]，占比 20%)的独立中介作用也均显著；(3)调节中介效应检验表明，有调节的链式中介效应存在，调节的路径为自尊的独立中介作用和链式中介作用，调节中介效应指数(Index of moderated mediation)分别为 0.0006，95%CI=[0.0002, 0.0011]和-0.0009，95%CI=[-0.0018, -0.0002]。调节中介效应说明，在高特质正念水平下，自尊的独立中介效应和链式中介效应才会显著，而在低特质水平下，上述效应均不显著。这一发现为社交网站使用的问题性使用提供了理论依据。

关键词 社交网站使用强度，上行社会比较，自尊，相对剥夺感，特质正念

The Effect of Social Networking Site Use Intensity on of Relative Deprivation: A Moderated Chain Mediation Model

Wang Hongyang[1] Yu Jia[2]

([1]The Fourth People's Hospital of Chengdu, Chengdu)

([2]Shaanxi Collaborative Innovation Center of Chinese Medicinal Resources Industrialization, Xianyang)

Abstract: With the rapid popularization of the Internet, social networking sites have brought great convenience to people, but excessive reliance on social media will bring negative effects on people's body and mind. The study found that people tend to present the positive information formed by the rectification on social media, which leads to a certain bias in the information display on social networking sites and intensifies the phenomenon of social comparison. One of the consequences of social comparison is relative deprivation. Relative deprivation refers to the subjective cognition and emotional experience of individuals or groups perceiving themselves at a disadvantage by comparing with the reference group, and then experiencing negative emotions such as anger and dissatisfaction. The ancient Chinese "not suffering from quantity but suffering from imbalance" is the embodiment of this psychology. Information presentation in social networking sites is more likely to induce upward social comparison, and upward social comparison can reduce the level of self-evaluation and self-esteem of individuals.

Therefore, by combing through previous studies, this study hypothesized that the intensity of social networking site use affects relative deprivation through the mediating effect of ascending social comparison and self-esteem. In addition, some studies have found that individuals with different levels of trait mindfulness behave differently in the face of conflict and stress, so a moderated chain mediation model was constructed in this study. In this study, more than 1100 college students from Chengdu, Nanchong, Mianyang, Jiujiang, Guangxi and other universities were investigated by using the Intensity of Social Networking Site Use Scale, Upward Social Comparison Scale, self-esteem scale, Relative deprivation scale and Mindful awareness attention scale. Finally, 880 questionnaires were collected. A total of 817 valid questionnaires were obtained (N=817, Mage=18.81±1.79, 297 males).

The results showed that: (1) The intensity of social networking site use was positively correlated with relative deprivation (0.14, $p<0.01$), self-esteem was negatively correlated with relative deprivation (-0.30, $p<0.01$), and trait mindfulness was positively correlated with self-esteem (0.52, $p<0.01$). (2) The mediating effect test showed that the chain mediating effect of upward social comparison and self-esteem was significant (Ind3=0.02, CI= [0.02, 0.07], 20%), and the chain mediating effect of upward social comparison (Ind3=0.02, CI= [0.02, 0.07], 20%) and self-esteem (Ind2=-0.02, CI= [-0.04, -0.01], 20%) were also significant. (3) The test of moderated mediation effect showed that there was a moderated chain mediation effect, and the path of moderation was independent mediation and chain mediation. The Index of moderated mediation was 0.0006, respectively. 95% CI = 0.0002, 0.0011 and 0.0009, 95% CI = [0.0018, 0.0002]. The moderating mediating effect indicated that the independent mediating effect and chain mediating effect of self-esteem were significant only at high trait mindfulness levels, while none of the above effects were significant at low trait levels. This finding provides a rationale for problematic use of social networking site use.

Keywords: social networking site use intensity, upward social comparison, self-esteem, relative deprivation, trait mindfulness

两亚型注意缺陷多动障碍儿童心智空白的行为和脑电研究

方荣[1] 曹龙飞[2] 唐颖[1] 张禹[3] 李杰[2]（通讯作者）
1 杭州师范大学经亨颐教育学院，杭州，311121
2 杭州师范大学附属医院认知与脑疾病研究中心，杭州，311121，lijie.psy@hznu.edu.cn
3 北京体育大学心理学院，北京，100084

摘 要 注意缺陷多动障碍(Attention Deficit Hyperactivity Disorder，ADHD)是儿童时期常见的神经行为障碍。唤醒调节障碍是 ADHD 的核心问题之一，ADHD 患者长期处于紧张性低唤醒状态。而唤醒水平在 ADHD 亚型间存在差异，相较于 ADHD- C(Combined)，ADHD-I(Inattentive)唤醒水平更低。ADHD 的低唤醒与注意缺陷之间存在联系，研究发现相较于高唤醒的健康群体，ADHD 会表现更多注意缺失，经历更频繁的心智空白（Mind Blanking）。心智空白是一种注意缺失现象，表现为个体主观报告意识减少，报告脑中没有想法或无法报告脑中想法，该状态会导致个体注意任务表现下降。由于 ADHD 两亚型之间存在唤醒差异，故两亚型 ADHD 是否都会频繁经历心智空白仍需研究。本研究探究了 ADHD-I 与 C 型患儿于持续性注意任务（Sustained attention to response task, SART）中心智空白频率以及行为与脑电活动表现差异，进一步探讨了两亚型 ADHD 患儿心智空白的行为与脑电活动机制。

本研究于杭州师范大学附属医院招募了 33 名 ADHD-I、23 名 ADHD-C 患儿，于当地小学招募了 30 名健康儿童，采用 SART 作为实验任务。任务过程中每 20 秒-40 秒插入一个思想探针采集心智状态，记录行为、瞳孔和脑电数据。

行为结果显示：(1) 两亚型组报告心智空白占比显著高于对照组(27.19%, 29.34% vs. 18.25%; F=7.78, η^2=.138, p=.005; F=2.63, η^2=.092, p=.009)，亚型间无显著差异(p=.429)。(2)心智空白下，各组漏报率(11.97%, 11.98% vs. 5.36%; F=9.65, η^2=.100, p=.003; F=17.49, η^2=.185, p<.001)和虚报率(79.11%, 77.89% vs. 41.72%; F=60.21, η^2=.470, p<.001; F=61.95, η^2=.446, p<.001)均显著高于对照组，反应时变异性均显著高于对照组(73.16ms, 71.18ms vs. 41.30ms; F=15.19, η^2=.187, p<.001; F=18.05, η^2=.198, p<.001)。瞳孔结果显示：心智空白下，两亚型患儿瞳孔显著小于对照组(1.98mm, 2.23mm vs. 2.34mm; F=60.45, η^2=.515, p<.001; F=6.94, η^2=.129, p=.011)，ADHD-I 组瞳孔显著小于 ADHD-C 组(1.98mm vs. 2.23mm; F=36.80, η^2=.444, p<.001)。脑电结果显示：(1)心智空白下，两亚型患儿后部脑区局部睡眠慢波(Local sleep slow wave, LSSW)数量显著高于对照组，亚型间无显著差异。（2）各心智状态下 LSSW 数量区域差异类似，总体呈现出后部与前额脑区 LSSW 数量显著高于其他脑区。

本研究说明了频繁经历心智空白是两亚型 ADHD 患儿共同的现象，均伴随着持续注意表现下降与瞳孔收缩。心智空白与患儿后部脑区 LSSW 数量增加相关，LSSW 在后部脑区堆积减弱了 ADHD 患儿对外部输入刺激的处理能力，可能是导致 ADHD 患儿唤醒水平低、持续性注意力差的原因。

Behavioral and EEG studies of mind blanking in children with different subtypes of ADHD

Rong Fang[1], Longfei Cao[2], Ying Tang[1], Yu Zhang[3] and Jie Li[2]
1 College of Education, Hangzhou Normal University, Hangzhou
2 Center for Cognition and Brain Disorders, the Affiliated Hospital, Hangzhou Normal University, Hangzhou
3 School of Psychology, Beijing Sport University, Beijing

Abstract **:** Attention Deficit Hyperactivity Disorder (ADHD) is a prevalent neurobehavioral disorder in childhood. Dysregulation of arousal serves as a key underlying issue within ADHD, whereby individuals with ADHD often experience prolonged states of hypervigilant low arousal. There are variations in arousal levels among different subtypes of ADHD, with ADHD-I (Inattentive) displaying lower levels of arousal compared to ADHD-C (Combined). The connection between low arousal and attention deficits in ADHD has been established, as research indicates that individuals with ADHD exhibit a greater degree of attentional lapses and more frequent episodes of mind blanking compared to healthier populations with higher arousal levels. MB refers to a phenomenon of attentional lapses, characterized by a subjective reduction in conscious awareness, wherein individuals report a lack of any thoughts or an inability to report their thoughts. This state can result in a decline in individual attentional task performance. Due to the arousal differences between the two subtypes of ADHD, it is still necessary to conduct research to determine whether both ADHD-I and ADHD-C subtypes frequently experience episodes of mind blanking. This study aimed to investigate the frequency of mind blanking, as well as the behavioral and electroencephalographic (EEG) differences, during a sustained attention to response task (SART) in children with ADHD-I and ADHD-C. Furthermore, the study sought to further explore the behavioral and EEG mechanisms underlying mind blanking in children with these two subtypes of ADHD.

This study recruited 33 children with ADHD-I and 23 children with ADHD-C from Hangzhou Normal University Affiliated Hospital. Additionally, 30 healthy children were recruited from local elementary schools. SART was utilized as the experimental task. During the task, a thought probe was inserted every 20 to 40 seconds to capture the mental state, and behavioral, pupil, and EEG data were recorded.

Behavioral and pupil data results showed the following:1) The number of reported mind blanking episodes was significantly higher in both ADHD subtypes compared to the control group (27.19%, 29.34% vs. 18.25%; F=7.78, η^2=.138, p=.005; F=2.63, η^2=.092, p=.009), with no significant difference between the subtypes (p=.429).2) During mind blanking episodes, all groups exhibited significantly higher rates of task omissions (11.97%, 11.98% vs. 5.36%; F=9.65, η^2=.100, p=.003; F=17.49, η^2=.185, p<.001) and rates of false alarm accuracy (79.11%, 77.89% vs. 41.72%; F=60.21, η^2=.470, p<.001; F=61.95, η^2=.446, p<.001)compared to the focused attention state. Reaction time variability was significantly higher during mind blanking episodes compared to the focused attention state (73.16ms, 71.18ms vs. 41.30ms; F=15.19, η^2=.187, p<.001; F=18.05, η^2=.198, p<.001). The Pupil size measurements in all ADHD subtypes were smaller than those in the control group (1.98mm, 2.23mm vs. 2.34mm; F=60.45, η^2=.515, p<.001; F=6.94, η^2=.129,

p=.011). In comparison between ADHD-I and ADHD-C groups, pupil size in the ADHD-I group was significantly influenced by mental states (1.98mm vs. 2.23mm; F=36.80, η^2=.444, p<.001), with significantly smaller pupil size during mind blanking episodes compared to the focused attention state (p<.001). The EEG data results are as follows:1) During mind blanking episodes, children with both ADHD subtypes exhibited a significantly higher number of local sleep slow waves in the posterior brain regions compared to the control group. There was no significant difference between the subtypes.2) Across all three groups, there were similar regional differences in the number of local sleep slow waves across different mental states. Overall, there were significantly more local sleep slow waves in the posterior brain regions during mind blanking compared to the on task state.

Therefore, this study demonstrates that mind blanking is a shared phenomenon among children with different subtypes of ADHD. It is accompanied by a decline in sustained attention performance and pupil constriction. The occurrence of mind blanking is correlated with an increase in the number of local sleep slow waves in the posterior brain regions, the accumulation of local sleep slow waves in the posterior brain regions diminishes the ability of children with ADHD to process external stimuli effectively. This is likely one of the contributing factors to their lower levels of wakefulness and poor sustained attention. Local sleep slow waves may be a valuable but neglected indicator of brain electrical activity to explain the cognitive and behavioral performance of ADHD patients.

Keywords：attention deficit hyperactivity disorder; mind blanking; arousal; local sleep slow wave; sustained attention

元认知疗法干预强迫症的临床对照研究

姜帆[1]　刘晓明[2]（通讯作者）

[1、2] 东北师范大学大学心理学院，长春，130024，jiangf581@nenu.edu.cn

摘 要　**目的：**明确元认知疗法对中国强迫临床样本的实际干预效果，并与暴露与反应预防疗法进行多维度的比较。**方法：**将首诊强迫临床被试 32 名分为元认知疗法（MCT）组、暴露与反应预防疗法（ERP）组及心理健康宣教组（对照组），分别进行 12 周的集中干预，采用耶鲁布朗强迫量表（Y-BOCS）与元认知问卷（MCQ-30）执行评估任务，分别在干预前、干预后、干预后 12 周施测，同时考察各组被试应答率、脱落率及复发率。**结果：**干预前各组量表得分无显著差异；干预后 3 组 Y-BOCS 得分均较干预前显著下降（$p<0.05$），MCT 组与 ERP 组的 Y-BOCS 得分无显著差异，两组 Y-BOCS 得分下降率均较对照组更高（$p<0.05$）；干预后 MCT 组 MCQ-30 得分显著小于 ERP 组与对照组（$p<0.05$）；干预后 12 周 MCT 组 Y-BOCS 与 MCQ-30 得分均显著低于 ERP 组（$p<0.05$）与对照组（$p<0.01$）；应答率方面，MCT 组与 ERP 组无显著差异，两组均高于对照组（$p<0.05$）；脱落率方面，MCT 组显著低于 ERP 组与对照组（$p<0.05$）；复发率方面，MCT 组显著低于 ERP 组与对照组（$p<0.05$）。**结论：**MCT 与 ERP 均可改善强迫症状，MCT 的干预效果较 ERP 维持更久，脱落率及复发率更低，能够较好适用于中国强迫症群体。并且，其核心机制可能在于元认知信念的改善，提示强迫症心理机制与功能失调性元认知有关，研究结果为强迫症的元认知理论模型提供了佐证。

Application of metacognitive therapy for obsessive-compulsive disorder: a controlled clinical study

Jiang Fan[1]　Liu Xiaoming[2]

[1,2]NorthEast Normal University,Changchun,130024,China

***Abstract*：Aim:** To determine the effect of metacognitive therapy on compulsive clinical samples in China and to compare it with exposure and response prevention in multiple dimensions. **Method:** The 32 first compulsive clinical patients were divided into metacognitive therapy (MCT) group, exposure and response prevention therapy (ERP) group and mental health education group (control group), respectively, and were subjected to 12-week intensive intervention. The assessment tasks were performed using Yale-Brown Compulsive Scale (Y-BOCS) and metacognitive questionnaire (MCQ-30). The test was performed before, after and 12 weeks after intervention, and the response rate, shedding rate and recurrence rate of each group were investigated. **Results:** Before intervention, there was no significant difference in scale scores among all groups. After intervention, Y-BOCS scores of the three groups were significantly decreased compared with those before intervention ($p < 0.05$), while Y-BOCS scores of the MCT group and ERP group had no significant difference, and the decrease rate of Y-BOCS scores of the two groups was higher than that of the control group ($p < 0.05$). After intervention, the MCQ-30 score of MCT group was significantly lower than that of ERP group and control group ($p < 0.05$). At 12 weeks after intervention, Y-BOCS and MCQ-30 scores in MCT group were significantly lower than those in ERP group ($p < 0.05$) and

control group ($p < 0.01$). In terms of response rate, there was no significant difference between MCT group and ERP group, both groups were higher than control group ($p < 0.05$). The shedding rate of MCT group was significantly lower than that of ERP group and control group ($p < 0.05$). The recurrence rate of MCT group was significantly lower than that of ERP group and control group ($p < 0.05$). **Conclusion:** Both MCT and ERP can relieve obsessive-compulsive symptoms. The intervention effect of MCT is longer than that of ERP, and the shedding rate and recurrence rate are lower, which can be better applied to Chinese obsessive-compulsive disorder group. In addition, the core mechanism may be the improvement of metacognitive belief, suggesting that the psychological mechanism of OCD is related to dysfunctional metacognition, and the research results provide evidence for the metacognitive theoretical model of OCD.

死亡反省干预对大学生死亡焦虑和生命意义感影响的效果研究

刘威彤[1]　唐苏勤[2]（通讯作者）
1 北京师范大学心理学部，珠海，519087
2 深圳大学心理学院，深圳，518060，jasminetsq@hotmail.com

摘 要　在忌讳死亡的中华文化背景下，随着新冠疫情等卫生事件的突发，死亡教育不足的问题日益凸显，包括课程内容缺乏死亡理论支撑，课程效果研究缺乏严谨的随机对照试验设计。本研究基于死亡反省理论，将实验室诱发死亡反省的操纵进行适应性修订，形成干预方案，考察新开发干预方案对缓解中国大学生死亡焦虑和提升生命意义感的干预效果。本研究采用随机对照试验，研究设计为 2×3 混合实验设计，其中被试间变量为干预类型（干预组与对照组），被试内变量为时间（干预前、干预后、干预后一个月）。共纳入 47 名体验到死亡焦虑（死亡焦虑总分≥35）的大学生，随机分配至干预组（n = 24）和对照组（n = 23）：干预组接受为期 8 周的死亡反省书写任务干预，干预任务包含了死亡反省的核心成分：面对真实死亡、生命回顾和他人视角；对照组进行自由书写，书写日期和时长与干预组一致，书写内容为自由书写当天或当周的生活事件及心情。干预前、干预后、干预后一个月随访的问卷调查包括死亡焦虑（中文版死亡焦虑量表）、生命意义感（中文版生命意义感问卷）和死亡反省（中文版死亡反省量表）。结果显示，全样本和高水平（55 < 死亡焦虑总分 ≦ 75，n = 25）死亡焦虑组的大学生死亡焦虑水平与生命意义感在两组间均无显著差异。中等水平（35 ≦ 死亡焦虑总分 ≦ 55，n = 22）死亡焦虑大学生在干预前后死亡焦虑显著降低：在后测时，干预组死亡焦虑水平显著低于对照组（$F = 10.664$，$p = 0.005$）；随访时，两组死亡焦虑差异不显著（$F = 1.79$，$p = 0.199$）。本研究揭示，基于死亡反省理论开发的干预适用于我国文化背景下的大学生，干预方案能显著降低中等水平死亡焦虑大学生的死亡焦虑水平，未来研究应进一步研发适用于高水平死亡焦虑大学生的干预方案，并继续探索如何有效提升大学生的生命意义感。

EFFECTS OF A DEATH REFLECTION INTERVENTION ON DEATH ANXIETY AND MEANING IN LIFE AMONG COLLEGE STUDENTS

Liu Weitong[1]　Tang Suqin[2]
1 Faculty of Psychology, Beijing Normal University, Zhuhai 519087, China
2 School of Psychology, Shenzhen University, Shenzhen 518060, China

Abstract：With the Chinese culture of death taboos and the emergence of public health events such as the COVID-19 pandemic, insufficient death education has become a increasingly prominently problem, including a

lack of theoretical support for death course contents and a lack of rigorous randomized controlled experimental designs for course effectiveness studies. Based on death reflection theory, this study adapted a foreign laboratory-induced death reflection manipulation to form an intervention protocol and examined the effectiveness of the newly developed intervention protocol on death anxiety and meaning in life among Chinese college students. This study was a randomized controlled trial and a 2×3 mixed experimental design, with the between-subjects variable being the type of intervention (intervention group vs. control group) and the within-subjects variable being time (pre-intervention, post-intervention, and one-month post-intervention). A total of 47 college students experiencing death anxiety (death anxiety total score ≥ 35) were included and randomly assigned to the intervention (n = 24) and control (n = 23) groups. The intervention group received an 8-week intervention with a death reflection writing task that incorporated the core components of death reflection, namely confronting a real death, life review, and thinking from others' perspectives. The control group underwent free writing with the same date and duration as the intervention group, and the writing consisted of free writing about life events and moods of the day or week. Death anxiety (Chinese version of the Templer-Death Anxiety Scale), sense of meaning in life (Chinese Meaning in Life Questionnaire), and death reflection (Chinese version of the Death Reflection Scale) were measured before and after the intervention, as well as at the one-month follow-up. The results showed no significant differences in death anxiety and meaning in life between the control and intervention groups among students in both the full sample and high level (55 < death anxiety total score ≦ 75, n = 25) death anxiety group. Moderate-level (35 ≦ death anxiety total score ≦ 55, n = 22) death anxiety college students had significantly lower death anxiety before and after the intervention. To specific, the level of death anxiety of the intervention group was significantly lower than that of the control group at post-intervention (F = 10.664, p = 0.005), yet the difference in death anxiety between the two groups was not significant at follow-up (F = 1.79, p = 0.199). This study reveals that the intervention developed based on death reflection theory is applicable to college students in the Chinese culture, and the intervention significantly reduced death anxiety levels in college students with moderate levels of death anxiety. Future research should further develop interventions applicable to college students with high level of death anxiety and continue to explore how to effectively enhance the sense of meaning in life among college students.

Keywords： death reflection, death anxiety, meaning in life, randomized controlled trial, college students

哀伤记忆特征对大学生丧亲后适应的影响

唐任之慧[1] 谢童[1] 王建平[1]（通讯作者）
1 北京师范大学心理学部，北京，100875
1 北京师范大学心理学部，北京，100875，wjphh@bnu.edu.cn

摘 要 在经历亲人或朋友去世后，丧亲者会出现一系列严重的哀伤反应，通常以对逝者强烈地思念和渴望、沉湎于有关逝者的想法或记忆为核心症状，伴随一系列诸如愤怒、内疚、自责等的强烈情绪痛苦，以及身份紊乱、难以接受死亡、回避提醒物等表现。随着时间流逝，部分丧亲者会逐渐从这种哀伤反应中恢复，但仍有 10%左右的丧亲者会沉溺与哀伤之中，发展为延长哀伤障碍。哀伤的认知行为概念化模型指出，自传体记忆的整合不充分是哀伤症状维持的一个重要因素。既往实证研究也强调了对丧失记忆的暴露疗法在治疗延长哀伤障碍中的重要性。鉴于整合记忆在哀伤中的重要作用，对丧失相关记忆特征的研究具有重要的临床及理论意义。本研究尝试引入牛津哀伤记忆特征问卷，进行中文版修订，探究中国大学生样本群体丧失相关记忆问卷的结构模型，并考察修订后的问卷信度和效度，为本研究及后续研究者提供可靠的测评工具。

Psychometric Characteristics of the Oxford Grief Memory Characteristics Scale and Its Relationship With Symptoms of Prolonged Grief Disorder in Bereaved College Students

Renzhihui Tang, Tong Xie, Jianping Wang
Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract：After the death of relatives or friends, the bereaved will have a series of serious grief reactions, usually with strong yearning and longing for the deceased, indulging in the thoughts or memories of the deceased as the core symptoms, accompanied by a series of strong emotional pain such as anger, guilt, self blame, as well as identity disorder, difficulty accepting death, avoiding reminders and other manifestations. With the passage of time, some bereaved people will gradually recover from this grief reaction, but about 10% of the bereaved people will become addicted to grief and develop into extended grief disorder. Theoretical models of prolonged grief hypothesise that symptoms of grief result from a failure to integrate information about the reality of the loss into the autobiographical memory base. Empirical studies have also highlighted the importance of exposure therapy for memory in the treatment of grief symptoms. In view of the important role of integrated memory in grief, the study of the characteristics of loss related memory has important clinical and theoretical significance. This study attempts to introduce the Oxford grief memory characteristics scale, revise the Chinese version, and investigate the reliability and validity of the revised questionnaire, so as to provide a reliable evaluation tool for future studies.

自我同情对高社交焦虑个体情节式未来思考中记忆偏向的影响

祝珂[1]　李洁[2]

1 江西师范大学心理学院，南昌，330022

2 江西师范大学心理教育中心，南昌，330022，598389101@qq.com

摘　要　先前研究表明社交焦虑个体存在负性记忆偏向，但目前关于社交焦虑个体记忆偏向的研究大多集中在对实验刺激材料的再认偏向和自传体回忆偏向，而对于情节式未来思考中社交焦虑个体的记忆偏向及其影响机制尚不清楚。由于担忧未来是焦虑的核心表现之一，在研究消极未来想法对焦虑的影响时，更深入地考察这些想象的事件是如何随着时间的推移而被留存是有必要的。此外，已有研究发现自我同情可以缓解焦虑相关的情绪障碍，但其具体作用机制还未明晰。采用 2（组别：实验组、控制组）×2（线索组类别：积极、消极）的混合实验设计，以回忆准确性为因变量，检验高社交焦虑个体在情节式未来思考中的记忆偏向及自我同情对这种记忆偏向的影响。共 57 名高社交焦虑被试参与实验，实验组 28 人，控制组 29 人。采用自我同情写作任务对实验组被试进行自我同情的诱导，实验组和控制组被试均完成了状态自我同情和状态焦虑的测量、未来情节模拟任务以及第二天的回忆任务。结果发现：（1）实验组自我同情水平显著高于控制组，状态焦虑程度低于控制组，自我同情操纵有效；（2）实验组在积极线索条件下的回忆准确性显著高于消极线索条件下的回忆准确性，而控制组在消极线索条件下的回忆准确性显著高于积极线索条件下的回忆准确性，且实验组在积极线索组条件下的回忆准确性显著高于控制组。结果表明高社交焦虑个体在情节式未来思考中存在负性记忆偏向，且自我同情写作可以降低状态焦虑水平并消除负性记忆偏向。本研究首次综合多种实验任务揭示自我同情的作用机制和高社交焦虑个体在情节式未来思考中的记忆偏向，对自我同情缓解焦虑症状的起效机制进行了部分的验证，并有助于进一步完善社交焦虑认知模型。

关键词　自我同情，社交焦虑，记忆偏向，情节式未来思考

The Effect of Self-Compassion on Memory Bias in Episodic Future Thinking of Individuals with High Social Anxiety

Zhu ke[1], Li Jie[2]

([1]School of Psychology, Jiangxi Normal University, Nanchang, 330022)

([2]Psychological Education Center of Jiangxi Normal University, Nanchang, 330022)

***Abstract*：** Previous research has demonstrated the existence of negative memory biases in socially anxious individuals, but most of the current research on memory bias in socially anxious individuals has focused on the memory bias for experimental stimulus material and autobiographical memory biases, whereas the memory bias of socially anxious individuals in episodic future thinking and the mechanisms that influence it are not clear. Worrying about the future as one of the core manifestations of anxiety, it is necessary to examine more deeply how these imagined events are retained over time when considering the impact of negative future thoughts on anxiety. Besides, self-compassion has been found to alleviate anxiety-related mood disorders, but the exact mechanism of action is not yet clear. The present study used a 2 (group: experimental, control) × 2 (cue group category: positive, negative) mixed experimental design to examine the recall bias in episodic future thinking and the effect of self-compassion on this recall bias in individuals with high social anxiety, where recall accuracy was the dependent variable. A total of 57 valid high social anxiety subjects were tested, 28 in the experimental group and 29 in the control group. The self-compassion writing task was used to induce self-compassion in the experimental group subjects, and both experimental and control group subjects completed measures of state self-compassion and

state anxiety, a future episode simulation task, and a second day recall task. The results found that (1) the experimental group had significantly higher levels of self-compassion than the control group, lower state anxiety than the control group, and the self-compassion manipulation was effective; (2) the experimental group's recall accuracy in the positive cue condition was significantly higher than the recall accuracy in the negative cue condition, while the control group's recall accuracy in the negative cue condition was significantly higher than the recall accuracy in the positive cue condition, and the experimental group's recall accuracy in the positive cue group condition had significantly higher recall accuracy than the control group. The results suggest that individuals with high social anxiety have a negative recall bias in episodic future thinking, and that self-compassionate writing reduces state anxiety levels and eliminates the negative recall bias. This study is the first to integrate multiple experimental tasks to reveal the mechanism of action of self-compassion and memory bias in episodic future thinking among individuals with high social anxiety, which partially validates the mechanism of action of self-compassion to alleviate anxiety symptoms and contributes to the further refinement of the cognitive model of social anxiety.

Keywords：self-compassion, social anxiety, memory bias, episodic future thinking

青少年创伤后应激障碍与成长的共存模式及社会支持、共情与应对方式的作用

甄宝华[1,2]　姚本先[2]（通讯作者）
1 南京师范大学心理学院，南京，210097
2 安徽师范大学心理学系，芜湖，241000，ybx7756@126.com

摘 要　新冠疫情的爆发和持续可能使个体产生创伤体验，导致人们出现创伤后应激障碍(PTSD)和创伤后成长(PTG)等心理反应。这些积极或消极心理反应性质不同，却能够共存于经历创伤的人群中，对个体的认知和行为功能具有广泛的影响。以往研究多从变量角度探究不同因素对个体 PTSD 和 PTG 的影响，但这种方式忽略了个体存在的异质性，采用个体中心对个体创伤后心理反应进行分析的研究较少。针对这些问题，同时考虑到青少年心理发展的重要性，本研究基于创伤后心理反应的破碎世界假设和情感-认知加工模型，探究青少年 PTSD 和 PTG 共存的潜在类别及社会支持、共情与应对方式的作用。采用问卷方式对湖北省某初中学生进行调查，获得有效问卷 921 份，对数据进行潜在剖面分析，并通过多元 Logistic 回归探索青少年 PTSD 和 PTG 的潜在类别及其影响因素。结果发现，青少年 PTSD 与 PTG 共存模式可以分为成长组(42.5%)，低症状组(20.9%)和压力抗争组(36.6%)三种类型。社会支持、共情、积极应对和消极应对方式可以预测青少年的潜在类别状况。这些结果说明，青少年创伤后心理反应存在成长组、低症状组和压力抗争组三种潜在类别，表明青少年创伤后心理反应具有异质性和稳定性的特点。因此，对青少年创伤后心理反应进行干预时既要重视积极因素的普遍性影响，也要关注个体差异，以更好促进青少年成长。

Analysis of co-existence patterns and influencing factors of posttraumatic stress disorder and growth among adolescents

Zhen Baohua[1,2], Yao Benxian[2] (Corresponding author)
1 School of Psychology, Nanjing Normal University, Nanjing 210097, China
2 Department of Psychology, Anhui Normal University, Wuhu 241000, China

Abstract: Coronavirus disease 2019 (COVID-19) causes individuals to experience trauma, lead to various positive and negative psychological reactions. Posttraumatic stress disorder (PTSD) and post-traumatic growth disorder (PTG) are two of the common psychological reactions. As two posttraumatic outcomes with distinct valence, PTSD and PTG may coexist in people with traumatic experience, and have extensive effects on individuals' cognitive and behavioral functions. Previous studies found that PTSD and PTG were affected by different factors, such as environmental, emotional and behavioral factors. However, most studies explored the effect used the variable-centered analysis, and few studies analyzed posttraumatic psychological reactions from person-center. In order to solve these problems, and considering the importance of adolescent psychological development, based on shattered assumptions and affective-cognitive processing model of post-traumatic psychological reactions, the present study explored the latent patterns of adolescent PTSD and PTG, and the role of social support, empathy and coping styles. A self-report questionnaire was used to investigate the students of a

junior middle school in Hubei Province, and 921 valid questionnaires were obtained. The latent profile analysis was used to explore the latent patterns of PTSD and PTG in adolescents, which were finally identified into three subtypes: growth group (42.5%), low symptoms group (20.9%), stressed and struggled group (36.6%). Multiple logistic regression found that social support, empathy, positive coping and negative coping styles could predict adolescents' latent patterns. These results suggested that there are three latent patterns of adolescent posttraumatic psychological reactions, indicating that adolescent posttraumatic psychological reaction has the characteristics of heterogeneity and stability. Therefore, in the intervention of adolescents' posttraumatic psychological reactions, attention should be paid to both universal influence of positive factors and individual differences, so as to better develop the growth of adolescents.

孤独症诊断知情和行为特征对孤独症儿童污名、道德判断和共情的影响

曾莉婷[1]　苏娃浔[1]　王乾东[2]（通讯作者）

1 北京师范大学心理学部，北京，100875

2 北京师范大学心理学部，北京，100875，wangqd@bnu.edu.cn

摘 要　孤独症是以社交交流障碍和重复刻板行为或局限兴趣为主要特征的神经发育障碍，是一个长期遭受污名（歧视和偏见）的疾病。这种污名使孤独症儿童在学校学习和未来社会就业等方面受到排斥的风险更高，严重影响他们的身心健康。因此，探究孤独症污名的影响因素有利于了解污名的产生机制并进行干预，以改善孤独症儿童的生活环境，促进他们的身心健康的发展。本研究探究孤独症标签化的疾病诊断结果和异常行为对污名的影响。同时，本研究还测量了人们对孤独症儿童的道德判断和共情以全面了解大众对孤独症的认知、情感和行为反应。实验 1 探究诊断知情的影响。60 名被试阅读一名被诊断为孤独症的儿童（未描述孤独症的典型行为特征）的信息和一名正常发育儿童的信息，随后完成对这两名儿童的社会距离、道德评价和共情的问卷调查。实验 2 探究行为特征的影响。60 名被试阅读一名具有孤独症典型行为特征的儿童（未提供孤独症的诊断知情）的信息和一名正常发育儿童的信息，随后完成对这两名儿童的社会距离、道德评价和共情的问卷调查。结果发现，相比于正常发育儿童，被试对被诊断为孤独症（实验 1）或是具有孤独症行为特征（实验 2）的儿童的社会距离更远(社会回避)，即存在污名。然而，当描述儿童做了不道德的事以及受伤时，相比于正常发育儿童，被试对被诊断为孤独症或具有孤独症行为特征的儿童的道德评价更高，并且更共情。进一步对比实验 1 和实验 2 的结果发现与具有孤独症行为特征的儿童相比，被试对被诊断为孤独症的儿童的社会距离更近，认为他们更有道德，并更共情他们。这些结果说明孤独症诊断知情和行为特征均会影响大众对孤独症儿童的污名、道德判断和共情：人们对孤独症儿童“既爱又憎”。虽然孤独症诊断知情和行为特征会让人们对孤独症儿童更共情、更认为有道德，但是更不愿意接近他们。同时，揭露孤独症的诊断可能能降低孤独症的污名。

The Influence of Diagnostic Awareness and Behavioral Characteristics of Autism on Stigma, Moral Judgment, and Empathy in Children with Autism

Zeng Liting [1] Su Waxun [1] Wang Qiandong [2] (corresponding author)
1 Faculty of Psychology, Beijing Normal University, Beijing, 100875
2 Faculty of Psychology, Beijing Normal University, Beijing, 100875, wangqd@bnu.edu.cn

Abstract: Autism is a neurodevelopmental disorder characterized by social communication deficits, repetitive stereotyped behaviors and restricted interests. It is a condition that has long suffered from stigma. This stigma results in a higher risk of exclusion for autistic childrenin school learning and future employment, significantly impacting their physical and mental well-being. Therefore, exploring the factors influencing the stigmatization of autism is beneficial for understanding the mechanisms behind stigma and implementing interventions to improve the living environment and promote the physical and mental health development of autistic children. This study investigated the impact of diagnostic awareness and behavioral characteristics on the stigmatization of autism. Additionally, we measured participants' moral judgments and empathy towards autistic children to gain a comprehensive understanding of the public's cognitive, emotional, and behavioral responses towards autism. Experiment 1 explored the influence of diagnostic awareness. Sixty participants read information about a child diagnosed with autism (without describing typical autistic behavioral features) and about a typically developing child. They then completed questionnaires on social distance, moral evaluation, and empathy towards these two children. Experiment 2 investigated the influence of behavioral characteristics. Sixty participants read information about a child displaying typical autistic behavioral features (without mentioning autism diagnosis) and information about a typically developing child. Similar questionnaires were administered to assess social distance, moral evaluation, and empathy towards both children. The results revealed that compared to typically developing children, participants exhibited greater social distance (i.e., more social avoidance), indicating stigmatization, towards children diagnosed with autism (Experiment 1) or displaying typical autistic behavioral features (Experiment 2). However, when the children's actions were described as immoral or when they were depicted as being injured, participants displayed higher moral evaluations and increased empathy towards children diagnosed with autism or displaying autistic behavioral characteristics compared to typically developing children. Furthermore, comparisons between Experiment 1 and Experiment 2 revealed that participants showed less social distance towards children diagnosed with autism, perceived them as more moral, and exhibited higher empath, compared to children displaying autistic behavioral features. These findings indicate that both diagnostic awareness and behavioral characteristics of autism influence public stigmatization, moral judgments, and empathy towards autistic children, leading to ambivalent attitudes of both affection and aversion. Although diagnostic awareness and autistic behavioral characteristics may enhance empathy and moral evaluation towards autistic children, people are still reluctant to approach them. Nonetheless, disclosing autism diagnosis could potentially reduce the stigma associated with the condition.

长期在线学习对中学生焦虑、抑郁和网络成瘾的影响：来自一项交叉面板网络分析方法的启示

陶言强[1] 王书剑[1] 马紫娟[2] 张亮[3] 刘翔平[1]（通讯作者）

1 北京师范大学心理学部，北京，100875

2 华南师范大学心理学院，广州，510631

3 东北农业大学心理健康中心，哈尔滨，150030

通讯作者 E-mail：89034@bnu.edu.cn

摘 要 **目的：**在过去的研究中，主要运用以变量为中心的方法，如潜变量模型，探索了中学生焦虑、抑郁和网络成瘾之间的关系。然而，长期的 COVID-19 大流行使得这三种心理障碍之间的相互关系变得更加严重，并且缺乏症状视角的相关研究。因此，本研究采用网络分析方法，评估了这些障碍症状的潜在动态变化。

方法：在跨度为四个月的时间，累计有 2,356 名中国中学生参与了调查，完成了广泛焦虑障碍量表、患者健康问卷和网络成瘾测试。本研究主要采取横断面的症状网络（CSSN）和交叉滞后面板网络（CLPN）分析。

结果：通过比较两个不同时期的 CSSN，确定了“无法控制的担忧”、“离线时情绪低落/易怒”和“工作表现或生产力下降”这几个症状具备最有影响力的中心症状且在时间上保持一致。此外，CLPN 的结果显示，“烦恼时容易发脾气或表现出厌烦”这个症状表现出最强的内部中心性，即被网络中其他症状预测最强的症状。同时，“无欢乐感”（抑郁症状）和“易怒”（焦虑症状）表现出对网络中其他症状具有最高的外部中心性，即触发症状。

结论：针对中心症状进行适当的干预可能有助于预防或减少焦虑、抑郁和网络成瘾的风险。本研究结果提供了指导制定相关干预措施的重要线索，例如针对无法控制的担忧、离线时情绪低落/易怒和工作表现或生产力下降的干预措施。此外，了解烦恼时容易发脾气或表现出厌烦的症状与网络成瘾之间的关联，也有助于制定干预策略，以减少网络成瘾的风险。

[3] College Students' Mental Health Education Center, Northeast Agricultural University, Harbin, 150030, China

***Abstract*: Objectives:** Previous research has examined the relationship between anxiety, depression, and Internet addiction (IA) using variable-centered approaches among secondary school students. However, the ongoing COVID-19 pandemic is exacerbating the relationship between the three mental disorders. Therefore, the present study assessed the underlying dynamic changes in the symptoms of these disorders using a network analysis approach.

Methods: A total of 2,356 Chinese secondary school students were followed for four months at baseline by completing the Generalized Anxiety Disorder Scale, Patient Health Questionnaire, and Internet Addiction Test surveys. Cross-sectional symptom network (CSSN) and cross-lagged panel network (CLPN) analyses were used for statistical analysis.

Results: Two comorbidity CSSNs were compared, and the symptoms "uncontrollable worry", "depressed/moody/nervous being offline", and "work performance or productivity suffer" were identified as influential central symptoms and consistent over time. In addition, the CLPN revealed that the symptom "snap or act annoyed when bothered" was the highest "in" expected influence IA symptom predicted by other symptoms, and "anhedonia" (i.e., a depression symptom) and "'irritability" (i.e., an anxiety symptom) had the highest "out" expected influence.

Conclusions: Appropriate interventions targeting core symptoms may potentially prevent or reduce the risk of anxiety, depression, and IA.

通讯作者 E-mail：89034@bnu.edu.cn

摘 要 **背景：**现有的关于智能手机的问题使用（PSU）和攻击性之间关系的文献主要集中在研究它们的单向关系，对于这种关系的双向性质，尤其是考虑共情的作用，关注较少。本研究采用一种新颖的调节网络方法，研究智能手机的问题使用和攻击性之间的双向关系，并探讨共情在其中的的调节作用机制。

方法：本研究共有来自中国哈尔滨市 35 所初高中的 2,469 名学生参与，其中女性占 49.1%，平均年龄为 13.83 岁，年龄标准差为 1.48。使用基本共情量表、巴斯-沃伦攻击问卷和手机成瘾指数评估共情水平、攻击性和智能手机的问题使用症状。

结果：分析结果显示智能手机的问题使用和攻击性之间的关系是复杂且双向的。无论是认知共情网络，还是情感共情网络，本研究揭示最强关联的症状对为在“敌意”和“回避/逃避”。此外，“愤怒”在情感和认知调节网络模型中的中心性（EI）最高。研究还发现了在不同水平的情感共情下，“效率下降”和“身体攻击”的可调节的条件效应。具体来说，在较低水平的情感共情下，“效率下降”和“身体攻击”之间存在正向的双向关系。然而，在较高水平的情感共情下，这种关系变为负向且双向。

结论：这些研究结果有助于更全面地理解智能手机的问题使用和攻击性之间的复杂动态，并强调有必要针对性地推进情感共情，以减轻过度手机使用带来的负面后果，并需要针对性的干预措施。

Effects of empathy on the bidirectional relationships between problematic smartphone use and aggression among secondary school students: A moderated network approach

Yanqiang Tao [1], Xinyuan Zou [1], Qihui Tang [1], Shujian Wang [1], Zijuan Ma [2], Liang Zhang [3], Gang Liu [4], Xiangping Liu [1*]

[1] Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

[2] School of Psychology, South China Normal University, Guangzhou, 510631, China

[3] College Students' Mental Health Education Center, Northeast Agricultural University, Harbin 150030, China

[4] Department of Psychiatry, Affiliated Nanjing Brain Hospital, Nanjing Medical University, Nanjing, 210029, China

***Abstract*: Background:** Existing literature on the relationship between problematic smartphone use (PSU) and aggression has primarily focused on examining their unidirectional association, with limited attention paid to the bidirectional nature of this relationship, particularly when considering the role of empathy. This study employs a novel moderated network approach to examine the bidirectional relationship between problematic smartphone use and aggression, while also investigating the moderating mechanism of empathy.

Methods: A total of 2,469 students (49.1% female, Mean age = 13.83, SD age = 1.48) from 35 junior and senior high schools in Harbin, China, participated in this study. Empathy level, aggressiveness, and PSU symptoms were assessed using the Basic Empathy Scale, the Buss-Warren Aggression Questionnaire, and the Mobile Phone Addiction Index.

Results: Analysis revealed that the relationship between PSU and aggression was complex and bidirectional. The strongest association was observed between "hostility" and "withdrawal/escape". In addition, "anger" had the highest ExpectedInfluence (EI) in both affective and cognitive moderate network models. An important discovery was also made regarding the conditional effect of "productive loss" and "physical aggression" across different levels of affective empathy. Specifically, at lower levels of affective empathy, a positive bidirectional relationship was found between "productive loss" and "physical aggression". However, this relationship turned negative and bidirectional at higher levels of affective empathy.

Conclusions: The findings contribute to a more comprehensive understanding of the complex dynamics between PSU and aggression and highlight the need for targeted interventions that promote affective empathy to mitigate the negative consequences of excessive smartphone use.

长期在线学习对抑郁中学生网络成瘾症状的影响：一项交叉滞后网络分析

陶言强[1] 邹欣原[1] 唐绮惠[1] 刘翔平[1] 张亮[2]（通讯作者）

1 北京师范大学心理学部，北京，100875

2 东北农业大学心理健康中心，哈尔滨，150030

通讯作者 E-mail：zhangliangpsy@neau.edu.cn

摘 要 **背景：**COVID-19 的肆虐以及受此影响而采取的在线学习课堂，增加了青少年网络成瘾的风险，尤其是那些有抑郁倾向的的青少年群体。本研究旨在使用交叉滞后面板网络分析方法，寻找具备抑郁倾向的青少年群体中网络成瘾的核心症状，以及网络成瘾症状的动态轨迹变化。为了解网络成瘾症状之间的相互关联提供新的视角。

方法：最初有 2,415 名学生参与了研究，但经过匹配后，仅有 342 名学生（14.16%的抑郁发病率）具备抑郁倾向，因此用于最终数据分析。所有的参与者均完成了网络成瘾测试和患者健康问卷。采用交叉滞后面板网络分析方法，考察了网络成瘾症状随时间的自回归和交叉滞后的轨迹。

结果：在网络成瘾的网络结构中，“预期”症状表现出最高的外在影响力，其次是“在线时间延长”和“工作(学习)表现或生产力受损”。在抑郁症状网络结构中，“工作（学习）表现或生产力受损”具有最高的内在影响力，其次是“生活乏味空虚”，“发脾气或感到烦躁”，“在做事之前检查电子邮件/社交网络”，以及“学校成绩受损”。最后，研究发现，在第 1 波和第 2 波之间的全局网络强度和网络结构没有显著的差异。

结论：这些研究结果对于制定更有效的干预措施和政策，以减轻患有抑郁症的青少年在在线学习中的网络成瘾水平具有重要意义。

The Influence of Prolonged Online Learning on Internet Addiction Symptoms in Depressed Secondary School Students: A Cross-Lagged Panel Network Study

Yanqiang Tao [1], Xinyuan Zou [1], Qihui Tang [1], Xiangping Liu [1], Liang Zhang [2*]

[1] Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

[2] College Students' Mental Health Education Center, Northeast Agricultural University, Harbin 150030, China

Abstract **: Background:** The COVID-19 pandemic and the shift to online learning have increased the risk of Internet addiction (IA) among adolescents, particularly those with depression. This study aims to identify the core symptoms of IA among depressed adolescents using a cross-lagged panel network framework, which offers a novel perspective on understanding the interconnectedness of IA symptoms.

Methods: Initially 2,415 students were recruited, but after matching only 342 students (14.16% depression incidence rate) were retained for final data analysis. Participants completed the Internet Addiction Test and the Patient Health Questionnaire-9. A cross-lagged panel network analysis was conducted to examine the autoregressive and cross-lagged trajectories of IA symptoms over time.

Results: Within the IA network, the symptom "Anticipation" showed the highest unexpected influence, followed by "Staying online longer" and "Work performance or productivity suffers". For the depression symptom network, "Work performance or productivity suffer" had the highest unexpected influence, followed by "Life boring and empty", "Snap or act annoyed when bothered", "Check email/SNS before doing things" and "School grades suffer". No significant differences in global network strength and network structure were found between Wave 1 and Wave 2.

Conclusions: These findings have important implications for the development of more effective interventions and strategies to mitigate IA in depressed adolescents engaged in online learning.

3 华南师范大学心理学院，广州，510631

通讯作者 E-mail：psyxuele2020@163.com

摘 要 **目标：**研究表明焦虑、抑郁和问题行为之间可能存在双向关系。但是，关于抑郁、焦虑和问题行为之间关系的研究还很有限。同时，探讨这种关系中的性别差异的研究几乎没有。本研究旨在通过网络方法检验中国学龄儿童焦虑、抑郁和问题行为之间的复杂关系，并探索网络结构是否存在性别上的差异。

方法：本研究采用中科院心理所的“农村儿童心理健康数据库”，共有 1,601 名学生参与（平均年龄=11.22 岁，标准差=1.32 岁），分为女孩组（N=846）和男孩组（N=755）。抑郁、焦虑和问题行为的水平分别通过儿童抑郁量表、广泛性焦虑障碍量表和儿童行为检查表进行评估。本研究主要采用症状网络方法来实现研究目的。

结果：在抑郁和焦虑网络中，“无欢愉感”和“感觉不被爱”被确定为最具影响力的症状。同时，在所有农村学龄儿童中，“学业表现下降”和“缺乏友谊”之间存在最强的边的联系。此外，在农村女孩中，“自尊心低”和“感到害怕”是沟通抑郁和焦虑网络的关键侨联症状，而在农村男孩中，“无法控制的担忧”和“过度担忧”则是沟通抑郁和焦虑网络的关键侨联症状。此外，问题行为与农村女孩的“缺乏友谊”症状和农村男孩的“学业表现下降”症状具备最强的直接关联。

结论：本研究深化了我们对农村学龄儿童抑郁、焦虑和问题行为之间关系的理解，并揭示了其中的性别差异。

The interrelationship of symptoms between anxiety and depression and its association with problem behaviors in Chinese rural school-aged children: A network analysis

Jie Gui [1] Qihui Tang [2] Xinyuan Zou [2] Zijuan Ma [3] Yanqiang Tao [2]

[1] Faculty of Architectural Decoration and Art, Jiangsu Vocational College of Electronics and Information, Huaian, 223003, China

[2] Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

[3] School of Psychology, South China Normal University, Guangzhou, 510631, China

***Abstract*：Objectives:** Studies revealed the relationship between anxiety, depression, and problem behaviors (PBs) may be bidirectional. But studies on the relationship between depression, anxiety, and PBs are limited. Meanwhile, studies exploring gender differences in the relationship are even more scarce. This study aimed to examine the complex relationship between anxiety, depression, and PBs among children and explore the gender differences in this relationship through a network approach.

Methods: The current study, conducted on the Database on Rural Children's Mental Health, included 1,601 students ($Mean_{age}$ = 11.22, SD_{age} = 1.32) divided into girl (N = 846) and boy (N = 755) groups. The levels of depression, anxiety, and PBs were accessed by the Children's Depression Inventory, Generalized Anxiety Disorder Scale, and Child Behavior Checklist separately. The symptom network approach and the flow network approach were used.

Results: "Anhedonia" and "feeling unloved" were identified as the most influential symptoms in the network of depression and anxiety. Meanwhile, the strongest edges existed between "school performance decrement" and "lack of friendship" among all rural school-aged children. Moreover, "low self-esteem" and "feeling afraid" served as the bridge symptoms among rural girls, while "uncontrollable worry" and "excessive worry" were the bridge symptoms among rural boys. Furthermore, in the flow network, PBs shared the strongest connection to "lack of friendship" among rural girls and "school performance decrement" among rural boys.

Conclusion: The study deepened our understanding of the relationship between depression, anxiety, and PBs among rural school-aged children and disclosed the gender difference in it.

抑郁症情绪失调的动态特征：情绪动力学的视角

吴朝毅[1]　王振[1](通讯作者)

1 上海交通大学医学院附属精神卫生中心，上海，200030，Email：wangzhen@smhc.org.cn

摘 要　抑郁症在 DSM-5 中界定的核心特征是持久的情绪紊乱，如过度悲伤和急剧减少的愉悦情绪体验。过去的研究主要基于人格的特质模型，将情绪视为反映个体情绪体验整体水平的特质，从静态的、特质性的整体情绪强度出发探索抑郁症情绪失调的特征。然而，现实生活中，情绪是由社交互动、个体评估过程和外界环境等多种因素共同影响的动态过程。情绪动力学将情绪的时间维度和波动性视为情绪的本质特征，该理论强调：抑郁症临床人群的情绪失调不局限于高消极情绪平均强度和低积极情绪平均强度，还表现为异常的情绪动态模式。本综述系统地纳入 18 篇采用生态瞬时评估探究日常生活中抑郁症临床人群的情绪动态特征的文献，结果表明：(1) 相比于健康对照组，抑郁症患者消极情绪波动幅度更大，表现为更大的消极情绪变异性和消极情绪不稳定性。(2) 抑郁症患者的情绪系统僵化且缺乏灵活性，表现为更大的消极情绪惯性和更密集的情绪网络。(3) 抑郁症患者情绪反应性存在异常，表现为经历积极事件后的心境点亮效应，经历消极事件后更大的消极情绪反应性。(4) 患者情绪系统的复杂度下降，表现为更低的情绪分化水平。(5) 处于抑郁症缓解期的个体也表现出一定程度的情绪失调。本综述首次从情绪动力学的视角总结了抑郁症情绪失调的特征。研究结果进一步佐证了复杂动态系统理论和网络理论等精神障碍的动态模型，并且有助于为抑郁症的个体化医疗和复发预防提供潜在的、具有高生态效度的干预靶点。

The Dynamic Features of Emotion Dysregulation in Major Depressive Disorder：An Emotion Dynamics Perspective

WU Chaoyi[1] WANG Zhen[1]

1 Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, 200030, China

***Abstract*：** The core feature of major depressive disorder, as defined in the DSM-5, is persistent mood disturbances such as excessive sadness and drastically reduced pleasant emotional experiences. Previous studies have mainly relied on the trait model of personality, which regards emotion as trait that reflects an individual's overall level of emotional experience. These studies explore the characteristics of depressive emotional disorder by examining the static and trait-related aspects of overall emotional intensity. However, in real life, emotion is a dynamic process influenced by social interaction, individual evaluation processes and external environment. Emotion dynamics considers the temporal dimension and volatility as the essential characteristics of emotions. Research on emotion dynamics has emphasized that the emotion dysregulation in major depressive disorder is not limited to the high average intensity of negative emotion and low average intensity of positive emotion. It is also manifested as abnormal patterns of emotion dynamics. This review systematically included 18 literatures using ecological momentary assessment to explore everyday emotion dynamics in major depression. The results showed that patients with current depression had greater negative mood fluctuations compared with the healthy control group. These fluctuations were manifested as greater negative emotion variability and negative emotion instability. Additionally, depressed patients exhibit a rigid and inflexible emotional system, which is characterized by greater negative emotion inertia and denser emotion networks. Moreover, there are abnormalities in the emotion reactivity of depressed patients. This is manifested as the mood brightening effect after positive events and greater negative emotion reactivity after negative events. Furthermore, the complexity of the patient's emotional system decreases, manifested as a lower level of emotion differentiation. Finally, Patients with remitted depression also exhibit some degree of mood dysregulation. This review is the first to elucidate the main features of emotion dysregulation in major depressive disorder viewed from emotion dynamics. The results enhance support for dynamic models of mental disorders such as complex dynamical system theory and network theory, and provide potential intervention targets with high ecological validity for individualized treatment and relapse prevention of depression.

摘 要 【目的】高中生的身体、心理和社会角色都在发生重大变化，他们需要面对许多新的挑战和适应不同的环境。尤其是学业压力、家庭关系、社交困难等。既往研究表明，高中生心理健康存在性别差异，但大多数仅关注水平高低，忽视了心理健康的内部结构的关联。心理健康的内部结构多元复杂，仅仅关注水平高低无法全面了解心理健康问题的本质。网络分析方法可以从“共病网络”角度出发，解释各个症状、各类心理障碍之间相互影响、相互作用的机制。因此，本研究旨在探讨高中生心理健康网络结构及其性别差异。【方法】研究采用了 MHSMSS（Middle School Students Mental Health Scale）量表作为测量工具，对 3769 名高中生（包括 1563 名女性）进行问卷调查和数据分析。【结果】方差分析显示了高中生在强迫症状、偏执、敌意、人际敏感性、抑郁、焦虑、学业压力和情绪不稳定方面存在着性别差异（F＞4.493，P＜0.05）；网络分析结果表明高中生心理健康问题共存于同一个心理病理网络中（Sparsity=0.13）；中心性结果表明男生的核心症状是抑郁（Expected influence=1.189），女生的核心症状是焦虑（Expected influence=1.472）。【结论】高中生心理健康网络存在性别差异。上述发现有助于我们更好地理解高中生心理健康网络的性别差异，并为高中生心理社会服务提供基于性别视角的针对性参考。

3 The University of Sheffield

Abstract **：** During adolescence, high school students experience significant changes in their physical, psychological, and social roles, which expose them to various challenges and the need to adapt to different environments. This study aims to investigate the gender differences in the network structure of psychological health among high school students, using the MHSMSS (Middle School Students Mental Health Scale) as a measurement tool. The study surveyed and analyzed data from 3769 high school students, including 1563 females. The findings reveal significant gender differences in symptoms such as obsessive-compulsive tendencies, paranoia, hostility, interpersonal sensitivity, depression, anxiety, academic stress, and emotional instability ($F > 4.493$, $P < 0.05$). Network analysis demonstrates that psychological health issues coexist within the same psychopathological network among high school students (Sparsity = 0.13). Centrality analysis indicates that depression is the core

symptom for males (Expected influence = 1.189), while anxiety is the core symptom for females (Expected influence = 1.472). These findings enhance our understanding of gender differences in the psychological health network of high school students and provide targeted insights from a gender perspective for psychological and social services in high schools.

[3]南京医科大学附属南京脑科医院精神科，南京，210029

通讯作者 E-mail：lxp599@163.com

摘 要 **目的：**童年创伤会严重影响个人发展，甚至引起创伤后应激障碍、抑郁、焦虑等多种精神疾病。但目前基于症状学视角研究童年创伤和精神疾病间的研究还很有限，本研究旨在比较遭受童年创伤和未遭受童年创伤的青年的焦虑、压力和抑郁症状特点。

方法:本研究使用童年创伤问卷(CTQ)和抑郁、焦虑和压力量表(DASS-21)对 4469 名在校大学生的童年创伤，焦虑、抑郁和压力进行了测量。根据参与者在童年创伤问卷中的得分，按照童年创伤各维度的最低阈值（即情感忽视≥15、情感虐待≥13、身体忽视≥10、身体虐待≥10 和性虐待≥8），将其分为创伤组(3427 人)和对照组(1042 人)。采用症状网络分析法进行分析，对比两组症状网络是否存在差异。

结果:经受过童年创伤的大学生在 DASS-21 各项目上的得分均显著高于未经受过童年创伤的学生。虽然经受过童年创伤与未经受过童年创伤大学生的症状网络整体强度之间无显著差异（$S = 0.08, p = 0.085$），但两组的网络结构之间存在显著差异($M = 0.25, p = 0.000$)，具体表现为“颤抖”-“消耗精力”，“消沉”-“易激惹”，“易激惹”-“敏感”，“敏感”-“恐惧”这几对症状间的关联性在两组间存在显著差异。值得注意的是，在经受过童年创伤的大学生的症状网络中，“不积极”、“不主动”、“不期待”、“消沉”这四个抑郁症状是沟通其抑郁-焦虑-压力症状网络的关键侨联症状。不同的是，在没经受过童年创伤经历的大学生症状网络中，“过度反应”、“颤抖”、“消耗精力”和“心律不齐”，这四个涉及焦虑和压力属性的关键症状则是沟通抑郁-焦虑-压力症状网络的关键侨联症状。

结论:目前的研究表明，经历过童年创伤的大学生的焦虑、抑郁和压力症状显著区别于未经历过童年创伤的大学生的焦虑、压力和抑郁症状。经历过童年创伤的大学生的症状特点表明，以改善情绪状态和重建生活意义为目标的干预措施可能能够有效缓解其抑郁、焦虑和压力。

Comparison symptoms of anxiety, depression, and stress between adolescents with and without childhood trauma—Evidence from a network analysis

Xinyuan Zou [1] Yanqiang Tao [1] Jie Gui [2] Qihui Tang [1] Gang Liu [3] XiangPing Liu [1]

[1] Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

[2] Faculty of Architectural Decoration and Art, Jiangsu Vocational College of Electronics and Information, Huaian, 223003, China

[3] Department of Psychiatry, Affiliated Nanjing Brain Hospital, Nanjing Medical University, Nanjing, 210029, China

***Abstract*：** **Objectives:** Childhood trauma can leave lasting influence on individuals and contribute to mental disorders, including post-traumatic stress disorder, depression, anxiety. The current study aimed to compare the symptomatic characteristic of depression, anxiety, and stress between adolescents with and without childhood-trauma.

Methods: In order to assess the depression, anxiety, stress, and childhood trauma of college students, total of 4469 college students (2,570 males and 1,899 females) in China complete the Childhood Trauma Questionnaire (CTQ) and the Depression, Anxiety, and Stress Scales (DASS-21). The participates were divided into trauma group (N=3427, $Mean_{age}$ = 19.70, SD_{age} = 1.42) and control group (N=1042, $Mean_{age}$ = 19.80, SD_{age} = 1.20) based on their score on CTQ and the cut-off scores for each type of abuse or neglect (a score of ≥8 was used to classify sexual abuse, a score of ≥8 for physical abuse, a score of ≥10 for emotional abuse, a score of ≥10 for physical neglect, and a score of ≥15 for emotional neglect). The symptom network analysis was employed.

Results: Students with childhood trauma scored significantly higher on all DASS-21 items than students without childhood trauma. No significant difference was found in the global strength between the network of students with and without childhood trauma (S = 0.08, p = 0.085), but the network structures of the two groups differ significantly (M = 0.25, p = 0.000). Specifically, the difference between two groups existed in the edge weights of Trembling (DASS7) - Nervous energy (DASS8), Down-hearted (DASS13) - Intolerant (DASS15), Intolerant (DASS15) - Touchy (DASS18), and Touchy (DASS18) - Scared (DASS20). Notably, among students with childhood trauma, four depression-related symptoms, namely No positive (DASS3), No initiative (DASS5), No look forward (DASS10), and Down-hearted (DASS13) served as the bridge symptoms connecting depression, anxiety, and stress, whereas two stress-related symptoms, namely Over-react (DASS6) and Trembling (DASS7), and two anxiety-related symptoms, namely Nervous energy (DASS8) and Heart aware (DASS19), were identified as the bridge symptoms among students without childhood trauma.

Conclusion: The current study suggested that the symptomatic characteristic of depression, anxiety, and stress was unique among college students with childhood trauma. Indeed, interventions targeted on improving mood state and re-constructing the meaning of life may be efficient in alleviating the depression, anxiety, and stress among college students with childhood trauma.

青少年自尊依存性的异质性及其与抑郁、社交焦虑状况的关系

梁芃伟[1] 张航[1] 张蕊[1] 边玉芳[1,2]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

2 北京师范大学儿童家庭教育研究中心，北京，100875，bianyufang66@163.com

摘 要 **目的：**青春期早期是个体自我意识和自尊发展的重要时期。自尊依存性是个体将其自尊依存于生活事件、并在发生积极或消极事件时，其自尊相应上升或下降的一种特质。高自尊依存性的青少年被证明存在更高水平的抑郁和焦虑。然而，将自尊依存性作为一个单向的概念整体分析，可能掩盖了将自尊依存于积极事件或消极事件可能给个体带来的不同影响。本研究采用潜在剖面分析区分青少年的自尊依存性的不亚类型，并考察人口学因素对不同亚类型的影响，以及不同自尊依存性亚类型青少年的抑郁和社交焦虑水平的差异。**方法：**采用青少年自尊依存性量表、Kutcher 青少年抑郁量表和青少年社交焦虑量表，对云南省某中学 844 名初中学生进行调查。**结果：**（1）根据青少年在积极和消极事件中自尊依存性的不同可以区分出三种模式：低依存组（42.9%），在积极和消极事件都具有普遍低水平的自尊依存性；高依存组（41.1%），在积极和消极事件都具有高水平的自尊依存性；积极依存组（16.1%），其特征为仅对积极事件表现出较高水平的自尊依存性，而对消极事件则表现出较低水平的自尊依存性。（2）多元逻辑回归分析表明，较高的家庭社会经济地位的青少年更有可能归属于积极依存组；男性相较于女性更有可能归属于积极依存组。（3）不同自尊依存性亚类型青少年抑郁(F=36.47, p<.001)以及社交焦虑水平(F=101.18, p<.001)存在显著差异：积极依存组的抑郁(M=2.40)与社交焦虑(M=32.77)水平均低于高依存组($M_{抑郁}$=7.38, $M_{社交焦虑}$=49.47)(p<.001)和低依存组($M_{抑郁}$=6.60, $M_{社交焦虑}$=40.47)(p<.001)，低依存组的社交焦虑水平低于高依存组(p<.001)，高、低依存组在抑郁水平之间无显著差异(p=.076)。**结论：**本研究验证了青少年自尊依存性存在异质性，发现了积极依存组这一较为特殊的亚类型。该类型青少年能够更倾向于关注积极经历，从而帮助他们保持较低水平的抑郁与社交焦虑状况。这提示在学校和家庭教育中需要关注高依存性个体的心理健康状况，培养向上依存性性自尊，从而减少焦虑抑郁风险，也提示研究者需要进一步关注自尊依存性这一青少年心理健康状况的发展与异质性。

Heterogeneity in Adolescent Self-Esteem Contingency and Its Relationship with Depression and Social Anxiety

Liang Pengwei[1], Zhang Hang[1], Zhang Rui[1], Bian Yufang[1,2](corresponding author)

1 Collaborative Innovation Center of Assessment toward Basic Education Quality at Beijing Normal University, Beijing

2 Child and Family Education Research Center at Beijing Normal University, Beijing

***Abstract*：Objective:** Early adolescence is a crucial period in the development of self-awareness and self-esteem. Self-esteem contingency refers to the trait in which an individual's self-esteem is reliant on life events, and correspondingly increases or decreases with positive or negative experiences. Adolescents with high self-esteem contingency are found to exhibit higher levels of depression and anxiety. However, treating self-esteem contingency as a unidimensional construct may mask the varying impacts deriving from contingencies based on

positive or negative events. This study uses latent profile analysis to differentiate subtypes of self-esteem contingency among adolescents and investigates the effects of demographic factors on these subtypes, as well as the variations in depression and social anxiety levels among adolescents with different self-esteem contingency subtypes. **Method:** Using the Adolescent Self-Esteem Contingency Scale, Kutcher Adolescent Depression Scale, and Adolescent Social Anxiety Scale, a survey was conducted on 844 middle school students in a school in Yunnan Province. **Results:** (1) Adolescents can be divided into three groups based on their self-esteem contingencies in positive and negative events: low contingency group (42.9%) with universally low levels of self-esteem contingency in both positive and negative events; high contingency group (41.1%) displaying high levels of self-esteem contingency in both types of events; positive contingency group (16.1%) characterized by higher levels of self-esteem contingency in positive events and lower in negative ones. (2) Multivariate logistic regression analysis indicated that adolescents from higher socioeconomic status families and males are more likely to belong to the positive contingency group. (3) There are significant differences in depression (F=36.47, p<.001) and social anxiety (F=101.18, p<.001) levels among adolescents with different self-esteem contingencies: the depression (M=2.40) and social anxiety (M=32.77) levels of the Upward Contingency Group are lower than those of the High Contingency Group ($M_{\text{depression}}$=7.38, $M_{\text{social anxiety}}$=49.47) (p<.001) and Low Contingency Group ($M_{\text{depression}}$=6.60, $M_{\text{social anxiety}}$=40.47) ($p$<.001), the social anxiety level of the Low Contingency Group is lower than that of the High Contingency Group (p<.001), there is no significant difference in depression levels between the High and Low Contingency Groups (p=.076). **Conclusion:** This study confirms the heterogeneity of adolescent self-esteem contingency and discovers the relatively special subtype of Upward Contingency Group. Adolescents of this type are more inclined to focus on positive experiences, thus helping them maintain lower levels of depression and social anxiety. This also suggests the need to pay attention to the mental health status of high contingency individuals in school and family education, to foster upward contingent self-esteem, thereby reducing the risk of anxiety and depression, and also suggests that researchers need to further pay attention to the development and heterogeneity of adolescent self-esteem contingency.

相似经历对共情选择的影响：未完成事件的调节作用

谭凤娥　朱旭（通讯作者）

华中师范大学心理学院，武汉，430079，通讯作者 E-mail：xzhu@ccnu.edu.cn

摘 要　研究者们对相似经历如何影响共情的观点相互矛盾，本研究将从未完成事件角度细化相似经历的类型，以共情选择（在备选任务中选择共情的次数）作为共情的指标。研究一旨在引进和修订 Singh 的未完成事件量表(Unfinished Business Resolution Scale, UFB-RS)。选取华中地区在校大学生进行施测，收集有效样本 1（n=843）和样本 2（n=251）；采用 SCL-90 的人际敏感和敌对两维度、接纳与行动问卷第二版(AAQ-II)和愤怒反刍量表(ARS）作为效标工具；2 周后对样本 2 中的 60 人进行重测。结果显示：（1）修订后中文版未完成事件量表包含 11 个条目和 2 个因子（感受和需要、共情接纳），解释总变异的 57.29%，验证性因素分析表明 2 因子模型拟合良好（$\chi 2/df$=2.92, *CFI*=0.93, *TLI*=0.91, *SRMR*=0.05, *RMSEA*=0.08）；（2）未完成事件量表得分与各效标量表均为显著负相关（*r*=-0.30～-0.13）；（3）量表总分及各维度的内部一致性信度为 0.68~0.88，重测信度为 0.63~0.75。因此，中文版未完成事件量表信效度良好，可用于相关测量。研究二选取有失恋经历的在校大学生 154 名，以有效反应失恋经历的人物图片为实验材料，用中文版未完成事件量表进行测量，采用共情选择任务范式(被试在共情任务和描述任务中二选一)，从未完成事件角度探究不同类型相似经历在共情选择和认知成本上的差异，进一步采用拟合两水平广义线性模型检验认知成本各成分对共情选择的预测作用。结果发现：（1）有相似经历的两组共情选择比例显著高于无相似经历组，其中未完成组共情选择比例显著高于随机概率(0.5)；（2）未完成组共情效能感和厌恶感都最高，已完成组次之，无相似经历组最低；（3）与描述任务相比，共情任务效能感更低，厌恶感和心理努力更高；（4）试次显著负向预测共情选择，共情效能感显著正向预测共情选择。说明相似经历能够通过降低共情认知成本来增加共情选择，未完成组尤其显著。这是因为未完成组关于失恋经历的情绪记忆更易被激活，对这种情景也更熟悉。本研究从未完成事件的角度划分相似经历类型，为以往研究矛盾发现提供了解释，为寻求更有效共情者提供了实践指导。

The impact of similar experiences on empathy choice and accuracy: the moderating effect of unfinished business

Tan Fenge　Zhu Xu(corresponding author)

School of Psychology, Central China Normal University, Wu Han, 430079,

Correspondence: xzhu@ccnu.edu.cn

Abstract：Researchers have conflicting views on how similar experiences affect empathy. This study will refine the types of similar experiences from the perspective of unfinished business, using empathy choice (the number of times empathy is selected in alternative tasks) as an indicator of empathy. The first study aims to introduce and revise Singh's Unfinished Business Resolution Scale (UFB-RS). College students in Central China were selected to conduct the survey, and valid sample 1 (n=843) and sample 2 (n=251) were collected; Using the interpersonal sensitivity and hostility dimensions of SCL-90, the Acceptance and Questionnaire II (AAQ-II) , and the and Anger Rumination Scales (ARS) as tools for criterion related validity; After 2 weeks, retest 60 people in sample 2. The results showed that: (1) The revised Chinese version of the unfinished business resolution scale　contained 11 items and 2 factors (feelings and needs, empathic acceptance), accounting for 57.29% of the total variance. Confirmatory factor analysis showed that the 2-factor model fitted well(χ^2/df=2.92, *CFI*=0.93, *TLI*=0.91, *SRMR*=0.05, *RMSEA*=0.08). (2) The scale and its factors scores were significantly negatively correlated with the scores of various criteria-related validity instruments (*r*=-0.30~-0.13). (3) The Cronbach's α coefficient of the total scale and its various dimensions was 0.68~0.88. Re-test reliability was 0.63~0.75. Therefore, the Chinese version

of the unfinished business resolution scale has good reliability and validity, and can be used for relevant measurements. Study 2 selected 154 college students who had experienced heartbreak and used images of characters that effectively reflected their experiences as experimental materials. The Chinese version of the unfinished business resolution scale was used for measurement, and the empathetic selection task paradigm (participants chose between empathetic and descriptive tasks) was used to explore the differences in empathy choice and cognitive costs among participants with different types of similar experiences from the perspective of unfinished business. Furthermore, a two-level Generalized linear model was used to test the predictive effect of cognitive cost components on empathy choice. The results showed that: (1) the proportion of empathy choice in the two groups with similar experiences was significantly higher than that in the group without similar experiences, with the proportion of empathy choice in the unfinished group being significantly higher than the random probability (0.5). (2) The unfinished group had the highest sense of empathy and disgust, followed by the finished group, and the group without similar experiences had the lowest. (3) Compared with descriptive tasks, empathy tasks had lower efficacy, higher aversion, and higher psychological effort. (4) The number of trials in the experiment significantly negatively predicted empathy choice, while empathy efficacy significantly positively predicted empathy choices Similar experiences can increase empathy choice by reducing the cost of empathy cognition, especially in the unfinished group. This is because the unfinished group is more likely to activate their emotional memory about their breakup experiences and are more familiar with this situation. This study categorizes similar types of experiences from the perspective of unfinished business, providing an explanation for conflicting findings in previous studies and practical guidance for seeking more effective empathy.

Revision and reliability and validity of Chinese version of Unfinished Business Resolution Scale (UFB-RS) in College Students

Tan Fenge　Zhu Xu(corresponding author)

School of Psychology, Central China Normal University, Wu Han, 430079,

Correspondence: xzhu@ccnu.edu.cn

Abstract: Objective: To introduce and revise Singh's Unfinished Business Resolution Scale (UFB-RS) and test its reliability and validity among college students. Method: A preliminary test was conducted on 843 college students using the Chinese translation version of the unfinished business resolution scale. Item analysis and exploratory factor analysis were conducted on the preliminary data to form a formal questionnaire. Using the interpersonal sensitivity and hostility dimensions of SCL-90, the Acceptance and Action Questionnaire Second Edition (AAQ-II), and the Anger Rumination Scale (ARS) as the criteria-related validity instruments. 251 college students were tested for the reliability and validity of the formal scale. Two weeks later, 60 students in sample 2 were retested. Results: (1) The revised Chinese version of the unfinished business resolution scale contained 11 items and 2 factors (feelings and needs, empathy acceptance), which accounted for the total variance 57.29%. The confirmatory factor analysis(CFA) showed that the 2-factor structure fitted well($\chi 2/df$=2.92, *CFI*=0.93, *TLI*=0.91, *SRMR*=0.05, *RMSEA*=0.08); (2) The scale and its factors scores were significantly negatively correlated with the scores of various criteria-related validity instruments (r=-0.30~-0.13); (3) The Cronbach's α coefficient of the total scale and its various dimensions was 0.68~0.88. Re-test reliability was 0.63~0.75. Conclusion: The revised Chinese version of the unfinished business resolution scale has good reliability and validity, and can be used for relevant measurements.

公共卫生突发事件下大学生复杂创伤后应激障碍症状和创伤后成长的动态关系:交叉滞后面板网络分析

刘艾祎[1] 张漠子[1] 黄柳玥[2] 迟新丽[3](通讯作者)

1 北京师范大学心理学部，北京，100875

2 澳门大学社会科学学院心理学系，澳门特别行政区

3 深圳大学心理学院，广东，519087，xinlichi@126.com

摘 要 研究目的：复杂创伤后应激障碍（CPTSD）作为一种独立的诊断提出尚早，其与创伤后成长（PTG）之间关系的研究存在空白。新兴的交叉滞后网络模型提供了细化研究 CPTSD 各症状与 PTG 各特征之间关联的可能。本纵向研究旨在利用追踪数据建立 CPTSD 和 PTG 构成要素的交叉滞后网络模型，以揭示在公共卫生突发事件下因封校被隔离在家的大学生群体中，这两种创伤后心理反应的关系及方向。方法：我们采用自我报告量表评估 CPTSD 和 PTG 的状态。对 1361 名在 2020 年 5 月中至 5 月底由于封校而经历家庭隔离的大学生进行了基线评估（时间点 1，T1）。随后，我们在 3 个月（时间点 2，T2）和 6 个月（时间点 3，T3）的时间间隔进行了随访评估。最终，保留了参与了三次调查的 701 名被试。结果：CPTSD 的两个构成要素，即 PTSD 和自我组织障碍（DSO），与 PTG 呈现截然不同的关系。在 T1→T2 网络中，再体验和高警觉症状正向预测了 PTG 的构成要素，回避性症状则对 PTG 有消极的预测作用。而这些预测关系在 T2→T3 网络中减弱。然而，在两个网络中，DSO 中的消极自我概念和情绪紊乱始终对 PTG 的多个维度有负向预测作用。结论：本研究强调了 PTSD 和 DSO 症状与 PTG 构成要素之间的差异及关系，既揭示了 CPTSD 作为独立诊断与 PTSD 症状表现的不同，也提示了心理干预工作者可以从减轻 DSO 症状并促进 PTSD 症状的积极改变中受益。

The longitudinal course of complex posttraumatic stress disorder symptoms and posttraumatic growth among college students during the coronavirus disease (COVID-19) pandemic: Cross-lagged panel network analyses

Aiyi Liu[1], Lake Mozi Zhang[1], Liuyue Huang[2], Xinli Chi[3*]

[1] Faculty of Psychology, Beijing Normal University, Beijing 100875, China

[2] Department of Psychology, Faculty of Social Sciences, University of Macau, Macau SAR, China

[3] School of Psychology, Shenzhen University, Shenzhen 518061, China

Abstract ： *Background and Objective:* There is a gap in the literature concerning the relationship between complex posttraumatic stress disorder (CPTSD) and posttraumatic growth (PTG). The recent network analysis provided opportunities to investigate the associations between CPTSD and PTG on a more fine-grained level. This longitudinal study aimed to model cross-lagged network of components of CPTSD and PTG with longitudinal data to unveil the direction of their relationships among college students exposed to the COVID-19 pandemic. *Method:* We utilized self-report measures to evaluate the presence of CPTSD and PTG. We conducted a baseline assessment on 1361 college students who experienced home isolation due to school closures during the COVID-19 pandemic from mid-to-late May 2020 (Time 1, T1). Subsequently, we performed follow-up assessments at 3-month (Time 2, T2) and 6-month (Time 3, T3) intervals. Ultimately, 701 participants who participated in three surveys were

retained. *Results:* Two components of CPTSD, PTSD and disturbances in self-organization (DSO) shared vastly different relationships with PTG. In T1→T2 network, Re-experiencing and Sense of current threat positively predicted components of PTG, Avoidance exhibited negative predictive value on PTG. These predictive relationships were weakened in T2→T3 network. However, Negative self-concept and Affective dysregulation in DSO negatively predicted multiple dimensions of PTG in both networks. *Conclusions:* The study highlighted the differential relationships that PTSD and DSO symptoms shared with the PTG components, suggesting that interventions could benefit from mitigating DSO symptoms and incorporating PTSD symptoms into positive change.

Keywords: CPTSD, PTG, cross-lagged panel network, college students, COVID-19

压力知觉对军医大学研究生心理健康的影响：一般自我效能感、职业使命感与职业倦怠的中介作用

林鑫鑫[1] 崔迪[1] 李翊君[1] 武圣君[1] 刘旭峰[1]（通讯作者）

空军军医大学军事医学心理学系，西安，710000，通讯作者 E-mail：lllfmmu@fmmu.edu.cn

摘 要 目的：研究压力知觉对军医大学研究生心理健康的影响，并探讨一般自我效能、职业使命感与职业倦怠的中介作用。方法：采用压力知觉量表(CPSS)、职业使命感量表(CCS)、一般自我效能感量表（CSES）、职业倦怠量表（MBI-GS）和中国心理健康量表（CPHI）对 1393 名军医大学研究生施测。结果：压力知觉女性高于男性(p<0.05)，一般自我效能感男性高于女性(p<0.05)，延期学生的压力知觉和职业倦怠高于其他年级学生(p< 0.05, p<0.01)，延期学生一般自我效能感和心理健康水平低于其他年级(p< 0.05, p <0.01)。压力知觉与职业倦怠呈正相关（r=0.233, p <0.01）；自我效能与职业使命感呈正相关（r=0.536, p <0.01）；一般自我效能、职业使命感与心理健康呈正相关（r=0.536, p <0.01；r=0.512, p <0.01）；压力知觉与自我效能、职业使命感、心理健康呈负相关（r=-0.579, p <0.01；r=-0.473, p <0.01；r=-0.652, p <0.01）；职业倦怠与一般自我效能、心理健康呈负相关（r=-0.075, p <0.01；r=-0.167, p <0.01）。压力知觉对心理健康有直接的负向预测作用,直接效应值为-0.455。一般自我效能感、职业使命感与职业倦怠在压力知觉对心理健康的影响中起部分中介的作用（-0.1965[95%CI：-0.229,-0.164]），并且可以通过四条部分中介路径影响心理健康：第一条为压力知觉通过工作倦怠影响心理健康,其效应值为-0.0091；第二条为压力知觉通过自我效能影响心理健康,其效应值为-0.0857；第三条为压力知觉通过职业使命感影响心理健康,其效应值为-0.0525；第四条为压力知觉通过自我效能影响职业使命感从而影响心理健康,其效应值为-0.0492。间接效应量共-0.1965，间接效应95%置信区间[-0.229,-0.164]，其区间不包含 0，中介效应显著。总效应量为-0.652，说明压力知觉可解释心理健康 65.2%的变异。结论：可以通过降低职业倦怠或提高军人缓解压力的能力、职业使命感和一般自我效能提高军人的心理健康水平。

关键词 军医大学研究生，压力知觉，职业使命感，职业倦怠，心理健康

The Impact of Stress Perception on the Psychological Health of Postgraduates in Military Medical Universities: the Mediation Model of General Self-Efficacy, Career Calling and Burnout

Lin Xinxin[1], Cui Di[1],Li Yijun[1], Wu Shengjun[1], Liu Xufeng[1]
Department of Military Medical Psychology, Air Force Military Medical University，Xi'an

Abstract：Objective: To study the impact of stress perception on the psychological health of postgraduates in military medical universities, and to explore the mediating role of self-efficacy, career calling and burnout. Methods: Using the Chinese Perceived Stress Scale (CPSS), Career Calling Scale (CCS), General Self-Efficacy Scale (GSES), Maslach Burnout Inventory General Survey (MBI-GS) and Chinese Psychological Health Inventory (CPHI) to compare 1393 postgraduate of a military medical university administered the test. Results: The stress perception of females was higher than males (p<0.05). The self-efficacy of males was higher than females (p<0.05). The stress perception and burnout of deferred students were higher than other grades (p< 0.05, p<0.01). And the general self-efficacy and mental health of deferred students were lower than other grades (p< 0.05, p<0.01). The stress perception was positively correlated with burnout (r=0.233, p<0.01). The self-efficacy was positively correlated with career calling (r=0.536, p<0.01). The self-efficacy, career calling and psychological health were positively correlated (r =0.536, p<0.01; r=0.512, p<0.01). The stress perception is negatively correlated with self-efficacy, career calling, and psychological health (r=-0.579, p<0.01; r=-0.473, p<0.01; r=-0.652, p<0.01). The burnout is negatively correlated with psychological health r=-0.167, p<0.01).

General self-efficacy, career calling and burnout play a mediating role in the impact of stress perception on psychological health (-0.1965[95%CI: -0.229, -0.164]). There are four paths in it. The first one is that the stress perception affects the psychological health through the burnout, and its effect value is -0.0091. The second one is that the stress perception affects the psychological health through the self-efficacy, and its effect value is -0.0857. The third one is that the stress perception affects the psychological health through the career calling, and its effect value is -0.0525. The last one is that the stress perception affects the career calling through the self-efficacy and thus affects the psychological health, and its effect value is -0.0492. Conclusion: The psychological health of soldiers can improve their self-efficacy and the career calling, so as to reduce the burnout, and then achieve the purpose of maintaining the psychological health.

团体心理训练对军校大学生情绪的影响

蒲昭君，张芫蓓，杨梦圆，武圣君

空军军医大学军事医学心理学系,西安，710032，wushj@fmmu.edu.cn

摘 要 **目的** 探讨团体心理训练对军校大学生情绪的干预效果。**方法** 采用实验组和对照组前后测实验设计,每组16人,利用自编教材和团体辅导活动方案,分别进行为期6周的情绪干预。其中实验班采用情绪调节的团体心理辅导(每周1次，每次1.5h)，在此期间对照组每周1次集中参加常规心理健康教育活动。以抑郁自评量表(SDS)、广泛性焦虑量表(GAD)、情绪调节量表（ERQ）和心率变异性(HRV)指标进行干预前后的评定。两组在基线与6周后分别测评抑郁自评量表、焦虑自评量表、情绪调节量表和心率变异性(HRV)指标。**结果** 组间比较显示，实验组焦虑、抑郁、认知重评得分6周后均低于对照组(P＜0.01)，表达抑制得分6周后则高于对照组(P＜0.01)；组内比较显示，6周干预后实验组焦虑、抑郁、认知重评得分均低于基线期(P＜0.01)，而表达抑制得分则高于基线期(P＜0.01)。实验组6周前后R-R间期标准差(SDNN)、相邻R-R间期差值的均方根(RMSSD)、低频功率(LF)、高频功率(HF)的差值明显低于对照组，正常R-R间期标准差(SDANN)、低频功率与高频功率之比(LF/HF)差值明显高于对照组(P＜0.01或P＜0.05)。**结论** 团体心理训练能能够有效的改善军校大学生的焦虑、抑郁情绪,提升主观认知重评的能力，并可能增加患者的迷走神经活性、减低交感神经激活。

The effect of group psychological training on the emotions of military college students

Pu Zhaojun,Zhang Yuanbei,Yang Mengyuan,Wu Shengjun

Department of Military Medical Psychology, Air Force Military Medical University, Xi'an,710032，

wushj@fmmu.edu.cn

Abstract: **Objective** To explore the intervention effect of group psychological training on the emotions o f military college students. **Methods** A pre and post-test experimental design was adopted for the experi mental and control groups, with 16 participants in each group, who underwent a 6-week emotional interv ention using self-developed teaching materials and a group counseling activity program, respectively. Amo ng them, the experimental class used group counseling for emotion regulation (1 time per week, 1.5 h ea ch time), and the control group participated in regular mental health education activities centrally once a week during this period. The depression self-assessment scale (SDS), generalized anxiety scale (GAD), em otion regulation scale (ERQ), and heart rate variability (HRV) indexes were used for pre- and post-interve ntion evaluation. Depression Self-Rating Scale, Anxiety Self-Rating Scale, Emotion Regulation Scale, and Heart Rate Variability indexes were measured in both groups at baseline and after 6 weeks. **Results** Betw een-group comparisons showed that the anxiety, depression, and cognitive reassessment scores of the expe rimental group were lower than those of the control group after 6 weeks (P<0.01), whereas the expressio n inhibition score was higher than that of the control group after 6 weeks (P<0.01); within-group compar isons showed that the anxiety, depression, and cognitive reassessment scores of the experimental group w ere lower than those at the baseline period after 6 weeks of intervention (P<0.01), while the expression i nhibition score was higher than that at the baseline period (P<0.01). The standard deviation of R-R interv al (SDNN), root mean square of the difference between adjacent R-R intervals (RMSSD), low frequency power (LF), and high frequency power (HF) were significantly lower in the experimental group than in t

he control group before and after the 6-week period, and the difference between the standard deviation of normal R-R intervals (SDANN), and the ratio of low-frequency to high-frequency power (LF/HF) was significantly higher than that in the control group ($P<0.01$ or $P<0.05$). **Conclusion** Group psychological training can effectively improve the anxiety and depression of military college students, enhance the ability of subjective cognitive reappraisal, and may increase vagal activity and decrease sympathetic activation.

摘 要 **目的**：分析陆军某部军人的知觉压力、应激后成长及其与职业适应性的关联，探讨知觉压力影响军人职业适应性的心理机制，考察应激后成长的中介作用。**方法**：本研究为横断面调查研究。2023 年 5-6 月，以陆军某部 340 名军人为研究对象，采用中文版压力知觉量表（Chinese version perceived stress scale，CPSS）评估其知觉压力水平，简易心理弹性量表（Connor-Davidson Resilience Scale-10，CD-RISC-10）测试其心理弹性状况，军人职业适应性问卷（Military Career Adaptability Questionnaire，MCAQ）评估该部军人的职业适应性，中文版本应激后成长量表（Chinese version of Posttraumatic Growth Inventory，PTGI-C）测量该部军人的应激后成长，以及自编一般情况调查表搜集基本信息。**结果**：陆军军人的知觉压力得分为（15.79±9.20）分，心理弹性得分为（30.80±7.38）分，应激后成长得分为（83.19±18.90）分。知觉压力与职业适应性呈负相关（r=-0.584，p<0.01），心理弹性与职业适应性呈正相关（r=0.615，p<0.01），应激后成长与职业适应性呈正相关（r=0.526，p<0.01）。中介效应分析显示，知觉压力可以直接影响职业适应性（直接效应β=-0.4229，p<0.01），也可以通过影响应激后成长继而影响职业适应性（间接效应β=-0.1609，p<0.01）。**结论**：知觉压力不仅可以直接影响陆军军人职业适应性，也可以通过创伤后成长的间接作用影响职业适应性，应激后成长在知觉压力对职业适应性影响的模型中起到中介作用，并且为不完全中介。应激后成长是职业适应性的积极促进因素。

关键词 陆军，军人，职业适应，心理弹性，应激后成长

The Relationship between Perceived Stress and Occupational Adaptation in Army Soldiers: The Mediation Effect of Post Stress Growth

Wang Xu[1] Liu Yu[2] Peng Li[1] Xu Chen[1] Li Min[1] (Corresponding author)

1Department of Military Psychology, Army Medical University (Third Military Medical University) , Chongqing, 400038, China , E-mail ： 2474591914@qq.com

2 Unit 75738 of the People's Liberation Army, Heyuan, Guangdong, 517139

***Abstract*： Objective**: To analyze the perceived stress, post stress growth, and its correlation with occupational adaptability of soldiers in a certain army unit, explore the psychological mechanism of the impact of perceived stress on soldiers' occupational adaptability, and examine the mediating role of post stress growth. **Method**: This study is a cross-sectional survey. From May to June in 2023, 340 soldiers from a certain army department were taken as the research objects, and their perceived stress level were assessed with the Chinese version of perceived stress scale (CPSS), and their Psychological resilience were tested with the Connor Psychological resilience Scale-10 (CD-RISC-10), The Military Career Adaptability Questionnaire (MCAQ) evaluated the professional adaptability of soldiers in the department, and the Chinese version of Posttraumatic Growth Inventory (PTGI-C) measured the post stress growth of soldiers in the department. A self-designed general situation questionnaire was also used to collect basic information. **Results**: The scores of perceived stress, psychological resilience and posttraumatic growth were (15.79 ± 9.20), (30.80 ± 7.38) and (83.19 ± 18.90) respectively. Perceived stress was

negatively correlated with occupational adaptability (r=-0.584, p<0.01), psychological resilience was positively correlated with occupational adaptability (r=0.615, p<0.01), and posttraumatic growth was positively correlated with occupational adaptability (r=0.526, p<0.01). Mediation effect analysis shows that perceived stress can directly affect occupational adaptability (direct effect β=- 0.4229, p<0.01), and perceived stress can also affect occupational adaptability by influencing post stress growth (indirect effect β=- 0.1609, p<0.01). **Conclusion**: Perceived stress can not only directly affect the occupational adaptability of army soldiers, but also indirectly affect occupational adaptability through the effect of post traumatic growth. Posttraumatic growth plays a mediating role in the model of the impact of perceived stress on occupational adaptability and is an incomplete mediator. Post stress growth is a positive promoting factor for occupational adaptability.

Keywords： Army, military, occupational adaptation, psychological resilience, post stress growth

气质性乐观研究述评

陈庆华[1,2]（通讯作者） 叶静娴[1]

1 合肥师范学院教育与心理科学学院，合肥，230601

2 青少年心理健康与危机智能干预安徽省哲学社会科学重点实验室，合肥，230601

通讯作者 E-mail：873498616@qq.com

摘　要 乐观作为心理资本的重要组成部分之一，在积极心理学研究中受到广泛关注。综观国内外对于乐观的研究，目前主要有能力论与气质论两种取向，能力论把乐观看作一种具有稳定性的解释风格，气质论认为乐观是一种稳定的人格特质，即气质性乐观。气质性乐观这一概念最早是由 Scheier 和 Carver 等人于 1985 年根据动机的期望价值理论提出，并被定义为个体对未来结果的产生总体的、积极、对行为具有调节作用的预期的一种稳定人格特质。随着气质性乐观研究的不断深入，研究者提出气质性乐观的结构维度包含单维模型、二维模型、多维模型和等级模型四种设想。目前测量气质性乐观的问卷主要为生活定向测验量表（The Life Orientation Test, LOT）、个人和社会乐观评定问卷，以及相关的修订版与扩展版问卷。通过文献梳理发现，性别、年龄等个体差异，文化背景、社会支持等环境因素，积极认知图式和负性事件均为影响气质性乐观的重要因素。研究证明，气质性乐观会促进个体身心健康和积极的行为结果，增强免疫、降低传染病感染风险、减少疾病发生，有效提高主观幸福感、自我效能感等积极心理要素，降低焦虑、压力和抑郁等负面影响，促进认知能力和社会适应发展。气质性乐观的后续研究可在以下几方面进一步拓展：一是气质性乐观的理论模型还需完善；二是加强对气质性乐观研究的实际应用探索；三是气质性乐观的本土化研究有待深入，特别是缺乏适宜我国国情的测量工具等。

Corresponding Author，E-mail：873498616@qq.com
Abstract：Optimism, as an important component of psychological capital, has received widespread attention in positive psychology research. Throughout the research on optimism both domestically and internationally, there are currently two main orientations: the competence theory and the temperament theory. Competency theory views optimism as a stable explanatory style, while temperament theory views optimism as a stable personality trait, namely dispositional optimism. The concept of dispositional optimism was first proposed by Scheier and Carver et al. in 1985 based on expectancy-value theory of motivation, and was defined as a stable personality trait in which individuals have overall, positive, and regulatory expectations for future outcomes. With the continuous deepening of research on dispositional optimism, researchers have proposed four structural dimensions of dispositional optimism: single dimensional model, two-dimensional model, multidimensional model, and hierarchical model. At present, the main questionnaires used to measure dispositional optimism are the Life Orientation Test (LOT), the Personal and Social Optimism Assessment Questionnaire, and related revised and expanded versions of the questionnaire. Through literature review, it was found that individual differences such as gender and age, environmental factors such as cultural background and social support, positive cognitive schemata, and negative events are all important factors affecting dispositional optimism. Research has shown that dispositional optimism can promote individual physical and mental health and positive behavioral outcomes, enhance immunity, reduce the risk of infectious disease infection, reduce disease occurrence, effectively improve positive psychological factors such as subjective well-being and self-efficacy, reduce the negative effects of anxiety, stress, depression and so on, also facilitate the development of cognitive ability and social adaptation. The follow-up research on dispositional optimism can be further expanded in the following aspects: Firstly, the theoretical model of dispositional optimism still needs to be improved. Secondly is to strengthen the exploration of the practical application of research on dispositional optimism. Thirdly, there is a need for in-depth research on the localization of dispositional optimism, especially the lack of measurement tools suitable for China's national conditions.

核心自我评价与创造力倾向之间的关系：自我效能感的中介作用

肖秦[1]

1 清华大学附属中学管庄学校，北京，100024，xiaoqin_0808@163.com

摘 要　在当今以创新型人才竞争为核心的知识经济时代背景下，创造力的研究越来越重要。创造力已成为一个人能否很好的适应社会、充满竞争力的关键因素。创造力的这种倾向是具有积极性的，它调节着个体的生理和心理，是创造活动产生的重要条件。创造力会受到来自自我评价的影响，但以往研究者却较少探讨核心自我评价对创造力的影响机制。为此，本研究采用问卷调查法，通过问卷星平台在 9 省市高校随机招募 393 名被试，考察其对于核心自我评价、自我效能感和创造力倾向之间的关系。结果发现：（1）在创造力倾向水平上存在显著的性别差异，男生的创造力倾向和自我效能感显著高于女生，且男生在创造力的好奇性维度上显著高于女生，其他维度如冒险性、想象力和挑战性方面无显著差异。（2）核心自我评价能够正向预测自我效能感和创造力倾向。（3）自我效能感在核心自我评价对创造力倾向的影响中发挥完全中介作用。本研究证实了核心自我评价和自我效能感是影响创造性倾向的两个重要因素，为开拓个体创造性发展的途径提供了借鉴，具有重要的实践意义。根据本研究得到的结论，通过提升核心自我评价和自我效能感两个内部因素，可以更直接、有效地提升个体的创造性水平，进而对其自身毕生的发展，推动社会的进步都具有重要意义。

关键词　核心自我评价，自我效能感，创造力倾向

The Relationship Between Core Self-evaluation and Creative Tendencies: The Mediating Effect of Self-efficacy

Xiao Qin

Tsinghua University High School-Guanzhuang, Courtyard 6 Kangyue Middle Street, Chaoyang District, Beijing

Abstract：In the context of the competition for innovative talents, research on creativity is becoming increasingly important. Creativity has become a key factor in a person's ability to adapt to society and be competitive. The creative tendencies is positive, regulating individual physiology and psychology, and is an important condition for creative activities to occur. Creativity is influenced by self-evaluation, but previous researchers have rarely explored the mechanism by which core self-evaluation affects creativity. Therefore, this study adopted a questionnaire survey method and randomly recruited 393 participants from universities in 9 provinces and cities through the Questionnaire Star platform to investigate the relationship between their core self-evaluation, self-efficacy, and creativity tendencies. The results showed that: (1) there were significant gender differences in the level of creativity tendency, with boys having significantly higher levels of creativity tendency and self-efficacy than girls, and boys having significantly higher levels of curiosity in creativity than girls. There were no significant differences in other dimensions such as adventure, imagination, and challenge. (2) Core self-evaluation can positively predict self-efficacy and creativity tendencies. (3) Self efficacy plays a completely mediating role in the impact of core self-evaluation on creativity tendencies. This study confirms that core self-evaluation and

self-efficacy are two important factors affecting creative tendencies, providing reference for exploring ways for individual creative development and having important practical significance. According to the conclusions drawn from this study, by enhancing the internal factors of core self-evaluation and self-efficacy, an individual's level of creativity can be more directly and effectively improved, which is of great significance for their lifelong development and promoting social progress.

体育活动心理投入对儿童心理健康的影响：BMI 的调节作用

祝欣怡　　丁雪辰（通讯作者）

上海师范大学心理学系，上海，200234，通讯作者 E-mail：dingxuechen_psy@163.com

摘要　体育活动是儿童心理发展的重要课程，积极参与体育活动的儿童在认知灵活性、情绪适应能力、同伴关系等方面都表现出较好的结果，而肥胖是阻碍个体参与体育活动的一大原因。为明确积极参与体育活动对儿童心理健康的益处，本研究旨在（1）确定心理投入(认知、情感、联结感三个维度）与个体心理健康（抑郁、主观幸福感）之间的联系，（2）构建调节效应模型，探索在不同学段、性别群体中，身体质量指数(body mass index，简称 BMI)对于这两者关系的影响差异。被试选取上海某小学三至五年级的 555 位处于童年晚期的学生和上海某初中 306 位处于青春期早期的学生，记录他们的身高和体重计算 BMI。研究采用参与度调查量表收集儿童在认知、情感、联结感维度上对自己参与体育活动的心理投入程度，以及实际的体育活动行为参与度，并且采用自评式的儿童抑郁量表和 Stirling 儿童主观幸福感量表测量抑郁和主观幸福感作为心理健康的两个指标，使用 SPSS 26.0 进行数据的描述性统计和相关分析，并检验调节效应模型。结果发现：（1）无论是小学生还是初中生，在控制性别和行为参与度的条件下，对体育活动的心理参与程度越积极的儿童往往表现出更低的抑郁水平和更高的主观幸福感；（2）相比小学生，初中生的 BMI 会影响体育活动心理投入和心理健康之间的关系，也就是说，高 BMI 的儿童所表现的抑郁水平受到心理投入程度的变化更敏感，主要表现在联结感维度上；（3）就性别而言，高 BMI 初中男生的抑郁水平受到联结感投入带来的影响更大，低 BMI 的初中男生的抑郁水平在不同的联结感投入水平上无显著差异。因此，本研究表明积极的体育活动心理投入能够给儿童提供心理发展的支持，这类儿童往往更加心理健康。但是儿童进入初中后，体型特征带来的影响变得显著，学校应当注意引导高 BMI 的学生（尤其是男生）寻找到体育活动的乐趣和联结感，以此改善他们的心理健康。

The effect of psychological engagement in physical activity on children's mental health: the moderating role of BMI

ZHU Xinyi　　DING Xuechen

(Department of Psychology, Shanghai Normal University, Shanghai 200234, China)

Abstract：Physical activity is an important course during children's psychological development. Children who actively participate in physical activity show better results in cognitive flexibility, emotional adaptability, peer relationship and other aspects, while obesity is a major reason that prevents individuals from participating in physical activity. In order to clarify the benefits of active participation in physical activity on children's mental health, the purpose of this study was to (1) determine the relationship between psychological engagement (cognitive, affective, and relational/spiritual items) and individual mental health(depression, well-being), and (2) construct a moderating effect model to explore the the effect of BMI(body mass index) between this relationship among children with different ages or genders. The subjects were selected from 555 students during late childhood from grade 3 to 5 of a primary school and 306 students during early adolescence of a middle school in Shanghai, and their height and weight were recorded to calculate BMI. The Snapshot Survey of Engagement tool was used to collect children's psychological involvement in physical activity in terms of cognition, affect and relation/spirit, as well as their actual behavior. Childhood Depression Inventory and Stirling Children's Well-being Scale were used

to measure depression and well-being as two indicators of mental health. SPSS 26.0 was used for descriptive statistics, correlation analysis, and testing the moderating effect. The results show that: (1) Whether students in primary school or in middle school, controlling gender and behavioral participation, the children with more active psychological engagement in physical activity tend to show lower depression level and higher well-being; (2) Compared with primary school students, middle school students' BMI affect the relationship between psychological engagement in physical activity and mental health. In other words, the depression level of children with high BMI is more sensitive to psychological engagement, mainly in the relational/spiritual items; (3) In terms of gender, the depression level of boys with high BMI in middle school is more affected by relation/spiritual engagement, while the depression level of boys with low BMI in middle school shows no difference whether their relation/spiritual engagement is much or little. Therefore, this study shows that active psychological engagement in physical activity can provide psychological support for children who tend to be more psychologically healthy. However, as children enter middle school, the impact of body type becomes more pronounced, and schools should pay attention to guiding high BMI students(especially boys) to find the fun and relatedness during physical activity to improve their mental health.

Keywords：physical activity, BMI, depression, well-being

黑暗人格与抑郁症状间关系的网络分析

李佳怡[1,2]　刘畅[3]　任垒[1,2]（通讯作者）

1 武警后勤学院军事心理学教研室，天津，300309，rl_fmmu@163.com

2 军队心理健康服务与研究中心，天津，300309

3 莫纳什大学 BrainPark，克莱顿，3168

摘 要　人格被认为是抑郁（Depression）发展和维持的重要影响因素。目前的研究大多关注大五人格（The Big Five personality traits），而大五人格无法完全捕捉到人格中与抑郁关联更紧密的“黑暗”一面。本研究旨在探索黑暗三联征（Dark Triad，DT）的不同方面与抑郁不同症状之间的关联模式以及黑暗三联征的哪些方面是抑郁症状的重要影响因素，从而为相关预防和干预提供一定参考。以吉林省、陕西省 1327 名大学生为研究对象。采用黑暗十二条（Dirty Dozen, DD）测量黑暗三联征；采用抑郁症筛查量表（PHQ-9）测量抑郁各症状。使用软件 R 中 qgraph 包的 ggmModSelect 方法构建非正则化偏相关网络（Unregularized partial correlation network）并进行可视化呈现，重点关注网络中黑暗三联征和抑郁症状之间的关联模式以及黑暗三联征不同方面的桥预期影响（Bridge expected influence）。结果表明：1）马基雅维里主义同“内疚/自我评价低”，以及自恋同“心情低落”存在正性关联；2）马基雅维里主义和精神病态均与“自杀意念”存在正性关联；3）在黑暗三联征的不同方面中，精神病态具有最高的正性桥预期影响，意味着其对抑郁可能具有更高的风险性作用。本研究从网络视角出发，为黑暗三联征与抑郁之间的关系提供了更精细的视角。同时，研究结果为抑郁的预防和干预方案提供了新的思路，例如通过数字化人格干预方法以及认知重评干预方法来预防和缓解精神病态程度较高群体的抑郁症状。

The relations between Dark Triad traits and depression symptoms: A network analysis

LI Jiayi[1,2], LIU Chang[3], REN Lei[1,2,*]

1Military Psychology Section, Logistics University of PAP, Tianjin, 300309, rl_fmmu@163.com

2Military Mental Health Services & Research Center, Tianjin, 300309

3BrainPark, Monash University, Clayton, 3168

Abstract Personality traits have been implicated as triggers for depression. Although the work on the relationship between personality traits and depression has been fruitful, most of it has focused heavily on the "Big-Five" personality. Some negative valence factors that are not covered by the Big Five model may better capture the "dark" side of personality traits, and these personality traits are more closely related to depression. The present study (N=1287) measured the Dark Triad (DT) traits and depression using the 12-item Dirty Dozen (DD) and the Patient Health Questionnaire-9 (PHQ-9). We used the ggmModSelect method of the qgraph package in software R to construct the non-regularized partial correlation network to understand: 1) differential associations between specific traits of the DT and symptoms of depression, and 2) the importance of each trait in heightening the risk for depression. Results showed positive pathways between Machiavellianism and feelings of worthlessness, narcissism and depressed or sad mood, and between Machiavellianism and psychopathy and thoughts of death. Moreover, our findings suggested that targeting psychopathy may be promising in reducing depression from the context of the DT. This study provides a deeper understanding of the relationship between the Dark Triad traits and depression from a network perspective. It also offers new ideas for related prevention and intervention programs, such as digital personality change interventions and brief reappraisal interventions, that may be helpful in preventing and alleviating depressive symptoms for individuals with dark personality traits.

Keywords dark triad traits, depression, network analysis

社交媒体使用行为与人格特质的关系

周庆庆[1] 王卉澜[1] 陈哲惠[1] 张鹏美[1] 李倩[1]（通讯作者）

1 温州肯恩大学心理系，温州，325000，qli@kean.edu

摘 要 随着互联网发展和社交需求增加，社交媒体日益流行且呈现多样化趋势。以往研究表明，社交媒体使用行为与人格特质相关，不同性格的用户在不同的平台呈现出不同行为，例如头像特征和文本内容的情绪特征。然而，过去研究主要集中在国外的社交媒体平台，比如推特和脸书，针对国内的社交媒体平台及其差异的研究鲜见。本研究旨在通过用户在微信、微博和小红书三个主流社交平台上发布的文本内容、头像照片和社交关系的特征，分析用户社交媒体使用行为与其人格特质之间的关系，并比较不同平台上使用行为的差异与一致性。本研究的被试为拥有三个平台账户、近两个月内至少发布一次文字信息、拥有好友、粉丝或关注者的用户。我们记录了被试两个月内在三个平台的使用行为，包括发布的文本内容；头像照片（记录六个维度的信息：颜色、类型、人数、是否包含本人、脸部特征和拍照方式）；社交关系（好友或关注者数量，好友列表中真实好友比率）。本研究使用混合性研究方法，采用了质性研究方法通过“文心”中文心理分析系统对用户发布的文本内容在五个维度上进行分析，包括文字标准计数，心理过程，相关性(关于时间，过去，未来的内容)，个人关注(如职业，金钱，健康)，以及其他维度(标点符号，脏话等)。同时，采用了量化方法对被试的社交媒体使用行为与其人格特质（开放性、宜人性、外向性、尽责性和负面情绪性）之间的相关关系进行了统计分析。研究一结果发现用户社交媒体发布文案内容和社交关系与人格特质相关。例如，微信文案中尽责性与健康词频呈正相关，微博文案中宜人性与脏话频率呈负相关。另外，尽责性与微信真实好友比率呈负相关。研究二对比微博、微信和小红书上用呈现的性格差异。结果表明微博的真实好友比率显著低于微信和小红书，用户的开放性与三个平台的总真实好友比率呈负相关。本研究帮助用户认识自己和他人在社交网络中的行为差异，并对社交媒体平台用户使用行为的研究具有积极意义。

关键词 社交媒体使用行为，人格特质，社交关系

The Relationship between Social Networking Services Behavior and Personality

Qingqing Zhou[1] Huilan Wang[1] Zhehui Chen[1] Pengmei Zhang[1] Qian Li[1](Corresponding author)
[1]Department of Psychology, Wenzhou-Kean University, Wenzhou, 325000

Abstract： With the rapid development of the internet and the increasing demand for social interactions, Social Networking Services (SNS) have become increasingly popular and diversified. Previous research has shown that individuals' SNS behavior is related to personality traits, and users with different personalities exhibit distinct behaviors across different platforms, such as profile picture features and emotional valence of text content. However, previous studies have predominantly focused on platforms such as Twitter and Facebook, with limited studies addressing domestic SNS platforms and their differences. This study aims to explore the relationship between SNS behavior and personality traits and identify the differences in users' SNS behavior by examining the features of text content, profile pictures, and social network across the three major SNS platforms in China: WeChat, Weibo, and Little Red Book. Participants in this study include users who have accounts on all three SNS platforms, have posted text content at least once within the past two months, and have friends or followers. We documented their SNS behavior on the three platforms over two months, including the content of their posts, profile picture (six characteristics: color, type, number of people, whether it includes oneself, facial features, and photo-taking method), and social connections (number of friends or followers, and the ratio of real friends in their friend list). This study employed a mixed research method. Qualitative research was conducted using the "TextMind" Chinese psychological analysis system to analyze five major dimensions of the text content posted by users, including word counts, psychological processes, relevance (related to time, past, and future words), personal concerns (such as occupation, money, health), and other dimensions (punctuation marks, count of swear words). Meanwhile, quantitative methods were used to statistically analyze the correlation between users' SNS behavior and personality traits (openness, agreeableness, extraversion, conscientiousness, and negative emotionality). Results of Study 1 revealed that the features of text content and social connections on SNS platforms were correlated with users' personality traits. For instance, users' conscientiousness showed a positive correlation with the frequency of health-related words in their WeChat posts, while agreeableness exhibited a negative correlation with the frequency of swear words in their Weibo posts. Moreover, conscientiousness showed a negative correlation with the ratio of real friends on WeChat. In Study 2, we compared users' SNS behavior across WeChat, Weibo, and Little Red Book and found that the ratio of real friends on Weibo was significantly lower than that on WeChat and Little Red Book. In addition, users' openness was negatively correlated with the ratio of real friends across all three platforms. This study helps understand the differences in SNS users' own and others' behaviors on multiple SNS platforms and has positive implications for research on SNS behavior.

经颅直流电刺激联合工作记忆训练对航空听觉警报失聪的影响

朱荣娟[1]　惠琪[1]　游旭群[2]（通讯作者）
1 西安科技大学管理学院，西安，710054

2 陕西省行为与认知重点实验室，陕西师范大学心理学院，西安，710062，youxuqun@snnu.edu.cn

摘 要 听觉警报失聪是指在高负荷任务中，个体无法感知周围环境中出现的意外听觉刺激。这种现象是导致飞行事故的主要原因之一，对航空安全构成巨大威胁。听觉警报失聪可能与认知资源有限性有关，高负荷任务消耗大部分认知资源导致没有足够资源加工额外的听觉刺激。而工作记忆被认为是人类认知活动的核心，能够最直观地反映认知资源的可用性。有关工作记忆与听觉警报探测的关系研究提出了单路径和双路径两种不同的理论。单路径理论从资源有限性角度阐释了工作记忆容量较高的个体具有丰富的中央注意资源用于加工意外刺激。双路径理论从认知控制和资源有限性两个视角阐述了工作记忆容量较高的个体其抑制控制能力较强，过度抑制控制导致意外刺激不被知觉；而工作记忆容量较低的个体没有足够的注意资源分配到意外刺激之上。本研究基于上述理论，旨在通过两个实验探索不同类型的工作记忆和航空听觉警报失聪之间的关系，以及从工作记忆增强的角度探索规避航空听觉警报失聪的有效途径。实验 1 采用模拟高负荷航空着陆决策情境，分别探究了视空间和言语工作记忆、以及中央执行功能的个体差异对听觉警报探测的影响。结果发现，视空间和言语工作记忆较高与较低的个体在航空听觉警报探测绩效上没有显著差异，符合双路径理论。而中央执行功能越高的个体其听觉警报反应敏感性较强，符合单路径理论。针对此，实验 2 进一步探索基于经颅直流电刺激（tDCS）技术的中央执行功能训练能否减少高负荷条件下听觉警报失聪的发生。实验中被试被分为阳极刺激训练组、伪刺激训练组和单独刺激组，刺激脑区为右侧背外侧前额叶皮层，电流大小为 1.5mA，每次持续作用 20 分钟,训练时间为 4 周。结果发现，阳极 tDCS 联合训练组不仅能提高工作记忆执行功能，还能提升高负荷情境下的听觉警报反应敏感性。本研究结果提示高负荷情境下的听觉警报失聪与个体的中央执行功能有关，且 tDCS 联合中央执行功能训练可能成为提升高负荷情境下听觉警报反应敏感性的有效途径之一。

关键词 航空听觉警报失聪，背外侧前额叶皮层，经颅直流电刺激，中央执行功能训练，工作记忆

The Effect of Transcranial Direct Current Stimulation Combined with Working Memory Training on Auditory Alarm Deafness in Aviation

Rongjuan Zhu[1], Qi Hui[1], Xuqun You[2]

1 School of Management, Xi'an University of Science and Technology, Xi'an 710054, China

2 Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province, School of Psychology, Shaanxi Normal University, Xi'an 710062, China

***Abstract*:** Auditory alarm deafness refers to the inability of individuals to perceive unexpected auditory stimuli in high-load tasks. This phenomenon is one of the main causes of aviation accidents, posing a significant threat to aviation safety. Auditory alarm deafness may be related to the limited cognitive resources, as high-load tasks consume most of the cognitive resources, leaving insufficient resources to process additional auditory stimuli. Working memory is considered the core of human cognitive activity and can intuitively reflect the availability of cognitive resources. Studies on the relationship between working memory and auditory alarm detection have proposed two different theoretical models: the single-route and dual-route theories. The single-route theory indicates that individuals with high working memory capacity have abundant central attention resources to process unexpected stimuli due to limited resources. In contrast, the dual-route theory explains that individuals with higher working memory capacity have stronger inhibitory control, and excessive inhibition leads to the failure of perceiving unexpected stimuli. On the other hand, individuals with lower working memory capacity lack sufficient

attention resources to allocate to unexpected stimuli. Based on these theoretical frameworks, this study aims to explore the relationship between different types of working memory and auditory alarm deafness in aviation and investigate effective ways to mitigate auditory alarm deafness through enhancing working memory. Experiment 1 investigated the effects of visual-spatial and verbal working memory, as well as central executive function, on the detection of auditory alarm during a simulated high-load aviation landing decision-making scenario. The results showed that individuals with higher visual-spatial and verbal working memory did not exhibit significant differences in auditory alarm detection performance compared to those with lower working memory, supporting the dual-route theory. However, individuals with higher central executive function displayed stronger auditory alarm sensitivity, in line with the single-route theory. Based on the findings from Experiment 1, Experiment 2 further explored whether transcranial direct current stimulation (tDCS) combined with central executive function training could reduce auditory alarm deafness under high-load conditions, with the right dorsolateral prefrontal cortex as the stimulation site. Participants were randomly divided into anodal tDCS + training group, sham tDCS + training group and tDCS group, respectively. The current was 1.5mA and the duration of tDCS was 20 minutes. The whole training time lasted for 4 weeks. The results revealed that anodal tDCS combined with training not only improved working memory executive function but also enhanced auditory alarm sensitivity in high-load conditions. These findings suggest that auditory alarm deafness in high-load conditions is related to individuals' central executive function, and tDCS combined with central executive function training may serve as an effective approach to enhance auditory alarm sensitivity in such scenarios.

摘 要　信任是人机交互的重要前提，而恰当的信任水平是维持人机良好合作的核心要素之一。以往研究缺乏对人-机组队和人-人机组队下人机信任的对比研究，可靠性等外部因素对情景信任和动态信任的影响也存在争议，影响动态信任变化的机制也尚不清晰。因此，本研究目的在于阐明人机交互中不同组队方式下动态信任的影响因素及变化模式。本研究共开展两个实验。实验 1 包含 40 名被试，采用 2(自动化可靠性：高可靠性、低可靠性)× 2(组队方式：人-机组队、人-人机组队)两因素混合设计。被试内变量为组队方式，被试间变量为自动化可靠性，因变量为信任量表分数，探讨自动化可靠性与人机组队方式对情景信任的影响。实验 2 包含 40 名被试，采用 2(自动化可靠性：高可靠性、低可靠性)×2(组队方式：人-机组队、人-人机组队)× 2(交互表现：判断正确、错误)的三因素混合设计。被试内变量为组队方式和交互表现，被试间变量为自动化可靠性，因变量为动态信任评分，探讨可靠性、人机组队方式与交互表现模式对动态信任变化模式的影响。研究结果发现：（1）自动化可靠性对情境信任的主效应显著，被试对高可靠性自动化的情境信任水平显著高于低可靠性自动化；（2）人机组队方式对动态信任变化量的主效应显著，人-机组队下的动态信任变化程度显著大于人-人机组队；（3）交互表现模式对动态信任变化模式的主效应显著；（4）人机组队方式与交互表现模式对动态信任变化的交互效应显著。本研究主要结论：（1）自动化可靠性影响情景信任；（2）人机组队方式影响情景信任和动态习得信任；（3）人机交互表现模式影响动态信任变化，其中自动化建议的表现决定信任变化的方向，个体表现、自动化表现和组队表现共同影响信任变化的程度。上述结论丰富了人机交互的人机组队理论、信任影响因素以及动态习得信任变化模式的影响机制，为人机组队优化、信任训练提供了理论依据和实践建议。

***Abstract*:** Trust is an important prerequisite for human-computer interaction, and the appropriate level of trust is one of the core elements to maintain proper human-automation collaboration. Previous research lacks comparative studies of trust in automation under human- automation(HA) teaming and human-human-automation (HHA) teaming, and the effects of external factors such as reliability on situational and dynamic trust are controversial, in addition the mechanisms influencing dynamic learned trust changes are unclear. Therefore, the purpose of this study is to elucidate the influencing factors and changing patterns of dynamic trust under different teaming methods in human-computer interaction. Two experiments were conducted in this study. Experiment 1 contained 40 participants in a 2 (automation reliability: high reliability vs low reliability) × 2 (teaming: HA teaming vs HHA teaming) two-factor mixed design. The within-subjects variable was teaming, the between-subjects variable was automated reliability, and the dependent variables were trust scale scores. The study investigated the effects of automation reliability and human teaming on situational trust. Experiment 2 contained 40 participants in a 2 (automation reliability: high reliability vs low reliability × 2 (teaming: HA teaming vs HHA teaming) × 2 (interactive performance pattern: correct vs wrong) three- factor mixed design. The within-subjects variables were teaming and interactive performance pattern, the between-subjects variable was automation reliability, and the dependent variable were dynamic trust scores. This study investigated the effects of automation reliability, teaming, and interactive performance on dynamic trust variation patterns. The findings revealed that (1)The main effect of automation reliability on situational trust was significant, and the level of situational trust in high-reliability automation was significantly higher than that in low-reliability;(2)The main effect of human-automation teaming ondynamic trust was significant, and the degree of dynamic trust variation under HA teaming was significantly greater than that under HHA teaming;(3) The main effect of interactive performance patterns on dynamic trust was significant;(4) The interaction effect of human-automation teaming and interactive performance patterns on dynamic trust variation is significant. The main conclusions of this study are as follows:(1)Automation reliability affects situational trust;(2)Teaming affects situational trust and dynamic learned trust; (3) Interactive performance patterns affect dynamic trust variation, where the performance of automation recommendations determines the direction of trust variation, and individual performance, automation performance, and teaming performance jointly affect the degree of trust variation. The above conclusions enrich the theory of human- automation teaming formation in human-computer interaction, the influencing factors of trust, and the influence mechanism of dynamic variation patterns. The findings also provide a theoretical support and practical suggestions for the optimization of Human-Machine teaming formation and the training of trust.

基于文献计量分析法的人-机器人信任修复研究

蔡敏敏[1] 蔡杰[2]

[1]浙江理工大学心理系，杭州，310018

[2]浙江理工大学心理系，杭州，310018，caijei@zstu.edu.cn

摘 要 随着机器人技术的发展，人-机器人信任研究已逐渐成为心理学、人机交互等领域中的研究热点。其中，如何修复人类对机器人的信任对于促进人机协同效率、提高人机合作绩效具有重要意义，并已成为人-机器人信任研究领域中的新兴热点话题。为更好地了解人-机器人交互中信任修复的研究现状及发展趋势，本研究以 Web of Science(WoS)核心合集和 Scopus 两大数据库为主要数据源，以(“trust” or “trustworthiness”) and (“repair” or “recovery”) and (“robot” or “robotics” or “HRI” or “human-robot interaction”)为检索关键词，筛选得 2015 - 2023 年间 60 篇人-机器人信任修复文献，采用文献计量分析软件 CiteSpace6.2 R2 进行分析。结果发现，（1）从 2015-2023 年，该领域的文献发表量呈逐年增长趋势。（2）共被引分析表明，共被引期刊频次前 5 位的专业期刊以及会议依次为:《Human Factors》、《Academy of Management Review》、《ACM/IEEE International Conference on Human-robot Interaction》、《Organizational Behavior and Human Decision Processes》和《Ergonomics》。（3）共词分析表明，研究最多的 10 个关键词依次是信任修复、自动化、人机交互、性能、人工智能、模型、态度、道歉、拟人化和可信度。（4）时间线谱图分析表明，2016 年至 2020 年的研究热点是人工智能、性能和信息。2021 年以来的研究热点是用户信任框架违约、组织、智能机器人、人与代理团队、合作修复、虚假知识信息。本研究证实人-机器人信任修复研究已逐步受到研究人员的关注，有助于相关科研人员了解人-机器人信任修复的研究现状，把控人-机器人信任修复的热点变化，并为其确立相关科研方案提供一定的理论参考。

Research on human-robot trust repair based on bibliometric analysis

Minmin Cai, Jie Cai

Department of Psychology, Zhejiang Sci-Tech University, Hangzhou, Zhejiang

Abstract: With the development of robot technology, human-robot trust research has gradually become a research hotspot in psychology, human-robot interaction and other fields. Among them, how to restore human trust in robots is of great significance to promote human-robot cooperation efficiency and improve human-robot cooperation performance, and has become an emerging hot topic in the field of human-robot trust research. In order to better understand the research status and development trend of trust repair in human-robot interaction, this study uses two databases, Web of Science(WoS) core collection and Scopus, as the main data sources. Take (" trust "or" trustworthiness ") and (" repair "or" recovery ") and (" robot "or" robotics "or" HRI "or" human-robot interaction ") as the keywords, 60 literatures on human-robot trust repair from 2015 to 2023 were selected, which were analyzed using bibliometric analysis software CiteSpace6.2 R2. The results show than t (1) From 2015 to 2023, the amount of literature published in this field shows an increasing trend year by year. (2) Co-citation analysis shows that, The top 5 professional journals and conferences with a total frequency of citations are: *Human Factors, Academy of Management Review, ACM/IEEE International Conference on Human-Robot Interaction, Organizational Behavior and Human Decision Processes,* and *Ergonomics*. (3) Co-word analysis shows that the top 10 most researched keywords are trust repair, automation, human-robot interaction, performance, artificial intelligence, model, attitude, apology, anthropomorphism, and trustworthiness. (4) Timeline analysis shows that the research hotspots from 2016 to 2020 are artificial intelligence, performance and information. The research hotspots since 2021 are user trust

framework breach, organization, intelligent robots, human and agent team, repair in cooperation, and false knowledge information. This study confirms that the research on human-robot trust repair has gradually attracted the attention of researchers, which is helpful for relevant researchers to understand the research status of human-robot trust repair, grasp the hotspots of human-robot trust repair, and provide some theoretical references for establishing relevant scientific research programs.
Key words: trust repair, bibliometric, human-robot interaction

立体刺激的加工表现总优于平面？对立体航空多任务范式（MATB-II）加工的高认知负荷

车翔[1] 林靖康[1] 唐睿翼[1] 惠琪[2] 兰继军[1]（通讯作者）
1 陕西师范大学心理学院，陕西省行为与认知重点实验室，西安，710062, xingzhilab@126.com
2 西安科技大学管理学院，西安，710054

摘 要 多任务加工处理在我们的日常生活和人-机交互环境中非常常见。在航空领域，MATB-II 任务是美国航空航天局(NASA)于 1992 年开发的用于测量航空多任务性能并广泛使用的范式。在该范式中，所有子任务都在 PC 显示器的不同空间位置上呈现，在每个子任务上的绩效被计算以评估总体 MATB-II 航空多任务的绩效。近年来，有研究者深度信息可以提高工作记忆和选择性注意的表现。然而，其他研究人员提出，在两个深度平面之间串行切换注意会导致更高的注意成本和较高的认知负荷。本研究的目的是调查 MATB-II 在立体(虚拟现实)和平面(桌面显示器)环境下的性能和机制。我们招募了 49 名大学生参与者(M = 18.63 岁，SD = 0.78，女性= 24)，要求他们完成 MATB-II 中的需要飞行摇杆操纵的“追踪任务(Tracking)”和模拟飞行仪表监控的“系统监控任务(System monitoring)”作为子任务。我们采用了 2 (任务需求：低、高)× 3 (深度情况：无深度(No Depth; ND)、追踪任务远-系统监控近(Tracking Far - System monitoring Near; TF-SN)、追踪任务近-系统监控远(Tracking Near - System monitoring Far; TN-SF)的被试内实验设计，并测量了每个任务期间的 NASA 任务负荷量表(NASA-TLX)和心率变异性(HRV)以衡量任务期间的认知负荷。因变量是各子任务的正确率、NASA-TLX 的总分和 HRV 的 RMSSD 指标。我们发现深度对追踪任务(F(2, 96) = 115.01, p < .001, η_p^2 = 0.706)和系统监控任务(F(2, 96) = 10.32, p < .001, η_p^2 = 0.177)有显著主效应，无深度条件(ND)的表现优于有深度的追踪任务近-系统监控远(TN-SF)条件和追踪任务远-系统监控近(TF-SN)条件。此外，这些结果与深度的 NASA-TLX 主效应(F(2, 96) = 10.489, p < .001, η_p^2 = 0.179)和 HRV 的 RMSSD(F(2, 96) = 4.462, p = .014, η_p^2 = 0.085)一致。这表明相对于有深度的立体条件，无深度条件的 NASA-TLX 总分较低且 RMSSD 值较高。综上所述，本研究推进了我们对用户如何感知和处理具有不同深度的多任务的理解。在处理不同深度平面上的多任务时，相比于平面场景，立体有深度场景的表现较差可能是由于更多的主观和客观认知负荷。

关键词 MATB-II, 多任务，虚拟现实，心率变异性，认知负荷

Stereo stimuli processing are always better than flat? A high

cognitive load in processing stereo multi-tasking evidenced by MATB-II

Xiang Che[1] Jingkang Lin[1] Ruiyi Tang[1] Qi Hui[2] Jijun Lan[1*]
1 School of Psychology, Shaanxi Normal University, Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province,710062, China
2 School of Management, Xi'an University of Science and Technology, Xi'an, 710054, China

Abstract： Multi-tasking is common in our daily life human-computer interaction environment. Multi-Attribute Task Battery (MATB) II is a widely used tool in measuring aviation muti-task performance developed by NASA. The all sub-tasks were presented on the varied spatial location of the PC monitor, and their performance on each sub-task were calculated to evaluated the overall MATB-II performance. Recently, depth information can benefit both working memory and selective attention performance Yet, other researchers suggested more attentional cost in switching serially attention between two depths planes and induce high cognitive load. The aim of the present study is to investigate the performance and the mechanism of MATB-II under stereo (VR) and flat (PC monitor) environment. We recruited 49 participants (M = 18.63 years, SD = 0.78, female = 24) and require them to finish "Tracking task" and "System monitoring task" which as sub-task in the MATB-II. We adopted 2(task demand: low, high) × 3(Depth (No depth(ND), Tracking Far - System monitoring Near (TF-SN), Tracking Near - System monitoring Far (TN-SF)) within-subjects experimental design and measures NASA-TLX and HRV during each tasks to measure cognitive load. The dependent variable is task accuracy, total score of NASA-TLX and RMSSD of HRV. We found there was a significant main effect of depth (F(2, 96) = 115.01, p < .001, η_p^2 = 0.706) on Tracking task and System monitoring task (F(2, 96) = 10.32, p < .001, η_p^2 = 0.177). ND condition was performed better than TN-SF and TF-SN condition. Furthermore, these result is in line with NASA-TLX on main effect of depths (F(2, 96) = 10.489, p < .001, η_p^2 = 0.179) and RMSSD of HRV (F(2, 96) = 4.462, p = .014, η_p^2 = 0.085), indicates ND condition performed higher score of NASA-TLX and lower value of RMSSD than other conditions. In summary, this study advances our understanding of how users perceive and processing multi-tasks with different depth. Worse performance in processing multi-tasks in different depth plane than same depth plane may result in more cognitive load subjectively and objectively induced.

Keywords： MATB-II, muti-task, Virtual Reality (VR), Heart rate variability (HRV), cognitive load

跨期决策中的自我–他人差异：眼动证据

杨钰兰[1] 王嘉伟[1] 梁彦[1] 魏子晗[2] 刘洪志[1]（通讯作者）
1 南开大学周恩来政府管理学院社会心理学系，天津, 300350, liuhz@nankai.edu.cn
2 天津师范大学心理学部，天津, 300387

摘 要 跨期决策是指对发生在未来不同时间点上的结果做出选择的决策过程，它需要决策者在眼前利益与未来利益之间做出权衡与取舍，是关乎国计民生的重要决策类型。前人研究发现，个体在跨期决策中存在自我–他人决策差异，即，相比于为自己决策，个体在为他人进行跨期决策时会表现得更有耐心。然而，这种自我–他人决策差异的成因及心理机制尚缺乏足够证据。为检验跨期决策中自我–他人差异的认知加工

机制，本研究采用眼动追踪技术，基于被试内设计，考察了个体在为自己决策和为他人决策两种情境下行为指标和眼动指标的差异。研究结果发现：（1）在行为结果上，相比于为他人决策，在为自己进行跨期决策时，个体更倾向于选择小而近的选项，并表现出较高的时间折扣率，这与前人发现是一致的。（2）在眼动指标上，相比于为他人决策，在为自己进行跨期决策时，个体表现出更多的注视次数，决策前注视的信息比例更高，对结果维度的注视比例更低，随机眼跳指数越低。此外，这些眼动指标可以中介决策任务对跨期选择的效应。（3）决策任务调节了选项注视时间优势对选择的预测效应，即相比于为自己决策任务，选项注视时间优势在为他人决策任务中的预测效应更强，这表明为他人决策任务存在更多的自下而上的信息加工。（4）人际距离调节了决策任务对选择的预测作用，即人际距离越远，自我–他人决策差异越大。这些结果提示，相比于为他人决策，个体在为自己决策任务中表现出更高的卷入度和策略一致性，从而导致其在跨期决策中变得更加不耐心。本研究发现为解释自我–他人跨期决策差异提供过程检验的认知加工证据，并为今后的自我–他人决策差异研究提供了重要参考。

Self-other discrepancies in intertemporal choice: Eye-tracking evidence

Xing-Lan Yang[1]　Jia-Wei Wang[1]　Yan Liang[1]　Zi-Han Wei[2]　Hong-Zhi Liu[1*]

[1]Department of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin 300350, China; *Email: liuhz@nankai.edu.cn

[2]Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China

***Abstract*:** Intertemporal choice refers to decisions that involve tradeoffs among outcomes at different points of time. It is not only a unique characteristic of human behavior, but is also a relevant matter to policymaking and national welfare. Previous studies have revealed the self-other discrepancies in intertemporal choices, wherein individuals exhibited more patience when making intertemporal choices for others than for themselves. However, there is a lack of sufficient evidence on the underlying mechanisms of the self-other decision discrepancies. To examine the cognitive processing mechanisms underlying self-other discrepancies in intertemporal choice, the present study used eye-tracking techniques to examine the differences in behavioral and eye-tracking measures between decision for self and others in a within-subject design. The results revealed that: (1) individuals preferred the smaller-but-sooner options and showed greater discounting rate when making intertemporal choices for themselves compared with making decisions for others, which is consistent with previous findings. (2) Individuals showed more fixations, higher percentage of total information searched, lower outcome-gaze-proportion, and lower proportion of random transitions when making intertemporal choices for themselves than making decisions for others. In addition, these eye-tracking measures mediated the effect of the decision task on intertemporal choices. (3) The task moderated the predictive effect of option-based dwell advantage on choice. That is, the predictive effect of option-based dwell advantage was stronger in the decision-for-other task than the decision-for-self task, suggesting more bottom-up information processing in the decision-for-other task. (4) Interpersonal distance moderated the predictive effect of the decision task on choice. The farther the interpersonal distance, the greater the self-other decision discrepancies. These results suggest that compared with the decision-for-other task, individuals show higher engagement and strategic consistency in the decision-for-self task, leading to more impatience in intertemporal choice. The findings of this study provided cognitive processing evidence to explain self-other discrepancies in intertemporal choice and highlighted implications for future studies focusing on self-other discrepancies.

Keywords：intertemporal choice, self-other discrepancies, eye-tracking, discounting rate

外卖软件中营养标签对消费意愿的影响

刘翔宇[1]　刘洪志[1]（通讯作者）

1 南开大学周恩来政府管理学院社会心理学系，天津, 300350, liuhz@nankai.edu.cn

摘 要　营养标签是指预包装食品标签上向消费者提供食品营养信息和特性的说明，包括营养成分表、营养声称等内容。目前来看，学界关于营养标签对消费者行为影响的研究相对较少，营养标签在移动端软件上的应用研究也相对空缺。随着互联网经济的发展，移动端购物方式也越来越普遍，便捷的外卖成为非常广泛的就餐途径。根据《中国居民膳食报告》，我国居民的膳食存在严重的不平衡现象。基于《“健康中国2030”规划纲要》的指导，我国在营养均衡和营养知识普及上还需进一步努力，因此了解移动端软件中营养标签的影响对于改善现代消费者饮食结构具有十分重要的作用。本研究通过两个实验，系统考察了营养标签对个体的消费选择、购买意愿及健康评价等方面的影响。实验一考查了移动端外卖软件中营养标签对于店铺选择的影响。结果发现，消费者更可能选择有营养标签的店铺，且对有营养标签店铺的健康评价和信赖度比无营养标签店铺更高。实验二考查了影响标签对菜品选择的影响。结果发现，消费者对有无营养标签的菜品在选择上并无差异，但营养标签会提高消费者对菜品的积极评价。本研究结果表明，在移动端外卖软件上，相比于在菜品上标记营养标签，在店铺上标记营养标签的效果更好。本研究结果提示了个体对营养标签的认知特点，对营养标签在消费行为中的应用具有一定的指导作用，对食品健康领域的实践具有一定的启发。未来研究可考虑在本研究基础上进一步构建助推研究，帮助完善营养标签体制和监督市场，促进居民的饮食健康水平。

The influence of Front-of-Pack nutrition label on consumers' purchase intention in mobile software

Xiang-Yu Liu[1] Hong-Zhi Liu[1*]

[1] Department of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin 300350, China; *Email: liuhz@nankai.edu.cn

Abstract：The nutrition label refers to the description on the pre-packaged food that provides consumers with the nutritional information and characteristics of the food, including the nutrition facts table and nutrition claims. In recent years, few studies focused on the impact of nutrition labels on consumer behavior, and the application of nutrition labels on mobile software is also under development. With the growth of the digital economy, mobile shopping has become increasingly common, and convenient take-out has emerged as a popular dining option. According to the “Chinese Residents’ Dietary Report”, there is a significant imbalance in the dietary habits of Chinese residents. The “Healthy China 2030” program suggested that the Chinese government should make further efforts in popularizing nutritional knowledge. Therefore, understanding the impact of nutrition labels in mobile

software seems significant in improving the dietary patterns of the populations. Through two experiments, the present study systematically investigated the effect of nutrition labels on individual consumer choices, purchase intentions, and health evaluations. In Experiment 1, we examined the impact of nutrition labels in mobile delivery software on store preference. The results revealed that consumers are more likely to choose the stores with nutrition labels, and they hold higher health evaluations and trust for the stores with nutrition labels than the stores without labels. In Experiment 2, we examined the effect of labels on cuisine preference. The results showed that there was no significant difference in consumers' choices between cuisines with or without nutrition labels, but the nutrition labels had a positive effect on consumers' evaluation of the cuisine. Our findings suggest that, in the context of mobile delivery software, labeling nutrition information on stores is more effective than labeling it on the cuisine. These results shed light on individuals' cognitive characteristics related to nutrition labels, providing valuable guidance for the application of nutrition labels in consumer behavior and serving as an inspiration for the practices in the field of food health. Future research could consider further conducting nudge research based on our findings to help improve the nutrition label system and market supervision, so as to promote the dietary health levels of residents.

Keywords：nutrition label, mobile deliver software, health evaluation, purchase intention

偶然情绪对动态决策的影响：来自行为与 ERPs 的证据

赵睿楠[12] 赵迪[2] 徐雯静[1] 周丽清[1]（通信作者）

1 杭州师范大学经亨颐教育学院心理系，杭州，311100，zhouliqing@hznu.edu.cn

2 上海市精神卫生中心，上海，201109

摘 要 在社会生活中，人类经常需要在信息不完备的情况下做出决策，并从决策的结果反馈中习得规律，完成决策目标。以往研究大多关注情绪如何影响描述性决策，但情绪对动态决策的影响机制尚且不清楚，特别是动态决策的认知神经机制。本研究采用单因素（情绪类型：积极、消极、中性）被试间设计，要求被试在接受情绪处理后完成动态决策任务并达到决策目标，同时记录了其在完成动态决策任务时的行为和神经反应。结果发现，积极情绪组的决策正确率显著大于中性情绪组（$p<0.01$）。在决策结果反馈阶段，分数增加反馈比分数减小反馈诱发了更正的 P2 成分，分数减小反馈比分数增加反馈诱发更负的 FRN 成分。研究结果表明积极情绪更有利于决策目标的达成，在动态决策任务中，分数增加反馈诱发个体更强的认知冲突，分数减小反馈诱发个体在决策中预期与结果之间的更大偏离。在动态决策任务中，选择分数增加项会使下一次决策的每个选项分数都增加，而选择分数减小项会使下一次决策的每个选项分数都减小，而在每次决策中，分数增加项对应的分数总是小于分数减小项，从单个决策选择来看，选择分数减少项为最佳选择。然而，在整个动态决策过程中选择分数增加选项可以使累计的总分更高，更有利于目标分数的达成。个体需要从分数减小反馈中觉察到决策规律并调整决策，并克服认知冲突所造成的影响，最终达成决策的目标。本研究为情绪对动态决策的影响机制，以及动态决策的认知加工过程提供了初步的行为与电生理依据。

关键词 动态决策任务，偶然情绪，反馈，P2，FRN

The influence of contingent emotions on dynamic decision making: evidence from behavior and ERPs

Zhao Ruinan [12] Zhao Di[2] Xu Wenjing[1] Zhou Liqing[1] (Corresponding author)

1Hangzhou Normal University, Hangzhou, 311100,zhouliqing@hznu.edu.cn

2 Shanghai Mental Health Center, Shanghai ,201109,

Abstract **:** In social life, human beings often need to make decisions under the condition of incomplete information, and learn the rule from the feedback of the decision results to complete the decision goal. Most previous studies have focused on how emotion affects descriptive decision making, but the mechanism of emotion's influence on dynamic decision making is still unclear, especially the cognitive neural mechanism of dynamic decision making. In this study, a single factor (emotion type: positive, negative, neutral) inter-subject design was adopted. Subjects were required to complete the dynamic decision making task and reach the decision goal after receiving the emotion processing, and their behavior and neural response during the completion of the dynamic decision making task were recorded. The results showed that the decision accuracy of the positive emotion group was significantly higher than that of the neutral emotion group (p< 0.01). In the feedback stage of decision result, the increase of score induces the correct P2 component, and the decrease of score induces the more negative FRN component. The results show that positive emotion is more conducive to the achievement of decision-making goals. In dynamic decision-making tasks, the increase of score feedback induces stronger cognitive conflict, while the decrease of score feedback induces greater deviation between expectation and outcome in decision-making. In a dynamic decision making task, choosing the score increase item will increase the score of each option in the next decision, while choosing the score decrease item will decrease the score of each option in the next decision, and in each decision, the score corresponding to the score increase item is always

smaller than the score decrease item. From a single decision choice, choosing the score decrease item is the best choice. However, selecting the score increase option in the whole dynamic decision-making process can make the cumulative total score higher and more conducive to the achievement of the target score. Individuals need to perceive the decision rule from the feedback of score reduction and adjust the decision, and overcome the impact of cognitive conflict, and finally achieve the goal of decision. This study provides a preliminary behavioral and electrophysiological basis for the mechanism of emotional influence on dynamic decision making and the cognitive processing of dynamic decision making.

Keywords：dynamic decision task, contingent emotion, feedback, P2, FRN

社会距离对不同社会价值取向个体自我-他人风险决策的影响研究

石生浩　黄浦江　刘志远(通讯作者)
陕西师范大学心理学院，西安，710062
通讯作者邮箱：zyliu@snnu.edu.cn

摘 要　在自我-他人风险决策领域中，现有研究结论并不一致，这可能与研究者们没有充分考虑个体的人格特质与决策情境等因素有关系。目前，社会距离是否会对不同社会价值取向个体自我-他人风险决策产生影响还不清楚。为了探究该问题，我们设置三项研究：研究 1 基于大样本的问卷调查(N = 422)探究不同社会价值取向个体的自我-他人风险决策特点；研究 2 利用连续风险决策任务对研究 1 结果进行验证，并探究个体对决策结果的情绪反应在自我-他人风险决策中的作用；在研究 2 的基础上，研究 3 将他人区分为朋友和陌生人，探究社会距离对不同社会价值取向个体自我-他人风险决策的影响。研究 1 发现，亲自我价值取向个体为他人决策比为自己决策有更强的风险偏好，而亲社会价值取向个体为自己和他人决策时在风险偏好上无显著差异。研究 2 与研究 1 结果相一致，且还发现亲自我价值取向个体在为他人决策时若获得较差结果，其对该结果的消极感受程度更弱；而亲社会价值取向个体在为自己和他人决策获得较差结果时的消极感受程度无显著差异。研究 3 发现相比于为自己做决策，亲自我价值取向个体仅在为陌生人做决策时表现出更加冒险，遇到较差决策结果时消极感受程度更弱，而为朋友做决策在冒险行为及情绪上均没有显著差异；此外，亲社会价值取向个体为自己决策、为朋友决策和为陌生人决策在冒险行为和情绪上均无显著差异。综上，本研究表明社会价值取向这一人格特质与社会距离这一决策情境对自我-他人风险决策的影响存在着交互作用。这一发现有助于更加全面的了解自我-他人风险决策的内在机制，且对于理解人们在现实生活社会互动过程中的风险决策行为有着重要的启示作用。

关键词 自我-他人风险决策，社会价值取向，社会距离

Research on the impact of social distance on self-other risk decision-making for individuals with different social value orientations

Shenghao Shi, Pujiang Huang, and Zhiyuan Liu[CA]
School of Psychology, Shaanxi Normal University, Xi'an, 710062.

***Abstract*:** In the field of self-other risk decision-making, research findings are inconsistent, which may be related to researchers not fully considering individual personality traits and decision-making contexts. Currently, it is unclear whether social distance affects self-other risk decision-making for individuals with different social value orientations. To explore this question, we conducted three studies: Study 1 used a large sample questionnaire survey (N = 422) to investigate the characteristics of self-other risk decision-making for individuals with different social value orientations; Study 2 validated the results of Study 1 using a continuous risk decision-making task and explored the role of individuals' emotional reactions to decision outcomes in self-other risk decision-making; Building on Study 2, Study 3 differentiated others into friends and strangers to examine the impact of social distance on self-other risk decision-making for individuals with different social value orientations. Study 1 found that individuals with a strong self-value orientation had a stronger risk preference for others' decisions compared to their own decisions, while individuals with a strong social value orientation showed no significant difference in risk preference between their own and others' decisions. Study 2 confirmed the results of Study 1 and also found that individuals with a strong self-value orientation had weaker negative feelings towards poor decision outcomes when making decisions for others. However, individuals with a strong social value orientation showed no significant difference in negative feelings towards poor decision outcomes when making decisions for themselves or others. Study 3 found that compared to making decisions for themselves, individuals with a strong self-value orientation exhibited more risk-taking behavior only when making decisions for strangers, and they had weaker negative feelings towards poor decision outcomes. There were no significant differences in risk-taking behavior and emotions when making decisions for friends. Additionally, individuals with a strong social value orientation showed no significant differences in risk-taking behavior and emotions when making decisions for themselves, friends, or strangers. In conclusion, this study demonstrates that the interaction between social value orientation as a personality trait and social distance as a decision-making context influences self-other risk decision-making. This

finding contributes to a more comprehensive understanding of the underlying mechanisms of self-other risk decision-making and provides important insights into people's risk decision-making behavior in real-life social interactions.

接受-拒绝框架对跨期决策的影响：选项吸引力的调节效应

魏李帆[2] 杨钰兰[1] 刘洪志[1] 魏子晗[2]（通讯作者）

1 南开大学周恩来政府管理学院社会心理学系，天津，300350

2 天津师范大学心理学部，天津，300387 E-mail：weizihan@tjnu.edu.cn

摘 要 跨期决策是指在不同时间点权衡成本和收益的决策，通常要求个体在一个小而近和一个大而迟的选项间进行抉择，以考察个体的跨期偏好。以往研究总是在接受框架下考察跨期决策，根据个体选择接受哪个选项来构建提问框架。但已有研究表明，在“接受”和“拒绝”两种不同的提问框架下，个体的偏好并不总是保持一致，接受-拒绝框架对跨期决策的影响尚缺乏相关研究。本研究通过 3 个实验探究了接受-拒绝框架对跨期决策的影响及其认知机制。

实验一考察了接受-拒绝框架对跨期决策影响，结果发现，接受和拒绝框架下决策者的跨期偏好有显著差异，且受到选项吸引力差值的调节作用。具体来讲，当大而迟选项（LL 选项）的吸引力大于小而近选项的吸引力（SS 选项）时，决策者在接受框架下比拒绝框架下更偏好 LL 选项；当 LL 选项的吸引力小于 SS 选项的吸引力时，决策者在接受框架下比拒绝框架下更偏好 SS 的选项。实验二进一步采用眼动追踪技术探究了接受-拒绝框架对跨期决策影响的认知机制，依据强调假说理论，决策者在拒绝框架下认知负荷更大，决策难度更高，辨别力更弱，因此更不容易受到选项吸引力的影响。实验二的行为结果和眼动结果支持了这一理论，实验二的结果发现，接受比拒绝框架更受选项吸引力的影响，决策者在接受框架下比拒绝框架下更偏爱选项吸引力高的选项，并且与接受框架相比，被试在拒绝框架下的反应时和平均注视时长更长，说明其在拒绝框架下的认知负荷更大。实验三在理财储蓄和网络购物两种更自然的情景中再次检验了接受-拒绝框架对跨期决策的影响以及选项吸引力差异的调节作用。

本研究丰富和拓展了接受拒绝框架效应领域的相关研究，为跨期决策中的接受-拒绝框架效应提供了过程证据，有助于相关理论的进一步完善和发展。

The Impact of accept-reject frame on intertemporal choice: the moderating effect of option attractiveness

Li-Fan Wei[2] Xing-Lan Yang[1] Hong-Zhi Liu[1] Zi-Han Wei[2] (Corresponding Author)

1Department of Social Psychology, Zhou Enlai School of Government, Nankai University, Tianjin, 300350

2Faculty of Psychology, Tianjin Normal University, Tianjin, 300387 E-mail: weizihan@tjnu.edu.cn.

Abstract： Intertemporal choices refer to decisions involving tradeoffs between costs and benefits at different

times. individuals are usually asked to choose between a small sooner (SS) option and a large later (LL) option in order to examine their intertemporal preferences. Previous studies have always examined intertemporal choices in the accept-frame, wherein the choices were framed in terms of which option one would choose to accept. However, it has been demonstrated that individuals' preferences are not always consistent under accept-frame and reject-frame. There is a lack of research on the impact of accept-reject frame on intertemporal choice. The present research investigated the impact of accept-reject frame on intertemporal choice and its cognitive mechanisms behind through three experiments.

Study 1 examined the impact of accept-reject frame on intertemporal choice and found that participants' intertemporal choices are influenced by accept-rejection frames and this accept-reject frame effect was moderated by the option attractiveness differences. Specifically, when the option attractiveness of the large later (LL) option is greater than that of the small sooner(SS) option, decision maker are more likely to choose the LL option in the accept-frame than in the reject-frame; whereas, when the option attractiveness of the LL option is less than the SS option, the decision maker are more likely to choose the SS option in the accept-frame than in the reject-frame. Study 2 further explored the cognitive mechanism of the accept-reject frame effect on intertemporal choice using eye-tracking technology. And based on the accentuation hypothesis, the reject-frame is more difficult, people have to devote more effort to understanding the task itself, leaving fewer cognitive resources available for processing the options. People are less discriminating in the reject-frame than in the accept-frame, therefore less influenced by the attractiveness of options. Study 2 examined this account behind the reject-frame effect. The results showed that participants are more likely to choose the more attractive option in the accept-frame than in reject-frame, indicating that their preference was more likely to be influenced by option attractiveness in accept-frame compared to reject-frame. In addition, participants reaction time and mean fixation duration in reject-frame were longer than that in accept-frame, indicating that there are more cognitive load in reject-frame than than in accept-frame. Study 3 re-examed the impact of accept-reject frame effect in intertemporal choice and the moderating effect of option attractiveness differences in more natural scenarios.

This study provides process evidence for the accept-reject frame in intertemporal choice and contributes to the further improvement and development of related theories.

应用振动影像技术预测飞行员模拟飞行中的风险决策

黄睿[1]　刘映杰[1]（通讯作者）

1 华北理工大学心理与精神卫生学院，河北，唐山，063210

摘 要　随着民用航空的发展，飞行安全成为公众关注的焦点，其中飞行员的风险决策能力——即综合各种可能的结果和概率信息并制定最优行动方案的能力，尤为重要。本研究应用振动影像技术采集头面部肌肉振幅信息，采用 2（任务情境：正常和紧急）×2（锚定条件：高锚定启发和低锚定启发）×5（决策组块：组块 1 至组块 5）的混合实验设计，同时使用决策树算法模型进一步探索飞行员风险决策的预测指标，以此实现对飞行员风险决策的评估。研究共招募 41 名民航飞行员，要求他们在不同任务情境和认知启发条件下进行分阶段的飞行模拟驾驶和爱荷华赌博任务。结果发现，在紧急状态下飞行员更易做出风险决策，而在高锚定启发条件下则相反；在紧急情境下，低锚定启发条件更可能促使飞行员做出风险决策。根据决策

树算法模型，结果发现振动影像信息中的焦虑指数能够有效地预测飞行员在飞行过程中的风险决策。研究表明，高锚定启发的条件诱发了飞行员对飞行环境的关注和风险行为的高度认知，因此降低了他们在异常飞行情况下的风险决策，而通过分析飞行员头面部的焦虑指数信息能够更好地预测他们对于风险的“盲视”。本研究为预测飞行员风险决策提供了一种新的研究方法，能够为飞行训练提供新的参考。振动影像技术可作为一种新型的、非侵入式的生理信号监测方法，能够在飞行员认知评估领域提供有力支持。

Predicting Pilot's Risk Decision-Making during Simulated Flight Using VibraImage Technology

Rui Huang[1], Yingjie Liu[1] (Corresponding Author)
School of Psychology and Mental Health, North China University of Technology, Tangshan, Hebei, 063210, China

***Abstract*：** As the civil aviation industry advances, flight safety is garnering significant public attention, particularly the pilot's risk decision-making ability, which can integrate possible outcomes and probability information to devise optimal action plans. This research employs Vibraimage technology to collect facial muscle amplitude data from the head and face, implementing a 2 (task conditions: normal and emergency) × 2 (anchoring situations: high anchoring heuristic and low anchoring heuristic) × 5 (decision-making blocks: block1 to block5) mixed experimental design. Concurrently, a decision tree algorithm model was utilized to investigate predictive indicators of pilot risk decision-making further, thereby providing a comprehensive assessment. The research recruited a cohort of 41 aviation pilots, requiring them to perform sequential flight simulation tasks and the Iowa Gambling Task under various task conditions and cognitive heuristic situations. The results illustrate that pilots are more inclined to make risk decisions in emergencies, whereas the opposite is true in high anchoring heuristic conditions. Pilots are more likely to make risk decisions under emergencies with low anchoring heuristic conditions. Based on the decision tree model, it was revealed that the anxiety index within Vibraimage information could effectively predict pilot risk decisions during flights. The findings suggest that high anchoring heuristics conditions induced an elevated cognitive awareness and focus on the flight environment and risk-related behavior among pilots, thereby reducing their propensity for risky decision-making during abnormal flight situations. Analyzing facial anxiety index information provides a more accurate prediction of their risk of 'blindness'. This study offers a novel approach to predicting pilot risk decision-making, providing fresh insights for flight training. Vibraimage technology, as a non-invasive physiological signal monitoring method, can provide substantial support within the field of pilot cognition assessment.

第三方决策权对多人公平决策的影响

陆晓清　李特　李葆明　杨仲（通讯作者）
杭州师范大学基础医学院脑科学研究所，杭州，311121

摘 要　公平是人类社会的基本价值理念和行为准则，人们的公平决策行为不仅取决于自己是否受到公平对待，也会考虑到其他的社会成员。前人基于多人最后通牒博弈范式的研究表明，对第三方可能同时存在不平等厌恶和社会比较两种心理机制，且可能会受到第三方身份的调控。然而，这两种心理机制在不同情境中是如何变化的仍不清楚，且不平等厌恶理论不能很好地解释已有的多人公平决策研究结果。为了阐明不同情境下多人公平决策的心理机制，本研究采用了修改版的三人最后通牒博弈范式，并结合计算建模的方法，探讨第三方决策权（无决策权 vs.有决策权）对多人公平决策行为的影响。研究结果表明相比于第三方无决策权条件，第三方有决策权条件下对自己公平/第三方不公平方案的接受率更高。另外，混合线性模型的结果显示，尽管第三方收益在两种决策条件下都会影响决策行为，但第三方有决策权时的影响相对更小。计算建模结果表明，在第三方无决策权时，人们会采用公平准则进行决策，对第三方同时存在不利不平等厌恶和有利不平等厌恶；在第三方有决策权时，人们会同时采用公平准则和社会比较的准则进行决策，对第三方存在不利不平等厌恶和有利不平等偏好。基于此，本研究的结果扩展了不平等厌恶理论的内涵，指出对不同身份的对象可能存在不同程度的不平等厌恶，甚至可能存在不平等偏好。

The Influence of Third-Party's Decision-Making Power on Multi-person Fairness Decision-Making

Xiaoqing Lu Te Li Baoming Li Zhong Yang
Institute of Brain Science, School of Basic Medical Sciences, Hangzhou Normal University, Hangzhou, 311121

Abstract **：** Fairness is a fundamental value and behavioral norm of human society. People's fairness decision-making depends not only on whether they themselves are treated fairly, but also on their consideration of other members of society. Previous studies based on the multi-person ultimatum game have shown that people can exhibit both inequity aversion and social comparison when it comes to their perception of third party, which may be regulated by the identity of the third party. However, it is still unclear how these two motivations vary in different contexts, and the inequity aversion theory does not catch well the existing results from studies on multi-person fairness decision-making. In order to clarify the psychological mechanisms underlying multi-person fairness decision-making in different scenarios, we employed the modified three-person ultimatum game and combined it with computational modeling methods to investigate the influence of third-party's decision-making power (powerless vs. power) on multi-person fairness decision-making. Our results indicated that compared to the condition where the third party was powerless, the acceptance rates of Self-Fair/Other-Unfair offer were higher. Furthermore, the results of the mixed linear model indicated that although the third-party payoff influenced decision-making in both conditions, its impact was relatively smaller when the third party has power. Computational modeling results suggested that when the third party was powerless, people tended to make decisions based on the fairness norm and exhibited both disadvantageous and advantageous inequity aversion towards the third party. When the third party has power, people made decisions based on both the fairness norm and social comparison, exhibiting both disadvantageous inequity aversion and advantageous inequity preference towards the third party. This study may contribute to the expansion and improvement of the theory of inequity aversion, suggesting that there may be varying levels of inequity aversion and even inequity preferences, for individuals with different identities.

积极视角的综合干预对老年人心血管健康促进：一项随机对照实验

翟博宇[1,2] 刘笑梅[1,2] 朱心怡[1,2] 郑志伟[1,2] 李娟[1,2]（通讯作者）
1 中国科学院心理研究所心理健康重点实验室老年心理研究中心，北京，100101
2 中国科学院大学心理学系，北京，100049

摘 要 心血管疾病作为健康的主要威胁之一，在老年人群中的发病率尤为突出。已有研究发现，改善老年人的心理健康对于促进心血管健康具有重要意义。积极的心理健康可直接影响生理功能，如降低血压、控制血糖。同时，促使个体采取更健康的行为，如加强体育锻炼，从而改善心血管健康。遗憾的是，少有研究系统性融合积极心理和生活方式两大方面对心血管健康进行综合干预。因此，本研究的目标是通过 6 个月的积极心理与生活方式管理综合干预，提升有心血管健康风险的社区老年人的心理和身体健康。纳入标准为：（1）年龄：60-80 岁；（2）社区常住居民；（3）初中及以上学历；（4）心脑血管病风险评估

10 年风险指数≥5%；（5）存在可改变的心血管健康风险因素。排除标准为：（1）因身体功能受限或健康状况影响，无法参与干预活动；（2）存在认知功能损伤；（3）存在重度负性情绪症状。正式试验共招募了 253 名符合入组标准的社区老年人，平均年龄为 69.08 岁（范围=60-80 岁，*SD*=5.19）。采用随机对照试验设计，被试被随机分配到综合干预组（*n*=85）、生活方式组（*n*=84）和消极对照组（*n*=84）。综合干预组采用团体辅导的形式，每组约 14 人（范围=11-16 人），每周进行 1 次约 1 小时的活动，共进行 24 次。干预内容包括积极心理辅导（自身认知、情绪体验、人际关系）和积极生活方式管理（膳食、运动、睡眠等）。生活方式组的干预内容与综合干预组的积极生活方式管理主题内容相同，同样采用团体活动形式，每 3 周 1 次，每次活动约 1 小时。消极对照组维持日常活动，不接受任何形式的干预。前期预试验结果显示，干预方案在可行性和依从性方面表现良好，并且被试的身心健康呈现改善的趋势。本研究将为进一步了解积极心理对心血管健康的影响提供新的证据支持。同时，本研究对推动老年人心理健康和健康生活方式的发展、改善心血管健康、提高老年人的生活质量具有重要的现实意义。

Ameliorate Cardiovascular Condition through Positive Psychology and Lifestyle Intervention in China (ACCOMPLI-CH): A Randomized Controlled Trial

ZHAI Boyu[1 2] LIU Xiaomei[1 2] ZHU XinYi[1 2] ZHENG ZhiWei[1 2] LI Juan[1 2]

1 Center on Aging Psychology, CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing

Abstract：Cardiovascular diseases, as one of the major health threats, have a high prevalence, particularly among older adults. Previous research has found that psychological well-being improvement is of significant importance for promoting cardiovascular health. Positive psychological health has a direct impact on physiological functions, such as lowering blood pressure and controlling blood glucose level. Additionally, individuals with a higher level of psychological well-being are more likely to adopt healthy behaviors, for instance engaging in regular physical exercise, which in turn would improve cardiovascular health. Unfortunately, there is limited research that systematically incorporates both positive psychological intervention and lifestyle management as a multidomain intervention approach for cardiovascular health. Therefore, this study aimed to enhance the psychological and physical health of community-dwelling older adults who are at risk of cardiovascular health issues through a comprehensive multidomain intervention of positive psychological intervention and lifestyle management over a period of six months. The inclusion criteria for participants were as follows: (1) aged between 60-80 years; (2) permanent residents in the community; (3) at least a junior high school education; (4) 10-year cardiovascular risk assessment index ≥5%; (5) presence of modifiable cardiovascular risk factors. Exclusion criteria include: (1) limited physical functioning or poor health conditions that prevented from participation in intervention activities; (2) cognitive impairment (assessed using the Mini-Mental State Examination, MMSE score<24); (3) severe negative mood symptoms. A total of 253 eligible community-dwelling older adults were enrolled in the intervention study, with an average age of 69.08 years (range=60-80 years, *SD*=5.19). The study employed a randomized controlled trial design, and participants were randomly assigned to the multidomain intervention group (*n*=85), lifestyle intervention group (*n*=84), or control group (*n*=84). The multidomain intervention group received

group counseling sessions with approximately 14 participants per group (range= 11-16), which was delivered once a week for approximately one hour, totaling 24 sessions. The intervention content encompassed positive psychological counseling (self-cognition, emotional experience, and relationships) and healthy lifestyle management (diet, physical exercise, and sleep). The training curriculum in the lifestyle intervention group were the same as those covered in the multidomain intervention group, and it was delivered every three weeks with each session for about one hour. The control group maintained their regular activities without any form of intervention. Preliminary results of pilot trial indicated good feasibility and compliance with the intervention, with trends of improvement in the outcomes for health and psychological well-being. This study is expected to provide new evidence for further understanding the impact of positive psychological well-being on cardiovascular health. Additionally, the research holds significant practical implications in enhancing psychological well-being and healthy lifestyle, cardiovascular health, and quality of life among older adults.
Keywords **：** Cardiovascular health, older adults, positive psychological intervention, lifestyle management, well-being

轻度认知障碍老人注意网络间交互作用模式的改变

马玲[1]，何昊[1,2]，陈娟[1]，邱月虹[1]，陈毅琦[1,3]，关青[1,2]（通讯作者）

[1]深圳大学心理学院,深圳,518060，hehao@szu.edu.cn

摘 要 以往研究证实了轻度认知障碍(mild cognitive impairment, MCI)老人的注意功能网络出现损伤，但尚不清楚其中警报、定向、执行控制三个子网络之间的交互模式是否伴随 MCI 而改变。为回答这一问题，本研究招募了 21 名 MCI 老人和 27 名健康对照(HC)老人，采用改进的注意网络测试(ANT-R)来测量注意网络及其相互作用。结果发现，在网络主效应方面，与 HC 组相比，MCI 组在正确率上表现出了较差的执行控制和有效性效应。在子网络的交互作用方面，执行控制网络与警报网络的交互作用、Flanker 冲突加工与位置冲突加工的交互作用无显著的组间差异。而定向网络对冲突解决的促进作用在 MCI 组和 HC 组之间的表现模式不同：MCI 组较少表现出网络间的交互作用，并且两组在线索有效性与 Flanker 冲突加工的交互作用上存在显著的组间差异。这些结果表明，MCI 老人的注意功能网络的改变主要反映在定向网络和执行控制网络的相互作用上，提示 MCI 老人对线索的敏感性、将注意力从错误线索转移到目标刺激的实际位置、抑制无关信息以解决冲突等诸项能力下降。本研究进一步加深了对 MCI 老人注意力下降的认识，为 MCI 的检测和干预提供了新的思路。

[3]Department of Psychology, University of Mannheim, Mannheim, Germany

Abstract： Previous studies have found that older adults with mild cognitive impairment (MCI) has a decline in attention ability, especially in the three attentional networks of alerting, orienting, and executive control. This study aimed to further address the question of whether the interactions between these networks are altered in older adults with MCI. Using the revised attention network test (ANT-R), we examined attention networks and their interactions in 21 older adults with MCI and 27 demographically-matched HCs. We observed that compared to the HC group, the MCI group showed poorer executive control and validity effect on accuracy. The executive control network interaction with alerting network and the flanker conflict effect interaction with location conflict effect had no significant group difference. The orienting network fostered conflict resolution with different manifestations between MCI and HC groups, the MCI group showed less interaction between networks, and there was a significant group difference in the validity-flanker interaction. These results showed that the altered attentional function network in older adults with MCI is reflected in the interaction between the orienting network and the executive control network, which suggests that decreased attention function in MCI patients may be due to reduced cue-sensitivity and decreased ability to shift attention from error cues to the actual location of the target stimulus, inhibit irrelevant information to resolve conflict, which deepens the understanding of attention decline and provides a new idea for the detection of MCI and interventions.

老年人移动支付中的交易金额输入错误特征及界面优化

乔思远　马国杰　庄想灵（通讯作者）

陕西师范大学心理学院，西安，710000，通讯作者邮箱：zhuangxl@snnu.edu.cn

摘 要　老年人在使用微信、支付宝等程序进行移动支付时，往往会出现各种各样的输入错误，导致对移动支付的信任程度大大降低，甚至会拒绝使用。从支付的心理过程看，正确的支付包含金额输入和核查确认过程。与此对应，我们分两个研究分别探讨了老年人金额输入中的错误特征和提高核查绩效的界面优化方

法。研究一招募了 52 名老年人（$M_{年龄}$ = 69.88, SD = 5.05）在有时间压力的条件下模拟使用微信支付界面输入指定交易金额，记录其输入的错误及老人是否意识到错误。通过对收集到的 711 个错误进行分类，根据每一种错误类型中未意识到的错误个数/该类型错误总个数得到的比例来看，397 个未意识到错误中以下四种错误较危险、难觉察，分别是数字转置（84.44%）、小数点错误（64.58%）、数字错误（59.56%）、数字增加或减少（37.01%）。为了提高老年人对数字金额的核查能力，研究二中我们提出了一种模拟纸币交易的人民币图像反馈界面，招募无反馈组 14 名（$M_{年龄}$ = 70.21, SD = 4.84），有人民币图像反馈组 13 名老年人（$M_{年龄}$ = 69.00, SD = 4.51），分别完成模拟的金额核查任务，即判断支付界面的交易金额是否和听到的语音（如“请支付一百二十元”）一致，其中在不一致条件下设置了研究一中的四种错误类型，在模拟金额核查任务后老年人还完成了主观评估。基于信号检测论的分析结果显示，相比于无反馈组，人民币图像反馈组的老年人对错误的辨别力更高，尤其是对最难发现的数字转置和小数点错误，而且人民币图像反馈组的判断标准更低、更宽松，更倾向于将界面的金额判断为错误；另外，人民币图像反馈组的老年人在任务中对错误的识别能力（识别速度、识别准确性、易识别性）和对界面支付透明度的主观评分均显著高于无反馈组。综上，本研究发现了老年人移动支付界面输入的典型错误类型，并提出了增加人民币图像反馈的优化方案，有效提高了老年人对错误金额的辨别能力，增强了老年人对错误金额识别的信心，提升了界面的支付透明度，这为移动支付界面老年版本的设计提供了参考。

Characteristics of Transaction Amount Input Errors and Interface Optimization in Mobile Payment for the Older Adults

Siyuan Qiao, Guojie Ma, and Xiangling Zhuang [CA]
School of Psychology, Shaanxi Normal University, Xi'an, 710000.

Abstract：When older people make mobile payments using programs such as WeChat and Alipay, they tend to make a variety of input errors, leading to a much lower level of trust in mobile payments, and they may even refuse to use them. From the perspective of the psychological process of mobile payment, correct payment

involves inputting and confirmation of the payment amount. Correspondingly, we explored the characteristics of errors in the amount of input and interface optimization methods to improve verification performance among older adults in two studies, respectively. In Study 1, 52 older adults (M_{age} = 69.88, SD = 5.05) were recruited to simulate using the WeChat payment interface to input a specified transaction amount in a time-pressured condition, and their input errors and whether the older adults were aware of the errors were recorded. By categorizing the 711 errors collected, based on the ratio obtained from the number of unrecognized errors in each error type/total number of errors of that type, the following four errors among the 397 unrecognized errors were more dangerous and difficult to detect, which were digit transposition (84.44%), decimal point error (64.58%), digit error (59.56%), and digit increase or decrease (37.01%). To improve older adults' ability to verify numerical amounts, in Study 2 we proposed a RMB image feedback interface that simulated paper money transactions, recruiting 14 older adults in the no-feedback group (M_{age} = 70.21, SD = 4.84) and 13 older adults in the group with RMB image feedback (M_{age} = 69.00, SD = 4.51) to complete the simulated amount verification task, i.e., to determine the payment interface whether the transaction amount was consistent with the voice heard (e.g., "Please pay one hundred and twenty yuan"), where the four error types from Study 1 were presented in the inconsistency condition. The older adults also completed a subjective assessment after the simulated amount verification task. The results of the analysis based on the signal detection theory showed that compared to the no-feedback group, the older adults in the RMB image feedback group had a higher discrimination of errors, especially for the most difficulty in detecting number transposition and decimal point errors, and that the RMB image feedback group had lower and more loose judgmental criteria, and were more inclined to judge the amount of money in the interface as an error; furthermore, the older adults in the RMB image feedback group were more capable of recognizing the errors in the task (measured by speed, accuracy, and ease of recognition) and subjective ratings of the transparency of payment in the interface were significantly higher than those of the no-feedback group. In summary, this study found the typical types of input errors in the mobile payment interface for older adults and proposed an optimization method to increase the RMB image feedback, which effectively improved the ability of the older adults to identify the wrong amount, strengthened the confidence of the older adults in identifying the wrong amount, and enhanced the payment transparency of the interface, which provides a reference for the design of the older adults version of the mobile payment interface.

Keywords：mobile payments, input errors, older adults, RMB image feedback

动态视频中群体情绪判断准确性的年龄差异

金梦菡[1] 彭华茂[1*]（通讯作者）

1 北京师范大学心理学部，北京，100875

2 北京师范大学心理学部，北京，100875，penghuamao@bnu.edu.cn

摘 要 群体情绪（group emotion）是指一个群体表现出来的情绪趋同性。判断群体情绪不仅意味着要观察感知其中每个人情绪，还需要感知群体的整体氛围，这不仅依赖于个体的人际经验，还可能依赖于情绪信息的识别和加工能力。过往研究在关注判断动态视频中人物情绪时，老年人与年轻人的判断准确性并没有一致可靠的年龄差异结论。本研究旨在探究老年人和年轻人在判断动态视频中群体情绪时的年龄特点。

研究共招募了 47 名老年人（M_{age}=65.21±3.30）和 48 名年轻人（M_{age}=19.88±2.1）。实验视频材料来源于三组大学生（每组 4 人）的讨论录像，从中共截取出 30 个片段短视频用于被试观看。被试按照随机顺序

依次观看这 30 段视频，每看完一段视频需要评定这个小组的整体情绪的唤醒度。此外，被试的认知能力（加工速度、工作记忆、抑制能力）和共情倾向也进行了测量。视频中每位学生的心率数据由佩戴的心率腕表所记录和收集，心率被认为是个体情绪唤醒度的客观生理指标。因此，将每个被试的判断准确性定义为在 30 个视频片段中群体情绪唤醒度评定与视频人物平均心率的相关系数 r，r 值越大表示判断越准确。t 检验结果发现，老年人的判断准确性显著低于年轻人的判断准确性（t=4.45，p<0.001）。并且，分层回归分析结果表明，在控制了共情分数之后，年龄组仍然能够显著预测准确性（β=0.39, p<0.001），表现为老年组的判断更不准确。但是当控制了认知能力之后，年龄组的预测作用就不显著了（β=0.20, p=0.329）。

本研究的结果表明，在判断群体情绪时，与年轻人相比，老年人表现出更低的准确性。判断群体情绪与共情倾向无关，但这些年龄差异能一定程度上得到认知能力的解释。具体来说，老年人认知能力的下降可能导致他们在处理和解读动态视频中的情绪线索信息时效率降低，这使得他们更难判断多人的群体情绪。这意味着影响老年人判断群体情绪的关键可能不在于共情能力，而更可能在于加工分析线索信息的能力。

Age Differences in the Accuracy of Video-based Group Emotions Judgment

Menghan Jin[1] Huamao Peng[1*]

[1] Institute of Developmental Psychology, Beijing Normal University, Beijing, China

***Abstract*：** Group emotion refers to the phenomenon where a group exhibits emotional convergence. Judging group emotion not only involves perceiving the emotions of each individual but also sensing the overall atmosphere of the group. This process relies not only on individual interpersonal experiences but also on the recognition and processing of emotional information. Previous studies on judging emotions of characters in dynamic videos have not reached a consistent and reliable conclusion regarding age differences between older and younger adults. This study aims to explore the age characteristics of older and younger adults in judging group emotions in dynamic videos.

The study recruited 47 older adults (M_{age}=65.21±3.30) and 48 younger adults (M_{age}=19.88±2.1). Experimental video materials were obtained from recorded discussions of three groups of university students, with each group comprising four individuals. From these recordings, 30 short video clips were extracted for participants to watch. The participants viewed the 30 video clips in a random order, and after each clip, they were required to rate the overall emotional arousal of the group. Additionally, the participants' cognitive abilities (processing speed, working memory, inhibitory ability) and empathic tendencies were measured. Heart rate data of each student in the video were recorded and collected using a heart rate wristband, which was considered an objective physiological indicator of individual emotional arousal. Thus, the judgment accuracy of each participant was defined as the correlation coefficient (r) between their ratings of group emotional arousal in the 30 video clips and the average heart rate of the characters in the videos. A higher r value indicates higher judgment accuracy. The t-test results revealed that the judgment accuracy of older adults was significantly lower than that of younger adults (t=4.45, p<0.001). Furthermore, hierarchical regression analysis indicated that even after controlling for empathic scores, age remained a significant predictor of judgment accuracy (β=0.39, p<0.001), indicating that the older group's judgments were less accurate. However, after controlling for cognitive abilities, the predictive effect of age was no longer significant (β=0.20, p=0.329).

The results of this study suggest that compared to younger adults, older adults demonstrate lower accuracy in judging group emotions. The judgment of group emotions is unrelated to empathic tendencies, but these age differences may be partly explained by declines in cognitive abilities. Specifically, the decline in cognitive abilities among older adults may result in reduced efficiency in processing and interpreting emotional cues in dynamic videos, making it more challenging for them to judge the emotions of multiple individuals in a group. This suggests that the key factor influencing older adults' judgment of group emotions may not lie in empathic abilities but rather in their ability to process and analyze cue information.

老年人社会参与的目标导向和自我调节策略与心理健康的关系

刘小溪[1]　高林[1]　王大华[1]（通讯作者）

1 北京师范大学，北京，100875

1 北京师范大学心理学部，北京，100875，通讯作者 E-mail: wangdahua@bnu.edu.cn

摘 要　基于社会情绪选择理论和毕生发展控制理论，研究老年人参与社会活动的目标导向，自我调节策略，以及其与心理健康的关系。经过专家评定，将 287 位老人报告的持续参与 3 个月以上的一项社会活动分为情感导向和知识导向，使用修订的 16 个条目的老年人自我调节策略问卷，评估以实现活动目标为目的的结合策略和以自我保护为目的的解除策略，该问卷的内部一致性系数为 0.926，重测信度为 0.858。研究采用问卷法对老年人在社会参与过程中的自我调节策略和三个心理健康指标（孤独、抑郁、焦虑）进行了测量，结果没有发现老年人的心理健康指标在以目标导向和情感导向上存在显著差异。但研究发现，老年人在参与社会活动时所采用的结合策略和解除策略与老人心理健康指标存在显著关联，即以实现目标为目的的结合策略得分高的老年人在孤独和抑郁水平上显著低于结合策略得分低的老年人，表明结合策略对心理健康有优势效应；而解除策略得分高的老年人在焦虑水平上显著高于解除策略得分低的老年人，表明对于有参与活动目标的老年人，以自我保护为目的的解除策略并不缓解老年人焦虑的水平。

The relationship between goal orientation and self-regulation strategies in the social participation of elderly individuals and their psychological well-being

LIU Xiaoxi[1], GAO Lin[1], WANG Dahua[1]

[1]Insititute of Developmental Psychology, Beijing Normal University, Beijing 100875, China

Abstract：Based on the Socioemotional Selectivity Theory and the Life-Span Theory of Control, this study explores the goal orientations, self-regulation strategies, and their relationship with psychological well-being among elderly individuals participating in social activities. After expert evaluation, 287 elderly participants who engaged in a single social activity for more than 3 months were categorized into two groups: emotion-oriented and knowledge-oriented. The revised 16-item Elderly Self-Regulation Strategy Questionnaire was used to assess

strategies focused on an engagement strategy oriented towards goal pursuit and the other being a disengagement strategy oriented towards self-protection. The Cronbach's α of the questionnaire was 0.926, and the retest reliability was 0.858. The study utilized a questionnaire to measure the self-regulation strategies adopted by the elderly during social participation and three psychological well-being indicators (loneliness, depression, and anxiety). The results did not reveal significant differences in the psychological well-being indicators between elderly individuals with knowledge orientations and those with emotion orientations. However, the study found a significant correlation between the engagement strategies and disengagement strategies used by the elderly in social activities and their psychological well-being indicators. Specifically, elderly individuals with higher scores in engagement strategies demonstrated significantly lower levels of loneliness and depression compared to those with lower scores, indicating a beneficial effect of engagement strategies on psychological well-being. On the other hand, elderly individuals with higher scores in disengagement strategies exhibited significantly higher levels of anxiety compared to those with lower scores, suggesting that disengagement strategies did not alleviate anxiety levels among elderly individuals with activity-related goals.

学习、休闲和社交降低老年抑郁风险：基于机器学习的非线性视角

高林[1]　王大华[1]（通讯作者）

1 北京师范大学发展心理研究院，北京，100875

通讯作者 E-mail：wangdahua@bnu.edu.cn

摘 要　**背景和目的：**以往研究表明，老年人的日常活动模式与抑郁存在关联。然而，这些研究仅从线性视角检验了活动投入水平或种类多样性对抑郁的影响。本研究旨在从基于机器学习的非线性视角进行探究：（1）检验老年人的日常活动特征是否能预测抑郁风险；（2）确定哪些日常活动特征是预测抑郁风险的关键因素。**方法：**我们在国内七个城市的养老社区招募了 564 名老年人（平均年龄 80.58 ± 6.77 岁），并进行了问卷调查。基于简版 CES-D 量表的得分，我们确定了 139 名受访者（24.65%）存在抑郁风险。我们使用极致梯度提升树（XGBoost）算法，将受访者的人口学信息和日常活动特征作为预测变量，预测其是否存在抑郁风险，并使用 SHapley 增量解释值（SHAP）评估特征的重要性。**结果：**模型的预测准确率为 89.35%（95%置信区间：83.53%~95.29%），F1 分数为 90.11%（95%置信区间：84.48%~95.40%），AUC 为 96.38%（95%置信区间：91.52%~99.70%）。学习时长、休闲时长和与朋友聚会是预测抑郁风险最关键的三个活动特征。此外，照料他人呈正向预测抑郁，而在社区活动中心服务和养护绿植呈负向预测抑郁。**结论：**老年人的日常活动特征能够有效地预测抑郁风险。保障老年人群在终身学习、休闲活动和社交关系中的充分投入是降低晚年抑郁风险的关键措施。社区应特别关注有照料负担的老年人的心理健康问题。

Learning, Leisure, and Social Interaction Can Reduce Late-Life Depression Risk: A Machine Learning-Based Nonlinear Perspective

Lin Gao[1], Dahua Wang[1]
[1] Institute of Developmental Psychology, Beijing Normal University, Beijing, China

***Abstract*：** **Background and Objectives:** Previous studies have indicated an association between daily activity patterns and depression among older adults. However, these studies have primarily examined the linear effects of activity levels or diversity on depression. This study aimed to explore the relationship from a nonlinear perspective based on machine learning. Specifically, it aimed to (1) examine whether daily activity characteristics can predict depression risk in older adults and (2) identify key factors among daily activity characteristics for predicting depression risk. **Method:** A questionnaire survey was conducted with 564 older adults (mean age = 80.58 ± 6.77 years) recruited from retirement communities in seven cities of China. Based on scores from the brief version of the Center for Epidemiologic Studies Depression Scale (CES-D), 139 participants (24.65%) were identified as being at risk of depression. XGBoost algorithm, a gradient boosting method, was used to predict depression risk using demographic information and daily activity characteristics as predictors. The SHapley Additive exPlanations (SHAP) values were employed to assess the importance of each feature. **Results:** The model achieved an accuracy of 89.35% (95% confidence interval: 83.53%~95.29%), an F1 score of 90.11% (95% confidence interval: 84.48%~95.40%), and an area under the curve (AUC) of 96.38% (95% confidence interval: 91.52%~99.70%). The duration of learning, leisure activities, and gathering with friends were identified as the three key activity features for predicting depression risk. Additionally, caregiving had a positive predictive effect on depression, while serving in community activity centers and plant cultivation had negative predictive effects. **Conclusion:** The daily activity characteristics of older adults can effectively predict depression risk. Ensuring their active engagement in lifelong learning, leisure activities, and social relationships is a key measure for reducing late-life depression risk. Community interventions should pay particular attention to the mental health of older adults burdened with caregiving responsibilities.

3.湖州师范学院人文学院，湖州，313000
4.湖州师范学院团委，湖州，313000

摘　要　在社会大转型过程中，伴随流动人口的大幅度增长，与留守老年人群相对应，出现了另一类老年人口，即“老漂族”。为了支持子女、照顾孙辈、默默支持二胎三胎生育政策的实施，他们本应在故乡安享幸福晚年，却漂流到陌生的他乡，成为城市中一个被忽视的弱势群体。暮年离土，境况如何，路在何方？通过在全国华东地区五省一市以及

其他地区的部分省份运用访谈法对千名“老漂族”进行调查，并对其中百名困境较为突出、尤其是“漂”在浙江的“老漂族”进行个案分析，**结果发现：**（1）“老漂族”多为女性，以单“漂”、乡-城“漂”、被动“漂”为主，“漂”的原因多为照顾孙辈及家庭。（2）部分“老漂族”虽然体验到生命的价值和家庭的幸福，但多数“老漂族”在生活中多面临“融不进、回不去”的两难困境：“融不进”主要体现在日常生活难以适应、核心家庭难以融入、家庭教育难以提议、地域文化难以调和等方面；“回不去”主要表现在房屋年久失修居无定所、年老体衰生理不济、旧友难寻情感无托等方面。（3）“老漂族”“异乡难融、故里难归”进退两难困境的主要原因是生活差异筑成的现实鸿沟和传统观念导致的情感牢笼，难以调节的生活模式、相互排斥的教养方式、异地政策限制的社会保障等使“老漂族”异乡难融；天伦之乐思想的牵绊、落叶归根念想的无望、对子女“扶上马再送一程”的奉献等使“老漂族”故里难归。为破除“老漂族”进退两难的困境，**研究建议，**针对“漂”在异乡的“老漂族”，从“医、养、乐、学、为”五方面为“老漂族”创建“融得进的城”，针对回归故乡的“老漂族”，可从“居、护、念、宽”四方面为“老漂族”创建“回得去的乡”，使他们漂归皆宜，提升晚年幸福！本项目研究成果不仅对于解决老年人口流动、托老育幼等问题具有重要参考价值，而且可为当前转型社会我国老“漂”友好型社会的建设起到抛砖引玉的作用；同时可为我国孝道文化发展、家庭和谐发展、民生政策改善、三胎政策实施等提供理论参考依据。

Where is the road when leave from home town in the old age?

——The dilemmas and countermeasures for the “Lao piao zu”

Zhao Lingling[1]，Zhang Yuxi[2]，Zhang Xinyu[3]，Hua Jiaying[3]，Guan Xuejiao[4]，Zhu Jing[1]，Chen Chuanfeng[1](Corresponding author)

1.College of Teacher Education，Huzhou University，Huzhou 313000，corresponding author E-mail:2089178531@qq.com

3.College of Humanities，Huzhou University，Huzhou，313000

4.Youth League Committee，Huzhou University，Huzhou，313000

Abstract: With the substantial growth of the floating population，“Lao piao zu” (who leave from their hometown in the old age)， corresponding to the left-behind elderly population， has emerged. In order to support their children，take care of their grandchildren，and support the implementation of the two-child and three-child birth policy，they gave up on enjoying a happy life in their old age at their hometown，and drifted to a strange place and became a neglected and vulnerable group in the city. Then what's their survival status and what's the right way of them to get out of troubles？A survey of interview was conducted among 1,000 “Lao piao zu” in five provinces and one city in eastern China and some provinces in other regions, and case study was conducted in Zhejiang province among 100 “Lao piao zu” who suffered from serious dilemmas in their life . The results are as follows:(1) Most of “Lao piao zu” are women，mainly single “drift”，township-city “drift”and passive “drift” and the reason for drifting is mostly taking care of grandchildren and families. (2)Although some“Lao piao zu” have experienced the value of life and the happiness of their families, most of the them face the dilemma of “can't adapt to city and can't go back hometown”.“Can't adapt to city” is mainly reflected in the difficulty of adapting to daily life，the difficulty of integrating into the nuclear family， the difficulty of proposing family education advise，and the difficulty of reconciling regional culture；“Can't go back their hometown” is mainly manifested in the the disrepairing houses，the weakness of physical，the difficulty of finding emotional support from old friends,etc. (3)The main reasons for the dilemma of “Lao piao zu” are the realistic gap built by life differences between the new residential place and their hometown and the emotional cage caused by traditional concepts.The hard-to-adjust life pattern, the mutually exclusive upbringing styles, the social security restricted by the displaced policy make the“Lao piao zu” difficult to

adapt to city life. The thought of family happiness, the hopelessness of getting back home, and the dedication to their children constantly make them difficult to return to their hometown. In order to break the dilemma of “Lao piao zu”，the study suggests that we should create a “city that can be adapted” from the five aspects，and we can create a "hometown that can go back" from the four aspects to make them have a happiness life in old age！The research results of this project not only have important reference value for solving the problems of elderly population mobility，caring for the elderly and raising children，but also play a role in the construction of China's old “drift” friendly society in the current transition society.At the same time，it can provide theoretical reference for the development of filial piety culture，the harmonious development of families，the improvement of people's livelihood policies，and the implementation of the three-child policy in China.

Keywords:“Lao piao zu”; the dilemma of adaptation to city life; the dilemma of returning hometown; “Lao piao”friendly society

公众对失独父母的伦理归咎
及其对公众关于失独父母困境感知的影响

李金凤　王大华（通讯作者）

北京师范大学心理学部，北京，100875，通讯作者 E-mail: wangdahua@bnu.edu.cn

摘 要　失独父母(parents who have lost their only child, PLOCs)指失去了唯一的亲生子女，母亲超过 49 岁且双方无二次生育能力或意愿的夫妇。这是一个亟需社会关注和帮助的弱势群体。一方面，截止 2010 年失独父母大约在 82.1 万人，预估在 2030 年将达到 142.3 万人；另一方面，失独父母面临着养老困难、社交退缩与回避、婚姻冲突、抑郁焦虑等诸多现实困境。以往研究大多基于失独父母这一个体视角，考察失独父母所面临的哀伤、心理健康、社交网络等心理-社会适应问题，忽略了失独父母所处的环境视角。基于布朗分布伦纳生态系统理论，失独父母所处的社会环境对其适应和发展具有重要意义。因此，本研究基于公众这一环境视角，考察公众对失独父母所持有的伦理归咎及其对公众关于失独父母困境感知的影响，试图勾勒出失独父母所处的公众环境轮廓，为政策制定者提供实证指导意义。

本研究从全国共 23 个省会、直辖市抽取共 2029 名非失独家庭被试，采用关于失独父母的伦理归咎量表、社会信任感量表、困境感知问卷以及人口学信息问卷对被试进行测量。基于多元回归分析的统计分析方法，并控制性别、年龄和教育水平等基本人口学变量，结果发现：（1）公众对失独父母的伦理归咎为中

等程度的严苛(M = 2.99, SD = 0.93, 得分范围为 1 ~ 5，分数越高代表公众对失独父母的伦理归咎程度越高)；（2）公众对失独父母的困境感知水平非常低(M = 4.28, SD = 2.09, 得分范围为 1 ~ 11，分数越高代表公众对失独父母所处实际困境的感知水平越高)；（3）伦理归咎负向预测困境感知(b = -.59, p < .001)；（4）社会信任感在伦理归咎与困境感知的关系中起着缓冲作用。具体而言，对于低社会信任感的公众，伦理归咎负向预测困境感知(b = -.64, p < .001)；对于高社会信任感的公众，伦理归咎对困境感知的影响减弱(b = -.46, p < .001)。本研究促进了人们关于公众如何看待和理解失独群体的认识，为政策制定者动员社会公众力量帮助失独群体提供理论依据。

The public's ethical attribution towards PLOCs and its impacts on the public's perception of challenges faced by PLOCs

Li Jinfeng Wang Dahua (corresponding author)
Faculty of Psychology, Beijing Normal University, Beijing, 100875, China

Abstract: Parents who have lost their only child (PLOCs) refer to couples who have lost their sole biological child, and where the mother is over 49 years old, and both parents are unable or unwilling to have a second child. This is a vulnerable group in urgent need of social attention and assistance. On one hand, by 2010, the number of PLOCs was approximately 821,000, and it is estimated to reach 1,423,000 by 2030. On the other hand, PLOCs face various real-life challenges, including difficulties in elderly care, social withdrawal and avoidance, marital conflicts, depression, anxiety, and others. Previous research has predominantly adopted an individual perspective to investigate the psychological-social adaptation issues of PLOCs, exploring grief, mental health, social networks, and other factors, but neglecting the environmental perspective in which PLOCs are situated. Based on Bronfenbrenner's ecological systems theory, the social environment surrounding PLOCs holds significant importance for their adaptation and development. Therefore, the current study adopts a public perspective to investigate the ethical attributions held by the general public towards PLOCs and its impact on the public's perception of the challenges faced by PLOCs. The study aims to outline the public environment surrounding PLOCs and provide empirical guidance for policy-makers.

The current study recruited a total of 2,029 participants from 23 provincial capitals and direct-controlled municipalities across the country as non-bereaved family participants. Measurements included the ethical attribution scale for PLOCs, social trust scale, perception of challenges questionnaire, and demographic information questionnaire. Utilizing multiple regression analysis and controlling for basic demographic variables such as gender, age, and education level, the results revealed: (1) The general public held a moderately severe level of ethical attribution towards PLOCs (M = 2.99, SD = 0.93, scores ranged from 1 to 5, with higher scores indicating greater ethical attribution); (2) The public's perception of the challenges faced by PLOCs was at a very low level (M = 4.28, SD = 2.09, scores ranged from 1 to 11, with higher scores indicating a higher level of perception of the actual challenges faced by PLOCs); (3) Ethical attribution negatively predicted the perception of challenges (b = -.59, p < .001); (4) social trust played a buffering role in the relationship between ethical attribution and the perception of challenges. Specifically, for the public with low social trust, ethical attribution negatively predicted the perception of challenges (b = -.64, p < .001); for the public with high social trust, the impact of ethical attribution on the perception of challenges was weakened (b = -.46, p < .001). The present study enhances understanding of how the public perceives the PLOCs group, and provides theoretical evidence for policy-makers to mobilize social forces to assist the PLOCs group.

Keywords: Public perspective, parents who have lost their only child (PLOCs), ethical attribution, social trust, perception of challenges faced by PLOCs

情绪上头就想买买买？主播情绪唤醒度对中老年人直播购物意愿的影响

金梦菡[1] 徐慧[2]（共同一作）龚先旻[3] 彭华茂[1]（通讯作者）
1 北京师范大学发展心理研究院，北京，100875，*penghuamao@bnu.edu.cn
2 浙江金融职业学院心理健康教育指导中心，浙江杭州，310018
3 香港中文大学何鸿燊何海量数据决策分析研究中心，中国香港，999077

摘 要 近年来，直播购物领域发展空前，中老年群体也日渐成为重要的消费群体，其消费决策的心理特点值得关注。过往研究表明，个体能够通过观看视频感知他人所表达的情绪从而实现情绪感染，并进一步影响自身后续的态度与行为。此外，有研究发现较高的情绪唤醒度可能占据更多认知资源，从而影响中老年人的信息加工过程。因此，直播购物中主播的情绪唤醒状态可能通过不同路径对中老年人的购买意愿产生影响。为了考察中老年人的消费决策是否受主播情绪唤醒度影响并探索可能的作用机制，本研究采用两水平（高主播情绪唤醒组，低主播情绪唤醒组）的单因素被试间实验设计，招募被试 193 名（年龄：*M*=65.64, *SD*=4.94；女性 131 人），让被试观看模拟真实的直播购物场景视频并报告其商品购买意愿。后续以被试自身情绪唤醒度、决策过程中的感知信任，以及对不同商品属性的回忆率作为中介变量进行分析。

结果表明，主播情绪唤醒度会显著影响被试的直播购物意愿，高主播情绪唤醒组被试的购买意愿显著高于低唤醒组被试；且高主播情绪唤醒组被试在观看直播片段后对自身唤醒度的评分也显著更高。此外，在高主播情绪唤醒度条件下，被试的总属性回忆率和积极属性回忆率均显著更高，消极属性回忆率的差异不显著。后续中介效应分析的结果发现，在主播情绪唤醒度与购买意愿之间，被试自身的情绪唤醒及感知信任具有显著链式中介效应，而被试对商品属性信息加工的中介效应不显著。

上述结果表明，在购物主播极具感染力的商品宣传下，中老年人在直播购物过程中易表现出“情绪化”的消费决策特点，而非基于理智的信息加工进行消费决策。因此，中老年人更应在直播购物中保持谨慎，避免因受到情绪煽动而盲目信任、产生冲动消费行为。

The influence of anchor’s emotional arousal on older consumer’s purchase intention under livestreaming e-commerce situation

Menghan Jin[1] Hui Xu[2] (co-first author) Xianmin Gong[3] Huamao Peng[1]
1 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875
2 Zhejiang Financial College, Hangzhou, 310018
3 The Chinese University of Hong Kong Research Portal, Hong Kong, 999077

Abstract： The livestreaming e-commerce has grown by leaps and bounds in recent years, which makes older consumers start to pay attention to this new form of consumption. Previous studies have shown that emotional states can be transferred to others via emotional contagion, leading people to experience the same emotions not only real-world communities but also online social media. Emotional contagion can further affect individuals’ subsequent attitudes and behaviors. In addition, some studies have found that higher emotional arousal may occupy more cognitive resource, thus affecting the information processing process of older consumers under livestreaming e-commerce situation.

To examine the effects of anchors’ emotional arousal on older consumers’ willingness to purchase in livestreaming e-commerce context, and further explore the potential mechanism, 193 healthy participants with a

mean age of 65.64 years were recruited and randomly assigned to two groups (high-emotional-arousal vs. low-emotional-arousal). All participants performed the simulated consumer decision-making task, in which decision scenarios were created using video materials shot beforehand.

The results found that: (1) the emotional arousal of the anchor had a positive impact on older people' purchase intention of livestreaming e-commerce; (2) the emotional arousal of the anchor triggered emotional arousal of consumers; (3) the emotional arousal of the anchor had a positive impact on the overall recall and the recall of positive products' attributes; (4) older consumers' emotional arousal and perceived trust mediated the relationship between anchor's arousal emotion and online shoppers' purchase intention.

In conclusion, for older consumers, the purchase intention on the livestreaming e-commerce platform is affected by diverse factors, and the influence of subjective factors such as anchor's emotional arousal, is stronger than objective factors such as commodity attributes, which indicating that older consumers should pay more attention to products, and be alert to impulsive consumption under livestreaming e-commerce situation.

冠心病患者孤独感的现状及影响因素研究

张静文[1]，向贤程[1]，梅倩[1]，杨晓莉[1]，程利[15*]

（1. 湖北医药学院护理学院，湖北十堰 442000）

通讯作者：程利，Email: piaopiao1125@126.com

摘 要 目的：调查冠心病患者的孤独感的现状，并分析其影响因素。方法：于 2022 年 7 月—2023 年 3 月选取在十堰市某三级甲等医院心血管疾病诊疗中心住院的 248 名冠心病患者作为调查对象，采用一般资料调查表、UCLA 孤独量表（UCLA Loneliness Scale）、心理一致感量表（SOC-13）、社会支持量表（SSRS）、痛苦表露指数量表（DDI）进行调查。结果：冠心病患者孤独感总分为（39.83±8.83）分。分层回归分析结果显示，家庭收入、心理一致感、社会支持是孤独感的主要影响因素（P<0.05）；结论：冠心病患者的孤独感处于一般偏上水平，医务人员应关注冠心病患者的心理状态和情绪变化，根据其文化程度、居住形式、家庭收入、心理一致感、社会支持等制定相应的护理措施，从而降低患者的孤独感，提高生活质量。

Abstract: Objective: To investigate the current situation of loneliness in patients with coronary heart disease and analyze its influencing factors. Methods: From July 2022 to March 2023, 248 patients with coronary heart disease who were hospitalized in the cardiovascular disease diagnosis and treatment center of a tertiary first-class hospital in Shiyan City were selected as the subjects of investigation. The general information questionnaire, UCLA Loneliness Scale, SOC-13, SSRS and DDI were used to investigate. Result: The total score of loneliness in patients with coronary heart disease was (39.83 ± 8.83). The results of stratified regression analysis showed that family income, SOC, and social support were the main influencing factors of loneliness (P<0.05); Conclusion: The loneliness of patients with coronary heart disease is at a generally higher level. Medical staff should pay attention to the psychological state and emotional changes of patients with coronary heart disease, and develop corresponding nursing measures based on their educational level, living form, family income, SOC, social support, etc., in order to reduce the loneliness of patients and improve their quality of life.

综合抗逆力干预对遭受工作场所暴力后急诊护士抗逆力提升的干预研究

廖俪雯[1] 王琳[1]（通讯作者）

1 上海交通大学护理学院，上海，200025

1 上海交通大学护理学院，上海，200025，E-mail：wanglsd@shsmu.edu.cn

摘 要 **目的** 本研究通过实施综合性抗逆力干预，旨在提高遭受工作场所暴力后急诊护士的抗逆力水平，维护急诊护士身心健康，为未来医院管理者实施工作场所暴力后医护人员规范化心理干预提供指导。

方法 采用类实验性研究设计，通过整群抽样方法于 2022 年 11 月-2023 年 4 月抽取上海市某三级甲等医院两所院区 71 名遭受工作场所暴力的急诊护士作为研究对象，试验组 35 名，对照组 36 名。试验组接受为期 4 个月的 8 次综合抗逆力干预，主要内容包括：课程引入、融入组织、情绪感知、情绪调节、正念练习、应对暴力、情景演练和回顾课程。对照组予以常规心理干预。在干预前、后采用一般资料调查表、中文版抗逆力简表 、医院焦虑抑郁量表、护士留职意愿量表进行资料收集。采用 SPSS26.0 对数据进行统计分析。

结果 共 71 名遭受过工作场所暴力的急诊护士完成干预。数据分析结果显示，干预前两组急诊护士的一般资料、抗逆力、焦虑抑郁、组织支持和留职意愿得分均无统计学意义（p 均＞0.05）。干预后试验组抗逆力和留职意愿得分均高于干预前，焦虑得分低于干预前，差异具有统计学意义（p 均＜0.05），抑郁得分低于干预前，但差异无统计学意义（p＞0.05）。干预前后对照组抗逆力、焦虑抑郁和留职意愿得分均无统

计学意义（p 均＞0.05）。与对照组相比，干预后试验组焦虑得分显著低于对照组，留职意愿得分显著高于对照组，差异具有统计学意义（p 均＜0.05）；试验组抗逆力与抑郁得分较对照组有所改善，但差异无统计学意义（p＞0.05）。

结论 实施综合抗逆力干预可有效改善遭受工作场所暴力后急诊护士的抗逆力、缓解焦虑抑郁情绪、提高留职意愿。急诊管理者应定期评估遭受工作场所暴力后急诊护士的抗逆力水平，及时采取针对性的心理干预措施以减少工作场所暴力对急诊护士带来的心理创伤。未来可以将该综合抗逆力干预方案整合至急诊护士的职前教育或继续教育中，作为常规心理健康教育课程进行推广，以维护护理人员身心健康，促进护理团队健康发展。

A comprehensive resilience intervention program to enhance the resilience of emergency nurses exposed to workplace violence

Liao LW, Wang L

School of Nursing, Shanghai Jiaotong University, Shanghai, No. 227, South Chongqing Road

***Abstract*:**

Objective

This study aimed to improve the resilience level of emergency nurses exposed to workplace violence by implementing a comprehensive resilience intervention program to maintain physical and mental health and to provide guidance for future hospital administrators to implement standardized psychological interventions for healthcare workers after workplace violence.

Methods

This is a qusi-experimental study. A total of 71 emergency nurses from tertiary-level general hospitals in Shanghai were recruited from November 2022 to April 2023 using the cluster sampling method and assigned to the intervention group (n=35) and control group (n=36). The intervention group received the comprehensive resilience intervention program, which included eight modules: the introduction, integration into the organization, emotion perception, emotion regulation, mindfulness, coping with violence, scenario rehearsal, and review of all sessions. The control group received the general psychological intervention. The outcomes were measured using the Chinese version of the Resilience Scale (CD-RISC-10), the Hospital Anxiety and Depression Scale (HADS), and the Nurse's Intention to Stay Scale. SPSS26.0 was used for data analysis.

Results

71 participants completed our intervention. Before the intervention, no significant differences in demographics, resilience, anxiety, depression, and nurse's intention to stay were observed between the two groups ($p > 0.05$). Comparing the scores before and after the intervention, the scores of resilience and nurse's intention to stay in the intervention group were significantly improved after the intervention, and the score of anxiety was significantly decreased ($p < 0.05$); the scores of depression were decreased, but the differences were not statistically significant ($p > 0.05$). For the control group, there was little change in all variables ($p > 0.05$). Compared with the control group, the score of anxiety in the intervention group showed a significant decrease, and the score of nurse's intention to stay showed a significant increase ($p < 0.05$); the score of resilience and depression in the intervention group was improved, but the differences were not statistically significant ($p > 0.05$).

Conclusion

The comprehensive resilience intervention program was effective in improving resilience, alleviating anxiety and depression, and increasing the nurse's intention to stay in emergency nurses exposed to workplace violence. Emergency departments and managers should prioritize regular assessments of the resilience levels among emergency nurses exposed to WPV and take proactive measures to maintain their emotional well-being. Managers could integrate this comprehensive resilience intervention program into future pre-employment training or continuing education help them boost resilience and promote the development of the nursing team.

Keywords：comprehensive resilience intervention, workplace violence, emergency nurses, mental health

本科实习护生心理弹性与临床沟通能力调查分析

刘芯如[1] 董薇[2](通讯作者)

1 海军军医大学，上海，200433

2 海军军医大学心理系，上海，200433， E-mail：sophiedongwei@163.com

摘 要 目的：了解本科实习护生心理弹性与临床沟通能力水平，分析其相关因素，为改善本科护理专业学生心理弹性状况，提高临床沟通水平提供理论依据。方法：从青岛市几所三级甲等医院随机抽取 212（有效数据 200 名）名本科实习护生进行问卷调查。调查研究工具包括：一般情况调查表,临床沟通能力量表和心理弹性量表(CD-RISC 10)。所有资料经审核后建立数据库,采用 SPSS24.0 软件进行统计分析,包括描述性统计、方差分析及 Pearson 相关分析。结果：1.本科实习护生临床沟通能力总得分为(84.18±14.15),其各维度得分从高到低依次为：建立和谐关系(17.80±3.56)、敏锐倾听(16.40±3.33)、确认患者问题(16.26±3.20)、验证感受(15.77±3.41)、共同参与(9.87±2.31)、传递有效信息(8.08±1.83)。其中,学生干部在沟通能力总分及建立和谐关系、确认患者问题和验证感受维度得分均高于非学生干部,其差异均具有统计学意义(P<0.05)。本科实习护生心理弹性总得分为(29.34 ±7.77)。其中学生干部在心理弹性总分得分高于非学生干部，且该差异具有统计学意义（P<0.0001）。2.Pearson 相关分析显示：本科实习护生的临床沟通能力及其分维度与心理弹性（r=0.167-0.901,P<0.0001)呈显著正相关。结论：本科实习护生临床沟通能力和心理弹性整体水平不高，处于中游水平。本科实习护生的临床沟通能力及其分维度与心理弹性呈显著正相关。这说明心理弹性可直接影响护生临床沟通能力。护理学教育阶段，高校心理健康教育应加强培养学生的心理弹性，从而提高护生的临床沟通能力。

Investigation and analysis on psychological flexibility and clinical communication ability of undergraduate nursing students

Liu Xinru[1] Dong Wei[2]

Naval Military Medical University Department of Psychology

Address: No. 800, Xiangyin Road, Yangpu District, Shanghai

***Abstract*:** Objective: To understand the psychological resilience and clinical communication ability of undergraduate nursing students, analyze their related factors, and provide a theoretical basis for improving the psychological resilience of undergraduate nursing students and improving the level of clinical communication.Methods: A questionnaire survey was conducted on 212 (200 valid data) undergraduate intern nurses randomly selected from a third-class Grade A hospital in Qingdao. Survey research tools include: general questionnaire, clinical communication ability scale and psychological resilience scale (CD-RISC 10). After all the materials have been reviewed, a database is established and SPSS 24.0 software is used for statistical analysis, including descriptive statistics, analysis of variance and Pearson correlation analysis.Results:The total score of clinical communication ability of undergraduate intern nurses is (84.18 ± 14.15), and the scores of each dimension from high to low are: establishing a harmonious relationship (17.80 ± 3.56), keen listening (16.40 ± 3.33), confirming patient problems (16.26 ± 3.20), verifying feelings (15.77 ± 3.41), joint participation (9.87 ± 2.31), transmitting effective information (8.08 ± 1.83). Among them, student cadres scored higher than non-student cadres in the overall scores of communication skills and the establishment of harmonious relations, confirmation of patient problems and verification of feeling dimensions (P <0.05). The total score of psychological resilience of undergraduate nursing students is (29.34 ± 7.77). Among them, student cadres had higher scores in total mental resilience than non-student cadres, and the difference was statistically significant (P <0.0001).Pearson correlation analysis showed that the clinical communication ability and its sub-dimensions of undergraduate nursing students were significantly positively correlated with psychological resilience (r = 0.167-0.901, P <0.0001).Conclusions: The overall level of clinical communication skills and psychological resilience of undergraduate intern nurses is not high, and is at the midstream level. The clinical communication ability and its sub-dimensions of undergraduate intern nurses are significantly positively correlated with psychological resilience. This shows that psychological flexibility can directly affect the clinical communication ability of nursing students. At the stage of nursing education, psychological health education in colleges and universities should strengthen the training of students' psychological flexibility, so as to improve the clinical communication ability of nursing students.

摘 要 近年来，冠心病的发病率和病死率呈上升趋势，其严重危害个体健康。多数冠心病病人常伴随焦虑、抑郁、睡眠障碍等问题，其中睡眠障碍逐渐得到大家的重视及关注。冠心病病人经常经历睡眠障碍，包括睡眠质量下降、入睡困难和夜间觉醒。睡眠障碍的发生会严重影响冠心病病人的心脏状况，增加精神行为异常，降低生活质量，给病人带来较大负担，增加社会经济成本。睡眠质量被确定为焦虑和抑郁的预测因子，这意味着病人的睡眠质量可能会影响心理健康，缺乏有效的睡眠可能会引起焦虑或抑郁等负性情绪。并且睡眠障碍的药物治疗并不令人满意，睡眠药物可能会与其他药物产生重大不良反应，包括身体依赖、镇静和运动能力障碍等。非药物干预作为替代治疗方案和药物治疗的补充，简单可行且远期效果好，逐渐得到关注。鉴于睡眠障碍在冠心病病人中的高患病率和有害影响以及潜在的不良后果，迫切需要为这一群体的睡眠障碍的短期管理提供建议。因此，该文对国内外冠心病患者睡眠障碍的相关研究进行综述，从睡眠障碍的评价工具、干预方法等方面进行归纳总结，指出未来研究方向，使临床医护人员采用适宜的工具有效评估病人的睡眠障碍程度，制定合理的个体化干预措施，尤其是非药物的干预措施，包括物理治疗、认知行为干预、中医疗法、音乐疗法等，进而改善改善冠心病病人的生活质量和远期预后。

Research progress of evaluation and intervention of sleep disorders in patients with coronary heart disease

WANG Wenjie[1], LIU Jinyu[1], WEI Yilan[1], ZHANG Aihua[2]

[1]School of Nursing, Shandong First Medical University and Shandong Academy of Medical Sciences, Taian, China.

[2]School of Nursing, Shandong First Medical University and Shandong Academy of Medical Sciences, Taian, China.

***Abstract*：** In recent years, the incidence and mortality of coronary heart disease are on the rise, which is seriously harmful to individual health. Most patients with coronary heart disease are often accompanied by anxiety, depression, sleep disorders and other problems, in which sleep disorders gradually get everyone's attention. Patients with coronary heart disease often experience sleep disorders, including decreased sleep quality, difficulty falling asleep and nocturnal awakening. The occurrence of sleep disorders will seriously affect the heart condition of patients with coronary heart disease, increase mental and behavioral abnormalities, reduce the quality of life, bring greater burden to patients, and increase social and economic costs. Sleep quality has been identified as a predictor of anxiety and depression, which means that patients' sleep quality may affect mental health, and lack of effective sleep may cause negative emotions such as anxiety or depression. And the drug treatment of sleep disorders is not satisfactory, sleep drugs may have major adverse reactions with other drugs, including physical dependence, sedation and dyskinesia. As a supplement to alternative treatment and drug therapy, non-drug intervention is simple, feasible and has good long-term effect, and has been paid more and more attention. In view of the high prevalence, harmful effects and potential adverse consequences of sleep disorders in patients with coronary heart disease, there is an urgent need to provide suggestions for the short-term management of sleep disorders in this group. Therefore, this paper summarizes the relevant studies on sleep disorders in patients with coronary heart disease at home and abroad, summarizes the evaluation tools and intervention methods of sleep disorders, and points out the direction of future research. make clinical doctors and nurses use appropriate tools to effectively evaluate the degree of sleep disorders and formulate reasonable individual intervention measures, especially non-drug intervention measures. It includes physiotherapy, cognitive behavior intervention, traditional Chinese medicine therapy, music therapy and so on, so as to improve the quality of life and long-term prognosis of

patients with coronary heart disease.

癌症患者家属心理健康状况追踪研究与干预策略

——基于照顾负担、家庭功能视角

程文丽[1]　徐紫璇[1]　于文军[1]（通讯作者）

1 井冈山大学教育学院，江西吉安，343009

摘 要　目的：癌症患者家属担负着患者的主要生活照顾者、密切接触者和经济负担者等多种重要角色，面对着亲人罹患癌症这样一个重大、持久的应激性生活事件，加之癌症疾病治疗本身具有的高投入和长疗程等特点，致使患者家属长期处于高度的心理应激状态。癌症患者家属容易出现抑郁、焦虑等不良情绪，不仅影响他们自己的生活质量和社会交往等方面而且也在很大程度上影响癌症患者身心健康及疾病康复。但是相比癌症患者本身，患者家属通常容易被忽视，不被社会所关注。因而，系统研究癌症患者家属的心理特征成为当务之急。方法：研究综合采用横向设计与纵向追踪设计，定性定量相结合开展研究。采用访谈法对癌症患者家属心理需求、重点关切，开展定性研究；采用问卷法定量横向研究癌症患者家属照顾负担、家庭功能及心理健康现状；以每间隔 6 个月，为期 1 年，共 3 轮次追踪测量共计 561 人次，定量纵向追踪研究了癌症患者家属照顾负担、家庭功能及心理健康状况随时间动态变化的趋势，并基于照顾负担、家庭功能视角构建了患者家属心理健康预测模型。结果：癌症患者家属承受了沉重的经济负担，癌症改变了患者家属的家庭互动模式；癌症患者的父母照顾负担水平显著高于其他关系的家属。癌症患者家属家庭功能在照顾负担和心理健康之间起部分中介作用。纵向追踪研究显示，癌症患者家属心理健康、照顾负担以及家庭功能在患者确诊之初受到了严重消极影响，但随着时间的推移患者家属心理应激水平有下降趋势，其心理健康消极状态有所缓和，家庭功能也趋于恢复，照顾负担也由起初的高强度出现缓和趋势。第 1 轮家庭功能不能预测患者家属未来的心理健康，但第 2 轮家庭功能可以可靠地预测第 3 轮照顾负担。第 1 轮心理健康预示着第 2 轮照顾负担和家庭功能。第 1 轮照顾负担预测第 2 轮心理健康，第 2 轮照顾负担预测第 3 轮心理健康。在照顾负担和心理健康之间存在动态的互动关系。研究结果将为开展针对癌症患者家属的心理援助提供重要的实践指南。

A follow-up study on the mental health of in primary caregivers of cancer patients based on the perspective of caregiving burden and family function

Wenli Chen Zixuan Xu WenjunYu
School of Education, Jinggangshan University, Ji 'an 343009, China

Abstract: The primary caregivers of cancer patients are the main caregivers, close contacts and financial burden of the patients. Faced with such a major and long-lasting stressful life event as cancer, coupled with the characteristics of high investment and long course of cancer treatment itself, the family members of cancer patients are in a high stress state for a long time. The primary caregivers of cancer patients are prone to depression, anxiety and other bad emotions, which not only affect their own quality of life and social communication, but also affect the physical and mental health and disease rehabilitation of cancer patients. However, compared with the cancer patients themselves, the primary caregivers of cancer patients are often easily ignored and not paid attention to by the society. Therefore, it is urgent to systematically study the psychological characteristics of The primary caregivers of cancer patients. Horizontal design and longitudinal tracking design were comprehensively used to carry out the research, both qualitative and quantitative. Qualitative research was carried out on psychological needs and key concerns of family members of cancer patients by interview. Questionnaire method was used to study the caring burden, family function and mental health of cancer patients' family members. A total of 561 patients were tracked in 3 rounds every 6 months for 1 year. The dynamic trends of care burden, family function and mental health of the primary caregivers of cancer patients were tracked quantitatively and longitudedly over time, and a prediction model of mental health of patients' family members was constructed based on the perspective of care burden and family function. The primary caregivers of cancer patients bear a heavy economic burden, and cancer changes the family interaction pattern of patients' family members; The level of caregiving burden of parents of cancer patients is significantly higher than that of family members of other relationships. The family function of cancer patients' family members plays a partial mediating role between care burden and mental health. Longitudinal follow-up studies have shown that the mental health, caring burden and family function of the primary caregivers of cancer patients have been seriously negatively affected at the beginning of the diagnosis of cancer patients, but as time goes on, the psychological stress level of the primary caregivers of cancer patients has a downward trend, their negative mental health has been alleviated, family function has tended to recover, and the caring burden has also been alleviated from the initial high intensity. Round 1 family function did not predict the future mental health of the primary caregivers of cancer patients, but round 2 family function reliably predicted round 3 caregiving burden. Round 1 mental health predicts round 2 caretaking burden and family functioning. The first round of care burden predicted the second round of mental health, and the second round of care burden predicted the third round of mental health. There is a dynamic interaction between care burden and mental health. The results of this study will provide important practical guidelines for the development of psychological assistance for family members of cancer patients.

应急医疗救援人员心理集体主义的潜在剖面分析及其与生命意义感的关系

邓甜甜[1]　封丹珺[1]（通讯作者）

[1]山东大学护理与康复学院，济南，250012，fdj19@sdu.edu.cn

摘 要 **目的** 识别新冠肺炎疫情期间援沪应急医疗救援人员心理集体主义的不同类别，并探讨心理集体主义的不同类别与生命意义感的关系。**方法** 于 2022 年 4-5 月，采用一般资料调查表、心理集体主义量表、生命意义感中文版量表对参与上海新冠肺炎疫情救援工作的 352 名应急医疗救援人员进行调查。**结果** 援沪应急医疗救援人员的心理集体主义情况可被划分为 3 种类别：高心理集体主义型(60.5%)、低主观/高客观型(12.2%)和低心理集体主义型(27.3%)。与低心理集体主义型相比，高心理集体主义型会增加应急医疗救援人员的存在生命意义感(β=0.914, P<0.001)和追寻生命意义感(β=0.605, P<0.001)，低主观/高客观型仅增加应急医疗救援人员的存在生命意义感(β=0.368,P=0.025)。与低主观/高客观型相比，高心理集体主义型会增加应急医疗救援人员的存在生命意义感(β=0.547, P<0.001)和追寻生命意义感(β=0.512, P<0.008)。**结论** 援沪应急医疗救援人员心理集体主义可分为高心理集体主义型、低主观/高客观型和低心理集体主义型 3 种潜在类别，且高心理集体主义型会增加应急医疗救援人员的存在生命意义感和追寻生命意义感，低主观/高客观型会增加应急医疗救援人员的存在生命意义感。可以根据应急医疗救援人员心理集体主义的不同类别为其提供针对性的干预措施，以改善其心理集体主义情况，提高应急医疗救援人员的存在生命意义感和追寻生命意义感。

Latent profile analysis of psychological collectivism and its association with meaning in life among emergency medical staff in Shanghai fighting COVID-19

Tiantian Deng[1], Danjun Feng[1*]

[1]School of Nursing and Rehabilitation, Shandong University, Jinan, 250012, fdj19@sdu.edu.cn

***Abstract*: Objective** To identify different profiles of psychological collectivism among emergency medical staff in Shanghai fighting COVID-19 pandemic, and to explore the association between different profiles of psychological collectivism and meaning in life. **Methods** A total of 352 emergency medical staff in Shanghai during COVID-19 pandemic were surveyed with the general information questionnaire, the psychological collectivism scale, and the Chinese version of the meaning in life questionnaire from April to May 2022. **Results** The psychological collectivism of emergency medical staff could be classified into three latent profiles: high psychological collectivism (60.5%), low subjective/high objective (12.2%), and low psychological collectivism

(27.3%). Compared to the low psychological collectivism, the high psychological collectivism increased the presence of meaning in life (β=0.914, P<0.001) and searching for meaning in life (β=0.605, P<0.001) of emergency medical staff, and the low subjective/high objective only increased the presence of meaning of life (β=0.368, P=0.025). Compared to the low subjective/high objective, the high psychological collectivism increased the presence of meaning in life (β=0.547, P<0.001) and searching for meaning in life (β=0.512, P<0.008) of emergency medical staff. **Conclusion** Three latent profiles of psychological collectivism could be identified among emergency medical staff, including high psychological collectivism, low subjective/high objective, and low psychological collectivism. High psychological collectivism increased the presence of meaning in life and searching for meaning in life of emergency medical staff, and low subjective/high objective increased the presence of meaning in life. Targeted interventions can be provided to emergency medical staff according to their different profiles in order to improve their psychological collectivism and increase their presence of meaning in life and searching for meaning in life.

抽象词语加工的神经基础—基于 fMRI 研究的元分析

李想[1]（通讯作者）

1 新乡医学院，新乡，453000，lixiang_psy@163.com

摘 要 抽象词语是语言的重要组成部分。与具体词语相比，抽象词语表示的内容在现实世界中无直接对应的指代物，如“道德/忘记”等，其意义具有模糊性和多样性等特点。根据具身认知的观点，抽象词语和具体词语的意义均植根于知觉和运动经验，因此，词语加工时的神经活动应包含初级的感知觉运动脑区的激活。目前，抽象词语加工有关的神经成像研究尚未获得一致结论，部分研究并未发现感觉运动有关脑区在抽象词语加工中的参与。这可能是因为这些神经成像研究使用了能够引发感觉运动区域更强激活的具体词语作为抽象词语的比较基线；也可能与功能磁共振技术（fMRI）本身的局限性有关，例如单个成像研究可能存在的假阳性或假阴性问题、研究被试数量普遍较少结果不稳定等。因而抽象词语加工的神经基础仍需进一步探究。神经成像数据的元分析能够从多个研究中寻找特定认知加工过程对应的稳定激活脑区，被认为是一种有效整合神经成像数据的可靠方法。

本研究采用 ALE 神经成像元分析（Activation Likelihood Estimation, 激活似然性估计）对探讨以简单视觉符号等非具体词语为比较基线的抽象词语加工的 fMRI 研究进行量化分析和论述，目的是获得抽象词语加工时的稳定激活脑区。在 PubMed、Web Of Science、中国知网等数据库中使用关键词检索文献，将符合 1)实验刺激为抽象名词或动词，基线条件为非具体词语；2)研究报告了全脑激活坐标；3)被试为健康成年人等标准的 13 篇已发表的 fMRI 研究纳入元分析（共包括 181 个 foci 以及 316 名被试），坐标转换及数据分析等均使用 Ginger ALE 软件完成。结果显示，位于大脑左侧的颞中回、中央前回、额内侧回、颞上回，及大脑右侧的颞上回、屏状核等区域在抽象词语加工时稳定激活。这表明除了经典的语言加工脑区（如左侧颞中回、颞上回等），抽象词语加工确实包含中央前回等感觉运动有关脑区的稳定参与，支持了具身认知的观点。本研究结果为进一步深入探讨抽象概念的神经表征提供了基础。

关键词 抽象词语，具身认知，元分析，激活似然性估计

The Neural Basis of Abstract Words Processing: an ALE Meta-analysis

Li Xiang[1]
1 Xinxiang Medical University, Xinxiang, 453000, lixiang_psy@163.com

Abstract: Abstract words, such as "morality/forget", constitute a critical component of human language. The meaning of these words lack the specific referent in the physical world and are independent of sensory motor experiences. As the Emboided Cognition theory holds, the primary sensorimotor system would be activated in the processing of abstract words, just as in the processing of concrete words . However, some neuroimaging studies found the processing of abstract words only relied on the language related areas. This may be caused by the comparing baselines used in these studies. In addition, it is noteworthy that the neuroimaging techniques such as fMRI per se have limitations which may result in the mixed and unstable results. For instance, in a single fMRI study, there are fewer participants and a greater possibility of false-positive or false-negative. The coordinate-based meta-analysis methods of brain imaging -- Activation Likelihood Estimation (ALE) could compare and combine data from diverse studies and provide a more reliable way to explore the neural basis of abstract words processing.

The present study, using the Ginger ALE, conducted an ALE meta-analysis on the data from strictly screened fMRI studies with the aim to investigate the stable activation areas during abstract words processing. Based on the standards including 1) abstract words were used as stimulus and non-concrete words as the comparing baselines; 2) the whole brain activation peak coordinates were reported; 3) participants were healthy and normal adults etc., 13 studies were selected, with a total of 181 foci from 316 participants. The results showed that brain areas located in the bilateral superior temporal gyrus, the left middle temporal gyrus, precentral gyrus, medial frontal gyrus, and the right claustrum were stably activated during abstract words processing. This suggests that sensorimotor related areas are involved in the abstract words processing, in line with the views of Embodied Cognition. To summarize, the present neuroimaging meta-analysis provides a more systematic and reliable evidence to further exploration of the neural basis of abstract words processing.

Key words: abstract words, embodied cognition, meta-analysis, ALE

生命意义概念的隐喻表征：来自大小、上下和重量的证据

赵雨萌 丁凤琴（通讯作者） 张蓉
宁夏大学教师教育学院，银川，750021，dingfqin@nxu.edu.cn

摘 要 生命的意义是一个构成人类存在目的与意义的哲学问题，1962 年 Frankl 率先将生命意义引入心理学领域，认为生命意义就是个人所知觉的主要本体的价值。自此，有关生命意义的问题，成为心理学研究者探讨的热点。生命意义作为抽象概念，人们是如何对其进行理解和加工的呢？Lakoff 和 Johnson(1999)年提出概念隐喻理论，认为抽象概念可通过隐喻的方式在大脑中进行表征，个体在探索未知世界过程中，当遇到无法形容的概念、观点或感觉时，便会自动将身体经验有关的具体概念与抽象复杂的概念形成联结，来对新事物进行描述。具身认知理论也提出，个体对抽象概念的认知加工过程会受到身体感知觉经验的影响。

生命意义是否也可以在具身认知视角下对其进行概念隐喻从而完成意义建构？人们常使用“生命是伟大的”“人命关天，生命至上”“重于泰山，轻于鸿毛”等词句对生命意义进行描述。那么，生命意义与大小、上下和重量之间的具身感知是否存在隐喻联结并符合隐喻一致性假设？本研究将对以上问题进行回答。研究采用三个实验探讨生命意义与大小、上下和重量隐喻的心理现实性。实验 1 采用分离式空间 Stroop 范式探讨生命意义大小隐喻表征，实验 2 同样采用分离式空间 Stroop 范式探讨生命意义的上下隐喻表征，实验 3 采用天平启动范式探索生命意义与重量之间的隐喻关系，并得到如下结果：实验 1 发现，大小知觉促进生命意义词的判断，“大”的概念与高生命意义词联结，“小”的概念与低生命意义词联结。实验 2 发现，上下空间知觉也会促进生命意义词的判断，“上”的概念与高生命意义词联结，“下”的概念与低生命意义词联结。实验 3 发现，重量知觉促进了生命意义词的判断，“重”的概念与高生命意义词联结，“轻”的概念与低生命意义词联结。以上研究说明，生命意义的隐喻表征在大小、上下以及重量维度上存在心理现实性。理论上，丰富了概念隐喻表征的具身理论；实践上，有助于为生命意义具身认知研究提供参考价值，为个体生命教育的建构提供干预依据。

Metaphorical representations of the concept of the meaning of life: Evidence from Size, Vertical and Weight

Zhao Yumeng; Ding Fengqin; Zhang Rong
Teacher education college, Ningxia University, Yinchuan 750021, China

Abstract： The meaning of life is a philosophical question that constitutes the purpose and meaning of human existence. Frankl pioneered the introduction of the meaning of life into the field of psychology in 1962, arguing that the meaning of life is the value of the primary ontology as perceived by the individual. Since then, questions about the meaning of life have become a hot topic for psychological researchers to explore. How do people understand and process the meaning of life as an abstract concept? Lakoff and Johnson (1999) proposed the conceptual metaphor theory in 1999, which argues that abstract concepts can be represented in the brain by means of metaphors, and that individuals, in the process of exploring the unknown world, when encountering indescribable concepts, ideas, or sensations, automatically associate concrete concepts related to bodily experience with the abstract and complex concepts to form associations to describe new things. Embodied cognition theory also proposes that an individual's cognitive processing of abstract concepts is influenced by bodily perceptual experiences. Can the meaning of life also be constructed through conceptual metaphors from an embodied cognition perspective? People often use words and phrases such as “life is great”, “human life is of paramount importance”, “heavier than Mt. Tai, lighter than a feather” to describe the meaning of life. Is there a metaphorical connection between the embodied perception of the meaning of life and size, top and bottom, and weight that is consistent with the assumption of metaphorical consistency? This study will answer these questions. The study used three experiments to explore the psychological realism of the meaning of life in relation to the metaphors of size, up and down, and weight. Experiment 1 used a detached spatial Stroop paradigm to explore the metaphorical representation of the meaning of life in terms of size, Experiment 2 also used a detached spatial Stroop paradigm to explore the metaphorical representation of the meaning of life in terms of up and down, and Experiment 3 used a balance-starting paradigm to explore the metaphorical relationship between the meaning of life and weight, and the following results were obtained: Experiment 1 found that size perception facilitates judgments of meaning-of-life words. The concept of “big” was associated with high life meaning words, and the concept of

"small" was associated with low life meaning words. Experiment 2 found that upper and lower spatial perception also facilitated meaning word judgments, with the concept of "up" being associated with high meaning words and the concept of "down" being associated with low meaning words. Experiment 3 found that weight perception facilitated the judgment of life meaning words, with the concept of "heavy" being associated with high life meaning words and the concept of "light" being associated with low life meaning words. The above study illustrates that metaphorical representations of life meaning are psychologically realistic in terms of size, top and bottom, and weight dimensions. Theoretically, it enriches the embodiment theory of conceptual metaphorical representations; practically, it helps to provide reference value for the study of embodied cognition of life meaning and provides a basis for intervention in the construction of individual life education.

Keywords：meaning of life, conceptual metaphorical representation, size metaphor, vertical metaphor, weight metaphor

认知负荷对健康成年人言语的影响：一项基于 fNIRS 的研究

江紫辉

上海体育大学运动健康学院，上海，邮编 200000，jiangzihui1999@163.com

摘 要　目的：探索基于功能性近红外光谱技术（fNIRS）下增加认知负荷时进行言语时发音质量和大脑激活的差异。

方法：有参与者共 10 例，6 名女性和 4 名男性，平均年龄为 22±0.94 岁。参与者阅读两种不同条件的嵌入式 stroop 句子。句子包含一致和不一致的条件。在一致情况中，颜色的词语和其字体颜色是匹配的（如蓝色字体的颜色是蓝色的），不一致的情况中，颜色的词语和其字体颜色是不匹配的，在一致和不一致的情况下，我们要求参与者说出字体的颜色，而不是字体本身的读音，在不一致情况下，认知要求会更高，从而有低认知负荷和高认知负荷两种不同的负荷条件。用近红外光谱技术(fNIRS)在言语时监测各脑区之间功能连接强度。本研究采用的 fNIRS 设备（NirSmart，丹阳慧创）设备只要由光纤探头、探测器、头帽和软件组成，可进行 39 通道同步测量，以连续波形式记录两种不同波长的近红外光（760，850nm）信号，采样频率为 11Hz，可实时检测受试者大脑中脱氧血红蛋白和含氧血红蛋白的浓度变化。在前额叶（PFC）和运动皮层（MC）采用用 fNIRS 记录氧合血红蛋白浓度信号。利用 praat 软件分析言语表现，采用 NirSpark 工具包在 Matlab R2014b (MathWorks，美国)运行，在 NirSpark 工具包中进行数据预处理。

结果：与低认知负荷条件下相比，高认知负荷条件下年轻人的言语表现变差，主要有停顿时间延长（t=3.679，p=0.005），语速变慢（t=5.24，p=0.001），构音速率减慢（t=3.32，p=0.09），错误次数增加（t=6.0，p<0.001），强度标准差增高（t=5.2，p=0.001）增高。基频（p=0.29）、基频标准差（p=0.59）和强度(p=0.054)在两种负荷条件下没有显著差异。和低认知负荷相比，较高认知负荷下通道 1（p=0.028），通道 4（p=0.045），通道 13（p=0.038），通道 16（p=0.048），通道 19（p=0.048），通道 32（p=0.038），通道 35（p=0.029）通道 39（p=0.01）多个通道发生了显著变化。

结论：结果表明，增加认知负荷增加会损害言语表现，大脑多个通道会发生显著激活。本文为认知负荷影响言语的神经表现提供一定的依据。

Effects of cognitive load on speech in healthy adults: an fNIRS study

Zihui Jiang
School of Sports and Health, Shanghai Sport University, Shanghai 200000, China

***Abstract*：** Purpose: To explore differences in articulatory quality and brain activation when performing speech under increased cognitive load based on functional near-infrared spectroscopy (fNIRS).

Methods: There were a total of 10 participants, 6 females and 4 males, with a mean age of 22 ± 0.94 years. Participants read embedded stroop sentences in two different conditions. The sentences contained both congruent and incongruent conditions. In the congruent condition, the word for the color and its font color matched (e.g., the color of the blue font was blue), and in the incongruent condition, the word for the color and its font color did not match. in both the congruent and incongruent conditions, we asked participants to name the color of the font rather than the pronunciation of the font itself, and the cognitive demands would be higher in the incongruent condition, leading to a low cognitive load and a high cognitive load two different loading conditions. Functional connectivity strength between brain regions was monitored using near infrared spectroscopy (fNIRS) applied during speech. The fNIRS device (NirSmart, Danyang Huichuang) equipment used in this study, as long as it consists of a fiber optic probe, detector, head cap, and software, can perform 49-channel simultaneous measurements, record two different wavelengths of near-infrared light (760, 850 nm) signals in a continuous-wave format, with a sampling frequency of 11 Hz, and detect the real-time deoxygenated and oxygenated hemoglobin concentration changes in the brain of the subjects. concentration changes. Oxyhemoglobin concentration signals recorded with fNIRS were used in the prefrontal (PFC) and motor cortex (MC). Speech performance was analyzed using praat software, which was run in Matlab R2014b (MathWorks, USA) using the NirSpark toolkit, and data preprocessing was performed in the NirSpark toolkit.

Result: Compared to the low cognitive load condition, young people's speech performance became worse in the high cognitive load condition, mainly due to longer pauses ($t=3.679$, $p=0.005$), slower rate of speech ($t=5.24$, $p=0.001$), slower rate of prosody ($t=3.32$, $p=0.09$), higher number of errors ($t=6.0$, $p<0.001$), and higher intensity standard deviation increased ($t=5.2$, $p=0.001$) increase in the Fundamental frequency ($p=0.29$), standard deviation of fundamental frequency ($p=0.59$), and intensity ($p=0.054$) were not significantly different between the two loading conditions. Compared to the low cognitive load, higher cognitive loads multiple channels changed significantly in channel 1 ($p=0.028$), channel 4 ($p=0.045$), channel 13 ($p=0.038$), channel 16 ($p=0.048$), channel 19 ($p=0.048$), channel 32 ($p=0.038$),channel 35 ($p=0.029$) channel 39 ($p=0.01$) .

Conclusion: The results suggest that increased cognitive load increases impair speech performance and that significant activation of multiple brain channels occurs. This study provides some evidence that cognitive load affects the neural performance of speech.

大学生错失恐惧对问题性社交媒体使用的影响：社交媒体自我控制失败的多水平纵向中介作用

李佳钰[1]　高雪梅[1]（通讯作者）

1 西南大学心理学部，重庆，400715，通讯作者 E-mail：zhenggao@swu.edu.cn

摘 要　本研究使用特质-状态错失恐惧量表、社交媒体自我控制失败量表和大学生问题性社交媒体使用量表，进行为期半年的三次问卷追踪调查，使用纵向多水平模型对 520 名大学生（平均年龄 20.25±1.83 岁，其中男生 136 名，女生 384 名）的特质和状态错失恐惧水平、社交媒体使用现状进行了调查，并且对社交媒体特异性自我控制失败在二者间的作用进行了探讨。该模型可以用来探究社交媒体自我控制失败在个体间（即，在同一时间点，有更多社交媒体自我控制失败的个体比更少的个体会表现出更高的问题性社交媒体使用风险）和个体内（即，对于同一个体来说，更多的社交媒体自我控制失败会导致后续出现更高的问题性社交媒体使用风险）不同水平的中介效应，结果发现：（1）特质错失恐惧、状态错失恐惧、社交媒体自我控制失败和问题性社交媒体使用在同一时间点和不同时间点均呈显著正相关；（2）在个体间和个体内水平上均发现，在控制性别后，社交媒体自我控制失败在特质和状态错失恐惧与问题性社交媒体使用的关系中起到部分中介作用。具体来说，高水平的特质和状态错失恐惧是个体社交媒体自我控制失败的预测因子，这种特异性自我控制失败又与该时间点问题性社交媒体使用风险的增加呈显著正相关。因此，在问题性社交媒体使用的预防和干预需要考虑错失恐惧和社交媒体自我控制失败的重要作用。

Effect of Fear of Missing Out on problematic social media use among Young Adults: Longitudinal Mediating Roles of Social media self-control failure in Between- and Within- person levels

Li Jiayu[1], Gao Xuemei[1]

1 Faculty of Psychology, Southwest University, Chongqing, China

Abstract: This study based on multilevel statistical models using Trait-State Fear of Missing Out Scale, Social Media Self-control Failure Scale and Problematic Mobile Social Media Usage Assessment Questionnaire explored the relationship between fear of missing out (FoMO, including trait-FoMO and state-FoMO) and problematic social media use (PSMU) in young adults (N = 630, M±SD = 20.25±1.83, males = 136, females = 384) with three follow-up measures, taking into account the effects of social media self-control failure (SMSCF). Multilevel statistical models were used to disaggregate between-person effects (i.e., people with SMSCF show more risk of PSMU than those who are less SMSCF at one point in time) and within-person effects (i.e., a person with SMSCF show more risk of PSMU over time). Results showed that: (1) these four variables were significantly and positively correlated with each other, which were significant both at one point in time and over time; (2) at both the between- and within-person levels, after controlling the gender, SMSCF was found to be a significant mediator of

the association between FoMO (i.e., trait-FoMO and state-FoMO) and PSMU. That is, within a given individual, a more favorable perceived trait-FoMO and state-FoMO at a given time point were the significant positive predictors of SMSCF for that individual, and in turn, SMSCF was associated with significantly more risk of PSMU at a particular time point. Thus, both FoMO and SMSCF should be considered in prevention and intervention strategies aimed at reducing the risk of PSMU.

解释偏向与情绪对网络利他行为影响的实验研究

王洁琳[1] 陈琳[1] 李湘琴[1] 周祥森[1] 郑显亮[2]（通讯作者）
1 赣南师范大学教育科学学院，赣州，341000
2 赣南师范大学教育科学学院，赣州，341000，zxl2004@sina.com

摘 要 日常生活中会遇到大量的意义不明的信息，有的个体对这种意义不明的信息做出积极的解释，有的个体对此做出消极的解释，这种差异的存在显示了不同的个体存在不同解释偏向。本研究旨在探讨在不同的解释偏向模式下，对情绪的启动是否会影响个体的网络利他行为，使用实验法通过两个研究对这一问题进行探讨。研究一以 134 名大学生（M = 21.23 岁, SD = 1.76）为被试，采用单因素被试间实验设计，运用情境启动法测量个体的解释偏向（积极、消极）与网络利他行为，探讨不同解释偏向个体对网络利他行为的影响；研究二以 210 名大学生（M = 20.93 岁, SD = 2.14）为被试，采用 2（解释偏向：积极、消极）× 3（情绪分组：快乐情绪组、中性情绪组、愤怒情绪组）被试间实验设计，对情绪的启动采用视频诱发的研究范式，主要探讨加入情绪这一变量后，解释偏向与情绪对网络利他行为的影响。结果表明：（1）研究一中网络利他行为在不同解释偏向上存在显著差异，相对于消极解释偏向组，积极解释偏向组会表现出更多的网络利他行为。（2）网络利他行为在不同情绪类型上（快乐、中性和愤怒）差异显著，相对于中性和愤怒情绪，快乐情绪会增加个体的网络利他行为；相对于快乐和中性情绪，愤怒情绪下的个体网络利他行为明显减少，即快乐情绪能促使网络利他行为的发生，而愤怒情绪减少了网络利他行为的产生。（3）研究二解释偏向与情绪的交互作用显著，在解释偏向分组的条件下，情绪分组中的快乐组和中性组简单效应显著。本研究使用实验法深入揭示了解释偏向对网络利他行为的影响，具有一定的理论和实践意义。

An Experimental Study on the Influence of Interpretive Bias and Emotion on Online Altruistic Behavior

Wang Jielin[1] Chen Lin[1] Li Xiangqin[1] Zhou Xiangsen[1] Zheng Xianliang[2]
1 School of Education Science, Gannan Normal University, Ganzhou, 34100
2 School of Education Science, Gannan Normal University, Ganzhou, 34100, zxl2004@sina.com

***Abstract*:** In daily life, we will encounter a large amount of information with unknown meaning. Some individuals interpret this information positively while others interpret it negatively. The existence of this difference shows that

different individuals have different interpretation biases. The purpose of this study is to explore whether the priming of emotions will affect individuals' altruistic behavior on the Internet under different interpretive bias models, and to explore this issue through two studies using experimental methods. In the first study, 134 college students (M = 21.23 years old, SD = 1.76) were selected as subjects. A single factor inter-subject experimental design was used to measure the individual's interpretive bias (positive and negative) and online altruistic behavior by using the situation priming method, and the influence of different interpretive bias on online altruistic behavior was investigated. In the second study, 210 college students (M = 20.93 years old, SD = 2.14) were used as subjects, and 2 (explanatory bias: positive, negative) × 3 (emotional grouping: The experimental design among subjects of happy emotion group, neutral emotion group, and angry emotion group adopted the video-induced research paradigm for emotion priming, and mainly discussed the influence of interpretive bias and emotion on online altruistic behavior after adding emotion as a variable. The results show that: (1) In study 1, there are significant differences in interpretation bias of network altruism. Compared with negative interpretation bias group, positive interpretation bias group shows more network altruism behavior. (2) There are significant differences in online altruism among different emotion types (happiness, neutral and angry). Compared with neutral and angry emotions, happy emotions can increase individuals' online altruism. Compared with happiness and neutral emotions, individuals' online altruistic behaviors are significantly reduced under anger emotion, that is, happy emotion can promote the occurrence of online altruistic behaviors, while anger emotion can reduce the occurrence of online altruistic behaviors. (3) In study 2, the interaction between interpretation bias and emotion is significant. Under the condition of interpretation bias grouping, the happy group and neutral group in emotion grouping have significant simple effects. This study uses the experimental method to deeply reveal the influence of interpretive bias on network altruistic behavior, which has certain theoretical and practical significance.

摘 要 青春期是个体一生发展的重要时期，也是焦虑抑郁的高发时期。青少年的焦虑抑郁可能会损害其心理健康，严重的甚至可能导致自杀。因此，探究青少年焦虑抑郁的影响因素并且实施保护性干预计划是很有必要的。在影响青少年焦虑抑郁的诸多因素中，较少有研究者关注到问题性网络使用这一变量。问题性网络使用是指个体对心理健康、社会适应、学业及工作等方面造成负面影响的网络使用行为。根据社会置换假说，问题性网络使用会导致青少年在虚拟世界中花费过多的时间和精力，缺乏与他人面对面地交流，缺少现实社会的支持，因此有可能提高其焦虑抑郁水平。此外，网络世界的匿名性与自由性能够给予个体所需要的社会支持与成就感，因此有焦虑抑郁情绪问题的个体更有可能通过问题性网络使用减轻自己的不适。综上，问题性网络使用与焦虑抑郁之间可能存在双向关系。目前研究多采用横断设计对二者之间的单向关系进行探讨，对其相互关系的研究相对较少。本研究采用交叉滞后设计来探讨问题性网络使用与青少年焦虑抑郁之间的双向关系，试图阐明二者之间具体的作用机制。

采用问题性网络使用问卷与焦虑抑郁量表对江西省 976 名青少年（M_{age} = 14.33, 48.1%为男生）进行了一学期的追踪调查。结果表明：（1）在一学年内，问题性网络使用与青少年焦虑抑郁均表现出较强的稳定性（$r = 0.62, p < 0.001$; $r = 0.71, p < 0.001$）；（2）学期初的问题性网络使用可以正向预测学期末的焦虑抑

郁（b_1 = 0.07, SE = 0.02, p < 0.001）。同时，学期初的焦虑抑郁也可以正向预测学期末的问题性网络使用（b_2 = 0.17, SE = 0.04, p < 0.001）。上述结果表明，问题性网络使用可能是影响青少年焦虑抑郁的重要风险之一，同时，青少年不良的情绪状态（如焦虑抑郁）也提高了他们问题性网络使用发生的概率。因此，学校及家长应对这种恶性循环予以关注，做好事前预防和事后干预的双途径工作。

Problematic Internet Use and Anxiety and Depression among Adolescents: A Cross-Lagged Panel Analysis

Yu Mingshen[1] Yang Lingqing[1] Xu Ziwei[1] Bao Zhenzhou[1] (Corresponding author)
School of Educational Science, Gannan Normal University, Ganzhou, 341000

Abstract ：Adolescence is an important period for an individual's lifelong development, which is also a period with a high incidence of anxiety and depression. Adolescents' anxiety and depression may damage their mental health, and in severe cases, it may result in suicide. Therefore, it is essential to explore the predictive factors of adolescents' anxiety and depression and implement protective intervention plans. Among the factors which may affect adolescents' anxiety and depression, few researchers have paid attention to Problematic Internet Use (PIU). Problematic Internet Use (PIU) refers to use of the Internet that creates psychological, social, school, and/or work difficulties in a person's life. According to the social displacement hypothesis, adolescents who use internet problematically may spend too much time and energy in the virtual world, lacking face-to-face communication with others, and lacking support from the real society, which may lead to the improvement of their anxiety and depression levels. In addition, the anonymity and freedom of the online world can provide adolescents with the social support and sense of achievement they need, therefore, adolescents with negative emotional experiences may be more likely to alleviate their discomfort through the internet. In summary, there may be a bidirectional relationship between PIU and anxiety and depression. At present, research mostly uses cross-sectional design to explore the unidirectional relationship between the two variables, there is relatively little research on their bidirectional relationship. This study used a cross-lagged design to explore the bidirectional relationship between PIU and anxiety and depression among adolescents and attempted to clarify the specific mechanism between the two variables.

Participants 976 adolescents (M_{age} = 14.33, 48.1% were boys) who provided self-report data on PIU and anxiety and depression at the beginning and end of the semester. the results showed that: (1) PIU and anxiety and depression showed strong stability across time (r = 0.62, p < 0.001; r = 0.71, p < 0.001); (2) PIU at the beginning of the semester positively predicted adolescents' anxiety and depression at the end of the semester (b_1 = 0.07, SE = 0.02, p < 0.001). In the meantime, adolescents' anxiety and depression at the beginning of the semester positively predicted PIU at the end of the semester (b_2 = 0.17, SE = 0.04, p < 0.001). Based on the results, PIU may serve as a risk factor for anxiety and depression in adolescents, in the meantime, adolescents with negative emotional states (such as anxiety and depression) also increased the probability of their problematic internet use. Therefore, teachers and parents should pay attention to this vicious cycle and ensure dual-pathway approaches work of prevention and intervention.

Keywords: adolescents, problematic internet use, anxiety and depression, cross-lagged analysis

突发公共卫生事件中信息过载对大学生学习倦怠的影响：一个多重的

中介模型

3 南昌大学教育发展研究院（南昌）330006；

摘 要 双加工理论认为，人们在进行信息加工处理的时候，会采用两种不同的处理方式，分别是启发式处理和系统式处理。启发式处理是快速的，不需要耗费太多认知资源，凭借着以往的经验，就能将呈现出来的一些暗示信息做出判断或决策。而系统式处理通常需要耗费较多的认知资源，经过深思熟虑才能做出决策。在现存的研究中，有关健康有关的信息过载的研究集中于慢性病，对突发公共卫生事件的研究较少。并且已有研究表明，有相关突发公共卫生事件的信息过载会对人们产生负面影响，而对于频繁使用网络的大学生群体，更有必要成为重点关注的研究对象。基于此，本文探究突发公共卫生事件中的信息过载是否通过信息双加工理论对大学生学习倦怠产生影响及其内部心理机制。

本文采用信息过载严重程度量表、大学生学习倦怠量表、网络疑病量表、风险认知量表、焦虑自评量表对江西等地区 842 名在校大学生进行数据调查。结果显示，①突发公共卫生事件信息过载、网络疑症、风险认知和焦虑两两变量之间显著正相关。突发公共卫生事件信息过载与网络疑症、疫情风险认知和焦虑显著正相关（r=0.41，r=0.17,r=0.39,p＜0.01）；网络疑症、风险认知与焦虑呈显著正相关（r=0.44,r=0.22,p＜0.01）；②突发公共卫生事件信息过载对焦虑的直接效应显著，效应值为 0.45，网络疑症和风险认知在信息过载对焦虑之间起单独中介作用，中介效应值分别为 0.24、0.03；③突发公共卫生事件信息过载与焦虑和学习倦怠之间显著正相关（r=0.39、r=0.21，p＜0.01）;焦虑与学习倦怠呈显著正相关（r=0.29,p＜0.01）；④突发公共卫生事件信息过载对学习倦怠的直接效应显著，效应值为 0.23，焦虑在突发公共卫生事件信息过载与学习倦怠之间起单独中介作用，中介效应值为 0.20。结果证明，突发公共卫生事件信息过载可以通过双加工过程中的认知过程和情感过程来影响大学生的焦虑情绪，并通过焦虑情绪来影响大学生的学习倦怠。

The effect of information overload on college students' learning burnout in a public health emergency: a multiple mediation model

Qifei Kang[1] ,Sanrong Xiao[2], Yingying Xiao[3], Ting Wang[1] (Corresponding author) E-mail: 125323611@qq.com

1 College of Humanities, Jiangxi University of Traditional Chinese Medicine, Nanchang, 330004, China

2 Department of Psychology, School of Public Policy and Management, Nanchang University, Nanchang, 330006, China;

3 Institute of Educational Development, Nanchang University, Nanchang, 330006, China;

Abstract： Dual processing theory suggests that people use two different types of processing when processing information, heuristic processing and systematic processing. Heuristic processing is fast and does not require much cognitive resources, and with previous experience, one can make a judgment or decision on some of the implied information presented. Systematic processing, on the other hand, usually requires more cognitive resources and

thoughtful consideration to make a decision. Among the extant studies, research on health-related information overload has focused on chronic diseases and less on public health emergencies. Moreover, studies have shown that information overload related to public health emergencies can have a negative impact on people, and it is necessary to focus on college students who frequently use the Internet. Based on this, this paper investigates whether information overload in public health emergencies affects college students' learning burnout through information dual processing theory and its internal psychological mechanisms.

This paper investigated 842 college students in Jiangxi and other regions using the Information Overload Severity Scale, the College Student Burnout Scale, Cyberchondria Scale, the Risk Perception Scale, and the Anxiety Self-Rating Scale. The results showed that (1) there were significant positive correlations between two variables of information overload of sudden public health events, Cyberchondria, risk perception and anxiety. Information overload of public health emergencies was significantly and positively correlated with Cyberchondria, risk perception of epidemic and anxiety ($r=0.41$, $r=0.17$,$r=0.39$,$p<0.01$); Cyberchondria, risk perception and anxiety were significantly and positively correlated ($r=0.44$,$r=0.22$,$p<0.01$); (ii) information overload of public health emergencies had a significant direct effect on anxiety with an effect (2) The direct effect of information overload on anxiety was significant, with an effect value of 0.45, while Cyberchondria and risk perception mediated the effect of information overload on anxiety, with a mediating effect value of 0.24 and 0.03, respectively; (3) Information overload on public health emergencies was significantly positively correlated with anxiety and burnout ($r=0.39$, $r=0.21$, $p<0.01$); anxiety was significantly positively correlated with burnout ($r=0.29$, $p<0.01$) It is concluded that information overload from public health emergencies can affect college students' anxiety through cognitive and emotional processes in dual processing, and affect college students' learning burnout through anxiety. It is concluded that information overload from public health emergencies can affect college students' anxiety through cognitive and emotional processes in dual processing, and affect college students' learning burnout through anxiety.

问题性短视频使用与大学生日常记忆失败：一个链式中介模型

王丽霞[1,2] 余易达[1,2] 谷传华[1,2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院，武汉，guchuanhua@ccnu.edu.cn

摘 要 随着各种移动短视频类应用的迅速发展，短视频已成为人们休闲娱乐、获取信息的极受欢迎的社交媒体形式。大学生是短视频使用的重要群体，也是问题性短视频使用的高发群体。近年来，短视频成瘾对大学生认知功能的影响得到了研究者们的关注。问题性短视频使用与记忆的关系虽然得到了研究者的关注，但由于对两者关系的研究较为有限，尚不清楚问题性短视频使用如何影响日常记忆。因此，本研究以910名大学生为研究对象，采用短视频成瘾量表、注意控制量表、注意相关的认知错误量表和日常记忆失败量表，探讨问题性短视频使用对日常记忆失败的影响及其作用机制。结果发现：(1)在控制了每日短视频使用时长后，问题性短视频使用能显著正向预测注意控制缺陷、注意相关的认知错误以及日常记忆失败，注意控制缺陷显著正向预测注意相关的认知错误和日常记忆失败，注意相关的认知错误显著正向预测日常记忆失败；(2)在控制了每日短视频使用时长后，注意控制缺陷和注意相关的认知错误在问题性短视频使用与日常记忆失败的关系中起部分中介作用。具体而言，问题性短视频使用通过三条路径影响日常记忆失败：

一是注意控制缺陷的单独中介作用；二是注意相关的认知错误的单独中介作用；三是注意控制缺陷—注意相关的认知错误的链式中介作用。研究结果提示问题性短视频使用会损害日常记忆，并在一定程度上揭示了其中的中介机制，丰富了问题性短视频使用对大学生认知功能研究领域的内容，并对指导大学生合理使用短视频具有一定的理论和实践价值。

Problematic Use of Short Videos and Everyday Memory Failure in College Students: A Chain Mediation Model

Lixia Wang[1 2], Yida Yu[1 2], Chuanhua Gu[1 2]
1 Key Laboratory of Adolescent CyberPsychology and Behavior, Ministry of Education, Wuhan
2 School of Psychology, Central China Normal University, Wuhan

Abstract：With the rapid development of various mobile short video applications, short videos have become a highly popular form of social media for leisure, entertainment, and information acquisition. College students are an important group in the use of short videos and are also prone to problematic use. In recent years, the impact of short video addiction on the cognitive functions of college students has attracted the attention of researchers. While the relationship between problematic use of short videos and memory has been studied, there is limited understanding of how problematic use of short videos affects everyday memory. Therefore, a questionnaire survey was conducted among 910 college students using the Short Video Addiction Scale, Attention Control Scale, Attention-Related Cognitive Errors Scale, and Everyday Memory Failure Scale to investigate the impact of problematic use of short videos on everyday memory failure and its underlying mechanisms. The results revealed the following: (1) After controlling for daily short video usage duration, problematic use of short videos significantly and positively predicted attention control deficits, attention-related cognitive errors, and everyday memory failure. Attention control deficits significantly and positively predicted attention-related cognitive errors and everyday memory failure, while attention-related cognitive errors significantly and positively predicted everyday memory failure. (2) After controlling for daily short video usage duration, attention control deficits and attention-related cognitive errors partially mediated the relationship between problematic use of short videos and everyday memory failure. Specifically, problematic use of short videos influenced everyday memory failure through three pathways: the independent mediation of attention control deficits, the independent mediation of attention-related cognitive errors, and the chain mediation of attention control deficits and attention-related cognitive errors. The findings suggest that problematic use of short videos can impair everyday memory and provide insights into the underlying mechanisms. This study enriches the research on the cognitive functions of college students in the context of problematic use of short videos and has theoretical and practical implications for guiding college students in the rational use of short videos.

Keywords：problematic use of short videos, attention control deficits, attention-related cognitive errors, everyday memory failure, college students

手机依赖者自我损耗程度对风险决策的影响

黄扬[1]　郑玮琦[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，weiqi71@126.com

摘 要　手机在我们的生活中扮演着重要的角色，虽然它给我们带来了方便和效率，但过度使用也会带来负面影响，目前各界研究者通常通过问卷调查探讨手机依赖对个人人格特质或者社会适应能力的影响，而很少采用实证研究来讨论手机依赖对个体认知功能的影响。本研究首先通过熊婕等人(2012)编制的大学生手机成瘾倾向量表对大学生群体进行施测，并进一步通过实验综合探究手机依赖程度与自我损耗状态如何影响大学生风险决策。采用爱荷华赌博任务(IGT)作为考察风险决策的测量指标，研究为三因素混合设计，自变量为 2(手机依赖程度：高手机依赖、低手机依赖)×2(自我损耗程度：高损耗、低损耗)×6(决策组块数)，并探索决策的性别差异，因变量为被试在爱荷华赌博任务上的净分数，并分析即时收益与惩罚频率对被试决策策略的影响。根据大学生手机依赖量表得分，从 164 名大学生中筛选出高分组(得分前 27%)和低分组(得分后 27%)，两组被试又平均分配进高自我损耗组与低自我损耗组，每组 44 人，各包括 22 名高分组和 22 名低分组。实验中，采用中文版 E-crossing 任务来操控高低损耗组被试的自我损耗水平。问卷结果显示手机依赖检出率高达 56.3%。实验结果表明手机依赖主效应、损耗程度主效应以及两者的交互作用均不显著($p > .05$)；被试在决策中均会产生学习效应，但自我损耗程度高的高手机依赖者能够更快地总结出有利的决策策略($F(5, 35) = 2.24$，$p < .05$，$\eta^2 = .03$)；被试均在高即时收益条件下对惩罚频率更敏感($F(1, 81) = 87.75$，$p < .001$，$\eta^2 = .52$)；男性被试在决策任务中做出了更多的不利选择($t = -2.09$，$p < .05$)，且更多地选择即时收益量更高的牌(即使伴随更大的损失)($F(1, 80) = 3.96$，$p < .05$，$\eta^2 = .26$)。结论：本研究并未发现手机依赖程度与自我损耗对风险决策的显著影响，但手机依赖程度高的被试处于损耗状态时能更快地总结出有利的决策策略；在高奖赏时被试的惩罚敏感度普遍更高；男性在决策中更加冲动、更看重当下收益。这丰富了手机依赖者高级认知功能相关研究，对手机依赖相关研究有一定启示。

The influence of self-depletion degree on risk decision of mobile phone dependents

Yang Huang[1], Weiqi Zheng[1]
School of Psychology, Beijing Sport University, Beijing, 100084, weiqi71@126.com

Abstract：Mobile phones play an important role in our lives. Although they bring us convenience and efficiency, overuse will also bring negative effects. At present, researchers from diverse backgrounds usually discuss the impact of mobile phone dependence on individual personality traits or social adaptability through questionnaires, while empirical studies are rarely used to discuss the impact of mobile phone dependence on individual cognitive

function. This study first tested college students through the Mobile Phone Addiction Tendency Scale compiled by Xiong Jie (2012), and further explored how the degree of mobile phone dependence and the state of self-depletion affected college students' risk decision-making through experiments. Using the Iowa Gambling Task (IGT) as a measure of risk decision-making, the study was a three-factor mixed design with independent variables of 2(mobile phone dependence: high mobile phone dependence, low mobile phone dependence)×2(self-depletion: high depletion, low depletion)×6(number of decision group blocks), and explore the gender difference in decision making. The dependent variable is the participants' net score on the Iowa Gambling Task and analyzes the effects of immediate reward and punishment frequency on the participants' decision strategies. According to the score of the Mobile Phone Dependence Scale for college students, subjects were selected from 164 college students in the high group (the top 27% score) and the low group (the bottom 27% score), and the two groups were equally divided into the high self-depletion group and the low self-depletion group, 44 subjects in each group, including 22 high score group and 22 low score group. In the experiment, the Chinese version of E-crossing task was used to control the level of self-depletion of the participants in the high-low depletion group. The results of the questionnaire showed that the detection rate of mobile phone dependence was as high as 56.3%. The experimental results show that the main effect of mobile phone dependence, the degree of depletion, and their interaction did not yield significant results ($p > .05$); All the subjects have learning effect in decision making, but the subject of the high mobile phone dependence with high self-depletion degree can summarize the favorable decision making strategy faster ($F(5, 35) = 2.24$, $p < .05$, $\eta^2 = .03$); All subjects were more sensitive to punishment frequency under the condition of high immediate gain ($F(1, 81) = 87.75$, $p < .001$, $\eta^2 = .52$); Male subjects made more adverse choices in the decision making task ($t = -2.09$, $p < .05$), and more likely to choose cards with higher immediate gains (even with greater losses) ($F(1, 80) = 3.96$, $p < .05$, $\eta^2 = .26$). Conclusion: The findings suggest that mobile phone dependence and self-depletion do not exert a significant influence on risk decision-making, but the subjects with high mobile phone dependence can summarize favorable decision-making strategies faster when they are in high self-depletion. The punishment sensitivity of the subjects is generally higher when the reward is high. Men are more impulsive in their decision-making and value immediate gains. This has enriched the research on the cognitive function of mobile phone dependents and has certain implications for the research on mobile phone dependents.

Keywords：mobile phone dependence, self-depletion, decision-making, Iowa Gambling Task

初次网络实时互动后的人际距离感知：表情符号的作用

周爱华[1] 陈晓冰[1] 张雨婷[1] 郭芷璇[1] 徐雷[1](通讯作者)

1 四川师范大学脑与心理科学研究院，四川省成都市，610068，xulei@sicnu.edu.cn

摘 要 表情符号是网络沟通中不可或缺的一环，它可以传达出更多的情感和情绪，帮助人们更准确地理解对方的意图和感受。以往研究指出，表情符号可以影响第一印象、增强人际信任和亲密感。但这些研究或以问卷调查为主要形式，或采用静态图片作为刺激材料，缺乏网络环境中实时的人际互动，且人际知觉的指标多为主观的亲密感或心理距离评分。因此，本研究将采用计算机版的人际距离任务，考察网络实时互动中表情符号的使用对个体人际距离感知的影响。

本研究招募了 50 名大学生被试（34 名女性，平均年龄为 19.66±1.72 岁），以微信作为实时互动媒介，探索首次网络实时互动中表情符号的使用与否如何影响个体的人际距离感知。被试在微信上分别与 2 个陌

生人进行结构化的自我表露互动过程，其中 1 个陌生人在提问时使用表情符号，另 1 个陌生人则不使用表情符号。每次实时互动后，被试需要对本次互动过程中接收与表露的信息、感知表露回应、以及互动享受程度进行 7 点评分。在实时互动前后，被试均需完成计算机版的人际距离任务。该任务要求被试想象自己在一个圆形的房间内，会有不同身份的小人不断从远处（主动/被动）靠近自己，被试通过按键暂停来选择与对方之间感到舒适的人际距离。

实时互动后的评分结果显示，被试在互动享受程度上存在显著差异：与不使用表情符号的陌生人相比，被试更享受与使用表情符号的陌生人的互动($t_{(50)} = 3.61, p < 0.01$)；在人际距离任务上，实时互动后被试对两个陌生人的人际距离感知均显著小于实时互动前(时间主效应：$F_{(1,49)} = 17.32, p < 0.01$)，且对使用表情符号的陌生人的人际距离感知显著小于不使用表情符号的陌生人(交互效应：$F_{(1,49)} = 12.87, p < 0.01$)。中介模型显示，互动享受程度完全中介表情符号的使用对人际距离感知的影响(β = -1.91, SE = 0.96, 95%CI [-3.94, -0.20])。上述结果表明，表情符号的使用能增强个体在网络初识阶段对实时互动的享受，进而增近对对方的人际距离感知，这为表情符号的使用如何促进或阻碍关系的启动提供了新的见解。

Perception of interpersonal distance after first real-time online initiation: the role of emoji use

Zhou Aihua[1] Chen Xiaobing[1] Zhang Yuting[1] Guo Zhixuan[1] Xu Lei[1] (Corresponding author)
1 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, Sichuan, 610068, xulei@sicnu.edu.cn

Abstract： Emojis play a crucial role in online communication by adding emotion and sentiment, thereby facilitating better understanding of intentions and feelings. Previous research has highlighted the impact of emojis on first impressions, as well as their ability to enhance interpersonal trust and intimacy. However, these studies primarily relied on questionnaires or static images as stimuli, which lacked real-time interpersonal interactions in online environments. Additionally, most studies focused on subjective intimacy or psychological distance rating. Thus, the current study aims to investigate the effect of emoji use during first real-time online initiation on perception of interpersonal distance measured by computerized comfortable interpersonal distance task.

In the current study, we recruited 50 college students (34 female; Mage = 19.66 ± 1.72 years) and chose WeChat as the real-time interaction medium to explore whether emojis are being used or not during the initial phases of interaction would influence the perception of interpersonal distance. The participants engaged in a structured self-disclosure interaction procedure on WeChat with two strangers separately. One of the strangers used emojis when asking questions, while the other did not. After each real-time interaction, the participants were asked to rate perceived information received and given, perceived responsiveness of the other, and enjoyment of the interaction on a 7-point scale. To measure changes in interpersonal distance, the participants completed a computerized comfortable the interpersonal distance task both before and after the real-time interactions. In this task,participants were required to imagine themselves in a circular room where little figures of different identities continuously (either actively or passively) approached them from a distance. The participants were then asked to choose the interpersonal distance they felt comfortable with this identity by pressing a key to pause the simulation.

The results of ratings after real-time interaction revealed significant differences in enjoyment of the interaction, participants enjoyed more during the interaction with the stranger who used emojis than with the stranger who did not use emojis ($t_{(50)} = 3.61$, $p < 0.01$). Furthermore, perception of interpersonal distance for both strangers after the real-time interaction was significantly smaller than before (main effect of time: $F_{(1,49)} = 17.32$, $p < 0.01$). And after the real-time interaction, perception of interpersonal distance was significantly smaller for the stranger who used emojis compared to the stranger who did not use emojis (interaction effect: $F_{(1,49)} = 12.87$, $p < 0.01$). The mediation model showed that enjoyment of the interaction fully mediated the effect of emoji usage on percption of interpersonal distance (β = -1.91, SE = 0.96, 95% CI [-3.94, -0.20]). The current finding suggest that the use of emojis enhances individuals' enjoyment of interactions during real-time online interaction at the initial acquaintance stage, which subsequently leads to a closer perception of interpersonal distance towards the other. This provides valuable insights into the role of emoji usage in facilitating or impeding the initiation of relationships.

Keywords： Emojis, Interpersonal distance, Real-time online interaction, Enjoyment of the interaction

状态自悯对大学生网络利他行为的影响：心理距离的中介作用和网络头像可信度的调节作用

蔡若男[1] 郑显亮[1]（通讯作者）谢佳雯[1] 宋子佳[1] 刘志青[1]
1 赣南师范大学教育科学学院，赣州, 341000, zxl2004@sina.com

摘 要 截至 2022 年 12 月，我国网民规模达到 10.67 亿，互联网普及率达 75.6%，随着网络科技的不断发展，网络利他行为也越来越普遍、便捷。网络利他行为是指在网络中发生的，对有需求个体或群体进行主动帮助且不求汇报的助人行为。以往研究主要从施助者的个人特质来研究网络利他行为，但是助人行为通常会收到施助者与受助者的双重影响，仅从施助者层面进行研究过于单一，因此本研究将从施助者与受助者双重视角探究状态自悯和心理距离对网络利他行为的影响与机制作用。在积极心理学中，自悯与积极情绪密切相关，是影响个人身心发展和健康人格的重要因素。状态自悯是指对幸福与痛苦的理解与包容，以及给予自我温暖与关注。心理距离是指与另一对象或事物的主观感受与判断。研究一运用实验法从施助者视角下，探讨状态自悯对网络利他行为的影响。实验招募 132 名高校学生被试，采用单因素被试间实验设计，自变量为状态自悯（启动、控制），因变量为独裁者游戏捐助数额。研究二运用实验法从施助者视角下，探究心理距离在状态自悯与网络利他行为间的中介作用。实验招募 88 名高校学生被试，采用 2（状态自悯：启动、控制）*2（心理距离：远、近）混合实验设计，因变量为独裁者游戏捐助数额。研究三运用实验法从施助者与受助者双重视角下，采用捐助行为独裁者游戏来探究网络头像在状态自悯与网络利他行为关系间的调节作用。实验招募 88 名高校学生被试，采用 2（状态自悯：启动、控制）*2（网络头像可信度：高、低）混合实验设计，因变量为独裁者游戏捐助数额，并运用 SPSS 26.0 进行数据分析。结果显示：（1）施助者的状态自悯正向预测其网络利他行为；（2）心理距离在状态自悯与网络利他行为间起中介作用；（3）受助者的网络头像可信度会调节施助者状态自悯对网络利他行为的影响。本研究有利于培养大学生积极心理特质，正确使用网络头像，从而提升网络利他行为。

The Effect of State Self-Compassion on College Students' Internet Altruistic Behavior: The Mediating Role of Psychological Distance and the Moderating Effect of Network Avatar Credibility

Cai Ruonan[1] Zheng Xianliang[1] Xie Jiawen[1] Song Zijia[1] Liu Zhiqing[1]
1 School of Education Science, Gannan Normal University, Ganzhou, 34100, zxl2004@sina.com

Abstract： As of December 2022, the size of China's Internet users has reached 1.067 billion, and the Internet penetration rate has reached 75.6%, and with the continuous development of network technology, internet altruistic behavior has become more and more common and convenient. Internet altruistic behavior refers to the behavior of helping others that occurs in the network and actively helps individuals or groups in need without reporting. Previous studies have mainly studied internet altruistic behavior from the personal characteristics of donors, but helping behaviors usually receive the dual influence of donors and recipients, and it is too single to study only from the level of donors, so this study will explore the influence and mechanism of state self-compassion and psychological distance on internet altruistic behavior from the dual perspectives of donors and recipients. In positive psychology, self-compassion is closely related to positive emotions and is an important factor affecting an individual's physical and mental development and healthy personality. State self-compassion refers to the understanding and tolerance of happiness and pain, as well as giving self-warmth and attention. Psychological distance refers to subjective feelings and judgments with another object or thing. Study 1: Using experimental

methods, from the perspective of donors, the impact of state self-compassion on internet altruistic behavior is discussed. The experiment recruited 128 college students, and adopted a single-factor inter-participant experimental design, with the independent variable being state self-compassion (priming, control), and the dependent variable being the amount of dictator's game donation. Study 2: Using experimental methods, from the perspective of donors, the mediating role of psychological distance in state self-compassion and internet altruistic behavior is explored. The experiment recruited 88 college students, using a mixed experimental design of 2 (state self-compassion: priming, control) *2 (psychological distance: far, near), and the dependent variable was the amount donated by the dictator's game. Study 3: Using the experimental method from the dual perspectives of donors and recipients, the donor dictator game is used to explore the moderating effect of network avatars in the relationship between state self-compassion and internet altruistic behavior. The experiment recruited 88 college students, using 2 (state self-compassion: priming, control) *2 (network avatar credibility: high, low) mixed experimental design, the dependent variable is the amount of dictator game donation, and SPSS 26.0 was used for data analysis. The results showed that: (1) The state of the helper's self-compassion positively predicted his internet altruistic behavior. (2) Psychological distance plays a mediating role between state self-compassion and internet altruistic behavior. (3) The credibility of the recipient's network avatar will regulate the influence of the recipient's state self-compassion on the internet altruistic behavior. This study is conducive to cultivating college students' positive psychological traits and correct use of network avatars, thereby improving internet altruistic behavior.

Keywords：Internet altruistic behavior, state self-compassion, psychological distance, network avatar credibility

错失恐惧和手机成瘾之间的联系：一项元分析

赵金霞[1] 张亚利[2]

1 河北师范大学教育学院，石家庄，050000

2 河北师范大学教育学院，石家庄，050000，zhangyali531@sina.com

摘 要 背景：错失恐惧和手机成瘾之间的关系一直是最近研究人员关注的焦点。国内外已有许多研究探索了错失恐惧和手机成瘾之间的联系，但结果并不一致。本研究旨在进一步探讨错失恐惧与手机成瘾之间的关系，以及以往研究结果不同的原因。方法：为实现我们的目标，本研究采用随机效应模型对 85 项研究（90 个独立效应量）进行了元分析。通过元分析，本研究来估计相关系数，并分析可能影响关联的潜在调节因素。结果：主效应分析显示，错失恐惧与手机成瘾之间呈较高的正相关关系（r=0.47,95%CI [0.44,0.50]），错失恐惧程度越高，对手机上瘾的程度就越高。手机成瘾的测量调节了错失恐惧和手机成瘾之间的关联强度，使用 MPATS 测量的相关性最高，使用 MPDQ 测量的相关性最低。研究发现个体因素（性别和年龄）、环境因素（文化背景和出版年份）、FoMO 测量对错失恐惧与手机成瘾的相关性无显著影响。此外，研究表明，测量结果缓和了错失恐惧和手机成瘾之间的关系，进一步阐明了为什么与之前关于错失恐惧和手机成瘾之间联系的研究结果如此不一致的原因。结论：错失恐惧与手机成瘾密切相关，符合人-情感-认知-执行模型（I-PACE 模型）。根据研究结果，我们应该集中精力预防和尽量减少错失恐惧，这可能是减少手机成瘾的新策略。未来，需要实验和纵向研究来进一步探索错失恐惧与手机成瘾之间的动态关系。

关键词 错失恐惧，手机成瘾，元分析

The association between fear of missing out and mobile phone addiction: A meta-analysis

Jinxia Zhao
Hebei Normal University，Shijiazhuang

Abstract:Background: The relationship between fear of missing out and mobile phone addiction has been the focus of recent researchers. Many studies both at home and abroad have explored the association between fear of missing out and mobile phone addiction, but the results are inconsistent. This study aimed to further explore the relationship between fear of missing out and mobile phone addiction and the reasons for the different findings in previous studies. Methods: To achieve our goals, a meta-analysis of 85 studies (90 independent effect sizes) was conducted with a random-effects model in this research. Through the meta-analysis, this study was conducted to estimate the correlation coefficient and analyze potential regulatory factors that may influence the association.Results: The main effect analysis showed a high positive correlation between fear of missing out and mobile phone addiction (r=0.47,95%CI [0.44,0.50]), and that the higher the degree of fear of missing out, the higher the degree of addiction to mobile phone. The measure of mobile phone addiction mediated the strength of the association between fear of missing out and mobile phone addiction, with the highest correlations measured using the MPATS and the lowest associations measured using the MPDQ. Individual factors (sex and age), environmental factors (cultural background and year of publication), and FoMO measures had no significant effects on the association of fear of missing out and mobile phone addiction. Furthermore, studies show that the measurement result moderates the relationship between missing fear and mobile phone addiction, further clarifying why it is so inconsistent with previous findings on the link between missing fear and mobile phone addiction.Conclusion: Miss fear is closely related to mobile phone addiction in consistent with the Interaction of Person-Affect-Cognition-Execution model (I-PACE model). Based on the findings, we should focus on preventing and minimizing the fear of missing out, which may be a new strategy to reduce mobile phone addiction. In the future, experimental and longitudinal studies are needed to further explore the dynamic relationship between fear of missing out and mobile phone addiction.

Keywords: Fear of missing out, Mobile phone addiction, Meta-analysis

特质决定平台之旅:联系依恋、负性情绪、动机与特定问题性社交媒体使用的网络分析模型

白栩嘉　高雪梅（通讯作者）
西南大学心理学部，重庆，400715，zhenggao@swu.edu.cn

摘 要　随着互联网技术的不断升级和数字媒体的日益普及，社交媒体也逐渐发展为一场全民参与的狂欢，迎来了飞速发展。当享受着社交媒体带来的便捷时，部分个体却面临着被它们“绑架”的风险，表现出问题性社交媒体使用行为。一些理论将这种成瘾性质的社交媒体使用归因于个体特质差异，在此基础上，大量研究探讨了依恋与问题性社交媒体使用的关系，并显示不安全依恋是问题性社交媒体使用的易感性因素。但细分依恋取向时，其具体的影响效应及机制尚未达成共识。使用与满足理论强调了个体特质、动机和媒体使用之间的关系，提示不同依恋个体在不同动机作用下存在不同的社交媒体使用表现。但以往研究往往未能将个体特质与平台特性相结合，从而限制了不安全依恋与问题性社交媒体使用之间更为清晰准确的关联描述。因此，本研究旨在采用网络分析的方法，探讨依恋、负性情绪、动机之间复杂的相互作用，并找到其与微信、微博和抖音三个社交媒体平台问题性使用的关系。共有 685 名用户完成了在线自我报告问卷的调查，结果显示焦虑依恋个体与问题性微信使用和问题性抖音使用的关系最为密切，而回避依恋个体更容易面临问题性微博使用和问题性抖音使用风险。此外，负性情绪，包括压力、焦虑和抑郁，伴随依恋焦虑和依恋回避发生，并显示出更高水平的状态性依恋焦虑和依恋回避。状态性依恋焦虑在三种动机（应对、增强、顺从）影响下与问题性微信使用相关联。状态性依恋回避则通过应对动机、顺从动机的积极作用和社会动机的消极作用，与问题性微博使用和问题性抖音使用相关联。状态性依恋安全虽然显示出强烈的动机（增强和社会），但并未表现出问题性社交媒体使用风险。上述结果再次验证了不安全依恋个体在满足自身需求方面的困难使其更容易陷入问题性社交媒体使用风险，并揭示了不同依恋取向与不同问题性社交媒体使用之间的特定关联，为理解二者关系补充了网络分析视角的证据。
关键词　不安全依恋，问题性社交媒体使用，负性情绪，动机，网络分析。

A Network Analysis Approach to the Relationship Between Attachment, Negative Emotions, Motivations, and Specific Problematic Social Media Problematic Use

Bai Xujia, Gao Xuemei*
Faculty of Psychology, Southwest University, Chongqing, China

Abstract：The problematic use of social media is on the rise due to its increasing popularity. The addictive nature of social media use has been attributed to dispositional differences, and numerous studies have explored the relationship between attachment and problematic social media use, showing that insecure attachment is a vulnerability factor. Nevertheless, there is currently no consensus on the specific effects and mechanisms of different attachment orientations. The Uses and Gratifications Theory emphasizes the relationship between individual traits, motivations, and media use, suggesting that individuals with different attachment orientations exhibit different patterns of social media use under different motivations. Previous research often failed to integrate individual traits with platform characteristics, limiting the clear and accurate description of the relationship between insecure attachment and problematic social media use. Therefore, this study aims to use a network analysis approach to explore the complex interactions between attachment, negative emotions, motives, and their relationship with the problematic use of three social media platforms: WeChat, Weibo, and Tiktok. A total of 685 social media users completed the online self-report questionnaires. The results indicate that individuals with anxiety attachment have the closest relationship with problematic WeChat and TikTok use, while individuals with avoidance attachment are more likely to face risks of problematic Weibo and TikTok use. It was also found that negative emotions, including stress, anxiety, and depression, occurred alongside both attachment anxiety and attachment avoidance, indicating higher levels of state attachment anxiety and attachment avoidance. State anxiety attachment is associated with problematic WeChat use under the influence of three motives (coping, enhancement, and compliance). State avoidance attachment, on the other hand, is correlated with problematic Weibo and TikTok use through the positive impact of coping and compliance motives, as well as the negative impact of social motives. In contrast, state attachment security showed strong motives (enhancement and social), but did not exhibit any risks of problematic social media use. The above results once again validate that individuals with insecure attachment are more susceptible to engaging in problematic social media use, as they have more difficulties in satisfying their needs. Furthermore, this study uncovers specific correlations between different attachment orientations and particular problematic social media use, thereby enhancing our understanding of their relationship from a network analysis perspective.

摘 要 随着信息网络技术的不断发展，智能手机与人们的日常生活深度融合。一方面，媒介的使用成为家庭互动中的常见现象，越来越多的个体沉迷于手机使用，加入“低头族”的大军，父母群体也不例外；另一方面，以智能手机为代表的新兴电子媒介使用呈现低龄化趋势，电子媒体日益成为幼儿成长的重要影响因素之一。近年来，亲子互动中的媒体使用行为引起了学者们的关注。本研究基于以往实证研究结果，并以生态系统理论（Ecological Systems Theory）和自我决定理论（Self-Determination Theory）理论为依据，考察父母低头行为和亲子依恋在父母手机依赖与幼儿电子媒介使用关系中作用机制。采用手机依赖问卷、父母低头行为问卷、亲子依恋问卷和幼儿电子媒介使用程度问卷对 758 名幼儿家长进行调查。结果发现：（1）父母低头行为和父母手机依赖、幼儿电子媒介使用呈显著正相关，与亲子依恋呈显著负相关；父母手机依赖和幼儿电子媒介过度使用呈显著正相关，与亲子依恋呈显著负相关；幼儿电子媒介过度使用和亲子依恋呈显著负相关。（2）多重中介效应检验表明，父母手机依赖不仅可以直接影响幼儿电子媒体的过度使用，还可以通过三条路径的间接作用影响幼儿的电子媒体过度使用。具体而言，一是父母低头行为的单独中介作用；二是亲子依恋的单独中介作用；三是父母低头行为-亲子依恋的链式中介作用。本研究揭示了父母手机依赖影响幼儿电子媒体过度使用的内部机制，并启示父母减少手机使用，为幼儿树立良好的榜样作用，从而保证良好的亲子关系，减少幼儿过度使用电子媒介的行为。

The Effect of Parental Mobile Phone Dependence on Electronic Media Overuse in Young Children: The Chain Mediating Effect of Parental Phubbing Behavior and Parent-child Attachment

Jie-ying Yin[a,b], Kuai Song[a,b,c], Yan-rong Fan[a,b], Jin-jin Xu[a,b], Zhang-hua Gu[a,b], Zong-kui Zhou[a,b]

[c] School of Preschool education, Hubei Preschool Teachers College, Ezhou, 436032

Abstract: With the continuous development of information network technology, smart phones are deeply integrated into People's Daily life. On the one hand, the use of media has become a common phenomenon in family interaction. More and more individuals are addicted to mobile phone use and join the army of "phubbing", and parents are no exception. On the other hand, the use of emerging electronic media represented by smart phones shows a trend of younger age, and electronic media has increasingly become one of the important factors affecting the growth of children. In recent years, media use behavior in parent-child interaction has attracted scholars' attention. This study is based on previous empirical research results and Ecological Systems Theory and Self-Determination Theory. To investigate the mechanism of parental phub-down behavior and parent-child attachment in the relationship between parents' mobile phone dependence and children's electronic media use. A total of 758 parents of young children were investigated by mobile phone dependence questionnaire, parental phub-down questionnaire, parent-child attachment questionnaire and children's electronic media use questionnaire. The results showed that: (1) Parents' phub-down behavior was positively correlated with parents' mobile phone

dependence and children's electronic media use, and negatively correlated with parent-child attachment; There is a significant positive correlation between parents' mobile phone dependence and children's excessive use of electronic media, and a significant negative correlation with parent-child attachment. There is a significant negative correlation between children's excessive use of electronic media and parent-child attachment. (2) The multiple mediation effect test shows that parents' mobile phone dependence can not only directly affect children's overuse of electronic media, but also indirectly affect children's overuse of electronic media through three pathways. Specifically, one is the single mediating effect of parental phubbing behavior; Second, the single mediating effect of parent-child attachment; The third is the chain mediating effect of parental phubbing behavior - parent-child attachment. This study reveals the internal mechanism of parents' mobile phone dependence affecting children's excessive use of electronic media, and suggests that parents should reduce mobile phone use to set a good example for children, so as to ensure a good parent-child relationship and reduce children's excessive use of electronic media.

Keywords ： parental mobile phone dependence, parental phubbing behavior, parent-child attachment, electronic media overuse, young children

社会善念对大学生网络利他行为的影响：解释偏向的中介作用及其性别差异

摘 要 随着互联网发展模式的创新、新技术的应用及普及，网络心理和行为的研究越来越成为热点。网络利他行为彰显团结、友善、奉献的交往理念，对网络利他行为进行深入研究符合新时代网络文明建设要求。社会善念强调关注他人的状态，是人际互动情境中表达出的善意，是亲社会动机的一种，与网络利他行为有着密不可分的联系，但当前学界二者的研究还不够系统和深入。因此，本研究以认知图式理论和认知信息加工模型等为理论基础，探讨社会善念对大学生网络利他行为的影响，并进一步探讨解释偏向的中介作用及其性别差异。采用单因素被试间实验设计，通过“物品选择游戏”操纵被试的社会善念水平高低，将 440 名大学生(*M*=20.05 岁，*SD*=2.37)被试分为高低 2 组，并分别通过模糊情景自我报告范式和网络利他行为情景实验测查被试的解释偏向和网络利他行为，运用 SPSS26.0 和 PEOCESS v3.5 对数据进行分析和处理。结果显示：(1)相比于低社会善念者，社会善念高的个体解释偏向更积极，并且表现出更多的网络利他行为；(2)解释偏向在社会善念与网络利他行为间发挥着部分中介作用；(3)此中介效应仅出现在女性中，在男性中不显著。因此,社会善念水平高的大学生会产生更积极的解释偏向,从而做出网络利他行为，并且这一影响会存在性别的差异。本研究聚焦于大学生的社会善念对网络利他行为的影响，对于培育积极健康、向上向善的网络文化有一定的积极作用，同时在一定程度也上丰富了网络心理学的研究内容。

How social mindfulness influences internet altruistic behavior: The mediating effect of interpretation bias and its gender differences

Li Xiangqin Wang Jielin Chen Lin Zheng Xianliang (Correspondence author)
(School of Education and Science, Gannan Normal University, Ganzhou, 341000, Email: zxl2004@sina.com)

Abstract: With the innovation of the Internet development model and the application and popularization of new technologies, the research on network psychology and behavior has become a hot spot. Internet altruistic behavior (IAB) shows the communication concept of unity, friendliness and dedication. The in-depth study of IAB is in line with the requirements of the construction of network civilization in the new era. Social mindfulness, which emphasizes the state of concern for others, is the goodwill expressed in the context of interpersonal interaction, which is a kind of prosocial motivation and closely related to the IAB. However, the current academic research on the two is not systematic and in-depth. Therefore, based on the cognitive schema theory and the cognitive information processing theory, this study explored the influence of social mindfulness on college students' IAB, and further explored the mediating role of interpretation bias and its gender differences. This experiment was a single factor experimental design, 440 participants were randomly assigned to one of two conditions (i.e., 220 participants for high social mindfulness condition; 220 participants for low social mindfulness condition). Social Mindfulness Paradigm was used to manipulated individual' s levels of social mindfulness, a self-report material of ambiguous scenarios was used to measure the participants' interpretation bias, and IAB was tested using a scenario of IAB. The results show that: (1) Compared with those with low social kindness, individuals with high social kindness tend to interpret more positively and show more altruistic behaviors on the Internet; (2) Interpretation bias plays a partial mediating role between social mindfulness and IAB; (3) Such mediating role is mainly observed among females and is not significant among males.

Keywords: social mindfulness, internet altruistic behavior, interpretation bias, gender, college student

女性和儿童被虐待的新闻引发的公众反应：性别差异及新闻语境的影响

方静怡　余毕月　王晓田（通讯作者）
香港中文大学（深圳）人文社科学院应用心理学系，广东省深圳市龙岗区，518172，lauren_fang@163.com

摘 要　最近，以三孩政策为例等计划生育政策的变化，引发了公众对有关妇女儿童被虐待的案件的更多的关注。研究调查了公众对妇女儿童虐待新闻会有怎样的态度和情绪反应，尤其是新闻接收者的性别和新闻来源（网络新闻，从朋友处得知的新闻，或无来源信息的新闻）对公众新闻感知与反应的影响。运用三个版本的问卷，涵盖单纯事实，线上来源和朋友处获悉三个信息源和两类（妇女，儿童）问题，每个问题有两组新闻。问卷发布在线上问卷平台 Creadamo 上，以检测公众对两类新闻报道的风险直觉与情绪反应，新闻报道的具体场景分别是妇女工作场合遭遇性霸凌和校园中的儿童受到虐待。除了参与者的性别和新闻的来源，另一个自变量为新闻中提到的预防措施是否有效。样本包含 299 名参与者（121 名女性）。结果显示：1）相比涉及儿童受害者的案件，参与者对涉及女性受害者的案件有着更高的风险知觉。2）涉及儿童受害者与涉及女性受害者的案件，信息的来源对知觉到的类似案件的发生风险与严重性都有影响。与单纯信息相比，信息源为网络和朋友的新闻语境下，被试的风险认知更低。这一发现于实验预期不一致，表明网络或私人信息可能会减低新闻的可信性和权威性，进而削弱风险知觉。其中，私人信息源在风险知觉上

得分最低。 3）受访者的性别对女性虐待案件中的情绪反应有影响。男性被试的恐惧反应(M = 7.011, SD = 0.125)低于女性(M = 7.404, SD = 0.104)，但他们的愤怒反应(M = 0.545, SD = 0.005)高于女性(M = 0.5331, SD = 0.004)。 4）相较于女性被试，男性被试整体对风险预防措施的有效性有着更高的预期。 5）男性被试自身的婚育状态增加对女性和儿童虐待案件的共情，产生更强的情绪反应。总结而言，新闻的来源影响公众对同一新闻事件的反应。新闻受众根据信息的来源调节对新闻事件的反应，减弱对网络来源和私人渠道获取的新闻的反应强度。男女对于女性与儿童虐待案件的风险直觉与不同类别的情绪反应（恐惧或愤怒）有所不同；身为人父增加对女性和儿童受虐的共情。研究结果对相关法规和政策的制定具有借鉴作用。

Public Reactions to News Stories on Female and Child Abuse: Sex Differences and Effects of News Context

FANG Jinyi　YU Biyue　Wang Xiaotian

Applied Psychology, School of Humanities and Social Science, The Chinese University of Hong Kong (Shenzhen), Shenzhen City, Guangdong, 518172, lauren_fang@163.com

***Abstract*：** Recent changes in family planning policy, such as the third-child policy, caught the public's attention and brought up cases regarding female and child abuse. The study examines how the public reacted to the news about female and child abuse. Particularly how the sex of the receivers and the news contact (online news, news from a friend, or news without source information) affect the perception and reactions of the public to the news. We designed the questionnaires with three versions, including pure facts, online sources, and news from friends. The questionnaires were launched on the online survey platform Credamo to test the public's risk perception and emotional reactions to two types of news stories: Sexual bullying against a female in the workplace and a child abuse case at school. A third independent variable, besides the sex of the participant and source of news, was whether a prevention policy was in effect. The sample included 299 participants (121 females). The results showed that 1) participants perceived higher risks in the cases involving a female victim than a child victim. 2) The information source affected the perceived probability and severity of the cases involving both female and child victims. The online and personal contexts attenuated risk perception compared to the news without source information. The personal context had the lowest score of risk perception. 3) The effects of the sex of the respondents appeared in the emotional reactions to female abuse cases only. Male respondents perceived had a lower fear reaction (M = 7.011, SD = 0.125) than female respondents (M = 7.404, SD = 0.104) but a higher score of anger reaction (M = 0.545, SD = 0.005) than female respondents (M = 0.5331, SD = 0.004). 4) Male respondents held overall higher and more ideological expectations of risk prevention efficacy and were less sensitive to the lack of security for women. 5) Marriage and parenthood increased the empathetic sensitivity in male respondents to both female and child abuse cases. To conclude, news source matters. People may discount the validity of news from personal connections and online. Men and women perceive female and child abuse cases differently in risk perception and emotional reactions. Policy implications of these findings are discussed.

3 深圳市光明区教育科学研究院，深圳，518107

摘 要 人工智能的高速发展引起了公众的普遍关注，其在青少年群体中的使用也越来越普遍，统计显示55%的美国青少年每天至少一次使用人工智能语音搜索助手。以往研究认为人工智能对青少年的心理健康发展有着重要的影响，如提高幸福感，或是取代现实生活中的关系和情感从而造成心理健康问题。使用动机是数字技术与心理健康关系研究中的重要领域，现有研究认为人工智能使用动机有不同类型，如信息获取，娱乐放松等。青少年作为数字技术的易感人群，研究青少年人工智能使用动机对其心理健康(如抑郁)的影响具有重要意义。另外，大量研究显示体育活动对心理健康(如抑郁)有积极影响，体育活动也可能因影响个体心理需求而对数字技术使用效果存在影响。因此，体育活动可能削弱或增加人工智能对个体心理健康的影响。综上，本研究旨在探讨青少年人工智能使用动机对抑郁情绪的影响以及体育活动在其中的调节作用。本研究采用人工智能使用动机量表、病人健康问卷(Patient Health Questionnaire-9, PHQ-9)和体育活动等级量表(Physical Activity Rating Scale-3, PARS-3)对2043名六所来自云南和四川中小学的学生(M_{age}=15.00±2.33岁，男性共925名)进行了测量。结果表明人工智能使用逃避动机(β=0.371, p<0.001)和归属动机(β=0.301, p<0.001)显著正向预测青少年抑郁情绪，体育活动水平显著负向预测抑郁情绪(β= -0.083, p<0.001)，但人工智能使用成就动机(p=0.094)和娱乐动机(p=0.201)则无显著预测作用。另外，体育活动仅在逃避动机对抑郁情绪的影响中存在调节作用，对于不同体育活动水平组的个体，逃避动机越高，抑郁情绪均越高，但高体育活动水平组(β=0.411, p<0.001)中逃避动机对抑郁的影响比低体育活动水平组(β=0.321, p<0.001)更大。本研究结果表明，不同类型人工智能使用动机对个体抑郁情绪的影响存在差异，且体育活动在低水平逃避动机对抑郁情绪的影响中具有更强的保护作用。这表明指导青少年形成良好的人工智能使用动机对促进其心理健康可能具有重要意义，未来可利用追踪研究进行验证。

3 Guangming Institute of Education Sciences, Shenzhen, China

Abstract: The rapid development of artificial intelligence (AI) has attracted widespread public attention, and its use is becoming more prevalent in the adolescent population, with statistics showing that 55% of American adolescents use an AI voice search assistant at least once a day. Previous studies have suggested that AI may have important impact on the mental health development of adolescents, such as increasing well-being, or replacing real-life relationships and emotions, causing mental health problems. The use motivation is an important area in the study of the relationship between digital technology and mental health. Existing studies believe that there are

different types of use motivation of AI, such as information acquisition, entertainment and relaxation. As a population susceptible to digital technology, it is of great importance to study the influence of AI use motivation on mental health (such as depression) in adolescents. In addition, a large number of studies have shown positive effects of physical activity on mental health (e.g., depression), and physical activity may also have an impact on the effects of digital technology use by influencing individuals' psychological needs. Therefore, physical activity may diminish or increase the effects of AI on individual mental health. In summary, this study is to explore the effects of AI use motivation on depression and the moderating role of physical activity in adolescents. In this study, 2043 students (M_{age}=15.00±2.33 years old, 925 males) from six primary and secondary schools in Yunnan and Sichuan provinces of China were measured with Use Motivation of Artificial Intelligence Scale, Patient Health Questionnaire-9 and Physical Activity Rating Scale-3. The results showed that the avoidance motivation (β=0.371, p<0.001) and belonging motivation (β=0.301, p<0.001) of AI use significantly and positively predicted adolescents' depression levels, and that physical activity level significantly and negatively predicted adolescents' depression levels (β=-0.083, p<0.001), but the achievement motivation (p=0.094) and recreation motivation (p=0.201) of AI use did not significantly predict adolescents' depression levels. In addition, physical activity only has a moderating effect on the influence of avoidance motivation on depression. For individuals with different physical activity levels, the higher the avoidance motivation, the higher the depression level, but the effect of avoidance motivation on depression in the high physical activity level group (β=0.411, p<0.001) is greater than that in the low physical activity level group (β=0.321, p<0.001). The results of this study indicate that different types of AI use motivation have different effects on depression, and physical activity has a stronger protective effect on the effect of low level of avoidance motivation on ddepression. This suggests that guiding adolescents to form different use motivation for AI may be important for influencing their mental health, which can be verified by follow-up studies in the future.

女性社交媒体成瘾对视觉工作记忆及面孔记忆度的影响

李倩[1]　郭利静[2]　叶超雄[1]（通讯作者）

1 四川师范大学脑与心理科学研究院，四川成都，610066，cxye1988@163.com

2 于韦斯屈莱大学心理系，芬兰于韦斯屈莱，40014

摘 要　随着网络技术的大力发展，各种各样的社交软件大量涌现，人们花费在社交媒体上的时间也逐步增加，一些用户甚至出现了社交媒体成瘾行为。社交媒体成瘾是指个体对微博、微信、抖音等社交软件产生心理依赖的新兴现象。社交媒体成瘾作为一种新兴成瘾现象会给成瘾者带来诸多问题，例如社交媒体成瘾可能导致社交焦虑、抑郁、错失恐惧，并且相关研究表明社交媒体成瘾度越高，实际睡眠时间越少。视觉工作记忆是一个容量有限的工作空间，能够在线保存信息，并可以随时被高级认知功能访问和操作，它是一种核心的认知功能，使人能保持对过去预期的感觉，并可能指导未来的行动。研究表明一些心理因素，如抑郁、焦虑、压力、失眠和有问题的社交媒体使用，能够改变我们的记忆，并可能对记忆功能和检索产生影响。目前，成瘾与工作记忆相关的研究层出不穷，主要集中在网络成瘾、手机成瘾、游戏成瘾、药物成瘾等方面，然而社交媒体成瘾这类新兴成瘾行为与工作记忆的相关研究甚少，且社交媒体成瘾是否会对视觉工作记忆产生影响尚不清楚。所以本研究实验 1 采用了变化觉察范式测量了女性群体中高低社交媒体成瘾组的视觉工作记忆容量，对两组被试进行独立样本 T 检验，发现高低成瘾组的视觉工作记忆容量存在显著差异。结果显示，高成瘾组的视觉工作记忆容量显著高于低成瘾组。这说明高社交媒体成瘾者的视觉工作记忆能力更好，这一结果与前人研究中的网络成瘾者的工作记忆存在缺陷截然相反。

Effects of social media addiction on visual working memory and facial memorability in female

Qian Li[1], Lijing Guo[2], Chaoxiong Ye[1]
1 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, China
2 Department of Psychology, University of Jyvaskyla, Jyväskylä, Finland

Abstract：With the vigorous development of network technology, a variety of social software has emerged in large numbers, and the time people spend on social media has gradually increased. Some users even have social media addictive behavior. Social media addiction refers to the emerging phenomenon of individuals' psychological dependence on social software, such as Weibo, WeChat, Tiktok, etc. Social media addiction, as an emerging addiction phenomenon, will bring many problems to addicts. For example, social media addiction may lead to social anxiety, depression, and fear of missing out. Relevant research shows that the higher the social media addiction, the less the actual sleep time. Visual working memory is a workspace with limited capacity, which can store information online, and can be accessed and operated by advanced cognitive functions at any time. It is a core cognitive function that enables people to maintain a sense of past expectations and may guide future actions. Research has shown that some psychological factors, such as depression, anxiety, stress, insomnia, and problematic social media use, can alter our memory and may have an impact on memory function and retrieval. At present, research on addiction and working memory has emerged in an endless stream, mainly focusing on internet addiction, mobile phone addiction, game addiction, drug addiction, etc. However, there is little research on social media addiction and working memory, and it is not clear whether social media addiction will affect visual working memory. Therefore, in experiment 1 of this study, the change detection task was used to measure the visual working memory capacity of the high and low social media addiction groups in female, and independent sample T test was conducted for the two groups of subjects. It was found that the visual working memory capacity of the high and low addiction groups was significantly different. The results showed that the visual working memory capacity of high addiction group was significantly higher than that of low addiction group. This indicates that the visual working memory ability of high social media addicts is better, which is contrary to the defect of working memory of internet addicts in previous studies.

儿童期心理虐待对初中生网络欺负的影响：自我控制的中介效应和同伴依恋的调节作用

徐贝贝[1]　裴广倩[2]　桑青松[1]（通讯作者）
[1] 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn
[2] 扬州市江都区育才中学，扬州，225200，2192995866@qq.com

摘 要　网络欺负是欺负行为在网络空间中的延伸，受到了国内外研究者和一线教育工作者的重点关注。初中生正处于青春期，网络具有匿名性特征，在网络环境中实施欺负行为不用担心受到惩罚。因此，初中生更容易产生网络欺负行为，这对欺负者的学习生活、受欺负者的心理发展与行为适应都造成严重危

害。本研究采用儿童期心理虐待量表、自我控制量表、同伴依恋量表、网络欺负量表修订版，通过整群抽样对 1400 名初中生开展问卷调查，使用 SPSS 27.0、PROCESS 4.0 进行数据分析，探讨儿童期心理虐待对初中生网络欺负的影响中自我控制的中介作用和同伴依恋的调节作用。结果显示：（1）儿童期心理虐待与自我控制呈显著负相关（r=-0.418，p<0.01），与网络欺负呈显著正相关（r=0.286，p<0.01）；自我控制与网络欺负呈显著负相关（r=-0.310，p<0.01）；同伴依恋与儿童期心理虐待、网络欺负均呈显著负相关（r=-0.280，p<0.01；r=-0.144，p<0.01），与自我控制呈显著正相关（r=0.411，p<0.01）。（2）儿童期心理虐待能显著正向预测初中生网络欺负（B=0.187，95%CI[0.111，0.273]），也可以通过自我控制间接影响初中生网络欺负（B=0.098，95%CI[0.068，0.132]）。（3）自我控制在儿童期心理虐待与初中生网络欺负间的中介路径的前半段受到同伴依恋的调节，在低水平同伴依恋的情况下，儿童期心理虐待对自我控制的负向预测效应较小，（$Bsimple$=-0.185，t=-5.966，p<0.001）；在高水平同伴依恋的情况下，儿童期心理虐待对自我控制的负向预测效应增强，（$Bsimple$=-0.509，t=-14.002，p<0.001）。结论：儿童期心理虐待会直接影响初中生网络欺负，也通过自我控制间接影响初中生网络欺负；自我控制在儿童期心理虐待与初中生网络欺负间的中介路径的前半段受到同伴依恋的调节。因此改善儿童期心理虐待情况、增强自我控制能力、提高同伴依恋质量对减少网络欺负有积极影响。

The Influence of Childhood Psychological Maltreatment on Cyberbullying Among Middle School Students: the Mediating Effect of Self-control and the Moderating Effect of Peer Attachment

Xu Beibei[1], Pei Guangqian[2], Sang Qingsong[1]

[1] College of Education Sciences, Anhui Normal University, Wuhu, 241000

[2] Yangzhou Jiangdu District Yucai Middle School, Yangzhou, 225200, 2192995866@qq.com

Abstract: The extension of cyberbullying in cyberspace has attracted the attention of researchers and front-line educators at home and abroad. Junior high school students are in adolescence, the Internet is anonymous, and bullying in the online environment does not have to worry about punishment. Therefore, junior high school students are more likely to have cyberbullying behavior, which causes serious harm to the bullying's learning life, the psychological development and behavior adaptation of the bullied. In this study, the revised versions of the Childhood Psychological Abuse Scale, Self-Control Scale, Peer Attachment Scale, and Cyberbullying Scale were used to conduct a questionnaire survey on 1400 junior high school students through a whole sample of 1400 junior high school students, and SPSS 27.0 and PROCESS 4.0 were used for data analysis to explore the mediating role of self-control and the moderating effect of peer attachment in the impact of childhood psychological abuse on cyberbullying among junior high school students. The results showed that: (1) Childhood psychological abuse was significantly negatively correlated with self-control (r=-0.418, p<0.01) and cyberbullying (r=0.286, p<0.01). Self-control was significantly negatively correlated with cyberbullying (r=-0.310, p<0.01). Peer attachment was significantly negatively correlated with childhood psychological abuse and cyberbullying (r=-0.280, p<0.01; r=-0.144, p<0.01), and self-control (r=0.411, p<0.01). (2) Childhood psychological abuse can significantly positively predict cyberbullying in junior high school students (B=0.187, 95% CI [0.111 to 0.273]), and can also indirectly affect cyberbullying in junior high school students through self-control (B=0.098, 95% CI [0.068 to 0.132]). (3) The first half of the mediating path between childhood psychological abuse and junior high school students' cyberbullying was regulated by peer attachment, and in the case of low level peer attachment, the

negative predictive effect of childhood psychological abuse on self-control was small, (*Bsimple*=-0.185, *t*=-5.966, *p*<0.001); In the case of high levels of peer attachment, the negative predictive effect of childhood psychological abuse on self-control was enhanced, *(Bsimple*=-0.509, *t*=-14.002, *p*<0.001). Conclusion: Childhood psychological abuse can directly affect the cyberbullying of junior high school students, and also indirectly affect the cyberbullying of junior high school students through self-control. The first half of the mediating path between childhood psychological abuse and junior high school students' cyberbullying is moderated by peer attachment. Therefore, improving childhood psychological abuse, enhancing self-control, and improving the quality of peer attachment have a positive impact on reducing cyberbullying.

错失焦虑对初中生手机成瘾的影响：压力知觉和自我控制的链式中介作用

徐贝贝[1]　吴小曼[1]　金玥[1]　桑青松[1]（通讯作者）

1 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn

摘 要　错失焦虑是个体因担心错失他人的新奇经历或正性事件而产生的一种焦虑，而使用手机就可以随时关注这些事情避免错过，但当个体过度使用手机时，就容易产生手机成瘾问题。以往研究表明初中生是手机成瘾的易感人群，在学业压力和自我控制力不足的加持下，手机成瘾给初中生带来的负面影响会更大。基于此本研究探究了错失焦虑对初中生手机成瘾的影响，同时构建了一个链式中介模型，考察压力知觉与自我控制在二者之间的中介作用。通过整群抽样的方式，使用错失焦虑量表（FOMOS）、压力知觉量表（CPSS)、自我控制量表（CSC）和手机成瘾指数量表（MPAI）对 1395 名初中生进行问卷调查，使用 SPSS 26.0 和 PROCESS 4.0 进行数据分析。结果显示：（1）初中生的错失焦虑、压力知觉与手机成瘾两两之间显著正相关，自我控制与错失焦虑、压力知觉、手机成瘾均呈显著负相关（*r=-0.04，p＜0.001；r=-0.59，p＜0.001；r=-0.56，p＜0.001*）；（2）错失焦虑可以直接显著正向预测初中生手机成瘾行为（*B=0.33*，95% CI[0.29，0.38]），也可以通过三条路径的间接作用影响初中生手机成瘾：通过压力知觉的中介作用（*B=0.04*，95% CI[0.02，0.06]），通过自我控制的中介作用（*B=0.08*，95% CI[0.06，0.11]），通过“压力知觉→自我控制”的链式中介作用（*B=0.06*，95% CI[0.04，0.07]）。结论：错失焦虑既可以直接正向预测初中生手机成瘾，又可以通过压力知觉和自我控制的链式中介作用间接影响初中生手机成瘾。因此，关注初中生对压力的感受以及提高初中生的自我控制能力对改善错失焦虑对初中生手机成瘾的影响具有重要意义。

The Effect of Fear of Missing Out on Junior High School Students' Mobile Phone Addiction: Chain Mediating Effect of Perceived Stress and Self-control

Xu Beibei[1], Wu Xiaoman[1], Jin Yue[1], Sang Qingsong[1]

College of Education Sciences, Anhui Normal University, Wuhu, 241000

Abstract：Fear of missing out is a type of anxiety that arises when individuals are concerned about missing out on novel experiences or positive events from others. By using a mobile phone, they can always pay attention to these things and avoid missing them. However, when individuals overuse their phones, they are prone to developing mobile addiction problems. Previous studies have shown that junior high school students are susceptible to mobile phone addiction. With the support of academic pressure and insufficient self-control, the negative impact of mobile phone addiction on junior high school students will be greater. This study investigated the impact of fear of missing out on junior high school students' mobile phone addiction, and constructed a chain mediated model to examine the mediating role of perceived stress and self-control between the two. A questionnaire survey was conducted on 1395 middle school students using the Fear of Missing Out Scale (FOMOS), Chinese Perceived Stress Scale (CPSS), Self-Control Scale (CSC), and Mobile Phone Addiction Index (MPAI) through cluster sampling. Data analysis was conducted using SPSS 26.0 and PROCESS 4.0. The results showed that: (1) There was a significant positive correlation between junior high school students' fear of missing out, perceived stress, and mobile phone addiction, while self-control was significantly negatively correlated with fear of missing out, perceived stress, and mobile phone addiction (*r=-0.04, p<0.001; r=-0.59, p<0.001; r=-0.56, p<0.001*); (2) Fear of missing out can directly significantly and positively predict junior high school students' mobile phone addictive behavior (*B=0.33*, 95% CI[0.29, 0.38]), and can also affect junior high school students' mobile phone addiction through the indirect effects of three paths: through the mediation of perceived stress (*B=0.04*, 95% CI[0.02, 0.06]), mediation through self-control (*B=0.08*, 95% CI[0.06, 0.11]), through the chain mediating effect of "perceived stress→self-control" (*B=0.06*, 95% CI[0.04, 0.07]). Conclusion: Fear of missing out can directly and positively predict junior high school students' mobile phone addiction, and can indirectly affect junior high school students' mobile phone addiction through the chain mediating effect of perceived stress and self-control. Therefore, paying attention to junior high school students' feelings of stress and improving their ability of self-control is of great significance in improving the impact of fear of missing out on their mobile phone addiction.

摘 要 网络游戏的技术不断发展和成熟，并伴随着互联网时代到来和普及，其市场规模不断扩大，成为娱乐产业的一大巨头。《2022 年中国游戏产业报告》指出，2022 年中国游戏市场用户达 6.64 亿，我国游戏产业进入承压蓄力阶段。可见网络游戏受众群体数量之多，越来越多的大学生群体投入到网络游戏之中。以往研究者多关注于网络游戏的负面影响，认为网络游戏会导致游戏用户情感漠视、现实攻击行为等。但是随着网络游戏相关法律法规的完善和游戏防沉迷机制的进步，网络游戏中的色情暴露等负面元素逐渐减少，其对玩家的影响仅存在消极影响这一说法值得商榷，网络游戏的积极影响也应受到关注。根据存在

主义理论，人在一切关系中寻求意义，以建立有意义的联结。已有研究证实良好的人际关系，有利于个体社会适应，提升生活满意度，正向影响个体感受生命意义的水平。在网络游戏中，个体可以匿名化进行交流，减少了个体的威胁觉知。并且，网络游戏可以组织一些兴趣爱好相同的人，对大学生人际交往的同质性及社会适应会产生明显影响。基于此，本次研究主要探讨网络游戏中的大学生网络交往、社会自我效能感和现实人际交往能力的关系，采用大学生网络交往问卷、社会自我效能感量表和人际交往能力问卷对462名在校大学生游戏用户进行调查。分析结果显示：（1）在大学生网络交往、社会自我效能感和人际交往能力中，两两变量之间均呈显著正相关；（2）大学生网络交往和社会自我效能感显著正向预测人际交往能力；（3）在大学生网络交往对人际交往能力的预测中，社会自我效能感起部分中介作用。本研究表明，在网络游戏中进行网络交往，可以一定程度上增强大学生的社会自我效能感，进而促进人际交往能力的提升。

***Abstract*：** The technology of online games continues to develop and mature, and along with the arrival and popularization of the Internet era, its market size continues to expand, becoming a major giant in the entertainment industry. China Game Industry Report 2022 pointed out that China's game market users reached 664 million in 2022, and China's game industry has entered the stage of pressure storage. It can be seen that the number of online game audience groups is large, and more and more college students play online games. Previous researchers have mostly focused on the negative impact of online games, arguing that online games can lead to emotional indifference and the realistic aggressive behavior of game users. However, with the improvement of laws and regulations related to online games and the progress of game anti-addiction mechanisms, the negative elements of online games such as pornographic exposure are gradually reduced, and the argument that its impact on players is only negative is debatable, and the positive impacts of online games should also be paid attention to. According to existentialist theory, human beings seek meaning in all relationships in order to build meaningful connections. It has been established that good interpersonal relationships facilitate individuals' social adaptation, enhance life satisfaction, and positively influence the level at which individuals feel the meaning of life. In online games, individuals can communicate anonymously, which reduces the threat perception of individuals. Moreover, online games can organize some people with the same interests, which will have a significant impact on the homogeneity of college students' interpersonal communication and social adaptation. Based on this, this study mainly explored the relationship between college students' online game interactions, perceived social self-efficacy, and interpersonal competence. 462 college student game users were investigated with the college Student Internet Interaction Questionnaire, Perceived Social Self-Efficacy Scale, and Interpersonal Competence Questionnaire. Structural equation modeling using a bootstrap procedure reveals that (1) college student internet interaction, perceived social self-efficacy, and interpersonal competence were significantly and positively correlated with each

other, (2) a mediating effect analysis showed that the direct effect of college student internet interaction on interpersonal competence was significant, and (3) perceived social self-efficacy played a mediating effect between college student internet interaction and interpersonal competence. The results show that online interactions in online games can enhance college students' perceived social self-efficacy–to a certain extent, which in turn promotes the enhancement of interpersonal competence.

Keywords: online game, internet interactions, perceived social self-efficacy, interpersonal competence, realistic interpersonal interactions

状态无聊、无聊倾向、注意控制与问题性短视频使用之间的关系

—— 一项来自中国成年人的网络分析

周莲 高雪梅（通讯作者）

西南大学心理学部，重庆，400715，zhenggao@swu.edu.cn

摘 要：根据无聊的反馈模型（BFM），当人们注意投入不足时，状态无聊就会产生，此时人们会采用试误法将注意转向外部、内部或回到当下任务上，重新投入注意退出无聊的循环。近来年，短视频应用在全球发展迅速，由于其操作简单、内容丰富，已成为人们快速缓解状态无聊的常用方式。然而，长期使用短视频来缓解状态无聊可能会造成注意控制受损，加剧无聊倾向，甚至形成问题性短视频使用。先前研究发现状态无聊、无聊倾向、注意控制和问题性短视频使用之间存在着复杂的双向关系。然而，很少有研究使用网络分析的方法来确定变量之间的相互作用。因此，本研究采用网络分析方法，在主层级分析中探究中国成年人状态无聊、无聊倾向、注意控制和问题性短视频使用之间的复杂关系，在面层级分析中直观地阐述四者的症状表现和关联。研究采用问卷调查法对 720 名 18-30 岁的中国成年人进行调查，测量工具包括多维状态无聊量表(MSBS)，简式无聊倾向量表(BPS-SR)，中文版注意控制量表(ACS-C)和改编的问题性短视频使用量表(PSVUS)，得到有效问卷 632 份（男性 330 人，女性 302 人）。研究结果显示：（1）状态无聊、无聊倾向、注意控制和问题性短视频使用之间均存在着显著关联；（2）在主层级分析中，无聊倾向是网络中最核心的节点；（3）在面层级分析中，注意力不集中节点具有最高的强度中心度和紧密中心度，中介中心度最高的是冲突这一节点。该结果表明，低水平的注意控制和高水平的无聊倾向可能会诱发状态无聊并影响问题性短视频使用。反过来，问题性短视频使用也会对注意控制造成负面影响，进而加剧状态无聊的产生，形成恶性循环。研究结果为无聊的反馈模型提供了实证支持，从理论的视角扩充了该模型与问题性行为的联系；并提出了干预问题性短视频使用者注意力不集中和冲突的观点，这将有助于未来的研究与实践。

关键词：网络分析，问题性短视频使用，状态无聊，无聊倾向，注意控制

A network analysis perspective on the relationship between state boredom, boredom proneness, attention control and problematic short video use among a sample of Chinese Adults

Lian Zhou, Xuemei Gao*
Faculty of Psychology, Southwest University, Chongqing, 400715, zhenggao@swu.edu.cn

Abstract: The Boredom Feedback Model (BFM) proposes that the core of state boredom is inadequate attention engagement, which is closely related to attention control. When experiencing bored, people engage in trial-and-error learning through three forms of attention shifts (shift outward, inward, or back to the source of boredom) to test which strategies can exit the boredom cycle. Short videos have been spreading rapidly in recent years. Due to the simplicity and richness of short videos, they have become common for people to quickly alleviate state boredom. However, using short videos as a long-term strategy to alleviate boredom may result in impaired attention control, exacerbate boredom proneness, and even lead to PSVU. Previous research has proposed a complex and bidirectional relationship between state boredom, boredom proneness, attention control, and PSVU. However, few studies have used network analysis approach to identify the reciprocal action between the aforementioned variables. Therefore, the present study used network analysis to better explain these interactive relationships in a sample of Chinese adults (in domain-level analysis) and elaborate more visually on the symptom presentation and associations between boredom, attention control, and PSVU (in facet-level analysis). A sample comprising 720 Chinese adults (male = 330, female = 302) aged 18-30 years completed a survey including the Multidimensional State Boredom Scale (MSBS), the Boredom Proneness Scale–Short Form (BPS-SR), the Chinese version of the Attention Control Scale (ACS-C), and the adapted Problematic Short Video Use Scale (PSVUS), and 632 valid questionnaires were obtained (male = 330, female = 302). The findings found that: (1) There were significant associations between state boredom, boredom proneness, attention control, and PSVU. (2) Boredom proneness was the most central node in the domain-level network. (3) The facet-level network analysis showed that inattention had the highest strength and closeness centrality, and conflict had the highest betweenness centrality. The findings indicated that there is a close relationship between state boredom, boredom proneness, attention control, and PSVU. Low attention control and high boredom proneness may induce state boredom and affect PSVU. In turn, PSVU may also further worsen attention control, exacerbating state boredom and resulting in a vicious cycle. The findings provided empirical support for the Boredom Feedback Model, expanding the model's link to problematic behaviors from a theoretical perspective; and suggested a new perspective on the intervention of inattention and conflict in problematic short video users that will contribute to future research and practice.

Keywords: Network analysis, problematic short video use, state boredom, boredom proneness, attention control

个性化算法推荐对问题性短视频使用的影响：来自纵向追踪和行为实验的证据

张利兵[1] 谷传华[2]（通讯作者）
1 河南师范大学教育学部，河南新乡，453007
2 华中师范大学心理学院，湖北武汉，430079，guchuanhua@ccnu.edu.cn

摘 要 作为一种新型社交媒体，短视频以其便捷的形式和个性化的内容受到用户青睐，并跃居成为互联网最“费时”的行业。但人们在拥抱这一新技术的同时，对其可能引发的负面效应及其关键影响因素的关注却较为有限。个性化算法推荐是短视频区别于其他传统社交媒体的核心技术特性，也是吸引用户注意力并引发用户持续或重复使用的主要特点。这一技术特性在满足用户个性化需求的同时也可能带来问题性技

术使用的风险。本研究在生态位理论和使用-满足理论的指导下，通过两个研究来探讨个性化算法推荐对用户问题性短视频使用的影响。

研究 1 通过对 810 名大学生间隔两个月的两次纵向问卷调查，构建了个性化算法推荐与问题性短视频使用之间的交叉滞后模型。研究结果发现：两个时间点的个性化算法推荐与大学生问题性短视频使用之间都呈显著正相关；在控制性别、年龄和平均使用时长后，T_1 的个性化算法推荐可以显著正向预测 T_2 的大学生问题性短视频使用。在证实个性化算法推荐与问题性短视频使用之间准因果关系的基础上，研究 2 以 60 名大学生为实验被试，通过操纵算法推荐的视频的个性化水平来检验实际观看短视频的过程中个性化算法推荐对问题性短视频使用的影响。研究结果显示：个性化算法推荐可以显著正向影响大学生问题性短视频使用倾向，即，相比观看低个性化视频的大学生，观看高个性化视频的大学生问题性短视频使用倾向更高。

个性化算法推荐对问题性短视频使用的正向预测作用和积极影响契合了生态位理论和使用-满足理论，并拓展了其在短视频领域的应用。短视频通过其优势技术与传统社交媒体竞争并在行业中占据生态位置，个性化算法推荐技术令用户毫不费力即可满足各种需求，在海量的个性化视频内容中停不下来。本研究结果提醒我们，个性化算法推荐这一短视频平台的优势技术，确实为人们的生活带来了消极影响。技术的研发和设计者在追求技术进步和发展的同时，也应重视其可能带来的负面影响并加以控制。

关键词　个性化算法推荐，问题性短视频使用，生态位理论，使用-满足理论

The Effect of Personalized Algorithmic Recommendation on Problematic Short-form Video Use: Evidence from Longitudinal tracking and Behavioral Experiment

Libing Zhang[1], Chuanhua Gu[2]

1 Faculty of Education, Henan Normal University, Xinxiang, China

2 School of Psychology, Central China Normal University, Wuhan, China

***Abstract*:** As a new type of social media, short-form video is favored by users for its convenient form and personalized content, and has become the most “time-consuming” industry on the Internet. However, while people have embraced this new technology, there has been more limited attention to the negative effects and its’ key influence. Personalized algorithmic recommendation is the core technical feature that distinguishes short-form video from other traditional social media, and it is also the main feature that attracts users’ attention and triggers their continuous or repeated use. This technological feature may pose a risk of problematic technology use while meeting the individual needs of users. Guided by Niche theory and Uses and Gratifications theory, this study examines the effect of personalized algorithmic recommendation on users’ problematic short-form video use through two studies. In study 1, 810 college students were investigated for two times and the cross-lag model between algorithm recommendation personalization and problematic short-form video use was constructed. The results showed that there were significant positive correlations between algorithm recommendation personalization and problematic short-form video use at two time points. Algorithm recommendation personalization at Time 1 can significantly positively predict problematic short-form video use at Time 2. On the basis of confirming a quasi-causal relationship between personalized algorithmic recommendations and problematic short-form video use. In study 2, 60 college students were selected as experimental subjects to examine the effect of algorithm recommendation personalization on problematic short-form video use during the actual viewing of short-form videos by manipulating the personalization level of videos recommended by the algorithm. The results showed that

algorithm recommendation personalization can significantly positively affected problematic short-form video use, that is, college students who watch videos with high personalization level have a higher tendency on problematic short-form video use than those who watch videos with low personalization level. The positive predictive role and effect of personalized algorithmic recommendations on problematic short-form video use fits Niche theory and Uses and Gratifications theory and expands their application to the short-form video domain. Short-form video competes with traditional social media and takes an ecological position in the industry through its superior technology. Personalized algorithmic recommendation technology makes it effortless for users to satisfy a variety of needs, and it's impossible to stop at the vast amount of personalized video content available. The results of this study remind us that personalized algorithmic recommendation, a dominant technology of short-form video platform, does bring negative impacts on people's lives. While pursuing technological progress and development, researchers and designers of technology should also pay attention to its possible negative impacts and control them.

人工智能相关知识对青少年职业选择的影响

王欢蕾[1]　来枭雄[1,2]　黄顺森[1]　代欣然[1]　赵心媚[1]　何滢[1]　王耘[1](通讯作者)

1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875，wangyun@bnu.edu.cn

2 中国教育科学研究院未来教育研究所，北京，100088

摘　要　人工智能技术的应用给人类的工作带来了巨大的影响。青少年时期是制定职业规划和做出职业决策的重要阶段。与人工智能相关的互动经历会塑造人机交互不同的态度，从而导致不同的决策和后果。在人工智能背景下，关于人工智能的知识如何影响青少年职业决策的研究较少。本研究使用问卷型实验法探讨两个问题：（1）关于人工智能的先验知识、实验即时知识暴露（如，人工智能工作替代危机的暴露）和积极未来取向是否影响青少年对低或高替代性工作的选择;（2）积极未来取向是否调节实验干预的作用，实验即时知识暴露是否调节人工智能的先验知识对职业选择的影响。本研究纳入了836名青少年被试(M_{age} = 13.98，SD = 1.35；男=52.30%)。

实验分为三个阶段。首先，要求所有被试依次填写积极未来取向问卷、人工智能先验知识的问卷（包括对人工智能的熟悉度、信任、积极态度、消极态度、能力、善良性和真诚性的感知）。完成后，将被试随机分为实验组和控制组，要求实验组阅读一段关于人工智能取代工作岗位的信息，对照组则直接进入下一阶段。最后，要求两组被试做出职业意向决策。结果显示，实验即时知识暴露对青少年选择高替代性工作有显著的负向预测作用(β=-0.090, p=0.009)。此外，对人工智能的熟悉度显著正向预测青少年选择低可替代性工作(β=0.140, p<0.001)，对人工智能的信任显著正向预测青少年选择高可替代性工作(β=0.103, p=0.008)。这说明对人工智能的先验知识和知识暴露会影响青少年的职业决策，但人工智能知识暴露和积极未来取向的调节效应不存在。

本研究首次探索了人工智能的先验和即时知识暴露是否对青少年的职业决策产生影响，其研究结果也启发我们在人工智能时代下，有必要向青少年提供足够的人工智能相关信息，以帮助他们更全面地考虑并做出职业决策。

The impact of artificial intelligence-related knowledge on adolescents' career choices

Huanlei Wang [1] Xiaoxiong Lai[1,2] Shunsen Huang[1] Xinran Dai[1] Xinmei Zhao [1] He Ying[1] Yun Wang[1] (Corresponding author)

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, China

2 Institute of Future Education, China National Academy of Educational Sciences, Beijing, China

Abstract：The application of artificial intelligence technology has produced a huge impact on human work. Adolescence is an important stage for career planning and making career decisions. Interaction experiences related to AI shape different attitudes towards human-computer interaction, leading to different behavioral decisions and outcomes. However, there is limited research on how knowledge about AI influences career decision-making in the context of AI era. This study aims to use a questionnaire-based experimental approach to explore two issues: (1) whether prior knowledge of AI, experimental instant knowledge exposure (AI job replacement crisis), and positive future orientation affect adolescents' choices of low- or high-alternative jobs, and (2) whether positive future orientation moderates the effect of experimental intervention, and whether experimental instant knowledge exposure moderates the effect of prior knowledge of AI on career choices. The study included 836 adolescent participants (M_{age} = 13.98, *SD* = 1.35 years; male=52.30%).

The study consisted of three stages. First, all participants were asked to complete questionnaires related to positive future orientation and prior knowledge of AI (including familiarity, trust, positive attitudes, negative attitudes, competence, benevolence, and integrity towards AI). After completion, the participants were randomly divided into experimental and control groups, with the experimental group reading information about AI replacing jobs, while the control group proceeded directly to the next stage. Finally, both groups were asked to make career decision intentions. The results showed that experimental instant knowledge exposure had a significant negative predictive effect on adolescents' choices of high replaceable jobs (β=-0.090, *p*=0.009). In addition, familiarity with AI significantly positively predicted adolescents' choices of low replaceable jobs (β=0.140, *p*<0.001), while trust in AI significantly positively predicted adolescents' choices of highly replaceable jobs (β=0.103, *p*=0.008). This suggests that prior knowledge and experimental instant knowledge exposure about AI influence adolescents' career decisions. But AI knowledge exposure and positive future orientation has no moderating effect.

This study is the first to explore whether prior and experimental instant knowledge of AI exposure affects adolescents' career decisions. This study inspires the necessity of providing sufficient AI-related information to adolescents in the AI era, to assist them in making more comprehensive career decisions.

Keywords：Artificial intelligence, career decision, adolescents, positive future orientation

基于情境学习理论的网络适应性互动教学游戏设计与开发

马诗浩 [12] 叶建梅 [12] 周瑾宜 [12] 李佳洋 [12] 王伟军 [12]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430000

2 华中师范大学心理学院，武汉，430000，wangwj@mail.ccnu.edu.cn

摘 要 网络适应性反映了个体积极适应网络环境的能力水平，如果个体没有良好的网络适应能力，他们可能会表现出一些如沉迷于网络社交等不良的网络使用行为。因此，习得网络适应知识，提升网络适应

能力对个体正确使用网络，避免网络负面影响至关重要。情境学习理论强调知识具有情境性，学生需要“参与”到具体情境中构建有用的知识。而互动式电影游戏作为叙事与互动的结合体能够很好的体现出情境学习理论所强调的知识的情境性与学生的参与性。因此，本研究以情境学习理论为指导，从情境故事视角出发，借鉴互动式电影游戏框架，将网络适应性量表与青少年当下网络使用过程、使用环境、使用问题等内容相结合，构建了网络适应性互动教学游戏模型。并开发了网络适应性互动教学游戏——《网际行动》。游戏初开发完成后在某中学得到了应用，检验了该游戏的教学效果。结果表明，该游戏对于网络适应性具有促进作用，且在教学过程中也有效的帮助学生提升了学习兴趣。因此，证明了将互动式电影游戏机制运用于网络适应性教学中是合理可行的，可以帮助解决传统教学过程中情境缺失的问题。同时，也证明了“情境故事”的方式是成本低、效果好的教学游戏化方式，为以后教育游戏的设计与开发提供了理论与实践方面的参考价值。

Design and Development of a Internet Adaptability Interactive Teaching Game Based on Situated Learning Theory

MA Shihao　YE Jianmei　ZHOU Jinyi　LI Jiayang　WANG Weijun
School of Psychology, Central China Normal University, Wuhan, China

***Abstract*:** Internet adaptability reflects the level of an individual's ability to positively adapt to the network environment, and if individuals do not have good internet adaptability, they may show some undesirable network use behaviors such as indulging in network socialization. Therefore, acquiring knowledge of internet adaptation and improving ability of internet adaptation are crucial for individuals to use the network correctly and avoid the negative effects of the network. situated learning theory emphasizes that knowledge is situated, and students need to "participate" in specific contexts to construct useful knowledge. Interactive movie games, as a combination of narrative and interaction, can well reflect the contextual nature of knowledge and students' participation emphasized by situated learning theory. Therefore, this study takes situated learning theory as a guide, starts from the perspective of situated storytelling, draws on the framework of interactive movie games, combines the Internet Adaptability Scale with the process of adolescents' current Internet use, the use of the environment, the use of the problem, etc., and constructs an interactive teaching game model of Internet adaptability. And we developed the interactive teaching game of internet adaptability - "Interweb Action". After the initial development of the game was completed, it was applied in a middle school to test the teaching effect of the game. The results show that the game has a facilitating effect on internet adaptability, and it is also effective in helping students to enhance their learning interest during the teaching process. Therefore, it proves that it is reasonable and feasible to apply the interactive movie game mechanism to the teaching of internet adaptability. It can help to solve the problem of the lack of context in the traditional teaching process. At the same time, it also proves that the "situated story" approach is a low-cost and effective way of teaching gamification. It provides theoretical and practical reference value for the design and development of educational games in the future.

社会支持与网络欺凌中旁观者行为的关系：攻击规范信念的中介和感

恩的调节

金玥[1]　孙婷婷[1]　桑青松[1]（通讯作者）

1 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn

摘 要　在面对网络欺凌时，旁观者的不同反应对事件的发展变化具有重要作用，一般将网络欺凌中的旁观者行为分为促进欺凌行为、保护受欺凌者行为和局外行为三种方式。本文旨在探讨社会支持对网络欺凌中旁观者行为的影响，并厘清该影响背后的作用机制。研究一使用社会支持评定量表、攻击规范信念量表、网络欺凌中旁观者行为意愿问卷和中文版感恩问卷对安徽省 754 名大学生进行调查；研究二采用感恩情绪启动材料对安徽省 392 名大学生进行感恩启动，再采用社会支持评定量表、网络欺凌中旁观者行为意愿问卷对三组大学生（高感恩启动组、低感恩启动组和空白对照组）进行调查。结果发现：(1)社会支持能直接预测网络欺凌中旁观者行为，社会支持水平越高，越多表现出维护受欺凌者行为，越少表现出局外行为和鼓励欺凌者行为。(2)攻击规范信念在社会支持与网络欺凌中旁观者行为间起到中介作用。社会支持水平越高，大学生攻击规范信念越低，表现出的维护受欺凌者行为越多，表现出的鼓励欺凌者行为、局外行为越少。(3)感恩在社会支持与网络欺凌中旁观者行为间起到调节作用。在同一社会支持水平下，特质感恩水平高的大学生，表现出更多的维护受欺凌者行为和更少的鼓励欺凌者行为、局外行为；在同一社会支持水平下，状态感恩水平高的大学生，表现出更多的维护受欺凌者行为。本研究结果不仅从理论上丰富了网络欺凌中旁观者行为的研究内容，同时为避免网络欺凌事件的传播和升级，促进和谐网络环境的建立提供有价值的参考建议。

The Relationship between Social Support and Bystander Behavior in Cyberbullying: The Mediation of Normative Beliefs About Aggression and the Moderation of Gratitude

Jin Yue[1], Liu Tingting[1], Sang Qingsong[1]

College of Education Sciences, Anhui Normal University, Wuhu, 241000

Abstract：In the face of cyberbullying, the different reactions of bystanders play an important role in the development and change of the incident. Bystander behavior in cyberbullying is generally divided into three ways:maintaining the behavior of the bullied, encouraging the behavior of the bully, and outside behavior. This paper aims to explore the effect of social support on bystander behavior in cyberbullying and to clarify the mechanism behind this effect. The first study mainly used the social support assessment scale, normative beliefs about aggression scale, the bystander behavior willingness questionnaire in cyberbullying, and the Chinese version of the gratitude questionnaire to survey 754 college students in Anhui Province; research 2 used gratitude emotion initiation materials to start gratitude for 392 college students in Anhui Province, and then used the social support assessment scale and the bystander behavior willingness questionnaire in cyberbullying to conduct a questionnaire survey on three groups (high gratitude initiation group, low gratitude initiation group and blank control group) of college students. The research conclusions of the study are as follows: (1) Social support could directly predict the bystander behavior in online bullying. The higher the level of social support, the more it showed the behavior of maintaining the bullied, and the less it showed the behavior of outside and encouraging the bullied. (2) Normative beliefs about aggression played a mediating role between social support and bystander behavior in cyberbullying.

The higher the level of social support, the lower the college students' normative beliefs about aggression, the more they showed the behavior of maintaining the bullied, and the less they showed the behavior of encouraging the bullied and the behavior of being outside. (3) Gratitude played a moderating role between social support and bystander behavior in online bullying. Under the same level of social support, college students with high level of trait gratitude showed more support for the bullied behavior and less encouragement for the bullied behavior and external behavior; under the same level of social support, college students with a high level of state gratitude showed more behaviors to protect the bullied. The results of this study not only enrich the research content of bystander behavior in cyberbullying theoretically, but also provide valuable reference suggestions for avoiding the spread and escalation of cyberbullying incidents and promoting the establishment of a harmonious network environment.

Keywords：Cyberbullying, Bystander, Social support, Normative beliefs about aggression, Gratitude

社交媒体中身体积极性内容对女性身体意象的影响

郎敏[1]　叶一舵[2]（通讯作者）

1 成都师范学院教育与心理学院，成都，611130

2 福建师范大学大学心理学院，福州，邮编 350117，通讯作者 yeyiduo@163.com

摘 要　近年来一场全球化的名为“身体积极性”的运动在社交媒体中流行。在这场活动中女性通过展示自己真实的、不同于理想美的身材和相貌来表达女性身体的多样性，同时也鼓励女性不论自己的身材和相貌如何都要接纳和欣赏自己的身体。基于国外社交媒体特别是 Instagram 的研究初步表明，社交媒体中的身体积极性内容有望作为干预女性不良身体意象的新途径。然而，已有研究成果均是基于国外社交媒体，国内社交媒体中的身体积极性内容是否也有利于女性的身体意象尚不清楚。基于此，本研究的目的在于探讨社交媒体中身体积极性图片对女性身体意象（身体满意度、身体欣赏、自我客体化）的直接影响，同时也考查状态外貌比较、状态自我同情在其中的作用。本研究共包含 3 个实验，均采用单因素被试间前后测设计，共 494 名女大学生参与实验。结果发现：（1）观看身体积极性社交媒体内容的被试其状态身体满意度、身体欣赏水平均有显著上升，状态自我客体化显著下降；（2）不论是观看身体积极性社交媒体内容还是理想美图片，被试的状态外貌比较水平均显著高于中性组，但身体积极性组被试的状态外貌比较的负面影响不显著；（3）社交媒体中的身体积极性图片激发女性产生更高水平的自我同情，且实验过程中所激发的状态自我同情，能解释被试身体满意度和身体欣赏的改变。总体上讲，观看国内社交媒体中的身体积极性内容有利于女性的身体意象，利用身体积极性社交媒体内容对女性的身体意象进行干预是可行的。

The effect of body positive social media content on female body image

Lang Min[1]　Ye Yiduo[2]（Corresponding author）

1 School of Education and Psychology, Chengdu Normal University, Chengdu, 611130

2 School of Psychology, Fujian Normal University, Fuzhou, 350117, E-mail address: yeyiduo@163.com

Abstract：In recent years, a global momentum called "body positivity" has been trending on social media.

In this movement, women show the diversity of women's bodies by showing their real bodies and looks, and encourage women to accept and appreciate their bodies regardless of how their body size and appearance. Studies based on foreign social media, especially Instagram, preliminary showed that body positive social media is expected to be a new way to intervene women's poor body image. the existing studies are all based on foreign social media, and it is not clear whether “body positivity” content on Chinese social media also benefits women's body image. Based on this, the purpose of this study is to explore the impact of body positive social media images on female body image (body satisfaction, body appreciation, self-objectification), and also examine the role of state appearance comparison and state self-compassion in the relationship. This study consisted of three experiments, all of which adopted a single-factor inter-subject pre and post test design. A total of 494 female college students participated in the experiment. The results showed that: (1) the level of state body satisfaction and body appreciation of the participants who watched the body positive social media images increased significantly, and the level of state self-objectification decreased significantly; (2) no matter watching body positive social media images or beauty ideal images, the state appearance comparison level of the subjects was significantly higher than that of the neutral group, but the negative impact of the state appearance comparison of the body positivity group was not significant; (3) body positive images on social media elicited higher levels of state self-compassion in women, and that state self-compassion elicited over the course of the experiment explained changes in body satisfaction and body appreciation. In general, watching body positive social media content is conducive to women's body image, and it may be feasible to use body positive social media content to intervene women's body image.

摘 要　睡眠质量与个体的生理、心理健康关系密切，受多种因素的影响，其中包括身体健康状况、心理和社会因素等。中国大学生存在睡眠时间短、入睡时间晚等不健康的睡眠习惯和睡眠问题，关注大学生睡眠问题的预防和干预问题具有一定的现实意义。压力知觉是个体将其生活状态评估为有压力的程度。以往研究发现个体感知到的压力水平越高，其睡眠质量越差。另外，社交媒体因其便捷和趣味性，已经成为大学生的生活中不可或缺的一部分，社交媒体的使用与更长的入睡时间、就寝时间和更少的总睡眠时间有关，进而会影响睡眠质量。根据互联网补偿理论和使用满足理论，个体因生活中的负面情绪、社交焦虑和学习压力，诱发了使用互联网的动机和行为，而互联网可以提供个体所需要的满足感、安全感和网络社会支持，从而缓解压力。睡眠拖延指在没有外部原因阻碍的情况下，仍无法在预定时间上床睡觉的现象。由于睡眠拖延行为拖延上床入睡，会直接使得个体睡眠时长减少，因此睡眠拖延行为会使个体的睡眠质量降低。为探讨大学生压力知觉与睡眠质量的关系，以及问题性社交媒体使用与睡眠拖延在其中的作用，采用压力知觉量表、皮茨堡睡眠质量量表、问题性社交媒体使用量表、睡眠拖延量表对 417 名在校大学生进行施测。结果发现：（1）各变量两两之间均存在显著正相关关系；（2）压力知觉可显著正向预测睡眠质量；（3）

问题性社交媒体使用、睡眠拖延在压力知觉和睡眠质量之间起链式中介作用。本研究结果进一步揭示了大学生压力知觉和睡眠质量之间的关系，发现不良的睡眠习惯是导致睡眠问题的重要因素之一， 为改善大学生睡眠质量提供了参考。

College Students' Perceived Stress and Sleep Quality: The Chain Mediating Effect of Problematic Social Media Use and Bedtime Procrastination

Yang Xiao[1], Ke Huihui[1], Zhao Xiaoxiao[1], Zhu Jun[1], Xie Aixin[1], Wang Yuxiao[1], Ao Fang[1], Hu Yulu[1]

1 Department of Psychology, Guizhou Normal University, Guizhou, Guiyang

***Abstract*:** The sleep quality is closely related to an individual's physiological and psychological well-being and is influenced by various factors, including physical health, psychological factors, and social factors. Chinese college students have unhealthy sleep habits and sleep problems such as insufficient sleep time and late bedtimes. Therefore, it is of practical significance to pay attention to the prevention and intervention of sleep problems in university students. Perceived stress refers to an individual's assessment of the level of stress in their life. Previous research has found that the higher the perceived stress level, the poorer the sleep quality. In addition, social media has become an indispensable part of college students' lives due to its convenience and entertainment value. The use of social media is associated with longer sleep latency, later bedtimes, and shorter total sleep duration, which in turn can affect sleep quality. According to the theories of internet compensation and uses and gratifications, individuals are motivated to use the internet and engage in online activities as a response to negative emotions, social anxiety, and academic pressures. The internet can provide individuals with a sense of satisfaction, security, and online social support, thereby helping to alleviate stress. Bedtime procrastination refers to the phenomenon where individuals are unable to go to bed at the scheduled time without any external obstacles. Due to the act of delaying bedtime, bedtime procrastination directly reduces the duration of sleep, thereby decreasing the sleep quality for individuals. To explore the relationship between perceived stress and sleep quality among college students, as well as the role of problematic social media use and bedtime procrastination, a total of 417 college students were assessed using the Perceived Stress Scale, Pittsburgh Sleep Quality Index, Problematic Social Media Use Scale, and Bedtime Procrastination Scale. The results revealed the following findings: (1) There was a significant positive correlation among all variables. (2) Perceived stress significantly predicted sleep quality in a positive direction. (3) Problematic social media use and bedtime procrastination acted as a chain mediating between perceived stress and sleep quality. These findings further elucidate the relationship between perceived stress and sleep quality among college students. It highlights that poor sleep habits, including problematic social media use and bedtime procrastination, play important roles in sleep-related issues. This study provides valuable insights for improving sleep

quality among college students.

Keywords：Perceived stress, Sleep quality, Problematic social media use, Bedtime procrastination

威胁相关特征对视觉工作记忆精度的影响：项目相似性的调节作用

杨潇[1, 2]，何相材[1, 2]，念靖晴[1, 2]，李金津[1, 2]，张禹[1, 2]，罗禹[1, 2]（通讯作者）

摘 要　工作记忆用来暂时存储和加工信息的资源有限的系统。与人类生存和发展相关的威胁相关刺激通常具有更高的加工优先级，会影响注意和视觉过程进而影响工作记忆。到目前为止，威胁刺激和项目相似性对工作记忆表现的影响的研究都存在不一致。恐惧泛化是条件性恐惧反应转移到与威胁刺激相似的中性刺激上的一种现象。因此，本研究将探究威胁相关特征与相似的中性特征一起进入工作记忆后，两者是如何影响工作记忆精度的。实验共招募了 50 名被试。采用电刺激联结训练，使被试将特定刺激颜色与电刺激联结，为了排除电刺激所产生的负性情绪唤醒对工作记忆的影响，被试随之完成威胁消退训练，然后进行延迟估计任务来判断色条的朝向，并用状态焦虑量表（SAI）、正负性情绪量表（PANAS）测试被试的情绪反应。采用 2（威胁：有，无）×5（相似性：15°，30°，45°，60°，90°）的被试内实验设计。威胁条件下，威胁相关特征作为分心刺激，不同相似性的颜色沿着 CIE Lab 中的色轮顺时针（逆时针）15°，30°，45°，60°，90°选取，无威胁条件下的颜色在色轮上与威胁颜色相隔 180°，其余相似性的颜色选取方式同上。结果发现：（1）状态焦虑量表、正负性情绪量表得分的时间点主效应显著；（2）威胁条件的主效应显著；（3）相似性的主效应显著；（4）威胁和相似性的交互作用显著，简单效应分析发现，在相似性为 30°、45°、60°、90°时，与无威胁条件相比，有威胁相关特征存在时，目标的工作记忆精度更高，在相似性为 15°时，无威胁条件和有威胁条件的工作记忆精度没有显著差异。结果表明，当威胁相关特征作为分心物时，个体会采用策略抑制来提升目标刺激的工作记忆精度，相似性会降低工作记忆精度，当与威胁相关特征越相似时，两者会相互竞争，发生混淆，从而使得威胁相关特征的注意优先受损，与无威胁条件相比，通过策略抑制所体现的记忆优势消失，即相似性调节了威胁相关特征对视觉工作记忆精度的影响。

2 Laboratory of Stress and Attention, Department of Psychology, Guizhou Normal University, Guizhou, Guiyang

Abstract：Working memory is a limited- capacity system used for temporarily storing and processing information. Threat-related stimuli that are relevant to human survival and development typically have a higher processing

priority, affecting attention and visual processes, which in turn can impact working memory. Indeed, research on the influence of threat stimuli and item similarity on working memory performance has yielded inconsistent findings so far. Correct, fear generalization refers to the phenomenon where conditioned fear responses transfer to neutral stimuli that are similar to the threatening stimulus. Therefore, this study aims to investigate how the presence of threat-relevant features alongside similar neutral features in working memory precision. The study recruited a total of 50 participants. An electric stimulation pairing task was used, where participants were trained to associate specific stimulus colors with electric shocks. To control for the potential impact of negative emotions triggered by the electric shocks on working memory, participants subsequently completed threat extinction training. Following this, they engaged in a delayed estimation task to judge the orientation of color bars. Participants' emotional responses were assessed using the State Anxiety Inventory(SAI) and Positive and Negative Affect Schedule(PANAS). The study employed a 2 (Threat: Present, Absent)×5 (Similarity: 15°,30°,45°,60°,90°) within-subject experimental design. Under the threat condition, threat-relevant features served as distractor, and colors with different levels of similarity were selected along the clockwise(or counterclockwise) direction on the CIE Lab color wheel at intervals of 15°,30°,45°,60°and 90°. In the absence of threat condition, colors with no threat-relevant features were selected at the position on the color wheel that was 180°away from the threat color, and the selection process for other levels of similarity remained the same. The results revealed the following findings: (1) There was a significant main effect of time point for the State Anxiety Inventory and Positive and Negative Affect Schedule scores. (2) There was a significant main effect of threat condition. (3) There was a significant main effect of similarity. (4) There was a significant interaction between threat and similarity. Simple effect analysis revealed that at similarity levels of 30°, 45°,60°and 90°, working memory precision was significantly higher when threat-relevant features were present compared to when they were absent. However, at a similarity level of 15°, there was no significant difference in working memory precision between the threat and non-threat conditions. The results suggest that when threat-relevant features serve as distractors, individuals employ an inhibition strategy to enhance the working memory precision of target stimuli. Similarity, on the other hand, decreases working memory precision. As the similarity between the distractors and the threat-relevant features increases, they compete with each other and cause confusion, leading to a diminished attentional priority for the threat-relevant features. Compared to the non-threat condition, the memory advantage mediated by inhibition strategy disappears. In other words, similarity moderates the impact of threat-relevant features on visual working memory precision.

消极情绪启动下不同情绪调节能力大学生的认知控制差异

焦江丽　赵少兰　刘毅　闻素霞　（通讯作者）
新疆师范大学心理学院，乌鲁木齐，　830017　wsx@xjnu.edu.cn

摘　要　消极情绪状态对认知控制的影响一直存在争议，分析原因发现：首先，以往研究中常常将认知控制作为一个整合的心理过程；Braver 等认为，认知控制包括主动控制模式和反应控制模式，两种模式涉及了不同的认知加工阶段和功能，消极情绪对两种模式的影响可能存在差异。其次，相关研究中并没有区分具体的被试类型，特别是被试人格特质中与情绪相关的情绪调节能力的差异；而这种差异可能影响被试的情

绪反应和认知表现。本研究基于双重认知控制理论，采用 AX-CPT 范式探讨消极情绪启动下，高情绪调节能力和低情绪调节能力大学生在认知控制的两个模式，即：主动控制模式和反应控制模式中的认知控制差异。实验为 2（高情绪调节能力组 vs.低情绪调节能力组）×4（AY、BY、BX vs. AX）的混合实验设计，采用 E-prime 软件记录被试的反应时和错误率。结果发现：（1）高情绪调节能力组的错误率显著低于低情绪调节能力组；（2）被试在 AY 序列上的平均反应时显著长于 BX 序列，错误率显著大于 BX 序列；（3）在反应控制模式下，高情绪调节能力组的平均反应时显著短于低情绪调节能力组；d'-target 值大于低情绪调节能力组；在主动控制模式下，高情绪调节能力组的 d'-context 值显著大于低情绪调节能力组。以上结果说明，消极情绪启动对认知控制中反应控制模式的损害大于主动控制模式；高情绪调节能力大学生在反应控制模式和主动控制模式中均表现出比低情绪调节能力组更好的认知控制能力。

Differences in Cognitive Control among College Students with Different Emotional Regulation Abilities under Negative Emotional Priming

Jiao Jiangli　Zhao Shaolan　Liuyi　Wen Suxia
School of Psychology, Xinjiang Normal University, Urumqi, 830017

***Abstract*:** The impact of negative emotional states on cognitive control has always been controversial. Analysis of the reasons reveals that: firstly, in previous studies, cognitive control had often been regarded as an integrated psychological process; Braver et al. argued that cognitive control included active control mode and reactive control mode, which involve different cognitive processing stages and functions. The impact of negative emotions on the two modes may differ. Secondly, relevant studies have not distinguished specific types of participants, especially the differences in emotional regulation abilities related to emotions in participants' personality traits; And this difference may affect the emotional response and cognitive performance of the participants. This study is based on the dual cognitive control theory and uses the AX-CPT paradigm to explore the cognitive control differences between high and low emotion regulation ability college students in two modes of cognitive control under negative emotion priming, namely active control mode and reactive control mode. Experiment 2 (high emotion regulation ability group vs. low emotion regulation ability group) × A mixed experimental design of 4 (AY, BY, BX vs. AX) was used to record the reaction time and error rate of the subjects using E-prime software. The results showed that: (1) the error rate of the high emotion regulation ability group was significantly lower than that of the low emotion regulation ability group; (2) The average reaction time of the subjects on the AY sequence was significantly longer than that on the BX sequence, and the error rate was significantly higher than that on the BX sequence; (3) In response control mode, the average reaction time of the high emotion regulation ability group was significantly shorter than that of the low emotion regulation ability group; The d '- target value is greater than that of the low emotion regulation ability group; In the active control mode, the d '- context value of the high emotion regulation ability group was significantly higher than that of the low emotion regulation ability group. The above results indicate that the damage of negative emotion priming to the reactive control mode in cognitive control is greater than that of the active control mode; College students with high emotional regulation ability showed better cognitive control abilities in both reactive control mode and active control mode compared to the group with low emotional regulation ability.

***Keywords*:** Negative emotions, emotional regulation ability, reactive control mode, active control mode

大学生错失恐惧与心理健康的变化轨迹：基于潜变量增长模型的分析

杨佳奇[1] 刘拓[234] 王烨晖[1]（通讯作者）

4 学生心理发展与学习天津市高校社会科学实验室，300387

摘 要 错失恐惧是个体害怕错过奖励和快乐经历的一种担忧，与心理健康具有紧密的关联。但目前关于错失恐惧与心理健康的相关研究多聚焦于横断数据的分析，并不能揭示随时间的发展它们纵向变化的关系。因此，错失恐惧和心理健康之间的纵向变化关系尚不明确。本研究使用错失恐惧量表（FoMOs）和抑郁-焦虑-压力简版量表（DASS-21）对 541 名大学生的错失恐惧和心理健康进行三次追踪测量，间隔时间为两周。使用 SPSS26.0 进行描述性统计分析和相关分析，使用 Mplus8.3 建立潜变量增长模型对大学生的错失恐惧和心理健康的纵向关系进行探究。结果发现：（1）在三个时间点上，错失恐惧和抑郁、焦虑、压力、心理健康之间均具有显著的正相关（r = 0.24~0.42，p<0.001）；（2）多指标潜变量模型结果显示，错失恐惧和心理健康的变化速率呈显著正相关关系（β = 0.70，p<0.001），且错失恐惧的初始水平负向预测心理健康的变化速率（β = -0.28，p<0.01）；（3）建立三个并行潜变量模型进一步对心理健康的不同维度（抑郁、焦虑和压力）与错失恐惧之间的纵向变化进行探究，结果显示，错失恐惧的变化速率与压力的变化速率呈显著正相关关系（r = 0.56，p<0.01），且错失恐惧的初始水平负向预测压力的变化速率（β = -0.20，p<0.05）；但错失恐惧的变化速率与抑郁和焦虑的变化速率的相关不显著，且错失恐惧的初始水平对于抑郁和焦虑的变化速率的预测作用也不显著（p>0.05）。本研究通过潜变量增长模型探究大学生错失恐惧和心理健康之间的纵向变化关系，发现错失恐惧较高的个体心理健康状况不易改变，进一步对心理健康的不同维度（抑郁、焦虑和压力）与错失恐惧之间的关系进行探究，发现纵向变化的显著关联仅存在于压力维度，显示了抑郁和焦虑特质的相对稳定性。本研究揭示了错失恐惧初始水平对压力变化的影响以及二者随时间同向变化的规律，为降低错失恐惧、减轻压力、提升心理健康提供了一定的启示。

Trajectories of Fear of Missing Out and Mental Health among College Students: A Latent Growth Curve Model

Jiaqi Yang[1], Tuo Liu[234], Yehui Wang[1]

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

2 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

3 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, 300387

4 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin Normal University, Tianjin, 300387

Abstract： Fear of missing out (FoMO) is an individual's apprehension about missing out on rewarding and pleasurable experiences, and it has been strongly linked to mental health. However, existing researches on FoMO and mental health have primarily focused on analyzing cross-sectional data, which limits the understanding of the interrelationships of their trajectories. Therefore, the longitudinal relationship between changes in FoMO and mental health remains unclear. To address this gap, this study investigated the relationship between the trajectories of FoMO and mental health among 541 college students through three follow-up surveys conducted at two-week intervals. FoMO and mental health were measured by Fear of missing out scales (FoMOs) and the Depression-Anxiety-Stress Short Version Scale (DASS-21) respectively. Descriptive statistics and correlation analyses were conducted using SPSS 26.0. Additionally, latent variable growth models were conducted in Mplus 8.3 to explore the relationship between the trajectories of FoMO and mental health among college students. The results revealed that: (1) There were significant positive correlations between FoMO and depression, anxiety, stress, and mental health across the three time points (r = 0.24~0.42, p<0.001). (2) The multiple indicator latent growth model demonstrated a significant positive correlation between the slopes of change in FoMO and mental health (β = 0.70, p<0.001), and the initial level of FoMO negatively predicted the slope of change in mental health (β = -0.28, p<0.01). (3) The parallel process latent variable models were developed to further explore the longitudinal changes between different dimensions of mental health (i.e., depression, anxiety, and stress) and FoMO. The results showed a significant positive correlation between the slopes of change in FoMO and stress (r = 0.56, p<0.01), and the initial level of FoMO negatively predicted the slope of change in stress (β = -0.20, p<0.05). However, there was no significant correlation between the slopes of change in FoMO and depression, as well as anxiety, and the initial level of FoMO did not significantly predict the slopes of change in depression and anxiety (p>0.05). In summary, this study employed latent variable growth models to investigate the relationship between trajectories of FoMO and mental health among college students. The findings indicated that individuals with higher FoMO were less likely to change their mental health. Furthermore, the relationship between trajectories of FoMO and dimensions of mental health (i.e., depression, anxiety, and stress) demonstrated significant associations only in stress, suggesting the relative stability of depression and anxiety traits. The study revealed the influence of the initial level of FoMO on changes in stress, and their changes were in the same direction, providing valuable insights for interventions aimed at reducing fear of missing out, alleviating stress, and promoting mental health.

高中生的正念水平对心理健康的影响：述情障碍和孤独感的中介作用

吴嘉骏[1]　吉琳[1]　叶圣炉[2]（通讯作者）

1 广州医科大学应用心理学系，广州，511436

2 广州医科大学应用心理学系，广州，511436，yesl@gzhmu.edu.cn

摘 要　近年来，心理健康问题逐步成为我国普遍面临的社会性难题，且该问题已逐渐扩展延伸至大中小学生群体，呈现“低龄化”发展趋势，提升青少年心理健康水平已成为当前全社会的共识。研究者发现基于

正念为干预方式可以有效地改善心理健康，但其具体机制仍有待探究。而有研究表明正念可以降低个体的述情障碍和孤独感水平，因此我们假设正念可以从降低述情障碍和孤独感的途径来提高个体的心理健康水平。本研究聚焦述情障碍与孤独感在正念和心理健康关系中的作用。研究采用正念注意与觉知量表（MAAS），一般健康问卷（GHQ-12），多伦多述情障碍量表（TAS-20）以及孤独感问卷（ULS-8）对佛山某高中 516 名高一学生进行问卷调查。结果显示：（1）正念水平与述情障碍、孤独感、心理健康皆呈显著负相关；（2）述情障碍、孤独感和心理健康两两呈正相关；（3）述情障碍和孤独感在正念对心理健康的影响中起部分中介作用；（4）孤独感在述情障碍对心理健康的影响中起部分中介作用。本研究阐明了正念水平影响个体心理健康的可能机制，为以正念改善心理健康的干预方式补充了证据。在校园中，可以开展简单的正念干预来帮助改善高中生的心理健康水平，同时，改善述情障碍的程度和降低孤独感对提升个体的心理健康水平也有重要意义。

The Effects of Mindfulness on mental health of high Students: Mediating role of Alexithymia and Loneliness

Jiajun Wu[1], Lin Ji[1], Shenglu Ye[2]

1 Department of Psychology, Guangzhou Medical University, Guangzhou,511436，

2 Department of Psychology, Guangzhou Medical University, Guangzhou, 511436, yesl@gzhmu.edu.cn

Abstract： In recent years, mental health issues have gradually become a widespread social problem in our country. This issue has extended to the student population in primary, secondary, and high schools, showing a trend of "youthification." Elevating the mental health levels of adolescents has become a consensus in our society. Researchers have found that mindfulness-based interventions can effectively improve mental health, but the specific mechanisms behind this remain to be explored. Some studies indicate that mindfulness can reduce alexithymia and feelings of loneliness in individuals. Therefore, we hypothesize that mindfulness can enhance individual mental health by reducing alexithymia and feelings of loneliness. This study focuses on the role of alexithymia and feelings of loneliness in the relationship between mindfulness and mental health. A questionnaire survey was conducted among 516 first-year high school students in a high school in Foshan. The instruments used in the study included the Mindful Attention Awareness Scale (MAAS), the General Health Questionnaire (GHQ-12), the Toronto Alexithymia Scale (TAS-20), and the UCLA Loneliness Scale (ULS-8). The results showed that: (1) Mindfulness levels were significantly negatively correlated with alexithymia, feelings of loneliness, and mental health. (2) Alexithymia, feelings of loneliness, and mental health were positively correlated with each other. (3) Alexithymia and feelings of loneliness partially mediated the impact of mindfulness on mental health. (4) Feelings of loneliness partially mediated the impact of alexithymia on mental health. This study elucidates the potential mechanisms through which mindfulness levels influence individual mental health, providing additional evidence for using mindfulness to improve mental health. In the school context, implementing simple mindfulness interventions can help improve the mental health of high school students. Additionally, addressing alexithymia and reducing feelings of loneliness are essential steps in enhancing individual mental health.

基于童年创伤和波谱指标的抑郁症机器学习分类模型

苗浩飞[1] 钟舒明[2] 陈盼[2] 贾艳滨[2]（通讯作者）
1 北京体育大学心理学院，北京，100091
2 暨南大学附属第一医院（广州华侨医院），广州，510630，yanbinjia2006@163.com

摘 要 **目的：**抑郁症的发病率、复发率较高。根据抑郁障碍防治指南，患者从起病到接受系统治疗的平均时间为3年。抑郁症的误诊和迁延病情给患者和社会造成了巨大经济负担。氢质子磁共振波谱是抑郁症等疾病的重要诊断手段之一。然而既往多数研究仅采用波谱等影像指标来预测疾病诊断。抑郁症的发病机制是基于生理-心理-社会的综合模型。仅采集单维度的神经影像信息，易忽略患者重要的临床风险因子。童年创伤是抑郁症的重要风险因子之一。为了提升诊断的准确率，现将童年创伤等指标结合波谱特征，建立预测抑郁症诊断的综合模型。

方法：根据DSM-5诊断标准，共入组72例未经治疗的18-50岁抑郁症患者，招募30名不伴童年创伤的健康对照。现检测被试双侧前额叶白质、前扣带回皮质、壳核和小脑的胆碱和N-乙酰天门冬酸与肌酸的比值，联合情感虐待、情感忽视、躯体虐待、躯体忽视、性虐待以及性别、年龄、教育年限共28个特征指标，预测标签为抑郁患者或健康对照。采用可优化的最近邻(K-Nearest Neighbor,KNN)模型，对比预测变量为28个全特征和仅20个波谱特征的模型，采用十折交叉验证评估结果。

结果：全特征的预测模型查准率(Precision)为98.1，召回率(recall)为87.9%，F1值为92.7%。仅采用波谱预测诊断时，查准率为81.6%，召回率为96.6%，F1值为88.2%。综合来看，全特征的F1值高出波谱特征模型约5%，这说明采用基于童年创伤、波谱特征的模型分类效果优于仅采用波谱特征的模型。

结论：结合了患者童年创伤和波谱特征的模型分类准确性更好。未来临床诊断过程中，应综合患者的生理心理等多模态指标，建立抑郁症等的诊断分类模型。

Based on childhood trauma and spectral indices, a machine learning classification model for depression

Miao Haofei[1] Zhong Shuming[2] Chen Pan[2] Jia Yanbin[2]
[1]Beijing Sport University, Beijing, 100091
[2]The First Affiliated Hospital of Jinan University, Guangzhou, 510630, yanbinjia2006@163.com

Abstract：Objective: Depression has a high incidence and recurrence rate, and the time from the first onset of depression to receiving systematic treatment in China is currently about three years. Misdiagnosis and delayed treatment of depression impose a significant economic burden on patients and society. Proton magnetic resonance spectroscopy (MRS) is one of the important diagnostic methods for depression and other diseases. However, previous studies often only used imaging indices such as spectroscopy to predict disease diagnosis. The pathogenesis of depression is based on a comprehensive model of physiology, psychology, and society. Gathering only single-dimensional neural imaging information may overlook important clinical risk factors in patients. Childhood trauma is one of the important risk factors for depression. To improve the accuracy of diagnosis, we have combined childhood trauma and spectroscopy features to establish a comprehensive model for predicting depression diagnosis.

Methods: According to the DSM-5 diagnostic criteria, a total of 72 untreated depression patients aged 18-50 were enrolled, and 30 healthy controls without childhood trauma were recruited. Choline, N-acetylaspartate, and creatine in the bilateral frontal white matter, anterior cingulate cortex, caudate nucleus, and cerebellum were measured in the subjects, along with emotional abuse, emotional neglect, physical abuse, physical neglect, sexual abuse, as well as gender, age, and education level, which were used as 28 feature indicators to predict the labels of depression patients or healthy controls. The K-Nearest Neighbor (KNN) model was used with 10-fold cross-validation to compare the prediction models with 28 full-feature variables and only 20 spectroscopy feature variables.

Results: The precision of the full-feature prediction model was 98.1%, the recall was 87.9%, and the F1 value was 92.7%. When predicting the diagnosis using only the spectroscopy features, the precision was 81.6%, the recall was 96.6%, and the F1 value was 88.2%. Overall, the F1 value of the full-feature model was about 5% higher than that of the spectroscopy feature model, indicating that the model based on childhood trauma and spectroscopy features had better classification performance than the model based solely on spectroscopy features.

Conclusion: The model combining childhood trauma and spectroscopy features had better classification accuracy. In the future clinical diagnosis process, multiple modal indicators such as patients' physiology and psychology should be comprehensively considered to establish diagnostic classification models for depression and other diseases.

The role of inferior frontal gyrus in emotion regulation using reappraisal strategy

Wenjuan Li, Ling Li*

University of Electronic Science and Technology of China, Chengdu 61005, China

Abstract**：** Previous neuroimaging studies indicate that the inferior frontal gyrus (IFG) may be associated with the emotion regulation using reappraisal strategy. To explore the causal role of IFG in emotion regulation, we recruited 3 studies (one fMRI experiment and two tDCS experiments). In the fMRI experiment (study 1, n = 32), participants completed an emotion regulation task and we observed the brain activation related to reappraisal strategy. We then separately applied online anodal tDCS over the right IFG (study 2, n = 20), and the left IFG (study 3, n = 22), to observe the stimulation effect on emotional state ratings. Study 1 showed that the bilateral IFG engages in the reappraisal strategy. In addition, study 2 and 3 showed that the anodal stimulation over the right IFG, not the left IFG, reduces participants' negative feelings using reappraisal strategy. In conclusion, our findings provide evidence that the right IFG plays a causal role in down-regulation of emotions when using the reappraisal strategy. This may have a potential implication for clinical intervention especially in psychiatric conditions associated with deficits in emotion regulation.

Keywords：anodal tDCS, causal role, emotion regulation, IFG, reappraisal

以往的神经影像学研究表明，额下回可能与认知重评策略下的情绪调节有关。为了探索额下回在情绪调节中的因果作用，本研究做了 3 项实验(1 项 fMRI 实验和 2 项 tDCS 实验)。在 fMRI 实验(实验 1，n = 32)中，被试完成了一项情绪调节任务，我们观察到了与认知重评策略相关的大脑激活。然后，我们分别对右侧额下回(实验 2，n = 20)和左侧额下回(实验 3，n = 22)进行在线阳极 tDCS 刺激，观察刺激对情绪状态评分的影响。实验 1 表明，双侧额下回参与了认知重评策略。实验 2 和 3 表明，使用认知重评策略时，右侧额下回经过阳极刺激后，被试的负面情绪感受降低，但刺激左侧额下回未出现负面情绪感受的下降。本研究结果表明在使用认知重评策略时，右侧额下回在下调情绪中起因果作用。这可能对临床干预（特别是在与情绪调节缺陷相关的精神疾病中）有潜在提示作用。

摘 要　抑郁和非自杀性自伤行为（non-suicidal self-injury, NSSI）是危害公众心理健康的问题。前人研究发现高抑郁水平个体的奖赏敏感性异常降低，而有 NSSI 的个体存在异常的奖赏敏感性升高。此外，抑郁与 NSSI 共同发生率较高。但是，抑郁、NSSI、奖赏敏感性之间的关系尚不明确。因此，本研究旨在采用网络分析的方法探索奖赏敏感性、抑郁、NSSI 及其相关风险因素（童年期创伤、情绪调控）之间的关系，并探讨有无 NSSI 的抑郁个体与健康对照个体在奖赏加工、童年期创伤、情绪调控的网络上是否存在显著差异。本研究线上招募 3598 名大学生，完成包含人口学信息、巴金斯敏感性/活跃性量表（Behavioral Inhibition System/Behavioral Activation System Scale, BIS/BAS）、抑郁自评量表（Patient Health Questionnaire, PHQ）、青少年非自杀性自伤行为评定问卷（Adolescent Non-suicidal Self-injury Assessment Questionnaire, NSSI）、童年创伤问卷（Childhood Trauma Questionnaire, CTQ）、情绪调节问卷（Emotion Regulation Questionnaire, ERQ）的问卷调查。基于网络分析的方法，运用高斯模型（Gaussian graphical model, GGM）计算共 5 组症状群、21 个节点之间的网络结构。同时，将被试分为抑郁伴 NSSI、抑郁不伴 NSSI 和健康对照组进行网络比较，探索三组被试在奖赏敏感性、童年期创伤和情绪调控的网络差异。结果显示，情感虐待和快感追求在网络中的预期影响力最高。认知重评的情绪调控方式与 NSSI 在 5 组症状群间有最高的桥梁中心性，在症状群之间起到关键的桥梁作用。网络比较结果显示存在组间边中心性的显著差异。本研究为识别存在 NSSI 风险的抑郁个体提供了来自网络分析的证据，为 NSSI 行为的干预具有启示意义。

An exploration of the relationship between reward sensitivity, depression, and non-suicidal self-injury: A network analysis

Lin Zhu[1], Xinlu Cai[1]
1 Institute of Brain Science, Hangzhou Normal University, Hangzhou, 311121

Abstract： Depression and non-suicidal self-injury (NSSI) are serious health problems. Current studies have found that people with high depressive symptoms have decreased sensitivity to rewards, while people with NSSI have increased sensitivity to rewards. The comorbidity between depression and NSSI has gained much attention due to its notable prevalence. Yet, the relationship between reward sensitivity, depression, and NSSI remains unknown. Therefore, our study aimed at exploring the relationship between reward sensitivity and depression, NSSI as well as its risk factors. A total of 3598 college students were recruited to fill out questionnaires including demographics, Behavioral Inhibition System/Behavioral Activation System Scale (BIS/BAS), Patient Health Questionnaire (PHQ), Adolescent Non-suicidal Self-injury Assessment Questionnaire (NSSI), Childhood Trauma Questionnaire (CTQ), and Emotion Regulation Questionnaire (ERQ). A network analysis was utilized to visualize the relationship between a total of 21 nodes, grouped in 5 clusters. A network comparison test was conducted between the group of depression with NSSI, depression without NSSI, and healthy controls. Emotional abuse and fun seeking had highest expected influence centrality. Cognitive reappraisal and NSSI had highest bridge centrality, indicating their significance in connecting different clusters of nodes. Results of network comparison test showed significant differences between networks for the groups of participants. Our exploration of network analysis provided evidence for identification of depressive individuals with potential NSSI. Additionally, the comparative results of the networks inspired potential treatment targets of depression with and without NSSI.

不同动机类型负性情绪和认知负荷对工作记忆的影响

邢蓉[1] 孙美荣[1]（通讯作者）
北京体育大学心理学院，北京，100091，leer@bsu.edu.cn

摘 要 情绪的动机维度理论认为动机有方向(趋近和回避)和强度(由低到高)之分，不同的情绪属于不同的动机类型，如愤怒、悲伤虽为负性情绪但属于趋近动机。有研究发现个体在诱发回避动机类型的负性情绪时比诱发趋近动机更快，并且负性情绪与工作记忆产生的注意资源竞争与认知负荷密切相关，即不同的认知负荷会对负性情绪和工作记忆的相互作用产生不同的影响。但目前并未有研究探讨当工作记忆任务难度增加时是否产生同样的影响。本研究将讨论在不同的认知负荷下，诱发不同动机类型的负性情绪会对个体的工作记忆产生什么影响，其中，愤怒与悲伤属于趋近动机，恐惧和厌恶属于回避动机。实验一采用低认知负荷的延迟匹配任务，结果表明被试在愤怒情绪下的反应时显著高于恐惧和厌恶情绪，说明个体在回避动机类型的负性情绪条件下反应更快。实验二采用高认知负荷的延迟匹配任务，结果表明在高认知负荷下，两种动机类型负性情绪对个体工作记忆成绩的影响无显著差异，说明回避动机类型负性情绪对个体反应变快的影响会随着个体认知负荷的增加而消失。本研究证实了情绪动机类型和认知负荷会影响工作记忆任务表现，揭示了情绪体验与认知负荷在工作记忆过程中的交互作用,有利于推进工作

记忆前因变量的深入研究，为情绪的动机维度理论在工作记忆这一领域的应用提供了实证依据。

The effects of negative emotion of different motivation types and cognitive load on working memory

XingRong[1]　Sun Meirong[1]（corresponding author）

School of Psychology，Beijing Sport University，Beijing，100091，China

Abstract：The motivation dimension theory of emotion believes that motivation can be divided into direction (approach and avoidance) and intensity (from low to high), and different emotions belong to different motivation types. For example, anger and sadness are negative emotions but belong to approach motivation.Some studies have found that individuals can induce negative emotions of avoidance motivation faster than that of approach motivation, and the competition for attention resources generated by negative emotions and working memory is closely related to cognitive load, that is, different cognitive load will have different effects on the interaction between negative emotions and working memory.But no research has examined whether the same effect occurs when working memory tasks become more difficult. This study will discuss the effects of negative emotions induced by different motivation types on individuals' working memory under different cognitive loads. Among them, anger and sadness belong to the approach motivation, and fear and disgust belong to the avoidance motivation. Experiment 1 with low cognitive load delay matching task, the results show that the reaction of the participants under the anger in significantly higher than that of fear and disgust, indicating that the individuals react faster under the negative emotion condition of avoidance motivation. Experiment 2 with high cognitive load delay matching task, the results show that there is no significant difference between the two types of motivation negative emotions on individual working memory performance under high cognitive load, indicating that the influence of avoidance motivation negative emotions on individual response speed would disappear with the increase of individual cognitive load. This study confirms that the types of emotional motivation and cognitive load affect the performance of working memory tasks, revealing the interaction between emotional experience and cognitive load in the process of working memory, which is conducive to promoting the in-depth study of the antecedents of working memory, and provides an empirical basis for the application of the theory of emotional motivation dimension in the field of working memory.

无法忍受不确定性与焦虑：人际疏离感的中介与生命意义感的调节作用

王昊[1]（通讯作者）　张悦[1]　刘皖沙[1]　秦彦梅[1]

1 邯郸幼儿师范高等专科学校健康服务系，邯郸，056000，通讯作者 E-mail：wanghpsy@qq.com

摘 要　对未知的恐惧与担忧通常会引起心理健康问题，无法忍受不确定性（IU）是一种常见的认知偏差，指个体无法忍受由不确定性感知而引发的厌恶反应，以及对未来更消极的预期。以往研究表明，IU 是焦虑的认知脆弱性因素，对焦虑的产生和持续有显著影响，同时也会导致社交苦恼与回避行为，而良好的人际

关系与生命意义感可以作为一种稳定的资源减少焦虑的产生。尽管以往研究揭示了无法忍受不确定性对焦虑的影响及其机制，但人际关系状况与生命意义感如何影响 IU 与焦虑之间的关系还需要进一步探索。本研究探讨人际疏离感在 IU 与焦虑之间的中介作用，以及生命意义感的调节作用，采用简版无法忍受不确定性量表（IUS-12），人际疏离感量表，生命意义感量表（MLQ），焦虑自评量表（SAS）对 605 名大学生进行了问卷测量。研究结果发现：（1）无法忍受不确定性，焦虑，人际疏离感存在显著两两正相关，生命意义感与人际疏离感，焦虑存在显著负相关；（2）无法忍受不确定性既可以直接影响焦虑,也可以通过人际疏离感的中介作用间接影响焦虑。（3）生命意义感调节了无法忍受不确定性对焦虑的直接影响，当生活缺乏意义时，无法忍受不确定性更容易导致焦虑。本研究进一步解释了无法忍受不确定性与焦虑的关系，丰富了焦虑的理论模型，并为减少由不确定导致的焦虑提供了实证依据。

Intolerance of Uncertainty and Anxiety: Mediating Effect of Interpersonal Alienation and Moderating Effect of Meaning in Life

WANG Hao[1]　ZHANG Yue[1]　LIU Wansha[1]　QIN yanmei[1]
1Handan Preschool Teachers College, Handan Hebei

***Abstract*:** Fear and worry about the unknown usually cause mental health problems,intolerance of uncertainty(IU) is a common cognitive bias that refers to an individual's aversive response due to the perception of uncertainty,as well as more negative expectations about the future.Previous studies have shown that IU is a cognitive vulnerability factor for anxiety, which has a significant impact on the occurrence and persistence of anxiety, and can also lead to social distress and avoidance behaviors.Healthy relationships with others and meaning in life can be a stable resource to reduce anxiety.Although previous studies have revealed the influence of intolerance of uncertainty on anxiety,how the interpersonal relationship and meaning in life affect the relationship between IU and anxiety needs to be further explored.This study explores the mediating effect of interpersonal alienation between IU and anxiety, and the moderating effect of meaning in life,605 college students were investigated with the Intolerance of Uncertainty Scale- Short Form(IUS-12),Adolescent Alienation Scale,Meaning in Life Questionnaire(MLQ),and Self-Rating Anxiety Scale(SAS).The results show that:(1)There is a significant pairwise positive correlation between intolerance of uncertainty, anxiety and interpersonal alienation,and a significant negative correlation between meaning in life and interpersonal alienation and anxiety.(2)intolerance of uncertainty can not only directly affect anxiety, but also indirectly affect anxiety through the mediation of interpersonal alienation.(3)The meaning in life moderates the direct impact of intolerance of uncertainty on anxiety, Intolerable of uncertainty more likely to lead to anxiety when life lacks meaning.This study further explained the relationship between intolerance of uncertainty and anxiety, enriched the theoretical model of anxiety, and provided an empirical basis for reducing anxiety caused by uncertainty.

CALMME-青少年情绪健康线上产品的用户体验设计：基于情绪释放技术

吴汶颖[1,2]，杨蕾[2]，范家琳[1*]（通讯作者）
[1]深圳大学心理学院，深圳，518060
[2]西南科技大学制造科学与工程学院，绵阳，621010
[*]fanjl@szu.edu.cn

摘 要　背景：随着在线心理产品种类和功能愈发增多，人们对于针对个体需求的个性化和专业化线上心理服务的需求也逐渐提升。调查显示，目前我国尚未有专门针对青少年情绪调节的线上产品。然而，情绪健康对于青少年的身心健康、社会适应和学业等方面具有重要影响，我国高中生的心理健康水平呈下降趋势，其中焦虑和抑郁问题尤为突出。因此，本研究旨在设计一款适用于青少年的情绪健康线上产品。

方法：本研究通过竞品分析对国内外现有情绪类应用进行了比较研究，总结出了目前产品存在的痛点和机会点。之后，通过在线问卷调查收集了 200 份有效答卷（回收率 79%），并对 15-19 岁的初中生、高中生和准大学生进行了半结构化访谈（N=27，男 14 人，女 13 人）。根据数据分析结果，采用了用户体验设计的方法和原则进行了原型开发，并通过可用性测试确保其功能和可用性。

结果：竞品分析结果显示超过 50%的产品缺乏课程功能，核心功能主要围绕专业咨询和心理测试展开，并缺乏针对青少年情绪的分区或专栏。访谈中，77%的学生在情绪冲动后表示后悔，65.4%希望能够自行解决情绪问题。通过相关分析发现，情绪效能感和情绪控制之间存在一定相关性。此外，大多数受访者表达了对于创造轻松舒适的心理环境的需求。因此，我们将 APP 风格定义为舒适、清新和安全，核心功能以情绪课程板块和情绪缓解板块为主，并引入情绪释放技术（EFT）供用户自主学习。此外，我们还增加了冥想和睡眠元素以丰富应用的功能。最终，我们实现了 Web 端和移动端的高保真可交互原型（31 个界面），并制作了概念展示视频。

结论：本研究关注青少年的情绪健康问题，从市场需求和产品设计的角度对情绪类产品进行了探讨。情绪类产品作为线上心理服务的一个细分领域，具备更强的针对性和专业性。该设计验证了针对青少年情绪问题的设计思路和可行性，并为未来情绪类产品的用户体验设计提供了参考和启发。

Abstract：BACKGROUND: With the increasing variety and functions of online psychological products, people's demand for personalized and professional online psychological services aimed at individual needs has gradually increased. According to the survey, there is no online product specifically for teenagers' emotional regulation in

China. However, emotional health has an important influence on teenagers' physical and mental health, social adaptation, and studies. The mental health level of senior high school students in China is on the decline, especially anxiety and depression. Therefore, the purpose of this study is to design an online emotional health product suitable for teenagers.

Methods: Through the analysis of competing products, this study made a comparative study of the existing emotional applications at home and abroad, and summarized the pain points and opportunities of the current products. After that, 200 valid answers were collected through an online questionnaire survey (the recovery rate was 79%), and semi-structured interviews were conducted with junior high school students, senior high school students, and prospective college students aged 15-19 (N=27, 14 males and 13 females). According to the results of the data analysis, the prototype is developed by using the methods and principles of user experience design, and its function and usability are ensured by usability testing.

Results: The analysis of competing products showed that more than 50% of the products lacked curriculum functions, the core functions were mainly focused on professional consultation and psychological testing, and there was no division or column for teenagers' emotions. In the interview, 77% of the students expressed regret after emotional impulse, and 65.4% hoped to solve their emotional problems by themselves. Through correlation analysis, it is found that there is a certain correlation between emotional self-efficacy and emotional control. In addition, most interviewees expressed the need to create a relaxed and comfortable psychological environment. Therefore, we define the style of the APP as comfortable, fresh, and safe, and the core functions are mainly emotional courses and emotional relief, and we introduce emotional Freedom technology (EFT) for users to learn independently. In addition, we have added meditation and sleep elements to enrich the functions of the application. Finally, we have realized a high-fidelity interactive prototype (31 interfaces) of the Web and mobile terminals and made a concept demonstration video.

Conclusion: This study focuses on the emotional health of teenagers and discusses emotional products from the perspective of market demand and product design. As a subdivision of online psychological services, emotional products are more targeted and professional. The design verifies the design idea and feasibility of emotional problems for teenagers and provides reference and inspiration for the user experience design of emotional products in the future.

3 上海体育大学“运动认知评定与调控”重点实验室，上海，200438，zhoullbjmu@yeah.net

摘 要 目的：原发性痛经（primary dysmenorrhea, PDM）是一种在月经来潮前或行经期间的下腹部疼痛，常见于年轻女性，严重影响其工作和生活。研究表明，虚拟现实（virtual reality, VR）技术是一种有效的非药物替代性镇痛疗法。目前尚未有研究应用 VR 技术干预 PDM。本研究旨在评估 VR 技术对 PDM 的干预

效果，并探索其潜在的镇痛机制。方法：采用随机对照试验，招募 12 名 PDM 患者在其月经期第 1-2 天参与实验。实验组（n=7）进行 Nature Treks VR 游戏，对照组(n=5)则观看相同内容的 2D 视频。采用 0-10 级的数字评定量表评估患者在干预各阶段由电刺激诱发的疼痛相关反应及其痛经强度。结果：两组患者在干预前的痛经强度无显著差异（实验:4.73±1.30,对照:4.45±0.65;Z=-0.652,p=0.514）。与干预前比较，实验组患者在干预中的痛经强度变化比率显著高于干预后的变化比率（中:-0.26±0.13,后:-0.03±0.15;Z=-2.239,p=0.025）；而对照组患者在干预中的痛经强度变化比率与干预后的变化比率无显著差异（中:-0.17±0.20,后:-0.12±0.21;Z=-0.722，p=0.470）。两组患者由低强度电刺激（实验:0.06±0.14,对照:0.09±0.25,Z<0.001,p>0.999）或高强度电刺激（实验:-0.01±0.16,对照:0.11±0.19;Z=-1.000,p=0.317）诱发的干预前后疼痛强度变化比率均无显著差异；由低强度电刺激（实验:0.02±0.13,对照:0.17±0.39;Z=-1.286,p=0.199）或高强度电刺激（实验:0.01±0.20,对照：0.14±0.34;Z=-1.286，p=0.199）诱发的干预前后疼痛不愉悦度变化比率无显著差异；由低强度电刺激（实验:0.02±0.12,对照:0.07±0.32;Z=-0.143,p=0.886）或高强度电刺激（实验:-0.03±0.18,对照:0.11±0.26;Z=-1.286,p=0.199）诱发的干预前后疼痛新异性变化比率无显著差异。两组患者在干预前后的疼痛焦虑（实验:-0.13±0.13,对照:-0.07±0.22;Z=-0.568,p=0.570）、疼痛灾难化（实验:-0.05±0.30,对照:0.52±1.05;Z=-0.893,p=0.372）、疼痛警觉/意识（实验:-0.06±0.14,对照:0.06±0.22;Z=-0.893,p=0.372）、情绪调节（实验:-0.05±0.09,对照:0.02±0.08;Z=-1.548,p=0.122）以及注意控制（实验:0.01±0.17,对照:0.07±0.10;Z=-1.554,p=0.120）的变化比率均无显著差异。此外，实验组患者在干预中的痛经强度变化比率与注意控制变化比率呈显著正相关性（r=0.760,p=0.047）；而对照组患者在干预中的痛经强度变化比率与注意控制变化比率无显著相关性（r=-0.024,p=0.970）。结论：虚拟现实技术对原发性痛经具有即时的镇痛效应，但无持久的镇痛效应；这种即时镇痛效应的产生可能与注意控制能力的改善有关。
关键词 原发性痛经，虚拟现实，镇痛效应，随机对照试验

The analgesic effects of alternative therapy based on virtual reality on primary dysmenorrhea and its underlying mechanisms

Juanjuan Zhang[1,2,3] Lili Zhou[1,2,3]

1 School of Psychology, Shanghai University of Sport, Shanghai, 200438

2 Center for Exercise and Brain Science, Shanghai University of Sport, Shanghai, 200438

3 Key Laboratory of Motor Cognitive Assessment and Regulation, Shanghai University of Sport, Shanghai, 200438, zhoullbjmu@yeah.net

Abstract: Objective: Primary dysmenorrhea (PDM) refers to a kind of lower abdominal pain experienced before or during menstruation. PDM is common among young women and has profound impacts on their work and daily life. Previous studies have indicated that virtual reality (VR) is an effective non-pharmacological alternative therapy on pain. To date, there are no studies focusing on the effects of VR technology on the intervention of PDM. Therefore, the present study aimed to investigate the analgesic effects of VR technology on PDM and its potential mechanisms.

Methods: Twelve PDM patients were recruited to participate the experiment during their first or second day of menstrual cycle with a randomized controlled trial. They were randomly assigned into two different groups (experimental v.s. control). Specifically, participants in the experimental group (n=7) engaged in Nature Treks VR game, while others in the control group (n=5) watched a 2D video with the same contents. For all participants, their pain-related responses induced by electrical stimulation and menstrual pain intensity at different phases of the

intervention were assessed using a 11-point numeric rating scale (0 represents no pain at all and 10 represents unbearable pain).

Results: There were no significant differences in menstrual pain intensity between the two groups in the pre-intervention phase (experimental: 4.73±1.30, control: 4.45±0.65; *Z*=-0.652, *p*=0.514). For the menstrual pain intensity, participants in the experimental group showed significantly higher pre- to during-intervention change ratios than pre- to post-intervention change ratios (pre-during: -0.26±0.13, pre-post: -0.03±0.15; *Z*=-2.239, *p*=0.025), while no significant differences were observed between the pre- to during-intervention change ratios and pre- to post-intervention change ratios in the control group (pre-during: -0.17±0.20, pre-post: -0.12±0.21; *Z*=-0.722, *p*=0.470). There was no significant group difference in pre- to post-intervention change ratios in the pain intensity induced by low-intensity electrical stimulation (experimental: 0.06±0.14, control: 0.09±0.25; Z<0.001, p>0.999) or high-intensity electrical stimulation (experimental: -0.01±0.16, control: 0.11±0.19; *Z*=-1.000, *p*=0.317). Similar results were found in the pre- to post-intervention change ratios in the pain unpleasantness induced by low-intensity electrical stimulation (experimental: 0.02±0.13, control: 0.17±0.39; *Z*=-1.286, *p*=0.199) or high-intensity electrical stimulation (experimental: 0.01±0.20, control: 0.14±0.34; *Z*=-1.286, *p*=0.199). For the stimulus salience of pain, no significant group difference was observed in the pre- to post-intervention change ratios induced by low-intensity electrical stimulation (experimental: 0.02±0.12, control: 0.07±0.32; *Z*=-0.143, *p*=0.886) or high-intensity electrical stimulation (experimental: -0.03±0.18, control: 0.11±0.26; *Z*=-1.286, *p*=0.199). Similarly, there were no significant group differences in the pre- to post-intervention change ratios in the pain anxiety (experimental: -0.13±0.13, control: -0.07±0.22; Z=-0.568, p=0.570), the pain catastrophizing (experimental: -0.05±0.30, control: 0.52±1.05; *Z*=-0.893, *p*=0.372), the pain vigilance/consciousness (experimental: -0.06±0.14, control: 0.06±0.22; *Z*=-0.893, *p*=0.372), the emotion regulation (experimental: -0.05±0.09, control: 0.02±0.08; *Z*=-1.548, *p*=0.122), and the attentional control (experimental: 0.01±0.17, control: 0.07±0.10; *Z*=-1.554, *p*=0.120). Additionally, a significant positive correlation was found between the pre- to post-intervention change ratios in the menstrual pain intensity and the pre- to post-intervention change ratios in the attention control among the experimental group (r=0.760, *p*=0.047), whereas no significant correlation was observed between these two variables in the control group (r=-0.024, *p*=0.970).

Conclusion: The alternative therapy based on virtual reality has immediate analgesic effects on primary dysmenorrhea rather than lasting analgesic effects. The generation of this immediate analgesic effect may be related to the improvement of attentional control.

突发公共卫生事件下护士家庭功能和焦虑状态的关系：心理弹性和体育锻炼的调节中介模型

侯田雅　毛晓飞　董薇（通讯作者）

海军军医大学（第二军医大学）心理系，上海，200433，通讯作者 E-mail：sophiedongwei@163.com

摘 要　在突发性公共卫生事件中，护士作为主力军面临着较大的生理心理负荷，容易产生紧张焦虑等负性情绪，严重时会影响其工作效率和生活质量，探讨突发公共卫生事件下护士的焦虑水平及其影响因素十

分重要。以往研究发现了家庭功能对心理健康的保护作用，但探究突发公共卫生事件下护士的家庭功能和焦虑状态的关系及其背后影响机制的研究尚未见报道。本研究旨在通过构建有调节的中介效应模型探讨突发公共卫生事件下护士的家庭功能对焦虑状态的影响及其作用机制。本研究采用家庭关怀度指数量表、心理弹性量表、体育活动等级量表和广泛性焦虑障碍量表对突发公共卫生事件期间的 779 名护士进行测量，通过 Mackinnon(2008)的四步程序对中介效应进行分析，并使用 Hayes PROCESS 宏程序对调节中介模型进行检验。结果表明：（1）护士的家庭功能和焦虑水平呈显著负相关，家庭功能和心理弹性呈显著正相关，心理弹性和焦虑水平呈显著负相关；（2）家庭功能不但直接影响护士焦虑水平，还通过心理弹性的部分中介作用间接影响焦虑水平；（3）护理人员家庭功能对焦虑的直接作用和心理弹性的中介作用受到体育锻炼的调节。随着体育锻炼的增加，护理人员家庭功能的直接效应减小，心理弹性的中介效应增大。采用 Johnson-Neyman 法进行简单斜率分析显示：对于体育锻炼水平较高的护士，家庭功能对焦虑的直接预测作用减弱，心理弹性对焦虑的预测作用增强。本研究为深入理解家庭功能与焦虑之间的关系及其潜在机制提供了理论基础，有助于降低突发公共卫生事件下护士的焦虑水平。

Family function and anxiety among nurses during a public health emergency: A moderated mediation model of resilience and physical activity

HOU Tianya，MAO Xiaofei, DONG Wei（Corresponding author）

Department of Psychology, Naval Medical University (Second Military Medical University),

Shanghai, 200433, Corresponding Email: sophiedongwei@163.com

***Abstract*：** During a public health emergency, nurses, as the main force, are facing high physiological and psychological loads, which might result in negative emotions (e.g. anxiety) and further lead to reduces work efficiency and quality of life. Thus, it is important to explore the anxiety and its influential factors among nurses during a public health emergency. Previous studies have found the protective effect of family function on mental well-being, but there have been no reports on exploring the association of family function with anxiety and its underlying mechanisms among nurses during a public health emergency. The present study aimed to explore the impact of family function on anxiety among nurses and its potential mechanisms through a moderated mediation model. Family Care Index Questionnaire, Connor-Davidson Resilience Scale, Physical Activity Rating Scale and 7-item Generalized Anxiety Disorder Scale were employed to measure family function, resilience, physical activity and anxiety among 779 Chinese nurses during a public health emergency. Mackinnon's four-step procedure was applied to examine the mediating effect, while Hayes PROCESS macro for SPSS was employed to investigate the moderated mediation model. The results showed: (1) There were a significant negative correlation between family function and anxiety, a significant positive correlation between family function and resilience, and a significant negative correlation between resilience and anxiety. (2) Family function not only had a direct influence on anxiety, but also exerted an indirect effect on anxiety through resilience. (3) The direct effect of family function on anxiety and the indirect effect of resilience were moderated by physical activity. With the increase of physical activity, the direct effect of family function on anxiety decreased and the mediating effect of resilience increased. Further simple slope analysis through Johnson-Neyman technique presented that for the

nurses with higher levels of physical activity, family function had a weaker direct effect on anxiety, while resilience had a stronger predictive effect on anxiety. The present study provided a theoretically grounded foundation for an in-depth understanding of the association between family function and anxiety and its underlying mechanisms, which could be helpful for the reduction of anxiety among nurses during a public health emergency.

摘 要 背景：失眠是全球重要的公共卫生问题。神经质与失眠之间的关联已得到广泛确认，但其心理机制尚不清楚。心智游移是指个体在思维和情感上的不稳定性，症状反刍是指个体对失眠症状的反复思考和担忧。二者都可能导致个体在夜间难以停止思考和放松，从而增加失眠的发生。方法：共有 1,790 名在线参与者完成了大五人格问卷、AIS 失眠量表、心智游移问卷以及反刍思维量表的中文版本。通过相关分析和中介分析来探索神经质与失眠之间的关系，并研究心智游移和反刍症状的中介效应。结果：研究结果显示，神经质、心智游移、症状反刍和失眠之间存在显著正相关关系（r>0.464，p<0.001）。此外，中介分析显示，神经质对失眠具有显著的直接影响，同时通过心智游移和症状反刍产生间接影响(estimate=0.372, SE=0.031, p<0.001)。此外，心智游移（estimate=0.361，SE=0.038，p<0.001）和症状反刍（estimate=0.759，SE=0.046，p<0.001）都独立中介了神经质与失眠之间的关系。结论：上述发现对于预防和治疗失眠具有重要的启示。首先，个体的心智游移和症状反刍水平应被认为是评估失眠风险的重要指标之一。其次，针对心智游移和症状反刍的干预措施可能有助于改善失眠症状。例如，通过认知行为疗法和心理教育，帮助个体学会放松和控制思维，减少夜间的思维游移和反刍症状，从而改善睡眠质量。总之，本研究揭示了神经质、心智游移和症状反刍在失眠发生中的重要作用，并为预防和治疗失眠提供了一定的指导。进一步的研究可以进一步拓展我们对失眠心理机制的认识，为制定更有效的干预措施提供依据。

The Influence of Neuroticism on Insomnia: The Chain Mediating Effect of Mind Wandering and Symptom Rumination

Zhang Zheng [1,2] Tang Huajia [1] Huang Ying [1] Li Xuting [1] Chen Shurui [1] Shu Zhan [1] Zhou Jiansong [1*]

[1] Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha, Hunan, China.

[2] College of Educational Sciences, Anhui Normal University, Wuhu, Anhui, China

Abstract： Background: Insomnia is a significant public health issue worldwide. The association between neuroticism and insomnia has been widely acknowledged, but the psychological mechanisms underlying this connection remain unclear. Cognitive instability refers to an individual's instability in thinking and emotions, while rumination symptomatology refers to an individual's repetitive thinking and worrying about insomnia symptoms. Both factors can contribute to difficulties in ceasing thoughts and relaxing at night, thereby increasing the occurrence of insomnia.

Methods: A total of 1,790 online participants completed the Big Five Personality Inventory, the Athens Insomnia Scale, the Cognitive Instability Questionnaire, and the Rumination Thinking Scale in Chinese. Correlation and mediation analyses were conducted to explore the relationship between neuroticism and insomnia and the mediating effects of cognitive instability and rumination symptoms.

Results: The findings revealed significant positive correlations between neuroticism, cognitive instability, rumination symptoms, and insomnia ($r > 0.464$, $p < 0.001$). Furthermore, mediation analysis demonstrated that neuroticism had a significant direct impact on insomnia, while also exerting indirect effects through cognitive instability and rumination (estimate = 0.372, SE = 0.031, $p < 0.001$). Additionally, both cognitive instability (estimate = 0.361, SE = 0.038, $p < 0.001$) and rumination symptoms (estimate = 0.759, SE = 0.046, $p < 0.001$) independently mediated the relationship between neuroticism and insomnia.

Conclusion: The above findings have important implications for preventing and treating insomnia. Firstly, the individual's level of rumination and symptom rumination should be considered as crucial indicators for assessing insomnia risk. Secondly, interventions targeting rumination and symptom rumination can potentially improve insomnia symptoms. For instance, cognitive-behavioral therapy and psychological education can help individuals relax, control thoughts, and reduce nocturnal rumination, thereby enhancing sleep quality. This study highlights the significant roles of neuroticism, rumination, and symptom rumination in insomnia occurrence and provides guidance for prevention and treatment. Further research can expand our understanding of insomnia's psychological mechanisms and inform more effective interventions.

Keywords：Insomnia, Neuroticism, Mind Wandering, Rumination Symptoms

特质情绪智力的神经生物学：系统性综述

孙华千[1] 王淞[2]（通讯作者）

1 大理大学，大理，671000

2 四川大学华西医院，成都，610000，wangs_psych@163.com

特质情绪智力（TEI）是指一系列能使个体有效地适应环境和保持幸福感的与情绪相关的感知技能，这些技能可使个体可以有效地适应环境并且保持幸福感。TEI 和很多心理疾病有关，特别是跟和焦虑抑郁的发病率有关，我们需要更深入地了解 TEI 的神经生物学机制，来确定潜在地干预目标，我们没有发现关于 TEI 的系统综述。使用 Web of Science 和 PubMed 在线数据库，我们搜索了同行评议的研究特质情绪智力和神经生物学的出版物。我们确定了 29 项研究(n=16，771 名参与者)，这些研究采用了各种方法，包括结构磁共振成像(MRI)、功能磁共振成像(FMRI)、任务磁共振成像（task-fMRI）、弥散张量成像（DTI）。我们对已发表的研究结果的进行综合分析，结果显示，前额叶皮层（特别是内侧和背外侧）、颞后上皮层、脑岛（特别是前侧）、杏仁核、海马的异常结构（灰质体积或白质完整性）和/或活动（对愉快和压力图像/声音

的反应）异常。功能磁共振成像研究报告了 TEI 与注意网络、视觉网络和缺省模式网络的差异激活之间的联系。尽管已发表的研究有局限性，但这篇综述表明特质情绪智力与特定脑区和网络的结构和功能的改变之间的关系。 我们发现情绪智力和抑郁这两种人格特质在以前的研究中是负相关的，这两种人格特质在区域上有明显的重叠。我们为未来特质情绪智力的神经生物学研究提供了建议。

Neurobiology of Trait Emotional Intelligence: a systematic review

Huaqian Sun[1] Song Wang[2]
1Dali University Dali China
2 Huaxi MR Research Center (HMRRC), Departmentof Radiology, West China Hospital of Sichuan University,Chengdu, China

Abstract： Trait Emotional Intelligence (TEI) refers to a set of emotionally relevant perceptual skills that enable individuals to adapt effectively to their environments and maintain a sense of well-being.TEI has been linked to a number of psychological disorders, particularly to the prevalence of anxiety and depression, and we need to gain a deeper understanding of the neurobiological mechanisms of TEI in order to identify potential targets for intervention. found no systematic reviews on TEI. Using the Web OF SCIENCE and PubMed online databases, we searched for peer-reviewed publications examining trait emotional intelligence and neurobiology. We identified 29 studies (n=16, 771 participants) that used a variety of methods, including structural magnetic resonance imaging (MRI), functional magnetic resonance imaging (FMRI), task magnetic resonance imaging (task-fMRI), and diffusion tensor imaging (DTI). Our comprehensive analysis of the results of published studies showed abnormalities in the prefrontal cortex (especially medial and dorsolateral), posterior superior temporal cortex, insulae (especially anterior), amygdala, and hippocampus in terms of abnormal structure (gray matter volume or white matter integrity) and/or activity (response to pleasant and stressful images/sounds). Functional magnetic resonance imaging studies have reported links between TEI and differential activation of attentional, visual, and default mode networks. Despite the limitations of published studies, this review suggests a relationship between trait emotional intelligence and alterations in the structure and function of specific brain regions and networks. We found that two personality traits, emotional intelligence and depression, which have been negatively correlated in previous studies, overlap significantly regionally. We provide suggestions for future neurobiological studies of trait emotional intelligence.

共同反刍与抑郁症状的关系：一项系统综述和元分析

董凯喜[1, 2]　齐惠紫[1, 2]　赵国朕[1, 2]（通讯作者）
1 中国科学院心理研究所行为科学重点实验室，北京，100101

2 中国科学院大学心理系，北京，100049，通讯作者 zhaogz@psych.ac.cn

摘 要 背景：共同反刍指的是以一种过度的、思辨的、消极的方式与他人谈论问题。研究人员试图探究共同反刍和抑郁症状之间的复杂联系，但研究结果却存在较大差异，并且两者之间的心理机制尚不清晰。

方法：本研究旨在通过系统综述和元分析来探讨共同反刍和抑郁症状的关系。在 Web of science，PsycINFO，PsycArticles，ElsevierSD，Springer Online Journals，EBSCO-ERIC，SAGE Online Journals，ProQuest，中国知网，万方，维普数据库检索 2002 年以来发表的论文。纳入的研究评估了儿童、青少年（占 60%）和成年人的抑郁症状，并计算了抑郁症状和共同反刍的相关关系。所有文章均由两名研究人员独立审阅并编码数据，使用随机效应模型对样本进行估计。

结果：68 项研究（共 31163 名被试）被纳入分析。共同反刍与抑郁症状之间存在显著的正相关关系（n = 130；R = 0.108；95% CI 为 [0.091，0.125]）。两者的关系受到被试类型、抑郁症状和共同反刍的测量工具的调节作用，但不受共同反刍的伙伴类型、被试年龄、女性比例、样本量、文献质量和发表年份的调节。

结论：通过综述以往的文献，基于抑郁传染理论提出了解释共同反刍和抑郁症状关系的双路径模型，并通过元分析的方法检验了被试类型、共同反刍对象、测量工具、年龄等对两者关系的调节作用。结果表明共同反刍水平高的人往往也会伴随着较高程度的抑郁症状。防止共同反刍的频繁发生，尤其是引导个体在遇到困难时不过度关注负面信息和情绪，而是采取有效措施帮助其积极应对困难有助于抑郁症状的缓解。

The relationship between co-rumination and depressive symptoms: A systematic review and meta-analysis

Kaixi Dong[1, 2], Huizi Qi[1, 2], Guozhen Zhao[1, 2, *]

1 Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, China.

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, China.

Abstract: Background: Co-rumination refers to talking about problems to others in an excessive, speculative, and negatively focused way. Researchers have sought to figure out the intricate link between co-rumination and depressive symptoms. However, little is known about which processes explain the well-established link between co-rumination and depressive symptoms. Results across studies have not reached an agreement yet, and the mechanism remains unclear.

Method: The present research aimed to investigate the relationship between co-rumination and depressive symptoms through a systematic review and a meta-analysis. An electronic search was conducted in Web of Science, PsycINFO, PsycArticles, ElsevierSD, Springer Online Journals, EBSCO-ERIC, SAGE Online Journals, ProQuest, CNKI, WANFANG, and VIP database for studies published since 2002. The included studies measured depressive symptoms and examined their association with co-rumination in children, adolescents (60%), and adults. All relevant articles were reviewed and data extracted by two independent coders. Estimates were examined by using random-effects meta-analysis.

Results: Sixty-eight studies (31,163 participants) were included in the analysis (n = 130; r = 0.108; 95% confidence interval [CI] = 0.091 to 0.125). The relationship was moderated by participant type, the measurement tool for depressive symptoms and co-rumination, but not by co-partner, participant age, female ratio, sample size,

literature quality, and year of publication.

Conclusion: Based on the previous literature review, this study proposes a dual-path model to explain the relationship between co-rumination and depressive symptoms based on the theory of contagion of depression. And through the method of meta-analysis, we tested the moderating effect of the participant type, co-partner, measurement tools, and age on the relationship between the two. The results showed that people with high levels of co-rumination also tended to have more severer depressive symptoms. To prevent the frequent occurrence of co-rumination, especially to guide individuals not to pay excessive attention to negative information and emotions when encountering difficulties but to take adequate measures to help them actively cope with problems, is conducive to relieving depressive symptoms.

Keywords：Co-rumination, depressive symptoms, contagious depression, meta-analysis

时间预测错误对喜爱度评价的影响：来自 ERP 的证据

卢蕾安[1]　王春生[2]　任俊[2]（通讯作者）

1 中共东阳市委党校，东阳，322100

摘 要　准确预测未来是应对不确定世界的重要能力，人们经常尝试预测未来，但很容易出错。预测错误(prediction error)是重要的心理学研究课题。其中时间预测错误(timing prediction error)是指事件发生在意料之外的时间。以往研究只是聚焦于时间预测错误本身，考察发现了 FRN 对时间预测错误敏感，但尚不清楚时间预测错误如何影响人们对其后续相关事件的态度看法。为此，本研究探究时间预测错误如何影响个体对刺激图片的喜爱程度以及脑电变化，采用 2（图片效价：积极、消极）×3（时间预测错误：时间提前、时间不变、时间推迟）两因素被试内设计。要求被试对时间提前、时间不变、时间推迟（时间提前与时间推迟是时间预测错误的两类情况）三类情况下出现的积极图片和消极图片进行喜爱度评价，同时记录神经反应。结果发现，被试对刺激图片的喜爱度受到了效价和时间预测错误影响。时间预测错误比时间预测正确诱发更大的 FRN，进一步检验发现，实际上是时间推迟诱发了更大的 FRN。积极图片比消极图片诱发更大的 P2 和 P3。积极条件下，个体对时间推迟图片的喜爱度评价和 P2 波幅显著高于时间不变图片；而消极条件下，个体对时间提前图片的喜爱度评价和 P2 波幅显著高于时间不变图片。时间推迟图片诱发的 P3 显著小于时间不变图片。这些结果表明：（1）FRN 对时间预测错误敏感，尤其是时间推迟。（2）时间预测错误现象存在“积极-消极不对称”，相较于控制组，人们偏好时间推迟的积极图片和时间提前的消极图片。（3）人们厌恶时间推迟的图片，将其视作较低情感价值结果，进而减少投入注意力资源。

Influence of timing prediction error on degree of preference: Evidence from ERP

LU Leian, WANG Chunsheng, REN Jun
[1]Party School of Dongyang City Committee of C. P. C; [2]Department of Psychology, College of Psychology, Zhejiang Normal University, Jinhua 321004, China

Abstract：Accurate prediction of the future is an important ability to coping the uncertain world. People often try to predict the future, but it is easy to make mistakes.Prediction error is an important research topic in psychology. Timing prediction error refers to an event that occurs at an unexpected time. Previous studies found that FRN is sensitive to timing prediction error, but it is not clear how timing prediction errors affect people's attitudes to subsequent events. Thus, this study explores how timing prediction errors affect an individual's preference for pictures and changes in brain electrical activity. 2(valence: positive, negative)×3(timing prediction error: time advance, time invariance, time delay) two-factor internal design was used. The participants were asked to rate how much they liked the positive and negative pictures in three types of situations, the neural responses were recorded at the same time. The results showed that subjects' preference of pictures was influenced by the valence and timing prediction error.Timing prediction error induced larger FRN than time prediction correct. Further examination showed that time delay actually induced larger FRN. Positive pictures induced greater P2 and P3 than negative pictures.Under the positive condition, compared with the time-invariant pictures, individual's degree of preference and P2 amplitude of time-delayed pictures were significantly higher; while under the negative condition, compared with the time-invariant pictures, the individual's degree of preference and P2 amplitude of time-ahead pictures were significantly higher.P3 induced by time-delayed pictures was significantly smaller than that induced by time-invariant pictures.These results indicate that: (1) FRN is sensitive to timing prediction errors, especially time delay. (2) There was a“Positive-Negative Asymmetry” in the timing prediction error. Compared with the control group, people prefer the positive pictures of time delay and the negative pictures of time advance. (3) People disliked delayed pictures, consider it as a result of lower emotional value, which in turn reduced their attentional resources.

Keywords：timing prediction error, FRN, P2, P3

高中生认知灵活性与情绪弹性的关系：基于潜在剖面分析

王叶影[1]　贾宁[1]（通讯作者）

1 河北师范大学教育学院，石家庄市，050010

1 河北师范大学教育学院，石家庄市，050010，Jianing@hebtu.edu.cn

摘 要 在当今社会环境下，学生网络成瘾、厌学、逃学和打架等问题频发，这些问题应当引起社会的关注与思考，以促进学生的心理健康和社会适应。以往研究发现，认知灵活性与情绪调节均作为个体适应现实的方式，但对二者之间的关系的研究较少，本研究主要探索高中生认知灵活性的潜在类别，并讨论各类别与情绪弹性的关系。采用整群随机抽样的方法选取河北省某中学 1708 名高中生为研究对象，使用高中生认知灵活性问卷、青少年情绪弹性问卷对其进行调查，对认知灵活性进行潜在剖面分析，同时运用方差分析探讨认知灵活性潜在类别与情绪弹性的关系。结果分析发现高中生认知灵活性得分与情绪弹性得分正相关(r=0.60,P<0.01)。潜在类别分析将高中生认知灵活性分为灵活型（22.1%）、中等型（68.1%）和僵化型（9.8%）三类，其中中等型占比较多，灵活型个体占比少，有较大的提升空间，且各组在认知灵活性的不同维度上得分均具有显著性差异。经方差分析和 Logistic 回归分析结果表明，高中生认知灵活性潜在类别在性别、不同班级类型上差异有统计学意义。经方差分析发现认知灵活性灵活型组高中生在情绪弹性的积极情绪能力和情绪恢复能力维度得分显著高于其他 2 组（$F(2,1702)=266.765$, $p<0.001$,$\eta^2=0.239$；$F(2,1702)=145.011$,$p<0.001$,$\eta^2=0.146$)。经以上研究结果，教育者可通过改善高中生的认知灵活性类型提高其积极情绪和情绪恢复能力，培养心理素质优良的高中生。

Cognitive Flexibility and Emotional Elasticity of High School Students: A Potential Profile Analysis

Wang Yeying[1] Jia Ning[1]

[1]School of education，Hebei Normal University，Shijiazhuang 050000，China

Abstract：In today's social environment, students' internet addiction, weariness of learning, truancy and fighting are frequent, which should arouse social concern and thinking to promote students' mental health and social adaptation. Previous studies have found that cognitive flexibility and emotional adjustment are both ways for individuals to adapt to reality, but there is little research on the relationship between them. This study mainly explores the potential categories of cognitive flexibility of senior high school students and discusses the relationship between each category and emotional flexibility. 1708 senior high school students from a middle school in Hebei Province were selected by cluster random sampling. They were investigated by using the Cognitive Flexibility Questionnaire for Senior High School Students and the Emotional Flexibility Questionnaire for Adolescents, and the potential profile of cognitive flexibility was analyzed. At the same time, the relationship between the potential categories of cognitive flexibility and emotional resilience was discussed by using the analysis of variance. Results It was found that the scores of cognitive flexibility and emotional flexibility of senior high school students were positively correlated (r=0.60,P<0.01). The latent category analysis divides senior high school students' cognitive flexibility into three categories: flexible (22.1%), medium (68.1%) and rigid (9.8%), in which the medium type accounts for more, while the flexible individual accounts for less, which has great room for improvement, and the scores of each group in different dimensions of cognitive flexibility are significantly different. The results of variance analysis and Logistic regression analysis show that there are significant differences in gender and different class types in the potential categories of cognitive flexibility of senior high school students. The analysis of variance shows that the scores of high school students in cognitive flexibility group are significantly higher than those in other two groups (f (2,1702) = 266.765, P < 0.001, η 2 = 0.239; F(2,1702)=145.011,p<0.001,η2=0.146)。 Through the above research results, educators can improve their positive emotions and emotional recovery ability by improving their cognitive flexibility types, and cultivate high school students with excellent psychological quality.

Keywords：Cognitive flexibility, emotional resilience, latent profile analysis, senior high school students

基于执行意图的自我同情语料库的编制及初步试用：以抑郁倾向大学生为例

孙萌 付晓彤 杨洁敏 袁加锦（通讯作者）

四川师范大学脑与心理科学研究院，成都，610066，yuanjiajin168@sicnu.edu.cn

摘 要 自我同情是个体进行积极自我调节的一种方式，在调节消极情绪、改善不良认知时具有重要意义。现有研究多关注指导下的自我同情实施过程，然而，传统指导下的自我同情存在认知资源消耗大、生态效度低等特点，致使特殊群体（如抑郁症）难以自发应用。因此，为降低自我同情使用时的认知损耗并提升

其在日常情境中个体自发使用的可能性，我们通过执行意图这一结构建立起预期消极情境与自我同情之间的自动化联结，构建了基于执行意图的自我同情语料库，并以抑郁倾向的大学生为例检验其在调节抑郁情感时的效用。首先，研究一以大学生常见的消极生活事件为预期情境，自我同情的三个维度（自我关怀、共同人性、正念）为目标导向行为，对预期情境和基于执行意图的自我同情语句分别进行编制，招募 106 名大学生被试根据语句与自我同情的三个维度的相关度进行筛选，并进行语句的属性评定。 其次，研究二筛选 74 名有抑郁倾向的大学生作为研究对象并随机分为三组，即基于执行意图的自我同情组、传统自我同情组和控制组（基于执行意图的中性语句）。在实验室条件下诱发被试的抑郁情感，记录并比较三组被试在诱发前后的情绪主观评分，以检验基于执行意图的自我同情语料库中的语句对抑郁情感的调节作用。结果显示：（1）根据评定结果筛选出基于执行意图的自我同情语句和基于执行意图的中性语句各 117 个；与中性情境句相比，消极情境句效价、熟悉度更低，唤醒度更高。被试对两组执行意图语句均表现出较高的接受度，且在效价与唤醒度评分上，能够和中性组进行区分；语料库具有较高的信度与内部一致性。（2）基于执行意图的自我同情与传统自我同情均能有效诱发个体的自我同情并降低抑郁情感；控制组在情绪调节过程中耗费的认知努力最少，其次是基于执行意图的自我同情语句组，而传统自我同情语句组耗费认知努力最多；三组被试在自我同情的使用难度上并无差异。这说明通过本语料库触发基于自我同情策略的情绪调节具有较高的有效性与可靠性，同时相比传统自我同情具有低认知努力的特征。

Development of a Self-Compassion Sentence Database based on implementation intention: testing its validity in moderate depression

Meng Sun, Xiaotong Fu, Jiemin Yang, Jiajin Yuan
Institute of Brain and Psychological Science, Sichuan Normal University, Chengdu, 610066,
yuanjiajin168@sicnu.edu.cn

Abstract: Self-compassion is a positive attitude when faced with painful events, which plays an important role in the regulation of depressed mood and maladaptive cognition. Existing research has mostly focused on guided self-compassion implementation. However, traditional self-compassion (TSC) interventions are characterized by high cognitive resource consumption and low ecological validity, making it difficult for specific populations (e.g., depression) to spontaneously apply. Therefore, to reduce cognitive consumption and enhance the possibility of spontaneous application in daily situations, we established an automatic association between anticipated negative situations and self-compassion based on the implementation intention (II-SC) statements. We constructed a self-compassion sentence database based on the implementation intentions and examined its effectiveness in regulating depressed mood in college students with moderate depression. II-SC statements were constructed in Study 1. For the construction of this database negative life events of college students were included in the anticipation situation while the three dimensions of self-compassion (self-kindness, common humanity, and mindfulness) were included as the response strategy. 106 college students were recruited to participate in the study to evaluate the relevant attributes of the statements and the correlation with the three dimensions of self-compassion. In Study 2, we recruited 74 depressed college subjects in the experiment, they were randomly divided into three groups: II-SC, TSC, and control (no-regulation) groups. We induced depressed mood and compared the differences in subjective scores in regulating depressed mood among three groups to verify the effectiveness of the database. The results indicated that: (1) 117 self-compassionate statements based on implementation intention and 117 neutral statements were determined according to the relevance scores; Compared to the neutral sentences, the negative context sentences showed lower scores in valence and familiarity, but higher in arousal. Participants displayed a higher acceptance level for both sets of implementation intention statements,

and they were able to distinguish them from the neutral group in terms of valence and arousal ratings; The database demonstrated high reliability and internal consistency. (2) Both II-SC and traditional self-compassion were effective in inducing self-compassion and reducing depressed mood; The control group exhibited the least cognitive effort during depressive mood induction, followed by the II-SC group, while the traditional self-compassion group required the most cognitive effort; There was no significant difference among the three groups in terms of the difficulty of using self-compassion. This indicates that emotion regulation based on the current database has higher effectiveness and reliability, as well as being characterized by lower cognitive effort compared to traditional self-compassion.

浙江大学动态面部表情数据库的建立和验证

潘之禾，陈惠敏，刘思琦，方霞 (通讯作者：x.fang@zju.edu.cn)
浙江大学心理与行为科学系，杭州，310058

摘 要 面部表情的动态特性传递了丰富而复杂的运动模式，使面孔成为人们情绪交流的重要媒介。然而，以往研究主要集中在对静态、基本情绪种类的考察，并且聚焦于西方文化。近年来，越来越多的研究表明情绪表达具有文化特异性。本研究旨在探究在中国文化背景下，可由动/静态面部表情传递的情绪类别以及是否存在动态识别优势效应，包括两个实验。实验 1 建立了常见情绪词汇库。通过回顾整理以往东西方情绪研究中的情绪词汇，并依据专家和参与者(N = 61)的评价，筛选常见性高且相似性低的情绪词汇纳入情绪词汇库。招募另一批参与者(N = 105)对筛选后的情绪词汇进行情绪表达方式评价(包括面部表情、声音、肢体动作等)。最终，选取面部表情表情选择比例大于 85%的情绪，连同基本情绪，共 28 种情绪(包括害羞，悲伤，开心，胜利等)。实验 2 采集并验证了面部表情。在第一阶段中，招募 64 名参与者表演 28 种情绪的面部表情并进行录制。全部表演完毕后，参与者回看自己的录像并指出最能代表每种情绪的画面，依此得到每种情绪相应的动/静态面部表情。在第二阶段中，招募另一批参与者对所有动态(N = 386)和静态面部表情(N = 415)进行情绪识别和维度评价。结果显示，参与者可以从静态表情中识别 13 种情绪，但能从动态表情中识别 23 种情绪。此外，18 种情绪显示了动态识别优势，其余 10 种情绪则未显示动静态表情识别的显著差异。本动态情绪面孔数据库丰富了国内现有的情绪面孔研究材料，并为面部表情情绪识别、动态面孔识别优势提供了证据。

Establishment and Validation of the Zhejiang University Dynamic Facial Expression Database

Zhihe Pan, Huimin Chen, Siqi Liu, Xia Fang (x.fang@zju.edu.cn)
Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310058

Abstract: The dynamic characteristics of facial expressions convey rich and complex patterns of movements, making the face a vital medium for emotion communication among individuals. However, previous research has mainly focused on static, basic emotions and has primarily been centered on Western cultures. In recent years,

research has highlighted the cultural specificity of emotion expression. The present research aims to explore the emotions that can be conveyed through dynamic/static facial expressions as well as whether there exists dynamic advantage effect in emotion recognition in the Chinese culture. The study consists of two experiments. Experiment 1 established the emotion word set. By reviewing emotion words involved in Eastern and Western emotion researches, and based on evaluations from experts and participants (N = 61), emotion words with high commonality and low similarity were selected and included in the emotion word set. Another group of participants (N = 105) self-reported their expression modes for selected emotion words (including facial expressions, vocalizations, and body movements, etc.). Twenty-eight emotions (including shyness, sadness, happiness, triumph, etc.) with facial expression selection rate of over 85% along with basic emotions were ultimately chosen. In Experiment 2, facial expressions were collected and validated. In phase 1, 64 participants posed and recorded facial expressions of 28 emotions. After posing all the expressions, they reviewed their recordings and indicated the images that best represented each emotion, resulting in the corresponding dynamic and static facial expressions. In phase 2, another group of participants performed emotion recognition and dimensional evaluation on all dynamic facial expressions (N = 386) and static facial expressions (N = 415). The results showed that participants could recognize 13 emotions from static expressions, but 23 emotions from dynamic ones. Additionally, 18 emotions exhibited dynamic advantage, while the remaining 10 emotions did not show significant differences in recognition between dynamic and static expressions. The current dynamic facial expression database enriches the existing materials for facial expression research in Chinese culture as well as provides evidence for the facial expression recognition and its dynamic advantage.

摘 要 孤独感是当个体的人际关系需求无法得到满足时，主观上产生的一种负性情绪体验，长期的处于孤独状态会影响个体的身心健康，进而可能引发一些情绪障碍和出现问题行为。积极心理干预是通过干预增加个体的积极情绪、积极认知和积极行为，从而促使个体达到一种丰盈的状态，而摄影干预作为积极心理干预的方法之一，通过注意转移聚焦积极事物，培养积极情绪体验，进而增强社会联系和对社会支持的感知，对缓解孤独感这一典型的负面情绪发挥着独特的作用。本研究旨在从积极心理学的角度出发，关注降低孤独感的积极因素，探索摄影干预对降低个体孤独感的作用，为缓解大学生孤独感提供一条新路径和新形式。本研究选取大学生被试，采用随机对照实验设计，将被试随机分为干预组与对照组，其中干预组连续进行 7 天的摄影干预，对照组不做任何实验处理，并在干预前、干预后、以及干预后一个月分别进行一次 UCLA 孤独量表(第三版)的问卷施测，以探讨摄影干预效果以及干预在时间上的稳定性。结果发现，与对照组相比，摄影干预显著增加了干预组被试的积极情绪，并显著降低了干预组的孤独感水平，且摄影干预后一个月干预组、对照组的孤独感水平依然存在显著差异。本研究初步探讨了摄影干预在缓解大学生的孤独感中的作用，表明摄影干预可以作为一种降低大学生孤独感的干预措施进行应用。

Effect of a Photography-Based Intervention on Loneliness:

A Randomized Controlled Trial

Shi Lu, Jiao Jiao, A Meina, Zhao Sinan, Gao Youheng, Mu Dan
School of Psychology，Inner Mongolia Normal University，Hohhot

Abstract: Loneliness is a subjective negative emotional experience when an individual's interpersonal needs can not be met. Long-term loneliness will affect an individual's physical and mental health, which may lead to some emotional disorders and problematic behaviors. Positive psychological intervention is to increase the individual's positive emotions, positive cognition and positive behavior through intervention, so as to promote the individual to achieve a state of abundance. As one of the methods of positive psychological intervention, photography-based intervention can focus on positive things by shifting attention, cultivate positive emotional experience, and further enhance social connection and perception of social support. It plays a unique role in relieving loneliness, a typical negative emotion. This study aims to focus on the positive factors that reduce loneliness from the perspective of positive psychology, explore the effect of photography-based intervention on reducing individual loneliness, and provide a new path and form for alleviating loneliness among college students. In this study, college students were selected and randomly divided into the intervention group and the control group by a randomized controlled experimental design. The intervention group was subjected to photographic intervention for 7 consecutive days, while the control group was not subjected to any experimental treatment. The UCLA Loneliness Scale (3rd edition) questionnaire was tested before, after and one month after the intervention respectively. To explore the effect of photography-based intervention and the stability of intervention in time. The results showed that, compared with the control group, the photographic intervention significantly increased the positive emotions of the subjects in the intervention group, and significantly reduced the level of loneliness in the intervention group, and there was still a significant difference in the level of loneliness between the intervention group and the control group one month after the photographic intervention. This study preliminarily discusses the role of photography-based intervention in alleviating loneliness of college students, indicating that photography intervention can be applied as an intervention measure to reduce loneliness of college students.

Keywords: loneliness, college student, photography-based intervention

认知损耗对情绪调节的影响及特质自控的调节作用：行为与事件相关电位证据

黄瑞文[1]　乐嵋[1]　袁加锦[1]　颜心雨[1]　杨洁敏[1]

1 四川师范大学脑与心理科学研究院，成都，610066，yangjiemin85@126.com

摘 要　情绪调节需要消耗大量认知资源来克服对情感刺激的非适应性反应，而忙碌的工作和生活可能会极大地消耗个体的认知资源从而导致情绪失调。然而，目前认知损耗影响情绪调节背后的认知机制尚不清楚，因此本研究采用经典字词/颜色 Stroop 任务和情绪调节策略选择任务考察了认知损耗对情绪调节选择阶段的影响，并探究了特质自我控制能否有效抑制认知损耗对情绪调节产生的影响。实验 *1* 采用 Stroop 任务操纵损耗程度以探究个体在不同损耗状态下，面对不同强度的负性情绪图片刺激时对“分心”、“重评”调节策略的选择偏好，以不进行情绪调节的“观察”选择作为基线条件；同时，采用特质自我控制量表（Trait

self-control Scale）将被试分为高、低特质自控组，考察特质自控在其中的调节作用。实验 *2* 采用 *ERP* 技术，观测在高损耗状态下高、低特质自我控制个体情绪调节的神经生理特征。结果发现：（1）在低损耗状态下，个体选择分心和重评策略的比例显著高于观察；而在高损耗状态下，三种策略选择比例均无显著差异（损耗导致策略使用减少）。另一方面，与低损耗状态相比，高损耗状态下个体对分心和观察策略的选择比例显著上升而重评策略的选择显著减少。（2）个体在高强度刺激下更多选择分心而更少选择重评，且分心和重评的选择比例都显著高于观察；在低强度刺激下，个体对分心、重评和观察的选择均无显著差异（更愿意调节高强度情绪）。（3）高自控个体的晚期正成分波幅(late positive potential, LPP)在策略选择前显著低于低自控个体；高自控个体的 P3 波幅在策略执行阶段显著大于低自控个体（损耗状态下高自控个体的情绪调节能力更强）。研究结果基本重复了前人关于情绪刺激强度影响情绪调节策略选择的发现，更进一步揭示了随着损耗的增加，个体更倾向于选择低卷入度的情绪调节策略，且特质自我控制在这一影响过程中起调节作用。

The Moderator Role of Trait Self-Control in the Effects of Depletion on the Process of Emotion regulation：Evidence from Behavioral and Event-Related Potential

Ruiwen Huang, Mei Le, Jiajin Yuan, Xinyu Yan, and Jiemin Yang
Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu

Abstract：Emotion regulation requires amounts of cognitive resources to to overcome non adaptive responses to emotional stimuli, and excessive depletion of an individual's cognitive resources may lead to emotional dissonances. However, the cognitive mechanisms of the impact of depletion on emotion regulation is currently unknown. Therefore, this study used the classic word/color Stroop task and emotion regulation strategy selection task to explore the effects of cognitive depletion on emotion regulation and the role of trait self-control in the effects of depletion on the process of emotion regulation. In Experiment 1, we manipulated the level of depletion using to Stroop task to investigate individuals' preference for “distraction”, “reappraisal” strategies when facing negative emotional stimuli of different intensities under different depletion states, with “observation” (no emotion regulation) as the baseline condition. Additionally, the participants were divided into high and low trait self-control groups using the Trait Self Control Scale to investigate the moderating effect of trait self-control. In Experiment 2, we used ERP technology to observe the neurophysiological characteristics of emotion regulation in individuals with high and low trait self-control under high depletion conditions. The results indicated the following: (1) Under conditions of low depletion, individuals exhibited a significantly higher preference for the distract and reappraise strategies compared to observe. However, under conditions of high depletion, there were no significant differences in the proportions of the three strategy choice(depletion led to a reduction in strategy use). Moreover, compared to low depletion, high depletion resulted in a significant decrease in the proportion of reappeaisal choices. (2) In the case of high-intensity stimuli, individuals were more likely to choose the distract strategy and less likely to choose reappraise, with both distract and reappraise strategies being significantly higher than observe. Under low-intensity stimuli, there were no significant differences in the proportions of distraction, reappraisal, and observation choices (individuals were more willing to regulate high-intensity emotions). (3) The late positive potential (LPP) amplitudes of high self-control individuals were significantly lower than those of low self-control individuals prior

to strategy selection, and the P3 amplitudes of high self-control individuals during the strategy implementation stage were significantly higher than those of low self-control individuals (high self-control individuals showed stronger emotion regulation abilities under conditions of depletion). The results of this study essentially replicate previous findings regarding the influence of emotion stimulus intensity on emotion regulation strategy selection. Furthermore, it provide further insight into the tendency of individuals to choose low-engagement emotion regulation strategies as depletion increases, and the moderator role of trait self-control in this process.

经颅交流电刺激基于前额叶网络的情绪调节作用

彭芝琳 [1] 张丹丹 [1]

[1] 四川师范大学脑与心理科学研究院，成都，610066，zhangdd05@gmail.com

摘 要　本文介绍了经颅交流电刺激在前额叶网络上的情绪调节作用的研究进展。经颅交流电刺激是一种非侵入性的神经调节技术，可以通过向头皮上的特定脑区传送正弦交流电，影响神经元的振荡活动和同步性，从而改善认知功能。近年来，经颅交流电刺激因其简单、便捷、廉价、可重复、可个体化等特点，受到了越来越多的关注和应用。尤其是在情绪障碍方面，经颅交流电刺激有可能成为一种有效和安全的治疗手段。经颅交流电刺激可以夹带和调节内源性的脑节律，如θ、α、β和γ波，这些节律与情绪调节相关的前额叶网络有密切的联系。前额叶网络包括内侧前额叶皮质（mPFC）、前扣带皮质（ACC）、外侧前额叶皮质（lPFC）等区域，它们在情绪加工、情绪认知控制、情绪记忆和情绪调节等过程中发挥重要作用。许多精神神经疾病，如抑郁症、焦虑症、精神分裂症等，都表现出前额叶网络的功能异常和脑节律的同步障碍。因此，经颅交流电刺激有可能通过改善前额叶网络的节律同步性，来缓解这些疾病的情绪障碍。目前，关于经颅交流电刺激在前额叶网络上的情绪调节作用的研究还比较少，但已有一些初步的证据支持其有效性和安全性。未来需要更多高质量、大样本、多中心、随机对照、双盲等设计的研究来验证和优化经颅交流电刺激在前额叶网络上的情绪调节作用，并为其在精神神经疾病中的临床应用提供更有力的证据和指导。

Effect of transcranial alternating current stimulation on emotion regulation based on prefrontal network

Peng Zhilin [1] Zhang Dandan[1]

Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, 610066, China

Abstract: This article introduces the research progress of transcranial alternating current stimulation on emotion regulation in the prefrontal network. Transcranial alternating current stimulation (TDCS) is a non-invasive neuromodulation technique that can improve cognitive function by delivering sinusoidal alternating current to specific brain regions on the scalp, affecting the oscillatory activity and synchrony of neurons. In recent years, transcranial alternating current stimulation has received more and more attention and applications because of its simple, convenient, inexpensive, repeatable, and individualized characteristics. Transcranial alternating current stimulation has the potential to be an effective and safe treatment for mood disorders in particular. Transcranial

alternating current stimulation can entrain and modulate endogenous brain rhythms, such as theta, α, β, and γ waves, which are closely linked to prefrontal networks related to emotion regulation. The prefrontal network includes the medial prefrontal cortex (mPFC), anterior cingulate cortex (ACC), lateral prefrontal cortex (lPFC) and other regions, which play an important role in emotional processing, emotional cognitive control, emotional memory, and emotional regulation. Many neuropsychiatric disorders, such as depression, anxiety, schizophrenia, etc., show dysfunction of prefrontal networks and desynchrony of brain rhythms. Thus, transcranial alternating current stimulation has the potential to alleviate mood disorders in these disorders by improving the rhythmic synchrony of prefrontal networks. At present, there are few studies on the effect of transcranial alternating current stimulation on emotion regulation in the prefrontal network, but there are some preliminary evidence to support its efficacy and safety. In the future, more high-quality, large-sample, multi-center, randomized controlled, double-blind and other designed studies are needed to verify and optimize the emotional regulation effect of transcranial alternating current stimulation on prefrontal network, and to provide stronger evidence and guidance for its clinical application in psychiatric diseases.

基于 theta 的脑电神经反馈训练改善个体情绪调节能力

黄宇 [1] 张丹丹 [1]

[1]四川师范大学脑与心理科学研究院，成都，610066, zhangdd05@gmail.com

摘 要　情绪调节在适应性行为中起着至关重要的作用。已有大量研究表明，神经反馈训练能够有效改善个体的情绪调节能力。在情绪调节领域，脑电神经反馈（EEG-NF）通常通过两种方式来实现： (1) 增加双侧额叶的 alpha 不对称 (ALAY)和 (2) 下调高 beta。这两种方案在以往大部分研究中都已得到证明可以有效改善精神障碍患者的情绪调节能力。然而却有部分研究发现，尽管个体可以通过神经反馈训练来增加或减少 alpha 不对称，但是这种改变对于情绪改善没有任何帮助。以往研究表明，theta 振荡与情绪有关。然而目前还没有研究考察过基于 theta 振荡的神经反馈训练对于情绪调节的影响。基于此，在本研究中，我们采用基于 theta 震荡的脑电神经反馈训练来改善健康大学生的情绪调节能力。基于前人的研究，我们提出研究假设：相比于假反馈组，真反馈组在神经反馈训练之后，被试的情绪调节能力得到改善。本研究所选择的情绪调节策略为认知重评。实验以“反馈类型”（真反馈组、假反馈组）为被试间变量，“时间”（前测、后测）为被试内因素。结果发现，与假反馈组相比，真反馈组的情绪调节能力得到了改善。但是两组的负性情绪差异并不显著。本研究是首次考察基于 theta 振荡的神经反馈训练对于情绪调节的影响。研究结果表明，基于 theta 振荡的神经反馈训练可以改善个体的情绪调节能力，但是仍然需要更多的进一步研究。

EEG neural feedback training based on theta improves individual's emotional regulation ability

Huang Yu[1] Zhang [1]

Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, 610066, China

Abstract： Emotional regulation plays a vital role in adaptive behavior. A large number of studies have shown that neural feedback training can effectively improve the individual's emotional regulation ability. In the field of emotion regulation, EEG-NF is usually realized in two ways: (1) increasing the alpha asymmetry of bilateral frontal lobes (ALAY) and (2) down-regulating the beta. These two schemes have been proved to be effective in improving the emotional adjustment ability of patients with mental disorders in most previous studies. However, some studies have found that although individuals can increase or decrease alpha asymmetry through neural feedback training, this change is not helpful for emotional improvement. Previous studies have shown that theta oscillation is related to emotions. However, the influence of neural feedback training based on theta oscillation on emotional regulation has not been studied yet. Based on this, in this study, we use EEG neural feedback training based on theta oscillation to improve the emotional regulation ability of healthy college students. Based on previous studies, we put forward a research hypothesis: compared with the false feedback group, the true feedback group improved the emotional adjustment ability of the subjects after neural feedback training. The emotional adjustment strategy chosen in this study is cognitive reappraisal. In the experiment, "feedback type" (true feedback group and false feedback group) is the inter-subject variable, and "time" (pre-test and post-test) is the intra-subject factor. The results showed that compared with the false feedback group, the emotional adjustment ability of the true feedback group was improved. However, there is no significant difference in negative emotions between the two groups. This study is the first time to investigate the influence of neural feedback training based on theta oscillation on emotional regulation. The results show that neural feedback training based on theta oscillation can improve the individual's emotional regulation ability, but more further research is still needed.

自动化情绪调节策略对抑郁倾向大学生负性注意偏向的影响

董佳宜[1] 梁碧珊[1]（通讯作者）

1 广东技术师范大学，广州，510665

通讯作者 E-mail(bishanliang1030@163.com）

摘 要 近年来，随着社会竞争不断加大，抑郁倾向成为当今大学生最普遍的心理健康问题之一，同时也一直是社会关注的热点。研究表明情绪调节策略可以有效调节抑郁倾向个体的负性注意偏向，其中有意识情绪调节策略需要消耗大量认知资源，而认知资源是影响注意偏向的重要因素之一。自动化（无意识）情绪调节能够在消耗极少甚至不消耗认知资源的情况下保持调节的高效性，能够克服有意识情绪调节消耗大量认知资源的缺陷，从而提升个体的负性注意偏向及负性情绪的调节效果。值得注意的是，在有意识层面上具体的情绪调节策略：认知重评和表达抑制，这两者对负性注意偏向存在不同程度的影响，然而在无意识层面上这两者是否存在差异需要进一步探讨。同时，也有研究发现个体的元情绪与抑郁情绪之间存在联系。因此，本研究以抑郁倾向大学生作为被试，选用了点探测范式以及句子整理任务范式作为实验材料，探索自动化情绪调节策略对抑郁倾向个体负性注意偏向有何作用，以及个体的元情绪水平是否能够影响该策略调节负性注意偏向的有效性。

结果显示：（1）抑郁倾向大学生存在负性注意偏向。（2）自动化情绪调节策略（句子整理任务）能够有效减少抑郁倾向大学生的负性注意偏向。（3）元情绪得分和抑郁得分呈显著负相关，且抑郁倾向个体的元情绪水平会影响自动化情绪调节策略对负性注意偏向的调节效果，表现为：低元情绪水平个体运用认知重评策略比运用表达抑制策略的调节效果更好；在运用表达抑制策略的抑郁倾向个体中，高元情绪水平个体比低元情绪水平的调节效果更好。

The effect of automatic emotion regulation strategies on negative attention bias in depressed college students

Jiayi Dong[1]　Bishan Liang[1]
Guangdong Polytechnic Normal University, Guangzhou, 510665
Email: bishanliang1030@163.com

Abstract：In recent years, with the increasing social competition, depression tendency has become one of the most common mental health problems of college students, and has been the focus of social attention. Studies have shown that college students are one of the groups susceptible to depression, and the detection rate of depression among college students is generally higher than that of their peers, and negative attention bias is one of the important factors for the generation, persistence and development of depression. By referring to domestic and foreign literatures on meta-emotion, automatic emotion regulation strategies, depression-prone individuals and negative attention bias, we can see that there are many studies on the relationship between depression-prone individuals and negative attention bias and the conclusions are clear. However, few studies have included automatic emotion regulation strategies. In addition, there are few researches on the relationship between meta-emotion and negative attention bias, so there is a certain space for research. This study theoretically summarizes previous studies, takes depression-prone college students as subjects, selects the point detection paradigm and the sentence organizing task paradigm as experimental materials, and explores the effect of automatic emotion regulation strategy on the negative attention bias of depression-prone individuals, and whether the meta-emotional level of individuals can affect the effectiveness of this strategy in regulating negative attention bias.

The results showed that: (1) depressed college students had negative attention bias. (2) Automatic emotion regulation strategy (sentence sorting task) can effectively reduce the negative attention bias of depression-prone college students. (3) Meta-emotion score and depression score were significantly negatively correlated, and meta-emotion level of depression-prone individuals would affect the effect of automatic emotion regulation strategy on negative attention bias. The results showed that cognitive reappraisal strategy was better than expression inhibition strategy in individuals with low meta-emotion level. In the depressed individuals who used expression inhibition strategies, the adjustment effect of high mood level was better than that of low mood level.

Keywords：Automated emotion regulation strategies; Depression tendency; Attention bias; meta-emotion

社会排斥与大学生心理危机脆弱性的关系：自我不确定、主观社会阶层的链式中介作用

黎俊良[1]（通讯作者） 李纯瑜[2] 孙路遥[3] 耿晓伟[4]
1 滇西科技师范学院，临沧，677000, li_junliang@foxmail.com
2 曲靖师范学院，曲靖，655011
3 昆明医科大学，昆明，650500
4 杭州师范大学经亨颐教育学院，杭州，311121

摘 要 采用大学生社会排斥问卷、心理危机脆弱性量表、自我不确定性量表、主观社会地位量表对 758 名在校大学生进行调查，探讨了大学生社会排斥与心理危机脆弱性的关系，以及自我不确定和主观社会阶层在大学生社会排斥与心理危机脆弱性间的链式中介作用。结果显示：(1)社会排斥、自我不确定和心理危机脆弱性之间均呈现显著正相关，主观社会阶层和社会排斥、自我不确定、心理危机脆弱性之间均呈现显著负相关；(2)自我不确定、主观社会阶层在社会排斥与心理危机脆弱性的关系间均起着部分中介作用；(3)自我不确定与主观社会阶层在社会排斥与心理危机脆弱性的关系间起着链式中介作用。因此，社会排斥、自我不确定、主观社会阶层是大学生心理危机脆弱性的重要影响因素，社会排斥除了能直接影响大学生的心理危机脆弱性外，还可以通过自我不确定、主观社会阶层的链式中介作用间接影响其心理危机脆弱性水平。

关键词 社会排斥 心理危机脆弱性 自我不确定 主观社会阶层 链式中介

Relationships between Ostracism and psychological vulnerability: The Chain Mediating Roles of self-uncertainty and social class

Li Junliang[1] Li Chunyu[2] Sun Luyao[3] Geng Xiaowei[4]
1 West Yunnan University, Lincang 677000, China.
2 Qujing Normal University, Qujing 655011, China.
3 Kunming Medical University, Kunming 650500, China.
4 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou 31121 China.

Abstract：The survey was conducted on 758 college students by using the College Student Social Exclusion Questionnaire, Psychological Vulnerability Scale, Self-Uncertainty Scale, and Social class Scale to explore the relationship between Ostracism and Psychological vulnerability of college students, as well as the chain mediating role of Self-uncertainty and social class. The results show that: (1) there is a significant positive correlation between ostracism, self-uncertainty, and psychological vulnerability, while there is a significant negative correlation between social class and ostracism, self-uncertainty, and psychological vulnerability; (2) Self-uncertainty and

social class both play a partial mediating role in the relationship between ostracism and psychological vulnerability; (3) self-uncertainty and social class play a chain mediating role in the relationship between social exclusion and psychological vulnerability. Therefore, ostracism, self-uncertainty, and social class are important factors influencing the psychological vulnerability of college students. In addition to directly affecting students' psychological vulnerability, ostracism can also indirectly affect the level of psychological vulnerability through the chain mediating effect of self-uncertainty and social class.

感知父母评价准确性与中小学生完美主义、幸福感及学业行为的关系：基于多项式回归与响应面分析的探索

邢慧琳[1]　姚梅林[1] 吴心玥[1] 胡悠悠[1] 刘红瑞[1]（通讯作者）

1 北京师范大学，北京，100101，hrliu@bnu.edu.cn

摘　要　童年后期至青春期，个体已经具备从他人的角度评估自己以及内化他人对其看法的认知能力，来自重要他人的反馈和评价塑造着他们的心理和行为发展。父母表扬和批评是家庭系统中最为常见的两种反馈形式，对儿童适应性发展有着持续影响。然而，以往研究仅聚焦于表扬和批评中的其一，缺乏对二者影响的整合探讨；多关注表扬或批评的频率、内容等，忽略了准确性在其中的关键作用。本研究基于自我价值理论和符号互动论的视角，探究感知父母表扬和批评准确性与我国中小学生心理（积极和消极情感、社会规范型和自我导向型完美主义）和学业发展（学习投入、学业自我设障）的关系。采用多项式回归和响应面分析技术，对 2169 名初中生和 1230 名小学生两个样本进行分析，得出主要结果如下：（1）我国中小学生认为，父母存在夸大批评、夸大表扬的倾向；（2）与批评不足或夸大相比，父母的准确批评与子女最佳的适应性结果相关联，夸大批评虽会在一定程度上促使子女增加学业投入、形成自我增强型完美主义，但也与子女更高水平的消极情感体验、非适应性社会规范型完美主义和学业自我设障相关联；（3）准确表扬对于促进适应性的自我导向型完美主义重要；夸大表扬与中小学生的高学习投入相关；而对于减少学业自我设障，夸大表扬对儿童更有效，而表扬不足则对青少年更有效；（4）感知父母表扬与批评准确性是否一致与各结果变量水平的差异无关。研究提示了反馈准确性（尤其是批评准确性）的重要价值，试图揭示父母如何给予评价反馈以促进孩子心理健康和学业发展的最佳条件。

关键词　表扬准确性，批评准确性，多项式回归与响应面分析

Understanding the Optimal Parental Feedback: the Effects of Perceived Parental Praise and Criticism Accuracy on Youths' Adjustment Outcomes

Huilin Xing[1], Meilin Yao[1], Xinyue Wu[1], Youyou Hu[1], Hongrui Liu[1]
Beijing Normal University, No.19, Xinjiekouwai St, Haidian District, Beijing, 100875, P.R.China

Abstract：During late childhood and adolescence, individuals have gained the ability of evaluating themselves from the responses of important others and internalizing these perceptions to shape their psychological development and behaviors. Parental praise and criticism are two of the most common feedback in the family system, which may have a lasting impact on children's adaptive development. However, previous studies only focus on one side of praise or criticism, and lack of exploration on the integrated influence of both. Most of them emphasized the frequency and content of praise or criticism while ignored the critical role of accuracy in giving feedback. Based on the Self-worth Theory and Symbolic Interactionism, the current research investigated the relationship between perceived accuracy of parents' praise and criticism and the psychology and academic adjustment among Chinese primary and secondary school students. Applying polynomial regression and response surface analysis techniques, data from 1230 primary school students and 2169 middle school students were analyzed. The main results are as follows: (1) students perceived that their parents tended to praise and criticize them exaggeratedly; (2) Compared with insufficient or exaggerated criticism, accurate criticism from parents was associated with children's most adaptive outcomes. Although exaggerated criticism may promote children's academic involvement and self-enhancing perfectionism to a some degree, it is also associated with children's higher levels of negative affects, non-adaptive social norm perfectionism and academic self-handicapping; (3) Accurate praise is important for promoting adaptive self-oriented perfectionism, while exaggerated praise is related to higher level of learning involvement. However, as for reducing academic self-handicapping, exaggerated praise is more effective for children, whereas insufficient praise is more effective for adolescents. (4) The consistency of perceived parental praise and criticism accuracy were not found to be associated with the levels of outcomes. Our study shed lights on the important value of parental feedback accuracy, especially the accuracy of giving criticism. At the first attempt, we uncovered the optimal conditions for parents to give evaluative feedback to promote their children's mental health and academic adjustment.

Keywords：Praise accuracy, criticism accuracy, polynomial regression, response surface analysis

情绪调节的神经反馈

黄宇[1] 李华[1] 李宜伟[2] 张丹丹*
（四川师范大学脑与心理科学研究院，成都，610066，zhangdd05@gmail.com ）

摘 要 情绪调节的神经反馈是一种测量与情绪调节相关脑区的活动并将其呈现给被试，以帮助改善情绪调节能力的方法。良好的情绪调节能力对于维持身心健康、减少情绪失调导致的神经生理疾病具有重要作用。本文回顾总结了在健康人群和精神障碍人群中，当前情绪调节的神经反馈领域的发现，同时也指出了该领域尚未解决的一些问题。首先，未来的研究应探索不同人群情绪调节神经反馈的脑机制，以深入了解情绪

调节的神经基础。其次，训练策略及训练时长对训练效果的影响需要进行更丰富的考察，以制定有效的神经反馈训练方案。同时，在精神障碍人群中，对内隐情绪调节机制的研究也是一个重要方向，了解其特异性将有助于开发更为精准的干预手段，以改善精神障碍患者的情绪调节能力。此外，多模态及解码神经反馈等新技术手段的引入，也有望为情绪调节训练提供更为全面准确的信息。这些创新技术的运用，将有助于加快情绪调节神经反馈研究的进展，并为相关精神障碍的治疗提供新的可能性。情绪调节的神经反馈作为一种前沿研究领域，在健康人群和精神障碍人群中都展示出巨大潜力。但是仍有许多问题需要进一步探索和解决。未来研究应致力于揭示不同人群情绪调节神经反馈的脑机制、深入考察训练策略及时长对训练效果的影响、探索内隐情绪调节在精神障碍人群中的特异性，并充分利用多模态及解码神经反馈等技术手段来辅助情绪调节。

Neurofeedback for emotion regulation

Yu Huang[1] , Hua Li[1] , Yiwei Li[2] , Dandan Zhang[*]

Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu , China

Abstract：Neurofeedback for emotion regulation is a method of measuring activity in brain regions associated with emotion regulation and presenting it to participants to help improve emotion regulation. Good emotional regulation plays an important role in maintaining physical and mental health and reducing neurophysiological diseases caused by emotional disorders. This article reviews and summarizes the findings in the current field of neurofeedback in emotion regulation in healthy and mentally disordered people, and also points out some unresolved problems in this field. First, future research should explore the brain mechanisms of emotion regulation neural feedback in different populations to gain insight into the neural basis of emotion regulation. Secondly, the influence of training strategy and training duration on training effect needs to be more abundantly investigated to formulate effective neurofeedback training schemes. At the same time, in people with mental disorders, the study of the mechanism of implicit emotion regulation is also an important direction, and understanding its specificity will help to develop more precise interventions to improve the emotional regulation ability of patients with mental disorders. In addition, the introduction of new technologies such as multimodal and decoded neurofeedback is also expected to provide more comprehensive and accurate information for emotion regulation training. The use of these innovative technologies will help accelerate the progress of emotion regulation neurofeedback research and provide new possibilities for the treatment of related mental disorders. As a frontier research field, neurofeedback for emotion regulation has shown great potential in both healthy and mentally disordered people. However, there are still many issues that need to be further explored and resolved. Future research should focus on revealing the brain mechanism of neurofeedback of emotion regulation in different populations, deeply investigating the influence of training strategy and length on training effect, exploring the specificity of implicit emotion regulation in people with mental disorders, and making full use of multimodal and decoded neurofeedback and other technical means to assist emotion regulation.

后悔情绪对幸福感的影响：情绪调节自我效能感的中介作用

王子坤　叶娜(通讯作者)

武汉体育学院心理学系，武汉, 430079, 通讯作者 E-mail:345570920@qq.com

摘 要 后悔是生活中一种常见的消极情绪。已有研究表明后悔情绪与幸福感有着密切的关系。一方面，频繁体验到后悔的人往往具有更低的生活满意度。另一方面，情绪(如后悔)被认为是自我调节的工具，可以通过反思来改善，从而提高幸福感。情绪调节自我效能感是指个体对自身调节能力的认识与评价而持有的自信程度。富于情绪调节自我效能者，善于调整对消极事件的感知进而调节消极情绪；而情绪调节自我效能感较低者，情绪的反思功能可能导致消极体验频繁产生，降低幸福感水平。本研究旨在探讨后悔情绪与幸福感的关系以及其内在的作用机制。实验一采用网络问卷方法测量后悔频率和幸福感水平，结果发现，高后悔频率个体的幸福感水平显著低于低后悔频率个体。实验二使用故事情境法，选取贴近现实生活的场景材料诱发后悔情绪和中性情绪并测量幸福感水平，结果发现，与中性情绪组相比，后悔情绪组的个体其幸福感水平更低。实验三采用后悔情境量表测量后悔情绪，主观幸福感量表(GWB)测量幸福感水平，情绪调节自我效能感量表(RES)测量情绪调节自我效能感，结果发现，后悔情绪与幸福感水平之间呈负相关，情绪调节自我效能感在其中起到中介作用。本研究的结果表明后悔情绪是影响个体幸福感水平的一个重要因素，而情绪调节自我效能感在两者之间关系中有着重要的作用。本研究的发现为进一步研究影响幸福感的因素以及内在机制提供了新的方向。

The Effect of Regret on Well-being: The Mediating Role of Regulatory Emotional Self-efficacy

Wang Zikun;Ye na
Psychology department of Wuhan Sport University

Abstract：Regret is a common negative emotion in life.Previous studies have shown that regret is closely related to happiness. On the one hand, people who frequently experience regret tend to have lower life satisfaction.On the other hand, emotions (such as regret) are considered self-regulating tools that can be improved through reflection and thus increase happiness.Self-efficacy of emotion regulation refers to the degree of confidence in the cognition and evaluation of self-regulation ability. Those with rich emotional regulation self-efficacy are good at adjusting the perception of negative events and then regulating negative emotions; while those with low emotional regulation self-efficacy, emotional reflective function may lead to frequent negative experiences and lower happiness level.This study aimed to explore the relationship between regret emotion and well-being and the internal mechanism of action.Experiment 1 measured the frequency of regret and well-being level, and found that individuals with high regret frequency were significantly lower than those with low regret frequency.Experiment 2 used the story situation method to select scene materials close to real life to induce regret and neutral emotions and measure the happiness level of happiness. The results found that individuals in the regret group had a lower level of happiness compared with the neutral mood group.Experiment 3 using regret situation scale to measure regret, subjective well-being scale (GWB) measure happiness level, emotional regulation self-efficacy scale (RES) to measure emotional regulation self-efficacy, the results found that the negative correlation between regret and happiness level, emotional regulation self-efficacy plays a mediating role.The results of this study indicate that regret emotion is an important factor affecting the level of individual well-being, and that emotion regulation self-efficacy has an important role in the relationship between the two. The findings of this study provide new directions for further investigation of the factors as well as the intrinsic mechanisms influencing well-being.

摘 要 **背景：**渴求是药物成瘾的一个核心特征，对于预测药物使用和复吸行为具有重要意义，了解渴求产生的神经机制对降低复吸率非常关键。药物线索可以强烈诱发渴求，伴随着身体和心理的不适感，和对药物线索的过度关注。渴求的产生与大脑网络调节异常密切相关。脑电图（EEG）微状态可以反映大脑神经元网络的快速变化，目前已经识别出四种与语音处理、视觉处理、默认网络和背侧注意相关的微状态，这些状态的持续时间、发生频次、覆盖比例和转移概率等特征，可以反映特定的情绪与动机状态。本研究旨在探讨甲基苯丙胺成瘾者在渴求情绪和一般情绪时的微状态表征，识别渴求产生的脑区机制，为渴求的评估建立客观指标。

方法：本研究招募了 124 名甲基苯丙胺成瘾者和健康人参与实验，其中成瘾组 92 人（52 名女性），健康对照组 32 人（16 名女性）。通过虚拟现实技术模拟真实的吸毒环境诱发渴求，记录在静息、一般情绪和渴求情绪时的 EEG 数据，并在线索条件下要求被试报告渴求分数。比较两组人群在三种状态下的微状态特征差异以及和主观渴求的关系。

结果：静息状态下，两组的微状态没有显著差异。一般情绪时，成瘾组相比对照组微状态 D 的覆盖比例和持续时长显著升高，微状态 A、B 和 C 向 D 的转换概率增加。和静息时相比，成瘾组在渴求情绪时微状态 D 的覆盖比例显著升高，微状态 A、B 和 C 向 D 的转移概率升高，微状态 C 的覆盖比例显著降低，其他三种状态向 C 的转移概率降低。主观渴求评分与微状态 D 的覆盖比例和持续时间显著正相关。和一般情绪相比，成瘾组在渴求情绪时微状态 C 的三个特征显著降低，微状态 D 的覆盖比例和持续时长显著升高。

结论：渴求时，表征着注意网络的微状态 D 的时间参数升高，其他三个状态向 D 的转移概率升高，同时微状态 C 的变化方向和 D 相反，表明渴求时成瘾者更加专注，注意网络激活增加，内部信息处理降低，那些对药物线索专注且注意增加的成瘾者，体验到的渴求强度更高。这可能是渴求产生的脑网络活动模式，未来研究可通过降低渴求观察微状态特征变化以确定其特征的敏感性。

***Abstract*:**

Background: Craving is a core feature of drug addiction and holds significant importance in predicting drug use and relapse behavior. Understanding the neural mechanisms underlying craving is crucial for reducing relapse rates. Drug-related cues can strongly induce craving, accompanied by physical and psychological discomfort, and excessive attention to drug-related cues. The generation of craving is closely related to the dysregulation of brain networks. Electroencephalogram (EEG) microstates can reflect rapid changes in large-scale neural networks in the brain. Currently, four microstates related to speech processing, visual processing, default mode network, and dorsal attention have been identified. The features of these microstates, such as mean duration (Duration), time coverage (Coverage), frequency of occurrence (Occurrence), and transition probability (TP)., can reflect specific emotional and motivational states. This study aims to explore the microstate characteristics of methamphetamine addicts during craving and general emotional states, aiming to identify the neural mechanisms underlying craving and establish objective indicators for craving assessment..

Methods: This study recruited 124 participants, including methamphetamine addicts and healthy controls. The addiction group consisted of 92 individuals (52 females), while the healthy control group included 32 individuals (16 females). Using virtual reality technology, the experiment simulated real drug-related environments to induce craving. EEG data were recorded during rest, general emotional state, and craving emotional state. Participants were asked to report their craving scores under the cue conditions. Compare the differences in microstate characteristics between the two groups in three states and their relationship with subjective craving.

Results: During the rest state, there were no significant differences in the time parameters of the four microstates between the two groups. However, in the general emotional state, the addiction group showed significantly higher coverage and duration for microstate D compared to the control group. Additionally, the transition probabilities from microstates A, B, and C to microstate D were increased in the addiction group. In the craving emotional state, compared to the rest state, microstate D exhibited a striking increase in coverage ratio, and the transition probabilities from microstates A, B, and C to microstate D were also elevated. On the other hand, the coverage ratio of microstate C significantly decreased, and the transition probabilities from the other three microstates to microstate C were reduced. Furthermore, the subjective craving ratings were significantly positively correlated with the coverage and duration of microstate D. When comparing craving emotional state with general emotional state, microstate C showed a significant decrease in all three features, while microstate D demonstrated a significant increase in coverage ratio and duration.

Conclusion: During craving, the time parameters of microstate D, which represents the attention network,

increased, and the transition probabilities from the other three microstates to microstate D also increased. Meanwhile, the changes in microstate C were in the opposite direction to microstate D, indicating that during craving, addicted individuals become more focused, with increased activation in the attention network and decreased internal information processing. Those addicts who exhibit higher focus on drug-related cues and increased attention experience stronger cravings. This may reflect the brain network activity patterns underlying the generation of craving. Future research can investigate the sensitivity of these microstate features by observing changes in craving through the modulation of craving.

左侧 dlPFC 偏侧化激活对应激下创造力损伤的预防作用：一项 tDCS 和 fNIRS 研究

王一凡[1] 段海军[1]（通讯作者）

1 陕西师范大学现代教学技术教育部重点实验室，西安 710062

摘 要 压力是威胁创造性活动的主要外部因素。本研究探讨了通过经颅直流电刺激（tDCS）诱导的背外侧前额叶皮层（dlPFC）左侧偏侧化激活是否可以缓解应激诱导的创造力损伤。功能性近红外光谱技术（fNIRS）用于探索 tDCS 影响的潜在神经机制。90 名女性被试被随机分为三组，分别接受假刺激应激诱发、真刺激应激诱发（tDCS 阳极位于左侧 dlPFC/阴极位于右侧 dlPFC）和假刺激对照条件。被试在 tDCS 刺激后接受应激诱发或控制任务，然后完成多物品用途任务（AUT）来测量创造力。行为学结果显示，tDCS 降低了心率和焦虑上的应激反应水平。fNIRS 结果显示，tDCS 缓解了应激下前额叶皮层（PFC）的功能障碍，表现为 dlPFC 和额顶叶皮层的更高激活，以及 PFC 内更强的半球间和半球内功能连接。进一步的分析表明，tDCS 对皮层的调节作用有效防止了压力引起的创造力损伤。研究结果验证了关于压力的半球不对称假说，并证明了大脑刺激在干预压力相关精神障碍和增强创造力方面的潜力。

Preventative effect of left-lateralized dlPFC activation on stress-induced creativity impairment: a tDCS and fNIRS study

Yifan Wang[1], Haijun Duan[1] (Corresponding Author)
1MOE, Key Laboratory of Modern Teaching Technology, Shaanxi Normal University, Xi'an, 710062

Abstract: Stress is a major external factor threatening creative activity. The study explored whether left-lateralized activation in the dorsolateral prefrontal cortex (dlPFC) manipulated through transcranial direct current stimulation (tDCS) could alleviate stress-induced impairment in creativity. Functional near-infrared spectroscopy (fNIRS) was used to explore the underlying neural mechanisms. Ninety female participants were randomly assigned to three groups that received stress induction with sham stimulation, stress induction with true stimulation (anode over the left dlPFC and cathode over the right dlPFC), and control manipulation with sham stimulation, respectively. Participants underwent the stress or control task after the tDCS manipulation, and then completed the alternative uses task (AUT) to measure creativity. Behavioral results showed that tDCS reduced stress responses in heart rate and anxiety. The fNIRS results revealed that tDCS alleviated dysfunction of the prefrontal cortex (PFC) under stress, as evidenced by higher activation of dlPFC and frontopolar cortex, as well as the stronger inter-hemispheric and intra-hemispheric functional connectivity within PFC. Further analysis demonstrated that the cortical regulatory effect prevented creativity deficiencies induced by stress. The findings validated the hemispheric asymmetry hypothesis regarding stress and highlighted the potential of brain stimulation for intervention in stress-related mental disorders and enhancement of creativity.

青春期分裂型人格特质的核心症状及性别差异：基于网络分析方法

马旭 朱湘茹（通讯作者）
河南大学教育学部，开封，475000，zhuxiangru@gmail.com

摘 要 分裂型人格特质是一种潜在的人格结构，反映了精神分裂症谱系障碍的易感性。针对分裂型人格特质的研究可以避免精神分裂症谱系障碍带来的无关混杂因素，有助于鉴别高风险人群，促进对精神分裂症谱系障碍发生、发展的理解。基于青春期是精神分裂症谱系障碍发生的高危阶段，本研究的目的是采用网络分析方法识别这一时期的核心症状。通过分裂型人格特质问卷-儿童版(Schizotypal Personality Questionnaire-Child)对 1170 名青少年的分裂型人格特质进行评估。使用网络分析方法构建青少年时期的分

裂型人格特质网络，根据稳定性和准确性检验评估网络模型的稳健性，并通过中心性指标对症状的重要程度进行量化。此外，本研究还对不同性别的网络模型进行了差异检验。结果发现，青少年时期的分裂型人格特质网络具有良好的稳健性，症状之间具有紧密的相互连接。其中“倾向于将自己的感受隐藏起来”是该阶段的核心症状，并且“倾向于将自己的感受隐藏起来”、“跟不熟悉的人讲话我会觉得很不自在”和“在有陌生人的社交场合感到非常不自在”三者间的相互作用最强。针对不同性别的差异性检验发现，男性在网络整体连接强度上显著高于女性，而在网络结构上没有显著差异。已知精神分裂症患者经常使用表达抑制的情绪调节策略，即“倾向于将自己的感受隐藏起来”。这可能意味着“倾向于将自己的感受隐藏起来”早在青少年时期就已存在，并在各项症状中发挥着核心作用。此外，不同性别在网络整体连接强度上的差异也与精神分裂症的性别差异一致，即男性精神分裂症谱系障碍的发病高峰期早于女性。

The network structure of schizotypal personality in adolescence

Xu Ma, Xiangru Zhu (Corresponding author)
Faculty of education, Henan University, Kaifeng, 475000，zhuxiangru@gmail.com

***Abstract*：** Schizotypal personality represents the latent personality organization reflecting vulnerability to schizophrenia spectrum disorders. Substantial evidences suggest that schizotypal personality shows symptoms qualitatively similar to schizophrenia, including abnormalities in cognitive systems, social cognitive systems, and behavioral systems, but the degree of abnormality does not meet the full criteria for schizophrenia spectrum disorders. Accordingly, focusing on schizotypal personality can elucidate the onset and development of schizophrenia spectrum disorders without certain confounding factors (e.g., medication and comorbidity). Given that adolescence is a high-risk period for the onset of schizophrenia spectrum disorders, we used network analysis to identify which symptoms and associations between symptoms are most central to adolescent schizotypal personality. The schizotypal personality of 1,170 adolescents was assessed using the Schizotypal Personality Questionnaire-Child (SPQ-C). The structural relationship between schizotypal symptoms was modeled using a network analysis. Stability and accuracy tests evaluated the robustness of the network model, and centrality indicators quantified symptoms importance. In addition, we compared the schizotypal network model of adolescent boys and girls. The results showed that the adolescent schizotypal network had good robustness, with close interactions between symptoms. The most central symptom during this period was "I tend to keep my feelings to myself", and the associations between "I tend to keep my feelings to myself", "I feel very uneasy talking to people I do not know well", and "I feel very uncomfortable in social situations involving people I don‘t know" were the strongest. For the differences between genders, boys had significantly higher overall connectivity than girls, while there were no significant differences in network structures. Consistent with our findings, previous studies had shown that patients with schizophrenia often used expressive suppression as an emotional regulation strategy, i.e., "I tend to keep my feelings to myself", which means that "I tend to keep my feelings to myself" already existed in adolescence and played a core role among symptoms. In addition, gender differences in overall connectivity were also in line with gender differences in schizophrenia, i.e., the peak onset of schizophrenia spectrum disorders in males is earlier than in females. Our findings indicate that expressive suppression, i.e., "I tend to keep my feelings to myself", may be a promising target in the treatment and prevention of schizophrenia, especially in adolescent boys.

3 浙江省认知功能障碍评估研究重点实验室，浙江杭州

4 浙江大学物理系，杭州，310000，yuanlixia2022@zju.edu.cn

摘 要　背景：孤独症谱系障碍(ASD)是一类以社交障碍为核心症状的复杂神经发育障碍。社会动机假说认为 ASD 的社交障碍与奖赏系统功能异常有关。越来越多的证据表明，ASD 涉及大脑功能连接(FC)的异常，然而，还没有研究对 ASD 奖赏系统 FC 的异常进行探讨。

方法：将奖赏网络定义为左右大脑半球各 8 个感兴趣区域(ROI)，包括伏隔核、尾状核、壳核、前扣带皮层(ACC)、腹内侧前额叶皮层(vmPFC)、眶额皮质(OFC)、杏仁核和脑岛。我们从孤独症脑成像交换数据集(ABIDE) I 中筛选了 298 名 ASD 被试和 348 名正常对照(TD)，分别计算了基于 ROI 的静息态 FC 和每个 ROI 和全脑体素的 FC。通过双样本 *t* 检验获得异常 FC，并采用 Pearson 相关法来探索异常 FC 与临床症状的关系。此外，我们利用 Neurosynth 图像解码器生成词云图，以验证奖赏网络中异常通路的认知含义，并进一步采用三因素多变量方差分析(MANOVA)来探索性别、亚型和年龄对异常 FC 的影响。

结果：在网络内分析中，与 TD 组相比，ASD 患者左侧 ACC 与右侧杏仁核之间、左侧 ACC 与左侧伏隔核之间的 FC 较弱，且与社会反应量表(SRS)总分呈负相关。在全脑分析中，相对于 TD 组，ASD 组表现出较弱的 FC (即左侧 vmPFC 与左侧钙化沟之间；右侧 vmPFC 与左侧楔前叶之间)和较强的 FC(即左侧尾状核与右侧脑岛之间)，这些异常 FC 均与 SRS 动机评分呈正相关。Neurosynth 对异常 FC 的自动解码进一步验证了其认知含义(即左侧 ACC 与右侧杏仁核通路参与情绪；左侧 ACC 和左侧 NAc 通路参与奖赏；左侧尾状核和右侧脑岛通路参与感觉和运动；左侧 vmPFC 和左侧钙化沟通路以及右侧 vmPFC 和左侧楔前叶通路参与记忆和心智化)。三因素方差分析结果显示，左侧 vmPFC 与左侧钙化沟之间异常 FC 的年龄主效应显著，右侧 vmPFC 与左侧楔前叶之间异常 FC 的亚型主效应显著，左侧尾状核与右侧岛叶之间异常 FC 的年龄主效应以及性别和年龄的交互作用显著。

结论：我们的研究结果强调了奖赏网络异常 FC 模式在 ASD 核心社会缺陷中的关键作用，这有可能揭示新的 ASD 生物标志物。此外，对奖赏回路中与性别、亚型和年龄相关的 FC 变化的深入了解可能促进开发更有效的干预措施。

***Abstract*:**

Background: Autism spectrum disorder (ASD) is a complex neurodevelopmental disorder with social communication impairments as a core symptom. The social motivation hypothesis proposes that the social deficits of ASD are related to reward system dysfunction. Converging evidence indicates that brain abnormalities in ASD involve atypical functional connectivity (FC), however, the abnormalities of FC patterns of the reward network in individuals with ASD have not been explored yet.

Methods: The reward network was defined as eight regions of interest (ROIs) per hemisphere, including nucleus accumbens (NAc), caudate, putamen, anterior cingulate cortex (ACC), ventromedial prefrontal cortex (vmPFC), orbitofrontal cortex (OFC), amygdala, and insula. We computed both the ROI-wise resting-state FC within the reward network and the seed-based whole-brain voxel-wise FC of each ROI in 298 participants with ASD and 348 typically developing (TD) controls available through the Autism Brain Imaging Data Exchange I dataset. Two-sample t-test was applied to obtain the aberrant FCs and their relationship with clinical symptoms was explored using Pearson's correlation. In addition, the Neurosynth Image Decoder was used to generate word clouds verifying the cognitive implications of the aberrant pathways. Furthermore, a three-way multivariate analysis of variance (MANOVA) was conducted to examine the effects of gender, subtype, and age on the atypical FC.

Results: For the within network analysis, ASD patients showed weaker FC between the left ACC and the right amygdala and between the left ACC and the left NAc compared with the TD group, which were negatively correlated with the Social Responsiveness Scale (SRS) total scores. For the whole-brain analysis, weaker FC (i.e., between the left vmPFC and the left calcarine sulcus, and between the right vmPFC and the left precuneus) accompanied by stronger FC (i.e., between the left caudate and the right insula) were exhibited in ASD relative to TD, which were positively associated with the SRS motivation scores. Automated decoding of these aberrant FCs by the Neurosynth further verified their cognitive implications (i.e., the left ACC-right amydala pathway involved in emotion; the left ACC-left NAc pathway involved in reward; the left caudate-right insula pathway involved in sensation and motor; the vmPFC-precuneus/calcarine pathways involved in memory and mentalizing). The three-way MANOVA analysis revealed main effect of age on the abnormal FC between the left vmPFC and the left calcarine sulcus, main effect of subtype on the abnormal FC between the right vmPFC and the left precuneus, main effect of age and age-by-gender interaction on FC between the left caudate and the right insula.

Conclusions: Our findings highlight the crucial role of abnormal FC patterns of the reward network in the core social deficits of ASD, which have the potential to reveal new biomarkers for ASD. Furthermore, increasing insight on gender, subtype, and age-related FC changes in reward circuit may advance the development of more effective interventions.

基于动态低频振幅的冠状动脉粥样硬化性心脏病患者的自发脑活动研究

张胜辉[1] 胡思琪[1] 游瑶[1] 汤嘉柯[1] 陈晨[1] 王明伟[12]（通讯作者）

1 杭州师范大学，杭州，311121

2 杭州师范大学附属医院心内科，杭州市心血管病研究所，浙江省认知障碍评估研究重点实验室，杭州，310015，wmw990556@hznu.edu.cn

摘 要

目的：冠状动脉粥样硬化性心脏病（Coronary Heart Disease, CHD）是最常见的心血管疾病之一，是导致心血管疾病死亡和慢性残疾的主要原因。既往研究发现 CHD 与认知障碍（Cognitive Impairment, CI）的风险增加相关。以往的研究主要关注脑活动的静态特征，而对其动态变化的特征关注较少。在本研究中，我们旨在利用功能磁共振成像(functional magnetic resonance imaging, fMRI)探讨 CHD 患者的动态脑活动特征。

方法：本研究共纳入 22 例 CHD 患者及 13 例对照者。所有受试者均于杭州师范大学附属医院接受 fMRI 扫描和认知评估。认知评估采用简易精神状态检查（Mini-Mental State Examination, MMSE）和汉密尔顿抑郁量表（Hamilton Depression Scale, HAMD）进行。采用滑动窗口法计算所有受试者的动态低频振幅(dynamic amplitude of low-frequency fluctuation, dALFF)，采用两样本 T 检验比较 CHD 与对照组之间 dALFF 时间变异性的差异，并采用 Pearson 分析受试者 dALFF 值与 HAMD、MMSE 量表等指标的相关性。

结果：两样本 T 检验发现，与对照组相比，CHD 患者颞下回的时间变异性降低（t=-3.95，GRF 校正，P<0.05）.相关性分析显示，颞下回 dALFF 的时间变异性与所有受试者的 MMSE 量表（r=0.57. P<0.05）及 HAMD(r=-0.40,P<0.05)量表得分相关显著，与对照组的 MMSE 量表（r=0.67, P<0.05）相关显著，但与 CHD 患者的量表得分无显著相关。

结论：本研究发现 CHD 患者存在动态脑活动特征的异常，通过分析大脑内在活动的动态变化，为 CHD 相关的 CI 研究提供了新的思路。然而 dALFF 与量表的相关不显著可能是由于样本量较少所致，需要纳入更多受试者以进一步探究 CHD 患者的认知情况与脑活动之间的联系。

***Abstract*：**

Objectives: Coronary Heart Disease (CHD) is a prevalent cardiovascular condition, representing the leading cause of death and chronic disability in cardiovascular diseases. Research has established a link between CHD and increased risk of Cognitive Impairment (CI). However, prior studies have mainly focused on the static characteristics of brain activity, leaving a gap in our understanding of its dynamic features over time, particularly in CHD patients. This study aims to investigate dynamic brain activity patterns in patients with CHD using functional magnetic resonance imaging (fMRI).

Methods: This study enrolled a total of 22 CHD patients and 13 healthy controls at the Affiliated Hospital of Hangzhou Normal University. All subjects underwent fMRI scans and cognitive assessments, which included the Mini-Mental State Examination (MMSE) and Hamilton Depression Scale (HAMD). The dynamic amplitude of low-frequency fluctuation (dALFF) was calculated using the sliding window method for all participants. A two-sample T-test was employed to compare dALFF time variability between the CHD and control groups. Additionally, Pearson correlation analysis was used to examine the relationship between dALFF values and HAMD, MMSE scores, and other relevant indicators.

Results: Compared to the control group, patients with CHD exhibited decreased dALFF variability in the temporal gyrus ($P<0.05$, Gaussian Random Field corrected). The altered dALFF in the temporal gyrus was significantly associated with MMSE scores ($r=0.57$, $P<0.05$) and HAMD scores ($r=-0.40$, $P<0.05$) across all subjects. Furthermore, in the control group, dALFF showed a positive correlation with MMSE scores ($r=0.67$, $P<0.05$). However, there was no significant correlation between the patients' altered dALFF and their MMSE scores or HAMD scores.

Conclusion: This study revealed abnormal characteristics of dynamic brain activity in patients with CHD, providing valuable insights into CHD-induced alterations in the dynamic features of local brain activity. These findings contribute to a better understanding of the relationship between brain function and diseases. Nonetheless, the limited sample size prevented the establishment of significant correlations between dALFF and patients' MMSE and HAMD scores. Future investigations with larger subject cohorts are warranted to further explore the association between cognition and brain activity in patients with CHD.

投桃报李：互惠情境下奖赏加工的神经机制

许扬[1]　李嘉[1]　朱彤彤[1]　魏萍[1]（通讯作者）

1 首都师范大学心理学院，北京，100048

通讯作者 E-mail：weiping@cnu.edu.cn

摘 要　人际互动中的互惠行为无处不在，互惠动机是促使人类社会发展的重要因素。从奖赏加工的视角看，互惠行为包含自己为他人获得奖赏和他人为自己获得奖赏。以往研究已经揭示了为自己和为他人获得奖赏时认知神经机制的异同。而涉及观察他人获得奖赏时，以往研究主要关注他人为他自己获得奖赏。然而，观察他人为自己获得奖赏可能是促进互惠行为的一个重要因素，但其认知神经机制尚不清楚。为解决这个问题，本研究采用金钱激励延迟任务和功能磁共振技术（fMRI），考察互惠情境下被试为自己、为朋友获得奖赏和观察朋友为自身和为被试获得奖赏的神经机制。

本研究包括主动反应和被动观察两个阶段,被试和同性朋友成对完成实验。在主动反应阶段，首先呈现线索，线索类型是为自己获得奖赏、为朋友获得奖赏或无奖赏。被试需要对线索后的目标进行按键反应，根据按键反应时快慢获得正、负反馈。在被动观察阶段，被试需要观察朋友完成上述任务。两个阶段所积累的正反馈均会在实验结束兑换成额外奖赏支付给被试及其朋友。

行为结果显示，主动为自己和为朋友获得奖赏的条件下获得正反馈的概率相当，且都高于无奖赏条件。fMRI 的多变量模式分析显示，在奖赏结果阶段，颞顶联合区（TPJ）可以区分被试为自己和朋友为被试获得奖赏，而腹侧纹状体（VS）可以区分被试为朋友和朋友为他自己获得奖赏。此外，当为朋友获得奖赏时，TPJ 的活动模式可以预测被试与朋友的亲密度，且表征相似性分析的结果表明，被试与朋友的亲密度在被试间越相似，TPJ 的活动也越相似。而观察朋友为被试获得奖赏时 TPJ 的活动模式则可以预测被试的感恩特质。

本研究设置了一个互惠情境，发现奖赏加工和社会认知的两个核心脑区 VS 和 TPJ 参与互惠情境下的奖赏加工，并且 TPJ 的活动可以预测与朋友的亲密度和被试自身的感恩特质。本研究揭示了加工互惠结果的神经活动模式，为理解互惠行为的神经基础提供了新的证据。

***Abstract*:** Reciprocity behavior is ubiquitous in human society. From the perspective of reward processing, reciprocal behavior includes winning rewards for others and receiving rewards from others. Previous research indicated the existence of common and specific cognitive neural mechanisms when winning rewards for oneself and others. While observing others receiving rewards, past studies have primarily focused on vicarious reward processing, wherein others win rewards for themselves. However, witnessing others successfully winning rewards for the participant oneself is a crucial factor promoting reciprocal behavior, yet its cognitive neural mechanisms remain unclear. To address this issue, the present study employs a Monetary Incentive Delay task and functional magnetic resonance imaging (fMRI) technique to investigate the neural mechanisms underlying winning rewards for oneself and a friend, as well as observing this friend winning rewards in a reciprocal context.

The current study included an active phase and a passive phase and participant came with his or her same-gender friend to complete the experiment. In the active phase, the participants need to respond as quickly as possible after the presentation of the target stimulus to gain a possible reward following a pre-target cue. The cue included three types, win for the participant himself/herself, win for the friend, and no reward condition. After the response, a positive or negative feedback is provided based on their reaction time. In the passive observation phase, participants are required to observe their friend completing the same task. The friend can win for him/herself, for the participant, in compared with a no reward condition. The accumulated positive feedback from both phases will be converted into bonus and paid to the participants and their friends after the experiment.

The behavioral results indicate that the positive feedback rate is comparable when actively winning rewards for oneself and for a friend, and both are higher than that in the no reward condition. Using multivariate pattern analysis, the neuroimaging results revealed that the temporo-parietal junction (TPJ) can distinguish between successfully winning rewards for oneself and receiving rewards from a friend, and the ventral stritum (VS) can classify wining rewards for a friend and observing friends winning him/herself rewards. When successfully gaining rewards for a friend, the activities of TPJ can predict the level of intimacy between the participants and their friends. Moreover, representational similarity analysis showed that the more similar the participants were in terms of intimacy with their friends, the more similar their TPJ activity patterns were. When observing a friend successfully obtaining rewards for the participant oneself, the TPJ activities can predict the participants' gratitude traits.

In this study, we motivated participants to win rewards for themselves and for their friends, as well as to observe their friends winning rewards reciprocally. We found that two core brain regions involved in reward processing and social cognition, the VS and the TPJ, activated in the reward processing during the reciprocal context. The current study revealed the neural mechanisms underlying the processing of reciprocal rewards, providing new insights into how reciprocal behavior emerges. These results contribute to a better understanding of the neural mechanisms underlying reciprocity in social interactions.

摘 要 药物成瘾是一种慢性、复发性疾病，复吸率居高不下，给个体健康、家庭经济和社会安定带来巨大挑战。冲动性是药物成瘾的核心特征之一，药物成瘾者的冲动性异常增高导致药物戒断困难，促使复吸率升高。因此，解析药物成瘾人群的冲动性特征及其神经机制可促进精准干预模式的构建，降低复吸率。本研究纳入203名甲基苯丙胺使用障碍患者（methamphetamine use disorder，MUD）及114名健康对照（Health control，HC），采用巴瑞特冲动量表（BIS-11）测量特质冲动水平，并使用128导高密度脑电图记录患者静息态下的大脑活动。通过溯源分析、频谱分析和功能连接分析得到跨频段不同脑区的功率谱和脑区间功能连接指数（WPLI）。采用LASSO回归及支持向量机（SVM）提取MUD和HC的核心脑网络差异，进一步采用支持向量回归（SVR）阐明MUD患者冲动性的核心神经机制，基于潜在生物标记物，探索MUD患者潜在亚组。研究结果表明MUD与HC的脑网络特征差异主要表现为小脑（Cerebellum）、基底节（Basal Ganglia）、默认模式网络（DMN）区域连接的下降。其中小脑、额顶网络（Fronto-parietal Network）和运动区(Motor Area)是预测MUD冲动性异常增高的核心脑网络。整合可MUD患者异常脑网络特征（与HC相对比）和冲动性的核心预测特征后，发现以小脑为重要节点，以内侧颞叶（Medial Frontal Gyrus）和运动区为次重要节点的脑网络为MUD冲动性增高的核心神经机制。进一步基于以小脑为核心的特征进行亚组划分，可有效区分冲动性、焦虑抑郁状态。综上所述，本研究首次发现小脑为甲基苯丙胺使用障碍冲动性脑网络的重要节点，提示小脑可以成为降低甲基苯丙胺使用障碍冲动性的潜在干预靶点。

Abstract: Drug addiction is a chronic and relapsing disorder, presenting immense challenges to individual health, family finances, and social stability. High rates of relapse continue to persist, partially attributed to heightened impulsivity among individuals with drug addiction. Understanding the impulsivity characteristics and underlying neural mechanisms in this population is crucial for the development of targeted intervention strategies aimed at reducing relapse rates. This study aims to analyze the impulsivity phenotypes and investigate the neural mechanisms associated with drug addiction. By dissecting the impulsivity characteristics and underlying neural mechanisms in individuals with drug addiction can facilitate the establishment of precision-based intervention models, ultimately leading to improved outcomes and a decrease in relapse rates. This study included 203 patients with methamphetamine use disorder (MUD) and 114 healthy controls (HC). Trait impulsivity levels were measured using the Barrett Impulsiveness Scale (BIS-11), and high-density electroencephalography (EEG) with 128 channels was employed to record resting-state brain activity in patients. Source localization analysis, spectral analysis, and functional connectivity analysis were conducted to obtain power spectra and interregional functional connectivity indices (WPLI) across different frequency bands. LASSO regression and support vector machine (SVM) were applied to extract the core brain network differences between MUD and HC, and support vector regression (SVR) was further employed to elucidate the core neural mechanisms underlying impulsivity in MUD patients. Additionally, potential subgroups of MUD patients were explored based on latent biomarkers. The results of the study revealed that the differences in brain network characteristics between MUD and HC primarily manifested as decreased connectivity in the cerebellum, basal ganglia, and default mode network (DMN). Additionally, the cerebellum, fronto-parietal network, and motor area were identified as core brain networks associated with the heightened impulsivity observed in MUD. Integrating the abnormal brain network features (relative to HC) and core predictive features of impulsivity in MUD, it was found that the core neural mechanisms underlying heightened impulsivity in MUD primarily involved the cerebellum as a crucial node and medial frontal gyrus and motor area as secondary nodes. Furthermore, utilizing the cerebellum-centered features for subgroup classification effectively differentiated impulsivity and anxiety-depressive states. In conclusion, this study for the first time identified the cerebellum as a crucial node in the impulsivity-related brain network in individuals with methamphetamine use disorder, suggesting that the cerebellum may serve as a potential intervention target for reducing impulsivity in methamphetamine use disorder.

背景音乐诱发下情绪对高三学生执行功能的影响研究

——来自 ERPs 的证据

马晴[1]　颜志雄[2]

1 云南大学滇池学院，昆明，650228

2 南宁师范大学教育科学学院，南宁，530001，yanzx@nnnu.edu.cn

摘 要 近年来，认知心理学与音乐心理学的结合使得越来越多的学者开展了音乐对认知影响的研究，针对不同的音乐诱发不同情绪对于认知是何种影响，并没有一致的结论。本研究试图从行为和脑电生理两方面共同探求背景音乐诱发下情绪对于个体执行功能的影响，验证音乐诱发情绪对高三学生认知产生的影响，为今后校园学生心理健康工作提供一些可行性的意见与建议，帮助高三学生通过简单易于接受的音乐形式，提高学业成绩，促进心理健康发展。本研究运用实验法，设计了三个实验进行探索。实验一：选取 32 名高三学生分别接受三种背景的刺激（正性音乐、负性音乐、无音乐），完成执行功能抑制控制成分的数字 Stroop 测试任务，并使用事件相关电位技术记录脑电信号；实验二：选取 32 名高三学生分别接受三种背景的刺激，完成执行功能信息刷新成分的 2-Back 测试任务，并使用事件相关电位技术记录脑电信号；实验三：选取 32 名高三学生分别接受三种背景的刺激，完成执行功能认知灵活性成分的数字转化测试任务，并使用事件相关电位技术记录脑电信号。通过对三种不同音乐背景下高三学生执行功能测试行为数据和脑电数据的统计分析，结果发现：（1）不同背景音乐诱发情绪对抑制控制成分的影响表现为正负性情绪对高中生抑制控制能力都产生影响，但存在性别差异，在负性情绪下，女学生的抑制能力比男性更差。（2）不同背景音乐诱发情绪对刷新成分的影响表现为正性情绪促进了信息刷新能力的提升，负性情绪有碍该能力，并且存在民族差异，少数民族学生在正性情绪下比负性情绪下信息刷新能力得到更好发挥。（3）不同背景音乐诱发情绪对认知灵活性成分的影响表现在正性音乐加快了高三学生认知灵活性能力的发挥，在少数民族学生上更为明显。有喜爱音乐类型偏好的汉族学生在其喜欢音乐类型下，认知灵活能力的运用需要投入更多的认知资源。（4）能够诱发正性情绪的音乐对高三学生执行功能产生促进作用，并且存在性别、民族和喜爱音乐类型偏好的差异。

The effect of emotions induced by background music on executive function of senior high school students: evidence from event-related potentials

Ma Qing[1] Yan Zhixiong[2]
1 Dianchi College of Yunnan University,Kunming
2 School of Education Science, Nanning Normal University,Nanning

***Abstract*:** In recent years, the combination of cognitive psychology and music psychology has led more and more scholars to carry out research on the impact of music on cognition.But each has its own theory and viewpoint.There is no consistent conclusion about the effect of different emotions induced by different music on cognition.This study attempts to explore the effects of mood induced by background music on individual executive function from both behavioral and electrophysiological. Verify whether the effect of music-induced emotions on the cognition of high school students promotes or hinders.Provide some feasible opinions and suggestions for the future psychological health work of students.To help high school students improve their academic performance and promote the development of mental health in an easy-to-accept way.In this study, we used experimental methods to design a total of three experiments to explore.Experiment 1: Select 32 senior high school students to receive stimulation from three backgrounds (positive music, negative music, no music),complete the digital Stroop test task of the suppression control component in the executive function, and record the EEG signals using event-related potential technology;Experiment 2: Select 32 senior high school students to receive the stimulation of three backgrounds respectively, complete the 2-Back test task of the information refresh component of the executive function, and record the EEG signals using event-related potential technology;Experiment 3:Thirty two senior three students were selected to receive three kinds of background stimuli, complete the digital transformation test task of executive functional cognitive flexibility component, and use Evoked potential technology to record EEG signals.Through statistical analysis of the behavioral data and EEG data of high school students performing functional tests on three different music backgrounds, the results found that:(I)The effects of different background music-induced emotions on inhibitory control components are shown as positive and negative emotions have an effect on the inhibition and control ability of high school students, but there are gender differences. Negative emotions, female students' ability to inhibit and control is worse than men's. (II)The influence of different background music-induced emotions on refresh components is expressed as positive emotions promote the improvement of

information refresh ability, negative emotions hinder this ability, and there are ethnic differences.Minority students have better information refreshing ability in positive emotions than in negative emotions.(III)The influence of different background music-induced emotions on the components of cognitive flexibility is manifested in positive music, which accelerates the play of cognitive flexibility of senior high school students, and is more obvious among minority students.For Han students who have a preference for music genres, the use of cognitive flexibility requires more cognitive resources. (IV)Music capable of inducing positive emotions promotes executive function of high school students, and there are differences in preference for gender, ethnicity, and favorite music types.

音乐快感缺失与一般快感缺失关系：一项探索性分析

张思雨[1] 蔡新璐[2]（通讯作者）

1 杭州师范大学经亨颐教育学院，杭州，311100

2 杭州师范大学基础医学院脑科学研究所，杭州，311100，caixinlu@hznu.edu.cn

摘 要 音乐，作为一种特殊的奖赏物，能够给人们带来愉悦体验。前人研究表明个体音乐奖赏敏感性的高低决定了其在音乐中体验到的愉悦程度。在一般人群体中，约有 5%的个体无法如常人一样从音乐中获得愉悦，这种现象被称为音乐快感缺失。目前，关于音乐快感缺失是特定类型的快感缺失还是属于一般快感缺失的一部分这一问题尚存在争议。本研究旨在探索音乐快感缺失和一般快感缺失之间的关系，并试图提出新的关于音乐快感缺失和其他快感缺失关系的理论模型。我们招募了 3372 名大学生被试，线上填写巴塞罗那音乐奖赏问卷、Snaith 快感缺失量表、时间体验愉悦量表及人口学信息，通过相关分析和回归分析发现音乐奖赏敏感性较低的人群对其他奖赏物（初级强化物和次级强化物）的敏感性也较低（$p < 0.001$），且性别差异显著（$\chi^2 = 16.23$，$p < 0.001$），其中 BMRQ 的 Mood Regulation 维度得分和 TEPS 的四个维度得分呈现出强相关性（r 在 0.72～0.87 之间），且 BMRQ 各维度及其总分可预测 TEPS 总分（调整后 $R^2 = 0.83$）。由此，可以得出结论：音乐快感缺失和一般快感缺失相关，尤其是与以时间维度划分的期待性愉悦体验和消费性愉悦体验密切相关，这可能与音乐的时间序列性和可预测性有关。我们希望后续研究可以进一步地明确音乐奖赏敏感性和其他奖赏敏感性之间的关系，以便更好地发挥音乐在提升个体和群体社会功能方面的作用，如临床音乐治疗等。

The Relationship between Musical Anhedonia and General Anhedonia: An Exploratory Investigation

Siyu Zhang[1], Xin-lu Cai[2]

1 Department of Psychology, School of Education, Hangzhou Normal University, Hangzhou, China
2 Institute of Brain Science and Department of Physiology, School of Basic Medical Sciences, Hangzhou Normal University, Hangzhou, China

Abstract： Music, as a kind of special reward, can bring people pleasure. Previous studies have shown that an individual's musical reward sensitivity determines the degree of pleasure they experience in music. In the general population, about 5% of individuals are unable to get pleasure from music as usual, a phenomenon called musical anhedonia. At present, it is still controversial whether musical anhedonia is a specific type of anhedonia or a part of general anhedonia. The purpose of this study was to explore the relationship between musical anhedonia and general anhedonia, and to attempt to propose a new theoretical model of the relationship between musical anhedonia and other kinds of anhedonia. We recruited 3372 college students to fill out the Barcelona Music Reward Questionnaire (BMRQ), the Snaith Anhedonia Scale (SHAPS), the Temporal Experience Pleasure Scale (TEPS) and demographic information online. Through correlation analysis and regression analysis, it was found that people with low sensitivity to musical reward were also less sensitive to other kinds of rewards (including the primary reinforcers and the secondary reinforcers, $p < 0.001$), and the gender difference was significant ($\chi^2 = 16.23$, $p < 0.001$). Among them, the scores of Mood Regulation dimension of BMRQ showed a strong correlation with the scores of four dimensions of TEPS ($r = .72$ to $.82$), and the scores of each dimension and its total score of BMRQ could predict the total score of TEPS (adjusted $R^2 = 0.83$). Hence, it can be concluded that musical anhedonia is related to general anhedonia, especially closely related to the anticipatory and consummatory pleasure experience divided temporally, which may be related to the chronology and predictability of music. We hope that future studies will further clarify the relationship between musical reward sensitivity and other kinds of reward sensitivity, to better play the role of music in improving individuals and groups' social function, such as in clinical music therapy.

6.27“眼动心理学专业委员会”分组展贴报告

阅读理解中的预测加工：一项来自眼动和中文量词的研究

赵赛男[1]，张俐娟[2]，张涵[1]，胡青[1]，王敬欣[2]
1 临沂大学教育学院，临沂，276000
2 天津师范大学心理学部，天津，300387，wjxpsy@126.com

摘 要 传统语言观认为阅读理解是一个自下而上的整合加工过程，即个体不断地将出现的词汇信息或概念整合到自己对前文语境所建立的内在心理表征之中。近年来，随着预测编码理论框架的提出，句子理解的观点也从单纯的信息表征向语言的“预处理”方向转变，即阅读是基于不断预测达成的读者与文本的交互对话的过程。引文激增分析也表明近几年阅读领域预测性研究的激增性最强，是未来研究的热点。虽然已有研究表明阅读中存在稳定的预测性效应，但绝大多数研究对阅读中预测性效应的测量是在词汇视觉信息出现之后，词汇视觉信息的出现对阅读中的提前预测加工造成了混淆和提出了挑战。因此，为了排除词汇视觉信息对预测加工测量造成的混淆，当前研究利用汉语中量词和名词之间特定的搭配关系，在词汇视觉信息出现之前就对预测性效应进行了测量。某高校 64 名在校大学生（*M*=20.3，*SD*=1.14）参与了正式实验。

实验为单因素两水平（名词类型：可预测名词、不可预测名词）被试内设计，共有 60 组实验句（可预测名词：“李阿姨脖子上戴的**那条**漂亮的**项链**是她昨天逛街时买的。”/不可预测名词：“李阿姨没告诉丈夫**那条**漂亮的**项链**是她昨天逛街时买的。”）。最后，利用线性混合模型对量词和名词上的跳读和注视时间类指标进行数据分析。结果发现，（1）对于量词：相较于不可预测名词前的量词，读者对可预测名词前量词的跳读更加频繁（$z=3.61$，$p<0.001$），注视时间更短（首次注视时间：$t=1.77$，$p=0.08$；凝视时间：$t=4.63$，$p<0.001$；总注视时间：$t=4.69$，$p<0.001$）；（2）对于名词：可预测名词和不可预测名词之间的跳读和注视时间没有显著差异（$t/z>0.09, p>0.93$）。上述实验结果表明，读者在没有出现词汇视觉信息之前就能够根据前文输入的语境对接下来的内容进行提前预测加工，并且会根据出现的新内容（量词）不断的动态调整预测内容。

Prediction during reading comprehension: Evidence from Eye-movement and Chinese classifier

Zhao Sainan[1], Zhang Lijuan[2], Zhang Han[1], Hu Qing[1], Wang Jingxin[2]
1 The school of education, Linyi University, Linyi, 276000
2 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387, wjxpsy@126.com

***Abstract*：** According to the traditional view of language, reading comprehension is a bottom-up integrated process, in which individuals continuously integrate the emerging lexical information or concepts into their internal mental representation of the previous context. In recent years, with the proposed framework of prediction coding theory, the view of sentence understanding has also changed from the single information representation to language "preprocessing", in which reading is the interactive dialogue process between the reader and the text. The citation surge analysis also shows that in recent years, predictability research has had the biggest surge in the field of reading and has become a hot spot for future research. Previous studies have shown a stable predictability effect in reading. However, most studies measure the predictability effect in reading after the appearance of lexical visual information, which confuses and challenges the prediction processing in reading. Therefore, to eliminate the confusion caused by lexical visual information in the measurement of prediction processing, the current study uses the specific collocation relationship between quantifiers and nouns in Chinese to measure the predictability effect before the appearance of lexical visual information. 64 college students (M=20.3, SD=1.14) participated in the formal experiment. The experiment was single-factor two-level (noun type: predictable noun, unpredictable noun), and there were 60 sets of experimental sentences (predictable noun: "Aunt Li is wearing **that** beautiful **necklace** she bought when she went shopping yesterday." / Unpredictable noun: "Aunt Li didn't tell her husband that she bought **that** beautiful **necklace** when she went shopping yesterday."). Finally, the linear mixed model was used to analyze the data of skipping and fixation times on classifiers and nouns. The results showed that (1) for classifiers: compared with the classifiers before unpredictable nouns, readers skipped the classifiers before predictable nouns

more frequently ($z = 3.61$, $p < 0.001$), and the fixation times were shorter (first fixation duration: $t = 1.77$, $p = 0.08$; gaze duration: $t = 4.63$, $p < 0.001$; total fixation duration: $t = 4.69$, $p < 0.001$); (2) for nouns: there was no significant difference in skipping and fixation times between predictable and unpredictable nouns ($t/z > 0.09$, $p > 0.93$). Those results suggested readers exactly predict the following content according to the previous context in advance of the appearance of visual information and dynamically adjust the content according to the new content (classifiers).

场景认知中知觉对象对事件理解的影响

唐庭豪　康廷虎　刘维　瞿萌 刘子馨

西北师范大学心理学院，兰州，730070，octadecamoon@163com

摘 要　事件是传达外界状态变化的动态过程，它由多种元素构成。事件理解建立在场景识别的基础上，涉及客体状态的认知，并可以直接影响个体的适应功能。场景知觉与事件理解理论(Scene Perception and Event Comprehension Theory, SPECT)协调了感知和理解的部分，认为对特定实体和实体细节进行的狭义信息提取在后端加工中可以帮助事件编码与理解。工具线索和动作关系线索作为狭义信息提取的对象在事件理解中可能起到不同的引导作用。本研究基于 SPECT 模型，从社会场景的角度进行了两个眼动实验，旨在探讨不同知觉对象对事件理解的影响。实验一为单因素被试内实验设计，自变量为工具线索（有、无），使用 EyeLink Portable Duo 便携式眼动仪记录 40 名大学生被试观察事件场景的眼动数据，分析正确率、反应时等行为指标与平均注视时长、眼跳幅度、瞳孔大小、眼跳次数等眼动指标。实验二采用 2（施动者状态：清晰，模糊）×2（受动者状态：清晰，模糊）的两因素被试内实验设计，记录了 38 名大学生的眼动数据，与实验 1 使用相同的实验仪器和因变量。结果发现：（1）有工具线索的水平下，被试对场景事件判断的正确率、反应时显著优于无工具线索时，同时眼跳次数显著减少，说明工具线索可以明确对信息的搜索以引导被试对场景进行识别；（2）施动者状态清晰水平下的反应时、眼跳幅度和正确率较模糊水平下小，而眼跳次数多；受动者状态在模糊水平下，眼跳幅度和眼跳次数较少。说明施动者的清晰状态能够引导信息搜索，显著减少事件理解所需的时间，但是也可能导致正确率下降；受动者的模糊状态可能被视为干扰刺激，导致被试降低信息搜索效。

The Influence of Perceived Objects on Event Comprehension in Scene Cognition

Tang Tinghao, Kang Tinghu, Liu Wei, Qu Meng, Liu Zixin

School of Psychology, Northwest Normal University, LanZhou, 730070,

octadecamoon@163.com

Abstract： An event is a dynamic process that conveys changes in the external world, consisting of various

elements. Event comprehension builds upon scene recognition and involves the cognition of object states, directly influencing individual adaptive functioning. The Scene Perception and Event Comprehension Theory (SPECT) integrates perceptual and cognitive aspects, proposing that narrow information extraction concerning specific entities and their details aids in event encoding and comprehension. Tool-related and action-related cues, as objects of narrow information extraction, may play distinct guiding roles in event understanding. This study, based on the SPECT model, conducted two eye-tracking experiments from a social scene perspective, aiming to explore the impact of different perceived objects on event comprehension. Experiment 1 employed a single-factor within-subject design with the independent variable being the presence or absence of tool-related cues. Eye movement data of 40 college students observing event scenes were recorded using the EyeLink Portable Duo eye-tracking system. Behavioral measures, including accuracy and response time, were analyzed alongside eye movement metrics such as fixation duration, saccadic amplitude, pupil size, and saccade count. Experiment 2 adopted a 2 (agent's state: clear, blurry) × 2 (patient 's state: clear, blurry) two-factor within-subject design, recording eye movement data of 38 college students using the same experimental apparatus and dependent variables as Experiment 1. The results revealed that (1) with the presence of tool-related cues, participants demonstrated significantly higher accuracy and faster response times in event recognition compared to conditions without such cues, while the saccade count decreased significantly, indicating that tool-related cues facilitated targeted information search and guided participants in scene recognition; (2) in the clear state of the agent, response times, saccadic amplitude, and accuracy were lower than in the blurry state, whereas the number of eye movements was higher. For the patient, in the blurry state, saccadic amplitude and the number of eye movements were lower. These findings suggest that a clear agent's state can guide information search and significantly reduce the time required for event comprehension, but it may also lead to a decrease in overall accuracy; the blurry state of the patient may be considered an interfering stimulus, resulting in reduced efficiency of information search.

斜体字的认知加工效率与美感：基于眼动技术的研究

唐圣林 仝文(通讯作者)

山西师范大学教育科学学院心理系，太原，030000

E-mail: twaaa@126.com

摘要 斜体汉字常应用于书籍、论文、政治文章和其他许多其他形式的书面文本中，在各种广告、标牌、艺术字等尤为常见。已有的拼音文字研究发现斜体字一定程度上降低了阅读效率，但汉字与拼音文字的研究结论是不能完全照搬的。本研究基于眼动技术，考察不同倾斜角度的中文句子、英文句子以及随机数字串对读者阅读效率的影响。包括三项实验：实验一通过问卷调查探索读者是否会对不同倾斜角度的汉字产生不同的审美，实验二主要考察不同字（汉字、拼音文字、随机数字串）与不同倾斜角度对眼动模式的影响，实验三通过设置相容关系任务（倾斜字与美观图片）与不相容关系任务（正字与非美观图片），考察被试对不同倾斜方向是否存在内隐态度。结果发现：（1）同倾斜角度的汉语句子的外显评价上大部分存在差异，其中正字的评价是最高的；（2）汉字的正字句子注视时间最短，英语左倾斜 15 度最短，并且随机数字串的注视时间差异不显著；（3）被试对倾斜角度存在内隐态度，表现出右倾斜汉字与美观图片相联系，左倾斜汉字与非美观图相联系。综上，这可能说明外显的评价没有反应出内隐的审美，在内隐态度上，读者对倾斜一定角度的汉字持积极态度，而不同字（汉字、拼音文字、随机数字串）在眼动模式上的差异可能是由于倾斜导致的眼动模式受到语言的影响，即有意义文字的阅读模式受到倾斜角度的影响。

关键词 倾斜角度，阅读效率，审美，内隐态度

Cognitive processing efficiency and aesthetics of italics：A Study Based on Eye-Tracking Technology

Shenglin Tang　Wen Tong
Department of Psychology, Shanxi Normal University, Taiyuan, 030000
E-mail: twaaa@126.com

Abstract：Italicized Chinese characters are often used in books, papers, political articles and many other forms of written text, especially in various advertisements, signs, artistic characters and so on. It has been proved that italics reduce the reading efficiency to a certain extent. But the research conclusion of Chinese characters is not necessarily the same as that of alphabetic writing. Based on eye-tracking technology, this study investigated the effects of Chinese sentences, English sentences and random number strings with different inclined angles on readers ' reading efficiency. In experiment 1, a questionnaire survey was conducted to explore whether readers will have different aesthetic perceptions of Chinese characters with different tilt angles. Experiments 2 focused on the effects of different characters (Chinese characters, alphabetic characters, random number strings) and different tilt angles on eye movement patterns. Experiment 3 examined whether the participants had implicit attitudes towards different tilt directions by setting compatible relationship tasks (tilted words and beautiful pictures) and incompatible relationship tasks (upright words and non-beautiful pictures). The results show that : (1) Most of the explicit evaluations of Chinese sentences with the same tilt angle are different, among which the evaluation of orthography is the highest ; (2) The fixation time of Chinese character sentences is the shortest, and that of English left tilt 15 degrees is the shortest, and there is no significant difference in the fixation time of random number strings. (3) The subjects had an implicit attitude towards the inclined angles, showing that the right-leaning Chinese characters were associated with beautiful pictures, and the left-leaning Chinese characters were associated with non-beautiful pictures. In summary, this may indicate that explicit evaluation does not reflect implicit aesthetics, In terms of implicit attitude, readers have a positive attitude towards Chinese characters tilted at a certain angle. And the difference in eye movement patterns of different characters (Chinese characters, alphabetic characters, random number strings) may be due to the influence of language on the eye movement pattern caused by tilt, that is, the reading pattern of meaningful words is affected by the tilt angle.

生成与遏制：未成年人的犯罪影响

——基于 QCA 的组态路径分析

胡青　张涵（通讯作者）
临沂大学教育学院心理系，临沂，276005
E-mail：zhanghanwf@163.com

摘 要　青少年犯罪是世界性的社会问题，严重威胁着整个社会的和谐与稳定。少年守法，则国之兴盛；少年违法，则国之大殇。学术界已从多个角度对青少年犯罪进行溯源分析，探索了各因素间的线性关系，但尚未从组态视角研究因素间的共同作用和交互影响。本文基于犯罪遏制理论，构建了“个体-家庭-学校”三个层面分析框架，运用 fsQCA3.0 软件对 19 名犯罪未成年和 8 名普通未成年作为研究对象进行定性比较分析（QCA），探讨导致未成年人犯罪的组态路径。研究发现：(1) 自我控制、心理韧性、家庭监管、不良交往和学业受挫是关键要素构成，但单个要素并不是未成年人犯罪的必要条件；（2）生成未成年人犯罪有 5 种充分条件组态，遏制未成年人犯罪有 3 种充分条件组态，未成年人犯罪的生成与遏制条件组态存在不对称性。（3）未成年人犯罪的五条生成路径，可进一步概括为外在推力型、外在拉力型、推拉联动型，其中不良交往和以家庭监管缺失共同存在是促发未成年人犯罪的核心条件（原始覆盖度为 31.58%），学业受挫是次要条件。（4）未成年人犯罪的三条遏制路径可以区分为外在遏制与内在遏制两种类型，其中自我控制与心理韧性的共同作用是核心条件（原始覆盖度为 37.5%），无不良交往是次要条件。多种条件组合路径分析揭示了未成年人犯罪的复杂因果本质，可对未成年人品格培育、家庭家教家风建设以及教育政策制定提供参考建议，具有积极的理论价值和实践借鉴。

关键词　未成年人犯罪，家庭监管，不良交往，自我控制，定性比较分析（QCA）

Generation and Deterrence: Influencing Factors of Juvenile Delinquency-Analysis of Configuration Path Based on QCA

Qing Hu Han Zhang [1]
1 Department of Psychology, School of Education, Linyi University, Linyi, 276005, zhanghanwf@163.com

***Abstract*：** Juvenile delinquency is a worldwide social problem, which seriously threatens the harmony and stability of the whole society. If teenagers obey the law, the country will prosper. If a teenager breaks the law, the country will be devastated. Academic circles have traced back to juvenile delinquency from many angles and explored the linear relationship between various factors, but they have not yet studied the reciprocal influence and interaction between factors from the perspective of configuration. Based on the theory of crime deterrence, this study creates a three-level analysis framework of "individual-family-school" and uses fsQCA3.0 software to conduct a qualitative comparative analysis (QCA) on 19 delinquent minors and 8 ordinary minors as the study's subjects to examine the grouping paths that result in delinquency among minors.

It was found that (1) self-control, mental resilience, family supervision, bad peer interactions, and academic frustration were the key element components, but a single element is not necessary for juvenile delinquency; (2) there were five sufficient condition groupings for generating juvenile delinquency and three sufficient condition groupings for curbing juvenile delinquency, and there was an asymmetry in the condition groupings for generating and curbing juvenile delinquency. (3) The five driving paths of juvenile delinquency can be further summarized as extrinsic push type, extrinsic pull type, and push-pull linkage-type, in which bad peer interactions and the co-existence of the lack of family supervision are the core conditions that promote juvenile delinquency (the

original coverage is 31.58%), and academic frustration is the secondary condition; the three juvenile delinquency containment paths can be differentiated into two types of external and internal containment, in which the joint effect of self-control and mental resilience is the core condition (original coverage of 37.5%), and the absence of bad peer interactions is the secondary condition. The analysis of multiple conditions combined paths reveals the complex causal nature of juvenile delinquency, which can provide reference suggestions for the cultivation of minors' character, the construction of family tutelage and family culture, as well as the formulation of educational policies, with positive theoretical value and practical reference.

Keywords： juvenile delinquency, family supervision, bad peer interactions, self-control, QCA

急性睡眠剥夺对任务转换表现的影响：一项 ERP 研究

廉洁[1]　邵永聪[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，budeshao@aliyun.com

摘 要　目的：许多行业的工作者都经历着睡眠剥夺，而急性睡眠剥夺会对个体的执行功能造成负面影响，包括注意力、工作记忆、情绪和决策等方面，但是较少研究探讨急性睡眠剥夺对任务转换能力产生的影响。本研究通过事件相关电位技术(event-related potentials, ERP)，探讨了 36 小时急性睡眠剥夺对任务转换表现的影响，并进一步探讨急性睡眠剥夺对不同时间的脑电成分产生的影响。方法：本研究共选取了 11 名参与者，完成 36 小时的急性睡眠剥夺实验，在 36 小时的睡眠剥夺前后每名参与者分别完成大小奇偶转换任务，并同时记录脑电数据。大小奇偶转换任务包括重复试次和转换试次两种类型，重复试次分为大小任务（判断数字大于 5 还是小于 5）和奇偶任务（判断数字是奇数还是偶数），转换试次为序列为 AABBAA 的大小奇偶转换任务。结果：ERP 结果表明，在 Cz，CPz 和 Pz 三个电极点上，36 小时急性睡眠剥夺后转换条件下的 N2 波幅显著增加，而重复试次的 N2 波幅显著降低。与之相反，睡眠剥夺后转换条件下的 P3 波幅显著降低，而重复试次的 P3 波幅显著增加。结论：36 小时急性睡眠剥夺后转换条件下消耗的认知资源更多，而重复试次并没有消耗过多的认知资源。与重复试次相比，在急性睡眠剥夺后转换试次对执行控制能力的要求更高，可能是大脑出现了代偿作用。

关键词　急性睡眠剥夺，任务转换，事件相关电位

The effect of acute sleep deprivation on task switching performance: An ERP study

Jie Lian，Yongcong Shao

Beijing Sports University, Beijing

Abstract：Objective: Workers in many industries are experiencing sleep deprivation, and acute sleep deprivation can have a negative impact on the executive function of individuals, including attention, working memory,

emotion and decision-making, but few studies have explored the impact of acute sleep deprivation on task switching ability. In this study, the effect of 36 hours of acute sleep deprivation on task switching performance was investigated by event-related potentials (ERP), and the effect of acute sleep deprivation on EEG components at different times was further explored. Methods: In this study, a total of 11 participants were selected to complete the 36-hour acute sleep deprivation experiment. Before and after 36 hours of sleep deprivation, each participant completed the size parity conversion task, and recorded the EEG data at the same time. The size parity conversion task includes two types: repeated trials and conversion trials. The repeated trials are divided into size tasks (judging whether the number is greater than 5 or less than 5) and parity tasks (judging whether the number is odd or even). The conversion trial is a size parity conversion task with a sequence of AABBAA. Results: ERP results showed that the amplitude of N2 increased significantly under the conversion condition after 36 hours of acute sleep deprivation at the three electrode points of Cz, CPz and Pz, while the amplitude of N2 decreased significantly after repeated trials. On the contrary, the P3 amplitude under switching conditions after sleep deprivation was significantly reduced, while the P3 amplitude of repeated trials was significantly increased. Conclusion: 36 hours of acute sleep deprivation after conversion conditions consume more cognitive resources, and repeated trials did not consume too much cognitive resources. Compared with the repeated trials, the switching trials after acute sleep deprivation have higher requirements for executive control ability, which may be due to the compensatory effect of the brain.

Keywords：acute sleep deprivation, task switching, event-related potentials

多维静息态脑电特征预测记忆控制：基于机器学习

程雪林　张云飞　丁锦红（通讯作者）

首都师范大学心理学院，北京，100048，E-mail:dingjh@cnu.edu.cn

摘 要　记忆控制（Memory control）是对某些信息的主动遗忘（Anderson & Hanslmayr, 2014; Liu et al., 2020）。它对个体心理健康至关重要，记忆控制能力受损是很多精神疾病的重要诱因（Nørby, 2018; Waldhauser et al., 2018）。准确识别记忆控制能力损伤程度并进行及时干预将有助于降低个体发展出精神疾病的风险。静息态是人脑活动的基线状态，反映了大脑固有的功能维持和基本信息加工能力（Deco et al., 2011）。已有研究表明，静息态神经活动能够预测个体的多种认知功能，如抑制控制和记忆等（Dong et al., 2021; Zhou et al., 2021）。因此，静息态神经活动可能也是个体记忆控制的有效预测指标。然而，如何从大量静息态脑电信号中筛选出更为有效的预测特征以及这些特征在记忆控制中如何发挥作用等问题尚不清楚。本研究结合EEG 技术和机器学习技术，深入分析多维静息态脑电特征在准确预测个体记忆控制能力中的作用。

实验共有被试 46 名（女性 32 名，年龄范围 21~28 岁）。实验中，先采集被试闭眼静息态 EEG 信号 5 分钟；再通过项目法测量被试定向遗忘任务成绩作为记忆控制分数。在数据分析过程中，首先，分别计算时域、频域及微状态等特征共 2604 个；通过最大相关最小冗余法选择最优特征子集，即为机器学习的预测变量。然后，以中位数为临界值将记忆控制得分转化为二分变量，作为机器学习的标签。最后，通过训练贝叶斯优化的支持向量机模型预测被试的记忆控制能力，采用十折交叉验证法训练模型并评估模型性能。实验结果显示，（1）最优特征子集包含 15 个静息态脑电特征，其中频域特征 12 个、微状态特征 2 个、时域特征 1 个；（2）训练的支持向量机模型对被试记忆控制能力分类的准确率为 95.65%、查准率为 95.65%、召回率为 95.65%、F1 得分为 95.65%，操作特性曲线面积为 0.97。结果表明，多维静息态脑电特征能够有效预测个体的记忆控制能力，其中频域特征在预测中发挥主要作用；支持向量机模型能够基于静息态脑电特征准确识别不同水平的记忆控制能力。

Predicting memory control from multidimensional resting-state EEG features: Based on machine learning

CHENG Xuelin ZHANG Yunfei DING Jinhong (Corresponding author)
College of Psychology, Capital Normal University, Beijing, 100048, E-mail: dingjh@cnu.edu.cn

Abstract: Memory control refers to the active forgetting of certain information (Anderson & Hanslmayr, 2014; Liu et al., 2020). It is crucial for individual mental health, and its impairment is an important risk factor for a number of mental disorders (Nørby, 2018; Waldhauser et al., 2018). Accurately identifying the extent of memory control impairment and providing timely intervention can help reduce the risk of mental disorders. The resting state is the baseline state of brain activity, reflecting the intrinsic ability of the brain to maintain function and to process information (Deco et al., 2011). Previous studies have shown that resting-state neural activity can predict various cognitive functions, such as inhibitory control and memory (Dong et al., 2021; Zhou et al., 2021). Therefore, resting-state neural activity may also serve as an effective predictor of memory control. However, it remains unclear how to select more effective features from a large amount of resting-state EEG signals to predict memory control and how these features predict memory control. In this study, we combined EEG technology and machine learning approach to analyze the role of multidimensional resting-state EEG features in accurately predicting individual memory control abilities.

There were 46 participants in the experiment (32 females, aged 21-28 years). During the experiment, the eye-closed EEG data in the resting state were collected for 5 minutes. Participants' performance in the directed forgetting task was measured using the item method, and the scores obtained were used as memory control scores. In the data analysis process, firstly, a total of 2604 features including time-domain, frequency-domain, and microstate features were calculated separately. The maximum relevance and minimum redundancy technique was employed to select the optimal feature subset as the predictors in machine learning. Then, the memory control scores were transformed into binary variables by using the median as the threshold to serve as the labels for machine learning. Finally, a Bayesian-optimized support vector machine model was trained to predict participants' memory control abilities. The model was trained and evaluated using 10-fold cross-validation. The results showed that (1) the optimal feature subset comprised 15 resting-state EEG features, including 12 frequency-domain features, 2 microstate features, and 1 time-domain feature; (2) the trained support vector machine model achieved an accuracy of 95.65%, precision of 95.65%, recall of 95.65%, F1 score of 95.65%, and the area under the operating characteristic curve of 0.97 in classifying participants' memory control abilities. These results indicate that multidimensional resting-state EEG features can effectively predict memory control abilities, with frequency-domain features playing a major role in the prediction. The support vector machine model can accurately identify different levels of memory control based on resting-state EEG features.

频繁进行媒体多任务对静息态脑电微状态的影响

张杰 李溪言 宋涵 张志杰（通讯作者）
河北师范大学心理系，石家庄，050024，zhzhj@mail.hebtu.edu.cn

摘 要 科技的高速发展使我们的工作和休闲时间都充斥着各种媒体信息，这也使得同时加工两种或两种以上媒体信息的行为越来越普遍。例如，一边听音乐一边读电子书，或者一边看视频一边聊天。近年来，研究者们将这种行为命名为媒体多任务，并开发了媒体多任务问卷来评估个体媒体多任务行为的程度，以期探讨长时间进行媒体多任务对各项认知功能的影响。研究发现，重度媒体多任务者比轻度媒体多任务者更容易受到任务无关信息的干扰，使得注意力难以集中在正在进行的任务中。然而，目前尚不清楚这一现象是由于重度媒体多任务者的注意控制能力受损造成的(缺陷假说)，还是他们仅仅采用了一种不忽视这些干扰物的策略(策略假说)。以往研究往往基于任务数据对重度和轻度媒体多任务者进行比较，而这些任务数据受到注意控制能力和策略使用的共同影响，难以区分。因此，仅仅基于传统的任务数据难以对这两个假说进行验证。本研究通过分析静息态脑电数据的方法，能够有效分离策略使用的影响，进而探讨重度和轻度媒体多任务者在注意控制能力上是否存在差异，以期对缺陷假说进行验证。通过对重度和轻度媒体多任务者的静息态脑电数据进行微观状态分析，结果发现重度媒体度者的凸显网络（微状态 C）激活程度要弱于轻度媒体多任务者。这一发现表明，与轻度媒体多任务者相比，重度媒体多任务者检测和过滤任务相关刺激的能力降低，从而支持了缺陷假说。此外，研究结果还发现与轻度媒体多任务者相比，重度媒体多任务者的视觉网络（微状态 B）激活增强，表明重度媒体多任务者对视觉信息的寻求更为强烈。综上所述，本研究结果表明重度媒体多任务者倾向于采用自下而上的注意分配方式，而轻度媒体多任务者则采用自上而下的方法。

Frequent media multitasking modulates the temporal dynamics of resting-state electroencephalography networks

Jie Zhang, Xiyan Li, Han Song, Zhijie Zhang*

Department of Psychology, Hebei Normal University, Shijiazhuang, China.

Abstract：Media and technology are saturating our work and entertainment time. Meanwhile, multitasking with two or more media and devices is increasingly pervasive. For example, one may read an electronic book while listening to music, or watch videos while chatting on instant messaging. To empirically investigate whether frequent media multitasking affects our cognitive abilities, a media use questionnaire has been developed to evaluate individuals' degree of media multitasking behavior. Converging studies have shown that heavy media multitaskers (HMM) are more easily distracted by task-irrelevant information than light media multitaskers (LMM). However, it remains unclear whether this phenomenon is due to deficits in HMM's attention control ability (deficit-producing hypothesis) or if they simply employ a strategy not to ignore such distractors (strategic hypothesis). Verifying the two hypotheses poses methodological difficulties because attention control ability and strategy usage are indistinguishable in traditional task-based data. The present study analyzed the electroencephalogram data recorded during resting-state periods to separate the influence of strategy usage.

Microstate analysis revealed that the activation of the salience network is weakened in HMM compared to LMM. This finding suggests HMM have a reduced ability to detect and filter pertinent stimuli compared to LMM, thereby supporting the deficit-producing hypothesis. Additionally, our results showed enhanced activation of the visual network in HMM compared to LMM, which is consistent with the findings that HMM have a greater demand for sensation seeking. Taken together, these results support the view that HMM allocate attention in a bottom-up manner, while LMM deploy a top-down approach.

间隔治疗范式优化高频 rTMS 对神经病理性疼痛的作用

刘颖[1]，严敏[1]，车先伟[2]（通讯作者）

1 浙江大学医学院附属第二医院，杭州，310009

2 杭州师范大学认知与脑疾病研究中心，杭州，311100，通讯作者 E-mail（xwcheswu@gmail.com）

摘 要

背景：重复经颅磁刺激（rTMS）是一种安全、无创的神经调控技术。大量研究证明 rTMS 能够有效缓解慢性疼痛。我们前期研究结果显示，10-Hz rTMS 和 pcTBS 连续干预 5 次可对神经病理性疼痛患者产生镇痛作用，但短期高频 rTMS 的镇痛效应通常只能维持几天，亟待优化刺激模式，延长镇痛作用。

目的: 本研究为随机双盲假刺激对照试验的系列研究，旨在探索连续 5 次的 rTMS 或 pcTBS 干预后的响应者再进行一周两次，为期四周的间隔治疗模式能否维持 rTMS 的镇痛疗效。

方法：一周连续 5 次干预后，10-Hz rTMS 组（n=10）和 pcTBS 组（n=11）获得镇痛效应的患者（$\frac{T1-T0}{T0}\times 100\% \geq 30\%$，或者 NRS 评分降低≧2 分）接受为期四周、每周两次的间隔治疗范式。并在干预后一个月进行随访。主要结局指标为疼痛的强度，采用 NRS 量表评估。次要结局指标包括简化的 McGill 问卷调查（SF-MPQ）、BPI、PGIC、BDI-II、MEP、CSP。

结果：pcTBS 和 10-Hz rTMS 的间隔治疗能进一步降低疼痛强度、SF-MPQ 总分、情感项和感觉项总分。BPI 结果显示，仅 10-Hz 组的间隔治疗能进一步降低 BPI 总分。一个月后随访两组各项指标仍可保持在五次干预后水平。TMS-EMG 结果显示，pcTBS 和 10-Hz rTMS 的间隔治疗均可显著增加 MEP 但对 CSP 无显著影响。相关性分析显示，四周连续治疗后 MEP 变化值能够有效预测随访期疼痛强度。

结论：间隔治疗范式可以进一步减轻神经病理性疼痛患者的疼痛感觉和疼痛相关负向情绪，并产生中短期累积效应。镇痛机制涉及皮质脊髓环路的兴奋性增加，且 10-Hz rTMS 与 pcTBS 的持续性镇痛效应可能在皮质脊髓环路存在部分重叠的机制。这些结果为未来优化 rTMS 的临床效果提供了实证基础和研究方向。

Extending the effects of transcranial magnetic stimulation on neuropathic pain by applying continuous treatment sessions

Ying Liu[1] , Min Yan[1], Xianwei Che[2]

1 Department of Anesthesiology, The Second Affiliated Hospital of Zhejiang University School of Medicine

2 Centre for Cognition and Brain Disorders, The Affiliated Hospital of Hangzhou Normal University

***Abstract*:**

Background: Repetitive transcranial magnetic stimulation (TMS) is a safe and noninvasive form of brain stimulation technique. A large number of studies have demonstrated a consistent analgesic effect of rTMS. Our previous research results showed that 5 consecutive interventions of 10-Hz rTMS and pcTBS can produce analgesic effect on patients with neuropathic pain. The analgesic effect of high-frequency rTMS usually lasts for a few days and needs to be maintained. However, a maintenance program with long-term efficacy has not been developed yet.

Aims: This study is a follow-up study of a randomized double-blind sham-stimulation controlled trial. The purpose was to explore whether continuous trial involving twice weekly sessions for 4 weeks could extend the analgesic effects of rTMS.

Method: Responders of patients in 10-Hz rTMS (n=10) and pcTBS group (n=11) (NRS score reduction ≧ 2 points or ≧ 30%) received continuous sessions of twice weekly for 4 weeks. Follow-up assessment was performed at one month after the intervention. The primary outcome was pain intensity and assessed using a numerical scale. Secondary outcomes included the simplified McGill questionnaire (SF-MPQ), BPI, PGIC, BDI-II, MEP, and CSP.

Result: Continuous TMS trials could further reduce pain intensity, SF-MPQ total score, and the affective and sensory dimension of pain. The BPI data showed that only the 10-Hz rTMS stimulation reduced the BPI score. During one-month follow-up, all the outcome measures could still be

maintained at the post1 treatment level. TMS-EMG data indicated that both pcTBS and 10-Hz rTMS increased MEP amplitude but had no effect on CSP. Moreover, MEP changes relative to post1 were associated with less pain changes in the follow-up period.

Conclusion: Continuous sessions of both 10-Hz rTMS and pcTBS are necessary to produce accumulative analgesic effect, which may share a common mechanism of corticospinal excitability in the sustained analgesic effect. These novel findings provide insight into the optimization of rTMS analgesia.

视觉工作记忆中相似性效应的时间进程

程钰欣[1]　郭利静[2]　叶超雄[1]（通讯作者）

1 四川师范大学脑与心理科学研究院，四川成都，610066，cxye1988@163.com

2 于韦斯屈莱大学心理系，芬兰于韦斯屈莱，40014

摘 要　视觉工作记忆是人类对输入的视觉信息进行短暂存储与加工的空间，其在高级认知系统中担任重要作用，但是视觉工作记忆容量是非常有限的。那么，为了适应同时输入的大量视觉信息，这就要求资源有限的视觉工作记忆高效存储的。因此，大量的研究围绕着视觉工作记忆如何高效处理信息。部分研究将视知觉领域的格式塔原则引入视觉工作记忆，并发现按照不同的格式塔原则排列的记忆刺激能够提高视觉工作记的表现，即格式塔效应。其中，由于在日常生活中人们需要处理大量类似的视觉刺激，因此本次研究着眼于相似性效应对视觉工作记忆的影响。前人研究发现相似性能够促进视觉工作记忆的表现，但尚未研究相似性效应产生的阶段。本次研究通过采用行为与脑电指标---对侧延迟活动（Contralateral Delay Activity, CDA）(对视觉工作记忆维持的信息数量敏感的脑电成分）来探究该效应及其时间进程。所有实验在项目数量一致的情况下设置了三种不同的分组条件，分别为一组相似项目分组，两组相似项目分组以及未分组（以下分别简称为“分组 1”、“分组 2”、“未分组”），以便观察相似性效应。实验一为行为实验，通过比较相似性分组与未分组的条件，重复前人在一组相似性分组条件下的相似性优势效应，同时证实分组 2 条件下也能够提升记忆表现。实验二为脑电实验，将维持阶段时间窗分为维持早期和维持晚期，并比较不同分组条件下在维持早期和维持晚期的 CDA 振幅，利用脑电技术在时间分辨率方面的优点，揭示相似性效应产生的阶段。实验二的结果显示，在维持早期时，分组 1 的 CDA 振幅显著小于分组 2 与未分组的 CDA 振幅，分组 2 和未分组之间的 CDA 振幅差异不显著；但在维持晚期分组 2 的 CDA 振幅低于未分组的 CDA 振幅。因此本次研究的证实了多个相似性分组条件下存在相似性效应，说明了当相似性分组的数量较少时，其相似性效应来源于视觉工作记忆的编码阶段；但当相似性分组的数量较多时，其相似性效应来源于视觉工作记忆的维持阶段。

Time course of similarity effects in visual working memory

Yuxin Cheng[1], Lijing Guo[2], Chaoxiong Ye[1]

1 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, China

2 Department of Psychology, University of Jyvaskyla, Jyväskylä, Finland

Abstract： Visual working memory is the space where humans transiently store and process incoming visual information, and it serves an important role in the higher cognitive system, but the capacity of visual working memory is very limited. Then, in order to adapt to the large amount of visual information input at the same time, it requires efficient storage of visual working memory with limited resources. Therefore, a great deal of research has centered on how visual working memory processes information efficiently. Some studies have introduced the Gestalt principles in the field of visual perception into visual working memory and found that memory stimuli arranged according to different Gestalt principles can improve the performance of visual working memory, i.e., the Gestalt effect. Among them, since people need to process a large number of similar visual stimuli in daily life, the current study looks at the effect of similarity effect on visual working memory. Previous studies have found that similarity promotes visual working memory performance, but the stage at which the similarity effect occurs has not been investigated. The current study explored the effect and its time course by using a behavioral and electroencephalographic indicator, Contralateral Delay Activity (CDA) (an electroencephalographic component sensitive to the amount of information maintained in visual working memory). Three different grouping conditions were set up for all experiments with the same number of items: one group of similar items grouped together, two groups of similar items grouped together, and no grouping (hereafter referred to as "Grouped 1", "Grouped 2", and "No Grouping", respectively), "ungrouped") in order to observe the similarity effect. Experiment 1 was a behavioral experiment, in which we compared the similarity grouped and ungrouped conditions to replicate the similarity effect of the previous experiment in a set of similarity grouped conditions, and to confirm that the grouped 2 condition was also able to enhance memory performance. Experiment 2 was an ERP experiment in which the maintenance phase time window was divided into early and late maintenance, and the CDA amplitudes in the early and late maintenance phases were compared between the different grouping conditions, to utilize the advantages of EEG technology in terms of temporal resolution and to reveal the phases in which the similarity effect occurs. The results of Experiment 2 showed that at the early maintenance stage, the CDA amplitude of grouped 1 was significantly smaller than that of grouped 2 and the ungrouped, and the difference in CDA amplitude between grouped 2 and the ungroup was not significant; however, at the late maintenance stage, the CDA amplitude of grouped 2 was lower than the CDA amplitude of the ungrouped. Therefore, the present study confirmed the existence of similarity effects under multiple similarity grouping conditions, indicating that when the number of similarity groupings is small, the similarity effect originates from the encoding stage of visual working memory; however, when the number of similarity groupings is large, the similarity effect originates from the maintenance stage of visual working memory.

基于特征的干扰物在视觉早期加工阶段的主动抑制

朱小章[1] 李宜伟[2] 王小桃[1]（通讯作者）

1 江西师范大学心理学院，南昌，330022，wangxt@jxnu.edu.cn

2 四川师范大学脑与心理科学研究院，成都，610066

摘 要　关于记住的干扰物特征（拒绝模板或干扰物模板）是否能被预先主动地抑制现在还存在争论。一种观点认为在刺激呈现之前干扰物就已经被预先抑制了，即主动抑制；另一种观点则认为干扰物最初会捕获注意力，随后快速地将注意力从干扰物上转移，即反应性抑制。为了检验这两种观点，本研究采用随机运动点阵范式(random dot kinematograms, RDKs)。在该范式中，两种颜色（分别为目标颜色和干扰物颜色）的 RDKs 重叠呈现，并可能会进行上下左右四个方向的移动。当目标颜色 RDKs 移动时，被试需要进行按键反应。两种颜色的 RDKs 以不同的频率闪烁，以在大脑视觉区域诱发相对应的神经震荡，即稳态视觉诱发电位（SSVEPs）。SSVEPs 振幅受注意的影响，被注意的刺激诱发的 SSVEP 振幅要大于不被注意的刺激。每位被试需要在连续两天的时间里面完成目标模板和干扰物模板两种条件。目标模板条件下，目标颜色只有一种并在实验前告知被试，而干扰物颜色在距离目标颜色 60 度之外的色轮上随机选取。反之，在干扰物模板条件下干扰物颜色只有一种，而目标颜色不固定。为更好的观察不同条件下注意的变化进程，本研究设定目标模板条件下干扰物颜色诱发的 SSVEP 为基线。结果显示，在目标模板条件下，目标颜色诱发的 SSVEP 振幅从刺激呈现 730ms 之后显著大于基线，并一直持续到刺激消失。在干扰物模板条件下，目标颜色诱发的 SSVEP 振幅在刺激呈现开始 200-342ms 之间显著高于基线，之后振幅降低至与基线没有显著差异；干扰物颜色诱发的 SSVEP 振幅在整个时间段都与基线不存在显著差异。这结果说明，当采用目标模板进行搜索时，对目标的注意增强作用发生在刺激呈现后的 730ms 之后，并且这种注意增强一直持续到刺激消失。而当采用干扰物模板进行搜索时，被试首先快速地注意目标颜色然后减少对目标的注意，而干扰物从一开始就没有被注意，说明对目标的注意增强是短暂的，并且记住的干扰物被预先主动地抑制了。本研究结果支持记住的干扰物特征能被预先主动地抑制这一观点，并且发现目标模板和干扰物模板条件下具有不同的注意模式。

Proactive suppression of feature-based distractor in the early stage of visual process

Zhu Xiaozhang[1]　Li Yiwei[2]　Wang Xiaotao[1]

1 School of Psychology, Jiangxi Normal University, Nanchang 330022, China

2 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu 610066, China

***Abstract*:** There has been a debate about whether the distractor features (a template for rejection or a distractor template) in memory can be suppressed in advance. One view is that the suppression happened before the onset of the stimulus, that is the proactive suppression. Another view is that the distractor capture attention in the first place, while it can shift away from it rapidly, that is the reactive suppression. Here, we investigated the two different views by using random dot kinematograms (RDKs), in which two completely overlapping RDKs of two different colors (target color and distractor color) are presented and may move in four directions, up, down, left or right. When the target color RDKs move, the participants need to respond by keystrokes. The two colors of RDKs flicker at different frequencies to evoke the steady-state visual evoked potentials (SSVEPs), an ongoing oscillatory that corresponding to the visual area of the brain. The amplitude

of SSVEPs is affected by attention, with attended stimulus evoking greater SSVEPs amplitudes than unattended stimulus. Participants were asked to complete both the target template and distractor template conditions over two consecutive days. In the target template condition, participants were informed in advance that there was only one target color and the distractor colors were randomly selected on a color wheel 60° away from the target color. Conversely, in the distractor template condition there was only one distractor color and the target color was random. To better observe the process of change in attention under different conditions, the present study set the SSVEPs evoked by the distractor color in the target template condition as the baseline. The results showed that in the target template condition, the target color RDKs evoked SSVEPs amplitude was significantly larger than the baseline from 730 ms after stimulus presentation and persisted until stimulus disappearance. In the distractor template condition, target color RDKS evoked SSVEPs amplitudes were significantly higher than baseline between 200-342ms from the onset of stimulus presentation, after which the amplitudes decreased to not significantly different from baseline; distractor color RDKs evoked SSVEPs amplitudes were not significantly different from baseline throughout the entire time period. These results suggests that when a target template was employed for search, the attentional enhancement to the target occurred after 730 ms after stimulus presentation, and that this attentional enhancement continued until the stimulus disappeared. In contrast, when a distractor template was used for search, subjects first rapidly attended to the target color and then reduced their attention to the target, and the distractor was not attended to from the beginning, suggesting that the attentional enhancement to the target was transient and that the distractor was suppressed in advance. Thus, we support that remembered distractor features can be proactively suppressed, and the attentional patterns of the target template and distractor template are different.

道德提升感对回收意愿的影响：自然联结的中介作用

杨倩[1] 黄瑶[1] 曾练平[1]（通讯作者 Email:zenglianping@163.com）
1 贵州师范大学心理学院，贵阳，550001

摘 要 近年来，由于产品快速更新换代以及人们消费模式转变，导致大量废弃物产生。废弃物的有效回收处理对保护环境、节约资源等有重要意义。已有研究探讨了道德提升感对亲环境行为的影响，但并未具体到某一领域（如回收），且其内在机制也较少探讨。本研究的目的是探讨诱发道德提升感是否会促进人们的回收意愿，及验证自然联结在两者之间的中介作用。首先随机呈现视频（道德提升感诱发视频和中性视频）或不呈现视频，对道德提升感水平进行操纵，然后使用道德提升感量表(C-MES)、自然联结量表(CNS)以及回收意愿量表，对 162 名成人进行线上问卷调查，其中男生 92 人占 56.79%，女生 70 人占 43.21%。采用 SPSS27.0 对数据进行分析处理。结果表明：（1）高道德提升感水平的个体，回收意愿越强，道德提升感对回收意愿有正向预测作用(β=0.08, $p < 0.05$)；（2）自然联结在道德提升感和回收意愿之间起完全中介作用；（3）加入回收态度和回收经验后，自然联结在道德提升感和回收意愿之间起部分中介作用。结论：

本研究表明道德提升感不仅可以直接预测回收意愿，也可以通过自然联结的中介作用间接预测其回收意愿。因此，提高人们的道德提升感或自然联结水平，能够促进人们的回收意愿，进而有助于改善环境、维护生态系统平衡，有效减缓资源浪费。

The effect of perceived moral elevation on recycling intention: the mediating role of natural connectedness

YangQian [1], HuangYao[1], Zeng Lianping[1]
1School of Psychology, Guizhou Normal University, Guiyang 550001, China

Abstract：In recent years, a large amount of waste has been generated due to the rapid renewal of products and changes in people's consumption patterns. Effective recycling and disposal of waste is important for protecting the environment and saving resources. Studies have been conducted to explore the effects of a sense of moral elevation on pro-environmental behavior, but they have not been specific to a particular area (e.g., recycling) and their underlying mechanisms have been less explored. The purpose of this study was to investigate whether inducing a sense of moral elevation promotes people's recycling intention, and to verify the mediating role of natural associations between them. The level of moral elevation was first manipulated by randomly presenting videos (moral uplift-evoking and neutral videos) or not presenting videos, and then an online questionnaire was administered by using the Moral Elevation Scale (C-MES), the Connectedness of Nature Scale (CNS), and the Recycling Intention Scale to 162 adults, of whom 92 (56.79%) were male and 70 (43.21%) were female. SPSS27.0 was used to analyze and process the data. The results showed that (1) individuals with high levels of moral elevation had stronger willingness to recycle, and moral elevation had a positive predictive effect on recycling intention (β = 0.08, p < 0.05); (2) the natural connectedness fully mediated the relationship between moral elevation and recycling intention; and (3) the natural linkage partially mediated the relationship between moral elevation and recycling intention after adding the attitude toward recycling and the experience of recycling. **Conclusion**: The present study shows that moral upliftment not only directly predicts the recycling intention, but also indirectly predicts the willingness to recycle through the mediating role of natural connectedness. Therefore, improving people's sense of moral elevation or natural connectedness can promote people's recycling intention, which in turn can help to improve the environmental protection, maintain the balance of the ecosystem, and effectively reduce the waste of resources.

中国优秀传统文化下主动全域健康和全人成长至兴盛的路径探索

王歆睿 [1]　韩布新 [2]（通讯作者）
1 成都工业学院，成都，611730

2 中国科学院心理健康重点实验室（心理研究所），北京，100101，hanbx@psych.ac.cn

摘 要 本文立足于中国优秀传统文化思想探索实现兴盛（flourish）的路径方法，提出基于文化本位的心理健康维护与促进模型。中国式兴盛观不同于西方兴盛观，西方文化背景（个体主义、理性）导致积极心理学研究带有明显西方文化印记。而中国文化注重精神生活的践行方式、人与自然、天人合一、中庸，中国兴盛观更重视人的动机、自我实现以及自我实现的动机、自我潜能的发挥。“精神性”是中国式兴盛观的重要内容，基于中国传统文化的中国式兴盛观包括“全人成长”和“主动全域健康”，涉及人观、健康观、疾病观、治疗观的认识，以精神健康为核心，是实现兴盛的理论基础和重要途径。本文致力于探索实现兴盛的主动健康行为，基于文化的主动全域健康行为是从心流获得兴盛的最佳途径，尤其是在中国优秀传统艺术实践活动中获得最佳心流体验。主动健康的心流文化实践需具备天赋、兴趣和才能三个要素。个人主动健康结合个人独特的天赋、兴趣和才能寻找适合自己的心流文化实践活动（如喜爱的工作和学习活动，习练诗书画印、广场舞、太极拳、八段锦、五禽戏、正念等），实现人的个性化发展，发现天赋、培养兴趣、发展能力，体悟人生三感（意义感、控制感和归属感），获得自我觉醒与发展成长，长久有效调动自身积极资源，在个人（表情达意）、社会（服务社会）、自然（天人合一或人类命运共同体）和宇宙（浩然正气）的各自层面及整合水平实现主动全域健康，以达到兴盛。

Path exploration of Active health and whole-person growth to flourishing path exploration under the excellent traditional Chinese culture

Wang Xinrui [1] Han Buxin[2*]

1.Student Affairs Department of Chengdu Technological University, Chengdu, 611730

2. CAS Key Laboratory of Mental Health, Chinese Academy of Sciences (Institute of Psychology), Beijing, 100101

***Abstract*:** Based on the way of Chinese excellent traditional cultural thoughts to explore the way to flourish, this paper puts forward a model of maintaining and promoting mental health based on cultural model. The Chinese view of flourishing is different from the western view of flourishing. The Western cultural background (individualism, rationality) leads to the positive psychology research with obvious Western cultural imprint. Chinese culture focuses on the practice of spiritual life, man and nature, the unity of nature and man, the Golden Mean, the view of flourishing in China pays more attention to people's motivation, self-realization, motivation of self-realization and the exertion of self-potential. "Spirituality" is an important content of Chinese flourishing, which based on Chinese traditional culture includes "Whole-person growth" and "Active health", it is the theoretical basis and important way to realize the flourishing with the core of mental health, which involves the cognition of human view, health view, disease view and treatment view. This paper aims to explore the active health behaviors to achieve flourishing, and culture-based active health behaviors are the best way to achieve flourishing from flow, especially in Chinese outstanding traditional art practice to get the best flow experience. Active and healthy flow culture practice requires three elements: talent, interest and ability. Individuals active healthy need combine their unique talents, interests and ability to find suitable flow cultural activities (such as favourite work and study activities, practising poetry, calligraphy and painting, square dance, tai chi, Baduanjin exercise, Five-Animal Exercises, mindfulness, etc.) , to realize individual development, to discover talent, to

cultivate interest, to develop ability, to realize the three senses of life (sense of meaning, sense of control and sense of belonging) , to achieve self-awakening and development and growth, long-term and effective mobilization of their own positive resources, in the individual (expression of ideas) , society (service to society) , Nature (the unity of man and nature or the community of human destiny) and the universe (Noble and righteous) at their respective levels and integration level to achieve active health, to achieve flourishing.

Keywords**:** Excellent traditional Chinese culture; Flourishing; Whole-person growth; Active health; Practice of flow culture

当代成年人忧患意识的结构与测量

宿飞扬　胡永祺　桑明磊　姜温君　陈英敏（通讯作者）

山东师范大学心理学院，济南，250358，通讯作者 E-mail: cc8030306@163.com

摘 要　当今人类社会处于变局之中，各种危机频发，大如自然生态危机、国际战争危机等，小如家庭危机、个人发展性危机等，如何应对这些危机？中华民族在几千年的发展中积累和塑造了一定的经验和智慧，其中，作为积极应对危机与灾难方式之一的忧患意识千古流传，它能够提醒个体居安思危，防患未然，帮助个体更好地适应与发展，也可以帮助国家防范重大风险，在危机中育先机，于变局中开新局。

目的：目前对于忧患意识的研究基本集中在哲学领域，且多为理论研究，从心理学角度进行探讨几乎空白。因此，本研究拟对忧患意识这一传统文化基因进行心理学探究。

方法：首先通过对古籍整理建立忧患意识的语料库，梳理出有关忧患意识的内涵、外延、功能等基本内容；在此基础上以成年人为对象进行调查，编制当代中国人的忧患意识量表；最后以自编的忧患意识量表为测量工具，一方面考察忧患意识的当代特点与时代变迁；另一方面，选取心理健康作为个体适应性的指标，初步考察忧患意识的适应功能，以便为忧患意识的科学继承与发展提供客观的依据与参考。

结果：（1）通过数据库检索的方法，收集儒家经典中关于忧患意识的语段，经过简化整理后形成了正式的语料库，并按照忧患意识的主体、产生的情境属性、成分、内容以及功能等进行了整理；（2）对被试进行忧患意识的开放式调查，调查 150 名被试，分析了解当今国人对忧患意识的含义、情境、反应、内容与功能的认识与理解，以及忧患意识的古今对比；（3）在前面研究基础上，调查 390 名被试，编制了当代中国人忧患意识初测问卷，并对问卷的信效度加以检验，最终得到 22 个题项的忧患意识问卷，分为个人忧患意识、家庭忧患意识、国家忧患意识和自然忧患意识四个维度，且符合心理测量学要求，具有良好的信效度；（4）以自编忧患意识问卷为测量工具，调查 1478 名被试，初探中国成年人忧患意识特点及其个体的适应性，发现忧患意识显著正向预测个体的心理健康，且应对方式在其中起部分中介效应。

The structure and measurement of contemporary adult sense of hardship

Feiyang Su　Yongqi Hu　Minglei Sang　Wenjun Jiang　Yingmin Chen（Corresponding Author）

School of Psychology in ShanDong Normal University, Jinan, 250358

Abstract**：** Nowadays, human society is in a state of change, with various crises occurring frequently, such as

natural ecological crisis, international war crisis, etc., and small crises such as family crisis and personal development crisis, etc. How to deal with these crises? The Chinese nation has accumulated and shaped a certain amount of experience and wisdom during thousands of years of development, among which, the sense of distress, as one of the ways to actively respond to crises and disasters, has been passed down through the ages. It can remind individuals to be prepared for danger in times of safety, prevent disasters before they arise, help individuals better adapt to and develop, and help the country to prevent major risks, foster opportunities in crises, and open new situations in times of change.

Purpose: At present, the research on the awareness of distress is mainly concentrated in the field of philosophy, and most of it is theoretical, and there is almost no discussion from the perspective of psychology. Therefore, this study intends to conduct psychological research on the traditional cultural gene of distress awareness.

Methods: Firstly, by collating ancient books and establishing a corpus of the sense of distress, the basic contents of the sense of distress, such as connotation, extension and function, were sorted out. On this basis, adults are investigated and a scale of contemporary Chinese people's sense of distress is compiled. At last, we use the self-designed anxiety consciousness scale as a measuring tool. On the one hand, we examine the contemporary characteristics and times changes of anxiety consciousness. On the other hand, mental health is selected as the index of individual adaptability, and the adaptive function of the sense of distress is preliminarily investigated in order to provide objective basis and reference for the scientific inheritance and development of the sense of distress.

Results: (1) Through the method of database retrieval, we collected the passages about the sense of distress in the Confucian classics, and formed a formal corpus after simplification, and sorted them according to the subject of the sense of distress, the situational attributes, components, content and functions; (2) Conduct an open survey on the awareness of anxiety among 150 subjects to analyze and understand the current Chinese people's awareness and understanding of the meaning, context, reaction, content and function of the awareness of anxiety, as well as the comparison between ancient and modern awareness of anxiety; (3) On the basis of the previous research, 390 subjects were investigated, and a preliminary questionnaire for the awareness of anxiety of contemporary Chinese people was prepared. The reliability and validity of the questionnaire were tested, and a 22-item questionnaire was finally obtained, which was divided into four dimensions: personal awareness of anxiety, family awareness of anxiety, national awareness of anxiety and natural awareness of anxiety, and it met the requirements of psychometrics. It has good reliability and validity; (4) Using self-designed anxiety awareness questionnaire as a measuring tool, 1,478 subjects were investigated to explore the characteristics of Chinese adults' anxiety awareness and their individual adaptability, and it was found that anxiety awareness significantly positively predicted individual mental health, and coping style played a part in mediating effect.

人际敏感性与大学生生活满意度的关系：

智能手机成瘾的中介作用和自然联结的调节效应

代文武[1] 魏秀超[2] 李秋怡[1] 杨智辉[1]（通讯作者）

1 北京林业大学人文社会科学学院心理系，北京，100083，zhihuiyang2008@126.com
2 河北师范大学教育学院，石家庄，050024

摘 要　生活满意度是积极心理学研究热点之一，属于主观幸福感的认知因子。相比于主观幸福感的情感因子，生活满意度是更能反映中国人的幸福感状况。对大学生而言，生活满意度在个体适应性发展上发挥着关键作用。因此，探究大学生生活满意度的影响机制一直受到研究者的广泛关注。在众多影响因素中，人际敏感性作为一种典型的人际关系问题因素，对大学生生活满意度具有深远影响。然而，探究人际敏感性究竟是如何影响大学生生活满意度的研究尚少，仍有待于进一步探究。其中，手机成瘾作为极易受到人际关系问题影响且对大学生生活满意度同样具有重要影响作用的变量，极可能在人际敏感性和生活满意度之间扮演着重要角色；为了有效降低人际敏感性和手机成瘾对大学生生活满意度的风险，本研究还从人与自然关系的视角探索自然联结这一保护性因素在其关系中发挥的调节作用。本研究探究了大学生人际敏感性和生活满意度的关系，以及智能手机成瘾的中介作用和自然联结的调节效应。采用人际敏感性量表，智能手机成瘾量表，自然联结量表和生活满意度量表对 702 名大学生进行了问卷调查。结果发现：（1）大学生人际敏感性与生活满意度之间存在显著地负相关；（2）智能手机成瘾在大学生人际敏感性与生活满意度的关系中起到部分中介作用；（3）自然联结在人际敏感性对大学生生活满意度的影响路径中没有起到调节作用，但自然联结在智能手机成瘾对大学生生活满意度的影响路径中起到了调节作用，且调节模式符合“杯水车薪”模式。本研究发现了影响大学生生活满意度的风险因素和保护因素，为提高大学生生活满意度和生活质量提供了实证研究依据。

The Mediating Role of Smartphone Addiction between Interpersonal Sensitivity and Life Satisfaction among College Students: The Moderating Effect of Connectedness to Nature

Wenwu Dai[1], Xiuchao Wei[2], Qiuyi Li[1], Zhihui Yang[1] (Corresponding author)
1 Department of Psychology，School of Humanities and Social Sciences，Beijing Forestry University，Beijing 100083，China
2 College of Education，Hebei Normal University，Shijiazhuang，050024

Abstract：Life satisfaction is one of the hot topics in positive psychology, and it is as a cognitive factor of subjective well-being. Compared with an emotional factor, life satisfaction is a better reflection of Chinese subjective well-being. For college students, life satisfaction plays a key role in individual adaptive development. Therefore, exploring the influencing factors of college students' life satisfaction has been widely concerned by researchers. Among many influencing factors, interpersonal sensitivity, as a typical interpersonal problem factor, has a profound impact on college students' life satisfaction. However, there are still few studies on how interpersonal sensitivity affects college students' life satisfaction, and further research is still needed. Smartphone addiction is a variable that is easily affected by interpersonal problems and also has an important role on college students' life satisfaction, which is likely to play an important role between interpersonal sensitivity and life satisfaction. In order to effectively reduce the risk of interpersonal sensitivity and smartphone addiction on life satisfaction, this study also explores the moderating effect of connectedness to nature in the relationship from the perspective of the relationship between human and nature.Our study investigated the relationship between interpersonal sensitivity and life satisfaction among college students, the mediating effect of smartphone addiction,

and the moderating effect of connectedness to nature. A total of 702 college students were tested by Interpersonal Sensitivity Scale, Smartphone Addiction Scale, Connectedness to Nature Scale, and Satisfaction with Life Scale. This study indicated that: (1) Interpersonal sensitivity showed a significant negative correlation with life satisfaction among college students; (2) Smartphone addiction played a partial mediatingrole in the relationship between interpersonal sensitivity and life satisfaction among college students; (3) Connectedness to nature did not play a moderating effect in the relationship between interpersonal sensitivity and life satisfaction among college students, but it played a moderating effect in the relationship between smartphone addiction and life satisfaction among college students, following a “drop-in-the-bucket”(杯水车薪) pattern. These findings identified both risk factors and protective factors that influence life satisfaction among college students, providing valuable guidance for enhancing their life satisfaction.

Keywords：Interpersonal sensitivity, Smartphone addiction , Connectedness to nature, Life satisfaction

亲子关系与中学生生活满意度的关系：心理韧性的中介作用

姚琼[1,2]（通讯作者） 陈文琴[1]

1 合肥师范学院，合肥，230061，E-mail：120400298@qq.com

2 安徽省学生心理健康教育指导中心，合肥，230061，

摘 要 家庭是影响中学生发展的重要微观系统之一，对中学生的生活满意度会产生影响，但对其中影响机制的探讨还较为缺乏，特别是个体的内在主观能动性在环境对人产生作用的过程中所起的作用应该引起关注。因此，本研究基于积极心理学的视角，对中学生的亲子关系、心理韧性和生活满意度进行调查，探究亲子关系对生活满意度的影响机制，进一步丰富生活满意度的相关研究。采用《亲子亲密度量表》、《心理韧性量表》和《生活满意度表》对安徽省普通初中、普通高中的学生进行调查，获得 1420 份有效数据，三个量表在本研究中的内部一致性系数分别为 0.93,0.92,0.95。结果发现，亲子关系、心理韧性和生活满意度之间两两相关（相关系数范围 0.525-0.878），进一步中介效应检验发现，心理韧性在亲子关系和生活满意度中起部分中介作用，中介效应占比 53.85%。研究提示，亲子关系不仅可以直接对生活满意度产生影响，也可以通过心理韧性的中介作用产生影响。为增进中学生的心理健康水平，一方面需要通过家庭支持构建良好的亲子关系，父母注重与孩子的沟通，提高陪伴质量，为中学生提供良好的情感支持和帮助，以提升中学生的生活满意度；另一方面，关注心理韧性这一比较稳定的个体内部因素，家校合作共育培养中学生的心理韧性，通过团体心理辅导等帮助中学生在面对生活与学习中的挫折时保持积极情绪和弹性应对，以提升其生活满意度。

The research between parent-child relationship and life satisfaction of middle school students：The mediating role of Resilience

Yao Qiong[1, 2] Wen-qin Chen[1]

1 Hefei Normal University, Anhui Hefei, 230601, E-mail：120400298@qq.com

2 Anhui Mental Health Education and Guidance Center for Student,Anhui Hefei, 230601

Abstract：Family is one of the important microsystems that affect the development of middle school students, and it can have an impact on their life satisfaction. However, there is still a lack of exploration of the mechanism of its impact, especially the role of individuals' internal subjective initiative in the process of environmental impact on people, which should be paid attention to. Therefore, this study is based on the perspective of positive psychology

to investigate the parent-child relationship, resilience, and life satisfaction of middle school students, explore the impact mechanism of parent-child relationship on life satisfaction, and further enrich relevant research on life satisfaction. A survey was conducted on students in ordinary middle and high schools in Anhui Province using the Parent-child Intimacy Scale, Resilience Scale, and Life Satisfaction Scale. 1420 valid data were obtained, and the internal consistency coefficients of the three scales in this study were 0.93, 0.92, and 0.95, respectively. The results showed that there was a pairwise correlation between parent-child relationship, resilience and life satisfaction (the correlation coefficient ranged from 0.525-0.878). Further Mesomeric effect test found that resilience played a part of mediation role in parent-child relationship and life satisfaction, with the Mesomeric effect accounting for 53.85%. Research suggests that parent-child relationships can not only directly affect life satisfaction, but also have an impact through the mediating role of resilience. To improve the mental health level of middle school students, on the one hand, it is necessary to build a good parent-child relationship through family support. Parents should pay attention to communication with their children, improve the quality of companionship, provide good emotional support and assistance for middle school students, and improve their life satisfaction; On the other hand, attention should be paid to resilience, a relatively stable internal factor of the individual. Family school cooperative education should cultivate the resilience of middle school students, and group psychological counseling should be used to help them maintain positive emotions and resilience when facing setbacks in life and learning, in order to improve their life satisfaction.

Keywords：Middle school students，Life satisfaction，Resilience，Parent-child relationship

职前教师社会支持与心理幸福感：一个有调节的中介模型

惠琪[1] 朱荣娟[1] 李苑[2] 李瑛[2] 车翔[2] 游旭群[2]（通讯作者）

1 西安科技大学管理学院，西安，710054

2 陕西师范大学心理学院，陕西省行为与认知重点实验室，西安，710062, youxuqun@snnu.edu.cn

摘 要 职前教师群体是基础教育工作的骨干力量，该群体在工作中是否能体验到幸福感，对于提高未来教育工作质量和教师自身生活质量都有着重要意义。社会支持是影响教师心理幸福感中极为重要的宏观社会类因素之一，它是指个体从其所拥有的社会关系网络中获得的主观支持、客观支持以及个体自身对所获得支持的利用度。已有研究发现，社会支持在心理幸福感中扮演着重要角色，然而对于社会支持对心理幸福感影响的潜在机制还有待深入探讨。本研究拟构建一个有调节的中介模型，旨在考察职前教师职业认同在社会支持与幸福感之间的中介作用以及情绪智力的调节作用。社会支持缓冲器模型认为，社会支持是通过消除个体的压力进而缓冲压力事件对个体身心状况的消极影响，保持与提高个体的身心健康水平。情绪智力理论认为，情绪智力作为个体认识、利用、理解和控制情感信息的能力，会促进积极情绪对其职业认同的正向预测作用。综上，我们假设社会支持对心理幸福感有正向预测作用，情绪智力可以调节社会支持对和职业认同的影响。本研究采用社会支持量表、免费师范生教师职业认同量表、心盛量表和情绪智力量表对 450 名职前教师进行了调查。研究分析了社会支持、职业认同、心理幸福感和情绪智力之间的相互作用。结果表明，在控制性别、年龄后，职前教师社会支持、心理幸福感、职业认同和情绪智力两两之间存在显著相关。职业认同在社会支持与心理幸福感的关系间起部分中介作用。情绪智力调节了“社会支持-职业认同-心理幸福感”的前半段路径，即当职前教师情绪智力水平低时，社会支持对职业认同的正向预测作用减弱；当情绪智力水平高时，社会支持对职业认同的正向预测作用增强。基于上述发现，本研究认为职前教师的社会支持对于其职业认同感和心理幸福感有着重要作用，此外，该调节模式也从实践角度启示我们，有必要加强职前教师的情绪智力水平，这将有助于促进职前教师的心理幸福感。

关键词　职前教师，社会支持，职业认同，心理幸福感，情绪智力

Social Support and Psychological Well-being of Pre-service Teachers: A Moderated Mediation Model

Qi Hui[1] Rongjuan Zhu[1] Yuan Li[2] Ying Li[2] Xiang Che[2] Xuqun You[2*]
1 School of Management, Xi'an University of Science and Technology, Xi'an, 710054, China
2 School of Psychology, Shaanxi Normal University, Key Laboratory for Behavior and Cognitive Neuroscience of Shaanxi Province,710062, China

Abstract：The group of pre-service teachers is the backbone of basic education work, and whether this group can experience well-being in their work is of great significance for improving the quality of future education work and the quality of teachers' own lives. Social support is one of the extremely important macro social factors that affect teachers' psychological well-being. It refers to the subjective and objective support individuals receive from their social relationship network, as well as their own utilization of the support they receive. Previous studies have found that social support plays an important role in psychological well-being, but the potential mechanisms underlying the impact of social support on psychological well-being still need to be further explored. This study aims to construct a moderated mediation model to examine the mediating role of pre-service teacher professional identity between social support and psychological well-being, as well as the moderating effect of emotional intelligence. The social support buffer model believes that social support is to eliminate individual pressure and then buffer the negative impact of stress events on individual physical and mental conditions, so as to maintain and improve individual physical and mental health. The theory of emotional intelligence suggests that emotional intelligence, as an individual's ability to recognize, utilize, understand, and control emotional information, promotes a positive predictive effect of positive emotions on their professional identity. In summary, we assume that social support has a positive predictive effect on psychological well-being, and emotional intelligence can regulate the impact of social support on professional identity. This study conducted a survey on 450 pre-service teachers using the Social Support Scale, Student Teacher Professional Identity Scale, Prosperity Flourishing Scale, and Emotional Intelligence Scale. The study analyzed the interaction between social support, professional identity, psychological well-being, and emotional intelligence. The results indicate that after controlling for gender and age, there is a significant correlation between pre-service teachers' social support, psychological well-being, professional identity, and emotional intelligence. Professional identity plays a partial mediating role in the relationship between social support and psychological well-being. Emotional intelligence regulates the first half of the path of "social support-professional identity-psychological well-being", that is, when the emotional intelligence level of pre-service teachers is low, the positive predictive effect of social support on professional identity weakens; When the level of emotional intelligence is high, the positive predictive effect of social support on professional identity increases. Based on the above findings, this study suggests that social support for pre-service teachers plays an important role in their professional identity and psychological well-being. In addition, this regulatory model also enlightens us from a practical perspective that it is necessary to strengthen the emotional intelligence level of pre-service teachers, which will help promote their psychological well-being.

Keywords： pre-service teachers, social support, professional identity, psychological well-being, emotional intelligence

年轻人的儿童期积极经历与快乐论幸福感和实现论幸福感的关系

王日新[1] 李程程[1] 郭甜甜[1] 钟凯馨[1] 朱宁哲[1] 孔凤[1]（通讯作者）
1 陕西师范大学心理学院，西安，710062，kongfeng87@126.com

摘 要 儿童期的经历与个体的人格形成和各种能力的发展有关，会对个体一生的成长和健康产生重要影响，其中积极经历近几年来受到了越来越多的关注。根据幸福感的引擎模型和积极经历的健康结果框架理论，儿童期积极经历能够通过影响个体的情绪、认识等内部过程带来一些有益的结果，从而有助于幸福感的提升。以往研究显示，儿童期积极经历与成年期的快乐论幸福感和实现论幸福感呈正相关关系，但主要采用横断设计，并且目前仍缺乏关于儿童期积极经历对两种幸福感的影响是否存在差异的研究。因此有必要在一个研究中同时探讨儿童期积极经历与快乐论幸福感和实现论幸福感的关系，并进一步从纵向发展的角度研究儿童期的积极经历对成年早期两种幸福感的影响。为此，研究一选取了西安市 1265 名大学生作为被试，采用横断研究检验儿童期积极经历和两种幸福感的关系。结果显示，儿童期积极经历和成年早期的快乐论幸福感和实现论幸福感均呈显著的正相关。为了进一步考察儿童期积极经历对于两种幸福感的预测效应，研究二选取了 232 名大学生被试，通过两拨次纵向设计检验了儿童期积极经历对六个月后两种幸福感的影响。结果显示，儿童期积极经历可以正向预测成年早期快乐论幸福感和实现论幸福感。此外，两个研究的结果都表明，儿童期的积极经历对两种幸福感有着同等程度的影响。在控制了年龄、性别和另一种幸福感之后，研究结果保持不变。综上所述，本研究揭示了儿童期积极经历对成年早期的快乐论幸福感和实现论幸福感的同等正向影响。因此，学术界、政府、社会和家庭应该更加重视儿童期经历的作用，努力为儿童营造更好的成长环境以促进儿童身心健康发展。

Abstract： Experiences during childhood are related to the formation of an individual's personality and the development of various abilities, and they have significant impacts on a person's lifelong growth and well-being. Among these experiences, positive experiences have received increasing attention in recent years. According to the Engine Model of Well-being and the Health Outcomes of Positive Experiences framework, positive childhood experiences (PCEs) can bring about beneficial outcomes by influencing internal processes such as emotions and cognition in individuals, thus contributing to the enhancement of well-being. Previous studies have demonstrated a positive correlation between PCEs and both hedonic well-being and eudaimonic well-being in adulthood. However, these studies primarily utilized cross-sectional designs, and currently, there is still a lack of research examining whether there are differences in the impact of PCEs on these two kinds of well-being. Therefore, it is necessary to examine the relationship between PCEs and both hedonic well-being and eudaimonic well-being in a single study, and further investigate the impact of PCEs on these two kinds of well-being in young adults from a longitudinal perspective. In Study1, we selected a sample of 1265 college students from Xi'an City as participants to examine the relationship between PCEs and two kinds of well-being using a cross-sectional research design. The results showed a significant positive correlation between PCEs and young adults' hedonic well-being as well as eudaimonic well-being. To further examine the predictive effects of PCEs on the two kinds of well-being, Study 2

selected 232 college student participants and utilized a two-wave longitudinal design to investigate the impact of PCEs on the two kinds of well-being six months later. The results revealed that PCEs positively predict both hedonic well-being and eudaimonic well-being in early adulthood. Furthermore, the results from both studies indicate that PCEs have an equal level of influence on both kinds of well-being. After controlling for age, gender, and the other kind of well-being, the findings remained consistent. In summary, this study demonstrated an equal positive influence of PCEs on both hedonic well-being and eudaimonic well-being in young adults. In the future, the academic community, government, society, and families should place greater emphasis on the role of childhood experiences and strive to create better developmental environments for children to foster their physical and mental well-being.

***Keywords*:** Positive childhood experiences, Hedonic well-being, Eudaimonic well-being, Early adulthood

不执着的机制研究：认知灵活性的中介作用

朱筠[1]　张禹[1]　罗禹[1]

1 贵州师范大学心理学院，贵阳，550025，cathy_zhu214@163.com

摘 要　不执着是与正念相关但不同的概念，它是个体积极融入当下环境，接纳生命的短暂和变化无常，并且自主地做出选择的心理特性，具体表现为不固着于想法、情绪或外在事物，对成就、得失等一切经验保持开放与灵活。不执着有益于个体的心理健康、高级心理发展和人际功能，如个体的不执着水平与生活满意度、自我实现、共情等正相关，与抑郁、焦虑、压力、排斥敏感性、焦虑型依恋等负相关。研究表明，不执着是正念最突出的机制之一，且研究者认为冥想研究和干预的重点应放在类似不执着这样的概念上。然而，不执着起作用的机制还未曾探索。有研究者提出，执行功能中的认知灵活性可能是不执着的机制。本研究构建以认知灵活性为中介变量的中介模型以考察不执着的机制。采用在网络平台随机发放问卷的方式，共有 725 人（男生 257 人，年龄 18~60 岁）完成了不执着简版量表(Brief Version of Nonattachment Scale, NAS-7)、认知灵活性问卷中文版(Cognitive Flexibility Inventory, CFI)、生活满意度量表(Satisfaction With Life Scale, SWLS)、抑郁-焦虑-压力自评量表简版(Depression Anxiety and Stress Scale，DASS-21)、普遍信任量表(Inclusive General Trust Scale, IGTS)，采用 bootstrap 方法进行中介检验，以年龄、性别、婚姻状况、是否有正念经验作为协变量。结果显示：（1）不执着与生活满意度、认知灵活性正相关，与抑郁、焦虑、压力负相关，且认知灵活性在不执着与生活满意度以及不执着与抑郁、焦虑、压力的关系中起部分中介作用。（2）不执着与信任正相关，认知灵活性与信任正相关，但认知灵活性在不执着与信任的关系中中介效应不显著。原因可能为个体的态度和行为存在差异，且认知灵活性问卷的题目偏向于问题解决方面，未来可使用实验范式测量认知灵活性和信任，进一步探究认知灵活性为不执着的生物学基础。

Mechanisms of Nonattachment : The Mediating Role of Cognitive Flexibility

Jun Zhu[1]　Yu Zhang[1]　Yu Luo[1]

1 School of Psychology, Guizhou Normal University, Guiyang, 550025, cathy_zhu214@163.com

***Abstract*：** Nonattachment is a construct distinct from mindfulness. It refers to an individual's psychological characteristic of actively engaging with the present moment, accepting the impermanence and unpredictability of life, and autonomously making choices. It entails not clinging to thoughts, emotions, or external circumstances,

and maintaining openness and flexibility in the face of achievements, gains, and losses. Nonattachment promotes psychological well-being, advanced psychological development, and interpersonal functioning. Higher levels of nonattachment are positively correlated with life satisfaction, self-actualization, empathy, etc., while negatively correlated with depression, anxiety, stress, rejection sensitivity, and anxious attachment. Research suggests that nonattachment is one of the prominent mechanisms underlying mindfulness, and researchers propose that meditation research and interventions should focus on concepts similar to nonattachment. However, the mechanisms through which nonattachment operates have not been explored. Some researchers propose that cognitive flexibility, a facet of executive functioning, may be a mechanism of nonattachment. This study aims to examine the mechanism of nonattachment by constructing a mediation model with cognitive flexibility as a mediating variable. A total of 725 participants (257 males, aged 18~60 years) completed the Brief Version of Nonattachment Scale (NAS-7), the Chinese version of the Cognitive Flexibility Inventory (CFI), the Satisfaction With Life Scale (SWLS), the Depression Anxiety and Stress Scale (DASS-21), and the Inclusive General Trust Scale (IGTS) through online questionnaires distributed randomly. Bootstrap method was used for mediation analysis, with age, gender, marital status, and mindfulness experience as covariates. The results showed that: (1) Nonattachment was positively correlated with life satisfaction and cognitive flexibility, and negatively correlated with depression, anxiety, and stress. Cognitive flexibility partially mediated the relationship between nonattachment and life satisfaction, as well as between nonattachment and depression, anxiety, and stress. (2) Nonattachment was positively correlated with trust, and cognitive flexibility was positively correlated with trust. However, cognitive flexibility did not significantly mediate the relationship between nonattachment and trust. This may be due to individual differences in attitudes and behaviors, as well as the problem-solving focus of the cognitive flexibility questionnaire. Future research could employ experimental paradigms to measure cognitive flexibility and trust, further exploring the biological basis of cognitive flexibility for nonattachment.

来自自然的力量：敬畏对个体自我扩展的影响

布雅静　张晓瑜　张潮（通讯作者）
山西师范大学教育科学学院，太原，030031，zhangchao951217@163.com

摘 要 自我扩展通常被理论化为一种重要的个人动机，旨在通过增加一个人的新资源、观点和身份，并将这种新颖性纳入一个人的自我定义，来增加自我概念的多样性和复杂性。相关研究指出：更大的自我扩展偏好与更大的个人成长、自我认同强度、生活满意度、心理健康等有关。自我扩展通常被研究于恋爱关系之中，而研究发现在自然环境中的人们随着社会观念的减弱，个体的自我会融入自然环境之中，得到很大的成长。而敬畏是由神秘、浩大且超出当前认知的事物所引发的复杂情绪体验，是个体在面对自然时产生的最主要的一个情绪。敬畏情绪会使个体产生深刻的“小我”体验，个体的感知从以自我为中心转变为一个更广阔的框架，使个体对生命意义产生深刻思考，个体自我概念由此会得到很大的明晰。个体自我概念清晰性也会影响个体自我扩展的动机，对自己是谁没有清晰认识的人，自我扩张的欲望较低。以此，本研究基于敬畏的小我理论和积极情绪扩展理论，探究自然敬畏是否会通过影响个体的自我概念清晰性而影响个体的自我扩展动机。方法:将 326 名被试分为两组，实验组通过视频材料激活敬畏情绪，对照组不激活敬畏情绪，并采用敬畏体验量表(Awe Experience Scale, AWE-S)、修改后的将他人纳入自我量表(IOS)和自我概念清晰性量表进行问卷调查。预期结果：（1）敬畏、自我概念清晰性与自我扩展动机两两呈显著正相关。（2）自我概念清晰性在敬畏对自我扩展动机的影响中起中介作用。
关键词 敬畏，自我扩展，自我概念清晰性

Power from Nature: The Impact of Awe on Individual Self-expansion

BU Yajing Zhang Xiaoyu Zhang Chao(Corresponding Author)
College of Education Science, Shanxi Normal University, Taiyuan

Abstract: Self-expansion is often theorized as an important personal motivation aimed at increasing the variety and complexity of one's self-concept by adding one's new resources, perspectives, and identities and incorporating this novelty into one's self-definition sex. Related research indicates that a greater preference for self-expansion is associated with greater personal growth, strength of self-identity, life satisfaction, mental health, and more. Self-expansion is usually studied in romantic relationships, and studies have found that people in natural environments have weakened social concepts, and individual ego will integrate into the natural environment and grow greatly. Awe is a complex emotional experience triggered by mysterious, vast, and beyond current cognition, and it is the most important emotion that an individual generates when facing nature. The emotion of awe will cause the individual to have a profound "ego" experience, and the individual's perception will change from self-centered to a broader framework, making the individual think deeply about the meaning of life and the individual self-concept will be greatly clarified. Individual self-concept clarity also affects individual motivation for self-expansion. People who do not clearly understand who they are have a lower desire for self-expansion. Therefore, based on the ego theory of awe and the expansion theory of positive emotions, this study explores whether natural awe can affect individuals' self-expansion motivation by affecting the clarity of individuals' self-concept. Method: Divide 326 subjects into two groups. The experimental group activates the awe emotion through video materials, and the control group does not trigger the awe emotion. The Awe Experience Scale (AWE-S) and the modified Awe Experience Scale (AWE-S) are used to include others. Self-inventory (IOS) and Self-Concept Clarity Scale for questionnaire survey. Expected results: (1) There is a significant positive correlation between awe, self-concept clarity, and self-expansion motivation. (2) Self-concept clarity plays a mediating role in the effect of awe on self-expansion motivation.

Keywords：awe, self-expansion, self-concept clarity

社会排斥对大学生学业倦怠的影响：基本心理需要和主动性人格的作用

郝祥森[1]（通讯作者） 杨静怡[1] 赵华夏[1]
1 郑州市第八人民医院，郑州，450000，haoxiangs@foxmail.com

摘 要 在我国平均受教育水平不断提高的背景下，大学生的学业压力越来越大，学业倦怠问题凸显。学业倦怠会降低大学生的学习动机和学习质量，影响心理健康。以往研究表明，外部变量诸如人际关系会通过个体心理状态影响学习行为，而关于负面人际体验对学业倦怠的影响机制研究尚不充分。社会排斥指个体被他人或团体忽视和拒绝，作为一种典型的负面人际体验，可能致使大学生出现学业倦怠。根据自我决定理论，和他人建立关系、有自主性和胜任感是每个人的基本心理需要，需要得到满足会提高内在动机、积极发展自我，反之则可能出现焦虑、抑郁、倦怠等问题。而基本心理需要的满足主要受环境影响，因此遭受社会排斥的个体可能有损基本心理需要的满足，继而导致学业倦怠。不同的人对外部负面环境可能有不同的应对，若个体主动采取行动改善负面环境，就更能维护心理健康与积极状态。为探讨社会排斥与学业倦怠的关系以及基本心理需要、主动性人格在其中的影响机制，本研究采用社会排斥量表、大学生学习倦怠量表、基本心理需要量表和主动性人格量表对 473 名大学生进行调查，结果表明：（1）学业倦怠与社

会排斥显著正相关，与三个基本心理需要的和主动性人格均显著负相关；（2）社会排斥正向预测学业倦怠，关系需要、自主需要、胜任需要在其中均起部分中介作用；（3）主动性人格调节了社会排斥对学业倦怠的直接作用，以及分别调节了关系需要和自主需要的中介作用的前半段路径。因此，遭受社会排斥会阻碍三个基本心理需要的满足，增加学业倦怠，拥有主动性人格的个体会更加积极地干预负面人际环境，促进关系需要和自主需要的满足，缓解学业倦怠。本研究表明良好的人际关系和主动的人格特质对大学生学业发展十分重要。

The influence of Social Exclusion on College Students' Academic Burnout: the role of Basic Psychological Needs and Proactive Personality

Hao Xiangsen(corresponding author), Yang Jingyi, Zhao Huaxia
The Eighth People’s Hospital of Zhengzhou, Zhengzhou, 450001

***Abstract*:** With the improvement of the average level of education in China, college students are facing increasing academic pressure, and the problem of academic burnout is significant. Academic burnout can reduce the learning motivation and quality of college students, and affect their mental health.. Previous studies have shown that external variables such as interpersonal relationship can affect learning behavior through individual psychological state, while the research on the impact mechanism of negative interpersonal experience on academic burnout is still insufficient. Social exclusion refers to the phenomenon that individuals are ignored and rejected by others or groups. As a typical negative interpersonal experience, it may lead to academic burnout of college students. According to the theory of self-determination, establishing relationships with others, autonomy and competence are everyone's basic psychological needs. Satisfaction of needs will improve internal motivation and actively develop themselves. On the contrary, anxiety, depression, burnout and other problems may occur. The satisfaction of basic psychological needs is mainly affected by the environment, so individuals who suffer from social exclusion may damage the satisfaction of basic psychological needs, and then lead to academic burnout. In addition, different people may have different responses to the external negative environment. If individuals take proactive actions to improve the negative environment, they are better able to maintain mental health and a positive state. To explore the relationship between social exclusion and academic burnout, as well as the impact mechanisms of basic psychological needs and proactive personality, 473 college students were investigated by social exclusion scale, college students' learning burnout scale, basic psychological needs scale and proactive personality scale. The results showed that: (1) academic burnout is significantly positively correlated with social exclusion, and negatively correlated with basic psychological needs and proactive personality; (2) Social exclusion positively predicts academic burnout, with relatedness, competence, autonomy all playing a partial mediating role; (3) Proactive personality moderates the direct effect of social exclusion on academic burnout, as well as the mediating role of relational needs and autonomous needs in the first half of the pathway. Therefore, suffering from social exclusion will hinder the satisfaction of the three basic psychological needs and increase academic burnout. Individuals with proactive personality will more actively intervene in negative interpersonal environment, promote the satisfaction of relatedness and autonomy, and alleviate academic burnout. This study indicates that good interpersonal relationships and proactive personality traits are crucial for the academic development of college students.

大学生日常生活的独处：基于生活经验取样法（ESM）

陈晓[1,2]（通讯作者） 宋欢庆[3]

1 广东白云学院 应用心理学系，广州，510450

2 北京师范大学 未来教育学院，珠海，519087 psychenxiao@126.com

3 北京师范大学珠海分校 教育学院，珠海，519087

摘要 本研究采用生活经验取样法考察大学生在日常生活中的独处情况。对 345 名大学生施测《独处问卷》和《UCL 孤独感量表》，选取独处总分高于一个标准差，孤独感总分低于平均分的被试作为高独处组（n=19），独处总分低于一个标准差且孤独感总分低于平均分的的被试作为低独处组(n=19)。采用生活经验取样法，在两周的研究期间研究者每周随机抽取三天并从周末随机抽取一天，总共八天，在当天下午 6 点给被试发送手机信号，被试接收到信息完成问卷，报告当天的独处体验次数、独处持续时间及独处时的愉悦、孤独感和情绪平静程度。结果显示：1）在自然条件下，高独处个体与低独处个体在独处频率上不存在显著差异，但高独处个体与低独处个体每天独处总时间长度上存在显著差异，高独处个体单次独处平均时间也显著高于低独处个体；2）高低独处的大学生在独处时的愉悦感、孤独感和情绪平静程度无显著差异；3）高、低独处的大学生在独处时的平静情绪和愉悦情绪得分均高于孤独情绪的分。高独处个体每天每次独处花费的时间多于低独处个体，且独处时体验到更多的积极情绪。

Solitude in the Daily Life of College Students: Based on the Experience Sampling Method (ESM)

Chen Xiao[1,2] Song huanqing[3]

7. Department of Applied Psychology, Guangdong Baiyun University, Guangzhou, 510450
8. College of Education for the Future, Beijing Normal University, Zhuhai, 519087, Email: psychenxiao@126.com
9. School of Education, Beijing Normal University, Zhuhai campus, Zhuhai, 519087

Abstract：This study investigated the solitude experiences of college students in their daily lives with Experience Sampling Method (ESM). A total of 345 college students were administered with the Solitude Questionnaire and the UCL Loneliness Scale. Participants who scored above one standard deviation on the total score of solitude and below the mean score on loneliness were recorded as the high solitude group (n=19), while participants who scored below one standard deviation on solitude questionnaire and below the mean score on loneliness were recorded as the low solitude group (n=19). During the two-week study period, researcher selected three days in weekday randomly and one day in weekend, for a total of eight days. At 6 PM on the selected days, the participants received a mobile signal and completed the questionnaire, reporting their frequency of solitude experiences, the duration of each solitude experience, and their levels of pleasure, loneliness, and emotional calmness during solitude. The results showed that: 1) There was no significant difference in the frequency of solitude between high solitude group and low solitude group. However, there was a significant difference in the

total duration of solitude per day. Compared to low solitude group, high solitude group spent more time alone. They also reported longer time of solitude time on solitary solitude periods. 2) There was no significant difference in feelings of pleasure, loneliness, and emotional calmness during solitude between high and low solitude group. 3) Both group reported higher level of pleasure and emotional calmness during solitude. Individuals experiencing high levels of solitude spent more time alone per day and experienced more positive emotions during solitude.

职业资本与幸福感的关系：职业成功观及清晰度的调节作用

徐前[1] 李浩[2] 崔一帆[3] 扈欣宇[4] 张潮[1](通讯作者)

1 山西师范大学教育科学学院，太原，030000，zhangchao951217@163.com

2 南通市北城小学，南通，226000

3 南京信息工程大学教师教育学院，南京，210000

4 淮阴师范学院教育科学学院，淮安，223000

摘 要 职业资本体现个体职业发展竞争力，包括人力资本、社会资本、心理资本。大量研究表明，三种职业资本能够有效提升幸福感水平。但是，职业动机因素(例如职业价值观及清晰度)如何调节职业资本对幸福感的增值作用还有待研究。职业成功观是主观职业成功标准，反映了人们的职业目标，包括外在报酬、内在满足及和谐平衡三个维度。职业成功观清晰度指人们对自身职业成功观认知的清晰、坚定和自信的程度。目标可以影响个体的行动方向、努力程度以及坚持时间；目标的清晰度越高，越容易产生高标准和高成就，进而对行为结果更加满意。即使拥有同样的职业资本，但是目标内容和清晰度不同，会导致个体对行为结果满意度不同，进而影响其幸福感体验。因此，本研究试图考察职业成功观及清晰度如何如何调节三种职业资本对幸福感的作用。通过对 312 名大学生进行问卷调查，结果发现：(1) 外在报酬对主观幸福感存在显著的负向预测作用，内在满足、工作生活平衡与职业成功观清晰度均对主观幸福感和心理幸福感有显著的正向预测作用；(2) 内在满足负向调节人力资本对主观幸福感的正向作用，并负向调节心理资本对主观幸福感和心理幸福感的正向作用，职业成功观清晰度正向调节社会资本对心理幸福感的正向作用。
关键词 职业资本，幸福感，职业成功观，职业成功观清晰度

Career capital and well-being:

The moderating role of career success criteria and its clarity

Qian Xu[1] Hao Li[2] Yifan Cui[3] Xinyu Hu[4] Chao Zhang[1]

1 School of Education Science, Shanxi Normal University, Taiyuan

2 Nantong Beicheng Primary School, Nantong

3 School of Teacher Education, Nanjing University of Information Science and Technology, Nanjing

4 School of Educational Science, Huai Normal University, Huai'an

Abstract: Career capital reflects the competitiveness of individual career development, including human capital, social capital, and psychological capital. Numerous studies have shown that three career capitals can effectively enhance the level of well-being. However, it remains to be studied how career motivation factors (such as career success criteria and its clarity) moderate the value-added effect of career capital on well-being. The concept of career success criteria reflects people's career goals, including three dimensions: external reward, internal satisfaction, and harmonious balance. The clarity of career success criteria refers to the degree to which people

have a clear, firm, and confident understanding of their own career success criteria. Goals can affect an individual's direction of action, level of effort, and duration of persistence; The higher the clarity of the goal, the more likely it is to generate high standards and achievements, and thus be more satisfied with the behavioral results. Even with the same career capital, differences in career success criteria and its clarity can lead to varying levels of individual satisfaction with behavioral outcomes, thereby affecting their well-being. Therefore, this study attempts to examine how the career success criteria and its clarity moderate the relationship between career capital and well-being. The results of a questionnaire survey of 312 college students show that: (1) External compensation has a significant negative predictive effect on subjective well-being. Intrinsic fulfillment, work-life balance and career success criteria clarity have a significant positive effect on subjective and psychological well-being. (2) Intrinsic fulfillment negatively moderates the positive effect of human capital on subjective well-being, and it negatively moderates the positive effect of psychological capital on subjective and psychological well-being. Career success criteria clarity positively moderates the positive effect of social capital on psychological well-being.

敬畏对制造业产业工人安全意识和操作规范意识的影响及干预

蔺哲子[1]　张潮[2]（通讯作者）

1 山西师范大学教育科学学院，太原，030031

2 山西师范大学教育科学学院，太原，030031，zhangchao951217@163.com

摘 要　为贯彻落实党的二十大精神和国家关于安全生产特别是安全红线的要求，推动高水平安全与高质量发展。在生产过程中，如何能够提高工人的安全系数，提高产品质量，降低生产过程中的事故率，减少悲剧的发生，成了目前社会的一个热点话题。安全意识是一种安全的生产观念，是因外部环境的作用而形成的自我安全防备和警戒理智，并由此控制个体的行为表现。操作规范意识是指工人在操作过程中形成并控制工人操作行为的观念。敬畏作为一种积极情绪对内能影响个体的精神世界，实现自我超越，同时对外能够更多的关注外界他人和集体，但是目前关于敬畏如何影响工人的安全意识和操作规范意识的研究仍是空白。本研究试图探讨敬畏对工人安全意识和操作规范意识的影响。研究一，要求山西省 436 名制造业产业工人进行特质积极情绪中的敬畏分量表(DPES)、安全意识问卷、操作规范意识问卷的填写。预期结果：特质敬畏正向预测安全意识和操作规范意识。研究二，将 80 名产业工人随机分为实验组和对照组，每组 40 名。实验组使用敬畏情绪视频材料诱发被试的敬畏情绪，对照组观看中性情绪视频材料。分别在实验处理后比较两组被试的状态敬畏、安全意识、操作规范意识的结果。预期结果：实验组的被试的安全意识显著高于对照组的被试，实验组的操作规范意识显著高于对照组的被试。

The influence and intervention of awe on safety consciousness and operation standard consciousness of industrial workers

Lin Zhezi, Zhang Chao(Corresponding author)

School of Education Science , Shanxi Normal University , Taiyuan , 030031

***Abstract*:** In order to implement the spirit of the Party's 20 National Congress and the requirements of the state on production safety, especially the red line of safety, we will promote a high level of safety and high-quality development. In the production process, how to improve the safety factor of workers, improve product quality,

reduce the accident rate in the production process, reduce the occurrence of tragedy, has become a hot topic in the society. Safety consciousness is a kind of safety production concept, which is formed by the role of external environment and self-safety precaution and vigilance, and thus control individual behavior. Operation standard consciousness refers to the idea that workers form and control their operation behavior in the process of operation. As a positive emotion, awe can influence the spiritual world of the individual internally to achieve self-transcendence, and at the same time, it can pay more attention to the external others and the collective. However, there is still no research on how awe affects the safety consciousness and operation standard consciousness of workers. This study attempts to explore the effects of awe on workers' awareness of safety and operational norms. In study 1, 436 industrial workers in Shanxi Province were asked to fill in the awe subscale of Dispositional Positive Emotion Scale(DPES), the Safety Awareness Questionnaire, and the Operation Standard Consciousness Questionnaire. Expected results: Trait awe positive predictive safety awareness and operation standard consciousness. In study 2, 80 industrial workers were randomly divided into experimental group and control group, with 40 workers in each group. The experimental group used awe emotion video material to induce awe emotion, while the control group watched neutral emotion video material. After experimental treatment, the results of state awe, safety consciousness and operation standard consciousness were compared between the two groups. Expected results: The safety consciousness of the experimental group was significantly higher than that of the control group, and the operation standard consciousness of the experimental group was significantly higher than that of the control group.

老年慢性病的心理康复体系研究进展

曾蔚佳[1]　林贤浩[1]（通讯作者）

1 福建医科大学应用心理学系，福州，350108，1073551616@qq.com

摘 要　随着我国老龄化进程的加速，老年慢性病的管理已成为当今时代的主题。心理康复作为临床护理工作中极为重要的环节，能够有效改善老年患者的心理健康水平、增强其心理弹性，坚定治疗信心以提升预后效果。然而，考虑到康复护理最终的目的旨在使患者的身体、心理、职业和社会活动等各功能方面恢复正常或接近正常，鼓励患者走出医院，尽早重返社会，需要我们时刻抱持全病程服务的工作态度和工作体系。为确保患者出院后仍存在的心理问题得到充分解决并维持，保证其在医院-家庭的过渡时期能获得并满足持续性、适应性的心理护理服务和需求，过渡期心理康复模式应运而生。同时，结合我国慢性病群体面临的医疗成本高、患病时间长、服务需求大等巨大挑战，全国的康复护理工作都开始致力于提高医院床位周转率、缩短患者住院时间，这意味着老年慢性病患者在医院度过急性期返回家庭或社区后还需要辅以一定的康复治疗和护理服务以维持预后。需强调，全病程护理意味着这不是一方的坚守，更是多方资源共同助力下搭建的桥梁。临床护理工作者在患者患病急性期可提供相关的心理评估、健康宣教、专业的心理治疗并辅以放松训练和认知干预等技术以结合基础药物及生活护理达到康复护理的最大效果。在医院-家庭过渡期，护理人员以患者为中心的工作基调，挖掘并巩固患者的良好社会支持系统、建立患者积极的自我调适和自我管理模式是提高护理质量的工作方向。出院后，护理工作则强调对患者疾病的监测和管控，为出院老年慢性病患者提供基于多学科协作的社区护理及居家护理服务，在医养结合的理念之上接受家庭医生签约服务对患者疾病的监测和管控具有稳定明显的护理效果。本文探索并整合老年慢性病的心理康复工作

内容和思路，通过重构以患者为中心的全病程医疗服务闭环，建立多方关系的良好康复护理链，致力构建全病程心理康复体系以更好推进心理康复护理在老年慢性病中的应用，强化慢性病防控效果，降低疾病负担，提高老年患者的生存质量。

Research progress on psychological rehabilitation system of chronic diseases in the elderly

Weijia Zeng[1]　Xianhao Lin[1]
Department of Applied Psychology, Fujian Medical University

Abstract：With the acceleration of the aging process in our country, the management of senile chronic diseases has become the theme of today's times. As a very important link in clinical nursing work, psychological rehabilitation can effectively improve the mental health level of elderly patients, enhance their mental resilience, and strengthen treatment confidence to improve the prognosis. However, considering that the ultimate goal of rehabilitation care is to restore patients to normal or near-normal functioning in terms of physical, psychological, occupational and social activities, and to encourage patients to leave the hospital and reintegrate into the community as soon as possible, it is necessary for us to always adopt a work attitude and a work system that serves the whole course of the patient's illness. In order to ensure that the psychological problems that still exist after patients are discharged from the hospital are adequately resolved and maintained, and to ensure that they can obtain and satisfy continuous and adaptive psychological care services and needs during the hospital-home transition period, the Transitional Psychological Rehabilitation Model has emerged. At the same time, in conjunction with the enormous challenges faced by China's chronic disease population, such as high healthcare costs, long duration of illness, and high demand for services, rehabilitation care across the country has begun to work on improving hospital bed turnover and shortening patients' length of stay, which means that elderly patients with chronic illnesses who have spent the acute phase in the hospital and returned to their families or communities also need to be supplemented with certain rehabilitation treatment and nursing services to maintain their prognosis. It is important to emphasize that whole-course care implies that it is not a one-party commitment, but a bridge built with the help of multiple resources. Clinical nursing workers can provide relevant psychological assessment, health education, professional psychotherapy and relaxation training and cognitive intervention techniques in the acute phase of the patient's illness in order to maximize the effect of rehabilitation care in conjunction with basic medication and life care. In the transition period between hospital and home, the patient-centered work of nursing staff, the exploration and consolidation of the patient's good social support system, and the establishment of the patient's positive self-adjustment and self-management mode are the directions to improve the quality of nursing care. After discharge, nursing care emphasizes the monitoring and control of patients' diseases, providing community care and home care services based on multidisciplinary collaboration for discharged elderly patients with chronic diseases, and accepting the contracted services of family doctors on the basis of the concept of integration of health care on the basis of the monitoring and control of patients' diseases has a stable and obvious effect of nursing care. This paper explores and integrates the contents and ideas of psychological rehabilitation of chronic diseases in the elderly, through reconstructing the closed loop of patient-centered whole-course medical service, establishing a good rehabilitation care chain of multi-party relationship, and endeavoring to construct a whole-course psychological rehabilitation system in order to better promote the application of psychological rehabilitation care in chronic diseases in the elderly, strengthen the effect of prevention and control of chronic diseases, reduce the burden of disease, and improve the quality of survival of elderly patients.

压力知觉与青少年关系攻击：自我控制的中介作用以及正念的调节作用

利振华 陈雪飞 陈佳榕 何嘉杰 吴煜琪 聂衍刚（通讯作者）
广州大学教育学院青少年心理与行为研究中心，广州，510006，
nie-yangang@gzhu.edu.cn

摘 要 压力知觉(Perceived Stress)是个体对压力的心理感知，是指个体将当下情景评价为威胁，但没有足够资源应对时所产生的心理反应。研究发现，压力知觉高的个体更容易出现网络成瘾、吸烟、攻击行为、抑郁焦虑等内外化问题行为。以往研究较多关注身体攻击、言语攻击等容易发现的直接攻击行为，但以破坏同学关系以伤害他人的隐性攻击缺乏一定探讨。因此，本研究以3638名初高中学生为研究对象，采用压力知觉量表、特质自我控制量表、关系攻击量表以及正念量表进行测查，旨在考察压力知觉对青少年关系攻击的影响，并且探究自我控制的中介作用以及正念的调节作用。研究结果发现：（1）压力知觉与自我控制、正念呈显著负相关，与关系攻击呈显著正相关；自我控制与正念呈显著正相关、与关系攻击呈显著负相关；正念与关系攻击呈显著负相关。（2）中介效应分析显示，在控制性别、年龄后，压力知觉能够显著正向预测青少年关系攻击，自我控制在压力知觉和关系攻击的关系中起到显著的中介作用 (effect = 0.15, 95% CI = [0.13, 0.17])。有调节的中介效应显示，正念显著调节了压力与自我控制之间的关系以及压力与关系攻击之间的关系。简单效应分析发现，在高水平的正念下，压力对自我控制的作用以及压力对关系攻击的作用更强。研究表明，压力知觉对青少年关系攻击的影响通过降低自我控制而发挥作用，正念能够增强压力知觉对青少年自我控制以及压力知觉对青少年关系攻击的影响。本研究有助于加深理解压力知觉如何加剧青少年的关系攻击，对于预防和减少青少年的关系攻击具有一定启示。

Perceived Stress and Adolescent Relational Aggression: the Mediating Role of Self-control and the Moderating Role of Mindfulness

Li Zhenhua Chen Xuefei Chen jiarong He jiajie Wu Yuqi Nie Yangang*
Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

Abstract：Perceived stress is the psychological perception of stress, which refers to the psychological response when individual perceives the current situation as a threat but does not have enough resources to cope with it. It is

found that high perceived stress is more likely to have internet addiction, smoking, aggressive behavior, depression and anxiety and other internal and external problem behaviors. Previous studies have paid more attention to the direct aggression which is easy to find such as physical aggression and verbal aggression, but there is a lack of discussion on the hidden aggression which damages the relationship between classmates and harms others. Therefore, this study took 3638 middle and high school students as the research objects, and used the perceived stress scale, trait self-control scale, relational aggression scale and mindfulness scale to investigate the impact of stress perception on adolescent relational aggression, and explore the mediating role of self-control and the moderating role of mindfulness. The results showed that: (1) perceived stress was negatively correlated with self-control and mindfulness, and positively correlated with relational aggression; Self-control was positively correlated with mindfulness and negatively correlated with relational aggression. There was a significant negative correlation between mindfulness and relational aggression. (2) Mediation effect analysis showed that, after controlling for gender and age, perceived stress could significantly positively predict adolescent relational aggression, and self-control played a significant mediating role in the relationship between perceived stress and relational aggression (effect = 0.15, 95%CI = [0.13, 0.17]). Moderated mediating effects showed that mindfulness significantly moderated the relationship between perceived stress and self-control, and the relationship between perceived stress and relational aggression. Simple effects analysis found that the effect of perceived stress on self-control and the effect of perceived stress on relational aggression were stronger at high levels of mindfulness. Studies have shown that the influence of perceived stress on adolescents' relational aggression plays a role by reducing self-control, and mindfulness can enhance the influence of perceived stress on adolescents' self-control and perceived stress on adolescents' relational aggression. This study helps to deepen the understanding of how the perceived stress intensifies the relational aggression of adolescents, and has some implications for preventing and reducing the relational aggression of adolescents.

Keywords: perceived stress, relational aggression, self-control, mindfulness, adolescent

受欺凌中学生观点采择和创伤后成长的关系：一项交叉滞后研究

陈博[1] 郁嘉铭[1] 高美慧[1] 甄瑞[1,2]（通讯作者）

1 杭州师范大学经亨颐教育学院，杭州，311121，E-mail: zhenrui1206@126.com

2 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘 要 个体在与主要的生活危机（如校园欺凌事件）进行抗争后，会出现创伤后成长这样积极的心理变化，它包括自我觉知积极变化、人际关系积极变化、生命价值观积极变化三个方面。观点采择是共情的认知成分，它是指个体从他人或他人所处情境出发，想象或推测他人观点与态度的心理过程。以往研究显示，经历创伤事件的个体从他人的视角考虑问题，可以促进其积极的情绪表达，这有助于个体发现创伤事件的积极部分，实现心理发展和成长。另一方面，实现创伤后成长的个体更可能获得良好的社会关系，体验到更多的社会支持。这使得其更专注于与他人的交往，理解他人的感情和想法，促进个体观点采择能力的发展。可以说，观点采择能力和创伤后成长可能存在双向关系。基于此，为探究受欺凌中学生观点采择能力和创伤后成长的关系，本研究采用追踪研究设计，分别在 2019 年 11 月(T1)，2020 年 11 月(T2)，2021 年 11 月(T3)三个时间点，采用中文版特拉华受欺负量表（学生版）、人际反应指数量表、创伤后成长问卷对 2173 名中学生进行调查，并根据问卷答结果筛选出 725 名有受欺凌经历的中学生进行分析。结果发现，在控制了性别后，T1、T2 受欺凌中学生的观点采择能力分别可以正向预测 T2、T3 创伤后成长；T1、T2 创伤后成长则对 T2、T3 观点采择能力没有显著的预测作用。这些结果说明，对于有受欺凌经历的中学生

而言，观点采择能力可以促进其实现创伤后成长，但创伤后成长并不能促进或抑制个体观点采择能力的发展。

The Relationship between Perspective-taking and Posttraumatic Growth among Middle School Students Who Were Bullied: A Cross-lagged Study

Bo Chen[1], Jiaming Yu, Meihui Gao, Rui Zhen[1 2*] (Corresponding Author)
1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China
2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract: Individuals who struggled with traumatic events (e.g. bullying victimization) often reported positive psychological changes in self-perception, interpersonal relationships, and world values, which have been defined as posttraumatic growth (PTG). Perspective-taking is the cognitive part of empathy. It refers to the mental process in which an individual image or speculate the views and attitudes of others from the perspective of others or their situation. On the one hand, previous studies have shown that individuals who experienced traumatic events consider problems from the perspective of others, which can promote their positive emotional expression, help them to find the positive part of traumatic events, and have positive psychological changes. On the other hand, traumatized individuals who had higher PTG were more likely to have better interpersonal relationships, which enable them to perceive more social support. It made them to focus more on the relationship with others, empathize with others in interpersonal interactions, perceive or imagine the emotions and feelings from others. Based on the previous studies, there may be a bidirectional relationship between perspective-taking and PTG. The present study adopted a longitudinal design in November 2019 (Time 1, T1), November 2020 (Time 2, T2), and November 2021 (Time 3, T3) to investigate the relationship between perspective-taking and PTG among middle school students who were bullied. A total of 2173 middle school students were administered three scales: the Delaware Bullying Victimization Scale, Interpersonal Response Index Scale and Post-Traumatic Growth Inventory. Then 725 middle school students who had been bullied were screen out through the questionnaire results to analysis. The results showed that after controlling for gender, perspective-taking at T1 and T2 can respectively positively predict PTG at T2 and T3; however, PTG at T1 and T2 had no significant effect on perspective-taking at T2 and T3. In summary, for middle school students who were bullied, perspective-taking can promote PTG, but PTG can not promote or restrain the development of perspective-taking.

Keywords: bullying victimization, middle school students, perspective-taking, PTG, cross-lagged study

旁观者归因与保护行为的关系：同情和保护动机的链式中介作用

杨凌青[1] 于明申[1] 徐梓唯[1] 鲍振宙[1]（通讯作者）
[1]赣南师范大学教育科学学院 赣州 341000 通讯作者 E-mail：baozhenzhou0819@163.com

江西省社会科学“十四五”（2021 年）基金项目（编号：21JY48）

摘 要 旁观者保护行为是指在校园欺凌发生时个体通过劝阻欺凌者来阻止或减少欺凌，或给予受害者支持和安慰的行为。旁观者保护行为可以有效降低校园欺凌的发生率，是反欺凌干预的重要组成部分。但在欺凌事件中保护行为所占的比例远远低于消极旁观行为（亲欺凌行为和局外者行为），所以了解旁观者保护行为的发生机制对制止校园欺凌事件的发生具有现实意义。已有研究表明，旁观者对欺凌事件的不同归因方式将会影响其对欺凌事件的反应及后续的旁观行为。在欺凌事件中，当旁观者将欺凌行为的发生归于欺凌者的原因时，就更容易做出保护行为。基于此，本研究认为旁观者倾向将欺凌发生归因于欺凌者原因时是其做出保护行为的预测因子。韦纳的情绪—动机归因理论强调，对事件归因后产生的情绪和动机会影响个体后续的行为。故本研究认为，同情和保护动机都可能是影响旁观者归因与保护行为关系的中介变量。

本研究采用旁观者归因量表、道德情绪量表、保护动机量表、校园欺凌的保护者行为问卷对江西省 1168 名青少年（M_{age} = 13.35，SD = 1.72）进行问卷调查。结果显示：（1）在控制了性别和年龄后，旁观者对欺凌者归因显著正向预测保护行为。（2）同情、保护动机在旁观者归因和保护行为之间起中介作用。具体而言，旁观者归因通过三条路径对保护者行为产生作用，即同情的单独中介作用（β = 0.02，95%CI = [0.01, 0.03]），保护动机的单独中介作用（β = 0.03，95%CI = [0.004, 0.06]）以及二者的链式中介作用（β = 0.03，95%CI = [0.01, 0.05]）。综上，本研究揭示了旁观者归因与保护者行为之间的关系及其中介机制，对促进旁观者保护行为具有一定的启示意义。

The Effect of Bystanders' Attributions to Bully on Defending Behavior: The Chain Mediating Role of Empathy and The Motivation to Defend

Yang Lingqing[1] Yu Mingshen[1] Xu Ziwei[1] Bao Zhenzhou[1] (Corresponding author)
School of Educational Science, Gannan Normal University, Ganzhou, 341000

Abstract ：Bystanders' defending behavior refers to " individuals whose behavior acts as active bystanders to stop bullying, or provide support and comfort for victims ". Bystanders' defending behavior could effectively reduce the frequency of school bullying and it was an important component of anti-bullying interventions. However, many studies have found that the proportion of defending behavior in school bullying was much lower than negative bystander behaviors (i.e., outsider behavior and pro-bullying behavior). Therefore, understanding the mechanism of bystanders' defending behavior plays an important role in stopping the occurrence of school bullying. Previous research indicated that bystanders' different attribution of bullying incidents would influence their reaction and subsequent different bystander behaviors. In a bullying incident, individuals who blamed to the bully were more likely to exhibit defending behavior. Thus, this study hypothesized that attributions to bully could predict bystanders' defending behavior. According to Weiner's emotional-motivational attribution theory, the emotions and motivations that results from attributions to events would have impacts on subsequent behaviors. Based on the emotional-motivational attribution theory, we tested whether empathy and the motivation to defend served as mediators in the relationship between attributions to bully and bystanders' defending behavior.

In this study, the bystanders' attribution scale, moral emotions scale, the motivation to defend scale, and defending behavior questionnaire of school bullying were used to conduct a questionnaire survey on 1,168 adolescents (M_{age} = 13.35, SD = 1.72) in Jiangxi Province. A bias-corrected bootstrapping method was used to calculate the mediating effects of empathy and the motivation to defend in the relationship between attributions to bully and adolescents' defending behaviors. The results showed that: (1) After controlling for gender and age, attributions to bully was significantly positively predicted adolescents' defending behavior. (2) Empathy and the motivation to defend mediated this association, which contained three significant mediating pathways: the separate

mediating effects of (a) empathy (β = 0.02, 95%CI = [0.01, 0.03]) and (b) the motivation to defend (β = 0.03, 95%CI = [0.004, 0.06]), and the chain mediating effect of (c) empathy and the motivation to defend (β = 0.03, 95%CI = [0.01, 0.05]). The present study uncovered the mechanisms underlying the relationship between attributions to bully and adolescents' defending behaviors. Our findings contributed to the understanding of the internal psychological mechanisms of adolescents' defending behaviors and how to improve defending behavior to prevent and intervene school bullying.

父母卷入与青少年校园受欺凌的关系：一个有调节的中介效应分析

孙悦阳[1]　王蔚晨[1]　王海英[2]（通讯作者）
1 东北师范大学心理学院，长春，130024
2 东北师范大学心理学院，长春，130024，wanghy178@nenu.edu.cn

摘　要　基于社会环境的变化与青少年身心发展的特点，校园欺凌问题在中学阶段日益凸显。校园受欺凌对青少年的心理健康发展具有消极影响，引起了学校和社会的广泛关注。家庭作为影响青少年心理健康发展最直接、最微观的环境之一，对青少年校园受欺凌具有重要影响。已有研究表明，父母卷入是保护青少年免受同伴伤害的重要因素，但鲜有研究探讨其对青少年校园受欺凌影响的内在机制。因此，本研究基于家庭生态系统理论，考察了父母卷入与青少年校园受欺凌的关系，并分析了作为个体水平因素的社会情绪能力与作为家庭水平因素的家庭社会经济地位在其中所起的作用。本研究采用《中学生父母卷入量表》、《特拉华社会情绪能力量表》以及《Olweus 儿童欺负/受欺负问卷（中学版）》对东北地区 1613 名青少年进行了横断研究。研究结果显示，在控制性别和年龄后：（1）父母卷入与青少年校园受欺凌之间存在显著负相关，即父母卷入对青少年校园受欺凌有负向预测作用；（2）社会情绪能力在父母卷入与青少年校园受欺凌之间起部分中介作用，即父母卷入通过影响青少年的社会情绪能力，减少其校园受欺凌问题的发生；（3）家庭社会经济地位显著调节了中介路径的后半段和直接路径。具体而言，家庭社会经济地位较高的青少年在社会情绪能力与校园受欺凌之间的负相关性更强，且父母卷入与校园受欺凌之间的负相关性也更强。本研究结果表明，青少年校园受欺凌受到家庭环境因素和个体内部因素的共同影响，家庭环境在预防和降低青少年校园欺凌风险方面起关键作用。这些发现为青少年提供安全、支持和积极的生活环境，以及促进他们心理健康发展提供了理论依据和干预方向。

Parental Involvement and School Victimization among Adolescents: A Moderated Mediation Analysis

Yueyang Sun, Weichen Wang, Haiying Wang
Department of Psychology, Northeast Normal University, Changchun, Jilin

***Abstract*:** Due to the changing social environment and the characteristics of adolescents' physical and mental development, the issue of school bullying is becoming increasingly prominent at the middle school level. The persistent negative impact of school victimization on the physical and mental health of adolescents has attracted widespread attention from schools and society. As one of the most micro and fundamental environments influencing adolescent psychological development, the family plays a crucial role in addressing school

victimization. Existing studies have shown that parental involvement is a significant protective factor for adolescents against peer victimization, but the intrinsic mechanisms influencing the impact of parental involvement on school victimization remain understudied. Therefore, drawing upon the family ecosystems theory, this study examined the relationship between parental involvement and school victimization among adolescents, while also analyzing the mediating role of social-emotional competency at the individual level and the moderating effect of family socioeconomic status at the family level. A cross-sectional study was conducted on 1,613 adolescents from the Northeast region of the country, employing the Parental Involvement Scale, Delaware Social and Emotional Competency Scale, and Olweus Bully/Victim Questionnaire (Middle School Version). The research findings reveal the following after controlling for gender and age: (1) there was a significant negative correlation between parental involvement and school victimization, with parental involvement negatively predicting school victimization among adolescents; (2) social-emotional competency partially mediated the relationship between parental involvement and school victimization, suggesting that parental involvement reduces the occurrence of school victimization by influencing adolescents' social-emotional competency; (3) family socioeconomic status significantly moderated the second half of the mediation path and the direct path. Specifically, higher family socioeconomic status strengthened the negative correlation between social-emotional competency and school victimization, as well as the negative correlation between parental involvement and school victimization. These results indicate that adolescents' experiences of victimization are jointly influenced by both family environmental factors and individual internal factors, with the family environment playing a pivotal role in preventing and reducing the risk of school victimization among adolescents. These findings provide a theoretical foundation and intervention direction for establishing safe, supportive, and positive learning environments for adolescents and promoting their psychological well-being.

***Keywords*:** adolescents, school victimization, parental involvement, social-emotional competency, family socioeconomic status

安全依恋启动对有受欺负经历青少年的攻击行为的影响

陆增颜[1]　吴小曼[1]　王丽君[1]　桑青松[1]（通讯作者）

1 安徽师范大学教育科学学院，芜湖，241000，s7210qs1@ahnu.edu.cn

摘 要　在校园欺凌中，青少年可能会因为自身性别、特质等，而沦为受欺负者。根据挫折-攻击理论，受欺负者可能会增加攻击行为，甚至转变成欺负者。而安全依恋是一种缓解威胁的积极状态，能在实验室情境下通过阈上/阈下技术激活，并对个体的认知、情感和行为产生一系列积极效应。安全依恋的拓延-建构环理论指出，安全依恋启动也能显著促进个体积极的自我-他人认知及同情、利他等积极品质，对有受欺负经历的青少年起到保护作用。基于此本研究探讨安全依恋启动对有受欺负经历青少年的攻击行为水平的影响。本研究通过整群抽样的方式，向合肥市 600 名中学生发放 Olweus 儿童欺负问卷分量表和 Buss-Perry 攻击量表，筛选出受欺负总分最高 27%的被试为受欺负水平高组，受欺负总分最低 27%的被试为受欺负水平低组，共计 240 人。采用 2（受欺负程度：受欺负水平高、受欺负水平低）×3（启动分组：安全依恋启动、积极情绪启动、中性控制启动）混合实验设计，采用回忆书写任务完成安全依恋启动和积极情绪启动，并采用“辣椒酱”实验范式，测查被试攻击行为水平。结果表明：（1）受欺负与攻击行为水平呈显著正相关，安全依恋与受欺负、攻击行为水平呈显著负相关。（2）不同的启动分组会导致青少年攻击行为水平的不同，安全依恋启动可以显著降低有受欺负经历青少年的攻击行为水平。结论：安全依恋启动对减少有受欺负经历青少年的攻击行为产生了积极的影响。本研究的发现有助于完善青少年攻击行为的相关研究，对保护受欺负青少年，减少校园欺凌有一定的启示意义。

The Impact of Attachment Security Priming on Aggressive Behavior among Adolescents with Bullying Experiences

Lu Zengyan[1], Wu Xiaoman[1], Wang Lijun[1], Sang Qingsong[1]
1 College of Education Sciences, Anhui Normal University, Wuhu, 241000

Abstract ： In school bullying, teenagers may become the victims of bullying because of their gender, characteristics, etc. According to the frustration-aggression theory, a bullied person may increase aggressive behavior or even transform into a bully. Secure attachment is a positive state of threat mitigation, which can be activated by above/below threshold techniques in laboratory Settings and has a series of positive effects on individual cognition, emotion and behavior. The extension-construct ring theory of secure attachment suggests that secure attachment priming can also significantly promote positive self-others cognition and positive qualities such as empathy and altruism, and play a protective role for adolescents with bullying experience. Based on this, this study explored the effect of secure attachment priming on the level of aggressive behavior in adolescents with bullying experience. In this study, the Olweus child bullying Questionnaire subscale and Buss-Perry Aggression Scale were distributed to 600 middle school students in Hefei City through cluster sampling. The subjects with the highest 27% total score of bullying were selected as the group with high level of bullying, and the subjects with the lowest 27% total score of bullying were selected as the group with low level of bullying, a total of 240 people. A mixed experimental design of 2 (bullying degree: high level of bullying, low level of bullying) ×3 (priming subgroups: secure attachment priming, positive emotion priming, neutral control priming) was adopted. Secure attachment priming and positive emotion priming were completed by memory writing task, and the aggressive behavior level of the subjects was measured by using the "hot sauce" experimental paradigm. The results showed that: (1) There was a significant positive correlation between bullying and aggressive behavior, and a significant negative correlation between secure attachment and bullying and aggressive behavior. (2) Different priming groups will lead to different levels of aggressive behavior in adolescents, and secure attachment priming can significantly reduce the level of aggressive behavior in adolescents with bullying experience. Conclusion: Secure attachment priming has a positive effect on reducing aggressive behavior in adolescents with bullying experience. The findings of this study are helpful to improve the relevant research of adolescent aggressive behavior, and have certain implications for the protection of bullied teenagers and the reduction of campus bullying.

童年中晚期受欺负、自尊和母亲拒绝教养的关系：一个发展级联模型

刘阳阳[1]　金国敏[2]　周同[2]　刘俊升[2]　成丹丹[1]（通讯作者）
1 山东中医药大学健康学院，济南，250355，512671170@qq.com
2 华东师范大学心理与认知科学学院，上海，200234

摘　要　受欺负是个体在学校的不良生活事件之一，严重危害学生身心健康发展。已有研究表明，个体的受欺负经历与其自身特点、所处环境密切相关，如人格特点、家庭环境、同伴关系等。受欺负个体通常具有消极的自我认知，表现出较低的自尊水平，进而导致父母采用拒绝的教养方式。而当父母频繁采用拒绝教养时，往往又会降低儿童自尊水平，引发受欺负。但以往研究大多考察两两之间的单向关系，对于三者之

间动态相互作用的研究比较不充分。本研究采用为期三年的追踪研究设计，通过构建发展级联模型探讨儿童中晚期受欺负，自尊和母亲拒绝教养的相互预测关系，以及受欺负通过自尊对母亲拒绝教养的影响。研究以 607 名 3、4 年级学生为被试（$M_{年龄}$=9.00 岁，*SD*=.78，女生 287 人），采用学生报告和母亲报告的多主体报告方式，分别测量学生的受欺负，自尊和母亲拒绝教养。结果表明：（1）受欺负，自尊和母亲拒绝教养在三年中具有一定程度的稳定性，受欺负和自尊呈负相关，自尊和母亲拒绝教养呈负相关，受欺负和母亲拒绝教养呈正相关；（2）受欺负和自尊能够相互预测，受欺负（T1）负向预测自尊（T2），自尊（T2）负向预测受欺负（T3）；（3）自尊和母亲拒绝能够相互预测，自尊（T2）负向预测母亲拒绝教养，母亲拒绝教养（T2）负向预测自尊（T3）；（4）发展级联的结果表明，自尊（T2）在受欺负（T1）与母亲拒绝教养（T3）的关系中起中介作用，即儿童受欺负经历降低了其自尊水平，进而引发了更多的母亲拒绝。

The Relationship Between Bullying, Self-esteem and Maternal Rejection in Middle and Late Childhood: a Developmental Cascade Model

Yangyang Liu[1], Guomin Jin[2], Zhou Tong[2], Junsheng Liu[2], Dandan Cheng[1] (corresponding author)
1 College of Health Sciences, Shandong University of Traditional Chinese Medicine, Jinan, 250355，512671170@qq.com
2 College of Psychological and Cognitive Science, East China Normal University, Shanghai, 200234

Abstract：Bullying is one of the adverse life events in school, which seriously endangers students' physical and mental health development. Studies have shown that individuals who suffer frequent bullying are closely related to their characteristics and surrounding environment, such as personality characteristics, family environment, peer relationship. Bullied individuals usually have a negative self-perception and a low level of self-esteem, which leads to parents adopting a rejection parenting style. When parents frequently adopt rejection parenting, it often reduces children's self-esteem and leads to bullying. However, most of the previous studies have investigated the one-way relationship between the two pairs, and the research on the dynamic interaction between the three is relatively insufficient. To address the limitations in existing literature, this study used data from 607 students(*M* age =9.00 years, *SD*=.78, 287 girls) and their mother to examine the longitudinal and dynamic association among bullying, self-esteem and maternal rejection. The results show that: (1) Bullying, self-esteem and maternal rejection had a certain degree of stability in the three years, bullying and self-esteem were negatively correlated, self-esteem and maternal rejection to parent were negatively correlated, bullying and maternal rejection to parent were positively correlated; (2) Bullying and self-esteem predicted each other, bullying (T1) negatively predicted self-esteem (T2), and self-esteem (T2) negatively predicted bullying (T3); (3) Self-esteem and maternal rejection predicted each other, self-esteem (T2) negatively predicted maternal rejection, and maternal rejection (T2) negatively predicted self-esteem (T3) ; (4) The results of the developmental cascade showed that self-esteem (T2) plays a mediating role in the relationship between bullying (T1) and maternal rejection (T3). Children's bullying experience reduced the self-esteem level, which in turn led to more maternal rejection.

自尊与攻击行为的关系：反刍思维与社交焦虑的链式中介作用

卫殿博[1]　焦江丽[1]（通讯作者）

新疆师范大学心理学院，乌鲁木齐市，830017，通讯作者 E-mail：jiaoannie@126.com

摘 要 目的：攻击行为作为一种有意伤害他人的行为或倾向，普遍存在于校园生活中，并对青少年身心健康发展造成诸多不良影响。已有研究发现自尊是攻击行为的重要影响因素，但自尊与攻击行为之间的关系呈现多样性，并无一致结论。本研究基于一般攻击模型和反应风格理论，探究自尊与攻击行为的关系以及反刍思维和社交焦虑在其中发挥的作用，以阐明自尊作用于攻击行为的潜在机制。方法：采用简单随机抽样的方式，通过自尊量表、反刍思维量表、交往焦虑量表和攻击性量表对 538 名大学生进行问卷调查，收取有效问卷 501 份；被试平均年龄为 20.11 岁（SD=1.68）。结果：（1）自尊与攻击行为（r=-0.32, p＜0.01）、反刍思维（r=-0.44, p＜0.01）、社交焦虑（r=-0.31, p＜0.01）均呈显著负相关，反刍思维与社交焦虑（r=0.39, p＜0.01）、攻击行为（r=0.46, p＜0.01）均呈显著正相关，社交焦虑与攻击行为（r=0.35, p＜0.01）呈显著正相关。（2）自尊通过反刍思维和社交焦虑的中介作用影响个体攻击行为，中介效应由 3 条路径组成：自尊→反刍思维→攻击行为、自尊→社交焦虑→攻击行为、自尊→反刍思维→社交焦虑→攻击行为，相对效应分别为 46.30%、10.12%、8.3%。结论：自尊不仅可以直接影响攻击行为，而且可以通过反刍思维和社交焦虑对个体攻击行为产生影响，即自尊水平越低的大学生越容易陷入反刍思维状态，加剧社交焦虑，进而导致攻击行为。

关键词 自尊，攻击行为，反刍思维，社交焦虑

Relationship between self-esteem and aggressive behavior: Chain mediating effect of rumination and social anxiety

WEI Dianbo, JIAO Jiangli

School of Psychology, Xinjiang Normal University, Urumqi, 830017

***Abstract*:** objective: As a deliberate act or tendency to harm others, aggressive behavior is prevalent in campus life and causes many adverse effects on the physical and mental health development of adolescents. Self-esteem has been found to be an important influence on aggressive behavior, but the relationship between self-esteem and aggressive behavior presents diversity and no consistent conclusion. Based on the general aggression model and response style theory, this study explores the relationship between self-esteem and aggressive behavior, as well as the role that rumination and social anxiety play in order to elucidate the potential mechanisms by which self-esteem acts on aggression. Methods: A simple random sampling was used to survey 538 college students through the Self-Esteem Scale, Ruminative Thinking Scale, Interaction Anxiety Scale, and Aggression Scale, and 501 valid questionnaires were collected. The mean age of the subjects was 20.11 years (SD=1.68). Results: (1)Self-esteem was significantly negatively correlated with aggressive behavior (r=-0.32, p<0.01), rumination(r=-0.44, p<0.01), and social anxiety(r=-0.31, p<0.01). Rumination was significantly positively correlated with social anxiety(r=0.39, p<0.01) and aggressive behavior(r=0.46, p<0.01). Social anxiety was significantly positively correlated with aggression(r=0.35, p<0.01). (2)Self-esteem influences individual aggressive behavior through the mediating effect of rumination and social anxiety, and the mediating effect consists of three pathways: self-esteem→ rumination→ aggressive behavior, self-esteem→ social anxiety→ aggressive behavior, and self-esteem→ rumination→ social anxiety→ aggressive behavior, with relative effects of 46.30%, 10.12%, and 8.3%, respectively. Conclusion: Self-esteem can not only directly influence aggressive behavior, but also affect individual aggressive behavior through rumination and social anxiety. In other words, college students with

lower self-esteem are more likely to fall into rumination and increase social anxiety, and leads to aggressive behavior.

Keywords：self-esteem, aggressive behavior, rumination, social anxiety

青少年领悟社会支持对自杀意念的影响：心理素质和正负情绪的链式中介作用

唐天桂　王婷　谭磊　彭小凡（通讯作者）

贵州师范大学心理学院，贵阳，50025，Pengxf@gznu.edu.cn

摘 要　自杀是导致青少年死亡的第二大原因。自杀意念作为个体自杀行为的有效预测因素，主要是指想结束生命的想法。因此，探讨青少年自杀意念的影响机制对预防其自杀行为具有重要意义。本研究从积极心理学的视角，基于自杀的人际理论和自杀缓冲假设，考察家庭支持和朋友支持与自杀意念的关系，并探讨心理素质和正负情绪在其中的作用。研究采用领悟社会支持量表中的家庭支持和朋友支持分量表、心理素质量表、正负情绪量表和青少年自杀意念量表对 2045 名中学生进行问卷调查。结果发现：(1）除了正性情绪和负性情绪的相关不显著，其余变量均两两显著相关。其中自杀意念与家庭支持、朋友支持、心理素质、正性情绪显著负相关，与负性情绪显著正相关；(2)家庭支持对年自杀意念的预测显著(β = -0.20，p < 0.001)，朋友支持对自杀意念的预测不显著（β = -0.02，p > 0.05）；（3）家庭支持能通过心理素质和正负情绪的中介作用对自杀意念产生影响，且该中介作用包含了 5 条路径：家庭支持→心理素质→自杀意念（Bootstrap 法重复抽取 5000 次,95% CI = [-0.045, -0.013]，中介作用显著，中介效应值-0.028）；家庭支持→正性情绪→自杀意念（95% CI = [-0.069, -0.017]，中介作用显著，中介效应值-0.042）；家庭支持→负性情绪→自杀意念（95% CI = [-0.061, -0.016]，中介作用显著，中介效应值-0.037）；家庭支持→心理素质→正性情绪→自杀意念（95% CI = [-0.079, -0.046]，链式中介作用显著，中介效应值-0.060）；家庭支持→心理素质→负性情绪→自杀意念（95% CI = [-0.024, -0.011]，链式中介作用显著，中介效应值-0.016）；（4）朋友支持能通过心理素质和正性情绪的中介作用对自杀意念产生影响，且该中介作用包含了 2 条路径：朋友支持→正性情绪→自杀意念（95% CI = [-0.095, -0.041]，中介作用显著，中介效应值-0.067）；朋友支持→心理素质→正性情绪→自杀意念（95% CI = [-0.048, -0.018]，链式中介作用显著，中介效应值-0.032）。结论：家庭支持能直接削弱自杀意念，也可通过影响心理素质和正负情绪对自杀意念产生间接削弱。朋友支持仅通过心理素质和正性情绪对自杀意念产生间接削弱。本研究结果认为学校应注重协调中学生的亲子关系，提高学生的心理素质和积极情绪，提升心理健康水平，减少自杀意念的产生，从而有效的预防自杀现象的发生。

The Influence of Perceive Social Support on Suicidal Ideation among Adolescents: The Chain Mediating Effect of Psychological Suzhi and Positive and Negative Emotions

Tang Tiangui, Wang Ting, Tan Lei, Peng Xiaofan

School of Psychology, Guizhou Normal University, Guiyang 550025, China

Abstract: Suicide is the second leading cause of death among adolescents. Suicidal ideation, as an effective predictor of individual suicidal behavior, mainly refers to the thoughts of ending one's life. Therefore, it is of great significance to explore the influencing mechanism of suicidal ideation among adolescents for the prevention of

their suicidal behavior. This study, from the perspective of positive psychology, based on the interpersonal theory of suicide and the suicide buffer hypothesis, examines the relationship between family support, friend support, and suicidal ideation, and explores the role of psychological suzhi and positive and negative emotions in this relationship. The study used the Family Support and Friend Support subscales from the Perceived Social Support Scale, the Psychological Suzhi Scale, the Positive and Negative Emotion Scale, and the Adolescent Suicidal Ideation Scale to conduct a questionnaire survey on 2045 middle school students. The results showed that: (1) except for the non-significant correlation between positive emotions and negative emotions, all other variables were significantly correlated with each other; Suicidal ideation was significantly negatively correlated with family support, friend support, psychological suzhi, and positive emotions, and significantly positively correlated with negative emotions; (2) Family support had a significant predictive effect on suicidal ideation (β = -0.20, p < 0.001), while friend support did not have a significant predictive effect (β = -0.02, p > 0.05); (3) Family support could influence suicidal ideation through the mediating effects of psychological suzhi and positive/negative emotions, and the mediating effects included five paths: family support → psychological suzhi → suicidal ideation (Bootstrap method, repeated sampling 5000 times, 95% CI = [-0.045, -0.013], the mediating effect was significant, the mediating effect value was -0.028); family support → positive emotions → suicidal ideation (95% CI = [-0.069, -0.017], the mediating effect was significant, the mediating effect value was -0.042); family support → negative emotions → suicidal ideation (95% CI = [-0.061, -0.016], the mediating effect was significant, the mediating effect value was -0.037); family support → psychological suzhi → positive emotions → suicidal ideation (95% CI = [-0.079, -0.046], the chain mediating effect was significant, the mediating effect value was -0.060); family support → psychological suzhi → negative emotions → suicidal ideation (95% CI = [-0.024, -0.011], the chain mediating effect was significant, the mediating effect value was -0.016). (4) Friend support could influence suicidal ideation through the mediating effects of psychological suzhi and positive emotions, and this mediating effect included two paths: friend support → positive emotions → suicidal ideation (95% CI = [-0.095, -0.041], the mediating effect was significant, the mediating effect value was -0.067); friend support → psychological suzhi → positive emotions → suicidal ideation (95% CI = [-0.048, -0.018], the chain mediating effect was significant, the mediating effect value was -0.032). Conclusion: Family support can directly weaken suicidal ideation and indirectly weaken it by influencing psychological suzhi and positive/negative emotions. Friend support only indirectly weakens suicidal ideation through psychological suzhi and positive emotions. The results of this study suggest that schools should focus on coordinating the parent-child relationship of middle school students, improving their psychological suzhi and positive emotions, enhancing their mental health, and reducing the occurrence of suicidal ideation, thus effectively preventing suicide.

快生命史策略对心理困扰的影响：成长型思维的缓冲作用

王馨蕊

山西师范大学教育科学学院，太原，030031

摘　要 以往研究表明，由恶劣和不确定的成长环境塑造的快生命史策略，与心理困扰和精神病理相联系。然而，这一联系可能受到成长型思维的缓冲。成长型思维指的是个体对自身特质可以改变或发展的信念。本研究通过两个子研究考察了上述缓冲效应。研究一通过网络招募了 691 名被试（男性 273 名，年龄 17-62 岁，M = 22.62, SD = 8.50）。被试完成抑郁-焦虑-压力自评量表，K-SF-42 量表，以及成长型思维量表。结果显示，成长型思维调节效应显著（p = .011），对于成长型思维倾向更强的个体，快生命史策略对心理困扰的影响较弱（t = 6.37, p < .001），而对于固定型思维倾向更强的个体，快生命史策略对心理困扰的影响更强

（$t = 8.21, p < .001$）。研究二使用了中国家庭追踪调查（2014–2018）数据，考察快生命策略对心理困扰的长期影响是否受到成长型思维的缓冲作用。研究样本包含 1255 名完成了两次调查问卷的青少年和年轻成年人（男性 625 名，年龄 10-21 岁，$M = 14.29, SD = 4.43$）。生命史策略和成长型思维相关题目于 2014 年（T1）测量，心理困扰相关题目于 2018 年（T2）测量。结果验证了研究一发现的成长型思维的调节作用（$p = .04$）。对于 T1 报告的成长型思维倾向更低的个体，快生命史策略（T1）可以显著预测更严重的心理困扰（T2）（$t = 4.38, p < .001$）；而对于 T1 报告的成长型思维倾向更强的个体，快生命史策略（T1）则不能预测心理困扰（T2）（$p > .05$）。本研究说明关于成长型思维的干预可能是保护快生命史策略的个体更少地受到心理困扰的一种有效方式。

Psychological distress as a manifestation of fast life-history strategies: Buffering effect of growth mindset

Xinrui Wang
Faculty of Educational Sciences, Shanxi Normal University, Taiyuan, China

Abstract: Fast life-history strategy (LHS), calibrated by harsh and unpredictable environments, has been linked with mental distress and psychopathology. This cascade might be buffered by growth mindset, which refers to beliefs that personal attributes can be improved or developed. The present research investigated the above-mentioned buffering effect via two studies. Study 1: A community sample of 691 participants were recruited (273 male, aged 17 to 62 years old, $M = 22.62$, $SD = 8.50$). Participants completed the Depression Anxiety Stress Scales, the K-SF-42, and the mindset of SES scale, and report demographics. Results indicated significant moderating effect of growth mindset ($p = .011$). For individuals who are more prone to growth mindset, the influence of fast LHS on mental distress is weaker ($t = 6.37, p < .001$), compared with individuals who incline to fixed mindset ($t = 8.21, p < .001$). Study 2: We used data of the 2014–2018 China Family Panel Studies, a nationally representative longitudinal data set in China. The sample contains 1255 adolescents and young adults who completed both waves of the survey (625 male, aged 10-21 years, $M = 14.29$, $SD = 4.43$). LHS and growth mindset were tested in 2014 (T1), and mental distress was tested in 2018 (T2). Results showed that the growth mindset (T1) significantly moderated the relation between fast LHS (T1) and mental distress (T2), $p = .04$. Simple slope analyses showed that for individuals who reported lower growth mindset in T1, fast LHS (T1) significantly predicted greater mental distress ($\beta = .17$, $t = 4.38$, $p < .001$, 95%CI[.09, .24]). While for individuals who reported higher growth mindset in T1, association between fast LHS (T1) and mental distress (T2) was not significant ($p > .05$). The present research implied that growth mindset interventions could be considered as an effective way to prevent people with fast LHS from mental distress.

儿童期虐待对大学生抑郁症状的影响：基本心理需求满足的中介作用

孔凤[1]（通讯作者） 李程程[1] 钟凯馨[1] 郭甜甜[1]
1 陕西师范大学心理学院，西安，710062，kongfeng87@126.com

摘 要 儿童期虐待作为一个全球性问题，影响着不同国家和地区的数百万儿童。童年时期的虐待经历会

给个体留下潜在创伤，这些创伤伴随着个体成长，可能对其心理健康造成深远的不利影响。抑郁症作为最常见的精神障碍之一，其形成与发展也易受到儿童期虐待的持久影响。已有研究发现儿童期虐待与抑郁症状密切相关，但很少有研究使用周记法和日记法调查两者之间的联系。这两种方法在较短时间内对个体进行纵向追踪，可以更准确地考察到个体一段时间内抑郁症状的平均水平。此外，目前尚不清楚儿童期虐待对日常生活中抑郁症状的影响机制。根据自我决定理论，不良环境因素（如儿童期虐待）会阻碍个体的基本心理需求获得满足，长此以往可能会导致抑郁。因此，本研究旨在通过周记法和日记法检验儿童期虐待与大学生抑郁症状的关系，并探究基本心理需求满足在两者之间的中介作用。研究 1 基于周记法，采用儿童期创伤问卷、基本心理需求满足量表、抑郁-焦虑-压力量表的抑郁分量表，连续 9 周对 106 名大学生进行纵向周记调查。运用 Mplus 8.3 进行多水平回归分析和多水平中介分析。结果发现，在控制了被试的性别、年龄和社会经济地位后，儿童期虐待显著正向预测抑郁症状，并且基本心理需求满足在儿童期虐待与抑郁症状之间发挥中介作用。为减少被试报告的回忆偏差，研究 2 进一步基于日记法，采用儿童期创伤问卷、日记基本心理需求满足量表、日记抑郁心境量表，连续 14 天对 243 名大学生进行日记调查。研究 2 发现，在控制性别、年龄和社会经济地位后，基本心理需求满足在儿童期虐待与抑郁症状之间起到了中介作用。本研究联合周记法和日记法，从短期和长期视角揭示了儿童期虐待对大学生抑郁症状的预测作用。同时，本研究强调了基本心理需求满足在儿童期虐待影响大学生抑郁症状中的中介作用，这对抑郁症的有效预防和干预实践工作具有一定参考价值。

Childhood maltreatment and depressive symptoms in college students: The mediating effect of basic psychological need satisfaction

Feng Kong[1] (Corresponding author), Chengcheng Li[1], Kaixin Zhong[1], Tiantian Guo[1]
1 School of Psychology, Shaanxi Normal University, Xi'an, 710062, kongfeng87@126.com

Abstract: Childhood maltreatment is a global issue that affects millions of children in different countries and regions. Childhood maltreatment may leave individuals with hidden trauma that may have a far-reaching adverse impact on their mental health with their growth. Depression is one of the most prevalent mental disorders, and its formation and development are also vulnerable to the lasting influence of childhood maltreatment. It has been found that childhood maltreatment has well-documented relations with depression, but few studies have employed weekly and daily diary methods to investigate the relation between childhood maltreatment and depressive symptoms. These two methods follow individuals longitudinally in a shorter period of time, which can more accurately examine the average level of depressive symptoms in individuals over a period of time. Moreover, the mechanism of childhood maltreatment on depressive symptoms in daily life is still unclear. According to Self-Decide Theory, adverse environmental factors (such as childhood maltreatment) may hinder individuals' basic psychological need satisfaction, which may lead to depression in the long run. Therefore, the current study aimed to examine the relation between childhood maltreatment and depressive symptoms in college students using weekly and daily diary methods, and to explore the mediating effect of basic psychological need satisfaction. Based on the weekly diary method, Study 1 conducted a longitudinal weekly diary survey on 106 college students for 9 consecutive weeks using the Childhood Trauma Questionnaire-Short Form, the Basic Psychological Need Satisfaction Scale, and the depression subscale of 21-item Depression Anxiety Stress Scale. Mplus 8.3 was used for multilevel regression and mediation analyses. The results found that after controlling for sex, age, and

socioeconomic status of the participants, childhood maltreatment significantly positively predicts depressive symptoms and basic psychological need satisfaction mediated the relation between childhood maltreatment and depressive symptoms. In order to reduce the recall bias reported by the participants, Study 2 was further based on the daily diary method, and used the Childhood Trauma Questionnaire-Short Form, the daily Basic Psychological Need Satisfaction Scale, and the daily depression items of Profile of Mood States to conduct a diary survey on 243 college students for 14 consecutive days. Study 2 also found that basic psychological need satisfaction mediated the relation between childhood maltreatment and depressive symptoms after controlling for sex, age, and socioeconomic status. Overall, the current study combined the weekly and daily diary methods to reveal the predictive effect of childhood maltreatment on depression symptoms of college students from short-term and long-term perspectives. This study also emphasizes the mediating effect of basic psychological need satisfaction in the influence of childhood maltreatment on depressive symptoms in college students, which has implications for effective prevention and intervention of depression.

儿童期不良经历对青少年主观幸福感的影响：基本心理需求满足中介作用和自我关怀的调节作用

杨晓彤[1]　李文洁[2]　孔凤[1]（通讯作者）

1 陕西师范大学心理学院，西安，710062，通讯作者 E-mail：kongfeng@snnu.edu.cn

2 清华大学心理学系，北京，100084

摘 要　儿童期不良经历（Adverse Childhood Experiences，ACEs）是个体在 18 岁之前所遭受的有损生理、心理健康的实际或潜在的各种不良经历的统称。以往国内研究重点关注儿童期不良经历与青少年功能障碍、疾病和死亡率的关系，但关于儿童期不良经历与青少年主观幸福感的研究仍然有限。根据家庭风险模型和自我决定理论，儿童期不良经历可能会对基本心理需求满足产生负性影响，进而影响青少年主观幸福感。此外，根据弹性框架理论，自我关怀在有虐待经历青少年的健康发展中可以起到保护作用。因而自我关怀可能调节儿童期不良经历对青少年主观幸福感的影响以及调节儿童期不良经历对青少年基本心理需求满足的影响。因此，本研究通过构建一个有调节的中介模型，旨在考察基本心理需求满足在儿童期不良经历与青少年主观幸福感的中介作用以及自我关怀在该过程中的调节作用。研究对陕西省某高中学生进行问卷调查，采用儿童期不良经历量表、积极情绪和消极情绪量表、生活满意度量表、自我关怀简版量表和基本心理需求满足量表作为测量工具，共收集有效问卷 1246 份，平均年龄 17.11±0.71 岁。使用 SPSS 和 PROCESS 插件进行统计分析。结果表明：（1）儿童期不良经历可以显著负向预测青少年主观幸福感；（2）基本心理需求满足在儿童期不良经历和青少年主观幸福感之间起部分中介作用，中介效应值为 0.21（95%*CI*=[-0.24，-0.17]）；（3）自我关怀调节了儿童期不良经历和基本心理需求满足的影响，具体而言，高度的自我关怀会提高青少年的基本心理需求满足，而此效应在遭受较少儿童期不良经历的青少年中比遭受较多童年期不良经历的青少年中更强（β=-0.18，95%*CI*=[-0.23, -0.13], $p < 0.001$；β=-0.30, 95%*CI*=[-0.38, -0.22]，$p < 0.001$），但自我关怀没有调节儿童期不良经历对青少年主观幸福感的影响。综上，本研究发现个体所遭受的儿童期不良经历会负向影响其青少年期主观幸福感，而提升其基本心理需求满足和自我关怀水平可能成为这一特殊群体的有效干预方式。

关键词　儿童期不良经历，主观幸福感，基本心理需求，自我关怀

Adverse childhood experiences and subjective well-being: the role of need satisfaction and self-compassion

Xiaotong Yang[1], Wenjie Li[2], Feng Kong[1] (Corresponding author)
1 School of Psychology, Shaanxi Normal University, Xi'an, 710062
2 Department of Psychology, Tsinghua University, Beijing, 100084

***Abstract*:** Adverse childhood experiences (ACEs) refer to a collective term for a variety of actual or potential adversities suffered by individuals before the age of 18 that are detrimental to their physical and psychological health. Previous national studies have focused on the relationships between adverse childhood experiences and adolescent dysfunction, illness, and mortality, while research on adverse childhood experiences and adolescents' subjective well-being remains limited. According to the risky families model and the self-determination theory, adverse childhood experiences may negatively affect basic psychological needs satisfaction, which further affect adolescents' subjective well-being. In addition, according to the Resilience Framework Theory, self-compassion can play a protective role in the healthy development of adolescents who have experienced maltreatment. Thus, self-compassion may moderate the effects of adverse childhood experiences on adolescents' subjective well-being as well as the effects of adverse childhood experiences on adolescents' basic psychological needs satisfaction. Therefore, by constructing a moderated mediation model, the present study aimed to examine the mediating role of basic psychological needs satisfaction in adverse childhood experiences and adolescents' subjective well-being, as well as the moderating role of self-compassion in this process. The study invited students from a high school in Shaanxi Province to participate in a questionnaire survey, using the Adverse Childhood Experiences Scale, the Scale of Positive and Negative Experience, the Satisfaction with Life Scale, Self-compassion Scale-Short Form, and Basic Psychological Needs Scale as the measurement tools, and collected a total of 1246 valid questionnaires, with an average age of 17.11 ± 0.71 years. Statistical analyses were performed using SPSS and PROCESS programs. The results showed that: (1) Adverse childhood experiences significantly and negatively predicted adolescents' subjective well-being. (2) Basic psychological needs satisfaction partially mediated the relationships between adverse childhood experiences and adolescents' subjective well-being with standardized effect value of 0.21 (95%*CI* = [-0.24～-0.17]). (3) Self-compassion moderated the relationship between adverse childhood experiences and basic psychological needs satisfaction. Specifically, high self-compassion increased adolescents' basic psychological needs satisfaction, and these effects were stronger in adolescents low in adverse childhood experiences than in those with high levels of adverse childhood experiences(β = -0.18，95%*CI* = [-0.23, -0.13], $p < 0.001$; β = -0.30, 95%*CI* = [-0.38, -0.22], $p < 0.001$). But self-compassion did not moderate the effects of adverse childhood experiences and adolescents' subjective well-being. The present study has discovered that adverse childhood experiences have a detrimental impact on the subjective well-being of individuals during adolescence. It has been determined that facilitating their satisfaction of basic psychological needs and improving their levels of self-compassion could be effective interventions for this group.

网游成瘾者奖赏网络与执行控制网络之间不足的功能连接：来自与网游娱乐者对比的证据

王凌霄 [1, 2, 3]（通讯作者）
1 杭州师范大学附属医院认知与脑部疾病研究中心，杭州，311121
2 杭州师范大学心理科学研究所，杭州，311121
3 浙江省认知障碍评估研究重点实验室，杭州，311121，wanglingxiao@hznu.edu.cn
摘 要 网游成瘾日趋严重，目前迫切需要探究该成瘾疾病的发病机制，为网游成瘾的预防和干预提供新的视角和思路。在以往网游成瘾研究中，控制组人群的游戏经历未有明确。多数研究中的控制组包含了完全不玩网游和有游戏经历的游戏玩家两种。控制组与网游成瘾组的游戏经历差异是成瘾研究中需要考虑的重要因素。为克服以往网游成瘾研究的不足，本研究采用网游娱乐人群作为控制对照组。网游娱乐人群指的是与成瘾人群有同样历史和时间的游戏经历，但并未发展为成瘾的人群。与该人群的对比，可更好地理解和探究网游成瘾人群的发病机制。对游戏行为和渴求的失控是网游成瘾人群的核心特征。本研究共包含64 名网游成瘾者和 63 名网游娱乐者，两组在游戏经历上无显著差异。通过种子点功能连接的分析方法对比了两组在静息状态下其奖赏网络和执行控制网络之间的功能连接强度。结果发现，和娱乐组相比，网游成瘾组的奖赏网络与额下回、额中回及部分额上回脑区的功能连接更弱，且其右侧执行控制网络与皮层下脑区纹状体的功能连接更弱。该结果揭示了网游成瘾人群对游戏渴求失控的神经基础：不足的奖赏和执行控制网络之间的功能连接。与娱乐人群对比的该研究结果精准揭示了网游成瘾人群发展成瘾的原因和特征，可为网游成瘾的预防和干预提供可靠的靶点。

Deficient functional connectivity between reward network and executive control network in people with Internet gaming disorder: Evidence from the comparison with recreational Internet game users

Lingxiao Wang[1,2,3*]
1 Centre for Cognition and Brain disorders, The Affiliated Hospital of Hangzhou Normal University, Hangzhou, Zhejiang Province, China
2 Institute of Psychological Science, Hangzhou Normal University, Hangzhou, Zhejiang Province, China
3 Zhejiang Key Laboratory for Research in Assessment of Cognitive Impairments, Hangzhou, Zhejiang Province, China
Abstract：Internet gaming disorder (IGD) is becoming more and more serious. At present, it is urgent to explore the pathogenesis of this addiction disorder, so as to provide new perspectives and ideas for the prevention and intervention of IGD. In previous studies on IGD, the gaming experience of the control group was not clear. The control groups in most studies included both non-gamers and experienced gamers. The difference in gaming experience between the control group and the addicted group is an important factor to be considered in addiction research. To overcome the shortcoming of previous studies on IGD, the study used the recreational internet gaming users (RGU) as the control group. RGU refers to people who have the same history and time of gaming experience as group with IGD, but have not developed IGD. Compared with RGU, we can better understand and explore the pathogenesis of IGD. The loss of control over gaming behavior and desire is a core characteristic of people with IGD. This study compared the functional connectivity between the reward network and the executive control network in the resting state of 64 IGD subjects and 63 RGU subjects by using the seed-based functional

connectivity analysis. There was no significant difference in gaming experience between the two groups. The results showed that compared with the RGU group, the reward network in the IGD group had weaker functional connections with the inferior frontal gyrus, the middle frontal gyrus and some parts of superior frontal gyrus, and the functional connections between the right executive control network and the subcortical brain region striatum were weaker. The results reveal the neural basis of the uncontrolled behavior over gaming craving in IGD population: the deficient functional connectivity between inadequate reward and executive control networks. The results from comparison with the RGU group of this study accurately reveal the causes and characteristics of the development of addiction in IGD population, which can provide a reliable target for the prevention and intervention of IGD.

流动青少年的脆弱自恋对非自杀性自伤的影响机制

徐泽静[1]　何宁[2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西师范大学心理学院，西安，710062，通讯作者 E-mail：hening@snnu.edu.cn

摘 要　流动青少年是指因求学、务工及监护人流动等原因，从农村或乡镇迁移到城市，造成现居地与户籍地址相异的 12-18 岁人群。非自杀性自伤（NSSI）是指没有自杀意图，故意伤害身体组织的行为且这种行为不受到社会的认可。青春期是 NSSI 的高危期，新近的一项元分析表明，全球 18.6%的青少年报告称在过去 12 个月内有过 NSSI。而已有研究表明，流动青少年又是自伤行为的高发群体。脆弱自恋是一种隐蔽的自恋，表现为过于看重他人对自己的评价、缺乏自信、对批评和拒绝等威胁极度敏感等特点，且与 NSSI 呈显著相关。然而，国内研究者较少关注流动青少年的 NSSI 及其心理机制。基于此，本研究旨在探索脆弱自恋对非自杀性自伤的影响，以及生命意义感、个人神话和假想观众的作用机制。

采用问卷调查法对西安三所初中进行调查，被试共 620 人，年龄均在 12-16 岁之间。采用 SPSS22.0、Process 插件以及 AMOS 进行数据分析，探讨脆弱自恋对非自杀性自伤影响，以及个人神话、想象观众的中介作用和及生命意义感的调节效应。

结果发现：（1）流动青少年的脆弱自恋、个人神话、想象观众、生命意义感、非自杀性自伤在性别、家庭收入、家庭结构上存在差异；（2）脆弱自恋、个人神话、想象观众均可正向预测非自杀性自伤，生命意义感负向预测非自杀性自伤；（3）个人神话、想象观众在脆弱自恋和非自杀性自伤关系中起中介作用；（4）生命意义感对脆弱自恋影响非自杀性自伤的关系有调节作用：高生命意义感会弱化个人神话、想象观众对非自杀性自伤的正向影响；反之，低生命意义感会提升个人神话、想象观众对非自杀性自伤的正向影响。

本研究丰富了非自杀性自伤的影响机制研究，为流动青少年的非自杀性自伤的干预提供了一定的理论依据和实证支持。

关键词　脆弱自恋，个人神话，想象观众，生命意义感，非自杀性自伤

The impact mechanism of vulnerable narcissism on NSSI among Migrant teenagers

Xu Zejing　He Ning

Department of Psychology, Shaanxi Normal University, Xi'an

Abstract: Migrant teenagers refer to the 12-18 year old people who migrate from rural areas or towns to cities due to reasons such as schooling, working, and the mobility of guardians, resulting in the difference between their current residence and registered residence address. Non suicidal self-injury (NSSI) refers to the act of intentionally harming body tissues without suicidal intent, and such behavior is not recognized by society.Adolescence is a high-risk period for NSSI, and a recent meta-analysis shows that 18.6% of adolescents worldwide report having NSSI within the past 12 months. Some studies have shown that migrant teenagers are also a high-risk group for self harm behavior.vulnerable narcissism is a hidden form of narcissism characterized by overemphasis on others' evaluations of oneself, lack of confidence, and extreme sensitivity to threats such as criticism and rejection, which is significantly correlated with NSSI. However, domestic researchers have paid less attention to the NSSI and its psychological mechanisms of migrant adolescents. Based on this, this study aims to explore the impact of vulnerable narcissism on NSSI, as well as the mechanisms of the sense of life meaning, personal fable, and imaginary audience. A questionnaire survey was conducted on three junior high schools in Xi'an, with a total of 620 participants aged between 12 and 16. Using SPSS 22.0, Process plugin, and AMOS for data analysis, explore the impact of vulnerable narcissism on NSSI, as well as the mediating effect of personal fable, imaginary audience, and the moderating effect of meaning in life

The results showed that: (1) there were differences in gender, family income, and family structure in the vulnerable narcissism, personal fable, imaginary audience, meaning in life, and non suicidal self harm of migrant adolescents; (2)vulnerable narcissism, personal fable, and imaginary audiences can all positively predict NSSI, while meaning in life can negatively predict NSSI; (3) Personal fable and imaginary audiences play a mediating role in vulnerable narcissistic and NSSI relationships; (4) The sense of meaning in life has a moderating effect on the relationship between vulnerable narcissism and NSSI: a high sense of meaning in life weakens the positive impact of personal fable and imaginary audience on the NSSI; On the contrary, a low sense of meaning in life will enhance the positive impact of personal fable and imaginary audiences on NSSI.

This study enriches the research on the impact mechanism of NSSI and provides certain theoretical basis and empirical support for the intervention of NSSI in migrant teenagers.

Keywords: vulnerable narcissism, personal fable, imaginary audience, meaning in life, non suicidal self-injury

知觉压力与大学生睡眠质量的关系：有调节的中介模型

陆增颜[1]　李泱巾[1]　孙文强[1]（通讯作者）

1 安徽师范大学教育科学学院，芜湖，241000，sunwq2007@163.com

摘 要　睡眠在个体生存和发展中起到非常重要的作用，良好的睡眠是保证个体身心健康的重要条件。长期睡眠不良不仅会导致个体认知和情绪障碍，还会引起免疫系统、代谢和心血管等生理方面的问题。根据以往研究，影响睡眠质量的因素主要来自知觉压力、电子产品的使用、生活事件和个体特征等方面。因此，本研究基于个体与环境交互作用理论，通过构建一个有调节的中介模型，考察了大学生睡眠质量的影响因素及作用机制。具体考察了错失焦虑和手机依赖在知觉压力与大学生睡眠质量间的链式中介作用，进而检验了个体对环境的敏感性在手机依赖预测大学生睡眠质量间的调节作用。本研究采用知觉压力问卷、错失

焦虑量表、手机依赖问卷、阿森斯失眠量表、环境敏感性量表对安徽省 748 名大学生($Mage$ = 20.6, SD = 2.65)进行问卷调查。使用 SPSS 26.0 进行数据的描述性统计和相关分析，使用 Process 插件进行中介和调节效应分析。结果显示：(1)知觉压力、错失焦虑、手机依赖和睡眠质量均显著正相关，环境敏感性和睡眠质量显著负相关。(2)知觉压力不仅对大学生睡眠质量的直接预测作用显著(β = 0.27, 95% CI [0.20, 0.34])，还能通过三条间接路径预测睡眠质量：错失焦虑的中介作用(R^2=0.10, β = 0.02, 95% CI [0.01, 0.04])、手机依赖的中介作用(R^2=0.22, β = 0.06, 95% CI [0.04, 0.09])以及错失焦虑和手机依赖的链式中介作用(R^2=0.24, β = 0.02, 95% CI [0.01, 0.03])。(3)环境敏感性调节了手机依赖的中介作用的后半段(β = 0.06, p < 0.05)，具体而言，高环境敏感性水平的个体手机依赖对睡眠质量的影响更大。本研究构建的有调节的中介模型，在一定程度上揭示了知觉压力对大学生睡眠质量的影响机制，对提升大学生睡眠质量有一定的启示作用。

The Effect of Perceived Stress on Sleep Quality in College Students: A Moderated Mediation Model

Lu Zengyan[1], Li Yangjin[1], Sun Wenqiang[1]
1 School of Educational Science, Anhui Normal University, Wuhu, 241000

Abstract：Sleep plays a very important role in individual survival and development, and good sleep is an important condition to ensure individual physical and mental health. Long-term poor sleep will not only lead to individual cognitive and emotional disorders, but also cause physiological problems such as immune system, metabolism and cardiovascular. According to previous studies, the factors that affect sleep quality mainly come from perceived stress, the use of electronic products, life events and individual characteristics. Therefore, based on the organism-environment interaction model, this study investigated the influencing factors and mechanism of sleep quality of college students by constructing a moderated mediation model. The mediation effects of fear of missing out and mobile phone dependence on perceived stress and sleep quality of college students were investigated, and the moderating effects of individual sensitivity to environment on the prediction of sleep quality of college students were examined. In this study, 748 college students ($Mage$ = 20.6, SD = 2.65) in Anhui Province were investigated by means of perceived stress questionnaire, fear of missing out scale, mobile phone dependence questionnaire, Assens Insomnia Scale and environmental sensitivity scale. SPSS 26.0 was used for descriptive statistics and correlation analysis of data, and Process plug-in was used for mediation and moderating effect analysis. The results showed that: (1) Perceived stress, fear of missing out, mobile phone dependence were significantly positively correlated with sleep quality, while environmental sensitivity was significantly negatively correlated with sleep quality. (2) Perceived stress not only directly predicted the sleep quality of college students significantly (β = 0.27, 95%CI [0.20, 0.34]), but also predicted the sleep quality through three indirect paths: The mediating role of fear of missing out (R^2=0.10, β = 0.02, 95%CI [0.01, 0.04]) and mobile phone dependence (R^2=0.22, β = 0.06, 95%CI [0.04, 0.09]) and the chain mediating effect of fear of missing out and mobile phone dependence (R^2=0.24, β = 0.02, 95% CI [0.01, 0.03]). (3) The mediating effect of mobile phone dependence on sleep quality of college students was regulated by individual sensitivity to environment (β = 0.06, p < 0.05), individuals with high environmental sensitivity had a greater impact on sleep quality. The mediated model constructed in this study reveals the mechanism of the influence of perceived stress on the sleep quality of college students to a certain extent, and has certain implications for improving the sleep quality of college students.
Keywords：sleep quality, perceived stress, fear of missing out, mobile phone dependence, environmental sensitivity

情景未来思维对进食和食物跨期决策的影响

黄艾玥[1] 何清华[2]（通讯作者）
1 西南大学心理学部教育部认知与人格重点实验室，重庆，404100
2 西南大学心理学部，重庆，404100， heqinghua@swu.edu.cn

摘 要 对于正在寻找有效的减肥方法的超重和肥胖群体而言，了解影响食物选择的因素对实现他们控制饮食并达到减肥目标至关重要。在本次文献综述中，我们聚焦于两种与饮食行为密切相关的概念：延迟折扣和情景未来思维。延迟折扣是指个体更倾向于接受立即获得的较小回报，而不是未来的较大回报。对于肥胖的个体，他们往往表现出较高的延迟折扣率，这通常表现为他们更偏向于选择高热量食物以获得瞬间的满足，而忽略了由不良饮食带来的长期健康风险。另一方面，情景未来思维被描述为将自我投射到未来以预期某一事件发生的认知过程。情景未来思维和情景记忆过程被认为都具有相似的神经激活表征。之前的研究表明肥胖人群在情景未来思维的表现较差，这可能是他们在食物选择上倾向即时满足的一个重要原因。而越来越多的研究也发现，通过干预情景未来思维可以减少正常体重群体和肥胖群体的进食量，这无疑提供了一种具有潜力的干预策略，尽管其长期效果还需要更多实证性的研究支持。此外，由于情景未来思维可以改变未来选项的主观价值，因此也有许多研究探讨了情景未来思维对延迟折扣的改善。我们总结了前人在这方面的研究，完善了情景未来思维对决策造成影响的模型，并且由于情景未来思维的干预可以调节未来选项的主观价值，探索延迟折扣的个体差异对情景未来思维影响的调节作用至关重要。我们以期根据这一模型获得更加规范化和个性化的干预方案，进一步提高情景未来思维对饮食选择的干预效果。
关键词 肥胖，食物选择，情景未来思维，延迟折扣

The impact of episodic future thinking on eating and food intertemporal decision

Aiyue Huang[a], Qinghua He[b] (corresponding author)
[a] Faculty of Psychology, MOE Key Laboratory of Cognition and Personality, Southwest University, Chongqing, China
[b] Southwest University Branch, Collaborative Innovation Center of Assessment toward Basic Education Quality, Chongqing, China
2 Tiansheng Rd, Chongqing, 400715 CHINA.

Abstract： Understanding the factors that influence food choices is crucial in controlling diets and achieving weight loss, especially in populations seeking effective weight reduction methods. This paper presents a systematic review of the literature on delay discounting (DD) and episodic future thinking (EFT) in relation to eating behavior. DD refers to the preference for immediate smaller rewards over larger future rewards, while EFT is a cognitive process of projecting oneself into the future to pre-experience an event, enabling an accurate imagination of the future. The evidence indicates that adolescents with obesity and adults exhibit higher DD and poorer EFT. Furthermore, interventions using EFT can reduce eating in normal-weight or groups with obesity, but long-term interventions require further research and practical application. Additionally, exploring the moderating effect of individual differences in DD on the impact of EFT is crucial since EFT interventions moderate future option values. These studies provide a more profound understanding and a reference for developing measures to improve

eating behavior.

Keywords: Obesity, Food choice, Episodic future thinking, Delay discounting

时间流逝观：体悟生命行进的形式与过程

余习德　刘嘉帆　邱智婷　张琳　张思旖
广东技术师范大学教育科学学院，广州，510665
通讯作者：余习德
E-mail: dr_cider@gpnu.edu.cn

摘 要 从生命历程的角度，时间流逝既是客观现象，也是心理表征。一个事实不能罔顾：对所有人来说，流逝的每一天，既是成长的一天，也是离死亡更近的一天。死亡的必然性促使个体思考生命的有限与时间的稀缺。根据稀缺理论，因生命流逝而“时间稀缺”的感知，促使个体做出“珍惜时间”的补偿行为。典型表现是：重新定义目标、为目标而行动、享受行动过程，以此完成对“死亡”的三重超越——海德格尔的“向死而生”。行为受制于观念，并与观念交互，珍惜时间的行为源于珍重时间的观念，而惜时观念又与“感知时间流逝、体悟时间稀缺”息息相关。国内学者余习德等人(2023)首次明确提出“时间流逝观”，并通过心理测量技术考察了大学生时间流逝观的概念结构。结果表明：时间流逝观包含正性促进、负性抑制、生命触动、时间估计与基本价值五个维度。尽管“流逝观”这一概念近期才被提出，但拟基于以下两点开展再探索：第一，突出考察对补偿行为更有促进意义的维度——流逝意识启动后效；第二，优化概念内涵与精简测量模型。对余习德等(2023)的访谈资料再次深入挖掘，根据分析结果修饰原概念结构、调整原量表维度。对 996、770、817 与 84 名大学生分别进行探索性与验证性因素分析、效标关联效度分析与重测信度检验。结果表明：第一，时间流逝观包含启动后效、生命触动、积极促进与消极抑制四个维度，修订量表各维度分别对应 9、5、4 与 4 题(共 22 题)。第二，修订量表信效度良好。信度：在不同样本中的内部一致性 Cronbach’s *a* 系数范围是 0.83-0.95；分半信度是 0.75；重测信度为 0.82；效度：验证性因素分析结果良好(χ^2/df=1.97, RMSEA = 0.035, CFI = 0.961, SRMR = 0.040)；同时，流逝观总分与时间观中的消极过去维度呈显著正相关(r = 0.37, p＜0.01)，流逝观总分与时间管理总分也呈显著正相关(r =0.45, p＜0.01)。总之，修缮的概念内涵更简练，修订的量表结构更稳健。

View of the passage of time (VPT):

Realizing the form and process of life’s journey

Yu Xide, Liu Jiafan, Qiu Zhiting, Zhang Lin, Zhang Siyi
School of Educational Science, Guangdong Polytechnic Normal University, Guangzhou (510665)
Corresponding authors: Yu Xide
E-mail: dr_cider@gpnu.edu.cn

Abstract From the perspective of the life course, the passage of time is both an objective phenomenon and a psychological representation. One fact cannot be ignored: for all of us, each passing day is both a time of growth and a time closer to death. The inevitability of death prompts individuals to think about the finite nature of life and the scarcity of time and prompts them to engage in compensatory behaviors to value time. Typical expressions are:

redefining the goal, acting for the goal, and enjoying the process of action - thus completing the triple transcendence of death. Behavior is constrained by concepts and interacts with them: the behavior of valuing time originates from the concept of valuing time, and the concept of valuing time is closely related to “perceiving the passage of time and realizing the scarcity of time”. Yu et al. (2023) first explicitly proposed the concept of the view of the passage of time, and examined the conceptual structure of college students’ view of time passing through psychometric techniques. The results showed that the view of time passing contains five dimensions: positive promotion, negative inhibition, life touch, life estimation, and basic value. Although the concept of the view of the passage of time has only been proposed recently, we propose to re-explore this concept based on the following two points: first, focusing on the dimension that has a greater significance in facilitating compensatory behaviors, namely, the after-effects of the initiation of time passing awareness; and second, optimizing the conceptual connotation and streamlining the measurement model. The interview data of Yu et al. (2023) were further explored, and the original conceptual structure and scale dimensions were adjusted according to the results of the analysis. Exploratory and confirmatory factor analyses, criterion correlation validity, and retest reliability tests were conducted on 996, 770, 817, and 84 college students, respectively. The results showed that, first, the view of time passing contains four dimensions, namely, initiation aftereffect, life touch, positive promotion, and negative inhibition, and each dimension of the revised scale corresponds to 9, 5, 4, and 4 questions (22 items in total). Second, the reliability of the revised scale is good. Reliability: internal consistency Cronbach’s *a* coefficient in different samples ranged from 0.83 to 0.95; split-half reliability was 0.75; retest reliability was 0.82; validity: the results of the validated factor analyses were good (χ^2/df = 1.97, RMSEA = 0.035, CFI = 0.961, SRMR = 0.040); meanwhile, the total score of the VPT was significantly and positively correlated with the negative past dimension of the Time Perspective (r = 0.37, p < 0.01), as well as the similar relationship between the VPT and the Time Management Disposition (r = 0.45, p < 0.01). In conclusion, the revised concept was more concise and the revised scale was more robust.

未来自我连续性的研究述评

王佳荷

河南大学教育学部，开封，475004，wjh9540210@163.com

摘 要　未来自我连续性指个体将现在自我和未来自我联系在一起的紧密程度，包括相似性、生动性、积极性三个方面。2009 年以来，学者对未来自我连续性的概念界定、结构、测量工具、影响因素和干预措施进行了探讨，并取得了一定的成果。未来自我连续性的操作性定义主要涉及测量和操作两个方面，前者将其看作是一种特质或个体差异，关注对未来自我连续性进行准确测量；后者将其看作是一种状态，关注对其进行有效操纵。研究发现，未来自我连续性对心理和行为有重要影响。高未来自我连续性的个体意识到“未来自我”与“现在自我”在时间维度上的同一性，以此增加对未来自我的关注，使现在和未来的目标一致，从而根据当前情况做出有利于未来的决策。而且，未来自我连续性能够促进个体面向未来的行为或表现，如学业成绩、自我控制、锻炼行为以及储蓄行为等；同时可以预测低水平的病理性焦虑、抑郁、职业倦怠、学术拖延、不道德行为、违法犯罪行为等不良情绪或行为。此外，已有研究通过让被试阅读文本材料，以及借助书信交流和新兴技术与“未来自我”进行互动等手段，实现了对个体未来自我连续性的成功操纵。未来研究可以进一步清晰界定未来自我连续性的内涵和外延、深入探讨其神经基础、形成机制以及加强定制化干预研究，以拓展未来自我连续性相关的应用研究。

A Review of Future Self-Continuity

Jiahe Wang
Faculty of Education, Henan University, Kaifeng, 475004, wjh9540210@163.com

Abstract：Future self-continuity refers to the degree to which an individual connects the present self with the future self, including similarity, vividness and enthusiasm. Since 2009, scholars have discussed the concept definition, structure, measurement tools, influencing factors and intervention measures of future self-continuity, and have achieved certain results. The operational definition of future self-continuity mainly involves two aspects: measurement and operation. The former regards it as a trait or individual difference and focuses on accurate measurement of future self-continuity. The latter sees it as a state and is concerned with manipulating it effectively. Research has found that future self-continuity has important effects on psychology and behavior. Individuals with high future self-continuity realize the identity of the "future self" and the "present self" in the time dimension, so as to increase their attention to the future self and make the present and future goals consistent, so as to make decisions conducive to the future according to the current situation. In addition, future self-continuity can promote the individual's future-oriented behavior or performance, such as academic achievement, self-control, exercise behavior and saving behavior. At the same time, it can predict the low level of pathological anxiety, depression, job burnout, academic procrastination, unethical behavior, illegal and criminal behavior and other bad emotions or behaviors. In addition, previous studies have successfully manipulated an individual's future self-continuity by having subjects read text materials and interacting with the "future self" through letter exchanges and emerging technologies. Future research can further clearly define the connotation and extension of future self-continuity, deeply explore its neural basis and formation mechanism, and strengthen customized intervention research, so as to expand the applied research on future self-continuity.

Keywords：future self-continuity, temporal self

依恋焦虑和回避、自我扩张与婚姻质量：基于主客体互倚模型

杨培滢 曾加慧 刘学兰（通讯作者）
"儿童青少年阅读与发展"教育部哲学社会科学实验室(华南师范大学)/心理应用研究中心/华南师范大学心理学院，广州，510631，liuxuelan@m.scnu.edu.cn

摘 要　婚姻关系和谐与否对个体和家庭影响重大，识别个体因素和人际关系过程对婚姻质量的影响，有助于深入了解婚姻家庭幸福与稳固的基础。研究者将依恋理论扩展到成人阶段，认为浪漫关系中对伴侣的情感联结也可以被看做为一种依恋关系，即成人依恋。根据依恋维度观,成人依恋分为依恋焦虑和依恋回避，以往已有研究揭示了依恋焦虑和回避与婚姻质量之间的密切关系。基于相互依赖理论，同属一对关系的个体以复杂的方式相互影响, 一方在影响自己的同时也会影响对方。前人在探究依恋焦虑和回避与婚姻质量的联系时，大多关注成人依恋对自身婚姻质量的影响，较少研究考察夫妻双方的成人依恋是否以及如何影响自身和彼此的婚姻质量。此外，自我扩张是指个体将伴侣的观点、资源和身份纳入到自我中，是浪漫关

系中的一个重要影响变量。因此，本研究旨在探究夫妻的依恋焦虑和回避与婚姻质量的关系，以及自我扩张的中介作用。研究对 567 对夫妻（丈夫 M_{age}=37.89，SD = 5.11；妻子 M_{age}=35.33，SD = 4.90）进行了问卷调查，并采用主客体互倚模型对数据进行了分析。结果发现：（1）妻子和丈夫的依恋回避和依恋焦虑与婚姻质量均呈负相关。（2）妻子和丈夫的依恋回避显著负向预测自身的婚姻质量（主体效应）和对方的婚姻质量（客体效应）。（3）丈夫和妻子的依恋焦虑显著负向预测自身的婚姻质量（主体效应），但客体效应不显著。（3）丈夫的自我扩张在自身依恋焦虑对自身婚姻质量的影响路径中存在“遮蔽效应”。（4）妻子和丈夫的自我扩张中介依恋回避对婚姻质量的主体和客体影响。本研究发现不仅有助于深化人们对于依恋焦虑和回避、自我扩张和婚姻质量之间的联系，而且可以为婚姻干预实践提供一定的启示：了解夫妻双方的依恋类型，并关注夫妻的自我扩张水平，进而促进夫妻的婚姻质量和主观幸福。

Attachment Anxiety and Avoidance, Self-expansion, and Marital Quality: Based on the Actor-Partner Interdependence Model

YANG Peiying; ZENG Jiahui; LIU Xuelan

"Reading and Development of Children and Adolescents" Philosophy and Social Science Laboratory of the Ministry of Education (South China Normal University) / Centre for Applied Psychological Research / School of Psychology, South China Normal University, Guangzhou, 510631

***Abstract*:** Harmonious marital relationships have a significant impact on individuals and families, and identifying the impact of individual factors and interpersonal processes on marital quality can help provide insight into the foundations of marital and family happiness and stability. Researchers have extended attachment theory to the adult stage, arguing that the emotional connection to a partner in a romantic relationship can also be viewed as an attachment relationship, i.e., adult attachment. According to the dimensional view of attachment, adult attachment is categorised as attachment anxiety and attachment avoidance, and previous research has revealed a strong relationship between attachment anxiety and avoidance and marital quality. Based on the theory of interdependence, individuals belonging to the same pair interact with each other in a complex way, and the behaviour of one party affects the other party while affecting oneself. When exploring the link between attachment anxiety and avoidance and marital quality, most of the previous studies have focused on the effects of adult attachment on one's own marital quality, and fewer studies have examined whether and how adult attachment in couples affects their own and each other's marital quality. In addition, self-expansion, which refers to an individual's incorporation of a partner's perspectives, resources, and identity into the self, is an important influence variable in romantic relationships. Therefore, the purpose of this study was to explore the relationship between couples' attachment anxiety and avoidance and marital quality, as well as the mediating role of self-expansion. The study administered a questionnaire to 567 couples (husbands M_{age} = 37.89, SD = 5.11; wives M_{age} = 35.33, SD = 4.90) and analysed the data using the actor-partner interdependence model. The results found that (1) both wives' and husbands' attachment avoidance and attachment anxiety were negatively related to marital quality. (2) Wives' and husbands' attachment avoidance significantly and negatively predicted their own marital quality (actor effect) and the other's marital quality (partner effect). (3) Husbands' and wives' attachment anxiety significantly and negatively predicted their own marital quality (actor effect), but the partner effect was not significant. (3) Husbands' self-expansion had a “suppressing effect” in the path of their own attachment anxiety on their own marital quality. (4) Wives' and husbands' self-expansion mediated the actor and partner effects of attachment

avoidance on marital quality. The findings of this study not only help to deepen the understanding of the links between attachment anxiety and avoidance, self-expansion, and marital quality, but also may provide some insights into marital intervention practices: understanding the attachment types of couples and focusing on the level of self-expansion of couples, which in turn can promote the marital quality and subjective well-being of couples.

Keywords ： attachment anxiety, attachment avoidance, marital quality, self-expansion, actor-partner interdependence model

婚姻访谈情感语义特征及其对婚姻质量的预测

郑庆广[1]　方晓义[1]（通讯作者）

1 北京师范大学发展心理研究院，北京, 100875, fangxy@bnu.edu.cn

摘 要　在诸多婚姻质量的影响因素之中，情感方面的因素被认为是最具有影响力的因素之一。个体的语言使用模式、风格以及内容等等语义特征，往往能够反映其许多内隐的心理特质和心理状态，包括情感。此外，婚姻访谈法是婚姻家庭领域研究的常用范式，在访谈文稿中往往蕴藏着受访者对于婚姻的大量认知信息。近年来对海量文本信息的语义特征进行处理和分析的自然语言处理技术日渐成熟，使得从访谈文本中提取情感语义特征信息并进行分析具有可行性。本研究招募 76 名被试对其进行婚姻访谈，并使用婚姻质量量表(Quality of Marriage Index, QMI)测量其婚姻质量。利用自然语言处理技术进行情感分析，探究其中情感语义特征对婚姻质量的预测作用。通过分步回归分析，检验了访谈文本中情感比例特征（即被试不同情感的发言条目占访谈总发言条目的比例）和情感字数特征（即被试不同情感的发言字数）对于婚姻质量的预测作用，并通过设置字数门槛进行筛选的方式，控制参与分析的文本长度，以检验积极和消极情感的字数特征各自的优势字数范围。结果表明，积极和消极情感的字数特征表现出不同的预测作用和模式，在积极情感比例特征的基础上，加入积极情感字数特征不能提高模型对婚姻质量的预测作用($\beta = -0.027$, $p = 0.841$, $R^2 = 0.090$, $\Delta R^2 = 0.001$)；而在消极情感比例特征的基础上，加入消极情感字数特征显著提高模型对婚姻质量的预测作用($\beta = -0.259$, $p = 0.036$, $R^2 = 0.127$, $\Delta R^2 = 0.055$)。字数门槛分析发现积极和消极情感的字数特征所敏感的字数范围不同，积极情感字数特征在字数范围较低（60 字左右）的文本中表现出更好的预测作用，而消极情感字数特征在字数范围较高（200 字以上）的文本中表现出更好的预测作用。研究结果强调对字数特征的关注能够更加准确地从文本中提取隐藏的情感信息，提升对婚姻质量的预测作用，并初步发现了婚姻访谈中所蕴含的情感信息所敏感的字数范围不同的特点。

Emotional Semantic Features in Marriage Interviews and Their Prediction of Marital Quality

Qingguang Zheng[1], Xiaoyi Fang[1]

1 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875,

fangxy@bnu.edu.cn

Abstract：Among the numerous factors influencing the quality of marriage, emotional factors are considered one of the most impactful. An individual's language use patterns, styles, content, and other semantic features often

reflect many implicit psychological traits and states, including emotions. In addition, the marriage interview method is a common research paradigm in the field of marriage and family, with the interview transcripts often containing a wealth of cognitive information about marriage from the interviewees. Recent advancements in natural language processing technology for handling and analyzing semantic features in massive text information have made it feasible to extract and analyze emotional semantic features from interview texts. This study recruited 76 participants for marriage interviews and used the Quality of Marriage Index (QMI) to measure their marital quality. Using natural language processing technology for emotional analysis, we investigated the predictive role of emotional semantic features in marital quality. Through stepwise regression analysis, we tested the predictive role of emotional proportion features (i.e., the proportion of the interviewee's different emotional statements to total statements) and emotional word count features (i.e., the word count of the interviewee's different emotional statements) on marital quality. By setting a word count threshold for screening, we controlled the length of text included in the analysis, to test the optimal word count range for both positive and negative emotional features. The results show that the word count features of positive and negative emotions present different predictive roles and patterns. Adding the positive emotional word count feature based on the positive emotional proportion feature does not improve the model's predictive power for marital quality ($\beta = -0.027$, $p = 0.841$, $R^2 = 0.090$, $\Delta R^2 = 0.001$). However, adding the negative emotional word count feature based on the negative emotional proportion feature significantly improves the model's predictive power for marital quality ($\beta = -0.259$, $p = 0.036$, $R^2 = 0.127$, $\Delta R^2 = 0.055$).The word count threshold analysis revealed that the sensitive word count ranges for positive and negative emotional features are different. The positive emotional word count feature shows better predictive power in texts of lower word count (around 60 words), whereas the negative emotional word count feature performs better in texts with a higher word count (over 200 words).The results emphasize that focusing on word count features can extract hidden emotional information from texts more accurately, improve the prediction of marital quality, and initially identify the different sensitive word count ranges for emotional information contained in marriage interviews.

基于正念训练的专注力游戏课程对小学生注意力的改善效果

陈晓[1,2]（通讯作者） 钟紫琪[3]

1 广东白云学院 应用心理学系，广州，510450

2 北京师范大学 未来教育学院，珠海，519087 psychenxiao@126.com

3 深圳市光明区玉律学校，深圳，518132

摘 要 本研究基于正念训练为基础开发一套面向小学生专注力游戏干预课程，课程以“外星人的地球探索之旅”游戏主题活动。课程共由十节课组成，每周一节，一节课时长约为 50 分钟。在每节课开始时，教师介绍本次课程的故事背景并进行热身活动，正式课程活动包括两个主活动，主活动是在传统正念训练基础上结合当节外星人的故事进行改编包括正念的呼吸、正念行走、正念进食等。25 名 3-5 年级小学生参与为期 10 周的课程。在课程前、课程后和课程结束一个月后父母完成 Conners 父母症状问卷，学生完成儿童版注意网络测试。结果表明：1）干预结束一个月后的多动水平和学习问题上均显著低于前测水平，但这两个

方面在前测和后测以及后测和一个月后的追踪无显著差异；2）干预后的冲动水平显著低于前测，一个月后的冲动水平显著低于前测，但是后测和一个月追踪的冲动水平无显著差异；3）干预后的注意执行网络效率反应时显著低于前测，其他检测点之间无显著差异；4）品行问题和心身问题方面在各个监测点之间均无显著差异。基于正念的专注力游戏课程对小学生的多动和学习问题有显著的延时效果，对冲动多动有显著的即时效果和延时效果；对盖上小学生的注意力执行网络效率有显著改善作用。

The Effect of a Mindfulness-Based Attention Training Game Program on Elementary School Students' Attention

Chen Xiao[1,2]　Zhong Ziqi[3]

10. Department of Applied Psychology, Guangdong Baiyun University, Guangzhou, 510450

11. College of Education for the Future, Beijing Normal University, Zhuhai, 519087, Email: psychenxiao@126.com

12. Shenzhen Gungming Yulv School, Shenzhen, 518132

Abstract: This study developed a mindfulness-based attention training game intervention program specifically for elementary school students. The program themed was "Aliens' Journey to Earth". The program consisted of ten sessions, with one session per week, and each session lasted approximately 50 minutes. At the beginning of each session, the teacher introduced the story background of the session and conducted warm-up activities. Each session included two main activities, adapted from traditional mindfulness training, such as mindful breathing, mindful walking, mindful eating, et al. A total of 25 students in grades 3-5 participated in the 10 weeks. Their parents completed the Conners Parent Symptom Questionnaire, and students completed the Children's Version of the Attention Network Test before, after, and a month after the program. The results showed that: 1)One month after the program, the level of students' hyperactivity and learning problems were significantly lower than the pre-program levels. However, there were no significant differences between the pre-program, post-program, post-program and one-month follow-up for these aspects. 2) Students' impulsivity after the intervention were significantly lower than the pre-program level, and the levels of impulsivity one month after the program were also significantly lower than the pre-program level. However, there were no significant differences in impulsivity between the post-program and one-month follow-up. 3)The reaction time of attentional executive network efficiency after the program was significantly lower than the pre-program levels. 4)There were no significant differences in conduct problems and psychosomatic problems between the different measurement points. The mindfulness-based attention training game program showed significant delayed effects on reducing hyperactivity and learning problems in elementary school students. It also had significant immediate and delayed effects on reducing impulsive behavior. The program significantly improved the efficiency of attentional executive network in elementary school students.

正念训练对记忆的影响及其对抑郁症患者的临床应用

杨雅[1]　任桂琴[1]（通讯作者）　栗庆阳[1]　邵红涛[1]

1 辽宁师范大学心理学院，大连，116029, renguiqin@126.com

摘 要 正念训练是一种特定类型的冥想练习方式，它强调专注于体验当下意识，而不试图压制、判断或对任何刺激做出任何反应。近年来正念训练带来的积极效用得到了研究者们的高度关注。研究发现，正念训练能提高工作记忆容量，通过注意力的提升加强信息的储存和加工，减少默认网络活动的激活，对工作记忆有一定程度的保护作用，同时预防与压力相关的工作记忆障碍，甚至改变影响工作记忆的因素。同时正念训练对短时记忆和长时记忆也具有改善作用。大量研究显示正念训练不仅可以改善正常人的记忆，作为一种临床干预的手段，它也有助于改善精神疾病患者或是其他类型临床患者相关的记忆，比如通过训练抑郁症患者注意他们经历的特定方面，提高对心理内容的意识，从而促进更准确的编码和检索，改善自传体记忆的过度概括化；同时正念训练调节对消极刺激的情绪反应，减少对消极刺激的注意偏向，改善情绪记忆偏差都具有积极的效应。正念训练可以以简单的形式展开，从而应用到需要改善记忆的不同情境中，更广泛地提升其应用价值。未来研究应当探寻正念训练影响记忆加工的路径及过程；对不同的正念训练类型进行归纳和标准化；比较正念训练与其他影响记忆干预措施的差异；并探究正念训练影响记忆的普遍适用性和持续性。

The effects of Mindfulness Meditation Practices on Memory and its clinical application in depressed patients

Yang Ya, Ren Guiqin, Li Qingyang, Shao Hongtao

Liaoning Normal University, Dalian, 116029, China, renguiqin@126.com

Abstract：As a specific method of meditation practice, Mindfulness meditation practices emphasize experiencing the current consciousness rather than trying to suppress, judge or react to any stimulus. In recent years, the positive effects of mindfulness training have attracted much attention from researchers. Recent researches have found that mindfulness meditation practices can protect the working memory to a certain extent, increase the working memory capacity, as well as prevent the stress-related working memory disorders. even chang the factors that affect working memory. Furthermore, mindfulness meditation practices can be used to improve the short-term and long-term memory. A great number of researches have shown that mindfulness meditation practices can not only improve memory in normal people, but also help to improve the relevant memory of mental patients or other types of clinical patients as a means of clinical intervention. For example, by training people with depression to pay attention to specific aspects of their experiences, increasing awareness of psychological content, thereby promoting more accurate encoding and retrieval, and improving overgeneralization of autobiographical memory; At the same time, mindfulness training has positive effects on regulating emotional response to negative stimuli, reducing attention bias to negative stimuli, and improving emotional memory bias. Mindfulness training can be developed in a simple form, so that it can be applied to different situations that need to improve memory, increasing its application value more broadly. Further follow-up studies need to be conducted to determine the psychological mechanism of mindfulness meditation practices affecting memory, and to generalize and standardize different mindfulness practices training types, as well as studies compare the differences between mindfulness practices training and other memory interventions, Moreover, it is important to explore the impact of mindfulness practices training on the universality and persistence of memory.

Effect of College Students' Mindfulness on Internet Addiction: Chain Mediation Effect of Experience Avoidance and Redundancy

Liu Qun[1]　Miao Hongxia[2]　Song Guangwen[3]

1 Wanjiang College of Anhui Normal University, Wuhu, 241000

2 Miao Hongxia, Qufu Normal University, Qufu, 273165

3 Song Guangwen, South China University of Technology, Guangzhou, 510641

Abstract：The problem of Internet addiction among college students is becoming more and more prominent. Objective: To analyze the effect of mindfulness on Internet addiction in college students and the mechanism of experience avoidance and redundancy. Methods: 1011 college students were investigated by Mindful Attention Awareness Scale（MAAS）,Acceptance and Action Questionnaire-and Edition（AAQ-II）,Ruminative Responses Scale（RRS）, Adolescent Pathological Internet Use Scale（APIUS）. Results: (1) Mindfulness was negatively correlated with experience avoidance, redundancy, and Internet addiction (r=-0.283, -0.252, -0.269, P < 0.05). Experience avoidance was positively correlated with redundancy and Internet addiction (r=0.548,0.432, P < 0.05). Experience avoidance was positively correlated with redundancy and Internet addiction (r=0.548,0.432, P < 0.05). (2) Mindfulness can have a direct impact on Internet addiction (95% CI: -0.156 to -0.042). It can also act on Internet addiction through three mediating pathways: Mediating effect of experience avoidance (95% CI: -0.090 to -0.031), mediating effect of experience avoidance (95% CI: -0.090 to -0.031), chain mediating effect of

experiential avoidance and redundancy (95% CI: -0.065 to -0.027). Conclusion: Mindfulness can affect individual Internet addiction through experiential avoidance and redundancy. College educators can help college students strengthen mindfulness training and improve positive psychological quality; reduce experience avoidance and improve the level of psychological flexibility; reduce the trouble of redundancy and improve the ability of psychological adaptation.

正念疗法对进食障碍的影响及作用机制

曹燕华[1] 张敏[2] 何元庆[1]

（1.安徽师范大学教育科学学院，芜湖，241000，E-mail: hyqkgq@126.com；

2.泰兴市第三高级中学，泰兴，225400）

摘 要　进食障碍是一种由心理障碍引发的精神障碍疾病，大量研究表明对其治疗方法的探究是该领域的研究重点。正念疗法是以“正念”为核心的心理疗法的总称，强调对当下经验的注意和接纳，被众多研究证明能有效缓解进食障碍症状。本文首先总结了正念疗法应用于进食障碍的心理临床成果，包括正念进食的主要评估工具和正念疗法干预进食障碍的有效性两个方面。其中，评估工具包括正念进食问卷（The Mindful Eating Questionnaire，MEQ）、正念进食量表（The Mindful Eating Scale, MES）、进食行为量表（The Mindful Eating Behavior Scale, MEBS）、正念进食量表（The Mindful Eating Inventory, MEI），为进食障碍的临床干预和正念疗法在进食障碍中的潜在作用机制研究提供参照依据。然后提出正念疗法在进食障碍中的生理作用机制：个体在正念训练过程中大脑神经生理活动和大脑功能及结构的变化在一定程度上改善了个体的注意、感知觉、情绪调节以及自我控制能力；接着提出正念疗法在进食障碍中的心理作用机制：进食障碍患者在正念状态下可以通过注意和接纳技能提高其对身体外部线索（如体像）、身体内部线索（如饥饿感、饱腹感）和内部情感线索（如冲动、焦虑）的感知觉能力，提升其对内部情感线索的情绪调节和自我控制能力，进而改善患者的进食障碍；最后对当前研究提出展望：完善研究方法，提升结果可靠性、加强正念疗法的本土化和差异性研究、深入探明正念疗法发挥作用的机制。

Application and Mechanism of Mindfulness Therapy in Eating Disorders

Cao YanHua[1], Zhang Min[2] He YuanQing[1]

([1]School of Educational Science, WuHu, 241000, China) ([2]Taixing 3 rd high school, TaiXing, 225400 , China)

Abstract：Eating disorder is a mental disorder caused by psychological disorder, and a large number of studies show that the exploration of its treatment is the focus of research in this field. Mindfulness therapy is the general name of psychotherapy with mindfulness as the core, which emphasizes the attention and acceptance of current experience and has been proved by many studies to effectively alleviate eating disorder symptoms. Firstly, this paper summarizes the psychological and clinical achievements of mindfulness therapy in eating disorders, including the main evaluation tools of mindfulness eating and the effectiveness of mindfulness therapy in intervening eating disorders. Among them, the evaluation tools include The Mindful Eating Questionnaire (MEQ), The Mindful Eating Scale, MES) and The Mindful Eating Behavior Scale (MEQ). MEBS) and The Mindful Eating Inventory, MEI) provide reference for clinical intervention of eating disorders and the study of the potential

mechanism of mindfulness therapy in eating disorders. Then the physiological mechanism of mindfulness therapy in eating disorders is put forward: the physiological activities of the brain and the changes of brain function and structure in the process of mindfulness training improve the individual's ability of attention, perception, emotional regulation and self-control to some extent; Then, the psychological mechanism of mindfulness therapy in eating disorders is put forward: patients with eating disorders can improve their perception ability of external cues (such as body image), internal cues (such as hunger and satiety) and internal emotional cues (such as impulse and anxiety) by paying attention to and accepting skills, so as to improve their emotional adjustment and self-control ability of internal emotional cues, and then improve their eating disorders; Finally, the prospect of current research is put forward: perfecting research methods, improving the reliability of results, strengthening the localization and difference research of mindfulness therapy, and deeply exploring the mechanism of mindfulness therapy.

结合虚拟现实技术的正念减压干预：自我关怀和睡眠问题的动态交互

翁小芳[1]　郭鑫苗[1]　韩卓[2]（通讯作者）

1 北京师范大学，北京，100875

2 北京师范大学心理学部，北京，100875，rachhan@bnu.edu.cn

摘 要　目的 ：基于正念的减压疗法具有改善自我关怀和减少睡眠问题的作用，但存在正念练习的坚持难和依从性低等问题，而且正念干预起效的过程和动态相关研究仍较为缺乏。本研究将利用虚拟现实技术（VR）的沉浸感特点，设计一个结合传统正念干预技术和 VR 放松减压技术的八周正念减压干预方案，并进行随机对照试验探究该方案对大学生的干预效果及过程机制，评估正念干预是否能够提升大学生的自我关怀水平，并解析正念干预过程中自我关怀与睡眠障碍的动态变化关系。方法： 在北京某大学通过线上线下相结合的方式招募自愿参加八周正念团体辅导的大学生被试，通过问卷进行筛选，筛选标准包括年龄 18 以上、无任何精神类疾病、无参加过任何有关正念技能的培训。采用随机分配法将其分成控制组和实验组各 31 例，其中控制组不接受任何干预，实验组接受正念疗法的 8 周干预。对照组和干预组在八周干预前和八周干预后分别报告自我关怀水平，干预组每周干预前（T1-T8）报告过去一周的自我关怀水平和过去一周的睡眠障碍。结果 ：在 SPSS 26 进行方差分析，发现干预 8 周后实验组 SCS 评分显著高于控制组（控制前测 SCS 得分，$F = 4.926, t = 2.29, p < 0.05$）。在 Mplus 采用两水平时间序列模型分析，发现自我关怀水平和睡眠障碍的自回归效应均显著（$\beta = 0.334$，$p < 0.01$, $\beta = 0.267$，$p < 0.01$），睡眠障碍不能预测下一周的自我关怀水平($\beta = 0.087$，$p > 0.1$)，更高的自我关怀与下一周更少的睡眠障碍相关($\beta = -0.154$，$p < 0.05$)。结论 ：①正念疗法可以显著提升大学生的自我关怀水平；②干预过程中的自我关怀水平能降低睡眠障碍。本研究开发的结合 VR 的正念减压方案能提升自我关怀水平，而且解析了干预过程中的自我关怀能持续有效地促进睡眠质量这一动态过程，为未来正念干预的开发和实施提供证据，特别是针对具有睡眠困扰的大学生群体。

Mindfulness-based intervention using Virtual Reality: a dynamic interaction between self-care and sleep problems

Weng Xiaofang, Guo Xinmiao, Han Zhuo

Beijing Normal University, 19 Xinjiekou Wai Street, Haidian District, Beijing

***Abstract*:** Mindfulness-Based Stress Reduction(MBSR)has the effect of improving self- compassion and reducing sleep problems, but there are problems such as difficulty in adherence to positive thinking practice and low compliance, and there is still a lack of research related to the process and dynamics of the effectiveness of positive thinking intervention. In this study, we will utilize the immersive characteristics of virtual reality (VR) technology to design an eight-week positive thinking stress reduction intervention program that combines traditional positive thinking intervention technology and VR relaxation and stress reduction technology, and conduct a randomized controlled trial to investigate the intervention effect and process mechanism of the program on college students, to assess whether positive thinking intervention can improve the level of self- compassion of college students, and to analyze the dynamic change of the relationship between self-concern and sleep disorders in the process of positive thinking intervention. We also analyze the relationship between self- compassion and sleep disorders during the process of positive thinking intervention. College student who voluntarily participated in eight weeks of positive thinking group counseling were recruited through a combination of online and offline methods at a university in Beijing, and were screened through a questionnaire, with the screening criteria including age of 18 or above, absence of any psychiatric disease, and absence of any training on positive thinking skills. Random assignment method was used to divide them into 31 cases each in the control group and the experimental group, in which the control group did not receive any intervention and the experimental group received the eight-week intervention of positive thinking therapy. The control group and the intervention group reported the level of self- compassion before and after the eight-week intervention, respectively, and the intervention group reported the level of self-compassion in the past week and sleep disturbances in the past week before each weekly intervention (T1-T8). SCS scores were significantly higher in the experimental group than in the control group after 8 weeks of intervention (control pre-tested SCS scores, $F = 4.926$, $t = 2.29$, $p < 0.05$). Analysis at Mplus using two-level time-series modeling revealed significant autoregressive effects for both level of self- compassion and sleep disorder ($\beta = 0.334$, $p < 0.01$, $\beta = 0.267$, $p < 0.01$), with sleep disorder failing to predict level of self- compassion in the following week ($\beta = 0.087$, $p > 0.1$), and higher self- compassion being associated with fewer sleep disorders in the following week ($\beta = -0.154$, $p < 0.05$). We conclude that (1) MBSR can significantly enhance the level of self- compassion among college students; (2) the level of self- compassion during the intervention reduces sleep disturbance. The positive thinking stress reduction program combined with VR developed in this study enhances the level of self-compassion, and resolves the dynamic process that self- compassion during intervention can continue to effectively promote sleep quality, providing evidence for the development and implementation of positive thinking interventions in the future, especially for the college student population with sleep disturbances.

学习意图和环境复杂度对个体空间记忆的影响

张亚南[1] 刘仙芸[2]（通讯作者）

1 天津师范大学心理学部，天津，300387

2 天津师范大学心理学部，天津，300387，liuxianyun5099@163.com

摘 要 虽然有意学习在多种一般记忆如情节信息、言语、风味中的积极作用已经被证实，但空间学习过程中学习意图对空间记忆的作用还存在争议。一种观点认为空间学习是自动发生的，学习结果不受练习、年龄、学习意图等因素的影响；另一种观点认为空间学习结果（如方向和距离）受到练习和努力加工信息的影响。考虑到外出环境类型的多样性，本研究旨在借助虚拟环境考察巡航过程中学习意图和环境复杂度对个体空间记忆的影响。先前研究认为个体的空间能力是影响空间记忆的一个重要因素，因此本研究在实验前根据圣巴巴拉方向感问卷对被试进行筛选。实验采用 2（学习意图：有意、无意）×2（环境复杂度：城市、郊区）被试间设计，88 名中等空间能力的被试被随机分配到四个条件下，性别在各个条件下平衡。研究包括环境学习和任务测试两个部分，在环境学习过程中，被试根据路线的导航提示模拟驾驶至终点；随后依次完成路线再巡航、地图绘制、场景再认、顺序再认四个任务。结果发现：城市环境中被试在地图绘制和场景再认任务上的表现优于郊区环境；有意学习条件下被试在各个任务上的表现都优于无意学习条件；与郊区环境相比，城市环境中被试有意学习和无意学习的路线再巡航表现差异更大。结果表明：学习意图在空间学习过程中发挥着重要作用，有意学习能够促进中等空间能力水平个体的空间记忆，这种促进作用在城市环境中更明显，对于理解空间记忆的影响因素以及设计有效的空间学习策略具有一定的指导意义。

关键词 学习意图，环境复杂度，空间记忆，空间学习

The effect of learning intention and environment complexity on spatial memory in individuals

Yanan Zhang[1] Xianyun Liu[2]
1 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387
2 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387, liuxianyun5099@163.com

***Abstract*:** While the positive role of intentional learning in a variety of general memories such as episodic information, verbal, and flavor has been demonstrated, the role of learning intentions on spatial memory during spatial learning is still controversial. One view was that spatial learning occurred automatically and that learning results were not influenced by factors such as practice, age, or intention; another view suggested that spatial learning results (e.g., direction and distance) were influenced by practice and effort to process information. Given the diversity of outdoor environment types, this study aimed to examine the effects of learning intention and environment complexity on individual spatial memory during navigation with the help of virtual environments. Previous researches have suggested that individuals' spatial ability was an important factor in spatial memory, so the present study selected participants based on the Santa Barbara Sense-of-Direction scale first. Then a 2(learning intention: intentional learning/incidental learning)×2(environment complexity: urban/suburban) between-subjects design was used, 88 participants with moderate spatial ability were randomly assigned to four conditions, with gender counterbalanced across conditions. The study consisted of two parts: environment learning and task testing. During learning process, participants simulated driving to the end point according to the navigation cues of the route; then completed the four tasks of route retracing, map-drawing, scenes recognition, and scenes order recognition in turn. The results showed that participants in the urban environment performed better than in the suburban environment on map-drawing and scenes recognition tasks; participants in the intentional learning condition were better at four tasks than in the incidental learning condition; the difference in route retracing performance between intentional and incidental learning was greater in the urban environment compared to the suburban environment. The results suggested that learning intentions played an important role in the spatial learning process, and intentional learning could promote spatial memory in individuals with moderate levels of spatial ability, the promotion was more obvious in the urban environment, which were instructive for understanding the influences on spatial memory and for designing effective spatial learning strategies.

触屏手势对幼儿数认知的影响：匹配性的优势效应

伍韫旖，毛忆晨，王福兴（通讯作者）
华中师范大学心理学院，武汉，430079，E-mail: fxwang@ccnu.edu.cn

摘 要 具身认知的研究表明手势会影响儿童的认知过程和学习表现。随着技术的发展，触屏手势在儿童基于触屏的数认知学习中起到支持作用，这种作用在学习材料与心理表征高度映射时可能更加突出。本研究关注不同的触屏交互手势在幼儿数认知中的作用。我们考察了在具备连续意义的数轴材料中，拖拽手势（连续动作-匹配）和点击手势（离散动作-不匹配）对儿童数估计表现的影响，并通过分析触屏手势在数估计范围大小和位置上的差异，探讨匹配手势产生优势效应的边界条件。实验采用 2（触屏交互方式：拖拽/点

击）× 2（数估计范围：0-10/0-20）×2（数估计位置：中点左侧/中点右侧）的三因素混合设计。70 名 5-6 岁幼儿(其中女生 33 人)被随机分配拖拽组(n = 34)和点击组(n = 36)完成实验。结果发现，在错误率上，拖拽组只有在进行难度较大（大数估计中的数轴右侧）数估计时会更有优势；在反应时间指标上，相较于点击组，拖拽组更快地对刺激做出反应，并在进行较大的数估计时思考的时间更长。结论认为，在儿童需要外显化脚手架的辅助时，与数轴匹配的拖拽手势为建构心理表征提供了更好的支持，降低了数估计难度，并帮助幼儿释放更多的心理资源进行策略调整。研究发现说明触屏媒体能够促进幼儿的数认知，对触屏学习提供了启示。

The influence of touchscreen gestures on young children's numerical cognition: the superiority effect of congruency

Yunyi Wu, Yichen Mao, Fuxing Wang*
School of Psychology, Central China Normal University, Wuhan

***Abstract*:** Research on embodied cognition shows that gestures may impact children's cognitive processes and learning outcomes. As technology advances, touchscreen gestures play a supportive role in children's touchscreen-based numerical cognitive learning, and this role may be more pronounced when learning materials are highly mapped to mental representations. The current study examined how different interactions on touchscreen devices influence children's numerical cognition. In the continuous number line material, we investigated the impact of drag gestures (continuous action - congruent) and tap gestures (discrete action - incongruent) on children's performance in numerical estimation. By examining differences in the set size and position of the number line estimation, we also explored the boundary conditions for the superiority effect of congruent gestures. The study used a 2 (type of touchscreen interaction: drag/tap) × 2 (estimated set size: 0-10/0-20) × 2 (estimated position: left of midpoint/right of midpoint) mixed design. 70 children aged 5-6 years (33 girls) were recruited and randomly assigned to either the drag group (n = 34) or the tap group (n = 36) to complete the experiment. Regarding the results of estimating error, only while completing challenging estimation (right side in the large-size set) was the drag group superior to the tap group. In terms of response time, the drag group responded to the stimulus faster and spent more time in thought than the tap group in the large-size set of estimation. The results suggest that when young children require explicit scaffolding, congruent gestures enable them to release more mental resources for strategic adjustments, decrease the difficulty of numerical estimation, and provide better support for constructing mental representations. The findings show that touchscreen media can facilitate young children's numerical cognition and provide insight into touchscreen learning.

听障成年人动作序列学习过程的特异性：视觉和本体觉成分的比较研

究

辛梦瑶 王芸姣 马伟娜 谢宇（通讯作者）
杭州师范大学经亨颐教育学院，杭州，311121，yu_xie@hznu.edu.cn

摘要 听障成年人的动作技能尚未得到广泛探索，他们学习动作技能的过程是否表现出特异性一直是研究者关注的焦点问题，然后当前观点并不一致。新动作技能的发展涉及整合来自多种感官模式的信息，尤其依赖于视觉和本体觉输入的信息。个体通过反复练习能够顺利且轻松地将一系列简单或复杂的动作元素整合为一个整体的过程被称为动作序列学习，它与动作技能学习密切相关。本研究采用改版的序列反应时任务（serial reaction time task, SRTT）对动作序列学习过程中本体觉和视觉成分进行分离，考察听障成年人对不同成分的学习表现并探讨他们的动作序列学习模式与健听组相比是否存在特异性。共招募 31 名听障成年人和 32 名健听成年人分别完成了序列反应时任务，两组被试的年龄与性别做了匹配。结果表明：在测验阶段，听障组的视觉成分和本体觉成分的序列反应时均慢于健听组，但两组被试在序列反应时任务中视觉成分和本体觉成分的学习分数上均不存在显著性差异。在前期的训练阶段，两组被试在完成相同试次任务时，只有听障组表现出序列学习，即序列试次的平均反应时比随机试次的平均反应时更短。此外，听障组被试是先天或后天的听力损伤与其动作序列学习表现之间不存在显著性相关关系。综合上述研究结果可发现，听障成年人具有正常的动作技能学习能力，并且在动作序列学习模式上的特异性主要表现为序列学习的敏锐度更高。

关键词 听觉障碍，序列反应时间任务（SRTT），视觉，本体觉

The specificity of motor sequence learning process in hearing-impaired adults : a comparative study of visual and proprioceptive components

Xin Mengyao Wang Yunjiao Ma Weina Xie Yu
Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou

***Abstract*:** The motor skills of hearing-impaired adults have not been widely explored, whether the process of motor skill learning shows specificity has always been the focus of researchers ' attention, and then the current views are not consistent. Development of new motor skills involves integrating information from multiple sensory modalities, which is particularly reliant on information of visual and proprioceptive input. The individual takes a series of simple or complex action elements as a whole through repeated practice, and the process that can be completed smoothly and easily is called motor sequence learning, which is closely related to the learning of motor skills. In this study, a modified serial reaction time task (SRTT) was used to separate the proprioceptive and visual components in the process of motor sequence learning, investigate the learning performance of hearing-impaired adults on different components and explore whether patterns of motor skill learning differ in hearing-impaired adults as compared with healthy controls. 31 hearing-impaired adults were recruited in this study and 32 normal-hearing adults matched for age and gender served as controls. The findings suggest that, in the testing period, the reaction time (RT) of hearing-impaired participants was slower than healthy controls during the visual and proprioceptive component task, but the two groups did not significantly differ in the learning scores. In the training period, only hearing-impaired group demonstrated sequence learning that the average RT of sequenced trials were significantly faster than that of random trials. In addition, congenital or acquired hearing loss and motor

sequence learning performance were not significantly correlated in the hearing-impaired group. In conclusion, hearing-impaired adults have normal motor skill learning ability, and the specificity of motor sequence learning mode is mainly manifested in the higher sensitivity of sequence learning.

摘 要　研究言语产生过程中，词汇产生尤为重要，重点是研究语义干扰效应（semantic interference effect, SIE），通常使用图片—词汇干扰任务（picture-word interference task, PWI）。该任务是用于探测口语词汇产生机制的典型任务，任务中会呈现目标图片和一个干扰词，要求被试忽略干扰词，说出图画名称。通过该任务，前人发现了语义干扰效应，即干扰词和目标词相关时的命名潜伏期显著长于两者无关时。相比语义无关的干扰词，语义相关的干扰词干扰图片的命名，产生语义干扰效应。

语义干扰效应的存在得到了大量研究的证实，但语义效应并非只有语义干扰，语义相关的类型影响语义干扰效应的产生和大小。研究者们通常将语义相关的类型划分为类别相关、联想相关、反义相关、同义相关等，其中，类别相关和联想相关对词汇产生的作用相反，前者是语义干扰作用，后者是语义促进作用。大多数研究中使用的是单一的相关关系进行语义干扰效应的研究，本研究重点是在语义相关类型中的类别相关材料中加入不同程度的联想相关，即将材料划分为高联想类别相关、中联想类别相关、低联想类别相关和类别无关四种材料。以此来研究联想程度对语义干扰效应的产生及效应大小的影响。

本研究使用图画-词汇干扰任务对 48 张黑白图片进行反应，采用 4（语义相关类型：高联想类别相关/中联想类别相关/低联想类别相关/类别无关）单因素四水平被试内设计，51 名被试完成了该项任务。发现命名潜伏期上，语义相关类型主效应显著。高联想类别相关显著快于中联想类别相关、低联想类别相关和类别无关，中联想类别相关、类别无关均显著快于低联想类别相关。

总的来说，一方面，该研究再次证实了词汇产生过程中语义干扰效应的存在。另一方面，本研究在类别相关中细分词对的联想相关程度，发现即使存在类别相关，当联想程度的不同，语义效应的极性会发生改变，由语义干扰变为语义促进。本研究中，高联想类别相关表现出语义促进，仅低联想类别相关表现为语义干扰。

The influence of semantic association degree on semantic effect

Wang Wenyuan[1], Leng Ying[1]
1 Nantong University, Nantong

Abstract：In the process of speech production, word generation is particularly important, and the focus is on the semantic interference effect (SIE), usually using picture-word interference task (PWI). This task is a typical task used to detect the production mechanism of spoken words. In the task, the target picture and a distractor word are presented, and the subjects are asked to ignore the distractor and name the picture. Through this task, predecessors found semantic interference effect, that is, the naming latency when the distractor and the target word are correlated is significantly longer than when they are unrelated. Compared with the semantically irrelevant distractors, the semantically related distractors interfere with the naming of pictures, resulting in semantic

interference effect.

The existence of semantic interference effect has been confirmed by a large number of studies, but semantic effect is not only semantic interference, and the type of semantic relatedness affects the generation and size of semantic interference effect. Researchers usually divide the types of semantic relatedness into category relatedness, association relatedness, antisense relatedness and synonym relatedness, etc. Among them, category relatedness and association relatedness have opposite effects on words, the former is semantic interference, the latter is semantic promotion. In most studies, a single relatedness is used to study semantic interference effects. This study focuses on adding different degrees of associative relatedness to category-related materials of semantically correlated types, that is, materials are divided into four types: high-associative category relatedness, medium-associative category relatedness, low-associative category relatedness and category-unrelatedness. In this paper, the influence of association degree on semantic interference effect and effect size is studied.

In this study, 48 black and white pictures were responded to using a picture-word interference task, which was completed by 51 subjects in a four-level, single-factor within-subject design with (high-associative category relatedness/medium-associative category relatedness/low-associative category relatedness/category-unrelatedness). It was found that the semantic relatedness type had a significant main effect on the naming latency. High-associative category relatedness is significantly faster than medium-associative category relatedness, low-associative category relatedness and category-unrelatedness, and medium-associative category relatedness and category-unrelatedness are significantly faster than low-associative category relatedness.

In conclusion, on the one hand, this study once again confirms the existence of semantic interference effect in the process of word production. On the other hand, this study subdivides the associative relatedness degree of word pairs in category relatedness, and finds that even if there is category relatedness, the polarity of semantic effect will change from semantic interference to semantic promotion when the association degree is different. In this study, high-associative category relatedness shows semantic promotion, while low-associative category relatedness shows semantic interference.

摘 要 基于个体中心的视角，考察高一新生求助数学教师行为和感知到的数学教师支持的异质性，并进一步探究不同类型的个体在数学学业积极发展上表现出的差异。采用求助数学教师行为问卷，感知到的数学教师支持问卷，积极学业情绪量表和数学学习投入量表对 687 名高一新生进行问卷调查，运用潜在剖面分析探索高一新生求助数学教师行为和感知到的数学教师支持组合的异质性及特征，并通过方差分析比较不同组别个体在数学学业积极发展指标上的差异。结果发现：（1）求助数学教师行为和感知到的数学教师支持可被分为四个潜在类别：“双高积极型”（n = 200，29.11%），“中等匹配型”（n =171，24.89%），“情感缺失型”（n =233，33.92%），“双低消极型”（n =83，12.08%）；（2）四个潜在类型的个体在积极学业情绪和学习投入上均存在显著差异。具体而言，“双高积极型”在积极高唤醒情绪、积极低唤醒情绪和学习投入上，显著优于“中等匹配型”，“情感缺失型”和“双低消极型”。高一新生求助数学教师行为和感知到的

数学教师支持存在显著的群体异质性，且不同类型群体在数学学业积极发展上存在一定差异，未来可根据人群特点开展针对性的干预措施。

***Abstract*：** From an individual-centered perspective, this study examines the heterogeneity of high school freshmen's seeking help from mathematics teachers and their perceived mathematics teacher support, and further explored the differences in positive mathematics academic development among different types of individuals. Seeking help from mathematics teachers questionnaire, perceived mathematics teacher support questionnaire, positive academic emotion scale, and mathematics learning engagement scale were adopted to test 687 high school freshmen. Latent profile analysis was employed to explore the heterogeneity and characteristics of the combinations of seeking help from mathematics teachers and perceived mathematics teacher support among high school freshmen. Differences in positive mathematics academic development indicators among different types were compared using analysis of variance. The results were as follows: (1) Seeking help from mathematics teachers and perceived mathematics teacher support could be classified into four latent categories: "dual-high positive type" (n = 200, 29.11%), "moderate matching type" (n = 171, 24.89%), "affective deficiency type" (n = 233, 33.92%), and "dual-low negative type" (n = 83, 12.08%). (2) Significant differences were found among the four latent types of individuals in positive academic emotions and learning engagement. Specifically, the "dual-high positive type" outperformed the "moderate matching type," "affective deficiency type," and "dual-low negative type" in positive-high arousal emotions, positive-low arousal emotions, and learning engagement. There exists significant heterogeneity in high school freshmen's seeking help from mathematics teachers and their perceived mathematics teacher support, and different groups exhibit differences in positive mathematics academic development. Future interventions can be tailored based on these characteristics to promote positive development in mathematics learning.

波动环境下 Alpha 振荡编码空间注意的计算神经机制：基于贝叶斯信念更新框架

李思莹[1]　刘梦[2]　董文珊[2]　陈琦[1]（通讯作者）
1 深圳大学心理学院，深圳，518000，chenqi@szu.edu.cn
2 华南师范大学心理学院，广州，510000

摘 要　空间注意资源部署被认为取决于对即将发生事件的预测与推断，尤其是当人们处在一个充满不确定性的波动环境中。根据贝叶斯大脑假说（Bayesian brain hypothesis），大脑在不断更新基于感官输入的生成模型，以此来推断环境的因果关系结构并预测未来事件。尽管有关贝叶斯信念更新如何影响感知刺激加工的讨论十分广泛，但相关研究仍未完全揭示其中潜在的神经机制。因此，为了探讨 alpha 频段神经活动（8-13Hz）如何编码空间注意的部署，以及预测精度（信念更新过程的决定因素之一）如何作为计算神经基础参与这些调控过程，本研究采用了中央线索 Posner 实验范式，线索有效概率在 88%、69%、50%三个水平之间变化，随时间不断变化的线索有效概率构成了波动的概率环境条件。本研究收集了 28 名正常被试的行为和脑电数据，并通过计算建模（包含感知模型 Hierarchical Gaussian Filter，HGF 模型与反应模型）来量化个体内部注意加工的信念更新过程，最后通过线性回归分析考察确定性（预测精度）调控的注意资源部署与 alpha 频段神经活动的关系。计算行为结果表明，可以从信念更新的角度来解释注意资源分配过程，不同的注意资源比例对反应速度存在影响。神经生理方面：（1）在目标出现之前，对于高确定性的线索（88%有效概率）个体会利用预测精度影响注意资源分配，并负向调节 alpha 频段神经活动。但这种显著的调节关系并未出现在低确定性（69%、50%有效概率）的线索条件中。（2）在目标刺激呈现后，当目标出现在提示位置时（有效线索条件），预测精度对注意资源分配的影响由 alpha 频段编码，表现为对 alpha 频段活动的负向调节；但是当刺激出现在未提示的位置时（无效线索条件），并未发现这种显著的调节关系。以上研究结果表明，预测精度是 alpha 频段振荡调控注意资源分配的计算神经基础。

The Computational and Neural Mechanisms of Alpha Oscillation Encoding for Spatial Attention in Dynamic Environments: Based on the Bayesian Belief Updating Framework

Siying Li[1], Meng Liu[2], Wenshan Dong[2], Qi Chen[1*]
1 School of Psychology, Shenzhen University, Shenzhen, China.
2 School of Psychology, South China Normal University, Guangzhou, China

***Abstract*：** The deployment of spatial attention is believed to depend on predictions and inferences about upcoming events, especially when individuals are in a volatile environment filled with uncertainty. According to the Bayesian brain hypothesis, the brain continuously updates its generative model based on sensory inputs to infer causal relationship structures in the environment and predict future events. Although there has been extensive discussion on how Bayesian belief updating affects the processing of perceptual stimuli, the underlying neural mechanisms remain largely unexplored. Therefore, to investigate how neural activity in the alpha frequency

(8-13Hz) encodes the deployment of spatial attention and how precision of prediction (one of the determinants of belief updating) serves as a computational neural basis in these regulatory processes, this study adopted the central cue Posner paradigm. The probability of valid cues varied among three levels: 88%, 69%, and 50%, reflecting a volatile probabilistic environment over time. Behavioral and electroencephalographic (EEG) data from 28 healthy participants were collected, and computational modeling (including the hierarchical Gaussian filter perceptual model, HGF model, and response model) was employed to quantify the belief updating process in individual internal processing. Lastly, linear regression analysis was used to examine the relationship between certainty (precision) of attentional resource allocation and neural activity in the alpha frequency. The computational behavioral results suggest that the process of attentional resource allocation can be explained from the perspective of Bayesian belief updating, and different proportions of attentional resources have an impact on reaction speed. Neurophysiological aspect: (1) Prior to the appearance of the target, precision of prediction influenced attentional resource allocation and negatively regulated alpha-band power in response to high-certain cues (with 88% valid probability). However, this significant regulatory relationship did not appear in conditions with low-certain cues (with 69% and 50% valid probability). (2) Following the presentation of the target, when the target appeared at the cued location (valid condition), the influence of precision on attentional allocation was encoded by the alpha-band power. However, when the stimulus appeared at the uncued location (invalid condition), no significant regulatory relationship was observed. The formal findings indicated that precision of prediction served as a computational foundation for the regulation of attentional allocation by alpha-band oscillations.

基于反应抑制训练对排球运动员执行功能的训练效应和迁移效应的影响研究

盖子墨[1] 施伟[1] 杨东[2] 付哲敏（通讯作者）[3]

1 沈阳体育学院，沈阳,110102

2 沈阳体育学院，沈阳,110102

3 沈阳体育学院，沈阳，110102（1007243254@qq.com）

摘 要 **目的：**反应抑制是指抑制不符合当前需要的或不恰当行为反应的能力。Stopsignal 任务作为一种与 Stroop 任务、Go/No-go 任务加工过程相似，训练对执行功能是否会发生训练效应和迁移效应？因此，本研究基于即时反馈的反应抑制任务——StopSignal 范式为训练任务，测量训练前后排球运动员在执行功能中反应抑制的 Go/No-go 任务、干扰抑制的 Stroop 任务、工作记忆的 N-back 任务和推理上是否发生训练效应及迁移效应。

方法：采用实验法，招募国家二级及以上排球运动员 100 人，青少年被试 40 人。其中成年男性 30 人，成年女性 30 人，将成人被试随机分配到成人实验组、成人积极控制组和消极控制组，将青少年被试随机分配到青少年实验组和青少年积极控制组。在前、后测阶段，抑制功能任务（StopSignal、Go/No-go、Stroop）、工作记忆任务（N-back）、瑞文标准推理测验采用随机顺序进行测量，为避免疲劳效应，均分为两天进行。在训练阶段，对实验组和积极控制组进行持续 3 周，每周 3 次的 Stop Signal 任务训练，其中实验组训练任务中加入即时反馈，积极控制组无反馈。训练共分为 8 个 block，每个 block 包含 100 个试次。

结果：两个实验组均产生了对反应抑制 Go/No-go 任务的迁移效应；但只有青少年实验组出现了对干扰抑制 Stroop 任务的迁移效应。成人实验组和积极控制组都出现了对 2-back 任务的迁移效应；但只有青少年实验组出现了在 2-和 3-back 任务上的迁移效应。所有组别都未能出现对推理能力的迁移。基于即时反馈的反应抑制训练能够对执行功能产生训练和迁移效应，但迁移仅限于抑制和工作记忆等基础成分，无法改善推理

能力。
结论：迁移效应受到认知可塑性的年龄差异和任务性质的双重影响。在青少年和成人组，均发生了对同为反应抑制的 Go/No-go 任务和工作记忆的迁移效应，但未能出现对推理能力的迁移。补充了抑制训练改善执行功能的发展趋势，提示未来抑制功能训练对排球运动员成年期以前的年龄阶段更具有塑造作用。

Based on the effect of response inhibition training on the training effect and migration effect of volleyball players executive function

GaiZimo[1] SHIWei[1] YANGdong[2] FUZhemin（corresponding author）[3]
1Shenyang Sport University, Shenyang,110102
2Shenyang Sport University, Shenyang,110102
3Shenyang Sport University, Shenyang,110102(1007243254@qq.com)

***Abstract*：** **Objective :** Response inhibition refers to the ability to suppress responses that do not meet current needs or inappropriate behaviors. Stopsignal task is similar to Stroop task and Go / No-go task. Does training have training effect and transfer effect on executive function ? Therefore, based on the response inhibition task of immediate feedback-StopSignal paradigm as the training task, this study measured whether the training effect and transfer effect occurred in the response inhibition Go / No-go task, interference inhibition Stroop task, working memory N-back task and reasoning of volleyball players before and after training.

Methods : The experimental method was used to recruit 100 national second-level and above volleyball players and 40 teenagers. There were 30 adult males and 30 adult females. The adult subjects were randomly assigned to the adult experimental group, the adult positive control group and the negative control group. The adolescent subjects were randomly assigned to the adolescent experimental group and the adolescent positive control group. In the pre-test and post-test stages, inhibition function tasks (StopSignal, Go / No-go, Stroop), working memory tasks (N-back), and Raven 's Standard Progressive Matrices were measured in random order. In order to avoid fatigue effects, they were divided into two days. In the training phase, the experimental group and the active control group were trained in the Stop Signal task for 3 weeks, 3 times a week. The experimental group added instant feedback to the training task, and the active control group had no feedback. The training is divided into 8 blocks, each block contains 100 trials.

Results : Both experimental groups produced a migration effect on the response inhibition Go / No-go task ; however, only the adolescent experimental group showed a migration effect on the interference suppression Stroop task. Both the adult experimental group and the active control group showed a migration effect on the 2-back task ; however, only the adolescent experimental group showed the transfer effect on the 2-and 3-back tasks. No transfer of reasoning ability occurred in all groups. Response inhibition training based on immediate feedback can produce training and transfer effects on executive function, but transfer is limited to basic components such as inhibition and working memory, and cannot improve reasoning ability.

Conclusion : The transfer effect is influenced by the age difference of cognitive plasticity and the nature of the task. In both adolescent and adult groups, the transfer effect of Go / No-go task and working memory with the same response inhibition occurred, but the transfer of reasoning ability did not occur. It complements the development trend of inhibition training to improve executive function, suggesting that future inhibition function training has a more shaping effect on the age stage of volleyball players before adulthood.

Keywords : response inhibition training, executive function, volleyball player

健康人群延迟折扣与灰质体积的关系：基于体素形态测量学的 ALE 元分析研究

刘洋[1]，蔡新璐[1]

[1] 杭州师范大学基础医学院脑科学研究所，杭州，310012

通讯作者 Email：caixinlu@hznu.edu.cn

摘 要　延迟折扣是发生在跨期决策中的现象，是指个体在面临即时奖励和延迟奖励时，对延迟奖励金额的主观估值下降而更偏好即时奖励。延迟折扣在评估个体的冲动性方面也起到了重要作用，通过衡量个体对即时奖励和延迟奖励的偏好程度，我们可以使用延迟折扣率这一指标来评估个体的冲动性，较高的延迟折扣率意味着个体更倾向于选择即时奖励，也就是更冲动。前人研究结果发现异常的延迟折扣率和冲动性行为和心理健康程度紧密相关。随着脑成像技术的发展，研究者们已经深入探索了健康人群的脑结构与延迟折扣之间的关系，发现凸显网络、默认网络、执行控制网络和奖赏网络相关脑区的灰质体积与延迟折扣率之间存在相关关系，但是尚缺少统一的结论，因此本研究旨在使用激活似然估计（Activation likelihood estimation， ALE）元分析的方法来考察健康群体延迟折扣任务相关的脑灰质体积。本研究在 PubMed、Web of Science 和 PsycInfo 数据库中进行检索，最终纳入 6 项实验（共 667 名健康被试）。使用 GingerALE 软件进行元分析，结果发现左侧脑岛的灰质体积与延迟折扣率之间成显著正相关。脑岛是多模态信息加工的整合位点，与认知、情感、奖赏加工和执行控制等功能之间紧密相关，本元分析的结果提示脑岛在跨期决策中起着重要的作用，为临床与非临床群体中的延迟折扣研究提供启示。

Brain gray matter volume associated with delay discounting and in healthy subjects: A voxel-based morphometry ALE meta-analysis

Liu Yang[1], Cai Xinlu[1]

[1] Institute of Brain Science and Department of Physiology, School of Basic Medical Science, Hangzhou Normal University, Hangzhou, China

Abstract: Delay discounting refers to the phenomenon in intertemporal choice where individuals subjectively undervalue delayed rewards compared to immediate rewards. Delay discounting also plays an important role in assessing one's impulsivity. By measuring an individual's preference for immediate versus delayed rewards, we can use the index of delay discounting rate to evaluate one's impulsiveness. Elevated discount rates imply an increased probability of individuals opting for instantaneous reinforcement. Previous studies have found that abnormal delay discounting rates are closely related to impulsive behaviors and psychological health. With the development of brain imaging techniques, researchers have extensively explored the relationship between brain structures and delay discounting in healthy populations. They found that gray matter volumes in regions related to salience network, default mode network, executive control network and reward circuitry are correlated with delay discounting rates, but a unified conclusion is still lacking. Therefore, this study aims to use activation likelihood estimation (ALE) meta-analysis to investigate the relationship between gray matter volumes and delay discounting in healthy subjects. Literature search was conducted in PubMed, Web of Science and PsycInfo databases, and 6

experiments (with 667 healthy subjects) were finally included. Meta-analysis using GingerALE software found that left insular gray matter volume was significantly positively correlated with delay discounting rates. The insula is a hub integrating multimodal information and closely involved in cognition, emotion, reward processing and executive control. The results of this meta-analysis suggest the insula plays an important role in intertemporal choice, providing insights for clinical and non-clinical research on delay discounting.

虚拟环境中工具材料对干扰抑制的影响：来自行为和 EEG 的证据

冯健儒[1]，赵鑫[1]（通讯作者）

1 西北师范大学心理学院，兰州，730070，psyzhaoxin@nwnu.edu.cn

摘 要 干扰抑制，又称为认知抑制，指个体为了达成当下的认知目标，抑制先前主动或被动激活的与当前认知内容无关的信息，既包括对外源性物理刺激的抑制，也包括对内源性刺激的抑制。目前的研究发现，相较于图片与虚拟物体，真实工具材料对干扰抑制的行为表现影响更大，这可能是因为人类需要额外的认知资源来抑制真实工具材料提供的交互可能性（如勺子提供抓取这一交互可能）。但交互可能对干扰抑制的神经机制仍然未知，且现实世界中工具材料所提供的交互可能无法操纵。本研究搭建了一个虚拟环境，并以 Flanker 范式为任务，探索如下几个问题：（1）交互可能是否影响干扰抑制（2）对干扰抑制的影响是否随交互方式变化而改变（3）交互可能影响干扰抑制的神经机制。本实验为 3（交互可能：可交互 vs 不可交互 vs 无交互）*2（前测 vs 后测）*2（一致 vs 不一致）的混合实验设计。66 名健康成年人完成本实验并同时采集了 64 导 EEG 信号。使用 MATLAB 工具包 EEGLab、Feildtrip 对 EEG 数据进行 ERP、时频、溯源以及源水平连通性分析，使用 R 对 EEG 数据以及行为数据进行统计分析。结果发现，不可交互组的后测干扰效应相较于前测显著降低，而无交互组与可交互组的前后测无显著差异。EEG 结果发现，无交互组的 P3 差异波平均波幅后测显著高于前测，后测一致与不一致条件下α节律 ERD 的差异更小，且后测不一致条件下顶区与枕区间的相干性显著降低。本研究的结果表明，干扰抑制受交互可能的影响，抑制工具材料交互可能所需的认知资源在交互后不会增加，但在交互失败后会减少。此外，背侧视觉流可能在这一过程中起到了关键作用，顶枕间α节律连通性的改变可能是所需认知资源减少的原因。

关键词 干扰抑制，虚拟现实，交互，EEG

Effects of instrumental materials on interference inhibition in virtual environments: evidence from behavior and EEG

Jianru Feng[1], Xin Zhao[1]

1 Department of Psychology, Northwest Normal University, Lanzhou

Abstract：Interference inhibition, also known as cognitive inhibition, refers to an individual's inhibition of prior active or passive activation of information unrelated to the current cognitive content in order to reach the cognitive goal of the moment, both to exogenous physical stimuli and to endogenous stimuli. The current study found that

real tool materials have a greater impact on behavioral performance of interference inhibition compared to pictures and virtual objects, possibly because humans require additional cognitive resources to suppress the interaction possibilities provided by real tool materials (e.g., spoons provide the interaction possibility of grasping). However, the neural mechanisms by which interaction possibilities contribute to interference inhibition remain unknown, and interactions provided by tool materials in the real world may not be manipulated. In this study, a virtual environment was constructed and the Flanker paradigm was used as a task to explore the following questions: (1) whether interaction possibilities affect interference inhibition (2) whether the effect on interference inhibition changes with interaction modality (3) the neural mechanisms by which interaction possibilities affect interference inhibition. This experiment was a 3 (interaction possible: interactable vs. non-interactable vs. no interaction) * 2 (pre-test vs. post-test) * 2 (congruent vs. incongruent) mixed experimental design. Sixty-six healthy adults completed this experiment and simultaneously acquired 64-lead EEG signals. ERP, time-frequency, traceability, and source-level connectivity analyses of the EEG data were performed using the MATLAB toolbox EEGLab, Feildtrip, and statistical analyses of the EEG data and the behavioral data were performed using R. The results revealed that the posttest interference effect was significantly lower in the non-interactable group compared to the pretest, while there was no significant difference between the pre and posttests of the non-interactable group and the interactable group. EEG results revealed that the mean amplitude of the P3 difference wave was significantly higher posttest than pretest in the no-interaction group, that the difference in alpha rhythm ERDs was even smaller in the posttest concordant versus discordant condition, and that coherence between the parietal and occipital regions was significantly lower in the posttest discordant condition. The results of the present study suggest that interference inhibition is affected by interaction possibilities, and that the cognitive resources required to suppress tool-material interaction possibilities do not increase after interaction, but decrease after interaction failure. In addition, dorsal visual streaming may play a key role in this process, and alterations in parieto-occipital alpha rhythm connectivity may account for the decrease in required cognitive resources.

分裂型特质个体视听跨通道 Stroop 效应：一项 ERP 研究

赖文昊[1, 2]　贾璐霞[1, 2]　王亚[1, 2, 3]（通讯作者）

1 中国科学院心理研究所，北京，100101

2 中国科学院大学心理系，北京，100101

3 首都师范大学心理学院，北京，100048

通讯作者 E-mail：wangyazsu@gmail.com

摘 要

背景：精神分裂症患者存在认知控制缺损，比如在 Stroop 任务中更容易受到不一致信息的干扰。精神分裂症的风险人群，分裂型特质个体中也存在认知控制的缺损。但过往研究大多专注于考察单感觉通道的抑制能力，对视听觉跨通道干扰抑制的研究较少。本研究旨在考察分裂型特质个体视听觉跨通道干扰抑制的表现和神经机制。

方法：30 名高分裂型特质个体和 29 名低分裂型特质个体完成跨通道 Stroop 任务并记录脑电。任务中同时呈现一个听觉颜色词和视觉颜色词（可能一致也可能不一致），被试需要对特定的注意通道刺激的颜色进行按键反应。研究采用 2（组别：高分裂型特质组、低分裂型特质对照组）*2（注意通道：注意视觉忽略听觉、注意听觉忽略视觉）*2（刺激一致性：一致、不一致）混合实验设计，分析被试的行为表现、

前额区 N1（80-140ms）和 P3（280-420ms）的平均波幅及额中区 theta（4-8hz）节律在 N1 和 P3 潜伏期内的功率值是否存在差异。

结果：1）行为结果显示，任务正确率的组别主效应显著，高分裂型特质个体正确率高于低分裂型特质个体。2）脑电结果显示，N1 平均波幅的组别主效应显著，高分组小于低分组；组别*刺激一致性的交互作用显著，简单效应检验表明高分组刺激一致显著大于刺激不一致的平均波幅，低分裂型特质个体不存在条件间差异。P3 平均波幅的组别主效应及与组别相关的交互作用均不显著。3）时频分析结果显示，额中区 theta 节律组别主效应显著，高分裂特质个体在 N1、P3 潜伏期内的功率值均显著大于低分裂特质个体。

结论：本研究提示高分裂型特质个体较低分裂型特质在 Stroop 任务中表现更好，且高分裂特质个体在处理干扰抑制任务时额中区 theta 节律更强；高分裂型特质个体对刺激一致性敏感；这些结果为理解分裂型特质个体的干扰抑制能力提供了启示。

Abstract

Background: Schizophrenia is associated with deficits in cognitive control, such as having a high level of Stroop interference effect. Individuals with high schizotypal traits, a high risk group for schizophrenia, also have cognitive inhibition impairment. However, previous studies mainly focused on the audio or visual unimodal task, little is known about cross-modal interference effect in the schizophrenia spectrum. This study aimed to investigate cross modality interference in an audiovisual Stroop task and its neural correlates in individuals with high schizotypal traits.

Methods: Thirty high (HST) and 29 low (LST) schizotypal trait individuals underwent a cross modality Stroop task while EEG were recorded. In the study, a visual color name and an audio color name were presented simultaneously (either congruent or incongruent), participants were instructed to attend to one modality and make relevant responses. A 2 (Group: HST, LST) x 2 (Attended modality: visual vs. auditory) x 2 (Congruency: congruent vs. incongruent) mixed design was adopted. Behavioral performance, mean amplitude for N1 (80-140ms) and P3 (280-420ms), and midfrontal theta (4-8Hz) during N1 and P3 time window were analyzed.

Results: 1) Behavioral results showed that HST had a higher overall accuracy than LST. 2) For N1 mean amplitude, there was a main effect of Group, LST exhibited greater amplitude than HST; there was a significant Group * Congruency interaction, further analysis revealed that HST showed a greater amplitude in congruent condition than incongruent condition, while LST did not show this difference. The main effect of Group and interactions involving Group were non-significant for P3 mean amplitude. 3) Midfrontal theta power showed a main effect of Group, HST had higher power than LST during the time windows of both N1 and P3.

Discussion: These results suggest that HST had a higher accuracy in Stroop tasks and larger midfrontal theta

power than LST. In addition, HST were more sensitive to stimulus congruency in cross-modality Stroop tasks. These findings may shed light on understanding the cognitive inhibition mechanism in individuals with schizotypal traits.
