1 特邀报告

Psychology and Science diplomacy: An intersection to promote human well-being and global sustainability

Germán Gutiérrez

International Union of Psychological Science

Personal Biography：

Germán Gutiérrez is the president of the International Union of Psychological Science, the leading global psychology organization. He studied Psychology at the Universidad Nacional de Colombia (UNC) and earned his Ph.D. in Behavioral neuroscience from the University of Texas at Austin, USA. Gutiérrez is a professor at UNC and researches the evolution of learning mechanisms in reproduction and other behavioral systems. In addition, he has studied the development of psychology worldwide. He has held numerous leadership positions at the national, regional, and international levels, including President of the Colombian Association of Psychology Departments, Director of the Observatory of Psychology in Latin America, and President of the International Society for Comparative Psychology. Gutiérrez is currently an advisor to the International Science Council's Regional Focal Point for Latin America and the Caribbean.

Abstract：

The connection between human behavior and global problems has long been documented by science. In recent decades, psychological knowledge has played a significant role in promoting human well-being and global sustainability. This presentation makes a case for connecting psychological insights and scientific diplomacy strategies to improve the power of psychology to address complex global issues. Psychology has made significant discoveries in cognitive, emotional, and social processes used to develop behavioral strategies to improve the well-being of individuals and communities. Yet, there is a need for a broader approach to address global concerns that affect the human population. Psychological science diplomacy promotes international collaboration to share behavioral knowledge to address problems like climate change, conflict resolution, demographic challenges, and infectious and non-communicable diseases. Psychology and science diplomacy must create a common framework to enhance sustainable development, global harmony, and aspiring human qualities.

2 大会重点报告

2.1 大会重点报告一

自我控制的过去、现在与未来

党君华

报告人简介：

现任西安交通大学教授、博士生导师。曾任瑞典乌普萨拉大学副教授、博士生导师，瑞典乌普萨拉大学和加拿大多伦多大学博士后研究员。本科毕业于北京邮电大学自动化学院，硕士毕业于北京大学心理学系，博士毕业于瑞典隆德大学心理学系。

共发表 SCI/SSCI 论文 40 余篇 ，部分论文发表在行为科学高影响力期刊如 Trends in Cognitive Sciences (2022IF=19.9)，Perspectives on Psychological Science (2022IF=12.6), Behavioral and Brain Sciences (2022IF=29.3)，Social Psychological and Personality Science (2022IF=5.7)，Journal of Global Health (2022IF=7.2)，以及 Translational Psychiatry (2022IF=6.8)，或入选高被引论文。谷歌学术总被引 1300 余次，H index = 16。曾获瑞典心理学会评选的 2020 度优秀青年研究者奖（全瑞典每年一位）。

现任中国心理学学会行为与健康心理学专业委员会委员，美国心理学会旗舰期刊 American Psychologist (2022IF=16.4)编委、欧洲社会心理学会旗舰期刊 European Journal of Social Psychology (2022IF=3.9)编委。曾任 BMC Psychology 副主编、International Journal of Social Psychology 副主编，Social Psychology 和 Frontiers in Psychology 客座编辑，曾为美国国家科学基金与二十余种国际知名期刊如 Journal of Experimental Psychology: General 担任审稿人。

主要研究领域为社会心理学，包括自我控制、决策与群体关系。主要贡献为：1）为自我控制及社会心理学领域普遍存在的方法学问题提供了理论解释并指出了应用方向，相关论文 2020 年发表于 TiCS,目前谷歌学术被引超过 350 次，为 TiCS 过去 3 年发表的所有论文中被引最高。2）通过多项元分析、多实验室重复研究，有效地推动了自我损耗效应可重复性的发展；3）提出了新的整合性的自控理论；4）在其他研究方向如人际晕轮效应、跨期决策、外群体偏差提出新的理论解释，相关论文发表在 BBS、SPPS 等。

摘要：

自我控制（self-control）是人类区分于其他物种的核心特征之一，对人类生活的方方面面都有着重要的促进作用。现在心理学对于自控控制的科学探索肇始于上世纪六十年代，后来一直缓慢发展，直到本世纪初才被学界高度重视，目前正处于蓬勃发展之际，虽然这其中也有可重复性危机带来的一些不利影响。本报告分为以下几个方面。首先，报告人将界定自我控制的概念，介绍其与相关概念的区别与联系，比如自我调控（self-regulation）。其次，报告人将梳理自我控制研究的发展历史，介绍其肇始、发展、各个子领域的当前状况，可重复性危机带来的影响及解决思路等。最后，报告人将在以上分析的基础上提出自我控制未来发展与整合的几个可能方向。

The Past, Present, and Future of Self-Control

Abstract：

Self-control is one of the defining features of human nature. No matter how self-control was measured, it has been consistently associated with numerous positive outcomes. The empirical exploration of modern psychology on self-control started in 60s of the 20th century, which then developed slowly during the next 40 years. Until the beginning of the 21th century did self-control receive the attention it deserves. Currently, self-control is one of the most flourishing areas in social psychology, although it has also been negatively influenced by the replication crisis. This report consists of the following sections. First, the reporter will talk about the definition of self-control and differentiate it from other related concepts such as self-regulation. Second, the reporter will review the research history of self-control, introducing the inception, development, the current status of various subfields of self-control, and the negative influence of the replication crisis. Finally, the reporter will propose possible directions for future integration and further development based on the above-mentioned analyses.

2.2 大会重点报告二

生死之间：生命史框架内的跨期决策

王晓田

香港中文大学（深圳）人文社科学院 广东 深圳 518172

报告人简介：

王晓田教授现任香港中文大学（深圳）人文社科学院，应用心理学学科主任, 终身教授，深圳市人民政府认证的外籍高层次人才, 美国南达科他州大学终身荣誉教授，国际心理科学学会的会士。曾任北京大学光华管理学院特聘教授，中欧国际商学院访问教授，德国柏林马克斯.普朗克研究所人类发展研究中心访问科学家，香港科技大学工商管理学院访问教授; 新加坡管理大学访问教授。王晓田教授的跨学科研究聚焦于行为决策、风险认知、和进化心理学。王晓田教授的研究成果发表在 30 多种专业期刊，也被普通心理学, 认知心理学, 认知神经学, 和进化心理学的教科书所引用。美国《时代》周刊,《科学新闻》,《科学日报》等均有专文报道王晓田教授的研究；维基百科, 雅虎新闻,《华尔街日报》以及《中欧商业评论》均对王晓田教授的研究有所介绍。王晓田教授任美国国家科学基金会, 美国麦克道尔基金会, 中国国家自然科学基金委等资助项目的主持人, 中国科学院王宽诚科研奖获奖人; 曾任美国国家科学基金会特邀评审专家; 中国国家基金委管理学部海外评审专家, 及香港研資局评审专家; 也曾为松下、IBM, 中国移动、招商银行、平安保险等机构， 政府部门以及民营企业的管理人员讲授培训课程。

摘要：

经济学和心理学大多数学说背后都存在两个共同的前提：时间的有限性和资源的有限性。时间有限性也就是生命有限性如何塑造了人类的行为？我们每个人与时间的交互仅仅存在于短暂或漫长的一生之中，所以心理学需要关注生命史和生命史理论。不同于其他动物，自主意识使人类能够有意识地在有限的生命中规划人生并依此决策。决定一个人世界观（时间观和价值观）的不仅仅是时间的感知和时间观，还在于我们如何感知和应对生命的两大特性：死亡的必然性（inevitability of death）和死亡的不确定性/无常性（uncertainty of death）。在报告中我将展示如何在生命史的框架内通过调节死亡的必然性和不确定性影响个体或人群的延迟折扣（未来折扣），以及如何通过元分析建模比较不同的发展心理学理论并从 172 个样本中生成对应全生命史延迟折扣的年龄曲线；并讨论我们目前的研究进展以及相关思考。

Between Birth and Death: Intertemporal Decision-Making within the Framework of Life History

WANG XT (XiaoTian)

School of Humanities and Social Science, The Chinese University of Hong Kong (Shenzhen), Shenzhen 518172, China

There are two common premises behind most theories in economics and psychology: the finiteness of time and limited resources. How does the finiteness of time, that is, the finiteness of life, shape human behavior? We interact with time only within a short or long lifespan, so psychology needs to pay attention to life-history variables and theory. Unlike other animals, autonoetic consciousness enables humans to consciously plan their lives in their limited lives and make decisions accordingly. What determines a person's worldview (time perspective and values) is not only time perception and time perspective but also how we perceive and respond to the two major characteristics of life: the inevitability of death and the uncertainty of death. In this talk, I will show how delay discounting (future discounting) of individuals or groups is affected by manipulating the inevitability and uncertainty of death within a life-history framework and how to compare different theories in developmental psychology via meta-analytic modeling and generate age age-specific delay discounting curve across the lifespan based on 172 samples. I will also discuss ongoing research progress in my lab and related thinking.

2.3 大会重点报告三

从神经心理到神经调控

汪 凯

报告人简介：

长江学者特聘教授，万人计划领军人才，百千万人才工程国家级人选，获吴阶平-保罗 杨森奖，中国杰出神经内科医师--学术成就奖，人民名医，江淮名医。安徽医科大学学术委员会主任，第一附属医院神经内科主任；安徽省转化医学研究院院长，“神经精神疾病与心理健康”协同创新中心主任，“认知与神经精神疾病”安徽省重点实验室主任；中国医师协会神经内科医师分会副会长；中国卒中学会血管性认知障碍分会主任委员；中国研究型医院学会神经科学专业委员会副主委；中华医学会神经病学分会神经心理学和行为神经病学组组长；安徽省医学会神经病学分会主任委员。主持国家自然科学基金 9 项（其中重大项目 1 项，重大研究计划 1 项），国家重点研发计划 2 项。研究论文在 Nature Genetics, Nature Neuroscience, Nature Mental Health， PNAS, European Heart Journal, Neurology, Schizophrenia Bulletin, Stroke 等 SCI 杂志发表 307 篇，其中第一、通讯作者 SCI 论文 217 篇。获得省科技进步一、二等奖各 2 项，中华医学科技一等奖 1 项。

摘要：

神经心理学的主要任务是认知与行为的脑图以及认知促进。神经心理学利用脑损伤患者的行为学研究来刻画脑功能取得了大量里程碑式成果，奠定了脑图的基础。新近 fMRI 的研究能更加精确地、个体化刻画脑皮层功能图谱。我们进一步建立了脑白质功能研究方法，刻画了神经心理疾病的皮层和皮层下宏观脑环路。基于脑影像的脑环路研究，我们进行了 rTMS 参数优化，完成了焦虑抑郁、Alzheimer 病和帕金森病等脑疾病等的 rTMS 脑调控系列临床研究。初步的临床研究结果表明 rTMS 等无创脑调控对脑与心理疾病具有临床应用价值。

From Neuropsychology to brain stimulation

The main mission and goal of neuropsychology is brain-mapping or function-promoting of behavioralor psychological activity. Neuropsychological studies of brain-injured patients have been useful in mapping brain function, leading to important milestones and foundation for understading of brain mapping. More recently, functional magnetic resonance imaging (fMRI) studies have enabled us to achieve even a precision and individualization in cortical function mapping. Our team has focused an approach for detecting brain macro-connections in individuals with mental health disorders based on rfMRI of the brain cortex or white matter. We try to optimize parameters for precise target rTMS, and also expand the application prospect of rTMS on neuropsychiatry disorders. The clinical trials have demonstrated a series of positive results for the rTMS modulation of numerous brain disorders, including anxiety, depression, Alzheimer's disease, Parkinson's disease, and other neuropsychiatry disorders. Primary results have shown the clinical value for the non-invasive brain modulation, known as rTMS, of brain and psychological disorders.

2.4 大会重点报告四

休息和睡眠期间的离线学习

柳昀哲

报告人简介：

柳昀哲，北京师范大学认知神经科学与学习国家重点实验室，教授。北京脑科学与类脑研究中心，研究员，PI，博士生导师，国家级人才。博士毕业于伦敦大学学院（UCL）计算精神病学中心，于牛津大学完成博士后训练。成立了计算和整合认知神经科学课题组，关注人类高级智能和灵活行为的心理、神经机制。目前以第一或通讯作者身份，围绕“认知地图的神经机制”，在 Science，Cell，Nature Neuroscience，Neuron，Nature Reviews Neuroscience 等杂志发表论文多篇。先后主持科技创新 2030-“脑科学与类脑研究”（脑计划）重大项目，国家自然科学基金项目等。

摘要：

人类高级智能的核心在于举一反三和触类旁通。特别是，有组织地串联和整合相关信息与事件，进而进行推理决策，这无疑是人类智能的一个突出特征。休息和睡眠期间，人们的记忆会经历某种转变，进而构建认知地图。有研究证明，睡眠可以增强人在无意识状态下的长距离推理能力。但对于人类认知地图的形成，其背后的神经和计算机制仍不清楚。在啮齿动物的研究中，休息和睡眠期间，经验的离线重现（replay）被认为是形成此类地图的关键环节。目前，我们已经开始针对这一主题进行人类实验研究。在这次报告中，我将详细介绍：1) 我们如何开发算法，利用 MEG、EEG 和 EEG-fMRI 来测量人类的离线回放；2) 睡眠是如何加强信息与事件之间的“串联关联”；3) 以及我们在探索超出线性连接，向 2 维认知地图发展的相关研究成果。

Offline Learning During Rest and Sleep

Abstract:

‘‘Joining the-dots’’ between events that have not been observed together is crucial for inferential decisions – a key feature of human intelligence. Such memory transformation, forming cognitive map, is thought to happen during rest and sleep. For example, sleep is found to promote long distance transitive inference with unconsciousness in human. However, little is known about the neural and computational underpinning of cognitive map formation in humans. In rodents, offline replay of past experience is found important to form the map. We have set out to test this in humans. In this talk, I will discuss 1) our efforts for developing algorithms to measure offline replay in humans using MEG, EEG and simultaneous EEG-fMRI; 2) our findings on sleep promoting “dots joining”; 3) and beyond line chainning, promoting formation of 2-diemensional cognitive map.

2.5 大会重点报告五

基于脑影像大数据的抑郁症默认网络机制

严超赣

报告人简介：

严超赣，中国科学院心理研究所研究员，博士生导师，心理所所务委员，认知与发展心理学研究室主任，抑郁症大数据国际研究中心主任，磁共振成像研究中心主任，国家优秀青年科学基金获得者，入选爱思唯尔中国高被引学者（2019/2020/2021/2022 年度）和斯坦福全球前 2%顶尖科学家，获国际人脑图谱学会青年科学家奖、北京市科学技术奖自然科学奖二等奖（第一完成人）和中国科学院优秀导师奖。主要研究领域为脑影像学及其在抑郁症中的应用。在 PNAS、Science Bulletin 和 Molecular Psychiatry 等期刊发表论文 90 余篇，总引用 1.9 万余次（Google Scholar）。有 6 篇第一/通讯作者论文入选 ESI 高被引论文（其中 1 篇为前万分之一，1 篇为前千分之一），3 篇单篇被引过千。他建立了被引 5000 余次的脑成像系列分析软件 DPARSF、 DPABI、DPABISurf、DPABIFiber 和 DPABINet，牵头建立了抑郁症脑成像大数据联盟(DIRECT)，发起了“心花计划”抑郁症干预研究项目， 还是《Imaging Neuroscience》执行编辑。

摘要：

抑郁症，是一种具有高复发率、高自杀率和高致残率的精神疾病，但诊断手段仍然依靠临床观察，缺乏生物学客观标志物。我们联合国内外抑郁症研究专家成立了抑郁症脑影像大数据联盟(DIRECT)，建立了全球最大的抑郁症脑功能影像数据库（REST-meta-MDD），基于抑郁症脑影像大数据明确了抑郁症默认网络异常机制，推动了抑郁症脑影像研究从小样本模式转向大数据开放合作模式。我们开发了抑郁反刍思维研究新范式，明确了抑郁反刍思维默认网络机制，提出了抑郁反刍思维默认网络干预新假说。我们还开发了高效信度的脑影像计算方法和平台，成为领域通用流程，推动了抑郁症脑影像学领域的发展。基于脑影像大数据，我们开发了大数据统计图引导的抑郁症经颅磁刺激个体化靶点定位方法，正在展开多中心临床验证。未来，我们希望和全国心理学同道通过认知实验标准工具箱建设，共同为中国人群建立可用于参考基线的脑认知和脑影像参考常模，并应用于抑郁症以识别患者个体精准的异常靶点，改善抑郁症个体化精准神经调控治疗。

Mechanism of the Default Mode Network in Major Depressive Disorder Based on Big Data of Brain Imaging

Speaker:

Dr. Chao-Gan Yan is a professor at the Institute of Psychology, Chinese Academy of Sciences, a member of the Institute's Administrative Committee, the Director of the Cognitive and Developmental Psychology Research Branch, the Director of the International Big-Data Center for Depression Research, and the Director of the Magnetic Resonance Imaging Research Center. He is a recipient of the National Excellent Young Scientist Fund, and has been ranked as an Elsevier Highly Cited Researcher in China for the years 2019/2020/2021/2022, and ranked Top 2% Scientists Worldwide by Stanford University. He has received awards such as the Early Career Investigator Award by The Organization for Human Brain Mapping (OHBM), the Second Prize for Natural Science from the Beijing Science and Technology Awards (as the first author), and the Outstanding Mentor Award from the Chinese Academy of Sciences. He has long focused on the development of brain imaging techniques and is committed to discovering reliable neuroimaging biomarkers for depression. To address the issue

of high heterogeneity in small-sample studies on depression brain imaging, he initiated the Depression Imaging REsearch ConsorTium (DIRECT) through innovative open team collaboration. Based on multi-center big data, he has discovered reliable abnormal brain imaging patterns in patients with depression (papers published in PNAS, Molecular Psychiatry, and other journals, and ranked as ESI Highly Cited Papers). He has developed a new research paradigm for depressive rumination and proposed a new hypothesis for intervening in the default mode network of depressive rumination (papers published in NeuroImage and other journals, and ranked as ESI Highly Cited Papers). He has initiated a prospective study called the "Mind Flower Project" to propose new integrated psychophysical intervention programs for depression. To provide methodological support for brain imaging research in depression, he has developed highly reliable computational methods for brain imaging (adopted by over 2,000 studies), and a standardized brain imaging analysis platform used by peers in 58 countries/regions (cited over 5,000 times), becoming one of the internationally accepted analysis procedures (papers published in Science Bulletin and other journals, including one in the top 0.01% of ESI Highly Cited Papers, one in the top 0.1%, and two in the top 1%).

Abstract:

Major Depressive Disorder (MDD) is a mental illness with high rates of recurrence, suicide, and disability. However, diagnostic methods still rely on clinical observations and lack objective biomarkers. We have collaborated with depression research experts both domestically and internationally to establish the Depression Imaging REsearch ConsorTium (DIRECT). We have built the world's largest functional brain imaging database of MDD (REST-meta-MDD). Based on the big data of brain imaging for depression, we have discovered the abnormal mechanisms of the default mode network in depression, promoting the transition from small-sample research to large scale open collaboration in the field of depression brain imaging. We have developed a new paradigm for researching depressive rumination, identified the default mode network mechanism of depressive rumination, and proposed a new hypothesis for intervening in the default mode network of depressive rumination. We have also developed highly reliable computational methods and platforms for brain imaging, becoming a general process in the field and driving the development of depression neuroimaging. Based on big data of depression brain imaging, we have developed a big-data statistical map guided method for individualized target localization in transcranial magnetic stimulation for depression and are currently conducting multi-center clinical validations. In the future, we hope to collaborate with psychology colleagues nationwide to build a cognitive experiments standard toolbox. Together, we aim to establish a reference norm for brain cognition and brain imaging applicable to the Chinese population, and apply them to depression to identify precise abnormal targets for individual patients, improving personalized precision neural modulation treatment for depression.

2.6 大会重点报告六

下颞叶中的客体表征空间

鲍平磊

报告人简介：

鲍平磊 ，北京大学心理与认知科学学院、麦戈文脑科学研究所、北大-清华生命科学联合研究中心研究员，博士生导师，自然科学基金优秀青年科学基金项目（海外）获得者，并参与和主持了科技部科技创新 2030-“脑科学与类脑研究”重大项目, 国家自然科学基金重点项目和面上项目，以第一作者以及共同通讯作者身份《Nature》,《Nature Communications》,以及《eLife》等知名期刊上发表文章。2020 年加入北京大学之前，与 2014 年南加州大学获得神经科学博士学位，并在加州理工学院进行了博士后的工作。研究方向是探索物体识别的神经技术，实验室采用了一系列技术，包括电生理记录，脑功能成像，钙成像，微电刺激，心理物理以及数学建模，来探索这一问题。

摘要：

下颞叶（IT cortex）在物体识别中具有关键作用，但其功能性组织原则一直以来尚不清楚。我们的研究采用了功能性磁共振成像（functional MRI）、微电刺激（microstimulation）、电生理学以及深度神经网络，对猕猴和人类的下颞叶皮层组织进行了研究。我们发现，深度神经网络所构建的低维客体空间，可以解释不同人和猕猴的下颞叶皮层组织。该物体空间不仅能帮助我们理解下颞叶未知脑区的物体选择性，也可以解释类别特异性区域的存在。分析进一步揭示了人类下颞叶皮层反应构建的物体空间与猕猴下颞叶皮层中的物体空间之间存在高度相似性，而且进一步阐明了物体客间模型是由物体的视觉特性，而非语义类别决定，并且依赖于视觉经验。我们的研究证明了客体空间模型对于理解客体识别机制的重要性，对人工智能的发展也有着启迪作用。

Object representation space in the inferotemporal cortex

Abstract:

The inferotemporal cortex (IT cortex) plays a pivotal role in object recognition, yet its principles of functional organization have remained unclear. Our research utilized fMRI, microstimulation, electrophysiology, and deep neural networks to investigate the organization of the IT cortex in both macaques and humans. We found that a low-dimensional object space constructed by a deep neural network can account for the organization of the IT cortex across different individuals and macaques. This object space not only helps us understand the object selectivity in uncharted regions of the IT cortex but also explains the presence of category-specific areas. Further studies revealed a high similarity between the object space constructed by human IT cortex responses and that in the macaque IT cortex. Additionally, it elucidated that the object space model is determined by the visual properties of objects rather than semantic categories and is reliant on visual experience. Our research demonstrates the importance of object space models in understanding object recognition mechanisms and provides insights that can inspire developments in artificial intelligence.

3 专题研讨会

3.1 “教育心理学专业委员会”专题研讨会

网络学习情境下自主选择反馈对初中生数学学习的影响：元认知监控能力的调节作用

摘 要　随着计算机技术的快速发展，在网络学习环境中提供反馈逐渐受到关注，但不同反馈类型对学习的影响的研究结果并不一致，这可能是由于提供的反馈缺乏个性化，忽略了学习者的个体特征。自主选择反馈可以让学习者根据自身需求选择适合自己的反馈类型，提高反馈的个性化。然而，少有研究将自主选择与反馈复杂性结合，探究学习者自主选择不同反馈的作用。此外，根据交互-辅导反馈模型，学习者的元认知能力是影响反馈学习的重要因素。基于此，本研究聚焦于网络学习情景下的反馈学习设计了两个实验，探究学习者自主选择反馈相比于系统提供的反馈是否对初中数学学习更有效，并探究其发挥作用的边界条件。实验 1 采用单因素被试间设计，以 310 名初中生为研究对象，探究不同反馈类型（自主选择反馈、系统提供的简单反馈、系统提供的线索反馈、系统提供的解释性反馈）对其数学学习的影响。结果发现：（1）与系统提供的反馈（简单反馈、线索反馈、解释性反馈）相比，自主选择反馈可以提高学习者的决策自由感；（2）与系统提供的简单反馈和线索反馈相比，自主选择反馈可以提高积极情绪和动机；（3）与系统提供的简单反馈相比，自主选择反馈可以提高迁移成绩。实验 2 在实验 1 的基础上，采用了 2 元认知监控能力（高 VS 低）×2 反馈类型（自主选择反馈 VS 系统提供的简单反馈）的两因素被试间设计，探究元认知监控能力在自主选择反馈影响学习中的调节作用，并发现：（1）自主选择反馈可以提高学习者的积极情绪、动机、自主需求满足感和迁移成绩，验证了实验 1 的结果；（2）元认知监控能力调节了反馈类型对积极情绪、动机、相关认知负荷和迁移成绩的影响。当可以自主选择反馈类型时，高元认知监控能力的学习者有更高的积极情绪、更强的动机和更好的迁移表现；而对于低元认知监控能力的学习者，系统提供的反馈更能提高其相关认知负荷。本研究启发教师和教学设计者在设计和提供反馈时要考虑学习者的个体特征，为其提供自主选择反馈的机会或者由系统为其提供反馈。

The effects of autonomous choice feedback on junior high school students’ mathematics learning in online: the moderating role of metacognitive monitoring ability

Shaoying Gong, Jing Wang, Jiangnan Guo

School of Psychology, Central China Normal University, Wuhan

Abstract： With the rapid development of computer technology, the provision of feedback has gradually gained attention in online learning, but the results of research on the effects of different feedback types on learning are inconsistent, which may be due to the lack of personalization of feedback and the neglect of learners’ individual characteristics. Autonomous choice feedback could allow learners to choose according to their own needs and improve the personalization of feedback. However, few studies have combined autonomous choice with feedback complexity to explore the role of

autonomous choice of different feedback. In addition, according to the interaction-coaching feedback model, metacognitive ability is an important factor influencing feedback. Based on this, this study focused on feedback learning designing two experiments to investigate whether learner autonomous choice feedback is more effective for junior high school mathematics learning compared to feedback provided by the system in online learning, and to explore the boundary conditions for its role. Experiment 1 used a one-way between-subjects design with 310 junior high school students to investigate the effects of different types of feedback (autonomous choice feedback/simple feedback provided by the system/cue feedback provided by the system/explanatory feedback provided by the system) on their mathematics learning. The results found that (1) compared with feedback by the system (simple feedback, cue feedback, and explanatory feedback), autonomous choice feedback could increase learners' sense of decision-making freedom; (2) compared with simple feedback and cue feedback provided by the system, autonomous choice feedback could increase positive emotions and motivation; (3) compared with simple feedback, provided by the system, autonomous choice feedback increased transfer performance. Based on experiment 1, experiment 2 used a two-factor between-subjects design with 2 metacognitive monitoring ability (high vs. low) × 2 feedback types (autonomous choice feedback vs. simple feedback provided by the system) to investigate the moderating effect of metacognitive monitoring ability on the influence of autonomous choice feedback on learning and found that (1) autonomous choice feedback improved learners' positive emotions, motivation, autonomy need satisfaction and transfer performance, validating the results of experiment 1; (2) metacognitive monitoring ability moderated the effects of feedback type on positive emotions, motivation, related cognitive load and transfer performance. When learners could autonomously choose the type of feedback, learners with high metacognitive monitoring ability had higher positive emotions, stronger motivation, and better transfer performance; whereas for learners with low metacognitive monitoring ability, feedback provided by the system was more likely to increase their related cognitive load. This study has the potential to inspire teachers and instructional designers take into account the individual characteristics of learners when designing or providing feedback, and to provide them with the opportunity to choose feedback on their own or have the system provide feedback for them.

弹幕属性和认知风格对线上视频学习效果的影响

高峰强[1]　赵宇飞[1]　刘忠[1]　韩磊[1]（通讯作者）

1 山东师范大学心理学院，山东，济南，250358，hanlei-0333@163.com

摘 要　目前弹幕对在线学习的实证研究还比较少，尤其是缺乏弹幕自身属性对在线学习效果影响的研究。因此，探讨不同弹幕属性设置对学生在线视频学习效果的影响成为一项重要的科学问题。此外，弹幕的多维感官刺激，在一定程度上对不同认知风格的人会有不同的影响。因此，本研究以《PR 教学课程》为例展开实验研究，考察弹幕属性设置对场独立和场依存学习者学习效果和学习感知的影响。研究 1 考察弹幕呈现方式（滚动、固定）对不同认知风格学习者学习效果、学习感知和认知负荷的影响。结果发现：在固定弹幕呈现方式下，场独立学习者的材料感知难度显著低于场依存学习者；在滚动弹幕呈现方式下，场独立学习者的相关认知负荷显著高于场依存学习者；在场依存条件下，相较于固定弹幕呈现方式，滚动弹幕呈现方式下学习者的材料感知难度更低、相关认知负荷更低。在研究 1 的基础上，研究 2 使用滚动弹幕呈现方式，继续考察弹幕显示区域（四分之一、二分之一）对不同认知风格学习者学习效果、学习感知和认知负荷的影响。结果发现：与二分之一弹幕显示区域相比，在四分之一弹幕显示区域下学习者的测验得分更高。对于场独立的个体，四分之一弹幕组的学习兴趣更高，相关认知负荷更高；对于场依存个体，二分之一弹幕组学习者课堂参与度更高，相关认知负荷更高。综上所述，本研究发现弹幕滚动或固定式呈现方式以及弹幕显示区域面积对个体在线视频学习都会产生影响，且受个体认知方式的调节。因此，在线教学过

程中如果开启弹幕，除了弹幕呈现方式和呈现区域外，我们还需要考虑学习者的认知风格。该研究能够为在线视频教学设计中如何使用弹幕提供研究依据和优化建议，有利于加深关于在线视频教学中弹幕作用的认识。

The Influence of Danmaku Properties and Cognitive Styles on Online Video Learning Effect

Gao Fengqiang[1],　Zhao Yufei[1],　Liu Zhong[1],　Han Lei[1](corresponding author)
1 School of Psychology, Shandong Normal University, Jinan, Shandong 250358, hanlei-0333@163.com

***Abstract*：** Currently, empirical research on the influence of danmaku (barrage) on online learning is limited, particularly regarding the impact of danmaku properties on learning effects. Therefore, investigating the influence of different danmaku property settings on students' online video learning effects becomes an important scientific inquiry. Additionally, the multidimensional sensory stimuli of danmaku may have varying effects on individuals with different cognitive styles. Thus, this study focuses on experimental research conducted on the "PR Teaching Course" to examine the influence of danmaku property settings on learning effects and perceived learning of field-independent and field-dependent learners. Study 1 investigated the influence of danmaku presentation modes (scrolling, fixed) on learning effects, perceived learning, and cognitive load of learners with different cognitive styles. The results revealed that under the fixed danmaku presentation mode, field-independent learners exhibit significantly lower material perception difficulty compared to field-dependent learners. Conversely, under the scrolling danmaku presentation mode, field-independent learners experience significantly higher germane cognitive load than field-dependent learners. Moreover, under field-dependent conditions, compared to the fixed danmaku presentation mode, the scrolling danmaku presentation mode leads to lower material perception difficulty and lower germane cognitive load among learners. Building upon Study 1, Study 2 utilized the scrolling danmaku presentation mode to further explore the influence of danmaku display areas (one-quarter, one-half) on learning effects, perceived learning, and cognitive load of learners with different cognitive styles. The results indicated that compared to the one-half display area, learners achieve higher test scores in the one-quarter display area. For field-independent individuals, the one-quarter danmaku group exhibits higher learning interest and higher germane cognitive load, whereas for field-dependent individuals, the one-half danmaku group demonstrates higher classroom engagement and germane cognitive load. In summary, this research revealed that both scrolling and fixed danmaku presentation modes, as well as the danmaku display area, have an impact on individuals' online video learning and are influenced by their cognitive styles. Therefore, when implementing danmaku in online teaching processes, in addition to considering the presentation mode and display area, learners' cognitive styles should also be taken into account. This study provided research insights and optimization suggestions for the utilization of danmaku in online video teaching design, enhancing our understanding of the role of danmaku in online video instruction.

学习材料复杂性和呈现学习目标对诱人细节效应的影响及其机制

李芊诺[1,2]　路海东[1]（通讯作者）
1 东北师范大学心理学院，长春，130024 通讯作者 luhd@nenu.edu.cn
2 无锡市硕放中学，无锡，214142

摘 要　最初在教学材料中添加诱人细节是为了吸引学生注意力，提高学习兴趣。一方面诱人细节存在不可忽视的情感益处，另一方面诱人细节被发现损害学生的认知过程从而降低学习成绩产生了诱人细节效应。但随着研究的不断丰富，发现诱人细节效应也存在一定边界条件，这些发现对于如何发挥诱人细节的积极作用，减少其不利影响具有重要的意义。本研究以大学生为被试，在有关病毒与免疫的多媒体学习中，对学习材料复杂程度、诱人细节、学习目标进行操纵，并对学习者的保持和迁移成绩、自我报告的认知负荷、学习动机、情境兴趣以及学习过程中的眼动指标进行了测量。研究包括两个实验。实验一采用 2（学习文本的复杂程度：简单 vs.复杂）×2（诱人细节：有 vs.无）两因素被试间设计；实验二采用 2（诱人细节：有 vs.无）×2（学习目标：呈现 vs.不呈现）两因素被试间设计。本研究得出以下结论：（1）学习材料的复杂性是诱人细节效应产生的一个重要的边界条件。在简单学习材料中添加诱人细节并不影响学习者的学习成绩，而在复杂学习材料中添加诱人细节会降低学习者的学习成绩，表现出诱人细节效应。（2）在学习材料中增加诱人细节具有提高学习者的学习动机和情境兴趣的积极作用。（3）学习目标的呈现对诱人细节效应起缓冲调节作用。呈现学习目标通过增加学习者对学习文本的注视时间和注视次数从而提高了学习成绩，学习者对学习文本的注视时间和注视次数在学习目标呈现对学习成绩的影响中起到中介作用，在有诱人细节条件下，学习者对学习文本的注视次数在学习目标呈现对学习成绩的影响中起到中介作用。

The Influence of Learning Material Complexity and Presenting Learning Objective on Seductive Detail Affect and Its Mechanism

Qiannuo Li[1,2]　Haidong Lu[1]
1 School of Psychology, Northeast Normal University,Changchun,130024
2 Wuxi Shuofang Middle School,Wuxi,214142

Abstract：Seductive details were originally added to teaching materials to attract students' attention and increase their interest in learning. On the one hand, seductive details have emotional benefits that cannot be ignored; on the other hand, seductive details have been found to damage students' cognitive processes and thus reduce their academic performance, resulting in seductive details effect. This study took college students as subjects, manipulated the complexity, seductive details and learning objectives of the learning materials in the multimedia learning about viruses and immunity, and measured the learners' retention and transfer performance, self-reported cognitive load, learning motivation, situational interest and eye movement indicators during the learning process. The study consisted of two experiments. In experiment 1, used a 2 (seductive details: with vs. without) × 2 (complexity of learning material: simple vs. Complex) between-subjects design; In experiment 2, used a 2 (seductive details: with vs. without) × 2 (learning goals :with vs. without) between-subjects design. This study draws the following conclusions: (1) The complexity of learning materials is an important boundary condition for the seductive detail effect. Adding seductive details to simple learning materials does not affect learners' academic performance, while adding seductive details to complex learning materials will reduce learners' academic performance, showing the effect of seductive details. (2) Adding seductive details to learning materials has a positive effect on improving learners' learning motivation and situational interest. (3) The presentation of learning objectives plays a moderating role in the effect of seductive details. Presenting learning objectives improves learning performance by

increasing learners' dwell time and fixation count of learning texts. Learners' dwell time and fixation count of learning texts play a mediating role in the influence of the presentation of learning objectives on learning performance. Under condition of seductive details, The fixation count on learning text plays a mediating role in the influence of learning goal presentation on learning achievement.

提取练习与生成性策略的组合对文本学习的效果

唐云[1,2] （通讯作者） 杨晶莹[1]

1 华中师范大学心理学院，湖北武汉，430079

2 青少年网络心理与行为教育部重点实验室，湖北武汉，430079

通讯作者 E-mail: tangyun@ccnu.edu.cn

摘 要 以往研究发现，提取练习(retrieval practice)和生成性策略都能有效促进文本学习，但是二者的具体功能存在差异。提取练习主要通过提取过程巩固所学内容，促进记忆的长期保持，而生成性策略则通过帮助学习者构建连贯的心理表征来促进对学习材料的理解和迁移。本研究通过两个实验室实验，采用社科类文本作为学习材料，探究不同策略组合对学习过程和学习效果的影响。

实验 1 采用 3×2 混合设计，组间因素为学习策略（线索提取+生成、自由提取+生成、生成），组内因素为后测时间（即时、延迟），被试为 105 名大学生。结果发现，提供提取线索能提高学习者的初始提取表现，且不会降低提取阶段的认知负荷；但生成任务得分和后测成绩与其他组没有差异。与只完成生成任务的学习者相比，同时完成提取练习和生成任务的学习者在生成任务中会投入更少的努力，但生成质量、保持和迁移成绩没有差异。此外，进行提取练习对学习判断的准确性产生积极作用。实验 2 采用 3×2 混合设计，组间因素为学习策略（笔记+提取、生成+提取、提取），组内因素为后测时间（即时、延迟），被试为 99 名大学生。结果发现，与只进行提取练习的学习者相比，先记录笔记或者先完成生成任务的学习者在提取质量、保持和迁移成绩都有更好的表现，但是笔记+提取和生成+提取之间并不存在显著差异。

综合两项实验的结果，本研究表明提取练习和生成策略的组合相比单纯进行提取练习具有更积极的效果，且这种积极作用不受到任务顺序的影响。对提取再生成而言，提取对信息的激活和巩固并不会影响生成性任务的质量；对生成再提取而言，生成有利于学习者构建更高质量的心理表征，帮助学习者记忆更多信息。这些发现提示教师或学习者，在学习文本材料的时候可以考虑结合记忆类策略和生成性策略，能促进较深层次的认知加工，以达到更好的学习效果。

The Effect of Combining Retrieval Practice and Generative Strategy on Learning Social Science Texts

Yun TANG[1,2], Jingying YANG[1]

1 School of Psychology, Central China Normal University, 430079, Wuhan, Hubei

2 Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, 430079 Wuhan, Hubei

Abstract: Previous studies have found that both retrieval practice and generative strategies are effective in facilitating text learning, but there are differences in their specific functions. Retrieval practice consolidates what has been learned through the retrieval process and promotes long-term retention, whereas generative strategies promote comprehension and

transfer of learning materials by helping learners construct coherent mental models. In this study, two laboratory experiments were conducted to investigate the effects of different strategy combinations on the learning process and learning outcomes by using social science texts as learning materials.

Experiment 1 used a 3 × 2 mixed design with the between-group factor of learning strategies (cued recall + generation, free recall + generation, and generation) and the within-group factor of posttest time (immediate, delayed). Participants were 105 college students. The results found that providing retrieval cues improved learners' initial recall performance and did not reduce cognitive load in the retrieval phase, whereas no difference was found on generation task or posttest scores. Learners who completed both the retrieval practice and the generative tasks would engage less into the generative task compared to learners who only completed the generation task, but there were no differences in generation quality, retention, or transfer scores. In addition, learners who performed retrieval practice demonstrated more accurate metacognitive monitoring. Experiment 2 used a 3 × 2 mixed design with the between-group factor of learning strategies (notes + free recall, generation + free recall, free recall) and the within-group factor of posttest time (immediate, delayed). Participants were 99 college students. It was found that learners who took notes first or completed the generative task first performed better in terms of retrieval quality, retention, and transfer scores compared to learners who only did retrieval practice. No significant difference was found between notes + free recall and generation + free recall.

Collectively, the present study suggests that the combination of retrieval practice and generative strategies has a more positive effect than retrieval practice alone, and that this positive effect is not affected by task order. For retrieve-then-generate, the activation and consolidation of information by retrieval did not affect the quality of the generative task; for generate-then-retrieve, generation facilitated the construction of higher-quality mental models and helped learners memorize more information. These findings suggest that teachers or learners may consider combining retrieval practice and generative strategies when learning textual materials, which can promote deeper cognitive processing for better learning outcomes.

上网课需要开摄像头吗？社会存在感对在线学习的影响

祝婉玲[1]　冷晓雪[1]　王福兴[2]（通讯作者）

1 华中师范大学心理学院，武汉，430079

2 华中师范大学心理学院，武汉，430079，fxwang@ccnu.edu.cn

摘 要　在视频学习中，教师存在和学生存在是影响学习效果的重要因素。准社会交往理论、社会代理理论和社会存在感理论认为呈现教师形象能够促进学习，而多媒体学习理论和认知负荷理论则认为教师形象会与学习材料竞争认知资源从而阻碍学习。近年来，随着在线同步教育的发展，教师存在的操控由在视频中呈现教师形象转变为教师直接打开摄像头。同时，技术的保障也使得学生可以自由选择是否打开摄像头呈现自己的形象，形象呈现可能会诱发更高的自我监控，影响学生的学习投入和心理努力。本研究主要关注在线教学课堂中，教师和学生的存在（开关摄像头）是否会影响学习体验和学习结果。实验采用 2（教师存在：打开摄像头，关闭摄像头）×2（学生存在：打开摄像头，关闭摄像头）的被试内设计，共招募 33 名被试，在模拟真实线上授课情景的实验室中完成英语单词的学习，并对比不同学习条件下学习者的学习表现（保持测验和迁移测验）、主观体验（元认知判断、心理努力、感知难度和社会存在感）和动作能量（头部移动变化量）。被试需要连续 4 天来到实验室学习不同的英语单词，不同条件和不同材料的学习顺序在被试间进行平衡。结果发现：（1）在保持和迁移测验上，教师存在的主效应显著，当教师关闭摄像头时，学生的学习表现优于教师打开摄像头，其他主效应和交互作用均不显著；（2）在元认知判断和心理努力上，学生存在的主效应显著，相比于关闭摄像头，学习过程中学生打开摄像头提高了学习投入，同时对测验成绩有更高的估计。在社会存在感上，教师存在的主效应显著，教师打开摄像头时，学生感知到教师的社会存在

更高。（3）在动作能量上，教师的主效应显著，当教师关闭摄像头时，学生的动作幅度更大。研究结果表明，在线教学中，教师打开摄像头可能会造成学生的身体紧张和注意资源分散，从而不利于学习效果，并且学生的主观感受和学习表现存在偏差。本研究支持了多媒体学习理论和认知负荷理论，对在线同步教学的开展具有一定指导意义。

关键词　在线学习；社会存在；动作能量分析

Can the presence of teacher and student promote online learning?

Zhu Wanling[1]　Leng Xiaoxue[1]　Wang Fuxing[1]

1. School of Psychology, Central China Normal University, Wuhan 430079

Abstract：The presence of teachers and students is considered a crucial factor that affects learning outcomes in video-based learning. Parasocial interaction theory, social agency theory, and social presence theory suggest that presenting teacher images can enhance learning, while multimedia learning theory and cognitive load theory argue that teacher images may compete for cognitive resources with learning materials, thereby hindering learning. In recent years, with the development of synchronous online education, the manipulation of teacher presence has shifted from presenting teacher images in videos to teachers directly turning on their webcams. Simultaneously, technological advancements have allowed students to choose whether or not to present their own images by turning on their webcams. Students' presentation of images may induce higher self-monitoring, thereby influencing students' learning engagement and mental. This study primarily focuses on whether the presence of teachers and students (webcam on/off) in online teaching classrooms affects learning experiences and outcomes. A within-subject design was employed, with a total of 33 participants recruited. Participants completed English vocabulary learning tasks in a laboratory setting that simulated real online teaching scenarios. The study compared learners' performance (retention and transfer tests), subjective experiences (judgment of learning, mental effort, perceived difficulty, and social presence), and motion energy under different learning conditions. Participants were required to come to the laboratory for four consecutive days to learn different English vocabulary words, with the learning conditions and material sequences counterbalanced across participants. The results revealed that: (1) significant main effects of teacher presence were found on retention and transfer tests, with students performing better when the teacher's webcam was off; no other main effects or interaction effects were significant; (2) significant main effects of student presence were found on judgment of learning and mental effort, indicating that students' engagement and estimation of test scores were higher when they had their webcams on during the learning process. A significant main effect of teacher presence was found on social presence, with students perceiving higher social presence when the teacher's webcam was on; (3) a significant main effect of teacher presence was found on motion energy, with students exhibiting greater head movement when the teacher's webcam was off. The findings of the present study suggest that within the realm of online teaching, the presence of a teacher's webcam may elicit physical tension and result in divided attention among students, ultimately exerting a detrimental influence on learning outcomes. Moreover, it is important to acknowledge that students' subjective perceptions and learning performance may be susceptible to bias in relation to this particular factor. These empirical findings are consistent with the theoretical frameworks of multimedia learning and cognitive load, thereby providing valuable insights and guidance for the advancement of synchronous online teaching.

教师高兴的面部表情什么时候促进视频学习？手势和鼠标指示的作用

皮忠玲[1]　黄雪玫[1]　李西营[1]（通讯作者）

1 陕西师范大学现代教学技术教育部重点实验室，西安，710062

摘 要　教学视频中教师常常无意识的使用多种非言语行为，如面部表情、手势和身体动作等，激发学生的社会反应，或引导其注意资源分配。研究表明，这些行为会共同影响视频学习的过程和效果。然而，以往研究主要关注单一的教师非言语行为的作用，忽略了它们的整合作用。本研究包含三个眼动实验，其中实验一和实验二考察教师面部表情和指示性手势在幻灯片复杂度不同的教学视频中的作用，实验三考察了教师面部表情在有鼠标指示的教学视频中的作用。实验一和实验二发现，指示性手势吸引了学习者分配更多的注意资源加工教师形象，并且教师高兴的面部表情和指示性手势同时使用时，会降低学习者在幻灯片较为复杂的视频中的学习效果。实验三发现，教师高兴的面部表情增加了学习者在幻灯片较为复杂且有鼠标指示的视频中的学习效果。本研究结果对教学视频设计具有重要的指导意义。

Promoting Learning with Happy Facial Expressions: The Role of Pointing Gestures and Mouse Pointing in Video Lectures

Zhongling Pi, Xuemei Huang, Xiying Li

Key Laboratory of Modern Teaching Technology (Ministry of Education), Shaanxi Normal University

Address: South Chang'an Road 199, Yanta District, Shaanxi Normal University, Xi'an 710062, Shaanxi Province, P.R.China

Abstract：Instructors frequently use multiple nonverbal behaviors to trigger a social reaction and guide learners' attention even in video lectures. Furthermore, these nonverbal behaviors interactively influence learners' learning process and performance. However, previous studies mainly focus on either the behaviors acting as social cues or the behaviors acting as attentional cues. This study conducted three eye-tracking experiments to examine the effects of an instructor's facial expressions and pointing gestures in video lectures with simple and complex slides. The study also examined the effects of the instructor's facial expressions in the video lectures with mouse pointing. Results of Experiments 1 and 2 exhibited that the instructor's pointing gestures attracted learners' greater attention to her image, and the combination of happy facial expressions and pointing gestures hindered learning performance regardless of the complexity of slides in video lectures. Results of Experiment 3 exhibited that when video lectures with complex slides presented mouse pointing, the instructor's happy facial expressions enhanced learning performance. The current study affords implications for designing of video lectures with instructor presence. Specifically, instructors should use mouse pointing instead of pointing gestures to strengthen the benefits of happy facial expressions in video lectures with complex slides.

Keywords：video lectures, instructor, facial expressions, pointing gestures, mouse pointing

小学生注意控制对数学策略灵活性的作用

蒋舒阳[1]　刘儒德[1]（通讯作者）　王佳[2]

1 北京师范大学心理学部，北京，100875，通讯作者 E-mail：rdliu@bnu.edu.cn

2 北京联合大学

摘 要　数学策略灵活性反映了学生灵活地运用所学知识选择最优策略来解决问题的能力。以往大量以单一问题为背景的研究仅关注个体在策略转换方面的表现，而忽略了数学问题解决的系列背景以及策略灵活性可能具有不同的表现形式。对此，近期研究提出了新的看法，即策略灵活性的本质要求个体在面对变化的问题情境时决定是要保持先前的策略还是要转换到新策略，经历了一个更为复杂的加工过程。相应地，策略灵活性的表现形式、测量方式需要随之思考，其影响因素及作用机制也有待重新探讨。为此，本研究首先提出策略灵活性“策略保持、策略转换”的双重表现框架，并通过设置系列问题情境，同时考察双重过程；其次，从过程重叠理论视角出发，探究注意控制与策略灵活性的关系及其随年级的发展变化；最后，引入心智游移作为中介变量，进一步揭示二者的关系的内在机制。本研究通过三个研究逐步检验上述观点。研究 1a 和 1b 分别以加法、乘法估算问题为例开发策略灵活性任务，通过比较不同灵活性水平学生的任务表现差异，来验证双重过程指标的有效性。研究 2a 和 2b 通过考察小学生的注意控制水平与策略灵活性加法、乘法任务表现的关系以及年级的调节作用，以明确注意控制与策略灵活性的关系及其边界条件。研究 3a 和 3b 则分别采用中介测量、中介操纵设计，检验心智游移是否在注意控制对策略灵活性的影响中起到中介作用。结果表明：1）相比于低灵活性学生，高灵活性学生在策略保持和策略转换上的表现均更好，表明双重过程都是反映策略灵活性的有效指标；2）在控制了工作记忆容量之后，注意控制正向预测小学生策略灵活性的双重表现，且年级因素起到调节作用，表明策略灵活性需要注意控制的参与，尤其针对发展早期阶段；3）心智游移在注意控制与策略灵活性的关系中起到中介作用。本研究提出的数学策略灵活性双重表现框架有助于完善相关测查方式，并为揭示策略灵活性背后的认知机制与发展规律提供科学依据。

The Relation between Attention Control and Mathematical Strategic Flexibility among Elementary School Students

Jiang Shuyang[1]　Liu Ru-De[1]　Jia Wang[2]
1 Faculty of Psychology, Beijing Normal University
2 Beijing Union University

Abstract： Mathematical strategic flexibility reflects students' ability to flexible use of mathematical knowledge to choose the most efficient strategy in the problem-solving process. Previous studies mostly focused on investigating participants' performance in strategic switching by using a single question context, which neglected the context of mathematical problem-solving and the possibility that strategic flexibility may manifest in different forms. In fact, recent studies have suggested that the nature of strategic flexibility requires that when confronted with a series of mathematical problems, it is important to know when to continue with a previous strategy and when to switch to a new one, which involved with a more complex processing procedure. Accordingly, the form and measurement of strategic flexibility need to be considered, and it’s impact factors and underlying mechanisms need to be revisited.

To address the above issues, the first concern of this study was to propose a dual-process framework for strategic flexibility and investigate it in a series of problem-solving contexts. Tasks were developed to assess performance in both maintenance and switching aspects. Secondly, by taking the perspective of the process overlap theory, the relationship between attention control and strategic flexibility , as well as its developmental changes were explored. Thirdly, b it is proposed that mind wandering may serve as a possible mediating factor to account for the relationship between attention control and strategic flexibility. We tested these hypotheses in three studies.

Studies 1a and 1b developed tasks of strategic flexibility using addition and multiplication estimation problems as examples. By comparing the performance of students with different levels of flexibility, the effectiveness of dual-process indicators is verified. To clarify the relationship between attention control and strategic flexibility, Study 2a and 2b examined

the relationship between primary school students' attention control and task performance, as well as the moderating effect of grade level. Study 3a and 3b further tested whether mind wandering play a mediating role in the relationship between attention control and strategic flexibility through mediation measurement and mediation manipulation design.

The results showed that: 1）Students with higher strategic flexibility exhibited better performance in both maintaining and switching, indicating that maintaining and switching are valid indicators for measuring mathematical strategic flexibility. 2）After controlling for the effect of working memory capacity, attention control demonstrated a significant predictive effect on strategic flexibility. Grade moderated the relationship between attention control and strategic flexibility. These indicated that both maintaining and switching involve attention control processes, particularly for low-grade students. 3） Mind wandering served as a mediator in the relationship between attention control and strategic flexibility.

By proposing a dual-process framework of strategic flexibility, the present study improved the related methods and provided empirical evidence for a deeper understanding of the cognitive mechanisms and developmental patterns underlying strategic flexibility.

摘 要　传统上，学习策略被分为三大类：认知策略，元认知策略，资源管理策略。其中认知策略又包含注意策略、精加工策略、复述策略、组织策略等，元认知策略又包含自我监控、自我评价、自我调节策略等，资源管理策略又包含时间管理策略、环境营造策略和学业求助策略等。从心理学研究角度看，这种分类框架有助于聚焦某一特定的学习过程，进而对学习者的有效学习提供支持；但它也存在两个明显的缺点：一是过于碎片化，不利于教师在教学设计和教学实施过程中整体顾及；二是过于关注信息的输入性加工，而相对忽视信息的输出过程。在实际的教学情境中，教师较少教授学生学习策略与这两方面都存在密切关系。无论是哪种形式的学习策略，最终都要通过促进学生的知识建构来促进其学习。建构主义通常把建构分为认知建构和社会建构两类，但后者依然需要通过促进前者来最终促进学习。我们认为，从更为有效地促进学生的学习和相应的教学角度，学习策略的开发应围绕学生的知识建构过程来进行。学生的知识建构有两个基本过程：输入性建构和输出性建构。输入性建构重在通过新旧知识的互动建构理解和记忆，输出性建构则重在重组已有知识建构问题解决方案。当前研究者聚焦的认知策略（如精加工策略）和资源管理策略（如学业求助策略）主要指向的是输入性建构，问题解决策略所指向的主要是输出性建构，元认知策略则同时适用于两种建构过程。总体而言，旨在促进输出性建构的学习策略研究目前相对缺乏。为此，我们应围绕学生的生成性作业（如写作）、项目化学习、创造性问题解决等方面，着力开发促进其学习的策略。如此，经过一段时间探索，就可以构建起促进输入性建构和输出性建构相平衡的学习策略系统。

关键词　学习策略，知识建构，输入性建构，输出性建构

A Knowledge Constrution-based Taxonomy of Learning Strategies

Weiguo Pang

School of Psychology and Cognitive Science, East China Normal University

***Abstract*：** Traditionally, learning strategies are categorized into three types, namely cognitive strategy, meta-cognitve strategy, and resource management strategy. Cognitive strategies, such as attention strategy, elaboration, rehearsal, and organization, are developed to promote general information processing. Meta-cognitve strategies are used to monitor, evaluate, and regulate learning processes. And resource management strategies, which include time management, environmental arrangement, and academic help-seeking, are acquired to enhance the employment of learning resoureces. Although the trichotomy of learning strategies is helpful for the psychologists to highlight some learning processes and develop according strategies to support them, the taxonomy is with two pitfalls. First, the strategies in the trichotomy are so miscellaneous that teachers could not sufficiently integrate them into instruction. Second and more importantly, the strategies are mainly developed to promote the input processes of learning whereas the strategies used to improve the output processes are relatively rare. To some extent, these pitfalls account for the less learning strategies instruction in the classroom. Any learning strategies must make effect through the intervention of individual knowledge construction. Despite that constructivists emphasize the significances of both coginitive construction and social construction, social construction essentially affect the learner by strengthening their personal knowledge construction. As such, we recommend that, in order to effectively support students learning and classroom instruction, the development of learning stratigies should centre on individual knowledge construction. Basically, knowledge construction takes in two forms: input-oriented construction (IOC) and output-oriented construction (OOC). While IOC occurs when prior knowledge interacts with new information to construct understanding and memory, OOC arises when prior knowledge was reorganized and combined to achieve solutions

for given problems. It is important to point out that the cognitive strategies (e.g. elaboration) and resource management strategies (e.g. academic help-seeking) highlighted by the previous researchers are mainly used to promote the IOC, whereas problem solving strategies are mainly used to inprove the OOC, though meta-cognitive strategies can serve the both construction. Considering that the research on the learning strategies which could promote the OOC, we suggest that the development of learning strategies should pay more attention to the activities which involve the OOC process, such as generative assignment, project-based learning, and creative problem solving. As such, the number of learning strategies which could serve both the IOC and the OOC would be commensurate.

Keywords： Learning strategies, Knowledge construction, Input-oriented construction, Output-oriented construction

儿童犯错态度的特征、前因和结果：基于变量中心及个体中心视角

刘宇轩　姚梅林　刘红瑞（通讯作者）

北京师范大学心理学部，北京，100875，hrliu@bnu.edu.cn

摘 要　接受并纠正错误有益进步，但学生对犯错的态度与反应复杂多样，如厌恶犯错的同时积极改错、接受犯错但拒绝改正等。目前鲜有研究就学生的犯错态度开展异质性研究。同时，关于“不同犯错态度如何形成？”“不同犯错态度会带来怎样的结果？”等科学问题尚缺乏充分解答。本研究综合运用变量中心和个体中心的方法，探索犯错态度的三个方面即认知（关于犯错是否有益的观念）、情感（犯错时的情绪体验）及行为（犯错后采取的行动）的组合模式，检验环境（父母失败思维和社会比较）及个人因素（成就目标）在犯错态度形成中的作用，并考察犯错态度对主观幸福感和学业发展的影响。采取随机整群抽样的方法，对 495 名小学高年级儿童（$M_{年龄}$ = 11.03 岁，SD = 0.82）进行问卷调查。检验共同方法偏差后，首先在 Mplus 中采用结构方程模型考察犯错态度与各变量的线性关系，再用潜在剖面分析探索学生犯错态度的剖面类型与占比，最后用回归混合模型揭示犯错态度剖面与前因变量及结果变量的关系。结果显示，（1）父母失败思维和社会比较正向预测犯错情感，不同成就目标对犯错态度的认知、情感及行为的影响侧重不同，犯错态度的这三个方面对儿童主观幸福感、学业自我妨碍、求学意愿的影响侧重也不同；（2）存在 3 种学生犯错态度剖面，即消极组（55.35%）、积极组（28.28%）和知行不一组（16.36%）；（3）年级、父母失败思维、掌握目标得分越高的儿童越易进入消极组和知行不一组，父母社会比较倾向及自身表现目标越高的儿童越有可能归于知行不一组；（4）知行不一组儿童的消极情感和学业自我妨碍最高，积极组儿童的求学意愿最高。整体而言，研究表明学生犯错态度的不同方面难以一概而论，需加以区分；家长信念与行为以及儿童自身持有的成就目标对犯错态度乃至未来发展的影响不容忽略；犯错态度中的“知”与“行”虽不同但关系密切，未形成对错误的积极认知而被动或被迫改错可能会危害儿童的心理健康及学业发展。

关键词　犯错态度，成就目标，主观幸福感，学业发展，潜在剖面分析

Characteristics, Predictors, and Outcomes of Attitudes Toward Mistakes Among Children: From Variable- and Person-Centered Perspectives

Yuxuan Liu, Meilin Yao, Hongrui Liu

(Faculty of Psychology, Beijing Normal University, Beijing, 100875)

Abstract： Accepting and correcting mistakes is beneficial for progress, yet the students' attitude and reaction to making mistakes are complex (e.g., disgusting but correcting mistakes carefully, accepting mistakes but refusing to correct). Currently, limited studies have focused on mistake attitudes, let alone exploring the heterogeneity of student attitudes toward

mistakes and addressing the significant issues of “how different mistake attitudes form?” and “What are the consequences of mistake attitudes?” deeply. The present study adopted both variable- and person-centered approaches to a) explore the combinations of three aspects of mistake attitudes, including cognition (belief about the benefits of mistake), emotions (emotional experiences when making mistakes), and behavior (actions taken when making mistakes), b) examine the role of potential environmental (i.e., parental failure mindset and social comparison) and personal antecedents (i.e., achievement goals) in the formation of mistake attitudes, and c) investigate the impact of mistake attitudes on subjective well-being and academic development among children. For the questionnaire survey of 495 primary high school children (M_{age} = 11.03 years, SD = 0,82), a random sampling method was adopted. After testing the common method bias, the structural equation model was used to examine the liner relationship of attitudes toward mistakes with other variables; then, latent profile analysis was applied to explore the profiles of mistake attitude and profile proportions; and finally, regression mixed modeling was taken to reveal the relationships of mistake attitude profiles with antecedent and consequent variables. The results showed that (1) parental failure mindset and social comparison positively predicted mistake attitude, and various achievement goals had different predicting role in the three aspects of mistake attitude, which differed in predicting subjective well-being, academic self-inhibition, and willingness to pursue education. (2) Three mistake attitudes profiles were identified: Negative (55.35%), positive (28.28%), and disunity of knowing and doing (16.36%). (3) High grades, parental failure mindset, and mastery goals increased probabilities of belonging to the negative and the disunity of knowing and doing group; and high perception of parental social comparison and performance goals increased probabilities of belonging to disunity of knowing and doing group. Moreover, (4) disunity of knowing and doing group had the highest negative affect and academic self-handicapping, while the positive group had the highest willingness to pursue education. Overall, findings indicate that it is necessary to distinguish the different aspects of mistake attitudes, and to value the influences of parental beliefs and behaviors, as well as personal achievement goals on the mistake attitude and future development of children. Move on, note that the cognition and behaviors in the mistake attitudes are different but closely related. Passive or forced correction without a positive cognition of making mistake may endanger child’s mental health and academic development.

弹幕同步交互对初中生在线学习投入的影响

刘颖[1]　韩超楠[2]（通讯作者）
1 河北师范大学教育学院，石家庄，050000
2 商丘工学院，商丘，476000，通讯作者 E-mail：hcn2018@163.com

摘 要　在线学习往往因其教学交互深度、广度不足而导致学习者产生较低的学习投入。随着“互联网+”时代到来，弹幕为在线学习提供了新的即时性、可控性的交互方式。大量研究证实，及时反馈是促进深层次学习的有效策略之一，因而，弹幕交互其独特的交互优势是否有利于增强在线学习投入值得进一步验证。然而，目前尚无研究直接证明这一点。已有研究大多仅从理论上推论弹幕的特点与学习过程及学习结果之间的相关关系，且相对忽略了实时模式下，师生、生生弹幕同步交互对在线学习投入的本质影响。本研究通过四个实验，从生生交互、师生交互两大方面探究弹幕同步交互对初中生在线学习投入的影响。实验 1 即探索性研究，实验 1a 揭示弹幕交互功能（打开、关闭、偶尔打开偶尔关闭）对学生学习投入的影响。实验 1b 进一步将弹幕状态限制在开启功能时，揭示学生弹幕使用模式（自发、观看）对其学习投入的影响。在此基础上，实验 2 进一步探究生生弹幕互动数量及质量对学习投入的影响。实验 3 则从师生交互角度，探究教师对学生弹幕的回应方式以及回应时间对学生学习投入的影响。研究结果表明：1）开启弹幕功能组的学生的学习投入水平显著高于关闭弹幕功能组。2）发送弹幕组的学生学习投入水平显著高于观看弹幕组。3）发送高质量弹幕组的学生学习投入水平显著高于低质量组。4）教师不回应组和延时回应组学生的学习投入差异不显著，及时回应组学生的学习投入水平显著高于其他各组。基于时代背景，本研究通过探清弹幕交互对在线学习投入的作用机理，为在线学习中适当发挥弹幕交互的作用提供实证支持。

The Effect of Danmaku on Middle School Students' Online Learning Engagement

Liu Ying　Han Chaonan
School of Education, Hebei Normal University
College Student Mental Health Education Center, Shangqiu Institute of Technology

Abstract：Online learning often leads to low engagement due to insufficient depth and breadth of teaching interaction. With the arrival of the "Internet+" era, danmaku provides a new interactive way for online learning with immediacy and controllability. A large amount of research has confirmed that timely feedback is one of the effective strategies to promote deep learning. Therefore, it is worth further exploring whether the unique interactive advantages of danmaku interaction are conducive to enhancing online learning engagement. However, there is currently no direct research to prove it. Most existing research only infers the correlation between the characteristics of danmaku and the learning process and results from a theoretical perspective, and relatively neglects the essential impact of synchronous danmaku interaction between teachers and students or among students on online learning engagement in real-time mode.

This study explores the impact of danmaku synchronous interaction on the engagement of middle school students in online learning from two aspects: student-student interaction and teacher-student interaction through four experiments. Experiment 1 is an exploratory study, and Experiment 1a reveals the impact of danmaku interaction functions (turning on, turning off, occasionally turning on and off) on student engagement. Experiment 1b further limits the danmaku status and reveals the impact of student danmaku usage patterns (spontaneous, watching) on their engagement. Based on this, Experiment 2 further explores the impact of the quantity and quality of student-student danmaku interaction on engagement.

Experiment 3 explores the impact of teacher response methods and response time to students' danmaku on engagement from the perspective of teacher-student interaction. The results show that: 1) the engagement level of students in the group with danmaku turned on is significantly higher than that of the group with danmaku turned off; 2) the engagement level of students in the group sending danmaku is significantly higher than that of the group watching danmaku; 3) the engagement level of students in the group sending high-quality danmaku is significantly higher than that of the low-quality group; 4) there is no significant difference in the engagement level of students in the group where the teacher did not respond and the group with delayed response, and the engagement level of students in the group with timely response is significantly higher than that of other groups. In a word, this study provides empirical support for appropriately leveraging the role of danmaku interaction in online learning by exploring the mechanism of the impact of danmaku interaction on online learning engagement. In a word, this study provides empirical data on the impact of danmaku synchronous interaction on learning engagement, and supports the optimization of the role of danmaku in online learning with empirical results.

课堂测验对新知识学习、走神频率、考试焦虑及学业成绩的影响

杨春亮

北京师范大学心理学部-发展心理研究院，北京，100875

Email：chunliang.yang@bnu.edu.cn

摘要：在教学情境中，学生及教师往往将测试（即记忆提取练习）视之为一种知识或能力评估工具，但大量认知与教育心理学研究表明测试更是一种高效的学习策略和教学技术。例如，测试已学知识能够巩固人们对所学知识的长时记忆保持，该现象被称之为后向测试效应（the backward testing effect）。此外，大量实验室研究表明，测试已学知识还能够促进人们对新知识的学习效率，该现象被称之为前向测试效应（the forward testing effect）。本研究首次在课堂情境下考察课堂测验是否能够促进学生对新知识的学习效率。在持续四周的英语课程中，学生共参加四次英语课程。在前三次英语课程中，测试条件下的学生需要在每次课程结束后完成一个课堂测验，而重学条件下的学生则重新复习每次课程的知识要点。在完成第四次课程后，测试条件和重学条件下的学生均完成本次课程的课堂测验。在每次授课过程中，本研究使用走神探针测量每位学生的走神状态。在第四次课程结束一周后，学生完成单元测验，且在测验前报告考试焦虑程度。

结果表明，测试组的第四次课堂测验成绩显著高于重学组，表明真实教学情境下前向测试效应依然稳定存在。测试组学生的课堂走神频率显著低于成学组，表明课堂测验能够有效维持学生的学习投入。测试组关于单元测验的焦虑程度显著低于重学组，表明课堂测验能够有效降低考试焦虑。测试组的单元测试成绩显著高于重学组，表明课堂测验能够提升学生的学业成绩。个体差异分析表明课堂测验能够更有效提高学习能力较差的学生的学业成绩，表明课堂测验能够减小学生间的学业成绩差异。学生普遍对低风险的课堂测验持积极态度，且推荐教师在未来课程中继续实施课堂测验。上述结果表明，课堂测验是一种有效的教学技术，能够促进学生对新知识的学习效率、增强课堂注意力、提升学业成绩及降低考试焦虑。研究结果的理论贡献将在会议报告中进行详细阐述。

Effects of Class Quizzes on New Learning, Mind Wandering, Test Anxiety and Exam Performance

Chunliang Yang

Institute of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, 100875

Email: chunliang.yang@bnu.edu.cn

Abstract: In educational settings, both students and teachers frequently regard testing (i.e., retrieval practice) as a tool for knowledge or skill assessment. However, a substantial body of research in cognitive and educational psychology suggests that testing is not only an assessment tool but also an effective learning strategy and instructional technique. For instance, testing can consolidate long-term retention of previously learned material, a phenomenon known as *the backward testing effect*. Additionally, numerous laboratory studies have shown that testing can also potentiate subsequent learning of new material, known as *the forward testing effect*. We conducted the first quasi-experiment to investigate whether end-of-class quizzes can promote students' learning of new information in the real classroom.

Over the course of four weeks of English classes, students attended to four English lessons. During the first three lessons, students in the testing condition completed a quiz at the end of each lesson, while students in the restudy condition reviewed the key knowledge summary of each lesson. After the fourth lesson, both the testing and restudy groups took a classroom quiz on that lesson. During each lesson, students' mind states were measured by five occasionally presented mind-wandering (MW) probes. One week after the fourth lesson, the students took a unit exam and reported their levels of test anxiety (TA) before the exam.

The results showed that Class 4 quiz performance was significantly better in the test than in the restudy group, indicating that the forward testing effect survives in real classroom settings. MW rates during classes were significantly lower in the test than in the restudy group, suggesting that classroom quizzes effectively sustain students' learning engagement across the lecture phase. The test group also exhibited significantly lower levels of TA regarding the unit exam compared to the re-study group, indicating that classroom quizzes can also effectively reduce TA. Moreover, the test group's unit exam performance was significantly better than the restudy group's exam performance, suggesting that classroom quizzes can boost academic performance. Individual difference analysis revealed that classroom quizzes were more effective in enhancing academic performance for students with lower learning abilities, thereby reducing achievement gaps among students. Students generally held positive perspectives on low-stakes quizzes and recommended teachers to continue implementing quizzes in future classes. These findings indicate that classroom quizzes are an effective instructional technique that potentiates new learning, enhances learning engagement, improves academic performance, and mitigates TA. Theoretical contributions of the documented findings will be further elaborated in the conference presentation.

大学生规则学习方法的选择倾向及学习效果

班宇威　张奇 (通讯作者)
辽宁师范大学心理学院, 大连, 116029, zq55822@163.com

摘要：规则学习方法主要有三种：（1）阅读学习法,即通过阅读教材习得规则；（2）样例学习法，即通过样例学习习得规则；（3）范例学习法，即在规则范例教学条件下通过范例学习习得规则。为考察大学生三种规则学习方法的自我选择倾向和学习效果，也为了考察大学生先前知识水平对三种学习方法选择倾向和学习效果的影响，我们开发出低、中、高三种元素交互性水平的各 4 种人工代数运算规则，并划分出有、无先前知识的两种被试，使有、无先前知识的被试都经历分别采用三种学习方法学习三种元素交互性水平的前三个代数规则的学习过程。最后，让被试自主选择一种学习方法进行第四个规则的学习。以此考察大学生阅读学习、样例学习和范例学习三种规则学习方法的自我选择倾向及学习效果。

实验结果显示：（1）在学习低交互水平的规则时，三种学习方法的学习效果均较好，学习成绩均无显著差异。被试选择样例学习方法的人数显著多于选择另两种学习方法的人数，有、无先前知识对学习方法的自我选择倾向均无显著影响。（2）在学习中等交互水平的规则时，有先前知识被试的样例学习和范例学习效果均明显优于阅读学习；无先前知识被试的样例学习的效果明显优于阅读学习。无先前知识被试选择样例学习方法的人数显著多于选择另两种学习方法的人数；有先前知识的被试选择范例学习方法的人数显著多于选择另两种学习方法的人数，选择样例学习方法的人数显著多于选择阅读学习方法的人数。（3）在学习高交互水平的规则时，有先前知识被试的范例学习效果均明显优于样例学习和阅读学习，样例学习的效果明显优于阅读学习；无先前知识被试的样例学习和范例学习的效果均明显优于阅读学习。有、无先前知识的被试选择样例学习和范例学习的人数均显著多于选择阅读学习的人数。

实验结果表明，在学习规则时，大学生更倾向于选择样例学习方法或范例学习方法并取得较好学习效果。

关键词：规则学习方法；元素交互性水平；阅读学习；样例学习；范例学习

The Choose Tendency and Learning Effect of Learning Method for Rule of Student

Ban Yuwei　Zhang Qi
School of Psychology, Liaoning Normal University, Dalian

***Abstract*:** There were three main methods of students learning rules: first method was read learning; second method was worked-examples learning; third method was modeling example learning. In order to research the influence of element interactivity and prior knowledge to the applicability of learning method, we created four kinds of new algebraic operation rules for each low, middle and high interactive element, and the participants were divided into two kinds, one was the with prior knowledge of students, other was without prior knowledge students. The participants with or without prior knowledge were all experienced three kinds of learning methods to learn three different algebraic rules that have the same level of element interaction. Then themselves choose one of three kinds methods to learn the fourth rule, we investigated the choose tendency and the learning effects of every kind learning method.

The experimental results showed that: (1) When learning the algebraic rules of low element interaction, three learning methods could all achieved better learning effect, and the difference among three learning methods was not significant. The number of choose second method were significantly more than those of the first and third method. (2) When learning the algebraic rules of middle element interaction, the learning effect of second method and third method of participants with prior knowledge were all significantly better than those of first method. The learning effect of second method of the participants without prior knowledge was significantly better than those of first method. The number of choose second method of the participants without prior knowledge were all significantly more than those of the first method and third

method. The number of choose third method of the participants with prior knowledge were all significantly more than those of the first method and second method. (3)When learning the algebraic rules of high element interaction, the learning effect of third method of the participants with prior knowledge were all significantly better than those of first method and second method, and the learning effects of second method and third method of the participants without prior knowledge were all significantly better than those of first method. The number of choose second method or third method of participants with or without prior knowledge were all significantly more than those of first method.

The conclusion was that when learning rule, the students more tend to choose the method of modeling example learning or worked-example learning and achieved better learning effect.

青少年抑郁和自杀问题的时代特点与教育对策

——基于“无望理论”的拓展性分析

盖笑松[1,2]（通讯作者）

1 东北师范大学心理学院，长春，130024

2 吉林省普通高等学校人文社会科学重点研究基地东北师范大学心理健康教育研究中心，长春，130024

通讯作者 Email: gaixs669@nenu.edu.cn

摘要：古今中外都不乏青少年抑郁和自我伤害事例，然而近年来我国青少年抑郁和自我伤害问题的高发趋势和低龄化趋势需要得到特别的注意。流调显示中学生抑郁发生率达到 17.9%（史珊珊等，2023），13.65%的中学生曾有意伤害过自己，12.25%的中学生认真考虑过自杀,6.46%的中学生有过自杀计划,2.33%的中学生采取过自杀措施（沈艳辉等，2020）。尽管心理学中的“无望”理论（Abramson, Metalsky, Alloy, 1989）和自杀人际理论（Van Orden, 2010）已经对抑郁和自杀问题做出了有力的解释，但是这些解释未能考虑中国社会转型期青少年问题的特殊性。本文基于我国社会转型期的时代背景分析和社会主要矛盾转型分析，结合社会学的阶层分化模型和失范理论，从学校教育竞赛、家长育儿焦虑、学生竞争心态、文化取向变迁、网络信息穿透性等角度拓展了远端变量，从青少年幸福感、基本心理需求（自主感、胜任感、关联感）受阻等角度拓展了介观变量，以无望感、无力感、意义感危机和消极推理风格为近端变量，建构了具有本土时代特征的抑郁和自杀行为的解释模型。在此基础上，一方面提出了预警监测系统的建设方案，从问题症状、风险因子、韧性因子三个方面去建设红、橙、黄、蓝、绿不同性质的心理档案；另一方面设计了分层应对的教育方案，从人生观引导、家长心态导向和养育风格优化、学校氛围改进措施、学生心理韧性提升活动等角度提出了有针对性的应对方法。

Current Characteristics and Educational Interventions of Adolescent Depression and Suicide: An Extensional Analysis Based on the Hopelessness Theory of Depression

Xiaosong Gai[1,2]

1 School of Psychology, Northeast Normal University, Changchun 110024, China

2 Key Research Base of Humanities and Social Sciences of Higher Education in Jilin Province, Center of Mental Health Education and Research, Northeast Normal University, Changchun 110024, China

Abstract：Cases of adolescent depression and suicide are not uncommon throughout history. However, in recent years, the escalating trend of depression and suicide among Chinese adolescents, starting at younger ages, warrants special attention.

Epidemiological investigation reveals that the incidence of depression among middle school students has reached 17.9% (Shi et al., 2023). Moreover, 13.65% of middle school students have intentionally harmed themselves, while 12.25% have seriously considered about suicide. Furthermore, 6.46% of middle school students have formulated suicide plans and 2.33% have taken actual steps toward it (Shen et al., 2020). While the hopelessness theory of depression (Abramson et al., 1989) and the interpersonal theory of suicide (Van Orden, 2010) in psychology have provided powerful explanations for depression and suicide, they did not consider the particularities of adolescent issues in China's social transition period. Based on the analysis of the historical context and major social contradictions during China's social transition period, this study integrates the sociological models of class differentiation and the anomie theory. It expands the distal variables including school educational competition, parental anxiety in child-rearing, students' competitive mentality, cultural orientation shifts, and the permeability of online information. Additionally, mesoscopic variables pertaining to adolescent well-being and obstructed basic psychological needs (autonomy, competence, relatedness) are also examined. By considering hopelessness, powerlessness, crisis of meaning, and negative reasoning style as proximal variables, an explanatory model of depression and suicide behavior with local era characteristics is constructed. Building upon this model, on the one hand, an early warning monitoring system is proposed. It aims to construct psychological profiles from the perspectives of problem symptoms, risk factors, and resilience factors, categorized into different natures, namely red, orange, yellow, blue, and green. On the other hand, a stratified response educational plan is designed. The targeted approaches include guiding outlook on life, orienting parental mentality, optimizing parenting style, improving school atmosphere, and implementing activities to enhance students' psychological resilience.

阻断大学生自杀意念向自杀尝试演变的保护因子：构成、维度、特点

孟迎芳[1]（通讯作者） 许世梅[12]

1 福建师范大学心理学院，福州，350117

2 福州大学心理中心，福州，350108，Mengyf1978@126.com

摘要：自杀危机依然严峻的原因之一是目前对自杀内部进程演变认识不足导致的自杀干预受限。以往研究较多关注的是自杀进程如何从自杀意念演变成自杀尝试，即导致自杀意念演变的风险因素。仅关注风险因素不足以全面了解和预防自杀，识别保护因素同样重要。多数自杀意念者不会尝试自杀，背后原因不得而知。本研究聚焦回答为何多数自杀意念者没有尝试自杀这一问题，寻找阻断自杀意念向自杀尝试演变的保护因素，探讨这些保护因素的构成、维度、特点等。本研究通过访谈 19 名无自杀尝试史的大学生自杀意念者，基于扎根理论范式进行文本编码，总结出保护因子由联结、理智、自杀否定构成。在此基础上，编制了联结问卷、理智问卷和自杀否定问卷，确定了联结因子包括家庭联结、自我联结和社会联结 3 个维度，理智因子包括理性认知、调节情绪、生命至上、勇敢乐观 4 个维度，自杀否定因子包括自杀行为否定、自杀后果否定、自杀情绪否定和自杀条件否定 4 个维度。经检验，3 个因子问卷信效度良好。为进一步探讨当前大学生在各类保护因子上的现状，为大学生自杀或生命教育提供更多参考依据，本研究采用自编的联结问卷、理智问卷和自杀否定问卷，选取 1014 名大学生进行调查研究。结果发现，总体上大学生在三个保护因子上处于中上水平。但也表现出一些人口学上的差异。女生的自杀后果否定、自杀情绪否定略显著高于男生，男生的勇敢乐观、自杀行为否定略显著高于女生。没有留守经历的大学生更担心自杀给他人带来不良影响。家庭经济不困难的大学生的保护因子高于家庭经济困难学生。非独生大学生的保护因子高于独生大学生。大二学生的保护因子在所有年级中最突出。本研究揭示了阻断自杀意念向自杀尝试演变的保护因子，有助于更全面了解自杀演变过程，为及时阻断自杀演变发展提供科学参考，为从上游防止自杀行为发生提供干预焦点。

Protective Factors Against the Progression of Suicidal Ideation to Suicide Attempt: Construct, Dimension and Characteristic

Meng Yingfang [1], Xu Shimei [12]

1 School of Psychology, Fujian Normal University, Fuzhou, 350117

2 Psychological Center, Fuzhou University, Fuzhou, 350108

Abstract: One of the reasons underlying the acute nature of suicide crisis is the limited understanding of the internal processes and progression of suicidal ideation; correspondingly, suicide interventions have limited efficacy. Previous studies have focused on how the suicide process evolves from suicidal ideation to suicide attempt, that is, the risk factors that lead to the progression of suicidal ideation. Focusing on risk factors alone is not enough to fully understand and prevent suicide, and it is equally important to identify protective factors. Most individuals with suicidal ideation do not attempt suicide, but the reasons are unknown. The present study focuses on answering the question of why most suicidal ideators do not attempt suicide, looking for protective factors against the progression of suicidal ideation to suicide attempt, and exploring the construct, dimension and characteristics of these protective factors. In this study, 19 college students without a history of suicide attempts but with suicidal ideation within the past year were interviewed, text coding was conducted based on the grounded theory paradigm, and the protective factors were concluded to be composed of connection, sanity and suicide negation. On this basis, the connection questionnaire, sanity questionnaire and suicide negation questionnaire were compiled. The connection factor included three dimensions: family connection, self-connection and social connection. The sanity factor included four dimensions: rational cognition, emotional regulation, life first, courage and optimism. Suicide negation factor include four dimensions: suicide behavior negation, suicide consequence negation, suicide emotion negation and suicide condition negation. The reliability and validity of the questionnaires were good. In order to further explore the current characteristics of college students in various protective factors and provide more reference for college students' suicide or life education, this study used self-designed connection questionnaire, sanity questionnaire and suicide negation questionnaire, and selected 1014 college students for investigation and research. The results showed that college students were above average in the three protective factors. But there were also some demographic differences. The negation of suicide consequence and suicidal emotion of girls were slightly higher than that of boys. Brave optimism and negation of suicidal behavior of boys were slightly higher than that of girls. College students who had no experience of left-behind were more worried about the adverse effects of suicide on others. The protective factors of college students who did not have financial difficulties were higher than that of students with financial difficulties. The protective factors of non-only-child college students were higher than that of only-child college students. The protective factors of sophomores were most prominent in all grades. This study reveals the protective factors against the progression of suicidal ideation to suicide attempt, which is helpful to understand the progression of suicide more comprehensively, provides scientific reference for timely blocking the evolution and development of suicide, and intervention focus for preventing the occurrence of suicidal behavior from the upstream.

Keywords: suicidal ideation, suicide attempt, progression, protective factors

积极父母教养与青少年亲社会行为：自我控制的中介作用和多基因分数的调节作用

聂衍刚（通讯作者）[1]　陈沛[1]　王林欣[2]　喻承甫[1]　利振华[1]
1 广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn
2 北京师范大学发展心理研究院，北京，100875

摘要：遗传和社会环境因素均是亲社会行为产生的基础，以往研究也证明单基因多态性与消极环境可以交互影响青少年亲社会行为的发展。随着研究的深入，越来越多研究者强调多基因与积极社会环境的交互作用对青少年亲社会行为的影响。此外，具有生物学基础的内表型（如自我控制）被证明与亲社会行为显著关联，可能是环境与基因交互影响行为水平的重要桥梁。基于此，本研究从“多基因×积极环境→内表型→行为”的理论视角，纵向考察积极父母教养与多基因分数如何通过自我控制影响青少年亲社会行为。本研究对广东省广州市三所普通中学的 880 名中学生（$Mean_{age}$=14.11 岁，*SD*=1.48）进行为期半年的追踪研究。所有被试进行了积极父母教养(W1)、自我控制(W2)、亲社会行为(W1/W2)的问卷填写，并提供了唾液样本进行基因分型。多基因分数是根据四个基因多态性 *OXTR* rs2254298、*OXTR* rs2254295、*COMT* rs6269 和 *5-HTR2A* rs6313 进行累加获得。研究结果显示：（1）W2 自我控制在 W1 积极父母教养与 W2 青少年亲社会行为的关系中起中介作用（indirect effect = 0.01, *SE*= 0.003, 95%CI = [0.001, 0.016]）；（2）多基因分数显著调节“W1 积极父母教养→W2 自我控制双系统→W2 青少年亲社会行为”的前半段（β= 0.15, *SE*= 0.04, $p < 0.001$），具体表现为，相比于多基因分数较低的青少年，积极父母教养对多基因分数较高的青少年自我控制的影响更显著。本研究有助于我们较为深刻地了解环境因素和遗传因素如何交互作用于内表型，并进一步影响亲社会行为，对培养和促进儿童青少年的亲社会倾向和行为具有重要意义。

Positive Parenting and Adolescent Prosocial Behavior: The Mediating Role of Self-control and The Moderating Role of Polygenic Score

Yangang Nie[1]　Pei Chen[1]　Linxing Wang[2]　Chengfu Yu[1]　Zhenhua Li[1]

1 Department of Psychology/Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

2 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract: Prosocial behavior was based on genetic and environmental factors. Previous studies have also demonstrated that negative environment and single gene polymorphism interact to predict the development of prosocial behavior. With the in-depth study, more and more researchers emphasize the interaction between positive social environment and multiple genes on adolescent prosocial behavior. In addition, endophenotypes with a biological basis, such as self-control, have been shown to be associated with prosocial behavior, and may be important mediators of environmental and genetic interactions on individual behavior. Therefore, from the theoretical perspective of "polygenic × positive environment → endophenotype → behavior", this study investigates longitudinally how positive parenting and polygenic score influences adolescent prosocial behavior through self-control. In this research, 880 Chinese adolescents ($Mean_{age}$=14.11 years, *SD*=1.48) were recruited to participate in a two-wave longitudinal study (6 months apart) and complete questionnaires regarding positive parenting (W1), self-control (W2), prosocial behavior (W1/W2), and provided saliva samples for genotyping. Polygenic score was created by *OXTR* rs2254298, *OXTR* rs2254295, *COMT* rs6269 and *5-HTR2A* rs6313. The results showed that: (1) W2 self-control played a mediating role in the relationship between W1 positive parenting and W2 adolescent prosocial behavior; (2) this mediating mechanism was moderated by polygenic score, the relationship between positive parenting and self-control was

more significant for participants with high polygenic scores than those with low polygenic scores. This study contributed us to deeply understand how environmental factors and genetic factors interact with endophenotypes and further affect prosocial behavior, and provided scientific guidance for adolescent prosocial behavior intervention programs in practice.
Key words: positive parenting, prosocial behavior, self-control, polygenic score, adolescent

父母对孩子自我客体化的影响：物质教养和外表自我价值权变性的作用

向梦涵[1] 吴泳桃[1] 刘学兰[1]（通讯作者）

1“儿童青少年阅读与发展”教育部哲学社会科学实验室(华南师范大学)/ 心理应用研究中心 /华南师范大学心理学院，广州，510631，liuxuelan@m.scnu.edu.cn

摘要：自我客体化指的是人们通过所接触的被社会默认的身体标准信息来评估自身身体的程度 (Tiggemann, 2011)。自我客体化高的个体会因对身体变化极其敏感而更多进行身体监控，且因未能达到社会标准而产生更高身体羞耻感(Bradley & David , 2016；McKinley & Hyde,1996)。以往的研究主要集中在自我客体化对成年女性群体的负面影响，然而较少关注家庭内部，父母自我客体化对其孩子自我客体化的影响。因此，本研究采用亲子配对的调查方式，共招募到 592 对被试。采用自我客体化量表、物质教养问卷以及外表自我价值权变性量表进行调查。

结果发现：（1）中学生群体中女性自我客体化显著高于男性；中学生自我客体化水平整体较高，各个年级之间差异并不显著；父母的自我客体化、父母无条件物质奖励、青少年外表自我价值权变性和孩子自我客体化之间均存在密切的相关关系。（2）父母无条件物质奖励和青少年外表自我价值权变性在父母自我客体化对孩子自我客体化的影响中起链式中介作用。（3）父母自我客体化对孩子自我客体化的影响路径在不同性别的青少年群体中存在差异。

结果表明，父母自我客体化会影响孩子自我客体化，本研究为进一步了解父母自我客体化对孩子自我客体化的作用机制提供了理论支持，对孩子自我客体化的干预具有实践意义。
关键词：自我客体化，物质教养，无条件物质奖励，外表自我价值权变性

The Influence of Parents on Children's Self-objectification: The Role of Material Parenting and Appearance-contingent Self-Worth

Menghan Xiang[1], Yongtao Wu[1], Xuelan Liu[1]

1 Philosophy and Social Science Laboratory of Reading and Development in Children and Adolescents (South China Normal University), Ministry of Education / Center for Studies of Psychological Application/ School of Psychology, South China Normal University, Guangzhou, 510631

Abstract: Self-objectification refers to individuals evaluating their own bodies based on societal body standards that they have been exposed to (Tiggemann, 2011). Individuals with high levels of self-objectification are more sensitive to changes in their bodies and experience higher levels of body shame due to not meeting societal standards (Bradley & David, 2016; McKinley & Hyde, 1996). Previous research has mainly focused on the negative effects of self-objectification on adult women, but little attention has been paid to intergenerational transmission of self-objectification. Therefore, this study recruited 592 parent-child pairs and used Objectified Body Consciousness Scale, Material Parenting Questionnaire, and

Appearance-contingent Self-worth Scale to investigate.

The results showed that: (1) Female self-objectification was significantly higher than male self-objectification in middle school students; The overall level of self-objectification of middle school students is higher, and there is no significant difference among different grades; There is a close correlation between parents' self-objectification, parents' unconditional material reward, adolescents' appearance-contingent self-worth and adolescents' self-objectification. (2) Parents' unconditional material rewards and adolescents' self-worth rights play a chain mediating role in the intergenerational transmission of self-objectification. (3) There are differences in the intergenerational transmission paths of self-objectification among adolescents of different genders.

The results show that parents' self-objectification affects adolescents' self-objectification. This study provides theoretical support for further understanding of the mechanism of intergenerational transmission of self-objectification, and has practical significance for the intervention of adolescents' self-objectification.

Keywords: self-objectification, material parenting, unconditional material rewards, appearance-contingent self-worth

青少年自我意识与问题性互联网使用的关系：意向性自我调节的作用

胡花花　陈沛　吴煜琪　陈振锋　聂衍刚（通讯作者）

广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn

摘要：问题性互联网使用是一种指向自我的社会适应不良的行为障碍。以往研究表明，青少年自我意识与其社会适应行为密切相关，但自我意识与问题性互联网使用的关系及其作用机制有待深入考察。根据自我意识的心理功能理论，自我意识在个体的心理活动和社会生活中起着调节和监控的作用，它可能是问题性互联网使用的保护因素。同时，问题性互联网使用容易导致个体产生自我失调，可能降低个体的自我意识。为考察自我意识和问题性互联网使用的双向关系，及两者的作用机制，本研究采用交叉滞后设计，对广州市三所中学 669 名学生进行间隔半年的两次追踪测量。结果发现：（1）青少年自我意识在追踪研究期间显著下降（其中，自我认识和自我控制成分显著下降，t= 8.85, p < 0.001; t = 2.28, p < 0.05，自我体验成分保持稳定，t = -1.89, p > 0.05），问题性互联网使用显著上升（t= -8.74, p < 0.001）。（2）路径分析表明，T1 自我控制显著预测 T2 问题性互联网使用（β = -0.13, p < 0.001），T1 问题性互联网使用显著预测 T2 自我认识（β = -0.09, p < 0.01）、自我体验（β = -0.07, p < 0.05）和自我控制（β = -0.11, p < 0.01）。（3）T1 意向性自我调节在自我意识和问题性互联网使用的关系中起调节作用，不起中介作用。调节效应分析表明，T1 意向性自我调节显著调节了 T1 自我控制与 T2 问题性互联网使用的关系（β = -0.06, p < 0.05）。当青少年具有更高水平的 T1 意向性自我调节时，T1 自我控制对 T2 问题性互联网使用的负向预测作用更强。结果表明自我控制更高的青少年更少产生问题性互联网使用，尤其是当青少年具有更强的意向性自我调节时。而青少年更多的问题性互联网使用则容易导致更低的自我认识和评价、更消极的自我体验和更弱的自我控制。本研究揭示了自我意识和问题性互联网使用的双向关系，以及意向性自我调节在其中所起的作用，为减少青少年问题性互联网使用提供了重要参考。

Self-consciousness and problematic Internet use in adolescence: Role of intentional self-regulation

Huahua Hu　Pei Chen　Yuqi Wu　Zhenfeng Chen　Yangang Nie

Department of Psychology/Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

Abstract：Problematic Internet use is a socially maladaptive behavioral disorder directed at the self. Previous studies have shown that adolescent self-consciousness is closely related to their social adaptation behavior. However, it should be further investigated about the relationship between self-consciousness and problematic Internet use and its mechanism. According to the mental function theory of self-consciousness, self-consciousness plays a regulating and monitoring role in an individual's mental activity and social life, and it may be a protective factor of problematic Internet use. Meanwhile, problematic Internet use can easily lead to self-dysregulation, which may reduce an individual's self-consciousness. To examine the bidirectional association between self-consciousness and problematic Internet use, and the underlying mechanism, this study used a cross-lagged study design, and investigated 669 students in three middle schools in Guangzhou. The participants were followed up 6-months later. The results showed that: (1) Adolescents' self-consciousness decreased significantly (the self-cognition and self-control components decreased significantly, t= 8.85, p < 0.001; t = 2.28, p < 0.05, and the self-experience component remained stable, t = -1.89, p > 0.05), and the problem Internet use increased significantly (t= -8.74, p < 0.001). (2) Path analyses showed that T1 self-control significantly predicted T2 problem Internet use (β = -0.13, p < 0.001), and T1 problem Internet use significantly predicted the self- cognition (β = -0.09, p < 0.01), self-experience (β = -0.07, p < 0.05) and self-control components of T2 self-consciousness (β = -0.11, p < 0.01). (3) In the relationship between self-consciousness and problematic Internet use, T1 intentional self-regulation played a moderating rather than mediating role. The moderation effect analysis showed that T1 intentional self-regulation significantly moderated between the self-control component of T1 self-consciousness and T2 problem Internet use (β = -0.06, p < 0.05). T1 self-control had a stronger negative and predictive effect on T2 problematic Internet use among those adolescents with higher levels of T1 intentional self-regulation. The findings suggest that adolescents with higher self-control may be less likely to engage in problematic Internet use, especially when they have stronger intentional self-regulation. More problematic internet use among adolescents may lead to lower self-cognition and evaluation, more negative self-experience, and weaker self-control. This study reveals a bidirectional relationship between self-consciousness and problematic Internet use, and the role of intentional self-regulation in this relationship, which provides an important support for reducing adolescent problematic Internet use.

Keywords：Self- consciousness, problematic Internet use, intentional self-regulation, adolescence

小学儿童阅读信念与阅读理解的双向关系：一项交叉滞后研究

王淏蘭[1]　赵轶[1]　伍新春[1]（通讯作者）陈红君[1]　赵英[2]

1 北京师范大学心理学部，应用实验心理北京市重点实验室，儿童阅读与学习研究院，北京，100875，xcwu@bnu.cdu.cn

2 南京师范大学心理学院，南京，210097

摘 要　阅读信念指个体对阅读过程和价值等方面的较为稳定的认知，一般可分为传递信念和互动信念两个维度。传递信念指读者倾向于认为阅读是被动地接收信息，强调提取文本作者的原意；互动信念指读者倾向于认为阅读需要通过积极地解释、组织和运用信息来建构意义，强调读者在理解文本过程中的个人贡献。这两种信念并非对立关系，而可能在不同的阅读情境中同时存在并发挥作用。小学阶段是儿童逐步形成稳定阅读信念的关键期，该阶段的阅读信念对其当下和未来的阅读能力发展有着重要影响。以往研究表明，阅读信念可能会直接或间接地影响儿童的阅读理解。然而，阅读信念究竟会影响何种类型和层次的阅读理解仍有待探究。此外，根据成就动机理论和经验效应，读者自身的阅读理解能力也可能会反过来影响儿童的阅读信念。为探讨小学儿童阅读信念（传递信念、互动信念）与不同文本体裁类型（叙事性文本、说明性文本）和理解加工层次（基础理解、高阶理解）阅读理解的双向关系，本研究采用交叉滞后研究设计，对 290 名小学中高年级儿童（男生占比：55.5%，平均年龄：10.69±1.03 岁）进行为期半年的追踪测量。结果发现：（1）T1 和 T2 时间点的传递信念和互动信念两两之间均呈正相关；（2）T1 和

T2 时间点的阅读信念仅与 T1 和 T2 时间点的高阶叙事理解呈正相关，而与两个时间点的基础叙事理解和说明理解不相关。（3）传递信念、互动信念和高阶叙事理解的交叉滞后分析结果表明，高阶叙事理解与互动信念在半年时间内能够互相正向预测；此外，T1 高阶叙事理解和 T1 互动信念均能正向预测 T2 传递信念，但 T1 传递信念不能预测 T2 高阶叙事理解和 T2 互动信念。本研究揭示了阅读信念与阅读理解之间的复杂双向关系，并进一步明确了二者关系的作用靶点在于互动信念与高阶叙事阅读理解之间的相互预测，启示教育者应在教学中关注并促进儿童互动信念的生成，重视培养其高阶阅读理解能力，并综合考虑二者在儿童阅读发展中的相互影响。

The Bidirectional Relationship between Reading Beliefs and Reading Comprehension in Primary School Children: A Cross-Lagged Study

Haolan Wang[1], Yi Zhao[1], Xinchun Wu[1*], Hongjun Chen[1], Ying Zhao[2]

[1]Research Center of Children's Reading and Learning, Beijing Key Laboratory of Applied Experimental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, China
[2]School of Psychology, Nanjing Normal University, Nanjing, China

Abstract：Reading beliefs refer to an individual's relatively stable cognitive understanding of the reading process and its value, which can be broadly categorized into two dimensions: transmission beliefs and interaction beliefs. Transmission beliefs involve perceiving reading as a passive process of receiving information, emphasizing the extraction of the author's intended meaning. Interactive beliefs, on the other hand, involve considering reading as an active process that requires actively interpreting, organizing, and applying information to construct meaning, highlighting the reader's personal contribution in the comprehension process. Nevertheless, these two beliefs are not mutually exclusive but can coexist and exert influence simultaneously within different reading contexts. The primary school years are a crucial period for children to develop stable reading beliefs, which significantly influence their current and future reading abilities. Previous research suggests that reading beliefs may directly or indirectly impact children's reading comprehension processes. However, the exact impact of reading beliefs on the types and levels of reading comprehension remains to be explored. Furthermore, based on achievement motivation theory and the experience effect, children's own reading comprehension abilities may, in turn, affect their reading beliefs. To investigate the bidirectional relationship between reading beliefs (transmission beliefs, interactive beliefs) and different text genres (narrative texts, expository texts) and levels of comprehension processing (basic comprehension, higher-order comprehension), this study employed a cross-lagged research design and conducted a six-month longitudinal measurement involving 290 primary school children in upper grades (55.5%males, M_{age}=10.69±1.03). The results revealed that (1) transmission beliefs and interactive beliefs at T1 and T2 were positively correlated; (2) reading beliefs at T1 and T2 were only positively correlated with advanced narrative comprehension at T1 and T2, while showing no correlation with basic narrative comprehension and expository comprehension at both time points; and (3) The results of a cross-lagged analysis examining the relationship between transmission beliefs, interaction beliefs, and advanced narrative comprehension indicate that advanced narrative comprehension and interaction beliefs positively predict each other over a six-month period. Additionally, T1 advanced narrative comprehension and T1 interactive beliefs positively predicted T2 transmission beliefs, while T1 transmission beliefs did not predict T2 advanced narrative comprehension or interactive beliefs. This study reveals the complex bidirectional relationship between reading beliefs and reading comprehension and further clarifies that the interplay between interactive beliefs and advanced narrative comprehension is the target for mutual

prediction. These findings emphasize the importance of promoting the generation of interactive beliefs in educational settings and also cultivating their advanced reading comprehension abilities, while considering the mutual influence of these factors on children's reading development.

Keywords：Reading beliefs, Reading comprehension, Cross-lagged design, Primary school children

解码和听力理解对阅读理解的影响：朗读流畅性和默读流畅性的中介作用

陈红君[1]　赵英[2]　伍新春[1,3]（通讯作者）　王淏蘭[1]　孙鹏[1]

1 北京师范大学心理学部，应用实验心理北京市重点实验室，儿童阅读与学习研究院，北京，100875，xcwu@bnu.cdu.cn

2 南京师范大学心理学院，南京，210097

3 北京师范大学应用心理学院（珠海校区），广东，519087

摘 要　篇章阅读理解是一项复杂的活动，既包含读者基于篇章内容的加工，又涉及读者站在篇章之外的思考。本研究旨在考察小学不同学段儿童的解码和听力理解对不同层次阅读理解（基于文本和超越文本）的纵向影响，并进一步检验朗读阅读流利性和默读流利性在其中的中介作用。共有 449 名二、四、六年级的儿童参加了这项研究。在时间 1 (T1，2020 年 11 月)测试解码（汉字识别）和听力理解（篇章听力测试），同时测试瑞文、工作记忆和快速命名作为控制变量。半年后，在时间 2 (2021 年 5 月，T2)测试儿童的朗读流畅性、默读流畅性和阅读理解。使用 Process 程序分别在三个年级中检验 T1 的解码和听力理解对 T2 阅读理解的预测作用，及朗读流畅性和默读流畅性的中介效应，在控制了年龄、瑞文测试、工作记忆和快速命名后，结果表明：(1)在二年级儿童中，解码既能直接预测基于文本的理解，也能通过朗读流畅性的中介作用产生影响；解码和听力理解都直接预测超越文本的理解。(2)四年级儿童中，解码对基于文本的理解有显著的直接预测作用，并通过朗读流畅性的中介作用影响基于文本和超越文本的理解；而听力理解通过默读流畅性间接预测基于文本的理解。(3)在六年级儿童中，听力理解直接预测基于文本的理解，解码和听力理解均能显著预测超越文本的理解；默读流畅性中介了解码和听力理解对基于文本的理解和超越文本的理解的影响。研究结果表明，解码和听力理解对阅读理解的影响因年级而异。在早期“学习阅读”阶段，解码在阅读理解中的作用较为突出，而随着儿童基础技能的提高，听力理解的影响变得更加明显。阅读理解(尤其是超越文本的理解)在高年级受默读流畅性的影响最大，而朗读流畅性主要在低年级中起作用。

Decoding and listening comprehension contribute to reading comprehension in different ways: The mediating roles of oral and silent reading fluency

Hongjun CHEN [1], Ying ZHAO [2], Xinchun WU [1, 3 *], Haolan WANG [1], Peng SUN [1]

1 Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Research Center of Children’s Reading and Learning, Faculty of Psychology, Beijing Normal University, Beijing 100875, China

2 School of Psychology, Nanjing Normal University, Nanjing 210023, China

3 School of Applied Psychology, Beijing Normal University at Zhuhai, Guangdong 519087, China

Abstract：Reading comprehension (RC) is a complicated activity with several components. This study aims to examine the longitudinal effect of decoding and listening comprehension (LC) on different levels of RC (in-text comprehension and beyond-text comprehension), and explore the mediating effect of oral reading fluency (ORF) and silent reading fluency (SRF) in various grades of Chinese elementary school students. A total of 449 Chinese students from grades 2, 4, and 6 participated in this study. Decoding and LC was tested at Time 1 (T1, November of 2020), along with nonverbal intelligence (IQ),

working memory (WM), and rapid automatized naming (RAN) as controlling variables. After half a year, ORF, SRF and RC were test at Time 2 (T2, May of 2021). Model 4 in macro program PROCESS 3.3 was used to test the direct and indirect effect through ORF and SRF of decoding and LC on text-based comprehension and critical comprehension. After controlling for age, IQ, WM, and RAN, the results showed that (1) among second graders, decoding predicted in-text comprehension directly and indirectly through ORF, and both decoding and LC directly precited later beyond-text comprehension; (2) In Grade 4, decoding predicted in-text comprehension directly and indirectly through ORF, and indirectly predicted beyond-text comprehension through ORF, while LC indirectly predicted in-text comprehension through SRF; (3) In Grade 6, only LC directly predicted in-text comprehension, both decoding and LC directly predicted beyond-text comprehension, and SRF mediated the effects of decoding and LC on in-text and beyond-text comprehension. The influence of decoding and LC on RC varied across different grades. During the early “learning to read” phase, decoding was more important in RC while the impact of LC became more apparent as children improved their reading skills. The mediating effect of ORF was primarily highlighted in the lower grades, while the RC (especially beyond-text comprehension) was most influenced through SRF in the upper grades.

汉语儿童阅读理解与阅读流畅性的影响因素及机制：来自六年追踪研究的证据

赵英[1]　伍新春[2]（通讯作者）　程亚华[3]

[1]南京师范大学心理学院，南京，210097

[2]北京师范大学心理学部，北京，100875，xcwu@bnu.edu.cn

[3]上海政法学院政府管理学院，上海，201701

摘 要　阅读是个体积累知识、提升自身素质的重要途径，对于儿童各方面的发展都十分重要。因此，明晰表征儿童阅读能力的指标，并进一步探索其影响因素及机制具有重要意义。然而，以往研究多仅仅关注儿童阅读理解的影响因素及机制。近些年来，阅读流畅性逐渐进入研究者及教育者的视野。本研究同时以篇章层面的阅读理解与阅读流畅性作为表征儿童阅读能力的指标，追踪小学一年级的汉语儿童至六年级，旨在探讨儿童一年级时的元语言意识与快速命名对小学末期两项阅读能力的影响，以及两项阅读能力影响机制的共享性与特异性。本研究以 117 名小学汉语儿童为被试，在一年级时测量了其元语言意识（语音意识、正字法意识和语素意识）与快速命名，在四年级时测量了其字词层面的阅读技能（字词识别准确性、字词识别流畅性和词汇知识），在六年级时测量了其篇章层面的阅读能力（阅读理解和阅读流畅性）。直接效应模型的结果表明，在控制了一般认知能力和工作记忆后，一年级的语素意识可以显著预测六年级的阅读理解，而一年级的快速命名可以显著预测六年级的阅读流畅性。此外，中介模型的结果表明，四年级的词汇知识在一年级的语素意识影响六年级阅读理解的过程中发挥中介作用，而四年级的字词识别流畅性在一年级的快速命名影响六年级阅读流畅性的过程中发挥中介作用，其他的间接路径均不显著。本研究的结果表明，早期的语素意识与快速命名对于小学末期的阅读能力十分重要，且阅读理解与阅读流畅性影响机制的特异性而非共享性更为突显。

Examining factors and mechanisms of reading comprehension and reading fluency: Longitudinal evidence for Chinese children from grade 1 to grade 6

Ying Zhao[a], Xinchun Wu[b*], Yahua Cheng[c]

[a]School of Psychology, Nanjing Normal University, Nanjing, China
[b]Faculty of Psychology, Beijing Normal University, Beijing, China
[c]School of Government, Shanghai University of Political Science and Law, Shanghai, China

***Abstract*:** Reading is an important way for individuals to accumulate knowledge and improve their own quality, and it is important for all aspects of children's development. Thus, it is necessary to clarify the indicators representing children's reading ability and explore their influencing factors and underlying mechanisms. However, most of the previous studies only focused on children's reading comprehension. In recent years, reading fluency gradually came into the vision of researchers and educators. This study aimed to explore early predictors of reading ability at the end of elementary school in 117 Chinese children and further examined whether shared or distinct factors and mechanisms affected reading comprehension versus reading fluency. Metalinguistic awareness (phonological awareness, orthographic awareness, and morphological awareness) and rapid automatized naming (RAN) were administered in grade 1 (G1), word-level reading skills (word-reading accuracy, word-reading fluency, and vocabulary knowledge) were administered in grade 4 (G4), and passage-level reading abilities were administered in grade 6 (G6). The results of direct effect model showed that G1 morphological awareness had a significant effect on G6 reading comprehension, while G1 RAN predicted G6 reading fluency significantly. The results of mediation model revealed that G4 vocabulary knowledge played a mediating role in the effect of G1 morphological awareness on G6 reading comprehension, while G1 RAN predicted G6 reading fluency via G4 word-reading fluency. The effects of other indirect routes were not significant. Our findings demonstrate the importance of early morphological awareness and RAN in facilitating reading ability at the end of elementary school, and suggest the distinct rather than shared factors and mechanisms of reading comprehension versus reading fluency.

网络语言对小学高年级儿童字词句加工的影响

赵轶[1] 伍新春[1]（通讯作者） 赵英[2] 王淏蘭[1] 陈红君[1] 吴皖赣[1,3]

1 北京师范大学心理学部，应用实验心理北京市重点实验室，儿童阅读与学习研究中心，北京，100875，xcwu@bnu.edu.cn

2 南京师范大学心理学院，南京，210097

3 合肥师范学院，教育与心理科学学院，合肥，230061

摘 要 在网络媒体海量信息的冲击下，具有高度简洁度、生动性和创意性特点的网络语言逐渐受到儿童青少年群体的追捧。一方面，网络语言作为智能时代发展的必然产物，丰富了现代汉语的表达功能。另一方面，越来越多小学生沉迷“网络烂梗”的现象不断引发社会争议。小学儿童处于语言能力发展的关键阶段，网络语言往往脱离了传统语言规范限制，在汉字、词汇或句法上表现出不规则的变体形式，那么长期接触这些变体语言对小学儿童在汉字、词汇或句法层面的语言加工分别会产生怎样的影响？首先，本研究基于对近五年 616 条网络语言的项目评定，编制了包含谐音、缩略、转义、新词、语句五类网络语言、共 50 个项目的网络语言测验。其次，以北京市某小学的 180 名高年级儿童（男：86 人；女：94 人；平均年龄：11.61 ± 0.58 岁）为对象，进一步考察了不同类型网络语言对小学高年级儿童汉字识别、词汇知识和句法意识三个层次语言能力的影响。结果发现：（1）本研究编制的网络语言测验在各项信效度指标上符合心理测量标准，能够用于衡量小学高年级儿童对各类网络语言的熟知程度；（2）在控制性别、年龄、一般认知能力、工作记忆、快速命名、句子流畅性和传统文学性阅读经验后，网络语言测验总分对小学高年级儿童的汉字识别和句法意识有显著的正向预测作用；（3）从网络语言的类型看，谐音、缩略、转义与语句四类网络语言得分均能显著正向预测汉字识别水平，转义类得分能显著正向预测词汇知识水平，语句类得分能显著正向预测句法意识水平。综上，本研究结果表明，网络语言能够对小学高年级儿童汉字、词汇和句法层次的语言加工产生正向预测作用，且网络语言的各类型与语言能力的各层次间存在部分对应关系。这提示不应将网络语言全盘视为儿童青少年发展中的洪水猛兽，而应适当利用网络语言在汉字、词汇和句法等层次上的创新变化，引导儿童青少年在适度使用中提升不同层次的语言能力，以此发挥网络语言的教育价值。

关键词 网络语言，测验编制，汉字识别，词汇知识，句法意识

Effects of Internet Language on the Processing of Character, Vocabulary and Sentence in Senior Children of Primary School

Yi Zhao[1], Xinchun Wu[1*], Ying Zhao[2], Haolan Wang[1], Hongjun Chen[1], Wangan Wu[1,3]

[3]School of Education and Psychological science, Hefei Normal University, Hefei, China

Abstract: With the impact of massive information in network media, Internet language with high simplicity, vividness and creativity is gradually sought after by children and adolescents. On the one hand, as an inevitable product of the development of the intelligent age, Internet language enriches the expression function of modern Chinese language. On the other hand, more and more primary school students indulging in "bad Internet memes" became a problem that caused social controversy. Primary school children are at the key stage of language ability development. Internet language often breaks away from

traditional language norms and shows irregular variants in Chinese characters, vocabulary or syntax. So what are the effects of long-term use of these variants on primary school children's language processing at the Chinese character, vocabulary and syntactic levels? Firstly, this study evaluated 616 items of Internet language in the past five years and developed 50 items of Internet language tests including homophony, contraction, escape, neologism and sentence. Secondly, this study took 180 senior children (86 males, 94 females; mean age: 11.61 ± 0.58 years) in a primary school in Beijing as subjects to investigate the effects of different types of Internet language on Chinese character recognition, vocabulary knowledge and syntactic awareness. The results revealed that (1) The Internet language test developed in this study meets the psychological measurement standards in various reliability and validity indicators, and can be used to measure the familiarity of senior primary school children with various Internet languages; (2) After controlling for gender, age, general cognitive ability, working memory, quick naming, sentence fluency and traditional literary reading experience, the total score of Internet language test has a significant positive effect on Chinese character recognition and syntactic awareness of primary school children; (3) From the perspective of the types of Internet language, the scores of homophony, contraction, escape and sentence can significantly predict the level of Chinese character recognition, the scores of escape can significantly predict the level of vocabulary knowledge, and the scores of sentence can significantly predict the level of syntactic awareness. In summary, the results of this study show that Internet language can positively predict the language processing of primary school children at the Chinese character, vocabulary and syntactic levels, and there is a certain correspondence between various types of Internet language and various levels of language ability. This suggests that Internet language should not be regarded as a scourge in the development of children and adolescents. We should make proper use of the innovative changes of Internet language in different levels such as Chinese characters, vocabulary and syntax, and guide children and adolescents to improve their language ability at different levels in moderate use, so as to give full play to the educational value of Internet language.

摘 要 家庭阅读环境是影响儿童阅读发展的直接生态环境。相关研究发现了家庭阅读环境与儿童的语言和阅读发展关系密切，然而，目前研究主要探讨的是家庭阅读环境与儿童某一阅读能力如字词识别或阅读理解的关系，体现的是简单的单向关系，而阅读是一项复杂的认知活动。因此，家庭阅读环境与儿童阅读能力之间可能存在着复杂的相互关系。发展级联指的是发展系统中多个层次或多个水平的因素之间相互作用及相互累积作用所产生的跨时间或跨领域影响。家庭阅读环境与儿童阅读能力之间可能的发展级联对儿童阅读发展具有潜在价值，能够更加系统和深入地了解儿童阅读发展的规律。本研究对 149 名小学一年级儿童进行三年追踪，探讨学龄儿童家庭阅读环境、汉字识别、口语词汇知识和阅读理解的发展级联。结果发现：(1)家庭阅读环境通过一年级的阅读理解扩散到二年级的汉字识别，进而影响三年级的阅读理解。(2)家庭阅读环境通过一年级的口语词汇知识扩散到二年级的阅读理解，进而影响三年级的口语词汇知识和阅读理解。(3)虽然家庭阅读环境对一年级汉字识别仅有边缘显著的直接预测效应，但一年级的汉字识别可以预测二年级的阅读理解和口语词汇知识，进而影响三年级的汉字识别、阅读理解和口语词汇知识。结果表明，学龄儿童家庭阅读环境、汉字识别、口语词汇知识和阅读理解之间存在间接的、多向的发展级联

效应，这一结果有助于揭示家庭阅读环境对儿童阅读发展潜移默化的影响机制，为系统考察家庭阅读环境对儿童阅读发展的影响及作用机制提供了参考依据。

3 Department of Early Childhood Education, The Education University of Hong Kong, Hong Kong 999077, China

Abstract: Home literacy environment (HLE) could be more influential than intervention programs because HLE promotes children's language and literacy development from early on. Therefore, understanding the developmental cascades of HLE, character recognition, oral vocabulary knowledge, and reading comprehension is of great value to children's reading development. The present study aimed to test the developmental cascades of HLE, character recognition, oral vocabulary knowledge, and reading comprehension among Chinese children. Participants were 149 children, who were followed up from Grades 1 to 3. Their HLE was obtained from their parents in Grade 1. They were assessed on character recognition, oral vocabulary knowledge, and reading comprehension once per school year, three times in total. A structural equation model was constructed to examine the developmental cascades of HLE, character recognition, oral vocabulary knowledge, and reading comprehension over the three testing time points. Results suggested the excellent model fit of the developmental cascade model: (1) HLE spread through reading comprehension in Grade 1 ($\beta = 0.19$, $p = 0.030$) to character recognition in Grade 2 ($\beta = 0.28$, $p < 0.001$), and then affected reading comprehension in Grade 3 ($\beta = 0.26$, $p = 0.002$). (2) HLE spread through oral vocabulary knowledge in Grade 1 ($\beta = 0.45$, $p < 0.001$) to reading comprehension in Grade 2 ($\beta = 0.20$, $p = 0.003$), which in turn affected oral vocabulary knowledge ($\beta = 0.27$, $p < 0.001$) and reading comprehension ($\beta = 0.34$, $p < 0.001$) in Grade 3. (3) Although the direct predictive effect of HLE on character recognition in Grade 1 ($\beta = 0.16$, $p = 0.078$) was found to be marginally significant, character recognition in Grade 1could predict reading comprehension ($\beta = 0.41$, $p < 0.001$) and oral vocabulary knowledge ($\beta = 0.14$, $p = 0.051$) in Grade 2, which in turn affected character recognition ($\beta = 0.15$, $p < 0.001$) and reading comprehension ($\beta = 0.27$, $p < 0.001$) in Grade 3. The results demonstrate that the relationship between HLE and children's reading development is not merely a one-way predictive effect, but a complex process with long-term, mutual influence. The present findings have an important role in elucidating developmental cascades of HLE and children's reading competence. The findings underline the importance of HLE and suggest a long-standing impact of HLE on reading development both directly and indirectly through oral vocabulary knowledge and character recognition. These findings extend our understanding of the relationship between HLE and children's reading development. The practical implications for HLE and Chinese children's reading development are discussed.

Keywords: Home Literacy Environment, oral vocabulary knowledge, character recognition, reading comprehension, developmental cascades

儿童口语词汇知识和词语结构意识的相互作用及其对汉语阅读理解的预测作用:一项 3-6 年级的纵向研究

张文建[1]　李宜逊[2]　程亚华[3]（通讯作者）

1 宁波大学心理学系，宁波 315211

2 香港教育大学幼儿教育学系，香港 999077

3 上海政法学院政府管理学院，上海 201701, chengyahua@nbu.edu.cn

摘　要　以往的跨语言研究发现，儿童的口语词汇知识与词语结构意识(即对复合词的语法结构的意识)有关，并且这两者都对阅读理解有显著的预测作用。然而，以往很少有研究探讨口语词汇知识和词语结构意识之间的动态关系，以及两者的发展速度对阅读理解的预测作用。本研究对中国大陆 125 名母语为汉语的儿童进行了为期 4 年 4 次的追踪测试，从三年级到六年级，每个年级的秋季有一个测试点，总共有四次测试。每次，测量所有参与者的口语词汇知识、词语结构意识和阅读理解，并评估他们的汉字识别和字词流畅性作为所有模型分析的两个控制变量。所有的测量方法都是根据已发表的研究改编的，并且被认为是高度可靠和有效的。本研究采用了潜变量增长模型考察了儿童口语词汇知识与词语结构意识的独立发展对阅读理解的预测作用，以及儿童口语词汇知识与词语结构意识的发展相互促进后对阅读理解的预测作用。结果发现：(1)在控制儿童的汉字识别和字词流畅性后，学生词汇知识与构词意识三年级时的起始水平和三至六年级间的发展速度对其六年级时的阅读理解水平有预测作用；(2) 同样在控制儿童的汉字识别和字词流畅性后，学生口语词语知识三年级时的起始水平可预测其三至六年级间构词意识的发展速度，进而对六年级时的阅读理解水平有预测作用；没有发现学生构词意识三年级时的起始水平对其三至六年级间词汇知识发展速度的显著预测作用。

Interaction between children's oral vocabulary knowledge and word structure awareness and its predictive effect on Chinese reading comprehension: a longitudinal study of grades 3-6

ZHANG Wenjian[1]　LI Yixun[2]　CHENG Yahua[3]

1 Department of Psychology, Ningbo University, Ningbo 315211, China

2 Department of Early Childhood Education, The Education University of Hong Kong, Hong Kong 999077, China

3 School of Government, Shanghai University of Political Science and Law, Shanghai 201701, China

Abstract：Previous cross-language studies have found that children's oral vocabulary knowledge is related to the awareness of word structure (that is, the awareness of grammatical structure of compound words), and both of them have a significant predictive effect on reading comprehension. However, few studies have explored the dynamic relationship between oral vocabulary knowledge and word structure awareness, and the predictive effect of their development speed on reading comprehension. In this study, 125 Chinese-speaking children in Chinese mainland were followed up for four times in four years. From grade three to grade six, there was a test point in autumn of each grade, with a total of four tests. Each time, all participants' oral vocabulary knowledge, word structure awareness and reading comprehension were measured, and their

Chinese character recognition and word fluency were evaluated as the two control variables of all model analysis. All measurement methods are adapted from published research and are considered to be highly reliable and effective. In this study, the latent variable growth model was used to investigate the predictive effect of independent development of children's oral vocabulary knowledge and word structure awareness on reading comprehension, and the predictive effect of mutual promotion of children's oral vocabulary knowledge and word structure awareness on reading comprehension. The results show that: (1) after controlling children's Chinese character recognition and word reading fluency, the initial level of students' vocabulary knowledge and word structure awareness in the third grade and the development speed between the third and sixth grades can predict their reading comprehension level in the sixth grade; (2) After controlling children's Chinese character recognition and word reading fluency, the initial level of students' oral word knowledge in the third grade can predict the development speed of their word structure awareness between the third and sixth grades, and then predict the reading comprehension level in the sixth grade; It is not found that the initial level of students' word structure awareness in the third grade has a significant predictive effect on the development speed of their vocabulary knowledge between the third and sixth grades.

人际伤害对青少年自伤的影响

——基于追踪研究的个体间和个体内分析

王晖[1]　高叶淼[2] 薛的妮[2] 刘霞[2]（通讯作者）

1 北京工业大学文法学部，北京，100124

2 北京师范大学心理学部，北京，100875，liuxia@bnu.edu.cn

摘 要　自伤是指个体在没有明确自杀意图的情况下，由自己施加的对身体组织的伤害或损坏，包括自伤的行为、倾向和意念。自伤的整合发展病理模型指出，来自人际互动中的伤害性事件是青少自伤的关键影响因素，并且随着个体步入青少年期，家人、同伴、教师等不同人际领域对自伤的作用可能不同。然而，已有研究多从单一领域考察了如同伴侵害、亲子冲突等的作用，缺乏整合不同人际伤害事件的系统考察，并不能很好地回答这一研究问题。此外，已有研究关注了个别人际伤害事件对青少年自伤的长期影响，然而由于并未剥离个体间和个体内效应，难以明确二者关系的真实效应。因此，本研究将同时纳入家人、同伴、教师多个人际领域，通过对 934 名 13~16 岁青少年进行为期近一年的三次追踪测查，采用个体内分析方法考察家人伤害、同伴伤害和教师伤害对青少年自伤行为、自伤倾向和自伤意念的纵向作用，并与传统的交叉滞后分析进行比较。结果发现，采用个体内分析方法得到的研究结果与传统交叉滞后分析方法不同。具体而言，（1）当采用传统交叉滞后分析方法，也即并未区分个体间和个体内效应时，家人和同伴伤害与青少年自伤存在双向预测关系，T1/T2 的家人、同伴伤害显著正向预测 T2/T3 自伤行为、倾向或意念，T1/T2 自伤行为、倾向或意念显著正向预测 T2/T3 的家人或同伴伤害，不过教师伤害仅能单向预测后期青少年自伤；（2）当区分个体间与个体内效应时，发现在个体内水平上，家人伤害与青少年自伤表现为循环作用关系，T1 家人伤害正向预测 T2 自伤行为/倾向/意念，并且 T2 自伤行为会进一步显著正向预测 T3 家人伤害；而同伴和教师伤害仅能单向预测青少年自伤， T1 同伴教师伤害显著正向预测 T2 自伤行为或倾向。综上所述，本研究在排除了稳定的个体间差异的基础上，揭示了不同领域人际伤害的个体内部变化与自伤内部变化的纵向作用关系，为促进青少年自伤预防和干预提供科学参考和实践依据。

The Relations Between Interpersonal Harm and NSSI among Adolescents: Within- and Between- person Analysis Based on a Follow-up Study

WANG Hui[1], GAO Yemiao[2], XUE Dini[2], LIU Xia[2]

1 Faculty of Humanities and Social Sciences, Beijing University of Technology，Beijing，100124

2 Faculty of Psychology, Beijing Normal University，Beijing，100875

Abstract：Non-suicidal Self-injury (NSSI) refers to the injury, tendencies, and intentions of self-inflicted on body tissues without clear suicidal intent. The integrated developmental pathological model of NSSI pointed out that harmful events from interpersonal interaction are the key influencing factors of adolescent NSSI. As individuals enter adolescence, different interpersonal fields such as family, peers, and teachers may have different effects on NSSI. However, previous studies have examined the role of peer victimization and parent-child conflict, lack of systematic investigation of different interpersonal injury events. Moreover, studies focused on the long-term effects of several interpersonal harm on adolescent NSSI failed to clarify the true effect of the relationship because the between- and within- person effects have not been separated. Therefore, this study used three follow-up tests of 934 adolescents aged 13~16 for nearly one year to explore the longitudinal effects of family, peer, and teacher harm on adolescents' NSSI behavior, tendency, and intention, using within-personal analysis and compared with traditional cross-lagged analysis. The results from two kinds of analysis are different. Specifically, (1) when the traditional cross-lagged analysis method was adopted, there is a bidirectional relationship between family and peer harm and adolescent NSSI. T1/T2 family and peer harm significantly positively predicted T2/T3 NSSI behavior, tendency or intention, T1/T2 NSSI behavior, tendency or intention significantly predicted T2/T3 family or peer harm, but teacher harm could only predict later adolescent NSSI; (2) Using within-person analysis, it was found that there was a reciprocal relation between family harm and adolescent NSSI, T1 family harm positively predicted T2 NSSI behavior/tendency/intention, and T2 NSSI further significantly predicted T3 family harm. However, peer and teacher harm could only predict adolescent NSSI in one direction, that is T1 peer and teacher harm significantly predicted T2 NSSI behavior or tendency. Overall, this study reveals the longitudinal relationship between interpersonal harm in different fields and NSSI at within-person level, providing a scientific reference and practical basis for promoting the prevention and intervention of adolescent NSSI.

Keywords：adolescents, interpersonal harm, NSSI, within-person analysis, cross-lagged analysis

留守/非留守初中生抑郁的发展轨迹异质性：亲子沟通和友谊质量的作用

王玉龙（通讯作者） 李荣 刘冰瑞

湖南师范大学教育科学学院，湖南师范大学认知与行为湖南省重点实验室，长沙 410081，E-mail: yulongwang107@126.com

摘　要 抑郁（depression）是一种较持续、长久的负面情绪，其发展始于童年期，爆发于青春期。青少年由于同时遭受身心发展巨变和学业竞争增大的双重压力，心理健康往往面临着严峻的挑战，而留守初中生由于父母关爱的缺乏则更容易出现心理适应问题。父母和同伴是初中生最重要的社会支持来源，为初中生应对不利处境提供了必要的心理资源，也在个体身心健康的发展以及有效社会化的过程中扮演着关键角色。为此，本研究采用纵向追踪设计，通过比较留守和非留守初中生的抑郁在初中三年期间发展趋势的异质性，并通过探讨亲子沟通和友谊质量对留守和

非留守初中生抑郁轨迹分类及不同类别的作用。本研究对湖南省八所中学的 882 名七年级学生（M_{age} = 12.23 岁，*SD*=0.51）进行三次追踪测量，间隔时间为 1 年。结果发现：(1) 初中生的总体抑郁发展呈倒 U 性发展趋势，对比留守/非留守初中发现，留守初中生抑郁发展轨迹呈现倒 U 型发展，初一到初二的增长迅速，初二到初三的下降较缓，而非留守初中生抑郁发展轨迹呈线性增长；(2)留守初中生抑郁发展轨迹类型可以分成 3 个潜类别，分别是：低抑郁－陡升组；低抑郁－稳定组；高抑郁－下降组。多元 Logistic 回归分析的结果发现，男生更可能属于“高抑郁－下降组”，父(母)子沟通和友谊质量越好的个体越可能属于“高抑郁－下降组”；(3)非留守初中生抑郁发展轨迹类型可以分成 2 个潜类别，分别是：高抑郁－下降组，低抑郁－缓升组。二元 Logistic 回归分析的结果发现，父（母）子沟通和友谊质量越好的个体越可能属于“高抑郁－下降组”。本研究通过构建潜类别增长模型来考察留守与非留守初中生抑郁的发展趋势和类别，以及亲子沟通和友谊质量的作用，其中亲子沟通和友谊质量对留守初中生抑郁发展的作用较非留守初中生大。本研究丰富了留守青少年抑郁发展的理论研究和为其干预提供了一些启示。

关键词 留守初中生，抑郁，亲子沟通，友谊质量

Developmental trajectory heterogeneity of depression in left-behind/non-left-behind junior high school students: The role of parent-child communication and friendship quality

WANG Yulong（Corresponding Author） Li Rong Liu Bingrui

School of Education, Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University, Changsha, 410081，E-mail: yulongwang107@126.com

Abstract: Depression is a more persistent, long-lasting negative emotion that begins in childhood and erupts in adolescence. Adolescents often face severe challenges to their mental health due to the dual pressure of great changes in physical and mental development and increased academic competition, while left-behind junior high school students are more likely to have psychological adjustment problems due to a lack of parental care. Parents and peers are the most important sources of social support for junior high school students, providing the necessary psychological resources for junior high school students to cope with disadvantage, and also playing a key role in the development of individual physical and mental health and effective socialization. To this end, this study adopts a longitudinal tracking design, compares the heterogeneity of depression trends of left-behind and non-left-behind junior high school students during the three years of junior high school, and explores the effects of parent-child communication and friendship quality on the classification of depression trajectories and different categories of left-behind and non-left-behind junior high school students. In this study, 882 grade 7 students (*Mage* = 12.23 years, *SD*=0.51) were followed three times in eight middle schools in Hunan Province with an interval of 1 year. The results showed that: (1) the overall depression development of junior high school students showed an inverted U development trend, and compared with the left-behind/non-left-behind junior high schools, it was found that the depression development trajectory of left-behind junior high school students showed an inverted U-shaped development, with rapid growth from the first to the second year of junior high school, and a slower decline from the second to the third year of junior high school, while the development trajectory of depression among non-left-behind junior high school students showed a linear increase. (2) The development trajectory of depression among left-behind junior high school students can be divided into three latent categories, namely: low depression-steep rise group; Low depression stable group; High depression-falling group. The results of multivariate logistic regression analysis found that boys were more likely to belong to the "high depression-decline group", and individuals with better communication and friendship quality between parents and children were more likely to belong to the "high depression-falling group"; (3) The development trajectory of depression in non-left-behind junior high school students can be divided into two latent categories, namely: high depression-decline group and low depression-slow rise group. The results of binary logistic regression analysis found that individuals with

better quality parent-child communication and friendship were more likely to belong to the "high depression-falling group". In this study, the development trend and categories of depression in left-behind and non-left-behind junior high school students, as well as the role of parent-child communication and friendship quality, were examined by constructing a latent category growth model, among which the role of personal communication and friendship quality on the depression development of left-behind junior high school students was greater than that of non-left-behind junior high school students. This study enriches the theoretical research on the development of depression in left-behind adolescents and provides some enlightenment for its intervention.
Keywords: left-behind junior high school students, depression, parent-child communication, friendship quality

亲子分离与青少年抑郁的发展轨迹：亲子沟通与性别的作用

赵景欣（通讯作者） 上官梦麒
山东师范大学心理学院，济南，250014，jingxinzhao@126.com

摘 要 在中国，约有25%的儿童青少年因父母外出务工而经历亲子分离。长期的亲子分离会极大地增加青少年出现抑郁症状的风险。揭示亲子分离对青少年抑郁发展的影响，并考察其中可能存在的保护因素已经成为亟待解决的重要科学问题。虽然父母外出务工会让青少年在空间上与父母分离，但是良好的亲子沟通不仅能够维系亲子之间的情感联结，还能让青少年获得必要的心理资源以应对亲子分离处境下的各种挑战。研究表明，良好的亲子沟通能够缓解亲子分离青少年的情绪适应问题。然而，已有研究以横断设计为主，主要关注亲子沟通与留守青少年抑郁水平的关系，难以探明亲子分离、亲子沟通对青少年抑郁发展轨迹的影响；并且，亲子沟通如何作用于亲子分离与青少年抑郁发展轨迹之间的关系也不清楚。

基于追踪研究设计，本研究对2726名初中生（696名与双亲分离青少年、685名父子分离青少年、1345名非亲子分离青少年）进行了间隔6个月的5次追踪测查，系统考察亲子分离、亲子沟通对抑郁发展轨迹的影响及其性别差异。结果发现：（1）青少年抑郁的发展轨迹呈非线性，具体来说，青少年抑郁在T1到T3呈上升趋势，T4下降，T5又略有上升；（2）亲子分离正向预测青少年抑郁发展的线性斜率，负向预测青少年抑郁发展的二次斜率；（3）父子沟通负向预测青少年抑郁的初始水平，正向预测青少年抑郁发展的线性斜率；母子沟通负向预测青少年抑郁的初始水平；（4）亲子分离与青少年抑郁的初始水平、发展的线性斜率和二次斜率之间的关系会因亲子沟通和性别的不同而有所差异。这表明，良好的亲子沟通能够缓解亲子分离对青少年抑郁发展轨迹的影响，且该作用存在性别差异。

关键词 亲子分离，抑郁，亲子沟通，性别

Parent-Child Separation and Developmental Trajectory of Depressive Symptoms in Adolescents: The Roles of Parent-Child Communication and Gender

Jingxin Zhao (corresponding author), Mengqi Shangguan
School of Psychology, Shandong Normal University, Jinan 250014, China

***Abstract*:** In China, about a quarter of children and adolescents have experienced parent-child separation due to their one or both parents' migration in search of better employment opportunities. Adolescents who experience parent-child separation are at increased risk for depressive symptoms. In this situation, it is critical to explore the effects of parent-child separation

on the developmental trajectory of depressive symptoms in adolescents, and to examine the possible protective factors in their relationships. Although parents' migration will make them separated from their children in space, good parent-child communication could not only maintain the emotional connection between parents and children, but also enable adolescents to obtain the necessary psychological resources to cope with various challenges in the context of parent-child separation. Studies have shown that good parent-child communication could alleviate the emotional problems in adolescents experiencing parent-child separation. However, existing studies mainly focused on cross-sectional design, and it is still unclear how parent-child separation and parent-child communication affect the developmental trajectory of depressive symptoms in adolescents, and how parent-child communication affects the relationship between parent-child separation and development trajectory of depressive symptoms in adolescents.

Based on longitudinal design, 2726 junior high school students (696 adolescents separated from their both parent, 685 adolescents separated from their father, and 1345 adolescents without parent-child separation) were measured five times at intervals of 6 months. The purpose is to investigate the effects of parent-child separation, parent-child communication and their interactions on the developmental trajectory of depressive symptoms in adolescents, as well as gender differences in these relationships. The results showed that: (1) The development trajectory of adolescents' depressive symptoms showed a non-linear trend. Specifically, depressive symptoms increased from T1 to T3, decreased in T4, and slightly increased in T5. (2) Parent-child separation positively predicted the linear slope of adolescents' depressive symptoms development, and negatively predicted the quadratic slope of adolescents' depressive symptoms development. (3) Both mother-child communication and father-child communication negatively predicted the initial level of adolescents' depressive symptoms development, and father-child communication positively predicted the linear slope of adolescents' depressive symptoms development. (4) The relationships between parent-child separation and the initial level, the linear slope and the quadratic slope of depressive symptoms development in adolescents varied by parent-child communication and gender. These results indicate that good parent-child communication could buffer the effects of parent-child separation on the developmental trajectory of depressive symptoms in adolescents, and there are gender differences in these effects.

Keywords：parent-child separation, depressive symptoms, parent-child communication, gender

留守青少年孤独感的发展轨迹：

友谊质量与副交感神经系统活动的作用

赵景欣（通讯作者） 敖成明 王蕾 徐国翔

山东师范大学心理学院，济南，250014，jingxinzhao@126.com

摘 要 孤独感是留守青少年普遍存在的情绪体验。探讨能够缓解留守青少年孤独感发展的保护因素已经成为该领域研究中的一个重要问题。然而，已有研究主要采用横断设计考察留守青少年孤独感水平的差异，对于留守青少年孤独感的发展轨迹尚不清楚。并且，以往研究主要考察环境因素对于留守青少年孤独感的作用，相对忽视了个体神经生物因素及其与环境因素的交互作用。鉴于此，本研究将在探讨青少年孤独感异质性发展轨迹的基础上，考察友谊质量、副交感神经系统活动(以呼吸性窦性心律不齐为测量指标, RSA)对孤独感发展轨迹的作用及其群体类别差异。

采用追踪设计，本研究对 482 名青少年(162 名双亲外出青少年、164 名父亲外出青少年、156 名非留守青少年)进行了间隔 6 个月的四次追踪测查。结果表明：(1)青少年的孤独感存在三条发展轨迹：低-下降组(46.1%)、中等-上升组(37.5%)、恒高组(16.4%)；与非留守青少年相比，父亲外出青少年更有可能进入恒高组而非中等-上升组。(2)朋友信任与支持、陪伴与娱乐、肯定价值、亲密袒露与交流水平较高的青少年更有可能进入低-下降组和中等-上升组而非恒高组；朋友冲突与背叛水平较高的青少年更有可能进入中等-上升组和恒高组而非低-下降组；与非留守青少年相比，朋友陪伴与娱乐水平较高的父亲外出青少年更有可能进入低-下降组而非中等-上升组。(3)RSA 反应性能够调节友谊质量与青少年孤独感异质性发展轨迹之间的关系，且该调节作用存在群体类别差异：对于 RSA 反应性较高的双亲外出青少年和 RSA 反应性较低的非留守青少年，朋友较高水平的肯定价值、亲密袒露与交流会使其更有可能进入为低-下降组而非中等-上升组，朋友较高水平的冲突与背叛会使其更有可能进入恒高组而非低-下降组。这表明，青少年孤独感的发展轨迹存在个体差异，友谊质量、副交感神经系统活动及其交互项能够影响该发展轨迹且该影响会因群体类别的不同而有所差异。

关键词 留守青少年，孤独感，友谊质量，副交感神经系统活动

Developmental Trajectories of Left-Behind Adolescents' Loneliness: The Roles of Friendship Quality and Parasympathetic Nervous System Activity

Jingxin Zhao Chengming Ao Lei Wang Guoxiang Xu

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract：Loneliness is a common emotional experience among left-behind adolescents. It has become an important issue to explore the protective factors that could buffer the development of left-behind adolescents' loneliness. However, existing studies have mainly focused on the differences of the levels of left-behind adolescents' loneliness by cross-sectional design, and far less is known about the developmental trajectories of left-behind adolescents' loneliness. Meanwhile, previous studies primarily examined the effects of environmental factors on left-behind adolescents' loneliness, relatively ignoring the roles of individual neurobiological factors and the interactions between neurobiological and environmental factors. To address these research gaps, the present study investigated the heterogeneous developmental trajectories of adolescents' loneliness, and examined the roles of friendship quality and parasympathetic nervous system activity (measured by respiratory sinus arrhythmia, RSA) on the heterogeneous developmental trajectories of loneliness. In addition, the potential differences of group category in the above associations were also tested.

A total of 482 adolescents were measured four times at an interval of 6 months, including 162 adolescents from both-parent migrant families, 164 adolescents from father-only migrant families, and 156 adolescents from nonparent

migrant families. The results showed that: (1) The trajectories of adolescents' loneliness could be divided into three sub-groups: "low-decreasing" (46.1%), "moderate-increasing" (37.5%), and "sustained-high" (16.4%). Compared to adolescents from nonparent migrant families, those from father-only migrant families were more likely to be classified into sustained-high group rather than moderate-increasing group. (2) Adolescents with higher levels of trust and support, companionship and recreation, validation, and intimate exchange were more likely to be classified into low-decreasing and moderate-increasing group rather than sustained-high group. Adolescents with higher levels of conflict and betrayal were more likely to be classified into moderate-increasing and sustained-high group rather than low-decreasing group. Compared to adolescents from nonparent migrant families, those from father-only migrant families with higher levels of companionship and recreation were more likely to be classified into low-decreasing group rather than moderate-increasing group. (3) RSA reactivity moderated the association between friendship quality and the heterogeneous developmental trajectories of adolescents' loneliness, and the moderating effect differed by group category: for adolescents with higher RSA reactivity from both-parent migrant families and those with lower RSA reactivity from nonparent migrant families, higher levels of validation and intimate exchange would make them more likely to be classified into low-decreasing group rather than moderate-increasing group. Similarly, higher levels of conflict and betrayal would make them more likely to be classified into sustained-high group rather than moderate-increasing group. These indicated that there were individual differences in the developmental trajectories of left-behind adolescents' loneliness. Friendship quality, parasympathetic nervous system activity, and their interactions were important factors affecting the developmental trajectories of left-behind adolescents' loneliness, and these effects varied with group category.

Keywords：left-behind adolescents, loneliness, friendship quality, parasympathetic nervous system activity

强化敏感性对青少年重复性自伤的影响：抑制控制的作用

刘金梦[1]　刘霞[2]（通讯作者）

1 北京师范大学发展心理研究院，北京，100875

2 北京师范大学发展心理研究院，北京，100875，liuxia@bnu.edu.cn

摘 要　重复性自伤行为（Repetitive non-suicidal self-injury, R- NSSI, 以下简称重复性自伤）是指在没有自杀倾向的情况下，直接地、重复性地导致身体轻微或中度伤害的行为，是青少年适应不良的典型表现，也是预测后续严重心理健康问题的重要风险因素。基于神经发育的自伤模型指出，强化敏感性异常是青少年重复性自伤行为发生的重要风险因素之一，而以往研究多关注重复性自伤青少年奖励敏感性特征，忽略了惩罚敏感性在重复性自伤青少年中的具体表现。另外，已有研究指出重复性自伤青少年普遍表现出较低的抑制控制，控制因素是否在重复性自伤青少年的奖惩加工过程中发挥作用，以及如何影响其奖惩加工进程，还尚不明确，需要进一步探讨和关注。

本研究共包含三个实验，其中实验一采用改编的金钱奖惩敏感性任务，检验对照组和重复自伤组在金钱奖励和惩罚任务中的差异，结果表明，重复性自伤组青少年在奖励和惩罚刺激条件下均表现出较高的敏感性。实验二与实验三纳入抑制控制因素，将奖惩敏感性范式与双选 Oddball 范式相结合，进一步考察奖惩敏感性与抑制控制相互作用对青少年重复性自伤行为的影响。结果发现：（1）奖励背景下，不论是高奖励还是低奖励，重复性自伤青少年表现出与对照组相当的抑制控制能力；（2）惩罚背景下，与对照组相比，重复性自伤组表现出更弱的抑制高惩罚线索的能力。研究结果提示，重复性自伤青少年的强化敏感性异常；个体可以有效控制奖励线索，但在抑制惩罚线索时存在一定偏差，惩罚敏感性与抑制控制相互作用的不平衡可能是影响青少年重复性自伤行为产生的重要机制。

关键词 重复性自伤行为，强化敏感性，抑制控制，青少年

The effect of reinforcement sensitivity in repetitive non-suicidal self-injury adolescence: The role of inhibitory control

Liu Jinmeng　Liu Xia
Institute of Developmental Psychology, Beijing Normal University, Beijing, China

Abstract：Repetitive non-suicidal self-injury (R-NSSI) refers to the direct and repetitive destruction of body tissue and leads to minor or moderate physical harm in the absence of any observable intent to die. It is a typical manifestation of adolescent maladaptation and an important risk factor for predicting subsequent serious mental health problems. Developmental neuroscience model of NSSI pointed that abnormal reinforcement sensitivity is one of the important risk factors for R-NSSI in adolescence. However, previous studies have mostly focused on the reward sensitivity of adolescents with NSSI, ignoring the features of punishment sensitivity. In addition, existing studies have found that adolescents with NSSI generally show lower inhibitory control. Whether in the process of reward and punishment processing, adolescents will further interact with inhibitory control, resulting in R-NSSI still unclear, and needs further discussion and attention.

This study consists of three experiments. Experiment 1 used an adapted monetary reward and punishment sensitivity tasks to explore the difference between control group and R-NSSI group. The results showed that R-NSSI group showed high sensitivity under both reward and punishment stimuli. Experiment 2 and 3 included inhibitory control, combined the reward and punishment sensitivity paradigm with the two choice Oddball paradigm, and further investigated the impact of the interaction between reward and punishment sensitivity and inhibitory control on adolescent with R-NSSI. The results showed that: (1) In the context of reward, there was no significant difference in the response between R-NSSI group and control group in either the standard stimulus or the deviation stimulus; (2) In the context of punishment, compared to the control group, R-NSSI group showed weaker ability to suppress high punishment cues. The results suggest that adolescents with R-NSSI exhibit abnormal reinforcement sensitivity; Individuals with R-NSSI can effectively control reward cues, but there is a certain deviation in inhibiting punishment cues. The imbalance between punishment sensitivity and inhibitory control may be an important mechanism that affecting the occurrence of R-NSSI.

留守初中生成就动机与学习投入的关系：时间管理倾向与自我控制的链式中介作用

冯新敏[1]　朱盈盈[1]　赵俊峰[1,2]（通讯作者）
1 河南大学心理学院，开封，475004
2 河南大学心理与行为研究所，开封，475004，jfzhao63@hotmail.com

摘 要　由于父母外出务工，中国出现了大量的留守儿童。留守儿童缺少父母的监管与陪伴，尽管其自我意识不断增强，但仍缺乏自律能力，学习专注力和坚持力较弱，容易受到外界环境中不利因素的干扰。此外，初中阶段是学生学业发展的重要时期，也是价值观和学习习惯形成的关键期，衡量学生学业成就的核心要素就是其学习投入。以往研究均表明，学生的成就动机是预测其学习投入水平的重要因子，但成就动机如何促进学生的学习投入行为还需要进一步探讨。因此，本研究对河南省四所中学的 1460 名初中生的成就动机和学业投入进行调查，考察留守初中生成就动机和学习投入的现状及其作用机制。结果发现：（1）城市留守初中生和农村留守初中生的学习投入水平存在显著差异（$t=-11.14$，$p<0.01$）；（2）留守初中生的成就动机、时间管理倾向、自我控制、学习投入两两之间存在显著相关；（3）时间管理倾向和自我控制在留守初中生追求成功与学习投入之间起到链式中介作用。（4）时间管理倾向和自我控制在留守初中生避免失败与学习投入之间起到完全中介作用。综上所述，本研究揭示了留守初中生的学习投入水平在居住地上的差异，且留守初中生追求成功、避免失败通过影响时间管理倾向和自我控制进而影响学习投入。

The Relationship between Achievement Motivation and Learning Engagement of Left-Behind Junior Students: a chain mediation of Time Management Disposition and Self-Control

FENG Xinmin[1] ZHU Yingying[1] ZHAO Junfeng[1, 2]
1 School of Psychology, Henan University, Kaifeng 475004
2 Institute of Behavior and Psychology, Henan University, Kaifeng 475004

Abstract： A large number of left-behind children have appeared in China as a result of their parents going out to work. Left-behind children lack supervision and companionship from their parents, and despite their self-awareness is growing, they still lack self-discipline, their learning concentration and persistence are weak, and they are easily disturbed by adverse factors in the external environment. In addition, junior high school is an important period for students' learning development, and it is also a critical period for the formation of values and learning habits. The core element to measure students' learning achievement is their learning engagement. Previous studies have shown that students' achievement motivation is an important factor to predict their learning engagement level, but how achievement motivation promotes students' learning engagement behavior needs further discussion. Therefore, this study investigated the achievement motivation and learning engagement of 1460 middle school students from four middle schools in Henan Province, and investigated the status quo and mechanism of achievement motivation and learning engagement of left-behind junior students. The results showed that: (1) there were significant differences in the level of learning engagement between urban and rural left-behind middle school students (t = — 11.14, p < 0.01); (2) There is a significant correlation between achievement motivation, time management disposition, self-control and learning engagement of left-behind junior students; (3) Time management disposition and self-control play a chain mediating role between left-behind junior middle school students' hope of success and learning engagement. (4) Time management tendency and self-control play a totally mediating role between left-behind junior students' fear of failure and learning engagement. To sum up, this study reveals the differences in the level of learning engagement of left-behind junior middle school students in residential areas, and left-behind junior students' hope of success and fear of failure affect their learning engagement through influencing their time management disposition and self-control.

专家-新手教师理解学生课堂动作意图的认知神经差异

林怡杉[1] 李蕊[1] 孙炳海[1]（通讯作者）
1 浙江师范大学心理学院，浙江金华，3210041，jky18@zjnu.cn

摘 要 在教学情境中观察学生的行为并理解其背后的意图是教学专长的重要体现，不同发展阶段的教师在处理课堂教学情境信息时存在明显的认知加工差异。先前研究探讨了先验知识对教师识别学生课堂动作的影响。然而，以前的研究更多关注执行动作的方式，而较少关注执行动作背后的原因。为了研究不同知识经验的教师在理解学生课堂动作意图时的行为和认知神经差异，我们招募了专家教师和新手教师，将 “如何/为什么”文字提示与行动图片联

系起来，让教师推断学生的课堂动作意图，并利用 ERP(Event-related potentials）技术探讨了这一过程的神经机制。行为结果显示，在实验结束后，两类教师对学生课堂行为的理解程度均高于实验前；专家教师的理解程度显著高于新手教师；规范动作的可理解性高于非规范动作。ERP 结果表明，新手教师在理解学生课堂动作意图时诱发的 N250 波幅显著大于专家教师，而专家教师的晚期 P300 波幅显著大于新手教师。此外，对于两类教师来说，在理解学生规范动作时的 N250 波幅更为显著，而 P300 和 LPC 波幅对于非规范动作更为显著。当前结果表明，专家教师和新手教师在对学生课堂动作的判断和感知上存在差异，专家教师具有更好的意图理解能力和洞察力。本研究为不同专业发展阶段的教师理解学生动作意图的动态加工过程提供了神经电生理学的初步证据。

Expert and Novice Teachers' Cognitive Neural Differences in Understanding Students' Classroom Action Intentions: A ERP study

Yishan Lin[1], Rui Li[1], Binghai Sun[1]
1 College of Psychology, Zhejiang Normal University, Jinhua, 321004, Zhejiang, China

***Abstract*：** Observing students' behavior in instructional contexts and understanding the intentions behind them is an important demonstration of teaching expertise, and there are significant cognitive processing differences between teachers at different developmental stages in processing information about classroom instructional contexts. Prior research has explored the effects of prior knowledge on teachers' recognition of students' classroom actions. However, previous research has focused more on the manner in which actions are executed and less on the reasons behind the execution of the actions. In order to investigate the behavioral and cognitive neural differences of teachers with different knowledge and experience in understanding students' classroom action intentions, we recruited expert and novice teachers and linked the "how/why" text prompts with action pictures, so that teachers were asked to infer students' classroom action intentions, and used ERP technology to explore the neural mechanisms of this process. Behavioral results showed that at the end of the experiment, both types of teachers understood students' classroom actions better than they did before the experiment; expert teachers' understanding was significantly higher than novice teachers'; and normative actions were more comprehensible than non-normative actions. The results of the ERP showed that novice teachers induced significantly greater N250 amplitudes than did expert teachers when they understood the intentions of students' classroom actions, and that expert teachers had significantly greater P300 amplitudes in the late period than did novice teachers. In addition, for both types of teachers, N250 amplitudes were more significant in understanding students' normative actions, while P300 and LPC amplitudes were more significant for non-normative actions. The current results suggest that expert and novice teachers differ in their judgments and perceptions of students' classroom actions, with expert teachers having better intention understanding ability and insight. This study provides preliminary electroneurophysiology evidence of the dynamic processing process for teachers at different stages of professional development to understand students' action intention.

1 浙江师范大学心理学院，浙江金华，321004，jky18@zjnu.cn
2 荷语鲁汶大学心理与教育学院，比利时弗兰德斯鲁汶，3000

摘 要　在过去的 40 年中，基于基础教育背景下的教学专长研究已成为备受关注的领域。教学专长指教师有效促进学习、推动学生获取知识和技能的能力。自 20 世纪 70 年代初以来，关于教师教学专长的研究主要采用了专家-新手的比较范式。尽管存在大量关于专家与新手差异的研究报告，但据我们所知，在基础教育背景下尚未发表过针对该主题的系统综述文献。

本研究通过进行四个独立的元分析，探讨了专家与新手比较范式对基础教育背景下教学专长的差异。经过文献搜索和筛选，最终纳入了 45 篇符合标准的文章进行后续分析。元分析结果显示，整体上，专家教师在教学专长方面优于新手教师（k = 131，g = 0.53）。进一步的分析结果表明，专家教师在与技能相关的教学专长（k = 79，g = 0.58）和判断相关的教学专长（k = 20，g = 0.80）方面表现出更高水平。然而，在知识相关的教学专长方面（k = 32，g = 0.26），本研究未发现专家和新手教师之间存在显著差异。我们从不同的理论角度讨论了这些发现。总的来说，专家教师在技能（例如, 反馈）与判断等方面的专长优于新手教师。

本研究首次对过去几十年来专家与新手教师比较范式的研究结果进行了详细描述。该研究提供了全面的总结，对全球基础教育和教育研究领域的教师、教育师资和其他专业人员具有重要意义。

What differences are revealed? A systematic literature review of expert-novice comparison paradigm on teaching expertise

Changkang Sun[1], Weilong Xiao[2,1], Binghai Sun[1]

1. College of Psychology, Zhejiang Normal University, Jinhua, Zhejiang, China
2. Faculty of Psychology and Education, Katholieke Universiteit Leuven, Flanders, Belgium

Abstract：Teaching expertise in the K12 context has become a popular of educational research over the last 40 years. Teaching expertise refers to the ability of a teacher to effectively facilitate learning and promote the acquisition of knowledge and skills in students. Since the early 1970s, investigations into the nature of teaching expertise have predominantly assumed the form of expert-novice comparisons. Despite the existence of numerous of such research reports of expert-novice differences, there are, to our knowledge, no published systematic reviews of this ever-expanding literature for primary and secondary contexts.

The study described in this paper provides conducted four separate meta-analyses to address what differences are revealed based on the expert-novice comparison paradigm on teaching expertise in primary and secondary contexts from a wide range of educational systems around the world. We found 45 articles met the inclusion criteria. The results of the meta-analysis indicated that expert teachers have better teaching expertise than novice teachers (k = 131, g = 0. 53). Moreover, expert teachers also have superior performance than the novice teachers in the skill-related (k = 79, g = 0. 58) and judgement related (k = 20, g = 0. 80) teaching expertise. However, we did not find the difference in knowledge (k = 32, g = 0. 26) related teaching expertise.

This study offers the first detailed description of the expert–novice teacher comparison paradigm findings for the past decades. We believe this work provides a comprehensive and unbiased summary of the comparison between expert teachers and novice teachers, which will be of use to teachers, teacher educators, and other professionals working in basic education and educational research around the world.
Keywords：teaching expertise, expert-novice comparison, meta-analyse

课堂教学中知识重构的认知神经机制

冯小丹[1] 徐昕然[1] 孟兆楠[1] 周思远[2] 龙宇航[3] 郑丽芬[4] 卢春明[1]（通讯作者）

1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875，luchunming@bnu.edu.cn

4 中国民航管理干部学院航空运输经济与管理系，北京，100102

摘要 以往研究对个体或小组学习的认知神经机制进行了广泛的探讨。然而，囿于实验室情境或单脑活动的研究结果还不足以解释课堂教学的认知神经机制，尤其是学生的大脑如何对授课知识进行编码和建构仍不明晰。为了解决这个问题，本研究招募 21 名被试，在真实课堂中开展教学和知识回忆，结合近红外超扫描技术同步测量师生的脑活动。首先，使用隐含狄利克雷分布模型（LDA）对知识点进行向量化表征，并将知识点的语义表征转化为知识网络，结果发现影响学生记忆表现的是知识结构而非知识内容，即知识的中心度越高，学生的记忆表现越好。其次，运用表征相似性方法对实验 1 的教学阶段以及教学后的回忆阶段的脑活动进行分析。结果表明，角回(AG)的神经表征与教学阶段的知识结构表征显著相关，而额中回(MFC)的神经表征则与回忆阶段的知识结构表征呈现显著正相关，可能表明在回忆过程中，学生通过主观建构对知识进行深度加工。最后，为了检验知识重构是否只发生在教学之后，我们在实验 2 先进行知识回忆而后开展教学。表征相似性分析结果发现，回忆阶段并未在任何脑区出现显著的神经表征，而在回忆后的教学阶段发现知识结构与 MFC 的神经表征显著相关。以上结果表明，在课堂教学中，对概念知识的共享表征与知识的内在结构有关，并受到学习方式的调节。教学与浅层语义的共享表征有关，而回忆则与基于个体先验知识的主观建构所获得的深层语义有关。

***Abstract*:** Previously extensive studies have been conducted on the cognitive and neural mechanism of individual or group learning. However, the neurocognitive mechanism of classroom teaching is largely unknown. To address this issue, an integrated functional near-infrared spectroscopy hyperscanning system with 21 nodes was employed to measure changes of hemoglobin concentrations as well as behavioral data such as the videos, audio and memory tests from 21 students while a teaching or a recalling occurred during classroom teaching (i.e., either lecturing or discussing). By vectoring the knowledge segments using the Latent Dirichlet Allocation (LDA) model and transforming semantic representations into networks of knowledge, we found the knowledge structure, rather than the knowledge content itself, positively predicted the subsequent recall probability; that was, the stronger the semantic connections a knowledge has with other knowledges, it is better to be remembered. Next, to understand neural representations, a representational similarity analysis was conducted between fNIRS signals and knowledge structure in experiment 1. The results indicated that, while shared neural representation was found in the angular gyrus (AG) during teaching phase. And the neural responses in the middle frontal cortex (MFC) was closely associated with the representation of knowledge structure during the recalling phase immediately following teaching phase, suggesting a deep processing of knowledge through subjective construction during recalling. Additionally, test whether knowledge reconstruction occurred only after teaching, RSA was applied to the data in the recalling phase of experiment 2. However, the results did not show any significant results in neural alignment. During the teaching phase that immediately followed the recalling phase, we found that knowledge structure was significantly associated with the activity of the MFC. Together, these results suggested that during the classroom teaching, the shared cognitive representation of conceptual knowledge was associated with the intrinsic structure of the knowledge and modulated by group learning styles. While teaching was associated with the shared representation of shallow semantics, recalling was associated with the deep semantics accessed through subjective construction probably based on individual's prior knowledge.

专家型数学教师课堂视觉注意轨迹的眼动研究

丁福军[1]，肖威龙[1]，朱锋[1]，孙炳海[1]（通讯作者）
1 浙江师范大学心理学院，浙江金华，321004，jky18@zjnu.cn

摘 要 视觉注意作为课堂最典型的非言语行为，不仅反映教师的教学意图，同时也是教师教学机智的具体表现之一。课堂视觉注意力的提升是新手向专家型教师转变的重要成长环节。由此，解码专家型教师课堂视觉注意特征，是理解专家型教师核心特征与促进专家型教师培养的重要切入口。新兴眼动追踪技术可以实时记录教师课堂教学过程中的眼动轨迹，使得在真实课堂情境下打开专家型教师视觉注意过程的黑箱成为可能。本研究以专家型数学教师为研究对象，利用眼动追踪技术从视觉注意分布和视觉注意转移两个方面揭示专家型数学教师课堂视觉注意轨迹。研究发现，专家型数学教师视觉注意分布主要聚焦于学生，且以中间位置学生为视觉中心点来回扫视左右两边学生；对

于学业成就水平低的学生提供了更多的视觉注意，且频繁将视觉注意由学生转移到学习材料；在课堂引入阶段重视将视觉注意分配给学生和学习材料，同时频繁将视觉注意由教学材料转移到黑板；在课堂讲解阶段增加了对黑板的视觉注意，且频繁将视觉注意由黑板转移到学生。

Eye-tracking Study on Classroom Visual Attention Trajectories of Expert Mathematics Teachers

Fujun Ding1, Weilong Xiao1, Feng Zhu1, Binghai Sun1 (Corresponding author)
1 School of Psychology, Zhejiang Normal University, Jinhua, Zhejiang 321004, jky18@zjnu.cn

Abstract: Visual attention, as the most typical nonverbal behavior in the classroom, not only reflects the teacher's instructional intentions but also represents one of the specific manifestations of a teacher's teaching expertise. Enhancing classroom visual attention is an important developmental milestone for novice teachers to become expert teachers. Therefore, decoding the characteristics of expert teachers' classroom visual attention serves as an important entry point for understanding the core features of expert teachers and promoting their cultivation. The emerging eye-tracking technology allows real-time recording of teachers' eye movement trajectories during classroom instruction, making it possible to open the "black box" of expert teachers' visual attention processes in authentic classroom contexts. This study focused on expert mathematics teachers and used eye-tracking technology to reveal their classroom visual attention trajectories from two aspects: visual attention distribution and visual attention shifts. The study found that expert mathematics teachers primarily focused their visual attention on students, with the central students serving as the visual center point, scanning left and right repeatedly. They provided more visual attention to students with lower academic achievement, and frequently shifted visual attention from students to learning materials. During the introduction phase of the class, they prioritized distributing visual attention to students and learning materials, while frequently shifting visual attention from teaching materials to the blackboard. During the explanation phase of the class, they increased visual attention on the blackboard and frequently shifted visual attention from the blackboard to students.
Keywords: Expert mathematics teachers, visual attention, attention distribution, attention shifts, eye-tracking.

成长型思维与大脑结构和功能发育的关系研究

家晓余 [1] 陈群林 [2] 郝磊 [1]
1 西南大学教师教育学院，重庆，400715
2 西南大学心理学部，重庆，400715

摘 要 大脑可塑性是成长型思维干预的核心要点，大脑的可塑性是指大脑在经历学习、经验和环境刺激后产生结构和功能上的变化能力。成长型思维干预旨在培养个体积极、灵活和发展的思维方式，从而促进他们在面对挑战时的成长和成功。然而，目前对于成长型思维干预所依赖的神经基础还不够明确。为了深入揭示成长型思维与大脑结构、功能发育之间的关系，本研究使用了功能磁共振成像（FMRI）技术，并选择了 53 名小学生作为研究对象（其中男生 33 名，平均年龄为 8.42 岁）。每位学生接受了两次磁共振扫描，两次扫描之间的平均时间间隔为 1.8 年，以此收集了关于大脑结构和静息态功能方面的数据。研究结果表明，成长型思维得分与背侧前扣带回（dACC）的灰质体积变化呈正相关。这意味着那些具有成长型思维的个体，在大脑发育阶段，其 dACC 的灰质体积增长更快。此外，以

dACC 作为种子点，计算了两次静息态数据的全脑功能连接，并进行了比较。结果发现，与腹内侧前额叶（包括内侧眶额叶）和外侧前额叶之间的功能连接得到增强，且连接变化率与成长型思维得分呈正相关，而 dACC 与后扣带回之间的功能连接减弱。本研究首次揭示了成长型思维与儿童大脑结构和功能发育之间的关系，这为成长型思维干预的神经可塑性提供了一定的证据。

The Relationship Between Growth Mindset and Brain Structure and Functional Development

Xiaoyu Jia[1], Qunlin Chen[2], Lei Hao[1]
1 School of Teacher Education, Southwest University, Chongqing, 400715
2 Department of Psychology, Southwest University, Chongqing, 400715

Abstract: Brain plasticity is the core concept of growth mindset intervention. It refers to the brain's ability to undergo structural and functional changes after learning, experience, and environmental stimuli. The goal of growth mindset intervention is to cultivate individuals' positive, flexible, and developmental ways of thinking, thereby promoting their growth and success in the face of challenges. However, the neural basis on which growth mindset intervention relies is not yet clear.To delve into the relationship between growth mindset and the structural and functional development of the brain, this study employed functional magnetic resonance imaging (fMRI) technology and selected 53 primary school students as participants (including 33 boys, with an average age of 8.42 years). Each student underwent two MRI scans, with an average time interval of 1.8 years, to collect data on brain structure and resting-state function.The research findings indicate that there is a positive correlation between growth mindset scores and gray matter volume changes in the dorsal anterior cingulate cortex (dACC). This suggests that individuals with a growth mindset experience faster increases in gray matter volume in the dACC during brain development. Additionally, using the dACC as a seed region, the researchers calculated whole-brain functional connectivity based on the resting-state data collected from the two scans and compared them. The results revealed enhanced functional connectivity between the dACC and the ventromedial prefrontal cortex (including the medial orbitofrontal cortex) and the lateral prefrontal cortex. Furthermore, the rate of connectivity changes was positively correlated with growth mindset scores. On the other hand, the functional connectivity between the dACC and the posterior cingulate cortex was found to be weakened.This study provides evidence for the neural plasticity of growth mindset interventions by revealing the relationship between growth mindset and the structural and functional development of the brain in children. Further research is needed to explore the roles of other brain regions and validate the stability and generalizability of these findings.
Keywords: Growth mindset, neuroplasticity, gray matter volume, functional connectivity, anterior cingulate cortex.

场景序列性对专家-新手教师动作意图理解的影响：一项 ERP 研究

林怡杉[1] 张秦涵[1] 孙炳海[1]（通讯作者）
1 浙江师范大学心理学院，浙江金华，321004，jky18@zjnu.cn

摘 要 教师的意图理解能力体现出教师教学的监控能力，是有效课堂教学活动的基础。以往研究使用眼动技术，发现专家和新手教师对不同教学场景下学生动作意图的注视次数时间以及判断正确率等有所不同，但其脑机制差异尚不可知。本研究采用两项实验，利用事件相关电位（Event-Related Potentials）技术，探讨场景信息对专家-新手教师理解学生课堂动作意图的行为及其认知神经差异。实验一和实验二考察场景信息（教学场景与非教学场景）与学生动作（课堂动作与非课堂动作）分别作为启动和目标刺激时，专家与新手教师对二者一致性的判断与加工。行为结果显示，相较于新手教师，专家教师在判断学生动作与场景信息一致性时反应时更快，正确率更高；相比于场景信息作为启动刺激，当学生动作作为启动刺激时，教师判断二者一致性的反应时更快，正确率更高。ERP 结果显示，相较于新手教师，专家教师在学生动作与场景信息不一致条件下，大脑的后部顶枕区诱发的 N400 更为显著；相较于学生动作作为启动刺激，当场景信息作为启动刺激时，教师在不一致条件下产生 N400 的更为显著。本研究发现

场景信息对不同职业发展阶段教师意图理解能力的影响，新手教师需要加深对学生在教学场景中所产生动作意图的理解，以加强课堂上的教学监控能力。

The Effect of Scenario Information on Expert-Novice Teachers' Understanding of Students' Classroom Action Intentions

Yishan Lin[1], Qinhan Zhang [1], Binghai Sun[1] (corresponding author)
College of Psychology, Zhejiang Normal University, Jinhua, Zhejiang, 321004, jky18@zjnu.cn

Abstract：Teachers' ability to comprehend intentions reflects their ability to monitor their teaching and is the basis for effective classroom activities. Previous studies using eye-movement techniques have found that expert and novice teachers differ in the number and duration of gaze and the rate of correct judgment of students' movement intentions in different teaching scenarios, but the differences in brain mechanisms are unknown. The present study used two experiments to examine the behavioral and cognitive-neural differences of scene information on expert-novice teachers' understanding of students' movement intentions in the classroom and their cognition using Event-Related Potentials (ERPs) technology. Experiments 1 and 2 examined expert and novice teachers' judgments and processing of the congruence between scene information (instructional vs. non-instructional scenes) and student actions (classroom vs. non-classroom actions) when they were used as initiating and target stimuli, respectively. Behavioral results showed that expert teachers reacted faster and were more correct when judging the consistency of student actions and scene information compared to novice teachers, and that teachers reacted faster and were more correct when judging the consistency of the two when student actions were used as the initiating stimulus compared to scene information as the initiating stimulus. The ERP results showed that expert teachers evoked more significant N400s in the posterior parieto-occipital region of the brain under the condition of incongruence between student actions and scene information compared to novice teachers, and that teachers produced more significant N400s under the condition of incongruence when scene information was used as a priming stimulus compared to when student actions were used as a priming stimulus. The present study found the effects of scene information on teachers' intention comprehension at different stages of professional development, and that novice teachers need to deepen their understanding of the intentions of students' movements produced in instructional scenarios in order to strengthen their ability to monitor instruction in the classroom.

精神分裂症患者在空间路线学习中的前向测试效应

谭瑶瑶 [12]　李甜甜 [12]　马小凤 [12]（通讯作者）
1 甘肃省行为与心理健康重点实验室,甘肃 兰州，730070
2 西北师范大学心理学院，甘肃 兰州，730070，psymaxiaofeng@126.com

摘 要　前向测试效应是指在学习过程中进行测试，将会减少前面所学材料的前摄干扰，促进后续学习的新信息的记忆保持。这种记忆效应并不局限于健康人群，在严重的创伤性脑损伤患者中，提取先前学习的信息可以提高后续学习新信息的记忆保持率，其影响大小与健康对照组相当。但是，尚未有研究探讨测试的前向效应是否适用于精神分裂症患者。本研究拟探讨在空间位置记忆任务上受损的精神分裂症患者是否可以通过前置测试提高空间位置的记忆。

研究选取了 124 名精神分裂症患者和 124 名健康被试作对照组参与实验，探讨在四个二维平面路线地图（实验 1）和四个三维视频空间路线信息（实验 2）的学习中，精神分裂症患者的前向测试效应。实验 1 的结果表明，在二维平面路线地图中，相对于重复学习条件，测试条件下的精神分裂症患者和健康组对于空间路线信息的回忆效果更好。但是，由于精神分裂症患者的抑制能力受损，在抑制前摄干扰上比健康被试要差。中介检验表明，无论是健康组还是精神分裂症患者，干扰率的部分中介效应显著，说明干扰率的降低的确在正确率的提升上起到了作用。其后，在实验 2 中使用三维视频空间路线信息，发现了与实验 1 一致的结果。

综上，本研究揭示了前向测试效应的内在机制，为前摄抑制减少理论提供直接的实验证据，也发现测试带来的好处不局限于前摄干扰的减少，学习材料对认知资源的要求也会影响前置测试在促进新信息学习时的作用。本研究提供了关于测试增强精神分裂症患者视觉空间信息学习的重要的新发现，测试可能是改善精神分裂症患者学习和记忆的有力工具。

The Forward Testing Effect in Spatial Route Learning in Patients with Schizophrenia

Tan YaoYao Li TianTian Ma XiaoFeng

1Key Laboratory of Behavioral and Mental Health of Gansu province, Lanzhou Gansu, 730070
2 School of Psychology, Northwest Normal University, Lanzhou Gansu, 730070

Abstract：Forward testing effects indicate that testing in the learning process reduces proactive interference from previously learned materials and promotes the retention of new information in subsequent learning.These effects are not limited to healthy individuals. In patients with severe TBI (Traumatic brain injury), previous research demonstrates that retrieving previously learned information helps improve retention rates of subsequent learning of new information with effect sizes comparable to that in the control group. To date, it has not been determined whether the forward effects of tests are applicable to clinical patients with cognitive impairments, such as patients with schizophrenia.Therefore, this study intends to investigate whether schizophrenia patients with impaired spatial location memory can improve spatial location memory through preposed tests.

We conducted two experiments—to explore the forward testing effects in schizophrenic patients in learning a new route—with 124 schizophrenic patients and a control group of 124 randomly selected healthy. All participants were tasked with learning four two-dimensional planar route maps (Experiment 1) and four three-dimensional video spatial route information (Experiment 2). Results from Experiment 1 demonstrated that in a two-dimensional planar route map, both schizophrenic and healthy participants recalled the spatial route information under the test condition versus the repetitive learning condition. However, due to the impaired inhibitory ability of patients with schizophrenia, their ability to suppress proactive interference is worse than that of healthy subjects. The mediation test shows that in 2D route learning, the mediation effect of the interference rate is significant, and it is part of the mediation, whether it is the healthy group or schizophrenic patients, indicating that the reduction of interference rate does play a role in improving the accuracy rate. In Experiment 2, we used three-dimensional video spatial route information and obtained the same results found in Experiment 1.

In summary, this study reveals the intrinsic mechanism of the forward testing effect.It not only provides direct experimental evidence for the reduction of proactive inhibition theory but also finds that the benefits of testing are not limited to the reduction of proactive interference and that the requirements of learning materials on cognitive resources affected the mechanism of forward testing in promoting the learning of new information.This study provides important new findings regarding how testing enhances visuospatial information learning in schizophrenia,tests may be a powerful tool for improving learning and memory in patients with schizophrenia.

Keywords：schizophrenic patient, forward test effect, spatial memory, route information

患寡且患不均：公平和奖赏对情景记忆的影响

龙翼婷　姜英杰（通讯作者）　袁媛　张晓靖
东北师范大学心理学院，长春，130024，jiangyj993@nenu.edu.cn

摘 要　在教育领域中，奖赏作为一种促进学生记忆效果的方法被广泛使用。然而，实际情境中，除了奖赏的客观高低之外，个人收益与他人收益的差异，即公平性，也可能对个体的记忆产生影响。为了考察同一情境中公平和奖赏对情景记忆的影响，本研究采用了独裁者游戏范式进行了实验。

在学习阶段，被试接触了不同独裁者的奖赏分配，包括 1：4 到 2：3 以及 1：9 到 5：5 共 7 种分配条件，被试的公平感随着比例值的升高而提高。在测试阶段，被试需要根据独裁者的头像回忆其分配情况并做出信心判断（JOC）。最后，在决策阶段，被试需要报告与不同独裁者的合作意愿，其选择合作的独裁者所分配奖赏的平均值将作为额外的被试费用。

两种分析方法（t 检验和广义混合效应线性模型）的结果一致地显示：首先，情景记忆成绩随着公平程度的提高而下降，但随着奖赏的增加而提高。其次，被试更倾向于选择高公平或高奖赏的独裁者进行合作，此外，在回忆正确时，被试对高奖赏独裁者的合作率更高。然而，两种方法对于 JOC 的分析结果略有不同：t 检验显示高奖赏提高了 JOC，而低公平时的 JOC 准确性更高，但广义混合效应线性模型显示高公平提高了 JOC，而低奖赏时被试的 JOC 准确性更高。

综上所述，情境中的公平和奖赏信息对情景记忆有共同的影响，人们不仅关注自身的收益，也关注收益的公平性，即患寡且患不均。一方面，奖赏是非社会性信息，高奖赏偏好的价值导向记忆是稳定的，且个体能够根据记忆中的奖赏信息进行合作决策。另一方面，公平作为社会性信息，更低程度的公平意味着对社会规范更强的违背，此时个体的情景记忆被增强，并且个体无需记忆的帮助就能更多地选择与高公平独裁者合作。对于提取阶段的元记忆监测（JOC），高奖赏时个体有更高的信心，但其准确性更低，而低公平能够提高元记忆监测的准确性。

关键词　情景记忆，奖赏，公平，JOC，独裁者游戏

Suffering from Scarcity and Inequality: The Influence of Fairness and Reward on Episodic Memory

LONG Yiting, JIANG Yingjie, YUAN Yuan, ZHANG Xiaojing
School of Psychology, Northeast Normal University, Changchun

Abstract：In the field of education, reward is widely used as a method to promote students' memory effectiveness. However, in actual situations, besides the objective high or low of the reward, the equality between personal gain and others' gain, namely fairness, may also have an impact on individuals' memory. To investigate the influence of fairness and reward on episodic memory in the same situation, this study used the dictator game paradigm to conduct the experiment.

During the learning phase, the subjects were exposed to different dictators' reward allocations, including seven allocation conditions from 1:4 to 2:3 and from 1:9 to 5:5. The subjects' sense of fairness increased with the increase of the ratio value. In the testing phase, the subjects needed to recall the allocations based on the dictators' portraits and make confidence judgments (JOC). Finally, in the decision stage, the subjects needed to report their willingness to cooperate with different dictators, and the average value of the rewards allocated by the dictator they chose to cooperate with would be used as additional participant compensation.

The results of two analysis methods (t-test and generalized mixed-effect linear model) consistently showed that: firstly,

episodic memory performance decreased with increasing fairness but increased with increasing reward. Secondly, subjects tended to choose dictators with high fairness or high reward to cooperate with. In addition, when recalling correctly, subjects had higher cooperation rates with dictators with high reward. However, the two methods had slightly different results for JOC analysis: t-test showed that high reward increased JOC, and JOC accuracy was higher when fairness was low, but the generalized mixed-effect linear model showed that high fairness increased JOC, and JOC accuracy was higher when reward was lower.

In summary, fairness and reward information in one situation have a joint influence on episodic memory. People not only pay attention to their own gain but also to the fairness of the gain, that is, they suffer from both poverty and inequality. On the one hand, reward is a non-social information, and the preference for high reward in value-directed memory is stable, and individuals can make cooperation decisions based on reward information in memory. On the other hand, fairness is a social information, and lower fairness means a stronger violation of social norms, at which time individuals' episodic memory is enhanced, and individuals can choose to cooperate more with dictators with high fairness without the help of memory. For metamemory monitoring during retrieval (JOC), individuals have higher confidence when reward is high, but its accuracy is lower, and low fairness can improve the accuracy of metamemory monitoring.

文化对元认知的影响：非洲和中国人群的比较分析

黄滢[1]　吴罗汐[1]　叶群[1]（通讯作者）

1 浙江师范大学心理学院，金华，321004，qun.ye@zjnu.edu.cn

摘 要　文化起源假说认为，文化选择可能塑造了人类元认知的某些形式，比如依赖于工作记忆且对认知负荷敏感的外显元认知。目前支持该假说的研究主要集中在比较东亚和欧美地区人群的元认知能力差异，而对于非洲地区的研究较为缺乏。相较于东亚和欧美地区，非洲地区在价值观、社会结构等方面都具有独特性。基于此，本研究旨在分析非洲人的元认知能力，并与中国人元认知进行比较，以探究文化选择对元认知能力的影响。40 名中国大学生和 26 名非洲留学生被招募完成知觉任务和记忆任务以及相应的回溯性信心度评估。通过采用线性混合模型分析文化对元认知指标（元认知敏感性、元认知效率）的影响，研究结果显示：非洲被试在知觉任务上的正确率和辨别力显著高于中国被试，而在记忆任务上两者的正确率和辨别力没有显著差异。非洲被试在知觉任务上的平均信心显著高于记忆任务，但中国被试在两个任务上的平均信心没有差异。非洲被试在两个任务上的平均信心均显著高于中国被试。在元认知指标上，不论是非洲被试还是中国被试，记忆任务的元认知敏感性和元认知效率均显著高于知觉任务。非洲被试和中国被试的元认知敏感性不存在显著差异，然而非洲被试的元认知效率显著低于中国被试。综上所述，本研究为文化起源假说提供了直接证据，即社会文化可以塑造个体的元认知能力。另外，本研究提供了对非洲文化背景的初步探索，为未来进一步研究非洲文化背景提供了借鉴和启示。

Cultural Influence on Metacognition: A Comparative Analysis of African and Chinese Individuals

Ying Huang[1]　Luoxi Wu[1]　Qun Ye[1]

1 College of Psychology, Zhejiang Normal University, Jinhua, 321004, qun.ye@zjnu.edu.cn

Abstract： The Cultural Origins Hypothesis suggests that cultural selection may shape certain forms of metacognition in humans, such as explicit metacognition, which relies on working memory and is sensitive to cognitive load. While previous research has predominantly focused on comparing metacognitive abilities between East Asian and Western populations, there is a lack of studies examining the African region. Compared to East Asia and the West, African is unique in terms of values and social structures. This study analyzed and compared the metacognitive abilities of Africans and Chinese to investigate how cultural selection influences metacognitive abilities. A total of 40 Chinese university students and 26 African international students were recruited to complete perceptual and memory tasks, as well as corresponding retrospective confidence judgment. Linear mixed-effects models were employed to analyze the effects of culture on metacognitive performance indicators (metacognitive sensitivity, metacognitive efficiency). The results revealed that African participants had significantly higher accuracy and discriminability in the perceptual task compared to Chinese participants. However, no significant differences were observed between African and Chinese participants in accuracy and discriminability for the memory task. Chinese participants did not show a significant difference in average confidence between the two tasks, whereas African participants displayed significantly higher average confidence on the perception task compared to the memory task. On both tasks, African participants' average confidence was noticeably higher than Chinese participants'. Regarding metacognitive indicators, both African and Chinese participants showed significantly higher metacognitive sensitivity and metacognitive efficiency in the memory task compared to the perception task. Although there was no significant difference in metacognitive sensitivity between African and Chinese participants, African participants displayed significantly lower metacognitive efficiency compared to Chinese participants. In conclusion, the present study provides direct evidence for the Cultural Origins Hypothesis, suggesting that socio-cultural could shape an individual’s metacognitive abilities. Additionally, the current study offers a preliminary exploration of the African culture, providing valuable insights for further studies investigating the African cultural context.

元认知监测对元认知控制的影响：框架效应的作用

王婉宁[1]，贾宁[1]（通讯作者）

1 河北师范大学教育学院，河北，石家庄 050024，jianing@hebtu.edu.cn

摘要　目前关于元认知监测对控制的影响，及框架效应对该过程的调节，主要集中在前瞻性元认知监测（如学习判断）。本研究以信心判断作为回溯性元认知监测的指标，以重学选择作为元认知控制的指标，基于信号检测论分析信心判断对元认知控制的影响，以及框架效应对该过程的作用。研究旨在通过两个实验探讨如下问题：（1）信心判断是否影响元认知控制；（2）框架效应是否调节信心判断对元认知控制的影响。实验一采用被试间设计，以有无信心判断作为自变量，重学选择次数作为因变量，探讨信心判断对元认知控制的影响；实验二采用被试间设计，以正负框架作为自变量，重学选择次数作为因变量，探讨框架效应在信心判断影响元认知控制过程中的作用。实验发现：第一，信心判断影响元认知控制。信心判断组的重学选择次数与辨别力标准 d'显著低于无信心判断组；第二，框架效应能够调节信心判断对元认知控制的影响。正框架组的重学选择次数显著低于负框架组，报告标准 c 显著高于负框架组。正负框架下选择是否重学的信心判断阈值不同，正框架组最大约登指数所对应的信心判断等级低于负框架组。研究得出以下结论：回溯性的信心判断能够影响元认知控制，且这一过程会受到框架效应的调节。使用信号检测论进行的分析能够很好地解释信心判断如何影响元认知控制与框架效应对该过程的调节作用，为未来的元认知监控研究提供了启示。

关键词　元认知监测，元认知控制，信心判断，框架效应，信号检测论

Metacognitive monitoring influences metacognitive control: the role of framing effects

Wanning Wang[1], Ning Jia[1]

1 Department of Education, Hebei Normal University, Shijiazhuang

Abstract：Current research on the influence of metacognitive monitoring on control, and the moderation of the process by framing effects, has focused on prospective metacognitive monitoring (e.g., judgements of learning). In the present study, we used confidence judgements as an indicator of retrospective metacognitive monitoring and restudy choice as an indicator of metacognitive control, and analysed the influence of confidence judgements on metacognitive control and the role of framing effects on the process based on signal detection theory. The study aimed to explore the following questions through two experiments: (1) whether confidence judgements influence metacognitive control; (2) whether framing effects modulate the influence of confidence judgements on metacognitive control. Experiment 1 used a between-subjects design with the presence or absence of confidence judgements as the independent variable and the number of restudy choice as the dependent variable to explore the effect of confidence judgements on metacognitive control; Experiment 2 used a between-subjects design with positive and negative framing as the independent variable and the number of restudy choices as the dependent variable to explore the role of framing effects in the process of confidence judgements affecting metacognitive control. The experiment found that, first, confidence judgements influences metacognitive control. The number of restudy choices and the sensory discriminability d' were significantly lower in the confidence judgement group than in the no-confidence judgement group; secondly, the framing effect was able to modulate the influence of confidence judgement on metacognitive control. The number of restudy choices was significantly lower in the positive framing group than in the negative framing group, and the report criterion c was significantly higher than in the negative framing group. The confidence judgement thresholds for choosing whether or not to restudy were different in the positive and negative frames, and the confidence judgement level corresponding to the maximum Yoden index was lower in the positive frame group than in the negative frame group. The study concluded that retrospective confidence judgements can influence metacognitive control and that this process is moderated by framing effects. Analyses using signal detection theory can well explain how confidence judgements affect metacognitive control versus the moderating role of framing effects on this process, providing insights for future research on metacognitive monitoring.

线索影响提取选择倾向——来自行为和 ERP 的证据

张孟霞　张俐娟 张锦坤（通讯作者）

福建师范大学心理学院，福州，350117

jinkunzhang@126.com

摘 要　提取练习对促进记忆长久保持的有效性已得到大量研究支持。然而，在自我管理学习情境下，学习者常常存在元认知偏差，导致难以做出有效的学习策略选择。本研究旨在探讨如何提高学习者对有效策略的选择倾向，并考察提取线索的加入及线索类型对学习策略选择的影响。实验 1 探究斯瓦西里语词汇学习的提取过程中，逐步呈

现辅音线索（如 w_ _ _ _, w_ng_, wingu）对学习者策略选择、内在动机、学习有效性感知的影响。结果表明，相较于重学和无线索提取，学习者对线索提取具有更强的选择倾向。同时，加入线索使得提取过程更有趣，提升了学习者的内在动机和对学习有效性的认识，从而增加了对线索提取的选择。研究发现了学习有效性感知在有趣性与策略选择间起完全中介作用。实验 2 进一步探究不同线索类型（辅音线索、元音线索）以及线索呈现方式（逐步呈现、非逐步呈现）对学习者线索提取选择倾向的影响。结果发现，学习者更倾向于选择辅音线索提取，且非逐步呈现的辅音线索（如 w_ng_, wingu）对选择倾向的促进作用更加显著；相反，学习者提取过程中对元音线索（如_ i _ _ _，_i_ _u， wingu）表现出回避倾向，并且在逐步呈现元音线索时，学习者感知到的心理努力与无线索条件之间没有显著差异。实验 3 采用事件相关电位探讨不同线索类型在情绪、认知加工上的差异以及对记忆保持的影响。实验设计为 2（线索数量：2 字母提示、3 字母提示）×2（线索类型：辅音线索、元音线索）的被试内实验，另设置无线索为控制组。结果显示，行为结果上，相较于无线索，线索的加入会损害记忆表现，且线索越多对记忆的损害越大。脑电指标上，P200 成分显示 2 字母元音线索提取的波幅显著高于无线索提取；而在 LPC 成分上，3 字母辅音线索提取的波幅显著高于元音线索，这表明元音线索可能伴随更多消极情绪，学习者需要投入更多的注意资源且难以成功提取相关信息。本研究表明，提取线索类型影响学习策略的选择，元音线索下的负面情绪与提取困难可能降低对该线索的选择倾向。

Cue Types Affect Desire to Test-Evidence from Behavior and ERPs

Mengxia Zhang, Lijuan Zhang, Jinkun Zhang*

School of Psychology, Fujian Normal University, No.1, Science and Technology Road, University Town, Fuzhou, Fujian, China

Abstract：The effectiveness of retrieval practice in facilitating long-lasting memory retention has been extensively supported by numerous research. However, learners often fail to make accurate metacognitive monitoring and make suboptimal strategy choices in self-regulated learning. This study aims to investigate how to enhance learners' inclination to choose effective strategies and to explore the effects of cue incorporation and cue type on learning strategy choice. Experiment 1 explored the effects of the gradual presentation of consonant cues (e.g., w_ _ _ _ _, w_ng_, wingu) on learners' tendency to strategies options, intrinsic motivation, and perceived effectiveness during Swahili word learning. The results showed that learners exhibited a stronger preference for cue-based retrieval compared to restudy and no-cue retrieval. Furthermore, the inclusion of cues made the retrieval process more interesting, enhancing learners' intrinsic motivation and their perception of learning effectiveness, thus increasing the inclination to choose cue-based retrieval. The study revealed that the perception of learning effectiveness fully mediated the relationship between interestingness and strategy option. Experiment 2 further investigated the effects of different cue types (consonant cues, vowel cues) and cue presentation modes (gradual presentation, non-gradual presentation) on learners' strategy options. The findings showed that learners demonstrated a preference for consonant cue retrieval, and non-gradual presentation of consonant cues (e.g., w_ng_, wingu) facilitated the option tendency for retrieval more significantly. Conversely, learners tend to avoid the vowel cues (e.g., _ i _ _ _ _, _i_ _u, wingu) during the retrieval process, and no significant difference was observed in perceived mental effort between the gradual presentation of vowel cues and the no-cue condition. Event-related potentials were conducted in experiment 3 to explore the differences between different cue types in emotion and cognitive processing and the effects of different cue types on memory retention. There was a 2 (number of cues: 2-letter cues, 3-letter cues)×2(type of cues: consonant cues, vowel cues) within-subject experimental design, and a standard retrieval condition as the control group. The results showed that in terms of behavioral outcomes, cues may hinder memory performance, and the more cues there were, the greater the damage to memory. In terms of electroencephalographic (EEG) indicators, the P200 component exhibited

significantly higher amplitude for the retrieval of 2-letter vowel cues compared to the no-cue retrieval, whereas the LPC component showed significantly higher amplitude for the retrieval of 3-letter consonant cues compared to the retrieval of vowel cues. These findings suggest that the vowel cues may be associated with more negative emotions, requiring learners to devote more attention and making it more challenging to successfully retrieve relevant information. The present study indicates that cue type influences learning strategy options, and the negative emotions and retrieval difficulties with vowel cues may reduce retrieval inclination to select such cues.

情绪线索在学习判断中的误导性作用

孙晓军　姜英杰（通讯作者）
东北师范大学心理学院，长春，130024，jiangyj993@nenu.edu.cn

摘 要　学习判断(Judgments of learning，JOLs)是个体对当前所学内容在随后测试中能否正确回忆的预测性评估。直接访问假说提出 JOLs 能通过监测记忆内容来进行预测，但线索利用理论则认为 JOLs 并不能直接监测记忆，而是依据线索来进行推测。先前研究表明，人们通常对情绪信息有比中性信息更高的 JOLs，但前人研究大多集中在项目记忆，鲜有探究情绪对联结记忆 JOLs 的影响。情绪对记忆的影响因记忆类型而异，情绪仅影响项目记忆而不影响联结记忆(图片-边框形式)。若情绪对项目和联结记忆的不同影响能反映在 JOLs 上就支持了直接访问假说，反之则支持线索利用框架。故本研究通过探究情绪对项目和联结记忆 JOLs 的影响，来揭示情绪影响的 JOLs 认知机制。被试学习负性、正性和中性图片，之后进行 JOLs(项目记忆任务中评估记住图片的可能性，联结记忆中评估记住图片对应边框的可能性)，然后进行记忆测试，让他们判断该图片是否在学习阶段见过(项目记忆)或图片对应的边框是什么(联结记忆)。结果发现，项目记忆表现出情绪显著效应，即被试对情绪图片的记忆优于中性图片，联结记忆中则无情绪显著效应，项目和联结记忆的 JOLs 都表现出情绪显著效应。上述结果揭示了情绪对 JOLs 的影响并非依据对记忆内容的直接访问，而是个体将情绪作为可用线索对记忆进行推测的结果，说明情绪线索在 JOLs 中可能会产生误导性作用。这有助于进一步了解元记忆监测机制，并为提高个体元记忆监测准确性提供了前期理论支持。

The misleading role of emotional cues in judgments of learning

Xiaojun Sun　Yingjie Jiang
School of Psychology，Northeast Normal University，Changchun

Abstract：Judgments of learning (JOLs) are predictive assessments of an individual's ability to correctly recall currently learned content on subsequent tests. While the direct-access view proposes that JOLs can be predicted by monitoring memory content, the cue utilization theory suggests that JOLs do not directly monitor memory but make inferences based on cues. Previous research has shown that people typically have higher JOLs for emotional information than for neutral information, but most of the previous research has focused on item memory, and rarely has it examined the effect of emotion on the JOLs of associative memory. The effect of emotion on memory varies by memory type, and emotion only affects item memory but not associative memory. If the different effects of emotion on the item and associative

memory can be reflected in JOLs it supports the direct access hypothesis, and vice versa supports the cue utilization framework. Therefore, the current study was conducted to reveal the cognitive mechanism of emotion-influenced JOLs by exploring the effects of emotion on item and associative memory JOLs. Participants studied negative, positive, and neutral pictures, followed by JOLs (the likelihood of remembering the picture was assessed in the item memory task, and the likelihood of remembering the picture's corresponding frame was assessed in the associative memory), and then a memory test in which they were asked to decide whether the picture had been seen in the learning phase (item memory) or what the picture's corresponding frame was (associative memory). It was found that item memory showed emotional salience effects, i.e., participants remembered emotional pictures better than neutral pictures, while there were no emotional salience effects in associative memory, and JOLs for both item and associative memory showed emotional salience effects. The above results reveal that the effect of emotion on JOLs is not based on direct access to memory content, but is the result of individuals' speculation about memory using emotion as an available cue, suggesting that emotional cues may have a misleading effect in JOLs. This contributes to further understanding of metamemory monitoring mechanisms and provides pre-theoretical support for improving the accuracy of individual metamemory monitoring.

低执行功能可能是儿童学习数学焦虑发展的重要远端风险因素：数学表现的纵向中介作用

黄碧娟[1]　朱红祥[1]　李红霞[1]　禚新峰[1]　司继伟[1]（通讯作者）

1 山东师范大学心理学院，济南，250358，sijiwei1974@126.com

摘 要　数学焦虑是影响所有年龄阶段的、普遍的、全球性问题。高数学焦虑个体更可能出现数学回避行为，数学成绩低下，数学自我概念和态度更消极，数学信心和动机较低，甚至限制个体后期的专业或职业选择（如，从事 STEM 相关职业）和长期职业成功。因此，降低数学焦虑水平对个体的学业情感和成就以及职业成功等方面的发展显得尤为重要。数学焦虑的相关理论指出，执行功能与数学表现对儿童数学焦虑发展均有显著预测作用。但尚缺乏研究对比两者在数学焦虑发展过程中的相对贡献。此外，执行功能不足是否引起个体较差的数学表现，进而诱发个体的学习数学焦虑，对于该间接效应仍未得到检验。为回答上述问题，本研究采用纵向设计，对三、四年级的儿童（$N = 756$，$M_{age} = 9.25$，51.85%女生）进行一年追踪，每次间隔六个月，以确定执行功能、数学表现与儿童学习数学焦虑的纵向联系。结果显示：执行功能与数学表现之间存在交叉滞后联系；前一时间点的数学表现可显著负向预测后一时间点的学习数学焦虑；数学表现在执行功能与学习数学焦虑之间起纵向中介作用。上述结果表明，较低的执行功能通过诱发更差的数学表现致使个体发展学习数学焦虑的可能性。该研究结果增进了对童年中期儿童学习数学焦虑发展的认识，有助于更深刻地理解促成数学焦虑的认知因素。

Lower Executive Function may be an Important Distal Risk Factor for the Development of Mathematics Anxiety for Learning in Children: A Longitudinal Mediating Role of Mathematical Performance

Bijuan Huang, Hongxiang Zhu, Hongxia Li, Xinfeng Zhuo, Jiwei Si
School of Psychology, Shandong Normal University, Jinan

Abstract：Mathematics anxiety is a universal, global problem that affects all ages. Students, who experience higher level of mathematics anxiety, are more likely to take fewer elective math course, receive lower math grades, report negative self-concepts and attitudes towards mathematics, and hold lower confidence and lower motivation for mathematics. Moreover, these negative effects further limit the individual's later professional or career choices, such as a stem-related career, or even long-term professional success. Therefore, it is vital to alleviate mathematics anxiety for the development of individual academic emotion and achievement, as well as career success. The relevant theories of mathematics anxiety pointed out that both executive function and mathematical performance are important predictors on the development of mathematics anxiety in children. However, few research compared their relative contributions in the development of mathematics anxiety. In addition, it is still unknown that whether insufficient executive function causes poor mathematical performance and then lead to children's mathematics anxiety. To answer the above questions, the present study used a longitudinal design with one-year tracking of 3- and 4-grade children (N = 1,169, M_{age} = 9.49 years, 49.19% girls) with six months apart to determine the longitudinal association of executive function, mathematical performance and children's mathematics anxiety for learning. The results showed that there was a cross-lag link between executive function and mathematical performance. The mathematical performance at the previous time points could predict children's LMA at the later time points. The executive function could longitudinally predict children's mathematics anxiety for learning through mathematical performance. The above results suggested that lower executive function drove the possibility of developing children's mathematics anxiety for learning by inducing worse mathematical performance. The findings of it deepened our understanding of the development of mathematics anxiety for learning during middle childhood. It also helped to better recognize how the cognitive factors contributed to the development of mathematics anxiety.

Keywords：executive function, mathematical performance, mathematics anxiety, longitudinal mediation

小学生不同层次数学学习的认知基础

徐洁　蔡丹（通讯作者）
上海师范大学心理学系，上海，200234, caidan@shnu.edu.cn

摘 要　数学能力的发展需要以特定的认知能力为基础。LeFevre 等人于 2010 年提出的数学路径模型(the Pathways to Mathematics Model)指出，数量、言语和空间注意，这三种认知能力为幼儿掌握基础数学技能做出了重要贡献。尽管随后有多项研究为该模型提供了实证研究支持，但现有的研究缺乏对不同数学学习层次充分考虑。本研究的主要目标是修改和扩展 LeFevre 等人的数学路径模型，并使用该模型来揭示小学生不同层次数学能力发展的潜在认知机制。从上海市两所小学招募一至五年级共 309 名小学生作为研究对象（平均月龄=112.78; 173 个男孩）。对这些小学生进行一系列认知、符号数字处理和数学能力测试，包括近似数量系统（点估计、符号数字比较）、言语能力（阅读流畅性）、视觉空间工作记忆（空间 N-back）、以及不同水平的数学能力（数学流畅性、数值计算和数学问题解决任务）。在控制了儿童年龄和非言语智力后，路径分析的结果表明: 1) 近似数量、言语和空间路径对于儿童符号数字加工具有独特的贡献；2)符号数字加工为数学流畅性的发展提供了支持; 3)不同层次数学学习所需要的认知基础有所不同。具体而言，数量路径与数学流畅性和问题解决直接相关，并通过符号数字加工和数学流畅性间接影响数值计算；言语路径与数学流畅性、数值计算和问题解决直接相关；空间路径则与数值计算直接相关，并通过符号数字加工间接影响数学流畅性，通过符号数字加工、数学流畅性和数值计算间接影响数学问题解决。4)基本的数学流畅性能力对于复杂的数值计算具有支持作用，并进而影响儿童问题解决能力的发展。这些研究结果表明数学学习具有层次性，从基本认知能力到符号数字处理，再到数学流畅性，再到复杂的数值计算和问题解决，层层递进。这些发现进一步揭示了小学生基本符号加工和正式数学技能发展的潜在认知机制，对于数学知识的教学和实践和学习困难的筛选和

改善具有启示意义。

The Cognitive Foundations of Different Levels of Mathematics in School-aged Children

XU Jie, CAI Dan

(Department of Psychology, Shanghai Normal University, Shanghai 200234)

Abstract： Mathematics, as a vital tool in our lives, was crucial for individuals to obtain and maintain success in school and elsewhere. Domain-general and domain-specific cognitive factors have always been suggested to serve as the critical building blocks for the acquisition and development of mathematical skills. In light of the Pathways to Mathematics Model, three types of cognitive precursors provided important contributions to young children's mathematics skills learning and development. The existing model-based research was deficient in at least two aspects—lack of attention to school-aged children, insufficient consideration of mathematical hierarchy. The main goal of the study was to modify and extend the original model and use it to further reveal the cognitive mechanisms underlying mathematics development in school-aged children. A battery of cognitive, symbolic number processing and mathematics measures, including dot estimation, reading fluency, spatial N-back, symbol number comparison, math fluency, numerical calculation and math problem -solving tasks, were performed on 309 7- to 12-year-old children (mean month age = 112.78; with 141 girls). After controlling for sex, age, nonverbal intelligence and verbal speed, the main results of the path analysis were as follows: 1) Three basic cognitive precursors—quantitative, linguistic and spatial abilities—could make independent contributions to symbolic number processing; 2) The development of symbolic number processing could support math fluency; 3) The contributions of these three cognitive precursors to mathematics learning were different. Specifically, the quantitative pathway was directly associated with math fluency and problem-solving, and indirectly associated with numerical computation via symbolic number processing and math fluency; the linguistic pathway was directly associated with all three mathematical outcomes; the spatial pathway was directly associated with numerical computation, and indirectly associated with math fluency via symbolic number processing, indirectly associated with math problem-solving via symbolic number processing, math fluency and numerical computation. 4) Basic math fluency supported complex the development of numerical calculation, which in turn influenced problem-solving. These findings further revealed the cognitive mechanisms underlying the development of basic symbolic number processing and formal mathematical skills in school-age children, having implications for the effective teaching and practice of mathematics knowledge and early identification and intervention of learning difficulties.

数量感知中时间维度下的分组化效应：

刺激目标异步性和分组线索的影响

杨环瑜[1] 潘运[1](通讯作者)

1 贵州师范大学心理学院，贵阳， 550025，通讯作者 E-mail：panyun129@163.com

摘 要 “分组化”（Groupitizing）是指当一组数组在视觉上被划分为子组时，数量估计变得更快、更准确的现象。尽管已有研究探讨了数量感知中的分组化策略的认知机制，但主要基于空间分布的角度，忽略了数量与其他知觉因素之间的相互关系。根据"量级理论"（ATOM）的观点，数量、时间和空间是互补概念，在数量系统中共享相同的量级系统，并且顶叶皮层是该系统的核心脑区。如果数量感知的加工机制确实依赖于这种共享的量级系统，那么通过操作时间顺序这一变量可能会导致数量感知中的分组化策略发生变化。以往研究主要从内部分组线索（如邻近性、颜色相似性）的角度探讨分组化策略，较少直接比较内部和外部分组线索对分组化效应强度的影响。由于这两种分组线索在性质上存在明显差异，通过直接比较这两种线索产生的效应，可以揭示它们在数量感知分组化策略中的作用。已有研究指出，时间维度上数量感知的研究中，刺激目标异步性（SOA）对结果有重要影响，300 毫秒的 SOA 被认为是计数和估计的临界值。本研究通过操纵不同的刺激目标异步性（150 毫秒、300 毫秒）和分组线索（内部和外部），来探索时间维度中数量感知的分组化效应。结果显示，在数量感知中，分组条件具有明显的优势，能够使估计速度更快、准确性更高。特别是在高数学能力个体中，分组化效应更为显著。我们的结果还发现外部分组线索的感知精度优于内部分组线索。此外，在较短的 SOA 下（150 毫秒），分组化效应更为明显，进一步证实了刺激持续时间对于时间序列数量感知的重要性。最后，本研究复制了序列估计中的小数量优势（SNA），与以前的研究结果一致。研究发现对于深入理解数量感知中的分组化现象以及数量系统的运作机制具有重要意义。直接比较内部和外部分组线索的效应揭示了它们在数量感知分组化策略中的不同作用。此外，研究结果对于数量感知中刺激持续时间和数学能力的影响也提供了进一步证据。

Groupitizing in Numerosity Perception within the Temporal Dimension: Effects of Stimulus Onset Asynchronies and Grouping Cues

Yang Huanyu[1] Pan Yun[1*]

School of Psychology, Guizhou Normal University, Guiyang, China. Email: panyun129@163.com

Abstract：When a set of arrays is visually divided into subgroups, the estimation of numerosity becomes faster and more accurate, a phenomenon referred to as "groupitizing." While previous studies on groupitizing have primarily focused on the spatial dimension, only a limited number of studies have explored groupitizing in the temporal dimension. According to the Theory of Magnitude (ATOM), space, time, and number are interconnected concepts that share common mechanisms within the magnitude system. Thus, it is crucial to systematically investigate groupitizing in numerosity perception within the temporal dimension. In this study, we manipulated different stimulus onset asynchronies (SOAs) (150 ms, 300 ms) and employed various grouping cues (intrinsic and extrinsic) to explore the phenomenon of groupitizing in numerosity perception within the temporal dimension. The findings revealed a clear advantage of grouping in numerosity perception, with a more pronounced effect observed in individuals with a high level of mathematics proficiency. Additionally, the sensory precision of extrinsic grouping cues surpassed that of intrinsic grouping cues. Furthermore, we found a stronger grouping effect at shorter SOAs (150 ms), providing further evidence for the significance of stimulus duration in temporal sequence numerosity perception. Finally, our study replicated the small numerosity advantage (SNA) for sequential enumeration, which aligns with previous research. These findings contribute to a deeper understanding of the phenomenon of groupitizing in numerosity perception and shed light on the operational mechanisms of the numerical system. The direct comparison of intrinsic and extrinsic grouping cues reveals their differential roles in numerosity perception grouping strategies. Furthermore, the results provide additional evidence regarding the impact of stimulus duration and mathematical abilities on numerosity perception.

关系推理在学龄儿童符号分数表征中的作用

戚玥[1]　于晓[2]　陈英和[1]（通讯作者）

1 北京师范大学心理学部发展心理研究院，北京，100875

2 北京林业大学人文社会科学学院心理学系，北京，100083

通讯作者 E-mail: chenyinghe@bnu.edu.cn

摘 要 分数是一种以关系形式表达的数，被认为是小学阶段最困难的数学知识之一。整数偏向是分数表征中的常见错误，指个体倾向于分离地考虑分数中各元素（分子或分母）的数值，而不是元素之间的关系，这与个体在关系推理中的常见错误是相似的。因此，儿童在分数表征中相对较差的表现，可能正是源于其关系推理困难，即难以在表面不同的情景中识别和整合抽象关系。先前对这一问题的研究停留在相关层面，本研究采用 A:B::C:D 类比任务这一常用的关系推理任务，通过正启动范式直接检验上述假设。如果分数表征与类比同样包含关系推理过程，则类比启动将促进后续的分数表征。

本研究首先招募 32 名五年级儿童（9 名男生，平均年龄 11.57 ± 0.27 岁）为被试。实验任务包含测试条件和控制条件，每种条件下包含启动和探测刺激。测试条件的启动刺激为数材料类比任务（如，7:28::9:?），控制条件的启动刺激为材料相同的数字搜索任务。探测刺激均为符号分数比较任务，包含一致试次（分子和分母更大的，分数值也更大）和不一致试次（分子和分母更大的，分数值反而小），以两种试次的表现差异刻画整数偏向大小。2（条件：测试，控制）×2（一致性：一致，不一致）两因素重复测量方差分析结果表明，数材料类比启动显著减小了儿童分数比较的整数偏向。

然而，数材料类比任务不仅包含关系推理，也包含完成分数比较所需的计算过程。为进一步剥离出关系推理的作用，以 31 名五年级儿童（14 名男生，平均年龄 11.70 ± 0.43 岁）为被试，将测试和控制条件的启动刺激分别替换为非数材料类比任务（如，粉笔:黑板::铅笔:？）和相应的物品搜索任务。2（条件：测试，控制）×2（一致性：一致，不一致）两因素重复测量方差分析结果表明，非数材料类比启动显著降低了儿童分数比较的错误率，且同样显著减小了儿童分数比较的整数偏向。本研究揭示了关系推理对符号分数表征的重要作用，有助于深入理解表征分数的心理过程，并说明强调分数的关系结构、提升关系推理能力是促进儿童分数学习的可能途径。

The Role of Relational Reasoning in School-age Children's Symbolic Fraction Magnitude Processing

Qi Yue[1] Yu Xiao[2] Chen Yinghe[1]

[1]School of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, P. R. China, 19 Xinjiekouwai Avenue, Haidian District, 100875, Beijing, P. R. China

[2]Department of Psychology, School of Humanities and Social Sciences, Beijing Forestry University, Beijing, P. R. China, 35 Qinghua East Road, Haidian District,100083, Beijing, P. R. China

Abstract：Fractions are inherently relational and are considered one of the most difficult mathematical skills for primary school students. Whole number bias is a common error in fraction magnitude processing, which refers to individuals' inclination to consider the components of a fraction (i.e., the numerator and the denominator) separately rather than considering the relations between its components. This is similar to the common error in relational reasoning. Therefore, the bias showed in children's fraction magnitude processing may reflect their difficulties in relational reasoning. That is, they have difficulties in identifying and integrating abstract relations in situations with different surface features. Previous studies on this question were correlational. The current study would directly examine this hypothesis with the inter-task positive priming paradigm, using A:B::C:D analogical reasoning task (a commonly used relational reasoning task). If symbolic

fraction magnitude processing contains relational reasoning, analogical priming could facilitate subsequent fraction magnitude processing.

Firstly, 32 fifth graders (9 boys, mean age: 11.57 ± 0.27 years old) were recruited. The task contained a test condition and a control condition. Each condition included prime stimuli and probe stimuli. The prime stimuli of the test condition were numerical analogical reasoning tasks (e.g., 7:28::9:?), and the prime stimuli of the control condition were numerical visual searching tasks that used the same materials as the analogical reasoning task. The probe stimuli were the symbolic fraction magnitude comparison task, which contained two types of trials: congruent trials (the fraction with the larger overall magnitude was made up of larger numerator and denominator) and incongruent trials (the fraction with the larger overall magnitude was made up of smaller numerator and denominator). 2(condition: test, control) × 2(congruency: congruent, incongruent) repeated ANOVA showed that the numerical analogical priming significantly reduced children's whole number bias in fraction magnitude comparison.

However, the numerical analogical reasoning task involved not only relational reasoning but also calculation, which was also needed in fraction magnitude processing. To isolate the role of relational reasoning, 31 fifth graders (14 boys, mean age: 11.70 ± 0.43 years old) completed another positive priming task. In this task, the prime stimuli of the test condition were non-numerical analogical reasoning tasks (e.g., chalk:blackboard::pencil:?), and the prime stimuli of the control condition were non-numerical visual searching tasks that used the same materials as the non-numerical analogical reasoning task. 2(condition: test, control) × 2(congruency: congruent, incongruent) repeated ANOVA showed that the error rate of fraction comparison in the test condition was significantly lower than that in the control condition, and non-numerical relational priming also significantly reduced children's whole number bias. The results of the current study revealed the importance of relational reasoning for symbolic fraction magnitude processing, which contributes to the understanding of the cognitive process underlying fraction magnitude processing. It also showed that emphasizing the relational structure of fractions and improving children's relational reasoning ability may be potential ways to prompt fraction learning.

3-5 岁儿童概率推理的发展特点及其影响机制

靳紫阳　侯如月　史滋福（通讯作者）

湖南师范大学心理学系，长沙，410000，shizf@hunnu.edu.cn

摘要 概率推理是学龄前儿童理解数字认知发展的基础，研究 3-5 岁学龄前儿童的概率推理不仅可以帮助其更好地进行推理决策，而且对儿童其他方面能力的提升也具有重要的意义。纵观以往，有关 3-5 岁学龄前儿童是否具备概率推理能力的结论并不一致，这可能与材料的呈现方式和任务难度有关。因此，本文试图设计 3 个实验，探讨在不同呈现方式和不同任务难度的情况下 3-5 岁儿童的概率推理及其特点，同时进一步探讨提升儿童概率推理能力的策略。具体地，实验 1 探究呈现方式对 3-5 岁儿童概率推理表现的影响；实验 2 则在实验 1 的基础上选用更适合儿童进行推理的呈现方式来探究任务难度对 3-5 岁儿童概率推理表现的影响；实验 3 继续探究提问方式在不同难度下是否可以提高 3-5 岁儿童的概率推理表现。结果发现，(1)3-5 岁儿童在平面呈现方式上的概率推理表现显著优于空间呈现方式下的表现，在简单难度上的推理表现显著优于中等难度和困难难度，中等难度和困难难度之间的差异较小；(2)相比于一般性提问，指导性提问可以显著提升 3-5 岁儿童的概率推理成绩，特别是在简单难度任务上的提升最为迅速，中等难度次之，困难难度作用不大；(3)有关推理策略，3 岁儿童主要依靠一阶关系，而 4、5 岁儿童则可以使用二阶关系进行推理判断。总之，儿童是否具有概率推理能力，与呈现方式和任务难度有关，指导性提问可以促进儿童概率推理，且学龄前儿童概率推理策略具有由简单到复杂的发展特点。本研究对儿童数学认知的培养具有一定的指导意义。

Developmental Characteristics and Influencing Mechanisms of Probabilistic Reasoning in Children aged 3-5 Years

Ziyang Jin Ruyue Hou Zifu Shi
Department of Psychology, Hunan Normal University，Changsha，410000

***Abstract*:** Probabilistic reasoning is the basis of preschool children's understanding of number cognitive development. Studying the probabilistic reasoning of 3-5 years old preschool children can not only help them make better reasoning decisions, but also have important significance for the improvement of children's ability in other aspects. Throughout the past, the conclusions about whether preschoolers aged 3-5 years old possess probabilistic reasoning ability have been inconsistent, which may be related to the way the material is presented and the difficulty of the task. Therefore, this paper attempted to design three experiments to explore the probabilistic reasoning and its characteristics of children aged 3-5 under different presentation modes and task difficulties, and further explore strategies to improve children's probabilistic reasoning ability. Specifically, experiment 1 explored the effect of presentation style on the probabilistic reasoning performance of children aged 3-5. On the basis of experiment 1, experiment 2 selected a more suitable way for children to reason to explore the influence of task difficulty on the probabilistic reasoning performance of 3-5 years old children. Experiment 3 continued to explore whether questioning methods can improve the probabilistic reasoning performance of children aged 3-5 at different difficulties. The results showed that (1) the probability reasoning performance of 3-5 years old children in the plane presentation mode was significantly better than that in the space presentation mode, and the reasoning performance in the easy difficulty mode was significantly better than that in the medium difficulty mode and the hard difficulty mode, and the difference between the medium difficulty and the hard difficulty mode was small; (2) Compared with general questioning, guided questioning could significantly improve the probabilistic reasoning performance of children aged 3-5, especially in simple and difficult tasks, the fastest improvement, followed by moderate difficulty tasks, and difficult difficulty tasks had little effect; (3) Regarding reasoning strategies, 3-year-olds mainly relied on first-order relations, while 4 - and 5-year-olds could use second-order relations to make reasoning judgments. In short, whether children had the ability of probabilistic reasoning was related to the presentation mode and task difficulty. Guided questioning could promote children's probabilistic reasoning, and preschool children's probabilistic reasoning strategies had the characteristics of development from simple to complex. This study has certain guiding significance to the cultivation of children's mathematics cognition.

[3] 中央财经大学社会与心理学院，北京，100098，lilyking_0717@126.com，13699203261

摘　要　随着 STEM 教育的兴起，空间能力对数学能力的影响受到越来越多研究者和教育者的关注。一般而言，空间能力强的个体，数学能力也越好。以往研究大多选择某一种数学或空间能力进行考察，然而，空间能力和数学能力都是多结构的综合能力，不同空间能力和数学能力具有特异性，仅基于某种空间或数学能力对二者关系进行考察，难以厘清每一种空间能力和数学能力间的确切关系，造成空间能力对数学能力的影响及其认知机制结果的不一致。本研究基于认知负荷理论和空间-数学关联理论，在中学生中考察了不同空间能力对不同数学能力的同时和延时作用，在此基础上进一步探讨了心理数字线和视空间工作记忆在不同空间和数学能力间的中介作用。研究结果主要发现：(1)不同空间能力对不同数学能力存在影响且影响不同，心理旋转对数量能力、计算能力和逻辑思维能力存在同时和延时影响，而镶嵌图形、运动迷宫和定位对不同数学能力具有预测作用，这种预测作用随时间发生变化。(2)心理旋转、镶嵌图形、定位测验可以通过心理数字线分别影响数量能力、计算能力和几何能力。心理旋转、镶嵌图形、运动迷宫和定位测验四种空间能力可以通过视空间工作记忆影响数量能力、计算能力、几何能力和逻辑思维能力。由此可见，心理数字线的中介作用受到空间能力和数学能力亚成分的调节，而视空工作记忆的中介作用几乎不受空间能力和数学能力亚成分的影响。

The association between spatial ability and mathematical ability: The mediating role of mental number line and visuo-spatial working memory

Zheng Kejun[1]　Xie Fang[2]　Zhang Li[3]

[1] School of Psychology, Guizhou Normal University, Guiyang, 550025

[2] School of Educational Science, Chongqing Normal University, Chongqing, 401331

[3] School of Sociology and Psychology, Central University of Finance and Economics, Beijing, 100098

Abstract：With the rise of STEM education, the impact of spatial ability on math ability has received increasing attention from researchers and educators. In general, individuals with better spatial ability also have better math ability. However, both spatial ability and mathematical ability are multi-structural and comprehensive abilities, and previous studies have chosen a certain type of mathematical or spatial ability to be examined, ignoring the specifics of different spatial abilities and different mathematical abilities, and it is difficult to clarify the exact relationship between each type of spatial and mathematical ability, resulting in inconsistent results, including the influence of spatial ability on mathematical ability and the cognitive m mechanisms. Based on cognitive load theory and the spatial-mathematical correlation theory, this study examined the simultaneous and delayed effects of different spatial abilities on different mathematical abilities, on the basis of which we explored the mediating roles of mental digit lines and visuospatial working memory between different spatial and mathematical abilities. The main findings of present study are: (1) Different spatial abilities have effects on different

mathematical abilities, mental rotation has simultaneous and delayed effects on numerical ability, arithmetical ability and logical thinking ability, while embedded figures test, motion maze, and localization ability have a predictive effect on different mathematical abilities, and this predictive effect changes over time. (2) Mental rotation, embedded figures test and localization ability can affect numerical ability, arithmetical ability, and geometric ability through the mental number line, respectively. The four spatial abilities can influence quantitative, computational, geometric, and logical thinking abilities through visuospatial working memory. It can be seen that the mediating effect of mental number line is moderated by the subcomponents of spatial and mathematical abilities, whereas the mediating effect of visuospatial working memory is hardly affected by the subcomponents of spatial and mathematical abilities.

基于 RTI 模式对小学低年级阅读障碍高危儿童的鉴别和干预

古丽菲艳　买合甫来提•坎吉（通讯作者）
新疆心智发展与学习科学重点实验室，乌鲁木齐，830000

摘 要　干预反应模式(Response to Intervention,RTI)是评估鉴别并干预学习障碍的多层级教育干预模式，是通过三个层级评估和干预，分析在每个层级中对教学干预的反应，以动态评估学习障碍的儿童。本研究以乌市某小学一年级学生为被试，通过三个层级的鉴别和干预，，探讨 RTI 模式对小学低年级阅读障碍高危儿童鉴别和干预的有效性。

在第一层级，以一年级全体学生（267 名）学生为被试，在正常教学环境中进行为期一个学期的教学干预后，根据学生期中与期末成绩后 10%和教师提名初步筛选出 20 名阅读障碍高危儿童进入第二层级。依据这 20 名学生的课程本位测验结果制定第二层级的干预方案，每周进行 5 次小组式干预，每次 1 个小时，持续 10 周。之后，分析 20 名阅读障碍高危儿童在干预前和干预后的期末成绩与正常学生期末成绩的差异发现，干预前有显著差异($p<0.001$)，而干预后没有显著差异($p=0.844>0.05$)。对这 20 名阅读障碍高危儿童进行的课程本位测量结果进行周测验成绩和周改善率分析，发现，与第一周相比第十周测验成绩显著提高。其中 16 名儿童周改善率大于 1，其余 4 名儿童周改善率小于 1，表明 16 名儿童的学业成就和行为表现在第二层级中得到了明显的改善和提高，其余 4 名学生儿童成绩仍没有明显进步。这 4 名学生中有 2 名儿童继续进入第三层级干预，另有 2 名儿童由于外在因素退出。对这 2 名儿童在第二层级干预中的表现，制定了针对性更强的干预方案，并进行了每周 5 次的一对一干预，每次 1 个小时，持续干预 4 周。结果显示，其中，1 名学生周改善率大于 1，表明对第三层级有反应，另 1 名学生周改善率小于 1，表明对第三层级干预没有反应。通过对这名无反应学生进行全方位分析确定该生为阅读障碍儿童。

综上得出结论： RTI 模式能够对小学低年级阅读障碍高危儿童进行有效的动态评估，能够及早发现阅读障碍高危儿童，并对其给予及时有效地干预，及早鉴别出真正的阅读障碍儿童。

Application of RTI Model in Identification and Intervention of Children at High Risk of Dyslexia in Lower Grade

Gulifeiyan　Maihefulaiti•Kanji（corresponding author）
Xinjiang Key Laboratory of Mental Development and Learning Science

***Abstract*：** Response to Intervention (RTI), which can be translated as Response to Intervention or Response to teaching, is a multi-level educational model that provides identification and Intervention for people with learning disabilities. the RTI model is designed to dynamically assess children with learning disabilities through three levels of assessment and intervention, analyzing responses to instructional interventions at each level. In this study, RTI model was used to explore the effectiveness of RTI model in the identification and intervention of children at high risk of dyslexia in the lower grades of elementary school.

In this study, the first grade students in a primary school in Urumqi were selected as the subjects. And the children with dyslexia were dynamically evaluated through three levels of identification and intervention. At the first level, all the first grade students (267 students) were selected as the subjects. After the one-semester teaching intervention in the normal teaching environment, 20 high-risk children with dyslexia were initially selected to enter the second level according to the bottom10% of the mid-term and final scores of the students as well as the teacher's nomination. According to the curriculum standard test results of 20 students for the second level of intervention, with one-hour group interventions 5 times a week for

10 weeks, the results were as follows: By analyzing the difference between the final scores of 20 students at high risk of dyslexia and those of normal students before and after intervention, it was found that the final scores of 20 students at high risk of dyslexia were significantly different from those of normal students before intervention ($p < 0.001$). After intervention, the final scores of 20 students at high risk of dyslexia were not significantly different from those of normal students ($p= 0.844> 0.05$). The weekly test scores and weekly improvement rate analysis of the curriculum based measurement results of the 20 children at high risk of reading disability showed that the test scores in the tenth week were significantly higher than those in the first week.

Among them, the weekly improvement rate of 16 children was greater than 1, and the weekly improvement rate of the remaining 4 children was less than 1, indicating that the academic achievement and behavior of 16 children were significantly improved and improved in the second level, while the performance of the remaining 4 students was still not significantly improved. Of these 4 students, 2 children went on to the level 3 intervention, and the other 2 children withdrew due to external factors. A more targeted intervention program was developed for the two children in response to their performance at the second level of intervention, and one-on-one intervention was conducted five times a week for 1 hour each time for 4 weeks. The results showed that one student had a weekly improvement rate of more than 1, indicating a response to level 3 intervention, while the other student had a weekly improvement rate of less than 1, indicating no response to level 3 intervention. The nonresponsive student was identified as dyslexic by comprehensive analysis.

It can be concluded from the above that RTI model can effectively and dynamically assess children at high risk of dyslexia in the lower grade of primary school, and early detection of children at high risk of dyslexia, timely and effective intervention can be given to them, and early identification of real dyslexia children.

摘 要 准确和敏感地感知到环境的声音对个体的日常生活很重要，因为它有助于个体对环境做出快速的反应并避免潜在的风险。但是，目前尚不清楚不同母语背景的双语学习经验是否以及如何影响个体环境声音感知的大脑反应。本研究比较了汉-英双语者、西班牙-英语双语者和英语母语者对环境声音感知的大脑反应，并进一步探讨了其加工机制。本研究未发现英语母语者和两组双语者在环境声音感知方面的差异，但是却发现，与西班牙-英语双语者相比，汉-英双语者表现出显著更大的失匹配负波（mismatch negativity, MMN），这表明汉-英双语者对环境声音的感知比西班牙-英语双语者更敏感。此外，与西班牙-英语双语者相比，汉-英双语者表现出显著更大的 theta 振荡，而

且，汉-英双语者的 theta 振荡与 MMN 显著相关，这表明汉-英双语经验在环境声音感知方面的优势可能是由于其自上而下的认知能力增强所致。总之，本研究的发现表明，与西班牙-英语双语者相比，汉-英双语者通过增强自上而下的认知加工机制调节了其在环境声音感知方面的加工优势。

关键词　环境声音感知，汉-英双语者，西班牙-英语双语者，自上而下的认知加工机制

Chinese-English bilinguals are more sensitive to environmental sound perception than Spanish-English bilinguals through top-down cognitive mechanism

Abstract：Sensitive perception to environmental sound is important for an individual's daily life since it helps in responding to the environment quickly and avoiding potential risks. It remains unclear, however, whether and how bilingual experiences with different native language backgrounds influence brain responses reflecting environmental sound perception. The present study compared Chinese-English bilinguals, Spanish-English bilinguals, and English monolinguals on their brain response to environmental sound perception and further examined its processing mechanism. The present study did not find the differences between English monolinguals and two bilingual groups on the environmental sound perception. However, we found that compared with Spanish-English bilinguals, Chinese-English bilinguals showed significantly larger mismatch negativity (MMN), indicating that Chinese-English bilinguals were more sensitive to the environmental sounds than that of Spanish-English bilinguals. Further, compared with Spanish-English bilinguals, Chinese-English bilinguals showed significantly larger theta oscillation. In addition, the theta oscillation is significantly correlated with MMN for Chinese-English bilinguals. The results indicated that the advantage of Chinese-English bilingual experience on environmental sound perception may be due to the enhanced top-down cognitive ability. In summary, these findings suggest that compared with the Spanish-English bilinguals, Chinese-English bilinguals showed an advantage in environmental sound perception via enhanced top-down cognitive modulation.

摘　要：家庭读写环境在儿童早期阅读发展的过程中提供了一个非常重要的环境支持，但已有研究主要聚焦于家长、尤其是父母的作用。已有研究显示在多子女家庭中，同辈兄弟姊妹参与在儿童发展中起着独特的作用，尤其是在父母参与较低的低社会经济地位家庭中。本研究基于干预的设计，考察了在农村多子女家庭中，兄弟姊妹共读参与在小学低年级儿童阅读发展中的作用。60 名 1-2 年级儿童被随机分配到干预组和对照组（每组各 30 名），两组儿童在性别、年龄、家长受教育水平、家庭月均收入、家庭读写资源以及基线水平的阅读测试上都进行了匹配。干预组儿童参与为期八周，每周 2 次，每次 30 分钟的兄弟姊妹共读活动，对照组不进行任何处理。研究结果显示，在 8 周的干预结束后，兄弟姊妹共读组儿童不仅在共读干预故事书中的词汇理解和文本理解上显著优于对照组；同时也在共读干预故事书外的篇章阅读理解上显著高于对照组。本研究的结果扩展了已有主要聚焦于父母作用的家庭读写模型，表明在父母之外，兄弟姊妹读写参与在小学低年级儿童阅读技能的发展中也起着重要的作用。这一研究结果也对促进农村多子女家庭儿童阅读技能的发展提供了重要的基于科学证据的指导。

1 School of Psychology, Northwest Normal University, Lanzhou, China
2 Key Laboratory of Behavioral and Mental Health of Gansu, Lanzhou, China
*Corresponding author E-mail：lishifeng1988@126.com

Abstract: The home literacy environment provides important support for reading development for preschool and early school-aged children; however, existing research has mainly focused on the role of parents. Studies also revealed sibling involvement plays a unique role in child development in multi-child families, especially in families of lower socio-economic status in which parents are hardly engaged with their children. The current study examines the effect of sibling-shared reading on the reading development of children in lower-grade primary schools in rural China via an intervention approach. Sixty children in grades 1-2 in multi-child families were randomly assigned to the intervention and control groups (30 in each group), and the two groups were matched on gender, age, parental education level, family income, home literacy resources, and reading performances at baseline. Children in the intervention group participated in an eight weeks sibling shared-reading activity (2 times a week, and 30 minutes each time), and the control group did not receive any treatment. The results showed that after the 8-week intervention, the children in the intervention group not only performed significantly better than the control group on intervention-based vocabulary comprehension and reading comprehension, but also showed significantly higher performance on reading comprehension beyond intervention materials than the control group. The findings of the present study extended the home literacy model and suggested that sibling is also an important resource in facilitating the reading development of children in multi-child families beyond the parents. The findings of the present study also had important implications in promoting the development of reading skills of children from multi-child families in rural China.

Keywords: Home literacy environment; sibling-shared reading; rural children; intervention

学校环境下语音干预与语义干预对 3 年级汉语阅读障碍儿童的作用

徐琴芳，梁喻然

南京特殊教育师范学院语言学院，南京，240012

通讯作者 E-mail：fangerhappy@163.com

摘　要：阅读障碍影响了儿童的学业成绩和身心发展，但是当下对儿童阅读障碍的认知机制尚且存在争论，普通学校缺乏对阅读障碍有效的干预。本研究基于前期阅读障碍儿童的筛选结果，阅读困难的儿童主要在语音加工和语义加工上存在缺陷，对存在阅读障碍的 3 年级儿童进行了干预。22 名 3 年级阅读障碍儿童根据其缺陷类型分为两组，一组接受词形语音教学干预，另外一组接受词形语义干预。语音干预组儿童在课后参与为期八周，每周 2 次，每次 30 分钟的语音干预，语义干预组在此时间内接受语义干预。研究结果显示，在 8 周的干预结束后，语音干预促进汉语发展性阅读障碍儿童的声母意识、韵母意识、声调意识与音素意识发展；语义组的干预效果更加全面，它不仅训练了阅读障碍儿童的语素意识，而且提高了阅读障碍儿童的阅读成绩。这一研究结果对学校环境下阅读障碍儿童的干预提供了重要的证据。

The Effect of Phonological Intervention and Semantic Intervention on Chinese Dyslexic Students in Grade 3

Xu Qinfang, Liang Yuran

Nanjing Normal University of Special Education, Nanjing, 240012

Correspondence: fangerhappy@163.com

Abstract: Dyslexia influences the children's academic performance and mental development, however, there is no consensus on the mechanism of dyslexia and lack of effective intervention in the mainstream school. This research is conducted on the basis of the results of screening of third graders and found reading difficulties mainly have deficits on phonological and semantic processing. Thus, 22 third graders were divided into two groups according to their difficulties. The first group received phonological intervention twice a week and last 8 weeks. At the same time, the second group received the sematic intervention. The results showed that phonological intervention can improve onset and rhyme, tone and phonological awareness, while the effect of sematic intervention is more comprehensive, which can improve morphological awareness and reading comprehension as well. It also provided evidence for the intervention in the mainstream school for dyslexia.

中小学英语教师语言学知识与教学策略的关系：基于潜在剖面分析

杨一鸣[1] (17-16222) 李世峰[2] 陶沙[1]（通讯作者）
1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875
2 西北师范大学心理学院，兰州，730070
通讯作者：陶沙，taosha@bnu.edu.cn

摘 要 掌握基本语言学知识是中小学英语教师实现有效教学的重要前提，英语教师基本语言知识包括词素意识（morphological awareness）、音素意识（phonemic awareness）、语音技能（phonological skill）、自然拼读（phonics）和语法知识（grammar knowledge）五个构成要素。以 587 名中小学英语教师为研究对象验证英语教师基本语言学知识的潜在剖面结构，并探讨不同知识类型教师的教学策略是否存在差异。结果显示，中小学英语教师语言学知识可分为优势型（10.9%）、均衡型（68.86%）和薄弱型（20.24%）三类。其中，优势型教师的词汇教学显著优于均衡型教师，优势型教师的语音教学和语法教学显著优于薄弱型教师。因此，中小学英语教师在提高自身语言知识水平的同时，应根据自身的优势开展有针对性的教学策略，以提高教学效果。

Teachers' English Language Knowledge and Its Relationship with Instruction：A Latent Profile Analysis

Yiming Yang[1], Shifeng Li[2], Sha Tao[1]
1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875
2 School of Psychology, Northwest Normal University, Lanzhou, 730070

Abstract： This study aimed to validate the potential profile structure of basic linguistic knowledge among 587 primary and secondary school English teachers and examine possible differences in teaching strategies across different knowledge types. The essential components of English teachers' linguistic knowledge, including morphological awareness, phonemic awareness, phonological skill, phonics, and grammar knowledge. Findings revealed three distinct types of linguistic knowledge among the EFL teachers: superior (10.9%), balanced (68.86%), and weak (20.24%). Notably, the superior teachers demonstrated significantly enhanced vocabulary instruction compared to the balanced ones. Furthermore, superior teachers exhibited notable proficiency in phonics and grammar teaching, surpassing the weak teachers in these domains. Therefore， English teachers need to continuously enhance their linguistic knowledge as well as to tailor their teaching strategies based on their individual strengths, ultimately enhancing overall teaching efficacy.

摘 要 高效掌握英语阅读技能对于学业成就和职业成功都至关重要，英语单词解码是第一步。对于促使某些英语学习者比其他同伴更快掌握英语单词解码技能的神经预测指标知之甚少。本研究旨在探讨英语单词解码技能训练获益的个体差异的静息脑电预测指标。为此，我们在小学采用随机干预设计开展了为期一年的研究。在英语单词解码与绘本阅读训练前后，我们测量了学生的睁眼和闭眼静息态脑电、英语单词解码能力、一般认知能力。其中，43名7-10岁小学生完成了训练及训练前后脑电和行为测试。34名同龄对照学生完成了前后测。结果表明，与对照组相比，参加英语单词解码与绘本阅读训练的小学生英语解码能力显著提高。训练组学生训练前睁眼静息态脑电节律有效预测其英语单词解码能力的提高，其中β节律发挥主要的预测作用。在对照组中，没有任何静息脑电特征显著预测其英语单词解码能力的提高。训练前睁眼静息态θ和α节律有效预测英语训练带来的认知获益。总之，研究结果表明，大脑静息态活动的个体差异，尤其是与学习和记忆相关的静息活动特征有效预测小学生英语解码训练获益。这提示，性价比高、耗时短且易于实施的静息态脑电可作为外语解码技能学习和认知能力提高的有效神经指标。

Abstract The ability to acquire English skills efficiently is critical for academic and professional success, yet little is known about the neural mechanisms that drive some children to acquire these skills faster than others. Here we investigated the neural predictors of individual differences in English decoding skills in response to one year, group-based English training programs involving 43 children aged 7 to 10. A passive control group was also included (n = 34). In pre-tutoring and post-tutoring, eyes-closed and eyes-open resting-state EEG recording, English decoding skills, and generally cognitive abilities were measured for all children. Our results illustrate a significant improvement in English decoding skill among the training participants as compared to the control group. Interestingly, pre-tutoring eyes-open resting-state EEG rhythms predicted individual differences in English decoding improvement, with beta band playing an important predictive role. While, no neural measures in the control group predicted improvement in English decoding. Moreover, pre-tutoring resting-state EEG rhythms also forecasted the cognitive gains from English training. In conclusion, our findings underscore that individual difference in resting-state brain activity, particularly those associated with learning and memory, strongly predict the responsiveness to English training in school-age children. This suggests the potential of low-cost, easily-implementable resting-state EEG as sensitive marker of skill acquisition and general cognitive functions.

Keywords**:** English decoding skill, individual difference, resting-state EEG, English training, school-age children

亲子间期望差异与青少年教育规划的关系：基于多项式回归的分析

于凤杰[1]（通讯作者） 张文杰[2] 王瑞洁[2]

1 山东青年政治学院政治与公共管理学院，济南，250103, yufengjie2003@126.com

2 山东师范大学心理学院，济南，250014

摘 要 教育规划是指个体通过思考确定未来教育目标，制定教育计划，执行和实施教育计划的过程，其确立对个体的发展适应具有重要意义。已有研究表明，青少年自我期望和父母期望可以分别从内外部角度影响青少年自身的教育规划水平，但二者是如何相互协调共同发挥作用，尚不明晰。为此，本研究以 794 名高中生为对象，采用问卷调查的方式，考察了亲子间期望差异、父母之间期望差异对青少年未来规划的影响，并进一步分别探讨了青少年与父亲、母亲之间期望差异的不同方向，以及父母之间期望差异的不同方向对青少年自身教育规划的影响。研究结果如下：（1）与青少年自我期望与父亲、母亲期望不一致相比，青少年的教育规划水平在父子期望、母子期望一致情况下均更高；（2）青少年自我期望与父亲、母亲期望一致且一致性水平较高时，教育规划水平更高；（3）分别与父亲、母亲期望高于青少年自我期望相比，青少年自我期望高于父亲、母亲期望时，教育规划水平均更高；（4）与父母之间期望不一致相比，青少年的教育规划水平在父母期望一致情况下更高；（5）父母期望一致且一致性水平较高时，青少年的教育规划水平更高；（6）父母之间期望差异的方向不能显著预测青少年的教育规划。这些结果表明，在对青少年教育规划的干预工作中，要重视亲子间期望差异以及父母期望差异的作用。

The Association between Parent-Child Discrepancies in Expectations and Adolescents' Educational Planning: A Polynomial Regression Analysis

Yu Fengjie[1], Zhang Wenjie[2], Wang Ruijie[2]
1 Shandong Youth University of Political Science, Jinan, 250103, yufengjie2003@126.com
2 School of Psychology, Shandong Normal University, Jinan, 250014

***Abstract*:** Educational planning refers to the process in which individuals think and make decisions about their future educational goals. Previous studies have shown that adolescents' self-expectations and parental expectations can affect the level of adolescent educational planning, but it is not yet clear how the two variables coordinate and interact with each other. Therefore, this study surveyed 794 high school students using questionnaires to investigate the impact of the discrepancies in expectations about future between parent-adolescent and both parents on adolescent future planning. The results show that: (1) Compared to the inconsistency between adolescents' self-expectations and the expectations of fathers and mothers, adolescents' educational planning level is higher when both father-child expectations and mother-child expectations are consistent; (2) When adolescents' self-expectations are highly consistent with those of their parents, the level of adolescent educational planning is higher; (3) Compared with those fathers' or mothers' expectations being higher than adolescents' self-expectations, when adolescents' self-expectations are higher than fathers' or mothers' expectations, adolescents' level of educational planning is higher; (4) Compared to inconsistent expectations between parents, adolescents' educational planning level is higher when parents' expectations are consistent; (5) When parents show consistent expectations and a high level of consistency, adolescents' educational planning level is higher; (6) The direction of the expectation difference between parents cannot significantly predict adolescents' educational planning. These results indicate that in intervention on adolescents' educational planning, attention should be paid to the differences in expectations between parents and adolescents, as well as the role of differences in parental expectations.

***Keywords*:** educational planning, self-expectations, parental expectations, parent-adolescent expectations' difference, parental expectations' difference

10-16 岁儿童青少年执行功能结构：分化和去分化

马建平　翟欣　袁媛　纪林芹（通讯作者）
山东师范大学心理学院，济南，250014，sdjlq@126.com

摘要 执行功能在儿童青少年阶段表现出持续的发展，且对儿童青少年的人际关系、学业成就等非常重要。执行功能的操作化和测量会影响对执行功能的评估。当前对于执行功能的测量、结构及其发展还存在争议。其一，现有研究表明执行功能存在包括单因子、双因子、三因子多种结构；其次，执行功能的结构发展是否具有稳定性还未有定论；最后，执行功能发展是分化还是去分化仍未得到一致的结论。基于此，本研究通过多队列追踪研究的设计考察执行功能的结构及其发展稳定性，以期探究执行功能结构及其发展是否随年龄分化或去分化。以 799 名 4 年级（$M_{年龄}$ = 9.90，SD = 0.60，161 男孩, 113 女孩），6 年级（$M_{年龄}$ = 11.63，SD = 0.56，140 男孩，101 女孩)，8 年级（$M_{年龄}$ = 13.62，SD = 0.68，134 男孩，150 女孩）学生作为研究对象进行为期 3 年共 6 次数据收集。采用抑制（Flanker test，Stroop task）、转换（Dimension Change Card Sort，Picture-Symbol，Wisconsin Card Sorting Test）、更新（The Backwards Digit Span Task，The Ranking Test）等实验任务测量。验证性因子分析和纵向因子分析表明，4 年级队列存在二因子模型到三因子模型的分化，具体表现为转换和抑制的分离；6 年级队列分化和去分化同时存在；8 年级队列显示出稳定的抑制/转换—更新二因子模型。本研究揭示了执行功能结构在儿童青少年期存在双因子和三因子模型，结构发展同时存在分化和去分化，表明执行功能不同成分发育时期不一致，为执行功能的发展和分化提供了依据。

关键词 执行功能，分化和去分化，儿童青少年

The Component Structure of Executive Functions across Age 10 to 16 Years: Differentiation and/or de-differentiation across development

Ma Jianping　Zhai Xin　Yuan Yuan　Ji Linqin
School of psychology, Shandong Normal University, Jinan 250014

Abstract: Executive functioning shows continuous development during childhood and adolescence and it is important to children and adolescents' interpersonal relationships, academic achievement, and so on. The operationalization and measurement of EF is a key issue that directly impact the inferences we can make about these competencies, yet there are consistently arguments regarding the measurement, structure, and development of executive functioning. First, existing research suggests that there are multiple structures of executive functioning, including one-factor, two-factor, and three-factor; second, it is inconclusive whether the structural development of executive functioning is stable; and lastly, there is no consistent conclusion on whether executive functioning develops differentially or de-differentially. Based on this, the present study examined the structure of executive functioning and its developmental stability through a multiple cohort follow-up study design, with the aim of investigating the structure of executive functioning and whether its development differentiates or de-differentiates with age. A total of 799 grade 4 (M_{age} = 9.90, SD = 0.60, 161 boys, 113 girls), grade 6 (M_{age} = 11.63, SD = 0.56, 140 boys, 101 girls), and grade 8 (M_{age} = 13.62, SD = 0.68, 134 boys, 150 girls) students were enrolled in the study for a total of 6 data collections over a 3-year period. Experimental tasks such as inhibition (Flanker test, Stroop task), switching (Dimension Change Card Sort, Picture-Symbol, Wisconsin Card Sorting Test), and updating (The Backwards Digit Span Task, The Ranking Test) to measure executive function. Confirmatory factor analyses and longitudinal factor analyses indicated that two-factor differentiated to three-factor model with grade 4 cohort, implying the separation of switching and inhibition; the structure was not stable for the grade 6 cohort, during which the two- and three-factor models vacillated in their abilities to provide the best description for the data, simultaneous differentiation and de-differentiation exist. and the grade 8 cohort showed a stable bifactorial structure. This study reveals the existence of

two-factor and three-factor models of executive function structure in childhood and adolescence, and the simultaneous existence of differentiation and de-differentiation in structural development, suggesting inconsistencies in the developmental periods of different components of executive functioning, and provide evidence for the development and differentiation of executive functions.

积极同伴特征对初中生学业成绩的影响：社会比较和焦虑的调节作用

陈亮（通讯作者） 张师霞 唐鹤
山东师范大学心理学院，济南，250014， chen_liang1010@126.com

摘 要 同伴群体的特征能够影响到青少年的行为表现，这种影响程度在不同的学生中影响是否一致？为探索这个问题，本研究采用问卷调查法对来自 2 所初中 20 个班级的 898（男生占比 51.3%）名学生进行测量，考察了同伴群体的积极特征对初中生学业成绩的影响，并探讨初中生的社会比较倾向以及焦虑在积极同伴特征和学业成绩之间的调节作用。研究结果如下：（1）积极同伴特征水平越高，学生的学业成绩越高。（2）社会比较和焦虑在积极同伴特征与学业成绩之间起调节作用。具体来说，相较于低焦虑水平的青少年，高焦虑水平的青少年中，积极同伴特征对青少年的学业成绩预测能力更强；对于高比较（高上行比较和高下行比较）倾向的个体，积极的同伴特征负向预测学生的学业成绩；对于单纯下行比较倾向的个体，积极的同伴特征正向预测学生的学业成绩,而对于单纯上行比较倾向和低比较(低上行比较和低下行比较)倾向的个体，积极的同伴特征对学生的学业成绩的预测作用不显著。（3）积极同伴特征、社会比较和焦虑间存在显著的三项交互作用。具体来说，对于高比较倾向、高焦虑的个体来说，积极同伴特征的水平越高，学生的学业成绩越低；对于其他社会比较倾向和焦虑水平的个体来说，积极的同伴特征对学生的学业成绩的预测作用不显著。研究结果揭示了青少年同伴群体特征与其自身学业成绩的关系，同时说明对于不同的个体而言，同伴群体的积极特征所产生的影响并不一致。
关键词 积极同伴特征，学业成绩，同伴影响，调节作用

The Influence of Positive Peer Characteristics on Academic Performance of Junior High School Students: The Moderating Effect of Social Comparison and Anxiety

Chen Liang , Zhang Shixia , Tang He
School of Psychology, Shandong Normal University, Jinan, 250014, chen_liang1010@126.com

Abstract：Peer characteristics can influence adolescent behavior. Is this degree of influence consistent among different students? In order to further explore this issue, this study investigated 898 (boys accounted for 51.3%) students from 20 classes in two junior high schools, examined the impact of positive characteristics of their peers on the academic performance of junior high school students, and explored the moderating role of social comparison tendency and anxiety in the associations between positive peer characteristics and academic performance in junior high school students. The research results are as follows: (1) The higher the level of positive peer characteristics, the higher the students' academic performance. (2) Social comparison and anxiety moderated the relationship between positive peer characteristics and academic

performance. Specifically, compared with adolescents with lower anxiety levels, for those with higher levels of anxiety, positive peer characteristics showed greater effects on adolescents' academic performance; for individuals with higher levels of comparison (high upward comparison and high downward comparison), positive peer characteristics negatively predict students' academic performance; for individuals with pure downward comparison tendency, positive peer characteristics positively predict students' academic performance, whereas for individuals with pure upward comparison tendency and low comparison tendency (low uplink comparison and low downward comparison), positive peer characteristics showed no significant effects on students' academic performance. (3) A significant three-way interaction among positive peer characteristics, social comparison and anxiety was found. Specifically, for individuals with higher comparison tendency and higher anxiety, higher levels of positive peer characteristics are associated with lower academic performance of students; for individuals with other levels of social comparison and anxiety, positive peer characteristics were not significant predictors of student academic performance. The findings revealed the relationship between adolescents' peer characteristics and their own academic performance, and illustrated that the impact of characteristics of peer groups depends on their individual acharacteristics.

Keywords：positive peer characteristics, academic performance, peer influence, moderating effect

父母教育参与与心理控制对学龄儿童发展的联合作用

刘伊宁[1]　邢淑芬[1]（通讯作者）

1 首都师范大学，北京，100048，通讯作者 E-mail：xsf2986@163.com

摘　要　父母教育参与一直是教育研究领域的热点话题，许多研究表明父母教育参与对于儿童的学业成绩有着至关重要的作用。但是，父母高度的教育参与是否总是在儿童发展中产生理想的结果仍然存在争议。大多数研究也只关注父母教育参与程度在儿童学业发展中的作用，而没有同时考虑父母如何参与（即心理控制是高或低的）以及父母教育参与与儿童内化问题的关系，对父母教育参与质量的研究仍然是不充分的。为此，本研究基于以个体为中心的研究视角，采用潜在剖面分析探索青春期早期学龄儿童父母教育参与和心理控制的潜在组合，并探究这些组合与学龄儿童学业成绩和内化问题的关系。本研究以我国北京、山东、河北等多地区 516 名青春期早期的学龄儿童为被试（平均年龄 12.57 ± 1.43 岁, 248 名男孩），采用问卷调查等方法进行数据收集。研究结果发现：1）父母教育参与和心理控制有 5 种潜在组合类型：低参与低控制型（C1; 18.41%），低参与高控制型（C2; 9.30%），中等参与控制型（C3; 44.38%），高参与低控制型（C4; 18.80%），高参与高控制型（C5; 9.11%）；2）处于不同组合类型中的学龄儿童学业成绩与内化问题水平有所不同：在儿童的学业成绩上，高参与低控制型的儿童学业成绩显著大于低参与低控制型、低参与高控制型、中等参与控制型的儿童，中等参与控制型儿童的学业成绩显著大于低参与高控制型的儿童；在儿童的内化问题上，低参与高控制型的儿童内化问题水平显著大于低参与低控制型的儿童，中等参与控制型的儿童内化问题水平显著大于低参与低控制型的儿童，低参与低控制型、低参与高控制型、中等参与控制型、高参与高控制型的儿童显著大于高参与低控制型的儿童。本研究结果对父母教育参与的质量做出了回应，丰富了实证研究结果，并对父母参与子女教育具有指导性意义。

The combined effect of parental involvement and psychological control on the development of school-age children

Liu Yining[1]　Xing Shufen (corresponding author)[1]

1 Capital Normal University, Beijing, 100048, corresponding author E-mail: xsf2986@163.com

Abstract: Parental involvement has always been a hot topic in the field of education research. Many studies show that parental involvement in education plays a crucial role in children's academic achievement. However, whether a high level of parental involvement always produces desirable outcomes in their children's academic development remains controversial. Most studies also only focus on the role of parental involvement in children's academic development, without simultaneously considering how parents participate (i.e., whether psychological control is high or low) and the relationship between parental involvement and children's internalizing problems. The research on the quality of parental involvement in education is still insufficient, and more empirical research is needed. To address this gap, based on an individual-centered research perspective, this study uses latent profile analysis to explore potential combinations of parental educational involvement and psychological control in school-age children in early adolescence, and to explore the relationship between these combinations and children's academic achievement and internalizing problems. This study recruited 516 early adolescent school-age children from various regions in China, including Beijing, Shandong, and Hebei (average age 12.57 ± 1.43 years, 248 boys). Data collection was conducted through questionnaire surveys and other methods. The results show that: 1) There are five potential combinations of parental involvement and psychological control: low involvement and low control (C1; 18.41%), low involvement and high control (C2; 9.30%), medium involvement and control (C3; 44.38%), high involvement and low control (C4; 18.80%), high involvement and high control (C5; 9.11%). 2) The academic achievement and internalizing problems of school-age children of different combination types is different: for the academic achievement of school-age children, C4 is significantly greater than C3, C2, and C1. C3 is significantly greater than C2; for internalizing problems of school-age children, C2 is significantly higher than C1 and C4; C3 is significantly higher than C1; C1, C2, C3 and C5 is significantly higher than C4. These research findings contribute to the understanding of the quality of parental involvement and have practical implications for guiding parents in their involvement in their children's education.

Keywords: parental involvement, psychological control, academic achievement, internalizing problems, latent profile analysis

父母社会比较对儿童学习动机的影响

潘莱珂[1] 洪佩佩[1] 翟舒怡[1] 何洁[2]

1 浙江大学心理与行为科学系，杭州，310030

2 浙江大学心理与行为科学系，杭州，310030，jiehe@zju.edu.cn

摘 要 在竞争日益激烈的教育环境下，社会比较愈发普遍且不可避免。儿童在主动开展社会比较的同时，也会被动地接受他人的比较。父母社会比较倾向水平与使用的社会比较策略可能会对儿童的学习动机产生影响。基于自我拓展理论和自我决定理论，父母的社会比较行为可能会影响儿童的自我认知和心理需要的满足，进而影响其学习动机。在这个过程中，儿童对父母社会比较的认知评价可能扮演着关键的角色。本研究旨在探讨（1）父母社会比较倾向是否会影响儿童的学习动机，以及儿童的认知评价是否会调节这种影响；（2）父母使用的社会比较策略（上行同化、上行对比、下行同化、下行对比）对儿童学习动机的影响。

研究一采用问卷法对 452 名 4-6 年级学生进行调查。结果发现，父母社会比较倾向与儿童的学习动机以及儿童的认知评价之间没有显著的相关性。儿童的认知评价与儿童的学习动机呈正相关。此外，儿童的认知评价在父母社会比较倾向和儿童的学习动机之间起到了调节作用。对具有高认知评价的儿童而言，父母较高的社会比较倾向会引发其更高的学习动机。

研究二对 742 名 4-6 年级学生进行调查，并采用相关分析和潜在剖面分析方法。结果表明，父母上行同化和下行对比策略与儿童的学习动机呈正相关，而上行对比和下行同化策略与儿童的学习动机呈负相关。此外，根据采用的社会比较策略可以将父母分为积极比较策略组（50.6%）、惯用比较策略组（28.4%）和肯定策略缺乏组（21.0%）

三个异质亚组。其中，积极比较策略组父母更倾向于进行上行同化和下行对比，而较少进行上行对比和下行同化。惯用比较策略组父母高频使用四种策略。这两个亚组的儿童表现出更高的学习动机。相比之下，肯定策略缺乏组的父母更倾向于通过上行同化、上行对比和下行同化激励孩子，而很少使用下行对比肯定孩子，该亚组的儿童学习动机最低。

本研究揭示了父母社会比较对儿童学习动机所产生的正向和负向作用。同时，本研究强调了儿童对父母社会比较的主观认知的重要性。这些发现为父母如何合理运用社会比较教育孩子提供了启示。

Effects of parental social comparison on children's learning motivation

Laike Pan　Peipei Hong　Shuyi Zhai　Jie He

Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310030

Abstract: In an increasingly competitive educational environment, social comparison has become more prevalent and unavoidable. Children engage in social comparison actively, while they also being passively exposed to others' comparisons. Parental social comparison tendencies and strategies may have an impact on children's learning motivation. Based on the self-expansion theory and self-determination theory, parental social comparison may affect children's self-awareness and the satisfaction of their psychological needs, which in turn may affect their learning motivation. Children's cognitive appraisal of their parents' social comparison behavior may play a crucial role in this process. This study aims to investigate (1) whether parental social comparison tendencies affect children's learning motivation and whether children's cognitive appraisal moderates this effect, and (2) the impact of parental social comparison strategies (upward identification, upward contrast, downward identification, downward contrast) on children's learning motivation.

In study 1, 452 primary school students in grades 4-6 participated in the questionnaire survey. The results showed that there was no significant correlation between parental social comparison tendencies and children's learning motivation or their cognitive appraisal. However, children's cognitive appraisal was positively related to their learning motivation. Furthermore, children's cognitive appraisal moderated associations between parental social comparison tendencies and children's learning motivation. For children with high cognitive appraisal, higher social comparison tendencies in parents led to higher learning motivation.

Study 2 surveyed 742 students in grades 4-6 and used correlation analysis and latent profile analysis. The results showed that parents' upward identification and downward contrast strategies were positively related to children's learning motivation, while upward contrast and downward identification strategies were negatively related to children's learning motivation. Additionally, parental social comparison strategies could be divided into three heterogeneous subgroups: positive comparison group (50.6%), conventional comparison group (28.4%), and affirmative strategy deficiency group (21.0%). Among them, parents in the positive comparison group tended to use upward identification and downward contrast more, while upward contrast and downward identification less. Parents in the conventional comparison group used the four strategies frequently. Children in these two subgroups showed higher learning motivation. In contrast, parents in the affirmative strategy deficiency group were more likely to use upward identification, upward contrast, and downward identification to motivate their children, while using downward contrast to affirm their children less often. Children in this subgroup had the lowest learning motivation.

This research revealed both positive and negative effects of parental social comparison on children's learning motivation. Additionally, this research emphasized the importance of children's cognitive appraisal about parental social

comparison. These findings provide insights into how parents can use social comparison to educate their children in a reasonable way.

内外化问题和执行功能的关系：年龄和性别差异

王徐志　生雪梅　张文新　纪林芹（通讯作者）

山东师范大学心理学院，济南，250014，sdjlq@126.com

摘 要　研究表明，内外化问题与执行功能相关联，然而纵向发展过程中它们之间关系的方向缺乏探讨。其一，资源分配假说认为，与内化问题相关的适应不良认知模式（例如，反刍、消极想法）可能会占用认知资源，影响执行功能。研究也表明了外化问题会导致执行功能的表现恶化，然而关于外化问题影响执行功能的研究仍较少。其二，现有研究表明执行功能缺陷可能导致广泛的消极行为产生，如学业、同伴问题和心理问题等，是内外化问题发展的潜在风险因素。其三，基于精神病理学的发展级联模型，内外化问题和执行功能之间的关系可能是双向的。因此，本研究以 285 名儿童（M_{age} = 10.81±0.49 岁，57.9%男性）、267 名青少年（M_{age} = 14.75±0.46 岁，46.8%男性）为研究对象进行间隔半年共 4 次（T1-T4）的追踪研究，考察儿童和青少年两个队列中内外化问题和执行功能之间的关系及性别差异。交叉滞后分析表明，不同年级队列中，内外化问题对执行功能的作用不同，高年级更显著。执行功能、内外化问题均具有显著的自回归（除高年级队列中 T2 抑制至 T3 抑制的路径），T1 抑制可以显著预测 T2 更新，T2 更新显著预测 T3 抑制，更高水平的内化问题显著预测半年后更高水平的外化问题（除低年级队列中 T2 内化到 T3 外化的路径）。低年级队列中，T1 和 T3 的内化显著预测半年后的转换，T1 和 T3 的外化显著预测半年后的抑制、转换和更新（除 T2 外化到 T3 更新的路径），路径大多边缘显著。高年级队列中，内化预测半年后的执行功能（抑制，转移和更新），外化预测半年后的抑制，转换预测半年后的内化，且路径均显著。性别差异表明，低年级队列中，T2 内化到 T3 内化和 T3 内化到 T4 内化的预测作用，女孩更显著；内化到转换的预测作用（除 T2 内化到 T3 转换的路径）以及内化到更新的预测作用（除 T2 内化到 T3 更新的路径），男孩更显著；外化到转换的预测作用和外化到更新的预测作用，女孩更显著。本研究表明了内外化问题和执行功能纵向发展的双向关系，揭示了其年龄和性别差异。

The Relationship Between Internalizing and Externalizing Problems and Executive Function: Age and Gender Differences

Wang Xuzhi　Sheng Xuemei　Zhang Wenxin　Ji Linqin

School of psychology, Shandong Normal University, Jinan 250014

Abstract: Previous studies have revealed that internalizing and externalizing problems are linked to executive function, yet the direction of their relationship during longitudinal development is unexplored. The resource allocation hypothesis suggests that maladaptive cognitive patterns associated with internalizing problems (e.g., rumination, negative thoughts) may take cognitive resources away from executive function. Externalizing problems may lead to deterioration of executive function performance, but studies on the effects of externalizing problems on executive function remains scarce. Studies have suggested that executive function deficits are potential risk factors for the development of internalizing and

externalizing problems, and executive function deficits may lead negative behavioral consequences, such as academic, peer problems, and psychological domains. Based on the developmental cascade model of psychopathology, the relationship between internalizing and externalizing problems and executive function may be bidirectional. Therefore, the present study examined the bidirectional relationship between executive function and internalizing and externalizing problems, and gender differences of the association in two children's and adolescents' cohorts with a Four times every six months (T1-T4) study of 285 children (M = 10.81 ± 0.49, 57.9% male) and 267 adolescents (M = 14.75 ± 0.46, 46.8% male). Cross-lagged analyses showed that internalizing and externalizing problems played different roles on executive function in the different grade cohorts, with older grades being more significant. Executive function, internalizing and externalizing problems were significantly autoregressive (except for the path from T2 inhibit to T3 inhibit in the older cohort), T1 inhibit significantly predicted T2 update, T2 update significantly predicted T3 inhibit, and internalizing problems significantly predicted externalizing problems half a year later (except for the path from T2 internalizing to T3 externalizing in the younger grade cohort). In the younger cohort, T1 and T3 internalization significantly predicted shift half a year later, and T1 and T3 externalization significantly predicted executive function (inhibit, update, and shift) half a year later (except for the pathway from T2 externalization to T3 update), and most of these associations were marginal salience. In the older cohort, internalization predicted executive function (inhibit, shift, and update) half a year later, externalization predicted inhibit half a year later, and shift predicted internalization after half a year, and all of these associations were significant. Gender differences indicated that the predictive effects of T2 internalization to T3 internalization and T3 internalization to T4 internalization were stronger for girls in the younger cohort; the predictive effects of internalization to shift (except for the path from T2 internalization to T3 shift) and internalization to update (except for the path from T2 internalization to T3 update) were stronger for boys; and the predictive effects of externalization to shift and externalization to update were stronger for girls. The present study suggests that individual differences in executive function development (age and gender differences) may be influenced by internalizing and externalizing problems in favor of executive function interventions.
Keywords: internalizing and externalizing problems, executive function, cross-lagged analysis, gender difference

同伴关系、多巴胺系统基因与青少年亲社会行为：基于平行潜变量增长模型的分析

李曦[1]　曹衍淼[1]　王舒冉[1]　纪林芹[1]　张文新[1]（通讯作者）

1 山东师范大学心理学院，山东省学生心理健康发展中心，济南，250014，zhangwenxin@sdnu.edu.cn

摘 要　青少年期是亲社会行为发展的关键阶段，该时期亲社会行为的发展模式不仅与个体环境背景的动态变化有关，并且可能会因青少年期的生理过渡性特点而存在较大的个体差异。研究显示青少年早期个体经历了同伴群体的变化、重组，需要重新确立其在同伴群体中的等级地位，因而会对其亲社会行为发展轨迹产生影响。同时，多巴胺系统基因在调节个体对社会奖赏信息的反应性中发挥重要作用，可能影响个体对同伴关系变化的敏感性。基于此，本研究采用动态发展和多基因研究视角，对 1044 名青少年（初测年龄 13.32 ± 0.48 岁, 50.1%女生）进行为期三年的追踪，考察同伴关系（同伴接纳、同伴拒绝）的发展变化对青少年亲社会行为发展变化的影响，以及多巴胺系统基因的调节作用。分别采用同伴提名和同伴评定测评青少年同伴关系和亲社会行为，采用 *DAT1* 基因 rs27072 多态性、*DRD2* 基因 rs1079598 多态性和 *COMT* 基因 rs4680 多态性作为多巴胺系统基因累加得分指标。结果发现：（1）青少年亲社会行为和同伴拒绝均呈线性增长趋势，但同伴接纳没有显著的下降趋势；（2）同伴关系的初始水平能够影响亲社会行为的初始水平以及增长速度。较高的同伴接纳初始水平和较低的同伴拒绝初始水平均与亲社会行为较高的初始水平以及较低的增长速度有关；（3）同伴关系的发展速度能够影响亲社会行为的增长速度。较高的同伴接纳下降速度与较低的同伴拒绝增长速度均与亲社会行为较高的增长速度有关；（4）多巴胺系统多基因累加得分调节

了同伴拒绝初始水平与亲社会行为初始水平以及发展速度间的关系。具体而言，相较于高分组青少年，低分组青少年同伴拒绝的初始水平越高，其亲社会行为初始水平越低且增长速度越快。本研究为青少年期同伴关系与亲社会行为的动态关联以及亲社会行为的多基因遗传基础提供了新的证据，促进了对亲社会行为个体差异和发生发展机制的理解。

Peer Relationships, Dopaminergic Genetic Variants, and Adolescents' Prosocial Behavior: Parallel Latent Growth Modeling Analyses

LI Xi, CAO Yanmiao, WANG Shuran, JI Linqin, ZHANG Wenxin
Shandong Normal University, School of Psychology,
Shandong Provincial Institute of Student Development and Mental Health, Jinan 250014

***Abstract*:** As markers of positive social functioning, prosocial behaviors (i.e., actions that are taken with an intention to benefit others such as sharing, comforting, cooperation, and helping) have drawn increasing attention due to their contributions to enhance adaptive outcomes and mitigate maladaptive outcomes. Adolescence is a critical developmental period for internalizing prosocial values, which may be related to the dramatic changes in developmental background and physiology. Considering the changes and restructuring of peer groups in early adolescents, adolescents need to re-establish their peer status, which may influence the development of prosocial behavior. Moreover, adolescents exposed to peer environments vary widely in their susceptibility to prosocial behavior, often as a result of their genetic predispositions. Behavioral genetics and recent molecular genetics evidence indicated that the genes involved in dopamine neurotransmission and metabolism work in an additive manner to influence the sensitivity to the environment. However, there is a lack of exploration regarding the dynamic trajectory of the relationship between peer relationships and prosocial behavior, and whether the dynamic relationship was moderated by the dopaminergic genes in a longitudinal framework. Adopting the multilocus genetic profile score (MGPS) approach, the present study aimed to explore the dynamic trajectory of the relationship between peer relationships and prosocial behavior, and whether the dynamic association was moderated by dopaminergic genes.

Participants were 1044 adolescents who were followed from age 13 to 15 (mean age 13.32 ± 0.48 years old at Time 1, 50.1% females). Adolescents' saliva samples were collected at age 13. Adolescents' prosocial behaviors were assessed by peer-rated and peer relationships were assessed using the within-classroom peer nomination annually. All measures showed good reliability. The MGPS was compiled by *DRD2* gene rs1079598 polymorphism, *DAT1* gene rs27072 polymorphism, and *COMT* gene rs4680 polymorphism, reflecting the additive effects of alleles conferring relatively increased dopamine activity. Genotyping in three dopaminergic genes was performed for each participant in real-time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom). The parallel latent growth model and multiple group comparison analyses were used to examine the relationship between the developmental trajectories of peer relationships and prosocial behavior and the moderating role of dopaminergic genes.

The results showed that adolescents' prosocial behavior and peer rejection increased linearly while peer acceptance remained relatively stable during the follow-up period. Higher initial levels of peer rejection and lower levels of peer acceptance were associated with lower initial levels and slower growth of prosocial behavior. The change rates of peer relationships were associated with the developmental change of prosocial behavior, that is, the steeper decrease in peer acceptance and the slower increase in peer rejection were associated with a greater increase in prosocial behavior over time. In addition, the relationships between the initial level of peer rejection and the initial level and growth in prosocial behavior

were moderated by MGPS, with lower MGPS being more sensitive to the initial level of peer rejection. These findings lend support to the dynamic relationship between peer relationships and prosocial behavior and shed light on the complex polygenic underpinnings of prosocial behavior.

累积家庭环境风险与青少年攻击行为的非线性关系：5-羟色胺系统多基因的调节作用

迟晓慧[1]　曹衍淼[1]　宋晓凡[1]　纪林芹[1]　张文新[1]（通讯作者）

山东师范大学心理学院，山东省学生心理健康发展中心，济南，250014，zhangwenxin@sdnu.edu.cn

摘 要　诸多家庭环境风险通常不是独立影响青少年的攻击行为，而是呈现出风险累积效应。累积环境风险与青少年攻击行为的关系模式具有多样性，一些研究发现累积环境风险会线性增加个体攻击行为的风险，但是也有研究发现随着累积环境风险因素的增多，攻击行为的风险呈加速增长模式或者呈现减速增长（高原期）模式。然而，个体对家庭累积环境风险的敏感性或反应性存在较大的差异。特别是，研究发现 5-羟色胺系统基因通过调节杏仁核等环境敏感性脑区功能影响个体对环境的反应模式。因此，本研究关注累积家庭环境风险与青少年攻击行为的线性与非线性作用模式，并深入探讨携带不同 5-羟色胺系统基因的个体对累积环境风险的反应模式差异。本研究以 1088 名青少年(平均年龄 14.32 ± 0.48 岁, 50.1%女生)为被试，采用家庭社会经济地位、亲子冲突、母亲消极教养作为累积环境风险指标，采用 *5-HTR1A* 基因 rs6295 多态性、*5-HTR2A* 基因 rs6311 多态性、*TPH1* 基因 rs1800532 多态性作为基因累加得分指标。结果发现：（1）相比任一环境风险，累积环境风险对青少年攻击行为的预测作用更强；（2）累积环境风险与青少年攻击行为呈 J 型关系，即累积环境风险越高则个体攻击行为风险呈加速增长模式；（3）5-羟色胺系统基因在累积家庭环境风险和攻击行为间发挥调节作用，在携带较多 5-HT 风险基因的青少年中，累积家庭环境风险得分过高或过低的个体均表现出高攻击行为；但是在携带较少 5-HT 风险基因的青少年中，累积环境风险及其二次项均与青少年的攻击行为无显著关联。本研究关注累积家庭不利环境对青少年攻击行为的作用模式，发现随着环境风险因素数量的增多，个体攻击行为的风险不是简单地线性叠加而是呈加速增长模式，这一结果提示在攻击行为的预防和干预中，通过改善家庭不利环境可能达到“事半功倍”的效果。同时，本研究发现不同基因型携带者对家庭不利环境的敏感性存在差异，这也提示青少年的环境敏感性模式存在多样性，并非所有青少年均遵循非线性的环境敏感性模式。

关键词　累积环境风险，5-羟色胺多基因，非线性，攻击行为

The J-shaped Relationship Between Cumulative Family Environmental Risk and Adolescent Aggressive Behavior: The Moderating Role of Serotonin System Genes

CHI Xiaohui; CAO Yanmiao; SONG Xiaofan; JI Linqin; ZHANG Wenxin

Shandong Normal University, School of Psychology,

Shandong Provincial Institute of Student Development and Mental Health, Jinan 250014

***Abstract*:** Numerous studies have indicated that family environmental risks are important etiological factors of adolescent aggressive behavior. However, different family environmental risks do not independently affect adolescent

aggressive behavior, but work in a cumulative way. Inconsistent results were observed regarding the relationship between cumulative environmental risk and adolescent aggressive behavior. Some studies have found that cumulative environmental risk linearly increases the risk of individual aggressive behavior, while other studies have found that with the increase of cumulative environmental risk factors, the risk of aggressive behavior shows an accelerated increase pattern or a deceleration increase (plateau period) pattern. In addition, there are significant differences in the sensitivity or responsiveness of individuals to cumulative family environmental risks. In particular, previous studies found that the 5-hydroxytryptamine system gene affects the individuals' response mode to the environment by regulating the function of brain regions related to environmental sensitivity, such as the amygdala. Therefore, this study focused on the linear and non-linear patterns of cumulative family environmental risks on adolescent aggressive behavior and explored the moderating role of serotonin system genes.

Participants were 1088 adolescents (50.1% females, M_{age} = 14.32 ± 0.48 years). Mother-reported family socio-economic status and negative parenting, adolescent-reported parent-child conflict, and teacher-reported adolescent aggression were collected. The cumulative family environmental risk score was created by family socio-economic status, parent-child conflict, and negative parenting. The MGPS was created by *5-HTR1A* rs6296 polymorphisms, *5-HTR2A* rs6311 polymorphisms, and *TPH1* rs1800532 polymorphisms. DNA was extracted from saliva and genotyping in serotonin system polygene were performed for each participant in real-time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom).

The results showed that: (1) Compared to any environmental risk, cumulative environmental risk score has a stronger predictive effect on adolescent aggressive behavior. (2) There was a J-shaped relationship between cumulative family environmental risk score and adolescent aggressive behavior. (3) The relationship between cumulative family environmental risk score and adolescent aggressive behavior was moderated by serotonin system polygene. Specifically, compared to adolescents with lower MGPS, adolescents with higher MGPS exhibited higher levels of aggressive behavior when experiencing higher or lower levels of cumulative family environmental risk.

This study focused on the pattern of the cumulative family adverse environment on adolescent aggressive behavior, which found that with the increase of the number of environmental risk factors, the risk of individual aggressive behavior is not simply a linear superposition but an accelerated growth pattern. These findings suggested that it could yield twice the result with half the effort in the prevention and intervention of aggressive behavior, by improving the family adverse environment. Meanwhile, this study shed light on the complex polygenic underpinnings of adolescent aggressive behavior.

气质对青少年内外化问题的影响：亲子亲合与唾液淀粉酶的作用

王玲晓　于晓明　潘腾　纪林芹（通讯作者）
山东师范大学心理学院，济南，250014，sdjlq@126.com

摘 要　气质对青少年内外化问题具有重要影响，但气质“如何”以及“何时”影响青少年内外化问题仍不明晰。气质理论强调儿童气质是亲子关系质量的基础。同时，高亲子亲合的父母不仅能够为子女发展提供有效支持，还能够促使子女愿意与其沟通，这都可能降低子女内外化问题。因此，亲子亲合在气质与内外化问题间可能存在中介作用。此外，交感神经系统可能与气质、亲子亲合共同影响青少年内外化问题。交感神经系统与气质同属于环境反应性的多系统表征，可以交互影响青少年内外化问题，可在一定程度上解释为何相同环境会使部分个体适应良好，而使另外个体出现适应不良。本研究以 505 名五（$M_{年龄}$=10.49±0.54，男生占 56.4%）、七（$M_{年龄}$=12.39±0.51，男生占 64.9%）和九（$M_{年龄}$=14.45±0.59，男生占 39.1%）年级青少年作为被试，进行间隔半年的两次追踪调查，考察不同气质对青少年内外化问题的影响及亲子亲合的中介作用和唾液淀粉酶的调节作用。结果发现：（1）意志控制负向预测外化问题，恐惧正向预测内化问题；（2）亲子亲合在意志控制/易受挫性与外化和内化问题间的中介效应显著，但亲子亲合

在恐惧与外化和内化问题间的中介效应不显著；（3）唾液淀粉酶调节中介的直接路径“意志控制→外化和内化问题”和“易受挫性→外化问题”及中介的后半路径“亲子亲合→内化问题”，具体而言，在高唾液淀粉酶情况下，意志控制负向预测外化和内化问题，易受挫性正向预测外化问题，亲子亲合对内化问题的负向预测作用减弱。结果提示，气质、亲子关系及生理特征共同影响青少年内外化问题行为，因而为降低问题行为需要针对个体差异制定有效预防和干预策略。
关键词：气质，亲子亲合，唾液淀粉酶，内外化问题

Temperament on Adolescents Externalizing and Internalizing Problems: The Role of Parent-Child Cohesion and Salivary Amylase

WANG Lingxiao　Yu Xiaoming　Pan Teng　Ji Linqin
School of Psychology, Shandong Normal University, Jinan 250014

***Abstract*:** Previous studies have revealed that temperament predicted adolescents' externalizing/internalizing problems. However, it was still unclear that "how" and "when" temperament influenced externalizing/internalizing problems. Temperament theory emphasizes that children's temperament is the basis of parent-child relationship quality. Meanwhile, parents with high parent-child cohesion could not only provide effective support for children's development, but also promote children's willingness to communicate with them, which might reduce children's problem behaviors. Thus, parent-child cohesion might play a mediating role between temperament and problem behaviors. Moreover, sympathetic nervous system, temperament, and parent-child cohesion might jointly affect adolescent' problems behaviors. Both the sympathetic nervous system and temperament are multi-system representations of environmental reactivity, which can interactively affect adolescent' problems behaviors. The sympathetic nervous system may partly explain why the same environment makes some individuals well-adjusted and others maladaptation. In this study, 505students of Grade 5 (M_{age} =10.49 ± 0.54 years; 56.4% boys), 7 (M_{age} =12.39 ± 0.51 years; 64.9% boys), and 9 (M_{age} =14.45 ± 0.59 years; 39.1% boys) participated in study and completed two surveys six months apart. This study intends to investigate the longitudinal relationship between temperament and externalizing/internalizing behaviors, and examined the mediating effect of parent-child cohesion and the moderating effects of salivary amylase on the relationship. Results showed that: (1) effortful control negatively predicted externalizing behaviors six months later, fear positively predicted internalizing behavior six months later; (2) parent-child cohesion mediated the associations between effortful control/frustration and externalizing/internalizing behaviors six months later; (3) salivary amylase moderated the association between effortful control and externalizing/internalizing behaviors six months later, the association between frustration and externalizing behaviors six months later, the association between parent-child cohesion and internalizing behaviors six months later. Specifically, effortful control negatively predicted externalizing/internalizing behaviors, frustration positively predicted externalizing behaviors when salivary amylase were high. And the negative effect of parent-child cohesion on internalizing behaviors was smaller under a high salivary amylase. The results reveal the link of temperament, physiological response, parent-child relationship, and externalizing/internalizing behaviors, and suggest that it is necessary to develop effective prevention and intervention measures for individual differences.
Key words: temperament, parent-child cohesion, salivary amylase, externalizing and internalizing problems

FKBP5 基因与同伴侵害对青少年攻击行为的交互作用：基于潜变量增长模型的分析

宋晓凡[1]　曹衍淼[1]　迟晓慧[1]　纪林芹[1]　张文新[1]（通讯作者）

1 山东师范大学心理学院，山东省学生心理健康发展中心，济南，250014，zhangwenxin@sdnu.edu.cn

摘 要　随着全球攻击与暴力问题日趋严重，儿童青少年攻击行为的发展和干预受到研究者的广泛关注。儿童青少年攻击行为的发展主要涉及两个关键问题：一是攻击行为发展的连续性和稳定性，二是攻击行为的个体差异。已有攻击的发展研究主要围绕攻击的发展轨迹展开，但是对于攻击发展轨迹的个体差异，特别是个体的遗传差异及其与环境的交互作用对攻击发展轨迹的研究相对较少。基于此，本研究基于潜变量增长模型，对 1076 名初一青少年（初次测评时 M_{age} = 13.32 岁, SD = 0.49; 女生占 50.2%）进行为期三年的追踪调查。通过建立潜变量增长模型，描述青少年早期攻击行为的发展轨迹，揭示不同类型的同伴侵害（身体侵害、关系侵害）、*FKBP5* 基因以及两者的交互作用对攻击初始水平和发展趋势的影响。采用自我报告测评青少年身体侵害和关系侵害，教师报告测评攻击行为，并通过唾液提取 DNA 样本对 *FKBP5* 基因 rs9470080 多态性进行基因分型。结果发现：（1）在青少年早期（13~15 岁）青少年攻击水平保持稳定，无显著上升趋势，但无论是攻击初始水平还是发展速度均存在明显的个体差异，且攻击初始水平与发展速度间呈显著负相关；（2）关系侵害不仅显著正向预测攻击的初始水平，还能显著正向预测攻击的发展速度，身体侵害仅正向预测攻击的发展速度，但 *FKBP5* 基因对攻击行为初始水平和发展速度的预测作用均不显著；（3）*FKBP5* 基因与关系侵害而非身体侵害交互预测攻击的初始水平和发展速度，具体表现为，相较于携带 CT 基因型的青少年，CC 基因型携带者对关系侵害更为敏感，而表现出更高的攻击初始水平和更大的增长速度。本研究发现青少年早期攻击行为的发展具有高度的稳定性，有助于在理论上深入理解青少年攻击的发展规律。同时，本研究发现具有遗传风险且遭遇更多关系侵害的青少年更可能具有更高的增长速度，这提示青少年期对人际关系具有较高的敏感性，并且攻击是具有明显个体差异性的行为，因而在攻击的预防和干预工作中需考虑个体的环境敏感性差异。

Abstract: Aggression in adolescents is a major concern for researchers and educators alike. This behavior that deliberately aims to harm others has a long-lasting effect on the psychological and physical health of individuals as well as on the social fabric more broadly. The developmental continuity and change, and the individual difference in aggression are two pivotal issues in aggression research. However, previous studies primarily focused on the general development of adolescent aggressive behavior, and little is known about the individual differences in aggression trajectory, especially the gene-environment interaction mechanism underlying the development of adolescent aggressive behavior. Adopting the latent growth modeling approach, this study aimed to explore the developmental trajectory of aggressive behavior in early adolescence, and whether *FKBP5* rs9470080 polymorphism and peer victimization (physical victimization, relational victimization) interact to influence the development of adolescent aggressive behavior.

Participants were 1076 adolescents who were followed from age 13 to 15 (mean age 13.32 ± 0.49 years old at Time 1, 50.2% females). Adolescents' saliva samples and self-reported peer victimization were collected at age 13. Adolescents' aggressive behaviors were assessed by teacher-reported annually. All measures showed good reliability. Genotyping was performed for each participant in real-time with MassARRAY RT software version 3.0.0.4 and analyzed using the MassARRAY Typer software version 3.4 (Sequenom). Latent growth curve models (LGCM) were conducted to explore the developmental trajectory of aggressive behavior and its gene-environment interaction mechanism.

The results showed that the aggressive behavior remained relatively stable during the follow-up period with significant individual variances in both the initial level and the growth rate of adolescent aggressive behavior. There was a significant negative correlation between the initial level and the growth rate of aggression. Relational victimization significantly positively predicts the initial level and the growth rate of adolescent aggressive behavior, while physical victimization only positively predicts the growth rate of aggression. The main effects of the *FKBP5* gene on the initial level and the growth rate of aggression were not significant. The *FKBP5* gene interacts with relational victimization to influence the initial level and the growth rate of aggression. Specifically, compared to adolescents carrying the CT genotype, CC genotype carriers are more sensitive to relational victimization, exhibiting higher initial levels of aggression and greater growth rates.

These findings supported the high stability of adolescent aggression, and the interaction between the *FKBP5* and relational victimization on the development of aggressive behavior, which shed light on the necessary of considering improving interpersonal relationships and individual differences in environmental sensitivity in the prevention and intervention of aggression.

Keywords: aggressive behavior, peer victimization, *FKBP5* gene, latent growth modeling

多巴胺系统基因与母亲心理控制对学前儿童攻击行为的交互作用：一项多基因研究

帅星宇[1]　邢淑芬[1]（通讯作者）

1 首都师范大学心理学院，北京，100048，通讯作者邮箱：xsf2986@163.com

摘　要　消极的教养方式是儿童青少年攻击行为产生和发展的重要风险因素，心理控制作为一种典型的侵入式教养方式会对个体心理和行为产生影响，并与一系列消极结果有关。近二十年来,基于分子遗传学范式的研究考察了遗传因素对攻击行为的影响,确定了攻击行为的系列风险基因及其基因—环境的交互作用机制，然而,随着系列研究的深入,单基因研究如遗传解释率不足、小效应量、结果的不可重复性等局限性日益凸显,越来越多的研究强调考察攻击行为多基因遗传机制的重要性。因此，本研究基于基因－环境交互作用的研究范式，采取整群抽样的方法，选取 339 名学前儿童（197 名男孩，M_{age} = 5.42 岁）及其母亲、教师进行测查，采用问卷法、实验法和 DNA 分型技术，考察多巴胺系统基因与母亲心理控制对学前儿童攻击行为的交互作用及具体作用形式。结果发现：（1）在控制儿童年龄后，母亲心理控制的直接效应显著，即母亲心理控制正向预测学前儿童的攻击行为。多巴胺系统基因累加得分的直接效应不显著；（2）多巴胺系统基因与母亲心理控制显著交互作用于学前儿童的攻击行为，符合"素质压力模型"，即相比多巴胺系统基因累加得分较低的儿童,得分较高的儿童在经历高母亲心理控制后表现出更多的攻击行为。研究结果有助于从多基因累加得分与家庭环境交互作用的视角揭示儿童攻击行为的产生，并为有效预防与干预学前儿童的攻击行为提供了支持。

关键词　母亲心理控制,多巴胺系统基因，攻击行为，基因×环境交互作用

Interaction between dopamine system genes and maternal psychological control on aggressive behaviour in preschool children: a multigene study

Shuai Xingyu[1] Xing Shufen[1]
[1] Capital Normal University, Beijing, 100048, corresponding author E-mail: xsf2986@163.com

Abstract： Negative parenting styles are important risk factors for the emergence and development of aggressive behaviour in children and adolescents, and psychological control, a typically intrusive parenting style, can have an impact on individual psychology and behaviour and is associated with a range of negative outcomes. In the past two decades, studies based on the molecular genetics paradigm have examined the influence of genetic factors on aggression and identified a series of risk genes for aggression and their gene-environment interaction mechanisms; however, as the series of studies have progressed, the limitations of single-gene studies, such as the insufficient genetic explanatory rate, small effect sizes, and the irreproducibility of the results have become increasingly prominent, and more and more studies have stressed the importance of examining the multigene genetic mechanisms of aggressive behaviour. Therefore, based on the research paradigm of gene-environment interaction, the present study adopted the whole population sampling method to select 339 preschool children (197 boys, Mage = 5.42 years), their mothers, and their teachers, and used questionnaires, experimental methods, and DNA typing techniques to examine the effects of the genes of the dopamine system and the mothers' psychological control on the aggressive behaviours of the preschool children and the specific forms of the effects. interaction and specific forms of action.The results showed that: (1) the direct effect of maternal psychological control was significant after controlling for the age of the child, i.e., maternal psychological control positively predicted preschool children's aggressive behaviour. The direct effect of cumulative dopamine gene scores was not significant; (2) dopamine genes interacted significantly with maternal psychological control on preschool children's aggressive behaviour, in line with the "diathesis stress mode", i.e., children with higher cumulative dopamine scores showed more aggressive behaviour after experiencing high levels of maternal psychological control, compared to those with lower cumulative dopamine gene scores. more aggressive behaviours than children with lower dopamine system gene accrual scores. The results of this study shed light on the development of aggression in children from the perspective of the interaction between polygenic cumulative scores and the family environment, and provide support for the effective prevention and intervention of aggression in preschool children.

Keywords ： maternal psychological control,dopamine system genes,aggressive behaviour,gene x environment interaction

社会角色影响儿童亲社会认知与行为

吴璇[1] 柴乔[1] 何洁[2]
1 浙江大学心理与行为科学系，杭州，310030

摘 要 受启蒙运动的影响，西方当代的道德理论和道德实践更加强调道德的普遍性和公平性。然而，包括中国在内的许多传统文化则强调角色伦理，认为个体在社会生活中的道德义务在很大程度上由其所承担的社会角色所决定。本研究旨在探究，在社会化的过程中，学前儿童是否已经习得这种内嵌于社会角色的道德行为，并且考察观察学习在其中的作用。研究招募了 128 名年龄为 6 至 7 岁的儿童，给予他们不同的社会角色（自身角色：值日生与非值日生），通过使用独裁者游戏范式考察其分享行为。在做出分享决策之前，他们会观察视频中多名同伴进行慷慨分享（视频角色：值日生与非值日生）。看完视频后，儿童进行自己的分享，并回答一系列关于自身角色分享行为的认知和评价问题。

研究结果表明：（1）儿童的分享行为受自身角色影响，相比于非值日生条件，当儿童被赋予值日生角色时，他们的分享数量更多；（2）儿童对分享行为的义务认知受视频中同伴角色的影响，当儿童观看值日生同伴进行慷慨分享的视频时，他们更倾向于认为慷慨分享是义务之内的；（3）视频角色不仅影响儿童对于非慷慨分享的评价，且与自身角色存在交互影响，当儿童观看值日生的视频后，他们对非慷慨分享的同伴的评价更低，且在自身角色也是值日生时评价最低；（4）在控制角色变量后，儿童的分享行为与义务认知有显著的相关（r 的范围为 0.184 到 0.340），与行为评价也有显著的相关（r 的范围为 0.233 到 0.236）。这些结果说明：学前儿童已经能够通过观察学习习得内嵌于社会角色的道德行为。社会角色通过影响学前儿童的义务认知和道德行为评价，一定程度导致了道德行为的差异。

Social Roles Influence Children's Prosocial Cognition and Behaviors

Xuan Wu　Qiao Chai　Jie He

Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310030

Abstract：Under the influence of the Enlightenment, modern moral theory and practice in the West emphasize the universality and fairness of morality. However, in many traditional cultures, including China, the view of role ethics is underlined, proposing that the moral obligations of individuals in social life are largely determined by the social roles they assume. The purpose of this study is to explore whether preschoolers have acquired the moral behavior embedded in social roles in the process of socialization, and to examine the role of observational learning in this process. 128 children aged 6 to 7 years were recruited and assigned different social roles (Self roles: duty vs. non-duty). Using the dictator game paradigm, we examined children's sharing behavior. Before making a sharing decision, children observed multiple peers sharing generously in the same sharing task (Video roles: duty vs. non-duty). After watching the video, children made their own sharing decision and answered a series of cognitive and evaluation questions about sharing behavior of their own roles.

The results showed that: (1) Children's sharing behavior was affected by their own roles. Compared with non-duty roles, children shared more when they were assigned the duty role. (2) The type of children's obligation cognition of sharing behaviors was influenced by the role of peers in the video. When children watched the video of generous sharing by peers on duty, they were more inclined to believe that generous sharing is obligatory. (3) Video roles not only affected children's evaluation of not generously sharing, but also interacted with Self roles. When children watched the videos of peers on duty, their evaluation of not generously sharing was lower, and when their own roles were on duty, their evaluation was the lowest. (4) After controlling for role variables, children's sharing behavior had a significant correlation with obligation cognition (*rs* ranging from 0.184 to 0.340), and also a significant correlation with behavioral evaluation (*rs* ranging from 0.233 to 0.236). These results suggest that preschoolers can acquire the moral behavior embedded in social roles through observational learning. Social roles lead to differences in moral behavior to some extent by influencing preschooler's obligation cognition and evaluation of moral behavior.

揭示复杂性：超越整体，青少年抑郁症海马亚区结构的分割及其与认知的关系

张艺馨[1] 刘轩[1] 杨楹[2] 王康程[1]（通讯作者） 张文新[1]

1 山东师范大学心理学院，济南，250014

2 山东省精神卫生中心，济南，250014，wangkangcheng@sdnu.edu.cn

摘 要 背景：青少年处于大脑发育关键时期，罹患抑郁会导致神经解剖及认知发育异常。多项神经影像学研究发现，包括青少年患者在内，重度抑郁症出现海马异常。海马功能可以反映到解剖学定义的海马亚区上。然而，鲜有研究考察青少年重度抑郁症患者海马亚区紊乱的变化趋势及其与认知功能异常的关系。

方法：我们入组了 79 例重度青少年抑郁症患者（男生占 21.5%，年龄=15.54±1.83 岁）和 71 名健康青少年对照组（男生占 32.4%，年龄=16.18±2.85 岁），对被试进行磁共振扫描。采用儿童抑郁量表、自杀和自伤量表、贝克自杀意念量表、自杀风险评估量表以及病程衡量抑郁的严重程度。采用 9 个认知测试测量记忆、认知控制、注意能力。使用 FreeSurfer v6.0 将海马分割为 12 个亚区。采用混合方差分析评估患者和对照组海马亚区体积的差异，并根据严重程度对比严重抑郁患者和轻度抑郁患者在亚区结构上的差异。最后，使用套索回归探索海马亚区与患者认知异常的关联。

结果：方差分析显示，患者组海马的 CA1，CA2/3，CA4，齿状回，海马尾，海马裂和分子层区域表现出严重萎缩。不论自杀、自伤或病程分组，严重抑郁患者的海马亚区都表现出更加广泛的萎缩，主要表现在 CA1-4 到旁下托区域。套索回归结果显示，海马亚区萎缩与患者记忆功能异常关联最强，与认知控制、注意关联较弱，同时海马亚区的齿状回，CA4 所占权重最大。

结论：青少年抑郁患者海马异常表现在主要的亚区结构。随着严重程度，海马亚区的萎缩呈 CA 区域往周围区域扩散趋势。这种趋势是以影响记忆功能为主要发展变化。这些结果确定了罹患抑郁后海马的核心神经标志物，表明了青少年抑郁疾病进展的潜在标记，为临床早期干预提供了新的方向。

Revealing Complexity: Beyond the Whole, Segmentation of Hippocampal Subfields and its Relation with Cognition in Adolescents with Depression

Yixin Zhang[1] Xuan Liu[1] Ying Yang[2] Kangcheng Wang[1] Wenxin Zhang[1]

1.Institute of Shandong Normal University Psychology, Jinan

2. Shandong Mental Health Center, Jinan

Abstract ： Background: Adolescents are in a critical period of brain development, and depression can lead to neuroanatomical and cognitive abnormalities. Several neuroimaging studies have found hippocampal abnormalities in major depressive disorder (MDD), including adolescents. The function of hippocampus can be reflected in the anatomically defined hippocampal subfields. However, few studies have investigated the atrophy trend of hippocampal subfields and its relation with cognitive dysfunction in adolescents with MDD.

Methods: We recruited 79 adolescents with MDD (Males 21.5%, Mage = 15.54±1.83) and 71 healthy controls (Males 32.4%,

Mage = 16.18±2.85), all of them completed MRI scans. The severity of depression was measured by the Children Depression Inventory (CDI), Ottawa Self-injury Inventory (OSI), Beck Scale for Suicide Ideation (BSI), Nurses' Global Assessment of Suicide Risk scale (NGASR) and illness duration. Nine cognitive tasks were used to measure the ability of memory, cognitive control and attention. Hippocampus were segmented by Freesurfer v6.0 into twelve subfields. Mixed-method Analysis of Variance (ANOVA) was performed to assess the volume differences of hippocampal subfields between MDD and HC. The volume differences in hippocampal subfields between patients with different depression severity were compared, too. Finally, the Least Absolute Shrinkage and Selection Operator (LASSO) regression was used to explore the association between hippocampal subfields and cognitive abnormalities in patients.

Results: Results of ANOVA showed that there are significant hippocampal subfields atrophy in CA1, CA2/3, CA4, dentate gyrus of MDD patients. Hippocampal subfields of all the high depression group showed more extensive atrophy, mainly in the CA1-4 and parasubiculum. LASSO regression showed that hippocampal atrophy had the strongest association with abnormal memory function, and was weakly associated with cognitive control and attention. Meanwhile, CA4 and dentate gyrus had the biggest weight in the LASSO model.

Conclusions: Hippocampal abnormalities in adolescent MDD patients was discovered in the main subfields. With depression severity deepen, the atrophy of the hippocampal substructures showed a tendency that spread from the CA region to the surrounding subfields. This trend mainly affects memory function of MDD patients. These results identified core neural markers in the hippocampus after depression, indicating potential markers of adolescent depressive disease progression and providing new directions for early clinical intervention.

青少年童年创伤经历与抑郁症状、自杀意念的关系：基于潜在剖面分析

贤业敏　胡宇飞　邓会成　陈光辉（通讯作者）

山东师范大学心理学院，济南，250014，chengh2100@126.com

摘 要　童年创伤是青少年抑郁症状和自杀意念的风险因素。以往研究主要关注特定类型创伤对个体心理健康的影响，而忽略了多重创伤。事实上，儿童更多是遭受多种类型的虐待和忽视，这会对其造成更严重、持久的负面影响。采用潜在剖面分析方法（Latent profile analysis, LPA）可以揭示不同创伤类型的叠加效应。本研究旨在探究中国青少年童年创伤经历的潜在类别分布特征，了解童年创伤经历不同亚群组的影响因素及其对抑郁症状和自杀意念的预测作用。采取整群抽样法选取山东、山西、天津、陕西、河南、甘肃、上海七个省市 3 至 12 年级 24323 名青少年（平均年龄 13.95±2.21 岁，女生 12820 名）为被试。采用童年创伤问卷（Childhood Trauma Questionnaire, CTQ）评估被试的童年创伤经历，儿童抑郁量表(Children's Depression Inventory, CDI)和自编的自杀意念问卷评估被试的抑郁情绪及自杀意念。研究结果发现：1）青少年童年创伤经历可分为四种亚群组：严重创伤组(2.3%)、轻度创伤组（3.5%）、严重忽视组（12.4%）和无创伤组（82.8%）。2）以无创伤组为参考，与女性相比，男性更有可能属于轻度创伤组和严重创伤组；与居住在农村的青少年相比，城市青少年更有可能属于无创组；父亲或母亲的受教育水平越高，青少年越有可能属于严重创伤组。3）严重创伤组青少年抑郁水平显著高于严重忽视组、轻度创伤组和无创伤组，严重忽视组和轻度创伤组无显著差异。4）与无创组相比，轻度创伤组、严重创伤组和严重忽视组均能显著正向预测自杀意念。本研究在一个全国性的大样本中确定了青少年童年创伤经历的潜在类别，可以基于此结果制定更具有针对性的干预和治疗方案，进而降低青少年抑郁和自杀意念的风险。

The Association Between Childhood Trauma and Depressive Symptoms, Suicidal Ideation in Adolescents: A Latent Profile Analysis

Yemin Xian, Yufei Hu, Huicheng Deng, Guanghui Chen*
School of Psychology, Shandong Normal University, Jinan 250014

Abstract: Childhood maltreatment is a risk factor for depressive symptoms and suicidal ideation in adolescents. Previous research has predominantly focused on the impact of specific types of maltreatment on individuals' mental health, thereby overlooking the effects of multiple maltreatment. In reality, children who have experienced multiple maltreatment tend to have more severe and enduring negative outcomes. By utilizing latent profile analysis (LPA), the cumulative effects of different subtypes of maltreatment can be revealed. This study aims to explore profiles of childhood maltreatment among Chinese adolescents and identify the influencing factors of different subgroups, as well as the impact of different latent profiles on depression and suicidal ideation. Using a cluster sampling method, a total of 24,323 adolescents (M_{age}= 13.95, *SD*= 2.21; 52.8% females) were selected from seven provinces and cities in China, including Shandong, Shanxi, Tianjin, Shaanxi, Henan, Gansu, and Shanghai, spanning grades 3 to 12. The Childhood Trauma Questionnaire (CTQ) was employed to assess participants' childhood trauma experiences, while the Children's Depression Inventory (CDI) and a self-developed suicidal ideation questionnaire were used to evaluate their depressive mood and suicidal ideation. The results revealed that: 1) LPA identified four subgroups: severe trauma group (2.3%), mild trauma group (3.5%), severe neglect group (12.4%), and non-trauma group (82.8%). 2) Using non-trauma group as reference, males were more likely to be assigned to the mild trauma group and severe trauma group compared to females. Urban adolescents were more likely to be assigned to the non-trauma group compared to rural adolescents. Higher educational attainment of fathers or mothers was associated with a higher likelihood of adolescents belonging to the severe trauma group. 3) The severe trauma group exhibited significantly higher levels of depression compared to the severe neglect group, mild trauma group, and non-trauma group, while no significant differences were observed between the severe neglect group and mild trauma group. 4) In comparison to the non-trauma group, both the mild trauma group and severe trauma group, as well as the severe neglect group, significantly positively predicted suicidal ideation. Overall, this study identifies distinct subgroups of childhood maltreatment among a large national sample of adolescents in China. These findings can contribute to guiding targeted interventions and treatments aimed at reducing the risks of depression and suicidal ideation among adolescents who have experienced childhood maltreatment.

过犹不及——父母直升机教养与学龄儿童内化问题

赵晶晶[1] 王文慧[1] 邢淑芬[1]（通讯作者）
1 首都师范大学，北京，100048，通讯作者 xsf2986@163.com

摘　要 以 285 名学龄儿童（147 名男孩，M_{age} = 11.93 岁）及其父母为研究对象进行为期两年的短期追踪研究，考察 T1 父母直升机教养具体维度与 T2 学龄儿童内化问题间的关系模式，揭示儿童性别和年龄在上述关系中的特异性。结果发现：（1）父母直升机教育的不同维度对学龄儿童内化问题的影响是不同的；（2）父母比较子女的成绩正向预测学龄儿童一年后的内化问题，且两者之间呈线性关系；（3）父母过度情感投入（二次项）与儿童性别的交互

作用显著，过度情感投入与男孩内化问题之间存在 U 型效应，但这种关系在女孩中不显著；（4）父母干扰子女生活与儿童年龄的交互作用显著，小学高年级学生的父母干扰子女生活显著正向预测儿童一年后的内化问题，两者之间呈线性关系，初中阶段学生的父母干扰子女生活与学龄儿童一年后的内化问题之间无显著关联；（5）父母过度重视子女成绩与儿童年龄和性别的三项交互作用显著，在初中年级男孩父母的过度重视子女成绩负向预测学龄儿童一年后的内化问题，两者之间呈线性关系，但这种关系在初中年级女孩、小学高年级男孩和女孩中不显著。本研究结果对于丰富我国文化背景下直升机教养领域的研究有重要的理论意义，对于减少学龄儿童内化问题具有重要的实践意义。

Too much is not enough—Helicopter Parenting and Internalizing Problems in School-Age Children

Zhao Jingjing[1]　Wang Wenhui[1]　Xing Shufen[1] (corresponding author)
1 Capital Normal University, Beijing, 100048, corresponding author xsf2986@163.com

Abstract：A short-term two-year longitudinal study was conducted with 285 school-age children (147 boys, M_{age} = 11.93 years) and their parents as research participants to examine the relationship between specific dimensions of helicopter parenting at T1 and internalizing problems in school-age children at T2, while also exploring the moderating effects of children's gender and age in this relationship. The results revealed the following findings: (1) Different dimensions of helicopter parenting had varying effects on school-age children's internalizing problems; (2) Parental academic comparison positively predicted children's internalizing problems one year later, and this relationship showed a linear effect; (3) The interaction between parents' overinvolvement (quadratic term) and children's gender was significant, indicating a U-shaped effect between overinvolvement and internalizing problems in boys, but this relationship was not significant in girls; (4) The interaction between parents' interference in children's lives and children's age was significant, with parental interference in the lives of upper-grade primary school students positively predicting their internalizing problems one year later in a linear effect, while there was no significant association between parental interference and internalizing problems in middle-grade students; (5) The three-way interaction among parents' excessive emphasis on children's academic performance, children's age, and gender was significant. In middle-grade boys, parental excessive emphasis on academic performance negatively predicted children's internalizing problems in a linear effect, but this relationship was not significant in middle-grade girls, upper-grade primary school boys, and girls. The results of this study carry important theoretical implications for enriching research on helicopter parenting within the cultural context of China and hold practical significance in reducing internalizing problems in school-age children.

儿童青少年内化问题的症状结构——病理性网络分析的结果

刘晓曦　马建平　纪林芹　张文新（通讯作者）
山东师范大学心理学院，济南，250014，zhangwenxin@sdnu.edu.cn

摘 要　儿童青少年内化问题的共发现象是心理病理学和发展心理学家关注的重点，同时内化问题子类的划分亦存在争议。本研究采用儿童抑郁量表(Children’s Depression Inventory, CDI)、广泛性焦虑自评量表(Generalized Anxiety

Disorder, GAD-7)、Achenbach 青少年行为自评量表(Youth Self-Report, YSR)评估儿童青少年内化问题。以病理性网络分析的方法，对 45866 名小学至高中（职专）样本（四五年级 17874 人，平均年龄 10.64±0.77 岁，男性 52%；六七八年级 21997 人，平均年龄 12.90±0.94 岁，男性 53%；高一高二年级 4119 人，平均年龄 16.21±0.74 岁，男性 50%；职业中专 1876 人，平均年龄 16.17±0.72 岁，男性 54%）进行分析，构建各症状间的关系网络以确定不同年龄段的典型症状、探究内化问题网络是否存在发展的稳定性。结果表明，构建的网络属于密集连接型，症状间存在大量微弱关联。各阶段儿童青少年的代表性症状基本一致，其中焦虑在内化问题症状网络中占据重要位置。不同年龄段的网络对比表明，随年龄增长，普遍的趋势为抑郁症状的中心性下降，焦虑症状的中心性上升。此外，基于 Walktrap 算法的社区发现分析结果表明，各阶段维度划分的界限不清晰；四五年级、六七八年级症状分为 5 个社区、高中及职专症状分为 6 个社区；除躯体化的“疲劳”、“噩梦”症状以及焦虑的“易怒”外，抑郁、躯体化、焦虑症状能够较好的划分至同维度。网络差异分析的结果说明，高中网络结构同四五年级、六七八年级两阶段明显不同，这表明内化问题表现特征与年龄相关。本研究结果揭示了内化症状的核心症状及其相互关联，为内化问题各维度的共发现象提供了证据。

The Symptom Structure of Internalizing Problems in Children and Adolescents——Results of a Pathological Network Analysis

LIU Xiaoxi, MA Jianping, JI Linqin, ZHANG Wenxin
School of psychology, Shandong Normal University, Jinan 250014 China

Abstract: The co-occurrence of internalizing problems in children and adolescents is a focus of attention for psychopathologists and developmental psychologists, and there is also controversy over the classification of internalizing problems. This study used the Children’s Depression Inventory (CDI), Generalized Anxiety Disorder 7-item (GAD-7), and Achenbach Youth Self-Report (YSR) to assess internalizing problems in children and adolescents. Using a pathological network analysis approach, we analyzed 45,866 elementary to high school/professional school students (17,874 in grades 4-5, mean age 10.64±0.77 years, 52% male; 21,997 in grades 6-8, mean age 12.90±0.94 years, 53% male; 4,119 in grades 10-11, mean age 16.21±0.74 years, 50% male; and 1,876 professional school students, mean age 16.17±0.72 years, 54% male) to construct a network of relationships between symptoms to identify typical symptoms at different ages and explore whether the network of internalizing problems has developmental stability. The results showed that the estimated network was densely connected and characterized by a multitude of weak associations between symptoms. The representative symptoms of children and adolescents at each stage were basically consistent, with anxiety occupying an important position in the network of internalizing problem symptoms. Comparison of networks at different ages showed that as age increased, the general trend was for the centrality of depressive symptoms to decrease and the centrality of anxiety symptoms to increase. In addition, based on Walktrap community detection results showed that the boundaries between dimensions are weak at each stage; symptoms were divided into 5 communities in grades 4-5 and 6-8, and into 6 communities in high school and professional school; except for individual symptoms, the division of depression, somatization, and anxiety dimensions was relatively accurate. Network difference analysis results showed that the high school network structure was significantly different from those in grades 4-5 and 6-8, indicating that internalizing problems are related to age. The results of this study reveal the core symptoms of internalization and their interrelationships, providing

evidence for the co-occurrence phenomenon of various dimensions of internalizing problems.

跨诊断儿童青少年精神病患者的非自杀性自伤行为与脑结构、功能连接和心理健康的关系

刘轩[1]，张艺馨[1],张文新[1]王康程[1]（通讯作者）

1 山东师范大学心理学院，济南，250358，wangkangcheng@sdnu.edu.cn

摘 要　非自杀性自伤(Non-suicidal self-injury, NSSI)是指在无自杀意图的条件下对身体故意的、自我造成的伤害。它是一种常见的心理健康问题，在儿童和青少年中发病率高，且存在与多种精神疾病中。之前的研究表明，在特定的诊断背景下（如注意力缺陷多动障碍和抑郁症），NSSI 与奖励处理、执行控制和情绪调节相关大脑区域的改变有关。然而，很少有研究探讨儿童和青少年跨诊断队列中与 NSSI 相关的大脑改变。

在本研究中，我们使用了 Healthy Brain Network (HBN) 中的一个跨诊断样本（n = 386，平均年龄= 10.72，从 5.04 到 21.22 岁，诊断障碍包括注意缺陷多动障碍，抑郁，焦虑等）的脑结构（灰质体积），功能连接和 NSSI 之间的关联。我们采用多元回归模型探索与 NSSI 严重程度相关的结构和功能连接的改变。此外，我们也进行了调节分析，以探讨大脑改变在内化和外化问题与自伤行为之间的作用。

我们发现壳核体积的减少与 NSSI 的严重程度显著相关。左侧壳核与双侧颞上回、颞中回与左侧角回之间以及右侧壳核与双侧距状回之间的连接也与 NSSI 行为相关。有趣的是，这些大脑改变在内化和外化问题与自伤行为之间的关系中起着显著的调节作用。

我们的研究结果表明，在各种跨诊断的精神疾病中，NSSI 与壳核的结构改变和功能异常有关，这表明壳核可能是启动 NSSI 行为的共同生物标志物和神经调控治疗的潜在靶点。

Non-suicidal self-injury and brain structure, functional connectivity and mental health in transdiagnostic psychiatric patients of children and adolescents

Xuan Liu[1], Yixin Zhang[1], Wenxin Zhang[1] , Kangcheng Wang[1*],

1 School of Psychology, Shandong Normal University, Jinan, 250358, China

Abstract：Non-suicidal self-injury (NSSI) refers to the deliberate, self-inflicted harm to the body without suicidal intent. It is a common mental health problem with a high incidence in children and adolescents, and it presents across disorders. Previous studies have shown it associated with alterations in brain regions, such as reward processing, executive control and emotion regulation, in specific diagnostic disorder, such as ADHD and depression. However, few studies have explored the brain alterations associated with NSSI in a transdiagnostic cohort of children and adolescents.

Here, we examined the associations between brain structure (gray matter volume), functional connectivity and NSSI, in a transdiagnostic sample (n = 386, mean age = 10.72, from 5.04 to 21.22 years old, disorders included ADHD, depression, anxiety, etc.), from the Healthy Brain Network (HBN) study. We conducted a multiple regression model to explore the structural and functional connectivity alterations associated with the severity of NSSI. Also, moderation analyses were

performed to explore the role of brain alterations between internalizing and externalizing problems and NSSI.

We found that decreased putamen volume was significantly associated with the severity of NSSI. Further, our results revealed that connectives between the left putamen and bilateral superior temporal gyrus, middle temporal gyrus and left angular gyrus, and between the right putamen and bilateral calcarine gyrus were also associated with NSSI behavior. Interestingly, these brain alterations played the significant moderating roles in the relationships between internalizing and externalizing problems and NSSI.

Our findings suggest that NSSI is linked to structural alterations and dysfunctions in putamen across various transdiagnostic disorders, highlighting the putamen may server as a common biomarker for initiating NSSI behavior and the potential target for neuromodulation treatments across conditions.

Keywords：Non-suicidal self-injury, children and adolescents, brain alterations, transdiagnostic disorders

亲-子感知协同教养差异模式与青少年情绪相关变量的关系研究

应洁峰[1] 伍新春[1,2]（通讯作者）

1 北京师范大学心理学部, 应用实验心理北京市重点实验室, 心理学国家级实验教学示范中心（北京师范大学），北京 100875，xcwu@bnu.edu.cn；

2 北京师范大学应用心理学院（珠海校区），广东 519087

摘 要 协同教养行为是指承担父母角色的夫妻双方围绕子女教育而相互作用的方式，家庭科学领域的研究表明，不同家庭成员对于同一教养行为的感知可能存在潜在差异，但是目前对于亲-子感知协同教养差异模式的具体类型，以及不同类型在青少年情绪相关变量上的差异性还有待探究。通过方便取样，从北京、广东、山东、湖北、四川、宁夏、内蒙古等地，邀请中小学校在读学生及其父母三方，以家庭为单位参与调查。通过匹配，得到 747 个家庭的亲子成对数据。其中 48.6%的家庭中是男性青少年，青少年的平均年龄为 13.26 岁。本次调查通过在线问卷进行评估，采用以个体为中心的分析视角，主要涉及潜在剖面分析和混合回归模型分析。调查及分析内容包括父-母-子三方的人口学变量、对协同教养行为的感知、情绪调节策略和消极情绪症状。结果表明：（1）亲-子感知消极协同教养差异模式有“一致型”、“孩子同时高于父母型”、“仅母亲高于孩子型”、“仅父亲高于孩子型”4 个亚类；亲-子感知积极协同教养行为差异模式有“一致型”、“父母同时高于孩子型”、“孩子同时高于父母型”3 个亚类；（2）针对消极协同教养的感知差异亚类，“孩子同时高于父母型”在孤独感、焦虑、抑郁水平上显著更高，而针对积极协同教养的感知差异亚类，“父母同时高于孩子型”在孤独感、焦虑、抑郁水平上显著更高；（3）情绪调节策略在感知差异模式亚类和消极情绪症状之间起到中介作用。本研究进一步揭示了中国亲子感知协同教养行为差异模式的多样性，回应了有关亲子感知差异的“三合一”模型，同时也为家庭环境中青少年情绪健康问题的干预和疏导提供了理论支持。

Abstract：Coparenting behaviors refer to the ways in which couples who are assuming parental roles interact around their children's education. Studies in the field of family science have shown that there may be discrepancies in how different family members perceive the same parenting behaviors. Further research is needed to understand the specifics of the patterns of parent-adolescent discrepancies in perceived parental coparenting, and how they can influence adolescent emotional outcomes. A total of 747 adolescent students (48.6% male; M_{age} = 13.26 years, *SD* = 3.39) and their mothers and fathers participated in this study. To strengthen the diversity of sample sources, the family sample included regions from Beijing, Guangdong, Shandong, Hubei, Sichuan, Ningxia, and Inner Mongolia. This questionnaire survey includes demographic, negative and positive coparenting behaviors, emotion regulation strategies, loneliness, anxiety, and depression symptoms. Latent profile analysis and regression mixture model with the BCH method were conducted. Through a person-centered approach, this study identified distinct patterns of parent-adolescent discrepancies in perceived coparenting and their different associations with adolescent emotional outcomes. Adolescents' more perceptions of negative coparenting relative to parents were associated with more loneliness, anxiety, and depression symptoms, whereas adolescents' fewer perceptions of positive coparenting relative to parents were related to more loneliness, anxiety, and depression symptoms. Emotion regulation strategies mediate the relationship between the patterns of parent-adolescent discrepancies in perceived coparenting and adolescent negative emotional symptoms. This study further reveals the diversity of perceived differences in coparenting behaviors between parents and children in China, responds to the Operation Triad Model, and provides theoretical support for the intervention and guidance of adolescents' emotional health problems in the family environment.

Keywords：Parental coparenting, emotion regulation strategies, loneliness, anxiety, depression

协同教养冲突对父母抑郁症状的影响：一个有调节的主客体互倚中介模型

邹盛奇[1]　伍新春[2]（通讯作者）

1 湖南师范大学教育科学学院心理学系，认知与人类行为湖南省重点实验室，心-脑交叉科学研究中心，长沙 410081；

2 北京师范大学心理学部, 应用实验心理北京市重点实验室，心理学国家级实验教学示范中心（北京师范大学），北京 100875，通讯作者 E-mail: xcwu@bnu.edu.cn

摘 要　协同教养冲突是父母协同教养的核心特征，指父母在共同教养子女过程中的争论、对立、不一致和相互贬低。家庭系统理论指出，父母协同教养冲突在家庭中具有中心地位，发挥核心作用。然而，由于已有研究集中关注父母协同教养冲突对子女心理和行为适应的影响，忽视了其在父母自身心理健康中的作用，因而现有的实证证据不足以支持这一观点。因此，本研究拟考察协同教养冲突对父母抑郁症状的影响及其作用机制，以期为家庭系统理论的这一观点提供新的证据支持。通过方便取样的方法共选取 628 对学前儿童的父亲和母亲参与研究，采用父母协同教养行为问卷、教养能力感问卷、生活满意度问卷、抑郁自评量表和工作家庭冲突问卷进行测量，使用主客体互倚模型进行数据分析，结果显示：（1）父亲冲突和贬低对自身抑郁症状的主体效应显著，仅母亲冲突对自身抑郁症状的主体效应显著，即协同教养冲突对父母抑郁症状的影响呈现主体模式。（2）主客体互倚中介模型结果发现，父亲冲突和贬低通过对教养满意度产生的主体效应对自身抑郁症状起主体中介效应，也对母亲抑郁症状起客体中介效应；母亲冲突通过对教养满意度和生活满意度产生的主体效应对自身抑郁症状起主体中介作用，同时通过对父亲教养满意度产生客体效应起中介作用；母亲贬低通过对生活满意度产生的主体效应对自身抑郁症状起主体中介作用。（3）家庭对工作的冲突通过调节父亲和母亲冲突对生活满意度的主体效应来调节其对自身抑郁症状的主体中介效应，通过调节父亲贬低对教养满意度产生的主体效应来调节其对自身抑郁症状的主体中介效应，进一步通过调节母亲贬低对父亲教养满意度的客体效应来调节其对父亲抑郁症状的客体中介效应。研究结果一定程度上补充了支持协同教

养冲突在家庭中发挥核心作用的支持证据，也阐释了协同教养冲突影响父母抑郁症状的过程及其父母差异，对改善父母的心理健康状况具有一定的启示作用。

The Effect of Coparenting Conflict on Parental Depressive Symptoms: A Moderated Mediation Model of Actor-Partner Interdependence Model

Shengqi Zou[1]　Xinchun Wu[2]

1. Center for Mind & Brain Science, Cognition and Human Behavior Key Laboratory of Hunan Province, Department of Psychology, School of Educational Science, Hunan Normal University, Changsha 410081;

2. Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing 100875

***Abstract*：** Coparenting conflict is a core characteristic of coparenting, referring to the arguments, opposition, inconsistency, and mutual undermining between parents during the process of jointly raising children. Family systems theory suggests that coparenting conflict holds a central position within the family and plays a pivotal role. However, existing research has primarily focused on the impact of coparenting conflict on children's psychological and behavioral adaptation, neglecting its role in parents' own mental well-being. Consequently, there is insufficient empirical evidence to support this viewpoint. Therefore, this study aimed to examine the effect of coparenting conflict on parental depressive symptoms and its underlying mechanisms, in order to provide new evidence supporting this aspect of family systems theory. A convenience sample of 628 pairs of preschool children's fathers and mothers participated in the study. Measurements were conducted using the Co-parenting Behavior Questionnaire, Parenting Self-Efficacy Scale, Life Satisfaction Questionnaire, Self-rating Depression Scale, and Work-Family Conflict Scale. Data analysis was performed using the actor-partner interdependence model. The results showed that: (1) The actor effects of coparenting conflict and undermining on their own depressive symptoms were significant, while only maternal coparenting conflict had a significant actor effect on their own depressive symptoms, indicating that the impact of coparenting conflict on parental depressive symptoms followed an actor-only pattern. (2) The results of the actor-partner interdependence mediation model revealed that paternal coparenting conflict and undermining had an actor mediating effect on their own depressive symptoms through the actor effects on parenting satisfaction, as well as a partner mediating effect on maternal depressive symptoms. Maternal coparenting conflict had an actor mediating effect on their own depressive symptoms through the actor effects on parenting satisfaction and life satisfaction, while also having a partner mediating effect through the actor effect on paternal parenting satisfaction. Maternal coparenting undermining had an actor mediating effect on their own depressive symptoms through the actor effect on life satisfaction. (3) The family-to-work conflict moderated the actor effect of paternal and maternal coparenting conflict on life satisfaction, thereby moderating their respective actor mediating effects on their own depressive symptoms. It also moderated the actor mediating effect of paternal coparenting undermining on parenting satisfaction, further moderating the partner mediating effect on paternal depressive symptoms through the actor effect on maternal parenting satisfaction. The findings of this study to some extent supplemented the supporting evidence for the central role of coparenting conflict within the family and elucidated the process of how coparenting conflict affected parenal depressive symptoms and the parental

differences. These findings had implications for improving parents' mental health.

父母婚姻质量与协同教养冲突：儿童气质与子女数量的作用

刘畅

北京教育学院学前教育学院，北京，100120

通讯作者 E-mail: liuchang@bjie.ac.cn

摘 要　父母协同教养是父亲与母亲之间的教养联盟，对儿童发展具有重要作用。其中协同教养冲突指父亲和母亲在儿童面前的争论，是研究者关注较多的协同教养指标。研究者发现婚姻质量是协同教养预测因素中最稳定的预测源，并提出亲职易感性用于解释父职与父子关系或母职与母子关系易受婚姻质量影响的现象。目前父职易感性已得到大量研究支持，但相关研究在母职易感性方面的支持仍十分有限。在父职易感性的研究中，研究者同时关注了婚姻质量与父职关系中的中间变量。由于父母的协同教养直接指向儿童，儿童并非被动地受父母教养行为的影响，而是具有塑造协同教养的作用，因此本研究的目的是探讨儿童气质与子女数量在父亲和母亲婚姻质量与协同教养冲突中的多重调节作用，以分析亲职易感性。在 27 个省（市、自治区）采取主试入户与现场集体施测相结合的方式进行抽样调查，共 364 个家庭参与了研究。采用协同教养问卷、婚姻质量问卷、儿童气质问卷对研究的主要变量进行测查。研究发现，父母婚姻质量均负向作用于协同教养冲突，儿童节律性与趋避性在婚姻质量与协同教养冲突的关系中具有调节作用，子女数量与儿童反应强度不存在调节作用；儿童节律性越高，父亲婚姻质量与协同教养冲突的负向关系越弱；儿童趋避性越高，母亲婚姻质量与协同教养冲突的负向关系越弱。本研究的结果提示了父职与母职易感性的保护性因子不同。

The Relationship of Marital Quality and Coparenting Conflict: The Moderating Role of Child Temperament and Number of Children

Chang Liu

Preschool Academy, Beijing Institute of Education, Beijing 100120, China

Abstract： Coparenting refers to parenting alliance between father and mother that plays an important role in child development. One of the indicators of that has received more attention is coparenting conflict, which refers to arguments between father and mother in the presence of children. Researchers have found marital quality to be the most stable predictor of coparenting and have proposed parenting vulnerability for explaining the vulnerability of fatherhood and father-child relationships or motherhood and mother-child relationships to marital quality. Fathering vulnerability has been supported by a large body of research, but support from related research on mothering vulnerability remains limited. In studies of fathering vulnerability, researchers also have focused on moderator variables. Coparenting is directed to children, who are not passively influenced but have a role in shaping coparenting. The aim of this study was to explore the multiple moderating roles of child temperament and number of children in the associations between marital quality and coparenting in order to explore parenting vulnerability. A total of 364 families participated a sample of 27 provinces, municipalities and autonomous regions, using home visit and on-site measure. The main variables of this study were measured using Coparenting Scale, Marital Inventory and Parent Temperament Questionnaire. It was found that father and mother marital quality had negative

effect on coparenting conflict; Rhythmicity, Approach and withdrawal moderated the associations between marital quality and coparenting conflict; Number of children and Intensity of reaction did not play a moderating role; father marital quality had lower negative relationship with coparenting conflict when child had higher rhythmicity; mother marital quality had lower negative relationship with coparenting conflict when child had higher approach and withdrawal. The results of this study suggest father and mother vulnerability had different protective factors.

父母冲突与青少年学校适应：协同教养的中介作用

石佳霖[1]　伍新春[1,2]（通讯作者）

1 北京师范大学心理学部，应用实验心理北京市重点实验室，心理学国家级实验教学示范中心（北京师范大学），北京，100875，xcwu@bnu.edu.cn

2.北京师范大学应用心理学院（珠海校区），广东，519087

摘 要　学校适应是指个体对学校生活的适应性以及在学校中表现出的社会行为结果，包括社会能力和反社会行为两方面，是青少年时期的重要社会化指标。学校适应会影响青少年的身心健康发展，也关系到其成年后的社会适应。以往研究发现，父母冲突是影响青少年适应的风险因子，然而领域内对父母冲突的不同维度带来的影响差异关注较少，且父母冲突可能存在积极作用，因此本研究同时检验了父母冲突的频率、强度和解决程度对青少年的学校适应的不同影响。相关理论和研究表明，父母产生的冲突可能会通过二人的共同的教养行为进而对青少年产生影响，本研究考察了父亲和母亲的协同教养在父母冲突和学校适应间的中介作用。

本研究共有 803 名 10-19 岁青少年参与，平均年龄为 13.65 岁，其中包括 371 名男生，占总体样本的 46.2%。研究采用问卷调查的方法，对青少年感知的父母冲突、父母协同教养和学校适应进行评估，并使用 SPSS 25.0 和 Mplus 8.3 进行数据分析。

研究结果表明：(1)父母冲突的不同维度对青少年学校适应的影响不同：父母冲突强度正向影响青少年反社会行为，冲突解决程度正向影响青少年社会能力；(2)协同教养的中介作用：父母冲突频率通过父亲积极协同教养对青少年的社会能力产生影响；冲突解决程度通过父亲和母亲的积极协同教养对青少年的社会能力产生正向影响；父母冲突频率、强度、解决程度通过父亲消极协同教养对青少年的反社会行为产生影响。理论角度上，本研究的结果揭示了父母冲突的不同维度对青少年学校适应有着消极和积极的影响，父母的协同教养在其中能够起到中介作用，对其机制有了进一步理解。实践角度上，研究结果提示我们，帮助父母提升应对和解决冲突的能力能够让双方在养育行为上更好地配合，从而对青少年的适应发展有着促进作用。

The Relationship Between Interparental Conflict and Adolescents' School Adjustment: The Mediation Role of Co-parenting

Jialin Shi[1]　Xinchun Wu[1,2] (Correspondence)

1 Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing, 100875, China；

2 School of Applied Psychology, Beijing Normal University at Zhuhai, Guangdong, 519087, China

Abstract：School adjustment refers to the individual's adaptability to school life and the social behavior in school, including social competence and anti-social behavior. School adjustment is an important socialization index of adolescence,

it will not only affect the physical and mental development, but also related to their adult social adjustment. Previous studies have found that interparental conflict is a risk factor for adolescent adjustment, however, there is less attention paid to the impact of different dimensions of parental conflict in the field, which interparental conflict may have a positive effect. Therefore, this study examined the frequency, intensity and resolution of interparental conflict on the different impact of school adjustment of adolescents. According to theories and studies, interparental conflict may affect adolescents through their parents' co-parenting behaviors, this study also examined the mediating effect of both father's and mother's co-parenting between interparental conflict and school adjustment.

A total of 803 adolescents aged 10-19 years old participated in the study. The mean age of adolescents was 13.65 years old (*SD*=2.53),46.2% of the adolescents were boys (n=371). We used questionnaire to assess adolescents' perceptions of interparental conflict, parent's co-parenting behavior, and school adjustment. Data were analyzed in SPSS 25.0 and Mplus 8.3.

The results showed that: (1) Different dimensions of interparental conflict had different effects on adolescents' school adjustment. The intensity of interparental conflict positively affected adolescents' antisocial behavior, and the degree of conflict resolution positively affected adolescents' social competence. (2) The mediating effect of co-parenting: the frequency of interparental conflict has an effect on adolescents' social competence through father's positive co-parenting, the degree of conflict resolution has a positive effect on adolescents' social competence through the positive co-parenting of both parents.The frequency, intensity and resolution of interparental conflict have an impact on adolescents' antisocial behavior through the negative co-parenting of fathers. Theoretically, the results of this study reveal that different dimensions of interparental conflict have both negative and positive impact on adolescents' school adjustment, and co-parenting can play a mediating role as the mechanism. Pratically, the findings suggest that helping parents improve their ability to deal with and resolve conflicts can lead to better cooperation of parenting behaviors, which can promote adaptive development of adolescents.

工作-家庭冲突与父母协同教养行为的关系：教养压力的中介作用

张佳捷[1]　邹盛奇[2]（通讯作者）

1 湖南师范大学教育科学学院心理学系，长沙

2 湖南师范大学教育科学学院心理学系，认知与人类行为湖南省重点实验室，心-脑交叉科学研究中心，长沙 410081，

通讯作者 E-mail:，zoushengqi@hunnu.edu.cn

摘　要：为儿童的学前教育创造一个良好的家庭环境，不仅能够促进个体的身心健康，还能引导个体适应社会，为其日后发展打下坚实基础。大量研究表明，工作-家庭冲突会对家庭产生负面影响，但现有研究对家庭功能的考察范围仍然有限。家庭系统理论指出，协同教养子系统是家庭系统的中心，而父母协同教养行为是该子系统的核心特征，指父母在共同承担抚养特定儿童时所表现出来的支持协调或矛盾冲突，是父母教养研究的新趋势。因此，本研究拟考察工作-家庭冲突与父母协同教养行为之间的关系及其作用机制。通过方便取样选取 706 位幼儿园儿童家长进行问卷调查，采用工作-家庭冲突问卷、养育压力量表和协同教养行为问卷作为测量工具，使用结构方程模型进行数据分析。结果发现：（1）家庭对工作冲突负向预测父母协同教养一致行为，正向预测父母协同教养冲突行为。（2）工作对家庭的冲突能够通过负向预测教养压力，进一步负向预测父母协同教养一致行为，正向预测父母协同教养冲突行为。（3）家庭对工作的冲突则通过正向预测教养压力，负向预测父母协同教养一致行为以及正向预测父母协同教养冲突行为，同时家庭对工作的冲突对父母协同教养冲突行为的直接预测作用仍然显著。研究结果不仅扩展了工作-家庭冲突的影响范围，也可以为提升和促进父母协同教养的实践活动提供干预策略，未来研究可进一步探究工作

-家庭冲突对父母协同教养行为的影响及其作用机制的父母性别差异，以提供更有针对性的促进父母协同教养的建议和策略。

The relationship between work-family conflict and coparenting behavior: the mediating effect of parenting pressure

Jiajie Zhang[1], Shengqi Zou[2] (corresponding author)

1.Department of Psychology, College of Education Science, Hunan Normal University, Changsha, 410006,

2. Center for Mind & Brain Science, Cognition and Human Behavior Key Laboratory of Hunan Province, Department of Psychology, School of Educational Science, Hunan Normal University, Changsha 410081

Abstract：Creating a good family environment for children's preschool education can not only promote individual physical and mental health, but also guide individuals to adapt to society and lay a solid foundation for their future development. Numerous studies have shown that work-family conflict can have a negative impact on families, but the scope of existing research on family function is still limited. Family Systems Theory states that
the coparenting subsystem is the center of the family system, and the coparenting behavior of parents is the core feature of this subsystem. It refers to the support, coordination, or conflicts that parents exhibit when jointly taking on the responsibility of raising a specific child, which is a new trend in parental parenting research. Therefore,
the purpose of this study is to explore the relationship and mechanism between work-family conflict and parental coparenting behavior . 706 parents of kindergarten children were selected for a questionnaire survey through convenient sampling. The work-family conflict questionnaire, parenting stress scale, and collaborative parenting questionnaire were used as measurement tools, and structural equation modeling was used for data analysis. The results showed that: (1) family-work conflict negatively predicts parental coparenting consistent behavior and positively predicts parental coparenting conflict behavior. (2)work-family conflict can negatively predict parenting stress, further negatively predict parental coparenting consistent behavior , and positively predict parental coparenting conflict behavior. (3) family-work conflict can positively predict parenting pressure, negatively predict parental coparenting consistent behavior, and positively predict parental coparenting conflict behavior. At the same time, the direct predictive effect of family-work conflict on parental coparenting conflict behavior is still significant. The research results not only expand the scope of the impact of work-family conflict, but also provide intervention strategies for enhancing and promoting practical activities of parental coparenting. Future research can further explore the impact of work-family conflict on parental coparenting behavior and the gender differences in its mechanisms, in order to provide more targeted suggestions and strategies for promoting parental coparenting.

Keywords：work-family conflict,parenting pressure, parental coparentingt behavior.

父母认知情绪调节与青少年的依恋和抑郁症状的关系：一项潜在剖面分析

余晓晴[1] 刘明宵[1] 刘艾祎[1] 伍新春[1]（通讯作者）任怡臻[1]

[1]北京师范大学心理学部，应用实验心理北京市重点实验室，心理学国家级实验教学示范中心（北京师范大学），北京，100875，xcwu@bnu.cdu.cn

摘 要 基于家庭生态系统理论，父母的认知情绪调节可能会影响亲子关系以及父母和孩子的心理健康。本研究使用潜在剖面分析(Latent Profile Analysis，LPA)来探索父母的认知情绪调节，并考虑父母的年龄、教育程度和工作时间等人口学变量对潜在剖面分析的影响，以及不同父母认知情绪调节对青少年的亲子依恋、三方抑郁症状的影响。在北京、广东和湖北等地，采用认知情绪调节问卷（父母）、亲子依恋量表和抑郁量表等对 700 名青少年（男孩 346 人，女孩 354 人；平均年龄：孩子 14.34 ± 2.419 岁）及其父母进行了调查。结果发现：（1）父母的认知情绪调节可以分为三种潜在类别：低水平组（5.15%），中等水平组（65.09%），高水平组(29.76%) 。（2）较低教育程度的母亲更可能归于认知情绪调节的低水平组，而父母双方的年龄和工作时间和父亲的教育程度对认知父母情绪调节的潜在剖面的关系不显著。（2）在父母的抑郁症状方面，低水平组的父亲和母亲均出现更严重的抑郁症状。（3）高水平组的父子和母子依恋水平显著高于中等水平组和低水平组，而中等水平组和低水平组间的差异不显著。（4）在孩子的抑郁症状方面，低水平组和中等水平组的青少年抑郁症状高于高水平组，而中等水平组和低水平组间的差异不显著。本研究结果表明，父母认知情绪调节的潜在类别体现为能力水平的差异，强调父母认知情绪调节在促进良好的亲子关系和心理健康的重要意义。启示父母应该提高认知情绪调节的学习和使用，以改善自身的心理健康，为建立积极稳定的情绪环境，有助于青少年建立良好的亲子依恋和降低抑郁症状的风险。

Parental cognitive emotion regulation in relation to attachment and depressive symptoms in adolescents: a latent profile analysis

Xiaoqing Yu[1], Mingxiao Liu[1], Aiyi Liu[1], Xinchun Wu[1*], Yizhen Ren[1]

[1]Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing 100875, China

Abstract：Based on the family systems theory, parents' cognitive emotional regulation may affect the parent-child relationship as well as the psychological health of both parents and children. This study used the Latent Profile Analysis (LPA) to explore the latent of parental cognitive emotional regulation, considering the effect of demographic variables such as parents' age, educational level, and work hours, and the different patents of cognitive emotional regulation's impact on adolescents' parent-child attachment and depression symptoms. A survey was conducted among 700 adolescents(346 boys, 354 girls; average age: 14.34±2.419 years old) and their parents in Beijing, Guangdong, and Hubei, using the cognitive emotional regulation questionnaire, parent-child attachment scale, and depression scale. The results revealed that: (1) A latent profile analysis was conducted and determined three subtypes of parental cognitive emotional regulation: low-level group (5.15%), medium-level group (65.09%), and high-level group (29.76%). (2) Mothers with lower educational levels were more likely to fall into the low-level

group, whereas the age, work hours, and educational level of parents did not significantly influence the latent profile of parental cognitive emotional regulation. (3) Regarding parental depression symptoms, both fathers and mothers in the low-level group presented more severe depression symptoms. (4) The attachment levels of fathers and mothers in the high-level group were significantly higher than those in the medium and low-level groups, with no significant difference between the medium and low-level groups. (5) In terms of children's depression symptoms, the adolescents in the low and medium-level groups were higher than those in the high-level group, with no significant difference between the low and medium-level groups. The results of this study indicate that the latent category of parental cognitive emotional regulation reflects differences in ability level, emphasizing the importance of parental cognitive emotional regulation in fostering positive parent-child relationships and mental health. It suggests that parents should enhance their learning and use of cognitive emotional regulation to improve their own mental health, to establish a positive and stable emotional environment, which helps adolescents to establish good parent-child attachment and reduce the risk of depression.

Key words: parental emotional regulation strategies, latent profile analysis (LPA) , parent-child attachment, depressive symptoms

家庭功能对留守幼儿外化行为的影响：社会支持的调节作用

李志敏（通讯作者）　何冬丽

新乡学院教育科学学院，河南省新乡市，453000，lizhimin1987@hotmail.com

摘要：家庭功能是影响儿童心理健康的重要因素，并与其行为和情绪问题密切相关。拥有良好家庭功能背景的儿童往往有较低的心理健康问题检出率、较好的学校表现和较少的不良行为；反之，家庭功能失调则易使儿童出现更多适应问题。同伴关系、师幼关系是幼儿社会支持的重要来源。同伴关系是预测儿童行为问题的一个重要因素。如同伴间相互支持、关心和团结的程度越高，外化问题行为就越少。良好的师幼关系对幼儿社会技能的形成和积极社会行为的产生要的促进作用。高师幼冲突性往往会造成幼儿的社会适应不良（如产生攻击行为），而高师幼依赖性会导致幼儿的退缩行为。为了考察社会支持在留守幼儿家庭功能和外化行为之间的调节作用，选取河南省 4 地市的 6 所幼儿园 328 名留守幼儿为研究对象，采用家庭功能问卷，长处与困难问卷（家长版）和师幼关系问卷，并采用同伴提名法测查儿童同伴关系。结果显示，留守幼儿的情绪问题行为与家庭功能水平呈显著正相关，家庭功能水平越低，外化问题行为越多。当同伴拒绝较高时，家庭功能能够正向预测留守幼儿的情绪外化问题。当同伴接纳较高时，家庭功能对留守幼儿的正向预测不显著。当师幼亲密性处于低水平时，幼儿家庭功能对情绪问题行为正向预测作用显著；当师幼冲突性处于中、高水平时，幼儿家庭功能对情绪问题行为起到正向预测作用显著。

关键词：家庭功能，外化行为，社会支持，留守幼儿

The effect of family function on the externalized behavior of left-behind children: the moderating effect of social support

Li zhimin He dongli

Department of Educational and science, Xinxiang University, Henan province, Xinxiang City, 453000

Abstract：Family functioning is an important factor in children's mental health and is closely related to their behavioral and emotional problems. Children with a good family functioning background tend to have lower rates of mental health problems, better school performance, and fewer bad behaviors; Conversely, family dysfunction tend to increase adjustment

problems in children. Peer relationship and teacher-child relationship are important sources of social support for young children. Peer relationships are an important factor in predicting behavioral problems in children. The higher the level of mutual support, concern, and solidarity among peers, the less externalized problem behaviors will be. Good teacher-child relationship plays an important role in promoting the formation of children's social skills and the production of positive social behavior. Conflictuality often leads to social maladjustment (such as aggressive behavior) in young children, while dependence on senior teachers and children can lead to withdrawn behavior. In order to investigate the moderating effect of social support between family function and externalized behavior of left-behind children, 328 left-behind children from 6 kindergartens in 4 cities in Henan Province were selected as research objects, and the family functioning questionnaire, the strengths and difficulties questionnaire (parent version) and the teacher-child relationship questionnaire were used, and the peer nomination method was used to measure the children's peer relationship. The results showed that the emotional problem behavior of left-behind children was significantly positively correlated with the level of family functioning, and the lower the level of family functioning, the more externalized problem behavior. When peer rejection is high, family functioning can positively predict the emotional externalization of left-behind children. When peer acceptance was high, the positive prediction of family functioning on left-behind children was not significant. When the intimacy between teachers and children was at a low level, children's family functioning had a significant positive predictive effect on emotional problem behavior. When the conflict between teachers and children is at a medium or high level, children's family function has a significant positive predictive effect on emotional problem behavior.

Keywords：Family functioning, externalized behavior, social support, left-behind young children

8-12 岁留守儿童羞怯与情绪适应的关系：父母关爱的调节作用及其干预

张嘉琪　刘文 （通讯作者） 刘程成

辽宁师范大学，大连，116029

通讯作者 E-mail：wenliu703@126.com

摘 要　情绪适应指个体在面临内外环境中的压力时表现出的情绪的稳定与平衡状态，是衡量个体心理发展状况的重要指标之一。情绪适应良好与否关系着儿童青少年的健康成长。由于缺乏父母的关爱与陪伴，留守儿童的情绪适应状况堪忧。羞怯作为一种气质特征，对儿童的情绪适应具有消极影响。以往虽有研究关注到了羞怯与儿童情绪适应之间的关系，但大多只简单探讨了羞怯对情绪适应的直接作用，鲜有研究考虑到了其他因素在其中的作用。父母关爱指父母在心理和情感上对孩子的积极关注，是儿童成长过程中的重要支持资源，对儿童的情绪适应状况具有一定的保护作用。本研究采用问卷研究和干预研究相结合的方式，选取 508 名 8–12 岁留守儿童，探究父母关爱在羞怯与留守儿童情绪适应之间的作用机制，并根据研究结果设计相应的干预方案以改善留守儿童的情绪适应状况。结果发现，8–12 岁留守儿童的羞怯和情绪适应之间存在显著相关关系，具体表现为羞怯与留守儿童的社交焦虑、抑郁显著正相关，与主观幸福感显著负相关。结论：父母关爱在羞怯与情绪适应之间起调节作用，且均属于“雪中送炭”调节模式，具体表现为较高的父母关爱水平可以帮助缓解羞怯对留守儿童情绪适应的不利影响。经过为期六周共六次的父母关爱干预，结果发现父母关爱干预方案能显著提高干预组留守儿童的父母关爱得分，改善干预组留守儿童的情绪适应状况。

关键词　留守儿童，情绪适应，羞怯，父母关爱，干预研究

The Relationship between Shyness and Emotional Adjustment in Left-behind Children Aged 8–12 years: The Moderating Effect of Parental Care and its Intervention

Jiaqi Zhang Wen Liu Chengcheng Liu
Liaoning Normal University, Dalian, 116029

Abstract：Emotional adaptation refers to the stable and balanced state of emotions that an individual shows when facing the pressure of internal and external environment. It is one of the important indicators to measure the psychological development of an individual. Whether the emotional adaptation is good or not is related to the healthy growth of children and adolescents. Due to the lack of parental care and companionship, the emotional adaptation of left-behind children is worrying. As a kind of temperament, shyness has a negative effect on children's emotional adaptation. Reviewing the previous studies, although some studies have focused on the relationship between shyness and children's emotional adaptation, most of them only discussed the correlation between the two, and few studies took into account the role of other factors. Parental care refers to parents' active psychological and emotional attention to their children, which is an important support resource for children's growth process and may have a certain protective effect on children's emotional adaptation. This study used a combination of questionnaire research and intervention research of 508 8-12-year-old children to explore the mechanism of parental care between shyness and emotional adjustment of left-behind children, and design the corresponding intervention plan according to the research results to improve the emotional adjustment of left-behind children. Results showed that there was a significant correlation between shyness and emotional adjustment in left-behind children aged 8-12 years old. Specifically, shyness had a significant positive correlation with social anxiety and depression, and a significant negative correlation with subjective well-being. Conclusions: parental care played a regulating role in the relationship between shyness and emotional adjustment, and both of them belong to the regulation mode of "providing help in need". Specifically, a higher level of parental care can help alleviate the adverse effects of shyness on emotional adjustment of left-behind children. After six times of parental care intervention for six weeks, the results shows that the parental care intervention program can significantly improve the scores of parental care of left-behind children in the experimental group, and improve the emotional adaptation of left-behind children in the experimental group.

Keywords：Left-behind children, Emotional adaptation, Shyness, Parental care, Intervention study

学校心理环境与留守初中生社会适应：同伴侵害的中介作用与心理资本的调节作用

梁琳琳 刘文（通讯作者）
辽宁师范大学心理学院，大连，116029，wenliu703@126.com

摘要：社会适应是指个体在与社会环境的交互作用过程中,主动地顺应环境,调控和改变环境,最终达到与社会环境保持和谐关系和平衡状态。研究发现，留守儿童由于长期缺少父母关爱及有效的教育、引导和管理，与非留守儿童相比，社会适应问题较多。根据生态系统理论，学校是除家庭以外对学生发展影响最大的微观系统，学校氛围(如学校心理环境)与青少年社会适应的发展有着密切联系。然而，以往较少探讨学校心理环境影响青少年社会适应的内在作

用机制，且忽略了对留守儿童这一类处境不利儿童的考察。本研究基于生态系统理论和社会背景论探究了学校心理环境对留守初中生社会适应的影响，并旨在厘清该影响背后的心理机制。方法：采用学校积极心理环境问卷、积极心理资本问卷、多维同伴侵害量表以及儿童青少年社会适应问卷对农村儿童进行问卷调查，1 年后实施追踪，以前后测中一直处于留守状态的 482 名初中生（254 名男生，228 名女生；M_{age}=12.81，*SD*=0.75）作为研究对象，结果发现：(1)同伴侵害在学校心理环境与留守初中生社会适应的纵向关系中起到完全中介作用。(2)学校心理环境影响留守初中生社会适应的间接效应受到心理资本的调节。具体来说，学校心理环境能够通过减少同伴侵害进而促进留守初中生社会适应水平，心理资本可以缓冲不良学校心理环境对同伴侵害的消极影响，也能够降低同伴侵害对社会适应的负面影响。这启示我们促进留守初中生的社会适应水平，可从改进学校环境的角度入手，并且注重提升留守初中生的积极心理资本。
关键词：留守初中生，社会适应，学校心理环境，同伴侵害，心理资本

School Psychological Environment and Social Adjustment of Left -Behind Children: The Mediating Role of Peer Aggression and the Moderating Role of Psychological Capital

Linlin Liang, Wen Liu(corresponding author)
School of Psychology, Liaoning Normal University, Dalian 116029, China
wenliu703@126.com

***Abstract*:** Social adjustment refers to the process of interaction between individual and the social environment, actively conforming to the environment, regulating and changing the environment, and ultimately achieving a harmonious relationship and a balanced state with the social environment. It is found that left-behind children have more social adjustment problems than non-left-behind children due to the long-term lack of parental care and effective education, guidance and management. According to the ecosystem theory, school is the micro-system that has the greatest influence on students' development besides the family, and the school climate (e.g., the school psychological environment) is closely related to the development of adolescents' social adjustment. However, in the past, the intrinsic mechanisms by which the school psychological environment affects adolescents' social adjustment have been less explored, and the examination of disadvantaged children, such as left-behind children, has been neglected. The present study explored the influence of school psychological environment on the social adjustment of left-behind junior high school students based on the ecosystem theory and social context theory, and aimed to clarify the psychological mechanisms behind this influence. Methods: The School Positive Psychological Environment Questionnaire, the Positive Psychological Capital Questionnaire, the Multidimensional Peer Victimization Scale, and the Social Adjustment Questionnaire for Children and Adolescents were administered to rural children, and follow-up was implemented 1 year later, with 482 junior high school students (254 boys, 228 girls; *M*age=12.81, *SD*=0.75), who were consistently left behind in the pre and posttests, as the subjects of the study. The results found that (1)Peer victimization played a fully mediating role in the longitudinal relationship between school psychological environment and social adjustment of left-behind children. (2) The indirect effect of the school psychological environment influencing the social adjustment of left-behind children was moderated by psychological capital. Specifically, the school psychological environment can promote the social adjustment level of left-behind children by reducing peer victimization, and psychological capital can buffer the negative effects of poor school psychological environment on peer victimization and also reduce the negative effects of peer aggression on social adjustment. This suggests that we can start from the perspective

of improving the school environment to promote the social adjustment of left-behind children, and focus on improving the positive psychological capital of left-behind children.
***Keywords*:** Left-behind children, Social adjustment, School psychological environment, Peer victimization, Psychological capital

学校心理环境对留守初中生学习适应行为的影响：链式中介效应

李明鑫　刘文（通讯作者）
辽宁师范大学，大连，116012，wenliu703@126.com

摘要:随着我国城镇化进程的快速发展和农村劳动力向城镇转移，近年来留守儿童的数量逐年增多。家庭监护教育功能不足以及情感支持的缺乏使得留守儿童在学业表现、人际关系、情绪行为等方面都表现出了不同程度的适应不良。而学业的适应与成就是留守儿童寻求更好发展的关键途径，为促进留守儿童积极发展，应关注留守儿童学业适应问题。学习适应行为是学业适应的具体表现，反应了个体学习适应的过程和行为特点。学校是学生生活的主要场所，对学生的学习适应行为产生重要影响，学校氛围（学校心理环境）对家庭结构缺失的留守儿童的影响更为明显。然而，以往较少探讨学校心理环境对青少年学习适应行为的内在作用机制，且忽略了对留守儿童这一类处境不利儿童的考察。本研究基于自我决定理论探讨学校心理环境对留守初中生学习适应行为的影响及其内部心理机制。采用学校心理环境问卷、学习适应行为问卷、成长型思维问卷和心理资本问卷对 7~9 年级 1172 名留守初中生进行调查。研究结果发现：（1）学校心理环境对留守初中生学习适应行为有显著正向影响；（2）心理资本在学校心理环境和留守初中生学习适应行为之间起单独的中介作用；（3）成长型思维与心理资本起链式中介作用。研究表明良好的学校心理环境有利于提高留守初中生的心理资本，从而促进学习适应行为的增加。

关键词 学校心理环境，学习适应行为，成长型思维，心理资本，留守初中生

The Effect of School Psychology Environment on Left-behind Middle School Students' Academic Adaptive Behavior: The Chain Mediating Effect

Mingxin Li , Wen Liu (corresponding author)
School of Psychology, Liaoning Normal University, Dalian 116029, China
wenliu703@126.com

***Abstract*:** With the rapid development of China's urbanization process and the transfer of rural labour to the cities and towns, the number of left-behind children has been increasing year by year in recent years. Due to the insufficient function of family guardianship and education as well as the lack of emotional support, left-behind children show different degrees of maladjustment in academic performance, interpersonal relationships, emotional behavior, and other aspects. Academic adaptation and achievement are the key ways for left-behind children to seek better development. In order to promote the positive development of left-behind children, attention should be paid to the problem of academic adaptation. Academic adaptive behavior is the specific performance of academic adaptation, which reflects the process and behavioral characteristics of individual learning adaptation. School is the main place of students' lives, which has an important influence on students' academic adaptive behaviors, and the school atmosphere (school psychology environment) has an obvious

influence on left-behind children whose family structure is missing. However, the intrinsic mechanisms of the school psychological environment on adolescents' adaptive behaviors have been less explored in the past, and the examination of left-behind children, a category of disadvantaged children, has been neglected. Based on self-determination theory, explore the effect of perception of the school psychology environment on the academic adaptive behavior of left-behind middle school students and its underlying mechanisms. The Psychology Environment at School Questionnaire, Scale of Adaptive Behavior for Adolesents, Growth Mindset Scale, and Psychological Capital Questionnaire were administered to 1172 left-behind middle school students from grades 7 to 9. The results showed that: (1) the school psychological environment had a significant negative effect on left-behind middle school students' academic adaptive behavior; (2) psychological capital played a significant mediating role between the school psychological environment and left-behind middle school students' academic adaptive behavior, growth mindset, and psychological capital. The study suggests that a positive school psychology environment is conducive to increasing the psychological capital of left-behind middle school students, thus promoting academic adaptive behavior.
Keywords**:** School psychological environment, Academic adaptive behavior, Growth mindset, Psychological capital, Left-behind middle school students

生命早期环境不可预测性与青少年执行功能的关系：有调节的中介模型

徐旻昱　黎志华（通讯作者）
湖南科技大学教育学院，湖南省，湘潭市，411201，通讯作者 E-mail：lzhua1018@163.com

摘 要：基于进化生物学领域的生命史理论，生命早期不可预测的发育环境与执行功能较差存在一定联系，前人研究发现了生命早期环境不可预测性对执行功能的负面影响，但很少探讨其相关的作用机制。为了进一步明确生命早期环境不可预测性与青少年执行功能的关系及相关作用机制，研究采用生命早期环境不可预测性问卷、控制感量表、青少年执行功能问卷、首要次级控制优化量表对 570 名初高中生（M_{age}=14.9）进行调查。有调节的中介结果表明，（1）生命早期环境不可预测性显著负向预测青少年执行功能；（2）青少年早期的不可预测性越高，所感受到的控制感越低，执行功能也越差；（3）控制感的中介作用受到最优化策略的调节。研究有助于揭示生命早期环境不可预测性对青少年执行功能影响的作用机制，为未来执行功能的干预研究奠定基础。

关键字：青少年执行功能，生命早期环境不可预测性，控制感，最优化策略

The relationship between environmental unpredictability in early life and adolescent executive functioning: a mediated model with moderation

XU Minyu　LI Zhihua
College of education, Hunan University of Science & Technology, Xiangtan, 411201, Hunan Province

Abstract: Based on life history theories in the field of evolutionary biology, unpredictable developmental environments early in life are associated with poorer executive functioning. Previous studies have identified the negative effects of environmental unpredictability early in life on executive functioning, but have rarely explored the related mechanisms of action. To further clarify the relationship between early life environmental unpredictability and adolescents' executive functioning and the related mechanisms of action, the study was conducted with 570 junior and senior high school students (Mage = 14.9) using the Early Life Environmental Unpredictability Questionnaire, the Sense of Control Scale, the

Adolescent Executive Functioning Questionnaire, and the Optimization in primary and secondary control Scale. Moderated mediation results indicated that (1) early life environmental unpredictability significantly and negatively predicted adolescent executive functioning; (2) the higher the early adolescent unpredictability, the lower the perceived sense of control and the poorer the executive functioning; and (3) the mediating role of the sense of control was moderated by the optimisation strategy. The study helps to reveal the mechanism of action of environmental unpredictability in early life on adolescents' executive functioning and lays the foundation for future intervention studies on executive functioning.

Keywords: adolescent executive function, early life environmental unpredictability, sense of control, optimisation strategies

流动儿童相对剥夺感对学业倦怠的影响：公正世界信念的中介和逆境信念的调节作用

蔡滢[1] 孙天义[2]（通讯作者）

1 河南机电职业学院，郑州，451191

2 信阳师范大学，信阳，464000，sty543@126.com

摘 要 随着我国城镇化进程的快速发展和农村适龄劳动力向城镇转移，近年来，流动人口的“家庭化趋势”已经成为近十年人口流动的新趋势。如何保障流动儿童的心理健康和学业发展，是心理学和教育学工作者共同关注的重要问题。然而，许多从农村来到城市生活和学习的流动儿童因为种种原因无法适应学校紧张的学习氛围和高负荷的学业压力，出现了学业倦怠的现象，这对于青少年的学业表现和身心发展都是十分不利的，也有悖于我国教育强国的发展规划。以往研究发现，相对剥夺感会对流动儿童的偏差行为（如网络成瘾）和逃避行为（如职业倦怠）等产生影响，但少有研究探讨相对剥夺感对流动儿童学业倦怠的影响。本研究构建了一个有调节的中介模型来探究相对剥夺感对学业倦怠的影响，并研究公正世界信念和逆境信念在其中的作用机制。本研究采用相对剥夺感量表、学业倦怠量表、公正世界信念量表和逆境信念量表对 627 名流动儿童进行问卷调查研究，并从中选取高学业倦怠水平的个体进行焦点解决取向的干预研究，以证明本文构建的模型。结果显示：相对剥夺感对学业倦怠会产生影响，在这条影响路径上，公正世界信念能够起到中介作用，而逆境信念会对这种间接影响的后半段路径起调节作用。通过对流动儿童的相对剥夺感进行干预，我们发现流动儿童的相对剥夺感水平和学业倦怠水平显著下降，公正世界信念水平显著提高。综上所述，流动儿童的相对剥夺感能够通过公正世界信念的中介作用影响其学业倦怠，并且逆境信念在这一路径的后半段起到调节作用；以相对剥夺感为主题的团体心理辅导能够降低流动儿童的学业倦怠，具有可操作性。

关键词 相对剥夺感，学业倦怠，公正世界信念，逆境信念，流动儿童

The Effects of Migrant Children's Relative Deprivation on Academic Burnout: The Mediation of Belief in a Just World and The Regulation of Belief about Adversity

Cai Ying[1] Sun Tianyi[2]

1 Henan Mechanical & Electrical Vocational College, Zhengzhou, 451191

2 Xinyang Normal University, Xinyang, 464000, sty543@126.com

Abstract: With the rapid development of China's economy and the acceleration of the transfer of rural labor force, the "family trend" of migrant population has become a new trend of population mobility in the past decade. How to ensure the

mental health and academic development of migrant children is an important issue of common concern for psychologists and educators. However, many migrant children who come from rural areas cannot adapt to the tense learning atmosphere and high academic pressure for various reasons. The develop academic burnout, which has a bad influence to the academic performance and physical and mental development. It also runs counter to the development plan of China's education. Previous studies have found that the feeling of relative deprivation may have an impact on the biased behavior (such as Internet addiction) and avoidance behavior (such as burnout) in migrant children, but few studies have noticed the effect of relative deprivation on the academic burnout of migrant children. Therefore, this study constructs a moderated mediation model to explore the effects of relative deprivation on academic burnout, and to discuss the mechanisms of the belief in a just world and the beliefs about adversity. In this study, a questionnaire survey was conducted on 627 migrant children using the Relative Deprivation Scale, the School Burnout Scale, the Belief in a just world Scale, and the Beliefs about adversity Scale. Then we selected individuals with higher levels of academic burnout for intervention.

The results showed that the relative deprivation have an impact on academic burnout. In this path, the belief in a just world can play a mediating role, while the belief of adversity will regulate the second half of this indirect impact path. By intervening on migrant children's sense of relative deprivation, we found that migrant children's levels of relative deprivation and academic burnout decreased significantly and their levels of beliefs in a just world increased significantly.In summary, we conclude that migrant children's relative deprivation can influence their academic burnout through the mediating role of beliefs in a just world, and that beliefs about adversity play a moderating role in the second half of this pathway. Group counseling on the theme of relative deprivation can reduce academic burnout in migrant children and it's available.

Keywords: Relative Deprivation, School Burnout, Belief in a Just World, Beliefs about adversity, Migrant Children

父亲育儿参与在孤独症儿童语言发展中的作用

华子慧[1]，王筝[2]，李天碧[1]，李智[1]，易莉[1,3]

1 北京大学心理与认知科学学院/北京行为与心理健康重点实验室

2 北京市应用实验心理学重点实验室，实验心理学教育国家示范中心（北京师范大学），北京师范大学心理学院

3 北京大学 IDG 麦戈文脑科学研究所

摘 要 背景：过往针对孤独症儿童家庭的研究主要以母亲为参与者，且多关注母亲的作用和经历，较少关注父亲。现有的涉及孤独症儿童父亲的研究侧重于他们自我报告的生活经历，并研究了诸如亲职压力、心理健康和社会支持需求等问题（e.g., Rudelli et al., 2021）。很少有研究探究父亲在孤独症儿童发展中的作用。然而，根据以往在典型发育儿童家庭的研究，父亲对儿童的发展可能也扮演着重要且独特的角色。了解父亲的角色有助于更好地为孤独症儿童家庭提供支持，促进家庭干预的发展。

目标：本研究旨在调查孤独症儿童的父亲的育儿参与状况，并探究父亲育儿参与和孤独症儿童语言发展的关系，以及父亲育儿参与如何解释孤独症儿童与典型发展儿童在语言发展上的差异。

方法：本研究纳入了 83 名被诊断为孤独症谱系障碍（ASD）的 3 至 8 岁儿童（其中女孩 12 人，平均年龄为 5.39 岁，标准差为 1.09 岁）和 82 名年龄性别匹配的典型儿童（其中女孩 19 人，平均年龄为 5.66 岁，标准差为 0.82 岁）。儿童完成了韦氏学前和初等智力测验第四版（WPPSI-IV；Wechsler，2012），其语言发展由该测试的言语理解指数（VCI）进行测量。陪同儿童进行测试的照顾者通过问卷填写报告儿童的主要照顾者情况和家庭社会经济状况（SES）。

结果：孤独症儿童父亲的育儿参与率（32.5%）显著低于典型发展儿童父亲的育儿参与率（69.5%），$p < .001$。父亲

育儿参与与孤独症儿童的 VCI 显著相关，p = .004，并且在典型儿童中也显著相关，p = .002。父亲对 VCI 的影响不受其他照顾者的参与或任何家庭 SES 变量的中介。中介分析结果显示，父亲的育儿参与在 ASD 诊断与 VCI 之间起到部分中介作用，p < .001。

结论：我们发现孤独症儿童的父亲育儿参与率低于典型儿童父亲。父亲作为主要照顾者的孤独症儿童语言发展好于父亲不作为主要照顾者的孤独症儿童。父亲的育儿参与可能对于孤独症儿童的语言困难起到保护作用。我们的研究突出了父亲在孤独症儿童发展中的重要角色，并为涉及孤独症儿童家庭的干预提供了启示。

Unique association between increased father-child interaction and reduced pragmatic difficulties in autistic children: The mediating role of joint reading

Zihui Hua, Zhi Li, & Li Yi

Abstract: Background: Fathers have been underrepresented in research on families of autistic children (Rankin et al., 2019), and research on fathers' role in the language development of autistic children is limited. However, extensive research on neurotypical children has highlighted the importance of fathers in language development (e.g., Cabrera et al., 2017), necessitating investigation in the context of autistic children. Understanding fathers' role can inform parent-mediated interventions targeting language difficulties of autistic children.

Objectives: This study aimed to investigate the association between father-child interaction and autistic children's language development, specifically focusing on pragmatic difficulties. Our objectives were to a) examine the association between overall level of father-child interaction and pragmatic difficulties compared to mother-child interaction, and b) compare four types of father-child interactive activities (joint reading, chatting, video watching, game playing) in their associations with autistic children's pragmatic difficulties and identify the most influential activity.

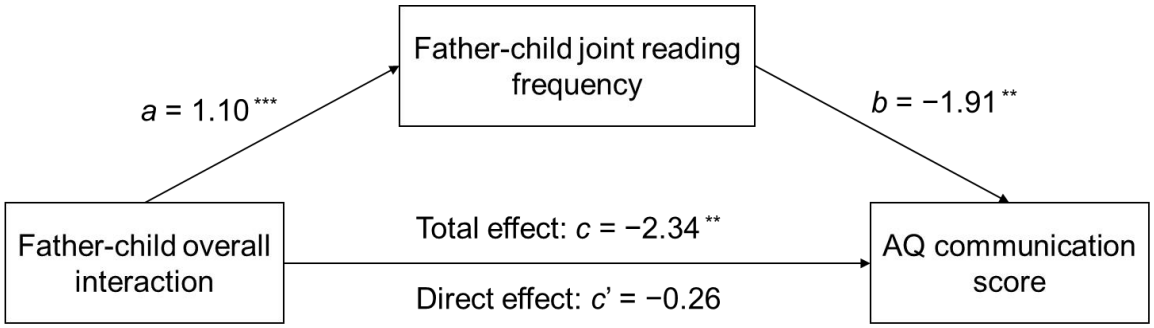
Method: Thirty-one dyads of parents raising autistic children participated in this study (child age: M = 6.25, SD = 1.09; father age: M = 37.32, SD = 5.01; mother age: M = 36.45, SD = 4.53). Fathers and mothers completed online questionnaires. Fathers reported their overall interaction levels with their child using the Interaction subscale of the Father Involvement Questionnaire (Wu et al., 2015). For comparison purpose, mothers reported mother-child overall interaction levels using the same scale. Besides, parents reported how often they engage in the following interactive activities with their child: joint reading, chatting, video watching, and game playing. Autistic children's pragmatic difficulties were reported by mothers using the communication subscale of the Autism Spectrum Quotient—Children's Version (AQ-Child; Auyeung et al., 2008), with higher scores indicating increased pragmatic difficulties. Both parents reported their education, job, and income, which were synthesized to indicate the family's overall socioeconomic status (SES).

Result: Linear regression showed that after controlling for child's age and overall family SES, greater father-child overall interaction was associated with lower AQ communication scores of autistic children (β = -2.33, p = .009), whereas no significant association was found for mother-child overall interaction (p = .926). The association between father-child overall interaction and AQ communication scores remained significant after controlling for mother-child overall interaction (β = -2.34, p = .010). Among the four types of father-child interactive activities, joint reading was the only factor significantly

linked to AQ communication scores (β = -1.76, p = .032; see Table 1). Mediation analysis further revealed a significant indirect effect of father-child overall interaction on AQ communication scores through joint reading (indirect effect = -2.09, p = .011, indirect/total effect = 0.89; see Figure 1).

Discussion: This study revealed a unique association between father-child interaction and autistic children's pragmatic difficulties. Increased father-child overall interaction was associated with reduced pragmatic difficulties, independent of mother-child overall interaction and family SES. Furthermore, joint reading emerged as a critical activity in autistic children's pragmatic development, accounting for the effect of father-child interaction on autistic children's pragmatic difficulties. Our findings highlight the importance of father-child joint reading in autistic children's pragmatic development and provide implications for psychoeducation and intervention programs that involve families of autistic children.

Table 1



Linear Regression Analysis: Examining the Effects of Various Father-Child Interactive Activities on AQ Communication Scores in Autistic Children

Variable	B	p	95%CI
Father-child joint reading	-1.76	.032	[-3.36, -0.16]
Father-child chatting	1.12	.088	[-0.18, 2.42]
Father-child video watching	-0.12	.853	[-1.49, 1.25]
Father-child game playing	-0.79	.445	[-2.89, 1.31]

Note. Child's age, family's overall SES, and mother-child overall interaction were added in the regression model as covariates. AQ = Autism Spectrum Quotient; CI = confidence interval.

Figure 1

Mediation Model: Father-Child Joint Reading Frequency as a Full Mediator between Father-Child Overall Interaction and AQ Communication Scores in Autistic Children

Note. Child's age, family's overall SES, and mother-child overall interaction were added in all regression models as covariates. AQ = Autism Spectrum Quotient.

学龄期家长的教养焦虑体验及量表修订

李洁[1]（通讯作者） 王媛媛[1]
1 中国人民大学心理学系，北京，100182
通讯作者 E-mail（lijie2013@ruc.edu.cn）

摘 要 焦虑情绪在家长中普遍存在。在对孩子的教育及养育过程中产生的焦虑是其主要来源。教育焦虑是指家长在对子女实施教育的过程中因承受教育压力、面临不易解决的教育问题和对教育结果的不确定性所诱发的一系列不愉快情绪状态。养育焦虑是指父母抚养子女的过程中对于健康、安全、竞争压力等因素所产生的过度担忧、恐惧以及不安的情绪。而教养焦虑则是二者的整合。本研究旨在系统了解学龄孩子家长的教养焦虑情况，并为将来的研究提供测量工具。研究一对 15 名学龄期孩子家长的教养焦虑体验进行了深度访谈。对质性数据的分析发现，家长的教养焦虑主要是关于孩子的性格品质、学习问题，行为习惯、待人处事、身心健康，未来前途，以及自身的教育方式、情绪传染、隔代育儿所带来的不良影响等 9。焦虑对家庭关系、工作和身心健康都存在负面影响。家长对焦虑的应对既有积极也有消极的方式。配偶的不协助、与同龄的对比以及对未知的低容忍加剧了教养焦虑。研究二在访谈内容的基础上结合以往量表形成了《学龄孩子家长教养焦虑量表》原始条目，并收集了 510 名家长的问卷调查数据对该量表进行修订和信效度检验。最终量表包含 32 个条目，分为 8 个维度：教育方式、身心健康、性格品质、行为习惯、学习问题、未来前途、情绪传染及隔代育儿。验证性因素分析及内部一致性分析显示问卷信效度良好，可为将来相关调查研究使用。

The experience of parenting anxiety and scale validation

Jie Li, Yuanyuan Wang
Department of Psychology, Renmin University of China

***Abstract*:**

Anxiety is commonly experienced among Chinese parents of school-age children. The anxiety includes two main aspects. One is related to education, which involves stress, competition uncertainty and difficulties encountered in school. The other is related to the growing up experience, which involves psychological and physical health, interacting with the society and entering adulthood. Parenting anxiety includes both of these aspects, indicating the negative emotional experience, such as worry, upset, fear and so on, related to acting the role as a parent when raising the child. The connotation of parenting anxiety is unique in Chinese society, giving the merged self between parent and the child, as well as the traditional cultural expectation on offspring in achievement so that to bring glory to the family. Study one adopted an semi-structured in-depth interview among 15 parents of school-aged children, so that to understand their experience of parenting anxiety. The interpretative phenomenological analysis (IPA) was adopted to analyze the qualitative data, and identified several themes. Parents anxiety was about children's characteristic traits, study problems, behavioral conducts, social interactions, mental health, future development, and the impacts of their parenting style, emotional contagion and problems involving with intergenerational parenting. The anxiety elicited from parenting process yield negative influence on their work, health and family relationships. Parents reported various ways to deal with their anxiety, involving both positive and negative coping strategies. They also reported factors which they perceived to deteriorate their anxiety, such as the lack of assistance from the spouse, the upward comparison with others, and the

difficulty in tolerating uncertainties in children's development. Study two generated original items pool for the 《Parenting anxiety scale》based on the qualitative data, as well as items from existing relevant scales. Then a questionnaires survey was conducted among 510 parents for item analysis and validating the new sale. The confirmatory factor analysis indicated that the measure contained eight sub-domains of their worry, namely parenting style, psychological and physical health, characteristic trait, behavior conduct, study problem, future development, emotion contagion and intergenerational parenting. The measure has been proved to show good validity and reliability and is a suitable tool for studies which explore parenting anxiety in the future.

Keywords：parenting anxiety, qualitative data analysis, scale development

亲子脑间同步的行为学意义：情境依赖的视角

亲子脑间同步是亲子在互动过程中双方大脑活动的协调一致性，反映了亲子互动中情感与行为的相互传递和共同调节，同时也是亲子在神经层面建立情感联结的重要标志。随着认知神经科学超扫描技术的发展，研究者们开始采用功能性近红外光学成像等手段来测量亲子在前额叶、颞顶联合区等脑区的脑间同步。不少研究者指出，脑间同步是进行亲子互动、塑造亲子关系的生物基础；认为高水平的脑间同步反映了亲密、稳定的关系质量。然而，目前的实证研究并未得出一致结论。同步性作用的情境观认为，亲子同步性只是一个客观的生理指标，本身并没有"好坏"之分，其行为学意义需要结合互动中的情感环境来探讨。本研究基于同步性作用的情境观，检验脑间同步与亲子关系质量间的关系是否依赖于亲子互动中情感环境。88 对亲子（儿童平均年龄 8.07 岁，51 名男孩）来到实验室进行一个 5 分钟的合作绘画任务。在任务过程中，采用 16 导 Nirsport2 分别记录家长和孩子背外侧前额叶和颞顶联合区的大脑活动，采用行为编码的方式评估亲子在任务中的互动情感环境。亲子关系质量采用两种方式衡量：互动任务中的行为编码以及儿童汇报的亲子依恋水平。互动中的脑间同步采用基于从聚置换检验（cluster-based permutation）的小波相干分析（wavelet coherence analysis）。结果发现，在合作绘画任务中，亲子在左右侧颞顶联合区存在对应脑区的脑间同步。进一步地，互动情感环境调节了亲子在左侧颞顶联合区脑间同步与亲子关系质量间的关系。具体来说，在支持型情感环境中（父母对孩子有较高的情绪敏感性），脑间同步水平越高，亲子关系质量越高；然而，在非支持型情感环境中（父母对孩子的情感需要缺乏支持），脑间同步水平越高，亲子关系质量越差。本研究发现了左侧颞顶联合区在亲子互动中的重要作用，并首次在大脑活动层面为同步性作用的情境观提供了实证支持，证明了亲子脑间同步的情境依赖性。未来脑间同步研究需要关注同步行产生的情境，在特定情境中解释脑间同步的行为学意义。

Abstract

Theory suggests that parent-child interbrain synchrony (IBS; i.e., concordance between regions of brain activation) is fundamental to human attachment. However, empirical support is mixed regarding this relation. With the functional near-infrared spectroscopy (fNIRS) hyperscanning methodology, the present study considers parent emotional support during an interaction with their child as a moderator of parent-child IBS and relationship quality (via behavioral observation and child report). Eighty-eight parent-child dyads (Mage = 39.03 years, SD = 3.54 years for parents; Mage = 8.07 years, SD = 1.16 years for children; N = 176) participated in the study and their brain activity was assessed during a dyadic cooperation task. Cluster-based permutation tests indicated the above-chance parent-child IBS at the left and right temporoparietal junction (TPJ). Results showed that IBS at the left TPJ was related to better relationship quality in the context of high parent emotional support whereas the association was diminished and negative in the midst of low parent emotional support, depending on the indicator of relationship quality. Findings contribute to a more nuanced understanding of the relation between parent-child IBS and relationship quality and underscore the need to assess the degree of parent emotional support that is occurring when IBS is captured.

母亲安抚婴儿时的生理动态受到母亲参与度和新生儿特征的影响

高梦宇 北京师范大学

安抚婴儿是育儿过程中的一项常见又费体力的挑战，因此那些能够有效调节自身生理机能的父母更能为婴儿提供积极的照顾，例如对婴儿的需求更加敏感（Moore 等，2009 ）。然而，并不是所有的父母都会因为婴儿的哭闹而感到不安（Jones-Mason 等，2018 ），存在着较大的个体差异，但鲜有研究对此进行探究。本研究运用动态系统的分析方法，在婴儿“平静”和“不安”两种情境下，考察母亲对婴儿投入是否会影响其生理指标的失调。此外，还将考察新生儿注意力（一项个体与生俱来的持续警觉性的特征）是否可以调节母亲参与度与其生理动态之间的关联。

数据来自 155 名新生儿（77 名男性，占 47.5%）及产后 7 个月的母亲。婴儿出生后不久即施测《新生儿重症监护室网络神经行为量表》（Lester 和 Tronick，2004 ）中的注意力分量表，该量表可反映婴儿对听觉和视觉刺激的注意和反应能力。产后 7 个月，母亲和婴儿回到实验室，完成静止脸范式（Haley 和 Stansbury, 2003），这是一种常用的诱发婴儿不安的范式。在最初的自由玩耍期（即 "玩耍期"）后，母亲被要求在两分钟内不对孩子做任何回应，然后再与婴儿继续互动两分钟（即 "团聚期"）。母亲的生理反应和调节的指标将由呼吸窦性心律失常（RSA）表征，这是一项测量副交感神经对心脏唤醒的调节能力的指标。此外，母亲在 "玩耍 "和 "团聚 "过程中与婴儿的积极互动被逐秒编码。

通过对母亲 RSA 进行非线性动态系统模型拟合确定平衡点（即母亲 RSA 的典型水平）和恢复强度（即母亲 RSA 在受到干扰后恢复平衡的速度）。从 "玩耍 "到 "团聚 "期间，母亲的 RSA 恢复强度越来越弱，这表明母亲的 RSA 恢复到平衡点的速度越来越慢，因此副交感神经的调节受到了更大的干扰。有趣的是，与参与度较低的母亲相比，在 "游戏 "过程中参与度较高的母亲表现出更多的生理紊乱。然而，在 "团聚 "过程中，母亲的积极投入并没有显示出同样的效果。此外，婴儿出生时注意力更集中的母亲的 RSA 返回强度下降幅度更大。然而，新生儿的注意力和母亲的参与并不会相互影响母亲的 RSA 返回强度。我们将讨论早期护理的生理基础的启示作用。

Mothers’ Physiological Dynamics While Soothing a Distressed Infant

Soothing a distressed infant is a common parenting challenge, and a physiologically taxing one. Parents who regulate their own physiology effectively are more likely to provide positive caregiving, such as greater sensitivity to the infant needs (Moore et al., 2009). However, not all parents are equally disturbed by a distressed infant (Jones-Mason et al., 2018), and there have been few efforts devoted to understanding the contributing factors. Applying dynamic systems analyses, the present study investigated whether maternal engagement during *distressing* and *non-distressing* situations with the infant would be differentially associated with mothers’ physiological dysregulation. Moreover, we tested whether newborn attention, an innate infant characteristic of sustained alertness, moderated the link between maternal engagement and maternal physiological dynamics.

Data for the present study were from 155 newborn infants (77 males, 47.5%) and their mothers at 7 months postpartum. The attention subscale of the NICU Network Neurobehavioral Scale (Lester & Tronick, 2004), administered shortly after birth, was used as the index of infant characteristics. This scale captures infants’ ability to attend and respond to auditory and visual simulation. Mothers and their 7-month-old infants returned to the laboratory and completed the

still-face paradigm (Haley & Stansbury, 2003), a commonly used paradigm to elicit infant distress. After an initial free play period (i.e., Play episode), mothers were instructed to maintain a flat affect for two minutes and then resume their interactions with the baby for another two minutes (i.e., the Reunion episode). Mothers' respiratory sinus arrhythmia (RSA)—a measure of parasympathetic regulation of cardiac arousal—were used as the index of physiological reactivity and regulation. Moreover, mothers' positive engagement with the infant during the Play, as well as the Reunion episode, was coded second-by-second.

Nonlinear dynamic systems models were fitted for maternal RSA, with discrete changes as outcomes. The homeostatic point (i.e., typical levels of a mother's RSA) and return strength (i.e., the rate at which maternal RSA return to homeostasis after being perturbed) were identified by these models. Results showed that mothers' RSA return strength became weaker from Play to Reunion, indicating a slower return to the homeostatic point, therefore a more disturbed parasympathetic regulation. Interestingly, mothers who were more positively engaged during Play showed more physiological disturbance, compared to the less engaged. Mothers' positive engagement during Reunion, however, did not show the same effect. Additionally, mothers of infants who are more attentive at birth showed a larger decrease in RSA return strength. However, newborn attention and maternal engagement did not interact to influence maternal RSA return strength. Implications for the physiological foundations of early caregiving will be discussed.

不同社会经济地位的父母"将心比心"如何影响儿童共情与心理理论

徐丞谊　伍珍 (通讯作者)
清华大学心理学系，北京，100084，zhen-wu@mail.tsinghua.edu.cn

摘 要　"将心比心"（mind-mindedness）指养育者将孩子作为有自己的情感、思想和愿望的独立心理个体来对待的认知倾向 (Meins et al., 2002)，是形成安全型亲子依恋、促进儿童发展的重要因素。过往的研究着重探讨了"将心比心"与西方国家儿童心理发展相关，忽视了生活在非西方国家社会经济地位较低的家庭，而对"将心比心"的编码也较多地忽略了不同效价描述可能存在的影响。本研究包括两部分，旨在揭示"将心比心"对中国学前儿童共情与心理理论发展的作用机制。家长参与者皆被要求自由描述自己的孩子，继而对其五分钟语音样本进行记录和编码：(i)"将心比心" (以儿童为主的描述中，关于其心理描述而非行为、生理或一般性描述的比例）和 (ii) 积极评价 (以儿童为主的描述中，对其积极描述而非中立或消极描述的比例)。研究一 (*n*=117; 50 名男孩，平均年龄 4.84 岁) 采用情绪情境故事测试方法测量儿童参与者的共情能力，结果发现在控制了人口统计和社会经济地位的个体差异之后，"将心比心"和学前儿童共情能力正相关，然而父母的积极评价与儿童共情能力无显著相关。研究二 (*n*=291; 149 名男孩，平均年龄 5.29 岁) 采用错误信念任务测量儿童参与者的心理理论，结果发现在控制了人口统计和语言能力的个体差异之后,"将心比心"在不同社会经济地位影响儿童心理理论能力之间起部分中介作用；相反地，积极评价却不能中介社会经济地位与儿童心理理论之间的关系。总之，本研究初步证实了父母"将心比心"能力对于中国学前期儿童共情与心理理论发展的重要性；父母"将心比心"可能部分解释不同社会经济地位儿童心理理论能力发展的差异。

Does mind-mindedness account for socioeconomic differences in Chinese preschool children's cognitive and affective aspects of perspective-taking?

Chengyi Xu and Zhen Wu*
Department of Psychology, Tsinghua University, Beijing 100084, China

***Abstract*:** Parental mind-mindedness, defined as the proclivity to view one's child as a mental agent with independent thoughts, feelings and desires (Meins et al., 2002), robustly correlates with theory of mind (ToM) in preschoolers living in Western countries, but has been little studied in much more populous areas of the world, such as mainland China. Although ToM and empathy are often intertwined and contribute to cognitive and affective aspects of perspective-taking respectively, the link between parental mind-mindedness and children's empathy has been largely overlooked (for an exception, see Centifanti et al, 2016). Addressing these gaps, we conducted two studies on parental mind-mindedness as a potential mechanism underlying socioeconomic gradients in Chinese 4- to 6-year-olds' perspective-taking abilities.

Participating parents in both studies are asked to talk about their children, enabling transcripts of parents' 5-min speech samples to be coded for (i) mind-mindedness (indexed by the proportion of child-focused descriptions that are mental rather than behavioral, physical, or general) and (ii) positivity (indexed by the proportion of child-focused descriptions that are positive rather than neutral or negative). Study 1 involved 103 parent-child dyads (50 boys; child M_{age} = 4.84 years, SD = 0.57), with each child completing a story-telling task to assess trait empathy. Study 2 involved 291 parent-child dyads (149 boys; child M_{age} = 5.29 years, SD = 0.67), with each child completing a 3-task battery to assess ToM development. Study 1 indicated a moderate association between parental mind-mindedness and Chinese preschoolers' empathy (affective perspective-taking) that persisted even when individual differences in child demographics and socioeconomic status were taken into account. Study 2 indicated that parental mind-mindedness (rather than positivity) partially accounted for the association between socioeconomic status and ToM (cognitive perspective-taking).

Overall, Study 1 provides an opportunity to examine whether there is a meaningful correlation between Chinese mothers' mind-mindedness and their children's empathy. Study 2 provides evidence for the promise of mind-mindedness in explaining socioeconomic related contrasts in ToM. Taken together, our findings confirm the importance of parental mind-mindedness for preschool-aged children's ToM and empathy, even in Confucian cultures where mind-minded parenting is not particularly prominent.

社交媒体分享奢侈消费：动机推理和下行结果

王彦[1]（通讯作者） 刘琳[1] 刘冰洁[1]
1 华东师范大学心理与认知科学学院，上海，200062，wangyan@psy.ecnu.edu.cn

摘 要　人们越来越多地在社交媒体平台上分享他们的消费活动。然而，人们根据消费帖子所做出的推理却未得到充分研究。本研究假设，当观察者看到他人在社交媒体上发布奢侈品（与发布非奢侈品相比）消费时，他们会推断出更多的自我展示动机和更少的自我表达动机。并且，更多的自我展示动机和更少的自我表达动机导致观察者认为发帖者不太真实，以及削弱观察者对发帖者的人际兴趣。研究 1 使用微信朋友圈中的奢侈实物材料，确定了分享奢侈品消费对自我展示动机和自我表达动机推断的基本影响。研究 2 通过微博中的奢侈体验材料重复了这一动机推理效应，并进一步表明，分享奢侈品消费的人被认为不那么真实，并且人们对他们不那么感兴趣。此外，自我展示和自我表达动机推断在分享奢侈品消费对感知真实性和人际兴趣的影响中起中介作用。研究 3 显示，当帖子强调与奢侈品消费相关的能力（与强调财富相比）时，发布奢侈消费的负面效应会减弱。研究在理论上贡献于社交媒体信号传递、动机推理和不同形式奢侈消费方面的研究。研究发现对社交媒体用户和从业人员具有实践意义。未来研究可以分析社会媒体的真实访问数据、整合发帖者与观察者视角、考虑其他非传统形式的奢侈消费，以及检验观察者特征的调节作用。

关键词　真实，人际兴趣，奢侈消费，自我表达动机，自我展示动机

Sharing Luxury Consumption on Social Media Platforms: Motive Inferences and Downstream Consequences

Yan Wang, Lin Liu, Bingjie Liu
School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

***Abstract*：** Individuals are increasingly sharing their consumption activities on social media platforms. However, the inferences people draw from consumption posts are understudied. Three studies show that observers infer greater self-presentational motives and less self-expressive motives when they see others post luxury (vs. nonluxury) consumption on social media. The attributions of more self-presentational motives and less self-expressive motives lead observers to perceive the poster as less authentic and undermine observers' interpersonal interest toward the poster. The negative effects of posting luxury consumption are attenuated when the post content emphasizes competencies (vs. wealth). This work contributes theoretically to research on signaling and motive inferences. The current findings have practical implications for social media users and practitioners.

***Keywords*：** authenticity, interpersonal interest, luxury consumption, self-expressive motives, self-presentational motives

神经质对青少年抑郁的影响：人际情绪调节与消极偏向有调节的中介作用

王依宁 苏彦捷（通讯作者）
北京大学心理与认知科学学院行为与心理健康北京市重点实验室，北京，100871，yjsu@pku.edu.cn

摘 要　青少年抑郁是全球性的问题。以往研究发现高神经质人格个体具有较高的抑郁风险，而消极偏向是个体抑郁症状的重要认知机制，但消极偏向发挥作用的机制及其条件还有待深入探讨。为探索青少年抑郁的影响因素及相关干预途径，探讨神经质对青少年抑郁的影响以及人际情绪调节与消极偏向有调节

的中介作用。招募 167 名青少年，采用以双字词为材料的效价偏向范式测量消极偏向，用大五人格问卷中神经质分量表、人际情绪调节问卷、流调用抑郁量表分别测量青少年的神经质、人际情绪调节与抑郁症状。结果发现：（1）消极偏向与青少年的抑郁症状呈现显著正相关。（2）消极偏向在神经质对青少年抑郁症状的影响中具有完全中介作用；（3）青少年神经质通过消极偏向影响抑郁症状的中介过程受到人际情绪调节的影响：只有当人际情绪调节水平较低时，青少年神经质通过消极偏向影响了其抑郁症状。研究结果揭示了消极偏向是神经质人格影响青少年抑郁症状的重要认知机制，神经质水平较高的青少年形成了较为消极的认知偏向，即将歧义信息更多地判断为消极的，因此有较高的抑郁风险。人际情绪调节能够使个体在产生消极情绪时能够通过人际交互的方式进行情绪调节，由此降低消极情绪的强度与频率从而降低抑郁的风险。研究结果为通过消极偏向和人际情绪调节改善青少年抑郁的预防与干预研究提供了重要参考。

How Neuroticism Influence Depression in Adolescence: Moderated Mediating Effect of Interpersonal Emotion Regulation and Negative Bias

Yining Wang; Yanjie Su
（School of Psychological and Cognitive Sciences, Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871）

Abstract：Adolescent depression is a global issue. Previous studies have found that individuals with high level of neuroticism have a higher risk of depression and the negative bias is an important cognitive mechanism of depressive symptoms in individuals, but the mechanism and conditions of negative bias are still to be further explored. To explore the influencing factors and related intervention ways of adolescent depression, we explored the influence of neuroticism on adolescent depression and the roles of interpersonal emotion regulation and negative bias. A total of 167 adolescents were recruited and negative bias was measured using the two-word Valence Bias paradigm. Neuroticism, interpersonal emotion regulation and depressive symptoms were measured by the neuroticism subscale of the Big Five Personality Questionnaire, the Interpersonal Emotion Regulation Questionnaire, and the Center for Epidemiologic Studies Depression Scale. The results showed that: (1) There was a significant positive correlation between negative bias and depressive symptoms in adolescents. (2) Negative bias plays a complete mediating role in the influence of neuroticism on depressive symptoms in adolescents; (3) The mediating process of adolescent neuroticism affecting depressive symptoms through negative bias is influenced by interpersonal emotion regulation: only when the level of interpersonal emotion regulation is low, adolescent neuroticism affects depressive symptoms through negative bias. The results of the study revealed that negative bias is an important cognitive mechanism of neuroticism personality affecting depressive symptoms in adolescents. Adolescents with higher levels of neuroticism might formed a more negative cognitive bias, that categorizing ambiguous information as more negative, so they have a higher risk of depression. Interpersonal emotional regulation can reduce the risk of depression in adolescents with high neuroticism and enable them to regulate their negative emotions through interpersonal interaction. The results of this study provide important reference for the

prevention and intervention of adolescent depression through the adjustment of negative bias and interpersonal emotion regulation.

Keywords：adolescent depression, negative bias, neuroticism, interpersonal emotion regulation

肥胖对儿童学业成绩的影响：工作记忆和污名化感知的作用

吴南[1,2]（通讯作者） 刘丽丝[1] 郭消然[2]

1 北京联合大学师范学院心理学系，北京，100011

2 北京联合大学儿童及青少年学习与心理发展研究所，北京，100011

通讯作者邮箱: wunantom@126.com

摘 要: 近十年，青少年肥胖的发生率呈现明显上升的趋势和低龄化趋向，越来越多的小学生备受肥胖问题的困扰。童年期的超重和肥胖问题不仅会给儿童的生理带来很多不利的影响，还易造成小学生的心理损害和学业劣势 。研究显示，儿童的肥胖程度就已显示出与其执行功能和语言方面认知能力的显著相关性，引起数学学习困难。明晰导致肥胖儿童学业劣势的认知因素和社会化因素是一个重要的科学问题。本研究通过两个研究探查了肥胖儿童学业成绩的表现及其背后可能的认识因素（工作记忆）和社会化因素（污名化感知）。研究一通过实验法考察了 227 名 10-13 岁儿童工作记忆和学业成绩的关系，发现肥胖儿童的学业成绩显著低于正常体重儿童，且肥胖儿童的一般工作记忆可以部分解释其学业成绩上的弱势。但进一步分析发现肥胖儿童在有食物线索上的工作记忆成绩却显著高于正常体重儿童。提示肥胖儿童工作记忆缺陷可能是领域特殊的。研究二 进一步考察了肥胖儿童在社会化过程中可能产生的污名化对儿童学业成绩的影响，选取北京市小学 8~11 岁儿童共 246 人，研究工具包括《中国学龄儿童青少年超重、肥胖筛查体重指数值分类标准》、《感知嘲笑量表》以及人口学变量。结果发现，肥胖儿童学业成绩显著低于正常体重儿童，肥胖儿童受到嘲笑的频率和被嘲笑后的沮丧程度均显著高于体重正常儿童。污名化感知在 BMI 指数和学业成绩中起到完全中介的作用。

关键词：学业成绩，肥胖儿童，工作记忆，污名化感知

How Obesity Influence Academic Performance：The Role of Working Memory and Stigma Perception

Nan Wu[1,2] Lisi Liu[1] Xiaoran Guo[1]

1 Teachers College of Beijing Union University, Beijing, 100011

2 Learning and Psychological Development Institution for Children and Adolescents，Beijing Union University, Beijing 100101

Abstract: The prevalence of childhood obesity in China has tripled extended into a smaller age in the past 10 years. Childhood obesity and overweight are associated with several physical illness as well as psychosocial issues, for example, overweight and obese children are more likely to have poor academic performance. The present study aimed to explore the underlying cognitive and social factors of the poor academic achievement for those obese children. In study 1, a total of 227 primary school students aged 10 to 13 years were analyzed for weight and height, filled out questionnaires on school performance and demographic variables. All subjects received three kinds of working memory materials based on the digit memory task.

Study 1 showed normal-weight children scoring higher than overweight and obese children. A mediation model revealed a partial indirect effect of working memory in the relationship between obesity and academic performance. Although the performance of obese children in basic working memory tests was poorer than that of normal-weight children, they recalled more items than normal-weight children in working memory tasks involving with food/drink. Study 2 explored the relationship between stigma perception and academic performance of 8-11 years old primary school students. A total of 246 primary school students were selected using the BSQ-8C. Study 2 found that the scores of stigma perception of the obesity group were significantly higher than those of the normal weight group, and the degree of being laughed at plays a completely intermediary role in BMI and academic performance.

Key Words：Academic performance, obese children, working memory, stigma perception

亲子触觉互动与小学生负性情绪的关系

张文庆[1]　苏金龙[2]（通讯作者）

1 常州市新北区三井实验小学,常州，213022

2 南京师范大学心理学院，南京，210024，jlsu@njnu.edu.cn

摘 要　虽然较少被关注，触觉在儿童的发展过程中可能起到独特的作用。已有研究显示，早期亲子触觉接触会影响婴幼儿的生理发育、认知发展和亲子关系的建立。然而，关于亲子触觉接触与儿童负性情绪的联系，却较少被探讨。小学高年级是负性情绪开始逐渐增多的过渡阶段，该阶段负性情绪影响因素的探究对儿童情绪问题的预防及干预有着重要意义。基于此，研究拟考察亲子触觉接触与小学高年级儿童负性情绪的关系及背后机制。

研究招募江苏省某小学四、五、六年级学生 385 人，以及其中部分学生的母亲 226 人。儿童分别完成亲子触觉互动量表、亲子依恋量表、抑郁—焦虑—压力量表、小学生情绪调节自我效能感问卷；母亲完成儿童行为量表。数据分析结果显示，总体而言，小学生负性情绪水平较低，但存在年级差异——六年级负性情绪得分显著高于五年级、四年级。另外，学生报告的负性情绪与其母亲报告的问题行为呈显著正相关，提示负性情绪会对儿童在校期间的行为表现产生影响。

相关分析显示，亲子触觉接触与儿童抑郁（r = -.25）、焦虑（r = -.17）、压力（r = -.17）均呈显著负相关。在控制了年龄、性别等人口统计学变量后，亲子触觉接触可以显著负向预测儿童的负性情绪。进一步的，考察亲子依恋及情绪调节自我效能感在上述预测中的作用，发现二者均起到完全中介作用。链式中介分析显示，亲子触觉接触可以正向预测亲子依恋，亲子依恋正向预测亲子调节自我效能感，而情绪调节自我效能感负向预测负性情绪。

关键词　亲子触觉经验，小学生，负性情绪，情绪调节，亲子依恋

The Relation Between Maternal Touch and Negative Emotion in Primary School Children

Wenqing Zhang[1], Jinlong Su[2]

Changzhou Xinbei Sanjing Experimental Primary School, Changzhou, Jiangsu Province

School of Psychology, Nanjing Normal University, Nanjing, Jiangsu Province

Abstract: Although it has received less attention, tactile experience may play a unique role in the development of children. Previous research has shown that early maternal touch can affect the physiological development, cognitive development, and establishment of parent-child relationships of infants and young children. However, there is relatively little exploration of the connection between maternal touch and children's negative emotions. The upper elementary grades are a transitional period during which negative emotions begin to gradually increase. Exploring the factors that influence negative emotions during this period is important for preventing and intervening in children's emotional problems. Based on this, the study aimed to examine the relationship between early maternal touch and child negative emotions in elementary school and the underlying mechanisms.

A total of 385 students from fourth, fifth, and sixth grades and 226 mothers of some of the students were recruited from a primary school in Jiangsu Province. The children completed the Parent-Child Tactile Interaction Scale, Parent-Child Attachment Scale, Depression-Anxiety-Stress Scale-Short Form, and Self-Efficacy Questionnaire for Regulating Emotions; the mothers completed the Child Behavior Scale. Results of data analyses showed that, overall, the level of negative emotions in elementary school students was relatively low, but there were significant differences among children in different grades. Children in grade sixth had significantly higher scores on negative emotions than fifth graders and fourth graders. In addition, there was a significant positive correlation between students' reports of negative emotions and their mothers' reports of problem behaviors, indicating that negative emotions can have an impact on children's behavior in school.

Correlation analyses showed that maternal touch was negatively correlated to child depression (r = -.25), anxiety (r = -.17), and stress (r = -.17). After controlling for demographic variables such as age and gender, maternal touch significantly negatively predicted children's negative emotions. Furthermore, the mediating roles of parent-child attachment and emotional regulation self-efficacy in this above relation were examined, and it was found that both of them fully mediated the relation between maternal touch and child negative emotion. Results of the chain mediation analysis showed that early maternal touch positively predicted mother-child attachment, mother-child attachment positively predicted children’s emotional regulation self-efficacy, and children’s emotional regulation self-efficacy negatively predicted negative emotions.

父母监控、交往不良同伴和青少年的网络受欺凌：在个体内水平上的纵向关系

王兴超[1]（通讯作者） 王诗茵[1]

1 山西大学教育科学学院，太原，030006, wangxch9@126.com

摘 要　网络受欺凌是严重的世界公共卫生问题。以往研究发现父母监控作为保护因素可以降低青少年的网络受欺凌，但关注二者之间的双向关系及中介机制的研究较少，且未区分个体间效应和个体内效应。基于此，本研究以来自山西省 7 所中学的 2407 名青少年为被试(50.23%为女生，M_{age} = 12.75，*SD* = .58)，进行为期 3 年共 3 次、间隔一年的追踪调查，通过潜增长模型和随机截距交叉滞后模型探究父母监控、交往不良同伴和网络受欺凌的发展轨迹的相互影响及三者之间的动态联系。潜增长模型结果表明：父母监控的初始水平和交往不良同伴及网络受欺凌的初始水平呈显著负相关，交往不良同伴和网络受欺凌的初始水平呈显著正相关；父母监控的变化速率和交往不良同伴及网络受欺凌的变化速率呈显著负相关，交往不良同伴和网络受欺凌的变化速率呈显著正相关；交往不良同伴的初始水平在父母监控的初始水平与网络受欺凌的初始水平之间起到中介作用，交往不良同伴的变化速率在父母监控的变化速率与网络受欺凌的变化速率之间起到中介作用。随机截距交叉滞后结果表明：在个体间水平，父母监控、交往不良同伴和网络受欺凌之间存在显著相关；在个体内水平，父母监控、交往不良同伴和网络受欺凌之间存在双向关系，交往不良同伴在父母监控和网络受欺凌之间起到纵向中介作用。多群组分析发现在父母监控，交往不良同伴和网络受欺凌的双向关系间存在性别差异。本研究结果为从发展的视角理解父母监控、不良同伴交往和网络受欺负之间的动态相互关系提供了有价值的信息，同时也为青少年网络受欺凌预防保护计划提供建议。

Parental Monitoring, Deviant Peer Affiliation, and Adolescents' Cybervictimization: Prospective Within-person Associations

Xingchao Wang*, Shiyin Wang
School of Educational Science, Shanxi University, No. 92 Wucheng Road, Taiyuan 030006, China

Abstract：Cybervictimization is a serious public health problem. Parental monitoring as a protective factor reduces adolescents' cybervictimization. However, few studies have clarified the directionality and potential mediating of this link, let along disaggregating within- from between-person effects. To address these gaps, the current study followed 2,407 Chinese adolescents (50.23% girl, M_{age} = 12.75, *SD* = .58 at baseline) from seven schools at 3-time points with 1-year intervals and tested the process of influence and dynamic relationships among parental monitoring, deviant peer affiliation, and cybervictimization by the latent growth models and the random intercept cross-lagged models. Results showed that initial levels and changes of parental monitoring were negatively and directly associated with initial levels and changes of deviant peer affiliation and initial levels and changes of cybervictimization, respectively. Initial levels and changes of deviant peer affiliation were positively and directly associated with initial levels and changes of cybervictimization, respectively. Initial levels and changes of deviant peer affiliation mediated the relationship between initial levels and changes of parental monitoring and initial levels and changes of cybervictimization, respectively. At the between-person level, there were significant associations among parental monitoring, deviant peer affiliation, and cybervictimization. At the within-person level, parental monitoring, deviant peer affiliation, and cybervictimization were reciprocally predictable. Parental monitoring indirectly predicted cybervictimization via deviant peer affiliation. The longitudinal associations were different in sex. The present study would provide valuable information about the relationships among parental monitoring, deviant peer affiliation, and cybervictimization from a developmental perspective, and provide a new scientific basis for adolescents' cybervictimization prevention/protection programs.

Keywords：Parental monitoring, deviant peer affiliation, cybervictimization, sex

母亲男孩偏好与青少年早期抑郁的关系：亲子依恋、学校联结和性别的作用

摘 要：家庭和学校是青少年最重要的生活和学习场所，在青少年的身心健康发展中发挥着不可或缺的作用。以往研究表明，母亲男孩偏好与青少年的抑郁症状之间存在显著关系，但其中的作用机制如何尚不清楚。本研究基于家庭系统理论、依恋的内部工作模式和生态系统理论，采用母亲男孩偏好量表、亲子依恋量表、学校联结量表以及抑郁-焦虑-压力量表对西安市某中学的1093名初中生进行问卷调查（平均年龄12.96±0.42，其中女生占比42.26%），探讨母亲男孩偏好与中国早期青少年抑郁的关系以及亲子依恋、学校联结和性别在其中的作用机制。结果显示：（1）在女性青少年中，母亲男孩偏好与抑郁呈显著正相关（r=0.20，p＜0.001）；在男性青少年中，母亲男孩偏好与抑郁相关不显著（r=0.02，p＞0.05）；（2）母子依恋和父子依恋在母亲男孩偏好与女性青少年的抑郁症状之间存在着部分中介作用。母子依恋的间接效应值为0.058，Bootstrap的95%置信区间为[0.013，0.118]；父子依恋的间接效应值为0.053，Bootstrap的95%置信区间为[0.014，0.103]；（3）学校联结调节了母亲男孩偏好与女性青少年抑郁症状之间的关系。具体来说，低学校联结（小于或等于-0.04标准差），母亲男孩偏好与女性抑郁症状呈显著正相关，而高学校联结（大于或等于0.90标准差），母亲男孩偏好与抑郁症状呈显著负相关。本研究有助于增强对男孩偏好这一文化现象的认识，并提醒我们在强调男女平等的背景下，男孩偏好依旧值得重视并需要着力改善。

关键词：母亲男孩偏好，亲子依恋，学校联结，抑郁症状，性别

Mother boy preference and depressive symptoms among Chinese early adolescents: The roles of parent-child attachment, school connectedness, and gender

Wang Yinge, Li Yudan, Wu Haomeng, Lv Liying, Zhang Huifang, Zhao Fengqing (Corresponding author)
School of Education, Zhengzhou University, Zhengzhou, China, susanfair@163.com

Abstract: Family and school are the most important places for adolescents to live and learn, which play an indispensable role in the development of their physical and mental health. Previous studies have shown that there is a significant relationship between mother boy preference and depressive symptoms in adolescents, but the mechanism is still unclear. Based on family system theory, internal work model of attachment and ecological system theory, this study investigated 1093 junior high school students from a middle school in Xi'an city, China (Mage=12.96±0.42, 42.26% are girls). Using mother boy preference scale, mother-child attachment scale, father-child attachment scale, school connectedness scale and depression-anxiety-stress scale to explore the relationship between mother boy preference and depressive symptoms among Chinese early adolescents, as well as the roles of mother-child attachment, father-child attachment, school connectedness and gender. The results showed that: (1) Mother boy preference had a significant positive correlation with depressive symptoms among female adolescents (r=0.20, p<0.001), while the association was not significant among male adolescents (r=0.02,

p>0.05); (2) Mediation analysis showed that mother-child attachment and father-child attachment partially mediated the association between mother boy preference and female adolescents' depressive symptoms. The indirect effect value of mother-child attachment is 0.058 and 95% confidence interval of Bootstrap is [0.013,0.118]. The indirect effect value of father-child attachment is 0.053 and 95% confidence interval of Bootstrap is [0.014,0.103]. (3) School connectedness moderated the association between mother boy preference and female adolescents' depressive symptoms. Specifically, low school connectedness (less than or equal to -0.04 standard deviation) was positively correlated with depressive symptoms, while high school connectedness (greater than or equal to 0.90 standard deviation) was negatively correlated with depressive symptoms. This study helps to enhance people's understanding of the cultural phenomenon of boy preference, and reminds us that boy preference still deserves attention and needs to be improved in the context emphasizing gender equality.
***Keywords*:** mother boy preference, parent-child attachment, school connectedness, depressive symptoms, gender

父母低头、青少年低头与青少年适应性问题：基于交叉滞后网络分析模型

童薇[1]　贾继超[2]　王鹏程[3]（通讯作者）　贺雯[1]

1 上海师范大学心理系，上海，200234

2 北京师范大学心理学部，北京，100875，

3 上海交通大学传媒学院，上海，通讯作者 E-mail（小五号宋体）

摘 要　根据《第 51 次中国互联网络发展状况统计报告》，截止 2022 年 12 月，我国我国网民规模达 10.67 亿，其中 99.8%的网民使用手机上网，远超台式电脑、笔记本、平板电脑等终端设备。尽管手机上网在打破沟通的时空限制，提高沟通频率和沟通便利性的同时，但也可能对线下的交流互动产生消极影响。青春期是适应性问题的高发期。这一时期青少年面临着身心的巨变以及亲子关系的重塑与协调，这增加了青少年出现适应性问题的风险。而伴随手机使用出现的新的亲子互动问题——低头，无疑加剧了这一时期的适应性问题风险，因而成为当前领域的热点问题。但现有研究主要考察父母一方低头对青少年适应性问题的影响，忽视家庭视角下的低头在亲子之间具有传染性，即父、母、子三者的低头可能会相互影响。也就是说，在家庭层面上，父亲低头、母亲低头和青少年低头相互作用，形成了一个复杂的低头网络。因此，本研究将家庭低头概念化为一个多维概念，基于 1447 名青少年（60.5%为女性）的两批次纵向数据，采用横断网络分析与交叉滞后纵向网络分析，探索家庭低头网络特点及其与青少年适应性问题的关系。结果显示，（1）在父母低头上，父亲低头的各节点与母亲低头的相应节点均呈现高度相关，表明低头在父母之间的传染效应；（2）在父母与青少年低头上，父母忽视和青少年自我隔离是亲子低头行为相互强化的主要路径；（3）在家庭低头和青少年适应性问题上，学业倦怠更可能引发父母和青少年的低头行为。上述结果为我们预防和干预家庭低头及青少年心理健康问题有重要启示。

关键词　低头，青少年，适应性问题，交叉滞后网络分析

The associations between parental phubbing, adolescent phubbing, and adolescents' adjustment problems: A cross-lagged panel network analysis

Wei Tong[1] Jichao Jia[2] Pengcheng Wang[3] Wen He[1]
[1] Department of Psychology, Shanghai Normal University, China
[2]Institute of Developmental Psychology, Beijing Normal University, China
[3]School of Media and Communication, Shanghai Jiao Tong University, China

Abstract：Network analyses have been increasingly used in cyberpsychology in the last few years. However, no existing research has examined the relationships between phubbing and adolescent adjustment problems from a network perspective. Our study is the first to conceptualize family phubbing as a multidimensional variable that includes maternal, paternal (i.e., perceived norms, feeling ignored, and interpersonal conflict), and adolescent phubbing (i.e., nomophobia, interpersonal conflict, self-isolation, and problem acknowledgement), and estimate networks for family pubbing and for the interplay between family phubbing and adolescents' adjustment problems (i.e., depression, anxiety, loneliness, and academic burnout in this study). Participants were 1,447 students (60.5% females) in China. The results indicate that parental phubbing, maternal phubbing, and adolescent phubbing mutually reinforced each other in contemporaneous networks at Time 1 and Time 2. Moreover, among the phubbing nodes, adolescents' problem acknowledgement was most directly related to academic burnoout. Besides, A cross-lagged panel network analysis indicated that child-driven effects rather than parent-driven effects may better characterize how phubbing is related to adolescent's adjustment problems over time.
Keywords：phubbing; adjustment problems; cross-lagged panel network analyses; adolescents

正念教养和感恩对青少年生命意义感的积极作用：一项纵向研究

张慧芳 [1] 李煜丹 [1] 吴昊蒙 [1] 赵凤青 [1]（通讯作者）
1 郑州大学教育学院，郑州，450001，susanfair@163.com

摘 要 幸福和意义是衡量人类美好生活的两个主要指标。以往研究表明，正念教养促进了青少年的主观幸福感和其他积极结果。但是，正念教养和青少年生命意义感的因果关系还不清楚。探究正念教养对青少年生命意义感的作用及其机制，可为提升青少年的生命意义感提供针对性指导。因此，本研究检验了正念教养是否促进了青少年的生命意义感（包括人生意义体验和人生意义寻求两方面），感恩是否在正念教养和生命意义感之间起中介作用，同时考虑这种作用机制是否因性别而异。采用纵向设计，使用青少年报告版正念教养量表、生命意义感量表以及感恩量表，间隔 8 个月对 293 名青少年（Mage = 13.87±0.50 岁）施测 2 次，数据收集时间分别为 2022 年 6 月和 2023 年 2 月。结果表明，正念教养预测了 8 个月后青少年人生意义寻求的提升，但是正念教养不能显著预测 8 个月后青少年的人生意义体验。感恩在正念教养和人生意义寻求之间的纵向关系中起中介作用。感恩的中介效应存在性别差异。对男孩来说，感恩不能中介正念教养和男孩人生意义寻求之间的关系。对女孩来说，正念教养通过促进女孩感恩，进而提升了她们 8 个月后的人生意义寻求。本研究首次提供了正念教养和青少年生命意义感之间因果关系的证据。家庭和学校可以通过正念教养和感恩干预有针对地提升不同性别的青少年对人生意义的寻求。
关键词 正念教养，生命意义感，感恩，性别差异，青少年

The beneficial effects of mindful parenting and gratitude on adolescents' meaning in life in China: A longitudinal study

Zhang Huifang [1], Li Yudan[1] Wu Haomeng [1], Zhao Fengqing [1] (Corresponding author)
1 School of Education, Zhengzhou University, Zhengzhou, China, susanfair@163.com

***Abstract*:** Happiness and meaning are the two main indicators of a good life. Previous studies have shown that mindful parenting benefits adolescents' subjective well-being and other positive developmental outcomes. However, the causal relationship between mindful parenting and adolescents' meaning in life remains unclear. Exploring the relationship and mechanism of mindful parenting on adolescents' meaning in life can provide targeted guidance for improving adolescents' meaning in life. Therefore, this study examined whether mindful parenting promotes adolescents' meaning in life (including presence of meaning in life and search for meaning in life), whether gratitude plays a mediating role between mindful parenting and meaning in life, and whether this mechanism varies with gender. A longitudinal design was adopted, and 293 adolescents (Mage = 13.87±0.50 years old) were tested twice at 8-month interval, with data collected in June 2022 and February 2023, respectively. Results showed that mindful parenting significantly positively predicted adolescent search for meaning in life after 8 months, but mindful parenting did not significantly predict adolescents' presence of meaning in life after 8 months. Gratitude played a mediating role in the longitudinal relationship between mindful parenting and search for meaning in life. Gender differences were found in the mediating effect of gratitude. For boys, gratitude did not mediate the relationship between mindful parenting and search for meaning in life. For girls, mindful parenting enhanced their search for meaning in life after 8 months by fostering gratitude. Results provide the first evidence of causality between mindful parenting and adolescents' meaning in life. Families and schools can improve adolescent search for meaning in life through mindful parenting and gratitude interventions, taking into account the gender of the adolescents.
Keywords: Mindful parenting, Meaning in life, Gratitude, Gender differences, Adolescents

父母心理虐待一致性和青少年抑郁的关系：社会支持的作用

巩宁宁[1]　林一瑾[1]　张佳静[1]　尤若男[1]　李森[1]（通讯作者）
1 河北大学教育学院，保定，071000，1447123652@qq.com

摘 要　**背景** 童年期心理虐待是青少年抑郁的重要风险因素。虽然父亲心理虐待和母亲心理虐待与青少年抑郁皆存在显著相关，但尚不明晰二者是如何共同影响青少年抑郁的。基于此，本研究采用多项式回归与响应面分析的方法，旨在探讨父母心理虐待一致性和不一致性对青少年抑郁的影响，以及社会支持的调节作用。**方法** 对河北省某地级市 1639 名初高中学生进行问卷调查。调查工具包括一般人口学调查表、父母心理虐待量表（CTS-PC）、青少年抑郁量表（CES-D）、社会支持量表（PSSS）。使用 SPSS26.0 进行数据录入和调节效应分析，使用 Mplus8.0 进行多项式回归和响应面分析。**结果** （1）父母心理虐待一致性对抑郁有正向预测作用（CS = 0.147, $p < 0.001$），中等程度的心理虐待更能预测抑郁的发生（CC = -0.025，$p < 0.001$）；（2）父母心理虐待不一致时，父母心理虐待差异性越大则青少年抑郁程度越高（IC = 0.013，$p < 0.05$），父亲心理虐待高于母亲与母亲心理虐待水平高于父亲两种情况对青少年抑郁的影响没有显著差异（IS = 0.019，$p > 0.1$）；（3）社会支持在父母心理虐待与青少年抑郁关系中具有显著调节作用。低社会支持时，父母心理虐待一致性与青少年抑郁具有显著正相关；高社会支持时，父母心理虐待一致性与青少年抑郁相关不显著。**结论** 父母心理虐待一致性与青少年抑郁显著相关，社会支持可以在一定程度上缓解父母心理虐待的不利影响。这些发现为青少年抑郁的预防和干预工作提供了新的科学依据。

Paternal-maternal congruence in emotional abuse and adolescent depression: Role of social support

Ningning Gong[1] Yijin Lin[1] Jiajing Zhang[1] Ruonan You[1] Sen Li[1*]

1 School of Education, Hebei University, No. 180 Wusi Dong Road, Lian Chi District, Baoding City, Hebei Province, China, 071002, Email: 1447123652@qq.com

Abstract： *Background:* Childhood emotional abuse is a significant risk factor for adolescent depression. However, little is known how paternal and maternal emotional abuse work together to affect adolescent depression. The current study aimed to explore the unique and joint impacts of paternal and maternal emotional abuse on adolescent depression. *Method:* A total of 1639 adolescents (M_{age} = 14.49 years, *SD* = 1.11) completed questionnaires regarding demographics, parental emotional abuse, depression, and social support. The data were analyzed with polynomial regressions and response surface analyses. *Results:* The consistency between paternal-maternal emotional abuse was positively related to adolescent depression (CS=0.147, p<0.001), and moderate levels of emotional abuse were stronger predictors of adolescent depression (CC=-0.025, p<0.001). In addition, the discrepancy between paternal and maternal emotional abuse was positively related to adolescent depression (IC=0.013, p < 0.05), and there was no significant differences in adolescent depression when paternal emotional abuse is higher than maternal emotional abuse or vice versa (IS=0.019, p>0.1). Furthermore, social support moderated the congruence and incongruence effects of paternal-maternal emotional abuse on adolescent depression. *Conclusions:* The congruence between paternal-maternal emotional abuse is positively related to adolescent depression, and it is moderated by social support.

Keywords ： Paternal-maternal emotional abuse, Depression, Social support, Polynomial regressions, Response surface analyses

父母低头行为与数字自我伤害的关系：有调节的中介效应分析

汤玉玲 段蓉蓉 谢笑春（通讯作者）

东北师范大学心理学院，长春，130024，xiexc713@nenu.edu.cn

摘 要 数字自我伤害是指在网络上匿名发布、发送或以其他方式分享关于自己的伤害性内容。根据人际关系理论，父母低头行为作为一种人际风险因素，可能会增加青少年的数字自我伤害的频率。前人研究表明，拥有更多负面情绪的青少年倾向于实施数字自我伤害行为。结合体验回避模型，焦虑可能在父母低头行为与数字自我伤害的关系中起中介作用。另外，根据素质-压力模型，个体特征（如自我概念清晰性）可以调节压力环境（如父母低头行为）与个人心理或行为结果（如数字自我伤害）之间的关系。本研究旨在探究父母低头行为与青少年的数字自我伤害的关系，并揭示焦虑的中介作用，以及自我概念清晰性的调节作用。本研究采用问卷法对 1055 名初高中生（平均年龄 15.05 ± 1.63 岁，女生占 50.90%）的父母低头行为、数字自我伤害、焦虑、自我概念清晰性进行调查。结果发现：（1）父母低头行为正向预测青少年的数字自我伤害；（2）焦虑在父母低头行为与数字自我伤害的关系中起完全中介作用，间接效应值为.13，95%置信区间（*CI*）为[.09, .18]；（3）自我概念清晰性在该中介模型的前半段和中介效应中起调节作用，简单斜率分析发现，当自我概念清晰性水平较低(*M* - *SD*)时，焦虑的中介作用显著，中介效应值为.07，95% *CI* 为[.03, .13]，父母低头行为的直接作用显著，直接效应值为.17，95% *CI* 为[.01, .34]；当自我概念清晰性水平

较高($M + SD$)时，焦虑的中介作用和父母低头行为的直接作用都不显著。结果表明，父母低头行为是数字自我伤害的风险因素，父母低头行为主要是通过影响青少年的焦虑水平，进而影响青少年的数字自我伤害；随着个体自我概念清晰性水平的提高，父母低头行为对焦虑、数字自我伤害的预测作用都呈逐渐降低趋势。本研究在理论上丰富了关于数字自我伤害的风险因素的实证研究；在实践上建议父母合理使用手机，这对青少年，尤其是自我概念清晰性水平较低的青少年，形成良好的情绪和行为具有重要意义。

Parental Phubbing and Digital Self-harm: Analysis of a Moderated Mediation Model

Yuling Tang, Rongrong Duan, Xiaochun Xie (Corresponding author)
School of Psychology, Northeast Normal University, Changchun 130024, China,
xiexc713@nenu.edu.cn

Abstract： Digital self-harm is the anonymous online posting, sending, or otherwise sharing of hurtful content about oneself. According to interpersonal theory, parental phubbing as an interpersonal risk factor may increase the frequency of digital self-harm in adolescents. Previous research has shown that adolescents who possess more negative emotions tend to commit digital self-harm behaviors. Combined with the experiential avoidance model, anxiety may play a mediating role in the relationship between parental phubbing and digital self-harm. Furthermore, according to the diathesis-stress model, individual characteristics (e.g., self-concept clarity) may mediate the relationship between stressful environments (e.g., parental phubbing) and individual psychological or behavioral outcomes (e.g., digital self-harm). This study aimed to investigate the relationship between parental phubbing and adolescents' digital self-harm and to reveal the mediating role of anxiety and the moderating role of self-concept clarity. This study used a questionnaire method to investigate parental phubbing, digital self-harm, anxiety, and self-concept clarity in 1055 middle and high school students (mean age 15.05 ± 1.63 years, 50.90% girls). The results found that (1) parental phubbing positively predicted digital self-harm in adolescents; (2) anxiety played a fully mediated role in the relationship between parental phubbing and digital self-harm with an indirect effect value of .13 and 95% confidence interval (*CI*) of [.09, .18]; (3) self-concept clarity played a moderating role in the first half of this mediated model and in the mediated effect, and a simple slope analysis found that when the level of self-concept clarity was low (M - SD), the mediating effect of anxiety was significant, with a mediating effect value of .07, 95% *CI* of [.03, .13], and the direct effect of parental phubbing was significant, with a direct effect value of .17, 95% *CI* of [.01, .34]; when the level of self-concept clarity was high ($M + SD$), the mediating effect of anxiety and the direct effect of parental phubbing were not significant. The results suggest that parental phubbing is a risk factor for digital self-harm, and parental phubbing affects adolescents' digital self-harm mainly through influencing their anxiety levels; the predictive effects of parental phubbing on both anxiety and digital self-harm tended to decrease gradually as the level of individual self-concept clarity increased. This study theoretically enriches the empirical research on the risk factors of digital self-harm; practically, it suggests that parents' reasonable use of cell phones is important for adolescents, especially those with low levels of self-concept clarity, to develop good emotions and behaviors.

Keywords： parental phubbing, digital self-harm, anxiety, self-concept clarity, adolescent

第三方惩罚中的群体偏差的发展：基于强化学习计算模型

郭子妍，于佳露，王文心，伍珍
清华大学心理学系，北京，100084
E-mail: zhen-wu@tsinghua.edu.cn

摘 要 第三方惩罚是指作为不相关的第三方去惩罚违反社会规范的行为，是一种有利于维护社会规范的亲社会行为。研究发现，第三方惩罚常表现出群体偏差，即对外群成员的惩罚力度大于内群。然而，该行为如何受到社会与文化规范的影响，以及这一群体偏差的学习机制及发展规律仍不甚明晰。围绕以上问题，本研究采用经济决策范式，对中西方文化下从儿童到成人的不同发展阶段的参与者进行了测试：参与者观看内群或外群分配者对接受者实施的不公平分配，然后决定是否以及如何进行第三方惩罚；之后参与者将收到来自另外旁观玩家的评价。研究采用强化学习计算模型探讨参与者如何根据他人的反馈动态调整其决策过程。

主要结果如下：1）显著的文化差异：中国与西方成年被试在惩罚行为上均表现出内群偏好，惩罚内群少于外群；但是当被要求仔细思考后再决策时，西方成人的内群偏好显著减少，而中国成人的内群偏好仍旧保持。此外，计算建模结果显示，在学习外部反馈以调整惩罚行为的过程中，中国成人对惩罚内群这一规范的学习速度显著低于惩罚外群的规范，而美国成人对内外群惩罚规范的学习速度差异不显著，表明中国文化下对内群和外群的惩罚行为可能存在两种分离的不同学习机制。2）进一步探究中国文化下内群偏好的发展轨迹，发现中国参与者对内群的惩罚随年龄增长显著下降，并且对惩罚内群这一规范的学习速度也随着年龄增长显著下降；相反地，对惩罚外群的学习速度随年龄增长保持不变，表明中国参与者在社会化中逐渐发展出对内群更稳定的内在价值。

研究结果显示了社会文化规范对第三方惩罚和群体偏差的影响，有助于揭示这一影响背后的动态学习机制及发展规律，也为制定相关政策以营造良好的社会与教育环境提供理论依据。

关键词 第三方惩罚，群体偏差，强化学习，社会文化规范

Development of Group Bias in Third-Party Punishment: A Computational Model Based on Reinforcement Learning

Ziyan Guo, Jialu Yu, Wenxin Wang, Zhen Wu

Department of Psychology, Tsinghua University, Beijing, 100084

Email: zhen-wu@tsinghua.edu.cn

Abstract: Third-party punishment refers to the behavior of unaffected bystanders who penalize norm violations, representing a prosocial act that upholds social norms. Group bias has been observed in previous studies, wherein out-group members receive more severe punishments than in-group members. However, the impact of social and cultural norms on this behavior, as well as the learning mechanisms and developmental patterns of group bias, remain unclear. To address these questions, we employed an economic decision-making paradigm to investigate third-party punishment across different developmental stages, encompassing children to adults, in Eastern and

Western cultures. Participants observed unfair allocations by either in-group or out-group allocators towards recipients and then decided whether and how to engage in third-party punishment. Subsequently, participants received evaluations from observers. By utilizing a reinforcement learning computational model, we explored how participants dynamically adjusted their decision-making processes based on received feedback.

The main findings are as follows: 1) Substantial cultural differences were identified, as both Chinese and Western adult participants exhibited an in-group preference in their punishment behavior, meting out lesser punishment to the in-group compared to the out-group. However, when participants were required to reflect carefully before making decisions, the in-group preference significantly decreased among Western adults, while it remained stable among Chinese adults. Furthermore, computational modeling results demonstrated that, during the process of adjusting punishment behavior based on external feedback, Chinese adults exhibited a significantly lower learning rate for punishing in-group norm violations compared to punishing out-group norm violations. Conversely, the learning rate difference between in-group and out-group punishment norms was not significant for American adults. These findings suggest the existence of two distinct learning mechanisms for punishing the in-group and out-group within Chinese culture. 2) Further investigation of the developmental trajectory of in-group preference in Chinese culture revealed a significant decrease in punishment towards the in-group as participants matured. Additionally, the learning rate for punishing in-group norm violations also significantly decreased with age. In contrast, the learning rate for punishing out-group norm violations remained constant with age, indicating a gradual development of a more stable intrinsic value towards the in-group among Chinese participants during socialization.

The research findings illuminate the influence of social and cultural norms on third-party punishment and group bias. They contribute to a deeper understanding of the dynamic learning mechanisms and developmental patterns underlying this influence. Moreover, they hold implications for formulating relevant policies aimed at cultivating a positive social and educational environment.

Keywords: Third-party punishment, group bias, reinforcement learning, social and cultural norms.

青少年在复杂情境中的资源分配及其与心理理论和共情的关系

陈雨露[1,2]（通讯作者） 赵明悦[1] 张浩颖[1] 李冉芃[1]

1 北京联合大学师范学院心理学系，北京，100011

2 北京联合大学儿童及青少年学习与心理发展研究所，北京，100011

通讯作者邮箱 chenyulu@buu.edu.cn

摘 要 通过两部分研究、4 个子实验、共 702 人次的数据考察 13-16 岁青少年在同时存在外内群体与贡献量差异的复杂资源分配情境中的行为表现（是否会表现出内群体偏爱和按劳分配倾向），以及心理理论和共情在其中的影响机制。

研究一包括实验 1a、1b、1c 三个子实验，旨在揭示青少年在同时涉及内外群体差异和贡献量差异的复杂情境中的资源分配的表现特点。其中，实验 1a 选取了 303 名青少年被试，完成内外群体成员的贡献量存在差异的复杂情境资源分配故事任务，包括内群体偏爱因素和按劳分配因素一致、不一致的两种情境，以及不涉及内外群体的控制情境。综合三种情境的统计分析表明，青少年会根据内、外群体成员贡献量的情况使用不同的分配原则，其内群体偏爱和按劳分配倾向同时存在，但按劳分配的倾向程度会更加明显。LPA

分析得到三种类型被试，按劳分配型（91.1%）、内群体偏爱型（5.6%）、均分型（3.3%）。实验 1b 选取以 49 名青少年为有效被试，采用追踪研究，考察资源分配决策前后间隔一个月的稳定。结果发现，青少年的资源分配群体均值在三种情境中都能够稳定。实验 1c 在实验 1a 基础上，额外招募 100 名大学生作为成年对照组，结果发现，青少年的内群体偏爱程度更大，而成年人的按劳分配倾向更明显。

研究二包括实验 2，旨在考察心理理论和共情对青少年基于内群体偏爱和贡献量差异的资源分配的影响。选取 201 名青少年为被试，测量了其在同时存在内外群体差异和贡献量差异的复杂情境中的资源分配行为决策，以及心理理论（心理理论故事任务）、共情（人际反应指数量表）。结果发现，青少年的心理理论总分、共情中的移情关注和个人忧伤水平越高，其在进行资源分配时内群体偏爱越大，按劳分配倾向越低。

本研究从理论上一定程度上填补和完善了关于同时存在内群体偏爱和贡献量差异的复杂资源分配行为决策的研究的体系框图，也还在一定程度上为青少年资源分配的稳定性研究、青少年与成年人在资源分配方面的发展比较方面提供了支撑。

关键词　第三方资源分配，内群体偏爱，按劳分配，心理理论，共情

Adolescents' resource allocation in complex situations and its relationship with theory of mind and empathy

Yulu Chen[1,2,*], Mingyue Zhao[1], Haoying Zhang[1], Ranpeng Li[1]

1 Department of Psychology, Teachers College, Beijing Union University, Beijing, 100011

2 Institute of Child and Adolescent Learning and Psychological Development, Beijing Union University, Beijing, 100011

*Corresponding author: chenyulu@buu.edu.cn

Abstract：The current study, composed of two sub studies with four experiments as well as a total of 702 person-time participants, investigated how adolescents make decisions as well as the relative factors when they are faced with complex resource allocation situations where in-group and out-group members are in differed contribution situations.

Study 1, including experiment 1a to 3c, aimed to reveal the characteristics of adolescents' performance in resource allocation in complex situations involving both in/out-group differences and labor contribution differences. Specifically, in experiment 1a, 303 adolescents were selected to complete a resource allocation story task with differences in the amount of contribution of in- and out-group members, including two contexts in which the in-group preference factor and the pay-to-play factor were congruent and incongruent, and an additional control context which did not involve the in- and out-group. Statistical analysis of the three contexts combined showed that adolescents use different allocation principles depending on the amount of contribution of in- and out-group members, and that their in-group preference and work-based allocation tendencies coexist. In experiment 1b, 49 adolescents were selected as valid subjects and a follow-up test was conducted to examine the stability of adolescents' resource allocation decisions over a one-month interval. The results showed that adolescents' resource allocation decisions remained stable over time in consistent, inconsistent and control situations. In experiment 1c, which recruited an additional 100 university students as adult control group subjects, compared adolescents' and adults' decisions in a complex resource allocation task involving both in-group preference and work-based allocation, and found that adolescents had greater in-group preference and adults had more pronounced work-based allocation tendencies.

Study 2, including experiment 2, aimed to examine the patterns of influence of theory of mind and empathy

on adolescents' resource allocation based on in-group preference and differences in contribution amount. 201 adolescents were recruited to measured decisions on resource allocation in complex situations with both in-group differences and contribution amount difference, as well as theory of mind (theory of mind story task), and empathy (Interpersonal Response Index scale). The results revealed that the higher the adolescents' levels of total psychological theory scores, empathic concern in empathy, and personal sadness, the higher their tendency to in-group bias and the lower their tendency to apportion resources according to their work.

The current study theoretically fills in and complete to a certain extent the framework of research on complex resource allocation decisions in the presence of both in-group bias and differences in the amount of contribution, and also provide some support for research on the stability of resource allocation among adolescents and the developmental comparison between adolescents and adults in terms of resource allocation.

Keywords：third-person resource allocation, in-group bias, distribution according to work, theory of mind, empathy

摘 要 当行为所造成的消极结果相同时，人们更能容忍不作为行为，这种现象被称之为不作为偏差。成年人在多种道德情境下均倾向于认为作为比不作为更不道德，然而目前关于青少年不作为偏差发展的研究结果尚不一致，这可能是因为青少年在整合道德情境中的意图和因果信息时存在困难。本研究考察了 677 名 13-25 岁的被试（青少年中期 210 人，平均年龄为 13.31±0.60，女性 99 人；青少年后期 267 人，平均年龄为 16.63±0.64，女性 146 人；成年早期 200 人，平均年龄为 21.31±1.80，女性 136 人）对作为和不作为的道德判断、意图性判断和因果性判断。结果显示，对于因果性判断，所有年龄段的个体均认为作为与行为结果之间的因果关系显著强于不作为与行为结果之间的因果关系；对于意图性判断，只有青少年后期的个体认为作为的行为主体相比于不作为的行为主体是更有意造成消极结果的，而青少年中期和成年早期的个体则没有表现出这一倾向；而对于道德判断，青少年后期和成年早期的个体认为作为行为显著比不作为行为更不道德，而青少年中期的个体则没有表现出这一倾向。研究结果提示青少年后期可能是不作为偏差发展的重要时期，这一时期的个体对意图信息和因果信息的整合相比于青少年中期更加成熟。成年早期个体的意图性不作为偏差减弱可能反映了整合意图和因果信息能力的进一步发展，说明成年早期个体能够在考虑行为信息的同时推断出作为和不作为背后相同的伤害他人的意图。

Omission Bias in Adolescence:

Perception of Morality, Intention and Causality

Yanwei Wang[1], Yanjie Su[1*]

1 School of Psychological and Cognitive Sciences, Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing, 100871

[*]Corresponding author, E-mail: yjsu@pku.edu.cn

Abstract： People are more tolerant of omission than commission when both behaviors cause similar negative outcomes, which is defined as omission bias. Adults steadily consider commission as more immoral than omission in various moral contexts. However, the evidence regarding how omission bias develops in adolescence is still inconsistent, which may be due to the difficulty in integrating intentional and causal information. The present study examined moral judgment, intention judgment, and causality judgment regarding commission and omission behavior based on the data from 677 participants aged 13 to 25 (210 middle adolescents, M_{age} = 13.31 ± 0.60, 99 females; 267 late adolescents, M_{age} = 16.63 ± 0.64, 146 females; 200 young adults, M_{age} = 21.31 ± 1.80, 136 females). All age groups considered commission to have more causal links to the outcome than omission. Only late adolescents regarded commission as more intentional than omission, while middle adolescents and young adults did not. Late adolescents and young adults regarded commission as more immoral, while middle adolescents did not. These findings suggest that late adolescence might be a crucial period for the development of omission bias. The ability to integrate intentional and causal information may be more mature in late adolescence compared to middle adolescence. The diminished intentional omission bias in young adults may reflect further development in the ability to integrate intentional and causal information, indicating that young adults are able to infer the same intent to harm others behind omission and commission.

Keywords： omission bias, adolescent, moral judgment, intention, causality

被提名为帮助者或分享者可促进 5 岁儿童的帮助或分享行为

张真 [1,2]（通讯作者） 王欣 [1,2] 宗语飞 [1,2]

1 中国科学院心理研究所行为科学重点实验室，北京，100101

2 中国科学院大学心理学系，北京 100049，通讯作者 E-mail（zhangzhen@psych.ac.cn）

摘 要 儿童不满 2 岁，就开始做出使他人获益的亲社会行为。随着年龄的增长，到 5 岁时，儿童做出亲社会行为背后的动机变得复杂起来，开始具有策略性，即他们会为了让自己受益而做出有益于他人的行为。对儿童来说，建立亲社会声誉是促使他们做出亲社会行为的一种典型的策略性动机。那么，如果儿童已经获得了亲社会声誉，5 岁儿童是否也会为了维护自己的亲社会声誉而策略性地做出亲社会行为呢？本研究通过 2 个实验考察了这个问题。研究选取儿童中最常见的两种不同类型的亲社会行为，分享和帮助行为，考察当 5 岁儿童知道自己在同伴眼中是一个“爱助人”或“爱分享”的个体后，会不会出于对自己“爱助人”或“爱分享”这样亲社会声誉的维护，更多地做出助人或分享行为。实验 1（N = 90）发现，当告诉儿童同伴提名他们爱助人时（被赋予助人声誉），相比于被赋予分享声誉或没有被赋予任何声誉两种条件，他们更迅速地做出帮助他人的行为；实验 2（N = 90）发现，当告诉儿童同伴提名他们爱分享时（被赋予分享声誉），相比于被赋予助人声誉或没有被赋予任何声誉两种条件，他们表现出更多的分享行为。结果表明，5 岁儿童会为了维护自己特定类别的亲社会声誉而策略性地做出相应的亲社会行为。该研究发现在理论上拓展了我们对 5 岁儿童声誉管理能力及其亲社会行为动机的理解,在实践上可以为促进儿童的亲社会行为表现提供指导。

Being named as a helper or a sharer promotes 5-year-olds' helping or sharing behavior

Zhen Zhang [1,2], Xin Wang [1,2], and Yufei Zong [1,2]

[1] CAS Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, China;

[2] Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049, China.

Abstract：Children start to engage in prosocial behaviors that benefit others in their second year of life. As children get older, by age 5, the motivation behind their prosocial behavior becomes complex and strategic: they engage in behaviors that benefit others in order to benefit themselves. Among these strategical prosocial behaviors, acquiring a good reputation is evidenced as a main concern. So, if children have already acquired a prosocial reputation, are 5-year-old motived to maintain their reputation by engaging in prosocial behaviors? The current study examined this question in 2 experiments. To answer this question, we selected two of the most common and distinct types of prosocial behaviors in young children, namely helping and sharing. We examined whether 5-year-old children, knowing that they are perceived as "helpful" or "sharing" children in the eyes of their peers, will engage in more helping or sharing behaviors to maintain these existing prosocial reputation. Experiment 1 (N = 90) found that when children were told that their peers had nominated them as kids who like to help (assigned a helpful reputation), they exhibited helping behaviors more quickly compared to when they were assigned a sharing reputation or no reputation at all. Experiment 2 (N = 90) found that when children were told that their peers had nominated them as kids who like to share (assigned a sharing reputation), they shared more compared to when they were assigned a helpful reputation or no reputation at all. These results suggest that 5-year-old children behave prosocially in order to maintain their existing prosocial reputation. These findings extend our understanding of young children's reputation management competence as well as the underlying motivation of their prosocial behavior, and might provide insight into ways of promoting children's prosociality in practice.

Keywords：prosocial reputation, prosocial behavior, helping; sharing, young children.

合作/竞争情境下幼儿承诺与说谎的关系

——心理理论和执行功能的作用

王异芳[1]　尚博文[1]　张娜[1]

1 首都师范大学学前教育学院，北京，100089

摘 要　诚信是中华民族的传承之美，是我国道德教育的重要组成。已有研究关注了幼儿的承诺和说谎行为，旨在发现其发展特点和影响因素，但承诺和说谎之间存在何种关系尚无明确定论。因此，本研究通过情境实验探讨 4-6 岁幼儿在合作和竞争情境下是否违背承诺及说谎，分析承诺与说谎的关系，以及心理理论和执行功能在其中的作用。研究采用改编的“抵制诱惑”实验范式，分别考察幼儿在合作或竞争情境中许下承诺后是否会违规和说谎。合作情境以 92 名 4-6 岁幼儿为研究对象，竞争情境以 95 名 4-6 岁幼儿为研究对象，同时以意外地点任务和意外内容任务考察幼儿心理理论发展水平，执行功能任务包括：抑制控制-Go/No Go 实验，工作记忆-倒背数字广度任务，认知灵活性-维度卡片分类任务。结果表明：**在合作任务中，**79.3%的幼儿违规，幼儿违规行为存在显著年龄差异；5 岁组幼儿违背承诺的人数比例显著高于 4 岁组，年龄和工作记忆显著正向预测幼儿的违规行为；幼儿说谎人数显著少于没说谎人数；承诺能够正向预测幼儿的说谎行为。在竞争任务中，76.8%幼儿违规；幼儿违规行为存在显著年龄和承诺组/控制组的差异，5 岁组幼儿违背承诺的人数比例显著高于 4 岁组，控制组违背承诺的人数比例显著高于承诺组；幼儿说谎人数显著少

于不说谎人数；认知灵活性与幼儿为自己说谎呈显著负相关，心理理论与幼儿为同伴说谎成显著负相关，工作记忆能够显著负向预测幼儿为同伴说谎行为；承诺能够负向预测幼儿的违规行为。

关键词　幼儿，合作，竞争，承诺，说谎

The relationship between promise and lying in young children in cooperative/competitive contexts: the role of theory of mind and executive function

Yifang Wang[1]　Bowen Shang[1]　Na Zhang[1]

1 Capital Normal University, College of Preschool Education, Beijing, 100089

Abstract： Integrity is the beauty of inheritance in Chinese culture and an important component of moral education in China. Existing studies have focused on preschoolers' promise making and lying behaviors, aiming to discover their developmental characteristics and influencing factors. However, the relationship between promise making and lying remains inconclusive. Therefore, this study explored whether 4-6-year-old preschoolers would break promises and lie in cooperative and competitive contexts through scenario experiments. It also analyzed the relationship between promise breaking and lying, as well as the roles of theory of mind and executive function. The study adopted a modified "resisting temptation" experimental paradigm to examine whether preschoolers would break rules and lie after making promises in cooperative or competitive contexts. The cooperative context included 92 4-6-year-old preschoolers, while the competitive context had 95 4-6-year-olds. Preschoolers' theory of mind development was measured using unexpected location and unexpected content tasks. Executive function tasks included inhibition control (Go/No-Go), working memory (backward digit span), and cognitive flexibility (Dimensional Change Card Sort). Results showed that 79.3% of preschoolers broke rules in the cooperative task, with significant age differences. The percentage of 5-year-olds breaking promises was markedly higher than 4-year-olds. Age and working memory significantly predicted preschoolers' rule breaking positively. The number of preschoolers who lied was significantly lower than those who did not. Lying was related to promise making, with more lying in the experimental group. Promise making positively predicted preschoolers' lying. In the competitive task, 76.8% of preschoolers broke rules. Rule breaking differed significantly by age and experimental/control groups. More 5-year-olds broke promises than 4-year-olds, and more control group children broke promises than the experimental group. The percentage of lying was significantly lower than not lying. Cognitive flexibility was significantly negatively correlated with lying for self, while theory of mind was significantly negatively related to lying for partners. Working memory significantly negatively predicted lying for partners. Promise making negatively predicted rule breaking.

情感补偿效应：偶然情绪和共情影响亲社会行为的调节中介模型

郭睿[1、2]　伍珍（通讯作者）[2]

1 北京师范大学马克思主义学院，北京，100875

2 清华大学心理学系，北京，100084，通讯作者 E-mail：zhen-wu@tsinghua.edu.cn

摘 要　亲社会行为有助于个人发展和社会和谐，如何促进个体的亲社会行为兼具理论和实践意义。过往指出与亲社会目标有关的整合情绪是影响亲社会行为的重要因素，然而与目标无关的偶然情绪的作用尚不明晰。本研究采用多种方法，探讨了偶然情绪对个体亲社会行为的影响，以及特质共情及状态共情在这一过程中的作用。研究一采用问卷测量与建模(N = 503)，探讨特质性积极消极情绪和亲社会行为倾向的关系；研究二采用日记法（N = 69）,探讨个体的积极、消极情绪对接下来一周日常亲社会行为的影响；研究三采用实验法（N = 466），通过视频诱发个体的积极、消极或中性情绪，探讨其对状态共情以及接下来的公益捐赠和志愿行为的影响。同时，三个研究中均测量了个体的特质共情，分析这一重要的个体差异如何影响上述情绪作用。研究结果主要发现:(1)以快乐为主的积极情绪和以悲伤为主的消极情绪促进成人亲社会行为;(2)这种促进作用受到特质共情的调节：低共情者受到情绪的促进更强，而高共情者保持相对稳定较高的亲社会行为，较少受到情绪影响；（3）积极情绪和消极情绪虽然促进低共情者的亲社会行为，但通过不同类型的状态共情中介而发挥作用。上述结果说明了一种情感补偿效应：情绪可以促进低共情者亲社会水平，从而弥补共情带来的差距，就像补偿了低共情者的亲社会行为缺陷。在理论上，本研究有助于我们理解从相对稳定到即时诱发的偶然情绪如何影响不同特质共情水平个体的亲社会行为；在实践上，有助于客观理性和看待情绪，针对性促进亲社会行为，助力个体心理健康和社会良性互动。

Affect as compensation: The moderated mediation model of how incidental emotions and empathy influence prosocial behavior

Rui Guo[a b], Zhen Wu[b*]

[a]School of Marxism, Beijing Normal University, Beijing, 100875

[b]Department of Psychology, Tsinghua University, Beijing, 100084; Email: zhen-wu@tsinghua.edu.cn

***Abstract*：** Prosocial behavior contributes to individual development and social harmony; therefore, how to promote prosocial behavior has both theoretical and practical significance. Integrative emotions that are related to prosocial targets play an essential role in prosocial behaviors, yet it remains unclear about the role of incidental emotions that are unrelated to prosocial targets. Employing diverse methods, the current study explored the impact of incidental emotions on adults' prosocial behaviors, as well as the role of trait empathy and state empathy in such a process. Study 1 (N = 503) investigated the association between trait positive and negative affect and prosocial behavioral tendency using questionnaires and modeling. Study 2 (N = 69) used a diary method to explore the influence of positive and negative emotions on daily prosocial behaviors in the following week. Study 3 (N = 466) conducted an experiment, where we elicited positive, negative, or neutral emotions through videos and explored their effects on state empathy and subsequent charitable giving and volunteering behaviors. At the same time, we measured participants' trait empathy in all three studies to analyze how this significant individual difference affected the emotional effects. The main findings were as follows: (1) positive emotions (represented by happiness) and negative emotions (represented by sadness) both promoted adult prosocial behaviors; (2) The promoting effect was moderated by trait empathy: it was more substantial in participants with lower trait empathy, while those with higher empathy maintained stable and high level of prosocial behaviors and were less affected by emotions; (3) Although positive and negative emotions both promoted prosocial behaviors of people with lower trait empathy, their effects are mediated by different types of state empathy. The above results illustrate an *Affect as compensation effect:* emotions promote prosocial behaviors of those with lower empathy, thus bridging the prosocial gap between those with higher trait empathy; thus, emotions seem to compensate for prosociality deficits

brought by low trait empathy. Theoretically, this study contributes to our understanding of how incidental emotions, stable or instant, influence the prosocial behaviors of individuals with different levels of trait empathy. In practice, it helps us objectively and rationally treat emotions, and adequately use them to promote prosocial behaviors, thus facilitating individual mental health and harmonious social interaction.

相似客体化经历对个体评价他人被性客体化的影响：认知共情和情绪共情的作用

叶芸伶[1] 杨琬婷[1] 廖宗卿[1](通讯作者)
1 四川师范大学心理学院，成都，610066

摘 要 过去大量的研究已经证明，性客体化改变了人们对女性的认知——更多地将她们视为物品而非人类。这导致遭遇性客体化的女性受害者们难以获得他人（包括女性同胞）的同情和理解，从而陷入孤立无援的困境中。然而，很少有研究进一步探讨女性群体彼此理解的条件和机制，以及相似的性客体化经历在其中扮演的角色。我们预测，在情感上，相似的性客体化经历调节了女性对其他受害者的共情路径；在认知上，相似的性客体化经历调节了女性对其他受害者的担责判断。同时，我们拓宽了相似性客体化经历的时间范畴，探究过去的经历（实验一，回忆启发）以及当下的经历（实验二，视频启发）调节机制的异同。实验一招募了 80 名女性，参与者被要求回忆某个特定事件（被性客体化事件或者无关事件），并在此之后评估拥有相似遭遇的女性受害者的难过程度以及做出担责判断，最后测量被试的两种特质共情能力。结果显示，相似性客体化经历对个体情绪共情能力到识别他人难过的调节作用不显著。但相似性客体化经历对个体认知共情能力到判断他人担责程度的调节作用显著，回忆相似性客体化遭遇的女性，她们的认知共情能力越高，则认为处于相似情景中女性受害者需要的担责程度越低；而回忆其他事件的女性身上并未发现类似结果。实验二同样招募了 80 名女性，与实验一不同的是，参与者被要求观看以第一视角拍摄的被他人性客体化或者正常对待的视频。其余流程与实验一保持一致。结果显示，相似性客体化经历对个体情绪共情能力到识别他人难过的调节作用显著，当女性没有被性客体化时，她们对相似情境中的受害者感知到的难过程度随其情绪共情能力的增加而增加；而当女性被性客体化之后，这种效应就消失了。而其认知共情与担责程度判断的关系则重复验证了实验一的结果。

The influence of similar experiences of objectification on individuals' assessment of others' sexual objectification: The role of cognitive and emotional empathy

Yunling Ye[1] Zongqing Liao[1]
College of Psychology, Sichuan Normal University, Chengdu, Sichuan 610068, China

***Abstract*：** Numerous past studies have shown that sexual objectification changes how women are perceived—more as objects than human beings. This makes it difficult for female victims of sexual objectification to gain sympathy and understanding from others (including female compatriots), and thus fall into a predicament of isolation. However, little research has further explored the conditions and mechanisms by which groups of women understand each other, and the role that similar experiences of sexual objectification play in this. We predict that emotionally, similar experiences of sexual objectification moderated women's empathic pathways toward other victims; Cognitively, similar experiences of sexual objectification moderated women's judgments of responsibility towards other victims. At the same time, we broaden the temporal scope of similar objectified experiences and explore the differences and similarities between the regulatory mechanisms of past experiences (Study 1, recollection) and present experiences (Study 2, video watching). In Study 1, 80 women were asked to recall a specific event (sexually objectifying or unrelated), assess how sad a female victim of a similar experience felt, and assess what extent she's responsible for all of being sexually objectified. Finally measure two traits of empathy. The results showed that the moderating effect of similar experiences of sexual objectification on individual emotional empathy to the recognition of others' sadness was not significant. However, similarity objectification experience has a significant moderating effect on individual cognitive empathy ability to judge the degree of responsibility of others. Women who recall similar objectification experience, the higher their cognitive empathy ability, the lower the degree of responsibility that female victims in similar situations need; No similar results were found for women who recalled other events. In Study 2, which also recruited 80 women, participants were asked to watch a first-view video of either being objectified by another person or being treated normally. Other procedures are consistent with Study 1. The results showed that similar objectification experiences significantly moderated individual emotional empathy and ability to recognize other people's sadness. When women were not sexually objectified, their perceived sadness to victims in similar situations increased with the increase of their emotional empathy ability. However, when women were sexually objectified, this effect disappears. The relationship between cognitive empathy and the degree of responsibility was repeated to verify the results of Study 1.

人们何时对机器人共情？

机器人身份未知时儿童和成人会对其产生共情

陈敏[1] 周可[1] 颜志强[1,2]（通讯作者）

1 湖南师范大学教育科学学院心理学系，长沙，410081，yanzhiqiangpsy@hunnu.edu.cn

2 湖南师范大学认知与人类行为湖南省重点实验室，长沙，410081

摘 要 **目的：**随着科技的进步，机器人外形拟人化不断发展，机器人与人类外形的边界日益模糊，这影响着人们在人机交互中的认知与情绪反应，例如共情。本研究旨在探讨外形拟人化和机器人的机器身份对儿童和成人疼痛共情的差异性影响。**方法：**实验采用 2（年龄组：儿童 vs. 成人）×2（机器身份组别：机器身份未知 vs. 机器身份已知）×2（图片类型：非疼痛 vs. 疼痛）×4（对象类型：椅子 vs. 低拟人机器人 vs. 高拟人机器人 vs. 人类）的四因素混合实验设计。采用疼痛评价范式，要求被试分别对图片中的对象进行疼痛评分，其中被试被随机划分为机器身份未知组（儿童：$n = 26$；成人：$n = 24$）和已知组（儿童：$n = 26$；成人：$n = 24$）。**结果：**1.年龄组、机器身份组别、对象类型和图片类型的四重交互作用不显著($F(3,282) = 2.35$, $p = 0.072$, $\eta_p^2 = 0.02$)。2.年龄组、机器身份组别和对象类型的三重交互作用显著($F(3,282) = 3.66$, $p = 0.013$, $\eta_p^2 = 0.04$)，仅在成人组发现机器身份未知组对高拟人机器人的疼痛共情更高。3.机器身份组别和对象类型的交互作用显著($F(3,282) = 10.90$, $p < 0.001$, $\eta_p^2 = 0.10$)，仅在高拟人机器人上，机器身份未知组的疼痛共情更高。4.年龄组和机器身份组别交互作用显著($F(1,94) = 8.3$, $p = 0.005$, $\eta_p^2 = 0.08$)，仅在成人组发现，机器身份未知组的疼痛共情更高。5.年龄组和对象类型的交互作用显著($F(3,282) = 9.29$, $p < 0.001$, $\eta_p^2 = 0.09$)，儿童对低拟人机器人的疼痛共情更高。但仅在成人组发现对人类的疼痛共情高于高拟人机器人，高拟人机器人高于低拟人机器人。**结论：**本研究发现，在未知机器人机器身份的情况下，儿童和成人均会混淆高拟人机器人与人，表现出更高的疼痛共情。而告知机器人机器身份仅能够帮助成人区分高拟人机器人和人，降低成人的疼痛共情，儿童不受影响。同时，与成人相比，儿童更容易受到机器人外形拟人化的影响，表现出更高的疼痛共情。

关键词 疼痛共情，机器人，拟人化，儿童，成人

When do people empathise with robots?

Children and adults empathise with robots when their machine identity is unknown

Chen Min[1], Zhou Ke[1], Yan Zhiqiang[1,2*]

Department of Psychology, College of Education Science, Hunan Normal University, Changsha 410081, China

Cognition and Human Behavior Key Laboratory of Hunan Province, Hunan Normal University

***Abstract*: objective:** As technology advances, the anthropomorphization of robot appearance continues to develop. The increasingly blurred boundary between robot and human appearance affects people's cognitive and emotional responses in human-robot interaction, such as empathy. The aim of this study was to investigate the differential effects of appearance anthropomorphism and the robot's machine identity on pain empathy in children and adults.

Methods: The experiment adopts a 2 (age group: children vs. adults) x 2 (machine identity group: machine identity unknown vs. machine identity known) x 2 (picture type: non-pain vs. pain) x 4 (object type: chair vs. low anthropomorphic robot vs. high anthropomorphic robot vs. human) four-factor mixed design. Using a pain rating paradigm, participants were asked to rate the pain of the objects in the pictures separately, where participants were randomly divided into a machine identity unknown group (children: n = 26; adults: n = 24) and a known group (children: n = 26; adults: n = 24). **Results:** 1. The quadruple interaction of age group, machine identity group, object type and picture type was not significant ($F(3,282) = 2.35$, $p = 0.072$, $\eta_p^2 = 0.02$). 2. The triple interaction of age group, machine identity group and object type was significant ($F(3,282) = 3.66$, $p = 0.013$, $\eta_p^2 = 0.04$). Pain empathy for the highly anthropomorphic robot was found to be higher in the machine identity unknown group than in the known group only in the adult group. 3. The machine identity group and object type interaction effect was significant($F(3,282) = 10.90$, $p < 0.001$, $\eta_p^2 = 0.10$). Pain empathy was higher in the machine-identity unknown group than in the known group only on the highly anthropomorphic robot. 4. The age group and machine-identity group interaction effect was significant($F(1,94) = 8.3$, $p = 0.005$, $\eta_p^2 = 0.08$). Pain empathy was higher in the machine identity unknown group than in the known group only in the adult group. 5. The age group and object type interaction effect was significant ($F(3,282) = 9.29$, $p < 0.001$, $\eta_p^2 = 0.09$). Children showed higher pain empathy for the low anthropomorphic robot than adults. However, pain empathy was found to be higher for humans than for high anthropomorphic robots and higher for high anthropomorphic robots than for low anthropomorphic robots only in the adult group. **Conclusion:** This study shows that both children and adults confused highly anthropomorphic robots with humans and thus showed higher pain empathy when the robot's machine identity was unknown. Whereas informing the robot machine identity helped adults to distinguish between a highly anthropomorphic robot and a human, thereby reducing pain empathy for the highly anthropomorphic robot in adults, children were not affected by the machine identity. At the same time, children were more likely to be influenced by the anthropomorphic of the robot's appearance and showed higher pain empathy compared to adults.

共情和人际距离在青少年调节他人情绪中的作用及其神经基础

王启忱[1] 苏彦捷[1]（通讯作者）

[1] 北京大学心理与认知科学学院和行为与心理健康北京市重点实验室，北京， 100871，

yjsu@pku.edu.cn

摘 要 个体对他人的情绪调节是指个体通过某些策略调整或改变他人情绪状态的过程，同时涉及调节者和被调节者双方。青少年经历着强烈生理和心理变化，对于情绪线索的敏感性较强，已有研究发现青少年阶段同龄人帮助调节情绪比仅自我调节更为有效。而在这一过程中，反映个体社会认知能力的共情和表征个体间关系的人际距离的作用仍有待探究。研究一从行为基础角度探究上述因素的作用，在人际距离较近条件下招募 212 对朋友关系的青少年，人际距离较远条件下招募 208 对陌生关系的青少年。实验要求调节者针对特定情境写出调节策略，被调节者在查看策略前后分别进行情绪评价，将其差异作为调节有效性的评分标准。结果表明，调节者和被调节者的情绪共情能够分别显著正向预测调节意愿、策略整体使用倾向和调节效果感知程度。而认知共情与调节意愿程度和有效性感知的关系均受到人际距离的调节，在人际距离较近的情况下，认知共情的作用显著。同时，有调节的中介模型分析表明，仅在人际距离较近条件下，调节者的认知共情通过正向作用于其对被调节者情绪判断的准确性，进而正向预测客观调节效果，这在一定程度上揭示了共情与人际距离共同作用的行为基础。研究二使用生态效度更高的范式，探究上述因

素产生作用的神经基础。对较近人际距离条件下的 34 对青少年，较远人际距离条件下的 30 对青少年，采用近红外光谱成像超扫描技术，在被调节者自由讲述负性经历阶段和调节者调节对方情绪阶段记录双方与共情相关脑区的神经同步性。结果表明，人际距离较近条件下的青少年双方在认知共情相关脑区（背外侧前额皮层）对应通道对上的神经同步性显著高于人际距离较远的青少年。同时，仅在朋友配对条件下，调节效果对于背外侧前额皮层脑区对应通道对上的神经同步性的正向预测作用显著，提示神经同步性是解释共情和人际距离共同作用于调节他人情绪过程的神经基础。研究有助于深入认识调节他人情绪的过程理论，同时为青少年人际间的情绪调节相关干预实践提供指导。

The role of empathy and interpersonal distance in adolescents' interpersonal emotion regulation and its neural basis

Wang Qichen[1], Su Yanjie[1]

[1] School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Wangkezhen Building, Haidian Road, Beijing, 100871

Abstract：Interpersonal emotion regulation of others refers to the process by which an individual adjusts or alters another person's emotional state through certain strategies, involving both the regulator and the regulated. Considering the intense physiological and psychological changes, adolescents are more sensitive to emotional cues, and it has been found that interpersonal emotion regulation among peers during adolescence is more effective than self-regulation alone. The roles of empathy, which reflects individual's social cognitive ability, and social distance, which characterizes inter-individual relationships, remain to be unexplored in this process. Study 1 explores the role of the above factors from the perspective of behavioral basis. Two hundred and twelve pairs of adolescent-friends were recruited in the proximate social distance condition, and 208 pairs of adolescent-strangers were recruited in the remote social distance condition. The regulators were required to write regulation strategies for a specific situation, and the regulated rated their emotions before and after viewing the strategies respectively, and the rating difference was used as an index for the regulation effectiveness. The results indicated that affective empathy of the regulator and the regulated significantly and positively predicted willingness to regulate, overall tendency to use regulation strategies, and the degree of perceived effectiveness of regulation, respectively. Whereas the relationship between cognitive empathy and both the degree of willingness to regulate and the perceived effectiveness were moderated by social distance, the role of cognitive empathy was significant under proximate social distances only. At the same time, moderated mediation model showed that only under conditions of proximate social distance, the regulators' cognitive empathy positively predicted the objective regulation effectiveness by positively affecting the accuracy of their judgment of the regulated persons' emotions, which, to some extent, revealed the behavioral basis for the interrelated role of empathy and social distance. Using a paradigm of greater ecological validity and the fNIRS-based hyperscanning, study 2 focused on the neural basis by recruiting 34 pairs of adolescents in the proximate social distance condition and 30 pairs of adolescents in the remote social distance condition. Interpersonal neural synchronization (INS) in empathy-related brain regions were recorded during the stages in which the regulated person freely narrated their negative experience, and the regulator regulated the other person's negative emotion. The results showed that INS on corresponding channel pairs in cognitive empathy-related brain regions (dorsolateral prefrontal cortex, dlPFC) was significantly higher under the condition of proximate social distance. Meanwhile, the positive prediction of the regulation effect for

INS on corresponding channel pairs in dlPFC was significant only under the friend-pairing condition, suggesting that INS is the neural basis for explaining the interrelated role of empathy and social distance in the process of interpersonal emotion regulation. Current study, on one hand, contributes to a deeper understanding of extended process model of interpersonal emotion regulation, on the other hand, it provides guidance for intervention practices for emotion regulation in adolescents.

童年逆境对在线学习的影响：共情能力的个体差异视角

何子静（中山大学心理系，广州，510275）
通讯作者：hezij2@mail.sysu.edu.cn

摘要：童年逆境指个体从婴儿期到青春期经历过的创伤事件，如父母分离或离婚、虐待和忽视、父母药物滥用、家庭精神疾病等(Horn et al., 2019。影响个体发展的童年逆境通常包括两个方面：环境严峻性和不可预测性(Ellis, Figueredo, Brumbach, & Schlomer, 2009)。严峻性指导致人群的发病率和死亡率的一般物理压力，包括资源稀缺、极端气候、传染病等，常以社会经济地位来衡量。而不可预测性指行为结果的不可预测程度，体现在时间、空间上波动程度，常以家庭生态变化来衡量，如居住地、父母工作、家庭结构变动等。许多社会政策及干预措施基于缺陷模型应运而生，希望通过降低造成缺陷的风险和弥补缺陷，提高经历童年逆境的个体的认知和社交表现(Reynolds, Ou, Mondi, & Giovanelli, 2019)。缺陷模型主要关注缺陷和劣势，忽视个体具有调整自身认知以适应环境压力的潜能。这种不平衡的认识会带来歧视，造成其心理痛苦(Ellis et al., 2022)。隐性才能模型全面探究童年逆境对个体认知的影响。人类认知是为应对特异的环境挑战不断进化的信息加工机制(Young, & Ellis, 2020)。不利环境也会提高个体解决环境相关问题的专门技能，塑造特定隐性才能(Frankenhuis & Nettle, 2020)。近年来在线学习成为边远地区或乡村学生获得教育机会的重要途径。为了评估童年逆境对于学生在线学习表现的影响，本研究通过三个系列实验，从进化与发展的角度进行探究。具体分析童年逆境如何适应性地塑造个体认知，并影响学生在线学习时的行为与心理表现。实验一和实验二考查童年逆境对在线课程中的学习成绩和学习疲劳的影响。结果发现童年逆境的影响受在线课程形式的调节，当课程形式匹配童年逆境所塑造的认知特点时，童年逆境产生积极的影响。实验三考查童年逆境情境的启动对学生在线课程中表现的影响。根据情境认知理论，童年逆境的影响与当前的背景有关，当启动他人的童年逆境时，也可以产生相似的影响，并且启动效应与个体的共情能力有关。本研究对面向贫困地区或弱势人群以远程在线课程开展教育有启示意义。在扶贫实践中扶智应该顺应人群特征以合乎其认知特点的课程形式变弱势为优势。

The influences of childhood adversity on online learning: individual differences in empathy

Zijing He

Psychological department，Sun Yat-sen University, Guangzhou, 510275

Abstract: Childhood adversity refers to traumatic events experienced by individuals from infancy to adolescence, such as parental separation or divorce, abuse and neglect, parental drug abuse, and family mental illness (Horn et al., 2019）. Childhood adversity that affects individual development typically includes two dimensions: harshness and unpredictability (Ellis, Figueredo, Brumbach &Schlomer, 2009). Harshness is the general physical pressure causing mortality, including resource scarcity, extreme climate, infectious diseases, etc. It is often measured by socioeconomic status. The unpredictability refers to the unpredictability of behavior outcomes, which is reflected in the fluctuation degree in time and space, and is often measured by the changes in family ecology, such as residence, parents' work, changes in family structure, etc. Based on the deficit model, many social policies and interventions have emerged, aiming to improve the cognitive and social performance of individuals experiencing childhood adversity by reducing the risk of deficit (Reynolds, Ou, Mondi,& Giovanelli, 2019). The deficit model mainly focuses on disadvantage and weaknesses, neglecting the individual's potential to adjust their own cognition to adapt to environmental pressure. This imbalanced understanding can lead to discrimination and psychological pain (Ellis et al., 2022). The hidden talent model comprehensively explores the impact of childhood adversity on individual cognition. Human cognition is an evolved information processing mechanism that responds to specific environmental challenges (Young & llis, 2020). Adverse environments can also enhance individuals' specialized skills in solving environmental related problems, shaping specific implicit talents (Frankenhuis Nettle, 2020). In recent years, online learning has become an important way for students in remote areas or rural areas to access educational opportunities. In order to evaluate the impact of childhood adversity on students' online learning performance, this study conducted a series of three experiments from the evolutionary and developmental perspective. We analyze how childhood adversity adaptively shapes individual cognition and affects students' behavior and psychological performance during online learning. Experiment 1 and Experiment 2 examined the impact of childhood adversity on learning performance and fatigue in online courses. The results showed that the impact of childhood adversity was moderated by the online course format. When the course format matched the cognitive characteristics shaped by childhood adversity, childhood adversity had a positive impact. Experiment 3 examines the impact of priming childhood adversity situations on students' performance in online courses. Experiment 3 examines the impact of childhood adversity situations on students' performance in online courses. According to the theory of situational cognition, the impact of childhood adversity is related to the current context. When priming others' childhood adversity, similar effects can also occur, and the priming effect is related to an individual's empathy ability. This study has implications for developing education program s through remote online courses targeting impoverished or disadvantaged areas. In poverty alleviation practice, supporting intelligence should adapt to the characteristics of the population and transform weaknesses into advantages in the form of courses that conform to their cognitive characteristics.

Key words: childhood adversity, hidden talent model, online learning, empathy

3-6 岁幼儿执行功能和社会退缩关系的追踪研究：共情的中介作用

黄嚞青 马艺煊 吕晋晋

首都师范大学学前教育学院，北京，100089，通讯作者 Email（aivita@126.com）

摘 要　社会退缩指个体独自游戏、消磨时光的孤单行为，具有跨情境、跨时间的一致性。不同亚型社会退缩幼儿具有不同特点：沉默害羞型幼儿对社会交往表现出严重焦虑和恐惧，同时具有高社交趋近和高社交回避动机的特征；主动退缩型幼儿缺乏交往愿望，具有低社交趋近动机和高回避动机；被动退缩型幼儿有同伴互动的愿望，但缺乏交往能力而常常被同伴拒绝。执行功能广泛参与到社会适应的各个环节中，已有纵向研究指出执行功能对三种不同类型的社会退缩行为均具有保护性作用。共情在个体的社会交往中发挥重要作用，共情中包括指向他人的成分（other-oriented empathy）和指向自我的成分（self-oriented empathy）。在执行功能影响社会退缩的通路中，共情不同成分可能具有不同作用。为了验证抑制控制对社会退缩的保护性作用，并考察共情不同成分是否在其中发挥中介作用，本研究，以 123 名小班幼儿为对象（M 年龄=3.67，SD 年龄=0.87），使用了 18 个月的三波纵向研究设计通过《执行功能量表》（CHEXI）考察幼儿执行功能的发展状况（T1），通过《早期儿童共情量表》（EmQue）考察幼儿共情指向自我和指向他人的成分（T2），使用《社会退缩问卷（教师版）》考察幼儿三种社会退缩程度（T3）。使用 SPSS 及其 process 插件、Mplus 进行数据处理分析。研究结果表明，执行功能对主动退缩和被动退缩的预测会受到指向他人共情成分的正向中介；执行功能对沉默害羞的预测受到共情中情绪感染维度的负向中介。本研究进一步探讨了执行功能影响社会退缩的作用机制，对学前儿童社会退缩的预防和干预有积极的意义。

A Three-Wave Longitudinal Research to the Effect of Executive Function on Social Withdraw: A Mediation Effect of Empathy

Heqing Huang, Yixuan Ma, and Jinjin Lv

College of Preschool Education, Capital Normal University, Beijing, 100089, China.

Abstract：Social withdrawal, the lonely behavior of individuals, was stable across situations and time. Children of different subtypes of social withdrawal perform different characteristics: children of the shy withdrawal type typically exhibit severe anxiety and fear about social interactions, children of the active withdrawal type of children usually lack social motivation and have the conflict of social approach and social avoidance, and the children of the passive withdrawal type lack communication skills and are often rejected by peers. Executive function has complicated relationships with individuals' social adaption and was proven to play a protective role against all three subtypes of social withdrawal. Empathy, which contains the self-orient component and other-oriented component, also plays a critical role in individuals' social life. Using a three-wave longitude design, This research aims to examine the protective role of executive function and the mediating effects of the two different empathy components. The initial sample is 123 children in the first grade in the preschool, the Childhood Executive Functioning Inventory (2018) was used to measure children's executive function (T1), Empathy Questionnaire was used to measure children's self-oriented and other-oriented empathy (T2), and the Social Withdrawal Questionnaire (teacher-report version) was used to measure the children's three subtypes of social withdrawal (T3). The result indicated that, the predictions of executive function for active and passive withdrawal were positively mediated by the other-oriented empathy, while the prediction of executive function for shy withdrawal was negatively mediated by the other-oriented empathy. This study further discussd the mechanism of executive function affecting social withdrawal, which has positive implications for the prevention and intervention of social withdrawal in young children.

Keywords：social withdrawal, executive function, empathy, young children.

自发性知觉经络反应中个体情绪体验出现差异的原因

王协顺（通讯作者）
山东师范大学心理学院，济南，250014
通讯作者 E-mail: wangxs1036@126.com

摘 要　自发性知觉经络反应（autonomous sensory meridian response, ASMR）是指在特定视听刺激下，一些人（ASMR 敏感者）在头皮后部或颈部体验到电流般、令人愉悦和放松的刺麻感的现象。借助 ASMR 这一特殊现象，将为深入理解情感认知的机制提供新的突破口。已有研究普遍认为，ASMR 视听刺激会诱发积极情绪，然而越来越多证据表明，ASMR 视听刺激下人们的情绪体验存在明显差异，有的产生积极情绪（典型敏感者），有的产生消极情绪（非典型敏感者），也有的无情绪变化（不敏感者）。为揭示 ASMR 视听刺激下个体情绪体验出现差异的原因，本研究首先通过 K-means 聚类的方式，识别出 36 名典型敏感者（29 女）、21 名非典型敏感者（14 女）和 37 名不敏感者（28 女）。然后，要求所有被试依次接受三种不同的实验处理，分别是无视频刺激条件、ASMR 视频刺激条件和中性视频刺激条件。在每个实验处理之后，被试均需要完成积极情感和消极情感量表（PANAS）和情绪线索 Go/Nogo 任务。结果显示，ASMR 视频刺激可以降低典型敏感者在情绪线索 Go/Nogo 任务上的表现，但可以增强非典型敏感者在 PANAS 消极情感维度上的评分。这表明，在接受 ASMR 视听刺激后，不同类型敏感者在情绪体验上的差异可能与他们在情绪控制和情绪唤起方面的独特性有关。具体是，在 ASMR 视听刺激下，之所以个体会出现积极情绪，是因其情绪控制受到暂时抑制，导致积极情绪表征过度表达；之所以出现消极情绪，是因个体对视听刺激中的情感信息做出较多负性评估，导致消极情绪过度唤起。

关键词　ASMR, 情绪唤起, 情绪控制, 个体差异

Why ASMR Responders Show Different Emotional Experiences during ASMR Episodes

WANG Xieshun
School of Psychology, Shandong Normal University, Jinan 250358, China

Abstract: The autonomous sensory meridian response (ASMR) is a unique sensory phenomenon in which some individuals (ASMR responders) experience a static-like tingling sensation in the scalp in response to certain auditory/visual stimuli (ASMR triggers). The ASMR phenomenon will provide a new breakthrough to deeply understand the mechanism of affective cognition. Increasing evidence shows that some ASMR responders experience positive emotions after receiving ASMR triggers (typical responders), but some experience negative emotions (atypical responders). The present study aims to investigate why people experience different emotions after being stimulated by ASMR triggers. We first identified the typical responders (7 males, 29 females), atypical responders (7 males, 14 females), and non-responders (9 males, 28 females) by a K-means clustering approach. Then, all participants were asked to experience three different treatment conditions in sequence (Non-trigger, ASMR-trigger, and Neutral-trigger). After each treatment, participants were instructed to complete the Positive Affect and Negative Affect Scale (PANAS) and an emotional Go/Nogo task. The results showed that the ASMR triggers could weaken the performance of emotional Go/Nogo task in typical responders but elevated the ratings of the Negative Affect subscale of PANAS in atypical responders. We interpreted these findings in terms of the

specificities of emotional arousal and emotional control among the different types of responders. Septically, after being stimulated by ASMR triggers, the processing of emotional control in typical responders was temporarily suppressed, resulting in the overexpression of positive emotional representations and, thus, experiencing stronger positive emotions; however, the atypical responders tended to make more negative evaluations of the emotional information in ASMR triggers, resulting in excessive arousal of negative emotions.

情绪性注意瞬脱在青少年时期的发展

林悦 谢宇航 苏彦捷（通讯作者）

北京大学心理与认知科学学院，行为与健康北京市重点实验室，北京，100871

E-mail: yjsu@pku.edu.cn

摘 要 青少年对社会情绪线索敏感，在空间维度上表现出对情绪刺激的注意偏向。注意是随时间变化的动态过程，以往研究发现时间维度的情绪注意偏向比空间维度的测量更加直接并且具有更高的信效度。探究青少年对情绪刺激注意偏向的时间动态过程将有助于理解青少年的情绪症状的发生和发展。情绪性注意瞬脱任务可用以测量情绪性目标对注意的保持时间。该任务在快速序列视觉呈现刺激流中插入情绪刺激作为目标 1，中性刺激作为目标 2，在目标 1 和目标 2 之间填充干扰刺激以操控两个目标之间的时间间隔，当目标 1 和目标 2 间隔时间很短时（通常为 200-500ms），正确识别目标 1 后注意资源来不及释放并分配到目标 2，即发生注意瞬脱现象。相比于中性刺激，情绪性刺激更容易保持注意，会诱发更大更长时间的注意瞬脱。本研究设计了适用于青少年的情绪性注意瞬脱的范式，并探究情绪性注意瞬脱在青少年时期的发展特点。共 138 名 10~25 岁的青少年完成了情绪性注意瞬脱任务。结果发现不同情绪面孔诱发的注意瞬脱时间窗口显示出不同的发展轨迹：恐惧面孔诱发的注意瞬脱时间窗口呈 U 型发展轨迹，早期青少年和早期成人的时间窗口比中晚期青少年长；愉悦面孔诱发的注意瞬脱时间窗口呈倒 U 型发展轨迹，早期青少年和早期成人的时间窗口比中晚期青少年短；中性面孔诱发的注意瞬脱时间窗口呈线性发展轨迹，早期青少年的时间窗口比中晚期青少年及成人长。这些结果表明在时间维度上，中晚期青少年相比于早期青少年和早期成人表现出独特的情绪性注意偏向模式：对威胁性刺激的注意保持时间更短，对愉悦刺激的注意保持时间更长。这些发现从情绪性注意的时间维度为社会情绪系统在青少年时期的非线性发展理论提供了证据。青少年情绪性注意瞬脱的发展特点与青少年情绪症状发生和发展的关系还有待未来研究进一步探讨。

The Development of Emotional Attentional Blink in Adolescence

Yue Lin, Yuhang Xie, Yanjie Su

School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing 100871, China.

***Abstract*：** Adolescents are sensitive to social-emotional cues and show an attentional bias toward emotional stimuli in the spatial dimension. Attention is a dynamic process that changes over time. Previous research has found that the temporal dimension measures of emotion-biased attention is more direct and shows higher reliability than spatial dimension measures. Exploring the temporal dynamics of attentional bias toward emotional stimuli will contribute to understanding the onset and development of emotional symptoms in adolescents. The emotional attentional blink task provides a measure of how long attention is retained on emotional targets. The task inserts an emotional stimulus as target 1 and a neutral stimulus as target 2 in a stream of rapid serial visual presentation, and fills in a specific number of distractors between target 1 and target 2 to manipulate the time interval between the two targets. When target 1 and target 2 occur with a short interval between them (usually 200-500ms), attentional resources are too late to be released and allocated to target 2 after correctly identifying target 1(i.e., attentional blink phenomenon). Compared with neutral stimuli, emotional stimuli are more likely to maintain attention and induce a larger and longer attentional blink. The current study designed a paradigm to explore the developmental characteristics of the emotional attentional blink during adolescence. A total of 138 adolescents between the ages of 10 and 25 completed an emotional attentional blink task. The results revealed that the time windows of attentional blink elicited by different emotional faces showed different developmental trajectories. The time windows of attentional blink elicited by fearful faces showed a U-shaped developmental trajectory, and were longer in early adolescents and early adults than in middle- to late-adolescents; the time windows of attentional blink elicited by happy faces showed an inverted U-shaped developmental trajectory, and were shorter in early adolescents and early adults than in middle- to late-adolescents; and the time windows of attentional blink elicited by neutral faces showed a linear developmental trajectory, and were longer in early adolescents than in middle- to late-adolescents and in adults. These findings suggest that on the temporal dimension, mid- to late-adolescents show a unique pattern of emotional attention bias compared to early adolescents and early adults, with shorter retention of attention to threatening stimuli and longer retention of attention to pleasant stimuli. These findings provide evidence for theories of the nonlinear development of the social-emotional system during adolescence in terms of the temporal attention. The relationship between the developmental characteristics of emotional attention blink and the onset and development of adolescent emotional symptoms remains to be further explored in future studies.

框架效应对不同记忆能力群体认知负载转移偏差的影响

王雅楠　刘岩（通讯作者）

辽宁师范大学心理学院，大连，116029，psysabrina@126.com

摘 要　在生活中人们常常将信息存储在外部媒介上，从而减少大脑的认知负荷，也就是进行认知负载转移。比如在平板电脑上记录课堂笔记，或者在手机上设置重要事项的提醒等等。然而许多研究表明人们在进行认知负载转移时往往没有做出最优选择，而是过多或过少地使用了这一策略，也就是出现了认知负载转移偏差。本研究试图探讨对于不同记忆能力的群体，面对收益和损失框架时其认知负载转移偏差是否有所不同。研究使用 2（框架：收益框架、损失框架）×2（记忆水平：低水平、高水平）的混合实验设计，最终将 50 名参与者的数据纳入分析。结果发现框架和记忆水平都对认知负载转移偏差有显著的影响。整体而言，被试在收益框架下会比在损失框架下更倾向于使用认知负载转移，同时高记忆水平的被试会比低水平被试更加倾向于使用认知负载转移。将不同群体在收益和损失框架下的表现分别与最优策略作比较，

结果显示，收益框架下低记忆水平群体没有出现认知负载转移偏差，而高水平群体过多地使用了认知负载转移。损失框架下情况有所不同，低水平群体过少地使用认知负载转移，而此时高水平群体则没有认知负载转移偏差。以上结果说明，框架效应对于不同记忆能力群体认知负载转移偏差的影响是不同的：对于记忆能力高的群体而言，在传统的收益框架下会有过度使用认知负载转移的倾向，而在损失框架下这种倾向被消除了。但对于记忆能力低的群体来说，从收益框架转为损失框架反而带来了更多了认知负载转移偏差。本研究以个体差异为切入点，为认知负载转移偏差的产生机制提供了新的研究视角。

The Influence of Framing Effect on Cognitive Offloading Bias in Groups with Different Memory Abilities

Yanan Wang　Yan Liu
School of Psychology, Liaoning Normal University, Dalian

Abstract：In daily life, people often store information in external storage, thereby reducing the cognitive load of the brain, which is cognitive offloading. Such as taking notes in class on a tablet, or setting reminders of important things on your phone. However, many studies have shown that people often do not make the optimal choice when carrying out cognitive offloading, but use this strategy too much or too little, that is, there is a cognitive offloading bias. This study attempted to explore whether the cognitive offloading bias differs for groups with different memory abilities when faced with a gain and loss framing. The study used a mixed experimental design of 2 (framing: gain framing, loss framing) ×2 (memory level: low level, high level), and finally included data from 50 participants in the analysis. The results showed that both framing and memory level had significant effects on cognitive offloading bias. Overall, participants were more inclined to use cognitive offloading in the gain farming than in the loss farming. Participants with high memory levels were also more inclined to use cognitive offloading than those with low memory levels. Comparing the performance of different groups in the gain and loss framing with the optimal strategy, the results show that, under the gain framing, there was no cognitive offloading bias in the group with low memory level, while the group with high memory level used cognitive offloading excessively. The situation was different in the loss framing. The low memory group used cognitive offloading too little, while the high memory group had no cognitive offloading bias. These results indicate that the framing effect has different effects on cognitive offloading bias in different memory ability groups. For the group with high memory ability, there is a tendency to overuse cognitive offloading under the traditional gain framing, but this tendency is eliminated under the loss framing. However, for the group with low memory ability, the shift from gain framing to loss framing resulted in more cognitive offloading bias. This study provides a new perspective on the mechanism of cognitive offloading bias by taking individual differences as the starting point.

Keywords：Cognitive offloading, Memory ability, Framing effect

社会性奖励与非社会性奖励对儿童期认知控制的影响

金晓雨[1] (通讯作者)　Nicolas Chevalier[2]
1 北京语言大学心理学院，北京，100083，xiaoyu.jin@blcu.edu.cn
2 爱丁堡大学心理学系，英国，EH9 7YJ

摘 要　奖励对于认知控制过程的影响一直备受关注，然而对于社会性奖励与非社会性奖励间的对比研究却较为少见，特别是学龄前阶段。已有证据表明，非社会性奖励（如，金钱）可以在学龄前儿童、学龄儿童和成人中稳定地提升认知控制表现，促进“未雨绸缪”式的前摄控制模式，而社会性奖励的作用则更不明显或相对更弱。然而，值得注意的是，已有研究对于奖励的社会性维度的考察经常与奖励的其他重要维度（如，可数性）相混淆，从而很可能低估了社会性奖励的潜在作用。因此，社会性奖励的作用仍有待进一步探究：随着个体对于社会性信息敏感度的逐渐发展变化，尤其是对于社会性信息更敏感的学龄前阶段，社会性奖励与非社会性奖励发挥着怎样的作用？本研究旨在关注奖励的社会性维度，重新检验社会性奖励与非社会性奖励对儿童期认知控制的影响。在尽可能匹配奖励的其他维度的情况下，研究采用线上版本的AX-Continuous Performance Task（AX-CPT）任务，考察了 30 名 5-6 岁学龄前儿童和 30 名 9-10 岁学龄儿童在社会性奖励、非社会性奖励和无奖励（控制）条件下的认知控制表现，以及对前摄和反应控制模式的偏好情况。结果表明，学龄前儿童和学龄儿童的认知控制表现仅在社会性奖励条件下有所提升，表现为更高的任务准确率；然而，并没有观察到其对认知控制模式偏好（前摄控制或反应控制）的影响。两组儿童的认知控制并未在非社会性（金钱）奖励条件下表现出差异。相比于非社会性奖励，社会性奖励能够更显著地促进儿童期的认知控制。本研究不仅为儿童认知过程中奖励动机的作用研究提供了更多数据，同时也为相关教育实践提供了科学建议和实证依据。

Influences of social and non-social rewards on cognitive control in childhood

Xiaoyu Jin[1], Nicolas Chevalier[2]
1 School of Psychology, Beijing Language and Culture University, Beijing, 100083
Xiaoyu.Jin@blcu.edu.cn
2 Department of Psychology, The University of Edinburgh, UK, EH9 7YJ

Abstract： The modulation of cognitive control by rewards has long been discussed, but there is scarce evidence of how social and non-social rewards influence cognitive control in childhood, especially in the preschool years. It has been shown that non-social rewards could improve cognitive control performance and promote proactive mode of control, while the effect of social rewards was found inconsistent. Critically, sociality has often been confounded with other important reward dimensions (e.g., tangibility) in these previous studies, hence potentially misestimating the effect of social rewards. Given this, the influence of social rewards on cognitive control remains to be further explored: With the developmental change of sensitivity to social information, how social and non-social rewards influence cognitive control during childhood, specially in the preschool years, which are more sensitive to social information. Thus, the present study re-examined the effects of social and non-social rewards on cognitive control, particularly on proactive and reactive control engagement during childhood. Thirty 5- to 6-year-olds and thirty 9- to 10-year-olds

completed an AX-Continuous Performance Task (AX-CPT) during an online session in three conditions: control, social reward, and non-social (i.e., monetary) reward conditions. Social rewards increased younger and older children's response accuracy, suggesting greater cognitive control. However, no influence on how children engage cognitive control (i.e., proactively or reactively) was observed. The provision of non-social rewards did not influence performance in either group of children. Social rewards, but not non-social rewards, can promote cognitive control performance in childhood. These findings not only shed light on the effect of reward incentives on children's cognitive processes, but also have important implications for educational fields.

Keywords：Social reward, non-social reward, cognitive control, childhood

7 到 10 岁儿童离散与连续形式下的直觉性统计推断

刘思燚[1] 苏彦捷[1*]

1 北京大学心理与认知科学学院，行为与心理健康北京市重点实验室，北京，100871

*通讯作者 E-mail：yjsu@pku.edu.cn

摘 要 直觉性统计推断是基于有限的统计信息对概率事件进行推断的能力，该能力对人类以及其它非人动物的生存与繁衍具有重要适应意义。以往研究发现，在控制了启发式策略后，7-8 岁儿童无法通过直觉性统计推断任务，9-10 岁儿童则可以通过该任务。7-8 岁儿童无法通过该任务的原因可能是在离散量的比例加工过程中产生了“整体数量偏差”，这导致他们更多地关注比例信息中绝对数量的大小而非相对数量的大小。为了探讨 7-8 岁儿童是否可以进行直觉性统计推断而非单纯使用了启发式策略，本研究同时使用了离散与连续形式的刺激对 7-10 岁儿童进行测试。以往研究发现连续型刺激下儿童对比例信息的加工会更少地表现出“整体数量偏差”。

结果发现，随年龄增大，7-10 岁儿童（$N = 99$）在直觉性统计任务中的表现变得更好；且在离散条件且控制了启发式策略后，7-8 岁儿童无法通过该任务，而在连续条件且控制了启发式策略后，7-8 岁儿童能够通过该任务。这说明 7-8 岁儿童能够基于比例信息进行直觉性统计推断，而非单纯依赖于启发式策略。在连续条件下的直觉性统计推断不依赖于离散的数量信息，这说明可能存在一般量的加工系统支持儿童的直觉性统计推断能力，其与离散条件下的推断是否基于相同的量的加工系统还需要更多研究证据来明确。

Intuitive Statistical Inferences Across Discrete and Continuous Formats in 7- to 10-year-old Children

Siyi Liu[1], Yanjie Su[1*]

1 School of Psychological and Cognitive Sciences, Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing, 100871

*Corresponding author, E-mail: yjsu@pku.edu.cn

Abstract: Intuitive statistical inferences refer to the ability to make inferences about probabilistic events based on limited statistical information, which is of great importance for the survival and reproduction of both human and non-human animals. Previous studies found that 7- to 8-year-old children failed in intuitive statistical inference tasks after heuristic strategy had been controlled, while 9- to 10-year-olds succeeded. Their failure might

be caused by “whole number bias” while processing proportional information in discrete formats. This bias made them focus on the absolute number rather than the relative number of proportional information. Considering that continuous-format stimuli could reduce “whole number bias” in previous studies, we used discrete- and continuous-format stimuli in present study, to examine whether 7- to 8-year-old children were able to make genuine intuitive statistical inferences, rather than relying solely on heuristic strategies.

Results revealed that 7- to 10-year-old children (N = 99) performances became better with age. Besides, 7- to 8-year-old succeeded in intuitive statistical inference tasks with continuous-format stimuli after heuristic strategy had been controlled but still failed in discrete-format stimuli condition. There was no discrete-format information in continuous condition, so general magnitude processing system might exist underlying intuitive statistical inferences. More empirical evidence is needed to clarify whether intuitive statistical inferences with discrete- and continuous-format information rely on the same magnitude processing system.

Keywords**:** intuitive statistical inferences, 7- to 8-year-old children, stimulus formats, strategy, magnitude processing

从无别到定向，动机对青少年创造力的影响：环境资源和坚毅的作用

张悠然　王依宁　苏彦捷（通讯作者）

北京大学 心理与认知科学学院/行为与心理健康北京市重点实验室，北京，100871，yjsu@pku.edu.cn

摘 要　创造力是一个从儿童到成年的连续适应性行为表现。本研究从发展心理学视角探讨了青少年创造力发展过程中环境资源和坚毅的作用，其中环境资源是指来自家庭和学校的能够有效促进个体积极健康发展的经验、社会关系、技能以及价值观的外部条件。研究还重点探究了动机在不同年龄段青少年创造力发展中的动态作用。采用随机抽样的方法，从中国东、西、中部区域随机抽样 7 个省份，分别通过儿童和青少年资源评估问卷（QARCA）、坚毅量表、一般因果取向量表（GCOS）和创造性行为传记清单（BICB）考察了 47278 名青少年的环境发展资源、坚毅、动机和日常创造行为。

研究结果表明，环境资源和坚毅可以正向预测各个学龄段下青少年的创造力表现，表现出稳定的促进作用。此外，结构方程模型指出，不同学龄段个体创造力的动机促进路径存在差异。对于高中和大学学生而言，环境资源和坚毅可以通过个体的自主定向动机正向预测其创造力表现。对于小学高年级学生而言，环境资源和坚毅是通过个体的控制定向动机来正向预测其创造力表现的。而小学低年级学生的自主定向和控制定向动机均可以预测其创造力表现，进一步地发现动机变量还具有内部的从“控制定向-自主定向”的方向性。这些研究结果丰富了当前青少年创造力模型，并为中国文化背景下不同年级学生创造力发展中动机的作用提供了参考。

关键词　创造力，自主定向，控制定向，环境资源，坚毅

From no distinction to direction, the impact of motivation on adolescent creativity: The contribution of environmental resources and grit

Abstract: Creativity is a continuum of adaptive behavioral expressions from childhood to adulthood. This study explored the role of environmental resources and grit in the development of adolescent creativity from a developmental psychology perspective, where environmental resources refer to the external conditions of experiences, social relationships, skills, and values from the family and school that can effectively promote the positive and healthy growth of individuals. The study also investigates the dynamic role of motivation in adolescent creativity at various ages. A random sample of 47,278 adolescents from seven provinces in the eastern, western, and central regions of China was examined the environmental developmental resources, grit, motivation, and daily creative behaviors, through the Questionnaire for Assessment of Resources for Children and Adolescents (QARCA), the Grit Scale, the General Causal Orientation Scale (GCOS), and the Biographical Inventory of Creative Behavior (BICB), respectively.

The results found that environmental resources and grit positively predicted adolescents' creativity performance at all school ages, demonstrating stable facilitative effects. In addition, structural equation modelling indicated differences in the pathways of motivational facilitation of individual creativity across school ages. For high school and university students, environmental resources and grit positively predicted creativity performance through autonomy orientation. For upper primary schools, environmental resources and grit positively predicted their creativity performance through controlled orientation. For lower primary schools predictions held for both motivations, and the motivational variables were further found to have an internal "control-autonomy" connection. These findings enrich the current models of adolescent creativity and provide a reference for the role of motivation in creative development among different grade students in the Chinese cultural context.

Keywords: creativity, autonomy orientation, controlled orientation, environmental resources, grit

大语言模型对精神心理障碍诊断服务的变革性影响

颜文靖 许冬武（通讯作者）
温州医科大学精神医学学院，温州，325015
通讯作者：E-mail：xdw@wmu.edu.cn

摘 要 在精神心理健康服务需求逐渐增长与及相关服务资源紧缺的失衡背景下，人们对人工智能技术辅助精神心理健康服务的关注度逐日提升。本文着重探讨了大语言模型（如 ChatGPT）在基于症状的精神心理障碍诊断中的潜在价值。以往的研究常常采用基于客观指标（如面部表情、身体姿态、语音、脑电图、脑成像以及神经递质等）的精神心理障碍诊断方法。这种基于监督学习的判别模型往往面临许多挑战。第一，客观指标与主观体验无明确的映射关系，而主观报告是诊断的主要依据。第二，现行的精神心理障碍诊断主要依赖于症状的定性描述，缺乏明确的标准。第三，精神心理疾病症状复杂，存在共病普遍、个体差异明显等特点。第四，训练模型的数据生态效度不高，限制了模型在实际环境中的应用。然而，基于无监督学习的自然语言模型，能较好地解决精神心理领域的自动化诊断问题，如 ChatGPT 这类 LLM 能建立起“主观报告-症状定性描述-精神障碍类别”间的映射关系，即依据患者的主观报告，匹配最接近的症状条目，进而匹配最接近的疾病类型。这一流程与精神科医生的实际诊断思路高度一致，也符合精神障碍的诊断手册 ICD-10 或 DSM-5 以症状为导向的诊断思路。在一个虚拟案例研究中，ChatGPT 与患者进行模拟互动，显示该模型在收集信息、共情、引导重点、澄清以及总结对话等方面都展现出了较高的能力。ChatGPT 等人工智能模型显示出了在辅助传统精神心理障碍诊断、提供个性化健康服务方面的巨大潜力。这种人工智能加持的工具有可能彻底改变精神心理健康服务现状，使其变得更为便利、更具有效性、以及更加个性化。然而，为了确保在精神心理健康服务环境中以道德和负责任的方式使用这些技术，我们仍需要持续进行研究，并以谨慎的态度实施。

The Transformative Impact of the Large Language Models on the Diagnosis Services of Mental Health Disorders

Yan Wen-Jing and Xu Dongwu (Corresponding author)
School of Mental Health, Wenzhou Medical University, Wenzhou 325015, China
Corresponding author: E-mail: xdw@wmu.edu.cn

Abstract：Against the background of the imbalance between the gradual increase in demand for mental health services and the shortage of related service resources, people's attention to artificial intelligence technology-assisted mental health services is increasing. This paper focuses on the potential value of large language models (e.g., ChatGPT) in symptom-based diagnosis of mental disorders. Previous studies have often used psychosomatic disorder diagnosis based on objective indicators (e.g., facial expression, posture, voice, EEG,

brain imaging, and neurotransmitters). Such supervised learning based discriminative models often face many challenges. First, there is no clear mapping of objective measures to subjective experience, and subjective reports are the primary basis for diagnosis. Second, the current diagnosis of psychosomatic disorders relies mainly on qualitative descriptions of symptoms and lacks clear criteria. Third, the symptoms of psychosomatic disorders are complex, characterized by widespread comorbidity and obvious individual differences. Fourth, the ecological validity of the data used to train the model is not high, which limits the application of the model in real-world settings. However, natural language models based on unsupervised learning can better solve the problem of automated diagnosis in psychiatric and psychological fields. For example, LLMs such as ChatGPT can establish a mapping relationship between "subjective reports - qualitative descriptions of symptoms - categories of mental disorders", i.e., based on the patient's subjective report, matching the closest symptom entries, and then matching the closest disease types. This process is highly consistent with the actual diagnostic thinking of psychiatrists and the symptom-oriented diagnostic thinking of the ICD-10 or DSM-5 diagnostic manuals for mental disorders. In a virtual case study, ChatGPT interacted with a patient in a simulation and showed that the model demonstrated a high level of competence in gathering information, empathizing, guiding focus, clarifying, and summarizing the conversation. Artificial intelligence models such as ChatGPT show great potential for assisting in the traditional diagnosis of psychiatric disorders and providing personalized healthcare services. Such AI-based tools have the potential to revolutionize mental health services by making them more accessible, effective, and personalized. However, there is a need for continued research and careful implementation to ensure that these technologies are used ethically and responsibly in mental health services.

人工智能接入心理服务——人类智慧与机器智慧的匹配

蒋柯
温州医科大学精神医学学院

摘 要 要实现自动化的心理健康服务，真正的障碍不在于智能化技术的硬件和软件的限制，而是在于心理健康服务本身如何被形式化表征。

本研究首先从人类智慧、机器智慧等基础概念的意义分析入手，形成关于人类智慧的形式化表征建议：智慧即意味着主客体或主体与主体之间发生互动时的灵活的、结构化的响应模式。研究进一步提出：心理健康问题与个体结构化水平降低有关。

接下来的心理学实验研究结果分离了心理问题人群与对照组在认知加工指标上的特殊变化。

在此基础上，研究预期：将人工智能的形式化表征与人类心智活动的形式化表征做匹配，通过人工智能与人类心智的形式化匹配训练，引入人工智能技术来辅助解决人类心理健康问题。

本研究还提出，通过人工智能技术辅助心理健康服务有两种模式：一种是“类人心理机器人”，即让机器人尽可能模拟人类心理师的活动；另一类是“非类人心理机器人”。它的工作可能与人类心理师的活动完全不同，但是可以通过程序对人的底层认知过程进行训练，从而实现心理服务的目的。

Artificial Intelligence Integration in Psychological Services: Matching Human Intelligence and Machine Intelligence

Jiang Ke
School of Psychiatry, Wenzhou Medical University

Abstract：To achieve automated mental health services, the true challenge lies not in the limitations of hardware and software of intelligent technology but in how mental health services themselves are formally represented.

This study starts with a semantic analysis of fundamental concepts such as human intelligence and machine intelligence, leading to a proposed formal representation of human intelligence: wisdom implies flexible and structured response patterns when interactions occur between subjects or between subject and object. Furthermore, the research suggests that mental health issues are related to the reduction of individual structured levels.

The results of psychological experiments distinguish specific changes in cognitive processing indices between the group with psychological issues and the control group.

Based on this, the study anticipates matching the formal representation of artificial intelligence with the formal representation of human mental activities. Through the formal matching training of artificial intelligence and human cognition, artificial intelligence technology can be introduced to assist in addressing human psychological problems.

The study also proposes two modes of using artificial intelligence technology for supporting mental health services: one is the "human-like psychological robot," where the robot attempts to mimic the activities of human psychologists as much as possible; the other is the "non-human-like psychological robot." It may work completely differently from human psychologists but can be trained through programs to address underlying cognitive processes in humans, thus achieving the goal of psychological services.

咨询服务中的心理机器人

王啸天（通讯作者）
华东政法大学心理健康教育与咨询中心，上海，200050
通讯作者：E-mail：jsnt@ntu.edu.cn

摘 要　科技的进步可以助力心理咨询事业的发展。心理机器人包括输入模块、语言分析模块、逻辑树对话模块、预料数据库、小结与反馈模块等，基于人工智能（AI）的心理咨询会话系统会模仿真人心理咨询师的话术，结合机器人与来访者间的会话信息，反馈来访者心理问题并输出相关的信息，来访者可以获得心理咨询建议和对应的心理干预方案。但是不管人工智能的程序写得有多么精细，心理咨询师的工作也不会被 AI 轻易取代，心理机器人仍存在以下几个问题：1、信息收集受限，无法收集语音、语调、肢体

动作等非言语信息；2、情绪的激发、联结受限，咨询师需敏感地捕捉来访者的情绪变化，良好的咨询与治疗效果离不开咨询师与来访者之间建立稳定而又安全的关系，关系中的情感和温度，AI 很难捕捉和反馈。3、行为的示范作用受限，在咨询过程中，咨询师本人就是咨询的工具，可通过咨询师的行为表现影响来访者，这点心理机器人无法做到。当下看来，心理机器人可助力心理咨询服务：1、可以作为咨询师辅助工具，帮助咨询师进行记录、分析、建议、总结等等，汇总资料、查询信息，针对问题给出启发式建议；2、心理机器人作为一个简易便捷的解决简单心理问题的工具，降低了心理咨询的门槛，它利用大数据优势，对于一些可被程序化、线性的问题，或者不需要掺杂太多情感因素的简单问题，可以提供服务；3、心理机器人可在规范化、结构化的疗法中提供咨询服务，通过大量缜密的设计和学习，它可以提供“认知行为疗法”等程序化较强的心理咨询服务。展望未来，除加强 AI 技术外，还要重视与之相应的法规、伦理研究，以使新技术更好的服务于来访者。

Consulting Service: Psychological Chatbot

Xiaotian Wang

Center for Psychological Health Education and Counseling, East China University of Political Science and Law

Abstract：Technological advancements can contribute to the development of the psychological counseling profession. Psychological chatbots, consisting of input modules, language analysis modules, logical tree dialogue modules, predictive databases, summarization, and feedback modules, are based on artificial intelligence (AI) and can simulate the language of a human psychological counselor. By incorporating conversation information between the robot and the visitor, the AI-driven psychological counseling session system can provide feedback on the visitor's psychological issues and offer relevant information, enabling visitors to obtain counseling advice and corresponding psychological intervention plans. However, regardless of how sophisticated the AI program is, the work of a psychological counselor cannot be easily replaced by AI. Psychological chatbots still face the following issues:

Limited information collection: They are unable to gather non-verbal information such as voice tone, intonation, and body language.

Restricted emotional elicitation and connection: Effective counseling and therapy outcomes depend on counselors sensitively capturing the visitor's emotional changes and establishing a stable and secure relationship with them. The emotional aspects and warmth in this relationship are challenging for AI to capture and provide feedback on.

Limited demonstration of behavior: In the counseling process, the counselor themselves act as a tool for counseling, and their behavior can influence the visitor. This is something that psychological chatbots cannot achieve.

Currently, psychological chatbots can assist in psychological counseling services in the following

ways: Assistive tools for counselors: They can help counselors with tasks like recording, analysis, suggestions, and summarization, as well as gather data and provide heuristic advice for specific issues.
Simple problem-solving tool: As an easy and convenient tool, psychological chatbots can address simple psychological problems, lowering the entry barrier for seeking counseling. Leveraging the advantages of big data, they can handle programmatic and linear issues or those that do not involve complex emotional factors.
Support for standardized and structured therapies: Through rigorous design and learning, psychological chatbots can provide counseling services based on highly structured therapies like "cognitive-behavioral therapy."
Looking ahead to the future, besides strengthening AI technology, attention should also be given to relevant regulations and ethical research to ensure that new technologies better serve visitors.

Keywords: Psychological counseling, psychological chatbot, challenges, assistance.

智能的进化连续性：

通过内稳态和动态调节连接通用人工智能与生物情感

刘崇艺　尹彬*（通讯作者）
福建师范大学心理学院，福建福州，350117
*通讯作者 Email: byin@fjnu.edu.cn

摘 要　OpenAI 的 GPT-4 是一款领先的大型语言模型，因其在多个领域中与人类智慧相匹敌或超越的卓越能力而受到关注。值得注意的是，GPT-4 在与人类的有效沟通和合作中展现出了显著的心理理论能力，这使它能够在现实背景中预测各种行为对个体心智状态的影响。然而，在逼近实现通用人工智能 (AGI) 的过程中，GPT-4 表现出明显的局限性。一个主要的关切是它无法识别输入命令背后的潜在意图，导致在涉及会话细微差异时可能会有误解。根据 Legg 和 Hutter 的观点，AGI 可以被视为一个执行任何人类可以完成的任务的系统。这种理解的背后，实质上是人类对于外部主体的一种向上的拟人化。在这个框架中，人们不仅认为体现出智能的机器或其他动物个体具有与人类相似的能力，而且还给予它们与人类相似的道德伦理地位。这意味着在人为中心的认知模型中，AGI 与其他智能生物是平等的。

因此，我们认为解决人与人工智能交互中的问题，关键可能在于研究人与不同物种之间的沟通与合作机制。从进化生物学的视角出发，所有动物，包括人类，都共享着某种进化历程，尤其是情感的进化连续性。这种进化连续性意味着，尽管物种之间存在着明显的差异，但通过某种互通的情感作用机制，它们仍然可以达成互相理解和交流。我们认为生命的内稳态和动态调节—一种调节身体状态的机制，可能是人与不同物种间情感互通的基础。我们提出了一个自适应的修正框架来解释这一可能过程。在这个框架中，身体感觉启动行为决策，以生存为中心的内稳态驱使生物体检测和响应来自内外环境的潜在威胁和奖赏，以维持其生存和繁衍。这种超越不同生物主体之间的进化距离的共享生命算法，可能为增强 AGI 处理环境反馈和培养主体能力提供了启示。

Evolutionary Continuity in Intelligence: Bridging AGI and Biological Emotion through Homeostasis and Allostasis

LIU Chongyi & YIN Bin*
School of Psychology, Fujian Normal University, Fuzhou, Fujian 350117
*Corresponding Email: byin@fjnu.edu.cn

***Abstract*:** OpenAI's GPT-4 emerges as a leading large-scale language model, capturing attention for its remarkable abilities that either rival or surpass human intelligence across multiple domains. Notably, GPT-4 exhibits a significant capacity for theory of mind in its effective communication and collaboration with humans, enabling it to anticipate the real-world impact of various behaviors on an individual's mental state. However, as we edge closer to realizing Artificial General Intelligence (AGI), GPT-4 presents discernible limitations. A primary concern is its inability to grasp the underlying intent behind input commands, potentially leading to misunderstandings in nuanced conversational exchanges. According to the perspectives of Legg and Hutter, AGI is envisioned as a system competent to execute any task a human can undertake. Central to this understanding is a form of upward anthropomorphism, where humans attribute to external entities not only cognitive capacities akin to their own but also comparable moral and ethical standings. Within this framework, AGI, along with other sentient beings or intelligent machines, is seen as holding an equitable position in a human-centric cognitive model.

Subsequently, we argue that resolving challenges in human-AI interactions might be contingent on exploring communication and collaboration mechanisms between humans and other species. Approaching from an evolutionary biology standpoint, all animals, including humans, share a particular evolutionary trajectory, especially with regards to the evolutionary continuity of emotions. Such continuity suggests that despite evident differences between species, they might still achieve mutual understanding and communication through some kind of interoperative emotional mechanism. We hypothesize that the principles of homeostasis and allostasis, mechanisms governing an organism's state, might underlie this emotional bridge between humans and other species. We propose an adaptive correction framework to elucidate this potential process, where bodily sensations initiate behavioral decisions and a survival-centric homeostasis propels organisms to detect and respond to potential threats and rewards from their environments to safeguard their survival and reproduction. This shared life algorithm, transcending evolutionary distances between varied biological entities, could provide insights for enhancing AGI's environmental feedback processing and nurturing its agency.

论心理学与现象学的关系

高申春

吉林大学哲学社会学院（长春，130012，gsc@jlu.edu.cn）

摘 要 施皮格伯格曾指出，阐明现象学与心理学之间的关系，是理解胡塞尔哲学的最重要的必要条件之一。这一评论实质上蕴含了一项哲学史任务。对这一任务的执行同时有助于对心理学的理解：从心理学角度说，阐明心理学与现象学之间的关系，是理解心理学的最重要的必要条件之一。无疑，胡塞尔的现象学兴起于布伦塔诺的心理学，由此决定了现象学与心理学之间必然的内在同一性关系；先验现象学转向导致心理学在其中发生性质的根本变故而从属于先验现象学，这种否定关系既决定于又揭示了先验现象学作为思想迷宫的性质；胡塞尔晚年关于“生活世界”、“前述谓经验”等主题的研究，乃是突破这个困境的不同尝试，并表达了向心理学回归的必然趋势。对于理解心理学与哲学的关系而言，这个趋势尤其富于启发性而值得关注。

科学心理学是否还需要哲学

舒跃育

（西北师范大学心理学院，兰州，730070；shuyueyu@nwnu.edu.cn）

摘 要 在心理学的教科书中有句句经典的表述：“1879 年，心理学脱离哲学的束缚而成为一门独立科学。”这句话暗示了三点：“自从心理学与哲学一刀两断之后，这门学科就成长起来了；哲学曾经拖累了心理学；而且哲学将来随时还可能‘反扑’，将心理学‘拉回’到思辨水平。所以，这是当代心理学家们要警惕的。”其实，心理学与哲学的关系并非如此。哲学究竟是什么？对具体的经验学科而言，按照孙正聿教授的观点，哲学在于“对理论思维的前提批判”。那么，心理学是否需要“批判”？这里所说的“批判”，是指心理学的基本概念、命题、理论体系，需要不断地从哲学层面进行“反思和审查”。为什么需要审查呢？因为任何一门具体的学科，在表达观点的时候，都会无意识地、不自觉地暗含许多不能证明的哲学预设，这些哲学预设既不能证实，也不能证伪，甚至很难下定义。但是，这些强制性、无条件的哲学预设，却为这些理论表述划定了界限，如果我们的推论超出了这些界限，那么，原本可靠的知识体系就失去了根基，“科学”就变成了“迷信”。因此，在数学、物理学、化学中，都会有一些不需要证明的公理，或者不言自明的假设。比如，在牛顿力学体系中，就预设了时间均匀流逝、空间均匀分布，这就是一个基于常识的预设，只有在这个预设的范围内，牛顿力学体系才有效，一旦超出了这个范围，就需要新的科学体系了。爱因斯坦正是超越了牛顿的这个前提预设，讨论了时间和空间发生变化的情况，于是就提出了相对论。同样，心理学的研究也是如此。比如，在心理学的方法体系中，“小概率事件不会发生”就构成了心理统计的前提预设之一，“心理现象必有其数量，有数量必可测量”构成了心理测量的前提预设。按照“科学心理学”的标准，这两个预设不能“证实”，它只是在一定条件下有效。但在实际操作中，由于对这些“理论问题”的前提预设缺乏系统的反思和批判，$P<0.05$ 就变成了心理学研究的金科玉律。一个心理现象暂时不能定量分析就被视为“不科学”，这显然不妥。任何学科，包括物理学这样的自然科学，在其发展过程中都不能离开哲学的观照。因为任何经验科学，其最基本的概念、命题、公理体系，都根植于哲学。心理学的发展，不能缺乏从哲学层面对其基本理论预设的探讨，而是需要不断返回基本理论问题，以检视学科的初心和未来方向。

作者对本研究工作贡献相同。

摘 要 研究证明虚拟现实（VR）干预和经皮神经电刺激（TENS）疗法可用于缓解多种急慢性疼痛。然而，两种技术各自单独应用镇痛的效果有限。鉴于两种干预技术的镇痛效果及作用机制存在差异并具有互补优势，我们创新性的提出了一种将虚拟现实和经皮神经电刺激同步联合干预疼痛的调节策略。本研究采用被试内对照实验设计，共招募 32 名健康受试者接受三种不同类型的干预，包括：单独应用虚拟现实、虚拟现

实与传统经皮神经电刺激的单纯组合以及虚拟现实与同步经皮神经电刺激的同步组合。此外，本研究设置了一个不进行任何干预的条件作为对照。本研究收集了被试干预前后的疼痛强度、疼痛不愉悦度、积极和消极情绪以及脑电数据。研究结果显示，当被试接受低强度和高强度疼痛刺激时，两种组合干预的镇痛效果均优于单独虚拟现实干预，且虚拟现实与同步经皮神经电刺激同步组合干预的镇痛效果优于虚拟现实与传统经皮神经电刺激单纯组合干预。脑电数据进一步支持了以上行为结果，表明当被试接受低强度和高强度疼痛刺激时，两种组合干预比单独虚拟现实干预诱发更大的事件相关电位（ERP）幅值降低；当被试接受低疼痛刺激时，同步组合干预比单独虚拟现实干预诱发了更大的 N2 振幅降低。此外，与单独虚拟现实干预相比，两种组合干预均可显著降低被试的消极情绪。总体而言，本研究证实了虚拟现实和经皮神经电刺激同步组合在增强镇痛效果方面的有效性。这些发现为创新疼痛治疗的发展提供了重要的理论支持。

# These authors contributed equally to this work.

Abstract: Virtual reality (VR) and transcutaneous electrical nerve stimulation (TENS) have emerged as effective interventions for pain reduction. However, their standalone applications often yield limited analgesic effects, particularly in certain painful conditions. To address this challenge, we propose a novel pain modulation strategy that combines VR and TENS in a synchronous manner, aiming to capitalize on the complementary pain modulation mechanisms of both techniques. Thirty-two healthy subjects participated in the study and underwent three types of interventions: VR alone, a combination of VR with conventional TENS, and a combination of VR with synchronous TENS. Additionally, a control condition with no intervention was included. Perceived pain intensity, pain unpleasantness, positive and negative affective scales, and EEG data were collected before and after the interventions. Our findings revealed that both combination interventions, when exposed to low and high pain stimuli, exhibited superior analgesic effects compared to the VR-alone intervention. Importantly, the combination of VR with synchronous TENS demonstrated greater analgesic efficacy than the combination of VR with conventional TENS. EEG data further supported these results, indicating that both combination interventions elicited a greater reduction in ERP magnitude compared to the VR-alone intervention during exposure to low- and high-pain stimuli. Moreover, the synchronous combination intervention induced a more significant reduction in N2 amplitude than the VR-alone intervention during exposure to low-pain stimuli. Both combination interventions resulted in a greater reduction in negative affect compared to the VR-alone intervention. Altogether, our study highlights the effectiveness of the synchronous combination of VR and TENS in enhancing pain modulation. These findings offer valuable insights into the development of innovative pain treatments, emphasizing the importance of tailored and multifaceted therapeutic approaches for various painful conditions.

基于节律同步化的音乐与动作联合镇痛研究

肖懿桉 [1,2]　潘信羽 [1, 2]　吕雪靖 [1,2]（通讯作者）
1 中国科学院心理研究所，中国科学院心理健康重点实验室，北京，100101
2 中国科学院大学心理系，北京 100049
通讯作者 luxj@psych.ac.cn

摘 要　音乐与运动因为其经济、安全、便捷等优势已逐步成为非药物镇痛的重要手段，其单独应用的镇痛作用也得到证实，且研究表明二者可能涉及不同的镇痛机制并各有优势。因此，将两者有效整合，不仅可以从外周和中枢多个层次调节疼痛，更能够从感觉、认知和情绪多个维度彼此加强，实现非药物镇痛手段的相互补充和相互促进。节律性（即规律性的时间结构）作为音乐和运动共有的主要特征之一，为二者的有效结合提供了可能性。为探讨音乐与动作联合镇痛的效果，本研究以音乐节律与简单动作为出发点，以节律同步化为纽带开展了三个实验。实验一招募了 80 名被试，对比了四种干预方案（单独音乐、单独击鼓、音乐击鼓联合、无干预）对激光诱发短时疼痛的镇痛效果，结果发现音乐击鼓联合干预显著降低了疼痛强度和不愉悦度，且提高了正性情绪；实验二招募了 66 名被试，进一步探讨了音乐与动作节律的同步性（同步、异步和随机）是否是影响联合镇痛效果的决定性因素，结果表明与异步和随机条件相比，音乐与击鼓节律同步的条件下个体的疼痛强度评分更低，且个体对同步性程度的评分与疼痛评分的降低程度正相关，提示节律同步性在音乐与动作联合镇痛中的重要作用；实验三拟考察音乐与动作联合镇痛方案对长时程冷痛的镇痛效果，进一步验证该方案的可推广性。本研究结果均表明音乐与动作联合镇痛具有明显优势，可以进一步提高镇痛效果，具有较大的应用价值，为未来临床缓解疼痛提供了新思路。

A Study on Pain Management by Combining Music and Movement Based on Synchronization

Xiao Yian [1,2]　Pan Xinyu [1,2]　Lu Xuejing[1,2]
1 Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China
2 Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract：Music and exercise have gradually become important non-pharmacological analgesic methods due to their economic, safety, and convenience advantages. The analgesic effects of their individual application have also been confirmed, and research indicates that they may involve different analgesic mechanisms and have their respective advantages. Therefore, effectively integrating both can not only regulate pain at multiple levels, both peripherally and centrally, but also enhance each other from sensory, cognitive, and emotional dimensions, achieving mutual supplementation and promotion of non-pharmacological analgesic methods. Rhythm (i.e., regular temporal structure), as one of the main shared characteristics of music and exercise, provides the

possibility for their effective combination. To explore the effects of music and movement combined analgesia, this study conducted three experiments based on the starting point of music rhythm and simple movements, with rhythmic synchronization as the link. Experiment 1 recruited 80 participants and compared the analgesic effects of four intervention schemes (music alone, drumming alone, music-drumming combination, no intervention) on laser-induced pain. The results showed that the music-drumming combination intervention significantly reduced pain intensity and unpleasantness while increasing positive mood. Experiment 2 recruited 66 participants to further investigate whether the synchronicity of music and movement rhythm (synchronous, asynchronous, and random) was a determining factor in the combined analgesic effect. The results indicated that compared to asynchronous and random conditions, individuals scored lower on pain intensity under the condition of synchronous music and drumming rhythm, and the degree of synchronicity rating was positively correlated with the reduction in pain rating, suggesting the important role of rhythmic synchronicity in music and movement combined analgesia. Experiment 3 aimed to examine the analgesic effect of the music and movement combined analgesic scheme on long-term cold pain and further validate the generalizability of this scheme. The results of this study all indicate significant advantages of music and movement combined analgesia, which can further improve analgesic effects and have great application value, providing new ideas for future clinical pain relief.

多巴胺和阿片类递质神经活动选择性调节重复经颅磁刺激的镇痛作用

车先伟[1]（通讯作者） 王滢[1] 刘颖[2]

1 杭州师范大学认知与脑疾病研究中心，杭州，311100

2 浙江大学医学院附属第二医院，杭州，310009，通讯作者 E-mail（xwcheswu@gmail.com）

摘 要

背景：重复经颅磁刺激（rTMS）是一种安全、无创的神经调控技术。大量研究证明 rTMS 能够有效缓解慢性疼痛，但目前临床研究仅报告了约 40%的响应率，这一点制约了 rTMS 的临床价值和推广。因此，探索 rTMS 镇痛的神经机制是一种有效的研究思路，能够为优化 rTMS 的临床效果提供实证基础。

目的：本项目设计了两个研究，分别考察了多巴胺（研究一）和阿片类递质（研究二）介导的神经活动在 rTMS 镇痛中的作用。我们同时探索了这些神经活动在不同刺激靶点的表现形式。

方法：本项目两个研究均为双盲、交叉、假刺激对照研究，每个研究均招收 45 名健康成年人，并随机分配到左侧运动皮层（M1）、左侧前额叶（DLPFC），和假刺激组（Sham）各 15 名。受试者来访实验室两次，并接受不同的药物干预。其中，研究一受试者两次来访中分别在 rTMS 刺激前 90 分钟服用氯丙嗪（25mg）或安慰剂（维生素 C）。在研究二中，受试者在 rTMS 刺激前接受静脉注射纳洛酮（0.1 mg/kg，配置至 20 ml）或生理盐水（20 ml），并在纳洛酮/生理盐水代谢完成后（90 分钟）再接受第二次 rTMS 干预。两个研究分别在 rTMS 干预前和药物干预后评估受试者的疼痛感受。

结果：在研究一中，DLPFC 刺激增加了被试的疼痛耐受性，但氯丙嗪能够有效抵消 DLPFC 的镇痛作用。该结果并未出现在 M1 靶点中。在研究二中，纳洛酮有效抵消了 M1 和 DLPFC 刺激的镇痛作用并显著增加疼痛感受性。当纳洛酮代谢完成后，二次 rTMS 仅在 M1 靶点显著降低了疼痛感受，DLPFC 刺激未诱导显著的镇痛作用。

讨论与结论：前额叶脑区产生的镇痛作用可能同时依赖于多巴胺和阿片类递质介导的神经活动，而运动皮层的镇痛作用仅受到阿片类递质神经活动的调节。这些新颖的研究结果为未来优化 rTMS 的临床效果提供了实证基础和研究方向。

Dopaminergic and opioidergic neural transmissions selectively modulate the analgesic effects of rTMS

Xianwei Che[1], Ying Wang[1], Ying Liu[2]

1 Centre for Cognition and Brain Disorders, The Affiliated Hospital of Hangzhou Normal University

2 Department of Anesthesiology, The Second Affiliated Hospital of Zhejiang University School of Medicine

Abstract：

Background: Repetitive transcranial magnetic stimulation (TMS) is a safe and noninvasive form of brain stimulation technique. A large number of studies have demonstrated a consistent analgesic effect of rTMS. However, the clinical application of rTMS is limited by a moderate response rate of around 40%. It is therefore important to investigate the neural mechanisms underlying rTMS analgesia, which can be used to optimize the analgesic efficacy of rTMS.

Aims: We conducted two studies investigating the role of dopaminergic (study 1) and opioidergic (study 2) neural transmissions in the analgesic effects of rTMS. We specifically focused on the two most prominent targets for pain modulation, i.e., the primary motor cortex (M1) and the dorsolateral prefrontal cortex (DLPFC).

Methods: Both two studies were double-blind, crossover, and sham-controlled. Each study enrolled 45 healthy participants and they were equally randomized to the M1, DLPFC, and Sham group. Each participant visited the lab on two separate days and received different drugs. Specifically, participants in study 1 received an oral dose of chlorpromazine (25 mg) or placebo (Vitamin C) 90 minutes before rTMS administration. In study 2, intravenous administration of naloxone (0.1 mg/kg, 20 ml dilution) or saline (20 ml) was provided 20 minutes before rTMS. A second session of rTMS was then administrated when naloxone was fully metabolized (90 minutes). In both studies, pain experience was induced and evaluated both before rTMS and following drug administration.

Results: Study 1 indicated that rTMS over the DLPFC increased pain threshold. Chlorpromazine pre-treatment further abolished the analgesic effect induced by DLPFC stimulation. This effect was not observed in the M1 stimulation. In study 2, naloxone abolished the analgesic effects induced by both M1- and DLPFC- stimulation. When naloxone was fully metabolized (90 minutes), a second session of rTMS decreased pain perception only in the M1 stimulation, not in the DLPFC group.

Discussion and conclusion: DLPFC analgesia relies on both dopaminergic and opioidergic neural transmissions. Meanwhile, M1-induced analgesia is primarily mediated by opioidergic neural transmissions. These novel findings provide insight into the optimization of rTMS analgesia.

对疼痛线索的注意加工与慢性疼痛发展的关系：来自 EM-ERP 的证据

杨周（通讯作者） 张兴宇

西南大学心理学部，重庆，400715，yangz@swu.edu.cn

摘 要 个体对环境中的特定线索保持视觉注视或回避是诸多心身疾病出现和发展的关键。研究探讨了慢性疼痛患者对疼痛线索的注意加工和慢性疼痛发展的关系。研究一使用眼动追踪技术（eye movement，EM），结合点探测视觉任务和融入真实疼痛刺激的视觉任务，以疼痛-中性、中性-中性图片对的日常生活场景为实验材料，测量慢性疼痛患者对疼痛线索的动态注视偏向指标，及其对六个月后慢性疼痛发展的预测作用。研究发现，点探测视觉任务中，慢性疼痛患者在前三个时间窗（0-500 ms、500-1000 ms、1000-1500 ms）对疼痛线索的注视偏向显著高于中性线索，但在第四个时间窗（1500-2000 ms）上不存在差异；融入真实疼痛刺激的视觉任务中，慢性疼痛患者在四个时间窗上对疼痛线索的注视偏向均显著高于中性线索。慢性疼痛患者在两个任务中对疼痛线索的晚阶注视偏向（1000-1500 ms、1500-2000 ms）预测了六个月后慢性疼痛强度和功能损伤的维持。为了进一步探究慢性疼痛患者对疼痛线索的注意控制及其与慢性疼痛发展之间的关系，研究二使用眼动追踪和时间相关电位同步采集技术（EM-ERP），结合改编的反眼跳范式，以疼痛姿势图片（如腰痛、背痛等）和中性姿势图片为实验材料，考察了慢性疼痛患者对疼痛线索的首次眼跳错误率、首次眼跳潜伏期和总注视时间三个眼动指标上的偏向，以及脑电指标 N1、P2、N2、P3 和 LPP 成分，及其与六个月后慢性疼痛发展之间的关系。结果显示，在朝向眼跳任务中，相比于中性姿势图片，慢性疼痛患者对疼痛姿势图片的首次眼跳潜伏期更短、总注视时间更长。慢性疼痛患者在观看疼痛图片时，相比中性图片表现出显著更大的 P2、P3、LPP 波幅，以及更小的 N2 波幅。在朝向任务条件下，慢性疼痛患者的 N2 波幅越小，六个月后的疼痛功能损伤就越严重。综述所述，慢性疼痛患者对疼痛信息的注意加工与六个月后慢性疼痛的发展密切相关，这为进一步研究慢性疼痛的机制和治疗提供了新的方向。

The association between the attention processing to pain related cues and the development of chronic pain：Evidence from EM-ERP studies

Yang Zhou, Zhang Xingyu

Faculty of Psychology, Southwest University, Chongqing, China, 400715

***Abstract*:** Individuals' visual attention towards or avoidance of specific clues in the environment is crucial for the occurrence and development of various mind-body disorders. Exploring the relationship between attentional processing of pain-related cues and the development of chronic pain is of great importance for understanding the maintenance and progression of chronic pain. In this study, we used eye tracking technology (eye movement, EM) combined with point detection visual tasks and visual tasks incorporating real pain stimuli, using pain-neutral and neutral-neutral image pairs as experimental materials, to measure the dynamic gaze bias index of chronic pain patients towards pain cues and its relationship with chronic pain development six months later. The study found that in the point detection visual task, chronic pain patients had a significantly higher gaze bias towards pain cues than neutral cues in the first three time windows (0-500 ms, 500-1000 ms, 1000-1500 ms), but no difference was

found in the fourth time window (1500-2000 ms); in the visual task incorporating real pain stimuli, chronic pain patients showed a significantly higher gaze bias towards pain cues in all four time windows. The late-stage gaze bias towards pain cues (1000-1500 ms, 1500-2000 ms) in both tasks predicted the maintenance of chronic pain intensity and pain interference six months later. To further investigate the attentional control of chronic pain patients towards pain-related cues and its relationship with chronic pain development, Study 2 used eye tracking and event-related potential synchronization collection technologies (EM-ERP), combined with an adapted anti-saccade paradigm, using pain posture images (e.g. back pain, neck pain) and neutral posture images as experimental materials to examine the bias of chronic pain patients in three eye movement measures: first saccade error rate, first saccade latency, and total gaze time, as well as brainwave components N1, P2, N2, P3, and LPP, and their relationship with chronic pain development six months later. The results showed that in the anti-saccade task, compared to neutral posture images, chronic pain patients had a shorter first saccade latency and longer total gaze time towards pain posture images. When viewing pain images, chronic pain patients showed significantly larger P2, P3, and LPP amplitudes, as well as smaller N2 amplitudes compared to neutral images. Under the conditions of the anti-saccade task, the smaller N2 amplitude towards pain posture images in chronic pain patients, the greater the pain-related functional impairment six months later. In summary, the attentional processing of pain cues in chronic pain patients is closely related to the development of chronic pain six months later, providing new directions for further research on the mechanisms and treatment of chronic pain.

基于虚拟现实增强的经皮神经电刺激镇痛研究

李军[1]　刘继欣[1]（通讯作者）

1 西安电子科技大学，生命科学技术学院，西安，710126，liujixin@xidian.edu.cn

摘 要　经皮神经电刺激（Transcutaneous electrical nerve stimulation）是一种非侵入性、非药物的疼痛治疗技术。虽然 TENS 已被广泛用于治疗健康和慢性疼痛患者的疼痛，但反复使用 TENS 可能会引起镇痛耐受。在当前工作中，我们设计并测试了一种将 TENS 与沉浸式虚拟现实(immersive virtual reality, iVR)相结合的方案，以测试 iVR 是否可增强 TENS 的急性镇痛效果并探索其可能的神经机制。该方案可以从第一人称视角实现 iVR，通过对虚拟场景的控制和真实的实验操作，实现与 TENS 感觉相关的视觉反馈。我们采用了横断面前瞻性介入实验设计，75 名健康志愿者被随机分到 TENS 组（25 名）、TENS-VR 一致组（25 名）和 TENS-VR 非一致组中（25 名）。疼痛-恐惧评分任务被使用，我们评估了志愿者在低、高强度疼痛刺激下对疼痛和恐惧的主观体验，志愿者恐惧、疼痛评分、脑电信号被采集。任务刺激后所有志愿者均接受了 30 分钟的 TENS（刺激频率 85 Hz，脉冲宽度 200 us）联合 VR 干预。在 VR 场景中，我们构建了一个封闭房间组成的中性治疗环境，仅包括一把椅子、一张桌子和一双虚拟手臂。在 TENS 组中，VR 场景仅呈现一个黑暗的环境；在 TENS-VR 一致组中，iVR 根据 TENS 频率和志愿者个体感受照亮手臂 TENS 干预点到疼痛处的区域；在 TENS-VR 非一致组中，TENS 干预点到疼痛处对侧手臂区域被照亮。在 TENS-VR 干预后，所有志愿者又接受了疼痛-恐惧评分任务和脑电采集。行为学研究结果发现：TENS 和一致 TENS-VR 干预可降低志愿者的疼痛分数，而且一致 TENS-VR 干预效果显著高于 TENS。上述结果未在非一致 TENS-VR 干预组中发现。此外，一致 TENS-VR 干预可有效降低志愿者的疼痛恐惧分数。脑电信号研究结果发现：TENS 和一致 TENS-VR 干预可降低志愿者在疼痛状态下 Cz 电极处 N2 波的绝对幅值，而且一致 TENS-VR 干预效果显著高于 TENS。此外，志愿者脑电信号特征前后变化显著相关于疼痛分数前后变化。

我们的研究结果表明一致 TENS-VR 可有效增强 TENS 的镇痛效果，这可能为疼痛干预策略提供新的参考方案。

Enhancing analgesic TENS with immersive virtual reality: a preliminary EEG study

Jun Li, Jixin Liu
School of Life Science and Technology, Xidian University, Xi'an, Shaanxi, China

Abstract：Transcutaneous electrical nerve stimulation (TENS) is a non-invasive, non-pharmacological pain treatment technique. Although TENS has been widely used to treat pain in healthy and chronic pain patients, repeated use of TENS may induce analgesic tolerance. In the current work, we designed and tested a protocol combining TENS with immersive virtual reality (iVR) to test whether iVR can enhance the acute analgesic effect of TENS and explore its possible neural mechanisms. Our platform can realize iVR from the first-person perspective and the visual feedback related to TENS sensory through the control of the virtual scene and the real experimental operation. We used a cross-sectional prospective interventional experimental design, and 75 healthy volunteers were randomized to the TENS group (n=25), the TENS-VR consistent group (n=25), and the TENS-VR non-consistent group (n=25). The fear-pain scoring task was used. We evaluated the volunteers 'subjective experience of pain and fear under low and high intensity pain stimuli, and the volunteers' fear, pain scores, and EEG signals were collected. After this task, all volunteers received 30 minutes of TENS (stimulation frequency 85 Hz, pulse width 200 us) combined with VR intervention. In the VR, we created a neutral physiotherapy environment consisting of a closed room in the current study. The room contained simply a chair, a large table, and a pair of virtual arms, with no additional things that could interfere with the experiment. In the TENS group, the VR scene was presented only in a dark environment. In the TENS-VR consistent group, the immersive TENS-VR platform illuminated the area according to the sensations the individual experienced as induced by TENS. In the TENS-VR inconsistent group, VR illuminated the area of the hand contralaterally to the TENS side in real time. After the TENS-VR intervention, all volunteers again underwent the fear-pain scoring task and EEG acquisition. Behavioral findings found that the TENS and consistent TENS-VR interventions reduced pain scores in volunteers, and the changes of pain scores in the consistent TENS-VR intervention were significantly higher than those from the TENS intervention. The above results were not found in the non-concordant TENS-VR intervention group. Furthermore, the consistent TENS-VR intervention was effective in reducing pain fear scores in volunteers. The results of the EEG study found that TENS and consistent TENS-VR intervention could reduce the absolute amplitude of the N2 wave at the Cz electrode in high-pain, and the effect of consistent TENS-VR intervention was significantly higher than that of TENS. Furthermore, pre-post changes in volunteer EEG features were significantly correlated with pre-post changes in pain scores. Our results indicated that consistent TENS-VR may effectively enhance the analgesic effect of TENS, which may provide a new reference scheme for pain intervention strategies.

疼痛共情刺激库(EPSS)及其在认知神经领域的初步应用

孟景

重庆师范大学脑与认知科学研究中心，重庆，401331，qufumj@qq.com

摘 要　为了更好地研究疼痛共情，我们建立了疼痛共情刺激库(Empathy for Pain Stimuli System, EPSS)。该数据库包括 5 个子数据库，分别是疼痛共情肢体图片库(EPSS-Limb)、疼痛共情面孔图片库(EPSS-Face)、疼痛共情语音库(EPSS-Voice)、疼痛共情动作视频库(EPSS-Action_Video)、疼痛共情动作图片库(EPSS-Action_Picture)。EPSS 数据库包括图片、声音和视频等刺激类型，贴近真实情境，具有较好的生态效度。EPSS 数据库可免费下载使用。我们采用 EPSS 数据库已对认知神经领域的很多共情相关问题进行了初步研究，例如我们采用 EPSS-Limb 和 EPSS-Voice 探索了视觉和听觉双感官通道下注意线索对疼痛共情的影响、情绪启动对疼痛共情的影响、社会情境对疼痛共情影响、疼痛共情和疼痛的关系等研究，采用 EPSS-Action_Video 和 EPSS-Action_Picture 对自闭症等特殊人群进行动态-静态疼痛共情的认知神经机制的探索，取得了较为丰富的研究成果。EPSS 数据库可助力未来疼痛共情、共情或痛觉领域的其他热点问题的进一步科学研究。

The Empathy for Pain Stimuli System (EPSS): Preliminary Application in Cognitive and Neural Research

Jing Meng

Research Center for Brain and Cognitive Science, Chongqing Normal University, Chongqing, 401331, qufumj@qq.com

***Abstract*:** In order to better investigate empathy for pain, we established the Empathy for Pain Stimuli System (EPSS). The database comprises 5 sub-databases, which are the Empathy for Limb Pain Picture Database (EPSS-Limb), the Empathy for Face Pain Picture Database (EPSS-Face), the Empathy for Voice Pain Database (EPSS-Voice), the Empathy for Action Pain Video Database (EPSS-Action_video), and the Empathy for Action Pain Picture Database (EPSS-Action_Picture). The EPSS including abundant stimulus types such as pictures, sounds, and videos, which are close to real situations and have good ecological validity. The EPSS can be downloaded for free. We have conducted preliminary studies on many empathy-related issues in the cognitive and neural domain using the EPSS database. For instance, using the stimuli from EPSS-Limb and EPSS-Voice, we explored the modulation of top-down attention on empathy for pain in both visual and auditory modalities, the effects of emotional priming on empathy for pain, social presence effects on empathy for pain, as well as the relationship between pain and empathy for pain. In addition, the EPSS-Action_Video and EPSS-Action_Picture were also used to investigate the cognitive and neural mechanisms of empathy for pain in individuals with autistic traits and other special groups during observation of static and dynamic empathic stimuli, which has already achieved ample results. Therefore, the EPSS database is able to contribute in further scientific research within the field of empathy for pain, empathy, and pain.

外源性睾酮对疼痛共情的调控及机制

卓诗维[1]　彭微微[1]（通讯作者）

[1]深圳大学心理学院，深圳，518060

通讯作者 彭微微 ww.peng0923@gmail.com

摘 要　睾酮是一种类固醇激素，被认为可以调控人类的生理和心理过程。根据极端男性大脑理论，在自闭症人群中观察到的共情缺损可能与产前睾酮暴露过多有关。这提示了睾酮会损害共情能力，然而相关研究证据尚存争议。研究一通过外源性给药操纵睾酮水平，考察了睾酮如何影响个体在目睹他人承受生理性疼痛时的行为和神经响应，以及这一影响是否受到自上而下的注意调节。当要求被试对图片中的非疼痛线索进行判断时，被试的反应正确率在睾酮条件显著低于安慰剂条件，且疼痛图片诱发的晚期正成分（500-900 ms）波幅在睾酮条件下显著高于安慰剂条件。这表明睾酮会通过增强晚期认知控制和情绪调节有关的神经响应从而干扰任务表现。当要求被试对图片中的疼痛情境进行评分时，睾酮会增强与早期自动化加工有关的 N1（115-155 ms）和 N2（240-280 ms）响应，但不会显著影响主观评分。因此，睾酮会总体增强生理性疼痛共情有关的早期和晚期神经响应，且与自上而下的注意调控有关。这可能与大脑状态的改变有关，即睾酮总体降低了刺激前大脑α频带的神经振荡幅度，提升了个体的警觉与唤醒度水平。研究二通过给被试呈现他人处于被群体接纳、排斥和中性互动的情境图片，考察了外源性睾酮如何影响个体在目睹他人承受社会性疼痛时的行为和神经响应。与安慰剂条件对比，睾酮增强了由社会排斥诱发的 N2（250-310 ms）波幅，降低了由社会接纳诱发的α神经振荡（8.28-10 Hz；1226-1901 ms）的抑制。这说明了外源性睾酮促进了在目睹他人社会疼痛时共情的早期自动化加工过程，但抑制了在目睹他人社会接纳时共情的晚期认知加工过程。研究结果共同说明睾酮促进对他人生理与社会疼痛情境的共情加工，这有助于我们理解共情的神经内分泌机制，还为基于激素给药的共情干预提供循证依据。

The modulation of pain empathy by exogenous testosterone administration and its mechanism

Shiwei Zhuo[1], Weiwei Peng[1]*

[1] School of Psychology, Shenzhen University, Shenzhen, 518060, China

* Corresponding author. Email: ww.peng0923@gmail.com (W.P.)

***Abstract*:** Testosterone is a steroid hormone that is thought to modulate physiological and psychological processes in humans. According to the extreme male brain theory, the impaired empathy observed among people with autism might arise from elevated prenatal exposure to the sex hormone testosterone. This suggests that testosterone impairs empathic abilities, however the evidence in the literature is controversial. Study 1 manipulated testosterone levels by exogenous administration and examined how testosterone affects individuals' behavioral and neural responses while witnessing others suffering physical pain, as well as whether this effect is modulated by top-down attention. When discriminating nonpainful aspects of the images in the hands-counting task, accuracies were lower and empathic late positive potential responses were greater in the testosterone sessions than in the placebo sessions. This suggested that testosterone enhanced empathic responses to task-irrelevant pain-related

features, which interfered with task performance. When providing empathic ratings to the images in the pain-rating task, empathic event-related potentials in the early stage were only observed in the testosterone session. This suggested that testosterone facilitated automatic affective reactivity to others' pain when elaborately processing empathic stimuli. Hence, testosterone generally enhanced neural responses related to pain empathy in both early and late stages, and these effects were dependent upon task demands deploying attention allocation. The enhancement of brain reactivity to empathic stimuli likely arose from the altered brain state (e.g., increased vigilance and arousal levels) after testosterone administration, as evidenced by the reduced amplitude of spontaneous α-oscillation recorded before the onset of the empathic stimulation. Study 2 examined how exogenous testosterone influenced behavioral and neural responses related to empathy for social rejection and acceptance. Compared to the placebo session, testosterone enhanced the N2 (250-310 ms) responses to the social rejection image and reduced the inhibition of alpha neural oscillations (8.28-10 Hz; 1226-1901 ms) evoked by social acceptance. However, there were no significant differences between the testosterone and placebo session on subjective ratings to pictures. Hence, testosterone administration facilitated early automated processing of empathy when witnessing others suffering social exclusion but inhibited late cognitive processing of empathy when witnessing others included by the social group. Altogether, these results indicate that testosterone facilitates brain reactivity to empathy for physical and social pain. This finding contributes to a better understanding of the neuroendocrine mechanisms of empathy in humans and provide an evidence-based basis for the intervention of empathy based on hormone administration.

摘 要 健康的社交关系对人有益，而异常的社交关系与精神障碍密切相关。尽管目前学术界对亲子关系和伴侣关系进行了广泛研究，但目前我们对同伴关系的分子及神经生物学基础知之甚少。同伴关系指的是在家庭之外形成的社交联结，由于缺乏实验模型，一直以来对这一社会关系的研究相对较少。在本研究中，我们发现无亲缘关系的成年（同龄、同性）SD 大鼠在共同生活后可以形成亲密的社交联结。这些大鼠在同伴受到应激或疼痛刺激时，对同笼伙伴表现出亲和行为；但在同样的压力刺激下，对陌生鼠表现出攻击行为。我们使用 CRISPR/Cas9 方法获得了敲除催产素受体（*Oxtr*）基因的 SD 大鼠（$Oxtr^{KO}$），发现 $Oxtr^{KO}$ 大鼠在与同笼伙伴的互动中表现出亲和行为明显减少的现象。通过损毁背侧海马中的 OXTR 表达神经元，我们发现这些神经元对于建立新的同伴社交联结起着重要作用，但对于维持同伴社交联结则没有影响。

Abstract: Healthy social relationships are beneficial whereas abnormal social relationships are closely related to psychiatric disorders. While parental bonding and pair bonding have been well studied, little is known about the molecular basis of peer bonding, defined as social bonds formed outside of the immediate family, largely due to the lack of experimental models. Here, we found that adult peer (same-age, -sex) Sprague Dawley (SD) rats can form close social relationships after co-housing. The rats exhibit affiliative displays toward their cagemates under distress or pain, but exhibit agonistic behaviors toward strangers under the same stressful conditions. We generated oxytocin receptor (*Oxtr*)-null SD rats ($Oxtr^{KO}$) using the CRISPR/Cas9 method and found that $Oxtr^{KO}$ rats significantly decreased affiliative displays toward their co-housed cagemates. By ablating dorsal hippocampal OXTR-expressing neurons, we found that these neurons are required for new peer social bonding establishment but not maintaining.

摘 要：在社会化物种中，亲社会行为对物种的生存具有积极影响。在高等哺乳动物中，存在复杂的亲社会行为，如海豚拯救人类的生命，或猴子挽救同伴的生命。有关于啮齿动物的研究表明，大鼠能够自发地安抚同伴，并通过训练学会解救被困同伴。然而，在小鼠中，目前的研究主要关注安抚行为，而对于解救和救援等高级行为的研究尚不完善。在本研究中，我们惊讶地发现，当小鼠观察到同伴处于异常状态时（被麻醉剂麻醉），自身的应激水平会升高，并且自发地去救援被麻醉的同伴，即小鼠会在没有接受过任何训练的情况下通过舔舐同伴的身体或面部来试图唤醒另一只麻醉的小鼠，并且被麻醉的小鼠也会因为这类的救援样行为而提前从麻醉状态中苏醒过来。

催产素（oxytocin, OXT）在哺乳类动物的社会行为，特别是亲社会行为为中发挥重要作用。本研究使用 Oxt^{Cre}，$Oxtr^{Cre}$ 以及 $Oxtr^{flox/flox}$ 转基因小鼠，并结合化学遗传学、光遗传学、光线记录等技术发现了下丘脑室旁核（paraventricular nucleus of the hypothalamus, PVN）投射至中央杏仁核（central nucleus of amygdala, CeA）以及投射至背侧终纹床核（dorsal bed nucleus of the stria terminalis, dBNST）的两条催产素神经环路介导了小鼠的救援样行为。

本研究首次证明了小鼠能够自发地表现出救援样行为，这种出现在高等动物中的亲社会行为。并且通过神经环路研究，我们发现了两条下丘脑催产素神经环路，即 PVN-CeA 和 PVN-dBNST，分别介导救援样行为的情绪和运动功能。

Abstract：Prosocial behavior occurs among social creatures, benefits other individuals, and forms the ethos of social lives. In higher level mammals, such as dolphins and primates, it is common to observe complex prosocial behavior, for example, a dolphin saves a human's life or a monkey revives a conspecific's life. In rodent researches, rats exhibit both innate consolation behaviors and gained-by-training helping behaviors, while mice only perform consolation behavior towards conspecifics suffering from negative stimuli, and it still remains debatable whether mice would act real helping behavior. In the present study, we surprisingly observed mice became stressed and exhibited spontaneous rescue-like behavior towards anesthetized conspecifics, i.e. a naïve mouse will revive another anesthetized mouse by licking its body and facial area without any training. By receiving the rescue-like behavior, the anesthetized mouse regained consciousness faster.

The nonapeptide oxytocin (OXT) is a conserved prosocial neuropeptide that plays a role in prosocial behavior. In the present study, we employed *Oxt*^{Cre}, *Oxtr*^{Cre}, and *Oxtr*$^{flox/flox}$ mice, combining chemogenetics, optogenetics, and fiber photometry approaches, and found that the paraventricular nucleus of the hypothalamus (PVN) projecting to central the nucleus of amygdala (CeA) and PVN to dorsal bed nucleus of the stria terminalis (dBNST) two neural oxytocin circuits mediated the rescue-like behavior.

The present study demonstrates for the first time that mice are capable to exhibit rescue-like behavior spontaneously. Moreover, we found two hypothalamic oxytocin neural circuits, PVN-CeA and PVN-dBNST, which mediate the emotional and motor functions of rescue-like behavior, respectively.

聋人大学生共情的特点及其神经机制

武向慈　贾会宾　王恩国（通讯作者）

河南大学心理学院，开封 475004

摘 要 聋人普遍存在社会认知功能发展异常。近年来，国外相关研究发现，不同年龄段（如幼儿期、儿童期、青少年期和成年期）的聋人均表现出共情障碍，特别是认知共情。本研究通过共情相关行为范式和 ERP 技术系统考察了聋人大学生共情的特点及其神经机制。

实验一和实验二分别借助外显和内隐生理性疼痛共情范式考察了聋人大学生生理性疼痛共情的神经机制。这两个研究发现：（1）聋人大学生在生理性疼痛共情任务中正确率显著低于健听大学生；（2）实验一中，聋人大学生早期 ERP 成分（即 N1 和 N2 成分）显著比健听大学生更负，但是晚期 P3 成分显著比健听大学生更正。

实验三借助社会性疼痛共情范式考察了聋人大学生社会性疼痛共情的神经机制。该研究发现：聋人大学生早期 N1 成分显著比健听大学生更负，但是晚期 LPC 成分显著比健听大学生更正。

实验四和实验五采用启动范式引导聋人大学生对内群体（“聋人”）和外群体（“听人”）进行区分，并借助外显和内隐生理性疼痛共情范式考察了聋人大学生生理性疼痛共情内外群体效应的神经机制。这两个研究发现：（1）相比于内群体启动时，外群体启动时聋人大学生疼痛判断任务的反应时更长、正确率更低；（2）外群体启动时，疼痛图片早期 ERP 成分波幅与非疼痛图片早期 ERP 波幅差值会显著比内群体启动时更大（实验四：N2；实验五：N1）；但是在晚期成分（P3 和 LPC）上，上述波幅差值在内群体启动时波幅更大。

实验六采用启动范式引导聋人大学生对内群体和外群体进行区分，并借助社会性疼痛共情范式考察了聋人大学生社会性疼痛共情内外群体效应的神经机制。实验六发现：（1）相比于内群体启动时，外群体启动时聋人大学生疼痛判断任务的反应时更长、正确率更低；（2）内群体启动时 ERP 早期成分 N1 和 N2 的波幅显著比外群体启动时更负；（3）内群体启动时社会排斥与社会接纳图片晚期 P3 成分波幅差值显著比外群体启动时更大。

本研究借助六个实验发现：（1）聋人大学生存在情绪共情和认知共情障碍，并同时表现在生理性和社会性疼痛刺激加工过程中；（2）聋人大学生对生理性和社会性疼痛刺激加工存在内外群体效应，并表现出其独特的特点。

关键词 聋人，共情，ERP 技术

The characteristics and neural mechanisms of empathy in deaf college students

Xiangci Wu Huibin Jia Enguo Wang (corresponding author)
School of Psychology, Henan University，Kaifeng 475004

Abstract： Deaf individuals often have an atypical development of social cognitive abilities. Research from abroad has revealed that deaf people of various age groups, including early childhood, childhood, adolescence, and adulthood, tend to have difficulties with empathy, particularly cognitive empathy. To investigate the characteristics and neural mechanisms of empathy among deaf college students, this study used empathy-related behavioral paradigms and ERP technology.

In Experiment 1 and Experiment 2, the neural mechanisms of physiological pain empathy in deaf college students

were investigated using explicit and implicit physiological pain empathy paradigms, respectively. The results showed that deaf college students had a lower accuracy in physiological pain empathy tasks than healthy listening college students. Additionally, the amplitudes of early ERP components (N1 and N2) of deaf college students were significantly more negative than those of healthy listening college students, while the amplitude of late P3 component was significantly more positive in deaf college students.

Experiment 3 explored the neural mechanisms of social pain empathy among deaf college students using the paradigm of social pain empathy. Results revealed that the early N1 component of deaf college students was significantly more negative than that of healthy listening college students, while the late LPC component was significantly more positive in comparison to healthy listening college students.

In Experiments 4 and 5, deaf college students were primed to differentiate between the inner group ("deaf") and the outer group ("listener") using the priming paradigm, and the explicit and implicit physiological pain empathy paradigms were used to investigate the psychological mechanisms of physical pain empathy in deaf college students. The results showed that compared to inner group priming, outer group priming caused significantly longer reaction times and lower accuracy in pain judgment tasks for deaf college students. Furthermore, when the outer group was primed, the difference in early ERP component amplitudes between pain images and non-pain images was significantly greater than when the inner group was primed (Experiment 4: N2; Experiment 5: N1). However, in the late ERP components (P3 and LPC), the amplitude difference was significantly larger in inner group priming condition.

Experiment 6 used the priming paradigm and the social pain empathy paradigm to investigate the neural mechanisms of social pain empathy in deaf college students. Results showed that compared to inner group priming, outer group priming evoked significantly longer reaction time and lower accuracy in the pain judgment task. Additionally, the early components N1 and N2 in ERP when the inner group was primed were significantly more negative than those when the outer group was primed. Lastly, the amplitude difference of P3 components in the late stage of social exclusion and social inclusion images when the inner group was primed was significantly greater than that when the outer group was primed.

This research revealed that, through six experiments, deaf college students have emotional and cognitive empathy defects which appear in both physical and social pain empathy tasks. Moreover, the deaf college students demonstrate inner group effects when handling physical and social painful signals, and have their own distinct characteristics.

Keywords：deaf people, empathy, ERP techniques

延时惩罚对第二方和第三方惩罚的神经机制的影响

摘 要：

第二方惩罚(SPP)和第三方惩罚(TPP)都是控制社会行为的重要机制，两者对维护社会秩序起着至关重要的作用。然而，延迟惩罚可能会导致犯罪者在制裁中低估惩罚的效用，从而降低惩罚在维护社会规范上的作用。但延迟时间如何影响第二方及第三方的惩罚决策以及背后的神经机制仍不清楚。本研究采用功能磁共振技术，通过犯罪场景评估任务考察了立即和延迟时间条件对第二方和第三方惩罚决策影响的神经机制。在实验过程中，随机分配被试到 SPP 组或 TPP 组，要求被试扮演受害人（第二方）或法官（第三方），对法律案件中的被告人做出适当的惩罚决策。结果发现：首先，在行为上，两组被试均可以根据法律案件的社会危险性和严重性对被告人做出适当的惩罚决策，且两组在惩罚程度的选择上没有显著差异。神经层面上发现，SPP 组和 TPP 组均发现了颞顶联合区（TPJ）的激活，由于 TPJ 与支持惩罚决定的心理化过程有关，这表明两组被试均对被告人做出了惩罚决策。此外，在不同时间条件下，SPP 在心理理论（ToM）的脑区激活没有显著差异，而 TPP 组在延迟时间条件下在左侧心理理论区域的激活更强。由于第三方补偿受害者的行为与心理理论区域之间的线性相关性已得到证实，这表明第二方主要通过惩罚违规者来维护社会规范，而第三方可以利用惩罚违法者和补偿受害者两种方式来维持社会规范。其次，在行为上，研究发现第二方在立即和时间条件下的给予被告人的惩罚程度没有显著差异，但是，第三方在延迟时间条件下给予被告的惩罚程度显著高于立即时间条件并且在神经层面上伴随着背内侧前额叶皮层(DMPFC)的激活，由于 DMPFC 与时间感知下的奖赏决策和 ToM 相关，这可能表明了当违法者由于某种原因不能立即受到惩罚时，第三方希望通过补偿受害者来维持社会规范，从而阻止惩罚效用的减弱而这种决策在大脑中被识别为一种奖励信号。最后，神经层面上发现，与 TPP 相比，双侧楔前叶在 SPP 中的激活增加。此外，探索性分析揭示了第二方和第三方惩罚的严重程度的主要影响与默认模式网络、额叶网络和视觉网络的脑区有关。这表明默认模式网络、额叶网络和视觉网络构成了立即和延迟时间条件下第二方及第三方的惩罚决策背后的神经机制，而双侧楔前肌的激活参与了第二方和第三方惩罚决策不同心理过程。此外，本研究还为分级惩罚模型(HPM)提供了神经层面的证据，HPM 认为显著网络(SN)、默认模式网络(DMN)和中央执行网络(CEN)构成了 SPP 和 TPP 神经机制的框架。本研究揭示了立即和延迟时间条件下第二方及第三方的惩罚决策背后的神经机制，有助于更好的理解和预测延迟惩罚对维护社会规范和秩序的影响。

The neural mechanisms underlying the effects of delayed punishment on second-party and third-party punishment

Abstract:Both second-party punishment (SPP) and third-party punishment (TPP) are important mechanisms for regulating social behavior, playing crucial roles in maintaining social order. However, delayed punishment may lead to the underestimation of the utility of punishment by wrongdoers, thereby reducing its effectiveness in upholding social norms. Yet, the impact of delay on punishment decisions and the underlying neural mechanisms for both second-party and third-party punishment remain unclear. In this study, functional magnetic resonance imaging (fMRI) was employed to investigate the neural mechanisms underlying the influence of immediate and delayed time conditions on second-party and third-party punishment decisions using a crime scenario evaluation task. Participants were randomly assigned to either the SPP or TPP group and were instructed to play the role of a victim (second-party) or a judge (third-party) to make appropriate punishment decisions for defendants in legal cases. The results revealed that both groups were able to make appropriate punishment decisions based on the social dangerousness and severity of the legal cases, with no significant differences in the level of punishment chosen between the two groups. At the neural level, activation was observed in the temporoparietal junction (TPJ)

in both the SPP and TPP groups, which is associated with mental processes supporting punishment decisions, indicating that both groups made punishment decisions for the defendants. Furthermore, under different time conditions, the SPP group showed no significant differences in activation in the theory of mind (ToM) brain region, while the TPP group exhibited stronger activation in the left ToM region under the delayed time condition. Given that a linear correlation between third-party compensation for victims and activation in the ToM region has been confirmed, this suggests that second parties primarily uphold social norms by punishing violators, while third parties can maintain social norms by either punishing offenders or compensating victims. Additionally, at the behavioral level, the study found no significant differences in the level of punishment given to defendants by second parties between immediate and delayed time conditions. However, third parties gave significantly higher levels of punishment to defendants under the delayed time condition, accompanied by activation in the dorsal medial prefrontal cortex (DMPFC), which is associated with reward decision-making and ToM under time perception. This may indicate that when offenders cannot be immediately punished for some reason, third parties aim to uphold social norms by compensating victims, thereby preventing the weakening of punishment utility, and this decision is identified as a reward signal in the brain. Finally, at the neural level, increased activation in the bilateral anterior cingulate cortex (ACC) was found in the SPP group compared to the TPP group. Furthermore, exploratory analyses revealed that the main effects of severity of second-party and third-party punishment were associated with brain regions in the default mode network (DMN), frontal lobe network, and visual network. This suggests that the DMN, frontal lobe network, and visual network constitute the neural mechanisms underlying second-party and third-party punishment decisions under both immediate and delayed time conditions, while activation in the bilateral anterior cingulate cortex is involved in different psychological processes underlying second-party and third-party punishment decisions. Moreover, this study provides neural evidence for the Hierarchical Punishment Model (HPM), which posits that the salience network (SN), default mode network (DMN), and central executive network (CEN) form the framework for the neural mechanisms of SPP and TPP. Overall, this study reveals the neural mechanisms underlying second-party and third-party punishment decisions under immediate and delayed time conditions, contributing to a better understanding and prediction of the effects of delayed punishment on maintaining social norms and order.

摘 要 日常生活中的社会决策常常面临时间压力和认知负荷，但二者如何影响我们的决策以及背后的神经机制仍不清楚。本研究采用功能磁共振技术，通过两项实验分别考察了时间压力和认知负荷对亲社会决策(社会决策)和（非社会性）自我决策影响的神经机制以及个体共情特质在其中的作用。

实验一中，被试在高低时间压力下分别决定是否花费自己的金钱消除自己/他人可能接收的疼痛刺激。结果发现：行为上，相比于低时间压力，高时间压力下个体更不愿意选择付出金钱消除疼痛威胁，且这一效应在自我决策下更强。此外，时间压力对亲社会决策的效应强度（计算为亲社会决策中高低时间压力下的行为结果差值）与被试共情特质得分负相关，即共情得分越高的个体，亲社会倾向受到时间压力的影响越小，自我决策中这一相关不显著。神经层面上发现，时间压力对自我决策和社会决策的影响存在差异，自我决策在低时间压力下双侧脑岛的激活比高时间压力下更强，而社会决策在低时间压力下价值整合相关的眶额皮层，共情相关的内侧扣带回以及奖赏相关的壳核等区域的激活更强。这表明，个体在低时间压力下调动了更多的情绪和认知加工脑区参与社会决策，更多的伤害回避脑区参与自我决策。RVR 分析表明，社会决策相关脑区间的功能连接可以显著预测时间压力对亲社会决策的影响程度。此外，眶额皮层的激活可以中介共情特质对亲社会决策的行为结果的影响。

实验二中，被试在高低认知负荷下进行类似的自我/他人决策任务。结果发现：行为上，相比于低认知负荷，高认知负荷下个体花费更多的金钱为自己/他人消除威胁。这一效应对对亲社会决策的影响更强。认知负荷对亲社会决策的效应强度（计算为亲社会决策中高低认知负荷下的反应时差值）与个体共情中的个人痛苦特质正相关，即个人痛苦得分越高的个体，亲社会决策中受到认知负荷的影响越大。神经层面上，认知负荷对自我决策和社会决策的影响表现出相同的模式。具体而言，高认知负荷下，双侧下顶叶，双侧颞下回以及左侧壳核等负责计算和情绪加工的区域激活更强，而低认知负荷下，楔前叶，右侧额上回以及双侧角回等默认网络脑区激活更强。RVR 分析表明，对认知负荷敏感的脑区间的功能连接可以显著预测认知负荷对自我以及亲社会决策的影响程度。此外，MVPA 的结果还发现，左侧下顶叶，右侧颞下回，双侧角回以及左侧颞顶联合区的激活可以准确的分类自我和社会决策，其中左侧颞顶联合区的分类效果最佳。

本研究揭示了时间压力和认知负荷影响自我和社会决策的神经机制，有助于更好地理解和预测时间压力及认知负荷下的社会行为。

Time pressure and cognitive load regulate the neural mechanism of self-concerned and social decision-making

Liu Zhengjie[1] Liu Jie[1,2] Cui Fang[1,2]

1 School of Psychology, Shenzhen University, Shenzhen, China;

2 Center for Brain Disorders and Cognitive Neuroscience, Shenzhen, China;

Abstract： Social decision-making in daily life often faces time pressure and cognitive load, but the impact of these factors on decision-making and the underlying neural mechanisms are still unclear. Using fMRI, this study

conducted two experiments to investigate the neural mechanisms underlying the effects of time pressure and cognitive load on prosocial decision-making (social decision-making) and non-social self-concerned decision-making, as well as the role of individual traits in these effects.

Experiment 1 found that time pressure had a stronger impact on self-concerned decision-making than on prosocial decision-making. The probability of making self-benefiting decisions was significantly higher under low time pressure than under high time pressure. The effect of time pressure on prosocial decision-making (calculated as the difference in behavioral outcomes between high and low time pressure in prosocial decision-making) was negatively correlated with individual trait scores of empathy. This indicates that individuals with higher empathy scores are less influenced by time pressure in their prosocial tendencies. At the neural level, there were differences in the effects of time pressure on self-concerned decision-making and social decision-making. Under low time pressure, the bilateral insula was more active in self-concerned decision-making, while the medial orbitofrontal cortex related to value integration, the middle temporal gyrus related to empathy, and the putamen related to reward were more active in social decision-making. This suggests that individuals activate more emotional and cognitive processing areas in social decision-making under low time pressure, and more harm-avoidance areas in self-concerned decision-making. RVR analysis showed that functional connectivity between brain regions related to social decision-making significantly predicted the degree of the impact of time pressure on prosocial decision-making. Additionally, the activation of the medial orbitofrontal cortex mediated the effect of empathy on the behavioral outcomes of prosocial decision-making.

The second experiment found that cognitive load had a stronger impact on prosocial decision-making behavior. Specifically, under high cognitive load, the amount of tokens spent in prosocial decision-making was significantly higher than under low cognitive load. The strength of the cognitive load effect on prosocial decision-making (calculated as the reaction time difference between high and low cognitive load in prosocial decision-making) was positively correlated with individual trait of personal distress (PD), meaning that individuals with higher PD scores were more affected by cognitive load in prosocial decision-making. At the neural level, cognitive load affected self-concerned and social decision-making in a similar pattern. Specifically, under high cognitive load, regions responsible for calculation and emotion processing, such as the bilateral inferior parietal lobule, bilateral inferior temporal gyrus, and left putamen, were more activated, while under low cognitive load, default network brain regions such as the precuneus, right superior frontal gyrus, and bilateral angular gyrus were more activated. RVR analysis showed that the functional connections between brain regions sensitive to cognitive load could significantly predict the degree of its impact on self and prosocial decision-making. In addition, MVPA results revealed that the activation of the left inferior parietal lobule, right inferior temporal gyrus, bilateral angular gyrus, and left temporo-parietal junction could accurately classify self and social decision-making, with the left temporo-parietal junction showing the best classification performance.

This study reveals the neural mechanisms underlying the effects of time pressure and cognitive load on self and social decision-making, contributing to a better understanding and prediction of social behavior under time pressure and cognitive load.

摘 要 人类攻击性行为是指有意对他人造成痛苦或伤害的行为。尽管攻击性行为在进化上具有重要意义，但病态的攻击性行为是多种精神障碍的核心症状。从目前文献状况来看，研究者们对病态攻击性行为的神经回路仍然缺乏共识。在本文中，我们通过比较攻击性人群（尤其是表现出病态攻击性行为的精神障碍患者）与对照人群之间的脑功能和结构差异来解决这个问题。

我们首先进行了一项元分析，综合了前人关于病态攻击性行为的功能或结构神经影像学数据（共 325 个实验，2997 个激活峰值点，16529 名被试）。随后进行了网络分析和功能解码分析，对元分析中发现的主要脑区进行定量描述。

我们的分析结果表明，与病态攻击性行为相关的脑区主要位于：与情绪加工相关的皮层下网络（例如杏仁核和外侧眶额叶皮层），与心智推理相关的默认模式网络（例如背侧前额叶皮层和中颞回），以及与认知控制相关的显著性网络（例如前扣带回和前岛叶）。我们进一步执行针对情绪加工、心智推理和认知控制领域的额外元分析，发现与这些领域对应的脑网络跟上述元分析所发现的脑区高度重叠，从而支持了我们的结论。

总的来说，我们认为这些研究结果有助于研究者们确定攻击性行为的风险生物标记（risk biomarker），同时有助于完善人类攻击性行为的理论模型。

Abstract: Human aggression refers to deliberate actions aimed at causing pain or harm to another individual. While aggression plays a significant role in survival, it can escalate and become a core symptom of various psychiatric disorders. However, there is currently a lack of consistent evidence regarding the neural circuitry responsible for escalated aggression. To address this gap, we conducted a comparative analysis of brain functions and structures between populations exhibiting aggression (particularly psychiatric disorders with symptoms of escalated aggression) and non-aggressive populations.

In our study, we performed a comprehensive meta-analysis synthesizing previous neuroimaging studies investigating functional and structural alterations associated with escalated aggression. This meta-analysis encompassed 325 experiments, involving 2997 focal points and 16529 subjects. Subsequently, we conducted network and functional decoding analyses to provide quantitative characterizations of the identified brain regions.

Our findings revealed that the brain regions consistently implicated in escalated aggression were localized within the subcortical network, including the amygdala and lateral orbitofrontal cortex, which are associated with emotion processing. Additionally, the default mode network, involving the dorsal medial prefrontal cortex and middle temporal gyrus associated with mentalizing, as well as the salience network, encompassing the anterior cingulate cortex and anterior insula associated with cognitive control, were also consistently implicated in escalated aggression. These findings were further supported by additional meta-analyses focusing on emotional processing, mentalizing, and cognitive control, which demonstrated overlap with the brain regions identified in escalated aggression.

Collectively, our study contributes to a better understanding of the risk biomarkers associated with aggressive populations and refines the theoretical models of human aggression.

摘 要 共情是理解和分享他人情感的关键心理过程，是亲社会行为的基石。鉴于共情在人类社会生活中的重要性，系统研究共情习得与改变的机制尤为关键。既往研究发现个体共情会在人际间发生传递，但其深层的学习机制和神经基础尚未可知。本研究基于此，通过三个独立实验，结合观察学习范式与疼痛共情范式，从观察学习的角度尝试回答这一问题。运用强化学习模型以及功能磁共振成像，我们考察个体在观察他人共情反应后，其自身共情以及其相关脑响应的变化。我们发现，在行为水平上，观察比自己预期高或比自己预期低共情的个体后，人们会产生基于观察学习的预期偏差，并推动其增加或减少自身的共情反应。同时，共情的改变将进一步影响亲社会倾向的改变。通过独立的控制实验，我们发现共情的传递主要发生在观察人类(而非观察计算机)的行为上。在神经层面上，共情反应的改变发生在左侧前脑岛，这一与共情行为反应高度相关的脑区。在学习机制上，观察高共情与低共情个体均会在左侧颞顶联合区产生学习信号，而进一步的功能连接分析发现，左侧颞顶联合区与左侧前脑岛的功能连接与共情观察学习的程度呈现高度相关。我们的结果深化了对共情社会性传递在计算和神经机制上的理解，也将为未来设计相关的共情提升手段供科学证据。

***Abstract*:**

Theories of moral development propose that empathy is transmitted across individuals. However, the mechanisms through which empathy is socially transmitted remain unclear. Here, we combine computational learning models and functional magnetic resonance imaging to investigate whether and how empathic and non-empathic responses

observed in others affect the empathy of the observer. Replicated in two independent studies, the results showed that watching empathic or non-empathic responses generates a learning signal that increases or decreases empathy ratings of the observer. A third study revealed that the learning-related transmission of empathy is stronger when observing human than computer demonstrators. Finally, we show that the social transmission of empathy alters empathy-related responses in the anterior insula, i.e., the same region that correlated with empathy baseline ratings, as well as its functional connectivity with the temporal-parietal junction. Together, our findings provide a computational and neural mechanism for the social transmission of empathy that accounts for changes in individual empathic responses in empathic and non-empathic social environments.

不公平情境中妒忌体验的认知加工与神经机制

敬文曦[1], **汪晨波**[1]
1 华东师范大学心理与认知科学学院，上海，200062
通讯作者 Email：cbwang@psy.ecnu.edu.cn

摘 要

妒忌往往发生在自己与相关他人进行社会比较时处于劣势地位。然而，当自己处于社会比较的优势地位却依然没有获得应有回报时，这种妒忌可能更加强烈。那么，这种不公平情境下的妒忌体验有何独特之处？本研究通过两个实验描述这类妒忌的认知加工特征和神经机制。

实验一招募 315 名大学生，采用情境诱发行为学范式研究妒忌的认知加工机制。结果显示，妒忌程度随着自我相关和实力信息的披露而逐渐增高。这一过程伴随着沮丧和愤怒情绪的增强，以及钦佩和愉悦情绪的减弱。相比实力相当条件，自己实力更强时的妒忌程度显著更高。此外，恶意妒忌特质更高的个体，在这种不公平情境下会体验到更多的愤怒情绪，这使他们更希望他人失去已有获利。

实验二招募 42 名大学生，结合磁共振成像技术考察不公平情境中妒忌的神经机制。结果显示，当对方获得竞争结果，自己实力更强时的妒忌程度显著最高。第二，这种不公平情境中妒忌体验的神经活动主要体现在脑岛、额中回、楔前叶和枕中回等区域的激活。第三，在自己实力更强条件下，左侧脑岛的激活强度越大，羞愧评分越低，妒忌程度越高。

本研究揭示了在不公平情境下妒忌发生并逐渐增强时的认知加工机制。这其中伴随着消极情绪（尤其是愤怒）的增强和积极情绪的减弱。研究进一步揭示了不公平情境中妒忌发生的神经机制，推测脑岛对不公平引发愤怒情绪的表征是此类妒忌体验的加工特征。研究拓展了特定情境下妒忌的认知神经机制。

The cognitive processing and neural mechanism of envy experience in unfair situations

Wenxi Jing[1], **Chenbo Wang**[1]

1 School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062

Correspondence: cbwang@psy.ecnu.edu.cn

***Abstract*:**

Envy often occurs when one finds themselves in a disadvantaged position compared to relevant others during social comparisons. However, this envy can become even stronger when one is in a socially advantageous position but still fails to receive the expected rewards. Thus, what are the unique aspects of experiencing envy in such unfair situations? This study describes the cognitive processing features and neural mechanisms of this type of envy through two experiments.

In Experiment 1, 315 college students were recruited to investigate the cognitive processing mechanisms of envy using a situation-induced behavioral paradigm. The results showed that the level of envy gradually increased with the disclosure of self-relevant and competence-related information. This process was accompanied by enhanced feelings of frustration and anger, as well as reduced feelings of admiration and joy. Compared to situations of comparable competence, envy was significantly higher when one's own competence is stronger. Additionally, individuals with higher levels of malicious envy traits experienced more anger in such unfair situations, making them more inclined to wish others would lose their gains.

In Experiment 2, 42 college students were recruited, and the neural mechanisms of envy in unfair situations were examined using functional magnetic resonance imaging (fMRI) technology. The results showed that the level of envy was significantly highest when the other person achieved the competitive result while one's own competence is stronger. Second, the neural activity associated with the experience of envy in this unfair situation was mainly reflected in the activation of regions such as the insula, middle frontal gyrus, precuneus and middle occipital gyrus. Third, under conditions of stronger personal competence, the greater the activation intensity in the left insula, the lower the shame scores, and the higher the level of envy.

This study reveals the cognitive processing mechanisms of envy when it occurs and gradually intensifies in unfair situations. This process is accompanied by increased negative emotions, particularly anger, and decreased positive emotions. The study further reveals the neural mechanisms underlying envy in unfair situations, suggesting that the insula's representation of anger emotion in response to unfairness is a processing feature of this type of envy experience. The research expands our understanding of the cognitive and neural mechanisms of envy in specific contexts.

神经调控的影像学引导与机制解读

季公俊[1]

1 安徽医科大学，合肥，230000

摘 要：作为无创神经调控技术，重复经颅磁刺激（rTMS）已成为脑科学研究的关键技术之一，对抑郁症等精神疾病也有明确的治疗作用。近年来，随着神经影像尤其是磁共振（MRI）技术与 rTMS 的深入结合，为强化 rTMS 在认知与脑疾病的调控效果发挥了重要作用，也为解读 rTMS 的调控机制提供了大量的新线索。自 2015 年以来，安徽医科大学“神经影像与调控”实验室开展了多项包括 RCT 在内的临床研究，在 rTMS 的方案优化和机制解读方面做了大量的探索性研究。结合实验室的研究经验，本次报告以 MRI 在 rTMS 发展中的作用为主线，介绍 rTMS 技术的参数优化、临床应用及机制解读。最后，以神经影像的新技术探讨 rTMS 未来的发展方向。

Imaging guidance and mechanism interpretation of neuromodulation

Gong-Jun Ji

Anhui Medical University, Hefei, China

Abstract：As a non-invasive neuroregulation technique, repetitive transcranial magnetic stimulation (rTMS) has become one of the key techniques in brain science research, and it also has a clear therapeutic effect on mental diseases such as depression. In recent years, with the in-depth integration of neuroimaging and rTMS, magnetic resonance image (MRI) has played an important role in strengthening the modulation effect of rTMS in cognitive and brain diseases, and also provided a lot of new clues for understanding the modulation mechanism of rTMS. Since 2015, the "Neuroimaging and Modulation" Laboratory of Anhui Medical University has carried out a number of clinical studies including RCT, and has done a lot of exploratory research in the protocol optimization and mechanism interpretation of rTMS. Combined with laboratory research experience, this report takes the role of MRI in the development of rTMS as the main line, and introduces the parameter optimization, clinical application and mechanism interpretation of rTMS technology.Finally, the future direction of rTMS is discussed with the new technology of neuroimaging.

深部经颅磁刺激在药物成瘾中的应用和展望

赵迪[1] 袁逖飞[1]（通讯作者）

1 上海市精神卫生中心，上海，200030

通讯作者 E-mail ytf0707@126.com

摘 要 药物成瘾是全球性的重大医学难题。甲基苯丙胺(俗称“冰毒”)是我国现有主要的成瘾药物，复吸率高达 80%以上。线索诱发渴求是成瘾者接触到药物相关线索后，呈现出一种反复、强烈的想要使用药

物的心理状态，也是导致复吸的重要原因。在过去的十年中，非侵入性脑刺激，特别是经颅磁刺激已成为最具前景的成瘾（包括渴求）治疗策略。重复经颅磁刺激(rTMS)在改善物质成瘾者渴求方面的治疗潜力越来越受到关注。本研究中进一步探索了深部经颅磁刺激(deep rTMS)对冰毒成瘾者渴求的作用，并使用高密度脑电图(HD-EEG)探讨了全脑神经振荡和脑功能连接的变化。23 名冰毒成瘾者完成了针对内侧前额叶皮层（MPFC）和前扣带皮层(ACC)的 10Hz rTMS 为期三周的双盲、伪刺激组的临床试验。在治疗前后评估提示诱发的渴求测量和静息状态全脑活动和功能连接。结果：结果显示，与伪刺激组相比，10Hz rTMS 组的线索诱发的渴求显著降低。源定位分析显示，alpha 频段中以 MPFC 为中心的全局连通性增加，从网络的角度表明了治疗效果。此外，在线索诱导的渴求降低的成瘾中，MPFC 的β频段的活动选择性降低。结论：这些发现表明靶向深部脑区 MPFC 可作为一种减少成瘾者渴求的有效的治疗方式，该研究为其有效性背后的神经网络调节提供了见解。之后的研究有必要对更大的样本和长期随访进行进一步研究，以验证这些发现，并扩大这项技术在成瘾领域的应用。

Deep magnetic stimulation targeting the medial prefrontal and anterior cingulate cortices for methamphetamine use disorder

Di Zhao [1], Ti-fei Yuan [1]

1 Shanghai Mental Health Center, 666 South Wanping Road，Xuhui District, Shanghai，200030

***Abstract*：** Substance use disorder (SUD) is a major global medical problem. Methamphetamine (commonly known as "meth") is the main addictive drug in China, with a relapse rate of over 80%. Cue-induced craving is a recurring, strong desire to use drugs after individuals with methamphetamine use disorder (MUD) has been exposed to drug-related cues, which is an important cause of relapse. In past decades, non-invasive brain stimulation, especially repetitive transcranial magnetic stimulation (rTMS), emerged as the most prospective therapeutic strategy for craving. Chronic rTMS treatment efficiently reduces craving for drugs and drug associated cues in heroin, methamphetamine, cocaine, etc. We investigated the effects of rTMS on cravings in MUD and explored changes in neural oscillations and connectivity using high-density electroencephalography (EEG). Twenty-three male MUD patients completed a three-week double-blind, sham-controlled trial of 10Hz rTMS targeting the medial prefrontal cortex (MPFC) and anterior cingulate cortex (ACC). Cue-induced craving measures and resting-state EEG were assessed before and after treatment. Results revealed a significant reduction in cue-induced cravings in the 10Hz rTMS group compared to the sham group. Source localization analysis showed increased global connectivity in the MPFC for the alpha band, indicating treatment efficacy from a network perspective. Additionally, MPFC beta activity was selectively reduced in MUD patients with decreased cue-induced craving. Conclusions: These findings highlight the potential of MPFC-targeted rTMS as a treatment modality for reducing cravings in MUD and provide insights into neural network modulation underlying its effectiveness. Further research with larger samples and long-term follow-ups is warranted to validate these findings and expand the application of this technique in the addiction field.

摘 要

大脑功能连接在个体之间表现出有组织规律的差异，这种差异与个体在认知和行为上的差异有关。以往的研究表明，脑区水平功能连接的个体变异沿着皮层梯度的轴连续减小，该梯度从高级联合皮层逐渐过渡到初级感觉运动皮层。这种皮层梯度与不同皮层属性的分布一致，如解剖、功能、进化和分子，表明皮层个体功能变异具有多尺度神经生物学基础。然而，这些研究仅限于描述皮层的脑区水平功能连接，皮层区域间的连接变异性是否也呈现梯度结构仍不清楚。

在本研究中，我们通过两个独立数据集，在连接水平上展示了一个连续的梯度。我们使用 fMRI 数据为每个被试构建了任意两个皮层区域彼此互连的功能连接网络。然后，我们估计了每条功能连接在所有被试间的个体变异。我们发现，个体变异沿着从网络内的连接到感觉运动和联合皮层网络之间的连接的梯度连续下降。例如，个体变异沿着从默认模式网络内部的连接到默认模式与其他联合皮层网络间的连接的轴下降，并且在默认模式和感觉运动网络之间的连接继续下降。我们将这种沿着连接的变异性的轴称为“连接梯度”。

我们发现，这种个体功能变异性的连接梯度与通过弥散磁共振成像数据所得到的结构连接的变异性的分布一致。并且，功能连接变异性的梯度模式与基因表达和神经递质受体表达的区域间相似性网络相关。此外，我们发现在儿童期、青春期和青年期的发育过程中，连接水平的个体功能变异性模式与成人越来越相似。最后，我们发现网络水平连接梯度的斜率在青少年时期下降，并且与认知能力呈负相关。这些结果在控制功能连接强度和脑区间的距离后仍然显著。

总之，我们在连接组上发现了一种新的个体功能变异性的连接梯度，它沿着从网络内部连接到感觉运动和联合皮层网络之间的连接的连续梯度变化。这种梯度模式与多模态和多尺度的人类连接组相关，并在青少年的发育过程中得到完善。这些结果对理解精神病理学和设计最优的神经调节干预措施具有重要意义。

Abstract

Functional brain connectivity exhibits organizational differences between individuals that are associated with individual differences in cognition and behavior. Previous studies have shown that inter-individual variability in regional functional connectivity continuously decreases along the axis of cortical gradient, which progresses from higher-order association cortex to primary sensorimotor cortex. This cortical gradient aligns with the distribution of diverse cortical properties, such as anatomy, function, evolution, and molecule, suggesting multi-scale neurobiological bases of cortical individual functional variability. However, these studies have been limited to the description of the regional functional connectivity across the cortex, and it remains unclear whether the variability of the connections between cortical regions also exhibits a gradient organization across the edges.

Here, we address this gap by demonstrating a continuous gradient at connectional level across connectome edges with two independent datasets. We generated the network of functional connectivity between any two cortical regions for each participant using fMRI data and estimated the inter-individual variability of each functional connectivity edge across all participants. We found that individual variability continuously declined along a gradient from within-network connections to between-network edges connecting sensorimotor and association networks. For example, the variability declines along an axis from edges within the default mode network to edges between default mode and other association networks, and continues to decrease in edges between default mode and sensorimotor networks. We termed this axis of variability across connectome edges “connectional gradient”.

We found that this connectional gradient of individual functional variability aligns with the distribution of edge-level variability in structural connectivity from diffusion MRI data. We

also found the patterning of the variability gradient is associated with the between-region similarity networks for gene expression. Moreover, we found the pattern of individual functional variability at connectional level becomes increasingly similar to that in adults during the development through childhood, adolescence, and young adulthood. Finally, we found the slope of the network-level connectional gradient in individual functional variability declined in youth and was negatively associated with cognitions. All these results were still significant after controlling for the pattern of functional connectivity strength as well as between-region distance.

Altogether, we identified a novel connectional gradient of individual functional variability across the connectome edges, progressing along a continuous gradient from within-network connections to the edge between sensorimotor and association networks. This gradient pattern was associated with multi-modal and multi-scale human connectome and was refined during development in youth. These results could inform important implications in understanding of psychopathology and the design of optimal neuromodulatory interventions.

感觉运动皮层的 alpha 经颅交流电刺激对疼痛的调控作用

李晓云[1]　彭微微[1]（通讯作者）

[1]深圳大学心理学院，深圳，518060

通讯作者 彭微微 ww.peng0923@gmail.com

摘 要　经颅交变电流刺激（transcranial alternating current stimulation, tACS）是一种非侵入式的神经调控技术，被认为能以频率特异的方式调控大脑的内在神经振荡活动。以往的研究表明感觉运动皮层的α神经振荡能量与疼痛体验呈现负相关关系，这提示通过施加α-tACS 提高感觉运动皮层的α神经振荡幅度有望有效缓解疼痛。为验证这一假设，研究一和研究二采用双盲、随机和假对照设计，通过在单侧的初级感觉运动皮层（primary sensorimotor cortex, SM1）施加高精度α-tACS，调控前后分别采集了激光疼痛诱发的 EEG 和 fMRI 响应。EEG 结果表明相对于假刺激组，α-tACS 能有效提高 SM1 的α神经振荡能量，但未观察到对主观痛觉产生直接的影响。fMRI 结果表明，α-tACS 能有效减弱了双侧 SM1 对疼痛刺激的 BOLD 响应，从而间接降低痛觉体验。功能连接分析进一步揭示α-tACS 有效降低了调控靶区 SM1 与疼痛信息加工有关的多个脑区的信息交流，包括中扣带回皮层、背外侧前额叶皮层等。研究三进一步探讨了α-tACS 对疼痛的调控效果是如何受到情境因素的影响。相对于假刺激组，α-tACS 能有效提高 SM1 的α神经振荡能量，但抑制了由疼痛刺激重复导致的习惯化现象（包括痛觉体验和激光疼痛诱发响应）。在确定性情境下，α-tACS 比假刺激组显著提升了前额叶区域的θ神经振荡能量以及疼痛诱发的 P2 响应（主要与痛觉的情绪动机过程有关）。中介分析进一步表明，α-tACS 通过提高前额叶区域的θ神经振荡能量，从而抑制激光疼痛诱发的 P2 响应和痛觉体验。然而，在不确定情境，我们并没有发现α-tACS 对θ神经振荡能量的影响。因此，α-tACS 能有效提高 SM1 的α神经振荡能量及其在疼痛信息加工过程中的脑响应。与此同时，α-tACS 还可能以情境依赖的方式影响其他频带的神经振荡活动从而干扰其镇痛效果。

The modulation of pain by transcranial alternating current stimulation over the sensorimotor cortex at alpha frequency

Xiaoyun Li[1], Weiwei Peng[1]*

[1] School of Psychology, Shenzhen University, Shenzhen, 518060, China

* Corresponding author. Email: ww.peng0923@gmail.com (W.P.)

Abstract: Transcranial alternating current stimulation (tACS) is thought to modulate brain oscillations in a frequency-specific manner. Given the negative correlation between sensorimotor α-oscillation amplitude and pain perception, tACS that enhances sensorimotor α-oscillations has the potential to reduce pain. Therefore, studies 1&2 sought to determine the aftereffects of α-tACS over unilateral primary sensorimotor cortex (SM1) on the perceptual and neural responses to noxious painful stimulation. Using a double-blinded, randomized and sham-controlled design, we recruited healthy participants to receive either a single-session α-tACS or sham stimulation of unilateral SM1 through an electrode montage in a 4 × 1 ring configuration. Neural responses to laser nociceptive stimuli were assessed using electroencephalogram (EEG, Study 1) and functional magnetic resonance imaging (fMRI, Study 2) immediately before and after α-tACS intervention. Perceptual reports were recorded simultaneously. EEG results revealed that compared with sham stimulation, α-tACS significantly enhanced the spontaneous α-oscillation over SM1, but did not exert direct effect on subjective pain perception. fMRI results revealed that α-tACS could reduce bilateral SM1 responses to painful stimuli, thus indirectly contributing to the decrease of pain perception. Moreover, α-tACS decreased the functional connectivity between the targeted SM1 and a network of regions that are crucially involved in pain processing, including the middle cingulate cortex and dorsolateral prefrontal cortex. Study 3 further explore how the contextual factor (e.g., certainty) influenced the aftereffects of α-tACS on pain perception. Compared with sham stimulation, α-tACS could effectively elevate α-oscillation over the SM1, but inhibited the habituation induced by repeated painful stimuli (including subjective pain perception and laser-evoked brain responses). In the certain context, α-tACS significantly enhanced middle-frontal θ -oscillation amplitude and pain-evoked P2 responses (related to the affective-motivational dimension of pain). Mediation analysis further revealed that α-tACS could indirectly attenuate laser-evoked P2 responses and subjective pain perception by increasing middle-frontal θ-oscillation amplitude. However, in the uncertain contexts, we did not observe significant effects of α-tACS on θ-oscillations. These findings provided evidence for the effective role of α-tACS on enhancing sensorimotor α-oscillation and its effects on brain responses to painful stimuli. Meanwhile, α-tACS may also affect brain oscillation at other frequency bands in a context-dependent manner, thus exerting interferences on its analgesic effects.

爱情存在于大脑中:调节额下回的活动可以长期改善恋爱关系

宋洪文[1]，张效初[1]（通讯作者）

1 中国科学技术大学生命科学与医学部，合肥 230027，通讯作者 E-mail：zxcustc@ustc.edu.cn

摘 要 幸福、持久的浪漫关系可以对健康、工作效率和父母/孩子的幸福产生积极影响。不幸的是，随着时间的推移，全球范围内，浪漫关系满意度和关系承诺呈下降的趋势，许多国家的离婚率仍然很高。当人们积极地看待他们的浪漫伴侣时，这种“积极感知”与关系满意度和关系持久性存在密切关联。本研究，我们探讨了积极感知是否可以改善浪漫关系的质量，促进了我们对其潜在的神经机制的理解，并提供了一个维持 18 个月的因果推断。在积极感知生成实验中，我们使用功能磁共振成像技术发现，被试在更新对浪漫伴侣的看法时，选择性的降低了对不利信息的学习。这种积极感知的过程与左侧额下回（IFG）对他们的浪漫伴侣的不利信息的估计误差的神经表征有关。在经颅直流电刺激实验中，我们利用功能磁共振成像技术和经颅直流电刺激技术建立了 IFG 在积极感知中的因果作用。经颅直流电刺激可以增加左侧额下回的神经活动，增强积极感知，改善浪漫关系质量。此外，我们发现在左侧额下回上进行重复经颅直流电刺激干预可以降低关系破裂率，提高关系承诺和关系满意度。我们的结果提供了一个理解浪漫关系的新的生物学和心理学机制。未来将这一知识用于改变浪漫关系持久性和浪漫关系质量，具有重要的社会和伦理意义。

Abstract **：** A satisfying and persistent romantic relationship can positively impact health, work productivity, and parent/child wellbeing. Unfortunately, there is a global trend toward a decline in relationship satisfaction and relationship commitment over time, and divorce rates remain high in many countries. When humans view their romantic partner optimistically, this “positive perception” is associated with satisfying and persistent relationships. Here we investigated whether positive perception can improve romantic relationship quality, progress our understanding of its underlying neural mechanisms, and provide a causal inference, lasting up to 18 months. In the positive perception generation experiment, we used functional MRI (fMRI) to show that participants selectively discount unfavorable information while updating their beliefs about romantic partners. This positive perception process is associated with an increased neural representation of unfavorable estimation error about their romantic partner in the left inferior frontal gyrus (IFG). In the tDCS intervention experiment, we established the causal role of the IFG in positive perception using fMRI-transcranial direct current stimulation (tDCS). tDCS increased the neural activity in the left IFG, enhanced positive perception, and improve perceived relationship quality. Furthermore, we show that a repeated application of tDCS

intervention over the left IFG reduced the odds of relationship dissolution, and improved relationship commitment and satisfaction, highlighting the role of positive perception. Our results provide a novel biological and psychological mechanistic understanding of romantic relationships. The future translation of this knowledge to alter relationship persistence and romantic relationship quality has societal and ethical implications.

摘 要 经颅电刺激（tES）是一种具有潜在临床多样化应用的有希望的非侵入性神经调节技术，包括中风治疗、运动功能改善、记忆巩固和脑疾病治疗等。然而，tES 的一个重要挑战在于受试者对刺激的反应存在明显的个体差异，因此需要个性化的方法。为了解决这个问题，我们提出了一个新颖的框架，多目标优化进化算法（MOVEA），旨在通过帕累托优化同时优化多个目标。MOVEA 框架接受个体结构性 MRI、tES 传感器参数以及目标脑区等作为输入。首先进行预处理，将脑体积分割为具有不同传导率的组织，将个体结构性 MRI 与电极通道进行配准，并根据脑区分割图谱定义目标区域。随后，构建精确的有限元方法（FEM）头部模型，并计算引导场矩阵（Leadfield Matrix）。MOVEA 然后使用进化算法高效地探索参数空间，生成一系列最优传感器配置的帕累托前沿，可以同时优化多个目标，包括最大化电场强度、汇聚性刺激、控制刺激深度以及最小化避免区域刺激。帕累托前沿包含一系列最优解，展现了在冲突目标之间多样化的权衡，无需手动调整权重。MOVEA 的灵活性使其能够适应各种 tES 模式，包括经颅交流电刺激（tACS）和经颅时间干涉刺激（tTIS）。此外，MOVEA 可以增加用户定义的约束，使其能够根据个体需求定制刺激方案。我们使用 MOVEA 评估和比较了不同 tES 模式的性能。我们的分析表明，在没有预先定义方向的电场中，HD-tACS 和 HD-tTIS 都能够实现更高的刺激强度。此外，HD-tTIS 在其卓越的焦点性方面表现突出，特别适用于精确瞄准特定的脑区域。MOVEA 的有效性和灵活性使其成为推进基于 tES 的神经调节的宝贵工具，能够实现考虑受试者间变异性的个性化策略。它在理解大脑认知关系和为神经系统疾病开发定制治疗方面具有潜在应用价值。完整代码可以在该链接获得： https://github.com/ncclabsustech/MOVEA 。

Abstract： Transcranial electrical stimulation (tES) is a promising non-invasive neuromodulation technique with the potential for diverse clinical applications, including stroke treatment, motor function improvement, memory consolidation, and brain disease treatment. However, a significant challenge in harnessing the full potential of tES lies in the inter-subject variability of response to stimulation, necessitating personalized approaches. To address this issue, we present a novel framework, Multi-Objective Optimization via Evolutionary Algorithm (MOVEA), designed to optimize multiple objectives simultaneously through Pareto optimization.

Our MOVEA framework takes individual structural MRI, tES sensor montage, and target areas as inputs, initiating with pre-processing steps to segment the brain volume into tissues with distinct conductivities, co-register the individual's structural MRI with HD-tES sensors, and define target areas based on the Brodmann atlas. Subsequently, an accurate finite element method (FEM) head model is constructed, and the leadfield matrix for the region of interest is computed. This matrix represents the relationship between applied tES montages and the resulting electric field distribution within the brain.

MOVEA then efficiently explores the parameter space to generate a Pareto front of optimal montages. It simultaneously optimizes objectives, including maximizing the electric field intensity, achieving high focality, controlling stimulation depth, and minimizing unwanted stimulation in specific regions (avoidance zone). The Pareto front contains optimal solutions that exhibit diverse trade-offs between conflicting objectives, without the need for manual weight adjustments.

The versatility of MOVEA allows it to accommodate various tES modalities, such as transcranial alternating current stimulation (tACS) based on both large sponge electrodes and high-definition (HD) electrodes, and transcranial temporal interference stimulation (tTIS) based on HD and two-pair systems. Furthermore, MOVEA considers user-defined constraints, making it possible to customize stimulation protocols to individual needs.

We evaluated and compared the performance of different tES modalities using MOVEA. Our analysis revealed that, for electrical fields without a predefined orientation, both HD-tACS and HD-tTIS can achieve higher stimulation intensities. Additionally, HD-tTIS stood out for its superior focality, making it particularly effective in precisely targeting specific brain regions.

The effectiveness and versatility of MOVEA make it a valuable tool for advancing tES-based neuromodulation, enabling personalized strategies that account for inter-subject variability. It offers potential applications in understanding brain-cognition relationships and developing tailored treatments for neurological disorders. To facilitate its implementation, we have provided the code for MOVEA at https://github.com/ncclabsustech/MOVEA, empowering researchers to design effective and personalized tES protocols.

In conclusion, our novel MOVEA framework offers a promising solution to the challenges posed by inter-subject variability in tES-based neuromodulation. By optimizing multiple objectives through Pareto optimization, MOVEA enables personalized strategies that can achieve higher stimulation intensities and superior focality, thus advancing the understanding and clinical applications of tES.

Abstract：The development of sensation seeking and collectivism plays a crucial role in adolescents' social adaptation and identity recognition. Despite this, the shared growth and interaction of these two elements have been largely overlooked, leaving the heterogeneity of their developmental trajectories and the nature and evolution of their relationship unclear. This study employs Growth Mixture Modeling to investigate the heterogeneous growth trajectories of sensation seeking and collectivism, alongside a network analytical perspective to probe their relationship across different latent classes. Our research involves a three-year longitudinal dataset from 20,225 first and second-year vocational high school students (average baseline age of 16.76 ± 0.68 years, 60.4% male) from

Guangdong, Sichuan, Guizhou, and Hebei provinces. The Univariate Growth Mixture Model identified four and three latent classes for sensation seeking and collectivism growth trajectories respectively; while the Parallel Process Growth Mixture Model revealed four latent classes representing different joint growth trajectories of sensation seeking and collectivism. Network analysis results indicate that sensation seeking and collectivism networks in all classes show sufficient stability and accuracy. Over time, the global strength and connectivity of networks within all classes increased, albeit with varying rates and patterns across classes. The sensation seeking nodes exhibited the highest expected influence in all classes, while the collectivism nodes served as significant bridge nodes linking sensation seeking and collectivism. Our findings shed light on the intricate dynamic relationship between sensation seeking and collectivism. They underscore an increasingly tight correlation over time, although the specific sensation seeking-collectivism association and certain bridge factors may vary depending on the latent class. This study provides nuanced insights, underscoring the value of understanding the heterogeneity and complexity of adolescents' psychological development trajectories.

摘 要　述情障碍又称“情感难言症”，是指个体存在情绪识别和情绪表达困难，同时表现有缺乏想象力和外向性思维的特征。高中生群体正处于身心发展的动荡期，加之沉重的学习压力，述情障碍的发生率可能更高。对此，很多研究采用变量中心法探讨了高中生的述情障碍问题。由于个体特征、生活环境等差异，不同的高中生在述情障碍的表现上也可能存在差异，并可能会随着时间的推移而变化，但以往研究难以有效地考察述情障碍在高中生群体中的异质性及其变化转归特征。为明确述情障碍在高中生群体中的表现和变化转归特征以及社会支持的作用，本研究采用潜在剖面分析与潜在转变分析对高中生的述情障碍进行研究。研究采用了社会支持、述情障碍等问卷对 789 名高中学生进行问卷调查。一年后，对原始的班级进行了追踪调查，回收 798 份问卷。为保障结果的可靠性，研究最后保留同时参加两次调查的 684 名学生。潜在剖面分析的结果发现，述情障碍在高中生群体中有三种表现类型，即情绪表达正常组(T1：17.8%；T2：12.9%)、情绪表达一般组(T1：61.9%；T2：64.7%)、情绪表达困难组(T1：20.3%；T2：22.5%)，其中，相对情绪表达困难组的学生，男生和社会支持多的学生更可能归于情绪表达正常和一般组。潜在转变分析的结果发现，在两个时间点之间，情绪表达一般组的稳定性较好，有 74.4%的学生保持不变，其余 12.3%和 13.3%的学生分别向情绪表达正常组和情绪表达困难组转变；情绪表达正常组中，有 40.5%的学生保持不变，有 49.8%的学生向情绪表达一般组转变；情绪表达困难组中，有 46.3%的学生保持不变，有 46.7%的学生向情绪表达一般组转变。此外，社会支持水平高的学生更不可能向情绪表达困难组转化。这些研究结果说明，述情障碍在高中生群体中存在异质性的特征，并会随着时间的变化发生转归；社会支持是述情障碍恶化转向的保护性因子。

关键词　高中生，述情障碍，社会支持，潜在转变分析

A latent transition analysis of alexithymia in senior high school students: Roles of social support

Jiaming Yu[1] Bo Chen[1] Zhanjie Chen[1] Rui Zhen[12]

1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China
2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract：Alexithymia, also known as "emotional unspeakable disease", means that individuals have difficulties in emotional recognition and expression, and at the same time they are characterized by lack of imagination and extroversion thinking. High school students are in a turbulent period of physical and mental development, and the incidence of alexithymia may be higher due to heavy study pressure. In this regard, many studies have discussed the alexithymia of senior high school students by variable center method. Because of the differences in individual characteristics and living environment, different high school students may have differences in the performance of alexithymia, which may change with the passage of time. However, it is difficult to effectively investigate the heterogeneity of alexithymia in high school students and its changing and turning characteristics in previous studies. In order to clarify the characteristics of alexithymia in senior high school students and its influencing factors, this study uses latent profile analysis and latent transformation analysis to study alexithymia in senior high school students. The study used social support, alexithymia and other questionnaires to investigate 789 senior high school students. A year later, the original class was followed up and 798 questionnaires were collected. In order to ensure the reliability of the results, the study finally retained 684 students who participated in two surveys at the same time. The results of latent profile analysis show that alexithymia has three types in high school students, namely, the emotional expression normal group (T1: 17.8%; T2: 12.9%), emotional expression general group (T1: 61.9%; T2: 64.7%), emotional expression difficulty group (T1: 20.3%; T2: 22.5%), among them, students in emotional expression difficulty group, boys and students with more social support are more likely to belong to the emotional expression normal and general groups. The results of latent transition analysis show that between two time points, the emotional expression general group is stable, with 74.4% students remaining unchanged, and the remaining 12.3% and 13.3% students changing to the emotional expression normal group and the emotional expression difficulty group respectively. In the emotional expression normal group, 40.5% of the students remained unchanged, and 49.8% of the students changed to the emotional expression general group. In the emotional expression difficulty group, 46.3% students remained unchanged, and 46.7% students changed to the emotional expression general group. In addition, students with high level of social support are even less likely to transform into emotional expression difficulty group. These results show that alexithymia is heterogeneous in high school students and will change with time. Social support is a protective factor for the deterioration of alexithymia.

Keywords：senior high school students, alexithymia, social support, latent transformation analysis

青少年个人公正世界信念与成长型思维的关系：自尊的纵向中介作用

陈楚琪[1]　沈腾辉[1]　唐赛[1]　高洋[1]　王道阳[1,2]（通讯作者）
1 杭州师范大学经亨颐教育学院，浙江 杭州，311121
2 浙江省婴幼儿发展与托育哲学社会科学实验室，浙江 杭州，311121，daoyangwang@hznu.edu.cn

摘 要　个人公正世界信念与成长型思维有着紧密的联系，然而，缺少对两者关系方向性以及影响这种关系的潜在过程的研究。已有研究表明个人公正世界信念能有效缓冲消极事件对自尊的负面影响，同时高自尊往往与成长型思维相伴随。因此，自尊可能在个人公正世界信念与成长型思维之间起中介作用。本研究采用问卷法对 10350 名青少年（基线平均年龄 16.62 ± 0.81，男性占比 62.6%，女性占比 37.4%）进行

了历时 3 年的 3 次追踪测试（T1：基线；T2：一年后；T3：两年后）。青少年是人格发展的关键时期，首先，采用潜变量增长模型（LGM）考察个人公正世界信念、成长型思维与自尊的发展变化趋势；其次，采用交叉滞后模型（CLPM）和带随机截距的交叉滞后模型（RI-CLPM）分别从个体间和个体内水平考察个人公正世界信念与成长型思维是否存在互动性因果关系；最后，考察自尊在个人公正世界信念与成长型思维之间的纵向中介效应。结果发现：（1）个人公正世界信念、成长型思维与自尊在 3 年内均呈线性递增。（2）在个体间水平上，发现个人公正世界信念与成长型思维存在双向因果关系；在个体内水平上，个人公正世界信念可以预测成长型思维，成长型思维无法预测个人公正世界信念。（3）自尊在个人公正世界信念与成长型思维之间起到中介作用。这表明青少年的个人公正世界信念对成长型思维的培养具有重要作用，而且个人公正世界信念可以通过自尊进而影响成长型思维。

关键词　青少年，个人公正世界信念，成长型思维，自尊

The longitudinal association between personal belief of just world and growth mindset in Chinese adolescents: the mediation of self-esteem

Chuqi Chen[1]　Tenghui Shen[1,2]　Sai Tang[1]　Yang Gao[1]　Daoyang Wang[1,2]（Corresponding Author）

(1. College of Education, Hangzhou Normal University, Hangzhou 311121, China;
2. Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University, Hangzhou 311121, China)

Abstract：Emerging evidence highlights the strong association between personal belief of just world and growth mindset, however, little is known about the direction of the relationship and the underlying processes mediating it. The present study surveyed 10,350 adolescents (62.6% male; M_{age} =16.62, SD=0.81 at baseline) during a 3-year period over 3 time points. First, the latent growth model (LGM) was used to examined the longitudinal trajectories of the 3 variables; second, the causal relationship between personal belief of just world and growth mindset was examined at the between-person and within-person level using the cross-lagged model (CLPM) and the cross-lagged model with random intercept (RI-CLPM), respectively; finally, the longitudinal mediation of self-esteem between personal belief of just world and growth mindset was examined. The results revealed that (1) personal belief of just world, growth mindset, and self-esteem all showed a liner increasing trend. (2) At the between-person level, a bidirectional causal relationship was found between personal belief of just world and growth mindset; at the within-person level, only personal belief of just world can predicted growth mindset. (3) Self-esteem partially mediated the relationship between personal belief of just world and growth mindset. This suggests that adolescents' personal belief of just world plays an important role in the development of growth mindset and the effect can be mediated by self-esteem.

Keywords：Chinese adolescents, Personal belief of just world, Growth mindset, Self-esteem

童年虐待经历对疫情期间青少年心理健康的影响

刘正一 杨西玛 周宵（通讯作者）
浙江大学心理与行为科学系，杭州，310028，psyzx@zju.edu.cn

摘 要 以往研究探讨了童年期虐待经历对青少年心理健康的消极作用，但均是从虐待经历的整体水平出发进行探究，尚未考虑到虐待经历类型及其异质性特征。实际上，童年期虐待经历包括情感虐待和躯体虐待两个方面，并且这两种虐待经历在不同个体中有不同的表现形式。因此，这可能对青少年的心理健康产生不同的作用。本研究采用潜在剖面分析方法对童年期情感和躯体虐待经历类型进行分析，并进一步探究了虐待经历的异质性类型对青少年在疫情期间的心理健康的影响。

研究采用自陈式量表于 2019 年 11 月(T1)、2020 年 11 月(T2)以及 2021 年 11 月(T3)对 1032 名青少年的童年虐待经历、抑郁、问题行为、孤独和希望感进行测查。潜在剖面分析结果发现，童年虐待经历主要表现为 5 种类别组，即高度躯体-情感虐待组，中度躯体-情感虐待组，高情感虐待组，矛盾型虐待组以及低躯体-情感虐待组。将低躯体-情感虐待组作为参照组进行回归分析，结果表明，相比于低躯体-情感虐待组，T2 时间点青少年其余各童年虐待经历组均与问题行为水平呈显著的正相关，即躯体虐待和情感虐待水平越高，个体问题行为水平越高。然而，在 T3 时间点，只有高度躯体-情感虐待组和中度躯体-情感虐待组的青少年表现出类似的模式。另外，除中度躯体-情感虐待组外，所有类别组均与 T2 时间点的抑郁呈正相关，但在 T3 时间点，仅矛盾型虐待组与抑郁呈显著正相关。相比于低躯体-情感虐待组，矛盾虐待组、高情感虐待与 T2 时间点的孤独感之间存在显著正相关；仅高度躯体-情感虐待组与 T3 时间点的孤独感之间存在显著正相关。最后，仅高度躯体-情感虐待组与 T2 时间点的希望感具有显著的负相关。本研究不仅表明童年虐待经历具有异质性特征，而且还对疫情期间青少年的心理健康有不同影响，因此，为提升疫情后青少年的心理健康，可以依据不同童年虐待经历类型对各青少年亚群体开展具体且有针对性的干预策略。

The Impact of Childhood Abuse Experiences on Adolescent Mental Health during the Pandemic

Zhengyi Liu, Xima Yang, Xiao Zhou(Corresponding author）
Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310028, China

***Abstract*:** Previous studies have explored the negative effects of childhood abuse experience on adolescents' mental health, but all studies have been conducted from the perspective of the overall level of abuse experience, without considering specific types of abuse experience and its heterogeneity among these types. In fact, childhood abuse experiences include both psychological abuse and physical abuse, and these two types of abuse experiences exhibit differently on individuals. Therefore, this may have a distinct effect on the mental health of adolescents. In this study, latent profile analysis was used to analyze the types of childhood psychological and physical abuse, and we further explored the impact of heterogeneous types of abuse experiences on adolescents' mental health during the pandemic.

Childhood abuse, depression, problem behavior, loneliness, and sense of hope were measured in 1032 adolescents using the self-report scale in November 2019 (T1), November 2020 (T2), and November 2021 (T3).

The results of latent profile analysis showed that childhood abuse experience mainly manifested in 5 classes: high physical-psychological abuse group, moderate physical-psychological group, high psychological abuse group, ambivalent group and low physical-psychological abuse group. Regression analysis was performed with the low physical-psychological abuse group as the reference group. The results showed that compared with the low physical-psychological abuse group, the other childhood abuse experience groups of adolescents at T2 were significantly positively correlated with problem behavior, that is, the higher the level of physical abuse and psychological abuse, the higher the level of individual problem behavior. However, at T3, only adolescents in the high physical-psychological abuse group and the moderate physical-psychological abuse group showed similar patterns. In addition, all groups except the moderate physical-psychological abuse group were positively associated with depression at T2, but only the ambivalent group was significantly positively associated with depression at T3. Compared with low physical-psychological abuse group, ambivalent group and high psychological abuse group were significantly positively correlated with loneliness at T2; Only the high physical-psychological abuse group had a significant positive association with loneliness at the T3. Finally, only the high physical-psychological abuse group had a significant and negative association with the sense of hope at the T2. This study not only shows the heterogeneity of childhood abuse experience, but also highlights the different effects of heterogeneous abuse on adolescents' mental health during the pandemic. Therefore, in order to improve the mental health of adolescents after the pandemic, specific and targeted intervention strategies can be carried out for each adolescent subgroup according to different types of childhood abuse experience.

青少年受害与自伤的性别特异性联合发展轨迹及童年期情感虐待与忽视的影响:男孩危机与女孩风险

王思怡[1]　谢瑞波[1]（通讯作者）

1 浙江师范大学心理学院，家长教育研究中心，浙江省儿童青少年心理健康与危机干预智能实验室，浙江金华, 321004, xrb4526@zjnu.edu.cn

摘 要　尽管受害与非自杀性自伤（简称自伤）分别属于被动与主动两种不同形式的伤害，但却有着紧密的联系。探讨二者的发展规律是阻断二者共生发展的前提。不仅如此，受害与自伤的联合发展可能存在独特的性别模式与异质性轨迹，且受到童年期情感虐待与忽视的影响。本研究从性别与个体差异视角出发，旨在探讨青少年受害与自伤的性别特异性联合发展轨迹以及童年期情感虐待和情感忽视的预测作用。使用问卷法对 1214 名高中一年级学生进行间隔半年的三次追踪调查，构建平行发展的潜类别增长模型并使用多元逻辑回归进行回归分析。结果发现（1）在男孩中识别出男孩安全组（87.25%）与男孩高分增长组（12.75%）两类轨迹，在女孩中识别出女孩安全组（79.37%）、女孩高分增长组（7.29%）和女孩高受害-低自伤分化组（13.34%）三类轨迹。（2）童年期情感虐待与忽视对不同性别联合发展轨迹的影响存在差异。童年期情感虐待水平越高的男孩在青春期越倾向于男孩高分增长组，而在女孩中，童年期情感虐待水平越高则越倾向于女孩高受欺凌-低自伤分化组；童年期情感忽视对男孩未来受害与自伤联合发展轨迹的影响并不显著，却使女孩倾向于女孩高分增长组和女孩高受欺凌-低自伤分化组的可能性变大。本研究揭示了不同性别青少年受害与自伤发生发展的独特类别与形态，并检验了早期情感虐待与忽视的作用，为未来构建系统性、针对性和性别化的儿童教养模式与青少年风险干预提供支持与思路。

Gender-specific joint developmental trajectories of victimization and NSSI in adolescents and the impact of childhood emotional abuse and neglect: boys' crisis and girls' risk

SiYi Wang[1], Wan Ding[1*]

[1]School of Psychology, Parent Education Research Center, Intelligent Laboratory of Child and Adolescent Mental Health and Crisis Intervention of Zhejiang Province, Zhejiang Normal University, Jinhua, 321004, China

***Abstract*:** Although victimization and nonsuicidal self-injury (NSSI) belong to passive and active forms of injury respectively, they are closely related. To explore the development law of the two is the premise of blocking their symbiotic development. Moreover, the joint development of victimization and NSSI may have unique gender patterns and heterogeneous trajectories, and may be affected by childhood emotional abuse and neglect.

This study aimed to investigate the gender-specific joint development trajectory of adolescent victimization and NSSI as well as the predictive value of emotional abuse and neglect in early life from the perspective of gender and individual variations. A total of 1214 senior high school students were surveyed three times with an interval of six months by questionnaire method. A parallel-process latent category growth model was constructed and multivariate logistic regression was used for regression analysis.

The results show that (1) in boys, two classes of trajectories are identified: the boy safety group (87.25%) and the boy high score increase group (12.75%). Three classes of trajectories were identified among girls: the girl safety group (79.37%), the girl high score increase group (7.29%), and the girl high victim-low NSSI differentiation group (13.34%); (2) The impact of childhood emotional abuse and neglect on the joint development trajectory of different genders is different. Boys with higher levels of childhood emotional abuse tended to be in the boy high score growth group in adolescence, while girls with higher levels of childhood emotional abuse tended to be in the girls high victim-low NSSI differentiation group. Emotional neglect in childhood has no significant effect on the joint development trajectory of victimization and NSSI in boys, but makes girls more likely to be inclined to the girl high score increase group and girl high victim-low NSSI differentiation group.

This study reveals the unique categories and forms of victimization and NSSI in adolescents of different genders, and examines the role of early emotional abuse and neglect, which provides support and ideas for the construction of systematic, targeted, and gendered child-rearing models and adolescent risk intervention in the future.

***Keywords*:** Victimization, Nonsuicidal self-injury, Childhood emotional abuse and neglect, Joint development trajectory, Gender difference

受害为何变加害？童年期严厉管教对青少年攻击行为发展轨迹的影响：自我同情的中介作用

杨青风[1]　丁菀[1]（通讯作者）

1 浙江师范大学心理学院，家长教育研究中心，浙江省儿童青少年心理健康与危机干预智能实验室，浙江金华, 321004, dingwan@zjnu.edu.cn

摘 要　以往研究发现，青少年时期是攻击行为发展的高峰时期，童年期严厉管教可能是其早期风险因素之一。仅有少数研究综合考察了心理攻击和体罚与青少年攻击行为发展水平之间的关系，二者对青少年攻击行为发展速度的影响缺乏进一步探讨。此外，自我同情可能是童年期严厉管教与青少年攻击性行为发展间的潜在中介机制。然而，到目前为止，尚未有研究对此进行系统探讨。本研究对 1214 名高一学生间隔 6 个月的 3 次追踪测试，采用潜变量增长模型考察了青少年攻击行为的发展轨迹，并综合探讨了童年期严厉管教（心理攻击和体罚）与青少年攻击行为发展轨迹的关系，以及自我同情在这种联系中的潜在中介作用。本研究样本的调查结果发现：（1）青少年攻击行为呈线性下降趋势，其初始水平和发展速度间没有显著关联。（2）在控制青少年性别、年龄、家庭主观经济地位后，童年期心理攻击和体罚均直接正向预测青少年攻击行为发展水平，然而，只有童年期心理攻击经历能够直接减缓青少年攻击行为的下降速度，童年期体罚经历对青少年攻击行为发展速度的直接预测作用不显著。（3）在此基础上，童年期心理攻击和体罚均通过自我同情对青少年攻击行为的初始水平和发展速度起间接作用。这些研究发现表明，童年期的心理攻击和体罚经历是青少年攻击行为发展轨迹的重要预测因子。此外，童年期的心理攻击和体罚都可能通过降低自我同情水平而增加青少年攻击性。

关键词　心理攻击，体罚，自我同情，攻击行为，发展轨迹

How Victims Become Victimizers? The Influence of Harsh Discipline During Childhood on the Development Trajectory of Adolescent Aggression: The Mediating Role of Self-Compassion

Qingfeng Yang[1], Wan Ding[1*]

[1]School of Psychology, Parent Education Research Center,　Intelligent Laboratory of Child and Adolescent Mental Health and Crisis Intervention of Zhejiang Province, Zhejiang Normal University, Jinhua, 321004, China

Abstract：Previous research has found that adolescence is a peak period for the development of aggressive behavior, and harsh discipline during childhood may be one of its early risk factors. Only a few studies have comprehensively examined the relationship between psychological aggression, corporal punishment, and the development of adolescent aggressive behavior, and the impact of these factors on the speed of development of adolescent aggressive behavior needs further exploration. In addition, self-compassion may be a potential mediator between harsh discipline during childhood and the development of adolescent aggression. However, to date, few study has systematically explored this issue. In this study, a latent variable growth model was used to examine the trajectory of adolescent aggressive behavior among 1214 high school students who were followed up three times at

six-month intervals. The study also explored the relationship between childhood harsh discipline (psychological aggression and corporal punishment) and the trajectory of adolescent aggressive behavior, as well as the potential mediating role of self-compassion in this relationship. The survey results of the study sample revealed that: (1) Adolescent aggressive behavior showed a linear declining trend, and there was no significant correlation between its initial levels and growth rate. (2) Controlling for adolescent gender, age, and subjective family economic status, childhood psychological aggression and corporal punishment both directly and positively predicted the level of development of adolescent aggressive behavior. However, only childhood psychological aggression could directly slow down the decline of adolescent aggressive behavior, and the direct predictive effect of childhood corporal punishment on the growth rate of development of adolescent aggressive behavior was not significant. (3) On this basis, childhood psychological aggression and corporal punishment both indirectly affected the initial levels and growth rate of adolescent aggressive behavior through self-compassion. These findings suggest that childhood psychological aggression and corporal punishment are important predictors of the trajectory of adolescent aggressive behavior. In addition, both childhood psychological aggression and corporal punishment may increase adolescent aggression by reducing self-compassion levels.

Keywords： psychological aggression, corporal punishment, self-compassion, aggression, developmental trajectories

学业压力对大学生情绪耗竭的影响：学业延迟满足的中介作用

刘宵　宋金泽　潘颖　张潮（通讯作者）

1 山西师范大学教育科学学院，山西太原，030000，zhangchao951217@163.com

2 山西大学教育科学学院，山西太原，030000，1240318989@qq.com

摘 要：情绪耗竭是一种疲劳的状态，是由于生活中压力源所引发的个体过多的耗费情感和情绪资源造成的，长期处于情绪耗竭状态下势必会影响个体的心理健康，因此产生情绪耗竭的心理成因以及减少情绪耗竭的对策方法值得关注。学业压力是个体在学习生活中的主要压力源，是指个体因为外部环境的学习要求或个体自身的期望在学习过程中出现的一系列生理或心理上的不良反应。根据资源保存理论，人们有建立、保护和培养自己资源库的动机，以保护自我和支持自己的社会关系。较大的学业压力会消耗个体更多的精力，如果资源没有得到进一步的补充就会使个体更容易产生情绪耗竭，而学业延迟满足更高的个体可能会有更少的资源补充。学业延迟满足是指学生在面临不断变化的学业情境时，为了取得更好的学业成绩，延迟对某种快乐的满足的一种自我控制能力。为调查学业压力对大学生情绪耗竭的影响以及是否存在学业延迟满足的中介机制，采用学业压力量表、学业延迟满足量表、情绪耗竭量表对某大学学生进行调查，预期研究结果为：(1)情绪耗竭与学业压力和学业延迟满足之间呈现负相关；(2)学业延迟满足在学业压力与情绪耗竭之间起部分中介作用。

关键词：学业压力，情绪耗竭，学业延迟满足

The Effect of Academic Pressure on College Students' Emotional Exhaustion: the Mediation of Academic Delayed gratification

LIU Xiao[1]　SONG Jinze[2]　PAN Ying[1]　ZHANG Chao[1]

1 School of Education Science, Shanxi Normal University, Taiyuan, Shanxi, 030000

2 School of Education Science, Shanxi University，Taiyuan，030032，1240318989@qq.com
Corresponding Author: ZHANG Chao E-mail: zhangchao951217@163.com

Abstract：Emotional exhaustion is a state of fatigue caused by excessive consumption of emotions and emotional resources by stressors in daily life. Long term exposure to emotional exhaustion will inevitably affect individual mental health. Therefore, the psychological causes of emotional exhaustion and strategies to reduce emotional exhaustion are worth paying attention to. Academic pressure is the main source of stress for individuals in their learning and life, which refers to a series of physiological or psychological adverse reactions that occur during the learning process due to external learning requirements or individual expectations. According to the theory of resource conservation, people have the motivation to establish, protect, and cultivate their own resource pool to protect themselves and support their social relationships. Higher academic pressure will consume more energy of individuals, and if resources are not further supplemented, individuals will be more likely to have emotional exhaustion, while individuals with higher academic delayed gratification may have less resource supplementation. Academic delayed gratification refers to the self-control ability of students to delay the satisfaction of a certain happiness in order to achieve better academic performance when facing changing academic situations. In order to investigate the impact of academic stress on college students' emotional exhaustion and whether there is a mediating mechanism of academic delayed gratification, we used the academic stress scale, academic delayed gratification scale, and emotional exhaustion scale to investigate a college student. The expected research results are: (1) Emotional exhaustion is negatively correlated with academic stress and academic delayed gratification; (2) Academic delayed gratification plays a partial mediating role between academic stress and emotional exhaustion.

Keywords：academic pressure,, academic delayed gratification, emotional exhaustion

无法忍受不确定性对中小学生拖延的影响：正念和自我控制的链式中介作用

连培琴[1] 柴彩霞[1] 徐思元[1] 邸美琴[1] 吴怡霖[2] 冯喜珍[1]（通讯作者）
1 山西师范大学教育科学学院，太原，030000，517824719@qq.com
2 北京师范大学教育学部特殊教育学院，北京，100875

摘 要 拖延作为一种非适应性行为，会导致学生成绩下降，引发焦虑、自责、抑郁等负性情绪，出现手机成瘾等不良行为，对身心健康造成不利影响。中小学时期正是行为习惯养成的关键期，拖延无疑会阻碍学生身心健康发展，因此探究中小学生拖延的发生机制具有一定的现实意义。生活中我们会听到诸如“不确定该怎么做，稍后再处理”之类的话，人们是否会因不确定而拖延？中小学生在学习、人际交往、家庭关系以及个人成长等方面均会面临不确定性情境或事件，正念和自我控制强调对当下的觉知与专注，对拖延可能起到一定的抑制作用。基于此，本研究使用《简版无法忍受不确定性量表（IUS-12）》、《正念注意觉知量表》、《自我控制量表》、《一般拖延量表(GP)》，以 541 名五到八年级学生为研究对象，探究中小学生的无法忍受不确定性对拖延的影响以及正念和自我控制在其中的作用机制。结果显示：（1）无法忍受不确定性与正念、自我控制呈显著负相关，与拖延呈显著正相关；正念与自我控制呈显著正相关，与拖延呈显著负相关；自我控制与拖延呈显著负相关；（2）正念和自我控制在无法忍受不确定性对拖延的影响中起到中介作用。具体表现为四条路径：一是正念的完全中介作用；二是自我控制的完全中介作用；三是通过正念和自我控制的中介顺序在无法忍受不确定性与拖延之间起链式中介作用，且是完全中介；四是通过自我控制和正念的中介顺序在无法忍受不确定性与拖延之间起链式中介作用，且是完全中介。研究表明：

无法忍受不确定性无法直接影响拖延，但是可以通过正念和自我控制间接影响拖延，且正念和自我控制的关系是双向的。研究启示学校和家庭教育不仅要加强学生正念、自我控制能力的培养，也要减少学生学习生活中的不确定性，如布置任务要清晰明确，以此减少或避免学生拖延的发生。

The effect of intolerance of uncertainty on procrastination in primary and secondary school students: the chain mediation between mindfulness and self-control

Lian Peiqin[1], Chai Caixia[1], Xu Siyuan[1], Di Meiqin[1], Wu Yilin[2], Feng Xizhen[1]
1 Institute of Education Science, Shanxi Normal University, TaiYuan
2 Department of Special Education, Faculty of Education, Beijing Normal University, Beijing, 100875

Abstract：Procrastination, as a kind of non-adaptive behavior, will lead to the decline of students' grades, lead to anxiety, self-blame, depression and other negative emotions,lead to such bad behavior as addiction to mobile phone, which has a negative effect on physical and mental health. The primary and middle school period is the key period for the formation of behavior habit, procrastination will undoubtedly hinder the development of students' physical and mental health.Therefore, it is of practical significance to explore the mechanism of procrastination in primary and middle school students. In our daily life, we hear things like"If you are not sure what to do, deal with it later." Do people procrastinate because they are not sure? Primary and secondary school students face uncertain situations or events in learning, interpersonal relationships, family relationships and personal growth. Mindfulness and self-control emphasize awareness and focus on the present, may play a role in the inhibition of procrastination. Based on this, this study used IUS-12, mindfulness attention perception scale, self-control scale, general procrastination scale (GP) , and investigated the effects of intolerance of uncertainty on procrastination and the mechanisms of mindfulness and self-control in 541 students in grades 5 to 8. The results showed that: (1) intolerance of uncertainty was negatively correlated with mindfulness and self-control, intolerance of uncertainty was positively correlated with procrastination, and mindfulness was positively correlated with self-control, there was a significant negative correlation between mindfulness and procrastination, and a significant negative correlation between self-control and procrastination; (2) mindfulness and self-control mediate the effects of intolerance of uncertainty on procrastination. There are four paths: one is the complete mediation of mindfulness, the other is the complete mediation of self-control; Third, through the mediation order of mindfulness and self-control, it plays a chain mediation role between intolerance of uncertainty and procrastination, and it is a complete mediation; Fourthly, through the Mediation order of self-control and mindfulness, there is a chain mediation between intolerance of uncertainty and procrastination, and it is a complete mediation. Research shows that intolerance of uncertainty can not directly affect procrastination, but it can indirectly affect procrastination through mindfulness and self-control, and the relationship between mindfulness and self-control is bidirectional. The findings suggest that schools and child discipline should not only strengthen the development of students' mindfulness and self-control, but also reduce the uncertainty in students' learning and life, in order to reduce or avoid the occurrence of students' procrastination.

摘 要 社会退缩是指在社会情境中，个体不与他人交往，主动选择孤独的行为。以往的情绪调节研究表明，回避导向行为是妒忌等令人不快、痛苦的情绪的一种常见反应。而社会退缩可能是妒忌产生后选择的行为反应。妒忌分为善意妒忌和恶意妒忌两种亚型，不同类型的妒忌对社会退缩的影响可能存在差异。本研究想要探讨妒忌与社会退缩的影响及其内在机制。本研究共包括三个实验：实验一采用社会退缩亚型和同伴孤立量表(CSPS-R)、善意和恶意妒忌量表(BeMaS)、核心自我评价量表(CSES)对大学生进行问卷调查。预期善意妒忌负向预测社会退缩，恶意妒忌正向预测社会退缩，善意妒忌正向预测核心自我评价，恶意妒忌负向预测核心自我评价，核心自我评价在不同类型的妒忌与社会退缩之间起中介作用。实验二采用单因素(善意妒忌、恶意妒忌、中性)被试间设计，通过回忆书写范式诱发三种情绪，并完成核心自我评价量表与社会退缩亚型和同伴孤立量表，预期善意妒忌组的社会退缩和核心自我评价的得分显著高于中性组，中性组社会退缩和核心自我评价显著的得分显著高于恶意妒忌。实验三采用单因素(高核心自我评价、低核心自我评价)被试间设计，通过回忆书写范式诱发核心自我评价的高低，并完成社会退缩亚型和同伴孤立量表，预期高核心自我评价组社会退缩的得分显著高于低核心自我评价组。

关键词 妒忌，社会退缩，核心自我评价

The impact of envy on social withdrawal: the mediating role of core self-evaluation

Li Anzhe Zhang Xiaoyu Shi Yanjun ZhangChao(Corresponding author)
School of Education Science, Shanxi Normal University, Taiyuan, 030032，
zhangchao951217@163.com

Abstract：Social withdrawal refers to the behavior of individuals actively choosing to be lonely without interacting with others in a social context. Previous studies on emotional regulation have shown that avoidance oriented behavior is a common response to unpleasant and painful emotions such as envy. Social withdrawal may be a behavioral response to envy and choice. Envy can be divided into two subtypes: benign envy and malicious envy, and the impact of different types of envy on social withdrawal may vary.This study aims to explore the impact and underlying mechanisms of envy and social withdrawal. This study consists of three experiments: Experiment 1 used the Social Withdrawal Subtypes and Peer Isolation (CSPS-R), the Benign and Malicious Envy Scale (BeMaS), and the Core Self Evaluation Scale (CSES) to conduct a questionnaire survey on college students. Anticipated benign envy negatively predicts social withdrawal, malicious envy positively predicts social withdrawal, benign envy positively predicts core self-evaluation, malicious envy negatively predicts core self-evaluation, and core self-evaluation plays a mediating role between different types of envy and social withdrawal. In Experiment 2, a single factor (benign envy, malicious envy, and neutrality) inter subject design was used to induce three emotions through the recall writing paradigm. CSES and CSPS-R were completed. The expected benign envy group had significantly higher scores for social withdrawal and core self-evaluation than the neutral group, while the neutral group had significantly higher scores for social withdrawal and core self-evaluation than the malicious envy group. Experiment 3 adopted a single factor (high core self-evaluation, low core self-evaluation) inter subject design, and induced the high and low levels of core self-evaluation through the recall writing paradigm. CSPS-R were completed, and it was expected that the high core self-evaluation group had significantly higher scores of social withdrawal than the low core self-evaluation group.

Keywords：Envy, Social Withdrawal, Core Self-Evaluations

无法忍受不确定性与同性恋者生活满意度的关系：一个有调节的中介模型

邸美琴　徐思元　连培琴　李烨　冯喜珍（通讯作者）
山西师范大学教育科学学院，太原，030000，517824719@qq.com

摘 要　近年来，随着思想文化的多元化，同性恋群体逐渐浮现在大众视野，并受到多领域学者的关注。但是同性恋者依然面临生存空间缺失、传统道德束缚和社会偏见等各方面难题，生活满意度较低。根据性少数压力模型，研究不仅要关注远端压力，也需重视近端压力的影响。研究发现，无法忍受不确定性对生活满意度具有显著的负向影响。与异性恋者相比，同性恋者体验到的不确定感更高，无法忍受不确定性对他们的生活满意度可能产生更为严重的影响。基于此，本研究通过构建一个有调节的中介模型，旨在考察同性恋者无法忍受不确定性对生活满意度的影响及其内在机制。研究采用无法忍受不确定性量表、自我概念清晰性量表、未来取向量表和生活满意度量表进行在线调查，通过网络抽样法选取 16 岁以上的同性恋被试，得到有效数据 367 份（男 265 人，女 102 人）。结果发现：（1）同性恋者的无法忍受不确定性处于中等偏高水平，且在性别上存在显著差异，即男同性恋者的无法忍受不确定性水平显著高于女同性恋者；（2）无法忍受不确定性显著负向预测同性恋者的生活满意度；（3）无法忍受不确定性与自我概念清晰性、未来取向和生活满意度均呈显著负相关，自我概念清晰性、未来取向和生活满意度三者两两之间存在显著正相关；（4）自我概念清晰性在无法忍受不确定性与生活满意度的关系间起部分中介作用；（5）未来取向调节了“无法忍受不确定性→自我概念清晰性→生活满意度”的前半段路径，即高未来取向的同性恋者，无法忍受不确定性对自我概念清晰性的负向预测作用减弱。总之，研究结果证实了无法忍受不确定性不仅会直接影响同性恋者的生活满意度，还会通过自我概念清晰性的中介作用和未来取向的调节作用对同性恋者的生活满意度产生间接影响。研究结果有助于公众对同性恋者获得更深层次的认识和了解，也启发同性恋者积极探索自我，减少不确定感，提高生活满意度。

The Relationship between Intolerance of Uncertainty and Life Satisfaction among Homosexuals: A Moderated Mediation Model

Di Meiqin[1], Xu Siyuan[1], Lian Peiqin[1], Li Ye[1], Feng Xizhen[1] (corresponding author)
Institute of Education Science, Shanxi Normal University, Taiyuan, 030000

Abstract：In recent years, with the diversification of ideology and culture, the LGBT community has gradually emerged in the public view and received attention from scholars in various fields. However, homosexuals still face various problems such as the lack of Lebensraum, traditional moral constraints and social prejudice, and their life satisfaction is low. According to the Sexual Minority Stress Model, research should not only focus on the distal pressure, but also pay attention to the influence of the proximal pressure. Researches have found that intolerance of uncertainty has a significant negative impact on life satisfaction. Compared with heterosexuality people, homosexuals experience higher uncertainty, and their inability to tolerate uncertainty may have a more serious impact on their life satisfaction. Based on this, this study aims to investigate the impact of intolerance of

uncertainty on life satisfaction among homosexuals and its underlying mechanisms by constructing a moderated mediation model. The study conducted an online survey using the Intolerance of Uncertainty Scale, Self-Concept Clarity Scale, Future Orientation Scale, and Life Satisfaction Scale. A network sampling method was used to select homosexual participants aged 16 and above, and 367 valid data were obtained (265 males and 102 females). The results showed that: (1) The intolerance of uncertainty of homosexuals is at a medium to high level, and there are significant differences in gender, that is, the intolerance of uncertainty of Gay men is significantly higher than that of lesbians; (2) Intolerance of uncertainty is significant negative predicting the life satisfaction of homosexuals; (3) Intolerance of uncertainty is significantly negatively correlated with self-concept clarity, future orientation, and life satisfaction. There is a significant positive correlation between self-concept clarity, future orientation, and life satisfaction; (4)Self-concept clarity partially mediates the relationship between intolerance of uncertainty and life satisfaction; (5) Future orientation moderated the first half of the path of " intolerance of uncertainty → self-concept clarity → life satisfaction", which means that for homosexuals with high future orientation, the negative predictive effect of intolerance of uncertainty on self-concept clarity weakens. In summary, the research results confirm that intolerance of uncertainty not only directly affects the life satisfaction of homosexuals, but also indirectly affects their life satisfaction through the mediating effect of self-concept clarity and the moderating effect of future orientation. The results help the public gain a deeper understanding of homosexuals, and also inspire homosexuals to actively explore themselves, reduce uncertainty, and improve life satisfaction.
Keywords：intolerance of uncertainty, homosexuals, life satisfaction, self-concept clarity, future orientation

初中生视屏时间对人际适应的影响：共情的中介作用和亲子沟通的调节作用

郝伟廷　史艳君　潘颖 张潮（通讯作者）
山西师范大学教育科学学院，山西太原，030000，zhangchao951217@163.com

摘 要　人际适应是指个体在社会交往中，与他人建立并保持和睦、温暖的关系、获得支持与爱的能力。作为一种积极的社会行为，有助于初中生的身心发展。已有研究发现视屏时间能够负向预测个体的人际适应，但视屏时间对人际适应的作用机制及作用条件还有待探讨。本研究采用整群抽样的方法，对视屏时间采用自编问题“在非学习时间，你每天使用电子产品（包括电视、电脑、手机、平板电脑等）用来娱乐的时间共___小时”，和人际适应量表、人际反应指针量表、亲子沟通量表为研究工具，对山西省太原市、临汾市 6 所中学共 800 名初中生进行问卷调查，探究视屏时间与人际适应的关系，并进一步考察了共情在视屏时间与人际适应的中介作用以及亲子沟通对此过程的调节作用。结果发现:（1）视屏时间、人际适应、共情和亲子沟通两两显著正相关；（2）在控制生源地、年级后，视屏时间负向预测初中生的人际适应；（3）共情在视屏时间与初中生人际适应之间起部分中介作用；（4）亲子沟通正向调节了“视屏时间→共情→人际适应”的后半段,即亲子沟通能够通过提升大学生的共情，从而促进自身的社会适应。

关键词　初中生，视屏时间，人际适应，共情，亲子沟通

The Effect of Screen Time on Interpersonal Adaptation of Junior High School Students: The Mediating Role of Empathy and

the Moderation Role of Parent-child Communication

Hao Weiting　Shi Yanjun　Zhang Chao（Corresponding author）
School of Education Science, Shanxi Normal University, Taiyuan , 030000,
zhangchao951217@163.com

Abstract：Interpersonal adaptation is the ability of an individual to establish and maintain harmony, warm relationships, obtain support and love with others in social interaction. As a positive social behavior, it contributes to the physical and mental development of junior high school students. It has been found that screen time negatively predicts interpersonal adaptation, but the mechanism and conditions of screen time's effect on interpersonal adaptation have yet to be explored. In this study, we used the cluster sampling method, the self-administered question "During non-study time, you use electronic products (including TV, computers, cell phones, tablets, etc.) for recreation for a total of __ hours per day", and the Interpersonal Adaptation Scale, Interpersonal Response Pointer Scale, and the Parent-Child Communication Scale as the instruments. A total of 800 junior high school students from six middle schools in Taiyuan and Linfen City, Shanxi Province, are surveyed to investigate the relationship between screen time and interpersonal adaptation, and the mediating role of empathy in screen time and interpersonal adaptation and the moderating role of parent-child communication in this process are further examined. The results show that: 1. screen time, interpersonal adaptation, empathy and parent-child communication are two-two significantly correlated; 2. screen time negatively predicted junior high school students' interpersonal adaptation after controlling for place of origin and grade level; 3. empathy partially mediated the relationship between screen time and junior high school students' interpersonal adaptation; 4. Parent-child communication positively moderates the latter part of "screen time→empathy→interpersonal adaptation", i.e., parent-child communication enhances college students' empathy and thus promotes their social adaptation.

居住流动性感知对人际信任的影响

侯恒松　潘颖　张晓瑜　张潮（通讯作者）
山西师范大学教育科学学院，太原，030000，zhangchao951217@163.com

摘　要：人际信任问题长期受到学者的关注。信任对社会稳定、个体幸福感等都有积极作用。随着经济的发展，现代社会的流动性不断增大，个体感知到的不确定性逐渐增加，生活中的信任危机现象也频繁出现，日常生活中的信任包括普遍信任和特殊信任，即对无直接关系者的信任和对朋友亲人等的信任。因此，本文通过聚焦于居住流动，探究个体的居住流动性感知与普遍信任、特殊信任的关系；当外界环境发生改变影响人们日常生活秩序时，个体的本体安全感会受到威胁，而安全感受到威胁时会影响个体的人际信任，本研究期望探讨本体安全感在其中起到的中介作用；地方认同是个人对所处的外界物理环境的依恋感，归属感与认同感，当个体感知到外界环境发生的巨大改变时，地方认同感不同的个体是否会在人际信任中表现出差异，本研究期望探讨地方认同在其中起到的调节作用。本研究通过启动个体的居住流动性感知，采用本体安全感威胁感知量表、一般信任量表（GTS），特殊信任量表（SITS），地方认同量表对被试进行测试，本文预期实验结果为，居住流动性感知高的个体的普遍信任和特殊信任有显著差异，而居住流动性感知低的个体在这两种信任感的测量中没有显著差异，相较于居住流动性感知高的个体，居住流动性感知低

的个体的普遍信任和特殊信任感更高。其中本体安全感起到中介作用，具体而言，居住流动性感知高的个体更容易体验到本体安全感威胁，从而更容易对周围环境和他人产生不信任感，而亲友所表现的可依赖性和可靠性能够帮助个体应对本体安全感下降所带来的心理威胁，使个体更加信任和依赖亲友；反之，居住流动性感知低的个体具有更高的本体安全感，因而对亲友和陌生人的信任不存在显著差异。实验结果还发现，地方认同在居住流动性感知对人际信任的影响中起到调节作用，地方认同感高的个体即使感知到高的居住流动性也能信任他人，而地方认同感低的个体只有在感知到的低的居住流动性时才能信任他人。
关键词：居住流动性感知, 本体安全感, 地方认同, 普遍信任, 特殊信任

The impact of residential mobility perception on interpersonal trust

Hou Hengsong　Pan Ying　Zhang Xiaoyu　Zhang Chao（corresponding author）
School of Education Science, Shanxi Normal University, Tai Yuan

***Abstract*：** The problem of interpersonal trust has long been concerned by scholars. Trust has positive effects on social stability and individual happiness. With the development of economy, the mobility of modern society is increasing, the uncertainty perceived by individuals is gradually increasing, and the phenomenon of trust crisis in daily life is also frequent. Trust in daily life includes general trust and special trust, that is, trust in people with no direct relationship and trust in friends and relatives. Therefore, by focusing on residential mobility, this paper explores the relationship between individuals' perception of residential mobility and general trust and special trust. When changes in the external environment affect the order of People's Daily life, the sense of security of individuals will be threatened, and the perceived threat of security will affect the interpersonal trust of individuals. This study is expected to explore the mediating role of the sense of security of individuals in this process. Place identity is an individual's sense of attachment, belonging and identity to the external physical environment. When individuals perceive great changes in the external environment, will individuals with different local identities show differences in interpersonal trust? This study is expected to explore the moderating role of place identity in this process. This study activates individuals' perception of residential mobility and tests subjects with the ontological security threat perception Scale, General Trust Scale (GTS), special Trust Scale (SITS), and place identity Scale. The expected experimental result of this paper is that individuals with high perception of residential mobility have significant differences in general trust and special trust, while individuals with low perception of residential mobility have significant differences There was no significant difference between the two measures of trust. Compared with the individuals with high perception of residence mobility, the individuals with low perception of residence mobility had higher general trust and special trust. Specifically, individuals with a high perception of residential mobility are more likely to experience the threat of ontological security, and thus more likely to distrust the surrounding environment and others. The dependability and reliability of relatives and friends can help individuals cope with the psychological threat brought by the decline of ontological security, and make individuals more trust and rely on their relatives and friends. On the contrary, individuals with low perception of residential mobility have higher ontological security, so there is no significant difference in trust between relatives and strangers. The experimental results also found that place identity plays a

moderating role in the impact of residence mobility perception on interpersonal trust. Individuals with high local identity can trust others even when they perceive high residential mobility, while individuals with low local identity can trust others only when they perceive low residential mobility.

[4]上海市教育科学研究院

摘要:目的：虽然抑郁和焦虑症状之间的共病现象已普遍得到证实，且二者具有高度相关性，但多个文化背景下的抑郁和焦虑症状网络特征尚未得到交叉检验。因此，本研究的主要目的是探讨不同文化背景下焦虑和抑郁症状之间的网络，以及它们的症状-结构关联。方法：本研究数据来自一项跨文化研究项目（中国、坦桑尼亚、加拿大），采用一系列网络分析，基于儿童行为评估系统（Behavior Assessment System for Children; BASC）的子量表收集的青少年焦虑抑郁水平（中国：$N = 2073$; $M_{age} = 16.36$, $SD = 1.14$；坦桑尼亚：$N = 990$; $M_{age} = 15.98$, $SD = 2.02$；加拿大：$N = 653$; $M_{age} = 12.12$，$SD = 0.76$），评估各自网络的中心症状及桥梁症状。网络分析结果：焦虑-抑郁症状网络在三个国家都可以得到可靠评估（中国：$CS_{Strength} = 0.594$; 坦桑尼亚：$CS_{Strength} = 0.595$；$CS_{Strength} = 0.361$）。Anxiety 8（“我担心将要发生的事情”）为中国和加拿大青少年焦虑和抑郁症状网络的核心和桥梁症状，而 Anxiety 4（“我感到紧张”）为坦桑尼亚青少年的核心和桥梁症状。比较结果显示，两两网络在症状结构和整体强度方面均存在显著差异，中国青少年的焦虑-抑郁网络联系更为紧密，强度相对更高(中国= 6.03；坦桑尼亚= 5.54；加拿大= 5.76；$S = 0.21 \sim 0.49$；$ps < 0.05$)。结论：总的来说，研究结果强调了不同文化背景下焦虑和抑郁症状网络的独特特征，有助于为青少年制定符合文化敏感的干预措施。

Abstract：**Object:** Although the comorbidity between depressive and anxiety symptoms has generally been validated and highly correlated, the network structure of mental symptoms across multiple countries has not yet been cross-examined. Thus, the purpose of this study was to investigate the relationships between anxiety and depressive symptoms, along with their symptoms-structure associations. **Methods:** The adapted subscale of the Behavior Assessment System for Children (BASC) was used to evaluate the anxiety-depressive symptoms network among adolescents, based on a series of network analysis across three countries: China (N = 2,073; M_{age} = 16.36, SD = 1.14), Tanzania (N = 990; M_{age} = 15.98, SD = 2.02), and Canada (N = 653; M_{age} = 12.12, SD = .76). **Results:** Networks of symptoms could be reliably assessed among all three countries ($CS_{Strength_china}$ = 0.594; $CS_{Strength_Tanzania}$ = 0.595; $CS_{Strength_Canada}$ = 0.361). In China and Canada, Anxiety ("I worry about what is going to happen") was identified as the core symptom in the anxiety and depressive symptoms network, while in Tanzanian adolescents, Anxiety ("I get nervous") was reported as the core symptom. Furthermore, these networks exhibited significant differences in terms of symptom-structure and global strength, with a stronger and more density yielded in Chinese network (China = 6.03, Tanzania = 5.54; Canada = 5.76; S = 0.21 – 0.49; ps < 0.05). **Conclusion:** Overall, our findings emphasized the importance of understanding and addressing the unique features of anxiety and depressive symptoms networks in different cultural contexts, contributing to the development of effective and culturally sensitive interventions for adolescents.

4 北京师范大学发展心理研究院，北京，100875，liuxia@bnu.edu.cn

摘 要 以往研究表明，重大公共卫生事件的相关媒体报道会对人们的心理健康产生重要影响，其中不同媒体形式的媒体使用行为也与不同的心理结果相关。但前期研究聚焦研究变量较少，难以揭示诸多变量之间的复杂关系。因此，本研究旨在采用网络分析方法，探究不同媒体形式的疫情相关媒体使用与心理健康之间的关系。通过网络问卷形式收集了来自全国范围内 30 个省份的 917 份有效数据。问卷采用自编的疫情背景下的《媒体形式使用问卷》测量了被试在电视和报纸等、新闻（如今日头条等）、视频（如抖音等）、微信推送（如公众号等）、微博（如热搜等）上观看或浏览疫情信息的时间。采用《中文版正负性情绪量表(PANAS)》、《抑郁焦虑压力量表(DASS-21)》、《生活满意度量表(SWLS)》、《无聊量表》，以及结合疫情背景改编的《死亡焦虑量表(DAS)》、《中文版人生意义问卷(C-MLQ)》、《共情-同情量表》评估了被试的心理健康状况。数据分析使用 R 包 qgraph 包中图像最小绝对值收敛和选择算法(GLASSO)估计和可视化偏相关网络(partial correlation model)，并根据节点中心性指标以及网络结构探索变量关系中的关键变量和可能的作用机制。节点中心性指标结果显示，负性情绪具有最高的中介中心性(Z=2.80)和接近中心性(Z=2.55)和较强的强度中心性(Z=0.69)，是网络的中心节点。网络结构显示负性情绪连接了媒体形式变量与心理健康变量，由此构建以负性情绪为中介，以媒体形式使用为自变量和抑郁、焦虑、压力为因变量的中介模型。运用 Mplus 8.0 进行中介分析，结果发现微博形式的疫情相关媒体使用能够正向预测负性情绪(β=0.242, p<0.001)并进一步的正向预测抑郁焦虑压力(β=0.479, p<0.001)，间接效应为 0.116(p<0.001)，直接效应为 0.014(p=0.697)。负性情绪的中介作用在其他的中介路径中均不显著。结果警示在重大公共卫生事件发生时，政府应该积极干预舆论尤其是微博等社交媒体，以削弱媒体使用对心理健康的消极影响。

Relationship between public health event-related media information and mental health: a network analysis study

Dini Xue[1] Tuo Liu[2,3] Xia Liu[4]

1 Institute of Developmental Psychology, Beijing Normal University, Beijing 100875, China

2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

4 Institute of Developmental Psychology, Beijing Normal University, Beijing 100875, China, liuxia@bnu.edu.cn

***Abstract*:** Previous studies have shown that media coverage of major public health events has significant impact on people's mental health, and media use behaviors of different media forms are also associated with different

psychological outcomes. However, previous research focused on limited variables, and it was difficult to reveal the complex relationships among multiple variables. Therefore, this study aims to explore the relationship between epidemic related media use and mental health using network analysis methods. We collected 917 valid data from 30 provinces across the country through online questionnaires. Revised Media Usage Questionnaire under the epidemic background measured participants' time spent browsing epidemic information on various media forms such as television, newspapers, news platforms (e.g., Headline), videos (e.g., Tiktok), WeChat push (e.g., Official Accounts), and microblogs (e.g., hot searches). The mental health questionnaires included the Chinese Version of Positive and Negative Emotion Scale (PANAS), Depression, Anxiety and Stress Scale (DASS-21), Life Satisfaction Scale (SWLS) and Boredom Scale. In addition, Death Anxiety Scale (DAS), Meaning of Life Questionnaire (C-MLQ) and Empathy-Compassion Scale were adapted based on the epidemic background. Data analysis was conducted using the graphical least absolute shrinkage and selection operator (GLASSO) algorithm implemented in the R package qgraph to estimate and visualize the partial correlation network. Key variables and potential mechanisms were explored based on node centrality indexes and network structure. The node centrality indexes revealed that negative affect had the highest betweenness centrality (Z=2.80), closeness centrality (Z=2.55), and strong strength centrality (Z=0.69), making it the important node in the network. The network structure showed that negative affect connected media use with mental health. Therefore, we constructed a mediating model with negative emotions as the mediator, media use as the independent variable and depression, anxiety and stress as the dependent variable. Mediation analysis results revealed that the use of epidemic-related microblogs positively predicted negative affect (β=0.242, p<0.001), which further positively predicted depression, anxiety, and stress (β=0.479, p<0.001), with an indirect effect of 0.116 (p<0.001) and a direct effect of 0.014 (p=0.697). Other mediation paths were not significant. These results highlight the need for proactive government intervention, particularly in social media platforms like microblogs, to mitigate the negative impact of media usage on mental health during major public health events.

通讯作者 E-mail:xiaocuizhang@csu.edu.cn

摘 要　**目的：**非自杀性自伤行为对青少年的身心健康威胁极大，而有自伤行为的青少年往往伴有抑郁症状。抑郁与非自杀性自伤又很大程度上受童年期创伤的影响。为了探究青少年非自杀性自伤、抑郁和童年期创伤的关系，为更有针对性的青少年心理健康干预和教育工作提供启示，本研究采用网络分析方法从症状的角度探讨三者之间的关系。**方法：**本次研究在四所初中进行横断面调查，回收有效问卷 2640 份。分别使用青少年自伤量表、儿童抑郁量表和儿童期创伤问卷评估非自杀性自伤、抑郁症状和儿童期创伤。随后对三者的关系进行网络分析研究。**结果：**网络分析结果显示，青少年非自杀性自伤、抑郁症状和童年创伤密切相关。抑郁症状中的低自尊和童年创伤类别中的情感虐待是最中心的节点。低自尊和消极情绪与非自杀性自伤直接相关，抑郁症状的其他节点可以通过这两个节点与非自杀性自伤间接相连。情感虐待是童年创伤类别中唯一与非自杀性自伤直接相连的节点。其他类别的童年创伤(身体忽视、身体虐待、情感忽视和

性虐待) 到非自杀性自伤的最短的途径均是通过情感虐待的作用。**结论：**本研究结果表明，将低自尊、消极情绪和情感虐待作为干预目标可以最大程度地缓解青少年的抑郁症状和减少非自杀性自伤行为，有助于实现青少年身心健康发展。

[4] National Clinical Research Center for Mental Disorders, Changsha, Hunan, China.

***Abstract*：Objective:** Non-suicidal self-injury behavior is a great threat to teenagers' physical and mental health, while teenagers who have self-injury behavior are often accompanied by depression symptoms. Depression and non-suicidal self-injury are largely affected by childhood trauma. In order to explore the relationship among non-suicidal self-injury, depression and childhood trauma in adolescents, and provide new inspiration for more targeted adolescent mental health intervention and education, network analysis was used to explore the relationship among them from the perspective of symptoms. **Methods:** A cross-sectional survey was conducted in four junior high middle schools and collected 2640 valid questionnaires. Non-suicidal self-injury (NSSI), depressive symptoms, and childhood trauma were assessed using the Adolescent Self-Harm Scale, the Childhood Depression Scale, and the Childhood Trauma Questionnaire, respectively. A network analysis was performed. **Results:** In the network, NSSI, depressive symptoms and childhood trauma are closely related. Negative self-esteem in the depressive symptoms and emotional Abuse in the childhood trauma categories were the most central nodes. Negative self-esteem and negative mood were directly connected to NSSI, other nodes of depressive symptoms appeared to be indirectly connected to NSSI through these two nodes. Emotional abuse was the only node in the childhood trauma categories directly connected to NSSI. The shortest pathways form other categories of childhood trauma (physical neglect, physical abuse, emotional neglect, and sexual abuse) to the NSSI through the effect of emotional abuse. **Conclusion:** Our findings indicate that targeting negative self-esteem, negative mood, and emotional abuse as intervention targets may alleviate depression and reduce NSSI in adolescents to the greatest extent, which is helpful to realize the healthy development of adolescents.

摘 要　网络分析是一种允许研究人员探索和理解人类、生物和其他表现出相互依存结构的系统的方法。通过对表示离散对象之间关系的图的探索，网络分析试图解释特定类别的现象。网络分析方法认为，精神障碍的特点是可观察到的精神病理现象之间的因果相互作用。精神障碍的出现、维持和停止可以通过症状的动态相互作用来描述。本文拟采用网络分析方法考察创伤后应激障碍筛查表（The PTSD Checklist for DSM-5，PCL-5）在处境不利儿童中的网络结构，并探索其核心症状及因子结构。采用 PCL-5 和创伤后应激障碍反应指数量表对 2056 名处境不利儿童进行调查。结果显示：(1) 除了不能体验积极情感（D7）和惊跳反应(E4)，其他症状在网络内是均正相关的；(2) 回避创伤相关的思想(C1)和回避提示创伤的线索(C2)是网络中联系最强的边；(3) 持续的负性情绪（D4）、过度警觉（E3）、回避创伤相关的思想（C1）、生理反应（B5）和情感疏远（D6）是预期影响和强度最高的症状；(4) 处境不利儿童的网络结构支持了 PCL-5 七因子混合模型。综上可见，持续的负面情绪可能是参与者报告经历中最显著的症状。发展或完善现有的治疗方法，以精确地针对持续的负性情绪，可能会改善创伤后应激障碍的整体长期临床病程。

The network structure of the PTSD Checklist for DSM-5 in disadvantaged children

Fei Shienyu[1,2]　CHENG Jiayuan[1, 2]　CHEN Wei[1,2]

[1] School of Psychology, Guizhou Normal University, Guiyang 550025, China

[2] Psychology Big Data Research Center, Guizhou Normal University, Guiyang 550025, China

***Abstract*:** Network analysis is a method that allows researchers to explore and understand systems that exhibit interdependent structures among humans, organisms, and others. By exploring graphs that represent the relationships between discrete objects, network analysis attempts to explain phenomena of specific categories. The network analysis method believes that the characteristic of mental disorders is the causal interaction between observable psychopathological phenomena. The emergence, maintenance, and cessation of mental disorders can be described through the dynamic interaction of symptoms. This article intends to use network analysis methods to investigate the network structure of the PTSD Checklist for DSM-5 (PCL-5) in disadvantaged children, and explore its core symptoms and factor structure. A survey was conducted on 2056 disadvantaged children using PCL-5 and the Posttraumatic Stress Disorder Response Index Scale. The results showed that (1) except for the inability to experience positive emotions (D7) and startle reactions (E4), all other symptoms were positively correlated within the network; (2) Avoiding trauma-related thoughts (C1) and avoiding clues that suggest trauma (C2) are the most strongly connected edges in the network; (3) Persistent negative emotion (D4), Hypervigilance (E3), avoidance of trauma related thoughts (C1), physiological reaction (B5) and emotional alienation (D6) are the symptoms with the highest expected impact and intensity; (4) The network structure of disadvantaged children supports the PCL-5 seven factor Mixture model. In summary, persistent negative emotions may be the most significant symptom reported by participants in their experiences. Developing or improving existing treatment methods to accurately target persistent negative emotions may improve the overall long-term clinical course of

post-traumatic stress disorder.

青少年精神病态网络及其与攻击的关系

鲜国徽 罗杰（通讯作者）

贵州师范大学心理学院，贵阳，550025，luojiegznu@163.com

摘　要：精神病态是一种多维度的人格障碍，包括人际关系维度、情感维度、行为/生活方式维度以及可能的反社会维度，同时精神病态与攻击的正向关系受到了众多研究的支持。然而，关于精神病态核心特征的认识依然不一致，其与攻击之间的关系也大多局限于相关分析。本研究旨在以贵州省某高中 1396 名学生（平均年龄 15.41 岁，男生 703 人）作为研究对象，利用网络分析方法探究青少年精神病态的核心特征，同时细化精神病态与攻击之间的关系。首先对少年精神病态特质量表(YPI-50)所有项目进行网络分析，之后将 YPI-50 中的十个精神病态特质（分量表）与被动-主动攻击问卷中文版(RPQ)两维度进行网络分析。结果发现，在青少年精神病态网络中， C15（“我很擅长让人们相信我捏造的事情”）、 C20（“对我来说操作他人是一件很容易的事情”）和 C31（“为了让别人为我做事，欺骗他们是很有效的办法”）等要比其他项目位于更中心的位置。在精神病态与攻击的联合网络中，被动性攻击与精神病态行为维度中的冲动特征、寻求刺激特征有直接的正向联系，尤其是与冲动特征的联系最强，而主动性攻击与精神病态各特质联系微弱。本研究中的结果表明，在青少年精神病态网络中人际关系因子的项目具有非常核心的位置，而情感因子的项目则较为边缘化，这说明青少年精神病态的核心可能是在于人际关系层面。同时，青少年精神病态更多与被动性而不是主动性攻击相联系，可能是由于研究对象是普通高中生，他们作为正常人大多数都具有较低的主动性攻击水平，所以他们的攻击主要是体现在被动性上面，其次也可能是由于精神病态者冲动和无情的天性会导致他们会以一种鲁莽的方式来应对攻击性威胁，即精神病态者的攻击性是对外界挑衅的反应。

Adolescent Psychopathy Network and Their Relationship with Aggression

XIAN Guohui, LUO Jie

Guizhou Normal University, School of Psychology, Guiyang

***Abstract*:** Psychopathy is a multidimensional personality disorder, including interpersonal dimensions, affective dimensions, behavioral/lifestyle dimensions, and possible antisocial dimensions, while the positive relationship between psychopathy and aggression has been supported by numerous studies. However, the understanding of the core features of psychopathy remains inconsistent and the relationship between psychopathy and aggression is mostly limited to correlation analysis. In this study, 1396 students (M_{age}=15.41, 703 male) from a high school in Guizhou Province were selected as the research objects, and the core features of adolescent psychopathy were explored by using network analysis method, and the relationship between psychopathy and aggression was detailed. Firstly, the network analysis of all items of the Youth Psychopathic Traits Inventory (YPI-50) was carried out, and then the network analysis of the ten psychopathic traits (subscale) in YPI-50 and the Reactive-Proactive Aggression Questionnaire (RPQ) were carried out. The results showed that C15 ("I am good at getting people to believe in me when I make something up"), C20 ("It’s easy for me to manipulate people"), and C31 ("To get people to do what I want, I often find it efficient to con them") were more central to the adolescent psychopathy network than other items. In the network of psychopathy and aggression, reactive aggression has a direct positive correlation with impulsiveness and thrill-seeking in the behavioral dimension of psychopathy, especially the

strongest correlation with impulsiveness, while proactive aggression has a weak correlation with various traits of psychopathy. This study showed that the interpersonal dimensions have a very central position in the adolescent psychopathy network, while the affective dimensions are relatively marginal, which indicates that the core of adolescent psychopathy may lie in the interpersonal relationship level. Meanwhile, adolescent psychopathy is more associated with reactive rather than proactive aggression, which may be because the research objects are ordinary high school students. As normal people, most of them have a low level of proactive aggression, so their aggression is mainly reflected in reaction. It is also possible that the impulsive and ruthless nature of psychopaths can lead them to respond to aggressive threats in a reckless way, that is, aggression in psychopaths is a response to external provocation.

大学生无手机恐惧与抑郁、焦虑之间的纵向网络特征

贝冬丽[1] 罗杰[1,2]（通讯作者）

1 贵州师范大学心理学院，贵阳，550025

2 贵州师范大学心理大数据研究中心，贵阳，550025，luojiegznu@163.com

摘 要 无手机恐惧是21世纪信息科学技术高速发展背景下的一种衍生品，指的是由于手机不在身边或无法使用手机产生的一种焦虑或不舒适的感觉。本研究基于网络测量学构建大学生无手机恐惧与抑郁、焦虑之间的心理网络结构，以探讨大学生无手机恐惧与抑郁、焦虑之间的相互关系以及这种网络关系随时间发展的变化情况。采用无手机恐惧问卷，病人健康问卷(PHQ)以及广泛焦虑量表(GAD)对来自全国21个省/自治区/直辖市的2037名大学生间隔6个月的调查数据构建偏相关网络，并在此基础上进行网络差异分析。结果显示：（1）抑郁-焦虑网络的核心症状为“感到似乎将有可怕的事情发生而害怕”、“变得容易烦恼或急躁”以及“感到心情低落，沮丧或绝望”，该抑郁-焦虑网络及其核心症状在两个时点表现出稳定性；（2）无手机恐惧和抑郁、焦虑之间在不同时点存在相互影响的关系但是边线强度较弱；（3）网络等值性检验(Network Invariance Test)和全局强度不变性(Global Strength Invariance Test)检验分别表明无手机恐惧与抑郁、焦虑节点连接模式(M=0.19, p<0.05)以及全局强度(S=0.95, p<0.05)在两个网络之间存在显著差异。由此可知，无手机恐惧和抑郁、焦虑网络在整体结构上前后保持稳定，并且整个网络不同症状之间的连接及其重要性随时间发生显著变化。此外，无手机恐惧与抑郁、焦虑之间的弱边线权重说明无手机恐惧与焦虑、抑郁概念有所不同，未来需要进一步探讨无手机恐惧的形成机制。

Longitudinal Network Characteristics Between Nomophobia and Depression and Anxiety in College Students

BEI Dong-li[1] LUO Jie[1,2]

[1] School of Psychology, Guizhou Normal University, Guiyang 550025, China

[2] Psychology Big Data Research Center, Guizhou Normal University, Guiyang 550025, China

Abstract: Nomophobia, a derivative of the rapid development of information science and technology in the 21st century, refers to the anxiety or discomfort generated from being without a mobile phone or being unable to use it. This study aims to construct the psychological network structure between nomophobia and depression and anxiety symptoms in college students, and explore the mutual influence between nomophobia and depression and anxiety

symptoms, as well as the temporal changes in this network relationship based on network measurement. Using the Nomophobia Questionnaire (NMP-Q), the Patient Health Questionnaire (PHQ-9), and the Generalized Anxiety Disorder scale (GAD-7), survey data from 2037 college students from 21 provinces in China were collected at six-month intervals to construct two partial correlation networks. Network difference analysis was leveraged based on that. Results showed that: (1) The core symptoms of the depression-anxiety network were "feeling afraid that something terrible might happen," "becoming easily annoyed or irritable," and "feeling down, depressed, or hopeless." The depression-anxiety network and its core symptoms exhibited stability across two time points. (2) There was a mutual influence between nomophobia and depression and anxiety symptoms at different time points, but the edge strength was relatively weak. (3) Network invariance test and global strength invariance test indicated significant differences in the nomophobia-depression and anxiety symptom node connection pattern (M=0.19, p<0.05) and global strength (S=0.95, p<0.05) between the two networks. To sum up, the nomophobia and depression-anxiety network maintains stability in the overall structure, and the connectivity and importance between different symptoms in the entire network changed significantly over time. Furthermore, the weak edge weight between nomophobia and depression and anxiety suggests that nomophobia is distinct from the concept of anxiety and depression, and further research is needed to explore the mechanisms underlying the development of nomophobia.

基于贝叶斯正则化方法的潜变量多重中介分析

潘俊豪[1]（通讯作者）张沥今[2]
1 中山大学心理学系，广州，510006，panjunh@mail.sysu.edu.cn
2 斯坦福大学研究生教育院，美国

摘 要 中介变量在解释预测变量对结果变量的影响方面起着重要作用。在行为科学领域，经常会存在多个中介变量的情况。传统检验间接效应的方法，如 Sobel 检验和 bootstrap 法适用于单个中介变量的情况，然而在处理多个中介变量时，这些方法可能会导致过高的一类错误率和过拟合问题。为了解决这些问题，Serang 等人(2017)将基于可观测变量的中介模型与频率学派框架下的 Lasso 方法结合，以改进多重中介分析中的变量选择。然而，该方法仍然存在一些局限性，例如未考虑可观测变量的测量误差以及无法提供间接效应的区间估计等。因此，本研究旨在解决多重中介分析中传统方法存在的局限性。具体而言，本研究把贝叶斯正则化方法，包括岭回归(Ridge)、Lasso、自适应 Lasso、Horseshoe 和 Spike and Slab，应用于潜变量多重中介模型，从而克服了这些局限性。为了评估所提出方法的表现，本研究进行了蒙特卡洛模拟研究，并将其与传统的 Sobel 检验和 bootstrap 法进行了比较。研究结果显示，正则化方法受样本量和信度变化的影响较小。此外，模拟研究突显了全局和局部正则化方法在变量选择和中介模型参数估计方面的差异。基于这些发现，本研究提出了建议并给出了未来研究的方向。总体而言，本研究为潜变量多重中介分析中的变量选择提供了改进的方法，在考虑测量误差的同时纳入了不确定性信息。这种方法可以帮助研究人员更好地理解复杂模型中的中介机制。

Latent Multiple Mediation Analysis with the Bayesian Regularization Method

[1]Junhao Pan, [2] Lijin Zhang
1. Department of Psychology, Sun Yat-sen University, China
2. Graduate School of Education, Stanford University, U.S.

***Abstract*：** Mediators have played a crucial role in understanding how predictors influence outcome variables. It is common to have multiple mediators in behavior research. Traditional approaches for testing the indirect effects, such as the Sobel test and bootstrap methods, are used. However, when dealing with multiple mediators simultaneously, these approaches can lead to inflated Type I error rates and overfitting. To address these issues, Serang et al. (2017) combined mediation models of observed variables with the frequentist Lasso (least absolute shrinkage and selection operator) method to improve variable selection in multiple mediation analysis. However, this method has limitations: it doesn't consider measurement errors of manifest variables, and it cannot provide uncertainty information such as interval estimation of indirect effects. In this study, we extended the Bayesian regularization methods, including Ridge, Lasso, Adaptive Lasso, Horseshoe, and Spike and Slab, to latent multiple mediation models to overcome these limitations. A Monte Carlo simulation study was conducted to compare the proposed method with the traditional Sobel and bootstrap methods. The results showed that the regularization methods were less affected by changes in sample size and reliability. Furthermore, the simulation study highlighted the differences between global and local regularization methods in variable selection and parameter estimation in the mediation model. Based on these findings, we provided recommendations and

suggested future directions for research. Overall, our study offers an improved approach for variable selection in latent multiple mediation analysis, incorporating uncertainty information and considering measurement errors. This method can help researchers better understand the mechanism of mediation in complex models.

密集追踪数据的中介效应分析方法

方杰[1]（通讯作者） 温忠麟[2]

1 广东财经大学新发展研究院，广州，510320，E-mail: fangj@gdufe.edu.cn

2 华南师范大学心理学院，广州，510631

摘 要 随着智能手机和可穿戴设备的普及，研究者可以便利地收集密集追踪数据，即重复测量的时间间隔短、测量频次大于 20 的追踪数据。不仅截面数据和面板数据的数据格式不适合密集追踪数据，更重要的是，截面数据和面板数据的中介效应分析方法也不都适用于密集追踪数据。新的数据类型意味着需要新的数据分析方法。目前有两类模型可以进行密集追踪数据的中介效应分析，即多水平自回归中介模型和动态结构方程模型（包括两水平动态结构方程模型和交叉嵌套的动态结构方程模型）。本研究首先述评了密集追踪数据的中介效应分析方法从多水平自回归中介模型到动态结构方程模型的发展历程，建议优先使用动态结构方程模型进行密集追踪数据的中介效应分析(Mplus 软件实现)。然后讨论了如何利用两水平动态结构方程模型进行随个体变化的中介效应分析。具体地，两水平动态结构方程模型将密集追踪数据看成是测量时间点嵌套于个体的两层嵌套结构，因此层 2 只有个体层，可以进行随个体变化的中介效应分析。接着，讨论了如何利用交叉嵌套的动态结构方程模型进行随时间变化的中介效应分析。具体地，密集追踪数据还可以看成既嵌套于个体，又同时嵌套于时间的交叉嵌套数据，因此层 2 也有时间组的方程，可以进行随时间变化的中介效应分析。最后展望了密集追踪数据的中介效应分析方法的拓展方向。

Mediation Analysis Methods for Intensive Longitudinal Data

Fang Jie[1] Wen Zhonglin[2]

(1. Institute of New Development, Guangdong University of Finance & Economics, Guangzhou 510320, China;

2. School of Psychology, South China Normal University, Guangzhou 510631, China)

Abstract： Technological advances have made it possible to collect intensive longitudinal data (ILD) via devices like smartphones or wearable devices. ILD is characterized by frequent and dense repeated measures (e.g., 20 or more; Collins, 2006) and a relatively short between measurement occasions. Not only are the data structures of cross section data and longitudinal panel data not suitable for intensive longitudinal data, but more importantly, the mediation analysis methods for cross section data and longitudinal panel data are not always applicable to ILD. At present, there are two types of mediation models for ILD, namely multilevel autoregressive mediation model and dynamic structural equation model (DSEM). DSEM include two-level DSEM and cross-classified DSEM.

In the present study, we firstly reviewed the development of mediation analysis methods for ILD from the multilevel autoregressive mediation model to DSEM. It is recommended to use DSEM for mediation analysis in ILD (implemented by Mplus software). Secondly, we discussed how to use the two-level DSEM to analyze the

person-specific mediation. Specifically, ILD was treated as a two-layer structure with measurement occasions nested within individual in the two-level DSEM, so that layer 2 has only an individual layer and the person-specific mediation can be analyzed. Third, we discussed how to use the cross-classified DSEM to analyze the dynamic mediation (i.e., mediation effect over time). ILD can be regarded as cross-classified data nested in both individuals and time points, so that layer 2 has both individual layer and time layer, and the dynamic mediation can be analyzed. Finally, the development direction of mediation analysis methods for ILD is prospected.

因子分析模型中的贝叶斯次序假设评估

顾昕

华东师范大学教育心理学系，上海，200062，xgu@dep.ecnu.edu.cn

摘 要　次序假设表达研究者关于模型参数大小关系的理论。次序假设包括不等式假设 p1>p2>p3 和等式假设 p1=p2=p3，以及它们的混合形式 p1=p2>p3，其中 p 表示模型参数。在因子分析模型中，评估关于因子负荷的次序假设可以解决许多心理测量问题。例如，在信度分析中，研究者可以通过检验因子负荷的等式假设，即 tau equivalence 检验，作为使用 Cronbach's alpha 系数的前提。在效度分析中，研究者可以通过比较特定指标的主负荷与交叉负荷的大小，来判断题项的区分效度。此外，评估某个因子的各负荷次序大小，可以明确各指标在测量该因子时的相对重要性。

本研究提出因子分析模型中的贝叶斯次序假设评估方法，使用贝叶斯因子检验次序假设是否受到数据的支持。贝叶斯因子量化了数据支持假设的相对程度，比如若 p1>p2>p3 与备择假设的贝叶斯因子等于 5，则表示次序假设受到数据的支持程度是备择假设的 5 倍。贝叶斯次序假设评估的关键是先验分布的设置和贝叶斯因子的计算。对于因子分析模型，本研究设置因子负荷的条件正态分布，以及测量误差方差、潜变量方差的逆 Wishart 分布，并使用训练样本(training sample)估计以上分布的先验参数。根据 Savage-Dickey 密度比方法，次序假设的贝叶斯因子可表示为因子负荷的后验密度与先验密度在假设限制下的比值。本研究在 MCMC 抽样的每一步计算因子负荷的条件密度，即条件正态密度。因子负荷的后验或先验密度等于 MCMC 抽样中其条件密度的均值。

模拟研究验证了贝叶斯次序假设评估的有效性、准确性和一致性。模拟设置不同的总体模型和样本模型，考虑样本模型完全正确和略微错误情形下贝叶斯因子的表现。结果显示，模型设置正确时，1000 次模拟的贝叶斯因子中位数总是能够正确选择假设；模型设置错误时，特别是部分交叉负荷被忽视时，贝叶斯因子中位数可能选择错误的假设。最后，本研究以因子分析模型的经典例子展示因子负荷次序假设的贝叶斯因子检验步骤和结果解读。

Bayesian evaluation of order hypotheses in factor analysis models

Xin Gu

Department of Educational Psychology, East China Normal University, Shanghai

Abstract： Order hypotheses represent researchers' theories about model parameters using equality and inequality constraints. Order hypotheses include inequality hypothesis p1>p2>p3, equality hypothesis p1=p2=p3, and their mixture p1=p2>p3. In factor analysis models, evaluating order hypotheses with respect to factor loadings can address many problems in psychological measurement. For example, researchers can test the equality of loadings on one factor for using Cronbach's coefficient alpha (i.e., essential tau equivalence) in reliability analysis, compare the main loading with cross-loadings of a specific indicator to assess item-level discriminant validity, and evaluate the ordering of loadings on a factor to understand the relative importance of indicators in the measurement.

This study presents a Bayesian method of evaluating order hypotheses in factor analysis models. The order hypotheses are tested using Bayes factors. The Bayes factor quantifies the relative support in the data for the order hypothesis. If, for example, the Bayes factor of hypothesis p1>p2>p3 versus the alternative hypothesis is 5, this implies that the support for the order hypothesis is 5 times larger than the alternative. Prior specification and Bayes factor computation are the key of Bayesian tests. For factor analysis models, we specify conditional normal priors for factor loadings and inverse-Wishart priors for the variance-covariance of measurement errors and latent factors. The training sample of the data is used to estimate the prior parameters. Based on the Savage-Dickey density ratio method, the Bayes factor of the order hypothesis can be expressed as the ratio of the posterior and prior densities of factor loadings under the hypothesis constraints. We compute the conditional densities of the loadings (i.e., conditional normal densities) in each step of the MCMC sampling. The posterior or prior density of the loadings is obtained by averaging the conditional densities in the MCMC samples.

Simulation studies assess the effectiveness, accuracy and consistency of the Bayesian order hypothesis testing. Different population models and sample models are considered to investigate the performance of the Bayes factor when the sample model is completely correct or slightly misspecified. The result shows that when the sample model is correct, the median Bayes factor under 1,000 simulated datasets can always correctly select the hypothesis, whereas when the sample model is wrong, especially when some cross-loadings are ignored, the Bayes factor median may favor the incorrect hypothesis. Finally, a classical example of factor analysis models is used to illustrate the procedure of the Bayes factor test for order hypothesis with factor loadings and interpret the result.

两水平框架下调节作用分析及其拓展模型中效应量的估计

刘红云[1] （通讯作者） hyliu@bnu.edu.cn 董洁源[1] 辛畅[1]

1 北京师范大学心理学部，北京，100875

摘 要：在社会科学研究中，调节(moderation)效应分析和中介(mediation)效应分析和是探讨自变量和因变量之间复杂关系常用的两类方法。一方面，随着研究问题的不断深入，近年来越来越多的研究者将两类方法整合以探讨更加复杂的变量间关系以及关系的变化。另一方面，针对研究报告中过分强调统计显著性的问题，越来越多的期刊要求研究者提供效应量和区间估计的结果。因此，针对所关注的研究问题，发展合适的统计性质良好的效应量指标至关重要。刘红云和袁克海（2021），刘红云，袁克海和甘凯宇（2021），以及刘红云，袁克海和温忠麟（2022）针对常用调节效应量指标的局限，以及测量有中介的调节和有调节中介效应量大小指标缺乏的现状，提出了对单一水平数据的两水平建模的框架，以更好区分模型中预测变量、调节变量和中介变量的不同角色，更好匹配概念模型，并在此基础上定义了系列统计性质良好的效应量指标。然而，这些新效应量指标在实际中的应用仍很有限，其中最主要的原因是对于单水平数据如何定义两水平的模型以及如何操作实现效应量的估计，对应用研究者存在一定的困难。

为了推动心理学应用研究中复杂变量关系模型中效应量指标的应用，本研究拟重点结合 Mplus 软件和 Jags 程序包，解决实际操作中如何更好估计效应量以及置信区间的问题。本文首先通过蒙特卡洛模拟研究，比较两种不同实现方法在效应量以及置信区间估计精度上的差异，系统探讨样本量、效应量大小、随机方差、以及先验分布对效应量估计精度的影响，为应用研究者提供选择方法的指导。另外，本研究还将结合实证研究数据，演示实际应用中如何采用 Mplus 和 Jags 计算效应量的指标，以及如何结合研究假设正确解释和选择新效应量指标的系列问题。最后，我们讨论了参数估计软件和方法选择上的建议以及优缺点。

Estimation of effect sizes for moderation analysis and its extended model: under a two-level framework

Hongyun Liu, Jieyuan Dong, Chang Xin
Faculty of Psychology, Beijing Normal University, Beijing, 100875

***Abstract*:** Mediation and moderation analyses are commonly used methods for studying the relationship between a predictor and an outcome variable in social science research. To better understand the relationships among variables, there is an increasing demand for a more general theoretical framework that combines moderation and mediation analyses. Recently, statistical analysis of moderation (MO) effects, moderated mediation (moME) effects and mediated moderation (meMO) have become powerful tools for scientists to investigate complex processes. Routinely reporting ESs has been recommended as the primary solution to the issue of overemphasis on significance testing. Therefore, appropriate ESs for measuring MO effects, moME effects, and meMO effects are very important in reporting and interpreting inferential results. Liu and Yuan (2021), Liu, Yuan, and Wen (2022), and Liu, Yuan, and Gan (2021) proposes a two-level framework with single level data to distinguish the roles of predictor, moderator, mediator variables, and developed several measures to quantify the moderation effect sizes, moderated mediation (moME) effect sizes, and mediated moderation (meMO) effect sizes. They demonstrated that the new developed measures of ES are more interpretable, and directly answer the questions corresponding to the conceptual models. However, the application of these new effects in practice is still limited, with the main reason being the difficulty for application researchers in defining two-level models with single level data and estimating effect sizes.

This paper aims to focus on how to better estimate the effect sizes and the corresponding confidence intervals by using Mplus and Jags package. Using Monte Carlo simulation study, we compare the differences between two different implementation methods in accuracy of estimating the effect sizes and confidence intervals. A simulation study was conducted to compare the performance of the two methods, and examine the performance of Bayesian methods in estimating and testing the effect sizes and the corresponding ESs under different conditions. The conditions manipulated in our design include the effect sizes, the moderation-residual variances, sample size， and prior distributions. The Bias, MSE, and coverage rate of the 95% nominal CI are used to evaluate the performances of the two methods in estimating ESs. Three empirical examples illustrate the applications of Mplus 8.7 and Jags in practice.

We conclude that the two level model with single level data is simple to implement, and the Bayesian estimation procedure can be conducted using either free Bayesian programs or commercially available software Mplus 8.7. In particular, Jags are easily assessable to researchers, and they allow very flexible specifications of likelihood functions and prior distributions; and Mplus 8.7 program is easy to operate and user friendly, especially

for empirical researchers. Overall, the results indicated that the differences of two methods can be ignored in most cases.

多维潜变量建模：方法演变和模型发展

顾红磊[1]（通讯作者） 温忠麟[2]

1 湖南师范大学教育科学学院，长沙，410081，GHL@hunnu.edu.cn

2 华南师范大学心理学院，广州，510631

摘 要 在心理、教育、管理等社会和行为科学研究中，所涉及的变量往往是不能直接观测的，即所谓的潜变量，如情绪智力、自我效能感等。潜变量可以通过精心设计的若干指标来间接测量，测量模型构建是研究潜变量的重要环节。验证性因子分析(Confirmatory Factor Analysis, CFA)是应用最为广泛的构建测量模型的方法。然而，不少研究者认为，CFA 至少存在两方面的不足：一是过分依赖严格且不切实际的独立分群模型假设，即每个指标只从属于一个因子。二是无法同时检验多维构念各维度的共同效应和独特效应。

为了克服 CFA 的不足，研究者相继提出了双因子模型(bifactor model)和探索性结构方程模型(Exploratory Structural Equation Modeling, ESEM)。双因子模型可以分析多维构念的共性和维度独特性(通常作为高阶因子模型的竞争模型)；而 ESEM 则容许因子之间存在交叉负荷(cross-loading)，使得测量模型更符合实际(例如, 一个测量数学能力的题目同时也测量了阅读理解能力)。近年出现的双因子探索性结构方程模型(bifactor Exploratory Structural Equation Modeling, bifactor-ESEM)则使用新算法允许双因子模型的局部因子之间存在交叉负荷，同时整合了双因子模型和 ESEM 的优点。与 bifactor-ESEM 可比的还有新近出现的双因子贝叶斯结构方程模型(bifactor Bayesian Structural Equation Modeling, bifactor-BSEM)。bifactor-BSEM 使用贝叶斯方法分析双因子模型，在模型设定上跟 bifactor-ESEM 类似，都比双因子模型更具灵活性和现实意义。目前，bifactor-ESEM 和 bifactor-BSEM 的研究和应用在国内罕见，国际上也刚起步不久。

尽管国内学者对 CFA 比较熟知，对双因子模型和 ESEM 也有一定的了解，但对两种新型的建模方法——bifactor-ESEM 和 bifactor-BSEM 知之甚少。鉴于此，本文在回顾和评介多维潜变量的传统建模方法的基础上，介绍 bifactor-ESEM 和 bifactor-BSEM 的特点以及在心理学等社科研究中的应用，然后总结出一个兼顾简洁性和精确性的多维潜变量建模流程。最后通过一个实例对两种新方法的使用进行演示。

Multidimensional latent variable modeling:

The evolution of methods and the development of models

Gu Honglei[1] Wen Zhonglin[2]

1 School of Educational Science, Hunan Normal University, Changsha, 410081, China

2 School of Psychology, South China Normal University, Guangzhou, 510631, China

***Abstract*:** Empirical psychological, educational, social, and behavioral researches are frequently confronted with multidimensional latent variables (e.g., emotional intelligence, self-efficacy). Latent variables can be measured indirectly by carefully designed indicators. The construction of measurement model is an important part of studying latent variables. The confirmatory factor analysis (CFA) is the most commonly used approach to model multidimensional latent variables. CFA, however, is often criticized for its overly restrictive independent cluster model (ICM) assumption, which requires that each item is defined by one, and only one, content domain. Furthermore, CFA could not test the common and unique effects of each dimension simultaneously.

In order to overcome the limitations of CFA, researchers have successively developed the bifactor model and Exploratory Structural Equation Modeling (ESEM). The bifactor model can examine the commonality and dimensional uniqueness of multidimensional constructs. ESEM allows for the cross-loadings between items and non-target factors, making the measurement model more realistic. Bifactor Exploratory Structural Equation Modeling (bifactor-ESEM), which has emerged in recent years, uses a new algorithm to allow for the cross-loadings between the items and non-target specific factors, and integrates the advantages of both the bifactor model and ESEM. Likewise, the bifactor Bayesian Structural Equation Modeling (bifactor-BSEM) is recently developed as a new modeling method. Bifactor-BSEM uses Bayesian method to analyze the bifactor model and is similar to bifactor-ESEM in model specification, both of which are more flexible and realistic than the traditional bifactor model.

Although domestic scholars are familiar with CFA and have a certain understanding of bifactor model and ESEM, they know little about two new modeling methods, namely bifactor-ESEM and bifactor-BSEM. This study firstly reviews and comments on the traditional modeling methods of multidimensional latent variables, and introduces the characteristics of bifactor-ESEM and bifactor-BSEM and their applications in social science research (e.g., psychology). Then a flow chart of multidimensional latent variable modeling is presented, which balances the simplicity and the precision. Finally, an empirical example is illustrated to demonstrate the use of the two new methods.

潜剖面分析能使用项目打包吗？一项蒙特卡罗模拟研究

王孟成（通讯作者）

广州大学教育学院心理测量与潜变量建模研究中心，广州 510006，通讯作者邮箱 wmcheng2006@126.com

摘 要 潜在类别和潜在剖面分析是探索群体异质性最流行方法。如果分析的指标或题目较多时研究者常常使用 SEM 建模时项目打包的方法，但在潜在类别和潜在剖面分析是打包的使用条件尚不清晰。为此本研究通过蒙特卡罗模拟系统探讨了打包数、组成包的条目数、样本容量等因素对项目打包法应用于 LCA/LPA 的影响。结果表明：(1)条目在潜在类别上的条件概率间距较大、存在清晰的潜在类别时：①对单个量表的条目进行打包，打包后的分类结果与不打包的结果基本一致；②对多个量表的条目进行打包，样本容量与打包数相同时，组成包的条目数越多，打包后的分类效果与不打包结果一致的可能性越大；③对多个量表的条目进行打包，样本容量与组成包的条目数相同时，打包数越多，越有利于得到与不打包一致的分类结果；(2)条目在潜在类别上的条件概率间距较小、存在程度差异较多的潜在类别时，打包的模型支持率明显低于不打包的结果，而且难以得出打包数、组成包的条目数、样本容量与分类效果之间的关系。

Can item parceling be used in latent profile analysis:

A Monte Carlo simulation study

Meng-Cheng Wang, Qiaowen Deng, Jiaxin Deng
Center for Psychometrics and Latent Variable Modeling, Guangzhou University, Guangzhou, China

Abstract：Latent Class Analysis (LCA) and Latent Profile Analysis (LPA) have become popular statistical methods for modelling latent population heterogeneity. Due to the benefits of using item parcels, researchers use parcels as indicators in LCA/LPA models. However, no studies explore its rationality. By using parcels instead of items as model indicators, the original information of items will be covered to a certain extent. Hence, it is essential to explore whether item parcels will influence the accuracy of class enumeration.

Via applying Monte Carlo simulation methods, we generated artificial data to compare the performance of parcels with items under different LCA/LPA modeling conditions. Each simulation was repeated 200 times for each condition of the combinations: sample sizes, number of parcels and number of items in each parcel. The sample data were generated and analyzed with Mplus8.0.

Results found that latent class distance plays an important role in class enumeration when using parcels as latent variable indicators. When analyzing a unidimensional scale in LCA/LPA model which class distance is large, the class enumeration of parcels is consistent with the results of items. When the model analyzes more than one unidimensional scale with large class distance, the model evaluation is influenced by sample sizes, number of parcels and number of items in each parcel. Parcels perform well with more number of items in each parcel across sample size and number of parcels. In addition, parcels perform well with more number of parcels. However, when the latent class distance of the un-parcel model is small, making the right judgement of model evaluation is much smaller with parcels as indicators. Also, it is hard to achieve coincident results in consideration of sample sizes, number of parcels and number of items in each parcel.

The simulation indicates that item parcels can be used under large latent class distance and a single unidimensional scale condition. When the model composes of more than one unidimensional scale with large latent class distance, the combinations of sample sizes, number of parcels and number of items in each parcel should be considered. It is unsuitable to use item parcels when the latent class distance of the un-parcel LCA model is small.

小学生社会情感能力、学校人际关系和学业成就：基于交叉滞后分析

杨佳奇[1]　邓宇泽[1]　王烨晖[1]（通讯作者）
1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875，yehuiwang@bnu.edu.cn

摘 要　社会情感能力对学生发展具有积极的促进作用，近年来受到政策制定者和教育研究者的广泛关注，与学业成就并列为学生学校学习的两大主要任务。以往研究表明，同伴关系和师生关系作为学校人际关系的主要组成部分，与社会情感能力和学业成就具有紧密的关联。但以往的横断研究和纵向研究大多数

关注同伴接纳和同伴拒绝，少有研究探讨其他同伴关系指标（如社会偏好和社会影响）的作用，使得社会情感能力、社会偏好、社会影响、师生关系和学业成就之间的纵向关系尚不明确。此外，由于学生与教授不同科目的教师可能具有不同的师生关系，有必要基于不同科目对师生关系的作用进行研究。基于此，本研究采用分层随机抽样法，使用社会情感能力量表、师生关系量表、同伴提名法和学业成就测验（阅读、数学和科学）对 3995 名四年级学生首次进行调查，时隔两年后，再次对这批学生进行追踪（n=2789），并使用 Mplus 8.3 建立交叉滞后面板模型探究小学生社会情感能力、社会偏好、社会影响与不同科目背景下的师生关系和学业成就之间的纵向关系。结果显示，在阅读、数学和科学三个科目中，学生社会情感能力、学业成就和师生关系两两之间均存在显著的正向预测关系，且学业成就和社会偏好之间也能够相互预测。另外，学生社会情感能力、社会偏好、社会影响、师生关系和学业成就之间的预测作用在不同科目背景下存在差异。总体而言，本研究揭示了小学生社会情感能力、学校人际关系以及学业成就之间的相互预测关系，为提高学生社会情感能力和学业成就、促进其建立积极的同伴关系和师生关系提供了启示。此外，本研究通过考虑这些因素在特定科目中复杂的相互预测关系，能够对特定学科的教育方法和教育政策的制定提供实证依据。

关键词　社会情感能力，学业成就，师生关系，社会偏好，社会影响

Reciprocal Associations among Social-emotional Competence, School Interpersonal Relationships and Academic Achievements in Primary School: based on Cross-lagged Analysis

Jiaqi Yang [1], Yuze Deng [1], Yehui Wang [1]

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

Abstract **：** In recent years, social-emotional competence has been underscored by policymakers and researchers due to its positive influence on students' development. And it alongside academic achievement, is recognized as a crucial aspect of students' school learning. Previous studies have highlighted the strong associations between peer and teacher-student relationship and both social-emotional competence and academic achievement. However, the majority of these studies have focused primarily on peer acceptance and rejection, neglecting other indicators of peer relationships, such as social preference and social impact. As a result, the longitudinal associations among social-emotional competence, social preference, social impact, teacher-student relationship, and academic achievement remain unclear. Furthermore, considering that students may have different relationships with teachers across different subjects, there is a need for research that examines the role of subject-specific teacher-student relationship. In light of these gaps, this study utilized a stratified random sampling method to investigate the reciprocal associations among social-emotional competence, social preference, social impact, teacher-student relationships, and academic achievements in reading, mathematics and science of primary school students. The Social Emotional Competence Scale, Teacher-Student Relationship Scale, Peer Nomination Method, and Academic Achievement Tests (Reading, Mathematics, and Science) were administered to a sample of 3,995 fourth-grade students. Two years later, the same tests were readministered to the same group of students (n=2789), and a cross-lagged panel model was developed using Mplus 8.3 to explore the reciprocal associations among social-emotional competence, social preference, social impact, teacher-student relationships, and academic

achievements in reading, mathematics and science. The results of the study revealed positive reciprocal associations between students' social-emotional competence, academic achievements, and teacher-student relationships in the subjects of reading, mathematics, and science. Additionally, academic achievements and social preference demonstrated reciprocal predictions. Moreover, the predictive effects of social-emotional competence, social preference, social influence, teacher-student relationships, and academic achievements varied across different subjects. Overall, this study demonstrates the reciprocal associations among primary school students' social-emotional competence, teacher-student relationships, academic achievements, and peer relationships. These findings provide evidence for enhancing students' social-emotional competence and academic achievements while fostering positive peer and teacher-student relationships. Furthermore, by considering the complex interplay of these factors within specific subjects, this study offers insights for subject-specific educational approaches and the development of educational policies.

父母自我效能感量表在中国父母中的效度和测量不变性：探索性结构方程模型

成嘉园[1] 高美慧[1] 费史恩宇[1] 陈维[1,2]（通讯作者）

1 贵州师范大学心理学院，贵阳，550025

2 贵州师范大学心理大数据研究中心，贵阳，550025，chenweipsy@yeah.net

摘 要 小学生的内在化障碍与青少年焦虑症、抑郁的发展有关，并且可以被视为青少年情绪的延续和积累。基于班杜拉的社会认知理论父母自我效能感高的个体对孩子表现出积极的态度、观点和信念。PSE预防性养育行为的一个重要决定因素，并与健康的儿童发展密切相关。但是 PSES 目前仅有英文版本且国内关于父母自我效能的研究较少。所以本研究将 PSES 汉化且在中国父母中进行效度和测量不变性探讨。我们最终回收有效问卷 403 份组成样本 1，其中父母的平均年龄 37.25（SD=3.69）岁，年龄范围 23-56 岁，孩子的平均年龄 8.67（SD=0.97）。六个月后对同一批被试进行重测获得样本 2，有效配对问卷 225 份，其中父母的平均年龄 38.99（SD=3.47）岁，年龄范围 32-53 岁，孩子的平均年龄 10.40（SD=1.02）。结果显示，PSES 的 Cronbach's α=0.89，具有良好的内部一致性信度。校标效度我们选用 PSI-SF 和 SDQ 作为标准。PSES 与 PSI-SF 和 SDQ 的 4 个困难分量表之间存在显著的负相关，表明具有良好的判别效度。与 SDQ 的长处分量表呈正相关，具有良好的收敛效度。结构效度下，单因素模型的拟合指数达到理想水平，采用传统的验证因子分析（CFA）和探索性结构方程建模（ESEM）对 PSES 的因子结构进行了检验和比较；ESEM 的结果显示 PSES 符合单维性的构想，χ^2=38.677，*df*=27，CFI=0.991，TLI=0.988，SRMR=0.024，RMSEA=0.033，模型拟合良好。而且项目 8 在中文版中并不会影响总量表的结果，这与之前的研究不同。随后，本研究检验了 PSES 的跨父母性别和纵向测量不变性。在性别不变性中，形态等值、弱等值、强等值和严格等值四个模型的 CFI 指标在 0.929~0.934 之间，TLI 指标在 0.962~0.975 之间，SRMR 在 0.035~0.099 之间，RESEA 指标在 0.053~0.059 之间，达到了心理测量学的基本要求，表明 PSES 没有性别差异。在纵向不变性中，形态等值、弱等值、强等值和严格等值四个模型检验中，CFI 指标在 0.922~0.942 之间，TLI 指标在 0.920~0.930 之间，SRMR 指标在 0.058~0.108 之间，RMSEA 指标在 0.039~0.059 之间，均达到模型拟合良好的标准。综上所述，PSES 中文版具有良好的效度，可能被证明是未来研究和儿童和家庭治疗干预的有用工具。

The validity and measurement invariance of the Parental Self-efficacy Scale (PSES) in Chinese parents: An exploratory structural equation model

Cheng, Jiayuan[1] GAO, Meihui[1] FEI, Shienyu[1] Chen, Wei[1,2]

[1] School of Psychology, Guizhou Normal University, Guiyang 550025, China
[2] Psychology Big Data Research Center, Guizhou Normal University, Guiyang 550025, China

Abstract:The internalization disorder of primary school students is related to the development of adolescent anxiety and depression, and can be regarded as the continuation and accumulation of adolescent emotions. Based on Bandura's social cognitive theory, individuals with high parental self-efficacy show positive attitudes, opinions and beliefs toward their children. PSE is an important determinant of preventive parenting behavior and is strongly associated with healthy child development. However, there are only English versions of the PSES , and there are few domestic studies on parental self-efficacy. In this study, PSES will be translated into Chinese and validity and measurement invariance will be explored in Chinese parents. We finally collected 403 valid questionnaires and composed sample 1, in which the mean age of parents was 37.25 (SD=3.69) years, the age range was 23-56 years, and the average age of children was 8.67 (SD=0.97). Six months later, the same group of subjects were retested to obtain sample 2, with 225 valid matching questionnaires, in which the average age of parents was 38.99 (SD=3.47) years old, the age range was 32-53 years old, and the mean age of children was 10.40 (SD=1.02). The results showed that Cronbach's α of PSES =0.89 had good homogeneity reliability. Criterion validity We chose PSI-SF and SDQ as the criterion. There were significant negative correlations between PSES and the four Difficulties subscales of PSI-SF and SDQ, indicating good discriminant validity. It is positively correlated with SDQ's Strengths subscales and has good convergence validity. Under the structural validity, the fitting index of the single-factor model reached an ideal level, and Exploratory Structural Equation Modeling (ESEM) was used to examine the PSES factor structure. The results of ESEM showed PSES，χ^2=38.677，*df*=27，CFI=0.991，TLI=0.988，SRMR=0.024， RMSEA=0.033, and the model was well fitted. Moreover, item 8 in the Chinese version does not affect the results of the total table, which is different from previous studies. Subsequently, the present study examined the PSES of cross-parent gender and longitudinal measurement invariance. In the gender measurement invariance of configural invariance, metric invariance, scalar invariance and strict invariance models, CFI ranged from 0.929 to 0.934, TLI ranged from 0.962 to 0.975, SRMR ranged from 0.035 to 0.099, and RESEA ranged from 0.053 to 0.059. The basic requirements of psychometrics were met, showing that there was no sex difference. In the longitudinal measure invariance test of configural invariance, metric invariance, scalar invariance and strict invariance models, CFI ranges from 0.922 to 0.942, TLI ranges from 0.920 to 0.930, SRMR ranges from 0.058 to 0.108, and RMSEA ranges from 0.039 to 0.059. All the models meet the standard of good fit. In summary, the PSES Chinese version has good validity and may prove to be a useful tool for future research and therapeutic interventions in children and families.

摘要 本研究以 Paulhus 等人(2021)开发的短式黑暗四联征量表(the short Dark Tetrad scale, SD4)为基础，修订出了适用于国内的中文版黑暗人格四联征量表 (SD4-C)。研究首先使用探索性因素分析对量表结构进行初探；其次使用项目反应理论 GRM 模型进行项目分析，并根据分析结果对项目进行修改和筛选，形成正式版量表；最后对正式版量表进行信效度检验，并再次对量表题目进行项目分析。最终量表共 12 道题目，包括马基雅维利主义、自恋、精神病态和施虐狂 4 个维度；总量表的 Cronbach α系数为 0. 661，四个维度的α系数分别为: 0.633, 0.672, 0.557 和 0.730。CFA 验证性结果显示量表结构较好 (χ^2 / *df* = 5.721, CFI = 0.933, TLI = 0.902, RMSEA = 0.057, SRMR = 0.045)；使用大五人格极简版量表(CBF-PI-B) 作为校标，结果显示黑暗人格各维度与大五人格各维度之间相关在[0.015, 0.339]，效度良好。最终量表项目区分度在[0.974, 3.552]之间，四维度区分度均值为 1.609, 2.011, 1.497 和 2.337，项目难度参数在[-4.558, 4.367]之间。综上结果显示该研究修订的中文版黑暗人格四联征量表各项指标均达到了心理测量学要求，可供后续研究使用。

***Abstract*:** Based on the short Dark Tetrad Scale (SD4) developed by Paulhus et al. (2021), this study revised the Chinese version of the short Dark Tetrad Scale (SD4) for China. Our study firstly used exploratory factor analysis (EFA) to explore the structure of the scale; secondly, we used item response theory (IRT) GRM model to analyze the items, and then modified and screened the items according to the results of the analysis to form the revised version of the scale; finally, we conducted a reliability test on the revised version of the scale, and then analyzed the items on the questions of the scale again. The final scale consisted of 12 questions, including four dimensions: Machiavellianism, narcissism, psychopathy and sadism; the Cronbach's alpha coefficient of the total scale was 0.661, and the alpha coefficients of the four dimensions were 0.633, 0.672, 0.557, and 0.730, respectively. The CFA results showed good scale structure (χ^2 / *df* = 5.721, CFI = 0.933, TLI = 0.902, RMSEA = 0.057, SRMR = 0.045). Using Chinese Big Five Personality Inventory-15 scale as a criterion, the results showed that the correlation between the dimensions of the dark tetrad and the Big Five personality was [0.015, 0.339]. The item discrimination of the final scale ranged from [0.974, 3.552], the mean values of the four-dimensional

discrimination were 1.609, 2.011, 1.494, and 2.337, and the item difficulty parameter ranged from [-4.558, 4.367]. The results show that the revised Chinese version of the short Dark Tetrad Scale meets the psychometric requirements and can be used in subsequent studies.

Psychometric Properties of the Chinese Version of Knowledge Hidding Scale (C-KH) in Chinese Adolescents: Based on the CTT, GT and IRT

QIU Ting[1]　LUO Jie[1]

[1] School of Psychology, Guizhou Normal University, Guiyang 550025, China

***Abstract*:** The reliability and validity of the Chinese version of Knowledge Hidding Scale (C-KH) in adolescents was tested based on classical testing theory, generalizability theory and item response theory. The results showed that: (1) the item-total correlations of all items greater than 0.5 (*ps*<0.01), independent samples' t-test reached the measurement standard(*p*<0.001), and the item differentiations were between [0.72, 3.00] and the item difficulty parameters were between [-2.58, 3.57]; (2) for the confirmatory factor analysis, each fitting index reached the acceptable standard(CFI=0.948, TLI=0.933, SRMR=0.056, RMSEA=0.065) , the factor load of each item in the

target dimension was above 0.40, and the multi-group confirmatory factor analysis showed that the KH had full strict measurement invariance across gender; (4) KH subscales and total scale were significantly positively correlated with interpersonal distrust scale and neuroticism scale(*p*s<0.05) and significantly negatively correlated with the knowledge sharing scale (*ps*<0.05), the rationalized hidding subscale and total scale showed significantly positively correlated with knowledge hoarding(*ps*<0.05), the playing dumb and evasive hidding subscales and total scale showed significantly positively correlation with agreeableness scale(*ps*<0.01), and the playing dumb subscale was significantly positively correlated with conscientiousness scale(*ps*<0.05); (5) the Cronbach's alpha of the playing dumb, evasive hidding, rationalized hidding subscales and total scale were 0.80, 0.77, 0.76 and 0.83, the omega were 0.82, 0.77, 0.77 and 0.81, the generalization coefficients were 0.80, 0.77, 0.76, and 0.87, and the dependability indexes were 0.75, 0.77, 0.76, and 0.86, respectively. In sum, the Chinese Knowledge Hiding Scale is a reliable and valid instrument for assessing knowledge hiding behavior in adolescents.

基于贝叶斯协方差 Lasso 的多层异质性因子分析模型及其应用

潘俊豪[1]（通讯作者），Edward Ip[2]

1 中山大学心理学系，广州，510006，panjunh@mail.sysu.edu.cn

2 Wake Forest University School of Medicine, USA

摘 要 近年来，生态瞬时评估(Ecological Momentary Assessment; EMA)数据已经被广泛应用到心理学的多个领域。Ansari 等人(2002)在验证性因子分析模型(Confirmatory Factor Analysis; CFA)的基础上，提出了异质性 CFA(Heterogeneous CFA)模型，以分析个体重复测量的 EMA 数据。在该模型中，虽然均值以及因子载荷参数允许随个体而变化，但假设因子结构在不同个体中保持不变，即该模型以满足形态不变性(Configural Invariance)为重要前提。本研究通过允许个体水平残差相关以放宽上述模型形态不变性的限制，把机器学习中 Lasso(Least Absolute Shrinkage and Selection Operator)正则化方法与异质性 CFA 模型结合，建立多层异质性因子分析模型(Multilevel Heterogeneous CFA)，在平衡模型简约性、模型拟合和参数估计准确性的同时，放宽上述形态不变性的假设，实现对因子结构不同的个体予以识别和区分，将因子结构的探讨从传统的变量层面拓展到个体差异层面。同时，本研究还提出了相应的贝叶斯算法对所提出的模型进行统计推断(包括未知参数估计和模型比较)。计算机模拟研究以及基于情绪 EMA 数据的实证研究均表明所提出的新模型和新方法具备有效性、稳健性和实用性。

Multilevel Heterogeneous Factor Analysis Models with Bayesian Covariance Lasso Prior: Statistical Inference and Application

Junhao Pan[1], Edward Ip[2]

3. Department of Psychology, Sun Yat-sen University, China

4. Wake Forest University School of Medicine, USA

Abstract**:** In recent years, ecological momentary assessment (EMA) data has been widely utilized in

various fields of psychology. Ansari et al. (2002) introduced a heterogeneous confirmatory factor analysis (CFA) model to analyze individual repeated measurements EMA data. In their model, they allowed the mean and factor loading parameters to vary across individuals while assuming that the factor structure remains constant across different individuals, meeting the requirement for configural invariance. However, this study relaxes the assumption of configural invariance by considering correlated residuals at the individual level. By combining the least absolute shrinkage and selection operator (Lasso) regularization method from machine learning with the heterogeneous CFA model, this study presents a multilevel heterogeneous CFA model. This model enables the identification and differentiation of individuals with different factor structures, expanding the exploration of factor structures from the traditional variable level to the individual difference level. The model strikes a balance between simplicity, model fit, and parameter estimation accuracy. Moreover, this study proposes corresponding Bayesian algorithms for statistical inference, including the estimation of unknown parameters and model comparison. The effectiveness, robustness, and practicality of the proposed model and method are demonstrated through simulation studies and empirical study based on emotion EMA data.

密集追踪研究中测量跨时间等价性的检验

刘红云[1]（通讯作者） hyliu@bnu.edu.cn

1 北京师范大学心理学部，北京，100875

摘 要：追踪研究中测量工具满足跨时间等价性是后续分析的基础。近年来随着研究问题的不断深入和数据收集方法和存储方式的发展，密集型追踪研究设计在心理学研究中越来越普遍。然而，由于密集型追踪数据具有测量时间点多，测量时间间隔不等的特点，传统的用于分析长期追踪数据测验等价性的方法，如纵向因素分析，并不适应于密集型追踪数据。但是如何检验密集型追踪数据跨测量时间点的等价性，这一问题尚没有很好的解决。

本文的目的是尝试将含惩罚的结构方程模型的方法用于密集型追踪研究中测量跨时间等价性的检验。文章首先简要介绍密集型追踪数据等价性检验中，含惩罚结构方程模型的定义和检验逻辑；其次通过一个模拟研究检验含惩罚的结构方程模型在检验等价性方面的表现，并探讨样本量（50,100,200）、测量时间点（30,60,100）、不等价参数所占比例（10%，20%），以及不等价参数差异大小（载荷参数：0.4 和 0.6; 截距参数：0.25 和 0.5）对检验结果的影响。另外，文章还将结合一个实际例子演示含惩罚的结构方程模型在检验测量跨时间等价性中的应用，为应用研究者提供实现检验方法和正确解释结果的范例。最后，我们简要谈论方法应用和选择的建议，以及未来需进一步研究的问题。

关键词：密集追踪数据，测量等价性，含惩罚结构方程模型

Testing of measurement invariance across time in intensive longitudinal data

Hongyun Liu

Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract: The literature on longitudinal research have argued that measurement invariance of measured constructs need to be addressed regardless of the type of analysis that involves data collected from more than one time point. Assumption of invariance has to be tested to ensure that the measurement is on the same metric at each

measurement occasion. If such assumption is not met, any conclusion about between-time differences or change in the constructs is not substantial. Recently, the intensive longitudinal method (ILM) has gained popularity over the last decade with the advancement on communication and data storage technology. However, unlike longitudinal panel method, longitudinal measurement invariance has not been widely discussed in ILM. This could partly due to the unique data composition in which there may be more variables measured across the measurement occasions (T) than participants (N) which renders estimation problem in conventional longitudinal confirmatory factor analysis approach with the wide-form data.

This paper aims to test measurement invariance across timepoint using the penalized structural equation model (PSEM). Firstly, we briefly introduce the penalized structural equation model for testing longitudinal measurement invariance for intensive longitudinal data. Then, a simulation study is conducted to examine the performance of the PSEM. The factors of sample size (N=50, 100, and 200), measurement occasion (T = 30, 60, and 100), the percentage of non-invariance overall measurement occasions for that particular parameter (10% and 20%), and the size of the non-invariance (for loading 0.4 and 0.6; for thresholds 0.25 and 0.5) are considered in the simulation study. Next, an empirical example is analyzed for illustration purposes. In addition, pros and cons of the model, as well as issues for further research will also be discussed.

Keywords: intensive longitudinal data, measurement invariance, penalized structural equation model

二阶潜增长模型两种标准化估计的比较

温忠麟 （通讯作者） 王一帆

华南师范大学心理学院/心理应用研究中心, 广州, 510631, wenzl@scnu.edu.cn

摘 要 潜增长模型（LGM）是分析追踪数据的一种重要方法。LGM 是一种特殊的因子模型，但不能像通常的因子分析那样得到参数的标准化估计。对于一阶 LGM，求解标准化估计的方法是将时间点 1 的变量 X_1 进行标准化变换，其他时间点的变量逐一进行与时间点 1 相同的变换（即减去 X_1 的均值后除以 X_1 的标准差），对变换后的变量进行建模，便可得到标准化估计。

对于使用多个指标测量的潜变量，比较精确的 LGM 建模方法是从指标出发建立潜变量 LGM（也称为二阶 LGM，是二阶因子模型的特例）。因为二阶 LGM 中的一阶因子（即潜变量）的均值和方差都不是模型的参数，所以不能直接对时间点 1 的潜变量η_1进行标准化。

Yang 等（2021）在指标的信度已知或者合成分数的信度已知的假设下，提出了潜变量标准化标度方法（简称为信度已知的标准化），可以得到二阶 LGM 的一种标准化估计。但实际应用中上述信度是未知的，因而他们的方法缺乏可操作性。温忠麟等（2023）提出二阶 LGM 的一种两阶段标准化方法：第一阶段，固定η_1的均值为 0、方差为 1，设置负荷和截距有跨时间的不变性，做验证性因子分析；第二阶段：建立二阶 LGM，将指标的截距之和限制为第一时间点各指标的样本均值之和，并将负荷之和限制为第一阶段得到的负荷之和。

本文要研究的问题是，上述二阶 LGM 的两阶段标准化估计方法表现如何？使用文献中常见的 LGM 参数和相应的模型，设计了 4 种样本容量，将两阶段标准化估计与信度已知的标准化估计进行比较。模拟研究结果发现，在估计偏差、均方根误差(RMSE)等评价指标上，两阶段标准化估计与信度已知的标准化估计表现相当，但前者更具可操作性。

A comparison of two standardized estimation methods of second-order latent growth models

Wen Zhonglin, Wang Yifan
School of Psychology, South China Normal University, Guangzhou 510631, China

***Abstract*:** The latent growth model (LGM) is an important method for analyzing longitudinal data. It is a special type of factor models, but the standardized estimation of the model parameters obtained by conventional factor analysis is not appropriate. For the first-order LGM (i.e., univariate LGM), the standardized estimation method is to standardize the variable at the first time point (X_1) and then perform the same transformation (i.e., subtract the mean of X_1 and then divide it by the standard deviation of X_1) on the variables at the remaining time points. By modeling the transformed variables, standardized estimates can be obtained.

For latent variables measured by multiple indicators, a more precise modeling approach for LGM is to establish a latent variable LGM based on the indicators (also known as the second-order LGM, a special type of second-order factor models). However, since the mean and variance of the first-order factors (i.e., latent variables) in the second-order LGM are not model parameters, it is not possible to directly standardize the latent variable at time point 1 (η_1).

Yang et al. (2021) suggested a standardized estimation method for the second-order LGM (abbreviated as the standardized method with known reliability) under the assumption that the reliability of the indicator or the reliability of the composite score is known. In empirical research, however, the above reliabilities are unknown, so this method is not feasible. Wen et al. (2023) proposed a two-stage standardization method for the second-order LGM. In the first stage, a confirmatory factor analysis is conducted by fixing the mean and variance of η_1 to 0 and 1 respectively, under the assumption that loadings and intercepts are cross-time invariant. In the second stage, a second-order LGM is established, with the constraints that the sum of the intercepts of indicators equals the sum of the sample means of indicators at the first time point, and the total loadings equals the total loadings obtained in the first stage.

The present study investigated the performances of the two-stage standardized estimation method for the second-order LGM. Using common LGM parameters and corresponding models in the literature, we compared two-stage standardized estimates with those obtained by the standardized method with known reliability. Simulation results showed that the two standardized estimation methods performed rather similarly in terms of estimation bias, RMSE (root mean squared error) and other evaluation measures, but the two-stage standardization method turned out to be of greater feasibility.

密集型追踪研究中个体内和个体间信度的评估——基于两水平随机动态模型的方法

肖悦[1] 王璞珏[2] 刘红云[2]（通讯作者） 罗晓慧[2]
1 华东师范大学教育心理学系，上海，200062

2 北京师范大学心理学部，北京，100875，hyliu@bnu.edu.cn

摘 要 密集型追踪研究因在短期内对个体进行频繁、密集地测量，适合用于探究个体内部心理过程的动态变化及其作用机制与个体间差异，已成为近年来心理学领域的一大热点。但是，由于测量时间点非常密集，这类研究中使用的测验工具通常很短，很容易受到测量误差的影响，而关于这些测量是否可靠这一问题并没有受到足够的关注。已有的大多数信度评估方法或是混淆了个体内和个体间水平的变异，或是难以处理个体间差异，并不适用于密集型追踪数据。同时，在密集型追踪数据的建模方法中，测量模型总是被轻视或是直接被忽略。因此，本研究介绍了一个在密集型追踪情境下考虑所关注变量的测量模型的方法——两水平随机动态测量模型（two-level random dynamic measurement model，简称为 2RDM 模型)。该模型建立于密集型追踪数据的常用分析方法之一——动态结构方程模型（dynamic structural equation modeling, DSEM）的框架下，能够有效分离变量的个体内和个体间水平变异。基于 2RDM 模型，本研究讨论了如何进行方差分解，推导出项目和量表的个体内与个体间信度。本研究通过一个小的模拟研究，展现了 2RDM 模型在 Mplus 软件中的实现及信度指标的估计准确性。并且，本研究将所提出方法应用于简版的感知压力量表（Perceived Stress Scale, PSS），以说明该方法对于多维量表的实际应用。使用基于实际数据的 2RDM 模型参数估计值，计算了 PSS 每个项目以及分量表的个体内和个体间信度。结果显示，尽管 PSS 各项目以及分量表的个体间信度较高，均达到 0.7 以上，但是个体内信度都存在很大的个体间差异，也即，对于一部分人来说，该工具并不能可靠地测量出其实际状态的波动。

Assessing Intra- and Inter-individual Reliabilities in Intensive Longitudinal Studies: A Two-Level Random Dynamic Model-Based Approach

Yue Xiao[1], Pujue Wang[2], Hongyun Liu[2] (corresponding author), Xiaohui Luo[2]
1 Department of Educational Psychology, East China Normal University, Shanghai, 200062
2 Faculty of Psychology, Beijing Normal University, Beijing, 100875, hyliu@bnu.edu.cn

Abstract： Due to the frequent and intensive nature of measurements, intensive longitudinal studies are suitable for investigating the dynamic changes and the corresponding mechanisms as well as the interindividual differences, and are becoming increasingly popular in psychology. However, measures used in such studies are quite susceptible to measurement errors due to their short lengths and whether they are reliable has not received enough attention. Most existing approaches for assessing reliability are not appropriate for the intensive longitudinal data (ILD) because of the conflation of inter- and intraindividual variations or the difficulty in handling interindividual differences. In addition, measurement models are always relegated or omitted in the ILD modeling approaches. Therefore, in this study, we introduce a two-level random dynamic measurement (2RDM) model for ILD, which takes into account measurement models for key variables of interest. This model is built upon the dynamic structural equation modeling (DSEM) framework that is commonly used for ILD and can separate the between- and within-level variations. Then we discuss how to realize the variance decomposition and derive the within-person and between-person reliabilities for items and scales in the context of the 2RDM model. A small simulation study is presented to illustrate the implementation of the 2RDM model in Mplus and the

reliability estimation. An empirical application is also provided to demonstrate the application of the proposed approach for multidimensional scales, in which we calculated the within- and between-person reliabilities for both items and subscales of a short version of the Perceived Stress Scale. Results showed that although the inter-individual reliabilities of items and subscales were high (＞0.7), there were large inter-individual differences in the intra-individual reliabilities of items and subscales. In other words, for a subset of the participants, the instrument could not reliably measure the intraindividual fluctuations in their states over time.

Keywords： within-person reliability, between-person reliability, intensive longitudinal data, two-level random dynamic measurement model, interindividual differences

错误设定与过度参数化：往复影响模型中的模型选择

都弘彦[1]　刘源[1,2]（通讯作者）

[1]西南大学心理学部，重庆，400715

[2]认知与人格教育部重点实验室，重庆，400715

通讯作者 E-mail:lyuuan@swu.edu.cn

摘 要　往复影响模型(reciprocal effect model)是检验不同潜在心理构念之间纵向关系的常用模型。该系列模型在结构方程模型的框架下能灵活地抽取纵向设计中的不同成分，包括但不限于交叉滞后面板模型(CLPM)、特质-状态-误差模型(TSE)、自回归潜增长模型(ALT)等。由于简单模型在统计上嵌套在复杂模型中，模型设定错误(misspecification，例如，使用错误模型或获得不适当的解)和过度参数化(over-parameterization，例如，所选择模型拟合良好但参数估计不合适的复杂模型)困扰着没有明确理论依据的实证研究者。此外，近年来不少学者基于研究需要在纵向模型的构建过程中拓展出多指标模型，丰富了纵向模型的使用情境。研究旨在基于多指标视角探究纵向模型之间的模型选择，并为实证研究者提供切实的建议。采用模拟研究和实证研究以考察在拟合不同复杂程度数据集时，交叉滞后和自回归参数估计的表现。模拟研究探讨了模型复杂程度、时间点和因子载荷对不同模型拟合表现的影响，共设置 3（真模型）×3（测量时间点）×3（因子载荷）=27 个模拟条件。实证研究则基于美国青年纵向研究(Longitudinal Study of American Youth，LSAY)数据库进行。研究结果发现：（1）不管在何真实数据的情况下，TSE 模型总体优于 CLPM 和 ALT；（2）随着因子载荷和测量时间点的增加，模型参数估计精度得到提升；（3）单指标模型与多指标模型的参数估计结果比较接近。在研究者不确定数据的真实结构如何时，TSE 是更为合适的选择。该模型具有相对精确的估计结果，并且足以检验个体间和个体内成分。此外，通过增加时间点和因子载荷在一定程度上能够提升参数估计的精度。如果只有部分测量指标满足强载荷要求，确保测量指标中至少有一个或两个具有代表性的测量指标对提升估计精度有所帮助。

Misspecification and Over-parameterization: Model Selection in Reciprocal Effect Models

Hongyan Du[1] and Yuan Liu[1,2]

[1] Faculty of Psychology, Southwest University, Chongqing, 400715

[2] Key Laboratory of Cognition and Personality (SWU), Ministry of Education, Chongqing, 400715

Abstract：Reciprocal effect models are popular to examine the longitudinal relationships between different latent psychological constructs. The series of models includes but is not limited to Cross-lagged Panel Model (CLPM), Trait-State-Error Model (TSE), Autoregressive Latent Trajectory Model (LV-ALT), etc. Since the simple models are statistically nested in the complex ones, model misspecification (e.g., using the wrong model or obtaining inappropriate solutions) and over-parameterization (e.g., selecting the complex model good in model fit but inappropriate in parameter estimation) confused empirical researchers without clear theoretical basis. Moreover, many researchers have added multiple indicators to longitudinal models in their empirical research and enriched the family of longitudinal models in recent years. In the present study, we aim to provide instructions for model selection between these longitudinal models based on the multiple-indicator perspective. The study performs a simulation study and empirical study to investigate the performance of the nested models with single and multiple indicators when fitting datasets with different levels of complexity. The simulation study set 3 (true data generating models) × 3 (measurement waves) × 3 (factor loading) = 27 simulation conditions. And the empirical study is based on the database - Longitudinal Study of American Youth (LSAY). Results indicate that (1) TSE family generally outperforms CLPM and ALT families; (2) The estimated accuracy improves as the factor loadings and measurement waves increase; (3) Single-indicator models had close estimates of parameter to the multiple-indicator ones. Irrespective of the datasets, the TSE seems to be the first choice for researchers to use. It has precise estimates and is powerful enough to detect between- and within-person components. In addition, increasing time points and factor loadings can improve the estimated accuracy of the fitted model to some extent. If not all the items have high factor loadings, ensure that there are at least one or two representative items among the indicators.

时间序列中早期预警信号的阈值探索——基于变点自回归模型

陈照盟[1]　刘玥[1]

四川师范大学脑与心理科学研究院，成都，610066，helena701@126.com

摘 要　精神疾病（如焦虑症等）可被视作复杂动力系统中的不健康状态。基于临界减速理论的早期预警信号有助于预测从健康到精神疾病的转变，并及时实施干预。预警信号在时间序列上通常表现为自回归的突然增加，然而其阈值目前尚没有统一标准，为实际应用带来了困难。变点自回归模型（Change Point Autocorrelation Model，CPAM）通常用于识别心理状态转变的临界点。一般来说，预警信号后会紧接发生状态的转变。因此，本研究提出了一种基于 CPAM 确定预警信号阈值的方法。该方法主要包括三个步骤：第一，对自回归系数定义系列备选阈值（如 1σ,1.5σ,2σ,...等，σ表示所有滑动窗口自相关的标准差）；第二，使用备选阈值发出预警信号，将其作为变点，分别拟合 CPAM 并计算拟合指标（如 AIC）；计算不含变点的 CPAM 的拟合指标；第三，首先将不含变点的 CPAM 的拟合指标与每个备选阈值得到的 CPAM 的拟合指标比较，如果差异小于定义的临界值，则认为不存在状态转变；如果差异大于定义的临界值，则将拟合指标最优模型所对应的备选阈值作为最终阈值。模拟研究使用 Lotka-Volterra 模型生成数据，在包含变点的情况下，变量对当前时刻变化率的影响程度固定为在转换阶段从 0.6 均匀增长至 1.2，基线阶段和转换后阶段分别为 0.6 和 1.2。在不包含变点的情况下变量对当前时刻变化率的影响程度固定为 0.6。时间序列总长度固定为 1000 个时间点，基线阶段和转换后阶段的时间点数量相等，模型残差方差（即噪声）固定为 1。模拟因素包括：转换阶段长度（50，100，200 个时间点）；滑动窗口大小（50，100，200 个时间点）；拟

合指标 AIC 差异临界值（5,10,15,20）。三个因素完全交叉共形成 3*3*4=36 个水平的组合，在每种组合下重复生成 1 个被试的时间序列 1000 次，其中 500 次包含变点，500 次不包含变点。评价标准：真阳性率，假阳性率，识别变点和实际变点的时间差。研究结果表明：（1）随着转换阶段长度的减少，所提出方法选取阈值的表现变好；（2）更大的滑动窗口适合检测转换阶段更短的情况；（3）设置 AIC 差异临界值为 15 时选取的阈值有较低的假阳性率。

Investigating the Threshold for Early Warning Signals in Time Series Data——Based on Change Point Autoregressive Models

Chen Zhaomeng[1]　Liu Yue[1]

Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu,610066

***Abstract*：** Mental illnesses (such as anxiety disorder) can be regarded as unhealthy states in complex dynamical systems. Early warning signals based on critical deceleration theory can predict the transition from health to mental illness in order to apply interventions. Early warning signals usually manifest as sudden increases in autoregression in time series. However, the threshold for signaling a critical transition is still unclear, which limits the application of early warning signals. Change Point Autoregressive Model (CPAM) are often used to identify critical points at which mental states shift. Consequently, the current study proposed a method for determining the threshold of early warning signals based on CPAM. The method has three steps. (1) Define a series of candidate thresholds for autoregressive coefficients (e.g., 1σ, 1.5σ, 2σ,…, σ represents the standard deviation of autocorrelations from all sliding windows). (2) Locate the change points at where the early warning indicator values are above the candidate thresholds, and calculate the model fit index (e.g., AIC) of the corresponding CPAM. The fit index of CAPM without change point is calculated as well. (3) The value of fit index of CPAM without change points is compared to those of CPAM defined based on each threshold. If the difference is less than a pre-defined threshold value, it means that the improvement of model fit is too small. Thus, there is no indication for a change point. Otherwise, the threshold for the best-fitted model according to the fit index is used to locate early warning signal. In the simulation study, data were generated based on a Lotka-Volterra model. In the scenario with change point, the extent of the influence of the variable on the rate of its change (*r(t)*) was fixed as 0.6 and 1.2 at the baseline and period after transition respectively, with linear change in the transition period. In the scenario without change point, *r(t)* remained 0.6 in the whole time series. The time series length was 1000 time points, with equal length of baseline period and after-transition period. Noise intensity (i.e., residual variance of the Lotka-Volterra model) was fixed as 1. The manipulated factors were: length of transition period (50，100，200 time points)；rolling window size(50，100，200 time points)；the threshold of AIC-difference to indicate the existence of change point (5,10,15,20). Therefore, a total of 36 ($3 \times 3 \times 4$) simulation conditions were examined. For each condition, 1000 replications were generated (500 without change points, 500 with change point). The evaluation measures were true positive rate, false negative rate, and the distance between the early warning signal and its true change point. The results showed that as the length of the transition period decreased, the proposed method performed better, especially with smaller sliding window size. Smaller false negative rate was obtained when the threshold of AIC-difference was 15.

00 后大学生榜样认同对积极自我认知的影响探析

——基于榜样特质的多维探索

付丽莎[1]　昂然[1]　方若彤[2]（通讯作者）

1 北京航空航天大学马克思主义学院，北京，100191

2 伦敦大学学院心理与语言科学系，伦敦，WC1E 6BT，通讯作者 E-mail：imfangruotong@163.com

摘 要　榜样认同指的是个体充分认知榜样精神的基础上，经过引导自发产生对榜样的崇敬及模仿心理，最终自觉向榜样学习的一种理想的榜样教育下的人格范式，榜样认同影响着个体积极自我认知的形成。

本研究借助“三元论”理论模型，分析了 00 后大学生的榜样认同对其情感、认知、行为三个维度的影响。研究自编《大学生榜样认同及心理机制调查问卷》，自变量为榜样有无和榜样特质，因变量分为情感、认知、行为三个角度，其中情感维度的因变量包括自尊和生命意义感；认知维度的因变量包括自我同一性；行为维度的因变量包括匿名亲社会行为、成就动机和性格外倾程度。

研究发现，在情感方面，有榜样的人表现出更高的自尊水平和更强的生命意义感，且 00 后大学生对榜样积极态度的认同程度越高，其自尊水平也就越高；在认知方面，有榜样的人有更强的自我同一性，个体对榜样知名度和积极态度的认可都会带来更稳定的自我同一性，但对榜样财富水平的认同会降低自我同一性水平；在行为方面，有榜样的人更希望取得成就、更期待向外界展现自我，同时有更高的可能性在匿名的情况下帮助他人，进一步分析榜样特质对个体自我认同的影响，发现榜样知名度与成就动机、榜样个人美德与匿名亲社会行为、榜样积极态度与性格外倾程度之间均有显著正相关关系，而榜样的财富水平则对 00 后大学生匿名亲社会的意向产生负面的影响。

基于以上结果，本研究认为 00 后大学生群体能够感知榜样的价值观、行为标准和行为倾向等方面的特质，并将这些特质融入自我观念，形成积极的自我认知。在这一过程中建立起的积极自我认知能够为个体在社会实践中提供情感、认知、行为层面的积极引导。研究通过考察榜样对 00 后大学生自我认知的影响，厘清了榜样认同在大学生情感、认知、行为层面积极态度形成的作用路径，能够更好地指导大学生在树立榜样的过程中发现自我意义、完善自我构建，实现自我价值。

Influence of Role Model Identification on Positive Self-Cognition of the Post-00s College Students --A Multidimensional Analysis Based on Role Model Traits

Fu Lisha[1]　Ang Ran[1]　Fang Ruotong[2] (Corresponding Author)

1 School of Marxism, Beihang University, 37# Xueyuan Rd., Haidian District, Beijing, China

2 Division of Psychology and Language Sciences, University College London, Gower Street, London, United Kingdom, Email: imfangruotong@163.com

Abstract：Role model identification refers to an ideal personality paradigm under role model education, in which an individual recognizes the spirit of role models, spontaneously generates respect and imitation for role models through guidance, and consciously learns from role models. Role model identification influences the formation of an individual's positive self-cognition.

Referring to the triadic theoretical model, this study analyzes the influence of role model identification in three aspects, namely emotion, cognition, and behavior, of post-00s college students. The study compiled the *Role Model Identification and Psychological Mechanisms of College Students* questionnaire. The independent variables were role model presence and role model traits. The dependent variables were divided into emotion, cognition, and behavior groups. The dependent variables of the emotion group included self-esteem and meaning in life. The dependent variable of the cognition group included self-identity. The dependent variables of the behavior group included anonymous prosocial behaviors, achievement motivation, and extraversion of personality.

It was found that, from the perspective of emotion, people who had role models showed higher levels of self-esteem and a stronger sense of meaning in life. The higher the level of identification with positive attitudes of role models, the higher the level of self-esteem of post-00 college students. From the perspective of cognition, people who had role models were in stronger self-identity. Individuals' recognition of role models' popularity and their positive attitudes would lead to a higher level of self-identity, but role model identification of their wealth would reduce the level of self-identity. From the perspective of behavior, people who had role models had stronger desires to achieve success and to present themselves in public. They also have a higher likelihood of helping others anonymously. Discussing the effects of role model traits on an individual's self-identity, the study found that there was a statistically significant positive correlation between the role model's popularity and college students' achievement motivation, between the role model's virtues and individual's anonymous pro-social behaviors, and between the role models' positive attitudes and the extroversion of personality. While role models' wealth negatively affected individuals' intention of anonymous pro-social behaviors of post-00 college students.

Based on the above analysis, this study finds that post-00 college students can perceive the qualities of values, behavioral standards, and behavioral tendencies of role models, and integrate these qualities into their self-cognition. The positive self-cognitions established in this process provide positive guidance for individuals in social interactions in the aspects of emotion, cognition, and behavior. By examining the influence of role models on self-cognition of post-00s college students, the study clarifies the role of role model identification in the formation of an individual's positive attitudes, which can better guide college students to discover the meaning of self, improve the self-construction, and realize their self-value in the process of setting up role models.

工作倦怠对体验型消费偏好的影响及其内在机制

邢采[1]（通讯作者）周文惠[1] 王霞[2] 鲁宇涛[1]

1 中国人民大学心理学系，北京，100872

2 中国人民大学商学院，北京，100872

通讯作者 E-mail：cxing@ruc.edu.cn

摘 要 每个人都具有不同的社会角色，是工作时的打工人，也是消费时的“上帝”。随着科技的发展，生活与工作之间界限变得模糊，在工作时的状态会影响下班后的行为表现，而在消费时对消费

决策也会产生影响。随着工作节奏变快，工作压力的增加，工作倦怠逐渐成为影响个人产生各种行为的重要因素，并且作为一种稳定的心理因素持续的在生活中产生影响。

个体的每一次的消费都是一次综合状态的决策，消费者会根据自身的需求，个人的状态做出各种消费行为，比如今天下班后是去看哪一场电影或者去买哪一双新出的鞋子。然而，消费者个人状态是不同的，需求也是有先后顺序的，能够满足所有需求的消费很难在同一次消费决策中得到实现，究竟是先看电影还是先买鞋子，消费者往往会面对“厚此就可能薄彼”的处境时。不同的消费方式能够满足的需要不同，根据 Van Boven 的研究结论按照购买的目的不同能够将消费者的消费类型划分为实物型和体验型。当消费者以获得体验为目的时则为体验型消费，重视体验；当消费者以获得某种有形实物为目的则为实物消费，为了拥有或保存。

本研究基于资源保存理论和努力恢复理论，认为个体的工作倦怠状态是一种资源消耗状态，并且会持续到生活状态中，同时做出寻求资源恢复的寻求的需要，这种需要动机被称为恢复需要。在恢复需要寻求动机下进行消费时，面对体验与实物不同的消费类型，基于以往的研究发现，体验消费比实物消费给个体带来的体验优势，积极情绪和幸福感以及心理资本，社会支持更丰富，与自我的联系更加密切，在这种情况下，个体会更倾向选择体验消费。而为了更进一步证明体验消费具备的这种动机满足的功能，本研究结合恢复需要满足的过程中，恢复体验在其中的核心作用，结合体验消费优势认为体验消费可能比实物消费更容易满足恢复体验。基于此，本研究对“经历工作倦怠对消费类型的影响”这一问题进行了深入探讨，并在工作倦怠条件下探索体验型消费的这种对满足恢复体验感的优势是否成立。最后，本研究在工作倦怠-消费类型偏好的影响路径上，对恢复需要的中介作用进行了探索。

研究 1 通过两个子研究探索了工作倦怠与消费偏好的关系和工作倦怠操纵对于消费偏好的影响。结果发现，工作倦怠与体验型消费偏好存在正相关，相比于控制组，工作倦怠组的被试更偏好体验型消费。研究 2 通过操纵工作倦怠探究恢复需要在工作倦怠影响消费类型偏好这一路径上的中介作用。研究 2 发现，工作倦怠后的个体是通过恢复需要的提高而更偏好体验型消费的。研究 3 通过实验研究操纵工作倦怠与消费类型来研究体验型消费的恢复体验调节作用。研究结果显示：工作倦怠和消费类型对于个体的恢复体验存在交互作用，在工作倦怠组，相比回忆实物消费的被试而言，回忆体验消费的被试报告更高的恢复体验；研究 3 从恢复体验调节的角度解释了研究 1 的结果，即当经历工作倦怠时，个体偏好购买体验的原因之一是因为体验型消费可以帮助获得恢复体验，满足寻求恢复需要的动机。

综上，本研究深入探究了工作倦怠对个体消费类型偏好的影响，并探究了其中的中介过程，以及体验型消费在工作倦怠下对个体恢复体验满足的积极作用。具体而言，本研究发现经历工作倦怠时，个体会更偏爱体验型消费，个体的恢复需要在其中起到中介作用。同时，工作倦怠时，体验型消费能够帮助个体获得更高的恢复体验。

The Underlying Effect of the Promoting Role of Job Burnout on Experiential Consumption

Cai Xing[1], Wenhui Zhou[1], Xia Wang[1], Yutao Lu[1]

1　Department of Psychology, Renmin University of China, Beijing, 100872

2　Business School, Renmin University of China, Beijing, 100872

Abstract： As society develops and the line between life and work begins to blur, the link between an individual's role as a worker at work and his or her role as a consumer in life becomes stronger. Various factors

such as work stress can influence consumer choices. Research has shown that consumer decisions are influenced after experiencing work stress and work conflict. Compared to material consumption, experiential consumption delivers greater and persistent well-being and it is emerging as an extremely important consumption pattern. However, it is unclear how being at work affects consumers' preferences for experiential consumption. Based on the Conservation of Resources theory, four experiments were conducted to examine how job burnout affects consumers' preferences for experiential consumption.

Experiment 1a and Experiment 1b explored the effects of job burnout on consumption type preferences. Experiment 1a (*N*=200) was a questionnaire study and Experiment 1b (*N*=198) manipulated job burnout experimentally. Experiment 2 (*N*=300) built on Experiment 1b by manipulating job burnout, replicating the effect of job burnout on preference for experiential consumption choice, and further validating the mediating role of need for recovery between job burnout and preference for experiential consumption. Experiment 3 (*N*=200) used a 2 (job burnout vs. control condition) x 2 (physical vs. experiential consumption) between-subjects design to explore the advantages of experiential consumption in terms of recovery functions from a recovery experience perspective.

The main findings of this study are as follows: (1) Individuals in a state of job burnout prefer experiential consumption. (2) Need for recovery mediates the relationship between job burnout and preference for experiential consumption. Specifically, job burnout increases consumers' preference for experiential consumption by increasing their need for recovery. (3) Compared to physical consumption, experiential consumption has a higher recovery function and provides consumers with more recovery experiences. In summary, resource recovery is an important mechanism by which job burnout increases experiential consumption.

This study has theoretical and practical implications, confirming that job burnout positively affects consumers' preferences for experiential consumption and that experiential consumption has advantages in terms of restoring the experience, which provides references for promoting employees' subjective well-being and improving companies' marketing strategies.

恐惧管理理论视角下的性别化饮食：死亡凸显对两性健康饮食的影响

高阳[1*] 陆可心[2] 席欣佳[1] 甘雅晴[1]

1 西北大学公共管理学院，西安，710127，

2 同济大学心理健康教育与咨询中心，上海，200092

[*]通讯作者 E-mail：20185300@nwu.edu.cn

摘 要 公共健康宣教中常常采用凸显不健康饮食的致病和致死风险来促进大众的健康饮食，但对其效果及其作用机制却鲜有探讨。饮食不仅关乎健康，其在社会生活中也具有重要的性别文化意义：国内外研究均表明，人们普遍具有“肉类为偏男性化食物”、“蔬菜水果为偏女性化食物”的食物性别刻板印象。而恐惧管理理论的大量研究证实，在面对致死风险的死亡凸显后，人们会更加依从社会文化，当然也包括性别文化。那么，在面对健康宣教中的死亡凸显时，是否会影响两性对于饮食性别刻板文化的依从？进而影响其健康饮食呢？本研究通过两个实验展开探讨：实验一在死亡凸显（或控制）操纵后，采用饮食刻板印象量表（GBFISS）评估两性被试对饮食性别刻板文化的依从，发现死亡凸显后，两性被试对于饮食性别刻板文化认同程度都更高；实验二进一步考察在死亡凸显（或控制）操纵后，

两性被试对于典型男性化和女性化食物的选择，发现死亡凸显后，女性倾向选择典型的女性化食物（小份精致的蔬菜），而男性倾向选择典型的男性化食物（大份粗糙的肉）。这些结果说明在死亡凸显后两性会更加依从饮食性别刻板文化，选择符合自身性别刻板文化的食物，这可能反而导致男性更不健康的饮食。

Gendered Food Consumption from the Perspective of Terror Management Theory: The Effect of Mortality Salience on Gender-Specific Health Diets

Gao Yang[1], Lu Kexin[2], Xi Xinjia[1], Gan Yaqin[1]
1.School of Public Management, Northwest University, Xi' an, 710127
2. Mental Health Education and Counseling Center of Tongji University, Shanghai, 200092

Abstract： Public health education often utilizes highlighting of the risks of unhealthy diets and their association with disease and mortality to promote healthier eating habits among the general population. However, there is a limited exploration of its effectiveness and underlying mechanisms. Food consumption not only relates to health but also holds significant gender cultural implications in social life. Studies have consistently demonstrated the existence of food gender stereotypes, such as the perception of meat as predominantly masculine food and vegetables and fruits as predominantly feminine foods. Extensive research on Terror Management Theory has confirmed that individuals tend to conform to social and cultural norms, including gender norms when faced with mortality salience, a heightened awareness of mortality risk. Thus, when confronted with death salience in health education campaigns, does it influence adherence to gendered food stereotypes and subsequently impact individuals' health diets? This study aims to investigate this question through two experiments. Experiment 1 manipulated mortality salience (compare to the control condition) and assessed the conformity to gendered food stereotypes using the Gender-based food intake stereotype scale (GBFISS) among male and female participants. The findings revealed that male and female participants exhibited higher conformity to gendered food stereotypes when facing death. Experiment 2 further examined the food choices of male and female participants regarding prototypical masculine and feminine foods after mortality salience (compare to the control condition). The results indicated that females tended to choose prototypical feminine foods (smaller portions of vegetables), while males tended to choose prototypical masculine foods (larger portions of meat) after death salience. These findings suggest that individuals tend to conform more to gendered food stereotypes and select foods that align with their gender norms after experiencing death salience, potentially leading to less healthy eating patterns, particularly among males.

Keywords： terror management theory， mortality salience， gendered food consumption stereotype，gendered food stereotypes

抵抗或顺从：算法意识下的网络浏览决策行为研究

元英[1]　石垠[2]（通讯作者）　张晗瑄[1]　苏缇[2]

1 北京师范大学新闻传播学院，北京，100875

2 北京师范大学教育学部，北京，100875，shiyin@bnu.edu.cn

摘 要　随着大数据技术的不断发展，算法日益深入到我们的日常生活中。受限于自身的思维和运算能力,人们一方面依赖算法对数据进行挖掘、解析、排序和配置来获取有用信息,另一方面，又困扰于个人被算法推荐机制裹挟而产生的对个人获取信息自主性“失权”的冲击。算法意识下，人们为什么会出现算法顺从和算法抵抗，又是如何在网络浏览中产生算法权力的让渡行为？本研究从用户内生体验的角度出发，采用 2×2 的混合实验设计，以算法意识和浏览目的为自变量，考察网络浏览决策的行为变化。研究结果发现，算法意识显著减少人们浏览单条信息的时间，但增加浏览信息数量和继续浏览意愿。无论是否存在浏览目的，人们均认为被告知是算法推荐产生信息的浏览体验更好（尽管实验中所有的信息均为随机呈现）。算法意识提高人们对信息的内控感，进而增加算法顺从行为。本研究通过对移动新媒体用户顺从与抵抗算法影响因素的研究，为帮助用户摆脱技术无意识状态，达成算法善用具有一定的帮助。

Resistance or Compliance: A Study of Web-browsing Decision-making Behavior under Algorithmic Consciousness

Yuan Ying[1], Shi Yin[2](corresponding author), Zhang Hanxuan[1], Su Ti[2]

1 School of Journalism and Communication, Beijing Normal University, Beijing, 100875

2 Faculty of Education, Beijing Normal University, Beijing, 100875, shiyin@bnu.edu.cn

Abstract：With the continuous development of big data technology, algorithms are increasingly penetrating into our daily life. Restricted by their own thinking and computing power, people rely on algorithms to mine, analyze, sort and configure data to obtain useful information on the one hand, and on the other hand, they are disturbed by the impact of "disempowerment" of personal autonomy in obtaining information when they are held hostage by algorithmic recommendation mechanism. Under algorithmic awareness, why do people become algorithmically compliant and algorithmically resistant, and how do they cede algorithmic power in web browsing? This study examines behavioral changes in web browsing decisions from the perspective of endogenous user experience, using a 2×2 mixed experimental design with algorithm awareness and browsing purpose as independent variables. The results of the study found that algorithm awareness significantly reduced the time people spent browsing a single message, but increased the number of messages browsed and their willingness to continue browsing. Regardless of the presence or absence of browsing purpose, people perceived a better browsing experience when they were told that the algorithmic recommendation generated the information (even though all the information in the experiment was presented randomly). Algorithmic awareness increases people's sense of internal control over information, which in turn increases algorithmic compliance behavior. By studying the influencing factors of mobile new media users' compliance and resistance to algorithms, this study is helpful in helping users to get rid of the state of technological unconsciousness and reach algorithmic good use.

Keywords：Algorithmic consciousness, algorithmic power,compliance, resistance, internal control

感恩对创新决策的影响：自尊的中介作用

王晓宇[1] 张玉凤[1]（通讯作者）
1 北京师范大学教育学部，北京，100875，zhangyf19@bnu.edu.cn

摘 要 感恩作为一种积极情绪，对于个体心理健康和组织良性发展具有重要的促进作用。近年来，学界逐渐开始关注感恩对决策的影响机制，却很少有研究关注在组织管理领域感恩对个体创新决策的影响及其内在机制。本研究通过四个一系列的实验，深入探讨了感恩对组织中的个体创新意愿和行为的影响及其机制。研究一采用特质感恩量表和创新意愿量表，初步证实了特质感恩对个体创新意愿和行为的正向预测作用。研究二进一步探讨了在两种具体的决策情境下，特质感恩对个体创新意愿和行为的影响。研究三采用实验操控的方式，证实了状态感恩与个体在具体决策情境下的创新意愿之间的因果关系。研究四进一步探讨了自尊在感恩与组织中的个体创新意愿之间关系中的中介作用机制。总之，本研究系统探讨了感恩对组织中的个体创新决策的影响，及其自尊在二者关系中的中介作用，拓展了感恩在组织管理领域中的影响研究，对于促进组织管理情境中的员工创新行为具有重要的启示作用。

How gratitude affects innovative decision making: the mediating role of self-esteem

Xiaoyu Wang
Faculty of Education, Beijing Normal University, Beijing, 100875
Yufeng Zhang
Faculty of Education, Beijing Normal University, Beijing, 100875

Abstract： Gratitude, as a specific positive emotion, has been proved to predict individual well-being and organizational development positively. Recently researchers have paid increasing attention to how gratitude affects decision making, yet little research has explored the effect of gratitude on innovative intention in organizational behavior. Therefore, the present research aimed to examine how gratitude affects innovative intention and behavior and the underlying mechanism, and four studies were conducted to test our two hypotheses. Study 1 examined how trait gratitude affects innovative intention by scales and preliminarily supported our main hypothesis. Study 2 further explored the relationship between trait gratitude and innovative intention in specific scenarios. Study 3 experimentally manipulated state gratitude and tested the causal link between gratitude and innovative intention. Study 4 explored the mediating role of self-esteem in the relationship between gratitude and innovative intention. The present research adds evidence to how gratitude affects decision making in organizational settings, and have practical implications on how to stimulate organizational innovative behavior.

Keywords： gratitude, innovation, decision, self-esteem

追求稳定还是无私奉献：街头官僚在风险决策中的避责倾向

秦川申　孟悦

上海交通大学国际与公共事务学院，上海，200030

摘 要　街头官僚是直接与公众互动的公职人员，在执行工作时具有实质性的自由裁量权。一方面，由于日常工作中需要面临复杂琐碎的公共事务，街头官僚可能通过自由裁量权让自己的工作变得安全和轻松；另一方面，公职人员的公共服务动机驱动街头官僚在处理公共事务时具有奉献精神。既有研究指出街头官僚在风险决策中由于风险厌恶而存在避责倾向。但是街头官僚在不同概率以及不同框架下是否都存在避责倾向？这些避责倾向是否存在差异？这些差异如何受到公共服务动机的调节？这些问题还有待研究。本文基于上海基层公务员样本，采用实验设计，以台风应急管理为情景，从避责视角对街头官僚的风险决策进行了研究，检验了不同概率水平（大概率 vs 小概率）的框架效应（收益框架 vs 损失框架）如何对街头官僚的避责倾向产生影响。研究发现：（1）概率水平的主效应显著，在大概率风险决策中，街头官僚有更高的避责倾向；（2）框架效应的主效应显著，在损失框架风险决策中，街头官僚有更高的避责倾向；（3）概率水平和框架效应的交互效应显著，在大概率损失框架的风险决策中，街头官僚有更高的避责倾向；（4）公共服务动机能够调节风险条件对避责倾向的影响，更高的公共服务动机削弱了风险决策情景的影响。本研究整合了外部风险决策条件和内在公共服务动机，深化了对街头官僚避责倾向机制的解释；此外，本研究也进一步将心理学与公共管理进行融合，丰富了行为公共管理的应用。

关键词　风险决策，框架效应，概率水平，街头官僚，避责倾向

Stability or selflessness: street bureaucrats' intention to avoid blame in risk decision-making

Chuanshen Qin　　Yue Meng

1 School of International and Public Affairs, Shanghai Jiao Tong University, Shanghai, 200030

Abstract：Street-level bureaucrats are public officeholders who interact directly with citizens and have substantive discretion in the execution of their work. On the one hand, because of the complexity of public affairs in their daily task, street-level bureaucrats may use discretion to make work safe and easy. On the other hand, the public service motivation (PSM) of public officials drives street-level bureaucrats to sacrifice themselves in the conduct of public affairs. Previous studies have indicated that street-level bureaucrats intend to avoid blame due to risk aversion in risk decision-making. However, the following questions remain unanswered. Do street-level bureaucrats intend to avoid blame in different probabilities and framings? Are there differences in intention of blame avoidance? How are these differences moderated by PSM? Based on the sample of grassroots civil servants in Shanghai, applying experimental design in a scenario of typhoon emergency management, this study explains the risk decision-making of street-level bureaucrats from the perspective of blame avoidance. Specifically, this study examines how the framing effect (gain-framed vs loss-framed) of different probability levels (high probability vs small probability) affects the street-level bureaucrats' intention to avoid blame. The results show that (1) the main effect of probability level is significant, and street-level bureaucrats have a higher intention to avoid blame in high-probability risk decision-making. (2) The main effect of the framing effect is significant, and in the loss-framed condition, street-level bureaucrats have a higher intention to avoid blame. (3) The interaction

effect of probability level and framing effect is significant, and in the risk decision of high probability loss-framed condition, street-level bureaucrats have a higher intention to avoid blame. (4) PSM can moderate the influence of risk conditions on the intention to avoid blame, and higher PSM weakens the impact of risk decision-making conditions. This study synthesizes the external risk decision-making conditions and intrinsic public service motivation to deepens the explanation of the mechanism of street-level bureaucrats' intention to avoid blame. In addition, this study further integrates psychology and public administration, enriching the application of behavioral public administration.

Keywords：risk decision-making, framing effect, probability level, street-level bureaucrats, intention to avoid blame

超强台风后青少年自我同情与内化问题发展的关系：反刍发展变化的作用

黄佳丽　周宵（通讯作者）

浙江大学心理与行为科学系，杭州，310028，通讯作者 E-mail: psyzx@zju.edu.cn

摘 要　内化问题在青少年群体中普遍存在，可能会影响到他们的外化问题、学业问题等。自我同情理论和现有研究表明，自我同情高的个体能够不回避也不过分沉溺于消极情绪，可能通过反刍的情绪调节方式对内化问题产生影响。然而目前对青少年内化问题的机制探讨主要关注变量自身水平层面，这忽略了影响因素对内化问题发展的影响作用，以致青少年内化问题干预效果缓慢。为此，本研究采用纵向追踪数据来探究经历台风利奇马后青少年积极和消极自我同情与内化问题发展变化的关系，以及侵入反刍和主动反刍发展变化的中介作用。研究采用自陈量表获取台风后青少年三次追踪数据 1342（$M_{年龄}$ 17.14，SD = 1.54；44.6% 为男生），被试报告了他们在台风后 3 个月（T1）的创伤暴露和积极、消极自我同情，以及他们在台风后 3 个月、15 个月（T2）和 27 个月（T3）的侵入反刍、主动反刍和内化问题（创伤后应激障碍和抑郁）。潜变量增长模型结果发现，台风后青少年的内化问题、侵入反刍和主动反刍均呈显著下降趋势。潜变量增长中介模型结果发现，消极自我同情不仅可以直接地正向预测内化问题的截距，还可以间接地分别通过侵入反刍和主动反刍的截距，或通过侵入反刍的截距经主动反刍的截距产生影响；消极自我同情可以直接或间接地通过侵入反刍的斜率对内化问题斜率产生负向影响。积极自我同情可以直接或间接地通过主动反刍的截距对内化问题的截距产生负向影响，但对内化问题的斜率没有影响作用。这些结果说明消极自我同情主要通过侵入反刍对青少年台风后内化问题的初始水平和变化速率产生消极影响，积极自我同情则主要通过主动反刍对青少年内化问题产生缓解作用，但这一作用只体现在初始水平层面。该研究结果提示临床工作者在对青少年内化问题进行干预时应将重点放在缓解消极层面上，减轻青少年消极自我同情和侵入反刍，从而加速内化问题的下降过程，而非通过促进积极自我同情和主动反刍只缓解当下的内化问题。

The relationship of self-compassion and the development of internalizing problems among adolescents following super typhoon Lekima: the role of the development of rumination

Jia-li HUANG, Xiao ZHOU
Department of Psychology and Behavioral Sciences, Zhejiang University Hangzhou China

Abstract: Internalizing problems is considered common among adolescents, which is associated with externalizing problems and low academic achievement. Self-compassion theory and prior studies have posited that individuals with high level of self-compassion are able not to avoid or overindulge in negative emotions, which may associate with internalizing problems via rumination. However, the literature of the mechanism of adolescents' internalizing problems mainly focused on variables themselves, and ignored exploring the influence of risk factors on the development of internalizing problems, which may lead to low intervention effect. Therefore, in this study, longitudinal data was used to explore the associations of positive self-compassion (PSC) and negative self-compassion (NSC) with the development of internalizing problems, and the mediating role of the development of intrusive rumination (IR) and deliberate rumination (DR) among adolescents following super typhoon Lekima. The data of 1342 longitudinal adolescents was collected using self-report scale (44.6% were boys; *M*age = 17.14 years old, *SD* = 1.54). Participants reported their trauma exposure, PSC and NSC 3 months after typhoon (T1), as well as IR, DR, and internalizing problems (posttraumatic stress disorder and depression) 3, 15, and 27 months after typhoon (T1- T3). The results of latent univariate growth models showed decrease in ID, DR, and internalizing problems over time. The latent growth mediation model indicated that NSC was not only directly predicted the intercept of internalizing problems, but also indirectly via the intercept of IR and DI respectively, or indirectly via the intercept of IR and then to the intercept of DR; NSC negatively predicted the slope of internalizing problems directly, or indirectly via the slope of intrusive rumination. PSC could negatively predict the intercept of internalizing problems directly, or indirectly via the intercept of DR, but have no prediction in the slope of internalizing problems. The results indicate that NSC has a negative effect on the initial level and decline rate of internalizing problems after typhoon mainly through IR, while the alleviating role of PSC on internalizing problems mainly through DR, only showing at initial level. That advises clinical workers paying more attention to alleviating the negative aspects of adolescents, reducing NSC and IR to accelerate the decline rate of internalization problems. Promoting their PSC and DR could only alleviate the current internalization problems.

Keywords*:* internalizing problems, positive and negative self-compassion, intrusive rumination, deliberate rumination, latent growth mediation model

基于网络分析探索大学生童年创伤类型、创伤后应激障碍与抑郁的关系及性别差异

刘艾祎[1] 刘明宵[1] 任怡臻[1] 林文舟[1] 伍新春[1,2](通讯作者)
1 北京师范大学心理学部，北京，100875
2 北京师范大学应用心理学院（珠海校区），广东，519087，xcwu@bnu.edu.cn

摘 要　研究目的：经历童年创伤的大学生常常表现出创伤后应激障碍（PTSD）和抑郁等心理病理性症状，而二者又在经历过童年创伤的群体中高病名。然而，目前对童年创伤群体的干预在有效性上存在局限，而探究不同童年创伤类型与成年后个体不同的心理病理性症状是精准化干预的基础。本研究旨在运用网络分析探究不同类型童年虐待、PTSD 和抑郁之间的复杂联系。方法：本研究从 5,231 名大学生中筛选出 481 名经历过童年创伤，并达到 PTSD 和抑郁症状临床诊断值的被试（平均年龄为 19.25 岁，女性占比 54.5%）。被试分别完成了经过信效度检验的测量工具，用于评估童年创伤、PTSD 和抑郁症状。结果：对整体样本进行的网络分析显示出不同类型童年虐待、PTSD 症状簇和抑郁之间的强相关。在 PTSD 和抑郁中最核心的症状是负性认知和情绪改变，而情感虐待在不同类型童年创伤类型中显示出最高的中心性。在比较不同性别子网络的中心性时发现，性虐待、身体忽视、情感忽视和回避等节点上存在显著的性别差异。结论：本研究的发现确认了不同形式的童年创伤与成年后的心理病理症状之间复杂而多面的联系。此外，负性认知和情绪改变可能是最显著的症状，而情感虐待可能在不良心理结果中起着重要作用。此外，在不同性别个体中，虐待类型和心理病理症状存在显著差异。

Exploring Gender Differences in the Relationships Among Childhood Maltreatment, PTSD, and Depression in young adults through Network Analysis

Aiyi Liu[1], Mingxiao Liu[1], Yizhen Ren[1], Wenzhou Lin[1], Xinchun Wu[1, 2*]

[1]Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing 100875, China

[2]School of Applied Psychology, Beijing Normal University at Zhuhai, Zhuhai, Guangdong 519087, China

Abstract ： *Background and objectives:* College students who have experienced childhood maltreatment commonly exhibit psychopathology symptoms such as post-traumatic stress disorder (PTSD) and depression. However, the current interventions for childhood maltreatment are limited in their efficacy. The aim of this study is to use network analysis to investigate the complex connections among various types of childhood maltreatment, PTSD, and depression. *Methods:* This study involved 481 participants (*M* = 19.25 years, 54.5% female) who were selected from a larger sample of 5,231 college students. These participants had experienced childhood maltreatment and exhibited significant clinical symptoms of PTSD and depression. The participants completed validated measures that assessed childhood trauma, PTSD, and depression. *Results:* The network analysis performed on the entire sample revealed robust connections among various types of childhood maltreatment, symptom clusters of PTSD, and depression. The most central symptom that emerged was negative alterations in cognitions and mood emerged (NACM), with emotional abuse displaying the highest centrality measure among the various types of childhood maltreatment. Upon comparing the subnetworks, the centrality analysis identified significant gender differences in nodes such as sexual abuse, physical neglect, emotional neglect, and avoidance. *Conclusions:* The study's findings confirm that various forms of childhood abuse have intricate and multifaceted connections with psychopathological symptoms in adulthood. The study suggests that NACM could be the most

significant symptom, and emotional abuse may play a vital role in adverse psychological outcomes. Furthermore, significant differences were observed in the types of abuse and psychopathological symptoms among individuals of different genders.

童年期虐待和欺凌受害的模式及其与大学生创伤后应激障碍症状的关系：自我同情的中介作用

刘明宵[1] 刘思含[1] 刘艾祎[1] 余晓晴[1] 伍新春[1,2](通讯作者)

1 北京师范大学心理学部，北京，100875

2 北京师范大学应用心理学院（珠海校区），广东，519087，xcwu@bnu.edu.cn

摘 要 家庭和校园是个体社会化的主要场所，对个体发展起着重要的作用。目前大多数研究分别探究了来自家庭和学校逆境的影响。然而，家庭虐待和校园欺凌受害可能同时发生，进而对个体产生共同影响。鉴于两者关系密切，只关注一种环境的逆境形式会高估这一创伤事件的作用。因此，本研究将同时关注家庭和学校这两种逆境形式。采用潜在剖面分析识别中国大学生在发展早期受到的家庭虐待和欺凌受害的模式，并检验不同模式对创伤后应激障碍(post-traumatic stress disorder, PTSD)症状的影响及自我同情的中介作用。采用童年期虐待、欺凌受害、自我同情和 PTSD 量表，对来自河北和湖北的 5231 名大学生(男生 2171 人，女生 3060 人，平均年龄 19.40 ± 1.47 岁)进行调查，并采用潜在剖面分析和结构方程模型进行数据分析。结果发现：（1）家庭虐待和欺凌受害模式可分为五个亚群组：低风险组(72.6%, *n* = 3800)、忽视组(14.2%, *n* = 742)、欺凌受害组(8.1%, *n* = 425)、严重虐待组(2.9%, *n* = 152)和多重受害组(2.1%, *n* = 112)；（2）与低风险组相比，严重虐待组、欺凌受害组和多重受害组表现出更强的 PTSD 症状，而忽视组表现出更低 PTSD 症状；（3）以低风险组为基准组，积极和消极的自我同情在严重虐待组、欺凌受害组和多重受害组与 PTSD 症状的关系中起并行中介作用，而在忽视组中起到完全中介的作用。本研究为揭示家庭虐待和欺凌受害的模式提供了新的视角，强调了关注个体可能存在的不同创伤模式的重要性，以及针对不同的群体培养自我同情能力的必要性。

Profiles of Childhood Maltreatment and Bullying Victimization and Their Associations with Posttraumatic Stress Disorder Symptoms among College Students: The Mediating Role of Self-Compassion

Mingxiao Liu[1], Sihan Liu[1], Aiyi Liu[1], Xiaoqing Yu[1], Xinchun Wu[1,2*]

[1]Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing 100875, China

[2]School of Applied Psychology, Beijing Normal University at Zhuhai, Zhuhai, Guangdong 519087, China

Abstract: Family and school are both crucial for youth development because they are the main places of socialization. Most current studies have examined impact one of adversities from family or school and not both in a single study, but family maltreatment and bullying victimization may co-occur and exert a joint impact on youth.

Given the high correlation between them, focusing on only one form of environmental adversity overestimates the role of this traumatic event. Therefore, we identified the profiles of family and peer victimization and then explored how these profiles are related to post-traumatic stress disorder (PTSD) symptoms through self-compassion. In total, 5231 college students ()were recruited from Hebei and Hubei provinces in mainland China in this study and completed questionnaires for childhood maltreatment, bullying victimization, self-compassion, and PTSD. The latent profile analysis and structural equation model were used for data analyses. In total, five profiles were identified: low-risk (72.6%, *n* = 3800), neglect (14.2%, *n* = 742), bullying victimization (8.1%, *n* = 425), severe maltreatment (2.9%, *n* = 152), and doubly disadvantaged (2.1%, *n* = 112). Compared with the low-risk group, the severe maltreatment, bullying victimization, and doubly disadvantaged groups report higher levels of PTSD symptoms, whereas the neglect group was more negatively related to PTSD symptoms. Meanwhile, compared with the low-risk group, positive and negative self-compassion exerted mediating functions in the relationship between severe maltreatment, bullying victimization, and doubly disadvantaged groups association with PTSD symptoms but a full mediating role in the neglect group. The identification of maltreatment and victimization profiles suggests that interventions need to be administered to college students in the specific profiles. This study reveals new insights into the patterns of childhood maltreatment and bullying victimization in Chinese youths and implies that the importance of focusing on the different patterns of trauma. It also highlights the necessity of developing self-compassion for distinct groups.

警察工作倦怠的潜在类别转变及其影响因素

程选[1]　安媛媛[1]（通讯作者）

[1]南京师范大学心理学院，南京，210097，anran220@163.com

摘 要　工作倦怠是指个体因为不能有效应对工作上延续不断的各种压力，而产生的一种长期性反应，包括情绪衰竭(emotional exhaustion, EE)、玩世不恭(cynicism, Cy)和成就感低落(decreased professional efficacy, PE)。警察群体面临高压力、高风险的工作任务，可能发展出不同类型的工作倦怠模式，但以往研究较少关注警察工作倦怠潜在类别及其转变情况。本研究于 2020 年 5 月(T1)、2020 年 9 月(T2)和 2021 年 1 月(T3)三次对 325 名警察(78.77%男性)的工作倦怠水平进行了追踪施测，采用潜在剖面分析和潜在转变分析方法探究警察工作倦怠类型转变及其影响因素。结果发现：(1)T1 时警察工作倦怠存在“中 EE-中 Cy-中 PE”(占比 69.54%)、“高 EE-高 Cy-中 PE 组”(占比 30.46%)两种类型，T2 和 T3 时警察工作倦怠存在“低 EE-低 Cy-低 PE”(T2 占比 32.31%；T3 占比 32.62%)”、“中 EE-中 Cy-中 PE”(T2 占比 52.62%；T3 占比 53.54%)和“高 EE-高 Cy-中 PE”(T2 占比 15.08%；T3 占比 13.85%)三种类型；(2)性别和警种与 T1 两种工作倦怠类型关联显著(*p*s < 0.05)，年龄和受教育水平与 T2 三种工作倦怠类型关联显著(*p*s < 0.05)，婚姻状况和受教育水平与 T3 三种工作倦怠类型关联显著(*p*s < 0.05)；(3)从 T2 到 T3，警察工作倦怠的三种类型均保持较高的稳定性(转变概率为 0.811~0.926)；(4)婚姻状况能显著预测警察工作倦怠类型从 T2 到 T3 的转变(*p*s < 0.05)。研究结果有助于深化对警察群体工作倦怠发展模式的理解，并提示管理部门有必要对警察的社会人口学信息进行多方位了解，对其工作倦怠进行动态监测，以便根据不同类型和社会人口学特点制定更具针对性的预防和干预方案。

The profiles and transition patterns of police officers' burnout and its effect factors: A latent transition analysis

Xuan Cheng[1], Yuanyuan An[1] (Corresponding author)
[1] School of Psychology, Nanjing Normal University, Nanjing, China, anran220@163.com

Abstract: Burnout refers to a long-term reaction that individuals experience due to their inability to effectively cope with various ongoing pressures at work, including emotional exhaustion (EE), cynicism (CY), and decreased professional efficiency (PE). The police officers face high pressure and high-risk work tasks, and may develop different burnout patterns. However, previous studies have paid less attention to the profiles and transition patterns of police officers' burnout. This study tracked and measured the level of burnout among 325 police officers (78.77% male) three times in May 2020 (T1), September 2020 (T2), and January 2021 (T3). Latent profile analysis and latent transition analysis were used to explore the profiles and transition patterns of police officers' burnout and their effect factors. The results showed that: (1) At T1, there were two patterns: "medium EE-medium Cy-medium PE" (69.54%) and "high EE-high Cy-medium PE" (30.46%). At T2 and T3, there were "low EE-low Cy-low PE" (32.31% for T2; 32.62% for T3), "medium EE-medium Cy-medium PE" (52.62% for T2; 53.54% for T3), and "high EE-high Cy-medium PE" (15.08% for T2; (accounting for 13.85%) three patterns; (2) There was a significant correlation between gender and police type and the two patterns of burnout in T1 (ps < 0.05), age and education level were significantly correlated with the three patterns of burnout in T2 (ps < 0.05), and marital status and education level were significantly correlated with the three patterns of burnout in T3 (ps < 0.05); (3) From T2 to T3, the three patterns of police officers' burnout maintain high stability with a transition probability of 0.811 to 0.926; (4) Marriage status can significantly predict the transition of police officers' burnout patterns from T2 to T3 (ps < 0.05). The results of the study help to deepen the understanding of the development patterns of police officers' burnout, and remind the management department of the need to understand the social demography information of the police from multiple perspectives, and dynamically monitor their burnout, so as to formulate more targeted prevention and intervention programs according to different types and social demography characteristics.

有童年期人际创伤的大学生复杂性创伤后应激障碍和抑郁症状共存模式及性别差异

林文舟[1] 伍新春[12]
1 应用实验心理北京市重点实验室，心理学国家级实验教学示范中心（北京师范大学），北京 100875
2. 北京师范大学应用心理学院（珠海校区），广东 519087 伍新春 xcwu@bnu.edu.cn

摘 要 童年期人际创伤可能导致个体在青春期和成年早期出现 CPTSD 和抑郁障碍的症状，并且影响其社会适应和身心健康。本研究旨在以经历过童年期人际创伤的大学生群体为研究对象，鉴别这一群体中 CPTSD 和抑郁障碍之间的关系，识别其相关风险因素，并考察其性别差异，对于有效开展预防和干预具有重要意义。为此，本研究采用网络分析方法，构建一个囊括所有 CPTSD 和抑郁症状的共存网络，探索 CPTSD

和抑郁在这一群体中的症状表现，并使用网络比较检验男性和女性样本在 CPTSD 和抑郁症状表达上的差异。结果发现：

（1）在 CPTSD 和抑郁症状共存网络中，存在五个子网络，分别为 PTSD 子网络、DSO 子网络、抑郁情绪伴躯体化症状子网络、抑郁情绪伴人际关系子网络、缺乏积极情绪子网络。其中，抑郁情绪、人际关系问题、感到失败和回避症状是共存网络的核心症状，情绪调节困难、高度警觉和孤独感是两种障碍之间的桥接症状。

（2）从宏观上来看，CPTSD 和抑郁症状共存网络均是由 CPTSD 症状激发抑郁症状，且是由 PTSD 症状簇激发 DSO 症状簇。噩梦是触发两种障碍的初始症状，没有任何一个节点指向它。食欲不振、活力减退是两种障碍的末端症状，不触发任何节点。

（3）CPTSD 和抑郁共存网络的性别差异主要体现在抑郁症状上。男性以抑郁情绪激活和维持共存网络；女性除情绪外，还受人际关系影响。二者在抑郁子网络中的激活路径也不同，女性从抑郁情绪伴人际关系子网络激活共存网络，而男性更多从抑郁情绪伴躯体化子网络激活共存网络。

总之，本研究首次在经历过童年期人际创伤的大学生群体中，利用网络分析模型，构建了 CPTSD 和抑郁症状共存的网络，在症状层面探讨了 CPTSD 和抑郁症状的共存模式，并得到以下结论：（1）PTSD、DSO 和抑郁是不同但相关的结构；（2）情绪调节困难、高警觉和孤独感在 CPTSD 和抑郁的共存中起到了关键作用；（3）CPTSD 和抑郁共存潜在的因果机制可能是 PTSD 激活 DSO，进而引发抑郁；（4）CPTSD 和抑郁共存的性别差异重点在于抑郁子网络的激活和维持有所不同。

THE CO-OCCURRENCE PATTERNS AND GENDER DIFFERENCES OF CPTSD AND DEPRESSION SYMTOMS AMONG COLLEGE STUDENTS WHO EXPERIENCED CHILDHOOD MALTREATMENT

Wenzhou Lin[1], Xinchun Wu[12]

1. Faculty of Psychology, Beijing Normal University, Beijing 100875, China；
2. School of Applied Psychology, Beijing Normal University at Zhuhai, Guangdong 519087, China

Abstract **：** Childhood maltreatment may lead to CPTSD and depression symptoms in adolescence and early adulthood, and affect their social functioning and mental health. Therefore, identifying the relationship between CPTSD and depressive disorder among college students who experienced childhood maltreatment, recognizing their associated risk factors, and examining their gender differences are important for developing effective prevention and intervention strategies. This study used network analysis to construct a co-occurrence network of all CPTSD and depression symptoms, and explored the symptom expression of CPTSD and depression in this population. Moreover, our study used network comparison test to compare the male and female samples in terms of CPTSD and depression symptom expression. We found that:

(1) In the co-occurrence network of CPTSD and depression symptoms, there were five sub-networks, namely PTSD, DSO, depressive mood with somatic symptoms, depressive mood

with interpersonal problems, and lack of positive affect sub-networks. Depressive moods, relationship problems, feel defeated, avoidance symptoms were the core symptoms of the co-occurrence network, and emotion dysregulation, hyperarousal and loneliness were the bridge symptoms between the two disorders.

(2) From a macro perspective, the co-occurrence network of CPTSD and depressive disorder symptoms was activated by CPTSD symptoms, and the PTSD symptom cluster activated the DSO symptom cluster. The node of nightmares was the initial symptoms that triggered the two disorders, and no node pointed to it. Loss of appetite and reduced vitality were the end symptoms of the two disorders, and did not trigger any node.

(3) The gender difference in the co-occurrence network of CPTSD and depression is mainly reflected in the depression symptoms. Males activate and maintain the co-occurrence network with depressive mood, while females were affected by interpersonal problems in addition to emotional problems. They also have different activation paths in the depression sub-network. Females activate the co-occurrence network from the depressive mood with interpersonal relationships sub-network, while males more often activate the co-occurrence network from the depressive mood with somatic symptoms sub-network.

In summary, our study was the first to construct a co-occurrence network of CPTSD and depressive disorder symptoms in college students who experienced childhood interpersonal trauma, using network analysis model and without the boundaries defined by existing diagnostic criteria. Our study explored the co-occurrence pattern of CPTSD and depression symptoms at the symptom level, and obtained the following conclusions: (1) PTSD, DSO and depression were different but related structures; (2) emotion regulation difficulties, hyperarousal and loneliness played a key role in the co-occurrence of CPTSD and depression; (3) the potential causal mechanism of CPTSD and depression co-occurrence might be that PTSD activated DSO, which then led to depression; (4) the gender differences in CPTSD and depression co-occurrence were mainly in the activation and maintenance of the depression sub-network.

一线医务工作者的心理应激反应、影响因素及干预策略的研究进展：以新冠疫情为例

周宁宁[1] 申了[1] 田雨[1] 席居哲[1]（通讯作者）

1 华东师范大学心理与认知科学学院，华东师范大学附属精神卫生中心，上海市心理健康与危机干预重点实验室，上海，200062 通讯作者 Email: jzxi@psy.ecnu.edu.cn

基金信息：国家社会科学基金青年项目(21CSH091)

摘要 2022 年底疫情防控进入优化调整期，目前，一线医务人员已不像疫情期间处于绷紧状态，但长期高强度、高风险的一线工作经历仍会有部分遗留影响，如部分人员可能仍存在慢性应激反应；而且，我们也需要思考和总结，如何在危机事件爆发时以及结束后，为医务工作者提供有针对性的心理社会支持。本研究通过回顾已有研究成果，分别从心理应激反应、

影响因素和干预策略三个方面对国内外研究现状进行梳理，总结当前研究所存在的局限性，提出可能的方向，旨在为改善医务工作者的心理健康，做好相应的社会心理服务提供可能的进路和方法。

方法：检索国内外新冠疫情防控一线医务工作者心理健康相关文献，系统总结并分析一线医务工作者的心理应激反应、影响因素及干预策略。

结果：一线医务工作者呈现出急慢性心理应激反应，包括失眠、疲劳等躯体症状，抑郁、焦虑、创伤后应激等心理症状。个体、工作和社会三个层面的风险和保护因素会影响心理应激反应。国内外研究者开发了多种类型的线上和线下干预策略。线下干预包括以下内容，心理科普，积极心理学培训，涵盖倾听、正念、确认、认知重构等的心理健康支持计划，等等。线上干预包括，聚焦心理支持、生活管理等主题的线上非结构式团体心理咨询，心理科普数字化工具包，心理弹性训练，基于认知行为和正念疗法的自我管理式心理干预，等等。不同的干预策略均能在一定程度上帮助一线医务工作者缓解压力。

结论：已有研究多聚焦于疫情爆发期，针对疫情常态化阶段的长期追踪研究较为匮乏；干预研究更多报告方案的开发和执行，而较少涉及干预效果的循证检验，未来可考虑结合数字化技术开发干预方案并检验干预效果。

关键词 一线医务工作者，心理应激反应，影响因素，心理干预

Research progress about the psychological reactions, influential factors, and intervention strategies in frontline healthcare workers: taking the COVID-19 as an example

Ningning Zhou[1], Liao Shen[1], Yu Tian[1], Juzhe Xi (Corresponding author) [1]

1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China, Correspondence: jzxi@psy.ecnu.edu.cn

Abstract At the end of 2022, epidemic prevention and control entered a period of optimization and adjustment. At present, front-line medical staff are no longer in a tense state like they were during the epidemic, but long-term high-intensity, high-risk front-line work experience might still have some legacy effects. For example, some personnel may experience chronic stress reactions. Moreover, we also need to reflect and summarize how to provide targeted psychosocial support for medical workers when a crisis breaks out and after it ends. By reviewing the existing research, this study sorts out the research status from the three aspects of psychological stress response, influencing factors and intervention strategies, summarizes the limitations of the current research, and proposes possible directions, aiming to provide possible approaches and methods for improving the mental health of medical workers and providing corresponding social and psychological services.

Methods By reviewing English and Chinese literature regarding the mental health of front-line medical workers during the Covid-19 epidemic, we summarized and analyzed the

psychological stress response, influencing factors, and intervention strategies.

Results The front-line medical workers showed acute and chronic stress responses, including physical symptoms such as insomnia and fatigue, and psychological symptoms such as depression, anxiety, and post-traumatic stress. Risk and protective factors at the individual, work, and social levels affect their responses. Researchers developed various types of online and offline intervention strategies. Offline interventions include, psychological education, positive psychology training, mental health support programs (e.g., listening, mindfulness, confirmation, and cognitive restructuring), etc. Online interventions include online unstructured group counseling focusing on topics such as psychological support and life management, digital toolkits for psychological education, psychological resilience training, self-management psychological interventions based on cognitive behavior and mindfulness therapy, etc. These interventions can help front-line medical workers relieve stress.

Conclusion Most of the existing research focuses on the outbreak period, and long-term follow-up research on the normalization stage of the epidemic is relatively scarce. Intervention research is more about the development and implementation, and evidence-based tests of intervention effects are few. In the future, digitalization technology can be combined when developing intervention programs.

新冠疫情下中国留学生心理危机远程干预的反思

摘要：新冠疫情对中国留学生的心理健康提出新的挑战，部分中国留学生出现急性焦虑发作、自伤甚至幻觉妄想等，由于文化、个性和家庭等因素影响，远程心理危机干预服务成为应急途径之一，针对留学生心理问题分类、伦理、干预效果评价和督导等，作者从多个角度探索和反思，为留学生心理危机数字化干预积累了可靠经验。

关键词：中国留学生；心理危机；远程干预；反思

Reflections on Remote Intervention for Psychological Crisis among Chinese International Students

Abstracts:The COVID-19 epidemic has posed new challenges to the mental health of Chinese international students, and some Chinese international students have experienced acute anxiety attacks, self-injury, even hallucinations and delusions, etc. Due to the influence of culture, personality, and family, remote psychological crisis intervention services have become one of the emergency response pathways, and with regard to the categorisation of international student's psychological problems, ethics, evaluation of the intervention effect, and supervision, etc., the authors have explored and reflected on the issue from multiple perspectives, and have accumulated reliable experience in digital intervention for international student's psychological crises.

Keywords:Chinese international students; psychological crisis; remote intervention; reflection

提高成年早期个体亲密关系质量：治疗性评估和收集信息模型的比较

严文华[1] 靳雯悦[2] 岳冰洁[2] 杨美潭[2]

1 华东师范大学心理与认知科学学院，上海市心理健康与危机干预重点实验室，上海 200062

2 华东师范大学心理与认知科学学院，上海，200062

摘要

成年早期个体心理发展水平并不成熟，缺乏亲密关系相关经验及能力，因此成年早期个体的亲密关系质量不稳定，存在不良交流、冲突、糟糕的应对方式等问题，对其身心健康造成消极影响。目前针对成年早期个体亲密关系的辅导和改善方案主要包括测验评估反馈以及关系教育，但传统的测验评估反馈即信息收集模型（information gathering, IG）并未实现个性化反馈，关系教育较为枯燥，参与者缺乏积极性，成年早期个体需要更为有效的亲密关系改善方案。治疗性评估（therapeutic assessment, TA）是一种以心理测验为简短治疗核心的评估和干预的半结构化模型，与传统模型相比较，治疗性评估更为个性化，强调评估者与被评估者之间的联系，具有效率高、时间短等优势，且已被证明适用于亲密关系。

本研究招募本研究招募 30 名正处于亲密关系中且亲密关系遇到困难的成年早期个体，运用治疗性评估和信息收集模型，利用投资模型量表、每日亲密关系满意度量表、评估问卷等测量工具，探讨了治疗性评估和信息收集模型对提高成年早期亲密关系质量的作用。

重复测量方差分析结果显示，接受治疗性评估或信息收集模型的个体面谈结束后 1 个月的每日亲密关系满意（p=0.094<0.1）、每周亲密关系满意度（p<0.01）以及亲密关系承诺度（p=0.001<0.01）均显著性或边缘显著高于未进行治疗性评估前，两组个体不存在显著性差异；个体面谈结束后 1 个月的不合理期望显著降低（p=0.001<0.01;p=0.003<0.01），对亲密关系及其期望的了解均显著提高（p=0.003<0.01），两组个体不存在显著性差异；在工作同盟方面，两组个体面谈后的工作同盟均显著增加（p<0.001），但 TA 组个体工作同盟显著性高于 IG 组个体（p=0.003<0.01）。评估问卷结果显示，TA 组个体在新的自我觉知（t_{27}=2.114，p=0.044<0.05）、与评估者积极的关系（t_{27}=2.536，p=0.017<0.05）以及整体满意度上（t_{27}=2.148，p=0.041<0.05）的得分显著高于 IG 组。

研究结果初步证明了治疗性评估以及信息收集模型在对提高成年早期个体亲密关系质量的有效性，治疗性评估在建立工作同盟方面具有优势。此外，该研究对治疗性评估在中国的发展提供了有效性的证据。

Improving the quality of individual intimate relationships of young adulthood: a comparison of Therapeutic Assessment and Information Gathering model

Wenhua Yan[1], Wenyue Jin[2], Bingjie Yue[2], Meitang Yang[2]

1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai, China, 200062

2 School of Psychology and Cognitive Science, East China Normal University, Shanghai, China, 200062

The psychological development level of individuals in young adulthood is not mature, and they lack the experience and ability related to intimate relationship. Therefore, the quality of intimate relationship of individuals in early adulthood is unstable, and there are problems such as poor communication, conflict and poor coping styles,

which have a negative impact on their physical and mental health. At present, the counseling and improvement programs for individual intimate relationships in early adulthood mainly include test feedback and relationship education. However, the traditional test feedback, namely information gathering (IG), has not achieved personalized feedback, and relationship education is boring and participants lack enthusiasm. Individuals in early adulthood need more effective intimacy improvement approaches. Therapeutic Assessment (TA) is a semi-structured assessment and intervention model with psychological test as the core of brief treatment. Compared with traditional models, TA is more personalized and emphasizes the relationship between assessor and assessee, and has the advantages of high efficiency in short time, which has been shown to work in intimate relationships.

To explore effects of Therapeutic Assessment and Information Gathering on improving intimate relationships for young adults, 30 early adult individuals who were in romantic relationships and encountered difficulties in intimate relationships were recruited, Measurement tools, such as Romantic Discrepancy Scale, Daily Intimate Relationship Satisfaction Scale, and Assessment Questionnaire were used.

Repeated measurements of ANOVA showed that, The Daily Intimate Relationship Satisfaction ($p=0.094<0.1$), weekly intimate relationship satisfaction ($p<0.01$) and intimate relationship commitment ($p=0.001<0.01$) of both groups were significantly or marginal significantly higher than baseline. There was no significant difference between the two groups. Unreasonable expectations were significantly decreased one month after three individual interviews ($p=0.001<0.01$; $p=0.003<0.01$), the understanding of intimate relationship and its expectation was significantly improved ($p=0.003<0.01$), there was no significant difference between the two groups. In terms of work alliance, the work alliance of both groups increased significantly after the interviews ($p<0.001$), but the work alliance of TA group was significantly higher than that of IG group ($p=0.003<0.01$). The results of the Assessment Questionnaire showed that: new self-awareness ($t27=2.114$, $p=0.044<0.05$), positive relationship with evaluators ($t27=2.536$, $p=0.017<0.05$) and overall satisfaction ($t27=2.148$, $p=0.041<0.05$) of individuals in TA group were significantly higher than that in IG group.

The results of this study preliminarily demonstrated the effectiveness of therapeutic assessment and information gathering in improving the quality of intimacy in early adulthood. Therapeutic assessment has its unique advantages in working alliance. In addition, the study provides evidence of effectiveness for the development of Therapeutic Assessment in China.

低强度心理干预在高校中的探索和检验

魏晨光　刘静洋　吴睿瑶　梁一鸣（通讯作者）

摘 要　背景：学业相关的压力是影响大学生心理健康的主要风险因素之一，过高的学业压力不仅会影响学生的学业成就，还会增加身体和心理健康风险。然而在国内高校，有限的心理健康资源往往难以满足学生较为广泛的心理服务需求，亟需一些低强度心理干预模式以解决当前难题。低强度心理干预是填补

巨大心理健康需求与获得优质治疗之间的差距的一个可行的解决方案，是全球精神卫生研究议程的重要组成部分。

方法：本研究对两种低强度心理模式进行了探索和检验。问题管理家（problem management plus, PM+）是由世界卫生组织开发的一种短程结构化的心理干预措施，可由非专业人员经培训后开展。自助正念认知训练被研究者设计为线上自助打卡收听音频的形式。研究招募了有较高学业压力和中度以上抑郁和焦虑的被试，分为 PM+组（n=26）和正念组（n=26），PM+组被试接受连续五周的线下 PM+训练，正念组自助完成线上正念音频，两组被试都完成前测和后测问卷。

结果：在接受相应干预后，两组被试的心理健康状况均有显著提高。在控制前测变量后，PM+组的后测抑郁显著低于正念组，PM+组的后测领悟社会支持显著高于正念组并且这种效果能延续到干预结束三周后。学业压力、焦虑、感知压力、正负性情绪和应对方式的干预效果在两组间均没有显著差异。

结论：本研究发现两种低强度心理干预均有效提升了大学生的心理健康状况，在缓解抑郁症状和加强社会支持方面，线下的 PM+干预比线上的正念干预更优。这些发现为高校建设心理健康服务、推进低强度心理干预的模式提供了启示。

Exploring and testing low-intensity psychological interventions in Chinese college students

Chenguang Wei, Jingyang Liu, Ruiyao Wu, Yiming Liang (Corresponding author)

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China, Correspondence: ymliang@psy.ecnu.edu.cn

***Abstract*：** Background: Academic-related pressure is one of the main risk factors for college students' mental health. Excessive academic stress not only affects students' academic achievements but also increases physical and risk of mental health. However, limited mental health resources are often difficult to meet students' psychological service needs in Chinese college, and there is an urgent need for some low-intensity psychological interventions to address the current challenges. Low-intensity psychological intervention is a feasible solution to bridge the gap between the enormous mental health needs and access to quality treatment, and it is an important part of the global mental health research agenda.

Method: This study explored and tested two low-intensity psychological models. Problem Management Plus (PM+) is a short-term structured psychological intervention developed by the World Health Organization, which can be carried out by non-professionals after training. Self-help mindfulness cognitive training was designed by researchers in the form of online self-help check-in and audio listening. The study recruited participants with high academic pressure and moderate to severe depression and anxiety, divided into the PM+ group (n=26) and the mindfulness group (n=26). The PM+ group participants received PM+ training for five weeks. The mindfulness group completed online mindfulness audio by themselves. Both groups completed the baseline and post-test questionnaires.

Results: After receiving the respective interventions, the mental health status of the participants in both groups significantly improved. After controlling for pre-test variables, the post-test depression in the PM+ group

was significantly lower than in the mindfulness group, and the post-test perceived social support in the PM+ group was significantly higher than in the mindfulness group, and this effect could last until three weeks after the intervention. There were no significant differences between the two groups in the intervention effects on academic pressure, anxiety, perceived stress, positive and negative emotions, and coping strategies.

Conclusion: The current study found that two types of low-intensity psychological intervention effectively improved the mental health status of college students. In terms of alleviating depressive symptoms and enhancing social support, the face-to-face PM+ intervention was superior to the online mindfulness intervention. These findings provide insights for universities to build mental health services and promote low-intensity psychological intervention models.

Key words: problem management plus, low-intensity psychological interventions, online mindfulness, college student, depression

汶川地震 10 年后个体创伤累积与心理健康的关系：社会支持的作用

王东方[1]　陈小燕[2]　范方[1]（通讯作者）

1 华南师范大学心理学院，广州，510000，fangfan@scnu.edu.cn

2 香港理工大学应用社会科学系，香港，100872

摘 要 背景：在自然灾害之后，创伤性事件通常会继续积累，以与原始灾难不同的方式影响个体。然而很少有研究考察创伤事件对心理健康结果的累积影响以及社会支持作用的这些关联。本研究基于汶川地震青少年队列（WEAHC）探索了个体累积创伤事件、心理健康问题和社会支持的前瞻性关系。方法：695 名汶川地震幸存者在震后 6 个月（基线）和震后 10 年完成了评估，评估内容包括地震暴露指数、童年期虐待、日常负性生活事件和基线的社会支持。基线和震后 10 年的抑郁症状和创伤后应激障碍作为心理健康的指标。使用累积创伤事件指数评估累积创伤事件的水平，并采用线性回归比较预测效应。结果：在 695 名参与者中，分别有 41.3%，28.5%和 7.9%的参与者报告了一项，两项和三项创伤事件。震后 10 年的累积创伤事件与心理健康问题之间的关联呈现出剂量反应模式：那些经历了三项事件的人出现了心理健康问题的风险最高，随后是那些经历了两项事件的人和报告了一项事件的人。此外，较高的社会支持部分减少了累积创伤事件对心理健康的负面影响。结论：在地震幸存者中，累积创伤事件与 10 年后的心理健康问题有关，且社会支持可能减少这一负面影响，但是当创伤事件积累达到最高水平时，其保护作用则会消失。这些发现强调了评估灾难幸存者可能遇到的创伤事件和社会支持的累积影响的重要性，并进行干预以防止心理健康状况恶化。

Cumulative traumatic events and mental health in young adults after 10 years of Wenchuan earthquake: the role of social support

Dongfang Wang[1] Xiaoyan Chen[2] Fang Fan[1] (corresponding author)
1 School of Psychology, South China Normal University, Guangzhou，510000
2 Department of Applied Social Sciences, Hong Kong Polytechnic University, Hong Kong, 100872

Abstract： Background: After a natural disaster, traumatic events often continue to accumulate, affecting individuals in a different manner than the original disaster never occurred. However, few studies have examined these associations, the cumulative impacts of traumatic events on mental health outcomes, and the role of social support. This study examined the prospective association between cumulative traumatic events and mental health problems and the role of social support based on the Wenchuan Earthquake Adolescent Health Cohort (WEAHC). Methods: 695 participants provided available data on earthquake exposure, childhood maltreatment, other negative life events, and social support at baseline. Depressive symptoms and posttraumatic stress disorder were assessed at baseline and 10 years after the earthquake (T_{10y}). A cumulative traumatic events index was used to evaluate the levels of cumulative traumatic events. Linear regressions were used to explore the predictive effects. Results: Of 695 participants, 41.3%, 28.5%, and 7.9% reported one, two, and three traumatic events, respectively. The associations between cumulative traumatic events and mental health problems at T_{10y} presented a dose–response pattern: those who experienced three events had the highest risk of mental health problems, followed by those who experienced two events and those who reported one event. Additionally, higher social support partially reduced the negative impact of cumulative traumatic events on mental health. Conclusions: Cumulative traumatic events are associated with mental health problems 10 years later in young earthquake survivors. Social support could reduce the negative impact, but its protective role disappears when traumatic events accumulate at the highest level. These findings highlight the importance of assessing the cumulative impacts of traumatic events and social support available to young disaster survivors and intervening to prevent worse mental health outcomes

Keywords： cumulative traumatic events, mental health, social support, earthquake, Wenchuan Earthquake Adolescent Health Cohort

地震与疾病丧亲者的哀伤症状网络分析

龙梦媛[1] 盖弈涵[1] 李洁[1]（通讯作者） 李梅[2] 时勘[3]
1 中国人民大学心理学系，北京，100872，lijie2013@ruc.edu.cn
2 中国戏曲学院学生工作部，北京，100073
3 温州大学温州模式发展研究院，温州，325035

摘 要 哀伤是丧亲后的一种普遍反应，但一部分丧亲者可能会经历病理性的复杂哀伤。先前研究表明，创伤性死亡是复杂哀伤的风险因素，因创伤性死亡(如事故、自然灾害、自杀等)而丧亲的群体中复杂哀伤的患病率(约 49%)远高于一般丧亲人群(约 9.8%)。针对创伤性丧亲的干预重点也与普通哀伤有所不同。这些都提示，创伤性丧失带来的哀伤与非创伤性情景存在差异。增进对创伤性和非创伤性丧失下个体哀伤表达的认识，有利于促进理解创伤性死亡为什么是风险因素，并为干预方案提供指导。本研究借助网络分析方法，在距离丧亲时间平均都为 12.5 个月的因地震(创伤性死亡, N=818)和疾病(相对而言属于非创伤性死亡, N=237)丧亲的两个样本中，以复杂哀伤问卷(Inventory of grief, ICG)各条目作为节点，分别估计其正则化偏相关网络，以识别高中心节点和强联系边缘。结果显示，孤独和难以接受死亡是两个网络中共同的高中心节点。对所发生的事情感到难以置信、丧亲后的空虚感以及觉得他死了我活着是不公平的(幸存者内疚)在疾病样本中也显示出高中心性。在地震样本中，“很难相信他人”、“对逝者的渴望”和“幻视”也表现出高中

心性。两个网络节点和边线间的差异表明，创伤性和非创伤性丧亲下，哀伤症状网络的相互作用可能存在不同。研究结果为“促进创伤性记忆的整合和探索、寻找追忆逝者的同时减轻痛苦的适应性方法、保留与逝者有关的非创伤型记忆”等现有干预措施的合理性提供了支持。

Bereaved from earthquake or illness: Differences in networks of complicated grief

Mengyuan Long[1]　Yihan Gai[1]　Jie Li[1]　Mei Li[1]　Kan Shi[1]

1 Department of Psychology, Renmin University of China, Beijing, China

2 Students' Affairs Division, National Academy of Chinese Theatre Arts, Beijing, China

3 Wenzhou Model Development Institute, Wenzhou University, Wenzhou, China

Abstract：Grief is a common response to bereavement, but a proportion of bereaved people may experience pathologically complex grief. Previous research has shown that traumatic death is a risk factor for complicated grief, and that the prevalence of complicated grief in groups bereaved by traumatic deaths (e.g., accidents, natural disasters, suicides, etc.) is much higher (approximately 49%) than in the general bereaved population (approximately 9.8%). The focus of interventions for traumatic bereavement also differed from that of ordinary grief. These suggest that there are differences between grief from traumatic loss and non-traumatic scenarios. Increasing knowledge of individual expressions of grief in the context of traumatic and non-traumatic loss can be beneficial in facilitating an understanding of why traumatic death is a risk factor and provide guidance for intervention programs. In this study, with the help of network analysis methods, in two samples bereaved by earthquake (traumatic death, N=818) and illness (relatively non-traumatic death, N=237), both with a mean of 12.5 months from the time of bereavement, we estimated their regularized partial correlation networks separately using each entry of the Inventory of Complex Grief (ICG) questionnaire as a node, in order to identify high center nodes and strong linkage edges. The results showed that loneliness and difficulty in accepting death were common high center nodes in both networks. Incredulity about what happened, emptiness after bereavement, and the feeling that it is not fair for me to live when he died (survivor's guilt) also showed high centrality in the disease sample. In the earthquake sample, "difficulty in trusting others", "longing for the dead" and "hallucinations" also showed a high intermediate level of mindfulness. Differences between the nodes and edges of the two networks suggest that the interactions of the grief symptom networks may differ between traumatic and non-traumatic bereavement. The findings provide support for the rationale of existing interventions such as "promoting the integration and exploration of traumatic memories, finding adaptive ways to alleviate suffering while remembering the deceased, and preserving non-traumatic memories associated with the deceased."

Keywords：complicated grief, network analysis, traumatic loss, bereaved Chinese

哀伤干预中的什么元素有效？基于干预模块的元分析

盖弈涵　宁婧　李洁（通讯作者）

中国人民大学心理学系，北京，100872，lijie2013@ruc.edu.cn

摘 要　亲人去世是一类重大应激事件，往往会给个体的身心健康造成负面影响，甚至有部分丧亲者

会经历不随时间而缓解的、持续而强烈的病理性哀伤反应，被称为“延长哀伤障碍”。有许多研究考察了不同的哀伤干预方法对丧亲人群的效果，但已有的哀伤干预在技术和内容上存在较大的异质性，目前尚不清楚哪些具体的干预元素最有效。本研究采用提炼和匹配模型（distillation and matching model）提取哀伤干预中共同和特异的干预成分。我们在四个英文数据库（PsycINFO, Web of Science, Embase, PubMed）与三个中文数据库（知网、万方、维普）中进行文献检索，并从初步检索到的 17492 篇文献中根据纳入标准：干预方法为心理干预、被试为成年丧亲者、研究设计为随机对照实验等标准进行文献筛选。随后对入选文献中的干预元素采用内容分析的方法进行编码，提取出与哀伤理论相关的干预元素并进行元分析。本研究将报告各干预模块的使用频率及其效应量，并探讨潜在调节变量（死亡原因、干预前症状水平、干预时长等）的作用。研究结果能对丧亲者的心理干预提供实证依据，增进对哀伤辅导有效性的机制理解，为未来丧亲干预项目的开放设计提供参考，并促进模块化干预的发展。

What elements of a grief intervention work? A meta-analysis based on intervention modules

Yihan Gai　Jing Ning　Jie Li*

Department of Psychology, Renmin University of China, Beijing, China

Abstract：The death of a loved one is a major stressful event that often negatively affects an individual's physical and psychological well-being. And some bereaved individuals may even experience a persistent, intense, and pathologically significant grief reaction that does not resolve over time, referred to as "prolonged grief disorder" (PGD). Many studies have examined the effectiveness of different grief interventions for bereaved populations. But there is considerable heterogeneity in the techniques and content of existing grief interventions, and it is unclear which specific intervention elements are most effective. This study used a distillation and matching model (DMM) to extract common and specific intervention components of grief interventions. We conducted a literature search in four English databases (PsycINFO, Web of Science, Embase, PubMed) and three Chinese databases (CNKI, Wanfang Data, and VIP Information) and screened the literature from the preliminary 17,492 retrieved articles based on the inclusion criteria: the intervention method was psychological, the participants were adult bereaved people, and the study design was a randomized controlled trial. Then the intervention elements in the selected literature were coded by the method of content analysis, and the intervention elements related to grief theory were extracted and meta-analyzed. This study will report the frequency of use of each intervention module and its effect size, and explore the role of potential moderating variables (cause of death, pre-intervention symptom level, length of intervention, etc.). Findings can provide an empirical basis for psychological interventions for the bereaved and improve mechanistic understanding of the effectiveness of grief counseling. It can also inform the design of future bereavement intervention programs, and promote the development of modular interventions.

Keywords：bereavement, grief, intervention, meta-analysis, distillation and matching model(DMM)

哀伤反刍思维如何影响丧亲适应？来自生态瞬时评估的启示

唐苏勤[1]（通讯作者）　周士人[1]

1 深圳大学心理学院，深圳，618060，jasminetsq@hotmail.com

摘 要　丧亲个体的哀伤反刍思维在延长哀伤障碍的发展与维持中起着重要作用，其中不同内容的哀伤反刍思维作用不一。现有研究多采用横断面问卷调查，难以捕捉哀伤反刍思维在日常生活中的变化，也难以考察其与丧亲适应的动态关系。本研究旨在采用生态瞬时评估法考察丧亲个体哀伤反刍思维与日常情绪、延长哀伤症状变化之间的关系。研究共纳入 65 名中国丧亲个体（平均年龄 21.9±2.9 岁，女性 42 人），连续 14 天、每天 4 次评估其哀伤反刍思维和日常情绪，并在 14 天前后分别对其哀伤反刍思维与延长哀伤症状进行测量。每日评估问卷回收率为 95.7%，后测问卷回收率为 93.8%。对数据进行两水平回归分析、同时性相关分析和交叉滞后分析。结果显示：（1）控制人口学变量及丧亲经历特征变量后，前测延长哀伤症状水平与哀伤反刍思维总分均不能预测每日评估中的哀伤反刍思维；（2）每日评估中，回想冲突、思考不公平、考虑他人与悲伤之间为同时正相关关系，自我安慰则与焦虑为同时负相关关系，思考丧亲意义与焦虑和开心均存在同时正相关关系，而寻求积极意义则与悲伤和开心均存在同时负相关关系；（3）每日评估中，当前有关考虑他人的反刍思维可负向预测随后的悲伤情绪，回想冲突可负向预测随后的孤独情绪，怀念逝者可正向预测随后的孤独情绪，而当前的焦虑情绪则会负向预测思考丧亲反应的反刍思维；（4）每日评估中有关考虑他人的反刍思维能预测延长哀伤症状的减轻，思考丧亲意义、寻求积极意义则负向预测了延长哀伤症状的减轻，认为反刍可控及给自己带来了积极影响也负向预测了延长哀伤症状的减轻。本研究揭示，丧亲个体的哀伤反刍思维与日常情绪、延长哀伤症状水平变化之间的关系随不同反刍内容而变化，对其进行心理干预时应基于哀伤反刍思维的内容及元认知调整干预策略。

How Does Grief Rumination Affect Bereavement Adjustment? Implications from Ecological Momentary Assessment

Suqin Tang, Shiren Zhou
School of Psychology, Shenzhen University, Shenzhen 518060, China

Abstract：Grief rumination plays a significant role in the development and maintenance of prolonged grief among bereaved individuals, and grief rumination could be adaptive and maladaptive depending on specific content. Existing studies mainly adopted cross-sectional surveys, which failed to capture the daily changes of grief rumination and to examine the dynamic relationship between grief rumination and bereavement adjustment. This study aimed to investigate grief rumination in the daily life of the bereaved individuals, and its relationship with daily emotions, as well as changes in the severity of prolonged grief symptoms, via ecological momentary assessment (EMA). Sixty-five bereaved Chinese individuals (Mage = 21.9 ± 2.9, 42 females) were recruited and invited to assess their grief rumination and daily emotions four times a day for 14 successive days in the EMA period. They were also asked to complete two assessments on grief rumination and prolonged grief before and after the 14-day EMA period. The response rates of the EMA questionnaires and post-EMA assessment were 95.7% and 93.8%, respectively. Two-level regression analyses, concurrent correlation analyses, and cross-lagged analyses were performed to handle the data. Results showed that after controlling for the demographic and bereavement-related variables, symptom levels of prolonged grief and the total score of grief rumination at pre-EMA assessment were unable to predict grief rumination in daily life. Daily grief rumination including recalling conflicts, thinking about injustice, and considering others had a positively concurrent correlation with sadness, while self-comforting was negatively

concurrently correlated with anxiety. Daily thinking about the consequences and meaning of the loss was positively concurrently associated with both anxiety and happiness and seeking positivity had a negatively concurrent association with both sadness and happiness. Regarding the cross-lagged relationships, considering others and recalling conflicts at an earlier time point predicted lower levels of sadness and loneliness later, respectively, whereas earlier yearning predicted later loneliness. On the other hand, earlier anxiety could predict later thinking about one's own reactions to the loss. When predicting the decrease in the severity of prolonged grief symptoms, considering others in daily life had a positive effect, while thinking about the consequences and meanings of the loss, seeking positivity, considering rumination as controllable, and perceiving rumination as having positive influences had negative effects. This study suggests that grief rumination plays a distinct role in its relationship with daily emotions and changes in prolonged grief symptoms, given its specific content. When working with bereaved individuals with prolonged grief symptoms, intervention strategies should be chosen and integrated based on the specific content of and the meta-cognition for their grief rumination.

Keywords **：** grief rumination, prolonged grief disorder, daily emotion, meta-cognition, ecological momentary assessment

基于“心房模型”干预改善失独老人自我概念和情绪的探索性研究*

李雅青　白雪聪　郑文怡　贾若楠　林依倩　张宇迪（通讯作者）
北京科技大学社会学系，北京，100083，zhangyudi@ustb.edu.cn

* 基金项目：本研究是国家社会科学基金一般项目“基于情感视角提升失独老人生活质量的社会工作介入研究”（21BSH161）的阶段性研究成果。

摘 要　“失独”是“失去独生子女”的简称。失独老人是指独生子女去世，且未再生或养育新的子女的老人。人口学家估计，失独家庭的数量在我国已超百万，且将长期处于增长趋势。受到丧子事件的打击，失独群体有着极大的身心健康风险。本研究以 8 位失独老人为干预对象，构建了“心房模型”干预模式，并基于该模式对失独老人开展人生回顾式干预。“心房”是失独老人内心状态的比喻，基于“心房模型”的人生回顾是在帮助失独老人系统回顾人生经历的过程中，在象征层面开展“修缮或整理心房”和“对住客发声方式和声量的调整”两部分工作，以达到重塑“心房”的目的。本研究的干预采用单组前中后测设计，使用 Wallace 自我概念量表和 PANAS 正性负性情绪量表进行量化评估，并通过访谈对效果和满意度进行评估。研究结果显示，Wallace 自我概念量表与 PANAS 正性情绪分量表的前中后测得分存在边缘显著的差异且呈上升趋势，PANAS 负性情绪分量表的前中后测得分呈显著差异且后测得分低于前测。访谈评估中，有 6 位干预对象认为参与活动帮助其加深了对自我的认识，有 5 位干预对象表示参与活动后情绪有所改善。访谈评估还包括干预对象对干预过程的满意度，满分为 10，平均得分为 8.5。本研究的结果支持了基于“心房模型”的干预对改善失独老人的自我概念和情绪有一定效果且易被失独老人接受，且由于该干预方法不必然涉及对失独老人丧失经历的挖掘，带来二次伤害的风险低、安全性高。本研究也存在一些局限，由于是探索性研究，样本量小，且未设立对照组，将来尚需开展大样本随机对照实验。

An Exploratory Study Based on the “Room-of-heart Model”

Intervention to Improve Self-concept and Emotion in the elderly with shidu

LI Yaqing BAI Xuecong ZHENG Wenyi JIA Ruonan LIN Yiqian ZHANG Yudi
Department of Sociology, University of Science and Technology Beijing, Beijing, 100083,
zhangyudi@ustb.edu.cn

***Abstract*:** Shidu is short for "losing one's only child". The elderly with shidu refers to the elderly who have lost the only child and have not reborn or raised new children. Demographers estimate that the number of shidu families in China has exceeded one million, and will keep a long-term growth. Affected by bereavement of children, the shidu group suffers a great risk of health both physically and mentally. In this study, 8 elderly people suffering such losses were selected as intervention objects. We built the "Room-of-heart Model" intervention, carrying out our intervention by reviewing their lives based on this model. "Room-of-heart" is a metaphor for the inner state of the elderly with shidu. The life review based on the "Room-of-heart Model" is to carry out two parts of work at the symbolic level, which are "repairing or arranging the room-of-heart" and "adjusting the voice and volume of the residents" in the process of reviewing their life experiences systematically, so as to reshape the room-of-heart. The intervention was a one-sample design with pre-mid-post test. The Wallace Self-concept Scale and PANAS (Positive and Negative Affect Schedule) were used for our quantitative evaluation, and the effects and satisfaction were evaluated through interviews. The results demonstrated that, there were marginal significant differences between the Wallace Self-concept Scale and the positive affect subscale of PANAS in their pre-mid-post test scores. Also, the negative emotion subscale of PANAS showed differences in the pre-mid-post test scores significantly, and the post-test scores were lower than the pre-test scores. As for the interview evaluation, 6 of our intervention objects believed that the activity helped them deepen their self-understanding, and 5 of the objects indicated that their mood improved after the activity. Besides, the interview evaluation included the intervention objects' satisfaction with the intervention process, with an average score of 8.5 out of 10. The results of this study support that the intervention based on the "Room-of-heart Model" is effective on improving the self-concept and emotion of the elderly with shidu, and it is easily accepted by the objects. Moreover, as the intervention method does not necessarily evoke of the loss experience of the elderly with shidu, it has a low risk of secondary harm and high safety. However, there are still some limitations. Since it is an exploratory study with a small sample size and no control group, it would need to conduct randomized controlled experiments with a large sample size in the future.

新冠肺炎疫情期间大学生睡眠紊乱和精神健康问题之间桥接症状和动态网络的纵向变化：来自新冠肺炎疫情三个不同时期的启示

马紫娟[1] 王东方[1] 范方[1]（通讯作者）
[1]华南师范大学心理学院/华南师范大学心理应用研究中心，广州，510631
通讯作者 E-mail: fangfan@scnu.edu.cn

摘 要

目的: 现有文献表明新冠肺炎疫情可能会诱发人们多种精神健康问题。尽管前人研究已初步探讨了新冠肺炎疫情期间睡眠问题、焦虑或抑郁网络结构的核心症状；然而，鲜少了解疫情发展的不同时期下睡眠紊乱与精神健康问题之间的桥接症状以及他们之间的因果关系。因此，我们用网络方法来研究从新冠肺炎爆发期到控制期间睡眠紊乱与精神健康问题之间是如何发生发展的。

方法: 共有 35516 名来自新冠肺炎疫情期间大学生行为与健康队列的大学生参与者参与了本研究。青少年失眠自评量表、广泛性焦虑症 7 项量表和患者健康问卷分别用于评估睡眠紊乱、焦虑和抑郁症状。使用 EBICglasso 和交叉滞后面板网络估计新冠肺炎大流行期间的桥接症状和动态网络。

结果: 桥接症状的结果发现，“易怒”、“精力不足”和“内疚”是三个网络在不同时期的关键桥接症状。新冠肺炎不同时期的纵向关系是独特不同的。具体而言，在新冠肺炎爆发期间出现“神经紧张”症状的个体，在新冠肺炎转折期出现“难以放松”症状的可能性有 2.75 倍，而在新冠肺炎过渡期报告“睡眠不满意”症状的人群在新冠肺炎控制期出现“睡眠质量差”症状的可能性为 3.23 倍。此外，新冠肺炎爆发期间的症状“感到疲乏”是新冠肺炎转折期和控制期其他症状的最强预测性症状。

结论: 这些探索性的发现突出了症状（“易怒”、“精力不足”、“内疚”、“感到疲乏”）在不同网络中对其他症状的潜在影响。在新冠肺炎爆发期间针对这些症状，理论上有助于预防和/或减少随后控制期间出现自发性抑郁症的可能性。

Longitudinal changes in bridge symptoms and dynamics network between sleep disturbance and mental health problems among college students in China: Insights from three distinct periods of the COVID-19

Zijuan Ma[1] Dongfang Wang[1] Fang Fan[1,*]

[1] School of Psychology and Center for Studies of Psychological Application, South China Normal University, Guangzhou, China, 510631

***Abstract*:**

Objectives: Existing literature has revealed that the COVID-19 pandemic was related to multiple mental health problems。 Although previous studies have contributed to understanding the central symptoms of sleep problems, anxiety, or depression during the COVID-19 pandemic; however, less is known about the vital bridge symptoms and the temporal relationship between sleep disturbance and mental health problems across distinct periods of the COVID-19 over time. Going beyond a pathogenetic pathway perspective, we thus applied the network approach to examine how psychological distress unfolds from the outbreak to the control period of COVID-19.

Methods: A total of 35,516 young participants from the College Students' Behavior and Health Cohort during the COVID-19 pandemic were included in the current study. The Youth Self-Rating Insomnia Scale, the Generalized Anxiety Disorder 7-item scale, and the Patient Health Questionnaire were used to assess sleep disturbance, anxiety, and depressive symptoms, respectively. Bridge symptoms and unique longitudinal relationships between symptoms during the COVID-19 pandemic were estimated using the EBICglasso and

selection operator and cross-lagged panel network.

Results: The results of bridge symptoms found that "Irritability", "Lack of energy", and "Guilt" are the key bridge symptoms for three networks across different periods. Longitudinal relationships across distinct periods of COVID-19 were unique. Specifically, individuals with the symptom "Nervousness" during the COVID-19 outbreak were 2.75 times more likely to endorse the symptom "Trouble relaxing" during the COVID-19 transitional period, while people who reported the symptom "Unsatisfactory sleep" during the COVID-19 transitional period were 3.23 time likely to suffer from the symptom "Poor sleep quality" during the COVID-19 control period. In addition, the symptom "Feel unrestored" during the COVID-19 outbreak was most predictive of other symptoms during the transitional and control period of COVID-19.

Conclusion: These exploratory findings highlight symptoms ("Irritability", "Lack of energy", "Guilt", "Feel unrestored") as potential influencers of other symptoms across distinct networks. Targeting those symptoms during the outbreak period of COVID-19 would theoretically have been beneficial in preventing and/or reducing the likelihood of spontaneous depression during the subsequent control period.

新冠疫情期间大学生失眠症状的变化轨迹及其对自杀意念的预测作用

李媛媛[1,2]　王东方[2]　张一凡[2]　黄水清[2]　马紫娟[2]　范方[2]（通讯作者）

1 中山大学孙逸仙纪念医院心理支持与咨询部，广州，510515

2 华南师范大学心理学院，广州，510515，

摘 要　背景 新冠疫情对大学生睡眠状况产生了重要影响，并加剧了其自杀意念（suicidal ideation，SI）的检出率。本研究旨在考察疫情不同流行阶段下大学生失眠症状的变化轨迹和相关影响因素，以及失眠症状和自杀意念之间的横向和纵向关系。**方法** 采用方便抽样方法，本研究分别于疫情爆发期（2020 年 2 月）、初始缓解期（2020 年 4 月）和有效控制期（2020 年 6 月），通过电子问卷向广东省内 22 所大学进行线上调查。研究纳入完成 3 次调查的有效被试 35,516 名（年龄：20.3±1.9，73.9%为女性）。采用匹兹堡睡眠质量指数量表（PSQI）中的 5 项条目从入睡困难、睡眠维持困难、早醒、睡眠时长和睡眠质量 5 方面评估失眠症状；采用 9 条目患者健康问卷 PHQ-9 中第九项测量自杀意念；分别采用 2 条目患者健康问卷（PHQ-2 ≥ 3），广泛性焦虑量表(GAD-7 ≥10）和 6 条目事件影响量表（IES-6）测量其他心理影响因素如抑郁、焦虑和应激症状。通过潜在剖面分析得到不同的睡眠障碍亚组，采用多元逻辑回归分析失眠症状的影响因素以及失眠症状与自杀意念的关系。**结果** （1）大学生人群失眠症状（7.8%升至 8.5%）和自杀意念（7.6%升至 10.0%）检出率在疫情期间均持续上升。（2）失眠症状呈现五种变化轨迹：高抗性组（82.8%），恢复组（5.0%），迟发性障碍组（5.8%），持续性障碍组（1.8%），复发/缓解组（4.6%）。（3）城市居住、有睡眠问题史、有心理健康问题（抑郁、焦虑、应激症状）、饮酒、消极应对方式和低领悟社会支持与失眠症状风险显著正相关，而良好的家庭功能有助于持续性失眠症状的恢复与缓解。（4）在控制了人口学变量和心理问题相关变量后，大学生失眠症状和睡眠时间不足（<6 小时/天）与当下和两个月后的自杀意念风险的提高均显著相关（all ORs > 2.47）。并且，失眠症状和睡眠时间不足可预测自杀意念的出现和维持。**结论** 在疫情期间，大学生群体失眠症状的发展具有异质性，尤需关注具有以上危险因素的学生。具有失眠症状的大学生自杀意念明显升高，建议加强对疫情下大学生失眠症状的早期评估和干预，以预防危机事件的发生。

Longitudinal trajectories of insomnia symptoms and its predictive effect of suicidal ideation among college students during the COVID-19 lockdown in China

Yuanyuan Li[1,2] Dongfang Wang[2] Yifan Zhang[2] Shuiqing Huang[2] Zijuan Ma[2] Fanf Fan[2]

1 Department of Psychology, Sun Yat-sen Memorial Hospital, Sun Yat-sen University, Guangzhou, China

2 School of Psychology, South China Normal University, Guangzhou, China

***Abstract*:**

Background The COVID-19 epidemic has had an essential impact on the sleep status of college students, and has exacerbated the detection rate of suicidal ideation (SI). The purpose of this study is to examine the patterns and predictors of the trajectories of college students' insomnia symptoms across different stages of the COVID-19 pandemic, as well as the cross-sectional and longitudinal association between insomnia symptoms and suicidal ideation among them. **Methods** Using the convenience sampling method, this study conducted online surveys to the college students of 22 universities in Guangdong Province through electronic questionnaires during the outbreak period (February 2020), initial remission period (April 2020), and the effective control period (June 2020). A total of 35,516 valid subjects (age: 20.3±1.9, 73.9% female) who completed all three surveys were included in this study. The 5 items adapted from Pittsburgh Sleep Quality Index (PSQI) were used to assess insomnia symptoms from 5 aspects including difficulty initiating sleep, difficulty maintaining sleep, early morning awakening, sleep duration, and subjective sleep quality; the ninth item of the 9-item Patient Health Questionnaire PHQ-9 was used to measure suicidal ideation. The 9th item of the 9-item Patient Health Questionnaire (PHQ-9) was used to assess SI. The 2-item Patient Health Questionnaire (PHQ-2 ≥ 3), the Chinese 7-item Generalized Anxiety Disorder Scale (GAD-7 ≥ 10), and the 6-item Event Impact Scale (IES-6) were used to measure other psychological factors such as depression, anxiety, and stress symptoms. Different subgroups of insomnia symptoms were obtained through latent profile analysis, and multiple logistic regression was used to analyze the influencing factors of insomnia symptoms and the relationship between s insomnia symptoms and suicidal ideation. **Results** (1) The prevalence rates of c (from 7.8% to 8.5%) and suicidal ideation (from 7.6% to 10.0%) in college students continued to increase during the epidemic. (2) We have also identified five groups of insomnia symptoms trajectories: 82.8% (n =29,395) of the cohort met the criteria for sleep problems at neither of the three waves, and these students were classified as resistance group; 1.8% (n =649) met the criteria at all three waves and were classified as chronic-dysfunction group. Meanwhile, 11.3% (n =4004) met the criteria at only one wave, 4.1% (n =1468) at any combinations of two waves (T1 and T2, T1 and T3, or T2 and T3). Among these participants, 5.8% were delayed-dysfunction group, and 5.0% were recovery group. In addition, 4.6% was relapsing/remitting group: 3.7% of the sample showed no sleep problems at T1 and onset at T2, while remission at T3; 0.9% showed insomnia symptoms at T1 with remission at T2, while relapse at T3. (3) Urban residence, history of sleep problems, mental health problems (having depression, anxiety, stress symptoms), ever using alcohol, higher level of negative coping, and low level of social support were significantly positively correlated with the risk of insomnia symptoms. At the same time, good family functions might decrease the likelihood of developing insomnia symptoms in at least one of the non-resistance waves. (4) After controlling for demographic variables and variables related to mental health problems, college students' insomnia symptoms and insufficient sleep time (<6 hours/day) were

significantly related to the increased risk of suicidal ideation at cross-sectional and two months later (all ORs > 2.47). Also, insomnia symptoms and s insufficient sleep time predicted the onset and maintenance of suicidal ideation. **Conclusion** College students have different trajectories of insomnia symptoms during pandemic lockdown, special attention should be paid to students with the risk factors noted above. College students with insomnia symptoms have significantly increased suicidal ideation. Early assessment and treatment of sleep disturbance may be an essential strategy for preventing and intervening in SI in individuals after exposure to the special public health emergency of COVID-19.

摘 要 **背景** 新冠疫情对学生的身心健康产生了持久而严重的影响。因此，识别疫情期间高风险心理健康的人群和确定相关的风险因素至关重要。**方法** 本研究于 2021 年 6 月 10 日至 18 日对广东省 6 所学校大学生进行问卷调查，共收集有效问卷 6309 份；采用患者健康问卷（PHQ-9）来评估抑郁症状，并用潜在类别分析来识别抑郁亚组，用无法忍受不确定性量表 (IUS) 和一般人口统计学变量来评估风险因素；用逻辑回归方法探索不同抑郁亚组的相关风险因素。**结果** （1）根据潜在类别分析确定了 4 个潜在亚组："低症状组（2244 人，35.57%）"、"中度症状组（1323 人，20.97%）"、"重度症状低自杀风险组（1128 人，17.88%）"、"重度症状高自杀风险组（1614 人，25.58%）"；(2) IU 高的学生更有可能报告更严重的自杀意念(OR=14.14, p<0.001)；(3)女性更容易出现抑郁症状(OR=1.55,p<0.001),但男性一旦出现抑郁症状，则其症状更严重(OR=0.73,p<0.001)；(4)运动较少、未接种疫苗，家庭经济受疫情影响较严重的学生更有可能出现严重的抑郁症状。 **结论** 疫情期间，有效识别高风险心理健康人群，尤其是具有自杀风险的抑郁症状亚组人群，有利于进行有针对性的心理干预。

2 Mental Health Education and Counseling Center, School of Public Health, Southern Medical University, Guangzhou 510515, China

Abstract:

Background: The ongoing epidemic continues to exert a lasting impact on the physical and mental health of students. Therefore, it is crucial to identify the related risk factors and target populations with a high risk of mental health issues.

Method: A sample of 6309 participants from 6 colleges in Guangdong Province, China was recruited from June 10 to 18, 2021. Depressive symptoms were assessed using the Patient Health Questionnaire and risk factors were assessed using the Intolerance of Uncertainty (IU) scale and demographics. Data analysis consisted of chi-square test, latent class analysis, and Multinomial Logistic Regression.

Result: (1) Four latent subgroups were identified: “low-symptom group (2244, 35.57%),” “moderate-symptom group (1323, 20.97%),” “major-symptom with low-risk of suicide group (1128, 17.88%),” and “major-symptom with high-risk of suicide group (1614, 25.58%).” (2) Students with high IU were more likely to report severe suicidal ideation (OR=14.14, p<0.001,). (3) Although females were more likely to have depressive symptoms (OR=1.55, p<0.001,), but that of male may be server once they had depressive symptoms (OR=0.73, p<0.001,). (4) The students with severe depressive symptoms were likely to be non-exercise, uninfected area, unvaccinated and severer epidemic impact on family economy.

Conclusion: Our findings offer valuable data support for identifying subgroups that are particularly susceptible to developing depressive symptoms during the epidemic. These results have important implications for mental health interventions and the formulation of public health policies.

摘 要 **背景** 无法忍受不确定性（intolerance of uncertainty, IU）是指个体难以忍受模糊的，不确定情境的素质倾向，也是一种常见的跨诊断特质。鉴于学生群体在心理症状上存在的易感性，本研究旨在探讨新冠疫情期间大学生 IU 的个体特征，以及不同 IU 特征组中的心理症状差异和风险因素。**方法** 采用方便抽样方法，本研究于 2021 年 6 月 10 日至 18 日通过问卷星向广东省内 22 所大学发放线上调查问卷。研究纳入有效被试 86767 名（年龄：20.3±1.6，60.1%为女性）。使用 8 条目患者健康问卷（PHQ-8≥10），广泛性焦虑量表(GAD-7≥10），失眠自评量表（YSIS≥22）及 PHQ-9 中的第九项测量抑郁症状、焦虑症状、失眠症状和自杀意念，并计算心理症状的流行率。使用 IUS-12 来测量无法忍受不确定性，并通过潜在剖面分析得到不同的IU 亚组。使用逻辑回归来分析 IU 组的风险因素。**结果**（1）潜在剖面分析得到两个亚组：高 IU 组（39.1±5.1，62.1%）、低 IU 组（25.0±5.7，37.9%）。高 IU 组中 62.9%为女性，51.4%为新生。此外，浏览疫情相关信息时间较长的学生，以及主观报告受疫情影响程度大的学生，在高 IU 组中占比更高。（2）与低 IU 组相比，高 IU 组的学生在所有心理症状上的得分较高，流行率也较高（高 IU 组 vs. 低 IU 组：抑郁：12.0% vs. 1.9%，焦虑：5.5% vs. 0.9%，失眠：10.8% vs. 2.6%，自杀意念：21.5% vs. 8.4%）。（3）女性、低年级学生、主观感受到严重的疫情影响，以及每天浏览疫情相关信息超过 3 小时是高 IU 组的风险因素。**结论** 在疫情期间，无法忍受不确定程度较高的学生表现出更糟糕的心理状况，尤其需要关注女性、低年级学生、感受疫情影响更严重的学生，以及长时间寻求疫情相关信息的学生。针对高 IU 群体采取有针对性的措施，是改善他们

的心理状况的关键路径。

The association between subgroups of Intolerance of Uncertainty and mental health symptoms among Chinese college students during the COVID-19 pandemic: a cross-sectional study using Latent Profile Analysis

Zijie Ma[1], Yujing Chen[1], Yishuai Deng[1], Cong Luo[1], Lili Liu[1], Andi Huang[1], Xiayong Wang[1], Jiahong Li[1], Jingbo Zhao[12]

1 Department of Psychology, School of Public Health, Southern Medical University, Guangzhou 510515, China

2 Mental Health Education and Counseling Center, School of Public Health, Southern Medical University, Guangzhou 510515, China

***Abstract*:**

Background Intolerance of uncertainty (IU) is the inability to withstand uncertainty, which is a common transdiagnostic factor in mental disorders. Vulnerability to mental symptoms has been found in the student population. Thus, the current study aimed to explore the differences of mental symptoms between IU's subgroups and associated risk factors in Chinese college students during the COVID-19 pandemic. **Methods** A cross-sectional study was conducted online among 86,767 college students (mean age = 20.3 years, SD = 1.6; 60.1% female) in 20 schools in Guangdong province between June 10 and June 18, 2021. In this study, rates of depression (PHQ-8), anxiety (GAD-7), insomnia (YSIS), and suicidal ideation (SI, 9th item of PHQ-9) were measured. Intolerance of Uncertainty Scale (IUS) was used to measure IU. Latent profile analysis was used to classify different IU groups. Logistic regression identified risk factors. **Results** In our study, the high IU group (IUS: 39.1±5.1, 62.1% sample) and the low IU group (IUS: 25.0±5.7, 37.9% sample) were identified. In the high IU group, 62.9% were females and 51.4% were freshmen. The proportion of students surfing longer on COVID-19 information and those perceiving more impact from COVID-19 were higher in the high IU group. Furthermore, the high IU group scored higher in all mental symptoms. The prevalence rates of mental symptoms were also higher in the high IU group (high vs. low: 12.0% vs. 1.9% for depression, 5.5% vs. 0.9% for anxiety, 10.8% vs. 2.6% for insomnia, and 21.5% vs. 8.4% for SI). Females, students in the earlier academic year, those perceiving severe impacts and surfing more than 3 hours/day of COVID-19 information were at risk of high IU. **Conclusion** Our findings showed that students with high IU were associated with worse mental symptoms during the COVID-19. Females, younger students, those perceiving more impacts, and seeking more pandemic-related information tend to be more intolerant of uncertainties. Thus, re-establishing a sense of social certainty, taking actions to target the high IU groups and improve their mental well-being is imperative during pandemics.

2 南方医科大学公共卫生学院心理健康教育与咨询中心，广州，510515，mingtian@smu.edu.cn

摘 要 **目的** 本研究探讨新冠疫情初期到乙类乙管期间，大学生心理症状的长期变化趋势及风险因素。**方法** 本研究使用问卷星向广东省 22 所高校全体在校学生发送了在线问卷，测量时间点分别为 2020 年 2 月（基线，COVID-19 暴发初期）、2021 年 9 月（基线后 19 个月，在校封控期）、2023 年 3 月（基线后 37 个月，乙类乙管期），在三个测量阶段分别回收有效问卷 164101、86767 和 130285 份。累计调查了 381,153 名大学生。通过计算抑郁（PHQ-8）、焦虑（GAD-7）、自杀意念(PHQ-9 第 9 条)、失眠（YSIS）、急性应激（IES-6）和疫情恐慌（CV-19FSS）的标准化率，本研究对三个阶段的心理症状流行率进行比较。多变量逻辑回归分析被用来探索乙类乙管期大学生心理症状的风险因素。**结果** 乙类乙管期，样本中学生年龄的中位数 (四分位差) 为 20 (19-21) 岁；样本中 58.9%为女性，94.4%为本科生，78.2%的学生经历了新冠感染。有 8.1% 和 8.4% 的学生报告家庭收入和个人发展层面受到来自疫情的重大影响；与新冠疫情初期时相比，焦虑、抑郁、失眠和自杀意念的流行率显著增加。失眠的增加幅度最低，增加了 9.1%；自杀意念的增长幅度最高，增加了 23.5%。相比之下，乙类乙管期间急性应激和新冠恐慌的流行率有所下降。由此可见，新冠疫情暴发 37 个月后大学生的心理状况仍然较差。逻辑回归的结果显示，经历新冠感染、报告疫情影响严重、采取过多或不采取新冠的预防措施都是心理症状的风险因素。**结论** 从新冠疫情暴发到乙类乙管期间，大学生的心理症状持续恶化。在乙类乙管期间，心理症状的流行率仍然较高。这提示，未来几年应该持续监测大学生心理状况、预防心理症状的产生并提供及时有效的心理干预。

Mental Health Symptoms of College Students 37 Months After the Onset of the COVID-19 Pandemic: A serial cross-sectional study in Guangdong Province, China

Jingbo Zhao[12], Zijie Ma[1], Yujing Chen[1], Yishuai Deng[1], Lili Liu[1], Andi Huang[1]

1 Department of Psychology, School of Public Health, Southern Medical University, Guangzhou 510515, China

2 Mental Health Education and Counseling Center, School of Public Health, Southern Medical University, Guangzhou 510515, China

***Abstract*:**

Objective To measure long-term changing trends of mental symptoms and associated risk factors from the onset of the COVID-19 to the period that China manages COVID-19 with measures against Class B infectious diseases. **Method** Questionnaires were sent to all students from 22 universities in Guangdong using so-jump. We measured mental symptoms in February 2020 (baseline, the onset of COVID-19), September, 2021 (19 months after baseline, quarantine in school), March, 2023 (37 months after baseline, period that China manages COVID-19 with measures against Class B infectious diseases). 164101, 86767, and 130285 valid questionnaires were collected in

the survey at each measurement. In total, 381,153 students were surveyed. Prevalence of depression (PHQ-8) and suicidal ideation (9th item of PHQ-9), anxiety (GAD-7), insomnia (YSIS), acute stress (IES-6), fear (CV-19FSS) during the period that China manages COVID-19 with measures against Class B infectious diseases were standardized and compared with data from 18 and 37 months ago. Multivariate logistic regression analyses identified risk factors. **Results** During the period that China manages COVID-19 with measures against Class B infectious diseases, 130285 participants, 58.9% females, were included. Median (IQR) age was 20 (19-21) years. 94.4% were undergraduates and 78.2% students have been infected. 8.1% and 8.4% of students reported severe impact from COVID-19 on family income and personal development. Compared with the onset of COVID-19, rates of anxiety, depression, insomnia, and suicidal ideation were dramatically increased. Prevalence of insomnia increased by 9.1% for the least and suicidal ideation by 23.5% for the most. In contrast, the prevalence rates of acute stress and fear of COVID-19 decreased but was still high. Mental status remains poor when China manages COVID-19 with measures against Class B infectious diseases. Furthermore, students with COVID-19 infection, perceiving more impact from COVID-19, and those without or taking too many precautions were at risk of mental symptoms. **Conclusions** These results suggest a negative long-term change in mental symptoms of Chinese students from the onset of the COVID-19 to the period that China manages COVID-19 with measures against Class B infectious diseases. Thus, mental status of college students remains poor after the relaxation of COVID-19. Monitoring mental health, prevention and care access should be a priority in recent years.

不同不确定性耐受度的青少年中焦虑与抑郁的纵向关系：一项交叉滞后网络分析

叶灏贤[1] 马紫娟[1] 王东方[1] 刘文煦[1] 卜洛威[1] 范方[1]（通讯作者）

[1]华南师范大学心理学院/华南师范大学心理应用研究中心，广州，510631

摘 要

背景：已有研究表明，低不确定性耐受度，即无法耐受不确定性(intolerance of uncertainty,IU)是焦虑和抑郁的跨诊断风险因素，然而，尚无研究从症状层面上探讨不同 IU 水平对焦虑抑郁间相互关系的影响。本研究采用交叉滞后网络分析（CLPN），首次探讨 IU 对焦虑抑郁症状间因果关系的调节作用。

方法：根据 IU 量表得分，32331 名青少年被分为“高 IU 组”和“低 IU 组”。在 6 个月的时间间隔内，两组青少年先后完成两次焦虑症状与抑郁症状的自陈量表。基于 R 4.3.0 构建的四个横断面网络和两个交叉滞后网络被用以分析不同 IU 水平下焦虑抑郁症状间的横向与纵向关系。

结果：高 IU 组的青少年具有更高的“焦虑-抑郁”共病，体现在横向与纵向的“焦虑-抑郁”网络结构连接均更为紧密。在高 IU 组中，“难以控制担忧”对六个月后其他症状的预测作用最大，而“过度担忧”最容易受到六个月前其他症状的影响；在低 IU 组中，“容易急躁”与“精力减退”分别是预测作用最大与被预测作用最大的症状。

结论：IU 加剧了症状层面上的“焦虑-抑郁”共病，导致两者之间形成了更为复杂的相互触发关系。这一发现为了解焦虑抑郁症状之间相互关系的潜在机制提供了重要见解，突显了 IU 在“焦虑-抑郁”动态网络中的风险性作用。针对 IU 的干预有助于减少焦虑和抑郁的共病情况，同时，将“难以控制担忧”作为高 IU 青少年的核心干预目标可能最为有效，并有利于限制其他焦虑抑郁症状的未来发展。

The temporal relationships between anxiety and depression among adolescents with different levels of intolerance of uncertainty: A cross-lagged panel network analysis

Haoxian Ye [1]; Zijuan Ma [1]; Dongfang Wang [1]; Wenxu Liu [1]; Luowei Bu [1]; Fang Fan [1*]

[1] Centre for Studies of Psychological Applications, Guangdong Key Laboratory of Mental Health and Cognitive Science, Ministry of Education Key Laboratory of Brain Cognition and Educational Science, School of Psychology, South China Normal University, Guangzhou, China

Abstract:

Background: The transdiagnostic risk role of intolerance of uncertainty (IU) in the development of anxiety and depression has been acknowledged, but its effect on the symptom-level interrelationship between these two mental health problems remains unclear. This study aimed to investigate the casual associations between anxiety and depression symptoms using a cross-lagged panel network (CLPN) approach while examining the moderating influence of IU.

Methods: A total of 32331 adolescents were categorized into "high IU group" and "low IU group" based on their IU scores. They completed self-reported questionnaires on anxiety and depression twice over a 6-month period. Four cross-sectional networks and two cross-lagged panel networks, constructed based on R 4.3.0, were used to analyze the contemporaneous and temporal relationships between anxiety and depression symptoms at different IU levels.

Results: Adolescents with high IU exhibited a higher comorbidity of anxiety and depression, resulting in a more interconnected contemporaneous and temporal network structure of anxiety and depression symptoms compared to those with low IU. Specifically, in the high IU group, "uncontrollable worry" had the strongest predictive effect on other symptoms six months later, while "worry too much" was most susceptible to the influence of other symptoms six months prior. In the low IU group, "irritable" and "energy loss" were the symptoms with the highest predictive and influenced effects, respectively.

Conclusions: IU exacerbates the comorbidity of anxiety and depression at the symptom level, resulting in a more intricate mutually triggering relationship between the two. This finding provides valuable insights into the underlying mechanisms driving the interrelationship between anxiety and depression symptoms and highlights the risk role of IU in this dynamic. Interventions targeting IU could be beneficial in reducing the comorbidity of anxiety and depression, and "uncontrollable worry" may be a core intervention target for adolescents with high IU to prevent the development of additional anxiety and depression symptoms.

Keywords: Anxiety, depression, intolerance of uncertainty, adolescents, cross-lagged panel network

中国民众捐赠行为的变迁趋势——基于年龄-时期-世代效应分析

王林欣[1]　林靓[1]　寇彧[1]（通讯作者）

1 北京师范大学发展心理研究院，北京，100875，通讯作者 E-mail（yu_kou1@163.com）

摘 要　社会文化环境会随着时期和世代的变化而变化，并塑造个人的亲社会行为。自改革开放 40 余年来，中国经济蓬勃发展的同时也面临社会阶层差距扩大、经济不平等加剧等问题，这些因素可能影响个体的亲社会行为。然而，过往研究大多基于横断历史元分析，探究合作行为的演变趋势。对于亲社会行为(如，捐赠行为)，特别是在中国经济快速发展时期下的变迁趋势尚付阙如。因此，本研究基于中国家庭追踪调查（China Family Panel Studies, CFPS）2010–2020 年的六期的成人和家庭经济问卷数据，采用分层交叉年龄-时期-世代分析，考察我国民众捐赠行为的时代变化，并检验经济不平等是否能解释时期效应。研究结果表明，捐赠行为在年龄上呈倒“U”型趋势。在控制人口学变量、社会关系变量和社会经济地位变量后，时期效应表明，我国民众的捐赠行为在 2010–2020 年间呈上升趋势，但加入基尼系数后，时期效应不显著。世代效应表明，在 1920 年至 2002 年出生的世代群体中，捐赠行为呈现 U 型趋势，即 1920-1926 年间出生的世代和 1978-1991 年间出生的世代呈现两个高峰，1958-1961 年间出生的世代处于低谷。在控制人均 GDP 增量后，基尼系数能够解释捐赠行为的时期效应。以上研究结果有助于理解中国民众的捐赠行为在不同年龄、时期和世代的变化趋势，并探讨经济不平等对时期效应的影响。

The Trend of Donation Behavior in China: An Age-Period-Cohort Effects Analysis

Lin-Xin Wang[1]　Jing Lin[1]　Yu Kou[1]

[1] Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

***Abstract*：** Social and cultural environments change over periods and across generations, shaping individuals' prosocial behaviors. Over the past four decades of economic reforms in China, while the economy has experienced rapid growth, it has also faced challenges such as widening social disparities and increasing economic inequality, which may influence individuals' prosocial behaviors. However, most previous research on the evolution of cooperative behavior has been based on cross-temporal meta-analyses. There is a relative scarcity of studies examining the changing trends of prosocial behaviors, particularly donation behaviors, during the period of rapid economic development in China. To address this gap, this study utilized data from six waves of the China Family Panel Studies (CFPS) spanning from 2010 to 2020, including adult and household economic questionnaires. This study employed hierarchical APC-cross-classified random effects models (HAPC-CCREM) to investigate the donation behaviors’ period and cohort changes in China and examine whether economic inequality can explain the period effects. The results showed that donation behavior showed an inverted U-shaped trend in age. After controlling for demographic variables, social relationship variables, and socioeconomic status variables, period effects indicated a rising trend in donation behavior from 2010 to 2020 in China. However, when incorporating the Gini coefficient, the period effect was found to be not significant. Furthermore, the cohort effects revealed a

U-shaped pattern in donation behavior among generational cohorts born between 1920 and 2002, with two peaks observed in the 1920-1926 Cohort and 1978-1991 Cohort, while the 1958-1961 Cohort exhibited a valley pattern. After controlling for per capita GDP growth, the Gini coefficient could explain the period effects on donation behavior. Our findings contribute to understanding the changing trends of donation behavior across different ages, periods and cohorts in China, and explore the influence of economic inequality on the period effects.

Keywords：donation behavior, economic inequality, social change, age-period-cohort analysis

VR 模拟环境中见义勇为行为的性别差异研究

摘 要 英雄通常被视人类道德的顶峰，在个人生活、人际关系和文化层面都发挥着非常重要的作用。然而在自然情境下开展该类行为研究受到诸多限制，同时还存在一定的风险。本文创新性地将沉浸式虚拟现实技术应用于社会心理学研究中，探究了英雄行为的内在心理机制。研究表明在其他因素相同的情况下，男生相比于女生，更可能采取英雄行为；个体的亲社会取向的程度越高，个体采取英雄行为的概率越高。研究还发现了英雄行为性别差异的内在心理机制：越有同情心的女生越可能采取英雄行为，然而，对于男生而言，越冷血的男生反而越可能采取英雄行为。本文为理解英雄行为的心理机制，特别是性别差异的内在驱动机制带来了新的研究观点和理论基础。

关键词 虚拟现实，英雄行为，见义勇为，性别差异

Gender Differences in Heroic Behavior in VR-Simulated Environment

The first two authors contribute equally to the paper.

Abstract：Heroism is often seen as the pinnacle of human morality, playing an extremely important role in

personal life, interpersonal relationships, and cultural aspects. However, conducting research on such behaviors in real-life situations faces many restrictions and certain risks. This paper creatively applied immersive virtual reality technology to social psychological research, exploring the intrinsic psychological mechanisms behind heroic behavior. The results showed that under the same other conditions, males were more likely to engage in heroic behavior compared to females. The higher an individual's prosocial orientation was, the more likely they were to carry out heroic acts. The study also revealed the intrinsic psychological mechanisms behind gender differences in heroic behavior: the more empathetic females were, the more likely they were to engage in heroic behavior; however, for males, the more cold-blooded they were, the more likely they were to carry out heroic behavior. This paper brings new research perspectives and theoretical foundations for understanding the psychological mechanisms of heroic behavior, especially the intrinsic motivational mechanisms behind gender differences.

环境的严酷性和不确定性对个体合作行为的影响

李明晖[1] 饶俪琳[2, 3]（通讯作者）

1 中国人民公安大学犯罪学学院，北京，100038

2 中国科学院心理研究所，北京，100101

3 中国科学院大学心理学系，北京，100049，raoll@psych.ac.cn

摘 要 环境的严酷性和不确定性影响个体的心理和行为模式，使个体能够充分利用不利的环境。虽然环境对合作和亲社会行为的作用愈发受到关注，但是相关理论和实验结果仍然存在争议。本研究探索了环境的严酷性和不确定性对个体合作行为的影响。四个实验（$N = 2{,}763$）的结果表明，环境的严酷性与合作水平负相关。具体地，个体现在的生存环境越严酷，在独裁者博弈任务和利他行为量表上自我报告的合作水平越低（实验 1）。并且，在影响实际收益的独裁者博弈任务中，个体现在的生存环境越严酷，分配给他人的金钱越少（实验 2）。实验 3 和实验 4 探究环境严酷性与合作水平之间关系的中介效应。实验 3 使用利他行为量表测量合作水平，检验生命史策略、信任、共情和不确定性容忍度的平行中介模型。结果发现生命史策略的中介效应显著，即环境的严酷性越高，个体越倾向于使用快生命史策略，从而表现出更低的合作水平。信任、共情和不确定性容忍度的中介效应均不显著。实验 4 同时使用公共物品博弈任务和独裁者博弈任务，并分别检验生命史策略和分析式思维的平行中介模型。结果与实验 3 一致，在公共物品博弈任务和独裁者博弈任务下，生命史策略的中介效应均显著。分析式思维的中介效应均不显著。对于环境的不确定性，四个实验没有一致的结果。环境不确定性与利他行为量表测量的合作水平显著正相关，并且这一关系可以被不确定性容忍度中介，即个体经历的环境不确定性越高，对不确定的容忍度越低，进而合作水平更高（实验 1 和 3）。然而，环境不确定性与独裁者博弈任务和公共物品博弈任务测量的合作水平均没有显著相关（实验 1、2 和 4）。总之，研究结果表明环境的严酷性与合作水平负相关，这一关系被生命史策略中介，该结果部分支持生命史理论，与不确定管理观点不一致。环境的不确定性仅在特定的测量方式下与合作水平正相关，未来研究需进一步探索不确定性影响合作行为的边界条件。研究结果强调了成年个体的合作行为可能易受所处环境的影响，与行为生态学的观点一致。

关键词 合作行为，严酷性，不确定性，生命史策略，行为生态学

The effects of environmental harshness and uncertainty on cooperative behaviors

Ming-Hui Li [1] Li-Lin Rao [2,3]

1 School of Criminology, People's Public Security University of China, Beijing, China

2 Institute of Psychology, Chinese Academy of Sciences, Beijing, China

3 Department of Psychology, University of Chinese Academy of Sciences, Beijing, China

Abstract： Environmental harshness and uncertainty are associated with individuals' psychological and behavioral patterns, which allow individuals to optimize adaptation to adverse environments. Despite the growing interest in the role of environment on cooperation and prosocial behavior, there is ongoing controversy surrounding the theoretical framework and experimental findings for such effect. The current research investigated the effects of environmental harshness and uncertainty on individual differences in cooperation. Four studies (N = 2,763) found that environmental harshness was associated with lower level of cooperation. Specifically, individuals living in harsher environment showed lower level of cooperation on the dictator game and the self-report altruism behavior scale (Study 1). Moreover, in the context of the dictator game involving real monetary outcomes, environmental harshness was associated with reduced willingness to allocate money to others (Study 2). Studies 3 and 4 investigated possible mediators accounting for the relationship between environmental harshness and cooperation. Study 3 employed the self-report altruism behavior scale and examined the mediating effects of life-history strategy, trust, empathy, and tolerance of uncertainty using the parallel mediation model. We found that the life-history strategy mediated the relationship between environmental harshness and cooperation. It showed that individuals living in harsher environment tended to use faster life-history strategy, and thus showed a lower level of cooperation. The mediating effects of trust, empathy, and tolerance of uncertainty were not significant. Study 4 employed the public goods game and the dictator game, and examined the mediating effects of life-history strategy and analytic thinking using the parallel mediation models. The results of Study 4 were consistent with Study 3. The mediating effects of life-history strategy on the relationship between environmental harshness and cooperation was significant for both the public goods game and the dictator game. The mediating effect of analytic thinking was not significant. For the effect of environmental uncertainty, the results were inconsistent. Environmental uncertainty was associated with higher level of cooperation measured by the self-report altruism behavior scale. The relationship was mediated by the tolerance of uncertainty. It appeared that people who experienced more uncertain environments were more intolerance of uncertainty, and accordingly, they exhibited greater cooperation. However, the relationship between environmental uncertainty and the level of cooperation measured by either the dictator game or the public goods game was not significant. Taken together, the findings partially support the life-history theory and are inconsistent with the uncertainty management perspective. Future research is needed to investigate the boundary conditions and contextual factors that shape the relationship between environmental uncertainty and cooperative behavior. These findings align with the principles of behavioral ecology, highlighting the role of the environment in shaping cooperative behaviors.

摘 要 信任及其波动在人类社会中普遍存在。虽然不信任的后果对社会尤其在抗击疫情威胁方面具有巨大意义，但在疫情威胁是否以及如何影响信任方面仍存在许多不清楚之处。为了回答这个问题，我们在疫情爆发（研究 1）和 COVID-19 工作恢复阶段（研究 2 和 3）进行了一系列跨文化研究。这三项研究共同展示了感知的疫情威胁与信任（包括人际信任和组织信任）之间存在文化普遍的负相关关系，以及这一过程中宽恕信念的中介效应。为了进一步研究这三个因素之间的因果关系，我们操纵了不同水平的宽恕信念（研究 4）和疫情威胁（研究 5），揭示了它们之间进一步的因果联系。当前的研究结果阐明了疫情威胁对信任及其潜在机制的影响。

***Abstract*:** Trust and its fluctuations are ubiquitous in human societies. While the consequences of distrust have been of tremendous significance to society, especially in combating pandemic threats, much remains unclear about whether and how such threats would affect trust. To address this question, we conducted a series of cross-cultural studies during the outbreak (Study 1) and the work resumption stages of COVID-19 (Study 2 and 3). The three studies jointly demonstrated a culturally universal negative correlation between perceived pandemic threat and trust (including interpersonal trust and organizational trust), as well as the mediating effect of BJW in this process. To further examine the causal relationships among these three factors, we manipulated different levels of BJW (Study 4) and pandemic threats (Study 5), revealing further causal links between them. The current findings shed light on the impact of pandemic threats on trust and its underlying mechanisms.

摘 要 收入水平是参与慈善捐款程度的重要预测指标，但相关的研究包含很多矛盾的结果。本研究基于数据库挖掘分析，为收入与慈善捐赠之间的U型关系提供了新的证据和视角。收入和慈善捐赠之间的U型关系在四个数据库(CGSS, N=11765;CFPS, N=5750 追踪6年; WGI & WDI, N=132)中得到了复现。创新地采用响应面分析法排除收入流动性对慈善捐赠行为的影响，使收入阶层与慈善捐赠之间的关系更加稳定。结果显示出一种更为稳健的关系模式:随着收入水平的提高，慈善捐赠的相对水平先减少后增加。本研究试图对收入地位对亲社会的混合效应提供一个综合的视角，旨在提供一个基于现象学的分析视角来整合利他主义文献中的共识分歧，同时也从社会阶层语境的特征以及唯我主义和语境主义社会认知倾向的表现的角度提供一个可能的机制解释。

关键词 慈善捐赠，数据库分析，响应面分析，收入水平

Edge of cliffs and paradise, the giving dilemma of middle income status

Fan Gao[1], Xiaofei Xie[2*]
School of Psychological and Cognitive Sciences, Peking University, No. 5 Yiheyuan Rd, Haidian District, Beijing 100871, P.R. China.

Abstract: Current research, based on database mining analysis, presents novel evidence and perspectives on the U-shaped association between income and charitable giving. This U-shaped association between income and charitable giving is replicated in four databases(CGSS, N=11765;CFPS, N=5750 trace 6 years; WGI&WDI N=132). The response surface analysis method was innovatively adopted to exclude the influence of income mobility, leaving a more stable relationship between income class and charitable giving. The results show a more robust and solid pattern: as income levels rise, relative charitable giving first decreases and then increases. The current research attempts to provide an integrated perspective on the mixed effect of income status on prosociality and aims to offer a phenomenologically based analytical perspective to integrate the divergences of consensus in altruism literature, while also providing a possible mechanistic explanation.

Keywords: charitable giving, database analysis, response surface analysis, income level

两条大路通罗马：诉诸效能与诉诸共情募捐信息的相对有效性

赵远婕[1] 马京晶[1]（通讯作者）Danit Ein-Gar[2] Neal Roese[3]
1 北京大学国家发展研究院，北京，100871，jingjingma@nsd.pku.edu.cn
2 以色列特拉维夫大学科勒管理学院，特拉维夫，6997801
3 西北大学凯洛格商学院，芝加哥，60208

摘 要　在实践中，诉诸效能(即，旨在提升个体效能感知)和诉诸共情(即，旨在引发个体共情)是筹款人员常用的两种募捐信息策略。尽管过往已有诸多研究分别检验了效能与共情在驱动个体捐赠行为中的重要作用，并佐证了诉诸效能和诉诸共情两类募捐信息的有效性，然而，这两类研究之间几乎没有交叉。基于此，本研究以一种非常普遍，并且在慈善捐赠领域十分重要的思维方式——“最优化思维 (Maximizing Mindset)”为切入点，探索了最优化思维(vs.普通思维)对效能与共情这两个关键捐赠驱动因素的相对重要性的影响，以及对诉诸效能和诉诸共情两类募捐信息的相对有效性的影响和背后机制。

本研究包含四项实验：实验一是一项具有全国代表性的大样本问卷调研，通过测量参与者的最优化倾向及其主导捐赠驱动因素(共情 vs.效能)，本研究初步探索了最优化对效能与共情这两个关键捐赠驱动因素的相对重要性的影响。随后，实验二通过操纵参与者的最优化思维，检验了最优化思维（vs.普通思维)对诉诸效能和诉诸共情两类募捐信息的相对有效性的影响。接着，实验三和实验四分别通过操纵诉诸效能和诉诸共情信息的强度，探究了信息敏感度在最优化思维对这两类募捐信息的相对有效性的影响中的中介作用。本研究发现：最优化思维（vs.普通思维）将提升诉诸效能（vs.诉诸共情）募捐信息在促进个体捐赠中的相对有效性，这是由于采用最优化思维（vs.普通思维）的个体对效能相关信息更敏感，对共情相关信息则相对不敏感。

本研究发现兼具重要的理论意义和实践价值。一方面，本研究首次对效能与共情这两个捐赠驱动因素的相对重要性、以及诉诸效能和诉诸共情两类募捐信息的相对有效性进行了讨论和比较，深化了个体捐赠行为影响因素的理论研究，同时也丰富与加深了对最优化思维的理解；另一方面，本研究发现为慈善行业开展精准化沟通以提升筹款效率提供了重要的理论参考。

基于人的主动决策和基于计算机的被动决策对结果评估的影响：来自主观报告和电生理的证据

徐四华（通讯作者） 陶瑞文　张灿　赵汉璇

上海外国语大学国际工商管理学院，上海，200083，通讯作者 E-mail: xusihua80@gmail.com

摘 要 人类总是为自己拥有自主决策的权利而感到自豪，但在数字生活中，人们有时候却只是被动地接受决策结果。例如，智能手机上的在线购物应用程序会提供默认选项，消费者通常不需要主动做出选择，而是被动地接受。这是为什么？难道是因为人们对这两种决策模式没有明显的偏好吗？为了回答该问题，本研究采用事件相关电位（ERPs）研究了决策者对在主动决策模式和在基于计算机被动决策模式下完成卡片赌博任务时的结果评估差异。主观报告的结果显示，相对于被动决策模式，决策者在主动决策模式中会付出更多的认知努力、产生更强的情感体验。对于被选中的卡片，我们观察到两种模式下的决策结果引起的 d-FRN 没有显著性差异，但在主动决策模式下的决策结果引起了比被动模式更大的 P300。对于未被选中的卡片，相比被动决策模式，在主动决策模式下的负性决策结果诱发了更大的 d-FRN。对 P300 分析显示，结果反馈、决策模式和相对（已选结果）价值之间存在相互作用。此外，被选中卡片的损失结果引起的 P300 部分中介了主观认知努力和对损失的负面情绪评价之间的关系。我们的研究结果表明，基于人的主动决策模式和基于计算机的被动模式对决策结果的评估存在差异，主动决策模式下的损失结果诱发了更强的大脑活动，且基于人的主动决策模式需要更多的认知努力，并伴随有更强的情感体验。

Active vs. computer-based passive decision-making leads to discrepancies in outcome evaluation: Evidence from self-reported emotional experience and brain activity

Sihua Xu(Corresponding Author), Ruiwen Tao, Can Zhang, Hanxuan Zhao,
School of Business and Management, Shanghai International Studies University, Shanghai, 200083

Abstract ： People prefer active decision-making and induce a more positive affective state than computer-based passive mode, yet the modulation of decision-making mode on outcome evaluation remains unknown. The present study adopted event-related potentials (ERPs) to investigate the discrepancies in active and computer-based passive mode on outcome evaluation using a card gambling task. The subjective rating results showed that active mode elicited more cognitive effort and emotional experience than passive mode. For received outcomes, we observed no significant FRN effect on difference waveshapes (d-FRN) between the two modes, but active decision-making elicited larger P300 amplitudes than the passive mode. For unchosen card outcomes, the results revealed larger d-FRN amplitudes of relative valences (superior minus inferior) in responses to negative feedback in active mode than in passive mode. The averaged P300 results revealed an interplay among outcome feedback, decision-making mode, and relative valence, and the average P300 amplitude elicited by the received loss outcome partially mediated the relationship between subjective cognitive effort and negative emotion ratings on loss. Our findings indicate discrepancies between active and computer-based passive modes, cognitive effort, and emotional experience involved in outcome evaluation.

Keywords：decision-making mode, passive decision-making, ERP, outcome evaluation

社会关系影响双人风险决策的神经机制：一项基于 fNIRS 的超扫描研究

赵汉璇　徐四华（通讯作者）
上海外国语大学国际工商管理学院，上海，200083，通讯作者 E-mail: xusihua80@gmail.com

摘 要　当人们在与处于不同关系中的同伴共同进行团体决策的过程中，随着受益人由个体转向团体，人们往往会表现出不同的决策倾向。本研究结合基于 fNIRS 的超扫描技术，采用经典的仿真气球冒险任务（Balloon Analogue Risk Task, BART）来考察社会关系影响双人动态风险决策的脑间神经机制。本研究共招募了 50 对同性别的被试小组，并根据他们的认识时间和自我包含他人（Inclusion of Other in the Self, IOS）量表评分将其随机分到好友组和陌生组。在实验过程中，两名被试将被轮流指派到两个角色：决策者和观察者。决策者的一方通过选择吹大气球还是保存收益进行单次决策，而观察者的一方则在决策者进行决策时进行观看即可。本研究的行为结果表明，在和熟悉的朋友搭档进行合作决策时被试小组往往会呈现出损失厌恶的风险偏好。本研究的 fNIRS 结果表明，在感兴趣频段 1 上，在大脑右侧前额下回脑区（right inferior prefrontal gyrus, r-IFG）上，对于负反馈的结果加工时朋友关系组内两名被试的脑间活动同步性显著高于正反馈加工时两名被试的脑间活动同步性。在感兴趣频段 2 上，在大脑左侧前额下回脑区（left inferior frontal gyrus, l-IFG），朋友关系组内两名被试对于负反馈的结果加工时，脑间活动同步性显著高于正反馈加工时

两名被试的脑间活动同步性；陌生人关系组内两名被试加工负反馈的结果时，脑间活动同步性显著低于正反馈加工时两名被试的脑间活动同步性。在大脑额极脑区（medial frontopolar cortex, mPFC），朋友关系组内两名被试对于负反馈的结果加工时，脑间活动同步性显著高于正反馈加工时两名被试的脑间活动同步性。后续格兰杰因果分析的结果表明，在大脑左侧前额下回脑区（left inferior frontal gyrus, l-IFG），朋友关系组被试在从决策者到观察者方向上的因果方向性显著高于陌生人关系组被试在从决策者到观察者方向上的因果方向性。支持向量回归的结果表明，朋友组被试加工负反馈结果时的脑间活动同步性可以预测双方随后的风险偏好倾向，而陌生组被试加工正反馈结果时的脑间活动同步性可以预测双方随后的风险偏好倾向。

Neural Mechanism Underlying the Effect of Social Relationships on Group Decision-Making Under Uncertainty: An fNIRS-Based Hyperscanning Study

Hanxuan Zhao, Sihua Xu (Corresponding Author)
School of Business and Management, Shanghai International Studies University, Shanghai, 200083

Abstract：Humans may behave in different manners when making decisions with friends and strangers. Whether the interpersonal relationships affected the group decision-making under uncertainty in the real-time interaction remains unknown. Using the turn-based Balloon Analogue Risk Task (BART), the present study examined the group decision-making propensity under uncertainty with partners in different interpersonal relationships. Corresponding inter-brain synchronization (IBS) patterns at the prefrontal cortex (PFC) were also uncovered with the fNIRS-based hyperscanning approach. Behavioral results identified that dyads in the friend group exhibited the uncertainty-averse propensity when com- paring with the stranger group. The fNIRS results reported that feedback-related IBS at the left inferior frontal gyrus (l-IFG) and medial frontopolar cortex (mFPC) during different feedbacks was modulated by interpersonal relationships. The IBS at all channels in the PFC during the positive and negative feedbacks, respectively, predicted the decision-making propensity under uncertainty in the stranger and friend groups based on the support vector machine (SVM) algorithm. These findings demonstrated disparate behavioral responses and inter-brain synchronization patterns underlying group decision-making under uncertainty with partners in different interpersonal relationships.

Two Roads Lead to Rome: The Relative Effectiveness of Empathy vs. Efficacy in Inducing Donation

Yuanjie Zhao[1] Jingjing Ma[1] Danit Ein-Gar[2] Neal Roese [3]
1 National School of Development, Peking University, Beijing, 100871, jingjingma@nsd.pku.edu.cn
2 Coller School of Management, Tel Aviv University, Tel Aviv, 6997801

3 Kellogg School of Management, Northwestern University, Chicago, 60208

Abstract：In practice, efficacy-inducing and empathy-inducing are two types of fundraising appeals that charities commonly used to encourage charitable support. Numerous studies have underscored the importance of efficacy and empathy in driving donations and validated the effectiveness of these two types of appeals. Yet, a gap remains in the intersection of these research areas. Given this, our study introduces the concept of the 'Maximizing Mindset' as an entry point. We probe into how this mindset (vs. a neutral mindset) affects the relative importance of efficacy and empathy, the two key drivers for donations, as well as the relative effectiveness of efficacy-inducing and empathy-inducing appeals, and the underlying mechanisms.

Our research includes four studies: The first is a large-scale, nationally representative survey that initially investigates the impact of a maximizing tendency on the relative importance of efficacy and empathy in driving charitable giving. In the second study, we manipulate participants' mindsets to explore how the maximizing mindset (vs. a neutral mindset) affects the relative effectiveness of efficacy-inducing and empathy-inducing appeals. In the third and fourth studies, we manipulate the intensity of efficacy-inducing and empathy-inducing appeals to investigate the mediating role of information sensitivity in the impact of a maximizing mindset on the relative effectiveness of these two types of appeals.

Results indicate that a maximizing mindset (vs. a neutral mindset) increases the relative effectiveness of efficacy- inducing (vs. empathy-inducing) appeals. Moreover, the findings suggest that this effect is driven by information sensitivity, showing that a maximizing mindset (vs. a neutral mindset) increases one's sensitivity to efficacy-inducing appeals while decreasing one's sensitivity to empathy-inducing appeals, thus affecting their relative effectiveness.

The findings of this study offer important theoretical insights and practical implications. From a theoretical standpoint, our work is pioneering in its comparative discussion of the relative importance of efficacy and empathy as donation drivers, and the relative effectiveness of efficacy-inducing and empathy-inducing appeals. Not only does it contribute to research concerning fundraising appeals, charitable behavior, and the maximizing mindset, but it also offers practical implications that can aid fundraisers in amplifying the success of their initiatives.

摘 要　千百年来，人类对于美的追求从未止步过。面孔吸引力影响人类的经济决策，实验室实验和现场实验的结果都表明高吸引力面孔可诱发"美貌溢价"效应，即漂亮的人比相貌一般的人在社会交往中更占优势，得到更多的资源。电生理研究进一步揭示高吸引力面孔在决策过程中能诱发较大的晚期正成分，并激活伏隔核、眶额叶皮层、腹侧纹状体等与奖赏加工有关的脑区。进化理论、经济学理论和社会心理学理论则从不同视角予以阐释，进化理论主要从遗传基因和择偶动机的角度解释人们在经济决策中对不同面

孔吸引力的对象表现出的差异，这种差异往往受到决策中互动双方性别的影响。经济学家们基于真实经济情境和劳动市场中对于外貌的歧视和偏见，认为长相好看的人工作表现也会更优，提出了“基于偏好的歧视”和“统计性歧视”。社会心理学则认为刻板印象理论可以解释面孔吸引力偏好。其中获得实验证据支持最多的是进化理论，但是其无法解释少数研究报告的“美貌惩罚”效应，即美貌不仅并非利器，还可能造成经济上的亏损。未来的研究应设法创新研究范式或者多范式结合多模态脑成像技术，尝试建立完善系统的理论解释体系，构建面孔吸引力的动态连续变化模型，深入探究真实经济决策情境以提升研究的外部效度，更全面地阐释面孔吸引力影响经济决策的神经机制。

The effect of facial attractiveness on economic decision-making and its neutral mechanism

Junchen Shang [1], Yizhuo Zhang [1], Wenfeng Chen [2], Xiaolan Fu [3]*

1 Department of Medical Humanities, School of Humanities, Southeast University, Nanjing

2 Department of Psychology, Renmin University of China, Beijing

3 Institute of Psychology, Chinese Academy of Sciences, Beijing

Abstract： For thousands of years, human beings have never stopped in their pursuit of beauty. Facial attractiveness influences human’s economic decision-making. Results of laboratory and field experiments suggested that attractive faces induce a “beauty premium” effect. That is, beautiful people are more advantageous in social interactions and get more resources than people with average looks. Electrophysiological studies have further revealed that attractive faces elicited greater late positive components in decision-making and activated brain regions involved in reward processing such as the nucleus accumben, orbitofrontal cortex, and ventral striatum. Evolutionary theory, economic theory, and social psychological theory provide explanations of this effect from different perspectives. Evolutionary theory explains differences in people's performance in economic decision making towards objects of differential face attractiveness mainly in terms of genetic and mate selection motivations, which are often influenced by the gender of the two interacting parties in the decision. Economists suggested “taste-based discrimination” and “statistical discrimination”, such that attractive people also perform better at work, based on real economic situations and labor market discrimination and bias against physical appearance. Social psychology, instead, argues that stereotype theory can explain face attractiveness preferences. The evolutionary theory has received the most support from experimental evidence. However, it fails to explain the “beauty penalty” effect. That is, beauty is not only not a good tool, but can also cause financial losses. Future researches should apply new paradigms, or integrate multiple paradigms combining with multimodal brain imaging technology to establish a more systematic theoretical model, construct a dynamic and continuous changing model of face attractiveness, and explore decision-making in real economic situations for higher external validity, in order to comprehensively explain the neural mechanism of the influence of facial attractiveness on economic decision-making.

Keywords： facial attractiveness, economic decision-making, beauty premium, evolutionary theory, beauty penalty

社会排斥对风险决策和模糊决策的不同影响：来自电生理的证据

陶瑞文　赵汉璇　张灿　徐四华（通讯作者）

上海外国语大学国际工商管理学院，上海，200083，通讯作者 E-mail: xusihua80@gmail.com

摘 要 社会排斥作为一种普遍存在的社会联结破坏现象，会损耗个体的认知资源，导致人们不能理性地进行决策。风险决策和模糊决策都与人类的生活息息相关，但目前并不清楚社会排斥是否以及如何影响风险决策和模糊决策。因此，本研究基于事件相关电位（ERPs）技术，采用幸运轮盘任务（wheel- of- fortune task）来考察社会排斥影响风险决策和模糊决策的神经机制差异。本研究共招募了 60 名被试，通过看图启动任务将其随机分为社会排斥组和社会接纳组。接着进行一项轮盘博弈任务，分为 “风险决策”和“模糊决策”两部分，任务顺序在被试间随机平衡。本研究的行为结果表明，社会排斥情境下，模糊决策的反应时显著大于风险决策；但在社会接纳情境下模糊决策和风险决策的反应时差异不显著。本研究的 ERP 结果表明，在选择阶段，在社会接纳情境下，风险决策比模糊决策诱发更强的 Cue-P3 波幅；社会排斥情景则使决策类型诱发的 Cue-P3 波幅差异不显著。在结果评估阶段发现，社会排斥情景下，只有风险决策中的无收益比收益诱发更强的 FRN 波幅；社会接纳情境下，无论是风险还是模糊决策后，无收益均比收益诱发更强的 FRN。对 P300 分析显示，两种社会情境下，风险决策和模糊决策后的收益和无收益结果引起的 P300 波幅没有显著性差异。我们的研究结果表明，在选择阶段和结果评估早期阶段，社会排斥对风险决策和模糊决策产生了不同的影响，并为此提供认知神经科学层面的依据。

Distinct neural dynamics of social exclusion in decision making under risk and ambiguity: An ERP study

Ruiwen Tao, Hanxuan Zhao, Can Zhang, Sihua Xu (Corresponding Author),
School of Business and Management, Shanghai International Studies University, Shanghai, 200083

Abstract：Social exclusion is ubiquitous in everyday life, impairs individuals' cognitive resources and lead to difficulties in making rational judgements and decisions. Decisions under uncertainty can be further divided into decisions under risk in which outcome probabilities are known, and decisions under ambiguity in which outcome probabilities are ill-defined or unknown. However, whether and how risk and ambiguity are dissociated in terms of neural dynamics during social exclusion context remains unclear. The present event-related potential (ERP) study addressed these issues by asking participants to perform a wheel-of-fortune task during a risky decision and an ambiguous decision under social exclusion and social inclusion contexts. Behavioral results identified slower reaction time in ambiguous decision in the social inclusion context when comparing with risky decision. However, this effect was absent in the social exclusion context. The ERPs results reported that the cue-P3 was more enhanced during the choice phase in the risky decisions when comparing with the ambiguity decisions only in the social inclusion contexts but not in the social exclusion contexts. During the outcome evaluation phase, the results revealed that in the social inclusion context, the FRN amplitudes following both risk decisions and ambiguous decisions were greater in the gain condition than those in the no-gain condition, whereas in the social exclusion context, this unstable effect was only observed following the risk decisions. The P300 was insensitive to the gain condition and no-gain condition following risk and ambiguous decisions in both social exclusion and social inclusion contexts. These findings demonstrated the neural dissociation between risk and ambiguity decision-making during social exclusion context, and further unfolded from the choice phase to the outcome evaluation phase.

Keywords：social exclusion, decision-making under risk, decision-making under ambiguity, ERP, outcome evaluation

博弈中赢家何以脱颖而出——来自行为和脑影像的证据

张裕煊[1] 张明明[2] 蔡丹[2] 崔丽莹[2]（通讯作者）

摘 要 竞争是人类社会互动的关键要素，在竞争中，个体不可避免地被区分为赢家或输家。然而，在社会竞争过程中，赢家与输家之间的人际神经机制仍不清楚。随着超扫描技术与“第二人称神经科学”方法的应用，为揭示社会互动过程中动态的脑机制提供了可能。因此，为了更好地理解人际竞争中群体脑活动的动态性和复杂性，揭示竞争行为背后的神经过程。本研究招募 54 名参与者，两两配对完成一个基于“石头-剪刀-布”游戏的计算机任务，同时使用功能性近红外光谱成像仪器记录任务期间两名被试前额叶和颞顶联合区域的神经活动。任务结束后，根据被试的博弈结果筛选出二人组中的赢家和输家。脑影像的分析结果显示：赢家和输家在左侧额极皮层-左侧背外侧前额叶皮层、左侧额极皮层-左侧额下回皮层、右侧背外侧前额叶皮层-右侧背外侧前额叶皮层等区域的脑间同步显著增强，且赢家的神经活动先于输家发生变化。格兰杰因果分析发现二人组之间的影响是单向的，即在博弈关系中赢家到输家的信息流向显著强于输家到赢家的信息流向。此外，脑间同步与赢家采取的博弈策略（博弈转变）显著相关。综上，赢家先于输家出现的脑活动变化和随之产生的脑间同步，以及在脑际信息流向上的优势可能是竞争中赢家脱颖而出的潜在脑机制。同时，在任务过程中，当赢家的策略转变与输家的优势策略一致时，人际神经活动耦合增强。我们的发现揭示了在社会互动情境下竞争活动中赢家与输家之间独特的人际神经模式。

How Winners Emerge in Competition: Evidence from Behavior and Neuroimaging

Zhang Yuxuan; Zhang Mingming; Cai Dan; Cui Liying

Department of Psychology, College of Education, Shanghai Normal University, Shanghai 200234, China

***Abstract*：** Competition is a key aspect of human interaction and competition inevitably leads to the division of individuals into either winners or losers. However, the interpersonal neural mechanism of winner and loser during competitive interactions remains unclear. The advent of hyperscanning techniques and the adoption of a second-person neuroscience framework offer promising avenues for elucidating the intricate cerebral mechanisms involved in social interactions. Therefore, in order to advance our comprehension of the intricacies and dynamics between two brains, as well as to uncover the neural mechanisms involved in competition, a total of fifty-four participants were enlisted for the study and paired into dyads. These dyads then completed a computer task around the ‘Rock-paper-scissors’ game. Functional near-infrared spectroscopy (fNIRS) was used to record both members’ neural activity in the prefrontal cortex (PFC) and temporal-parietal junction (TPJ) regions during the task. After the task ended, we identified winners and losers in the dyads based on participant performance. The

results showed that winners and losers had significantly larger inter-brain synchrony (IBS) in the left frontopolar cortex-left dorsolateral prefrontal cortex, left frontopolar cortex-left Inferior frontal gyrus, and right dorsolateral prefrontal cortex-right dorsolateral prefrontal cortex, and neural activity changes of winners preceded the onset of losers. Granger causality analyses revealed the influence between dyads was unidirectional and was significantly stronger from the winners to the losers than the other direction. In addition, the IBS was significantly associated with the winners' shift strategy. All these findings suggest that brain activity differences, consequent IBS and preponderant inter-brain information flow between winners and losers, potentially serve as the fundamental neural mechanisms contributing to the emergence of winners. Furthermore, when the winners' strategy shifted in line with the dominant strategy of the losers, interpersonal neural activity coupling was enhanced. Our findings demonstrate a distinctive neural pattern of interpersonal dynamics between winners and losers in the context of natural interactions.

社交媒体使用与老年人生活满意度：一个有调节的中介模型

李颖聪 [1,2]　邵景进 [1,2]

1 西南大学心理健康教育研究中心，重庆，400715

2 西南大学心理学部，重庆，400715，jingjinshao@126.com

摘 要：已有研究表明社交媒体使用有助于提升老年人的生活满意度，但其潜在影响机制仍有待探索。为系统考察社交媒体使用是否通过线上和线下社会联结的中介作用而影响老年人生活满意度，以及线上和线下社会联结的中介作用是否受到孤独感和躯体功能障碍的调节，以最受中国老年人欢迎的社交媒体平台——微信为例，采用社交媒体使用强度量表、线上和线下社会联结量表、生活满意度量表（SWLS）、UCLA 孤独感量表 8 条目简化版（ULS-8）、日常生活能力量表（ADL）对 232 名中国老年人（$M = 65.28$，$SD = 6.77$）进行调查。研究结果表明：（1）线上社会联结和线下社会联结在社交媒体使用和老年人生活满意度之间起到中介作用；（2）孤独感对线上社会联结在社交媒体使用和老年人生活满意度间中介效应的前半路径起调节作用，线上社会联结的中介作用仅在孤独感较高的老年人中显著，即对于高孤独感老年人，社交媒体使用强度越高，线上社会联结越强；（3）躯体功能障碍对线下社会联结在社交媒体使用和老年人生活满意度间中介效应的前半路径起调节作用，线下社会联结的中介作用仅在躯体功能障碍程度较高的老年人中显著，即对于高躯体功能障碍老年人，社交媒体使用强度越高，线下社会联结越强。该研究结果有助于更好地了解社交媒体使用“如何”以及“何时”影响老年人生活满意度，为数字化时代提升老年人的生活满意度提供有益借鉴。

Social Media Use and Life Satisfaction among Older Adults: A

Moderated Mediation Model

Yingcong Li[1,2], Jingjin Shao[1,2]

1Centre for Mental Health Education, Southwest University, Chongqing, 400715

2 Faculty of Psychology, Southwest University, Chongqing, 400715

***Abstract*:** Previous studies have demonstrated that social media use (SMU) benefits older adults' life satisfaction, however, the underlying mechanisms of this relationship have not been fully explored. This study focused on WeChat, the most popular social media platform among Chinese older adults, to examine whether SMU affects older adults' life satisfaction through the mediating role of online and offline social connectedness, and whether these mediating processes are moderated by loneliness and functional disability. Using Social Media Usage Intensity Scale, Online and Offline Social Connectedness Scales, Satisfaction with Life Scale (SWLS), the 8-item simplified version of UCLA Loneliness Scale (ULS-8), and Activities of Daily Living Scale (ADL), a questionnaire survey was conducted among 232 Chinese older adults (M = 65.28, SD = 6.77). The results showed that: (1) Online and offline social connectedness mediated the relationship between SMU and the life satisfaction of older adults; (2) Loneliness moderated the first half of the mediating effect of online social connectedness between SMU and older adults' life satisfaction, with the mediating effect of online social connectedness being significant only among older adults experiencing high levels of loneliness. That is, for older adults with high levels of loneliness, higher intensity of SMU was associated with stronger online social connectedness. (3) Functional disability moderated the first half of the mediating effect of offline social connectedness between SMU and older adults' life satisfaction, with the mediating effect of offline social connections being significant only among older adults with high levels of functional disability. That is, for older adults with high levels of functional disability, higher intensity of SMU was related to stronger offline social connectedness. These findings contribute to a better understanding of how and when SMU influences the life satisfaction of older adults, providing valuable insights for enhancing the life satisfaction of older adults in the digital age.

摘 要 随着信息科学技术的快速发展，越来越多的老年人开始使用网络和短视频应用(Application, APP)。但目前关于短视频 APP 使用与老年人自评健康之间的关系及其作用机制还不够清晰。本研究旨在构建一个有调节的中介模型，探讨使用短视频 APP 与老年人自评健康的关系及主观社会支持和媒介素养在其中的作用。对 319 位老年人展开问卷调查，以每周使用时间测量短视频 APP 使用，以主观健康测量老年人的健康水平，采用社会支持评定量表、媒介素养量表测量老年人的主观社会支持和媒介素养。通过 SPSS21.0 和

SPSS 宏 process 程序对数据进行分析。结果发现： (1) 短视频 APP 每周使用时间正向预测老年人的主观健康水平($b = 0.38, p < .001$)；(2) 主观社会支持在两者关系间起中介作用，95%的 Bootstrap 置信区间为[0.03, 0.10]，中介效应占比 25.93%；(3) 仅对于媒介素养较低的老年人而言，短视频 APP 每周使用时间正向预测主观社会支持($b = 0.36, p < 0.01$)，中介路径成立。本研究提示未来开展老年人（特别是媒介素养较低的老年人）健康和幸福感方面的干预研究，可以考虑涉及短视频 APP 使用方面的内容。

[3]Department of Psychology, The Chinese University of Hong Kong, Hong Kong, China

Abstract：Although short-form video applications (apps) are increasingly popular among older adults, little research has investigated the relationship between their use of such apps and health outcomes. The present study aims to investigate this relationship while also examining the mediating role of perceived social support and the moderating role of media literacy. Three hundred and nineteen older adults completed our questionnaire. The results showed that short-form video app use had a positive association with self-rated health among older adults, and the association was mediated by perceived social support. Moreover, the positive association between short-form video app use and perceived social support was observed in older adults with lower (but not higher) levels of media literacy. Future interventions aimed at promoting the health and well-being of older adults (especially those with lower media literacy) should consider teaching their participants to appropriately use short-form video apps.

情景记忆和错误记忆影响价值决策的年老化效应

王俭勤
复旦大学心理学系，上海，200433，wjq@fudan.edu.cn

摘 要　随着年龄的增长，老年人的记忆功能逐渐衰退，主要表现为情景记忆水平的下降，以及错误记忆水平的上升。记忆对于指导个体的决策具有重要作用，目前鲜有研究关注老年人记忆功能的改变对其决策的影响。对这一问题的回答有助于揭示记忆影响决策的年老化模式，并为将来开发提升老年人决策质量的手段提供依据。本研究采用系列实验，同时考察了情景记忆和错误记忆影响决策偏好的年老化机制。实验一结合了错误记忆 DRM 范式和奖励学习范式，实验二则将类别错误记忆范式和奖励学习相结合，同时比较了青年组和老年被试组基于经验的价值决策模式。实验一和实验二均发现，老年组被试对奖励经历的情景记忆显著低于青年组，且在随后的决策任务中，老年组被试对学习阶段奖励过的图片的决策偏好显

著低于青年组被试，说明老年被试的情景记忆衰退使得其决策表现显著下降。对于错误记忆而言，老年组的错误记忆水平与青年组相当（实验一）甚至更低（实验二），因此老年组被试基于错误记忆的决策偏好表现为显著低于青年组被试。对记忆水平和决策偏好二者进行相关分析发现，记忆水平能显著地预测青年人的决策偏好，但不能很好地预测老年人的决策偏好。以上结果表明，老年人记忆功能的下降是其决策表现下降的重要机制，且记忆对决策的直接影响在老年人群体中表现为一定程度的分离效应。

关键词　错误记忆，情景记忆，价值决策，年老化，

Aging Effects on the Impact of Episodic Memory and False Memory on Decision-making

Jianqin Wang
Department of Psychology, Fudan University, Shanghai, 200433, jq@fudan.edu.cn

***Abstract*：** As people age, their episodic memory declines and meanwhile, their false memory level increases. Recent research has shown the critical role of episodic memory in experience-based decision-making. An unanswered question is, how would the decline of episodic memory and increase of false memory impact older adults' decision-making. Answering this question could help uncover the aging pattern of memory based decision-making, and have practical implications in exploring interventions on how to improve older adults' decision-making performance. The current study conducted a series of experiments to examine the role of episodic memory and false memory in decision-making in older adults. Experiment 1 combined the false memory DRM paradigm and the reward learning task, while Experiment 2 combined the categorical false memory paradigm and reward learning, in order to investigate the aging pattern of experience-based value decision-making via testing both younger and older adults. Both Experiment 1 and Experiment 2 found that older adults had significantly lower episodic memory for past rewarding experiences than younger adults, and in the follow-up decision-making task, older adults' decision-making preferences for rewarded pictures were significantly lower than that of younger adults, suggesting that the decline of episodic memory might lead to worse performance in decision-making in older adults. For false memory and decision-making, older adults had equivalent level of false memory with younger adults (Experiment 1) or even lower false memory rates (Experiment 2), which led to significantly fewer false memory-based decisions than younger adults. Correlational analyses revealed that, memory level can significantly predict the decision-making preferences in younger but not older adults. The above findings suggest that the deficit of memory function in older adults is a potential mechanism underlying their decreased decision-making performance, and a dissociation between memory and decision-making emerges in older adults.

价值对情景记忆老化的影响

王宝玺 王雪静 盘汝忆
江西师范大学心理学院，南昌，330022，wangbaoxi@126.com
摘 要 随着年龄的增长，老年人的情景记忆存在不同程度的老化。鉴于老年人的回想能力受损而熟悉性保存完好，价值对老年人来源记忆的影响是基于熟悉性还是回想有待进一步探讨。由于不同类型的来源记忆所占用的认知资源的不同，可能导致价值对老年人来源记忆影响存在差异。本研究探讨价值对来源记忆和联结记忆等不同类型的情景记忆的影响及其相关机制。本研究设计两个实验探究在无意编码条件下价值对来源记忆的影响。实验 1 使用了对认知资源需求较低的内在来源任务探究价值对来源记忆的影响。实验 1 使用了对认知资源需求较高的外在来源任务探究价值对来源记忆的影响。实验 1 发现无论是青年人还是老年人的高价值条件下的项目记忆成绩显著高于低价值条件。对于来源记忆，两个年龄组在记得条件下对高价值的来源记忆再认成绩显著高于低价值材料的来源记忆，而在知道条件下对低价值的来源记忆再认成绩显著低于高价值。实验 2 发现在两个年龄组中，高价值材料的项目记忆成绩显著高于低价值，而高低价值材料之间的来源记忆成绩没有显著差异。结果表明，价值对老年人来源记忆影响依赖于来源记忆的类型，在内部来源条件下，高价值材料的项目记忆和来源记忆都高于低价值材料，价值对来源记忆的促进作用基于回想过程。但是在外部来源条件下，价值仅仅促进了项目记忆而对来源记忆没有影响。价值对不同来源记忆影响存在差异可能是因为不同来源记忆任务对认知资源的占用情况不同导致的。
关键词 价值，情景记忆，回想，熟悉性，记忆老化

The effect of value on episodic memory in older adults

Baoxi Wang, Xuejing Wang, Ruyi Pan
School of Psychology，Jiangxi Normal University, NanChang
***Abstract*:** While memory generally declines with increasing age, aging has varied effects on different types of episodic memory in older adults. Whether the effect of value on episodic memory in older adults is based on familiarity or recollection needs to be further explored, given that recollection is impaired and familiarity is well preserved in older adults. Differences in the cognitive resources occupied by different types of episodic memory may lead to different effects of value on episodic memory in older adults. The study examines the effects of value on different types of episodic memory and their related mechanisms. Two experiments were used to explore the effects of value on source memory, respectively. Experiment 1 explores the effects of value on source memory under incidental encoding condition. Experiment 1 used an intrinsic source task with a low demand for cognitive resources to explore the effect of value on source memory. Experiment 2 used an extrinsic source task with a high demand for cognitive resources to explore the effect of value on source memory. Experiment 1 found that item memory performance was significantly higher in the high-value condition than in the low-value condition for both young and older adults. For source memory, both age groups had significantly higher recollection scores for high-value source memory in the remembering condition than for low-value material, and significantly lower recollection scores for low-value source memory in the knowing condition than for high-value. Experiment 2 found that item memory performance was significantly higher for high-value materials than for low-value in both age groups, while there was no significant difference in source memory performance between high and low-value materials. The results indicated that the effect of value on source memory in older adults depended on the type of source memory, that item memory and source memory were higher for high-value materials than for low-value materials in the intrinsic source condition, and that the facilitating effect of value on source memory was based on the recollection. In the external source condition, however, value only facilitated item memory without having an effect on source memory. Differences in the effect of value on different source memories may result from the

different occupation of cognitive resources by different source memory tasks. This may be due to the resource demands of the different source memory tests.

***Keywords*:** value, episodic memory, recollection, familiarity, memory aging

老助老模式的作用机制：来自心理-行为-脑间同步性的证据

4 Centre for Tactile Internet with Human-in-the-Loop, Technische Universität Dresden, Dresden, Germany

摘 要 随着老龄化加剧，中国 60 岁及以上老年人口增至 2.64 亿，而同时，服务于老年群体的青年活跃志愿者人数约 14.27 万，志愿者与受助者在数量上呈现严重供需不平衡。因此，鼓励老年人成为志愿者，帮扶同龄人，或将成为缓解该人力资源紧张的有效方式之一。本研究从心理、行为、神经证据三个层面探究老助老模式与传统青助老模式的差异及潜在机制，揭示老助老的可行性与科学性。研究通过问卷调查、行为实验、近红外超扫描展开，探讨 1) 老助老模式跨人群、跨任务的接受度；2) 老助老与青助老模式的实际帮扶效果，及该效果如何受任务特征的调节(认知相关 vs.情绪相关)；3) 两种模式在人际神经同步性（INS）上的差异，及该差异对行为结果的影响。研究一考察老年人(n = 210)、家属(n = 567)、社区工作者(n = 108)三类人群在两类任务(认知相关 vs. 情绪相关)中对帮扶模式的偏好。结果显示，在认知相关任务中，老年人和社区工作者都更倾向于青助老模式，家属未表现出明显偏好；在情绪相关任务中，家属更倾向于老助老模式，而老年人和社区工作者未表现出明显偏好。研究二考察不同模式对老年受助者(n = 122)的帮扶效果差异，及任务类型的调节作用。结果显示，在认知相关任务——智能手机教学活动中，青助老组的老年人使用智能应用的正确率更高；在情绪相关任务——情感疏导活动中，老助老对老年人情绪的改善作用更明显，其消极情绪得分更低、积极情绪得分更高。研究三采用近红外超扫描技术，对比老助老和青助老模式中，志愿者-受助者的人际神经同步性(INS)，挖掘不同模式行为表现差异的神经生理证据。结果显示，在简单任务中，两种模式未出现行为差异；在困难任务中，老助老组的学习成绩显著高于青助老组。在人际神经同步性上，出现与行为结果相吻合的模式。中介分析表明，不同帮扶模式通过人际神经同步性影响了老年人的学习行为表现。综上，本研究对老助老模式行为效果及机制进行探讨，为该模式提供了多层次科学依据，助力创新型养老服务的建设。

Centre for Tactile Internet with Human-in-the-Loop, Technische Universität Dresden, Dresden, Germany

Abstract：With the intensification of ageing, China's old adults aged 60 and above has increased to 264 million, while at the same time the number of young active volunteers serving the older adults is about 142,700, reflecting a serious imbalance between volunteers and beneficiaries. Therefore, encouraging older people to volunteer and help their peers may be one of the effective ways to alleviate the shortage of human resources. This study explores the differences and potential mechanisms between the old-help-old model and the traditional youth-help-old model from three levels of psychological, behavioural and neurological evidence, and demonstrates the feasibility and scientificity of the old-help-old model. The study was conducted using questionnaire surveys, behavioural experiments, and NIRS-based hyperscanning to examine 1) the acceptability of the old-help-old model across populations and tasks; 2) the behavioral effect of old-help-old and youth-help-old, and how this effect is regulated by task characteristics (cognitive vs. emotional); 3) differences in interpersonal neural synchrony (INS) between the two models and the effect of this difference on behavioural outcomes. Study 1 investigated the preference of older people (n = 210), family members (n = 567) and community workers (n = 108) in two types of tasks (cognitive vs. emotional). The results showed that in the cognitive tasks, both the older people and the community workers tended to prefer the youth-help-old, while the family members showed no obvious preference. For the emotional tasks, families tended to old-help-old model, while older adults and community workers showed no clear preference. Study 2 examined the helping effect of different models on older recipients (n = 122) and the moderating effect of task type. The results showed that in the cognitive task - smart phone teaching activity, the older adults in youth-help-old group had a higher correct rate of using smart applications. In the emotion-related task - emotional counselling activity, the effect of old-help-old on the older adults' mood was more obvious, and the negative emotion score was lower and the positive emotion score was higher. Study 3 compare the interpersonal neural synchrony (INS) of the volunteer-recipient in the old-help-old and youth-help-old models, and to examine the neurophysiological evidence for differences in behavioural performance between the models. The results show that in the simple task there is no difference in behaviour between the two modes; in the hard tasks the learning performance of the old-help-old group was significantly higher than that of the youth-help-old group. Patterns of INS are consistent with behavioural outcomes. Mediation analysis showed that different models influenced the learning behaviour of older people through INS. These results confirm the feasibility of old-help-old model and provide evidence for brain activity.

第二受害者护士心理创伤的潜在剖面分析及与创伤后成长的关系：一项横断面研究

孙连荣[1] 叶旭春[2]（通讯作者）

1 上海师范大学天华学院，上海

2 中国人民解放军海军军医大学护理系，上海，200433，ye_xch8639@163.com

摘 要 尽管不良事件会使护士成为第二受害者（Second Victoms, SVs）并经历心理创伤，但它们也能为护士提供职业发展的机会。辨别第二受害者护士心理创伤的潜在类别并探讨各类别与创伤后成长

（Posttraumatic growth, PTG）的关系，对建立有效的第二受害者支持系统具有重要的理论价值和现实意义。为了分析第二受害者护士心理创伤的潜在类别，并研究各类别与个人特质和创伤后成长的关联，本研究收集 523 名中国第二受害者护士的人口学资料、心理创伤和创伤后成长分数并采用潜在剖面分析法（Latent quality analysis, LPA）进行数据分析。结果显示第二受害者护士的心理创伤可分为三个潜在类别：C1 为高痛苦感知-高支持组（70.1%）；C2 为高痛苦感知-中度支持组（23.8%）；C3 为低痛苦感知-低支持组（6.1%）。与 C3 相比，C1 和 C2 具有显著的职称效应；C2 的创伤后成长分数是三个类别中最低的。聚焦职称较低的护士并关注其心理需求是促进第二受害者护士心理康复和创伤后成长的有效策略。
关键词 护士，第二受害者，创伤后成长，潜在剖面分析

A latent profile analysis of second victim nurses' psychological trauma and its relationship with their posttraumatic growth: A cross-sectional study in China

Sun Lianrong[1], Ye Xuchun[2]
Tianhua College， Shanghai Normal University,Shanghai
Department of Nursing, Naval Medical University, Shanghai

Abstract: Although adverse events can cause nurses to become second victims (SVs) and experience psychological trauma, they can also provide opportunities for professional development. Exploring the categories of SV nurses' psychological trauma and the connection to their posttraumatic growth (PTG) has great academic value and practical significance for building an effective SV support system. To analyze potential categories of psychological trauma in SV nurses and investigate its association with personal information and PTG. In this study, 523 Chinese SV nurses' demographic information, psychological trauma, and PTG were surveyed. Data statistics were performed using latent quality analysis (LPA). SV nurses' psychological trauma can be divided into three potential categories: C1, high distress with high perceived support (70.1%); C2, high physical and mental distress with moderate perceived support (23.8%); and C3, low distress with low perceived support (6.1%). Compared with C3, C1 and C2 have a significant professional title effect; C2's PTG was the lowest of the three categories. Anchoring nurses with low professional titles and focusing on their psychological needs is an effective strategy for promoting SV nurses' psychological rehabilitation and PTG.

遭受工作场所暴力后急诊护士综合抗逆力干预的可行性、可接受性和有效性研究

廖俪雯[1] 王琳[1]（通讯作者）
1 上海交通大学护理学院，上海，200025
1 上海交通大学护理学院，上海，200025，E-mail：wanglsd@shsmu.edu.cn

摘 要 目的:本研究旨在探讨综合性抗逆力干预对遭受工作场所暴力后急诊护士抗逆力提升的可行性、可接受性和有效性，为未来进一步临床应用提供依据，以维护护理团队的整体身心健康。方法:采用类实验性研究设计和混合式研究方法，于 2022 年 11 月-2023 年 4 月通过整群抽样选取上海市某三级甲等医院两所院区 71 名遭受工作场所暴力的急诊护士作为研究对象，试验组 35 名，对照组 36 名。试验组接受为期 4 个

月的 8 次综合抗逆力干预，对照组予以常规心理干预。量性资料收集时间点为干预前和干预后，采用一般资料调查表、中文版抗逆力简表、认知情绪调节量表和特质应对方式问卷进行现场收集。同时在干预后对 9 名急诊护士开展半结构式访谈以收集其对干预方案的看法和体验，以评估该综合抗逆力干预方案的可行性和可接受性。量性资料分析采用 SPSS26.0，质性资料分析采用内容分析法。结果:共 71 名遭受过工作场所暴力的急诊护士完成干预研究，完成率 100%。试验组 26 名急诊护士完成了 6 次以上的干预课程（74.3%），35 名急诊护士均完成了家庭作业（100%）。量性研究结果显示，干预前两组急诊护士的一般资料、抗逆力、情绪调节策略和应对方式得分均无统计学意义（p 均＞0.05）。干预后，试验组抗逆力和积极应对方式得分较干预前提高，消极应对方式和非适应性情绪调节策略得分较干预前降低，差异具有统计学意义（p 均＜0.05）。同时，干预后试验组抗逆力、情绪调节策略和应对方式得分均较对照组有所改善，但差异无统计学意义（p 均＞0.05）。干预前后对照组抗逆力、情绪调节策略和应对方式得分均无统计学意义（p 均＞0.05）。质性研究结果显示，试验组急诊护士对该方案表现出积极评价，具体可归纳为愉快的参与体验、抗逆力的提升、情绪调节和应对能力的提升三个主题。结论:综合抗逆力干预具有良好可行性、可接受性和有效性，可提高遭受工作场所暴力后急诊护士的抗逆力、改善其情绪调节策略、提升其积极应对工作场所暴力的能力。我国护理管理者应重视工作场所暴力对护士身心健康和职业发展的影响，积极采取措施减轻工作场所暴力的后遗症。未来可将该综合抗逆力干预方案整合至护士职前教育或继续教育中，进一步扩大临床应用对象以促进全体护士的身心健康，推动护理团队的稳定健康发展。

Effect, feasibility, and acceptability of a comprehensive resilience intervention program in emergency nurses exposed to workplace violence

Liao LW, Wang L

School of Nursing, Shanghai Jiaotong University, Shanghai, No. 227, South Chongqing Road

***Abstract*：Objective：** This study aimed to test the feasibility, acceptability, and effect of a comprehensive resilience intervention in emergency nurses exposed to workplace violence. This study would provide a basis for further clinical application in the future and promote maintaining the physical and mental health of overall nurses.**Methods：** This is a quasi-experimental study with mixed methods. This study was performed from October 2022 to April 2023. 71 emergency nurses exposed to workplace violence from tertiary-level general hospitals in Shanghai were recruited and assigned to the intervention group (n=35) and control group (n=36). The intervention group received the comprehensive resilience intervention program. The control group received the general psychological intervention. The quantitative data was measured using the Chinese version of the Resilience Scale (CD-RISC-10), the Cognitive Emotion Regulation Questionnaire (CERQ), and the Trait Coping Style Questionnaire (TCSQ) at baseline and after intervention. In addition, we conducted semi-structured interviews with 9 participants from the intervention group to test the feasibility and acceptability of the program. SPSS26.0 was used for data analysis. The qualitative data was analyzed using content analysis methods. **Results:**71 participants completed our intervention (100%). 26 participants in the intervention group completed more than six courses (74.3%). All participants in the intervention group completed the homework (100%). The quantitative study showed that before the intervention, no significant differences in demographics, resilience, emotion

regulation strategies, and coping were observed between the two groups (all p > 0.05). Comparing the scores before and after the intervention, the scores of resilience and positive coping in the intervention group were significantly improved, and the score of maladaptive emotion regulation strategies and negative coping was significantly decreased (all p < 0.05). Compared with the control group, the scores of all variables were improved, but the differences were not statistically significant (all p > 0.05). For the control group, there was little change in all variables (p > 0.05). The qualitative data showed that the emergency nurses demonstrated a positive evaluation of the program, which could be categorized into three themes: joyful engagement experience, improvement in resilience, and improvement in emotional regulation and coping skills.**Conclusion:** The comprehensive resilience intervention program was effective, feasible, and acceptable in increasing resilience, improving emotion regulation strategies, and enhancing their ability to cope with workplace violence in emergency nurses exposed to workplace violence. Emergency departments and managers should emphasize the impact of workplace violence on nurses' well-being and career development and actively take measures to mitigate the sequelae of workplace violence. This comprehensive resilience intervention program could be integrated into the training of nurses, whether they are just starting or continuing their education. This will enable nurses better to promote both their own physical and mental health and that of their nursing team, leading to a stable and healthy work environment.

Keywords：comprehensive resilience intervention, workplace violence, emergency nurses, mental health, mixed methods

心理负荷在 ICU 女性护士组织支持和职业倦怠间的中介效应分析

杨洁[1]　刘晓芯（通讯作者）[2]　居馨星[2]　成钰娜[3]

1 上海市胸科医院日间手术病房，上海，200030

2 上海市胸科医院护理部，上海，200030，通讯作者 E-mail：lxx1018@hotmail.com

3 上海交通大学护理学院，上海，200025

摘要 目的 了解 ICU 女性护士组织支持、心理负荷及职业倦怠现状，并探讨三者关系。**方法** 采用方便抽样法，于 2023 年 4 月-5 月选取上海市三所三级甲等医院的 174 例 ICU 女性护士，采用一般资料调查表、组织支持感问卷、NASA 任务负荷指数量表、职业倦怠量表进行问卷调查。**结果** ICU 女性护士组织支持感总分（54.25±12.39）分，心理负荷总分（75.14±14.75）分，职业倦怠总分（41.28±16.14）分，组织支持与心理负荷、职业倦怠呈负相关（均 $P<0.05$），心理负荷与职业倦怠呈正相关（$P<0.05$），心理负荷在组织支持与职业倦怠间起部分中介作用，间接效应占总效应的 34.35%。**结论** ICU 女性护士组织支持、心理负荷和职业倦怠均处于中等水平；心理负荷在 ICU 女性护士组织支持和职业倦怠之间起部分中介作用。护理管理者应提供多样化的组织专业支持，可设计干预项目以减轻工作负荷感受，并提高自我评价，进而改善 ICU 女性护士职业倦怠水平。

关键词：ICU 女性护士，组织支持，心理负荷，职业倦怠，中介效应

Mediating effect of mental workload between organisational support and job burnout among female ICU nurses

Yang Jie[1]　Liu Xiaoxin[2]　Ju Xinxing[2]　Cheng Yuna[3]

1 Day surgery Ward, Shanghai Chest Hopstial, Shanghai, 200030

2 Nursing Department, Shanghai Chest Hopstial, Shanghai, 200030. E-mail: lxx1018@hotmail.com

3 School of Nursing, Shanghai Jiao Tong University, Shanghai, 200025

Abstract **Objective** To understand the status quo of organizational support, mental workload and job burnout of female nurses in ICU, and explore the relationship among them. **Methods** A total of 174 female ICU nurses from three grade-A hospitals in Shanghai were selected by convenience sampling method from April to May 2023. General data questionnaire, organizational support questionnaire, National Aeronautics and space administration task load index(NASA-TLX) and job burnout scale were used to conduct questionnaire survey. **Results** The total scores of organizational support, mental workload and job burnout of female nurses in ICU were (54.25±12.39) , (75.14±14.75) and (41.28±16.14) respectively. Organizational support was negatively correlated with mental workload and job burnout (all $P < 0.05$). There was a positive correlation between mental workload and job burnout ($P < 0.05$). Mental workload played a partial mediating role between organizational support and job burnout, and the indirect effect accounted for 34.35% of the total effect. **Conclusion** The organizational support, mental workload and job burnout of ICU female nurses were all at medium level. Mental workload plays a partial mediating role between organizational support and job burnout of ICU female nurses. Nursing managers should provide diverse organizational professional support, and can design intervention programs to reduce workload perception and improve self-evaluation, which in turn will improve the level of job burnout among female ICU nurses.

护士工作场所欺凌与自杀的关系：基于不同维度及亚型分析

肖意苹[1]　张烜[1]　吕苒[2]　曹枫林[1]（通讯作者）

1 山东大学护理与康复学院，济南，250012，通讯作者 E-mail: caofenglin2008@126.com

2 山东大学口腔医院，济南，250012

摘 要　**目的：**探讨护士工作场所欺凌的不同维度及亚型与自杀的关系。 **方法：**采用方便抽样法从山东省四所三甲医院选取 3026 名护士作为研究对象。采用负性行为问卷-修订版和自杀行为问卷-修订版评估护士的工作场所欺凌情况及自杀风险。使用潜在类别分析识别护士工作场所欺凌的不同亚型，使用多元 logistic 回归探讨工作场所欺凌的总分、不同维度及不同亚型与护士自杀风险的关系。 **结果：**研究发现，工作场所欺凌总分越高，护士报告自杀的可能性越大（OR=1.037；95%CI：1.030，1.043），工作场所欺凌三个维度中仅组织不公与自杀呈显著关联（OR=1.223；95%CI：1.149，1.302）。本研究共识别出工作场所欺凌的五个亚型，即低欺凌组（52.25%）、中欺凌组（9.35%）、高欺凌组（17.02%）、超负荷组（10.67%）和不匹配组（10.71%）。与低欺凌组相比，中欺凌组（OR=5.935；95%CI：4.183，8.420）、高欺凌组（OR=5.577；95%CI：4.112，7.566）、超负荷组（OR=3.506；95%CI：2.426，5.067）和不匹配组（OR=3.333；95%CI：2.300，4.828）的护士报告自杀的可能性更大。此外，护士的 BMI 指数高（OR=1.040；95%CI：1.001，1.081）、女性（OR=2.295；95%CI：1.283，4.106）和经历过精神心理疾病、重大躯体疾病或头部受伤史（OR=3.383；95%CI：2.163，5.292）与护士报告自杀的可能性呈正相关，已婚（OR=0.733；95%CI：0.536，1.002，*P*=0.051）与护士报告自杀的可能性呈负相关。 **结论：**护士遭受的工作场所欺凌与自杀关系密切，医院管理者要重视护士的工作环境，及时识别自杀的高风险人群并采取合适的干预措施。

***Abstract*：** **Objective:** To explore the relationship between different dimensions and subtypes of workplace bullying and suicide among nurses. **Methods:** A total of 3026 nurses from four tertiary hospitals in Shandong Province were recruited by convenience sampling method. The Negative Acts Questionnaire Revised and Suicidal Behaviors Questionnaire Revised were used to assess the workplace bullying and suicide risk of nurses. Latent class analysis was used to identify the different subtypes of workplace bullying, and multivariate logistic regressions were used to explore the association of the total score, different dimensions and different subtypes of workplace bullying and the suicide risk of nurses. **Results:** A higher total score on workplace bullying is associated with an increased likelihood of nurses reporting suicide (OR=1.037; 95%CI: 1.030, 1.043). Among the three dimensions of workplace bullying, only organizational injustice was positively correlated with suicide (OR=1.223; 95%CI: 1.149, 1.302). Five subtypes of workplace bullying were identified including “low bullying type” (52.25%), “moderate bullying type” (9.35%), “high bullying type” (17.02%), “overloaded type” (10.67%), and “mismatch type” (10.71%). Compared with the “low bullying type”, “moderate bullying type” (OR=5.935; 95%CI: 4.183, 8.420), “high bullying type” (OR=5.577; 95%CI: 4.112, 7.566), “overloaded type” (OR=3.506; 95%CI: 2.426, 5.067) and “mismatch type” (OR=3.333; 95%CI: 2.300, 4.828) exhibit a greater likelihood of reporting suicide. In addition, nurses who have a higher BMI (OR=1.040; 95%CI: 1.001, 1.081), are female (OR=2.295; 95%CI: 1.283, 4.106) and have a history of mental illness, major physical illness, or head injury (OR=3.383; 95%CI: 2.163, 5.292) were positively associated with the likelihood of a nurse reporting suicide, and married (OR=0.733; 95%CI: 0.536, 1.002, *P*=0.051) was inversely associated with the likelihood of a nurse reporting suicide. **Conclusions:** Workplace bullying is closely related to suicide among nurses. Hospital managers should pay attention to the work environment of nurses, identify high-risk groups of suicide in time, and take appropriate intervention measures.

网络情境下房颤患者及家属的需求分析

吴清[1,2]　王沛[2]（通讯作者）
1 上海交通大学护理学院，上海，200025
2 华东师范大学教育学部，上海，200032，通讯作者 Email: wangpei1970@163.com

摘 要 **目的：**分析真实网络情境下房颤患者及家属的房颤相关需求，并构建房颤相关需求分类模型。**方法：**收集房颤相关 QQ 群、微信群近 5 年的群聊信息，以及知乎和新浪微博中经“房颤”或“导管消融”认证的账号和百度房颤贴吧中的房颤相关信息，形成研究资料。基于 Python 自然语言处理技术，应用 Jieba、Pandas、NumPy 对收集的文本进行预处理后，结合 TF-IDF 算法进行关键词提取、词频分析以获取房颤相关需求，采用神经网络构建需求分类模型。**结果：**累计获取网络分析文本 536786 字。文本分析结果显示，词频分析和 TF-IDF 算法进行关键词的分析结果基本一致，词频排在前 15 的分别是“治疗”、“手术”、“消融”、“成功率”、“心悸”、“复发”、“医院”、“原因”、“担心”、“发作”、“症状”、“心律失常”、“检查”、“药物”、“心房

[1] 本研究受国家自然科学基金项目（72104078），上海交通大学医学院护理学科建设项目（学科骨干人才项目）和上海交通大学护理学院高阶专科护理基地建设项目资助。

变大”。基于神经网络的模型结果显示，房颤患者及家属的需求可以分为“临床表现信息”、“诊断信息”、“治疗信息”、“预后信息”、“自我管理信息”、“活动信息”、“心理支持”、“社会支持”，预测准确率为 78.6%。**结论：**房颤患者及家属的需求存在共性，主要关注手术相关的治疗信息，尤其是导管消融术、术后复发、症状控制等效果信息，其次患者还关注就诊医院、情绪、发病症状及药物治疗相关信息。房颤患者及家属需求分类模型能较好识别患者的需求，有助于后续进行精准的需求支持。

Needs analysis of patients with atrial fibrillation and their families in the context of the Internet

Qing Wu[1,2] Pei Wang[2] (Corresponding author)
1 School of Nursing, Shanghai Jiao Tong University, Shanghai, 200025
2 Faculty of Education, East China Normal University, Shanghai, 200032
E-mail: wangpei1970@163.com

***Abstract*：Objective:** To analyze the needs of patients with atrial fibrillation (AF) and their families in the context of the Internet, and to build a classification model of the needs of atrial fibrillation. **Methods:** The information related to AF on the QQ group, WeChat group, the accounts certified by "atrial fibrillation" or "catheter ablation" in Zhihu and Sina Weibo, as well as Baidu's AF post bar were collected. Based on Python natural language processing technology, Jieba, Pandas and NumPy were applied to pre-process the collected texts, and then keyword extraction and word frequency analysis were carried out in combination with TF-IDF algorithm to obtain the needs of patients with AF and their families. A need classification model was constructed by neural network. **Results:** A total of 536,786 words of network analysis text were obtained. The results of text analysis showed that the results of word frequency analysis and TF-IDF algorithm for keyword analysis were basically consistent. The top 15 of word frequency were "treatment", "operation", "ablation", "success rate", "palpitation", "recurrence", "hospital", "reason" and "fear", "attack", "symptoms", "arrhythmia", "test", "drug" and " atrial enlargement". The model based on neural network showed that the needs of patients with AF and their families could be divided into "clinical information", "diagnosis information", "treatment information", "prognosis information", "self-management information", "activity information", "psychological support" and "social support", and the prediction accuracy was 78.6%. **Conclusions:** Patients with AF and their families have common needs. They mainly pay attention to surgical treatment information, especially information about the effects of catheter ablation, postoperative recurrence, and symptom control, and they also take notes of hospital information, symptoms and drug treatment information. The need classification model could identify the needs of patients, which contributes to the subsequent accurate demand support.

肢体功能障碍患者对康复机器人使用意愿影响因素模型的构建与验证

毕轩懿，叶旭春（通讯作者）

海军军医大学护理系，上海，200433，通讯作者 E-mail（ye_xch8639@163.com）
（国家自然科学基金面上项目资助，编号 71974196）

摘 要 **目的：**从用户、机器人、环境及人-机器人交互四方面特征构建并验证肢体功能障碍患者对康复机器人的使用意愿影响因素模型，以期为工业 4.0 时代背景下推动康复护理事业的高质量发展、应对全生命周期的健康挑战提供指导。**方法：**采用便利抽样法，对 204 名肢体功能障碍患者进行问卷调查，并采用结构方程模型验证肢体功能障碍患者对康复机器人的使用意愿影响因素模型。**结果：**对 204 名肢体功能障碍患者的调查结果显示：（1）肢体功能障碍患者对康复机器人使用意愿得分为（4.66±1.41）分，各变量得分由高到低依次为社会影响、感知价值、感知有用性、系统质量、感知愉悦、个体创新性、感知易用性和感知风险；（2）不同年龄、学历、康复机器人使用经验和对机器人相关新闻的关注程度的肢体功能障碍患者对康复机器人使用意愿得分的差异具有统计学意义；（3）结构方程模型和中介效应分析结果显示，模型拟合指数均达到理想标准，感知易用性、感知价值、感知愉悦和感知风险可直接预测肢体功能障碍患者对康复机器人的使用意愿，而个体创新性、系统质量、社会影响和感知有用性仅能间接预测患者使用意愿。**结论：**本研究构建并验证了肢体功能障碍患者对康复机器人的使用意愿影响因素模型，使用意愿受多方面特征的影响，后续应重视患者、机器人设计、环境等多方面因素的优化来提升患者的使用意愿。

关键词 肢体功能障碍患者，康复机器人，使用意愿，影响因素模型

Development and validation of the influencing factor model of usage intention to rehabilitation robots in patients with limb dysfunction

Bi Xuanyi, Ye Xuchun*
Department of Nursing, Naval Medical University, Shanghai, 200433

***Abstract*：** **Objective:** This study aims to develop and validate the influencing factor model of usage intention to rehabilitation robots in patients with limb dysfunction from four characteristics (user, robot, environment, and human-robot interaction). It is expected to provide a reference for promoting the high-quality development of nursing and addressing health challenges across the life cycle in the context of Industry 4.0. **Methods:** A cross-sectional survey was conducted by the convenience sampling method among patients with limb dysfunction, and structural equation modeling was applied to explore the paths of four characteristics on patients' usage intention to rehabilitation robots. **Results:** The survey on 204 patients with limb dysfunction showed that: (1) patients with limb dysfunction scored (4.66±1.41) on usage intention to rehabilitation robots, with the highest to lowest scores on each variable being social influence, perceived value, perceived usefulness, system quality, perceived enjoyment, personal innovativeness, perceived ease of use, and perceived risk; (2) the difference in usage intention scores among patients of different ages, education, experience in using rehabilitation robots, and attention to robot-related news were statistically significant; (3) The results of the structural equation modeling and mediating effect analysis showed that the model fit indices all met the ideal criteria, and perceived ease of use, perceived value, perceived enjoyment and perceived risk could directly predict the usage intention to rehabilitation robots in patients with limb dysfunction, while personal innovativeness, system quality, social influence, and perceived usefulness only indirectly predicted the usage intention. **Conclusion:** The influencing factor model of usage intention to lower limb rehabilitation robots in patients with limb dysfunction was developed and validated. Further studies should place more emphasis on the optimization of multiple factors such as patient, robot design,

and environment to enhance patients' usage intention.

基于价值感知的养老机器人接纳态度：一项扎根理论研究

周祎敏[1] 姚宇哲[1] 叶旭春[1]（通讯作者）

1 海军军医大学护理系，上海，200433，通讯作者 E-mail（ye_xch8639@163.com）

（国家自然科学基金面上项目资助，编号 71974196）

摘 要 **目的** 探索我国文化背景下，社区中老年人对养老机器人基于价值感知的接纳态度机制。**方法** 运用格拉泽传统扎根理论方法论,对 22 名社区中老年人进行深入半结构访谈，并借助质性分析软件 NVivo 获得资料进行编码分析和理论性编码分析。**结果** 共得到 308 个概念编码，析出 12 个相关范畴，其核心范畴为“中老年人的养老机器人价值感知”。分析发现社区中老年人对养老护理机器人的价值感知可分为期望价值和感知价值两部分，每部分又包含功能价值、情感价值和符号价值三个维度。中老年人对养老机器人价值感知的情境在于社会变迁中的智慧养老现实需要，包括家庭养老功能削弱，社会养老资源不足和社会科技助力。动机在于养老观念转变，基于代际关系转变、重新审视养儿防老和将养老视作人生新起点。另一个动机为个人需求，包括维持健康需求、情感陪伴需求和自我表达需求。条件在于人机信任，源自中老年人的体制性信任和技术信任。协变量为中老年人面对机器人的弱势身份感知，表现为技术焦虑和控制感低。偶发事件为机器人要素和多元外部环境支持，前者包括技术成熟度、机器人价格和机器人外观，后者包括技术反哺、同辈学习和政府激励。结果为中老年人基于期望价值和感知价值形成的养老机器人接纳态度，包括基于高期望-高感知价值形成的积极态度，低期望-高感知价值形成的认可态度，高期望-低感知形成的观望态度，低期望-低感知形成的排斥态度。 **结论** 本研究构建了基于价值感知的养老机器人接纳态度理论框架，为机器人感知价值和态度研究拓宽了视角，对将机器人引入社区养老生活具有实践指导意义。

Adoption attitude of robots for aged care based on perceived value：a grounded theory research

Zhou Yimin1, Yao Yuzhe1, Ye Xuchun1*

School of Nursing， the Naval Medical University， Shanghai 200433， China

Abstract*： *Objective *To explore Adoption attitude of robots for aged care based on perceived value among older adults in communities in our cultural context.* ***Methods*** *The present study conducted semi-structured interviews under the guidance of Glaser's classical grounded theory. A total of 22 middle-aged and older adults were selected to be study subjects by purposive and theoretical sampling. The data collected were subsequently analyzed in Nvivo using substantive and theoretical codes.* ***Results*** *According to this present study, a total of 338 conceptual codes*

were obtained, that could be categorized into 12 themes, and a theoretical framework of perceived value in an attitude toward robots in aged care aging among middle-aged and older adults was constructed. The value perception of middle-aged and elderly people in the community toward robots for aged care could be divided into two parts: desired value and perceived value, each containing three dimensions: functional value, emotional value, and symbolic value. The context of value perception laid in the practical need for smart aging in social change, which meant weakened family elderly care function, insufficient social elderly care resources, and the development of social technology. The cause of value perception——"changes in the value of aged care" was defined as people's viewpoints for no longer relying on children, shifting in intergenerational relations, and expecting to pursue their own happiness in old age. As the other cause, "personal needs" included maintaining health, emotional support, and self-worth expression. The condition was human-robot trust, stemming from the institutional and technological trust. The covariance was perceived vulnerable identity, as evidenced by technology anxiety and a lack of control. The contingencies were robot factors including technological maturity, the price of the robot, and its appearance image, and environment support including child support, peer support, and government support. The consequence was acceptance attitude according to the judgment of expected value and perceived value of robots, and there were four attitudes of acceptance developed, including positive attitudes based on high expected-high perceived value, recognized attitudes based on low expected-high perceived value, wait-and-see attitudes based on high expected-low perceived value, and rejected attitudes based on low expected-low perceived value. ***Conclusion*** *This study constructed a theoretical framework of the adoption attitude of robots for aged care based on perceived value, which broadened the perspective for the research on perceived value and attitude of robots, and provided practical guidance for provides a theoretical basis for guiding the integration of robots into elderly life.*

虚拟现实技术在 ICU 患者中应用的可行性分析：一项混合研究

居馨星[1] 蒋莉[2] 刘晓芯[1]（通讯作者）

1 上海交通大学医学院附属胸科医院护理部，上海，200030

2 上海交通大学医学院附属胸科医院 ICU，上海，200030

通讯作者邮箱：lxx1018@hotmail.com

摘 要 **目的** 初步探讨虚拟现实（Virtual Reality, VR）技术在 ICU 患者中的可用性和易用性，挖掘患者对 VR 的态度和使用意愿，为 VR 在 ICU 的应用和推广提供依据。**方法** 采用混合方法研究的解释性序列设计，先后收集定量数据和定性数据。定量研究采用方便抽样法，于 2023 年 1 月—5 月选取上海市某三级甲等医院 ICU 患者 50 例进行自身前后对照的 VR 干预性研究，探索 VR 在 ICU 患者中的应用效果；定性研究采用方便抽样法，选取定量研究中的 10 名患者进行半结构式访谈，挖掘 ICU 患者在使用 VR 的过程和体验。**结果** 定性研究结果：32 例（64%）患者有效完成干预，干预后 ICU 患者在疼痛、疲乏、抑郁和焦虑得分有明显降低，整体舒适度评分显著上升（P＜0.05），在血压、心率、呼吸和血氧饱和度干预前后均并无统计学差异（P＞0.05），技术接受程度条目均分为 3.90±0.62 分，且整体不适得分位于无症状到轻微之间。定性研究结果： 分别得出 ICU 患者对 VR 持积极态度、VR 对患者体验有独特价值、实施 VR 干预受多因素

影响以及实施 VR 技术具备安全保障四个主题。**结论** ICU 患者对 VR 持积极评价，可显著改善其情绪状态，优化整体舒适度，是安全、有效、易用的干预方法。可系统化构建干预策略以精准化筛选个体、科学化干预时长和频次提升 VR 的可用性；提高硬件舒适度、内容满足个体偏好等方式提高 VR 的易用性，从而推动 VR 成为在 ICU 患者心理干预的切实可行、行之有效的干预方式。

Feasibility Analysis of Virtual Reality Technology Application in ICU Patients: A Mixed-Methods Study

Xin Xinxing Ju[1], Li Jiang[2], Xiaoxin Liu[1] (Corresponding Author)
1 Department of Nursing, Shanghai Chest Hospital, Affiliated Shanghai Jiao Tong University School of Medicine, Shanghai 200030, China
2 ICU Department, Shanghai Chest Hospital, Affiliated Shanghai Jiao Tong University School of Medicine, Shanghai 200030, China
Corresponding Author Email: lxx1018@hotmail.com

Abstract: Objective: This study aimed to explore the feasibility and usability of Virtual Reality (VR) technology in ICU patients, investigate patients' attitudes towards VR, and their willingness to use it, thereby providing evidence for the application and promotion of VR in ICU settings. Methods: A mixed-methods explanatory sequential design was used to collect both quantitative and qualitative data. Convenience sampling was employed for the quantitative study, and from January to May 2023, 50 ICU patients from a tertiary grade A hospital in Shanghai were included in a pre-post comparison study of VR intervention to explore its effects in ICU patients. For the qualitative study, convenience sampling was used to select 10 patients from the quantitative study for semi-structured interviews, aiming to explore the process and experiences of ICU patients using VR. Results: Qualitative study results showed that 32 patients (64%) successfully completed the intervention. After the intervention, ICU patients exhibited a significant reduction in pain, fatigue, depression, and anxiety scores, with a significant increase in overall comfort rating ($P<0.05$). There were no statistically significant differences in blood pressure, heart rate, respiration, and blood oxygen saturation before and after the intervention ($P>0.05$). The technology acceptance level scored an average of 3.90±0.62, and the overall discomfort score ranged from asymptomatic to mild. The qualitative study yielded four themes: positive attitudes towards VR, unique value of VR in patient experiences, multifactorial influence on VR intervention implementation, and the safety assurance of VR technology. Conclusion: ICU patients evaluated VR positively, as it significantly improved their emotional state and overall comfort, representing a safe, effective, and user-friendly intervention method. To enhance VR usability, systematic intervention strategies can be developed to accurately select individuals, optimize intervention duration and frequency based on scientific evidence. Hardware comfort and personalized content preferences can be improved to enhance VR usability, making it a feasible and effective psychological intervention for ICU patients.

母亲童年不良经历对婴儿忽视的作用:多视角研究

张烜[1]　肖意苹[1]　曹枫林[1]（通讯作者）

[1] 山东大学护理与康复学院，济南，250012
通讯作者：caofenglin2008@126.com
摘 要 本研究从多个角度探讨了母亲童年不良经历对婴儿忽视影响的代际传递效应。研究对象为中国山东省济南市某三级医院门诊儿童保健科的产后母亲和婴儿（N = 550）。首先，本研究估计了母亲童年期不良经历与婴儿忽视的总体关系。其次，探讨了 14 种母亲童年期不良经历对婴儿忽视的累积效应和独立效应。最后，确定了 4 种母亲童年期不良经历的模式，并探讨了不同模式与婴儿忽视的关系。主要有三个发现：第一，有儿童期不良经历的母亲其婴儿，比没有童年期不良经历母亲的婴儿受到更多的忽视。第二，有三种或更多童年期不良经历亚型母亲的婴儿最容易被忽视，且母亲童年期躯体忽视对婴儿的忽视的影响最大。第三，“中等母亲童年期不良经历”组和“高母亲忽视和不良同伴关系”组的婴儿比“低母亲童年期不良经历”组的婴儿经历了更严重的忽视。这些结果表明，早期不良经历影响了未来的养育行为，比如婴儿忽视。
关键词 童年期虐待，童年期逆境，婴儿，母亲，忽视

Role of Maternal Adverse Childhood Experiences on Infant Neglect: A Multi-Perspective Approach

Xuan Zhang[1] Yiping Xiao[1] Fenglin Cao[1] (Corresponding Author)
[1]School of Nursing and Rehabilitation, Shandong University, Jinan, Shandong Province, China
Abstract: We explored the intergenerational transmission effects of maternal adverse childhood experiences (ACEs) and infant neglect from various perspectives. The participants were postpartum mothers and infants (*N* = 550) from the outpatient child health care department of a tertiary hospital in Jinan, Shandong Province, China. First, we estimated the association of overall maternal ACEs with child neglect. Second, we explored the cumulative and independent effects of 14 types of maternal ACEs on infant neglect. Finally, we identified different patterns of 14 maternal ACEs and explored the association between the different patterns and infant neglect. There were three main findings. One, infants born to mothers with ACEs were subjected to more neglect than those born to mothers without ACEs. Two, infants born to mothers with three or more subtypes of ACEs experienced the most neglect; maternal childhood physical neglect had a substantial adverse effect on infant neglect. Three, infants in the “median maternal ACEs” and “high maternal neglect and poor peer relationship” groups experienced more severe neglect than those in the “low maternal ACEs” group. These results suggest that early life experiences substantially impact future parenting behaviors, such as infant neglect.

生活方式因素与妊娠期抑郁症状、焦虑症状的关联：单独效应及累积效应

黄永棋[1] 曹枫林[2]（通讯作者）
1 山东大学护理与康复学院，济南，250012
2 山东大学护理与康复学院，济南，250012，caofenglin2008@126.com

摘 要

目的

（1）分别探讨饮食质量、睡眠质量、体力活动、久坐以及吸烟史、饮酒史与妊娠期抑郁症状和焦虑症状的关联，并采用 XGBoost 识别与抑郁症状和焦虑症状关联最强的生活方式因素；

（2）探讨多种生活方式对妊娠期抑郁症状和焦虑症状的累积效应。

方法

本研究为横断面研究，纳入 851 位孕妇，使用爱丁堡产后抑郁量表和广泛性焦虑量表评估孕妇的抑郁症状和焦虑症状，使用中国孕妇膳食指南依从性指数、匹兹堡睡眠指数量表、丹麦体力活动量表、久坐 2 域量表、自编吸烟史、饮酒史问卷分别评估饮食质量、睡眠质量、体力活动、久坐、吸烟史、饮酒史。采用二元 logistic 回归，分别探讨多种生活方式因素与妊娠期抑郁症状、焦虑症状的关联，采用极端梯度提升识别与抑郁症状和焦虑症状关联最强的生活方式因素。计算累积的不良生活方式风险评分，使用二元 logistic 回归探讨累积的生活方式风险评分与抑郁症状和焦虑症状的关系。

结果

（1）本研究中妊娠期抑郁症状和焦虑症状的发生率分别为 19.3%和 4.8%。

（2）单独效应：暴露于饮食质量较差（*OR*=2.010，95% *CI*：1.318~3.066）、睡眠质量较差（*OR*=2.263，95% *CI*： 1.329~3.852）、体力活动水平较低（*OR*=1.621，95% *CI*：1.102~2.384）与报告妊娠期抑郁症状的可能性更高相关。XGBoost 显示，与妊娠期抑郁症状关联最强的是体力活动，其他依次是睡眠质量，饮食质量，久坐，饮酒史，吸烟史。

暴露于睡眠质量较差（*OR*=5.940，95% *CI*：2.736~12.896）、体力活动水平较低（*OR*=2.103，95% *CI*：1.056~4.187）与报告妊娠期焦虑症状的可能性更高相关。XGBoost 显示，与妊娠期焦虑症状关联最强的是睡眠质量，其他依次是体力活动，久坐，饮食质量，饮酒史，吸烟史。

（3）累积效应模式显示（0~1 个为参照组）

1）有 2~3 个（*OR*=2.515，95% *CI*: 1.679~3.769）/ ≥ 4 个（*OR*=5.126，95% *CI*: 2.220~11.835）不良生活方式因素的孕妇报告妊娠期抑郁症状的可能性更高。

2）有 2~3 个（*OR*=2.194，95% *CI*：1.037~4.646）/≥ 4 个（*OR*=5.243，95%*CI*：1.455~18.897）不良生活方式因素报告妊娠期焦虑症状的可能性更高。

结论 睡眠质量差、体力活动水平低及报告多种不良生活方式因素的女性可能是妊娠期抑郁症状和焦虑症状的高风险人群。

Association of lifestyle factors with depressive symptoms and anxiety symptoms during pregnancy: separate and cumulative effects

Yongqi HUANG, Fenglin Cao

School of nursing and rehabilitation, Shandong University, Jinan, 250012

***Abstract*：**

Objectives：

(1) To explore the associations of diet quality, sleep quality, physical activity, sedentary behavior, and history of smoking and alcohol consumption with depressive and anxiety symptoms in pregnancy, and to identify the lifestyle factors most strongly associated with depressive and anxiety symptoms using XGBoost;

(2) To explore the cumulative effects of multiple lifestyles on depressive symptoms and anxiety symptoms in

pregnancy.

Methods：

This was a cross-sectional study that included 851 pregnant women. The Edinburgh Postnatal Depression Scale and Generalized Anxiety Scale were used to assess the depressive and anxiety symptoms of pregnant women, and the Chinese Dietary Guidelines Compliance Index for Pregnant Women (CDGCI-PW), the Pittsburgh Sleep Quality Index (PSQI), the Danish Physical Activity Scale, Sedentary Behavior Two Domain Questionnaire (SB2D), and self-administered smoking and alcohol history questionnaires were used to assess the quality of diet, sleep, physical activity, sedentary behavior, smoking history, and alcohol history of pregnant women. Binary logistic regression was used to explore the associations between various lifestyle factors and depressive and anxiety symptoms during pregnancy, and extreme gradients were used to identify the lifestyle factors most strongly associated with depressive and anxiety symptoms. Cumulative adverse lifestyle risk scores were calculated, and binary logistic regression was used to investigate the association between cumulative lifestyle risk scores and depressive and anxiety symptoms.

Results：

(1) The prevalence of depressive symptoms and anxiety symptoms during pregnancy in this study was 19.3% and 4.8%, respectively.

(2) Separate effects: exposure to poorer diet quality (OR=2.010, 95% CI: 1.318-3.066), poorer sleep quality (OR=2.263, 95% CI: 1.329-3.852), and lower levels of physical activity (OR=1.621, 95% CI: 1.102-2.384) were associated with a higher likelihood of reporting depressive symptoms in pregnancy. XGBoost showed that the strongest association with depressive symptoms in pregnancy was physical activity, followed by quality of sleep, quality of diet, sedentary behavior, history of alcohol consumption, and history of smoking. Exposure to poorer sleep quality (OR=5.940, 95% CI: 2.736 to 12.896), and lower levels of physical activity (OR=2.103, 95% CI: 1.056 to 4.187) were associated with a higher likelihood of reporting symptoms of anxiety during pregnancy. XGBoost showed that the strongest association with symptoms of anxiety during pregnancy was sleep quality, and the others, in order of importance, were physical activity, sedentary lifestyle, diet quality, alcohol consumption history, and smoking history.

(3) The cumulative effect model showed that (0-1 for the reference group)

(1) Pregnant women with 2-3 (OR=2.515, 95% CI: 1.679-3.769) / ≥ 4 (OR=5.126, 95% CI: 2.220-11.835) adverse lifestyle factors were more likely to report depressive symptoms during pregnancy.

2) Pregnant women with 2 to 3 (OR=2.194, 95% CI: 1.037~4.646)/ ≥ 4 (OR=5.243, 95% CI: 1.455~18.897) adverse lifestyle factors were more likely to report symptoms of anxiety during pregnancy.

Conclusion： Women who have poor sleep quality, low level of physical activity, and report multiple adverse lifestyle factors may be at high risk for depressive symptoms and anxiety symptoms during pregnancy.

***Keywords*：** depressive symptoms in pregnancy, anxiety symptoms in pregnancy, lifestyle, separate effect, cumulative effects

摘要：背景 围产期抑郁症受到越来越多的关注。然而，对抑郁症的网络结构的详细研究仍然缺乏。本研究的目的是从网络的角度来研究爱丁堡产后抑郁量表（EPDS）和患者健康问卷（PHQ-9）之间的异同。**方法** 于 2020 年 8 月-2022 年 3 月进行横断面研究。研究按照流行病学观察性研究报告进行撰文。研究共招募了 2484 名孕妇。所有参与者都完成了 EPDS 和 PHQ-9 量表的评估。主要使用网络分析方法进行统计分析，并构建了两个网络模型：EPDS 模型和 PHQ-9 模型。**结果** 使用 EPDS 和 PHQ-9 量表进行产前抑郁检出率分别为 30.2%和 28.2%。在 EPDS 量表网络结构中，EPDS 第 8 条目“悲伤或痛苦”节点（强度= 1.2161）是最中心的节点，而 EPDS 第 10 条目“自残”节点（强度= 0.4360）是最小的中心节点。在 PHQ-9 量表网络结构中，第 4 条目“疲劳”节点（强度= 0.9815）是最中心的节点，而第 9 条目“自杀”是最小的中心症状（强度= 0.5667）。对于这两种模型来说，“悲伤”都是一个重要的中心症状。**结论** 心理症状在 EPDS 量表评估抑郁症时可能更重要，而身体症状在 PHQ-9 量表评估抑郁症时可能更有影响力。对于 EPDS 和 PHQ-9 量表来说，“悲伤”都是一个重要的中心症状，这表明它可能是未来进一步的母亲抑郁干预的最重要的目标。

关键词：孕妇，抑郁症，网络分析，EPDS，PHQ-9

Comparison of the EPDS and PHQ-9 in the assessment of depression among pregnant women: Similarities and differences

***Abstract*：Objective** Perinatal depression has attracted increasing attention. However, a detailed investigation of the network structure of depression is still lacking. We aim to examine the similarities and differences between the Edinburgh Postnatal Depression Scale (EPDS) and Patient Health Questionnaire (PHQ-9) from a network perspective. **Methods** A cross-sectional study was conducted from August 2020 to March 2022. We followed the STROBE checklist to report our research. Pregnant women (n = 2484) were recruited. All participants completed the EPDS and PHQ-9. We mainly used network analyses for statistical analysis and constructed two network models: the EPDS and PHQ-9 models. **Results** The detection rates of prenatal depression measured by the EPDS and PHQ-9 were 30.2% and 28.2%, respectively. In the EPDS network, the EPDS8 ‘sad or miserable’ node (strength = 1.2161) was the most central node, and the EPDS10 ‘self-harming’ node (strength = 0.4360) was the least central node. In the PHQ-9 network, the PHQ4 ‘fatigue’ node (strength = 0.9815) was the most central node, and PHQ9 ‘suicide’ was the least central symptom (strength = 0.5667). For both models, ‘sad’ acted as an important central symptom. **Conclusions** Psychological symptoms may be more important in assessing depression using the EPDS, while physical symptoms may be more influential in assessing depression using the PHQ-9. For both the EPDS and PHQ-9, “sad” was an important central symptom, suggesting that it may be the most important

target for further maternal depression interventions in the future.

Keywords：Pregnant women, depression, network analysis, EPDS, PHQ-9

基于“肠-脑”轴探究肠道菌群在产前抑郁发生中的作用机制

刘燕群[1]（通讯作者）

1 武汉大学护理学院妇幼健康研究中心，武汉，4300071

摘 要　产前抑郁是在孕期一种以抑郁、哭泣、悲伤、易怒或自杀等一系列症状为特征的心理障碍。产前抑郁是孕期最常见的精神障碍之一，全球发病率为 20.7%，不仅严重影响孕妇的健康，还会对婴儿造成许多不良健康影响，如宫内生长受限、出生体重过低、早产和认知行为问题。目前在孕妇群体中，母体肠道菌群通过调节色氨酸代谢影响大脑功能和情绪的机制尚未完全阐明。本研究的目的是探讨妊娠期肠道菌群变化对产前抑郁症发生的影响，研究色氨酸在母体肠道菌群与产前抑郁之间的潜在中介作用。本研究共有 73 名孕妇参加，将爱丁堡产后抑郁量表(EPDS)得分 10 分为产前抑郁的临界点，并收集了人口学资料、粪便和血浆样本。采用高通量 Illumina 测序 16S rRNA V3-V4 基因序列分析肠道菌群，使用液相色谱-质谱分析法测定了血浆氨基酸浓度。采用 SPSS 进行数据分析，使用 SPSS 中 process 插件的模型 4 建立了中介模型。结果发现产前抑郁组与对照组之间肠道菌群α-和β-多样性无显著差异。产前抑郁组与对照组两组之间血浆色氨酸浓度有显著差异。母体肠道菌群中 *candidatus_soleaferia* 菌属和 *Enterococcus* 菌属是产前抑郁的保护因素，*Lachnospiraceae_NC2004_group* 菌属是产前抑郁的危险因素。色氨酸在肠道菌群中 *Enterococcus* 菌属与产前抑郁之间起到了中介作用。孕妇产前抑郁与妊娠期间肠道菌群组成的改变有关，而色氨酸作为 5-羟色胺的前体可能介导了这一途径。未来的研究需要确定和了解与这种关系相关的代谢途径中的特定代谢物和限速酶。

关键词　产前抑郁，妊娠，肠道菌群，肠脑轴，色氨酸代谢

Exploring the mechanism of gut microbiota in prenatal depression based on the “gut-brain” axis

Yanqun Liu[1,*]

1 Center for Women and Children Health and Metabolism Research, Wuhan University School of Nursing, Wuhan, 430071

Abstract: Prenatal depression is a psychological disorder during pregnancy characterized by a range of symptoms such as depression, crying, sadness, irritability, or suicide. Prenatal depression is one of the most common mental disorders during pregnancy, with a global incidence of 20.7%, which not only seriously affects the health of pregnant women, but also causes many adverse health effects on the baby, such as intrauterine growth restriction, low birth weight, preterm birth, and cognitive behavioral problems. At present, the mechanism by which maternal gut microbiota affects brain function and mood by regulating tryptophan metabolism has not yet been fully elucidated. The purpose of this study was to investigate the influence of gut microbiota changes during pregnancy on the occurrence of prenatal depression, and to investigate the potential mediating role of tryptophan

between maternal gut microbiota and prenatal depression. There were 73 pregnant women enrolled in this study. An Edinburgh Postpartum Depression Scale (EPDS) score of 10 was considered the cut-off value for prenatal depression. We collected demographic information, fecal and plasma samples. The gut microbiota was profiled using V3-V4 gene sequence of 16S rRNA, and plasma amino acids were analyzed. The mediation model was investigated by using the model 4 in the process procedure for SPSS. There was no significant difference in the α- and β-diversity of gut microbiota between the prenatal depression group and comparison group. The plasma tryptophan concentration was significantly different between two groups. *Candidatus_Soleaferrea* and *Enterococcus* were protective factors for prenatal depression, and *Lachnospiraceae_NC2004_group* was a risk factor. Tryptophan was a mediator between *Enterococcus* in gut microbiota and prenatal depression. Maternal prenatal depression was associated with altered gut microbiota composition during pregnancy, and tryptophan as a precursor of 5-HT may potentially mediate this pathway. Future research is needed to identify and understand the specific metabolites and rate-limiting enzymes in the metabolic pathways that link this relationship.

问题性网络使用与倦怠的关系：一项三水平元分析

毛佩佩 [1,2] 孙晓军 [1,2,3]（通讯作者）蔡志慧 [1,2] 陈必忠 [1,2]

1 华中师范大学心理学院，武汉，430079

2 青少年网络心理与行为教育部重点实验室，武汉，430079

3 中国基础教育质量监测协同创新中心华中师范大学分中心，武汉，430079，sunxiaojun@ccnu.edu.cn

摘 要 倦怠指个体的一种心理状态，通常表现为情绪耗竭、人格解体和低效能感特征，包括学业倦怠、工作倦怠等类型。不仅对个体的学习成绩或工作效率产生负面影响，还会危害他们的心理健康，甚至引发问题行为。众多研究表明问题性网络使用与倦怠的关系密切，但尚未得出一致的结论。一些研究发现两者呈显著正相关，而另一些研究发现两者相关不显著，甚至一些研究在问题性网络使用与倦怠的不同维度上得出了不一致的结果。本研究归纳整合了相关实证研究，运用三水平元分析技术系统探讨问题性网络使用与倦怠的关系，并通过调节效应分析考察群体、地区、问题性网络使用类型、倦怠维度、倦怠测量工具、性别及文章发表年份的调节作用。通过文献检索与筛选，获得 42 项研究和 103 个效应量，共包含 54121 名被试。随机效应模型分析结果表明，问题性网络使用和倦怠呈中等程度正相关（$r = 0.265$）。调节效应分析结果表明，群体的调节作用显著，问题性网络使用与倦怠的关系强度在学生群体显著高于员工群体；倦怠维度的调节作用显著，问题性网络使用与情绪耗竭和人格解体显著正相关，而与低效能感相关不显著；倦怠测量工具的调节作用显著，使用学业倦怠问卷（LBQ）、马斯拉赫倦怠量表-学生调查（MBI-SS）和学业倦怠量表（SBI）比使用马斯拉赫倦怠量表（MBI）和马斯拉赫倦怠量表-一般调查（MBI-GS）来评估倦怠的研究与问题性网络使用的相关性更强，其它变量均不存在显著调节作用。未来研究可以通过追踪调查进一步揭示问题性网络使用和倦怠的因果关系，并及时引导个体合理使用网络，降低其倦怠水平。

3 Beijing Normal University Collaboration Innovation Center, Wuhan 430079,
sunxiaojun@ccnu.edu.cn

***Abstract*:** Burnout was described as a psychological syndrome and generally composed of three symptoms, namely, emotional exhaustion, depersonalization, and reduced personal accomplishment, and included academic burnout, work burnout, and other types. It had a negative impact on individual's academic achievement and work performance, as well as leading to mental health problems and some problematic behaviors. A number of studies have shown that the problematic internet use is closely related to burnout, but there is still no consistent conclusion. Some studies found that there was a significant positive correlation between problematic internet use and burnout, while other studies revealed that there was no significant correlation between the two variables, and even some studies reported inconsistent results regarding the associations between problematic internet use and burnout in different dimensions. This study synthesized relevant empirical studies and performed a three-level meta-analysis to investigate the association between problematic internet use and burnout, and to explore if some study characteristics (e.g., population, country, type of problematic internet use, dimension of burnout, measure of burnout, gender and publication year) could have contributed to the inconsistent findings across individual studies. A total of 42 studies, 103 effect sizes, and 54,121 participants were identified through literature search. The results of random effects model analysis showed a significant positive and moderate correlation between problematic internet use and burnout (r = 0.265). Furthermore, we found that this association was moderated by population, dimension of burnout, and the measure of burnout. Specifically, students with high levels of problematic internet use suffered from more burnout than employees, and problematic internet use was significantly positively related to emotional exhaustion and depersonalization, but was not significantly associated with reduced personal accomplishment, and the strength of this association was stronger for the studies that assessed burnout with LBQ, MBI-SS, and SBI than in those studies that measured with MBI and MBI-GS. Other variables did not have a moderating effects on the association between problematic internet use and burnout. It is possible for future research to investigate the causal relationship between problematic internet use and burnout through longitudinal surveys and to assist individuals to use the internet in a reasonable manner in order to reduce their level of burnout.

父母心理控制与青少年手机依赖的关系：自我概念清晰性的中介作用和学校连结的调节作用

张元灏[1,2] 陈倩[1,2] 陆琴[1,2] 周宗奎[1,2]（通讯作者）
1 青少年网络心理与行为教育部重点实验室，武汉，430079
2 华中师范大学心理学院，武汉，430079，zhouzk@ccnu.edu.cn

摘 要 近年来，青少年手机依赖问题备受关注，手机依赖会严重危害青少年的身心发展。因此，有必要探究青少年手机依赖的风险和保护因素。目前已有不少研究从家庭因素探究青少年手机依赖的原因，其中父母心理控制负向预测青少年手机依赖，父母心理控制作为一种侵入型的消极教养方式，是指父母通过爱的撤回、诱发内疚感和焦虑、限制表达等方式侵扰子女的思想和情感，从而使孩子遵循父母意愿的养

育行为。已有研究表明，父母心理控制会对青少年心理社会适应产生严重消极影响，并增加其手机依赖的风险，但其内在作用机制还不清晰，尤其是从学校层面和个人层面对父母心理控制与青少年手机依赖内在机制的探索仍较为匮乏。因此，本研究构建一个有调节的中介模型，考察父母心理控制与青少年手机依赖的关系。采用《父母心理控制量表》、《手机依赖量表》、《自我概念清晰性量表》和《学校联结量表》对 990 名青少年被试进行调查。结果表明，在控制性别和年龄后，（1）父母心理控制与手机依赖呈显著正相关，且二者都与自我概念清晰性和学校联结呈显著负相关；（2）父母心理控制可以直接影响青少年手机依赖，也可以通过自我概念清晰性的中介作用影响其手机依赖；（3）学校联结调节父母心理控制和自我概念清晰性的关系，即随着学校联结水平的提高，父母心理控制较低的青少年的手机依赖水平更低；但学校联结对父母心理控制与手机依赖的关系以及自我概念清晰性与手机依赖的关系的调节效应不显著。本研究发现，父母作为青少年的重要他人，其心理控制越多，会降低青少年的自我概念清晰性，最终导致其产生手机依赖；同时较高水平的学校联结能有效补偿父母心理控制对自我概念清晰性的不利影响，本研究揭示了学校联结在青少年手机依赖中的调节作用，对预防和干预青少年手机依赖提供了理论依据。

The association between parental psychological control and adolescent cell phone dependence: The Mediating Role of Self-Concept Clarity and the Moderating Role of School Connection

Zhang Yuanhao [a,b]　Chen Qian [a,b]　Lu Qin [a,b]　Zhou Zongkui [a,b]

[a] Key Laboratory of Adolescent Cyber Psychology and Behavior, Ministry of Education, Wuhan 430079

[b] School of Psychology, Central China Normal University, Wuhan 430079

Abstract：In recent years, the problem of cell phone dependence among adolescents has attracted much attention, and cell phone dependence could seriously jeopardize the physical and mental development of adolescents. Therefore, it is necessary to explore the risk and protective factors of adolescent cell phone dependence. A number of studies have been conducted to explore the causes of adolescent cell phone dependence from family factors, in which parental psychological control negatively predicts adolescents' cell phone dependence. Parental psychological control, as an intrusive and negative parenting style, refers to parenting behaviors in which parents intrusively interfere with their children's thoughts and emotions by withdrawing love, inducing guilt and anxiety, and restricting expression, so as to make their children follow the wishes of their parents. It has been shown that parental psychological control could have a serious negative impact on adolescents' psychosocial adjustment and increase the risk of their cell phone dependence, but its intrinsic mechanism of action is unclear, especially the exploration of the intrinsic mechanism of parental psychological control and adolescents' cell phone dependence from the school level and the individual level is still relatively scarce. Therefore, this study constructed a moderated mediation model to examine the relationship between parental psychological control and adolescent' cell phone dependence. The Parental Psychological Control Scale, the Cell Phone Dependence Scale, the Self-Concept Clarity Scale, and the School Connection Scale were used to investigate 990 adolescent subjects. The results showed that after controlling for gender and age, (1) parental psychological control was significantly and positively related to cell phone dependence, and both were significantly and negatively related to self-concept

clarity and school connectedness; (2) parental psychological control could directly affect adolescents' cell phone dependence, and it can also affect their cell phone dependence through the mediating role of self-concept clarity; (3) school connectedness moderates the relationship between parental psychological control and self-concept clarity, i.e., as the level of school connectedness increases, adolescents with lower parental psychological control have lower levels of cell phone dependence; however, the moderating effect of school connectedness on the relationship between parental psychological control and cell phone dependence, and on the relationship between self-concept clarity and cell phone dependence, was not significant. The present study found that the more parental psychological control, the more it will reduce adolescents' self-concept clarity, which will eventually lead to their cell phone dependence; at the same time, a higher level of school connectedness can effectively compensate for the negative effect of parental psychological control on self-concept clarity. This study reveals the moderating effect of school connectedness in adolescents' cell phone dependence, and provides a theoretical basis for preventing and intervening adolescents' cell phone dependence. This study reveals the moderating role of school connection in adolescents' cell phone dependence and provides a theoretical basis for prevention and intervention.

Keywords：parental psychological control，cell phone dependence，self-concept clarity，school connection，adolescents

新冠疫情期间大学生的睡眠健康及其相关因素：一项纵向网络分析

何健康[1]　赵成佳[2]　徐慧慧[1]　赖炘懿[1]　杜铭煊[1]　胡海燕[1]　丁宁宁[1]　田雯雯[1]　赵文倩[1]　俞国良[2]（通讯作者）　张国华[1]（通讯作者）

1 温州医科大学心理系，温州，325035，zghcnu@wmu.edu.cn（张国华）

2 中国人民大学教育学院，北京，100872，yugllxl@sina.com（俞国良）

摘 要　背景：新冠肺炎疫情已被证明会影响民众的睡眠健康，并且造成心理困扰。研究表明，民众在疫情期间的睡眠健康状况普遍不佳，但较少研究涉及睡眠健康的影响因素和相互作用机制。此外，大多数与疫情相关的睡眠健康研究本质上是描述性的，主要集中在失眠频率和睡眠质量的自我报告，且很少有追踪研究。网络分析是一种检验变量间关系的分析方法。通过这种方法，可以发现多个变量的相关结构。本研究通过两次追踪调查，使用网络分析考察大学生睡眠健康的相关因素及其随时间变化的规律。

方法：分别于 2021 年 12 月（T1）和 2022 年 6 月（T2）对浙江温州的 1423 名大学生进行在线问卷调查。采用 IBM SPSS 统计软件进行描述性统计、正态和差异性检验。使用 R 语言进行网络分析，主要指标包括中心性和聚类系数。通过网络比较检验来分析睡眠健康相关因素的时间变化。

结果：两次调查中，大学生睡眠拖延、自我控制、情绪调节和问题性手机使用的水平显著升高，睡眠质量和生物节律的水平显著降低，而心理困扰的水平无显著变化。通过网络分析发现，生物节律、睡眠拖延和睡眠质量形成了一个稳定的网络结构，在两次调查中保持不变；情绪调节和心理困扰节点的强度、中间性和紧密性均有所增加，且两者之间的联系在 T2 时得到加强；自我控制节点网络中的强度和紧密性有所下降，而且与问题性手机使用、睡眠质量没有稳定的联系；问题性手机使用与睡眠拖延有关，但与生物节律、睡眠质量无关。

结论：本研究发现睡眠拖延在大学生的睡眠健康网络结构中处于中心地位，由于其中心性水平很高而且与生物节律、睡眠质量的强相关性，对其他相关因素可能产生很强的影响；问题性手机使用可能引发睡眠拖延，而自我控制可能对此产生调节作用。这些发现为了解新冠疫情期间中国大学生的睡眠健康及其影响因素提供了新的思路。在后疫情时代，有必要开展心理健康教育和心理干预，以改善大学生的睡眠健康、降低风险因素的影响。

***Abstract*:** *Background:* The COVID-19 pandemic has been proven had a dramatic impact on sleep health, and have caused psychological distress to the public. Preliminary research has shown that poor sleep health during the COVID-19 pandemic among the general population, little research has been carried out examining the interplay among broader dimensions and correlates of individual sleep health. Besides, the majority of COVID-19-related research on sleep health has been descriptive in nature and has concentrated on the frequency of self-reported insomnia symptoms and sleep quality. And there are few follow-up studies. Network analysis is a valuable method for examining the relationships between variables. Using this approach, studies can find out how interconnected variables from the same design are and how different structures relate to one another. The current two-wave longitudinal study investigated the pathways that underlie selected components of sleep health and their changes over time by using the network analysis.

Methods: A total of 1423 College students (80.60% female) in Wenzhou, China, participated the two-wave online survey in December 2021 (T1) and June 2022 (T2). Participants filled out a series of validated questionnaires. The IBM SPSS statistics was used to do descriptive statistics, and tests for normality and differences. Networks at T1 and T2 were estimated via Gaussian graphical models in the R software, and their temporal changes were compared through centrality and clustering measures. The difference between the two networks at T1 and T2 was performed by using the network comparison test.

Results: From T1 to T2, levels of sleep procrastination, self-control, emotion regulation and problematic smartphone use increased significantly, while levels of sleep quality and chronotypologies decreased significantly, and the level of psychological distress did not change notably. Through network analyses, chronotypologies, sleep procrastination, and sleep quality formed a spatially contiguous pattern that remain unchanged in both waves. Both the emotion regulation and psychological distress node increased its strength, betweenness, and closeness in the network, while the link between the two was strengthened at T2. The self-control node reduced its strength and closeness in the network, and it showed no lasting association with problematic smartphone use and sleep quality. Problematic smartphone use was connected to sleep procrastination, but not to chronotypologies and sleep quality during both waves.

Conclusions: Our research highlights the central position of sleep procrastination, which has a powerful effect on other related factors due to its high-intensity centrality and its strong correlation with chronotypologies and sleep quality. Specifically, the results suggest that problematic smartphone use may trigger sleep procrastination, which can be weakened by self-control. These findings shed new lights on understanding the development and influencing factors of sleep health during the COVID-19 among college students in China. Educational programs and psychological interventions are warranted to improve sleep health and reduce risk factors in the post pandemic era.

4 中国人民大学心理学系，北京，100872

5 中国人民大学教育学院，北京，100872，dr.leili@qq.com

摘 要 手机冷落是指个体在直接的人际互动中使用手机而冷落对方的行为，这一现象较为普遍。手机冷落行为不仅会对人际关系的质量产生消极影响，而且会降低人际对象的幸福感。已有研究主要关注手机冷落行为所带来的不良后果，而对手机冷落行为的潜在原因和内在机制的研究相对较少。因此，本研究基于使用与满足理论、补偿性网络使用理论、置换假说和社会阶层的社会认知理论，构建了一个有调节的中介模型，探讨了社交焦虑对手机冷落行为的影响及其作用机制——问题性社交网络使用的中介作用和家庭社会经济地位的调节作用。采用社交焦虑量表、社交网络成瘾倾向量表、手机冷落行为量表和家庭社会经济地位问卷对北京市两所大学的1379名被试进行了测试，其中男生816人（59.17%），女生563人（40.84%），平均年龄18.84岁（*SD* = 0.94）。研究结果显示，社交焦虑与手机冷落之间存在正相关关系；问题性社交网络使用在社交焦虑与手机冷落之间起着中介作用；而家庭社会经济地位在这一中介过程的前半段起到调节作用。具体而言，在家庭社会经济地位较低的大学生中，问题性社交网络使用在社交焦虑与手机冷落之间的中介作用更强。以上研究结果为理解手机冷落行为提供了新的视角，为干预和减少手机冷落行为提供了理论支持，具有重要的学术和实践意义。

[4] Department of Psychology, Renmin University of China, Beijing, China

[5] School of Education, Renmin University of China, Beijing, China, dr.leili@qq.com

Abstract：Phubbing describes the phenomenon of mobile phone use by an individual during a direct social interaction, which is not unfamiliar to most people. It harms relationships and reduces well-being of phubbees. However, little research has explored the potential causes and underlying mechanisms of phubbing. Existing studies have primarily focused on the adverse consequences of phubbing, often overlooking an important contributing factor, social anxiety. Thus, based on the uses and gratifications approach, the theory of compensatory internet use, the displacement hypothesis, and the social cognitive theory of social class, the present study examined whether social anxiety was positively related to phubbing, whether problematic social networking mediated the relationship, and whether the first path of this mediating process was moderated by family

socioeconomic status. This study collected anonymous data from 1,379 undergraduates (female = 563; male = 816; M_{age} = 18.84; *SD* = 0.94) through a questionnaire survey. Finding demonstrated that social anxiety was positively linked to phubbing, problematic social networking mediated the connection between social anxiety and phubbing, and family socioeconomic status played a moderating role in the first stage. Specifically, the indirect association between social anxiety and phubbing via problematic social networking was stronger for undergraduates with lower family socioeconomic status. Results provide another perspective for understanding phubbing, highlighting the significance of uncovering the underlying mechanisms and offering theoretical support for reducing phubbing behavior with significant academic and practical implications.

Keywords **：** social anxiety, phubbing, problematic social networking, family socioeconomic status, moderated mediating model

社会隔离感对问题性社交网络使用的影响：意向性自我调节与准社会关系的链式中介作用

李芊芊 [1,2]　周宗奎 [1,2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院暨湖北省人的发展与心理健康重点实验室，武汉，400379，

通讯作者 E-mail zhouzk@ccnu.edu.cn

摘要 社交网络已经高度卷入人们的现实生活中，成为人们浏览信息、交流和娱乐必不可少的选择。大学生作为社交网络的主要用户，更容易产生问题性社交网络使用，这可能对其学习、心理和社会方面造成持久的伤害。根据“失补偿”理论，个体的上网行为是其在自身成长阶段中遇到了阻碍而出现的一种补偿心理和行为。社会隔离感是个体对自己的孤独或脱节的感知，它可能是问题性社交网络使用的预测因素。然而，个体可以通过自己体内自动修复，恢复自身的常态发展，进而产生正常的网络行为，意向性自我调节在其中起着重要作用。意向性自我调节指面对生活中可预期或不可预期的事件时，个体能够协调环境中的各种资源，根据自身能力选择合适的目标和策略。研究表明，压力性事件可以削弱个体的意向性自我调节。因此，社会隔离感可能通过削弱意向性自我调节影响问题性社交网络使用。此外，感到孤独、社交孤立或被拒绝的个体可能会导致更强烈的准社会关系。准社会关系即是个体与媒体人物之间的亲密感和关系感。较高的意向性自我调节可能会增加个体通过更有意识地使用社交网络并且发展准社会关系，进而可能导致问题性社交网络使用。因此，本研究主要探讨社会隔离感、意向性自我调节、准社会关系和问题性社交网络使用的关系，采用社会隔离感量表、意向性自我调节问卷、准社会关系量表和改编的 Facebook 成瘾量表，对 893 名大学生进行调查。结果发现：（1）社会隔离感和准社会关系显著正向预测问题性社交网络使用，意向性自我调节显著负向预测问题性社交网络使用；（2）中介效应分析显示，意向性自我调节和准社会关系在社会隔离感和问题性社交网络使用之间起部分中介作用。社会隔离感通过降低意向性自我调节，既能够直接增加问题性社交网络使用，又通过进一步减弱准社会关系进而减少问题性社交网络使用。结果表明，社会隔离感能够正向预测问题性社交网络使用，意向性自我调节在二者的关系中具有双刃剑效应。

The Effect of Perceived Social Isolation on Problematic Social Network Use: Serial Mediating Role of Intentional Self-regulation

and Parasocial Relationship

Li Qianqian [a, b], Zhou Zongkui [a, b]

[a]Key Laboratory of Adolescent Cyberpsychology and Behavior(CCNU), Ministry of Education, ,Wuhan 430079, China;

[b] School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079, China.

Abstract：Social networks have become deeply intertwined with people's real lives, becoming an essential choice for browsing information, communication, and entertainment. As the primary users of social networks, college students are susceptible to the negative effects of problematic social network use, which can lead to persistent harm in their academic, psychological, and social domains. According to the compensation theory, an individual's online behavior is a compensatory psychological and behavioral response to obstacles encountered during their personal development. Perceived social isolation refers to an individual's perception of their loneliness or disconnection. It may serve as a predictive factor for problematic social network use. However, individuals can automatically repair themselves and restore their normal development, thereby generating normal online behavior. Intentional self-regulation plays an important role in this process. Intentional self-regulation refers to the ability of individuals to coordinate various resources in the environment and choose appropriate goals and strategies based on their abilities when facing predictable or unpredictable events in life. Research has shown that stressful events can weaken an individual's intentional self-regulation. Therefore, perceived social isolation may influence problematic social network use by weakening intentional self-regulation. In addition, individuals who feel lonely, socially isolated, or rejected may develop stronger parasocial relationships. Parasocial relationship refers to the sense of intimacy and relationality individuals experience with media figures. Higher levels of intentional self-regulation may increase individuals' use of social networks with more consciousness and the development of parasocial relationships, which can further lead to problematic social network use. Therefore, this study primarily explored the relationships among perceived social isolation, intentional self-regulation, parasocial relationships, and problematic social network use. 893 college students were investigated with Perceived Social Isolation Scale, Intentional Self-Regulation Questionnaire, Parasocial Relationship Scale, and an adapted Facebook Addiction Scale. The results revealed that: (1) perceived social isolation and parasocial relationship significantly positively predicted problematic social network use, while intentional self-regulation significantly negatively predicted problematic social network use; (2) The Mediating effect analysis showed that intentional self-regulation and parasocial relationship partially mediated the relationship between perceived social isolation and problematic social network use. Perceived social isolation can directly increase problematic social network use by reducing intentional self-regulation. On the other hand, it can also decrease problematic social network use by weakening parasocial relationship. The findings indicated that perceived social isolation positively predicts problematic social network use, and intentional self-regulation has a dual-edged effect in their relationship.

Keywords ： Perceived social isolation, Problematic social network use, Intentional self-regulation, Parasocial relationship

从网络视角理解智能手机成瘾及其相关因素

李睿[1]，孙岩[1]（通讯作者），冯雪[1]，陈婷[1]

1 辽宁师范大学心理学院，大连，116029，sunyan@lnnu.edu.cn

摘 要　背景与目的:截至 2022 年 12 月，中国互联网络信息中心发布的第 51 次《中国互联网发展状况统计报告》显示，中国通过智能手机上网的互联网用户为 10.65 亿，占比 99.8%。大学生智能手机成瘾是一个值得关注的问题。之前的研究已经确定了智能手机成瘾的风险因素，但很少有研究从网络的角度来探讨这个问题。因此，本研究利用网络分析来研究智能手机成瘾的核心症状，并分析了智能手机成瘾与其影响因素的相互关系。

研究方法:研究采用问卷调查法，在山东省的两所大学中共收集到 1438 份有效问卷。其中男生 633 人，平均年龄 19.19 岁，SD=1.084。本研究测量了智能手机成瘾及其相关因素，首先使用网络分析构建了智能手机成瘾的症状网络，然后将其他影响因素纳入网络中进行分析，最后采用网络对比检验对不同性别、低成瘾倾向组和高成瘾倾向组的影响因素网络进行比较。

结果与结论:本研究发现，大学生智能手机成瘾的核心症状为无手机恐惧症、孤独感、无手机的不舒服感、喜欢在线互动。被动性社交网站使用与智能手机成瘾关系最为密切。网络对比检验的结果显示，智能手机成瘾低倾向组和高倾向组的网络结构存在显著差异。这些结果从网络分析的角度扩展了前人的研究结果，未来对这些核心症状和关键因素的干预可能会使效果最大化，对于预防和干预大学生智能手机成瘾具有显著意义。

A network perspective on understanding smartphone addiction and related factors

Rui Li[1]，Yan Sun[1](Corresponding Author)，Xue Feng[1]，Ting Chen[1]
1 School of Psychology, Liaoning Normal University, Dalian, 116029
Corresponding Author E-mail: sunyan@lnnu.edu.cn

Abstract：*Background and aims:* As of December 2022, according to the 49th statistical report on Internet development in China issued by the China Internet Network Information Center, 1.065 billion Internet users access the Internet through smartphones in China, accounting for 99.8%. Smartphone addiction in university students is a concerning issue. Previous research has established risk factors for smartphone addiction, but few studies have explored this issue taking a network perspective. As such, this study capitalizes on network analysis to examine the core symptoms of smartphone addiction and the interaction with related factors.

Methods: 1438 participants (males = 633, mean age = 19.19, SD = 1.084) were included in the study. This study measured university students' smartphone addiction and its related factors. The collected data were analyzed using a network analysis method. The two networks from the different groups were compared using the network comparison test.

Results and conclusions:: This study found that phobia without a smartphone, loneliness, uncomfortableness without a smartphone, and comfort for online interaction were core symptoms of smartphone addiction in university students. Passive social networking sites use was most closely associated with smartphone addiction. The network comparison test showed the network structure had significant differences between the low and high groups of smartphone addiction tendency. These results extend the results of previous studies from the network analysis perspective. Future interventions on these core symptoms and vital factors may maximize the effect and be more inexpensive than current modalities.

无法容忍不确定性与网络游戏成瘾：经验回避和非适应认知的序列中介作用

徐旋[1,2] 曹敏[1,2] 陈倩[1,2] 许放[1,2] 周宗奎[1,2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

摘 要 随着人们的娱乐从线下活动转为网络游戏，网络游戏成瘾成为了公众最为关切的心理障碍之一。对于网络游戏障碍的前因机制的探索逐步受到重视。近年来，新冠肺炎疫情、俄乌冲突等重大事件的发生，不断增加着个体生活中的不确定性。而对不确定性的容忍度，可能显著影响着个体的心理和行为。以往研究显示，无法容忍不确定性可能会导致过度游戏等非适应性问题的发生。然而,无法容忍不确定性预测网络游戏成瘾的作用和路径尚未明确。故本研究基于 I-PACE 模型和认知-行为模型，检验无法容忍不确定性和网络游戏成瘾的关系，以及经验回避和非适应认知的序列中介作用。本研究使用无法容忍不确定性量表（IUS-12）、网络游戏成瘾量表（IGD-20）、接纳与承诺量表（AAQ-II）和网络游戏非适应认知量表作为研究工具，共收集 1393 名中国网络游戏玩家（62.5%为男性，年龄范围为 14 至 51 岁）的有效数据。路径分析的结果表明，在控制被试的性别、年龄和游戏使用时间后，无法容忍不确定性能显著正向预测网络游戏成瘾；同时，经验回避和非适应认知的序列中介作用显著。这提示我们，个体的无法容忍不确定性程度越高，就越容易发展成为网络游戏成瘾。而对负面经验的习惯性回避和对网络游戏的扭曲认知，可能是无法容忍不确定导致网络游戏成瘾的中介机制。综上所述，害怕无法容忍不确定性的人可能更容易出现网络游戏成瘾问题。改善个体对负面体验的回避方式及矫正关于游戏的不适应认知，可能是有效的干预策略。

2 School of Psychology, Central China Normal University, Wuhan, China

Abstract: As people's entertainment activities transition from offline to online gaming, Internet Gaming Disorder (IGD) has emerged as one of the most concerning psychological disorders in the public's eye. The exploration of the antecedent mechanisms of IGD has received increasing attention. In recent years, major events such as the COVID-19 pandemic and the Russia-Ukraine conflict have continuously increased uncertainty in individuals' lives. The tolerance for uncertainty may significantly impact individuals' psychology and behavior. Previous research has indicated that intolerance of uncertainty may lead to maladaptive issues, such as excessive gaming. However, the specific role and pathways through which intolerance of uncertainty predicts Internet gaming addiction remain unclear. Therefore, this study, based on the I-PACE model and cognitive-behavioral model, examined the relationship between intolerance of uncertainty and Internet gaming addiction, as well as the

sequential mediating roles of experiential avoidance and maladaptive cognitions. The study employed measures including the Intolerance of Uncertainty Scale (IUS-12), Internet Gaming Disorder Scale (IGD-20), Acceptance and Action Questionnaire (AAQ-II), and Internet Gaming Maladaptive Cognitions Scale. Valid data were collected from a total of 1393 Chinese online gamers (62.5% male), ranging in age from 14 to 51. Path analysis results, controlling for participants' gender, age, and gaming usage time, demonstrated that intolerance of uncertainty significantly and positively predicted Internet gaming addiction. Furthermore, the sequential mediating effects of experiential avoidance and maladaptive cognitions were significant. These findings suggest that individuals with a higher intolerance of uncertainty are more likely to develop Internet gaming addiction. Habitual avoidance of negative experiences and distorted cognitions about gaming may serve as mediating mechanisms linking intolerance of uncertainty to Internet gaming addiction. In conclusion, individuals who fear and are unable to tolerate uncertainty may be more susceptible to developing Internet gaming addiction. Targeting improvements in avoidance strategies for negative experiences and correcting maladaptive cognitions about gaming may be effective intervention strategies.

摘 要 电子游戏不仅成为人们日常生活中重要的娱乐方式，还产生了一个庞大的游戏产业和市场。研究发现，游戏中的消费行为可能与赌博存在一些类似的特征，购买后所带来的游戏奖励和成就更有可能使玩家出现强迫性购买的行为。基于使用满足视角，高游戏动机的个体更有可能产生过度的补偿，发展成了强迫性的游戏消费。但不同游戏动机对强迫性游戏消费的影响机制还不清楚，也不清晰游戏动机的性别差异是否会产生影响。本研究采用 PLS-SEM 探讨不同游戏动机对强迫性游戏消费的影响机制及性别的群组差异。研究采用游戏玩家类型问卷、社会资本量表、强迫性游戏消费量表对 571 名游戏玩家（男 323、女 248）进行调查，结果发现：（1）竞争动机正向影响强迫性游戏消费；（2）社交动机、能力动机、竞争动机、逃避动机、智力动机正向影响游戏社会资本，并通过游戏社会资本的中介正向影响游戏强迫性消费，故事动机与强迫性游戏消费无显著相关；（3）在性别差异方面，女性竞争动机对强迫性消费的正向影响大于男性，男性逃避动机对游戏社会资本的影响大于女性，并且逃避动机–游戏社交资本–强迫性游戏消费的路径对男性的影响大于女性。本研究基于使用满足视角，发现过高的游戏动机会对需要过度补偿，发展出强迫性游戏消费，并且高游戏动机的玩家也希望获得更高的游戏社交资本，高游戏社会资本会让玩家更加认同游戏的价值，有更高的消费意愿，同时也更容易让玩家更加沉浸在游戏的虚拟世界之中，渐渐失去对游戏消费的控制，发展成强迫性消费。另外，女性和男性游戏行为特征和游戏需要的差异，女性玩家更有可能为了顺利的游戏体验和社交需要导致强迫性消费，而男性玩家更可能为了满足逃避现实和沉浸于游戏中的需要导致强迫性消费。因此，在干预不同性别玩家的强迫性游戏消费时应采取不同的策略。未来研究可基于动机和游戏特征的差异探讨不同性别玩家强迫性游戏消费的保护因素，并对开展针对性的干预策略提供实践引导。

The impact of video game playing motivations on compulsive gaming buying in gamers of different genders: The mediating effect of social capital

Xu Fang [a,b] Niu Gengfeng [a,b] Xu Xuan [a,b] Cao Min [a,b] Dong Rouchun [c] Zhou Zongkui [a,b]

[a] Key Laboratory of Adolescent Cyberpsychology and Behavior (Central China Normal University), Ministry of Education, Wuhan, 430079

[b] School of Psychology, Central China Normal University, Wuhan, 430079

[c] Preschool Education School, Jiangsu Second Normal University, Nanjing 210013

***Abstract*:** Video games have not only emerged as a significant source of entertainment in people's everyday lives but have also generated an extensive gaming industry and market. Research has found that buying in games may share some similarities with gambling. The rewards and accomplishments acquired through in-game buying are more likely to contribute to compulsive buying behaviors among players. Based on the perspective on uses and gratifications, individuals with high motivations for video game playing are more susceptible to engaging in excessive compensatory behaviors that may lead to the development of compulsive gaming buying. However, the mechanisms by which motivations for video game playing influence compulsive in-game purchasing, as well as the potential impact of gender differences, remain uncertain. This study use PLS-SEM to explore the mechanisms of different video game playing motivations on compulsive gaming buying and examine gender differences. A questionnaire on The Trojan Player Typology, The Social Capital Scale and The Compulsive Gaming Buying Scale were used to survey 571 video games player (323 males, 248 females). The results indicate that (1) Competitors positively influences compulsive gaming buying; (2) Socializers, completionists, competitors, escapists, and smarty-pants positively impact compulsive gaming buying through the mediated variable of game-related social capital. Story-driven shows no significant correlation with compulsive gaming buying; (3) in terms of gender differences, the positive influence of competitors on compulsive consumption is greater among females than males, and the impact of escapists on game-related social capital is greater among males than females. Additionally, the path of escapists – game-related social capital – compulsive gaming buying has a greater effect on males than females. According to the perspective of uses and gratifications, suggests that individuals with high video game playing motivations are more likely to engage in compulsive gaming purchases as a form of excessive compensation. Additionally, individuals with strong video game playing motivations strive for increased game-related social capital. Increased game-related social capital enhances players' inclination to endorse the game's value, increases their willingness to engage in buying, and facilitates their immersion in the virtual gaming world, potentially leading to diminished control over gaming buying and the development of compulsive behavior. Furthermore, variations in gaming behavior characteristics and needs between female and male players indicate that females are more prone to engage in compulsive buying to enhance their gaming experiences and fulfill their social needs, whereas males are more inclined to engage in compulsive buying as an escapists in the game. Therefore, distinctive strategies should be employed to address compulsive gaming buying in players of different genders. Future research should aim to examine the protective factors related to compulsive gaming buying among players of different genders, considering variations in motivations and game characteristics, in order to offer practical guidance for targeted intervention strategies.

Keywords：compulsive gaming buying, video game playing motivations, social capital, gender differences

主播特征与大学生观看游戏直播成瘾和冲动打赏的关系：准社会关系、直播氛围和感知价值的中介作用

金斯妤 [1,2,3]　许放 [1,2,3]　朱安琪 [1,2,3]　袁子惠 [1,2,3]　牛更枫 [1,2,3]（通讯作者）

1 华中师范大学心理学院，武汉，430079

3 华中师范大学网络素养与行为研究中心，武汉，430079，niugfpsy@ccnu.edu.cn

摘 要　随着各种娱乐终端设备的普及，大学生使用电子游戏作为日常休闲娱乐活动已较为普遍，伴随着这一趋势，通过直播平台观看主播游玩电子游戏也变得日渐受欢迎，然而其负面影响也日益凸显，如观看直播成瘾和冲动打赏会对个体身心健康、人际关系和生活的其他方面造成不良影响。因此，大学生游戏直播观看行为及其影响因素也需要研究者更多关注。主播特征包括主播的个体特征(如吸引力、专业性)以及与观众的互动特征，是游戏直播的重要组成部分。主播特征作为刺激，所带来的身心激活能够促使个体产生一系列认知、情绪反应，观众能够感知到良好的直播氛围、高价值的直播内容以及与主播之间积极的准社会关系，从而满足观众的工具性需求和情感需求，并进一步增加其观看直播成瘾和冲动打赏的可能性。因此，本研究拟在大学生群体中探讨主播特征、心理需求满足和问题性游戏直播使用的关系及其内在作用机制——采用直播互动性量表、主播特征量表、准社会关系量表、直播场景氛围线索量表、感知价值量表、直播冲动消费量表和流媒体成瘾量表对 334 名大学生进行调查，采用偏最小二乘法进行分析，结果显示：(1)在主播个体特征、主播互动性、准社会关系、直播氛围、感知价值、冲动打赏、直播成瘾中，两两变量之间均呈显著正相关；(2)主播个体特征能显著正向预测直播成瘾；(3)直播成瘾能显著正向预测冲动打赏；(4)准社会关系和直播氛围在主播个体特征和直播成瘾关系中的中介作用显著；(5)准社会关系、直播氛围和感知价值在主播个体特征和冲动打赏关系中起完全中介作用；(6)准社会关系、直播氛围和感知价值在主播互动性和冲动打赏关系中起完全中介作用；(7)准社会关系、直播氛围和感知价值在主播互动性和直播成瘾关系中起完全中介作用。本研究以大学生为研究对象，以主播特征为切入，研究发现有助于深入揭示直播观看动机与问题性使用的内在机制，这是对以往研究的扩展和深化，也能为合理的游戏直播观看行为的塑造提供依据和思路。

The association between Anchor characteristics and college students' problematic video game live streaming and impulse consumption: the mediating role of parasocial relationships, live atmosphere, and perceived value

Si-yu Jin[a, b, c], Fang Xu[a, b, c], An-qi Zhu[a, b, c], Zi-hui Yuan[a, b, c], Geng-feng Niu[a, b, c]

[a] School of Psychology, Central China Normal University, Wuhan, 430079

[b] Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079

[C] Center for Research on Internet Literacy and Behavior, Central China Normal University, Wuhan 430079, China niugfpsy@mail.ccnu.edu.cn

Abstract：The increasing popularity of entertainment terminals has led to a rise in video game usage among college students for daily leisure and entertainment activities. Furthermore, the growing trend of watching anchors play video games through live broadcasting platforms has brought with it negative impacts such as addiction to live broadcasting and impulsive rewarding, which can have detrimental effects on individuals' physical and mental well-being, interpersonal relationships, and other aspects of life. Hence, it is imperative for researchers to pay more attention to college students' live game viewing behavior and the factors that influence it. The individual characteristics of the anchor (for example, attractiveness and professionalism) as well as their interaction with the audience, collectively referred to as anchor characteristics, play a crucial role in game live streaming. Anchor characteristics act as stimuli that trigger physical and mental activation in individuals, eliciting a range of cognitive and emotional responses. Viewers, in turn, perceive a favorable live broadcasting atmosphere, valuable content, and foster positive parasocial relationships with the anchors. These factors satisfy viewers' instrumental and emotional needs, potentially exacerbating their addiction to live broadcasting and impulsive rewarding. Therefore, this study intends to explore the relationship between anchor characteristics, psychological need fulfillment and problematic game live streaming use and its intrinsic mechanism of action in a group of college students - using the Live Streaming Interactivity Scale, the Anchor Characteristics Scale, the Parasocial Relationships Scale, the Live Streaming Scene Atmosphere Cues Scale, the Perceived Value Scale, the Live Streaming Impulsive Consumption Scale, and the Streaming addiction scale for 334 college students, and analyzed by partial least squares, the results show that (1) there is a significant positive correlation between the two two variables in anchor individual characteristics, anchor interactivity, parasocial relationship, live scene atmosphere, perceived value, impulse rewarding, and live streaming addiction; (2) individual characteristics of anchors can significantly and positively predict live streaming addiction; (3) live streaming addiction can significantly and positively predict impulse rewarding; (4) parasocial relationships and live atmosphere mediated significantly in the relationship between anchor individual characteristics and live addiction; (5) parasocial relationships, live atmosphere and perceived value fully mediated the relationship between anchor individual characteristics and impulse rewarding; (6) parasocial relationships, live atmosphere and perceived value fully mediated the relationship between anchor interactivity and impulse rewarding; and (7) parasocial relationships, live-streaming atmosphere and perceived value play a fully mediating role in the relationship between anchor interactivity and live-streaming addiction. Taking college students as the research object and anchor characteristics as the entry point, the findings of this study help to deeply reveal the intrinsic mechanism of live viewing motivation and problematic use, which is an extension and deepening of previous studies and can also provide the basis and ideas for the shaping of reasonable game live viewing behavior.

父母低头行为对初中生短视频成瘾的影响：一个链式中介模型

柏忆[1] 王兴超[2]（通讯作者）

1 复旦大学社会发展与公共政策学院，上海，200433

2 山西大学教育科学学院，太原，wangxch9@126.com

摘 要　短视频成瘾指个体无法控制自己对短视频软件的使用，忽略其带来的负面的心理和社会后果的行为。在青春期早期，个体自我调节能力尚未发展成熟，较容易产生短视频成瘾行为。父母低头行为指父母在亲子互动的过程中因为过于沉浸手机使用而忽略子女的现象。作为一种消极的亲子互动行为，近年来父母低头行为已受到广泛的关注。本研究参考社会学习理论，对父母低头行为和初中生短视频成瘾的关系进行了探索，即当初中生感知到自己父母低头行为时，会采取模仿学习的行动，也将关注点转移到智能手机上并对其产生依赖。同时引入中介变量感觉寻求和自我控制，并对四个变量的互相作用机制进行模型构建和分析验证。本研究旨在考察父母低头行为对初中生短视频成瘾的影响，并分析感觉寻求和自我控制在其中的中介作用。对 1006 名初中生 (M = 13.00，SD = 0.90，女生 498 人，男生 508 人) 采用低头量表、简版感觉寻求问卷、简版自我控制问卷、短视频成瘾问卷进行调查。测量了父母低头行为、短视频成瘾、感觉寻求和自我控制 4 个变量。使用 SPSS 和 PROCESS 插件进行相关分析和路径分析。结果：（1）父母低头行为与感觉寻求呈显著正相关，与自我控制呈显著负相关。感觉寻求和自我控制之间也呈现显著负相关。此外，初中生短视频成瘾与父母低头行为和感觉寻求之间呈现显著正相关，与自我控制呈现显著负相关。（2）链式中介模型分析显示，父母低头行为不仅能够直接影响初中生短视频成瘾，也可以通过感觉寻求和自我控制间接对初中生短视频成瘾产生影响。具体而言，感觉寻求和自我控制在父母低头行为与初中生短视频成瘾之间分别起显著的中介作用。同时，感觉寻求与自我控制在父母低头行为与初中生短视频成瘾之间也起到显著的链式中介作用。可以看出，在预防和干预青少年尤其是初中生短视频成瘾问题中，需要重视父母低头行为，同时引导青少年减低感觉寻求，提高自我控制，从而减少短视频成瘾的发生。

The Impact of Parental Phubbing on Junior High School Students' Short-form Video Addiction: A Serial Mediation Model

Bo Yi[1] Wang Xingchao[2]

1 School of Social Development and Public Policy, Fudan University, Shanghai, 200433

2 School of Educational Science, Shanxi University, Taiyuan

***Abstract*:** Short-form video addiction refers to the individual's inability to control their use of short-form video software, and ignore its negative psychological and social consequences. In people's early adolescence, the development of individual self-regulation ability is not that mature. So, teenagers are more likely to have short-form video addiction. Parental phubbing refers to the phenomenon that parents neglect their children because they are too immersed in mobile phone use in the process of parent-child interaction. and as a negative parent-child interaction behavior, parental phubbing has received widespread attention in recent years. This study explores the relationship between parental phubbing and junior high school students' short-form video addiction with reference to social learning theory, that is, when junior high school students perceive phubbing from parents, they will take imitation learning actions, and also shift their focus to smartphones and become dependent on them. At the same time, mediating variables sensation seeking and self-control are introduced, and the interaction mechanism of the four variables is modeled and analyzed. The purpose of this study is to examine the effects of parental phubbing behavior on junior high school students' short-form video addiction and to analyze the mediating roles of sensation-seeking and self-control in this context. 1006 junior high school students (M = 13.00, SD = 0.90, female: 498, male: 508) were surveyed using the parental phubbing Scale, the short version of the Sensation Seeking scale, the short version of the Self-Control scale, and the Short-form Video Addiction scale. Four variables were measured: parental phubbing, short-form video addiction, sensation seeking, and self-control. SPSS and PROCESS plug-ins were used to perform statistical analysis and pathway analysis. Results: (1) Parental phubbing was significantly positively correlated with sensation seeking and significantly negatively correlated with

self-control. There was also a significant negative correlation between sensation-seeking and self-control. In addition, junior high school students' short-form video addiction showed a significant positive correlation with parental phubbing and sensation seeking, and a significant negative correlation with self-control. (2) Serial-mediated model analysis showed that parental phubbing could not only directly affect junior high school students' short-form video addiction, but also indirectly affect junior high school students' short-form video addiction through sensation-seeking and self-control. Specifically, sensation-seeking and self-control played significant mediating roles in the relationship between parental phubbing and junior high school students' short-form video addiction. At the same time, the sensation of seeking and self-control in parental phubbing has a significant serial mediating effect between parental phubbing and the short-form video addiction of junior high school students. Conclusion: In the problem of short-form video addiction for junior high schoolers, the demand for intervention and prevention of short-form video addiction is as important as the demand for attention to parental phubbing, which at the same time leads to lower sensation in the children and higher self-control, and from this, less short-form video game addiction is produced.

奖赏类型对网络游戏成瘾者行为抑制的影响：来自 ERP 的证据

尹欣怡 谢笑春（通讯作者）

东北师范大学心理学院，长春，130024，xiexc713@nenu.edu.cn

摘 要 行为抑制是指个体对已形成的优势反应的主动压抑，行为抑制能力下降是成瘾的重要特征之一。双系统模型认为，奖赏失调和执行功能障碍共同导致了成瘾行为。物质成瘾的相关研究表明，奖赏能够提高抑制控制能力，进而缓解物质成瘾，但少有研究关注奖赏对网络游戏成瘾的作用。同时，诱因-易感理论提出，当成瘾相关奖赏作为动机时，能够促进对成瘾物的注意偏向，降低对自然奖赏的敏感性。以往研究通常是考察单一奖赏的作用，对不同类型奖赏的作用关注不足。因此，本研究将奖赏划分为金钱、社会和网络游戏奖赏三类，考察不同奖赏类型对网游成瘾者行为抑制的影响及作用机制。本研究利用《网络游戏障碍量表》（ISDS-SF9）对被试进行筛选，并在 Oddball 双选择任务前后设置线索和反馈阶段，创设四种奖赏情境，以风景图片为标准刺激，网络游戏截图为偏差刺激，结合行为和 ERP 技术记录数据。研究采用 2（被试类型：网络游戏成瘾组，对照组）×4（奖赏类型：无奖赏，金钱奖赏，社会奖赏，网络游戏奖赏）混合设计。结果发现：（1）行为结果显示，两组被试在行为抑制上无显著差异，但网游奖赏能够显著减少成瘾组的反应时代价，社会奖赏减少正常组的反应时代价。（2）脑电结果显示，网游成瘾组比对照组诱发的 N2 波幅更小，P3 波幅更大。（3）相较于其他奖赏条件，网游奖赏对成瘾组，社会奖赏对对照组均能诱发更小的 N2 波幅和更大的 P3 波幅。研究结果表明，网游成瘾者对网络游戏图片存在反应抑制缺陷；不同类型奖赏对行为抑制的提升程度不同：社会奖赏能显著提升对照组的行为抑制，网游奖赏能显著提升成瘾组的行为抑制能力。本研究结果有助于为网络游戏成瘾的预防和干预提供启示。

关键词 网络游戏成瘾，行为抑制，奖赏，ERP

Effect of reward type on Internet gaming disorder’s behavioral inhibition: evidence from ERPs

Xinyi Yin, Xiaochun Xie

School of Psychology, Northeast Normal University, Changchun

***Abstract*：** Behavioral inhibition refers to an individual's active repression of an established dominant response, and decreased behavioral inhibition is one of the key features of addiction. The dual-systems model suggests that reward dysregulation and executive dysfunction together contribute to addictive behavior. Existing research on substance addiction suggests that rewards can improve inhibitory control and thus improve addiction, but few researchers have focused on the role of rewards in Internet gaming disorder. Meanwhile, the causal susceptibility theory proposes that when addictive substance-related rewards serve as motivators, they can promote attentional bias toward the addictive substance and reduce sensitivity to natural rewards. Previous studies typically examined the role of a single reward, but ignored the effects of different types of reward. Therefore, the current study classified rewards into three categories: monetary, social, and online game rewards, and explored the effects of different reward types on behavioral inhibition and mechanisms of action in Internet gaming disorder. This study utilized the Internet Game Disorder Scale (ISDS-SF9) to screen subjects, set up cues and feedback stages before and after the Oddball double-choice task, created four types of reward situations, used landscape pictures as the standard stimulus and online game screenshots as the deviant stimulus, and combined behavioral and ERP techniques to record data. The study used a 2 (subject type: Internet gaming disorder, control group) × 4 (reward type: no reward, monetary reward, social reward, Internet game reward) mixed design. It was found that (1) behavioral results showed that there was no significant difference in behavioral inhibition between the two groups of subjects, but online game reward significantly reduced the cost of response time in the Internet gaming disorder and social reward reduced the cost of response time in the normal group. (2) EEG results showed that the online gaming addiction group induced smaller N2 wave amplitude and larger P3 wave amplitude than the control group. (3) Compared with other rewards, online gaming reward for the addiction group and social reward for the control group both induced smaller N2 wave amplitude and larger P3 wave amplitude. The findings suggest that Internet gaming disorder have a response inhibition deficit to Internet game pictures; different types of rewards enhance behavioral inhibition to different degrees, with social rewards significantly enhancing behavioral inhibition in the control group and Internet game rewards significant in the addicted group. The results of this study help to provide insights into the prevention and intervention of Internet gaming disorder.

摘 要 随着互联网和各种电子产品的发展与普及，网络游戏已经成为许多年轻人的主要休闲娱乐方式之一，网络购买和游戏内的冲动购买行为也随着这一趋势变得格外突出。许多游戏鼓励玩家不断进行游

戏内购买，这使得游戏公司获得收益的主要方式，并且购买各种虚拟商品可以直接或是间接地改善玩家的游戏体验，鼓励了玩家的游戏内的购买行为。除此之外，女性游戏玩家的数量也在急剧增加，她们比男性有更高的强迫购买率和更强的网上购买意图，并且她们相对来说也更易受到来自同龄人的关系欺负。女性游戏玩家和她们的行为特征吸引了大量的研究关注，成为了研究热点对象。在这种背景下，本研究旨在探讨女大学生关系欺负与游戏内冲动购买之间的关系，以及这一关系的潜在发生机制。研究人员招募了 465 名女大学生，并要求被试完成一组问卷，从而对被试的关系欺负、感知孤独感以及非适应性认知和冲动购买倾向的水平进行评估。研究结果表明：(1)女大学生的关系欺负与游戏内冲动购买呈正相关；(2)女大学生的孤独感和非适应性认知在这一关系中起显著的调节作用，其中包括了两条中介路径：非适应性认知的独立中介效应、孤独感和非适应性认知的序列中介效应。这些发现加深了我们对于同伴欺凌给女大学生带来的消极影响、女性网络游戏内冲动购买行为和女性玩家的游戏行为的理解，从而为健康和合理的游戏行为的发展提供有效的指导。

关键词　关系欺负，游戏内冲动购买，孤独感，非适应性认知，女大学生

The association between relational victimization and impulsive in-game buying among female college students: The mediating roles of loneliness and maladaptive cognitions

Abstract： Online games have become one of the main ways of entertainment for many youths, virtual buying and impulsive in-game buying have also become prominent along this trend. Besides, the number of female gamers has been increasing drastically, attracting much research attention. Against this background, the current study aimed to examine the association between relational victimization and in-game impulsive buying among female college students, as well as the underlying mechanism. A sample of 465 female college students was recruited to complete a set of questionnaires assessing the relational victimization, perceived loneliness, as well as the maladaptive cognitions and impulse buying tendency associated with online games. Results indicated that: (1) relational victimization was positively associated with impulsive in-game buying; (2) loneliness and maladaptive cognitions significantly mediated this relation, which contained two mediating pathways – the independent mediating effect of maladaptive cognitions, and the sequential mediating effect of loneliness and maladaptive cognitions. These findings deepen our understanding of the influences of being victimized by peers, impulsive buying in games and females' game usage, providing suggestions for the development of healthy and reasonable

gaming behaviors.

4 华中师范大学网络素养与行为研究中心，武汉，430079，sunxiaojun@mail.ccnu.edu.cn

摘 要 现代信息和通信技术(Information and communication technologies, ICT)的广泛普及，使其已成为个体学习、生活、社交和工作中必不可少的一部分，并对个体适应数字生活带来了新的发展要求。数字素养指通过数字技术安全并适当地获取、管理、理解、整合、交流、评估和创造信息，以参与社会生产的能力。如何在个体发展过程中培育其良好的数字素养已成为广受关注的教育问题。科技生态亚系统理论认为个体发展中与数字媒体的交互过程会受到重要他人(父母和朋友)的多重影响，以往研究也表明重要他人的观念可能存在并不一致的情况。基于已有研究和科技生态压系统理论，本研究通过旨在通过潜在剖面分析探究重要他人 ICT 态度的不同类别和中小学生 ICT 态度及数字素养之间的关系。我们对 1544 名中小学生(年龄范围 9-19 岁，M_{age}=13.13， SD=2.54)进行问卷调查，通过潜在剖面分析识别了 5 个重要他人 ICT 态度的潜在类别：消极组(22.93%)；朋友消极，父母积极组(4.40%)；父母消极，朋友积极组(18.33%)；中立组(36.66%)；积极组(17.68%)。与理论假设一致，积极组报告了最积极的 ICT 态度和最高的数字素养水平，而消极组相反。消极组与朋友消极父母积极组在数字素养上不存在显著差异。然而，父母消极朋友积极组的社会情感素养水平显著低于朋友消极父母积极组。研究结果揭示了重要他人 ICT 态度在影响中小学生 ICT 态度和数字素养发展上的异质性，并发现了朋友在社会情感素养发展中的独特作用。

***Abstract*：** In the current digital age, the widespread availability of Information and Communication

Technologies (ICT) has made them an indispensable part of individual learning, daily life, social interactions, and work. This has brought about new developmental demands for individuals to adapt to the digital environment. Digital literacy refers to the ability to safely and appropriately access, manage, understand, integrate, communicate, evaluate, and create information through digital technologies for active participation in society. Cultivating good digital literacy during individual development has become a highly relevant educational concern. The ecological techno-subsystem theory posits that individuals' interactions with digital media during their development are influenced by significant others (such as parents and friends) in multiple ways. Previous research has also suggested that significant others may hold diverse views on digital media usage. Building upon previous research and the ecological techno-subsystem theory, this study aimed to examine how significant others (parents and friends) contribute to the formation of students' ICT attitudes and digital literacy using Latent profile analysis (LPA). A total of 1544 Chinese students (age range 9-19 years, *M*age=13.13, *SD*=2.54), participated in the study. The LPA identified five distinctive profiles of significant others' ICT attitudes: *Negative* (22.93%), *Negative from friends. positive from parents* (4.40%), *Negative from parents, positive from friends* (18.33%), *Neutral* (36.66%), and *Positive* (17.68%). Consistent with the theoretical hypothesis, the *Positive* profile exhibited the most positive ICT attitudes and the highest level of digital literacy, while the *Negative* profile displayed the opposite pattern. There were no significant differences in digital literacy between the *Negative* and *Negative from friends, positive from parents* profiles. However, the Social-emotional literacy scores of the *Negative from friends, positive from parents* were significantly lower than those of *Negative from parents, positive from friends* profile. These findings shed light on the distinctiveness and heterogeneity of significant others' ICT attitudes in shaping students' development of digital literacy.

Keywords： Digital literacy, ICT attitudes, Parents' ICT attitudes, Friends' ICT attitudes, Latent Profile Analysis

信息囤积与信息处理偏差的关系：信息过载、身份气泡强化和不确定性容忍度的作用

白旭青 [1,2]　连帅磊 [2,3]　孙晓军 [1,2]（通讯作者）

1 华中师范大学心理学院，武汉，430079，sunxiaojun@ccnu.edu.cn

摘 要　在信息化的时代背景下，数字信息资源对个体的生存和发展有着重要的意义。不幸的是，越来越多的个体在保存数字信息资源时迷失，如：害怕错过、积累过多、犹豫是否删除不必要的数字信息资源。研究者将这种不断保存、杂乱堆积且难以删除数字信息资源的倾向称为信息囤积，并将其视为非适应性的信息使用行为。在规避风险动机的驱动下，大量研究探讨了信息囤积的影响因素和机制，却忽略了信息囤积对个体心理的影响，尤其是对信息加工的影响。信息存储载体发生的变化可能对个体的信息处理产生一系列的连锁反应。以往研究发现了个体信息处理的“谷歌效应”，即个体对存储地址的记忆对存储好于对存储内容本身的记忆。这表明基于数字设备的信息使用行为会对个体的信息处理产生影响。然而，在非适应性的信息使用行为和信息处理之间仍然存在研究空白。信息处理偏差已逐渐成研究者关注的焦点，其是指个体在信息选择过程中倾向于选择与自己观点一致的信息。信息处理偏差会导致个体做出错误的判断、加剧群体极化和羊群效应。因此，探讨信息囤积对信息处理偏差的影响至关重要。尽管许多间接证据表明信息囤积和信息处理偏差之间存在正相关，但信息囤积如何导致信息处理偏差以及是否存在边界条件仍不清

楚。根据信息生态系统理论，信息、信息环境和信息人会对个体的信息处理产生影响。其中，过载的信息、身份气泡强化的信息环境、不确定性容忍度的信息人可能成为信息囤积和信息处理偏差中的关键中介或调节因素。研究以 717 名大学生为被试，采用问卷法对相关变量进行测量。结果显示：（1）信息囤积与信息处理偏差之间显著正相关。（2）信息过载和身份气泡强化在信息囤积和信息处理偏差之间起中介作用。（3）不确定性容忍度调节了信息囤积和信息处理偏差、信息过载和信息处理偏差之间的关系。研究结果不仅有助于填补信息囤积对信息处理偏差影响的研究空白，还有助于引导个体合理利用信息资源并为个体信息处理偏差敲响警钟。

The relationship between information hoarding and information processing bias: The role of information overload, identity bubble reinforcement, and intolerance of uncertainty

Xuqing Bai[1,2], Shuailei Lian[2,3], Xiaojun Sun[1,2] (corresponding author)
1 School of Psychology, Central China Normal University, Wuhan, 430079
2 Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan, 430079

***Abstract*：** In the current information age, digital information resources have gained unprecedented significance for individuals. Unfortunately, more and more people are getting lost and losing control when it comes to saving digital information resources. They worry about missing out on digital information resources, accumulate an excessive number of similar resources, and are hesitant to delete unnecessary ones. Researchers refer to this phenomenon of continuously save, clutter and have difficulty deleting digital information resources as information hoarding, which is seen as a maladaptive information use behavior in the information age. Driven by risk-averse motives, numerous studies have examined influencing factors and mechanism of information hoarding. But few studies explore the impact of information hoarding on individual psychology, especially on individual information processing. What cannot be ignored is that in the information age, changes in information storage and use behaviors may bring about a series of chain reactions that affect individual information processing. Previous studies have found the "Google effect" of individual information processing, that is, individuals remember more about the address where the content is stored than the stored content. This indicates that the information storage and use behaviors based on digital devices has changed individual information processing. However, previous research pays less attention to the impact of maladaptive information use behavior on information processing. Information processing bias has gradually become a focal point among researchers, which refers that individuals tend to choose information that is consistent with their own views in the process of information selection. Information processing bias can lead to individuals making incorrect judgements, exacerbating group polarization and the herd effect. It is crucial to explore the influencing factors of information processing bias. Although much indirect evidence indicates a positive correlation between information hoarding and information processing bias, it remains unclear how information hoarding leads to information processing bias and for whom it applies. According to the information ecosystem theory, information, information environment, and informants can have an impact on an individual's information processing. Among them, information overload (information), identity bubble reinforcement (information environment), and intolerance of uncertainty (informants) may become key

mediators or moderators in information hoarding and information processing bias. Through the method of questionnaires, we measured and tested the proposed model in a sample of 717 validated participants. The findings showed that information hoarding was positively associated with information processing bias, that information overload and identity bubble reinforcement mediated this relationship, respectively. In addition, intolerance of uncertainty moderates the relationship between information hoarding and information processing bias, and information overload and information processing bias. These findings not only help to understand the mechanism of information hoarding on information processing bias, but also help to guide individuals to make rational use of information resources and sound the alarm for individual information processing bias.

摘 要 **目的：**大学生中普遍存在过度使用手机的现状。大学生过度使用手机会造成人际关系不良，产生孤独感和空虚感，影响大学生心理健康。因此本研究将探讨大学生手机成瘾对心理健康的影响机制，为大学生手机成瘾矫正及其抑郁、焦虑、压力和自身价值认识以及心理健康维护途径的探索提供科学依据。**方法：**本研究选取 912 名大学生，采用分层整群抽样法使用手机成瘾量表、自尊量表、主观幸福感量表和抑郁-焦虑-压力量表进行问卷调查，并对数据进行分析。有效被试手机成瘾总分为 58.05 士 15.34。手机成瘾者 92 人(10.08%),智能手机成瘾倾向者 210 人(23.03%),正常使用手机者人(66.89%)。各变量之间存在相关关系。基于此建立结构方程模型，**结果显示：**手机成瘾对抑郁、焦虑、压力的直接效应分别为 0.35、0.28、0.07，自尊对抑郁、焦虑、压力的直接效应分别为-0.32、-0.32、-0.12，主观幸福感对抑郁、焦虑、压力的直接效应分别为-0.25、-0.33、-2.70。自尊（β=-0.14,P<0.001）在大学生手机成瘾与抑郁之间存在中介作用；主观幸福感（β=-0.25,P<0.001）在大学生手机成瘾与抑郁之间存在中介作用；主观幸福感（β=-0.33,P<0.001）在大学生手机成瘾与压力之间存在中介作用；主观幸福感在（β=-0.33,P<0.001）大学生手机成瘾与压力之间存在中介作用；自尊与主观幸福感在大学生手机成瘾与抑郁、焦虑、压力之间存在链式中介作用。**建议：**为提高大学生心理健康水平，应从提高大学生自尊与主观幸福感入手，组织团体活动，提高学生自我认知水平，减少手机成瘾行为，实现学生的积极发展。

关键词 手机成瘾，心理健康，自尊，主观幸福感

The Relationship Between Mobile Phone Addiction and Mental Health among College Students: The Mediating Role of Self-esteem and Subjective Well-being

Che Hanbo [1*] (correspondent) Zhao Xiaoqi [1] Han Chong [2] Jing Tian [3]
[1] Department of Education, Liaoning Normal University, Dalian, 116029, * Corresponding author
E-mail: chbdhr@163.com

[3] College of Education Science, Shanxi Normal University, Taiyuan, 030000

Abstract： Objective: Overuse of mobile phones is common among college students. Excessive use of mobile phones by college students will lead to bad interpersonal relationships, loneliness and emptiness, which will affect their mental health. Therefore, this study will explore the influence mechanism of mobile phone addiction on mental health of college students, and provide scientific basis for the correction of mobile phone addiction, depression, anxiety, stress, self-worth and the exploration of ways to maintain mental health. Methods: In this study, 912 college students were selected, and the stratified cluster sampling method was used to conduct a questionnaire survey with the Mobile Phone Addiction Scale, Self-esteem Scale, Subjective Well-being Scale and Depression-Anxiety-Stress Scale, and the data were analyzed. The total score of effective subjects with mobile phone addiction was 58.05 and 15.34. There are 92 mobile phone addicts (10.08%), 210 smartphone addicts (23.03%) and normal mobile phone users (66.89%). There is a correlation among the variables. Based on this, the structural equation model is established. The results show that the direct effects of cell phone addiction on depression, anxiety and stress are 0.35, 0.28 and 0.07 respectively, the direct effects of self-esteem on depression, anxiety and stress are -0.32, -0.32 and -0.12 respectively, and the direct effects of subjective well-being on depression, anxiety and stress are -0.25 and-0 respectively. Self-esteem (β=-0.14,P<0.001) mediates the relationship between cell phone addiction and depression. Subjective well-being (β=-0.25,P<0.001) mediates the relationship between mobile phone addiction and depression. Subjective well-being (β=-0.33,P<0.001) mediates the relationship between college students' cell phone addiction and stress. Subjective well-being plays an intermediary role between college students' cell phone addiction and stress (β=-0.33,P<0.001). Self-esteem and subjective well-being play a chain intermediary role between college students' mobile phone addiction and depression, anxiety and stress. Suggestions: In order to improve the mental health level of college students, we should start with improving their self-esteem and subjective well-being, organize group activities, improve their self-awareness level, reduce their addiction to mobile phones, and realize their positive development.

Keywords： Mobile phone addiction, Mental health, Self-esteem, Subjective well-being

数字反哺与老年人幸福感：主动使用社交媒体与社会隔离的中介作用

袁子惠 [1,2] 张雨芒 [1,2] 史晓涵 [1,2] 杨文城 [1,2] 金斯妤 [1,2] 牛更枫 [1,2,3]（通讯作者）
1 华中师范大学心理学院，武汉，430070
2 青少年网络心理与行为教育部重点实验室，武汉，430070
3 华中师范大学网络素养与行为研究中心，武汉，430070，niugfpsy@ccnu.edu.cn

摘 要 在当前社会，老龄化趋势日益加剧，由于面临身心功能衰退，老年人往往面临更多的健康和适应问题。当前信息社会，网络成为影响人们生活质量的重要因素，但老年人由于身体和认知能力的限制，他们在信息技术的使用上处于劣势，这会给其生活适应带来消极影响，降低老年人的幸福感。研究发现，代际互动能够提升老年人的自我价值感与幸福感，是促进积极老龄化的有效手段；家庭中自下而上技术传递有利于老年人弥合数字鸿沟。有学者将这种家庭中年轻世代在数字接入、使用和素养上对年长世代的教辅行为定义为数字反哺。但数字反哺对老年人幸福感的影响机制尚不清晰。基于此，本研究探讨了数字反哺与老年人幸福感的关系及其内在机制。研究采用数字反哺问卷、社交媒体主动使用问卷、社会隔离量表、幸福感量表对 544 位老年人（男性 216 人，女性 328 人）进行调查，结果发现：（1）数字反哺能显著正向影响老年人的幸福感；（3）社交媒体主动使用和社会隔离在其中的中介作用显著，且该中介作用包含了三条中介路径——社交媒体主动使用和社会隔离的单独中介作用，以及社交媒体主动使用和社会隔离的链式中介作用。

本研究基于归属需要理论，发现数字反哺与老年人的幸福感呈正相关。当老年人能够跨越技术障碍使用社交媒体，对于归属的需要会驱动着个体进行社会互动。而社交媒体主动使用产生的积极人际互动，满足了个体归属的需要，其产生的积极情绪能提升个体的幸福感。同时，数字反哺中产生的代际互动提供的联系感和归属感会降低老年人的社会隔离感促进老年人归属需要的满足，从而提升个体的幸福感。此外，社交媒体主动使用是一种主动的社会互动行为。而社会互动是建立和巩固的社会关系纽带的重要要素。而人际之间的互动能够满足个体对于社会接触与关系的需要，降低社会隔离。

本研究为深入揭示了数字反哺对幸福感的影响及其机制，并为网络时代提升老年人的幸福感，帮助老年人跨越数字鸿沟的干预措施提供了新视角和思路。

关键词 老年人，数字反哺，幸福感，社交媒体主动使用，社会隔离

Digital Feedback and Well-being among the elderly: The Mediating Role of Active Social Media Use and Social isolation

Zihui Yuan[1,2] Yumang Zhang[1,2] Xiaohan Shi[1,2] Wencheng Yang[1,2] Siyu Jin[1,2] Gengfeng Niu[1,2,3]

1 School of Psychology, Central China Normal University, Wuhan 430079, China

2 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079, China

3 Center for Research on Internet Literacy and Behavior, Central China Normal University, Wuhan 430079, China niugfpsy@mail.ccnu.edu.cn

Abstract：In society today, the trend of population aging is becoming more pronounced. Due to physical and mental decline, often experience more health and adaptation issues. In today's information society, the internet has become a significant factor impacting people's quality of life. However, due to physical and cognitive limitations, elderly people face disadvantages in using information technology, which negatively impacts their adaptation and reduces their well-being. Bottom-up technology transfer within families can help bridge the digital divide for elderly people. Scholars define this behavior, in which the younger generation assists the older generation in digital access, use, and literacy, as "digital feedback". However, the mechanism through which digital feedback affects the well-being of elderly people is not yet clear. This study explores the relationship between digital feedback and the well-being of elderly people, as well as its underlying mechanism. The research surveyed 544 elderly people (216 males, 328 females) using questionnaires on digital feedback, active social media use, social isolation, and well-being. The results showed that: (1) Digital feedback significantly and positively

influences the well-being of elderly people. (3) The mediating effects of active social media use and social isolation are significant, including separate mediating effects and chained mediating effects.

This study, based on the theory of the need to belong, finds a positive correlation between digital feedback and the well-being of elderly people. Overcoming technological barriers and using social media enables elderly people to engage in social interactions driven by the need for belongingness. The positive interpersonal interactions resulting from proactive use of social media satisfy the need to belong and enhance individual well-being. Additionally, the sense of connection and belonging fostered by intergenerational interaction in digital feedback can mitigate the social isolation experienced by elderly people, promote their satisfaction of the need to belong, and enhance individual well-being. Furthermore, active social media use involves active social interaction behavior. Interaction is crucial in establishing and strengthening social relationships. Interactions between individuals can fulfill the need for social contact and relationships, and alleviate social isolation.

This study reveals the profound influence of digital feedback on well-being and its mechanism, and offers new perspectives and approaches to enhance the well-being of elderly people in the digital age and bridge the digital divide.

Keywords：The elderly, Digital feedback, Well-being, Active social media use, Social isolation

不确定感对大学生网络利他行为的影响：疏离感和群体认同的作用

刘志青 刘玺玉 蔡若男 谢佳雯 郑显亮（通讯作者）

赣南师范大学教育科学学院，赣州，341000，zxl2004@sina.com

摘 要 随着信息技术的快速发展，网络已经成为人们生活中不可或缺的第二空间，因此研究者们越来越关注个体在网络上的心理机制和行为反应。网络利他行为是指个体在网络环境中表现出来的有利于他人和社会、且不期望得到任何回报的自觉自愿行为。但以往的研究多集中于积极因素对网络利他行为的影响，而较少关注个体消极因素对网络利他行为的影响,尤其是缺少不确定感等相关因素与网络利他行为的研究。因此，本研究基于风险和保护因素模型，以当代大学生为研究对象，通过 3 个实验考察不确定感对网络利他行为的影响及内在机制。实验 1 为单因素被试间实验设计，采用联想范式操纵个体不确定感并结合拟真情境测量其网络利他行为水平。实验 2 在实验 1 的基础上，考察疏离感在不确定感与网络利他行为间的中介作用。实验 3 为两因素被试间设计，采用最简群体分类范式和联想范式，操纵个体不确定感(高、低)和群体认同(高、低)，考察群体认同在其中所起的作用。研究结果表明：(1)高不确定感比低不确定感诱发了更少的网络利他行为；(2)高不确定感比低不确定感产生了更多的疏离感，疏离感在不确定感和网络利他行为之间起中介作用；(3)群体认同能调节不确定感对网络利他行为的影响，具体而言，高群体认同会削弱不确定感对网络利他行为的负向影响，而低群体认同者这种趋势并不明显。本研究从群体认同的视角揭示不确定感对网络利他行为的影响及其内在机制，表明处于自我同一性混乱的个体在高群体认同水平下能做出更多的适应性行为，为今后网络行为研究提供了相应的理论依据与实证支持。

关键词 不确定感，网络利他行为，疏离感，群体认同，大学生

The Effect of Uncertainty on Undergraduate's Internet Altruistic Behavior: The Role of Alienation and Group Identity

Liu Zhiqing, Liu Xiyu, Cai Ruonan, Xie Jiawen, Zheng Xianliang (Correspondence author)
School of Education and Science, Gannan Normal University, Ganzhou, 341000,
Email: zxl2004@sina.com

Abstract：With the rapid development of information technology, the Internet has become an indispensable second space in people's lives. Consequently, researchers are increasingly concerned about the psychological mechanisms and behavioral responses of individuals on the Internet. Internet altruistic behavior refers to conscious and voluntary helping behaviors exhibited by individuals online benefiting others without expecting anything in return. However, previous studies primarily focused on the influence of positive factors on Internet altruistic behavior, while giving less attention to the impact of individual negative factors on such behavior. Particularly, limited research conducted on the correlation between factors like uncertainty and Internet altruistic behavior. Therefore, this study aims to examine the effects of uncertainty on online altruistic behavior and its underlying mechanisms using a risk and protective factor model. Three experiments were conducted with contemporary college students as research subjects. Experiment 1 utilized a single factor between-subjects experimental design, manipulating individuals' uncertainty through an associative paradigm combined with a simulated situation to measure their level of Internet altruistic behavior. Based on Experiment 1, Experiment 2 explored the mediating role of alienation between uncertainty and Internet altruistic behavior. Finally, Experiment 3 employs a two-factor between-subjects design, manipulating individual uncertainty (high and low) and group identification (high and low) using a minimalist group categorization paradigm and an associative paradigm to examine the role of group identification. The findings suggest that: (1) high uncertainty induces less Internet altruistic behavior compared to low uncertainty; (2) high uncertainty could increase alienation, which mediates the relationship between uncertainty and Internet altruistic behavior; (3) group identity moderates the effect of uncertainty on online altruistic behavior. Specifically, high group identity mitigates the negative effect of uncertainty on online altruistic behavior, whereas this tendency is not observed among low group identifiers. This study reveals the influence of uncertainty on internet altruistic behavior and its internal mechanism from the perspective of group identity, showing that individuals in self-identity disruption can make more adaptive behaviors under high levels of group identity, which provides a corresponding theoretical basis and empirical support for future research on cyber-psychology.

Keywords：Uncertainty, Internet altruistic behavior, Alienation, Group identity, university student

网络警觉与大学生拖延的关系：心智游移和正念的链式中介作用

钟丹[1,2] 范艳蓉[1,2] 尹洁滢[1,2] 徐巾巾[1,2] 周宗奎[1,2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院暨湖北省人的发展与心理健康重点实验室，武汉，400379，zhouzk@mail.ccnu.edu.cn

摘 要 随着移动互联网设备的不断发展，时空限制被打破，“永久在线、永久连接”（POPC）成为了可能。随 POPC 一同到来的，还有网络警觉。网络警觉指的是人们对网络内容时刻保持注意的心理状态，是一种心理上与网络的连接。身处网络随处可见的时代，网络警觉现象在人群中普遍存在。但是，目前仅有较少研究关注网络警觉及其影响后效。然而，网络警觉会占据人们的部分注意力，可能会对人们造成一些影响，其中，拖延行为可能是网络警觉对大学生产生的重要影响后效。而拖延不仅会阻碍大学生的学习，还会威胁其身心健康。因此，探讨网络警觉对大学生拖延的影响及其作用机制具有重要意义。本研究采用了网络警觉量表、简版一般拖延量表、简版正念注意觉知量表、心智游移量表对 855 名大学生进行了问卷

调查，探讨了网络警觉与大学生拖延的关系以及正念和心智游移在其中的链式中介作用。研究结果显示：（1）网络警觉能够显著正向预测大学生拖延；（2）心智游移能够在网络警觉与大学生拖延的关系中起到单独的中介作用；（3）正念能够在网络警觉与大学生拖延的关系中起到单独的中介作用；（4）心智游移和正念能够在网络警觉和大学生拖延间起链式中介作用。本研究揭示了网络警觉与大学生拖延的关系，还探讨了两者间的作用机制，这不仅拓展了网络警觉的相关研究，还为大学生拖延行为的有效预防和干预工作提供了一定的参考价值。

关键词　网络警觉，拖延，心智游移，正念，大学生

The effect of online vigilance on procrastination in college students: the chain mediating role of mind wandering and mindfulness

Zhong Dan[a b]　Fan Yanrong[a b]　Yin Jieying[a b]　Xu Jinjin[a b]　Zhou Zongkui[a b]

[a] Key Laboratory of Adolescent onlinepsychology and Behavior(CCNU), Ministry of Education, Wuhan 430079

[b] School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079

Abstract：With the continuous development of mobile Internet devices, time and space constraints have been broken, and "permanently online and permanently connected" (POPC) has become possible. Along with POPC came online vigilance. Online vigilance refers to the psychological state that people always pay attention to the network content, which is a psychological connection with the network. In an era where the Internet is everywhere, online vigilance is widespread among people. However, few studies have looked at online vigilance and its effects. However, online vigilance will occupy part of people's attention and may have some effects on people, among which, procrastination behavior may be an important aftereffect of online vigilance on college students. Procrastination will not only hinder college students' learning, but also threaten their physical and mental health. Therefore, it is of great significance to explore the influence of online vigilance on college students' procrastination and its mechanism. In this study, 855 college students were surveyed with the Online vigilance Scale, the Short General Procrastination Scale, the Short Mindfulness Attention Awareness Scale and the Mental Wandering Scale to explore the relationship between online alertness and procrastination of college students and the chain mediating role of mindfulness and mental wandering. The results show that: (1) Internet alertness can significantly positively predict college students' procrastination; (2) Mind wandering can play an independent mediating role in the relationship between online vigilance and procrastination of college students; (3) Mindfulness can play an independent mediating role in the relationship between online vigilance and procrastination of college students; (4) Mind wandering and mindfulness can play a chain mediating role between Internet alertness and procrastination of college students. This study reveals the relationship between online vigilance and procrastination of college students, and discusses the mechanism of action between the two, which not only expands the relevant research of online vigilance, but also provides a certain reference value for the effective prevention and intervention of college students' procrastination behavior.

Keywords：online vigilance, procrastination, mind wandering, mindfulness, college students

网络炫富信息接触与青少年攻击行为：妒忌的中介作用和贫富归因的调节作用

丁倩[1,2]　李明蔚[1]　张永欣[1]　李晓彤[1]　周宗奎[2*]（通讯作者）

1 信阳师范大学教育科学学院，信阳，464000

2 青少年网络心理与行为教育部重点实验室，武汉，430079，zhouzk@ccnu.edu.cn

摘 要　媒体信息接触对攻击行为的影响一直是一个热点研究问题，但现有的研究主要集中于暴力信息接触，对其他形式的媒体信息的作用知之甚少。由于财富不平等在世界各地日益加剧，网络炫富正成为一种普遍现象。网络炫富信息可能会影响青少年受众的心理与行为。本研究基于相对剥夺感理论，探讨了网络炫富信息接触对青少年攻击行为的影响，以及妒忌的中介作用和贫富归因的调节作用。采取方便抽样，在河南省、海南省的三个城市选择中学生 1483 名，被试平均年龄为 14.30 岁（标准差 = 1.54 岁）。被试在 15 分钟内完成了自编网络炫富信息接触问卷、妒忌量表、贫富归因问卷和青少年攻击行为量表。回归分析表明，在控制性别、年龄和主观社会阶层的条件下，网络炫富信息接触显著正向预测青少年攻击行为；妒忌在网络炫富信息接触与青少年攻击行为之间起中介作用；贫富归因调节该中介路径的前半段。具体来说，相对于低贫富外归因的青少年，该间接效应对高贫富外归因的青少年更加显著。本研究首次提出了网络炫富信息接触这一概念，并检验了网络炫富信息接触对青少年攻击行为的影响，为网络炫富信息接触影响青少年适应提供了实证依据。本研究的结果在一定程度上拓展了媒体信息接触影响攻击行为的现有结论，为未来研究提供了一些新的思考方向。

Exposure to flaunting wealth online and aggression in Chinese adolescents: Envy as mediator and attribution for the rich-poor gap as moderator

Ding Qian[1, 2], Li Mingwei[1], Zhang Yongxin[1], Li Xiaotong[1], Zhou Zongkui[2*]

1 School of Education Science, Xinyang Normal University, Xinyang 464000

2 Key laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan 430079

Abstract：The effect of media exposure on aggression has always been a trending issue, however, existing research mainly concentrated on violence exposure, little is known about other forms of media information. Since wealth inequality is increasing around the world, and flaunting wealth online is becoming a common phenomenon. Based on relative deprivation theory, this study explored the effect of exposure to flaunting wealth online on the aggression of teenagers, as well as the role of envy and attribution for the rich-poor gap. The sample consisted of 1483 adolescents with a mean age of 14.30 years (*SD* = 1.54). Participants completed anonymous questionnaires regarding exposure to flaunting wealth online, envy, attribution for the rich-poor gap, and aggression. Regression analysis in PROCESS indicated that, when controlling for gender, age and subjective social class, exposure to flaunting wealth online directly influenced aggression and also indirectly influenced aggression through the mediating effect of envy. Moreover, attribution for the rich-poor gap played a moderating role in the path of exposure to flaunting wealth online affecting envy. That is, the effect was more significant for adolescents high in

external attribution for the rich-poor gap relative to those low in external attribution. To the best of our knowledge, this study is the first to demonstrate empirical evidence for the adverse effects of exposure to flaunting wealth online. And, our findings add to extant understandings on new forms of media exposure that influence adolescent aggression.

Keywords：exposure to flaunting wealth online, envy, attribution for the rich-poor gap, aggression

基于解释性人工智能的心理健康问答感知有用性影响机制研究：精细可能性模型和数字化治疗联盟的理论视角

黄英辉[1] 董王昊[2] 周瑾宜[2] 王伟军[2]（通讯作者）

1 武汉理工大学管理学院 中国湖北省武汉市珞狮路 122 号 430070

2 华中师范大学心理学院，湖北省武汉市洪山区珞喻路 152 号，430079，wangwj@mail.ccnu.edu.cn

摘 要 近年来网络心理健康问答社区发展迅速，为公众提供了便捷、普惠且具有高度隐私保护的心理健康信息及服务。针对这种基于文本的异步心理健康问答服务的有效性和影响机制的研究尚且不足。本研究构建了一个心理健康问答情境下咨询师回答有效性的评估模型。首先，我们构建了包含 19682 条来访者求助及咨询师应答信息的问答数据集，以公众对咨询师回复的感知有用性作为咨询师问答质量的评价指标，采用适用于大规模问答文本分析的计算语言学和解释性人工智能（XAI）方法，建立咨询师回答感知有用性的可解释性预测模型；分析了求助者、咨询师及两者互动同步性三种来源的语言线索要素对回答的感知有用性的影响，并探讨了语言线索要素之间的交互效应。预测模型的性能评估结果显示，所构建的感知有用性预测模型的 RMSE 及 MAPE 值分别达到 0.8234、22.7288%。特征消融实验的结果表明，咨询师卷入度相关语言线索（回答的词数和响应时间）具有最大的预测力（R^2=0.1114），且情感联结、治疗任务一致性、治疗目标一致性等数字化治疗联盟相关语言线索能有效提高预测模型的效果。基于 SHAP 值（Shapley 可加性解释）的解释性分析结果表明，咨询师积极的情感表露、卷入度、治疗任务一致性及治疗目标一致性相关语言线索正向预测回答有效性。因果推断分析结果进一步显示，上述预测关系受到咨询师回答的词数和响应时间的显著影响。本研究利用了可解释性机器学习及因果推断方法，从精细可能性模型及数字化治疗联盟理论视角，解释并验证不同心理语言学线索在单次、异步网络心理健康问答效果的预测作用，发现了咨询师的卷入度及数字化治疗联盟相关语言线索对其回答质量的显著预测作用，验证了咨询师卷入度对数字化治疗联盟相关语言线索的异质性效应，为理解社会化问答情境下心理支持服务效果的影响机制，提高心理健康问答服务质量提供了理论和方法参考。

Abstract： The rapid development of online mental health Q&A communities provides the public with convenient, inclusive, and highly confidential mental health information and services. However, research on the effectiveness and mechanism of such text-based asynchronous mental health Q&A services is still inadequate. This study aims to construct a model to assess the effectiveness of counselors' responses in mental health Q&A scenarios. We compiled a Q&A dataset of 19,682 instances of helpseekers' inquiries and counselor responses, and used the perceived helpfulness of counselor responses as the evaluation for the quality of the counselor's response. We employed computational linguistics, machine learning, and causal inference methods suitable for large-scale Q&A text analysis to establish an interpretable predictive model for the perceived usefulness of counselors' responses. We analyzed the influences of help seekers, counselors, and the synchronicity of their interactions, as well as three types of language cues - Linguistic Inquiry and Word Count (LIWC), interaction synchronicity, and peripheral cues - on the perceived usefulness of the responses, and explored the interactive effects among these language cues. The performance of our predictive model showed that the Root Mean Square Error (RMSE) and Mean Absolute Percentage Error (MAPE) of the constructed perceived usefulness predictive model were 0.8234 and 22.7288% respectively. The results of the feature ablation indicated that the language cues related to counselor involvement had the greatest predictive power（R^2=0.1114）, and the language cues related to emotional connection, therapeutic task consistency, and therapeutic goal consistency associated with the digital therapeutic alliance could effectively improve the effectiveness of the predictive model. The analysis results based on Shapley Additive Explanations (SHAP) values further demonstrated a positive prediction of answer effectiveness by the language cues related to counselor involvement and emotional connection, therapeutic task consistency, and therapeutic goal consistency. Causal inference analysis results showed that the aforementioned predictive relationships are significantly influenced by the counselor's word count and response time difference. This research leverages explainable artificial intelligence methods to interpret and validate the predictive roles of various psycholinguistic cues in single-instance, asynchronous online mental health Q&A, from the perspectives of elaboration likelihood model and digital therapeutic alliance theory. It has found the significant predictive roles of counselor involvement and digital therapeutic alliance-related language cues on the Q&A quality, verified the heterogeneous effects of counselor involvement on digital therapeutic alliance-related language cues, providing theoretical and methodological references for understanding the mechanisms of influence on the effectiveness of psychological support services in social Q&A scenarios and improving the quality of mental health Q&A services.

小学生短视频观看及其影响的潜在转变分析：一项纵向研究

石晶晶[1,2,3]　刘勤学[1,2,3]（通讯作者）
1 青少年网络心理与行为教育部重点实验室，武汉，430079
2 华中师范大学心理学院，武汉，430079
3 人的发展与心理健康湖北省重点实验室，武汉，430079，qinxueliu@ccnu.edu.cn

摘 要　在当今短视频浪潮中，认知发展尚不完善的小学生比较容易接触到大量短视频并受其影响。

与更新换代较快的网络热词具有异曲同工之处，由于短视频简短且多样化、浓缩且碎片化和吸引力强的特点，小学生观看短视频的模式也可能随之发生转变，探究这一转变对于小学生的成长发展具有深刻价值。为了探讨我国小学生短视频观看模式、转变特点及其影响。本研究通过基于以个体为中心的潜在转变分析方法，采用基于内容的短视频曝光量表等工具对 2820 名 4 至 6 年级小学生进行间隔一年的两时间点追踪施测。主要结果如下：（1）小学生短视频观看可以分成三种类别：高短视频观看、亲社会短视频观看和低短视频观看。（2）小学生短视频观看类别在不同类别中的稳定程度和转变模式不同。近七成的高观看类别和亲社会短视频观看类别保持稳定，而仅有二成的低观看类别保持稳定。从 T1 到 T2，低观看类别呈现出两种转变模式，近五成向亲社会类别转变，近三成向高观看类别转变。此外，从 T1 到 T2，近三成的高观看类别和亲社会类别相互转变。（3）小学生短视频观看对认知、学业和心理健康发展具有持续稳定影响。高短视频观看类别最不利于小学生的认知、学业和心理健康发展，亲社会短视频观看类别最有利于小学生的成长发展。本研究为教育工作者如何正确对待短视频在儿童成长中扮演的角色提供了进一步启示，并为未来有效预防和干预奠定了实证基础，总的来说，在儿童短视频观看行为的发展转变中，教育工作者要格外关注低短视频观看类别，督促儿童把握好方向。

Latent Transition Analysis of Short Video Viewing and effects among Chinese Primary School Students: A Longitudinal Study

Jingjing Shi[1,2,3,], Qinxue Liu[1,2,3,*]

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079, China

2 School of Psychology, Central China Normal University, Wuhan 430079, China

3 Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079, China

Abstract：In today's wave of short videos, primary school students with incomplete cognitive development are more likely to be exposed to and influenced by a large number of short videos. It is similar to the online hot words that have been updated quickly. Because of the characteristics of short videos, which are fragmented but condensed content, and short but diversified experience, and attractive, the mode of primary school students viewing short videos may also change. It is of profound value to explore this change for the growth and development of primary school students. In order to explore the short video viewing patterns, transformation characteristics and influence of primary school students in China. In this study, based on the personal-centered latent transition analysis, 2,820 primary school students from grade 4 to grade 6 were tested at two time points separated by one year by using content-based short video exposure scale and other measurements. The main results are as follows: (1) Primary school students' short video viewing can be divided into three classes: high short video viewing, prosocial short video viewing and low short video viewing. (2) Primary school students' short video viewing classes have different stability and transition patterns in different classes. Nearly 70% of the high viewing class and prosocial short video viewing class remain stable, while only 20% of the low viewing classes remain stable. From T1 to T2, the low viewing class showed two different transformation patterns, nearly 50% turned to the prosocial viewing class, and nearly 30% turned to the high viewing class. In addition, from T1 to T2, nearly 30% of the high viewing class and prosocial class changed with each other. (3) Primary school students' short video viewing has a sustained and stable influence on the development of cognitive, academic and mental health. The high short video viewing class is the most unfavorable to the cognitive, academic and mental health

development of primary school students, while the prosocial viewing class is the most beneficial to the growth and development of primary school students. This study provides further enlightenment for educators on how to correctly treat the role of short videos in children's growth, and lays an empirical foundation for effective prevention and intervention in the future. Generally speaking, in the development and transformation of children's short video viewing behaviors, educators should pay special attention to the low short video viewing class and help children to control the direction.

经过提示的 ChatGPT 能否实现有效的情感支持？基于机器学习的探索性研究

董王昊[1] 黄英辉[2] 周瑾宜[1] 王伟军[1]（通讯作者）
1 华中师范大学心理学院，湖北省武汉市洪山区珞喻路 152 号，430079，wangwj@mail.ccnu.edu.cn
2 武汉理工大学管理学院 湖北省武汉市洪山区珞狮路 122 号 430070

摘 要 情感支持(Emotional Support)旨在减少情感困扰，帮助求助者理解并克服所面临的挑战。人工智能能否为人类提供情感支持，是长久以来备受关注的话题。ChatGPT 是当前最具影响力的生成式人工智能，其突出的语言输出能力和前后文结合能力使得 AI 情感支持成为可能。本研究以 ChatGPT 为对象，通过设定专门的提示策略，发掘与验证其在情感支持中的能力。**研究一**：聚焦心理健康问答情景，目的在于探讨 ChatGPT 在单轮对话中的情感支持能力。基于由 10903 提问和 19682 回答组成的数据集，构建心理健康问答感知有用性的预测模型；通过特征敏感性分析及解释性机器学习方法，建立感知有用性的解释性模型，以识别影响感知有用性的关键性性语言线索及其影响方式，进而制定提示策略；然后采用统计分析方法比较提示之后的 ChatGPT 与人类咨询师在心理健康问答中的感知有用性。结果显示：在严重风险和中度风险问题上，提示后的 ChatGPT 达到了"人类咨询师"的平均水平（$p > 0.05$）；而对于低风险和无风险问题，提示后的 ChatGPT 已经超过了"人类咨询师"的平均水平（6.80%和 4.63%, $p < 0.001$）。**研究二**：聚焦基于文本的线上咨询情景，目的在于探讨 ChatGPT 在多轮对话中的情感支持能力。以一个公开发表的，经过人工标注的，包含 1300 个案例的情感支持会话数据集为研究材料。利用基于深度学习的自然语言处理模型（BERT-Integrated Attention LSTM Model，BIALM），建立会话策略预测模型和情绪强度预测模型。前者可对 ChatGPT 进行针对性会话策略提示，后者可用以评估 ChatGPT 会话的有效性。然后对提示后的 ChatGPT 和人类专家的情感会话有效性进行分析比较。结果发现：经过会话策略提示的 ChatGPT 的表现显著高于人类咨询师的平均水平（13.25%, $p < 0.001$）。最后，还对 ChatGPT 在不同问题类型上的表现进行了对比与探讨，并指明了存在的不足以及未来展望。总体上，本研究以计算社会科学为导向，初步证实了 ChatGPT 的情感支持能力，为 AI 在心理健康领域的运用提供了有力支持。

Abstract: Emotional support aims to alleviate emotional distress and assist individuals in understanding and overcoming the challenges they face. Whether artificial intelligence can provide emotional support to humans has been a long-standing and widely debated topic. ChatGPT, the most influential generative AI model, possesses remarkable language output and context comprehension capabilities, making AI emotional support feasible. The current research focuses on ChatGPT and employs specially designed prompt strategies to explore and validate its ability to provide emotional support. Study 1: Focusing on the context of mental health Q&A, aims to explore the emotional support capabilities of ChatGPT in single-turn dialogues. A predictive model for perceived usefulness is constructed based on datasets comprising 10,903 questions and 19,682 answers. Feature sensitivity analysis and explainable machine learning (XML) methods are employed to establish an interpretable model for perceived usefulness. This model identifies key linguistic cues and their impact on perceived usefulness, enabling the formulation of prompt strategies. Afterward, statistical analysis was employed to compare the perceived usefulness of prompted ChatGPT with that of human counselors. The results indicate that for high- and moderate-risk questions, prompted ChatGPT reaches the average level of "human counselors" ($p > 0.05$). However, for low- and no-risk questions, prompted ChatGPT even surpasses the average level of "human counselors" (6.80% and 4.63%, $p < 0.001$) in terms of perceived usefulness. Study 2: Focusing on the context of text-based online counseling, aims to explore the emotional support capabilities of ChatGPT in multi-turn dialogues. The research material consists of publicly available, manually annotated emotional support conversation datasets containing 1300 cases. Using a deep learning-based natural language processing model (BERT-Integrated Attention LSTM Model, BIALM), we establish two predictive models: a session strategy prediction model and an emotion intensity prediction model. The former is utilized to provide targeted session strategy prompts to ChatGPT, while the latter is employed to evaluate the effectiveness of ChatGPT's sessions. Subsequently, an analysis and comparison are performed on the emotional conversation effectiveness of prompted ChatGPT and human counselors. The results indicated that prompted ChatGPT's performance significantly surpasses the average level of human counselors (13.25%, $p < 0.001$) regarding emotional conversation effectiveness. Finally, the performance of ChatGPT on different question types is also compared and discussed, and deficiencies as well as future perspectives are indicated. Overall, driven by computational social science, our study has provided preliminary evidence of ChatGPT's emotional support capabilities, offering substantial support for the application of AI in the field of mental health.

亲子的手机干扰感知差异对儿童手机成瘾的影响：以人为中心的视角

宋君瑶 [1,2,3]　刘勤学 [1,2,3]（通讯作者）
1 青少年网络心理与行为教育部重点实验室，武汉，430079
2 华中师范大学心理学院，武汉，430079
3 人的发展与心理健康湖北省重点实验室，武汉，430079，qinxueliu@ccnu.edu.cn

摘 要　随着数字技术深入人们的日常生活，儿童的行为塑造和发展等受到了信息技术环境的广泛而深刻的影响。从社会生态学的视角来看，家庭因素如父母自身的手机使用行为等会直接影响儿童对电子设备和网络技术的态度与行为。然而已有研究发现，父母和孩子对这类行为及其影响产生的主观感知并不相

同。因此为了探讨家长和儿童在亲子互动中手机干扰的感知差异性以及这种差异性可能带来的影响，本研究采用了潜在剖面分析方法，将 878 对（$N_{男}$=449，占比 51.1%；M_{age}=9.99 岁，SD_{age}=0.77）亲子所报告的亲子互动中的手机干扰作为整体进行分类，并且比较了不同类型的感知差异组与儿童手机成瘾的关系。研究结果发现：1）亲子感知到的手机干扰组合存在四种潜在类别：家长高估组（家长感知水平高，孩子感知水平较低；28.7%）、家长低估组（家长感知水平低，孩子感知水平较高；11.0%）、低手机干扰组（亲子感知水平均较低；51.2%）、高手机干扰组（亲子感知水平均较高；9.2%）；2）不同组别的儿童手机成瘾水平存在显著性差异，高手机干扰组的儿童在当时以及一年后的手机成瘾水平最高，家长低估组的儿童手机成瘾水平显著高于低科技干扰组，而家长高估组和低手机干扰组在两年的手机成瘾水平测验中均无显著性差异。结果表明，亲子互动中的手机干扰感知差异会影响儿童手机成瘾水平。本研究采用以人为中心的视角，运用潜在剖面分析方法探究了亲子间手机干扰感知差异的潜在类别，为手机干扰领域拓展新的研究内容；同时本研究验证了手机干扰感知差异对儿童手机成瘾的影响，为维护未成年人健康使用手机提供了家庭层面的教育启示。

The influence of parent-child perception of mobile phone interference on children's mobile phone addiction: Insights from the Person-Centered Approach

Junyao Song[1,2,3,] Qinxue Liu [1,2,3,*]

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079, China

2 School of Psychology, Central China Normal University, Wuhan 430079, China

3 Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079, China

Abstract：As digital technology seeps into our daily lives, children's shaping behavior and development are widely and profoundly affected by the information-technology environment. According to social ecology, family elements such as parents' smartphone using behavior will directly affect children's attitudes and behaviors towards electronic devices and Internet technology. However, a substantial body of previous work has shown that there has a big different perceptions of such behaviors and its effects between parents and children have perceived. So we gathered a couple of 878 children-parent data (N_{boy}=449, 51.1%, M_{age}=9.99, SD_{age}=0.77) to investigated the parents-child perception difference of smartphone interference in interaction and the subsequent effects.The latent profile analysis was used for data analysis.

Results indicated that: 1) Latent profile analysis revealed 4 profiles of perceptional discrepancy. Profile 1, Parental overestimation group (parents reported higher level of Parent-child smartphone interference while child reported the lower level ） representing 28.7% of samples; Profile 2, Parental underestimation group (parents reported lower level of Parent-child smartphone interference while child reported the higher level ） representing 11.1% of samples; Profile 3, Low-interference group (both parents and child reported low level of Parent-child smartphone interference ） representing 51.2% of samples; Profile 4, High-interference group (both parents and child reported high level of Parent-child smartphone interference ） representing 9.2% of sample. 2)There were significant differences in the level of mobile phone addiction among different groups. Children in the High-interference group had the highest level of mobile phone addiction at that time and one year later; Children

in the Parental underestimate group reported a significantly higher level of mobile phone addiction than those in Low-interference group, while there was no difference between the Parental overestimation group and the Low-interference group in the two-year mobile phone addiction level test.

From the insights of the Person-Centered Approach, we explored profiles of perceptional discrepancy in parent-child smartphone interference by using latent profile analysis, which expanded new research content in the field of mobile phone interference. At the same time, this study focused on the influence of perceptional discrepancy in parent-child smartphone interference on children's mobile phone addiction, and provided a family-level education enlightenment for the maintenance of children's healthy use of mobile phones.

通用人工智能理论支持下抑郁症的心理学标记物识别

刘凯

渤海大学大学教育科学学院，锦州，121003，ccnulk@ccnu.edu.cn

摘 要　抑郁症病因始终是精神医学界和心理咨询界的共同关注重点和难点，但抑郁症的病理学机制至今不明，成为提升社会福祉的巨大挑战。作为人工智能领域近年迅速崛起的一支新生力量，通用人工智能（AGI）将人的大脑视为物理世界与主观精神世界影响的偶合体，认为生理和精神两个层面都存在诱发精神障碍症状的理论可能性。意味着也可能存在心理学标志物：在心理健康层面，精神问题的行为学症状表现也许与个体不良经验所构成的心理拓扑结构有关，从而衍生出某种特异性的稳定抽象结构。因此，假设抑郁个体主观精神世界中存在由其负性经验构成的心理拓扑结构——负性事件内联网络结构（即所谓“心结”），认为这是抑郁的心理病理学层面的关键致病因素。

本研究以抑郁症心理学病因探索为科学问题，以挖掘负性事件内联结构及其与抑郁程度的关系为目标。结合复杂网络分析方法，自编和开发负性事件内联结构测量问卷及移动程序后：首先，进行预实验，对程序的可使用性进行初步检验，并且初步提取内联结构要素。在此基础上，对负性事件内联结构理论假设和测量程序进行进一步完善。继而，进行抑郁与负性事件内联结构测量，并将实验组抑郁被试与对照组非抑郁被试的负性事件内联结构要素进行比较分析。最后，对抑郁的连续发展特征进行研究。

得到如下结论：

（1）负性事件内联结构 9 个关键指标析取成功，每个指标在非抑郁组与抑郁组均差异显著。

（2）最长闭合环代表指标，可作为一种心理学标志物预测抑郁发生。

（3）负性事件内联结构要素在连续不同严重程度抑郁组别间的差异，尽管并未全部达到统计显著，却初步印证了抑郁强度具有从“正常”到“疾病”更为宽广的的连续谱发展态势。

总体而言，当前心理健康问题需要重视，本研究发现不仅为抑郁的心理学标志物探索提供初步的测量与量化标准，也能为抑郁症的病理学研究提供新的理论思路及新的心理学诊断手段。

Identification of Psychological Markers for Depression Supported by General Artificial Intelligence Theory

Liu Kai

Department of Educational Science, Bohai University, Jingzhou 121013, China

***Abstract*：** The etiology of depression has long been a major concern and challenge in the fields of psychiatry and psychological counseling. Despite ongoing research, the underlying pathophysiology of depression remains unclear, presenting a significant obstacle to improving social welfare. In recent years, Artificial General Intelligence (AGI) has emerged as a rapidly growing force in the field of artificial intelligence. AGI views the human brain as a coupling between the physical world and the subjective spiritual world, suggesting that there may be a theoretical possibility of inducing mental disorder symptoms at both physiological and psychological levels. This implies that there may also be psychological markers for depression: at the level of mental health, behavioral symptoms of mental problems may be related to an individual's psychological topological structure, which is formed by their negative experiences. This structure may give rise to specific, stable abstract structures.

It is hypothesized that depressed individuals have a psychological topological structure in their subjective spiritual world that is composed of negative experiences - referred to as the negative event internal network structure or "knots" - which is considered to be a key pathogenic factor at the psychological level of depression. This study aims to explore the relationship between negative event internal linkage structures and depression levels, with the goal of shedding light on the psychological etiology of depression. Using complex network analysis methods and self-developed measurement questionnaires and mobile programs for negative event internal linkage structures, the study first conducted pre-experiments to test the usability of the program and extract internal linkage structure elements. Based on these results, the theoretical hypothesis and measurement program for negative event internal linkage structures were further refined. Depression and negative event internal linkage structures were then measured and compared between depressed subjects in the experimental group and non-depressed subjects in the control group. Finally, the continuous development characteristics of depression were studied.

The study yielded several key findings: (1) Nine key indicators of negative event internal linkage structures were successfully analyzed, with each indicator showing significant differences between non-depressed and depressed groups. (2) The longest closed loop representative indicator can serve as a psychological marker for predicting the onset of depression. (3) While not all differences between elements of negative event internal linkage structures in continuous groups with varying severity levels of depression reached statistical significance, initial results suggest that depression intensity follows a broader continuous spectrum development trend from "normal" to "disease".

In conclusion, addressing current mental health issues is of utmost importance. The findings of this study provide not only preliminary measurement and quantification standards for exploring psychological markers for depression but also offer new theoretical insights and diagnostic tools for pathological research on depression.

摘 要　近年来，内感受成为心理健康和精神健康领域的前沿研究方向。最近的具身认知理论同时也提出，情绪感知和情绪决策涉及到与情绪相关的对躯体内脏的感知和运动经验的重新唤起。因此，内感受作为大脑对自身身体的重要觉知过程，被认为能够直接影响情绪加工。另一方面，从临床实践上看，越来越多的临床证据标明，患有抑郁、焦虑、创伤后应激障碍、物质成瘾以及精神类疾病的个体出现情绪体验与加工异常的同时，往往伴随着内感受能力的受损。常用的抗抑郁药物被发现具有特异性的内感受调控的效果。诸多心理治疗技术，比如惊恐性障碍的内感受暴露疗法和正念训练均能直接影响内感受信息加工。以内感受为靶向目标的干预技术正成为心理疾病治疗的全新探索路径。

我们在研究一选取 40 名具有高、低述情障碍分数精神分裂症患者，采用基于心跳周期的情绪识别任务，探讨情绪识别是否为内感受影响述情障碍核心心理机制。研究二中，我们通过大样本的问卷调查，分别探究在成瘾人群、普通健康人群中内感受与情绪调节的关联。

研究一的结果发现，情绪识别在内感受影响述情障碍之间起到中介作用，内感受能力受损导致患者情绪识别能力出现缺陷，进一步导致述情障碍发生。研究二发现，药物成瘾者（n = 623）的内感受意识水平与情绪调节困难水平显著负相关(r = -0.122, p = 0.002)；在一较大样本的健康群体中(n = 1500)，内感受意识（MAIA）与认知重评得分显著正相关(r = 0.574, p < 0.001),在另一样本健康人群中(n = 553)，我们同样验证了，情绪调节（CERQ）与内感受能力的显著正相关（MAIA: r = 0.344, p < 0.001; BPQ: r = 0.481, p < 0.001）。这些结果证实了内感受与情绪加工之间的关系，同时也为未来以内感受为靶向目标的干预技术提供了依据。

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100101

Abstract：In recent years, interoception has emerged as a cutting-edge research direction in the fields of psychological and mental health. The recent theory of embodied cognition has also proposed that emotion perception and emotional decision-making involve the reactivation of emotion-related perceptions of visceral sensations and motor experiences. Therefore, as an important self-awareness process of the brain regarding one's own body, interoception is believed to directly influence emotional processing. On the other hand, from a clinical perspective, increasing clinical evidence indicates that individuals suffering from depression, anxiety, post-traumatic stress disorder, substance addiction, and other mental disorders often experience abnormal emotional experiences and processing, accompanied by impaired interoceptive abilities. Commonly used antidepressant drugs have been found to have specific effects on interoceptive regulation. Various psychological therapies, such as interoceptive exposure therapy for panic disorders and mindfulness training, can directly affect the processing of interoceptive information. Interventions targeting interoception are becoming a novel exploration path in the treatment of psychological disorders.

In our first study, we selected 40 schizophrenic patients with high and low levels of alexithymia scores and used a heartbeat-based emotion recognition task to investigate whether emotion recognition serves as a core psychological mechanism affected by interoception in alexithymia. In the second study, we conducted a large-scale questionnaire survey to explore the association between interoception and emotion regulation in both addiction and general healthy populations.

The results of the first study revealed that emotion recognition plays a mediating role in the relationship

between interoception and alexithymia. Impaired interoceptive ability led to deficient emotion recognition, which further contributed to the development of alexithymia. In the second study, we found a significant negative correlation between interoceptive awareness and emotion regulation difficulties in drug addicts (n = 623) (r = -0.122, p = 0.002). In a large sample of healthy individuals (n = 1500), we observed a significant positive correlation between interoceptive awareness (MAIA) and cognitive reappraisal scores (r = 0.574, p < 0.001). In another sample of healthy participants (n = 553), we similarly confirmed a significant positive correlation between emotion regulation (CERQ) and interoceptive abilities (MAIA: r = 0.344, p < 0.001; BPQ: r = 0.481, p < 0.001). These findings confirm the relationship between interoception and emotional processing while providing a basis for future interventions targeting interoception.

内感受的测量及其与情绪健康的关系

闫俊利[1]　张雨晴[1]　吴琼[1]（通讯作者）

1 首都师范大学，北京，100048，qwu@cnu.edu.cn

摘 要　内感受(interoception)是指神经系统（中枢和外周）对身体内部信号（如心跳、呼吸、内脏等）的加工。内感受和情绪加工、感知以及调节之间的关系密切，内感受加工缺陷可能会导致包括焦虑抑郁等情绪问题的发生。已有研究表明，内感受意识可以预测特质焦虑，较高的抑郁水平对应较差的心跳内感受能力，具有良好内感受准确性的个体通常更易调节负性情绪。Wu et al.(2021)提出正念训练可以通过增强个体内感受注意有效降低负性情绪水平，因此对内感受的训练和干预有助于我们缓解负性情绪，并提升心理健康。

Garfinkel 内感受三维模型将内感受分为内感受准确性、内感受敏感性和内感受意识三个维度。本研究基于该模型比较呼吸内感受和心跳内感受在各维度内及维度间的关系，进而分析它们在预测负性情绪中的作用，其中，内感受准确性通过呼吸延迟探测任务(breath-delay detection task, BDT)和心跳探测任务(heartbeat detection task, HDT)来客观测量，BDT 要求个体分辨呈现的呼吸曲线与自身真实呼吸节律相比是否同步，HDT 要求个体分辨跳动圆圈与自身真实心跳频率相比是否同步，内感受敏感性通过自信心评分以及内感受准确度量表(IAS)、内感受注意量表(IATS)和身体知觉问卷中的身体觉察子量表(BPQ-A)三个量表进行测量，内感受意识通过信号检测论来计算内感受准确性和信心评分之间对应关系来量化。情绪健康的指标使用状态特质焦虑量表(STAI)，贝克抑郁自评量表(BDI-13)和正性负性情绪量表(PANAS)。本研究假设：1）BDT 在内感受三维度以及维度间关系上的表现均优于 HDT；2）相较于心跳内感受，呼吸内感受能够更好地预测负性情绪。

主要研究结果如下：1）BDT 三维度间存在显著的相关关系，其内感受敏感性、内感受意识维度均可预测内感受准确性，HDT 则不存在这样的对应关系；2）相较于心跳内感受，呼吸内感受能够更好地预测负性情绪，其中对焦虑情绪的预测效果最佳。这些结果表明 BDT 能够有效而可靠的客观测量内感受加工，并且能够较好的预测负性情绪，这为进一步阐明不同内感受通道与情绪或精神疾病之间的关系奠定基础，同时也为回答内感受与情绪之间的相互作用机制提供可能。

Measurement of Interoception and Its Relationship with Emotional Well-being

Junli Yan[1] Qingyu Zhang[1]. Qiong Wu[1]
1 School of Psychology, Capital Normal University

Abstract：Interoception refers to the processing of internal bodily signals (such as heartbeat, breathing, and visceral sensations) by the central and peripheral nervous systems. There is a close relationship between interoception and the processing, perception, and regulation of emotions. Deficits in interoceptive processing may contribute to the occurrence of emotional problems, including anxiety and depression. Existing research indicates that interoceptive awareness can predict trait anxiety, and higher levels of depression are associated with poorer heartbeat interoceptive abilities. Individuals with better interoceptive accuracy are generally more adept at regulating negative emotions. Wu et al. (2021) proposed that mindfulness training can effectively reduce levels of negative emotions by enhancing individual attention to interoception. Therefore, training and interventions targeting interoception can help alleviate negative emotions and improve psychological well-being.

Garfinkel's three-dimensional model of interoception categorizes interoception into three dimensions: interoceptive accuracy, interoceptive sensitivity, and interoceptive awareness. This research study was based on this model and aimed to compare the relationships between breath-related interoception and heartbeat-related interoception within each dimension and between the dimensions. Additionally, the study sought to analyze their roles in predicting negative emotions. To objectively measure interoceptive accuracy, the study used the Breath-Delay Detection Task (BDT) and the Heartbeat Detection Task (HDT). In the BDT, individuals were asked to discern whether the presented breathing curves were synchronous with their actual breathing rhythm. In the HDT, individuals were asked to discern whether the displayed pulsating circles were synchronous with their actual heartbeat frequency. Interoceptive sensitivity was measured by confidence ratings, the Interoceptive Accuracy Scale (IAS), the Interoceptive Awareness Attention Scale (IATS), and the Body Perception Questionnaire (BPQ-A). Interoceptive awareness was quantified using signal detection theory to calculate the correspondence between interoceptive accuracy and confidence ratings. The indicators of emotional well-being used in the study were the State-Trait Anxiety Inventory (STAI), the Beck Depression Inventory-13 (BDI-13), and the Positive and Negative Affect Schedule (PANAS). The research hypotheses are as follows: 1) BDT will outperform HDT in terms of performance within each of the three dimensions of interoception and in their relationships between dimensions. 2) Compared to heartbeat-related interoception, breath-related interoception will better predict negative emotions.

The main findings of the research are as follows: 1) There were significant correlations between the three dimensions of the BDT. Both interoceptive sensitivity and interoceptive awareness dimensions could predict interoceptive accuracy. However, such corresponding relationships did not exist in the HDT. 2) Compared to heartbeat interoception, breath interoception was more effective in predicting negative emotions, with the best predictive effect seen for anxiety emotions. These results suggest that BDT is a reliable and effective objective measure of interoceptive processing. Moreover, it could better predict negative emotions, particularly anxiety. These findings laid the foundation for further understanding the relationships between different interoceptive domains and emotions or mental disorders. They also offer potential insights into the mechanisms of interaction between interoception and emotions.

心脑活动的双向交互-基于脑磁图的研究

张剑锋[1]，张艺卉[2]，秦鹏民[3]
1 脑疾病与认知科学研究中心，心理学院，深圳大学，深圳，518000，zhangjianfeng@szu.edu.cn

2 心理学院，华南师范大学，广州，510655
3 琶洲实验室，广州，510655

摘 要 引言：本研究的主要目标是探究内部心跳引发的脑活动与外部刺激之间如何交互的神经机制。理解这种交互机制对于理解心跳诱发活动的神经和功能意义至关重要。

方法：为了深入研究心跳引发的反应（HERs）与外部刺激（自我名词：SON）之间的相互作用，我们设计并进行了两个实验。在第一个实验中，我们的目标是确定 SON 的呈现是否能够调节 HERs。在第二个实验中，我们探索了自发 HERs 如何影响对 SON 的判断。

结果：实验结果显示了 HERs 和 SON 之间可双向交互。这两种交互作用在空间和时间模式上存在显著差异，表明涉及不同的神经通路。重要的是，我们的发现表明 HERs 和 SON 之间的相互作用无法通过听觉诱发反应、心脏活动或皮层兴奋性的变异来解释。

讨论：我们的研究结果对于加深我们对 HERs 和外部刺激（尤其是 SON）相互作用的神经机制的理解具有重要意义。值得注意的是，SON 对 HERs 的调节发生在 T 波后约 300 毫秒的时间点。相比之下，刺激前的 HERs 对 SON 的判断影响发生在更早的时间点，即 T 波后约 165 毫秒。此外，我们的空间分析显示，SON 引发的 HERs 调节主要出现在左侧颞顶联合区（TPJ），而与 SON 判断相关的前刺激 HERs 的差异主要出现在右侧 TPJ。

这些发现强调未来的研究需要更多关注调节 SON（以及其他刺激）对心跳引发的脑活动在不同信息处理阶段的影响。这些研究对于加深我们理解内感受相关活动如何影响我们的情绪与认知具有重要作用。

总结：我们的研究提供了有力的证据，表明个体自己的名字具有调节心跳引发的神经活动的能力，从而影响对自我的判断。两种相互作用所呈现的不同时间和空间模式，凸显了 HERs 和 SON 之间相互作用的复杂性。本研究显著推进了我们对心跳引发的脑活动在 SON 处理中的作用的理解，并引入了探索与外部刺激知觉的神经机制相关的新途径。这些发现为进一步研究人类大脑中内部和外部刺激之间如何交互提供了一定的启示。

Dual interaction between heartbeat-evoked responses and stimuli

Jianfeng Zhang [a], Yihui Zhang [b], Pengmin Qin [b, c]

[a] Center for Brain Disorders and Cognitive Sciences, School of Psychology, Shenzhen University,Shenzhen,China

[b] Key Laboratory of Brain, Cognition and Education Sciences, Ministry of Education; School of Psychology, Center for Studies of Psychological Application, and Guangdong Key Laboratory of Mental Health and Cognitive Science, South China Normal University, Guangzhou, China

[c] Pazhou Lab, Guangzhou, China

***Abstract*:**

Introduction:

In our study, our primary objective was to investigate the intricate neural mechanism underlying the interaction between internal heartbeat-evoked brain activity and external auditory stimuli, with a specific focus on a subject's own name (SON). Understanding this interaction is of utmost importance as SON plays a significant role in daily social communication and serves as a valuable indicator for detecting altered brain function in mental disorders and disorders of consciousness.

Methods:

To delve into the interaction between heartbeat-evoked responses (HERs) and SON, we designed and conducted two experiments employing rigorous methodologies. In the first experiment, our aim was to determine whether the presentation of SON could modulate HERs. In the second experiment, we sought to investigate the intriguing possibility of spontaneous HERs influencing the judgment of SON.

Results:

The outcomes of our experiments revealed a compelling dual interaction between HERs and SON. These interactions exhibited notable disparities in both spatial and temporal patterns, indicating the involvement of distinct neural pathways. Importantly, our findings established that the observed interactions between HERs and SON could not be accounted for by trial-by-trial variation in auditory-evoked response, cardiac activity, or cortical excitability.

Discussion:

The implications of our findings extend the current understanding of the neural mechanisms that underlie the intricate interaction between HERs and external stimuli, particularly SON. Notably, the modulation of HERs by SON was found to occur at approximately 300 ms after the T peak. In contrast, the influence of prestimulus HERs on SON judgment manifested in a much earlier period, approximately 165 ms after the T peak. Furthermore, our spatial analysis revealed that the SON-induced modulation of HERs was predominantly localized at the left temporoparietal junction (TPJ), whereas the disparities in prestimulus HERs associated with SON judgment were primarily observed in the right TPJ.

These novel findings underscore the need for future studies to devote increased attention to investigating the modulation of SON (as well as other stimuli) on heartbeat-induced brain activity at different information processing stages. Such investigations hold potential for enhancing our understanding of the neural mechanisms underlying perception and have promising implications for deciphering the neural processes of patients with mental disorders.

In conclusion, our study provides compelling evidence that a subject's own name has the capacity to modulate the neural activity of heartbeats, thereby exerting an influence on the judgment of SON. The distinct temporal and spatial patterns observed in the two types of interaction highlight the complexity of the interplay between HERs and SON, significantly advancing our understanding of the role of heartbeat-evoked brain activity in the processing of SON and introducing a new avenue for exploring the neural mechanisms associated with the perception of external stimuli. These findings pave the way for further investigations aimed at unraveling the intricate relationship between internal and external stimuli in the human brain, ultimately contributing to our knowledge of cognition and brain function.

慢呼吸调控焦虑情绪的作用：基于电生理的证据研究

罗倩[1] 位东涛[1*] 邱江[1*]

1 西南大学心理学部，重庆，400715

*通讯作者：位东涛:dongtao@swu.edu.cn；邱江：qiuj318@swu.edu.cn

摘 要 冥想和其他放松技巧都强调呼吸控制的重要性，以往研究发现慢呼吸可以通过增加副交感神经的活动水平影响身体内部器官的活动，从而降低压力或应激水平。基于动物的研究发现，慢呼吸不仅可以影响副交感神经系统，也能直接作用于大脑本身。焦虑是一种身心交互的疾病，表现为对未来不确定事件的过度担忧和自主神经系统的紊乱，已有研究发现焦虑水平与呼吸频率的关系。慢呼吸调节自主神经系统的活动的作用，为焦虑情绪的调节提供了可行的调控途径。尽管慢呼吸可以有效调节压力等情绪，但对慢呼吸调节焦虑情绪的心理和神经生理机制缺乏系统探究。

本研究在实验情境下探讨慢呼吸对焦虑情绪的调节作用，并揭示慢呼吸调控焦虑情绪的心理和神经生理机制。具体来说本研究将有节奏的呼吸任务与情绪预期任务相结合，探究慢呼吸调控焦虑情绪的作用，并通过频域和时频域的分析方法探究慢呼吸的神经活动特征，以及慢呼吸调控焦虑情绪的神经机制。27 名健康大学生参与实验，采用 2(呼吸频率:快呼吸，慢呼吸)×2(确定性：确定，不确定)被试内实验设计。实验任务包括两个阶段：呼吸练习阶段、情绪预期阶。在呼吸练习阶段依照指导音频进行呼吸，在情绪预期阶段以不确定线索诱发被试的焦虑情绪，并在观看负性刺激后进行效价和唤醒度评分。研究结果发现：（1）慢呼吸有效的降低了被试的焦虑情绪；与快呼吸条件相比，在慢呼吸条件下观看负性图片后所反应的效价和唤醒度水平更低。（2）慢呼吸增加了全脑的神经振荡活动；与快呼吸条件相比，慢呼吸条件下全脑 delta、theta、alpha 波段的功率值更高。（3）慢呼吸对焦虑情绪的神经振荡活动产生了显著的影响。频域分析发现慢呼吸降低了焦虑情绪 theta 波的功率值。时频-域分析发现在 500ms-1200ms，20-25Hz 慢呼吸条件下焦虑情绪的功率值呈较减少趋势，即去同步化特征。这些结果证实了呼吸活动对大脑活动的影响，并为慢呼吸调控焦虑情绪的作用提供了来自脑机制的新依据。

The role of slow breathing in regulating anxiety: Evidence based on electrophysiology

Qian Luo[1],Dongtao Wei[12], Jiang Qiu[12]

1 Faculty of Psychology, Southwest University (SWU), Chongqing, 400715, China

2 Faculty of Psychology, Southwest University (SWU), Beibei District, Chongqing 400715, China.

E-mail: dongtao@swu.edu.cn(D. Wei), qiuj318@swu.edu.cn (J. Qiu)

Abstract: Meditation and other relaxation techniques emphasize the importance of breath control. Previous studies have found that slow breathing can lower stress or anxiety levels by increasing the activity of the parasympathetic nervous system, which affects the activity of internal organs. Animal-based research has also shown that slow breathing can directly impact the brain itself. Anxiety is a psychosomatic disorder characterized by excessive worry about uncertain future events and dysregulation of the autonomic nervous system. Previous research has found a relationship between anxiety levels and respiratory frequency. The role of slow breathing in regulating the activity of the autonomic nervous system provides a feasible regulatory pathway for regulating anxiety. Although the slow breathing can effectively regulate emotions such as stress, there is a lack of systematic exploration of the psychological and neurophysiological mechanisms of slow breathing in regulating anxiety.

This study investigates the regulatory effects of slow breathing on anxiety emotions through experimental methods, and reveals the psychological and neurophysiological mechanisms of slow breathing in regulating anxiety. Specifically, this study combines rhythmic breathing tasks with an emotion anticipation task to investigate the role of slow breathing in regulating anxiety. Frequency domain and time-frequency domain analysis methods

are used to explore the neural activity characteristics of slow breathing and the neural mechanisms of its impact on anxiety. Twenty-seven healthy college students participated in the experiment, this experiment adopted the within-subject experimental design of 2(respiratory rate: fast breathing, slow breathing) ×2 (certainty: certain, uncertain). The experimental tasks consisted of two stages: breathing practice and emotion anticipation . During the breathing practice stage, participants followed guided audio instructions for breathing. During the emotion anticipation stage, participants' anxiety was induced by uncertain cues, and valence and arousal ratings were obtained after viewing negative stimuli. The results of the study found that: (1) Slow breathing effectively reduced participants' anxiety. Compared to the fast breathing condition, participants experienced lower levels of valence and arousal after viewing negative images under the slow breathing condition. (2) Slow breathing increased global neural oscillatory activity. Compared to the fast breathing condition, slow breathing resulted in higher power values in the delta, theta, and alpha bands. (3) Slow breathing had a significant impact on the neural oscillatory activity of anxiety. Frequency domain analysis found that slow breathing reduced the power values of anxiety in the theta band. Time-frequency domain analysis found a decreasing trend in power values of anxiety in the 500ms-1200ms, 20-25Hz range under the slow breathing condition, indicating desynchronization. These findings confirm the influence of respiratory activities on brain functioning and offer new insights into the role of slow breathing in regulating anxiety based on brain mechanisms.

自杀干预热线青少年来电者的特征分析

安静

北京回龙观医院，北京大学回龙观临床医学院，北京，100096，angieanjing@bjmu.edu.cn

摘 要　探索心理援助热线青少年来电者的基本特征。方法：收集 2018—2021 年打入北京市心理援助热线的青少年来电者的一般人口学资料、主诉的问题，通过评估抑郁情绪、希望感、痛苦感和自杀风险（如，近两周和来电当下是否有自杀行为）来了解心理健康状况，并根据不同性别和来电时间进行分组比较。根据希望感、心理痛苦感和抑郁情绪得分的中位数，将连续变量转为分类变量，分别将其分为高和低两组。结果：共纳入 19 341 例青少年来电，9.8%的来电者近 2 周实施过自杀行为，在来电的时候正在实施自杀行为的占比 3.1%。近 2 周有自杀未遂和来电当时正在实施自杀行为的比例女性高于男性（P<0.001），既往有自杀未遂史（P<0.001）、高心理痛苦感（P<0.001）、高抑郁程度（P<0.001）和低希望感（P<0.001）的比例女性高于男性。正在实施自杀行为（P<0.001）、低希望感（P<0.001）、高抑郁程度（P<0.001）和既往有自杀未遂史（P<0.001）的来电者在凌晨打电话的比例高于其他时间。结论：女性和凌晨来电的青少年来电者心理健康状况相对更差，自杀风险更高。

Characteristics of adolescents who called the suicide intervention hotline

AN Jing, TONG Yongsheng

Beijing Huilongguan Hospital, Peking University Huilongguan Clinical Medical School, Beijing 100096, China，angieanjing@bjmu.edu.cn

***Abstract*: Objective:** To explore the characteristics and mental health status of adolescent callers of Beijing Psychological Support Hotline. **Methods:** General demographic data, reported themes of adolescent callers of the hotline from 2018 to 2021 were collected, mental health status was evaluated by the indicator of depression, hopefulness, psychological distress and suicide risk (for example, whether have suicide act currently or in past 2 weeks). Besides, the data between callers with different gender and the time they called the hotline was compared. Hopefulness, psychological distress and depression were divided into two groups (high and low) according to the median of these indicators. **Results:** A total of 19 341 calls were enrolled into the study. 9.8% of adolescent callers had committed suicide in the past two weeks, and 3.1% of them were committing suicide when they called. The proportion of attempted suicide and suicidal behavior in the last two weeks was higher in female callers than in male callers (P<0.001). The proportion of having attempted suicide in the past (P<0.001), high level of depression (P<0.001) and psychological distress (P<0.001), and low level of hopefulness (P<0.001) was higher in female callers than in male callers. The proportion of adolescent callers who were committing suicide (P<0.001), with lower level of hopefulness (P<0.001), higher level of depression (P<0.001), and history of attempted suicide(P<0.001) were higher in those calling in the early morning than in those calling at other time. **Conclusion:** It suggests that female adolescent callers and those who call in the morning may have worse mental health and higher suicide risk.

不良童年经历与情绪问题和自伤的人群归因分数分析

万宇辉

安徽医科大学公共卫生学院，安徽，230032，2004500039@ahmu.edu.cn

摘 要　近年来，心理健康问题和自伤行为已被确定为疾病负担的主要原因。从 1990 年到 2019 年，全球因精神障碍导致的伤残调整生命年 (DALY) 的百分比从 3.1% 增加到 4.9%。因此，识别相关风险因素并采取相关行动格外重要。

不良童年经历（ACE）已被充分证明是个人不良心理健康结果的重要影响因素。ACE 是指个人可能经历的一系列创伤性事件，其中大部分源自周围环境。众所周知，ACE 与个人健康结果相关，其中不利的情况效果不仅包括心血管疾病、肥胖和糖尿病等身体健康问题，还包括抑郁、焦虑等心理健康问题。

本研究计算了中国中学生中由于 ACE 导致的不良后果的人群归因分数（Population Attributable Fraction, PAF）。PAF 是疾病负担研究中的常用指标，其大致含义是，假设人群的风险暴露降低至理想水平，预计可减少的患病人口数占实际患病人口数的比例。本研究发现，假设干预四个或更多 ACE 事件，PAF 的范围为 23.1%到 44.2%，对中学生中的情绪与自伤行为发生产生显著影响。此外，结果还显示，与女孩相比，低水平的 ACE 暴露可能对男孩产生保护作用，这与早期生活中的逆境与后来的健康功能之间存在的 J 形关系相吻合。总的来说，研究强调了 ACE 对青少年心理健康的影响以及考虑性别差异的重要性。

Population attributable fractions of adverse childhood experiences for emotional problems and self-harming behaviors among middle school students in China

Yuhui Wan (Corresponding author)
Department of Maternal, Child & Adolescent Health, School of Public Health, Anhui Medical University, Anhui, China
E-mail: wyhayd@163.com

Abstract: In recent years, mental health problems and self-harming behaviors have been identified as the leading causes of disease burden. From 1990–2019, the percentage of global disability-adjusted life years (DALYs) due to mental disorders increased from 3.1 % to 4.9 %. More importance must be given to recognizing and protecting people from the risk factors of mental health conditions

The psychological theory of mental health has focused on how early life factors play a critical role in the risk of harmful mental health outcomes. Adverse childhood experiences are strongly proven to be impacting factors on individual poor mental health outcomes. ACEs refer to a series of traumatic events that individuals may experience in their first 18 years, most of which derive from their surroundings. It has been well established that ACEs are associated with individual health outcomes, where adverse effects include not only physical health issues such as cardiovascular disease, obesity and diabetes, but also mental health conditions like depression, anxiety and so on.

In recent years, the population attributable fraction (PAF) has been introduced to calculate the proportion of adverse outcomes that can be attributed to ACEs in the general population. PAF represents to what extent the outcomes could be alleviated if a risk factor was eradicated.

Our findings suggest that ACE-focused preventative measures may have a large impact on the population level. For six outcomes, PAFs ranged from 23.1 % to 44.2 % of four or more ACEs, meaning that for interventions targeted at four or more ACEs were beneficial to quite a few people. Interestingly, the results of hierarchical analysis show that low levels of ACE exposure were protective factors for boys across suicidal behaviors and emotional problems when compared with girls. This is in line with stress inoculation model, that a J-shaped relationship between early life stressors and later health function has been found.

In conclusion, the strong associations between ACEs and six outcomes among adolescents emphasized the significance of upstream intervention initiatives. Realizing the contribution of ACEs to mental health problems can help related professionals take effective measures to ease the burden of mental illness.

从生物-心理-社会角度探究儿童自伤意念和行为的转变轨迹

张小芊 [1]
1 北京市石景山区五里坨医院，北京，100041，xiaoqian1211@163.com

摘 要　自伤意念和行为（Self-Injurious Thoughts and Behaviours，SITB）在儿童群体中的流行引发了公共卫生领域的关注。SITB 涵盖了自杀意念、非自杀性自伤和自杀尝试，对儿童的心理健康，神经发育，以及社会功能产生了深远的负面影响。尽管这一问题已引起学界和社会的广泛关注，但对于 SITB 在儿童中演变的影响因素的全面理解尚不明晰，亟待进一步研究。相关研究涉及公共卫生和社会福祉的关键议题，对于改善儿童心理健康，指导 SITB 相关预防干预策略的制定，最终降低 SITB 在儿童中的发生率至关重要。

本研究使用了来自“青少年脑与认知发展研究”（Adolescent Brain and Cognitive Development Study，简称 ABCD Study）的纵向数据，共纳入了 7,270 名儿童。根据生物-心理-社会理论框架，探究了儿童 1 年后 SITB 转变的多维度影响因素。在生物层面，本研究同时纳入了脑结构和脑网络；在心理层面，本研究考虑了 BIS/BAS 的作用，同时通过双因子模型提取了广泛性精神病理因子;在社会层面，研究纳入了学校支持和

家庭支持。最终，采用逐步回归分析探究了上述因素和 SITB 转变的关联，并通过敏感性分析检验上述因素的复杂交互对结局的影响。

研究结果表明，SITB 转变与大脑背外侧前额叶皮层（dorsal lateral prefrontal cortex, dlPFC）和后扣带皮层（posterior cingulate cortex, PCC）的结构改变，以及默认网络，背侧注意网络，腹侧注意网络（Ventral Attention Network，VAN）等脑网络之间的功能连接改变密切相关。此外，高行为抑制和高广泛性精神病理因子得分可能作为 SITB 转变的风险因素，而充足的家庭支持和学校支持则可能作为 SITB 转变的保护因素。

本研究澄清了特定生物、心理和社会因素在 SITB 发生中的先兆性，强调了它们在 SITB 发生方面的潜在预测价值。对这些因素的早期识别有望为未来的预防干预策略提供重要的指导，同时有助于有效应对自伤意念和行为所引发的紧迫公共卫生问题。

The transition trajectories of self-injurious thoughts and behaviors among children from a biopsychosocial perspective

Xiaoqian Zhang[1,] Zaixu Cui[2]

1 Wulituo Hospital of Shijingshan District, Beijing, China, xiaoqian1211@tsinghua.edu.cn

2. Chinese Institute for Brain Research, Beijing, China

Abstract：Although self-injurious thoughts and behaviors (SITB) among children pose an imminent public health concern, the comprehensive understanding of SITB transitions remains unclear. Here we used the longitudinal data of 7,270 children from the Adolescent Brain and Cognitive Developments Study (ABCD Study). We found that SITB transitions are linked to altered cortical areas of the dorsal lateral prefrontal cortex and the posterior cingulate cortex and altered functional connectivity between the default mode and attention networks. Additionally, high behavior inhibition and general psychopathology (that is, p-factor) were identified as risk factors for SITB transitions, while the presence of robust family support and school support served as protective factors. Our study extends prior cross-sectional investigations by elucidating the temporal precedence of specific biopsychosocial factors, underscoring their potential predictive significance in SITB occurrence. Early identification of these factors holds great promise for targeted prevention, addressing the pressing public health concerns associated with SITB.

Keywords：Self-injurious thoughts and behaviors, p-factor, behavior inhibition, longitudinal

中国青少年非自杀性自伤行为研究现状

屈笛扬

1 清华大学万科公共卫生与健康学院，北京，100101，diyangqu@outlook.com

摘 要　非自杀性自伤行为(Non-suicidal self-injury, NSSI)是一个严重的公共卫生问题，指的是个体在没有自杀意图的情况下，故意破坏身体组织以达到特定目的的行为。NSSI 行为对个体健康具有长期的负面影响，会显著增加个体自杀风险。现阶段，国内的研究者已经对 NSSI 行为进行了大量研究，并强调了 NSSI 行为防治的紧迫性，亟需政府、社会机构、公共卫生专业人员、精神卫生医护人员、心理学专业人员和社会工作者的高度重视。本研究旨在国内既往相关研究的基础上，进一步总结归纳中国 NSSI 行为的流行病学现状、方法、危险因素以及预防和干预现状。

研究团队通过对2000年1月1日至2022年12月30日期间发表于Web of Science、Pubmed、PsychINFO、中国知网、维普以及万方平台的中英文文献的检索，最终确定了符合研究分析标准的文章（第一部分：256篇；第二部分：306篇；第三部分：13篇）。

研究一：提供了关于中国人群的NSSI流行率和方法特点的最新证据。涉及的研究共256项，时间跨度为2007年至2022年，覆盖了中国的28个省份。其中，广东省（N=44）、安徽省（N=39）、贵州省（N=24）、河南省（N=23）和湖北省（N=22）是研究数量较多的前五个省份。自2017年以来，中国在NSSI流行率和方法研究方面的数量显著增加。这一部分的研究成果有助于提高人们对NSSI防治重要性的认识，促进精神卫生服务的提供，并为了解NSSI在全球范围内的发展趋势提供了重要依据。

研究二：该部分从生理-心理-社会-生态系统的角度对中国人群的NSSI风险因素进行了系统性总结，最终得到了249个风险因素，涵盖了生理（如基因）、心理（如情绪痛苦）、家庭（如家庭经历）、社区环境（如低社会支持）和自然环境等五个层面。值得注意的是，单亲家庭、留守儿童、学业压力、乡村到城市的迁移经历等风险因素是社会变迁特有的风险因素。该研究首次基于综合的视角对中国人群的风险因素进行归纳总结，将有助于相关人员以更具成本效益的方式解决这一公共卫生问题。

研究三：对所有中国NSSI行为相关的预防和干预研究进行了回顾，从研究的出版数量、干预人群、干预策略进行了总结，并描述了综合的实证研究结果。研究发现，干预研究的数量仅为12项，这可能是因为本研究仅纳入概念上明确界定为非自伤性自杀（NSSI）行为的研究。此外，几乎所有相关研究都发表在2020年后，数量逐年增加，其中3/4的研究发表在2022年。这呼吁我们需要更多本土化的预防和干预项目，以期减少中国人群NSSI行为。

本研究从广泛的文献中综合证据，全面探讨基于中国人群的NSSI研究的趋势和发展方向。研究旨在更深入地了解中国NSSI行为的流行病学现状、方法、危险因素以及预防和干预现状。相较于荟萃分析，本篇综述同时涵盖了多种研究方法（如荟萃分析、定性研究）和研究设计（如纵向研究）。特别值得一提的是，国内的既往相关研究对中国多个群体的NSSI特征进行了深入描述，为中国人群NSSI行为的相关研究奠定了坚实的基础，也为本研究提供了重要的参考和支持。本研究在国内研究成果的基础上进行了总结归纳，以期为中国人群的NSSI行为现状提供更加新颖和全面的证据。

Non-suicidal self-injury in Chinese adolescent population: a scoping review of prevalence, method, risk factors and preventive interventions

Diyang Qu

Vanke School of Public Health, Tsinghua University, Beijing, China, diyangqu@outlook.com

***Abstract*：** Non-suicidal self-injury behavior (NSSI) is a serious public health concern that requires immediate attention. Despite the high prevalence of NSSI among the Chinese population, there is a significant gap in research on the comprehensive picture of this field. Therefore, a scoping review was conducted to investigate the prevalence, methods, risk factors, and preventive intervention programs related to NSSI in China. The review found that the estimated lifetime prevalence of NSSI among Chinese youth population is alarmingly high at 24.7% (N = 1,088,433). Common methods of NSSI include scratching, hitting, and biting. Additionally, the review synthesized 249 risk factors based on the biopsychosocial-ecological framework, highlighting the urgent need for intervention. However, only 12 empirical studies focus on NSSI prevention or intervention programs were included. These findings underscore the necessity for more clinical practices and larger studies to identify effective

interventions and ultimately alleviate the burden of NSSI on the Chinese population.

iTBS 干预改善伴自杀未遂青少年抑郁症自杀意念的研究

卢凤梅（通讯作者）

电子科技大学成都脑科学研究院临床医院，成都市第四人民医院，成都, fengmei_lu@126.com

摘 要 本研究旨在探索 iTBS 联合药物干预对伴自杀未遂青少年抑郁症的疗效及自杀意念的影响，选取成都市第四人民医院心理科病房的 45 例伴自杀未遂青少年抑郁症患者，随机分为 iTBS 组（n=23）及伪刺激组（n=22）。两组均采用常规的抗抑郁药物治疗，iTBS 组采用依瑞德经颅磁刺激仪，每天刺激 1 次，连续 5 天，为期两周。刺激部位为左侧背外侧前额叶，线圈放置与头皮平行。伪刺激组采用伪线圈，治疗参数与 iTBS 组相同。分别在治疗前、治疗 2 周后采用 HAMD-24、抑郁自评量表（SDS）以及贝克自杀意念量表中文修订版（BSI-CV）评估其临床疗效和自杀意念。两组治疗结束后的 HAMD-24 评分均显著降低（$p<0.001$）；相比于伪刺激组，iTBS 组治疗后的 SDS 和 BSI-CV 分数降低更显著（$p=0.001$）。iTBS 联合药物能够在两周内迅速改善患者的自杀意念和抑郁症状，可为 iTBS 干预降低青少年抑郁症自杀意念提供初步证据，提示 iTBS 是一种安全、耐受良好的药物辅助疗法，未来需要进一步大样本的随机双盲对照研究进行验证和推广。

Effect of intermittent theta burst stimulation on suicidal ideation and depressive symptoms in adolescent depression with suicide attempt

Fengmei Lu

The Clinical Hospital of Chengdu Brain Science Institute, School of Life Science and Technology, University of Electronic Science and Technology of China, Chengdu 611731, China fengmei_lu@126.com

Abstract:

Background: Suicidal ideation is a serious symptom of major depressive disorder (MDD). Intermittent theta burst stimulation (iTBS) is a safe, effective brain stimulation treatment for alleviating suicidal ideation in adults with MDD. This study aimed to examine the clinical efficacy of iTBS on reducing suicidal ideation in adolescent MDD with suicide attempt.

Methods: In a randomized, sham-controlled protocol, a total of 10 sessions of iTBS was administrated to the left dorsolateral prefrontal cortex (DLPFC) in patients once a day for two weeks. The suicidal ideation and depressive symptoms were assessed using Beck Scale for Suicide Ideation-Chinese Version (BSI-CV), Hamilton Rating Scale for Depression (HAMD-24), and Self-rating Depression Scale (SDS) at baseline and after 10 treatment sessions. **Results:** Forty-five patients were randomized assigned to either active iTBS (n = 23) or sham group (n = 22). The suicidal ideation and depressive symptoms of the active iTBS group were significantly ameliorated over 2 weeks of treatment. Further, higher baseline SDS, HAMD-24 and BSI-CV scores in the active iTBS group were associated with greater reductions. Limitations: A larger sample size and double-blinded clinical trial should be conducted to verify the reliability and reproducibility.

Conclusions: The current study suggested that daily iTBS of the left DLPFC for 2 weeks could effectively and safely alleviate suicidal ideation and mitigate depression in adolescent MDD, especially for individuals with relatively more severe symptoms. Although caution is warranted, the findings could provide further evidence for the effectiveness and safety of iTBS in clinical practice.

中国“生命守门人”青少年自杀预防干预研究

陈润森（通讯作者）

清华大学万科公共卫生与健康学院，北京，100101, runsenchen@tsinghua.edu.cn

摘 要

背景：青少年的自杀问题是全球关注的重大公共卫生问题。学校是青少年生活的重要场所，基于学校的预防性干预项目可以有效减轻潜在的青少年自杀风险。生命守门人培训(Life Gatekeeper training)是一种广泛使用的自杀预防性干预策略，已被发现可以有效地增加受训者与自杀相关的知识素养、减少对自杀的污名化、提高受训者的自杀干预意愿和识别、沟通与转介高自杀风险者的技能，但目前还未在中国进行本土化实践。因此，本研究系统开发了首个中国本土化的生命守门人培训，通过培训师培训(Train the trainer)的模式进行推广，旨在为学校教师提供生命守门人相关知识和技能从而减少青少年的自杀风险。

方法：采用整群随机对照的方式，在中国某乡村城市抽取了 84 所学校，随机将 42 所学校分为干预组，42 所学校为等待对照组，学校的所有班主任教师参与本研究，干预组教师接受为期一天的八节生命守门人培训并完成前后测问卷，对照组教师同步完成两次问卷收集，一共 3646 名教师参与了本研究，最终共 3312 名教师完成了 6 个月追踪问卷(男性=34.6%，M*age*=37.1)，其中干预组 1527 名，对照组 1785 名。本研究的主要干预变量通过四个问卷来收集：自杀污名化量表(Stigma of Suicide Scale ,SOSS)、自杀知识素养量表(Literacy of Suicide Scale ,LOSS)、自杀干预意愿量表和干预自我效能感量表(Willingness to Intervene Against Suicide Questionnaire ,WIS)，采用广义估计方程模型(Generalized estimating equation, GEE)分析时间和组别效应。

结果：干预前后的结果为：生命守门人干预显著降低了受训教师对自杀的污名化(β=-2.57，SE=0.54，p<.001)，提高了自杀相关的知识素养(β=1.70，SE=0.21，p<.001)、干预自我效能感(β=6.97，SE=1.19，p<.001)，以及干预意愿(β=5.34，SE=0.81，p<.001)。六个月追踪数据与干预前对比结果为：生命守门人干预依然显著降低了受训教师对自杀的污名化(β=-1.60，SE=0.47，p=.001)，提高了自杀相关的知识素养(β=1.63，SE=0.18，p<.001)，干预自我效能感(β=5.71，SE=0.98，p<.001)，以及干预意愿(β=4.21，SE=0.76，p<.001)。

结论：本研究表明，首个本土化的中国生命守门人培训可以有效减少受训教师对自杀的污名化，提高教师自杀相关的知识素养、干预自我效能感以及干预意愿，并能够保持较为长期的干预效果。这证实了生命守门人项目在中国教师群体中实施的有效性，以及培训师培训方式在推广时的可行性。我们希望这项研究能够推动中国开发更多基于实证依据并符合文化特点的生命守门人培训，从而减少中国青少年自杀风险。

Effectiveness of a localised and systematically developed gatekeeper training program in preventing suicide among Chinese adolescents

Runsen Chen
Vanke School of Public Health, Tsinghua University, Beijing, China, runsenchen@tsinghua.edu.cn

Abstract：

Background: The issue of suicidal risks among adolescents has garnered significant global attention due to its implications for public health. The early identification of individuals at risk of suicide is a critical step to mitigate such risks through timely interventions as addressed by the ideation-to-action framework of suicide theories. In this case, schools can effectively take action to mitigate potential suicidal risks, particularly teachers who could be trained to recognize and address early warning signs of suicidal risks through a gatekeeper program. The Life Gatekeeper training program was systematically developed to equip school teachers with knowledge and skills to identify and intervene with students at risk of suicide. The current study aims to examine the effectiveness of this training program in rural China.

Methods: In a clustered randomized controlled trial conducted in a rural Chinese city, 84 schools were selected. These schools were randomly divided into an intervention group (42 schools) and a waitlist control group (42 schools). All homeroom teachers in the schools participated in this study. Teachers in the intervention group received a one-day, eight-session Life Gatekeeper training. A total of 3,646 teachers participated in this study, with 3,312 teachers ultimately completing the 6-month follow-up questionnaire (male=34.6%, M*age*=37.1). Among these, 1,527 were in the intervention group, and 1,785 were in the control group. The primary intervention outcomes in this study were collected through four questionnaires: Stigma subscale of the Stigma of Suicide Scale (SOSS), the short-form Literacy of Suicide Scale (LOSS), the perceived behavior control subscale and the willingness to intervene subscale of the Willingness to Intervene Against Suicide Questionnaire (WIS). Generalized Estimating Equation (GEE) models were employed to analyze the effects of time and group on these variables.

Results: Compare the results pre- and post intervention, the Gatekeeper intervention significantly reduced stigma against suicide (β=-2.57, SE=0.54, p<.001), increased suicide literacy (β=1.70, SE=0.21, p<.001), perceived competence (β=6.97, SE=1.19, p<.001), and willingness to intervene (β=5.34, SE=0.81, p<.001). the results pre-intervention and at the six-month follow-up, the Gatekeeper intervention also significantly reduced stigma against suicide (β=-1.60, SE=0.47, p=.001), increased suicide literacy (β=1.63, SE=0.18, p<.001), perceived competence (β=5.71, SE=0.98, p<.001), and willingness to intervene (β=4.21, SE=0.76, p<.001). The intervention lasted for six months.

Conclusion: This study showed a significant reduction in stigma against suicide, and significant improvement in suicide literacy, perceived competence, and willingness to intervene among gatekeepers over time, and the training effects were sustained at a six-month follow-up. This study confirms the effectiveness of the newly developed Life Gatekeeper program, as well as the feasibility of delivering the gatekeeper training program via the train the trainer modality in China. We hope this study could pave the way to more evidence-based, and culturally adapted gatekeeper training programs China.

4 国家基础学科公共科学数据中心，北京，100190

摘 要 心理学旨在理解人类的心理和行为。在科研实践中，科学心理学的研究结论在多大程度上能够推广到所有人类，很大程度上依赖于其样本是否能够代表全人类。然而，全球科学心理学研究中，大多数研究中的被试都是选修心理学课程的本科生，且他们大多来自西方的、受教育的、工业化的、富裕的和民主的国家或地区，这些特征被称为“WEIRD”(Henrich et al., 2010)。被试缺乏多样性和代表性，一方面限制了心理学对于人类心理和行为的完整描绘，另一方面影响了心理学研究的可推广性。为解决这一问题，许多研究者呼吁和参与了大规模的国际合作项目，并希望借此收集到更多来自非 WEIRD 区域的样本和数据。大规模的国际合作项目确实增加了样本的地域多样性和样本数量。然而，来自非 WEIRD 区域的被试是否能代表被调查区域的当地人口却是未知。为了理解这一问题，本研究从心理学报、心理科学、中国临床心理学杂志、心理发展与教育、心理与行为研究这五本中国主流学术期刊于三个不同时期（2008 年，2017~2018 年，2020~2021 年）所发表的论文中抽取 1000 篇实证研究，提取其被试信息。同时对大规模国际合作项目（比如：Many Labs projects , the Human Penguin Project, PSA）中报告的中国被试特征进行提取，以理解当前心理学实证研究中被试样本的现状，并将其与全国第七次人口普查数据进行比较。本研究结果提供了中国心理学参与者的真实情况，本研究也将讨论解决中国和全球代表性问题的潜在方案。

Representativeness of subjects in empirical research in psychology: A meta-research based on 1000 Chinese papers

Lei Yue[1,2], Xi-Nian Zuo[3], Hu Chuan-Peng[1]

1 School of Psychology, Nanjing Normal University, Nanjing, China, 210097

2 Ziyang College of Environmental Science and Technology, Ziyang, China, 641300

3 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, China, 100875

4 National Basic Science Data Center, Beijing, China, 100190

Abstract: Psychological science aims at understanding human mind and behaviour. In the practice of scientific research, the extent to which the findings of scientific psychology can be generalized to all human beings relies heavily on the representativeness of its samples. However, most of subjects of global psychological studies are undergraduate students who take psychology courses from “Western, Educated, Industrialized, Rich, and Democratic” countries or regions. These characteristics are referred to as "WEIRD" (Henrich et al., 2010). The lack of representativeness in psychological science limits our understanding of the whole picture of human mind and behavior and may influence generalizability of studies conclusion. To address this issue, Many researchers have called for and participated in large-scale international collaborative projects with the hope of collecting more samples and data from non-WEIRD regions. Large-scale international collaborative projects indeed increase the geographical diversity and sample sizes. However, it is unknown whether subjects from non-WEIRD regions are

representative of the local population in the surveyed regions. To understand this problem, in this study, 1,000 empirical studies were extracted from papers published in five mainstream Chinese academic journals, namely, *Acta Psychological Sinica*, *Journal of Psychological Science*, *Chinese Journal of Clinical Psychology*, *Psychological Development and Education*, *Psychological and Behavioral Studies Psychological Journal*, in three different periods (2008, 2017~2018, and 2020~2021) to extract their subjects' information. The characteristics of Chinese subjects reported in large-scale international collaborative projects (e.g., Many Labs projects , the Human Penguin Project, PSA) were also extracted to understand the current status of the subject samples in current empirical research in psychology, and compared with data from the Chinese 7th census data. The results will provide a realistic picture of Chinese subjects in psychology, and we will discuss potential solutions to the issue of representativeness in both China and worldwide.

摘 要 精神障碍严重影响了患者的社会功能和生活质量。精确诊断和有效治疗精神障碍一直是重大的科学问题及社会问题。目前，多模态数据及人工智能方法被应用于精神障碍研究，利用脑影像数据和机器学习技术构建精神障碍的诊断分类器得到了广泛关注。基于对精神分裂症患者脑-症状学/亚型关联模式的研究，以及先前相关文献的回顾，我们提出利用机器学习模型的分类准确率来(1)识别稳健的生物学标志物(2)提示 DSM 精神障碍之间的分类学关系，并运用无监督和半监督机器学习方法(3)定义（跨诊断)疾病亚型与维度。文章同时强调了脑影像机器学习研究中的常见陷阱，如"过拟合"，导致模型难以泛化推广。这为精神障碍生物标志物的鉴定、诊断异质性和跨诊断共病性关键问题的有效解析带来借鉴。采用机器学习模型，我们发现社会情感脑网络稳可以健预测精神分裂症患者的认知症状维度；精神障碍，尤其是在自闭症和精神分裂症中，社会认知与人际交互异常具有跨诊断、高共发性特点。然而，尽管机器学习在亚型甄别、预警预测和生物标志物识别等方面具有重要价值，数据驱动模型较难直接用于解析精神障碍患者异常行为的认知过程和神经机制。我们近期在 Lancet Psychiatry 提出人际计算精神病学的理论和方法，以精神分裂症为例，基于双人听音联合按键任务范式，采用贝叶斯预测编码框架解析患者社会互动异常的动态认知机制。通过主动推理模型，基于可观测行为推断处于隐藏状态的认知过程。我们分析得到模型特定参数可较好地复现精神分裂症患者真实场景人际互动按键的异态模式，并提示患者感觉衰减和运动功能异常可能为潜在机制。

Abstract: Mental illness poses significant challenges to society. The effective diagnosis and treatment of mental disorders remain major concerns in the field. Recent psychiatric research highlights the use of artificial intelligence techniques. Computational psychiatry, which leverages multi-view data and multi-level computations, aims to improve the understanding, prediction, and treatment of mental disorders. As a promising approach, it at least has two branches, data-driven and theory-based modeling. By our machine learning studies in schizophrenia as well as reviewing data-driven classification and prediction models in psychiatric research, we refined several new perspectives in this direction: 1) Accuracies from classification models as the dependent variable to select informative brain features 2) these Accuracies to inform nosological relationships between disorders 3) Data-driven consolidation using unsupervised and semi-supervised approaches to dissect heterogeneous disorders. Common pitfalls in this line of research, such as overfitting, have also been highlighted to help establish generalizable machine learning models. While data-driven approaches have demonstrated their value in guiding diagnostics and treatments, it is not readily by these methods to dissect the neurocognitive mechanisms underlying anomalistic behaviors. Theory-based approaches, in contrast, are designed for such purposes, and can help unravel hidden states that drive specific processes. We focused on social functioning impairment, which is a central psychopathology in many mental disorders. In our investigation of this aspect, two-person paradigms and Bayesian active inference are proposed to dissect the abnormal interactional processes in schizophrenia. In particular, through parameters tuning in the active inference model, we successfully replicated the manifold anomalistic social coordination patterns seen in patients with schizophrenia, which suggested that a failure of sensory attenuation and an impaired motor function would be the potential mechanisms.

心理科学和医学研究的可重复性实践：一项元科学研究

李威[1] 石丽萍[1]（通讯作者） 冯正直[1]（通讯作者） 陈志毅[1,2]（通讯作者）

1 第三军医大学医学心理系医学心理实验中心，重庆，400038

2 认知与人格教育部重点实验室，重庆，400715

通讯作者 E-mail：石丽萍（shiliping@tmmu.edu.cn），冯正直（fzz@tmmu.edu.cn），陈志毅（chenzhiyi@tmmu.edu.cn）

摘 要

背景 “可重复性危机”在心理科学和临床医学领域的爆发让研究者们直面科学研究的可靠性。近年来，许多期刊更新了数据可用性政策，鼓励研究人员共享研究数据。这一举措使同行研究者得以验证科学结果的可靠性，但其可行性和实践性仍有待商榷。因此，本研究以元科学方法系统性地探究了心理科学、医学领域期刊对于研究数据可用性的实践，以澄清其是否可用于解除这一危机。

方法 选取 ClarivateTM 数据库中 Journal Citation Reports(JCR) 1 区精神病学/心理学（n_1=219）和临床医学领域（n_2=931）期刊，对期刊官网作者须知部分数据共享和数据可用性声明的要求进行编码，并形成数据可用性等级（例如，mandatory），并记录了期刊 2021 年影响因子、出版社等信息。

结果 （1）在心理学期刊中，10.96% (24/219) 的期刊要求作者共享研究中产生的数据，38.36%（84/219）的期刊要求提供数据可用性声明，8.22%(18/219)的期刊要求作者共享数据并提供数据可用性声明。在临床医学期刊中，12.8%（119/931)）的期刊要求作者共享研究中产生的数据，42.15%（392/931）的期刊要求提供数据可用性声明，9.13%（85/931）的期刊要求作者共享数据并提供数据可用性声明。（2）期刊数据可用性等级在不同出版社中的分布存在差异。在心理学领域中，Elsevier 出版社要求作者共享数据的期刊比例最高（17/48, 35.42%）；APA(19/26, 73.08%)、Wiley(20/32, 62.50%)、Oxford(6/11, 54.54%)超过半数期刊要求作者提供数据可用性声明；在数据可用性等级中，Elsevier 评级为“Mandatory”的期刊比例最高（9/48, 18.75%）。在临床医学领域中，Nature 出版社要求作者共享数据的期刊比例最高(16/32, 50%)；Nature、BMJ、BMC 出版期刊均强制要求作者提供数据可用性声明；在数据可用性等级中，Nature 出版期刊“Mandatory”评级比例最高(16/32, 50%)。（3）心理科学期刊数据可用性等级与影响因子(2021JIF)相关不显著，而医学领域期刊数据可用性等级与 2021JIF 呈现正相关关系($r=0.198$, $p<0.01$)，其影响因子越高的期刊，数据可用性等级越高。

结论 心理科学和医学对于数据可用性的要求并不严格；绝大多数期刊遵循自愿原则，更加考验作者对于开放科学的重视程度和“自我纠偏”意识。这可能会阻碍心理科学和医学领域解除“可重复性危机”的政策实践。

关键词　可重复性，数据可用性声明，数据共享，元研究综述

Practices of Pursuing Reproducibility from “Data Availability Statements” in Psychological and Medical Science: A Systematic Meta-Research Review

Wei Li [1], Liping Shi [1*], Zhengzhi Feng[1*], Zhiyi Chen [1,2*]

[1] Experimental Research Center of Medical and Psychological Science (ERC-MPS), School of Psychology, Third Military Medical University, Chongqing, China, 400038

* Corresponding at Liping Shi (shiliping@tmmu.edu.cn) , Zhengzhi Feng (fzz@tmmu.edu.cn) and Zhiyi Chen (chenzhiyi@tmmu.edu.cn)

***Abstract*:**

Background

The outbreak of the "reproducibility crisis" in the field of psychological science has compelled researchers to confront and reflect on the reliability of psychological research. Meanwhile, in the thriving landscape of evidence-based medicine, the emergence of the "reproducibility crisis" in the medical science has raised similar concerns regarding fraud medical conclusions. In recent years, many journals have updated their policies about data availability and encouraged researchers to disclose their research data. This initiative enables peer researchers to test the credibility of scientific results and hopefully serves as a helpful way to mitigate the "reproducibility crisis". Despite promising solution and substantial efforts in the whole academia, it remains quite scarce for whether and how such changes and promotions are actually practical and workable. Therefore, the present study capitalized on this systematic meta-research review to investigate practices of these policies concerning data availability of these academic journals in the fields of psychological and medical science, favoring to clarify whether these data availability statements are practical to address the "reproducibility crisis".

Methods

We selected all Psychiatry/Psychology journals ($n_1=219$) and Clinical Medicine journals ($n_2=931$) from JIF

Quartile 1 as ranked by the Journal Citation Reports (JCR) that provided by Clarivate™. Subsequently, the requirements related to data sharing (DS) and data availability statement (DAS) in the author guidelines section claimed by journal's official document were coded. Based on this, we synthesized the data availability requirements (DAR) classification into four levels (i.e., not mentioned, reccomended, required or mandatory). Additionally, we collected data of journal impact factor (JIF) and publishers of each journal to quantitatively examine the correlative roles of these journals' characteristics to practices of DAS.

Results

Among 219 journals in the field of Psychological science, 10.96% (24/219) of journals enforce mandatory data sharing, 38.36% (84/219) of journals require a data availability statement, and 8.22% (18/219) of journals mandate both data sharing and the provision of a data availability statement. Among 931 journals in the field of Medical science, 12.8% (119/931) of journals enforce mandatory data sharing, 42.15% (392/931) of journals require a data availability statement, while only 9.13% (85/931) of journals mandate both data sharing and the provision of a data availability statement. The distribution of research data availability varies among different publishers. In the field of Psychological science, Elsevier has the highest proportion of journals that require authors to share data at 35.42% (17/48). More than half of the journals from APA (19/26, 73.08%), Wiley (20/32, 62.50%), and Oxford (6/11, 54.54%) require authors to provide a data availability statement. With the rating of data availability requirement, 18.75% (9/48) of Elsevier journals are rated as "Mandatory", which is the highest proportion. In the field of Medical science, Nature series exhibits the highest proportion of journals (16/32, 50.00%) that enforce mandatory data sharing in policies. All journals published by Nature (n_{Nature}=32), BMJ (n_{BMJ}=24), and BMC (n_{BMC}=62) enforce the provision of a data availability statement as a compulsory requirement for authors. With regards to DAR rating, Nature demonstrates the most substantial proportion of "Mandatory" level(50.00%, 16/32). In Psychological science, there is no significant correlation between the journal's data availability requirement (DAR) and the 2021 JIF. However, in the field of Medical science, it shows a slightly positive correlation between DAR and JIF ($r = 0.198$, $p<0.01$), indicating that higher impact factor journals tend to have higher data availability ratings.

Conclusion

The journals' Data availability requirements in the fields of Psychological and Medical science are generally lenient. The vast majority of journals encourage data sharing and recommend data availability statements, highlighting authors' commitment to open science and their awareness of "self-correction". This may hamper the policy practices to ameliorate "reproducibility crisis" in the psychological and medical scientific ecosystem.

摘 要　背景：全球性突发公共卫生事件不仅直接威胁着人类的身体健康，也给人类的精神健康带来了前所未有的沉重负担。为了防止患者、一线医务人员和受封锁人群之间潜在的公共精神卫生问题，相关的公共决策应以可靠和科学的临床循证证据为指导，特别是使用元分析，来明确主要精神卫生问题的患病率。尽管惊人增长的元分析证据提供了相当大的贡献和及时的循证支持，但这些证据是否在实际中可靠和可复制，以有效地指导国际关注的突发公共卫生事件的决策，尚未得到清楚的验证。方法：本研究遵循系统评价和荟萃分析的首选报告项目(Preferred Reporting Items for Systematic Reviews and Meta-Analyses, PRISMA)指南，进行了一项系统的元研究，以检查以往研究的偏倚风险(Risk of bias, ROB)，并对近期国际关注的突发公共卫生事件(2003 年 1 月 1 日至 2023 年 3 月 1 日)中主要精神健康问题的患病率进行了荟萃分析研究，主要包括抑郁、焦虑、睡眠问题、创伤后应激障碍和压力相关症状。文献检索在 Web of Science、PubMed、Scopus、Cochrane 和 Google Scholar 数据库中进行。而偏倚风险的系统回顾(Risk of Bias in Systematic Reviews, ROBIS)从研究选择、数据收集、研究评价、证据综合和单个研究的偏倚风险五个方面对 ROB 进行评估。结果：在当前的元研究综述中，我们主要关注了与三项公共卫生事相关的 109 项元分析：COVID-19 (K= 103, n= 22,019,975)，SARS (K= 4, n= 62,882)和埃博拉病毒病(K=2, n=4,192)。以 COVID-19 为例，2020 年 5 月至 2023 年 3 月期间发表的 COVID-19 研究，其数据涵盖了 25 个国家，其中中国、伊朗、加拿大、美国、英国、西班牙、印度、埃塞俄比亚、孟加拉国、澳大利亚、巴西、法国等国家占主导地位。而通过对 COVID-19 进行 ROBIS 评估，69.90%(72/103)的 meta 分析估计被评为高偏倚风险。而这些风险主要来自于是不可用的数据可用性 68.93%(71/103)和缺乏敏感性分析 85.43%(88/103)。此外，只有 44.66 %(46/103)的元分析研究提供了技术上可重复的数据和材料。结论：数量激增的元分析为国际关注的突发公共卫生事件如何阻碍心理健康提供了富有成效的证据，但我们应该对这些发现中存在的潜在偏见和可重复性问题保持谨慎。

***Abstract*:**

Background

Global emergent public health events not only directly threaten human's physical health but also heavily brings out unprecedented mental health burdens. To address potential public mental health problems across patients, front-line medical staffs and peoples under lockdown restriction, many public policy-makings are guided by massive clinical evidence-based evidences clarifying prevalence of major mental health problems, particularly

in meta-analytic estimates. Despite considerable contributions and timely evidence-based supports, startling rising meta-analytic evidences, it remains unclear whether these evidences are practically reliable and reproducible to effectively direct policy-making in Public Health Emergency of International Concern (PHEIC-related) events.

Method

This study followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guideline to conduct a systematic meta-research review to examine the risk of bias (ROB) and to reproduce meta-analytic studies for prevalence of main mental heath problems recent PHEIC-related events (Jan 1, 2003 - March 1, 2023), including depression, anxiety, sleep problems, post-traumatic stress disorder, and stress-related symptoms. Literature search was carried out across Web of Science, PubMed, Scopus, Cochrane and Google Scholar databases,. The ROBIS (Risk of Bias in Systematic Reviews) was utilized to assess ROB by following five aspects: Study Selection, Data Collection, Study Appraisal, Synthesis of Evidence and Risk of Bias in Individual Studies.

Result

In the current meta-research review, we captured three PHEIC events including 109 meta-analytic estimates: Corona Virus Disease 2019 (COVID-19) (K = 103, n = 22,019,975), Severe acute respiratory syndrome coronavirus disease (SARS) (K = 4, n = 62,882), and Ebola virus disease (K=2, n=4,192). Taking COVID-19 as an example, articles on COVID-19 were published from May 2020 to March 2023, covering data from 25 countries, particularly dominating in China, Iran, Canada, USA, England, Spain, India, Ethiopia, Bangladesh, Australia, Brazil, France and others. By using ROBIS assessments for COVID-19, 69.90 % (72/103) of meta-analytic estimates were rated to expose high overall ROB. Main sources of ROB are found in unworkable data availability 68.93%(71/103) and lack of sensitivity analysis85.43%(88/103). Furthermore, only 44.66 % (46/103)meta-analytic studies provided data and materials to be technically reproducible.

Conclusion

Though the rocketing number of meta-analytic evidences contributed well to guide public policy-makings for diluting ensuing mental health burdens or even problems that the PHEIC-related public events brought out, more than a half of these evidences are concerned for being exposed on high ROB. Poor technical reproducibility.may hamper the evidence-based confidence for these meta-analytic estimates.

过渡或让渡：独生子女婚育抉择的解释学探究

毛晓清

新乡学院，新乡，453002

摘 要　自 1979 年开始推行计划生育政策，我国目前已有超 1.7 亿独生子女。他们从出生便拥有父母“独一份”的爱，在独生子女成长过程中面临婚育抉择时，他们会自然过渡还是让渡于他者的期待，他们有哪些考虑并如何做出抉择。本研究采用个体深度访谈的方式收集资料，使用解释学的方法分析资料，探索独生子女的婚恋与生育观及应对方式。通过滚雪球和网络邀请两种抽样方式，邀请符合条件的 9 位独生子女各进行 50-70 分钟的半结构式访谈，音频转录文字共计约 20 万字。基于解释学分析的理论与方法，使用 Nvivo.12 软件作为辅助性工具，对资料进行开放式编码与主题聚合，聚合出四个核心主题及其相关

主题：（1）独生子女的婚育抉择，独生子婚育抉择为目标适宜型与资源拥有型，独生女婚育抉择为情感相融型与迷茫纠结型；（2）独生子女原生家庭关系为纠缠、聚合、分寸与疏离；（3）独生子女原生家庭与外界关系分为父系为主、母系为主和距离原则三种类型，其中独生女与母系为主的家族关系较密切。研究结果发现，独生子女的婚育抉择属于建构性多元化问题，建构性是由于未婚未育的独生子对婚育存在现实考量，独生女存在情感要求与期待；已婚独生子在生育方面向往“多子多福”，已婚独生女表现为迷茫与纠结。多元化是基于独生子女原生家庭内外部的关系，包括内部亲子关系与外部家族与社会关系。独生子女在婚育抉择方面存在性别差异，应对方式存在个体差异。

Transition or cession: a hermeneutic inquiry into the marriage and parenting choices of only-child family

Mao Xiaoqing
Xinxiang University, Xinxiang,453002

Abstract：Since the implementation of the family planning policy in 1979, there are now more than 170 million only-child family in China. They have had their parents' one-and-only love since birth. When only-child family face marriage and parenthood decisions during their growth, will they naturally make the transition or give in to the expectations of others, and what considerations do they have and how do they make their choices. This study used individual in-depth interviews to collect data and interpretive methods to analyze the data, exploring only-children's views on marriage and parenthood and their coping styles. Through two sampling methods, snowballing and online invitations, nine eligible only-child family were invited to conduct semi-structured interviews of 50-70 minutes each, with audio transcribed text totaling approximately 200,000 words. Based on the theory and method of hermeneutic analysis, Nvivo.12 software was used as an auxiliary tool to conduct open coding and thematic aggregation of the data, and four core themes and their related themes were aggregated: (1) marriage and parenthood choices of only-children, marriage and parenthood decisions of only-children were of the type of goal-suitability and resource-ownership, and marriage and parenthood choices of only-children were of the type of emotional compatibility and the type of perplexity and tangledness; (2) the relationship of only-children's family of origin was of entanglement, aggregation, and confusion; and (3) the relationship of only-child family on origin was of the type of entangled, aggregated, and tangled. Relationships are entangled, aggregated, measured and detached; (3) the origin and external relationships of only-child family are categorized into three types: paternal-dominated, maternal-dominated and distance-principle, with the only child having a closer relationship with the maternal-dominated family. The results of the study found that the marriage and parenting choices of only-children belong to the problem of constructive pluralism, which is due to the fact that unmarried and childless only-children have realistic considerations about marriage and parenthood, and only-children have emotional requirements and expectations; married only-children aspire to "many children, many blessings", and married only-children are confused and entangled. Diversity is based on the relationships within and outside the only child's family of origin, including internal parent-child relationships and external family and social relationships. There are gender differences in only-children's marriage and parenting choices and individual differences in their coping styles.

He current situation and development trend of psychologically oriented narrative research in the Chinese mainland

—— Knowledge mapping analysis based on CiteSpace

HE Chenglin[1, 3] SHU Yueyu[1] ZHENG Jianhong[2, 3,*]

1 School of Psychology of Northwest Normal University, Lanzhou , 730070

2 Department of Psychology ＆ Institute of Psycho-biography and Life Narrative, Lingnan Normal University, Zhanjiang, 524048

3 Guangdong Provincial Key Laboratory of Development and Education for Special Needs Children, Zhanjiang, 524048, E-mail: zjhong@sina.com

Abstract： This article is based on the China National Knowledge Infrastructure (CNKI) as the main data source, supplemented by other channels to analyze a total of 245 research papers. With the help of EXCEL and CiteSpace6.1R2 visualization software, we have created visual representations of the time distribution of

publications, author and institution collaborations, journal statistics, keyword clustering timelines, and detection of emerging hot topics. The study reveals that: (1) The first narrative research article in mainland psychology was published in 2003. The number of narrative research articles in psychology has been increasing over the years, with a more rapid growth in the last decade compared to the previous one. In particular, an increase in thesis papers (122 out of 245 literature sources accounting for 49.80%) has directly contributed to the continuous development of narrative psychology research. (2) Narrative research in psychology has gradually gained recognition as a research paradigm among universities and research institutions nationwide. Articles published within this field have been accepted by mainstream psychological journals. (3) In terms of research methods, most narrative psychology studies conducted on mainland China (53.06% of papers analyzed) primarily utilize semi-structured interviews for data collection. A few studies employ narrative interviews or life story interviews while some thesis papers adopt multiple methods. As for analysis methods, narrative analysis is predominantly used (68.57%), occasionally combined with thematic analysis or other mixed methods. (4) The top ten clusters identified within the content analysis are occupational identity, self-narrative, teacher development/growth stories/tales/narratives/stories/life stories/self-identity/kindergarten/stories/university students/self-related themes; among them identity-related studies constitute major content areas and hot topics. (5) The scope of narrative psychological research continues to expand with increased attention given to narratives from marginalized groups that are often overlooked by mainstream society or labeled negatively such as special education teachers, deaf parents, male kindergarten teachers, male nurses, individuals with same-sex orientation, deaf children, and internet-addicted youth. (6) The number of publications on narrative research with a psychological orientation in mainland China has been fluctuating, and the research community is continuously growing. While there have been some innovative research findings, progress is not significant. Currently, it is necessary to overcome issues such as scattered collaboration, vague concepts, chaotic practices, insufficient scientific standards, and lack of new research hotspots. In the future, research should be based on traditional Chinese narrative resources to construct a narrative psychology theory with localized characteristics. Furthermore, efforts should be made to promote the application and expansion of research achievements in narrative assessment, narratives of special populations, family narratives, national narratives and other different fields.

跨文化经历与自我发展：李小龙的心理传记学研究

谢霞[1] 潘超[1] 许敏[1] 何傲[1] 舒跃育[2]（通讯作者）

1 西北师范大学心理学院心理传记学研究所，兰州，730070

2 西北师范大学心理学院心理传记学研究所，兰州，730070，shuyueyu@nwnu.edu.cn

摘 要 如何解决文化冲突所引发的一系列适应问题是当今跨文化生活的人们共同面临的挑战。以心理传记法探索李小龙成功的跨文化经历可以给我们一定的启发和思考。李小龙一直以功夫高手的形象闻名于世。令人不解的是，作为功夫影片的开创者，自幼酷爱武术的李小龙在大学期间不仅没有选择自己熟悉的表演专业，也没有选择喜爱且擅长的武术（体育），反而选择了与这两者看似毫无关系的哲学。

的确，电影和武术是李小龙童年生活的主题。因为在 18 岁之前，李小龙已经参演过 18 部中国香港华语电影，并师从咏春宗师叶问习武，获得了出色的武术比赛成绩。通常来讲，哲学与功夫是背道而驰的。这条让人迷惑不解的人生道路是如何将代表东方文化的武术与代表西方文化的电影进行了融合，并最终开创了功夫影片呢？

李小龙的成长经历是世界万千华裔的缩影。生活在不同社会文化规范下的人们所具有的心理与行为特征已深深地根植于当地的文化传统之中。与此同时，地域文化的差异与冲突所引发的一系列社会问题也是这类群体面临的共同困境。而以李小龙为例的心理传记研究，可以探究社会文化是以何种机制对个体的心理与行为特征产生着影响。本研究收集关于李小龙的众多公开的资料（采访、纪录片视频，书信，笔记），参照主题分析法对研究资料进行分析。

Cross-cultural experience and self-development:

A psychobiographical study of Bruce Lee

Xie Xia　Pan Chao　Xu Min　He Ao　Shu Yueyu

Institute of Psychobiography, School of Psychology, Northwest Normal University, Lanzhou, P. R.China

Abstract：How to solve a series of adaptation problems caused by cultural conflict is a common challenge faced by people in today's cross-cultural life. Exploring Bruce Lee's successful cross-cultural experience through psychobiography can give us some inspiration and thinking. Bruce Lee has always been known as a Kung Fu master. It is puzzling that, as the pioneer of Kung Fu films, Bruce Lee, who had been loving Kung Fu since childhood, neither chose the performing arts major he was familiar with, nor chose the martial arts (sports) he loved and was good at. Instead, he chose the philosophy that seemed to have nothing to do with the two fields.

Indeed, movies and martial arts were the themes of Bruce Lee's childhood. Because before the age of 18, Bruce Lee had participated in 18 Chinese movies in Hong Kong, China, and learned martial arts from the Wing Chun master IP Man, obtaining excellent martial arts competition results. Generally speaking, philosophy is completely different from Kung Fu. How did this confusing path of life merge martial arts representing Eastern culture with movies representing Western culture, ultimately leading to the creation of Kung Fu films?

Bruce Lee's growth experience is a microcosm of thousands of the Ethnic Chinese in the world. The psychological and behavioral characteristics of people living under different social and cultural norms are deeply rooted in the local cultural traditions. At the same time, a series of social problems caused by regional cultural differences and conflicts are also common dilemmas faced by such groups. The psychobiographical research taking Bruce Lee as an example can explore the mechanism by which social culture affects individual psychological and behavioral characteristics. This study collected a large number of publicly available materials about Bruce Lee (interviews, documentary videos, letters, and notes) and analyzed the research data with reference to the thematic analysis method.

经历校园欺凌者创伤后成长的质性研究

丁乐馨[1]　　舒跃育[1]（通讯作者）

西北师范大学心理学院，心理传记研究所，兰州，730070，shuyueyu@nwnu.edu.cn

摘 要　　虽然校园欺凌造成了严重的身心伤害，但并不是所有遭遇校园欺凌的人都会永远笼罩在黑暗之下生活，有人堕入深渊，也有人在一段时间后得到恢复，还有人置之死地而后生，成长为更加强大的存

在。可见，伤害并非完全带来创伤，还有抗争之后的个体成长。创伤后成长 （posttraumatic growth，PTG）的过程关注受欺凌者的欺凌经历，以及他们是如何应对、创造意义并最终超越创伤经历的。本研究以积极成长为研究导向，从创伤后成长的新视角出发，采用质性研究的方式，主要关注校园受欺凌者的心理变化和成长，旨在探讨经历校园欺凌者创伤后成长的维度，探索创伤后成长的影响因素。具体采用主题访谈法收集原始资料，依据典型性原则选取研究对象。首先使用创伤后成长量表面向 100 位校园受欺凌者进行施测，将其创伤后成长得分进行排序，选取 PTGI 得分较高的 21 位被试进行一对一半结构式访谈，访谈提纲主要围绕 Tedeschi & Calhoun（1996）提出的创伤后成长五因素模型，质性分析软件采用 Nvivo 11.0。研究发现：经历校园欺凌的大学生的心理变化呈现三个阶段：（1）伤心欲绝期（2）心理成长的形成期（3）破茧成蝶期。创伤后成长结果有三个主题十五个亚主题：（1）主题一：个人力量增强，亚主题分别是增强自我效能感、自我调适能力提高、自我依靠感增强、自我提升、解决问题的能力提高和更乐观、自信；（2）主题二：人际体验的改变，亚主题分别是更能够表露和开放自己、同情心与利他意识的提升、社会支持系统增强、主动改善人际关系和与重要他人联系更紧密；（3）主题三：新的精神洞察力，其亚主题分别是更改的优先级、感恩之心、自我关爱和认知重组。创伤后成长的产生机制为积极的认知重评、主动应对、支持资源、自我暴露、模仿学习五个因素。无论是学生、学生家庭成员、学校管理者还是公众，每个人对反校园欺凌都负有责任，我们应对经历校园欺凌者创伤后成长有更加全面的认识，及时关注并给予他们更多帮助和多维度心理社会支持，维护未成年人的身心健康，促进其健康成长。

A Qualitative Study on the Post Traumatic Growth of People Experiencing School bullying

Abstract：Although School bullying has caused serious physical and mental damage, not all people who suffer from School bullying will live in the dark forever. Some people fall into the abyss, others recover after a period of time, and some people die and grow into more powerful beings. It can be seen that injury does not bring complete trauma, but also individual growth after resistance. The process of post traumatic growth (PTG) focuses on the bullying experiences of the victim and how they respond, create meaning, and ultimately transcend the traumatic experience. Guided by positive growth and starting from a new perspective of post-traumatic growth, this study focuses on the psychological changes and growth of campus bullies by qualitative research, aiming to explore the dimensions of post-traumatic growth of those who experience School bullying and explore the influencing factors of post-traumatic growth. Specifically, the thematic interview method is used to collect raw data and select research subjects based on the principle of typicality. First, 100 campus bullies were tested on the surface of post-traumatic growth, and their post-traumatic growth scores were ranked. Twenty one subjects with higher PTGI scores were selected for one-on-one Structured interview. The interview outline mainly focused on the five factor model of post-traumatic growth proposed by Tedeschi& Calhoun (1996). The qualitative analysis software was Nvivo 11.0. The research found that the psychological changes of college students who experienced School bullying took on three stages: (1) the heartbreaking stage, (2) the formation stage of psychological growth, and (3) the stage of breaking the cocoon into a butterfly. There are three themes and fifteen sub themes for post traumatic growth outcomes: (1) Theme 1: Personal strength enhancement, with sub themes including enhancing self-efficacy, self-adjustment ability, self-reliance, self-improvement, problem-solving ability, and being more optimistic and confident; (2) Theme 2: change of interpersonal experience. Subthemes are more able to reveal and open oneself, improve the sense of compassion and altruism, strengthen the social support system, actively improve interpersonal relationships and connect more closely with Significant other; (3) Theme 3: New spiritual

insights, with sub themes including changed priorities, gratitude, self care, and cognitive restructuring. The mechanism of post traumatic growth includes five factors: positive cognitive reappraisal, proactive coping, supportive resources, self exposure, and imitative learning. Everyone, whether students, student family members, school administrators or the public, is responsible for combating School bullying. We should have a more comprehensive understanding of the post-traumatic growth of those who experience School bullying, pay timely attention to and give them more help and multi-dimensional psychosocial support, maintain the physical and mental health of minors, and promote their healthy growth.

研究一个人有什么意义？——主体间性视角下的心理传记学解读

丁雪[1]　郭本禹[2]（通讯作者）

1 南京师范大学，南京，210024

2 南京师范大学心理系，南京，210024，snowy_927@sina.com

摘 要　虽然个案研究历史悠久，但国内学届对个案研究的认识尚存较大空间。作为个案研究中的典型代表，今日的心理传记学依然面临诸多不解与质疑。首当其冲的便是对单个案研究的价值质疑。研究单独个体能得出可推广的结论吗？没有无关变量的控制，研究结果如何保障其可靠性？研究为何作为心理学研究出现在心理学领域而不属于文学领域？面对这些来自主流心理学的拷问，心理传记学者给出了诸多角度思考与尝试。

第一种，方法建设的尝试。部分学者沿着科学心理学立场出发，积极推进心理传记的方法建设，不断提升其研究过程的可靠性，这条路径以 Alexande、Schultz 为代表；第二种，来到实证心理学的上下游，将心理传记学推入科学心理学理论发现的上游位置，以及推入验证科学心理学研究成果有效性的下游位置。这条路径以 Ponterotto 为代表；第三种，将心理学分区划片，主动为心理传记学划定合法区域。具体谈来，将心理学研究分为三大领域，适合所有人的研究，适合部分人、部分范围的研究以及适合具体个人的研究。这条路径以 Runyan 为代表。

第四种，深入主流心理学腹地，深入客观性、抽象性、普遍性的元心理学理论场域，以彻底消除理论中的主观性成分，追求理论的绝对普遍性为行动出发点，将心理传记学推入死地而后生。这条路径以 Atwood、Stolorow 为代表。前三种路径学界已经有所了解。我们择第四种建设路径作简要介绍。

关键词　主体间性（intersubjectivity），心理传记学，个案研究

What's the point of studying a person? Psychobiographical interpretation from the perspective of intersubjectivity

Ding Xu　GUO Benyu

1 Nanjing Normal University, Nanjing 210024, China

2 Department of Psychology, Nanjing Normal University, Nanjing 210024,

snowy_927@sina.com

Abstract：Although case study has a long history, there is still a large space for the understanding of case study in domestic scholars. As a typical case study, today's

psychobiography still faces many incomprehension and questions. The first is to question the value of individual case studies. Can the study of individual individuals draw generalizable conclusions? Without the control of irrelevant variables, how can the results be guaranteed to be reliable? Why does research appear in the field of psychology as psychological research and not in the field of literature? In the face of these interrogations from mainstream psychology, psychobiographers have given many perspectives and attempts.

The first is an attempt at method construction. Starting from the standpoint of scientific psychology, some scholars actively promoted the method construction of psychobiography and constantly improved the reliability of its research process. This path was represented by Alexande and Schultz. The second is to go upstream and downstream of positive psychology, pushing psychobiography into the upstream position of theoretical discoveries in scientific psychology and the downstream position of verifying the validity of scientific psychology research results. This path is represented by Ponterotto; The third is the partitioning of psychology and the active delineation of legal areas for psychobiography. To be specific, psychological research is divided into three major areas: research suitable for all people, research suitable for some people, partial range of research and research suitable for specific individuals. This path is represented by Runyan.

The fourth is to go deep into the hinterland of mainstream psychology, to go deep into the objective, abstract and universal meta-psychological theory field, to completely eliminate the subjective component of the theory, to pursue the absolute universality of the theory as the starting point of action, and to push the psychobiography into death. This path is represented by Atwood and Stolorow. The first three paths are well known. We choose the fourth construction path for a brief introduction.

国家高新区社区氛围的质性探索

岳童[1]　龙晖[2]

1 西南大学心理学部，重庆，400715

2 西南大学国家治理学院，重庆，400715，通讯作者 yue.suhong@163.com

摘 要　国家高新技术产业开发区是我国实施创新驱动发展战略的重要载体，在转变发展方式、优化产业结构、增强国际竞争力等方面发挥着重要作用。本研究采用开放式主题访谈的质性研究方法，对来自重庆、北京、苏州、上海、西安、深圳、武汉、成都、广州、合肥等地国家级高新区的 20 名科技人才和管理者进行了访谈，以期揭示高新区科技人才和管理者对氛围的主观感受及产生路径。研究表明：（1） 国家高新区科技人才和管理者理想的高新园区社区氛围结构，即包涵了管理氛围、生活氛围、人际氛围及创新氛围四个维度；（2）科技工作者对高新区氛围的感受主要体现在两点，一是与高新区社区氛围的交互作用过程中产生的对所在园区的心理感受，包括认同感、归属感和希望感三个方面，二是在良好的高新区社区氛围中，科技工作者自身也会产生心理感受上的良性循环，包括创业热情、自我肯定感和幸福感；（3）科技工作者所理解的氛围营造的功能主要体现在人才吸引安居功能和工作效率提升功能这两个方面。总之，本研究初步构建出高新区社区氛围的心理结构模型及其对人才聚集、成长的心理作用路径，这可以为高新区创新人才发展体制机制、优化人才发展环境、最大限度激发人才创新创业活力提供理论借鉴和政策参考。

Qualitative Exploration of Community Climate in National High tech Zone

Yue Tong
(Faculty of Psychology, Southwest University, Chongqing 400715, China)
Long Hui
(College of State Governance, Southwest University, Chongqing 400715, China)

***Abstract*：** The National High tech Industrial Development Zone is an important carrier for China to implement the innovation driven development strategy, playing an important role in transforming the development mode, optimizing industrial structure, and enhancing international competitiveness. This study used a qualitative research method of open-ended thematic interviews to interview 20 scientific and technological talents and managers from national high-tech zones in Chongqing, Beijing, Suzhou, Shanghai, Xi'an, Shenzhen, Wuhan, Chengdu, Guangzhou, Hefei, and other regions, in order to reveal the subjective feelings and production paths of the atmosphere of scientific and technological talents and managers in high-tech zones. Research has shown that: (1) the ideal community atmosphere structure for high-tech talents and managers in national high-tech zones includes four dimensions: management atmosphere, life atmosphere, interpersonal atmosphere, and innovation atmosphere; (2) The feelings of technology workers towards the atmosphere of the high-tech zone are mainly reflected in two aspects. Firstly, the psychological feelings generated during the interaction with the community atmosphere of the high-tech zone towards the park, including a sense of identity, belonging, and hope. Secondly, in a good community atmosphere of the high-tech zone, technology workers themselves will also experience a virtuous cycle of psychological feelings, including entrepreneurial enthusiasm, self-affirmation, and happiness; (3) The function of creating an atmosphere as understood by technology workers is mainly reflected in two aspects: attracting talents to settle down and improving work efficiency. In summary, this study has preliminarily constructed a psychological structure model of community atmosphere in high-tech zones and its psychological impact path on talent aggregation and growth. This can provide theoretical reference and policy reference for the development mechanism of innovative talents in high-tech zones, optimization of talent development environment, and maximum stimulation of talent innovation and entrepreneurship vitality.

质性心理学视角下自闭症儿童母亲生命故事初探

李继波
岭南师范学院心理系，湛江，524048

摘 要　由于自闭症难以治愈，家长尤其是母亲承受着持续的高强度的心理压力。目前对自闭症儿童母亲的研究多采用量化研究的方法，而量化研究无法从微观层面对问题进行深入细致的描述和分析，并且容易忽略人类经验的动态性和丰富性。本研究直接以自闭症儿童母亲为研究主体，将母亲放置于其整个生

命历程中来了解，采用质性研究的方法来揭示自闭症儿童母亲生活经验的本质与意义。在这个过程中，特别重视母亲这个性别角色在自闭症儿童确诊前后的心路历程，以质性心理学为理解的视角，感受自闭症儿童母亲的苦辣酸甜。本研究的数据来自 15 位自闭症儿童母亲的生活故事，通过面对面的半构造访谈收集，使用修订的生活故事访谈法。该研究中的数据分析是一个混合了访谈、转录、备忘录撰写、成员检查、同行评审和研究人员反思的循环。采用主题分析法，从熟悉数据、生成初始代码、寻找专题、审查专题、确定和命名专题以及生成报告来确定数据集中的主题。自闭症儿童母亲的生命故事中呈现出六个主题：确诊前的幸福生活、确诊带来的心理应激、长期养育带来的压力、自我调整、社会支持、孩子的未来。文章进一步探究了自闭症儿童母亲认为她们仍然需要额外支持的地方，以及她们认为对自我调整有用的关键策略和资源。

关键词　自闭症，母亲，生命故事，主题分析，质性研究

A preliminary study on the life story of mothers of autistic children from the perspective of qualitative psychology

LI Jibo

Department of Psychology, Lingnan Normal University, Zhanjiang, 524048

***Abstract*:** As autism is difficult to cure, parents, especially mothers, are under constant and intense psychological stress. Most current research on mothers of children with autism uses quantitative studies, which are unable to describe and analyze the problem in depth and detail at the micro level, and tend to ignore the dynamics and richness of human experience. This study takes mothers of children with autism directly as the subject of the study, placing mothers in the context of their entire life course to understand them, and using qualitative research methods to reveal the nature and meaning of the life experiences of mothers of children with autism. In this process, special attention is given to the journey of the gender role of mother before and after the diagnosis of an autistic child, and qualitative psychology is used as a lens for understanding the bitterness and sweetness of mothers of autistic children. Data for this study came from the life stories of 15 mothers of children with autism, collected through face-to-face, semi-constructed interviews using the Revised Life Story Interview Method. Data analysis in this study was a mixture of interviews, transcription, memo writing, member checking, peer review, and researcher reflection cycles. Thematic analysis was used to identify themes in the dataset from familiarization with the data, generating initial codes, finding themes, reviewing themes, identifying and naming themes, and generating reports. Six themes emerge from the life stories of mothers of children with autism: a happy life before diagnosis, psychological stress from diagnosis, stress from long-term parenting, self-adjustment, social support, and the future of the child. The article further explores where mothers of children with autism believe they still need additional support, as well as key strategies and resources they find useful for self-adjustment.

教师教学效能感的潜类别增长轨迹

——基于解释性序列设计的混合研究

吴胤霖[1]　陈煦海[2]（通讯作者）

1 陕西师范大学心理学院，西安，710061

2 陕西师范大学心理学院，西安，710061，shiningocean@snnu.edu.cn

摘 要　目的：考察新教师入职三年(T3-T5)教学效能感的潜类别增长轨迹，以及入职前两年(T1-T2)的预测变量和入职第三年(T5)的结果变量的影响。方法：采用混合研究解释性序列设计，对 196 名中小学教师职初历时 3 年(T3-T5)的 3 次追踪测量，相邻时间点间隔 1 年，使用 Mplus7.4 对数据进行线性潜类别增长模型和二次函数型潜类别增长模型的差异分析,考察新教师入职三年教学效能感的潜类别增长轨迹；再回溯教师入职前两年(T1-T2)的职业态度，使用稳健三步法的 R3STEP 程序进行多元 Logistic 回归分析，探究教师入职前两年的职业认同感和职业使命感对教学效能感发展轨迹的作用；使用 DU3STEP 方法进行平均差异检验，探究教学效能感发展轨迹对入职第三年(T5)生活满意度和希望感的影响。在量化研究结果的基础上编制半结构化访谈提纲，采用目的抽样对 15 名教师进行访谈，使用 Nvivo11.0 对文字资料作三级编码分析，提取出类属和核心概念。结果：三分类的二次函数型潜类别增长模型为教师教学效能感发展轨迹的最优拟合模型，分别为“高效能-稳定”、“较高效能-稳定”、“中效能-下降-不稳定”；教师入职前两年的职业认同感、职业使命感能够显著跨时预测此后 3 年教学效能感的发展趋势；教师的教学效能感越高，教学效能感发展越稳定，就能获得越高的生活满意度和希望感；质性研究结果进一步分析了教师教学效能感的发展趋势及影响因素。

Trajectories of latent sub-category growth in teachers' sense of teaching efficacy: A mixed-methods explanatory sequential design

WU Yinlin, CHEN Xuhai

(School of Psychology, Shaanxi Normal University, 199 South Chang'an Road, Xi'an 710062, China)

***Abstract*：** **Objective:** To examine the latent sub-category growth trajectories of teaching efficacy among new teachers in their first three years (T3-T5) and the impact of predictive variables during the first two years (T1-T2) and outcome variables in the third year (T5) of their employment. **Methods:** A mixed-methods explanatory sequential design was employed, involving three waves of tracking measurements over a span of three years (T3-T5) for 196 primary and secondary school teachers. Using Mplus7.4, linear latent class growth models and quadratic latent class growth models were analyzed to explore the differences in growth trajectories of teaching efficacy among new teachers during their first three years of employment. The R3STEP procedure of robust three-step regression analysis was used to retrospectively examine teachers' professional attitudes during the two years prior to employment (T1-T2) and investigate the role of professional identity and mission in shaping the trajectory of teaching efficacy development. The DU3STEP method was utilized for mean difference testing to examine the impact of teaching efficacy trajectory on life satisfaction and hope in the third year of employment (T5). Based on the quantitative research findings, a semi-structured interview guide was developed, and purposeful sampling was conducted to interview 15 teachers. NVivo11.0 was used for three-level coding analysis of textual data to extract categories and core concepts. **Results:** The quadratic latent class growth model with three classes demonstrated the best fit for the trajectory of teachers' teaching efficacy development, categorized as "High-Stable Efficacy," "Moderately High-Stable Efficacy," and "Moderate-Decreasing-Unstable Efficacy." Teachers' sense of professional identity and mission during the first two years of employment significantly predicted the subsequent three-year trajectory of teaching efficacy. Higher levels of teaching efficacy were associated with more stable

development trajectories, leading to increased life satisfaction and hope. The qualitative research findings further analyzed the developmental trends and influencing factors of teachers' teaching efficacy.

Keywords：teaching efficacy, latent category growth model, mixed-methods

消除服务暗礁：应用心理专硕研究生心理疾病污名的叙事研究

田昊 [1,2] 王晓刚 [1]

1 西南民族大学教育学与心理学学院，成都，610014

2 西华师范大学教育学院，南充，637000，wxg@swun.edu.cn

摘 要 心理疾病污名是指个体在社会互动中对心理疾病患者存有的负面评价、消极情感体验和歧视倾向，也是心理健康服务过程中的最大“暗礁”。研究发现心理健康服务人员对心理疾病患者也存在不可忽视的污名，这不仅严重影响了患者的治疗和康复，还降低了其对从事自身职业的意愿和信心。新时代中国特色社会心理服务体系建设亟需大量的心理健康服务专业人员，应用心理专硕是这方面学历人才培养的重要阵地。然而，当前鲜有应用心理专硕人才培养单位关注学生的心理疾病污名改善问题，以及探讨人才培养课程、实习和实践等对学生心理疾病污名的作用机制。因此，本研究通过叙事研究的范式了解应用心理专硕研究生的心理疾病污名现状，探寻专业化学历教育对其心理疾病污名的影响，以提升学生的助人工作胜任力。

本研究采用三维度叙事研究法对教育部教指委应用心理专硕试点培养单位 5 位应用心理专硕研究生进行深度访谈并完成故事架构，探讨其从入学到成长为心理健康服务专业人员期间的心理疾病态度变化及影响因素，并探讨去污名化干预手段。结果发现：（1）学生的心理疾病态度在学习期间呈现出积极改变，这与其受到的专业教育有很大关联，尤其是所接受的心理健康课程教育和专业实习实践；（2）社会文化、重要他人、风险把控、教育机制、关键事件、人际亲疏、个人特质等因素是影响应用心理专硕研究生心理疾病态度的关键因素；（3）通过专业知识、自我觉察、专业督导、教育信息和即时化等具体办法可以干预其自身的心理疾病态度，降低心理疾病污名。

综上所述，本研究发现应用心理专硕研究生具有一定的心理疾病污名，并且随着专业化学历教育的推进，污名程度会随之降低。研究结果表明学历教育中的有效因子有助于降低心理疾病污名，试点培养单位开展的人才培养模式有助于培养学生树立积极的心理疾病观。

Eliminating service barriers: Professional development:A narrative study of the attitude of applied psychology to mental illness

Tian Hao，Wang Xiaogang

School of Education and Psychology, Southwest Minzu University, Chengdu

Abstract： Mental illness stigma refers to the negative evaluation, negative emotional experience, and discrimination that individuals have towards people with mental illness in social interactions.It also is the biggest hidden reef in mental health service. Previous studies have found that mental health service providers also stigmatize people with mental illness, which not only seriously affects the treatment and rehabilitation of patients, but also reduces their willingness and confidence to pursue their profession. The construction of social

psychological service system with Chinese characteristics in the new era urgently needs a large number of mental health service professionals, and the application of psychological master's degree is an important position for the cultivation of academic talents in this regard. However, few applied psychology talent training units pay attention to the improvement of students' attitude towards mental illness, and explore the mechanism of talent training courses, internships and practices on students' attitude to mental illness. Therefore, this study uses the paradigm of narrative research to understand the current situation of mental illness attitudes of applied psychology graduates, and explores the influence of professional academic education on their mental illness attitudes, so as to improve students' ability to help others.

In this study, a three-dimensional narrative research method was used to conduct in-depth interviews and complete the story structure of five master's degree students in applied psychology, discuss the changes and influencing factors of mental illness attitudes from entry to growth as mental health service professionals, and explore destigmatization interventions. The results found: (1) positive changes in attitudes towards mental illness, which was greatly related to their postgraduate education, especially curriculum education and professional internships; (2) Social culture, significant others, risk control, educational mechanism, key events, interpersonal affinity, and personal characteristics were the key factors affecting the attitude of the five graduate students in applied psychology to mental illness; (3) Through specific methods such as professional knowledge, self-awareness, professional supervision, educational information and immediacy, they can intervene in their own mental illness stigma.

In summary, this study finds that applied psychology master's degree students have a certain stigma of mental illness, and with the advancement of professional academic education, the degree of stigma will decrease. This shows that effective factors in academic education help reduce the stigma of mental illness, and that the talent cultivation model carried out by pilot training units helps cultivate students to establish a positive outlook on mental illness.

民族地区青少年国家认同：结构与影响因素

岳彩镇[1] 刘 将[2]

1. 贵州民族大学，贵阳，550025，通讯作者 yczpsychology@163.com

2. 云南师范大学教育学部，昆明，650500

摘 要 党的二十大报告指出：“深化爱国主义、集体主义教育，着力培养担当民族复兴大任的时代新人”。《新时代爱国主义教育实施纲要》明确指出，“要把青少年作为爱国主义教育的重中之重”。国家认同是国家凝聚力和向心力的重要体现，是爱国主义教育的核心之所在。因此，爱国主义必然以国家认同为基础和前提，爱国主义教育本质上是一种国家认同教育。本研究针对青少年国家认同的结构内涵、影响因素、建构过程和提升路径等主题，对 17 名学生进行结构式访谈。结果发现，青少年国家认同包括认知评价、情感依恋和行为倾向三个维度；在青少年国家认同形成过程中，知觉到的群际评价和时间连续性（如国家集体记忆、集体未来想象）起着重要作用；并且民族地区青少年对国家存在着显著的积极偏向。鉴于认同问题是青少年心理发展中的核心问题，本研究关于民族地区青少年国家认同的探讨，对于铸牢中华民族共同体意识具有重要的现实意义。

关键词 民族地区，青少年，国家认同，访谈法

National Identity of Adolescents in Ethnic Regions: Structure and Influencing Factors

YUE Caizhen
Guizhou Minzu University, Guiyang, 550025
LIU Jiang
School of Education, Yunnan normal University, Kunming 650500

Abstract: The 19th National Congress of the Communist Party of China pointed out the importance of "deepening patriotic and collectivist education, focusing on cultivating the new generation capable of shouldering the great responsibility of national rejuvenation." The "Outline of Patriotic Education in the New Era" clearly emphasizes the significance of prioritizing adolescents in patriotic education. National identity embodies the cohesion and centripetal force of a country, representing the core of patriotic education. Hence, patriotism is inherently based on and contingent upon national identity education. This study aims to explore the structural connotations, influencing factors, developmental process, and paths to enhance the national identity of adolescents. Structured interviews were conducted with 17 students. The results revealed that adolescents' national identity comprises three dimensions: cognitive evaluation, emotional attachment, and behavioral inclination. Perceived intergroup evaluations and temporal continuity (such as national collective memory and collective future imagination) play crucial roles in the formation of national identity among adolescents. Moreover, ethnic region adolescents exhibit a significant positive bias towards their nation. Considering that identity issues are fundamental in the psychological development of adolescents, this study's investigation into the national identity of adolescents in ethnic regions holds substantial practical significance in fostering the consciousness of the Chinese national community.

Keywords: Ethnic Regions, Adolescents, National Identity, Interview Method

中国人时间洞察力的质性探究

吴　娜[1]　岳　童[1]　傅安国[2]
1 西南大学心理学部，重庆，400715
2 海南大学国际商学院,海口,570228,通讯作者 naya1225@126.com

摘　要　时间洞察力是个体精准把控时间的品格。当前，西方学者对时间洞察力的概念化与研究均含糊不清，国内学者的客位化研究取向亦难以触及中国人时间洞察力的实质。文章以中国人的时间洞察力为切入点，采用基于深度访谈的扎根理论方法，运用访谈精英的取样策略，以学术精英、政治精英及企业精英为研究对象，构建出中国人时间洞察力的三维结构模型。研究表明：1）在中国人的时间洞察力中，过去、现在和未来是有机整合的，个体在心理时间的往返回荡中扫描而生成历史理性并用来指导实践，进而构建出一种可以克服“理想”与“现实”矛盾的人文时间；2）中国人的时间洞察力有一套极为独特的思考，认为历史会遵循某种规律(即“势”)而向前推进，掌握时机(时点)、把握火候(时距)并遵从规律(时序)便能因势利导获取成功；3）在中国人的时间洞察力中，个人的生命时间虽然有限，但是主动参与群体共业却可创造出“超时间”的意义，继而创造其生命永恒不朽之价值。这种升华生命情感的超时间观，可能是疗愈现代时间病症的儒家养分。

Qualitative research into the “Time Perspective” of Chinese People

Wu Na
Faculty of Psychology, Southwest University, Chongqing 400715, China
Yue Tong
Faculty of Psychology, Southwest University, Chongqing 400715, China
Fu Anguo
International Business School, Hainan University, Haikou 570228, China

Abstract: Time perspective (TP) is the individual's character of accurately controlling time. Currently, both the conceptualization and research on TP by Western scholars are unclear, and the research orientation of domestic scholars also fails to grasp the essence of Chinese individuals' TP. Taking Chinese TP as the starting point, this article adopts a grounded theory approach based on in-depth interviews and employs a sampling strategy of interviewing elites, including academic elites, political elites, and business elites, to construct a three-dimensional structural model of Chinese TP. Results show that 1) in Chinese people’s TP, the past, present, and future are organically integrated, and individuals scan back and forth in mental time to generate historical rationality and obtain practical guidance for living, thus building a humanistic perspective of time that can overcome the contradiction between the “ideal” and “reality”; 2) in terms of TP, Chinese people have a unique way of thinking. They believe that history will follow a certain inner force (i.e., “momentum”) to move forward, and by mastering timing (temporal locus), grasping the duration and degree of time (temporal duration), and following the law (temporal succession), one can obtain success; (3) according to Chinese people’s TP, although an individual’s life span is limited, active participation in group work can create “super-temporal” meaning that has eternal value. This super-temporal perspective, which sublimates emotions experienced in life, may be the Confucian nutrient for healing the ills of modern life.

Keywords: time perspective, humanistic time orientation, super-temporal concept, modern time sickness, grounded theory

更高的经济不平等会导致更高的再分配偏向吗？不平等归因的调节作用

白洁
安徽大学哲学学院，合肥，230039，jbai@ahu.edu.cn

摘 要　经济不平等的增加一定会导致民众再分配偏向的增加吗？长期以来，经济不平等对再分配偏

向的影响备受研究者的关注，不过二者的关系目前还存在较大分歧。一些研究基于自利动机视角发现经济越不平等，民众的再分配偏向越高。然后也有研究发现随着经济不平等的增加，民众的再分配偏向并未随之增加。针对这一研究分歧，本研究基于公平认知视角的观点及相关研究发现，揭示出了贫富差距归因在二者关系中的调节作用。研究 1 基于问卷法，通过经济不平等感知量表、不平等归因问卷、再分配偏向量表对 676 名城乡居民展开了调查。结果发现对于持有较高外归因倾向的个体，经济不平等感知对再分配偏向正向预测作用显著；但对于持较高内归因倾向的个体，预测作用不显著。研究 2 进一步基于实验法验证了这一调节效应的因果关系。研究将 150 名成人被试随机分到低不平等外归因、高不平等外归因、低不平等外归因、低不平等内归因四种启动条件。结果发现在外归因启动条件下，经济不平等感知启动对再分配偏向存在正向影响效应；而在内归因启动条件下，经济不平等感知启动对再分配偏向的影响不显著。本研究为解决以往的研究分歧提供了一种思路，同时也为我国推动共同富裕的实践带来了社会治理启示：即不能以平均主义的眼光看待共同富裕，对于不公平的收入差距（由外部环境造成的，如灰色收入、垄断收入等）固然要缩小，但对于公平的收入差距（由个体内部因素造成的，如创新创业收入、公平竞争收入等），仍然要予以保护。如此，将能够满足民众的再分配需求，激发劳动积极性，并最终有助于共同富裕的实现。

关键词 经济不平等感知，不平等归因，再分配偏向，共同富裕

Does higher economic inequality cause higher support for redistribution? The role of attributions for inequality

BAI Jie

School of Philosophy, Anhui University, Hefei, 230039, China

Abstract：Does an increase in economic inequality necessarily lead to a rise in people's redistributive preferences? For a long time, researchers have paid much attention to the relationship between economic inequality and redistributive preferences, but it still needs to be clarified. Some studies based on the self-interest perspective found that the more unequal the economy, the higher the redistributive preferences of people. However, other studies have found that people's redistributive preferences have not increased with economic inequality. To solve these study controversies, from an ideology perspective, the present study uncovered that attributions for inequality could moderate the relationship between economic inequality and redistributive preferences. In study 1, we surveyed 676 adults, showing that perceived inequality correlated positively with redistributive preferences among people holding external attributions. In contrast, there was no significant relationship between perceived inequality and redistributive preferences among people holding internal attributions. In study 2, we experimented with 150 adults and primed both perceived inequality and attributions for inequality. The results were similar: the effect of primed perceived inequality on redistributive preferences was positive among people primed with external attributions but not significant among people primed with internal attributions. These findings provide an important solution to the controversies in previous studies and shed some light on how to realize common prosperity in China. Specifically, our government needs to implement policies to narrow income gaps resulting from external and unfair factors, such as gray and monopoly income. While for those income gaps resulting from internal and fair income factors, the government still needs to protect and encourage them, such as start-up and free competition income. This way, it will satisfy people's redistributive needs, stimulate labor enthusiasm, and help promote common prosperity eventually.

Keywords： perceived economic inequality, redistributive preferences, attributions for inequality, common prosperity

敬畏对不同社会阶层亲社会行为的影响及其机制

赵越[1]　胡小勇[1]（通讯作者）

1 西南大学心理学部，西南大学人格与认知教育部重点实验室，重庆，400715，huxiaoyong@swu.edu.cn

摘 要　敬畏是一种对浩瀚的刺激以及现有心理结构无法适应的刺激的情感反应。现有实证证据显示，作为一种积极的社会情感，敬畏可以通过激发小我感与真我感促使人们做出亲社会行为。然而，对于这种积极情绪将怎样具体作用于不同的社会阶层群体以发挥其亲社会效应，目前研究尚未得到明确结论。基于“大二”框架和社会阶层心理学的相关理论，本文以 724 名学生为被试，通过相关研究考察了敬畏对不同社会阶层个体亲社会行为的影响及其内在机制。结果发现，小我感和真我感在特质性敬畏和个体亲社会倾向之间起到中介作用；进一步分析发现，对于低阶层者而言，敬畏会更多地通过小我感促进亲社会行为的产生；而对于高阶层者而言，敬畏则更多地通过真我感促进亲社会行为。上述结果表明，敬畏对高低阶层者的亲社会行为均能产生积极的作用，只是背后所诱发的心理机制不同。以上研究结果有助于在一个系统的视角下解释敬畏作用于不同社会阶层群体亲社会行为的内在机制；对未来针对不同社会阶层者的心理特点充分发挥敬畏的积极干预作用并开发出有效的干预策略具有十分重要的参考意义，其结论可以为推进以慈善捐赠为核心的第三次分配战略的实施提供心理学建议，促进不同社会群体都参与分配的人人向善的社会氛围。

The effect of awe on prosocial behaviors of different social classes and its mechanisms

ZHAO Yue[1], HU Xiaoyong[1]

1 Faculty of Psychology, Southwest University, Key Laboratory of Cognition and Personality, Ministry of Education, Chongqing 400715, China

Abstract：Awe is an emotional response to vast stimuli that challenge the current frames of reference and require a new schema to accommodate. The current empirical evidence suggests that awe, as a positive social emotion, can motivate prosocial behaviors by stimulating feelings of small self and authentic self. However, research has not yet reached a clear conclusion as to how this positive emotion would work specifically in different social class groups to exert its prosocial effects. Based on the "Big Two" framework and the relevant theory of social class psychology, this paper examines the effects of awe on the prosocial behaviors of individuals from different social classes and its underlying mechanisms through a correlation study with 724 subjects. It was found that the sense of small self and the sense of authentic self mediated the relationship between dispositional awe and prosocial tendencies; further analyses revealed that for lower class individuals, awe would be more likely to promote prosocial behaviors through the sense of small self, whereas for higher class individuals, awe would be more likely to promote prosocial behaviors through the sense of authentic self. The above results suggest that awe can have a positive effect on prosocial behavior in both high and low class groups, but the underlying psychological mechanisms are different. The above findings help to explain the underlying mechanisms by which awe acts on the prosocial behavior of different social class groups in a systematic perspective. It is a very important reference for the future development of effective intervention strategies to fully utilize the positive

intervention role of awe in response to the psychological characteristics of people from different social classes. Its conclusions can provide psychological recommendations for advancing the implementation of the third distribution strategy centred on charitable giving, and promote a social atmosphere in which different social groups participate in the distribution for the good of all.

Keywords：awe, social class, small self, authentic self, prosociality

站得高，看得远？社会阶层对长远目标追求的影响

王阳[1] 于泽坤[2] 郭永玉[1]（通讯作者）

1 南京师范大学心理学院，南京，210097，通讯作者 yyguo@njnu.edu.cn

2 中建八局第四建设有限公司，青岛，266000

摘 要 近年来，自媒体极大揭开了贫富群体不同生活现状的面纱，浸染着民众的心态及行为，部分个体沉迷追求短平快的娱乐、生活甚至成长模式。尤其是在大学这一相对自由的阶段，来自不同社会背景的大学生表现出截然不同的长远目标追求以及一系列行为表现。如何解释和尝试改变这一现状？本研究通过 3 个研究，逐步深入考察了社会阶层对大学生长远目标追求的影响作用及其过程。研究 1（N = 427） 基于问卷法，通过社会阶层指标、长远目标追求对在校大学生展开调查。结果发现社会阶层对长远目标追求的正向预测作用显著。研究 2（N = 247） 基于实验法，将被试随机分为高阶层启动组、低阶层启动组，来探索社会阶层影响长远目标追求的心理机制。结果发现公正世界信念在两者之间起到了中介作用，即相比于高社会阶层，低阶层大学生的公正世界信念更低，并因此表现出水平更低的长远目标追求。研究 3（N = 303） 进一步通过问卷法，考察阶层流动知觉在公正世界信念的中介机制中的调节作用。结果没有发现阶层流动知觉的调节作用，但再次验证了公正世界信念在社会阶层和长远目标追求之间的中介作用。本研究聚焦于社会认知因素对于大学生长远目标追求的影响，为厘清和改变大学生的认知行为表现、促进社会良性流动提供新的视角。

Abstract: In recent years, the self-media has greatly unveiled the different living conditions of the rich and the poor, and has influenced the mentality and behavior of the public, with some individuals indulging in the pursuit of short and quick entertainment, life, and even growth patterns. Especially in the relatively free stage of university, college students from different social backgrounds show very different long-term goals and a series of behaviors. How to explain and try to change this situation? This study examined the role of social class in influencing college students' long-term goal pursuit and its process through three studies. In study 1, we surveyed 427 college students, showing that social class is correlated positively with long-term goal pursuit. In study 2, 247 college students were randomly divided into the high social class initiation group and the low

social class initiation group to explore the psychological mechanism of social class influencing long-term goal pursuit. We found just-world beliefs mediated between social class and long-term goal pursuit. Specifically, lower-class college students have lower just-world beliefs and, as a result, exhibit lower long-term goal-seeking than their higher social class counterparts. In study 3, to further examine the moderating role of perception of class mobility in the mediating mechanism of just world beliefs, we surveyed 303 college students. We did not find a moderating role for perception of class mobility, but again validated the mediating role of just world beliefs between social class and long-term goal pursuit. This study focuses on the influence of social cognitive factors on college students' long-term goal pursuit, providing new perspectives for clarifying and changing college students' cognitive-behavioral performance and promoting healthy social mobility.

Keywords: social class, long-term goal pursuit, belief in a just world, perception of class mobility

自主原因与相依幸福感：重视关系的自主让人更幸福？

莫婉丽[1]　韦庆旺[2]（通讯作者）

1 深圳市福田区东海实验小学，深圳，518040

2 中国人民大学心理学系，北京，100872，weiqingwang@ruc.edu.cn

摘 要　基于自主原因理论和相互依存的幸福感概念，在中国集体主义文化背景中，考察不同类型自主原因与突出关系导向的相依幸福感的关系，并进一步探讨自主原因影响相依幸福感的潜在机制，以及探讨社会阶层在其中的作用。研究一考察相对个人自主原因、相对关系自主原因和相依幸福感的关系，以及考察目标努力和社会阶层在其中的作用。结果发现，相对个人自主原因和相对关系自主原因对相依幸福感的正向预测作用显著，目标努力的中介作用不显著，主观阶层显著负向调节了相对关系自主和相依幸福感的关系。研究二通过情境启动的方式启动被试追求目标的自主原因，发现相对个人自主原因和相对关系自主原因对相依幸福感存在显著的正向预测作用，目标努力在相对个人自主原因、相对关系自主原因和相依幸福感之间的中介作用显著，主观阶层显著负向调节了相对关系自主和相依幸福感的关系。本研究从关系视角出发，分析了关系层面的自主原因和关系导向的幸福感的关系，并揭示了自主原因影响相依幸福感的潜在机制和影响因素。

关键词　个人自主原因，关系自主原因，相依幸福感，社会阶层，目标努力

Autonomous reasons and interdependent happiness: Autonomy for relationships makes people happier?

WanLi Mo

(Shenzhen Futian Donghai Experimental Primary School, Shenzhen, China)

Qingwang Wei

(Department of Psychology, Renmin University of China, Beijing, China)

Abstract: Based on the theory of autonomous reasons and the concept of interdependent happiness, this

study examines the relationship between different types of autonomous reasons (personally autonomous reasons and relationally autonomous reasons) and interdependent happiness in the collectivist culture. And further explore the underlying mechanism of autonomous reasons affecting interdependent happiness and the moderating role of social class in the link between autonomous reasons and interdependent happiness. Study 1 examines the relationship between relatively autonomous reasons and interdependent happiness, as well as the role of goal effort and social class in it. The results showed that relative autonomous reasons had significant positive predictive effects on interdependent happiness, while goal effort had nonsignificant mediating effect, and social class significantly negatively mediated the relationship between relative relationally autonomous reasons and interdependent happiness. Study 2 is an experimental study, which manipulates the subjects' autonomous reasons through situational priming. The results found that relative personally autonomous and relative relationally autonomous reasons have positive effects on interdependent happiness, and goal effort has a significant mediating effect between relative personally autonomous reasons, relative relationally autonomous reasons and interdependent happiness. And social class significantly negatively moderates the relationship between relative relationally autonomous and interdependent happiness. These studies supplement the research on the relationship between autonomous reasons and relationship-oriented well-being, and reveals the underlying mechanism and influencing factors of autonomous reasons affecting interdependent happiness.

Keywords：personally autonomous reasons, relationally autonomous reasons, well-being, interdependent happiness, social class, goal effort

延续性感知和生命意义感对文化自豪的影响

吴良　　毕重增（通讯作者）

西南大学心理学部、心理学与社会发展研究中心，重庆，400715，通讯作者 E-mail: alphapsy@163.com

摘 要　死亡是生存的对立面。恐惧管理理论认为，一旦意识到死亡，人便会投入对文化群体，获得延续性保障，缓解死亡带来的焦虑和恐惧。文化自豪是个体因文化所获得的成就而产生的自豪感，作为一种积极的情绪体验，它不仅受到文化延续性的影响，还与自我延续性、自我生命意义有关。所以，与焦虑、担忧等负面情绪有关的死亡意识，有可能降低人们对于文化延续性的预期，进而减弱与文化相关的积极情绪体验，并且这一路径受到自我延续性和生命意义感的影响。为此，本文通过三个研究考察死亡恐惧与文化自豪感的关系，以及延续性感知和生命意义感在其中的作用。研究 1 采用问卷法探讨文化延续性作为中介变量、生命意义感作为调节变量的解释作用。结果发现：（1）死亡恐惧通过降低文化延续性，削弱文化自豪感；（2）生命意义感在文化延续性和文化自豪间起调节作用，低生命意义感个体的文化历史延续性感知对文化自豪的正向预测作用更显著。研究 2 采用死亡凸显范式，考察死亡恐惧对个体文化自豪感的影响以及文化延续性的作用。结果发现，死亡恐惧通过降低对文化延续性的预测，削弱文化自豪感。研究 3 采用死亡凸显范式，进一步考察死亡恐惧对个体文化自豪感的影响，文化延续性、自我延续性与生命意义感在其中的作用。结果发现：（1）文化延续性的中介作用不显著；（2）生命意义感对文化延续性的调节效应显著，低生命意义感个体的文化延续性对于文化自豪感正向预测作用更强；（3）自我延续性对死亡恐惧的调节效应显著，低自我延续性的个体，死亡恐惧对于文化自豪感的负向预测作用显著，高自我延续性的个体，死亡恐惧对于文化自豪感的预测作用不显著。总体而言，死亡恐惧威胁文化延续性感知，进而降低了文化自豪感；生命意义感、自我延续性的调节作用则揭示了死亡意识与自我感知对个体文化情绪体验的影响，验证了自我与文化之间的相互关系。

关键词　恐惧管理理论，文化自豪，文化延续性，自我延续性，生命意义感

The Influence of Perception of Continuity and Meaning of Life on Cultural Pride

Liang Wu Chongzeng Bi
Faculty of Psychology, Southwest University, Chongqing, 400715, China

***Abstract*:** Terror management theory (TMT) proposed that when recognizing the fact that death is inevitable, individuals hope that their life will continue in some form. Researchers argued that joining culture can give individuals this sense of continuity and buffer their fear of death. Cultural pride is an emotional product of individuals' interaction with culture, influenced by the historical achievement of culture and related to perceived self-perpetuation and meaning of life. Awareness of death leads to a rise in negative emotions such as anxiety and worry, reduces people's expectations of cultural continuity, and then diminishes positive emotions toward culture, but this process may be influenced by perceived self-perpetuation and meaning of life. To this end, this paper investigates the relationship between fear of death and cultural pride as well as the factors that underlie it through three studies.

Study 1 used a questionnaire to examine the effect of fear of death on cultural pride and constructed a moderated mediation model to explore the explanatory role of cultural continuity as a mediating variable and meaning of life as a moderating variable. The results found that (1) fear of death reduced cultural pride by decreasing cultural continuity, (2) meaning of life moderated the effect of cultural continuity on cultural pride, and the positive predictive effect of cultural continuity on cultural pride was more significant for individuals with a low sense of meaning of life compared to individuals with a high sense of meaning of life. Study 2 examined the impact of fear of death on people's cultural pride and investigated the explanatory role of cultural continuity on cultural pride by using mortality salience (MS). The results found that the mediating effect of cultural continuity between fear of death and cultural pride was significant, i.e., fear of death weakened cultural pride by decreasing the prediction of cultural continuity. Study 3 used the same MS to examine the role of fear of death on individual cultural pride and the effect of cultural continuity, and to explore whether meaning of life and self-perpetuation moderate the role of fear of death on cultural pride. The results found that (1) effects between the MS group and the control group on cultural pride were not significant; (2) meaning of life moderated the effect of cultural continuity on cultural pride, the positive predictive effect of cultural continuity on cultural pride was stronger for individuals with low meaning of life compared to those with high meaning of life; (3) the moderating effect of self-perpetuation was significant, and for individuals with low self-perpetuation, the negative predictive effect of fear of death on cultural pride was significant, while for individuals with high self-perpetuation, the predictive effect on cultural pride was not significant.

Overall, these results suggest that individuals' cultural pride is influenced by fear of death, mainly because perceived cultural continuity is threatened, while the moderating effects of meaning of life and self-perception reveal that death, self-perception, and cultural worldview work together to influence individuals' emotional experience of culture, validating the assumption of interaction between individuals and culture.

感知经济社会发展对文化自信的影响：文化包容度的中介作用

董俊莹 李永雪 毕重增（通讯作者）

西南大学心理学部、心理学与社会发展研究中心，重庆，400715，alphapsy@163.com

摘 要　经济社会发展不仅是发生于文化内的社会变迁，也改变文化的认知和评价。本文探讨文化包容度随经济社会发展而影响文化自信的作用路径。研究一采用问卷法获得 396 名调查对象的感知经济社会发展和文化包容度的数据，结果发现经济社会发展对个体的文化自信具有显著正向预测作用，且文化包容度中介了感知经济社会发展对文化自信的影响；主观社会经济地位调节了经济社会发展对文化自信的影响，当主观社会经济地位较低时，经济社会发展对文化自信的影响更为明显。与研究一中静态的文化包容度不同，研究二将文化包容度也作为社会变迁变量，探讨文化包容变迁感是否在感知经济社会发展对文化自信的影响上具有解释力；研究收集了 458 名调查对象的数据，结果在概念水平验证了研究一的发现，文化包容变迁感也是感知经济社会发展对文化自信作用的中介因素；主观社会经济地位没有起到调节作用。两个研究的结果说明经济社会发展的主观感知转化为文化自信是以包容性文化观念及其变迁为桥梁的。感知社会经济发展对文化自信的作用模式的确认对于理解社会变迁与文化观念的关系提供了新证据。

关键词　感知经济社会发展，文化自信，文化包容度，社会变迁,主观社会经济地位

The Influence of Perceived Economic and Social Development on Cultural Self-Confidence: The Mediating Role of Cultural Inclusion

Junying Dong　Yongxue Li　Chongzeng Bi
Faculty of Psychology, Southwest University, Chongqing, 400715, China

Abstract：Economic and social development not only occurs within culture, but also influences people's perception and evaluation of culture. This paper explores the pathway through which cultural inclusion influences cultural self-confidence along with economic and social development. In Study 1， participants (n = 396) were asked to complete self-report questionnaires. The results illustrate that perceived economic and social development significantly exert a direct effect on cultural self-confidence and indirect effect on cultural self-confidence through the mediation of cultural inclusion. Subjective socio-economic status moderates the influence of perceived economic and social development on cultural self-confidence; when subjective socio-economic status is low, the effect is more pronounced. In Study 2, the cultural inclusion is not static but rather a variable that reflects social change. The aim is to explore whether changes in perceived cultural inclusion also mediate the influence of perceived economic and social development on cultural self-confidence. 464 participants were recruited online to complete self-report questionnaires, and the results validate what was found in Study 1 at the conceptual level. The perceived change in cultural inclusion is also a mediator, but subjective socioeconomic status does not play a moderating role. The results of the two studies suggest that the perception of economic and social development translates into cultural self-confidence through the concept of cultural inclusion and its change as a bridge. The identification of the influence of perceived economic and social development on cultural self-confidence provides new evidence for understanding the relationship between social change and cultural perceptions.

Keywords： Perceived economic and social development, Cultural self-confidence, Cultural inclusion, Social changes, Subjective socioeconomic status

未来环保者身份认同:基于社会认同理论的未来工作自我概念

王艇
西南石油大学经济管理学院,成都，610500

摘 要 中国文化强调集体主义和“天人合一”。受此影响，人们也通常从社会情景、人与自然关系的角度定义自己。同时，中国文化也具有长期导向的特征，使得人们关注和看着未来。在工作情景中，员工会基于对未来工作自我的积极期望，形成未来工作自我概念。基于中国文化情景上述特征和未来工作自我的概念，以及社会认同理论，本研究提出未来环保者身份认同的概念。未来环保者身份认同是组织中社会认同的一种形式，指员工在思考和展望未来工作情景中自己与自然环境的关系时，将自我归类到环保者，并由此产生的未来工作自我概念。通过三个研究验证未来工作自我概念。研究 1 依据未来工作自我清晰度测量范式、环保者身份认同、社会身份认同等量表题目发展未来环保者身份认同量表。通过探索性因素分析对量表进行了初步修订，在此基础上，研究结果表明未来环保者身份认同具有良好的因素结构。研究 2 通过验证性因素分析进一步验证了研究 1 所修订的未来环保者身份认同量表的因素结构。研究 3 进一步发现了未来环保者身份认同显著影响员工绿色行为。研究结论初步支持了未来环保者身份认同的概念。最后，研究讨论了未来环保者身份认同的理论和实践意义。包括未来环保者身份认同概念与中国文化的关系，对未来工作自我和社会认同理论的贡献，及其在组织绿色发展背景下的现实意义。

关键词 中国文化，社会认同，未来工作自我，未来环保者身份认同

Future Pro-Environmental Identity： A Social Identity-Based Future Work Self Concept

Ting Wang

(School of Economics and Management, Southwest Petroleum University, Chengdu, China)

Abstract: Chinese culture is characterized by values of collectivism and “the harmony between man and nature”. As a result of this cultural influence, individuals tend to define themselves in terms of their relationships with society and nature. Meanwhile, Chinese culture is long-term oriented, people tend to focus on the future and value long-term interests. In the workplace, employees can develop their future work self from their work-related hopes and aspirations. Drawing on these Chinese characteristics and the concept of future work, this study introduces the concept of Future Pro-Environmental Identity (FPEI). FPEI, a form of social identity in an organization, refers to individuals’ self-categorization as being environmentalists when envisioning their future work scenarios. This research conducted three studies to test the concept of FPEI. Study 1 utilized measures of future work salience, pro-environmental self-identity, and social identity to develop the FPEI measure. Exploratory factor analysis (EFA) was employed for item refinement. The refined measure had a good factor structure. Study 2 confirmed FPEI’s factor structure through confirmatory factor analysis (CFA). Study 3 further reveals that FPEI is positively related to employees’ green behavior. The evidence across three studies thus supported the conception of FPEI. Finally, this research discusses FPEI’s theoretical and practical implications, including its relationships with Chinese culture, its contributions to future work self conception and social identity theory, as well as its practical implications for organizations’ green development.

大学生文化自信对主观幸福感的影响：有调节的中介模型

韩淼[1 2] 邓雨虹[1] 张艳红[1 2]（通讯作者）

1 长江大学教育与体育学院，湖北荆州，434023

2 长江大学社会心理研究中心，湖北荆州，434023
通讯作者：张艳红，E-mail: zhangyanhong1998@163.com

摘 要 全球化趋势所带来的文化交融与文化冲突使人们对本土文化产生了许多思考，文化自信作为各国文化交融或冲突的关键议题之一更是受到诸多关注。文化自信是一个多维的、动态的、复杂的结构，包含个体对文化的归属感、积极评价以及对文化活动的卷入程度。主观幸福感是个体依据自我内化的标准对其生活质量做出的整体性判断，包括生活满意度、积极情绪和消极情绪三个维度。为探究文化自信对主观幸福感的影响，本研究依据社会认知内容的二维度理论、社会比较理论及依恋理论等理论构建了一个有调节的中介模型，来考察文化自信对个体主观幸福感的影响及作用机制。方法：采用文化自信问卷、主观幸福感问卷、文化依恋问卷及亲子关系问卷，对全国各高校的 504 名大学生进行调查，被试平均年龄在 17～24 岁之间(20.74±1.20)，其中男生 113 人(22.40%)，女生 391 人(77.6%)。结果发现：(1)文化自信、主观幸福感、文化依恋、亲子关系四个变量之间呈现显著正相关。(2)文化自信能直接正向预测主观幸福感，还能通过文化依恋的中介作用对主观幸福感产生影响。(3)亲子关系能够调节文化自信与文化依恋之间的关系，即调节中介路径的前半段。结论：本研究验证了大学生文化自信通过文化依恋影响主观幸福感并受到亲子关系调节作用的效应机制，揭示了文化因素与家庭因素的相互作用，为深入理解文化自信与幸福感之间的关系提供了理论支持和实证证据。同时，文化自信与良好的亲子关系产生交互作用，这也为家庭教育提供了新思路，要树立文化自信与家庭教育相结合的意识，使得个体对文化产生更深的情感联结和认同，从而更好地提升国民的文化自信和主观幸福感。

The influence of college students' cultural confidence on subjective well-being: A moderated mediation model

Miao Han[1 2] Yuhong Deng[1] Yanhong Zhang[1 2]
1 College of Education and Sports Sciences, Yangtze University, Jingzhou, Hubei,434023
2 Social Psychology Research Center of Yangtze University, Jingzhou, Hubei,434023
Corresponding: Yanhong Zhang, E-mail: zhangyanhong1998@163.com

Abstract: The trend of globalization has brought about cultural intermingling and cultural conflicts that have led people to think a lot about local cultures, and cultural confidence, as one of the key topics of cultural intermingling or conflicts among countries, has received much attention. Cultural confidence is a multidimensional, dynamic, and complex structure, which includes the individual's sense of belonging to the culture, positive evaluation, and the degree of involvement in cultural activities. Subjective well-being is a holistic judgment on an individual's quality of life based on self-internalized criteria, including three dimensions: life satisfaction, positive emotions and negative emotions. In order to investigate the effect of cultural confidence in subjective well-being, this study constructed a moderated mediation model based on theories such as the two-dimensional theory of social cognitive content, the social comparison theory and the attachment theory to examine the effect of cultural confidence in individuals' subjective well-being and its mechanism of action. Methods: The cultural confidence questionnaire, subjective happiness questionnaire, cultural attachment questionnaire and parent-child relationship questionnaire were used to survey 504 college students from various universities across the country, with the average age of the subjects ranging from 17 to 24 years old (20.74±1.20), of which 113 were male students (22.40%), and 391 were female students (77.6%). The results found that (1) there was a significant positive

correlation between the four variables of cultural confidence, subjective well-being, cultural attachment, and parent-child relationship. (2) Cultural confidence can directly and positively predict subjective well-being, and can also have an impact on subjective well-being through the mediating role of cultural attachment. (3) Parent-child relationship can moderate the relationship between cultural confidence and cultural attachment, that is, moderating the first half of the mediation path. Conclusion: This study verifies the effect mechanism that college students' cultural confidence affects subjective well-being through cultural attachment and is moderated by parent-child relationship, reveals the interaction between cultural factors and family factors, and provides theoretical support and empirical evidence for a deeper understanding of the relationship between cultural confidence and well-being. At the same time, cultural confidence interacts with good parent-child relationship, which also provides new ideas of family education to establish the awareness of the combination of cultural confidence and family education, so as to make individuals have a deeper emotional connection and identification with culture, and thus better enhance the cultural confidence and subjective well-being of nationals.

Keywords: cultural confidence, subjective well-being, cultural attachment, parent-child relationship

大学生感知父母文化社会化与文化自信的关系：父母情感温暖与社会责任感的链式中介作用

陈鏊昕[1 2]　陈心怡[1]　张艳红[1 2]（通讯作者）

1 长江大学教育与体育学院，湖北荆州，434023

2 长江大学社会心理研究中心，湖北荆州，434023

通讯作者：张艳红，E-mail: zhangyanhong1998@163.com

摘 要　经济全球化使世界各国人民交往日益密切，带来机遇的同时也带来了挑战，而文化是一个国家、一个民族的灵魂，文化自信已成为各国备受关注的议题。大学生群体作为新生力量、国家的年轻一代，在接受新事物时也受到了新信息的冲击，多元文化的交流碰撞使得他们的价值观念发生一定转变，较为盲目地追捧外来文化。而父母是孩子学习重要信念和技能的关键社会化中介，父母对孩子的文化教养，对于塑造大学生的文化自信起着十分重要的作用。然而，国内对父母文化社会化方面研究较少，多关注移民家庭或跨种族收养者，暂未将其与本国主流文化建设联系起来。因此，本研究基于心理学角度，从我国大学生感知父母文化社会化和文化自信现况出发，采用问卷法，对大学生感知父母文化社会化对文化自信的影响及其作用机制进行探讨。方法：采用文化自信问卷、感知父母文化社会化问卷、父母情感温暖问卷、社会责任感问卷，对全国各高校 517 名大学生进行调查，其中男生 212 人，女生 275 人。结果发现：(1)感知父母文化社会化能够正向预测文化自信;(2)社会责任感能够在感知父母文化社会化和文化自信的正向影响中起到部分中介作用;(3)父母情感温暖与社会责任感能够在感知父母文化社会化和文化自信的正向影响中起到链式中介作用。结论：本研究验证了父母情感温暖与社会责任感在大学生感知父母文化社会化与文化自信中的链式中介作用，从心理学角度出发为文化自信领域研究提供了实证数据支持。研究不仅促进了文化社会化这一概念的本土化，也有助于为改善大学生与父母的亲子关系和增强社会责任感提供实践指导。

关键词　父母文化社会化，文化自信，父母情感温暖，社会责任感

The relationship between college students' perception of parental cultural socialization and cultural confidence: The chain mediating effect of parental emotional warmth and social

responsibility

Zanxin Chen[1 2] Xinyi Chen[1] Yanhong Zhang[1 2]
1 College of Education and Sports Sciences, Yangtze University, Jingzhou, Hubei,434023
2 Social Psychology Research Center of Yangtze University, Jingzhou, Hubei,434023
Corresponding: Yanhong Zhang, E-mail: zhangyanhong1998@163.com

Abstract: Economic globalization has led to increasingly close communication among people from all over the world. It is not only an opportunity, but also a challenge, and culture is the core of a country and a nation. Cultural confidence has become a topic of great concern for all countries. As a new force and the young generation of the country, college students are also affected by new information when accepting new things, and the multicultural exchange and collision have caused a certain change in their values, and they are more blindly pursuing foreign cultures. Parents are the key socialization mediators for children to learn important beliefs and skills, and parents' cultural upbringing of children plays a very important role in shaping the cultural confidence of college students. However, there is little research on the socialization of parents' culture in China, and more attention is paid to immigrant families or interracial adopters, and it has not been linked to the construction of mainstream culture in the country. Therefore, based on the perspective of psychology, this study uses the questionnaire method to explore the influence and mechanism of college students' perception of parental cultural socialization on cultural confidence from the perspective of psychology. Methods: The cultural confidence questionnaire, the parental cultural socialization questionnaire, the parental emotional warmth questionnaire and the social responsibility questionnaire were used to survey 517 college students across the country, including 212 boys and 275 girls. The results show that: (1) perceiving parental cultural socialization can positively predict cultural confidence; (2) social responsibility can play a partial mediating role in perceiving the positive influence of parental cultural socialization and cultural confidence; (3) parental emotional warmth and social responsibility can play a chain mediating role in perceiving the positive influence of parental cultural socialization and cultural confidence. Conclusion: This study verifies the chain mediating role of parental emotional warmth and social responsibility in college students' perception of parental cultural socialization and cultural confidence, and provides empirical data support for the research on cultural confidence from the perspective of psychology. The research not only promotes the localization of the concept of cultural socialization, but also helps to provide practical guidance for improving the parent-child relationship between college students and parents and enhancing their sense of social responsibility.

中国大学生敬畏情绪的心理结构：基于网络分析方法

吕一超[1,2] 陶言强[1,2] 刘翔平[1,2] 徐前[3] 张潮[3]（通讯作者）
1. 北京师范大学心理学部，北京，100000
2 应用实验心理北京市重点实验室，北京，100000
3 山西师范大学教育科学学院，山西太原，030000，zhangchao951217@163.com

摘 要　敬畏(awe)指当我们面对那些广阔的、浩大的，以及超越我们当前理解范围的事物时产生的惊异的情绪体验。以敬畏原型理论及扩展模型为指导，敬畏情绪包括浩大感(vastness)、连通感(connectedness)、渺小感(tininess, small-self)、自我削弱感(self-diminishment)、服从感(compliance)、顺应需要(need for accommodation)、身体感觉(physical sensations)以及时间知觉变化(altered time perception)八个维度特征。同时，敬畏又可以分为积极敬畏和消极敬畏两大变体，二者具有不同的情绪特征和评价。然而，尚未有研究探究不同敬畏情绪的心理网络结构。因此，本文采用网络分析方法，初步构建并比较中国大学生不同敬畏情绪(积极敬畏和消极敬畏)的偏相关网络结构，评估不同网络中各个维度的强度中心性(expected influence)、中介中心性(betweenness)以及接近中心性(closeness)，并测试了网络结构和中心性指标的稳定性和准确性。

研究采用单因素被试间设计，1318 名被试随机观看积极敬畏、消极敬畏或中性情绪视频，而后完成情绪操纵检验量表和敬畏情绪问卷。网络分析表明，积极敬畏和消极敬畏的网络结构有显著差异($p < .05$).在积极敬畏网络中，除浩大感和身体感觉之间为负相关($r = -0.218$)之外，其余有效连线均为正相关($0.023 \leq r \leq 0.422$)；其中，连接最强的三组维度分别为浩大感和渺小感($r = 0.422$)、服从感和身体感觉($r = 0.386$)、浩大感和连通感($r = 0.348$)。服从感是强度中心性和接近中心性最强的维度，服从感、浩大感以及身体感觉为中介中心性最强的三个维度。而在消极敬畏网络中，所有有效连线均为正相关($0.011 \leq r \leq 0.552$)；其中，连接最强的三组维度分别为浩大感和渺小感($r = 0.552$)、服从感和身体感觉($r = 0.358$)、服从感和连通感($r = 0.322$)。浩大感具有最强的强度中心性，而自我削弱感具有最强的中介中心性和接近中心性。同时，无论是积极敬畏网络还是消极敬畏网络，网络结构和中心性指标均表现出较好的稳定性和准确性。识别不同变体敬畏的网络结构，有助于理解敬畏情绪的内在机制，对于更广泛地、更深刻地体验敬畏情绪有重要意义。

The Structure of Positive and Negative Awe Emotions among Chinese University Students: A Network Analysis

Lv Yichao[1,2]　Yanqiang Tao[1,2]　Xiangping Liu[1,2]　Qian Xu[3]　Chao Zhang[3](Corresponding author)

[1]Faculty of Psychology, Beijing Normal University, Beijing, China, 100000

[2]Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education, Beijing, China, 100000

[3]School of Education Science, Shanxi Normal University, Taiyuan, Shanxi, 030000

Abstract：Awe refers to a unique emotional experience that arises when individuals encounter vast, grand, and incomprehensible phenomena beyond our current understanding. Guided by the prototype theory and expanded model of awe, awe emotions can be characterized by eight dimensions: vastness, connectedness, tininess (or small-self), self-diminishment, compliance, need for accommodation, physical sensations, and altered time perception. Awe also can be categorized into two variants: positive awe and negative awe, each with distinct emotional features and evaluations. However, there is limited research exploring the psychological network structure of different awe emotions. Therefore, using network analysis, this study preliminarily construct and compare the partial correlation network structures of positive and negative awe emotions among Chinese university students, examine the strength centrality (expected influence), betweenness centrality, and closeness centrality of each dimension in the networks are evaluated, and tests the stability and accuracy of networks.

A single-factor between-subjects design was employed, involving 1318 participants who were randomly assigned to watch videos inducing positive awe, negative awe, or neutral emotions. Subsequently, participants completed manipulation check measures and an awe emotion questionnaire. Network analysis revealed significant differences in the network structures between positive and negative awe ($p < .05$). In the positive awe network, all

valid connections, except for a negative correlation between vastness and physical sensations (r = -0.218), were positive ($0.023 \leq r \leq 0.422$). The three strongest connections in this network were vastness and tininess (r = 0.422), compliance and physical sensations (r = 0.386), and vastness and connectedness (r = 0.348). Compliance exhibited the highest strength centrality and closeness centrality, while compliance, vastness, and physical sensations were the top three dimensions with the highest betweenness centrality. In the negative awe network, all valid connections were positive ($0.011 \leq r \leq 0.552$). The three strongest connections in this network were vastness and tininess (r = 0.552), compliance and physical sensations (r = 0.358), and compliance and connectedness (r = 0.322). Vastness displayed the highest strength centrality, while self-diminishment exhibited the highest betweenness centrality and closeness centrality. Additionally, both positive and negative awe networks demonstrated good stability and accuracy in terms of network structure and centrality indices. Exploring the network structures of distinct awe variants enhances our understanding of the underlying mechanisms behind awe emotions and has profound implications for enriching the experience of awe on a broader and deeper level.

Keywords：positive awe, negative awe, network analysis, vastness, compliance

敬畏对网络欺凌中积极旁观者行为的影响

摘 要　背景：网络欺凌会降低受欺凌者的幸福感，导致个体抑郁症、社交焦虑和低自尊水平。网络欺凌中的积极旁观者行为能够有效降低欺凌事件的发生频率，减轻受欺凌者的负性情绪及其带来的负面影响，是预防欺凌事件的重要组成部分。敬畏是一种表明个体处于安全环境的信号，能够为亲社会行为的发生创造相当理想的环境。敬畏表现出的自我超越特质能够使个体在面对网络欺凌事件时增强个体与他人的社会连接，提高其积极旁观者行为的出现概率。目的：本研究试图构建一个有调节的中介模型，考察共情在敬畏对网络欺凌中积极旁观者行为的影响中的中介作用以及未来自我连续性对这一过程的调节作用，为提高积极旁观者行为出现的概率提供实证依据。方法：研究使用网络欺凌中旁观者行为量表-积极旁观者行为分量表、特质敬畏情绪分量表、人际反应指针问卷、未来自我连续性问卷对 303 名大学生进行施测。结果：（1）敬畏与积极旁观者行为显著正相关($r = 0.326, p < 0.01$)，敬畏与共情显著正相关($r = 0.337, p < 0.01$)，共情与积极旁观者行为显著正相关($r = 0.226, p < 0.01$)，敬畏与未来自我连续性显著正相关($r = 0.395, p < 0.01$)，共情与未来自我连续性显著正相关($r = 0.182, p < 0.01$)；（2）共情在敬畏与积极旁观者行为中起中介作用(效应值＝ 0.04, 95CI: 0.008~0.07)；（3）敬畏对共情的中介路径会受到未来自我连续性的正向调节作用(交乘项 B＝ 0.09, $t = 2.61, p$ ＜ 0.01)，敬畏对积极旁观者行为的直接路径会受到未来自我连续性的正向调节作用(交乘项 B＝ 0.11, $t = 2.26, p$ ＜ 0.05)。结论：敬畏能够通过共情影响网络欺凌中的积极旁观者行为，且敬畏对共情的中介路径和对积极旁观者行为的直接路径均会受到未来自我连续性的正向调节。

Abstract: Background: Cyberbullying decreases the well-being of the bullied, leading to individual depression, social anxiety, and low self-esteem levels. Active bystander behavior in cyberbullying can effectively reduce the frequency of bullying incidents, alleviate the negative emotions of the bullied and their negative consequences, and is an important component of bullying prevention. Awe is a signal indicating that an individual is in a safe environment and can create a fairly ideal environment for pro-social behavior to occur. The self-transcendent trait exhibited by awe can enable enhance individuals' social connections with others when faced with cyberbullying incidents, enhancing the probability of their active bystander behavior. Objective: The study sought to construct a moderated mediation model to examine the mediating role of empathy in the effect of awe on active bystander behavior in cyberbullying and the moderating role of future self-continuity on this process to provide an empirical basis for increasing the probability of emergence of active bystander behavior. Methods: The study was administered to 303 college students using Bystander Behavior Scale in Cyberbullying-Active Bystander Behavior Sub, Dispositional Positive Emotions Scale-Dispositional Awe Sub, Interpersonal Reactivity Index-C and Future Self-Continuity Questionnaire. Results: After controlling gender and age, (1) Awe had a significantly positive correlation effect on active bystander behavior ($r = 0.326$, $p < 0.01$), awe had a significantly positive correlation effect on empathy ($r = 0.337$, $p < 0.01$), empathy had a significantly positive correlation effect on active bystander behavior ($r = 0.226$, $p < 0.01$), awe had a significantly positive correlation effect on future self-continuity ($r = 0.395$, $p < 0.01$), and empathy had a significantly positive correlation effect on future self-continuity ($r = 0.182$, $p < 0.01$); (2) empathy could play an intermediary role in the relationship between awe and active bystander behavior ($\beta = 0.04$, 95CI: 0.008~0.07); (3) The mediating role of empathy in the relationship between awe and active bystander behavior will be positively regulated by future self-continuity ($B = 0.09$, $t = 2.61$, $p < 0.01$), and the direct predictive effect of awe on active bystander behavior was positively regulated by future self-continuity ($B = 0.11$, $t = 2.26$, $p < 0.05$). Conclusion: Awe can influence active bystander behavior in cyberbullying through empathy, and this relationship is moderated by future self-continuity.

Keywords: Active bystander behavior in cyberbullying, Awe, Empathy, Future self-continuity

自然对无聊的影响：敬畏和生命意义感的链式中介作用

张恺敏　赵若晨　蔺哲子　张潮（通讯作者）

山西师范大学教育科学学院，太原，030000

通讯作者 E-mail: zhangchao951217@163.com

摘 要　进入现代社会，人们的无聊感伴随着社会的快速进步出现激增。城市高楼林立，人们终日生活在钢筋水泥和霓虹闪烁的都市环境中。网络高度发达，人们的工作和学习早已和网络深度绑定，手机上各类社交媒体和海量信息常常使人疲于应对。大量的研究结果发现,身处重复、单调、压抑的现代环境中,人们会频繁感到无聊和空虚。长期的无聊体验将会导致个体的注意力涣散,造成各种认知错误，严重影响人们的精神状态。更严重的情况下还会转化为精神疾病，如抑郁症。根据亲生命性假说和复愈性环境理论，人类与自然环境之间存在着天然的联结，自然环境不仅为我们维持生存提供了必需的物质条件，同时也储存了现代生活所需要的心理资源，对我们维持健康、平衡身心状态至关重要。自然是否能降低无聊？这一问题目前还没有相关的实证研究。因此，本研究试图探讨自然和无聊的关系，拓展能够降低无聊的影响因素，为深受无聊困扰得人群提供有效的解决办法。**目的：**本研究试图探讨自然对无聊的影响及其心理机制。**方法：**本研究分为两个部分。研究一招募 250 个大学生，利用问卷调查的方法，探讨自然接触的频率和无聊的关系。研究二招募 150 个被试，使用数方块任务诱发无聊，采用观看图片范式将被试分为自然组和中性组，因变量为无聊得分、敬畏得分和生命意义感得分。采用被试间前测后测实验设计。**预期结果：**自然

的主效应显著，相比于观看中性图片的被试，观看自然图片的被试的无聊后测得分更低，敬畏和生命意义感的得分更高。自然能够降低无聊感，自然也可以通过敬畏和生命意义感的链式中介作用对无聊产生影响。

关键词 自然，无聊，敬畏，生命意义感

The Influence of Nature on Boredom: The Mediating Role of Awe and Sense of Meaning in Life

ZHANG Kaimin ZHAO Ruochen LIN Zhezi ZHANG Chao
College of Education Science, Shanxi Normal University, Taiyuan, 030000
Corresponding Author: Zhang Chao Email :zhangchao951217@163.com

***Abstract*：** With the advent of modern society, people's sense of boredom has increased significantly alongside rapid social progress. In the midst of towering skyscrapers, individuals spend their days in urban environments dominated by concrete, steel, and flickering neon lights. The internet has become highly developed, and people's work and study have become deeply intertwined with the online world. Various social media platforms and an overwhelming amount of information on mobile phones often leave individuals exhausted. Numerous research findings have revealed that individuals in repetitive, monotonous, and oppressive modern environments frequently experience boredom and emptiness. Prolonged experiences of boredom can lead to a scattered attention span, resulting in various cognitive errors and severely affecting individuals' mental state. In more severe cases, it can even manifest as mental illnesses such as depression. According to the biophilia hypothesis and the restorative environment theory, there is a natural connection between human beings and the natural environment. The natural environment not only provides the necessary material conditions for our survival but also stores the psychological resources needed for modern life, which are crucial for maintaining a healthy and balanced state of body and mind. Can nature reduce boredom? Currently, there is no empirical research specifically addressing this question. Therefore, this study aims to investigate the relationship between nature and boredom, as well as to explore factors that can mitigate boredom. The goal is to provide effective solutions for individuals who are deeply affected by boredom, offering them practical ways to overcome this state of mind. **Objective:** This study aims to explore the influence of nature on boredom and its psychological mechanisms. **Methods:** The study consists of two parts. Study 1 recruited 250 college students and employed a questionnaire survey to investigate the relationship between the frequency of nature exposure and boredom. Study 2 recruited 150 participants and induced boredom using a number-square task. The participants were divided into a nature group and a neutral group using a picture viewing paradigm. The dependent variables were scores of boredom, awe, and sense of meaning in life. A between-subjects pretest-posttest experimental design was employed. **Expected results:** The main effect of nature is significant. Compared to participants who viewed neutral pictures, those who viewed nature pictures had lower scores of boredom in the posttest, and higher scores of awe and sense of meaning in life. Nature can reduce feelings of boredom and also exert an influence on boredom through the mediating effects of awe and a sense of meaning in life.

Keywords: Nature, boredom, awe, sense of meaning in life.

敬畏对性别刻板印象的影响

李汝勇 安梦娟 薛镜谷 张潮（通讯作者）

山西师范大学教育科学学院，太原，030032，zhangchao951217@163.com

摘 要　刻板印象是人们对社会群组知识、观念期望构成的认知结构。刻板印象能够帮助个体更快地了解认识新环境，更好地生存。同时，刻板印象形成对内外群体产生了不良影响，如标签化、污名化等，影响个体成长发展。敬畏（awe）作为一种自我超越情绪，情绪产生时个体与周围环境连接感增强，更加关注周围人事物。研究表明，敬畏可以改变个体的认知，与群体联系感更紧密。因此本研究假设敬畏可以减少个体的性别刻板印象。综上，本研究首先验证了敬畏与刻板印象的关系，探究了对刻板印象的影响及其内在机制。研究一（N=200）采用特质敬畏量表（DPES-awe）和青少年性别刻板印象量表（ASS）检验了本土环境下个体的性别刻板印象，探究其与个体特质性敬畏的关系。研究结果表明，大学生群体存在性别刻板印象。同时，特质敬畏的个体表现更低的性别刻板印象，两者呈现负相关。研究二（N=180）采用被试间实验设计 3 敬畏（高敬畏 VS 低敬畏 VS 中性）x2 刻板印象（积极 VS 消极），使用视频诱发目标情绪，通过 IAT 内隐联想任务测量被试对性别刻板印象的作用，并检验自我超越的作用。结果表明：（1）与愉悦和中性情绪相比，状态敬畏能够显著增强积极刻板印象（即内群体的刻板印象），减弱消极刻板印象（即对外群体的刻板印象）；（2）状态敬畏的自我超越感更强，相比于中性与愉悦情绪；（3）状态敬畏对刻板印象的影响中，自我超越起到中介作用。

The impact of awe on gender stereotypes

Li Ruyong　An Mengjuan　Xue Jinggu　Zhang Chao(Corresponding author)
College of Education Science, Shanxi Normal University, Taiyuan, 030031
Corresponding Author Email :zhangchao951217@163.com

Abstract：Stereotype is the cognitive structure formed by people's knowledge and expectations of social groups. Stereotypes can help individuals understand new environments faster and survive better. At the same time, the formation of stereotypes has a negative impact on the internal and external groups, such as labeling and stigmatization, which affect the growth and development of individuals. Awe (awe) is a self-transcendence emotion. When the emotion arises, the individual's sense of connection with the surrounding environment increases, and he pays more attention to the people and things around him. Research has shown that awe can alter an individual's perception of a greater sense of connection to a group. Therefore, this study hypothesizes that awe can reduce individual gender stereotypes. To sum up, this study first verified the relationship between awe and stereotypes, and explored the impact on stereotypes and its internal mechanism. Study 1 (N=200) used the Trait Awe Scale (DPES-awe) and the Adolescent Sex Stereotype Scale (ASS) to examine the gender stereotypes of individuals in the local environment, and to explore their relationship with individual trait awe.The results of the study show that there are gender stereotypes in college students. At the same time, individuals with trait awe showed lower gender stereotypes, and the two showed a negative correlation. Study 2 (N=180) adopts the experimental design between subjects 3 awe (high awe VS low awe VS neutral) x2 stereotype (positive VS negative), using video to elicit target emotions, and measuring subjects' perception of The role of gender stereotypes and examining the role of self-transcendence. The results showed that: (1) Compared with pleasant and neutral emotions, state awe can significantly enhance positive stereotypes (that is, in-group stereotypes) and weaken negative stereotypes (that is, out-group stereotypes); (2) state awe Compared with neutral and pleasant emotions, self-transcendence has a stronger sense of self-transcendence; (3) Self-transcendence plays a mediating role in the effect of state awe on stereotypes.

敬畏对社会善念的影响：道德提升感和共情的中介作用

王小慧　侯东月　布雅静　张潮（通讯作者）
山西师范大学教育科学学院，山西太原，030000，zhangchao951217@163.com

摘 要　社会善念指个体在人际交往中善意关注、尊重并保护他人的选择需要和权力的倾向。依据相互依赖理论，高社会善念的个体在与他人相互依赖的情况下，会尽可能让对方拥有对自己作出选择的控制权。从个人的角度来说，表现出社会善念行为可以给他人留下好印象，有利于人际交往与合作；从整个社会角度来说，社会善念属于亲社会行为的一种，着眼于日常生活中的低成本付出，有助于构建良好的社会关系以及和谐的社会环境。敬畏作为一种积极情绪，能够促使个体感知到更加浩大广阔的外界，会增强个体对他人和社会的善意，使得个体对自身的关注程度降低，从而产生利他动机，表现出更多的亲社会行为。因此，敬畏可能会影响个体的社会善念。道德提升感是指个体看到他人的道德行为时，欣赏他人的美德并感到自己的道德情操被提升，而产生的一种积极道德情绪。道德提升感会增强个体的亲社会行为动机，对社会善念具有一定的预测作用。共情指个体感知或想象其他人的情感，并体验到其他人感受的心理过程。共情-利他假说认为，在共情的作用下，个体会实施更多的助人行为，并提高其社会善念水平。为调查敬畏对社会善念的影响以及是否存在道德提升感和共情的中介机制，本研究采用特质性敬畏量表、社会善念量表、道德提升感量表和人际反应指针量表对某大学学生进行调查。预期研究结果为：(1)敬畏正向预测社会善念；(2)道德提升感和共情在敬畏和社会善念之间起中介作用。

The Influence of Awe on Social Mindfulness: The Mediating Role of Moral Elevation and Empathy

Wang Xiaohui, Hou Dongyue, Bu Yajing, Zhang Chao(Corresponding authour)
School of Education Science, Shanxi Normal University, Taiyuan, 030032

Abstract：Social mindfulness refers to the tendency of individuals to kindly pay attention to, respect and protect the choice needs and rights of others in interpersonal communication. According to the codependency theory, when individuals with high social mindfulness are interdependent with others, they will try their best to let the other person have control over their choices. From the individual's point of view, showing good social behavior can leave a good impression on others, which is conducive to interpersonal communication and cooperation. From the perspective of the whole society, social mindfulness belongs to a kind of prosocial behavior, focusing on low-cost efforts in daily life, which helps to build a good social relationship and a harmonious social environment. As a positive emotion, awe can promote individuals to perceive the wider world, enhance their goodwill toward others and society, and reduce their attention to themselves, thus generating altruistic motives and displaying more prosocial behaviors. Thus, awe may affect the social mindfulness of individuals. The sense of moral promotion refers to a positive moral emotion generated when an individual sees the moral behavior of others, appreciates the virtue of others and feels that his own moral sentiment has been promoted. The sense of moral elevation can enhance the motivation of prosocial behavior and has a certain predictive effect on social mindfulness. Empathy is the mental process by which an individual perceives or imagines the emotions of another person and experiences what the other person feels. The empathy-altruism hypothesis holds that under the influence of empathy, individuals will carry out more helpful behaviors and improve their level of social mindfulness. In order to

investigate the influence of awe on social mindfulness and whether there is an intermediary mechanism between moral elevation and empathy, this study used the trait awe scale, social mindfulness scale, moral elevation scale and interpersonal response indicator scale to investigate students in a certain university. The expected results are: (1) Awe positively predicts social mindfulness; (2) Moral elevation and empathy play a mediating role between awe and social mindfulness.

Keywords：awe　social mindfulness　moral elevation　empathy

敬畏对中学生校园欺凌行为的影响——自我概念和生命意义的链式中介作用

布雅静　蔺哲子　王小慧　张潮（通讯作者）
山西师范大学教育科学学院，太原，030000，zhangchao951217@163.com

摘 要 近年来，国内校园欺凌事件频发，深受社会的广泛关注。校园欺凌事件不仅对中学生的身心健康产生了极大的危害,且形成的创伤会伴随一生。研究发现，脾气暴躁、易怒的学生实施欺凌行为的频率最高，并且会吸引有不成熟慕强心理的学生加入形成小团体。敬畏作为一种尊敬和恐惧并含的复杂情绪，会使个体产生深刻的“小我”体验，个体的感知从以自我为中心转变为一个更广阔的框架，使个体对生命意义产生深刻思考，并且抑制个体的负面行为。中学生正处于自我概念和生命意义形成的关键时期，两者都会促使个体形成健全人格，拥有更温良的性格，以此减少校园欺凌行为。目的：本研究基于敬畏的小我理论和积极行为扩展理论，探讨敬畏对初中生校园欺凌行为的影响，以及自我概念和生命意义的链式中介作用。方法：将 378 名初中生分为两组，实验组使用敬畏材料激活敬畏情绪，对照组不激活敬畏情绪，并采用敬畏体验量表(Awe Experience Scale, AWE-S)、生命意义感量表(MLQ)、自我概念量表和攻击行为量表进行问卷调查。预期结果：（1）敬畏、自我概念、生命意义与攻击行为两两呈显著负相关；（2）自我概念和生命意义在敬畏对中学生攻击性行为中起链式中介作用。本研究启示我们学校心理健康教育可以注重学生的敬畏教育，发展学生的自我概念和生命意义感，来降低校园欺凌事件的发生。

关键词 敬畏，自我概念，生命意义，攻击行为

The Impact of Awe on School Bullying in Middle School Students: A Chain Mediating Role of Self-Concept and Meaning in Life

BU Yajing　LIN Zhezi　WANG Xiaohui　ZHANG Chao(Corresponding Author)
College of Education Science, Shanxi Normal University, Taiyuan, 030031
Corresponding Author Email :zhangchao951217@163.com

Abstract：In recent years, domestic campus bullying incidents have occurred frequently and have received widespread attention from the society. Campus bullying incidents not only do great harm to the physical and mental health of middle school students, but also cause trauma that will last a lifetime. The study found that short-tempered, irritable students reported the highest levels of bullying and attracted immature, obsessive students

to form cliques. Awe, as a complex emotion containing both respect and fear, will cause individuals to have a profound "ego" experience, and the individual's perception will change from self-centered to a broader framework, allowing individuals to think deeply about the meaning of life, And inhibit the negative behavior of the individual. Middle school students are in a critical period of forming self-concept and meaning of life, both of which will promote the individual to form a sound personality and have a more gentle personality, so as to reduce campus bullying. Objective: Based on the ego theory of awe and the extended theory of positive behavior, this study explores the influence of awe on campus bullying behavior of junior high school students, as well as the chain mediating effect of self-concept and meaning of life. Methods: 378 junior high school students were divided into two groups. The experimental group used awe materials to activate the awe emotion, and the control group did not activate the awe emotion. The Awe Experience Scale (AWE-S) and the meaning of life scale (MLQ), Self-Concept Scale and Aggressive Behavior Scale. Expected results: (1) Awe, self-concept, meaning of life and aggressive behavior are significantly negatively correlated in pairs; (2) Self-concept and meaning of life play a chain mediating role in the relationship between awe and aggressive behavior of middle school students. This study reveals that our school mental health education can focus on students' reverence education, develop students' self-concept and sense of life meaning, and reduce the occurrence of school bullying incidents.

失依儿童中复杂性创伤后应激症状的异质性表现

梁一鸣　孙悦　彭雅楠　席居哲（通讯作者）

华东师范大学心理与认知科学学院，华东师范大学附属精神卫生中心，上海市心理健康与危机干预重点实验室，上海, 200062 通讯作者 Email: jzxi@psy.ecnu.edu.cn

基金信息：上海市启明星计划扬帆专项（22YF1411600）

摘 要　背景：复杂性创伤后应激障碍(CPTSD)是近年来新确立的精神疾病诊断，被认为与童年期创伤密切相关。然而在困境儿童群体中详细探讨 CPTSD 症状表现的研究十分匮乏。失依儿童在我国一般指事实无人抚养儿童，数量不容小觑，且很多经历多种童年期创伤。本研究旨在描述中国失依儿童群体中 CPTSD 的现状，探究该群体中 CPTSD 症状的异质性表现。

方法：本研究收集了来自湖南省桂阳、新田两县的 244 名失依儿童（9 到 16 岁，45.49%女孩），使用 UCLA 创伤后应激障碍量表中的童年期创伤经历筛查表测量童年期创伤史，国际创伤问卷（ITQ）评估 CPTSD 症状。使用潜在剖面分析估计该群体内中 CPTSD 症状表现的亚组。

结果：失依儿童中存在 3 种 CPTSD 症状表现的亚组：低症状组（29.10%）、阈下 CPTSD 组（40.16%）和 CPTSD 组（30.74%）。低症状组的 PTSD 和 DSO 症状水平都很低，功能损伤也很轻；阈下 CPTSD 组的特点是症状得分接近检出标准，但功能损伤的水平明显低于检出标准；CPTSD 组的儿童同时具有高水平的 PTSD 和 DSO 症状，且具有超过检出标准的功能损伤。此外，人际暴力类型的创伤是失依儿童 CPTSD 症状最重要的风险因素，其次是意外事故类型的创伤。此外，就读于高年级具有一定保护作用，女孩有更高概率出现在 CPTSD 组。

结论：这些发现描绘了中国失依儿童群体中 CPTSD 的现状，并揭示了暴露于复杂性创伤的儿童群体具有与社区群体不同的 CPTSD 症状特点。人际暴力是 CPTSD 的重要风险因素也支持了国际疾病分类第 11 次修订版对于 CPTSD 在创伤类型上的界定。

Complex posttraumatic stress symptoms among Chinese unaccompanied children: A latent profile analysis

Yiming Liang, Yue Sun, Yanan Peng, Juzhe Xi (Corresponding author)
Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China, Correspondence: jzxi@psy.ecnu.edu.cn

Abstract: Background: Complex post-traumatic stress disorder (CPTSD), a newly established psychiatric diagnosis in recent years, is considered to be closely related to childhood trauma. However, there is a paucity of studies detailing the symptoms presentation of CPTSD in child populations with high trauma exposure. According to the Chinese government, facto unsupported children and are defined as children whose parents are both seriously disabled or ill, serving a sentence of imprisonment, under compulsory isolation, under other measures of restriction of personal freedom, or missing; or children whose one parent is dead or missing and the other parent is in the above circumstances. The number of such children is considerable, and many of them have experienced various forms of childhood trauma. Therefore, this study aimed to describe the current situation of CPTSD in a group of facto unsupported children in China, to investigate the heterogeneous manifestations of CPTSD symptoms in this group.

Methods: This study collected 244 children (9 to 16 years old, 45.49% girls) from Guiyang and Xintian counties in Hunan Province. Trauma exposure was measured by the UCLA-PTSD scale and CPTSD symptoms was measured by the International Trauma Questionnaire (ITQ). Latent profile analysis was used to identify subgroups of CPTSD symptom presentation among unsupported children.

Results: We identified three subgroups with heterogeneity in CPTSD symptom presentation in the study sample: a low-symptom group (29.10%), a sub-threshold CPTSD group (40.16%), and a CPTSD group (30.74%). The low-symptom group had low level of PTSD and DSO symptoms and mild functional impairment. The sub-threshold CPTSD group had PTSD and DSO symptoms which were close to the cut-off score, but the level of functional impairment was significantly lower than the cut-off score. Children in the CPTSD group had high levels of both PTSD and DSO symptoms, as well as functional impairment that exceeded the cut-off score. Interpersonal violence was also found to be the most important risk factor for CPTSD symptoms, followed by accidents, with a protective effect of attending higher grades and girls being more likely to belong to the CPTSD group.

Conclusion: These findings provide a concrete picture of the current status of CPTSD in the Chinese unsupported child population, reveal that the child population exposed to complex trauma has very different symptom presentation compared to the community population. Interpersonal violence is an important risk factor for complex post-traumatic stress disorder (CPTSD), which support the International Classification of Diseases, 11th revision's definition of CPTSD.

摘 要　随着网络技术的发展，网络已成为我国青少年进行社交的重要工具。在享受网络带来便利的同时，青少年也遭到网上骚扰、谩骂等网络受欺凌行为，网络受欺凌逐渐成为威胁学生身心健康的重要风险因子。大量研究发现，有网络受欺凌经历的青少年更容易出现攻击倾向等外化问题与焦虑、抑郁等内化问题。同时，网络受欺凌者也会出现愤怒反刍等情绪失调问题。根据一般压力理论，在面对消极情绪时，青少年会出现更多的问题行为。自我同情恐惧是指个体认为自己不值得被同情，并出现害怕同情自己的情绪。有学者发现同情恐惧与自伤行为呈正相关，并影响青少年的心理健康。综上，本研究探讨初中生网络受欺凌和攻击倾向的关系，以及愤怒反刍在其中发挥的中介作用和自我同情恐惧发挥的调节作用。本研究采用网络受害问卷、攻击倾向问卷、愤怒反刍量表和自我同情恐惧量表对 510 名来自青海省海东市民和县三所初中的初中生（平均年龄=13.67 岁，37%的被试为男性）进行调查，并采取基于潜调节的方法建立结构方程模型。结果发现：（1）网络受欺凌和攻击倾向呈显著的正相关；（2）愤怒反刍在网络受欺凌和攻击倾向间起中介作用；（3）自我同情恐惧在中介模型中起调节作用，调节了后半路径。结果有助于分析网络受欺凌影响初中生攻击倾向的深层原因并采取恰当的干预策略，减少愤怒反刍对青少年攻击行为的负面影响。

Abstract： With the development of internet technology, the Internet has become an essential tool for socializing among teenagers in our country China. While enjoying the convenience brought by the Internet, teenagers are also subject to online harassment, verbal abuse, and other forms of cybervictimization. Cybervictimization has gradually become a significant risk factor threatening students' mental and physical health.

Numerous studies have found that teenagers who have experienced cybervictimization are more prone to externalizing problems such as aggression and internalizing problems like anxiety and depression. At the same time, cybervictimization perpetrators may experience emotional disturbances like anger rumination. According to the general strain theory, when facing negative emotions, teenagers may exhibit more problematic behaviors. fear of self-compassion refers to individuals believing that they are not worthy of sympathy and experiencing fear of being pitied by others. Some scholars have found a positive correlation between fear of self-compassion and self-harming behaviors, which can affect teenagers' psychological well-being. In this study, we explore the relationship between cybervictimization and aggression among junior high school students, as well as the mediating role of anger rumination and the moderating role of fear of self-compassion .In this study, 510 students (average age =13.67 years old, 37% were male) from three middle schools in Minhe County, Haidong City, Qinghai Province were investigated using the Cybervictimization Scale, Aggression Questionnaire, Anger Rumination Scale, and Fear of fear of self-compassion. A structural equation model was established based on the method of latent moderation. The results showed that: (1) there was a significant positive correlation between cyberbullying and aggression tendencies; (2) anger rumination played a mediating role between cybervictimization and aggression; and (3) fear of self-compassion acted as a moderator in the mediation model, moderating the latter path. These findings help to analyze the underlying reasons for how cyberbullying affects junior high school students' aggression and implement appropriate intervention strategies to reduce the negative impact of anger rumination on adolescent aggressive behavior.

Keywords：cybervictimization, aggression, anger rumination, fear of self-compassion

留守和流动儿童孤独感与感知社会支持的关系：基于网络分析的比较

金佳露[1] Guangzhe Frank Yuan[2] 赵嘉琦[1] 安媛媛[1]（通讯作者） 程选[1]

摘 要 本研究聚焦于留守和流动儿童的孤独感与感知社会支持的关系。首先，通过网络分析的方法，分别构建留守和流动儿童孤独感网络结构，考察留守和流动儿童各自最核心的孤独感表现并进行比较；其次，分别构建留守和流动儿童孤独感与感知社会支持的联合网络结构，识别并比较对留守和流动儿童各自孤独感最具保护作用的感知社会支持要素，分析可能的机制原因。

本研究选取江苏省徐州市、盐城市和南京市的四所小学四至六年级共 241 名留守儿童和 285 名流动儿童进行施测，施测时间为 2018 年 12 月。基于儿童孤独感量表(CLS)和社会关系网络问卷(NRI)，通过网络分析方法，分别构建留守和流动儿童孤独感及孤独感与感知社会支持的网络模型并进行比较。

结果发现：(1)留守儿童最核心的孤独感表现为“没有人跟我一块玩”、“我感到寂寞”和“我有许多朋友（反向计分）”；流动儿童最核心的孤独感表现为“我感到寂寞”、“我有许多朋友（反向计分）”和“需要帮助时我无人可找”；(2)联合网络中，对留守儿童孤独感最具保护作用的感知社会支持要素是“这个人会为我排解烦恼”和“这个人会告诉我，说我擅长做某事”；对流动儿童孤独感最具保护作用的感知社会支持要素是“当我在学习（生活）上遇到问题时，这个人会帮我解决”和“这个人会使我觉得自己很重要”。

研究结果表明，留守和流动儿童在核心的孤独感表现上存在异同；在感知社会支持要素中，情感支持

和工具性支持分别对缓解留守和流动儿童孤独感最具关键作用，而肯定价值对两群体积极的心理适应均具有重要意义。

Abstract: The current study focused on the loneliness and the protective role of perceived social support among left-behind and migrant children. Firstly, the study built the network structures of loneliness of left-behind and migrant children respectively through network analysis, to investigate their core loneliness performance and compare their similarities and differences. Then, the study built joint network structures between loneliness and perceived social support among left-behind and migrant children respectively, to identify and compare the most protective factors of perceived social support for loneliness, and analysis its possible mechanism reasons.

A total of 241 left-behind children and 285 migrant children from grades 4 to 6 from four primary schools in Xuzhou, Yancheng and Nanjing, Jiangsu province participated in the study. The questionnaire survey was conducted in December 2018. Based on the Children's Loneliness Scale (CLS) and Network of Relationships Inventory (NRI), this study built and compared the network structures of loneliness and the joint network structures between loneliness and perceived social support of left-behind and migrant children respectively through network analysis.

The results showed that (1) The most core loneliness performance in left-behind children were “I don't have anyone to play with”, “I'm lonely” and “I have lots of friends (reverse scoring)”, and the most central loneliness performance in migrant children were “I am lonely”, “I have lots of friends (reverse scoring)” and “There's nobody I can go to when I need help”. (2) In the joint network structures, the perceived social support factors that have the most protective effect on left-behind children's loneliness were “This person will solve my troubles” and “This person will tell me what I am good at”, and the perceived social support factors that have the most protective effect on migrant children's loneliness were “This person will help me when I encounter difficulties in study (life)” and “This person will make me feel important”.

The research results showed that there were similarities and differences in the core performance of loneliness among left-behind and migrant children; among the factors of perceived social support, emotional support and instrumental support play the most crucial role in alleviating loneliness among left-behind and migrant children, respectively, while value affirmation is of great significance for both groups' positive psychological adaptation.

摘 要 失依儿童是一个特别需要支持的弱势群体，指因自身问题和父母的客观原因而临时或永久丧失生活依靠与家庭生活的未成年人。失依儿童的身心健康发展受到其所处困境的威胁。他们在不同程度上存在抑郁、焦虑、孤独感高、安全感缺失、攻击行为、厌学逃学等情绪和行为问题，亟待社会的密切关注和心理关护。

虽然境遇艰难，但失依儿童仍有可能免受影响、顺利发展，甚至奋发向上、愈挫弥坚，这一现象被称为心理弹性。心理弹性的形成是一个动态的过程，受到保护性因素(包括内部和外部)与风险因素的影响。由于缺乏来自家庭成员的有力支持，失依儿童需要在资源有限的成长环境中自力更生。自我同情或对失依儿童有着保护作用。此外，若失依儿童能够与其他重要他人建立良好的关系，获得更多社会支持，或将得到积极的发展结果。基于此，本研究以 90 名失依儿童为研究对象，进行间隔 6 个月的追踪，对该群体压力/逆境及发展功能进行描述，并探究自我同情与社会支持的保护性作用。

结果显示，(1) 绝大多数失依儿童处在严重的压力/逆境情况中。他们所遭受的负性生活事件呈现数量多和严重程度高两个特点，且主要来源于家庭。2) 失依儿童发展功能欠佳。与普通儿童相比，失依儿童的各方面发展结果都不够良好，突出表现为安全感较低、同伴交往问题较多和亲社会行为较少；3) 自我同情和社会支持可以正向预测失依儿童积极发展结果，负向预测消极发展结果，主要体现在减少情绪问题、增进同伴关系和提高安全感三个方面。

本研究清晰展现了失依儿童群体的困境特点和发展功能的不足之处，有利于社会大众对此群体的深入了解。本研究还验证了自我同情和社会支持对失依儿童群体的保护性作用，丰富了相关领域的理论研究成果，为失依儿童群体的福利与保护制度建设提供参考。

Protective Role of Self-compassion and Social Support on Development of Supportless Children

Yunxi Wang[1], Yanan Peng[1], Juzhe Xi (Corresponding author)[1]
[1] Shanghai Key Laboratory of Mental Health and Psychological Crisis, Affiliated Mental Health Center(ECNU), Positive Education China Academy (PECA) of Han-Jing Institute for Studies in Classics, Juzhe Xi's Master Workroom of Shanghai School Mental Health Service, School of Psychology and Cognitive Science, East China Normal University, Shanghai, China, [2] Shanghai Changning Mental Health Center Shanghai, China,
Correspondence: jzxi@psy.ecnu.edu.cn

***Abstract*:** Supportless children are a vulnerable group in particular need of help, which refers to minors who temporarily or permanently lose their dependence on family life due to their own problems and objective reasons of their parents. The healthy physical and mental development of supportless children is affected by their adversity. They have emotional and behavioral problems such as depression, anxiety, strong sense of loneliness, lack of security, aggressive behavior, anorexia and truancy, and need close attention and care from the society.

Despite the difficult circumstances, supportless children may still develop successfully, strive to rise and grow stronger, which is known as resilience. The formation of resilience is a dynamic process, which is influenced by

protective factors (both internal and external) and risk factors. Without strong support from family members, supportless children need to be self-reliant in resource-limited environment. Self-compassion may have a protective effect on them. In addition, if they are able to establish good relationships with other people and gain more social support, they may have positive developmental outcomes. Therefore, the present study followed 90 supportless children at 6-month intervals to characterize their stress/adversity and developmental functioning, and to explore the protective roles of self-compassion and social support.

The results showed that (1) The vast majority of supportless children were in severe stress/adversity situations. They suffered a high number of negative life events, which mainly originated from their family. (2) Supportless children had poor developmental functioning. Compared with ordinary children, supportless children had poorer developmental outcomes, including lower sense of security, more peer problems and less prosocial behavior. (3) Self-compassion and social support positively predicted the positive developmental outcome of children with disabilities, and negatively predict the negative developmental outcome, which is mainly reflected in three aspects: reducing emotional problems, enhancing peer relationship and improving sense of security.

The present study showed the characteristics of the adversity and the developmental functioning of supportless children, which was conducive to the public's in-depth understanding of them. This study also verified the protective effect of self-compassion and social support on supportless children, enriched the theoretical research results in related fields, and provided references for the construction of welfare and protection system for supportless children.

Keywords：supportless children, developmental function, protective factor, self-compassion, social support

精准评估网络成瘾者(青少年与青年成人)的难点：整合视角的分析

周家琦[1]　席居哲[1,2]（通讯作者）

[1]华东师范大学心理与认知科学学院, 华东师范大学附属精神卫生中心, 上海市心理健康与危机干预重点实验室, 上海, 200062; [2] 上海市长宁区精神卫生中心 通讯作者 Email: jzxi@psy.ecnu.edu.cn

基金项目：上海市科技计划项目(20DZ2260300)

摘 要　近年来网络成瘾在青少年与青年成人人群中的患病率已攀升至 36.7%，亟待治疗网瘾的有效方法，而准确评估与诊断网瘾是及时、有效地治疗网瘾至关重要的第一步。然而，网瘾的评估和诊断仍然是一个极具争议的研究课题，因为网瘾的概念界定、病理学理论和精神病学分类等都还没有在临床心理学行业内部达成共识。

首先，关于网瘾概念界定的争议点在于网瘾是否可以被广义化。大部分网瘾研究以广义化网瘾为概念基础进行测量，并不以网瘾的具体活动区分网瘾类型。然而，许多网瘾研究针对具体网络活动衍生出相应的临床术语与研究方向，如“社交媒体成瘾”，“网络游戏障碍”等。许多学者亦认为，与互联网相关的疾病必须在一系列相关但独立的疾病中进行概念化，而不能笼统地归纳为网瘾，因为网瘾作为问题行为甚至新型心理障碍具有高度异质性。

其次，从病理学理论的角度来看，网瘾是否是一种独立于其他心理障碍的心理疾病仍不明确。大量研究显示，网瘾与情感障碍有非常高的相关性，常为彼此的并发症与风险因素，而针对抑郁症的干预和药物治疗对治疗网瘾有一定的效果。这些研究反映了网瘾作为情感障碍次要表现的可能性。

最后，网瘾的精神病学分类仍不明确。有学者认为包括网瘾的行为成瘾在本质上与物质成瘾相似，因为两者的主要特征有着高度重合，包括过度使用、戒断现象、耐受性和负面影响。然而也有不同的观点和研究认为网瘾应被归类为冲动控制障碍甚至是强迫症。虽然众多学者已根据不同的精神病学分类给网瘾的诊断标准发表不同的提案，网瘾在精神病学的分类问题上还有待更多的实证性研究验证。

Challenges in Accurate Assessment of Internet Addiction (adolescents and young adult): A Review from An Integrated Perspective

Jiaqi Zhou [1], Juzhe Xi (Corresponding author)[1]

[1] Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China; [2] Shanghai Changning Mental Health Center, Shanghai, 200331, China　Correspondence: jzxi@psy.ecnu.edu.cn

***Abstract*:** In recent years the prevalence of Internet addiction among adolescents and young adults has climbed to 36.7%, calling for an effective treatment method for internet addiction. Accurate assessment and diagnosis of internet addiction are the first crucial steps for timely and effective treatment of internet addiction. However, the assessment and diagnosis of internet addiction is still a highly controversial research issue, as its definition, pathological conceptualization, and psychiatric classification have not reached agreement within the clinical psychology field.

Firstly, it is not clear whether the definition of internet addiction should be generalized. Most research on internet addiction is based on a generalized definition of internet addiction, and its measurement does not distinguish different types of internet addiction based on specific internet use activities. However, many internet addiction studies have derived corresponding clinical terms and research directions for specific internet activities, such as social media addiction and online gaming disorder. Many scholars also argue that internet-related disorders must be conceptualized in a series of related but independent diseases, and cannot be generalized as internet addiction given its high level of heterogeneity within its pathological spectrum.

Secondly, from the perspective of pathological theory, whether internet addiction is an independent psychological disease is still unclear. A large number of studies have shown that internet addiction and affective disorders are often associated as complications and risk factors for each other, and intervention and treatment for depression have a certain effect on the treatment of internet addiction as well. These studies reflect the possibility of internet addiction as a secondary manifestation of affective disorders.

Finally, the psychiatric classification of internet addiction also remains unclear. Some scholars believe that behavioral addiction, including internet addiction, is similar in nature to substance addiction, as their main features, including overuse, withdrawal phenomena, tolerance, and negative effects, tend to overlap. However, different studies and perspectives suggest that internet addiction should be classified as an impulse control disorder or even obsessive-compulsive disorder. Although many scholars have published different diagnostic criteria proposals for internet addiction according to different psychiatric classifications, more empirical research is still needed to verify the classification of internet addiction in psychiatry.

自闭症儿童自然教育有效方法的教学实践探究——以园艺疗法为例

范雨欣[1]　赵信如[1]　常琪[1]　雷秀雅[1]（通讯作者）
1 北京林业大学心理系，北京，100083，leixiuya@163.com

摘 要　自然教育的理念与心理学领域的园艺疗法相契合，对儿童的全面发展具有重要意义。对于自闭症儿童而言，自然可以为其提供丰富的感官刺激，有利于调节情绪，缓解症状。目前对自闭症儿童的教育仍以弥补发育障碍缺陷的康复训练为主，较少关注其自身能力的开发和积极心理品质的培养。因此，本研究试图从教育和心理的综合视角切入，借助自然教育的基本理念，采用园艺疗法的方法技术，以自闭症儿童为教学对象设计教学方案，并通过教学实践验证方案的有效性。以期以课程的形式促进自闭症儿童身心健康发展，利用自然为自闭症儿童谋求福祉。研究运用教育实验法，采用单组前测—后测设计，以辽宁省营口市某康复中心的 5 名自闭症儿童为教学对象，其年龄在 10-14 岁之间（$M = 12$，$SD = 1.87$），实施了 6 次园艺疗法课程教学。课程时长为每次 45 分钟，根据实际教学情况略有调整；课程内容包括水培大蒜的种植与养护两次，植物主题五感体验两次，校园园艺活动两次。在课程开始前及结束后采用儿童期孤独症评定量表（CARS）、基本功能观察评定量表（SVFB）以及行为观察项目与定义表对 5 名儿童的情况进行评估。同时，在教学中增加过程性观察评估，教学前后采用《园艺疗法课程前测/后测问卷》对课程设计及完成情况进行教师评价，以验证课程的有效性。教师评价显示，该课程在学生情绪舒缓、压力调节方面具有突出的作用；课程过程性评估显示 5 位同学在正向情绪、利社会行为方面频次较高，精细动作能力得到锻炼；课程实施前后的目标完成、情绪控制、意图表达、规则理解、与他人互动 5 个方面的存在显著差异。研究表明，针对自闭症儿童实施特殊教育，结合自然教育理念和园艺疗法技术的课程方案具有可行性和有效性，能够促进自闭症儿童身心健康发展。

Teaching Practice of Effective Methods of Natural Education for Autistic Children——Taking Horticultural Therapy as an Example

FAN Yuxin[1], ZHAO Xinru[1], CHANG Qi[1], LEI Xiuya[1] (corresponding author)
1 Department of Psychology, School of Humanities and Social Sciences, Beijing Forestry University, Beijing 100083, China

***Abstract*:** The idea of nature education is consistent with the horticultural therapy in the field of psychology, which is of great significance to the overall development of children. For autistic children, nature can provide them with rich sensory stimulation, which is beneficial for regulating emotions and alleviating symptoms. At present, the education of autistic children mainly focuses on rehabilitation training to compensate for developmental disabilities, with less attention paid to the development of their own abilities and the cultivation of positive psychological qualities. Therefore, this study attempts to design a teaching plan for autistic children from the comprehensive perspective of education and psychology, utilizing the basic concepts of natural education, methods and techniques of horticultural therapy, and verifying the effectiveness of the plan through teaching practice. To promote the physical and mental health development of autistic children in the form of courses, and to utilize

nature to seek the well-being of autistic children. The study used the educational experiment method and a single group pretest posttest design. Five autistic children aged 10-14 years old (*M*=12, *SD*=1.87) from a rehabilitation center in Yingkou, Liaoning Province were taken as the teaching objects, and six horticultural therapy courses were implemented. The course duration is 45 minutes per session, with slight adjustments based on actual teaching situations. The course contents include planting and maintenance of hydroponic garlic, a five-sense experience of plant theme twice, and campus gardening activities twice. Before and after the course, the Childhood Autism Rating Scale (CARS), The Observational Rating Scale of Basic Functions (SVFB), and Behavior Observation Items and Definition Table were used to evaluate the situation of 5 children. At the same time, process observation and evaluation were added in teaching. Before and after teaching, the Pre/Post Questionnaire of horticultural therapy Course were used to evaluate the course design and completion, so as to verify the effectiveness of the course. Teachers' evaluations showed that the course had an outstanding effect on students' emotional relief and stress regulation. The course process evaluation showed that the five students had a higher frequency of positive emotions, prosocial behaviors, and fine motor skills were exercised. There were significant differences in the completion of the objectives, emotional control, expression of intentions, understanding of the rules, and interactions with others before and after the implementation of the course. The study showed that the curriculum program combining the concept of nature education and horticultural therapy techniques for special education for autistic children was feasible and effective, and could promote the healthy development of autistic children physically and psychologically.

Keywords：autistic children, nature education, horticultural therapy, special education, curriculum design

孤独症谱系障碍儿童言语与情绪调节的纵向研究

胡婉雪[1] 王一捷[1] 郑晓霏[1] 杨琳瑜[1] 李新影[1]（通讯作者）

1 中国科学院心理研究所，北京，100101, lixy@psych.ac.cn

摘 要 背景：孤独症谱系障碍(Autism Spectrum Disorders, ASD)是一种起病于婴幼儿早期的发育障碍。以往研究表明，ASD儿童的情绪调节与ASD核心症状严重程度、破坏性行为等显著相关，情绪调节问题可能是解释ASD儿童多种情绪和行为问题高发生率的潜在共同因素。在普通发育儿童的研究中发现言语对情绪调节的发展至关重要，儿童期语言能力的发展有助于情绪调节的提升。而情绪调节对言语的影响尚不清晰，但有研究发现情绪调节与社交沟通能力显著相关，情绪稳定性高的ASD个体表现出更强的社交沟通能力。目前ASD儿童言语与情绪调节的关系研究很少且呈现出不一致的结果。目的：探究ASD儿童言语和情绪调节的关系。方法：通过网络招募 3~6 岁ASD儿童的家长。采用《ALSOLIFE孤独症儿童能力评估家庭辅助系统V3.0 版》间隔 1 个月以上进行 2 次测查，评估ASD儿童的言语和情绪调节水平。采用相关分析探讨言语和情绪调节的关系。在控制性别、年龄与时间间隔下，通过Mplus 7.0 建立结构方程模型检验言语与情绪调节的交叉滞后效应。结果：共招募到1638 名ASD儿童（男1297 人，女341 人；平均年龄 $\bar{x}\pm s$ = 4.33±0.78），完成间隔 1~12.8 个月（平均时间间隔 $\bar{x}\pm s$ = 5.78±2.94）的两次测量。相关分析结果表明在T1 上言语和情绪调节均成正相关（r=0.61, p < 0.001），在T2 上言语和情绪调节成正相关（r=0.76, p < 0.001）。T1 的言语与T2 的情绪调节成正相关（r=0.66，p < 0.001），T1 的情绪调节与T2 的言语成正相关（r=0.55，p < 0.001）。拟合指数结果表明结构方程模型拟合良好（χ^2/df = 1.46; CFI = 0.999; TLI = 0.999; $RMSEA$ = 0.017）。交叉滞后模型显示，T1 言语正向预测T2 情绪调节（β= 0.38，p < 0.001），但T1 情绪调节无法预测T2 言语。结论：ASD儿童言语发展越好，情绪调节水平越高。

关键词 孤独症谱系障碍，言语，情绪调节，交叉滞后分析

A cross-lagged study on speech and emotion regulation in children with autism spectrum disorders

HU Wanxue[1], WANG Yijie[1], ZHENG Xiaofei[1], YANG Linyu[1], LI Xinying[1]

1. Institute of Psychology, Chinese Academy of Sciences, Beijing 100101, China

Abstract：Background: Autism Spectrum Disorders (ASD) is a developmental disorder that begins in early infancy. Previous studies have shown that emotion regulation in children with ASD is significantly associated with ASD core symptom severity and disruptive behavior, and that problems with emotion regulation may be a potential common factor explaining the high prevalence of multiple emotional and behavioral problems in children with ASD. Speech has been found to be critical to the development of emotion regulation in studies of typically developing children, and the development of language skills in childhood contributes to the enhancement of emotion regulation. Whereas the effect of emotion regulation on speech is unclear, one study found that emotion regulation was significantly associated with social communication skills, with individuals with ASD who were emotionally stable showing greater social communication skills. Current research on the relationship between speech and emotion regulation in children with ASD is scarce and presents inconsistent results. Objective: To explore the relationship between speech and emotion regulation in children with ASD. Methods: Parents of children with ASD aged 3-6 years were recruited through the Internet. Using the "the ALSOLIFE Skills Assessment System V3.0", 2 tests were conducted at intervals of more than 1 month to assess the level of speech and emotion regulation of children with ASD. Correlation analysis was used to explore the relationship between speech and emotion regulation. The cross-lagged effects of speech and emotion regulation were tested by structural equation modeling with Mplus 7.0, controlling for gender, age and time interval. Results: A total of 1638 children with ASD were recruited (1297 males, 341 females; mean age $\bar{x}\pm s$ = 4.33±0.78), and completed two measurements separated by 1 to 12.8 months (mean time interval $\bar{x}\pm s$ = 5.78±2.94). Correlation analyses showed that both speech and emotion regulation were positively correlated on T1 (r=0.61, p < 0.001) and on T2 (r=0.76, p < 0.001). speech on T1 was positively correlated with emotion regulation on T2 (r=0.66, p < 0.001) and emotion regulation on T1 was positively correlated with speech on T2 (r= 0.55, p < 0.001). The results of the fit indices indicated a good fit for the structural equation modeling (χ^2/df = 1.46; CFI = 0.999; TLI = 0.999; $RMSEA$ = 0.017). Cross-lagged modeling showed that T1 speech positively predicted T2 emotion regulation (β = 0.38，p < 0.001), but T1 emotion regulation did not predict T2 speech. Conclusion: The better the verbal development of children with ASD, the higher the level of emotion regulation.

自然共情的神经机制：来自 ERP 的证据

张煜　孙世月（通讯作者）

北京林业大学心理学系，北京，100083，sunsy@bjfu.edu.cn

摘 要　　自然共情是指人们感受并共享自然世界的情绪体验，尤其是处于困境中的自然界或动植物的体验。大量研究显示，自然共情是预测亲环境行为的重要变量，且有大效应量，但过往研究对自然共情的考察主要基于明确指导下的个体主观报告，当缺乏明确的外在指令要求感受处于困境中的自然界时，

人脑是否仍然有明显自然共情反应，目前并不清楚。人际共情研究显示人们倾向于将他人疼痛线索分类为自动和受控，符合双加工理论的假设。鉴于此，本研究采用事件相关电位技术(Event-related potential, ERP)，从双加工理论的视角考察了自然共情体验的神经机制及其与环境-金钱价值取向的关系。研究首先对统一处理后的 360 张图片材料进行了共情强度和情绪效价的评定，选择诱导自然共情和控制对照的图片材料各 15 张。脑电实验采用经典 Oddball 范式，以自然共情相关的图片材料为标准刺激，含有人物的图片为偏差刺激，要求 36 名大学生被试仅对偏差刺激做按键反应。最后通过内隐联想测验，测量被试对环境-金钱的相对价值取向。重复测量方差分析显示，诱导自然共情与控制条件下 ERP 成分 N2、P3 波幅均未表现出显著差异。N2 波幅上在实验条件、电极点区域和电极点位置间的交互作用显著，简单效应分析显示，在诱导条件下，额叶区左侧的 N2 平均波幅显著大于额叶区中线上的平均波幅，控制条件下未发现这一差异。相对价值取向与自然共情相关脑电成分的相关分析显示，N2 成分波幅的差值与环境-金钱相对价值取向无显著相关，P3 成分波幅的差值与环境-金钱相对价值取向相关为边缘显著，环境价值取向越高，自然共情条件下 P3 成分波幅越高。上述研究结果表明，缺乏明确指导时，人脑对自然困境的共情反应较弱，与共情的双加工模型不符合。根据 Davidson 情绪趋避模型，自然共情条件下左侧更强的 N2 成分与趋近动机相关，可能解释了自然共情对亲环境行为的正向促进作用。同时，个体环境价值取向对自然共情体验的影响可能主要体现在认知评价阶段而非自动化情感共情阶段。

Neural Mechanisms of Empathy with Nature: An ERP Study

ZHANG Yu, SUN Shiyue

Department of Psychology, School of Humanities and Social Sciences, Beijing Forestry University, Beijing 100083, China

***Abstract*：** Empathy with nature refers to the understanding and sharing of the emotional experience, particularly distress, of the natural world. It shows robust positive prediction toward pro-environmental behaviors. However, little is known about people's reaction to distress of the nature without explicit instructions, not to mention the brain mechanisms of empathy with nature. The present study examined the neural mechanisms underlying the experience of empathy with nature from the perspective of dual-process theory using event-related potential techniques (ERP). The study first rated the empathic intensity and emotional value of uniformly processed 360 pictures to select 15 picture materials each for induced empathy with nature and control conditions. An Event-related potential experiment was conducted using the Oddball paradigm, with the rated picture materials as the standard stimuli and other pictures containing human characters as the deviant stimuli. Thirty-six undergraduates were asked to respond to the deviant stimuli. Finally, the relative value orientation towards environment versus money was measured using an implicit association test. Repeated-measures ANOVA revealed no significant difference in ERP component wave amplitudes evoked by induced empathy with nature versus control picture materials. When combined with brain topography, the mean wave amplitude of the N2 component was higher in the frontal than in the central region and higher on the midline in the central region than on either side, only for the induced empathy condition. The mean amplitude of the P3 component was higher in the parieto-occipital region than in the parietal region and lower on the midline than on either side. Correlation analyses revealed that the difference in N2 component wave amplitude was not significantly correlated with environment-money relative value orientation, while the difference in P3 component wave amplitude was borderline significantly correlated with environment-money relative value orientation. This may indicate that relative value orientation is more closely related to the cognitive appraisal stage than to the affective empathy stage

in the natural empathic experience. The present study proposed a model of empathy with nature consisting of early affective experience and late cognitive appraisal, but the results were not consistent with the hypothesis thus future research is needed to further test it using more refined research instruments and experimental designs.

Keywords：empathy with nature, environment value orientation, dual-process theory, oddball paradigm

儿童自然接触、亲社会行为、问题行为的纵向关系：基于交叉滞后的中介分析

摘 要　在“生态文明建设”和“健康中国行动”背景下，如何培育儿童亲近自然、增加亲社会行为、干预问题行为一直是社会关注的重要问题。以往研究发现儿童的自然接触、亲社会行为、问题行为之间存在密切关联，但三者之间是否存在随时间变化的动态作用仍不清晰，特别是缺乏三者之间潜在的中介作用机制的探讨。本研究旨在采用纵向追踪设计，考察儿童的自然接触、亲社会行为、问题行为的相互关系，并探究亲社会行为在自然接触和问题行为之间的潜在中介作用。研究采用绿色接触指数问卷和长处和困难问卷，对来自山东省的 519 名 4~6 年级学生（平均年龄 8.89 ± 0.66 岁），进行三次，间隔时间半年的追踪调查。交叉滞后分析结果显示：（1）儿童的自然接触和亲社会行为具有相互正向预测的关系，即前一阶段的自然接触显著正向预测后续的亲社会行为（$\beta = 0.24$，$ps < 0.001$），前一阶段的亲社会行为显著正向预测后续的自然接触（$\beta = 0.06$~0.07，$ps < 0.001$）；（2）自然接触和问题行为具有相互负向预测的关系，即前一阶段的自然接触水平显著负向预测后续的问题行为水平（$\beta = -0.14$~-0.13，$ps < 0.001$），前一阶段的问题行为水平显著负向预测后续的自然接触水平（$\beta = -0.12$~-0.11，$ps < 0.001$）；（3）亲社会行为对后续的问题行为预测不显著（$\beta = 0.01$，$ps > 0.05$），而问题行为负向预测后续的亲社会行为（$\beta = -0.08$~-0.07，$ps = 0.02$）。交叉滞后中介分析结果显示，亲社会行为在自然接触和问题行为之间起双向纵向中介作用，即 T1 自然接触通过 T2 亲社会行为对 T3 问题行为的间接效应显著（$\beta = -0.01$，$SE = 0.01$，95%CI = [-0.03，-0.01]），T1 问题行为通过 T2 亲社会行为对 T3 自然接触的间接效应显著（$\beta = -0.01$，$SE = 0.01$，95%CI = [-0.02，-0.01]）。研究结果为儿童与自然的关系和行为之间如何相互影响提供了证据，在实践层面对培育儿童亲近自然、干预问题行为具有启示意义，能够为学校开发自然教育提供理论支撑，服务于“生态文明建设”战略。

Longitudinal relationships among nature contact, prosocial behavior, and problem behavior in children: A mediation analysis based on cross-lagged model

LIU Haoning, YU Xiao (corresponding author)
Department of Psychology, School of Humanities and Social Sciences, Beijing Forestry University, Beijing 100083, China

Abstract: Under the background of “ecological civilization construction” and “healthy China initiative”, how to cultivate children to be close to nature, increase prosocial behavior, and prevent and intervene in problem

behavior have been critical issues of social concern. Previous studies have found that children's natural contact, prosocial behavior, and problem behavior are highly related, but no research has directly explored the bidirectional associations among the three variables over time. Additionally, the underlying mediating mechanism has not yet been explored. Thus, this study aimed to use a longitudinal tracking design to examine the relationships among children's natural contact, prosocial behavior, and problem behavior and the mediating role of prosocial behavior between natural contact and problem behavior. Data were collected using a three-wave longitudinal survey from 519 Chinese students in grades 4-6 from Shandong Province (Mage = 8.89 ± 0.66 years). Results of the cross-lagged panel model showed that: (1) natural contact and prosocial behavior bidirectionally predicted each other, i.e., nature contact positively predicted their later prosocial behavior (β = 0.24， ps < 0.001), prosocial behavior positively predicted their later nature contact (β = 0.06~0.07，ps < 0.001); (2) natural contact and problem behavior bidirectionally predicted each other, i.e., nature contact negatively predicted their later problem behavior (β = -0.14~-0.13， ps < 0.001), problem behavior negatively predicted their later nature contact (β = -0.12~-0.11， ps < 0.001); (3) problem behavior negatively predicted subsequent prosocial behavior (β = -0.08~-0.07，ps = 0.02) but not vice versa (β = 0.01，ps > 0.05). Results of the cross-lagged panel model combined with mediation analysis showed that prosocial behavior mediated the reciprocal relationship between natural contact and problem behavior. Specifically, nature contact at Time 1 improved prosocial behavior at Time 2, which further decreased problem behavior at Time 3 (β =-0.01，SE = 0.01，95%CI = [-0.03，-0.01]). Problem behavior at Time 1 decreased prosocial behavior at Time 2, which further decreased nature contact at Time 3 (β =-0.01，SE = 0.01，95%CI = [-0.02，-0.01]). Theoretically, this study contributes to our understanding of how children and nature interact. It also provides educational implications for promoting children's nature contact and developing positive behaviors, which could provide support for the development of natural education in schools and serve the strategy of "ecological civilization construction".

意义疗法对公费医学生生命意义感与职业认同感的团体干预研究

怀丹丹[1]　曲海英[1]（通讯作者）

1 滨州医学院应用心理系，烟台，264000，747246589@qq.com

摘 要　意义疗法是由著名心理学家维克多•弗兰克尔创立的一种心理治疗方法。该疗法将意义缺失导致的"存在挫折"视为心理问题的重要成因，通过引导个体重新探索自我，积极寻找生活目标和意义，化解心理问题。公费医学生，又称农村订单定向免费医学生，是我国为基层医疗卫生机构签约免费培养的卫生人才。职业认同，是个体对某一职业的积极态度和强烈的投入感。研究表明，公费医学生的职业认同低于普通医学生。生命意义是人们对自己某一特定时间内的生命目的、目标的认识和追求。公费医学生无论成绩好坏均不影响其基层就业，也无法通过努力考取研究生或进入市级医院，比普通医学生更易失去学习和生活的目标。本研究探讨公费医学生生命意义感和职业认同感的关系，并在此基础上开展基于意义疗法的团体干预。对 253 名某医学院公费医学生进行问卷调查，探究其生命意义感、职业认同感的现状及关系；筛选生命意义感低且有改善欲望的公费医学生，随机分为实验组和对照组，只对实验组进行团体干预，在干预前后对两组进行问卷测量。结果表明，公费医学生生命意义感总分及各因子分与职业认同总分及价值认同、行为认同、专业认同和环境认同 4 因子分显著正相关（r = 0.237~0.528，p < 0.001）；公费医学生生命意义感中的生命目的、生命控制、苦难接纳 3 因子正向预测职业认同。实验组干预后生命意义感总分及各因子分、职业认同感总分及行为认同、环境认同、态度认同因子分均显著高于前测（p < 0.05）；对照组前后测得分无统计学差异（p > 0.05）。实验组后测生命意义感总分及各因子分均显著高于对照组（p < 0.05）；

实验组职业认同感总分、价值认同、专业认同、环境认同、态度认同因子分均显著高于对照组（$p < 0.05$）。研究表明，基于意义疗法的团体干预可显著提高公费医学生生命意义感水平，并在一定程度上间接影响职业认同。

A Group Intervention Study of Logotherapy on Publicly Funded Medical Students' Sense of Meaning in Life and Professional Identity

HUAI Dandan, QU Haiying

Department of Applied Psychology, Binzhou Medical University

No. 346 Guanhai Road, Laishan District, Yantai City, Shandong Province, China

Abstract：Logotherapy is a psychotherapeutic method founded by the famous psychologist Viktor Frankl. The therapy regards "existential frustration" caused by the lack of meaning as an important cause of psychological problems, and resolves psychological problems by guiding individuals to re-explore themselves and actively search for goals and meaning in their lives. Publicly-funded medical students, also known as rural order-directed free medical students, are health professionals who are contracted to be trained free of charge for primary healthcare organizations in China. Professional identity is an individual 's positive attitude and strong sense of input to a certain profession. Studies have shown that the occupational identity of publicly-funded medical students is lower than that of ordinary medical students. Meaning of life is people's awareness and pursuit of their purpose and goal of life at a particular time. Publicly-funded medical students are more likely to lose the purpose of study and life than ordinary medical students, as their grades, whether good or bad, do not affect their employment at the grassroots level, and they are not able to get a postgraduate degree or enter a municipal hospital through efforts. This study explores the relationship between the sense of life meaning and professional identity of public-funded medical students, and conducted a group intervention based on Logotherapy on this basis. A questionnaire survey was conducted on 253 publicly-funded medical students of a medical school to explore the current status and relationship between their sense of meaning in life and sense of professional identity. Publicly-funded medical students with a low sense of meaning in life and a desire to improve were screened and randomly divided into the experimental group and the control group. Only the experimental group underwent the group intervention. Both groups were measured by questionnaires before and after intervention. The results showed that the total score and each factor of public medical students ' sense of meaning in life were positively correlated with the total score of professional identity and the four factors of value identity, behavioral identity, professional identity and environmental identity ($r = 0.237 \sim 0.528$, $p < 0.001$).The 3 factors of public-funded medical students' sense of meaning of life, life purpose, life control, and acceptance of suffering, positively predicted vocational identity. The total score of the sense of meaning of life and the scores of each factor, the total score of occupational identity and the scores of behavioral identity, environmental identity, and attitudinal identity of the experimental group were significantly higher than those of the pre-test after the intervention ($p < 0.05$). There was no significant difference in the scores of the control group before and after the test ($p > 0.05$). The total score of sense of meaning of life and the scores of each factor in the post-test of the experimental group were significantly higher than those of the control group ($p < 0.05$). The total score of sense of occupational identity and the scores of value identity, professional identity, environmental identity, and attitude identity of the experimental group were significantly higher than those of the control group ($p < 0.05$).

The study suggests that group intervention based on Logotherapy can significantly improve the level of sense

of meaning in life of publicly-funded medical students and indirectly affect professional identity to a certain extent.

摘 要　过去十年的研究发现了大脑奖励系统在压力恢复中的关键作用。然而，没有研究提供应激期间中脑-纹状体奖赏区域的活动与皮质醇应激反应的恢复之间的经验联系。此外，尽管奖赏敏感性作为一种特征已被证明可以促进应激恢复力，但它是否在应激恢复力中调节大脑奖赏系统，以及内在神经内分泌系统如何实现这一效果，仍不得而知。在本研究中，70 名年轻人参与了 ScanStress 任务，同时在任务期间收集了他们的大脑成像数据和皮质醇分泌。此外，还测量了参与者的奖赏敏感性、皮质醇觉醒反应（CAR）和大脑的内在功能连接。我们发现，压力暴露期间左壳核的激活可以积极预测皮质醇的恢复。此外，奖赏敏感性与左壳核的激活呈正相关，这种关系是由 CAR 和右海马（HIP）-左额下回内在连接串联介导的。这项研究表明，奖赏敏感性通过昼夜应激反应系统和 HIP 前额叶回路网络的相互作用来调节应激弹性中的奖赏途径。总之，目前的研究建立了一个模型，以突出奖励-恢复途径中相关异质性因素之间的动态和多方面的相互作用，并揭示了中脑-纹状体奖赏系统在压力期间的恢复功能。

Reward Sensitivity Regulates Brain Reward Pathway in Stress Resilience via Inherent Neuroendocrine System

Hu, Weiyu[12], Wang, Shuai[1], Zhou, Meijun[1], Yang Juan[1]

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University

2 Faculty of Psychology, Southwest University

Abstract：Over the last ten years, researchers suggested a critical role for brain reward system in stress resilience. However, no study has provided an empirical link between activity in mesostriatal reward regions during stress and the recovery of cortisol stress responses. Moreover, although reward sensitivity as a trait has been demonstrated to promote stress resilience, whether it regulates the brain reward system in stress resilience and how this effect could be achieved by the inherent neuroendocrine system remain elusive. To this end, seventy young adults participated in a *ScanStress* task while their brain imaging data and cortisol secretion were collected during the task. In addition, participants' reward sensitivity, cortisol awakening response (CAR), and brain's intrinsic functional connectivity were also measured. We found left putamen activation during stress exposure positively predicted cortisol recovery. In addition, reward sensitivity was positively linked with the activation of left putamen, and this relationship was serially mediated by the CAR and right hippocampus (HIP)-left inferior frontal gyrus intrinsic connectivity. This investigation suggested reward sensitivity regulated reward pathways in stress

resilience through the interplay of diurnal stress response system and network of the HIP-prefrontal circuitry. In all, the current study built a model to highlight the dynamic and multifaceted interaction between pertinent allostasis factors during the reward-resilience pathway and uncovered a new sight into the resilience function of the mesostriatal reward system during stress.

在挫折中成长——意义建构的中介作用

陈一笛[1]　阳光耀[1]　甘怡群[2]（通讯作者）

1 北京林业大学人文社会科学学院心理学系，北京，100083

2 北京大学心理与认知科学学院，北京市行为与健康重点实验室，北京，100871，ygan@pku.edu.cn

摘 要　通过三个研究，使用基于应激事件的视角，考察意义建构在应激事件中对应激相关成长的中介作用。研究 1 通过在 100 名职业应激被试中的日记研究，建立多水平中介模型验证了意义建构在应激与应激相关成长中的中介作用，日常感知应激负向预测意义建构，意义建构正向预测应激相关成长，意义建构可以削弱应激给应激相关成长带来的负面影响。研究 2 通过一个生态瞬时评估，在 109 名大学生样本中，进行连续一周 42 次测量，利用自相关/互相关的方法，得到了日常应激和累积生活应激事件对意义建构、应激相关成长的作用。日常应激可以通过正向预测下一个时间点的意义建构促进下一个时间点的应激相关成长，个体在压力下感知到的应激越多，在下一个时刻就会对该压力事件产生更多的意义建构，也会预测下个时间点更高的应激相关成长。意义建构可以中介负性生活应激对于应激相关成长的作用。研究 3 使用半纵向设计，对全国各地共 236 名大学生进行间隔 1 个月的追踪调查，得到了应激剂量与意义建构的倒 U 型曲线关系。中介效应分析显示，控制应激事件一次项时，T1 时间点的意义建构在应激事件二次项与 T2 时间点的应激相关成长之间有显著中介作用。研究揭示了应激接种理论，证明了意义建构理论，为应激领域的干预提供了实践证据。

Growing Through Frustration:

The Mediating Role of Meaning-making

Yidi Chen[1], Guangyao Yang[1], Yiqun Gan[2*]

1 School of Humanities and Social Sciences, Beijing Forestry University, China

2 School of Psychological Cognitive Sciences, and Beijing Key Laboratory of Behavior and Mental Health, Peking University, China

Abstract： The mediating role of meaning-making in stressful events on stress-related growth was examined through three studies using a stressful event-based perspective. Study 1 validated the mediating role of meaning-making in stress and stress-related growth through a multilevel mediation model in a diary study among 100 occupationally stressed employees, with daily perceived stress negatively predicting meaning-making, meaning-making positively predicting stress-related growth, and meaning-making attenuating the negative effects of stress on stress-related growth. Study 2 obtained the role of everyday stress and cumulative life stressful events on meaning-making, stress-related growth through an ecological transient assessment with 42 consecutive one-week measurements in a sample of 109 college students utilizing an autocorrelation/intercorrelation approach.

Everyday stress can promote stress-related growth at the next time point by positively predicting meaning-making at the next time point, and the more stress an individual perceives under stress, the more meaning-making he or she will have for that stressful event at the next moment, which also predicts higher stress-related growth at the next time point. Meaning-making can mediate the role of negative life stress on stress-related growth. Using a semi-longitudinal design, Study 3 followed a total of 236 college students across the country at 1-month intervals and obtained an inverted U-shaped curvilinear relationship between stress and meaning-making. Mediation effect analyses revealed that when controlling for the primary term of the stressful event, meaning-making at the T1 time point significantly mediated the relationship between the secondary term of the stressful event and stress-related growth at the T2 time point. The study reveals the theory of stress inoculation, demonstrates the meaning-making model, and provides empirical evidence for interventions in the stress domain.

磨难中开出灿烂的花：来自神经中介机制，遗传学和干预的证据

甘怡群 (通讯作者) 陈一笛

北京大学心理与认知科学学院，北京，100871，ygan@pku.edu.cn

摘 要 "杀不死我们的使我们更强大 "这句话强调了应激暴露对我们心理健康的重要影响，并对应激必然不利于心理健康的观点提出了挑战。应激相关成长是指个体在承受应激后所经历的积极变化。它包括社会资源、个人资源和应对过程。应激接种理论认为，适度的应激暴露可以促进成长和积极的健康结果。我们参考 Tabibnia 的三元情感神经科学复原力模型，探讨自我肯定、认知重评和意义建构在应激相关成长中的中介机制。以意义建构为例，通过 fMRI，在意义建构条件下，观察到默认模式网络的激活，这表明 DMN 在意义建构中起着至关重要的作用。以生活事件为自变量，DMN 激活为中介变量，应激相关成长的应对灵活性指数为因变量，中介效应显著，验证了我们的假设。然而，最佳应激水平可能因遗传差异而不同。通过对多个同大样本的研究，我们发现了调节应激-应对关系的遗传因素，HPA 相关基因是童年创伤与未来取向之间关系的调节因子。并提出了分化应激相关成长假说。最后，我们讨论了针对意义建构、应激心向的干预方案，用随机对照试验证明了其效果，展示了移动健康干预在提升心理健康方面的潜力。

关键词 应激相关成长，意义建构，移动健康干预，HPA 相关基因

What does not kill us makes us stronger: Insight from neuropsychological studies, molecular genetics, and behavioral interventions

Yiqun Gan, Yidi Chen

School of Psychological and Cognitive Sciences, Peking University, 5 Yiheyan Road, Beijing

Abstract: The phrase "what doesn't kill us makes us stronger" highlights the significant impact of stress exposure on our psychological well-being and challenges the notion that stress is invariably detrimental to mental health. Stress-related growth refers to the positive changes experienced by an individual after undergoing stress. It comprises social resources, personal resources, and coping processes. Stress Inoculation Theory suggests moderate

stress exposure can foster growth and positive health outcomes. We explore the mediating mechanism of self-affirmation, cognitive reappraisal, and meaning-making in stress-related growth, referencing Tabibnia's tripartite affective neuroscience model for resilience. Using fMRI, we investigate cognitive neural mechanisms linking meaning-making to the default mode network, revealing significant mediation effects on coping flexibility. However, optimal stress levels may vary due to genetic differences. By studying diverse samples, we identify genetic factors moderating the stress-coping relationship and propose the differential post-stress growth hypothesis. Last, we discuss intervention programs targeting meaning-making, self-affirmation, and positive reevaluation to enhance mental health after stress. For example, one of our intervention primarily consists of photographic tasks and psychoeducation targeting on stress mindset. We used RCT to demonstrate the potential of scalable m-health interventions for psychological well-being.

Keywords：Stress-related growth, meaning construction, m-Health interventions, HPA-related genes

应激心血管反应与青少年执行功能与情绪能力的“U”型关系

吕薇[12]（通讯作者）

1 陕西省儿童青少年心理与行为健康重点研究中心

2 陕西师范大学心理学院，陕西，西安，710062，lvwei@snnu.edu.cn

摘 要　青春期是个体认知功能与情绪能力迅速发展的时期。已有研究指出自主神经系统支配下的应激心血管反应与个体执行功能和情绪反应与调节能力之间有着密切联系，但研究结论并不一致。近年来理论与实证研究都表明适度的应激心血管反应性是一种适应性的生理应答模式，与健康适应结果相联系，而过大或钝化的应激心血管反应性都与不利的适应结果相关。因此，本研究关注应激心血管反应与青少年执行功能与情绪能力的非线性关系。通过两个子研究，分别考察应激心血管反应性与执行功能的关联（研究1）和应激心血管反应性与情绪反应、情绪调节能力的关联（研究2）。研究1有268名（样本1）初中生完成了实验室条件下的演讲任务并记录其心血管反应，和Flanker任务及面孔-词Stroop任务。研究2有341名初中生（样本2）完成了实验室条件下的心算任务并记录其心血管反应，和由家长报告的情绪反应和情绪调节能力。结果发现：（1）演讲任务下应激心血管反应性与执行功能之间存在显著的二次曲线关联，表明适度的应激心血管反应性与青少年较好执行功能有关；（2）心算任务下应激心血管反应性与情绪反应、情绪调节能力存在显著的二次曲线关联，也表明适度的应激心血管反应性与青少年适度的情绪反应和较好的情绪调节能力有关。这些研究揭示了应激心血管反应与青少年执行功能和情绪能力的“U”型关系，表明适度的应激心血管反应与最优化的执行功能和情绪能力相联系。

The “U” Shape Relationship between Cardiovascular Stress Reactivity and Executive Function and Emotional Ability among Adolescents

Wei Lü (Corresponding Author)

School of Psychology, Shaanxi Normal University, 199 South Chang’an Road, Xi’an

Abstract：Adolescence is sensitive developmental period for individual cognitive and emotional ability. Previous studies have found a close association between cardiovascular reactivity to stress which is regulated by the autonomic nervous system, individual executive function, and emotional reactivity and emotion regulation, while yielding inconsistent conclusions. Recently, the theoretical perspectives and empirical studies have together indicated that moderate cardiovascular reactivity to stress should be regarded as an adaptive physiological response pattern that is linked to adaptive outcomes, while excessive or blunted cardiovascular reactivity to stress is associated with maladaptive outcomes. Thus, the present study focused on the nonlinear association between cardiovascular reactivity to stress and executive function and emotional ability among adolescents. The association between cardiovascular reactivity to stress and executive function were explored in study 1 and the associations between cardiovascular reactivity to stress and emotional reactivity and emotion regulation were explored in study 2. In study 1, a sample of 268 middle school students were asked to complete the flanker task, face-word stroop task and a speech task during which their physiological data were obtained. In study 2, another sample of 341 middle school students were asked to complete a mental arithmetic task during which their physiological data were obtained and their parents were asked to report their children's emotion regulation and emotion reactivity. Results showed that (1) Cardiovascular reactivity to the speech task was quadratically associated with executive function, suggesting that moderate cardiovascular reactivity was related to better executive function. (2) Cardiovascular reactivity to the mental arithmetic task was quadratically associated with emotional reactivity and emotion regulation, suggesting that moderate cardiovascular reactivity was related to better emotional reactivity and emotion regulation. These findings reveal the "U" shape relationship between cardiovascular reactivity to stress and adolescent executive function and emotional ability, and suggest that moderate cardiovascular reactivity to stress is related to the optimal executive function and emotional ability among adolescents.

家庭不文明行为与家庭支持对青少年抑郁症状的影响

苗淼[1]　奇巍[1]　靳帅[1]　甘怡群[2]（通讯作者）

1 北京大学医学人文学院医学心理学系，北京，100191

2 北京大学心理与认知科学学院，北京，100871，通讯作者 E-mail(ygan@pku.edu.cn）

摘 要　积极的家庭互动与青少年的心理健康存在密切的联系，而消极的家庭互动则有可能引发青少年的心理健康问题。家庭不文明行为作为家庭日常互动中常见的慢性应激源，由于其影响较小、容易被忽视，其对于青少年心理健康的不良影响目前缺乏深入研究。本研究聚焦于家庭互动对青少年抑郁症状的影响，基于认知情感加工理论，考察了消极互动（家庭不文明行为）与积极互动（家庭支持）对青少年自我同情的影响，从而解释不同互动影响青少年抑郁症状的潜在中介机制。在此基础上，基于资源保存理论，引入生命意义感，将其视作积极的应对资源，探讨生命意义感对上述中介过程的调节作用。本研究在 999 名高中生群体中开展三个时间点的纵向调查，采用可信度校正的潜在结构方程模型对假设的带调节的中介模型进行检验。结果显示，家庭不文明行为通过负性自我同情成分（自我冷漠）的中介作用预测抑郁症状(B = 0.08, SE = 0.02, 95% BaCI = [0.054, 0.119])，而家庭支持则通过正性自我同情成分（自我同情）的中介作用预测抑郁症状(B = -0.03, SE = 0.01, 95% BaCI = [-0.049, -0.018])。此外，对生命意义感不同成分的分析显示，外在价值能够调节家庭不文明行为与自我冷漠以及家庭支持与自我同情之间的关系——高水平的外在价值能够缓冲家庭不文明行为对自我冷漠的预测作用，并加强家庭支持对自我同情的积极作用。并且，外在价值能够调节上述两条从家庭互动到抑郁症状的中介路径。综上，本研究证实了家庭不文明行为对青少年心理健康的不良影响及潜在机制，突出了家庭支持的积极作用。并且，本研究揭示了生命意义感（尤其

是外在价值成分）对于青少年心理健康的保护作用。这就提示我们，提升青少年群体的心理健康水平需要重视对家庭（减少家庭不文明行为、提升家庭支持）与青少年（提升自我同情与生命意义感）双方的心理健康教育与干预。

The impact of family incivility and family support on adolescent depressive symptoms

Miao Miao[1] Wei Qi[1] Shuai Jin[1] Yiqun Gan[2] (Corresponding author)
1 Department of Medical Psychology, School of Health Humanities, Peking University, Beijing
2 School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, Beijing. E-mail (ygan@pku.edu.cn)

***Abstract*:** Positive family interactions are closely associated with adolescent mental health, while negative family interactions may lead to adolescent mental health problems. Family incivility, a common chronic stressor in everyday family interactions, has received little attention due to the fact that it is less harmful and easily ignored. The present study focuses on the influence of family interaction on depressive symptoms among adolescents. Based on the cognitive affective processing system model, this study examined the impact of negative interactions (family incivility) and positive interactions (family support) on adolescent self-compassion, so as to explain the potential mediating mechanisms of different interactions affecting adolescent depressive symptoms. Moreover, based on the conservation of resources theory, meaning in life is considered as a positive coping resource, and its moderating effect on the mediating relationship was examined. A three-wave longitudinal survey was conducted among 999 high school students, and the hypothesized moderated mediating model was tested using reliability-corrected latent structural equations. The results showed that negative self-compassion component (i.e., self-coldness) mediated the relationship between family incivility and depressive symptoms (B = 0.08, SE = 0.02, 95% BaCI = [0.054, 0.119]). Positive self-compassion component (i.e., self-compassion) mediated the relationship between family support and depressive symptoms (B = -0.03, SE = 0.01, 95% BaCI = [-0.049, -0.018]). In addition, regarding different components of meaning in life, external value moderated the relationship between family incivility and self-coldness as well as that between family support and self-compassion; a high level of external value could bugger the impact of family incivility on self-coldness and strengthen the effect of family support on self-compassion. Moreover, external value moderated the mediating pathways from family interactions to depressive symptoms. The present findings shed light on the negative impact of family incivility on adolescent mental health, and highlighted the positive effect of family support. In addition, the present study provided support for the protective role of meaning in life for adolescents. To improve the mental health of adolescents, more emphasis should be placed on the intervention towards both the family (e.g., reducing family incivility and promoting family support) and the adolescents (e.g., strengthening self-compassion and meaning in life).

Keywords: family incivility, family support, self-compassion, meaning in life, adolescent depression

正念何以促进利他：悲悯心的作用

陈瑞琪[1]　宋晓兰[1]　（通讯作者）

1 浙江师范大学心理学院，金华，321004，xlsong@zjnu.cn

摘 要　利他行为是由完全指向缓解他人痛苦的利他动机而推动的助人行为。研究正念与利他行为的关系对于阐明正念与善行之间的关系具有深远的意义。已有研究提示正念与更多的助人行为相关，然而正念是否可以促进利他行为，仍是一个没有得到清晰回答的问题。如果正念与更高水平的利他相关，那么其中的原因又是什么？本研究聚焦于正念与利他行为之间的联系，并关注与人类产生利他行为直接相关的情感“悲悯（compassion）”在其中的作用。在中文语境中，悲悯不同于同情或共情，是在理解痛苦本质的基础上产生希望解除他人痛苦的情感，也包含由这种情感引发的动机，是人类面对痛苦的本性之一，也是利他行为的根本推动力。本研究以此为切入点，尝试回答“正念是否通过悲悯促进了利他行为”这一问题。

研究分别从正念作为一种人格特质和可以经由训练加以提升的心理能力两个角度，回答上述问题。研究一（*N=93*）探究特质正念与利他行为的关系以及悲悯在其中的作用，采用问卷测量特质正念、悲悯和自陈利他，用心理逃避范式中的利他捐赠测量利他行为。结果显示，特质正念正向预测自陈利他，且悲悯在其中起中介作用;没有发现特质正念与利他捐赠存在预测关系。研究二（*N=62*）采用八周正念训练的方式，探索正念训练是否可以提升利他行为以及悲悯悲悯在正念-利他关系中的作用，采用 2(组别:八周正念组、等待控制组)*2(时间:前测、后测) 的混合实验设计。采用问卷测量特质正念和悲悯，用心理逃避范式中的利他捐赠测量利他行为。结果显示:与等待控制组相比，八周正念训练显著提升了个体的正念水平，促进利他捐赠并提升了悲悯;且悲悯的改变值在八周正念训练促进利他捐赠的关系中起中介作用。

两个研究的结果支持了正念与利他行为之间的积极联系以及悲悯在其中的重要作用，显示正念训练可以提升个体对处于痛苦情境中他人的悲悯心，促进利他行为。

关键词　正念，悲悯，利他行为，正念训练，心理逃避范式。

THE EFFECT OF MINDFULNESS ON ALTRUISTIC BEHAVIOR: THE ROLE OF COMPASSION

Ruiqi Chen[1]　Xiaolan Song[1*]

School of Psychology, Zhejiang Normal University, Jinhua,321004，xlsong@zjnu.cn

***Abstract*：** Mindfulness is the awareness that arises from intentionally focusing attention on present experience with acceptance, which can lead to greater insight into the nature of physical and mental experience. Research in recent years has not only revealed a strong link between mindfulness and individual physical and mental health, but has also suggested that mindfulness can enhance helping behavior. However, can mindfulness promote altruistic behavior? And, if mindfulness can promote altruistic behavior, what are its internal mechanisms? Existing research is not yet sufficient to answer this question. Distinguished from helping behavior, altruistic behavior is driven by altruistic motives directed solely toward alleviating the suffering of others. The study of the relationship between mindfulness and altruistic behavior has profound implications for elucidating the relationship between mindfulness and good acts. In the Chinese context, compassion, unlike sympathy or empathy, is the emotion of wishing to relieve the suffering of others based on the understanding of the nature of suffering, and also contains the motivation triggered by this emotion, which is part of human nature in the face of suffering and is the fundamental driving force of altruistic behavior. This study explores the relationship between mindfulness and altruistic behavior, and attempts to answer the question "Does mindfulness promote altruistic behavior through

compassion? "

The research answers the above questions from two perspectives: mindfulness as a trait and a mental ability that can be improved through mindfulness training. Study 1 (*N=93*) explored the relationship between trait mindfulness and altruistic behavior and the role of compassion in it. Questionnaires were used to measure trait mindfulness, compassion, and self-reported altruism, and altruistic behavior was measured by altruistic donation in the psychological avoidance paradigm. The results showed that trait mindfulness positively predicted self-altruism, and compassion played a mediating role; no predictive relationship was found between trait mindfulness and altruistic donation. Study 2 (*N=62*) used eight-week mindfulness training to explore whether mindfulness training can improve altruistic behavior and the role of compassion in the mindfulness-altruism relationship, using 2 (groups: eight-week mindfulness group, waiting control group) *2 (time: pre-test, post-test) mixed experimental design. Questionnaires were used to measure the traits mindfulness and compassion, and altruistic behavior was measured with altruistic donation in the psychological avoidance paradigm. The results showed that compared with the waiting control group, eight weeks of mindfulness training significantly improved the level of individual mindfulness, promoted altruistic donation and increased compassion; and the change value of compassion mediated the relationship between eight weeks of mindfulness training and altruistic donation.

The results of the two studies support the positive link between mindfulness and altruistic behavior and the important role of compassion in it, showing that mindfulness training can enhance individuals' compassion for others in suffering and promote altruistic behavior.

Keywords：mindfulness, compassion, altruistic behavior, mindfulness training, psychological avoidance paradigm.

经验性回避在正念干预早期阶段的中介作用：每日日记研究

贺梦瑶[1]，李燕娟[1]，李恒之[2]，刘兴华[1]（通讯作者）

1 北京大学心理与认知科学学院，北京，100871，xinghua_liu@pku.edu.cn

2 广州美术学院，广州，510000

摘 要　背景：以往研究发现经验性回避中介了早期正念干预对情绪困扰的影响，但尚未有研究证明经验性回避与情绪困扰变化的时间先后顺序。本研究试图从时间顺序的原则出发，使用每日日记的方法检验经验性回避是否是早期正念干预缓解情绪困扰的机制。

方法：通过网络招募高情绪困扰的参与者。完成前测后，106 名参与者被随机分配到正念干预组(N = 53)或等候组(N = 53)。在干预开始之前的一周，以及干预开始后的前三周，所有参与者每日需完成一份问卷，测量当天的经验性回避、焦虑和抑郁困扰水平，共 28 天。

结果：多水平中介分析表明，在同日模型中，当日的经验性回避在个体间水平上可以显著中介正念干预与当日焦虑困扰（a*b：$B = 0.640$, $SE = 0.292$, $p = .028$）、抑郁困扰（a*b：$B = 0.515$, $SE = 0.243$, $p = .034$）的关系，个体内水平上当日的经验性回避也与当日的焦虑困扰（$B = 0.333$, $SE = 0.033$, $p < .001$）、抑郁困扰（$B = 0.291$, $SE = 0.037$, $p < .001$）显著正相关。在时间滞后模型中也有类似的发现，当日的经验性回避在个体间水平上可以显著中介正念干预与第二天焦虑困扰（a*b：$B = 0.668$, $SE = 0.309$, $p = .031$）、抑郁困扰（a*b：$B = 0.560$, $SE = 0.254$, $p = .028$）的关系，个体内水平上当日的经验性回避也与第二天的焦虑困扰（$B = 0.112$, $SE = 0.023$, $p < .001$）、抑郁困扰（$B = 0.279$, $SE = 0.036$, $p < .001$）显著正相关。

结论：本研究从时间顺序的角度，进一步揭示了经验性回避在早期正念干预缓解情绪困扰中的机制作用。

The Role of Experiential Avoidance in the Early Stage of Mindfulness Intervention: A Daily Diary Study

Mengyao He[1]，Yanjuan Li[1]，Hengzhi Li[2]，Xinghua Liu[1]*
1 School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871,
xinghua_liu@pku.edu.cn
2 Guangzhou Academy of Fine Arts, Guangzhou, 510000

Abstract: BACKGROUND: Previous studies have found that experiential avoidance mediates the influence of mindfulness intervention in the early stage on emotional distress, but no research has proved the temporal sequence of experiential avoidance and emotional distress. Based on the principle of temporal precedence, this study attempts to test whether experiential avoidance is the mechanism of mindfulness intervention in the early stage to alleviate emotional distress by using a daily diary research. METHOD: Participants with high emotional distress were recruited through the Internet. After completing the pre-test, 106 participants were randomly assigned to mindfulness intervention group (N = 53) or waiting group (N = 53). One week before the intervention and the first three weeks in the intervention, all participants were required to complete a questionnaire every day to measure the level of experiential avoidance, anxiety and depression on that day, lasting for 28 days. RESULTS: Multi-level mediation analysis showed that in the contemporary model, experiential avoidance could significantly mediate mindfulness intervention and anxiety distress (a*b: B = 0.640, SE = 0.292, p = .028) and depression distress (a*b: B = 0.515, SE = 0.243, p = .034) in the same day. In the within-person level, experiential avoidance was also significantly positively correlated with anxiety distress (B = 0.333, SE = 0.033, p < .001) and depression distress (B = 0.291, SE = 0.037, p < .001) in the same day. Similar findings were found in the time-lagged model. On the between-person level, experiential avoidance could significantly mediate the mindfulness intervention and the anxiety distress (a*b: B = 0.668, SE = 0.309, p = .031) and the depression distress (a*b: B = 0.560, SE = 0.254, p = 0.031) in the next day. In the within-person level, the experiential avoidance was also significantly positively correlated with anxiety distress (B = 0.112, SE = 0.023, p < .001) and depression distress (B = 0.279, SE = 0.036, p < .001) in the next day. CONCLUSION: This study further reveals that experiential avoidance is an important mechanism during the early-stage of MBIs for alleviating emotional distress from the perspective of temporal precedence.

小学生感知教师支持与学校表现的日常动态关系：消极情绪的中介作用与正念的调节作用

闻学[1,2]　刘晓妍[2]　徐慰[2](通讯作者)
1 南京师范大学心理学院，南京，100101
2 北京师范大学心理学部，北京，100875，livingxw@163.com

摘 要　面对繁重的学习任务和普遍的竞争，小学生在学校生活中易产生消极情绪，有不良学校表现。教师支持是小学生学校生活中社会支持的重要部分，是小学生健康心理的保护因素。感受到教师支持的小

学生能意识到教师的关心、爱护与鼓励，从而产生更少的消极情绪，积极专注地投入到学习任务中，促成良好的学校表现。但是，即使教师精力有限，班级中大部分学生无法感知到高水平的教师支持、消极情绪水平高，仍只有小部分学生有违纪、学业拖延、上课分心等不佳的学校表现，这可能得益于正念缓冲了消极情绪对学校表现的预测作用。因此，本研究探究每日教师支持与小学生学校表现(包含违纪、学业拖延、上课分心行为)的关系，以及消极情绪在其中的中介作用，并检验特质正念对中介模型后半段间接路径的调节作用。本研究招募某小学 3-6 年级的学生共 193 人(42.5%女性，平均年龄 9.91 岁，*SD*=2.16)，前测测量其特质正念水平，日记法阶段对其进行 10 个连续工作日的测量，测量内容为小学生自我报告每天的感知教师支持与消极情绪水平；此外，为了客观评价小学生的学校表现，要求班主任对每位学生当日的违纪、学业拖延、上课分心表现进行他评。结果表明，消极情绪中介学生每日感知教师支持与违纪或上课分心的关系(间接效应=-.02/-.02, 95% CI=[-0.037, -0.008]/[-0.038, -0.009])，也即学生在感知到更多教师支持的工作日有更少的消极情绪(*b*=-.25, *p*<.001)，从而有更少违纪(*b*=.09, *p*=.003)或上课分心(*b*=.09, *p*=.002)的表现；正念调节以违纪为结果变量的中介模型的后半段间接路径(*b*=-.09, *p*<.001)。具体而言，正念水平低时(标准化后分值=-1)，中介模型中消极情绪对违纪的预测作用显著(*b*=.18, *p*<.001) ，中介模型成立(间接效应=-.04，95% CI=[-0.061, -0.024])；正念水平高时(标准化后分值=1)，中介模型中消极情绪对违纪的预测作用不显著(*b*=-.01, *p*=.845)，中介模型不成立(间接效应=.00，95% CI=[-0.019, 0.021])。每日感知教师支持与学业拖延之间的关系不被消极情绪中介(间接效应=-.01 ,95% CI=[-0.022, 0.006])，后半段间接路径也不被正念调节(*b*=-.02, *p*=.403)。本研究强调了教师支持通过减少消极情绪对学校表现的积极作用，及正念对违纪行为的缓冲作用。

Daily Momentary Relationship between Elementary School Students' Perceived Teacher Support and School Performance: The Mediating Role of Negative Emotion and the Moderating Role of Mindfulness

Xue WEN[1], Xiaoyan LIU[2], Wei XU[2]
1 School of Psychology, Nanjing Normal University, Nanjing, 100101
2 Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract：Because of the heavy learning task and widespread competition, elementary school students are prone to negative emotion and poor school performance in their school life. Teacher support is an important part of social support in elementary school students' school life and is a protective factor for their psychological health. Elementary school students who perceive support from teachers can realize their teachers' care, love, and encouragement, which might predict less negative emotion, help students to proactively and attentively engage in learning tasks, and contribute to good school performance. However, even though most of the time teachers have limited energy, and most students in the class cannot perceive high levels of teacher support and have to face negative emotion, only a small percentage of students have poor school performance such as disciplinary infractions, academic delays, and distractions in class, which may be due to the fact that mindfulness buffers the predictive effect of negative emotion on school performance. Therefore, the present study explored the daily relationship between elementary school students' perceived teacher support and school performance (encompassing disciplinary infractions, academic delays, and distractions in class), and the mediating role of negative emotion, as well as the moderating role of trait mindfulness on the second half of the indirect path in the mediation model. A total of 193 students (42.5% female, mean age = 9.91 years, *SD* = 2.16) in grades 3-6 of an

elementary school were recruited for the present study. Their trait mindfulness levels were measured in the pre-test. In the daily diary part, the self-reported daily levels of perceived teacher support and negative emotion of the elementary school students were measured over 10 consecutive workdays; furthermore, in order to objectively assess the elementary school students' school performance, the class teachers were asked to make their assessments of each student's performance on disciplinary infractions, academic delays, and distractions in class for that day. Results showed that negative emotion mediated the relationship between daily perceived teacher support and disciplinary infractions/distractions in class (indirect effect = -.02/-.02, 95% CI=[-0.037, -0.008]/[-0.038, -0.009]). That means on the day when students perceived more support from teachers, they had less negative emotion, then had fewer disciplinary infractions (b=.09, p=.003) or distractions in class (b=.09, p=.002). Mindfulness moderated the mediation model of disciplinary infractions (b=-.09, p<.001). Specifically, to students whose mindfulness levels were low (standardized value=-1), negative emotion significantly predicted disciplinary infractions (b=.18, p<.001), and the mediation model was significantly set up (indirect effect=-.04,95% CI=[-0.061, -0.024]); to students whose mindfulness levels were high (standardized value=1), negative emotion could not predict disciplinary infractions(b=-.01, p=.845), and the mediation model could not be set up (indirect effect=.00, 95% CI=[-0.019, 0.021]). Negative emotion could not mediate the relationship between daily perceived teacher support and academic delays (indirect effect=-.01, 95% CI=[-0.022, 0.006]). The second half of the indirect path of the model was not moderated (b=-.02, p=.403). The present research highlights the positive effect of perceived teacher support on better school performance by reducing elementary school students' daily negative emotion, as well as the buttering effect of mindfulness on disciplinary infractions.

正念干预改善躯体症状：觉知压力的中介作用

李燕娟 贺梦瑶 刘兴华（通讯作者）

北京大学心理与认知科学学院，北京，100871，Xinghua_liu@pku.edu.cn

摘 要 受焦虑抑郁困扰的个体通常也会体验到躯体症状的困扰。近几十年来，不少研究发现基于正念的干预（mindfulness-based interventions; MBIs）除了能缓解焦虑抑郁等情绪困扰外，还能改善躯体症状。Creswell 等研究者提出了压力缓冲模型，认为在心理层面，MBIs 能通过减少压力作用于身体健康相关变量，但相关实证研究较少。因此，本研究旨在探究，觉知压力是否在正念干预改善躯体症状中起到中介作用。

研究一为横断面研究，共招募 481 名高焦虑抑郁困扰的个体（年龄 M = 31.39, SD = 8.90），测量其正念、觉知压力和躯体症状水平。中介分析结果表明，觉知压力在正念和躯体症状之间起到完全中介作用（间接效应 = -0.08, 95%CI = [-0.10, 0.06]）。

研究二为随机对照研究，招募 347 名高焦虑抑郁困扰的个体（年龄 M = 32.78, SD = 9.12），将其随机分到正念干预组（N = 173）和等待对照组（N = 174），在干预前，干预期间每周，干预后测量正念、觉知压力和躯体症状。正念干预采用的是情绪困扰的正念干预方案。混合线性模型结果表明，相比于等待对照组，正念干预组的参与者在干预后正念水平显著提高，觉知压力和躯体症状显著降低（时间*组别交互作用 ps < .05）。平行过程-潜增长曲线模型结果表明，觉知压力的改善在干预对躯体症状的改善中起到部分中介作用（间接效应 = -0.14, 95%CI = [-0.26, -0.06]）。随机截距-交叉滞后模型结果表明，在正念干预过程中，觉知压力的变化能够预测下一个时间点躯体症状的变化（β = 0.10, p = .020），反之不成立（β = 0.08, p = .334）。

综上，对于高焦虑抑郁困扰的个体而言，觉知压力在正念干预缓解躯体症状中起到中介作用，且在干预过程中，觉知压力的变化先于躯体症状的变化。本研究结果为正念干预起效模型——压力缓冲模型提供了实证依据，启示我们增加对觉知压力的干预剂量可能可以增加正念干预对躯体症状的作用效果。

The effect of Mindfulness-Based Interventions on Physical Symptoms: Perceived Stress as the mediator

Yan-juan, Li, Mengyao He, Xing-hua, LIU
School of Psychological and Cognitive Sciences, Peking, 100871

Abstract：Individuals troubled by anxiety and depression often experience distressing physical symptoms as well. In recent decades, numerous studies have found that mindfulness-based interventions (MBIs) not only alleviate emotional distress such as anxiety and depression but also improve physical symptoms. Creswell and other researchers proposed the stress-buffering model, suggesting that at the psychological level, MBIs can reduce stress and impact variables related to physical health. However, empirical research in this regard is limited. Therefore, this study aimed to explore whether perceived stress played a mediating role in the improvement of physical symptoms through MBIs.

Study 1 was a cross-sectional study that recruited 481 individuals with high levels of anxiety and depression symptoms (mean age = 31.39, *SD* = 8.90). Their levels of mindfulness, mindful awareness of stress, and physical symptoms were measured. Mediation analysis results indicated that perceived stress fully mediated the relationship between mindfulness and physical symptoms (indirect effect = -0.08, 95%CI = [-0.10, 0.06]).

Study 2 was a randomized controlled trial that recruited 347 individuals with high levels of anxiety and depression symptoms (mean age = 32.78, *SD* = 9.12). Participants were randomly assigned to either the mindfulness intervention group (*N* = 173) or the waitlist control group (*N* = 174). Before the intervention, each week during the intervention, and after the intervention, mindfulness, perceived stress, and physical symptoms were assessed. The mindfulness intervention employed the Mindfulness Intervention for Emotional Distress protocol. Mixed linear model results showed that compared to the waitlist control group, participants in the mindfulness intervention group exhibited significantly increased mindfulness levels and significantly reduced mindful awareness of stress and physical symptoms after the intervention (time×group interaction *p*s < .05). Parallel process-latent growth curve model results demonstrated that the improvement in perceived stress partially mediated the improvement in physical symptoms following the intervention (indirect effect = -0.14, 95%CI = [-0.26, -0.06]). Random intercept-cross-lagged panel model results indicated that during the mindfulness intervention, changes in perceived stress predicted subsequent changes in physical symptoms (β = 0.10, *p* = .020), but not vice versa (β = 0.08, *p* = .334).

In conclusion, for individuals with high levels of anxiety and depression symptoms, perceived serves as a mediating factor in the alleviation of physical symptoms through mindfulness interventions. Furthermore, during the intervention process, changes in mindful awareness of stress precede changes in physical symptoms. The findings of this study provide

empirical support for the mechanism model of mindfulness interventions—the stress-buffering model—and suggest that increasing the dosage of perceived stress intervention may enhance the effectiveness of mindfulness interventions on physical symptoms.

认知灵活性在正念干预缓解情绪困扰中的纵向中介作用：一项随机对照研究

王珍珍[1]　刘兴华[1]（通讯作者）

[1]北京大学心理与认知科学学院，北京，100871，xinghua_liu@pku.edu.cn

摘 要

目的：基于正念的干预对抑郁、焦虑等情绪困扰具有显著的干预效果，但其机制并不清晰。研究发现，认知灵活性的水平高低可以预测焦虑、抑郁等情绪困扰的缓解情况，基于正念的干预对认知灵活性也有显著的提高作用，因此，认知灵活性可能是基于正念的干预改善情绪困扰的潜在机制变量。本研究采用随机对照研究设计，探讨在认知灵活性正念干预缓解情绪困扰中的中介作用。

方法：在线招募了共 498 名具有高情绪困扰的参与者，并随机分配到 49 天的在线自助正念干预情绪困扰组(Mindfulness Intervention for Emotional Distress, MIED) (N = 249)或等待对照组(Wait-list control, WL)(N = 249)。在基线(干预前，T0)、第 1 周(T1) 、第 2 周(T2)、 第 3 周(T3)、第 4 周(T4)、第 5 周(T5)、第 6 周(T6)和第 7 周(干预后，T7)测量参与者的认知灵活性、正念、焦虑和抑郁水平。

结果：混合线性模型结果显示，正念(p<0.001)、认知灵活性(p<0.001)、焦虑(p<0.001)、抑郁(p<0.01)的组别(MIED 组，WL 组)和时间(T0，T1，T2，T3，T4，T5，T6，T7)的交互作用均显著。基于潜变量增长模型的纵向中介分析显示，认知灵活性的斜率（S_{CF}）在组别和焦虑的斜率（$S_{Anxiety}$）间起到显著的中介作用（CI: -0.178，-0.029），同时，认知灵活性的斜率（S_{CF}）在组别和抑郁的斜率（$S_{Depression}$）间也起到显著的中介作用（CI: -0.200, -0.034）。

结论：本研究采用多时间点测量的随机对照研究设计，证明了基于正念的干预可以通过提高个体的认知灵活性，进一步起到缓解焦虑、抑郁等情绪困扰的作用.因此，认知灵活性的提高可能是基于正念的干预缓解情绪困扰的机制。

The longitudinal mediating role of cognitive flexibility in a mindfulness intervention for emotional distress: a randomized controlled trail

Zhenzhen Wang[1]　Xinghua Liu[1]

[1]No.5 Yiheyuan Road, Haidian District, School of Psychological and Cognitive Sciences, Peking University, Beijing, 100871, P.R. China

Abstract：

Objectives: Mindfulness-based intervention has a significant effect on depression, anxiety and other emotional distress, but its mechanism is still unclear. Previous studies have found that the level of cognitive flexibility can predict the relief of anxiety, depression and other emotional distress, and mindfulness-based

intervention can also significantly improve cognitive flexibility level. Therefore, cognitive flexibility may be a potential mechanism variable for mindfulness-based intervention to improve emotional distress. This study used a randomized controlled study to explore the mediating role of cognitive flexibility between mindfulness intervention and emotional distress.

Methods: A total of 498 participants with high emotional distress were recruited online. Then they were randomly assigned to a 49-day online Mindfulness Intervention for Emotional Distress (MIED) group (N = 249) or a wait-list control (WL) group (N = 249). The levels of cognitive flexibility, mindfulness, anxiety, and depression were measured at baseline (pre-intervention, T0), week 1 (T1), week 2 (T2), week 3 (T3), week 4 (T4), week 5 (T5), week 6 (T6), and week 7 (post-intervention, T7).

Results: Mixed linear model showed significant Group (MIED group, WL group) by Time (T0，T1，T2，T3，T4，T5，T6，T7) interaction effects for mindfulness(p<0.001), cognitive flexibility (p<0.001), anxiety (p<0.001) and depression (p<0.01). Longitudinal mediation analysis based on the latent growth model showed that the slope of cognitive flexibility (S cognitive flexibility) played a significant mediating role (CI: -0.178，-0.029) between the group and the slope of anxiety ($S_{Anxiety}$). At the same time, the slope of cognitive flexibility (S_{CF}) also played a significant mediating role (CI: -0.200, -0.034) between the group and the slope of depression ($S_{depression}$).

Conclusions: This study adopted a randomized controlled trail measured at multiple time points, proving that mindfulness-based intervention can further relieve anxiety, depression and other emotional distress by improving cognitive flexibility. The improvement of cognitive flexibility may be the mechanism of mindfulness-based intervention to relieve emotional distress.

情绪对沉浸式虚拟现实环境中新词学习的影响

刘聪[1]（通讯作者） 周冠珠[1] 焦鲁[1]

1 青岛大学心理学系，青岛，266071，congu902@gmail.com

摘 要 先前研究已经针对认知因素如何影响虚拟现实环境中的语言学习做了一定的探讨，但鲜有研究考察情绪因素如何影响虚拟现实环境中的新词学习。中-英双语者在虚拟现实环境中学习三种具有不同情绪音调（积极、中性和消极）的德语词汇，然后通过四择一判断任务测试其学习效果。行为结果表明，带有积极情绪的词汇在反应时上要显著的快于带有消极情绪的词汇。ERPs 结果发现虚拟现实环境下所学词汇的情绪加工可以分为三个阶段，中性音调和情绪音调（积极和消极）的词汇加工差异出现在早期 N100 成分，而随后的 N200 和晚期正成分（LPC）进一步区分了积极音调和消极音调的词汇加工差异。总之，本研究不仅丰富了沉浸式学习的认知情感模型，而且从情感角度为虚拟现实环境中的新词学习研究提供了新的研究视角。

Effects of Emotion on the Novel Word Learning in an Immersive

Virtual Reality Environment

Cong Liu[1], Guanzhu Zhou[1], Lu Jiao[1]
1 Department of Psychology, Qingdao University, Qingdao, China

Abstract: Although previous studies have explored the influence of cognitive factors on language learning in a virtual reality (VR) environment, little work has examined how emotion influences novel word learning through VR. We trained Chinese-English bilinguals to learn German words in a VR context and employed a four-alternative forced choice task to analyze behavioral performance and electrophysiological activity. Words were present with positive, negative, or neutral emotions by manipulating lexical tones. Response times revealed a facilitative effect of positive emotions on novel word recognition compared to negative emotions. ERP analyses further showed the distinct stages of processing emotion. Differences between emotional tones and neutral tones were firstly observed by the N100 component. Negative and positive tone processing were reflected by N200 and LPC components. These findings provide empirical evidence for the Cognitive Affective Model of Immersive Learning and contribute new insight into language learning through VR from an affective dimension.

摘 要 普通话是我国的国家通用语言。学前儿童学习与掌握普通话具有重要意义。普通话是一种典型的声调语言。同一普通话音节附上不同的声调，能够表达不同的语义。以往研究显示，学前儿童的声调感知能力在不断发展，但其对声调的感知敏感性弱于声母和韵母。学前儿童的声调产出能力同样也还在发展，不像早期研究所认为的个体在 3 岁前就能基本掌握声调。那么，如何促进学前儿童声调感知与产出能力的提升呢？过去研究发现，个体通过具身模拟（个体对他人身体动作的观察和模拟）获得的身体感觉运动经验有助于语言学习。但是，具身模拟是否以及如何促进学前儿童的普通话声调学习还有待探讨。基于此，本研究采用新异词学习范式，通过比较音高观察、音高模拟和词图匹配三种方法对学前儿童声调感知和产出的影响，探讨具身模拟对学前儿童普通话声调学习的影响。研究招募了 90 名幼儿园中班幼儿，随机分为 3 组，分别通过上述三种方法学习 4 个不同声调的普通话假词及其对应的新异物品图片，学习结束后完成词图匹配任务和图片命名任务。结果显示，在词图匹配任务上，音高模拟组的正确率显著高于音高观察和词图匹配组，而音高观察组和词图匹配组的正确率无显著差异。在图片命名任务上，同样是音高模拟组的正确率显著高于音高观察和词图匹配组，音高观察组和词图匹配组的正确率无显著差异。这些结果表明，具身模拟，尤其是音高模拟有助于学前儿童声调感知和产出能力的提升。相比词图匹配，音高观察并没有表现出一定的作用。总体而言，本研究揭示了具身模拟对学前儿童普通话声调学习的影响，有助于推动口语学习具身理论的发展，为方言地区和民族地区学前儿童的普通话学习提供参考。

The effect of embodied simulation on preschool children's Mandarin lexical tone learning

Keke Yu[1] (Co-corresponding author), Jiahao Li[1], Liman Cai[2], Ruiming Wang[1] (Co-corresponding author)

1 School of Psychology, South China Normal University

2 School of Education, South China Normal University

Abstract: Mandarin is the official language in China. Learning and mastering Mandarin is significant to preschool children. Mandarin is a typical tonal language. The pitch variations on the syllable level can signify different word meanings. Previous studies suggested that preschool children's perception ability of Mandarin lexical tones was growing. However, their perception sensitivity to lexical tones was lower than consonants and vowels. Their Mandarin lexical tone production ability was also growing. Children did not master lexical tones before three years old, as early studies considered. Then, how to promote preschool children's Mandarin lexical tone perception and production ability? Previous studies indicated that the sensorimotor experience acquired from embodied simulation (individuals observing and simulating others' body movements) contributed to language learning. However, whether and how embodied simulation plays a role in Mandarin lexical tone learning remains unclear. The present study adopted a novel word learning paradigm. We compared three approaches: pitch observation, pitch simulation, and word-picture matching in Mandarin lexical tone perception and production. We randomly recruited 90 children from mid-class kindergarten and divided them into three groups. Each group adopted one approach to learning four Mandarin pseudo words and their corresponding novel object picture. After learning, they needed to complete a word-picture matching and a picture naming task. The results showed that the pitch simulation group's accuracy was significantly higher than the other two groups in the word-picture matching task. In comparison, the other two groups did not differ. In the picture naming task, the pitch simulation group's accuracy was significantly higher than the other two groups. The pitch observation group was not different from the word-picture matching group. The findings indicated that embodied simulation promotes preschool children's Mandarin lexical tone perception and production, especially pitch simulation. However, pitch observation did not play a role compared with the word-picture matching approach. The present study revealed the effect of embodied simulation on preschool children's Mandarin lexical tones learning, providing insight into an embodied view of spoken language learning.

Keywords: embodied simulation, pitch observation, pitch simulation, preschool children, Mandarin lexical tones

构词法的神经表征与词汇学习

高飞

复旦大学现代语言学研究院，上海，200433

摘 要　已有研究讨论了构词法在字母文字语言加工中的作用，但是大脑对非字母语言（比如汉语）构词法信息的编码方式鲜少被讨论。同时，对构词法神经表征的研究可以深化对不同情景下词汇学习效率和模式的认识。在本次报告中，我会分享一系列构词法加工的行为和脑成像研究以及这些研究对词汇学习的启示。首先，行为研究采用重复启动范式考察了整词启动、自由/黏着语素启动和符号启动对汉语母语者

和中高级学习者词汇识别的影响。结果表明，汉语母语者的词汇表征单位以整词为主导，学习者的词汇表征单位是发展变化的；随着语言水平的提高，整词对目标词通达表征的作用逐渐增强。其次，三个脑成像实验聚焦汉语构词法系统的独特性，通过事件相关电位（ERP）和功能性近红外光学成像（fNIRS）联合采集的技术手段探究汉语构词法加工的神经机制。实验一研究了单独呈现的汉语复合词如何被大脑编码其构词法合理性， ERP 结果表明构词法加工（LAN 效应，450-570 毫秒）晚于语义加工（N400 效应，300-450 毫秒）。fNIRS 的大脑激活数据显示，构词法加工主要分布在大脑左半球的额下回（IFG），而语义加工主要集中在左侧的颞区（包括颞中回 MTG）。实验二进一步探究了词语结构效应（复合词 vs.派生词）在大脑的时空表征。与复合词加工相比，派生词加工显示出更强烈的额区激活以及更广的大脑网络。实验三探究了成人汉英双语者第一语言和第二语言构词法加工的神经表征。构词法启动效应和语义启动效应在左半球的额颞网络表现出一定程度的分离。与第二语言英语相比，第一语言汉语的构词法加工诱发了更广泛的左侧前额皮层激活。由 ERP 数据反映的 ELAN 效应可以看出，构词法加工的跨语言差异是量的差别，而不是质的差别。第一语言和第二语言在词汇加工的进程中共享早期（P250）和晚期成分（300-500 毫秒负波）。总的来说，我们的研究表明汉语的构词法加工和语义加工相互独立，是人类心理词库一个重要成分，在词汇学习和过程中发挥着关键的作用。

Morphological processing in the human brain and vocabulary learning

Fei GAO

Institute of Modern Languages and Linguistics, Fudan University, Shanghai, China

***Abstract*:** While the role of morphology in alphabetic language processing has been extensively explored, it remains unclear how the human brain encodes the various aspects of morphological processing in Chinese word reading. Meanwhile, findings on the neural correlates of morphological processing would advance our understandings into the pathways of vocabulary learning in different settings. In this talk, I will present a series of studies that we carried out with respect to the behavioral and brain bases of morphological processing and how they might be informative to vocabulary acquisition and development. First, we investigated the representation units of Chinese compound words in mental lexicon among Chinese native speakers and second language learners using a repetition priming paradigm, which revealed that for intermediate-level learners, Chinese words could be accessed through either whole words or decomposed morphemes, while advanced-level learners and Chinese natives might employ a whole-word pathway. This might suggest that as language proficiency and reading experience develops, learners tend to rely more on whole words as a processing strategy. Then, three EEG-fNIRS studies set out to examine when, where, and how the human brain encodes Chinese morphological constraints and word structure effect (compound vs. derivation structure). EEG data showed that semantic processing occurred earlier (N400, 300~450 msec) than morphological processing (450~570 msec), while brain activation patterns revealed a differentiation between morphological parsing (specified in the left inferior frontal gyrus) and semantic analysis (in a broader fronto-temporal network). These findings offered new evidence that morphological constraints are encoded at a late stage of compound word processing in Chinese and suggested that the left prefrontal cortex plays an essential role in this process. Meanwhile, the compound vs. derivation structure effect was revealed by the behavioral data as well as the temporal and spatial brain activation patterns. In the masked priming task, Chinese derivations exhibited significantly enhanced brain activation in the frontal cortex and

involved broader brain networks as compared with lexicalized compounds. Additionally, we examined the extent to which the second language (L2) morphological processing would resemble or differ from that of their first language (L1) in adult Chinese-English bilinguals. fNIRS results revealed a neural dissociation between morphological and semantic priming effects in the left fronto-temporal network, while L1 Chinese engaged enhanced activation in the left prefrontal cortex for morphological parsing relative to L2 English. In the early stage of lexical processing, cross-language morphological processing manifested a difference in degree, not in kind, as revealed by the early left anterior negativity (ELAN) effect. In addition, L1 and L2 shared both early and late structural parsing processes (P250 and 300~500 msec negativity, respectively). Thus, the results supported a unified competition model for bilingual development, where bilinguals would primarily employ L1 neural resources for L2 morphological representation and processing. Together, these studies shed light upon the notion that morphology constitutes an integral component in the human mental lexicon, which is important for vocabulary learning and development.

中级水平留学生汉语语用原则习得的实验研究

张金桥[1, 2]　张巧宏[1]

1 暨南大学华文学院，广州，510610

2 暨南大学华文学院应用语言学系，广州，510610

摘 要　本研究采用移动动窗技术与选择判断任务，通过 2 个行为实验考察了中级水平留学生合作原则和礼貌原则等两种语用原则中各准则学习的特点与认知机制。实验一从理解和表达两个方面考察了 36 名中级水平留学生合作原则中各准则的习得特点与规律。结果表明：中级水平留学生对信息准则的理解最好，方式准则次之，量准则较弱；对信息准则的表达最好，量准则次之，方式准则最弱；对信息准则的理解与表达无差异，对量准则和方式准则的理解均优于表达；实验二考察了 25 名汉文化圈和 24 名欧美文化圈中级水平留学生礼貌原则中各准则的习得特点与规律。结果表明：汉文化圈留学生一致准则和同情准则习得效果最好，损惠准则和谦逊准则次之，赞誉准则较弱；欧美文化圈留学生同情准则习得效果最好，赞誉准则次之，损惠准则、谦逊准则和一致准则较弱：汉文化圈和欧美文化圈中级水平留学生同情准则习得效果一样好，前者对损惠准则、谦逊准则和一致准则的习得效果优于后者，后者对赞誉准则的习得效果优于前者。

我们认为，中级水平留学生可以习得合作原则和礼貌原则。合作原则中的信息准则始终具有理解与表达的优势，以联结性加工方式为主，而方式准则和量准则需要较为复杂的语用推理，以运算性加工方式为主。此外，文化价值观决定着各礼貌准则的习得难度，对于汉文化圈学习者而言，同情准则和一致准则处于价值观的核心层，能迅速激活该类信息，以联结性加工方式为主，赞誉准则处于价值观的边缘层，以运算性加工方式为主；对于欧美文化圈学习者而言，同情准则处于价值观的核心层，以联结性认知方式为主，损惠、谦逊和一致准则处于价值观的边缘层，以运算性加工方式为主。最后，构建了中级水平留学生语用原则习得的认知加工模型。

Experimental Study on the Acquisition of Pragmatic Principles for Intermediate-level Chinese Learners

Zhang Jinqiao　Zhang Qiaohong

1 *School of Chinese Language and culture*, *Jinan University*, *Guangzhou Guangdong* 510610;

2 *Institute of Applied Linguistics*, *Jinan University*, *Guangzhou Guangdong* 510610

***Abstract*：** This study used gaze-contingent moving-window technique and selection judgement task to investigate the characteristics and cognitive mechanisms of the acquisition of cooperative principles and politeness principles for intermediate-level Chinese learners. Two experiments were conducted to examine the learning characteristics and patterns of various principles within the cooperative principle for 36 intermediate-level Chinese learners in terms of comprehension and production. The results showed that intermediate-level Chinese learners had the best understanding of the information principle, followed by the manner principle, while the quantity principle was relatively weaker. In terms of production, they were most proficient in expressing the information principle, followed by the quantity principle, and the manner principle was the weakest. There was no difference in understanding and production between the information principle, but the understanding of the quantity and manner principles was superior to their production.

Experiment two investigated the learning characteristics and patterns of various principles within the politeness principle for 25 intermediate-level Chinese learners from Chinese cultural sphere and 24 from Western cultural sphere. The results showed that for students from Chinese cultural sphere, the maxims of agreement and sympathy were acquired the best, followed by *sunhui*（损惠）maxim and modesty maxim, while the approbation maxim was weaker. For students from Western cultural sphere, the sympathy maxim was acquired the best, followed by approbation maxim, while the maxims of *sunhui*, modesty, and agreement were weaker. The acquisition of sympathy maxim was equally good for students from Chinese and Western cultural spheres. However, the former had a better acquisition of *sunhui*, modesty, and agreement maxim, while the latter had a better acquisition of approbation maxim.

We believed that intermediate-level international students can acquire the principles of cooperation and politeness. The information maxim within the cooperative principle consistently exhibited an advantage in understanding and production, primarily relying on associative processing, while the manner and quantity maxim required more complex pragmatic reasoning, primarily relying on computational processing. Additionally, the acquisition difficulty of each politeness principle was determined by cultural values. For Chinese cultural sphere learners, the maxims of sympathy and agreement were at the core of their cultural values and can be quickly activated, primarily relying on associative processing, while approbation maxim was at the periphery of their cultural values, primarily relying on computational processing. For learners from Western cultural sphere, sympathy maxim is at the core of their cultural values, primarily relying on associative cognitive processing, while *sunhui*, modesty, and agreement were at the periphery of their cultural values, primarily relying on computational processing. Finally, a cognitive processing model for the acquisition of pragmatic principles in intermediate-level Chinese learners was constructed.

类型学视角下汉语情绪同词化加工机制的启动研究

袁立婷[1]　鹿士义[1]（通讯作者）

1 北京大学对外汉语教育学院，北京，100871，lushiyi@pku.edu.cn

摘 要　不同民族、地域和历史文化的人们对客观事件的概念化组织方式具有跨语言的共性和变异，因而作为概念化外部表现的词化模式同样具有类型学意义。同词化（colexification）是指在一种语言中用同一词形表达两个或者多个不同功能的语义概念（François 2008），这种词化方式在世界范围语言内具有普遍性（François 2008；Youn et al. 2016；Jackson et al. 2019；Xu et al. 2020）。Jackson 等人（2019）的研究首次提出了情绪语义的文化变异性和普遍结构模式，研究表明，世界上 20 个语族语言（包括印欧语系、南亚语系、南岛语系、壮侗语系、汉藏语系等）的情绪概念出现了显著不同的同词化网络聚类（colexification networks）。然而，Jackson 等人是基于语言经验构建的情绪概念静态网络，不一定反映不同语系语言中的人们是如何体验情绪的（Majid 2019），很少有研究从即时加工视角出发验证不同语系情绪同词化网络的心理表征现实性。汉语作为汉藏语系的普遍代表，与其他语系语言类型距离遥远，其情绪同词化网络形成和加工机制有待验证，汉语母语者的头脑中是否形成了如 Jackson 等人所说的汉藏语系情绪同词化网络的相应心理表征网络，这个问题仍需深入探索。鉴于此，本文以 34 名汉语母语者为被试，采用情感启动范式考察汉藏语系中汉语情绪语义同词化表征模式和认知特点。实验采用 2（启动词和目标词效价一致性：一致/不一致）× 2（同词化类型：有/无同词化）× 3（效价类型：正性/中性/负性）三因素被试内设计，在效价、唤醒度、支配度、熟悉度、词频、笔画数方面对实验材料进行了匹配。结果发现：（1）情绪词在汉语同词化加工中具有加工优势。正性词和负性词的反应时显著短于中性词，正确率也更高。（2）汉语情绪加工过程中存在同词化心理表征。在效价一致条件下有同词化词对反应时略快于无同词化词，产生了微弱的同词化加工优势，在有同词化关联的负性词、中性词加工中产生了强关联性加工优势，部分符合 Jackson 等人（2019）构建的汉藏语系情绪同词化网络。本文结果对于深入讨论汉语情绪同词化研究具有一定的启示意义。

A priming study on the processing mechanism of emotional colexification in Chinese from the perspective of typology

Liting Yuan　Shiyi Lu
School of Chinese as a Second Language, Peking University,
5th Yiheyuan Road, Haidian District, Beijing

***Abstract*:** People of different nationalities, regions and historical cultures have cross-language universalities and variations in the way they conceptualize objective events, so the lexicalization pattern, as an external manifestation of conceptualization, also has typological significance. Colexification refers to colexify two functionally distinct senses and associate them with the same lexical form (Francois 2008), it is universal across languages in the world (Francois 2008; Youn et al. 2016; Jackson et al. 2019; Xu et al. 2020). Jackson et al. (2019) first proposed cultural variations and universal patterns of emotional semantics, showing that there are significantly different colexification networks of emotional concepts in 20 language families (including Indo-European, Austroasiatic, Austronesian, Tai-Kadai, Sino-Tibetan, etc.). However, Jackson et al. constructed static emotional networks based on linguistic experience, which does not necessarily reflect how people in different languages experience emotions (Majid 2019). Few studies have verified the reality of mental representations of emotional colexification networks in different language families from the perspective of on-line processing. As a representative of the Sino-Tibetan, Mandarin Chinese is typologically distant from other language families, and its formation and processing mechanism of colexification networks needs to be explored. Whether native Chinese speakers have formed the corresponding mental representations of Sino-Tibetan emotional colexification network, remains to be further investigated. Therefore, we use the affective priming paradigm to

investigate the representation patterns and cognitive characteristics in Chinese colexification processing. 34 native Chinese speakers participated in the study. In the experiment, three factors of 2 (congruency: congruent/incongruent) × 2 (colexification: yes/no) × 3 (valence type: positive/neutral/negative) was designed. The experimental materials were controlled in terms of valence, arousal, dominance, familiarity, word frequency and strokes. The results show that: (1) emotional words have processing advantages in Chinese colexification processing. The response time of positive and negative words is significantly faster than that of neutral words, and the accuracy is also higher. (2) There are mental representations of emotional colexification in the processing of Chinese colexification. The weak processing advantage of colexification occurred in the processing of congruent word pairs. And in word pairs with colexification associativity, there is a processing advantage in negative and neutral words which have strong colexification associativity than that of weak colexification associativity. These results partly accords with the Sino-Tibetan colexification network in Jackson et al. (2019). Our findings have a certain enlightening significance for further discussion on the study of Chinese emotional colexification.

Keywords：Language typology, Chinese, emotional colexification, priming study

汉语母语者英语句子的韵律边界感知:

来自行为和脑电的证据

方岚　余可可　王瑞明（通讯作者）

华南师范大学心理学院，广州，510631，wruiming@163.com

摘 要　韵律边界的感知是语言认知加工中的重要方面。借助不同层级的韵律边界，我们得以将语流切分成小句、短语和词语等言语组块，适应大脑加工信息的方式。然而，韵律边界具有显著的母语语言学特征，二语学习者的加工可能不同于母语者。

本研究以英语专业高年级本科生和英语母语者为被试，结合使用行为实验范式和脑电(ERP)技术，探讨说汉语的母语者对英语句子、短语和韵律词三种不同韵律边界层级的识别和线索权重策略的使用，以期初步揭示二语者韵律边界加工的认知机制。

结果发现，在英语韵律词和句子这两种与汉语的韵律边界韵律音位一致的边界加工中，二语者与英语母语者的表现无显著差异，但是在加工韵律短语这个英汉韵律边界音位不一致的类型中，高熟二语者的识别表现不如母语者，说明二语者对二语韵律边界的感知受到母语韵律边界模式迁移的影响。进一步的线索权重探查发现，二语者对停顿倚重最大，延宕次之，最次是音高；和母语者相比，停顿条件下二者无显著差异，延宕条件下逊于母语者，但音高条件下优于母语者。最后，ERP 实验发现二语者产生了前置 CPS。这个结果说明二语者加工韵律短语边界时自动化程度不高，仅对声学信息有所反应，而不像母语者一样对声学信息和语言学信息进行加工。

基于上述实验结果，我们认为二语韵律边界感知加工在权重线索策略层面受母语中声学线索的功能负荷影响。

关键词　韵律边界加工,二语习得,母语迁移

Perception of Prosodic Boundary in English Sentences among Chinese Learners of English--- Evidenced by Behavior and ERP Experiments

Lan Fang, Keke Yu, Ruiming Wang

South China Normal University, Guangzhou, 510631

Abstract： The perception of prosodic boundaries is a crucial component of language processing. By utilizing different levels of prosodic boundaries, such as small phrases, phrases, and words, we can segment speech into linguistic units that align with the brain's information processing. However, prosodic boundaries exhibit distinct language-specific characteristics, and second language learners may process them differently compared to native speakers.

This study took English major senior undergraduates and native English speakers as participants. Through a combination of behavioral experiments and electroencephalography (ERP) techniques, the study investigated the recognition of 3 types of prosodic boundaries (i.e., sentences, phrases, and prosodic words) and the utilization of cue-weighting strategies by native Chinese speakers of English. The goal was to preliminarily reveal the cognitive mechanisms involved in prosodic boundary processing among second language learners.

The results indicated that there was no significant difference between the two groups in recognizing boundaries between words and sentences. However, second language learners performed less accurately than native speakers with prosodic phrase boundaries which had different phonogical patterns between English and Chinese. This suggested that the perception of prosodic boundaries in the second language was influenced by the transfer of prosodic boundary patterns from their native language.

Furtherly, the examination of cue-weighting strategies revealed that second language learners primarily relied on pauses, followed by duration, and placed less emphasis on pitch in the recognition of phrase boundaries. Under the solo-clue-condition, there was no significant difference between the two groups in terms of pause conditions. However, in lengthening conditions, second language learners performed less accurately than native speakers, while in pitch conditions performed better. Furthermore, ERP experiments demonstrated that second language learners exhibited an earlier Closure Positive Shift (CPS) distinct from that of native speakers. These findings suggest that second language learners have a lower level of automatization when processing prosodic phrase boundaries, as they primarily respond to acoustic information rather than integrating both acoustic and linguistic information, as native speakers do.

Based on these experimental findings, we argued that the perception of prosodic boundaries in second language learners is influenced by the functional load of acoustic cues from their native language at the cue-weighting strategy level and less automatic than the native speakers.

群内合作和群际竞争中的脑间同步性

马燚娜

北京师范大学认知神经科学与学习国家重点实验室，北京，100875，yma@bnu.edu.cn

摘 要　人类是天生的社会性动物，群居生活让我们得以生存和壮大。人类的大脑功能受到群居生活的影响，并进化出专门适应于群居群体生活的功能特性，并伴随着一系列独特的感知、认知、动机、情感、神经加工过程。然而，不同群体的形成和存在会导致内群体偏向性的合作以及群际间的竞争和冲突。我们提出群体有两个层面的功能意义，一方面，群体作为抽象的社会集体身份，为其群体成员提供群体身份和

成员身份，我们将这一层面称为群体的聚合层面影响。另一方面，群体也作为群体成员间沟通思想、情感以及社会行为互动的人际空间，我们将这一层面称为群体的人际层面影响。我将主要从人际层面的角度出发，分享我们近期的几个近红外同步扫描研究。这些研究考察了个体如何与内群体成员、外群体成员进行行为互动和神经同步。我将进一步探讨与内、外群体成员的这些不同的神经交互模式如何加强对内群体的归属感，以及如何激发个体对内群体及其成员的偏爱、倾向性合作，以及对外群体及其成员的认知偏差，进而潜在地引起群际间竞争。

关键词　脑间同步，群内合作，群际竞争

The functional significance of inter-brain synchrony in ingroup cooperation and intergroup competition

Yina Ma
Beijing Normal University

Abstract：Humans are inherently social creatures who thrive in group living. The human brain has evolved to specialize in group living, giving rise to a unique set of perceptual, cognitive, motivational, affective, and neural processes. However, the formation and existence of diverse groups can lead to parochial cooperation and intergroup competition and conflict. We propose that groups serve as abstract social collectives that provide group identity and membership (an aggregated group level) and also function as interpersonal spaces for group members to interact with their thoughts, emotions, and behaviors (an interpersonal level). In this talk, I will take the interpersonal level and discuss several of our recent studies that investigate how individuals interact and neurally synchronize with ingroup (vs. outgroup) members. I will further explore how these distinct neural patterns for ingroups and outgroups can strengthen the sense of belonging to the in-group, which, in turn, motivate ingroup favoritism and discriminatory behavior toward the outgroup and its members, potentially giving rise to intergroup conflict.

Keywords：inter-brain synchrony; ingroup cooperation; intergroup competition

人际社会互动的表征和计算机制

卢春明（通讯作者）
北京师范大学认知神经科学与学习国家重点实验室，北京，100875，luchunming@bnu.edu.cn

摘 要　通过人际社会互动发展社会智能是人类的核心能力，也是人类社会群体区别于其他社会性动物群体的本质属性。通过人际社会互动，个体之间形成传递信息，形成共享的概念和意图表征，构建群体水平的社会网络，表现出不同于个体水平的认知能力和行为模式，即社会智能。然而，人际社会互动的认知神经表征结构及其背后的计算机制却并不清楚。基于以往研究，我们提出了人际社会互动的认知神经层级模型，对人际社会互动的认知表征结构、认知计算机制及其独特的神经基础进行了解释。该模型认为，1）人际互动发生在 2 个以上的个体之间，因而不能仅关注 1 个个体。通过人际互动，互动各方在群体水平形成了具有层级结构的共享表征，并根据互动信息的物理属性和认知表征的心理属性，区分为交流符号、抽象概念、社会文化属性等不同层级。不同层级之间具有自下而上的累积关系和自上而下的调节关系。2）层级之间通过人际水平的预测机制实现动态累积和调节。3）人际之间的神经活动同步是共享表征和人际预测的神经基础，特别是具有时间滞后关系的神经活动同步能够特异性的反映人际预测过程中认知计算机制。

我们分别在不同人群、不同任务、不同情境对上述模型进行了系统验证，并得到了其他相关研究的支持。在报告中，我们将对模型的局限进行讨论，并展望未来的研究方向。

The representation and computational mechanisms of interpersonal social interaction

Chunming Lu
State Key Laboratory of Cognitive Neuroscience and Learning
Beijing Normal University

Abstract：It is one of the core abilities of human beings to develop social intelligence through interpersonal social interaction. Importantly, this ability separates humans from other non-human social animals. During interpersonal social interaction, we can communicate information, establish shared representations of concept and intention, build social connections at the group level and thereby demonstrate social cognitive abilities and behaviors that differ from those at the individual level. These characteristics together are usually termed as social intelligence. However, the neural and cognitive structure of the representation of interpersonal social interaction as well as the underlying computational mechanisms remain unclear. By integrating previous theories and evidence, recently we have proposed a neurocognitive hierarchical model for interpersonal social interaction. The purpose of this model is to provide a systematic and novel explanation for the cognitive architecture of representation, the cognitive computational mechanism and the distinct neural bases. In this model, we proposed that: 1) It is necessary to simultaneously examine multiple individuals rather than a single individual alone. This is because by interpersonal interaction, we can establish a shared representation at the group level which has a hierarchical architecture. In this hierarchy, information flows from one individual to another through the production and perception of communitive signals. Then, the abstract concept can be encoded and decoded from the signals and shared representation of concept is established. Finally, social attributes such as relationships emerge. Moreover, different levels of this hierarchy interact with one another either through bottom-up accumulation or top-down modulation. 2) An interpersonal prediction mechanism occurs during interpersonal interaction and underlies the dynamic interaction among levels of the hierarchy. 3) A unique pattern of brain activity, i.e., interpersonal neural synchronization, supports the shared representation and interpersonal prediction during social interaction. Particularly, the time-lag pattern of the neural synchronization is probably the neural base of the perdition-related computational process. This model has been tested and validated in different populations, different tasks and different contexts and is supported by evidence from other independent research groups. In this talk, we will also discuss the limitations and future directions of the model.

有效学科学习：工作记忆能力与学习经验的作用机制研究

陈菁菁[1,2]　何沐菲[1]　张丹[1,2]（通讯作者）
1 清华大学社科学院心理学系，北京，100084
2 清华大学脑与智能实验室，北京，100084

通讯作者 E-mail: dzhang@tsinghua.edu.cn

摘 要　日常学习中总是存在个体差异，一部分人能够取得比其他人更为突出的表现。其中，工作记忆能力和学习经验被认为是解释学业表现个体差异的重要因素。然而，上述因素如何在真实的学科学习过程中发挥作用尚不明晰。本研究招募 56 名具有不同物理学习经验的被试，通过采集被试在在线物理学习任务中的脑活动，探索学习经验、工作记忆能力对学习过程的影响。研究发现，学习经验在工作记忆能力对学习过程的影响中具有显著的调节作用：对低经验组，高工作记忆能力的个体对应高的个体-群体脑际相似性；对高经验组，低工作记忆能力的个体体现高的个体-群体脑际相似性。由于本研究中个体-群体脑际相似性指标与学习过程中的主观认知负荷呈显著负相关，与学业表现呈显著正相关，上述发现提示学习经验的积累有助于弥补工作记忆能力在学习过程中造成的差异，帮助低工作记忆能力群体以较低认知负荷完成学习任务。本研究通过引入脑际相似性指标对学习过程进行刻画，为理解工作记忆能力和学习经验对学习过程的影响机制提供了实证支撑，展示了学习经验和工作记忆能力在实现有效学习中的重要作用。

Abstract: Individual differences exist in everyday learning, with some individuals outperform than others. Working memory capacity and learning experience are considered important factors explaining different academic performance. However, how these two factors interact in real-world learning processes is still unclear. In this study, 56 participants with different levels of physical learning experience were recruited to investigate the influence of learning experience and working memory capacity on the learning process by collecting participants' brain activity during online physics learning tasks. Inter-brain coupling was computed to track learning processes. The study found a significant moderating effect of learning experience on the association between working memory capacity and learning process. In the low-experience group, individuals with low working memory capacity exhibited lower individual-group inter-brain coupling, while in the high-experience group, individuals with low working memory capacity showed higher individual-group inter-brain coupling. As the inter-brain coupling showed a significant negative correlation with cognitive load and a significant positive correlation with academic performance, the findings suggest that individuals with high working memory capacity can accomplish learning tasks with relatively lower cognitive load even when lacking learning experience, while the accumulation of learning experience helps compensate for the individual differences caused by working memory capacity, allowing individuals with low working memory capacity to effectively engage in learning. By using inter-brain coupling to characterize individuals' learning process, this study provides support for understanding the influence mechanisms of working memory capacity and learning experience on real-world learning tasks, highlighting the important roles of learning experience and working memory capacity in achieving successful learning.

社会学习的人际神经科学框架

潘亚峰[1]（通讯作者）

1 浙江大学心理与行为科学系，浙江，310058，yafeng.pan@zju.edu.cn

摘 要　社会行为的脑机制研究正在发生范式转变，从关注个体行为转移到关注群体间的实时互动。这一发展为我们理解人际大脑活动如何通过学习塑造行为提供了前所未有的机会，但其在学习科学领域的应用方兴未艾。在本次报告中，我将探讨快速发展的人际神经科学领域如何（并且可能）有助于我们理解社会学习。首先，我会回顾最近在社会行为、特别是社会学习领域中（包括观察学习、互动学习等）运用脑-脑耦合（即个体间的神经过程发生同步的现象）的实证研究。然后，我将讨论研究社交行为如何在学习过程中有助于解释脑-脑耦合的功能性含义（如，通过自动或半自动视频行为编码来建立脑-行为关系），以及研究脑-脑耦合如何帮助我们理解此类行为（如，基于机器学习的方法通过脑-脑耦合来预测社会学习行为）。随后，我会讨论脑-脑耦合和社交行为如何共同预测学习结果，并提出几种因果关系（即脑-脑耦合仅为社会学习行为的伴随产物，亦或是在社会学习中发挥了因果性作用）和机制模型（包括行为同步、认知对齐和情绪感染等）。最后，我将展示该领域目前关键的方法论和解释挑战，指出几个将人际神经科学研究与社会学习相结合的重要方向，并提出一个多人框架来理解个体大脑之间的人际信息传递如何塑造社会学习。

关键词　人际神经科学，社会学习，脑-脑耦合，机器学习，因果关系

The interpersonal neuroscience of social learning

Yafeng Pan

Department of Psychology and Behavioral Sciences, Zhejiang, 310058

***Abstract*：** The study of the brain mechanisms underpinning social behavior is currently undergoing a paradigm shift, moving its focus from single individuals to the real-time interaction among groups of individuals. Although this development opens unprecedented opportunities to study how interpersonal brain activity shapes behaviors through learning, there have been few direct connections to the rich field of learning science. In this talk, I will show how the rapidly developing field of interpersonal neuroscience is (and could be) contributing to our understanding of social learning. To this end, I will first present recent research extracting indices of brain-to-brain coupling (BtBC, neural processes in one brain that are temporally coupled to neural processes in another brain) in the context of social behaviors, and in particular social learning (including observational and interaction-based learning). Then, I will discuss how studying communicative behaviors during learning can aid the interpretation of BtBC, and how studying BtBC can inform our understanding of such behaviors. Importantly, I then discuss how BtBC and communicative behaviors collectively can predict learning outcomes, suggesting several causative (i.e., whether BtBC is simply epiphenomenal to interpersonal learning, or it might play a causative role in social-learning mechanisms) and mechanistic models (including behavioral entrainment, cognitive alignment, and affective contagion). Finally, I will highlight key methodological and interpretational challenges, as well as exciting opportunities for integrating research in interpersonal neuroscience with social learning, and propose a multi-person framework for understanding how interpersonal transmission of information between individual

brains shapes social learning.

信息交换提升群体决策绩效的脑机制

谢恩慧[1]　李先春[1]（通讯作者）

1 华东师范大学，心理与认知科学学院，上海，200062

通讯作者 E-mail（xcli@psy.ecnu.edu.cn）

摘 要　群体决策在日常生活中无处不在，并被发现可以产生高质量的绩效。众所周知，信息交换在这一过程中发挥着至关重要的作用，但它在实现集体绩效方面的确切作用尚不明确。具体而言，不同的信息交换方式如何影响集体表现，以及这种影响如何从心理和神经角度表现出来，仍值得探究。为此，我们进行了两个实验。实验 1 使用隐藏档案任务，研究了三种不同类型的信息交换（言语、非言语或控制组）对一宗谋杀悬案解决表现的影响。实验 2 开发了一项创新任务，将信息交换过程分为两个独立的阶段：小组共享（共享私人信息与不共享私人信息）和小组讨论（讨论信息与不讨论信息）。这使我们能够审查影响集体决策的信息交流的具体组成部分。结合功能性近红外光谱（fNIRS）的多人超扫描与行为评估，我们能够揭示有助于提高集体表现的行为和脑机制。我们的研究得出了三个主要发现。首先，我们发现不同的信息交换方式对集体绩效有显著影响，言语信息交换可以提高集体绩效，而非言语信息交换则没有同样的效果。其次，我们确认，小组分享和小组讨论是这种积极影响的两个重要组成部分。其中，小组讨论发挥着关键作用。最后，我们发现，群体认同是介导这种积极影响的一个关键心理因素。通过结合真实群体决策过程中的行为和大脑活动数据，我们发现这种中介过程得到了背外侧前额叶皮层（DLPFC）更高的互动频率和更高的神经同步性的进一步支持。在以上结果的基础上，我们提出了一个理论模型，解释了言语信息交换如何增强群体决策。

Neural correlates for enhancing group decision performance by information exchange

Eehui Xie　Xianchun Li

The School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062

Corresponding author: Xianchun Li, xcli@psy.ecnu.edu.cn

***Abstract*:** Group decision-making is ubiquitous in everyday life and has been found to produce high-quality performance. While information exchange is known to play a vital role in the process, its exact role in achieving collective performance is not fully understood. Specifically, it is yet to be determined how different ways of information exchange impact collective performance, and how such impacts are manifested from both a psychological and neural perspective.To this end, we conducted two experiments. Experiment 1 examined the impact of three different types of information exchange (verbal, nonverbal, or control) on the resolution of a murder mystery case, using the hidden profile task. Experiment 2 developed an innovative task that divided the process of information exchange into two separate stages: group sharing (Sharing private information vs. No Sharing private information) and group discussion (Discussing information vs. No Discussing information). This

enabled us to examine the specific components of information exchange that impact collective decisions. Utilizing functional near-infrared spectroscopy (fNIRS) in combination with behavioral assessments and multiparticipant hyperscanning, we are able to uncover the behavior and multiple-brain mechanisms that contribute to enhanced collective performance.Our research has yielded three major findings. Firstly, we have found that different ways of information exchange have a significant impact on collective performance, with verbal information exchange enhancing collective performance while nonverbal information exchange did not have the same effect. Secondly, we have identified that group sharing and group discussion are two essential components of this positive effect, with group discussion playing a pivotal role. Finally, we have determined that group identification is a crucial psychological factor that mediates this positive effect. By combining data from behavior and brain activity during real group decision-making, we have found that this mediation process is further supported by higher interactive frequency and increased neural synchronization in the dorsolateral prefrontal cortex (DLPFC). Building on the above results, we propose a multiparticipant theoretical mechanism that explains how verbal information exchange enhances collective performance by increasing group identification.

真实情境下社交互动的动态脑间同步：基于近红外超扫描的研究

李日辉 [1]

1 澳门大学协同创新研究院认知与脑科学中心，中国澳门

通讯作者 rihuili@um.edu.mo

摘 要

背景：在人与人社交互动的过程中，大脑之间的交流是高度动态和复杂的。迄今为止，大多数已有的基于功能性近红外光谱（fNIRS）的超扫描研究都局限于静态的、单个脑区之间的平均相干性（wavelet transform coherence）来评估多人交互时的脑间同步（inter-brain synchrony,IBS）。然而，我们认为这种传统的分析方法未能考虑到社交互动的动态性，并且可能过于主观，无法捕捉到多人互动中相关的内在模块化特点。基于数据驱动的思想，我们提出了一种基于滑动窗口和聚类算法的分析框架，用于捕捉自然社交互动任务中一系列动态的 IBS 网络。

方法：我们使用便携式 fNIRS 系统测量双人被试对（dyad）参与社会互动任务的的大脑血氧信号。通过滑动窗口策略和 k 均值聚类算法构建了互动期间每个被试对的动态 IBS 网络。通过统计检验获得了一系列个体水平和组水平重复出现的动态 IBS 网络。

结果：真实情景下的人际互动的脑间同步可以通过不同的动态 IBS 状态来描述，表明个体在互动合作过程中经历不同的脑同步状态。具体而言，每个动态 IBS 状态由多个脑区之间的活跃连接组成。这些连接无法通过传统的基于 fNIRS 的超扫描分析观察到，但可能代表合作过程中的复杂多功能过程（例如情绪、工作记忆、交流）。相关性分析表明，动态 IBS 状态的特性（例如动态 IBS 状态的转换）与双人组在互动期间的合作行为（例如 AUT 流畅性）显著相关。

结论：我们所提出的方法将社交互动中的复杂脑间同步用一系列具有更高时间分辨率的 IBS 脑网络来表示，有助于加深我们对社交互动背后的神经认知过程的理解，具有很大的应用空间。

Dynamic Inter-brain Synchrony in Real-life Social Interaction: fNIRS-based Hyperscanning Study

Rihui Li
Center for Cognitive and Brain Sciences, Institute of Collaborative Innovation, University of Macau, Macau SAR, China

Abstract：

Introduction: How two brains communicate with each other during social interaction is highly dynamic and complex. To date, most existing functional near-infrared spectroscopy (fNIRS) -based hyperscanning studies have focused on assessing participant dyad's inter-brain synchrony (IBS) at single brain region level based on averaged coherence within a manually segmented block/condition. However, we argue that this approach does not account for the dynamic nature of social interaction and might be too subjective to derive the intrinsic time-recurring brain sub-networks involved in multi-personal interaction. In this study, we proposed a data-driven approach based on a sliding window approach and k-mean clustering to capture a series of dynamic IBS networks during a naturalistic social interaction task.

Methods: We used a portable fNIRS system to measure the brain hemodynamic response of interacting partners engaged in a creative design task. Dynamic IBS networks of each dyad during the task were constructed using a sliding window strategy and k-means clustering algorithm. A series of distinct dynamic IBS networks that were recurrent throughout individual dyad-level and across dyads were obtained through permutation test.

Results: Inter-personal interaction during naturalistic cooperation can be characterized by different dynamic IBS states as individuals undergo interactive cooperation. Specifically, each dynamic IBS state was composed of active IBS connections between multiple brain regions, which might represent the complex multi-function processes during cooperation (e.g., emotion, working memory, commutation) that cannot be observed by conventional fNIRS-based hyperscanning analysis. Correlational analyses indicated that properties of the dynamic IBS states (e.g., transitions of dynamic IBS states) was significantly correlated with dyad's behavior (e.g., AUT fluency) during the task.

Conclusion: In summary, the proposed approach stands as a promising tool to distill complex inter-brain synchrony during social interaction into a set of representative brain networks with more fine-grained temporal resolution. This approach holds promise for advancing our current understanding of the dynamic nature of neurocognitive processes underlying social interaction.

认知训练对多动倾向儿童前瞻记忆的改善研究：一项随机对照试验

房欣 王艳丽 李伟 郭甜 蔡晨*（通讯作者）
青岛大学师范学院心理学系，青岛，266071，caichen@qdu.edu.cn

摘 要 前瞻记忆(prospective memory, PM)是记住在未来的特定时间或事件中执行预期行为的记忆。注意缺陷多动障碍(attention deficit hyperactivity disorder, ADHD)是以注意涣散、多动和冲动为主要特征的一种心理障碍。相比同龄正常发展的儿童，ADHD 儿童不能很好地组织和计划生活中的事情，即 PM 受损，这被推测与 ADHD 儿童认知功能的损伤有关。在多种 ADHD 儿童的干预训练中，涉及内部认知资源的认知训练(cognitive training)是一种最为常见并且被验证有效的方法。本研究分为两部分，实验一目的在于探究多动倾向儿童的多动行为与 PM 之间的关系。通过 Conners 教师评定量表以及家长评定量表在 137 名儿童中筛选出多动指数因子得分大于 1.2，量表总分大于 15 的 21 人，考虑到性别和人数差异，将唯一一名女生未纳入研究。采用 PM 研究中的双任务范式对这 20 名多动倾向儿童(4.95 ± 0.76 岁)的 PM 进行测试，多动行为指标由儿童家长和教师分别填写的 ADHD 评分量表确定。结果表明：多动倾向儿童的多动行为可以负向预测其 PM 表现，即多动倾向儿童的 PM 受损。实验二：为进一步探究减少多动倾向儿童的多动行为是否可以显著提升其 PM，采用随机对照试验(a randomized controlled trial)，将 20 名多动倾向儿童随机分为实验组和对照组。实验组参加为期 8 周，共 16 次的基于 PASS 理论设计的认知训练，并在训练前测量儿童的多动水平和 PM 表现，在训练结束时和 6 个月后再次测量。量表以及访谈结果表明：(1)经过两个月的认知训练，相比对照组，实验组儿童的多动行为明显减少、注意力水平显著提升，且效果至少维持 6 个月；(2)认知训练可以提升多动倾向儿童的 PM 能力，且在 6 个月的追踪测试中仍有效。本研究综合表明，认知训练可以有效地改善多动倾向儿童受损的 PM 功能，同时提升其注意力水平、减少其多动行为，改善效果至少可以维持 6 个月。本研究结果对多动倾向儿童 PM 的改善以及 ADHD 症状的预防和治疗均有一定的借鉴意义。

关键词 前瞻记忆，多动倾向儿童，认知训练，随机对照试验

Cognitive training enhances prospective memory of children at risk of ADHD：a randomized controlled trial

Xin Fang, Yanli Wang, Wei Li, Tian Guo, Chen Cai*
Department of Psychology, Normal College, Qingdao University, Qingdao, 266071,
caichen@qdu.edu.cn

Abstract：Prospective memory (PM) is the ability to remember to execute an intended action at the specific time or an event in the future. Attention Deficit hyperactivity disorder (ADHD) is a psychological disorder characterized by inattention, hyperactivity and impulsivity. ADHD children often struggle with organizing and planning tasks in their daily lives, indicating impaired PM. This impairment is believed to be associated with cognitive function deficits commonly observed in children with ADHD. Cognitive training, which focuses on enhancing internal cognitive resources, is a widely recognized and validated intervention method for children with ADHD. The study is divided into two parts. The purpose of Experiment 1 was to examine the relationship between hyperactive behavior in children and PM. The Conners' Teacher Rating Scales and Conners' Parent Rating Scales were utilized to screen a total of 137 children, aiming to identify individuals with a hyperactivity index factor score greater than 1.2 and a total scale score exceeding 15. As a result, 21 children met these criteria. However, to account for gender and sample size imbalances, the sole female participant was not included in the study. The PM

performance of 20 children at risk of ADHD (mean age: 4.95±0.76 years) was assessed using a dual-task program. The hyperactivity behavior of these children was measured through the ADHD rating scale, completed by both parents and teachers. The results revealed a negative correlation between hyperactivity behavior and PM performance in children at risk of ADHD, indicating impaired PM in this group. Experiment 2: To further investigate whether reducing hyperactive behavior in children can significantly improve their PM, a randomized controlled trial was conducted. Twenty children at risk of ADHD were randomly assigned to either the experimental group or the control group. The experimental group participated in an eight-week cognitive training program based on the PASS theory, with a total of 16 sessions. The hyperactivity level and PM performance of the participants were measured before training, immediately after training, and again after a six-month follow-up period. The results obtained from scales and interviews indicated the following findings: (1) After two months of cognitive training, the experimental group demonstrated a significant reduction in hyperactivity behavior compared to the control group. Additionally, attention levels in children at risk of ADHD increased, and these effects could be maintained for six months. (2) Cognitive training showed a positive impact on PM abilities in children at risk of ADHD, and the effects of training were still present after the six-month follow-up period. This study comprehensively demonstrates that cognitive training can effectively improve the impaired PM function in children at risk of ADHD. Additionally, it enhances their attention levels and reduces hyperactive behaviors, with the improvement effects lasting for at least six months. These findings have significant implications for improving PM in children at risk of ADHD and for the prevention and treatment of ADHD symptoms.

忙碌感对极简主义的影响及其机制

唐文文　陆筱佳　钟建安（通讯作者）

浙江大学心理与行为科学系，杭州，310058，通讯作者 E-mail：jiananzhong@zju.edu.cn

摘 要　忙碌成为现代人生活的常态，越来越多的人表示生活变得越来越忙碌。与此同时，极简主义消费日渐盛行，越来越多忙碌的消费者选择极简生活。基于以上社会现象和以往文献研究，本文采用实验法探究忙碌感如何影响个体的消费决策。本文基于自我调节理论展开了 4 项实证实验，探究了忙碌感对极简主义消费倾向的影响，同时探索了其中的内在心理机制和边界条件：认知闭合需要的中介作用，目标清晰度和生命意义感的调节作用。通过 4 项实验，得出以下结果：

（1）忙碌感会提升个体的极简主义消费倾向；

（2）认知闭合需要中介了忙碌感对极简主义消费倾向的影响，忙碌感会提升个体的认知闭合需要，从而提升对极简主义消费的偏好；

（3）目标清晰度调节了忙碌感对认知闭合需要的影响，相比于高目标清晰度的个体，低目标清晰度的个体在忙碌过后会有更高的认知闭合需要；

（4）生命意义感调节了认知闭合需要对极简主义消费倾向的影响，相比于高生命意义感的个体，对于低生命意义感的个体来说，认知闭合需要会导致更高的极简主义消费倾向。

本研究丰富和拓展了忙碌感在广告与消费领域相关的研究，从个体动机、个人特质等方面挖掘了忙碌感对极简主义消费影响的内在心理机制和边界条件，扩充了自我调节理论的应用范围，同时也为市场营销人员针对忙碌群体提供新的产品开发和推广思路。

The Effects of Busyness on Minimalist Consumption and Its Underlying Mechanism

Tang Wenwen[1] Lu Xiaojia[1] Zhong Jianan[1]（Corresponding author）
1 Department of Psychology and Behavioral Science, Zhejiang University; 866 Yuhangtang Rd., Hangzhou, 310058, China. E-mail：jiananzhong@zju.edu.cn

Abstract： Busyness has become a norm in modern life, with more and more people expressing that their lives have become increasingly busy. At the same time, minimalistic consumption is gaining popularity, with more busy consumers opting for a minimalist lifestyle. Building on these social phenomena and previous literature, this paper employs experimental methods to investigate how busyness impacts individuals' consumption decisions. Based on the self-regulation theory, four empirical studies were conducted to investigate the influence of busyness on the preference for minimalistic consumption, as well as to explore the underlying psychological mechanisms and boundary conditions, such as the mediating role of cognitive closure needs and the moderating effects of goal clarity and sense of life meaning. The four studies yielded the following results:

(1) Busyness increases individuals' preference for minimalistic consumption;

(2) Cognitive closure needs mediate the impact of busyness on minimalistic consumption, as busyness increases individuals' cognitive closure needs and thereby enhances their preference for minimalistic consumption;

(3) Goal clarity moderates the impact of busyness on cognitive closure needs, such that individuals with low goal clarity experience higher cognitive closure needs after being busy;

(4) Sense of life meaning moderates the impact of cognitive closure needs on minimalistic consumption, as individuals with low sense of life meaning are more likely to engage in minimalistic consumption when experiencing high cognitive closure needs.

This study enriches and extends previous research on the impact of busyness in the advertising and consumption domains by identifying the underlying psychological mechanisms and boundary conditions of busyness on minimalistic consumption, broadening the application scope of self-regulation theory, and providing new product development and marketing strategies for busy consumers.

心理治疗对躯体变形障碍的疗效：基于随机对照试验的元分析和试验序贯分析

刘奕浓[1] 赖丽足[1] 郭云霄[1] 任志洪[1]（通讯作者）
[1]青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘 要 躯体变形障碍（Body Dysmorphic Disorder, BDD)是一种严重且致残的精神障碍。本研究针对心理治疗干预 BDD 患者的随机对照试验（Randomized Controlled Trial, RCT)进行元分析和试验序贯分析，

评估心理治疗对 BDD 患者的干预效果及证据的稳健性。采用关键词在 Embase、Web of Science、PubMed、PsycINFO、Cochrane Library 和 Scopus 数据库进行文献搜索，检索时间截至 2023 年 5 月 30 日，纳入已发表和未发表的文献。使用元分析方法计算心理治疗对 BDD 的合并效应值，主要结果变量为躯体变形障碍症状的严重程度，次要结果变量为抑郁、焦虑、洞察力/妄想、功能水平和生活质量。此外，本研究还采用亚组分析和元回归分析考察潜在调节变量（人口学特征、共病、合并用药、干预特征）对干预效果的影响。本研究共纳入 15 项 RCT，包括 905 名被试。通过敏感性分析，躯体变形障碍症状、抑郁症状、洞察力/妄想、焦虑症状存在异常研究。排除异常研究后元分析结果显示，心理治疗显著改善了 BDD 患者的躯体变形障碍症状（g = -0.97）、抑郁症状（g = -0.51）、焦虑症状（g = -0.72）洞察力/妄想（g = -0.50），也显著提升了患者的功能水平（g = 0.45）和生活质量（g = 0.44）。追踪 1-6 个月时，效应仍显著。亚组分析表明，对于干预后测躯体变形障碍症状，对照组为等待组的效应相对于对照组为安慰剂组的效应更大；各结果变量网络化干预与面对面干预效应差异不显著。元回归分析表明相对于男性，女性干预后的即时躯体变形障碍症状和功能水平效应值更大；年龄越高，洞察力/妄想症状效应值越小；此外，每次干预时长越长，干预后即时躯体变形障碍、抑郁症状以及追踪时抑郁症状效应越大。试验序贯分析表明，只有干预后躯体变形障碍症状、抑郁症状以及追踪时躯体变形障碍症状的证据效应较为稳健，其他结果变量未达到期望信息量。未来还需要开展更多的 RCT 研究探索心理治疗对 BDD 的干预效果。

The efficacy of psychological treatments on body dysmorphic disorder: A meta-analysis and trial sequential analysis of randomized controlled trials

Yinong Liu[1], Lizu Lai[1] , Yunxiao Guo[1] , Zhihong Ren[1]

[1] Key Laboratory of Adolescent Cyberpsychology And Behavior (CCNU), Ministry Of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health Of Hubei Province, Wuhan, China

Abstract： Body Dysmorphic Disorder (BDD) is a distressing and disabling mental disorder. Current study conducted a meta-analysis and trial sequential analysis of randomized controlled trials (RCTs) on the psychological treatment of Body Dysmorphic Disorder (BDD) to evaluate the intervention effects and robustness of evidence. A literature search was conducted using keywords in the Embase, Web of Science, PubMed, PsycINFO, Cochrane Library, and Scopus databases, with a search cutoff date of May 30, 2023. Published and unpublished studies were included. The meta-analysis calculated the pooled effect sizes of psychological treatment on BDD. The primary outcome variable is the severity of body dysmorphic disorder symptoms, and secondary outcome variables including depression, anxiety, insight/delusion, functional level, and quality of life.Subgroup and meta-regression analyses were also conducted to examine the impact of potential moderator variables on the intervention effects. A total of 15 RCTs, including 905 participants, were included in this study.Through sensitivity analysis, studies with abnormal results were excluded for BDD symptoms, depression symptoms, insight/delusion, and anxiety symptoms. After excluding these studies, meta-analysis results showed that psychological treatment significantly alleviated body dysmorphic disorder symptoms (g = -0.97), depression symptoms (g = -0.51), anxiety symptoms (g = -0.72), insight/delusion (g = -0.50), and also significantly improved the functional level (g = 0.45) and quality of life (g = 0.44) of BDD patients. At the 1-6 month follow-up, the

effects remained significant. Subgroup analysis showed that for post-intervention BDD symptoms, studies with a waitlist control had larger effect sizes compared to studies with a placebo control. There was no significant difference in the effects between Internet-delivered interventions and face-to-face interventions for each outcome variable. Meta-regression analysis showed that compared to males, females had larger effect sizes for post-intervention BDD symptoms and functional level. The effect size of insight/delusion symptoms decreased with increasing age. Additionally, longer intervention durations were associated with larger effect sizes for post-intervention BDD symptoms, depression symptoms, and depression symptoms at follow-up. The trial sequential analysis indicated that only the evidence effects for BDD symptoms and depression symptoms at post-treatment and BDD symptoms at follow-up were robust. While other outcome variables did not reach the desired information size. Future research should conduct more RCTs to explore the intervention effects of psychological treatment for BDD.

Keywords：Body Dysmorphic Disorder, Psychological Treatment, Meta-analysis, Trial sequential analysis

老年就医回避：理论整合与实证检验

蔡雨晴[1]　高隽[1]（通讯作者）

1 复旦大学社会发展与公共政策学院心理学系，上海，200433，gaojun82@fudan.edu.cn

摘 要　老年人延迟或不就医、应住院而未住院的现象依旧存在，直接导致更高的住院率、更差的健康水平和更高的死亡率。深入理解老年人就医回避的原因与影响因素，将有助于在人口老龄化社会背景下积极展开老年人的疾病防治工作，促进积极老龄化和健康中国 2030 规划的实现。为此，本文整合就医相关理论，并在此基础上，梳理过往研究以验证理论因素的实证效力。在理论方面，健康信念模型，计划行为理论，Lauver 就医模型，Anderson 就医行为模型和 Levesque 的患者中心就医模型被用来阐述个体就医的动机及就医回避发生的可能情境。总体上，就医理论将就医行为看作由就医可能的功利结果和相应制约因素组成的函数，就医选择由患者意图（生理因素）引起，但受到个人特征（心理因素）和社会制度（社会因素）的制约。在研究方面，以“elderly/old/older”和“healthcare seeking/avoidance/delay”,“health service utilization”为关键词，在中国知网、ebsco、web of science 等数据库检索 2002-2022 年之间的文献。根据系统的文献阅读与梳理，老年人就医回避的影响因素被归纳为生理（症状特征）、心理（疾病识别与归因、情绪及社会支持等）、社会（人口学变量与社会保障因素）三方面。总体上，大部分研究验证了理论提出的假设，然而在部分心理和社会因素变量上，目前许多研究结果未能达成一致。目前该领域中的研究成果可为鉴别就医回避风险因素、促进合理医疗服务利用提供参考，未来研究应进一步探索部分因素影响异质性的可能原因与潜在机理。

关键词　就医回避，影响因素，老年人

Healthcare avoidance in the elderly: theoretical integration and empirical research

Yuqing Cai, Jun Gao (Corresponding author)

School of Social Development and Public Policy, Fudan University, Shanghai, 200433

Abstract：The avoidance of medical treatment among older individuals has been linked to higher rates of hospitalization, poorer health, and increased mortality. Understanding the underlying causes and influencing

factors of this behavior is crucial for proactive disease prevention and treatment in an aging society. This study integrates various theoretical frameworks and examines empirical evidence to shed light on the factors contributing to the avoidance of medical treatment among the elderly. Drawing upon theories such as the Health Belief Model, the Theory of Planned Behavior, the Theory of Care-seeking Behavior, the Behavioral Model of Health Services Use, and the Patient-centred Access to Healthcare Model, this research explores the motivation and potential situations surrounding the avoidance of medical treatment. Seeking medical treatment is viewed as a function influenced by the utilitarian outcomes of seeking care and the associated constraints. Individual intentions (physiological factors) drive the choice to seek medical treatment, while personal characteristics (psychological factors) and the social system (social factors) impose restrictions. A systematic literature review was conducted using keywords such as "elderly/old/older," "healthcare seeking/avoidance/delay," and "health service utilization." Relevant literature from 2002 to 2022 was retrieved from databases including CNKI, ebsco, and web of science. The review identified three main categories of influencing factors for the elderly's avoidance of medical treatment: physiological (symptom characteristics), psychological (disease identification and attribution, emotion, social support, etc.), and social (demographic variables and social security factors). Overall, the majority of studies reviewed supported the hypothesis that various factors contribute to the elderly's medical avoidance. By gaining a deeper understanding of these factors, we can work towards realizing the goals of active aging and the Healthy China 2030 plan by actively promoting disease prevention and treatment among the elderly population.

摘 要　学龄前儿童正处于抑制控制发展的“关键期”，最新研究表明学龄前儿童的抑制控制并不是单维结构，而是随年龄增长逐渐分化为“冷”抑制控制和“热”抑制控制，均对儿童的高级认知能力或情绪管理能力有重要影响；以往有大量研究证实了体力活动、久坐行为、睡眠时间等 24 小时动作行为与学龄前儿童抑制控制的关系。然而最新研究指出孤立地考虑单一的动作行为是一种不完善的方法，需将其看作完整的 24 小时动作行为，以此探究对个体健康状况的影响。因此，本研究结合问卷测量和行为实验，采用成分数据的等时替代模型，探究了 24 小时动作行为与学龄前儿童“冷”、“热”抑制控制的关联。研究共调查了 66 名学龄前儿童，采用相关问卷测量 24 小时动作行为，使用 Fish flanker 和 Emotional flanker 范式测量学前儿童的“冷”、“热”抑制控制。结果表明学龄前儿童 24 小时动作行为与其“冷”、“热”抑制控制存在显著性关联，且以牺牲久坐行为和睡眠为代价增加高强度体力活动的时间，或者牺牲久坐行为、低强度体力活动、高强度体力活动和睡眠为代价增加中强度体力活动的时间与学龄前儿童“冷”、“热”抑制控制的积极变化有关。因此，由研究结果可知，“冷”、“热”抑制控制的变化可以用学龄前儿童的日常 24 小时动作行为成分来解释，且这一变化因动作行为的不同组合而异。

Isotemporal Substitution Effect of 24h Movement Behavior on Inhibitory Control of Preschool Children

Zhang Shichen[1] Zhu Zhaohong[2]（Correspondence author）Xu Qinyu[1] Chen Yuanyuan[1] Mao Junxi[1]

1 Graduate School, Xi'an Physical Education University, Xi'an, 710000
2 School of Exercise and Health Sciences, Xi'an Physical Education University, Xi'an, 710000

***Abstract*:** Preschool-aged children are currently in a pivotal stage of inhibitory control development. Recent research indicates that inhibitory control in preschoolers is not a monolithic construct but rather differentiates into "cool" inhibitory control and "hot" inhibitory control as they age, both exerting significant influence on children's higher-order cognitive abilities and emotional regulation. A substantial body of prior research has affirmed the relationship between 24-hour Movement Behavior, such as physical activity, sedentary behavior, sleep duration, and inhibitory control in preschool-aged children. However, the latest research asserts that examining isolated, singular behaviors is an incomplete approach. It is imperative to regard them as components of a holistic 24-hour Movement Behavior in order to investigate their impact on individual health. Therefore, this study combines questionnaire assessments and behavioral experiments, employing a Isotemporal substitution model for compositional data to explore the associations between 24-hour Movement Behavior and "cool" and "hot" inhibitory control in preschool-aged children. The study encompassed a cohort of 66 preschool-aged children. It utilized relevant questionnaires to gauge their 24-hour Movement Behavior and employed the Fish Flanker and Emotional Flanker paradigms to measure the "cool" and "hot" inhibitory control in preschoolers. The findings revealed a significant association between the 24-hour Movement Behavior of preschool-aged children and their "cool" and "hot" inhibitory control. Notably, an increase in vigorous physical activity, at the expense of reducing sedentary behavior and sleep, or an increase in moderate physical activity at the cost of reducing sedentary behavior, light physical activity, vigorous physical activity, and sleep, was correlated with positive changes in the inhibitory control of preschool-aged children. Hence, the research findings elucidate that the variations in "cool" and "hot" inhibitory control can be elucidated through the components of preschool-aged children's daily 24-hour Movement Behavior, with these variations manifesting differently depending on the specific combinations of activity behaviors.

新冠疫情期间新入职护士离职意愿的调节中介模型

罗怡欣[1]　罗怡欣[2]
河南大学护理与健康学院，河南开封，475004
河南大学护理学系，开封，475004，kfyx2303@126.com

摘 要　**目的：**本研究旨在探讨新入职护士的组织氛围与离职意愿之间的关系，并分析情绪劳动与心理资本的作用机制。**方法：**本研究采用纵向追踪问卷调查方法。在两个不同的时间点（间隔 1 个月）收集纸质问卷。参与者是来自河南省 10 所医院的 910 名新入职护士，他们毕业后在医院工作不到一年。采用组织氛围量表（OCS）、情绪劳动量表（ELS）、心理资本量表（PCQ）和离职意愿量表（TIQ）等进行匿名自评问卷填写。采用描述性分析、皮尔逊相关分析和 Hayes 的 PROCESS Macro 3.3 软件 SPSS（25.0 版）对模型进行检验。**结果：**离职意愿的平均得分为（14.13±4.29），组织氛围的平均得分为（22.80±5.38），情绪劳动的平均得分为（49.57±9.67），心理资本的平均得分为（77.88±10.97）。相关分析表明，组织氛围与离职意愿呈负相关（r=-0.40，p<0.01），与情绪劳动呈负相关（r=-0.27，p<0.01），但与心理资本呈正相关（r=0.19，p<0.01）。情绪劳动与心理资本呈负相关（r=-0.14，p<0.01），但与离职意愿呈正相关（r=0.62，p<0.01）。中介效应分析结果表明，组织氛围对离职意愿有显著的直接影响（c=-0.24，t=-9.81，p<0.001），其中情绪劳动在组织氛围与离职意愿关系的中介作用显著，具有部分中介作用（ab= -0.140，95%CI: -0.174， -0.109），

占总效应的 37.26%。此外，心理资本在情绪劳动和离职意愿之间起着调节作用。**结论：**组织氛围与离职意愿呈负相关，情绪劳动是部分中介，心理资本在情绪劳动与离职意向之间具有调节作用。这建议护理管理者们需要重视刚进入临床工作的新入职护士的组织氛围和情感劳动，并可以通过制定心理资本干预措施来减少离职意愿。

关键词　新入职护士、组织氛围、离职意愿、情绪劳动、心理资本

A moderated mediation model of newly recruited nurses' turnover intention during COVID-19

Yixin Luo

Institute of Nursing and Health, School of Nursing and Health, Henan University, Kaifeng, China

***Abstract*：Purpose:** the aim of this study is to explore the relationship between organizational climate and turnover intention, and to analyse the mechanism of emotional labor and psychological capital. **Methods:** this study used a longitudinal tracking questionnaire survey method. Collect paper questionnaires at two different time points (with a 1-month interval). The participants were 910 newly recruited nurses from 10 hospitals in Henan Province who have worked in hospitals for less than one year after graduation. The anonymous self-assessment questionnaire including organizational climate scale (OCS), emotional labor scale (ELS), psychological capital questionnaire (PCQ) and turnover intention questionnaire (TIQ) was used. Descriptive analysis, Pearson's correlation analysis and Hayes' PROCESS Macro 3.3 software in SPSS (Version 25.0) were used to test the model. **Results:** The average score of turnover intention was (14.13±4.29), organizational climate was (22.80±5.38), emotional labor was (49.57±9.67 and psychological capital was (77.88±10.97). Correlation analysis showed that organizational climate was negatively correlated with turnover intention ($r = -0.40$, $p < 0.01$) and emotional labor ($r = -0.27$, $p < 0.01$), but positively correlated with psychological capital ($r = 0.19$, $p < 0.01$). Emotional labor was negatively correlated with psychological capital ($r = -0.14$, $p < 0.01$), but positively correlated with turnover intention ($r = 0.62$, $p < 0.01$). The mediation analysis showed that the organizational climate had a significant direct impact on turnover intention ($c = -0.24$, $t = -9.81$, $P < 0.001$) and the partial mediating effect of emotional labor therein. ($ab = -0.140$, 95%CI: -0.174, -0.109) and accounting for 37.26% of the total effect. In addition, psychological capital plays a moderating role between emotional labor and turnover intention. **Conclusion:** Organizational climate is negatively correlated with turnover intention, emotional labor is a partial mediating and psychological capital has a moderating effect between emotional labor and turnover intention. This suggests that nursing managers need to pay attention to the organizational atmosphere and emotional labor of newly recruited nurses who have just entered clinical work, and can reduce their willingness to resign by developing psychological capital intervention measures.

饮食决策的时间经济学：漂移扩散模型下的证据积累策略选择

刘梦颖[1]　蒋婧怡[1]　黄建平[1]（通讯作者）

1 苏州大学心理学系，苏州，215000，jphuang@suda.edu.cn

摘 要　漂移扩散模型（drift diffusion model，DDM）假定决策者在两个选项中积累支持或拒绝某一选项的证据，当积累值达到与这一选项相关的阈值时做出决策。在饮食决策背景下，食物选择过程中所积累的证据可能来源于食物对象的整体价值信号（即主观喜爱度），或是对该食物多重属性值（往往是健康和美味价值）的评估，即个体可能采取不同的证据积累策略来进行饮食决策。近期研究证明紧迫性作为一种与刺激属性无关的独立信号，能够影响决策的加工过程。然而，目前尚不清楚在时间紧迫与非紧迫的饮食决策背景下个体如何在两种证据积累策略中进行选择。本研究采用激励相容的饮食决策任务，探讨决策过程中时间紧迫性对被试证据积累策略选择的影响。具体而言，本研究在不同时间压力的决策条件下测试和比较了基于整体价值信号的层级漂移扩散模型（hierarchical drift diffusion model, HDDM）以及基于多重属性的漂移扩散模型（multi-attribute, time-dependent drift diffusion model，mtDDM）。研究共招募 39 名被试（12 男，27 女；M_{age} = 20.59），采用单因素（时间压力：有，无）被试内设计。预计在时间压力条件下，HDDM 可能是预测饮食决策的最优模型，表现为 HDDM（vs. mtDDM）在拟合度、预测性指标（BIC、negll、MSE、RMSE）等方面更佳；而在无时间压力条件下，mtDDM（vs. HDDM）的模型表现可能更佳。换言之，在二元食物选择任务中，当决策时间紧迫时，个体更倾向于基于整体价值信号（选项的相对喜爱度）积累决策证据；而在非紧迫的决策情境下，个体更依赖多重属性（选项的相对健康和美味属性）的决策证据。总而言之，个体可能采取灵活的证据积累策略来适应决策的时变条件。本研究旨在为动态环境中的饮食决策行为确定最优的解释与预测模型，未来健康饮食决策的干预策略可能需要考虑决策的时间紧迫性，例如，通过提高健康食物的整体价值来改善消费者在时间压力下的饮食决策。

Temporal economics of dietary decision-making: Evidence accumulation strategies selection under drift-diffusion models

Mengying Liu[1]　Jingyi Jiang[1]　Jinping Huang[1]

Department of Psychology, Soochow University, Suzhou

Abstract：The drift diffusion model (DDM) assumes that decision-makers accumulate evidence for or against an option until reaching a threshold, at which point they make a decision. In the context of dietary decision making, evidence accumulation can be based on the global value signal of the food object (i.e., subjective liking) or the evaluation of its multiple attribute values (often health and taste), suggesting different strategies individuals chosen in dietary decision-making. Recent research indicates that time pressure, as an independent signal unrelated to stimulus attributes, can affect decision-making. However, it remains unclear how individuals select between two evidence accumulation strategies in urgency versus non-urgent dietary decision-making contexts. Using an incentive-compatible dietary choices task, we investigated the impact of urgency on evidence accumulation strategy selection, comparing the hierarchical drift diffusion model (HDDM), based on the global value signal, and the multi-attribute, time-dependent drift diffusion model (mtDDM) under different time pressure conditions. We recruited 39 participants (12 males, 27 females; M_{age}=20.59) using a single-factor (time pressure: present, absent) within-subject design. We hypothesize that under time pressure, HDDM may be the optimal model for predicting food decision making, as indicated by its higher goodness-of-fit, predictiveness (BIC; negll, MSE, RMSE) compared to mtDDM. Conversely, under non-pressured conditions, mtDDM may perform better in predicting food

decision making. In other words, individuals may tend to rely on the global value signal for evidence accumulation when time is pressing, whereas they may depend more on multiple attributes under non-pressured conditions. Overall, individuals may adopt flexible evidence accumulation strategies to adapt to the time-varying conditions of decision making. This study aims to identify the optimal explanatory and predictive models for dietary decision-making behavior in dynamic environments. Future interventions for healthy food decision making may need to consider decision urgency, such as by increasing the overall value of healthy food options to improve consumers' food choices under time pressure.

Keywords：urgency, dietary decisions, drift-diffusion model, Bayesian inference, evidence accumulation

你的爱人知道你在说谎：浪漫关系对于谎言识别的影响以及心智化能力的中介作用

王书剑[1]　陶言强[1]　刘翔平[1]（通讯作者）

1 北京师范大学心理学部，北京，100875，89034@bnu.edu.cn

摘 要　背景：在人类的进化过程中，浪漫关系构成了繁衍后代的基础。当代心理学界也愈发将浪漫关系视为健康人际关系的一部分，以及影响个体情绪和认知的关键因素。进化心理学家认为，处于浪漫关系中的个体对于谎言线索的敏感度可能更高，因为识别浪漫关系中的欺骗行为可以更好的确保亲代对子代的投入和培育，从而增加种群生存和繁殖的机会。然而，这一假设尚未得到实证研究的检验。本研究通过实验室实验，探索了浪漫关系对心智化能力和谎言识别能力的影响及其内部机制。**方法：**在大学生群体中招募满足以下标准的被试：1）处于恋爱关系中的非心理学专业学生；2）恋爱关系时长三个月以内；3）在恋爱关系中，被试需要与伴侣发生过亲密接触。最终有 39 名被试满足招募要求，参与正式实验。所有被试在浪漫关系启动和中性关系启动下分别完成实验任务，并在启动后完成激情爱情量表（Passionate Love Scale, PLS)。在实验中，采用“眼识别（Reading the Mind in the Eyes, RTM）”任务作为被试的心智化能力指标，并使用在真实情景下录制的犯罪型视频测量被试的谎言识别能力。**结果：**浪漫关系可以提高被试对负面情绪的识别能力，女性在谎言检测任务中的表现优于男性。并且，浪漫关系可以通过心智化能力的中介作用来提高被试的谎言识别能力。**结论：**本研究验证了进化心理学中的经典假设，即浪漫关系可以提高个体的谎言识别能力，并发现了心智化在这一过程中的中介作用，有助于进一步理解浪漫关系对于人类认知与行为的深刻影响。

You know who truly loves you: The effect of romantic relationships on deception detection ability and the mediating role of mentalizing

Shujian Wang[1] Yanqiang Tao[1] Xiangping Liu[1]
1 Faculty of Psychology, Beijing Normal University, 100875, Beijing, China

***Abstract*:** In evolution, romantic relationships serve as the foundation for breeding and producing offspring. The ability to detect deception in these relationships can ensure the investment and cultivation of descendants, leading to greater chances of survival and reproduction. However, barely research was done into this domain. The current study investigated the preliminary relationship between romantic relationships, mentalizing ability, and deception detection ability through an empirical experiment. Participants were primed by their romantic experiences and neutral experiences, and then went through Reading the Mind in the Eyes (RTM) task and the deception detecting task for real person crime-type videos. Results showed that romantic relationships can improve participants' emotion recognition ability toward negative emotions, and females performed better in the deception detection task than males did. Most importantly, romantic relationship can improve participants' deception detection ability through the mediator of mentalizing ability. Though gender difference was not statistically significant in the RTM task, the result lays solid foundation for further investigation into females' mentalizing ability and disclose the evolutionary meaning of romantic relationships.

重复经颅磁刺激对抑郁症伴非自杀性自伤的影响：认知情绪调节的中介作用

兰金滢[1,2]，邹晓伟[1,2]，万爱兰[2]（通讯作者）
1 南昌大学公共政策与管理学院，南昌，330031
2 南昌大学第一附属医院心身医学科，南昌，330006

摘 要　目的：本研究将探究重复经颅磁刺激对抑郁症伴非自杀性自伤的影响，同时探讨认知情绪调节的中介作用。方法：选取 60 名青少年抑郁症伴非自杀性自伤患者作为研究对象，并随机分为实验组和对照组。研究采取单盲实验法，实验组在接受盐酸氟西汀药物治疗和一般性心理治疗的基础上，进行为期 2 周，每周 5 次的低频 rTMS 真刺激；对照组在接受盐酸氟西汀药物治疗和一般性心理治疗的基础上，进行为期 2 周，每周 5 次的低频 rTMS 伪刺激。干预前后采用自编的一般人口学资料问卷、抑郁自评量表（SDS）、认知情绪调节问卷（CERQ）、情绪调节困难量表（DERS）、青少年非自杀性自伤行为评定量表（ANSSIQ）对两组被试进行评估。利用 Bootstrapping 检验进行中介效应分析。结果：rTMS 干预后，实验组在 SDS、CERQ、DERS 以及 ANSSIQ 量表上的评分与干预前的差异具有统计学意义（$p<0.001$）；实验组在 SDS、CERQ、DERS 以及 ANSSIQ 量表上的评分显著低于对照组（$p<0.05$）。消极认知情绪调节问卷（NCERQ）的评分变化量作为低频 rTMS 减少 NSSI 行为的中介变量的中介效应值为-0.2510，95% CI 为（-0.5686，-0.0145），中介效应显著。NCERQ 的评分变化量作为低频 rTMS 降低 NSSI 意图的中介变量的中介效应值为-0.1944，95% CI 为（-0.4392，-0.0100），中介效应显著。结论：rTMS 能够有效改善青少年抑郁症伴非自杀性自伤患者的抑郁情绪，降低自伤意图和减少自伤行为。同时可以提高积极认知情绪调节策略的使用倾向，降低消极认知情绪调节策略的使用倾向，改善情绪调节困难。此外，消极

认知情绪调节策略在 rTMS 以减少自伤行为、降低自伤意图中起到中介作用，具体而言， rTMS 通过降低消极认知情绪调节策略使用倾向以减少自伤行为、降低自伤意图。

Effects of repetitive transcranial magnetic stimulation on depression with nonsuicidal self-injury: the mediating role of cognitive emotion regulation

Lan Jinying[1,2]　Zou Xiaowei[1,2]　Wan Ailan[2]

1 School of Public Policy and Administration，Nanchang University，Nanchang 330031

2 Department of Psychosomatic Medicine，The First Affiliated Hospital of Nanchang University，Nanchang 330006

Abstract：Background：This study will investigate the effects of repetitive transcranial magnetic stimulation on depression with non-suicidal self-injury, as well as the mediating role of cognitive emotion regulation. Methods：Sixty patients with adolescent depression with non-suicidal self-injury were selected as study subjects and randomly divided into experimental and control groups. The study was a single-blind experiment in which the experimental group received 2 weeks of low-frequency rTMS true stimulation 5 times per week on top of fluoxetine hydrochloride medication and general psychotherapy; the control group received 2 weeks of low-frequency rTMS pseudo-stimulation 5 times per week on top of fluoxetine hydrochloride medication and general psychotherapy. A self-administered questionnaire on general demographic information, the Self-Depression Scale (SDS), the Cognitive Emotion Regulation Questionnaire (CERQ), the Difficulty in Emotion Regulation Scale (DERS), and the Adolescent Non-Suicidal Self-Injurious Behavior Rating Scale (ANSSIQ) were used to assess the subjects in both groups before and after the intervention. Mediation effects were analyzed using the Bootstrapping test. Results：After the rTMS intervention, the difference between the experimental group's scores on the SDS, CERQ, DERS, and ANSSIQ scales and the pre-intervention scores was statistically significant ($p < 0.001$). The experimental group had significantly lower scores on the SDS, CERQ, DERS, and ANSSIQ scales than the control group ($p < 0.05$). The mediation effect value of the amount of change in scores on the Negative Cognitive Emotion Regulation Questionnaire (NCERQ) as a mediator variable for low-frequency rTMS to reduce NSSI behaviors was -0.2510, with a 95% CI of (-0.5686, -0.0145), which is a significant mediation effect. The mediation effect value for the amount of change in NCERQ scores as a mediating variable for the intention of low-frequency rTMS to reduce the NSSI was -0.1944, with a 95% CI of (-0.4392, -0.0100), which was a significant mediation effect. Conclusion：rTMS is effective in improving depressed mood, decreasing self-injurious intentions and reducing self-injurious behaviors in adolescents with depression with non-suicidal self-injury. It can also increase the propensity to use positive cognitive emotion regulation strategies, decrease the propensity to use negative cognitive emotion regulation strategies, and improve emotion regulation difficulties. In addition, negative cognitive emotion regulation strategies play a mediating role in rTMS in order to reduce self-injurious behaviors and lower self-injurious intentions; specifically, rTMS reduces self-injurious behaviors

and lowers self-injurious intentions by decreasing the propensity to use negative cognitive emotion regulation strategies.

应激中的“马后炮”现象：回溯性评估对应激反应的影响

陈泓宇[1]，王霈珊[1]，王晓宇[1]，张亮[1]（通讯作者）

[1]中国科学院心理研究所，北京，100101，zhangl@psych.ac.cn

摘 要 心理社会应激源(psychosocial stressor)能够有效地诱发个体的应激体验，并激活下丘脑-垂体-肾上腺(hypothalamus–pituitary–adrenocortical, HPA)轴从而产生神经内分泌反应，同时也是影响作业绩效和安全性的重要因素。尽管目前个体在应激情景下的心理、行为和生理反应模式及其之间的联系已得到了广泛的研究，但大多数研究所采用的单一时间点施测方法忽略了主观评估在应激过程中的动态性，得到的评估结果是否具有代表性仍存疑。因此，本研究旨在通过实验室研究探索不同时间点的主观评估结果能否从生理和行为的角度解释个体的应激反应。实验共招募了 120 名有效被试，采用特里尔社会压力测试(Trier Social stress Test)诱发个体的应激反应，并对应激源出现前(预期性评价)和出现后(回溯性评价)的主观评价进行测量，同时记录了被试的皮质醇反应和任务绩效。研究结果表明：(1)就任务绩效而言，预期性评价对演讲任务和心算任务的表现无显著影响，而回溯性评价结果可以特异性地反映对应的任务绩效；(2)就皮质醇而言，以年龄、性别、BMI 和月经周期为控制变量展开的多元回归分析结果显示，仅有针对演讲任务展开的回溯性评估结果能解释个体在应激情景下的皮质醇反应。综上结果表明，相较于预期性评估而言，回溯性评估结果更能反映个体在应激情景下的行为和生理反应，且 TSST 中的演讲任务是诱发个体应激反应的主要应激源。本实验的研究结果为完善生物心理社会模型提供了实验依据，同时也验证了回溯性评价解释个体应激反应差异的有效性，为后续的研究设计提供了理论支持。

The "afterthought" phenomenon in stress:

the impact of retrospective appraisal on stress response

Chen Hongyu, Wang Peishan, Wang Xiaoyu, Zhang Liang

Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, China

Abstract：Psychosocial stressors can effectively induce individuals' stress experience, activate the hypothalamus-pituitary-adrenocortical (HPA) axis to produce neuroendocrine responses, and is also an important factor affecting operation performance and safety. Although the psychological, behavioral and physiological response patterns of individuals in stressful situations and their relationships have been extensively studied, the measurement of subjective appraisal at single time point adopted in most studies ignores the dynamic property of

appraisal process, and the representativeness of the appraisal results reminds doubtable. Therefore, this study aims to explore whether subjective appraisal results at different time points can explain individual stress responses from behavioral and physiological perspectives through laboratory studies. A total of 120 effective participants were recruited to induce individual stress states using the Trier Social stress Test (TSST), and the subjective appraisals before the stressor (anticipatory appraisal) and after the stressor (retrospective appraisal) were both measured. Meanwhile, the cortisol response and task performance of the subjects were also recorded. The results showed that: (1) In terms of task performance, the anticipatory appraisal has no significant effect on the performance of speech task and mental arithmetic task, while the retrospective appraisal results can significantly affect the performance of the corresponding tasks; (2) In terms of cortisol, the results of multivariant regression analysis with age, gender, BMI and menstrual cycle as controlling variables showed that only the retrospective appraisal of speech task could explain the variance of cortisol response under stressful situation. In conclusion, compared with the anticipatory appraisal, the retrospective appraisal results can better reflect the behavioral and physiological response of individuals when they faced with psychosocial stressor, and the public speech task is the main stressor that intrigues the stress response in TSST. The results of this experiment provided experimental basis for improving the biopsychosocial model, and also verified the validity of retrospective appraisal to reflect the differences in individual stress responses, providing theoretical support for subsequent research design.

Keywords：stress, retrospective appraisal, behavioral performance, cortisol response

积极心理学视角下团体心理训练对基层部队团队合作的影响

蒲昭君[1-2]，马娟[1]， 张芫蓓[2]， 杨梦圆[2]， 武圣君[2]

1. 陕西中西药大学公共卫生学院；2.空军军医大学军事医学心理学系

摘 要　目的 实践和证明团体心理训练对改善基层部队团体合作的可行性、有效性和长期性，验证团体辅导方案的有效性，为新形势下提升基层部队军人心理素质、增强部队凝聚力和战斗力的提供科学的、完善的团体辅导方案。 **方法** 采用实验组和对照组前后测实验设计,每组 16 人,利用自编教材和团体辅导活动方案,分别进行为期 4 周的团体合作干预。其中实验组采用团队合作的团体心理训练(每周 1 次，每次 1.5h)，在此期间对照组每周 1 次集中参加常规心理健康教育活动。以作战部队基层单位信任量表、陆军部队凝聚力量表和博弈任务指标进行干预前后的评定。 **结果** 组间比较显示，4 周训练结束后团体干预组的作战部队基层单位信任量表总分高于基线[(87.44±5.15)vs.(83.00±5.51)，P<0.01]，陆军部队凝聚力量表总分以及博弈任务得分也高于基线[(88.44±5.01)vs.(82.31±5.50)，P<0.001]、[(8.44±0.96)vs.(6.31±0.87)，P<0.001]；而对照组各项得分与基线差异均无统计学意义(p 均>0.05）；干预结束一个月后，实验组作战部队基层单位信任量表和凝聚力量表与对照组相比也存在显著性差异（t=-4.538、-6.385 及-5.578，p 均＜0.05），个案访谈和问卷调查结果均显示团体辅导对基层部队士兵的人际信任有较好的效果，且存在长期效应。 **结论** 团体心理训练对基层部队团队合作的改善具有较好的效果，而且具有长期效果。

The Effects of Group Psychological Training on Teamwork of Grassroots Forces under the Perspective of Positive Psychology

Pu Zhaojun[1-2], Ma Juan[1], Zhang Yuanbei[2], Yang Mengyuan[2], Wu Shengjun[2]

1. School of Public Health, Shaanxi University of Traditional Chinese Medicine and Western Medicine;
2. Department of Military Medical Psychology, Air Force University of Military Medicine, China

Abstract: Objective To practice and prove the feasibility, effectiveness and long-term nature of group psychological training to improve the group cooperation of grass-roots troops, to verify the effectiveness of group counseling programs, and to provide scientific and perfect group counseling programs for the improvement of the psychological quality of soldiers in grass-roots troops and the enhancement of troop cohesion and combat effectiveness under the new situation. **Methods:** The experimental group and the control group were used in a pre and post-test experimental design, with 16 people in each group, and the group cooperation intervention was conducted for 4 weeks using self-developed teaching materials and group counseling activity programs, respectively. Among them, the experimental group used the group psychological training of teamwork (1 time per week, 1.5 h each time), during which the control group participated in the routine mental health education activities once a week centrally. The Combat Forces Base Unit Trust Scale, Army Force Cohesion Scale, and Gaming Task Indicator were used to rate before and after the intervention. **Results:** Between-group comparisons showed that the total score of the Combat Forces Base Unit Trust Scale was higher than baseline in the group intervention group at the end of the 4-week training [(87.44±5.15) vs. (83.00±5.51), P<0.01], and the total score of the Army Forces Cohesion Scale as well as the score of the gaming task were also higher than baseline [(88.44±5.01) vs. (82.31±5.50),. p<0.001], [(8.44±0.96) vs. (6.31±0.87), p<0.001]; whereas in the control group, the differences between all scores and the baseline were not statistically significant (all p>0.05); one month after the end of the intervention, there was also a statistically significant difference in the trust scale of the base unit of the combat troops and cohesion scale of the experimental group in comparison with the control group (t=-4.538, -6.385 and -5.578, p < 0.05), and the results of case interviews and questionnaires show that group counseling has a better effect on the interpersonal trust of soldiers in basic units, and there is a long-term effect. **Conclusion:** Group psychological training has a better effect on the improvement of teamwork in grassroots troops and has long-term effects.

摘 要 慢性疼痛患者可能存在注意控制损伤，表现为难以抑制疼痛信息带来的干扰，导致患者不能将注意分配到日常生活中更为重要的目标上，从而影响患者的身体和社会功能，加剧慢性疼痛的维持和发展。然而，慢性疼痛患者对疼痛信息的注意控制是否能预测慢性疼痛的发展尚未可知。本研究采用眼动追踪技术，结合改编的反眼跳任务，使用日常生活中受伤的场景图片和相应的中性图片，测量慢性疼痛患者对受伤信息注意控制的眼动指标对 6 个月后慢性疼痛发展的预测作用。改编的反眼跳任务中，在屏幕中央出现一张受伤或中性的图片，在图片的左边或右边出现一个黄色或蓝色的靶子。黄色靶子是朝向眼跳条件，提示被试看靶子不看图片；蓝色靶子是反向眼跳条件，提示被试看图片不看靶子。测量的指标及其含义为：

在图片为受伤图片的朝向眼跳条件下对靶子的首次眼跳潜伏期和对受伤图片的总注视时间越长，说明被试越难抑制对受伤图片的注意；在反眼跳条件下对受伤图片的首次眼跳错误率越低以及对受伤图片的总注视时间越长，说明被试更容易将注意保持在受伤图片上。然后考查了这些指标对患者 6 个月后慢性疼痛强度和功能损伤的预测作用。结果发现，慢性疼痛患者在图片为受伤图片的朝向眼跳条件下对靶子的首次眼跳潜伏期可以显著预测其 6 个月后的疼痛强度，即使在控制了基线相关因素后预测效果仍然显著。在朝向眼跳条件下对受伤图片的总注视时间能显著预测其疼痛持续时间。反向眼跳条件下对受伤图片的总注视时间可以显著预测患者 6 个月后的三个月内疼痛天数，但控制了基线相关因素后预测效果不再显著。综上所述，慢性疼痛患者对疼痛信息的注意控制指标与慢性疼痛的发展具有密切联系。

Pain-related attention control and later functioning among adults with chronic pain: a longitudinal eye-tracking study

Xiang Zhenzhen[1] (Corresponding author), Zhang Xingyu[2], Yang Zhou[1]

1 Faculty of Psychology, Southwest University, Chongqing 400715

2 Hunan Applied Technology University, Hunan 415000

Abstract：Patients with chronic pain may experience difficulties in controlling the attention to pain-related information, resulting in interference that hinders their ability to allocate attention to more important goals in daily life. This phenomenon can have detrimental effects on the physical and social functioning of individuals, exacerbating the maintenance and development of chronic pain. However, whether attention control of pain-related information in patients with chronic pain can predict the progression of chronic pain remains unknown. In this study, eye-tracking technology combined with an adapted anti-saccade task was utilized to investigate the predictive role of eye movement indices related to attention control of pain-related information for the development of chronic pain after 6 months. Daily-life scenarios depicting injury or corresponding neutral images were presented as stimuli. The adapted anti-saccade task involved the presentation of an injury or neutral image at the center of the screen, with a yellow or blue target appearing on the left or right side of the image. The yellow target indicated a saccade condition, instructing participants to view the target rather than the image, while the blue target represented an anti-saccade condition, instructing participants to view the image rather than the target. Measured indices and their interpretations included the latency of the first saccade towards the target in the saccade condition with an injury image, indicating the difficulty participants experienced in suppressing attention towards the injury image; the error rate of the first saccade towards the injury image in the anti-saccade condition, reflecting the ease with which participants maintained attention on the injury image; and the total gaze time on the injury image under both conditions. Subsequently, the predictive effects of these indices on pain intensity and interference after 6 months were evaluated. Results revealed that the latency of the first saccade towards the target in the saccade condition significantly predicted pain intensity after 6 months, even after controlling for baseline relevant factors. The total gaze time on the injury image in the saccade condition was a significant predictor of pain duration. However, the predictive effect of the total gaze time on the injury image in the anti-saccade condition for paindays in 3 months at follow-up was no longer significant after controlling for baseline relevant factors. In conclusion, attention control indices of pain-related information in patients with chronic pain are closely associated with the progression of chronic pain.

医患信息不对称对患方信任的影响路径：医疗风险感知与道德判断的并行中介作用

师雅昕[1]，林国斌[1]，廖美玲[1]

1 福建医科大学健康学院应用心理学系，福州，350108，Liaoml@fjmu.edu.cn

摘 要　医患关系是一种以医学知识与医疗服务为商品的特殊交易过程，患方信任影响着对医疗服务的满意度、医疗质量感知，以及医嘱遵从性，直接关系患者的疾病愈后与健康结果。目前研究多从宏观的理论建构层面探讨医患信任，较少深入解析微观的心理机制在医患信任建构过程中所发挥的作用。因此，本研究以信息不对称理论为研究视角，主要探讨医患双方在微观人际互动层面的“道德风险”，这种“道德风险”在医疗情境下，患方需要承担的风险既来自医方人员的职业道德水平，又来自于客观医疗过程可能的损害性后果，由此形成了“道德判断”与“医疗风险感知”两条并行的中介路径。

本研究采用单因素两水平（医患信息对称性水平：不对称，对称）被试间设计，通过自主开发的医患信息对称性场景工具，将信任游戏范式引进医患研究领域，并结合问卷工具，对医患信息不对称影响患方信任的路径展开探究。研究结果验证了医患信息不对称是患方信任的预测变量，并表明，医疗风险感知与道德判断在医患信息不对称与患方信任之间起部分中介作用（效应占比分别为 39.47%，21.05%），二者的并行中介效应显著。这与本研究的理论构想相一致，以信息不对称理论视角为指导开展量化研究，可以为当前国内研究关于医患信息不对称影响医患信任的理论探讨提供实证支持。

关键词　医患信息不对称，患者信任，医疗风险感知，道德判断

The Influence Path of Doctor-Patient Information Asymmetry on Patient Trust: The Parallel Mediating Role of Medical Risk Perception and Moral Judgment

Shi Yaxin[1],LinGuobin [1],Liao Meiling[1]

1 Department of Applied Psychology, School of Health, Fujian Medical University Fuzhou, 350108, Liaoml@fjmu.edu.cn

Abstract：The doctor-patient relationship is a special transaction process that takes medical knowledge and medical services as commodities. The patient's trust affects the satisfaction with medical services, the perception of medical quality, and the compliance with medical orders, and directly relates to the recovery and health outcomes of patients. At present, most studies discuss doctor-patient trust from the macro theoretical construction level, and few in-depth analysis of the role of micro psychological mechanism in the construction of doctor-patient trust. Therefore, from the perspective of information asymmetry theory, this study mainly discusses the "moral hazard" of both doctors and patients at the micro-level of interpersonal interaction. Such "moral hazard" in the medical situation requires the patient to bear the risk not only from the professional ethics of the medical staff, but also from the possible harmful consequences of the objective medical process. Thus, two parallel mediating paths of "moral judgment" and "medical risk perception" are formed.

In this study, a single-factor two-level (doctor-patient information symmetry level: asymmetry, symmetry) design was adopted among subjects. The self-developed doctor-patient information symmetry scenario tool was used to introduce the trust game paradigm into the doctor-patient research field, and the questionnaire tool was combined to explore the path of doctor-patient information asymmetry affecting the trust of patients. The research results verified that doctor-patient information asymmetry was a predictive variable of patient trust, and showed that medical risk perception and moral judgment played a partial mediating role between doctor-patient information asymmetry and patient trust (the effect ratio was 39.47% and 21.05%, respectively), and the parallel mediating effect of the two was significant. This is consistent with the theoretical conception of this study, and quantitative research guided by the perspective of information asymmetry theory can provide empirical support for the current theoretical discussion on the influence of doctor-patient information asymmetry on doctor-patient trust in China.

Keywords : Doctor-Patient Information Asymmetry, Patient Trust, Medical Risk Perception, Moral Judgment

自我厌恶对个体自我面孔注视影响的眼动研究

摘 要 为探讨个体对自我面孔加工的优势是有熟悉造成的还是由于自我面孔引起了个体的内隐积极自我联想，本研究采用眼动追踪技术，记录了高、低自我厌恶水平的各 40 名大学生，在观看自我和他人的积极、中性和负性情绪面孔时的眼动情况。结果发现：个体对自我面孔的总注视时间显著长于他人面孔；高自我厌恶组的个体观看自我面孔的注视比率显著低于观看他人面孔，低自我厌恶组未发现显著差异；个体在中性情绪面孔对眼睛的注视时间最长、注视次数最多；个体在积极情绪面孔下对嘴巴注视次数最多、注视时间最长；高自我厌恶组的对鼻子区域的注视时间长于低自我厌恶组，注视次数多于低自我厌恶组。结果表明，虽然高、低自我厌恶水平个体均具有自我面孔加工的优势，具有类似的注视模式；自我面孔加工优势受个体自我厌恶水平的影响，支持内隐积极自我联想假设。

关键词 自我厌恶，自我面孔，眼动

移动阿格纽关系问卷中文版(mARM–C)的信效度检验

摘 要 **背景：**随着在线心理干预的迅速发展，数字治疗联盟(Digital Therapeutic Alliance, DTA)概念也开始受到关注。基于初步研究发现，发展 DTA 将有希望促进用户参与度并改善干预效果。然而，我国目前仍无测量 DTA 的可靠工具。**目的：**本研究旨在修订 DTA 测量工具“移动阿格纽关系问卷”(mobile Agnew Relationship Measure, mARM)并检验中文版问卷(mARM-C)的信度和效度。**方法：**采用方便取样法招募 574 名近期使用过冥想 APP 的大学生进行施测，并于两周后抽取 102 名重测。选取数字工作同盟量表(Digital Working Alliance Inventory, DWAI)、咨询信任问卷(Trust of Counseling Scale, TCS)、当事人满意度问卷(Satisfaction Questionnaire-8, CSQ-8)作为效标效度工具，采用 SPSS 26.0，AMOS 26.0 以及 JASP 17.2 进行信度、效度及网络分析。**结果：**通过探索性因子分析和网络分析发现，mARM-C 包括 5 因子共 19 个条目；mARM-C 的各个条目具有良好的区分度，各条目与各维度总分及量表总分均呈显著正相关；验证性因子分析也表明模型拟合良好(χ^2=385.035, df =142, χ^2/df = 2.712, p<0.001, SRMR=0.046, RMR=0.040, RMSEA=0.077, IFI=0.940, TLI=0.927, CFI=0.940)；mARM-C 总分与 DWAI、TCS 以及 CSQ-8 的得分均呈显著正相关；问卷的聚敛效度、区分效度均达到心理测量学标准；在信度方面，mARM-C 具有良好的内部一致性信度(0.87 ~ 0.94)、分半信度(0.78 ~ 0.88)及重测信度(0.79 ~ 0.88)。**结论：**mARM-C 信效度良好，可用来测量在线自助干预中用户与程序间形成的 DTA。

关键词 移动阿格纽关系问卷，信度，效度，网络分析，数字治疗联盟。

Reliability and validity of the Chinese version of the mobile Agnew Relationship Measure (mARM-C)

***Abstract*:**

Background: The Digital Therapeutic Alliance (DTA) concept has emerged with the development of digital mental health, and it has the potential to play a constructive role in digital intervention. However, there still needs to be empirical backing. China currently needs the necessary questionnaire to measure this variable. **Objective:** This research aims to test the reliability and validity of the Chinese version of the mobile Agnew Relationship Measure (mARM-C). **Methods:** 574 college students who had recently used meditation applications were included. 102 of them were chosen for retesting two weeks later. Standards for evaluation included the Digital Working Alliance Inventory (DWAI), Trust of Counseling Scale (TCS), and Client Satisfaction Questionnaire-8 (CSQ-8). The formal questionnaire was created after further modifications based on item analysis, exploratory component analysis, and network analysis. **Results:** Confirmatory factor analysis revealed that the five-component model fit the data well (χ^2=385.035, *df* =142, χ^2/df = 2.712, *p*<0.001, SRMR=0.046, RMR=0.040, RMSEA=0.077, IFI=0.940, TLI=0.927, CFI=0.940). The mARM-C has intense item discrimination, and each item is substantially and positively linked with the total score of each dimension and the total score of the measure. The mARM-C had fair to excellent internal consistency (0.87 to 0.94), split-half (0.78 to 0.88), and test-retest (0.79 to 0.88) reliability. The convergent and criterion-related validity was acceptable. **Conclusion:** In conclusion, the results of this study indicate that the Chinese version of the mARM-C has good validity and reliability. It is an effective self-report measure of the DTA.

特质愤怒对网络攻击行为的影响：有调节的中介模型

陈丹[1]，孙红梅[1]（通讯作者）

1 天津中医药大学管理学院，天津，301617，shm1029@126.com

摘 要 随着互联网的快速发展，攻击行为的发生场所逐渐扩宽，并随之衍生出一种新的攻击形式，即网络攻击，59.5%的大学生出现过网络攻击行为，55.3%的大学生受到过网络攻击。网络攻击行为按照动机类型可分为反应性和主动性网络攻击行为，前者指对网络上感受到的激惹或威胁进行防卫的行为；后者指未被威胁但因个人利益所致的行为。两类网络攻击行为都会对个人的身心健康及社会的长治久安产生严重的负面影响，但前人研究大多忽视了对主动性攻击行为的探讨，有必要分别探讨这两类网络攻击行为的影响因素和作用机制，以期为网络攻击行为的防治工作提供更有针对性的实证支持。本研究采用了特质愤怒量表、敌意归因偏向分量表、自我控制量表以及网络攻击行为量表对天津市 968 名大学生进行调查。结果显示：（1）特质愤怒正向预测反应性网络攻击行为及主动性网络攻击行为；（2）特质愤怒通过敌意归因

偏向的部分中介作用预测反应性、主动性网络攻击行为；（3）自我控制调节了直接效应和中介效应的后半段路径。具体而言, 对于低自我控制个体来说，特质愤怒通过自身的直接作用以及敌意归因偏向的中介作用对反应性网络攻击行为产生影响，但特质愤怒只能通过敌意归因偏向的中介作用对主动性网络攻击行为产生影响；对于高自我控制个体来说，特质愤怒对网络攻击行为不再产生影响，体现了自我控制的重要作用。研究结果表明，主动性攻击行为是否产生，个体的自我控制、敌意归因水平可能是其中的主要原因，网络环境可能会导致个体自我控制水平暂时性降低，加强网络环境的外界干预措施是有必要的。研究结果支持并丰富了综合认知模型（ICM）关于特质愤怒对反应性攻击行为的理论假设，把其拓展到特质愤怒和反应性网络攻击行为、主动性网络攻击行为上，也扩展了目前对敌意归因偏向与攻击行为联系的理解。

The Effect of Trait Anger on Online Aggressive Behavior: A Moderated Mediation Model

CHEN Dan[1], SUN Hong-mei[1]
1 School of Management, Tianjin University of Traditional Chinese Medicine, Tianjin 301617, China

***Abstract*:** With the rapid development of the Internet, the place of aggressive behavior has gradually expanded, and a new form of aggressive behavior has been derived, that is, online aggressive behavior. 59.5% of college students have experienced online aggressive behavior, and 55.3% of college students have been attacked by online aggressive behavior. According to the type of motivation, online aggressive behavior can be divided into reactive and proactive online aggressive behavior. The former refers to the behavior of defending against the irritations or threats felt on the online. The latter refers to reaction that are not threatened but are motivated by personal gain. Both types of online aggressive behavior will have a serious negative impact on the physical and mental health of individuals and the long-term stability of society. However, most previous studies have ignored the discussion on proactive aggression. It is necessary to explore the factors and mechanisms of these two types of online aggressive behavior respectively, in order to provide more targeted empirical support for the prevention and treatment of online aggressive behavior. A total of 968 college students in Tianjin were tested by using trait anger scale, hostility attribution bias subscale, self-control scale and online aggressive behavior scale. The results showed that: (1) Trait anger positively predicted reactive and proactive online aggression behavior; (2) Hostility attribution bias played the partial mediating role between trait anger and reactive and proactive online aggression; (3) Self-control moderated the direct effect and the latter half of the mediating effect. That is, under the low self-control level, trait anger has the effect on reactive online aggression through its direct role and the mediating role of hostility attribution bias, but trait anger can only influence proactive online aggression through the mediating role of hostility attribution bias. however, there was a non-significant relation between trait anger and online online aggressive behavior under the high self-control level, which reflected the important role of self-control. The results show that whether proactive aggression occurs or not, individual self-control and hostility attribution level may be main reasons. The network environment may lead to the temporary reduction of individual self-control level, and it is necessary to strengthen the external intervention measures in the network environment. The results of this study support and enrich the theoretical hypothesis of the integrated cognitive model (ICM) on the role of trait anger on reactive aggressive behavior, extend it to trait anger, reactive online aggressive behavior and proactive online aggressive behavior, and expanding the current understanding of the relationship between hostility attribution bias and aggressive behavior.

工作家庭冲突对职场母亲育儿投入的影响机制：基于多水平的视角

王荣 王茹 李丹黎（通讯作者）
陕西师范大学心理学院，西安，710062，dlli@snnu.edu.cn

摘 要　随着我国女性就业比例的大幅提高，在工作与家庭的双重压力下，职场母亲频频陷入工作家

庭冲突的困境，从而引发一系列的育儿难题。研究表明，母亲育儿投入对儿童社会能力与学业的发展至关重要（Emine Ahmetoglu et al.,2020;Xin Ma et al.,2015）。然而，现有多数研究仅从个体间层面考察工作家庭冲突对母亲育儿的影响，较少关注个体内层面工作家庭冲突的波动对育儿投入的影响。母亲个体内每日经历的工作家庭冲突可能存在差异，仅从个体间水平、单一层面来考察不足以全面揭示其中的影响机制。因此，本研究拟采用日记法，从个体内和个体间两个层面去探究职场母亲工作家庭冲突对育儿投入的作用机制，以及母亲情绪调节策略的调节效应。研究选取有全职工作，幼儿园孩子的母亲为研究对象，在线招募了 236 位母亲。由于出差、生病等原因，最终全国 23 个省 50 个市的 203 位职场母亲（平均年龄 33.49±3.92 岁；孩子平均年龄 4.53±0.98 岁）完成了 6 天的日记法研究。使用问卷法测量母亲的情绪调节策略（认知重评、表达抑制），通过母亲日报告收集每天的工作家庭冲突和育儿投入。采用多层线性模型进行数据分析，结果显示：在个体内水平上，母亲每日工作家庭冲突负向预测每日的育儿投入(β=-.45，p = .01）。但在个体间水平上，控制了孩子数量和家庭收入后，母亲经历的冲突天数正向预测育儿投入(β=.22，p = .00）。认知重评策略对于每日预测效应的调节作用不显著(β=.08, p =.59)，而表达抑制策略则显著调节每日工作家庭冲突对育儿投入的预测效应(β=-.40，p = .01），经简单斜率分析发现，表达抑制处于高水平时，每日工作家庭冲突对每日育儿投入的负向预测被显著增强（b=-1.01 , t=-4.43 , p=.00）。这些结果说明，工作家庭冲突对于职场母亲育儿投入的影响在个体内与个体间水平上表现出相反的作用模式，体现出从多角度多层面来揭示工作家庭冲突对母亲育儿影响的重要性和必要性。同时，表达抑制作为非有效情绪调节策略，会加剧工作家庭冲突对母亲育儿投入的不利影响，这一发现对于实践干预具有重要指导价值。

关键词　职场母亲，工作家庭冲突，育儿投入，情绪调节策略,日记法

How Work-Family Conflict Affects Working Mothers' Childcare Involvement: A Multilevel Perspective

Rong Wang, Ru Wang, Danli Li (corresponding author)
School of Psychology, Shaanxi Normal University, Xian 710062

***Abstract*:** With the significant increase in the proportion of women's employment in China, under the dual pressure of work and family responsibilities, working mothers are frequently caught in the dilemma of *work-family conflict*, which consequently triggers a series of childcare problems. Research has shown that mothers' involvement in childcare is critical to the development of children's social competence and academics (Emine Ahmetoglu et al.,2020; Xin Ma et al.,2015). Emotion regulation is an important factor influencing mothers' parenting, and different emotion regulation strategies may play different roles in the process of mutual influence between mothers' *work-family conflict* and *childcare involvement*. However, most of the existing studies examine the impact of *work-family conflict* on mothers' parenting only at the individual level, with less attention paid to the impact of within-individual fluctuations in *work-family conflict* on *childcare involvement*. The level of work-family conflict experienced daily may vary within individual mothers, thus examining a single level at the personal level is insufficient to fully reveal the mechanisms of the influence process. In order to explore the mechanisms of how working mothers' *work-family conflict* affects maternal involvement at multiple levels, this study intends to use a diary method to investigate the effects of *work-family conflict* on *childcare involvement* at the within- and between-individual levels, respectively, and the role of mothers' emotion-regulation strategies in this context. Mothers with full-time job and kindergarten children were selected for the study, and 236 mothers were recruited online. Due to business trips, illness, and other reasons, 203 working mothers (mean age 33.49±3.92 years; mean age of children 4.53±0.98 years) from 50 cities in 23 provinces across the country eventually completed all the tasks for 6 consecutive days. Mothers' emotion regulation strategies (*Cognitive*

Reappraisal, *Expression Suppression*) were measured using questionnaires, and mothers' *work-family conflicts* and mothers' *childcare involvement* for each day were collected through mothers' daily reports. The Hierarchical Linear Model was used to analyze the data. Results of models showed that at the within-individual level, mothers' daily *work-family conflict* negatively predicted their daily *childcare involvement* (β = -.45, p = .01). However, at the between-individual level, controlling for the number of children and household income, the number of days experiencing *work-family conflict* positively predicted *childcare involvement* (β = .22, p = .00). The moderating effect of the *Cognitive Reappraisal* strategy on the daily prediction effect was not significant (β = .08, p = .59). In contrast, the *Expression Suppression* strategy significantly moderated the predictive effect of daily *work-family conflict* on *childcare involvement* (β = -.40, p = .01), and a simple slope analysis revealed that the negative prediction of daily *work-family conflict* on daily *childcare involvement* was significantly augmented when *Expression Suppression* was high (b = -1.01, t = -4.43, p = .00). These results suggest that the effects of the mother's *work-family conflict* on *childcare involvement* show opposite patterns of action at the within- and between-individual levels, reflecting the importance and necessity of revealing the effects of *work-family conflict* on mothers' parenting from multiple levels. In addition, the finding that *Expression Suppression*, as an ineffective emotion regulation strategy, exacerbates the negative impact of *work-family conflict* on maternal involvement is an important guideline for practical interventions.

亲密关系对消费行为的促进：来自 fNIRS 的证据

张辰宇[1]　刘敬越[1]　刘映杰[1]（通讯作者）

1 华北理工大学，河北，唐山，063210

1 华北理工大学心理与精神卫生学院，河北，唐山，063210，liuyjpsy@ncst.edu.cn

摘 要　亲密关系在一定程度上影响消费者的购买决策。本研究招募 61 名大学生被试，采用模拟购买决策任务，应用功能性近红外光谱成像（fNIRS）技术，在不同亲密关系中探究价格涨跌对消费者购买决策的影响及其神经机制。行为结果发现，情侣组的平均购买率显著高于朋友组；降价产品购买率显著高于涨价产品；在涨价时，情侣组的购买率显著高于朋友组，而在降价时差异不显著。近红外结果发现，背外侧前额叶皮层（dlPFC）和眶额皮质（OFC）在降价时的负激活水平显著高于涨价条件。朋友组在决策过程中 dlPFC 激活程度更高，涨价条件下 dlPFC 激活程度更高，购买涨价产品时情侣组的 dlPFC 激活强度显著低于朋友组。涨价条件下，OFC 的激活强度与朋友组的购买率呈显著正相关，降价条件下，dlPFC 的激活强度与朋友组购买率呈显著负相关。结果表明亲密关系程度越深，消费者产生的购买力越强，消费者更倾向于为他们的伴侣购买涨价产品。亲密程度的加深降低了消费者在购买决策时认知控制；提升了消费者的情感唤起程度。本研究系统分析了亲密关系的变化对消费者购买决策的影响，可以在一定程度上预测不同亲密关系中消费者的购买决策倾向，帮助企业更精准地定位其目标市场并改善营销策略。

Promotion of Consumer Behavior by Intimate Relationships: Evidence from fNIRS

Zhang Chenyu[1], Liu Jingyue[1], Liu Yingjie[1] (Corresponding author)

[1] School of Psychology and Mental Health, North China University of Science and Technology, Tangshan, Hebei 063210, liuyjpsy@ncst.edu.cn

Abstract： Intimate relationships, to some extent, influence consumer purchasing decisions. In this study, 61 university students were selected as participants. Functional near-infrared spectroscopy (fNIRS) was utilized to investigate the impact of different levels of intimacy on consumer purchase decisions and their neural mechanisms through a simulated purchasing task. Behavioral results revealed that the average purchase rate in the couple group was significantly higher than in the friend group. Purchase rates for discounted products were significantly higher than those with price increases. Specifically, during price increases, the couple group's purchase rate was significantly higher than that of the friend group, while during price decreases, the difference was not significant. fNIRS results demonstrated that the activation levels of the dorsolateral prefrontal cortex (dlPFC) and orbitofrontal cortex (OFC) were significantly higher during price decreases compared to price increases. In the friend group, dlPFC activation was higher during the decision-making process, and under price increase conditions, dlPFC activation was higher. Notably, during the purchase of products with price increases, the dlPFC activation intensity in the couple group was significantly lower than in the friend group. Under price increase conditions, the OFC activation intensity was significantly positively correlated with the purchase rate in the friend group, while under price decrease conditions, dlPFC activation intensity was significantly negatively correlated with the purchase rate in the friend group. These results indicate that couples exhibit stronger purchasing power, and deepening intimacy reduces cognitive control in consumer purchasing decisions. This study systematically analyzed the impact of changes in intimate relationships on consumer purchasing decisions, allowing for the partial prediction of consumer purchasing tendencies in different personal relationships. This can assist businesses in more accurately targeting their market and improving marketing strategies.

社会地位获取策略对提前/主动拖延行为选择的影响：解释水平的中介作用

陈柳　杜邦　付可可　李开云　贾凡路　侯婷婷

济南大学教育与心理科学学院，济南，250022，sep_liky@ujn.edu.cn

摘 要　完成一项任务时，有的人早早地开始着手做，而有的人却事先做好计划等快到截止时间时才开始。前者界定为提前行为，而后者界定为主动拖延行为。根据进化心理学中的生活史策略，个体提前/主动拖延行为选择可能会受到社会地位获取策略的影响。本研究采用改编的推木块任务测量个体的提前/主动拖延行为，通过三个实验考察了社会地位获取策略（支配策略和声望策略）对个体提前/主动拖延行为选择的影响，并探究个体认知方式--解释水平在这一关系中的作用。实验 1 通过情景操纵法启动个体的社会地位获取策略，考察被试在支配/声望策略状态下的提前/主动拖延行为选择。结果发现，支配策略启动组被试倾向于做出提前的选择，而声望策略启动组被试倾向于做出主动拖延的选择。实验 2 采用实验因果链设计考察解释水平在社会地位获取策略影响个体提前/主动拖延行为选择中的作用。实验 2a 考察支配/声望策略启动状态下，个体的解释水平类型（高/低）。结果发现，启动支配策略促使个体进行低解释水平表征，而启动声望策略促使个体进行高解释水平表征。实验 2b 则进一步考察高/低解释水平启动状态下，个体的提前/主动拖延行为的选择。结果发现，低解释水平表征下能够增强个体提前选择倾向，而高解释水平表征下能够增强个体主动拖延选择的倾向。实验 3 采用中介测量设计考察解释水平在社会地位获取策略影响个体提前/主动拖延行为中的作用。结果发现，解释水平在社会地位获取策略影响个体提前/主动拖延行为中起部

分中介作用。本研究结果表明，当个体完成一个任务时，支配策略的个体更多的对事物进行低解释水平表征，进而促使其做出提前行为；而声望策略的个体对事物更倾向于进行高解释水平表征，进而更多地表现出主动拖延行为。

The influence of social status acquisition strategies on the choice of precrastination/active procrastination behavior: The mediating role of construal level

CHEN Liu, DU Bang, FU Keke, LI Kaiyun, JIA Fanlu, HOU Tingting
(*School of Education and Psychology, University of Jinan, Jinan* 250022, *China*)

***Abstract*:** When carrying out a task, some people start working on it early, while others plan ahead and wait until the deadline is approaching. The former behavior is defined as precrastination, while the latter behavior is defined as active procrastination. According to the life history strategy in evolutionary psychology, individual precrastination/active procrastination behavior choices may be influenced by social status acquisition strategies. The current study used adapted the reach-to-grasp task to measure individuals' precrastination and active procrastination behavior. Three experiments were conducted to investigate the influence of social status acquisition strategies (dominance strategies and prestige strategies) on the choice of precrastination/active procrastination behavior, and to explore the role of individual cognitive style - explanatory level in this relationship. Experiment 1 examined participants' choice between precrastination and active procrastination when participants with no obvious tendency to dominate or prestige strategies but under the dominance/prestige strategies state by priming through situational manipulation. The results indicated that participants in the dominance-primed strategies group tended to choose precrastination, while the participants in the prestige-primed strategies group tended to choose active procrastination. Experiment 2 used an experimental-causal-chain design to investigate the role of construal level in the influence of the dominance/prestige strategies on individuals' choice between precrastination and active procrastination. Experiment 2a examined the type of individuals' construal level (high/low) when participants with no obvious tendency to dominate or prestige strategies but under the dominance/prestige strategies state by priming through situational manipulation. The results revealed that the priming of dominance strategies prompted individuals to engage in low construal level representation, while the priming of prestige strategies prompted individual to perform high construal level representation. Experiment 2b further investigated individuals' choice between precrastination and active procrastination in the high/low construal level primed state. The results indicated that low construal level representation enhanced individuals' tendency to choose behaving precrastination, whereas high construal level representation enhanced individuals' tendency to choose behaving active procrastination. Experiment 3 used a measurement-of-mediation design to investigate the role of construal level in the influence of the dominance/prestige strategies on individuals' choice between precrastination and active procrastination. The results revealed that construal level played a partially mediating role in this influence. Results of these three experiments firstly indicated that when carrying out a task, individuals who tend to adopt the dominance strategies to acquire or maintain their social status are more likely to represent events with low construal level, which in turn motivates them to behaving more precrastination, whereas individuals who tend to adopt the prestige strategies to acquire or maintain their social status are more inclined to represent events with high construal level, which in turn is more likely to lead to active procrastination.

气味效价对面孔吸引力感知的影响

雷佳玮[1]　吴婕[1]　冯果[1,2]（通讯作者）

1 西南交通大学心理研究与咨询中心，成都，611756

2 西南交通大学应用心理学研究院，成都，611756，fengguo@swjtu.edu.cn

摘 要　面孔吸引力具有诱发积极情绪的特质，且存在美貌溢价效应。生活中，人脑能整合来自不同感官通道的线索对面孔吸引力进行感知，且嗅觉系统与情绪加工系统高度重合。那么，气味的情绪效价是否会影响面孔吸引力感知呢？这是一个尚未完全回答的问题。已有研究验证了社会性气味对人类社会活动的影响，但非社会性气味是否也会干预我们对面孔吸引力的感知？目前还未有一致性结论。鉴于跨感官信息整合时遵循“反比效应”，即视觉信息输入越模糊时，嗅觉对其调节作用就越强。因此，本研究从中国面孔表情图片库中筛选出 16 张中性表情面孔图片，以吸引力从高到低生成 8 个模糊面孔序列（每个序列包括 25 帧），从中选取模糊度最高的 7 张图片作为视觉材料。气味材料经预实验选取橙味精油、5%戊酸溶液、水分别作为积极、消极、中性条件。实验一采用 3(气味效价:积极、消极、中性)x7(面孔吸引力的模糊程度:37.5%~62.5%)的被试内设计，实验在连续三天的同一时间持续进行，气味与面孔同时呈现，并要求被试对视觉面孔进行吸引力判断。三天实验前后均要求被试填写 PANAS 量表。结果发现：（1）气味效价主效应显著，与消极气味同时呈现的面孔更易被判断为低吸引力，与积极气味同时呈现的面孔则更易被判断为高吸引力。（2）模糊水平主效应显著，吸引力模糊度越高，气味的影响越大。（3）在所有气味效价下，男性面孔都被判断为比女性面孔更具吸引力。（4）对男性被试来说，即使女性面孔伴随积极气味，男性面孔伴随消极气味，他们也认为同性面孔更具吸引力；同样的效应在女性被试中未发现。实验二的视觉材料选取模糊程度为 37.5%和 62.5%的面孔图片，采用 3(气味效价:积极、消极、中性)x2(面孔吸引力高、低)的被试内设计，要求面孔出现时被试用 1(最不好看)-9(最好看)对吸引力进行评分，其余流程均同实验一。结果发现：（1）气味效价主效应显著：消极气味下面孔吸引力评分显著低于积极和中性气味；积极气味下面孔吸引力评分显著高于中性气味。（2）高吸引力面孔评分显著高于低吸引力面孔。（3）女性对男性面孔的评分高于男性对女性面孔的评分。本研究为面孔吸引力感知的跨感官信息整合提供了证据。

Effects of odor valence on the perception of facial attractiveness

Jiawei Lei[1]，Jie Wu[1]，Guo Feng[1,2]

1 Psychological Research and Counseling Center, Southwest Jiaotong University, Chengdu 611756, China;

2 Institute of Applied Psychology, Southwest Jiaotong University, Chengdu 611756, China;

Abstract：Facial attractiveness is supposed to be a trait that induces a positive, pleasant mood and there is a beauty premium effect. In daily life, Human brain can integrate cross-modal information to perceive facial attractiveness and the olfactory system is highly overlapping with the emotional processing system. Then, whether odor valence can affect facial attractiveness perception or not? This is a question that has not yet been fully answered. Previous studies have verified the influence of social odors on human social activities, however, for

nonsocial odor, there has not been a consistent conclusion. Considering the "inverse effect" when combining cross-modal information, the fuzzier the visual information input, the stronger the role of smell in regulating it. Therefore, in this study, 16 neutral facial images were selected from the Chinese Affective Face Picture System to generate 8 fuzzy face sequences ranging in attractiveness from high to low, and the 7 with the highest fuzzy degree were selected as visual stimuli. Olfactory stimuli were a neutral odor (water), a pleasant odor (essential oil with an orange-like smell), and an unpleasant odor (5% concentration valeric acid, diluted in propylene glycol). In experiment 1, we designed a 3(odor valence: neutral, pleasant, and unpleasant) ×7 (continuous levels of morphed fuzziness of attractiveness: 37.5% to 62.5%) within-subject experiment, which were conducted at the same time on three consecutive days. When odors were presented simultaneously with faces, participants were required to make attractiveness judgments about face images. Also, participants were asked to complete the PANAS scale before and after the three-day procedure. The results showed that: (1) The main effect of odor valence was significant. The faces presented with unpleasant odor were more likely to be judged as less attractive, while the faces presented with pleasant odor were more likely to be judged as more attractive. (2) The main effect of fuzzy level was also significant. The fuzzier the faces, the stronger the influence effect of odor valence. (3) In all odor conditions, male faces were rated as more attractive than female faces. (4) Male participants rated same-gender faces as more attractive even when female faces were accompanied by pleasant odors and male faces were accompanied by unpleasant odors. The same effect was not found in female participants. In experiment 2, the visual stimuli of faces with 37.5% and 62.5% fuzziness were selected, and a 3 (odor valence: pleasant, unpleasant, neutral) x 2 (face attractiveness high, low) within-subject design was adopted. The experiment was also carried out at the same time for three consecutive days and with the same procedure as experiment 1. Participants were asked to rate the attractiveness of faces on a scale of 1 (least attractive) to 9 (most attractive). The results showed that: (1) The main effect of odor valence was significant. The rating attractiveness of faces under unpleasant odor were lower than those under pleasant and neutral odors; the attractiveness score in pleasant odor condition was higher than those in neutral condition. (2) The score of highly attractive faces was significantly higher than that of low attractive faces. (3) Women rated male faces higher than men rated female faces. Our findings can provide evidence for cross-modal information integration of facial attractiveness perception.

自我同情对自觉性自传体记忆提取的影响：行为与脑活动的视角

殷海红[1,2] 郑玥[1,2] 董小帅[1,2] 胡伟[1,2,3] 王晓庄[1,2,3]（通讯作者）

1 天津师范大学心理学部，天津，300387

2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津 300387

3 学生心理发展与学习天津市高校社会科学实验室，天津，300387，wangxiaozhuang@tjnu.edu.cn

摘 要 自传体记忆是包含感知觉信息和情绪特征的有关自我经历的外显记忆，自觉性自传体记忆是指在线索提示下，个体对自己生活经历事件的有意提取。在抑郁以及精神分裂症患者身上，有自传体记忆过度概括化的现象。自我同情可以通过影响个体的情绪影响心理健康，也可以促进人们对积极信息的关注，通过认知加工影响心理健康。有研究表明，低自我同情的个体会出现负性记忆偏向，而对于自我同情对自传体记忆的影响及其内在机制还缺乏来自实证研究的证明。

本研究通过问卷调查、行为实验，并借助事件相关电位技术，考察自我同情水平的高低对自觉性自传体记忆提取的影响。研究 1 使用自我同情量表和记忆经验问卷，考察自我同情是否与自觉性自传体记忆存在正相关关系，结果表明自我同情的水平可以正向预测自觉性自传体记忆问卷的得分。研究 2 使用自传体记忆的线索词范式，采用 2（组别：高自我同情组、低自我同情组）×3（自传体记忆线索词效价： 消极、中性、积极）的混合实验设计，其中组别为被试间变量。因变量为自觉提取自传体记忆的具体性和生动性。由高自我同情组和低自我同情组被试根据线索词进行自觉性自传体记忆的提取。结果表明，自传体记忆的生动性不受自我同情水平的影响；自我同情水平高低影响自传体记忆的具体性。研究 3 借助事件相关电位技术，采用 2（组别：高自我同情、低自我同情）×3（自传体记忆线索词效价：积极、中性、消极）的混合实验设计，从认知神经角度探讨自我同情影响自觉性自传体记忆提取的加工机制。结果表明，组别和线索词效价会影响自觉性自传体记忆的提取，高自我同情组在反应认知加工的 LPP 平均波幅上高于低自我同情组的被试。以上结果表明，自我同情水平会影响自觉性自传体记忆的提取，较低自我同情组而言，高自我同情组提取到的自传体记忆更具体，在认知资源的投入上也更多。本研究为进一步解释自我同情如何影响认知加工过程从而影响心理健康提供了一定的实证依据。

2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387;

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin Normal University, Tianjin 300387;

Abstract：Autobiographical memory is an explicit memory of self-experience that contains sensory and perceptual information and emotional characteristics. Voluntary autobiographical memory refers to an individual's intentional extraction of life experience events under the cue. There is an overgeneralization of autobiographical memory in patients with depression and schizophrenia. Self-compassion can affect mental health by affecting an individual's emotions, and it can also promote people's attention to positive information and affect mental health through cognitive processing. Some studies have shown that individuals with low self-compassion will have negative memory bias, but there is a lack of empirical evidence on the impact of self-compassion on autobiographical memory and its internal mechanism. Through questionnaire survey, behavioral experiment and event-related potential technique, this study investigated the influence of self-compassion level on voluntary autobiographical memory retrieval. Study 1 used the self-compassion scale and the memory experience questionnaire to investigate whether there is a positive correlation between self-compassion and conscious autobiographical memory, and the results showed that the level of self-compassion can positively predict the score of the voluntary autobiographical memory questionnaire. In study 2, a mixed experimental design of 2 (group: high self-compassion group, low self-compassion group) ×3 (autobiographical memory cue word titers: negative, neutral, positive) was adopted using the cue word paradigm of autobiographical memory, where the group was the inter-subject variable. The dependent variable is the concreteness and vividness of autobiographical memory consciously extracted. The subjects of high self-compassion group and low self-compassion group extracted autobiographical memory consciously according to cue words. The results showed that the vividness of autobiographical memory was not affected by the level of self-compassion. The level of self-compassion affects the concreteness of autobiographical memory. In study 3, a mixed experimental design of 2 (group: high self-compassion, low self-compassion) ×3 (autobiographical memory cue word titers: positive, neutral, negative) was adopted with the help of event-related potential technology to explore the processing mechanism of self-compassion affecting voluntary autobiographical memory retrieval from the perspective of cognitive neural. The results showed that group and cue word titer could affect the retrieval of voluntary autobiographical memory. The average amplitude of LPP in the high self-compassion group was higher than that in the low self-compassion group. The above results show that the level of self-compassion can affect the extraction of conscious autobiographical memory. Compared with the low self-compassion group, the high self-compassion group extracts more specific autobiographical memory and invests more cognitive resources. This study provides an empirical basis for further explaining how self-compassion affects cognitive processing and thus mental health.

摘 要　语言加工会受到环境中各种因素的影响，而对于消防员、武警士兵、医生等特殊职业来说，

在危机情境中有效地进行语言加工是十分重要的。前人研究大多聚焦在安静环境下的语言加工，部分研究考察了非危机情境下的噪音对语言加工的干扰作用，认为过程干扰或注意分散可能是干扰起作用的原因，并且发现认知控制功能对噪音下的语言加工的行为表现可能起到保护作用。然而，缺少研究考察危机情境下的语言加工的认知神经机制，不清楚危机情境下语言脑网络与认知控制脑网络的工作方式。本研究使用近红外脑成像技术来考察该问题，招募 60 名大学生被试，让他们分别在模拟危机情境或者非危机情境下完成火灾救援过程中的语言理解和语言表达任务，同时使用近红外光学脑功能成像的技术记录他们的大脑活动，重点考察认知控制脑区（如左侧前额叶）与语言加工脑区（如左侧颞叶）的活动差异。结果显示：1）被试阅读文本与静息状态相比，在双侧额叶、左侧颞顶区，左侧颞枕区表现出显著的激活差异；2）其中双侧额叶、左侧颞顶联合区以及左侧枕叶的活动强度与被试在任务中感受到的压力程度显著正相关；3）相对于非危机情境组来说，危机情境组的左侧额叶在阅读中表现出显著的激活差异；4）危机情境组的答题正确率与双侧前额叶、左侧颞顶联合区以及左侧枕叶的激活显著正相关，非危机情境组的答题正确率与大脑激活无显著相关。这些结果表明危机情境的语言加工更强地依赖语言脑网络和认知控制脑网络的共同活动，进一步确认认知控制在危机情境下语言加工的重要作用，拓展了我们对复杂现实场景下的语言加工认知神经机制的认知。

Abstract: Various factors influence language processing in the environment. For special professions such as firefighters, police officers, and doctors, effective language processing in emergencies is crucial. Previous research has mainly focused on language processing in quiet environments. Some studies have investigated the disruptive effects of noise on language processing in non-emergency situations, suggesting that interference-by-process or attentional capture might be the underlying causes of the disruptions. They also found that cognitive control may protect language processing under noisy conditions. However, there needs to be more research exploring the cognitive and neural mechanisms of language processing in emergencies, specifically the interaction between the language and cognitive control networks in the brain. This study used functional near-infrared spectroscopy (fNIRS) to investigate this issue. We recruited 60 university students as participants and had them perform language comprehension and expression tasks during simulated emergencies or non-emergencies while their brain activities were recorded using fNIRS. We focused on examining the differences in activity between cognitive control brain regions (e.g., the left prefrontal lobe) and language processing brain regions (e.g., the left temporal

lobe). The results showed that: 1) compared to the resting state, the participants exhibited significant activation differences in bilateral frontal lobes, the left temporal-parietal region, and the left temporo-parietal-occipital region during reading tasks; 2) the degree of stress felt by the subjects during the task was positively correlated with the activity intensity of the bilateral frontal lobe, the left temporal-parietal region, and the left occipital lobe; 3) compared to the non-emergency group, the emergency group showed significant activation differences in the left frontal during reading tasks; 4) the emergency group's task accuracy was significantly positively correlated with the activation of bilateral prefrontal lobes, the left temporal-parietal region, and the left occipital lobe. There were no significant correlations between task accuracy and brain activation in the non-emergency group. These results suggest that language processing in emergencies relies more heavily on the coordinated activity of the language network and the cognitive control network in the brain. Furthermore, they provide further evidence for the vital role of cognitive control in language processing under emergency conditions, expanding our understanding of the cognitive and neural mechanisms of language processing in complex real-life scenarios.

强迫症的静息态脑电活动:基于功率谱特征的研究

陈婷婷 [1,2]　蔡晓晴 [1,2]　钟明天 [1,2]（通讯作者）

1 华南师范大学心理学院心理应用研究中心，广州，510631

2 华南师范大学脑认知与教育科学教育部重点实验室，广州，510631，ztomorrow@126.com

摘 要　目的：强迫症(Obsessive-compulsive disorder，OCD)是一种常见的精神障碍，其特征包括反复出现的侵入性意念(强迫思维)和重复行为(强迫行为)，严重干扰个体的日常生活和社交功能。既往研究提示，强迫症患者的大脑在静息态时存在异常的神经活动，这种异常在其病理中起着重要作用，并且可能成为强迫症的潜在生理标记物。本研究旨在从相对频率角度出发，分析强迫症患者与健康对照组在静息态时大脑活动的差异，获得强迫症静息态脑电功能功率谱特征，并探讨其可能的病理机制。方法：招募了 39 名符合 DSM-5 诊断标准的强迫症患者和 51 名健康对照组被试。采用 Neuroscan 公司的 64 导脑电检测仪分别对两组被试实施 6 分钟的静息态脑电数据采集，对数据进行预处理后，进行功率谱分析，计算了δ (1-4Hz)、θ(4-8Hz)、α(8-13Hz)、β(13-30Hz)以及γ(30-40Hz)五个频段的绝对功率值，并进一步计算了θ/β与α/β比值。使用 t 检验比较了两组在上述各指标上的差异。结果：(1)在睁眼状态下，两组在所有通道的所有频段均存在显著差异，在闭眼状态下，两组在δ频段的所有通道以及θ频段的额叶、顶叶区域通道均存在显著差异；(2)在睁闭眼状态下，强迫症组在δ与θ频段的绝对功率值均显著高于健康对照组；(3)在睁眼状态下，两组的α/β比值存在显著差异，；(4)θ/β比值在两组间也存在显著差异，在睁眼状态下，强迫症组前额区域的θ/β比值与 Y-BOCS 总分(r=0.321,*p*=0.047)及强迫观念分量表(r=0.362, *p*=0.023)存在显著正相关。结论：强迫症存在前额、部分顶叶和颞叶的慢波异常特征，注意力控制缺陷可能导致强迫症患者出现更严重的强迫观念。本研究结果为未来确定强迫症的生理标志物提供了进一步依据。

The characteristics of resting EEG power spectrum in Obsessive-compulsive disorder：from the perspective of relative frequency

CHEN Tingting[1,2],CAI Xiaoqing[1,2], ZHONG Mingtian[1,2] (Corresponding Author)
1 Center for Studies of Psychological Application, School of Psychology, South China Normal University, Guangzhou, 510631, China
2 Key Laboratory of Brain, Cognition and Education Sciences, South China Normal University, Ministry of Education, Guangzhou 510631, China

Abstract: Objective : Obsessive-compulsive disorder (OCD) is a prevalent mental disorder characterized by recurrent intrusive thoughts (Obsession) and repetitive behaviors (Compulsion), which seriously impact an individual 's daily life and social function. Previous studies have suggested the presence of abnormal resting-state brain activity in OCD, which plays a crucial role in its pathology and may serve as a potential physiological biomarker for the disorder. This research aimed to analyze the differences in resting-state brain activity between OCD patients and healthy controls from the perspective of relative frequencies, exploring the spectral features of resting-state electroencephalogram (EEG) in OCD and investigating its potential pathophysiological mechanism. Methods : A total of 39 participants diagnosed with OCD were recruited from a comprehensive tertiary hospital, while 51 healthy control participants were recruited from the community. The 64-channel EEG detector of Neuroscan Company was used to collect the resting state EEG data of the two groups of subjects for 6 minutes. After data preprocessing, power spectrum analysis was conducted to calculate the absolute power values in five frequency bands: δ (1 ~ 4Hz), θ (4 ~ 8Hz), α (8 ~ 13Hz), β (13 ~ 30Hz) and γ (30 ~ 40Hz). Additionally, we computed the θ/β and α/β ratio for each participant. Independent t-tests were used to compare the differences between the two groups in the above indicators. Results : (1)During eyes-open resting state, significant differences in all frequency bands were observed across all channels between the two groups. During eyes-closed resting state, significant differences were found between the two groups in δ frequency band in all channels and in θ frequency band was different in the frontal and parietal regions.(2) The OCD group exhibited higher absolute power values in both δ and θ frequency bands during both eyes-open and eyes-closed resting states compared to the healthy control group. (3) There were significant differences in the α/β ratio between the two groups during eyes-open resting state. (4)The θ/β ratio also showed significant differences between the two groups. Additionally, during eyes-open resting state, the frontal θ/β ratio was positively correlated with Y-BOCS total score (r=0.32,p=0.047) and the Obsession subscale (r=0.36,p=0.023).Conclusion :Obsessive-compulsive disorder has the characteristics of slow wave abnormalities in the frontal and some parietal and temporal regions. Attention control deficits may lead to more severe obsessive-compulsive symptoms in patients with obsessive-compulsive disorder. The results of this study may provide further evidence for identifying physiological biomarkers in OCD.

初中生社交网站自我表露的发展轨迹：一项潜变量增长模型分析

刘倩[1] 李振兴[1,2]（通讯作者）朱静婷[1] 郭秀秀[1] 刘耀耀[1] 张莲[1]
1 淮北师范大学教育学院，淮北，235000
2 安徽省认知行为智能计算与应用工程研究中心，淮北，235000，lzhx921110@126.com

摘 要 社交网站自我表露是指人们在社交网络平台上与他人分享个人信息的过程。初中阶段是青少年身心发展的关键期，培养初中生合理的进行社交网站自我表露不仅有利于身心健康，还有助于预防社交网站上瘾。然而，至今我们对初中时期社交网站自我表露的发展轨迹了解甚少。因此，本研究通过问卷调

查方式对 535 名 7 年级学生进行了为期 18 个月的 4 次追踪测试。利用潜变量增长模型进行建模分析，旨在检验 7 年级至 9 年级期间学生社交网站自我表露的变化趋势，并探讨不同性别学生在社交网站自我表露方面的差异以及自我概念清晰性对社交网站自我表露变化的影响。结果发现：（1）7 年级～9 年级期间学生的社交网站自我表露呈先增加后减少的曲线变化，且存在显著的个体差异；（2）男女生的社交网站自我表露的起始水平不存在显著的性别差异，但女生的发展速度、加速度则显著高于男生；（3）具有较高自我概念清晰性的初中生在社交网站自我表露方面呈现降低的趋势，而且这种趋势在农村和城镇学生之间存在显著差异。此外，研究还发现男女生的社交网站自我表露都在 8 年级到达顶峰，这一现象增强了我们对“8 年级效应”的理解。这些发现加深了我们对初中生社交网站自我表露发展轨迹和性别差异的认识，并为教育者制定针对性的干预措施提供实证支持。

[1] College of Education, Huaibei Normal University, No.100, Dongshan Road, Huaibei 235000, Anhui, China

[2] Anhui Engineering Research Center for Intelligent Computing and Application on Cognitive Behavior, Huaibei, China

Abstract: Online self-disclosure refers to the process of people sharing personal information with others on social networking platforms, a topic of significance due to its association with physical and mental development during adolescence. While less is known about its developmental trajectory during middle adolescence in previous studies. Thus, this study examines the developmental trajectories of online self-disclosure among Chinese middle school students. A sample of 535 grade 7 middle school students was followed for 18 months. Self-report assessments of online self-disclosure and self-concept clarity were collected at four time points. Latent growth modeling was employed for data analysis. The results indicate a curvilinear development which goes up and then it goes down in middle adolescent′ s online self-disclosure from grade 7 to grade 9. While no gender differences were observed in initial levels of online self-disclosure, girls exhibited a faster rate of change in online self-disclosure compared to boys over time. Additionally, findings from latent growth curve modeling revealed that self-concept clarity, which acts as a time-varying variable, influenced adolescent′ s online self-disclosure. Specifically, higher levels of self-concept clarity at a given testing point were associated with reduced online self-disclosure during that time, and the extent of this reduction was observed to differ between rural and urban students. This study underscores that middle school students′ online self-disclosure peaks in eighth grade. These findings enhance our understandings of the factors influencing online self-disclosure among adolescents and preventing online addiction in adolescents with low self-concept clarity is particularly valuable.

Keywords: online self-disclosure, middle school students, self-concept clarity, developmental trajectories, gender difference

摘 要 无聊倾向是智能手机成瘾的重要前因变量。然而，目前无聊倾向对智能手机成瘾的影响机制仍不明晰。本研究采用两波纵向追踪设计，以探究无聊倾向对大学生智能手机成瘾的影响以及拖延在二者之间的纵向中介作用。本研究采用整群随机取样法，抽取陕西省 370 名大学生(其中女性 280 名；平均年龄为 19.13 岁)，采用简版无聊倾向量表(BPS)、特质拖延量表(GPS-9)以及大学生智能手机成瘾量表(SAS)，在 2021 年 9 月(T1)和 2021 年 12 月(T2)分别进行了 2 次施测，测查大学生的无聊倾向、拖延以及智能手机成瘾水平，并检验拖延在无聊倾向和大学生智能手机成瘾之间的纵向中介作用。结果发现，① T1 的无聊倾向到 T2 的无聊倾向、T1 的拖延到 T2 的拖延以及 T1 的智能手机成瘾到 T2 的智能手机成瘾的自回归路径均极其显著；② T1 的无聊倾向显著预测 T2 的拖延，T1 的拖延显著预测 T2 的智能手机成瘾，即拖延在大学生无聊倾向和智能手机成瘾之间起纵向中介作用。Sobel 检验表明，该纵向中介作用显著($Z = 1.82, p < 0.1$)。这些结果不但克服了横断面中介研究的局限性，而且深入揭示了无聊倾向与智能手机成瘾之间的准因果关系及其影响机制。这些结果对于如何通过降低大学生的无聊倾向水平和拖延水平，进而干预大学生的智能手机成瘾具有十分重要的理论和现实意义。

关键词 智能手机成瘾，无聊倾向，拖延，纵向中介作用

Boredom Proneness and Smartphone Addiction: The Longitudinal Mediating Role of Procrastination

Gendi Wang[1] (Corresponding author), Qiao Zhang[1]

1 School of Psychology, Shaanxi Normal University, Xi'an 710062, China.
18810037025@163.com

Abstract: Boredom proneness is an important antecedent variable of smartphone addiction. However, the mechanism by which boredom proneness affects smartphone addiction remains unclear. This study uses a two-wave longitudinal design to explore the influence of boredom proneness on college students' smartphone addiction and the longitudinal mediating role of procrastination between them. In this study, 370 college students (280 female; M_{age} = 19.13), and the Chinese Version of the Short Boredom Proneness Scale (BPS), the Chinese Version of the General Procrastination Scale (GPS-9) and the Smartphone Addition Scale for College Students (SAS) were used to measure the boredom proneness, procrastination and smartphone addiction of college students twice in September 2021 (T1) and December 2021 (T2), respectively， and examine the longitudinal mediating effect of procrastination on boredom proneness and smartphone addiction among college students. The results showed that (1) there were significant autoregressive pathways from boredom proneness T1 to boredom proneness T2, from procrastination T1 to procrastination T2, and from smartphone addiction T1 to smartphone addiction T2. (2) The boredom proneness T1 significantly predicts the procrastination T2, and the procrastination T1

significantly predicts the smartphone addiction T2, that is, procrastination plays a longitudinal mediating role between boredom proneness and smartphone addiction of college students. Sobel test showed that the longitudinal mediating effect was significant ($Z = 1.82$, $p < 0.1$). These results not only overcome the limitations of cross-sectional mediation studies, but also reveal the quasi-causal relationship between boredom proneness and smartphone addiction and its influencing mechanism. These results have a very important theoretical and practical significance for how to reduce the boredom proneness and procrastination level of college students, and then intervene in the smartphone addiction of college students.

童年情感创伤预测大学生心理僵化不同发展轨迹：基于潜类别增长模型

曹妍媛[1,2,3] 樊洁[1,2,3] 于权浩[1,2,3] 刘倩[1,2,3] 朱熊兆[1,2,3]（通讯作者）

1 中南大学湘雅二医院医学心理研究中心，长沙，410011

2 中南大学医学心理研究所，长沙，410011

3 国家精神心理疾病临床医学研究中心，长沙，410011，Email: xiongzhaozhu@csu.edu.cn

摘 要 **背景：**心理僵化与许多心理健康问题密切相关。研究也开始关注在经历了相当大心理困扰的大学生群体中的心理僵化水平。然而，以往研究多采用静态视角以及变量中心方法，无法探究心理僵化发展及其异质性。此外，有研究也发现了童年创伤与心理僵化的关联，然而尚未有研究考察童年创伤对心理僵化的长期影响。因此，本研究采用三年的大样本追踪调查，在考察大学生心理僵化发展轨迹亚组后，分析了童年创伤以及其他因素对其轨迹的预测作用，并分析了心理僵化与抑郁、焦虑的关系。**方法：**本研究数据来源于一项对 3535 名大一新生（其中 65.6%为女生，平均年龄为 18.01±0.77 岁）进行的为期三年的五次纵向追踪研究。参与者在基线时完成了童年创伤问卷，在五个时间点均完成了心理僵化，抑郁和焦虑的问卷调查。构建了心理僵化的潜类别增长模型，进一步考察了不同类型的童年创伤对不同的心理僵化发展轨迹的预测作用，并比较了不同的心理僵化发展轨迹亚组在五个时间点的抑郁和焦虑水平。此外，也将性别、年龄、教育年限、十二岁以前居住地和早年分离经历纳入模型进行分析。**结果：**潜类别增长分析发现，大学生心理僵化可区分为两个异质的发展轨迹亚组：“高-较稳定”组和“低-下降”组。采用 Logistic 回归发现，童年情感忽视或情感虐待经历较多、有早年分离经历、女性、年龄较小以及十二岁以前居住地为农村的大学生更有可能属于“高-较稳定”组，而更少可能属于“低-下降”组。这说明童年情感创伤经历、早年分离经历、女性、年龄较小以及十二岁以前居住地为农村是高心理僵化的危险因素。此外，结果显示“高-较稳定”组在五个时间点的抑郁、焦虑水平均高于“低-下降”组。**结论：**本研究结果揭示了童年情感创伤对于大学生心理僵化的预测作用，并强调了心理僵化对于抑郁、焦虑的影响，进一步提示了针对心理僵化进行干预的重要价值。

关键词 心理僵化，童年创伤，大学生，潜类别增长分析

Childhood emotional maltreatment predicts different developmental trajectories of psychological inflexibility among university students

Yanyuan Cao[1,2,3], Jie Fan[1,2,3], Quanhao Yu[1,2,3], Qian Liu[1,2,3], Xiongzhao Zhu[1,2,3] (Corresponding author)

1 Medical Psychological Center, the Second Xiangya Hospital, Central South University, Changsha 410011, China

3 National Clinical Research Center for Mental Disorders, Changsha 410011, China

***Abstract*: Background:** Psychological inflexibility is associated with many mental health problems. This construct has recently started to be examined in university students, who experience considerable psychological distress. However, the primary methodology of the present study is cross-sectional and variable-centered, which is not conducive to identifying the development and the heterogeneity of psychological inflexibility. Research has also demonstrated that childhood maltreatment may contribute to psychological inflexibility, while little has studied the longitudinal effect of childhood maltreatment on psychological inflexibility. As a result, the current study investigated the developmental trajectories of psychological inflexibility, then analyzed the impact of childhood maltreatment on psychological inflexibility and the associations between psychological inflexibility and depression and anxiety.

Methods: Research data from a 3-year, five waves longitudinal tracking study was analyzed, in which a total of 3535 university freshmen (65.6% female, Age $_{Mean}$ = 18.01, Age $_{SD}$ = 0.77 at baseline) participated. Participants completed Childhood Trauma Questionnaire at baseline study and completed questionnaires about psychological inflexibility, depression, and anxiety at all time points. Latent class growth modeling analysis was used to identify latent classes of psychological inflexibility trajectories. Then we examined the impacts of different types of childhood maltreatment on the trajectories of psychological inflexibility and investigated the influence of psychological inflexibility on depression and anxiety. Gender, age, education years, residence before 12 years old, and left-behind experience were also considered.

Results: Latent class growth analysis identified two heterogeneous classes of psychological inflexibility trajectories among Chinese university students: the high-stable group and the low-decreasing group. A further regression analysis indicated that more childhood exposure to emotional abuse or neglect, left-behind experience, female gender, young age, and rural residence before 12 years old was significantly more likely to belong to the high-stable psychological inflexibility group in comparison to the low-decreasing psychological inflexibility group, which indicated that these are risk factors for high psychological inflexibility. Also, university students in the high-stable psychological inflexibility group reported a higher probability of depression and anxiety at all time points.

Conclusion: This study provided meaningful insights into the development of psychological inflexibility in university students and its relation to childhood emotional maltreatment as well as depression and anxiety. The findings suggest the necessity of intervention strategies aimed at reducing psychological inflexibility levels for university students with childhood emotional maltreatment.

恋人合作中的人际脑同步：急性压力和依恋类型的影响

刘希[1] 林震[1] 龚明亮[1]（通讯作者）
江西师范大学心理学院，南昌，330022，gongml@jxnu.edu.cn

摘 要　越来越多的研究表明，情侣之间增强的人际脑同步(Interpersonal brain synchrony, IBS)可能是恋爱关系中社会互动的神经基础。然而，这种同步并不完全稳定，它可以受到外部和内部因素的影响和调节。在此，我们探讨了急性应激和依恋类型对合作任务中情侣神经同步性的影响。我们使用亲密关系体验量表(ECR)选择具有不同依恋风格组合的情侣，包括安全-安全(安全依恋组，48 对)，安全-不安全(混合组，48 对)和不安全-不安全(不安全依恋组，42 对)。然后，他们被随机分配到压力和控制条件下，进行协作的时间估计任务。在实验过程中，我们利用功能性近红外光谱(fNIRS)监测被试大脑前额叶皮层(PFC)和右侧颞顶叶交界区(r-TPJ)的活动，并利用小波变换相干性(WTC)评估被试大脑的同步性。结果表明，与对照组相比，不安全依恋组的情侣的 DLPFC 在应激条件下的合作率显著降低，同时 IBS 也显著降低；而安全依恋组的情侣则表现出相反的结果。然而，混合组中在压力和控制条件中没有观察到显著差异。此外，我们发现急性应激对情侣之间颞上回(STG)的 IBS 具有破坏性影响。同时，依恋类型对运动前皮层和辅助运动皮层的 IBS 有显著影响，不安全组的 IBS 明显低于其他两组。有趣的是，格兰杰因果分析(GCA)显示，依恋类型可能影响 STG 中 IBS 的方向性，并受急性应激的调节。这些发现有助于更深入地理解情侣之间的情感互动和社会认知过程。

Interpersonal brain synchronization in romantic couples during cooperation: the effects of acute stress and attachment styles

Xi Liu, Zhen Lin, Mingliang Gong(Corresponding author)

School of Psychology, Jiangxi Normal University,

Nanchang, people's republic of china

Abstract： A growing body of research has suggested that enhanced interpersonal brain synchronization (IBS) between romantic partners may be the neural basis of social interaction in romantic relationships. However, the synchronization is not entirely stable and can be influenced and regulated by both external and internal factors. Here, we explores the influence of acute stress and attachment style on neural synchrony among couples during collaborative tasks. we used the Experience in Close Relationships Scale (ECR) to select couples with different combinations of attachment styles, including secure-secure (secure dyads, 48 couples), secure-insecure (mixed dyads, 48 couples), and insecure-insecure (insecure dyads, 42 couples). Then they were randomly assigned to stress and control conditons to carry out a collaborative time estimation task. During the task, we employed the functional near-infrared spectroscopy (fNIRS) to monitor brain activities in the prefrontal cortex (PFC) and right temporal-parietal junction (r-TPJ), and used Wavelet Transform Coherence (WTC) to assess the couples' brain synchrony. The results indicated that compared to control condition, couples with insecure dyads exhibit significantly diminished cooperation rates, accompanied by reduced IBS under the stress condition in the DLPFC, but secure dyads showed the opposite results. However, no significant differences were observed among mixed dyads both in the stress and control conditions. Additionally, we found that acute stress had a damaging effect on IBS in the superior temporal gyrus(STG) between couples. Meanwhile, attachment styles had a significant effect on IBS in the premotor and auxiliary motor cortex, with insecure dyads exhibited significantly lower IBS compared to both the other dyads. Interestingly, Granger causality analyses (GCA) revealed that the directionality of IBS in the STG could be affected by by attachment styles and modulated by acute stress. These findings contribute to a deeper understanding of emotional interactions and social cognitive processes among romantic

couples.

愤怒情绪对恶意创造力的影响：身体姿势的作用

张晓晨[1] 黄玲[1] 陈建新[1] (通讯作者)
1 湖北大学心理学系, 武汉, 430062, CHY_990802@163.com

摘 要 为探究愤怒情绪对恶意创造力的影响，及其与身体姿势的共同作用。实验 1 招募 72 名有效被试，通过自传体任务启动情绪类型（愤怒/中性），采用三种恶意创造力任务的流畅性、新颖性、恶意性得分为因变量。结果表明愤怒情绪组个体的伤害型和捉弄型恶意创造力任务三维度得分显著高于中性组。实验 2 招募有效被试 48 名，采用不同身体姿势操纵（扩张姿势/蜷缩姿势/控制姿势）。结果表明，愤怒情绪状态下，扩张姿势组和蜷缩姿势组在伤害型和捉弄型恶意创造力任务的三维度得分上均高于控制组，且在两种任务类型的流畅性、新颖性得分上扩张姿势组显著高于蜷缩姿势组，在伤害型任务的恶意性得分上蜷缩姿势组高于扩张姿势组。本研究拓展了具身及恶意创造力的相关研究，为进一步探究并干预个体恶意创造力表现提供了实验基础。

The effect of anger on malevolent creativity: the role of body posture

Xiaochen Zhang[1] Ling Huang[1] Jianxin Chen[1*]
1 Faculty of Education, Hubei University,Wuhan, 430062, China

Abstract：To explore the impact of anger on malevolent creativity and its interaction with body posture, Experiment 1 recruited 72 participants and activated different emotional types (anger/neutral) through autobiographical tasks. The fluency, novelty, and malevolence scores of three types of malevolent creativity were measured as dependent variables. Results showed that individuals in the anger condition scored significantly higher than those in the neutral condition on the dimensions of harmful and teasing malevolent creativity tasks. Experiment 2 recruited 48 participants and manipulated different body postures (expansive posture/contractive posture/control posture). Results indicated that under the anger condition, both the expansive posture group and the contractive posture group scored higher than the control group on the dimensions of harmful and teasing malevolent creativity tasks. Moreover, the expansive posture group scored significantly higher than the contractive posture group in terms of fluency and novelty scores for both types of tasks, while the contractive posture group scored higher than the expansive posture group in terms of malevolence scores for the harmful creativity task. This study extends research on embodiment and malevolent creativity, providing an experimental basis for further exploration and intervention of individuals' malevolent creativity performance.

Keywords：anger, body posture, malevolent creativity

中小学生社交网站自我表露与自我概念清晰性的关系：基于交叉

滞后的追踪研究

刘倩[1] 李振兴[1,2]（通讯作者）朱静婷[1] 郭秀秀[1] 刘耀耀[1] 张莲[1]

1 淮北师范大学教育学院，淮北，235000

2 安徽省认知行为智能计算与应用工程研究中心，淮北，235000，lzhx921110@126.com

摘 要 社交网站自我表露是指人们在社交网络平台上与他人分享个人信息的过程。自我概念清晰性是指是个体对自身看法感到明晰、确信、内部一致和跨时间稳定的程度。以往研究对社交网站自我表露与自我概念清晰性的关系提出了不同观点。为探讨社交网站自我表露和自我概念清晰性之间的因果关系。本研究采用社交网站自我表露问卷、自我概念清晰性问卷，通过问卷调查方式对 577 名四年级学生和 466 名七年级学生进行了为期 1 年的 3 次追踪测试。利用交叉滞后模型分析，结果表明：（1）社交网站自我表露与自我概念清晰性在 3 次测试中均呈显著负相关；（2）小学生的自我概念清晰性得分显著高于初中生，而社交网站自我表露得分显著低于初中生；（3）T1 时期的自我概念清晰性能显著负向预测 T2 时期的社交网站自我表露，T2 时期的自我概念清晰性能显著负向预测 T3 时期的社交网站自我表露，这种预测效应在初中生和小学生中都同时存在。本研究的结果表明自我概念清晰性对社交网站自我表露的预测作用在初中生和小学生中具有稳定性，且为社交网站自我表露与自我概念清晰性的因果关系提供了实证支持。这些发现加深了我们对中小学生的自我概念清晰性和社交网站自我表露关系的认识，未来研究应关注自我概念清晰性水平较低的中小学生社交网络成瘾问题。

关键词 社交网站自我表露，初中生，小学生，自我概念清晰性，交叉滞后模型

Longitudinal relationship between self-concept clarity and online self-disclosure among Chinese middle and primary school students: cross-lagged model evidence

Liu Qian[1]; Li Zhenxing[12]; Zhu Jingting[1]; Guo Xiuxiu[1]; Liu Yaoyao[1]; ZhangLian[1]

[1] College of Education, Huaibei Normal University, No.100, Dongshan Road, Huaibei 235000, Anhui, China

[2] Anhui Engineering Research Center for Intelligent Computing and Application on Cognitive Behavior, Huaibei, China

Abstract: This study investigates the bidirectional relationship between online self-disclosure and self-concept clarity among Chinese middle and primary school students. A three-wave, one-year longitudinal study was completed with two sample, one of 577 4th grade primary school students and 466 7th grade middle school students. The Self-Concept Clarity Scale and Online Self-Disclosure Scale were used for data collection. The study findings indicate the following: (1) Online self-disclosure was significantly and negatively correlated with self-concept clarity; (2) Early adolescents demonstrated higher self-concept clarity scores compared to middle adolescents, while their online self-disclosure scores were lower than those of middle adolescents; (3) Self-concept clarity significantly and negatively predicted subsequent online self-disclosure, and this predictive effect was consistent for both middle and primary school students. This study provides valuable insights into the causal relationship between self-concept clarity and online self-disclosure in early and middle adolescents. Future research should focus on adolescents with low levels of self-concept clarity to prevent potential issues of addiction to social networking sites associated with online self-disclosure.

Keywords: online self-disclosure, middle school students, primary school students, self-concept clarity, cross-lagged

父母性取向支持对失志综合征的影响：性取向隐瞒与关系自尊的中介作用

李铁柱[1]，公言全[1]，杨天原[1]，欧阳喆宇[2]，李放[1*]（通讯作者）

1 四川师范大学心理学院，成都，610066

2 上海电机学院电气学院，上海，201306

*四川师范大学心理学院，成都，610066，lifang_sicnu@126.com

摘 要　中国男同性恋者面临许多的压力，而压力是失志综合征产生的先决条件，因此中国男同性恋者可能存在着高水平的失志综合征。此外，中国文化重视家庭，家庭是孩子的重要支持来源，因而来自父母的性取向支持可能对同性恋者的心理健康有重要的影响。但是对于中国男同性恋者父母性取向支持与失志综合征的关系及机制的研究较少，因此本研究旨在考察中国男同性恋者父母性取向支持与失志综合征之间的关系以及性取向隐瞒与关系自尊在父母性取向支持与失志综合征之间的中介机制。采用自我报告量表对 405 名通过网络招募的中国男同性恋者进行了父母性取向支持、性取向隐瞒、关系自尊和失志综合征的评估。结果表明中国男同性恋者的父母性取向支持与失志综合征显著负相关。性取向隐瞒在父母性取向支持与失志综合征间起到显著的中介作用，关系自尊在父母性取向支持与失志综合征间起到显著的中介作用，且性取向隐瞒与关系自尊在父母性取向支持与失志综合征之间起到显著的链式中介作用。该研究提示父母性取向支持是预防中国男同性恋者失志综合征的重要保护因素，父母性取向支持可以通过降低性取向隐瞒和提高关系自尊缓解中国男同性恋者的失志综合征水平。本研究丰富拓展了性少数群体的心理韧性框架和少数压力心理中介模型，也为改善男同性恋者的心理健康状况提供了新的思路。

[2]School of Electrical Engineering, Shanghai Dian Ji University, Shanghai 201306, China

* School of Psychology, Sichuan Normal University, Chengdu 610066, China, lifang_sicnu@126.com

Abstract：Chinese gay men face a lot of pressure, and pressure is a prerequisite for the development of demoralization syndrome. Therefore, Chinese gay men may experience high levels of demoralization syndrome. In addition, Chinese culture places a strong emphasis on family, and the family is an important source of support for children. Therefore, parental support for sexual orientation may have a significant impact on the psychological

well-being of gay individuals. However, there is limited research on the relationship and mechanisms between parental support for sexual orientation and demoralization syndrome in Chinese gay men. Therefore, this study aims to investigate the relationship between parental support for sexual orientation and demoralization syndrome, as well as the mediating role of relational self-esteem in the relationship between parental support for sexual orientation and demoralization syndrome. A self-report questionnaire was used to assess parental support for sexual orientation, sexual orientation concealment, relational self-esteem, and demoralization syndrome among 405 Chinese gay men recruited through the internet. The results show a significant negative correlation between parental support for sexual orientation and demoralization syndrome in Chinese gay men. Sexual orientation concealment plays a significant mediating role between parental support for sexual orientation and demoralization syndrome, and relational self-esteem also plays a significant mediating role between parental support for sexual orientation and demoralization syndrome. Moreover, sexual orientation concealment and relational self-esteem have a significant chain mediating effect on the relationship between parental support for sexual orientation and demoralization syndrome. This study suggests that parental support for sexual orientation is an important protective factor against demoralization syndrome in Chinese gay men. It can alleviate levels of demoralization syndrome by reducing sexual orientation concealment and enhancing relational self-esteem. This study has enriched and expanded the theoretical framework of resilience in LGB individuals and the integrative mediation framework, providing new insights into improving the psychological well-being of gay men.

Emoji的社会认知加工特性及其与心理理论关系的研究：来自Emoji、简单图形和面孔的视觉工作记忆证据

李毓文，张丹丹，刘鑫，郭栋*

四川师范大学脑与心理科学研究院，成都市 610000

摘 要 Emoji是计算机媒介交流中广泛使用的交流符号，这种情绪特征突出的黄色圆脸符号成功弥补了单一文本交流中缺少的非言语交流线索。然而，人们尚不清楚，对网络虚拟世界中非言语交流线索的认知加工，是否会像现实世界中的非言语线索（面部表情、肢体动作等）那样，表现出独特的社会加工的特性，这对于理解人类认知加工系统与网络空间的交互至关重要。目的：从视觉工作记忆出发，研究Emoji与现实社会中的非言语线索是否具有类似的认知加工机制；

方法：采用变化检测范式测量工作记忆容量，并用眼动追踪技术进一步验证了工作记忆系统对具有社会属性的Emoji存在注意偏好，最后采用读眼识心任务测量被试的心理理论，探究Emoji的工作记忆与高级社会认知能力（心理理论）之间的关系；

结果：实验一和实验四显示，虽然Emoji的视觉复杂性明显高于图形（简单客体），但是两者的工作记忆水平相似，均显著高于面孔（复杂客体）。这种高效加工很可能来源于Emoji的整体加工特性，因为实验二揭示，倒置和打乱Emoji显著降低了Emoji的工作记忆绩效。实验三表明，在工作记忆中Emoji比简单图形的加工优先级更高，被试的眼动轨迹进一步验证了工作记忆对Emoji存在注意偏好。实验四发现，Emoji工作记忆容量与心理理论显著相关，与面孔工作记忆相似。

结论：人的底层认知加工系统将Emoji视为社会信息，表现出与现实世界中非言语社会线索（表情面孔）相似的认知加工特性，这很可能是Emoji被广泛使用的重要原因，即，Emoji满足了人们在计算机媒介

交流中对社会信息的需求，并且调用社会认知相关的机制处理 Emoji，大大提升了其加工效率，进而使其易于使用、传播。

A Study on the Social Cognitive Processing Properties of Emojis and Its Relationship to Theory of Mind: Evidence from Visual Working Memory for Emojis, Simple Shapes, and Human Faces

LI Yuwen, ZHANG Dandan, LIU Xin, GUO Dong*

Institute of Brain and Psychological Science, Sichuan Normal University, Chengdu, China

Abstract： Emoji is a widely used communication symbol in computer-medium communication, and this yellow round-faced symbol with prominent emotional characteristics successfully compensates for the lack of non-verbal communication cues in single text communication. However, it is unclear whether cognitive processing of nonverbal communication cues in the online virtual world exhibits unique social processing characteristics like nonverbal cues (facial expressions, body movements, etc.) in the real world, which is critical to understanding the interaction of human cognitive processing systems with cyberspace. Objective: To investigate whether Emoji and nonverbal cues in real society have similar cognitive processing mechanisms from visual working memory.

Methods: The working memory capacity was measured by change detection paradigm, and the attention preference of the working memory system for social Emoji was further verified by eye tracking technology, and finally the psychological theory of the participants was measured by the eye-reading task to explore the relationship between the working memory of Emoji and advanced social cognitive ability (psychological theory).

Results: Experiments 1 and 4 showed that although the visual complexity of emoji was significantly higher than that of graphics (simple objects), the working memory level of both was similar, and both were significantly higher than faces (complex objects). This efficient processing is likely to stem from the overall machining characteristics of Emoji, as Experiment 2 revealed that inverting and disrupting Emoji significantly reduced the working memory performance of Emoji. Experiment 3 showed that the processing priority of Emoji in working memory was higher than that of simple figures, and the eye movement trajectory of the participants further verified the working memory attention preference for Emoji. Experiment 4 found that Emoji working memory capacity was significantly correlated with psychological theory and similar to face working memory.

Conclusion: The underlying cognitive processing system of humans regards emoji as social information and shows similar cognitive processing characteristics to non-verbal social cues (expression faces) in the real world, which is likely to be an important reason for the widespread use of emoji, that is, emoji meets people's needs for social information in computer media communication, and invokes social cognition-related mechanisms to process emoji, which greatly improves its processing efficiency, and then makes it easy to use and disseminate.

中国自动驾驶道德决策因素分析

林依婷[1] 康良凯[1,2] 毛金阳[1] 倪正山[1] 郑新夷[1]（通讯作者）
1 福州大学心理系，福州，350100 2 中国科学院心理系，北京，100000

摘 要 随着自动驾驶技术在实际应用中的广泛普及，解决其面临的道德伦理问题的需求愈发紧迫。然而，在以人类道德决策为基础构建机器道德时，主要面临的挑战在于解释人类道德决策的偏差。此外，现有的关于道德偏好的研究主要以欧美群体为主，包括韩国、日本、中国等多个亚洲国家，缺乏以中国群体为背景的自动驾驶道德决策偏好相关研究。本研究以当代中国为研究背景，开展了四个自动驾驶道德困境的问卷调查，旨在探索中国群体在自动驾驶道德决策偏好方面的特点。

首先，第一个研究调查了中国群体在自动驾驶决策中的道德偏好。研究一招募了 2604 名被试，采用道德机器问卷调查在当代中国社会观念情境下，人们对于自动驾驶汽车的道德偏好差异趋势。与全球东方地区（Eastern）偏好趋势对比表明，中国地区更倾向于保护年轻人、保护乘客，而东方地区更倾向保护老年人和行人，更注重遵守交通法规。

其次，第二个情境实验在研究一的基础上进一步探索了道德决策偏偏好的心理机制，涉及到的道德困境包括年龄和社会地位，在不同视角（乘客、行人和旁观者）的基础上研究了决策视角和决策模式对于自动驾驶道德困境决策偏好的影响。结果表明，无论面临何种道德困境，人们的道德决策都会受到决策视角和决策模式的影响。

这些实验结果表明，基于不同的决策视角，人们更倾向于保护各自视角所处角色的利益。本研究揭示了中国群体在自动驾驶道德决策中的偏好特点，并探讨了决策视角和决策模式对于道德困境决策的影响。这些研究结果对于自动驾驶技术的发展和实际应用具有重要意义和参考价值，也提醒人们在普及自动驾驶技术的同时，必须重视解决其中涉及的伦理道德问题。

问题管理家（PM+）改善抑郁症状：来自行为和脑电的证据

郭阳[1] 张景宜[1]（共同作者） 崔亚楠[1] 崔雨秋[1] 余凤琼[1,2]（通讯作者）
[1]安徽医科大学精神卫生与心理科学学院，合肥，230032
[2]安徽医科大学第二附属医院转化医学研究中心，合肥，230032，yufengqin1@163.com

摘 要

目的 抑郁特质是我国大学生面临的重要心理健康问题，如没有得到及时干预，很有可能进一步发展为抑郁症，进而导致自杀行为等。问题管理家（problem management plus, PM+）是 WHO 于 2016 年推出的，整合了 CBT、行为激活、正念和人际关系治疗疗效因子的一种心理干预技术。本研究使用金钱与社会结合的奖赏延迟任务，结合事件相关电位考察了 PM+对抑郁特质的干预作用及其认知神经机制，探究其是否可以作为一种简单、短程、高效的手段有效改善抑郁症状。

方法 将 52 名抑郁特质大学生随机分为实验组和对照组，对实验组进行五次问题管理家干预。两组被试干预前后需要完成抑郁症自评量表（PHQ-9、社会性快感缺失量表(RSAS)及奖赏延迟任务并进行脑电数据采集，以此来评估干预效果。使用 SPSS26.0 对数据进行卡方检验、t 检验及方差分析。

结果 干预后两组 PHQ-9、RSAS 均比治疗前降低，干预后实验组 PHQ-9、RSAS 总分低于对照组(PHQ-9：$F_{1,43}$ = 10.460，p =0.002；RSAS：$F_{1,43}$ = 4.784, p =0.034)。干预后，在金钱和社会任务中，两组的击中率均有提高（p =0.007）；在社会任务中，干预后，PM+组在奖赏条件下击中率显著高于对照组（低奖赏：t=2.24，p =0.031，高奖赏：t=2.16，p =0.037），两组有奖赏条件下反应时比干预前更短（$F_{84,2}$=4.734，p =0.011）。最后，PM+组与奖赏处理相关的 ERP 成分 Cue-P3 在金钱任务中，其平均波幅时间和组别存在边缘显著的交互作用（$F_{41,1}$=3.877，p =0.056）；在社会任务中，干预后 pm+组高奖赏条件引起的 cue-P3 平均波幅显著大于低奖赏条件（$F_{40,2}$=7.875，p =0.001）。

结论 本研究是首次通过被试的自我评估、奖励延迟任务行为学及与奖赏过程相关的 ERP 成分来证明，问题管理家可以有效改善抑郁特质人群的快感缺失。

Problem Management Plus (PM+) Improve Depressive Symptoms:Behavioral and EEG Evidence

Yang Guo[1] Jingyi Zhang[1] Yanan Cui[1] Yuqiu Cui[1] Fengqiong Yu[1,2]

[1]School of Mental Health and Psychological Sciences, Anhui Medical University, Hefei, 230032
[2]Research Center for Translational Medicine, The Second Hospital of Anhui Medical University, Hefei, 230032，yufengqin1@163.com

***Abstract*:**

Objective Depression is an important mental health problem faced by college students in China, and without timely intervention, it is likely to further develop into depression, which may lead to suicidal behaviors and so on. Problem management plus (PM+) is a psychological intervention technique introduced by WHO in 2016 that integrates CBT, behavioral activation, positive thinking, and interpersonal therapy efficacy factors. The present study examined the interventional effects of PM+ on depressive states and its cognitive-neurological mechanisms in conjunction with event-related potentials using a reward-delay task that combines money and society to investigate whether it can be effective as a simple, short-course, and highly effective means of ameliorating depressive symptoms.

Methods Fifty-two college students with depressive traits were randomly divided into an experimental group and a control group, and the experimental group was given five sessions of the Problem Management Home intervention. The subjects in both groups were required to complete the Depression Self-rating Scale (PHQ-9, the Social Pleasure Deficit Scale (RSAS) and the Reward Delay Task with EEG data collection before and after the intervention as a way of assessing the effect of the intervention. Data were analyzed by chi-square test, t-test and ANOVA using SPSS 26.0.

Results The PHQ-9 and RSAS were lower in both groups after the intervention than before the treatment, and the total PHQ-9 and RSAS scores were lower in the experimental group than in the control group after the intervention (PHQ-9: $F_{1, 43}$ = 10.460, p = 0.002; RSAS: $F_{1, 43}$ = 4.784, p = 0.034). After the intervention, hit rates increased in both groups in the money and social tasks (p = 0.007); in the social task, after the intervention, the PM+ group had a significantly higher hit rate than the control group in the reward condition (low reward: t = 2.24, p = 0.031, high reward: t = 2.16, p = 0.037), and the response time was shorter in the reward condition in both groups compared to the pre-intervention period ($F_{84,2}$ = 4.734, p =0.011). Finally, the PM+ group altered the strength of the ERP component associated with reward processing, with a borderline significant interaction between Cue-P3 mean amplitude time and group in the money task ($F_{41,1}$= 3.877, p =0.056); in the social task, the post-intervention PM+ group elicited significantly greater Cue-P3 mean amplitude in the high reward condition than in the low reward condition ($F_{40,2}$= 7.875, p =0.001).

Conclusion The present study is the first to demonstrate that a problem manager is effective in improving depressive symptoms and anhedonia through subjects' self-assessment, reward-delay task behaviorology, and ERP components associated with the reward process.

摘 要

背景：肥胖已成为一个全球性的公共卫生问题，并且会对人类大脑功能造成损伤。近些年，静息状态功能磁共振成像(rsfMRI)技术已经被证明能够揭示肥胖个体的大脑功能的变化。

目的：我们采用 rsfMRI 来探究肥胖者和正常体重者的大脑内部活动的差异，并进一步探究其与神经递质以及执行功能之间的相关性。

方法：我们从公开的人类脑连接组项目（Human Connectome Project, HCP）中选取 489 名健康志愿者数据，并按照身体质量指数（Body Mass Index，BMI）来分成肥胖组（OB，BMI≧30kg/m2）和健康体重组（NW， BMI：20-24 kg/m2）。所有的被试都进行了静息态功能影像和结构影像的扫描。我们对所有的参与者都计算了内在连通性对比度（ICC），分数低频振幅（fALFF）和功能连接（FC）指标，并通过独立样本 T 检验分析两组之间的差异。之后，我们利用皮尔逊相关分别计算了由肥胖引起的 ICC 和 fALFF 的变化与大脑内神经递质活性之间的空间相关性。最后，我们计算了静息态指标的变化与执行控制功能之间的相关性。

结果：与正常体重者相比，肥胖者的 ICC 和 fALFF 值在背外侧前额叶（DLPFC）和左侧脑岛上都发现了显著的升高，这两个区域分别是额定网络（FPN）和突显网络（SN）的重要组成部分。功能连接的结果显示，右侧 DLPFC 与楔前叶的 FC 增强，而与与左侧中央前回、左侧中央后回和双侧中央旁小叶之间 FC 减少。左侧脑岛与左侧顶叶下小叶、右侧额叶中回和右侧舌回之间 FC 增强。相关性分析显示，两组之间的 ICC 的变化与去甲肾上腺素系统（DAT）有关，而 fALFF 的变化与多巴胺受体（D1）有关。此外，右侧DLPFC与中央旁小叶之间的FC与认知灵活性呈正相关。两侧小脑（cerebellum crus2）和右侧颞极的fALFF值与冲动性评分呈负相关。

结论：肥胖者在静息状态下，在与执行控制、自我评价和情绪处理相关的脑区发生了功能变化，为肥胖的神经生理基础和治疗肥胖的潜在神经靶点提供了进一步的证据。

* E-mail addresses: daozhezifei@163.com (S.-Y. Chen)

Abstract:

Background: Obesity has become a global public health problem and has been shown to have an adverse effect on human brain function. Resting-state functional magnetic resonance imaging (rsfMRI) techniques have proven invaluable in unraveling the neurobiological underpinnings of obesity.

Purpose: To evaluate the differences in intrinsic brain activity between the obesity people and normal-weight people and further explore its correlation with neurotransmitter activity and executive function.

Methods: A total of 489 individuals from the publicly available Human Connectome Project (HCP) database were selected and assigned to one of two groups: 1) the obesity (OB, BMI ≧ 30 kg/m2) group and 2) the normal-weight (NW, BMI: 20-24 kg/m2) group, based on body mass index (BMI). All participants underwent resting-state fMRI (rs-fMRI) and T1-weight imaging. Parameters for the intrinsic connectivity contrast (ICC), fractional amplitude of low-frequency fluctuation (fALFF), and functional connectivity (FC) were estimated and compared between two groups. Then, the spatial correlation between obesity-induced alteration in ICC and fALFF and PET- and SPECT-derived maps was respectively estimated. Finally, we calculated correlation between altered MRI parameters and executive function measurements.

Results: Compared with normal-weight people, obesity people showed increased ICC and fALFF in the right dorsolateral prefrontal cortex (DLPFC) and left insula, which are important components of Frontoparietal Network (FPN) and Salience Network (SN), respectively. FC enhancing was observed between right DLPFC and precuneus, left insula and left inferior parietal lobule (IPL), right middle frontal gyrus (MFG) and right lingual gyrus. FC decreasing was observed between right DLPFC and left precentral, left postcentral gyrus and bilateral paracentral lobules. Cross-modal correlations displayed that the changes of ICC and fALFF were respectively related to the noradrenaline system (NAT) and dopamine receptor (D1). The FC between right DLPFC and paracentral lobule was positively associated with cognitive flexibility (as measured by the Dimensional Change Card Sort Task). Additionally, the fALFF value in the bilateral cerebellum crus2 and right temporal pole was significantly negatively correlated with the impulsivity (as measured by the Delay Discounting Task).

Conclusion: These results demonstrate functional changes in brain regions associated with execution control, self-evaluation, and emotional processing in obese people even in the resting state, providing further evidence of the neurophysiological basis of obesity and potential neural targets for the treatment of obesity.

Keywords: obesity, resting-state fMRI, intrinsic connectivity contrast, fractional amplitude of low-frequency fluctuation, functional connectivity

高社交焦虑者在自我相关信息与外部社交线索之间的注意偏向

侯雅贤[1] 高雯[1]（通讯作者）郭笑笑[1]

1 辽宁师范大学心理学院，大连，116029，gaowen@lnnu.edu.cn

摘 要　与低社交焦虑者相比，高社交焦虑者对自我相关信息和外部威胁刺激都表现出较多的注意偏向。一些研究考察了高社交焦虑者在自我相关信息与外部社交线索之间的注意偏向，但没有得出一致的结论。因此，本研究使用修改的点探测任务，记录了 16 名高社交焦虑者和 20 名低社交焦虑者对三种“自我中性-他人情绪”面孔对的反应时和脑电。结果显示，两组被试对自我相关信息的反应时更快并且受到了不同情绪效价的调节。高社交焦虑组比低社交焦虑组对所有面孔对都产生了更大的 P1 波幅和更小的 N170 波幅；两组被试在自我-中性与他人-愤怒面孔对上诱发的 P2 波幅比另外两种面孔对都更大。这些结果表明，两组

被试会将注意资源优先分配到自我相关信息上，愤怒面孔对这种资源分配的影响最大。与低社交焦虑者相比，高社交焦虑者对面孔对都表现出更多的注意警觉和更少的结构编码并对自我-中性与他人-愤怒面孔对投入了更多的注意资源。

Attentional bias between self-relevant information and external social cues in people with high social anxiety

Yaxian Hou[1] Wen Gao[1](Corresponding author) Xiaoxiao Guo[1]

1School of Psychology, Liaoning Normal University, Dalian, 116029, gaowen@lnnu.edu.cn

Abstract： Compared to low social anxiety individuals, high social anxiety individuals show a more significant attentional bias toward self-relevant information and externally threatening stimuli. Several studies have examined the attentional bias between self-relevant information and external social cues in high social anxiety individuals, but no consistent conclusions have been drawn. Therefore, the present study used a modified dot-probe task to record the response times and EEGs of 16 high-social-anxious and 20 low-social-anxious subjects in three "self-neutral-other-emotional" face pairs. Results showed that both groups responded faster to self-relevant information and were moderated by different emotional potencies. The high social anxiety group produced larger P1 amplitudes and smaller N170 amplitudes than the low social anxiety group for all face pairs, and both groups evoked larger P2 amplitudes for the self-neutral and other-angry face pairs than for the other two face pairs. These results suggest that subjects in both groups prioritize allocating attentional resources to self-relevant information, with angry faces having the most significant effect on this resource allocation. High social anxiety individuals showed more attentional vigilance and less structural encoding. They devoted more attentional resources to the self-neutral versus other-angry face pairs than low social anxiety individuals.

职场排斥与离职倾向的关系：一个链式中介模型

苏春华[1,2]（通讯作者） 邹雨蓓[1] 韩宗义[1] 赵翔[1]

1 天津师范大学心理学部，天津，300387，3331596948@qq.com

摘　要　职场排斥就是发生在工作场所的排斥行为，是指在工作场所中员工主观感受到的他人对自己的忽略、排挤和拒绝。近年来，我国学者对职场排斥的研究热度越来越高，也让更多的人认识到了其中危害。职场排斥作为一种较为隐晦的职场负面行为其危害也是不可小觑的。研究表明，职场排斥会直接或间接的导致职场偏差行为并且会降低员工的工作表现。离职倾向是员工离职前的一种心理状态，受多种因素的影响，当发生离职行为时无疑会给组织带来较大人力成本的损失。本研究以资源保存理论、社会交换理论和社会认同理论为基础探讨职场排斥与离职倾向之间的关系，引入了情绪耗竭和工作投入两个中介变量。以天津市、河南省、山东省、广东省等地区的 423 名在职员工为研究对象，采用职场排斥量表、工作倦怠量表中的情绪耗竭维度、工作投入简短量表和离职倾向量表四个量表收取了问卷数据。具体来讲，当个体遭受到职场排斥时需要耗费自身资源加以应对，自身资源的持续消耗会导致情绪耗竭，没有更多的资源持续投入到工作中去，进而降低个体的工作投入，在工作中无法获取到有效的资源最终产生离职的想法。

面部遮挡对错误辨认和错误记忆的影响：基于误导信息范式

程伊敏　肖鑫　孙铭谣　王俭勤（通讯作者）
复旦大学心理学系，上海，200433，wiq@fudan.edu.cn

摘 要　新冠肺炎的全球大流行使得戴口罩成为一个必要的防疫措施，即使在疫情结束后很多人在公共场合中依旧保持了佩戴口罩的习惯。已有研究发现，采用口罩遮挡的面孔会损害被试面孔再认任务的表现。目击证人常常需要进行面孔的指认，目击者的错误记忆可导致司法系统的错误定罪。然而，目前还没有研究探讨过面部遮挡对目击证人错误辨认和错误记忆的影响。因此，本研究将在误导信息范式下，考察罪犯用口罩遮挡面部对目击证人的错误辨认和错误记忆产生的影响。实验 1 测试了 140 位被试，采用 2（罪犯是否戴口罩：是、否）×2（误导信息：有、无）两因素被试间设计，被试在观看罪犯戴或不戴口罩的犯罪视频后，阅读包含误导信息（罪犯眼睛周围有大痣）或不含误导信息的笔录，48 小时后填写记忆测试问卷并完成队列辨认。结果发现，观看戴口罩罪犯的被试更不容易受到误导信息的影响，错误记忆率和错误辨认率更低。这可能说明，口罩破坏了对人脸的整体加工，使人们对局部特征信息（眼睛）的记忆更加清晰。已有研究发现编码一致性可以提高证人的辨认表现，但是也有关于面孔再认的研究没有得出相似的结论，实验二进一步考察在误导信息条件下口罩佩戴与否是否存在编码一致性。实验 2 测试了 200 位被试，采用 2（罪犯是否戴口罩：是、否）×2（队列是否戴口罩：是、否）两因素被试间设计，被试观看视频后，均阅读含误导信息的笔录，实验程序同实验 1。在误导信息条件下，结果支持了“编码一致性”，即当视频的口罩条件和队列的口罩条件一致时，被试的正确辨认率相比不一致时更高。倘若罪犯是佩戴口罩的，那么呈现戴口罩的队列可以降低选择误导面孔的概率，并提高正确辨认率。这可能说明，司法辨认中，倘若罪犯在行凶时佩戴口罩，那么对目击者呈现佩戴口罩的队列可以减少口罩带来的认知损害。

The Effects of Facial Masking on False Identification and False Memory: A Misinformation Paradigm Study

Yimin Cheng, Xin Xiao, Mingyao Sun, Jianqin Wang
Department of Psychology, Fudan University, Shanghai

***Abstract*:** The global COVID-19 pandemic has made wearing masks a necessary preventive measure, and even after the pandemic, many individuals continue to maintain the habit of wearing masks in public settings. Previous research has found that covering the face with a mask impairs performance on face recognition tasks. Eyewitnesses are often required to make face identifications, and incorrect memory of eyewitnesses can lead to wrongful convictions. However, there is currently no research exploring the impact of facial masking on eyewitness misidentification and false memory. Therefore, this study aims to investigate the effects of using masks to cover the face of a perpetrator on eyewitness misidentification and false memory, using the misinformation paradigm.Experiment 1 involved 140 participants in a 2 (Perpetrator with mask: yes, no) × 2 (Misinformation: yes, no) between-subjects design. After watching a crime video in which the perpetrator either wore a mask or did not wear a mask, participants read a transcript containing either misleading information (a large mole around the perpetrator's eyes) or no misleading information. After 48 hours, participants completed a memory test questionnaire and a lineup

identification task. The results showed that participants who observed a perpetrator wearing a mask were less susceptible to the influence of misleading information, with lower rates of false memory and misidentification. This finding suggests that masks disrupt holistic processing of faces, leading individuals to have clearer memory for local facial features (e.g., the eyes).Previous research has shown that encoding consistency can improve witness identification performance. However, findings on face recognition have not consistently supported this conclusion. Experiment 2 further examined whether encoding consistency exists in the presence of misleading information when it comes to wearing masks. This experiment involved 200 participants in a 2 (Perpetrator with mask: yes, no) × 2 (Lineup with mask: yes, no) between-subjects design. Participants watched a video and subsequently read a transcript containing misleading information. The experimental procedure was the same as in Experiment 1. Under the condition of misleading information, the results supported the "encoding consistency" effect, indicating that when the mask condition in the video matched the mask condition in the lineup, participants had higher correct identification rates compared to when they were inconsistent. If the perpetrator was wearing a mask, presenting a lineup with individuals wearing masks reduced the probability of selecting a misleading face and increased correct identification rates. This suggests that in forensic identification, if the perpetrator wore a mask during the crime, presenting lineups with individuals wearing masks can mitigate the cognitive impairment caused by masks.

ChatGPT 对以学生者为中心的教学法的启示：将 ChatGPT 作为英语写作和口语学习的教师、伙伴和评估工具

张丹丹[1] 李俊辉[1] 孙艺[1] 刘恒[1] 郭栋（通讯作者）

1 四川师范大学脑与心理科学研究院，成都，610066，dongguo@sicnu.edu.com

摘 要 ChatGPT 是一款先进的语言生成模型，作为一个相对更为拟人化的人工智能，在众多领域都具有引发新变革的潜力。目的：本研究(N=107)旨在把英语作为学习主题，探讨利用 ChatGPT 实施以学习者为中心的教育法（Learner-Centered Pedagogy，简称 LCP）的途径。方法：实验 1 采用随机对照设计，考察 ChatGPT 能否胜任教师的角色；实验 2 考察的是 ChatGPT 生成测试题并评分的能力；实验 3 则探讨了 ChatGPT 在合作学习中扮演对话伙伴的作用。结果：实验 1 的结果表明，在 ChatGPT 上的学习显著提高了学习者的写作水平，减少了其消极情绪。在词汇习得上，ChatGPT 的提升效果也超越了基于视频的大规模在线开放课程（Massive Open Online Courses，简称 MOOCs）。实验 2 表明，ChatGPT 生成的测试题具有良好的信效度，同时它也可以作为评分工具，并提供个性化的反馈。实验 3 揭示了 ChatGPT 辅助口语练习能显著提高口语能力同时减少焦虑等负性情绪。交叉滞后分析的结果揭示出了学习者的状态焦虑和口语能力之间互为因果关系，这说明 ChatGPT 辅助的口语练习有助于将口语学习中的恶行循环转化为正性循环。本研究揭示了在以学习者为中心的教育法领域，ChatGPT 相对于 MOOCs 的独特优势。此外，还提出了 Chat-MOOCs 的概念，将两种方法的优势整合在一起，也许具有成为在线以学习者为中心的教学法的新形式的潜力。

ChatGPT Affordances Learner-Centered Pedagogy: Utilizing

ChatGPT as Teacher, Partner, and Assessment Tool for English Learning in Writing and Speaking

Dandan Zhang[1] Junhui Li[1] Yi Sun[1] Heng Liu[1] Dong Guo*

1 Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, 610066,dongguo@sicnu.edu.com

Abstract：ChatGPT is an advanced language generation model. As a more anthropomorphic artificial intelligence, it has the potential to trigger new changes in many fields.Objective: This study(*N*=107) aims to explore ways to use ChatGPT to implement Learner-Centered Pedagogy (LCP) with English as a learning theme.Methods: In experiment 1, a randomized control design was used to investigate whether ChatGPT was qualified for the role of teacher. Experiment 2 examined ChatGPT's ability to generate quiz questions and rate answers; Experiment 3 explores the role of ChatGPT as a dialogue partner in cooperative learning.Results: The results of experiment 1 showed that learning on ChatGPT significantly improved learners' writing skills and reduced their negative affect. ChatGPT also improves vocabulary acquisition beyond video-based Massive Open Online Courses (MOOCs).Experiment 2 shows that the test questions generated by ChatGPT have good reliability and validity, and it can also be used as a scoring tool and provide personalized feedback.Experiment 3 revealed that oral practice assisted by ChatGPT can significantly improve oral ability and reduce negative affect such as anxiety.The results of cross-lagged analysis revealed the mutual causal relationship between learners' state anxiety and oral ability, indicating that ChatGPT-assisted oral practice can help transform the negative cycle into a positive cycle in oral learning. This study reveals the unique advantages of ChatGPT over MOOCs in the field of learner-centered pedagogy.In addition, the concept of Chat-MOOCs has been proposed, bringing together the strengths of both approaches and perhaps having the potential to become a new form of online learner-centred pedagogy.

中国大学生寻求专业心理帮助的态度转变：横断历史元分析

曾莉[1]，杨文睿[1]

1 云南师范大学教育学部，昆明，650500

第一作者：曾莉 手机号：19971848493 邮箱：zengl487@gmail.com

通讯地址：云南省昆明市呈贡区聚贤街 879 号

通讯作者：曾莉 zengl487@gmail.com

摘 要 随着我国社会的变迁，精神和心理疾病的患病率逐年升高，人民心理健康状况逐渐受到关注。已有的西方背景下的研究显示，虽然对心理卫生门诊和心理健康服务的使用有所增加，但是人们对寻求专业心理帮助的态度却更加消极。为了解我国大学生对于寻求专业心理帮助态度是否随着时代变迁、经济发展、社会历史文化的改变等有所变化，本研究使用横断历史元分析的方法，来考察大学生寻求专业心理帮助随着年代的变化情况，为心理求助态度的变化提供实证的证据，以分析变化产生的原因。本研究选取了数据收集年代在 2008-2021 年间使用郝志红等修订的寻求专业心理帮助态度问卷（ATSPPH）的 34 项研究，总人数为 26572 名大学生。研究结果表明：（1）在控制文献来源、高校所在地和样本人数的情况下，年代可以显著正向预测大学生寻求心理帮助的态度($\beta = 0.48$, $t = 3.29$, $p<0.01$, $\Delta R^2 = 0.32$)，我国大学生对于

寻求专业心理帮助的态度在过去的 14 年间上升了 1.27 个标准差，这表明我国大学生对寻求心理帮助的态度随年代逐渐变得更为积极。（2）年代能够正向预测大学生对寻求专业心理帮助的自我需求认知(β = 0.58, t = 3.86, p < 0.05, ΔR^2 = 0.60)；而年代对其余维度的预测作用不显著，可见对于心理求助的认知随着年代的变迁产生了较大的改变，而对于心理咨询的污名的忍受、人际开放度和对心理健康服务人员的信心并未随着时代产生较大变化。（3）大学生寻求心理帮助的态度随年代变化中存在性别差异，14 年间，男女生在寻求心理帮助的态度上都存在着正向的转变，但是男生的变化量（Cohen'd = 1.00）小于女生（Cohen'd = 1.56）。（4）大学生寻求专业心理帮助的态度与经济发展指标 GDP（r = 0.41，p<0.05）、居民人均可支配收入（r = 0.40，p<0.05）呈现正相关；基本医疗保险支出（r = 0.37，p < 0.05）成正相关，说明国家快速的经济发展、消费和医疗水平的提升，对于大学生寻求专业心理帮助具有正向的影响。

Changes in attitudes toward seeking mental health services: A cross temporal meta-analysis

Li Zeng[1]; Wenrui Yang[1]

1 Psychology Department, School of Education ,Yunnan Normal University,Kunming,650500

First author: Li Zeng, Cell-phone：19971848493, E-mail：zengl487@gmail.com

Address： No.768, Juxian street, Chenggong District Kunming, Yunnan

Abstract：As China undergoes societal changes, the prevalence of mental and psychological illnesses are increasing which has raised a lot of concerns.Existing research from a Western context has shown that despite an increase in the utilization of mental health clinics and services, people's attitudes towards seeking professional psychological help have become increasingly negative over time. Help seeking attitudes are thought to be a key barrier to mental health service use, although little is known about whether such attitudes have changed over time. Research on this topic is mixed with respect to whether help seeking attitudes have become more or less positive with the significant societal changes. The aim of the current study was to help clarify this issue using a cross-temporal meta-analysis of scores on Hao and Liang help seeking attitude measure among university students (N= 26572) from 2008 to 2021. Results indicated that: attitudes have become increasingly positive over time,when controlling factors such as source of literature, geographical location of the university,which the data are weighted (w) for sample size and study variance(β = 0.48,t = 3.29,p<0.01, ΔR^2 = 0.32).Over the past 14 years, Chinese university students' attitudes toward seeking professional psychological help have increased by 1.27 standard deviations, suggesting a gradual shift towards a more positive attitude. (2) The era also positively predicted university students' self-perceived need for seeking professional psychological help (β = 0.58, t = 3.86, p <0.05, ΔR^2 = 0.60). However, the era did not significantly predict other dimensions, indicating that cognitive changes in seeking psychological help have undergone substantial shifts over the years, while tolerance of the stigma associated with psychological counseling, interpersonal openness, and confidence in mental health service providers have not changed significantly over time. (3) Gender differences were observed in the evolution of university students' attitudes toward seeking psychological help over the 14-yearperiod. Both male and female students exhibited positive changes in their attitudes, but the magnitude of change was smaller for males (Cohen's d = 1.00) compared to females (Cohen's d = 1.56). (4) College students' attitudes towards seeking professional psychological help were positively correlated with economic development indicators, including GDP (r=0.41, p<0.05), per capita disposable income (r=0.40, p<0.05), and basic medical insurance expenditure (r=0.37, p<0.05).

This suggests that the rapid economic development, increased consumerism, and improved healthcare accessibility in the country have had a positive impact on university students' willingness to seek professional psychological help.

家庭喂养行为及其预测性因素与学前儿童体质指数的追踪研究

姜朝玮[1]　翟相颖[1]　郝翠荣[1]　周楠[1]（通讯作者）

1 首都师范大学学前教育学院，北京，100048，nanzhou@cnu.edu.cn

摘　要　近年来，我国儿童超重/肥胖发生率逐年攀高。超重/肥胖问题不仅给儿童的日常生活、学习带来诸多不便，还会对他们身心健康发展产生深远影响。家长作为儿童最初的食物提供者和控制者，其喂养行为与儿童体质健康关系密切(Zhou& Cheah, 2015)。Belsky(1984)的养育过程模型和 Abidin(1995)的亲职压力模型指出，来自儿童特征、家长特征以及社会支持多方面的影响能够显著预测家长教养压力和喂养行为，并最终影响儿童的身心发展。此外，不同程度的教养压力也会影响家庭喂养行为的选择(Morales-Alducin et al., 2021)。在此基础上，本研究考查儿童抑制控制、母亲心理幸福感和婚姻质量对教养压力和喂养行为的预测性及与学前儿童体质指数的纵向关联，以及教养压力和家庭喂养行为在其中的链式中介作用。

本研究以 209 名小班幼儿(M_{age} = 3.36 , SD = 0.28; 男生 124 名)及其母亲(M_{age} = 35.6, SD = 3.26)为被试，并对其进行为期三年的追踪研究。分别在小班(T1)测量儿童的抑制控制(Sabbagh, 1997)、母亲的心理幸福感(Ryff, 1995)和婚姻质量(Busby, 1995)；在中班(T2)测量母亲的教养压力(Crnic, 1990)；在大班(T3)测量母亲的喂养行为(Birch et al., 2001; Musher, 2007)及儿童的体质指数(超重肥胖率 27.3%)。采用 Mplus8.0 建立结构方程模型进行链式中介效应检验。

结果发现：(1)母亲教养压力 T2 在儿童抑制控制 T1、母亲心理幸福感 T1、婚姻质量 T1 和鼓励性喂养行为 T3 之间起完全中介作用。模型各项拟合值均在可接受范围之内，$\chi^2/df = 1.49$, $p < 0.001$; RMSEA = 0.05; 95%CI [0.03, 0.06]; CFI = 0.95; SRMR =0.05。(2)儿童抑制控制、母亲心理幸福感和婚姻质量能够通过两条间接路径影响儿童体质指数，模型各项拟合值均在可接受范围之内，$\chi^2/df = 1.45$, $p < 0.001$; RMSEA = 0.05; 95%CI [0.03, 0.06]CFI = 0.95; SRMR = 0.05。两条间接路径分别为：儿童抑制控制、母亲心理幸福感和婚姻质量通过母亲教养压力影响儿童的体质指数，以及儿童抑制控制、母亲心理幸福感和婚姻质量通过母亲教养压力和鼓励性喂养行为影响儿童的体质指数。

本研究初步揭示了家庭喂养行为及其预测性因素对学前儿童体质指数的预测作用。较低的儿童抑制控制水平、母亲心理幸福感和婚姻质量都会显著预测较高的母亲教养压力，这不仅会直接负向预测儿童的体质指数，还会通过减少母亲的鼓励性喂养行为而间接对儿童体质指数产生消极影响。本研究结果将为我国城市家庭提供科学合理的养育指导，以促进儿童体质健康。

关键词　家庭喂养行为，抑制控制，心理幸福感，婚姻质量，教养压力，体质指数

A longitudinal study of family feeding and its predictive factors with preschool children's body mass index

Chaowei Jiang　Xiangying Zhai　Cuirong Hao　Nan Zhou

College of Preschool Education, Capital Normal University, Beijing, 100048

Abstract: In recent years, the incidence of overweight/obesity among children in China has been rising year

by year. The problem of overweight/obesity not only brings a lot of inconvenience to children's daily life and study, but also has a far-reaching impact on their physical and mental health development. Parents, as the initial food providers and controllers of children, have a close relationship between their feeding behaviors and children's physical health (Zhou & Cheah, 2015).Belsky's (1984) model of the parenting process and Abidin's (1995) model of parenting stress pointed out that influences from multiple aspects of children's characteristics, parents' characteristics, and social support can significantly predict parenting stress and feeding behaviors, and ultimately influence children's physical and psychological development. In addition, different levels of parenting stress can also influence the choice of family feeding behaviors (Morales-Alducin et al., 2021).On this basis, the present study examined the predictability of child inhibitory control, maternal psychological well-being, and marital quality on parenting stress and feeding behaviors and their longitudinal associations with preschool children's body mass index, as well as the chained mediating roles of parenting stress and family feeding behaviors therein.

In this study, 209 small-group children (M = 3.36, SD = 0.28; 124 boys) and their mothers (n = 209; M = 35.6, SD = 3.26) were utilized as subjects and followed up for three years. Children's inhibitory control (Sabbagh, 1997), mothers' psychological well-being (Ryff, 1995), and marital quality (Busby, 1995) were measured in the small class (T1); mothers' parenting stress (Crnic, 1990) was measured in the middle class (T2); and mothers' feeding behavior was measured in the large class (T3) (Birch et al. 2001; Musher, 2007), and the children's body mass index (27.3% overweight obesity rate). Structural equation modeling using Mplus 8.0 was used to conduct the chained mediation effect test.

The results found that (1) maternal parenting stress T2 fully mediated between child inhibitory control T1, maternal psychological well-being T1, marital quality T1, and encouraging feeding behavior T3. The model fit were all within acceptable limits, $\chi^2/df = 1.49$, $p < 0.001$; RMSEA = 0.05; 95% CI [0.03, 0.06]; CFI = 0.95; SRMR = 0.05. (2) Child inhibitory control, maternal psychological well-being, and marital quality were able to influence child body mass index through two indirect pathways. The model fit were all within acceptable limits, $\chi^2/df = 1.45$, $p < 0.001$; RMSEA = 0.05; 95% CI [0.03, 0.06]; CFI = 0.95; SRMR = 0.05. The two indirect paths were: child inhibitory control, mother's psychological well-being and marital quality influence children's body mass index through mother's parenting stress, and child inhibitory control, mother's psychological well-being and marital quality influence children's body mass index through mother's parenting stress and encouraging feeding behaviors, respectively.

The present study provides preliminary insights into the predictive role of family feeding behaviors and their predictive factors on preschool children's body mass index. Lower levels of child inhibitory control, maternal psychological well-being, and marital quality significantly predicted higher levels of maternal parenting stress, which not only negatively predicted children's body mass index (BMI) directly, but also negatively affected children's BMI indirectly by decreasing mothers' encouraging feeding behaviors. The results of this study will provide scientific and rational parenting guidance for urban families in China to promote children's physical health.

Keywords: family feeding behavior, inhibitory control, psychological well-being, marital quality, maternal parenting stress, body mass index

瑜伽锻炼对女性自我客体化的干预机制：短视频成瘾的中介作用

龙滢[1]　潘寒秋[1]　闫讷[1]　李玲[2]（通讯作者）

1 西安体育学院研究生部，西安，710068

2 西安体育学院心理学教研室，西安，710068，liling0530@163.com

摘 要　目的：探讨瑜伽对女性短视频成瘾和自我客体化的干预效果及其机制。方法：随机分配 74 名没有日常锻炼习惯的女大学生为实验组和对照组，实验组接受 8 周瑜伽练习，对照组不额外练习。干预前后分别使用自我客体化问卷和短视频成瘾量表进行测量。结果：(1)瑜伽干预、自我客体化与短视频成瘾均显著相关(R=-0.36～0.63，p＜0.01)。(2)实验组干预后自我客体化和短视频成瘾均显著低于干预前（F=19.35 和 F=10.78，p＜0.01），对照组两者无显著变化。(3)瑜伽锻炼对自我客体化有显著的负向直接效应（β=-0.46，p＜0.001），同时也通过降低短视频成瘾（β=-0.36,p＜0.01）而产生显著的负向间接效应（β=-0.18，p＜0.01）。结论：缺乏锻炼或过度使用短视频增加女性自我客体化风险，而瑜伽能有效降低自我客体化，并且这一效果部分是通过减少女性对于短视频成瘾水平而实现的。本研究揭示了瑜伽对提升女性身心健康的价值，也为防治自我客体化和短视频成瘾提供了方法。

The Intervention Effect of Yoga Exercise on Women's Self-Objectification: The Mediating Role of Addiction to Short Videos

LONG Ying[1] PAN Hanqiu[1] YAN Ne[1] LI Ling[1],*
1 Xi'an Physical Education University, Xi'an, China

Abstract ： Objective: We investigated how yoga intervention affects short video addiction and self-objectification in women, and examined the mediating role of short video addiction. Method: We randomly assigned 74 female college students to an experimental group or a control group. The experimental group underwent 8 weeks of yoga practice, while the control group did not receive any additional exercise. We used the self-objectification questionnaire and the short video addiction scale to assess the outcomes before and after the intervention. Results: (1) Yoga intervention, self-objectification, and short video addiction were significantly correlated (R=-0.36 ～ 0.63 ， p ＜ 0.01). (2) The experimental group showed significant decreases in self-objectification and short video addiction after the intervention compared to before (F=19.35 and F=10.78，p＜ 0.01), whereas the control group did not show any significant changes (F=1.20 and F=0.09，p＞0.05). (3) Yoga had a significant negative direct effect on self-objectification (β=-0.46， p＜0.001), and a significant negative indirect effect through reducing short video addiction (β=-0.36,p ＜ 0.01) (β=-0.18 ， p ＜ 0.01). Conclusion: Our study demonstrated that lack of exercise or excessive use of short videos increased the risk of female self-objectification, while yoga effectively reduced it, partly by lowering women's short video addiction level. Our study revealed the value of yoga for improving women's physical and mental health, and provided methods for preventing and treating short video addiction and self-objectification.

摘 要　目的：人格障碍诊断问卷（Personality Diagnostic Questionnaire-Fourth Edition Plus, PDQ-4+）是一种常用于筛查 12 种人格障碍的自陈式问卷。在科研与临床中，PDQ-4+的边缘性人格障碍（Borderline Personality Disorder, BPD）分量表被广泛用于筛选 BPD 个体。然而，虽然已有的研究支持了 PDQ-4+的 BPD 分量表具有良好的信效度，但其各个条目的特性仍有待进一步考察。本研究拟基于项目反应理论（Item Response Theory, IRT）对 PDQ-4+的 BPD 分量表的条目进行项目分析，为该量表的应用提供进一步依据。**方法：**1135 名心理门诊就诊患者（男性 471 人，女性 664 人，平均年龄 19.65±3.68 岁）和 789 名大学生被试（男性 268 人，女性 521 人，平均年龄 19.22±1.33 岁）完成了 PDQ-4+的 BPD 分量表。在 R 语言下采用多个程序包（bruceR、mirt、lordif、stats 等）进行数据处理。首先，通过验证性因素分析进行测验单维性检验、计算 Q_3 统计量考察项目间局部独立性检验，为进一步项目分析提供前提条件。其次，使用 Logistic 回归计算伪 R^2 变化量以检验性别的项目功能差异。最后，采用双参数 Logistic 模型分析 BPD 分量表的 9 个条目（0 与 1 计分），估计每个条目的区分度与难度以及计算项目和测验信息量。**结果：（1）**验证性因素分析结果提示 BPD 分量表结构良好（χ^2/df=8.486；RMSEA=0.062；CFI=0.928；TLI=0.903；SRMR=0.037）；任意两条目间计算的 Q_3 统计量均小于 0.36，满足局部独立性假设。（2）回归结果显示所有条目伪 R^2 变化量均小于 0.02，即性别在各条目上差异不显著。（3）9 个条目区分度参数 a 取值范围为 0.928~2.876，均达到中等以上区分度，难度参数 b 取值范围为-1.021~1.828。（4）9 个条目最大信息量范围为 0.215~2.068。测验信息函数曲线呈单峰形状，最大信息量为 5.204，提供信息量较少，整体质量较差。**结论：**PDQ-4+中文版边缘性人格障碍分量表的条目区分度良好，难度适中，支持其用于 BPD 的筛查，但由于项目信息量和测验信息量欠理想，需结合使用更客观的测评工具对 BPD 进行临床诊断。

3 National Clinical Research Center for Mental Disorders, Changsha
luoxingwei6@csu.edu.cn

Abstract: **Objective** The Personality Diagnostic Questionnaire-Fourth Edition Plus (PDQ-4+) is a self-reported scale, which is commonly used to screen 12 personality disorders. The borderline personality disorder (BPD) subscale of PDQ-4+ has been broadly used to screen patients with BPD. Though the BPD subscale of PDQ-4+ has been proven to have good reliability and validity in clinical and research context, its items characters still need to be further evaluated. This study employed the item response theory (IRT) technique to evaluate the 9 items of BPD subscale, trying to provide more information for further researches. **Method** Participants were consisted of

two samples: 1135 outpatients from psychological clinic (471 males, 664 females, the average age was 19.65 years old, SD=3.68) and 789 undergraduates (268 males, 521 females, the average age was 19.22 years old, SD=1.33). All of them finished the BPD subscale of PDQ-4+. Several packages for the R environment were performed for data analysis as follows: bruceR, mirt, lordif, stats. Firstly, the one-factor structure of BPD subscale was examined with confirmatory factor analysis (CFA), and the local independency was examined with the Q_3 value. Secondly, logistic regression was used to test differential item functioning (DIF) across gender, which was evaluated by means of change in McFadden's pseudo R^2 (ΔR^2). Thirdly, the discrimination parameter (a) and difficulty parameter (b) of each item (dichotomous item) were estimated in a two-parameter logistic model. The item information of each item and test information were also calculated. **Result** (1) The CFA results evidenced the unidimensionality with well-fitting criteria (χ^2/df=8.846, RMSEA =0.062, CFI =0.928, TLI = 0.903 and SRMR=0.037). Every Q_3 value was lower than 0.36, which suggested that the BPD subscale also satisfied the assumption of local independence. (2) The logistic regression result showed that every ΔR^2 was lower than 0.02, meaning no significant gender difference. (3) The 9 discrimination parameters (a) ranged from 0.928 to 2.876, all meeting the medium or above values. The 9 difficulty parameters (b) ranged from -1.021 to 1.828. (4) The maximum value of item information of the 9 items ranged from 0.215 to 2.068, and the test information curve (TIC) was unimodal, with a maximum value of 5.204, suggesting that the BPD subscale could not provide enough psychometric information. **Conclusion** The BPD subscale of PDQ-4+ has a good ability in discrimination and medium difficulty. The item parameters of BPD subscale are acceptable and suitable for screening, while the item information and test information are not ideal yet, suggesting that the diagnosis of BPD needs assistance of a more objective instrument.

Keywords：item response theory, personality diagnostic questionnaire, borderline personality disorder, item analysis

生成式人工智能的虚假评论言语行为分析及人机比较研究：可解释性机器学习方法

摘 要 随着生成式人工智能（AI）技术的重大突破，其产生的在线虚假评论的数量可能会大幅度增长，进而对以电子口碑为核心的网络消费信息内容生态构成潜在威胁。亟需深入分析人类与生成式 AI 产生的虚假评论在语言行为上的差异，并提出针对性的识别方法及治理策略。本研究以人类评论者及 ChatGPT 为研究对象，从欺骗识别领域中的认知负荷理论、人际欺骗理论及现实监控理论的整合视角出发，构建认知负荷、确定性、情感、事件的距离、感知情境细节、认知过程六类语言线索体系，利用计算语言学及机器学习方法构建人类真实评论、人类虚假评论与生成式 AI 产生的虚假评论的解释性分类预测模型，并比较三者对关键性语言线索使用的差别，探讨生成式 AI 与人类在欺骗策略使用上的异同。实验结果表明，分类

预测模型的准确率、精确度、召回率、F 值和 AUC-ROC 值分别达到 89.24%、90.77%、90.23%、90.23%和98.05%。认知负荷(0.0361:p<0.001)、感知情境细节(0.0159:p<0.001)、情感(0.0072:p<0.001)等传统欺骗识别理论相关语言线索，以及所发现的非正式语言(0.0097:p<0.001)、个人关切(0.0091:p<0.001)语言线索均能显著提高模型的 AUC-ROC 值。针对三者在语言线索使用上的比较分析结果发现，生成式 AI 产生的虚假评论表现出最大的认知负荷（p<0.001）、最多的情绪表达（p<0.001）和个人关切（p<0.001），且更具正式性（p<0.001）与确定性（p<0.01）。在欺骗策略的使用方面，一方面，人类和 AI 生成的虚假评论均表现出相似的较低水平的认知负荷；另一方面，生成式 AI 更多地使用了与人类不同的欺骗策略：相对更多的个人关切相关语言线索（p<0.001）、积极和消极情绪表达（p<0.001）；相对更少认知过程语言线索（p<0.01）。此外，通过干预认知负荷，能够有效从部分维度区分真实和虚假评论，这种干预对识别 AI 产生的虚假评论尤其有效。本研究探索了人类与生成式 AI 在虚假评论言语行为的可区分性及表现差异，验证了欺骗识别相关理论在生成式 AI 产生的虚假评论识别中应用价值，有利于网络平台管理机构及企业制定更好的虚假评论监管机制，以应对生成式 AI 对网络消费信息内容生态造成的潜在重大风险。

Abstract： With the breakthrough progress of generative artificial intelligence technology, the online fake reviews it generates may grow massively, potentially seriously threatening the online consumer information content ecology. It is urgent to deeply analyze the differences in language behavior between human and generative artificial intelligence (AI) reviews, and propose targeted fake review dectection methods and governance strategies. This study takes human reviewers and ChatGPT as research objects, based on the perspectives of cognitive load theory, interpersonal deception theory, and reality monitoring theory in the field of deception detection, integrates cognitive load, uncertainty, emotion, distance, perceived contextual details, cognitive process of language clues, using word embedding and machine learning methods to build explanatory classification prediction models of authentic and fake reviews of human, and fake review of generative AI, compare the differences in the use of language clues among the three, explore the similarities and differences in deception strategy use between generative AI and humans. The experimental results show that the accuracy, precision, recall, F-value, and AUC-ROC value of the classification prediction model are 89.24%, 90.77%, 90.23%, 90.23%, and 98.05%

respectively. Language cues related to traditional deception detection theories such as cognitive load (0.0361: p<0.001), perceived contextual details (0.0159: p<0.001), and emotions (0.0072: p<0.001), as well as the discovered language cues of informal language (0.0097: p<0.001) and personal concerns (0.0091: p<0.001) can significantly improve the ROC AUC value of the model. The comparative analysis results of language clue usage behavior found that the fake reviews generated by generative AI show the greatest cognitive load (p<0.001), the most emotional expression (p<0.001) and personal concern (p<0.001), and are more formal (p<0.001) and certain (p<0.01). In terms of the use of deception strategies, both human and AI-generated fake reviews show similar low levels of cognitive load. However, generative AI uses more deception strategies different from humans: relatively more personal concern-related language clues (p<0.001), positive and negative emotional expressions (p<0.001); relatively fewer cognitive process language clues (p<0.01). In addition, by intervening with cognitive load, it is possible to effectively differentiate between real and fake reviews in some of the dimensions, and this intervention is particularly effective in identifying AI-generated fake reviews. This study explores the distinguishability and performance differences of fake review verbal behavior between humans and generative AI, verifies the value of deception detection related theories in the dectection of fake reviews generated by AI, and is beneficial for online platform management agencies and enterprises to formulate better supervision mechanisms to cope with the potential major risks of generative artificial intelligence to the network information ecology.

摘 要 COVID-19 疫情背景下，网络化社会支持获得了越来越多的关注。互联网不仅是获得社会支持的重要渠道，同时也是疫情压力源之一。诸多研究探讨了两者间的内在联系，但研究结果却存在很大差异。本研究运用三水平元分析技术系统探讨 COVID-19 疫情背景下网络化社会支持与积极心理健康的关系及其调节因素。共纳入 9 项研究，34 个效应量，总样本量 8138。元分析结果显示疫情期间的网络化社会支持与积极心理健康之间存在显著正相关($r = 0.13, p < 0.001$)，对特定积极心理健康结果的进一步研究发现，在疫情期间，网络化社会支持与幸福感之间存在显著的正相关（$r = 0.18$，$p < 0.001$）。然而，网络化社会支持与自我效能感之间没有显著的相关性（$r = 0.07$，$p = 0.248$）。独居状态、工作状态显著调节网络化社会支持和积极心理健康的关系。独居状态负向预测疫情期间网络化社会支持与积极心理健康之间的相关($\beta_1 = -0.045$，$F(1, 3) = 22.541$，$p = 0.018$)。工作人群比例负向预测疫情期间网络化社会支持与积极心理健康之间的相关（$\beta_1 = -0.014$，$F(1, 21) = 21.592$，$p < 0.001$）。性别、年龄、婚姻状态、参与者招募来源均无调节效应。本研究不仅为网络化社会支持的理论研究提供信息，也为重大公共卫生事件下公众心理健康的网络化服务及针对不同人群特征的个性化干预提供了启示。

4 中国科学技术大学人文与社会科学学院心理学系，安徽省合肥市，230051

摘 要 网络游戏成瘾（IGD）在《精神疾病诊断与统计手册》第五版（DSM-5）中被列为一种潜在的障碍，游戏障碍在《国际疾病分类》第 11 版（ICD-11）中被列为 "成瘾行为导致的障碍"。已发现网络游戏成瘾者在奖励处理、认知控制和视听运动功能方面存在认知缺陷。然而，以前的研究主要依赖于单独的脑区或静态的脑网络的激活,有必要研究在游戏期间和与游戏断网时的动态脑网络。本研究招募 30 名 IGD 和 37 名娱乐游戏使用者（RGUs）。以静息态为基线，构建了一个多层网络模型，并计算了动态参数（promiscuity/recruitment/integration）来量化游戏-静息态和游戏断网-静息态阶段不同层次的社区重建。结果发现，在游戏期间-静息态阶段，IGD 受试者的动态重构特征明显低于 RGUs 的几个脑网络，包括基底神经节网络（BGN）、边缘网络、额叶-顶叶网络、内侧额叶网络、视觉网络和运动网络。然而，IGD 受试者在游戏断网-静息态阶段表现出比 RGUs 更高的 BGN 的招募参数。上述动态参数的结果与成瘾的严重程度（IAT 分数，DSM 分数和 Craving 分数）相关联。通过本研究可以发现，与 RGUs 相比，IGD 在游戏过程中表现出奖励处理、认知控制和视听运动功能方面的功能缺陷，并且功能缺陷与成瘾严重程度相关。在游戏突然中断后，他们还表现出 BGN 内增强的动态特征，这可能表明对游戏的渴求增强。这些发现对开发有效的 IGD 干预措施具有重要意义。

Disrupted dynamic network reconfiguration of the brain functional networks during gaming/disconnected in internet gaming disorder

Zhengjie Zhang[1,2,3], Min Wang[1,4], Lingxiao Wang[1,2,3*], Guang-Heng Dong[1,2,3]

1 Centre for Cognition and Brain disorders, The Affiliated Hospital of Hangzhou Normal University, Hangzhou, Zhejiang Province, China

2 Institute of Psychological Science, Hangzhou Normal University, Hangzhou, Zhejiang Province, China

3 Zhejiang Key Laboratory for Research in Assessment of Cognitive Impairments, Hangzhou, Zhejiang Province, China

4 Department of Psychology, School of Humanities and Social Science, University of Science and Technology of China, Hefei, Anhui Province, China

Abstract：Internet gaming disorder (IGD) has been included as a potential disorder in the Fifth Edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), gaming disorder has been included as a “disorder due to addictive behaviors” in the 11th revision of the International Classification of Diseases (ICD-11). Cognitive deficits in reward processing, cognitive control, and audiovisual-motor function have been identified in individuals with IGD. However, previous research has predominantly relied on the activation of isolated brain regions or static brain networks, necessitating an investigation into the dynamic brain networks during gaming and following game disconnections. This study recruited 30 IGD participants and 37 recreational game users (RGUs).

Using the resting state as a baseline, a multi-layer network model was constructed, and dynamic coefficients (promiscuity/recruitment/integration) were calculated to quantify community reconstruction at different levels during the gaming-rest and game disconnected-rest phases. The results revealed significantly lower dynamic reconstruction features in several brain networks, including the basal ganglia network (BGN), limbic network, frontal-parietal network, medial frontal network, visual network, and motor network, among IGD participants compared to RGUs during the gaming-rest phase. However, during the game disconnected-rest phase, IGD participants exhibited higher BGN recruitment coefficients than RGUs. The aforementioned dynamic coefficient results were correlated with the severity of addiction (IAT scores, DSM scores, and Craving scores). This study demonstrates that, compared to RGUs, individuals with IGD exhibit functional deficits in reward processing, cognitive control, and audiovisual-motor function during gaming, and these deficits are associated with the severity of addiction. Moreover, following sudden game interruptions, they also demonstrate enhanced dynamic features within the BGN, potentially indicating an intensified craving for gaming. These findings have important implications for the development of effective interventions for IGD.

中性词汇情绪习得机制：词汇具体性及社会线索的影响

张韵唯[1]　郭晶晶*（通讯作者）

1 陕西师范大学心理学院，西安，710000

* 陕西师范大学心理学院，西安，710000，guojjok@snnu.edu.cn

摘 要　研究发现中性词可以通过学习过程携带情绪信息，中性具体词相较于抽象词更易获得情绪色彩。相较于形象生动的具体词，抽象词的习得更依赖于情境信息，那么社会信息线索能否促进抽象词获得情绪信息？目前研究大多集中于词汇加工时具体性和情绪性的相互作用，但对于动态词汇学习过程以及词汇如何习得情绪性信息尚未有系统的探索。本研究采用情感错误归因范式(AMP)探究中性抽象词能否获得情绪信息及社会线索在其中的促进效应。

实验一考察经过 AMP 程序学习后，被试对中性词在开心、愤怒、恐惧、悲伤四个情绪维度上的评分变化。被试对中性词进行情绪感受评分之后进入情绪学习阶段，实验中随机呈现开心、愤怒、恐惧、悲伤四种启动情绪图片，观看启动图片后需判断该词是抽象词还是具体词。在测试阶段，被试需要再次对呈现的中性词在四种情绪维度上进行评分。结果发现，启动开心和恐惧情绪时中性词成功习得启动情绪，且具体词习得情绪结果更好。由于启动愤怒和悲伤情绪下词汇习得情绪结果不明显，故我们选用开心和恐惧作为实验二的启动情绪。实验二在 AMP 学习过程中，使用含有社会信息的情绪图片作为启动刺激，考察被试在开心、恐惧两种情绪维度上的评分变化。结果发现，社会线索在中性词习得情绪过程中发挥着调节作用，积极情绪启动下社会线索有利于具体词习得情绪，消极情绪启动下社会线索有助于抽象词习得情绪。

本研究进一步验证了前人研究结果，即具体词相较于抽象词更易获得情绪信息，除此之外更重要的是发现社会线索可以促进抽象词情绪信息的习得，这很可能由抽象词的学习方式所导致。该结果启示我们在词汇情绪学习过程中，应注意抽象词情绪的学习方式，增强抽象词学习时环境的情绪性，促进个体语言和词汇的发展。

The mechanism of neutral words' emotion acquisition: the influence

of lexical concreteness and social cues

Yunwei Zhang[1] Jingjing Guo*
Shaanxi Provincial Key Laboratory of Behavior and Cognitive Neuroscience, School of Psychology, Shaanxi Normal University, Xi'an 710000

Abstract： The previous studies found that neutral words can carry emotional information through the learning process, and neutral concrete words are easier to acquire emotional connotation than abstract words. Compared with vivid concrete words, the acquisition of abstract words depends more on situational information. Can social information cues promote the acquisition of emotional information by abstract words? Most of the current studies focused on the interaction of concreteness and emotion in vocabulary processing, but there is no systematic exploration of dynamic vocabulary learning process and how vocabulary acquires emotional information. In this study, the affect misattribution procedure (AMP) is used to explore whether neutral abstract words can obtain emotional information and the promoting effect of social cues in them.

Experiment 1 examined the changes in the score of neutral words in four emotional dimensions of happiness, anger, fear and sadness after learning AMP program. After scoring the emotional feeling of neutral words, the participants entered the emotional learning stage. In the experiment, four priming emotion pictures of happiness, anger, fear and sadness were randomly presented. After viewing the priming pictures, the participants were asked to judge whether the word was an abstract word or a concrete word. In the test phase, participants need to rate the neutral words again on four emotional dimensions. The results showed that the neutral words were successful in acquiring priming emotion, and the concrete words were better in acquiring priming emotion. Since the results of words learning emotions are not obvious under the priming of anger and sadness, we chose happy and fear as the priming emotions of experiment 2. In experiment 2, in the process of AMP, emotional pictures containing social information were used as priming stimuli to investigate the score changes of participants in the happy and fear dimensions. The results showed that social cues played a regulatory role in the process of neutral word emotion acquisition. The social cues under positive emotion priming is conducive to concrete word emotion acquisition, while negative emotion priming with social cues is conducive to abstract word acquisition.

This study further verifies the results of previous research results that concrete words are easier to obtain emotional information than abstract words. In addition, it is more important to find that social cues can promote the acquisition of emotional information of abstract words, which is probably caused by the learning style of abstract words. The result suggests that we should pay attention to the ways of emotional learning of abstract words, enhance the emotion of the learning environment, and promote the development of individual language and vocabulary.

Keywords： concreteness, emotional acquisition, social cues, AMP

汉语复合词首、尾歧义词素与整词语义激活的时间进程研究

郭泽希 伊力扎提·麦麦提（通讯作者）
新疆心智发展与学习科学重点实验室 新疆师范大学心理学院，乌鲁木齐，830017

摘 要 混合表征观点认为复合词的识别过程是词素分解路径和整词激活路径相互作用的结果，目前对复合词不同位置词素语义激活与整词语义激活先后问题上存在争议。意义计算观点认为，复合词的整词语义需要先经历首、尾词素语义依次激活，之后进一步整合生成；而双路径竞争模型认为整词语义激活会在首词素语义激活之后与尾词素语义同时产生，整词语义识别的具体路径选择取决于哪一方的效率更高。

当前研究尚缺乏中文复合词不同位置词素语义与整词语义激活过程的相关研究证据。不同于拼音文字，中文词素之间存在着明显的边界，这意味着词素语义启动过程可能更加高效，词素分解路径中的首、尾词素语义可能在首次注视时同时激活。另外，中文复合词中存在大量的歧义词素（词素拥有不止一个含义），歧义词素的具体语义需要在整词通达阶段才能确定，这意味着歧义词素的语义启动反而可能带来更多的认知负荷，整词通路将会成为优势路径。因此，考虑到中文词素的特殊性，为进一步探索汉语复合词的加工机制，有必要对中文复合词识别过程中词素语义和整词语义激活之间的相互作用机制开展进一步研究。为此，本研究以逆序词为实验材料，结合脑电技术，探讨在不同掩蔽启动条件下，启动词中歧义词素语义（与目标词相同、不同）和启动词中歧义词素位置（首部、尾部）对目标词词汇识别的影响。结果发现，尾部歧义词素比首部歧义词素在额区引发了更大的 N250 成分；当歧义词素位于尾部时，启动词中歧义词素的语义与目标词中歧义词素语义不同条件下比相同条件引发更大的 N400 成分，而当歧义词素位于首部时，未出现显著差异。结果表明，在汉语词汇识别的前词汇阶段，个体能够注意到双字复合词的两个词素，之后整词语义和首部词素语义得到激活，尾部词素语义的产生要晚于整词语义激活。

The semantic activation of different position morphemes and whole word meaning in Chinese compound words: an ERP study

GUO Ze-xi　YILIZHATI·Maimaiti

Xinjiang Key Laboratory of Mental Development and Learning Science, School of Psychology, Xinjiang Normal University, Urumqi, 830017

Abstract： According to the mixed representation theory, the recognition process of compound words is the result of the interaction between the morpheme decomposition path and the whole word representation path. From the meaning computing theory, the whole meaning of compound words needs to generate by the activation of the first and last morphemes successively. The two-path competition model holds that the whole word meaning will be activated at the same time as the last word meaning after the first morpheme semantic activation, and the specific path selection of the whole word meaning recognition depends on which side is more efficient. At present, there is a lack of relevant research evidence on the activation process of different position morphemes and whole word meanings of Chinese compound words. Different from alphabetic scripts, there is a clear boundary between Chinese morphemes, which means that the morpheme-semantic priming process may be more efficient, and the first and last morpheme-semantic semantics may be activated simultaneously at first glance. In addition, there are a large number of ambiguous morphemes (morphemes with more than one meaning) in Chinese compound words, and the specific semantics of ambiguous morphemes can only be determined in the whole word access stage, which means that semantic activation of ambiguous morphemes may bring more cognitive load, and the whole word path will become the dominant path. Therefore, considering the particularity of Chinese morpheme, in order to further explore the processing mechanism of Chinese compound words, it is necessary to further study the interaction mechanism between morpheme semantic and whole word meaning activation in the process of Chinese compound word recognition.For the purpose, this study takes reversible words as experimental materials and combines EEG technology to explore the influence of ambiguous morpheme semantics (same and different from target words) and ambiguous morpheme position (first and last) in prime words on the lexical recognition of target words under different masking priming conditions. The results show that the last ambiguous morphemes induce more N250 components in the frontal region than the first ambiguous morphemes. When the ambiguous morpheme is located at the last, the semantics of the ambiguous morpheme in the prime word and the ambiguous

morpheme in the target word generate more N400 components than the same conditions, but when the ambiguous morpheme is located at the first, there is no significant difference. The results show that in the prelexical phase of Chinese word recognition, subjects can pay attention to the two morphemes of two-word compound words, after which the whole word meaning and the first morpheme meaning are activated, the generation of the last morpheme meaning is later than the whole word meaning activation.

中文阅读中的预测性效应和词频效应：来自眼动和生存分析的证据

摘 要 自上而下的语境预测性信息和自下而上的词频信息在结果对阅读理解具有重要作用。拼音文字中有少量证据表明预测性和词频信息的加工是相互影响的，但更多证据支持两者独立影响词汇识别。然而，中文阅读中预测性信息加工的时间进程，以及预测性和词频究竟是如何影响词汇加工的尚不清楚。因此，本研究采用 2(预测性：可预测 vs. 不可预测)x2(词频：高频 vs. 低频)的被试内设计来探讨这一问题。结果发现，预测性和词频在所有指标上均显著，但两者的交互作用不显著。进一步生存分析发现，可预测和不可预测条件的分离点在注视时间为 83ms 时，高频和低频条件的分离点在注视时间为 154ms 时。这说明预测性和词频对注视时间的影响在词汇加工的早期阶段就已经发生，并且两者相对独立地对信息处理产生影响。

关键词 预测性，词频，生存分析，眼动

Predictability and Frequency Effect During Chinese Reading: Evidence from Eye Movements and Survival Analysis

Abstract：Top-down contextual information and bottom-up frequency information play an important role in reading. Although there are some evidences to show that word frequency and word predictability produced an interactive effect on lexical processing in alphabetic reading, most studies have demonstrated an additive effect of these two factors. However, it is still unclear that the time course of word predictability effect and the influence of predictability and frequency on lexical processing in Chinese reading. Accordingly, the present study used a 2 (predictability: predictable vs. unpredictable) × 2 (word frequency: high-frequency vs. low-frequency) within-subject design to address this issue. The results showed robust predictability effect and frequency effect across all measures. More Crucially, no reliable interaction between word predictability and word frequency was observed. Extending this finding, the present study further employs a survival analysis to demonstrate a significant influence of predictability on fixation duration as early as 83 ms, and frequency on fixation duration as early as 154 ms from the start of fixation. The current results indicated that word predictability and word frequency produced an additive influence during the early stage of lexical processing in reading.

近期生活压力与大脑功能连接的关系：童年虐待调节作用的纵向研究

罗菁菁　陈圆圆　朱键军（通讯作者）
广州大学教育学院早期环境与脑发展研究中心，广州，510006，jianjunzhu722@gmail.com

摘 要　本研究旨在调查童年虐待是否调节了前突显网络（ASN）、中央执行网络（CEN）、默认模式网络（DMN）和情绪调节网络（ERN）这四个关键脑网络内以及网络间的静息态功能连接与近期生活压力之间的关系，以发展针对有童年虐待史青少年的心理保护策略。采用磁共振成像（MRI）扫描技术，在两个特定时间点（IUA1 和 IUA2）对被试进行了检测，并通过功能性磁共振成像（fMRI）测量静息态功能连接。在 IUA1 使用儿童期虐待问卷（CTQ）对童年虐待进行评估，在 IUA2 之前至少两个月的时间使用生活事件问卷（LEQ）对近期生活压力进行评估。研究结果显示，童年虐待调节了近期生活压力与 ASN 内连接（β=0.209, pFDR=0.050）和 ERN 内连接（β=0.245, pFDR=0.028）之间的关系。此外，近期生活压力与童年虐待在 ASN-DMN（β= 0.288, pFDR=0.021）、ASN-CEN（β= 0.253, pFDR=0.025）、ASN-ERN（β= 0.280, pFDR=0.021）、DMN-ERN（β= 0.237, pFDR=0.031）和 CEN-ERN（β= 0.236, pFDR=0.028）网络间存在显著的交互作用。总体而言，在童年时期遭受较高程度虐待的青少年中，近期生活压力较大与网络连接性增强呈纵向相关。本研究揭示了压力敏感模型的潜在神经机制，并有助于制定预防策略和干预措施，以减轻童年虐待对个体大脑发育和身心健康的持久影响。

Childhood Abuse's Role in Modifying the Association between Recent Life Stress and Resting-State Network Connectivity

Abstract：This study aimed to examine the potential modulation of quiescence within and between four key brain networks—the anterior salience network (ASN), the central executive network (CEN), the default mode network (DMN), and the emotion regulation network (ERN)—by childhood abuse. Furthermore, the study sought to elucidate the interaction between functional connectivity and recent life stress in order to develop psychological protective strategies for adolescents who have a history of childhood abuse. Magnetic resonance imaging (MRI) scans were conducted at two specific time points (IUA1 and IUA2), and resting-state functional connectivity was measured using functional magnetic resonance imaging (fMRI). Childhood abuse was assessed with the Childhood Trauma Questionnaire (CTQ) at IUA1, while recent life stress was evaluated using the Life Events Questionnaire (LEQ) at least two months prior to IUA2. The findings revealed that childhood abuse moderated the association of recent life stress with within-network of ASN (β= 0.209, pFDR=0.050) and ERN (β= 0.245, pFDR=0.028). Additionally, recent life stress significantly interacted with childhood abuse to be associated with between-network of ASN-DMN (β= 0.288, pFDR=0.021), ASN-CEN (β= 0.253, pFDR=0.025), ASN-ERN (β= 0.280, pFDR=0.021), DMN-ERN (β= 0.237, pFDR=0.031) and CEN-ERN (β= 0.236, pFDR=0.028). In summary, the study provides evidence that greater recent life stress is longitudinally associated with heightened network connectivity among adolescents who have experienced higher levels of childhood abuse. These findings shed light on the underlying neural mechanisms of the stress-sensitivity model and have important implications for the development of prevention strategies and interventions aimed at mitigating the enduring effects of childhood abuse on brain development, as well as an individual's physical and mental health.

摘 要

背景：获取快乐对于日常的幸福感十分重要。在精神分裂症和重度抑郁症患者中，体验快乐能力的缺损，即快感缺失，往往严重影响着他们的社会功能。目前的实证研究在精神疾病对应的亚临床群体，如社会快感缺失特质和亚临床抑郁特征群体中也发现了一定程度的快感缺失。近期的理论框架认为，快感缺失作为一个多维结构，包括情绪体验、动机等多个部分。然而，与丰富的临床跨诊断研究不同，在亚临床群体中，目前仍没有依托快感缺失的多维框架进行的比较研究，尚不清楚不同亚临床群体的快感缺失表现特点，以及群体间是否存在差异。

方法：研究共招募 35 名社会快感缺失特质个体(Social Anhedonia, SA)、55 名亚临床抑郁特征个体(Subsyndromal Depression, SD)、20 名快感缺失与抑郁共同特征个体(Co-occurrence of social anhedonia and subsyndromal depression, CO)和 47 名低分对照个体(Controls, CN)(Mean Age= 20.46 years, SD Age = 1.99 years)。所有被试均通过中文版快感缺失量表(CSAS)、中文版病人健康问卷(PHQ-9)以及中文版贝克抑郁量表(BDI-I)进行筛选，并被邀请完成中文版时间性愉悦体验量表(TEPS)，通过 *Pavlovia* 实验平台完成金钱奖赏延迟(MID)任务、社会奖赏延迟(SID)任务。

结果：（1）在情绪体验维度上，SA、SD、CO 的抽象期待愉悦体验均显著低于 CN；SA 和 CO 组在具象期待、具象即时、抽象即时愉悦体验上也显著低于 CN，而 SD 则与 CN 无显著差异；（2）在动机维度上，均未发现亚临床样本相对对照组的动机强度差异；SD 与 CO 在面对社会性奖赏时，无显著的趋近动机和回避动机，但面对金钱性奖赏时，趋近动机和回避动机均显著；但 SA 和 CN 在面对两种奖赏时均有显著的趋近动机。

结论：研究初步发现亚临床个体均有异常较低的抽象期待愉悦体验。此外，亚临床抑郁个体和共同特征个体表现出针对社会性奖赏的特异性动机异常。本研究进一步揭示了亚临床群体在情绪体验维度和动机维度的快感缺失特点，未来需要结合跨诊断临床研究，考察快感缺失发展的潜在病理机制。

***Abstract*：**

Background Accessing pleasure is of vital significance for daily well-being. However, this ability to experience pleasure is reduced in patients of schizophrenia and major depressive disorder, a symptom known as anhedonia that has a severe impact on their social functions. Empirical findings suggest that anhedonia is also manifested in people with subclinical features such as high social anhedonia and subsyndromal depression. Recent theoretical framework suggests that anhedonia is a multidimensional construct comprising emotional experience, motivation and other related dimensions. However, few studies have adopted a multidimensional framework to investigate anhedonia performances in subclinical samples. As a result, the features of anhedonia in individuals with subclinical traits and potential differences between these traits remain unclear.

Methods This study recruited 35 participants with high social anhedonia (SA), 55 participants with subsyndromal depression (SD), 20 participants with co-occurrence of both traits (CO), and 47 low levels of both traits (CN) (Mean Age= 20.46 years, SD Age = 1.99 years). All participants were screened by the Chinese versions of the Chapman Social Anhedonia Scale, the Patient Health Questionnaire and the Beck Depression Inventory. They were then invited to complete the Temporal Experience of Pleasure Scale (TEPS), the Monetary Incentives Delay (MID) Task and the Social Incentives Delay (SID) Task through the *Pavlovia* platform.

Results Our main results showed that (1) regarding emotional experience, participants with SA, SD, CO reported significantly lower abstract anticipatory pleasure than CN. SA and CO reported lower concrete anticipatory, concrete consummatory and abstract consummatory pleasure than CN participants; (2) regarding motivation, all participants with SA, SD and CO showed no significant difference to CN participants. All participants with SD and CO showed no significant approach and avoidance motivation specifically in response to social incentives. However, significant approach motivation is observed in SA and CN participants for both incentives.

Conclusion These preliminary findings suggest that people with SA, SD and CO exhibited lower abstract anticipatory pleasure compared to CN. Moreover, people with SD and CO also exhibited specific impairment in response to social incentives. Taken together, these findings characterize the multidimensional features of anhedonia performances of subclinical samples with SA, SD and CO. Future study adopting a transdiagnostic approach recruiting clinical patients are needed to further examine the underlying pathological mechanism of anhedonia.

言语和空间工作记忆对长距离回视的影响：眼动研究

杨格[1] 王敬欣[12]（通讯作者）

1 天津师范大学，天津，300374

2 天津师范大学心理学部，天津，300374，wjxpsy@126.com

摘 要 在阅读过程中回看之前已经读过的内容被称为回视。目标词处于当前视野范围之外的回视被称为长距离回视，在这种情况下对目标词位置的确定需要记忆的引导，回视的引导过程通过一个首次眼跳以及后续的若干个修正眼跳完成。修正眼跳阶段究竟是由言语因素引导还是空间因素引导，目前仍没有定论。采用 2 (目标词位置：前半句、后半句)×2 (回视句语序：原序、乱序)的两因素被试内设计为基础实验，以区分回视过程中的不同阶段。同时，测量并分别筛选言语和空间工作记忆能力较强和较弱的被试作为两

个组间变量。选取首次回视误差、累计回视距离、回视反应时间等眼动指标，探究汉语阅读长距离回视中修正眼跳的引导机制。结果表明，目标词位于前半句时，原序和乱序的首次回视误差差异不显著，但累计回视距离差异显著，表明乱序对回视的影响主要发生在修正眼跳阶段。在累计回视距离上，言语工作记忆的主效应不显著但空间工作记忆的主效应显著，表明高低言语工作记忆者的回视效率相近，而高空间工作记忆者比低空间工作记忆者的回视效率更高。在回视反应时上，乱序与言语工作记忆的交互作用不显著，而乱序与空间工作记忆的交互作用显著，简单效应分析表明乱序对高空间工作记忆能力者回视效率的干扰更大。结果表明，汉语阅读中长距离回视的修正眼跳阶段受空间工作记忆的影响，支持空间编码假设。

Effects of verbal and spatial working memory on long regression: an eye-movement study

Ge Yang, Jingxin Wang(Corresponding author)
（Academy of Psychology and Behaviour, Tianjin Normal University, Hexi District, Tianjin 300374, China）

Abstract: Looking back at what has been read before during reading is called regression. When the target word of the regression is outside of the visual field, it is called long regression, and this situation requires memory guidance. This guidance is typically programmed to be accomplished by an initial regression accompanied by several corrective saccades.There is still no definitive conclusion whether the corrective saccades is guided by verbal or spatial factors.In this study, initial regression error, cumulative regression size, reaction time and other regression indicators were adopted to explore the guidance mechanism of corrective saccades in Chinese reading long distance. A two-factor within-subject design of 2 (target word position: first half-sentence, second half-sentence) × 2 (text order of non-target words in regression sentence: original order, disordered order) was used as the base experiment. In addition, verbal working memory and spatial working memory were measured for all subjects, and the high and low groups were screened separately as between-group variables for both groups.The results showed that the difference in initial regression error between the original and disordered order was not significant when the target word was located in the first half-sentence, but the difference in cumulative regression size was significant, indicating that the effect of disordered order on regression was at the stage of corrective saccades. The main effect of verbal working memory was not significant but the main effect of spatial working memory was significant for the cumulative regression size. The interaction between text order and verbal working memory was not significant but the interaction between text order and spatial working memory was significant on the reaction time.The results indicated that the corrective saccades for long regression in sentence reading were influenced by spatial working memory, supporting the spatial coding hypothesis.

信息模糊性与群体压力对从众行为的影响及其神经机制

杨婧[1]　张一凡[1]　李庆一[1]　李葆明[1]　李政汉[1,2,3]（通讯作者）
[1] 杭州师范大学基础医学院生理学系脑科学研究所，杭州，311121，lizh@hznu.edu.cn
[2] 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”，杭州，311121
[3] 浙江省认知障碍评估技术研究重点实验室，杭州，311121

摘 要 **背景：**信息的模糊性与群体压力是影响个体从众行为的重要因素。前人研究发现，越模糊的信息、越大的群体压力，越容易导致个体的从众行为。在现实场景中，信息模糊性与群体压力往往会同时作用于个体的从众行为，然而两者的交互作用及其背后的神经机制尚不明确。探明信息模糊性与群体压力对个体从众的行为影响及其神经机制，不仅可以揭示两者对从众行为的共同影响，还可以帮助个体理解舆论的形成，减少盲从。**方法：**本研究共招募 48 名健康被试，基于改编的多人决策任务，采用事件相关电位（event-related potential, ERP）技术，探究信息模糊性与群体压力对个体从众行为的影响机制。实验采用 2（信息模糊性：清晰、模糊）×3（群体压力：高、中、低）的被试内设计，因变量为被试从众行为的发生概率。**结果：**行为结果表明，信息模糊性：$F(1,47) = 14.13$, $p < .001$ 与群体压力：$F(2,94) = 19.64$, $p < .001$ 的主效应均显著，且两者的交互作用显著，$F(2,94) = 11.75$, $p < .001$。简单效应分析发现，只有在群体压力高的条件下，清晰的信息会降低个体从众的概率。脑电结果发现，与信息清晰条件相比，信息模糊条件下额叶和顶叶的 N200 和 N450 脑电成分的波幅均显著更负（$ps < .001$）。在中、高群体压力时，额叶的反馈相关负波（feedback-related negativity, FRN）更负，并且两个条件之间没有显著差异。当群体压力低时，顶叶 P3 成分呈现出更正的波幅，其他条件下没有发现显著差异。**结论：**信息模糊性与群体压力会共同影响个体的从众行为，在信息模糊情境下，群体压力高时，个体更容易发生从众行为，但在中度和低度群体压力下，个体发生从众行为的发生概率不受信息清晰度的影响。此外，模糊信息诱发了个体更负的 N200 和 N450 脑电成分，表明个体此时产生了更强的认知冲突，并投入了更多的认知资源来解决冲突。中度及以上的群体压力会诱发个体更大的反馈相关负波，使个体产生负性情绪体验。而低群体压力诱发了更大的 P3 波幅并带来正性情绪体验。未来可以进一步探究个体自尊水平等潜在因素在其中的影响，有助于我们更加全面深刻地理解从众行为。

The impact of information ambiguity and group pressure on conformity behavior and its neural mechanisms

Jing Yang[1] Yifan Zhang[1] Qingyi Li[1] Baoming Li[1] Zhenghan Li[1,2,3*]

[1] Institute of Brain Science and Department of Physiology, School of Basic Medical Sciences, Hangzhou Normal University, Hangzhou, China, 311121, lizh@hznu.edu.cn

[2] Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University, Hangzhou, China

[3] Zhejiang Key Laboratory for Research in Assessment of Cognitive Impairments, Hangzhou, China

***Abstract*: Background:** The ambiguity of information and group pressure are crucial factors that impact individual conformity behavior. Previous researches have demonstrated that individuals are more likely to engage in conformity behavior when the information is ambiguous and the group pressure is high. In real-life scenarios, both information ambiguity and group pressure often simultaneously affect individual conformity behavior. However, the interaction effect between these two factors and the underlying neural mechanisms remain unclear. Investigating the effects of information ambiguity and group pressure on individual conformity behavior and their neural mechanisms can not only reveal the common effects of both on the conformity behavior, but also enhance individuals to understand the formation of public opinion and reduce blind conformity. **Methods:** In this study, a total of 48 healthy subjects were recruited to investigate the mechanisms of information ambiguity and group pressure on individual conformity behavior based on an adapted joint decision-making task, with the event-related potential (ERP) technique. The experiment used a 2 (information ambiguity: clarity, ambiguity) x 3 (group

pressure: high, medium, low) within-subjects design, the dependent variable was the probability of subjects' conformity behavior. **Results:** The behavioral results indicated significant main effects for information ambiguity, $F(1,47) = 14.13$, $p < .001$, and group pressure, $F(2,94) = 19.64$, $p < .001$, the interaction effect between the two factors was significant, $F(2,94) = 11.75$, $p < .001$. Simple effect analysis revealed that only under the conditions of high group pressure, the ambiguity of information reduced the probability of individual conformity behavior. The neurophysiological results revealed that compared to the clear information condition, the amplitudes of N200 and N450 components in the frontal and parietal lobes were significantly more negative in the condition of ambiguous information ($ps < .001$). Under the conditions of medium and high group pressure, the feedback-related negativity (FRN) in the frontal lobe was more negative, with no significant difference observed between the two conditions. When group pressure was low, the P3 component in the parietal lobe showed a more positive amplitude, with no significant differences found in other conditions. **Conclusion:** Information ambiguity and group pressure jointly impact individuals' conformity behavior. When faced with ambiguous information, individuals are more likely to engage in conformity behavior when group pressure is high. However, the probability of conformity behavior is not affected by information ambiguity under conditions of moderate and low group pressure. In addition, ambiguous information elicits more negative N200 and N450 neurophysiological components, indicating that individuals experience stronger cognitive conflict and allocate more cognitive resources to resolve the conflict. Moderate and high levels of group pressure induce larger feedback-related negativity, leading to negative emotional experiences for individuals. In contrast, low group pressure elicits larger P3 amplitudes and promote positive emotional experiences. In the future, the impact of potential factors such as individual self-esteem levels in this context can be further explored, which will help us to have a more comprehensive and deeper understanding of conformity behavior.

摘 要 注意缺陷多动障碍 (ADHD) 儿童往往更难以在复杂听觉场景中进行目标言语识别。在复杂听觉场景中，噪音掩蔽声与目标声在物理上重合，从而产生能量掩蔽；而语音掩蔽声除了能量掩蔽，其和目标声的相似性还会带来信息掩蔽。去掩蔽的重要知觉线索之一是空间线索，即目标声和掩蔽声被知觉在不同位置时更易被识别。因此，本研究探索 ADHD 儿童在不同类型掩蔽刺激下言语识别能力的异常，以及他们能否利用空间线索来提高言语识别能力。本研究采集了 19 名 ADHD 儿童和 19 名健康儿童在掩蔽声中的目标言语识别阈限。掩蔽声为噪音掩蔽声或语音掩蔽声，且其和目标声的知觉空间分离 (对侧耳) 或不分离 (同侧耳)。结果显示，在噪音掩蔽情形下，两组儿童间差异不显著。在语音掩蔽情形下，空间不分离时，ADHD 儿童的言语识别能力显著低于健康儿童；而空间分离时，ADHD 儿童的言语识别能力恢复，与健康儿童无显著差异。此外，ADHD 儿童在语音掩蔽下，无论空间是否分离，其识别阈限与 Conners 儿童行为量表中的多动指数、学习问题、冲动-多动都呈显著相关。这些结果表明，ADHD 儿童在复杂听觉场景下难以抵抗信息掩蔽，但可以利用空间线索来补偿并提升目标言语识别能力。因此，建议今后使用空间线索来

帮助 ADHD 儿童进行言语识别和学习交流。

Abstract：Children with Attention Deficit Hyperactivity Disorder (ADHD) commonly face learning and social communication challenges, making it difficult to recognize speech in complex auditory scenes. Auditory masking effects in speech recognition tasks can be divided into energetic masking and informational masking. While energetic masking arises from overlapping sounds in the time and frequency domains, informational masking is based on the similarity between sounds and is regulated by cognitive resources. Both speech maskers and noise maskers can produce energetic masking, but informational masking can only be produced by speech maskers. Previous studies have shown that spatial cues are one of the perceptual cues that have a de-masking effect, meaning that target and masker sounds from different locations can reduce masking effects. Therefore, this study investigated whether ADHD children could recognize speech better under different types of masking stimuli using spatial cues than healthy children. The experiment recruited 19 diagnosed ADHD children and 19 healthy children. The study used the subjective spatial separation paradigm to measure recognition thresholds under different masking stimuli (speech and noise maskers) and different target-masker spatial states (separated and non-separated). The results showed that under speech masking conditions, ADHD children's speech recognition abilities were significantly lower than healthy children when the subjective spatial states were non-separated, and the differences were restored when spatial states were separated. However, there was no significant difference in recognition thresholds between the two groups under noise masking conditions. In addition, Conners children's behavior scale (parent version) was significantly positively correlated with the speech recognition thresholds of ADHD children under speech masking conditions. These findings suggest that ADHD children are more susceptible to information masking stimuli, but spatial cues can improve their speech recognition abilities and compensate for the negative effects of their susceptibility. In the future, interventions for ADHD children's learning, communication, and speech recognition should consider the use of spatial cues.

啮齿动物恐惧范式中如何表征动物的主观恐惧

——一项关于恐惧测量指标的系统综述和元分析

饶娇娇 包莉莉 俞德霖 郑本汇源 尹彬（通讯作者）
福建师范大学心理学院，福州，350108，byin@fjnu.edu.cn

摘 要 啮齿动物模型是研究精神疾病的重要范式，然而使用最普遍的条件恐惧范式大多以简单外显行为为测量指标，临床治疗成效不足和新理论的提出涌现了对主观恐惧研究的迫切需求。为了阐明啮齿动物主观恐惧表征的神经行为基础，我们系统检索了啮齿动物恐惧条件反射范式的相关研究，对常见的恐惧指标如僵直行为、条件抑制反应、恐惧增强惊跳反射、自主神经系统反应、22kHz 超声波呼叫等进行文献编码。通过分析自 1960 年以来 5054 篇涉及啮齿动物恐惧行为评估的文章，我们发现心理与神经科学领域呈现出从多种恐惧指标转向集中于观测僵直行为这一单一指标的趋势，进而对该变化及背后的理论演进做出系统综述。在此基础上，我们筛选出 61 篇在一个研究中同时报告僵直行为和另一种恐惧指标的文献。我们假定同一研究中两种不同测量指标的相关性反映了这两种指标是否表征同一功能，而这两种指标的变化幅度差异能揭示二者的作用机制或神经回路的异同。具体而言，我们以僵直行为为参照，对该指标与 22kHz 呼叫、条件抑制反应、心率、平均动脉压和排泄五项指标之间进行了相关分析以及在不同条件下变化幅度差异的三水平元分析。研究结果表明：1.系统综述的结果发现条件抑制和僵直行为变化高度一致；自主神经系统反应作为恐惧测量指标会受到多种生理因素的影响，与僵直行为的变化并不总是同步；杏仁核及 PAG 脑区受损能够减少各种恐惧反应，损伤基底前脑胆碱能系统选择性影响 22kHz 呼叫而不影响僵直；恐惧条件反射范式中不同阶段中刺激参数的呈现和改变对僵直和 22kHz 超声呼叫的影响不一致，体现出防御策略和认知评价过程的分离；2. 相关分析发现僵直行为和操作性行为及 22kHz 呼叫之间高相关，而僵直行为与自主神经系统反应之间低相关；3. 三水平元分析的结果发现，在行为分型处理方式、不同实验测试阶段和刺激条件的变化下僵直行为与 22kHz 呼叫之间的变化幅度出现分离；损伤大脑 PAG 和 vmPFC 区域使僵直行为和心率及平均动脉压之间的变化幅度出现分离。这些结果表明啮齿动物恐惧模型中也存在客观防御行为与主观恐惧体验的分离，并且二者之间的转换可能是基于一个阈值模型来进行的。通过进一步的努力，该研究有助于为恐惧相关精神障碍的临床干预建立理论基础。

What May Represent Subjective Fear in Rodent Models?

A Systematic Review and Meta-Analysis of Fear Indicators

RAO Jiaojiao, BAO Lili, YU Delin, ZHENG Benhuiyuan, & YIN Bin*
School of Psychology, Fujian Normal University, Fuzhou 350108
*Corresponding email: byin@fjnu.edu.cn

***Abstract*:** The rodent model is an important paradigm for studying mental disorders; however, the most commonly used fear conditioning paradigm mostly relies on simple overt behaviors as fear indicators. This has led to insufficient clinical treatment efficacy, prompting a growing need for studying subjective fear experiences. To elucidate the neural and behavioral basis of subjective fear representation in rodents, we conducted a systematic review on studies related to rodent fear conditioning paradigms, encoding common fear indicators such as freezing behavior, conditioned suppression, fear-potentiated startle, autonomic nervous system responses, and 22kHz ultrasonic vocalizations. By analyzing 5054 articles on rodent fear assessment published since 1960, we observed a

trend in the field of psychology and neuroscience, shifting from various fear indicators to a focus on observing freezing behavior as a singular measure. We hence study the underlying theoretical evolution underlying this trend. Based on this systematic review, we selected 61 articles that reported both freezing behavior and another fear indicator in the same study. We hypothesized that the correlation between two different fear indicators in the same study reflects whether these two indicators represent the same function, whereas their differences in magnitudes reveal the similarities and differences in their mechanisms or neural circuits. Specifically, using freezing behavior as a reference, we conducted correlation analyses between this indicator and the other five indicators (ultrasonic vocalizations, conditioned suppression, heart rate, mean arterial pressure, and defecation) and compared the magnitude differences under different conditions using three-level meta-analyses. The research findings indicate: 1. The systematic review revealed a high consistency between conditioned suppression and freezing behavior changes. However, autonomic nervous system responses, as fear indicators, are influenced by various physiological factors and do not always synchronize with freezing behavior changes. Lesions in the amygdala and PAG brain regions can reduce various fear responses, and damage to the basal forebrain cholinergic system selectively affects 22kHz ultrasonic vocalizations but not freezing behavior. In the fear conditioning paradigm, the presentation and alteration of stimulus parameters at different stages have inconsistent effects on freezing behavior and 22kHz vocalizations, indicating a dissociation between defensive strategies and cognitive appraisal processes. 2. The correlation analysis found a high correlation between freezing behavior and conditioned suppression behavior as well as 22kHz ultrasonic vocalizations, but a low correlation between freezing behavior and autonomic nervous system responses. 3. The results of the three-level meta-analysis also revealed that under different behavioral classifications, different experimental stages, and different experimental parameters conditions, the magnitude of freezing behavior and 22kHz ultrasonic vocalizations separated, whereas damage to the brain PAG and vmPFC areas caused a separation between freezing behavior and the two autonomic nervous system indicators, heart rate and mean arterial pressure. This study substantiates the presence of a two-system model of fear in rodent subjects, suggesting that the transition between objective and subjective fear behaviors could operate on a threshold-based model. With further efforts, this study contributes to establishing a theoretical foundation for the clinical management of fear-associated mental disorders.

冲突适应的形成机制：线索预期和经验习得及其权重变化

高宇 [1]　　向玲 [2](通讯作者)　　王宝玺 [3]

[1] 江西师范大学心理学院, 南昌 330022, 中国

摘 要 个体在面对一系列冲突时，认知系统会根据实际需要调整控制水平，体现出冲突适应。既往研究发现，内隐的经验习得和外显的线索期望都可以引发冲突适应，那么二者同时存在时是否会相互作用，影响冲突控制调整？本研究以组块比例一致性效应为指标，通过启动-目标数字判断（实验一）和数值-字号 Stroop（实验二）两种冲突任务，以广义线性混合模型拟合简化组块下的反应时，方差分析对比前后期脑电成分幅值，探究外显线索提示怎样调节基于内隐经验形成的冲突适应。反应时结果发现，在简化组块下，组块比例一致性效应随试次位次逐渐增大，但有线索提示后，经验积累的作用削减，几乎消失。ERP 结果在排除了联结学习的可能后，均发现了冲突相关早期负波和晚期正波的组块比例一致性效应，同样发

现有线索提示后，经验积累的权重变小，效应消失。结果表明，对于内隐经验的学习和基于外显线索的预期在冲突适应的形成中均发挥着重要作用，但运用外显信息的同时，经验学习作用的权重会降低，内隐习得过程弱化，二者在各自模式内形成冲突适应，两种冲突适应来源的作用不可加，具有领域特殊性。

Formation Mechanism of Conflict Adaptation: Cue-based Expectations, Experiential Learning, and their Weighting Dynamics

GAO Yu[1] XIANG Ling[2] (corresponding author) WANG Baoxi[3]

[1] *School of Psychology, Jiangxi Normal University, Nanchang 330022, China*

Abstract：When individuals face a series of conflicts, their cognitive system will adjust the level of control according to actual needs, reflecting conflict adaptation. Previous research has found that both implicit experiential learning and explicit cue expectations can trigger conflict adaptation. However, it remains unclear whether they interact with each other and affect conflict control adjustment when they coexist. In this study, we used the proportion congruent effect as an indicator and utilized two conflict tasks - the prime-target judgment task (Experiment 1) and the numerical Stroop task (Experiment 2). We fitted reaction time data under a simplified blocks using generalized linear mixed models and compared the amplitude of brain components with variance analysis in order to explore how explicit cue instructions modulate conflict adaptation based on implicit experiential learning. The results of reaction time showed that under the simplified blocks, the proportion congruent effect increased gradually with trial position. However, this effect was greatly reduced and almost disappeared with cue instructions, indicating that the influence of accumulated experience was diminished. The ERP results, after excluding the possibility of associative learning, revealed the presence of the proportion congruent effect in terms of conflict-related early negative deflection and late positive potentials. Similarly, with the cue instructions, the weight of experiential learning decreased and the effect disappeared. These findings suggest that both implicit experiential learning and explicit cue-based expectations play important roles in the shaping of conflict adaptation. However, while utilizing explicit information, the weight of experiential learning decreases, weakening the implicit learning process. Each mode forms conflict adaptation within its own domain, and the effects from these two sources of conflict adaptation are not additive, indicating domain specificity.

物理环境秩序对审美愉悦的影响及其机制：来自行为与脑电的证据

陈柳 杜邦 程雪晴 李开云 贾凡路 侯婷婷

济南大学教育与心理科学学院，济南，250022，sep_liky@ujn.edu.cn

摘 要 审美愉悦是个体欣赏自然风景或艺术品时产生的愉悦体验。审美体验模型提出外在所处周围环境或者情境会影响审美主体对审美客体的审美愉悦体验。环境中的整齐混乱程度也称环境秩序是对个体心理和行为有重要影响，以往研究者未关注到物理环境秩序对个体审美愉悦的影响及作用机制。本研究采用行为实验和 ERP 技术，通过四个实验来系统探讨物理环境秩序影响个体审美愉悦的认知机制、加工进

程以及个体差异。实验 1 探究有序和无序物理环境图片启动个体的秩序感，对其具象和抽象艺术作品审美愉悦的影响，发现物理环境的有序和无序只影响抽象艺术作品的审美愉悦评分，而不影响具象艺术作品的审美愉悦评分。基于认知加工流畅性理论，实验 2 和实验 3 聚焦探讨物理环境秩序影响抽象艺术作品审美愉悦的机制。实验 2 探究物理环境秩序对不同流畅性抽象艺术作品审美愉悦的影响，发现物理环境秩序可以调节流畅性类型对抽象艺术作品审美愉悦的影响，并且通过主观流畅度改变影响审美愉悦。实验 3 采用 ERPs 技术，探究物理环境秩序影响抽象艺术作品审美愉悦的具体加工阶段，发现有序和无序环境图片启动下，抽象艺术作品诱发的 P2(180~260 ms; P3/Pz/P4/PO3/POz/PO4)、N2(220~300 ms; F3/Fz/F4/FC3/FCz/FC4)波无显著差异；在无序环境下，低流畅性作品诱发的 P3((300~500 ms; P3/Pz/P4/PO3/POz/PO4)、LPP(500~800 ms; P3/Pz/P4/PO3/POz/PO4)波幅显著高于高流畅性艺术作品。根据控制感理论和无序的“随机世界”理论，实验 4 进一步考察高低控制感特质的个体在环境秩序影响抽象艺术作品审美愉悦程度上是否存在差异，结果发现高低控制感个体在无序环境图片启动下的抽象艺术作品审美愉悦得分都显著高于有序环境图片启动条件，但两类群体之间的抽象艺术审美愉悦得分不存在显著差异。本研究表明物理环境秩序对艺术作品审美愉悦的影响只限于抽象艺术作品，其作用机制是通过认知加工流畅/不流畅来进行的。

The influence of physical environmental order on aesthetic pleasure and its mechanism: ERP and behavioral evidences

CHEN Liu, DU Bang, CHENG Xueqing, LI Kaiyun, JIA Fanlu, HOU Tingting
(*School of Education and Psychology, University of Jinan, Jinan* 250022, *China*)

***Abstract*:** Aesthetic pleasure is the pleasant experience produced when appreciating natural scenery or works of art. In the past, researchers mainly focused on the effect of physical environment on aesthetic pleasure, but ignored the effect of physical environment order. The present study used figurative and abstract art works as experiment materials, uses behavioral experiments and ERP technology to explore the cognitive mechanisms, processing processes, and individual differences by which physical environment order affects aesthetic pleasure through four experiments.Experiment 1 screened the research materials--figurative and abstract art works, explored the impact of physical environment order on the aesthetic pleasure of figurative and abstract art works, and found that the physical environment order only affected the aesthetic pleasure of abstract art works, but had no effect on the figurative art works.Therefore, experiment 2 and experiment 3 only used abstract art works as experimental materials, and took the fluency of art works as independent variable. Experiment 2 explored the cognitive mechanism and the influence of physical environment order on aesthetic pleasure of abstract art works with different fluency. The results showed that physical environment order can regulate the influence of fluency on aesthetic pleasure, and affect aesthetic pleasure by the change of subjective fluency. In experiment 3, ERPs technology was used to explore the specific processing stage that physical environment order affecting aesthetic pleasure. It was found that P2 and N2 waves induced by art works had no significant difference between ordered and disordered environments, but in disorder environment, the P3 and LPP waves induced by low-fluency works were significantly higher than those induced by high-fluency works. In experiment 4, the sense of control was used as a trait variable to explore whether the influence of physical environment order on aesthetic pleasure is regulated by sense of control. It was found that regardless of the level of the sense of control, the aesthetic pleasure in the disorderly environment was significantly higher than that in the orderly environment. The conclusions can be drawn: (1) the physical environment order has a significant impact on the aesthetic pleasure of abstract art works,

and the aesthetic pleasure in the disorderly environment is higher than that in the orderly environment; (2) The physical environment order has a greater impact on low-fluency art works than high-fluency art works, and the control processing in the disorderly environment can reduce the disfluency of art works and improve aesthetic pleasure; (3) The sense of control can not regulate the influence of physical environment order on aesthetic pleasure, and the two have independent mechanisms to affect aesthetic pleasure. This study reveals the relationship between physical environment order and aesthetic pleasure, and provides a theoretical basis for improving the aesthetic experience of art works by interfering with environmental order.

Keywords: aesthetic pleasure, physical environment order, fluency, sense of control

妒忌对项目记忆与情景记忆定向遗忘的影响

尹元花 孙茹洁 翁超婷 孙影（通讯作者）

上海师范大学教育学院，上海市，200234，2553597957@qq.com

摘 要　使用定向遗忘范式，通过两个实验，探讨妒忌情绪对妒忌对象的相关项目信息和情景信息定向遗忘的影响，并确定个体与妒忌对象的人际关系、信息效价的调节作用。结果表明，项目材料除消极信息其他条件的信息均产生了定向遗忘效应，而情景材料中的积极和消极信息均未出现定向遗忘效应，且对妒忌对象再认的反应时更短。以上结果表明，妒忌情绪导致对优势他人信息的认知偏向，从而干扰了主动遗忘的加工，且在需要更深层加工的情景信息中更甚。

关键词　妒忌，项目记忆，情景记忆，定向遗忘

The effect of envy on item memory and episodic memory in directed forgetting

YIN Yuanhua, SUN Rujie, WENG Chaoting, SUN Ying

College of Education, Shanghai Normal University, Shanghai, 200234

***Abstract*:** This study employed a directed forgetting paradigm and conducted two experiments to investigate the impact of jealousy on directed forgetting of relevant item information and contextual information related to the jealous target, as well as to determine the moderating effects of interpersonal relationships and information valence. The results indicated that, except for negative information under certain conditions, directed forgetting effects were observed for item materials. However, no directed forgetting effects were found for both positive and negative information in the contextual materials, and participants exhibited shorter reaction times in recognition of the jealous target. These findings suggest that jealousy emotion leads to a cognitive bias toward advantageous others, thus interfering with the processing of proactive forgetting, especially in situations that require deeper processing of contextual information.

***Keywords*:** envy, item memory, episodic memory, directed forgetting

伪损伤左侧额下回和左侧颞叶后部不影响语言控制但影响非语言控制：来自经颅磁刺激的证据

摘 要 随着时代的发展，懂得多门语言的人越来越多。针对双语者乃至多语者是如何在不同的语言中切换自如，主流的观点认为在语言产生的过程中涉及到语言控制这一功能，而语言控制和一般领域认知控制之间的关系一直是双语领域的重要问题。前人研究大多通过考察双语者在语言控制任务和非语言控制任务上行为表现的相关程度或者脑激活的相似程度来回答该问题。然而，这些相似的行为指标或者脑区激活揭示的只是相关性，部分可能是在“滥竽充数”（即伴随性的活动），而不是真正“负重前行”（即具有因果致使性[causality]）。本研究招募 33 名汉英非平衡双语者（其中 19 名女性），使用非侵入性的经颅磁刺激（transcranial magnetic stimulation, TMS）技术对他们的左侧额下回（inferior frontal gyrus, IFG）和左侧颞叶后部（posterior temporal lobe, pTL）进行短暂性的伪损伤，考察他们在语言切换任务和非语言切换任务下行为表现的变化（相比于刺激额顶脑区[vertex]作为对照而言）。结果发现：相比于刺激额顶脑区，（1）刺激左侧 IFG 或者左侧 pTL 都没有改变语言切换代价和混合代价；（2）刺激左侧 IFG 增大了非语言切换任务的切换代价反应时，并且改变了非语言切换任务反应时的混合代价不对称性的方向；（3）刺激左侧 pTL 会使得非语言混合代价的错误率变小。这些结果表明左侧 IFG 和左侧 pTL 不负责双语语言控制，但对一般领域认知控制具有不可或缺的支持作用。本研究首次采用 TMS 技术为语言控制不同于一般领域认知控制这一观点提供因果性的证据。

***Abstract*:** An increasing number of individuals can speak more than one language, making understanding

how bilinguals and multilinguals effortlessly switch between different languages matter. The prevailing view suggests that language control plays a crucial role in this process, and revealing the relationship between bilingual language control and domain-general cognitive control is an important issue in the field of bilingualism. Previous research has primarily examined the correlation between performance in language control tasks and non-linguistic control tasks or the similarity in brain activation to address this issue. However, these behavioral or brain activation results only reveal correlations, some of which may be epiphenomenal rather than causally related. The present study recruited 33 Chinese-English unbalanced bilinguals (19 females) and applied non-invasive transcranial magnetic stimulation (TMS) to transiently disrupt their left inferior frontal gyrus (IFG) and left posterior temporal lobe (pTL). We investigated the changes in their performance during language switching tasks and non-linguistic switching tasks compared to stimulation of the vertex as a control condition. The results showed that, compared to stimulating vertex: (1) stimulating the pTL or IFG did not alter language switching costs and mixing costs; (2) stimulating the IFG accelerated reaction times of the switching cost in non-linguistic switching tasks, and changed the direction of reaction time of asymmetric mixing cost in non-linguistic switching tasks. (3) stimulating the pTL led to a lower error rate of mixing cost in non-linguistic switching tasks. These findings suggest that both the IFG and the pTL are not responsible for language control but may contribute to non-linguistic control. This study provides the first causal evidence from TMS for the distinction between bilingual language control and domain-general cognitive control.

Abstract：Suicidal thoughts and behaviors (STB) are one of leading causes of death worldwide. Although literature has consistently reported increased risk behavior in patients with STB and has proposed mood problems as the core of STB, cognitive and affective computational mechanisms underlying increased risky behavior remain unclear. Here, we tested 58 patients with STB (S^+) and 25 without STB (S^-) who have been recruited from adolescent inpatients with affective disorders, in a gambling task with momentary mood ratings where patients were asked to make decisions between certain vs. gamble option. After identifying increased risk behavior in S^+ vs. S^-, we used approach-avoidance prospect theory model and momentary mood model to quantify patients' behavior and mood. Choice data analysis showed that heighted approach motivation mediated an increase in gambling choices with STB severity, suggesting impaired Pavlovian approach system in STB resulting in higher gambling in gains. Mood model showed lower mood sensitivity to certain reward in S^+ than S^-, which further explained increased gambling decisions in STB, offering a mood computational account for increased risk behavior in STB. These results remain significant after controlling for demographic and clinical variables and medication factors. Overall, our findings revealed cognitive and affective computational mechanisms underlying increased risk behavior in STB. This work has important implications for prevention and intervention of suicide, especially for clinical populations.

情景记忆的自我参照效应对价值决策的影响

朱靖涵[1] 王俭勤[2]（通讯作者）

1 复旦大学心理学系，上海，200433

2 复旦大学心理学系，上海，200433，wjq@fudan.edu.cn

摘 要 大量研究表明，自我参照加工会促进个体的情景记忆，而情景记忆能够指导个体进行价值决策。然而，目前尚未有研究直接考察情景记忆的自我参照效应是否能够有助于个体的价值决策。本研究采用联结记忆范式，以奖券游戏的形式，考察了自我参照效应是否会增强奖励经验相关的情景记忆，尤其是刺激-奖励之间的联结记忆，从而使被试在价值决策中表现更好。本研究基于 G. Power 功效分析招募了有效被试 38 名，采用 2（参照条件：自我、他人）× 2（奖励价值：高、低）被试内设计。被试先通过奖券游戏学习了“参照条件-图片-金额”的对应关系，并在 5 分钟的干扰任务后进行了项目记忆与联结记忆测试，最后完成了决策任务。结果发现：（1）对于刺激-奖励联结记忆，被试在自我参照条件下所报告的奖券金额与实际金额之间的误差显著小于他人参照条件下的误差，且被试倾向于在记忆中低估高价值奖券金额，高估低价值奖券金额，形成对于价值的错误记忆；（2）“参照条件”和“价值”在决策偏好上存在交互作用：自我参照条件下，被试选择高价值的比例显著高于低价值（$p<0.001$），但是他人参照条件下差异不显著；（3）被试对自我参照高价值奖券的项目记忆越好，则被试在决策时选择该奖券的比例越高（$r=0.36$，$p=0.028$）；被试对于自我参照高价值奖券的价值联结记忆正确率越高，则被试在两张均为自我参照条件但价值不同的奖券中正确选择高价值奖券的比例越高（$r=0.48$，$p=0.002$）。综上所述，本研究揭示了情景记忆的自我参照效应如何影响个体的价值决策，即自我参照效应可通过提高与自身相关的奖励记忆从而提升个体的决策表现，体现了自我参照效应的适应性功能。

The Influence of self-reference effect of episodic memory on

value-based decision-making

ZHU Jinghan[1], WANG Jianqin[1]
School of psychology, Fudan University, Shanghai 200433, China

Abstract： Numerous research has shown that the self-reference effect promotes information processing, thus improving episodic memory, and the episodic memory can provide people with effective guidance about value-based decision-making. However, few studies have examined whether the self-reference effect of episodic memory could directly help individuals perform better when making value-based decisions. In the form of a lottery game, this study adopted the paradigm of associative memory to investigate whether self-referential processing would enhance the episodic memory that related to reward experiences, especially the associative memory between the stimulus and the reward, leading to better performance in value-based decision-making. Based on the power analysis of G.Power, this study recruited 38 effective participants. The experiment adopted a 2(referential conditions: self and other) ×2(reward value: high and low) within-subjects design. The participants first learned the relationship between "referential condition-picture-value" through a lottery game, and then they conducted item memory and associative memory tests after a 5-minute disorder task. Finally, they completed the decision-making task. The results showed that: (1) For stimulus-reward associative memory, the error between the reported lottery amount and the actual amount under self-referential conditions was significantly smaller than that under other-referential conditions, and participants tended to underestimate high-value lotteries and overestimate low-value lotteries in memory, forming false memories of value. (2) There was an interaction between “referential condition” and “value” on decision preference: under self-referential condition, the proportion of participants choosing high value was significantly higher than that of low value ($p < 0.001$), but the difference was not significant under other-referential condition. (3) The better item memory in self-referential and high-value lotteries, the higher proportion of participants choosing this type of lotteries when making decisions ($r=0.36$, $p=0.028$); The higher accuracy of participants' associative memory for self-referential and high-value lotteries, the higher proportion of correctly choosing high-value lotteries between two lotteries that were both self-referential but had different values ($r=0.48$, $p=0.002$). In conclusion, this study reveals how self-reference effect of episodic memory affects individuals’ value-based decision-making, that is, the self-reference effect can enhance decision-making performance by improving self-related reward memory, which reflects the adaptive function of the self-reference effect.

[3] 浙江省认知障碍评估技术研究重点实验室，杭州，311121

摘要　**背景**：越来越多的研究表明，对分散注意力的信息的抑制可能不受灵活的、自上而下的控制，而是严重依赖于从过去的经验中得出的对事件可能性的预期。然而，关于目标和干扰位置的预期如何影响认知控制的机制尚不清楚。认知控制是指个体为了达到具体的目的和意图， 灵活地、自适应地调动注意资源的心理过程，具体表现为对任务相关刺激的加工增强和对任务无关刺激的加工抑制。前人围绕认知控制的调

节机制开展了大量研究，然而大多围绕加工增强与加工抑制的是非之争展开，且并未得到一致的结果。我们基于以往的研究提出假设，认为认知控制的调控机制并非一成不变或非此即彼的，而是会受到对目标和干扰预期的影响，具体采用哪种调节策略会根据当前的信息进行灵活调整。**方法：**本研究采用改编的空间注意资源分配任务，进行了单因素被试内设计，自变量为对目标和干扰的预期，具体通过目标刺激与干扰刺激的比例来表现，包括七种不同的水平分别为 1:1、1:3、1:5、3:1、3:3、5:1、6:6，其中 1:1 表示目标刺激和干扰刺激都固定出现在同一个位置，6:6 表示目标和干扰刺激均完全随机呈现，每个条件重复六次再切随机切换到其他条件。实验包括 5 个组块，每个组块包括 252 个试次，涵盖上述 7 个条件及每个条件可能出现的 6 种位置。共有 29 名被试参与了本研究。**结果：**目标与干扰刺激比例的主效应在反应时，$F(6,11) = 112.01$，$p < .001$，和正确率上 $F(6,11) = 16.28$，$p < .001$ 均显著。成对比较结果发现，1:1 水平反应时显著小于 1:3 与 1:5 水平下的反应时；1:1 水平的正确率显著高于 1:5 水平的正确率（$ps < .05$）。此外，1:1 水平下的反应时显著小于 3:1 与 5:1 条件下的反应时，1:1 条件下的正确率显著高于 3:1 与 5:1 水平的正确率且 3:1 水平下的反应时显著小于 5:1 水平下的反应时（$ps < .05$）。**结论：**认知控制对选择性注意的调控受到对目标和干扰预期的影响，是一个动态的过程。当干扰刺激范围扩大时，个体会调用更多认知资源增强对目标的注意；当目标刺激范围扩大时，个体会调用更多的认知资源抑制对干扰的注意。这些发现对于深入理解认知控制机制以及相关认知过程具有重要意义。

Abstract:

Background: A growing body of research suggests that the suppression of distracting information may not be solely governed by flexible, top-down control mechanisms. Instead, it heavily relies on expectations formed through past experiences. However, the precise ways in which expectations regarding target and interference locations impact cognitive control remain unclear. Cognitive control refers to the psychological process through which individuals dynamically allocate attention resources to achieve specific goals and intentions. This process involves enhancing the processing of task-related stimuli while inhibiting the processing of task-unrelated stimuli. Previous studies have primarily focused on the regulatory mechanisms of cognitive control, often debating between processing enhancement and processing inhibition, with inconsistent results. Building on prior research, we hypothesize that the regulatory mechanism of cognitive control is not static or binary but is flexibly

adjusted based on the current information and expectations of targets and disturbances. **Methods:** In this study, we employed a modified spatial attention resource allocation task using a single-factor within-subject design. The independent variable was the expectation of target and interference, which was indicated by the ratio of target stimuli to interference stimuli. There were seven different levels: 1:1, 1:3, 1:5, 3:1, 3:3, 5:1, and 6:6. For instance, 1:1 represented fixed positions for both target and interference stimuli, while 6:6 indicated completely random positions for both. Each condition was repeated six times before randomly transitioning to other conditions. The experiment comprised five blocks, each containing 252 trials, covering all seven conditions and six possible positions for each. **Results:** The ratio of target to interference stimulus had a significant main effect on response ($F(6, 11) = 112.01$, $p < .001$)and accuracy ($F(6, 11) = 16.28$, $p < .001$). Pairwise comparisons revealed that the reaction time at the 1:1 level was significantly lower than that at the 1:3 and 1:5 levels, and the correct rate at the 1:1 level was significantly higher than that at the 1:5 level (*ps* <.05). Moreover, the reaction time at the 1:1 level was significantly lower than that at the 3:1 and 5:1 conditions, and the correct rate at the 1:1 condition was significantly higher than that at the 3:1 and 5:1 levels. Additionally, the reaction time at the 3:1 level was significantly lower than that at the 5:1 level (*ps* <.05). **Conclusion:** The regulation of selective attention by cognitive control is a dynamic process that is influenced by expectations of target and interference stimuli. As the range of interference stimuli expands, individuals allocate more cognitive resources to enhance their attention to the target. Conversely, when the range of target stimuli widens, individuals allocate more cognitive resources to suppress attention to interference. These findings hold significant implications for a deeper understanding of cognitive control mechanisms and related cognitive processes.

老年人多维睡眠与不同层面认知老化的效应

林国俊[1]　徐佳杰[1]　喻婧[1]（通讯作者）

1 西南大学心理学部，重庆，400715，helen12@swu.edu.cn

摘 要　以往研究睡眠问题与认知老化的不良关系时，倾向于支持主客观的独立双路径模式。本研究结合标准曲线分析（specification curve analysis），旨在研究上述主客观睡眠与主客观认知之间的关系。研

究采集了 55 名社区老年人多维睡眠与认知评估数据，涵盖（1）主观睡眠评估（匹茨堡睡眠 PSQI 问卷，Epworth 嗜睡量表，Stop-Bang 量表）；（2）多导睡眠图采集的客观睡眠评估（睡眠阶段，睡眠指数，睡眠纺锤波，睡眠慢波）；（3）主观认知下降（SCD-Q9）；（4）客观整体认知表现（MoCA，MMSE）和情景记忆任务。我们先对多导睡眠仪中的睡眠阶段、睡眠指数、睡眠纺锤波和睡眠慢振荡进行了迭代主成分分析，分别提取第一主成分以代表四种客观睡眠模式。将四个客观睡眠主成分与三项主观睡眠作为自变量，将主客观认知评估作为因变量，运用标准曲线分析揭示老年人认知与睡眠的稳健性。结果发现，主客观睡眠都仅与客观认知存在稳健关系，具体表现在三种主观睡眠与总体客观认知能力，客观睡眠（只有睡眠指数）与情景记忆表现之间。主客观睡眠均与主观认知无稳健关联，但睡眠不良者要比睡眠良好者的 PSQI 得分与 SCD 的关联性更强。这些结果表明主客观睡眠都仅与客观认知存在稳健关系，而非遵从双路径模式。客观测量的睡眠可能更能发现正常老化过程中早期出现的认知问题，尤其是情景记忆能力的衰退。当缓解睡眠问题与认知老化的不良关系时，需聚焦在特定的睡眠干预与认知评估上。

Robust Associations between Objectively–Measured and Subjectively–Reported Sleep and Objective, but not Subjective, Cognition in Older Adults

Guo-Jun Lin, Jia-Jie Xu, Jing Yu
Faculty of Psychology, Southwest University, Chongqing 400715, China

Abstract： Previous studies investigating the association between sleep problems and cognitive decline preferred to support independent dual–pathways based on subjectivity and objectivity in older adults. Combining specification–curve analysis across all reasonable models, this study aims to investigate above robust association and explore the relationship between multidimensional sleep and diverse cognition. The Pittsburgh Sleep Quality Index (PSQI), Epworth Sleepiness Scale (ESS), Stop–Bang, home polysomnography, Subjective Cognitive Decline Questionnaire 9 (SCD–Q9), Mini–Mental Status Examination (MMSE), Montreal Cognitive Assessment (MoCA) and episodic memory task were collected from 55 community–dwelling older adults, with 30 from Cohort A and 25 from Cohort B respectively. Iterative principal component analysis was performed on sleep stages, sleep index, spindles and slow oscillation from polysomnography as a representation of four objective sleep components, which were together with subjective sleep inventory and cognitive performance by specification–curve analysis as to reveal the robustness of association between them. Robust association were found between subjectively–reported sleep, descending are Stop–Bang, PSQI and ESS and global cognition, as well as association between objectively–measured sleep, only sleep index, and memory performance were. Neither of sleep measurement is robustly associated with subjective cognitive decline, whose association with poor sleepers were stronger than with good sleepers yet. Both subjectively–reported and objectively–measured sleep are robustly associated with objective cognition, except that in the case of the former, subjectively perceived sleep problems are directly reflected in global cognition, whereas in the case of the latter, sleep patterns measured by instruments and not yet directly subjective perceived may only be reflected in memory performance as early stages of sleep problems. Taken together, objectively-measured sleep may be better at detecting the early onset of cognitive problems in normal aging, particularly episodic memory decline. Moreover, it highlights the importance of focusing on specific sleep, while mitigating the adverse association between sleep problems and cognitive decline.

Keywords： sleep, cognitive aging, memory, specification curve analysis

急性应激降低男性捐赠行为而非合作行为

张晨[1#] 张茗喆[2#] 张茜媛[3] 余思雨[3] 刘阳[3] 李先春[3] 李世佳[3]（通讯作者）

1 上海交通大学医学院附属精神卫生中心，上海，200030

3 华东师范大学心理与认知科学学院，上海，200062，Email：sjli@psy.ecnu.edu.cn

摘 要 目的：急性应激反应是有机体在面对突发环境变化时产生的一种常见的应急响应，影响着人们的各种社会行为。其中，急性应激对于亲社会行为的影响在维持社会的稳定和谐方面有着重要的作用，受到了研究者们的广泛关注。关于急性应激下的人类行为，存在“战斗或逃跑”以及“照料与结盟”两种侧重点不同的理论，以往的实验室研究也存在大量不一致的结果，这可能是由于急性应激对于不同类型的亲社会行为存在不同的影响，需要通过更多直接测量不同种类亲社会行为的任务来加以验证。此外，既往研究也缺少来自脑机制的证据。**方法：**本研究招募了 55 名男性大学生被试（压力组=27），年龄范围在 18-26 岁之间(M=21.98, SD=2.54)。通过马斯特里赫特急性应激测试(MAST)诱发压力组被试进入急性应激状态，对照组被试完成非压力版本的 MAST，随后通过 Greater Good Game 范式测量两组被试的合作行为、自私行为和捐赠行为。在实验过程中通过功能性近红外光谱成像(fNIRS)记录被试大脑皮层的活动。同时，在实验过程中会四次收集被试的唾液皮质醇。**结果：**本研究的主要发现如下：(1)压力组被试的捐赠行为显著低于对照组，在自私行为和合作行为上与对照组没有显著差异。并且，相比于对照组被试，压力组被试在决策时，与亲社会情绪相关的双侧额极的激活程度显著降低。(2)在压力组中，压力诱导后的皮质醇曲线下面积(AUG)与捐赠行为存在一定程度的正相关。相比于皮质醇响应者，皮质醇不响应者表现出了更多的自私行为和更少的捐赠行为。(3)压力组中，捐赠行为与亲社会倾向正相关，而在对照组中，捐赠行为与亲社会倾向无显著相关。**结论：**本研究发现了急性应激会降低男性的捐赠行为，但对自私行为和合作行为没有影响。此外，急性应激降低了亲社会情绪相关的脑区双侧额极的激活程度。同时，本研究还揭示了急性应激状态下的皮质醇反应水平正向预测了捐赠行为。综上所述，本研究为急性应激会对不同类型的亲社会行为产生不同的影响提供了证据。对于纯粹利他行为，行为层面和神经层面的结果支持了“资源保护理论”。

Email：sjli@psy.ecnu.edu.cn

Abstract: ***Background:*** The acute stress response is a common rapid reaction sudden environmental changes, with the potential to impact diverse social behaviors. Understanding the influences of stress on prosocial behaviors is crucial for maintaining social stability and harmony. Previous studies have indicated that the effects of acute on prosocial behaviors highly depend on task design and individual differences. Moreover, further investigation is needed to uncover the undelying neurobiological mechanisms. ***Methods:*** Fifty-five healthy male students, aged 18-26 years (M = 21.98, SD = 2.54) were recruited, who were randomly assigned to either the stress or control group. The Maastricht Acute Stress Test (MAST) was administered in a controlled laboratory setting to induce acute stress. Following this procedure, participants engaged in a modified version of the Greater Good Game (GGG), aimed at evaluating their preferences for economic cooperation and donation behavior. Brain activity in the frontal regions was measured during the task using a portable functional near-infrared spectroscopy (fNIRS) device. ***Results:*** The main findings of this study are as follows: (1) Acute stress led to a decrease in the donation rate, while showing no discernible impact on the cooperation rate. (2) Stressed participants exhibited a positive correlation between their cortisol response and the donation rate, whereas no such correlation was observed in relation to the cooperation rate. Additionally, cortisol non-responders demonstrated significantly lower donation rates compared to cortisol responders and the control group. (3) The influence of acute stress was evident in reduced activations in the bilateral frontopolar and orbitofrontal cortex during the decision-making, process, regardless of conditions. Notably, the left pars opercularis, left superior temporal gyrus, and right temporopolar exhibited correlations with the donation rate under acute stress exclusively. ***Conclusion:*** This study affirms that acute stress adversely affects the preference for donation behavior, without a corresponding effect on the preference for economic cooperation in the GGG. Furthermore, the findings propose that both physiological individual differences (such as cortisol response) and psychological individual differences (such as prosocial tendencies) could substantially contribute to the way acute stress influences the donation preferences. Overall, this investigation advances our understanding of the diverse effects of acute stress on various forms of prosocial behaviors, while also providing behavioral and neurophysiological insights in line with the principles of the 'Conservation of Resources' theory.

摘 要　在传统的多目标跟踪(MOT)任务中，被跟踪目标的相对重要性是相等的。而在现实生活中的大多数情况，我们需要优先考虑某些目标，从而不平等地分配注意力。本研究修改了 MOT 范式，通过目标闪动的频率表示目标优先级高低，检验了改变目标优先级和目标数量的情况下，不同群体是否可以不平等地分配注意力。实验 1 关注在追踪中注意资源容量的有限性，考察了篮球运动员和普通大学生在追踪 2、4、6 个目标的平均和不平均条件下的追踪正确率。其中不平均条件指的是一半目标优先级高，另一半目标优先级低。将普通大学生和篮球运动员在平均条件、不平均条件下的低优先级和高优先级目标的追踪正确率进行重复测量方差分析，结果表明，组别和优先级高低的交互作用显著，$F(2,42)=3.347$, $p=.045$。在平均

条件和对低优先级目标的追踪中，篮球运动员显著好于普通大学生，$F(1,21)=20.418$, $p= .000$; $F(1,21)=7.481$, $p= .012$。在对高优先级目标的追踪中，两者的追踪正确率差异不显著。实验 2 主要关注追踪中注意资源容量的灵活性，细化了不同优先级的组合。实验 2a 追踪 4 个目标时的不平均包含 1 低 3 高和 1 高 3 低；实验 2b 追踪 6 个目标时的不平均包含四种条件，分别是 1 低 5 高、2 低 4 高、4 低 2 高和 5 低 1 高。结果表明，不平均条件的细化会显著的影响追踪不同群体的追踪正确率。实验 2a 的结果显示在基线和 1 低 3 高中无论是对低优先级还是对高优先级目标，都出现了篮球运动员的追踪正确率显著高于普通大学生的趋势(86.53%vs79.52%，p=.006；75.66%vs57.02%，p=.003)。但是篮球运动员和普通大学生在 1 高 3 低中对低优先级和高优先级的追踪正确率无显著差异。实验 2b 同理。在 2 低 4 高、4 低 5 高和 5 低 1 高的条件，篮球运动员对低优先级的目标的追踪正确率更高(61.45%vs51.68%, p=.002; 55.78%vs43.33%, p=.000; 67.60%vs56.51%, p=.000)。在 1 低 5 高条件下，对高优先级的目标的追踪正确率更高(75.41%vs69.45%，p=.002)。研究证明了个体可以将注意资源不均匀的分配到多个目标上，其中，相比于普通大学生，篮球运动员不仅具备更多的注意资源，而且可以根据任务要求更灵活的进行分配。研究结果为灵活注意资源理论做了支持和补充。

Goal-directed unequal attention allocation during multiple object tracking of basketball players

Qi Zhang[1] Jing Wang[1] Jie Li[2,3] Yu Zhang[1]

1 Department of Psychology, Bei Jing Sports University, Beijing, 100091

2 Center for Cognition and Brain Disorders, the Affiliated Hospital, Hangzhou Normal University, Hangzhou, 311121

3 Institutes of Psychological Sciences, Hang Zhou Normal University, Hang Zhou,311121

Abstract：In traditional multiple object tracking (MOT) tasks, the relative importance of the object being tracked is equal. In most situations in real life, we need to prioritize certain goals, thus distributing attention unequally. In this study, the MOT paradigm was modified to indicate the priority of the goal through the frequency of the goal flash, and to test whether different groups can distribute attention unequally when the priority and number of goals are changed. Experiment 1 focuses on the finiteness of attention resource capacity in tracking, and examines the tracking accuracy of basketball players and ordinary college students under the average and uneven conditions of tracking 2, 4 and 6 goals. The unbalanced condition refers to that half of the goals have a high priority and the other half have a low priority. The tracking accuracy of low priority and high priority objects of ordinary college students and basketball players under average and unequal conditions was analyzed by repeated measurement ANOVA. The results showed that the interaction between group and priority level was significant, F (2,42) = 3.347, p =.045. In the average condition and tracking of low priority goals, basketball players are significantly better than ordinary college students, F (1,21) = 20.418, p =.000; F (1,21) = 7.481, p =.012. In the tracking of high-priority objects, there is no significant difference between the two tracking accuracy rates. Experiment 2 focuses on the flexibility of attention resource capacity in tracking and refines the combination of different priorities. In experiment 2a, the inequality of tracking 4 objects includes 1 low, 3 high and 1 high, 3 low; The uneven of experiment 2b tracking 6 objects includes four conditions: 1 low 5 high, 2 low 4 high, 4 low 2 high, and 5 low 1 high. The results show that the refinement of unequal conditions can significantly affect the tracking accuracy of different groups. The results of experiment 2a showed that the tracking accuracy of basketball players was significantly higher than that of ordinary college students (86.53%vs79.52%, p=.006; 75.66%vs57.02%,

p=.003). However, there is no significant difference between basketball players and ordinary college students in the accuracy of tracking low priority and high priority. Same thing with experiment 2b. Under the conditions of 2 low, 4 high, 4 low, 5 high and 5 low, 1 high, basketball players were more accurate in tracking low priority objects (61.45%vs51.68%, *p*=.002; 55.78%vs43.33%, *p*=.000; 67.60%vs56.51%, *p*=.000). Under the condition of 1 low and 5 high, the tracking accuracy of the high-priority object was higher (75.41%vs69.45%, *p*=.002). The research proves that individuals can unevenly allocate attention resources to multiple objects. Compared with ordinary college students, basketball players not only have more attention resources, but also can allocate them more flexibly according to task requirements. The results support and supplement the theory of flexible attention resources.

强迫症患者行为学习双系统失衡特征及其神经机制

于权浩 [1,2,3] 高峰 [1,2,3] 曹妍媛 [1,2,3] 王向 [1,2,3] 樊洁 [1,2,3] 朱熊兆 [1,2,3]（通讯作者）

1 中南大学湘雅二医院医学心理研究中心，长沙，410011

2 中南大学医学心理研究所，长沙，410011

3 国家精神心理疾病临床医学研究中心，长沙，410011，Email: xiongzhaozhu@csu.edu.cn

摘 要 **背景：**基于行为学习双系统理论的框架下，强迫行为被认为是一种因刺激诱发的且对目标变化不敏感的过度习惯性行为。强迫行为的产生源自行为学习双系统的失衡。过去关于强迫症行为学习双系统失衡的研究较多关注行为反应阶段，在建立刺激—反应—结果联结的行为学习中强迫症患者表现出的特征尚不清楚。此外，过去关于强迫症行为学习双系统失衡的研究大多数为行为学研究，其失衡的神经机制尚未明确。**方法：**本研究纳入 49 名强迫症患者（Obsessive-Compulsive Disorder, OCD）和 38 名健康对照(Healthy Controls, HC)。被试首先完成强迫症状严重程度评估，然后完成 SOAT 的行为学习以及行为反应部分。行为反应阶段同时进行磁共振扫描。通过强化学习模型对行为学习阶段进行计算认知建模，采用分层贝叶斯的建模方法比较两组被试在学习阶段的学习率、强化敏感性以及坚持参数等指标，分析上述指标对行为反应阶段的影响。比较两组被试在行为反应阶段中负责习惯性行为和目标导向行为的脑区激活差异。**结果：**（1）在 SOAT 任务的行为学习阶段，OCD 组的正确率和反应时与 HC 组无显著差异（正确率：$F_{(1,82)}$= 0.104, $p > 0.05$；反应时：$F_{(1,82)} = 0.185, p > 0.05$）；基于强化学习模型结果发现，OCD 组的平均学习率、坚持参数，以及 3 种刺激—反应—结果的联结学习率以及显著低于 HC 组，强化敏感性参数显著高于 HC 组。（2）强迫症患者组平均学习率和坚持参数与 Y-BOCS 强迫行为得分表现出显著负相关($r = -0.311, p < 0.05$; $r = -0.315, p < 0.05$)，强化敏感性参数与强迫症状相关不显著。（3）在行为反应阶段，OCD 组的贬值敏感性指数以及对有价值结果反应率显著低于 HC 组（$p < 0.001$；$p < 0.05$），对贬值结果反应率显著高于 HC 组（$p < 0.001$）。（4）OCD 组平均学习率与对有价值结果反应率呈显著相关关系（$r = 0.373, p < 0.05$），坚持参数与对贬值结果反应率呈显著负相关关系（$r = -0.342, p < 0.05$）；OCD 组与 HC 组中均发现强化敏感性参数与对贬值结果反应率（OCD: $r = -0.382, p < 0.05$; HC: $r = -0.403, p < 0.05$）、贬值敏感性指数（OCD: $r = 0.432, p < 0.01$; HC: $r = 0.397, p < 0.01$）呈显著相关关系。（5）任务态磁共振结果发现，OCD 组在目标导向性行为与习惯性行为相竞争时以及执行习惯性行为时，均表现出眶额叶以及脑岛的激活显著低于 HC 组（团块水平 $p < 0.05$，FWE 校正），并且在执行习惯性行为时的条件下右侧眶额下回的激活与强迫行为严重程度显著负相关（$r = -0.394, p < 0.05$）；在对有价值刺激进行反应时，OCD 组在中央前后回的区域激活显著高于 HC 组（团块水平 $p < 0.05$，FWE 校正）。**结论：**（1）强迫症患者目标导向性行为和习惯性行为的学习能力受损，表现出无法根据预测误差及时更新行为联结强度，更容易怀疑已经建立的正确联结。强迫症患者双

系统行为学习能力受损主要与强迫行为而非强迫思维的症状严重程度有关。（2）强迫症患者在行为反应阶段，目标导向性行为表现不佳，过度依赖习惯性行为，表现出行为学习双系统失衡，强迫症患者在行为学习阶段的特征可以预测其行为反应阶段的行为模式。（3）强迫症患者过度依赖习惯性行为可能是因其眶额叶、脑岛区域的激活减弱从而导致对结果价值变化不敏感，提示强迫症患者可能由于编码预期结果价值的能力受损从而导致过度依赖刺激—反应联结。

关键词　强迫症，强迫行为，行为学习双系统，任务态功能磁共振

Characteristics and neural mechanism of dual-system imbalance in Obsessive-Compulsive Disorder patients

Quanhao Yu [1,2,3], Feng Gao [1,2,3], Yanyuan Cao [1,2,3], Xiang Wang [1,2,3],Jie Fan [1,2,3], Xiongzhao Zhu [1,2,3] (Corresponding author)

[3] National Clinical Research Center for Mental Disorders, Changsha 410011, China

Abstract*: *Background: Based on the dual-system theory, compulsive behavior is viewed as overly habitual behavior that is stimulus-driven and insensitive to changes in goals. The production of compulsive behavior arises from an imbalance between the two behavior systems. Previous research on the imbalance of the dual-systems in obsessive-compulsive disorder (OCD) has mainly focused on the behavioral response stage, and the characteristics exhibited by OCD patients in establishing the stimulus-response-reinforcement association are not yet clear. Additionally, most previous studies on the imbalance of the dual systems of behavior learning in OCD have been behavioral studies, and the neural mechanisms underlying the dual-system learning imbalance in OCD patients have not been elucidated. ***Methods:*** This study included 49 patients with obsessive-compulsive disorder and 38 healthy controls. Participants completed assessments of the severity of their compulsive symptoms, anxiety and depression, and demographic data collection. All participants completed the behavior learning phase of the Slip of Action Test (SOAT) in the laboratory, ensuring that each participant memorized the relationships between stimuli, behaviors, and outcomes. After that, they completed the outcome devaluation phase of SOAT in functional magnetic resonance imaging (fMRI). Reinforcement learning models were used for cognitive computational modeling of the learning phase, and hierarchical Bayesian modeling was used to compare the two groups of participants' learning rates, reinforcement sensitivity, persistence parameters, and their effects on behavioral response in the outcome devaluation phase. The impact of these parameters on behavioral responses during the reward devaluation stage were analyzed. Compare the differences in brain region activation between two groups of subjects responsible for habitual behavior and goal-directed behavior during the behavioral response phase. ***Results:*** (1) During the learning phase of SOAT, OCD patients showed no significant differences in accuracy and reaction time compared to healthy controls (ACC: $F_{(1,82)} = 0.104$, $p > 0.05$; RT: $F_{(1,82)} = 0.185$, $p > 0.05$). Based on the results of the computational cognitive model, OCD patients' three types of associative learning rates, average learning rate, and persistence parameter were significantly lower than those of healthy controls, while their reinforcement sensitivity parameter was significantly higher than that of healthy controls. (2) Average learning rate and persistence parameters were significantly negatively correlated with the Y-BOCS compulsive behavior score ($r = -0.311$, $p < 0.05$; $r = -0.315$, $p < 0.05$), while the reinforcement sensitivity parameter was not significantly correlated with OCD symptoms. (3) During the behavioral response phase, the OCD group had significantly lower

devaluation sensitivity and reaction rate to valuable results than the HC group ($p < 0.001$; $p < 0.05$), and a significantly higher reaction rate to devalued results than the HC group ($p < 0.001$). (4) The average learning rate in the OCD group was significantly positively correlated with the reaction rate to valuable results ($r = 0.373$, $p < 0.05$), and the persistence parameter was significantly negatively correlated with the reaction rate to devalued results ($r = -0.342$, $p < 0.05$). Both the OCD and HC groups showed a significant correlation between the reinforcement sensitivity parameter and the reaction rate to devalued results (OCD: $r = -0.382$, $p < 0.05$; HC: $r = -0.403$, $p < 0.05$), and the devaluation sensitivity index (OCD: $r = 0.432$, $p < 0.01$; HC: $r = 0.397$, $p < 0.01$). (5) The results of the task-state functional magnetic resonance imaging (fMRI) showed that in the competition between goal-directed behavior and habitual behavior, and during the execution of habitual behavior, patients with obsessive-compulsive disorder (OCD) exhibited significantly reduced activation in the orbitofrontal cortex and the insula (cluster level $p < 0.05$, family-wise error correction). Moreover, during the execution of habitual behavior, the activation of the right orbitofrontal cortex was significantly negatively correlated with the severity of compulsive behavior ($r = -0.394$, $p < 0.05$). When responding to valuable stimuli, patients with OCD showed significantly enhanced activation in the anterior and posterior cingulate regions (cluster level $p < 0.05$, family-wise error correction).***Conclusion:*** (1) The learning abilities of both goal-directed and habitual behaviors are impaired in patients with OCD, as they exhibit an inability to update the strength of behavior associations according to prediction errors and are more likely to doubt the correctness of established associations. The impairment of the dual-system learning abilities in patients with OCD is mainly related to the severity of compulsion rather than obsession. (2) In the behavior response stage, patients with OCD perform poorly in goal-directed behavior and overly rely on habitual behavior, leading to an imbalance in dual-system behavior. The characteristics of patients' behavior during the learning stage can predict their behavior patterns during the response stage. (3) The excessive reliance of patients with OCD on habitual behavior may be due to the reduced activation in the orbitofrontal cortex and insula, which leads to insensitivity to the change of the value of results. This suggests that patients with OCD may have impaired ability to encode the expected value of results, resulting in excessive dependence on stimulus-response associations.

负性效价预期想象的可控性调节了延迟折扣

陈玺雯 范聪（通讯作者） 罗文波（通讯作者）
辽宁师范大学脑与认知神经科学研究中心，大连，116029
通讯作者 E-mail: congfan1199@lnnu.edu.cn，luowb@lnnu.edu.cn

摘 要 跨期决策是既关乎人类个体利益、身体健康，又关乎国家经济的重要决策。然而，日常生活中，人们往往表现出延迟折扣，即相对于长远较大的奖励，人们更倾向于选择即时较小的奖励；这对人们理财和保健有消极影响。预期想象（episodic future thinking, EFT）影响延迟折扣。已有 fMRI 研究初步发现积极的预期想象降低延迟折扣的脑机制，但是消极效价对延迟折扣的影响机制仍存在争议。行为与环境可控性的理论认为，当人们生活在缺乏控制的严厉环境中时，通常会表现地更加冲动。因此，负性效价 EFT 的可控性可能会调节延迟折扣。为了探究这一问题，本实验设置了 EFT 的 4 个条件，分别为基线、负性可控、负性不可控和中性，操纵了延迟时间（1 个星期、1 个月、3 个月、6 个月、1 年和 3 年）和延迟奖励的金额幅度（小金额：200 元，大金额：1680 元），来探究其对延迟折扣任务的影响机制。我们通过要求被试事先对 EFT 事件的效价、可控性、个人相关性和生动性进行评分，来确定运用于延迟折扣任务中不同 EFT

条件下的提示事件。结果显示：（1）相对于负性可控条件，负性不可控条件下的延迟折扣率更高；（2）相比于基线条件，中性条件和负性可控条件均降低了延迟折扣率，而负性不可控条件与基线条件无显著差异；（3）当延迟时间较长时（3 年），相比于基线条件，负性不可控条件显著降低了延迟折扣率。结果表明，不可控的负性效价的预期想象有效降低了较长的延迟时间条件下的延迟折扣。本实验为正常群体的跨期决策的改善提供新的干预思路，未来研究需要重视负性事件的可控性对延迟折扣的影响，从而有助于人们在理财和保健中长远获益。

The controllability of negatively-valenced emotion in episodic future thinking modulates delay discounting

Xiwen Chen, Cong Fan*, Wenbo Luo*
Research Center of Brain and Cognitive Neuroscience, Liaoning Normal University, Liaoning 116029, China

Abstract: Intertemporal decision-making is important for not only human's private interest and physical health but also the national economy. Nevertheless, in daily life, individuals tend to prefer immediate and smaller rewards to delayed and larger rewards, which is known as delay discounting (DD). Episodic future thinking (EFT) has been proven to influence DD. A fMRI study preliminarily has found the brain mechanism of the effect of positive EFT on reducing DD. However, there is still no inconsistent conclusion on the effect of negative EFT on DD. One theory about the controllability of behaviors and environments explains that people living in harsh circumstance lacking of control tend to be more impulsive. Thus, it is proposed that the degree of controllability of negative EFT would modulate the DD rate. In the study, we set up four EFT conditions including the baseline, neutral EFT, negative-controllable EFT and negative-uncontrollable EFT. We also manipulated delayed time (e.i. 1 week, 1 month, 3 months, 6 months, 1 year and 3 years) and the reward magnitude (small magnitude: 200CNY; large magnitude: 1680CNY) to investigate the effect of controllability of negative EFT on DD. Participants were required to evaluate valence, controllability, personal relevance and vividness of future events in advance to determine the EFT cuing events with different valences used in the DD task. The results were as follows: (1) the DD was steeper in negative-uncontrollable EFT than in negative-controllable EFT ; (2) compared to the baseline, both neutral EFT and negative-controllable EFT reduced DD, while negative-uncontrollable EFT has no difference in reducing DD with the baseline; (3)more importantly, when the delayed time was longer (e.i., 3 years), participants tended to choose delayed and larger rewards in the condition of negative-uncontrollable EFT compared to the baseline. The present findings mainly suggested that negative-uncontrollable EFT effectively reduced DD when the delay time was longer. The current study supports new insight for healthy groups on optimizing EFT by paying attention to the controllability of negative future events. In that case, individuals are able to gain long-term benefits in financial management and healthcare.

家庭喂养与学前儿童饮食行为的关系——家庭教养方式的调节

杜巧金[1]　马东乐[1]　王健楠[1]　张洁[1]　周楠[1]（通讯作者）
1 首都师范大学学前教育学院，北京，100048
通讯作者 E-mail：nanzhou@cnu.edu.cn

摘 要　我国学前儿童饮食行为问题日益突出，不仅对儿童膳食营养和体质健康发展造成影响，而且给家长的喂养及教养方式也带来了挑战(Goodman et al., 2019)。儿童饮食习惯的养成受家庭环境影响(Steinsbekk et al., 2017)，家庭喂养行为作为饮食互动中的具体教养行为，与儿童的挑食、过饱响应、食物响应、情绪性进食等饮食行为有关(Zhou et al., 2015; Carnell et al., 2014; Jani et al., 2015)。教养方式作为家庭教育的整体氛围，则会调节特定教养行为与儿童发展状况间的关系(Darling & Steinberg, 1993)。因此，本研究拟通过建立调节模型，探究家庭教养方式在家庭喂养与学前儿童饮食行为之间的作用机制。

本研究选取北京市 360 名学前儿童（M = 4.41 ; SD = 0.72）及其母亲（M = 39.83 ; SD = 3.38）为研究对象，对管控型、工具型、情绪型、鼓励型喂养行为(Birch et al., 2001；Musher, 2007)、家庭教养方式(Robinson et al., 1995)和儿童饮食行为(Wardle et al., 2001)进行测量。采用 SPSS22.0 PROCESSv4.0 进行调节模型的分析。结果表明：(1)权威型教养方式调节了情绪性喂养行为与幼儿过饱响应饮食行为的关系，F (3, 368) = 8.64，$p < 0.001$，$R^2 = 0.07$，只有当权威型教养方式处于水平高时，情绪性喂养行为与幼儿过饱响应饮食行为呈显著正相关；（2）权威型教养方式调节了工具型喂养行为与幼儿食物响应行为，F (3, 356) = 6.92，$p < 0.001$，$R^2 = 0.06$，和幼儿情绪性饮食不足的关系，F (3, 356) = 3.34，$p < 0.01$，$R^2 = 0.04$，只有当权威型教养方式水平处于高时，工具型喂养行为与幼儿食物响应饮食行为、情绪性饮食不足行为呈显著正相关。

本研究初步揭示了权威型家庭教养方式在家庭情绪性和工具型喂养行为与儿童问题饮食行为间的调节作用机制。对于家长正确、合理地调整喂养行为以及教养方式，从而为幼儿良好饮食行为的形成与发展创设良好的家庭环境提供了实证研究支持。

The Association Between Family Feeding and Preschool Children's Eating Behaviors -- Moderation of Family Parenting Style

Qiaojin DU　Dongle Ma　Jiannan Wang　Jie Zhang　Nan Zhou
Capital Normal University，Beijing，100048

***Abstract*：** Eating behavior problems among preschool children in China are becoming increasingly prominent, not only impacting on children's dietary nutrition and physical health development, but also posing challenges to parents' feeding and parenting practices (Goodman et al., 2019). The development of children's eating habits is influenced by the family environment (Steinsbekk et al., 2017), and family feeding behaviors, as specific parenting behaviors in eating interactions, have been associated with children's eating behaviors such as picky eating, satiety responsiveness, food responsiveness, and emotional eating (Zhou et al., 2015; Carnell et al., 2014; Jani et al., 2015). Parenting styles, as the overall climate of family education, then moderates the relationship between specific parenting behaviors and children's developmental status (Darling & Steinberg, 1993). Therefore, the present study intends to investigate the mechanism of the role of family parenting styles in the relationship between family feeding and preschool children's eating behaviors by developing a model of

moderation.

In this study, 360 preschool children (M = 4.41 ; SD = 0.72) and their mothers (M = 39.83 ; SD = 3.38) in Beijing, China were selected to measure controlled, instrumental, emotional, and encouraging feeding behaviors (Birch et al., 2001; Musher, 2007), family parenting styles (Robinson et al. 1995) and children's eating behaviors (Wardle et al., 2001) were measured. Moderated models were analyzed using SPSS 22.0 PROCESSv4.0. The results showed that (1) authoritative parenting style moderated the relationship between emotional feeding behavior and toddler satiety responsiveness eating behavior, F (3, 368) = 8.64, $p < 0.001$, $R^2 = 0.07$, and emotional feeding behavior was significantly and positively related to toddler satiety responsiveness eating behavior only when authoritative parenting style was at a high level; (2) authoritative parenting style moderated the relationship between instrumental feeding behavior with toddler food responsiveness behavior, F (3, 356) = 6.92, $p < 0.001$, $R^2 = 0.06$, and toddler emotional under-eating, F (3, 356) = 3.34, $p < 0.01$, $R^2 = 0.04$, and instrumental feeding behavior was significantly positively correlated with toddler food responsiveness eating behavior, and emotional under-eating behavior, only when the level of the authoritative parenting style was at the level high. were significantly positively correlated.

This study preliminarily reveals the moderating mechanism of authoritative family parenting styles between family emotional and instrumental feeding behaviors and children's problematic eating behaviors. This study provides empirical support for parents to correctly and rationally adjust their feeding behaviors and parenting styles to create a good family environment for the formation and development of good eating behaviors in young children.

网络欺凌对留守中学生健康相关危险行为的影响：线上社交焦虑与抑郁的链式中介作用

孙云舒[1] 张珊珊[2]（通讯作者）

1 沈阳师范大学教育硕士研究生院，辽宁 沈阳，110034

2 沈阳师范大学教育科学学院，辽宁 沈阳，110034

摘 要 我国互联网普及率在未成年群体中已达到96.8%，网络不仅帮助青少年获取最新资讯、进行在线娱乐以及网络社交活动，其不当地使用也会给青少年带来心理上的威胁及伤害，其中，网络欺凌是网络使用不当的典型表现，主要指个体或团体通过电子或数字媒体，反复和长时间对他人进行故意的伤害，导致其不适的反应。根据一般压力理论，网络欺凌作为负性生活经历，可能是诱发留守中学生健康相关危险行为产生的网络风险因素，而线上社交焦虑和抑郁可能在其中分别起单独中介作用。根据社交重构假设理论和社交焦虑的认知行为模型，线上社交焦虑和抑郁可能在网络社交环境下存在关联性，推测其可能在网络欺凌对健康相关危险行为中起链式中介作用。本研究采用中学生网络和日常行为状况调查问卷、线上社交焦虑问卷、流调中心抑郁量表和青少年健康相关危险行为问卷对659名留守中学生进行调查。探讨网络欺凌与健康危险行为关系以及线上社交焦虑和抑郁在两者之间的链式中介作用。结果显示：（1）网络欺凌能够正向预测健康相关危险行为；（2）抑郁在网络欺凌和健康相关危险行为间存在单独中介作用；（3）线上社交焦虑和抑郁在网络欺凌和健康相关危险行为间存在链式中介效应。上述结果表明，网络欺凌是健康相关危险行为的重要影响因素，线上社交焦虑和抑郁在两者间发挥链式中介作用。

The impact of online bullying on health-related risk behaviors of left behind middle school students: the chain mediating effect of online Social anxiety and depression

Sun Yunshu, Zhang Jingqi, Zhang Shanshan,
1College School of Education, Shenyang Normal University, Shenyang, Liaoning 110034
2 College of Education Science, Shenyang Normal University, Shenyang, Liaoning 110034

Abstract： The internet penetration rate in China has reached 96.8% among underage groups. The internet not only helps teenagers obtain the latest information, engage in online entertainment, and social activities, but its improper use can also bring psychological threats and harm to teenagers. Among them, cyberbullying is a typical manifestation of improper internet use, mainly referring to individuals or groups repeatedly and intentionally harming others through electronic or digital media for a long time, A reaction that causes discomfort. According to the general stress theory,cyberbullying, as a negative life experience, may be an online risk factor that induces the health-related risk behaviors of left behind middle school students, and online Social anxiety and depression may play a separate mediating role in it. According to the social reconstruction hypothesis theory and the cognitive behavior model of Social anxiety, online Social anxiety and depression may be related in the online social environment, and it is speculated that they may play a chain mediating role in cyberbullying on health-related risk behaviors. In this study, 659 left behind middle school students were investigated by using the questionnaire of middle school students' network and daily behavior status, online Social anxiety questionnaire, the Center for Epidemiology Depression Scale and the Youth Health Related Risk Behavior Questionnaire. To explore the relationship between cyberbullying and health risk behaviors, and the chain mediating role of online Social anxiety and depression between them. The results show that: (1) cyberbullying can positively predict health-related risk behaviors; (2) Depression has a separate mediating effect between cyberbullying and health-related risky behaviors; (3) Online Social anxiety and depression have a chain Mesomeric effect between cyberbullying and health-related risk behaviors. The above results indicate that cyberbullying is an important influencing factor of health-related risk behaviors, and online Social anxiety and depression play a chain mediating role between them.

非对称联合运动中感觉运动交流的空-时映射关系

张珂[1] 童歆[1] 张琪涵[1,2]（通讯作者）白学军[1,2]（通讯作者）
1 天津师范大学心理学部，天津，300387；
2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387 bxuejun@126.com; zqhouou@126.com

摘 要 感觉运动交流(sensorimotor communication, SMC)指的是在工具性动作中嵌入交流性信号，由此该动作既有目的性属性，又有交流性属性。在复杂的联合行动和社会互动中，经常可以观察到感知运动交流。然而，感知运动交流背后的认知机制尚未厘清。本研究扩展了前人的研究，通过引入单人基线条件并设计了两类不同的非对称联合行动任务：距离任务和方向任务，从而探究个体间感觉运动交流的产生依

据。本研究采用2（合作意图：有、无）×2（任务特征：距离、方位）×4（目标：T1、T2、T3、T4）的被试内设计，考察了65名被试在不同实验条件下的动作表现。结果发现：（1）无论是距离任务还是方位任务，有合作意图条件下所有目标键的停留时间均大于无合作意图条件。（2）在有合作意图距离任务中，目标键T1、T2、T3、T4的停留时间及变异性逐渐增大，任务目标与个体的动作特征之间表现出“近小远大”的映射规律。（3）在有合作意图方位任务中，目标键T1、T2、T3、T4的停留时间及变异性有递增趋势，即信息发出者主要按“左上、右上、左下、右下”的顺序建立任务方位与个体动作特征之间的映射关系，以实现向他人传递信息的目的。这些结果表明，合作意图是感觉运动交流的前提；信息发出者感觉运动交流的产生主要依赖于任务目标与动作特征之间的映射关系。

Space-Time Mapping Relationships in Sensorimotor Communication during Asymmetric Joint Action

ZHANG Ke[1], TONG Xin[1], ZHANG Qihan[1,2], BAI Xuejun[1,2]

[1]Department of Psychology, Tianjin Normal University, Tianjin 300387, China

[2]Key Research Base of Humanities and Social Sciences, Institute of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China

***Abstract*：** Sensorimotor communication is frequently observed in complex joint actions and social interactions. However, it remains challenging to explore the cognitive foundations behind sensorimotor communication.

The present study extends previous research by introducing a single-person baseline condition and formulates two distinct categories of asymmetric joint action tasks: distance tasks and orientation tasks. This research investigates the action performance of 65 participants under various experimental conditions utilizing a 2 (cooperative intention: Coop, No-coop) × 2 (task characteristic: distance, orientation) × 4 (target: T1, T2, T3, T4) repeated-measures experimental design to investigate the cognitive mechanisms underlying sensorimotor communication between individuals.

The results showed, (1) In both the distance and orientation tasks, the dwell time for all target keys was significantly longer in the Coop condition than in the No-coop condition. (2) In the distance task with cooperative intention, the dwell time and its variability of T1, T2, T3, and T4 displayed an increasing trend, and observed a mapping relationship characterized by "near-small, far-large" between the task target and the individual's action characteristics. (3) In the orientation task with cooperative intention, the dwell time and variability of the target keys T1, T2, T3, and T4 had increasing trends. This suggests that message senders establish a mapping relationship between task orientation and action characteristics, following the sequence of “left-up, right-up, left-down, right-down” to transmit the message to others.

Those findings underscore the importance of cooperative intention as a prerequisite for sensorimotor communication. Furthermore, the generation of sensorimotor communication by the message senders relies on the mapping relationship between task targets and movement characteristics.

情何以护心：社会情感能力对大学生心理健康的影响研究

陈玉蕾[1] 陈兆军[1] 王仕超[1]
1 厦门大学教育研究院，厦门，361005

摘 要　社会情感能力（Social Emotional Competency, SEC）作为个体适应社会环境的重要心理资源，被视为学生心理健康的有效保护因素，关系到学生未来成功和幸福。剖析社会情感能力对大学生心理健康的作用机制可以为培养身心健康发展的人才提供可参考的经验。本研究基于全国 1360 所本科高等学校 150098 名大学生的数据，构建了两个涉及社会情感能力、压力、应对方式和压力反应的综合分析模型，以深入探究“以情护心”的影响路径。

研究 1 通过构建平行中介模型首先考察了 SEC、学业压力、人际压力与压力反应之间的关系，结果发现：SEC 不仅能显著直接减轻学业压力、人际压力、生理反应和心理反应，还能通过学业压力和人际压力来间接降低学生的生理反应和心理反应。**研究 2** 在研究 1 的基础上进一步关注应对方式的作用，通过构建多重链式中介模型考察了 SEC、人际压力、三种应对方式和压力反应之间的影响关系，研究结果显示：除了直接缓解压力反应，SEC 还可以通过减轻人际压力、促进问题解决和寻求帮助以及降低问题回避的应对方式来间接缓解压力反应，其中降低人际压力和减少问题回避是 SEC 发挥保护作用的关键。

本研究探讨了大学生社会情感能力对心理健康的影响及其作用关系，可望为今后通过培养大学生社会情感能力来调适学业和人际压力、提升应对问题和抗压能力、维护和促进大学生心理健康提供理论参考和实践启示。

How Emotion Sustains the Mind: A Study on the Impact of Social Emotional Competency on the Mental Health of College Students

Yulei Chen[1], Zhaojun Chen[1], Shichao Wang[1]
1 Institute of Education, Xiamen University, No. 422, Siming South Road, Xiamen, Fujian, 361005, China.

Abstract: Social Emotional Competency (SEC) serves as a crucial psychological resource for individuals in adapting to their social environments and is regarded as an effective protective factor for students' mental health, bearing implications for their future success and well-being. Analyzing the influence mechanism of SEC on college students' mental health offers valuable insights for nurturing talents with holistic mental and physical development. Drawing from data of 150,098 college students across 1,360 undergraduate institutions nationwide, this study designed two comprehensive Multiple Mediation Models involving SEC, stress, coping strategies, and stress reaction, aiming to investigate the "Protecting the Heart with Emotion" impact pathway in-depth.

Study 1, through the construction of a parallel mediation model, primarily examined the relationships among SEC, academic stress, interpersonal stress, and stress reactions. Results demonstrated that SEC could not only notably decrease academic and interpersonal stresses, physiological reactions, and psychological reactions directly but also indirectly mitigate students' physiological and psychological reactions through academic and interpersonal stresses. Building on Study 1, Study 2 further delved into the role of coping strategies. By establishing a multiple chained mediation model, it inspected the interplay among SEC, interpersonal stress, three coping strategies, and

stress reactions. The outcomes revealed that apart from directly alleviating stress reactions, SEC can also indirectly moderate stress reactions by minimizing interpersonal stress, promoting problem-solving, seeking assistance, and reducing avoidance as coping strategies. Notably, decreasing interpersonal stress and limiting avoidance strategies emerged as key to SEC's protective function.

This research explored the influence of college students' SEC on their mental health and its underlying relationships. It is hoped to provide theoretical references and practical insights for future efforts in cultivating SEC in college students, facilitating adjustment to academic and interpersonal stresses, bolstering problem-solving and resilience capacities, and preserving and enhancing students' mental health.

共享阅读中母亲共读行为和儿童参与对儿童阅读理解的影响：基于fNIRS超扫描的研究

郑莎 [1,2] 刘小宁 [1,2] 徐晨晨 [1,2] 杜思敏 [1,2] 卢珊 [1,2](通讯作者) 王争艳 [1,2]

1 北京市“学习与认知”重点实验室，首都师范大学心理学院，北京，100048

2 首都师范大学儿童发展研究中心，北京，100048，通讯作者：卢珊 lushan79@163.com

摘 要 家庭阅读环境中的近端过程被视为“支持儿童发展的引擎”。共享阅读作为近端过程的典型活动，体现出成年人、儿童和书本的积极相互作用，对支持学龄前儿童阅读理解能力发展、促进其塑造完善的大脑阅读网络有重要意义。然而，针对共享阅读影响儿童阅读理解的神经基础的探索尚不充分。自然互动过程中互动双方的脑间同步性(IBS)被视作人际互动行为的潜在神经标志。基于此，本研究将探索共享阅读期间母亲共读行为和儿童参与影响儿童阅读理解的神经基础。本研究共招募了 33 对母子(儿童平均年龄 2.85 岁)。使用皮博迪图片词汇测验测量儿童词汇理解能力后，采用近红外光学脑成像的超扫描技术分别评估静息状态和共读任务状态时母子前额叶皮层和颞顶联合区的 IBS；而后针对所读内容寻问儿童问题，记录阅读理解得分；对母亲共读行为中的文本外话语(具体性/推理性话语)进行编码；对儿童的参与程度进行评分。结果发现，母亲具体性话语比例和推理性话语比例呈边缘显著负相关；具体性/推理性话语比例和儿童阅读理解得分无显著相关。控制母亲推理性话语比例后，母亲具体性话语比例和儿童右侧颞上回-母亲右侧中央后回的 IBS 增值显著正相关，儿童参与和儿童右侧颞中回-母亲右侧下顶叶区域的 IBS 增值显著正相关；控制父母受教育水平、儿童年龄和词汇理解能力后，与母亲具体性话语相关的 IBS 增值和儿童阅读理解得分显著正相关，说明在共享阅读期间，与母亲具体性话语相关的 IBS 增强趋势越高，即儿童右侧颞上回-母亲右侧中央后回的 IBS 增强趋势越高，儿童的阅读理解分数越高。本研究表明，在共享阅读活动中，母亲具体性话语和儿童参与分别与双方脑间的神经耦合呈正相关，儿童在处理听觉信息脑区和母亲在处理深浅感觉信息脑区的脑间同步性增强是母亲具体性话语促进儿童阅读理解能力的神经基础。这一结果启示父母在共享阅读活动中应使用与学龄前儿童认知水平相近的共读行为，以促进双方共同理解和信息传递，进而支持儿童早期阅读理解能力发展。

Abstract: The proximal processes in home reading environments have been recognized as 'the engine that supports children's development'. As a typical activity of the proximal process, shared reading reflects the active interaction between adults, children and books, which is of great significance to support the early development of preschool children's reading comprehension ability and promote the formation of a well-developed brain reading network. However, the neural basis of shared reading affecting children's reading comprehension has not been sufficiently explored. The interpersonal brain synchronization (IBS) in natural interaction can be regarded as a potential neural marker of interpersonal interaction behavior. Based on this, the present study will explore the neural basis of the influence of maternal co-reading behavior and children's engagement on children's reading comprehension during shared reading. Thirty-three mother-child pairs were recruited for the study (mean age = 2.85 years). Children's vocabulary comprehension was measured using The Peabody Picture Vocabulary Test. We used hyperscanning techniques based on function near-infrared spectroscopy (fNIRS), recorded the brain activities of mother and child during resting state and co-reading task state, ealuated their IBS in the prefrontal cortex and the temporoparietal junction. Then, Children were asked questions about the book story, and reading comprehension scores were recorded based on children's responses. The extra-textual talk in maternal co-reading behaviours were coded as concrete utterances/inferential utterances. Finally we subjectively rated children's reading engagement. The results revealed a borderline significant negative correlation between the proportion of maternal concrete utterances and the proportion of inferential utterances; there was no significant correlation between the proportion of utterances/inferential utterances and children's reading comprehension scores. After controlling for the proportion of maternal inferential utterances, the maternal concrete utterances were significantly positively correlated with the IBS at the children's right superior temporal gyrus to the maternal postcentral gyrus. The children's engagement was significantly positively correlated with the IBS at the children's right superior temporal gyrus to the maternal inferior parietal, but supramarginal and angular gyri. After controlling for the parental education, children's age and vocabulary comprehension, the IBS value added associated with the maternal concrete utterance was significantly positively related to the children's reading comprehension, indicating that the higher the IBS enhancement trend related to maternal concrete utterance during shared reading, that is, the higher the IBS enhancement trend of children's right superior temporal gyrus to the maternal postcentral gyrus, the higher the reading comprehension score of child. The present study showed that maternal concrete utterance and children's engagement were positively associated with inter-brain neural coupling during shared reading activities, respectively. Furthermore, increased mother-child IBS between children's brain regions processing auditory information and maternal brain regions processing deep and shallow sensory information may serve as a neural indicator of the maternal concrete utterances promoting children's reading comprehension. The current study indicates that in shared reading activities, parents should adopt shared reading behaviors at a similar cognitive level as preschool children to promote shared understanding and information transfer, which in turn supports the early development of children's reading comprehension.

Email: qufangbing@cnu.edu.cn

摘 要 目的：幼儿教师由于其教育工作和对象具有特殊性，往往面临着多重压力，压力的累积可能造成过多的负性情绪如焦虑、抑郁等。灵活地运用不同情绪调节策略有助于减缓其感知压力所造成的负性情绪。本研究探究幼儿教师压力知觉与其负性情绪体验之间的关系，以及情绪调节灵活性在两者关系中的作用机制，为提高幼儿教师心理健康提供理论依据和实践参考。方法：本研究以 468 名幼儿教师作为研究对象，采用压力知觉量表、贝克抑郁量表、特质-状态焦虑量表及情绪调节灵活性量表分别测查幼儿教师的压力知觉、抑郁情绪、焦虑情绪及情绪调节灵活性水平。结果：（1）幼儿教师压力知觉与抑郁和焦虑两种负性情绪显著正相关，压力知觉正向预测幼儿教师的抑郁、焦虑水平；（2）情绪调节灵活性在幼儿教师压力知觉与抑郁情绪间起负向调节作用，具体来说，在低压力知觉水平下，高低情绪调节灵活性的幼儿教师抑郁情绪不存在显著差异，而在高压力知觉水平下，情绪调节灵活性高的幼儿教师抑郁情绪显著低于情绪调节灵活性低的幼儿教师。本研究结果表明情绪调节灵活性能够缓冲幼儿教师压力知觉对情绪健康的不良影响，这为指导幼儿教师如何应对压力而减少负性情绪困扰提供了新思路，提示教育工作者可从情绪调节灵活性角度入手，促进幼儿教师的身心健康发展。

Perceived Stress and Negative Emotion of Early Childhood Teachers: The Moderating Role of Emotion Regulation Flexibility

Gao Tianwen[1] Lv Yiqing[1] Dai Jia[1] Du Siqi[1] Guo Mengxin[1] Qu Fangbing[1] (Corresponding author)
College of Preschool Education, Capital Normal University, Beijing, 100048

***Abstract*: Objective:** As an occupation with a generally high sense of stress, early childhood teachers often face multiple stressors due to the specificity of their educational work and targets. The accumulation of stress may bring about negative emotion such as anxiety and depression. Early childhood teachers have frequent daily emotional labour, and being able to flexibly regulate their emotions may play an important role in mitigating negative emotions caused by perceived stress. The present study examined the relationship between perceived stress and negative emotions in early childhood teachers, and the mechanism of emotion regulation flexibility, in order to provide a theoretical basis and practical reference for improving the psychological health of this group. **Methods:** In this study, 468 teachers were selected by convenience sampling method, and the Chinese Perceived Stress Scale, Beck Depression Inventory, State-Trait Anxiety Inventory, and Flexible Emotion Regulation Scale were used to measure the perceived stress, negative emotion (including depression and anxiety), and emotion regulation flexibility of the early childhood teachers respectively. **Results:** (1) Perceived stress was significantly positively correlated with negative emotions, including depression and anxiety, and positively predicted the level

of negative emotions; (2) Emotion regulation flexibility played moderating role in the relationship between perceived stress and depression. Specifically, At a low level of stress perception, there were no significant differences in depression between early childhood teachers with low and high emotion regulation flexibility; At a high level of stress perception, the depression were significantly lower in early childhood teachers with high emotion regulation flexibility than in those who with low emotion regulation flexibility. The results show that emotion regulation flexibility can buffer the adverse effects of perceived stress on the emotional health of early childhood teachers, which provides new ideas for instructing them on how to cope with stress and reduce negative emotion , and suggests that educators can start from the perspective of emotion regulation flexibility to promote the physical health of early childhood teachers.

Keywords：Early Childhood Teachers; Perceived Stress; Negative Emotion; Emotion Regulation Flexibility

入园前家园共育对幼儿入园适应动态变化的影响研究

张亚欢[1]　邹昱欣[1]　王异芳[1]（通讯作者）

1 首都师范大学学前教育学院，北京，100048，wangyifang6275@126.com

摘 要　幼儿园是幼儿走向社会的第一步，入园适应是学前教育的开端。幼儿从家庭进入幼儿园的过程是从一个生态环境到另一个生态环境的过程，也是幼儿在成长过程中一段极为重要的经历。适应水平的高低不仅会影响到幼儿对幼儿园的融入程度，甚至还可能左右其心理和行为的长远发展。因此，本研究开展了向前一步的家园共育活动，旨在帮助初入园幼儿顺利度过入园适应期。

本研究以 427 名 3 岁幼儿及其家长为研究对象，在幼儿入园前一个月开展绘本阅读家园共育活动，入园后通过教师现场观察评分追踪幼儿初入园一个月的适应表现。运用多水平增长模型探讨幼儿初入园一个月的入园适应变化特征。分析结果发现：除认知与沟通维度外，幼儿在自我料理与情绪稳定、社会能力、学习倾向、班级规则等四个维度上的入园适应变化呈显著上升趋势；除班级规则适应维度，初始水平与变化速度呈正相关外，其余四个维度初始水平与变化速度呈负相关。研究中的家园共育可分为三种类型：无家园共育、有家园共育无反馈、有家园共育有反馈。采用两水平动态结构方程模型(DSEM)探讨家园共育入园准备对幼儿入园适应动态变化过程的影响。结果表明：幼儿入园适应五个维度平均水平从高到低依次为认知与沟通（4.21）、自我料理与情绪稳定（4.11）、班级规则（3.58）、社会能力（3.41）、学习倾向（3.28），且幼儿在入园适应五个维度上的自回归均呈显著正相关。与无家园共育组相比，有家园共育无反馈组和有家园共育有反馈组幼儿在自我料理与情绪稳定、社会能力、学习倾向三个维度的适应表现上有较强的自回归效应；以及在自我料理与情绪稳定、认知与沟通、学习倾向三个维度的适应表现上有较高的平均水平。进一步将家园共育频次和方式作为预测变量，以探究其对幼儿入园适应平均水平和自回归效应的影响。结果表明：幼儿年龄显著负向预测其在认知与沟通、社会能力、学习倾向、班级规则等四个维度上的自回归效应；家园共育频次显著负向预测幼儿在自我料理与情绪稳定维度上的平均水平。本研究结果表明，幼儿入园适应是一个动态变化的过程，开展入园前家园共育活动可以不同程度的影响幼儿入园适应表现，帮助幼儿完成新环境过渡。

Study on the Influence of Home-School Cooperation before Kindergarten on the Dynamic Change of Children's Adaptation to Kindergarten

Yahuan Zhang[1], Yuxin Zou[1], Yifang wang[1] (corresponding author)
1College of Preschool Education, Capital Normal University, Beijing

Abstract：Kindergarten is the first step for children to go to society, and kindergarten adaptation is the beginning of preschool education. The process of children entering kindergarten from home is from one ecological environment to another ecological environment, and it is also a very important experience for children in the growth process. The level of adaptation will not only affect the degree of children's integration into the kindergarten, but also may affect their long-term psychological and behavioral development. Therefore, this study carried out a step forward home co-parenting activity to help the children successfully through the adaptation period.

In this study, 427 3-year-old children and their parents were selected as the research objects. A picture book reading home co-parenting activity was carried out one month before the children entered the kindergarten. After the children entered the kindergarten, the adaptation performance of the children was tracked through the on-site observation and rating of the teachers. The multi-level growth model was used to investigate the change characteristics of children's kindergarten adaptation in the first month. The results showed that, apart from the cognitive and communication dimensions, the children's adaptation in four dimensions, such as self-care and emotional stability, social ability, learning tendency and class rules, showed a significant upward trend. In addition to the class rule adaptation dimension, the initial level is positively correlated with the change rate, and the other four dimensions are negatively correlated with the change rate. There are three types of home co-breeding in the study: no home co-breeding, home co-breeding without feedback, and home co-breeding with feedback. Two-level dynamic structural equation model (DSEM) was used to investigate the influence of home co-parenting preparation on the dynamic process of children's adaptation to kindergarten. The results showed that the average level of the five dimensions of kindergarten adaptation from high to low was cognition and communication (4.21), self-care and emotional stability (4.11), class rules (3.58), social ability (3.41) and learning tendency (3.28), and the autoregressive correlation was significant in the five dimensions of kindergarten adaptation. Compared with the non-homesteading group, the children in the homesteading group without feedback and the homesteading group had a stronger autoregressive effect on the three dimensions of self-care, emotional stability, social ability and learning tendency. The average level of adaptive performance in three dimensions of self-care and emotional stability, cognition and communication, and learning tendency is higher. The frequency and mode of home co-rearing were further used as predictive variables to explore the effects on the average level of children's adaptation to kindergarten and the autoregressive effect. The results showed that age negatively predicted the autoregressive effect on cognition and communication, social ability, learning tendency and class rules. The frequency of home sharing significantly negatively predicted the average level of children's self-care and emotional stability. The results of this study show that children's adaptation to kindergarten is a dynamic process, and carrying out home co-parenting activities before kindergarten can affect children's adaptation to kindergarten to different degrees and help children complete the transition to a new environment.

Keywords：Home-School Cooperation, Adaptation to Kindergarten, Dynamic Change

父母体罚与学龄儿童执行功能的双向关系：基于随机截距交叉滞后模型的分析

刘玉清　邢晓沛（通讯作者）
首都师范大学心理学院，北京，100048，xingxiaopei2006@126.com

摘 要　作为中国文化背景下父母普遍使用的消极教养方式，体罚已经被证实会对儿童的自我调节发展特别是执行功能产生消极影响。家庭系统理论指出家庭是各成员之间相互影响的动态系统，父母行为既会影响儿童特征，也会受到儿童特征的影响，即两者之间可能存在相互影响的双向关系。在考察这一问题时，本研究拟在以下三点来推进以往研究：1.执行功能是一个多成分结构，研究者有必要深入揭示体罚与执行功能之间的双向关系是否存在成分特异性；2.鉴于父母在儿童发展中的角色差异，有必要将父母体罚纳入同一模型中探讨父母双方与儿童执行功能关系的独特模式；3.发展理论强调心理发展及环境效应主要发生在个体内层面，有必要将个体间效应分离后，在个体内层面探讨上述双向互动效应。基于此，本研究对 548 名学龄儿童及其父母进行 4 个时间点(间隔半年)的追踪测查，采用随机截距交叉滞后模型考察父亲和母亲体罚与儿童执行功能子成分的双向关系及其父母性别差异。研究使用父母和儿童报告的亲子冲突解决策略量表测查父母体罚，使用母亲报告的执行功能行为评定量表测查儿童执行功能。结果发现：在个体间层面上，父母体罚与执行功能三成分的随机截距之间均显著相关。在个体内层面上，父亲和母亲体罚与执行功能的双向关系上存在成分差异性。具体表现为，T1 和 T3 的行为调节能够显著预测 T2 和 T4 的母亲体罚，而不能预测父亲体罚；认知调节仅与母亲体罚在 T1 和 T2 之间存在显著的双向预测效应，而与父亲体罚无显著预测效应；情绪调节与父亲或母亲体罚之间均无显著预测效应。研究结论：体罚与学龄儿童执行功能的关系模式因父母性别和执行功能成分的不同而异。具体来说，儿童执行功能各成分与母亲体罚之间的关系更为密切。行为调节与母亲体罚的关系表现出儿童驱动效应，认知调节与母亲体罚之间存在双向关系。研究提示我们，提升儿童的执行功能更有助于改善母亲的教养质量，这进而会促进儿童后期自我调节能力的发展。

Reciprocal Relations between Parental Corporal Punishment and School-Aged Children's Executive Function: An Analysis based on Random Intercept Cross-Lagged Panel Model

Yuqing Liu, Xiaopei Xing (corresponding author)
Department of Psychology, Capital Normal University, Beijing

***Abstract*:** Parental corporal punishment (CP) is a commonly used harsh parenting practice in Chinese families, and it plays an important role in child self-regulation development, especially executive function (EF). According to family system theory, family is a dynamic interactive system in which all members are reciprocally influenced, and accordingly the relations between parental CP and children's EF are hypothesized to be bidirectional. Given this, the present study attempted to contribute to the current knowledge by three ways below: First, EF is evidenced to be a multidimensional construct involving different skills, it is necessary to explore how the above hypothesized reciprocal relations vary by EF component. Second, mothers and fathers play distinct roles in children development, it is necessary to simultaneously consider both maternal and paternal CP in the single

model and to investigate the unique effects of mothers and fathers on children's EF. Third, developmental theory is typically concerned with within-person variability, and developmental processes are often assumed to occur within, rather than between, individuals; Thus, it is necessary to separate between-person variance from within-person variance when examining the above reciprocal relations. A total of 548 school-aged children and their parents were followed across 4 time points (six months apart), and random intercept cross-lagged panel models were used to examine whether maternal and paternal CP and EF were reciprocally predicted at within-person level, separately for each EF component. Parental CP were assessed by the Parent-Child Conflict Tactics Scales (CTSPC), and children's EF was assessed by the Behavior Rating Inventory of Executive Function Second Edition (BRIEF2). The results were as follows: at the between-person level, there were significant correlations between the random intercepts of parental CP and three EF components. At the within-person level, the predictive effects between maternal and paternal CP and EF varied for three EF components. Specifically, behavioral regulation at T1 and T3 significantly predict maternal but not paternal CP at T2 and T4, and maternal but not paternal CP and cognitive regulation were reciprocally predicted between T1 and T2, and no significant prediction were found for emotional regulation. Taken together, the relation patterns between parental CP and EF would vary according to parent gender and EF components, in which child-driven effects were only found for relations between behavioral regulation and maternal CP, and reciprocal effects were only found for relations between cognitive regulation and maternal CP. A practical implication of this study is that training children's EF could help to decrease maternal negative behavior, which in turn could support the subsequent development of EF.

Achievement goal orientations in college students: Longitudinal trajectories, related factors, and effects on academic performance

Zhang Yifan [1], Liu Xinqiao [1,*], Cao Xiaojie [2]

1 School of Education, Tianjin University, Tianjin 300350, China

2 Graduate School of Education, Peking University, Beijing 100871, China

***Abstract*:** Achievement goal orientations have a significant impact on students' self-regulation and development. An individual's achievement goal orientations may change at some critical stages. The sample of this study came from a survey of college students conducted in China for four consecutive years. The study used a growth mixture model to identify the longitudinal trajectories of achievement goal orientations during the college years, constructed a logistic regression model to analyze the related factors of students in different classes, and further examined the effects on academic performance. The results indicate that the longitudinal trajectories of all the 2x2 achievement goal orientations can be divided into decreasing class and increasing class. Taking the increasing class as the reference, extraversion, high BMI, high sleep duration, and major are related factors of students in the decreasing class of performance-approach goals. Extraversion and father's education level are associated with students in the decreasing class of mastery-avoidance goals. Extraversion, high sleep duration, father's education level, family economic status, and family social status correlate with students in the decreasing class of mastery-approach goals.

对自我的关怀会拓展到亲社会行为吗？一项多水平元分析研究

李嘉仪[1] 陈旭[1] 刘欣怡[1]（通讯作者)

1 西南大学心理学部，重庆，400700，chloe671@163.com

摘 要 自我关怀(Self-Compassion)是指当个体在面对压力、痛苦、失败时等消极事件时，采用理解、接纳、不批判的方式来对待自我的态度。具体地，根据个体面对消极事件表现出的策略，自我关怀可视为包含六个子成分的结构，即自我友善(Self-Kindness)、普遍人性(Common Humanity)与正念观(Mindfulness)，以及自我苛责(Self-Judgment)、孤立感(Isolation)与过度沉浸(Over-Identification)。其中，前三种成分可被总括为自我关怀的积极维度，即自我温暖(Self-Warmth)；而后三种成分可被总括为自我关怀的消极维度，即自我冷酷(Self-Coldness)。以往研究指出，自我关怀作为个体的一种对待自我的积极态度，可以扩展到对他人的关怀，尤其是亲社会行为表现，但针对两者关系的研究结果并不一致。因此，为更好地澄清两者间的关系，本研究结合共情-利他假说（Empathy-Altruism Hypothesis），从亲社会行为的过程性，即从“意图”（共情关注）到“实践”（亲社会行为），采用多水平元分析进一步探索两者关系。通过文献检索，本研究共纳入 37 项研究，涉及 79 个效应量和 21982 名被试。漏斗图和 Egger’s 检验结果显示，本研究纳入的文献不存在发表偏差；主效应检验发现，自我关怀总分与亲社会行为呈正相关(r=0.246)，自我温暖与亲社会行为呈正相关(r=0.213)，自我冷酷与亲社会行为呈正相关(r=0.150)；调节效应检验了被试性别、文化、自我关怀维度等因素的影响作用，结果显示，文化调节了自我关怀总分与亲社会行为的关系，自我温暖与亲社会行为的关联显著大于自我冷酷(p＜0.05)。基于上述研究结果，本研究证实了自我关怀能正向影响亲社会行为，且自我温暖与亲社会行为的联系相较自我冷酷更大，这提示了自我温暖作为自我关怀的积极维度，其对于个体亲社会行为的表现起着更为重要的正向影响，这为亲社会行为的干预提供了新视角。同时，本研究也发现了自我关怀与亲社会行为的正向关系在东方国家中表现更为显著，再次表明了在探索两者关系时需考虑文化背景的重要性。综上，本元分析结果揭示了自我关怀与亲社会行为的关系，为自我关怀与亲社会行为的未来研究与干预提供了证据与方向。

Does Self-Compassion Extend to Prosocial Behavior? A Multilevel Meta-analysis

Li Jiayi[1], Chen Xu[1], Liu Xinyi[1]

1 Department of Psychology, Southwest University, Chongqing

***Abstract*：** Self-Compassion is a kind of inner compassion that individuals can understand, accept and take a nonjudgmental attitude when facing stress, pain, and failures, rather than avoid or disconnect from them. Specifically, self-compassion consists of six components: Self-Kindness, Common Humanity, Mindfulness, Self-Judgment, Isolation, and Over-Identification. The first three components represent the positive dimension of self-compassion, known as Self-Warmth. The last three components are the negative dimension, known as Self-Coldness. Previous studies have pointed out that self-compassion, as a positive attitude towards oneself, can be extended to others, especially prosocial behavior. However, researchers have suggested inconsistent research

results on the relationship between self-compassion and prosocial behavior. To clarify the relationship between self-compassion and prosocial behavior, the present study combines the Empathy-Altruism Hypothesis to explore the relationship between the two variables. Thus, we focus on the process of prosocial behavior, specifically from "intention" (empathetic concern) to "action" (prosocial behavior). The present study conduct a multilevel meta-analysis to determine the relationship between self-compassion and prosocial behavior. It also takes into account potential moderators such as gender, culture, and self-compassion dimensions. Consequently, we extract 79 effect sizes from 37 studies, including 21,982 subjects. Based on funnel plots and Egger's test results, there is no publication bias in our study. The main effect analysis shows that the total score of self-compassion is positively correlated with prosocial behavior (r=0.246), self-warmth is positively correlated with prosocial behavior (r=0.213), and self-coldness is positively correlated with prosocial behavior (r=0.150). Moderation analysis suggests that culture moderates the relationship between the total score of self-compassion and prosocial behavior. Furthermore, the relationship between self-warmth and prosocial behavior is significantly higher than that between self-coldness and prosocial behavior (p< 0.05). According to the above results, this study confirms that there is a positive relationship between self-compassion and prosocial behavior. Moreover, we highlight that self-warmth, as a positive dimension of self-compassion, plays a more important role in individuals' demonstration of prosocial behavior compared to self-coldness, which provides a new perspective for the intervention of prosocial behavior. In addition, this study also found that the relationship between self-compassion and prosocial behavior is more significant in Eastern countries than that in Western countries, which emphasizes the influence of cultural background should be considered when exploring the relationship between self-compassion and prosocial behavior. In conclusion, the findings of our study were crucial for understanding the relationship between self-compassion and prosocial behavior, and the results provide evidence and direction for future research, as well as intervention for self-compassion and prosocial behavior.

Keywords ： Self-compassion, Self-warmth, Self-coldness, Prosocial behavior, Multilevel meta-analysis

执行功能与师生关系的变化轨迹对学龄儿童学业自我效能感的影响：独特效应和交互效应

艾慧玲　李竺　邢晓沛（通讯作者）

首都师范大学心理学院，北京，100048，xingxiaopei2006@126.com

摘　要　学业自我效能感在学生学习生涯中发挥重要作用，且得到国内外教育界的广泛关注。学业自我效能感的建立往往不是源于暂时的经验，而是源于经验的长期积累。然而很少有研究从动态发展的角度探讨影响学业自我效能感的因素。学龄阶段是儿童自我调节和师生关系发展变化的重要时期。儿童自我调节能力的迅速发展能帮助儿童应对学业压力增加过程中不断出现的新问题，同时持续性的积极师生关系也有助于学生问题解决自信心的增强。因此，有必要从动态变化的角度来探讨儿童自身因素和环境关系因素对学业自我效能感的影响。此外，儿童发展是自身与环境长期互动的结果，执行功能和师生关系分别作为个体认知和学校环境的重要部分，两者不仅会单独而且会通过交互效应共同作用于儿童的学业自我效能感。因此，本研究拟从发展变化的视角来探讨执行功能和师生关系影响儿童学业自我效能感的独特效应和交互效应。研究选取 526 名三到五年级的学龄儿童为被试进行了历时 6 个月的 3 次追踪测量，采用潜变量增长模型考察了儿童执行功能和师生关系的发展轨迹，并结合潜调节结构模型考察了执行功能和师生关系的初始水平和发展速度影响儿童学业自我效能感的独特效应和交互效应。结果发现：（1）在 6 个月内，学龄儿

童的执行功能有所增长，而师生关系质量有所下降；（2）执行功能和师生关系的初始水平和发展速度均能显著正向预测随后的学业自我效能感；（3）师生关系的初始水平和变化速度调节了儿童执行功能初始水平而非发展速度与学业自我效能感的关系。相较于初始师生关系较差或师生关系质量下降较快的儿童，初始师生关系较好或师生关系质量下降缓慢甚至有所上升的儿童，执行功能的初始水平对学业自我效能感的正向预测作用更强。研究结果有助于揭示个体因素与环境因素随时间交互影响学业自我效能感的复杂机制，对提高学龄儿童学业自我效能感具有实践指导意义。

The unique and interactive effects of trajectories in executive function and teacher-student relationship on academic self-efficacy of school-aged children

Huiling Ai, Zhu Li, Xiaopei Xing (corresponding author)
Department of Psychology, Capital Normal University, Beijing

Abstract：Academic self-efficacy plays an important role in children's academic success and has obtained considerable attention from educational researchers and practitioners to date. The development of academic self-efficacy is not only the outcomes of temporary experiences but rather stems from a sustained accumulation of mastery experiences. Nevertheless, few studies adopted a longitudinal dynamic perspective to explore the influencing factors of academic self-efficacy. Particularly, during the school-age years, a critical period for the development of children's self-regulation and changes of teacher-student relationship, self-regulation such as executive function develops rapidly in order to help children to effectively cope with new challenges, and meanwhile enduring positive teacher-student relationship also helps to enhance children's confidence in problem-solving. Given this, focusing on both individual (e.g., executive function) and external relationship (e.g., teacher-student relationship) factors and deeply exploring their unique and interactive effects on academic self-efficacy from a longitudinal perspective were believed to be important and necessary. Therefore, the current study conducted a longitudinal study across six months (3 months apart) to investigate the initial levels and growth rates of executive function and teacher-student relationship, and their unique and interactive effects on children's academic self-efficacy. Totally, 526 children in Grades 3 to 5 participated in this study, and latent variable growth model and latent moderated structural equation model were respectively employed to examine the above issues. The results indicated that: (1) children on average, experienced an increase in executive function and a decrease in relationship with their teachers over six months; (2) both the intercepts and slopes of executive function and teacher-student relationship positively predicted subsequent academic self-efficacy; and (3) both intercept and slope of teacher-student relationship could moderate the relation between the intercept (not the slope) of executive function and subsequent academic self-efficacy. Specifically, compared to those children with poor initial level or faster declining rate in teacher-student relationship, the initial level of executive function could be more strongly positively predicted later academic self-efficacy for those children with better initial level or slower declining rate or even rising rate in teacher-student relationship. In sum, our findings point to the importance of considering the complex longitudinal interactive effects of personal and contextual factors to improve children's academic self-efficacy.

Keywords：academic self-efficacy, executive function, teacher-student relationship, longitudinal interactive effect

父母教养行为、同伴互动和感觉加工敏感性对青少年亲社会行为的影响

摘 要 **目的：**通过两个研究探讨父母教养行为、同伴互动和感觉加工敏感性(SPS)对青少年亲社会行为的影响。**方法：**研究 1 采用问卷法招募了 600 名初中生，考察父母教养行为、同伴互动、SPS 和亲社会行为之间的相关关系以及可能存在的因果关系。研究 2 使用实验法招募了 233 名初中生，进一步探究父母教养行为、同伴互动、SPS 和亲社会行为之间的因果关系。**结果：**（1）父母积极教养行为、同伴积极互动能够正向预测青少年的亲社会行为；（2）与低 SPS 青少年相比，高 SPS 青少年在同伴积极互动时表现出更多的亲社会行为。（3）与高 SPS 青少年相比，低 SPS 青少年在父母积极教养行为时表现出更多的亲社会行为。**结论：**高 SPS 青少年的亲社会行为更受同伴互动的影响，而低 SPS 青少年的亲社会行为更受父母教养行为的影响，结果支持了环境敏感具有领域特殊性。

Effects of parenting behavior, peer interaction, and sensory processing sensitivity on adolescent pro-social behavior

Abstract：

Objective: Two studies were conducted to investigate the effects of parenting behaviors, peer interactions, and sensory processing sensitivity (SPS) on adolescents' pro-social behaviors. Methods: Study 1 recruited 600 middle school students using a scale approach to examine the correlations and possible causal relationships between parenting behaviors, peer interactions, SPS, and pro-social behaviors. Study 2 used an experimental method to recruit 233 junior high school students to further explore the causal relationships among parenting behaviors, peer interactions, SPS, and pro-social behaviors. Results: (1) Positive parenting behaviors and positive peer interactions positively predicted adolescents' pro-social behaviors; (2) Compared with low SPS adolescents, high SPS adolescents showed more pro-social behaviors during positive peer interactions. (3) Low SPS adolescents exhibited more pro-social behaviors when parents were positive parenting behaviors compared to high SPS adolescents. Conclusion: High SPS adolescents' pro-social behaviors are more influenced by peer interactions, whereas low SPS adolescents' pro-social behaviors are more influenced by parenting behaviors, and the results support the idea that environmental sensitivity is domain specific.

养育倦怠与生育意愿的关系：养育效能的中介作用

王佳[1] 卞小华[2]（通讯作者） 王宁霞[1]

1 大理大学教师教育学院，大理，671003

2 郑州师范学院教育科学学院，心理与行为科学国际联合实验室，郑州，450044

摘 要　生育意愿是生育需求的外在表现，直接对民众的生育行为和生育决策产生影响，这是关系国家根本的重大问题，这不但会影响到经济的发展，还会妨碍到整个社会的发展。目前已知影响适龄已育妇女再生育意愿的因素有很多，像一孩或二孩养育过程中亲子双方的互动，母亲的养育倦怠或养育效能等，但目前这些因素还没有得到重视。为人父母被证明为一段有压力的经历，父母的养育倦怠多数影响其养育孩子的质量，虽然很多科普读物都在探讨这一问题，但在心理学相关领域，关于此类研究还存在不足。最近的一项以随机样本为被试的研究表明，养育倦怠对生育意愿有显著影响。养育效能是父母对自己能否成功完成育儿行为的主观判断，是父母自评养育行为的重要指标。养育倦怠对生育意愿的影响得到了探索和证实，由于不同人的心理特质不同，对养育过程中的养育活动有不同的评价，由此会产生不同的生育抉择。目的：为了了解育龄妇女生育意愿现状，并探究养育倦怠、养育效能对生育意愿的影响。方法：采用《养育倦怠量表》（PBA）、《育儿胜任感量表》（PSOC）、《生育意愿调查表》测量工具，对河南省、山西省 312 名育龄妇女进行问卷调查，对养育倦怠、养育效能和生育意愿进行相关和回归分析。结果表明：①养育倦怠、养育效能与生育意愿在受教育程度上存在显著性差异，养育倦怠和养育效能在年龄上存在显著性差异，养育倦怠在家庭结构上存在显著性差异。②养育倦怠、养育效能和生育意愿三者存在两两相关。③养育倦怠负向预测生育意愿（β= -0.186，p<0.01），养育倦怠负向影响养育效能(β= -0.287，p<0.01)，养育效能显著正向影响生育意愿（β= 0.175，p<0.01）。④养育效能在养育倦怠和生育意愿间起部分中介作用。

The relationship between parenting burnout and fertility intention: the mediating role of parenting efficacy

JiaWang[1]　Xiaohua Bian[2](Corresponding author)　Ningxia Wang[1]

1 School of Teacher Education, Dali University ,Dali,Yunnan671003, China

2　School of Educational Science, International Joint Laboratory of Behavior and Cognitive Science, Zhengzhou Normal University, Zhengzhou, Henan 450044, China

Abstract: Fertility willingness is an external manifestation of fertility needs, which directly affects the reproductive behavior and decision-making of the public. This is a fundamental and significant issue related to the country, which not only affects economic development but also hinders the development of the entire society. At present, there are many factors known to affect the willingness of women of childbearing age to have another child, such as the interaction between parents and children during the process of raising one or two children, mother's parenting fatigue or parenting effectiveness, etc. However, these factors have not yet been taken seriously. Being a parent has been proven to be a stressful experience, and parental parenting fatigue mostly affects the quality of their child rearing. Although many popular science books are exploring this issue, there are still shortcomings in research related to psychology. A recent study using random samples as subjects showed that parenting burnout has a significant impact on fertility intention. Parental efficacy is the subjective judgment of parents on whether they can successfully complete their parenting behavior, and is an important indicator of parents' self-evaluation of parenting behavior. The impact of parenting burnout on fertility intention has been explored and confirmed. Due to the different psychological traits of different individuals, different evaluations of parenting activities during the parenting process can lead to different reproductive choices. Objective: To understand the current situation of childbearing age women's fertility intention and explore the impact of parenting burnout and parenting efficacy on

fertility intention. Method: A questionnaire survey was conducted on 312 women of childbearing age in Henan and Shanxi provinces using the "Parenting Burnout Scale" (PBA), "Parenting Competence Scale" (PSOC), and "Fertility Intention Questionnaire" measurement tools. Correlation and regression analysis were conducted on parenting burnout, parenting efficacy, and fertility intention. The results show that: ① There is a significant difference in educational level between parenting burnout, parenting efficacy, and fertility intention. There is a significant difference in age between parenting burnout and parenting efficacy, and there is a significant difference in family structure between parenting burnout and parenting efficacy. ② There is a pairwise correlation between parenting burnout, parenting efficacy, and fertility willingness Negative prediction of parenting burnout and fertility intention（ β= - 0.186 (p<0.01), negative impact of parenting burnout on parenting efficacy（ β= - 0.287, p<0.01), parenting efficacy significantly positively affects fertility intention（ β= 0.175, p<0.01). ④ Parenting efficacy plays a partial mediating role between parenting burnout and fertility intention.

学校环境下教师、同伴在场对儿童学习效果的影响

赵钰[1] 朱慧慧[1] 郑依凡[1] 周丹丹[1] 李永鑫[1]

河南大学心理与行为研究所，开封，475004,E-mail:liyongxin@henu.edu.cn

摘 要 “双减政策”政策下，如何提升儿童的学习效果成为当前的一大重要研究方向。课堂学习中，儿童对课堂知识的记忆效果是判断学习效果的重要指标。不同他人在场会影响儿童的记忆效果，说明儿童在学校的学习效果会受到身边他人的影响。儿童在学校接触个体一般区分为教师和同伴，受熟悉程度影响，同伴还可分为陌生同伴与熟悉同伴，儿童在学校需与这三类群体进行接触，那么儿童的学习效果是否受这三类群体的陪同而发生变化呢？以及这种变化又具有怎样的发展性特征呢？因此，本研究以小学一至六年级儿童为研究对象，结合实验和调查的方法，探讨教师、同伴在场对儿童学习效果的影响。研究发现：（1）教师或熟悉同伴在场影响了儿童的行为表现，儿童会牺牲反应时间以追求更高的准确性。（2）教师在场时，儿童学习更加认真，年级越低，教师在场的影响越明显，这点并不受教师所教授学科的影响。（3）陌生同伴的性别是影响儿童学习效果的关键因素，主要表现为异性陌生同伴在场会影响儿童行为表现。（4）同伴在场时，儿童学习效果都随年级的增长而增加。研究结果说明教师、同伴在场对儿童学习效果产生了不同影响，学校教育应关注此方面，同时要注意按照儿童认知发展规律合理设计学习任务。

The Influence Of Teacher And Peer Presence On Children's Learning Results In School Environment

Zhao Yu, Zhu Huihui, Jia Yifan, Zhou Dandan, Li Yongxin

Institute of Psychology & Behavior, Henan University, Kaifeng, 475004

Abstract: Under the "double reduction policy" policy, how to improve children's learning effect has become an important research direction at present. In classroom learning, children's memory effect of classroom knowledge is an important index to judge the learning effect. Different presence of others will affect children's memory effect, indicating that children's learning effect in school will be affected by others around them. Children's contact with individuals in school is generally divided into teachers and peers. Affected by familiarity, peers can also be divided into unfamiliar peers and familiar peers. Children need to have contact with these three

groups in school, so does the learning effect of children change when accompanied by these three groups? Teacher and peer factors are important factors affecting children's learning effect. Therefore, this study takes children from grade 1 to Grade 6 as the research object, and explores the influence of teacher and peer presence on children's learning effect by combining experiment and investigation methods. The study found that: (1) The presence of teachers or familiar peers affected children's behavior, and children would sacrifice reaction time in pursuit of higher accuracy. (2) When teachers are present, children learn more seriously. The lower the grade, the more obvious the influence of teachers' presence, which is not affected by the subject taught by teachers. (3) The gender of strange companions is the key factor affecting children's learning effect, which is mainly manifested that the presence of strange companions of the opposite sex will affect children's behavior. (4) When peers are present, children's learning results increase with the growth of grade. The research results reveal the different effects of the presence of teachers and peers on children's learning. School education should pay attention to this aspect, and pay attention to the rational design of learning tasks according to the rules of children's cognitive development.

Keywords: presence of others, teacher presence, peer presence, learning result

家长数学教育焦虑影响儿童数学学习的积极干预策略研究

曲克蒙 1　赵钰 1　杨敏 1　周丹丹 1

河南大学心理与行为研究所，开封，475004,E-mail:zhoudandan666@henu.edu.cn

摘 要　家庭成员之间的情绪状态会相互影响，有研究发现家长数学教育焦虑会导致儿童数学学习成绩不佳。父母情绪会影响学生自主学习，自主学习指学习者从元认知、动机和行为方面积极主动地参与自己学习活动的过程，能促进儿童学习成绩的提升。家长数学教育焦虑导致儿童数学学习成绩不佳，自主学习可能是影响儿童数学学习效果的重内在因素。如果家长的数学教育焦虑严重影响着数困儿童的数学学习，那么对于这种现象，家长越早干预越有利于儿童的数学学习。而积极心理暗示能改善儿童自我认知，该方法能否改善儿童数学成绩，值得探讨。因此，本研究以小学生为对象，采用问卷法和实验干预法考察家长数学教育焦虑对数学学习困难儿童数学学习成绩的影响，揭示儿童自主学习能力在家长数学焦虑与数学学习成绩之间的中介作用，并进一步对数学学习困难儿童进行积极的暗示干预，考察其对儿童数学学习效果的提升。结果发现：(1)家长数学教育焦虑越高，其孩子的自主学习程度和数学成绩表现越差。(2)自主学习在家长数学教育焦虑与数困儿童数学成绩之间起部分中介作用，家长数学教育焦虑即能直接影响数困儿童数学成绩，也能通过影响自主学习间接影响数困儿童数学成绩。(3)积极暗示干预显著提高了数学学习困难儿童的数学成绩。本研究的发现提示家庭教育对学生学习至关重要，未来可开展相关活动对学生父母进行培训，并且研究说明了积极暗示是一种好的家庭教育手段，可以促进儿童的学习。

Active intervention strategies for parental math education anxiety affecting children's math learning

Qu Kemeng, Zhao Yu, Yang Min, Zhou Dandan

Institute of Psychology & Behavior, Henan University, Kaifeng, 475004

Abstract：The emotional states of family members affect each other, and studies have found that parents

'math education anxiety can lead to children's poor math performance. Parents mood can affect students 'autonomous learning, autonomous learning refers to the learners from the aspects of metacognition, motivation and behavior actively participate in the process of their learning activities, can promote children's learning performance, parents mathematics education anxiety will lead to children's math learning performance, autonomous learning may be an important factor affecting children's math learning effect. If parents 'math education anxiety seriously affects the math learning of children with digital difficulties, then for this phenomenon, the earlier parents intervene, the more conducive to children's math learning. Positive psychological suggestion can improve children's self-cognition, and it is worth discussing whether this method can improve children's math performance. Therefore, this study in the primary school students as the object, the questionnaire method and experimental intervention method of parents mathematics education anxiety on mathematics learning difficulties, reveals children's autonomous learning ability mediation between parents mathematics anxiety and mathematics learning performance, and further to mathematics learning difficulties children positive hint intervention, examine the promotion of children's mathematics learning effect. The results show that: (1) the higher the anxiety of parents in math education, the worse the children's independent learning degree and math performance.(2) Independent learning plays a partial intermediary role between parents 'math education anxiety and the math performance of children with math difficulties.Parents' math education anxiety can directly affect the math performance of children with math difficulties, and can also indirectly affect the math performance of children with math difficulties by affecting independent learning.(3) Actively suggested that the intervention significantly improved the math performance of children with math learning difficulties. The findings of this study suggest that family education is crucial for students 'learning, and future activities can be carried out to train students' parents, and the study shows that positive suggestion is a good means of family education that can promote children's learning.

江西省社会科学“十四五”（2021 年）基金项目（编号：21JY48）

摘 要 亲欺凌旁观行为是指青少年目睹欺凌时通过鼓掌、嘲笑或帮助欺凌者捉弄、折磨受害者的行为。研究发现，亲欺凌旁观行为直接增加了欺凌的发生率及强度。鉴于亲欺凌旁观行为在青少年中的高发生率和负面后果，研究青少年亲欺凌旁观行为的预测因素尤为重要。亲子依恋是指个体与其照顾者之间持久的情感联系。研究表明，亲子依恋水平较低的个体更容易出现欺凌行为。近年来，有研究者提出，亲子依恋与亲欺凌旁观行为之间的作用机制值得研究。道德推脱是指人们通过松懈的内部调节机制，将自己有害行为合理化的认知过程。根据一般攻击模型，亲子依恋可能会作为外界环境因素影响青少年的道德推脱水平，而道德推脱可能是影响校园欺凌发生和发展的潜在内部心理机制。值得一提的是，现有研究大多是横断设计，较难解释变量间的因果关系。此外，国内外探究亲子依恋与亲欺凌旁观行为关系的现有研究犹显不足。因此，本研究拟探究道德推脱在青少年亲子依恋水平与其亲欺凌旁观行为之间是否存在纵向中介作用，并检验该纵向中介模型是否存在性别差异。

采用校园欺凌参与者相关问卷、亲子依恋量表和道德推脱量表对 1438 名青少年进行三次追踪调查，每次调查间隔 6 个月，最终获得有效数据 1083 份。研究结果表明：（1）T1 时间的亲子依恋能够负向预测 T2 时间的道德推脱和 T3 时间亲欺凌旁观行为。（2）T2 时间的道德推脱能够正向预测 T3 时间校园欺凌中的亲欺凌旁观行为。（3）T2 时间的道德推脱在 T1 时间的亲子依恋与 T3 时间的亲欺凌旁观行为之间的间接效应显著。（4）道德推脱的纵向中介作用存在着性别差异。具体而言，该纵向中介模型对于男生显著，而对于女生不显著。研究结果表明，道德推脱作为亲子依恋和亲欺凌旁观行为之间联系的纵向中介因素，可能是减少校园欺凌的干预措施中的一个有效焦点。

The Association between Parental Attachment and Adolescents' Pro-Bullying Behaviors is Mediated by Moral Disengagement: An 18-month Longitudinal Analysis

Yu Mingshen[1] Yang Lingqing[1] Xu Ziwei[1] Bao Zhenzhou[1] (Corresponding author)
School of Educational Science, Gannan Normal University, Ganzhou, 341000

Abstract：When adolescents witnessed the bullying, they assisted the bullies, laughing or cheering on the bullying, these behaviors were defined as pro-bullying bystander behavior. Pro-bullying bystander behavior has been found to predict increased incidence and intensity of bullying directly. Given the high incidence and negative consequences of pro-bullying bystander behavior among adolescents, it is particularly important to study the predictive factors of it. Parental attachment refers to an affectional bond between parents and children. Poor quality of parental attachment has been found to predict adolescents' pro-bullying bystander behaviors. The concept of moral disengagement refers to the "individual's tendency to use mechanisms conducive to a selective disengagement of moral censure". According to the general aggression model, moral disengagement might act as an underlying mediator of the association between family factors (e.g., parental attachment) and individual's negative behavior (e.g., pro-bullying bystander behavior). It is worth mentioning that most existing studies are cross-sectional designs, making it difficult to explain the causal relationship between variables. In addition, existing research at home and abroad on the relationship between parental attachment and pro-bullying bystander behavior is still insufficient. Therefore, we tested whether the adolescent's moral disengagement mediated the association and tested for gender differences in this process. A three-wave longitudinal study with a time interval of 6 months was conducted to test our hypotheses.

A total of 1083 adolescents (43.43% were boys) completed questionnaires concerning parental attachment, moral disengagement, and pro-bullying bystander behavior. The results showed that parental attachment at T1 negatively predicted moral disengagement at T2, and moral disengagement at T2 positively predicted adolescents' pro-bullying bystander behaviors at T3. Moral disengagement at T2 mediated the relationship between parental attachment at T1 and pro-bullying bystander behavior at T3. The longitudinal mediation was significant for boys but not for girls. Our findings indicated that moral disengagement, as a longitudinal mediating factor in the link between parental attachment and pro-bullying bystander behavior, might be a useful focus in interventions to reduce school bullying.

儿童与成人阅读中的工作记忆储存状态

王伊[1] 刘佳欣[2] 胡祎涵[1] 李京晓[1] 刘泽琪[2] 凌嘉[2] 周蔚[1]（通讯作者）
1 首都师范大学心理学院，北京，100048，zhouwei@cnu.edu.cn
2 首都师范大学初等教育学院，北京，100048

摘 要 工作记忆在阅读中起着非常重要的作用，负责存储信息同时连贯上下文。随着技术进步，越来越多的人开始电子阅读，使用超链接进行文本中或文本间跳转的超文本应用而生，这虽然增加了个体与文本的互动，但同时减少了语义线索，从而降低了文本连贯性，因此超文本对工作记忆的要求高于传统纸质文本。加之在 STEAM 教育盛行的背景下，个体不仅需要阅读记叙文，还要阅读大量的科普文、说明文等这类语义线索较少的文学体裁，如何帮助个体在当前时代下更好地阅读是值得关注的问题。本研究通过改变呈现记忆刺激到探测时间（序列回溯范式）来探究阅读超文本时，跳转前后的记忆存储效果；研究通过保持一个记忆刺激的负荷为高负荷状态，改变另一个记忆刺激的负荷，探究不同维度记忆负荷变化对于个体认知资源的影响；并使用语义相似度作为语义线索的指标，探究其对于个体阅读超文本的影响。由于既往研究通常使用色块、图形等无语义信息的刺激作为实验材料，所以本研究先以词汇为实验材料，在此基础上，实验二使用了更加复杂的说明文作为实验材料。两个实验均为 2（呈现刺激与探测时间间隔：长、短）*2（记忆负荷：高、低）*2（语义线索：高、低）三因素实验设计，被试为成年人和儿童（3 年级、5 年级），均使用线性混合模型进行两次差异检验。实验一的成人正确率结果发现，时间间隔和记忆负荷的交互作用显著，当其中一个刺激负荷变化时，有且只有一个时间间隔的正确率受到影响，儿童未发现该结果，实验二结果与实验一相似。进一步按照工作记忆容量对儿童进行分组，结果发现，低工作记忆容量组的语义相似度主效应显著。两个实验均发现成年人可以灵活地使用工作记忆的资源来维持某一维度的信息，儿童则不然。此外，语义线索类似于脚手架的作用，可以帮助工作记忆较低的个体阅读，但对于工作容量足够处理阅读信息的个体（5 年级儿童和成人），语义线索并不会对阅读产生影响。综上，在设计阅读文本时需要考虑个体的工作记忆水平，以帮助其阅读。

The Working Memory Storage State in Reading for Children and Adults

Yi Wang[1] Jiaxin Liu[2] Yihan Hu[1] Jingxiao Li[1] Zeqi Liu[2] Jia Ling[1] Wei Zhou [1]
1 School of Psychology, Capital Normal University, Beijing, 100048, China
2 College of Elementary Education, Capital Normal University, Beijing, 100048, China

Abstract：Working memory (WM) plays a critical role in reading by briefly holding text propositions and actively processing coherence gaps. Hypertext, a form of digital reading, allows for navigation within and between texts through hyperlinks, which has been a prevalent way of reading. While this enhances interactivity between individuals and texts, it simultaneously diminishes semantic cues and reduces text coherence. Consequently, hypertext imposes higher demands on WM than traditional print texts. Moreover, under the prevalence of STEAM education, individuals are required to read not only narrative texts but also a substantial of scientific popularizations, expository texts, and other genres with limited semantic cues. Therefore, it is essential to address the question of how to help individuals to read in the current era. This study investigated the effects of memory storage during reading hypertext by manipulating the presentation of memory stimuli and probe time (using a

sequential change detection paradigm). Furthermore, it examined the impact of changing WM loads in different dimensions on individuals' cognitive resources by maintaining one memory stimulus at a high load while changing the load of another stimulus. The study also consisted the semantic similarity as an indicator of semantic cues to explore its influence on individuals' reading of hypertext. Stimuli lack of semantic information, such as color blocks and shapes has been wildly used in previous studies. Therefore, this study initially employed vocabulary as experimental material and subsequently employed more complex texts, i.e., expository texts, in Experiment 2. Both experiments followed a 2 (presentation stimulus-probe time interval: long, short) * 2 (WM load: high, low) * 2 (semantic similarity: high, low) three-factor experimental design. Both adults and children (3rd and 5th graders) participated in the experiment, and two separate linear mixed models were employed for each experiment. Results from Experiment 1 showed a significant interaction effect between time interval and WM load in the accuracy of adults' responses. Specifically, when one stimulus load changed, only the accuracy corresponding to a one-time interval was affected. However, children did not exhibit this pattern, and Experiment 2 showed consistent results. After grouping the children based on their WM capacity, the results showed a significant main effect of semantic similarity in the low WM capacity group. Both experiments consistently indicated that adults showed the ability to use WM resources flexibly to maintain information in a specific dimension, whereas children did not exhibit the same ability. Additionally, semantic cues are akin to scaffolding, aiding individuals with lower WM capacity while reading. However, for individuals with adequate WM capacity (i.e., 5th graders and adults), the semantic cues did not significantly impact their reading comprehension. It is necessary to consider the individual's WM in order to design a suitable text.

面孔吸引力对幼儿面孔情绪识别能力的影响

代佳　高甜雯　杜思奇　吕怡晴　郭梦欣　曲方炳（通讯作者）

首都师范大学学前教育学院，北京，100048，qufangbing@cnu.edu.cn

摘 要　面孔情绪识别是指对各种面孔情绪进行加工、判断和分类的过程，准确地识别他人的面孔情绪对于幼儿的适应和人际交往有重要作用。但面孔情绪识别受到多种因素的影响，以往研究对面孔吸引力是否影响面孔情绪识别的结论并不一致。本研究旨在进一步明晰两者之间的关系，设置高、低两种面孔吸引力条件，考察幼儿的面孔情绪识别成绩是否受面孔年龄及性别的影响。研究以 62 名幼儿为研究对象，采用情绪标签任务，使用 2（面孔吸引力：高、低）×2（面孔年龄：成人、儿童）×6（情绪类型：快乐、生气、惊讶、害怕、厌恶、中性）的混合实验设计，考察面孔吸引力与幼儿面孔情绪识别成绩之间的关系研究结果：（1）情绪类型主效应显著，面孔吸引力主效应不显著，情绪类型和面孔吸引力的交互作用显著，幼儿识别高兴、生气、厌恶、中性面孔情绪的成绩存在显著的面孔吸引力差异；（2）面孔年龄与情绪类型的交互作用显著，幼儿识别害怕、惊讶、高兴、厌恶面孔情绪的成绩存在显著的面孔年龄效应；（3）性别主效应显著，性别和情绪类型交互作用显著，女孩识别面孔情绪特别是厌恶、中性情绪时的成绩显著高于男孩，本研究结果表明，幼儿识别面孔情绪受到面孔吸引力高低、面孔年龄以及性别的影响，为进一步探明影响幼儿识别面孔情绪的因素提供了新思路。

关键词　面孔吸引力，面孔情绪识别，幼儿

The influence of facial attractiveness on facial emotion recognition ability of young children

Dai Jia, Gao Tianwen, Du Siqi, Lv Yiqing, Guo Mengxin, Qu Fangbing
College of Preschool Education, Capital Normal University, Beijing, 100048

Abstract：Facial emotion recognition refers to the process of processing, judging and classifying various facial emotions. Accurately recognizing others' facial emotions plays an important role in children's adaptation and interpersonal communication. However, face emotion recognition is affected by many factors. Previous studies have not reached the same conclusion on whether face attractiveness affects face emotion recognition. The purpose of this study was to further clarify the relationship between the two, set two conditions of high and low facial attractiveness, and investigate whether children's facial emotion recognition performance is affected by face age and gender. This study took 62 young children as research objects, adopted the emotional labeling task, and used the mixed experimental design of 2 (face attractiveness: high, low) ×2 (face age: adult, child) ×6 (emotion type: happy, angry, surprised, afraid, disgusted, neutral) to investigate the relationship between face attractiveness and children's facial emotion recognition performance. (1) The main effect of emotional type was significant, while the dominant effect of face attraction was not. The interaction between emotional type and face attraction was significant. There were significant differences in children's performance in recognizing happy, angry, disgust and neutral faces. (2) The interaction between facial age and emotional type is significant, and there are significant facial age effects in children's recognition of fear, surprise, happy and disgust facial emotions; (3) Gender has a significant main effect, and gender and emotion type have a significant interaction. Girls' performance in recognizing face emotions, especially disgust and neutral emotions, is significantly higher than that of boys. The results of this study show that children's face recognition emotions are affected by face attractiveness, face age and gender, providing new ideas for further exploring the factors affecting children's face recognition emotions.

Keywords：facial attractiveness, facial emotion recognition, young children

逆境中成长：童年期忽视与青少年抑制控制之间的 U 型关系及近期压力的调节作用

贾悦悦[1]　吕薇[1]（通讯作者）
1 陕西师范大学，西安，710062，xuan006@126.com

摘 要 研究表明，抑制控制与内外化问题密切相关，对青少年的发展至关重要。逆境与心理病理学维度模型（DMAP）表明，童年期忽视作为一种典型的剥夺逆境类型，通常对抑制控制有负面的线性影响。但压力接种模型认为童年期忽视也可能产生积极的影响。因此，目前还不清楚童年期忽视是增强还是损害了抑制控制能力，以及什么条件下可能产生这些结果。根据压力敏感模型和压力放大模型，最近的压力可能与早期的逆境相互作用，影响抑制控制。然而，很少有研究关注童年忽视和抑制性控制之间的非线性关系，以及这种非线性关系是否受制于不同的近期压力水平。因此，本研究试图探索在青少年中，童年期忽视和抑制控制之间的非线性关系，以及近期压力在其中的调节作用。279 名青少年（$M_{年龄}$ = 12.92±0.78 岁，138 名女生）首先完成了中文版的儿童创伤问卷（CTQ-SF）和感知压力量表（PSS），以评估童年期忽视和近期压力，然后他们完成了 Flanker 任务，并计算了个体内反应时间变异性（IIV）以衡量抑制控制。分层

回归结果显示，在一致、不一致和联合条件下的 IIV 有相同的模式。童年期忽视对 IIV 的线性和二次效应均显著，童年期忽视和近期压力之间的二次交互作用显著，但线性交互作用不显著。显著性区域检验显示，在中度或高度的近期压力下，童年忽视和抑制控制之间存在显著的 U 型的关系，在较低的近期压力下则不存在。这些发现表明，适度的童年期忽视经历与青少年的最佳抑制控制能力有关，而过多或过少的童年期忽视经历似乎不利于抑制控制能力，并且较高的近期压力会加剧这种负面影响。

关键词 童年期忽视，抑制控制，近期压力，U 型关系，个体内反应时变异性

Growing up in Adversity: A U-shaped Relation between Childhood Neglect and Inhibitory Control in Adolescents and the Moderating Role of Recent Stress

Jia Yueyue & Lü Wei*

Shaanxi Key Research Center for Children Mental and Behavior Health, School of Psychology, Shaanxi Normal University, 199 South Chang'an Road, Xi'an, China

Abstract: Studies have shown that inhibitory control is closely related to internalization and externalization problems and is crucial to the development of individuals, especially adolescents. Dimensional Model of Adversity and Psychopathology (DMAP) suggests that childhood neglect, as a typical type of deprivation adversity, has a special relationship with inhibitory control. Childhood neglect generally has a negative linear effect on an individual's cognitive development, including inhibitory control. However, various studies examining the relationship between childhood neglect and childhood inhibitory control deficits have produced inconsistent results. According to the stress inoculation model, childhood neglect may also have a positive effect. Therefore, it is unclear whether childhood neglect enhances or impairs inhibition and what conditions might produce these results. According to the stress-sensitive model, recent stress may interact with early adversity to affect inhibitory control. However, few studies have concerned a nonlinear relation between childhood neglect and inhibitory control, and whether the nonlinear relation is subjected to different recent stress levels. Thus, the present study sought to explore a quadratic relation between childhood neglect and inhibitory control among adolescents, and the moderating effect of perceived recent stress in the relationship.

Participants were recruited from a local secondary school with a total of 279 adolescents aged 11 to 15 (M_{age} = 12.92, *SD* = 0.78, 138 females). Participants firstly completed the Chinese version of the short form of Childhood Trauma Questionnaire (CTQ-SF) and the Perceived Stress Scale (PSS) to assess their childhood neglect and perceived recent stress, and then they completed the modified flanker task where intra-individual reaction time variability (IIV) was calculated to access their inhibitory control. Then, hierarchical multiple regression analyses were constructed. Gender, age, socioeconomic status (SES) and childhood abuse were included as covariates. Finally, the Johnson-Neyman technique was used to estimate the childhood neglect values at which the simple slopes of the quadratic were significant ($p < .05$) when perceived recent stress has been fixed at 1 *SD* above the mean, the mean value, and 1 *SD* below the mean.

Results revealed that IIV under incongruent, congruent and combined conditions have the same pattern. Both linear and quadratic effects of childhood neglect on IIV were significant, and the quadratic interaction between childhood neglect and recent stress was significant, but the linear interaction was not. The region of significance test showed a quadratic U-shaped relationship between childhood neglect and inhibitory control at moderate or high levels of recent stress. With the increase in recent stress, the quadratic relationship was more obvious. When

recent stress was low (-1*SD*), the effect of childhood neglect on IIV under combined condition was not significant. When recent stress was average, there was a significantly negative relationship between childhood neglect and IIV under combined condition when childhood neglect was less than -2.00*Z* and a significantly positive association when childhood neglect was greater than 0.50*Z*. When recent stress was high (+1*SD*), there was a significantly negative relationship between childhood neglect and IIV under combined condition when childhood neglect was less than -0.25*Z* and a significantly positive association when childhood neglect was greater than 0.58*Z*.

These findings suggest that moderate childhood neglect experiences are associated with optimal inhibitory control ability among adolescents, while too much or too little childhood neglect experiences appear to be detrimental to inhibitory control ability, and these negative effects would be aggregated by recent stress.

Keywords: childhood neglect, inhibitory control, recent stress, U-shaped relation, intraindividual reaction time variability

中国父母教养方式与儿童心理韧性关系的三水平元分析

陆瑜[1] 曹晓君[2]（通讯作者）

1. 西华师范大学教育学院，南充 637000

2. 四川师范大学心理学院，成都 610068

摘 要 当前研究采用三水平元分析方法，以中国儿童为样本，明确父母教养方式（积极/消极）与儿童心理韧性的关系。通过文献检索，共获得 41 项研究，含 416 个独立效应量,被试总数 27631 名。主效应检验发现，父母积极教养方式与儿童心理韧性呈显著正相关（r=0.375，95%CI[0.325，0.464]），父母消极教养方式与儿童心理韧性呈显著负相关（r=-0.177，95%CI[-0.227，-0.131]），儿童将会在父母积极教养方式中受益更多。调节效应检验发现，父母角色、儿童年龄对父母积极教养方式与儿童心理韧性的关系起调节作用，但对父母消极教养方式与儿童心理韧性关系的调节作用不显著。值得注意的是，父亲的积极教养方式与儿童心理韧性的相关性高于母亲的积极教养方式。此外，父母教养方式与儿童心理韧性的关系不受儿童性别、独生状况、居住地、文献发表时间和发表状态的调节作用。以上结果表明，父母积极教养方式和消极教养方式分别是儿童心理韧性发展的保护性因素和风险性因素，父母应采取温暖、民主等积极教养方式，帮助儿童发展心理韧性。

儿童早期情绪调节能力发展轨迹的分类：线性与非线性方法比较

夏聪[1] 陈曦[2]（通讯作者）

1 华东师范大学心理与认知科学学院，上海，200062

2 华东师范大学心理与认知科学学院，上海，200062，xchen@psy.ecnu.edu.cn

摘 要 在早期情绪调节能力上呈现出不同发展轨迹的个体，可能在未来表现出不同的社会性发展结果，因此按照早期情绪调节能力的发展轨迹将个体分为不同类别，对于预测和预防未来的发展风险可能具有重要意义。然而，拟合发展轨迹所需的纵向追踪数据较为难得，当仅有三个时间点的追踪数据时，受限于常用的统计方法，研究者往往假定发展轨迹为线性。但大量神经科学证据表明儿童情绪调节相关脑区的发展轨迹呈二次曲线；而行为层面上，使用非线性方法研究该主题的研究较少。本研究的主要目的是比较线性模型（混合增长模型）和非线性模型（机器学习聚类）对儿童早期情绪调节能力发展轨迹的分类和拟

合效果，以及采用这两种方法分出的不同轨迹类别的儿童在未来行为适应上是否呈现显著差异。本研究分别使用混合增长模型和机器学习聚类结合二次函数拟合的方法，对 Early Head Start 项目中的 1200 名儿童（男生 598 名，女生 602 名）3 岁前的情绪调节能力发展轨迹进行分类，并对比不同类别儿童在 5 年级时的内化和外化问题，最后采用儿童在 14 个月时测量的家庭环境风险、父母教养方式、儿童气质预测其轨迹类别。结果表明：（1）混合增长模型划分出了三种类别，分别为高位缓慢上升组、低起点快速上升组和下降组；（2）机器学习聚类结合二次函数拟合的方法划分出了三种类别，分别为高位缓慢上升组、低起点快速上升组、U 型组;（3）相较于混合增长模型，非线性方法对儿童的情绪调节轨迹的拟合更准确，并且不同类别在 5 年级时的内化问题上有着更大的差异；（4）机器学习对发展轨迹类别的预测准确率优于线性模型。总结而言，本研究发现可采用机器学习方法将 0-3 岁儿童情绪调节能力的发展轨迹区分为 3 类二次函数，三种类别的儿童在 5 年级时的内化和外化行为问题上存在差异（U 型组问题更为严重），并且可采用机器学习模型预测该类别。该方法的分类和预测效果均优于混合增长模型。这一结果有助于更准确地识别在情绪调节能力发展上存在早期风险的儿童，便于精准干预。

Classification of developmental trajectories of emotion regulation ability in early childhood: Comparation between linear and nonlinear approaches

Cong Xia[1]　Xi Chen[2]

1 The School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

2 The School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

Abstract：Individuals who show different developmental trajectories of emotion regulation abilities in early childhood may exhibit different social developmental outcomes in the future, so categorizing individuals according to their developmental trajectories of emotion regulation abilities in early childhood may be important for predicting and preventing future developmental risks. However, the longitudinal data needed to fit developmental trajectories are difficult to obtain. When longitudinal data are available for only three time points, limited by commonly used statistical methods, researchers tend to assume that the developmental trajectories are linear. However, rich evidence from neuroscience suggests quadratic developmental trajectories in brain regions related to emotion regulation in children; yet there are fewer behavioral studies that have examined this topic using nonlinear methods. The main objective of the present study was to compare the effectiveness of a linear approach (growth mixture model) and a nonlinear approach (machine learning clustering) in classifying and fitting the developmental trajectories of children's emotion regulation abilities in early childhood and examine whether children in different trajectory categories classified using these two approaches showed significant differences in their future behavioral adjustment. The present study used the growth mixture model and machine learning clustering combined with quadratic function fitting, respectively, to classify the developmental trajectories of emotion regulation abilities in the first three years for 1,200 children (598 boys and 602 girls) in the Early Head Start program and compared internalizing and externalizing problems of different categories of children in Grade 5,

and finally, examined children's home environmental risk, parenting style, and child temperament at 14-month-old as predictors of their trajectory categories. The results showed that (1) the mixed growth model delineated three categories, namely, the high slow-rise group, the low-start fast-rise group, and the decline group; (2) the machine learning clustering combined with quadratic function fitting delineated three categories, namely, the high slow-rise group, the low-start fast-rise group, and the U-shaped group; (3) the nonlinear approach fitted the developmental trajectories more accurately than the growth mixture model, and there were greater differences in internalizing problems at Grade 5 between the categories identified using the nonlinear approach; (4) machine learning predicted the categories of developmental trajectories with better accuracy than the linear model. In summary, this study found that a machine learning approach could be used to differentiate the developmental trajectories of emotion regulation abilities in 0-3 year old into three quadratic categories, that the three categories differed in internalizing and externalizing behavioral problems at Grade 5 (with more severe problems in the U-shaped group), and that a machine learning model could be used to predict the categories. The method outperformed the mixed growth model in both classification and prediction. This result can help to more accurately identify children who are at early risk in the development of their emotion regulation abilities and to facilitate precise interventions.

中国高中生焦虑抑郁问题发展及其影响因素：基于潜在转变分析

张馨予[1] 周广东[123]（通讯作者） 杨海波[123]

1 天津师范大学心理学部，天津，300387

2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387

3 学生心理发展与学习天津市高校社会科学实验室，天津，300387，zhouguangdong@tjnu.edu.cn

摘 要 近年来，青少年群体焦虑抑郁问题的发生率显著上升，且存在明显的异质性，并随着时间的推移呈现出不同的发展特点。为了解青少年焦虑抑郁问题随时间发展的特点及相关影响因素，本研究以某高中 736 名非毕业生为研究对象，分别在 2021 年 7 月 13 日和 2021 年 9 月 13 日进行两次施测。采用潜在剖面分析（LPA）确定焦虑抑郁问题的潜在类别，采用潜在转变分析（LTA）确定潜在类别的转变趋势，并采用多元逻辑回归分析评估内部（神经质）和外部（负性生活事件）对亚类别及转变趋势的影响。结果得到：（1）焦虑抑郁问题具有三个潜在类别：低抑郁组、低症状组和共病组。（2）低抑郁组和低症状组的时间稳定性较高，共病组的时间稳定性较弱。（3）随着时间的推移，低抑郁组有可能发展至低症状组，共病组具有恢复到低症状组的可能性。（4）神经质和负性生活事件显著影响焦虑和抑郁的潜在类别的划分，神经质得分较高或经历负性生活事件频率较高的个体更可能处于低症状组和共病组。（5）消极生活事件会影响焦虑抑郁问题的过渡模式，经历更频繁的负性生活事件的个体更有可能转变至低症状组和共病组。综上，本研究得到青少年焦虑抑郁问题存在异质性。随着时间的推移，焦虑抑郁问题既表现出较高的稳定性，也呈现出恶化或恢复的可能。此外，本研究还发现内部和外部因素均会影响个体焦虑抑郁问题的发生，且外部因素会影响个体焦虑抑郁问题的维持和转变。本研究提供了深入了解青少年焦虑抑郁问题的发展过程的参考，并向教育工作者提供了有效方向，即通过改善青少年的外部生活环境来缓解焦虑抑郁问题。

The Development of Anxiety and Depression in Chinese High School Students and Its Influencing Factors: A Latent Transition Analysis

Xinyu Zhang[1] Guangdong Zhou[123] Haibo Yang[123]
1 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China
2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China
3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China

Abstract： In recent years, the prevalence of anxiety and depression among adolescents has increased significantly, showing obvious heterogeneity and presenting different developmental characteristics over time. To explore the characteristics of adolescent anxiety and depression, as well as their developmental patterns over time and related influencing factors, this study involved 736 non-graduates from a certain high school who completed two questionnaires on July 13, 2021, and September 13, 2021. The latent classes of anxiety and depression were determined using latent profile analysis (LPA). Additionally, latent transition analysis (LTA) was employed to identify the transformation trend of these latent classes. Multiple logistic regression analyses were conducted to evaluate the influence of internal factors (neuroticism) and external factors (negative life events) on the subcategories and transformation trends. The results were obtained: (1) Anxiety and depression were categorized into three latent classes: low-depression, low-symptom, and comorbid group. (2) The low-depression and low-symptom groups exhibited high time stability, whereas the comorbid group demonstrated weaker time stability. (3) Over time, individuals in the low-depression group tended to transition to the low-symptom group, while individuals in the comorbid group showed a potential return to the low-symptom group. (4) Neuroticism and negative life events significantly influence the classification of latent classes for anxiety and depression. Individuals with higher neurotic scores or a higher frequency of negative life events are more likely to belong to the low-symptom and comorbid groups. (5) negative life events influenced the transition patterns of anxiety and depression. Individuals who experienced more frequent negative life events were more likely to undergo transitions into the low-symptom and comorbid groups. In conclusion, this study found that there is heterogeneity in anxiety and depression among adolescents. Over time, these issues show both high stability and the possibility of worsening or improvement. Furthermore, the study revealed that both internal and external factors influence the occurrence of anxiety and depression in individuals, with external factors also impacting the maintenance and transition of these issues. This research provides insights into the occurrence and development of anxiety and depression among adolescents and offers effective directions to educators, suggesting that alleviating anxiety and depression issues can be achieved by improving the external living environment of young individuals.

大学生网络游戏障碍的发展轨迹和预测因素：一个五波的纵向追踪调查

乔小飞 石绪亮（通讯作者）
河北大学教育学院，保定，071002，shixl163@163.com

摘 要 背景：网络游戏障碍逐渐成为全球的一大公共健康问题，在大学生群体当中尤其普遍。本研究旨在以大学生群体为研究对象，探讨网络游戏障碍的变化轨迹及其保护性和风险性因素。方法：本研究对广东省某高校的 5785 名学生展开 3 年追踪调查。采用自评问卷的方式评估网络游戏障碍、自我控制、自我怜悯、抑郁、同伴冲突。结果：（1）本研究发现了 3 类不同的网络游戏障碍轨迹：低而稳定组，上升组和下降组；（2）自我控制和自我怜悯是网络游戏障碍的保护因素；（3）抑郁和同伴冲突是网络游戏障碍的风险因素。结论：大学生的网络游戏障碍较为普遍，并表现出了明显的异质性。高校心理健康工作者应特别关注高风险群体及其影响因素，从而进行有针对性的预防和干预。

Developmental trajectories and predictors of internet gaming disorder among college students: A five-wave longitudinal investigation

Xiaofei Qiao, Xuliang Shi

School of Education, Hebei University Hebei, Baoding 071002

***Abstract*：** Background*:* Internet gaming disorder (IGD) is becoming a major public health problem around the world, which is particularly prevalent among college students. This study aims to examine the trajectories of internet gaming disorder, and explore the protective and risk predictors of IGD among college students. Methods*:* This study followed 5787 college students from universities in Guangdong Province over 3 years. Self-assessment questionnaires were used to assess IGD, self-control, self-compassion, depressive symptoms, peer conflict, and demographic characteristics. Results*:* (1) this study identified three distinct trajectories of IGD: low-stable pattern, increasing pattern, and decreasing pattern; (2) self-control and self-compassion were protective factors for IGD; (3) depressive symptoms and peer conflict were risk factors for IGD. Conclusions*:* IGD is highly prevalent and shows significant heterogeneity among college students. Mental health practitioners in universities should pay more attention to high-risk students and associated predictors, early target prevention and interventions should be designed to improve IGD.

融合音乐训练的绘本阅读活动对 3-4 岁儿童言语能力的影响

王梓洋　刘世玉（通讯作者）

中国海洋大学教育系，青岛，266100

摘 要　早期言语能力被认为是预测儿童未来学业发展的一个重要指标，包含语音意识、言语表达及对言语和故事的理解等。绘本阅读能够有效提升儿童的言语和阅读能力。音乐与语言有着相似的特性和神经机制。音乐训练能够提高儿童听觉敏感度，对言语发展也起着积极作用。在阅读活动中加入节奏、律动等音乐训练，不仅能增强儿童的参与度与沉浸感，还能提高儿童的记忆力与兴趣，从而能更好地提升言语能力。然而，将二者融合应用于幼儿园集体活动中是否有效，仍有待深入研究。本研究旨在探讨融合音乐训练的绘本阅读活动对儿童言语能力的作用。为此，在幼儿园中进行准实验研究，随机选取某所公立幼儿园三个班级共 72 名小班儿童（$M_{月龄}$=48.63），并将这三个班随机分为实验组—融合音乐训练的绘本阅读组（N=23）、对照组—传统绘本阅读组（N=25）和空白组—无实验干预组（N=24）。实验前对三个班儿童进行言语能力前测，发现无显著差异。实验持续 8 周，每周 3 次，每次 10-15 分钟，实验班与对照班学习《小金鱼逃走了》、《鳄鱼怕怕，牙医怕怕》与《月亮的味道》三本绘本，每本学完后进行绘本故事理解测试。空白班不做干预，8 周后三个班进行言语能力后测。

研究结果表明：（1）融合音乐训练的绘本阅读活动能显著提升儿童的言语能力，尤其是言语理解与表

达能力，语音意识虽有提升但并未达到显著。（2）传统绘本阅读活动也能够显著提升儿童的言语能力，尤其是表达能力。言语理解有一定程度的提升，但无显著差异。对语音意识有较小影响。（3）组间比较结果得出，在言语能力的提升效果上，融合音乐训练的绘本阅读活动则更有效，实验组显著高于对照组（F=59.019,p<0.01），空白组实验前后得分无明显差异。故事理解测验中，实验组儿童得分显著高于对照组，尤其是对隐性问题的理解更好。本研究揭示了在幼儿园小班中将音乐训练融入到绘本阅读活动中的可行性与有效性。

The Impact of Integrated Music Training in Picture Book Reading Activities on the Language Abilities of 3-4-Year-Old Children

Ziyang Wang, Shiyu Liu (Corresponding Author)
Department of Education, Ocean University of China, Qingdao, 266100

Abstract: Early language ability is considered an important indicator for predicting children's future academic development, which includes phonological awareness, language expression, and comprehension of speech and stories. Reading picture books can effectively enhance children's language and reading abilities. Additionally, music and language share similar characteristics and neural mechanisms. Music training can improve children's auditory sensitivity and also positively influence language development. Incorporating rhythm, movement, and other music training elements into reading activities not only enhance children's engagement and immersion but also improves their memory and interest, leading to better language development. However, further research is needed to explore the effectiveness of integrating these two activities in collective educational settings, such as kindergarten. This study aims to investigate the role of integrated music training and picture book reading activities on children's language ability. A quasi-experimental research design was employed in a selected public kindergarten, randomly selecting three classes, a total of 72 preschool children were included in the study (M = 48.63 months). Randomly assigning children from three classrooms into three groups: experimental group—integrated music training and picture book reading group (N=23), control group—traditional picture book reading group (N=25), and blank group—no experimental intervention group (N=24). Before the experiment, a pretest on children's language ability was conducted, and there were no significant differences in language ability scores among the three groups. The experiment lasted for 8 weeks, with three sessions per week, each lasting 10-15 minutes. The experimental group and the control group studied three picture books: "The Goldfish Got Away," "The Crocodile and the Dentist," and "A Taste of the Moon." After studying each book, they underwent a picture book story comprehension test. The blank group received no intervention. After 8 weeks, all three groups underwent a posttest to assess their language abilities.

The research findings indicate that: (1) The integrated music training in picture book reading activities significantly improves children's language abilities, particularly in language comprehension and expression. Although there is some improvement in phonological awareness, it did not reach statistical significance. (2) Traditional picture book reading activities can significantly enhance children's language abilities, especially in terms of expression. There is a certain level of improvement in language comprehension, but no significant difference. There is a minor impact on phonological awareness. (3) The comparison between the groups revealed that in terms of the improvement in language ability, the integrated approach of music training and picture book reading was more effective. The experimental group showed a significant improvement compared to the control group (F=59.019, p<0.01), while the blank group did not show any significant difference in scores before and after

the experiment. In the story comprehension test, the children in the experimental group obtained significantly higher scores than those in the control group, particularly in their understanding of implicit questions. This study revealed the feasibility and effectiveness of integrating music training into picture book reading activities in kindergarten classrooms.

儿童屏幕暴露与执行功能的关系元分析

苏俊月 吴小凤 刘畅海 唐邑 魏勇刚（通讯作者）

重庆师范大学教育科学学院，重庆市学前教育质量监测与评估研究中心，重庆 401331

摘 要 屏幕暴露（Screen Exposure），是指个体接触屏幕类电子媒介的一系列活动，如看电视、玩电子游戏、上网、使用手机等。在日新月异的数字化时代，儿童已然成为数字原住民，其屏幕暴露的时间逐年成倍增长。已有研究表明，屏幕暴露对儿童的认知发展等产生显著影响。执行功能作为个体认知发展的重要因子，常被用来探讨与屏幕暴露之间的关系，且这方面的研究还存在着大量争议。因此，有必要充分考察已有实证研究的综合结果，明确屏幕暴露与执行功能间的关系，从而对儿童屏幕暴露进行科学有效的规范和引导。本研究采集了国内外 15 项实证研究的 19 种效应值，涉及 6167 名儿童的屏幕暴露和执行功能变量，对其进行元分析，以确定儿童屏幕暴露与执行功能之间的关系，并探究人口学变量、屏幕暴露时长、电子媒介类型、研究属性测试等因素对二者关系的影响。结果表明，屏幕暴露较高的儿童往往有更低的执行功能，且受到被试年龄、屏幕暴露时长、出版年份等因素的影响。屏幕暴露与执行功能之间的负相关关系在 3-6 岁中最强，其次是 6-12 岁，0-3 岁最低；日均暴露时长大于 1 小时比小于 1 小时更强；随着出版年份的推移，表现出更强的相关性。综合以上发现，可以得出以下论断：儿童屏幕暴露时间越长，其执行功能水平越低，尤其是 3-6 岁这个儿童群体中表现出更强烈的低执行功能。据此，未来我们应有意识地对学前儿童的屏幕暴露时长进行控制，以促进其执行功能的有效发展。

关键词 屏幕暴露；执行功能；儿童

A Meta-Analysis of the Relationship between Screen Exposure and Executive Function in Children

Junyue Su Xiaofeng Wu Changhai Liu Yi Tang Yonggang Wei (Contacts author)

College of Education Science, Chongqing Normal University,, Chongqing Early Childhood Education Quality Monitoring and Evaluation Research Center, Chongqing ,401331

Abstract: Screen Exposure refers to a series of activities in which individuals are exposed to screen-based electronic media, such as watching TV, playing video games, surfing the Internet, and using mobile phones. In the rapidly changing digital age, children have become digital natives, and their screen exposure time is increasing exponentially year by year. Studies have shown that screen exposure has a significant impact on children's cognitive development. As an important factor of individual cognitive development, executive function is often used to explore the relationship with screen exposure, and there are still a lot of controversies in this area of research. Therefore, it is necessary to fully examine the comprehensive results of existing empirical studies and clarify the relationship between screen exposure and executive function, so as to scientifically and effectively

regulate and guide children's screen exposure. This study collected 19 effect sizes from 15 empirical studies at home and abroad, involving 6167 children's screen exposure and executive function variables, and conducted a meta-analysis to determine the relationship between children's screen exposure and executive function, and explored the influence of demographic variables, screen exposure duration, electronic media type, research attribute testing and other factors on the relationship. The results showed that children with higher screen exposure tended to have lower executive function, which was influenced by subjects' age, screen exposure time, and publication year. The negative correlation between screen exposure and executive function was strongest in 3-6 years old, followed by 6-12 years old, and lowest in 0-3 years old. The average daily exposure time of more than 1 hour is stronger than that of less than 1 hour. Stronger correlations were shown as the year of publication progressed. Based on the above findings, the following conclusions can be drawn: the longer children's screen exposure time, the lower their executive function level, especially in the group of 3-6 years old children showed a stronger low executive function. Therefore, in the future, we should consciously control the screen exposure time of preschool children to promote the effective development of their executive functions.

Keywords: screen exposure; executive function; children

中学生述情障碍与社交焦虑的纵向关系-基于潜在转变分析

李森鹏 刘志军（通讯作者）王姣

海南师范大学心理学院，海南，570100

摘 要 **目的：**运用追踪研究设计和潜在转变分析法研究中学生述情障碍潜在类别的转变特点及其影响因素。**方法：**以湖南省 7 所中学的 1447 名中学生为被试进行为期 6 个月的追踪，对数据进行潜在转变分析。**结果：（1）**中学生述情障碍可分为高述情障碍组、普通组和低述情障碍组 3 个类别。（2）高述情障碍组稳定性最弱，保持原潜在状态的概率为 37.7%，普通组和低述情障碍组保持原潜在状态的概率分别是 58.1%和 50.7%。（3）高述情障碍组倾向于向普通组转变，转变概率为 50.2%。（4）社交焦虑和性别在述情障碍类别转变中起显著作用。**结论：**中学生述情障碍存在 3 个潜在类别，不同类别随时间推移发生转变且受多种因素影响，述情障碍转变呈现出“缓解模式”。

The Relationship between Alexithymia and Social anxiety in Middle School Students - Based on Latent transition Analysis

Li Senpeng Liu Zhijun Wang jiao

School of Psychology, Hainan Normal University，Hainan

***Abstract*:**

Objective: To study the transition characteristics and influencing factors of the latent class of alexithymia in middle school students by longitudinal design and latent transition analysis. **Methods**: A follow-up study was conducted on 1447 middle school students from 7 middle schools in Hunan Province at an interval of 6 months to

analyze the latent transition change. **Results**: (1) Alexithymia in middle school students can be divided into three categories: high alexithymia class, common class and low alexithymia class. (2) The stability of the high alexithymia class was the weakest, and the probability of maintaining the original latent state was 37.7%. The probability of maintaining the original latent state was 58.1% and 50.7% in the common class and the low alexithymia class, respectively. (3) The high alexithymia class tended to transition to the common class, and the probability of transition was 50.2%. (4) Social anxiety and gender play a significant role in the change of alexithymia. **Conclusion**: There are three latent class of alexithymia in middle school students, and the different class change over time and are affected by multiple factors. The transformation of Alexithymia presents a "mitigation mode".

儿童第三方惩罚的偏好：双赢还是双输

马睿[1]　刘丽丝[1]　吴南[1,2]（通讯作者）

1 北京联合大学师范学院，北京，100101

2 北京联合大学儿童及青少年学习与心理发展研究所，北京，100101, wunantom@126.com

摘 要　在儿童中期，儿童的公平观念得到进一步发展，能够出现付出代价以维护公平的行为，但儿童偏好的公平方式仍需要进一步探索。双赢与双输是公平的两种形式，双赢指双方获利最大化，双输指双方损失最大化。双赢公平使得维护公平的第三方获得更多声誉收益，但违规者不会受到惩罚，即“利己不损人”；双输是更具威慑力的公平形式，违规者会受到惩罚，但是第三方维护公平的行为存在“出力不讨好”的可能。同时研究表明，弱者（即资源较少的一方）利益是否受损会影响儿童的公平行为。因此，本研究借鉴第三方惩罚的独裁者博弈范式设计了两个实验，探查一至四年级儿童作为第三方时的公平形式偏好并明晰年龄变化的模式。实验一（*N*=111）探查了第三方惩罚损害弱者利益时，儿童偏爱的公平方式。结果发现，儿童更偏爱“双赢”的公平形式。这意味着他们更倾向于通过帮助双方获利最大化来维护公平，而不会选择对违规者进行惩罚。但该范式中的双输公平会损害弱者的利益。因此，实验二（*N*=109）进一步探查了第三方惩罚不损害弱者利益时，儿童偏爱的公平方式。结果发现儿童同样偏爱“双赢”的公平形式，这表明即使在没有弱者利益受损的情况下，他们仍然倾向于支持双方互惠互利，以维护公平。综上，本研究得出以下结论：

1、多数一至四年级儿童会做出维护公平公正的第三方惩罚行为，且更偏好“双赢”的公平形式。

2、不论弱者利益受损时，还是利益不受损，女孩均更偏爱双赢公平。

Children's preference for third-party punishment: Win-win or Lose-lose?

Rui Ma[1], Lisi Liu[1], Nan Wu[1,2]

1 Teachers College of Beijing Union University, Beijing, 100011

2 Learning and Psychological Development Institution for Children and Adolescents, Beijing Union University, Bei Jing 100101

Abstract ： In middle childhood, children's conception of fairness undergoes further development, manifesting behaviors that involve costs to uphold fairness. However, the preferred mode of fairness for children still requires deeper exploration. "Win-win" and "lose-lose" represent two types of fairness, where win-win signifies the maximization of benefits for both sides, while lose-lose means maximization of losses for both. Win-win fairness provides more reputational benefits for a third party upholding fairness, yet doesn't penalize the transgressors, encapsulated as "benefitting oneself without harming others." In contrast, lose-lose fairness holds a more deterrent effect, penalizing the rule-breakers, but the third party's actions in upholding fairness might not always be acknowledged or appreciated. Studies also indicate that whether the underprivileged party (those with fewer resources) is harmed influences children's fairness behaviors. This research, inspired by the third-party punishment paradigm from the dictator game, designed two experiments to examine the fairness preference of children from first to fourth grade when acting as the third party, and to elucidate patterns across ages. In Experiment 1 (*N*=111), children's preferred form of fairness was explored when third-party punishment harmed the interests of the weaker party. The findings revealed that children favored the "win-win" fairness approach, suggesting they lean more towards helping both parties maximize gains rather than penalizing wrongdoers. However, in this paradigm, the lose-lose fairness approach harmed the underprivileged. Hence, Experiment 2 (*N*=109) further explored children's fairness preference when third-party punishment didn't harm the underprivileged party's interests. The results again indicated a preference for "win-win" fairness, suggesting that even without detriment to the weaker party, children still tend to support mutual benefits to uphold fairness. In conclusion, this study deduced:

1. Most children from first to fourth grade engage in third-party punitive actions to maintain fairness and equity, with a stronger inclination towards "win-win" fairness.
2. Regardless of whether the weaker party's interests are harmed or not, girls consistently favor win-win fairness.

Keywords：children, third-party punishment, equality, win-win equality, lose-lose equality

体重指数和小学儿童工作记忆的关系：体重污名的中介作用

刘丽丝[1] 马睿[1] 徐茜[1,2] 吴南[1,2,*]

[1]北京联合大学师范学院，北京，100101

[2]北京联合大学儿童及青少年学习与心理发展研究所，北京，100101

[*]通讯作者：wunantom@126.com

摘 要 随着超重和肥胖检出率的逐年上升，儿童肥胖已经成为危害其健康的公共卫生问题，肥胖对儿童的生理、心理和认知能力发展的影响越来越受到关注。研究显示肥胖会损害儿童的认知能力，较于正常体重的儿童，肥胖儿童的工作记忆表现更差。与此同时，在追求“瘦理想”的时代，肥胖问题导致的体重污名现象也值得重视。体重污名不仅危害个体的心理健康，还会对儿童的认知和学习产生消极影响。因此，本研究将探讨肥胖问题对儿童工作记忆的影响，以及体重污名（体重嘲笑、身体意象）在其中的作用。选取北京市某小学五、六年级的学生共 365 人，依据《中国学龄儿童青少年超重、肥胖筛查体重指数值分类标准》将被试分为肥胖组、超重组和正常体重组。使用 E-prime 编制的简体中文版“自动化运算广度任务”测量被试的工作记忆能力。体重污名则选取 Thompson 等人编制的感知嘲笑量表（Perception of Teasing Scale, POTS），对被试感知到嘲笑的频率和被嘲笑后的沮丧程度进行测量。身体意象采用 Evans 等人修订的体像量表简短版（Body Shape Questionnare-8C, BSQ-8C），考察被试对自己身体的满意程度。研究发现：（1）不同体重（正常体重、超重、肥胖）类型的儿童工作记忆不存在显著差异；肥胖儿童受到的体重污名显著

高于体重正常儿童。（2）儿童的 BMI 值与工作记忆相关不显著；儿童的 BMI 值与体重污名呈显著正相关；儿童的工作记忆与被嘲笑的频率呈显著负相关。（3）体重污名在 BMI 指数和工作记忆之间起完全中介作用。

关键词　肥胖儿童，体重指数，工作记忆，体重污名

The Relationship between Body Mass Index and Working Memory in Primary School Children: The Mediating Role of Weight Stigma

Lisi Liu [1], Rui Ma [1], Qian Xu [1,2], Nan Wu [1,2,*]

[1] Teachers College of Beijing Union University, Beijing, 100011

[2] Learning and Psychological Development Institution for Children and Adolescents, Beijing Union University, Beijing 100101

[*]Corresponding author, wunantom@126.com

Abstract：With the increasing prevalence of overweight and obesity, childhood obesity has become a public health concern, posing risks to the health and development of children. The impact of obesity on the physiological, psychological, and cognitive development of children is receiving growing attention. Researches have shown that obesity can impair children's cognitive abilities, with obese children exhibiting poorer performance in working memory compared to their normal-weight peers. Meanwhile, in an era that idealizes thinness, the issue of weight stigma resulting from obesity is also a matter of concern. Weight stigma not only affects individuals' mental well-being but also has negative consequences on children's cognition and learning. Therefore, this study aims to explore the influence of obesity on children's working memory and the role of weight stigma (weight-teasing and body image) in this context. The study selected a total of 365 students from grades five and six in a primary school in Beijing. Participants were categorized into obese, overweight, and normal-weight groups based on the "Chinese screening body mass index classification standard for school-age children and adolescents." The simplified Chinese version of the "Automated Operation Span Task," created using E-prime, was used to measure the participants' working memory capacity. Weight stigma was measured using the Perception of Teasing Scale (POTS), developed by Thompson et al., which assessed the frequency of perceived teasing and the level of distress experienced after being teased. Body image was evaluated using the shortened version of the Body Shape Questionnaire-8C (BSQ-8C), revised by Evans et al., to assess the participants' satisfaction with their own bodies. The study findings are as follows: (1) There are no significant differences in working memory between different weight types (normal weight, overweight, obese); Obese children experience significantly higher levels of weight stigma compared to children with a normal weight. (2) BMI in children is not significantly correlated with working memory; Children's BMI values are significantly positively correlated with weight stigma; children's working memory is significantly negatively correlated with the frequency of teasing. (3) Weight stigma acts as a complete mediator between BMI index and working memory.

Keywords：Obese children, BMI, Working memory, Weight stigma

“当心脚下”：底部视觉线索对边界定位的影响机制

沈婷[1] 吴梓瑶[1] 郝鑫[1]（通讯作者）
1 华中师范大学心理学院，武汉，430079，psyhaoxin@ccnu.edu.cn

摘 要 边界定位是人类必备的生存技能。自然界中有直立式和坠落式两种边界，尽管研究表明视觉线索影响直立式边界定位，但缺乏对坠落式边界的探讨，且忽略了底部视觉线索的作用。本研究聚焦底部视觉线索，考察多种视觉线索对两种边界定位的影响，并探讨二者加工机制的异同。实验 1 考察底部显著性和透明度对坠落式边界定位的影响，结果发现个体将高显著性、不透明的坠落式边界定位得更近，且在高、低显著性下，均认为不透明边界更近（前者差异更大），线性混合模型结果表明透明度有着更大的作用。实验 2 综合底部和前面视觉线索考察底部显著性和前面透明度对直立式边界定位的影响，结果发现个体认为高显著性、不透明直立式边界更近，且透明度同样有着更大权重。实验 3 通过眼动技术进一步探究底部透明度对坠落式和直立式边界定位的影响，并探讨二者加工机制的异同，结果发现个体对场景底部兴趣区、坠落式边界和不透明条件给予更多的注视。另外，对透明坠落式边界的总注视次数多于不透明条件，但在直立式边界中差异不显著，表明两种边界存在共享和分离的加工机制。

综上，本研究首次揭示底部视觉线索对边界定位的作用机制，尤其是坠落式边界；还发现显著性和透明度对边界定位的不同作用权重，为空间导航的认知计算机制提供重要理论价值。

“Watch your feet”: the mechanism of bottom visual cues for boundary orientation

SHEN Ting[1], Ziyao Wu[1], HAO Xin [1,*]
School of Psychology, Central China Normal University, Wuhan, China

Abstract: Boundary orientation is an essential survival skill for humans. There are two types of boundaries in nature: upright (wall-up) and falling (drop-off) boundaries. Although research has shown that visual cues affect wall-up boundary orientation, there is a lack of exploration of drop-off boundary, and the role of bottom visual cues has been neglected. This study focused on bottom visual cues to examine the effects of multiple visual cues on the orientation of the two boundaries and to further explore the similarities and differences in the processing mechanisms of both. This study focused on bottom visual cues to examine the effects of multiple visual cues on the orientation of the two boundaries and to further explore the similarities and differences in the processing mechanisms of both. Experiment 1 examined the impact of bottom salience and transparency on the orientation of drop-off boundary, and found that individuals orientated high salience and opaque drop-off boundaries closer, and perceived opaque boundaries as closer at both high and low salience (with a greater difference in the former). The linear mixed model findings suggested that transparency had a greater effect. Experiment 2 combined bottom and front visual cues to examine the effects of bottom saliency and front transparency on the orientation of wall-up boundary, and found that individuals perceived high saliency and opaque conditions to be closer, and again transparency had greater weight. Experiment 3 further used eye-tracking technique to investigate the effects of bottom transparency on the orientation of the drop-off and wall-up boundaries, and to explore whether they share the same processing mechanism. The results found that individuals gave more attention to the region of interest at the bottom of the scene, the drop-off boundary and the opaque condition. In addition, the Fixation Count to the transparent drop-off boundary was more than that to the opaque condition, but the difference was not significant in the wall-up boundary, which indicated that there are shared and separate processing mechanisms for the two types of boundaries.

In summary, this study reveals the mechanism of bottom visual cues on boundary orientation for the first time, especially for drop-off boundary. It also shows the different role weights of saliency and transparency on boundary orientation, which provides an important theoretical value for cognitive computational mechanisms for spatial navigation.

急性应激与不同亲社会结果对努力型亲社会行为的影响

龚诗苗[1] 郝嘉佳[1]（通讯作者）

1 天津师范大学心理学部，天津，300387，haojiajia@tjnu.edu.cn

摘 要　急性应激会影响个体的情绪和行为。许多亲社会行为需要个体付出努力来为他人带来收益，或者帮助他人避免损失。本研究探讨急性应激和亲社会行为结果对努力型亲社会行为的影响，考查个体在急性应激条件下投入努力使得他人获得奖励或者避免损失的意愿和行为。实验设计为情境（奖励、损失）×组别（应激、对照）×努力水平（最大按键次数的 30%、50%、70%）×奖励水平（高、中、低）的混合设计，其中情境和组别为被试间因素。117 名被试随机分为两组，分别接受蒙特利尔脑成像应激任务（MIST）的应激版本或者对照版本，并完成奖励情境或损失情境下的努力型亲社会任务。结果发现，努力水平主效应显著，情境条件和努力水平的交互作用显著。简单效应发现，与帮助他人获得奖励付出努力相比，被试更愿意为他人避免损失而付出中低程度的努力。奖励水平的主效应显著，情境条件和奖励水平的交互作用显著。简单效应分析发现，与获得高奖励相比，被试在避免高损失条件中更加倾向于选择需要努力的亲社会行为。在避免损失的情境下，与避免低损失相比，被试在面对避免高损失时，更愿意选择需要努力的亲社会任务；在获得奖励的情境下，与获得低奖励相比，被试在面对高奖励时，更愿意选择需要努力的亲社会任务。综上所述，无论个体是否处于急性应激状态，相比于帮助他人获得奖励，被试更愿意为他人避免损失，以及需要付出努力的多少也会显著影响个体的努力型亲社会行为的选择。

关键词　急性应激，亲社会行为，努力，损失厌恶

The Effects of Acute Stress and Different Prosocial Outcomes on Prosocial Effort Behavior

Gong Shimiao[1] Hao Jiajia[1]

1 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387, haojiajia@tjnu.edu.cn

Abstract：Acute stress affects an individual's emotions and behavior. Many prosocial behaviors require individuals to exert effort to bring gains to others or to help others avoid losses. The present study examined the effects of acute stress and prosocial behavioral outcomes on effortful prosocial behavior, examining individuals' willingness and behavior to invest effort to bring about rewards for others or avoid losses under acute stress conditions. The experimental design was a mixed context (reward, loss) × group (stress, control) × effort level (30%, 50%, 70% of the maximum number of keystrokes) × reward level (three levels), in which context and group were between-participants factors. 117 participants were randomly divided into two groups to receive either the stress or control versions of the Montreal Imaging of Brain Stress Task (MIST) and to complete either the reward or loss context of an effortful prosocial task. The results found a significant main effect for level of effort and a significant interaction between context condition and level of effort. A simple effect was that participants were more willing to exert a low to moderate level of effort to avoid loss for others than to help them gain a reward.The

main effect of reward level was significant, and the interaction between context condition and reward level was significant. Simple effects analyses found that participants were more inclined to choose prosocial behaviors that required effort in avoiding high loss than in receiving high rewards conditions. In the loss avoidance context, participants were more inclined to choose prosocial tasks that required effort when avoiding high losses than avoiding low losses. In the reward acquisition context, participants were more inclined to choose prosocial tasks that required effort when faced with high rewards than obtaining low ones. In summary, regardless of whether an individual is in an acute stress situation, subjects' greater willingness to avoid losses for others than to help them gain rewards and the amount of effort required also significantly affects an individual's choice of effortful prosocial behaviors.

Keywords：acute stress, prosocial behavior, effort, loss aversion

推理和阅读的双向建构：

额中回对视觉和凸显网络功能调控的中介作用

王笳力[1]　王延培[1]　马磊磊[1]　陶沙[1]（通讯作者）

1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875，taosha@bnu.edu.cn

摘 要　推理作为一种复杂的高级认知技能，使儿童能够从一个熟悉任务的心理表征快速转移到另一个不熟悉的任务中，是在已有知识基础上得出新颖结论的能力。而阅读的过程也需推理能力的参与，儿童在实现阅读理解时会借助已有的知识系统或认知表征在新情境中进行推断和学习，从而理解语篇和句法。已有研究表明，推理能力的发展支持阅读的习得，而阅读的过程也可以促进认知能力的提升，但对于二者之间的双向作用关系和涉及的脑功能连接基础仍需要进一步探索。因此本研究旨在探查推理和阅读能力发展之间的纵向预测模式，以及该模式是如何通过特定脑区之间功能连接的变化所解释。为此，我们对于 464 名年龄介于 6 至 12 岁的儿童进行了两次推理和阅读能力的评估（平均年龄 8.96±1.31 岁，评估时间间隔为 1 年），并进行大脑结构像和静息态功能成像扫描。交叉滞后模型的结果显示，在控制了基线的阅读成绩后，基线的推理分数可以显著预测一年后的阅读成绩发展，这种预测关系不受背景变量，包括性别、年龄、父母受教育水平和家庭经济情况的影响。相反，在控制了基线的推理分数后，较低的阅读成绩显著预测了一年后的推理分数，而较高水平的阅读能力者的成绩对推理分数的预测关系则不显著。对脑功能机制的探索发现，左侧额中回与视觉和凸显网络之间的功能连接是推理和阅读能力共享的脑功能基础，其中，基线的推理分数对一年后阅读成绩的预测作用可以被共享的额中回-枕中回及额中回-脑岛间的功能连接所介导。综上，本研究发现了学龄儿童复杂的认知能力对阅读技能的稳定预测作用，且此关系模式的神经中介因素可能是额中回与视觉和凸显网络间的连通性。因此，针对推理能力的培养是优化儿童阅读技能和大脑发育的重要途径，值得在教育实践中予以重视。

Bidirectional construction of reasoning and reading:

the mediating role of the functional regulation from the middle frontal gyrus to visual and salience networks

Jiali Wang[1], Yanpei Wang[1], Leilei Ma[1], Sha Tao[1]

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875

***Abstract*：** As a complex cognitive skill, reasoning supports children to swiftly transfer mental representations from familiar tasks to unfamiliar ones and derive novel conclusions based on existing knowledge. The process of reading also involves the engagement of reasoning abilities, as children utilize their learned knowledge systems and cognitive representations to infer and comprehend texts in new contexts, thereby understanding discourse and syntax. Existing research has indicated that the development of reasoning abilities supports the acquisition of reading skills, and in turn, the reading process can enhance cognitive abilities. However, the bidirectional relationship between these two factors and the underlying neural functional connections involved require further exploration. Therefore, this study aims to investigate the longitudinal predictive patterns between reasoning and reading abilities, as well as how these patterns are explained by changes in functional connectivity between specific brain regions. To achieve this, we conducted two rounds of reasoning and reading ability assessments for 464 children aged between 6 and 12 years (mean age 8.96 ± 1.31 years), with a one-year interval. And structural and resting-state functional imaging scans of the brain were performed. The results from the cross-lagged panel model revealed that, after controlling for baseline reading scores, baseline reasoning scores significantly predicted the development of reading abilities one year later. This predictive relationship remained robust, unaffected by background variables, including gender, age, parental education levels, and family economic status. Conversely, after controlling for baseline reasoning scores, lower reading scores significantly predicted reasoning scores one year later, while the predictive relationship for individuals with higher reading proficiency was not significant. Through exploring the brain functional mechanisms, we found that the functional connectivity between the left middle frontal gyrus and the visual and salience networks serves as the shared neural foundation for reasoning and reading abilities. Specifically, the predictive effect of baseline reasoning scores on subsequent reading performance was mediated by the shared functional connectivity between the middle frontal gyrus and the middle occipital gyrus, as well as between the middle frontal gyrus and the insula. In conclusion, this study discovers the stable predictive role of complex cognitive abilities on reading skills in school-age children, with the identified neural mediation factor being the connectivity between the left middle frontal gyrus and the visual and salience networks. Therefore, nurturing reasoning abilities is a crucial pathway to optimize children's reading skills and promote healthy brain development, warranting significant attention in educational practice.

童年晚期至青少年中期自我概念发展轨迹及父母教养的作用

莫亚连　武雨晴　张文新　纪林芹（通讯作者）

山东师范大学心理学院，济南，250014，sdjlq@126.com

摘 要　自我概念的发展是儿童心理发展的重要指标。根据依恋理论，与父母的互动影响儿童自我图式的构建, 父母的教养方式对儿童自我概念的发展有重要的影响。但特定领域自我概念发展的异质性以及父母教养方式对不同自我概念发展轨迹的影响尚不清楚。本研究对 2118 名四年级学生（T1 时平均年龄为 10.70±0.48 岁，男生为 51.9%）进行了 7 年的追踪，探讨社交、身体和一般自我概念的一般发展轨迹、异质发展轨迹和联合发展轨迹，并探讨父母教养方式的作用。结果：（1）潜增长模型表明，个体的社交自我概念在童年晚期至青少年早期呈上升趋势，随后略有下降；从童年晚期到青少年中期，身体自我概念呈轻微下降趋势。一般的自我概念在童年晚期表现出轻微的、不显著的增加，随后显著的下降。（2）增长混合模

型表明，社交自我概念呈现 3 条异质性轨迹：持续高（85.4%）、低上升（11.7%）和后期上升（2.9%），身体自我概念呈现 4 条异质性轨迹：持续高（45.0%）、中高下降（20.0%）、中等上升（17.0%）和持续低（18.0%），一般自我概念呈现 3 条异质性轨迹：持续高（87.5%）、低上升（10.0%）和后期上升（2.5%）；（3）平行增长混合模型表明，存在 3 个联合轨迹组：持续高组（87.0%）、中等上升组（9.0%）和中等稳定组（3.0%）；（4）多元 logistic 回归分析表明，相较于中等上升组，父母温暖水平较高、拒绝和惩罚程度较低的儿童更容易归属为持续高自我概念组。研究结果表明，儿童青少年的自我概念的发展存在个体差异，父母教养方式对儿童青少年自我概念的发展存在重要影响。

Self-Concept Trajectories from Late Childhood to Middle Adolescence: The Role of Parenting

Mo Yalian Wu Yuqing Zhang Wenxin Ji Linqin
School of Psychology, Shandong Normal University, Jinan 250014

***Abstract*:** Development of self-concepts is an important indicator of their mental development. According to attachment theory, children construct schemas about self from their interactions with parents. Parenting behavior is expected to be a key influence on the development of children's self- concepts. Nevertheless, little is known about the heterogeneity of specific self-concepts development and the influence of parenting styles on different developmental trajectories of self-concept. In this study, 2118 4th students (T1: M_{age} = 10.70 ± 0.48 years, 51.9% boys) were followed-up across 7 years to determine general developmental trajectory, heterogeneous trajectories and joint trajectories of social, physical and general self-concepts, and to examine the role of parenting styles. Results: (1) LGM indicated that social self-concept increased from late childhood to early adolescence, and then declined slightly. Physical self-concept showed a slightly decreasing trend from late childhood to middle adolescence. General self-concept showed a pattern of slight, nonsignificant increases across late childhood, followed by more significant declines. (2) GMM indicated three groups including persistent high (85.4%), low increasing (11.7%), and later increasing (2.9%) for social self-concept, and four heterogeneous trajectories including persistent high (45.0%), moderately high decreasing (20.0%), modest increasing (17.0%), and stable low (18.0%) for physical self-concept, and for general self-concept three heterogeneous trajectories including persistent high (87.5%), low increasing (10.0%), and later increasing (2.5%); (3) Parallel GMM identified three trajectories: persistent high (87.0%), modest increasing (9.0%), and modest stable (3.0%). (4) Multiple logistic regression analyses indicated children with higher parental warmth and lower parental rejection and punishment are more likely to belong to the persistent high self-concept group rather than the modest increasing group. Overall, these findings suggest that individual differences existed in the development of self-concept among from late children to middle adolescents, and highlight the importance of parenting in understanding the development of self-concepts.

婴儿图式影响道德困境中的义务论认知

张志聪 1　辛聪 2（通讯作者）
1 华东师范大学教育学部教育心理学系，上海，200062
2 南京师范大学心理学院，南京，210097，E-mail:xincongpsy@163.com

摘 要　婴儿图式是一种与儿童特征有关的认知图式，会对个体的注意、情绪、动机、行为和知觉等多个方面产生影响。在经典的两难电车困境中，当个体作为旁观者感知他人可能做出的功利主义或义务论道德选择时，可能会受到决策者所具有的婴儿图式的影响。在首次接触到道德判断的主体时，他们的名字和面孔是最有可能给我们留下第一印象的特征。在这项研究的三个实验中，我们关注的是人们会如何看待具有婴儿图式（与名字和面孔有关）特征的个体或人工智能在道德两难困境中的决策倾向。

首先，在实验 1 中测试了人们是否会认为具有婴儿图式姓名的人将做出更多的义务论道德决策。结果发现，参与者认为有重复叠音名字（刘果果，具有婴儿图式）的决策者做出功利性选择的可能性要显著低于没有重复叠音名字（刘果）的决策者。

然后，在实验 2 中进一步验证了面孔婴儿图式的影响，并探究了人际知觉（温暖和能力）的中介作用。结果显示参与者认为成熟面孔的人比娃娃脸（具有婴儿图式）的人做出功利性选择的可能性更高。娃娃脸可以显著预测温暖感知和道德判断感知，温暖感知可以显著预测道德判断感知。并且温暖感知在娃娃脸对道德决策感知的影响中起部分中介作用。娃娃脸和能力感知对道德判断感知的影响是显著的。而娃娃脸对能力感知的影响并不显著，能力感知的中介效应也不显著。

最后，我们在实验 3 中检查了这种效应是否对非人类的人工智能助手仍然成立。结果显示参与者认为低可爱度的人工智能助手比高可爱度（具有婴儿图式）的人工智能助手做出功利性选择的可能性显著更高，但感知温暖和能力的中介作用都不显著。

本研究通过三个实验验证了婴儿图式能够影响个体对他人做出道德两难决策的认知。个体会更倾向于认为具有婴儿图式的道德决策者更可能做出义务论的道德选择，即更加遵守不伤害无辜者的道德准则。

Baby schema in moral dilemmas creates deontological perceptions

Zhang Zhicong[1], Xin Cong[2]
1 Faculty of Education, Department of Educational Psychology, East China Normal University, Shanghai, 200062
2 School of Psychology, Nanjing Normal University, Nanjing, 210097 E-mail: xincongpsy@163.com

Abstract：The Baby Schema is a kind of cognitive schema related to children's characteristics that can affect individual attention, emotion, motivation, behavior, and perception. In the classic trolley dilemma, individuals may be influenced by the decision-maker's baby schema when perceiving utilitarian or deontological moral choices made by others. When we first encounter moral decision-makers, their names and faces are the features that are most likely to leave a first impression on us. In the three experiments conducted in this study, we focused on how people perceive the moral choice tendencies of individuals or AI with baby schemas related to names and faces in moral dilemmas.

In the first experiment, we tested whether people believe that individuals with baby schema names would make more deontological moral decisions. It was found that participants perceived decision-makers with a repeated two-syllable name (e.g., Liu Guoguo, baby schema) to be significantly less likely to make utilitarian choices than decision-makers without a repeated two-syllable name (e.g., Liu Guo).

In the Experiment 2, we further investigated the effects of face baby schema and explored the mediating effect of interpersonal perception (warmth and competence). The results showed that participants perceived individuals with mature faces to be more likely to make utilitarian choices than those with baby-faced features (baby schema). Baby face significantly predicted warmth perception and moral judgment perception, with warmth perception playing a partial mediating role in the influence of baby face on moral decision perception. The influence of baby-faced features and competence perception on moral judgment perception was found to be significant. However, the influence of baby-faced features on competence perception and the mediating effect of competence perception were not significant.

Finally, we checked in Experiment 3 whether this effect still holds for non-human AI assistants. The results revealed that participants rated the low cuteness AI assistant as significantly more likely to make utilitarian choices than the high cuteness (baby schema) AI assistant, but the mediating role of perceived warmth and competence was not significant.

Overall, this study conducted three experiments to verify the baby schema can impact individual's perception that others make decision in moral dilemma. The findings provide evidence that individuals are more inclined to believe that moral decision-makers with baby schema are more likely to make deontological moral choices, indicating a stronger adherence to the moral code of not harming the innocent.

违反测量不变性（noninvariance）对二阶潜增长模型参数估计的影响：四种方法的比较

马鹏[1] 温忠麟[1]
1 华南师范大学心理学院，广州，510631，2022010253@m.scnu.edu.cn

摘 要　二阶潜增长模型（SLGM）基于指标构建二阶因子模型，其中一阶因子模型部分是潜变量的测量模型，考虑了测量误差的影响。SLGM 需要满足纵向测量不变性假设，但在标度项为变化情况下，违反测量不变性的影响尚未得到充分了解。研究采用蒙特卡罗模拟法，考察 SLGM 测量参数在自由估计法、全强不变法、部分不变法和基于对齐法的验证性因子分析（AwC）等四种方法下，增长参数估计的表现。研究设置了 3 个变量：变化大小、变化的比例和变化的位置。模型识别采用尺度指标法，标度项设置为跨时间变化。评价指标采用模型不适当解比例，相对偏差，RMSE，95%CI 错误率。结果表明：（1）四种估计方法在满足纵向测量强不变性时，SLGM 增长参数估计表现一致。（2）模型适当解比例方面。AwC 法表现最优，大多数情况下全强不变法和部分不变法表现相似，自由估计法表现最差。（3）相对偏差方面和 RMSE 方面表现相似。AwC 法表现最优，大多数情况部分不变法表现略优于全强不变法，截距因子方差估计表现上全强不变法优于部分不变法，自由估计法始终表现最差。（5）95%CI 错误率方面。AwC 法在各种条件下表现最佳；部分不变法和全强不变法的估计表现均不佳，仅在小规模变化条件下因子方差和协方差估计方面，部分不变法略优于全强不变法；自由估计法表现不佳。结论：标度项跨时间变化情况下，研究者可优先使用 AwC 法；其次部分不变法和全强不变法差别不大，在变化规模和变化比例较小时，也可以使用这两种方法；自由估计法既可能导致严重的非适当解，也容易导致参数估计产生较大相对偏差，不建议使用。

The effect of violation of measurement invariance (noninvariance) on parameter estimation in second-order latent growth models: a comparison of four approaches

Ma Peng, Wen Zhonglin
School of Psychology, South China Normal University, Guangzhou 510631

Abstract：In order to estimate parameters in the second-order latent growth model, a measurement model is used. This method can fully account for the influence of measurement error, but it is unclear what the impact of measurement invariance will be. The effectiveness of the free estimation (FE), full strong invariance (FI), partial strong invariance (PI), and AwC approaches for parameter estimation of the second-order latent growth model has been tested using Monte Carlo simulation. Non-invariant size, non-invariant proportion, non-invariant location, and slope factor mean were the four variables included in the study. With a sample size of 500 and 1000 replications, the study used a second-order linear latent growth model with a one-dimensional 6-question, 4-wave measurement. Evaluation criteria such the proportion of proper solutions, relative bias, RMSE, and error rate of 95% CI error rate. The results show that (1) When longitudinal strong invariance is satisfied, the four estimation methods reliably estimate the SLGM growth parameters. (2) The AwC method performs best, FI and PI generally perform similarly, and the FE performs worst in terms of the proportion of appropriate solutions. (3) Relative bias and RMSE show similar patterns of performance, with AwC performing best, PI typically slightly outperforming FI, FI outperforming PI when estimating the variance of the intercept factor, and FE consistently performing worst. PI and FI perform poorly, with PI significantly beating FI only when estimating factor variances and covariance in the small-variance condition, with FE performing poorly in terms of 95% CI error rates in every condition. **Conclusion**: Researchers can give priority to the AwC method in the case of invariance in the scalar terms; secondly, there is little difference between PI and FI, which can also be used in the case of small invariance and small proportions of invariance; FE can lead to both serious inappropriate solutions and large relative biases in parameter estimates, and is not recommended.

山光水色与人间烟火：民乐诱发意象影响虚拟食物选择

邱林波　宛小昂（通讯作者）
清华大学心理学系，北京，100084，wanxa@mail.tsinghua.edu.cn

摘 要　背景音乐作为一种被广泛应用的营销手段，可以显著影响个体对于食物的选择。以往研究主要聚焦于背景音乐通过其诱发的情绪从而影响个体的食物选择这一机制，但是音乐不仅可以影响个体的情绪感受，还会影响个体的一系列认知加工过程。其中一个重要的认知过程是个体在听到音乐后，可能会自发地产生多个感觉通道的心理意象。本研究通过两个虚拟现实实验考察了中国民乐诱发的心理意象对个体的食物选择的影响，并且采用层级漂移扩散模型量化了食物选择中的决策过程。实验 1 中，被试需要在听背景音乐时在虚拟现实环境中完成食物选择任务。我们选择了两类音乐片段来作为实验材料，其中一类音乐片

段可以诱发城市意象，另一类音乐片段可以诱发自然意象。被试需要在两道荤菜和两道素菜中选择三道自己想吃的菜式，因此被试会做出以素菜为主的食物选择和以荤菜为主的食物选择。结果表明，相较于诱发城市意象的背景音乐，被试在诱发自然意象的音乐下会更多地做出以素菜为主的食物选择。层级漂移扩散模型的结果表明，被试在诱发自然意象的音乐下会更快地累积素菜为主的相关信息。实验 2 中，我们通过操纵音乐诱发意象的强度检验了音乐诱发的意象在食物选择过程中发挥的作用。被试被随机分到促进视觉意象组、弱抑制视觉意象组和强抑制视觉意象组中，在完成意象操纵任务后，他们还需要完成与实验 1 中相同的食物选择任务。结果表明，促进意象后诱发不同意象的音乐仍对被试的食物选择产生影响，而在抑制意象后则没有这样的结果。这证实了心理意象在背景音乐影响食物选择的过程中的作用。层级漂移扩散模型的结果表明，只有促进意象组的被试在诱发自然意象的音乐下会更快地累积素菜为主的相关信息。本研究的结果表明背景音乐会通过诱发心理意象从而影响个体的食物选择，揭示了背景音乐影响食物选择的认知机制。

Beauty of nature vs. bustle of city:

Chinese folk music influences virtual food choices via mental imagery

Linbo Qiu & Xiaoang Wan

Department of Psychology, Tsinghua University, Beijing

***Abstract*：** Background music is an effective marketing tool to impact consumer behaviors, especially food choices. Previous studies emphasized that background music might influence consumers' food choices via music-induced emotions. However, music not only influences individuals' emotion experiences but also engages a multitude of cognitive processes such as inducing visual imagery. We conducted two experiments to examine the influence of music-induced visual imagery on food choices. Additionally, we utilized hierarchical drift-diffusion models to investigate the cognitive processes underlying food choices. In Experiment 1, young healthy participants were required to select three dishes out of a choice set while listening to the background music. Two types of Chinese folk music were chosen as music stimuli, one known to induce urban imagery and the other, nature imagery. And each choice set consisted of two meat and two vegetable dishes, from which participants could choose either a meat-heavy meal (consisting of two meat and one vegetable dishes) or a vegetable-forward meal (consisting of one meat and two vegetable dishes). The results revealed that participants chose vegetable-forward meals more often while listening to the music inducing nature imagery compared to that inducing urban imagery, indicative of an effect of music on food choice. Moreover, the results of drift-diffusion models suggest that participants are more likely to accumulate evidence of vegetable-forward meals when listening to the music inducing nature imagery. In Experiment 2, we attempted to examine the role of music-induced visual imagery on food choices by manipulating the extent of music-induced visual imagery. The participants were randomly divided into three groups. The first group of participants were instructed to perform an imagination task designed to enhance their music-induced visual imagery before engaging in the food choice task; the second group was asked to perform an articulatory verbal suppression task to suppress their music-induced visual imagery only before the food choice task; whereas the third group was instructed to perform the same articulatory verbal suppression task during the whole experiment. Consequently, the participants whose music-induced imagery were enhanced still chose vegetable-forward meals more often while listening to the music inducing nature imagery compared to that inducing urban imagery. By contrast, the other two groups of participants whose music-imagery were suppressed

did not show such an indicative of an effect of background music on food choices. Moreover, the results obtained from the drift-diffusion models also confirmed that only the first group of participants were more likely to accumulate evidence of vegetable-forward meals when listening to the music inducing nature imagery. Collectively, these results confirmed the role of music-induced imagery in the process of food selection. In conclusion, the results of the present study provide empirical evidence regarding how music inducing different types of visual imagery can influence people's food choices. These findings shed light on the cognitive processes through which background music influences food choices based on music-induced visual imagery, which has direct implications in the practice of nudging consumers toward healthier and more sustainable food choices.

摘 要　本研究通过一系列实证研究揭示了权力层级与权力建构间的关系。我们在权力层级(即高权力者 vs 低权力者)和权力建构(即责任 vs 机会)间建立了稳定的联结，并发现了权力视角(即期望 vs 感知)的调节作用。研究结果表明，高权力者倾向于将权力建构为责任，但他们在行为层面或许并不像自己所认为的那样亲社会。相反，低权力者倾向于将期望的权力建构为责任而非机会，但将感知的权力建构为机会而非责任。此外，本研究通过结合期望-感知权力差距的观点，扩展了原有文献中文化培育权力概念的单一理论框架，并为调和以往文献中的不一致发现提供了新的见解。具体而言，不论在何种文化或社会环境中，当高低权力者从期望或感知的视角建构权力时，他们所使用的建构方式是不同的。值得注意的是，我们的研究结果强调，权力在本质上被建构为一种实现个人追求的机会，高权力者的社会化光环是极具迷惑性的，因此我们需要看到对权力进行限制的必要性和迫切性。
关键词　权力层级，权力建构，权力视角，责任，机会

How Power Holders and Powerless People Construe Power: the Moderating Role of Power Perspective

Xinyue Wang[1]　Hong Li[1]
1 Tsinghua University, Beijing, lhong@mail.tsinghua.edu.cn

Abstract：This article elucidates the relationship between power hierarchy and power construal through four empirical studies. We establish a robust association between power hierarchy (i.e., power holders and powerless people) and power construal (i.e., opportunity and responsibility), with power perspective (i.e., envisioned power versus perceptual power) serving as a moderating factor. Our findings reveal that power holders tend to construe power as responsibility, but their pro-social behavior may not align with their perceptions. Conversely, powerless individuals tend to construe envisioned power as responsibility rather than opportunity, while construe perceptual power more as opportunity than responsibility. Moreover, our work extends the culturally nurtured power concept theory to incorporate an envisioned-perceptual power gap perspective, providing insights to reconcile inconsistent

findings in the literature. Specifically, power construal in terms of responsibility versus opportunity differs when power holders and powerless people construe power from an envisioned or perceptual perspective, regardless of culture or society. Notably, our findings underscore that power is inherently construed as opportunity, and the power holders socialized gloss can be deceptive, highlighting the imperative need for constraints on power.
Keywords：Power Hierarchy, Power Construal, Power Perspective, Responsibility, Opportunity

为什么追求最优的人总是后悔：记忆偏向的作用

黄荷[1]　李虹[1]（通讯作者）
1 清华大学社会科学学院心理学系，北京，100084
通讯作者 E-mail: lhong@mail.tsinghua.edu.cn

摘 要　随着社会经济和生产力的迅速发展，我们在日常生活中拥有的选择也越来越多。选择的增加意味着我们会不断面临“选择-放弃”的决策权衡过程。在这个过程中，决策后悔成为一种主要的负面情绪。由于追求最优而产生的后悔，是一种普遍但却未被深入研究的情绪现象。追求最优作为一种人类普遍的动机，在经济学和心理学领域被称为“最优化”。西蒙指出，由于环境的复杂性和人类认知资源的有限性，最优化在决策中往往是非理性的。许多最优化的研究都表明，最优化者在决策后更容易陷入后悔情绪，尽管他们的决策结果（例如收入）在客观层面上来说往往更好。

本研究旨在以最优化者的记忆偏向为视角，从基础认知的层面加深对“最优化悖论”的理解。本研究的基本假设是：对已选选项的记忆偏向对最优化和决策后悔之间的关系具有中介作用。具体而言，相较于满意化者，最优化者对已选选项呈现出削弱的正性记忆偏向（甚至是负性记忆偏向），而这种差异在针对未选选项的记忆偏向中并不存在；这种削弱的正性记忆偏向导致了更强烈的决策后悔。通过三个实验（包括一个真实实验），我们利用多种方法（分层逐步回归、Bootstrap 中介分析、结构方程建模）验证了中介效应以及中介模型的稳定性和可靠性。

本研究发现，最优化者对已选选项呈现出削弱的正性记忆偏向（甚至是负性记忆偏向，实验 1），以及记忆偏向在最优化者的决策后悔中起到中介作用（实验 1~3）。其次，本研究还发现，最优化者的决策后记忆偏向呈现出负向发展轨迹（实验 3），进一步解释了最优化者呈现出长期后悔模式的原因。综上，本研究揭示了最优化悖论的产生机制，并在认知层面进行了深度剖析。这也是第一项在基础认知水平上解释最优化悖论的研究，可以进一步加深我们对最优化的运作方式以及最优化概念的理解。
关键词　最优化，后悔，记忆偏向，中介作用

Why People Pursuing the Best Always Regret: Effect of Reduced Positive Memory Bias

He Huang[1], Hong Li[1*]
1 Department of Psychology, Tsinghua University, Beijing, China
* Correspondence: lhong@mail.tsinghua.edu.cn

Abstract：With the growth of economics and productivity, we have too much rather than not enough at our disposal. We no longer have to settle for what’s available in the market; we can shop around and compare for the best deal. However, this abundance of choices also means that decision-making is often a process of selecting and forgoing. When faced with such trade-offs, post-decisional regret becomes a primary negative emotion and can pose a significant problem for individuals. Post-decisional regret resulting from the pursuit of best is a very

common yet undervalued phenomenon among all regrets. As an universal motivation, the pursuit of best is described as “maximization” in the fields of economics and psychology. Simon stated the irrationality of the pursuit of best in decision-making due to the constraints of environment and cognitive abilities. Almost all research on maximization reports people who pursuing the best (maximizers) are more engaged in post-decisional regret, despite often achieving better decision outcomes (e.g., income).

The present research aims to deepen our understanding about such maximization paradox at the basic cognitive level from the perspective of memory bias. We hypothesized that memory bias for selected options mediates the effect of maximization on post-decisional regret. More specifically, maximizers have a less positive memory bias merely for selected options than satisficers, but no difference exists in foregone options, which leads to more post-decisional regret. Across three studies (including one real-life experiment), we used multiple methods to confirm the stability and reliability of our proposed mediation model (hierarchical stepwise regression, bootstrap mediation analysis and structure equation modeling).

Our research found that maximizers exhibit reduced positive memory bias (and even negative memory bias, see Study 1) for selected options, and further demonstrated the mediating role of memory bias in maximizers’ post-decisional regret (Study 1~3). Finally, our findings also highlight a negative developmental trajectory in maximizers’ post-event memory bias (Study 3), explaining their long-term pattern of regret. In conclusion, our study focuses on the paradoxical phenomenon of why people pursuing the best but feeling more regret, and provides insights into the underlying cognitive mechanism, which is more fundamental than behavioral explanations. More importantly, this is the first study to explain this relationship at a basic cognitive level, which can deepen our understanding of how maximization operates and the concept of maximization itself.

Keywords：maximization, regret, memory bias, mediating effect

他人评论特征对网络过激评论的影响及其机制:基于群体极化视角

摘 要　为在我国社交媒体情境中探讨他人评论对个体发送过激评论的影响及其机制，本研究通过一个基于真实评论数据的文本分析和两个行为实验展开探索。研究一结果发现：评论区首条评论的过激程度和评论发表时的评论区过激表达氛围均能正向预测后来评论的过激程度。研究二结果发现：当他人评论表达观点与个体一致时，个体会感受到更强的群体认同感，但这并不会直接导致个体更容易发送网络过激评论，仍需他人的过激评论作为群体规则的参照。研究三结果发现：在他人评论观点与个体一致的情况下（高群体认同感），他人评论过激性可以通过负面情绪（愤怒、轻蔑、厌恶和负面效价）的正向中介作用使得个体更易发送网络过激评论，但情境攻击规范在其中的中介作用不显著。这些结果说明，他人评论观点的一致可以使个体产生临时的群体认同感，并且当他人评论为过激评论时，这种过激评论的群体规则会让个体更容易受到群体影响进而更可能发送过激评论，而负面情绪传染可能是内群体过激评论影响个体发送网络过激评论的重要中介机制。

关键词　社交媒体，群体认同感，网络过激评论，负面情绪，群体极化

The impacts of the characteristics of others’ comments on online flaming comments and its mechanism: From the perspective of group polarization

***Abstract*：** Online flaming comments have been a common phenomenon in social media at present, which are comments that combine strong negative emotional expression and aggressive expression on the internet. With the internet software become more social, netizens can see other people's comments and participate in discussion in more places. Previous research has found that when there are some flaming comments in the comment area, users are more likely to send online flaming comments, which exhibit clustering and infectious distribution and dissemination characteristics. These comments not only affect the rational judgment of users, but also hinder fostering a harmonious communication atmosphere, and may even threaten the physical and mental health of individuals and groups. Previous research has found that groups also have an important impact on individuals' online flaming comments in social media, which can be interpreted from the group polarization perspective.

In the past, few studies have explored the mechanism of online flaming comments from the perspective of group polarization. At the same time, most of the existing research has been conducted in the context of foreign social media, focusing more on the online flaming comments between different parties under the articles of political topics, which may be inconsistent with the situation of social media in China. This study selected Sina Weibo, a typical social media in China, as the background, collected and compiled Chinese experimental materials (including blog posts and comments under different conditions). Considering the shortcomings of previous research, this study, based on the perspective of dual component of social identity, reference information impact theory, social identity model of deindividuation effects, explored the specific mechanism of online flaming comments, to provide evidence for the intervention of online flaming comments.

Study 1 collected real comments from Sina Weibo, coded the degree of flaming of each comment, and explored the effect of "the degree of flaming of first comment in the comment area" and "the average flaming score of the previous comments in the comment area". Finally, a hierarchical linear model was conducted to analyze 2736 comments under 73 popular blog posts. The results showed that: in China's comment areas, online flaming comments exhibit clustering and infectious dissemination characteristics. Specifically, both the degree of flaming of first comment in the comment area and the average flaming score of the previous comments in the comment area can positively predict the comments' degree of flaming.

Study 2 used a 2 (the consistency on views with others' comments: consistent / inconsistent) ×2 (the degree of flaming of others' comments: normal comments / flaming comments) inter subject design to explore whether group identity can be formed when others' comments are consistent with their own view, and whether group identity and the degree of flaming of others' comments are key factors for individuals to post online flaming comments. 155 college students were randomly assigned to four groups to read a blog post and four corresponding comments. The results showed that: when others' comments have the same views with individuals, individuals would perceived higher levels of group identity. However, group identity didn't directly lead to the individuals were more likely to send online flaming comments, others' online flaming comments were also needed as the reference for group rules. Specifically, compared to the conditions of low levels of group identity, individuals with high levels of group identity would be more susceptible to the impacts of the degree of flaming of others' comments. Therefore, when both the group rules were sending online flaming comments and individuals perceived high levels of group identity, individuals were more likely to send online flaming comments.

Study 3 used a single factor (the degree of flaming of others' comments: normal comments / flaming comments) inter subject design, to explore whether the degree of flaming of others' comments have impacts on the indicators of online flaming comments through negative emotions and situational normative beliefs about cyber aggression in the context that others' comments have the same views. 224 college students were randomly divided into a normal comments group and a flaming group to read a blog post and four normal / flaming comments that have the same

views with their own. The results showed that: in the context that others' comments have the same views (at the condition of high levels of group identity), negative emotions (anger, contempt, disgust, and negative emotion valence) played a positive mediating role between the degree of flaming of others' comments and the indicators of online flaming comments, but the mediating effect of situational normative beliefs about cyber aggression was insignificant.

In summary, the theories of group polarization provides a good perspective for understanding how the characteristics of other people's comments lead individuals to send online flaming comments. The consistency on views with others' comments can create a temporary sense of group identity for individuals, and when others' comments are flaming comments, this group rule for flaming comments makes individuals more susceptible to group influence and more likely to send online flaming comments. And negative emotional contagion may be an important mediating mechanism between intragroup members' online flaming comments and individuals' possibility to send online flaming comments. Finally, this study discusses the shortcomings. Based on a group polarization perspective, future research can explore individual differences and the role of other cognitive mechanisms in the generation of online flaming comments, and can further explore individual psychology and behavior when the situation of comments area become more complex.

Keyword: online flaming comments, group polarization, group identity, negative emotions, social media

游戏障碍、风险性游戏使用、娱乐性游戏使用者时间知觉能力研究

摘 要【目的】伴随着网络的普及，网络游戏使用问题受到越来越多的关注。研究发现，过度游戏会带来身体健康问题、学业成绩下降、睡眠模式紊乱、更差的精神状态，增加焦虑、抑郁和压力水平。特别是，游戏障碍的核心诊断标准之一为游戏行为失去控制，表现为游戏行为的发生、频率、强度、持续时间以及无法停止。这种时间丧失的背后可能是时间知觉方面的异常，且时间认知的异常在其他物质滥用障碍和行为障碍中已有体现。同时，游戏过度使用是一个从娱乐性使用、风险性使用、到成瘾性使用的连续发展过程。因此，本研究系统比较网络游戏成瘾者、风险性游戏使用者和娱乐性游戏使用者时间知觉能力的差异。
【方法】在大学生群体中，填写自评量表游戏障碍筛查量表（GDSS），GDSS 得分≥47 分的人群会进行一个依据 ICD-11 诊断标准的临床访谈，以确定是游戏成瘾还是风险性游戏使用人群。GDSS≤32 分人群被纳入到娱乐性游戏使用组，且通过临床访谈筛查，无过度游戏行为。所有被试会完成一个标准时间辨别任务，被试需要将比较时距 200，400，600，800，100ms 与标准时距 600ms 进行比较，以判断是长于标准时距还是短于标准时距，考察指标为主观相等点和考察时间辨别敏感度的韦伯系数。
【结果】本研究共入组 17 名游戏障碍者，32 名风险性游戏使用者和 45 名娱乐性游戏使用者，平均年龄为 19.21±0.45。对比发现，在主观相等点上三组被试（游戏障碍者：610ms；风险性：602ms；娱乐性：579ms）无显著差异（$F = 2.61$，$p = 0.07$）；在韦伯系数上，三组被试（游戏障碍者：0.071；风险性：0.091；娱乐性：0.079）无显著差异（$F = 1.14$，$p = 0.324$）。
【结论】游戏障碍者、风险性游戏使用、娱乐性游戏使用的时间知觉能力呈现不同的变化趋势，但仍需探讨背后的神经机制以及影响时间知觉的关键因素。

Investigation of Time Perception in Internet Gaming Disorder, At-risk Gaming, and Recreational Gaming

Haidi Shan[1] Chuanning Huang[1] Yue Wang[1] Hang Su[1] Lei Guo [1] Na Zhong[1] Min Zhao[1]

1 Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, 600 Wanping South Road, Xuhui District, Shanghai 200030, China

Corresponding author: Min Zhao, email: drminzhao@gmail.com

Abstract：Background: With the increasing popularity of the internet, the issue of problematic internet gaming has drawn more and more attention. Research has shown that excessive gaming can lead to physical health problems, academic performance decline, disrupted sleep patterns, and poorer mental health, such as increased anxiety, depression, and stress levels. One of the core diagnostic criteria for gaming disorder is the loss of control over gaming behavior, manifested by the occurrence, frequency, intensity, duration, and inability to stop gaming behavior. The underlying cause of this time loss may be abnormal time perception, which has also been observed in other substance use and behavioral disorders. Additionally, excessive gaming is a continuous development process from entertainment use, to risky use, and to addictive use. Therefore, this study aimed to systematically compare the differences in time perception abilities among internet gaming addicts, at-risk gaming users, and recreational gaming users.

Methods: University students completed the self-report game disorder screening scale (GDSS). Participants with a GDSS score ≥47 underwent a clinical interview based on the ICD-11 diagnostic criteria to determine if they were gaming addicts or at-risk gaming users. Participants with a GDSS score ≤32 were categorized as recreational gaming users and were screened to confirm the absence of excessive gaming behavior. All participants completed a standard time discrimination task, in which they compared time intervals of 200, 400, 600, 800, and 1000ms to a standard interval of 600ms to determine whether the interval was longer or shorter than the standard interval. The measured indices included subjective equality points and the Weber fraction, which assessed temporal discrimination sensitivity.

Results: The study included 17 internet gaming addicts, 32 at-risk gaming users, and 45 recreational gaming users, with an average age of 19.21±0.45. There was no significant difference in subjective equality points among the three groups (gaming addicts: 610ms; at-risk gaming users: 602ms; recreational gaming users: 579ms; $F = 2.61$, $p=0.079$). Similarly, there was no significant difference in the Weber fraction among the three groups (gaming addicts: 0.071; at-risk gaming users: 0.091; recreational gaming users: 0.079; $F = 1.14$, $p=0.324$).

Conclusion: The time perception ability of gaming disorder, risky game use and recreational game use showed different trends, but the underlying neural mechanism and key factors affecting time perception still need to be explored.

Keywords：Internet Gaming Disorder, Time Perception, At-risk Gaming

医学生睡眠拖延对学习投入的影响：基于日记法的研究

王慧[1] 路梦新[2] 封丹珺[1]（通讯作者）

1 山东大学护理与康复学院，济南，250012

2 青岛大学附属医院，青岛，266000

通信作者：fdj19@sdu.edu.cn

摘 要 目的：睡眠是人类的基本生理需求，对人类的身心健康具有极为重要的意义。然而，随着生活节奏的加快以及学习压力的增大，医学生的睡眠问题越来越突出，入睡时间逐渐变的越来越晚，睡眠时长也越来越少。不充足的睡眠问题严重影响了学生的注意力，降低学习投入，影响学业表现。睡眠拖延作为影响医学生晚睡和睡眠不足的重要原因，本研究拟采用密集纵向的日记法的研究设计，探讨医学生夜晚睡眠拖延对第二天学习投入的影响，并考察睡眠质量和睡眠时长在其中的中介作用，以期为采取措施促进医学生的学习投入、增进学业表现提供依据。

方法：本研究以山东省济南市某高校招募的 122 名医学生作为研究对象，并对其进行了连续 14 天的问卷追踪调查。研究对象完成一般资料调查表，并在每天早上醒来后报告昨晚的睡眠拖延，睡眠质量和睡眠时长；在每天晚上睡前填写当天的学业投入问卷。

结果：以睡眠质量为中介变量的多水平结构方程模型结果显示，在个体间水平，睡眠质量与更好的学习投入正相关(β=0.273，P<0.05)；在个体内水平，前一晚的睡眠拖延负向预测当晚的睡眠质量(β=-0.165，P<0.001)，当晚的睡眠质量又正向预测第二天的学习投入(β=0.082，P<0.01)，前一晚的睡眠质量在睡眠拖延与次日学习投入之间起完全中介作用(β=-0.012, 95%CI [-0.021, -0.003])。以睡眠时长为中介变量的多水平结构方程模型结果显示，在个体间水平，睡眠拖延与更短的睡眠时长有关(β=-0.498，P<0.001)；在个体内水平，前一晚的睡眠拖延与更短的睡眠时长有关(β=-0.207，P=0.118)，其余路径均不显著。

结论：医学生的睡眠拖延会降低当晚的睡眠质量，减少睡眠时长；睡眠拖延可通过降低当晚的睡眠质量，而非睡眠时长，从而影响医学生的学业投入。未来研究可采取应对拖延行为的有效策略，减少拖延行为的发生，从而改善医学生的睡眠质量，进而促进医学生的学业投入，提高学业表现。

关键词：医学生，睡眠拖延，学习投入，睡眠质量，日记法研究

The effect of bedtime procrastination on academic engagement in medical students: A Diary Study

Hui Wang[1], Mengxin Lu[2], Danjun Feng[1]

1 School of Nursing and Rehabilation, Shandong University, Jinan 250012, Shandong, China

2 Affiliated Hospital of Qingdao University, Qingdao 266000, Shandong, China

***Abstract*：Objectives:** Sleep is a basic physiological need of human beings, which is extremely vital to their physical and mental health. However, with the accelerated pace of life and increasing academic pressure, the sleep problem of medical students has become more and more prominent. Medical students experience less sleep duration and poorer sleep quality. Inadequate sleep problem seriously affects students' attention, reduces academic engagement and academic performance. Given bedtime procrastination is one of the most important reasons affecting medical students' sleep, this study aimed to use an intensive longitudinal diary study design to investigate the effect of medical students' night bedtime procrastination on their next-day study engagement, and to explore the mediating roles of sleep quality and sleep duration, which could provide evidence for taking measures to promote medical students' academic engagement and enhance academic performance.

Methods: A total of 122 medical students recruited from a university in Jinan, Shandong Province were investigated by questionnaires for 14 consecutive days. Study participants completed general information questionnaires and reported bedtime procrastination, sleep quality, and sleep duration upon waking up each morning; and filled out academic engagement questionnaires on the day before going to bed every night.

Results: The multilevel structural equation model with sleep quality as a mediator variable showed that sleep quality was positively associated with academic engagement (β=0.273, P<0.05) at the between-person level. At the within-person level, bedtime procrastination was negatively associated with medical students' night sleep quality (β=-0.165, P<0.001), which in turn positively predicted their next-day academic engagement (β=0.082, P<0.01).

Night sleep quality fully mediated the effect of bedtime procrastination on next-day academic engagement (β=-0.012, 95% CI [-0.021, -0.003]). The multilevel structural equation model with sleep duration as a mediator variable showed that bedtime procrastination was associated with shorter sleep duration (β=-0.498, P<0.001) at the between-person level. At the within-person level, bedtime procrastination was associated with shorter sleep duration (β=-0.207, P=0.118), with the rest of the paths being nonsignificant.

Conclusion: Bedtime procrastination was associated with shorter sleep duration and lower sleep quality at night. Medical students' bedtime procrastination can affect their next-day academic engagement by reducing sleep quality rather than sleep duration at night. Future research could adopt effective strategies for alleviating bedtime procrastination behaviors, thereby improving medical students' sleep quality, which in turn promotes their academic engagement and improves academic performance.

Keywords: medical students, bedtime procrastination, academic engagement, sleep quality, diary study

不同神经质水平抑郁症患者的核心症状：基于网络分析方法

马竹静 [a,1] 吴忠英 [a,1] 冯钰婷 [1] 关慕桢 [b] 郭力 [c] 金银川 [a] 刘斌 [a] 杨群 [a](通讯作者)

[a] 空军军医大学军事医学心理学系，西安，710032

[c] 西京医院心身科，西安，710032

通讯作者：空军军医大学军事医学心理学系，杨群，Email：yangqun1125@hotmail.com

摘 要　已有研究认为，从潜在变量模型转向症状网络模型，可以更深入地了解精神病理学。本研究旨在探讨抑郁症患者不同神经质水平与抑郁症状之间的关系。研究基于精神障碍网络理论，采用抑郁自评量表和艾森克人格问卷对 2322 名门诊抑郁症患者进行调查，使用网络分析方法考察不同神经质水平患者的核心抑郁症状，并比较不同神经质水平患者的抑郁症状网络特征，通过 R 软件进行数据可视化。结果发现：（1）不同神经质水平患者的核心抑郁症状不同。对于稳定型神经质患者，核心抑郁症状是："无用感"和"空虚感"；对于中间型神经质患者，核心抑郁症状是："兴趣丧失"、"抑郁情绪"和"空虚感"；对于不稳定型神经质患者，核心抑郁症状是："无用感"、"绝望"和"兴趣丧失"。（2）不同神经质水平患者的抑郁症状网络结构不同。网络比较测试显示，稳定型神经质患者与不稳定型神经质患者在抑郁症状网络结构上存在显著差异。在网络连接强度方面，不稳定型神经质患者网络连接强度显著高于中间型和稳定型神经质患者。

以上结果为抑郁症的干预或治疗提供了一些建议。首先，干预神经质水平以改善抑郁症状可能对抑郁症患者尤为重要。其次，确定具体的抑郁症状有助于问题聚焦，使干预更具针对性；从理论上讲，针对核心症状能最大限度地减少神经质-抑郁网络中激活的症状数量。此外，网络模型可以评估症状网络中每个症状的相对重要性，这会对理解每个症状的临床意义产生直接影响。

E-mail address: yangqun1125@hotmail.com

Abstract: Existing research proposed that shifting from a disorder-level analysis to a symptom-level analysis could provide a more fine-grained understanding of psychopathology. The current study aimed to explore the relationships between different levels of neuroticism and depressive symptoms of depression.

Based on the network analysis theory, this study used data collected from patients with MDD by using network method. The SDS scale and EPQ questionnaire were used to assess depressive symptoms and personality traits, respectively.

The result showed that the core symptoms, network structure, and global strength were varied in three groups. For patients with stable neuroticism, the core symptoms were Sense of futility, Emptiness of life; for patients with intermediate neuroticism, the core symptoms were Loss of interest or pleasure, Depressed mood, Emptiness of life. The unstable neuroticism group's core symptoms were Depressed mood, Sense of futility, Despair, Loss of interest or pleasure. Among them, the expected influence of symptom Depressed mood was significantly higher in unstable group than in the intermediate group and the expected influence of symptom Loss of interest or pleasure was significantly lower in the unstable group than in the intermediate group. The network comparison test showed that in the network structure, the stable group was different from unstable group but similar to the intermediate group and that in the global strength, the unstable group was significantly higher than the intermediate group and the stable group.

This research offers some suggestions for intervention or treatment towards depression. First, intervening in neuroticism to improve depressive symptoms may be particularly important among depression. Second, identifying specific symptoms may help focus on the problem and make the intervention more targeted; adjusting central component levels that might maximumly decrease the activated numbers of symptoms in the neuroticism-depression network theoretically. Furthermore, the network model can assess the relative importance of each symptom in the symptom network, which may have a direct impact on comprehending the clinical significance of each symptom.

使用治疗性电影制作降低儿童及青少年主动性和反应性攻击行为的系列实验研究

张羽璇
香港城市大学社会及行为科学系，香港，999077，yuxuan.z@my.cityu.edu.hk

摘 要　越来越多的儿童和青少年出现攻击性和暴力行为，迫切需要及时且有效的干预措施。治疗性电影制作是一种将艺术与叙事疗法相结合的方法，它引导参与者制作与其个人经历相关的微电影/视频，以达到心理治疗的效果。本研究采用治疗性电影制作作为干预方法，开展了三项使用混合研究方法（定量和定性研究）的子研究，来减少儿童和青少年的主动和反应攻击性。研究 1 在一所普通中学实施，采用 RCT 的实验设计（量性比较治疗组、安慰剂组、对照组）并对参与者进行访谈。 研究 2 在一个居民社区开展，定量比较了亲子组和对照组，并对家长和孩子进行访谈。研究 3 在一所有少年犯的特殊学校中实施，定量比较

了治疗组和对照组，并对教师和青少年进行访谈。所有研究都分三波时段收集数据：干预前、干预结束和干预后 3 个月。结果表明，治疗性电影制作可以有效减少儿童和青少年的主动和反应性攻击行为，增强他们的愤怒控制能力、情绪调节能力、同理心和解决问题的灵活性。然而，干预效果的持久性尚不确定。该系列研究为探索电影制作治疗方法奠定了理论基础，并提供了一套可用于学校或社会工作领域的可操作的治疗性电影制作方案。

A serial experimental study of using therapeutic filmmaking to reduce proactive and reactive aggression in children and adolescents

Zhang Yuxuan
Department of Social and Behavioural Sciences, City University of Hong Kong, Tat Chee Avenue, Kowloon, Hong Kong 999077, China, yuxuan.z@my.cityu.edu.hk

Abstract：The growing number of young people with aggressive and violent behavior urgently calls for timely intervention for aggression. Therapeutic filmmaking is an approach combining art and narrative-based therapies to conduct participants to make micro-films/videos related to their personal experiences to achieve psychotherapeutic outcomes. This study used therapeutic filmmaking as an intervention approach and conducted three sub-studies with mixed method (quantitative & qualitative study) to reduce children and adolescents' proactive and reactive aggressiveness. Study 1 was implemented in an ordinary middle school, using a quantitative RCT design (treatment group, placebo group, control group) and interviewing participants. Study 2 was implemented in a residential community, quantitatively comparing parent-child and waiting-list groups and interviewing parents and children. Study 3 was implemented in a special school with juvenile delinquents, quantitatively comparing the treatment and control groups and interviewing teachers and adolescents. All the studies collected data in three waves: pre-intervention, post-intervention, and 3 months after intervention. Results showed that therapeutic filmmaking is effective in reducing proactive and reactive aggression in children and adolescents, strengthening their anger control, emotional regulation skills, empathy, and the flexibility of problem solving. However, the durability of intervention effects was unsure. This serial study laid a theoretical foundation for exploring this specific therapy approach of filmmaking and provided a set of operational therapeutic filmmaking strategies for use in schools or social work areas.

摘　要　情境意识丧失导致的决策错误可能引发飞行事故。飞行情境中，既要对座舱内部保持良好的情境意识，利用仪表信息掌控飞行态势，还需关注座舱外物体的运动态势，根据其位置、速度等信息评估其对飞行安全的影响，做出预期决策。关注座舱外情境变化时，干扰等外部因素导致感知中断的情况可能发生，探讨在缺少感知信息时如何对抗外部因素带来的负荷并利用预期做出判断，能够为飞行监控和风险决策提

供科学依据。

采用掩蔽范式模拟动态情境缺失，探讨情境意识预期的特性和视听干扰对预期的影响及其工作记忆机制。情境为第一视角飞行场景，运动客体为飞机或云朵，背景为静止大山。实验 1 控制掩蔽时间（1s、3s、5s、7s）和干扰（有、无），掩蔽期间飞机继续沿固定路径飞行，掩蔽结束后情境恢复，飞机的位置可能存在偏差，被试需尽快判断它的位置是否正确，探讨时间因素和干扰对预期的影响；实验 2 固定掩蔽时间 3s，控制干扰时间（0s、1s、2s、3s），探讨预期的保持、更新及其工作记忆机制；实验 3 将干扰分类（视空、听觉）代表不同工作记忆负荷，加入云朵运动模拟复杂情境中相对位置变化，探讨不同类型干扰对单、多客体运动预期影响的差异及其工作记忆机制。因变量是预期判断的正确率、反应时以及辨别力水平 *d'*。

结果：（1）情境缺失时间越长空间运动预期越差，情境缺失 5s 左右，预期完全失准，干扰会损害预期，且在情境缺失 1s 时损害最大；（2）固定情境缺失 3s，干扰持续 0s、1s、2s 时空间运动预期无显著差异，且都优于干扰持续 3s 时；（3）视空干扰比听觉干扰对空间运动预期的损害更大；（4）情境越复杂，空间运动预期越差；（5）视空干扰对多客体空间运动的预期损害更大，听觉干扰对单、多客体空间运动预期的影响无显著差异。

结论：预期拥有与工作记忆视空模板子系统有关的动态更新机制，情境缺失时间变长、情境复杂化和干扰都能损害预期，持续干扰会导致情境意识丧失，对预期的损害不可逆，短时间内中断干扰，预期会有所恢复。

Projection of flight space situation awareness and its working memory mechanism

ZHANG Junheng, YAN Bihua (corresponding author)
(School of Psychology, Shaanxi Normal University, Xi′an 710062, China)

Abstract: Errors in decision-making due to loss of situation awareness may cause flight accidents. In a flight situation, it is necessary to maintain a good situation awareness of the cockpit interior, use instrument information to control the flight situation, and also pay attention to the movement of objects outside the cockpit, assess their impact on flight safety based on their position, speed, and other information, and make anticipatory decisions. When we pay attention to the change of the situation outside the cockpit, the interruption of perception caused by external factors such as interference may occur, and we will explore how to combat the load brought by external factors when there is a lack of perceptual information and make a judgement by using anticipation, so as to provide a scientific basis for flight monitoring and risk decision-making.

This study used masking paradigm to simulate situational loss and explored the characteristics of situation awareness predicted function, the impact of audiovisual interference on projection, and the mechanism of working memory. The situation was a first-view flight scene, in which an airplane or clouds moved on the background (static mountains). Experiment 1 controlled the masking time (1s, 3s, 5s, 7s) and interference (with, without). During the masking period, the airplane continued to fly along a fixed path. After the masking was completed, the situation was restored, the position of the aircraft may be biased, the subjects immediately judged whether the airplane's position should be correct, explored the impact of time factors and workload on spatial movement projection. Experiment 2 fixed the masking time (3s) and controlled the interference time (0s, 1s, 2s, 3s), and explored whether projection could be restored after interference in situational loss, to explore the rules of projection renewal and its working memory mechanism. In Experiment 3, the classification of interference (visuospatial and auditory) represented different working memory loads, and clouds motion was added to simulate

relative position changes in complex dynamic situation. The differences in the impact of different interference types on single and multiple object movement projection and their working memory mechanisms were explored. The dependent variables are the correct rate, reaction time of the subject's judgment and *d'*(sensitivity).

The findings of the three experiments were as follows. First, the longer the time of situation loss, the worse the spatial movement projection of airplane. When the situational loss for about 5s, the spatial movement projection would be completely inaccurate. Interference damaged the projection of spatial motion, and when the situational loss for 1s, the damage was greatest. Second, there was no significant difference in the projection of spatial motion under the conditions of situation loss time of 3s and interference duration of 0s, 1s, and 2s. The projections when the situational loss for 0s, 1s, and 2s were better than when the situational loss for 3s. Third, visuospatial interference had a greater impact on spatial motion projection than auditory interference. Then, the more complicated the situation was, the worse the projection of spatial motion was. Finally, visuospatial interference had a greater impact on spatial motion projection for multiple objects. There was no difference in the impact of auditory interference on spatial motion projection between single object motion situation and multiple objects motion situation.

In conclusion, projection possessed a dynamic updating mechanism related to the working memory visuospatial sketchpad subsystem. Prolonged situational absence, situational complexity, and interference can impair projection. Persistent interference can lead to loss of situational awareness and irreversible damage to projection. If interference was interrupted in a short period of time, projection will recover somewhat.

父母反思功能与孤独症谱系障碍儿童问题行为的关系：一项交叉滞后分析

张畅[1]　周婷[1]（通讯作者）　易春丽[2]　刘松怀[3,4,5]　张雁[3,5]

1 北京大学医学心理学系，北京，100191，zhouting.92@bjmu.edu.cn

2 北京大学心理与认知科学学院，北京，100871

3 首都医科大学康复医学院，北京，100068

4 中国康复研究中心北京博爱医院心理科，北京，100068

5 中国康复研究中心国家孤独症康复研究中心，北京，100068

摘 要　背景：在对典型发展儿童的研究中发现，父母更优的反思功能水平与儿童更安全的依恋类型，更好的社会情绪适应有关。相较于典型发展儿童，问题行为在孤独症谱系障碍儿童中更高发、更严重，对此类儿童的社会康复造成消极影响，并给家庭教养带来沉重负担。目前对父母反思功能和孤独症谱系障碍儿童问题行为关系的研究较少，且以横断面研究为主，需要进一步研究探索孤独症谱系障碍儿童的问题行为与父母反思功能的纵向关系。

目的：检验父母反思功能与孤独症谱系障碍儿童问题行为的关系。

方法：采用追踪研究设计，采用父母反思功能问卷（PRFQ，The Parental Reflective Functioning Questionnaire），和儿童长处与困难问卷（SDQ，strength and difficulties questionnaire）对 121 名孤独症谱系障碍儿童的父母进行三次问卷调查，每次调查间隔三个月。PRFQ 包括前心智化、对儿童心理状态的确定性，对儿童心理状态的兴趣及好奇心三个维度，SDQ 包括内化问题行为（情绪症状、同伴问题）和外化问题行为（多动/注意缺陷、品行问题）两个分量表。采用交叉滞后模型进行数据分析。

结果：1）父母前智化和对儿童心理状态的兴趣及好奇心得分呈下降趋势，父母对儿童心理状态的确定性和儿童内外化问题行为三次测量得分相对稳定；2）交叉滞后分析显示，父母前心智化与儿童的内化问题

行为可以相互预测，前测（Tn）的父母前心智化可以显著积极预测后测（Tn+1）的儿童内化问题行为，前测（Tn）的内化问题行为可以显著积极预测后测（Tn+1）的父母前心智化。

结论：父母反思功能与孤独症谱系障碍儿童问题行为存在双向关系，父母更好的反思功能与孤独症谱系障碍儿童更少的内化问题有关，父母反思功能的提升或对孤独症谱系障碍儿童内化问题行为的改善具有积极作用。

3 Faculty of Rehabilitation Medicine, Capital Medical University, Beijing, China

4 Department of Psychology, Beijing Bo'ai Hospital, China Rehabilitation Research Center, Beijing, China

5 China Autism Rehabilitation Research Center (CARRC) of China Rehabilitation Research Center, Beijing, China

Abstract： Background: According to the extant literature focusing on typically developed children, higher levels of parental reflective functioning were associated with children's secure attachment and better socioemotional functioning. Compared with typically developed children, behavioral problems are more frequent and severe in children with autism spectrum disorders (ASD), which hindered the child's social rehabilitation and placed a heavy burden on parenting. Because there have been limited studies on the relationship between parental reflective functioning and behavioral problems in children with ASD and most of them were cross-sectional studies, further research was needed to explore the longitudinal relationship between parental reflective functioning and behavioral problems in children with ASD.

Objective: To examine the relationship between parental reflective functioning and behavioral problems in children with ASD.

Methods: A longitudinal design was used in the present study. A total of 121 parents of children with autism spectrum disorder were investigated and completed the Parental Reflective Functioning Questionnaire(PRFQ) and the Strength and Difficulties Questionnaire (SDQ) at three timepoints(T1, three months after T1, and six months after T1). The PRFQ consists of three subscales: pre-mentalizing, certainty about mental states and interest and curiosity. The internalizing behavioral problems composite (emotional symptoms and peer problems) and externalizing behavioral problems composite (conduct problems and inattention hyperactivity) were calculated using the SDQ. The cross-lag model was used for data analysis.

Results: 1) The scores for pre-mentalizing and interest and curiosity decreased significantly, while the scores for certainty about mental states, internalizing behavioral problems and externalizing behavioral problems were relatively stable across the three timepoints. 2) The results of the cross-lag analysis showed that the relationship between parental reflective functioning and internalizing behavioral problems was bidirectional over the six months. Scores on the pre-mentalizing subscale at T_n significantly predicted internalizing behavioral problems at T_{n+1}, and internalizing behavioral problems at T_n significantly predicted scores on the pre-mentalizing subscale at T_{n+1}.

Conclusion: Parental reflective functioning and internalizing behavioral problems in children with ASD have a bidirectional predictive relationship. Improvement of parental reflective functioning may have a positive effect on reducing internalizing behavioral problems in children with ASD.

不同戒断期毒品成瘾者认知神经控制与迷走神经功能缺陷及失调研究

李欣，王振宏（通讯作者）

陕西师范大学心理学院，陕西（高校）儿童青少年心理与行为健康哲学社会科学重点研究基地，西安，710062，wangzhenhong@snnu.edu.cn

摘 要　执行脑功能受损往往被认为是毒品成瘾者复吸的关键。个体内反应时变异（Intraindividual Reaction Time Variability, IIRTV）是认知神经控制和注意控制的行为指标，同时也是执行功能的核心组成部分。此外，基线期的呼吸性窦性心律不齐（respiratory sinus arrhythmia, RSA）反映了迷走神经调节能力，它在药物滥用中也起着重要作用。本研究旨在检验毒品成瘾者的认知神经控制或注意控制（indexed by IIRTV）和迷走神经调节（indexed by baseline RSA）是否受损，以及是否会随着戒断而恢复。本研究使用双选择 oddball 任务测量 IIRTV，采集心电数据换算出基线 RSA。本研究对比了两个戒断组（短期戒断组，$N = 21$；长期戒断组，$N = 47$）和健康对照组（$N = 35$）的 IIRTV 和基线 RSA，并探究了 IIRTV 和基线 RSA 是否在两个戒断组间存在差异。结果发现：（1）健康对照组的 IIRTV 显著低于短期戒断组；（2）长期戒断组的 IIRTV 显著低于短期戒断组；（3）健康对照组基线 RSA 显著高于长期戒断组。研究结果表明，毒品成瘾者在认知神经控制和迷走神经调节能力方面存在缺陷，以 IIRTV 为指标的认知神经控制会随着戒断而恢复，但迷走神经调节能力并未恢复。因此，通过戒断干预，毒品成瘾者受损的认知神经控制能力可能会得到恢复，但受损的迷走神经调节能力难以恢复。

A Study on Cognitive Neurocontrol and Vagal Nerve Function Dysfunction of Drug Addicts in Different Abstinence Phases

Xin Li, Zhenhong Wang (Corresponding Author)

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062, wangzhenhong@snnu.edu.cn

***Abstract*:** Background: Impaired executive function in drug addicts tends to be considered the key to relapse. Intraindividual reaction time variability (IIRTV) is a behavioral indicator of cognitive neurocontrol or attentional control, representing a core component of executive function. Moreover, resting or baseline respiratory sinus arrhythmia (RSA) reflects vagal regulation capacity, which also plays an important role in substance use disorders.

Objectives: This study intends to examine whether the cognitive neurocontrol or attentional control indexed by IIRTV and vagal regulation indexed by baseline RSA are impaired in drug addicts compared with the healthy control group and whether they will recover with abstinence.

Methods: The two-choice oddball task was used to measure IIRTV, and electrocardiogram (ECG) data were collected to obtain baseline RSA. We compared drug addicts' IIRTV and baseline RSA in abstinence groups (short-term abstinence group, $N = 21$; long-term abstinence group, $N = 47$) vs. healthy control group ($N = 35$), and compared differences between the abstinence groups.

Results: (1) The IIRTV of the healthy control group was significantly lower than the short-term abstinence group; (2) the IIRTV of the long-term abstinence group was significantly lower than the short-term abstinence group; (3) the baseline RSA of the healthy control group was significantly higher than the long-term abstinence group.

Conclusion: The results indicate that drug addicts have deficits in cognitive neurocontrol and vagal regulation capacity. Moreover, the cognitive neurocontrol indexed by IIRTV can recover with abstinence intervention in addicts while vagal regulation capacity can't. Therefore, the impaired cognitive neurocontrol may be recovered with abstinence intervention, however, it is difficult to recover the impaired vagal regulation capacity in addicts.

AI 还是人类？不同设计来源影响消费者对广告的反应

郭曦玉[1]　黄建平[2]　宛小昂[1]（通讯作者）

1 清华大学心理学系，北京，100084，wanxa@mail.tsinghua.edu.cn

2 苏州大学心理学系，苏州，215123

摘 要　人工智能（artificial intelligence；AI）技术有望在未来几十年内从根本上改变广告和营销行业。因此，对于广告营销学者和商家而言，了解消费者如何评估 AI 设计的广告与人类设计的广告至关重要。先前研究发现消费者对 AI 创作的广告表现出复杂的态度并且会受到广告诉求的影响。鉴于平面广告在营销中的广泛应用以及 AI 绘画技术的发展，在本研究的两项实验中，我们探讨了消费者如何对由人类设计和真正由 AI 设计的广告图片进行反应，以及设计来源标签所发挥的作用。另外，我们还关注了产品类型是否会调节不同设计来源对消费者反应的影响。在两项实验中，被试被随机分配到功能型产品组或享乐型产品组，之后对随机出现的由人类设计或由 AI 设计的广告图片进行购买意愿、广告态度、设计创新感知、设计质量感知和设计美学感知五个方面的评价。实验一中未告知被试每张广告图片的设计来源，而在实验二中则告知被试。实验一发现，当不存在设计来源标签时，消费者无法明确区分 AI 设计的广告，从而并不会产生机器启发式而只根据对广告图片本身的整体印象进行判断和评价，使得 AI 设计的广告图片在五个方面都更加获得消费者的青睐。实验二表明，无论产品类型是什么，相较于未告知，告知消费者广告图片的设计来源会削弱 AI 设计在购买意愿上的积极影响。这可能是因为广告设计需要创造力，这通常被认为只存在于人类领域。因此，当消费者被告知广告图片是由 AI 自主创作时会感受到机器所带来的威胁，进而为了保护个体身份的独特性而使得 AI 设计的积极影响消失。这些研究结果揭示了由 AI 设计的广告图片可以在一定程度上获得消费者的积极评价，同时对于广告商是否选择在广告中突出 AI 设计标签具有借鉴意义。

AI or human? Different design sources affect consumer response to advertising

Xiyu Guo[1] Jianping Huang[2] Xiaoang Wan[1]
1Department of Psychology, Tsinghua University, Beijing, 100084
2Department of Psychology, Soochow University, Suzhou, 215123

Abstract： Artificial intelligence (AI) technology is expected to fundamentally change the advertising and marketing industry in the coming decades. Therefore, it is crucial for advertising and marketing scholars as well as practitioners to understand how consumers evaluate AI-designed advertisements versus those designed by humans. Previous research has found that consumers show complex attitudes toward AI-created ads and are affected by advertising appeals. Given the widespread use of print advertising in marketing and the development of AI painting technology, in two experiments, we investigated how consumers respond to advertising images designed by humans and those actually designed by AI, and the role of design source labels. Additionally, we focused on whether the impact of different design sources on consumer responses differed by product type. In two experiments, the participants were randomly assigned to the functional product group or the hedonic product group. They were asked to evaluate the purchase intention, advertising attitude, design innovation perception, design quality perception and design aesthetic perception for each advertisement that appeared randomly. In Experiment 1, the participants were not informed of the design source of each advertisement picture, whereas the participants were informed in Experiment 2. Experiment 1 found that when there is no design source label, consumers cannot clearly distinguish AI-designed advertisements. They made judgments only based on the overall impression of the advertisement image itself rather than machine heuristics, resulting in AI-designed advertisement images were more favored by consumers in five aspects. Experiment 2 showed that, regardless of the product type, compared to not being informed, informing consumers of the design source of advertising images weakened the positive impact of AI design on purchase intention. This may be because advertising design requires creativity, which is generally considered to exist only in the human realm. Therefore, when consumers know that advertising images are created by AI autonomously, they will feel the threat brought by the machine. In order to protect individuals' uniqueness, the positive impact of AI design will disappear. These findings reveal that advertising pictures designed by AI can obtain positive influence on consumers to a certain extent, and at the same time have reference significance for whether advertisers choose to highlight AI-designed labels in advertisements.

Keywords： artificial intelligence, label, advertising design, product type, consumer response

垃圾分类标识的具体优势效应及助推策略：一个行为实验研究

曹盖[1] 曹蓉[1]（通讯作者） 刘鹏[1]
1 西北大学公共管理学院，西安，710069，通讯作者 E-mail：caorong@nwu.edu.cn

摘 要 2019 年我国发布了全国统一的垃圾分类标识，以消除人们不知如何分类的疑惑进而指导其进行正确的分类。尽管标识研究领域发现标准化的标识对于用户行为理解和遵从的有效性很强，但是当前标准化垃圾分类标识情境下我国的垃圾分类率仍在较低。为提高居民垃圾分类效率，本研究通过两个实验探索抽象和具体分类标志之间的认知加工差异，并在此基础上提出一种提高垃圾分类效率的助推策略。实验 1 将

垃圾分类标识分为抽象条件（包括可回收物、有害垃圾和厨余垃圾分类标志）和具体条件（包括纸张、塑料、玻璃、金属、纺织品、电池、家用化学品、灯管和厨余分类标志等）。采用 Go/NoGo 任务用于模拟垃圾分类行为，当垃圾刺激与分类标识匹配时（Go 条件），被试根据指导按键，而在两者不匹配时，则不按键（NoGo 条件）。结果表明，被试对具体条件的反应速度显著快于抽象条件，表明具体分类标识在认知加工过程中消耗更少的认知资源，从而提高了垃圾分类效率。实验 2 将以抽象标识为主导的现有分类标识组合形式（传统条件），优化为以凸显具体分类标识的组合形式，即将具体分类标识放置在垃圾箱的上部，并放置在黄色框架中以吸引注意力（助推条件）。结果表明，与传统条件相比，助推条件下消耗的认知资源更少，从而提高了对于垃圾进行分类的加工效率。据此，本研究不仅验证了垃圾分类领域的具体优势效应，而且利用人们的认知特性设计符合个体决策加工规律的垃圾分类设施以提高垃圾分类效率，为在中国背景下补充现有的垃圾分类政策工具提供了有效的助推策略。

The Concreteness Effect and Nudge Strategy of Garbage Classification Signage Based on a Behavioral Experiment

Gai Cao[1], Rong Cao[1*], Peng Liu[1]

[1] School of Public Administration/ School of Emergency Management, Northwest University, Xi'an, China

[*]Corresponding author: Rong Cao (E-mail: caorong@nwu.edu.cn)

Abstract： In 2019, China standardized nationwide garbage classification signage to eliminate confusion about how to separate garbage and thus guiding people to sort garbage correctly. However, although research in the signage field has found that standardized signs are effective in understanding and complying with user behavior, the reality is that standardized gclassification signs are not effective in improving residential garbage classification efficiency. To improve residential garbage classification efficiency, we explored the cognitive processing differences between abstract and concrete classification signs and proposed a nudging strategy to improve garbage classification behavior through two experiments. Experiment 1 divided garbage classification signs into an abstract condition (including recyclables, hazardous garbage, and food signs) and a concrete condition (including paper, plastic, glass, metal, textiles, batteries, household chemicals, tubes, and food signs). Go/NoGo task were used to simulate garbage classification behavior, participants were instructed to press a key when the garbage stimulus matched the classification signs (Go condition) and not press the key when the two didn't match (NoGo condition). The results showed that responses for the concrete condition were faster than those for the abstract condition, suggesting concrete signs consume fewer cognitive resources and thus improving garbage classification efficiency. Experiment 2 optimized the current bin signage, which is dominated by abstract signs (traditional condition), into a bin signage that highlighted concrete classification signs. The concrete signs were placed on the upper part of the bins and in a yellow frame to attract attention (nudging condition). The results suggested that the nudging condition consumed fewer cognitive resources than the traditional condition, which in turn enhanced the processing garbage classification efficiency. To our knowledge, this study not only validates the concreteness effects in the garbage classification field, but also utilized people's cognitive characteristics to design garbage classification facilities that conform to the rules of individual decision processing to improve the efficiency of garbage classification， providing an effective nudge strategies to complement existing garbage classification management policy tools in a realistic Chinese context.

摘 要 网络谩骂是我们日常生活中普遍存在的一种现象，它通常是冲动和非计划的，涉及使用一般被认为是亵渎的词语。以往研究发现网络谩骂通常会给个人和网络环境带来有害影响，然而，目前尚不清楚人们在社交网络平台上何时以及为何进行谩骂，这使得改善网络谩骂行为变得困难。基于音乐可以塑造个人并可以作为一种有效干预工具的观点，本研究从音乐这个新颖的角度出发，试图揭示中国成年人网络谩骂这个复杂现象的影响因素，并为干预网络谩骂行为提供实证证据，特别是基于音乐的网络谩骂干预潜能的实证证据。基于三元交互理论和双系统理论，本研究采用 1378 名中国成年人的自我报告数据系统的测试了网络谩骂的决策树分类模型，并揭示了音乐偏好在其中的作用。具体而言，首先，本研究基于原版的音乐偏好短测验(Bonneville-Roussy, et al., 2013; Rentfrow & Gosling, 2003)确认了一种可靠有效的问卷工具，用于衡量中国文化中的音乐偏好。随后，利用基于分类树的机器学习技术构建了一个关于网络谩骂的多因素路径模型。结果表明，本研究成功构建了一个包含 10 个特征的分类决策树模型，其中压力被确定为模型的根节点。具体来看，对于压力水平较低的个体，性别、社交网络平台成瘾、情感虐待、生活在农村地区以及朋友支持与网络谩骂相关。对于压力水平较高的个体，较少的身体虐待、较低的社交网络平台成瘾、较弱的激烈音乐偏好以及较高的宜人性是网络谩骂的保护因素。总的来说，本研究为深入了解网络谩骂现象的发生机制提供了初步的证据，并强调了开发有针对性的干预措施以减少网络谩骂行为的潜力。

关键词 网络谩骂，音乐偏好，压力，虐待，分类树模型

Music may affect online behavior: Exploring the factors of swearing on social networking sites among Chinese adults using classification trees

Abstract：Swearing on social networking sites (SNS) is a prevalent unplanned situation in our daily life, which may bring harmful aspects to individuals and the internet environment. However, when and how people swear on the SNS is not clear, which has made it difficult to improve. Building on the idea that music can shape individuals and serve as an intervention tool, the purpose of this paper is to explore the role and intervention potential of music in influencing swearing on SNS under complex situations. This study used 1378 Chinese adults' self-reported data to test the proposed model of swearing on SNS and emphasized the role of music preference. Initially, the study confirmed a reliable and valid instrument to measure music preference within Chinese culture. Subsequently, a multifactor path model of swearing on SNS was constructed using a classification tree-based machine learning technique. Results indicated that for individuals with lower stress level, gender, SNS addiction, emotional abuse, living in a rural area, and friend support are associated with swearing on SNS. For individuals with higher stress level, less physical abuse, lower SNS addiction, weaker intense music preferences, and higher agreeableness, are protective factors for swearing on SNS. Overall, this study provides insights into the phenomenon of swearing on SNS and highlights the potential for developing targeted interventions to reduce such behavior.

摘 要 合作对于多个个体实现共同目标至关重要。合作行为与神经变异之间的因果关系尚未得到充分探讨，而这是帮助我们深入理解人类合作行为产生和演化的关键。本研究试图借助多脑经颅电刺激——经颅超电刺激技术（Hypertranscranial electrical stimulation, hyper-tES）阐明人类合作行为潜在脑机制的作用规律，即脑间同步（Interbrain synchronization，IBS）如何影响和促进合作行为。124 名健康成年人两两随机组合为 62 对，并随机分为直流超电刺激组（hyper-tDCS）、交流超电刺激组（hyper-tACS）和假刺激组（sham），每对参与者通过功能性近红外成像(Functional near-infrared spectroscopy，fNIRS）进行前额叶与右侧额下回皮层血流的连续超扫描记录，同步接受右侧额下回经颅超电刺激干预。结果发现两种超电刺激技术均可以提高合作表现，仅 hyper-tACS 可以优化合作任务中的速度-准确性平衡；hyper-tACS 有效增加前额叶的 IBS，且提升效益可以维持至刺激后静息态。我们的研究强调了 IBS 在人类合作行为产生与促进中的关键作用，以及两种经颅电刺激干预技术在不同时间窗口的潜在应用，这可能为改善社交障碍个体的合作能力提供治疗选择。

Abstract： Cooperation is crucial for individuals to achieve common goals. However, the causal relationship between cooperative behavior and neural variation, which was the key to help to deeply understand the emergence and evolution of human cooperative behavior, has not yet been fully explored. In the present study, we attempted to clarify how the potential brain mechanisms, interbrain synchronization (IBS), facilitate cooperation using hypertranscranial electrical stimulation (hyper-tES). A total of 124 healthy young adults were randomly divided into three groups (hyper-tACS, hyper-tDCS and sham) and received modulation of the right inferior frontal gyrus (IFG) while undergoing functional near-infrared spectroscopy (fNIRS). Multibrain tES improved cooperative performance, and only hyper-tACS can optimize speed-accuracy trade-off; Increased IBS induced by hyper-tACS can be extended to the rest state of poststimulation phase. Our findings highlight the importance of IBS for cooperation through the organic integration of hyper-tES and fNIRS, as well as potential applications of two interventions to improve cooperation in different temporal windows, which may provide potential treatment options to improve cooperative skills of individuals with impairment of social interaction.

Keywords： Cooperation, Interbrain synchronization, Hypertranscranial electrical stimulation, Functional near-infrared spectroscopy

摘 要　精神病风险综合征（psychosis risk syndrome，PRS）早于精神病出现，评估精神病高风险个体的神经心理异常有助于精神病的早期识别和早期积极干预。本研究的目标是讨论在有干扰刺激时，PRS 个体的 N200 和 P300 反应是否存在缺损并与其临床结果有关。共有 223 名参与者，包括 122 名符合 PRS 标准的个

体，50 名情绪障碍个体（emotional disorder，ED）和 51 名健康对照个体（healthy controls，HC）。使用由不同颜色的正方形图片组成的有干扰刺激的三刺激视觉 Oddball 范式，采集所有参与者的 EEG 数据。对几乎所有的 PRS 个体随访追踪 12 个月并将其重新分成了三个组别：PRS-conversion，PRS-symptomatic，and PRS-remission，比较临床结果各组在基线 N200 和 P300 反应上的差异。PRS 组的平均 N200 波幅显著大于 HC 组 ($p = 0.002$，$d = 0.53$)；ED 组的平均 N200 波幅介于 HC 和 PRS 之间，但与 HC 和 PRS 的差异均未达到统计学意义($p = 0.15$，$d = 0.27$；$p = 0.17$，$d = 0.22$)。在随访 12 个月后的临床结果各组上，PRS-conversion 组的基线平均 N200 波幅显著大于 PRS-symptomatic 组($p = 0.043$，$d = 0.58$)和 PRS-remission 组($p = 0.046$，$d = 0.50$)，也显著大于 HC 组($p < 0.001$，$d = 0.97$)。PRS-symptomatic 组和 PRS-remission 组的基线平均 N200 波幅均显著大于 HC 组($p = 0.023$，$d = 0.46$；$p = 0.044$，$d = 0.38$)，但 PRS-symptomatic 组和 PRS-remission 组之间无显著差异($p = 0.93$，$d = 0.02$)。在 P300 反应上未发现任何有统计学意义的结果 ($ps > 0.05$)。本研究发现 PRS 及转化为精神病的 PRS 个体在有干扰刺激的注意加工中存在明显的 N200 波幅缺损，N200 波幅具有作为 PRS 临床结果预后生物标志物的潜力。

Abstract：Schizophrenia often occurs in youth, and psychosis risk syndrome (PRS) occurs before the onset of psychosis. The present study aimed to determine whether the visual event-related potential responses in youth with PRS were defective in the presence of interference stimuli and associated with their clinical outcomes. In total, 223 participants, including 122 patients with PRS, 50 patients with emotional disorders (EDs), and 51 healthy controls (HCs) were assessed. Baseline electroencephalography was recorded during the three-stimulus visual Oddball task. The event-related potentials induced by square pictures with different colors were measured. Almost all patients with PRS were followed up with for 12 months and reclassified into three groups: PRS-conversion, PRS-symptomatic, and PRS-remission. The differences in baseline event-related potential responses were compared among the clinical outcome groups. The average N2 amplitude of the PRS group was significantly less negative than that in the HC group ($p = 0.002$, $d = 0.53$). The baseline average N2 amplitude in the PRS-conversion group was significantly less negative than that in the PRS-symptomatic ($p = 0.043$, $d = 0.58$), PRS-remission ($p = 0.046$, $d = 0.50$), and HC groups ($p < 0.001$, $d = 0.97$). The average N2 amplitude did not differ between PRS-symptomatic and PRS-remission groups ($p = 0.93$, $d = 0.02$). However, it was significantly less negative in the PRS-symptomatic and PRS-remission groups than in the HC group ($p = 0.023$, $d = 0.46$; $p = 0.044$, $d = 0.38$). No statistically significant results were found in the P3 response. This study found that youth

with PRS had significant N2 amplitude defects in attention processing with interference stimulus. N2 amplitude shows a potential prognostic biomarker of clinical outcome in the PRS.

摘　要　本研究运用潜在剖面分析与潜在转变分析考察青少年网络成瘾的潜在类别与转变情况，进一步探究

青少年负性生活事件在网络成瘾类别转变中的作用，以及网络成瘾与人生意义的关系。采用负性生活事件量表、网络成瘾量表和人生意义量表，对 1164 名学生进行为期一年的追踪研究，共收集三次数据（T1=2021 年 5 月; T2= 2021 年 11 月; T3=2022 年 5 月）。潜在类别分析结果表明：青少年网络成瘾存在 3 个潜在类别：无网络成瘾组、正常使用网络组和高网络成瘾组。潜在转变分析结果表明：从 T1 到 T2，保持在各组的概率分别为无网络成瘾组(69.7%)、正常使用网络组(57.7%)、高网络成瘾组(73.1%)，在发生转变的青少年中，T1 时属于正常使用网络和高网络成瘾组的青少年更可能随着时间推移转变到无网络成瘾组(转变概率分别为 20.3%、5.6%)，无网络成瘾组向正常使用网络组和高网络成瘾组转变的概率分别为 25.1%和 5.2%。从 T2 到 T3，保持在各组的概率分别为无网络成瘾组(83.4%)、正常使用网络组(65.3%)、高网络成瘾组(61.2%)，在发生转变的青少年中，T2 时属于正常使用网络和高网络成瘾组的青少年更可能随着时间推移转变到无网络成瘾组(转变概率分别为 23.9%、7.8%)，无网络成瘾组向正常使用网络组、高网络成瘾组转变的概率分别为 14.9%、1.8%。青少年人生意义在网络成瘾潜在类别上存在显著差异。研究结果有助于对青少年网络成瘾的不同阶段提供针对性的预防与干预，提高青少年的人生意义，促进青少年的健康发展。

Latent transition analysis of adolescent Internet addiction: the predictive role of negative life events and their impact on life meaning

Linran Zhang Sufei Xin

LuDong University School of Educational Science, Yantai, 264001

Abstract： This study used latent profile analysis and latent transition analysis to investigate the potential categories and transformations of adolescent Internet addiction, and further explored the role of adolescent negative life events in the category transformations of Internet addiction, as well as the relationship between Internet addiction and life meaning. The negative life events scale, Internet addiction Scale and Meaning of Life scale were used to follow 1170 students for one year, and the data were collected three times (Time 1 = May 2021; Time 2 = November 2021; Time 3 = May 2022). The analysis of potential categories shows that there are three potential categories of adolescent Internet addiction: no Internet addiction group, normal Internet use group and high Internet addiction group. The results of latent transition analysis show that: From T1 to T2, the probability of staying in each group was 69.7% (no Internet addiction), 57.7% (normal Internet use) and 73.1% (high Internet addiction). The adolescents in the normal and high Internet addiction groups at T1 were more likely to change to the no Internet addiction group over time (20.3% and 5.6%, respectively), and the transition probabilities from the no Internet addiction group to the normal Internet use group and the high Internet addiction group were 25.1% and 5.2%, respectively. From T2 to T3, the probability of staying in each group was no Internet addiction group (83.4%), normal Internet use group (65.3%) and high Internet addiction group (61.2%). The adolescents belonging to the normal Internet use group and the high Internet addiction group at T2 were more likely to change to the no Internet addiction group over time (23.9% and 7.8%, respectively), and the transition probabilities of the no Internet addiction group to the normal Internet use group and the high Internet addiction group were 14.9% and 1.8%, respectively. There are significant differences in the potential categories of Internet addiction among adolescents of life meaning. The results of this study are helpful to provide targeted prevention and intervention for different stages of adolescent Internet addiction, improve the meaning of life and promote the healthy development of adolescents.

摘 要　青春期是发展的关键阶段，充满着压力和挑战，同时也是精神障碍发展的易感期。先前研究表明，自悯(self-compassion)是青少年心理健康的保护因素，但目前缺乏有效且简便的工具干预青少年自悯。**目的：**本实验基于具身认知理论，设计并检验了包含了自我身体抚触元素的两种自我抚慰方式对青少年状态自悯、积极消极情绪、心率及心率变异性的干预效果。**方法：**本实验采用双因素混合设计，其中干预方式（混合干预、自我身体抚触、自我语言抚慰和对照组）作为组间变量，实验阶段（前测和后测）作为组内变量，状态自悯、积极消极情绪和心率及心率变异性为因变量。本实验共募集 124 名青少年被试，其中男性 37 名，女性 87 名，年龄范围 14-19 岁(M = 16.17， SD = 1.1)，采用随机区组对被试进行分组，每组人数均为 31 人。**程序：**被试首先佩戴心率测试仪器并全程记录；随后进行 5 分钟的静坐任务，结束后立即测量基线情绪；随后进行 8 分钟的消极情绪启动任务，结束后立即测量前测情绪和前测状态自悯；随后进行分组干预，其中自我身体抚触组遵循指导语录音依次双手抚摸脸颊、一只手抚摸胸口一只手抚摸腹部、双手自我拥抱进行自我安抚；自我语言抚慰组则根据慈心禅指导语录音进行自我祝福；混合干预则根据录音前半段进行自我祝福，后半段进行自我身体抚触；对照组为观看一段自然纪录片。上述干预时长均为 6 分 33 秒，随后测量后测情绪和状态自悯；最后静坐 5 分钟。**结果：**对实验数据进行重复测量方差分析和 Bonferroni 事后检验，研究结果显示, 消极情绪启动任务之后，各组被试的消极情绪与基线相比显著提升，并且没有组间差异；混合干预(0.48±0.11, p < .001)和自我身体抚触(0.50±0.11, p < .001)能够显著提高被试的状态自悯水平，自我语言抚慰(0.31±0.11, p = .193)和对照组(0.26±0.11, p = .69)的状态自悯前后测差异不显著；干预组和对照组均能减轻消极情绪和提高积极情绪。此外，未发现自我身体抚慰对心率及心率变异性的影响。**结论：**自我身体抚触能够帮助青少年在经历消极情绪时提升状态自悯水平，缓解消极情绪和改善积极情绪。

Abstract：Adolescence is a critical stage of development, full of pressures and challenges, and also a vulnerable period for the development of mental disorders. Previous research has suggested that self-compassion may be a protective factor for adolescent mental health, but there is currently a lack of effective and convenient tools to intervene in adolescent self-compassion. **Objective:** This study, based on embodied cognition theory, designed

and tested the intervention effects of two self-soothing tools on adolescents' state self-compassion, positive and negative affect, heart rate, and heart rate variability. **Methods:** This study used a two-factor mixed design, in which the intervention method (combined intervention, self-soothing touch, self-soothing talk, and control group) served as the between-subjects variable, and the experimental stage (pre-test and post-test) as the within-subjects variable, with state self-compassion, positive and negative affect, and heart rate and heart rate variability as dependent variables. This study recruited a total of 124 adolescent participants, including 37 males and 87 females, aged 14-19 years *(M* = 16.17, *SD* = 1.1). Participants were randomly grouped, with 31 people in each group. **Procedure:** Participants first wore heart rate monitors for continuous recording; then performed a 5-minute resting task, after which baseline emotion were immediately measured; then underwent a negative emotion induction task, after which pre-test emotions and pre-test state self-compassion were immediately measured; then underwent group intervention, where the self-soothing touch group followed the guidance audio recording and sequentially touched their cheeks, chest and abdomen, and hugged themselves; the self-soothing talk group performed self-blessing according to loving-kindness meditation guidance audio; the combined intervention group performed self-blessing in the first half according to the recording and self-soothing touch in the second half; the control group watched a nature documentary, after which post-test emotions and state self-compassion were measured; finally, they rested for 5 minutes. Results: Repeated measures ANOVA and post-hoc tests on the experimental data showed that after negative emotion induction, all groups' negative emotions significantly increased compared to the baseline, and there were no between-group differences; the combined intervention (0.48±0.11, $p < .001$) and self-soothing touch (0.50±0.11, $p < .001$) significantly improved participants' state self-compassion levels, while the self-soothing talk (0.31±0.11, $p = .193$) and control group (0.26±0.11, $p = .69$) showed no significant pre-post test differences in state self-compassion; both the intervention and control groups could alleviate negative affect and improve positive affect. Moreover, no effects of self-soothing touch on heart rate and heart rate variability were found. Conclusion: Self-soothing touch can help adolescents who are experiencing negative affect improve their immediate level of self-compassion, alleviate negative affect and enhance positive affect.

健康环境悖论视角下青少年受欺负与抑郁的关系

——基于 HLM 模型分析

3.华南师范大学华南先进光电子研究院广东省光信息材料与技术重点实验室&彩色动态电子纸显示技术研究所，广州，510631 通讯作者邮箱： taotao.ru@m.scnu.edu.cn 和 guofu.zhou@m.scnu.edu.cn

摘 要 近年来，研究者在校园欺凌干预实践中发现存在健康环境相悖现象，即在欺凌行为经常发生的学校，个体遭受欺负后反而较少出现内外化问题等适应不良症状；在欺凌行为较少发生的学校，受欺负个体反而出现较多适应不良症状(Yun & Juvonen, et al., 2022)。但以往研究仅限于讨论班级欺凌行为的发生频率对健康环境悖论现象的影响(刘晓薇 等人, 2021)，并未探究影响班级欺凌行为发生的重要因素——班级欺凌态度对受欺负影响抑郁的健康环境悖论机制。抑郁的素质-压力模型认为生活事件所诱发的压力是导致抑郁的危险因素；归因理论认为，人们会将自身的经历与他人的经历进行比较，进而对自身的的经历进行归因。如果在反对欺凌的环境中遭受欺凌这一压力事件，个体会倾向于认为是自身内在稳定的因素导致被欺凌，会进一步增加受欺凌个体产生抑郁的风险。因此，本研究使用嵌套模型(HLM)考察青少年受欺负与抑郁之

间的关系，并探究班级欺凌态度的跨层调节作用。采用受欺负量表、反刍思维量表、贝克抑郁量表以及欺凌态度量表对中国 3743 名青少年进行调查研究。结果发现：受欺负与反刍思维、抑郁呈显著负相关，与班级欺凌态度呈显著正相关；反刍思维与抑郁呈显著负相关，与班级欺凌态度呈显著正相关；抑郁与班级欺凌态度呈显著正相关。受欺负对抑郁具有正向影响作用；反刍思维在受欺负与抑郁之间起中介作用；班级欺凌态度在受欺负与反刍思维之间起负向跨层调节作用，在受欺负与抑郁之间起负向跨层调节作用。本研究表明，受欺负个体的抑郁情绪会受班级欺凌态度的跨层负向影响，即相比于班级欺凌态度消极的环境，在班级欺凌态度积极的环境中，青少年遭受欺凌后反而会更少产生反刍思维与抑郁。本研究为进一步理解受欺负与抑郁之间的关系提供了新的跨层视角，且本研究进一步验证并拓展了健康环境相悖的适用范围，为今后的反欺凌实践以及受欺凌个体的心理干预提供了新的参考视角。

3 Guangdong Provincial Key Laboratory of Optical Information Materials and Technology & Institute of Electronic Paper Displays, South China Academy of Advanced Optoelectronics, South China Normal University, Guangzhou 510006

Corresponding author email: taotao.ru@m.scnu.edu.cn & guofu.zhou@m.scnu.edu.cn

Abstract: In recent years, researchers have discovered a health context paradox in the context of school bullying interventions, whereby individuals who are bullied less frequently exhibit more maladaptive symptoms, including internalizing and externalizing problems, compared to those who are bullied more frequently (Yun & Juvonen, et al., 2022). However, previous research has only focused on the impact of the frequency of class bullying on the health context paradox (Liu et al., 2021), without exploring the role of an important factor influencing the occurrence of class bullying - class bullying attitude - in the mechanism of the health context paradox affecting depression in individuals who are bullied. The trait-stress model of depression suggests that stress induced by life events is a risk factor for depression, and attribution theory suggests that individuals compare their own experiences with those of others and attribute their experiences accordingly. If individuals experience bullied in an environment that opposes bullying, they are more likely to attribute the bullied to stable internal factors, which further increases the risk of depression. Therefore, this study employs a hierarchical Linear modeling (HLM) to investigate the relationship between being bullied and depression among adolescents, as well as the cross-level moderating effect of class bullying attitudes. A survey was conducted on 3,743 Chinese adolescents using measures such as the Victimization Scale, Rumination Scale, Beck Depression Inventory, and Bullying Attitude Scale. The results revealed that being bullied is significantly negatively correlated with rumination and depression, and significantly positively correlated with class bullying attitudes. Rumination is significantly negatively correlated with depression and significantly positively correlated with class bullying attitudes. Depression is significantly positively correlated with class bullying attitudes. Being bullied has a positive influence on

depression, rumination plays a mediating role between being bullied and depression, and class bullying attitudes play a negative cross-level moderating role between being bullied and rumination and a negative cross-level moderating role between being bullied and depression. This study demonstrates that the depression of individuals who are bullied is negatively influenced by class bullying attitudes at a cross-level, meaning that compared to a negative class bullying attitude environment, adolescents who experience bullied in a positive class bullying attitude environment are less likely to engage in rumination and develop depression. This study provides a new cross-level perspective for further understanding the relationship between being bullied and depression, and further confirms and expands the applicability of the health context paradox. It also offers new reference perspectives for future anti-bullying practices and psychological interventions for individuals who are bullied.

权力感、解释水平与最优化行为：中介效应与边界条件的探讨

景家驹[1]　李虹[1]（通讯作者）
1 清华大学社会科学学院心理学系，北京，100084
通讯作者 E-mail: lhong@mail.tsinghua.edu.cn

摘 要　权力感如何影响个体的决策行为一直是社会心理学领域的重要研究课题。在决策过程中，对于最优选项的追求是理想化的结果，但囿于个体的有限性，最优化的目的往往难以达成。本研究旨在探究高权力者在决策过程中的是否偏好采用最优化行为以实现其目的，这一过程是否受到解释水平的中介，高权力者在公开/私密情境中的最优化行为是否会出现系统性偏差。本研究的基本假设是：高权力感个体在决策中更倾向于采用最优化行为，这一过程是由于高权力感导致个体更多关注对象的渴望性特征；公开/私密情景调节了权力感和解释水平对最优化行为的影响。

三个研究探讨了权力感、解释水平和最优化行为之间的关系。研究 1 首先通过回忆法和角色扮演范式探索权力感与最优化行为的关系。结果显示，相较于低权力感个体，高权力感个体在决策任务中展现出更强的最优化倾向。研究 2 继续采用回忆法，进一步验证了权力感对于渴望性特征偏好的影响。结果发现，与低权力感个体相比，高权力感个体更倾向于选择具有较高渴望性特征的选项，这可能是他们在决策中表现出更强最优化行为的一个重要原因。研究 3 则采用了角色扮演范式来操纵权力感，同时探究解释水平对权力感与最优化行为关系的中介作用，并进一步探讨了作为边界条件的公开（vs.私密）情境对于中介过程的影响。结果显示，解释水平中介了权力感对最优化行为的影响。具体而言，高权力感个体偏好具有较高渴望性特征的选项，这进一步导致了他们在决策中的更多地采用最优化行为。在公开情境中，高权力感个体的最优化行为倾向表现得更为明显。

本研究揭示了权力感、解释水平和最优化行为之间的关系，并为我们理解这三者之间的相互作用机制提供了新的理论视角。特别是，研究强调了解释水平在权力感影响最优化行为过程中的中介作用，以及公开/私密情境作为边界条件对于这一过程的影响。这些发现对于理解高权力感个体的决策倾向，以及如何有效地影响和引导他们的决策行为，都具有重要的理论和实践意义。

Power, the Construal Level and Maximizing Behavior: A Discussion on Mediating Effects and Boundary Conditions

Jiaju Jing[1], Hong Li[1*]

1 Department of Psychology, Tsinghua University, Beijing, China
* Correspondence: lhong@mail.tsinghua.edu.cn

Abstract: How the sense of power affects individual decision-making has long been a crucial research problem in the field of social psychology. In the decision-making process, pursuing the best is the ideal outcome; however, given individuals' limitations, the maximizing goal is often challenging to accomplish. This research aims to explore whether individuals with a high sense of power prefer to adopt maximizing behavior to achieve their goals during the decision-making process, whether this process is mediated by the construal level, and whether systematic bias appears in the maximizing behavior of high-power individuals in public/private contexts. The basic hypothesis of this study is that individuals with a high sense of power tend to adopt maximizing behavior in decision-making, a process resulting from high power leading individuals to focus more on the desirable characteristics of an object; public/private contexts moderate the effect of the sense of power and the level of explanation on maximizing behavior.

Three studies investigated the relationship between the sense of power, the construal level, and maximizing behavior. Study 1 first used recall methods and role-playing paradigms to explore the relationship between the sense of power and maximizing behavior. The results showed that compared to individuals with a low sense of power, those with a high sense of power display a stronger tendency towards maximizing in decision-making tasks. Study 2 used the recall method to further verify the impact of the sense of power on the preference for desirable characteristics. The results revealed that, compared to individuals with a low sense of power, those with a high sense of power are more inclined to choose options with higher desirability features, which might be a significant reason for their stronger maximizing behavior in decision-making. Study 3 employed a role-playing paradigm to manipulate the sense of power, concurrently examining the mediating role of the construal level on the relationship between the sense of power and maximizing behavior, and further investigating the influence of public (vs. private) contexts as boundary conditions on the mediation process. The results showed that the construal level mediates the effect of the sense of power on maximizing behavior. Specifically, individuals with high power prefered options with higher desirability features, leading them to adopt maximizing behavior more frequently. In public contexts, the maximizing behavior tendency of individuals with high power was more pronounced.

This research uncovers the relationship between the sense of power, the construal level, and maximizing behavior, and provides a novel theoretical perspective for understanding the interaction mechanism among these three factors. In particular, the research emphasizes the mediating role of the construal level, and the impact of public/private contexts as crucial boundary conditions. These findings carry important theoretical and practical implications for understanding the decision-making tendencies of individuals with a high sense of power and for effectively influencing and guiding their decision-making behavior.

Keywords: the sense of power, maximizing behavior, the construal level, public, private

沮丧应激与状态焦虑的关系：急性应激下 HPA 轴功能的调节作用

摘 要　当代社会快速变动的生活环境和多元的压力场景，使得人们常常处于高度的焦虑状态之中。挑战与沮丧的应激理论自提出后在工业组织领域得到了很多研究的检验，也为许多应激相关的现象提供了解释。本研究将挑战与沮丧应激理论应用于解释日常生活中应激和焦虑的关系，并检验了 HPA 轴功能对于应激引

起焦虑的缓冲作用，为应激与焦虑间的关系做出进一步的解释，并提供了生理证据的支持。实验使用了中文修订版的学生挑战与沮丧应激量表，测量近 6 个月内挑战和沮丧的应激水平，同时测量了状态焦虑水平，并通过特里尔社会应激任务，检测急性应激后 60 分钟内唾液皮质醇水平的变化。研究结果发现，近期的沮丧应激水平能够正向预测当前的状态焦虑水平，而挑战应激并不预测状态焦虑的水平。更重要的是，我们发现，急性应激任务后个体 HPA 轴的恢复情况，即皮质醇在恢复阶段的下降率调节了沮丧应激与状态焦虑之间的关系。当应激源被撤销后，对于皮质醇下降率较低的个体，其皮质醇水平不能迅速且完全地恢复到基线，他们在生活中的沮丧应激会引发更高的焦虑水平；相对地，对于皮质醇恢复较快的个体，他们能在应激任务结束后迅速地恢复到基线水平，且由生活中的沮丧应激引起的焦虑水平相对较低。本研究在挑战与沮丧的应激框架下探讨了生活应激源对焦虑的影响，以及在急性应激环境下 HPA 轴功能的调节机制。同时，我们从资源和需求的角度，讨论了生理韧性在缓解应激源引发焦虑中的作用。

Abstract：Nowadays, young adults are facing stressors from several aspects. They have already become the most anxious groups in Chinese society and in risk of developing a series of anxiety disorders. The theory of challenge-hindrance stress was proposed to explain the positive and negative outcomes of different stressors. It has been widely tested mostly in the field of organization and management. In the current study, we used the challenge-hindrance stress theory to clarify the association between stress in daily life and anxiety. We also examined the HPA-axis function buffering the influence of daily stress on anxiety. Physiological evidence was provided through experiments. In the study, we used the edited Chinese version of challenge-hindrance stress scales to measure challenge and hindrance stress over 6 months. The level of anxiety was measured by state-trait anxiety inventory. We also carried out a Trier Social Stress Test (TSST) in laboratory and recorded the change of cortisol level during the 60 minutes right after the acute stress. Results show that the recent level of hindrance stress positively predicts trait anxiety, but the level of challenge stress does not predict trait anxiety. It is also found that, the cortisol decline rate during the recovery of acute stress moderates the association between stress and

anxiety. To be exact, individuals with low cortisol decline rate could not recover to baseline level even after rather long rest, and hindrance stress in their lives would lead to higher level of anxiety. But for individuals who has high cortisol decline rate after acute stress, they recover fast to baseline after the stressor disappear, and they become less anxious although facing the same level of hindrance stress. The current study checked the association between stress and anxiety under the framework of challenge-hindrance stress. We examined the moderating mechanism of HPA-axis function, and discussed the effect of physiological toughness from the respective of resources and demands.

Keywords：challenge-hindrance stress, state anxiety, cortisol, TSST, HPA-axis function

儿童工作记忆刷新能力的发展

刘格格[1]　李富洪[2]（通讯作者）

1 江西师范大学心理学院，南昌，330022

2 江西师范大学心理学院，南昌，330022，lifuhong@jxnu.edu.cn

摘 要　工作记忆刷新(working memory updating)是指个体根据新呈现的信息不断更改工作记忆内容的过程，体现了人们不断对记忆中内容进行修正的能力，是执行功能的重要组成部分。研究者在 6 个月大的婴儿身上已经观察到刷新能力的出现，这种能力在整个童年时期会持续发展。本文总结了研究儿童刷新能力的五种范式：N-back 任务(N-Back Task)、活动记忆任务(Running Memory Task)、隐形位移任务(Invisible Displacement Task)、旋转任务(Rotating Task)和检索转换替代任务(Retrieval Transformation and Substitution Task)，并从不同的角度探讨了每种范式的优势和不足。此外，文章从儿童认知发展的角度，总结了与儿童刷新能力的发展相关的能力—工作记忆表征与存储容量以及抑制控制能力的发展之间的关系。研究人员还发现了儿童工作记忆刷新功能的可塑性，这意味着工作记忆刷新训练可以有效改善个体的刷新能力。因此，本文对儿童刷新训练的有效性、持续性和训练任务的类型进行了简要分析。然而，儿童工作记忆刷新能力的发展仍有许多未解决的问题需要不断探索，后续研究可关注以下问题：改进儿童工作记忆刷新的研究范式；开发针对学习障碍儿童的刷新能力的训练工具；推进不同年龄儿童刷新能力发展的测量和评估。

Abstract：Working memory updating(WMU) is an important component of executive function(EF). Researchers have observed the updating function in infants as young as six months old, and this ability continues to develop throughout childhood. This article summarizes five paradigms for studying children's updating ability: N-Back Task, Running Memory Task, Invisible Displacement Task, Rotating Task and Retrieval Transformation and Substitution Task, exploring the strengths and weaknesses of each paradigm from different perspectives. In addition, from the perspective of the development of children's cognitive abilities, the article summarizes the relevance between working memory representation and storage capacity, and the development of inhibitory control

ability. Researchers have also discovered the plasticity of children's working memory updating, meaning that updating training is effective. Therefore, this article provides a preliminary summary of the effectiveness of updating training for children's working memory and the types of training tasks. However, there are still many unsolved issues in the development of children's working memory updating that need to be explored continuously, including: improving the paradigm of children's working memory updating; developing the tools of updating training for children with learning disabilities; promoting the measurement and assessment of updating development in different ages of children.

Keywords：children, working memory updating, working memory capacity, inhibitory control, updating training

病态赌博成瘾患者眶额皮质脑区局部解剖特征

董浩浩[1]　苗程菓[1] Sescousse G[2]　李岩松[1]（通讯作者）

摘 要　赌博成瘾（Gambling Disorder，GD）作为一种行为成瘾，其核心症状表现为奖赏和决策功能受损，同时可能伴随着脑眶额叶皮质（Orbitofrontal Cortex，OFC）区域局部解剖特征的异常。该脑区的局部解剖特征可以根据重要的脑沟回的连接模式分成三种类型：I型，II型 和III型。 以往研究发现，药物成瘾患者与该分型的变化有关。我们是否可以在行为成瘾的患者身上发现类似的结果仍然是急需我们回答的重要问题。为了回答这一问题，我们对 206 名 GD 患者和 206 名健康对照个体的脑结构像的数据进行分析以便揭示赌博成瘾患者脑眶额叶皮质区域局部解剖特征的特点。为了实现这一步目标，我们首先利用 FreeSurfer 软件对每个患者和正常对照个体的脑结构图像进行重建和皮质分割，并根据沟回的特征对眶额叶皮质进行分型。为了确保对分型判断的客观性，我们要求两名研究者独立学习分类标准并使用健康对照组的数据进行训练，然后他们独立评估所有样本，并统计分析两位评分者的评价一致性。针对评估不一致的样本，进行独立的重新评估。最后，两名研究者共同对剩余不一致的样本（占总数的 16%）进行了最后的评定。在个体分型的基础上，我们接下来完成了统计分析。结果显示，健康对照组的 OFC 分型比例与已有的黄金标准无显著差异（左侧：$\chi^2 = 1.1, p = .57$; 右侧：$\chi^2 = .67, p = .71$），证实了我们的评估方法的有效性。然而，对比赌博成瘾患者和健康对照组，我们并未发现 OFC 分型比例的显著差异（左侧：$\chi^2 = 1.5, p = .46$; 右侧：$\chi^2 = .39, p = .82$）。这一结果与一项已经发表的研究结果不一致。通过对比我们的研究和之前发表的一项研究的分析方法，导致结果不一致的可能原因是因为判断分型图像的质量导致的。因此，我们的研究为理解赌博成瘾患者眶额叶皮质区域局部解剖特征的特点提供了新的重要的证据，同时也表明更加精确和客观可靠的方法对于描述额叶皮质区域局部解剖特征的特点有重要的影响。

关键词　赌博成瘾，眶额叶皮质脑区局部解剖特征。

Characterizing the orbitofrontal sulcogyral patterns in Gambling Disorder

Haohao Dong[1] Chengguo Miao[1] Sescousse G[2] Yansong Li[1]

1 Department of Psychology, Nanjing University, Nanjing, 210023

2 National Centre for Scientific Research, Lyon, France

Abstract：Gambling Disorder (GD) is a type of behavioral addiction characterized by impaired reward and

decision-making functions, possibly accompanied by abnormalities in the local sulcogyral patterns of the Orbitofrontal Cortex (OFC) area. The local sulcogyral patterns of this brain region can be divided into three types based on the connection patterns of important brain sulci and gyri: Type I, Type II, and Type III. Previous studies have found a relationship between the changes in these types and drug addicts. It remains an important question whether similar findings can be discovered in patients with behavioral addictions. To answer this question, we analyzed brain structure image data from 206 GD patients and 206 healthy control individuals to reveal the characteristics of the local sulcogyral patterns of the OFC area in GD patients.To achieve this goal, we first used FreeSurfer software to reconstruct and segment the brain structure images of each patient and healthy control individual, and typed the OFC based on the patterns of the sulci and gyri. To ensure objectivity in the judgment of typing, we required two researchers to independently study the classification criteria and train with data from the healthy control group. They then independently assessed all samples and statistically analyzed the consistency of the two evaluators' evaluations. For samples with inconsistent evaluations, an independent re-evaluation was performed. Finally, the two researchers jointly made the final evaluation of the remaining inconsistent samples (16% of the total).Based on the individual typing, we then completed the statistical analysis. The results showed that the proportion of OFC typing in the healthy control group was not significantly different from the existing gold standard (left: $\chi^2 = 1.1$, $p = .57$; right: $\chi^2 = .67$, $p = .71$), confirming the validity of our evaluation method. However, we did not find a significant difference in the proportion of OFC typing between the gambling addiction patients and the healthy control group (left: $\chi^2 = 1.5$, $p = .46$; right: $\chi^2 = .39$, $p = .82$).This result is inconsistent with the results of a previously published study. By comparing our research and the analysis method of a previously published study, the potential cause of the inconsistency may be due to the quality of the typing image judgment. Therefore, our study provides new important evidence for understanding the characteristics of local sulcogyral patterns of the OFC area in GD patients, and also indicates that more precise and reliable methods have a significant impact on describing the characteristics of local sulcogyral patterns of the frontal cortex area.

摘 要 丘脑核及其投射的皮层靶点已被揭示参与疼痛信息处理。伤害性激光刺激诱发的脑响应反映了人类和动物痛觉系统的激活并与疼痛感知密切相关。为探究丘脑的激光诱发脑响应特征，本研究采用自由活动大鼠的激光诱发脑响应模型，结合伤害性激光刺激和在体电生理技术刻画了皮层和丘脑的脑响应特征。研究发现，丘脑和皮层具有类似的脑响应并被刺激强度显著调节，但丘脑场电位波形存在与皮层不同的早期小波响应（small wave, SW），其 N1 成分显著落后于皮层 N1 和丘脑本身的信息输出。结果表明内外侧疼痛通路中丘脑皮层脑区均参与疼痛强度信息编码，丘脑场电位中的伤害性丘脑响应不是 N1 而是 SW，本研究扩展了丘脑疼痛响应和编码特征的认识，有助于疼痛机制的系统性理解。

Abstract: The role of the thalamic nucleus and its cortical targets in pain processing has been extensively studied. Laser-evoked brain responses have been shown to reflect the activation of pain systems and are closely associated with pain perception in both humans and animals. In this study, we aimed to characterize the brain responses in the thalamus and cortex using a model of laser-induced brain responses in freely moving rats. By combining noxious laser stimulation with in vivo electrophysiological techniques, we investigated the similarities and differences in the brain responses between these regions. Our findings revealed that both the thalamus and cortex exhibited similar brain responses that were significantly modulated by the intensity of the stimulation. However, we observed a distinct characteristic in the thalamic field potential waveform, namely an early small wave response (SW) that differed from the cortex. Notably, the N1 component in the thalamus showed a significant delay compared to both the N1 of the cortex and the thalamus itself. These results suggest the involvement of both thalamic and cortical regions in encoding pain intensity information along the medial and lateral pain pathways. Furthermore, we propose that the SW, rather than the N1, represents the nociceptive thalamic response in the thalamic field potential. This study contributes to a more comprehensive understanding of the thalamic pain response and its encoding characteristics. The findings shed light on the complex mechanisms underlying pain processing and provide valuable insights for future research in the field of pain neuroscience.

通讯作者 valleyqq@swu.edu.cn

摘 要 能力应激 (Achievement Stressor)是最为常见的一种应激来源，它是指一切可以对人们自身能力感知产生威胁的事件或情景，如学业考试、工作面试、公众演讲等具有挑战性的任务。社会奖赏作为缓解能力应激反应的有效方式，可以进一步分为价值肯定与情感支持。许多研究表明，无论是价值肯定还是情感支持都可以有效地缓解能力应激反应，但并未有研究关注两类社会奖赏对能力应激的缓解效应是否存在差异。本研究选取 85 名在校大学生(55 名女生)作为被试，随机分配到价值肯定组、情感支持组和控制组，通过写作任务启动相应的奖赏类型，随后使用特里尔社会应激范式引发所有被试的能力应激反应。以奖赏启动类型为自变量，以在实验过程中多次采集的唾液皮质醇 (4 次)、心率 (8 次)、主观应激报告 (7 次)、应激后情绪反应和认知能力为因变量，采用传统曲线下面积增量 (AUCi; area under the curve increase)与潜在增长曲线模型 (LGCM; latent growth curve modeling) 两种方法验证研究假设。结果表明：（1）在皮质醇 AUCi 方面，价值肯定组显著低于情感支持组和控制组，而情感支持组显著低于控制组。（2）在心率 AUCi 方面，不同奖赏启动虽然不存在显著差异，但从趋势上看，价值肯定组的心率 AUCi 水平最低。更重要的是，在构建心率的 LGCM 中，相对于情感支持组，价值肯定组的被试在应激恢复阶段心率下降速率更快。（3）在应激主观报告方面，价值肯定组显著低于情感支持组和控制组，而情感支持组与控制组无显著差异。此外，价值肯定组比情感支持组和控制组表现出更强的应激后积极情绪和更高的认知能力。以上结果都表明，

虽然价值肯定与情感支持奖赏都能缓解能力应激反应，但价值肯定比情感支持的缓解效应更强。本研究提示当人们面临诸如重大考试、面试等能力应激事件时，价值肯定比情感支持更能缓解人们的应激反应，同时提高在应激情景下的任务表现。

Affirmation Rather than Support: Value Affirmation Is More Effective than Emotional Support in Buffering Achievement Stressor

Shuai Wang[1,2], Xiaolin Zhao [1,2], Meijun Zhou [1,2], Juan Yang[1,2]*

1 Faculty of Psychology, Southwest University, Chongqing 400715, China

2 Key Laboratory of Cognition and Personality, Southwest University, Chongqing 400715, China

***Abstract*:** Achievement stress is the most common stressor, referring to all events or situations that can pose a threat to people's perception of their own abilities, such as challenging tasks including academic exams, job interviews, public speeches, etc. Social rewards, as an effective way to buffer achievement stress reactions, can be further divided into value affirmation and emotional support. Many studies have shown that both value affirmation and emotional support can effectively buffer achievement stress responses, but few research has focused on whether there is a difference in the buffering effect of two types of social rewards on achievement stress. In this study, 85 college students (55 females) were selected as participants and randomly assigned to the value affirmation group, emotional support group, and control group. The corresponding reward types were manipulated through writing tasks, and then Trier's Social Stress Test was used to trigger the achievement stress of all participants. Using the reward types as the independent variable and multiple collections of salivary cortisol (4 times), heart rate (8 times), subjective stress reports (7 times), post-stress emotional response, and cognitive ability during the experimental process as the dependent variables, the research hypotheses were validated using two methods: AUCi (area under the curve increase) and LGCM (latent growth curve modeling). The results showed that: (1) In terms of cortisol AUCi, the value affirmation group was significantly lower than the emotional support group and the control group, while the emotional support group was significantly lower than the control group. (2) In terms of heart rate AUCi, although there was no significant difference in reward types, the value affirmation group had the lowest heart rate AUCi level in terms of trend. More importantly, in constructing LGCM for heart rate, participants in the value affirmation group had a faster rate of heart rate decline during the stress recovery phase compared to those in the emotional support group. (3) In terms of subjective stress reporting, the value affirmation group was significantly lower than the emotional support group and the control group, while there was no significant difference between the emotional support group and the control group. In addition, the value affirmation group exhibited stronger post-stress positive emotions and higher cognitive abilities than the emotional support and control groups. The above results indicate that although both value affirmation and emotional support rewards can buffer achievement stress reactions, value affirmation has a stronger buffering effect than emotional support. This study suggests that when people face achievement stress events such as major exams and interviews, value affirmation is definitely more effective than emotional support in buffering their stress response and improving task performance in stressful situations.

Feeling worse but not doing better: The impact of teachers' angry feedback on junior high school students

Abstract: Teachers may sometimes lose their temper and express anger toward their pupils. Some studies showed that teachers' angry expressions benefit students' learning, while others reported the opposite. Given that the effect of teachers' angry expressions on junior high school students has not been experimentally tested, the current study verified the effect of teachers' angry expressions on junior high school students' emotional experience, cognitive inference, and learning performance. In a vignette experiment (Study 1), participants felt angrier, made more negative inferences, and had lower willingness to improve learning performance after a teacher expressed anger rather than neutral expression. Replicating the findings in Study 1, participants in two separate field experiments (Study 2) felt worse, made more negative inferences, and had worse scores on subsequent tests after being confronted with an angry rather than a neutral teacher. In both studies, teachers' emotional displays affect junior-high-school students' learning performance partially through the chain mediation of emotional reactions and cognitive inference. These findings suggested that junior high school teachers should be cautious when displaying anger toward students.

Keyword: teachers' angry expressions, junior high students, Emotions as Social Information

摘 要 教师有时可能会对学生发脾气和表达愤怒。一些研究表明教师愤怒表达会促进学生的学习表现，但是，也有研究的结果与之相反。鉴于现有研究并未有教师愤怒表达对中学生影响的实验研究，当前研究探究教师愤怒情绪对中学生情绪体验、认知推断和学习表现的影响。在情景实验中（研究 1），相比经历教师中性情绪表达的被试，经历教师愤怒情绪表达的被试会感到更加愤怒，对教师有着更多地消极推断，并且有着更低的行为提升意向。与研究 1 结果相似的是，被试在两个现场实验中（研究 2），相比经历教师中性情绪表达的被试，经历教师愤怒情绪表达的被试会感到更加糟糕的情绪体验，对教师有着更多地消极推断，并且有更低的测验分数。在这两个研究中，教师情绪能够通过学生的情感体验和认知推断的链式中介对学生的学习表现产生影响。这些研究结果表明，中学教师应当持谨慎向学生表达愤怒。

摘 要 躯体感觉是否具有灵敏偏侧性，目前仍存在争议，并且，针对疼痛的脑脊传导通路进行疼痛偏侧性特点研究的相关工作至今尚未开展。为了深入探讨这一问题，我们采用了较大的样本量（N=92），通结

合脑脊同步功能成像的热痛刺激任务，获得了一些重要的发现：对于相同刺激温度的疼痛强度和不愉悦度评分，右手的主观感受高于左手；前颞部皮层（frontal operculum cortex）的结构不对称性程度与双手主观疼痛强度感受差异显著相关；双手手前颞部皮层及脊髓背角 C6 皮节热痛激活差异与主观疼痛强度感受差异呈显著相关。这些发现揭示了感觉偏侧性与运动偏侧性可能存在的关联性，且疼痛感受的偏侧性可能受多重因素影响，包括感觉类型、刺激模式以及神经解剖结构等，为深入理解疼痛感受及其神经机制提供了新的视角和启示。

***Abstract*:** The question of whether somatosensory perception exhibits lateralized sensitivity remains controversial. Furthermore, to date, no studies have specifically investigated the lateralized characteristics of pain through its brain-spinal transmission pathways. To delve deeper into this issue, we employed a larger sample size (N=92) and combined it with a thermal pain stimulation task using simultaneous cortico-spinal functional imaging. We made several significant findings: 1) For the same stimulus temperature, subjective pain intensity and unpleasantness ratings were higher for the right hand than the left hand; 2) The degree of structural asymmetry in the frontal operculum cortex was significantly positively correlated with the difference in pain intensity between the two hands; Differences in activation in the frontal operculum cortex and the dorsal horn of the C6 spinal segment between the left and right hands were positively correlated with differences in subjective pain intensity. These findings shed light on the potential association between sensory lateralization and motor lateralization. The lateralized perception of pain may be influenced by multiple factors, including the type of sensation, stimulus modality, and neuroanatomical structures, offering new insights and perspectives for a deeper understanding of pain perception and its neural mechanism.

仪式缓解状态焦虑：仪式效能感和仪式象征意义在其中的作用

周雅洁 [1,2] 陈文锋 [3] 刘长虹 [4] 傅小兰 [1,2]（通讯作者）

1 中国科学院心理研究所，北京，100101

2 中国科学院大学心理学系，北京，101408，fuxl@psych.ac.cn

3 中国人民大学心理学系，北京，100872

4 英国伯恩茅斯大学心理学系

摘 要 **目的：**仪式有助于调节情绪，例如当人们面临考试和比赛等焦虑事件时会选择做仪式动作缓解自己的状态焦虑水平。在对仪式的调节中，仪式效能感和仪式象征意义是两个重要的影响因素。因此，本研究旨在操纵新仪式动作象征意义的有无，分别考察仪式效能感和仪式象征意义在降低状态焦虑中的作用。

方法：研究 1 没有赋予新仪式动作象征意义，共分为 4 组：高仪式效能感组、低仪式效能感组、随机动作组和无动作组。实验阶段测量了三次被试的状态焦虑水平：休息之后（前测）、观看恐怖视频后（中测）、完成动作或回忆图片后（后测）。高、低仪式效能感组和随机动作组在观看恐怖视频前学习“仪式”或“随机”标签的动作，在观看恐怖视频后完成学习过的动作。无动作组在观看恐怖视频前观察一组图片，观看恐怖视频后进行图片再认任务。研究 2 赋予新仪式动作象征意义，共分为 3 组：高仪式效能感组、低仪式效能感组和随机动作组。状态焦虑水平测量方法同研究 1。在观看恐怖视频前，高、低仪式效能感组学习“仪式”标签动作的同时获取仪式动作被赋予的象征意义，随机动作组学习“随机”标签动作。在观看恐怖视频后，高、低仪式效能感组和随机动作组完成学习过的动作。

结果：在不知道仪式的象征意义时，仪式效能感更高的被试在完成仪式后状态焦虑缓解值更大（研究 1）。在知道仪式的象征意义时，仪式效能感不影响状态焦虑，高、低仪式效能感组的状态焦虑缓解值都显著大于随机动作组（研究 2）。

结论：当仪式的象征意义未知时，仪式通过仪式效能感影响状态焦虑，导致对仪式动作效能有更强信念的个体焦虑缓解值更大。当仪式的象征意义已知时，仪式通过仪式象征意义直接影响状态焦虑，而仪式效能感对状态焦虑的缓解不产生显著影响。

关键词 仪式，仪式效能感，仪式象征意义，状态焦虑

Rituals reduce state anxiety through perceived ritual efficacy and ritual symbolism

Yajie Zhou[1,2] Wenfeng Chen[3] Chang Hong Liu[4] Xiaolan Fu[1,2](corresponding author)

1 Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, China

2 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 101408, China, fuxl@psych.ac.cn

3 Department of Psychology, Renmin University of China, Beijing, 100872, China

4 Department of Psychology, Bournemouth University, Dorset, United Kingdom

***Abstract*：Objective:** Enacting rituals can help regulate emotions, particularly when experiencing anxiety. In the regulation, perceived ritual efficacy and ritual symbolic meaning may be two of key factors. The aim of this study was to examine the influence of perceived ritual efficacy and ritual symbolic meaning on reducing state anxiety, separately by introducing a novel ritual action with symbolic meaning or not.

Methods and Measures: In Study 1, the role of ritual actions without assigned symbolic meaning was investigated. It consisted of four conditions: high ritual efficacy, low ritual efficacy, random action and no action. The levels of state anxiety were measured three times: after rest (pre-test), after view a horror movie (mid-test), and after perform actions or recall pictures (post-test). The participants in high ritual efficacy, low ritual efficacy and random action condition learned actions labeled ritual or random before viewing a horror movie and perform learned actions after viewing a horror movie. In contrast, no action group observed pictures before viewing a horror movie and recalled pictures after viewing a horror movie. In Study 2, the role of ritual actions with assigned symbolic meaning was investigated. It consisted of three conditions: high ritual efficacy, low ritual efficacy, and random action. The levels of state anxiety were measured as in Study 1.The participants in high ritual efficacy and low ritual efficacy condition learned actions labeled ritual and knew assigned symbolic meanings before viewing a

horror movie and performed learned actions after viewing a horror movie. In contrast, random action group learned actions labeled random before viewing a horror movie and performed learned actions after viewing a horror movie.

Results: The results revealed that participants who perceived higher ritual efficacy experienced a significant reduction in state anxiety following rituals, particularly when they were unaware of the ritual symbolic meanings associated with the rituals (Study 1). In contrast to participants who perceived actions as a random sequence, those with knowledge of ritual symbolic meanings reported significantly lower anxiety scores after engaging in rituals, no matter what the perceived ritual efficacy on state anxiety was (Study 2).

Conclusion: When symbolic meaning is unknown, rituals influence state anxiety through perceived ritual efficacy, resulting in relief of state anxiety for individuals who hold a relatively strong belief in the efficacy of ritual action. When symbolic meaning is known, however, rituals directly influence state anxiety through ritual symbolic meaning, while the degree of belief in ritual efficacy does not have a significant impact on the relief of state anxiety.

工作记忆中时空背景对项目重复提取的促进作用

张亚亚[1] 严艳梅 1 夏立坤[2] 丁锦红[1]（通讯作者：dingjh@cnu.edu.cnu ）

1 首都师范大学心理学院，北京，100037

2 首都师范大学信息工程学院，北京，100037

摘 要 时间和空间信息与非时空特征信息一起，都会被编码到工作记忆的表征中。这些时空信息作为信息提取的重要线索，通过眼睛的注视或扫描路径恢复帮助记忆提取。然而，考虑到时间和空间是两个不同维度，它们在工作记忆表征中是以独立方式还是整合方式存在还不清楚。另一方面，当时空信息的完整性发生改变时，其促进作用是否也随之变化？

本研究采用延迟匹配任务和眼动追踪技术，考察记忆表征变化在记忆提取中的作用以及记忆表征恢复与更新的限制条件。实验一控制再认旧刺激与学习阶段序列呈现的 4 个客体时间序列（相同 VS 不同）与空间位置（相同 VS 不同），在学习阶段要求被试记住序列呈现在屏幕中四个象限的客体及其位置；测试阶段在屏幕中央依次呈现 8 个再认刺激（新旧各半），要求被试判断是否与学习阶段的 4 个客体相同。实验二中，学习阶段要求被试记住同时呈现的 5 个物体及其位置；测试阶段则要求被试判断空间分布与学习阶段一致的 5 格物体中有多少物体与学习中的物体相同并通过按键反应。两者全部不同和全部相同分别按键盘上的左右箭头键；1～2 个相同按向上箭头；3～4 个相同按向下箭头。

结果显示，当编码与提取的时空信息全部相同时，正确率随提取次数升高，反应时、平均注视时间、转移熵逐次降低，扫描路径相似性、静息熵无变化；时空信息部分相同时，正确率、平均注视时间、扫描路径相似性逐次降低，反应时、静息熵、转移熵无变化；时空信息完全不同时，正确率随提取逐渐先降低后稳定不变，反应时、平均注视时间、扫描路径相似性、转移熵逐次降低，静息熵无变化。上述结果表明，个体依据完整时空整合信息直接激活与之绑定的客体信息促进记忆提取，不需要重构背景；部分相同的时空信息破坏完整的时空表征，重构时空表征的稳定性降低进而干扰记忆维持与提取，随时间变化时空表征的稳定性越来越差；没有相同时空信息时，记忆提取随时间推移受到编码阶段形成的记忆表征（自上而下）影响越来越弱，当前输入的视觉刺激（自下而上）的影响越来越强。

关键词 视觉工作记忆，时空表征，扫描路径，重复提取

The Facilitating Effect of spatiotemporal Context on Repeated Retrieval in Working Memory

Yaya Zhang[1] Yanmei Yan[1] Likun Xia[2] Jinhong Ding[1] (Corresponding author:dingjh@cnu.edu.cnu)
1 School of psychology, Capital Normal University, Beijing, 100037
2 School of Information Engineering, Capital Normal University, Beijing, 100037

Abstract： Temporal and spatial features of a visual event are often incidentally encoded together to support memory retrieval. New theories of gaze recovery propose that gaze recovery supports the retrieval of memory representations through the recovery of spatiotemporal context. However, gaze recovery needs to rely on spatiotemporal information associated with encoding, but the effect of different spatiotemporal contextual similarities on the retrieval process of working memory representations is unclear.

In this study, we used a delayed matching task and eye-tracking technology to examine the role of memory representation changes in memory extraction and the constraints on memory representation recovery and updating. Experiment 1 controlled the temporal sequence (same vs. different) and spatial location (same vs. different) of the four objects presented in the sequence of recongnitional old stimuli and the learning phase. In the learning phase, subjects were asked to memorize the objects and their locations in the four quadrants of the screen in which the sequence was presented; in the testing phase, eight recongnitional stimuli (half of the old and half of the new) were presented in turn in the center of the screen, and subjects were asked to judge whether they were the same as the four objects in the learning phase. In Experiment 2, the learning phase required subjects to memorize 5 objects and their locations presented simultaneously; the testing phase required subjects to judge how many of the 5 frames of objects whose spatial distribution coincided with the learning phase were the same as the objects in the learning phase and to respond by pressing a key. All different and all the same pressed the left and right arrow keys on the keyboard, respectively; 1 or 2 the same pressed the up arrow; 3 or 4 the same pressed the down arrow.

The results showed that when the encoded and retrieved of spatiotemporal information were identical, accuracy increased with each retrieval trial, while response time, average fixation time , and gaze transition entropy decreased incrementally. However, scan path similarity and resting entropy remained unchanged. When the spatiotemporal information partially matched, accuracy, average gaze duration, and scan path similarity decreased progressively, while response time, gaze stationary entropy, and gaze transition entropy remained unchanged. When spatiotemporal information is completely different, accuracy decreases with the number of extractions, response time, average fixation time, scan path similarity, gaze transition entropy decreases, and gaze stationary entropy is unchanged.These findings suggest that individuals rely on complete spatiotemporal integration to directly activate associated object information for memory retrieval, without the need for reconstructing the background context. Partially matching spatiotemporal information disrupts stable spatio-temporal representations, thereby interfering with memory maintenance and retrieval. As time elapses, the stability of spatiotemporal representations deteriorates. In the absence of matching spatiotemporal information, memory retrieval becomes less influenced by the memory representation formed during encoding (top-down) and stronger influenced by the current visual stimulus input (bottom-up).

Keywords： visual working memory, spatiotemporal representation, scan path, item retrieval.

精神分裂症患者社会协作期间的异常群脑网络和人际同步过程

摘 要　精神分裂症是一种常见的精神障碍，患者常常表现出社交功能缺损。由于社会协作行为的复杂性，我们对精神分裂症中社交缺陷的计算和神经机制仍然知之甚少。为了填补这一知识空白，我们招募精神分裂症个体并指导其与健康被试进行配对（精分-常人组）完成社会协作任务（即，协作手指按键任务）。同时，我们也招募了健康对照配对（常人-常人组）参与任务，以便进行对比分析。在任务中，被试配对要么接受彼此的按键声音反馈，要么仅接受一方的按键声音反馈。被试配对的按键反应时被用来计算人际同步指标；基于该指标，我们进一步采用了动力系统模型来解析个体内和个体间的同步模式。任务期间，我们还使用近红外脑成像技术同步测量了他们的脑活动，来深入探讨精神分裂症患者社会协作缺陷的群脑机制。行为学结果表明，精神分裂症个体在与健康伙伴协作时表现出较不稳定的行为和较差的人际同步。此外，我们使用动力系统对双人的同步行为进行建模，计算建模的结果表明，当健康伙伴无法接受到精神分裂症个体的按键反馈时，双人动力系统中的个体间耦合系数较低，这些结果表明精神分裂症患者在协会协作方面存在缺陷。在群脑水平上，我们还发现精分-常人组相比常人-常人组表现出异常的脑间同步模式，这与行为同步呈正相关。另外，我们使用了偏最小二乘法来捕捉脑间连接和症状之间的潜在关系，结果表明脑间连接的预测分数与真实的阳性和阴性症状评定量表得分呈正相关。综上，本研究揭示了精神分裂症患者中的社会协作缺陷以及潜在的异常计算和群脑神经特征。这些发现有望为未来的治疗策略提供新的思路和方向，以帮助精神分裂症患者缓解其社交功能障碍。

***Abstract*:** Schizophrenia (SCZ) is a prevalent mental disorder often characterized by social function impairments. Given the complexity of social coordination behavior, our understanding of the computational and neural mechanisms underlying social deficits in SCZ remains limited. To address this knowledge gap, we recruited individuals with SCZ and instructed them to pair with healthy participants (SCZ-HC dyads) to perform a joint finger-tapping task. Additionally, we also included HC-HC dyads to participate in the task for comparative analysis. In the task, participant either received auditory feedback from their partner or from their own. The reaction time were used to calculate interpersonal synchronization indices. Based on these indices, we further employed a

dynamical system model to parse intra- and inter-individual synchronization patterns. Concurrently, we used near-infrared brain imaging technology to simultaneously measure their brain activity, aiming to delve into the group brain mechanisms of social coordination deficits in SCZ.

Behavioral results revealed that individuals with SCZ demonstrated less stable behavior and poorer interpersonal synchronization when cooperating with healthy partners. Additionally, we used a dynamical system to model the synchronous behavior of the dyad, and the results of the computational modeling indicated that when the healthy partner could not receive the auditory feedback from SCZ, the inter-individual coupling coefficient was lower. These findings suggest a deficiency in social coordination in patients with SCZ. At the group brain level, we also found that the SCZ-HC dyads exhibited abnormal inter-brain synchronization patterns compared to the HC-HC dyads, which positively correlated with behavioral synchronization. Furthermore, we employed partial least squares to capture the potential relationships between inter-brain connectivity and symptoms. The results indicated that the predictive scores of inter-brain connectivity were positively correlated with the actual scores of Positive and Negative Syndrome Scale. In summary, our study unveils social coordination deficits in individuals with SCZ, along with potential abnormal computational and group brain neural features. These findings are expected to provide novel insights and directions for future therapeutic strategies, aimed at alleviating social dysfunction in patients with SCZ.

运动物体意图和物理原因的联合感知

摘 要　智能体的运动（motion）是由其意图性行为和其所处系统的物理约束共同导致的。因此，人类视觉需要推断出最合理的物理-心理联合假设（joint physics-mind hypothesis）来解释物体运动。我们设计了一个遛狗的视觉运动，以数个小圆代表运动客体：其中一个圆（“狗”）正在追逐另一个圆（“猫”），当“狗”过于靠近“猫”的时候，第三个圆（“主人”）通过一根有弹性的拉绳用力拉“狗”阻碍其对“猫”的追逐。根据联合感知理论，当物理-心理二者中某一方面的感知被破坏或削弱时，另一方面的感知也将会相应地受到损害。在本研究中，实验一发现破坏对物理系统的感知会削弱对追逐意图的感知；实验二验证了破坏追逐意图的感知会对直观物理系统的感知产生损害；实验三表明该场景下不同的意图识别之间也会产生影响。上述现象说明，对物理系统和意图的感知之间存在着相互依赖，同时意图的感知之间也存在着关联。因此，人类能够联合感知场景背后的心理和物理机制。

Jointly Perceiving Intention and Physics

Abstract：The motion of an agent is influenced by both its intentional behavior and the physical constraints of its environment. Human vision relies on inferring the most plausible joint physics-mind hypothesis to explain observed object motion. We designed a visual motion scene involving dog walking, represented by several small discs: one disc ("dog") chasing another disc ("cat"), and when the "dog" gets too close to the "cat," a third disc ("master") forcefully drags the "dog" with an elastic rope to hinder its pursuit of the "cat". According to the theory of joint perception, impairing or undermining perception in one aspect will also affect perception in the other aspect accordingly. In this study, experiment 1 explored whether disrupting perception of the physical system would undermine perception of the chasing intention; experiment 2 examined whether disrupting

perception of the chasing intention would also impair perception of the intuitive physical system; experiment 3 shows that there is also an effect between different intention recognition in this scene. These results suggest a mutual dependency between perception of the physical system and intention, as well as an interrelation among different intention perceptions. Therefore, humans are able to jointly perceive the mental and physical mechanisms behind the scene.

摘 要　经皮耳部迷走神经电刺激（transcutaneous auricular vagus nerve stimulation, taVNS）具有调控注意理论和解剖基础，但目前相关研究结果并不一致，这可能归因于 taVNS 对不同注意系统调控效果存在独立性以及交互作用。因此，本研究以点探测范式为例，试图解构 taVNS 对不同注意系统的调控效果。结果表明，与对照组相比，施加在左耳的 taVNS 显著改善了右手反应的整体行为表现。此外，taVNS 还可显著提高右手反应相关的脑电 P3 成分振幅，且相关分析显示其与反应时的变化显著相关。频谱分析表明，taVNS 可降低刺激对侧初级体感运动皮层在基线段的高频-α神经振荡的功率谱密度。总的来说，本研究提供了行为和大脑证据，表明 taVNS 在警觉增强方面具有良好的作用，可能对之后 taVNS 调控注意网络的研究具有启发性意义。

The modulation effects of transcutaneous auricular vagus nerve stimulation (taVNS) on attention system: Taking the dot-probe task as an example

Chen Yuxin[1, 2]　Yang Haoyu[1, 2]　Hu Li[1, 2]　Lu Xuejing[1, 2]

[2]Department of Psychology, University of Chinese Academy of Science, Beijing 100049, China

Abstract： Transcutaneous auricular vagus nerve stimulation (taVNS) operates on a foundation of regulatory theories and anatomical bases pertaining to attention. However, current research yields inconsistent results, potentially due to the distinctive and interactive effects of taVNS on the different attention systems. Hence, this study utilizes the dot probe task to deconstruct the modulation effects of taVNS on distinct attention systems. The findings demonstrated that taVNS administered to the left ear significantly enhanced the overall behavioral performance of right-hand responses, compared to the control group. Additionally, taVNS significantly augments the amplitude of the P3 component associated with right-hand responses, which correlates with taVNS-induced variations in reaction time. Spectral analysis reveals that taVNS could reduce the power spectral density of the high-α oscillations in the stimulated-contralateral primary sensorimotor cortex during the baseline segment. In conclusion, this study provided behavioral and brain evidence supporting the potent role of taVNS in enhancing

alertness.

超重/肥胖对大脑“感觉运动-跨模态”系统动态活动的影响

韩金凤[1] 陈红[12]（通讯作者）

1 认知与人格教育部重点实验室，西南大学心理学部，重庆，400715

2 西南大学心理学与社会发展研究中心，重庆，400715，通讯作者 Email: chenhg@swu.edu.cn

摘 要 超重/肥胖会对大脑结构和功能产生系统性的负面影响，从而降低个体认知能力和引发情绪失调问题。然而，这些有害影响如何在大脑动态中具体表现需要进一步探究。本研究中，基于两个独立静息态功能 fMRI 数据集 (N_{BBP} =1,923; N_{HCP} =998) 和一个纵向数据集 ($N_{BBP\text{-}follow\text{-}up}$ =34)，首先采用隐马尔可夫模型 (HMM) 识别出大脑激活状态由若干个子状态聚合的两个“元状态”表征，一个元状态反映的是感觉运动系统（包括视觉、感觉运动、听觉和语义加工皮层）关联的大脑激活增强，另一个元状态反映的是跨模态系统（包括联合皮层和关键皮层下结构）关联的大脑激活增强。其次，通过一般线性模型研究发现超重/肥胖影响的大脑激活状态更多地滞留于感觉运动系统主导的元状态，难以向跨模态系统关联的元状态进行转移。最后，进行关联分析和建立中介模型，结果表明体重指数 (Body mass index, BMI) 会通过增加在感觉运动系统主导的元状态中的持续时间，以及减少在跨模态关联系统主导的元状态中的持续时间，进而降低个体的认知能力。另外，与感觉运动系统相关的元状态也可以显著介导 BMI 与精神病理症状之间的正向关系。综上，研究从脑动力学视角揭示了超重/肥胖对大脑“感觉运动-跨模态”层级结构的不良影响，并为进一步研究超重/肥胖相关的大脑功能障碍和心理健康问题提供新的理论视角。

Elevated body mass index impacts the brain-state dynamics within sensorimotor-to-transmodal hierarchy

Jinfeng Han[1], Hong Chen[1,2]

[1] Key Laboratory of Cognition and Personality, Ministry of Education, Faculty of Psychology, Southwest University, Chongqing, China

[2] Research Center of Psychology and Social Development, Faculty of Psychology, Southwest University, Chongqing, China

Abstract：Overweight and obesity, as commonly indicated by a higher body mass index (BMI), are associated with functional alterations in the brain, which may potentially result in cognitive decline and emotional illness. However, the manner in which these detrimental impacts manifest in the brain’s dynamic characteristics remains largely unknown. Based on two independent resting-state fMRI datasets (n_BBP=1,923; n_HCP=998), we employed a hidden Markov model (HMM) to identify the spatiotemporal features of brain activity states. Subsequently, we examined the changes in brain-state dynamics and the corresponding functional outcomes that arise with an increase in BMI. Elevated BMI tends to shift the brain’s activity states towards a greater emphasis on a specific set of states—the metastate—that are relevant to the joint activities of sensorimotor systems, making it harder to transfer to the metastate of transmodal systems. These findings were reconfirmed in a longitudinal sample (n_BBP=34) that exhibited a significant increase in BMI at follow-up. Importantly, the alternation of

brain-state dynamics specifically mediated the relationship between BMI and adverse functional outcomes including cognitive decline and symptoms of mental illness. The altered brain-state dynamics within the sensorimotor-to-transmodal hierarchy provide new insights into obesity-related brain dysfunctions and mental health issues.

不确定情境影响疼痛与无疼痛刺激知觉加工的时间进程

庄昀[1 2] 赵科[1 2] 傅小兰[1 2]（通讯作者）

1 中国科学院心理研究所，北京，100101

2 中国科学院大学心理学系，北京，100101，fuxl@psych.ac.cn

摘 要 刺激的不确定性会影响疼痛刺激的知觉。但不确定情境下，疼痛与无疼痛刺激的加工如何受到影响尚未明了。本研究采用基于线索的 NPU 威胁范式（NPU-threat task），将不确定条件与确定条件分成不同的区组，探究不确定情境对疼痛与无疼痛刺激的行为反应与脑电活动的影响。结果显示，不确定情境不仅影响对疼痛刺激的反应，而且会影响对无疼痛刺激的知觉加工。在不确定情境下，人们甚至会对中性结果产生强度接近疼痛事件的神经激活。在不确定情境下疼痛刺激加工相比确定情境表现出更大的激活，主要体现在早期的N1和P2波幅。在不确定情境下，无疼痛试次的中央区晚期正电位（late positive potential, LPP）波幅达到了疼痛试次的水平，远高于确定情境。此外，时间-频率分析结果显示，早期（200ms 前），不确定情境下的疼痛刺激诱发了更强烈的 alpha（8-13 Hz）、beta（16-30 Hz）频段振荡，而在晚期（200ms 后），即使在没有疼痛刺激的情况下，不确定情境依然诱发了 delta-theta（2-8 Hz）频段振荡的增强。这些结果表明，不确定情境对疼痛和非疼痛刺激的知觉加工具有时间效应，在疼痛刺激后的早期阶段和无疼痛刺激后的晚期阶段，情绪唤醒和神经反应明显增强。

关键词 不确定情境，疼痛，无疼痛刺激，时间进程

Temporal Effect of Uncertain Context on the Perceptual Processing to Painful and Non-Painful Stimulation

Yun Zhuang[1 2] Ke Zhao[1 2] Xiaolan Fu[1 2]

[1]State Key Laboratory of Brain and Cognitive Science, Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, China

[2]Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049, China

Abstract: Uncertainty can influence the perception of noxious stimuli. However, how perception of painful and non-painful stimuli is affected under prolonged uncertain contexts is still unknown. To address this issue, we conducted an experiment using a cue-based NPU-threat task with uncertain and certain trials separated into different blocks, to investigate the influence of uncertain context on the behavioral responses and electroencephalogram (EEG) activities to painful and non-painful stimuli. The results revealed that under uncertain context, when faced with neutral outcomes, individuals even exhibited neural activations with comparable intensities to those of painful events, reflecting similar patterns observed in behavioral results. Specifically, neural

responses elicited by painful stimuli displayed stronger early N1 and P2 amplitudes under uncertain context compared to certain context, while the late positive potential (LPP) amplitudes for non-painful stimuli reached the level of painful stimuli under uncertain context, significantly exceeding the amplitudes observed under certain context. Furthermore, the time-frequency results demonstrated that in the early stage (200 ms before), painful stimulations under uncertain context induced stronger neural oscillations in the alpha (8-13 Hz) and beta (16-30 Hz) band, while in the late stage (200 ms later), uncertain context induced increase in delta-theta band (2-8 Hz) oscillations even in the absence of pain stimulations. These results showed a temporal effect of uncertain context on the perceptual processing to painful and non-painful stimulation, with stronger emotional arousal and neural responses evident in the early stage following painful stimulation and in the late stage following non-painful stimulation.

Keywords：uncertain context, pain, non-painful stimuli, temporal effect

比较奖励联结的分心刺激捕获内部注意与外部注意的差异

廖洁洁[1]　陈玉洁[1]　张慕贤[1]　莫雷[1]（通讯作者）

1 华南师范大学心理学院，广州，510631

摘 要　根据注意对象的不同，人类的注意可以分为外部注意与内部注意两大类，分别指对外界刺激物的注意，和对内在心理表征的注意。关于外部注意的研究运用训练-测试范式发现了奖励驱动注意捕获效应，即在训练阶段与奖励建立联结的刺激，在测试阶段作为分心刺激捕获注意资源，对测试任务产生消极影响。奖励驱动注意捕获效应在外部注意领域中获得大量研究证实，对当今社会中的肥胖、成瘾等问题的解决提供了可靠方案。然而，尚未有研究对奖励驱动注意捕获效应是否在内部注意中存在这一问题进行探索。此外，如果奖励驱动注意捕获效应在内部注意和外部注意都存在，那么这两者有何差异？基于这两个问题，本研究设计了两个实验，实验一旨在探讨奖励驱动对内部注意资源的捕获效应是否存在，实验二将其与奖励驱动对外部资源的捕获效应的比较。实验一采用训练-测试范式，在训练阶段建立高低奖励与红绿颜色的联结，在测试阶段比较红绿颜色作为分心刺激对内外部注意的影响。实验一的结果显示，无论在外部注意任务还是在内部注意任务中，与高奖励联结的颜色作为分心刺激时对测试任务的干扰作用都大于与低奖励联结的颜色作为分心刺激时对测试任务的干扰作用。这一结果说明奖励驱动注意捕获效应不仅在外部注意中存在，在内部注意中也存在。实验一中内部注意与外部注意下的奖励驱动注意资源捕获并无差异，研究者认为可能是在内部注意任务中以颜色为联结高低奖励的刺激不可避免地混入外部注意的作用，因此掩盖了真正的内外部注意差异。基于此，实验二采用奖励线索范式，在线索阶段将高低奖励与位置信息建立联结，在测试阶段比较高低奖励联结的位置对测试任务的影响。实验二结果表明，相较于外部注意，奖励驱动注意捕获效应对内部注意的损害作用更大。由此可见，奖励联结的分心刺激对内部注意和外部注意都有捕获作用，并且对内部注意具有更强的干扰作用。

Comparison between reward-driven capture of internal and external attention

Jiejie Liao[1]　Yujie Chen[1]　Muxian Zhang[1]　Lei Mo[1] (corresponding author)

1 School of Psychology, South China Normal University, Guangzhou 510631

Abstract：According to different targets, human attention can be divided into two categories: external attention and internal attention, which refer to attention to external stimuli and attention to internal psychological representations respectively. Research on external attention employed the train-test paradigm and discovered the reward-driven attentional capture effect, that is, the stimulus bond with reward in training phase captured attention resources as a distractor in the subsequent testing phase. The reward-driven attention capture effect was confirmed by a large number of studies in the field of external attention, and provided a reliable solution to the problems of obesity and addiction in today's society. However, no studies have explored whether the reward-driven attention capture effect exists in internal attention. Also, if the reward-driven attentional capture effect exists for both internal and external attention, what is the difference between them? Based on these two questions, two experiments were conducted. The first experiment was designed to explore whether the reward-driven capture influenced internal attention resources. The second experiment compared it with the reward-driven capture effect on external resources. Experiment 1 adopted the training-test paradigm to establish the connection between high/low rewards and red/green colors in the training stage and compared the effects of red-green colors as distractors on internal and external attention in the test stage. The results of experiment 1 showed that the color associated with high reward has a greater disturbing effect on the test task as a distractor than the color associated with low reward, regardless of external or internal attention task. This result suggested that the reward-driven attention capture effect existed not only in external attention, but also in internal attention. In experiment 1, there was no reward-driven capture effect difference between internal and external attention tasks. The researchers believed that it might be that the color stimuli used to associate with high/low rewards were inevitably mixed with the effect of external attention, thus masking the real difference between internal and external attention. Based on this, experiment 2 used the reward-cue paradigm. The cue stage established a connection between high/low rewards with locations. In the test stage, comparisons for distracting effect of locations previously associated with high/low rewards were made between external and internal attention tasks. The results of experiment 2 showed that the reward-driven attentional capture effect had a greater damaging effect on internal attention than external attention. The distracting effect of reward association has a capture effect on both internal attention and external attention and has a stronger disturbing effect on internal attention.

Keywords：reward, internal attention, external attention, distractor, attentional capture

面孔中基于物体注意效应的争议：双矩形范式中 ERP 的证据

谢桐　付世敏（通讯作者）

广州大学教育学院心理系，脑与认知科学中心，广州，510006

摘 要　基于物体的注意（Object-based attention OBA）是一种视觉的选择性注意机制，它指注意选择物体为单位进行加工。在双矩形范式中，先前的研究表明各种不同的物体都可以引发 OBA 效应。然而，关于面孔能否引发 OBA 效应存在争议。现有研究主要采用行为实验方法探究此问题，然而，行为数据可能无法完全揭示面孔加工时间对 OBA 效应的影响。为了克服这一局限性并更全面地了解面孔对 OBA 机制的影响，本研究采用事件相关电位（ERP）技术重复之前的研究（Xie，Fu，& Mento，2022，2023），从电生理学角度提供面孔是否能引发 OBA 效应的证据。

本研究采用双矩形范式，在实验中呈现了面孔和非面孔物体。为了考虑注意的水平偏差，我们还引入了不呈现任何物体的基线条件。该条件旨在测量注意在水平和垂直方向上的差异，并利用这些差异来校正 OBA 效应。

在行为数据中，我们观察到非面孔物体中的 OBA 效应，但是在面孔中并未发现 OBA 效应。 根据 ERP 结果，我们确定了与 OBA 机制相关的两个成分：N1 和 P300。在面孔和非面孔物体中，物体内条件都引发

了更大 N1 的振幅。然而，P300 仅在非面孔物体中表现出更大的振幅，而在面孔中则没有出现差异。基于 ERP 结果，我们提出 N1 和 P300 成分反映了不桐时间上的 OBA 机制。在早期阶段，大脑有无法在面孔中提取社会信息。因此，无论是面孔还是非面孔物体都引发了相似的 N1 成分。在后续阶段中，物体得到充分加工，大脑将两个面孔知觉为一个整体，从而导致面孔和非面孔物体的 P300 成分出现差异。

总而言之，在双矩形范式中，面孔无法引发 OBA 效应，可能是因为对面孔的加工使得大脑将两个面孔知觉为同一整体。然而，在面孔被加工之前，面孔 OBA 效应可以通过 N1 成分表现出来。

Controversy of Face Involvement in Object-Based Attention: ERP Evidence from the Double-Rectangle Paradigm

Tong Xie　Shimin Fu*

Department of Psychology and Center for Brain and Cognitive Sciences, School of Education, Guangzhou University, Guangzhou 510006, China

Abstract： Object-based attention (OBA) is a specific type of visual selective attention mechanism where attentional resources are allocated based on an object as a cohesive unit. Numerous studies using the double-rectangle paradigm have consistently demonstrated the presence of the OBA effect in various objects. However, the involvement of faces in the OBA effect has sparked controversy. Note that the existing studies investigating the OBA effect in faces primarily rely on behavioral indicators, which may not fully capture the temporal dynamics of face processing and its impact on the OBA effect. To address this limitation and gain a more comprehensive understanding of how faces affect object-based mechanisms, this study aimed to replicate our previous studies (Xie, Fu, & Mento, 2022, 2023) using the event-related potential (ERP) technique, providing electrophysiological evidence to determine whether faces can elicit the OBA effect.

The double-rectangle paradigm was utilized in this study, wherein two rectangles were replaced by either two different human faces or non-face objects. To account for potential confounding factors of horizontal bias, a baseline condition was included in which no objects or faces were presented. This condition aimed to measure the horizontal and vertical attentional engagements and utilize their differences to correct for the OBA effect.

In behavioral data, we observed a significant OBA effect in non-face objects. However, for faces, no evidence of the OBA effect was found. Regarding the ERP results, two components were identified as being related to the OBA mechanism. The N1 component showed a larger amplitude in the within-object than between-object conditions, irrespective of whether faces or non-face objects were presented. However, the P300 component exhibited a larger amplitude exclusively in non-face objects. Based on the ERP results, we propose that the N1 and P3 components reflect the object-based mechanism at different time courses, thereby determining whether the OBA effect can be elicited by an object. During the early stages of processing, our brain has limited time to extract social information from faces. Consequently, both faces and non-face objects elicit similar N1 components regarding the object-based mechanism. However, as the processing of object content unfolds in the later stages, our brain perceives the two faces as a unified whole. As a result, the P3 component exhibits differences between faces and non-face objects.

In summary, faces can not elicit the OBA effect in the double-rectangle may be attributed to the brain perceiving two faces as a unified whole. Before faces are processed, the OBA effect in faces can be revealed by the larger N1.

一天内脑功能活动的重测信度：基于脑血流的研究

郭博文[1 2]　毛天欣[1 2]　饶恒毅[1 2]（通讯作者）

1 脑机协同信息行为教育部和上海市重点实验室，上海，201620

2 上海外国语大学国际工商管理学院，上海，201620，hengyi@gmail.com

摘 要　动脉自旋标记(Arterial Spin Labeled, ASL)灌注磁共振成像越来越多地用于评估健康和临床人群的局部脑活动和脑血管功能。ASL 灌注成像通过对静息态或任务执行期间的绝对脑血流量(cerebral blood flow, CBF)进行测量，提供了大脑局部活动的定量指标。以往的研究探讨了静息态和任务态以及任务引发的脑血流变化量在不同天的重测信度，然而，人类的行为和神经活动受到昼夜节律和稳态睡眠压力的调控，一天内的重测信度如何尚不清楚。本研究采用 ASL 灌注成像扫描方法，测量了 38 名健康被试在一天中六个时间点（8:00、10:00、13:00、15:00、18:00 和 20:00）静息态和精神运动警戒任务(Psychomotor Vigilance Test, PVT)中的脑血流。行为结果显示，相比于以往研究，一天内的重测信度较差，晚上 20：00 的平均重测信度相比于其它时刻明显下降，且重测信度随着测量时间间隔呈现整体下降的趋势。神经层面上，对于静息态和任务态的绝对脑血流，灰质、白质及大部分任务相关脑区和脑网络在一天内均表现出很高的重测信度。而任务引发的脑血流变化量则在各脑区和脑网络中表现出很差的重测信度。对于各个时刻点的进一步分析发现，相比于灰质，白质随时间点的波动较小。此外，对于静息态和任务态的绝对脑血流，灰质、任务激活脑区以及大部分脑网络在晚上 20：00 的平均重测信度相比其它时间点显著降低，且重测信度随测量的间隔时间呈现整体下降的趋势，但任务引发的脑血流变化量则随时间点及测量时间间隔没有显示出一致的变化规律。本研究对功能磁共振研究的可重复性具有一定的启发意义，表明测量时间早晚是影响功能磁共振领域可重复性的重要因素，未来的功能磁共振研究应尽量避免在晚上进行扫描，以减小测量时间对其可重复性的影响。

Abstract: Arterial spin labeled (ASL) perfusion magnetic resonance imaging (MRI) is increasingly used to assess regional brain activity and cerebrovascular function in both healthy and clinical populations. ASL perfusion imaging provides a quantitative measure of regional brain activity by determining absolute cerebral blood flow (CBF) values at a resting state or during task performance. Previous studies have explored the test-retest reliability of resting and task-state and task-induced cerebral blood flow across days; however, human behavior and neural

activity are modulated by circadian rhythms and homeostatic sleep pressure, in this case how is the test-retest reliability in a single day is unclear. To address this gap, we conducted a study with 38 healthy participants, quantifying CBF during at resting-state and a simple and reliable psychomotor vigilance test (PVT) at six fixed times (8:00 h, 10:00 h, 13:00 h, 15:00 h, 18:00 h, and 20:00 h) by ASL perfusion MRI. Behavioral results showed worse test-retest reliability in the day compared to other studies, with a decrease in mean test-retest reliability at 20:00 pm, and an overall trend of decreasing with scan intervals. Imaging results showed high test-retest reliabilities for absolute CBF in both resting and task-state in gray matter, white matter, and task-related brain regions and brain networks in the day. However, task-induced CBF changes showed poor test-retest reliability across brain regions and networks. Further analyses revealed that white matter showed less fluctuations with time points compared to gray matter. Additionally, the average test-retest reliability of gray matter, task-related brain regions, and most of the brain networks at 20:00 PM were significantly lower compared with other time points for absolute CBF in resting and task-state, and the test-retest reliability showed an overall decreasing trend with the scan intervals. However, task-induced CBF changes did not show consistent patterns with the time points and the scan intervals. This study also has some heuristic significance for the repeatability of functional magnetic resonance, indicating that time of day may be an important factor affecting the reproducibility of functional magnetic resonance, and future magnetic resonance research should try to avoid scanning at night to minimize the effect of time on its reproducibility.

Keywords：circadian rhythmicity, CBF, test-retest reliability, magnetic resonance imaging

从儿童到成年时期神经灵活性的功能分化

黄子懿　尹大志（通讯作者）

华东师范大学心理与认知科学学院，上海，200062, 通讯作者 E-mail（dzyin@psy.ecnu.edu.cn）

摘 要　人类大脑的功能组织可以灵活地重组以适应时刻变化的环境需求，即使在不做任务时也如此。大脑各个功能系统表现出不同程度的神经灵活性（NF），但是我们对 NF 的功能组织是如何发展、又是如何分化的知之甚少。为此，我们将研究 NF 在全脑和功能系统水平上的发展与功能分化以及它们与智商（IQ）的关系，使用 Consortium for Reliability and Reproducibility（CoRR）NYU2 公开数据库 41 名儿童、39 名青少年和 49 名成人的静息态功能磁共振成像数据。我们将大脑分为 200 个皮层脑区和 32 个皮层下脑区，组成 7 个皮层网络和 1 个皮层下网络，借助滑动时间窗技术（窗长 44 秒）建立动态功能连接矩阵，保留每个窗内最强的 3 条连接。我们将 NF 定义为每个脑区的功能连接模式在时间上的复杂性（香农熵）。我们对三组被试的 NF 进行方差分析（ANOVA）和事后检验，并对有显著组间差异的系统建立年龄的线性和二次项回归模型。为研究 NF 的功能分化，我们将功能系统内的分化定义为该系统 NF 分布的香农熵，熵越大，分化程度越高；我们将功能系统间的分化定义为两个系统 NF 分布的生态位重叠（NIO，一项生态学指标），重叠越小表示距离越远，分化程度越高。我们同样对功能分化指标进行 ANOVA、事后检验和回归分析，并对各项指标与 IQ 的关系进行回归分析。结果表明：（1）全脑的 NF 随年龄线性增加（$p = 0.004$），主要由背侧注意网络（DAN）($p < 0.001$)和皮层下网络（SUB）($p < 0.001$)驱动；（2）额顶网络（FPN）NF 分布的熵从儿童到成年初期随年龄线性增加（$p = 0.003$)；（3）功能系统间平均 NIO 随年龄线性降低（$p = 0.03$），SUB-感觉运动网络（SMN）的 NIO 随年龄线性降低（$p < 0.001$)，边缘网络（LIM）-FPN 的 NIO 从儿童到成年初期随年龄非线性地降低（$p = 0.02$）；（4）默认网络（DMN）的 NF 均值与 IQ 呈倒 U 型关系（$p = 0.01$），DMN NF 分布的熵与 IQ 正相关（$p = 0.03$），DMN-FPN 的 NIO 与 IQ 负相关（$p = 0.05$），SMN-DAN 的 NIO 与 IQ 呈倒 U 型关系（$p = 0.02$）。我们的研究表明从儿童到成年时期大脑的灵活性逐步增加，同时出现系统内和系统间的功能分化，并且灵活性和功能分化与 IQ 有关。

Functional differentiation of neural flexibility from childhood to adulthood

Ziyi Huang and Dazhi Yin*
School of Psychology and Cognitive Science, East China Normal University, 200062, Shanghai

Abstract：Functional brain organization can flexibly reconfigure in response to time-varying demands from the environment even at rest. Numerous studies have consistently reported a heterogeneous distribution of neural flexibility (NF) across different functional systems, however, how the functional organization of NF evolves and differentiates during development remains largely unknown. To address this, we investigated the development and differentiation of NF at the whole-brain and system levels and their relationship with IQ, using resting-state functional MRI data of 41 children, 39 adolescents, and 49 adults from publicly available datasets NYU2 in Consortium for Reliability and Reproducibility (CoRR). The brain was divided into 200 cortical and 32 subcortical regions that were grouped into 7 cortical and 1 subcortical networks. Applying the sliding-window technique (window length = 44s), we built dynamic functional connectivity matrices and reserved the strongest 3 connections for each window. NF was quantified as the complexity (Shannon entropy) of the functional connectivity profiles across temporal windows of each region. We conducted an analysis of variance (ANOVA) and then a post-hoc analysis among the three groups, after that we estimated linear and quadratic regression models for age effects. To investigate the functional differentiation of NF during development, we considered the entropy of flexibility distribution of each system as within-system differentiation. The larger entropy, the higher degree of within-system differentiation. We used niche overlap (NIO, a measure from ecological research) of flexibility distributions between two systems to define between-system differentiation. The smaller overlap, the greater distance and the higher degree of differentiation between the two systems. ANOVA, post-hoc, and regression analyses were also conducted on metrics of functional differentiation, and the relationship between IQ and all the metrics was examined using regression analyses. We found that (1) NF of the whole brain linearly increased during development (p = 0.004), mainly driven by dorsal attention network (DAN) (p < 0.001) and subcortical network (SUB) (p < 0.001); (2) the entropy of flexibility distribution of fronto-parietal control network (FPN) showed linear increase from childhood to the early adulthood (p = 0.003); (3) the mean NIO between each two functional systems linearly decreased with age (p = 0.03), NIO between SUB and sensorimotor network (SMN) linearly decreased with age (p < 0.001), and NIO between limbic network (LIM) and FPN nonlinearly decreased from childhood to the early adulthood (p = 0.02); (4) the mean NF of default mode network (DMN) and IQ showed an inverted-U shape relationship (p = 0.01), the entropy of flexibility distribution of DMN was positively correlated with IQ (p = 0.03), NIO between DMN and FPN was negatively correlated with IQ (p = 0.05), and NIO between SMN-DAN and IQ showed an inverted-U shape relationship (p = 0.02). Our study demonstrated that the brain is increasingly flexible from childhood to adulthood, the functional differentiation of neural flexibility occurs at both within- and between-system levels, and flexibility and functional differentiation are associated with IQ.

摘 要　长时字形启动效应指的是加工某个字（启动项）的经验对之后加工其它与其字形相似的字（目标项）所产生的影响。探讨长时字形启动效应的认知机制对于理解语言加工和语言学习之间的交互作用具有重要的理论意义。已有研究在长时字形启动效应的方向上尚未取得一致发现，存在促进效应、抑制效应和没有效应三种截然相反的结果，长时字形启动效应是否稳定存在也因而面临着争议。基于联结主义的理论框架，我们提出：长时字形启动效应可能受到启动词和目标词之间语音一致性的调节，如果这项调节因素得到控制，效应就会稳定出现。本研究以汉字及其声旁作为启动词和目标词，通过三个不同任务的实验，我们发现：命名任务中，启动词和目标词语音一致时，命名启动词会促进后续对目标词的命名，即出现促进的长时字形启动效应；启动词和目标词语音不一致时，则出现抑制的长时字形启动效应。实验结果支持了联结主义的观点。本研究的发现有助于证实长时字形启动效应的可靠性、稳定性及普遍性，并揭示其潜在的机制，同时也为语言加工与语言学习之间的相互作用提出了未来的研究方向。

Abstract：Elucidating the interaction between lexical processing and word learning is essential for a complete understanding of the underlying mechanisms of each of them. Long-term priming for words reflects an interplay between lexical processing and word learning. Although robust long-term priming effects have been found between two occurrences of the same word and between semantically similar words, it remains unclear whether long-term priming between orthographically similar words (i.e., long-term form priming) is a reliable effect. Following the theoretical analysis based on the connectionist framework, we articulated the possibility that long-term form priming might be modulated by the phonological congruency between the prime and target words, and that if this modulator was under control, reliable effects of long-term form priming would emerge. However, this hypothesis has not been adequately tested empirically. The present study tested this hypothesis by using Chinese phonograms and the phonetic radicals embedded in them as the prime and target items. In three experiments that varied in the types of stimuli and testing tasks, we consistently found that when the prime and target had the same phonology, naming the prime facilitated later processing of the target, while when they had different phonologies, the priming effect was inhibitory. These observations were consistent with the connectionist account of long-term priming for words. Our finding helped confirm the reliability, generalizability and robustness of long-term form priming and informed its underlying mechanisms, and suggested promising future directions on

the interactions between lexical processing and word learning.

焦点解决团体辅导对网瘾大学生注意网络的干预—基于 ERPs 的证据

摘 要 探究针对大学生网络成瘾的改善方法具有十分重要的临床价值。本研究以“以现在和未来为导向”的焦点解决短期疗法（Solution-Focused Brief Therapy, SFBT）为理论核心，以团体辅导的形式进行干预，结合行为及脑电技术，探讨：1）在行为层面通过干预改善网络成瘾大学生行为表现和注意网络功能；2）在电生理层面进一步探讨网络成瘾大学生干预后的注意网络神经活动变化。结果发现：1）SFBT 团辅改善网络成瘾分数与执行网络功能，而注意警觉网络和注意定向网络没有明显差异；2）SFBT 团辅干预可以改善个体注意执行网络的神经活动，提高个体将注意资源分配于处理冲突和干扰信息的能力；3）行为表现越差的个体，在完成一致目标时所产生的 P3 波幅越大。本研究从行为和神经生理层面较为全面地探讨焦点解决团体辅导对网络成瘾大学生干预效果，发现焦点解决团体辅导可以有效改善网瘾大学生的网瘾相关症状表现，并且进一步提高注意执行网络功能，丰富了网络成瘾大学生的注意网络神经基础的研究，为网络成瘾的临床干预提供了坚实地理论依据。

自上而下和自下而上控制在新颖性加工中的作用

李芊芊[1] 谷传华[1] 周宗奎[1]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，武汉，430079，zhouzk@ccnu.edu.cn

摘 要 独创性的观点意味着它是新的、不寻常的、新颖的和出乎意料的。研究证明新颖性因素会引起执行系统更多的激活，这个系统负责冲突检测和解决的过程。然而，有关执行控制在新颖性加工中的作用及神经机制的研究较少。为了探究认知控制是否以及如何参与新颖性观点的加工，本研究采用了 AX-CPT 范式，将刺激材料从字母替换为中文短语，并使用脑电技术来考察认知控制的作用。实验采用创造性问题的解决方案作为探针刺激，包括新颖和常见的观点。“X”探针代表指定的某个解决方案，而其他解决方案则作为“Y”探针。对于线索刺激，“A”线索由能够概括创造性问题的短语表示，而“B”线索代表与该问题无关的其他短语。本研究采用被试内设计，新颖和常见条件在不同的 block 之间平衡。反应时和错误率作为行为指标，而线索 P3、N2、探针 P3 和额中线 theta-ERS 作为大脑激活的指标。实验结果表明：相比于常见条件，新颖条件下的反应时更长，错误率更低。无论在新颖还是常见条件下，线索 P3 效应都显著。相比于常见条件，新颖条件下 AY 试次诱发的 N2 波幅更大，而探针 P3 波幅更小。此外，额中线 theta-ERS 的结果也发现了新颖条件下与 AY 试次相关的更大的 theta-ERS。可以得出以下结论：新颖和常见观点的加工都涉及自上而下的控制。与常见观点的加工相比，在加工新颖观点时冲突监测增加，而反应抑制减少。这提高了对新颖观点信息的注意，使其更容易被后续编码和加工。因此，新颖观点加工不仅包含自上而下控制，还涉及自下而上的控制。

The Role of Top-Down and Bottom-Up Control in Novelty Processing

Qianqian Li, Chuanhua Gu, Zongkui Zhou

Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, School of

Psychology, Central China Normal University, Wuhan, 430079

Abstract：An original idea means it is new, unusual, novel and unexpected. Novelty factors have been proven to lead to more activation in the executive system, which is responsible for the process of conflict detection and resolution. However, there is little research on the role and neural mechanisms of executive control in novelty processing. In order to find out whether and how the processing of novel ideas recruits cognitive control, this study employed the AX-CPT paradigm, replacing the stimulus material from letters to Chinese phrases, and using EEG technology to examine the role of cognitive control. In the experiment, probe stimulus were solutions to given creative problems, including novel and common ideas. “X” probes were represented by the specified solutions, while other solutions were served as “Y” probes. For cue stimulus, “A” cues were represented by phrases summarizing creative problems, while “B” cues were other phrases that unrelated to given problems. In a within-subjects design, novel and common conditions are balanced between blocks. The reaction time and error rate are used as behavioral indicators, and cue-P3, N2, probe-P3, and FM-theta-ERS are served as indicators of brain activation. The results showed that compared to the common condition, the reaction time is longer and the error rate is lower in the novel condition. The cue-P3 effect is significant under both novel and common condition. In the novel condition, the N2 amplitude induced by AY trials is larger, while the probe-P3 amplitude is smaller compared to the common condition. Additionally, the results of FM-theta-ERS also revealed a larger theta-ERS related to AY trials in the novel condition. The results indicated that both the processing of novel and common ideas involves top-down control, and compared to processing common ideas, conflict detection increases while response inhibition decreases when processing novel ideas. This enhances attention to the information of novel ideas and makes it easier to be subsequently encoded and processed. Consequently, processing novel ideas not only contains top-down control, but also involves bottom-up control.

Relationship between parental school involvement and its barriers: Based on latent class and correspondence analyses

Abstract：Parental school involvement is critical for students’ academic and educational success. Few studies have explored the relationship between parental school involvement and its barriers with latent class and correspondence analyses, which visually present the relationship between the two variables. In this study, the latent class analysis revealed sub-populations of parental school involvement and its barriers. The correspondence analysis demonstrated the relationship between the classes of both parental school involvement and its barriers. Data were obtained from parents of primary (N = 628) and secondary (N = 679) school students in China. The results showed: (1) six distinct classes of parental school involvement, namely the High Involvement in Child’s Things, All High Involvement, High Initiative Involvement, High Passive Involvement, Medium Involvement, and Low Involvement classes; (2) five classes of barriers to parental school involvement, namely the High Work-Transportation, High Work, Medium Personal, High Transportation, and None Barriers classes; (3) a visual pattern of the relationship between six classes of parental school involvement and five classes of barriers to parental school involvement. Specifically, the High Involvement in Child’s Things, All High Involvement, and High Initiative Involvement classes were closer to the None Barriers class; Medium Involvement was related to

High Work Barriers; Low Involvement to Medium Personal Barriers; and High Passive Involvement to High Transportation Barriers. This study clarifies relationships between the latent classes of parental involvement in school and the latent classes of barriers to involvement, which support the reformulated explanatory model of barriers to parental involvement in education.

多重慢性应激对急性应激反应的累积和性别分化效应:

基于进化视角的启示

刘念琪[1] 陈建文[1]（通讯作者）

1 华中科技大学教育科学研究院心理所，武汉，430074

通讯作者 E-mail：chenjianwen@hust.edu.cn

摘 要 关于不同类型的慢性应激对急性应激源反应的影响的文献很少。本项全国性的横断面调查时间为中国从“清零”政策调整到“新冠放开”政策一周左右，即于 2022 年 12 月 16 日至 22 日进行。在控制人口统计学、社会经济变量和创伤事件经历后，采用多元线性回归模型，分别验证不同类型的慢性压力经历对急性压力源的心理、生理和行为反应的单独及累积效应。感知压力和性别被列为慢性压力与急性压力反应之间的重要影响变量。本研究共纳入 3147 名被试参与分析，其中 77.2%为女性。结果表明，多重慢性压力对急性压力的心理反应（$F = 12.387$, $P < 0.001$，偏$\eta2 = 0.056$）和生理反应（$F = 12.929$, $P < 0.001$, partial $\eta2 = 0.059$）具有累积效应。感知压力部分中介了慢性压力对急性压力反应的影响（间接效应占总效应的 20.54%）。性别调节了情感照顾类慢性压力对急性压力生理反应的影响（$P < 0.05$, 95% CI = 0.008 ~ 0.552）。本研究证实了多重慢性压力对急性压力反应的累积效应，支持了压力源对生物体“磨损”效应的进化观点。性别分化效应表明，在人际关怀的慢性压力下，女性对急性压力的反应比男性更强烈，这从进化的角度支持了性选择理论。

* Email: chenjianwen@hust.edu.cn

***Abstract*：** There is a scarcity of literature on the impact of different types of chronic stress on responses to an acute stressor. The nationwide cross-sectional study was conducted on December 16-22, 2022, around one week after the policy adjustment from “zero-COVID” to “living-with-COVID” in China. After controlling for demographics, socioeconomic variables, and traumatic events experiences, the multiple linear regression models

were used to verify the effects of different types of ongoing chronic stress on the psychological, physiological, and behavioral acute stress responses, with perceived stress and sex considered as influencing factors. A total of 3147 participants, with 77.2% women, were involved in the analyses. The results show that there were cumulative effects of multiple chronic stresses on psychological ($F = 12.387$, $P < 0.001$, partial $\eta2 = 0.056$) and physiological ($F = 12.929$, $P < 0.001$, partial $\eta2 = 0.059$) acute stress responses, with perceived stress served as a mediator between chronic stress and acute stress response (20.54% of indirect effect). There was moderating effect of sex in the effect of chronic sympathetic-caregiving stress on acute physiological stress response ($P < 0.05$, 95% CI = 0.008~0.552). The study verified the cumulative effects of multiple chronic stresses on the responses to acute stressors, supporting the evolutionary view of the "wear and tear" effect of stressors on organisms. The sex-differentiated effect indicates that women respond more strongly to the acute stress under the chronic stress of interpersonal care than men, which sides the sexual selection theory from an evolutionary perspective.

依恋调节情绪冲突加工中的情绪-认知平衡

张孟可[1] 李松[1] 刘欣怡[1] 李晴[1] 陈旭[1,*]

1 西南大学心理学部，重庆，400715

* 西南大学心理学部，重庆，400715，chenxu@swu.edu.cn

摘 要 对情绪冲突进行快速准确的识别并加以控制有助于个体的情绪调节和人际适应，这涉及情绪和认知功能之间的交互。依恋的功能神经解剖模型(NAMA)认为，成人依恋风格的个体差异在调节情感评估和认知控制之间的平衡方面起着关键作用。然而，目前关于依恋风格(人格特质)和依恋情境启动(情境因素)如何调节情绪冲突加工的具体特征尚不清楚。因此，本研究设计了 3 个行为实验来探讨依恋相关的认知-情感模式及其在情绪冲突加工中的表现。实验 1（N = 138）采用情绪性的颜色-词汇 Stroop 任务，结果发现依恋回避与（依恋相关的）积极词汇产生的干扰效应减少有关，表明高依恋回避个体倾向采用认知控制，并抑制对情绪信息的注意偏向，表现出相对较强的抑制控制能力。实验 2（N = 151）通过情绪面孔-词汇 Stroop 任务来评估个体的情绪冲突控制能力。结果显示，依恋焦虑分数正向预测了（依恋相关/无关的）积极词汇产生的干扰效应，表明高依恋焦虑个体在面对积极干扰物时惯用情感评估而非认知控制策略，表现出相对较差的情绪冲突控制能力。另外，实验 3（N = 143）采用了相同的情绪冲突范式并结合回忆书写任务，探究依恋情境启动对个体情绪冲突加工表现的影响，以及依恋风格在其中的调节作用。结果显示，与依恋安全启动和中性控制组相比，依恋威胁启动降低了个体的情绪干扰效应。此外，消极情绪的唤醒在依恋威胁启动和情绪干扰效应之间起到了部分中介的作用。更重要的是，依恋焦虑调节了依恋安全启动与情绪干扰效应之间的关系，即只有在高依恋焦虑组被试中，依恋安全启动才能正向预测情绪干扰效应。这些发现强调了依恋风格与依恋情境启动共同影响个体在情绪冲突加工中的情绪-认知平衡，进而影响其行为表现。综上，本研究认为情绪冲突加工中的情绪-认知平衡可能受到个体的依恋风格、依恋情境启动和二者交互的调节，这进一步拓展了 NAMA，同时也凸显了依恋对社会信息加工的重要性。

Abstract： The effective identification and control of emotional conflict contribute to individuals' emotional regulation and interpersonal adaptation, involving the interaction between emotion and cognition. The functional neuro-anatomical model of human attachment (NAMA) proposed that individual differences in adult attachment styles play a key role in adjusting the balance between affective evaluation and cognitive control. However, little is known about the specific characteristics of emotional conflict processing that are modulated by attachment styles and attachment (in)security priming. Accordingly, the present study adopted three behavioral experiments to investigate attachment-related cognitive-affective patterns in emotional conflict processing. In Experiment 1 (N = 138), an emotional color-word Stroop task was used and it revealed that attachment avoidance was associated with reductions in emotional Stroop interference for (attachment-related) positive words, suggesting that individuals with high attachment avoidance were related to a predominant use of cognitive control and suppression of emotional attentional biases, indicating relatively strong inhibitory control ability. In Experiment 2 (N = 151), participants performed an emotional face-word Stroop task to assess their ability to emotional conflict control. The results showed that attachment anxiety score predicted greater Stroop interference induced by (non/attachment-related) positive words, indicating that individuals with high attachment anxiety habitually use emotional evaluation rather than cognitive control when facing positive distracters, leading to relatively worse performance in emotional conflict control. Furthermore, Experiment 3 (N = 143) employed the same paradigm combining a recall writing task to explore the effects of attachment security or threat priming on emotional conflict processing, as well as the moderating role of attachment styles in this association. The results of experiment 3 revealed that attachment threat priming reduced the emotional interference effect compared to attachment security and neutral control conditions. Furthermore, the arousal of negative emotion played a partial mediating role on the relationship between attachment threat priming and emotional interference effect. Crucially, attachment anxiety moderated the relationship between attachment security priming and emotional interference effect, as attachment security priming could predict individuals' emotional interference effects only in participants with high attachment anxiety. This emphasizes the attachment-related person-situation interaction on emotional-cognitive balance during emotional conflict processing. In summary, these findings have expanded the NAMA and provided corresponding evidence that the emotional-cognitive balance during emotional conflict processing is modulated by attachment styles, attachment (in)security priming, and their interaction, which highlights the contribution of attachment to social information processing.

5-8 岁儿童对领导者权利和责任的认知

王千[1]　陈逸菲[1]　李燕芳[1]（通讯作者）
1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875,liyanfang@bnu.edu.cn

摘 要　领导-成员等级关系是社会等级关系中的一种重要形式，在我们的社会生活中无处不在。儿童和成人是如何认知领导者的呢？儿童和成人是将领导者认知为享有更多权利的个体还是承担更多责任的个体呢？为了回答这一问题，该研究设计了一个涉及资源分配和劳动贡献情境的群体合作情境。实验 1 发现，在资源分配情境中，5-8 岁的儿童和成人期望领导者（与组员相比）会获得更多的奖励；而在劳动贡献情境中，儿童和成人期望领导者（与组员相比）更多的劳动任务。这些发现表明，与组员相比，儿童和成人将领导者视为要承担更多责任同时也享有更多权利的个体。实验 2 进一步考察了“被选为领导者”和“拥有决策权”这两个领导者的关键特征在儿童和成人权利和责任归因中所起的作用。结果表明，“被选为领导者”在儿童和成人权利和责任的归因中起到了重要作用。决策权仅在 7-8 岁儿童对权利的归因，以及成人对责任和权利的归因中发挥了作用。

Children and Adults Hold Leaders as Both Responsible and Entitled

Wang Qian[1]　Chen Yifei[1]　Li Yanfang[1]
Collaborative Innovation Center of Assessment for Basic Education Quality Beijing Normal University, Beijing, 100875

Abstract：Leadership hierarchies are one of forms of social hierarchical relations, which are ubiquitous in our social lives. Little is known about how children perceive the leadership hierarchies with age within a Chinese cultural context. To address this question, we designed a group cooperation scenario involving a resources allocation situation and a labor contribution situation. Experiment 1 revealed that in resource allocation situation, 5- to 8-year-olds and adults expected leaders to take more resources from a joint pool than nonleaders; while, in labor contribution situation, children and adults expected leaders to undertake the additional tasks than nonleaders. These results provide evidence that children and adults construe leaders both as more responsible and entitled individuals, relative to nonleaders. In experiment 2, we further investigated how much being elected as a leader and having decision power- two key features of leaders manipulated in Experiment 1 - contributed to children’s and adults’ attribution of increased responsibility and entitlement. Results suggested that election as a leader played a robust role in both children’s and adults’ attribution of increased entitlement and responsibility. Meanwhile, decision power also plays a role in 7- to 8-year-olds’ attribution of increased entitlement and in adults’ increased attribution of responsibility and entitlement.

摘 要　家庭是青少年发展的核心社会化背景。在家庭中遇到的各种风险，如低社会经济地位、亲子分离、家庭冲突、无效教养等，均会严重威胁青少年心理健康发展。然而，并不是所有暴露在家庭风险下的青少年都会出现不适应的情况，保护因素以削弱原有风险破坏力，从而对处境不利的青少年提供补偿/保护机会。本研究考察了保护因素（心理韧性和学校联结）在家庭风险（社会经济风险、家庭关系风险、父母教养风险）与青少年抑郁纵向关系中的补偿与保护作用，以及保护因素的补偿与保护作用是否在城市和农村背景下有差异。经过为期一年追踪调查，本研究共计追踪到1270名中学生及其他们的父母，其中城市地区有789名中学生(M_{age}=15.35岁，SD=0.49)，男生占比48.5%；农村地区共计481名中学生(M_{age}=15.82岁，SD=1.18)，男生占比40.0%。在T1阶段，通过青少年和父母的自我报告获取了社会经济风险、养育风险和家庭关系风险，以及青少年报告T1阶段的抑郁和心理韧性水平。在T2阶段，青少年报告了T2抑郁水平和学校联结状况。结果发现：(1)城市地区父母教养风险、农村地区家庭关系风险能正向预测T2青少年抑郁；(2)心理韧性与学校联结对城市与农村地区T2青少年抑郁均显著负向预测，起到补偿作用；(3)在城市地区中，心理韧性在社会经济风险与抑郁关系中起保护-增进作用，学校联结在社会经济风险与抑郁的关系中起着保护-反应作用、在家庭关系风险与抑郁中起着保护-恒定作用。在农村地区中，心理韧性在父母教养风险与抑郁关系中起着保护-恒定作用；(4)心理韧性与学校联结在农村地区社会经济风险与抑郁关系中起着三重交互作用，即社会经济风险对低心理韧性青少年抑郁的正向预测在高学校联结中消失。研究结果为理解不同地区风险因素与保护因素如何交互影响青少年发展提供更深入的证据。

The Association Between Family Risk and Adolescent Depression: The Compensatory and Protective Roles of Psychological Resilience and School Connectedness

Xia Yanyu[1], Chen Xiaopeng[1], Li Dan[1](corresponding author)
(1.Department of Psychology, Shanghai Normal University, Shanghai, 200234)

***Abstract*:** Family is the central socialization context for adolescent development. Family risks, such as low family socioeconomic status, parent-child separation, family conflict, and ineffective parenting, have been found to threaten adolescent mental health development. Nonetheless, not all adolescents exposed to family risks experience maladjustment. Protective factors can provide compensatory/protective opportunities for disadvantaged adolescents by reducing the destructive power of the risks that are already present. The present study examined the compensatory and protective effects of psychological resilience and school connectedness in the longitudinal associations between multiple family risks (ie., socio-economic risk, family relationship risk, parenting risk) and depression in Chinese adolescents, and whether the moderating roles differed between rural and urban contexts. A total of 1,270 adolescents and their parents were followed up for one year in this study (789 from urban areas, M_{age}=15.35 years, 48.5% were male; 481 from rural areas, M_{age}=15.82 years, 40.0% were male). At T1, adolescents and parents self-reported family risks including socio-economic risk, parenting risk, and family relationship risk, while adolescents also reported their levels of depression and psychological resilience. At T2, only adolescent depression levels and school connectedness were reported. Results showed that (1) T1 urban parenting risk and rural family relationship risk positively predicted T2 depression, respectively. (2) Psychological resilience and school connectedness both negatively predicted T2 depression in both regions, suggesting a compensatory role; (3) For adolescents in the urban area, psychological resilience played a protective-enhancing role in the association between socio-economic risk and depression. School connectedness played a

protective-reactive role in the association between socio-economic risk and depression and a protective-stabilizing role in the association between family relationship risk and depression. For adolescents in the rural area, psychological resilience showed a protective-stabilizing role in the relationship between parenting risk and depression. (4) There was a significant three-way interaction between psychological resilience, school connectedness and socio-economic risk in predicting youth depression in rural over time, suggesting that the positive prediction of socio-economic risk on depression among adolescents with low psychological resilience would disappear at high school connectedness. The findings provide for a greater understanding of how family risk and protective factors interact across regions to influence adolescent development.
Keywords：adolescents, family risk, depression, psychological resilience, school connectedness

大学生问题性网络使用与抑郁之间的独特关系：一项交叉滞后网络分析

贾继超[1]　童薇[2]　方晓义[1]（通讯作者）　王芳宇[1]　冉恒月[3]　郭雨馨[1]

摘 要　问题性网络使用和抑郁是大学生中常见的两种心理病理学问题，常常伴随发生。然而，这两种心理病理学问题之间的路径关系尚存争议：去分化假说认为，问题性网络使用是抑郁的预测因子；而自我医药假说则认为抑郁是问题性网络使用的影响因素。相关的实证结果也并不一致。为解决这一问题，本研究拟采用网络视角在更精细的症状层面上估计问题性网络使用与抑郁之间的横断关系、纵向关系及纵向关系的变化。对 2420 名大学生（基线时平均年龄 = 18.35 岁，*SD* = 0.84；女生占 67%）为被试进行四次追踪，收集大学生从大一到大四每学年的问题性网络使用的症状（即*耐受症状*、*强迫性使用*、*戒断症状*、*人际和身体问题*和*时间管理问题*）和抑郁的症状（即*能量缺失*、*食欲下降*、*不恰当的负罪感*、*抑郁情绪*、*兴趣下降*、*睡眠障碍*、*精神激越*、*自杀意念*和*注意力不集中或犹豫不决*），构建四个横断网络和三个交叉滞后网络。总体而言，大一至大四的四个横断网络结果一致显示，*人际和身体问题*是连接问题性网络使用和抑郁的重要桥节点。此外，交叉滞后网络的结果显示，几乎所有的桥边线都是从问题性网络使用出发指向抑郁，支持了去分化假说。进一步分析交叉滞后网络中的桥节点发现，在 T1→T2 网络和 T2→T3 的网络中，*时间管理问题*是最具影响力的桥节点，它最能够预测下一时点的抑郁症状。而在 T3→T4 网络中，*耐受症状*是最具影响力的桥节点，它最能激活 T4 网络中的抑郁症状。整体而言，这些发现刻画了大学生问题性网络使用和抑郁在同时期的共病关系、纵向关系以及纵向关系的变化，揭示了在大学的不同阶段，连接问题性网络使用和抑郁的整体网络的中心症状，为发展和制定大学生心理健康干预方案提供了理论指导。

Unique Relationships Between Problematic Internet Use and Depression Across the College Years: A Cross-Lagged Panel Network Analysis

Jichao Jia[1] Wei Tong[2] Xiaoyi Fang[1] Fangyu Wang[1] Hengyue Ran[3] Yuxin Guo[1]

1 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875
2 Department of Psychology, Shanghai Normal University, Shanghai, 100875
3 Department of Psychology and Behavioral Sciences, Zhejiang University, Zhejiang, 310058

Abstract： Problematic internet use (PIU) and depression are common among college students and usually co-occur. However, models on the pathway to relationship between PIU and depression dispute greatly. The deindividuated hypothesis assumed that PIU are predictor of depression, while self-mediated hypothesis assumed depression are case of PIU. Existing empirical literature often treating the PIU and depression as two latent variables also yielded mixed results. To clarify the dynamic relationship between PIU and depression, the present study adopted the network perspective to estimate the contemporaneous co-occurring relationship and the directionality of the temporal relationships between them among college students on a more fine-grained level. A total of 2,420 college students (*M* age= 18.35, *SD* = 0.84; 68% girls) completed the four annual times of survey. PIU (i.e., *tolerance symptoms*, *compulsive use*, *withdrawal symptoms*, *interpersonal and physical problems* and *time management problems*) and depression (i.e., *loss of energy*, *decrease appetite*, *inappropriate guilt*, *depressed mood*, *diminished interest*, *sleep disturbance*, *psychomotor agitation*, *suicidal ideation* and *inattention or indecisiveness*) were measured at T1 to T4. Four contemporaneous networks and three cross-lagged panel networks were examined. Overall, the results of contemporaneous networks across T1 to T4 consistently indicated that the *Interpersonal and Physical Problems* is the influential bridging nodes connect PIU and depression. In addition, the results of cross-lagged panel networks supported the deindividuated hypothesis, as almost all bridge edges in these networks were directed from PIU to depression, not the other way around. Among the PIU nodes, *Time Management Problems* was the most contagious nodes connect depression symptoms at next time in both T1 → T2 network and T2 → T3 networks. *Tolerance Symptoms* was the most contagious nodes connect depression symptoms at T4 in T3 → T4 network. These findings demonstrate the contemporaneous comorbidity, the directionality of temporal relationships, and the changes of the temporal relationships between PIU and depression symptoms across colleges students, and revealed the potential influencers in different stage of college.

Keywords： problematic internet use, depression, cross-lagged panel network analysis, college students

依恋关系在代际共育家庭中女性抚养者自我控制与幼儿自我控制之间的中介作用：主客体互倚性分析

崔秀敏[1] 蔺秀云[2]（通讯作者）

1 北京师范大学未来教育学院，珠海，519087

2 北京师范大学发展心理研究院，北京，100875，linxy@bnu.edu.cn

摘 要　随着社会节奏的加快，祖辈-父辈共同养育第三代的育儿模式已成为当今我国社会的普遍抚养模式。然而，幼儿在祖辈和父辈抚养者面前的自我控制能力却不尽相同。研究表明，幼儿的自我控制能力对其今后的身心发展、入学准备、人际关系、社会能力及创造力等方面影响重大。本研究采用幼儿依恋量表、3-5 岁儿童自我控制父母版问卷、家长自我控制量表简版对深圳市 495 名平均年龄为 4.40 岁的幼儿的祖母与母亲进行施测，旨在探讨祖辈-父辈共同养育的三代家庭中，女性抚养者的自我控制与学龄前儿童的自我控制之间的关系，以及祖孙依恋、亲子依恋在其中的中介作用。结果发现：（1）母亲的自我控制可以通过祖孙依恋、亲子依恋而间接影响幼儿的自我控制，与此同时，祖母的自我控制也可以通过祖孙依恋、亲子依恋而间接影响幼儿的自我控制。（2）母亲和祖母的自我控制与亲子依恋、祖孙依恋存在显著的主效应和客体效应。（3）亲子依恋、祖孙依恋均对幼儿的自我控制有影响，祖孙依恋到祖母评价幼儿自我控制的效果显著高于亲子依恋到母亲评价幼儿自我控制的效果。通过将自我调节的代际传递模型和自我控制理论拓展到三代家庭，本研究揭示了母亲和祖母共育家庭中自我控制代际传递的机制以及母亲和祖母对幼儿的影响方式的差异，强调了将家庭视为相互依存的动态系统以及将代际照顾者之间的互动纳入儿童发展研究的重要性，可以为幼儿自我控制能力的提升与干预方案提供依据，针对性的为三代家庭提供帮助。

The associations between maternal caregivers' self-control, attachment and preschool children's self-control in Chinese urban three-generation families: Test of actor, partner, and mediating effects

Xiumin Cui[1], Xiuyun Lin[2 *]

1 College of Education for the Future, Beijing Normal University at Zhuhai, Zhuhai 519087, China

2 Institute of Developmental Psychology, School of Psychology, Beijing Normal University, Beijing 100875, China

Abstract：In China, mother-grandmother co-parenting has emerged as one of the predominant parenting styles. Surprisingly, less is known about the impacts of dynamic interaction among subsystems on children in three-generation households. The current study examined how maternal caregivers' self-control specifically correlates with preschoolers' self-control and how caregiver-child attachment functions as a mediator in a mother-grandmother dyadic situation. A final sample of 495 mother-grandmother dyads in Southern China was recruited in this study. Mothers and grandmothers completed measures assessing caregivers' self-control, caregiver-child attachment, children's self-control and sociodemographic characteristics. The findings showed that both mothers' and grandmothers' self-control were indirectly linked to the child's self-control via the child's attachment to them and to their co-parents, implying that caregiver-child attachment played a major role in the intergenerational transfer of maternal caregivers' self-control. Significant actor and partner effects were obtained between mothers' and grandmothers' self-control and their kids' attachment to them. Additionally, the relationship

between grandmother-child attachment and the grandmother's report of child self-control was stronger than that between mother-child attachment and the mother's report of child self-control. By extending the intergenerational transmission model of self-regulation and self-control theory to three-generation families, the present results illustrated the mechanism of intergenerational transmission of self-control in mother-grandmother co-parenting families and the differences in influence modes of mothers and grandmothers on children. Further, the novel findings uncovered in this paper emphasize the importance of considering the family as an interdependent dynamic system and including dyadic interactions between intergenerational caregivers in studies of preschool children's development in three-generation households.

心理时间旅行中的积极偏向：基于个体与集体时间自我评价的证据

皮瑜[1]　张锋[2]（通讯作者）

1 山东师范大学心理学院，济南，250014

2 河南大学心理与行为研究所，开封，475004，通讯作者邮箱：zgfzhang@163.com

摘 要　心理时间旅行是指个体主观地将自我定位到曾经经历过的事件来重新体验自己的过去(情景记忆)，或者将自我定位到未来的某个事件预先体验自己的未来(情景预见)。时间自我评价是个体对过去、现在、未来的自我的诸多特性的认知和评价。本研究通过两个系列实验探讨了大学生的个体时间自我评价和集体时间自我评价。实验一 (N = 30) 采用基于社会比较的个体时间自我评价任务，实验二 (N = 23) 采用基于社会比较的个体时间自我评价任务，每个任务包括 3 个 block (过去、现在和未来)，每个 block 有两个阶段：首先启动被试的个体时间自我/集体时间自我，要求被试在两分钟之内描述五年前/现在/五年后的自己/中国人；然后进行词汇判断任务，让被试用积极和消极的人格形容词来评价过去、现在和未来的自己和他人/中国人和美国人。研究结果发现：(1) 实验一的被试均采用更多积极词、更少消极词来评价过去、现在和未来的个体自我，且个体自我评价在过去、现在和未来维度上存在积极递增效应。(2) 实验二的被试均采用更多积极词、更少消极词来评价过去、现在和未来的集体自我。这些结果表明，中国大学生的个体自我评价和集体自我评价均存在积极偏向，并具有跨时间的一致性。

Positive Bias in Mental Time Travel: Evidence from Individual and Collective Time Self-evaluation

Pi Yu[1], Zhang Feng[2] (Corresponding Author)

1 School of Psychology, Shandong Normal University, Jinan 250014

2 Department of Psychology and Institute of Psychology and Behavior, Henan University, Kaifeng 475004, Email: zgfzhang@163.com

Abstract： Mental time travel refers to individuals subjectively re-experiencing their past by orienting the self to a past event (situational memory) or pre-experiencing their future by orienting the self to a future event (situational foresight). Temporal self-evaluation is the individual's perception and evaluation of the many characteristics of the past, present, and future selves. The present study aimed to investigate individual and collective time self-evaluations of university students through two series of experiments. Experiment 1 (N=30) used a social

comparison-based individual temporal self-evaluation task, and Experiment 2 (N=23) used a social comparison-based collective temporal self- evaluation task. Each task consisted of 3 blocks (past, present and future) with two phases per block: Participants' temporal selves were initiated by asking them to describe themselves/Chinese past/present/future within two minutes; then an adjective judgment task was conducted to explore individual temporal self-evaluation/collective temporal self-evaluation by asking them to evaluate themselves and others /Chinese and Americans' past, present, and future using positive and negative adjectives. The results showed that: (1) Participants in Experiment 1 all used more positive adjectives and fewer negative adjectives to evaluate the past, present, and future of their individual selves, and there was a positive incremental effect of individual self-evaluation on the past, present, and future dimensions. (2) Participants in Experiment 2 all used more positive adjectives and fewer negative adjectives to evaluate their collective selves in the past, present, and future. In conclusion, the results of the present study demonstrated that individual and collective self-evaluations were positively biased in the past, present, and future.

Keywords： individual temporal self-evaluation, collective temporal self-evaluation, temporal self-reference paradigm, positive bias

高依恋焦虑者会轻信他人吗?——来自行为与 ERP 的证据

鲍秀琴 张孟可 陈旭（通讯作者）
西南大学心理学部，重庆，400715
通讯作者 E-mail: chenxu@swu.edu.cn

摘 要 人际信任被称为社会发展的粘合剂，是指在人际交往中个体基于对他人的积极期待而甘愿将自己置于弱势地位的倾向。信任是个体对他人可信特征的认知思考与双方关系情感考量的混合体。个体是否信任某对象受其可信度与双方关系亲近度的影响。适当的信任有助于个体的社会化，不信任或轻信（脱离对方可信度而依赖与其关系亲近度所表现出的信任）他人均不利于个体的社会化乃至社会的和谐。依恋的神经整合模型认为信息加工依托的认知控制与情感评估系统的动态平衡状态受个体依恋风格的调节，高依恋焦虑者（高 AX）较高的亲近需求导致其依赖情感评估系统处理社会信息。对情感评估系统的依赖致使认知控制功能的妥协会让高依恋焦虑者的行为失调。在面对不同可信度与关系亲近度对象时，其是否会轻信高亲近者呢？然而，当前对依恋焦虑者人际信任的研究主要是在特质视角下开展，忽视了信任客体——对象特征的影响，导致目前尚不清楚依恋焦虑者的人际信任特征。本研究借助 ERP 技术记录 60 名被试在 2（依恋风格：高、低依恋焦虑者）×2（对象可信度：高、低可信度）×2（关系亲近度：朋友与陌生人）的混合设计中完成掷硬币任务（以个体相信对象关于硬币朝向的陈述作为其信任指标）时的脑电成分，以探究对象可信度与关系亲近度对依恋焦虑者人际信任决策的影响及决策时的时程特征，从而揭示其人际信任特征。行为结果表明，高 AX 不论对象可信度的高低，对朋友的信任高于陌生人；低依恋焦虑者（低 AX）在面对低可信对象时更信任朋友，面对高可信对象时其信任不存在关系亲疏远近的差异。电生理学结果显示，低可信对象诱发高 AX 较大的 P1（100-150ms），高可信陌生人比高可信朋友诱发其较短的 P2（150-230ms）潜伏期与更负的 N2（280-360ms），高低可信条件下朋友均比陌生人诱发其更正的 LPP（500-600ms），但对象诱发的晚期（700-800ms）LPP 波无差异；低可信陌生人比低可信朋友诱发低 AX 较短的 P2 潜伏期与更负的 N2，高可信朋友比低可信朋友与高可信陌生人诱发其更大的 LPP；PCA 分析发现，高低可信条件下朋友均诱发高低 AX 比陌生人更正的 LPP（454ms）。该研究说明，高 AX 会轻信高亲近者，对他们有着积极的期待，其信任决策过度依赖双方关系亲近度而忽视可信度特征，认知控制功能的妥协使得其不能有效地分辨对象间的差异且对他们有着稳定的情感价值投入。本研究拓展了依恋的神经整合模型在人际交往领域的应用，同时也进一步深化对依恋焦虑者人际信任对象特征依赖性的认识与理解。

Are individuals with high attachment anxiety credulous others?

Evidence from a behavioral and ERPs study

Bao Xiuqin, Zhang mengke, Chen Xu
Faculty of Psychology, Southwest University, Chongqing, 400715
Corresponding author E-mail: chenxu@swu.edu.cn

Abstract: Interpersonal trust is known as the adhesive of social development, which refers to the tendency of individuals in interpersonal communication to willingly place themselves in a disadvantaged position based on positive expectations of others. Trust is a blend of individuals' cognitive thinking about the trustworthy characteristics of others and their emotional consideration of the relationship between the two parties. Whether an individual trusts someone is influenced by both the perceived trustworthiness of the person and the closeness of the relationship between them. Appropriate trust is beneficial to an individual's socialization, while distrust or credulity trust (trust solely based on relationship closeness rather than the perceived trustworthiness of the other party) towards others is detrimental to both an individual's socialization and social harmony. The integrative neural model of attachment proposes that the dynamic balance between cognitive control and affective evaluation systems, which underlies information processing, is modulated by an individual's attachment style. High attachment anxiety individuals (high AX) with greater need for closeness rely more heavily on their affective evaluation system to process social information. The reliance on affective evaluation system at the expense of cognitive control functions can lead to behavioral dysregulation in individuals with high attachment anxiety. When faced with individuals of varying trustworthiness and relationship closeness, would they be more prone to indiscriminately trust those who are closer to them? However, previous research on interpersonal trust among attachment anxious individuals has primarily been conducted from a trait perspective, neglecting the influence of partners' characteristics, resulting in unclear interpersonal trust characteristics of attachment anxious individuals. This study employed ERP (event-related potential) technology to record the EEG components of 60 participants in a 2 (attachment style: high and low attachment anxiety) x 2 (trustworthiness of the partner: high and low trustworthiness) x 2 (relationship closeness: friends and strangers) mixed design during a coin-tossing task. The task involved using the individual's belief in the partner's statements about the coin's orientation as a measure of their trust. The aim was to investigate the influence of partner trustworthiness and relationship closeness on interpersonal trust decision-making in individuals with attachment anxiety, as well as the temporal characteristics of the decision-making process, in order to reveal their interpersonal trust characteristics. The behavioral results indicated that high AX individuals, regardless of the trustworthiness of the partner, exhibited higher levels of trust towards friends compared to strangers. On the other hand, low attachment anxiety individuals (low AX) showed greater trust towards friends when facing low trustworthy partners, while there were no differences in their trust levels based on relationship closeness when facing high trustworthy partners. The electrophysiological results revealed that low trustworthy partners elicited greater P1 (100-150ms) in high AX individuals. High trustworthy strangers elicited shorter P2 (150-230ms) latency and more negative N2 (280-360ms) compared to high trustworthy friends. Friends, under both high and low trustworthy conditions, elicited more positive late positive potential (LPP) in the range of 500-600ms compared to strangers. However, there were no differences in the LPP wave between partners during the late stage (700-800ms). Low trustworthy strangers elicited shorter P2 latency and more negative N2 in low AX individuals compared to low trustworthy friends. High trustworthy friends elicited larger LPP compared to both low trustworthy friends and high trustworthy strangers in low AX individuals.

PCA analysis revealed that friends, under both high and low trustworthy conditions, elicited more positive LPP (454ms) in low and high AX individuals compared to strangers. This study demonstrates that individuals with high attachment anxiety (high AX) are credulous closer others and have positive expectations towards them. Their trust decision-making excessively relies on relationship closeness while disregarding the trustworthiness characteristics. The compromise in cognitive control functions hinders their ability to effectively distinguish between different partners and results in unstable motivational value investment in them. This study extends the application of the neural integration model of attachment in the field of interpersonal relationships, and further deepens the understanding of the reliance of interpersonal trust partner characteristics in attachment anxiety individuals.

假新闻，真危害：负面假新闻对社会判断的影响及其机制

徐旋[1, 2] 高崚峰[3] 陈倩[1, 2] 周宗奎[1, 2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院，武汉，430079

3 浙江师范大学心理与脑科学研究院，浙江，310012

通讯作者 zhouzk@ccnu.edu.cn（周宗奎）

摘 要 在数字时代中，真假混杂的新闻塑造着个人的观点和态度。由于负性信息偏向的存在，大量负面假新闻借助社交媒体广泛传播，并误导读者。近年来，负面假新闻在卫生事件、社会舆论、国际关系等领域表现出巨大破坏力，引发了公众担忧。研究者已开始关注于负面假新闻的辨别力影响因素和干预措施，但目前少有研究考察负面假新闻的影响后效。以往研究显示，即使个体知道某信息是不可靠的，仍会降低对信息涉及人物的社会判断。故本研究基于评价性条件作用和双系统理论，设计两项实验以考察负面假新闻对社会判断的影响，并揭示认知负荷和社交媒体指标（转发量）在该过程中的作用。本研究将标准化新闻标题与中性面孔配对形成新闻材料，邀请被试在阅读后对面孔进行信任度和喜爱度的 9 点评价。实验一采用 2(新闻真实性:真实/虚假)×3(测试时间:前测/后测/一天后)的被试内设计,54 名被试在阅读 6 条负面真新闻和 6 条负面假新闻后,对新闻涉及面孔进行喜爱度和信任度评价。线性混合模型的结果显示，与负面真新闻相似，负面假新闻显著降低了个体对新闻涉及面孔的信任度。实验二采用 2(认知负荷:高/低)×2(转发量:高/低)的混合实验设计,77 名被试被随机分到高认知负荷组和低认知负荷组,阅读 12 条转发量高低各半的负面假新闻后，对面孔进行喜爱度和信任度评价。线性混合模型的结果显示，高认知负荷和社交媒体指标显著增加了负面假新闻对社会判断的影响。综上所述,负面假新闻能显著降低个体对涉及人物的社会判断,并且认知负荷和社交媒体指标在其中发挥着“雪上加霜”的加剧作用。这表明，即使负面新闻被标注为虚假，其仍然产生有害影响。为降低负面假新闻的危害，降低阅读者的认知负荷和重视社交媒体指标的作用可能是有效策略。

关键词 假新闻，社会判断，认知负荷，社交媒体指标

Fake news, real harm: the impact and mechanisms of negative fake news on social judgement

Xuan Xu[1, 2] Ling-feng Gao[3], Qian Chen[1, 2], Zong-kui Zhou[1, 2,*]

1 Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan, China
2 School of Psychology, Central China Normal University, Wuhan, China
3 Institute of Psychological and Brain Sciences, Zhejiang Normal University, Jinhua, China
* Corresponding author: zhouzk@mail.ccnu.edu.cn (Zong-kui Zhou).

Abstract: In the digital age, the mixture of true and false news shapes individuals' viewpoints and attitudes. Due to the presence of negativity bias, a large number of negative fake news articles spread widely through social media, misleading readers. In recent years, negative fake news has demonstrated significant destructive power in various fields such as public health events, social discourse, and international relations, leading to public concerns. Researchers have begun to focus on the factors influencing the discernment of negative fake news and intervention measures, but there is currently limited research on the consequences of the influence of negative fake news. Previous studies have shown that even when individuals know that certain information is unreliable, it still reduces their social judgments of the individuals involved in the information. Therefore, based on the evaluative conditioning and dual-system theory, this study designed two experiments to investigate the impact of negative fake news on social judgments and to reveal the roles of cognitive load and social media metrics (such as sharing) in this process. The study created news materials by pairing standardized news headlines with neutral faces, and participants were invited to rate the trustworthiness and likability of the faces on a 9-point scale after reading the materials. Experiment 1 used a within-subject design with a 2 (News Authenticity: Real/Fake) × 3 (Testing Time: Pretest/Posttest/One Day Later) structure. A total of 54 participants read six negative real news and six negative fake news articles, and evaluated the likability and trustworthiness of the faces involved in the news. The results of the linear mixed model showed that, similar to negative real news, negative fake news significantly reduced individuals' trust in the faces involved. Experiment 2 employed a mixed design with a 2 (Cognitive Load: High/Low) × 2 (Social Media Metrics: High/Low) structure. A total of 77 participants were randomly assigned to the high cognitive load group or the low cognitive load group. They read 12 negative fake news articles with an equal number of high and low social media metrics, and evaluated the likability and trustworthiness of the faces. The results of the linear mixed model showed that high cognitive load and high social media metrics significantly increased the impact of negative fake news on social judgments. In conclusion, negative fake news significantly reduces individuals' social judgments of the individuals involved, and cognitive load and social media metrics exacerbate this effect. This suggests that even when negative news is labeled as fake, it still has harmful effects. To mitigate the harm of negative fake news, reducing readers' cognitive load and emphasizing the role of social media metrics may be effective strategies.

北京师范大学 中国基础教育质量监测协同创新中心，北京，100875，yyzhangff@bnu.edu.cn

摘 要　非自杀性自伤是世界范围内青少年面临的公共健康问题，在我国也呈现高发态势（青少年群体发生率在22%左右）。自伤不仅导致青少年身体组织受损，也使其面临抑郁、焦虑，甚至自杀的风险。鉴于

自伤在青少年群体中的高发性及其后果的严重性，更有针对性地探讨其产生机制具有重要意义。结合生态系统理论和自伤的人际理论来看，家庭系统带来的远端压力（童年期虐待与忽视）和同伴系统带来的近端压力（受欺凌）是青少年产生自伤行为的重要风险因素，但两者共同影响青少年自伤的作用模式（累积风险模型 VS.匹配/不匹配模型）尚未可知。此外，由于学生在学校中自伤的现象越来越频繁，以往的研究一直强调学校自伤干预的重要性，但是缺乏学校环境因素对青少年自伤影响和作用机制的探讨。本研究通过问卷调查，选取 1775 名初中生（平均年龄 14.22±1.04 岁，男生 914 名）为被试，考察了童年期逆境、受欺凌对青少年非自杀性自伤的交互影响模式以及感知学校安全的调节作用和性别差异。结果发现：（1）童年期逆境和受欺凌对青少年非自杀性自伤的影响遵循累积风险模型，童年期逆境水平越高的青少年在经历受欺凌后更容易自伤；（2）感知学校安全在累积影响机制中发挥调节作用。具体而言，感知学校安全水平越高，童年期逆境和受欺凌对自伤的累积作用越强，而感知学校安全水平越低，童年期逆境和受欺凌对自伤的累积作用越弱甚至消失，体现了“健康环境悖论”；（3）影响模式存在显著的性别差异。就女生而言，仅受欺凌和忽视对自伤的交互影响均遵循累积风险模型；就男生而言，受欺凌和虐待对自伤的交互影响遵循累积风险模型，而受欺凌和忽视对自伤的交互影响受到感知学校安全水平的增强。本研究通过检验累积风险模型和匹配/不匹配模型两种竞争性假设，揭示了家庭系统远端压力和同伴系统近端压力对自伤的累积风险效应，并发现了学校安全氛围下青少年自伤发生的“健康环境悖论”，为后续开展具有针对性的学校自伤干预工作提供了实证支持。

How Childhood Adversity and Victimization Interact to Influence Adolescent Non-Suicidal Self-Injury: The Moderating Role of Perceived School Safety and Sex Difference

Yang Yang　Wang Chenxu　Zhang Libin　Zhang Yunyun

Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, No.19 Xin Jie Kou Wai Street, Hai Dian District, Beijing 100875

***Abstract*:** Non-suicidal self-injury (NSSI) is a public health problem for adolescents worldwide, and is also showing a high prevalence in China (the incidence among adolescence is around 22%). NSSI not only leads to damage to body tissues, but also puts adolescents at risk for depression, anxiety, and even suicide. Given the high prevalence of NSSI among adolescents and the seriousness of its consequences, it is important to explore the mechanisms in a more focused manner. In conjunction with the ecosystem theory and the interpersonal theory of NSSI, both distal pressures from the family system (childhood abuse and neglect) and proximal pressures from the peer system (victimization) are important risk factors for adolescents to engage in NSSI, but the mode of action in which the two work together to influence adolescents' NSSI (cumulative risk model vs. match/mismatch model) is not yet known. In addition, because adolescents are injuring themselves more frequently in schools, previous research has emphasized the importance of self-injury interventions in schools, but there is a lack of exploration of the impact and mechanisms of school environmental factors on adolescent's NSSI. In this study, 1775 middle school students (M_{age} = 14.22 ± 1.04 years, 914 boys) completed the questionnaire to examine the pattern of interaction effects of childhood adversity and victimization on adolescents' NSSI, as well as the moderating effects of perceived school safety and gender differences. The results found that (1) the effects of childhood adversity and victimization on adolescents' NSSI followed a cumulative risk model, which means that adolescents with higher levels of childhood adversity more likely to engage in NSSI after experiencing bullying; (2) perceived school

safety played a moderating role in the cumulative impact mechanism. Specifically, the higher the level of perceived school safety, the stronger the cumulative effect of childhood adversity and victimization on NSSI, while the lower the level of perceived school safety, the weaker or even absent the cumulative effect, reflecting the 'healthy context paradox'; (3) there were significant gender differences in the pattern of effects. For girls, the cumulative effect of childhood and neglect and victimization on NSSI followed a cumulative risk model; for boys, the interaction effects of victimization and childhood abuse on self-injury followed a cumulative risk model, while the interaction effects of victimization and childhood neglect on NSSI were enhanced by the level of perceived school safety. By testing two competing hypotheses (the cumulative risk model and the match/mismatch model), this study revealed the cumulative risk effects of distal family system pressure and proximal peer system pressure on NSSI, and identified the 'health environment paradox' of NSSI among adolescents in a safe school environment, providing empirical support for school self-injury interventions.

2 中国科学院心理研究所，北京，100101

通讯作者：严超，cyan@psy.ecnu.edu.cn

摘 要　快感缺失是多种精神障碍共有的核心症状之一，愉悦情绪加工异常是其背后的病理心理机制。然而，愉悦情绪加工是一个多维结构，包含期待与即时性愉悦情绪。为理解不同情绪反应在精神分裂症谱系与抑郁症谱系障碍的共同和独特机制，从跨诊断和跨谱系的视角，基于网络分析的方法可以更深入探究奖赏期待与获取阶段的情绪反应之间的关系和相互作用，将有助于揭示不同精神障碍背后的情绪加工异常的本质。本研究共纳入 821 名被试，包括 175 名被诊断为精神分裂症(n = 115)或重性抑郁障碍(n = 60)的临床患者，83 名分裂型人格特质和 110 名亚临床抑郁个体以及 394 名健康对照，所有被试完成奖赏延迟任务。结果发现，相较于亚临床和健康对照，临床精神障碍患者在期待和获得奖赏时的愉悦体验显著下降，亚临床与健康对照的情绪反应特征类似，但亚临床个体的负性情绪在奖赏损失条件下显著增强。在精神分裂谱系，相对于健康对照，精神分裂患者在期待和获取阶段对奖赏刺激的愉悦感较低，并在奖赏损失和错失条件下也表现出较低的负性情绪水平，表明其情绪反应普遍降低，但分裂型人格特质个体的期待和即时情绪与健康对照无显著差异，情绪体验相对完好。而在抑郁症谱系，抑郁患者对奖赏期待和获得的愉悦感显著减少，但对奖赏损失和错失引起的负性情绪体验与健康对照无显著差异，亚临床抑郁个体则在期待损失阶段的负性情绪显著高于健康对照。谱系间组间分析显示，两类精神疾病谱系下个体的期待和即时愉快情绪与健康对照相比显著下降，但抑郁谱系相较于精神分裂谱系，个体对奖赏损失的负性情绪更高。进一步基于网络分析结果发现，亚临床群体的期待和即时情绪反应的网络全局强度显著低于临床患者(S = 1.509, p = .049)和健康对照(S = 1.561, p = .013)，表明其情绪反应之间的关联较低，其反应模式更不稳定且波动更强。此外，精神分裂和抑郁谱系的情绪反应的网络结构存在显著差异(M = 0.551, p = .0005)，与精神分裂谱系相比，抑郁症谱系在奖赏期待和即时阶段中的愉快情绪反应的连接强度较弱 (t = -0.304, p = .032)。综上，我们的研究结果表明，临床障碍患者的期待和即时愉悦情绪反应钝化，亚临床群体情绪反应间连接的不稳定

性可能是转化为临床水平的高风险机制，而情绪反应特征存在跨谱系的特异性，抑郁症谱系相对于精神分裂症谱系障碍的愉快体验和动机之间连接模式的减弱可能是不同谱系障碍快感缺失的潜在机制。

Characteristics of Anticipatory and Consummatory Affective Responses in Schizophrenia and Depression: A Re-examination Based on Network Analysis

SHEN Lei[1]　XIE Chi[1]　WANG Yi[2]　YAN Chao[1]

1 School of Psychology and Cognitive Science, East China Normal University, Shanghai

2 Institute of Psychology, Chinese Academy of Sciences, Beijing

***Abstract*:** Anhedonia is a core symptom shared by multiple psychiatric disorders, and abnormal processing of positive affect underlies its pathopsychological mechanism. However, positive affect processing is a multidimensional structure that encompasses anticipatory and consummatory pleasure. In order to understand the common and unique mechanisms of different affective responses in schizophrenia spectrum and depression spectrum disorders, from a transdiagnostic and cross-spectrum perspective, a network analysis-based approach can explore the relationship and interactions between affective responses during reward anticipation and outcome in more depth, and will help to reveal the nature of the abnormalities of affective processing underlying different psychiatric disorders. This study recruited a total of 821 participants, including 175 clinical patients diagnosed with either schizophrenia (n=115) or major depressive disorder (n=60), 83 individuals with schizotypal traits, 110 individuals with subclinical depression, and 394 healthy controls. All participants completed the reward delay task. The results revealed that compared to subclinical and healthy control groups, clinical patients experienced a significant decrease in pleasure during reward anticipation and outcome. The subclinical individuals showed similar affective response characteristics to healthy controls, but their negative affect significantly increased under reward loss conditions. In the schizophrenia spectrum, relative to healthy controls, schizophrenia patients experienced lower pleasure during reward anticipation and consumption phase, and also showed lower levels of negative affect under reward loss and omission conditions, indicating a general reduction in affective responses. However, individuals with schizotypal traits did not show significant differences in anticipatory and consummatory affective responses compared to healthy controls, suggesting relatively intact affective experiences in the subgroup. In the depression spectrum, the depressed patients showed a significant reduction in pleasure during reward anticipation and consumption. However, their negative affective experiences in response to reward loss and omission did not significantly differ from those of healthy controls. On the other hand, the individuals with subclinical depression exhibited significantly higher levels of negative emotions during the anticipation of reward loss compared to healthy controls. The inter-spectrum group analysis revealed that the individuals in both schizophrenia and depression spectrum showed a significant decrease in anticipatory and consummatory pleasure compared to healthy controls. However, individuals in the depression spectrum exhibited higher levels of negative affect in response to reward loss compared to those in the schizophrenia spectrum. Based on further network analysis, it was found that the global strength of the network for anticipatory and consummatory affective responses in the subclinical group was significantly lower than that of clinical patients (S = 1.509, p = .049) and healthy controls (S = 1.561, p = .013). This indicated that the

associations between affective responses in the subclinical group were lower, suggesting a less stable and more fluctuating response pattern. Additionally, there were significant differences in the network structure of affective responses between the schizophrenia and depression spectrum (M = 0.551, p = .0005). Specifically, in comparison to the schizophrenia spectrum, the depression spectrum exhibited weaker connections in the strength of pleasurable affective responses during reward anticipation and consumption (t = -0.304, p = .032). In conclusion, our study results indicated that clinical patients with psychiatric disorders exhibited blunted anticipatory and consummatory pleasure affective responses, and the instability of affective response connections in subclinical individuals might serve as a high-risk mechanism for transitioning to clinical levels. Moreover, there were specific characteristics in affective responses that vary across different spectra. The weakening of connections between pleasurable experiences and motivational processes in the depression spectrum relative to the schizophrenia spectrum might underlie the potential mechanisms of anhedonia in different spectrum disorders.

Keywords：schizophrenia, major depressive disorder, network analysis, anhedonia, anticipatory pleasure

催产素受体基因与家庭功能对学前儿童亲社会行为的交互影响：来自两个不同家庭社会经济地位样本的验证

刘倩文[1]　王振宏[1]（通讯作者）

1 陕西师范大学心理学院,陕西(高校)哲学社会科学重点研究基地-儿童青少年心理与行为健康研究中心，西安，710062，wangzhenhong@snnu.edu.cn

摘 要　儿童亲社会行为是指儿童在社会交往中自发地对他人表达关心和共情，并做出有益于他人的行为。儿童亲社会行为在学前阶段快速发展，并出现个体差异。研究表明，催产素受体基因(oxytocin receptor gene, OXTR)是影响个体亲社会行为的潜在候选基因之一。以往研究多采用单基因位点的方法探讨 *OXTR* 基因及其与环境因素交互对亲社会行为的影响，但研究结果并不一致且缺乏外部验证。本研究采用 *OXTR* 多基因位点累加评分(multilocus genetic profile score, MGPS)的方法，通过方便取样选取了来自高家庭社会经济地位和中低家庭社会经济地位的两个独立样本，考察了 *OXTR* 基因与作为家庭心理社会环境核心因素的家庭功能对学前儿童亲社会行为的交互作用。运用父母报告的《家庭亲密度与适应性量表》以及《长处与困难问卷》中的亲社会行为分问卷来测量家庭功能与儿童亲社会行为，采集儿童的唾液样本进行基因位点分型并基于此计算 *OXTR* MGPS。来自高家庭社会经济地位的 421 名学前儿童($M_{年龄}$ = 4.95 岁，SD = 0.95)样本的研究结果发现，*OXTR* MPGS 的二次项与家庭功能显著交互作用于儿童的亲社会行为。具体而言，*OXTR* MGPS 得分较高和较低的儿童均表现出对家庭功能影响的高敏感性，即在家庭功能较好的情况下会表现出更多的亲社会行为，在家庭功能较差的情况下则会表现出更少的亲社会行为，但家庭功能对 *OXTR* MGPS 得分中等学前儿童亲社会行为的影响不显著。这一结果在来自中低家庭社会经济地位的 326 名学前儿童($M_{年龄}$ = 4.91 岁，SD = 0.84)样本中也得到了验证。研究结果表明，*OXTR* MGPS 与儿童环境敏感性之间呈非线性（U 型）关系，较高和较低的 *OXTR* MGPS 都可能表征着高环境敏感性，进而与家庭功能等环境因素交互影响学前儿童的亲社会行为。研究结果为深入理解儿童社会行为的基因-环境交互机制提供了不同的证据。

关键词　学前儿童，亲社会行为，催产素受体基因，家庭功能，环境敏感性

The interactive effect of the oxytocin receptor gene and family functioning on preschoolers' prosocial behaviors: A replication in two samples with different socioeconomic backgrounds in China

Qianwen Liu Zhenhong Wang[1] (Corresponding author)
1 School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an, 710062, wangzhenhong@snnu.edu.cn

***Abstract*:** Prosocial behaviors are considered voluntary actions performed to benefit others, which develop rapidly in preschoolers. Previous studies suggested that the oxytocin receptor (OXTR) gene is a potential candidate gene for prosocial behaviors. However, it remains unclear whether and how *OXTR* gene interacts with family environments to contribute to prosocial behaviors. This study examined the interactive effect of the *OXTR* gene using a multilocus genetic profile score (MGPS) approach and family functioning on preschoolers' prosocial behaviors in two dependent samples with different backgrounds. The saliva of preschoolers was collected to genotype the *OXTR* SNPs, and their parents completed questionnaires to assess family functioning and preschoolers' prosocial behaviors. In the primary sample of 421 preschoolers (M_{age} = 4.95 years, *SD* = 0.95) with higher family SES, a quadratic instead of a linear interactive effect was found. That is, preschoolers with a higher or lower *OXTR* MGPS were highly sensitive to family functioning, and their prosocial behaviors were more strongly affected by family functioning than those in preschoolers with a moderate *OXTR* MGPS. Comparable results were replicated in an independent sample of 326 preschoolers (M_{age} = 4.91 years, *SD* = 0.84) with lower-middle family SES. In conclusion, the present study first revealed the quadratic relationship between *OXTR* MGPS and preschoolers' prosocial behaviors under different levels of family functioning with replication in two samples with different SES backgrounds and highlighted a U-shaped curve of the relationship between *OXTR* MGPS and children's environmental sensitivity, which provide a new understanding of the complex interplay between genes and environments in children's social behaviors.

学业倦怠对青少年抑郁的纵向影响：个体认知偏差与圈子倦怠规范的作用

宋省成 黄垣成 李彩娜（通讯作者）

陕西师范大学心理学院，陕西（高校）哲学社会科学重点研究基地-儿童青少年心理与行为健康研究中心，西安，710062，chinali7371@163.com

摘 要　学业倦怠是指学生不能有效应对学业压力而产生的应激反应，是导致青少年消极认知和抑郁最突出的风险因素之一。抑郁认知理论（The Cognitive Theory of Depression）认为个体在信息加工过程中的认知

偏差是抑郁的高危因素，因此，学业倦怠可能会通过个体自身的认知偏差进一步加剧其抑郁症状。然而以往研究多聚焦于个体层面，忽视了同伴圈子这一重要微观系统可能在其中发挥的作用。根据健康环境悖论（The Healthy Context Paradox），在相对“健康”的社会环境中（如低学业倦怠规范），个体可能会产生更多的认知偏差；而同伴濡染假说（The Peer Contagion Hypothesis）则认为，低学业倦怠规范的环境有利于纠正个体的偏差认知与行为。圈子倦怠规范缓解了倦怠个体的认知偏差还是进一步加剧其认知偏差仍需进一步探讨。综上，本研究旨在考察学业倦怠对青少年抑郁的纵向影响及认知偏差的中介作用，重点从圈子视角考察学业倦怠规范对该过程的影响。

本研究采用青少年自我报告法和同伴提名法对陕西省 904 名青少年（57%男生; M_{age} = 12.73, SD = 0.43）进行为期两年的追踪调查，多层线性分析得到 151 个圈子（M_{size} = 5.09, SD =1.89）。结果发现：（1）认知偏差在学业倦怠和抑郁之间起完全中介作用，即 T1 学业倦怠能够导致青少年的认知偏差从而增加其两年后抑郁的风险。（2）圈子学业倦怠规范在“学业倦怠-认知偏差”路径中起调节作用，即在低学业倦怠规范下，个体的学业倦怠对认知偏差的预测作用更强，这也在圈子层面支持了健康环境悖论。结果进一步表明，个体的认知因素作为抑郁产生的重要近端因素，是学业倦怠影响抑郁的重要中介机制，且低圈子学业倦怠规范加剧了“学业倦怠—认知偏差—抑郁”的恶性循环。该研究结果有利于我们从圈子的视角理解抑郁发生的内部机制，从而对抑郁的预防和干预提供参考依据。

反应性攻击青少年的恐惧过度泛化:来自行为和近红外的证据

摘 要 青春期是反应性攻击行为爆发的敏感时期，而反应性攻击行为常伴随着负性的情绪唤醒，如愤怒、焦虑。值得注意的是，焦虑症的典型特征之一是对条件性恐惧的过度泛化。本研究采用经典的恐惧泛化范式，通过反应性主动性攻击问卷筛选出高、低反应性攻击被试，以主观预期评分和内侧前额叶的激活情况作为指标，考察青少年反应性攻击与恐惧泛化之间的关系。行为结果发现：恐惧习得、泛化阶段中，高反应性攻击组对条件刺激和泛化刺激的主观预期评分显著高于低攻击组。近红外结果发现：恐惧泛化过程中泛化刺激诱发了高反应性攻击组较低的内侧前额叶激活。研究结果表明，反应性攻击青少年存在恐惧过度习得和泛化。研究提示对反应性攻击青少年的恐惧调节能力进行训练的必要性。

关键词 反应性攻击，青少年，恐惧泛化，内侧前额叶

Increased overgeneralization of fear and reduced medial prefrontal engagement in adolescents with reactive aggression

Abstract: Adolescence represents a sensitive period for the emergence of reactive aggression, often accompanied by the arousal of negative emotions such as anger and anxiety. It is noteworthy that one of the typical characteristics of anxiety disorders is the excessive generalization of conditioned fear. In this study, we employed a classic fear generalization paradigm and identified high and low reactive aggression groups through reactive-proactive aggression questionnaire. We utilized subjective expectancy ratings and assessed the activation of the medial prefrontal cortex as indicators to investigate the relationship between reactive aggression and fear generalization in adolescents. Behavioral results revealed that during fear learning and generalization phases, the high reactive aggression group exhibited significantly higher subjective expectancy ratings for conditioned and generalized stimuli compared to the low aggression group. Near-infrared spectroscopy results indicated that during

the fear generalization process, generalized stimuli elicited lower medial prefrontal cortex activation in the high reactive aggression group. The findings suggest the presence of fear overgeneralization in adolescents with reactive aggression, highlighting the necessity for training interventions targeting fear regulation in this population.

Keywords： Reactive aggression, Adolescence, Fear generalization, Medial prefrontal cortex.

抑制控制在数学概念推理中的作用：一项 fNIRS 研究

柳东林[1] 王丽娟[1]（通讯作者）

1 东北师范大学心理学院，长春，130024，wanglj699@nenu.edu.cn

摘 要 错误概念是学生学习中的常见阻碍之一，并干扰科学概念学习。当学生学习与错误概念相冲突的科学概念时，新的科学概念并不总能取代旧的错误概念，二者可能同时存在于学生的长期记忆中。研究者使用快速推理任务证明错误概念会干扰科学理论的检索，学生在推理过程中需要抑制错误概念才能做出正确的判断。最近的研究表明，反应抑制和语义抑制均参与科学推理。数学学习是学校教育的中心目标，也是人生成功的重要先决条件。大量研究表明数学领域广泛存在错误概念，如学生通常存在“当比较两个简分数，尤其是分数单位的大小时，分母较大的分数更大”的错误概念，即“1/9 大于 1/8”。然而，目前研究未能发现抑制在数学子领域如代数、几何和单位转换的作用，并且也没有神经科学证据直接支持反应抑制和语义抑制参与数学概念推理。基于此，本研究共招募了 30 名大学生，通过近红外成像技术结合经典抑制任务和快速推理任务来探究上述问题。研究分为两个步骤。第一步，使用 Go/Nogo 任务和 Stroop 任务分别测量了被试的反应抑制和语义抑制能力，同时使用 fNIRS 记录他们在任务中的大脑活动；第二步，被试进行快速判断任务，同时使用 fNIRS 记录他们在任务过程中的大脑活动。结果表明，个体在判断冲突的问题时，反应更慢，正确率更低，并且与抑制有关脑区的活动更强。支持了抑制在数学子领域的概念推理中发挥作用的假设。研究还发现个体在推理符合直觉的不一致非科学陈述时，抑制区域的活动与 Go/Nogo 任务中反应抑制的活动相似；而在推理反直觉的不一致科学陈述时，抑制区域的活动与 Stroop 任务中语义抑制的活动相似。结果支持了数学概念推理涉及反应抑制与语义抑制的假设，且两种抑制均参与了对数学错误概念的抑制。

关键词 抑制，数学，错误概念，科学推理，fNIRS

Inhibitory Control and the Understanding of Mathematics: An fNIRS Study

Donglin Liu, Lijuan Wang

School of psychology, Northeast Normal University, Changchun, 130024

Abstract： Misconceptions are one of the common obstacles in students' learning and interfere with scientific concept learning. When students learn scientific concepts that conflict with misconceptions, the newer scientific concepts does not always replace the older misconceptions, and both may exist in the students' long-term memory. Using a new speeded reasoning task, researchers showed that misconceptions interfere with retrieving scientific concepts. Students need to suppress misconceptions in the process of reasoning in order to make correct judgments. Recent studies have shown that both response inhibition and semantic inhibition are involved in scientific reasoning. Mathematics learning is a central aim of schooling and a vital prerequisite for success in life. Many studies have shown that there are widespread misconceptions in mathematics domain. For example, students often

have the misconception that "when comparing two simple fractions, especially the size of the fractional unit, the fraction with the larger denominator is larger", that is, "1/9 is greater than 1/8". However, current research has failed to find the role of inhibition in mathematical subfields such as algebra, geometry, and unit transformation, and there is no neuroscience evidences to directly support the involvement of response inhibition and semantic inhibition in mathematical conceptual reasoning. Based on this, a total of 30 college students were recruited in this study to explore the above questions through near-infrared imaging technology combined with classical suppression task and speeded reasoning task. The study has two steps. In the first step, response inhibition and semantic inhibition were measured using Go/Nogo task and Stroop task respectively, and their brain activity was recorded using fNIRS during the task. In the second step, participants performed the speeded reasoning task while using fNIRS to record their brain activity during the task. The results showed that individuals reacted more slowly, were less correct, and had greater activity in brain regions associated with inhibition when judging conflicting questions. It supports the hypothesis that inhibition plays a role in conceptual reasoning in the mathematical subdomain. It is also found that the activity of inhibitory region is related to the activity of response inhibition in the Go/Nogo task when individuals are reasoning intuitionistic conflict problems. In reasoning counterintuitive conflict problems, the activity of the inhibitory region is related to the activity of semantic inhibition in the Stroop task. The results supported the hypothesis that the reasoning of mathematical concepts involves both response inhibition and semantic inhibition, both of which are involved in the suppression of mathematical misconceptions.

建设性新闻对利他行为的影响及心理机制

邓洵　贺雯（通讯作者）
上海师范大学教育学院，上海 200234
hewen@shnu.edu.cn

摘 要　建设性新闻是新闻行业应对时代变化的一次自我革新。通过将积极心理学理论应用于新闻撰写过程，在保留新闻核心功能的同时，创造出更能被大众接纳和更有实践价值的报道，一般分为包含积极情绪或者包含解决方案两类。结合媒体效应差别易感性模型，建设性新闻可以通过共情或观点采择等间接地影响受众，并且受到个体因素如社会善念的调节。同时，建设性新闻的目的是引导读者思考社会问题，并积极参与社会治理，形成互帮互助的良好社会氛围。因此本研究通过三个实验揭示共情和观点采择在建设性新闻对利他行为的影响中地中介作用以及社会善念的调节作用。

实验 1A 选取 170 名在校大学生作为被试，采用单因素被试间实验设计，探究阅读三种不同类型的新闻(非建设性新闻/解决方案新闻/积极情绪新闻)对大学生利他行为的影响，以及共情和观点采择的中介作用。结果表明，阅读建设性新闻可以显著提升其利他行为水平，共情的中介作用显著，但观点采择的中介作用不显著。实验 1B 选取 150 名在校大学生作为被试，更换不同主题的建设性新闻，验证了以上共情中介模型的稳健性。实验 2 选取 177 名在校大学生作为被试，检验社会善念对共情中介路径的调节作用，结果表明与控制组相比，解决方案新闻通过共情影响利他行为的中介路径受到社会善念的调节，对于低社会善念的个体，阅读解决方案新闻可以显著提升其共情水平从而促进个体的利他行为；而高社会善念的个体的调节效应不显著。

因此，本研究通过三个系列实验研究揭示了建设性新闻对利他行为的作用机制。丰富了媒体效应差别易感性模型的理论内涵，同时为建设性新闻的推广提供了心理学层面的证据支持。未来研究可以从建设性新闻的长期影响等方面入手。

The Influence and Mechanism of Constructive Journalism on the Altruistic Behavior

DENG Xun, HE Wen
College of Education, Shanghai Normal University, Shanghai 200234, China

Abstract： Constructive journalism is the product of self-innovation of the news industry in recent years. It means the application of positive psychological methods, such as containing positive emotions or including solutions to the news production process to create attractive reports, while persisting in the core functions of journalism. According to the Different Susceptibility to Media Effect Model (DSMM), the influences of constructive news on the audience is indirect and it could be moderated by some individual factors. At the same time, the purpose of constructive journalism is to encourage readers to actively participate in solving social problems and build a good social atmosphere of mutual assistance. Therefore, this study aimed to explore the influence of constructive journalism on altruistic behavior, and the mediating role of empathy and perspective taking as well as the moderating role of social mindfulness.

In experiment 1A, 170 college students were selected as participants, and a single factor between-subjects experiment was designed to explore the influence of reading three different types of news (control group news/solution news/positive emotional news) on altruistic behavior, as well as the role of empathy and perspective taking. Results showed that compared with the control group, positive emotion news could promote participants' altruistic behavior by improving their empathy. The mediating effect of empathy was significant, but the mediating effect of perspective taking is not significant.

In experiment 1B, 150 college students were selected as participants, using constructive news with different themes to test the robustness of the empathy mediation model. Results showed that, compared with the control group, solution news and positive emotional news could significantly affect altruistic behavior through empathy.

In experiment 2, 177 college students were selected as participants. On the basis of experiment 1B, the moderating effect of social mindfulness on empathy mediating path was further tested. Results showed that compared with the control group, the mediating path of solution news affecting altruistic behavior through empathy was moderated by social mindfulness. For individuals with low social mindfulness, reading solution news can significantly improve their empathy level and further promote altruistic behavior. However, this mediating effect was not significant for individuals with high social mindfulness. This finding was consisted with the protective-attenuating hypothesis.

This study carried out three experiments to test the mediation effect of empathy and the moderating effect of social mindfulness in the influence of constructive journalism on altruistic behavior, which enriched the theoretical connotation of DSMM model and provided psychological evidence for the promotion of constructive journalism. Future research can start from the long-term effect of constructive journalism.

Keywords： constructive journalism, altruistic behavior, empathy, perspective taking, social mindfulness

摘 要 本研究基于多维度奖赏加工理论，探索了机器学习分类抑郁症的可靠性，并探讨各奖赏加工维度对抑郁症分类识别的贡献程度和对模型性能的影响，尝试为抑郁症快感缺失的精确诊断提供可行的实证依据。本研究招募符合 DSM-5 标准的抑郁症患者 58 例（M=27.07，SD=7.69，女性 42 人，男性 16 人），健康对照组 249 例（M=22.16，SD=5.33，女性 161 人，男性 88 人）。所有被试都完成金钱奖励延迟任务、贝克抑郁问卷、愉悦体验预测问卷和愉悦体验回忆问卷。本研究从任务与问卷中提取了期待性愉悦体验的预测成分与感受成分、即时性愉悦体验、动机、回忆性愉悦体验，共五个维度的成分用于分类模型的建立。首先，我们使用投票分类器训练分类模型。其次，分别选择来自 5 个成分的维度组合为特征集，分别包含单成分特征集 5 个（如预测模型），两成分（如预测-感受模型）和三成分（如预测-感受-动机模型）特征集各 10 个，四成分特征集 5 个（如预测-感受-动机-即时性愉悦体验模型），在此基础上构建了 1 个完整的全预测模型和 30 个子模型。并使用配对 t 检验对比所有模型预测结果的差异显著性。最后，我们采用了特征选择和重要性系数两种方法分别在逻辑回归模型、极限梯度提升树模型中可视化了特征的重要性。经过 10×10 交叉验证训练和评估模型，全模型 AUC=77.9%±9.6%，敏感度为 76.8%±17.6%，特异性为 79.1%±7.3%，子模型的 AUC∈[0.658，0.788]。预测-感觉-动机模型的 AUC 最高，为 0.788±0.093，但仅与动机模型有显著差异（t = 2.326，p = 0.023）。与大多数子模型相比，基于预测-动机维度的预测模型敏感度最高，为 88.3%±12.2%，基于预测-感觉-动机维度的预测模型特异性最高，为 89.2%±5.9%。使用 t 检验对比发现包含动机成分的模型性能在不同维度上与其他模型有显著差异。在逻辑回归模型、极限梯度提升树模型中，三个权重最高的特征分别源于预测、感觉和动机维度。我们的结果揭示，基于多维度奖赏加工成分对抑郁症患者进行分类具有可行性，预期和动机维度对抑郁症精准分类具有重要作用。

关键词：抑郁症，奖赏加工，期待性愉悦体验，机器学习算法，诊断分类

Recognizing depression based on the multidimensional reward theoretical framework: Preliminary evidence from machine learning algorithms

Abstract: In this study, we explored the reliability of machine learning to classify depression based on the multidimensional reward processing theory, and explored the contribution of each reward processing dimension to the recognition of depression and the impact on model performance. We attempted to provide viable empirical evidence for the precise diagnosis of anhedonia. Fifty-eight depressed patients (M = 27.07, SD = 7.69, 42 females and 16 males) with DSM-5 criteria were recruited for this study, compared to 249 healthy controls (M = 22.16, SD = 5.33, 161 females and 88 males). All subjects completed the Monetary Reward Delay Task, the Beck Depression Questionnaire, the Pleasure Experience Prediction Questionnaire, and the Pleasure Experience Recall

Questionnaire. The “prediction” and “feeling” components of anticipatory pleasure, “consummatory pleasure”, “motivation”, and “remembered pleasure”, totaling five dimensions, were extracted from the task and questionnaire for use in modeling. First, we train categorization models using the voting classifiers. Second, the dimensional combinations from each of the five components were selected as feature sets, containing five one-component feature sets (e.g., the prediction model), ten each of the two-component (e.g., the prediction-feeling model) and three-component (e.g., the prediction-feeling-motivation model) feature sets, and five four-component feature sets (e.g., the prediction-feeling-motivation-consummatory pleasure model). One complete full features model and 30 sub-models were constructed on these components. And paired t-test by the correctR package was used to compare the significance of the difference between the classification results of all models. Finally, we used feature selection and importance coefficients to visualize the importance of features in the logistic regression model and the eXtreme Gradient Boosting model respectively. After 10 × 10 cross-validation training and evaluation of models, the full model showed an AUC = 77.9% ± 9.6%, with a sensitivity of 76.8% ± 17.6%, a specificity of 79.1% ± 7.3%, and an AUC ∈ [0.658, 0.788] for sub-models. Furthermore, the prediction-feeling-motivation model had the highest AUC of 0.788 ± 0.093 but was only significantly different from the motivation model (t = 2.326, p = 0.023). Compared to most of the sub-models, the model based on the prediction-motivation dimension had the highest sensitivity of 88.3% ± 12.2%, and the model based on the prediction-feeling-motivation dimension had the highest specificity of 89.2% ± 5.9%. Comparisons using t-tests revealed that the performance of models that included a motivational component differed significantly from the other models. In addition, the three most highly weighted features originated from the prediction, feeling, and motivation dimensions. In conclusion, our results reveal that it is feasible to classify depression based on the multidimensional reward processing theory and that anticipatory pleasure and motivation dimensions played an essential part.

工作记忆与抑制控制对学前儿童自发性数量关注倾向的影响

洪伟　刘儒德(通讯作者)　丁子恩

北京师范大学心理学部，北京，100875，liurude@126.com

摘　要　儿童在非正式学习情境中的数学学习受到越来越多的重视。研究者们近年来开始关注非正式学习情境中的自发性数量关注倾向，具体是指个体在非特定于数学的情境中以自发的形式关注数量方面的特征或信息并加以使用的倾向，这种倾向在儿童数学能力发展中发挥着重要作用。基于自发性数量关注倾向的理论框架，本研究试图从认知视角出发，考察工作记忆与抑制控制对学前儿童自发性数量关注倾向的影响。研究 1 在现有测量工具的基础上进一步发展出基于视觉刺激和听觉刺激的复原任务，结果发现，两种刺激情境中的复原任务均具有良好的信效度。研究 2 和研究 3 为并列研究，分别聚焦于视觉刺激情境和听觉刺激情境。具体而言，研究 2a 和 3a 采用任务范式测量工作记忆容量和抑制控制能力。结果发现，在视觉刺激情境中，视觉空间工作记忆容量对学前儿童自发性数量关注倾向的预测作用显著，并且其与抑制控制交互项的预测作用也显著。在听觉刺激情境中，只有言语工作记忆容量的预测作用显著。研究 2b 和 3b 采用任务操纵工作记忆负荷和抑制控制需求，结果发现，无论在视觉刺激还是听觉刺激情境中，工作记忆负荷和抑制控制需求的主效应显著，即增加工作记忆负荷或抑制控制需求都能显著地降低学前儿童的自发性数量关注。并且，两者的交互效应也都显著，但方向存在不一致的情况。总之，本研究首次从多感觉通道探

讨学前儿童的自发性数量关注倾向，并从认知视角验证了工作记忆和抑制控制在不同刺激情境中自发性数量关注过程中的重要作用。

The influence of working memory and inhibitory control on spontaneous focusing on numerosity among preschoolers

Hong Wei, Liu Ru-De, Ding Zien
Faculty of Psychology, Beijing Normal University, Beijing, China

Abstract：Mathematics learning in informal contexts has received increasing attention, particularly for children. In recent decades, researchers have begun to focus on spontaneous focusing on numerosity (SFON) in informal learning contexts, which refers to the tendency to spontaneously focus on the aspect of numerosity and utilize enumeration skills in non-mathematical situations. This tendency has been found to play an important role in children's mathematical knowledge and skill development. Based on the theoretical framework of SFON, the present study focuses on the cognitive perspective and aims to explore the influence of working memory and inhibitory control on children's SFON. Specifically, Study 1 based on the existing measurements developed a new visual-based and auditory measure for SFON. The results showed that the visual- and auditory-based recovery tasks had acceptable reliability and validity. Study 2 and Study 3 were designed as parallel studies but focused on a visual and auditory context, respectively. Study 2a and 3a used tasks to measure working memory span, inhibitory control capacity, and SFON. The results showed that visuospatial working memory significantly predicted preschoolers' SFON and the interaction effect between visuospatial working memory and inhibitory control also did in the visual-based situation, but only verbal working memory significantly predicted preschoolers' SFON in the auditory-based situation. Study 2b and 3b manipulated working memory loads and inhibitory control demands. The results showed that the main effects of working memory load and inhibitory control demand and their interaction effect were significant, but the direction of interaction effect varied. In conclusion, the present study is the first to explore preschoolers' SFON through multi-sensory perceptions (i.e., extending from vision to hearing) and to explore the important roles of working memory and inhibitory control in the process of SFON in different stimulus contexts from a cognitive perspective.

Keywords：spontaneous focusing on numerosity, working memory, inhibitory control, preschoolers

青少年自我控制与心理健康的非线性影响：学校适应的中介作用和身体活动的调节作用

江悦妍　颜军（通讯作者）
扬州大学体育学院，扬州，225000，yanjun@yzu.edu.cn

摘　要　目的 考察青少年自我控制对心理健康的非线性影响，探讨学校适应的中介作用和身体活动的调节作用。方法 采用自我控制量表、中学生心理健康量表、高中生学校适应量表、国际体力活动问卷对 2077 名高中生进行测量，借助 Medcurve 和 Process 等工具对问卷数据进行实证研究。结果 (1)青少年自我控制对心理健康有 U 型影响；青少年自我控制对学校适应有 U 型影响；(2)学校适应在青少年自我控制和心理健

康的 U 型关系中起中介传导作用。(3)身体活动调节了青少年自我控制和心理健康之间经由学校适应的间接效应。结论 青少年为实现学校适应，有时需要对内在自我优先或外在适应优先策略进行抉择，在这一过程中易因自我控制资源过度损耗，陷入“过剩适应”状态，从而影响其心理健康。学校适应同青少年自我控制资源损耗、恢复的动态变化有关，介导了青少年自我控制与心理健康 U 型关系的产生。身体活动能够通过调节青少年学校适应和心理健康间的关系，弱化自我控制过程中“过剩适应”对心理健康的影响。与低身体活动青少年相比，高身体活动青少年通过调动更少的自我控制资源，获得更好的学校适应，且更为弱化对过剩适应引发的心理健康问题的关注。研究为青少年心理健康的影响因素研究提供了新思路，倡导教育者通过合理开展身体活动的方式，动态平衡青少年自我控制和学校适应，以维护青少年心理健康。

The Nonlinear Effect of Adolescent Self-control and Mental Health：The Mediating Role of School Adjustment and the Moderating Role of Physical Activity

Yueyan Jiang Jun Yan*
College of Physical Education, Yangzhou University
Address: No.196 West Huayang Road, Hanjiang District, Yangzhou, China

Abstract：Objective: To investigate the nonlinear effect of self-control on mental health of adolescents, and to explore the mediating role of School Adjustment and the moderating role of physical activity. Methods: Used self-control scale, mental health scale for middle school students, School Adjustment scale, international physical activity questionnaire to measure 2077 senior high school students. Conducted empirical research on questionnaire data with tools such as Medcurve and Process. Results: (1)Adolescent self-control had a U-shaped effect on mental health. Adolescent self-control had a U-shaped effect on School Adjustment. (2)School Adjustment played a mediating role in the U-shaped relationship between self-control and mental health of adolescents. (3)Physical activity regulated the indirect effect between self-control and mental health of adolescents through School Adjustment. Conclusions: In order to realize school adjustment, adolescents sometimes need to make a choice between internal self and external adaptation. In this process, it is easy to fall into a state of "over-adaptation" due to excessive loss of self-control resources, thus affecting their mental health. School adjustment is related to the dynamic changes in the depletion and recovery of self-control resources in adolescents, mediating the U-shaped relationship between self-control and mental health in adolescents. Physical activity can weaken the influence of "over-adaptation" on mental health in the process of self-control by adjusting the relationship between School Adjustment and mental health of adolescents. Compared to adolescents with low physical activity, adolescents with high physical activity gain better school adjustment by mobilizing fewer self-control resources, and weaken their attention to mental health issues caused by over-adaptation. The study provides a new way of the study of the influencing factors of adolescent mental health. Advocate educators to dynamically balance adolescent self-control and School Adjustment through appropriate physical activities.
Keywords：self-control，mental health，school adjustment，physical activity，nonlinear relation

“近朱者赤”：孤独症儿童广义互惠特征及自我观点和他人观点的作用

摘 要　广义互惠指个体接受施惠方行为后，随即以同质行为对待他人的互惠形式。孤独症群体社会交往受限，那么现实生活中，该群体是倾向跟从施惠方行为，还是会对自我-他人加以区分？以往针对典型学龄前和成人的研究给出了“近朱者赤，近墨者黑”的答案，但却忽视了处于社交敏感期的学龄群体。本研究通过三项研究考察了互惠情境（自私条件、慷慨条件）对 6-16 岁孤独症儿童（$N = 30$）、典型发展儿童（$N = 34$）广义互惠的影响及自我观点和他人观点的作用。研究发现，儿童在广义互惠中表现出选择性，即近朱变赤，近墨不黑。自我-他人区分调节了孤独症儿童慷慨条件下的行为回应。此外，孤独症儿童在广义互惠中较少受自我、他人观点影响，而他人观点可削弱典型发展儿童自私条件下的消极回应。这对于解析现有互惠理论的争议，揭示自我-他人区分的调节规律，助推中国融合教育实施中的环境创设及临床干预等有参考意义。

关键词　广义互惠，孤独症儿童，自我-他人区分，自我观点，　他人观点

“Attention of the like”: Generalized Reciprocity Characteristics and the Role of Self and Other’s Perspectives in Children with Autism

Abstract：Generalized reciprocity refers to the form of reciprocity in which an individual after receiving the behavior of the benefactor, immediately treats others with homogeneous behavior. Individual with autism have limited social interaction, so in real life, do they tend to follow altruistic behavior, or do they distinguish between self and others? Previous studies on typical preschoolers and adults have provided the answer of “those who are close to red, those who are close to ink”, but have overlooked the socially sensitive school-age group.

In this study, we investigate the impact of absolute self benefit on generalized reciprocity in children with autism (N=30) and typical developmental(N=34), as well as the possible social cognitive mechanisms involved (study 1) and the moderating effect of self-other distinction (study 2-5). In study 1, we created a generalized reciprocity selfish situation (1/6) and a generosity situation (5/6) by manipulating the number of homogeneous tokens shared by the benefactor (6 in total). It was found that the reciprocity situation affected children's generalized reciprocity behavior. Under the generosity situation, children with autism had a lower level of generosity and were regulated by the ability to self-other distinction. In study 2-3, we separated the regulating effects of self-perspective and others-perspective on generalized reciprocal behavior by highlighting self-perspective and highlighting others-perspective respectively, and found that self-perspective had no significant influence on the two groups of children's behavior, while the influence of others-perspective was different, that is, it would promote the behavior of autistic children in the generous situation and the behavior of typically developing children in the selfish situation. In study 4-5, we conducted a task of sharing heterogeneous apples (2 good apples and 2 bad apples) to test the explanations of separated self-other perspective. It was also found that the moderating differences of others' viewpoints did not have a significant impact on children with autism, while under selfish conditions, it could promote the sharing of good apples by children with typical development.

This indicates that the self-other distinction can regulate the generalized reciprocal behavior of children with autism, promote the group's generous behavior by highlighting the views of others, and narrow the generalized reciprocal differences form children with typical development. The current research is of great significance in analyzing the controversy over the existing hypothesis of psychological blindness and extreme male brain, revealing the variable patterns of the "self-others" perspective distinction in the broad sense of reciprocity among children with autism, and promoting the "improvement of rehabilitation education system" and "strengthening the full service for autism" proposed by China's 2023 National People's Congress.

***Keywords*:** generalized reciprocity, children with autism, self-other distinction, self-perspective, others-perspective

强制性养育与青少年学校投入：检验共情关怀调节作用中的性别差异

吴柯慧，李德*

*吴柯慧，澳门大学犯罪学博士，中国澳门氹仔大学大马路社会科学学院(E21B)，17741568777，ellawu00@163.com。

李德，澳门大学社会科学学院社会学系教授，博士生导师，亚洲药物滥用研究协会会长。

摘 要　强制性养育被认为是青少年发展的重要预测因素之一。通过使用严厉的管教方式，强制性养育对青少年发展产生了负面影响。然而，由于不同的个人特征及性别差异，青少年对养育方式的脆弱性和敏感性均有所不同，并非所有来自强制性养育家庭的青少年都会在学校、学业方面出现问题。本研究通过分析1075 名中国青少年在 2015-2016 年两轮跟踪调查数据，发现共情关怀水平较高的青少年在低至中度的强制性教养下表现出更高的学校投入；然而，当父母的强制性养育过度时，具有较高共情关注的青少年却减少了学校投入。此外，多组分析结果指出共情关注的调节作用存在性别差异：共情关注并未调节强制性养育对女性青少年学校投入的影响；相反，具有较高共情关注的男性对强制性养育更为敏感，即使中等程度的强制性养育也将导致其学校投入明显降低。研究结论强调了在检验养育方式与青少年学校投入的关系时，应充分考虑青少年个人特征和性别差异的重要作用。

Coercive Parenting and Adolescent School Commitment: Exploring Gender Differences in the Moderating Effect of Empathic Concern

Kehui Wu, Spencer D. Li

Abstract: Coercive parenting is recognized as one of the key predictors of adolescent development. Using strict disciplinary methods, coercive parenting negatively affects adolescent developmental outcomes. However, due to individual characteristics and gender differences, adolescents exhibit varying levels of vulnerability and susceptibility to parenting styles. Based on the two-wave survey data from a sample of 1075 Chinese adolescents, the study found that compared to adolescents with lower levels of empathic concern, those with higher levels of empathic concern report higher levels of school commitment under low to moderate levels of coercive parenting. However, when coercive parenting becomes excessive, adolescents with higher empathic concern exhibit reduced school commitment. Additionally, multiple-group analyses indicated gender differences in the moderating effect of empathic concern: empathic concern did not moderate the impact of coercive parenting on school commitment for female adolescents. Conversely, male adolescents with higher levels of empathic concern were more sensitive to coercive parenting, as even moderate levels of coercive parenting significantly decreased their school commitment. The findings highlight the significance of considering individual characteristics and gender differences when examining the relationship between parenting styles and adolescent school commitment.

Keywords: Coercive parenting, school commitment, empathic concern, gender difference

教师专业活力的特点与影响因素

李喜　王雨　唐甜　陈宁（通讯作者）
上海师范大学教育学院，上海，200234，chenning323@163.com

摘 要　基于我国教育改革与教育发展现状，原创性提出教师专业活力这一概念，在系统梳理国内外有关活力理论与研究的基础上，建构了我国中小学教师专业活力的“三核心”(能量感、积极性、创新性)“三范畴”(教学、育人、服务)的结构模型，并以此为基础研制了《教师专业活力量表》。为探明我国基础教育阶段教师专业活力的现状特点与影响因素，运用自编问卷对 5458 名中小幼学校教师进行调查。研究表明：(1)编制的“三核心三范畴”的《教师专业活力问卷》具有良好的心理测量学信效度；(2)教师专业活力整体发展处于中等向好水平，下属因子中积极性发展最佳，创新性对教师专业活力具有最强预测作用；(3)教师专业活力既存在活力衰竭、活力一般、活力充沛的亚类型差异，也在职称、教龄、任教学段上表现出不同发展水平；(4)组织支持与同事支持显著正向预测教师专业活力，且基本心理需求满足可在其中发挥中介作用。鉴此，为促进教专业活力的有效生成和持续释放，既要把握整体结构、综合施策，又要抓住重点群体与关键因素予以精准施策、赋能应需。

The Characteristics and Influencing Factors of Teachers' Professional Vitality

Li Xi, Wang Yu, Tang Tian & Chen Ning
College of Education, Shanghai Normal University, Shanghai, 200234

Abstract: Based on the current situation of education reform and development in China, the concept of teachers' professional vitality is originally proposed. Based on a systematic review of domestic and international theories and studies on vitality, a structural model of "three cores" (sense of energy, positivity, innovativeness) and "three spheres" (teaching, nurturing, service) of the professional vitality of primary and secondary school teachers in China was constructed, and based on which, the "Teacher Professional Vitality Questionnaire (TPVQ)" has been developed. In order to explore the current situation of teachers' professional vitality in China's basic education stage and the factors affecting it, a self-administered questionnaire was used to investigate 5458 teachers at the basic education. The study shows that: (1) The Teacher Professional Vitality Questionnaire (TPVQ) with three cores and three spheres has good psychometric reliability and validity; (2) The overall development of teachers' professional vitality is at a moderately good level, and among the subordinate factors, positivity is the best, and innovativeness has the strongest predictive effect on teachers' professional vitality; (3) Teachers' professional vitality not only exists sub-type differences of vitality exhaustion, general vitality and abundant vitality, but also shows different levels of development in professional titles, teaching years and teaching periods; (4) Organizational support and colleague support significantly and positively predicted teachers' professional vitality, and the satisfaction of basic psychological needs can play a mediating role in it. In view of this, in order to promote the effective generation and sustained release of teachers' professional vitality, it is necessary to grasp the overall structure and implement comprehensive policies, as well as to grasp the key groups and key factors to implement precise policies and empower them to respond to their needs.

Keywords: teachers' professional vitality; sense of energy; positivity; innovativeness; external resources; basic psychological needs satisfaction

社交焦虑和社会关系的往复式联系：基于纵向研究的元分析结构方程模型

陈必忠[1]　孙晓军[1]（通讯作者）
1 青少年网络心理与行为教育部重点实验室; 华中师范大学心理学院, 武汉，430079，
sunxiaojun@mail.ccnu.edu.cn

摘 要　不同发展阶段的理论均强调社交焦虑和社会关系可能存在往复式联系。然而，现有的实证证据并不一致，是社交焦虑导致社会关系受损？还是不良的社会关系催生社交焦虑？抑或是两者存在双向影响？为了回答这些问题并澄清以往研究的争议，本研究使用元分析技术对以往涉及社交焦虑和四种社会关系（家庭关系、学校关系、浪漫关系和一般性关系）的纵向研究进行定量整合，以明晰两者之间的往复式联系。文献检索和筛选后获取了来自 107 项纵向研究的 110 个独立样本，共计 115133 人，涵盖了从学步期至成年中期的样本。采用一阶段元分析结构方程模型的方法，分别构建 4 个交叉滞后面板模型进行分析，并检验了研究特征(发表年份和方法学质量)、样本特征(年龄、出生年代、男性比例和个体主义指数)和变量特征(时间间隔、社交焦虑成分和报告者)对交叉滞后系数的调节作用。基于 Begg 秩相关法和 Egger 线性回归法的

结果提示不存在显著的发表偏倚。交叉滞后分析表明，在控制了自回归效应后，T1 的社交焦虑依然能显著负向预测 T2 的所有社会关系(β = –0.107 ~ –0.048)。此外，T1 的家庭相关关系(β = –0.060)和一般性关系(β = –0.111)也能显著负向预测 T2 的社交焦虑，但 T1 的学校相关关系(β = –0.026)和浪漫关系(β = 0.019)则不能。调节效应分析表明，家庭相关关系和浪漫关系的模型中不存在显著的调节变量。对于学校相关关系，T1 的社会关系对 T2 的社交焦虑的路径受发表年份的调节。在一般关系中，男性比例调节了 T1 社会关系对 T2 社交焦虑的影响，时间间隔调节了 T1 社交焦虑对 T2 社会关系的影响，年龄则同时调节了社交焦虑和社会关系双向路径。上述发现表明社交焦虑是损害未来社会关系的关键因素，而不良的家庭关系和一般性关系则是滋生社交焦虑的土壤。本研究基于更先进的元分析方法，系统检验了社交焦虑和不同类型社会关系之间的往复式联系，为两变量间的因果关系提供了更有力的证据，也为未来干预社交焦虑和培养良好社会关系提供了实践启示。
关键词　社交焦虑，社会关系，往复式联系，纵向研究，元分析结构方程模型

Examining the reciprocal link between social anxiety and social relationships spanning from childhood to adulthood: A meta-analysis of longitudinal studies

CHEN Bizhong[1], SUN Xiaojun[1]
1 Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education; School of Psychology, Central China Normal University, Wuhan 430079, China

Abstract：Theoretical frameworks regarding various developmental stages highlight the potential for reciprocal connections between social anxiety and social relationships. However, the existing empirical evidence is inconclusive, as it remains uncertain whether social anxiety causes impaired social relationships or if poor social relationships contribute to social anxiety. Alternatively, it is plausible that both factors exert a bidirectional influence. To address these unresolved questions and clarify previous research controversies, this study utilized meta-analysis techniques to quantitatively integrate longitudinal studies that investigate the association between social anxiety and four types of social relationships: family-related, school-related, romantic, and general relationships. The primary objective is to elucidate the bidirectional nature of these associations. A comprehensive dataset comprising 110 independent samples from 107 longitudinal studies, encompassing a total participant count of 115,133 individuals spanning childhood through adulthood, is utilized. Employing the one-stage meta-analytic structural equation modeling approach, four cross-lagged panel models are constructed for thorough analysis. Additionally, this study tests the moderating effects of various study characteristics (publication year and methodological quality), sample characteristics (age, birth cohort, male proportion, and individualism index), and variable characteristics (time lag, facet of social anxiety, and reporter) on the cross-lagged coefficients. The findings from the Begg's rank correlation test and Egger's linear regression test indicated no significant publication bias. Effect size analyses demonstrated that, even after controlling for autoregressive effects, social anxiety at T1 significantly negatively predicted all social relationships at T2 (β = –0.107 ~ –0.048). Moreover, family-related relationships (β = –0.060) and general relationships (β = –0.111) at T1 also significantly and negatively predicted social anxiety at T2, whereas school-related relationships (β = –0.026) and romantic relationships (β = 0.019) at T1 did not. Moderator analyses revealed that there were no significant moderators in the family-related and romantic relationships models. However, in the case of school-related relationships, the path from T1 social relationships to T2 social anxiety was moderated by publication year. For general relationships, the

male proportion moderated the effect of T1 social relationships on T2 social anxiety, and the time lags moderated the effect of T1 social anxiety on T2 social relationships. Additionally, the sample age moderated the bidirectional paths of social anxiety and general relationships. Overall, the study revealed that social anxiety is a key factor that impairs future social relationships, while poor family relationships are the soil that breeds social anxiety. Using advanced meta-analysis methods, this study systematically examined the reciprocal links between social anxiety and various types of social relationships. The findings provide robust evidence for the causal association between these variables and offering practical implications for future interventions aimed at addressing social anxiety and fostering positive social relationships.

3~6 岁学前儿童早期数量认知的发展：符号数字的习得

梁笑[1]　康静梅[1]　王丽娟[1]（通讯作者）
1 东北师范大学，长春，130000，wanglj699@nenu.edu.cn

摘 要　当前研究者从两个角度解释学前儿童如何学习符号数字的问题：一些研究者从非符号数量系统(Non-Symbolic Number System, NSNS)和 SNS(Symbolic Number System, SNS)之间关系的角度出发，提出了近似起源假说和符号关联假说；另一些研究者则从符号数字的表现形式出发(口头数字和书面数字)，提出了基数水平理论和口头映射假说。虽然这四种假说均在某种程度上弥补了缺陷和空白，但均忽略了符号数字学习阶段性和递进式发展的本质。为此，本研究旨在全面深入地考察学前儿童学习符号数字的发展规律和内在机制。本研究测量了 647 名学前儿童（205 名小班、222 名中班、220 名大班）的先天数感、理解符号数字所代表数值含义的能力（口头或书面映射能力）、理解符号数字之间数值关系的能力（数字比较、序数知识、非正式计算）。结果采用结构方程模型发现，在控制工作记忆、执行功能、智力、家庭数量活动后，小班儿童会在数感的基础上，通过学习口头数字和书面数字之间的联结、口头数字和非符号数量之间的映射，进一步学习书面数字和非符号数量之间的映射。中班儿童在数感的基础上，通过三种双向映射的学习，可以更好地学习和理解序数知识，即更好地理解数字之间的数值关系。大班儿童则通过映射和序数知识，可以更好地学习非正式计算的能力，即操纵数值关系的能力。就此，学前儿童的符号数量系统达到早期成熟。
关键词　早期数量认知，符号数量系统，数值含义，数值关系，学前儿童发展

The development of early numerical cognition in preschool children aged 3~6: the acquisition of symbolic numbers

Xiao Liang[1]　Jingmei Kang[1]　Lijuan Wang[1*]
1 Northeast Normal University, Changchun, 130000, wanglj699@nenu.edu.cn

Abstract：3-6-year-old preschool children are in a critical stage of early numerical cognitive development, which mainly refers to the ability to understand the numerical meaning represented by symbolic numbers (e.g., the oral number "five", the written number "5"), that is, the ability of mapping), and the ability to understand the numerical relationship between symbolic numbers (including comparison, ordinal numbers and calculation), that is, the early development and maturity process of the symbolic number system (SNS). The current researchers explain how preschoolers learn symbolic numbers from two different perspectives. Some researchers have proposed the

Approximate Origins Hypothesis and the Symbol-Symbol Association Account from the perspective of the relationship between the Non-Symbolic Number System (NSNS) and SNS. Other researchers have proposed the Knower-Lever Theory and the Verbal Mapping Account based on the representation of symbolic numbers (oral and written). Although these four hypotheses make up for the shortcomings and gaps to some extent, they all ignore the phased and developmental nature of symbolic number learning. Therefore, this study aims to comprehensively and deeply investigate the development trajectory and internal mechanism of preschool children's learning of symbolic numbers. This study measured the number sense, the ability to understand the meaning of the numerical values represented by symbolic numbers (six oral or written NSNS-SNS mapping tasks), and the ability to understand the numerical relationships between symbolic numbers (number comparison, informal calculation task, ordinal task) of 647 preschool children (205 children aged 3-4 years, 222 children aged 4-5 years, 220 children aged 5-6 years). Using the path analysis model and structural equation model, it is found that after controlling for the above additional variables, preschool children would first learn the meaning of the numerical values represented by oral numbers in the order of values from smallest to largest, from oral to written. Secondly, on the basis of learning the audio-visual connection between oral and written numbers, understand the numerical meaning represented by written numbers; Then, the comparison of symbolic numbers would be learned on the basis of the number sense and the understanding of numerical relationships. Finally, on this basis, preschool children can truly understand the numerical relationship between symbolic numbers (ordinal numbers) while learning informal calculations, and the early development of their SNS has also reached maturity.

Keywords **：** early numerical cognitive, symbolic number system (SNS), numerical meaning, numerical relationship, preschool child development

亲社会还是偏差？网络社会行为的情绪驱动机制

摘 要 信息化背景下的网络社会行为备受关注，但其内在的情绪驱动机制尚不明晰。本研究探讨不同效价情绪对网络社会行为(网络亲社会行为与网络偏差行为)的影响及动态变化关系，还进一步考察情绪在社会排斥与网络社会行为间的中介作用及心理控制源的调节效应。研究 1 和 2 分别采用实验法和经验取样法，结果发现：在个体间及个体内水平，正性情绪及变化能促进网络亲社会行为及发展，负性情绪及变化则引发网络偏差行为及发展。研究 3 采用三时点问卷法，结果发现：社会排斥通过正性情绪间接负向影响网络亲社会行为，亦通过负性情绪间接增强网络偏差行为；内控性负向调节正性情绪在社会排斥与网络亲社会行为间中介效应的前半段路径，即随着个体内控性水平的增加，社会排斥对正性情绪的负向影响逐渐减弱。

关键词 正性情绪，负性情绪，社会排斥，网络偏差行为，网络亲社会行为

Prosocial or Deviant? Emotion Enhancement Mechanism of Cybersocial Behavior

Abstract：Cybersocial behavior (cyber-prosocial behavior and cyber-deviant behavior) under the background of information technology has attracted increasing attention. It is unclear, however, if and how emotion affects cybersocial behavior. Furthermore, previous studies have focused on the influence of trait factors on cybersocial behavior yet overlooked the important role of state fluctuation factors. Moreover, investigating the influence of negative and positive emotional fluctuations on cybersocial behaviors is helpful to extend the study of cybersocial behaviors driven by emotionalism and break the traditional cognitive model of "high quality and good behavior" or "low quality and bad behavior". Drawing upon mood-congruent theory and stressor-emotion model, we theorize that negative and positive emotional fluctuations influence different cybersocial behaviors and examine the impact of social exclusion on cybersocial behaviors and its mechanism——the mediating effect of emotions and the moderating effect of locus of control. Study 1 (N=129) and 2 (N=258) conducted an experiment and an experience sampling method separately. Results showed that positive emotions positively predicted cyber-prosocial behavior and negative emotions positively predicted cyber-deviant behaviors. Study 3 conducted a moderated mediation model on three-wave longitudinal data obtained from 319 college students. Results showed that: (1) Social exclusion contributed to cyber-prosocial behavior through positive emotion, and similarly contributed to cyber-deviant behavior partially through negative emotion. (2) The mediating effects of positive emotions on social exclusion and cyber-prosocial behavior were negatively moderated by internal control. The indirect effect was weaker for students with high internal control than for those with low internal control. These findings expand the cognitive framework of the driving mechanism of cybersocial behavior, excavate the rich implications of the emotional motivation of cybersocial behavior, and reveal the social spillover effects of emotions in the cyber environment under social exclusion.

Keywords: positive emotion, negative emotion, social exclusion, cyber-deviant behavior, cyber-prosocial behavior

父母受教育程度与父母期望对青少年学业和心理健康的影响：一项以个体为中心的分析

张蕊[1]　张航[1]　梁芃伟[1]　边玉芳[1,2]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

2 北京师范大学儿童家庭教育研究中心，北京，100875，bianyufang66@163.com

摘 要　家庭情境是影响青少年早期学业发展和心理健康发展的重要因素。教育期望指对未来教育成就的希望和期待。父母受教育程度是家庭的文化资本，也是父母教育期望的重要现实因素。根据情境期望价值理论，二者共同构成影响子女发展的家庭情境。然而，以往研究多从变量为中心的视角考察父母受教育程度及教育期望的影响，且往往仅考察母亲或将父亲和母亲视为一个整体，鲜有研究从家庭整体角度区分父母受教育程度及教育期望共同构成的家庭情境亚类型，以及考察其对青少年发展的影响差异。因此，本研究于 2021 年以 1104 名初一学生及其父母为被试进行初测，间隔 1 年进行追测（孩子年龄 $M_{wave.1age}$=13.23 岁），通过个体为中心的视角，同时将父亲和母亲的受教育程度及教育期望纳入分析，借助潜在剖面分析（Latent

Profile Analysis, LPA）探究家庭中父母受教育程度-父母期望的类别；使用潜在转变分析（Latent Transition Analysis, LTA）探究不同家庭类别的稳定性和变化特点；并探究不同类别对青少年儿童初一和初二时学业表现、主观幸福感和抑郁的影响。结果表明：（1）在两个时间点，父母受教育程度-父母教育期望均可以分成四种家庭类别：高受教育-高期望(T1=31.2%，T2=31.2%)、中受教育-中期望(T1=20.5%,T2=21.9%)、低受教育-高期望(T1=42.6%, T2=37.9%)、低受教育-低期望(T1=31.2%,T2=8.9%)；（2）从初一到初二,，高受教育-高期望、中受教育-中期望的家庭保持了较高的稳定性，而低受教育-低期望家庭向低受教育-高期望家庭转变的概率最高；（3）家庭类别对青少年子女的学业表现（语文、数学、英语）和心理健康（主观幸福感、抑郁）有显著影响，其中高受教育-高期望组最利于青少年的发展（学业表现最好，主观幸福感最高，抑郁最低）。与低受教育-低期望组相比，无论在初一还是初二，低受教育-高期望组青少年均具有更好的学业表现，更少的抑郁，在初二时，还具有更高的主观幸福感。研究结果从家庭角度揭示在低文化资本下，父母高教育期望能帮助青少年获得更好的发展，为帮助低文化资本家庭获得向上循环提供了一个实证研究基础。

The influence of parental educational level and parental expectations on adolescent academic performance and mental health: a person-centered analysis

Rui Zhang[1]　Hang Zhang[1]　Pengwei Liang[1]　Yufang Bian[1]（corresponding author）
1Collaborative Innovation Center of Assessment toward Basic Education Quality at Beijing Normal University, Beijing，100875
2 Child and Family Education Research Center at Beijing Normal University, Beijing

Abstract: Family situation is an important factor affecting the academic development and mental health development of early adolescents. Educational expectation refers to the expectation of future educational achievement. The parental educational level is not only the cultural capital of the family, but also an important realistic factor of parental educational expectation. According to the situated expectancy-value theory, the two together constitute the family situation that affects the development of adolescents. However, previous studies mostly examined the influence of parental education level and education expectation through the variable-centered approach, and often only examined the mother or regarded the father and mother as a whole. Few studies differentiated the subtypes of family situations jointly constituted by parental education level and education expectation from the perspective of the whole family, and examined the differences in their influence on adolescent development. Therefore, the current study adopted 1104 secondary school students and their parents as the subjects in 2021, and conduct follow-up tests one year later (children's age $M_{wave.1age}$=13.23 years). From a person-centered perspective, the educational level and educational expectation of fathers and mothers will be included in the analysis. Latent Profile Analysis (LPA) was used to explore different profiles of parental educational level-parental expectation; Latent Transition Analysis (LTA) was used to explore the stability and the changing characteristics of different profiles. It also explores the influence of different profiles on academic performance, subjective well-being and depression in the seventh and eighth grade. The results show that: (1) At both time points, parental education level-parental education expectation can be divided into four family profiles: High education-high expectation (T1 = 31.2%, T2 = 31.2%), middle education-middle expectation (T1 = 20.5%, T2 = 21.9%), low education-high expectation (T1 = 42.6%, T2 = 37.9%), low education-low expectation (T1 = 31.2%, T2 = 8.9%); (2) From seventh to eighth grade, high education-high expectation and middle

education-middle expectation profiles maintained high stability, while low education-low expectation profile had the highest probability of changing to low education-high expectation profile; (3) Family profiles have significant effects on adolescents' academic performance (Chinese, Math, English) and mental health (subjective well-being, depression), in which the high education-high expectation profile is the most beneficial to adolescent development (the best academic performance, the highest subjective well-being and the lowest depression). Compared with the low education-low expectation profile, adolescents in the low education-high expectation profile had better academic performance, less depression, and higher subjective well-being in eighth grade. The results of this study reveal that under the condition of low cultural capital, parental high educational expectation can help teenagers achieve better development, and provide an empirical research basis to help families with low cultural capital get an upward cycle.

Keywords: Parental educational level, parental educational expectation, person-centered, adolescent academic performance, adolescent mental health

童年不良经历对冒险行为发展的影响：自我控制纵向中介作用和多基因分数的调节作用

王林欣[12]　黎建斌[3]　刘子豪[4]　窦凯[2]（通讯作者）

1 北京师范大学发展心理研究院，北京，100875

2 广州大学教育学院青少年心理与行为研究中心，广州，510006，　通讯作者 psydk@gzhu.edu.cn

3 香港教育大学幼儿教育学系，香港，中国

4 中国科学院行为科学重点实验室(中国科学院心理研究所), 北京，100101

摘 要　过往横断研究表明，冒险行为随年龄（10~25 岁）的上升呈“倒 U 型”发展趋势。然而，尚不清楚在纵向研究中，中国青少年是否表现出相同冒险趋势。诚然，自我控制理论表明低自我控制是冒险行为的核心因素，但考察自我控制发展轨迹如何影响冒险行为的研究较为稀缺。此外，少有研究从“基因×环境”视角考察自我控制发展轨迹的影响因素，并采用多基因方法。基于人格社会生态遗传学框架和生活史理论，本研究探讨了多基因分数和童年不良经历交互作用，共同影响自我控制的发展轨迹，进而影响冒险行为的发展。本研究采用追踪设计(共 3 个时间点，间隔 6 个月)对广州市，对 1914 名青少年（男性 1008 名，M_{age}=14.51 岁，SD = 1.49）的童年不良经历(T1)、自我控制(T1/T2/T3)、冒险行为(T1/T2/T3)进行调查。

潜增长模型表明，(1) 早期青少年的自我控制发展呈下降趋势，冒险行为发展呈上升趋势，而中期青少年的自我控制发展呈上升趋势，冒险行为发展呈下降趋势。(2) 自我控制截距和斜率分别负向影响冒险行为截距和斜率。此外，自我控制截距正向预测中期青少年的冒险行为斜率。 (3) 纵向中介效应表明，童年不良经历通过削弱自我控制的截距，提高早、中期青少年冒险行为的截距。此外，童年不良经历能加剧早期青少年自我控制的下滑，间接影响冒险行为的斜率。(4) 本研究通过机器学习的留一法交叉验证确定了 5 个与自我控制有关的基因位点，即 *DRD1* 基因 rs686，*BDNF* 基因 rs2030324，*OXTR* 基因 rs2254295，*HTR2A* 基因 rs6311 和 *HTR2A* 基因 rs6313。这五个位点的多基因分数显著调节了自我控制截距在童年不良经历与冒险行为截距的纵向中介效应。相比于多基因分数较低的青少年，童年不良经历通过削弱自我控制初始水平，进而提高冒险行为初始水平的效应在多基因分数较高的早、中期青少年中更显著。该作用模式与差别易感模型相吻合，即携带特定易感基因型的青少年可能更容易受到外界环境因素的影响。该研究结果有助于临床工作人员识别和区分具有遗传易感性的青少年，从而通过行之有效的认知或行为干预来缓解童年不良经历对青少年的消极影响。

The Impact of Adverse Childhood Experiences on the Developmental Trajectory of Adolescents' Risk-Taking: Longitudinal Mediating Effect of Self-Control and Moderating Effect of Polygenic Scores

Lin-Xin Wang[12] Jian-Bin Li[3] Zi-Hao Liu[4] Kai Dou[2]

1 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

2 Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

3 Department of Early Childhood Education, The Education University of Hong Kong, Hong Kong, China

4 CAS Key Laboratory of Behavioral Science, Institute of Psychology, Beijing, 100101

Abstract: Previous cross-sectional studies have shown that risk-taking behaviors follow an "inverted U-shaped" developmental trend with age (10 to 25 years). It was unclear whether the same trend of risk-taking could be observed among Chinese adolescents in longitudinal studies. Despite self-control theory demonstrating that low self-control is the central factor for risk-taking, there is a paucity of research considering the impact of self-control developmental trajectory on risk-taking. Additionally, while researchers have gradually focused on the root of self-control from the perspective of "gene × environment", scant studies conducted a longitudinal design to consider its development trajectories and applied a polygenic approach. Drawing on the socioecological-genetic framework of personality and life history theory, this study investigated the interplay between polygenic score and adverse childhood experiences (ACEs) in relation to self-control developmental trajectory and further changes in risk-taking among early and middle adolescents. A longitudinal design with three time points (spaced 6 months apart) was employed to survey 1914 adolescents in Guangzhou (1008 males; M_{age}=14.51 years, SD = 1.49) regarding ACEs (T1), self-control (T1/T2/T3), and risk-taking behaviors (T1/T2/T3).

Latent growth modeling revealed the following findings: (1) self-control decreased and risk-taking increased over time among early adolescents, whereas self-control increased and risk-taking decreased over time among middle adolescents. (2) The initial level and slope of self-control were negatively associated with the initial level and slope of risk-taking in early adolescents, respectively, while the initial level of self-control was positively associated with the slope of risk-taking in middle adolescents. (3) The longitudinal mediating effect indicated that ACEs would increase early and middle adolescents' risk-taking intercept via dampening self-control intercept, and increase early adolescents' risk-taking slope via aggravating the decline in self-control. (4) Using a leave-one-out cross-validation approach, we identified five important SNPs: *DRD1* rs686, *BDNF* rs2030324, *OXTR* rs2254295, *HTR2A* rs6311, and *HTR2A* rs6313. The polygenic scores derived from these SNPs could interact with ACEs, co-shaping adolescents' self-control intercept and thus risk-taking intercept. Adolescents with higher polygenic scores exhibited a more pronounced effect of ACEs on reducing their initial self-control level and subsequently increasing their initial level of risk-taking behaviors compared to those with lower polygenic scores. This pattern aligns with the differential susceptibility model, suggesting that adolescents with plasticity genes may be more susceptible to external environmental factors. These findings could assist clinical practitioners in distinguishing adolescents who are genetically predisposed, enabling the mitigation of the negative impact of ACEs through effective cognitive or behavioral interventions.

教学得法：实现特定学习目标的教学活动与教学策略

牛端

中山大学心理学系，广州，510006

E-mail：edsnd@mail.sysu.edu.cn

摘 要　学教评一致性是有效教学的基本原则。经典著作《布卢姆教育目标分类学：分类学视野下的学与教及其测评》对如何测评特定学习目标，从而实现测评与目标的一致性，做了系统清晰的阐述，但是该书作者明确指出教学策略与学习目标之间的联系尚不够明确，需要进一步的研究，因为多数教师想知道何种教学才能有效实现某种特定目标。在该书出版 22 年之后，上述问题仍未得到基于实证研究的可靠回答。本研究采取《本科课程教学评价问卷》（学生版）和《本科课程教学信息问卷》（教师版）对两所普通高校的 137 门课程的教师（137 人）、120 门课程的学生（2690 人）进行了调查，基于调查数据得到 76 门课程的任课教师与修读学生的匹配数据。结果发现：①高校教师认为重要的课程学习目标有 3 项：理解本科目知识（G1）、知识的应用（G2）、形成与本课程最相关的专业技能与观点（G3）；②能够显著促进 G1 目标实现的教学活动包括：讲授、案例研究和服务学习，能够显著促进 G2 目标实现的教学活动包括：案例研究和服务学习，能够显著促进 G3 目标实现的教学活动包括：服务学习、讲授和讨论；③能够显著促进 G1 目标实现的教学策略包括：“讲清楚章节如何与课程相符”（S1）、鼓励课外联系（S2）、介绍具有启发意义的观点（S3），能够显著促进 G2 目标实现的教学策略包括：S3、帮助学生解答他们的问题（S4）、S2，能够显著促进 G3 目标实现的教学策略包括：让学生参与实践项目、S1、鼓励自我反思（S5）。教学有法，但无定法，贵在得法，本研究为高校教学实现特定目标提供了教学活动与教学策略决策参考。

Teaching Rightly: Teaching Activities and Teaching Strategies for Achieving Specific Learning Objectives

NIU Duan

Department of Psychology, Sun Yat-sen University, Guangzhou 510006

Abstract： The alignment among learning/teaching objectives, teaching activities, and assessment tasks is a fundamental principle of effective teaching. The classic work "A Taxonomy for Learning, Teaching, and Assessing- A Revision of Bloom's Taxonomy of Educational Objectives" provides a systematic and clear explanation of how to assess specific teaching objectives to achieve alignment between assessment and objectives. However, the author of this book explicitly points out that the linkage between teaching strategies and learning

objectives is not yet clear and requires further research, as most teachers want to know which teaching methods can effectively achieve specific goals. Twenty-two years after the publication of the book, the above-mentioned question has still not received a reliable answer based on empirical research. This study conducted surveys using the "Student Evaluation of Teaching Questionnaire" (Student Version) and the "Teaching Information Questionnaire" (Teacher Version) to investigate 137 courses and their teachers (137 individuals) and 120 courses and their students (2690 individuals) from two universities. Based on the survey data, matching data for 76 courses between the course teachers and the enrolled students were obtained. The results revealed the following:

1.College teachers considered the following three learning objectives as important or essential: gaining a basic understanding of the subject (G1), learning to apply course material (G2), and developing relevant professional skills and perspectives related to the course (G3).

2.Teaching activities that significantly promote the achievement of G1 objectives include lectures, case studies, and service learning. Teaching activities that significantly promote the achievement of G2 objectives include case studies and service learning. Teaching activities that significantly promote the achievement of G3 objectives include service learning, lectures, and discussions.

3.Teaching strategies that significantly promote the achievement of G1 objectives include "clearly explaining how each topic fit into the course" (S1), encouraging student-faculty interaction outside of class (S2), and introducing stimulating ideas about the subject (S3). Teaching strategies that significantly promote the achievement of G2 objectives include S3, helping students answer their own questions (S4), and S2. Teaching strategies that significantly promote the achievement of G3 objectives include involving students in hands-on projects, S1, and encouraging students to reflect on what they have learned (S5).

Teaching has methods, but there is no fixed method. The value lies in finding the right method. This research provides decision-making references for selecting right teaching activities and teaching strategies that can achieve specific learning goals in higher education.

不同思维模式对高中生学习动机和学业成绩的影响机制

李岳[1]　姜怡[2]（通讯作者）

1 上海外国语大学附属外国语学校，上海，200434

2 华东师范大学教育心理学系，上海，200062，yjiang@dep.ecnu.edu.cn

摘 要　在我国现行教育体制下，学业成绩一直是评价学生学习发展的核心要素，也是学校和社会广泛关注的学习成果指标。良好的学习动机能够对学生的学业成绩产生持久而稳定的促进作用。近年来，思维模式理论一直是学习动机领域的研究热点之一。思维模式是指个体对智力是否可塑的内隐信念，成长型思维认为智力具有可塑性，而固定型思维则认为智力是不可塑的。以往研究对于思维模式与学业成绩之间的影响关系仍存在较大争议，且两种思维模式的维度界定也有一定模糊性。因此，本研究主要探析中国高中生群体对于两种思维模式的具体认知，以及其对于学生学习动机和学业成绩的独特影响机制。本研究基于 878 份问卷数据，通过验证性因子分析和结构方程模型，使用以变量为中心的方法探究思维模式的作用机制。基于 SPSS 以及 Mplus 软件数据分析所得的结果表明：（1）成长型思维与固定型思维是两个独立的维度，应在研究中同时关注。（2）成长型思维与固定型思维的影响机制不同。成长型思维能够正向预测自我效能感、兴趣价值和努力成本；固定型思维能够负向预测自我效能感和兴趣价值，正向预测努力成本。（3）思

维模式并不直接对高中生的学业成绩产生影响，而是通过某些动机因素间接对成绩产生影响。具体来说，努力成本在成长型思维和学业成绩之间起负向的中介作用；固定型思维通过降低自我效能感、增加努力成本从而对学业成绩产生负面影响。本研究探析了两种思维模式如何影响高中生的学习动机和学业成绩，研究结果是对思维模式与学习动机和学业成绩之间关系的相关文献的重要补充，为思维模式与学业成绩之间作用机制的争议提供了更多可供参考的证据。此外，研究结果还具有重要的应用价值，能够为如何针对性培养中学生的成长型思维提供新的思路，有助于在教育实践中对差异化学生群体采取更有针对性的和个性化的干预措施。

Distinct Roles of Different Types of Mindset on High School Students' Academic Motivation and Achievement

Yue Li[1] , Yi Jiang[2] (Corresponding Author)

[1] Shanghai Foreign Language School Affiliated to Shanghai International Studies University, Shanghai, 200434

[2] Department of Educational Psychology, East China Normal University, Shanghai, 200062

Abstract：In China's current education system, academic performance has always been the core element for evaluating students' learning development, and it is also a widely concerned indicator of academic outcomes for both schools and society. Adaptive learning motivation can exert a lasting and stable promoting effect on students' academic performances. In recent years, the theory of mindset is one of the research hotspots in the field of motivation. Mindset is an implicit belief about whether intelligence is malleable or not, among which a growth mindset posits that intelligence is malleable, while a fixed mindset believes that intelligence is unchangeable. Significant controversy still exists in previous research on the relationship between mindsets and academic achievement, the dimensional definition of these two mindsets also has some ambiguities. Therefore, the present study mainly analyzed Chinese high school students' perceptions on these two mindsets and their unique impacts on students' learning motivation and academic achievement.This study based on a sample of 878 students, explored the mechanism of mindsets from the variable-centered approach through confirmatory factor analysis and structural equation modeling in SPSS and Mplus, The results indicated that: (1) Growth mindset and fixed mindset are two independent dimensions that should be simultaneously investigated in research. (2) Growth mindset and fixed mindset have different influence mechanisms. Growth mindset positively predicted self-efficacy, interest value, and effort cost. In contrast, fixed mindset negatively predicted self-efficacy and interest value, while positively predicted effort cost. (3) Mindset did not directly affect high school students' academic achievement, but indirectly influenced it through some motivational factors. Specifically, effort cost served as a negative mediator between growth mindset and academic achievement. Fixed mindset influenced academic achievement through declined self-efficacy and increased effort cost.This study explores the effects of two different types of thinking patterns on high school students' learning motivation and academic achievement. The results provide important supplementary evidence for the relationship between mindsets and learning motivation and academic achievement, and contribute to the debate on the influence mechanisms of the relationship between mindsets and academic achievement. Furthermore, the findings of this study have important practical implications, providing new insights into how to cultivate growth mindsets in middle school students in a targeted manner, and promoting more targeted and personalized interventions for diverse student groups in educational practice.

中小学教师对学生违规行为评价语的类型：基于潜在类别分析

孙月仙[1],李天昶[1],甄瑞[1 2*]（通讯作者）
1 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com
2.浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘 要 当中小学生做出违规行为时，很多教师会采用批评方式对其行为进行评价和教育。随着社会对中小学生心理健康问题的关注，教师也开始注重遵循学生的心理发展规律并从积极心理学视角看待和处理其违规行为。不过，当前尚缺少关于中小学教师对学生违规行为评价语类型的大样本研究，同时探讨教师评价语对学生情绪和学习影响的研究较多，考察评价语对教师自身情绪和工作状态影响的研究较少。为此，本研究对浙江省 7642 名中小学教师进行问卷调查，通过潜在类别分析探究其对学生违规行为评价语的类型，并以类型为自变量，以教学愉悦感和工作倦怠为因变量，进行独立样本非参数检验。研究结果发现，中小学教师对学生违规行为评价语存在以下四种类型：质疑批评型（组 1，13.5%）、共情关注型（组 2，60.9%）、批评与关注兼顾型（组 3，12.2%）、进步关注型（组 4，13.4%）。在面对学生总是上课迟到的问题时，质疑批评型的教师倾向于用较为严厉的语气质问学生迟到原因并质疑学生在其他事情上的表现；共情关注型教师会理解学生处境，关注学生为不再迟到做出的进步和努力，并感谢学生能够坚持赶到学校；批评与关注兼顾型教师会批评学生的迟到行为也能关注到学生进步；进步关注型教师关注学生每一次的进步。此外，这四种类型教师在教学愉悦感[$\chi^2(df=3)= 642.47, p<0.001$]和工作倦怠[$\chi^2(df=3)= 740.53, p<0.001$]上的得分都存在显著差异；在教学愉悦感上，得分排序是“组 2=组 3>组 4>组 1”，在工作倦怠上，得分排序是“组 1=组 3>组 4>组 2”。这些结果说明了，在面对学生违规行为时，超过一半的浙江省中小学教师会尝试理解和关注学生消极行为中蕴含的积极因素，较少教师会只对行为进行批评与质疑。教师对学生违规行为的评价也会影响教师情绪和工作倦怠，共情关注型、批评与关注兼顾型教师所体验到的教学愉悦感最强，质疑批评型教师的教学愉悦感最低；质疑批评型、批评与关注兼顾型教师的工作倦怠水平最高，共情关注型教师的工作倦怠水平最低，说明教师对学生行为的反馈也反映或影响了教师的内在心理资源。
关键词: 中小学教师，违规行为，评价语，教学愉悦感，工作倦怠

Patterns of Evaluation Language for Students’ Violations by Primary and Secondary School Teachers: A Latent Class Analysis

Yuexian Sun[1], Tianchang Li[1], Rui Zhen[1 2*]（Corresponding Author）
1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China
2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract：When primary and secondary school students make violations, many teachers use criticism to evaluate and educate their behavior. With the increasing attention to the mental health issues of primary and secondary school students in society, teachers have also begun to pay attention to following the psychological development rules of students and viewing and handling their violations from a positive psychological perspective.

However, there is still a lack of large sample research on the evaluation language types used by primary and secondary school teachers to evaluate students' violations. Meanwhile, there are many studies on the influence of

teachers' evaluation languages on students' emotions and learning, and few studies on the influence of these evaluation languages on teachers' own emotions and working status. We conducted a questionnaire survey on 7642 primary and secondary school teachers in Zhejiang Province, and explored the types of their evaluation of student violations through latent category analysis. These four types were used as independent variables, and teachers' enjoyment and job burnout were used as dependent variables to conduct independent sample non-parametric tests We found four types of evaluations by primary and secondary school teachers on students' violations: skeptical and criticism (Group 1, 13.5%), sympathetic attention (Group 2, 60.9%), combination of criticism and attention (Group 3, 12.2%), and progressive attention (Group 4, 13.4%). When facing the problem of students always being late for class, skeptical and criticism teachers tended to use a more severe tone to question the reasons for students' lateness and their performance in other things; empathetic attention teacher would understand the situation of students, paid attention to their progress and efforts to avoid being late, and was grateful that students could persist in arriving at class; A teacher who combination of criticism and attention would criticize students' late behavior and also paid attention to their progress every time; Progressive attention teachers tended to focus on students' progress every time. In addition, there were significant differences in the scores of teachers' enjoyment [$\chi^2(df=3)=642.47$, $p<0.001$] and job burnout [$\chi^2(df=3)=740.53$, $p<0.001$] among these four types of teachers; In terms of teachers' enjoyment, the score ranking was "Group 2=Group 3>Group 4>Group 1", and in terms of job burnout, the score ranking was "Group 1=Group 3>Group 4>Group 2".These results showed that more than half of primary and secondary school teachers in Zhejiang Province would try to understand and paid attention to the positive factors contained in the students' negative behaviors, while a relatively small number of teachers only gave the skeptical and criticism of the behaviors. Teachers' evaluation of students' violations would also affect teachers' emotions and job burnout, sympathetic attention and combination of criticism and attention teachers had the strongest sense of enjoyment, while teachers of skeptical criticism had the lowest; Skeptical criticism, combination of criticism and attention teachers had the highest level of job burnout, and teachers of sympathetic attention had the lowest level of job burnout, indicating that teachers' feedback on students' behavior also reflected or affected teachers' internal psychological resources.

Keywords： primary and secondary school teachers, violations, evaluation language, teachers' enjoyment, job burnout

师生关系对教师职业承诺的影响—基于情感分析和结构方程模型

摘 要　教师职业承诺是个体对其职业的认同和投入程度，它对于维护职业稳定性，提高工作效率，以及促进个体和组织的发展具有重要作用，然而如果教师职业承诺过低，往往会引发他们产生不同程度的离职倾向。目前的研究已经揭示了许多影响职业承诺的因素，如工作满意度、职业道德、工作环境等。然而，对于师生关系如何影响教师职业承诺的研究还相对缺乏。在这项研究中，我们基于社会认同理论、社会情感交换理论以及 P-O 适配理论做了两个研究，研究一初步对中小学教师的人际关系、情绪倾向和行为倾向进行探讨，研究二在研究一的基础上探讨了师生关系和中小学教师职业承诺的内在作用机制，即教师负性情绪的中介效应以及职业价值观的调节效应。本研究首先利用网络爬虫在抖音等平台获取了 10023 条评论信息，并对其进行了初步筛选，从中选出了 8345 条有效评论进行词频和情感分析，基于这些网络获取的数据分析结果，我们进一步对中国中南部地区的 2397 名中小学教师进行了在线匿名问卷调查。通过对近一年的

网络评论数据进行分析，我们发现中小学教师的师生关系对其职业承诺产生了最大的影响。根据这个结果，我们利用在线问卷调查的数据进行分析，结果显示，中小学教师的师生关系对其职业承诺产生了显著的正向影响。在此过程中，教师的负性情绪在师生关系和职业承诺之间起到了中介作用，而职业价值观在此过程中发挥了调节作用。这一发现为我们理解教师职业承诺的影响因素提供了新的视角，也为提高教师职业承诺，优化教育环境提供了理论依据。未来的研究可以进一步探讨其他可能的中介和调节变量，以便更全面地认识教师职业承诺的形成和发展过程。

3 Wuxi Teacher Development Institute, Wuxi, China

***Abstract*:** The concept of professional commitment in the teaching profession pertains to an individual's sense of identity and allegiance to their chosen field. This commitment is instrumental in fostering occupational longevity, enhancing work productivity, and facilitating both personal and institutional growth. Nevertheless, a deficiency in a teacher's professional commitment often precipitates varying intensities of turnover inclinations. Existing literature has identified numerous determinants of professional commitment, including job satisfaction, professional ethics, and the work milieu. However, the influence of teacher-student relationships on teachers' professional commitment remains relatively underexplored. In this research, we executed two investigations underpinned by social identity theory, social emotional exchange theory, and person-organization fit theory. The initial study embarked on a preliminary exploration of teachers' interpersonal relationships, emotional proclivities, and behavioral tendencies. The subsequent study, building upon the first, delved into the inherent mechanism linking teacher-student relationships and teachers' professional commitment, specifically the mediating role of teachers' negative emotions and the moderating role of professional values. Initially, we employed web crawlers to amass 10,023 comments from platforms such as TikTok, and following an initial screening, we selected 8,345 valid comments for word frequency and sentiment analysis. Based on the outcomes of this digital data analysis, we further implemented an anonymous online questionnaire survey involving 2,397 primary and secondary school educators in the central and southern regions of China. Through the analysis of nearly a year's worth of online commentary data, we discovered that the teacher-student relationship exerted the most substantial influence on their professional commitment. In light of these findings, we utilized the data from the online questionnaire survey for additional analysis, which demonstrated that the teacher-student relationship had a significant positive impact on their professional commitment. In this dynamic, teachers' negative emotions served as a mediating factor between teacher-student relationships and professional commitment, while professional values acted as a moderating factor. This discovery offers a novel viewpoint for comprehending the factors that shape teachers' professional commitment and provides a theoretical foundation for augmenting teachers' professional commitment

and refining the educational environment. Future research could delve into other potential mediating and moderating variables to gain a more holistic understanding of the genesis and evolution of teachers' professional commitment.

Keywords：Primary and secondary school teacher，teacher-student relationship, teacher professional commitment, negative emotions, professional values

绘本主题活动材料包干预对山村留守幼儿语言能力的促进作用

赵晓婷[1] Nguyen Thi Phuong[1]　张李斌[1]　吕丽莹[2]　张云运[1]（通讯作者）

2 童行学院，北京，100102

摘 要　语言能力是其他能力发展的前提和手段，关系着数学、执行功能、社会情绪能力等技能的发展，同时影响着后期学业表现。已有研究已经证明处于贫乏环境的幼儿语言发展明显落后于处于丰富环境的幼儿，当幼儿处于既是经济落后的山村同时也是留守儿童的多重叠加处境不利环境中时，语言的发展更需要干预提升。因此本研究尝试构建适合经济落后山村地区留守幼儿身心发展特点及发展需要的绘本主题教育活动材料包干预，帮助幼儿教师以绘本为媒介开展活动来促进经济落后地区农村留守幼儿的语言能力发展。本研究采用 2（组别：干预组/对照组）×2（年龄：4 岁/5 岁）×3（测试类型：前测/中测/后测）的实验设计探究干预的效果。该干预为幼儿园教师提供以绘本为主的主题活动材料包和远程培训的支持，对资金和时间的投入依赖较少。教师还可以根据自身特点使用绘本主题活动材料包，根据本班幼儿的特点灵活调整活动，灵活性高。选取“一村一园：山村幼儿园计划”的 6 所山村幼儿园中 4-5 岁留守幼儿共 69 名,39 名为干预组, 30 名为对照组，采用标准工具一对一测查幼儿语言能力的发展。研究结果表明，通过一学年的干预，不同年龄留守幼儿干预发挥作用时间和效果不同。（1）在词汇广度方面，4 岁幼儿在干预一学期后显著提升，5 岁幼儿在一学期和一学年后显著提升；（2）在词汇深度方面，5 岁幼儿在干预一学年后显著提升，4 岁幼儿无显著变化；（3）在口语表达能力方面，4 岁与 5 岁幼儿在干预一学年后显著提升。这说明该干预方法通过提供材料包和精简的培训，提升了山村留守幼儿的语言能力发展，该干预有望成为一种有效的、操作简单的、经济的、灵活的干预措施，来帮助提高山村学前留守幼儿的语言发展，为乡村振兴注入新的活力和希望。

1 Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, 100875

2 Tongxing School, Beijing, 100102

Abstract：Language ability is the prerequisite and means for the development of other abilities, which is related

to the development of mathematics, executive function, social emotional ability and other skills, and also affects later academic performance. Existing studies have proved that the language development of children in poor environments obviously lags behind that of children in rich environments. When children are in both economically backward mountain villages and left-behind children, their language development needs more intervention and improvement. Therefore, this study attempts to construct picture-book themed educational activity material package intervention that is suitable for the physical and mental development characteristics and development needs of left-behind children in economically backward mountain villages, so as to help preschool teachers carry out activities through picture books to promote the language ability development of left-behind children in economically backward rural areas. In this study, the experimental design of 2 (group: intervention group/control group) ×2 (age: 4 /5 years old) ×3 (test type: pre-test/mid-test/post-test) was used to explore the effect of the intervention. This intervention provides kindergarten teachers with the support of themed activity material packages based on picture books and remote training, and relies less on the investment of funds and time. Teachers can also use the picture book themed activity materials package according to their own characteristics, and adjust the activities flexibly according to the characteristics of the children in the class, with high flexibility. A total of 69 children aged 4-5 were selected from 6 kindergartens in mountain villages under the "One Village, One preschool: Mountain Village Kindergarten Plan",39 were in the intervention group and 30 were in the control group. Standard tools were used to measure the development of children's language ability. The results show that: (1) In terms of vocabulary breadth, 4-year-olds significantly improved after one semester of intervention, and 5-year-olds significantly improved after one semester and one school year; (2) In terms of vocabulary depth, 5-year-old children significantly improved after one school year of intervention, while 4-year-old children had no significant change; (3) In terms of oral expression ability, 4 - and 5-year-olds significantly improved after one school year of intervention. This indicates that the intervention method has improved the language ability development of left-behind children in mountain villages by providing material packages and simplified training. The intervention is expected to become an effective, simple, economical and flexible intervention measure to help improve the language development of left-behind preschool children in mountain villages, and inject new vitality and hope for rural revitalization.

初中生师生关系与数学学习投入：不同学业情绪的中介作用

王敬格　贾绪计(通讯作者)
天津师范大学心理学部，天津，300387

摘 要　百年大计，教育为本。随着我国基础教育课程改革的层层推进，素质教育已经取得显著的成效，但距离“立德树人”的高质量发展还有一定的差距。因此全面打造核心素养体系，关键因素之一就是提高学生的学习投入度。数学作为基础教育的三大主科之一，学好数学不仅有利于培养认知、逻辑、空间想象等各种能力，还有利于更长远的发展。数学学习投入(Mathematic Learning Engagement)是学习投入在数学科目上的具体运用，它受到师生关系、学业情绪等各种因素的影响。本研究以数学学习投入为立足点，探讨师生关系、学业情绪两个重要因素的作用。

采用三个彼此递进的研究探讨师生关系、学业情绪与数学学习投入的关系。研究一，基于对 1023 名学生的调查，修订适合中学生数学课堂情境中的《数学学业情绪问卷》。研究二，对 420 名初中生进行《数学学业情绪量表》、《师生关系量表》和《学习投入量表》的测量，探讨不同学业情绪在师生关系和数学

学习投入关系中的中介作用。研究三，采用经验取样法，对 68 名初二学生连续两周（10 个工作日）在每天的每节数学课后进行连续追踪测查，探讨数学学习投入与师生关系、学业情绪的瞬时动态变化关系。

研究结果表明：（1）修订的《数学学业情绪问卷》具有良好的效度信度，可以作为调查工具使用；（2）积极学业情绪中的愉快、希望、自豪在师生关系和数学学习投入之间起部分中介作用；消极学业情绪中的无聊在师生关系和数学学习投入之间起部分中介作用；其他学业情绪（如愤怒、焦虑、羞愧、绝望）的中介作用不显著；（3）每节课师生关系对数学学习投入有正向影响。每节数学课师生关系对积极学业情绪（愉快、希望、自豪）有正向影响。每节数学课师生关系对消极学业情绪（焦虑、羞愧、无聊）有负向影响。数学课堂学业情绪在师生关系与数学学习投入间起中介作用。

Teacher-student relationship and academic engagement in mathematics among middle school students: the mediating effects of different Achievement emotions

Wang Jing-ge　JIa Xu-ji (corresponding author)
Tianjin Normal University Faculty of Psychology, Tianjin, 300287

***Abstract*：** Education is a cause of fundamental importance for the future of our nation. In recent years, education is in the strategic position of giving priority to development in our Country. With the development of basic education curriculum reform in China, the liberal education has achieved remarkable results, but there is still a long way to go. Therefore, one of the key factors to construct the core literacy system is to improve students' learning engagement. Mathematics is one of the three major subjects of basic education. Learning mathematics well not only helps to cultivate various abilities such as cognition, logic and spatial imagination, but also helps to develop in the long run. The research is called mathematical Learning Engagement, which is often influenced by teacher-student relationship and academic emotion. Therefore, this research takes the mathematics study as the foothold, discusses the teacher-student relations, the study emotion two important factors to its function.

Three progressive studies were conducted to explore the relationship among teacher-student relationship, academic emotion and mathematics learning engagement. The first study, based on the survey of 1023 students, revised the mathematics academic emotion questionnaire which is suitable for middle school students in the mathematics classroom situation. In the second study, 420 junior middle school students were measured with the mathematics academic emotion scale, the teacher-student relationship scale and the learning engagement scale, to explore the mediating role of different academic emotions in teacher-student relationship and mathematics learning engagement. In study 3, 68 students were followed for two consecutive weeks (10 working days) after each math class, to further explore the dynamic longitudinal relationship between junior high school students' Mathematics learning involvement, teacher-student relationship and academic emotion.

The results show that: (1) The revised mathematics academic emotion questionnaire has good validity and reliability, which can be used as a survey tool; (2) Positive academic emotions, Enjoyment, Hope and Pride play a part of mediating role between teacher-student relationship and mathematics learning engagement; Boredom in negative academic emotion played a part of mediating role between teacher-student relationship and mathematics learning engagement, while other academic emotions such as Anger, Anxiety, Shame and Hopelessness played no significant mediating role;(3) The teacher-student relationship in each math class has a positive effect on the learning engagement. The teacher-student relationship in every math class has positive influence on the positive

academic emotions (Enjoyment, Hope, Pride) . The teacher-student relationship has a negative effect on the negative academic emotions (Anxiety, Shame, Boredom) in every math class. Mathematics classroom learning emotion plays an mediating role between teacher-student relationship and mathematics learning engagement.

自我控制策略使用促进自我控制能力提升

陈雪飞[1,2] 李盛楠[2] 陈沛[2] 周雅颂[2] 利振华[2] 聂衍刚[2]（通讯作者）
1 曲靖师范学院教师教育学院，曲靖，655011
2 广州大学教育学院（师范学院），广州，510006 通讯作者 nie-yangang@gzhu.edu.cn

摘 要 由于自我控制概念的核心是能够超越或改变自己的内心反应，以及能够打断不想要的行为倾向并避免对其采取行动，因此以往关于自我控制能力提升的研究主要是通过训练对主导反应的抑制，比如使用非惯用手，控制自己的行为来提高自我控制能力。但是，越来越多的研究表明，面对自我控制困境，人们不仅仅是努力抑制冲动或者行为，还会有许多方式来促进自我控制的成功，比如自我控制策略的使用。最近的研究认为，成功的自我控制依赖于努力抑制之外的多种策略，拥有更多的自我控制策略对促进自我控制成功是有益的，因为它让人们有能力应对各种各样的自我控制挑战。那么，自我控制策略的经常使用是否可以有效地促进自我控制能力的提升？本研究招募 59 名大学生参加实验，锻炼组和策略组需要持续进行 2 周体育锻炼来训练自我控制，其中策略组需要使用自我控制策略，对照组没有任何干预。假设 1：体育锻炼可以提升自我控制能力；假设 2：自我控制策略使用能够更加有效地促进自我控制能力提升。实验采用 3（组别：策略组，锻炼组，对照组）×2（前后测：前测，后测）× 2（刺激类型：一致，不一致）混合设计。结果发现：在 Stroop 任务中，前后测与组别交互效应显著，$F(2,56)=4.909$，$p=0.011$，$\eta_p^2=0.149$，策略组在后测中的 Stroop 效应量显著小于前测，$F(2, 56)=28.488$，$p=0.000$，$\eta_p^2=0.337$，锻炼组和对照组的 Stroop 效应量前后测差异不显著，说明体育锻炼后锻炼组和对照组的自我控制能力基线并没有提高，但是策略组的自我控制能力基线提高了。在 Stroop 任务后的 Go/NoGo 任务中，前后测与组别交互效应显著，$F(2, 56)=4.506$，$p=0.015$，$\eta_p^2=0.139$，策略组在后测中的正确率显著高于前测，$F(2, 56)=29.287$，$p=0.000$, $\eta_p^2=0.343$，锻炼组在后测中的正确率也显著高于前测，$F(2, 56)=4.457$，$p=0.014$，$\eta_p^2=0.103$，对照组的正确率在前后测中差异不显著，说明策略组和锻炼组的自我控制耐力都提高了。本研究再次证明了自我控制训练可以提升自我控制耐力，并且自我控制策略的使用可以提升自我控制能力基线，结果说明自我控制策略使用能够更加有效地促进自我控制能力的提升。

Self-Control Strategy Use to Promote Self-Control

CHEN Xuefei[1,2] LI Shengnan[2] CHEN Pei[2] ZHOU Yasong[2] LI Zhenhua[2] NIE Yangang[2]
1 School of Teacher Education, Qujing Normal University, Qujing 655011
2 School of Education (Teachers College), Guangzhou University, Guangzhou 510006

Abstract： Because the concept of self-control centers on the ability to outrun or change one's internal reactions, as well as the ability to interrupt unwanted behavioral tendencies and avoid acting on them, previous research on self-control enhancement has focused on improving self-control by training inhibition of dominant reactions, such as using the non-dominant hand, and controlling one's own behavior. However, a growing body of research suggests that, in the face of self-control dilemmas, people do not just strive to inhibit impulses or behaviors, but

that there are many ways to promote successful self-control, such as the use of self-control strategies. Recent research has argued that successful self-control relies on a variety of strategies beyond effortful inhibition and that having a wider range of self-control strategies is beneficial for promoting self-control success because it equips people to deal with a wide variety of self-control challenges. So, is the regular use of self-control strategies effective in promoting self-control? In this study, 59 college students were recruited to participate in an experiment in which the exercise group and the strategy group were required to consistently engage in physical activity for 2 weeks to train self-control, where the strategy group was required to use self-control strategies, and the control group did not have any intervention. Hypothesis 1: Physical exercise can enhance self-control; Hypothesis 2: Self-control strategy use can promote self-control more effectively. The experiment used a 3 (group: strategy group, exercise group, control group) × 2 (pre and post-test: pre-test, post-test) × 2 (stimulus type: consistent, inconsistent) mixed design. The results found that: in the Stroop task, there was a significant pre-posttest-group interaction effect, $F(2,56)=4.909$, $p=0.011$, $\eta_p^2=0.149$, and the amount of the Stroop effect in the posttest was significantly smaller in the strategy group than in the pre-test, $F(2, 56)=28.488$, $p=0.000$, $\eta_p^2=0.337$, the difference in the amount of Stroop effect between the exercise and control groups in the pre and post-tests was not significant, indicating that the baseline of self-control in the exercise and control groups did not improve after physical activity, but the baseline of self-control in the strategy group improved. In the Go/NoGo task following the Stroop task, there was a significant pre/post-test and group interaction effect, $F(2, 56)=4.506$, $p=0.015$, $\eta_p^2=0.139$, and the strategy group was significantly more likely to be correct in the post-test than in the pre-test, $F(2, 56)=29.287$, $p=0.000$, $\eta_p^2=0.343$, and the correct rate in the exercise group was also significantly higher in the posttest than in the pretest, $F(2, 56)=4.457$, $p=0.014$, $\eta_p^2=0.103$, and the correct rate of the control group did not differ significantly in the pre and posttests, which suggests that self-control endurance was improved in both the strategy and exercise groups. This study again demonstrated that self-control training can improve self-control endurance and that self-control strategy use can improve self-control baseline, and the results suggest that self-control strategy use can be more effective in promoting self-control.

一拍就忘 vs 多拍益善：大学生手机拍照对学习效果的影响

陈延妍[1] 刘儒德[1]（通讯作者）林静敏[1] 陈楚怡[2] 刘佳彬[1]

1 北京师范大学心理学部，北京，100875，liurude@126.com

2 北京大学心理与认知科学学院，北京，100871

摘 要 手机拍照是大学课堂中常见的记录行为，这一行为对学习效果的影响尚待探索。以往研究探究了在参观博物馆和观看视频的情境中拍照对记忆的影响，发现了不一致的结果，既存在拍照减损效应（即手机拍照导致记忆效果变差的现象），也存在反拍照减损效应的证据（即拍照有助于集中注意、增强体验）。这一矛盾可能是由于拍照动机（包括纪念和认知卸载两种动机）的调节作用所致，出于认知卸载的拍照可能存在拍照减损效应，出于纪念的拍照可能存在反拍照减损效应。这两种动机是否也会调节大学生课堂拍照对学习效果的影响？

本研究通过三个研究探究大学生课堂手机拍照对学习效果影响以及拍照动机的调节作用。研究 1 采用 2（拍照与否）×2（拍照动机：纪念或卸载）被试间完全随机设计，结果发现显著的拍照减损效应，但交互作用不显著。这可能是因为拍照动机的作用需要在更长的学习材料中才能体现。研究 2 增加学习材料的长度，采用 2（拍照与否，被试内）×2（拍照动机：纪念或卸载，被试间）混合设计，结果发现交互作用显著，卸载动机拍照存在拍照减损效应，而纪念动机拍照不存在这一效应。为了提高生态效度，研究 3 采用调查大学生的课堂拍照行为，结果发现，拍照数量与拍照动机共同影响主观学习效果的，高卸载低纪念的

拍照动机下拍照数量显著负向预测学习效果，低卸载高纪念的拍照动机下，拍照数量不能显著预测学习效果，但有正向预测的趋势。这三个研究表明，大学生课堂手机拍照的动机影响拍照后的学习效果，卸载动机下的拍照行为减损学习效果，纪念动机下的拍照行为则无碍于学习效果。本研究及其结果为以往有关拍照研究的矛盾提出了一种可行的解释，具有一定的学术价值，并对大学生课堂学习策略以及教师教学具有一定的启示意义。

Memento vs Offloading: The Impact of College Students' Mobile Photo-Taking on Learning

Yanyan Chen [1], Ru-De Liu[1] (corresponding author), Jinming Lin[1], Chuyi Chen[2], Jiabin Liu[1]
1 Faculty of Psychology, Beijing Normal University, Beijing, 100875
2 School of Psychology and Cognitive Sciences, Peking University, Beijing, 100871

Abstract：Mobile photo-taking is a common recording behavior in college classes, but how this behavior will affect the learning effect is still uncertain. Previous research has mainly examined the effects of photo-taking on memory in contexts such as museum visits and video watching. Some studies found a negative effect of using smartphones to take photos on memory (referred to as the photo-taking impairment effect), while others suggested that photo-taking can enhance attention and overall experience, thus denying the photo-taking impairment effect. This contradiction may be attributed to different motivations for taking photos, such as Memento or offloading (cognitive load). In the context of college classrooms, both motivations are present. Therefore, does photo-taking have inconsistent effects on learning outcomes?

We investigate the influence of smartphone photo-taking during college classroom activities on learning outcomes and the moderating role of photo-taking motivation through three studies. Study 1 employed a 2 (photo-taking: yes/no) × 2 (motivation: memento/offloading) completely random design and found a significant main effect of photo-taking, indicating the presence of a photo-taking impairment effect. However, the interaction effect was not significant, possibly because the effect of photo-taking motivation requires longer learning materials to manifest. Study 2 utilized a 2 (photo-taking: yes/no, within-subjects) × 2 (motivation: memento/offloading, between-subjects) mixed design, revealed a significant interaction effect. Photo-taking under the offloading motivation led to the photo-taking impairment effect, while photo-taking under the memento motivation did not exhibit this effect. Study 3 employed a survey method to enhance ecological validity and found the influence of the number of photos taken and photo-taking motivation on college students' subjective learning outcomes. Under higher offloading motivation and lower memento motivation, a higher number of photos taken negatively predicted learning outcomes. However, under lower offloading motivation and higher memento motivation, the number of photos taken did not significantly predict learning outcomes and showed a positive trend.

In summary, these three studies demonstrate that the motivation behind mobile photo-taking in college classrooms influences the subsequent learning outcomes. Photo-taking behavior under the offloading motivation impairs learning outcomes, while photo-taking behavior under the memento motivation does not interfere with learning outcomes. Therefore, this study provides a feasible explanation for the conflicting results in previous photo-taking research and contributes to advancing theories in this field. These findings have positive implications for students' classroom learning strategies and instructors' teaching methods.

青少年合作推理讨论中的互动行为特征及其影响因素

吴双[1] 陈森宇[2] 周洁林[1] 李璇[1] 马淑凤[3]（通讯作者）

1 华东师范大学教育心理学系，上海，200062

2 曼彻斯特大学健康科学学院，曼彻斯特，英国 M13 9PL

3 华东师范大学教育心理学系，上海，200062，sfma@dep.ecnu.edu.cn

摘 要 积极的同伴互动既能提升青少年的学校归属感（Sacco & Ismail, 2014），又有助于形成良好的课堂氛围（Shimizu et al., 2020），对青少年的社会性发展具有重要影响。为促进青少年之间积极的同伴互动，本研究在中学课堂实施了基于合作推理讨论（Anderson et al., 1998）的课堂干预，探究了青少年在合作学习过程中展现的同伴互动行为特征及其影响因素。合作推理讨论是一种开放式的、以学生为中心的合作学习模式。在合作推理讨论中，学生组成异质小组围绕一个有争议的话题进行互动与交流。本研究的参与者是河北省某县级中学的 29 名七年级学生（12 名男生，17 名女生），这些学生来自 4 个小组（每组 7-8 人），每个小组开展了 7 次合作推理讨论。本研究采取自下而上的视频分析方法对 28 个小组讨论（平均 27.3 分钟，共 765.9 分钟）中的同伴互动行为及行为的发生方向进行了编码。同伴互动行为共包含三类总计 6520 条编码：认知互动（如提供解释，4587 条）、情感互动（如安慰鼓励，963 条）及行为互动（如邀请发言，1170 条）。由于同伴互动行为的频数符合泊松分布且包含过量零，本研究构建了零膨胀泊松回归模型。研究结果显示：（1）同性之间，互动双方拥有较高的社会性水平，及发出者对接收者的喜爱度越高则**情感互动**越容易发生；（2）异性之间，互动双方拥有较高的认知水平，及发出者对接收者的喜爱度越高则**认知互动**越容易发生；（3）与前两种互动不同的是，接收者对发出者的喜爱度正向预测了二者之间发生**行为互动**的频率。以上结果表明，青少年在合作推理讨论中倾向于与自己相似的人进行情感互动，避免认知互动，而对与自己不同的人则更容易投入到认知互动中。互动双方对彼此的喜爱度能够预测二者之间的互动频率，认知和情感互动受发出者的喜爱度影响更大，行为互动则受接受者的喜爱度影响更大，表明不同类型互动的发生机制可能存在差异。总体而言，本研究通过视频分析揭示了合作推理讨论中青少年的同伴互动特征及其影响因素，为探究同伴互动的发生机制与促进方式提供了新的方法和思路。

Abstract： Positive peer social interaction has important influences on adolescents' social development as it fosters a sense of school belonging (Sacco & Ismail, 2014) and an open and warm classroom climate (Shimizu et al., 2020). To promote positive social interactions in the classroom, we implemented an intervention featuring Collaborative Reasoning (CR; Anderson et al., 1998) discussions in a rural middle school in Hebei, China. Based on moment-by-moment video-coding of adolescents' social interactions during CR discussions, we investigated the patterns of adolescents' peer interaction and the factors that influenced different types of interactive behaviors. The participants of this study were 29 seventh-grade students (12 males and 17 females) from four collaborative groups (7-8 students per group) and each group had seven CR discussions. The corpus contained 28 collaborative discussions and the average length of each discussion was 27.3 minutes. The video data were coded from three aspects—cognitive interaction (e.g., providing explanations; n = 4,587), emotional interaction (e.g., providing encouragements; n = 963), and behavioral interactions (e.g., inviting others to speak; n = 1,170). As the frequency of three types of peer interaction contained excessive zeros and conformed to a Poisson distribution, zero-inflated Poisson models were created to examine what factors influenced the likelihood that two students interacted with each other. The results showed that (1) *emotional interactions* were more likely to occur when two students were of the *same* gender, had similar social characteristics, or when the responder were more liked by the initiator; (2) *cognitive interactions* were more likely to occur when two students were of the *different* gender, showed similar social and cognitive characteristics, or when the responder were more liked by the initiator; and (3) *behavioral interactions* were more likely to occur when the initiator was more liked by the responder. The above results showed that adolescents were inclined to maintain a good relationship with peers who were similar to them by engaging emotional interactions and avoiding cognitive interactions; however, they tended to cognitively engaged with peers who were different from them. Cognitive and emotional interactions were associated with the responder's peer acceptance, while behavioral interactions were more related to the initiator's peer acceptance, suggesting that explicit and implicit social interactions may have different interacting mechanisms. Overall, this study revealed the patterns of Chinese adolescents' behavioral, cognitive, and emotional interaction during collaborative discussions, which provides new perspectives for understanding peer interaction in collaborative contexts and how to promote positive social interactions among adolescents.

小学生创造性行为与幸福感的关系：一项日记法的研究

滕美辰[1]　白新阳[1]　薛文瑞[1]　衣新发[1,2]（通讯作者）

1 陕西师范大学现代教学技术教育部重点实验室，西安，710062

2 中国基础教育质量监测协同创新中心陕西师范大学分中心，西安，710062，yixinfa@snnu.edu.cn

摘 要　培养少年儿童的创新素养是建设创新型国家的重要基础，少年儿童的心理健康水平攸关亿万家庭的幸福，因此，深入开展小学生创新素养和心理健康素养的研究具有特别重要的意义。考夫曼提出的创造力 4C 理论将创造力划分为 Big-C、Pro-C、Little-C 和 Mini-C 四个水平。以往的研究者对于 Big-C 和 Pro-C 的关注较多，而对小学生表现出的日常创造性行为（Little-C）关注较少；在讨论创造力和心理健康的关系时，也大多将侧重点放在单向关系上，对于相互影响的探讨较少。因此，本研究首先要界定小学生的哪些行为算作其日常创造性行为，进而探究小学生的日常创造性行为与小学生的幸福感之间的双向关系。研究 1 在文献综述、专家审议以及对 20 余名小学教师的个体访谈和 50 余名小学生的集体访谈的基础上，编制出一个 30 题 5 点计分的李克特量表：《小学生日常创造性行为量表》。在对 863 名被试进行施测后，探索性因素分析(EFA)表明其共有 5 个维度(KMO=0.91, Bartlett 球形检查χ^2= 3760.990, p<0.0001,解释了 49.52%的总体方差)，内部一致性信度系数 Cronbach's α=0.93；验证性因素分析(CFA)表明其具有较好的结构效度

（χ^2/df = 2.107, GFI = 0.921, RFI=0.909, RMSEA =0.033，因素载荷 > 0.5)；量表总分及各维度与被试的创造性倾向得分呈显著的正相关 (r = 0.37~0.82, p <0.001)，表明本量表有较好的效标关联效度。基于研究一，研究二采用日重现法探究小学生创造性行为与幸福感的双向关系及作用机制，选取 270 名小学生开展为期两周的追踪调查，结果如下：小学生的创造性活动不仅可以预测其当天的幸福感，还可以预测其第二天的幸福感；从另一角度来看，小学生的幸福感还可以预测当天的创造性活动。也就是说，小学生的幸福感和创造性行为之间有一种特殊的上升螺旋关系: 小学生参与创造性行为会导致第二天幸福感的增加，而这种增加的幸福感会促进当天的创造性活动。因此，在创造力培养的过程中，应重视学生的幸福感知教育；在学校心理辅导中，应鼓励学生主动尝试日常创造性活动。真正在生活中实现幸福感和创造力的螺旋上升。
关键词　创造性行为，幸福感，创造力，日重现法

The Relationship between Primary School Students' Creative Behavior and Well-being: a Daily Dairy investigation

Teng Meichen[1]　Bai Xinyang[1]　Xue Wenrui[1]　Yi Xinfa[1,2]　(Corresponding Author)

1 Key Laboratory of Modern Teaching Technology, Ministry of Education, Shaanxi Normal University, Xi'an710062, China

2 Shaanxi Normal University Sub-center of China Basic Education Quality Monitoring Collaborative Innovation Center, Xi'an710062, China

Abstract：For the development of an innovative nation, it is essential to cultivate the innovative qualities of children and adolescents; at the same time, to ensure the well-being of hundreds of millions of families, it is important to address mental health issues among children and adolescents. Therefore, it is of particular importance to conduct in-depth research on the innovative quality of primary school students and their mental health. The 4C theory of creativity proposed by Kaufman divides creativity into four levels: Big-C, Pro-C, Little-C and Mini-C. Previous researchers have paid more attention to Big-C and Pro-C, but less attention to the daily creative behaviors exhibited by primary school students (Little-C); In addition, when discussing the relationship between creativity and mental health, researchers have also mostly focused on the unidirectional relationship, with less exploration of the interplay. Therefore, this study begins by defining which behaviors of primary school students count as their daily creative behaviors, and then explores the bidirectional relationship between primary school students' daily creative behaviors and their well-being. Study 1 developed a 30-question, 5-point Likert scale: Daily Creative Behaviors Scale for Primary School Students, based on the literature review, expert deliberations, and individual interviews with primary school teachers and group interviews with students. After administering the test，exploratory factor analysis (EFA) revealed a total of five dimensions (KMO=0.91, and the Bartlett's test of sphericity χ2= 3760.990, p<0.0001, accounted for 49.52% of the total variance explained)) with an excellent internal consistency reliability coefficient Cronbach's α=0.95 and confirmatory factor analysis (CFA) goodness of fit indices indicated a good fit of the model to data(χ2/df = 2.107, GFI = 0.921, RFI=0.909, RMSEA =0.033，standardized factor loadings were greater than 0.5). The total score and dimensions of the scale were significantly and positively correlated with the subjects' creative tendency scores (r = 0.37-0.82, p < 0.001), indicating that the scale has good criterion-related validity. Based on Study 1, Study 2 used the daily reconstruction method to investigate the bidirectional relationship between creative behavior and well-being of primary school students. 270 primary school students were selected to carry out a 14-day tracking survey, and the results were as follows: Primary school students' creative activities not only predicted their well-being on that day, but also predicted their well-being on the next day; from another perspective, primary schools students' well-being also

predicted their creative activity on the day. The results of the study show that there was a special upward spiral relationship between students' well-being and creative behavior: students' participation in creative behavior lead to an increase in well-being on the next day, and this increased well-being promoted creative activities on the same day. Hence, as part of the process of creativity cultivation, students' well-being perception should be valued and they should be encouraged to try daily creative behaviors through school counseling.

中学生智力思维模式与坚毅性的发展：一项交叉滞后分析

李承杰[1] 杜宜展[2]（通讯作者）

1 闽南师范大学教育与心理学院心理系，福建漳州，363000

2 韶关学院教育科学学院学前教育学系，广东韶关，512005，E-mail: tu.yc@hotmail.com

摘 要 智力思维模式是 Deck（2000）智力内隐理论的延 ，认为个体对能力持有两种思维模式，一是持有能力增长观的成长型思维，另一是持有能力实体观的固定型思维。抱持成长型思维的个体认为能力是可以通过不断努力和克服困难而有所发展，而固定型思维则认为个体能力在出生时就已经固定不变。过去研究表明，成长型思维可以帮助个体促进坚毅性，因 持有成长型思维的个体勇于面对挑战，从错误中学习，坚持朝向目标努力，从而表现出较高的坚毅性（刘玉敏，2022；赵亚飞等，2022）。也有研究表明，坚毅性会强化成长型思维，因为具有坚毅性的个体会通过不断练习提升自身能力，证明自己的努力与成长（Duckworth et al., 2011）。另有研究发现，成长型思维和坚毅性具有相互影响的关系（Park et al., 2020; Zhang et al., 2022）。然而，过去研究仅探究成长型思维与坚毅性的关系，忽略固定型思维对坚毅性的影响，所以本研究目的除了基于过去成长型思维和坚毅性的假设，并补足固定型思维与坚毅性的关系的缺口。本研究采用方便取样福建省福州市某一中学进行三波问卷调查，测量 Dweck 发展的智力内隐理论量表和 Duckworth 等人发展的坚毅量表，通过三波重复测量样本且剔除无效问卷后，有效问卷为 571 份，回收率达 63.4%。整体样本分布，男生有 312 人（54.6%），女生有 259 人；年级方面，由于初三生面临中考，所以没有对初三生进行施测，初一生有 290 人（50.8%），初二生有 281 人。研究结果发现，成长型思维和坚毅性的交叉滞后模型相当理想（Bollen-Stine χ^2 (N = 571, df = 4) = 6.635, CFI = 0.998, TLI = 0.994, RMSEA = 0.034, SRMR = 0.055）。其次，成长型思维和坚毅性都具有跨时间的稳定性。再次通过交叉滞后分析，第一波和第二波坚毅性显着正向影响第二波和第三波成长型思维，表明本研究支持坚毅性会强化成长型思维的假设。在固定型思维方面，固定型思维和坚毅性的交叉滞后模型也相当理想（Bollen-stine χ^2 (N = 571, df = 4) = 5.773, CFI = 0.999, TLI = 0.997, RMSEA = 0.028, SRMR = 0.039）。其次，固定型思维和坚毅性都具有跨时间的稳定性。再次，第一波坚毅性显着负向影响固定型思维，表明坚毅性会削弱固定型思维的形成。

The development of intelligence mindset and grit among junior high school students: A cross-lagged analysis

Chengchieh Li[1] Yizhan Du[2]

1. School of Education and Psychology, Minnan Normal University, Zhangzhou, Fujian
2. School of Education Science, Shaoguan University, Shaoguan, Guangdong

Abstract： Intellectual mindset is based on Deck's (2000) implicit theory of intelligence. She thinks that individuals held two kinds of mindsets about abilities, one is growth mindset based on incremental theory or

beliefs, and the other is fixed mindset on the basis of entity theory or beliefs. Individuals with a growth mindset believe that abilities can be developed through effort and overcoming difficulties, while a fixed mindset believes that individual abilities are fixed at birth. Some studies have shown that growth mindset can help individuals promote grit, because individuals with a growth mindset are brave enough to face challenges, learn from mistakes, and persist in working toward goals, thus showing higher grit (Liu, 2022; Zhao et al., 2022). Some studies have also shown that grit will strengthen growth mindset, because gritty individuals will improve their abilities through hard practice and prove their efforts and growth (Duckworth et al., 2011). Other studies have found that growth mindset and grit have a reciprocal relationship (Park et al., 2020; Zhang et al., 2022). However, past studies only explored the relationship between growth mindset and grit, ignoring the impact of fixed mindset on grit. Therefore, the purpose of this study is based on the hypothesis of growth mindset and grit in the past, and complement the research gap of the relationship between fixed mindset and grit. The sample consisted of 571 seventh and eighth graders (54.6% male) recruited from a high school in Fuzhou city in Fujian and repeatedly measured both Duckworth's grit scale and Dweck's intelligence mindsets scale three times. The results of this study indicated that the model fit of the cross-lagged model on growth mindset and grit was great (Bollen-Stine χ^2 (N = 571, df = 4) = 6.635, CFI = 0.998, TLI = 0.994, RMSEA = 0.034, SRMR = 0.055). Second, all autoregressive paths were significant, suggested that grit and growth mindset reveal substantial rank-order stability. Third, the cross-lagged paths from grit to growth mindset were positive significant, while the reverse weren't. It indicated that grit will strengthen growth mindset. In terms of fixed mindset, the model fit of the cross-lagged model on fixed mindset and grit was great (Bollen-Stine χ^2 (N = 571, df = 4) = 5.773, CFI = 0.999, TLI = 0.997, RMSEA = 0.028, SRMR = 0.039). Second, all autoregressive paths were significant, suggested that grit and fixed mindset demonstrate substantial rank-order stability. Third, the cross-lagged paths from grit to fixed mindset were positive significant, while the reverse weren't. It revealed that grit will weaken fixed mindset.

“双减”背景下父母教育卷入对初中生学业能力的影响：基于潜在剖面分析

魏诗洁[1] 赵红艳[1] 李欢欢[1]（通讯作者）

1 中国人民大学，北京，100872，psylihh@ruc.edu.cn

摘 要 2021年提出的“双减”政策旨在建设高质量教育体系，这一背景下，父母教育卷入与初中生学业能力的密切关系受到越来越多的关注与证实。然而，一方面，以往研究注重于强调学业辅导、家庭监控等单一维度对学业能力的作用，对父母教育卷入各维度的整合性作用探讨不足；另一方面，父母教育卷入与初中生学业能力的关系存在不一致结果，可能与父母教育卷入的结构和水平有关。本研究使用父母教育卷入问卷及中国积极青少年发展量表-学业能力分量表，对来自北京市和湖北省的575名初中生（Mage=13.02±0.50）进行调查，使用潜在剖面分析探索父亲及母亲教育卷入各维度构成的异质性剖面，并探查父母教育卷入潜在剖面与初中生学业能力之间的关系。结果显示：（1）根据父亲及母亲家庭监控、学业辅导、亲子沟通、共同活动和家校沟通，样本划分为3个剖面：高父母教育卷入组（n=118, 占21%）、中等父母教育卷入组（n=298, 占52%）和低父母教育卷入组（n=159, 占28%），父母教育卷入各维度在各组间差异显著；（2）高父母教育卷入组中，仅父亲家校沟通显著低于母亲家校沟通，其余对应维度无显著差异，低父母教育卷入组和中等父母教育卷入组中，父亲教育卷入各维度均显著低于母亲教育卷入相应维度；（3）初中生学业能力水平在父母教育卷入潜在剖面上差异显著：高父母教育卷入组＞中等父母教育

卷入组＞低父母教育卷入组。上述结果提示，“双减”政策下，父亲与母亲协同且积极参与孩子的教育，可能是促进孩子学业能力的重要举措。

Effects of Parental Educational Involvement on Academic Competence of Junior School Students under the “Dual Reduction” Policy: A Latent Profile Analysis

Wei Shijie[1], Zhao Hongyan[1], Li Huanhuan[1] (corresponding author)
1 Department of Psychology, Renmin University of China, Beijing, 100872, psylihh@ruc.edu.cn

Abstract： Within the context of the “Dual Reduction” policy, aimed at constructing a high-quality education system in China, there has been a growing attention and confirmation on the intimate relationship between parental educational involvement and academic competence in junior school students. However, on the one hand, previous research has primarily focused on emphasizing the effects of singular dimensions (such as student learning tutorial or family supervision) on academic competence, thus lacking a comprehensive exploration of the integrated impact of parental educational involvement across multiple dimensions. On the other hand, there have been inconsistent findings regarding the relationship between parental educational involvement and the academic abilities in adolescents, potentially attributable to variations in the structure and levels of parental involvement. In current study, a total of 575 junior school students (Mage=13.02±0.50) were surveyed in Beijing and Hubei provinces by using Parents' Educational Involvement Questionnaire (PEIQ) and Chinese Positive Youth Development Scale (CPYDS). Latent profile analysis was used to explore the heterogeneity of parental involvement of junior school students. The results showed that, (1) Based on 10 dimensions (paternal and maternal family supervision, student learning tutorial, parents-children interaction, parents-children coactivity, and family-school communication), the sample was divided into 3 profiles: high parental involvement group (*n*=118, 21%), moderate parental involvement group (*n*=298, 52%), and low parental involvement group (*n*=159, 28%). Significant differences were found among the groups in terms of parental educational involvement across various dimensions. (2) In the high parental involvement group, only paternal family-school communication was significantly lower than maternal family-school communication, while there were no significant differences between remaining dimensions of paternal educational involvement and corresponding dimension of maternal educational involvement. Both in the low parental involvement group and moderate parental involvement group, every dimension of paternal educational involvement was significantly lower than the corresponding dimension of maternal educational involvement. (3) The academic competence level of junior school students has significant difference among groups: high parental involvement group > moderate parental involvement group > low parental involvement group. The results suggested that under the “double reduction” policy, parents should be more actively involved in their children’s education; in addition, fathers should bear an equal workload compared to mothers. These may be important ways to promote children’s academic competence.

Keywords： parental educational involvement, academic competence, latent profile analysis, junior school students

论文题目——校园受欺凌对小学生越轨同伴交往的影响：有调节的中介模型

李鸿杰[1] 许磊[1] 陈继文[1] 黄秀涵[1] 陈雅琪[1] 彭顺[1](通讯作者）
1 江汉大学教育学院，武汉，430056，ps_spy@163.com

摘 要 根据生态系统理论，在儿童时期，小学生的交往范围逐渐从家庭中扩展到学校，因此，儿童时期的同伴交往对其身心发展极其重要。越轨同伴交往是指与违反学校纪律、社会规范，甚至是法律行为的友伴交往，它能有效正向预测青少年问题行为，如网络游戏成瘾等。以往研究表明，受欺凌的个体可能会主动与离经叛道的同龄人交往。本研究探讨校园受欺凌对小学生越轨同伴交往的影响，并考察归属需求和自尊在其中的中介和调节作用。采用特拉华欺凌受害量表（学生卷）、越轨同伴交往量表、基本心理需求量表、自尊量表对 547 名在校小学生进行追踪调查，共两个时间段，间隔为 6 个月。结果表明：（1）校园受欺凌不仅能显著正向预测越轨同伴交往，还能够通过归属需求的中介作用对越轨同伴交往产生影响；（2）归属需求在校园受欺凌对越轨同伴交往的影响中起部分中介作用，中介效应占总效应的 17.95%；（3）校园受欺凌-归属需求-越轨同伴交往前半段受到自尊的调节，当自尊水平升高，校园受欺凌对归属需求的影响越大。上述发现启示我们，校园受欺凌与越轨同伴交往密切相关，有必要严格制止校园欺凌与受欺凌行为，降低越轨同伴交往的可能性。

关键词 小学生,校园受欺凌,越轨同伴交往,归属需求,自尊

Article Title——The effect of school bullying on transgressive peer interactions among elementary school students: a mediated model with moderation

LI Hongjie[1], XU Lei[1], CHEN Jiwen[1], HUANG Xiuhan[1], CHEN Yaqi[1], PENG Shun[1]
1 School of Education, Jianghan University, Wuhan, China

Abstract **：** According to the ecosystem theory, during childhood, elementary school students' interactions gradually expand from the home to the school, so peer interactions during childhood are extremely important for their physical and mental development. Transgressive peer interactions refer to friendships with peers who violate school discipline, social norms, or even legal behaviors, and it is an effective positive predictor of adolescent problem behaviors, such as online game addiction. Previous research suggests that bullied individuals may actively socialize with deviant peers. The present study explored the effects of school bullying on elementary school students' deviant peer interactions and examined the mediating and moderating roles of belonging needs and self-esteem. The Delaware Bullying Victimization Scale (student volume), the Transgressive Peer Interaction Scale, the Basic Psychological Needs Scale, and the Self-Esteem Scale were used to follow up 547 school elementary school students for two time periods with a 6-month interval. The results showed that: (1) school bullying not only significantly positively predicted transgressive peer interactions, but also influenced transgressive peer interactions through the mediation of attributional needs; (2) the need to belong partially mediated the effect of school bullying on transgressive peer interactions, with the mediating effect accounting for 17.95% of the total effect; (3) the first half of the school bullying-need to belong-transgressive peer interactions segment was moderated by self-esteem, and as self-esteem levels increased, the greater the effect of school bullying on the need to belong. The above

findings reveal that school bullying is closely related to transgressive peer interactions, and it is necessary to strictly stop school bullying and bullying behaviors to reduce the possibility of transgressive peer interactions.
Keywords： Elementary school students, bullying in school, transgressive peer interactions, need to belong, self-esteem

亲子分离特征与留守青少年孤独感的异质性发展轨迹

赵景欣（通讯作者）李鲁杰 刘婷婷

山东师范大学心理学院，济南，250014，jingxinzhao@126.com

摘 要 孤独感是留守青少年最常见的不良情绪体验。根据依恋理论，亲子分离会影响青少年与父母建立起安全稳定的依恋关系，这可能会增加留守青少年经历孤独感等情绪适应问题的风险。大量研究表明，留守青少年的孤独感显著高于一般青少年。然而，大多研究采用横断设计，主要关注留守青少年孤独感水平的差异，相对忽视了留守青少年孤独感的发展轨迹，尤其是异质性发展轨迹。并且，已有研究对留守青少年孤独感发展变化影响因素的关注也不足。因此，本研究将探讨留守青少年孤独感的异质性发展轨迹及其亲子分离特征对孤独感发展轨迹的长期影响。

基于追踪研究设计，本研究对山东省 4093 名初一年级学生（750 名双亲外出，1027 名父亲外出，67 名母亲外出，2249 名非留守）进行了间隔 6 个月的 5 次追踪测量，在考察青少年孤独感的异质性发展轨迹基础上，探讨了亲子分离形式、分离年龄、分离时长以及亲子之间面对面沟通间隔、远程沟通间隔等亲子分离特征对其发展轨迹的预测作用。结果表明：(1)青少年的孤独感存在 3 条异质性轨迹：低-下降组(44.6%)、中-稳定组(40.5%)、恒高组(15.9%)，且女生比男生更容易被归为恒高组、中-稳定组而不是低下降组，县城公办学校的青少年比私立学校的青少年更容易被归为恒高组而不是低-下降组；(2)相比于非留守青少年，双亲外出青少年更容易被归为恒高组、中稳定组而不是低-下降组；相比于青少年期分离，在学龄期分离的青少年更容易被归为低-下降组而不是恒高组；不同亲子分离时长的留守青少年孤独感轨迹之间不存在显著差异；(3)亲子之间面对面沟通间隔、远程沟通间隔时间越长的留守青少年，越容易被归为恒高组、中-稳定组而不是低-下降组。这表明，留守青少年孤独感的发展轨迹存在个体差异，亲子分离形式、分离年龄以及亲子之间沟通间隔均会对留守青少年孤独感的发展轨迹产生影响。

关键词 亲子分离特征，留守青少年，孤独感，异质性发展轨迹

Parent-Child Separation Characteristics and Heterogeneous Developmental Trajectories of Loneliness among Left-Behind Adolescents

Jingxin Zhao, Lujie Li, Tingting Liu

School of Psychology, Shandong Normal University, Jinan 250014

Abstract：Loneliness is the most common adverse emotional experience of left-behind adolescents. According to attachment theory, parent-child separation affects adolescents to establish a safe and stable attachment relationship with their parents, which may increase the risk of left-behind adolescents experiencing emotional adjustment problems such as loneliness. A large number of studies have shown that the level of loneliness among left-behind adolescents is significantly higher than that of non-left-behind adolescents. However, most studies use cross-sectional design, mainly focusing on the differences in the level of loneliness of left-behind adolescents, and

relatively ignoring the development trajectories of loneliness of left-behind adolescents, especially the heterogeneous development trajectories. In addition, insufficient attention has been paid to the factors influencing the development trajectories of loneliness among left-behind adolescents. Thus, this study explored the heterogeneous development trajectories of left-behind adolescents' loneliness and the long-term impact of parent-child separation characteristics on the development trajectories of loneliness.

Based on the design of the longitudinal study, a total of 4093 adolescents were recruited from Shandong Province, including 750 adolescents from both-parent migrant families, 1027 adolescents from father-only migrant families, 67 adolescents from mother-only migrant families and 2249 adolescents from non-parent migrant families. The data were collected at five time points during the period of a year with six months apart. Based on the examination of heterogeneous developmental trajectories of loneliness among adolescents, the present study explored the predictive role of parent-child separation characteristics such as parent-child separation status, separation age, separation duration, the interval of long-distance and face-to-face communication between parents and adolescents. The results showed that: (1) There were three heterogeneous trajectories of adolescent loneliness: "low-decreasing group"(44.6%), "moderate-stable group" (40.5%), and "sustained-high group" (15.9%), and girls were more likely to be classified in the sustained-high group, the moderate-stable group rather than the low-decreasing group than the boys, and adolescents in county public schools were more likely to be classified in the sustained-high group than low-decreasing group than the adolescents in private schools; (2) Compared with non-left-behind adolescents, adolescents from both-parent migrant families were more likely to be classified in the sustained-high group, the moderate-stable group than the low-decreasing group; compared with adolescents separated during adolescence, adolescents separated at school age were more likely to be classified in the low-decreasing group than sustained-high group; there was no significant difference in the loneliness trajectories of left-behind adolescents with different parent-child separation duration; (3) The longer the interval of face-to-face communication and the long-distance communication between parents and adolescents, the left-behind adolescents were more likely to be classified in the sustained-high group, moderate-stable group rather than the low-decreasing group. The finding showed that there were individual differences in the development trajectories of loneliness among left-behind adolescents, and the parent-child separation status, the separation age and the communication interval between parents and adolescents all affect the development trajectories of loneliness among left-behind adolescents.

***Keywords*:** parent-child separation characteristics, left-behind adolescents, loneliness, heterogeneous development trajectories

教师与父母恐惧诉求对儿童学业自我设障、抑郁和自伤的影响——变量中心和个体中心的视角

李政儒　刘红瑞（通讯作者）

北京师范大学心理学部，北京，100875，hrliu@bnu.edu.cn

摘 要　在学校与家庭的日常教育中，教师和父母经常会采取恐惧诉求的策略，即通过向儿童强调学业失败的后果，让儿童在学业任务中投入更多努力，采取替代性行为来避免面临学业失败。作为一种常见的教育策略，恐惧诉求具有一定积极意义，但也会对儿童的学业动机和行为造成负面影响，增大儿童的适应障碍风险。因此，本研究构建了一个多重中介模型，以表现回避目标和外部调控动机为中介变量，探究教师和父母恐惧诉求对儿童学业自我设障、抑郁和自伤行为的影响。同时，为了解当前儿童接受到的恐惧诉求现状，本研究又以个体为中心，通过潜剖面分析儿童感知到的教师和父母恐惧诉求的组合模式，并通过 BCH

法进行方差分析和事后检验，比较各组儿童在中介变量和因变量上的差异。研究被试为 762 名四、五年级的儿童（436 名男生，326 名女生；年龄 $M = 10.26$, $SD = 0.73$），采用问卷调查的方式对其感知到的教师和父母恐惧诉求、表现回避目标、外部调控动机、学业自我设障、抑郁和自伤水平进行测量。结果发现：1）父母恐惧诉求正向预测表现回避目标和外部调控动机，教师恐惧诉求则对二者无显著预测作用；2）表现回避目标正向中介父母恐惧诉求与自我设障的关系，外部调控动机正向中介父母恐惧诉求与儿童抑郁的关系；3）存在 4 类教师和父母恐惧诉剖面，分别为：低恐惧诉求型（31.975%）、中等恐惧诉求型（37.554%）、高恐惧诉求型（14.065%）以及父母恐惧诉求型（16.406%）；4）儿童所属剖面的恐惧诉求水平越高，表现回避目标、外部调控动机、学业自我设障、抑郁和自伤行为倾向于越严重。研究结果提示，相较于教师恐惧诉求，父母恐惧诉求对儿童的影响更重，尤其体现在一些负面影响上，父母在教养策略的选择和使用上应更加谨慎。

The influence of Teachers' and Parents' Fear Appeal on Children's Academic Self-Handicapping, Depression and Self-Injury: Variable-Centered and Person-Centered Perspectives

LI Zhengru, LIU Hongrui
Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract：In daily education of schools and families, teachers and parents often adopt a strategy of fear appeal, which emphasizes the consequences of academic failure to children, encourages them to invest more effort in academic tasks, and adopt alternative behaviors to avoid facing academic failure. As a common educational strategy, fear appeal has certain positive significance, but it can also have a negative impact on children's academic motivation and behavior, and increase the risk of adaptation disorders. Therefore, this study constructed a multiple mediation model, with performance-avoidance goal and external regulatory motivation as mediating variables, to explore the influence of teachers' and parents' fear appeals on children's academic self-handicapping, depression, and self-injury. At the same time, in order to understand the current situation of fear appeals received by children, this study also used a person-centered perspective to analyze the combination pattern of teachers' and parents' fear appeals perceived by children through latent profile analysis (LPA), and conducted variance analysis and post hoc test through BCH to compare the differences between each group in the mediator and dependent variables. The study involved 762 children in fourth and fifth grades (436 males and 326 females; $Mage = 10.26$, $SD = 0.73$). Questionnaire survey was used to measure their perceived levels of teachers' and parents' fear appeals, performance-avoidance goal, external regulatory motivation, academic self-handicapping, depression, and self-injury. The results showed that: 1) Parents' fear appeals positively predicted performance-avoidance goal and external regulatory motivation, while teachers' fear appeals had no significant predictive effect on both; 2) Performance-avoidance goal positively mediated the relationship between parents' fear appeals and self-handicapping, while external regulatory motivation positively mediated the relationship between parents' fear appeals and children's depression; 3) There are four types of teachers' and parents' fear appeals profiles: low fear demand type (31.975%), moderate fear demand type (37.554%), high fear demand type (14.065%), and parent fear demand type (16.406%); 4) The higher the level of fear appeals in the profile of children, the more severe the tendency to performance-avoidance goal, external regulatory motivation, academic self-handicapping, depression, and self-injury. The results suggest that compared to teacher's fear appeals, parents' fear appeals have a more

serious influence on children, especially in some negative influence. Parents should be more cautious in choosing and using parenting strategies.

不同管教类型母亲情绪表达与 2-3 岁幼儿情绪调节的关系

张娜[1]　张喜凤[1]　徐婧涵[1]　王异芳[1]（通讯作者）
1 首都师范大学学前教育学院，北京，100048，wangyifang6275@126.com

摘 要　随着《家庭教育促进法》的实施，家长如何对幼儿进行合理管教以促进其心理健康发展的问题得到重视，同时，传统观念下的严厉管教方式对幼儿心理发展的负面影响日益显现。2-3 岁是幼儿的第一个反抗期，家长管教较为频繁，也是幼儿情绪调节能力发展的重要时期。母亲对于幼儿起着重要的社会示范作用，其管教过程当中的情绪表达为幼儿情绪调节具有重要影响。本研究期望通过大样本调查和潜在类别分析方法，分类幼儿母亲的管教行为并分析各类别特征及差异；同时探讨不同管教样态下，母亲积极或消极情绪表达与幼儿情绪调节、情绪不稳定的关系。研究选取 1006 名 2-3 岁幼儿母亲进行问卷调查，考察母亲的管教行为、积极情绪表达、消极情绪表达，以及幼儿的情绪调节和情绪不稳定。研究结果表明：1.母亲管教方式可分为严厉管教型（占 14.1%），表现出高频率的管教行为，且体罚、心理攻击行为较多；理性管教型（占 44.4%），使用较多沟通说理等非暴力管教行为，但仍然会使用一定体罚与心理攻击行为；情绪指导型（占 41.5%），以非暴力管教行为为主，即注重与幼儿沟通交流、提供情感支持与更多的正面引导。2.不同管教方式的母亲在消极情绪表达和 2-3 岁幼儿情绪不稳定上存在显著差异，严厉管教型母亲消极情绪表达最高，其幼儿情绪最不稳定；理性管教型母亲消极情绪表达居中，其幼儿情绪不稳定性一般；情绪指导型消极情绪表达最低，幼儿情绪不稳定性也最低。3.除严管型母亲外，指导型和混合型母亲的积极情绪表达均对 2-3 岁幼儿情绪调节起促进作用，对 2-3 岁幼儿情绪不稳定性起缓解作用；严管型、指导型和混合型母亲消极情绪表达均正向显著预测幼儿的情绪不稳定。研究结果将为家庭情绪教养实践提供实证研究证据和科学指导，从而促进幼儿良好的情绪调节和适应。

Relations between maternal emotion expressiveness of different discipline classes and toddlers' emotion regulation

Zhang Na[1], Zhang Xifeng[1], Xu Jinghan[1], Wang Yifang[1]
1 College of Preschool Education, Capital Normal University, Beijing, 100048

Abstract： With the implementation of the *Family Education Promotion Law of the People's Republic of China*, the issue of how parents can reasonably discipline their children to promote their healthy psychological development has been emphasized, while the negative impact of traditional harsh discipline on children's psychological development has become increasingly obvious. The age of 2-3 years is the first resistance period of toddlers, during which parental discipline is rather frequent, and is also an important period for toddlers' emotional development. Mothers play an important role in social modeling for toddlers, and their maternal emotional expression in the process of discipline has a significant impact on toddlers' emotional regulation. The present study expects to categorize the discipline behaviors of mothers and analyze the characteristics and differences of each class through a large-sample survey and a latent category analysis method. Under different discipline classes, the

study explores the relationship between mothers' positive or negative maternal emotional expressions and toddlers' emotional regulation, and emotional instability. The study investigated 1006 mothers of 2-3-year-old toddlers by questionnaire to access their discipline behaviors, positive emotion expressiveness, negative emotion expressiveness, and toddlers' emotion regulation and emotion instability. The results showed that: 1. The three classes of discipline were defined as *the harsh discipline class*(14.1%), which shows high frequency of discipline behaviors and involves more corporal punishment and psychological aggression; *the rational discipline class*(44.4%), which shows more nonviolent discipline behaviors such as communication and reasoning, but still uses corporal punishment and psychological aggression; *the emotional guidance class*(41.5%), which mainly shows nonviolent discipline behaviors, that is, focusing on communication and interaction with the children, providing emotional support and more positive guidance. 2. There were significant differences in maternal negative emotion expressiveness, and toddlers' emotion instability among three classes. Mothers of *the harsh discipline class* had the highest negative emotion expressiveness and their toddlers' emotion instability was also the highest; mothers and toddlers of *the rational discipline class* had medium negative emotion expressiveness and emotion instability; mothers in *the emotional guidance class* had the lowest negative emotion expressiveness and their toddlers also had the least emotion instability. 3. A regression mixture modeling was employed to assess the relationship between maternal positive emotion expressiveness, negative emotion expressiveness, toddlers' emotion regulation, and emotion instability of three latent classes, which showed that except of *the harsh discipline class, the rational discipline class* and *the emotional guidance class* maternal positive emotion expressiveness had positive significant relationship with toddlers' emotion regulation and negative significant relationship with toddlers' emotion instability. Meanwhile, maternal negative emotion expressiveness positively and significantly predicted toddlers' emotion instability of all three classes. The results of the study will provide empirical research evidence and scientific guidance for family emotional parenting practices, which will promote better emotional regulation and adjustment in toddlers.

Keywords：maternal emotion expressiveness, harsh discipline, emotion regulation, latent class analysis

适度是关键:感知课程难度与大学生网络摸鱼的 U 型关系

丁子恩 刘儒德（通讯作者） 杨一

北京师范大学心理学部，北京，100875

摘 要 大学生的网络摸鱼行为普遍存在于在课堂上。课程难度被研究者认为是网络摸鱼行为的原因，学生觉得困难的课程会降低他们的学习兴趣和注意力；学生觉得简单的课程会导致他们学习的激活程度降低，这些都能增加网络摸鱼。根据心流理论和以往研究，当学生感觉课程难度适中，课程难度和个人能力之间存在平衡，学生更有可能产生心流体验，增加对学习的投入，减少网络摸鱼行为。本研究旨在通过四项研究探讨学生感知课程难度与网络摸鱼之间可能存的在 u 型关系以及学习投入在其中的中介作用。

研究 1 通过问卷调查检验了感知课程难度对网络摸鱼的直接关系。研究 2 通过让被试描述所上过的一堂课（困难，中等，简单）来操纵感知课程难度，并测量在不同难度课程情境中的网络摸鱼行为，揭示了感知课程难度与网络摸鱼之间的 U 型关系。研究 3 通过设置不同难度课程情境来操纵感知课程难度，并使用问卷对学习投入进行测量，再一次验证了感知课程难度与网络摸鱼之间的 u 型关系时，并证明了学习投入的中介作用。研究 4 使用并发双随机化设计同时操纵感知课程难度与学习投入，试图更进一步验证学习投入在感知课程难度和网络摸鱼之间的中介作用，然而结果显示，学习投入仅中介了中等课程难度与网络摸鱼之间的关系。

这一研究及其结果对教师的课程设计具有启示意义。教育工作者应该努力通过教学策略在他们的课程中创造一个最佳的挑战水平，并根据学生的即时反馈修改课程难度，减少学生在课堂上的网络摸鱼行为。

关键词 感知课程难度，学习投入，网络摸鱼，大学生

Moderation is the Key: Taking Too Easy or Too Hard Courses Increases Academic Cyberloafing

Zien Ding, Ru-De Liu (Corresponding author) Yi Yang
Faculty of Psychology, Beijing Normal University, Beijing 100875

Abstract: As technology permeates every aspect of our lives, college students increasingly use technology for non-academic purposes during class time. Previous studies found that perceiving a course to be hard decreases students' competence, learning interest, and concentration, which leads to academic cyberloafing; perceiving a course as easy may lead to diminished learning outcomes, such as less activation on learning, which increase academic cyberloafing. Moreover, according to flow theory, academic cyberloafing may decrease until a point of optimal perceived course difficulty is reached, after which academic cyberloafing increases. More specifically, there may be a U-shaped relation between perceived course difficulty and academic cyberloafing. Further, Flow theory proposed that learning engagement can be improved by creating academic activities that allow individuals to experience flow (i.e., the optimal perceived course difficulty), which can lead to a positive attitude towards learning and decrease academic cyberloafing. Thus, learning engagement may mediate the relation between perceived course difficulty and academic cyberloafing. Taken together, the current study aimed to address two fundamental questions: (1) Is the relation between perceived course difficulty and academic cyberloafing U-shaped curvilinear? (2) Does learning engagement mediate the effects of the perceived course difficulty and academic cyberloafing?

Four studies revealed the relation between perceived course difficulty and academic cyberloafing among Chinese college students. Study 1 measured perceived course difficulty and academic cyberloafing and found the U-shaped curvilinear relation between perceived course difficulty and college students' academic cyberloafing. Study 2 manipulated the perceived course difficulty by asking participants to describe a course that they felt difficult to learn, neither hard nor easy to learn, or easy to learn. The results further demonstrated that there was a U-shape in the relation between perceived course difficulty and academic cyberloafing. Study 3 changed the manipulation of perceived course difficulty by providing a situation and demonstrated the mediating role of learning engagement in the association between perceived course difficulty and academic cyberloafing. Study 4 used concurrent double randomization designs to further demonstrated the mediating role of learning engagement in the association between perceived course difficulty and academic cyberloafing. However, learning engagement only mediated the relation between moderate-hard course difficulty and academic cyberloafing.

Taken together, the findings have implications for teachers' course design and contribute to a more comprehensive understanding of academic cyberloafing in classrooms. The implications of this research suggest that educators should strive to create an optimal level of challenge in their courses and modify the course difficulty based on students' immediate feedback to decrease students' academic cyberloafing in class.

小学儿童数学能力的异质性发展轨迹：教师支持与数学焦虑的纵向预测作用

郭凯玥 朱红祥 徐艳丽 封洪敏 司继伟（通讯作者）
山东师范大学心理学院，济南，250358，通讯作者 E-mail：sijiwei1974@126.com

摘 要 儿童数学能力差异的来源是数学认知发展领域研究者持续关注的热点问题之一。已有研究多关注个体特定认知能力与数学能力的关系，而相对忽视了外部环境和个体成就情绪在儿童数学能力发展过程中的作用。控制-价值理论认为个体的学业成就通常受到远端环境和近端成就情绪因素的影响，且远端环境可以通过影响近端成就情绪进而影响学生的学业成就。本研究试图考察教师支持和数学焦虑如何影响儿童发展为不同数学能力水平亚组，首先建立潜类别增长模型（LCGM）考察儿童数学能力的异质性发展轨迹；其次，建立中介效应模型考察数学焦虑在教师支持和儿童数学能力发展轨迹之间的纵向中介作用。以 1198 名小学三年级儿童为被试，对其数学能力进行四次追踪，每次间隔一年，并在第一次测试时测量儿童感知到的数学教师支持、数学焦虑及协变量（包括性别、智力和家庭社会经济地位）。结果发现：（1）小学儿童的数学能力可区分为三条异质性发展轨迹组：低稳定组（9.7%）、中快速上升组（81.4%）、高稳定上升组（8.9%）；（2）数学教师支持对数学能力的异质性发展轨迹类别具有直接预测作用，表现为相较于高稳定上升组，儿童感知到的数学教师支持水平越高，后期发展为低稳定组的概率越低；（3）数学教师支持亦可通过数学焦虑间接影响儿童数学能力的异质性轨迹类别，表现为数学教师支持水平越高，数学焦虑水平越低，儿童后期越易发展为高稳定上升组，而非中快速上升组和低稳定组。上述发现初步揭示了环境因素与个体成就情绪因素在儿童数学能力发展中的独特作用，为从环境-个体多因素角度制定有效培养方案提供了证据支持。

Heterogeneous Developmental Trajectories of Children's Mathematics Ability in Primary School: the Longitudinal Predictive Role of Teacher Support and Mathematics Anxiety

Kaiyue Guo, Hongxiang Zhu, Yanli Xu, Hongmin Feng, Jiwei Si(Corresponding author)
School of Psychology, Shandong Normal University, Jinan 250358

***Abstract*：** Sources of individual differences in children's mathematics ability are one of the hot issues of continuing interest to researchers in the field of mathematical cognitive development. Previous studies have focused more on the relationship between individual specific cognitive abilities and mathematics ability, while relatively neglecting the role of external environment and individual achievement emotions in the development of children's mathematics ability. The Control-Value Theory suggests that an individual's academic achievement is usually influenced by both distal environment and proximal achievement emotions, and that the distal environment can affect students' academic achievement by influencing proximal achievement emotions. This study attempts to examine how teacher support and mathematics anxiety affect children's development into different subgroups of mathematics ability. Firstly, a latent class growth model (LCGM) was established to examine the heterogeneous

developmental trajectories of children's mathematics ability. Secondly, a mediating effect model was established to investigate the longitudinal mediating effect of mathematics anxiety between teacher support and children's mathematics ability developmental trajectories. 1198 third grade primary school students were selected as participants. Their mathematics ability was measured four times over four years, and perceived mathematics teacher support, mathematics anxiety and covariates (including gender, intelligence and socioeconomic status) were measured at the first wave. The result showed that: (1) The development of primary school children's mathematics ability involved three heterogeneous trajectories: low stable group (9.7%), medium fast rising group (81.4%), high stable rising group (8.9%). (2) Teacher support directly affected the heterogeneous developmental trajectory classes of children's mathematics ability. Compared with the highly stable rising group, the higher the level of perceived teacher support, the lower the probability of individual development into the low stable group. (3) Teacher support could also indirectly affect the heterogeneous developmental trajectory classes of children's mathematics ability through mathematics anxiety. The higher the level of perceived teacher support, the lower the level of mathematics anxiety, and the more likely children were to develop into high stable rising group, rather than middle fast rising group and low stable group. The results of this study initially reveal the unique roles of external environment and individual achievement emotions in the development of children's mathematics ability, and provide evidence support for formulating effective programs to cultivate children's mathematics ability from an environmental-individual multifactorial perspective.

反馈中的错误线索和呈现次数对学习的影响：个体对错误的适应性反应的调节作用

王静 姜甜甜 龚少英（通讯作者）

华中师范大学心理学院，武汉，430079，gongsy@ccnu.edu.cn

摘 要 以往研究已经发现基于计算机的反馈是一种有效的教学干预方式，但不同精细反馈对学习的作用仍然没有定论，这可能是因为精细反馈对学习的影响会受到反馈特征（如反馈内容）或学习者特征等因素的影响。反馈领域相关研究多是关注与任务解决相关的正确信息，在这种情况下，学习者会被动地接受反馈中的解题信息，难以进行深层加工，如果能够帮助学习者分析其错误原因并修正其原有认知，可能有助于充分发挥错误的价值。此外，以往研究多是呈现一次反馈信息，学习者没有机会将反馈信息即时应用到第二次或多次尝试中，无法检查学习者是否达到了掌握水平，并且对错误有不同反应的学习者在接收到反馈后可能会有不同的表现。基于此，本研究聚焦于从错误中学习的视角设计了两个实验，探究反馈中的错误线索和呈现次数如何影响学习，以及个体对错误的适应性反应是否会调节错误线索对学习的影响。实验 1 采用 2（错误线索：有 vs 无）× 2（反馈呈现次数：1 次 vs 2 次）的两因素被试间设计，以 113 名初中生为对象，探究有无错误线索和反馈的呈现次数对其数学学习的影响，结果发现：（1）与无错误线索相比，反馈中的错误线索能提高学习者的相关认知负荷和迁移成绩；（2）与呈现 1 次反馈信息相比，呈现 2 次反馈信息能提高学习者的积极情绪和相关认知负荷；（3）错误线索和呈现次数交互影响迁移成绩。当呈现 2 次反馈信息时，接受了错误线索的学习者有更好的迁移成绩。基于实验 1 的结果，实验 2 以 220 名初中生为对象，在呈现 2 次反馈信息的基础上探究了个体对错误的适应性反应在错误线索影响学习中的调节作用并发现：（1）错误线索提高了学习者的相关认知负荷和迁移成绩，验证了实验 1 的结果；（2）个体对错误的情感-动机适应性反应调节了错误线索对内部认知负荷和动机的影响；（3）个体对错误的行为适应性反应调节了错误线索对内部认知负荷、动机和迁移成绩的影响。本研究启发教学设计者要考虑学习者的特

征和其错误来设计和提供反馈信息。

The Effect of Error Clue and Feedback Frequency on Learning: The Moderating Role of Individual Adaptive Reactions to Errors

Jing Wang, Tiantian Jiang, Shaoying Gong
School of Psychology, Central China Normal University, Wuhan

Abstract：Previous studies have found that computer-based feedback to be an effective instructional intervention, but the role of different types of elaborated feedback on learning is still uncertain, probably because of the effect of elaborated feedback can be affected by feedback characteristics (e.g., feedback content) or learners' characteristics. Most studies in the field of feedback focused on correct information related to task solving, in which learners passively accept it and found it difficult to process feedback deeply, and it might help to fully utilize the value of errors if learners could be assisted to analyze the reasons for their errors and revised their original cognition. In addition, previous studies mostly present feedback information once, and learners cannot have the opportunity to apply the feedback information instantly to a second or multiple attempts to check whether they have reached the mastery level, and learners who respond differently to errors may perform differently after receiving the feedback. Based on this, this study focused on the learning-from-errors perspective by designing two experiments to investigate how error clue and frequency in feedback affect learning, and whether individuals' adaptive responses to errors could moderate the effect of error clue on learning. Experiment 1 used a 2 (error clue: yes vs. no) × 2 (feedback frequency: 1 time vs. twice) two-factor between subjects design with 113 junior high school students to explore the effects of the error clue and feedback frequency on their learning in mathematics, and the results found that (1) compared to no error clue, error clue increased learners' germane cognitive load and transfer performance; (2) learners of the group with twice feedback reported more positive emotion and higher germane cognitive load than those with 1 time feedback; (3) error clue and feedback frequency interacted to affect transfer performance. Learners who received the error clue had better transfer performance when presented twice feedback. Based on the results of experiment 1, experiment 2 investigated the moderating role of individual adaptive responses to errors in the influence of error clue on learning based on presenting twice feedback, and revealed that: (1) error clue improved learners' germane cognitive load and transfer performance, which verified the results of experiment 1; (2) individual affective-motivational adaptive responses to errors moderated the effects of error clue on intrinsic cognitive load and motivation; (3) individual action adaptive responses to errors moderated the effects of error clue on intrinsic cognitive load, motivation, and transfer performance. This study can inspire instructional designers to pay attention to learners' characteristics and their errors when they design and provide feedback.

Keywords: feedback, error clue, feedback frequency, adaptive reactions to errors

生涯社会支持对高中生职业生涯规划能力的影响及生涯活动课程的干预研究

黄加慧[1]　赵钦瑞[1]　戴艳[2]（通讯作者）

1 四川师范大学，成都，610066

2 四川师范大学心理学院，成都，610066，daiyanch@163.com

摘 要　四川省新高考的改革给了高中生在选科时更多的“自主性”和“选择性”，选择并不是盲目的，这也表明职业生涯规划任务将提前，教师应该提供完备的职业生涯辅导。依据社会认知生涯理论，已有研究表明家庭、社会、学校和个体会不同程度影响学生的职业生涯规划发展。本文共有两项研究：①研究一采用《生涯社会支持量表》、《生涯探索和决策学习经验量表》、《生涯自我效能感量表》、《高中生职业生涯规划能力问卷》对四川省成都市某高一年级的 830 名普通高中生进行问卷调查，探讨生涯社会支持、生涯学习经验、生涯自我效能感和高中生职业生涯规划能力的关系以及作用机制，为研究二提供理论基础。②研究二基于职业生涯规划能力的影响机制研究，以生涯学习经验和生涯自我效能感为切入点，筛选同质性的两个班级，分为实验组和对照组。对实验组的班级进行共计 8 次的生涯课程干预，对照组不涉及生涯相关内容，以分析和探讨生涯辅导活动课程对高中生职业生涯规划能力的干预效果，为高中生的生涯教育提供较为完善的生涯课程体系。得出如下研究结论：

（1）本研究的高一年级学生职业生涯规划能力处于中等水平；在性别、是否独生的人口学变量上差异显著；

（2）生涯社会支持、生涯学习经验、生涯自我效能感和职业生涯规划能力之间皆两两相关；

（3）生涯社会支持正向预测高中生职业生涯规划能力；

（4）生涯学习经验和生涯自我效能感分别在生涯社会支持与高中生职业生涯规划能力之间起部分中介作用；

（5）生涯学习经验和生涯自我效能感在生涯社会支持与高中生职业生涯规划能力之间起部分链式中介作用；

（6）生涯辅导活动课能够增加高中生的生涯学习经验，增强生涯自我效能感水平，进而提升其职业生涯规划能力，干预效果显著。

关键词　高中生职业生涯规划能力，生涯社会支持，生涯学习经验，生涯自我效能感，生涯课程干预

The Influence of Career Social Support on Career Planning Ability of High School Students and the Intervention of Career Activity Curriculum

Huang Jiahui[1] Zhao Qinrui[1] Qai Yan[2]（corresponding author）
Sichuan Normal University , No.5 Jing'an Road, Jinjiang District, Chengdu, Sichuan, China

Abstract: Sichuan Province implemented new college entrance examination reform., students have more"autonomy" and "selectivity" in choosing subjects. The selection is not blind, which also means that the task of career planning will be advanced. Teachers should provide complete career guidance. Career planning tasks are brought forward. Therefore, students' career planning education becomes particularly important. Existing studies have shown that family, society, school and individuals have different degrees of influence on students' career planning and development. According to the Social Cognitive Career Theory, the external environment system interacts with individuals and has an impact on their career development.

There are two studies in this paper: (1) In the first study, 830 grade one high school students from Chengdu, Sichuan Province were surveyed by the Career Social Support Scale, the Career Exploration and Decision Learning Experience Scale, the Career Self-efficacy Scale and the Career Planning Ability Questionnaire. To explore the relationship between career social support, career learning experience, career self-efficacy and career planning ability of high school students, and further enrich the theoretical research on the influencing mechanism of career planning ability: (2) In the second Study, two homogenous classes were selected and divided into the experimental group and the control group based on study one. A total of eight career course interventions were carried out on the classes of the experimental group, while the control group didn’t involve career-related content. It mainly analyzes and discusses the intervention effect of career curriculumon the career planning ability of high school students,and provides a more mature career curriculum scheme system for the career education of high school students. The results are as follows:

(1) In this study, the career planning ability of senior one students is at an average level. There areobvious differences in gender and single child.

(2) There is a positive collection between Career social support, career learning experience, career self-efficacy and career planning ability.

(3) Career social support plays a significant positive role in predicting the career planning ability of high school students;

(4) Career learning experience and Career self-efficacy play partial agents between career social support and career planning ability;

(5) Career learning experience and career self-efficacy play a partial chain agent role between career social support and career planning ability;

(6) Career counseling activities can not only increase the learning experience of senior high school students, but also enhance their sense of self-efficacy. And ultimately improve their career planning skills.The effect of intervention is good and remarkable.

Keywords: Senior High School Students, Career planning ability, Career social support, Career learning experience, Career self-efficacy, Career course intervention

大学-职场转变阶段的生涯适应力发展及其与主动性人格、离职倾向的关系

李学涵[1]　张春雨[1]（通讯作者）
1 陕西师范大学心理学院，西安，710062，chunyu.zhang@snnu.edu.cn

摘 要　对许多毕业生来说，从大学到职场的转变是生涯发展转折的关键期，同时也是人生发展的重要阶段之一。在这一阶段，即将迈入工作岗位的“新职场人”们会面临一系列与职业和工作相关的挑战，而能否顺利地通过这些挑战会极大地影响他们未来职业生涯的成功与否。生涯适应力，作为有助于个体应对生涯发展性任务的资源，可能在这一阶段发挥着重要的作用。以往研究已经对生涯适应力在大学-职场转变阶段的发展特征、生涯适应力与主动性人格、离职倾向的关系进行过一定的探索，但其多为横断研究且所得结论并不统一，仍存在一定局限，有待进一步研究。基于此，本研究采用问卷法对 340 名大学生（男 89 人，女 251 人，平均年龄为 23.04 ± 0.95 岁）在横跨毕业前后的 9 个月间进行三次纵向追踪研究，使用 Mplus 构建潜变量增长模型、时间变化协变量模型等，对生涯适应力在此过程中的变化趋势及其与主动性人格、离职倾向的关系进一步进行探究。结果发现：（1）个体的生涯适应力在这一转变中具有显著的线性增长趋势，起始水平及发展速度均存在显著个体差异且两者之间呈现出显著的负向相关关系；（2）较高的主动性人格水平对当时个体生涯适应力水平的增长有显著促进作用；（3）初始生涯适应力水平及发展速度均对个体工作后的离职倾向具有负性作用。该研究在促进大学毕业生生涯适应力的发展、提高其转变阶段后的适应性结果等方面提供了理论及实践启示，以期完善生涯教育体系，促进全面心理健康服务的进一步发展。

The Relationship between the Development of Career adaptability and Proactive personality and Turnover intention in the Transition from university to work

Xuehan Li [1], Chunyu Zhang [1]
[1] School of Psychology, Shaanxi Normal University, Xi’ an, China

Abstract **：** For many graduates, the transition from university to work is a critical period in their career development and also one of the most important stages in their whole life. During this transition, “new workers” who are about to enter the workplace will face with a number of career and job-related challenges, and their ability to effectively deal with these challenges will significantly impact their future career success or not. Career adaptability, as a valuable resource for individuals to navigate career development tasks effectively, can play an important role in this transition.Previous research has explored the developmental characteristics of career adaptability during the transition from university to work, as well as the relationship between career adaptability and proactive personality, and turnover intentions. However, most of these studies are cross-sectional, and the conclusions are not consistent, indicating certain limitations, further exploration is needed. Therefore, A three-waves longitudinal study over nine months was conducted among 340 university students (89 males and 251 females, with an average age of 23.04 ± 0.95 years old) to examine how career adaptability develops during the transition from university to work, how proactive personality relates to this development in this process, and how this development predicts turnover intention when transiting to workplace. Using the latent growth model with

Mplus, our study found that there was a significant increase in career adaptability during the transition. Meanwhile, proactive personality as a time-variant variable at given testing point positively predicted career adaptability at the respective time point. Lastly, both the initial level and development speed of career adaptability have a negative effect on individuals' turnover intention after graduation. This study provides theoretical and practical insights in the promotion of the development of career adaptability among university graduates and the improvement of their adaptive outcomes in the transition from university to work. It aims to contribute to the improvement of career education system and to the further development of comprehensive mental health services.

Keywords： career adaptability, proactive personality, turnover intention, the transition from university to work, latent growth modeling

形状知觉对小学生数学学业成绩的纵向预测作用

崔佳歆[1]　左钰涵[1]　王赛赛[1]　崔占玲[1]（通讯作者）周新林[2]（通讯作者）

1 河北师范大学教育学院，石家庄，050024，myselfczl@163.com

2 北京师范大学心理学部认知神经科学与学习国家重点实验室，北京，100875，zhou_xinlin@bnu.edu.cn

摘 要　以往大量研究从领域特殊性角度解释近似数量系统与数学学业能力的关系，认为近似数量系统与所有数学学业能力均显著相关，是因为二者共享数量加工这一内在认知机制。近年提出的形状知觉假设从领域一般性角度，有效地解释了近似数量系统与数学学业能力关系的认知机制。并通过系列研究证实，形状知觉是近似数量系统与数学学业能力的共有认知基础，即控制了形状知觉后，近似数量系统不再对数学学业能力有显著性作用。目前已有研究结果主要来自横断研究，唯一的纵向研究发现了形状知觉对数学认知能力的预测作用。那么，形状知觉对具有高生态效度的数学学业成绩是否也有显著的预测作用？本文将通过检验小学生的形状知觉能力对其在校数学考试成绩的纵向预测效果来回答这一问题。同时也将检验形状知觉能力对与数学学业成绩高度相关的数学学业情绪的纵向预测效果。

随机招募石家庄某校 176 名小学生（其中男生 86 名，平均年龄 10.75 岁，SD = 0.29 岁）参与研究，分别在小学五年级秋季学期测量形状知觉能力（箭头形状判断任务）与智力（瑞文推理任务）和反应速度（选择反应时任务）两种基础认知能力，同时收集其数学期中考试得分。在小学六年级秋季学期收集数学期中考试得分，同时测量其数学学业情绪（数学焦虑、数学学习投入和数学认识信念）。

结果发现，形状知觉能力与小学生五年级和六年级的数学成绩均显著相关（$r_{五年级} = 0.23$，$r_{六年级} = 0.27$，$p < 0.01$），但与其六年级的三种数学学业情绪均不相关（$r_{数学焦虑} = 0.01$，$r_{数学学习投入} = 0.05$，$r_{数学认识信念} = 0.13$，$p > 0.05$）。控制年龄性别和基础认知能力后，学生五年级的形状知觉能力仍能显著预测其六年级数学考试成绩（$\Delta R^2 = 0.054$，$p = 0.002$）。

可见，形状知觉是有效预测儿童未来数学学业成绩的认知行为指标，从纵向视角证实了形状知觉与数学学业能力的关系，体现了认知能力和学业能力的交会与融合，进一步支持了形状知觉假设。同时也发现形状知觉与小学生的数学学业情绪无关，体现了认知和情绪的分离性。

关键词　形状知觉，数学学业成绩，数学学业情绪，小学生，纵向预测

The longitudinal prediction of visual form perception on mathematics academic achievement of primary school students

Jiaxin Cui[1], Yuhan Zuo[1], Saisai Wang[1], Zhanling Cui[1], Xinlin Zhou[2]

[1] College of Education, Hebei Normal University, Shijiazhuang, 050024

[2] State Key Laboratory of Cognitive Neuroscience and Learning, Beijing

Normal University, Beijing, 100875

Abstract：Previous studies have extensively explained the relationship between approximate number system and mathematical abilities from the domain-specific perspective, suggesting that approximate number system are significantly correlated with nearly all types of mathematical abilities, because both share quantity processing as their common cognitive mechanism. The visual form perception hypothesis proposed in recent years effectively explains the cognitive mechanism of the relationship between approximate number system and mathematical abilities from a domain-general perspective. Through a series of studies, it was proved that visual form perception is a common cognitive basis for both approximate number system and mathematical abilities, that is, after controlling for visual form perception, the approximate number system no longer has a significant effect on mathematical abilities. The existing findings mainly come from cross-sectional studies, and the only longitudinal study has found a significant predictive effect of visual form perception on mathematical cognition. Therefore, does visual form perception also has a significant predictive effect on mathematical academic performance with high ecological validity? This study would focus on this problem by examining the longitudinal predictive effect of elementary school students' visual form perception ability on their school mathematics exam scores. At the same time, the longitudinal predictive effect of visual form perception on mathematical academic emotions highly correlated with mathematical academic performance will also be examined.

One hundred and seventy-six primary school students (86 boys, average age = 10.75, SD = 0.29) from a school in Shijiazhuang were randomly recruited to participate in this study. Visual form perception ability (measured by an arrow form judgment test) and two types of general cognitive abilities, intelligence (measured by Raven's matrix test) and processing speed (measured by choice reaction time test), were examined in the autumn semester of the fifth grade of primary school. At the same time, their mathematics midterm exam scores were collected. In the autumn semester of the sixth grade, their mathematics midterm exam scores and mathematics academic emotions (mathematics anxiety, mathematics learning engagement and mathematics epistemic belief) were collected.

The results showed that visual form perception was significantly related to the mathematics midterm exam scores in both grade 5 and grade 6 ($r_{grade5} = 0.23$, $r_{grade6} = 0.27$, $p < 0.01$), but was not significantly related to the three types of mathematical academic emotions in grade 6 ($r_{math_anxiety} = 0.01$, $r_{math_learning_involvement} = 0.05$, $r_{math_cognitive_beliefs} = 0.13$, $p > 0.05$). After controlling for age, gender, and general cognitive abilities, visual form perception in fifth grade can still significantly predict the sixth-grade mathematics exam scores ($\Delta R^2 = 0.054$, $p = 0.002$).

The results indicate that visual form perception is an effective cognitive behavioral indicator for predicting children's future mathematical academic achievement. From a longitudinal perspective, it confirms the relationship between visual form perception and mathematical ability, and further supports the visual form perception hypothesis. It was also found that visual form perception is not related to elementary school students' mathematical academic emotions, reflecting the separation of cognition and emotion.

Keywords：visual form perception, mathematics academic achievement, mathematics academic emotion, primary school students, longitudinal prediction

“量”与“质”对成绩的作用：

“双减”背景下作业减负增效的路径研究

秦可心[1]　王烨晖[1]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875，yehuiwang@bnu.edu.cn

摘 要　作业在为学生提供课后练习机会，提高教育效能的同时，也带来一定的学业负担。如何实现作业的减负增效是研究关注的重点。以往研究多关注作业时间这一“量”的因素，提出作业时间与成绩的复杂关系。然而，作业时间并非学业成功的保证，只有当学生有效参与作业，作业时间的投入才能高效转换为成绩。基于作业的理论基础，以学习兴趣和学习机会为代表的“质”的因素是构成作业有效性的关键。本研究以 2440 名八年级学生为研究样本，以数学学科为例，使用广义倾向值分析，在更精确地估计数学作业时间对数学成绩效应的基础上，进一步以下四分位数和上四分位数为界限，分别将学生在数学学习兴趣和学习机会上的得分划分为“低”、“中”、“高”三组，探究数学学习兴趣和学习机会对学生成绩及作业时间效率的影响。结果显示：（1）在控制学校、家庭和学生层面协变量后，数学作业时间与数学成绩呈倒 U 型的关系，其中，45 分钟是达到最佳数学成绩的作业时间阈值。（2）持有不同数学学习兴趣（$F_{(2,1409)} = 12.97, p < 0.001, \eta_p^2 = 0.019$）和不同学习机会（$F_{(2,1409)} = 28.61, p < 0.001, \eta_p^2 = 0.039$）的学生在数学成绩上表现出显著差异，随着学生数学学习兴趣的提升和数学学习机会的增加，成绩显著提升。（3）提升学生的数学学习兴趣，增加数学学习机会能够通过缩短达到最佳成绩所需的作业时间，提高作业效率。具体而言，“低数学学习兴趣”和“中等数学学习兴趣”组达到最佳数学成绩的作业时间位于第 60 个百分位数；而“高数学学习兴趣组”达到最佳数学成绩的作业时间提前至第 40 个百分位数；“低学习机会”和“中等学习机会”组达到最佳数学成绩的作业时间位于第 60 个百分位数；而“高学习机会”组达到最佳数学成绩的作业时间提前至第 50 个百分位数。本研究揭示了“量”与“质”的因素与成绩的复杂关系，对作业减负增效的实践具有一定启示：从量而言，建议统筹管理作业，合理设计作业结构，控制作业总量；从质而言，建议提升兴趣，增加学生获取知识的学习机会，实现增效减负。

The Effect of "Quantity" and "Quality" on Achievement: Research on Burden Reduction and Efficiency Increasement of Homework under the Background of “Double Reduction” Policy

Kexin Qin[1], Yehui Wang[1]

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

Abstract **：** Homework provides students with opportunities to practice learning content and improves educational efficiency, while at the cost of increasing academic burden. How to alleviate the burden and increase the efficiency of homework is the focus of research. Previous studies paid much attention to homework time, the “quantity” factor, and suggested the complex relationhip between homework time and achievement. However, homework time is not a guarantee of academic success. Only when students actively participate in homework can the investment of homework time be used effectively. According to the theoretical basis of homework research, the "quality" factors including learning interest and opportunity to learn (OTL) are key to the effectiveness of homework. The study recruited 2440 students in Grade 8. Taking mathematics as an example, generalized propensity score (GPS) analysis was used to accurately estimate the effect of mathematics homework time on mathematics achievement. Furthermore, students were

divided into different groups according to the first four quartile and the last quartile of the scores of the two “quality” factors respectively to explore the influence of mathematics interest and OTL on students' achievement and homework time efficiency. The results showed that (1) There was an inverted U-shaped relationship between mathematics homework time and mathematics achievement. The threshold of homework time that reached the best mathematics achievement was 45 minutes. (2) The increasing of mathematics interest ($F_{(2,1409)} = 12.97, p < 0.001, \eta_p^2 = 0.019$) and the OTL ($F_{(2,1409)} = 28.61, p < 0.001, \eta_p^2 = 0.039$) significantly improved mathematics achievement. (3) The increasing of mathematics interest and the OTL increased the efficiency of mathematics homework by shortening the homework time required for the highest achievement. Specifically, for students with below medium levels of mathematics interest and OTL, the threshold of homework time that reached the best mathematics achievement was in the 60th percentile; for students with high level of mathematics interest and OTL, the threshold of homework time was advanced to 40th percentile and 50th percentile respectively. The study reveals the complex relationship between "quantity" and "quality" factors and achievement. It is advised to adjust the structure of homework to control the total amount of homework, and improve classroom teaching to increase students' interest and OTL in mathematics.

低成本脑机接口技术的数学教学模式及其对提高学习效果的影响

许施扬[1] （通讯作者）杨佳闻[1] 范靖朝[1]

1 山西师范大学教育科学学院心理系，太原，030031，xushiyang@sxnu.edu.cn

摘 要　在21世纪，数学学习成为科学、技术、工程和数学（STEM）领域的关键，但学生常面临缺乏动机、焦虑和成绩不佳等挑战。因此，本研究探索了一种结合低成本脑机接口技术的教学模式，旨在通过提供基于α节律的神经反馈来提高学生的数学表现和自我效能。研究假设，增强α功率可以提升注意力、降低焦虑，并增强工作记忆，从而改善数学学习效果。

本研究招募了40名无代数先验知识的大学生（包括20名男性和20名女性，平均年龄为19.5岁，智商平均为110）参与，他们被随机分为实验组和对照组。实验中使用了由无线脑电图耳机、笔记本电脑及定制的采集软件组成的单通道低成本脑机接口设备进行神经反馈，脑电图耳机在国际10-20系统的Fp1位置放置一个干电极。利用在线平台提供代数主题的互动课程和练习，同时使用两份问卷来评估参与者的数学表现和自我效能。

实验结果表明，虽然所有参与者的数学表现和自我效能均有所提升，但实验组的提升幅度更大。实验组的数学表现正确率从前测的65%提升到后测的80%，而对照组从前测的58%提升到后测的62%，差异具有统计学显著性（$t(38) = 3.21, p < 0.01$）。同样，实验组的自我效能得分从前测的60提升到后测的72，而对照组则从58提升到62，差异同样具有统计显著性（$t(38) = 2.87, p < 0.01$）。此外，实验组在与数学认知相关的额叶区域（Fp1）表现出显著增强的α功率，而对照组并无此类变化（$t(38) = 3.67, p < 0.01$）。

综上，融合低成本脑机接口技术的教学模式能通过提供基于α节律的神经反馈来提升数学学习效果。这一发现支持了假设，即增强α功率能通过提升注意力、降低焦虑和增强工作记忆来提升数学学习效果。此外，研究揭示了脑机接口系统对数学认知相关脑区活动的调节作用，为教育神经科学领域提供了新视角，并为提升数学教育质量和培养数学素养提供了新的思路和途径。

The Impact of a Neurofeedback-Augmented Mathematics Teaching Model Using Low-Cost Brain-Computer Interface Technology

Xu Shiyang[1] (Corresponding Author), Yang Jiawen[1], Fan JingZhao[1],
[1] Department of Psychology, Faculty of Education Sciences, Shanxi Normal University, Taiyuan, 030031

***Abstract*：** In the 21st century, mathematics learning has become a cornerstone in Science, Technology, Engineering, and Mathematics (STEM) fields, yet many students grapple with obstacles such as lack of motivation, anxiety, and underperformance. Consequently, this study explored a pedagogical model integrating low-cost brain-computer interface technology, aiming to enhance students' mathematical performance and self-efficacy by providing neurofeedback based on alpha rhythms. The study hypothesizes that enhancing alpha power can improve attention, reduce anxiety, and augment working memory, thereby improving mathematics learning outcomes.

The study enlisted 40 college students (including 20 males and 20 females, averaging 19.5 years in age, with an average IQ of 110) with no prior knowledge of algebra. They were randomly assigned into an experimental group and a control group. The experiment used a single-channel, low-cost brain-computer interface device for neurofeedback, comprising a wireless EEG headset, a laptop, and customized acquisition software. The EEG headset placed a dry electrode at the Fp1 location of the International 10-20 system. An online platform was employed to offer interactive courses and exercises on algebraic themes, while two questionnaires were utilized to gauge participants' mathematical performance and self-efficacy.

The results demonstrated that while all participants improved in mathematical performance and self-efficacy, the experimental group saw a greater improvement. The correct rate of mathematical performance in the experimental group increased from 65% in the pre-test to 80% in the post-test, while the control group increased from 58% to 62%, with a statistically significant difference ($t(38) = 3.21$, $p < 0.01$). Similarly, the self-efficacy score of the experimental group rose from 60 in the pre-test to 72 in the post-test, with the control group rising from 58 to 62, a difference also statistically significant ($t(38) = 2.87$, $p < 0.01$). Additionally, the experimental group showed a significant enhancement in alpha power in the frontal lobe area (Fp1) related to mathematical cognition, a change not observed in the control group ($t(38) = 3.67$, $p < 0.01$).

In summary, the pedagogical model integrating low-cost brain-computer interface technology can improve mathematical learning outcomes by providing neurofeedback based on alpha rhythms. These findings support the hypothesis that enhancing alpha power can improve mathematical learning outcomes by promoting attention, reducing anxiety, and augmenting working memory. Moreover, the study reveals the modulatory role of the brain-computer interface system on brain activity related to mathematical cognition, offering a new perspective in the field of educational neuroscience, and paving new ways to enhance the quality of mathematics education and cultivate mathematical literacy.

多媒体学习中积极情绪设计视觉显著性的影响:呈现步调的调节

赵文静　沈姝含　关荐（通讯作者）

宁夏大学教师教育学院，银川，750021，guanjian@nxu.edu.cn

摘 要　在多媒体学习中,不同的视觉情绪设计会影响学习者情绪、提高内部动机并增进学习效果，是学习者获取信息的重要方式。以往研究较多关注视觉情绪设计的情绪效价特性和整体信息传递,忽视了具体视觉

元素在整个学习过程中对学习者注意力的引导和眼动层面的视觉认知加工影响。此外,学习材料的呈现步调是学习者与学习材料互动的新兴媒体学习模式,能够对学习者的情绪、主观体验及学习效果等产生不同的影响。因此，本文借助眼动追踪技术，首先验证视觉情绪设计在多媒体学习中的有效性,并进一步探讨视觉元素显著性对学习效果和视觉认知加工过程的影响及学习材料呈现步调在其中的调节作用。实验一采用单因素(视觉情绪设计:积极、中性)被试间实验设计,验证视觉情绪设计是否会影响多媒体学习中学习者的情绪状态,促进学习效果及视觉认知加工。实验二采用单因素(视觉元素显著性:高显著性、低显著性)被试间实验设计,考察在积极视觉情绪设计条件下,视觉元素显著性对多媒体学习的影响。实验三采用 2(视觉元素显著性:高显著性、低显著性)×2(呈现步调:系统步调、自定步调)两因素被试间实验设计，进一步探讨学习材料的呈现步调对学习者学习效果和视觉认知加工的影响。结果表明：（1）积极的视觉情绪设计能够在学习过程中稳定地维持学习者的积极情绪状态,促进更深入的视觉认知加工,进而提高多媒体学习中迁移测验成绩。（2）显著性能够提高教学材料的吸引力:在积极情绪设计条件下,高显著性的学习材料能够提升迁移测验成绩,并促进学习者的视觉认知加工。（3）呈现步调在视觉元素显著性对多媒体学习的影响中起调节作用,即在系统步调条件下,高显著性视觉元素学习材料可以促进视觉认知加工,提高迁移测验成绩；而在自定步调条件下,低显著性视觉元素教学材料也可以得到更充分的加工。

The Influence of Visual Saliency of Positive Emotion Design in Multimedia Learning: the Modulation of Presentation Pace

Zhao Wenjing　Shen Shuhan　Guan Jian
College of Teacher Education, Ningxia University,Yinchuan,750021,guanjian@nxu.edu.cn

Abstract： In multimedia learning, different visual emotion designs affect learners' emotions, improve internal motivation and enhance learning effects, which is an important way for learners to obtain information. Previous studies have paid more attention to the emotional potency characteristics and overall information transmission of visual emotion design, and ignored the influence of specific visual elements on the guidance of learners' attention and visual cognition processing at the eye movement level in the whole learning process. In addition, the pace of presentation of learning materials is an emerging media learning mode for learners to interact with learning materials, which can have different impacts on learners' emotions, subjective experiences and learning effects. Therefore, with the help of eye tracking technology, this paper first verifies the effectiveness of visual emotion design in multimedia learning, and further discusses the influence of visual element saliency on learning effect and visual cognitive processing process, and the regulating role of learning material presentation pace. Experiment 1 uses a single-factor (visual emotion design: positive and neutral) experimental design between participants to verify whether visual emotion design affects the emotional state of learners in multimedia learning, and promotes learning effect and visual cognitive processing. In the second experiment, a single-factor (visual element salience: high significance, low significance) experimental design was used to investigate the influence of visual element saliency on multimedia learning under positive visual emotion design conditions. Experiment 3 uses 2 (visual element salience: high salience, low salience) × 2 (presentation pace: system pacing, self-paced) to further explore the impact of the presentation pace of learning materials on learners' learning effect and visual cognitive processing. The results show that: (1) Positive visual emotion design can stably maintain the positive emotional state of learners in the learning process, promote deeper visual cognitive processing, and improve the transfer test score in multimedia learning. (2) Saliency can improve the attractiveness of teaching materials: Under the condition of positive emotion design, learning materials with high significance can improve transfer test scores and

promote learners' visual cognitive processing. (3) Presentation pace plays a regulating role in the influence of visual element saliency on multimedia learning, that is, under the condition of systematic pace, high significance visual element learning materials can promote visual cognitive processing and improve transfer test scores; Under self-paced conditions, teaching materials with low visual elements can also be processed more fully.

反应性效应对记忆可提取性和精确度的影响

唐华峰　杨春亮（通讯作者）
北京师范大学发展心理研究院，北京，100875，chunliang.yang@bnu.edu.cn

摘 要　学习判断（Judgments of Learning, JOLs）是指个体对当前学习内容在未来回忆测验中成绩的预测性评估，作为重要的元认知监测形式，常用于研究个体如何监控自己的学习。以往此类研究中会默认这种元认知判断并不影响学习过程本身，但近年来研究者们发现，在学习过程中做 JOL 会反应性地影响记忆本身，这种现象被称为反应性效应（the Reactivity Effect）。根据学习材料、测试类型的不同，反应性效应对记忆的影响没有一致定论，其内在机制尚不明晰。但这些研究往往采用离散的文字或图片刺激，全或无的评价方式也使得无法对记忆的保真度进行明确的测量，因此需要引入一种可能更有助于理解反应性效应对记忆质量影响的方法，允许被试沿着连续的反应空间从记忆中提取信息。本研究旨在使用一种可以估计记忆提取概率和提取表征质量的分析方法，检验反应性效应对连续性记忆的影响。研究一比较了在 JOL 和 no-JOL 条件下，被试在连续的色环上对图片颜色的回忆，结果显示反应性效应对记忆的可提取性有显著的提高，但显著降低了记忆的精确度。同时在研究一中发现，自由回忆的反应明显偏离颜色类别边界，并偏向类别中心，如果所有色调引起相似且无偏差的反应分布，则对所有颜色的选择应为相同的频率，即总体呈现出近均匀分布。 为了进一步探究反应性效应导致记忆不同成分分离性变化的原因，研究二重点关注视觉记忆的编码机制。视觉记忆的双轨迹理论认为个体将有两个信息来源：连续的视觉表征和口头标签，来自两种轨迹的信息在回忆过程中结合，以输出最终的反应。但研究者们也发现，标签记会阻碍视觉长时记忆，这与词语遮蔽效应相似，用语言描述视觉信息往往有助于回忆起的可能性，但会导致其在记忆中的失真，即与细节相关的精确度会降低。因此，研究二对被试的标签编码过程进行了抑制，结果发现在 JOL 和 no-JOL 条件下，记忆的可提取性和精确度均没有显著差异。综上，反应性效应对视觉连续记忆的影响体现在两方面，对从记忆中提取信息概率的积极促进，但代价是损失一定的精确度。这种影响的重要原因是，做 JOL 会导致个体更倾向于用口头标签的方式编码存储信息，从而在储存更精确信息的视觉表征通道上分配了更少的认知资源。

The Reactivity Effect Enhances the Accessibility of Memory but at the Cost of Precision

Huafeng Tang, Chunliang Yang (corresponding author)
Institute of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, 100875, chunliang.yang@bnu.edu.cn

Abstract：Judgments of Learning (JOLs) refer to learners' predictive evaluations of their future performance on memory tests for current learning materials. As a significant form of metacognitive monitoring, JOLs are commonly used to investigate how individuals regulate their own learning. Previous research had assumed that

such metacognitive judgments do not influence the learning process itself. However, in recent years, researchers have discovered that JOLs during learning can reactively impact memory itself, a phenomenon known as *the reactivity effect*. The impact of *the reactivity effect* on memory remains inconclusive, depending on the nature of the learning materials and testing conditions, and its underlying mechanisms are not yet well understood. Past studies often employed discrete textual or pictorial stimuli, and the all-or-none evaluation method made it difficult to precisely measure memory. Therefore, a new approach, allowing participants to extract information from memory along a continuous response space, may better aid in understanding the impact of *the reactivity effect* on visual memory. The present study aims to employ an analysis method capable of estimating memory retrieval probability and representation quality to examine the impact of *the reactivity effect* on continuous memory. Study 1 compared participants' recall of picture colors on a continuous color wheel under JOL and no-JOL conditions, with results showing that *the reactivity effect* significantly enhanced memory accessibility while significantly reducing its precision. Additionally, in Study 1, free recall responses noticeably deviated from color category boundaries and tended to cluster around category centers. If all hues elicited similar and unbiased response distributions, the choices for all colors should follow a uniform distribution, resulting in an overall near-uniform pattern. To further explore the reasons behind the changes in memory component separability due to *the reactivity effect*, Study 2 focused on the encoding mechanism of visual memory. *The dual trace theory* of visual memory posits that individuals have two sources of information: continuous visual representations and verbal labels. Information from both pathways combines during the recall process to produce the final response. However, researchers also found that labeling impairs visual long-term memory, similar to *the verbal overshadowing effect*. While describing visual information in language often aids in retrieval likelihood, it leads to distortions in memory, decreasing precision related to details. Thus, in Study 2, the labeling encoding process was inhibited, and the results showed no significant difference in accessibility and precision of memory under both JOL and no-JOL conditions. In summary, the impact of *the reactivity effect* on visual continuous memory manifests in two aspects: a positive promotion of information retrieval probability and a trade-off in precision. The crucial reason behind this influence is that JOLs prompts individuals to preferentially encode and store information using verbal labels, thereby allocating fewer cognitive resources to store more precise information in the visual representation channel.

职业价值观与研究生专业承诺的纵向联系：社会支持的中介作用

王笑　耿绯　袁熙庆 程新宇　邢秋连 明玉 王鹏（通讯作者）
山东师范大学心理学院，济南，250000，pengsdnu@163.com

摘 要　目的：基于男性和女性的职业与成就动机模型，考察领悟社会支持和职业价值观对研究生专业承诺的影响及其中介机制。方法：采用领悟社会支持量表、职业价值观量表、专业承诺量表，在 2022 年 11 月、2023 年 3 月对山东省一大学 1535 名一年级研究生进行两次追踪调查。在 SPSS25.0 中采用 Pearson 相关分析法分析领悟社会支持、职业价值观、专业承诺之间的相关性。在 Mplus8.3 中首先使用交叉滞后模型分析检验领悟社会支持和职业价值观的双向关系，之后采用结构方程模型探索了领悟社会支持、职业价值观和研究生专业承诺之间的中介作用。结果：（1）T1 领悟社会支持、T2 领悟社会支持、T1 职业价值观、T2 职业价值观、T2 专业承诺间两两显著正相关（p<0.01）。（2）交叉滞后分析显示，T1 领悟社会支持不能预测 T2 职业价值观（β= -0.025，p=0.417），但是 T1 职业价值观正向预测 T2 领悟社会支持（β=0.093，p=0.001）。（3）纵向中介的分析表明：T1 职业价值观通过 T2 领悟社会支持的影响 T2 专业承诺（效应值为 0.280，95%CI[0.071,0.674]）。T1 领悟社会支持可以通过 T2 领悟社会支持的影响 T2 专业承诺（效应值为 0.489，95%CI[0.313,0.702]），同样，T1 职业价值观也可以通过 T2 职业价值观的影响 T2 专业承诺（效应值为 0.407，

95%CI[0.122,0.613]）。此外，多组比较分析发现，三条中介路径在男生和女生群体中均不存在差异（p>0.05），即领悟社会支持和职业价值观对男生和女生的专业承诺的影响一致。结论：领悟社会支持在职业价值观和研究生的专业承诺之间起到了纵向中介的作用。

Longitudinal associations between career values and graduate student professional commitment: the mediating role of perceived social support

Xiao Wang Fei Geng Xiqing Yuan Xinyu Cheng Qiulian Xing Yu Ming Peng Wang
School of Psychology, Shandong Normal University, Jinan

Abstract： Purpose: Based on the model of career and achievement motivation for women and men, this study examined the effects of perceived social support and vocational values on postgraduate students' professional commitment and their mediating mechanisms. Methods: This study used the perceived social support scale, the vocational values scale, and the professional commitment scale to conduct two follow-up surveys in November 2022 and March 2023 on 1535 first-year postgraduate students at a university in Shandong Province. Pearson correlation analysis was used in SPSS25.0 to analyze the correlation among perceived social support, vocational values, and professional commitment. In Mplus 8.3, the bidirectional relationship between perceived social support and career values was first analyzed using cross-lagged modeling, followed by structural equation modeling to explore the mediating effect between perceived social support, career values, and postgraduate student professional commitment. Results: (1) A two-by-two significant positive correlation was found between T1 perceived social support, T2 perceived social support, T1 vocational values, T2 vocational values, and T2 professional commitment (p< 0.01). (2) Cross-lagged analysis showed that T1 perceived social support failed to predict T2 vocational values (β=-0.025, p=0.417), but T1 vocational values positively predicted T2 perceived social support (β=0.093, p=0.001). (3) Analyses of longitudinal mediation showed that T1 vocational values influenced T2 professional commitment through T2 perceived social support (effect size = 0.280, 95% CI [0.071,0.674]).T1 perceived social support could influence T2 professional commitment through T2 perceived social support (effect size = 0.489, 95% CI [0.313,0.702]), and similarly, T1 vocational values could influence T2 professional commitment through T2 vocational values (effect size = 0.407, 95% CI [0.122,0.613]). In addition, a multi-group comparative analysis revealed that three mediating paths did not differ between the women and men(p>0.05), i.e., the effects of perceived social support and vocational values on women’s and men’s professional commitment were consistent. Conclusion: Perceived social support acted as a longitudinal mediator between vocational values and graduate students' professional commitment.

不公平感对恶意创造力的影响

张文宇　梁秋雨　乔熙诺　郝宁（通讯作者）
华东师范大学心理与认知科学学院，上海市心理健康与危机干预重点实验室，上海，200062，
nhao@psy.ecnu.edu.cn

摘 要　恶意创造力作为一种蓄意做出伤害行为的创造力表现形式，其会受到各种环境因素与个人因素的影响，例如社会互动过程中给个体带来的不公平感。已有研究发现不公平感会增加个体的欺骗，攻击等行为，这类行为本身也正符合恶意创造力的概念内涵。因此本研究通过两个实验分别从特质水平和状态水平探究了不公平感会对个体恶意创造力表现产生怎样的影响，以及这种影响作用背后存在怎样的路径机制。研究一采用问卷法，405 名大学生被试(男性 222 名)参与实验，完成了恶意创造性行为量表，公民道德推脱量表，不公平感量表(由组织不公平量表，对不公平事件的情绪反应量表等组成)。结果显示(1)不公平感与恶意创造力倾向显著正相关($r = 0.37$, $p < 0.001$)，道德推脱也分别与不公平感和恶意创造性力显著正相关($r_1 = 0.52$, $p_1 < 0.001$; $r_2 = 0.60$, $p_2 < 0.001$)；(2)不公平感对恶意创造力的直接效应显著($b = 0.14$, $p = 0.041$, CI = [0.01, 0.28])，通过道德推脱对恶意创造力的间接效应显著($b = 0.28$, CI = [0.18, 0.39])，即道德推脱是不公平感对恶意创造力作用路径上的一个中介变量。研究二采用实验法，共招募 101 名大学生被试(男性 44 名)参与研究。被试被随机分配至控制组与实验组，通过最后通牒博弈任务诱发其不公平感，并分别在前后进行操纵检验并测量其情绪状态与内隐攻击性状态，然后通过恶意创造力问题解决任务测量其恶意创造力表现。结果显示(1)通过最后通牒博弈任务的不公平感诱发显著提升了被试的愤怒情绪与内隐攻击性($t_1 = -7.14$, $p_1 < 0.001$; $t_2 = -5.98$, $p_2 < 0.001$)；(2)不公平感对恶意创造力新颖性和伤害性的主效应显著($F_1 = 29.69$, $p_1 < 0.001$; $F_2 = 30.42$, $p_2 < 0.001$)，不公平感启动组的被试生成了更加新颖且恶意的创造性观点；(3)愤怒情绪和内隐攻击性在不公平感与恶意创造力之间起链式中介作用($b = -0.03$, CI = [-0.08, -0.01])；(4)语义分析和性别差异检验表明经历了不公平情境后女性会生成更多包含社会性攻击(例如造谣，诽谤)的恶意创造力观点，而男性会生成更多包含物理性攻击(例如故意使他人受伤)的恶意创造力观点。综上所述，本研究通过两个实验分别从特质和状态两个层面证明了不公平感会促进个体的恶意创造力，且道德推脱，愤怒情绪与内隐攻击性是其作用路径上可能的中介变量。

The Effect of Unfairness on Malevolent Creativity

Wenyu Zhang　Qiuyu Liang　Xinuo Qiao　Ning Hao (Corresponding author)
Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, The School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062,
nhao@psy.ecnu.edu.cn

Abstract: Malevolent creativity (MC) is a form of creativity which deliberately causes harm. It is influenced by carious environmental and personal factors, such as unfair situations that are common in social interaction. It has been previously demonstrated that the sense of unfairness could increase individual's deception, aggression and other such kinds of behaviors which are also in line with the concept of MC. The present study aims to explore how the sense of unfairness affects individual's MC performance and what pathway mechanisms exist behind this effect through two experiments from the level of trait and state respectively. Study 1 measured the relationship among unfairness, MC and moral disengagement. Malevolent Creativity Behavior Scale, Moral Disengagement Scale and several questionnaires about unfairness were collected from 405 participants (222 males). This study found that: (1) Unfairness was positively correlated with MC ($r = 0.37$, $p < 0.001$) and moral disengagement was

also positively correlated with unfairness and MC respectively (r_1 = 0.52, p_1 < 0.001; r_2 = 0.60, p_2 < 0.001). (2) The direct effect of unfairness on MC (b = 0.14, p = 0.041, CI = [0.01, 0.28]) and the indirect effect via moral disengagement (b = 0.28, CI = [0.18, 0.39]) were significant. Moral disengagement played a mediating role between unfairness and MC. In study 2, 101 participants were recruited and randomly divided into control group and experimental group. The ultimatum game task was used to induce their sense of unfairness and manipulation tests were performed before and after the task to measure participants' emotional state and implicit aggression state. Malevolent Creativity Task was used to measure their MC performance. The results showed that: (1) The unfairness induced by the ultimatum game task significantly increased anger and implicit aggression of the participants (t_1 = -7.14, p_1 < 0.001; t_2 = -5.98, p_2 < 0.001). (2) The main effect of unfairness on the novelty and harmfulness of MC was significant. Participants in the experimental group generated more novel and harmful creative ideas (F_1 = 29.69, p_1 < 0.001; F_2 = 30.42, p_2 < 0.001). (3) Anger and implicit aggression played a chain mediating role between unfairness and MC (b = -0.03, CI = [-0.08, -0.01]). (4) Semantic analysis and gender difference test showed that after experiencing unfair situations, women generated more MC ideas that included social aggression (damage to relationships, negative social media posts, etc) while men generated more MC ideas that included physical aggression (making someone hurt, assault, etc). In summary, the present study proved that unfairness would promote individual's malevolent creativity through tow experiments from the aspects of trait and state. And moral disengagement, anger and implicit aggression are possible mediating variables in the pathway.
Keywords：malevolent creativity, unfairness, moral disengagement, anger, implicit aggression

教师支持与小学生数学焦虑之间的动态联系及作用机制：四年追踪研究

李红霞[1]　张明亮[2] 侯舒洋[1] 禚新峰[1] 刘畅[1] 司继伟[1]（通讯作者）

摘 要　数学焦虑已经成为一种全球普遍现象，它对个体的学业乃至职业发展有长远影响。近几十年，越来越多的学者关注数学焦虑的影响因素。现有理论与实证研究指出，个体因素与环境因素均为数学焦虑的重要影响因素。本研究基于成就情绪控制-价值理论与数学焦虑动态发展生物-心理-社会模型，对 1796 名三年级小学生进行了为期四年（3~6 年级）的追踪研究，在每一时间点均测查被试的教师支持、数学学习投入和数学焦虑（包括数学学习焦虑与数学评估焦虑）。首先考察了教师支持与数学焦虑两维度的双向关系，然后进一步探讨了学生数学学习投入在两者关系间的作用机制。研究发现，3~6 年级小学生教师支持与数学学习焦虑之间存在双向预测关系，学生获得的教师支持越多，随后的数学学习焦虑越低，反之亦然；教师支持与数学评估焦虑之间存在单向预测关系，数学评估焦虑水平越高，随后的学生教师支持越低，而教师支持对数学评估焦虑的纵向预测作用不显著。纵向中介结果表明，学生数学学习投入在教师支持与数学学习焦虑两维度间的中介作用均成立，学生 3 年级时的数学焦虑水平通过 4 年级时的数学学习投入，进而预测 5 年级时的教师支持；4 年级时的数学焦虑水平通过 5 年级时的数学学习投入，进而预测 6 年级时的教师支持，但是教师支持通过数学学习投入对数学焦虑的预测作用不显著。该研究发现部分支持了成就情绪控制-价值理论与数学焦虑动态发展生物心理社会模型，强调了从发展的角度理解教师支持、数学学习投入与数学焦虑关系之间动态相互作用的重要性，对数学教育实践具有重要的指导意义。

Examining the Dynamic Links among Perceived Teacher Support, Mathematics Learning Engagement, and Dimensions of Mathematics Anxiety in Elementary School Students: A Four-wave Longitudinal Study

Hongxia Li[1], Mingliang Zhang[2], Shuyang Hou, Xinfeng Zhuo[1], Chang Liu[1], Jiwei Si[1]
1 School of Psychology, Shandong Normal University
2 Shandong Administrative Institute

***Abstract*:** There has been growing interest in the relation among students' perceived teacher support, mathematics learning engagement, and mathematics anxiety in the last decade. Longitudinal models are needed to provide new insights into the role of engagement in mathematics learning. Based on the control-value theory and developmental dynamic bio-psycho-social model of mathematics anxiety, the present study followed 1796 students from Grades 3 to 6 to investigate the longitudinal associations among perceived teacher support and two conceptually distinct dimensions of mathematics anxiety (i.e., mathematics evaluation anxiety and learning mathematics anxiety). We further explored the potential mediator effects of mathematics learning engagement between perceived teacher support and mathematics anxiety. We found bidirectional longitudinal associations between teacher support and learning mathematics anxiety from Grade 3 to grade 6, as well as unidirectional longitudinal associations between teacher support and mathematics evaluation anxiety (from mathematics evaluation anxiety to teacher support). Furthermore, mathematics learning engagement mediated the relation between perceived teacher support and mathematics anxiety (including learning mathematics anxiety and mathematics evaluation anxiety). These findings highlight the importance of understanding the dynamic interplay among perceived teacher support, mathematics learning engagement, and mathematics anxiety from a developmental perspective.

***Keywords*:** perceived teacher support, mathematics learning engagement, mathematics evaluation anxiety, learning mathematics anxiety, elementary school students

中国大学生在新冠疫情前后的失眠轨迹与抑郁和自我伤害行为之间的关系： 一个五波的纵向追踪调查

乔小飞 石绪亮（通讯作者）
河北大学教育学院，保定，071002，shixl163@163.com

摘 要 背景：在新冠疫情期间，睡眠问题是非常普遍的。然而，只有少部分的研究考察了新冠疫情前以及新冠疫情时期的失眠症状的变化轨迹，而且这些研究大多局限于两波的纵向设计和以变量为中心的方法。因此，本研究旨在运用以个体为中心的方法，考察中国大学生在疫情前后的失眠症状的变化模式以及与心理健康问题的关系，为高校心理健康工作者提供科学的干预建议。方法：数据来源于中国广东省某高校的一项大规模队列调查。该队列为五波的纵向追踪设计，其中 3834 名参与者完成了至少两波纵向调查并被纳入本研究。采用增长混合模型（GMM）来构建失眠症状的变化轨迹，然后用二元逻辑回归来探讨轨迹类别与随后的心理健康问题之间的关系。结果：本研究发现了 4 种不同的失眠症状轨迹：低而稳定组（n = 2897，75.6%），上升组（n = 405，10.6%），下降组（n = 182，4.7%），和高而稳定组（n = 350，9.1%）。此外，即使在调整了基线时的重要协变量后，处于高而稳定组和上升组的个体相较于低而稳定组的个体更有可能出现抑郁症状（OR = 3.13, 95% CI = 1.99-4.93; OR = 6.12, 95% CI = 4.1-9.11）、非自杀性自伤（OR = 1.67, 95% CI = 1.07-2.61; OR = 2.84, 95% CI = 1.96-4.11）和自杀风险（OR = 1.77, 95% CI = 1.16-2.70; OR = 3.70, 95% CI = 2.58-5.30）。结论：在新冠疫情前后，大学生的失眠症状表现出了明显的异质性，大约 20%的大学生被归类为失眠症状的高风险类别，并且这类别的个体出现心理健康问题的可能性更高。高校心理健康工作者应应针对性地干预这些风险群体，以减少心理健康问题的发生。

关键词 失眠症状，轨迹，心理健康问题，大学生，新冠疫情

Associations between insomnia symptom trajectories with depression and self-harm behaviors in Chinese college students before and during the COVID-19 pandemic: A five-wave longitudinal investigation

Xiaofei Qiao, Xuliang Shi
School of Education, Hebei University Hebei, Baoding 071002

Abstract: Background*:* Sleep problems are highly prevalent during the COVID-19 pandemic. However, only very limited studies have examined the changing patterns of insomnia symptoms before and during the COVID-19 pandemic, and most of these studies were limited to two-wave designs and the variable-centered approach. Therefore, this study aimed to examine the changing patterns of insomnia symptoms and the relationship with mental health problems among Chinese college students before and during the COVID-19 pandemic using an individual-centered approach, and to provide scientific intervention recommendations for college mental health practitioners. Methods*:* The data was taken from a large-scale health-related cohort at a university in Guangdong Province, China. This cohort was a five-wave design and 3834 participants who completed at least two waves were included in the present study. Growth mixture modeling (GMM) was used to estimate trajectory classes for insomnia symptoms, followed by binary logistic regression to explore the association between trajectory classes

and subsequent mental health problems. Results: GMM analyses extracted four distinct trajectories of insomnia symptoms: stable-low pattern (n = 2897, 75.6%), increasing pattern (n = 405, 10.6%), decreasing pattern (n = 182, 4.7%), and stable-high pattern (n = 350, 9.1%). Additionally, we found that individuals in stable-high and increasing patterns were more likely to experience depression (OR = 3.13, 95% CI = 1.99-4.93 and OR = 6.12, 95% CI = 4.11-9.11, respectively), non-suicidal self-injury (OR = 1.67, 95% CI = 1.07-2.61 and OR = 2.84, 95% CI = 1.96-4.11, respectively) and suicidal risk (OR = 1.77, 95% CI = 1.16-2.70 and OR = 3.70, 95% CI = 2.58-5.30, respectively) after the COVID-19 pandemic even after adjusting significant covariates and outcomes at baseline. Conclusions: Appreciable heterogeneity in insomnia symptoms among college students was revealed before and during the COVID-19 pandemic. About 20% of college students were classified as high-risk patterns of insomnia symptoms, and individuals in this category have a higher likelihood of developing mental health problems. Mental health workers in universities should target interventions to these risk groups to reduce the occurrence of mental health problems.

反态度任务中努力与对最喜爱游戏的态度改变之间的倒 U 型关系

林静敏[1] 刘儒德[1]（通讯作者） 陈延妍[1]

1 北京师范大学心理学部，北京，100875，liurude@126.com

摘 要 改变个体对游戏的态度可以预防过度游戏。以往研究基于认知失调理论设计了反态度任务以诱发个体对游戏的态度变化，并关注了努力在其中的影响，发现付出努力越多态度改变越多。但前人研究仅针对实验中青少年体验的游戏或者一般游戏行为进行态度测量，努力效应在个体最喜爱的游戏上是否也同样奏效呢？同时，在不同努力程度的任务中减少失调对认知加工和自我调节的要求也不同。对于认知加工能力成熟的大学生和自我调节系统较弱的小学生来说，努力在反态度任务的效应是否依然适用呢？

为了解决上述问题，本研究通过五项子研究探讨了大学生和小学生在反态度任务中的努力程度与其对最喜爱游戏的态度变化之间的关系。研究 1a 招募了两组大学生进行反态度排序任务（N = 106），发现高努力组被试的态度变化更大。但研究 1b 小学生进行类似的排序任务时（N = 89）却发现了相反的结果，低努力组的被试态度变化更大。这表明以往研究中努力和态度改变之间的正相关关系或许只揭示了二者潜在关系中的一部分。当努力超过个体的认知负荷承受范围时，可能会出现负面影响，使得努力和态度变化之间呈现一种倒 U 型关系模式。为了验证这种可能性，研究 1c 招募了大学生的更高努力组（N = 54）和小学生的更低努力组（N = 42），结合研究 1a 和 1b 进行比较，确定了努力和态度改变之间的倒 U 型关系。这可能是因为高努力任务导致了高水平认知负荷，被试更容易分心而削弱了态度改变。研究 2a 更换范式（反态度填空任务）对大学生进行实验（N = 143），验证了倒 U 型结果的稳健性。虽然研究 2b 小学生（N = 195）进行填空任务时没有发现倒 U 型结果，但其态度变化随着努力增加而增加的结果也反映了倒 U 型关系的一部分。

本研究扩展了对努力在认知失调研究中的作用的理解，并为预防过度游戏的干预计划提供了指导。只有在反态度任务中付出适度努力时，玩家才会最大程度地降低对最喜爱游戏的积极态度，干预效果才能发挥到最佳水平。

An inverted U-shaped relationship between attitude change towards the favorite game and effort exerted in the counter-attitudinal task

Jingmin Lin[1], Ru-De Liu[1] (Corresponding author), Yanyan Chen
Faculty of Psychology, Beijing Normal University, Beijing 100875

Abstract **:** Changing individuals' attitudes towards video games can effectively prevent excessive gaming. Previous studies have utilized counter-attitudinal tasks based on cognitive dissonance theory to induce attitude changes towards games and one study focused on the impact of effort. It supports the traditional view that the more effort exerted in the task leads to greater attitudinal changes. However, previous studies only measured attitudes towards games experienced in the experiment or general gaming behavior, so it remains unclear whether the effort effect applies to individuals' favorite games as well. Additionally, the requirements for cognitive processing and self-regulation in reducing dissonance may vary in tasks with different levels of effort. It is unknown whether the effect of effort in counter-attitudinal tasks still applies to college students with mature cognitive processing abilities and primary students with weaker self-regulation systems.

To address the aforementioned issues, this research conducted five studies to examine the relationship between effort in counter-attitudinal tasks and attitude changes towards participants' favorite games among college students and primary students. Study 1a recruited two groups of college students for a counter-attitudinal order-ranking task (N = 106) and found that participants in the high-effort group exhibited larger attitude changes. However, Study 1b, which involved a similar order-ranking task with primary students (N = 89), yielded opposite results, with greater attitude changes observed in the low-effort group. This suggests that the positive correlation observed in previous studies between effort and attitude change may only reveal a partial picture of their underlying relationship. When effort exceeds individuals' cognitive load capacity, negative consequences may arise, leading to an inverted U-shaped relationship between effort and attitude change. To verify this possibility, Study 1c recruited a higher-effort group of college students (N = 54) and a lower-effort group of primary students (N = 42), and compared with the other two groups of Studies 1a and 1b, confirming the inverted U-shaped relationship between effort and attitude change. This may be due to the high cognitive load generated by high-effort tasks, which makes participants more prone to distraction and weakens attitude change. Study 2a employed a different paradigm (counter-attitudinal blank-filling task) with college students (N = 143) to validate the robustness of the inverted U-shaped finding. Although Study 2b did not find the inverted U-shaped pattern among primary students (N = 195) during the blank-filling task, the results still indicated a partial picture of the inverted U-shaped relationship as attitude change increased with effort.

This research expands our understanding of the role of effort in cognitive dissonance research and provides guidance for intervention programs aimed at preventing excessive gaming. It is only when game-players exert moderate effort in the counter-attitudinal task that they can minimize their positive attitude towards their favorite games, allowing the intervention effects to be maximized.

学业与休闲成本价值在初中生学业-休闲冲突决策中的作用：多项式回归与响应面分析

张艺凡[1] 郭筱琳[2]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

2 北京师范大学中国基础教育质量监测协同创新中心，北京，100875，xlguo129@163.com

摘 要 努力学习是每名学生的重要发展任务。然而，专注于学业并非易事，学生们通常很难在学业和休闲活动之间做出选择，频繁的经历学业-休闲冲突。特别是初中生，他们面临着较大的学业压力，但抵抗诱惑的能力还不成熟。因此，探讨如何帮助他们抵制休闲的诱惑，在学业-休闲冲突中坚定地选择学业是很有必要的。初中生的价值观是影响他们学业-休闲冲突决策的重要因素。基于期望-价值理论，价值观分为积极成分和消极成分，分别衡量某任务的可能带来的益处和损害。然而，以往的研究只探讨初中生价值观的积极成分和他们的学业-休闲冲突决策的关系，忽略了价值观的消极成分，即成本价值的作用。不仅如此，成本价值分为三个维度，即努力成本、情感成本和机会成本，不同维度可能对初中生学业-休闲冲突决策有不同的影响。除此以外，基于动机行为冲突理论，学业和休闲价值观的相对强度，也就是学业价值相对于休闲价值的水平，而非是两种价值观单独的绝对强度和初中生在学业-休闲冲突中的决策有关。因此，本研究选用适切的多项式回归和响应面法，基于河北省某区县 5 所公立初中的 2564 名 7 年级初中生，探究初中生学业与休闲成本价值相对强度和学业-休闲冲突决策的关系，即：（1）针对每个成本价值维度，初中生学业成本价值相对休闲成本价值更低时，他们的学业-休闲冲突决策如何改变；（2）针对每个成本价值维度，初中生学业和休闲成本价值一致更低时，他们的学业-休闲冲突决策如何改变。结果发现：学生的学业努力成本（$a_3 = -0.13, p < 0.001$）、情感成本（$a_3 = -0.20, p < 0.001$）或机会成本（$a_3 = -0.07, p < 0.001$）相对休闲越低，他们在学业-休闲冲突中越倾向于选择学业。此外，学生的学业和休闲努力成本（$a_1 = -0.10, p < 0.001$）、情感成本（$a_1 = -0.17, p < 0.001$）或机会成本（$a_1 = -0.09, p < 0.001$）一致越低，他们在学业-休闲冲突中越倾向于选择学业。研究结果为探讨学生价值观与学习-休闲冲突决策的关系提供了新的视角和证据。

The role of study and leisure costs in students' decision in study-leisure conflict: A polynomial regression and response surface analysis

Yifan Zhang[1], Xiaolin Guo[1]

[1] Collaborative Innovation Center of Assessment Toward Basic Education Quality, Beijing Normal University, Beijing, China

Abstract：Studying hard is an important developmental task for every student. However, students usually have trouble in making a decision between academic and leisure activities. Especially for teenagers who have just entered in middle school, they face increasing academic pressure but their ability to resist temptation is not mature. Consequently, it is essential to explore how to help students resist the temptation of leisure and firmly choose to study in study-leisure conflict. Students' study and leisure values are important factors that affects their decision in study-leisure conflict. Based on the expectation-value theory, values could be divided into positive and negative components, which measure the possible benefits and harms of a task respectively. However, previous studies only

focused on the positive components, and did not explore the relationship between the negative components of values, which is also called cost, and students' decision in study-leisure conflict. Moreover, cost has three dimensions: effort cost, emotional cost and opportunity cost, and these dimensions may have different impacts on students' decision in study-leisure conflict. In addition, according to the motivation-action-conflict theory, the relative strength of study value and leisure value, that is, the level of study value relative to leisure value, rather than the absolute strength of the two values separately, is related to students' decision in study-leisure conflict. Therefore, this study used appropriate polynomial regression and response surface method to explore the relationship between the relative strength of students' study and leisure costs and decision in study-leisure conflict based on 2,564 junior high school students in 5 public middle schools in Hebei Province, namely: (1) For each cost dimension, when students' study cost is lower than the leisure one, how does their decision in study-leisure conflict change? (2) For each cost dimension, when students' study and leisure costs are congruently lower, how does students' decision in study-leisure conflict change? Results indicated that students with lower study effort cost ($a^3 = –0.13$, $p < 0.001$), emotional cost ($a^3 = –0.20$, $p < 0.001$) or opportunity cost ($a^3 = –0.07$, $p < 0.001$) relative to leisure one decided more often for academic alternative. More interesting, students with both lower congruent study and leisure effort costs ($a^1 = –0.10$, $p < 0.001$), emotional costs ($a^1 = –0.17$, $p < 0.001$) or opportunity costs ($a^1 = –0.09$, $p < 0.001$) decided more often for academic alternative. These findings provide a new perspective and new evidence for the relationship between students' values and decision in study-leisure conflict.

教育未来取向的性别差异：来自元分析的证据

宋瑞君[1]（通讯作者）

（1 长沙师范学院，长沙 410100）

Email: rjsong@sina.cn

摘 要 教育未来取向(educational future orientation)是个体对未来教育有目的的思考以及由此产生的情感及行为，是复杂的、多维度的动机-认知-行为的心理结构。在教育未来取向的众多结果中，教育未来取向的性别差异一直受到研究者们的广泛关注。然而，现有研究对于教育未来取向是否存在性别差异并未达成共识，对于是否有其他变量影响教育未来取向的性别差异尚不清楚。因此，本研究运用元分析技术考察教育未来取向与性别之间的关系及影响该关系的调节变量。通过文献检索与筛查，共有 34 项研究 42 个独立效应量纳入到元分析中($N = 73134$)。异质性检验表明应该选取随机效应模型($Q(38) = 223.10, p < 0.001$)，发表偏差检验说明元分析的结果不受发表偏差的影响 ($t = 0.73, p > 0.05$)。主效应结果显示，教育未来取向与性别呈相关关系，女性的教育未来取向高于男性($r = 0.11, p < 0.001$)。调节效应分析结果表明，出版年份的调节作用不显著($Q_b = 1.21, p > 0.05$),而测量工具($Q_b = 11.19, p < 0.001$)、被试发展阶段($Q_b = 10.14, p < 0.001$)、文化特征($Q_b = 9.82, p < 0.001$)会影响教育未来取向与性别的关系。具体而言，从测量工具来看，联合采用期望和愿望指标测量教育未来取向更容易出现性别差异，而采用开放式问卷测量教育未来取向的频次与性别间的关联较弱；从被试发展阶段来看，青春期个体的教育未来取向与性别之间的关系最强，成人初显期次之，童年期最低；从文化特征来看，教育未来取向的性别差异在美国、以色列等国家更为明显。 元分析结果澄清了教育未来取向是否存在性别差异的争论，对教育未来取向的理论研究及实践干预提供了一定的借鉴意义。

Gender Difference in Educational Future Orientation: The Evidence from Meta-Analysis

Song Ruijun[1]

1 Department of Applied Psychology, Changsha Normal University, Changsha, 410100, rjsong@sina.cn

Abstract: Educational future orientation is a complex, multidimensional, multistage construct, defined broadly as the extent to which an individual thinks about, anticipates, and plans for the future education. In recent years, gender difference in educational future orientation has garnered considerable attention. However, studies on the relationship between educational future orientation and gender have been mixed and inconclusive, and the factors affecting this relationship remain unclear. This study aims to synthesize the gender difference in educational future orientation and moderating variables affecting the relationship using meta-analytic techniques. Through literature retrieval, 34 cases and 42 independent effect sizes together with 73134 participants which met the inclusion criteria of meta-analysis were selected. Heterogeneity test indicated that the random effects model was appropriate for the meta-analysis ($Q(38) = 223.10, p < 0.001$). The result of Egger regression demonstrated that there was no publication bias ($t = 0.73, p > 0.05$). Main effect test findings showed that educational future orientation was significantly with gender ($r = 0.11, p < 0.001$). The moderator analysis revealed that publication time didn't moderate the correlation between educational future orientation and gender ($Q_b = 1.21, p > 0.05$), yet,

measurement tools (Q_b = 11.19, p < 0.001), development stage (Q_b = 10.14, p < 0.001), and culture (Q_b = 9.82, p < 0.001) moderated the relationship between educational future orientation and gender. Specifically, the questionnaire which currently measures expectation and aspiration would be easier to show gender difference, adolescence would be the most salient period in the relationship between educational future orientation and gender, and the gender differences in educational future orientation is more obvious in countries such as United State and Israel. The results provide an accurate estimate gender difference in educational future orientation, enriching our understanding of educational future orientation.

交错学习和阅读任务对冲突多文本阅读理解的影响

谭启瑶[1]　廖峻毅[1]　唐云[1, 2]（通讯作者）

1 华中师范大学心理学院，武汉，430079

2 青少年网络心理与行为教育部重点实验室，武汉，430079，tangyun@ccnu.edu.cn

摘 要　当今信息爆炸的时代，总是需要学习者对多来源、多视角的文本信息进行整合，这种复杂的认知活动不仅要求学习者单独理解每个文本，而且要求比较、综合不同文本的信息，形成整合的心理模型。而冲突的多文本（例如，对同一话题持有相反的立场）要求学习者不断识别和对比冲突的信息，进而在阅读中需要不断进行批判和重建整合心理模型，这带来了额外的认知负担。交错是一种有效的帮助学习者进行区别对比的学习方式，能够提高学习效果。另外，阅读是一项目标导向的学习活动，不同的阅读任务会影响学习者阅读和加工文本的方式。本研究基于文档模型，探讨不同学习方式和不同阅读任务对冲突多文本阅读理解的影响。研究采用 2（学习方式：交错 vs.集中）×2（阅读任务：立论 vs.总结）的被试间设计（N = 128）。对于阅读理解，具体考察被试的来源记忆、来源-内容链接、来源引用、观点描述，和互文整合的表现。结果表明，（1）在来源记忆、来源-内容链接、来源引用上，学习方式、阅读任务的主效应，及两者的交互效应均不显著；（2）在观点描述上，总结任务组得分显著高于立论任务组；（3）在互文整合上，立论任务组得分显著高于总结任务组。对于阅读行为，滞后序列分析的结果发现，（1）集中学习条件中，立论和总结任务下的被试均呈现整体式的阅读模式，被试在阅读某一立场的一篇文本后，都倾向阅读同样立场的另一篇文本，之后再转移至另一立场进行阅读；（2）交错学习条件下，立论任务下的被试呈现出对比式的阅读模式，被试在阅读某一立场的一篇文本后，倾向阅读另一立场的文本；（3）交错-总结条件下的被试既不呈现整体式，也不呈现对比式的阅读模式。综上，冲突的多文本阅读理解表现主要受阅读任务的影响，而学习者的阅读行为主要受到学习方式的影响。本研究提示教师可根据教学目标设置不同的阅读任务，以达到不同程度的理解；并结合学习方式的引导，达到合适的学习行为。

Comprehend in Interleaved Conflicting Multiple Documents under Different Reading Tasks

Qiyao Tan[1]　Junyi Liao[1]　Yun Tang[1, 2]

1 School of Psychology, Central China Normal University, Wuhan, 430079

2 Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan, 430079

***Abstract*：** In today's era of information explosion, learners are in constant need to integrating textual information from multiple sources and perspectives. This complex cognitive activity not only requires learners to comprehend each document, but also to compare and synthesize the information of multiple documents to form an integrated mental model. Whereas conflicting multiple documents (e.g., holding opposing stances on the same topic) require learners to constantly identify and compare conflicting information, thereby requiring constant critique and reconstruction of the integrated mental model during reading. Resulting in additional cognitive loads. Interleaving is an effective way of helping learners to discriminate and contrast, which can improve learning. In addition, as reading is a goal-oriented learning activity, different reading tasks would affect the way learners read and process documents. This study aims to explore the effects of different learning styles and reading tasks on reading comprehension about conflicting multiple documents. The present study employed a 2 (learning styles: interleaved vs. blocked) × 2 (reading tasks: argumentation vs. summarization), between-subjects design (N = 128). For reading comprehension, this study specifically examined participants' performance on source memory, source-content links, source citation, viewpoint description, and intertextual integration. The results showed that (1) On source memory, source-content links, and source citation, the main effect of learning style and reading task, as well as the interaction, were not significant; (2) Participants under summarization condition performed better on viewpoint descriptions than those in argumentation condition; (3) Participants under argumentation condition performed better on intertextual integration than those in summarization condition. For reading behaviors, results by Lag Sequential Analysis (LSA) revealed that (1) For blocked learning, participants with both argumentation and summarization tasks presented a holistic reading pattern. Participants tended to read the other documents of the same stance, after reading a document of one stance; (2) For interleaved learning, participants with argumentation task presented a contrastive reading pattern. Participants tended to read a document of the opposite stance, after reading a document of one stance; (3) Participants under interleaved- summarization condition presented neither holistic nor contrastive reading pattern. In sum, the reading comprehension about conflicting multiple documents is mainly impacted by the reading task, while the learning style would affect learners' reading behaviors. This study suggests that teachers can set different reading tasks to achieve different levels of understanding according to the teaching objectives. And teachers should incorporate the guidance of learning styles to achieve appropriate learning behaviors.

摘 要　执行功能作为支持数学学习与加工的核心认知成分，在儿童数学能力的发展中发挥着重要作用。尽管已有研究从横向与纵向的视角探究了学龄儿童执行功能与数学能力的关系，但很少有研究系统考察各执行功能子成分(干扰抑制、反应抑制、工作记忆广度、工作记忆刷新、认知灵活性)和不同数学能力(数学运算、逻辑思维、空间想象)间的关系及其二者间联系的动态发展。基于此，本研究采用 Stroop 任务、Flanker 任务、Go/No-go 任务、数字正背与倒背任务、数字刷新任务(1750ms、750ms)、数字转换任务及小学生数学基本能力测试量表中的五个分测验(加法、减法、续写数字、目测长度、方块计数)作为衡量儿童各执行功能成分和不同的数学能力的工具，对甘肃省四所小学的 542 名 3~5 年级儿童(Mage = 9.93 岁, SD = 0.91)进行了为期约 1.5 年的追踪测查，并通过构建交叉滞后模型(CLPM)来考察各执行功能成分与不同数学能力之间的关系。在控制了性别、年龄和家庭社会经济地位后，结果显示:(1)相关分析发现，除干扰抑制和反应抑制外，工作记忆广度、工作记忆刷新和认知灵活性均与数学能力存在显著的相关关系；(2)CLPM 的分析发现，执行功能、数学能力的自回归路径均呈现显著正向，T1 时的数学逻辑思维可以预测 T2 时的工作记忆广度、工作记忆刷新和干扰抑制，T1 时的认知灵活性可以显著正向预测 T2 时的数学运算、逻辑思维和空间想象；(3)多群组分析显示，执行功能子成分与不同数学能力的关系存在性别差异，具体为 T1 时的逻辑思维对 T2 时间点工作记忆广度的预测在女性中更强。结论：各执行功能子成分与不同数学能力间的纵向联系存在差异，其二者之间不存在显著的双向预测关系。

2 School of Psychology, Northwest Normal University, Lanzhou

Abstract：Executive function, as a core cognitive component supporting mathematical learning and processing, plays a substantial role in the development of children's mathematical ability. While prior research has explored the relationship between executive function and mathematical ability in school-age children from both cross-sectional and longitudinal perspectives, few studies have systematically examined the associations between various subcomponents of executive function (interference inhibition, response inhibition, working memory span, working memory updating, and cognitive flexibility) and distinct mathematical abilities (mathematical operation, logical thinking, and spatial imagination) and their dynamic development. In this study, various measures, including Stroop tasks, Flanker tasks, Go/No-go tasks, forward and backward digit span tasks, digital updating tasks (1750ms, 750ms), digit shifting tasks, and five subtests (addition, subtraction, digit writing, visual length estimation, and block counting) from the Elementary School Student Mathematical Basic Ability Test Scale, were employed to assess different executive function components and mathematical abilities in children. A longitudinal investigation was conducted over approximately 1.5 years on 542 children in grades 3 to 5 (Mage = 9.93 years, SD = 0.91) from four primary schools in Gansu Province. A Cross-Lagged Panel Model (CLPM) was constructed to

examine the relationships between various executive function components and different mathematical abilities. Controlling for gender, age, and family socioeconomic status, the results revealed the following: (1) Correlation analysis showed that, except for interference inhibition and response inhibition, working memory span, working memory updating, and cognitive flexibility were significantly correlated with mathematical abilities. (2) The CLPM analysis indicated notable positive autoregressive paths for executive function and mathematical ability. Meanwhile, mathematical logical reasoning at T1 was found to have predictive capabilities for working memory span, working memory updating, and interference inhibition at T2. Furthermore, cognitive flexibility at T1 showed significant predictive value for mathematical operations, logical thinking, and spatial imagination at T2. (3) Multiple group analysis indicated gender differences in the relationships between executive function subcomponents and different mathematical abilities. Specifically, logical reasoning at T1 had a stronger predictive effect on working memory span at T2 for females. Conclusions: the longitudinal connections between different executive function subcomponents and various mathematical abilities showed variations, and no significant bidirectional predictive relationship was observed between them.

摘 要　执行功能（Executive Function）是个体对注意和思维等认知活动进行有意控制的心理过程，在学习和推理等高级认知活动中发挥着关键作用。通常，研究者认为执行功能具有领域一般性（domain-general），即执行控制过程不会受到信息类型（如言语、数字或视空间）的影响。执行功能领域中最为主流的理论，Miyake 提出的抑制（inhibition）-刷新（updating）-转换（shifting）三成分论，在模型建构时主要基于领域一般性假设，并没有考虑执行功能的领域特殊性。近年来，一些个体差异研究、执行功能干预研究和元分析均发现：信息类型可能会影响执行功能对不同领域高级认知能力的预测作用。例如，基于数字（numerical）的执行功能任务表现对算术等数学能力的预测作用更大；而基于视空间（visuospatial）的执行功能任务对流体智力等非言语推理的预测作用更大。这些证据表明：执行功能可能具有领域特殊性（domain-specific）。目前，尚未有研究直接考察执行功能的领域一般性和领域特殊性，本研究首次尝试对该理论问题进行探究，以期建构更为完善的执行功能模型。

本研究以 246 名大学生为研究对象，选取 Stroop 任务、N-back 任务和 Task Switching 任务分别测量抑制、刷新和转换；同时系统操控不同任务中的刺激类型，即测查每个执行功能成分的任务均包含言语、数字和视空间三个版本，共 9 个任务。此外，我们还测量了被试的流体智力和数学能力。采用结构方程模型等统计方法分析数据，我们发现：首先，基于领域一般性的模型表明执行功能包含转换/抑制和刷新两个因子；其次，在最优的领域一般性模型中，加入视空间因子和数字因子，可以显著提升模型拟合度，表明执行功能具有领域特殊性。再次，刷新和视空间因子能够显著预测流体智力，但转换/抑制因子和数字因子与流体智力之间不存在显著相关。

本研究表明执行功能既具有领域一般性，也具有领域特殊性。这一发现挑战了 Miyake 的三成分模型，不仅有助于加深对执行功能内在结构的理解，而且对执行功能的干预训练具有重要的指导意义，提示未来的执行功能训练应考虑迁移效应的领域特殊性。

Abstract ： Executive Function (EF) refers to the mental process through which individuals exert intentional control over cognitive activities such as attention and thought, playing a crucial role in higher cognitive functions such as learning and reasoning. Traditionally, researchers have argued that executive function is domain-general, implying that the processes of executive control remain unaffected by the type of information involved (e.g., verbal, numerical, or visuospatial information). However, recent individual difference studies, executive function intervention research, and meta-analyses have yielded evidence suggesting that the type of information may influence the role of executive function in predicting high-level cognitive abilities in different domains. For example, performance on numerical-based executive function tasks seems more predictive of mathematical abilities such as arithmetic, while visuospatial-based executive function tasks appear to be more predictive of nonverbal reasoning, such as fluid intelligence. This emerging evidence implies that executive functions might exhibit domain-specific characteristics.

The current study endeavors to shed light on this theoretical issue and construct a more comprehensive model of executive functioning. For this purpose, the researchers selected 246 college students and assessed inhibition, updating, and switching using the Stroop task, the N-back task, and the Task Switching task, respectively. The present study systematically manipulated the stimulus types in the tasks, including verbal, numerical, and visuospatial versions of each task, resulting in nine tasks in total. Additionally, fluid intelligence and math ability were measured for every participants.

The data were analyzed using statistical methods, including structural equation modeling. The results indicated that the domain-generality-based model suggested executive function encompassed both switching/inhibition and updating factors. However, the inclusion of visuospatial and numerical factors in the optimal domain-generality model significantly improved model fit, supporting the notion that executive function has domain-specific aspects. Notably, both the updating and visuospatial factors significantly predicted fluid intelligence, whereas there was no significant correlation between the switching/inhibition factor and the numerical factor with fluid intelligence.

This study provides compelling evidence suggesting that executive functioning comprises both domain-general and domain-specific component. These findings challenge Miyake's three-component model and not only contribute to a deeper understanding of the intrinsic structure of executive functions but also offer valuable guidance for executive function intervention training. The results imply that future executive function training should consider the domain-specificity of the transfer effect.

摘 要 “六书”是古代文字学家总结而成的汉字构形理论，汉字系统在渐进演变的发展中具有以形表意的基本属性，其中象形、指事、会意、形声这“四书”认为是最基本的造字法，也是理解汉字构形的主要方式。本研究以中国学生为参照对象，和具有一定汉语水平的外国大学生进行比较探索，旨在探讨汉字构形对中外大学生生僻汉字学习的影响。采用学习-再认范式结合信号检测论研究汉字的再认问题，通过教予构字方式和字形想象为学习条件，要求中国大学生和达到汉语高级水平（HSK level 5 以上）的外国留学生学习生僻字，并根据汉字构形分为会意字和形声字，并通过事件相关电位记录学习-再认过程的 ERP 数据。结果表明：（1）在生僻字条件下，中国大学生的再认正确率、反应时、辨别力均显著高于外国大学生；（2）汉字构形中，形声字新字再认反应时显著快于会意字，会意字辨别力显著高于形声字；（3）学习方式主效应均不显著；（4）学习阶段 P2 成分：形声字诱发的 P2 波幅显著高于会意字，结合交互作用发现<1>字形想象组的中国大学生，会意字诱发的 P2 波幅显著小于形声字；<2>在会意字条件下，字形想象组中国大学生诱发的 P2 波幅显著高于构字方式组中国大学生；（5）学习阶段 N400 成分：结合交互作用发现，构字方式组中国大学生诱发的 N400 波幅显著比字形想象组中国大学生、构字方式组外国大学生和字形想象组外国大学生更负；（6）测验阶段 N400 成分：新字诱发的 N400 波幅显著比旧字更负，结合交互作用发现，中国大学生 N400 新旧效应量显著大于外国大学生；（7）测验阶段 LPC 成分：旧字诱发的 LPC 波幅显著比新字更正，形声字诱发的 LPC 波幅边缘显著大于会意字，中国大学生诱发的 LPC 波幅显著大于外国大学生，结合交互作用发现，中国大学生的新旧效应量显著大于外国大学生。

Abstract： The "Six Books" are a compilation of ancient philologists' theories on how Chinese characters are formed. The Chinese character system has the fundamental attribute of ideograms in its gradual evolution. The "Four Books," which are hieroglyphs, self-explanatory characters, associate characters, and phonograms, are thought to be the most basic methods of character formation and the main way to understand the most fundamental methodologies of character formation of Chinese characters. In order to examine the impact of Chinese character formation on Chinese character learning of rare Chinese characters, this study contrasts Chinese students with foreign university students of a particular level of Chinese language ability. The issue of Chinese character recognition is looked at using the learning-recognition paradigm in conjunction with the technique of signal detection theory. Chinese university students and foreign students with advanced Chinese language skills (HSK

level 5 or above) were asked to learn the rare characters by using character imagery and word formation as learning conditions. They were then divided into associate characters and phonograms in accordance with Chinese character formation, adding ERP data to record the learning-recognition process. The results of Study revealed that: (1) Under the circumstance of the rare characters, Chinese university students considerably outperformed foreign university students in terms of correct re-recognition rates, response times, and discriminative power. (2) Among the Chinese character formations, the phonograms' reaction times for new character re-recognition were much quicker, but the discriminative power of the associate characters was significantly higher than that of the phonograms. (3) There were no significant main impacts of learning method. (4) The P2 component of the learning phase: Phonograms significantly increased P2 amplitude compared to association characters. Moreover, the interaction showed that: <1> In the word imagery group of Chinese university students, the P2 wave amplitude evoked by association characters was much lower than that of phonograms. <2> In the associate characters condition, the Chinese university students in the word-form imagery group evoked significantly higher P2 amplitudes than those in the word formation group. (5) N400 component of the learning phase: Combining the interactions showed that Chinese university students in the characters formation group significantly increased the negative N400 wave amplitudes compared to the other three groups. (6) The N400 component of the quiz phase: New words evoked significantly larger negative N400 amplitudes than old words, and the interaction results showed that the N400 old/new effect were significantly larger for Chinese than for foreign university students. (7) LPC components at the quiz stage: Old words evoked significantly more positive LPC amplitudes than new words. Phonograms significantly increased the marginal LPC amplitudes compared to association characters. Chinese university students evoked significantly greater LPC amplitude than foreign university students. Combined with the interaction, the LPC old/new effect was found to be significantly larger for Chinese university students than for foreign university students.

工作记忆刷新对社交淡漠青少年情绪调节的影响

任苗苗[1] 何晓丽[1]（通讯作者）锁倩倩[1] 朱钰[1]

宁夏大学心理系，银川市，750021，通讯作者 E-mail:h1016632877@qq.com

摘 要　社会退缩是指儿童在跨时间情景下，更偏爱独自活动，是儿童社会发展研究领域的重要内容。社交淡漠作为社会退缩的重要亚型，常表现为情绪调节困难。以往包括社交淡漠在内的社会退缩行为研究中，多从外在因素入手，干预方式也着重于社会技能训练和行为纠正等外在方法。对于个体自身的认知功能，尤其是工作记忆刷新能力对情绪的重要作用鲜少被人重视。本研究认为，针对社交淡漠等情绪障碍的研究最终落脚点是为了预防和干预。也就是说，深入探究社交淡漠可能存在的影响因素，并有针对的制定符合的介入计划进行干预非常必要。社交淡漠作为典型的内化性行为问题，关注个体可能存在的内在诱因对全面认识社交淡漠的特征不可或缺。基于此，本研究通过两个实验考察工作记忆刷新能力对社交淡漠青少年情绪调节的影响及工作记忆刷新训练对社交淡漠青少年的刷新能力、情绪调节能力和社交淡漠程度的训练迁移效果。结果发现：（1）对于社交淡漠青少年来说，工作记忆刷新能力高的个体相较于刷新能力低的个体情绪调节能力更好；（2）与对照组相比，工作记忆刷新训练不仅能够提高社交淡漠青少年的工作记忆刷新能力和情绪调节能力，而且显著降低了其社交淡漠水平。这些结果表明工作记忆刷新能力对于社交淡漠青少年的情绪调节具有重要作用，研究结论为社交淡漠青少年的识别和干预提供参考。
