Abstract：Social withdrawal means that children prefer to move around alone in the cross-time situation, which is an important part of the research field of children's social development. As an important subtype of social withdrawal, social indifference is often manifested as difficulty in emotional regulation.In the previous studies on social withdrawal behavior, including social indifference, we mostly started from external factors, and the intervention methods also focused on external methods such as social skills training and behavior correction.Individuals pay little attention to the cognitive function, especially working memory refresh ability, on emotion.This study believes that the ultimate goal of research on mood disorders such as social apathy is for prevention and intervention. That is to say, it is necessary to deeply explore the possible influencing factors of social indifference, and to develop a targeted intervention plan.This study believes that the ultimate goal of research on mood disorders such as social apathy is for prevention and intervention. That is to say, it is necessary to deeply explore the possible influencing factors of social indifference, and to develop a targeted intervention plan.Based on this, this study examined the influence of working memory refresh ability on emotional regulation of social indifference adolescents and the transfer effect of working memory refresh ability, emotional regulation ability and social indifference youth. The results found that: (1) for teenagers with social indifference, individuals with high working memory refresh ability have better emotional regulation ability compared with individuals with low refresh ability; (2) compared with the control group, working memory refresh training can not only improve the working memory refresh ability and emotional regulation ability of social indifference teenagers, but also significantly reduce their social indifference level. These results indicate that working memory refresh ability plays an important role in emotion regulation in social indifference adolescents, and the research conclusions provide a reference for the identification and intervention of social indifference adolescents.

幼儿对自主获取的网络信息的信任偏好：主动决策的作用

童钰[1, 2] 王福兴[1, 2]（通讯作者） 王伟军[1, 2]（通讯作者）
1 华中师范大学心理学院，武汉，湖北，430079，fxwang@mail.ccnu.edu.cn，wangwj@ccnu.edu.cn
2 网络心理与行为教育部重点实验室，武汉，湖北，430079

摘 要 得益于网络和以触屏为代表的交互式可联网设备的广泛应用，幼儿可以前所未有地独立获取到多种网络信息(中国移动研究院, 2021)。Tong 等(2023)借鉴认识性信任领域中经典的冲突信息源范式，通过三个行为实验一致发现相对于通过成人转述得到的网络信息，4-8 岁的幼儿更多地信任自己直接与触屏交互而得

到的网络信息。但其中的机制尚不明确。首先，幼儿可能倾向于认为自己主动做出的行动背后的动机是清晰的，会产生更可靠的结果(Kushnir & Gopnik, 2005)；其次，当幼儿借助于触屏设备获得网络信息时，动作本身能提供触觉反馈，网页也会因幼儿操作而进行跳转，这种感知觉的反馈和关联性的响应都可能会唤起幼儿的具身认知，增加其对相关内容的认知加工(Christakis, 2014)。基于此，本研究拟检验面对多样化网络信息的主动决策和触屏交互是否是导致幼儿偏好自己直接交互获取而非成人转述的网络信息的机制。实验 1 纳入 4-8 岁的幼儿 80 名，以包含幼儿陌生动物知识的图片网页为实验材料。在直接交互且主动决策的条件下，幼儿点击图片网页中的索引图片后，屏幕中会首先呈现出包含了不同缩略图的多个答案，要求幼儿在其中选择一个自己认为合适的点开，随后幼儿会在跳转后的网页中浏览答案图片，并判断这个答案是否正确；在成人转述的条件下，则由一名研究助手点击网页后再在多个答案中选出一个并转述给幼儿对应的答案；对于幼儿触屏但代替选择的条件下，由成人在网页选择界面直接告诉幼儿应当选哪个并要求幼儿自己点开，随后幼儿自己看到答案并判断该答案是否正确。实验 1 结果发现，4-8 岁幼儿对自己决策和选择出的网络信息的赞同程度高于通过成人转述和成人代替选择出的网络信息，而后两者没有差异。进一步地，为控制选择阶段的材料凸显性以及个人偏向等无关因素的干扰，实验 2 (N = 78)模糊了网页选择界面，又进一步分离选择界面的缩略图使其无法反映后续任一答案的任何关键信息，结果重复了实验 1 的主要发现。综合而言，研究结论认为，主动决策在幼儿偏好自己直接交互获取的网络信息中具有重要作用，而触屏交互不是关键的影响因素。

What I chose is the best: Children's epistemic trust in image-based online information obtained on their own or relayed by an adult

Yu Tong[1, 2], Fuxing Wang[1, 2]*, Weijun Wang[1, 2]*

1 School of Psychology, Central China Normal University, Wuhan, Hubei 430079, China

2 Key Laboratory of Adolescent Cyberpsychology and Behavior, Ministry of Education, Wuhan, Hubei 430079, China

***Abstract*:** With the widespread use of the internet and internet-connected devices such as smartphones and tablets, young children now have unprecedented access to online information independently (China Mobile Research Institute, 2021). In a study conducted by Tong et al. (2023) using the classic conflicting sources paradigm in the field of epistemic trust, it was found that children between the ages of 4 and 8 were more likely to trust image-based online information that they obtained themselves, compared to information relayed to them by an adult. However, the underlying mechanisms behind this phenomenon remain unclear. On one hand, children tend to believe that their own actions are motivated by clear intentions and thus produce more reliable results (Kushnir & Gopnik, 2005). On the other hand, the use of touchscreens can provide sensory feedback and prompt responsive actions, potentially triggering children's embodied cognition and enhancing their cognitive processing (Christakis, 2014). Thus, the aim of this study is to investigate whether decision-making and touchscreen interactions serve as mechanisms to influence young children in valuing their firsthand experience when evaluating internet-based image information. In Experiment 1, a sample of 80 Chinese children aged 4 to 8 years was recruited, and picture web pages featuring unfamiliar animal facts were employed as experimental materials. In the children-decision condition, children were presented with multiple answer options, each containing different thumbnails. Then children were required to select and point the answer they deemed appropriate. They would then proceed to browse the answer image on the subsequent web page and judge whether the answer was correct or not. In the adult-relayed condition, a research assistant took on the responsibility of selecting and clicking on the web

page. In the adult-decision condition, the same research assistant selected one of the multiple answers but children took the responsibility to click the image. The findings of Experiment 1 indicated that children aged 4 to 8 were more likely to trust online information that they have personally selected and decided upon, compared to information selected for them by an adult or relayed to them by an adult. However, no significant difference was found between the latter two conditions. In order to eliminate the influence of material salience during the selection phase and minimize the interference of extraneous factors such as personal bias, Experiment 2 (N = 78) implemented a blurred web selection interface. Additionally, the thumbnails in the selection interface were separated to ensure that they did not provide any crucial information about the subsequent answers. Experiment 2 successfully replicated the main findings of Experiment 1. Taken together, the study suggest that active decision-making plays an important role in young children's preference for online information obtained on their own.

父母心理攻击与青少年焦虑的双向关系及其异质性：基于日记法的研究

权思翔[1]　付聪[2]（共同一作）　邢晓沛[1]　王美芳[3]（通讯作者）

1 首都师范大学心理学院，北京，100048

3 首都师范大学初等教育学院，北京，100037，meifangw@hotmail.com

摘 要　父母教养行为与儿童青少年内化问题间的关系一直是研究者关注的热点问题之一。近年来，父母心理攻击与青少年焦虑间的关系也得到了广泛关注。根据双向亲子关系理论，日常生活中父母与儿童间存在相互影响，且亲子互动每天都会发生，父母每天的教养行为随着时间的推移也会有一定波动。以往关于父母心理攻击与青少年焦虑的研究主要在宏观时间尺度上（如：年）考察了父母驱动效应，较少在微观时间尺度上（如：天）考察这两个变量间的关系。基于此，本研究对 326 名青少年进行连续 15 天的日记法调查，通过构建动态结构方程模型考察微观时间尺度上父母心理攻击和青少年焦虑的双向关系及其异质性。结果显示，在家庭间水平上，与经历较少父母心理攻击的青少年相比，经历较多父母心理攻击的青少年有更高的焦虑水平。在家庭内水平上，就同日效应而言，父母心理攻击与青少年焦虑在同一日内共同波动；就隔日效应而言，父亲驱动效应及儿童驱动效应均显著。具体地，父亲心理攻击的变化可以正向预测次日青少年焦虑状态的波动，而母亲心理攻击的变化对次日青少年焦虑状态波动的预测作用不显著。青少年焦虑状态的波动可以正向预测次日父亲和母亲心理攻击的变化。以上被试内关系在不同青少年间具有异质性，这表明亲子动态过程在不同家庭间具有一定差异性。对被试内效应存在异质性的原因进行探索性分析发现，青少年的平均焦虑水平及性别可以部分解释被试内效应的异质性。本研究采用密集追踪的研究设计及动态结构方程模型的分析方法真正为双向亲子关系理论提供了实证支持，并进一步阐明了家庭内过程的异质性。这些研究结果为干预者制定更有效、更有针对性的干预策略提供了可参考信息。

3 College of Elementary Education, Capital Normal University, Beijing

***Abstract*:** The relation between parenting behaviors and children and adolescents' internalizing problems has long been a focus of researchers. In recent years, the relation between parental psychological aggression and adolescent anxiety has received extensive attention. According to the bidirectional theory of parent-child relationships, there are reciprocal relations between parents and children. Moreover, parent-child interactions unfold on a daily basis, and the daily parenting behaviors within a family dynamically fluctuate over time. Regarding the relations between parental psychological aggression and adolescent anxiety, current studies mainly focused on exploring unidirectional parent-driven effects at the macro timescale (i.e., years), while few studies explore the reciprocal relation between these two variables at the micro timescale (i.e., days). To fill this gap, this study adopted the daily diary method to examine the reciprocal relation between parental psychological aggression and adolescent anxiety and the effects heterogeneity. Total 326 adolescents were recruited to fill out the questionnaires for 15 consecutive days. The results of dynamic structural equation models suggested that at the between-person level, adolescents who experienced more parental psychological aggression reported higher anxiety during the 15 days compared to those who experienced less parental psychological aggression. At the within-person level, parental psychological aggression co-fluctuated with adolescent anxiety within a day. As for the lagged associations, father-driven effects and child-driven effects for both parents were significant. Specifically, only changes in paternal psychological aggression predicted fluctuations in adolescent anxiety state the next day, whereas fluctuations in adolescent anxiety state predicted both changes in paternal and maternal psychological aggression the next day. These within-person associations were heterogeneous among adolescents, suggesting that the parent-adolescent dynamic may be different across families. An exploratory analysis of the potential explanations of the heterogeneity in the above within-person associations found that adolescent general levels of anxiety and gender could partially explain the heterogeneity. This study caught up with the longstanding theories of parent-child reciprocal processes and further elucidated the heterogeneity in within-family processes through intensive longitudinal design and dynamic structural equation modeling, which could provide information for more effective and tailored intervention strategies.

学龄前儿童对类平行折线的直观认识及平行分类的核心特征：基于网络分析的方法

高劭婧 胡清芬 （通讯作者）
北京师范大学心理学部，北京，100875，Email: qingfenhu@bnu.edu.cn

摘 要 对几何概念发展的研究是人类概念起源研究的重要组成部分，而平行概念则是几何概念中最为重要和基础的概念之一。实证研究发现，学龄前儿童对由欧氏几何定义的平行直线和由微分几何定义的平行曲线均具有直观认识，儿童可以从多个具有不同知觉特征的平行直线或平行曲线中抽取共同的“等距”特征，并将其与其他类别的图形(相交线)区分开，表明儿童在正式学习几何知识前，可以自发形成符合不同理论

数学体系定义的平行类别知识。然而，人类对理论数学体系未定义的几何图形是否具有相似的直观认识同样值得探索。例如，无论是欧氏几何还是微分几何，都无法描述不光滑的折线之间的平行关系，但在日常生活中，人们会经常遇到门框等 “类平行”的折线。本研究借鉴平行曲线“在各个方向上都等距”的定义，构造出理论数学体系中没有定义的“类平行折线”，考察儿童对这种未被数学家定义的类平行概念的直观认识。同时，本研究考察了儿童对不同类型平行线的直观认识的相似性与差异，并通过网络分析的方法考察处于核心地位的平行类别，进而推测人类直觉平行分类的核心特征。

本研究采用偏离觉察范式，102 名 3-5 岁儿童完成了一系列找不同题目。题目包括七类：类平行折线、平行直线、平行曲线、直线特征平行(直线;折线)、曲线特征平行(曲线;折线)、光滑特征平行(直线;曲线)、以及等距特征平行(直线;曲线;折线)，分别考察儿童对不同类型平行线进行分类并与相交线区分的能力。正确率分析结果表明：在类平行折线问题中，3-5 岁儿童均可成功区分相交折线，并且类平行折线问题与平行曲线问题的正确率不存在显著差异。基于不同题目间偏相关系数的网络分析结果表明：等距特征平行在平行概念网络中拥有最高的接近中心性和居间中心性，可能是处于核心地位的平行类别。据此可以推断，儿童对理论数学体系未定义的类平行折线同样具有直观认识，并且平行直线、平行曲线和类平行折线共有的等距特征可能是平行分类的核心特征。

Preschooler’s intuitive understanding of quasi-parallel polylines and the core feature of parallel category: a method based on network analysis

Gao Shaojing, Hu Qingfen
Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract： The research on the development of geometric concepts is an important part of the research on the origin of human concepts, and the parallel concept is one of the most important and basic concepts in geometry. The empirical study found that preschoolers have an intuitive understanding of parallel lines defined by Euclidean geometry and parallel curves defined by differential geometry. Children could extract invariant “equidistant” feature from multiple parallel lines or parallel curves with various perceptual features and distinguish them from other category (intersecting lines). Researchers believed that children spontaneously formed intuition of the parallel category which conforms to the definitions of theoretical mathematical systems before formally geometry education. However, it is also worth exploring whether human beings have a similar intuitive understanding of geometric shapes which are not defined by theoretical mathematical system. For example, neither Euclidean geometry nor differential geometry can describe the parallel relationship between the non-smooth polylines, but in daily life, people often encounter “quasi-parallel” polylines such as door frames. The present study drew on the definition of parallel curves as “equidistant in all directions”, constructed the “quasi-parallel polylines” which is not defined in the theoretical mathematical system, and examined the children’s intuitive understanding of this quasi-parallel shape. Meanwhile, the present study examined the similarities and differences of children’s intuition of different types of parallel shapes. Through the network analysis, we investigated the parallel category which is in the core position, and then speculated the core feature of children’s parallel intuition.

In the present study, 102 children aged 3-5 years completed a series of items based on the deviant-detection task. The items included seven types: quasi-parallel polylines, parallel lines, parallel curves, straight feature parallel (straight lines, polylines), curve feature parallel (curves, polylines), smooth feature parallel (straight lines, curves), and equidistant feature parallel (straight lines, curves, polylines). Children’s ability to categorize different types of parallel shapes and distinguish them from intersecting shapes was examined separately. The results of

accuracy analyses showed that children aged 3-5 could distinguish intersecting polylines successfully in parallel polylines items. And there was no significant difference between the accuracies of parallel polylines items and parallel curves items. The results of network analysis based on the partial correlation coefficients between different items showed that equidistant feature parallel items had the highest closeness centrality and betweenness centrality in parallel conceptual networks. It might be the parallel category in the core position. Therefore, we inferred that children also have an intuitive understanding of the quasi-parallel polylines which are not defined by the theoretical mathematical system. And the invariant equidistant feature shared by parallel lines, parallel curves and quasi-parallel polylines might be the core feature of the parallel category.

校外日常活动的类型和组织特征对幼儿执行功能的影响

卜晓妹[1]　盖笑松[1]（通讯作者）　王元[1]
1 东北师范大学心理学院，长春，130024，gaixs669@nenu.edu.cn

摘 要　先前关于执行功能的训练研究多数是由陌生主试在陌生情境中用陌生任务范式完成的，然而幼儿执行功能是在日常活动中发展起来的。有研究已经考察了日常活动的类型和组织特征对幼儿执行功能的影响，但主要集中在单一类型的日常活动上，且对组织特征的划分存在疑义。本研究首次借鉴经验采样法进行幼儿校外日常活动的采集。根据以往研究综述和 Aelterman 等人提出的特征环状模型分别获得 15 种校外日常活动类型和 8 种校外日常活动的组织特征。在控制了幼儿年龄和基线执行功能水后，分析幼儿校外日常活动的类型和组织特征对其执行功能的预测作用。研究共招募到 78 组幼儿家庭，按照“基线信息采集和基线执行功能测量→校外日常活动采集→后测执行功能测量”的顺序实施研究。其中，幼儿执行功能采用自定义顺序指出任务、头-脚-膝-肩任务、灵活项目选择任务和包礼物任务测量。校外日常活动的类型和组织特征的采集通过连续 7 周、每周 1 次的父母电话访谈获得。研究发现：（1）在校外日常活动的类型方面，控制了幼儿年龄和基线执行功能水平后，“学业准备活动”的参与总时长可以正向预测幼儿后测时执行功能表现。（2）在校外日常活动的组织特征方面，成人的“解释说明”行为越多，幼儿后测时执行功能的表现越好。但在控制了幼儿年龄和基线执行功能水平后，成人的“解释说明”行为就不再继续预测幼儿后测时执行功能表现。上述结果表明，只有“学业准备活动”有利于幼儿执行功能的发展，而校外日常活动的组织特征不能预测幼儿执行功能的发展。

The influence of types and organizational characteristics of off-campus daily activities on young children’s executive function

Bu XiaoMei[1]　Gai Xiaosong[1]　Wang Yuan[1]
1 Department of Psychology, Northeast Normal University, Changchun, 130024

Abstract：Most of the previous training studies on executive function were completed by unfamiliar subjects in unfamiliar situations with unfamiliar task paradigms. However, children’s executive function is developed in daily activities. Some studies have examined the impact of the types and organizational characteristics of daily activities on children’s executive function, but they mainly focus on a single type of daily activities, and there are doubts

about the division of organizational characteristics. This study is the first to use the Experience Sampling Method to collect children's off-campus daily activities. According to the previous research review and the characteristic circumplex model proposed by Aelterman et al., the organizational characteristics of 15 types of off-campus daily activities and 8 types of off-campus daily activities were obtained respectively. After controlling for children's age and baseline executive function, the predictive effect of the types and organizational characteristics of children's off-campus daily activities on executive function was analyzed. A total of 78 groups of children's families were recruited in the study, and the research was carried out in the order of 'baseline information collection and baseline executive function measurement → off-campus daily activity collection → post-test executive function measurement'. Among them, children's executive function is measured by the Self-ordered Pointing Task, the Head-Toe-Knee-Shoulder, the Flexible Item Selection Task, and Gift Wrap/Delay task. The types and organizational characteristics of out-of-school daily activities were collected through telephone interviews with parents once a week for 7 consecutive weeks. The study found that: (1) In terms of the types of daily activities outside school, after controlling for children's age and baseline executive function level, the total duration of participation in 'academic preparation activity' can positively predict children's executive function performance in post-test. (2) In terms of the organizational characteristics of daily activities outside school, the more 'explanatory' behaviors of adults, the better the performance of executive function in children's post-test. However, after controlling children's age and baseline executive function level, adult's 'explanation' behavior no longer continued to predict children's executive function performance in the post-test. The above results show that only 'academic preparation activity' are conducive to the development of children's executive function, while the organizational characteristics of off-campus daily activities cannot predict children's executive function.

青少年诚实-谦逊性的发展特点及对合作的影响

马昕玥[1] 崔丽莹[1]（通讯作者）

1 上海师范大学教育学院心理学系，上海，200234，E-mail: cui720926@163.com

摘 要 诚实-谦逊性指在与他人交往时维护公平和真诚的倾向。作为一种亲社会人格特质，虽然有研究发现它可以促进合作，但内在机制不甚清晰。因此，基于道德基础理论和社会交换理论，本文通过两个研究系统探讨青少年的诚实-谦逊性及其与合作倾向、合作行为的关系。研究一采用追踪研究，分析了 743 名（50.7%女生，平均年龄 11.64 岁）青少年诚实-谦逊性的发展特点、对青少年合作倾向的预测作用及公正敏感性的中介作用。结果发现：（1）青少年诚实-谦逊性整体得分及其避免贪婪、真诚和公平维度随时间呈下降趋势，未发现性别差异；但是相较于小学生，中学生下降得更多。（2）青少年 T1 诚实-谦逊性不能直接预测 T2 合作倾向；但是半纵向中介检验表明，诚实-谦逊性可以通过增加犯过者公正敏感性间接降低青少年未来的合群意愿。研究二采用行为实验法，利用双人囚徒困境和四人公共物品困境来测量合作行为，考察了高、低诚实-谦逊性青少年在不同剥削诱惑水平（研究二 a：88 名被试，平均年龄 11.61 岁，54.55%女生，53.41%高诚实-谦逊性青少年）和不同剥削威胁水平（研究二 b：81 名被试，平均年龄 11.67 岁，49.38%女生，45.48%高诚实-谦逊性青少年）下的合作表现。结果发现：青少年诚实-谦逊性水平与情境的剥削威胁水平交互影响其合作行为。高诚实-谦逊性青少年在中、高剥削威胁情境的合作率均低于低剥削威胁情境；而低诚实-谦逊性青少年在中、低剥削威胁情境的合作率均高于高剥削威胁情境。综上结果表明，我国青少年的整体诚实-谦逊性水平随时间呈下降趋势，表现出人格发展的暂时性下降；同时该阶段诚实-谦逊性人格与合作的关系不似成年人那般稳健，且更为复杂。这些结果说明了在青春期早期和中期培养和发展青少年诚实-谦逊性的重要性。

The developmental characteristics and effect on cooperation of Honesty-Humility among adolescents

Ma Xinyue[1] Cui Liying[1] (Corresponding Author)
1 Department of Psychology, College of Education, Shanghai Normal University, Shanghai 200234

***Abstract*：** As a prosocial personality trait, Honesty-Humility dimension from the HEXACO model of personality refers to the tendency to be fair and genuine in dealing with others. Although some studies have found that it promotes cooperation, the intrinsic mechanisms are less clear. Therefore, based on the Moral Foundations Theory and Social Exchanges Theory, this paper systematically explores adolescents' Honesty-Humility and its relationship with cooperativeness and cooperative behaviours. A longitudinal design was applied in Study 1 to detect the developmental characteristics of Honesty-Humility and examine the effect of this trait on cooperativeness as well as the mediating role of justice sensitivity in 743 adolescents (50.7% girls; initial Mage = 11.64 years). Results: (1) A decreased tendency in Honesty-Humility dimension and the greed-avoidance, sincerity and fairness facets from T1 to T2 were observed. (2) Honesty-Humility was not a direct predictor of cooperativeness; but, the half-longitudinal mediation analysis indicated that Honesty-Humility positively predicted perpetrator sensitivity which then influence cooperativeness negatively. Study 2 applied a behavioural experimental approach to measure cooperative behaviours in different situational levels of temptation to exploit others (Study 2a: 88 subjects, mean age 11.61 years, 54.55% girls, 53.41% adolescents with high honesty-humility) and different levels of fear being exploited by others (Study 2b: 81 subjects. mean age 11.67 years, 49.38% girls, 45.48% high honesty-humility adolescents) by using a two-person prisoner's dilemma and a four-person public goods dilemma among adolescents with higher and lower Honesty-Humility. A significant effect of personality and situation interaction was found in Study 2b, which demonstrated that adolescents with higher Honesty-Humility cooperated less in the medium and higher fear being exploited situations than in the lower situation; while lower Honesty-Humility adolescents cooperated less in the high situation than in the medium and low. To sum up, Honesty-Humility dimension among Chinese adolescents tends to decrease over time, showing a temporary dip in personality development; and, the link between the Honesty-Humility and cooperation at this stage of life is not as robust as in adults and is more complex. These findings highlight the value of fostering the Honesty-Humility dimension throughout early and middle adolescence.

***Keywords*：** Honesty-Humility, cooperation, perpetrator sensitivity, temptation to exploit others, fear of being exploited

童年期父母婚姻质量的发展轨迹与青少年抑郁的纵向关系：亲子依恋的中介作用

杨舒雅　于嘉霖　田文秀　王美芳(通讯作者)
首都师范大学初等教育学院，北京，100037，meifangw@hotmail.com

摘 要　情绪安全理论和认知-情境理论提出，较低的父母婚姻质量会使青少年更容易出现抑郁问题。然而，已有研究大多是用某一个时间点的父母婚姻质量来预测青少年抑郁，关于婚姻质量一般性和异质性发展轨迹对青少年抑郁的了解极少，因此有必要考察父母婚姻质量的发展轨迹对青少年抑郁的长期影响。此外，基于个体-情境交互作用理论，父母婚姻质量这一相对较远端的因素可能通过亲子依恋这一近段因素的作用，进而导致青少年抑郁。基于此，本研究以 378 名小学二年级学生及其父母为被试，进行连续八年的追踪测查，使用变量为中心和个体为中心相结合的方法，较为全面地考察童年期父亲和母亲婚姻质量发展轨迹对青少年抑郁的影响以及亲子依恋在童年期父亲和母亲婚姻质量发展轨迹与青少年抑郁关系间的中介作用。以变量为中心的结果发现童年期父亲和母亲的婚姻质量随着时间的推移而升高；童年期父母婚姻质量的初始水平和发展速度对青少年抑郁的直接预测作用均不显著；亲子依恋在童年期父母婚姻质量初始水平与青少年抑郁关系间的中介作用显著，但在父母婚姻质量的发展速度与青少年抑郁关系间的中介作用不显著。以个体为中心的结果发现，童年期父母婚姻质量异质性发展轨迹均分为三个亚组，即低-稳定组、中等-稳定组和高-上升组；青少年抑郁水平在童年期父母婚姻质量轨迹亚组间无显著差异；相比于父亲婚姻质量高-上升组，父子依恋在父亲婚姻质量低-稳定组和中等-稳定组与青少年抑郁的关系间的中介作用不显著；相比于母亲婚姻质量高-上升组，母子依恋在母亲婚姻质量低-稳定组和中等-稳定组与青少年抑郁的关系间的中介作用显著。研究结果强调了从变量水平和个体水平上探究父母婚姻质量对青少年抑郁的影响以及探究其机制的重要性，也提示同时提高父亲和母亲的婚姻质量以及通过增加亲子依恋的安全水平是降低青少年的抑郁水平的有效途径。

Longitudinal Relation Between The Developmental Trajectories of Childhood Parental Marital Quality and Adolescent Depression: The Mediating Role of Parent-child Attachment

Shuya Yang, Jialin Yu, Wenxiu Tian, Meifang Wang(corresponding author)
College of Elementary Education, Capital Normal University, Beijing, 100037,
E-mail: meifangw@hotmail.com

Abstract： According to the emotional security theory and cognitive-contextual theory, lower parental marital quality is associated with adolescent depression. Notably, previous research has primarily examined the influence of parental marital quality at a certain point in time on adolescent depression, and there is a lack of literature exploring the effects of the general and heterogeneous developmental trajectories of parental marital quality in childhood on adolescent depression. Therefore, it is essential to investigate the long-term impact of developmental trajectories of parental marital quality on adolescent depression. In addition, person-context interaction theory suggests that the relatively distal factor of parental marital quality may contribute to adolescent depression through the more proximal factor of parent-child attachment. Based on this, the present study conducted a continuous eight years longitudinal investigation with a sample of 378 second-grade elementary school students and their parents. Utilizing a combined variable-centered and person-centered method, the study comprehensively examined the impact of developmental trajectories of fathers' and mothers' marital quality in childhood on adolescent depression, as well as the mediating role of parent-child attachment in the relation between these trajectories and adolescent depression. The results of the variable-centered analysis indicated that both fathers' and mothers' marital quality improved over time. Neither the initial level nor the rate of development in parental marital quality during childhood significantly predicted adolescent depression. Parent-child attachment mediated the effect of initial level

of parental marital quality on adolescent depression but did not mediate the effect of development rate of parental marital quality on adolescent depression. The person-centered analysis revealed that the heterogeneous developmental trajectories of parental marital quality in childhood could be divided into three subgroups: low-stable, moderate-stable, and high-rising groups. There was no significant difference between childhood parental marital quality subgroups on the level of adolescent. The mediating effect of father-child attachment in the relation between fathers' low-stable and moderate-stable marital quality groups and adolescent depression was not significant compared to the fathers' high-increasing marital quality group. However, the mediating effect of mother-child attachment in the relation between mothers' low-stable and moderate-stable marital quality groups and adolescent depression was significant compared to the mothers' high-increasing marital quality group. These findings emphasize the importance of exploring the effects of parental marital quality on adolescent depression and its mechanisms at variable-centered and person-centered analyses, and also suggest that improving the fathers' and mothers' marital quality and increasing the safety level of parent-child attachment are effective ways to relieve adolescent depression.

摘 要　学业作弊在不同年龄段学生群体中均十分常见，它严重影响个人诚信，危害教育公平。纵观现有关于学业作弊行为的实证研究，绝大多数以大学生或中学生为研究对象，鲜有研究从学业作弊行为习惯形成的起源着手，考察这一行为在小学阶段的发展及机制。机器学习（Machine Learning）是数智时代新兴的数据分析方法，也是人工智能的核心方法，它依赖于计算机算法，旨在通过数据分析和建模实现对人类行为的模拟。本研究对 2,098 名来自三类学校（普通公办、含外来务工人员子女较多的普通公办，以及民办小学）的 2 至 6 年级小学生进行问卷调查，采用机器学习法，分别考察了个体认知、道德判断、同伴行为，及性别、年级、成绩等因素对小学生学业作弊行为的影响。结果表明，小学生自我报告的作弊率为 33%。其中，集成机器学习模型对小学生作弊行为的预测准确率(AUC 均值)达 80.46%，对小学生学业作弊行为预测效应最强的四个因素依次为个体对作业作弊的接受程度、观察到同伴作弊的普遍性和频率，及其自身成绩。上述结果不仅为在教育实践中有针对性地对小学生学业作弊进行教育和干预提供了重要的实证支持，也为机器学习算法在发展性数据分析方面的可行性和有效性提供了有力证据。

Academic cheating among elementary school children and its key predictors: A machine learning approach

Yi Zheng[1], Li Zhao[2*]
1 Jing Hengyi School of Education, Hangzhou Normal University, Yuhang Pond Road 2318, Yuhang District, Hangzhou, 311121
2 Department of Psychology, Hangzhou Normal University, Yuhang Pond Road 2318, Yuhang District, Hangzhou, 311121

Abstract：Academic cheating is pervasive among students of different ages. It hinders personal moral development and undermines fairness in education. Whereas a great deal is known about academic cheating and its correlates among college students and high school, little research has investigated its developmental origins. Machine Learning (ML) is an emerging method of data analysis in the age of digital intelligence. It is also a core method of artificial intelligence, which relies on computer algorithms and aims to achieve simulation of human behavior through data analysis and modelling. We conducting questionnaire surveys with 2,098 second- to sixth-grade students from three kinds of elementary schools (i.e., public school, public school with a large proportion of students whose parents are migrant workers, and private school). We used ensemble machine learning to capture the complex relations between academic cheating among elementary school children and various predictor variables (e.g., cognition, moral judgements, peer behaviors, and factors such as gender, grade, and grades). Overall, 33% of elementary school children reported having cheated. The best models with the ensemble machine learning accurately predicted the students' homework cheating with a mean Area Under the Curve (AUC) value of 80.46%. Children's cheating was most strongly predicted by their own beliefs about the acceptability of cheatings, how commonly and frequently they had observed their peers engaging in academic cheating, and their achievement level. These findings not only provide important empirical support for how to promote academic integrity and to prevent cheating during elementary school years' education, but they also illustrate machine learning as a viable and effective approach to analyze developmental data.

Keywords：elementary school children, academic cheating, machine learning, prediction, attitude

小学儿童教师支持、同伴支持、数学态度与数学焦虑的纵向联系：一项四年纵向考察

王阳阳[1]　禚新峰[1]　雒瑞帆[1]　刘畅[1]　司继伟[1]（通讯作者）
1 山东师范大学心理学院，济南，250358，sijiwei1974@126.com

摘 要　数学焦虑是一种普遍存在于学生群体中的消极学业情绪，会导致学生回避数学相关的教育情境和职业选择。数学态度是个体对于数学的控制价值评估。控制-价值理论认为数学态度是影响数学焦虑的核心个体要素，二者之间具有双向的联系，且环境因素（如，教师支持、同伴支持）会通过控制价值评估作用于学业情绪。然而，尚无研究探究教师支持和同伴支持对数学焦虑的协同作用形式及其作用机制。为揭示上述变量间的纵向联系，本研究对 1064 名小学三、四年级儿童（643 名男生，M_{age} = 9.25±0.63 岁）进行四次纵向测查，每次间隔为一年。基于传统交叉滞后模型的分析结果显示：（1）教师支持和同伴支持对数学焦虑不存在显著预测作用，但数学焦虑对教师支持存在显著单向预测作用；（2）数学态度与数学焦虑之间具有双向预测关系；（3）教师支持和同伴支持通过数学态度间接预测数学焦虑。即 T2 的教师支持负向预测

T3 的数学态度，进而增加了 T4 的数学焦；T2 的同伴支持正向预测的数学态度，进而降低了 T4 的数学焦虑；数学焦虑可通过数学态度间接负向预测教师支持和同伴支持。本研究从纵向角度为学业情绪的控制价值理论提供了进一步证据支持，强调了教师支持、同伴支持、数学态度在儿童数学焦虑发展中发挥的重要作用，并凸显出儿童的主导效应。所得发现为今后对数学焦虑的早期预防和干预提供了基础，有助于形成相应的干预措施。

Longitudinal Associations between Teacher Support, Peer Support, Math Attitudes and Children's Mathematics Anxiety in Primary School: A Four-year Longitudinal Study

Wang Yangyang[1] Zhuo Xinfeng[1] Luo Ruifan[1] Liu Chang[1] Si Jiwei[1]
1 School of Psychology, Shandong Normal University, Jinan, 250358

Abstract: Mathematics anxiety, a commonly experienced negative emotion among students, is a significant factor leading to their avoidance of math-related educational situations and career paths. Math attitudes reflect, in part, an individual's control and value assessment of math. According to the control-value theory, math attitudes may be a core individual element influencing mathematics anxiety, with a bidirectional link between the two; and environmental factors (e.g., teacher support, peer support) act on academic emotions through controlled value evaluations. However, the form of synergistic effect of these two key environmental factors on mathematics anxiety and the related mechanisms of action are still unknown. In order to reveal the longitudinal associations between the above variables, the present study was conducted on 1064 children (643 boys, M_{age} = 9.25 ± 0.63 years) in the third and fourth grades of elementary school on four longitudinal occasions, each with a one-year interval. Based on the cross-lagged model, results showed that: (1) Teacher support and peer support were not significant predictors of math anxiety, while conversely, math anxiety was a significant unidirectional predictor of teacher support; (2) There was a bidirectional predictive relationship between math attitudes and math anxiety; (3) Environmental factors (teacher support and peer support) indirectly predicted math anxiety through math attitudes. More specially, T2's teachers supported negatively predicted math attitudes for T3, which in turn increased math anxiety for T4, and T2's peers supported positively predicted math attitudes, which in turn decreased math anxiety for T4; mathematics anxiety negatively predicted teacher support and peer support indirectly through math attitude. These results provide further evidences for the control-value theory of academic emotions from longitudinal perspective, emphasizing that teacher support, peer support, and attitudes toward mathematics play a key role in the development of children's mathematics anxiety, and that the child-dominant effect is highlighted. The findings obtained provide a solid basis for future early prevention and help shape appropriate interventions for math anxiety.

错怪及其弥补对 5-6 岁幼儿道德判断与人际喜爱及信任的影响

莫秀锋（通讯作者）
广西师范大学教育学部，桂林，541004，E-mail:moxiufeng76@126.com

摘 要　友善是社会主义核心价值观的重要组成部分，也是中华民族的传统美德。如何避免错怪他人，以及错怪他人之后该如何弥补，是儿童期道德教育的重要内容，因其在一定程度上折射出个体是否友善。友善等积极的人格特质与道德判断、人际喜爱及信任之间关系密切。不过，错怪及其弥补行为与幼儿的道德判断、人际喜爱及信任之间是否存在类似关系，尚未可知。实验一考察错怪对 5-6 岁幼儿道德判断与人际喜爱及信任的影响。采用单因素两水平被试间设计，包括错怪程度轻和错怪程度重两个水平，因变量为幼儿的道德判断、人际喜爱及信任，共 72 位幼儿参与研究，每组各 36 人。先给幼儿叙述错怪程度轻或者错怪程度重的故事，然后测查幼儿对故事中人物角色的道德判断、人际喜爱及信任。结果表明：错怪对 5-6 岁幼儿的道德判断、人际喜爱及信任具有显著影响。无论是听错怪程度轻还是错怪程度重的故事，绝大多数幼儿不喜欢和不信任错怪者，并且对其做出否定性的道德判断。实验二考察错怪后弥补对 5-6 岁幼儿道德判断与人际喜爱及信任的影响。采用单因素四水平被试间设计，包括错怪之后沉默无为、仅道歉、默默补偿和道歉并补偿这四个水平，共 122 位幼儿参与研究。先随机四选一地叙述错怪后弥补情况的一种故事，然后测查因变量。结果表明，错怪后弥补对 5-6 岁幼儿的道德判断与人际喜爱及信任具有显著影响。听沉默无为故事之后，绝大多数幼儿不喜爱、不信任沉默无为的错怪者，并且对其做出否定性的道德判断，而听仅道歉故事、默默补偿故事或者道歉并补偿故事的绝大多数幼儿，均喜爱和信任知错就改的错怪者，并且对其做出积极的道德判断。两个实验综合揭示：错怪及其弥补对 5-6 岁幼儿道德判断、人际喜爱及信任具有显著影响，幼儿会对错怪行为予以否定性的道德判断，不喜爱和不信任错怪者，但是幼儿高度认可错怪之后的弥补行为，并且喜爱和信任“知错就改”的错怪者。

关键词　错怪，弥补，道德判断，人际喜爱，人际信任

The effects of misunderstanding as well as reparation on the moral judgment, interpersonal preference and trust of 5-6 years old children

Mo Xiufeng
Faculty of Education, Guangxi Normal University, Guilin 541004, China

Abstract：Friendliness is an essential component of the core socialist values, as well as traditional virtue of the Chinese nation. Avoiding misunderstanding and making amends after misunderstanding is an important part of moral education in childhood, as it reflects to a certain extent whether a person is friendly or not. Positive personality traits such as friendliness are closely related to moral judgement, interpersonal preference and trust. However, it is not yet known whether there is a similar relationship between misunderstanding and its compensation and young children's moral judgement, interpersonal preference and trust. Experiment 1 examined the effects of misunderstanding on the moral judgement, interpersonal preference and trust of 5-6 year olds. A one-way two-level between-subjects design was used, including two levels of mild and severe misunderstanding. The dependent variables were 5-6 years old children's moral judgement, interpersonal preference and trust, with a total of 72 children participating in the study, 36 in each group. Children listened to stories with a low or high degree of misunderstanding and then were measured moral judgement, interpersonal preference and trust about the

characters in the stories. The results showed that misunderstanding had a significant effect on the moral judgement, interpersonal preference and trust of 5-6 year olds. Whether listening to stories of mild or severe misunderstanding, most children dislike and distrust the wrongdoers and make negative moral judgements about them. Experiment 2 examined the effects of making amends after misunderstanding on the moral judgement, interpersonal preference and trust of 5-6 year olds. A univariate four-level between-subjects design was used, including four levels of silence with inaction, apology only, silent compensation, as well as apology with compensation after misunderstanding, with a total of 122 young children participating in the study. The results showed that making amends after misunderstanding had a significant effect on the moral judgement and interpersonal preference and trust of 5-6 year olds. Most children disliked and distrusted wrongdoers with inaction and made negative moral judgments about them. In contrast, most children who listened to apology-only stories, silent reparation stories, or apology-and-reparation stories liked and trusted the wrongdoers who knew and corrected their faults and made positive moral judgments about them. These two experiments revealed that misunderstanding and compensation after misunderstanding had a significant effect on the moral judgment, interpersonal preference, and trust of 5-6 year-olds. Children make negative moral judgments about wrongdoing and dislike and distrust the wrongdoers. However, children highly approved of making amends after misunderstanding, and liked and trusted the wrongdoers who knew and corrected their faults.

Keywords：misunderstanding, reparation, moral judgments, interpersonal preference, interpersonal trust

父母失败反馈与教师指导方式对儿童数学学习坚持性和失败消极反应的预测：一项追踪研究

周同[1#] 陈曦[1#] 范红瑜[2] 白婧瑶[1] 刘俊升[1]（通讯作者）

摘 要 数学是一个重要的学习领域，儿童在学习数学的过程中往往会遇到困难，并感到沮丧。以往研究发现，在面临学业挑战和挫折时，表现出更多坚持，更少消极反应的儿童更有可能获得学业成功与进步。因此，了解哪些因素会影响儿童的坚持性和对失败的消极反应非常重要。以往研究往往只关注父母或者教师一方的作用，发现当父母或教师采用掌握导向（而非表现导向）的做法时，儿童更有可能获得成长型思维，并表现出更好的学业成就和发展结果。然而，考虑到学校和家庭是儿童社会化过程中两个共同起作用的主要环境，有必要同时考察父母和教师的做法，并分析其独特效应和交互作用。因此，本研究同时考察父母和教师的做法对儿童坚持性和对失败的消极反应的影响。本研究采用为期 6 个月的追踪研究设计，被试为 2272 名 7-9 年级学生（M_{age} = 14.01，SD_{age}= 0.71，48.5% 女生），学生父母（M_{age} = 40.71，SD_{age}= 5.36，60.4%母亲），及其所在班级的数学老师（N = 29，M_{age} = 39.62，SD_{age}= 9.21，41.4% 女性）。学生在秋季学期末（T1，2022 年 12 月）和春季学期末（T2，2023 年 6 月）报告了在数学学习中的坚持性和对失败的消极反应水平。在 T1 时间点，家长报告了他们对孩子数学学习失败的反馈方式，数学老师报告了他们的指导方式。采用纵向多水平模型（longitudinal multilevel models）对数据进行分析，结果表明：1）相比于老师的做法，父母失败反馈方式对儿童的坚持性水平具有独特预测作用，个人导向的反馈负向预测儿童在 T2 的坚持性，过程导向的反馈正向预测儿童的坚持性。2）儿童的失败消极反应，则受到了父母和教师做法的交互影响。具体而言，在采用高水平掌握导向指导方式的数学教师班级中，父母个人导向的反馈正向预测了儿童在 T2 对失败的消极反应。然而，在教师掌握导向水平较低的班级中，这种关系不显著。本研究揭示了父母和教师的做法对儿童学业发展的独特效应和共同作用，为帮助儿童积极应对学业挑战和挫折提供了

实证依据。

Parents' Failure Response and Teachers' Teaching Approach Predicting Children's Persistence and Negative Reactions to Failure Among Chinese Rural Students

Tong Zhou[1#], Xi Chen[1#], Hongyu Fan[2], Jingyao Bai[1], Junsheng Liu[1*]

[1] Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

[2] Department of Basic Education, Education Bureau of Yumen, Gansu Province, China

Abstract: Mathematics is a crucial domain of learning wherein children frequently encounter difficulties and experience frustration. Children who demonstrate higher persistence and less negative reactions when confronted with challenging tasks or academic setbacks may be more likely to achieve better learning outcomes in mathematics. Thus, it is important to understand the antecedents of children's persistence and negative reactions to failure. Previous research has focused on influences of either parents or teachers and indicated that when parents or teachers use mastery-oriented approaches over performance-oriented approaches, children are more likely to adopt a growth mindset and exhibit better academic achievements. However, given that children are socialized in the familial and school contexts at the same time, researchers need to examine implications of both parents' and teachers' practices and their interactions simultaneously. Thus, the present study explored the unique and interactive predicting effects of parents' and teachers' practices on children's persistence and negative reactions to failure. A six-month longitudinal study was conducted to investigate the research question. The participants consisted of 2272 middle school students (M_{age} = 14.01, SD_{age} = 0.71, 48.5% female), their parents (M_{age} = 40.71, SD_{age} = 5.36, 60.4% mothers), and their mathematics teachers (N = 29, M_{age} = 39.62, SD_{age} = 9.21, 41.4% female). The students reported their levels of persistence and negative reactions to failure in mathematic learning during both the fall semester (i.e., T1, December 2022) and the spring semester (i.e., T2, June 2023). Parents reported their responses to their children's failure in mathematic learning, and math teachers reported their teaching approaches during the fall semester. The data were analyzed using longitudinal multilevel models, revealing distinct patterns linking parents' and teachers' practices to students' persistence and negative reactions to failure. Specifically, when considering both parents' and teachers' practices, the way parents responded to failure uniquely predicted children's persistence. Parents' person responses to failure negatively predicted children's persistence at T2, whereas parents' process responses to failure positively predicted children's persistence at T2 (see Figure 1). As to children's negative reactions to failure, an interactive effect of both parents' and teachers' practices emerged (see Figure 2). Specifically, for children in classrooms where teachers exhibited high levels of mastery-oriented approaches, parents' person responses to failure significantly and positively predicted their children's negative reactions to failure at T2. However, this relation was non-signficant for children in classrooms with low levels of teachers' mastery-oriented approaches.

These findings shed light on both the unique and joint effects of parents' and teachers' practices on children' persistence and negative responses when confronted with academic challenges and setbacks, underscoring the importance of considering factors in both familial and school context to foster children's social-emotional competencies in learning. Future research and interventions can further explore the complex interactions between

parents' and teachers' practices to develop effective strategies for nurturing resilience and promoting students' positive learning outcomes.

道德提醒对诚信考场中大学生考试作弊行为的影响：一项现场实验研究

杨鑫晨[1]　彭俊杰[1]　严巍浩[1]　柯诗琪[1]　赵立[1]

1 杭州师范大学心理学系，杭州，311121，zhaoli@hznu.edu.cn

摘 要　考试作弊是一个全世界普遍存在的问题，它对个人、国家和社会都具有严重的负面影响。目前越来越多的高校采用诚信考场（即无人监考）这一方式来促进大学生的考试诚信行为。一些高校会在诚信考场中设置不同形式的道德提醒，如提醒学生严格遵守考场纪律（*纪律提醒*）、考试作弊被处分的实际案例（*案例提醒*，如某学生作弊受到学校的处分），以及作弊被抓可能导致的后果（*后果提醒*，如一旦发现作弊则会记入学生的诚信档案并取消学位证书）等。然而，到目前为止，尚未有实证研究比较这些不同形式的道德提醒在减少作弊、促进诚信上的有效性。为此，本研究以我国东部某城市的在校大学生为研究对象（N = 770），采用随机双盲对照实验设计，通过两项现场实验研究，在真实情境中考察了诚信考场中不同形式的道德提醒对大学生考试作弊行为的影响。实验一设置了纪律提醒和案例提醒两个实验条件，以及无提醒（在无人监考的考试中最为常见的方式）这一控制条件。结果表明，纪律提醒和案例提醒两种条件下学生的作弊率均显著低于无提醒条件；且纪律提醒和案例提醒在减少作弊的效果上并无显著差异。实验二重复了实验一的结果并在其基础上增加后果提醒这一实验条件。结果发现，后果提醒在降低学生的作弊方面也有与纪律提醒和案例提醒相似的效果。本研究结果首次证明在诚信考场中设置不同形式的道德提醒能够有效减少学生的作弊行为。上述结果不仅说明在教育领域开展严格控制的行为实验的重要性，也为广大教师和教育工作者在实践中采用正确的道德提醒方式从而助推大学生的考试诚信提供了科学指导。

Effects of moral reminders on university students' cheating in trust exams: A field study

YANG Xinchen[1]; PENG Junjie[1]; YAN Weihao[1]; KE Shiqi[1]; ZHAO Li[1]

1 Department of Psychology, Hangzhou Normal University, Hangzhou, 311121, China, zhaoli@hznu.edu.cn

Abstract：Cheating in exams is a common problem all over the world, and it has serious negative effects on individuals, countries and societies. More and more universities are adopting trust exams (unproctored exams) to promote the academic integrity of university students. Some universities use different forms of moral reminders in trust exams, such as reminding students about academic integrity policies (*policy reminder)*, actual cases of academic cheating (*exemplar reminder*, such as a student being punished for cheating), and the negative consequences of cheating (*consequence reminder*, such as it will be recorded in the integrity file and the degree certificate will be cancelled if cheating is found). However, no empirical studies have directly compared the effectiveness of these different forms of moral reminders in reducing cheating and promoting academic integrity.

Therefore, we took college students (N = 770) in eastern China as subjects and conducted two double-blind randomized controlled field studies to examine the effects of moral reminders on university students' cheating in trust exams. Study 1 included policy reminder condition and exemplar reminder condition, as well as the control condition of no reminder (the most common way in trust exams). The results showed that policy reminder and exemplar reminder both significantly reduced students' cheating compared to no reminder. And there was no significant difference in the effect of reducing cheating between policy reminder and exemplar reminder. Study 2 repeated the results of study 1 and added consequence reminder condition. The results found that consequence reminder also had a similar effect as policy reminder and exemplar reminder in reducing students' cheating. Our study for the first time proves that using different forms of moral reminders in trust exams can effectively reduce students' cheating behavior. Our findings not only illustrate the importance of conducting well-controlled behavioral experiments in the field of education, but also provide scientific guidance for educators to use correct moral reminders in practice to promote university students' honest behavior.

3~5 岁幼儿时间概念“前后”、“上下”、“左右”隐喻的认知发展

贺晓玲（通讯作者） 那琳娜

南昌大学公共政策与管理学院心理学系，江西南昌，330031

E-mail:hxling1110@126.com

摘 要 利用揭示事件时间发展的图片材料来探讨 3~5 岁幼儿时间概念的前后、上下及左右方向的多重空间隐喻认知发展规律。实验 1 是让 3 岁、4 岁和 5 岁幼儿将表征时间早/晚的图片成对的放在目标人物的前/后、上/下、左/右方向；实验 2 是让 3 岁和 4 岁幼儿对由 3 幅图片组成表征事件时间发展的有序和无序组合进行选择。实验结果表明：3 岁幼儿尚未形成时间隐喻能力，但其将时间概念映射空间的能力在萌芽，较之无序图片组合，其更青睐有序图片；4 岁幼儿开始形成时间概念的隐喻认知能力，并初步形成“早为上/左，晚为下/右”的时间隐喻，即形成从上-下和左-右的心理时间线；5 岁幼儿时间概念多重隐喻能力进一步加强，并形成了三个方向的心理时间线。3~5 岁幼儿时间概念的隐喻认知能力的发展不同步，时间概念的上下及左右方向隐喻的认知发展优于前后方向隐喻。
关键词 3~5 岁幼儿，时间，空间，多重重隐喻，认知发展

Cognitive development of the metaphors of "front and back"、"up and down" and "left and right" in the concept of time in children aged 3 to 5

He Xiaoling, Na Linna

School of Public Policy and Administration,Nanchang University,Nanchang 330031

Abstract: This paper aims to explore the multi-spatial metaphor cognitive development of 3~5-year-old children's

concept of time in the direction of front and back, up and down, and left and right. In experiment 1, children aged 3, 4, and 5 were asked to place the early/late pictures in pairs in the front/back, up/down, and left/right direction of the target person; In experiment 2, 3 - and 4-year-olds were asked to choose between ordered and disordered combinations of three images representing the temporal development of events. The experimental results show that the 3-year-old children have not yet formed the ability of temporal metaphor, but their ability to map the concept of time into space is budding, and they prefer ordered pictures to disordered picture combinations. At the age of 4, children began to form the metaphorical cognitive ability of time concept, and initially formed the time metaphor of "early is up/left, late is down/right", that is, formed the mental timeline from top to bottom, front to back and left to right. Five-year-old children's ability of multiple metaphors in time concept was further strengthened. The cognitive ability of children aged 3 to 5 years old is not synchronized, and the cognitive development of the up and down and the left and right direction of the time concept is better than that of the forward and backward direction.

[3] Department of Psychology, Vanderbilt University

摘 要 社交焦虑症状最有可能出现在青春期，这一时期主要特点是对同伴评价的担忧加剧。最新的研究表明，错误相关负波（ERN）是社交焦虑中夸大自我/错误监测的潜在神经标志，尤其是在同龄人面前犯下的错误。然而，很少有研究考察社交焦虑个体差异如何与情境因素相互作用来影响 ERN，以及青少年时期社交焦虑个体差异与情境因素是否会影响 ERN 的发展模式。本研究采用青少年社交焦虑量表对 555 名初中生和 575 名高中生进行施测，分别筛选出社交焦虑高分组（初中：$n = 28$; 高中：$n = 24$）和低分组（初中：$n = 30$; 高中：$n = 29$），运用社交操纵范式，让被试在单独（非社交条件）和同伴评价（社交条件）两种情境下完成侧翼（Flanker）任务，同时记录被试完成 Flanker 任务期间的脑电数据。结果表明:（1）在初中组中，高社交焦虑个体比低社交焦虑个体犯错时诱发的 ERN 波幅更大（F（1,56）= 3.98，$p = 0.051$），而个体反应正确时诱发的正确相关负波（correct-related negativity，CRN）波幅在高低社交焦虑组间没有显著差异（F（1,56）= 0.24，$p = 0.627$）;（2）在高中组中，社交情境比非社交情境诱发了更大的 ERN 波幅（F（1,51）= 3.14，$p = 0.082$），而 CRN 在这两种情境下没有显著差异（F（1,51）= 0.26，$p = 0.611$）;（3）综合初中和高中年龄段来看，我们发现相较于低社交焦虑组，高社交焦虑青少年犯错时诱发的 ERN 波幅随年龄发展越来越小（F（1,50）= 5.08，$p = 0.029$），而 CRN 随年龄发展较稳定（F（1,50）= 0.05，$p = 0.820$）。研究表明，年龄较小的青少年的 ERN 更容易受到社交焦虑的影响，而年龄较大的青少年的 ERN 更容易受到社交情境的影响，且不同社交焦虑个体的 ERN 随年龄发展模式不同。研究促进了对青春期社交焦虑相关神经认知过程的理解。

Developmental patterns of error monitoring in socially anxious adolescents: evidence from ERPs

Jiahui Li[1,2], Ziyu Pu[1,2], Jianyi Liu[1,2], Yanbin Niu[3] and Jingjing Zhao[1,2]

1 School of Psychology, Shaanxi Normal University,710062
2 Shaanxi Provincial Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, China, 710062, corresponding author E-mail (jingjing.zhao@snnu.edu.cn)
3 Department of Psychology, Vanderbilt University

***Abstract*:** Social anxiety symptoms are most likely to emerge during adolescence, a period characterized primarily by heightened concerns over peer evaluation. Emerging work points to the error-related negativity (ERN) as a potential neural marker of exaggerated self/error monitoring in social anxiety, especially for errors committed in front of peers. However, few studies have examined how individual differences in social anxiety interact with contextual factors to influence ERN, and whether individual differences in social anxiety and contextual factors during adolescence influence patterns of ERN development. In this study, the Social Anxiety Scale for Adolescents was administered to 555 middle school students and 575 high school students, screened for high (middle school: n = 30; high school: n = 29) and low (middle school: n = 30; high school: n = 30) subgroups of social anxiety respectively, and utilizing a social manipulation paradigm, participants were asked to complete a flanker task, and EEG data were recorded during the participant's completion of the flanker task. The results showed that: (1) In the middle school group, highly socially anxiety individuals exhibited a larger ERN than low socially anxiety individuals (F(1,56) = 3.98, p = 0.051), whereas no differences in the CRN between the high and low socially anxiety groups (F(1,56) = 0.24, p = 0.627); (2) In the high school group, there was an enhanced ERN in the social condition relative to the nonsocial condition (F(1,51) = 3.14, p = 0.082), whereas no differences in the CRN were observed between the two conditions (F(1,51) = 0.26, p = 0.611); (3) combining the middle school and high school age groups, we found that highly socially anxious adolescents demonstrated smaller ERN with age compared to the low socially anxious group (F(1,50) = 5.08, p = 0.029) while CRN was stable with age (F(1,50) = 0.05, p = 0.820). The study suggests that social anxiety influences more on the ERN in younger adolescents, whereas ERN in older adolescents is more susceptible to social contexts, and that ERN develops in different patterns with age in different socially anxious individuals. The study contributes to the understanding of neurocognitive processes associated with social anxiety in adolescence.

摘 要　作为一种与社会互动过程密切相关的消极情绪体验，青少年的孤独感与其同伴交往经历及社会行为间存在密切关联。早期青少年(11-13 岁)会面临青春期转变与小升初的学校转变，必然经历原有同伴关系的疏离与维护，新的同伴关系建立与维护等诸多社会性发展任务，由此出现情绪困扰与行为问题的高发。以往研究多聚焦于孤独感对青少年友谊及社会行为的负面影响，近期孤独感的进化理论指出，孤独感体验在本质上是短暂的，其引发的孤独相关厌恶情绪会激励个体产生与其他人重新建立联系的需求，这一现象被

称为重新联结动机(reaffiliation motive, RAM)。即青少年早期的孤独感也可能会促使个体产生较多的同伴交往行为，并进一步为维护良好社会互动减少关系攻击等不良的同伴交往行为。为探讨青少年早期个体的孤独感、友谊质量及关系攻击间的纵向关联与内在机制，本研究以初中生为被试，通过为期两年的三次追踪测试，考察青少年早期孤独感、关系攻击与友谊质量间的双向关系模式及其内在机制。

本研究以陕西省西安市的 904 名初中生(M_{age} = 12.73±0.43)为对象，采用孤独感问卷、友谊质量问卷和关系攻击问卷进行了两年追踪研究。交叉滞后面板模型的中介分析结果表明：（1）在纵向发展上，青少年早期的孤独感持续正向预测一年后的友谊质量；相反，友谊质量则会持续负向预测一年后的孤独感；（2）青少年早期友谊质量能显著负向预测一年后的关系攻击，关系攻击则无法预测一年后的友谊质量；（3）T2 时间点的友谊质量在 T1 时间点的孤独感与 T3 时间点的关系攻击间起纵向中介作用，即 T1 时间点的孤独感能够显著正向预测 T2 时间点的友谊质量，进而降低 T3 时间点的关系攻击；（4）T2 时间点的友谊质量在 T1 时间点的关系攻击与 T3 时间点的孤独感间则无纵向中介。本研究结果揭示了青少年早期孤独感、友谊质量和关系攻击间的纵向关联及孤独感通过友谊质量对关系攻击的预测作用，支持了孤独感进化理论有关重新联结动机的观点，能够为基于重新联结动机视角的同伴交往干预策略提供实证研究的证据支持。

Abstract：As a negative emotional experience closely related to the process of social interaction, adolescents' loneliness is closely related to their peer interaction experience and social behavior. Early adolescents (11-13 years old) will face the transition of adolescence and school transition from primary school to junior high school, and will inevitably experience many social development tasks such as the alienation and maintenance of the original peer relationship and the establishment and maintenance of the new peer relationship, resulting in a high incidence of emotional distress and behavior problems. Previous studies mostly focused on the negative impact of loneliness on adolescents' friendship and social behavior. Recent evolutionary theory of loneliness pointed out that the experience of loneliness is transient in nature, and the aversive feelings associated with loneliness induced by it will motivate individuals to have a need to reconnect with others, a phenomenon known as the reaffiliation motive (RAM). In other words, early adolescent loneliness may also promote individuals to have more peer interaction behaviors, and further reduce delinquent peer interaction behaviors such as relational aggression in order to maintain positive social interaction. In order to explore the longitudinal relationship and internal mechanism among loneliness experience, friendship quality and relational aggression in early adolescents, this study recruited junior high school students as subjects, and investigated the bidirectional relationship pattern and internal

mechanism among loneliness, relational aggression and friendship quality in early adolescents through three follow-up studies for two years.

This study targeted 904 junior high school students (M_{age} = 12.73±0.43) in Xi'an, Shaanxi Province and surveyed loneliness questionnaire, friendship quality scale and relational aggression scale for two years. The cross-lagged panel and mediation analysis showed that: (1) In term of the longitudinal development, loneliness in early adolescence consistently and positively predicted friendship quality one year later. In contrast, friendship quality consistently negatively predicted loneliness one year later; (2) Early adolescent friendship quality significantly negatively predicted relational aggression one year later, but relational aggression did not predict friendship quality one year later; (3) Friendship quality at time T2 played a longitudinal mediating role between loneliness at time T1 and relational aggression at time T3, that is, loneliness at time T1 positively predicted friendship quality at time T2, and then reduced relational aggression at time T3; (4) Friendship quality at time T2 did not play a longitudinal mediating role between relational aggression at time T1 and loneliness at time T3. These findings suggest that the longitudinal relationship among loneliness, friendship quality and relational aggression in early adolescents and the predictive effect of loneliness on relational aggression through friendship quality. The research supports the view of reaffiliation motivation in the evolutionary theory of loneliness and provides empirical evidence for peer interaction intervention strategies based on reaffiliation motivation.

Keywords: early adolescence, reaffiliation motivation, loneliness, friendship quality, relational aggression

家庭社会经济地位、父母教育期望与青少年的未来目标：一项 15 年的时间滞后研究

张文杰[1] 于凤杰[2] 陈亮[1]（通讯作者） 张玲玲[3] 张文新[1]

1 山东师范大学心理学院，济南，250014，chen_liang1010@126.com

3 中国儿童中心，北京，100032

摘 要 未来目标是个体对希望实现或避免发生的未来状态或结果的内在表征，其确立对青少年的发展和适应具有指引作用。个体未来目标的建构根植于特定的社会历史环境，在不同社会文化背景、不同历史时期中，个体的目标内容会存在差异。然而，迄今为止尚没有研究对中国青少年未来目标的变化及其影响因素进行系统考察。本研究基于两个出生队列的高中生样本，队列 1 数据收集于 2007 年，共 1055 人（男生 490 人），队列 2 数据收集于 2021 年，共 897 人（男生 377 人）。采用时间滞后设计，考察了近 15 年青少年未来目标（希望和担忧）的差异，并探讨了不同队列下，性别、城乡、家庭社会经济地位和父母教育期望对青少年目标的影响。研究结果如下：（1）与队列 1 相比，队列 2 的青少年提及的未来教育、职业、婚姻/家庭领域的目标数量更少，提及的自我、人际关系、休闲娱乐领域的希望数量更多；（2）性别对青少年目标的影响不存在显著的队列差异；（3）在队列 1 中，与城市青少年相比，农村青少年报告了更多的职业、当前学业、人际关系和自我领域的目标数量，在队列 2 中，农村青少年报告了更少的当前学业和人际关系领域的目标数量，其他领域的目标数量无显著城乡差异；（4）在队列 1 中，家庭社会经济地位与更多的职业目标数量显著关联，在队列 2 中，家庭社会经济地位与更少的职业目标数量显著关联；（5）父母教育期望能预测青少年更多的未来受教育目标，并且这种关联不存在出生队列差异；（6）在队列 1 中，父母教育期望越高，农村青少年提及的父母安康领域的担忧越少，而在队列 2 中，父母教育期望越高，农村青少年提及的父母安康领域的担忧越多；在两个出生队列中，城市青少年报告的父母安康担忧与父母教育期望并无显著关联。结果表明，随着时间推移，青少年的未来目标更多元，城乡差异减小；家庭社会经济地位、父母教育期望对青少年未来目标的影响发生变化。

Abstract： Future goals are the internal representation of the future state that an individual want to achieve or avoid, which affects the development and adaptation of adolescents. The construction of individual future goals is rooted in specific social and historical environment, and the content of individual future goals will be different across different social and cultural backgrounds and different historical periods. However, no studies have systematically examined the changes in the future goals of Chinese adolescents and their influencing factors. In this study, the data were collected in 2007 and 2021. There were 1055 (490 boys) and 897 (377 boys) in the two cohorts, respectively. Using a time-lagged design, we examined the differences in future goals (hopes and fears) of adolescents in the past 15 years, and explored the effects of gender, residence, family socioeconomic status and parental educational expectations on adolescents' future goals in two cohorts. The results show that: (1) Compared to adolescents in 2007 (cohort 1), those in 2021 (cohort 2) were more likely to report both hopes and fears for self-related issues, interpersonal relationships and leisure activities, and were less likely to report both hopes and fears for future education, occupation and marriage and family; (2) There is no significant cohort difference regarding the i gender differences in adolescents' future goals; (3) For the 2007 cohort, rural adolescents were more likely to report both hopes and fears for occupation, academics, interpersonal relationships, and self-related issues than urban adolescents, whereas in the 2021 cohort, except that urban adolescents were more likely to report both hopes and fears for interpersonal relationships and academics than rural adolescents, there were no residence differences; (4) In cohort 1, with high family socioeconomic status were more likely to report both hopes and fears about occupation, whereas in cohort 2, high family socioeconomic status were less likely to report both hopes and fears for occupation; (5) Parental educational expectations predicted adolescents' goals of future education positively, and this association did not differ by cohort; (6) In cohort 1, rural participants with high parental educational expectation were less likely to report fears for parental well-being, but in cohort 2, rural participants with high parental educational expectation were more likely to report fears for parental well-being. In both cohorts, parental well-being fears reported by urban adolescents were not significantly associated with parental educational expectations. The results show that with time, the future goals of adolescents become more diversified, and the difference between urban and rural areas is reduced; The influence of family socioeconomic status and parental educational expectations on adolescents' future goals has changed over time.

Keywords: future goals, time lag study, cohort, family socioeconomic status, parental educational expectations

竞争情境对行为抑制控制的影响及其神经心理机制

狄思雨[1]　麻超[1,2]（通讯作者）

1 石河子大学 师范学院/兵团教育学院，新疆 石河子， 832003

摘 要 行为抑制控制是抑制控制功能的重要组成部分，良好的行为抑制控制能力被认为是做出正确行为决策的前提，是人类在不断进化过程中学习到的一项重要的生存技能。同时行为抑制控制对个体来说也起这一种重要的监控作用，能让个体实现对当前或即将发生的不恰当行为进行监控和抑制，有效引导人们根据环境的变化采取对应的行为模式，最终做出正确的行为决策。竞争是人类社会常见的人际互动方式，也是人类社会发展与进步的动力之一，对人类社会的发展起到了重要的促进作用，竞争指个体为了超过他人获得肯定而表现出的行为，尤其是在渴望获得资源或者争取有限的机会条件下，力争超越他人的行为表现。因此，本研究从社会情境的视角出发，结合当今大学生行为抑制控制发展特点，探讨竞争情境对大学生行为抑制控制的影响及其神经心理机制。**方法：**研究选取 29 名大学生（男 14，女 15），在中性情境及竞争情境后让其完成亚型双选择 oddball 任务，连续采集其实验过程中的脑电信号，探究竞争情境影响大学生行为抑制控制的行为表现，并从认知神经层面了解竞争情境对大学生行为抑制控制影响。**结果：**行为结果发现，竞争情境下被试的反应时显著小于中性情境，但错误率显著高于中性情境。ERP 结果显示，与中性情境相比，竞争情境被试的 N2d 波幅无显著变化，而被试的 P3d 波幅显著变大。**结论：**研究结论表明，竞争情境对个体行为抑制控制的影响在行为上存在不一致，这一结果主要与个体在竞争情境下的速度—准确率权衡有关，在反应时上体现出竞争情境对大学生行为抑制能力的提升作用。在脑机制中发现，竞争情境对行为抑制控制的早期阶段没有促进作用，但竞争情境促进大学生行为抑制控制的晚期加工，即竞争情境可以激活行为抑制控制的反应决策积极性。

***Abstract*：** Behavioral inhibitory control is an important part of the inhibitory control function, and the ability of good behavioral inhibitory control is considered to be a prerequisite for making correct behavioral decisions, which is an important survival skill that human beings have learned in the process of continuous evolution. At the same time, behavioral inhibitory control also plays an important monitoring role for individuals, enabling them to monitor and inhibit current or upcoming inappropriate behaviors, effectively guiding them to adopt corresponding behavioral patterns according to changes in the environment, and ultimately making correct behavioral decisions. Competition is a common form of interpersonal interaction in human society, and is also one of the driving forces for the development and progress of human society, which plays an important role in promoting the development of human society. Competition refers to the behaviors that individuals show in order to surpass others to gain affirmation, especially in the desire to obtain resources or to strive for a limited opportunity to surpass the behaviors of others. Therefore, from the perspective of social situation, this study combines the developmental characteristics of behavioral inhibitory control in today's college students to explore the effects of competitive

situation on college students' behavioral inhibitory control and its neuropsychological mechanisms. **Methods:** 29 college students (14 males and 15 females) were selected to complete the sub-type two-choice oddball task after neutral and competitive situations, and their EEG signals were continuously collected during the experimental process to investigate the behavioral performance of college students' behavioral inhibitory control affected by the competitive situation and to understand the effect of the competitive situation on the college students' behavioral inhibitory control from the cognitive-neural level. **Results:** Behavioral results revealed that the response time of subjects in the competitive situation was significantly shorter than that in the neutral situation, but the error rate was significantly higher than that in the neutral situation.ERP results showed that the N2d amplitude of the subjects in the competitive situation did not change significantly compared with that in the neutral situation, whereas the P3d amplitude of the subjects became significantly larger. **Conclusion:** The findings indicate that the effects of competitive situations on individual behavioral inhibitory control are behaviorally inconsistent, and this result is mainly related to the speed-accuracy trade-off of individuals in competitive situations, which is reflected in the enhancement of college students' behavioral inhibitory ability in response time. In brain mechanisms, it was found that competitive situations did not promote the early stage of behavioral inhibitory control, but competitive situations promoted the late processing of college students' behavioral inhibitory control, that is, competitive situations could activate the response decision-making activation of behavioral inhibitory control.

父母手机依赖对学龄前儿童亲社会行为的影响：专制教养方式的中介作用和儿童 BDNF 基因 rs6265 多态性的调节作用

贾翰琳　方心雨　杨晓辉（通讯作者）　王振宏

陕西师范大学心理学院，西安, 710062, yangxiaohui@snnu.edu.cn、

摘 要　家庭的媒介环境（如父母手机依赖）会对儿童的发展产生重要影响。个体与环境的交互视角以及媒介效果差别易感性模型都认为儿童的特点会影响媒介因素对儿童发展的影响效果，但是以往研究很少考察儿童的生物特点（如基因）对媒介环境的调节作用。基于此，本研究考察父母手机依赖是否通过父母专制教养影响学前儿童的亲社会行为，以及这个路径是否因学前儿童的生物特点（即 BDNF 基因 rs6265 多态性）而有所不同。499 名 3 ~ 6 岁儿童（$M_{年龄}$ = 5.20 岁，SD = 0.90 岁，女生 231 名）及其父母参与了本研究。分别采用父母报告的手机依赖量表、家庭教养方式量表中的专制教养分量表、长处与困难问卷中的亲社会行为分问卷测量了父母手机依赖水平、专制教养及儿童亲社会行为。同时采集儿童唾液样本进行基因位点的分型。研究结果发现，在控制了儿童的性别和年龄后，专制教养完全中介了父母手机依赖与幼儿的亲社会行为的负向关联。此外，儿童 BDNF 基因 rs6265 多态性能够调节父母手机依赖及专制教养对其亲社会行为的关系。具体来讲，携带 CC 基因型的儿童其父母手机依赖水平与其亲社会水平显著负相关，而携带 TT/CT 基因型的儿童其父母手机依赖水平与亲社会行为的关系不显著。而父母手机依赖通过专制教养方式对儿童的亲社会行为的消极作用主要体现在携带 TT/CT 基因型儿童中而非携带 CC 基因型的儿童中。本研究为深入了解个体的生物敏感性因素与家庭媒体环境交互影响儿童发展提供了证据。

Parental problematic smartphone use and preschooler' pro-social behavior: BDNF rs6265 polymorphism moderated the mediating

effect of authoritarian parenting

Hanlin Jia, Xinyu Fang, Xiaohui Yang (Corresponding author), Zhenhong Wang
School of Psychology, Shaanxi Normal University, Xi'an, China, yangxiaohui@snnu.edu.cn

***Abstract*:** Family media environment (e.g., parental problematic smartphone use) have important impacts on children's development. The person×environment perspective and the differential susceptibility to media effects model all assume that children's characteristics influence the effects of media environments on children's development. Yet few researches examined the role of biological characteristics (e.g., genes) of children in moderating the effects of media environment. Thus, this study tested whether and how BDNF rs6265 polymorphism moderated the path ways that parental problematic smartphone uses through authoritarian parenting link with preschool children's pro-social behaviors. Parents of 499 children aged 3 ~ 6 years (M_{age} = 5.20 years, *SD* = 0.90 years, 231 girls) participated. Parents reported their level of parental problematic smartphone use, authoritarian parenting and children's pro-social behavior. Children's saliva samples were also collected for DNA extraction. The results found that authoritarian parenting fully mediated the negative effect of parental problematic smartphone use on children's pro-social behavior after controlling for children's age and sex. In addition, the BDNF rs6265 polymorphism moderated the relationships between parental problematic smartphone use/authoritarian parenting and children's pro-social behavior. Specifically, parental problematic smartphone use was significantly negatively associated with pro-social behavior among children with CC genotype, while parental problematic smartphone use was not significantly associated with pro-social behavior in children with TT/CT genotype. In addition, the negative effects of parental problematic smartphone use on children's pro-social behavior through authoritarian parenting were only found among children with the TT/CT genotypes rather than children with the CC genotype. The present study provides evidence of children's biological susceptibility factors interact with the family media environment to impact on their development.

HPA 轴系统基因、关系侵害与青少年早期抑郁：基于动态发展视角

方惠慈[1]　曹衍淼[1]（通讯作者）　崔嘉仪[1]　丁晓凡[1]　张文新[1]
1 山东师范大学心理学院，山东省学生心理健康发展中心，济南，250014，cym8023@126.com

摘　要　近 20 年来, 抑郁的分子遗传研究取得了系列突破性进展，揭示了抑郁的风险基因、基因—环境的交互作用及其内表型机制。然而，多数分子遗传研究仍然采用静态视角，对抑郁遗传效应的动态发展问题关注不足。特别是对于抑郁遗传效应随年龄的变化、风险基因对抑郁发展轨迹的影响等问题无法给出确切的答案。此外，已有研究显示环境风险对青少年抑郁的作用模式具有多样性，可能呈现出线性或非线性模式，并因个体携带的遗传基因而存在差异。因此，本研究采用动态发展视角，以 1088 名初一学生为被试进行为期 3 年的追踪研究，考察 HPA 轴系统基因与关系侵害交互作用的年龄差异及其对青少年抑郁发展轨迹的影响。研究采用 *FKBP5* 基因 rs1360780 多态性、*CRHR1* 基因 rs110402 多态性、*BDNF* 基因 rs6265 和 *OXTR* 基因 rs53576 多态性等四个基因位点作为多基因指标，采用自我报告测评同伴侵害和青少年抑郁症状。结果发现：（1）控制性别后，关系侵害显著正向预测青少年的抑郁症状，但关系侵害与青少年抑郁的关系呈现非线性模式。具体表现为，关系侵害的严重程度越高，抑郁的风险不会随之继续增高；而多基因累加得分对抑郁的直接影响不显著。（2）在三个时间点上，HPA 轴多基因累加得分与关系侵害二次项的交互作

用显著同时性预测青少年抑郁，但交互作用模式存在年龄差异。相比多基因累加得分较高的青少年，多基因累加得分较低的个体在遭受更严重的侵害时，其抑郁风险不会随之继续增高。（3）青少年早期抑郁呈线性增长趋势，但是抑郁初始水平与增长速度无关。HPA 轴多基因累加得分与关系侵害的二次交互项显著预测抑郁的斜率。多群组比较显示，相比多基因累加得分较低的青少年，多基因累加得分较高的个体在经历较多关系侵害后抑郁的增长速度更慢。上述发现基于动态视角，采用多基因研究范式，拓展了对青少年抑郁的发生发展机制及差异的认识，为该领域的理论发展和干预研究提供了支持。

Genes, Relational Victimization, and Depression Across Early Adolescence: Dynamic Genetic Effects

FANG Huici, CAO Yanmiao, CUI Jiayi, DING Xiaofan, ZHANG Wenxin
School of Psychology, Research Institute of Child and Adolescent Development, Shandong Normal University, Jinan 250014, cym8023@126.com

Abstract: There has been a dramatic rise in gene–environment interaction (G × E) studies of depression over the last two decades. However, most of studies focus on static genetic effects, and few studies take into consideration how the genotype by environment interactions change over development and how the interactions work on the developmental trajectories of depression. Besides, existing evidence has shown that the relationship between environmental factors and adolescent depression is various, which may be linear or nonlinear patterns and may differ depending on the genes carried by individuals. Taken together, the present study aimed to examine age differences in the interaction between MGPS and relational victimization on adolescent depression and the G × E effect on the developmental trajectories of depression.

One thousand and eighty-six adolescents were followed up for three years. Adolescents' saliva samples, self-reported depressive symptoms and relational victimization were collected. All of the measures showed good reliability. The MGPS was compiled by *FKBP5* gene rs1360780 polymorphism, *CRHR1* gene rs110402 polymorphism, *BDNF* gene rs6265 polymorphism and *OXTR* gene rs53576 polymorphism.

The results showed that after controlling for gender, relational victimization positively predicted depression in a nonlinear pattern. Specifically, the risk of depression would not continuously elevated anymore as the severity of relational victimization increased. There was no main effect of the MGPS on depression. Second, at these three points, HPA-axis multilocus genetic profile score significantly interacted with the quadratic term of relational victimization in predicting adolescent depression concurrently, but this interaction had age differences. Particularly, the risk of depression in adolescents with lower multilocus genetic profile score would not continuously increase longer when exposed to more victimization, compared to those with higher multilocus genetic profile score. Third, early adolescent depression increased in a linear trajectory, but there was no significant association between the initial depression and growth rate. There were statistically significant quadratic effects of HPA-axis multilocus genetic profile score on relational victimization, predicting the slope of depression. From Multiple Group Analysis, adolescents with higher multilocus genetic profile score showed slower rate of depression when exposed to more victimization, compared to those with lower multilocus genetic profile score.

Based on the dynamic development perspective, these findings extended knowledge of the development mechanisms and differences of adolescent depression, also providing evidence in support of theoretical development and intervention research in the field.

depression

青少年心理韧性的发展轨迹：感恩和压力知觉的作用

罗芮[1] 陈福美[2] 罗玉晗[3] 李昭仪[2] 祁梦迪[1] 杨政乾[1] 王耘[1]（通讯作者）

1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875，wangyun@bnu.edu.cn

2 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

3 中央民族大学教育学院，北京，100081

摘 要 当前，世界发展遭遇“百年未有之大变革”，人类社会面临着越来越多的重大挑战，如大流行病、经济危机等。这些挑战给青少年发展带来了诸多压力，致使青少年心理健康问题日益严重(Hawes et al., 2022)。世界卫生组织的数据显示全球约有 14%的青少年罹患心理障碍(World Health Organization, 2021)，我国 6-16 岁在校学生心理障碍总体患病率则为 17.5%(Li et al., 2022)。在此背景下，了解青少年如何保持心理韧性，即面对重大风险或压力时仍能实现积极发展(Masten et al., 2021)，变得日益迫切。其中，揭示青少年心理韧性的发展轨迹及其影响因素对于制定更具针对性的心理韧性干预方案尤为重要。本研究从多维视角出发，探究了青少年心理韧性的发展轨迹以及感恩和压力知觉在其中的作用。研究采用青少年生活事件量表（ASLEC）、生活满意度量表（SWLS）、抑郁症状筛查量表（PHQ-9）、感恩问卷（GQ-6）、压力知觉量表（PSS-10）对 563 名青少年（男生 292 名，51.87%）进行了四次追踪调查，追踪间隔半年。首次测查时被试平均年龄为 12.83 岁（SD = 0.54）。首先，采用残差法分别计算青少年四次测量时的幸福感韧性（即压力情境下仍能保持幸福感）和抑郁韧性（即压力情境下未出现或较少出现抑郁症状）(Amstadter et al., 2014)；然后，对幸福感韧性和抑郁韧性建立平行过程的潜类别增长模型，考察二者的联合发展轨迹；最后，采用多元 Logistic 回归分析考察感恩和压力感知对二者联合发展轨迹的影响。结果发现：（1）青少年的心理韧性发展轨迹可分为“低幸福感韧性增长-低抑郁韧性增长”（26.47%）、“低幸福感韧性增长-高抑郁韧性降低”（21.31%）、“高幸福感韧性降低-高抑郁韧性降低”（28.06%）和“高幸福感韧性降低-低抑郁韧性增长”（24.16%）四类；（2）感恩和压力知觉分别是其发展的保护性因素和风险因素：相较于其他三组，高感恩的青少年更可能属于“低幸福感韧性增长-低抑郁韧性增长”组；相较于“低幸福感韧性增长-低抑郁韧性增长”组和“高幸福感韧性降低-低抑郁韧性增长”组，高压力知觉的青少年更可能属于“高幸福感韧性降低-高抑郁韧性降低”组。说明青少年心理韧性是动态变化的多维结构，其发展轨迹具有高度异质性，而感恩和压力知觉则可能是提高青少年心理韧性的潜在干预目标。

Trajectories of Resilience among Chinese Adolescents: Effects of Gratitude and Perceived Stress

Rui Luo[1], Fumei Chen [2], Yuhan Luo[3], Zhaoyi Li [2] ,Mengdi Qi[1], Zhengqian Yang[1], Yun Wang [1](corresponding author)

1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, China, wangyun@bnu.edu.cn

2 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, China

3 School of Education, Minzu University of China, Beijing, China

Abstract： Living in a time of fundamental changes (e.g., climate change), our human society is facing more and more major disruptions, such as pandemics, war, and global economic crises. These disruptions have profoundly affected our mental health (e.g., the COVID-19 pandemic, ref. Hawes et al., 2022). According to World Health Organization, one in seven (14%) adolescents experiences a mental disorder (World Health Organization, 2021). And in China, the prevalence of any mental disorders in 6-16-year-old school children and adolescents was 17.5% (Li et al., 2022). Under this background, understanding how individuals can be resilient, that is, attain positive adaptation despite exposure to significant risk or stressors (Masten et al., 2021), during such times is becoming more and more urgent. Particularly, needed is understanding how resilience develops over time and what drives it. Thus, the present study aimed to investigate developmental trajectories of resilience based on a multidimensional construct and the impact of gratitude and perceived stress on adolescents' resilience development. The samples included 563 Chinese adolescents (mean age at Time 1 = 12.83 years; 51.87% boys) from a four-wave longitudinal study with data spanning 0.5 years. All participants were asked to complete the adopted Adolescent Self-Rating Life Events Checklist (ASLEC), Satisfaction with Life Scale (SWLS), Patient Health Questionnaire-9 (PHQ-9), Gratitude Questionnaire–6 (GQ-6), and Perceived Stress Scale-10 (PSS-10). Firstly, a residualized approach to resilience was used to calculate well-being resilience (i.e., the ability to demonstrate well-being adversities or stress) and depressive resilience (i.e., a lack of depressive symptoms in response to adversities or stress), respectively (Amstadter et al., 2014); then, parallel process latent class growth models (PP-LCGM) were used to explore the heterogeneity of wellbeing and depressive resilience trajectories; and finally, multinomial logistic regression analysis was deployed to examine associations between trajectory membership and gratitude, and perceived stress. The results were as follows: (1) Four distinct developmental trajectories of resilience were identified: low-increasing wellbeing and depressive resilience (26.47%); low-increasing wellbeing resilience and high-decreasing depressive resilience (21.31%); high-decreasing wellbeing and depressive resilience (28.06%); and high-decreasing wellbeing resilience and low-increasing depressive resilience (24.16%). (2) Gratitude was associated with greater odds of membership in the low-increasing well-being and depressive resilience group compared to the other three groups. Additionally, perceived stress was related to greater odds of membership in the high-decreasing well-being and depressive resilience group compared to both low-increasing well-being and depressive resilience group and high-decreasing well-being and low-increasing depressive resilience group. The findings reveal that resilience is a dynamic and multidimensional construct with highly heterogeneous developmental trajectories. Furthermore, both gratitude and perceived stress are significant predictors of resilience developmental trajectories, indicating that they may be potentially effective targets of interventions to enhance youth resilience.

Keywords： resilience, developmental trajectory, gratitude, perceived stress

跨诊断视角下青少年焦虑和抑郁潜在共发结构的发展轨迹及发展特点

摘 要 焦虑和抑郁是青少年群体中最常见的心理健康问题，经常共同发生 (Cai et al., 2022)，二者的共发也预示着更严重的症状、更多的心理社会功能损害以及更高的自杀风险 (Coplan et al., 2015; Cummings et al.,

2014; van Loo et al., 2016)。在传统诊断框架下，不同心理健康问题被认为是相互独立的，并被划分为不同的诊断类别 (Kendler, 2009)。然而，不同心理健康问题之间共发的普遍性导致了跨诊断模型的出现 (Caspi et al., 2014)，该模型认为心理健康问题是连续的维度，不同心理健康问题间存在潜在共同结构，表征着它们的共发 (Dalgleish et al., 2020; Kotov et al., 2017)。目前，跨诊断视角下对焦虑和抑郁潜在共发结构的探究还处于初步探索阶段，更没有研究揭示焦虑和抑郁潜在共发结构的发展轨迹及发展特点。因此，本研究基于跨诊断模型，采用群组序列的追踪设计构建 10-18 岁青少年焦虑和抑郁潜在共发结构的潜增长模型，并探究其发展特点。60853 名青少年（初始年龄在 10-16 岁；51.2%男生）于 2020、2021 和 2022 年完成一系列人口学变量、焦虑和抑郁的测量，其中焦虑采用儿童焦虑性情绪障碍筛查量表（SCARED）中的广泛性焦虑分量表进行测量，抑郁采用患者健康抑郁量表（PHQ-9）进行测量。结果发现：（1）青少年的焦虑和抑郁在三年中均符合双因子模型，二者间存在潜在共发结构；（2）10-18 岁青少年焦虑和抑郁的潜在共发结构呈现负加速曲线增长模式（如图 1，$M_{截距}$=-0.048，$M_{线性斜率}$=0.403，$M_{曲线斜率}$=-0.229；*p*s＜0.001），预计在 18.80 岁达到峰值，其截距和斜率均存在个体差异；（3）相比于男生，女生潜在共发结构的初始水平更高（$\beta_{性别→截距}$=0.109，*p*＜0.001），发展速率更快（$\beta_{性别→线性斜率}$=0.796，*p*＜0.001），形状更陡峭（$\beta_{性别→曲线斜率}$=-1.159，*p*＜0.001），峰值的到来也要更早；（4）青少年每一年龄段的主观 SES 均能够显著负向预测同一年龄段的焦虑和抑郁潜在共发结构（$\beta_{主观SES→潜在共发结构}$：-0.131~-0.178；*p*s＜0.001）。研究结果从跨诊断的视角揭示了焦虑和抑郁存在潜在共发结构，其负增长的发展轨迹提示需要重点关注青春期中后期的青少年。此外，女生和主观 SES 低的青少年是焦虑和抑郁共发的风险群体。

2 Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University, Beijing, China, 100875
3 Haidian Institute of Education Sciences, Beijing, China, 100097

Abstract：Anxiety and depression are the most common mental health problems in adolescents and commonly co-occur (Cai et al., 2022). Their comorbidity also predicts more severe symptoms, more impairment of psychosocial functioning, and higher risks of suicide (Coplan et al., 2015; Cummings et al., 2014; van Loo et al., 2016). Under the traditional diagnostic framework, different mental health problems are considered to be independent and classified into different diagnostic categories (Kendler, 2009). However, the prevalence of comorbidity between different mental health problems has led to the emergence of the transdiagnostic model (Caspi et al., 2014). The model considers mental health problems to be continuous dimensions, with shared latent construct between different mental health problems, representing their comorbidity (Dalgleish et al., 2020; Kotov et al., 2017). At present, the exploration of the latent comorbidity construct of anxiety and depression from the transdiagnosis perspective is still in the preliminary exploring stage. No research has revealed the developmental trajectories and developmental characteristics of the latent comorbidity construct of anxiety and depression. Therefore, this study used a cohort sequential design for the investigation and multiple group multiple cohort growth models to fit the developmental trajectories of latent comorbidity construct of anxiety and depression among adolescents aged 10–18 years. 60,853 adolescents (initial age from 10 to 16 years; 51.2% male) completed a series of questionnaires assessing demographic variables, anxiety and depression in 2020, 2021 and 2022. The Generalized Anxiety Disorder subscale of Screen for Child Anxiety Related Disorders (SCARED) was used to measure anxiety and the Patient Health Questionnaire (PHQ-9) was used to measure depression. The results revealed that: (1) Anxiety and depression in adolescents fit the bifactor model in three years, and there is a latent comorbidity construct accounted for the comorbidity of anxiety and depression. (2) The latent comorbidity construct of anxiety and depression in adolescents aged 10-18 showed a negative acceleration curvilinearly manner ($M_{intercept}$=-0.048, $M_{linear\ slope}$=0.403, $M_{quadratic\ slope}$=-0.229; ps $<$ 0.001), with substantial levels of interindividual variations in intercept, linear slope and quadratic slope. It could be estimated that the latent comorbidity construct of anxiety and depression might peak at the age of 18.80. (3) Compared with boys, girls have a higher initial level of latent comorbidity construct of anxiety and depression ($\beta_{gender\rightarrow intercept}$=0.109，$p<$ 0.001), a faster rate of its trajectories ($\beta_{gender\rightarrow linear\ slope}$=0.796，$p<$0.001), a steeper shape ($\beta_{gender\rightarrow intercept}$=0.109，$p$ ＜0.001), and an earlier peak. (4) For adolescents of each age, the subjective SES can significantly negatively predict the latent comorbidity construct of anxiety and depression. The results of this study reveal the latent comorbidity construct of anxiety and depression from a transdiagnostic perspective, and its negative acceleration curvilinearly trajectories suggests the need to focus on the middle and late adolescence. In addition, girls and adolescents with low subjective SES are the risk groups for the comorbidity of anxiety and depression.

父亲、母亲拒绝与青少年违纪行为的双向关系：一项交叉滞后研究

段国萍　张丽锦（通讯作者）　吴秀娟
陕西师范大学心理学院，西安，710062，zhanglijin2013@snnu.edu.cn

摘　要　违纪行为指违背社会道德和准则的不良行为。根据父母接纳-拒绝理论，父母拒绝是违纪行为的重要预测因素。以往研究往往将父母拒绝视为整体，并发现其与青少年违纪行为间存在双向预测关系。但实际生活中，母亲作为子女的主要照料者，可能比父亲更容易觉察到孩子的情绪和行为变化；而父亲则更多参与到对子女的纪律和行为约束中。因此，本研究将分别探讨父亲、母亲拒绝与青少年违纪行为的关系。

以《简式父母教养方式问卷》拒绝分量表、《青少年自评量表》违纪行为分量表对 1477 名初中生(女生 728 名，T1 M_{age} = 13.02 ± 0.80 岁)进行为期半年的两次追踪调查，探讨父亲、母亲拒绝与青少年违纪行为的双向关系。结果发现：(1)控制年龄和家庭社会经济地位，T1 父亲、母亲拒绝均能显著正向预测 T2 违纪行为(β = 0.42, p < 0.001; β = 0.17, p < 0.001)，且父亲拒绝的预测作用显著高于母亲($Wald$ = 154.66, p < 0.001)；反过来，T1 违纪行为也能显著正向预测 T2 父亲、母亲拒绝(β = 0.14, p < 0.001; β = 0.31, p < 0.001)，且对母亲拒绝的预测作用显著高于父亲($Wald$ = 25.89, p < 0.001); (2)对比“父母效应”和“儿童效应”后发现，T1 父亲拒绝对 T2 违纪行为的预测作用显著高于 T1 违纪行为对 T2 父亲拒绝的预测作用($Wald$ = 39.22, p < 0.001)；而 T1 母亲拒绝对 T2 违纪行为的预测作用显著低于 T1 违纪行为对 T2 母亲拒绝的预测作用($Wald$ = 166.47, p < 0.001)；(3)多组比较发现，模型性别差异显著($\Delta\chi^2$ = 12.95, p = 0.012)，女生的违纪行为(β = 0.18, p < 0.001)对半年后父亲拒绝的预测作用显著大于男生(β = 0.11, p = 0.004)。

本研究验证了个体发展的交互模型和角色理论，在证实父亲、母亲拒绝与青少年违纪行为存在双向预测关系的同时；发现了父、母与子女相互影响的差异性表现：父亲拒绝对青少年违纪行为的预测作用更大、青少年违纪行为对母亲拒绝的预测作用更大；研究还发现了父亲拒绝对女生违纪行为影响更大的性别差异性。这些结果证实分别探讨父亲、母亲在不同性别青少年问题行为中的不同作用是有必要的。

The Bidirectional Associations Between Paternal and Maternal Rejection with Adolescent Delinquent Behaviors: A Cross-Lagged Study

Guoping Duan Lijin Zhang Xiujuan Wu
School of Psychology, Shaanxi Normal University, Xi'an, 710062, China

Abstract: Delinquency refers to bad behavior that is contrary to social morality and norms. According to the parental acceptance-rejection theory, parental rejection are important predictors of delinquent behavior. Previous studies have tended to consider parental rejection as a whole and have found a bidirectional predictive relationship between parental rejection and adolescent delinquent behavior. However, in real life, as primary caregivers of their children, mothers may be more likely to perceive changes in their children's mood and behaviors than fathers. Fathers, on the other hand, are more involved in the discipline and behavioral restraint of their children. Therefore, it is necessary to further explore the relationship between paternal and maternal rejection with adolescent delinquent behavior separately.

In this study, 1477 adolescents (728 girls, T1 M_{age} = 13.02 ± 0.80) were followed twice for half a year through the Refusal Subscale of the Short-Egna Minnen av Barndoms Uppfostran and the Delinquent Behavior Subscale of the Youth Self-Report. The results found that: (1) After controlling age and family socioeconomic status, T1 paternal rejection and maternal rejection positively predicted T2 delinquent behavior (β = 0.42, p < 0.001; β = 0.17, p < 0.001), and the predictive effect of paternal rejection was significantly higher than that of maternal rejection (*Wald* = 154.66, p < 0.001); Conversely, T1 delinquent behaviors positively predicted T2 paternal and maternal rejection (β = 0.14, p < 0.001; β = 0.31, p < 0.001), and the predictive effect on maternal rejection was significantly higher than that on paternal rejection (*Wald* = 25.89, p < 0.001); (2) After comparing the "parental effect" and the "child effect", it was found that the predictive effect of T1 paternal rejection on T2 delinquent behaviors was significantly higher than that of T2 delinquent behaviors on T1 paternal rejection (*Wald* = 39.22, p < 0.001). The predictive effect of T1 maternal rejection on T2 delinquent behaviors was significantly lower than that of T2 delinquent behaviors on T1 maternal rejection (*Wald* = 166.47, p < 0.001); (3) The multi-group comparison showed that the model sex difference was significant ($\Delta\chi^2$ = 12.95, p = 0.012), and the girls' delinquent behavior (β = 0.18, p < 0.001) had a significantly greater predictive effect on the paternal rejection than boys (β = 0.11, p = 0.004).

This study validated the transactional model and role theory of individual development, and confirmed that there is a two-way predictive relationship between paternal and maternal rejection with adolescent delinquent behavior. The differences in the interaction between fathers, mothers and children were found: paternal rejection had a greater predictive effect on adolescent delinquent behavior, and adolescent delinquent behavior had a greater predictive effect on maternal rejection. The study also found a greater gender disparity in the impact of paternal rejection on girls' delinquent behavior. These results confirmed the necessity to explore separately the different roles of fathers and mothers in the problem behavior of adolescents of different genders.

母亲工作-家庭冲突和养育倦怠的关系：一个有调节的中介模型

王婧怡　万琨　邓林园（通讯作者）
北京师范大学教育学部，北京，100875

摘 要：目的：本研究关注影响有职母亲养育倦怠的风险因素和保护因素，根据风险-资源平衡理论，具体探讨母亲工作-家庭冲突与其养育倦怠的关系以及教育焦虑、情绪调节策略在其中的作用。方法：使用工作-家庭冲突量表、养育倦怠量表、教育焦虑量表、情绪调节策略量表对贵州省 1269 名中小学生的母亲进行电子问卷调查，采用 SPSS 26.0 以及 PROCESS 插件对收到的答卷进行数据分析。结果：（1）有职母亲的工作-家庭冲突、养育倦怠、教育焦虑和表达抑制策略之间呈显著正相关。认知重评策略和有职母亲的养育倦怠之间呈显著负相关，和工作-家庭冲突之间相关性不显著。（2）有调节的中介模型检验结果显示，在控制了人口学变量信息之后，教育焦虑部分中介工作-家庭冲突对母亲养育倦怠的影响；表达抑制和认知重评都在中介效应的后半路径起调节作用，表达抑制会增强教育焦虑对养育倦怠的影响、认知重评会缓冲教育焦虑对养育倦怠的影响。结论：工作-家庭冲突、教育焦虑、表达抑制是有职母亲养育倦怠的风险因素，认知重评是其养育倦怠的保护因素，因此缓解工作-家庭冲突和教育焦虑、多运用认知重评策略、少运用表达抑制策略可减轻中小学生母亲的养育倦怠。本研究为预防有职母亲养育倦怠的路径提供了实证支持。

The Relationship Between Work-Family Conflict and

Parenting Burnout in Mothers: A Moderated Mediation Model

WANG Jingyi WAN Kun DENG Linyuan
Faculty of Education, Beijing Normal University, Beijing, 100875

Abstract: Objective: This study focuses on the risky factors and protective factors that affect the parenting burnout of working mothers. According to the risk-resource balance theory, it specifically discusses the relationship between work-family conflict and parenting burnout of mothers, and the role of educational anxiety and emotion regulation strategies in it. Method: An electronic questionnaire survey was conducted on 1269 mothers of primary and secondary school students in Guizhou Province with the Work-Family Conflict Scale, Parenting Burnout Scale, Education Anxiety Scale, and Emotional Regulation Strategy Scale. The received responses were analyzed by using SPSS 26.0 and the PROCESS plugin. Result: (1) There is a significant positive correlation between work-family conflict, parenting burnout, educational anxiety, and expression inhibition strategies among working mothers. There is a significant negative correlation between cognitive reappraisal strategies and parenting burnout among working mothers, but there is no significant correlation between cognitive reappraisal strategies and work-family conflict. (2) The results of the moderated mediation model test show that education anxiety partially mediates the impact of work-family conflict on mothers' parenting burnout, and expression inhibition and cognitive reappraisal play a moderating role in the second half of the mediating effect after controlling the information of demography variables. Expression inhibition will enhance the impact of education anxiety on parenting burnout, and cognitive reappraisal will buffer the impact of education anxiety on parenting burnout. Conclusion: Work-family conflict, educational anxiety, and expression inhibition are risky factors for parenting burnout among working mothers, and cognitive reappraisal is a protective factor for parenting burnout. Therefore, alleviating work-family conflict and educational anxiety, using cognitive reappraisal strategies more, and using expression inhibition strategies less, can alleviate parenting burnout among mothers of primary and secondary school students. This study provides empirical support for the prevention of parenting burnout among working mothers.

中学生有好成绩就一定会感到幸福吗？

——来自 PISA 2018（B-S-J-Z）的证据

刘雨婷[1] 林彤[1] 邓林园[1] 李蓓蕾[1]（通讯作者）
1 北京师范大学 教育学部，北京，100875，通讯作者 beileili@bnu.edu.cn

摘 要 目的：学生的学业成绩和主观幸福感都是教育的重要目标，两者之间存在显著正向联系。但是有些高学业成绩学生并不感到幸福，低学业成绩学生也并不必然不幸福。哪些因素会影响不同学业成绩学生的幸福感？在学业压力较重的中学生群体中探讨这一问题，有助于我们找出影响学生幸福感的关键因素。方法：本研究按照标准分从 PISA 2018 的中国数据库中筛选出高成绩高幸福感组（HH）、高成绩低幸福感组（HL）、低成绩高幸福感组（LH）和低成绩低幸福感组（LL）四组学生，试图考察学校氛围（合作氛围和竞争氛围）、社会支持（父母支持和教师支持）、成就目标（表现目标和掌握目标）和成就动机（失败恐惧和追求成功）等环境和个人因素与不同学业成绩学生的主观幸福感的关系。结果：多项逻辑回归模型的结果显示，（1）合作氛围、父母支持、追求成功显著正向预测 HH 组，竞争氛围、失败恐惧显著正向预测 HL 组；（2）合作氛围、父母支持、教师支持、掌握目标显著正向预测 LH 组，失败恐惧显著正向预

测 LL 组。根据结果，本研究将这些因素对学生主观幸福感的作用机制分为四类。第一，充分作用（合作氛围、父母支持和失败恐惧），即无论学生成绩高低均对其主观幸福感具有显著影响；第二，条件作用（竞争氛围），即在不同学业成绩学生群体中对其主观幸福感有不同效用；第三，同向作用（父母支持和教师支持，表现目标和掌握目标），即属于某个变量下的不同维度的因素对所有学生的主观幸福感有相同方向的影响；第四，异向作用（失败恐惧和追求成功），即属于某个变量下的不同维度的因素对所有学生的主观幸福感有相反方向的影响。结论：教育者应尽力为学生营造合作氛围、提高父母支持水平并避免过度强调失败后果，在低成绩群体中提供更多教师支持及鼓励学生尽量掌握所学内容，在高成绩群体中避免过度强调竞争以及激励学生突破自己追求成功，以提升所有中学生的主观幸福感。

Do Good Grades Necessarily Lead to Good Well-being Among Middle School Students?

—Evidence from PISA 2018 (B-S-J-Z)

LIU Yuting[1]　LIN Tong[1]　DENG Linyuan[1]　LI Beilei[1]
1 Faculty of Education, Beijing Normal University, Beijing 100875

Abstract：Academic achievement and subjective well-being were both central indicators of school education and they were generally positively associated. But low-achieving students do not necessarily report low well-being, and high-achieving students do not undoubtedly experience a high level of well-being. Exploring these issues, particularly among middle school students who face enormous academic pressure, will enable us to identify key factors that influence the subjective well-being of students across different levels of academic achievement. In order to examine the relationship between academic climate, social support, achievement goals, achievement motivation and well-being, four groups of students were selected from PISA 2018 (B-S-J-Z) based on their standardized scores of achievements and well-being, which were HH (high achievement and well-being), HL (high achievement with low well-being), LH (low achievement with high well-being) and LL (low achievement and well-being). The results of multinomial logistic regression analysis models respectively showed that: (1) cooperative climate, parental support, and hope of success positively predicted HH, and competitive climate and fear of failure positively predicted HL; (2) cooperative climate, parental support, teacher support, and mastery goals positively predicted LH, and fear of failure positively predicted LL. Based on the effects of these factors on well-being, they could be classified into four types: sufficient factors (cooperative climate, parental support, and fear of failure), which referring to those factors that have a decisive effect on students' subjective well-being regardless of their achievement; conditional factors (competitive climate) which denoting factors that elicit varying effects on the subjective well-being of different student groups based on their academic achievement; congruent factors (parental support and teacher support, performance goals and mastery goals) are defined as factors that fall under different dimensions within a single variable and exhibit a consistent directional effect on the subjective well-being of all students; and incongruent factors (fear of failure and hope of success) are defined as factors that belong to different dimensions of a variable and exhibit opposing effects on the subjective well-being. The results implicated the educators that a cooperative climate, supportive parent-child relationships, and avoidance focusing on failure were always needed to enhance students' subjective well-being despite their achievement, as well as provide more teacher support and encourage mastering the current contents in low-achieving students, and advocate the pursuit of success rather than overemphasizing competition in high-achieving students.

父母童年期创伤与父母养育行为的主客体互倚模型：对儿童问题行为的影响

井迪 [1,2] 程南华 [1,2] 王争艳 [1,2*]

[1] 北京市“学习与认知”重点实验室，首都师范大学心理学院，北京，100048

[2] 首都师范大学儿童发展研究中心，北京，100048

*Email：wangzhengyan@cnu.edu.cn

摘 要 父母童年期创伤是指父母在 18 岁以前经历过任何形式的身体虐待、性虐待、情感虐待以及身体忽视和情感忽视，这些经历以不同方式不同程度地影响着个体的身心健康水平发展，甚至可能存在着代际效应，增大子代患得精神健康疾病的风险。然而以往研究大多仅考察母亲的创伤经历及其影响，而未有研究从家庭视角更加全面地探讨父母双方童年期创伤经历对儿童问题行为的作用及行为机制。本研究基于暴力循环假说和社会学习理论，采用一项纵向的追踪研究设计，在 T1（儿童 9 岁）时收集儿童父亲和母亲的童年期创伤与养育行为数据，T2（儿童 11 岁）时测量儿童的内外化问题，构建主客体互倚模型阐释家庭内父亲与母亲的创伤经历对其自身和对方养育行为的作用，并通过设立中介模型进一步探究父母养育行为在父母童年期创伤与儿童问题行为间的中介作用。结果发现，（1）无论父亲还是母亲，童年期经历创伤越多，越有可能对孩子实施更加消极的养育方式；（2）母亲的积极养育行为可以被父亲童年期经历的创伤所影响，即父亲创伤经历越严重，母亲积极养育行为越少；父亲童年期创伤则可能在更大程度上预测着其自身消极养育行为的增加；（3）父亲的消极养育行为可以在父亲童年期创伤经历与儿童外化问题之间起到一定的中介作用。本研究的深入开展进一步表明了影响儿童发育的父母和家庭因素，也为对儿童问题行为进行有效地早期干预和预防提供了信息和支持。

Actor-partner interdependence model of parental childhood trauma and parenting: the impact on children's problem behavior

Jing Di[1,2], Cheng Nanhua[1,2], Wang Zhengyan[1,2]

[1] Beijing Key Laboratory of Learning and Cognition, School of Psychology, Capital Normal University, Beijing, 100048

[2] Child Development Research Center, Capital Normal University, Beijing, 100048

Abstract: Childhood trauma refers to any form of physical abuse, sexual abuse, emotional abuse, physical neglect and emotional neglect experienced by parents before the age of 18. These experiences affect the development of an individual's physical and mental health in different ways, and may even have intergenerational effects, increasing the risk of mental health disorders in the children. However, most of the previous studies only examined the traumatic experiences of mothers and their effects, but no studies have explored the effects and behavioral mechanisms of both parents' childhood traumatic experiences on children's problem behaviors from a family perspective. Based on the violence cycle hypothesis and social learning theory, this study adopted a longitudinal follow-up design to collect data on childhood trauma and parenting behaviors of fathers and mothers at T1 (children aged 9 years), and to measure children's externalization problems at T2 (children aged 11 years). A

actor-partner interdependence model is constructed to explain the effects of traumatic experiences of fathers and mothers on their own and each other's parenting behaviors, and the mediating role of parenting behaviors between parents' childhood trauma and children's problematic behaviors is further explored through the establishment of a mediating model. The results showed that: (1) The more childhood trauma experienced by both mothers and fathers, the more likely they were to adopt more negative parenting styles; (2) The mother's positive parenting behavior can be affected by the father's childhood trauma, that is, the more severe the father's traumatic experience, the less the mother's positive parenting behavior; Fathers' childhood trauma may predict their own negative parenting behavior to a greater extent. (3) Fathers' negative parenting behaviors may play a certain mediating role between fathers' childhood traumatic experiences and children's externalization problems. The in-depth development of this study further indicates the parental and family factors that affect children's development, and also provides information and support for effective early intervention and prevention of children's problem behaviors.

越富有越大方？相对财富在儿童公平分配决策中的作用

彭清蜂[1] 李红[1]（通讯作者）

1 华南师范大学心理学院，广州，510630, lihong_psych@m.scnu.edu.cn

摘 要 资源的分配公平性是儿童在幼儿时期遇到的一个重要的道德问题。在公平分配的依据当中，按需求（Need）分配原则是常见的公平原则之一，指的是在资源不平等情境中，将资源分配给更有需要的个体。尽管许多研究表明，儿童在进行资源分配时能关注到资源贫乏的个体，但较少研究探究了当儿童自己也处于预先存在的资源不平等情境中，儿童会如何做出分配决策。本研究旨在探讨资源不平等背景下个人相对资源的优劣势对儿童分配决策的影响。具体而言，本研究探究被试在操纵的经济不平等的背景下，个体财富相对优势或者劣势如何影响儿童的公平分配决策。181 名 6-8 儿童(50.8%为女性)通过实验操纵下变成资源优势个体（富人）或资源劣势个体（穷人），然后作为分配者对不同的分配对象（富人，穷人）进行第一方（涉及自我利益）或是第三方（不涉及自我利益）资源分配任务。研究结果表明：（1）分配者与分配对象间的相对财富会影响儿童的资源分配策略选择，富人身份时，面对穷人接受者时，儿童会更多选择按需分配，将更多的资源分配给穷人接受者，在穷人身份面对富人接受者时，则更多的采用多分给自己或者平均分配的策略；（2）当遇到相同身份的接受者时（富人-富人，穷人-穷人），在涉及自我利益的情况下，大部分儿童富人身份下选择平均分配，穷人身份下选择自利分配；（3）即使不涉及自我利益的第三方分配，相对优势的资源背景下的儿童，仍然更倾向于按需分配；（4）6-8 岁儿童之间的分配决策存在显著差异，无论是涉及到自我利益，8 岁在富人时相较于 6-7 岁儿童更倾向于按需求进行分配，而 6 岁和 7 岁的儿童则倾向于平均分配或是自利分配。研究提示在实验操纵下，处于富有身份下的儿童更加愿意按需分配，将更多的资源分配给资源相较少于自己的接受者，并且这种趋势随着年龄的发展而增长。这些发现对于理解儿童在不同情境下分配决策的影响具有重要的理论意义。

Wealth promotes generosity? The role of relative wealth in children's fairness allocation decisions

Qingfeng Peng[1], Hong Li[1]

School of psychology, South China Normal University, Guangzhou

***Abstract*:** The fair distribution of resources is a crucial moral issue faced by children during their early childhood. Among various fairness principles, the principle of need-based allocation is commonly observed, which entails distributing resources to individuals with greater needs in situations of resource inequality. Although existing research indicates that children show concern for individuals experiencing resource scarcity during resource allocation, limited research has investigated how children make allocation decisions when they themselves are placed in pre-existing contexts of resource inequality. Thus, this study aims to investigate the influence of relative resource advantages or disadvantages on children's allocation decisions within the context of resource inequality. Specifically, the study examines how individual wealth relative to others, manipulated through economic inequality, affects children's allocation decisions. A total of 181 children aged 6-8 (50.8% female) were assigned either the role of resource-advantaged individuals (rich) or resource-disadvantaged individuals (poor) through experimental manipulation. They were then tasked as allocators to distribute resources to different recipients (rich or poor) in both first-party (involving self-interest) and third-party (not involving self-interest) allocation tasks. The findings reveal the following: (1) The relative wealth between allocators and recipients significantly impacts children's resource allocation strategies. When assuming an advantage status, children tend to prioritize need-based allocation, allocating more resources to poor recipients. Conversely, when assuming a disadvantage status and facing wealthy recipients, children tend to adopt strategies such as allocating more resources to themselves or making equal distributions. (2) In situations involving self-interest and encounters with recipients of the same identity (rich-to-rich, poor-to-poor), most children exhibit a preference for equal distribution in the rich condition and self-interested allocation in the poor condition. (3) Even in third-party allocations where self-interest is not involved, children from relatively wealthy economic backgrounds still demonstrate a tendency to favor need-based allocation. (4) Notable differences exist in allocation decisions among children aged 6-8. Regarding self-interest, 8-year-olds, compared to 6-7-year-olds, exhibit a stronger inclination towards need-based allocation when assuming a rich identity, while 6-7-year-olds tend to prefer equal distribution or self-interested allocation. This study's findings provide valuable insights into the influence of resource inequality on children's allocation decisions across various contexts.

摘 要 孤独症谱系障碍(Autism Spectrum Disorder, ASD)是一种发展性神经发育障碍，核心特征为社交沟通障碍、重复刻板行为和限制性兴趣。同步是社会互动协调中的一种重要机制，对人们的社交沟通和人际关系产生重要影响。孤独症儿童感知运动同步的变异性较大，且在人际运动同步过程中自发同步的水平较低，可能对他们社会认知的发展产生不利影响。但目前孤独症儿童感知运动同步的相关研究较少，其同步表现的影响因素和背后的认知过程还不清楚。因此，本研究以孤独症儿童的感知运动同步为主题，探究影响孤独症儿童同步表现的三大因素。

实验 1 以手指按键敲击为实验范式，探究声音刺激时间间隔的长短对孤独症儿童感知运动同步的影响。选取了 21 名 5-8 岁的孤独症儿童和 21 名匹配的正常儿童，探讨时间间隔的长短对孤独症儿童同步运动的影响。实验 2 在实验 1 的基础上增加了视觉刺激，探究多感觉整合对孤独症儿童运动同步的影响，比较了

单通道和视听双通道条件下孤独症儿童的同步表现。实验 3 增加了社会性刺激线索，探究了社会性和非社会性刺激对孤独症儿童运动同步的影响。

结果表明：（1）孤独症儿童的同步稳定性显著低于正常儿童，时间间隔会进一步放大这种差异。这说明节奏刺激的时间间隔会影响孤独症儿童的感知运动同步，时间间隔越长，孤独症儿童的同步越困难。（2）多感觉整合对孤独症和正常儿童的运动同步都有促进作用。（3）相较于社会性刺激，非社会性刺激对两组儿童同步表现的促进作用更大。这可能给是因为实验操作条件中拟人化的机器人 NAO 更能激发两组儿童的内在动机。

本研究发现时间间隔、多感觉整合、（非）社会性刺激三种因素都会影响孤独症儿童的同步表现。时间间隔越长，孤独症儿童的同步越困难；多感觉整合对孤独症儿童的同步有促进作用；相较于社会性刺激，非社会性刺激对孤独症儿童的同步表现促进作用更大。该结果对我们更好的理解孤独症儿童感知运动同步的认知过程有重要帮助，对未来的干预训练也有重要意义。

Influencing Factors of Sensorimotor Synchronization in Children with Autism Spectrum Disorder

Linlin Zhang[1.2], Wenlu Zhao[1.2], Jing Li[1.2]

1. CAS Key Laboratory of Behavioral Science, Institute of Psychology, Chinese Academy of Sciences, Beijing 100101

2. Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049

Abstract：Autism Spectrum Disorder (ASD) is a developmental disability, characterized by social impairments, repetitive behaviors，and restricted interests. Synchronization is an important mechanism in the coordination of social interaction, which has an important impact on social communication and interpersonal relationships. Many studies have shown that children with autism have greater variability in sensorimotor synchronization, and the level of spontaneous synchronization in the process of interpersonal motor synchronization is low. Above symptoms may adversely affect the development of their social cognition abilities. However, there are relatively few studies on sensorimotor synchronization in children with autism, and the influencing factors behind their synchronization performance are still unclear. Therefore, this study focused on the sensorimotor synchronization of children with autism, and explored three potential factors that affect the synchronization performance among children with autism.

Experiment 1 used tapping as the experimental paradigm to explore the effect of the length of the sound stimulation time interval on the sensorimotor synchronization in children with autism. We selected 21 autistic children ages between 5-8 years and 21 typically developing children to explore the influence of the inter-stimulus interval on autistic children's performances. Experiment 2 added visual stimuli on the basis of Experiment 1, to explore the influence of multi-sensory integration on sensorimotor synchronization of children with autism, and compared the performance of children with autism under two conditions of single channel and audio-visual double channels. Experiment 3 added social stimulus cues to explore the influence of social stimulus and non-social stimulus on the synchronization performance of children with autism.

The main results of this paper: (1) The stability of synchronization in autistic children is significantly lower than typically developing children, and the time interval will further amplify this difference. (2) Multi-sensory integration can promote the performance of two groups. (3) Compared with social stimulation, non-social

stimulation has a greater effect on the performance of the two groups of children. This may be because the anthropomorphic robot NAO can stimulate the intrinsic motivation of the two groups.

These results indicate that three factors: inter-stimuli interval, multi-sensory integration, and (non-)social stimulation, affect the synchronization performance of children with autism. The longer the inter-stimuli interval, the more difficult the synchronization of children with ASD; multi-sensory integration can promote the synchronization of children with ASD; compared with social stimulation, non-social stimulation has a greater role in promoting the synchronization performance of autistic children. The result are of great help for us to understand the cognitive factors of sensorimotor synchronization in children with autism, and provide significance contribution toward future intervention training.

贫困、执行功能和学业成就的关系：来自微观系统和宏观系统的证据

胡琼[1] 张琼[1]（通讯作者）

1 浙江大学心理与行为科学系，杭州，310058，zhangqiongzgh@zju.edu.cn

摘 要 发展缺陷理论认为，家庭社会经济地位较低的儿童学业成就更低。研究者进一步探讨内部的认知机制，发现执行功能作为经济水平的产物，可以成为其影响学业成就的中介机制；但另一方面，根据个体-环境交互框架，个体因素和环境因素会相互作用来影响儿童的发展。因此，执行功能作为一种基本的认知能力，也可能作为一种缓冲机制来调节环境与学业成就的关系。然而，目前并未见实证研究支持执行功能的双重作用。因此，本文从微观系统和宏观系统的角度进行了两项研究和分析，探讨执行功能在贫困与学业成就关系中的中介和调节作用。在第一项研究中，我们从中国大陆招募了 84 名五年级学生，并在实验背景下操纵了他们的经济水平。结果表明，“贫困”组的孩子比“富有”组的孩子表现出更低的执行功能和学业成就。此外，执行功能在实验操纵的贫困状态和学业成就之间起到了中介和调节作用。具体来说，贫困通过损害儿童的执行功能来进一步影响其学业成就；同时儿童自身的执行功能缓冲了贫困对学业成就造成的消极影响，即在执行功能水平较高的儿童中，贫困与学业成就之间的相关不显著。在第二项分析中，我们采用国际学生评估项目（PISA）中 15,542 名学生的数据，发现生活在较低经济水平地区（泰国）的儿童的执行功能和学业成就均低于较高经济水平地区的儿童。与研究一结果一致的是，执行功能也中介了经济水平和学生学业成就之间的联系，即经济水平越低的地区，其儿童执行功能也越低，从而学业表现也更差；同时，执行功能还调节了经济水平与学业成就的关系，即对于执行功能较高的儿童来说，经济水平对其学业成就的预测作用更弱。综上所述，该研究提供了微观和宏观的证据，在理论上进一步丰富了经济水平与儿童发展关系的内在机制研究，并强调了执行功能的双重作用；同时也为提高贫困儿童的学业成就提供了实践指导，即可以通过认知层面的干预增强执行功能，从而最终缩小学业成就的差距。

A Complex Interplay among the Poverty, Executive Function, and Children's Academic Achievement: Evidence from Microsystem and Macrosystem

Qiong Hu[1] Qiong Zhang[1]

1 Zhejiang University, Hangzhou, 310058, China

***Abstract*:** Developmental deficit theory suggests that poor children usually perform worse academically. Researchers have further explored the internal cognitive mechanisms, and they found that executive function (EF), as a product of economic level, might be a mediating role in its impact on academic achievement. On the other hand, the person-environmental interaction pattern framework posited that environmental factors interact with personal factors to affect children's development. Thus, as a basic cognitive ability, EF could also act as a buffering role to moderate the relation between environment and academic achievement. However, no empirical research has been investigating the dual roles of EF. Thus, to further examine the association among poverty, EF, and academic achievement, this article comprises two studies from the perspectives of both microsystem and macrosystem. In the first study, we recruited 84 fifth graders from mainland China and manipulated their poverty status in the experiment's context. The results indicated that children in the "poorer" group showed lower EF performance and academic achievement than their "richer" peers. Besides, EF mediated and moderated the relationship between experimental poverty and academic achievement. Specifically, manipulated economic level was positively associated with posttest EF, and posttest EF significantly predicted posttest academic achievement, after controlling for pretest EF and academic achievement. Moreover, the interaction between manipulated economic level and pretest EF was significant for posttest academic achievement, that is the relation between economic level and posttest academic achievement was significant for children with lower levels of pretest EF, but not for children with higher levels of pretest EF. In the second study, we analyzed the Programme in International Student Assessment (PISA) data with 15,542 students, and found that children living in Thailand performed worse in EF and academic achievement than children living in China (Taiwan). Moreover, the results supported the finding in study 1 by suggesting that EF also meditated and moderated the association between economic levels and academic achievement. To be specific, countries' economic levels were positively associated with EF, and EF significantly predicted academic achievement. Besides, the interaction between countries' economic levels and EF was significant for children's academic achievement, that is the economic level was a weaker predictor of academic achievement for children with lower levels of EF Taken together, these results provided micro- and macro-evidence that EF has dual effects in the link between economic levels and academic achievement. This has significant implications for supporting the optimal development of children in poverty and further highlights the importance of improving children's EF to reduce the negative effect of poverty on academic achievement.

专制教养亲子感知差异与儿童抑郁的关系：亲子沟通的中介作用

郑天鹏[1]　蒋柳青[1]　边玉芳[1,2]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

2 北京师范大学儿童家庭教育研究中心，北京，100875

摘 要　以往研究发现父母和子女在父母教养行为上的感知往往存在差异，这种亲子感知差异对于预测儿童的发展有着重要意义。受到中国传统文化和教养观念的影响，中国父母的专制教养表现出不同于西方的特点和作用，中国父母专制教养的亲子感知差异的特点和作用也可能表现出一定的文化特异性，因此探究中国背景下专制教养的亲子感知差异的特点及作用具有重要意义。然而以往对于中国父母专制教养的亲子感知差异的研究有限，且仅以母亲为研究对象，缺乏对于父亲探讨，忽视了家庭的整体性和不同性别亲子组合之间的差异。此外，以往研究多探讨亲子感知差异对儿童抑郁的影响，但对其内部的作用机制关注较少。因此，本研究以北京和海口的 2443 个家庭的儿童及其父母为研究对象(儿童年龄为 12.64 ± 0.23 岁，其

中男生 1236 名)，以专制教养问卷、儿童抑郁量表和亲子沟通量表为研究工具，基于潜在差异分数建模和结构方程模型探究专制教养亲子感知差异与儿童抑郁的关系，以及亲子沟通在其中的中介作用，并进一步考察儿童性别在其中的作用。结果表明：(1) 父亲和母亲感知到的自身专制教养水平均高于儿童感知；(2) 父亲与子女在专制教养上的感知差异分数能够直接预测儿童抑郁 ($\beta = 0.11$, $p < .001$, 95% CI [0.053, 0.162])，而母亲与子女在专制教养上的感知差异分数无法显著预测儿童抑郁；(3) 父亲与子女在专制教养上的感知差异分数既能够通过父子沟通影响儿童抑郁 ($\beta = 0.08$, $p < .001$, 95% CI [0.049, 0.119])，也能够通过母子沟通影响儿童抑郁 ($\beta = 0.02$, $p < .001$, 95% CI [0.003, 0.033])；(4) 母亲与子女在专制教养上的感知差异分数既能够通过母子沟通影响儿童抑郁 ($\beta = 0.07$, $p < .001$, 95% CI [0.034, 0.107])，也能够通过父子沟通影响儿童抑郁 ($\beta = 0.03$, $p < .01$, 95% CI [0.006, 0.043])；(5) 在专制教养亲子感知差异通过亲子沟通影响儿童抑郁的路径中不存在显著的儿童性别差异。研究丰富了中国文化背景下对于专制教养亲子感知差异的认识，并探讨了其与儿童抑郁的影响机制，更能够为促进我国儿童青少年积极健康成长提供独特的干预视角。

Associations among Parent-Child Discrepancies in Perceived Authoritarian Parenting, and Children' Depressive Symptoms: Mediating Role of Parent-Child Communication

Tianpeng Zheng[1], Liuqing Jiang[1], Yufang BIAN[1,2](corresponding author)

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing

2 Child and Family Education Research Center, Beijing Normal University, Beijing

Abstract：Previous studies have found discrepancies in the perception of parenting between parents and children. Exploring the characteristics and effects of the parent-child discrepancies in perceived authoritarian parenting within the Chinese cultural context is of great significance. However, previous researches have been limited and focused only on mothers, neglecting the holistic nature of the family and the differences between different gender combinations of parent-child relationships. Furthermore, previous studies have mainly examined the impact of parent-child discrepancies in perceived parenting on children's depressive symptoms, with less focus on the underlying mechanisms. In this study, 2,443 children and their parents were recruited from Beijing and Haikou. Based on latent difference score modeling method, this study examined the relationship between parent-child discrepancies in perceived authoritarian parenting and children's depressive symptoms, and analyzed the mediating effect of parent-child and also examine the gender differences. Additionally, the study examined the role of child gender in these relationships. Results indicated that: (1) both fathers and mothers perceived their own levels of authoritarian parenting to be higher than the children's perceptions; (2) only father-child latent discrepancy scores of authoritarian parenting ($\beta = 0.11$, $p < .001$, 95% CI [0.053, 0.162]), not mother-child latent discrepancy scores, significantly positively predicted children's depressive symptoms; (3) father-child latent discrepancy scores of authoritarian parenting not only affect children's depressive symptoms through father-child communication ($\beta = 0.08$, $p < .001$, 95% CI [0.049, 0.119]), but also influence children's depressive symptoms through mother-child communication ($\beta = 0.02$, $p < .001$, 95% CI [0.003, 0.033]); (4) mother-child latent discrepancy scores of authoritarian parenting not only affect children's depressive symptoms through mother-child communication ($\beta = 0.07$, $p < .001$, 95% CI [0.034, 0.107]), but also influence children's

depressive symptoms through father-child communication (β = 0.03, p < .01, 95% CI [0.006, 0.043]); (5) children gender was not a moderator that altered the relationships between parent-child discrepancies in perceived authoritarian parenting, and children's depressive symptom via parent-child communication. This study enriches our understanding of the parent-child discrepancies in perceived authoritarian parenting within the Chinese cultural context and explores the mechanisms through which these discrepancies affect child depression. It provides a unique perspective for promoting the positive and healthy development of Chinese children.

童年期社会经济地位对心理贫穷感的影响：未来取向的干预作用

曹邵琪 刘爱书（通讯作者）

哈尔滨师范大学教育科学学院，哈尔滨，150025，liuaishu@163.com

摘 要 目的：考察低童年期社会经济地位个体的心理贫穷感，以及未来取向在其中的作用。方法：本研究采用问卷与实验相结合的方法，第一部分采用童年期社会经济地位问卷、心理贫穷感问卷以及未来取向问卷考察个体童年期社会经济地位对心理贫穷感的影响及未来取向的调节作用。第二部分通过词汇决策任务考察童年期社会经济地位对心理贫穷感的影响，并通过书写任务唤起被试的未来取向，进而考察未来取向在低童年期社会经济地位对心理贫穷感产生影响的机制中所起的干预作用。结果：通过问卷研究发现童年期社会经济地位对心理贫穷感有负向预测作用，未来取向在童年期社会经济地位和心理贫穷感间起调节作用。通过实验发现，在唤起未来取向前，低社会经济地位组对贫困相关词的反应时快于中性词，高社会经济地位组对贫困相关词和中性词的反应时没有显著差异，在唤起未来取向后，低社会经济地位组在贫困相关词和中性词直接的反应时没有显著差异，高社会经济地位组对贫困词的反应时间快于中性词。即低童年期社会经济地位组对贫困词的反应时间更短，且唤起未来取向有助于缓解该差异。结论：相较于高童年期社会经济地位个体，低童年期社会经济地位个体的心理贫穷感水平较高，唤起未来取向有助于缓解其心理贫穷感。

The impact of childhood socioeconomic status on the sense of psychological poverty: the intervention role of future orientation

Cao Shaoqi, Liu Aishu

Harbin Normal University, Harbin

Abstract: Purpose: To investigate the psychological poverty of individuals with low childhood socioeconomic status and the role of future orientation. Method: This study used a combination of questionnaire and experiment methods. In the first part, a childhood socioeconomic status questionnaire, a psychological poverty questionnaire, and a future orientation questionnaire were used to examine the impact of childhood socioeconomic status on psychological poverty and the moderating effect of future orientation. In the second part, a vocabulary decision task was used to examine the effect of childhood socioeconomic status on psychological poverty, and a writing task was used to evoke the participants' future orientation to explore the intervention effect of future orientation on the mechanism of the impact of childhood socioeconomic status on psychological poverty. Results: The questionnaire study found that childhood socioeconomic status had a negative predictive effect on psychological poverty, and future orientation played a moderating role between childhood socioeconomic status and

psychological poverty. The experimental study found that before evoking future orientation, the low socioeconomic status group responded faster to poverty-related words than neutral words, while the high socioeconomic status group showed no significant difference in response time. After evoking future orientation, there was no significant difference in response time between the low socioeconomic status group and the high socioeconomic status group in response to poverty-related and neutral words, and the high socioeconomic status group responded faster to poverty-related words than neutral words. In conclusion, individuals with low childhood socioeconomic status have a higher level of psychological poverty than those with high childhood socioeconomic status, and evoking future orientation can help alleviate their psychological poverty.

Intergenerational Transmission Mechanism of Smartphone Addiction :Chain Mediation of Basic Psychological Needs and Psychological Inflexibility

Bao Lingling, Zhang Ruoyao, Zhu Congshu

College of Education and Physical Education, Yangtze University，Jingzhou 434022，China

Abstract : **Objective:** To explore the impact of parental smartphone addiction on middle school students' smartphone addiction, as well as the chain mediating role of basic psychological needs and psychological inflexibility. **Methods:** A survey was conducted on 500 middle school students using the Smartphone Addiction Scale, Basic Psychological Needs Scale, and Psychological Inflexibility Scale. 461 valid questionnaires were collected. **Results:** ①Parents' smartphone addiction (r=0.173, p<0.01), basic psychological needs (r=-0.251, p<0.01), and psychological inflexibility (r=0.360, p<0.01) are significantly correlated with smartphone addiction

in middle school students. ② The chain mediating effect analysis shows that parents' smartphone addiction can not only directly affect middle school students' smartphone addiction, but also indirectly affect it through two paths: the mediation of basic psychological needs and the chain mediation of basic psychological needs and psychological inflexibility. The mediating effect accounts for 9.78% and 8.97% of the total effect respectively. **Conclusion:** This study reveals the Intergenerational Transitive Mechanism between parents' smartphone addiction and middle school students' smartphone addiction. Parental smartphone addiction can not only directly predict middle school students' smartphone addiction, but also have an impact through the independent mediating effect of basic psychological needs and the chain mediating effect of basic psychological needs and psychological inflexibility.

青少年成就目标和学业表现的关系类型对其学业投入的纵向影响：父母学业压力的调节作用

张云运[1]（通讯作者） 高淇[2] 周雨锴[1] 杨洋[1] 张李斌[1]

1 北京师范大学，中国基础教育质量监测协同创新中心，北京，yyzhangff@126.com

2 海军军医大学心理系精神医学教研室，上海，200433

摘 要 大量研究证实成就目标取向与学业表现显著相关，但以往基于多重目标模型的研究大多聚焦于成就目标取向的亚组分析，忽略了成就目标与学业表现的紧密关系。同时，多数研究支持父母学业压力对学生学业投入存在消极影响，但也有研究认为适度的父母学业压力可以促进个体的学业投入。为进一步澄清青少年中成就目标取向和学业表现的关系类型，探讨外源性的父母压力对青少年学业投入的影响，本研究选取 2378 名初中生（平均年龄为 13.41±0.62 岁，男生占比 49%），采用潜类别分析技术探究青少年成就目标取向和学业表现的特征模式，通过为期 6 个月的追踪调查（T1 为 7 年级下学期末，T2 为 8 年级上学期末），探讨不同亚组类型与青少年学业行为投入和情感投入的纵向关联，以及父母学业压力的调节作用。结果发现：（1）初中生成就目标取向和学业表现可分为 3 个亚群组：高掌握目标-低表现取向-高学业表现组（20.1%）、高掌握目标-高表现取向-中学业表现组（64.4%）、低掌握目标-低表现取向-低学业表现组（15.5%）；（2）在控制了年龄和性别之后，与低掌握目标-低表现取向-低学业表现组相比，T1 的高掌握目标-低表现取向-高学业表现组和高掌握目标-高表现取向-中学业表现组能显著正向预测 T2 的学业行为投入和情感投入；（3）父母学业压力越大，T1 的高掌握目标-低表现取向-高学业表现组和高掌握目标-高表现取向-中学业表现组在 T2 的学业行为投入越低，T1 的高掌握目标-高表现取向-中学业表现组在 T2 的情绪投入越低，而 T1 的高掌握目标-低表现取向-高学业表现组在 T2 的情绪投入水平不受父母学业压力的调节。本研究从群体异质性视角出发，证实父母学业压力对不同类型学生学业投入的影响存在差异，为从家庭层面减少青少年学业投入的消极影响因素提供了参考。

Longitudinal effects of the relationship subgroups of adolescents' achievement goal orientation and academic performance on their

academic engagement: The moderating role of parental academic pressure

ZHANG Yun-yun[1](Corresponding author), GAO Qi[2], ZHOU Yu-kai[1], YANG Yang[1], ZHANG Li-bin[1]

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, 100875

2 Department of Psychiatry, Faculty of Psychology, Naval Medical University, Shanghai, 200433

Abstract: Previous studies have confirmed that achievement goal orientation is significantly related to academic performance, while most of which based on multiple goal modeling only focused on the subgroups of achievement goal orientation, ignoring the tight association between achievement goals and academic performance. Meanwhile, most studies supported that parental academic pressure had a negative effect on students' academic engagement, whereas some other studies reported that moderate parental academic pressure promoted adolescents' academic engagement. To further clarify the relationship groups of achievement goal orientation and academic performance among adolescents, and to explore the effects of exogenous parental pressure on adolescents' academic engagement, this study selected 2378 junior high school students (mean age=13.41 ± 0.62 years, 49% boys) and used latent profile analysis to explore the patterns of adolescents' achievement goal orientation and academic performance based on a 6-month follow-up survey (T1 was the end of the second semester of grade 7 and T2 was the end of the first semester of grade 8), to explore the longitudinal associations between different subgroup types and adolescents' academic behavioral and emotional engagement, as well as the moderating role of parental academic pressure. The results showed that (1) junior high school students' achievement goal and academic performance could be categorized into three subgroups: high mastery -low performance -high academic performance group (20.1%), high mastery -high performance -moderate academic performance group (64.4%), and low mastery -low performance -low academic performance group (15.5%); (2) compared to the low mastery -low performance -low academic performance students, the high mastery -low performance -high academic performance students and the high mastery -high performance orientation-moderate academic performance students in T1 were more likely to report high levels of academic behavioral and emotional engagement in T2, controlling for age and gender; (3) the greater the parental academic pressure, the lower the academic behavioral engagement in T2 of the high mastery -low performance -high academic performance group and the high mastery -high performance -medium academic performance group in T1, and the lower emotional engagement in T2 of the high mastery -high performance -medium academic performance group in T1, whereas high mastery -low performance -high academic performance group's level of emotional engagement in T2 was not moderated by parental academic pressure. From the perspective of heterogeneity, this study confirmed that there were differences in the effects of parental academic pressure on the academic engagement of different type students, which provided a reference for reducing the negative influences on adolescents' academic engagement at the family level.

2.5-6.5 岁幼儿工作记忆刷新能力的发展

刘格格[1]　李富洪[2]（通讯作者）
1 江西师范大学心理学院，南昌，330022
2 江西师范大学心理学院，南昌，330022，lifuhong@jxnu.edu.cn

摘 要　人类生活在动态而复杂的环境中，人们必须不断记住新的环境信息来替代旧的信息以适应不断变化的生存环境，这对成人来说是相对简单的，但对于年幼的儿童来说却是具有挑战性的。他们需要依靠工作记忆存储来自环境的信息，并随着环境的变化不断刷新这些存储的表征。那么，幼儿工作记忆刷新能力有怎样的发展特点呢？本研究以测量成人刷新能力的 n-back 任务为背景，设计了适合测量学龄前儿童刷新能力的玩具交换任务，测量了 386 名 2 岁半-6 岁半幼儿(女孩 179 名)的工作记忆刷新能力。研究分为两个实验，实验一选取了 177 名 2 岁半-5 岁半幼儿，被试在玩具交换游戏中会看到不同玩具依次放入玩具交换屋后被遮挡，幼儿需要不断刷新玩具的信息并依次回忆每轮交换后可以得到的玩具(即曾经放进玩具交换屋的玩具)，游戏有两个难度，若当前为第 n 个试次，难度一为被试需要回忆第 n-1 个试次放入的玩具，难度二为回忆 n-2 个试次放入的玩具。结果发现，随着年龄的增长，幼儿在玩具交换任务中的正确率不断提高，且在每半岁间有显著差异；2 岁半-3 岁和 4 岁半-5 岁儿童在难度一中的正确率显著低于其在难度二中的正确率，但其他年龄段儿童在两难度中的正确率并无显著差异(即未表现出负荷效应)。分析其原因可能是难度二中考虑到被试年龄较小，所以在 n-1 个试次时设置了半透明窗口提示其上一个试次(即 n-2 试次)的玩具信息，因此，儿童在第 n 个试次回忆时难度有所降低。故实验二将该提示窗口关闭，选取 209 名 3 岁半-6 岁半幼儿，测量其在不同难度下的刷新表现。结果发现，随年龄增长，儿童的正确率不断提高，且除 5 岁-6 岁外其余年龄儿童均在半岁间有显著差异；3 岁半-6 岁半儿童在难度二中的正确率均显著低于其在难度一中的正确率，即表现出负荷效应。研究表明，儿童工作记忆刷新的能力在各个年龄段都有显著发展。刷新会对工作记忆存储造成影响，但提示线索会大大降低这种影响。本研究结果为儿童早期工作记忆的刷新和储存的发展轨迹提供了新的证据。

The development of working memory updating in 2.5-6.5 years old preschoolers

Liu Gege[1] Li Fuhong[2](Corresponding author)
1 college of psychology, jiangxi normal university, nanchang, China, 330022
2 college of psychology, jiangxi normal university, nanchang, China, lifuhong@jxnu.edu.cn

Abstract：　Humans live in a dynamic and complex environment, and people must constantly remember new environmental information to replace old information to adapt to the changing living environment, which is relatively simple for adults, but challenging for young children. They need to rely on working memory to store information from the environment and constantly update these stored representations as the environment changes. Based on the n-back task, which measures the updating ability of adults, this study designed a toy exchange task suitable for measuring the updating ability of preschool children. A total of 386 children aged 2 and a half years old to 6 and a half years old preschoolers(179 girls) were selected to measure their working memory updating ability. The study was divided into two experiments. In experiment 1, 177 children aged from 2.5 to 5.5 years old were selected. In the toy exchange game, the subjects would see that different toys were shielded after being put into the toy exchange house successively. Children need to constantly updating the toys information and successively recall the toys available after each round of exchange (that is, the toys that have been placed in the toy exchange house). The game has two difficulties, if the current is the n trial, difficulty 1 is that the participant needs

to recall the toy put in the n-1 trial, difficulty 2 is that the toy put in the n-2 trial. The results showed that with the increase of age, children's accuracy in the toy exchange task increased continuously, and there was a significant difference between every half year. The accuracy of children aged 2.5-3 years old and 4.5-5 years old in difficulty 1 is significantly lower than that of children in difficulty 2. However, there was no significant difference in the accuracy of children of other ages in the two difficulties (that is, no load effect was shown). The reason may be that in difficulty 2, considering the younger age of the subject, a semi-transparent window was set at n-1 trail to remind the toy information of the previous try (that is, n-2 trail). So the difficulty of the children's recall at the n trail was reduced. Therefore, in experiment 2, the prompt window was closed. And 209 children aged 3.5 to 6.5 were selected to measure their updating performance under different difficulties. The results showed that with the increase of age, the accuracy of children increased continuously, and except for 5-6 years old, there were significant differences between the ages of half a year. The accuracy of children aged 3.5-6.5 years in difficulty 2 is significantly lower than that in difficulty 1, that is, it shows the load effect. We found that children's working memory updating develops significantly at all ages. Updating have an impact on working memory storage, but referential cues greatly reduce this impact. The results of this study provide new evidence for the developmental trajectory of updating and storage of working memory in early childhood.

青少年早期内外化问题 p 因素和独特因素的发展稳定性及内在机制

马玉鑫[1] 张良[1] 纪林芹[1] 张文新[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，zhangwenxin@sdnu.edu.cn

摘 要　近十年来，p 因素理论被广泛应用于研究儿童青少年内外化问题的共发现象。p 因素代表个体产生心理病理问题的一般倾向性，内化和外化独特因素代表两类问题在共同因素之外的独特成分。当下对 p 因素以及内外化问题独特因素发展特点的关注相对较少。根据已有模型，p 因素及外化和外化独特因素可能存在发展变化性：据“动态相互作用（dynamic mutualism）”模型，内外化问题在发展过程中相互影响、彼此增强，表现为 p 因素的相对强度增大；而“p-分化（p-differentiation）”模型则认为，在发展过程中，一般性的 p 因素特异化增强，表现为内化或外化独特因素的相对强度增大。为检验这心理病理问题一般与独特因素的发展特点，本研究考察了青少年早期内外化问题的发展稳定性和连续性，采用家长报告的行为核查量表（Child Behavior Check List，CBCL）对 1754 名 6 年级学生进行为期 3 年的追踪研究，以共同方差解释率（Explained Common Variance，EVC）为指标考察各因素的发展稳定性，并进一步采用交叉滞后模型考察发展过程中各因素的相互作用机制。结果发现：（1）各因素的 EVC 值在发展过程中较为稳定，其中 p 因素相比于内外化问题独特因素解释了更多的共同方差（61.5%-66.4%）。（2）T1 的 p 因素和内化问题独特因素显著预测 T2 的外化问题独特因素，T1 的内化问题独特因素显著预测 T2 的 p 因素，p 因素和外化问题独特因素在 T2 和 T3 存在双向正向预测作用，外化问题独特因素和内化问题独特因素在 T2 和 T3 存在双向负向预测作用。研究结果既支持“动态相互作用”模型也支持“p 分化”模型，表明在发展过程中，内外化问题的各因素在同质性发展和异质性发展作用下形成动态平衡，使各因素呈现发展稳定性。

Developmental Stability and Internal Mechanisms of p Factor

and Specific Factors in Early Adolescence Internalizing and Externalizing Problems

MA Yuxin, ZHANG Liang, JI linqin ZHANG Wenxin
School of Psychology, Shandong Normal University, Jinan 250014

Abstract: In the last decade, p-factor theory has been widely used to study the co-occurring of internalizing and externalizing problems in children and adolescents. The p factor represents the general propensity of individuals to develop psychopathological problems, and the specific internalizing and externalizing factors represent the specifical components of the two types of problems beyond the common factors. Relatively little attention has been paid to the developmental stability of p factor and specific factors of internalizing and externalizing problems. According to the models, there may be developmental variability in the p factor and the specific factors of internalizing and externalizing problems: according to the "dynamic mutualism" model, the internalizing and externalizing problems interact and reinforce each other during the developmental process, which is manifested in an increase in the relative strength of the p factor, while the "p-differentiation" model suggests that the general p factor specialization increases during the developmental process, which is manifested in an increase in the relative strength of the specific internalizing and externalizing factors. To examine the developmental characteristics of this general and specific factors of psychopathological problems, this study examined the developmental stability and continuity of internalizing and externalizing problems in early adolescence by using the parent-reported Children's Behavior Checklist (CBCL) to follow up on 1,754 6th grade students over a period of 3 years, the Explained Common Variance (EVC) was used as an indicator to examine the developmental stability of the factors, and cross-lagged modeling was further used to examine the interaction mechanism of the factors during the developmental process. The results found that (1) the EVC values of the factors were more stable over the course of development, with the p factor explaining more of the common variance (61.5%-66.4%) compared to the specific factors. (2) The specific internalizing factor in T1 significantly predicted the p factor in T2, the p factor and the specific internalizing factor in T1 significantly predicted the specific externalizing factor in T2, there was a bi-directional positive predictive effect between the p factor and the specific externalizing factor in T2 and T3, and there was a bi-directional negative predictive effect between the specific externalizing factor and the specific internalizing factor in T2 and T3. The results of the study support both the "dynamic mutualism" model and the "p-differentiation" model, indicating that in the process of development, the factors of internalizing and externalizing problems form a dynamic equilibrium under the effect of homogeneous and heterogeneous development, so that the factors show developmental stability.

父母科技干扰通过亲子亲密度纵向预测儿童注意控制

方心雨　贾翰琳　杨晓辉（通讯作者）
陕西师范大学心理学院，西安，710062，yangxiaohui@snnu.edu.cn

摘　要　科技干扰是指在日常生活和他人互动过程中被电子设备打断或侵扰的现象。个体内反应时变异（Intraindividual Reaction Time Variability，IIRTV）是注意或认知控制的重要指标。个体内反应时变异得分越高，表明儿童的注意控制或注意的稳定性越差。IIRTV 可能是多种神经疾病(如 ADHD)的重要生物标记。已有研究表明科技干扰对儿童的问题行为、执行功能以及网络成瘾有密切关系，而这些认知和行为问题背后的重要基础就是儿童注意控制的发展。但是少有研究采用纵向设计关注科技干扰对儿童注意控制发展的影响效果及作用机制。因此，本研究采用为期两年（间隔一年）的纵向设计来探讨父母科技干扰对学龄前幼儿注意控制的影响以及亲子亲密度的中介作用。302 名 3~6 岁幼儿（$M_{年龄}$ = 4.7 岁，$SD_{年龄}$ = 0.55，其中女生 138 名）及其父母参与了本研究。在 T1 时刻，父母通过科技干扰量表和亲子关系量表报告他们在亲子互动中受到的科技干扰程度及其亲子关系质量；通过计算儿童在 Flanker 任务不一致试次内的反应时变异获得个体内反应时变异的指标。在 T2 时刻，再次通过 Flanker 任务收集儿童的 IIRTV 指标。研究结果发现：（1）T1 时刻内的父母科技干扰与亲子亲密度显著负相关；（2）T1 的亲子亲密度与儿童 T2 的 IIRTV 显著负相关；（3）在控制了儿童的性别和年龄以及 T1 的 IIRTV 水平之后，T1 亲子亲密度在 T1 科技干扰和 T2 的儿童 IIRTV 间起完全中介作用。本研究对于理解科技干扰对儿童认知发展的影响具有重要意义。

Parental Technoference Longitudinally Predicts Children's Attentional Control via Parent-Child Closeness

Xinyu Fang　Hanlin Jia　Xiaohui Yang (corresponding author)
Shaanxi Normal University, Affiliations School of Psychology, Xian, 710062,
yangxiaohui@snnu.edu.cn

Abstract: Technoference refers to the distraction, disruption, and interruption of interpersonal interactions caused by digital technology device use. Intraindividual Reaction Time Variability (IIRTV) is an indicator of attentional or cognitive control. Higher IIRTV indicate poorer attentional control or attentional stability in children. IIRTV was an important biomarker for a variety of neurological disorders (e.g. ADHD). It has been shown that technoference are closely related to children's problematic behaviors, executive functioning problems, and Internet addiction. The foundation of these cognitive and behavioral problems is probably the development of children's attentional control. However, few studies have used longitudinal design to examine the effects and mechanisms of technoference on children's attentional control development. Therefore, the present study used a two-year (with one-year interval) longitudinal design to examine the effect of parental technoference on preschoolers' attentional control indexed by IIRTV and the mediating role of parent-child closeness. 302 preschooler aged 3-6 years (M_{age} = 4.7 years, SD_{age} = 0.55, 138 girls) and their parents participated in this study. At T1, parents reported their technoference in parent-child interactions and the quality of their parent-child relationship. Children's attentional control was measured by a children's version Flanker task, and children's IIRTV were obtained by calculating the standard deviation of response-time within incongruent trials. At T2, IIRTV were collected from the children again. The results indicated that (1) T1 Technoference was significantly and negatively related to T1 parent-child closeness; (2) Parent-child closeness at T1 was significantly negatively correlated with children's IIRTV at T2; (3) After controlling for children's age, sex the level of IIRTV in T1, T1 parent-child closeness fully mediated the

relationship between T1 technoference and children's IIRTV at T2. The present study has important implication for understanding the impact of technoference on children's cognitive development.

2 教育部"教育大数据与教育决策"实验室，上海师范大学，上海，200234

* 通讯地址：caidan@shnu.edu.cn

摘 要：校园欺凌因其普遍性、稳定性和主体的脆弱性而受到广泛关注。然而，校园欺凌经历与个体认知能力发展间的关系仅存在较少探索且缺少对欺凌事件中多个角色的共同关注。基于自我损耗理论，校园欺凌受害者的痛苦经历会占用认知资源而限制执行功能的发展。此外，欺凌者与执行功能主要成分(抑制控制、工作记忆和认知灵活性)之间的关系存在争议。因此本研究研究采用三水平元分析的方法来明确儿童所经历的校园欺凌事件中不同角色与执行功能之间的关系，并探讨了影响二者关系的调节变量。通过系统的文献检索，共获得 18 项研究，含 73 个效应量，涉及被试共 21725 名。主效应检验发现，校园欺凌事件中的欺凌者和受害者均与执行功能呈负相关。调节效应检验显示，校园欺凌中的欺凌者与执行功能的负相关受到执行功能成分的调节作用，而不受到性别、年龄和执行功能测量方式的影响；具体而言，欺凌者与抑制控制的负相关比工作记忆和认知灵活性更强，同时欺凌者与认知灵活性的负相关强于工作记忆。此外，校园欺凌事件中的受害者与执行功能的负相关则不受欺凌形式、报告方式、执行功能成分、执行功能测量方式、性别、年龄和文化的影响。上述结果表明个体的校园欺凌经历与其认知损害存在密切关联，强调校园欺凌防治应当重视个体认知发展状况以更全面的进行有效干预。

The Association between School Bullying and Executive Function: A Three-Level Meta-Analysis

Jia Wei[1], Hu Na[1,2], Cai Dan[1*]

1 Department of Psychology, Shanghai Normal University, Shanghai, 200234

2 Lab for Educational Big Data and Policymaking, Ministry of Education, P.R. China, Shanghai Normal University, Shanghai, 200234

* caidan@shnu.edu.cn

Abstract: The pervasiveness, stability and vulnerability of school bullying have attracted widespread attention. However, the relationship between school bullying experience and the development of individual cognitive abilities has only been less explored and lacks a common focus on multiple roles in bullying incidents. Based on the ego depletion theory, the traumatic experience of victims of school bullying will occupy cognitive resources and limit the development of executive functions(EFs). Furthermore, the relationship between bullies and major components of EFs (inhibitory control, working memory, and cognitive flexibility) is controversial. The current study uses a three-level meta-analysis method to clarify the true relationship between different roles in school bullying and EFs' major components, and examines the moderating variables that may affect the relationship.

Through systematic literature search, a total of 18 studies were obtained, including 73 effect sizes, involving a total of 21,725 subjects. The main effect test found that both the bullies and the victims in school bullying incidents were negatively correlated with EFs. The moderating effect test showed that the negative correlation between bullies and EFs in school bullying was moderated by EFs' components, but not affected by gender, age and executive function's measurement methods; specifically, the negative correlation between bullies and inhibitory control were stronger than working memory and cognitive flexibility, while bullies was negatively associated with cognitive flexibility stronger than working memory. In addition, the negative correlation between victims and EFs in school bullying incidents was not affected by the form of bullying, source of reporting, EFs' component, executive function's measurement method, gender, age and culture. The above results show that there is a close relationship between individual school bullying experience and its cognitive impairment, emphasizing that the prevention and control of school bullying should pay attention to the individual cognitive development status in order to intervene more comprehensively and effectively.

摘 要 抑制控制（inhibitory control）是个体阻止或压抑无关信息,以排除或减少其对当前信息加工或行为产生干扰的认知过程。抑制控制是执行功能的重要成分，在流体智力、阅读理解和数学运算等高级认知中发挥着重要作用。尽管学前期（3-5 岁）是抑制控制发展的关键期，但鲜有研究在该阶段探究抑制控制的发展特点，及其与推理、言语和数学能力的纵向关系。而且，有研究表明存在不同类型的抑制控制，即反应抑制(response inhibition)和干扰抑制(interference inhibition)。两类抑制控制的发展轨迹可能存在差异，与高级认知能力的关系也可能有所不同，尚未有研究探索这些研究问题。

本研究拟采用纵向设计，探究反应抑制和干扰抑制的发展特点及其与推理、言语和数学能力的关系。采用 Simon 任务测查干扰抑制，Go/no go 任务测查反应抑制；在两个实验任务中，同时操控抑制负荷（低、中、高）和记忆负荷（低、中、高）。

研究一选取 144 名小、中、大班幼儿园儿童参与实验，完成 Simon 任务、Go/no go 任务、矩阵推理、常识、类同、点数判断、数字大小比较、顺序判断和加法判断任务。结果表明，学龄前阶段两种抑制控制能力均存在明显发展趋势，而且记忆负荷和抑制负荷存在显著交互，说明两者并非独立的成分。两种抑制控制与言语智力任务相关不显著，但与矩阵推理任务存在显著正相关。Simon 任务和多种数学任务之间存在稳定的正相关；但 Go/no go 任务与数学能力之间的相关并不稳定。

研究二基于研究一的被试，在一年后对原小、中班 91 名儿童进行第二次测量。交叉滞后分析（cross-lagged regression analysis）表明：Simon 任务和流体智力存在双向预测作用，和数学能力存在单向预测关系。潜在变化分数模型（latent change score model）结果表明：在时间点一（T1）上 Simon 任务表现更好的儿童，矩阵推理能力在两个时间点上的增长量更大，反之亦然。Go/no go 任务未发现相似的相互预测关系。

本研究采用纵向设计探究了不同类型抑制控制的发展特点及其与推理、言语和数学能力的关系，发现了抑制控制和高级认知能力之间的双向预测关系，但这一关系模式在不同类型的抑制控制上有所不同。研究结果能够为未来执行功能的测量、干预提供新的思路。

The longitudinal relationship between inhibitory control and Verbal intelligence, mathematics and reasoning in preschool children

Yueying Xiang[a], Kailing Li [b], Chris Jarrold [b], Tengfei Wang [a]

[a] Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, China，tfwang@zju.edu.cn

[b] School of Psychological Science, University of Bristol, UK

Abstract：Inhibitory control is a cognitive process in which individuals block or suppress irrelevant information to eliminate or reduce its interference with current information processing or behavior. Inhibitory control is an important component of executive function and plays an important role in advanced cognition ability such as fluid intelligence, reading comprehension and mathematical operations. Although the early school years (3-5 years old) are a critical period for inhibitory control development, few studies have explored the developmental characteristics of inhibitory control and its longitudinal relationship with reasoning, verbal and mathematical abilities during this period. Moreover, studies have shown that there are different types of inhibition control, namely response inhibition and interference inhibition. The developmental trajectories of the two types of inhibitory control may be different, and the relationship with advanced cognitive abilities may also be different, and no studies have explored these research questions.

In this study, a longitudinal design was used to explore the developmental characteristics of response inhibition and interference inhibition and their relationship with reasoning, verbal and mathematical abilities. Interference suppression was measured by Simon task and response suppression was measured by Go/no go task. In both experimental tasks, inhibition load (low, medium, high) and memory load (low, medium, high) were manipulated simultaneously.

In study 1, 144 kindergarten children were selected to participate in the experiment and complete the Simon task, Go/no go task, matrix reasoning, information, similarities, dots comparison, number comparison, number ordering and arithmetic task. The results showed that there was a significant development trend of the two inhibitory control abilities in preschool stage, and there was a significant interaction between memory load and inhibitory load, indicating that they were not independent components. There was no significant correlation between the two kinds of inhibition control and verbal intelligence tasks, but there was significant positive correlation with matrix reasoning tasks. There is a stable positive correlation between Simon task and various mathematical tasks. But the correlation between Go/no go tasks and math ability is not stable.

Based on the participants in Study 1, 91 children were measured a second time one year later. Cross-lagged regression analysis showed that Simon task has a bidirectional predictive relationship with fluid intelligence and a unidirectional predictive relationship with mathematical ability. Latent change score model showed that children with better inhibition performance in Simon task at time point one have greater increases in matrix reasoning ability between two time points, and vice versa. No similar mutual prediction relationship was found in the Go/no go tasks.

In this study, a longitudinal design was used to explore the developmental characteristics of different types of inhibitory control and their relationships with reasoning, verbal and mathematical abilities. A bidirectional predictive relationship between inhibitory control and advanced cognitive abilities was found, but the relationship model was different for different types of inhibitory control. The results can provide new ideas for the measurement and intervention of executive function in the future.

童年中后期网络使用的发展轨迹及其影响因素:一项多层追踪分析

石慧芬[1,2]，刘宇潇[1,2]，曹敏[1,2]，周宗奎[1,2]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院，武汉，430079，zhouzk@ccnu.edu.cn

摘 要 网络使用在未成年群体中有年轻化的趋势，而个体早期的网络使用是网络成瘾的高风险因素。本研究旨在探讨童年中后期个体互联网使用的发展，并找出影响其发展轨迹的因素。在生态系统理论的指导下，本研究探讨了特质好奇心、友谊质量和物质教养对不同类型智能个体(包括信息获取、娱乐和社会使用)的影响。利用 218 名小学生的三年纵向数据集，采用层次线性模型进行分析。研究结果显示，在整个童年中后期，信息获取网络使用、社交网络使用和娱乐网络使用的均有显著增加。对于信息获取网络使用时长而言，特质好奇对信息获取网络使用时长的截距和斜率均存在显著性影响。特质好奇正向预测信息获取网络使用时长的初始使用水平，特质好奇水平越高，信息获取网络使用时长的初始水平就越高；特质好奇负向预测信息获取网络使用时长的发展趋势，特质好奇水平越高，信息获取网络使用时长的增长趋势减缓。对于社会交往网络使用时长而言，特质好奇对信息获取网络使用时长的截距和斜率均存在显著性影响。具体而言，特质好奇正向预测社会交往网络使用时长的初始使用水平，特质好奇水平越高，社会交往网络使用时长的初始水平就越高；特质好奇负向预测社会交往网络使用时长的发展趋势，特质好奇水平越高，社会交往网络使用时长的增长趋势减缓。友谊质量对社会交往网络使用时长的截距存在显著性影响，但不能预测斜率。具体而言，友谊质量负向预测社会交往网络使用时长的初始使用水平，友谊质量水平越高，社会交往网络使用时长的初始水平就越低。此外，对于休闲娱乐网络使用时长而言，父母物质主义奖赏可以显著正向预测休闲娱乐网络使用时长的截距。父母物质主义奖赏水平越高，儿童休闲娱乐网络使用时长的初始水平越高。并且，相对于女性，男性休闲娱乐网络使用时长的初始水平更高。这些结果为理解儿童在童年中后期 IU 的发展轨迹提供了一个全面的框架，并揭示了导致其变化的因素，有助于网络成瘾的早期干预。

关键词 网络使用，特质好奇，友谊质量，物质养育

Developmental trajectory of internet use across the late childhood and its influencing factors: A multilevel analysis

Shi Huifen[1,2], Liu Yuxiao[1,2], Cao Min[1,2], Zhou Zongkui[1,2,*]

[1]Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079, China

[2]School of Psychology, Central China Normal University, Wuhan 430079, China, zhouzk@ccnu.edu.cn

Abstract: Currently, there is a noticeable trend of internet use shifting towards younger age groups. Early Internet use is a risk factor for Internet addiction. This study aims to explore the development of Internet use (IU) during late childhood and identify the factors that influence its trajectory. Guided by ecological systems theory, the research explores the influence of trait curiosity, friendship quality, and material parenting on different types of IU, including information acquisition, entertainment, and social usage. Utilizing a three-year longitudinal dataset comprising 218 primary students, a hierarchical linear model was employed for analysis. The findings reveal an overall increase in information acquisition IU, social IU, and entertainment IU throughout late childhood. For

information acquisition IU, trait curiosity was significantly positively related to the intercept of the information acquisition IU but negatively related to the slope of information acquisition IU. The higher the trait curiosity was, the higher the initial level while the slower the growth of information acquisition IU. For social IU, trait curiosity was significantly positively related to the intercept but negatively related to the slope of social IU. The higher the trait curiosity level was, the higher the initial level while the slower the growth trend of social IU. Friendship quality was negatively related to the intercept of social IU. The higher the level of friendship quality was, the lower the initial level of social IU. For entertainment IU, material parenting reward was significantly positively related to the intercept. The higher the level of material parenting reward was, the higher the initial level of children's entertainment IU. Gender was also significantly positively related to the intercept of entertainment IU. Boys reported higher initial level of entertainment IU than girls. These results provide a comprehensive framework for understanding the developmental trajectory of IU during late childhood and shed light on the factors that contribute to its changes.

父母控制对初中生个人成长主动性的纵向研究：基于潜在剖面分析

何幼银　李彩娜（通讯作者）

陕西师范大学心理学院，陕西（高校）哲学社会科学重点研究基地-儿童青少年心理与行为健康研究中心，710062，chinali7371@163.com

摘 要　父母控制指的是父母通过对青少年行为和心理的约束使其更加符合社会规范的教养方式，是青少年社会化的必经途径。但这与青少年期个体自主性发展及分离-个体化的发展需求间存在一定的冲突，并最终影响青少年的发展结果。客体关系理论（The Object Relations Theory）也指出，过高的父母控制会阻碍子女良好依恋关系和安全感的形成，并由此抑制个体发展的主动性。然而，“父慈子孝”的儒家文化强调父母权威地位和子女孝顺的价值观，使得中国父母更多关注对子女心理与行为规范的引导与监控，子女也更倾向于将父母控制看作接纳和爱的表达，从而更愿意做出积极的改变。此外，现有关于父母控制与青少年积极发展间关系的实证研究结论也存在争议。这可能是由于以往研究更多采用变量中心视角导致的。基于此，本研究采用“个体中心”视角下的潜在剖面分析方法，考察更为客观的父母报告的心理与行为控制的整体表现及其发展特征，并探讨了父母控制的不同亚型与初中生个人成长主动性间的纵向关系。

本研究对陕西省 8 所中学的 3613 名父母（68.5%女性；Mage = 39.67，SD = 7.32）与初中生（47.3%女生；Mage = 12.73，SD = 0.66）进行了为期 1 年的 2 次追踪调查。结果发现：（1）父母报告的心理控制总体处于中等水平，父母行为控制总体处于较高水平。依据父母报告的引发内疚、爱的撤回、专利专断和行为控制的多维度表现，中国文化下的父母控制可区分为低心理控制-高行为监控组(C1；37%)、中心理控制-高行为监控组(C2；58%)和高心理控制-高行为监控组(C3；5%);（2）相较于 T1 的低心理控制-高行为监控组，T1 中心理控制-高行为监控组能够显著正向预测 T2 初中生的个人成长主动性，T1 的高心理控制-高行为监控组则显著负向预测 T2 初中生的个人成长主动性。（3）初中生性别在父母控制和个人成长主动性间的调节作用不显著。本研究结果表明，中国文化背景下的父母控制存在最佳水平，中心理控制-高行为监控能够最大的程度地促进初中生的个人成长主动性，为科学认识和有效干预中国文化背景下父母控制对初中生个人成长主动性的影响提供了依据。

A longitudinal study of parental control on middle school students' personal growth initiatives: a latent profile analysis

HE Youyin LI Caina*

Shaanxi Provincial Key Research Center for Children Mental and Behavioral Health，
School of Psychology, Shaanxi Normal University, China, 710062, chinali7371@163.com

***Abstract*:** Parental control refers to the parenting style in which parents discipline their adolescents' behavior and psychology to make them more conform to social norms, and it is a necessary pathway for adolescents' socialization. However, it is in conflict with the developmental needs of adolescents for individual autonomy and separation-individualization, and ultimately affects the developmental outcomes of adolescents. The Object Relations Theory (ORT) also points out that too much parental control can hinder the formation of good attachment and sense of security in children, and thus inhibit individual developmental initiative. However, the Confucian culture of "father's kindness and son's filial piety" emphasizes the values of parental authority and filial piety, which makes Chinese parents pay more attention to guiding and monitoring their children's psychological and behavioral norms, and their children are more likely to see parental control as an expression of acceptance and love, and thus are more willing to make positive changes. In addition, the findings of existing empirical studies on the relationship between parental control and positive adolescent development are controversial. This may be due to the fact that previous studies have adopted a more variable-centered perspective. Based on this, the present study adopted the potential profile analysis method under the "individual-centered" perspective to examine the overall performance and developmental characteristics of parent-reported psychological and behavioral control in a more objective way, and explored the longitudinal relationship between different subtypes of parental control and junior high school students' personal growth initiative.

The present study was conducted on 3,613 parents (68.5% female; Mage = 39.67, SD = 7.32) and junior high school students (47.3% female; Mage = 12.73, SD = 0.66) in eight middle schools in Shaanxi Province with 2 follow-up surveys over a 1-year period. Results found (1) overall moderate levels of parent-reported psychological control and overall high levels of parent-behavioral control. Based on the multidimensional manifestations of parent-reported triggering guilt, love withdrawal, patent arbitrariness, and behavioral control, parental control in Chinese culture could be distinguished into a low psychological control-high behavioral monitoring group (C1; 37%), a medium psychological control-high behavioral monitoring group (C2; 58%), and a high psychological control-high behavioral monitoring group (C3; 5%); and (2) in comparison to the low psychological control-high behavioral monitoring group in T1 , the medium psychological control-high behavioral monitoring group in T1 was able to significantly and positively predict the personal growth initiative of T2 middle school students, while the high psychological control-high behavioral monitoring group in T1 significantly and negatively predicted the personal growth initiative of T2 middle school students. (3) The moderating role of junior high school students' gender between parental control and personal growth initiative was not significant. The results of this study indicate that there exists an optimal level of parental control in the Chinese cultural context, and that medium psychological control-high behavioral monitoring can maximally promote junior high school students' personal growth initiative, which provides a basis for scientific understanding and effective intervention of the effects of parental control on junior high school students' personal growth initiative in the Chinese cultural context.

摘 要　先前研究表明，父母心理攻击会随儿童年龄的增长表现出一定变化，且在不同家庭中，父母心理攻击的发展轨迹存在差异。家庭系统理论指出，父亲和母亲的严厉管教行为可能会受到对方影响。基于该理论，在不同家庭中父亲和母亲对儿童实施的心理攻击可能表现出不同的共同发展模式。然而，已有关于父母心理攻击的研究较少关注其共同发展模式及个体差异，对父母心理攻击共同发展的影响因素及其与儿童发展间关系的揭示也不够全面、充分。鉴于此，本研究以 1137 名小学一至三年级儿童及其父母为被试，采用连续五年的追踪研究设计来考察父母心理攻击发展轨迹亚组及其联合发展轨迹亚组，在此基础上进一步探讨家庭因素(家庭社会经济地位、父母婚姻满意度和儿时受心理攻击经历)和儿童因素(性别、年龄和气质)对父母心理攻击发展轨迹的预测作用，以及这一发展轨迹与儿童发展结果(内、外化问题)的关系。结果发现：(1)父亲心理攻击发展轨迹分为低-稳定、高-下降-上升和中-上升-下降三组，母亲心理攻击发展轨迹分为低-稳定、高-下降、中-上升-下降和低-上升四组，父母心理攻击联合发展轨迹分为父母低-稳定、父中-稳定/母高-下降、父高-上升-下降/母中-稳定三组。(2)父母较低的婚姻满意度和较多的儿时受心理攻击经历是父母心理攻击发展轨迹亚组及其联合发展轨迹亚组的危险因素。儿童较小的年龄是父亲心理攻击发展轨迹亚组的危险因素，儿童较高的消极情绪性是母亲心理攻击发展轨迹亚组及父母心理攻击联合发展轨迹亚组的危险因素。(3)在父亲心理攻击的中-上升-下降组、母亲心理攻击的中-上升-下降组和低-上升组以及父母心理攻击的父中-稳定/母高-下降组和父高-上升-下降/母中-稳定组中，儿童的内外化问题行为水平较高。研究结果表明，父母心理攻击对儿童内外化问题具有累积影响，干预研究应高度关注父母心理攻击随时间发展仍处于较高水平的家庭，并从家庭和儿童等多个层面给予恰当的指导和帮助。

Trajectories of Parental Psychological Aggression During Childhood: Links with Predictors and Children's Developmental Outcomes

Yuan Liu[1], Yuzhu Wang[1], Meifang Wang[2](corresponding author)
1 Department of Psychology, Capital Normal University, Beijing
2 College of Elementary Education, Capital Normal University, Beijing

Abstract：Previous research has shown that parental psychological aggression may change with children's age, and individual differences exist in the developmental trajectories of parental psychological aggression within different families. Family systems theory suggests that fathers and mothers discipline their children in a mutually influential relation. Consequently, paternal and maternal psychological aggression may exhibit distinct co-developmental patterns across different families. However, prior studies on psychological aggression have mainly focused on identifying influencing factors and examining children's developmental outcomes associated with parental psychological aggression. Limited attention has been given to understanding how paternal and maternal psychological aggression co-develop, the variations in co-developmental patterns across different subgroups, the factors that explain these co-developmental patterns, and whether these patterns are linked to

children's developmental outcomes. To address these gaps, utilizing five annual waves of survey data collected from 1137 families with children in grades 1 to 3, this study aimed to explore the developmental trajectories of paternal and maternal psychological aggression, as well as their joint presentation. Additionally, this study examined family-level factors (including socioeconomic status, parental marital satisfaction and psychological aggression experiences in childhood) and child-level factors (including gender, age, and temperament) that might influence the trajectories of parental psychological aggression. This study also investigated the association between these trajectories and children's developmental outcomes (internalizing and externalizing problem behaviors). The results revealed the following: (1) Three trajectory classes of paternal psychological aggression were identified: low-persistent, high-decreasing-increasing, and moderate-increasing-decreasing. Four trajectory classes of maternal psychological aggression were identified: low-persistent, high-decreasing, moderate-increasing-decreasing, and low-increasing. Three joint trajectory classes of paternal and maternal psychological aggression were identified: low-persistent-both, moderate-persistent-father/high-decreasing-mother, and high-increasing-decreasing-father/moderate-persistent-mother. (2) Lower marital satisfaction and more psychological aggression experiences during childhood were risk factors for the trajectory classes of paternal and maternal psychological aggression, as well as their joint presentation. In addition, a younger age of children was a risk factor for the trajectory classes of paternal psychological aggression, while higher levels of negative affectivity in children were a risk factor for the trajectory classes of maternal psychological aggression and the joint trajectory classes of paternal and maternal psychological aggression. (3) Children exhibited higher levels of internalizing and externalizing problem behaviors in the following trajectories: the moderate-increasing-decreasing trajectory of paternal psychological aggression, the moderate-increasing-decreasing trajectory and the low-increasing trajectory of maternal psychological aggression, and the moderate-persistent-father/high-decreasing-mother trajectory and the high-increasing-decreasing-father/moderate-persistent-mother trajectory of paternal and maternal psychological aggression. These findings indicate the cumulative effects of parental psychological aggression on children's internalizing and externalizing problem behaviors. Intervention projects should give adequate attention to families with chronically high parental psychological aggression and provide timely support to these families by interfering with both family- and child-related factors.

青少年受欺负、自尊和亲社会行为的双向关系：一项随机截距交叉滞后研究

边昊天[1] 边玉芳[1,2] 梁丽婵[1,2]（通讯作者）

1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

2 北京师范大学儿童家庭教育研究中心，北京，100875，lichanliang@163.com

摘 要 “受欺负后还愿意表现出亲社会行为吗？”“亲社会水平低会被贴上好欺负的标签吗？”已有研究表明，两者之间的关系可能是错综复杂的。目前还没有研究在个体内水平上探讨青少年受欺负和亲社会行为之间的双向关系、潜在的中介（如自尊）以及性别影响，也缺乏利用纵向数据来检查这些过程的研究。探究受欺负和亲社会行为间的双向关系及其机制，对进一步理解青少年社会性发展具有重要价值。因此，本研究以北京市2485名青少年为被试，开展初一至初三为期三年，每次间隔一年的追踪研究。采用随机截距交叉滞后模型(random intercept cross-lagged panel model, RI-CLPM)分离个体间和个体内效应，考察男女青少年受欺负和亲社会行为间的双向关系及自尊的中介作用。结果表明：(1)在男生和女生的个体间水平上，受欺负、自尊以及亲社会行为的随机截距项间相关均显著。(2)在男生的个体内水平上，T1的受欺负显著负向预测T2的自尊(β=-0.116, p<0.05)。T1和T2的自尊分别显著正向预测T2和T3的亲社会行为($\beta_{T1\rightarrow T2}$=0.180, p<0.05; $\beta_{T2\rightarrow T3}$=0.190, p<0.05)。T2的自尊没有中介T1的受欺负对T3的亲社会行为的影响(indirect effect$_{T1BV\rightarrow T2SE\rightarrow T3PB}$=-0.007, 95%CI=[-0.031, 0.003])。对男生来说，受欺负导致自尊受损，低水平的自尊会导致亲社会行为减少，但自尊在受欺负对亲社会行为的影响中并不起中介作用。(3)在女生的个体内水平上，T1和T2的受欺负均显著负向预测随后间隔一年的自尊($\beta_{T1\rightarrow T2}$=-0.151, p<0.05; $\beta_{T2\rightarrow T3}$=-0.133, p<0.05)。T1和T2的自尊均显著正向预测随后间隔一年的亲社会行为($\beta_{T1\rightarrow T2}$=0.240, p<0.05; $\beta_{T2\rightarrow T3}$=0.231, p<0.05)。女生还表现出比男生更复杂的影响模式，具体来说，T1的亲社会行为显著正向预测T2的自尊(β=0.138, p<0.05)，T2的自尊显著负向预测T3的受欺负(β=-0.156, p<0.05)。此外，T2的自尊同时中介了受欺负和亲社会行为之间的双向关系(indirect effect$_{T1BV\rightarrow T2SE\rightarrow T3PB}$=-0.035, 95%CI=[-0.071, -0.011]; indirect effect$_{T1PB\rightarrow T2SE\rightarrow T3BV}$=-0.022, 95%CI=[-0.067, -0.001])。对女生来说，更多受欺负经历会通过损害个体自尊进而降低其亲社会行为；较少的亲社会行为也会通过损害个体自尊进而增加其受欺负的频率。本研究的结果提示需要关注青少年，特别是女生自尊的发展，为改善受欺负现状和提高亲社会行为提供实证依据。

Reciprocal Relations between Bullying Victimization, Self-esteem, and Prosocial Behavior among Adolescents: A RI-CLPM study

Haotian Bian[1] Yufang Bian[1 2] Lichan Liang[1 2]

1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, Beijing, China

2 Child and Family Education Research Center, Beijing Normal University, Beijing, China

Abstract: "Would you still be inclined to exhibit prosocial behavior after experiencing bullying victimization?" "Would low levels of prosocial behavior be labeled as vulnerable to bullying victimization?" Studies have revealed that their relationship might be complex. Studies exploring the reciprocal relationship, potential mediators (e.g., self-esteem), and gender effects between bullying victimization and prosocial behavior among adolescents at the within-person level are limited, and studies using longitudinal data to examine these processes are also lacking. The examination of the reciprocal relationship between bullying victimization and prosocial behavior, as well as its mechanism, is valuable for gaining a deeper understanding of adolescents' social development. A total of 2485 adolescents from Beijing participated in a three-year longitudinal study, with data collected annually from the first year of junior high school to the third year. The research employed the Random Intercept Cross-Lagged Panel Model (RI-CLPM) that separated the between-person and within-person effects to analysis the reciprocal relationship between bullying victimization and prosocial behavior among male and female adolescents, as well as a mediating role of self-esteem in this reciprocal relationship. The results found that: (1) There are significant correlations between random intercept of both bullying victimization, self-esteem, and prosocial behavior at the between-person level for males and females. (2) For males at the within-person level, T1 bullying victimization significantly negatively predicts T2 self-esteem (β=-0.116, p<0.05). T1 and T2 self-esteem significantly positively predict T2 and T3 prosocial behavior ($\beta_{T1\rightarrow T2}$=0.180, p<0.05; $\beta_{T2\rightarrow T3}$=0.190, p<0.05). T2 self-esteem does not mediate the influence of T1 bullying victimization on T3 prosocial behavior(indirect effectT1BV→T2SE→T3PB=-0.007, 95%CI=[-0.031, 0.003]). For males, bullying victimization leads to impaired self-esteem and lower self-esteem results in reduced prosocial behavior. However, self-esteem does not play a mediating role in the impact of bullying victimization on prosocial behavior. (3) For females at the within-person level, both T1 and T2 bullying victimization significantly negatively predict self-esteem one year later ($\beta_{T1\rightarrow T2}$=-0.151, p<0.05; $\beta_{T2\rightarrow T3}$=-0.133, p<0.05). Both T1 and T2 self-esteem significantly positively predict prosocial behavior one year later($\beta_{T1\rightarrow T2}$=0.240, p<0.05; $\beta_{T2\rightarrow T3}$=0.231, p<0.05). Female adolescents exhibit more diverse patterns of influence than male adolescents, specifically, T1 prosocial behavior significantly positively predicts T2 self-esteem (β=0.138, p<0.05), and T2 self-esteem significantly negatively predicts T3 bullying victimization (β=-0.156, p<0.05). Furthermore, T2 self-esteem simultaneously mediates the reciprocal relationship between bullying victimization and prosocial behavior(indirect effect$_{T1BV\rightarrow T2SE\rightarrow T3PB}$=-0.035, 95%CI=[-0.071, -0.011]; indirect effect$_{T1PB\rightarrow T2SE\rightarrow T3BV}$=-0.022, 95%CI=[-0.067, -0.001]). For females, experiencing more bullying victimization is associated with lower self-esteem, which in turn leads to decreased prosocial behavior. Lower levels of prosocial behavior can also increase the frequency of bullying victimization by diminishing individuals' self-esteem. These findings highlight the importance of focusing on the self-esteem development of adolescents, particularly females, and provide empirical evidence for addressing bullying victimization and promoting prosocial behavior among adolescents.

儿童社交淡漠对心理社会适应的影响：父母心理控制的调节作用

胡义豪[1] 郑宏[2] 曹宇晨[3] 李冉[1] 王楠[1] 刘俊升[1 2]（通讯作者）
1 华东师范大学心理与认知科学学院，上海，200333，jsliu@psy.ecnu.edu.cn

3 珠海市第二中学，珠海，519000

摘 要 作为社会退缩的一种子类型，社交淡漠的特征是在社交情境中，个体同时有着较低的趋近动机和较低的回避动机。父母心理控制是指父母通过对儿童撤回关爱、诱发他们的内疚和羞耻等手段，从而控制儿童的思想、情感和行为的一种教养方式。以往研究表明，社交淡漠和父母心理控制对于儿童的心理社会适应都有着消极的影响，但二者的相互作用则少有研究关注。根据拟合优度模型（Goodness of Fit Model）的观点，当儿童自身的气质和父母的教养行为有着良好的匹配时，儿童能获得较好的发展。考虑到社交淡漠水平较高的儿童更喜欢自由而不受限制地行动，这和父母的心理控制是相冲突的，因此推测，对于社交淡漠水平较高的儿童来说，父母的心理控制可能会有更消极的影响。本研究旨在探索父母心理控制对儿童社交淡漠及其心理社会适应关系的调节作用。研究以上海市 1275 名 3 至 7 年级学生为被试，采用班级戏剧量表、儿童抑郁量表、儿童社交焦虑量表、感知父母心理控制量表进行集体施测。结果表明：（1）社交淡漠正向预测同伴侵害、抑郁、社交焦虑，负向预测社会偏爱，即儿童的社交淡漠可能导致其不良的心理社会适应结果；（2）父母心理控制在社交淡漠和心理社会适应各变量之间的关系上均起着显著的调节作用。具体而言，父母心理控制水平较高时，社交淡漠对四个适应变量均有着较强而显著的预测作用，父母心理控制水平较低时，社交淡漠对同伴侵害、抑郁、社会偏爱的预测作用虽仍显著，但程度也有显著的下降，而社交淡漠对社交焦虑的预测作用则变得不显著。即父母的心理控制加剧了社交淡漠对于儿童心理社会适应的消极影响。研究结果揭示了父母教养行为对于儿童社交淡漠和心理社会适应关系的影响机制，对于如何帮助社交淡漠水平较高的儿童获得更好的发展具有启示作用。

The Moderating Effect of Parental Psychological Control on the Associations between Children's Unsociability and Psychosocial Adjustment

Yihao Hu[1], Hong Zheng[2], Yuchen Cao[3], Ran Li[1], Nan Wang[1], Junsheng Liu[1 2]
1 School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200333
2 Shanghai Changning Mental Health Center, Shanghai, 200050
3 Zhuhai No.2 High School

Abstract：As a subtype of social withdrawal, unsociability is characterized by both low approach motivation and low avoidance motivation in social interactions. Parental psychological control is a type of parenting style, in which parents control their children's thought, emotion and behavior through withdrawing love and inducing children's guilt and shame. Previous studies have indicated that both unsociability and parental psychological control had negative influence on children's psychosocial adjustment, but their interaction has not been explored.

For the perspective of Goodness of Fit Model, children can acquire better development when their temperament matches their parents' parenting behavior well. Unsociable children prefer free and unrestricted activities, which may be conflicted with parental psychological control. Therefore, it can be speculated that parental psychological control may have more negative influence on psychosocial adjustment for unsociable children. The current study was aimed at exploring the moderating effect of parental psychological control on the associations between children's unsociability and psychosocial adjustment. We chose 1275 students of grade 3-7 as participants, and the measures included Revised Class Play, Children's Depression Inventory, Social Anxiety Scale for Children and Perceived Parental Psychological Scale. The results indicated that: (1) Unsociability could positively predict peer victimization, depression, and social anxiety, and negatively predict social preference. That is, children's unsociability might contribute to poor psychosocial adjustment; (2) Parental psychological control could significantly moderate the associations between unsociability and psychosocial adjustment. Specifically, when parental psychological control was high, the predicting effect of unsociability on four indices were all strong and significant. But when parental psychological control was low, although unsociability could still predict peer victimization, depression, and social preference significantly, the strength of predicting effect decreased significantly, and unsociability could not predict social anxiety significantly. That is, parental psychological control intensified the negative influence of children's unsociability on psychosocial adjustment. The results reveal the mechanism of parenting behavior on associations between children's unsociability and psychosocial adjustment, and have implications for how to help unsociable children to acquire better development.

母亲教养压力和学前儿童问题行为：心理控制的中介作用和抑制控制的调节作用

孙娟娟 李燕 （通讯作者）

上海师范大学学前教育学院，上海，200234，liyan@shnu.edu.cnE-mail

摘 要 儿童心理健康逐渐引起越来越多研究者的关注，是当前我国的一个重要问题。幼儿期是一个快速发展的时期。特别是，2 至 6 岁是从婴儿期过渡到自主成长以及社会和认知能力成长的关键时期。这也是问题行为出现的时期（Campbell, 1995, 2006）。儿童早期的问题行为一直与后来的负面发展结果有关，如学业成绩不佳、同伴关系困难、药物滥用和认知功能差。根据布朗芬布伦纳的生态系统理论，家庭是儿童生活中重要的微观环境。父母的压力在塑造孩子的个性和情感发展方面发挥着重要作用。因此，在本研究中，我们的主要目的是检验母亲教养压力影响儿童问题行为潜在的作用机制，为儿童问题行为早期预防和干预提供实践一句。

来自中国上海两所公立和普通幼儿园的 207 名儿童（107 名男孩；M_{age} = 48.62 个月，SD = 3.73）参与了这项研究。数据收集使用母亲报告的母亲教养压力，心理控制，抑制控制和教师报告的问题行为。本研究中的统计分析包括两个步骤。首先，我们进行了初步分析，计算了所有研究变量的描述性统计数据（平均值、标准差和相关性）。其次，我们使用 PROCESS 检验了母亲养育压力与儿童问题行为之间的有调节的中介模型。

结果表明：（1）母亲教养压力与母亲心理控制和儿童问题行为显著正相关，与儿童抑制控制显著负相关；（2）心理控制在母亲教养压力和儿童问题行为之间具有中介作用。母亲教养压力通过增加心理控制对问题行为的间接效应为 0.09（95%CI[0.01，0.18]，SE = 0.04）；（3）儿童的抑制控制调节了母亲教养压力与心理控制之间的关系。对于抑制控制水平较低的儿童，母亲的教养压力预测了较高的心理控制（$\beta = 0.45$，$p < 0.0001$），而对抑制控制水平较高的儿童这种消极影响则不显著（$\beta = 0.01$，$p > 0.05$）。

本研究有助于加深对中国背景下母亲教养压力对学前儿童行为问题的作用机制的理解。本研究结果强调了母亲教养压力在通过低水平的抑制控制增加儿童问题行为方面的重要性，并对父母和教育工作者在幼儿问题中母亲高教养压力背景下，加强儿童的抑制控制具有启示。父母应该更加积极地关注年幼的孩子，给予孩子更多的自主支持，与他们更友好地沟通，倾听他们的想法，这将有助于减少他们的问题行为

Maternal Parenting Stress and Problem Behaviors in Preschooler' Children: The Mediating Role of Psychological Control and the Moderating Role of children's Inhibit Control

Juanjuan Sun Yan Li

Shanghai Institute of Early Childhood Education, Shanghai Normal University, Shanghai, China

Email: liyan@shnu.edu.cn

Abstract： Children's mental health has gradually attracted more and more researchers' attention, which is an important issue in current China. Early childhood is a period of rapid development. In particular, the period between 2 and 6 years old is a critical period for the transition from infancy to the growth of autonomy, as well as for the growth of social and cognitive abilities. It is also a period when problem behaviors emerged (Campbell, 1995, 2006). Problems behavior in early childhood is persistently linked with later negative developmental outcomes, such as academic underachievement, peer relationship difficulties, substance abuse, and poor cognitive functions. According to Bronfenbrenner's ecosystem theory, family is an important micro-environment in children's life. Parenting stress can play an important role in shaping children's personality and emotional development. Thus, in the present study, our primary purpose was to examine the mechanism through which maternal and child characteristics may impact children's problems behavior, and the knowledge learned can be applied to early prevention and intervention programs.

207 children (107 boys; M_{age} = 48.62 month, *SD* = 3.73) from two public and regular preschools located in Shanghai, China participated in this study. Data were collected using mother-reports of maternal parenting stress, psychological control, inhibit control and teacher-report of problems behavior. The statistical analyses in this study consisted of two steps. First, we conducted a preliminary analysis calculating descriptive statistics (means, standard deviations and correlations) for all study variables. Second, we examined the moderated mediation model between maternal parenting stress and children's problems behavior using PROCESS.

The results showed that: (1) Maternal parenting stress was positively associated with psychological control and child problems behavior, and negatively associated with child inhibit control; (2) Psychological control had a mediating effect between maternal parenting stress and child problems behavior. The indirect effect of parenting stress on problems behavior through increasing psychological control was 0.09 (95% CI [0.01, 0.18], SE = 0.04); (3) Children's inhibit control moderated the relation between maternal parenting stress and psychological control. For children with low levels of inhibitory control, maternal parenting stress predicted high psychological control (β = 0.45, $p < 0.001$),while not significant for children with high levels of inhibit control (β = 0.01， $p > 0.05$).

This study contributes to deepen the understanding of the moderated mediating effects of maternal parenting stress on preschoolers' behavior problems in the Chinese context. The present findings highlight the importance of maternal parenting stress in increasing children's problem behaviors through low levels of inhibitory control and have implications for parents and educators in enhancing children's inhibitory control in the context of maternal

parenting stress in young children's problems. Parents should pay more positive attention to young children, give children more autonomous support, and communicate with them more friendly and listen to their ideas, which will help reduce their problems behavior.
Keywords：parenting stress, problems behavior, psychological control, inhibit control, young children

中国儿童青少年心理健康问题及预测因素：一项全国大样本网络分析

申净旖[1]　方晓义[1]（通讯作者）
1 北京师范大学发展心理研究院，北京，100875，通讯作者 E-mail（fangxy@bnu.edu.cn）

摘 要　儿童青少年心理健康问题一直是社会各界密切关注的焦点。然而，现有研究较少关注这些问题的相互作用和相对重要程度，也较为忽视各影响因素在预测心理健康问题的相对作用。目前，网络分析通过结合量化与可视化的优势成为理解这一问题的重要方法。本研究旨在通过网络分析探索儿童青少年九大心理健康问题（即抑郁、焦虑、压力、网络成瘾、学业倦怠、自杀意念、自伤行为、欺凌、受欺凌）与个体和环境两方面预测因素（即毅力、应对方式、父母教育期望、父母婚姻满意度、学校满意度、社会支持）之间的关系，并重点关注性别和学段差异。本研究采用具有全国代表性的样本，针对 151,336 名儿童青少年（49.57%女生，平均年龄 = 13.50，*SD* = 2.46）进行施测。结果显示，（1）在心理健康问题网络中，网络成瘾的预期影响指数最高，其次分别是学业倦怠和自杀意念；在影响因素网络中，桥节点分别为抑郁、毅力和应对方式。（2）通过性别子网络比较发现，在心理健康问题网络中，预期影响指数最高的三个节点与总网络相同，但各节点指数之间以及整体网络强度在男生和女生间存在显著差异；在影响因素网络中，抑郁和毅力为共有桥节点，自杀意念和学校满意度分别为男生和女生特异桥节点。（3）通过学段子网络比较发现，在心理健康问题网络中，预期影响指数最高的三个节点与总网络相同，但部分节点指数以及整体网络强度在不同学段间存在显著差异；在影响因素网络中，抑郁和毅力为共有桥节点，焦虑、父母教育期待、应对方式分别为三个学段特异桥节点。综上，本研究通过网络分析揭示中国儿童青少年发展的核心问题是网络成瘾，其次是学业倦怠和自杀意念，以上问题在性别和学段上表现稳定，但强度存在显著差异；此外核心影响因素是个体毅力，不同性别和学段存在特异性影响因素。本研究为考察中国儿童青少年发展提供了新视角，未来可以通过重点干预网络成瘾和学业倦怠等问题，并结合核共同和特异性影响因素，提升儿童青少年心理健康水平，促进儿童青少年积极发展。

Mental health problems and predictive factors among Chinese youth: A nationwide large-scale network analysis

Jingyi Shen　　Xiaoyi Fang
Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

Abstract：Youth Mental health problems have been a focal point of concern across various sectors of society. However, existing research has paid limited attention to the interplay and relative importance of these issues, as well as the varying impact of influencing factors on predicting mental health problems. Network analysis, with its combination of quantitative and visual advantages, has emerged as an essential method for understanding these complexities. This study aims to employ network analysis to explore the relationships between nine major mental health issues among youth (i.e., depression, anxiety, stress, internet addiction, academic burnout, suicidal ideation,

self-harm behavior, bullying, being bullied), and individual and contextual predictive factors (grit, coping strategies, parental educational expectations, parental marital satisfaction, school satisfaction, social support), with a particular focus on gender and educational stage differences. This research utilized a nationally representative sample of 151,336 youth (49.57% females, mean age = 13.50, SD = 2.46) for data collection. The results show that (1) in the mental health problem network, internet addiction had the highest Expected Influence Index (EI), followed by academic burnout and suicidal ideation. In the network of influencing factors, depression, resilience, and coping strategies were identified as bridge nodes. (2) Comparing gender-specific sub-networks, the top three nodes with the highest EI in the mental health problem network were consistent with the overall network, but there were significant differences in the EI index and overall network strength between male and female participants. In the network of influencing factors, depression and resilience were common bridge nodes, while suicidal ideation and school satisfaction were identified as gender-specific bridge nodes for males and females, respectively. (3) Comparing educational stage-specific sub-networks, the top three nodes with the highest EI in the mental health problem network were consistent with the overall network. However, there were significant differences in some node EI index and overall network strength between different educational stages. In the network of influencing factors, depression and resilience were common bridge nodes, and anxiety, parental educational expectations, and coping strategies were identified as stage-specific bridge nodes for elementary, middle, and high school stages, respectively. In conclusion, this study, through network analysis, revealed that internet addiction is the core problem in the development of Chinese youth, followed by academic burnout and suicidal ideation. While these problems remained stable across gender and educational stages, there were significant differences in their intensity. Additionally, grit was identified as a core influencing factor, while gender and educational stages exhibited other specific influencing factors. This study provides new perspectives on examining the development of Chinese youth and suggests future interventions targeting internet addiction and academic burnout, considering both core and specific influencing factors, to enhance youth's mental health level and promote their positive development.

大尺度结构协变网络预测儿童计算能力增长

叶学鉴[1#] 张凯杰[1#] 李征[1] 任天[1] 李葆明[1] 王春杰[1]（通讯作者）

1 杭州师范大学脑科学研究所，杭州，311121

摘 要 大脑不同脑区之间相互作用形成了不同的子网络。其中，结构协变网络是一种研究大脑不同脑区结构协变关系的研究手段。近年来，很多研究指出结构协变网络能够反映个体认知差异。尽管以往研究表明大脑结构对计算能力发展至关重要，然而较少有研究考察儿童大尺度结构协变网络与计算能力的关系。本研究旨在探讨儿童早期灰质结构协变网络是否有助于解释两年后儿童计算能力的增长速率。为了探究这个问题，我们使用了一个纵向样本数据集，其中包括 63 名正常发育儿童 11 岁的结构磁共振数据以及 11 岁和 13 岁两个时间点的一位数乘法减法行为数据。采用基于网络的统计方法发现，与乘法进步较低的儿童相比，乘法进步较高的儿童 11 岁时表现出一个结构协变显著增强的子网络，这个子网络的节点主要位于额顶、默认和突显网络。利用图论分析发现，乘法进步较高的儿童 11 岁时在额顶-突显网络之间和额顶-默认网络之间表现出更多的连接，而在默认网络内部表现出更少的连接。11 岁的大尺度结构协变网络与一位数减法纵向增长速率未表现出显著相关关系。我们的研究结果表明大尺度结构协变网络有助于解释儿童乘法计算能力的发展差异。本研究为结构协变网络与认知功能的关系进一步提供了证据。

Large-scale structural covariance networks predict longitudinal gain in arithmetic ability in children

Xuejian Ye[a#], Kaijie Zhang[a#], Zheng Lia[a], Tian Ren[a], Bao-ming Li[a], Chunjie Wang[a*]
Institute of Brain Science and Department of Physiology, School of Basic Medical Sciences, Hangzhou Normal University, Hangzhou, China

***Abstract*:** Although a number of studies have indicated the importance of brain structure for arithmetic, it remains unclear whether and how large-scale structural covariance networks support arithmetic development in children. Here, we investigated this important question by using a public longitudinal sample comprising 63 typically developing children. The participants received structural magnetic resonance imaging scanning when they were 11 years old, and were tested with both multiplication and subtraction tasks at 11 years old (Time 1) and 13 years old (Time 2), respectively. Structural covariance was constructed using mean gray matter volumes of regions of interest. By using network-based statistics (NBS), we detected a sub-network containing structural covariance strength among the frontal-parietal, default-mode and salience networks that were positively associated with longitudinal gain in multiplication. By using graph theory, we observed that children who improved over time in multiplication exhibited more between-network connections of salience network with frontal-parietal and default-mode networks but less within-network connections of default-mode network as compared to their peers who did not improve. When comparing children with and without improvement in subtraction, we did not observe any differences in structural covariance. Our findings indicate that children with improvement in multiplication have structural brain differences from those without improvement in the patterns of anatomical coupling among widely distributed cortical regions, possibly resulting to a system-level reorganization that might may contribute to the longitudinal development of multiplication ability.

孤独症谱系障碍的阅读理解缺陷：语言和任务的调节作用

雷硕[1,2] 张茜淼[1,2] 马雪儿[1,2] 李佳慧[1,2] 赵晶晶[1,2]（通讯作者）
1 陕西师范大学心理学院，西安，710062
2 陕西省行为与认知神经科学重点实验室，西安，710062，jingjing.zhao@snnu.edu.cn

摘 要 孤独症谱系障碍（autism spectrum disorder, ASD）的阅读理解缺陷已经在很多研究及元分析中得到证实。然而，很少有研究考察施测语言及阅读理解任务对 ASD 阅读理解缺陷的影响。本研究采用元分析技术，借助大样本检验了 ASD 群体和典型发育（typically developing, TD）群体在阅读理解上的组间差异，并系统探究了施测语言属性和阅读理解任务特征的调节作用。其中，施测语言属性包括书写系统及正字法深度；阅读理解的任务特征包括测验标准化类型、测验材料体裁、测验文本类型、任务难度、任务评估信息、任务作答类型和任务施测方式。元分析共纳入 55 篇文章，111 项独立研究，共计 6375 名被试，包括 2976 名 ASD（M_{age} = 13.98）和 3399 名 TD（M_{age} = 11.97）。结果表明，ASD 存在明显的阅读理解缺陷（g = -0.52, 95% CI [-0.76, -0.41]）。将施测语言属性和阅读理解的任务特征等变量纳入元回归模型，在控制了协变量后，主要结果表明：与表音文字相比，ASD 在施测语言为表意文字的阅读理解任务中的表现更差（β = -1.81, p = 0.019）；与浅层正字法语言相比，当深层正字法语言作为施测语言时，ASD 的阅读理解缺陷更明显（β = -0.82, p = 0.037）。此外，相较于非标准化或自编的阅读理解测验，ASD 在标准化阅读理解测验上具有更

差的表现（β = -0.91, p = 0.046）；与混合型的阅读理解相比，ASD 在仅针对段落或篇章（β = -1.58, p = 0.047）以及在仅针对句子的阅读理解上表现更差（β = -1.38, p = 0.049）；与未提及材料难度相比，ASD 在难度匹配时具有更差的阅读理解表现（β = -0.66, p = 0.017）。测验材料体裁以及任务作答类型对 ASD 和 TD 阅读理解的组间差异均不存在显著的调节作用（ps ≥ 0.080）。研究表明，对于施测语言属性，ASD 在使用表意文字（如中文）和深层正字法语言（如英文）进行阅读理解时会产生更多的困难；研究结果强调了阅读理解任务特征的重要性，在 ASD 的筛查与干预等应用中，应该根据应用场景和任务特点更有针对性地选用适合 ASD 的阅读理解任务。上述结果从任务特征和语言属性的角度为 ASD 的阅读理解缺陷提供了新的见解，并为未来有针对性的干预提供了灵感。

Reading comprehension deficits in autism spectrum disorders: Moderation of languages and tasks

Shuo Lei[1, 2], Ximiao Zhang[1, 2], Xueer Ma[1, 2], Jiahui Li[1, 2], Jingjing Zhao[1, 2*]
1 School of Psychology, Shaanxi Normal University, Xi'an, China, 710062
2 Shaanxi Provincial Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, China, 710062, jingjing.zhao@snnu.edu.cn

***Abstract*：** Individuals with autism spectrum disorder (ASD) often present poorer reading comprehension, a finding substantiated throughout the literature. However, few studies have investigated the moderation of test languages and reading comprehension tasks on reading comprehension deficits in ASD. This research therefore systematically conducted a meta-analysis of large sample to explore group differences and the moderation of test language attributes and task characteristics of reading comprehension between the ASD and typically developing (TD) groups. Test language attributes include writing system and orthography. Task characteristics of reading comprehension include standardized types of tests, test genres, formats of the materials, difficulty, task information assessed, and task types. 55 articles (111 studies) and 6,375 individuals (ASD: 2,976, M_{age} = 13.98; TD: 3,399, M_{age} = 11.97) were included in this meta-analysis. Results suggested that ASD showed worse performance (g = -0.52, 95%CI [-0.76, -0.41]) in reading comprehension, compared with age-matched TD peers. After putting test language attributes and task characteristics of reading comprehension as variables into the meta-regression model, and controlling for covariates, the results mainly found that reading comprehension of ASD was worse on ideographic writing systems (β = -1.81, p = 0.019), compared with alphabetic writing systems; and worse on deep orthographies (β = -0.82, p = 0.037), compared with shallow orthographies; worse on standardized tests (β = -0.91, p = 0.046), compared with unstandardized or researcher-constructed tests; worse on paragraphs or passages (β = -1.58, p = 0.047), and on sentences (β = -1.38, p = 0.049), compared with mix formats; worse on difficulty matched (β = -0.66, p = 0.017), compared with unknown difficulty. Genres and task types had no impact on reading comprehension in group differences between ASD and their TD peers strongly (ps ≥ 0.080). Our study showed that ASD performed more difficulties of reading comprehension on ideographic writing systems (e.g., Chinese), and deep orthographies (e.g., English). And our study emphasized the importance of the task characteristics of reading comprehension. In ASD screening and intervention, reading comprehension tasks suitable for ASD should be selected more pertinently by researchers according to application scenarios and task characteristics. These results advance the understanding of reading comprehension in ASD from the perspective of language attributes and task characteristics, and provide inspiration for future targeted interventions.

汉字手写能力发展轨迹、性别差异及相关心理机制

张傲雪[1,2]　杨炀[1,2]（通讯作者）

1 中国科学院心理研究所行为科学重点实验室，脑科学与学习困难研究中心，北京，100101

2 中国科学院大学心理学系，北京，100049，yangyang@psych.ac.cn

摘 要　本研究旨在探讨汉语学龄儿童汉字手写能力发展特征。研究对象包括 1-5 年级的小学生 240 人，其中男生 139 人。实验一采用 5（年级：一年级，二年级，三年级，四年级，五年级）×2（性别：男，女）的组间设计，通过延迟抄写（delayed copying）任务测量了被试的手写笔迹质量与手写运动指标（手写速度与潜伏期）。结果显示，小学生手写质量呈现非线性增长趋势：一到二年级阶段，手写质量快速提升；而在二到三年级，变化不明显；在三到五年级阶段，再次快速提升。另外，小学生的手写速度和潜伏期（即书写准备阶段到开始书写的时间间隔）也呈现非线性增长。在一到三年级，手写速度快速增长；而在三到五年级，增长幅度相对较小。

实验二进一步探究小学生手写运动能力的发展。为控制高水平认知加工的负荷，本实验采用直接抄写（direct copying）任务。实验二采用 5（年级：一年级，二年级，三年级，四年级，五年级）×2（视觉反馈：有，无）的混合设计。其中，年级为组间变量，视觉反馈为组内变量，因变量为手写平均时间。结果显示，随年级增长，有视觉反馈与无视觉反馈条件的手写平均时间均显著减少。且视觉反馈与年级之间存在交互作用，一、二年级学生有视觉反馈的手写时间比无视觉反馈长，三、四、五年级不受影响。随着年级的增加，学生逐渐更加熟练地控制手写过程，减少了对视觉反馈的依赖性。

本研究还考察了其他认知机制对手写能力的影响。相关分析结果表明，阅读流畅性、工作记忆（逆序数字工作记忆、非词工作记忆）、快速命名能力以及持续性注意（数字划消测试、偏旁划消测试）均与手写质量存在显著相关。同时，阅读流畅性、视觉空间工作记忆、快速命名能力和持续性注意与汉字手写总时间以及潜伏期之间存在显著相关。

综上所述，小学生的手写能力呈非线性增长，视觉反馈仅影响低年级学生手写时间。此外，认知机制与手写能力密切相关。研究结果将有助于改进汉字教学方法，并对儿童读写障碍诊断和干预有帮助。

Development trajectory, gender differences, and related psychological mechanisms of handwriting ability in Chinese characters

Aoxue Zhang[1,2] & Yang Yang[1,2] *

[1]CAS Key Laboratory of Behavioral Science, Center for Brain Science and Learning Difficulties, Institute of Psychology, Chinese Academy of Sciences, Beijing, 100101, China

[2]Department of Psychology, University of Chinese Academy of Sciences, Beijing 100049, China

Abstract：The purpose of this study was to investigate the developmental characteristics of Chinese handwriting ability in Chinese-speaking schoolchildren. The study population consisted of 240 elementary school students in grades 1-5, including 139 boys. Experiment 1 used a 5 (grade: 1st, 2nd, 3rd, 4th, 5th) × 2 (gender: male, female) between-groups design, and measured subject and handwriting handwriting quality and handwriting motor indexes (speed and latency) through a delayed copying task. The results showed that the handwriting quality of elementary

school students showed a non-linear growth trend: at the stage of grades 1 to 2, the quality of handwriting increased rapidly; whereas at the stage of grades 2 to 3, the change was not significant; and at the stage of grades 3 to 5, it increased rapidly again. In addition, elementary school students' handwriting speed and latency (i.e., the time interval between the writing preparation stage and the start of writing) showed a nonlinear increase. In grades one through three, handwriting speed increased rapidly; while in grades three through five, the increase was relatively small.

Experiment 2 further explored the development of handwriting motor skills in elementary school students. To control for the load of high-level cognitive processing, a direct copying task was used in this experiment. Experiment 2 utilized a 5 (grade: 1st, 2nd, 3rd, 4th, 5th) x 2 (visual feedback: yes, no) mixed design. In this case, grade level was the between-group variable, visual feedback was the within-group variable, and the dependent variable was the average handwriting time. The results showed that the mean handwriting time decreased significantly with grade level for both the with and without visual feedback conditions. And there was an interaction between visual feedback and grade level, with students in grades 1 and 2 taking longer to handwrite with visual feedback than without, and grades 3, 4, and 5 were unaffected. As the grade level increased, students gradually became more proficient in controlling the handwriting process, reducing their reliance on visual feedback.

This study also examined the effects of other cognitive mechanisms on handwriting ability. The results of correlation analyses showed that reading fluency, working memory (inverse numerical working memory, nonword working memory), rapid naming ability, and sustained attention (numerical scratch-off test, parabolic scratch-off test) were all significantly correlated with handwriting quality. Meanwhile, reading fluency, visuospatial working memory, rapid naming ability, and sustained attention were significantly correlated with total time spent writing Chinese characters and latency.

In summary, elementary school students' handwriting ability increased nonlinearly, and visual feedback only affected handwriting time in the lower grades. In addition, cognitive mechanisms are closely related to handwriting ability. The results of the study will help to improve the teaching methods of Chinese characters and will be useful for the diagnosis and intervention of dyslexia in children.

父母数学焦虑与家庭数学活动的关系

尧希[1] 李沛沛[1] 李晓敏[1] 朱映艳[2] 邓林园[3] 牟毅[1]

1 中山大学心理学系，广州，510006,mouyi5@mail.sysu.edu.cn

3 北京师范大学教育学部，北京

摘 要　父母自身的数学焦虑可能会阻碍他们对儿童的数学教育，但目前尚不清楚这一消极影响在儿童的什么年龄开始出现。本研究探讨学前儿童父母的数学焦虑与其在家中开展数学活动频率的关系，以及该关系是否受一系列人口学因素调节(家庭收入、父母受教育程度、家庭藏书数量、父母年龄和性别、儿童年龄和性别)。648 名学前儿童的父母(母亲 497 名，女孩 301 名，儿童平均年龄 4.47 岁；年龄范围 3-6 岁)线上报告自己的数学焦虑水平以及在家对儿童开展数学活动的频率。结果表明，数学活动的频率总体上随父母数学焦虑程度的增加而降低，随父母受教育程度、家庭藏书数量和儿童年龄的增加而增加。此外，儿童年龄调节了父母数学焦虑与数学活动频率的关系:当儿童大于 4.5 岁(4.5-6.0 岁)时，父母数学焦虑显著负向预测数学活动的频率(β = -0.21, p < .001)；但当儿童小于 4.5 岁(3.0-4.5 岁)时，父母数学焦虑和数学活动的关系不显著(β = -0.05, p = .38)。该调节作用可能是因为儿童随年龄增加而需要学习的数学内容更复杂，相应的数

学活动对家长的数学教学技巧也要求更高，这些更易触发家长的数学焦虑并回避居家数学活动；该调节也可能因为儿童即将进入小学，家长预计到儿童将面临的数学学业压力且触发自己的数学焦虑并回避数学活动。此外，结果还显示父女间的数学活动频率显著少于父子、母子和母女间的数学活动频率，提示了早期数学居家教育的性别不平等风险。总之，在儿童正式入学前，父母数学焦虑对其居家数学教学的负面影响已经出现，且其在儿童即将进入小学前尤为明显。这些发现也丰富了幼小衔接时期家庭教育的研究内容，并提示需要对父母的数学焦虑进行有针对性的干预。

The relation between parental mathematical anxiety and home-based math activity

Xi Yao[1]　Peipei Li[1]　Xiaomin Li[1]　Yingyan Zhu[2]　Linyuan Deng[3]　Yi Mou[1]

1 Department of Psychology, Sun Yat-sen University, Guangzhou

3 Faculty of Education, Beijing Normal University, Beijing

Abstract: The math anxiety of parents impedes their math parenting to children, but it is unclear from what age of children this negative impact begins to appear. This study examined the relation between parental math anxiety and the frequency of home-based math activities in parents with preschool-aged children, and the possible moderator effects of multiple demographic factors on this anxiety-activity relation, including family socioeconomic status (house income, educational level, amount of household books), and age and gender of parents and children. Totally 648 parents (497 mothers) of preschool-aged children ($Mean_{age}$ = 4.47y, $Range_{age}$ = 3y0m – 6y0m, 301 girls) reported the level of their math anxiety and the frequency of math activities at home through online surveys. The results showed that the frequency of math activities decreased with the level of parental math anxiety and increased with parental educational level, amount of household books, and children's age. Furthermore, the parental math anxiety-activity relation was moderated by children's age: The frequency of math activities significantly decreased with parental math anxiety when their children were older than age of 4.5 years (4y6m – 6y0m) (β = -0.21, p < .001), but this was not the case when children were younger (3y0m – 4y6m) (β = -0.05, p = .38). The moderator effect of children's age may be due to that the math knowledge children learn becomes more complex and abstract as they age, and teaching children this math knowledge may trigger parents' own math anxiety and induce math avoidance. It may also due to that parents with higher math anxiety tend to concern and perceive math learning pressures that children would suffer when moving to elementary school. In addition, regardless of parental math anxiety levels, the frequency of math activities was lowest in the father-daughter dyad, compared to other parent-child dyads (father-son, mother-daughter, and mother-son). This finding may suggest the existing of gender inequality in early math home education. Above all, our findings suggested that the negative impact of parental math anxiety can be observed even before children enroll into elementary school, and this necessitated early interventions for parental math anxiety.

夫妻冲突对幼儿社会技能的影响：家庭经济地位的调节作用

魏舒静　孙圣涛*

(上海师范大学心理学系，上海, 200234)

摘 要 家庭成员之间有着安全的情感联结，和幼儿的社会技能关系密切。而夫妻冲突对幼儿社会技能的影响尤其受到研究者们的广泛关注。本研究采用追踪设计旨在探讨夫妻冲突对幼儿社会技能的影响，以及家庭社会经济地位在其中的调节作用。采用 Liang 等人（2015）编制的父母冲突问卷和孙圣涛等人（2017）制定的幼儿社会技能家长评定问卷对 290 名幼儿家长进行调查，以分别测量夫妻之间的冲突水平和幼儿社会技能。在第一年时，父母报告了夫妻冲突和幼儿社会技能以及家庭社会经济地位；在第二年时，父母报告了幼儿的社会技能。研究结果显示：（1）夫妻冲突与幼儿社会技能显著相关，夫妻冲突越低，幼儿的 T1、T2 的社会技能越高；（2）家庭社会经济地位在夫妻冲突与幼儿 T1 社会技能间的调节作用不显著；家庭社会经济地位在夫妻冲突与幼儿 T2 社会技能间的调节作用显著。在高家庭社会经济地位中，夫妻冲突对幼儿社会技能的负面影响有所缓解。研究结论为幼儿父母努力改善父母关系提供了新的方向，从而共同为幼儿营造一个安全、温暖的环境，以促进幼儿社会技能的发展。

The impact of martial conflict on young children's social skills: the moderating role of family economic status

Wei Shujing， Sun Shengtao*

(Department of Psychology, Shanghai Normal University, Shanghai 200234, China)

Abstract: Family members have a secure emotional bond with each other, which is closely related to young children's social skills. However, the influence of marital conflict on young children's social skills has attracted extensive attention from researchers. The purpose of this study is to explore the influence of marital conflict on children's social skills and the moderating role of family socioeconomic status. The parental conflict questionnaire compiled by Liang et al. (2015) and the Parental Assessment questionnaire for social skills of young children developed by Sun Shengtao et al. (2017) were used to investigate 290 parents of young children to measure the conflict level between husband and wife and the social skills of young children respectively. In the first year, parents reported spousal conflict and young children's social skills and family socioeconomic status; In the second year, parents reported on their toddlers' social skills. The results show that: (1) there is a significant correlation between marital conflict and children's social skills. The lower the marital conflict, the higher the children's social skills of T1 and T2; (2) Family socioeconomic status has no significant moderating effect on spousal conflict and children's T1 social skills; Family socioeconomic status has a significant moderating effect on spousal conflict and children's T2 social skills. In high family socioeconomic status, the negative impact of marital conflict on children's social skills was mitigated. The conclusion of this study provides a new direction for parents of young children to strive to improve the parental relationship, so as to jointly create a safe and warm environment for

young children to promote the development of social skills.

日常亲子关系模式与青少年情绪问题的关系：基于多水平潜在剖面分析

安也[1] 王慧[2] 徐健捷[1] 车俐颖[1] 刘思含[1] 曹惠婷[1] 胡月琴[1] 韩卓[1]（通讯作者）

1 北京师范大学心理学部，北京，100875，rachhan@bnu.edu.cn

2 北京师范大学珠海校区文理学院，珠海，519087

摘 要 青少年与父母的关系模式与他们的情绪问题密切相关。然而，以往研究对亲子关系在日常生活中的模式特征关注不足。本研究采用最新的多水平潜在剖面分析（multilevel latent profile analysis, MLPA）的方法，探究在日常生活中青少年与父母的潜在关系模式，并进一步比较在不同关系模式的家庭中青少年的情绪问题水平的差异，以期从日常亲子关系的角度为干预青少年情绪问题提供思路。**方法：**315 名青少年（48.3%为女孩；平均年龄 13.05±0.77 岁）在基线调研阶段汇报总体焦虑和抑郁症状的程度，并连续两周（每周一至周五，共 10 天）每天填写亲子关系（即母子亲密、父子亲密、母子冲突和父子冲突）日记。通过对日记数据进行多水平潜在剖面分析分别得到两个水平的亲子关系潜在模型：即，第一水平（日常层面），根据所有天数中对多种亲子关系成分得分来确定每日亲子关系模式；第二水平（家庭层面），根据不同亲子关系模式的天数比例对不同家庭间的整体亲子关系模式进行分类。**结果：**日常层面的分析中，母子关系和父子关系在不同的剖面中是一致的，确定了四种剖面所占天数的比例情况："亲密日"（高亲密低冲突；占所有天数的 35.2%）、"疏离日"（低亲密低冲突；占所有天数的 50.8%）、"平稳日"（中等亲密中等冲突；占所有天数的 7.8%）、"冲突日"（低亲密高冲突；占所有天数的 6.2%）。在家庭层面的分析中，确定了三种剖面："稳定亲密"型家庭（占所有青少年的 38.4%），在这种家庭中日常的典型亲子关系模式是高亲密和低冲突；"稳定疏离"型家庭（占所有青少年的 50.4%），在这种家庭中日常的典型亲子关系模式是低亲密和低冲突；"不稳定冲突"型家庭（占所有青少年的 11.2%），在这种家庭中日常亲子关系是不稳定的，特点是在冲突层面变化很大。进一步分析发现，相比"稳定亲密"型家庭的青少年，"稳定疏离"型和"不稳定冲突"型家庭的青少年报告的焦虑和抑郁症状水平会更高，而"稳定疏离"型和"不稳定冲突"型家庭青少年间的抑郁焦虑症状水平没有明显差异。**讨论：**本研究首次揭示了青少年亲子关系模式在日常和家庭层面中存在不同的模式。由于中国传统文化价值观念强调对情感表达的克制和约束，参与本研究的家庭普遍存在着亲子关系疏离的现象：青少年与家长之间虽然没有过多冲突，但青少年与父母之间的亲密程度也很低，长时间亲子关系疏离的家庭会损害青少年的情绪健康。研究启示当代中国父母在对待青少年时应当表现出更多的爱意，让他们感知到更为亲密的亲子关系，同时多与青少年交流、理解他们的内心世界，有效化解亲子冲突。

关键词 亲子关系，情绪问题，多水平潜在剖面分析

Daily Parent-Adolescent Relationship Patterns and Adolescent Emotional Symptoms among Chinese Families: A Multilevel Latent Profile Analysis

Ye An[1], Hui Wang[2], Jianjie Xu[1], Liying Che[1], Sihan Liu[1], Huiting Cao[1], Yueqin Hu[1], Zhuo Rachel Han[1]*

[1] Faculty of Psychology, Beijing Normal University, China

[2] Department of Psychology, Faculty of Arts and Sciences, Beijing Normal University at Zhuhai, Zhuhai, China

***Abstract*:** Patterns of parent-adolescent relationship are closely associated with adolescent emotional symptoms (Miller et al., 2000; Qu et al., 2021). However, few prior studies have examined the dynamic configurations of the fine-grained components of parent-child relationships (e.g., closeness vs. conflict, father-adolescent relationship vs. mother-adolescent relationship). In addition, most studies have ignored the cultural specificity of parent-adolescent relationships. The present study employed an innovative technique – multilevel latent profile analysis (MLPA) – to identify daily- and family-level parent-adolescent relationship patterns. The adolescent emotional symptoms (i.e., depressive and anxiety symptoms) were then compared across distinct subgroups at the family-level. **Methods:** The study involved 315 Chinese adolescents (48.3% girls; M_{age} = 13.05 years, *SD* = 0.77 years) who completed daily diaries on four components of parent-adolescent relationships (i.e., mother-adolescent closeness, father-adolescent closeness, mother-adolescent conflict, and father-adolescent conflict) on school days of 2 consecutive weeks. Adolescents also reported their overall anxiety and depressive symptoms at baseline. In the MLPA model with daily diary data, the Level 1 model identified daily parent-adolescent relationship patterns based on daily reports of multiple parent-child relationship components across all days. The Level 2 model classified subgroups of adolescents based on the proportions of days of each parent-adolescent relationship patterns identified in Level 1 model. **Results:** At the daily level, both mother-adolescent and father-adolescent relationships exhibited consistency across profiles. MLPA at Level 1 identified four profiles across days (see Figure 1 for more details): "Intimate" (35.2% of all days), "Disengaged" (50.8% of all days), "Average" (7.8% of all days), and "Conflictual" (6.2% of all days). At the family level, three profiles were identified (Figure 2): "Stable intimate" family (38.4% of all adolescents), in which adolescents' typical daily relationship patterns with their parents were high in closeness and low in conflict; "Stable disengaged" family (50.4% of all adolescents), in which adolescents' typical daily relationship patterns with their parents were low on both closeness and conflict; and "Unstable conflictual" family (11.2% of all adolescents), in which adolescents' daily relationship patterns with their parents were unstable, characterizing by large variability at the conflict levels. Comparing the emotional symptoms of adolescents across these family profiles, it was observed that adolescents in both "Stable disengaged" and "Unstable conflictual" families reported higher levels of anxiety and depressive symptoms when compared to those in "intimate" families. **Discussion:** Embedded in Chinese culture, the present study extends previous research by identifying diverse configurations of parent-adolescent relationship patterns at both daily and family levels. Although there were no excessive conflicts between the adolescents and their parents, it was prevalent in the Chinese families in this study for adolescents to be perceived as being disengaged from their parents. This could be caused by the cultural emphasis on emotional restraint in China. Similar to families with parent-child conflicts, prolonged parent-child detachment can also harm adolescents' emotional well-being. Thus, Chinese parents are suggested to show more affection and reduce punishment and criticism towards their children.

Keywords： Parent-Adolescent Relationship，Emotional Symptoms，Multilevel Latent Profile Analysis

消极情绪性的潜在结构与青少年内外化问题的跨诊断及特异性关联：性别的调节作用

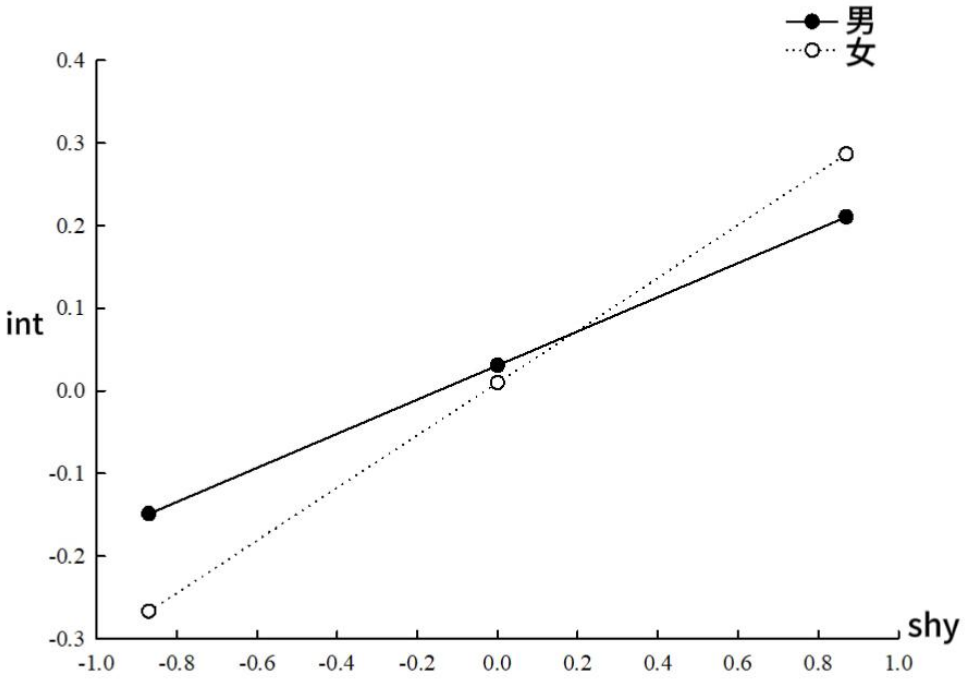
蔡晴雨[1] 杜舒[1] 张良[1] 纪林芹[1] 张文新[1]（通讯作者）

1 山东师范大学心理学院，济南，250014

摘 要 消极情绪性（Negative Emotionality）这种气质特质与多种心理病理问题有密切关系，是常见的跨诊断因素之一。根据 p 因子理论，内化和外化心理病理问题可以用一个包含一般精神病理学因子（general psychopathological factor；即 p 因子）和内化与外化问题独特因子的双因子结构来表征，其中各种心理病理问题共有的一般心理病理问题倾向被表征为 p 因子。有研究发现 p 因子与消极情绪性之间在表型水平和遗传水平上高度相关，然而，消极情绪性作为一个多维构念，它的不同方面与心理病理问题各潜在因子之间的关系还尚未明晰。因此，本研究拟以双因子模型范式界定消极情绪性的潜在结构，并进一步考察消极情绪性的不同因子（一般因子及独特因子）与心理病理问题 p 因子及独特因子的关系，从而确定消极情绪性的各因子能否作为心理病理问题的跨诊断风险因素或特异性风险因素，以及性别在其中的调节作用。通过在青少年样本中（N=1273）对单因子模型、相关因子模型、高阶因子模型和双因子模型等竞争模型进行比较，结果发现：（1）对于消极情绪性和心理病理问题，双因子模型都具有最佳拟合；消极情绪性的潜在结构包括一个一般消极情绪性因子（将其命名为 n 因子）和两个独特因子（羞怯、易受挫），心理病理问题的潜在结构包括 p 因子及内化、外化独特因子。（2）n 因子、羞怯因子、易受挫因子均能正向预测 p 因子，羞怯因子正向预测内化因子，易受挫因子正向预测外化因子，表明 n 因子是心理病理问题的跨诊断风险因素，而羞怯因子和易受挫因子分别是内化问题和外化问题的特异性风险因素。（3）性别在羞怯因子与内化因子之间存在调节作用，具体表现为羞怯因子与内化问题因子的关联在女生中更强。本研究结果支持了气质与心理病理问题的易感性模型（vulnerability model），并展示了细致区分气质的深层结构在揭示气质与心理病理问题间关系上的重要性。

关键词 消极情绪性，气质，心理病理问题，双因子模型

The Transdiagnostic and Specific Associations Between Latent Constructs of Psychopathology Symptoms and Negative Emotionality in Adolescence: the Moderate Role of Gender



Qingyu CAI[1]; Shu Du[1]; Liang ZHANG[1]; Linqin Ji[1]; Wenxin ZHANG[1]

School of Psychology, Shandong Normal University, Jinan, 250358

Abstract：Negative Emotionality (NE) is a transdiagnostic factor of psychopathology, which is highly associated with common mental and behavioral problems. According to the p factor theory, latent psychopathology construct includes a general common psychopathology factor (p factor) and specific latent internalizing and externalizing factor, as captured by a bifactor model. And the p factor represents co-occurrence between internalizing and externalizing problems. Some studies have found NE highly correlated with p factor at the phenotypic and genetic level. However, NE is a multidimensional construct, less is known about how lower-order facets of NE relate to each psychopathology factor. Therefore, we investigated the latent construct of NE and psychopathology by using

bifactor model, and we further examined the transdiagnostic and specific associations between latent constructs of psychopathology and NE, as well as the moderating role of gender. By comparing competing models (the one factor model, the correlated factor model, the higher order factor model, and the bifactor model) in a sample of youths (N = 1273), we found that (1) both the bifactor model of NE and psychopathology had best fit, with the latent structure of NE consisting of a general NE factor (named the n factor) and two specific factors (shyness, frustration), and the latent structure of psychopathology consisting p factor, internalizing and externalizing factor; (2) The n factor, shyness factor, and frustration factor all positively predicted the p factor, with the shyness positively predicting the internalizing factor and the frustration factor positively predicting the externalizing factor, suggesting that the n factor is a transdiagnostic risk factor for psychopathology, and that the shyness and frustration are specific risk factors for internalizing and externalizing problems, respectively; (3) Gender had moderate effect between the shyness factor and the internalizing factor. Specifically, the association between the shyness factor and the internalizing factor was stronger in girls. The results of this study support the vulnerability model of temperament and psychopathology and demonstrate the importance of carefully distinguishing the deep structure of temperament in revealing the relationship between temperament and psychopathology.

青春期早期欺凌受害与抑郁：生命意义感的中介作用与压力观的调节作用

吕沐华[1]　熊昱可[1]　陈嘉慧[1]　任萍[1]（通讯作者）
1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875
通讯作者 E-mail：renping@bnu.edu.cn

摘 要　欺凌受害是校园环境中严重的负性压力事件，在国内外青少年群体中普遍存在。欺凌受害会对青少年心理健康状况造成较高程度的负面影响，如产生抑郁等内化问题，受到国家和研究者的广泛关注。既往研究表明，欺凌受害是青春期早期抑郁的一个重要风险因素，然而并不是所有青少年都会经历抑郁，因此探究这一过程可能存在的缓冲因素及其作用机制具有重要理论意义及干预价值。压力观（Stress Mindset）是指个体关于压力对压力相关结果带来影响的一般观念，如压力会积极促进相关结果的产生（压力增强观），反之，压力削弱相关结果的产生（压力削弱观），压力增强观被认为是面对压力源的一种缓冲因素。本研究以陕西省 3547 名七年级学生（52.4%男生；M_{age} = 12.36；SD = 0.50）为研究对象，开展了横跨两学期的两次追踪调查，考察了欺凌受害与青春期早期抑郁的关系，以及生命意义感在二者之间的中介作用和压力观的调节作用。结果发现：（1）T1 欺凌受害显著正向预测青少年 T2 抑郁；（2）T1 生命意义感在 T1 欺凌受害与 T2 抑郁的关系中起部分中介作用；（3）在中介模型中，T1 压力观调节了 T1 欺凌受害对 T1 生命意义感的影响。具体而言，当压力观更为积极（压力增强观）时，欺凌受害与生命意义感的负相关显著弱于压力观更为消极（压力削弱观）时。这些发现为改进现有的欺凌受害干预措施提供了帮助，改善青春期早期青少年的压力观，可以明显减少欺凌受害对青少年生命意义感的影响，进而阻断欺凌受害与青少年抑郁之间的联系。

Peer Victimization and Depressive Symptoms among Early Adolescents: A Moderated Mediation Model of Meaning in Life and Stress Mindset

Muhua Lyu[1]　Yuke Xiong[1]　Jiahui Chen[1]　Ping Ren[1] *
1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, 100875

Abstract：Bullying victimization is a serious negative stress event in schools, which is widespread among early adolescents. The experience of bullying victimization has long-lasting deleterious effects on adolescents' mental health, such as depressive symptoms and other internalizing problems, which has attracted wide attention from governments and researchers. Previous literature has shown that bullying victimization is an important risk factor for depressive symptoms among early adolescents. However, not all adolescents will experience depressive symptoms. Therefore, it is of great theoretical significance and intervention value to explore the possible buffer factors and their mechanism of action in this process. Stress mindset has been defined as the extent to which one holds the belief that stress has enhancing consequences for various stress-related outcomes such as personal growth (referred to as a "stress-is-enhancing mindset") or the belief that stress has debilitating consequences for such outcomes (referred to as a "stress-is-debilitating mindset"). Stress-is-enhancing mindset is considered a buffer

factor in the face of stressors. Using a short-term longitudinal design, two-wave data were obtained from 3,547 Chinese adolescents (52.4% boys at Time 1 (T1); M_{age} = 12.36; *SD* = 0.50) from 76 classes over 6 months. The present study examined the mediating effects of meaning in life and the moderating effect of stress mindset on the association between bullying victimization and depressive symptoms. The results showed that: (1) T1 bullying victimization positively predicted T2 depressive symptoms among early adolescents. (2) T1 meaning in life played a partly mediating role in the relationship between T1 bullying victimization and T2 depressive symptoms. (3) Within the mediating model, T1 stress mindset moderated the effect of T1 bullying victimization on T1 meaning in life. Specifically, when the stress mindset was more like stress-is-enhancing, the negative correlation between bullying victimization and meaning in life was weaker than when the mindset was more of a stress-is-debilitating mindset. These findings provided support for improving existing bullying victimization interventions. Specifically, enhancing the adolescents' stress mindset can significantly reduce the impact of bullying victimization on meaning in life, and thus block the link between bullying victimization and depressive symptoms among early adolescents.
Keywords ： bullying victimization, depressive symptoms, meaning in life, stress mindset, early adolescents

登州文会馆开设心理学课程的考辨

阎书昌

河北师范大学心理学系，石家庄 050024，通讯作者 yanshuchang@126.com

摘 要 中国近代心理学史上的历史事件具有重要的参照价值，例如，哪些人，何时在开设心理学课程？最近笔者看到在山东登州文会馆首次开设心理学课程的时间问题上仍存在着疑问，诸如是 1876 年抑或 1877 年，是狄考文开设心理学课程吗？他有心理学背景性知识吗？登州文会馆是中国最早开设心理学课程的吗？本文希望呈现出登州文会馆心理学课程开设的过程、译称等问题，进而其内部争议及其与中国文化的联系。早在 1877 年 9、10 月，狄考文专门写了一篇文章时，就提到用“soullaw”来表示心理学（psychology）并不是合适的一种选择。1891 年印行的《登郡文会馆典章》中“文会学馆课程”中并没有心灵学课程，1891 年出版的英文的《登郡文会馆要览》中也未见心灵学课程。根据 1895 年 1 月文凭原件的影印件中有第一年开设的“诗文”课程而不是“策论经学”，而据刊印于 1913 年的登州文会馆文凭样式文凭样式中有“策论经学”，可以判断该文凭大致可能于 1896 至 1904 年之间（1904 年登州文会馆迁往潍县，更名为广文学堂），因此，可以判断出现心理学课程的时间，大致也是在这个时间段里。狄考文自身具有一定的心理学知识背景，在他对 psychology 的汉语译制，及对丁韪良著作的评述中可以看出，他对中国传统文化在译语创制中作用的认可。

关键词 登州文会馆，狄考文，心理学课程

On the Psychology Course in Tengchow College

Yan Shuchang

(Department of Psychology, Hebei Normal University, Shijiazhuang 050024)

Abstract： Historical events in the history of modern Chinese psychology have important reference values, for

example, who and when were psychology courses being offered? Recently, I have seen that there are still questions about the timing of the first psychology course at the Shandong Dengzhou Wenhui Hall, such as whether it was 1876 or 1877, and whether it was Di Cowen who offered the psychology course? Did he have background knowledge of psychology? Was the Dengzhou Wenhui Hall the first in China to offer a psychology program? This paper hopes to present the process of the opening of the psychology program at the Dengzhou Wenhui Hall, the translation of its name, and then its internal controversy and its connection with Chinese culture. As early as September or October 1877, Mateer wrote an article specifically mentioning that the use of "soullaw" to mean psychology was not a suitable choice, and that the "登郡文会馆典章" printed in 1891 did not have a course of study in psychology. There is no course on psychology in the 文会学馆 Curriculum in the "登郡文会馆要览" printed in 1891. According to the photocopy of the original diploma of January 1895, the first year of the course "诗文" was offered instead of "策论经学" and according to the style of the diploma of the Tengchow College, which was printed in 1913, the style of the diploma includes "策论经学" so it can be judged that the diploma was probably issued between 1896 and 1904. Therefore, it can be judged that the emergence of the psychology course was roughly in the same time period. Mateer himself has some intellectual background in psychology, and his recognition of the role of traditional Chinese culture in the creation of translations can be seen in his Chinese translations of psychology, and in his comments on the writings of W. A. P. Martin.

警惕脑神经科学的决定论陷阱

李莉莉 [1, 2]

1 新疆师范大学心理学院，乌鲁木齐，830017

2 新疆心智发展与学习科学重点实验室，乌鲁木齐，830017

通讯作者 E-mail: bluebird555@163.com

摘 要 神经决定论将脑或神经活动看作个体心理、行为和社会性的原因，力图通过对脑神经活动的探究来解释和控制人的心智。神经决定论有三个核心命题：（1）行为的原因并非意识，一个先于意识的神经活动才是行为的真正原因，自由意志不过是一种幻觉；（2）人类的心理和社会属性可以通过找到相应的脑神经结构进行解释；（3）心理或精神异常的原因在于脑的结构和机能异常,修缮神经，可以治愈心灵。通过否证以上三个命题，人们将看到神经决定论的逻辑错误及其可能的危险。

首先，意识或自由意志不能被看成是一种幻觉。因为：（1）神经决定论借以否定自由意志的实验论据存在错漏，且重现了实验研究的方法论困境。同时，意识不是动作意向的额外发起者，动作意向本身就是意识。（2）从脑与意识的关系看，意识是脑进化来的机能，在个体经验世界中，意识是脑的代理。从脑进化出意识以更好地适应环境这一点来说，脑并非是在制造幻觉。

其次，遗传的脑神经结构并非心理和社会属性的全部原因。脑结构的遗传决定论传递出的观念是，脑内的神经细胞有其与生俱来的角色，正是它们才使个体拥有了相应的心理机能和社会属性，并执行相关行为。这一观念忽略了三个事实。第一，人脑神经元功能的特异性以更为原始、低阶的功能为基础；第二，机能是先天的，但机能的内容是环境文化的；第三，神经细胞和神经系统的可塑性，决定了学习和经验可以对脑的机能和结构产生影响，脑的发育和心智的发生是一个与环境互动的过程。

最后，修复脑不能治愈心灵。与脑的系统性和复杂性相比，人们对它仍然知之甚少。通过修复脑来治愈心灵的生物学立场，忽略了脑是一个融合内外世界信息的意义处理系统。如果心理和行为症状是处理和加工病理性冲突的结果，那么它们必须经由同样的心理加工机制才能得以消除。

自我、灵魂、自由意志是人成为一个有意识存在之后对自身的假定，也是自我从物理世界的挣脱。因此，“脑是心理的器官”这一断言不能作为还原论和决定论的充足依据。

Be Alert to the Determinism Trap of Brain and Neuroscience

LI-Lili

School of Psychology, Xinjiang Normal University, Urumqi 830017

Xinjiang Key Laboratory of Mental Development and Learning Science, Urumqi 830017

Abstract: Neurological determinism regards the brain or neural activity as the cause of individual psychology, behavior and sociality, and tries to explain and control the human mind through the exploration of cranial nerves activity. There are three core propositions in neurological determinism: first, the cause of behavior is not consciousness, there is a neural activity prior to consciousness, which is the real cause of behavior, and free will is just an illusion; second, The psychological and social attributes of human beings can be explained by finding the corresponding brain nerves and their structures, which are responsible for all our psychological, behavioral and social attributes; the third, the cause of psychological or mental abnormality lies in the abnormal structure and function of brain nerves and insist that repairing the nerves can cure the mind. By questioning and disproving the rationality of these three propositions, one will see the logic errors of neurological determinism and its possible dangers.

First, consciousness or free will cannot be regarded as an illusion. There are three reasons. (1) The errors and omissions of the experimental argument by which neurological determinism negates free will reproduces the riddle of the quantum dilemma of physics that is, the methodological dilemma of experimental research. At the same time, consciousness is not the additional initiator of action intention, the action intention itself is also consciousness. (2) From the relationship between brain and consciousness, consciousness is an evolved function of brain. In the experience world of individuals, consciousness is the agent of the brain. From the point that the brain evolved the individual's consciousness function to better adapt to the environment, the brain is not producing a hallucination.

Secondly, the hereditary brain neural structure is not the whole reason for the psychological and social attributes. The idea conveyed by this claim is that the neural cells in our brain have their innate roles and functions. It is precisely the neural cells that enable individuals to have corresponding psychological and social attributes and perform relevant behaviors. This concept obviously ignores three facts. First, the specificity of human brain neuron function is based on more primitive and low-order function. Second, function is innate, but the content of function is environmental and cultural. Thirdly, the plasticity of nerve cells and nervous system determines that learning and experience can affect the function and structure of the brain, the development of brain and the generation of mind is a process of interaction with the environment.

Finally, repairing the brain cannot cure the mind. Compared with the systematization and complexity of the brain, we still know little about it. The biological standpoint of healing the mind by repairing the brain ignores that the brain is a meaning processing system that integrates the information of the internal and external world. If psychological and behavioral symptoms are the result of processing and processing pathological conflicts, they must be eliminated through the same psychological processing mechanism.

Self, soul and free will are the assumptions of human beings after becoming a conscious existence, and also the breakaway of self from the physical world. Therefore, the assertion that "Brain is the organ of mind" cannot be used as a sufficient basis for reductionism and determinism.

Keywords: neurological determinism, consciousness, free will

理想心理学的伦理挑战

刘雨纯[1]　曾祥龙[1]（通讯作者）
1 北京师范大学心理学部，北京，100875，xzeng@bnu.edu.cn

摘 要　儒释道等中国传统哲学蕴涵了丰富的心理学思想和修行体系，其有别于西方心理学的重要特色为追求理想心理（值得追求、但尚未实现的心理）。当代学者受此启发，提出理想心理学，将心理学的研究范围从既存心理扩展至理想心理。理想心理学提出采用设计、实现、评估之循环的方法来研究和实现理想心理，并提出了重视干预、重视价值澄清等具体的原则。目前理想心理学的实证研究数量较少，尽管有第二代正念干预部分采用了理想心理学的具体原则，如在干预时强调价值澄清，但尚未有研究按照设计、实现、评估之循环的方法，从无到有研究一个新的理想心理。限制理想心理学实践的因素之一，就是如何在伦理上，论证一种理想心理是值得培养的。实际上，理想心理学已将伦理方面的论证作为“设计”的重要方面，即已经意识到了这个问题的重要性，但并未给予清楚的回答。目前理想心理学理论中涉及的理想心理，往往来自佛学（如涅槃）和儒家（如天人合一），即以传统来论证理想心理值得追求。但这一策略依然存在诸多问题。首先，如何确保在具体的历史与现实条件下，这些理想心理依然是有益的、值得追求的？其次，不同传统的理想心理及其背后的价值观，经常是相互冲突的。这也意味着当代的心理学实践，依然要选择某种价值观为理想心理提供论证。并且，理想心理学强调理想心理不止来源于传统，未来也可以提出新的理想心理。这也意味着过度依靠传统是行不通的，新的理想心理需要其它方式论证其值得追求。此外，既然理想心理是被人为设计、尚未经过实证研究的，如何确保其实现的过程和结果对接受干预者安全且无伤害，也是伦理上需要关注的议题。尽管理想心理学在伦理层面尚有很多问题需要探讨，但其指向尚未实现之心理的研究方向，无疑拓展了心理学的领域，符合心理学未来发展的趋势；并且，即使是针对既存心理的研究，也会涉及对干预目的的论证，因此心理学界应对上述问题给予更多重视。

Ethical challenges in ideal psychology

Yuchun LIU[1], Xianglong ZENG[1]
Faculty of Psychology, Beijing Normal University, Beijing

***Abstract*：** Chinese spiritual traditions such as Confucianism, Buddhism, and Taoism contain a lot of psychological ideas and practice systems. An important feature that distinguishes them from Western psychology is the pursuit of ideal mentalities (mentalities that are desirable but have not yet been achieved). Inspired by them, contemporary scholars proposed ideal psychology, expanding the research scope of psychology from existing mentalities to ideal mentalities. Ideal psychology proposes the cycle of design, achieve and evaluate as the method to study and realize ideal mentalities, and puts forward specific principles such as emphasizing intervention and value clarification. The number of empirical studies on ideal psychology is currently small. Although some Second-Generation Mindfulness-Base Interventions partially adopt specific principles of ideal psychology, such as emphasizing value clarification in intervention, no research has designed, achieved and evaluated new ideal mentalities from scratch. One of the factors that limits the practice of ideal psychology is how to ethically demonstrate that an ideal mentality is worth pursuing. In fact, ideal psychology has made ethical arguments an important aspect of "design", i.e., scholars have recognized the importance of this issue, but have not given a clear answer. Ideal mentalities involved in the current theory of ideal psychology often come from Buddhism (such as nirvana) and Confucianism (such as oneness), that is, using tradition to argue the ideal mentality is worth pursuing. But there are still many problems of this strategy. First, how to ensure that under specific historical conditions,

these ideal mentalities are still beneficial and worth pursuing for human beings? Second, ideal mentalities of different traditions and the values behind them often conflict with each other, which means that contemporary psychological practice still has to choose certain values to provide arguments for ideal mentalities. Moreover, ideal psychology emphasizes that ideal mentalities not only come from tradition, new ideal mentalities also can be proposed in the future, which means that over-reliance on tradition will not work. New ideal mentalities need other ways to argue that they are worth pursuing. In addition, since ideal mentalities are artificially designed and has not been empirically studied, how to ensure that the processes and results of its realization are safe and harmless to the recipient of the interventions, which is also an important ethical concern. Although ideal psychology still has many issues to be explored at the ethical level, the research direction towards mentality that has not yet been achieved undoubtedly expands the field of psychology and is in line with the future development trend of psychology. Moreover, even research on existing mentalities also involve arguments for the purpose of intervention, so the psychology community should pay more attention to the above issues.

摘 要 我国心理健康研究发轫于民国时期，是在引介西方儿童心理学、心理测验及心理卫生研究成果的基础上，立足我国本土问题研究而逐渐兴起的。根据研究侧重点的变化，民国时期的心理健康研究可分为三个发展阶段：第一个阶段为引介国外研究期，时间上大致介于民国成立（1912 年）到心理健康学科创立（1930 年）之间。这一阶段的典型特征是开始重视心理健康问题，大力引介西方研究成果，但本土化研究较少。第二阶段为注重本土研究期，时间上大致介于 1930 年-1936 年之间。这一阶段的典型特征是心理健康学科正式建立，本土化的心理健康研究全面展开。第三阶段为服务普通大众期，时间上介于 1937 年-1949 年之间。这一阶段的典型特征是把心理健康研究的重心从高校转向社会，重视普通民众的心理健康。民国时期的心理健康研究内容主要有三方面：其一是儿童心理健康研究。这是民国时期心理学家特别重视的一个研究领域，他们注重考察儿童心理问题产生的根源，并在此基础上提出相应的干预措施，民国时期的心理学家还非常重视训育的育心功能，强调学校教育要能够促进儿童的心理健康。其二是心理健康测评研究。伴随国际心理测验运动的发展，民国时期的智力测验、人格测验、心理问题评估等研究发展迅速，且被广泛运用于诸多领域，成为研究者帮助国人解决心理健康问题的重要依据。其三是精神分析学说研究。以高觉敷、丁瓒等为代表的研究者不仅开展了大量关于精神分析的理论研究，而且还特别注重该理论在心理健康实践中的应用。归结而言，民国时期的心理健康研究具有鲜明的科学性、本土性与应用性特征，研究中体现出的爱国主义情怀、服务人民福祉以及扎根中国大地的精神，对于今天开展心理健康研究依然具有重要的现实意义。

Abstract：The research on mental health in China originated in the period of the Republic of China, which was based on the research results of western child psychology, psychological test and mental health, and established in the research on local problems in China. According to the point of research focus, the mental health research in the period of the Republic of China can be divided into three stages: the first stage is the period of introducing foreign research, roughly between the foundation of the Republic of China (1912) and the establishment of the discipline of mental health (1930). The typical characteristic of this stage is to pay attention to mental health problems and to introduce some western research results, but less focus on localized research. The second stage is the period of focusing on indigenous research, which is mainly between 1930 and 1936. The typical characteristic of this stage is the formal establishment of mental health discipline and the comprehensive development of localized mental health research. The third stage is the service period for the public, which is between 1937 and 1949. The typical characteristic of this stage is to shift the focus of mental health research from universities to society and pay attention to the mental health of ordinary people. The research on mental health in the period of the Republic of China mainly includes three aspects: first is the research on children's mental health. Psychologists during the period of the Republic of China paid special attention to this research field. They focus on the key causes of children's psychological problems and put forward corresponding intervention measures on this basis. Psychologists in the period of the Republic of China also attached great importance to the nurturing function of discipline and emphasized that school education should promote children's mental health. The second is the study of mental health evaluation. With the development of the international psychological test movement, the research on intelligence test, personality test and psychological problem assessment developed rapidly during the period of the Republic of China, which was widely used in many fields and became an important basis for researchers to help Chinese people solve mental health problems.Last is the study of psychoanalysis. The researchers represented by Gao Juefu and Ding Zan have not only carried out a lot of theoretical research on psychoanalysis, but paid special attention to the application of the theory in the practice of mental health as well. In summary, the research on mental health in the Republic of China has distinct scientific, local and applied characteristics. The patriotism, the spirit of serving the people's well-being and taking root in the land of China reflected in the research are still of important practical significance for the research on mental health today.

3 清华大学外国语言文学系，北京，100084

摘 要　大量心理学研究表明，人们倾向于表现出自我服务偏差（或自我优势）。一方面，传统认知心理学研究表明，与自我相关的信息（如面孔、名字等）在认知任务（包括记忆、注意、知觉等）中得到了更好的加工。这类研究大多以认知任务中的反应时、准确率等为指标，体现出了基于任务表现（performance）的自我优势。另一方面，使用传统社会心理学方法的研究发现，个体对于自己或与自己相关的物品给出相对于他人而言更高（甚至不切实际）的评价。这类研究大多以外显或内隐的主观评价为指标，体现出了基于效价（valence）的自我优势。虽然以往研究证明了这些自我优势在不同文化中的存在，但这些研究中往往都只涉及到了其中 1 种实验范式。本研究选取了 7 种基于任务表现的自我优势实验范式（例如自我参照记忆、自我面孔视觉搜索等）和 3 种基于效价的自我优势实验范式（例如自我增强、内隐联想测验等），同时测量了自我报告的个体差异变量（如自我建构、大五人格、幸福感、自尊等），从而建立起中国人个体层面的自我优势数据库。在这一数据库的基础上，我们将探索：（1）中国人在以上实验任务中能否表现出自我优势；（2）不同实验范式测得的自我优势量级之间是否存在关联；（3）自我优势可以被分为几类，是否可以从通过不同实验范式得到的自我优势中提取出共有因素。初步研究结果（N = 54）显示，中国被试群体在以上 10 种实验范式的 7 种中，表现出了显著的自我优势。探索性因素分析的结果表明，这些自我优势大致可以被分为 4 类。本研究将有助于我们深入了解中国文化背景下自我优势的表现形式，并为进一步探索不同类型的自我优势之间的关联提供了数据基础。

The database of Chinese People’s Self-biases

Yuxuan Qi [1], Fengjie Zou [3], Michelle Zhou [1], Xi Ying Chau [1], Kaiping Peng [1, 2], & Fei Wang [1, 2]
1 Department of Psychology, Tsinghua University, Beijing, China
2 The Centre for Positive Psychology Research, Tsinghua University, Beijing, China
3 Department of Foreign Languages and Literatures, Tsinghua University, China

Abstract: Numerous psychological studies have shown that people tend to exhibit self-serving biases. On the one hand, traditional cognitive psychological research indicates that information related to oneself (such as faces, names, etc.) is better processed in cognitive tasks (including memory, attention, perception, etc.). Most of these studies use the response time (RT) and the accuracy (ACC) in cognitive tasks as indicators, reflecting a self-bias based on task performance. On the other hand, studies using traditional social psychology methods have found that individuals give higher (and sometimes unrealistic) evaluations to themselves (or items related to themselves) compared to others (or items related to others). These studies often use explicit or implicit subjective ratings as measures, reflecting a self-bias based on valence. Although previous research has demonstrated these self-biases across various cultural backgrounds, they usually involve only one experimental paradigm in each study. In this study, we aim to establish a database of self-biases at the individual level among Chinese people. Specifically, we selected seven self-bias experimental paradigms based on task performance (e.g., self-reference memory, self-face visual search, etc.), and three based on valence (e.g., self-enhancement, Implicit Association Test, etc.). In addition, we measured some self-reported individual difference variables (e.g., self-construction, Big Five personality, happiness, self-esteem, etc.). Based on this database, we aim to explore: (1) whether Chinese people can exhibit self-biases in these experimental tasks; (2) whether there are any correlations between the magnitudes of self-bias obtained from different experimental paradigms; (3) how many types of self-biases are there, and whether common factors can be extracted from self-biases obtained through different experimental paradigms. Preliminary results (N

= 54) showed that the Chinese participants demonstrated a significant self-bias in seven of the ten experimental paradigms. Results of exploratory factor analysis also revealed that self-biases can roughly be divided into four categories. This research will not only contribute to a deeper understanding of the manifestations of self-bias within the Chinese cultural context, but also provides a data basis for further exploration of the relationships between different types of self-biases.

互补规则调控社会统计学习中的自我-他人整合：来自 EEG 脑间同步的证据

郑峥[1] 汪俊[1] (通讯作者)
1 浙江师范大学心理学院，浙江，金华，321003
通讯作者 E-mail: jun.wang@zjnu.edu.cn

摘 要 本课题组前期研究发现当与他人互动时，个体能够同时习得自己与他人任务刺激中的规律，即社会统计学习效应。但以往联合行动研究指出，联合行动中除了形成自我任务表征与他人任务表征外，个体还能整合双方任务信息形成整体表征，从而实现自我-他人整合。同时自我-他人整合会受到实验情景（如合作、竞争）或行动者因素（如情绪状态）的调控。因此在我们前期研究的基础上，有必要进一步探讨任务规则本身是否能调控自我-他人整合机制，从而实现个体间任务信息的整合。更重要的是，现有反映自我-他人整合的指标主要来源于行为层面或单脑层面，尚需研究进一步从脑际神经层面探讨自我-他人整合。

本研究采用 EEG 超扫描技术，运用互补任务规则范式探讨了社会统计学习中的自我-他人整合机制。实验过程中，被试需要根据目标刺激所在的空间位置进行空间相容的按键反应。目标刺激位置设定为长度为 12 的固定序列，同时目标刺激的颜色随机设置为红色或蓝色，由不同被试分别进行反应，即互补规则。整个实验共包括 8 个区块，其中区块 1 至 6 和区块 8 中出现的目标刺激位置为上述固定序列，而在区块 7 中目标刺激位置则替换为长度为 12 的随机位置序列。联合情景下，两名被试相邻而坐，分别对不同颜色的目标刺激位置做按键反应。控制情景下，两名被试相邻而坐，但仅有一名被试需要对预先指定颜色的目标刺激位置做按键反应，其同伴只需坐在旁边观察即可。结果发现个体仅在联合情景下通过整合同伴的信息习得了互补统计规则，表现为反应时在区块 1 至 6 间显著下降，同时在区块 6 至 8 间呈现出显著下降-上升-下降的模式。进一步，行为上的社会统计学习效应仅与 alpha 频段的脑间同步相关。研究结果说明，个体能够根据任务规则自发地调控自我-他人整合，从而实现对他人任务信息的整合和分离，且群际间神经同步可能是该过程的重要神经基础。

Complementarity Regularities Modulate Self-Other Integration in Social Statistical Learning: Evidence from EEG Interbrain Synchronization

Zheng Zheng[1] Wang Jun[1]
1 School of Psychology, Zhejiang Normal University, Jinhua, Zhejiang, China. E-mail: jun.wang@zjnu.edu.cn

***Abstract*：** The previous research of our laboratory found that when interacting with others, actors can simultaneously learn the regularities in their own and others' task stimuli, i.e., the social statistical learning effect. However, previous joint action literature has shown that in addition to forming self-task representations and others' task representations in joint action, actors can also integrate task information from both sides to form an overall representation, thus achieving self-other integration. Meanwhile, self-other integration can be modulated by experimental situations (e.g., cooperation, competition) or actor factors (e.g., emotional state). Therefore, based on our previous study, it is necessary to further explore whether the task rule itself can modulate the mechanism of self-other integration so as to realize the integration of task information among actors. More importantly, existing indicators of self-other integration are mainly derived from the behavioral level or the single-brain level, and research is needed to further explore self-other integration from the inter-brain level.

In the present study, we explored the mechanism of self-other integration in social statistical learning using the complementary task regularities paradigm with EEG hyperscanning. During the experiment, participants were required to perform spatially compatible key press responses according to the spatial location of the target stimulus. The target stimulus location was set as a fixed sequence of length 12, while the color of the target stimulus was randomly denoted as red or blue, and the responses were performed by different subjects separately, i.e., the complementary rule. The whole experiment consisted of eight blocks, in which the target stimulus positions appearing in blocks 1 to 6 and block 8 were the fixed sequences described above, while in block 7 the target stimulus positions were replaced with a randomized sequence of positions of length 12. In the joint condition, two actors sat next to each other and made key press responses to different colored target stimulus locations. In the control condition, two actors sat next to each other, but only one actor was required to make key press responses to target stimulus locations of a pre-specified color, and his/her partner simply sat next to him/her and observed. It was found that individuals acquired complementary statistical regularities by integrating information from their partners only in the joint condition, as evidenced by a significant decrease in response time between blocks 1 to 6, while showing a significant decrease-rise-decrease pattern between blocks 6 to 8. Further, reduction in response time was only associated with inter-brain synchronization in the alpha band. The findings suggest that individuals are able to spontaneously modulate self-other integration according to task rules, leading to integration and separation of task information from others, and that intergroup neural synchronization may be an important neural basis for this process.

压力是否扼杀了个体创造性？来自认知神经科学的证据

段海军[1]（通讯作者） 王一凡[1] 张佳琪[1] 段文劲[1]

1 陕西师范大学现代教学技术教育部重点实验室，西安 710062

摘 要 创造力既是人类独有的天赋，也是人类最重要的活动之一。当前，剧烈的社会变革对人类创造力提出严峻考验。VUCA 时代的到来让压力成为每个人都会面临的一种生活方式。无论个人还是组织，经常需要在压力状态下创造性地提出解决问题的策略。本研究围绕“压力是否扼杀了人类的创造性”这一核心问题，从生理、心理、脑与行为等多个层面，借助神经生理学及认知神经研究手段系统探讨了压力影响创造力的神经生理机制及提升创造力的干预手段。在个体层面，首先从神经内分泌变化的视角，探索了压力影响创造力的生理基础。以唾液皮质醇评估 HPA 轴的激活情况，以眨眼频率与瞳孔直径作为多巴胺和去甲肾上腺素的活动指标。结果显示，压力下的皮质醇、眨眼频率和瞳孔直径等生理反应能够负向预测创造性任务

表现，且认知灵活性在其中起到重要的中介作用。其次，采用 EEG 和 fNIRS 技术探究了压力影响创造性活动的认知神经机制。结果表明，在压力后个体α波全时程处于去同步化，表现出更低的右侧前额激活状态和更弱的前额内功能连接，反映出自下而上受刺激驱动的加工状态。在团体层面上，基于 fNIRS 超扫描技术，从亲密关系和人际互动的视角考察了压力对团体创造力的影响。结果表明，压力损害了团体创造力表现。互异性人格和独立型人格共存的团体有更好的创造力表现，表现出“照料与结盟”的习惯化反应模式。恋人组在压力下的合作水平和创造力成绩明显高于陌生组，且压力状态下男女合作策略不同。在干预层面上，tDCS 压力后干预能够促进状态焦虑缓解，从而改善压力诱导的创造力损伤。同时，压力前 tDCS 干预能够减弱压力下的心率、消极情绪和焦虑状态变化，并通过改善压力下的前额功能失调进而缓解创造力损伤。未来研究应综合运用多模态手段，从神经内分泌系统动态平衡机制的视角，进一步探讨神经内分泌系统的中介作用机制和个体基线的调节作用机制，以期构建起生化—认知—行为—脑的综合解释框架。

Does Stress Impair Creativity? Evidence from Cognitive Neuroscience

Haijun Duan[1](Corresponding Author), Yifan Wang[1], Jiaqi Zhang[1], Wenjin Duan[1]
[1]MOE, Key Laboratory of Modern Teaching Technology, Shaanxi Normal University, Xi’an, 710062

***Abstract*:** Creativity, as a unique human talent, is one of the most important human activities. Nowadays, with the advent of the VUCA (Volatility, Uncertainty, Complexity, and Ambiguity) era, stress has become a regular part of life that people have to face. Creative problem-solving under stress seems to be the norm for organizations and individuals. Both individuals and organizations often need to come up with creative problem-solving strategies under stressful situations. Surrounding the core proposition of “Does stress kill creativity?”, this study systematically explored the neurophysiological mechanisms of stress affecting creativity and the interventions to enhance creativity by means of neurophysiology and cognitive neuroscience. At the individual levels, we firstly explored the physiological basis of stress affecting creativity from the perspective of neuroendocrine changes. Salivary cortisol was assessed as a marker of stress-induced activation of the HPA axis. Blink frequency (EBR) and pupil diameter were measured as indicators of dopamine and noradrenaline released by SAM axis activation, respectively. The results showed that physiological responses such as cortisol, EBR and pupil diameter under stress can negatively influence creative task performance in which cognitive flexibility plays an important mediating role. Second, EEG and fNIRS techniques were employed to explore the cognitive neural mechanisms from both temporal and spatial process perspectives. Results showed a general decrease in upper-frequency alpha power after stress, compared with that of before stress. It reflected a bottom-up stimulus-driven processing state. At the group level, the effects of stress on group creativity were examined from the perspectives of intimacy and interpersonal interaction based on the fNIRS hyperscanning technique. The results indicated that stress impaired group creativity performance. Groups in which reciprocal and independent personalities coexisted had better creativity performance and showed a response pattern of "care and alignment". The couple group had significantly higher levels of cooperation and creativity scores under stress than the strangers' group, and male were the emitters of information flow under stress. At the intervention level, the tDCS post-stress intervention was able to promote state anxiety relief and thus ameliorate stress-induced creativity impairment. Meanwhile, the pre-stress tDCS intervention was able to attenuate stress-induced changes in heart rate, negative mood, and state anxiety. More importantly, tDCS mitigated creativity impairment by improving stress-induced prefrontal dysfunction. Future

studies should construct an integrated biochemical-cognitive-behavioral-brain explanatory framework by making comprehensive utilization of multimodal means to further explore the mediating role mechanism of the neuroendocrine system and the regulating role mechanism of the individual baseline.

实验设计的维度与空间——以知觉匹配任务为例

温佳慧[1] 胡传鹏[1]（通讯作者）

1 南京师范大学心理学院，南京，210037，hcp4715@hotmail.com

摘 要　实验设计是心理科学的灵魂，研究者通过不断改进和改变实验设计来深入探索人类行为与认知的机制。然而，研究者很少对实验设计本身进行探索，即“元设计(meta-design)”。例如，实验设计本身是否可以形式化为不同维度？是否可以将这些维度作为变量从而获得关于某一主题的全部实验设计的空间？回答这些问题将帮助研究者加深对实验设计的理解，开发算法以辅助研究者进行更有效的实验设计。本研究以自我认知中的知觉匹配任务(Perceptual Matching Task)为例进行初步的探索。知觉匹配任务分为两个阶段，在训练阶段，被试需要建立标签和形状的联结（例如，“自我是三角形，朋友是圆形”）；在匹配阶段，被试需要按键判断呈现的形状和标签的配对与习得的联结是否一致。自 2012 以来，该任务被广泛引用。通过对 136 篇文章中 256 个实验的知觉匹配任务的变式进行分析，本研究发现，在知觉匹配任务中，在基本任务结构不变的情况下，研究者可以通过改变联结的种类，刺激的内容、呈现顺序，试次数量等维度得到不同的实验设计。每个变式的数据都可能为自我优先效应的特定方面提供见解。这些结果提示，研究者可以采用整合方法(Integrative Approach)来理解研究对象，通过三个阶段的迭代过程来形成新知识：首先，总结或者推断实验设计维度及各个维度可能变化的范围，构建实验设计空间，然后根据试图解决的问题和理论假设，从设计空间中采样，最后，对采样获得的实验设计进行数据收集，从而得到实证数据以检验与更新理论。通过迭代，研究者将能够从更多角度理解研究对象，形成更完整的理论模型。本研究提出的方法适用于其他任务和范式，有望推动科学心理学的理论进步。

Dimensions and Spaces of Experimental Design: A Case Study of Shape Matching Task

Wen Jiahui[1] Hu Chuan-Peng[1](corresponding author)

1 School of Psychology, Nanjing Normal University, Nanjing, 210037, hcp4715@hotmail.com

Abstract：Experimental design is the soul of psychological science. Researchers investigate the cognitive and psychological mechanisms underlying human behavior by designing exquisite experiments. However, questions related to meta-design are rarely explored. For example, how to formalize experimental design in different dimensions? Can we treat these dimensions of design as variables to generate the space of all possible designs regarding a psychological phenomenon? Answering these questions will deepen our understanding of experimental design and may help us develop algorithms to facilitate experimental design. Here we take the perceptual matching task in self-cognition as an example to explore these unknown questions. The perceptual matching task has two stages. In the training stage, participants learn associations between labels and shapes (for example, self is a triangle and friend is a circle); in the matching phase, participants make the decision on whether the presented

shape and label pairing are matched with the learned association by pressing one of two buttons. Since 2012, the task has been widely used to study the self-prioritization effect. The current study examined the variations of perceptual matching tasks in 256 experiments from 136 articles. We found that different experimental designs varied in many dimensions, with the basic task structure unchanged, such as the association types, stimulus content, presentation order, and the number of trials. Data obtained from each variation may provide insights for a particular aspect of the self-prioritization effect. Our findings in this case study suggest that an integrative approach may provide more comprehensive picture of the effect of interest. More specifically, we suggest a three-step iterative process: First, summarizing/theorizing the dimensions of experimental designs, defining the variability of each dimension, and thus constructing the space of experimental designs. Then, sample from the design space according to the problems and theoretical hypotheses. Finally, collecting data for each sampled experimental design, testing and updating the theories. Through iteration, researchers will be able to examine multiple hypotheses/theories that explain the effect of interest. We believe the approach proposed here is applicable to other effects and paradigms, and will facilitate the theory development in psychological science.

摘 要 人们日常生活中解决问题常常不一定经过严密的逻辑推理或仔细的计算分析，而是通过直觉进行近似性预测，迅速地做出抉择。但是，基于直觉解决问题到底是什么样的一个心理学过程仍不清楚。本研究对线上采集的行为实验大数据建模，探究人们在遇到通过计算无法解决的难题时如何基于直觉做出抉择。在经典的组合优化类问题-货郎担问题（Travelling Salesman Problem，以下简称 TSP)中，卖货郎需要从指定城市出发，用最短路径遍历各个城市并回到起点。该问题是一个 NP-hard 问题，当节点数量增多时，无法在多项式时间内求得最优解。然而人类在 TSP 问题中拥有令人赞叹的直觉能力，可以在非常短的时间内预测出接近最优的路径，在某些情况下甚至超越计算机的算法。本研究通过线上小游戏，模拟解决对称性 TSP 问题，采集了超过 1.6 亿个点的有效行为反应，发现随着节点数增多，通过计算解决 TSP 问题的难度急剧增加，但人类解决该问题的效率并没有相应程度的下降，说明人类确实是基于直觉而非计算在做抉择。更有趣的是，人类倾向于沿着临近的节点顺次连接，并且尽量避免路线的交叉，在该任务中的表现与总体结构的视觉感知相关，当路线形成的凸包角度较大时，往往可获得更好成绩。可见在解决复杂问题时，人们常通过构建简单的心理表征进行计划。本研究运用深度学习与认知和行为的计算建模，尝试建立基于直觉解决问题的广泛探索性模型。与计算机的算法相比，人脑的不同之处在于丰富性和效率。本研究剖析了人类解决复杂问题的心理过程与起源，有益于理解基于直觉解决问题的认知行为机制，并且对现有 TSP 问题的算法开发提出新视角。目前，AI 在许多领域表现出了惊人的能力，但它仍然存在一些局限性。AI 需要明确的指令和规则，无法向人类那样依靠直觉做出判断。基于直觉解决问题的广泛探索性模型有助于提升 AI 的物理直觉熵能力，将人工智能和直觉结合起来，可以提高 AI 的决策和推理能力，使 AI 不仅是解决问题的模型，更可以是解释和理解世界的因果模型。

Abstract：In daily life, people often solve problems not necessarily through rigorous logical reasoning or careful computational analysis, but by making approximate predictions based on intuition and making decisions quickly. However, the psychological process underlying problem-solving based on intuition remains unclear. This study models large-scale behavioral experiments collected online to explore how people make decisions based on intuition when facing problems that cannot be solved through computation. In a classic combinatorial optimization problem, the Traveling Salesman Problem (TSP), a salesman is requested to start from a specified city, traverse various cities using the shortest path, and return to the starting point. This problem is NP-hard, and as the number of nodes increases, it is not possible to find the optimal solution in polynomial time. However, humans have an astonishing intuition ability in the TSP problem, able to predict a near-optimal path in a very short time and sometimes even surpassing computer algorithms. The present study used an online game to simulate the solution to the symmetric TSP problem and collected over 160 million valid behavioral responses. The computational complexity of solving the TSP increases dramatically as the number of points increases. However, human performance did not drop correspondingly, confirming the reliance on intuition instead of computation to make decisions in solving the TSP. More interestingly, it was found that humans tend to connect adjacent points in the visually presented TSP task and try to avoid crossing routes. Performance in this task is related to the visual perception of the overall structure, with better results obtained when the angle of the convex hull formed by the route is larger. It can be seen that when solving complex problems, people often use simple mental representations for planning. This study applies deep learning and computational modeling of cognition and behavior to establish a comprehensive exploratory model based on problem-solving intuition. The key differences between the human brain and computer algorithms lie in richness and efficiency. This study analyzes the psychological processes and origins of human problem-solving to better understand the cognitive and behavioral mechanisms underlying intuition-based problem-solving and provides a new perspective for the development of algorithms for the TSP. Currently, AI has demonstrated remarkable capabilities in many fields, but it requires explicit instructions and rules and cannot rely on intuition like humans to make decisions. The extensive exploratory model based on intuition for problem-solving may contribute to enhancing AI's physical intuition entropy, combining computation with intuition to improve AI's decision-making and reasoning abilities. This would make AI not only a model for problem-solving but also a causal model for explaining and understanding the world.

摘 要 自我优势效应（SPE）指在认知任务中，人们对于与自我相关的刺激反应更迅速，准确率更高的现象。知觉匹配任务（SPMT）被广泛运用于研究 SPE 现象，SPMT 所测量的 SPE 也被当作测量个体在自我信息加工上差异的指标，应用于个体差异和临床研究。作为一项简单的按键任务，SPMT 中得到两个直接用于量化 SPE 的结果变量：反应时和准确率。从反应时和准确率可派生出四种计算 SPE 的结果变量：信号检测理论下的灵敏度 *d'*、效率指数（Efficiency）、漂移扩散模型参数漂移率（*v*）和起始点（*z*）。此外，SPE 的计算可以采用不同的基线条件，包括亲密他人（Close other）、陌生人（Stranger）、名人（Celebrity）和非人条件（Non-person）。然而，以不同基线条件和不同结果变量计算出来的 SPE 指标的信度尚属未知，意味着 SPMT 测量的个体差异的稳定性也未知。本研究采用来自 11 篇论文中的 18 个独立数据集（N = 857），并使用分半信度（Split-half Reliability）和组内相关系数（ICC）探究以上 4 个基线条件和 6 个结果变量计算出的 24 个 SPE 指标的可靠性。结果显示，以亲密他人和陌生人条件为基线的反应时指标（yi_{Close} = 0.58; $yi_{Stranger}$ = 0.60）和效率指标（yi_{Close} = 0.52; $yi_{Stranger}$ = 0.58）的分半信度相对较高，但仍低于心理测量学所要求的信度水平。其他 20 个指标的估计分半信度在 0.5 及以下。ICC 分析得到类似的结果，在衡量个体差异的信度指标 ICC2 中,仅亲密他人和陌生人条件为基础的反应时指标（$ICC2_{Close}$ = 0.53; $ICC2_{Stranger}$ = 0.58）和效率指标（$ICC2_{Close}$ = 0.52; $ICC2_{Stranger}$ = 0.34）相对较高，同样远低于心理测量学所要求的水平。用于衡量群体水平的 ICC2k 指标则发现，以亲密他人和陌生人条件为基础的反应时指标（$ICC2k_{Close}$ = 0.87; $ICC2k_{Stranger}$ = 0.89）和效率指标（$ICC2k_{Close}$ = 0.86; $ICC2k_{Strange}$ = 0.76）达到较高信度，其余的 10 个 ICC2k 指标大约为 0.5，甚至更低。本研究结果表明，基于反应时和效率评估的 SPE 仅在群体水平上可靠，用于测量个体差异时则仍需进一步探索。这些结果对于更深入地理解 SPMT 的可靠性及其未来应用场景具有一定的启示意义。

Abstract: The self-prioritization effect (SPE) refers to the phenomenon where individuals demonstrate faster and more accurate responses to self-relevant stimuli in cognitive tasks. The self-perceptual matching task (SPMT) has emerged as a mainstream paradigm for studying the cognitive mechanisms underlying the SPE. Additionally, the

SPE measured by the SPMT has been utilized as an indicator of individual differences in research, including clinical studies. As a simple button-pressing task, SPMT eliminates familiarity effects and yields two outcome variables for quantifying SPE: reaction time (RT) and accuracy (ACC). Existing literature has also reported four additional outcome variables derived from reaction times and accuracy, including sensitivity *d'* under signal-detection theory, the efficiency (RT/ACC), drift rate (*v*) and starting point (*z*) estimated using the drift-diffusion models. Moreover, the calculation of SPE can employ different baseline conditions, including "Close other", "Stranger", "Celebrity", and "Non-person". However, the reliability of SPE measures computed using different baseline conditions and outcome variables has not been systematically examined, leaving the stability of using the SPMT for measuring individual differences unknown. To fill the gap, we conducted a pre-registered study wherein we re-analyzed 18 datasets from 11 papers (N = 857) using the split-half reliability and intraclass correlation coefficient (ICC). The results revealed that the split-half reliabilities of RT (yi_{Close} = 0.58; $yi_{Stranger}$ = 0.60) and Efficiency (yi_{Close} = 0.52; $yi_{Stranger}$ = 0.58), when close other and stranger used as the baseline condition, are relatively high but still lower than that required in psychometrics. The estimated split-half reliabilities for all other indices are approximately 0.5 or even lower. Similar results were obtained in ICC analysis, where the ICC2 for individual differences in the reaction time measures ($ICC2_{Close}$ = 0.53; $ICC2_{Stranger}$ = 0.58) and efficiency measures ($ICC2_{Close}$ = 0.52; $ICC2_{Stranger}$ = 0.34) are relatively high when using close other or stranger as baseline conditions, but still considerably lower than the desired level in psychometrics. For the ICC2k, which measures the stability of SPE on group level, the reaction time measures ($ICC2k_{Close}$ = 0.87; $ICC2k_{Stranger}$ = 0.89) and efficiency measures ($ICC2k_{Close}$ = 0.86; $ICC2k_{Stranger}$ = 0.76) are relatively high when using close other or stranger as baseline conditions, while the remaining 10 ICC2k indices are about 0.5 or even lower. These findings suggest that SPE measures based the reaction time and efficiency are reliable only at the group level, while further exploration is needed for measuring individual differences. These results provide insights into the reliability of the SPMT and its future applications.

风味信息引导视觉注意的机制：来自 ERP 的证据

彭宇彬 宛小昂（通讯作者）

清华大学心理学系，北京，100084（wanxa@mail.tsinghua.edu.cn）

摘 要　以往研究证实，人们在品尝到某种特定的风味后，会对与该风味关联的颜色产生自下而上的注意偏向。这可能是因为个体在品尝到某种风味后，与该风味有着联结的颜色概念就会被激活，而这种激活的内在表征能使具有这种表征特征的项目捕获被试的注意。以往使用行为范式的研究所得到的仅为最后的行为表现结果，无法考察风味信息影响视觉注意的内在过程。在接受风味信息后，当干扰项为风味关联颜色时对于形状靶子的搜索更慢，可能是因为风味关联颜色干扰项捕获了注意。然而个体也可能存在对干扰项的注意抑制，只是抑制程度还不足以弥补其注意被干扰项捕获的效率损失。为了考察真实风味信息影响视觉搜索的在不同时程的具体认知神经过程，本研究采用了事件相关电位（ERP）技术。在实验中，被试被随机分入靶子色味关联和不关联组，靶子色味关联意味着靶子的颜色与风味信息的关系符合色味联结，而不关联组即为靶子的颜色与风味信息不符合色味联结。此外，具有风味关联颜色的干扰项可能出现在靶子同侧、对侧或不出现。在每个试次中，被试会先品尝某种风味刺激然后进行基于形状的视觉搜索。考虑到 N2pc 和 Pd 成分分别表征了注意捕获和注意抑制过程，本研究的 ERP 主要关注这两个指标。行为结果表明，当风味关联颜色干扰项出现时，被试的视觉搜索反应时更慢，正确率更低。最重要的是，ERP 的结果表明，

当风味关联干扰项出现在靶子对侧时，表征注意捕获的 N2pc 波幅更大。而当风味关联干扰项出现在靶子同侧时，指示注意抑制的 Pd 波幅更大。这些结果说明，风味信息影响注意的过程根据时程的不同可分为两个过程：对早期注意首次发生转移的加工时段和后期认知控制发挥主导作用的加工时段。总的来说，本研究不仅首次为风味信息使风味关联颜色捕获注意提供了电生理证据，更是揭示了其中存在着行为范式无法证明的注意抑制过程，这也为进一步探讨跨通道交互的心理与神经机制奠定了基础。

Mechanisms underlying the influence of flavor information on visual attention: Evidence from ERP

Yubin Peng & Xiaoang Wan*
Department of Psychology, Tsinghua University, Beijing, China

Abstract： Previous research has demonstrated that after tasting a certain flavor, people's attention would be biased towards the flavor-associated color. It is possible that the concept of color associated with the flavor is activated after tasting the flavor, and this intrinsic representation of this activation enables items with such representational features to capture the attention. Although previous studies using the behavioral paradigm have obtained behavioral results, they did not examine the internal processes by which flavour information affects visual attention. After being exposed to flavor information, individuals make slower search for shape targets when the distractor was in flavour-associated color, possibly as attention was captured by the distractor with flavor-associated color. However, it is also possible that there was attentional inhibition of the distractor, just the power of inhibition can not make up for the loss of efficiency due to the attention capture of the distractor. In order to examine the specific cognitive neural processes underneath the influence of real flavor information on visual attention, the present study employed the event-related potential (ERP) technique. Therefore, the present study used the event-related potential (ERP) technique, leveraging its high temporal resolution, to investigate the cognitive and neural processes underlying the influence of real flavor information on visual search. In the experiment, participants were randomly assigned to either the target color-flavor congruency or the color-flavor incongruency. In the target color-flavor congruency, the color of the target was associated with the flavor, whereas in color-flavor incongruency group, the color of the target was not associated with the flavor. Moreover, distractors with flavor-associated colors were presented either ipsilaterally or contralaterally to the target, or they were absent. In each trial, participants were first exposed to a certain flavor information, followed by a shape-based visual search task. Considering that the N2pc and Pd components have been linked to the attentional capture and attentional suppression process, respectively, the ERP analysis in this study mainly focused on these two components. The behavioral results showed that participants exhibited slower response times and lower accuracy in their visual search when distractors with flavor-associated color were present. Most importantly, the ERP results revealed that the amplitude of the N2pc, which characterizes attentional capture, was greater when the distractor with flavor-associated color appeared on the contralateral side of the target. In contrast, the amplitude of the Pd, indicative of attentional inhibition, was greater when the distractor with flavor-associated color appeared on the ipsilateral side of the target. Collectively, the present study not only provides the initial electrophysiological evidence that flavor information facilitates the capture of attention by flavor-associated colors, but also reveals the presence of attentional inhibition processes that cannot be demonstrated through behavioral paradigms alone. These findings lay the groundwork for further investigation into the psychological and neural mechanisms of crossmodal interactions.

* 通讯作者: 冯文锋 (fengwf@suda.edu.cn), 冯成志 (psyfrank@126.com)

Abstract: The attentional blink (AB) demonstrates that recognizing the second of two targets (T1 and T2) is difficult when they appear in close succession in a rapid serial visual presentation (RSVP) stream. Although the AB has been widely accepted as a suppression of T2 processing at the *post-perceptual* stage, several event-related potential (ERP) studies using real-world objects or faces as RSVP items stumbled across reduced P1/N1 component evoked by T2 during the AB, suggesting that the AB may occur at the *perceptual* stage. The current study probed this possibility systematically by utilizing line drawings of common objects as RSVP items in two ERP experiments where T2 was presented at lag 3 or lag 8 after T1. Experiment 1 required participants to either discriminate the exact identities or simply classify the object categories of T1 and T2. To invalidate the temporal expectation as an alternative account, Experiment 2 instructed participants to discriminate either T1 and T2 identities (dual-target task) or only T2 identity (single-target task). The results showed that the T2-elicited P1 amplitude was consistently decreased at lag 3 relative to lag 8 whenever a dual-target, but not single-target, task was required, and the magnitude of this P1 amplitude decrease was significantly predictive of the behavioral AB magnitude in each dual-target task. These findings provide the strongest evidence to date that the AB can suppress T2 processing at a very early perceptual stage, at least when observers encounter RSVP items of real-life objects. Thus, we tentatively put forward a multiple-mechanism model for the AB, in which the invocation of the early-perceptual suppressive mechanism is hypothesized to be contingent on the salience of the stimulus materials, a factor that needs to be examined further in the future. More broadly, these findings also demonstrate that under certain circumstances, the earliest locus of *time*-based attentional selection can be as early as that of *space*-based attentional selection, thereby updating our understanding of the relationship between the two forms of attentional selection in general.

摘 要　心智游移(Mind wandering)是一种普遍存在的现象，指的是人们自主地将注意力从当前任务转移。已有研究表明心智游移受到各种因素的影响，例如任务要求、环境刺激和个体差异。但目前少有研究探讨心智游移与其发生时间之间的关系。

本研究旨在探索意向性维度的心智游移是否稳定。我们通过两个实验，使用持续注意反应任务和探针捕获相结合的方式测量个体的有意图心智游移(Intentional mind wandering, IMW)和无意图心智游移(Unintentional mind wandering, IMW)，使用 PANAS 测量个体的情绪状态。实验 1 在一天的三个主要时间段（早晨、中午和晚上）测量个体的心智游移频率和情绪状态，结果发现（1）个体在早晨时段的 IMW 和 UMW 均显著大于晚上时段。（2）在一天中，个体的 IMW 动态变化趋势与积极情绪的变化趋势一致，而 UMW 的动态变化趋势与消极情绪的变化趋势吻合。实验 2 为进一步验证 MW 随时间动态波动的稳定性，在连续五天的晚上时段以同样的方法测量个体的心智游移频率和情绪状态。另外，为检验认知控制对心智游移随时间波动的影响，我们使用变化察觉任务测量个体的工作记忆。实验结果表明（1）个体在第一天晚上时段的 UMW 显著大于其余四天，而连续五天夜晚时段的 IMW 频率无显著差异。（2）在连续五天中，个体 UMW 的波动趋势与积极情绪的变化趋势一致，而 IMW 和消极情绪的变化在连续五天中均保持稳定。（3）心智游移随时间的动态波动不受工作记忆容量的影响。

综上所述，我们首次发现了（1）意向性维度的心智游移会随时间变化而有规律地波动，主要体现为对于同一任务内容，个体的无意图心智游移(UMW)的频率随着发生时间段的累积而逐渐减少。（2）有意图心智游移(IMW)与无意图心智游移(UMW)在不同时间段中的波动模式存在差异，且两种心智游移的变化与个体当时的情绪有关。本研究揭示了心智游移不是一个静态的现象，而是随时间动态波动的，并且意图性的维度及个体的情绪状态对心智游移的动态波动有影响，为进一步探索心智游移在认知和行为中的基本机制和功能意义奠定了基础。

Abstract：Mind wandering, a prevalent phenomenon, refers to the voluntary shift of attention away from the current task. Previous research has indicated that mind wandering is influenced by various factors, such as task demands, environmental stimuli, and individual differences. However, limited studies have investigated the relationship between mind wandering and time periods.

This study aims to explore the stability of mind wandering based on the dimension of intentionality. Two experiments were conducted using a combination of sustained attention response tasks, probe-caught measures, and questionnaires to measure participants' levels of intentional mind wandering (IMW) and unintentional mind wandering (UMW). Additionally, participants' emotional states were assessed using the Positive and Negative Affect Scale (PANAS). In Experiment 1, mind wandering frequency and emotional states were measured during three main time periods of the day (morning, afternoon, and evening). The results revealed that (1) both IMW and UMW were significantly higher in the morning compared to the evening, and (2) the dynamic fluctuations of IMW throughout the day aligned with positive emotional trends, while UMW fluctuations corresponded to negative emotional trends. To verify the stability of temporal fluctuations in mind wandering, Experiment 2 was conducted

over five consecutive evenings using the same measures. Additionally, a change detection task was used to assess working memory and its influence on mind wandering fluctuations. The results indicated that (1) UMW was significantly higher on the first evening compared to the subsequent four days, while IMW frequency remained stable, and (2) the fluctuations of UMW over five consecutive evenings were consistent with positive emotional trends, while the changes in IMW and negative emotions remained stable across the five days. Moreover, the dynamic fluctuations of mind wandering were not affected by working memory capacity.

In summary, this study provides novel evidence that (1) mind wandering based on the dimension of intentionality exhibits regular temporal fluctuations, with a gradual decrease in the frequency of unintentional mind wandering (UMW) over time for the same task content, and (2) intentional mind wandering (IMW) and UMW show different patterns of fluctuations across different time periods, which are associated with individuals' current emotional states. These findings highlight the dynamic nature of mind wandering, and the influences of intentionality and emotional states on its temporal dynamics. This study contributes to our understanding of the fundamental mechanisms and functional significance of mind wandering in cognition and behavior.

摘 要　日常生活中的视觉场景往往由彼此关联的视觉对象组成，对象间的关系定义了场景的内在规律。人类的视觉系统通常在此类场景中表现出高效的目标搜索能力，但对于视觉系统如何利用场景中的规律引导注意从而利化视觉搜索仍所知甚少。本研究以数字为搜索对象，构建了数值大小随空间位置变化的有规律场景，同时也构建了无此规律的随机排布场景，通过三个实验考察了两种场景中的视觉搜索绩效和注意选择模式。行为结果发现，规律排布条件下的搜索时间显著短于随机排布条件。此外，在规律排布条件下，搜索时间与搜索集大小的函数关系呈对数模式；而在随机排布条件下，该函数关系呈线性模式。眼动结果显示，在规律排布场景中搜索时所需的注视次数显著更少，且眼跳方向正确的比例显著更高。以上结果表明，人类能利用视觉场景中的规律高效地缩小搜索空间和定位目标，从而实现更快速的视觉搜索。为进一步探究上述过程的实现机理，我们构建了四种模拟搜索中注意选择过程的计算模型：随机引导模型、方向引导模型、概率引导模型和预期信息增益引导模型，并使用与人类被试相同的任务进行模拟。结果显示，预期信息增益引导模型最接近人类的行为绩效和眼动模式，且随着搜索集的增大其优势更加明显。上述结果共同揭示了基于预期信息增益的注意选择机制，该机制可能是人类在复杂环境中顺利搜索目标的重要认知基础。

Abstract： Visual scenes in daily life commonly consist of interconnected visual objects, where the relations between these objects define the regularities observed in these scenes. The human visual system typically portrays efficient visual search capabilities in such scenes, but there is limited understanding of how it leverages the regularities within scenes to guide attention and enhance visual search. In this study, we employed number stimuli as search objects and created regularly arranged scenes where the numerical values of numbers varied with their spatial arrangements. Randomly arranged scenes with no such regularities were also included. Three experiments were conducted to investigate the behavioral performance and attention selection patterns during visual search in such scenes. The behavioral results demonstrated a significantly shorter search time in the regular condition compared to the random condition. Furthermore, in the regular condition, the relationship between search time and set size followed a logarithmic pattern, whereas in the random condition, it exhibited a linear pattern. Eye tracking data indicated that fewer number of fixations were required during visual search in the regularly arranged scenes, accompanied by a significantly higher proportion of correct saccade directions. These findings suggest that humans can efficiently narrow down the search space and locate targets by utilizing the embedded regularity within visual scenes, leading to faster visual search. To further investigate the underlying mechanisms of this process, we built four computational models to simulate the attention selection processes during visual search: a random guidance model, a direction guidance model, a probability guidance model, and an expected information gain guidance model. We conducted model simulations on tasks identical to those performed by human participants. The simulation results revealed that the expected information gain guidance model provided the best fit for human behavioral performance and eye movement patterns, and its advantage become more pronounced as the set size increased. Collectively, these findings unveil an attention selection mechanism based on expected information gain, which may serve as a vital cognitive foundation for humans to effectively search for targets in complex environments.

3 加利福利亚大学戴维斯分校心理学系，戴维斯，95616

摘 要 在视觉搜索中，目标信息存储在工作记忆或长期记忆中的“搜索模板”中。早期研究表明模板包含了目标的所有信息，并且这些信息都被用来引导注意并做出目标匹配决策。然而最近的研究却指出用于引导注意力的模板信息可以不同与用于做出匹配决策的信息。Yu 等人（2023）提出注意引导是基于一个“good-enough”的原则，即引导过程需要较低的注意资源来快速定位候选目标，从而可以做出更精确的目标匹配决策。大部分现有研究都集中在对单一特征维度信息的灵活调节上，然而较少的研究关注了在视觉搜索的两个阶段中如何使用具有多个特征维度的搜索模板。本研究采用 representational similarity analyses（RSA）来研究在注意引导和目标匹配决策过程中对多个特征维度信息的优先加工过程。在实验 1 中，被试需要在三个干扰物中搜索由颜色（1A）或方向（1B）定义的 Gabor 目标。该实验的目的是通过眼动数据来估计对于单一特征视觉搜索中不同阶段受到干扰物相似性影响的“ground-true”。然后基于第一扫视（first saccade）和注视持续时间（fixation duration）构建单一特征维度目标的 Representational-dissimilarity matrices（RDMs）。在实验 2 中，另一组被试完成了一个联合搜索任务，其中 Gabor 目标由颜色和方向两个特征共同定义。我们把实验 2 的生成的 RDMs 和实验 1 种生成的“ground-true” RDMs 进行一个多元回归模型拟合以估计每个特征的权重。在实验 2A 中，关键干扰物的颜色和方向的相似性被随机分配，因此其两个特

征都不可预测。结果显示，在此情况下注意引导主要依赖颜色信息，而匹配决策则同时涉及颜色和方向信息。在实验 2B 中，关键干扰物的方向的差异以 block 的形式出现，因此被试可以有效的预期目标和干扰物之间的方向差异但不能预期它们的颜色差异。结果显示，在此情况下颜色和方向都被用于注意引导和匹配决策。综合这两个实验的结果，本研究提供了新的证据支持这样一种观点：搜索模板信息可以灵活调节以适应最具诊断性的特征变化，而与此同时任务的情境也会同时导致不同特征之间的优先级的变化。

Abstract：During visual search, target information is stored in “search template” within working or long-term memory. Previous studies have suggested that the template is presumed to contain a complete version of the entire target object and that all of that information is used to guide attention and make identity match-decisions. It has recently been suggested that the template information used to guide attention could be different from the information used to make match decisions. In line with this, Yu et al. (2023) suggest that attentional guidance is designed to operate according to a good-enough principle, such that guidance takes low effort to rapidly localize target candidates and then make more precise identity decisions. Most existing research has focused on the flexible tuning of single-feature dimension information, yet less research has focused on how search template with multiple-feature dimensions is used during the two stages of visual search. The present study used representational similarity analyses (RSA) to investigate the prioritization for multiple-feature dimension information during attentional guidance and target match decision. In experiment 1, participants searched for a Gabor target defined either by the color (1A) or the orientation (1B) among three distractors. The eye-tracking data were used to estimate the “ground-true” of how distractors with varying similarity impacted target search. Representational-dissimilarity matrices (RDMs) for the single-feature dimension target during different stages of visual search were constructed based on the first saccade and fixation duration. In experiment 2, a new set of participants performed a conjunction search task in which the Gabor target was defined by both the color and orientation. The RDMs from experiment 2 were then fit into a multiple regression model to estimate the weight of each feature based on the “ground-true” RDMs. In experiment 2A, the similarity of color and orientation was randomly assigned, making it unpredictable. The results revealed that the attentional guidance mainly relied on the color information while the match decision recruited both color and orientation information. In experiment 2B, the dissimilarity of the critical distractor's orientation was blocked, providing participants with an expectation of reliable dissimilarity in orientation but not color between the target and distractor. The results revealed that both the color and orientation were used for attentional guidance as well as match decisions. Together, the results from the current study provide novel evidence to support the view that search template information is tuned flexibly towards the most diagnostic feature while the context of the task shapes the prioritization between different features.

成人 ADHD 自然语音追踪能力的脑电研究

马瑛[1] 王思诗[1] 孙美荣[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，leer@bsu.edu.cn

摘　要　成人注意缺陷多动障碍(Attention Deficit Hyperactivity Disorder, ADHD)以注意缺陷、多动/冲动为主要表现，患者的正常学习工作、人际关系等都会受到严重影响。本研究通过自然语音追踪任务，探讨了成人 ADHD 听觉选择注意中对注意语音的追踪过程和对非注意语音的干扰抑制过程，并进一步探究了成人 ADHD 的听觉选择注意能力与认知能力之间的关系。

我们选取了 27 名成人 ADHD 和 36 名正常成人，控制了年龄和性别等人口统计学变量，首先对其进行了一系列认知能力的评估。然后我们采用自然语音追踪任务，播放男生和女生同时讲述不同内容的混合语音材料（每段时长大约 1 分钟），被试需要注意先说话的人所讲述的内容，并根据听到的内容判断主试陈述的几个句子的对错。实验中共有 10 段不同的语音材料，每段重复三次，一共 30 个试次。

本研究的数据处理采用了时间响应函数模型(Temporal　Response Function，TRF)，根据语音刺激材料和 EEG 数据构建大脑中的时间响应函数(TRF)。用 TRF 以及语音刺激来预测被试的反应，并将该反应与真实的 EEG 数据进行对比，得到 Predict Power，即模型的预测力。结果表明，(1)与正常人群相比，成人 ADHD 的视觉学习能力($t(62) = 4.969, p = 0.03$)和社会认知能力($t(62) = 6.174, p = 0.016$)明显降低；(2)成人 ADHD 对注意语音的预测力显著低于健康对照组($F(1,61) = 10.155, p < 0.01$, *partical* $\eta^2 = 0.145$)；(3) 成人 ADHD 对注意语音的预测力与工作记忆成显著负相关（$r = -0.329$，$p = 0.011$），与视觉学习显著负相关（$r = -0.309$，$p = 0.017$）。注意语音的预测力能够显著地负向预测工作记忆 ($\beta = -0.329, t = -2.630, p = 0.011$)和视觉学习($\beta = -0.309, t = -2.449, p = 0.017$)。

综上，研究结果表明，与健康对照相比，成人 ADHD 的听觉选择注意能力较差，并且听觉选择注意能力与其认知功能有关。本研究结果可以为深入理解成人 ADHD 的听觉选择注意能力的神经机制提供一定的依据。

An EEG study on natural speech tracking ability of adults with ADHD

Ying Ma[1] , Sishi Wang[1], Meirong Sun[1]

1 School of Psychology, Beijing Sport University, Beijing, 100084, leer@bsu.edu.cn

***Abstract*:** Adult Attention Deficit Hyperactivity Disorder (ADHD) is characterized by attention deficits and hyperactivity/impulsivity, along with serious family and work difficulties. To explore the tracking process of attention speech and the interference suppression process of non-attention speech in auditory selective attention in adults with ADHD, a natural speech tracking task was used in this study, meanwhile, the relationship between auditory selective attention abilities and cognitive abilities in adults with ADHD was diggered out through EEG data.

27 adults with ADHD and 36 healthy adults were recruited, controlling for demographic variables such as age and sex differences. The subjects firstly performed a series of cognitive assessments. A natural speech tracking task was used in which we played mixed speech material (each segment was about 1 minute) in which boys and girls simultaneously narrated different contents, and subjects were required to pay attention to what the person who spoke first was narrating and to judge the rightness or wrongness of several sentences stated by the main subject based on what they heard. There were 10 speech materials in the experiment, each of which was

repeated three times, for a total of 30 trials.

Temporal Response Function (TRF) model was used for data processing in this study based on the speech stimulus material and EEG data. The TRF as well as the speech stimuli were used to predict the subject's response, and that response was compared to the real EEG data to obtain Predict Power, which is the predictive power of the model. The results showed that, (1) Compared with the healthy adults, adults with ADHD had significantly lower visual learning ($t(62) = 4.969$, $p = 0.03$) and lower social cognitive abilities ($t(62) = 6.174$, $p = 0.016$); (2) The Predict Power of the attention speech in adults with ADHD was significantly lower than healthy adults ($F(1,61) = 10.155$, $p < 0.01$, *partical* $\eta^2 = 0.145$); (3) The Predict Power of attention speech in adults with ADHD was significantly negatively correlated with working memory ($r = -0.329$, $p = 0.011$) and visual learning ($r = -0.309$, $p = 0.017$). And the predictive power for attention speech significantly negatively predicted working memory ($\beta = -0.329$, $t = -2.630$, $p = 0.011$) and visual learning ($\beta = -0.309$, $t = -2.449$, $p = 0.017$).

In summary, the results of this study showed that adults with ADHD showed poorer auditory selective attention compared to healthy controls and that the auditory selective attention might be related to their cognitive function ability. This may provide some insights into the neural mechanisms underlying auditory selective attention in adults with ADHD.

摘 要　时钟的发明和改进表达出人们对于客观时间精确性的追求，这或许是我们对无法在主观上精确评估时间的“补偿”。听觉加工是随时间展开的，听者能够准确表征言语中的时间信息（如：时域包络的神经夹带）似乎已成为公认的事实，但知觉层面上，听者似乎难以精确的评估言语的时间特征。实验一中，我们首先通过语谱噪声对人工言语进行频谱衰减降低其物理层面的可理解性，然后要求被试对部分测试语料进行熟悉训练增加材料的可理解性。实验任务是要求听者对熟悉和非熟悉的频谱衰减语料进行语速评估。结果发现熟悉语料下语速的主观相等点低于非熟悉语料，并且熟悉语料的再认成绩能够负向预测听者的主观相等点。这说明当言语可理解性较好时，相比于可理解性较低的材料，听者会主观认为言语的语速较慢。为了排除潜在计数策略的影响以及探究可理解性是如何改变听觉时间感知，在实验二中我们采用时间对比范式并通过漂移扩散模型解释行为结果。我们将言语材料替换为简单句和随机句，在认知层面控制可理解性的高低。时间对比范式通过事先呈现的语料快慢改变听者对后续音节的判定，即快语速下听者会更倾向于将模糊音节归类为具有更长的嗓音起始时间（如：/t/），反之亦然（如：/d/）。听者任务是对语速相同的简单句或随机句后出现的音节进行判定。结果表明事先出现随机句时，听者会有更大的概率将模糊音节判定为/ti/，这与以往研究中快语速语料的结果一致。这于实验一的结论类似，即可理解性较差的言语会加快语速感知。漂移扩散模型表明在随机句条件下，听者的漂移率更偏向/ti/，即更倾向将加工的信息归于比真实持续时间更长的一方。刺激编码模型对两种条件下初始点的估计，排除了随机句条件下被试会更偏好选择/ti/的干扰。我们还在非汉语母语群体中重复了实验二，结果并未表现出在音节判断上两种语料的差异。综上所述，本研究首次揭示了言语可理解性高低能够影响听者时间感知的现象，可理解性低时会导致听者低估持续时间产生语速增快的感受。

The comprehensibility of speech affects the auditory time perception

Liangjie Chen[1] Liangxi Lu[2] Yangping Jin[2] Liang Li[1] (Corresponding author)

1 School of Psychology and Cognitive Sciences, Peking University，Peking，100871
2 Center for the Cognitive Science of Language, Beijing Language and Culture University，Peking，100083，

Abstract：The invention and improvement of clocks express our pursuit of the precision of objective time, which perhaps serves as a “compensation” for our inability to accurately evaluate time subjectively. Auditory processing takes place over time, and it has become an accepted fact that listeners can precisely represent temporal information in speech (such as neural enslavement of time-domain envelopes). However, at the perceptual level, it seems difficult for listeners to accurately assess temporal features of speech. In our first experiment, we first used vocoder noise to attenuate the spectrum of synthetic speech thus reducing its physical comprehensibility, then we asked the subjects to undergo familiarization training with some of the test materials to enhance their comprehensibility. The task required listeners to assess the speed of speech for familiar and unfamiliar spectrally attenuated materials. The results showed that the subjective equivalence point of speech rate under familiar conditions was lower than under unfamiliar conditions, and the recognition scores of familiar materials could negatively predict the listeners' subjective equivalence points. This suggests that when speech comprehensibility is good, compared to materials with lower comprehensibility, listeners would perceive the speech rate to be slower. In order to rule out the potential impact of counting strategies and explore how comprehensibility changes auditory time perception, in the second experiment, we used a time comparison paradigm and interpreted the behavioral results via the drift diffusion model. We replaced speech materials with simple and random sentences to control the high or low comprehensibility at the cognitive level. Time comparison paradigm changes listeners' judgement of following syllables by the speed of the previously presented materials, that is, under high speech rates, listeners are more inclined to categorize ambiguous syllables as having a longer voice onset time (e.g., /t/), and vice versa (e.g., /d/). Listeners' task was to determine the syllable appearing after simple or random sentences with the same speech rate. Results showed that when random sentences are presented first, listeners are more likely to judge ambiguous syllables as /ti/, which is consistent with the results of previous studies involving fast speech rate materials. This is similar to the conclusion of Experiment One, where less comprehensible speech quickens perceived speech rate. The drift diffusion model revealed that under random sentence conditions, listeners have a higher drift rate towards /ti/, meaning they more likely attribute the processed information to be longer than the real duration. The stimulus encoding model’s estimates of starting points under both conditions ruled out the interference that test subjects would prefer choosing /ti/ under random sentence conditions. We also replicated Experiment Two among a non Chinese-speaking group, and the results did not show any difference in syllable judgment between the two types of materials. In summary, this study first revealed a phenomenon that the level of speech comprehensibility can affect listeners' time perception: lower comprehensibility may lead listeners to underestimate duration, resulting in a perceived acceleration of speech rate.

心理表象和未来情景思维对前瞻记忆的影响

全紫涵 林其玉 张乐 蔡晨(通讯作者)

青岛大学师范学院应用心理学系，青岛，266071，caichen@qdu.edu.cn

摘 要 作为日常生活中十分重要的一项认知功能，成功的前瞻记忆能够帮助人们记住并有效执行未来计划。有研究表明，表象能力能较好地预测前瞻记忆水平。心理表象是指个体根据描述来模拟或重新创造知觉经验，使个体能够感知目前不存在的事物的过程；而未来情景思维即个体将自我投射到未来，以预先体验未来事件的一种能力。现有研究已证明二者之间存在联系，但尚缺少研究同时考察二者对于前瞻记忆的交互影响。本研究旨在深入探讨心理表象与未来情景思维的关系，以及二者对前瞻记忆的交互作用机制。研究一采用相关研究，招募在校大学生 88 名（24 名男生，19.17±0.90 岁），通过间隔六个月的两次测试建立交叉滞后模型考察心理表象和未来情景思维之间的关系。结果表明，二者之间存在双向预测关系。研究二采用实验法，招募被试 116 名（25 名男生，18.76±0.89 岁），将被试随机分配到控制组、心理表象组与未来情景思维组以考察不同表象方式对前瞻记忆的影响。研究结果表明，心理表象和未来情景思维均可以促进被试的前瞻记忆任务表现，$F(2, 115) = 8.31, p < 0.001, \eta^2 = 0.499$。并且心理表象对于提升前瞻记忆任务执行速度的效果显著优于未来情景思维，$p = 0.025$。综上所述，心理表象和未来情景思维可相互预测，且二者可平行作用于前瞻记忆，这些发现对前瞻记忆领域的现有发现做出了补充，进一步揭示了三者之间相互作用的心理机制。

Effects of mental imagery and episodic future thinking on prospective memory

Zihan Quan, Qiyu Lin, Le Zhang, Chen Cai*

Department of Psychology, Normal College, Qingdao University, 266071

*E-mail: caichen@qdu.edu.cn

***Abstract*:** As a vital cognitive function in daily lives, successful prospective memory assumes a critical role in assisting individuals in recalling and effectively carrying out their future plans. Current research has revealed that the imagery ability is a potent predictor of prospective memory capabilities. Mental imagery involves the remarkable ability of individuals to recreate sensory experiences based on descriptions, enabling them to perceive things that are not physically present; episodic future thinking refers to the ability of individuals to project themselves into the future and mentally pre-experience forthcoming events. Existing studies have established a correlation between mental imagery and episodic future thinking, but systematic research exploring the simultaneous interactive effects of the two on prospective memory remains limited. Therefore, this study aims to conduct a comprehensive investigation into the intricate relationship between mental imagery, episodic future thinking, and their combined interaction mechanism, specifically in relation to prospective memory. In Study 1, we employed a correlation method by constructing a cross-lagged model to investigate the relationship between mental imagery and episodic future thinking. A total of 88 college students (24 males;

mean age = 19.17 years, *SD* = 0.90) were recruited and we conducted two tests at six-month intervals to analyze this relationship. The findings of the study revealed a noteworthy two-way predictive relationship between mental imagery and episodic future thinking. In Study 2, an experimental approach was employed to explore the influence of different imagery methods on prospective memory. A total of 116 participants (25 males; mean age = 18.76 years, *SD* = 0.89) were recruited and randomly allocated to three groups: the control group, the mental imagery group, and the episodic future thinking group. The study results showed that both mental imagery and episodic future thinking positively influenced the participants' performance in the prospective memory task, $F(2, 115) = 8.31$, $p < 0.001$, $\eta^2 = 0.499$. And mental imagery exhibited a more pronounced impact on enhancing the execution speed of prospective memory tasks compared to episodic future thinking, $p = 0.025$. In conclusion, the findings suggest a reciprocal relationship between mental imagery and episodic future thinking, with both factors exerting parallel effects on prospective memory, which not only supplement the existing discoveries in the field of prospective memory but also provide valuable insights into the underlying psychological mechanisms that govern the interactions among these three factors.

摘 要　经典理性行动模型认为，人们的联合行动基于预期效用最大化原则，即人们会以最高效的方式协调彼此的行动以完成联合行动规划。然而，最近研究发现，在面对多个冲突目标时，个体的连贯行动规划并不完全遵从最大化原则，而表现出意图性承诺：人们通过提前承诺于一个固定的未来目标，使个体在时序上的行动规划免受多个冲突目标的干扰，进而帮助个体协调更远的未来（Cheng et al.,2023）。为了将上述个人行动规划中发现的效应推广至双人联合行动场景，本研究设计了一个双人“吃豆人”范式来检验联合行动中人们是否会自发地表现出意图性承诺。在该任务中，地图上始终存在两个目标（两个豆子），两名被试轮流操作同一个吃豆人。每当吃豆人获取一个豆子后，该豆子会消失，此时地图上会出现另一个豆子（新），同时保留未被吃掉的豆子（旧）。被试被要求在一定时间内尽可能多地获取地图上的豆子。实验操纵了吃豆人距离新-旧豆子的距离来考察被试对新-旧豆子的偏好。如果被试的联合行动基于高效性原则，被试将选择更近的目标，且当吃豆人与新-旧豆子的距离相同时，被试不会表现出任何偏好；如果被试的联合行动基于意图性承诺，被试将会提前规划前往地图上原有的两个目标的行动路径，那么当新豆子出现时，被试已经规划好了到旧豆子的路径，因此其联合行动将会偏向于旧豆子。本研究根据任务中角色切换的方式设置了两个实验。实验一（N=40）在固定的时间点进行角色切换，一个被试吃到一个豆子后随即切换另一个被试操作吃豆人；实验二（N=40）中角色切换的时间点不固定，因而要求被试在联合行动中保持更高的协作程度。在两个实验中，被试均表现出对旧豆子的显著偏好。此外，相较实验一，实验二中的被试表现出对旧豆子更强的偏好，表明意图性承诺可能受到联合行动中协作程度的调控。两个实验的结果共同表明，人们在联合行动中会自发地形成意图性承诺来进行连贯的行动规划，且联合行动的程度越高，个体形成的意图性承诺越强。

Intentional Commitment in Joint Action

Shaoyan Hao[1]　Shaozhe Cheng[1]　Jingyin Zhu[1]　Mowei Shen[1]　Jifan Zhou[1*]

E-mail: jifanzhou@zju.edu.cn

Abstract: The classical rational model posits that joint action is based on the principle of maximizing expected utility (MEU). That is, people coordinate their actions in the most efficient way. However, recent research has demonstrated that when faced with multiple conflicting goals, individuals' coherent action planning is not always based on the MEU principle. Instead, they show intentional commitment by committing to a fixed future, which prevents their temporal action planning from being disrupted by multiple conflicting goals and helps them coordinate for a further future (Cheng et al., 2023). To investigate the intentional commitment in individual action to joint action, the current study employed a two-person "Pac-Man" paradigm to examine whether people spontaneously show intentional commitment in joint action. In this task, participants took turns operating the same Pac-Man to collect as many beans as possible within a certain time limit. The task involved two beans on the map, with the Pac-Man obtaining one bean at a time. Whenever the Pac-Man obtained a bean, the bean disappeared and another new bean appeared on the map alongside the uneaten old one. The distance between the Pac-Man and the beans was manipulated to examine participants' preferences. If participants' joint action was based on the MEU principle, they would choose the closer bean, and when the Pac-Man was equidistant from the beans, participants would not show any preference. However, if participants' joint action was based on intentional commitment, they would plan their paths to the two original beans beforehand, and their joint action would show preference for the old bean when a new bean appeared. The study conducted two experiments based on the setting of role-switching in the task. Experiment 1 (*N=40*) made role switching at a fixed time point, that is, as soon as one participant obtained a bean, the control of the Pac-Man was switched to the other participant. Experiment 2 (*N=40)* made role switching at an unspecified time point, requiring higher coordination in joint action. The results of both experiments indicated that participants showed a significant preference for the old bean, suggesting that people spontaneously form intentional commitment in joint action to achieve coherent action planning. Moreover, participants in Experiment 2 showed a stronger preference for the old bean compared to Experiment 1, indicating that intentional commitment may be modulated by the level of coordination in joint action. These findings provide evidence for the role of intentional commitment in joint action planning and highlight intentional commitment as a potential mechanism for coordinating joint action.

自主动作对声音诱发闪光错觉效应的影响

雷耀杰[1]　王凌云[2]（通讯作者）
1 东北师范大学心理学院，长春，130022
2 东北师范大学心理学院，长春，130022，wangly880@nenu.edu.cn

摘 要　个体对事物的感知不仅仅依赖于单一感官，多感官的交互作用才构成了个体内部多彩的世界，而自主动作作为自我的构成部分之一，与多感官的交互密切相关。相比于非自主动作产生的结果，自主动作的结果对动作发出者具有更特殊的意义，它能够使动作发出者对动作结果产生知觉层面的变化。以往研究主要关注自主动作对动作结果中视听单通道的影响，而很少有研究关注当视听信息同时作为动作的结果时，自主动作对视听整合的作用。本研究采用声音诱发闪光错觉作为视听整合的研究材料。该错觉是指在 100ms 内快速呈现的视听刺激条件下，被试倾向于依据听觉刺激个数判断视觉刺激的个数，即出现听觉主导效应。本研究以 23 名大学生为被试，采用声音诱发闪光错觉范式，考察视听刺激呈现前被试是否按键对非错觉条件(F1B1、F2B2)以及错觉条件(F2B1、F1B2)下视听整合的影响。其中，F 代表视觉刺激个数，B 代表听觉刺激个数；被试在实验中仅报告感知到的视觉刺激个数。研究结果发现，在非错觉条件下，自主动作显著提高了被试在 F2B2 条件下的正确率，而对 F1B1 条件没有显著影响。在错觉条件下，自主动作显著提高了被试在 F2B1 条件下的正确率，而对 F1B2 条件没有显著影响。进一步的辨别力分析发现，自主动作能够提高被试在 F2B1 条件下的辨别力，而对 F1B2 条件下的辨别力没有显著影响。研究结果表明，(1)在非错觉条件下，自主动作对视觉通道的影响大于听觉通道，表现在提高了视觉通道信息的可靠性。(2)在错觉条件下，自主动作能够通过提高被试视觉刺激间的辨别力以抵消部分听觉主导效应，但是无法通过提高被试听觉刺激间的辨别力以加强听觉主导效应。

The effect of voluntary action on sound-induced flash illusion

Yaojie Lei, Lingyun Wang
School of Psychology, Northeast Normal University, Changchun, 130022

Abstract：We investigated the influence of voluntary actions on the integration of audiovisual information as action outcomes. Previous research has primarily focused on the impact of voluntary actions on unimodal audio or visual outcomes, with little attention given to the role of voluntary actions in audiovisual integration when both auditory and visual information serve as action outcomes.In this study, we employed the sound-induced flash illusion as the experimental material for audiovisual integration research. This illusion refers to the phenomenon where participants tend to judge the number of visual stimuli based on the number of auditory stimuli presented within a rapid 100ms interval, resulting in an auditory-dominant effect.Twenty-three university students participated as subjects, and we used the sound-induced flash illusion paradigm to investigate the influence of voluntary actions on audiovisual integration under non-illusion conditions (F1B1, F2B2) and illusion conditions (F2B1, F1B2). Here, F represents the number of visual stimuli, and B represents the number of auditory stimuli. Subjects were only required to report the perceived number of visual stimuli during the experiment.The results of the study revealed that under non-illusion conditions, voluntary actions significantly increased the accuracy of subjects in the F2B2 condition, while showing no significant impact on the F1B1 condition. Under illusion conditions, voluntary actions significantly improved the accuracy of subjects in the F2B1 condition but had no

significant effect on the F1B2 condition. Further discriminability analysis indicated that voluntary actions could enhance the discriminability of subjects for the F2B1 condition, while having no significant effect on the discriminability for the F1B2 condition.

These findings suggest that (1) under non-illusion conditions, voluntary actions have a greater impact on the visual channel than the auditory channel, leading to an increase in the reliability of visual channel information; (2) under illusion conditions, voluntary actions can compensate for some auditory-dominant effects by enhancing subjects' discriminability between visual stimuli but cannot strengthen auditory-dominant effects by improving their discriminability between auditory stimuli.

考试焦虑对个体认知功能的影响

汪春楠[1]　李富洪[2]（通讯作者）

1 江西师范大学心理学院，南昌，330022

2 江西师范大学心理学院，南昌，330022，lifuhong@jxnu.edu.cn

摘 要　考试焦虑是个体在学业评价情境中产生的情绪、生理、行为方面的焦虑体验和认知担忧。减轻考试焦虑带来的负面影响有助于帮助学生降低焦虑情绪困扰、提升心理健康水平、提高学习效率。近年来，研究者开始关注考试焦虑对个体注意、工作记忆、抑制功能及相关脑机制的影响。研究发现，高特质考试焦虑个体对考试相关刺激存在更大的注意偏向，主要原因在于高特质考试个体对考试相关的特定刺激存在注意抑制困难。高特质考试焦虑个体在考试压力情境下工作记忆容量减小。对考试焦虑的理论解释最主要围绕注意控制理论展开，支持注意控制理论的研究者认为高焦虑与相关脑区的更大激活有关，且有相关研究结果支持该观点；反对注意控制理论的研究者认为高焦虑与相关脑区激活不足有关，也得到了相关研究结果的支持。认知功能的核心是执行功能，执行功能通常被分成三个子成分——认知切换、工作记忆表征的更新和监控、优势反应的抑制。考试焦虑作为焦虑症的一个亚类型，也会损害个体的认知功能。研究表明，当可用注意资源不足（高工作记忆负荷条件）时，高考试焦虑被试的抑制功能被削弱，以及在考试威胁条件下高考试焦虑个体的抑制功能也被削弱。然而，有关考试焦虑对记忆更新和任务切换功能的影响尚不清楚，目前还没有相关研究。今后的研究应该在现有理论基础上探究考试焦虑对记忆更新和任务切换功能的影响及相关认知神经机制，并探究有效的干预方法。

Abstract：Test anxiety (TA) is a situation-specific mood disorder, wherein individuals experience excessive worry, irrelevant thinking, and physical arousal in evaluation situations. Reducing the negative effects of test anxiety can help students reduce anxiety, improve their mental health and improve their learning efficiency. In recent years, researchers began to pay attention to the effects of test anxiety on individual attention, working memory, inhibitory function and related brain mechanisms. It is found that individuals with high test anxiety (HTAs) have greater attentional bias towards test-related stimuli, mainly because they have difficulty in attentional inhibition of specific test-related stimuli. For individuals with high test anxiety (HTAs), their working memory capacity decreased under

test stress. The theoretical explanation of test anxiety mainly focuses on Attention Control Theory (ACT). Researchers who support Attention Control Theory believe that high anxiety is related to greater activation of related brain areas, and relevant research results support this view. While, researchers who oppose Attention Control Theory believe that high anxiety is related to insufficient activation of relevant brain areas, which is also supported by relevant research results. The core of cognitive function is executive function, which is usually divided into three subcomponents: cognitive switching, updating and monitoring of working memory representations, and inhibition of dominant responses. Test anxiety, as a subtype of anxiety disorder, can also impair an individual's cognitive function. Studies have shown that when the available attention resources are insufficient (in high working memory load condition), the inhibitory function of high test anxiety subjects is weakened, and the inhibitory function of high test anxiety individuals is also weakened under the test threat condition. However, the effect of test anxiety on memory updating and task switching function is not clear, and no relevant studies have been conducted. Future studies should explore the effects of test anxiety on memory updating and task switching function and related cognitive neural mechanisms on the basis of existing theories, and explore effective intervention methods.

摘 要　学习判断(judgments of learning; JOLs)是指学习者对所学内容在未来测验中能够被成功提取可能性的预见性评估。以往研究主要聚焦于考察 JOL 的准确性及其内在产生机制等问题，然而近期研究表明 JOL 能够反应性改变记忆成绩本身，这种现象被称为反应性效应(the reactivity effect)。先前研究发现 JOL 对于项目自身记忆和项目间关系记忆的反应性效应存在分离，即学习时做 JOL 促进项目自身加工，表现出积极反应性效应；但同时做 JOL 将破坏项目间关系记忆（例如，项目间时序和项目间语义关系记忆），表现出消极反应性效应。Zhao 等人(2023)基于项目自身与关系理论(item-specific and relational account)来解释反应性效应的分离，该理论指出学习时做 JOL 增加了个体对项目自身特征的编码，进而提高项目自身记忆。但是，由于过多的注意资源投入到项目自身加工，导致个体忽略了项目间的关系加工，进而做 JOL 破坏项目间关系记忆。虽然，目前反应性效应的研究揭示出 JOL 对已学项目和项目间关系记忆的反应性效应，并发现这两种效应存在双分离现象，但尚未有研究探讨 JOL 是否对未学项目产生反应性影响，即是否对虚假记忆产生反应性效应。本研究采用 3 个实验，通过 DRM 范式，首次考察 JOL 对虚假记忆的反应性效应（实验 1），并进一步检验项目自身与关系理论（实验 2 和实验 3）。实验 1 发现，与 no-JOL 条件相比，逐项 JOL 降低了关键诱饵词的虚报率，即降低虚假记忆的产生。与此同时，逐项 JOL 促进了已学词的击中率，即项目自身记忆出现积极反应性效应。实验 2 和实验 3 通过改变 DRM 词列呈现形式和 JOL 类型，发现整体 JOL 促进项目内语义关系加工，但其破坏项目间语义关系加工，符合项目自身与关系理论的预期。上述研究结果不仅再次验证项目自身与关系理论在反应性效应研究中的适用性，而且为元记忆监测策略作为缓解虚假记忆产生的干预方式提供了重要启示。

The Reactivity Effect of Soliciting Judgments of Learning on False Memory

Wenbo Zhao[1], Yuqi Cao[2], Chunliang Yang[2] and Liang Luo[2*]

[1] School of Social Development and Public Policy, Beijing Normal University, Beijing, 100875

[2] Institute of Developmental Psychology, Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract：Judgments of learning (JOLs) refer to learners' predictive evaluations of the likelihood that they would successfully retrieve learned content in future tests. Previous research has mainly focused on examining the accuracy of JOLs and the mechanisms underlying JOL formation. However, recent studies have shown that JOLs can affect memory performance itself, which is called *the reactivity effect*. Previous research revealed dissociable reactivity effects on item and inter-item relational memory. Making JOLs enhances item-specific processing, showing a positive reactivity effect on item memory. However, it simultaneously disrupts relational memory (e.g., temporal order and semantic relational memory), resulting in a negative reactivity effect. Zhao et al. (2023) proposed that the item-specific and relational account can explain these dissociable reactivity effects. The item-specific relational account suggests that making JOLs promotes encoding of item-specific features, thereby facilitating item memory and producing a positive reactivity effect. However, due to limited cognitive resource, allocating more resources to item-specific processing corresponds to decreased resources for processing inter-item relations, leading to impaired inter-item relational memory and a negative reactivity effect. Although prior research observed the reactivity effects on memory for learned items and inter-item relations, no studies have examined whether making JOLs elicits reactivity effects on memory for non-learned items, specifically, false memory. Therefore, the current study utilized the DRM paradigm to examine the reactivity effect of making JOLs on false memory. Experiment 1 showed that item-by-item JOLs concurrently reduced false memory and increased correct recognition for studied words. Experiments 2 and 3, manipulating DRM word list presentation and JOL types, respectively, demonstrated that making global JOLs facilitates intra-item relational processing but disrupts inter-item relational processing. The results not only reconfirm the applicability of the item-specific and relational account but also provide valuable insights for using metacognitive monitoring strategies as interventions to mitigate the occurrence of false memory.

摘 要 **背景：**认知控制是指我们大脑动态调整注意资源、产生适应性目标导向行为的能力。作为一种核心的高级认知功能，认知控制参与从感知觉、注意、学习和记忆到情绪调节、奖励决策等心理过程的方方面面。认知控制对注意的调节机制有两种：一种是对目标刺激的加工增强，另一种是对干扰刺激的加工抑制，而相关理论模型大多将两者有机结合，认为是两种过程共同作用的结果。但近期的一些实证研究又发现了很多不一致的结果，重新引发了关于认知控制调控机制的争议。**方法：**为了更好地分离目标刺激与干扰刺激的加工，进一步探究认知控制的调节机制，本研究基于改编的视听跨通道 Stroop 任务，采用功能性磁共振（functional magnetic resonance imaging, fMRI）技术将目标刺激和干扰刺激的加工分离到相应的特异性脑区。该研究共包含三个任务，分别是视觉（目标刺激）Stroop 任务、听觉（目标刺激）Stroop 任务和匹配任务。其中视觉和听觉 Stroop 任务均为选择性注意，而被作为基线的匹配任务则为分配性注意。**结果：**感兴趣区分析发现，相比于匹配任务，在完成视觉 Stroop 任务时，视觉区和面孔特异性加工脑区的激活都显著增强，证明了任务相关刺激的加工增强。此外，我们分别对视觉区和听觉区进行了表征相似性分析（representational similarity analyses, RSA），结果发现相比于匹配任务，在完成视觉 Stroop 任务时，视觉区的模式相似性显著更高，而在完成听觉 Stroop 任务时，视觉区的模式相似性显著更低。表明任务相关刺激加工脑区的相似性被增强，而任务无关刺激加工脑区的相似性被抑制。最后，相关分析发现视觉 Stroop 任务中视觉区的激活增强与两侧顶内沟有关，而听觉 Stroop 任务中视觉区激活的减弱与前扣带回与背外侧前额叶有关。**结论：**我们发现了目标刺激加工增强与干扰刺激加工抑制同时作用的脑成像证据，但认知控制似乎更多通过调节视觉信息的加工促进冲突解决。这一结果不仅有助于加深人们对认知控制网络与其他脑网络之间作用关系的理解，也可以为开发更有效的认知训练程序提供理论依据。

关键词：跨通道 Stroop 任务，认知控制，功能性磁共振（fMRI），表征相似性分析（RSA）

Abstract： **Background**：Cognitive control refers to the ability of our brain to dynamically adjust attentional resources and generate adaptive goal-directed behavior. As a core higher-order cognitive function, cognitive control is involved in various aspects of psychological processes, ranging from perception, attention, learning, and memory to emotion regulation, reward decision-making, and more. There are two mechanisms of cognitive control in regulating attention: one is enhancing the processing of target stimuli, while the other is inhibiting the processing of interfering stimuli. Most relevant theoretical models integrate these two processes, considering them as the result of their combined action. However, recent empirical research has uncovered many inconsistent findings, reigniting the controversy surrounding the mechanisms of cognitive control regulation. **Methods**: In order to better separate the processing of target and interfering stimuli and further explore the regulatory mechanisms of cognitive control, this study conducted an adapted audiovisual cross-modal Stroop task, using functional magnetic resonance imaging (fMRI) technology to separate the processing of the target and the distractor into respective specific brain regions. The study consists of three tasks: Visual (target modality) Stroop

task, Auditory (target modality) Stroop task, and Matching task used as a baseline. Both Visual and Auditory Stroop tasks involve selective attention, while Matching task serves as a baseline involving only divided attention. **Results**: The region of interest (ROI) analysis revealed that compared to the matching task, activation in the visual area and face-specific processing brain regions significantly increased during the Visual Stroop task, demonstrating the enhancement of task-relevant stimulus processing. In addition, we conducted representational similarity analyses (RSA) for both the visual and auditory areas, and found that during the Visual Stroop task, the pattern similarity in the visual area was significantly higher, while during the Auditory Stroop task, the pattern similarity in the visual area was significantly lower, compared to the matching task. This indicates that the similarity of task-relevant stimulus processing in the brain region was enhanced, while the similarity of task-irrelevant stimulus processing in the brain region was suppressed. Furthermore, correlation analyses found that the enhanced activation in the visual area during the Visual Stroop task was related to the bilateral intraparietal sulcus, while the reduced activation in the visual area during the Auditory Stroop task was related to the anterior cingulate cortex and the dorsolateral prefrontal cortex. **Conclusion**: We found brain imaging evidence of both enhancement of target and inhibition of distractors, indicating that cognitive control operates through the modulation of visual information processing to facilitate conflict resolution. This result not only deepens our understanding of the interaction between the cognitive control network and other brain networks, but also provides a theoretical basis for developing more effective cognitive training programs.

Keywords: cross-modal Stroop task, cognitive control, fMRI, RSA

词汇再认记忆积极反应性效应的认知机制

李佰科[1]　杨春亮[2]（通讯作者）

1 辽宁师范大学心理学院，大连，116029

2 北京师范大学心理学部，北京，100875，通讯作者 E-mail：chunliang.yang@bnu.edu.cn

摘 要　在学习过程中进行学习判断(Judgments of Learning, JOLs)能够反应性地篡改个体对该项目的记忆表现，该现象被称为反应性效应(the reactivity effect)。纯列表词汇学习任务中，做 JOL 能够提高词汇再认记忆，表现出积极的反应性效应(the positive reactivity effect)。词汇再认记忆的积极反应性效应可以被学习投入增强理论所解释。该理论认为做 JOL 通过增加个体的学习投入（如注意、认知努力等）进而提高记忆表现。具体而言，在 No-JOL 条件下，随着学习过程的持续，被试集中到当前所学任务的注意力会逐渐衰退，进而开始产生走神行为。然而，在 JOL 条件下，被试需要寻找一些线索用来做出较为准确的 JOL。做 JOL 这一过程反应性地增加了个体对当前所学内容的注意，提高了个体的认知努力和学习参与程度，进而提高记忆成绩。虽然学习投入增强理论能够解释词汇再认记忆的积极反应性效应，但是较少有研究为该理论提供充足的实验证据。本研究使用三个行为范式（分散学习范式、产生效应范式以及节省时间范式）调节学习投入，为学习投入增强理论提供直接的行为证据。此外，本研究还通过认知神经手段(e.g., EEG)比较词汇编码阶段与认知投入相关的指标(例如，alpha 能量变化)，为学习投入增强理论提供认知神经证据。

The cognitive mechanisms underlying the positive reactivity effect to recognition memory

Baike Li[1] Chunliang Yang[2]

[1] School of Psychology, Liaoning Normal University, Dalian, 116029
[2] Department of Psychology, Beijing Normal University, Beijing, 100875, Corresponding Author's Email: chunliang.yang@bnu.edu.cn

Abstract： In the learning process, making a Judgments of Learning (JOLs) can reactively alter individuals' memory performance on the items, a phenomenon known as the reactivity effect. In pure list word learning tasks, making JOLs can enhance word recognition memory, demonstrating a positive reactivity effect. The positive reactivity effect in word recognition memory can be explained by the Enhanced-Engagement Theory (EET). The theory suggests that making JOLs increases participants' learning engagement (e.g., attention, cognitive effort, etc.), thereby improving memory performance. Specifically, under the No-JOL condition, as the learning process progresses, participants' attention to the concurrent learning materials gradually declines, leading to mind-wandering behavior. However, under the JOL condition, requiring participant to make JOL, they need to search for cues to make more accurate JOLs. This process reactively increases individuals' attention to the current learning content, enhancing their cognitive effort and engagement, thus improving memory performance. Although the EET can explain the positive reactivity effect in word recognition memory, there is limited research providing sufficient empirical evidence for this theory. This study employs three behavioral paradigms (spacing effect paradigm, production effect paradigm, and time-saving paradigm) to manipulate learning engagement, offering direct behavioral evidence for the EET. Additionally, the current study employs cognitive neuroimaging techniques (e.g., EEG) to compare encoding stage with cognitive engagement-related indicators (e.g., alpha power changes), providing cognitive neuroscientific evidence for the EET.

Keywords：judgments of learning, reactivity effect, recognition memory, enhanced engagement theory

认知冲突控制和情绪冲突控制的领域特殊性：来自比例一致性效应迁移的证据

向玲[1]（通讯作者） 高宇[2] 杨婷婷[3]
1 江西师范大学心理学院，南昌，330022，xiangling1997@126.com

摘 要 目前对于信息加工过程中认知冲突和情绪冲突的解决是依赖的认知控制资源是共享的还是相互独立的，这一点尚存在争论。已有研究从反应性控制的角度,以微观的序列一致性效应(SC 效应)为指标探讨了冲突解决的领域性问题，本研究则从宏观视角，以比例一致性效应(PC 效应)为指标，从主动性控制的视角出发，探究认知冲突和情绪冲突解决的领域性问题。采用面孔-词情绪效价冲突和空间 Simon 冲突的整合交叉任务开展两个实验，实验 1 操纵了 Simon 任务一致性比例，实验 2 则对情绪效价冲突任务的一致性比例进行了操纵，观察 Simon 冲突任务激发的控制资源的调整是否能够迁移到情绪冲突任务中，以及相反。结果发现，在正确率、反应时以及 N450 和晚期正波 SP 上，Simon 冲突和情绪效价冲突都只表现出任务内的 PC 效应，没有跨任务表现，这表明认知冲突诱发的持续性控制资源不能迁移到情绪冲突的解决，情绪冲突诱发的持续性控制资源也不能迁移到认知冲突的解决。研究进一步从宏观层面，基于主动性控制的角度，证明了冲突控制资源在认知冲突和情绪冲突上是领域特殊性的。结果强调了区分人类认知系统中特定领域控制机制的重要性，并支持情绪冲突和认知冲突的模块化架构。

The Domain Specificity of Cognitive Conflict Control and Emotional Conflict Control: Evidence from Proportion Congruency Effect Transfer

XIANG Ling[1](corresponding author) GAO Yu[2] YANG Tingting[3]
1 School of Psychology, Jiangxi Normal University, Nanchang 330022, China

Abstract： Currently, there is a debate regarding whether the cognitive control resources involved in resolving cognitive and emotional conflicts during information processing are shared or independent. Prior research has explored the domain specificity of conflict resolution from a reactive control perspective, using micro-level sequence congruency effect (SC effect) as an indicator. In contrast, this study adopts a macro-level perspective, employing the proportion congruency effect (PC effect) as an indicator from a proactive control viewpoint to investigate the domain specificity of resolving cognitive and emotional conflicts. Two experiments were conducted using an integrated cross-task involving face-word emotional valence conflict and spatial Simon conflict. Experiment 1 manipulated the congruency proportion of the Simon task, while Experiment 2 manipulated the congruency proportion of the emotional valence conflict task. The aim was to observe whether the adjustment of control resources triggered by the Simon conflict task could transfer to the emotional conflict task, and vice versa. The results indicates that both the Simon conflict and emotional valence conflict exhibited only within-task PC effects in accuracy, response time, N450, and late positive potential (late SP). There was no transfer of effects between tasks, suggesting that the sustained control resources triggered by cognitive conflict cannot transfer to emotional conflict resolution, and vice versa. From a macro-level perspective and based on the proactive control approach, this research provided evidence supporting the domain specificity of conflict control resources in cognitive and emotional conflict resolution. The findings underscore the importance of differentiating specific domain control mechanisms within the human cognitive system and support the modular architecture of emotional and cognitive conflict processing.

实际能力未必决定成败：认知控制中预期认知成本的作用

郑旭涛[1] 刘卓璇[1] 周吉帆[1]（通讯作者）
1 浙江大学心理与行为科学系，杭州，310000，jifanzhou@zju.edu.cn

摘 要　认知控制也被称作执行控制，是支持人们顺利实现目标导向行为所必需的能力。由于认知资源有限，为实现效用最大化，如何投入认知控制应同时考虑预期认知成本与预期收益。相关研究主要关注预期收益对认知控制的影响，但预期认知成本未得到足够重视。

本研究在成本-收益框架下，考察预期认知成本（高/低）与预期收益（高/低）对认知控制的影响。在 2 个实验中，分别采用虚假绩效反馈与真实绩效体验，操作被试对自身认知能力的判断，在此基础上形成执行后续任务的预期认知成本。实验 1（N=64）采用 Stroop 范式和任务切换范式。通过 Stroop 范式测量被试的实际认知能力，并在任务结束后提供虚假绩效反馈。获得高绩效反馈的被试感到自身认知能力高，在随后任务中将预期低认知成本。与之相对，获得低绩效反馈的被试在随后任务中将预

期高认知成本。随后，采用任务切换范式考察预期认知成本与预期收益对认知控制的影响。在该任务中，用金钱线索操作被试的预期收益，用任务类型发生切换时的反应损耗作为认知控制投入的指标。实验 2（N=64）中 Stroop 任务不再提供绩效反馈，改为插入一项高难度或低难度的对立要求任务，以操作被试在后续任务中的预期认知成本。

2 项实验结果均显示，预期认知成本与预期收益具有显著交互作用：预期高认知成本的被试在预期低收益时的反应损耗显著高于预期高收益时，而预期低认知成本的被试在预期高收益与预期低收益时的反应损耗相当。有趣的是，被试的实际认知能力与预期收益间不存在交互作用。

以上结果首次证明了预期认知成本对执行认知控制的关键作用。人们在预期高认知成本时变得“精明”，降低预期低收益时的认知控制，投入到预期高收益的情境中。而在预期低认知成本时，无论预期收益的高低，均投入较多认知控制，以获取完整的收益。预期认知成本取决于人们对自身能力的感知，其并非实际能力的直接反映。在目标导向行为中，人们“认为”自己拥有的能力可能比“实际”能力更为关键，这对教育工作者有重要意义。

Actual Capacity May Not Determine Success or Failure: The Effect of Expected Cognitive Costs on Cognitive Control

Xutao Zheng[1], Zhuoxuan Liu[1], Jifan Zhou (jifanzhou@zju.edu.cn)[1]

1 Department of Psychology and Behavioral Sciences, Zhejiang University

Abstract：Cognitive control, also known as executive control, is the ability necessary for individuals to successfully achieve goal-directed behavior. Since cognitive resources are limited, in order to maximize utility, how to invest cognitive control should consider both the expected cognitive costs and expected benefits. Previous research has mainly focused on the effect of expected benefits on cognitive control, while expected cognitive costs have not received sufficient attention.

This study examines the effect of expected cognitive costs (high vs. low) and expected benefits (high vs. low) on cognitive control within a cost-benefit framework. Two experiments were conducted, using false performance feedback and real performance experience to manipulate participants' judgments of their own cognitive capacity, based on which they formed their expectations of cognitive costs for subsequent task. Experiment 1 (N=64) used the Stroop paradigm and task-switching paradigm. First, participants' actual cognitive capacity was measured using the Stroop paradigm, and false performance feedback was provided after the task. Participants who received high-performance feedback perceived their cognitive capacity as high and formed expectations of low cognitive costs for the subsequent task. Conversely, participants who received low-performance feedback formed expectations of high cognitive costs for the subsequent task. Then, the task-switching paradigm was used to measure the effects of expected cognitive costs and expected benefits on cognitive control. In this task, monetary cues were used to manipulate participants' expected benefits, and the reaction cost when switching between task types was used as an indicator of cognitive control invested. In Experiment 2 (N=64), the Stroop task no longer provided performance feedback, instead inserted a hard or easy countermanding task to manipulate participants' expectations of cognitive costs for the subsequent task.

The results of both experiments showed a significant interaction between expected cognitive costs and expected benefits: participants with expectations of high cognitive costs showed significantly higher reaction costs when expecting low benefits compared to high benefits, while participants with expectations of low

cognitive costs showed similar reaction costs regardless of high or low expected benefits. Interestingly, there was no interaction between participants' actual cognitive capacity and expected benefits.

These results provide the first evidence of the crucial role of expected cognitive costs in cognitive control. Individuals become "shrewd" with high expected cognitive costs, reducing cognitive control in situations with low expected benefits so that they can invest more cognitive control in situations with high expected benefits. In contrast, with low expected costs, individuals tend to invest much cognitive control regardless of the magnitude of expected benefits in order to obtain complete rewards. Expected cognitive costs depend on Individuals' judgments of their own capacity, which are not a direct reflection to their true capacity. In goal-directed behavior, individuals' perceived cognitive capacity may be more critical than their actual cognitive capacity, which is of significant meaning for educators.

工作记忆捕获注意过程中认知控制参与的必要性研究

张豹[1]　刘树辉[1]　隋洁[2]　黄赛[2]（通讯作者）

1 广州大学心理学系，广州，510106

2 阿伯丁大学心理学系, 阿伯丁，AB24 3FX，通讯作者 huangsai@gzhu.edu.cn

摘 要 近年来的大量研究表明，在视觉搜索过程中，如果有刺激与当前保存在工作记忆中的内容有特征匹配，注意会被该记忆匹配刺激所捕获，即使该记忆匹配刺激只是作为视觉搜索的干扰刺激，这种现象被称为记忆驱动的注意捕获。然而，关于该注意捕获现象是自动化的过程，还是受到认知控制的调节，目前仍存在持续的争议。本研究采用眼动追踪技术，通过四个实验考察认知控制的作用边界。实验 1 中，通过给予被试与视觉搜索速度相关的金钱奖罚；实验 2 和实验 3 分别对选择记忆匹配干扰刺激与选择目标进行即时的金钱奖罚；实验 4 则只进行重复练习而无金钱激励的操作。结果显示，不管是激励还是重复练习都可以提高视觉搜索效率，但对注意捕获的影响呈现出两种不同的模式。实验 1-3 中，当视觉搜索涉及到金钱激励时，注意捕获被抑制，表明基于激励条件下可以促使认知控制参与，从而避免被记忆匹配的干扰物所捕获。相比之下，实验 4 尽管进行了重复练习而提升了视觉搜索效率，但仍观察到持续的注意捕获效应，表明在没有外部激励的情况下，被试优先考虑资源的平衡而非优化搜索效率。总体而言，这些结果表明，在工作记忆内容捕获视觉注意的过程中，并非必须启动认知控制来调节注意捕获，认知控制的参与程度一定程度上取决于其本身所消耗的资源和带来的收益之间的平衡。

Necessity of Cognitive Control Involvement in Memory-driven Attentional Capture

Bao Zhang [1] Shuhui Liu[1] Jie Sui[2], Sai Huang[1*]

1. Department of Psychology, Guangzhou University, Guangzhou, China

2. School of Psychology, University of Aberdeen, Aberdeen, United Kingdom

Abstract： Visual attention can be captured by distractors that match the contents of working memory during visual search. This phenomenon, known as memory-driven attentional capture, has been extensively studied.

However, there is ongoing debate regarding the role of cognitive control in mediating this capture effect. This study employed eye-tracking technology to explore the boundary conditions for cognitive control's influence in four experiments. Experiment 1 utilized performance-based monetary incentives tied to visual search speed, while Experiments 2 and 3 involved immediate monetary rewards or penalties for selecting memory-matching distractors or targets. Experiment 4 focused solely on repetitive practice without monetary incentives. The results showed that both incentives and repetitive practice improved visual search efficiency but had distinct effects on attentional capture. In Experiments 1 to 3, monetary incentives suppressed attentional capture, suggesting the involvement of cognitive control when motivated by external rewards, leading to the avoidance of memory-matching distractors. Conversely, Experiment 4 revealed persistent attentional capture despite repetitive practice, indicating that participants prioritized resource balance over optimizing search efficiency in the absence of external motivation. Overall, these findings support the assumption that the initiation of cognitive control is not always necessary for modulating attentional capture. The extent of cognitive control's involvement appears to depend on the balance between the resources it consumes and the benefits it yields.

Keywords：memory-driven attentional capture, cognitive control, working memory, monetary incentives

元认知干预中的认知训练效果及影响因素：一项元分析研究

翟钰慧[1]，郭宇飞[2]，叶群[1](通讯作者)

(浙江师范大学心理学院，金华，321004，qun.ye@zjnu.edu.cn)

摘 要　元认知是评估和调节自身认知过程的一种高级认知功能。良好的元认知能力能够帮助个体快速意识到行为表现的波动，并适当地调节其信心水平，进而优化行为表现。认知训练被认为是一种有效的元认知干预方式，但不同的认知训练类型对于元认知的干预效果不一。系统考察其干预效果及其影响因素，有助于理解其作用机制，并为今后的认知训练干预元认知提供实践指导。本研究运用元分析技术，以元认知效率、元认知偏差、元认知敏感性以及测量工具所测元认知分数为结果变量，考察训练类型、被试群体、干预周期和反馈类型（是/否）的调节作用。通过对文献的检索和筛选，最终纳入 30 篇文献，共 51 个效应量，总样本量为 3273。研究使用 Comprehensive Meta-Analysis(CMA 3.0)软件对数据进行分析。结果发现：总效应及各结果变量的干预效果均显著。认知训练对元认知的总体干预效果量达到中等以上水平(g=0.525)，评估工具、元认知效率和元认知偏差的干预均达到中到大的效果量(评估工具：g=0.557，元认知效率：g=0.603，元认知偏差：g=0.522)，而元认知敏感性的干预效果为小效果量(g=0.275)。亚组分析发现，认知训练对元认知的干预受到训练类型、干预周期、和反馈的调节，但不受被试群体的影响。最后，发表偏倚检验的结果显示纳入元分析的研究存在发表偏倚的可能性较低(N_{fs}>5k+10)。研究结果表明，认知训练确实可以改善元认知能力，尤其是针对元认知效率、元认知偏差和测量工具所测元认知能力方面，在一定程度上解决了不同研究结果之间存在的差异。这将有助于未来的研究改进方法，拓展干预领域，并为促进个体元认知能力的提升提供实践指导。

The Effect and Influencing Factors of Cognitive Training in Metacognitive Intervention: A Meta-analysis

YuHui Zhai[1], YuFei Guo[2], Qun Ye[1](Corresponding Author)

(School of psychology, Zhejiang Normal University, Jinhua, 321004, qun.ye@zjnu.edu.cn)

Abstract：Metacognition is an advanced cognitive function that involves evaluating and regulating one's own cognitive processes. Individuals with strong metacognition are aware of fluctuations in task performance and appropriately modulate their confidence levels, thus optimizing their behavioral performance. Cognitive training is considered an effective intervention for enhancing metacognition; however, its effects can vary depending on the type of cognitive training employed. Examining the intervention effects and influencing factors of cognitive training can help us understand its mechanisms and provide valuable guidance for future metacognitive interventions. In this study, we conducted a comprehensive meta-analysis to investigate the moderating effects of training type, participant group, intervention duration, and feedback type (yes/no) on metacognitive efficiency, metacognitive bias, metacognitive sensitivity, and metacognitive scores measured by assessment tools. A total of 30 articles, comprising 51 effect sizes and a sample size of 3273, were included after literature retrieval and screening. Data analysis was performed using Comprehensive Meta-Analysis (CMA 3.0) software. The results showed significant intervention effects for the overall effect size and all outcome variables. The overall effect size of cognitive training on metacognition reached a moderate level (g=.525), with moderate to large effect sizes for assessment tools (g=.557), metacognitive efficiency (g=.603), and metacognitive bias (g=.522), and a small effect size for metacognitive sensitivity (g=.275). Subgroup analyses revealed that the intervention effects of cognitive training on metacognition were moderated by training type, intervention duration, and feedback, but not by participant group. Finally, the results of publication bias tests indicated a low possibility of publication bias in the included studies (N_{fs}>5k+10). The findings suggest that cognitive training can indeed improve metacognitive abilities, particularly in terms of metacognitive efficiency, metacognitive bias, and metacognitive scores measured by assessment tools, thus partially resolving the discrepancies among different research results. This will contribute to methodological improvements in future studies, expand the scope of interventions, and provide practical guidance for enhancing individual metacognitive skills.

成人依恋与工作倦怠的关系：心理弹性及工作家庭冲突的作用

吴杨轩[1] 曹贤才[1,2,3]（通讯作者）

1 天津师范大学心理学部,天津，300387

2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院,天津，300387

3 学生心理发展与学习天津市高校社会科学实验室,天津，300387，通讯作者 caoxiancai@tjnu.edu.cn

摘 要 在组织情境中，工作倦怠是损害员工身心健康及组织工作绩效的一个重要因素，一直是组织心理学研究关注的重要方面。而近年来，依恋理论及相关研究提供了一种解释工作倦怠产生的新的视角，多项横断研究表明，安全的依恋关系可能会通过增加个体心理弹性进而降低工作倦怠的产生。本研究结合依恋控制系统理论及角色压力理论，从家庭与工作的相互作用角度，创新性提出：家庭对工作的冲突与工作对家庭的冲突在依恋与工作倦怠的关系中分别扮演不同角色，前者与心理弹性相似会中介依恋与工作倦怠的关系，而后者会调节依恋、心理弹性与工作倦怠中介模型的前半段。对此，研究采用亲密关系量表、成人心理弹性量表、工作家庭冲突量表和马斯勒倦怠量表对 492 名在职人员进行问卷调查，结果发现：（1）依恋焦虑、依恋回避与工作倦怠、工作-家庭冲突、家庭-工作冲突呈显著的正相关关系；心理弹性与依恋焦虑、

依恋回避、工作倦怠、工作-家庭冲突、家庭-工作冲突呈显著的负相关关系。（2）心理弹性在依恋焦虑和依恋回避与工作倦怠之间起部分中介作用。（3）家庭-工作冲突在依恋焦虑和依恋回避与工作倦怠之间起部分中介作用。（4）在依恋焦虑与工作倦怠的模型中，工作-家庭冲突调节了“依恋焦虑→家庭-工作冲突→工作倦怠”中介机制的前半段路径；而在依恋回避与工作倦怠的模型中，工作-家庭冲突对依恋回避与工作倦怠间直接路径的调节作用显著。本研究扩展了依恋理论的运用范围，可以从个体层面、家庭层面以及家庭与工作交互作用层面为工作倦怠的产生提供一种新的解释。

The relationship between adult attachment and job burnout: the role of psychological resilience and the conflict between work and family

Yangxuan WU[1]　Xiancai CAO[1,2,3]

1 Faculty of Psychology, Tianjin Normal University, Tianjin, China

2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin, China

Abstract：In the context of organizations, job burnout is a significant factor that undermines employees' mental and physical well-being as well as organizational performance. It has been an important focus of research in organizational psychology. In recent years, attachment theory and related studies have provided a new perspective for understanding the emergence of job burnout. Several cross-sectional studies have indicated that attachment security may reduce an individual’s job burnout by increasing psychological resilience.

Combining the control-systems model of attachment and the role stress theory, the current study considered the interaction between family and work and innovatively proposed that work-family conflict and family-work conflict may play different roles in the relationship between attachment and job burnout. The former is similar to psychological resilience in mediating the relationship between attachment and job burnout, while the latter moderates the first half of the mediating model between attachment, psychological resilience, and job burnout.

To test these hypotheses, a series of questionnaires, including the Experiences in Close Relationships Inventory, the Resilience Scale for Adults, the Work-Family Conflict and Family-Work Conflict Inventory, and the Maslach Burnout Inventory, were conducted with 492 employed individuals. The results revealed that: (1) There were significant positive correlations between attachment anxiety, attachment avoidance, job burnout, work-family conflict, and family-work conflict. Psychological resilience showed significant negative correlations with attachment anxiety, attachment avoidance, job burnout, work-family conflict, and family-work conflict. (2) Psychological resilience partially mediated the relationship between attachment anxiety, attachment avoidance, and job burnout. (3) Family-work conflict partially mediated the relationship between attachment anxiety, attachment avoidance, and job burnout. (4) In the model of attachment anxiety and job burnout, the mediating effect of family-work conflict was moderated by work-family conflict. Similarly, in the model of attachment avoidance and job burnout, work-family conflict moderated the direct effect of attachment avoidance and job burnout.

This study expands the application of attachment theory and provides a new explanation for the emergence of

job burnout from the perspectives of individuals, families, and the interaction between family and work.

企业家从众消费行为对投资者投资意愿的影响:感知领导力的中介作用

宗心雨　钟建安（通讯作者）

浙江大学心理与行为科学系，杭州，310004，jiananzhong@zju.edu.cn

摘 要　天使投资是初创企业早期阶段重要的资金来源，具有高不确定性和信息不对称性。在这种“高噪音环境”下，投资者时常寻找各种信号来确定一个新企业的价值。而随着社交媒体的普及，社交媒体也成为人们获取信息的重要渠道，社交媒体中的信息作为一种信号，可以用来减少天使投资中的信息不对称性。从众消费是一种常见的社会现象，人们对于从众消费的态度十分矛盾，有时候人们会认为从众消费的人没有个性、性格软弱，但有时候人们又希望他人在消费决策中跟从多数人的意见。所以，本研究基于信号理论，以企业家的社交媒体作为一种信息的展示形式，通过两个研究，探究其从众消费行为对投资者投资意愿的影响，并探究其中可能的中介机制与调节因素。研究一采用单因素（企业家消费行为：从众、不从众）被试间设计，探索了企业家从众消费行为对投资者投资意愿的影响，并检验了领导力感知的中介作用。研究二采用 2（企业家消费行为：从众、不从众）×2（感知动机：自利动机、利他动机）的被试间设计，再次检验领导力感知的中介作用，并考察了感知动机的调节作用。研究结果显示，相较于不从众消费行为，企业家的从众消费行为会引发投资者更低的投资意愿，领导力感知的中介作用显著；感知动机的调节作用显著，利他动机下，进行从众消费行为的企业家获得更低的领导力感知评价以及更低的投资意愿，自利动机下，领导力感知的中介作用不显著。本研究对于信号理论与内隐领导理论在天使投资中的应用进行了扩展，同时研究结果对于投资者与企业家具有一定的实践意义。

The influence of conformity consumption on investors' investment intention:the mediating role of leadership perception

Zong Xinyu　Zhong jianan

Department of Psychology and Behavior Sciences,Zhejiang University, Hangzhou, jiananzhong@zju.edu.cn

Abstract：Angel investment is an important source of start-ups in the early stage, and it is of high uncertainty and information asymmetry. In “high-noise environment” like this, investors often search for various signals to determine the value of a new enterprise. With the popularity of social media, it has become an important channel for people to obtain information from. As signals, information from social media can be used to reduce information asymmetry in angel investment. Conformity consumption is a common social phenomenon, however, people hold contradictory attitudes towards it. Sometimes people regard conformity consumer as of weak character, but sometimes people expect others to follow the majority in consumption decisions. Therefore, based on the signaling theory, this research takes entrepreneur's social media as the form of information display to explore the influence of conformity consumption on investors' investment intention, and to explore the possible mediating mechanism and moderating factors through two studies . In the first study, an one-way(entrepreneur's consumption behavior: conformity, nonconformity) between-subjects design was used to explore the influence of

entrepreneur's conformity consumption behavior on investors' investment intention, also the mediating role of leadership perception was tested. In the second study, a 2(entrepreneur's consumption behavior: conformity, nonconformity)×2(perceived motivation:self-focus motivation, group-focus motivation) between-subjects design was used to test the mediating role of leadership perception and to investigate the moderating role of perceived motivation. As the results showed, compared with nonconformity consumption, entrepreneur who engages in conformity consumption obtains lower investment intention from the investors, with the mediating role of leadership perception significant. Also, the moderating role of perceived motivation is significant, under group-focus motivation, entrepreneur who engages in conformity consumption obtains lower leadership perception evaluation and lower investment intention from the investors, while the mediating role of leadership perception is not significant under self-focus motivation. The research expands the application of signaling theory and implicit leadership theory in angel investment, while the results provides practical significance for the investors and the entrepreneurs.

省力休闲与休闲重塑对警察工作投入的影响：恢复体验的中介作用

张佳佳

1.四川警察学院 警察管理系 四川泸州 646000；

2.中国人民公安大学 犯罪学学院 北京 100038；

通讯作者 E-mail：zhangjj@scpolicec.edu.cn

摘 要 [目的]分析省力休闲、休闲重塑、恢复体验、工作投入之间的关系，检验恢复体验在省力休闲与休闲重塑和警察工作投入之间的中介效应。[方法]于 2021 年 2-6 月通过方便取样法对四川省某市 987 名公安民警进行问卷调查，采用省力休闲量表、休闲重塑量表、恢复体验量表及工作投入量表对研究对象的省力休闲、休闲重塑、恢复体验及工作投入水平进行评价。运用 SPSS21.0 软件对本次调查数据进行共同方法偏差检验、描述性统计、Pearson 相关分析、半偏相关分析、回归分析和 Process 宏程序提供的有偏差校正的 bootstrap 方法的中介效应检验。[结果]回收有效问卷 932 份。不同人口学变量警察群体在省力休闲、休闲重塑、恢复体验、工作投入得分差异具有统计学意义，其中男、女性警察恢复体验及工作投入得分差异具有统计学意义（t=-2.231,P<0.05；t=3.512,P<0.001）；不同年龄组警察的休闲重塑、恢复体验、工作投入得分差异均具有统计学意义（F=8.748,P<0.001；F=3.069,P<0.05；F=4.511,P<0.001）；不同警龄组警察省力休闲、休闲重塑、恢复体验及工作投入得分差异也均具有统计学意义（F=5.379, F=7.615, F=7.110, F=5.962,均 P<0.001）；刑侦特巡警的工作投入最强（F=4.812,P<0.01）；未婚警察恢复体验感最强（F=4.527,P<0.05）；不同学历与来源警察各变量得分差异不具统计学意义（P>0.05）；工作地点不同的警察休闲重塑得分差异具有统计学意义（F=3.429,P<0.05），且工作在市区的警察恢复体验感最强（F=4.818,P<0.01）；省力休闲、休闲重塑与恢复体验及工作投入变量得分间均呈正相关（r_P =0.217, 0.257; 0.383, 0.453,均 P<0.01；），恢复体验与工作投入变量得分间也呈正相关（r_P =0.310, P<0.01）。回归结果显示省力休闲、休闲重塑得分对警察工作投入均有正向影响作用(β=0.257,0.453,P<0.001)，其中，休闲重塑对警察工作投入的促进作用强于省力休闲（sr^2=0.194、0.057）；恢复体验在省力休闲、休闲重塑与警察工作投入之间具有中介效应，中介效应值分别为0.057（95%CI=0.035~0.086）和0.061（95%CI=0.029~0.100），中介效应百分比分别为22.26%和13.47%。[结论]不同人口学变量影响警察省力休闲、休闲重塑、恢复体验及工作投入得分；休闲有助于警察工作投入的提升，休闲重塑对警察工作投入的促进作用强于省力休闲；恢复体验在休闲与工作投入之间发挥部分中介作用。

关键词 省力休闲，休闲重塑，工作投入，恢复体验，中介效应

Low-effort Activities and Leisure Crafting Effect on Police' Work Engagement: the Mediating Role of Recovery Experiences

ZHANG Jia-jia

1.Department of Police Management, Sichuan Police College, Sichuan, Luzhou 646000, China；

2.School of Criminology, People's Public Security University of China, Beijing 10038, China

Abstract: [Objective] To explore the relationship among low-effort activities, leisure crafting, recovery experience and work engagement, and test the mediating role of recovery experience among low-effort activities, leisure crafting and police work engagement.[Methods] From February to June 2021, a questionnaire survey was conducted among 987 police officers in a city of Sichuan Province through the convenience sampling method. Low-effort Activities Scale, Leisure Crafting Scale, Recovery Experiences Scale and Work Engagement Scale were used to evaluate the low-effort activities, leisure crafting, recovery experiences and work engagement of police. SPSS21.0 software was used for identifying common method bias, descriptive statistics, Pearson correlation analysis, partial correlation analysis, regression analysis and mediation effect test.[Results] A total of 932 valid questionnaires were collected. There was significant differences in the scores of low-effort activities, leisure crafting, recovery experiences and work engagement among police groups with different demographic variables. First, there was a significant difference between men and women in recovery experiences and work engagement scores (t=-2.231,P<0.05;t=3.512,P<0.001). Second, there was significant differences in the scores of leisure crafting, recovery experiences and work engagement among police officers in different age groups (F=8.748,P<0.001;F=3.069,P<0.05;F=4.511,P<0.001). And there was significant differences in the scores of low-effort activities, leisure crafting, recovery experiences and work engagement among police officers in different length of police service groups (F=5.379, F=7.615, F=7.110, F=5.962, P<0.001 for all). Third, Comparing with other groups, the criminal investigation and special patrol police officers group, who had highest scores on the work engagement(F=4.812, P<0.01); The unmarried police officers had the strongest sense of recovery experiences (F=4.527, P<0.05). Forth, there was no statistically significant difference in scores across variables among police officers with different educational backgrounds and sources (P>0.05). Finally, there was a statistically significant difference in leisure crafting scores among police officers from different work locations (F=3.429, P<0.05), and police officers working in urban areas had the strongest sense of recovery experiences (F=4.818, P<0.01). Correlation analysis showed that police low-effort activities and leisure crafting were positively correlated with recovery experience and work engagement respectively (r_P =0.217, 0.257; 0.383, 0.453, P<0.01 for all), and recovery experience was also positively correlated with work engagement (r_P =0.310, P<0.01). Regression analysis found that in the case of controlling demographic variables, the scores of low-effort activities and leisure crafting could both positive influence the police work engagement scale (β=0.257, 0.453, P<0.001 for all), and among them, leisure crafting had a stronger effect on promoting police work engagement than low-effort activities (sr^2=0.194, 0.057). The results of mediation effect analysis revealed that recovery experience had a mediating effect between low-effort activities and police work engagement (Effect value=0.057, 95%CI=0.035-0.086; effect percentage=22.26%), and had a mediating effect between leisure crafting and police work engagement (Effect value=0.061, 95%CI=0.029-0.100; effect percentage=13.47%). [Conclusion] Demographic variables such as gender, age, length of police service, police division, marital status, education level and work location effected on the level of low-effort activities, leisure crafting, recovery experiences and work engagement among police officers. And leisure contributed to the enhancement of police job engagement, and

leisure crafting had a stronger promoting effect on police job engagement than low-effort activities, and recovery experience played a partial mediating role between leisure and work engagement among police officers.
Keywords: low-effort activities, leisure crafting, recovery experience, work engagement, mediating effect

善意性别偏见觉知对女性领导力涌现的影响

董航[1]　徐建平[1]（通讯作者）

北京师范大学心理学部，北京，100875，xujp@bnu.edu.cn

摘 要　近年来，无论是在网络论坛还是学术界，性别偏见都是容易引起热议的话题。随着人们受教育水平的提高，越来越多的女性具有了独立的经济实力，并开始意识到社会中对于女性的性别偏见。善意性别偏见是一种从主观情感上出于爱护女性，但实质上是将她们捆绑在传统性别角色上的一种隐含期望。本研究意欲探究在组织中下，善意性别偏见的觉知水平是否会对女性领导力涌现产生影响。

研究一编制了善意性别偏见量表。通过问卷网招募被试 566 名，参考多个经典量表，编制了一个含有 38 道题目的量表，分为性别角色、性别魅力、亲密关系三个维度。该工具信度 Cronbachα系数为 0.95，结构效度 CFI 为 0.83，信效度良好。

研究二检验了性别刻板印象威胁对唤醒善意性别偏见的作用。通过线上问卷平台进行被试招募与抽取，将 136 名被试随机分为实验组与对照组，进行被试内前后测实验。使用隐含善意性别偏见的性别刻板印象唤醒文本进行操纵，测量在唤醒前后的动态善意性别偏见。结果表明，在进行性别刻板印象唤醒后，善意性别偏见觉知水平显著提升。说明经过刻板印象威胁刺激，女性可以提高善意性别偏见觉知。

研究三探究了善意性别偏见对女性领导力涌现的作用。使用研究一编制的量表，以及研究二中的操纵文本作为实验材料，使用简单随机抽样法招募 136 名被试，分为实验组和控制组，实施随机对照实验。两组在实验前阅读实验材料，实验组阅读性别刻板印象唤醒本文，对照组阅读心理学科普类文本。随后两组均进行无领导研讨小组，解决经过简化处理的行政岗位公文筐试题，模拟组织研讨。任务完成后，对其善意性别偏见与领导力涌现水平进行测量。研究发现，善意性别偏见觉知水平正向预测了领导力涌现水平。

研究结论认为，编制的善意性别偏见量表，从多个角度能够较为全面的测量善意性别偏见，性别刻板印象唤醒文本能够提升对善意性别偏见的觉知。对善意性别偏见的觉知水平可以对领导力涌现的水平产生正向影响。本研究探索组织中对女性善意性别偏见的觉知，对改善组织中男女平等、促进女性领导上升发展有一定实践指导意义。

BENEVOLENT GENDER BIAS AROUSES THE INFLUENCE OF FEMALE LEADERSHIP EMERGENCE

Hang Dong, JianPing Xu
Faculty of Psychology, Beijing Normal University, 19 Xinjiekouwai Street, Xicheng District, Beijing 100875, China. Email: xujp@bnu.edu.cn

***Abstract*：** In recent years, sexism has been a hot topic both on the Internet and in academia. With the improvement of people's education level, more and more women have independent economic power and become aware of the sexism against women in society. Benevolent sexism is an implicit expectation that women are emotionally attached to traditional gender roles but are emotionally attached to women. The purpose of this study is to explore whether the perceived level of benevolent sexism affects the emergence of female leadership in organizations.

In Study 1, I developed a goodwill sexism scale. 566 subjects were recruited from the Internet. Referring to several classic scales, a scale with 38 questions was compiled to evaluate the three dimensions of gender role, gender charm and intimate relationship. In this tool, Cronbach α is 0.95, the structural validity CFI is 0.83, and the reliability and validity are great.

In Study 2, I examined the effect of gender stereotype arousal on benevolent sexism. Subjects were recruited and selected through the questionnaire network platform, and 136 subjects were randomly divided into experimental group and control group. The dynamic benevolent sexism before and after arousal was measured by manipulating the arousal text with gender stereotypes containing benevolent sexism. The results showed that the level of benevolent sexism awareness increased significantly after gender stereotype awakening. These results suggest that stereotype threat stimulation can enhance women's awareness of benevolent sexism.

In Study 3, I explored the role of benevolent sexism in the emergence of female leadership. Using the scale prepared in Study 1 and the manipulated text in Study 2 as experimental materials, 136 subjects in the society were collected by simple random sampling method, divided into experimental group and control group, and the randomized controlled experiment was carried out. The two groups read the experimental materials before the experiment, the experimental group read the text about gender stereotypes, and the control group read the text about psychological science. Subsequently, both groups conducted leaderless discussion groups to solve the simplified administrative post in-tray questions and simulate the discussion in the organization. After the task was completed, the level of benevolent sexism and leadership emergence was measured. The results show that the level of benevolent sexism positively predicts the level of leadership emergence.

The study concluded that the scale of benevolent sexism can measure benevolent sexism comprehensively from multiple perspectives, and gender stereotype awakening text can enhance awareness of benevolent sexism. The level of awareness of benevolent sexism has a positive impact on the level of leadership emergence. Exploring the awareness of sexism against female goodwill in organizations. It has certain practical guiding value for improving gender equality in organizations and promoting the rise and development of female leaders.

“随时在线”：非工作时间职场通讯压力的溢出与交叉效应：工作反刍的双向作用机制

何晓燕[1] 高钦[2] 曹雅[1] 卞冉[1](通讯作者)
1 北京师范大学心理学部，北京，100875，ranbian@bnu.edu.cn
2 中国政法大学社会学院, 北京，100088

摘 要 职场通讯压力指员工想要快速回复工作相关信息而体验到的紧迫感，是工作中频繁的使用通讯技术互动产生的心理体验。研究发现，职场通讯压力会给员工带来许多负面的影响，在非工作时间的影响更为明显。然而，这些研究未区分工作时间与非工作时间职场通讯压力，且仅从员工层面，强调职场通讯压力导致员工工作心理脱离困难，从而对员工产生负面影响。员工难以在心理上与工作脱离，实际反映了对工作的反刍，即对工作问题的持续思考，其包含两个反向作用维度：积极的问题解决沉思和消极的情感反刍。本研究认为聚焦于非工作时间职场通讯压力(workplace telepressure after hours, WTA)，从工作反刍双向作用机制，且基于溢出-交叉模型，从员工和伴侣层面考察非工作时间职场通讯压力的后续效应及驱动不同路径效应生效的边界条件，将会有助于更全面地认识 WTA 对员工自身及其整个家庭带来的影响。研究使用一个跨三个时间点的研究设计，收集了 333 对在职夫妻的相关数据。结果发现，溢出效应显著：(1) WTA 通过增加问题解决沉思减少家庭阻抑的中介效应显著，核心自我评价正向调节问题解决沉思的中介作用。(2)WTA 通过增加情感反刍增加家庭阻抑的中介效应不显著，但核心自我评价有效负向调节该中介路径；在低核心自我评价条件，情感反刍的中介效应显著。进一步地，交叉效应显著：(3)员工家庭阻抑增加配偶感知的压力交叉传递，进而负向影响配偶婚姻关系满意度和正向影响配偶家庭情绪耗竭的中介效应均显著。(4)WTA 通过问题解决沉思、家庭阻抑和配偶感知压力交叉传递，正向影响配偶婚姻关系满意度和负向影响配偶家庭情绪耗竭链式中介均显著, 核心自我评价均正向调节这两条链式中介效应。(5)WTA 通过情感反刍、家庭阻抑和配偶感知的压力交叉传递，负向影响配偶关系满意度和正向影响配偶家庭情绪耗竭的链式中介效应不显著，但核心自我评价显著负向调节这两条中介效应，且在低核心自我评价条件，这两条链式中介效应均显著。本研究发现，为组织领导探索更有效管理员工非工作时间通讯行为的方法提供理论启示。
关键词 非工作时间职场通讯压力，工作反刍，家庭阻抑，配偶婚姻关系满意度，配偶家庭情绪耗竭

"Always online": the spillover and crossover effects of workplace telepressure after hours: a bidirectional mechanism of work-related rumination

Xiaoyan He[1], Qin Gao[2], Ya Cao[1], Ran Bian[1](Corresponding author)
1 Department of Psychology, Beijing Normal University, Beijing, 100875, China
2 Department of Sociology, China University of Political Science and Law, Beijing, 100088, China

***Abstract*:** Workplace telepressure refers to the urgency experienced by employees when they want to respond quickly to work-related information, which is a unique psychological experience that accompanies the frequent use of communication technology interactions in the workplace. Research has found that workplace telepressure have many negative effects on employees, especially in non-working time. However, these studies do not differentiate between working time and non-working time workplace telepressure, and only at the employee level, emphasizing that workplace telepressure leads to difficulties in psychologically disengaging from the work, which in turn negatively affects employees. Employees' difficulties in psychologically disengaging from work actually reflects employees' work-related rumination i.e., continuous thinking about work-related problems, which consists of two inverse action dimensions: positive problem-solving pondering and negative affective rumination. Our study argues that focusing on workplace telepressure after hours (WTA), examining the subsequent effects of WTA and the boundary conditions that drive the effects of different pathways to take effect from the perspective of work-related rumination in terms of the bidirectional mechanism of action and based on the spillover-crossover model at the level of the employee and the partner, will help to provide a more comprehensive understanding of the impact of WTA on employees themselves and their families as a whole. Using a research design that spanned three time points, the study collected relevant data from 333 working couples. The results revealed significant spillover effects:(1) WTA had a significant mediating effect of reducing family undermining by increasing problem-solving pondering, and core self-evaluation positively moderated the mediating effect of problem-solving pondering. (2) The mediating effect of WTA increasing family undermining through increased affective rumination was not significant, but core self-evaluation effectively negatively moderated this mediating path; in the low core self-evaluation condition, the mediating effect was significant. Further, the crossover-effects were significant:(3) The mediating effects of employee family undermining increasing spousal perceived stress cross-transmission, and thus negatively affecting spousal marital relationship satisfaction and positively affecting spousal family emotional exhaustion were both significant. (4) WTA positively affects spousal marital relationship satisfaction and negatively affects spousal family emotional exhaustion chain mediators through problem-solving pondering, family undermining, and spousal perceived stress cross-transmission were all significant, and core self-assessment positively moderated both chain mediation effects. (5) WTA through emotional rumination, family undermining, and spousal perceived stress cross-transmission, negatively affecting spousal relationship satisfaction and positively affecting spousal family emotional exhaustion chain mediator effects were not significant, but core self-appraisal significantly negatively moderated both mediator effects, and in the low core self-appraisal condition, both chain mediator effects were significant. The findings of this study are useful in providing theoretical insights for organizational leaders to explore more scientific and effective ways to manage employees' non-working time communication behaviors.

数字监控如何影响志愿者的行为：基于情绪劳动的视角

苗青[1]　郁林瀚[2]（通讯作者）
1 浙江大学公共管理学院，杭州，310027
2 浙江大学心理与行为科学系，杭州，310027，ylinhan@126.com

摘 要　志愿者数字平台通过监控志愿者绩效，能够有效提高志愿者管理的效率。然而，对志愿者进行数字监控会带来何种后果及其内在机制仍然缺乏研究。本研究采用情绪劳动的视角，基于 110 家非营利组织的 3546 名志愿者的数据，对不同目的数字监控（预防型 Vs.发展型）如何影响志愿者不同情绪劳动策略（表层扮演 Vs.深层扮演），进而影响其工作投入和离职的问题进行了探索。结果表明，预防型数字监控会激发表层扮演策略，进而促进志愿者离职，志愿者感受到的绩效压力加强了这一路径。发展型数字监控则会激发志愿者的深层扮演，促进志愿者对工作的投入，减少志愿者的离职，而志愿者绩效压力不影响这一过程。本研究的结论对数字监控，志愿者情绪劳动及志愿者绩效压力等领域的文献具有理论贡献，并对非营利组织管理提供了实践启示。
关键词　数字监控，情绪劳动，志愿者工作投入，志愿者离职

How does digital monitoring influence volunteer behavior? The perspective of emotional labor

Qing Miao[1] Linhan Yu[2]
1 School of Public Affairs, Zhejiang University, Hangzhou, 310027
2 Department of Psychology and Behavioral Science, Zhejiang University, Hangzhou, 310027, ylinhan@126.com

Abstract：Using data from 3,546 volunteers at 110 nonprofit organizations, the present study explores how the digital monitoring for different purposes affects volunteer work engagement and turnover intention via emotional labor strategies. The results showed that digital monitoring for the purpose of deterrence-oriented caused surface acting, which in turn promoted volunteer turnover, and that performance pressure strengthened these relationships. Development-oriented digital monitoring can promote volunteer work engagement and reduce turnover intention through deep acting. However, volunteer performance pressure does not moderate these relationships. Our results provide theoretical contributions to the related literature and offer practical implications for nonprofit organization management.
Keywords：digital monitoring; emotional labor; volunteer's work engagement; volunteer's turnover intentions

效率与人性：算法管理对组织非人化的影响

宫剑　李晔（通讯作者）　吴旭瑶
华中师范大学心理学院，武汉，430079，liye@mail.ccun.edu.cn

摘 要　数智经济时代，人工智能已成为组织重要的生产要素，越来越多的企业开始使用人工智能算法自动化地执行劳动力管理功能，如招聘、解雇和绩效管理。尽管算法拥有远超人类的计算和重写升级能力，能帮助企业实现之前难以想象的管理范围、深度与强度，其本质仍是“冰冷无情”的代码。算法作为决策主体具有量化、结构化和去情境化的特点，人类员工在算法管理中很容易被手段化、抽象化，意识到自己对组织来说只是一个可被替换的零件。因此，本文尝试考察当组织用人工智能算法替代传统的人类上司时，人类员工是否会产生组织非人化（organizational dehumanization）的心理感受，以及感知尊重（perceived respect）是否是这一关系的内在机制。具体地，本文基于非人化理论，开展了两项研究。研究一招募了 250 名在职员工，在解雇这一算法管理的具体应用场景下，运用情景实验法初步检验了算法管理对组织非人化的影响。研究二在研究一的基础上，招募了 279 名在职员工，通过两个情景实验（分别以绩效管理和薪酬管理为背景），多场景、多指标地重复验证了算法管理对组织非人化的影响，并检验了感知尊重在其中的中介作用。结果显示：（1）与接受人类管理相比，接受算法管理的员工感知到的组织非人化水平更高；（2）感知尊重在算法（vs. 人类）管理对组织非人化的影响中起中介作用。本研究首次发现将算法技术纳入到管理流程当中会导致员工产生组织非人化的心理感受。这提示从业者，尽管日益兴起的算法管理是组织在数字经济浪潮中实现管理升级和高质量发展的常见选择，但推动员工像机器人一样地工作绝非组织获取最高利润的黄金途径。管理者在将算法技术纳入已有的管理流程中时，须做好“以效率为导向的数字管理”与“以人性为导向的伦理管理”之间的平衡。
关键词　算法管理，组织非人化，感知尊重

Efficiency and humanity: the effect of algorithmic management on organizational dehumanization

Jian Gong,　Ye Li,　Xuyao Wu

School of Psychology, Central China Normal University, Wuhan 430079, China

***Abstract*:** In the age of digital intelligence, artificial intelligence has become an important factor of production for organizations, and more and more enterprises are beginning to use artificial intelligence algorithms to automate workforce management, such as hiring, firing, and performance management. Although algorithms have far more computing and upgrading capabilities than humans and can help enterprises achieve previously unimaginable management scope, depth, and intensity, their essence is still “cold and heartless” code. As a decision-making agent, algorithm has the characteristics of quantification, structure and de-contextualization. Human employees are easily manipulated and abstracted in algorithmic management, realizing they are just a replaceable part for the organization. Therefore, this paper focuses on whether human employees will have feelings of organizational dehumanization when organizations replace human bosses with artificial intelligence algorithms, and whether perceived respect is the internal mechanism of this relationship. Specifically, based on the dehumanization theory, we carry out two studies. Study 1 recruited 250 employees to initially test the effect of algorithmic management on organizational dehumanization using experimental vignette methodology in the context of firing, a specific application scenario of algorithmic management. Study 2 recruited 279 employees to repeatedly validate the effect of algorithmic management on organizational dehumanization through two scenario experiments (in the context of performance management and salary management, respectively), and to test the mediating role of perceived respect. The results show that: (1) Compared with human management, employees who accept algorithmic management perceive a higher level of organizational dehumanization; (2) Perceived respect plays a mediating role in the effect of algorithmic management on the organizational dehumanization. This paper found for the first

time that incorporating algorithm technology into the management process will lead to psychological feelings of organizational dehumanization. This reminds organizational managers that while the rise of algorithmic management is a common choice for organizations to achieve high-quality development in the wave of the digital economy, pushing employees to work like robots is not the golden way for organizations to achieve the highest profits. When incorporating algorithmic technologies into existing management processes, managers must strike a balance between efficiency-oriented digital management and humanity-oriented ethical management.
Keywords：algorithmic management, organizational dehumanization, perceived respect

感知算法自主性支持对网约车司机工作投入的影响研究

杨琴 殷恬静 金致君 管圆圆 刘世勇（通讯作者）
中国地质大学（武汉）应用心理学研究所，武汉，430000，通讯作者 liushiyong@cug.edu.cn

摘 要 数字零工经济背景下，零工平台的算法管理机制以及零工工作者的生存现状受到社会和相关研究领域的广泛关注。自主性作为零工工作的重要特点，是众多零工工作者选择从事零工工作的关键驱动因素之一，但对于算法管理平台是否能够真正支持零工工作者的自主性，仍存在很多争议。本研究在前人研究的基础上，以自我决定理论的视角，探究零工工作者感知算法自主性支持对工作投入的影响机制，同时，验证自主性动机的中介作用以及程序公平的调节作用。

研究选择网约车司机群体作为研究对象，使用修订后的中文版感知算法自主性支持量表及自主性动机（The Multidimensional Work Motivation Scale，MWMS）、工作投入（Utrecht Work Engagement Scale–9）、程序公平量表（Procedural Justice，PJ），进行数据收集与模型检验。通过两阶段的数据收集方法，最终获得有效数据 316 份。借助 SPSS21.0 和 AMOS23.0 统计分析软件，对感知算法自主性支持与工作投入之间的影响机制进行了检验。研究结果表明，（a）零工工作者感知算法自主性支持对其工作投入有着显著的正向影响；（b）零工工作者感知算法自主性支持对其自主性动机有着显著的正向影响；（c）自主性工作动机在零工工作者感知算法自主性支持与工作投入之间起着部分中介作用；（d）程序公平调节了感知算法自主性支持对自主性动机的正向直接效应（e）程序公平调节了感知算法自主性支持通过自主性动机对工作投入的正向间接效应。本研究探索了零工工作者感知算法自主性支持及其对工作投入的影响机制，拓展了自我决定理论、组织支持以及工作投入在零工经济领域的应用，检验了程序公平的边界效应，对零工经济领域的研究及零工工作设计有着一定的启示作用。

Research on the influence of perceived algorithm autonomy support on the work engagement of ride-share drivers

Yang Qin Yin Tianjing Guan Yuanyuan Jin zhijun Liu Shiyong
Institute of Applied Psychology, China University of Geosciences (Wuhan), No. 388 Lumo Road, Hongshan District, Wuhan City

Abstract：In the background of digital part-time work economy, the algorithm management mechanism of the part-time work platform and the survival status of the part-time workers have been widely concerned by the society and relevant research fields. Autonomy, as an important feature of part-time work, is one of the key drivers

for many part-time workers to choose to engage in part-time work. However, there are still many disputes about whether the algorithm management platform can really support the autonomy of part-time workers. Therefore, on the basis of previous studies, this study explored the impact mechanism of perceived algorithmic autonomy support on job engagement by part-time workers through self-decision theory, and at the same time, verified the mediation role of autonomy motivation and the regulatory role of procedural fairness, further enriching relevant theoretical and empirical research.

This study selects the online ride-hailing driver group as the research object and carries out two studies in total. We used the revised Chinese version of the Perceived Algorithm Autonomy Support Scale, the Multidimensional Work Motivation Scale (MWMS), the Utrecht Work Engagement Scale – 9, and the Procedural Justice Scale (PJ) to collect data and test the model. By adopting the method of convenient sampling and two-stage data collection, 316 valid data were finally obtained. With the help of SPSS21.0 and AMOS23.0 statistical analysis software, the impact mechanism between autonomous support of perceptual algorithms and work engagement was tested. The results show that: (a) the perceived autonomy support of the algorithm has a significant positive impact on their work engagement; (b) The perceived algorithm autonomy support of part-time workers has a significant positive impact on their autonomy motivation; (c) Autonomous work motivation plays a part of intermediary role between the perceived algorithm autonomy support and work engagement of part-time workers; (d) Procedural fairness regulates the positive direct effect of perceived algorithmic autonomy support on autonomy motivation. (e) Procedural fairness regulates the positive and indirect effects of perceived algorithm autonomy support on work engagement through autonomy motivation.

This study explores the autonomous support of the perception algorithm of part-time workers and its impact mechanism on job engagement, expands the application of self-determining theory, organizational support and job engagement in the field of part-time work economy, tests the boundary effect of procedural fairness, and has some enlightenment on the research and design of part-time work in the field of part-time work economy.

Keywords：Perceived Algorithm Autonomy Support; Autonomous Motivation; Work Engagement; Procedural Fairness; Self-Determination Theory

挑战性压力、阻碍性压力和创新工作行为：工作繁荣和情绪耗竭的中介效应

谢晋艳　温忠麟　马益铭

华南师范大学心理学院，广州，510631，jinyanxie@m.scnu.edu.cn

摘 要　在市场竞争日益激烈的复杂经济环境中，创新已成为组织生产和发展的关键因素。组织创新本质上是员工的创新。员工的创新工作行为不仅是增强组织竞争力的核心要素，也有助于员工更好地完成工作任务，提高工作绩效。以往研究表明，影响创新工作行为的一个重要因素是压力。压力分为挑战性压力和阻碍性压力，这两者对员工的创新工作行为发挥着不同的作用。然而，挑战压力和阻碍压力对创新工作行为的影响机制尚未明确。本研究采用挑战性-阻断性压力量表、工作繁荣量表、情绪耗竭量表以及创新行为量表，通过互联网收集了 789 名在职员工的问卷调查数据。构建了一个双路径中介效应模型，以工作繁荣和情绪耗竭为中介变量，探讨挑战性压力和阻断性压力对创新工作行为的影响机制。结果表明：(1)挑战性压力正向预测工作繁荣和创新工作行为；(2)工作繁荣在挑战性压力与创新工作行为之间起部分中介作用；(3)阻碍性压力负向预测工作繁荣，正向预测情绪耗竭；(4)阻碍性压力对创新工作行为的直接效应不显著，间接效应显著，即阻碍性压力主要是通过工作繁荣和情绪耗竭的中介效应对创新工作行为产生影响。这些

研究结果表明，员工应该合理地应对不同性质的工作压力，而管理者应该科学规划工作任务，给员工更多的时间学习和休息，从而使员工能保持积极的状态解决问题和从事创新性的工作。
关键词　创新工作行为，挑战性压力，阻碍性压力，工作繁荣，情绪耗竭

Challenge stress, hindrance stress, and employees' innovative work behavior: Mediation effects of thriving at work and emotional exhaustion

Xie Jinyan, Wen Zhonglin, Ma Yiming
School of Psychology, South China Normal University, Guangzhou, 510631,
jinyanxie@m.scnu.edu.cn

***Abstract*：** In a complex economic environment with increasing market competition, innovation has become crucial for the production and development of an organization. Organizational innovation, in nature, is employee innovation. Innovative work behavior is not only one of the key factors in increasing organizational competitiveness, but it also helps employees better complete work tasks and improve work performance. Previous studies show that challenge and hindrance stress can impact employees' innovative work behavior, but our understanding of the exact mechanism underlying the impact is still limited. The present study employed four scales (Challenge and Hindrance Stress Scale, Thriving at Work Scale, Chinese Emotional Exhaustion Scale, and Employee Innovative Behavior Scale) to collect questionnaire data from 789 employees in diverse organizations via an online platform. A two-path mediation model was constructed. The results show that: (1) challenge stress positively predicted thriving at work and innovative work behavior; (2) thriving at work played a partial mediation effect between challenge stress and innovative work behavior; (3) hindrance stress negatively predicted thriving at work and positively predicted emotional exhaustion; and (4) hindrance stress did not directly impact innovation behavior while thriving at work and emotional exhaustion were main mediators of the relationship between hindrance stress and innovative work behavior. These findings suggest that employees should sensibly cope with different work stresses, while managers should plan work tasks scientifically and give employees adequate opportunities to learn and rest in order to keep them in a positive state to solve problems and work creatively.
***Keywords*：** Innovative work behavior, Challenge stress, Hindrance stress, Thriving at work, Emotional exhaustion

资质过剩感知对新员工社会化的影响研究—基于矛盾放大理论

颜爱民[1]　孙毅聪[1]　张颖慧[1]　齐丽雅[1]（通讯作者）
1 中南大学商学院，长沙，430018
通讯作者: 201601030@csu.edu.cn

摘 要　新员工的社会化意味着从“圈外人”向“圈内人”的转变，实现与组织的融合，但资质过剩感知意味着员工难以发挥其资质，不能从工作中获得成就感，产生情绪上的波动，对社会化产生负面影响。本研究基于矛盾放大理论，提出资质过剩感知作为一种能力感知上的失调,会放大个体认知和情感上的反应，造成情绪矛盾，从而对职场行为产生间接的影响。即资质过剩感知放大了新员工产生情绪矛盾，情绪矛盾进一步影响了新员工社会化进程，真实型领导可以降低员工的矛盾感，弱化这一负向中介机制，缓解资质过剩

感知对社会化的不良影响。本研究收集了 173 名新员工和主管领导的配对数据，员工分别在第一时点填写资质过剩感知量表，在第二时点填写情绪矛盾量表和真实型领导量表，领导在第三时点填写新员工的社会化评价量表。通过建立多层线性回归模型，得到如下结论：（1）资质感知过剩负向影响新员工的社会化；（2）资质感知过剩正向影响员工的情绪矛盾，情绪矛盾负向影响新员工的社会化，情绪矛盾在资质感知过剩对社会化的影响中发挥中介作用；（3）真实型领导负向调节了资质过剩感知和情绪矛盾之间的关系；（4）真实型领导负向调节了资质过剩感知通过情绪矛盾对社会化的间接中介关系。研究结果有助于了解资质感知过剩的新员工和社会化关系的情绪机制，也有助于了解真实型领导的调节作用，对于新员工更好的适应组织有一定的实践意义。
关键词　资质过剩感知，社会化，情绪矛盾，真实型领导

A Study of the Perceived Overqualification on Socialization of Newcomers: An Ambivalence Amplification Theory

Aimin Yan　Yicong Sun　Yinghui Zhang　Liya Qi
Business School, Central South University, Changsha, 430018
(Corresponding author: 201601030@csu.edu.cn)

Abstract： The socialization of new employees means the transition from "outsiders" to "insiders" and the integration with the organization, but the perceived overqualification means that employees have difficulty in utilizing their qualifications, fail to gain a sense of accomplishment from their work and experience emotional fluctuations, which negatively influences socialization. Based on ambivalence amplification theory, this study proposes that perceived overqualification, as a kind of dysfunction in the perception of competence, will amplify the cognitive and emotional reactions of individuals and cause emotional ambivalence, thus indirectly influencing workplace behaviors. That is, the perceived overqualification amplifies the newcomer's emotional ambivalence, which further influences the socialization process of newcomers. Authentic leadership can reduce employees' sense of ambivalence, weaken this negative intermediary mechanism, and alleviate the adverse effects of the perception of overqualification on socialization. In this study, we collected paired data from 173 new employees and supervisory leaders. Employees filled out the Perceived Overqualification Scale at the first time point, the Emotional Ambivalence Scale and the Authentic Leadership Scale at the second time point, and the leaders filled out the Newcomer's Socialization Scale at the third time point, respectively. By establishing a hierarchical linear regression, the following conclusions were obtained: (1) perceived overqualification negatively affects the socialization of new employees; (2) perceived overqualification positively affects employees' emotional ambivalence, and emotional ambivalence negatively affects the socialization of new employees, and emotional ambivalence plays a mediating role in the influence of perceived excess qualification on socialization; (3) authentic leadership negatively moderates the relationship between perceived overqualification and emotional ambivalence; (4) authentic leadership negatively moderated the indirect mediation of perceived overqualification on socialization through emotional ambivalence. The results of this study help to understand the emotional mechanisms of the relationship between perceived overqualification and socialization and also help to understand the moderating role of authentic leadership, which is of practical significance for new employees to better adapt to the organization.
Keywords： perceived overqualification, socialization, emotional ambivalence, authentic leadership

资质过剩感对高校毕业生生涯行为的影响：认知与情绪的双路径模型

潘润生[1]　王丹妮[2]　侯志瑾[1]（通讯作者）
1 北京师范大学心理学部，北京，100875
2 集美大学师范学院，福建省厦门市，361000
通讯作者 E-mail：zhijinhou@163.com

摘 要　资质过剩是当下青年人，特别是高校毕业生，在就业中普遍面临的生涯阻碍之一。现有研究表明，资质过剩感会对员工的心理健康和组织绩效带来消极影响。然而，鲜有研究从生涯发展发展的角度探讨资质过剩感对个体的影响，导致我们对其如何影响个体的生涯行为知之甚少。因此，本研究提出了一个认知和情绪的双过程模型，探讨了资质过剩感激励和阻碍生涯行为(包括工作搜寻和工作重塑)的中介机制。为了验证该模型，我们对 517 名近年毕业的高校学生进行了三波追踪问卷调查，并通过结构方程模型对假设模型进行检验。结果表明，资质过剩感通过生涯自我效能感和生涯探索的序列中介负向预测高校毕业生的工作搜寻和工作重塑行为。相反，资质过剩感通过工作中经历的愤怒情绪和职业探索的序列中介正向预测高校毕业生的工作搜寻和工作重塑行为。此外，我们还发现工作中经历的无聊情绪在资质过剩感和工作搜寻间起正向中介作用，同时在资质过剩感和工作重塑间起负向中介作用。上述研究结果拓展了我们对资质过剩感如何影响个体生涯行为、资质过剩感与生涯自我效能感的关系、以及负面情绪在职业困境中的激励作用的理解。从实践的角度看，本研究也对那些寻求为资质过剩员工提供生涯发展支持的组织或个体具有启示意义。
关键词　资质过剩感，生涯自我效能感，工作搜寻，工作重塑，消极情绪

The effect of perceived overqualification on college graduates' career behaviors: A dual-process model of cognition and emotion

Runsheng Pan[a], Danni Wang[b], Zhijin Hou[a*]
[a]Faculty of Psychology, Beijing Normal University, Beijing, China, 100875;
[b]Normal College, Jimei University, Xiamen, Fujian, China, 361000;
[*]Correspondence: Zhijin Hou, zhijinhou@163.com

Abstract: Overqualification is one of the common career barriers that young people, especially college graduates, face in employment nowadays. Existing research indicates that perceived overqualification can have negative influence on employees' mental well-being and organizational performance. However, there is limited research exploring the effects of perceived overqualification on individual career development, leaving us with little understanding of how it influences individuals' career behaviors. This study examines how perceived overqualification motivates and hinder college graduates' career behaviors (i.e., job search and job crafting), utilizing a dual-process model that stresses both the cognitive and emotional intermediate processes. To test the model, we conducted a three-wave questionnaire survey with 517 recent college graduates in China. Results indicate that perceived overqualification negatively predicted job search and job crafting through the serial mediation of career self-efficacy and career exploration. Conversely, perceived overqualification positively predicted job search and job crafting through the serial mediation of anger experienced at work and career exploration. Furthermore, we found that boredom experienced at work mediated the positive relationship between perceived overqualification and job search, as well as the negative relationship between perceived overqualification and job crafting. The results extend our understanding of how perceived overqualification influences career development, the relationship between perceived overqualification and career self-efficacy, and the motivational function of negative emotions in career adversity. This study also has implications for

practitioners who seek to support the career development of overqualified employees.

Keywords：perceived overqualification, career self-efficacy, job search, job crafting, negative emotions

冰毒和甲卡西酮使用者对愤怒面孔的注意偏向

尹杰（通讯作者） 李根

北京体育大学心理学院，北京，100084，yinjie2006@163.com

摘 要 注意偏向指的是个体在注意上选择性地加工某些刺激。以往研究表明，高攻击性个体对敌意性刺激具有注意偏向。冰毒和甲卡西酮都属于兴奋型毒品，其使用者都伴随较高的攻击性。然而，二者具有不同的分子结构，且使用者也存在不同的冲动性水平。那么，这两种毒品使用者对敌意性刺激（如愤怒表情）是否也存在注意偏向？以及他们对敌意性刺激的注意偏向是否存在差异？

本研究招募 32 名冰毒使用者，30 名甲卡西酮使用者和 39 名健康对照组，使用情绪 stroop 范式来探讨他们对敌意性刺激的注意偏向，同时采用 ERP 技术考察他们在加工不同面孔时的脑响应差异。行为结果显示，甲卡西酮组被试在愤怒面孔和悲伤面孔条件下的反应时都显著长于中性面孔。冰毒组被试在愤怒面孔条件下的反应时显著长于悲伤面孔和中性面孔。对照组被试在愤怒面孔条件下的反应时长于悲伤面孔，愤怒和悲伤面孔条件下的反应时长于中性面孔。脑电结果显示，甲卡西酮组的 EPN 波幅显著高于对照组，而与冰毒组之间没有差异。对于 N2 波幅，冰毒组显著高于甲卡西酮组和对照组，甲卡西酮组和对照组之间没有显著差异。对于 P3 波幅，冰毒组和甲卡西酮组显著高于对照组，冰毒组和甲卡西酮组之间差异不显著。对于 P3 的潜伏期，冰毒组和甲卡西酮组显著长于对照组，而冰毒组和甲卡西酮组之间差异不显著。

进一步对被试加工面孔信息的全脑电位活动进行多变量模式分析（MVPA）显示，三组被试对愤怒面孔和悲伤面孔表现出了不同的神经解码效率。对于愤怒面孔表征的持续时间，冰毒组大于甲卡西酮组，且大于对照组，冰毒组更早知觉到愤怒面孔。对于悲伤面孔表征的持续时间，甲卡西酮组大于冰毒组，且大于对照组，甲卡西酮组更早知觉到悲伤面孔。本研究表明，成瘾组被试对不同的负性面孔具有不同的注意偏向，或许源于他们对负性情绪面孔具有不同的加工模式。

关键词 冰毒，甲卡西酮，注意偏向，事件相关电位，多变量模式分析

Attentional biases for angry faces in individuals with methamphetamine and methcathinone use disorders

Jie Yin, Gen Li

School of psychology, Beijing Sport University, No.48 Xinxi Road, Beijing, 100084, China

Abstract：Attentional bias refers to the individual's selective attention to specific stimuli. Numerous previous studies have demonstrated that individuals with high level of aggression exhibited attentional bias towards threatening stimuli. Methamphetamine and methcathinone are both psychostimulants and the use of which is accompanied by a high level of aggression. However, the two drugs differ in the molecular structure and the users demonstrated different level of impulsivity. So, do they have attentional biases toward threatening stimuli? And whether there were differences in their attentional bias towards threatening stimuli.

In the present study, 32 methamphetamine users, 30 methcathinone users and 39 healthy controls were

recruited. The emotional Stroop paradigm was used to explore their attentional bias towards threatening stimuli. At the same time, ERP technology was used to investigate their brain responses to different emotional faces. The behavioral results showed that in methcathinone group, the reaction time of angry faces and sad faces were significantly longer than that of neutral faces. In methamphetamine group participants, the reaction time of angry faces was significantly longer that that of sad faces and neutral faces. In healthy controls, the reaction time of angry faces was significantly longer than that of sad faces, and the reaction times of angry and sad faces were significantly longer than that of neutral faces. The EEG results showed that the amplitude of EPN was significantly higher in the methcathinone group than that in the control group, but there was no difference in the methcathinone and methamphetamine group. The amplitude of N2 was significantly higher in the methamphetamine group compared to the methcathinone group and the control group. There was no difference in the methcathinone group and the control group. The amplitude of P3 was significantly higher in the methamphetamine and methcathinone groups compared to the control group. There was no difference in the methcathinone group and the methamphetamine group. The P3 latency was significantly delayed in the methamphetamine and methcathinone groups compared to the control group. There was no difference in the methcathinone and methamphetamine groups.

In addition, the multivariate pattern analysis (MVPA) showed that the three groups exhibited different neural decoding efficiency for angry and sad faces. The duration of angry face representation was significantly longer in the methamphetamine group compared to methcathinone group and the control group, and the methamphetamine group perceived angry faces earlier. The duration of sad face representation was significantly longer in the methcathinone group compared to methamphetamine group and the control group, and the methcathinone group perceived angry faces earlier. These findings suggested that the addiction groups have different attentional biases towards different negative faces, possibly due to their different processing patterns towards negative emotional faces.

Keywords： methamphetamine, methcathinone, attentional biases, event-related potentials, multivariate pattern analysis

医生与护士间抑郁-职业倦怠网络的差异：来自网络分析的证据

张正 [1,2] 陈慧 [1] 李思虹 [1] 叶严月 [1] 周建松 [1*]

2 安徽师范大学心理学系

通讯作者 E-mail：周建松 zhoujs2003@csu.edu.cn

摘 要 以往的研究已经证明医疗保健专业人员之间抑郁和职业倦怠之间存在很强的关联，但结果不一致，并且对不同医疗保健专业之间的这种关系缺乏深入探讨。基于心理病理网络理论的网络分析提供了新的视角，可以揭示医生与护士间抑郁-职业倦怠的网络结构、症状间相互作用模式，以及关键症状和网络的稳定性。通过分析网络结构和中心性，可以确定干预重点和预测症状演化趋势，为干预和预防提供科学依据。本研究旨在调查中国医疗保健专业人员之间抑郁和职业倦怠的相互关系，并探讨这些症状网络之间的差异是否存在于医生和护士之间。我们采用职业倦怠量表和 2 项患者健康问卷（PHQ2）来评估 3,684 名医疗保健专业人员的职业倦怠和抑郁。翻译经过改进以确保准确性和学术适用性。随后，对具有较高职业倦怠水平的 2,244 名参与者进行网络分析，包括 328 名男性和 1,919 名女性，平均年龄为 30.91±7.17 岁。以确定核心症状并探索职业倦怠与抑郁之间的关联。t 检验显示两个职业之间的抑郁和焦虑没有显著差异（t=0.595~1.079，p=0.281~0.552）。但是在网络分析中，我们发现了一些值得关注的细节。

抑郁和工作倦怠在医护人员中存在一定的相关性，其中抑郁症状（对事物失去兴趣和乐趣）与工作倦怠症状（工作精疲力尽、面对工作过度疲劳、倾向于崩溃、对工作的热情不如以前）之间存在一定的相关性（稀疏度＞0.463）。在医生和护士之间，抑郁和工作倦怠网络的结构有所差异，医生的网络结构似乎更松散、连接性较差，但两类专业人员之间的差异并不显著。在护士中，对事物失去兴趣和乐趣与对工作的热情不如以前之间的关联较强（0.12＞0.01）；过度工作压力和倾向于崩溃之间的相关性在护士中较强（0.46＞0.12），表明护士更容易在过度压力下出现崩溃。这些结果显示了医护人员在抑郁和工作倦怠方面的网络特征和职业差异。本研究为制定针对性干预措施改善医疗保健专业人员的心理健康提供了参考。

Abstract: Previous studies have shown a strong association between depression and professional burnout among healthcare professionals, but the results have been inconsistent, and there is a lack of in-depth exploration of this relationship among different healthcare professions. Network analysis based on the psychopathological network theory offers a new perspective to reveal the network structure of depression and professional burnout between doctors and nurses, patterns of symptom interactions, as well as key symptoms and network stability. By analyzing network structure and centrality, intervention priorities can be determined and symptom evolution trends can be predicted, providing a scientific basis for intervention and prevention. This study aims to investigate the mutual relationship between depression and professional burnout among Chinese healthcare professionals and explore whether there are differences in these symptom networks between doctors and nurses. We assessed the professional burnout and depression of 3,684 healthcare professionals using the Burnout Inventory and two items from the Patient Health Questionnaire (PHQ2). The translation has been improved to ensure accuracy and academic suitability. Subsequently, network analysis was conducted on 2,244 participants with higher levels of professional burnout, including 328 males and 1,919 females, with a mean age of 30.91±7.17 years, to identify core symptoms and explore the association between professional burnout and depression. T-tests showed no significant differences in depression and anxiety between the two professions (t=0.595~1.079, p=0.281~0.552). However, in network analysis, we found some noteworthy details. There is a certain correlation between depression and work burnout among medical personnel, with a correlation between depression symptoms (loss of interest and pleasure) and work burnout symptoms (exhaustion, excessive fatigue in work, tendency to collapse, decreased enthusiasm for work) (sparsity > 0.463). The network structure of depression and work burnout differs between doctors and nurses, with doctors' network structure appearing looser and less connected, but the differences between the two professions are not significant. Among nurses, there is a strong correlation between loss of interest and pleasure and decreased enthusiasm for work (0.12 > 0.01); the correlation between excessive work pressure and tendency to collapse is stronger in nurses (0.46 > 0.12), indicating that nurses are more likely to experience collapse under excessive pressure. These results demonstrate the network characteristics and

professional differences in depression and work burnout among medical personnel. This study provides reference for developing targeted interventions to improve the mental health of healthcare professionals.

佛罗里达强迫量表在中国临床样本中的信度和效度

曹璇[12] 范青[1*]（通讯作者）
1 上海交通大学医学院附属精神卫生中心，上海，200030，fanqing_98@sina.com
2 上海交通大学医学院附属新华医院，上海，201112，mengshuixiang@163.com

摘 要 背景：佛罗里达强迫症量表(FOCI)是一种自评问卷，旨在评估强迫症症状是否存在及严重程度。本研究评估了中国版 FOCI 的信度和效度，以及它的最佳分值。
方法：采用系统的翻译过程将英文 FOCI 翻译成中文。453 名成年人参与了这项研究，其中包括 153 名强迫症患者，150 名患有原发性焦虑或抑郁症的病例对照，以及 150 名健康对照。所有三组均采用一系列测量方法进行评估，包括耶鲁-布朗强迫症量表(Y-BOCS)、FOCI、强迫症量表修订版(OCI-R)、贝克抑郁量表第二版(BDI-II)、贝克焦虑量表(BAI)和简短健康调查(SF-36)。在强迫症患者中，对 47 名参与者进行了为期两周的评估，以评估 FOCI 的重测可靠性。
结果：强迫症组 FOCI 症状检查表和严重程度量表的内部一致性分别为 0.813 和 0.840。两周重测信度分别为 0.934 和 0.935。FOCI 症状检查表和严重程度量表的聚合效度均较强。总体而言，与区分效度各量表的相关性不大。对 FOCI 严重程度量表进行了因子分析，发现单因素解决方案解释了 62.3%的方差。强迫症组的 FOCI 得分高于病例对照组和健康对照组。8 分是预测病例的最佳分值。
结论:中文版 FOCI 具有良好的心理测量特性，包括内部一致性、重测信度、稳定的因子结构、聚合效度和区分效度。8 分是预测病例的最佳分值。

The reliability and validity of the Florida Obsessive-Compulsive Inventory in a Chinese clinical sample

Xuan Cao[1], Qing Fan[2*]
1 Xinhua Hospital, Shanghai Jiao Tong University School of Medicine
2 Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Abstract：Background: The Florida Obsessive-Compulsive Inventory (FOCI) is a self-report measure designed to assess obsessive-compulsive symptom presence and severity. This study evaluated the reliability and validity of

the Chinese version of the FOCI and its optimal cut-off score.

Methods: A systematic translation process was used to translate the English FOCI into Chinese. Four hundred and fifty-three adults participated in the study including 153 individuals with OCD, 150 case-controls with a primary anxiety or depressive disorder, and 150 healthy controls. All three groups were evaluated by a set of measures including the Yale-Brown Obsessive-Compulsive Scale (Y-BOCS), the FOCI, the Obsessive-Compulsive InventoryRevised (OCI-R), the Beck Depression Inventory-Second Edition (BDI-II), the Beck Anxiety Inventory (BAI), and the Short Form Health Survey (SF-36). Among the OCD patients, a subset of 47 participants were evaluated over a two-week interval to assess test-retest reliability of the FOCI.

Results: The internal consistency of the FOCI Symptom Checklist and Severity Scale in the OCD group were0.813 and 0.840. Two-week test-retest reliability were 0.934 and 0.935. Convergent validity of the FOCI Symptom Checklist and Severity Scale were both strong. Correlations with diverging constructs were modest overall. Factor analysis of the FOCI Severity Scale was conducted, identifying a single factor solution explaining 62.3% of the variance. FOCI scores among those in the OCD group were higher than those from the case-control and healthy control groups. A cut-off score of 8 was optimal in predicting caseness.

Conclusions: The Chinese version of the FOCI demonstrated good psychometric properties including internal consistency, test-retest reliability, a stable factor structure, and convergent and divergent validity. A cut-off score of 8 was optimal in predicting caseness.

重性抑郁障碍患者非自杀性自伤行为的决策相关神经机制

钟闰清[1] 方舒琳[1] 刘沁钰[1] 周玮婷[1] 季欣蕾[1] 王湘[1]（通讯作者）

1 中南大学湘雅二医院医学心理中心，长沙，410011，wangxiang0916@csu.edu.cn

摘 要 目的：自伤行为常见于重性抑郁障碍（MDD）患者，但往往被视为 MDD 的附属症状，直至 2013 年 DSM-5 将非自杀性自伤（NSSI）列为独立的行为综合征进行诊断后，其独立的心理与神经机制开始引起了研究者的关注。由于决策是最接近行为输出的心理加工过程，本研究拟采用阳性对照法，结合气球模拟风险决策任务(BART)与核磁共振成像技术，探索 MDD 患者中 NSSI 行为的特异性心理和神经机制。

方法：68 名 MDD 患者完成了 Beck 抑郁量表（BDI）、状态特质焦虑量表（STAI）、Barratt 冲动量表（BIS）、时间性愉快体验量表（TEPS）、三维心理痛苦量表（TDPPS），以及 Beck 自杀意念量表（BSI）等评估，并根据 DSM-5 的 NSSI 诊断标准分为伴 NSSI 的 MDD 患者（MDD_NSSI，n=26），以及不伴 NSSI 的 MDD 对照组（MDD_C，n=42）。随后进行 BART 任务态核磁共振实验，并对量表评估和 BART 任务的行为学指标，以及决策阶段、正/负反馈阶段的神经生理激活信号分别进行组间比较，还进行了脑激活信号-行为学/量表间的相关分析。

结果：MDD_NSSI 组在 BDI 总分及消极态度、操作困难分量表分，特质焦虑分量表分，TDPPS 的痛苦逃避分量表分，以及最严重时自杀意念得分上显著高于 MDD_C 组（均 $p < 0.05$），控制抑郁水平后的协方差分析表明特质焦虑水平组间差异仍显著（$F = 6.35$， $p = 0.014$）。BART 任务行为学指标两组无显著差异（均 $p > 0.05$），但在 BART 任务的正反馈阶段，MDD_NSSI 组的左侧脑岛、左侧扣带回及右侧额下回眶部脑区激活显著低于 MDD_C 组（$p < 0.05$，FWE corrected），且分别与 BDI 的操作困难和消极态度得分，以及特质焦虑得分等呈显著负相关（均 $p < 0.05$）；负反馈阶段右侧额下回三角部的脑区激活也显著低于 MDD_C 组（$p < 0.001$，uncorrected），且与特质焦虑得分呈显著负相关；决策阶段两组激活无显著差异。

结论：MDD 患者的非自杀性自伤行为主要由更高的负性情绪体验、高特质焦虑，以及痛苦逃避动机驱动，且高特质焦虑特征可能是 NSSI 出现的重要因素。在决策加工过程中伴 NSSI 的 MDD 患者主要表现为对决策结果的情绪调节异常，涉及左侧脑岛、左侧扣带回，以及双侧侧额下回等脑区。

The neural mechanisms of decision-making processing in major depressive disorder patients with non-suicidal self-injury

Runqing Zhong [1], Shulin Fang [1] , Qinyu Liu [1] ,Weiting Zhou[1],
Xinlei Ji[1] , Xiang Wang [1] (Correspondence)
1 Medical Psychological Center, The Second Xiangya Hospital, Central South University, Changsha, China, 410011

Abstract：Objective: Self-injurious behavior is common in patients with major depressive disorder (MDD), but was often viewed as an accessory symptom of MDD until its independent psychological and neurological mechanisms began to attract the attention of researchers after the DSM-5 classified nonsuicidal self-injury (NSSI) as a separate behavioral syndrome for diagnosis in 2013. Given that decision-making is the psychological process closest to behavior, this study proposes a method using positive control, in combination with the Balloon Analogue Risk Task (BART) and Magnetic Resonance Imaging (MRI) techniques, to explore the specific psychological and neurobiological mechanisms of NSSI behavior in patients with MDD.

Method: Sixty-eight patients with MDD completed various assessments, including the Beck Depression Inventory (BDI), State-Trait Anxiety Inventory (STAI), Barratt Impulsiveness Scale (BIS), Temporal Experience of Pleasure Scale (TEPS), Three-dimensional Psychological Pain Scale (TDPPS), and the Beck Scale for Suicide Ideation (BSI). According to the DSM-5 criteria for NSSI, patients were divided into two groups: a group with MDD and NSSI (MDD_NSSI, n=26), and a control group of MDD patients without NSSI (MDD_C, n=42). Subsequently, participants underwent an MRI experiment during the BART task. Behavioral measures from the task and questionnaire assessments, as well as neurophysiological activation signals during the decision-making phase and positive/negative feedback phases, were compared between groups. Correlation analyses were also conducted between brain activation signals and behavioral/questionnaire measures.

Results: The MDD_NSSI group scored significantly higher than the MDD_C group in total BDI scores, negative attitude subscale scores of BDI, operational difficulty subscale scores of BDI, trait anxiety scale scores,pain avoidance subscale scores of TDPPS, and scores of the suicidal ideation at the worst time(all $p < 0.05$). After controlling for depression severity, the analysis of covariance (ANCOVA) still showed a significant difference in trait anxiety level between the groups ($F = 6.35$, $p = 0.014$). In terms of behavioral measures in the BART task, there was no significant difference between the two groups (all $p > 0.05$). However, during the positive feedback phase of the BART task, the MDD_NSSI group demonstrated significantly lower activation in the left insula, left cingulate gyrus, and right inferior frontal gyrus (orbital part) compared to the MDD_C group ($p < 0.05$, FWE corrected). These areas showed significant negative correlations with the operational difficulty and negative attitude scores of BDI, as well as trait anxiety scores (all $p < 0.05$). During the negative feedback phase, activation in the right inferior frontal gyrus (triangular part) was also significantly lower in the MDD_NSSI group ($p < 0.001$, uncorrected) and showed a significant negative correlation with trait anxiety scores. There were no significant differences in activation between the groups during the decision-making phase.

Conclusion: Non-suicidal self-injury behavior in patients with MDD is primarily driven by higher negative

emotional experiences, high trait anxiety, and the motivation to pain avoidance. High trait anxiety might be a key factor contributing to NSSI. During the decision-making process, MDD patients with NSSI mainly exhibit abnormal emotional regulation of decision outcomes, involving brain regions such as the left insula, left cingulate gyrus, and bilateral inferior frontal gyri.

上海市初中生基于网络的 ADHD 筛查及计算机辅助干预研究

摘 要 **目的：**筛查初中生的注意缺陷多动障碍患病情况，探讨计算机辅助训练对患儿症状及执行功能缺陷的改善情况。**方法：**随机抽取上海市浦东新区 5 所初中阶段学校的全日制在校生 2396 名，先由父母完成长处和困难问卷（strengths and difficulties questionnaire，SDQ)。采用 SDQ 的“多动与注意不能因子”（以 7 分为分界）划分为 ADHD 高风险组，由儿少精神科医生对其逐个行电话 SNAP-IV 访谈，在结果阳性学生中展开计算机辅助训练干预（每次训练保证完成所有项目内容，每周训练 3 次，一共 12 次，基本在一月内完成)。在干预前后由父母完成 Conners 症状问卷(Parent Symptom Questionnaire, PSQ)、执行功能行为评定量表（BRIEF)；由学生本人接受执行功能相关神经心理测试。**结果：**以 SDQ 结果分组得到：ADHD 高风险组（(n=232；48.02±12.32）与低风险组（n=2164;60.86±10.49)。经 SNAP-IV 访谈得到阳性结果学生 89 名，签署同意及评估后，实际 64 人入组进行干预，在训练前、后 BRIEF（t=8.11~14.82，P<0.001） 及 PSQ 量表（t=8.12~14.82，P<0.001）的各维度及总分上的差异均有显著性（P<0.001)。在神经心理测试中 STROOP 乙表正确数/反应抑制（t=-5.68)、工作记忆（t=-4.38~-3.95）及加工速度（t=-5.78~-3.78）得分在训练后均有提高（P<0.001)。注意缺陷亚型的 AD HD 在经过训练后在部分神经心理测试表现上改善更显著（P<0.05)。亲子关系较好的较亲子关系差的组别在训练前后改善情况更明显 （PSQ，BRIFE，神经心理测试等)。**结论：**计算机辅助的执行功能训练模式可以在短期改善 ADHD 患儿的执行功能缺陷，对核心症状也有部分改善；AD HD 亚型、亲子关系也会影响训练干预的效果。

A study of Web-based ADHD screening and computer-assisted intervention in Shanghai junior middle school students

Abstract： Objectives To screen the incidence of attention deficit hyperactivity disorder(ADHD) in junior middle school students, and explore the improvement of computer-assisted training on symptoms and executive dysfunction of children affected with ADHD.

Method： A total of 2396 full-time students from 5 junior high schools in Pudong New Area of Shanghai were randomly selected to complete the strengths and difficulties questionnaire (SDQ) by their parents. The hyperactivity and inattentional factors of SDQ (divided into 7 points) were used to divide the high-risk group into ADHD, and the psychiatrists interviewed them with SNAP-IV by phone, and carried out computer-assisted training intervention in the students with positive results (each training guaranteed to complete all the items, 3 times a week, a total of 12 times, basically completed within one month). Parents completed the Parent Symptom Questionnaire (PSQ) and the Executive Functional Behavior Rating Scale (BRIEF) before and after the intervention. Neuropsychological tests related to executive function were performed by the students themselves.

result ： According to SDQ results, the students grouped into the high risk of ADHD ((n=232; 48.02±12.32) and low risk of ADHD (n=2164; 60.86±10.49). After the SNAP-IV interview, 89 students obtained positive results. After signing the agreement and evaluation, 64 students were actually enrolled for intervention. There were significant differences in each dimension and total score of BRIEF scale (t=8.11~14.82, P<0.001) and PSQ scale (t=8.12~14.82, P<0.001) before and after the training (P<0.001). In neuropsychological test, STROOP B correct number/response inhibition (t=-5.68), working memory (t=-4.38~-3.95) and processing speed (t=-5.78~-3.78) were all improved after training (P<0.001). Attention deficit subtype of AD HD showed more significant improvement in some neuropsychological tests after training (P<0.05). The group with better parent-child relationship than the group with worse parent-child relationship improved more significantly in scores (PSQ, BRIFE, neuropsychological test, etc.) after training. conclusion ： The computer-assisted executive function training can improve the executive function deficit and the core symptoms of ADHD children in the short term. Subtypes of ADHD and parent-child relationship also affect the effect of training intervention.

Keyword: Campus screening, attention deficit hyperactivity disorder, computer-assisted training, executive function training

强迫症患者在决策中的风险偏好和风险相关的脑激活特征

韩燕 [1,2,3] 高峰 [1,2,3] 刘倩 [1,2,3] 樊洁 [1,2,3] 朱熊兆 [1,2,3]（通讯作者）

1 中南大学湘雅二医院医学心理中心，长沙，410011

2 中南大学医学心理研究所，长沙，410011

3 国家精神心理疾病临床医学研究中心，长沙，410011，xiongzhaozhu@csu.edu.cn

摘 要 **目的：**既往研究关于强迫症（obsessive-compulsive disorde, OCD）患者在决策过程中的风险偏好以及风险相关的神经学基础尚不明确，本研究旨在进一步探索 OCD 患者在决策过程中的风险偏好表现以及风险相关的神经影像特征，以期为他们受损的决策功能提供更多有价值的信息。

方法：本研究共纳入 OCD 患者 51 人和健康被试（Healthy control, HC）50 人。通过仿真气球冒险任务（Balloon Analog Risk Task, BART）探讨个体的风险决策表现，所有被试在完成 BART 任务时进行功能核磁共振成像（functional magnetic resonance imaging, fMRI）扫描。计算被试在 BART 中的行为学表现和认知参数。探索个体在完成 BART 任务时受风险水平调节的脑激活特征以确定个体在决策中风险相关的神经学基础。采用 ANCOVA 对 OCD 患者和 HC 在决策中风险相关的行为学表现和脑激活特征进行组间比较。

结果：对 BART 行为学指标和认知参数的分析结果表明，与 HC 相比，OCD 患者在 BART 任务中出现显著增加的风险厌恶行为以及在接受负反馈后下调风险水平的程度显著增高。基于 ROI 的 fMRI 结果发现 OCD 患者左侧脑岛(BA13，体素数 202，t=4.28，MNI 坐标: -39 -6 0)和右侧脑岛(BA13，体素数 92，t=3.97，MNI 坐标: 39 3 9)受风险水平调节的激活程度显著低于 HC。

结论：本研究首次分离出 OCD 患者在决策过程中风险相关的神经学基础。OCD 患者在决策时表现出更高的风险厌恶且双侧脑岛的功能异常可能是 OCD 患者风险厌恶增高的神经学基础。本研究发现为理解 OCD 患者的风险厌恶和决策功能受损提供了更多线索。

The risk preference and neural correlates of risk taking in patients with obsessive-compulsive disorder during decision-making

Yan Han[1,2,3], Feng Gao[1,2,3], Qian Liu[1,2,3], Jie Fan[1,2,3], Xiongzhao Zhu [1,2,3]
[1]Medical Psychological Center, The Second Xiangya Hospital, Central South University, Changsha, Hunan 410011, China
[2]Medical Psychological Institute of Central South University, Changsha, Hunan 410011, China
[3]National Clinical Research Center for Mental Disorders, Changsha, Hunan 410011, China

Abstract

Background: The risk preference during decision-making and the involved neural substrates in patients with obsessive-compulsive disorder (OCD) remined unclear. The current study was designed to evaluate the risk-taking behavior during decision-making and the neural correlates of risk taking in OCD patients, attempting to provide more insight into their impaired decision-making function.

Methods: Fifty-one OCD patients and 50 healthy control (HC) were included in this study. The Balloon Analog Risk Task (BART) was used to test individuals' risk-taking performance during decision-making. All subjects underwent functional magnetic resonance imaging (fMRI) scans during completing BART. The behavioral indicators and cognitive model parameters in BART were calculated. The neural correlates of risk taking were explored by analyzing the individuals' brain activation modulated by risk levels in BART. The ANCOVA was used for comparison of the risk-taking related behavior and brain activation between OCD patients and HC during decision-making.

Results: The analyses of behavior indicator and cognitive model parameter during BART revealed that the OCD patients performed significantly more risk-averse behaviors and adjusted down risk level after negative feedbacks during BART relative to HC. The fMRI results based on region of interest showed that the OCD patients had significantly decreased activation modulated by risk levels both in left insula (BA13, voxel size=202, peak T=4.28; Peak MNI coordinates: -39 -6 0) and right insula (BA13, voxel size=92, peak T=3.97; Peak MNI coordinates: 39 3 9) compared with HC.

Conclusions: This study firstly dissociate the neural substrates of risk from decision-making in OCD patients. The OCD patients exhibited higher risk aversion during decision-making and the dysfunction of insula may be the neural underpinning of increased risk aversion in OCD. These findings provide more clues for understanding the risk aversion and impaired decision-making function of OCD patients.

抑制 mGluR5 改变大鼠额前皮质和海马 BDNF/TrkB 和 GLT-1 的表达和改善 PTSD 样行为

潘芳 1（通讯作者）、成淑月 1、徐晶晶 1
1 山东大学基础医学院医学心理学与伦理学系 山东 济南 250012

摘 要 目的：以往的研究表明，创伤应激会改变海马（HIP）和额前皮层（PFC）的代谢谷氨酸受体 5（mGluR5）的表达。而 mGluR5 表达通常伴随着脑源性神经营养因子（BDNF）/原肌球蛋白相关激酶 B（TrkB）信号的改变，后者通过调节谷氨酸转运蛋白-1（GLT-1）发挥抗抑郁作用。本研究旨在探讨 mGluR5 对不可避免的足休克（IFS）治疗大鼠创伤后应激障碍（PTSD）样行为、HIP 和 PFC 中 BDNF、TrkB 和 GLT-1 表达的影响。方法：用 7 天的不可逃避的足掌电击建立 PTSD 大鼠模型，用 10mg/kg 的 MPEP 抑制暴露于创伤应激的大鼠体内 mGluR5 的表达。建模后，检测 HIP 和 PFC 的行为变化、mGluR5、BDNF、TrkB 和 GLT-1

的表达。结果：IFS 程序诱导了类似焦虑和抑郁的行为，空间记忆缺陷。它增加了 mGluR5 的表达，降低了 HIP 和 PFC 中的 BDNF、TrkB 和 GLT-1。此外，使用 mGluR5-拮抗剂可以逆转这些变化。结论：mGluR5 通过改变 BDNF、TrkB 和 GLT-1 的表达参与 IFS 诱导的 PTSD 样行为。

Inhibiting mGluR5 Alters BDNF/TrkB and GLT-1 expression in the Prefrontal cortex and Hippocampus and Ameliorates PTSD-like behavior of the rats

Fang Pan, Shuyue Cheng, Jingjing Xu
Department of Medical Psychology and Ethnic, School of Basic Medical Sciences, Shandong University; Jinan, 250012, China

Abstract：Objective:: Post-traumatic stress disorder (PTSD) is a prevalent and debilitating psychiatric disorder. However, its specific etiological mechanism remains unclear. Previous studies have shown that traumatic stress changes metabolic glutamate receptor 5 (mGluR5) expressions in Hippocampus (HIP) and Prefrontal cortex (PFC). More importantly, the mGluR5 expression are often accompanied by alteration of Brain-derived neurotrophic factor (BDNF)/Tropomyosin-associated kinase B (TrkB) signaling, the later plays an antidepressant role by regulating Glutamate transporter-1 (GLT-1). The study aims to explore the effects of inhabiting the mGluR5 on PTSD-like behaviors, BDNF, TrkB and GLT-1 expression in HIP and PFC of inevitable foot shock (IFS) treated rats. Methods: Seven-day IFS was used to establish PTSD rats model, 10 mg/kg MPEP was used to inhibit (intraperitoneal injection) mGluR5 expression during rats exposed to IFS. After modeling, the behavioral changes, mGluR5, BDNF, TrkB and GLT-1 expressions in HIP and PFC were examined. Results: IFS procedure induced anxiety-like and depression-like behaviors, deficit in spatial memory. It increased the expression of mGluR5 and decreased the BDNF, TrkB and GLT-1 in HIP and PFC. Moreover, using mGluR5 antagonist could reverse these changes. Conclusions: mGluR5 was involved in IFS-induced PTSD-like behavior by changing the BDNF, TrkB and GLT-1 expression.

摘 要　目的：本研究旨在 1）根据自闭症谱系障碍(ASD, autism spectrum disorder)儿童及其家庭教养特征，对手册化的父母心智化（省映功能）团体干预（RPP, reflective parenting program）方案进行改编，形成针对 ASD 儿童父母的心理健康教育团体方案(RPP-ASD)；2）检验 RPP-ASD 线上团体干预的可行性和可接受性，并初步检验其缓解 ASD 儿童问题行为的效应。

方法：采用专家咨询法完成方案改编。采用混合研究方法中的嵌入性设计（embedded mix-method design），在单组前后测设计中嵌入质性研究，对干预方案的可行性和有效性进行初步评价。23 名 3-7 岁 ASD 儿童的父母自愿参加为期 8 周的父母省映式教养干预。在干预前后，通过问卷调查和父母洞察力访谈评估，完成

对父母心智化水平（以父母自评省映功能及父母洞察力评估结果为指标）、教养压力（父母自评）及儿童问题行为（父母评价）的测量。此外，在干预后，通过问卷调查了解父母满意度；通过半结构化访谈,了解父母的参与体验。

结果：1) 团体干预招募情况良好，家长需求强烈。家长活动完成率与后测完成率高，23 名被试中，1 名被试脱落。定量及定性数据均支持高干预满意度。团体干预保真度高；2) 定量数据分析结果表明，父母洞察力中的洞察、接纳和开放性指标有显著提升。父母对 ASD 儿童社交缺陷的教养压力得分显著降低。ASD 儿童问题行为得分有下降趋势，但未达到显著；3) 定性数据分析结果表明，家长的收获主要在于：更能够从 ASD 和发展阶段两个角度理解儿童行为，更注重自身情绪调节，对问题行为管理更有效能感。

结论：本研究结果支持，基于心智化的 ASD 儿童父母教养团体干预具有良好的可行性和可接受性。

Adapting and pilot testing a reflective parenting group intervention for parents of children with ASD: A feasibility study

Ting Zhou*, Chang Zhang, Zaitian Liu, Dan Gao, Shutian Chen, Zhuo Zeng, Jenifer Hu, Rui Wang

Department of Medical Psychology, School of Health Humanities, Peking University, Beijing, 100191

***Abstract*：**

Objective: the present study aimed to adapt the reflective parenting group intervention for parents of children with ASD and further to examine the feasibility, acceptability and preliminary efficacy of the online intervention in reducing behavioral problems in young children with ASD.

Method: A manualized reflective parenting group intervention program was adapted specially for parents of children with ASD. An embedded mix-method design with a pre- and post-test repeated measures pilot study and a qualitative study was employed to evaluate the feasibility and efficacy of the program. Twenty-three parents of 3-7 years old children with ASD participated in the 8-week online reflective parenting group program. The primary outcome was parent-report children's behavioral problems. Secondary outcomes were parental mentalization (self-reported parental reflective functioning and observed parental insightfulness) and parenting stress. The outcomes were assessed before and after the program. Interviews were conducted after the intervention to evaluate parental experience and satisfaction.

Results: 1) Recruitment, retention, completion of measures, and intervention fidelity were high. Quantitative and Qualitative data documented high rate of satisfaction. 2) There was significant pre-post increase in parental insightfulness, acceptance and openness. Parents also reported lower level of parenting stress on the child's social competence. There was a decreasing tendency of behavioral problems, but the difference did not reach a significant level. 3) Results of qualitative analyses suggested that parents were empowered by understanding the child from both perspectives of autism symptoms and children's abilities at specific developmental stages, enhancing emotion regulation of themselves and behavioral problems management.

Conclusion: The results suggest the feasibility and acceptability of the mentalization based parental psychoeducation program for parents of children with ASD.

摘 要 精神分裂症患者在共情等社会认知方面的缺损严重影响其正常社会功能。社会快感缺失指在社会互动过程中愉悦体验能力的降低，是精神分裂症的核心阴性症状之一。以往研究表明社会快感缺失与共情关联密切，相较于低分组被试，社会快感缺失高分组共情表现存在异常。但现有研究局限于实验室环境，目前尚缺乏在日常生活环境中对共情表现的考察。因此，本研究旨在通过经验采样法（Experience Sampling Method, ESM）考察社会快感缺失个体日常生活中的共情表现，及其与日常生活中社交愉悦度之间的关系。本研究采用社会快感缺失量表（The Revised Social Anhedonia Scale, CSAS）筛选并招募了 46 名社会快感缺失高分被试（平均年龄：19.85 ± 0.73 岁，男性 24 名; CSAS > 16）以及 53 名社会快感缺失低分被试（平均年龄：19.81 ± 0.71 岁，男性 21 名; CSAS < 11），两组被试的年龄、性别和受教育年限无显著差异。被试完成自评认知和情感共情问卷（Questionnaire of Cognitive and Affective Empathy, QCAE）以及为期 7 天每天 10 次的 ESM 调查，每次调查包括 36 道题目，测量日常生活中的积极和消极情绪体验、社交愉悦和共情表现。统计分析采用独立样本 t 检验考察 QCAE 量表得分的组间差异，采用多层混合效应模型分析 ESM 数据考察日常生活中共情表现的组间差异、共情表现与社交愉悦的关系及其组间差异。结果发现：1）与低分组相比，社会快感缺失高分组被试 QCAE 量表的情感共情维度得分显著更低，认知共情维度得分未发现显著差异；2）ESM 分析结果表明，社会快感缺失高分组被试日常生活中的认知和情感共情水平更低，社交愉悦度更低；3）日常生活中的社交愉悦度对认知共情和情感共情均具有正向预测作用，这一关系在社会快感缺失高低分组之间没有显著差异。总之，本研究提示社会快感缺失高分组被试日常生活中的认知和情感共情均存在异常，日常人际交往中的愉悦度水平可以预测认知和情感共情表现。本研究通过 ESM 研究探讨了日常生活中的共情，为理解精神分裂症及其风险人群的社会认知异常提供了新的视角。

3 Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049

Abstract： Deficits in social cognition such as empathy play an important role in social functioning impairments in patients with schizophrenia. Social anhedonia refers to diminished ability to experience pleasure from social activities, which belongs to core negative symptoms of schizophrenia. Previous studies suggested that social anhedonia is closely associated with empathy, for example, individuals with high level of social anhedonia reported lower scores on empathy compared to individuals with low social anhedonia. However, very few studies have investigated whether and how empathy experiences in daily life changes in individuals with social anhedonia. Applying the Experience Sampling Method (ESM), our study aimed to investigate empathy and its associations with social pleasure experience in daily life of individuals with high and low levels of social anhedonia. The Revised Social Anhedonia Scale (CSAS) was adopted to screen individuals with high social anhedonia (n=46, mean age:19.85 ± 0.73 years, 24 males) and low social anhedonia (n=53, mean age:19.81 ± 0.71 years, 21 males). There were no significant differences in age, gender proportions, and years of education between two groups. The self-report Questionnaire of Cognitive and Affective Empathy (QCAE) was used to measure trait cognitive and affective empathy. In addition, participants completed the ESM survey 10 times a day for 7 days, with 36 items covering positive and negative emotional states, social pleasure, and cognitive and affective empathy in daily life. Independent samples t-tests were used to examine between-group differences in dimensional and total scores of the QCAE. Multilevel mixed-effect linear model was conducted for the data of ESM surveys to examine the between-group differences of empathy and its associations with social pleasure in daily life. Results showed that: 1) Compared to individuals with low social anhedonia, high social anhedonia individuals reported lower scores on affective empathy dimension of the QCAE, no significant differences were found on cognitive empathy; 2) In daily life, individuals with high social anhedonia showed poorer cognitive and affective empathy and reduced social pleasure compared to their counterparts; 3) social pleasure positively predicted cognitive and affective empathy in both groups, no significant differences were observed on these associations. In conclusion, our findings suggest that individuals with high social anhedonia manifest reduced cognitive and affective empathy in daily life, and diminished pleasure from social interactions predict changes in cognitive and affective empathy. Taken together, our findings providing new perspective for understanding social cognitive impairments in patients with schizophrenia and at-risk individuals.

3 中国科学院大学心理系，北京，100049

摘 要 精神分裂症患者及高分裂型人格特质个体均存在不同程度的反应抑制异常，目前研究多集中于非情绪加工及外显加工方面，而考察内隐加工条件下反应抑制表现的研究较少。因此本研究基于谱系视角探究精神分裂症患者及高分裂型人格特质个体在不同条件下的情绪反应抑制特点。研究一招募 32 例精神分裂症患者及 36 例健康对照，研究二招募 34 例高分裂型人格特质个体及 39 例低分对照。两研究均采用包含

三种情绪加工条件的停止信号任务，即非情绪加工、外显加工及内隐加工，以此来考察被试的情绪反应抑制能力。采用混合模型方差分析组内和组间的差异。研究一表明，在非情绪性停止信号任务中，精神分裂症患者组与健康对照组在四个指标上的表现均无显著差异；在外显停止信号任务中，精神分裂症患者组的停止信号反应时(SSRT)大于健康对照组，而成功抑制率(PI)、停止信号延迟时间(SSD) 均小于健康对照组；在内隐停止信号任务中，精神分裂症患者组的 SSRT 大于健康对照组，而 PI 、SSD 均小于健康对照组。研究二表明，在非情绪性及外显停止信号任务中，高分裂型人格特质组与低分对照组在四个指标上的表现均无显著差异；而在内隐停止信号任务中，高分裂型人格特质组的 SSRT 大于低分对照组，尤其表现在对负性情绪面孔刺激方面，而 PI 、SSD 均小于低分对照组。本研究提示了内隐条件下对情绪刺激的反应抑制缺损有可能是精神分裂症患者及亚临床人群稳定的缺损，这一缺损有可能为精神分裂症的早期识别提供参考。

[3] Department of Psychology, University of Chinese Academy of Sciences, Beijing, 100049

Abstract：Most recent studies have concentrated on non-emotional and explicit processing, while fewer studies have looked at the performance of response inhibition under implicit processing conditions. Patients with schizophrenia and individuals with schizotypal personality disorder have varying degrees of response inhibition abnormalities. Therefore, based on a spectrum perspective, the current study examined the characteristics of emotional response inhibition in schizophrenic patients and individuals with schizotypal personality disorder under various circumstances.In Study 1, 32 schizophrenia patients and 36 healthy controls were recruited, while in Study 2, 34 participants with schizotypal personality disorder and 39 low-scoring controls were recruited. The ability of subjects to suppress emotional reactions was examined in both experiments using a stop signal task with three emotional processing conditions, including non-emotional processing, explicit-emotional processing, and implicit-emotional processing. A mixed-model ANOVA was used to examine variations within and between groups. According to Study 1, there was no significant difference in performance between the control group and the schizophrenia group on any of the four indices during the non-emotional stop signal task; however, during the explicit-emotional stop signal task, the stop-signal reaction time (SSRT) of the schizophrenia group was higher than the control group, while the successful inhibition rate (PI) and stop-signal latency (SSD) was lower than that of the control group. When it came to the task, the SSRT of the schizophrenia group was higher than that of the control group, while the PI and SSD were lower. Study 2 revealed that the low-scoring control group and the schizotypal personality disorder group performed similarly on all four indices in the non-emotional and

explicit-emotional stop signal tasks; however, in the implicit-emotional stop signal task, the SSRT of the schizotypal personality disorder group was higher than that of the low-scoring control group, particularly in response to the negative emotional face stimuli, whereas the PI and SSD we found no significant differences between the two groups. The present study suggests that the implicitly conditioned deficit in response inhibition to emotional stimuli is likely to be a stable deficit in patients with schizophrenia and subclinical individuals, and that this deficit has the potential to inform the early identification of schizophrenia.

4 上海纽约大学，文理学院，上海，200012

摘 要 认知理论认为，幻听可能与对信息来源的监控异常有关。对任何认知过程的一般性的监控功能是开启和停止此过程，在言语范畴中即开启和停止说话。以往对抑制控制功能的研究主要聚焦于外显的动作输出阶段，但动作产生的其他时间节点上抑制功能的神经机制还不清楚。言语产生和感知领域的研究表明，内部言语（在没有任何外部动作输出下在内部产生和言语感知过程相似的感觉）可能是言语幻听内容的来源，抑制功能如何作用于内部言语还有待进一步验证。本研究探讨了运动感知神经网络对言语抑制功能的调节作用，并探讨了言语幻听患者内部言语抑制功能异常的脑机制。本研究采用功能磁共振成像和两个停止信号范式任务，即发音停止任务和想象发音停止任务，在 31 例正常健康人和 29 例伴有幻听症状的精神分裂症病人中探索反应执行和抑制的神经机制。在“执行”试次中，视觉刺激后进行发音或者想象发音任务；在“停止”试次中，一个红色的圆作为停止信号出现在视觉刺激后的特定的“停止信号延迟时间(SSD)”时，进行停止发音或者想象发音反应。行为学结果表明，幻听患者的停止信号反应时间(SSRT)显著高于健康对照组。fMRI 结果表明，在发音抑制任务中，幻听患者的右侧额下回 (rIFC)激活程度较弱，而缘上回(SMG)和角回(AG)激活较强。而在想象发音抑制任务中，幻听患者 SMG 和 AG 激活程度较弱，但 rIFC 的激活程度与健康对照组没有差异。以上结果表明，rIFC 可能执行抑制功能，顶叶区域可能评估抑制功能的结果。此外，发音任务中，健康对照组中 rIFC 的激活程度与 SSRT 呈正相关；幻听患者组中 rIFC 激活与幻听严重程度 AHRS 总分呈负相关。行为和神经影像学结果一致表明，前额叶-顶叶网络的低效处理是言语幻听患者抑制控制缺陷的神经基础。

Abstract：According to recent cognitive models, impaired source monitoring may cause hallucinations. The most general monitoring and control function is to stop the action. Previous studies focus on the aspect of stopping motor outputs. How the inhibition function operates at any point of the production process is unclear. Specific in the speech domain, how the inhibitory function operates on inner speech (covert speaking without articulation motor output) that is potentially the internal source of auditory verbal hallucinations (AVHs) remains unknown. This study investigated the functional neural network that mediated the inhibition function of speech and examined the impairment of the function in patients with AVHs, especially during inner speech. In a functional magnetic resonance imaging (fMRI) study, 29 schizophrenia patients with AVHs and 31 healthy controls performed overt and imagined articulation tasks in a revised stop-signal paradigm. In the Go trials, participants articulated or imagined speaking a syllable as fast as possible after saw a visual cue in the overt and imagined articulation tasks, respectively. In the Stop trials that consisted of 1/3 of the total trials, participants were asked to stop their responses (either overt or imagined articulation) when a red circle was presented after the visual cue at the individually quantified stop-signal delay (SSD). Behaviorally, AVHs patients showed slower stop-signal reaction time (SSRT) than the healthy controls. For the fMRI results, a neural network including the right inferior frontal cortex (rIFC), supramarginal gyrus (SMG), and angular gyrus (AG) was observed for the inhibition function in both overt and imagined articulation tasks in patients and healthy controls. Moreover, during the inhibition of overt articulation, patients had significantly weaker responses in the rIFC, and stronger responses in the SMG and AG. Whereas during the inhibition of imagined articulation, patients had a weaker response in the SMG and AG, but not different from the healthy controls in the rIFC. These dissociations across groups and cortical regions in overt or imagined articulation inhibition tasks suggest that rIFC may execute the inhibition function and parietal regions may evaluate the results of the inhibition function. Furthermore, rIFC activation positively correlated with SSRT in the articulation task in the healthy controls. Whereas the rIFC activation negatively correlated with patients' AHRS total scores. These consistent behavioral and neuroimaging results suggest that inefficient processing in the frontal-parietal network underlies a deficiency of inhibitory speech control in AVHs patients.

摘 要 **研究背景**：抑郁症（Major Depressive Disorder，MDD）患者存在认知灵活性受损，本研究拟采用

非情绪和情绪性任务转换范式测量 MDD 患者认知灵活性，阐明 MDD 患者是仅对情绪性信息存在认知灵活性受损，或是对所有信息（情绪性与非情绪性）均存在认知灵活性受损，并结合基于脑电微状态的溯源分析获得 MDD 患者在任务转换过程的时空变化和相应的脑功能状态，以进一步阐明 MDD 认知灵活性受损的电生理机制。**方法**：人口学资料相匹配的 41 名首发未服药 MDD 患者与 42 名健康对照（Health Control，HC）被试完成非情绪和情绪性两种任务转换范式，同步采集其行为学和脑电数据。采用 2（组：MDD vs. HC）× 2（范式：非情绪 vs. 情绪）× 2（任务：重复 vs.转换）重复测量方差分析比较两组在反应时和错误率上的差异。采用偏相关分析计算脑电微状态指标与行为学变量的相关性。采用全脑体素 *t* 检验比较两组基于微状态时间进程的标准化低分辨率电磁脑断层扫描（Standardized Low Resolution Brain Electromagnetic Tomography, sLORETA）图像的差异。**结果**：（1）与 HC 组相比，MDD 组完成任务转换范式的错误率更高，反应时更长。（2）MDD 组情绪性转换任务条件下的反应时与该条件的微状态 2 出现频率呈显著负相关（r=-0.44, p<0.01），与该条件的微状态 2 持续时间呈显著正相关（r=0.35, p<0.05）；MDD 组情绪性错误率转换成本与情绪性转换任务条件微状态 3 的全局场功率（r=-0.29, p=0.068）、出现频率（r=-0.30, p=0.052）和覆盖率（r=-0.31, p=0.055）均呈边缘显著负相关。（3）情绪性转换任务和情绪性重复任务的微状态 2（在 162-214 毫秒时间窗内）sLORETA 图像对比显示，MDD 组在中央前回（Brodmann area 44; MNI coordinates: X=55, Y=10, Z=10）的激活程度显著高于 HC 组（t>-4.859, p<0.05）；情绪性转换任务和情绪性重复任务的微状态 3（在 260-350 毫秒时间窗内）sLORETA 图像对比显示，MDD 组在枕中回（Brodmann area 18; MNI coordinates: X=10, Y=-95, Z=10）的激活程度显著低于 HC 组（t>4.972, p<0.05）。**结论**：MDD 患者对情绪与非情绪信息均存在认知灵活性受损，但对情绪性信息的受损更严重。在任务早期对目标信息异常的知觉控制可能是 MDD 患者认知灵活性受损的电生理机制。

Impaired Cognitive Flexibility in Drug-naïve Patients with First-Episode Major Depressive Disorder: Source Localization Analysis based on Brain Electrical Microstates

Kaili Zheng[1,2], Zhaoxia Liu[1,2], Jinyao Yi[1,2,3](Corresponding author)

1 Medical Psychological Center, Second Xiangya Hospital, Central South University, Changsha 410011, China

2 Medical Psychological Institute, Central South University, Changsha 410011, China

3 National Clinical Research Center for Mental Disorders, Changsha 410011, China,

Email: jinyaoyi@csu.edu.cn

***Abstract*: Background:** Patients with Major depressive disorder (MDD) have impaired cognitive flexibility. With non-emotional and emotional task switching paradigms being adopted to measure the cognitive flexibility of patients with MDD, this study aimed to clarify whether patients with MDD only have impaired cognitive flexibility for emotional information or for all information (emotional and non-emotional). By combining source localization based on brain electrical microstates to obtain the spatiotemporal changes and corresponding brain function states during task switching paradigms in MDD, this study also further elucidates the electrophysiological mechanism of impaired cognitive flexibility in MDD. **Methods:** A demographically matched cohort of 41 first-episode, drug-naïve patients with MDD and 42 healthy control (HC) subjects completed both non-emotional and emotional task switching paradigms, and their behavioral and electroencephalogram data were collected simultaneously. The group differences in the reaction time and error rate were compared by 2 (group: MDD vs. HC) × 2 (paradigm: non-emotional vs. emotional) × 2 (task: repeat vs. switch) repeated measures analysis of variance. The correlation between the brain electrical microstate indicators and behavioral variables were calculated by partial correlation analysis. The group differences in the standardized low resolution brain electromagnetic

tomography (sLORETA) images based on microstate time course were compared by whole brain voxel *t* test. **Results:** (1) Compared with HC group, MDD group made more errors and had longer time completing task switching paradigms. (2) In MDD group, the reaction time under emotional switch task condition was negatively correlated with the occurrence of microstate2 (r=-0.44, p<0.01) and positively correlated with the duration of microstate2 (r=0.35, p<0.05), and the switching cost of emotional error rate was marginally negatively correlated with the global field power (r=-0.29, p=0.068), occurrence (r=-0.30, p=0.052) and coverage (r=-0.31, p=0.055) of microstate3 under the emotional switch task condition. (3) The comparison of sLORETA images of emotional switch task and emotional repeat task in microstate2 (time window :162-214 ms) showed that MDD group had more activation than HC group in the precentral gyrus (t>-4.859, p<0.05; Brodmann area 44, MNI coordinates: X=55, Y=10, Z=10); the comparison of sLORETA images of emotional switch task and emotional repeat task in the microstate3 (time window: 260-350 ms) showed that the MDD group had less activation than HC group in the medial occipital gyrus (t>4.972, p<0.05; Brodmann area 18, MNI coordinates: X=10, Y=-95, Z=10). **Conclusion:** Patients with MDD have impaired cognitive flexibility for both emotional and non-emotional information, but have more severely impaired for emotional information. The abnormal perceptual control of target information in the early stage of switching task may be the underlying electrophysiological mechanism of impaired cognitive flexibility in MDD.

摘 要 **目的：**本研究拟结合采用评价转换功能的任务和功能磁共振技术，分析抑郁症（Major Depressive Disorder, MDD）患者转换功能的行为学特征与任务态脑影像学特征，探析抑郁症转换功能受损特征的潜在神经机制。**方法：**37 名抑郁症患者和 37 名人口学资料匹配的健康对照（Healthy Control, HC）被试完成了任务转换范式，同步采集被试执行任务转换范式时的行为学数据与任务态功能磁共振数据。首先，采用重复测量方差分析比较两组在任务转换范式中的行为学表现差异。其次，采用单样本 *t* 检验分析被试由转换任务引发的脑区功能激活（转换条件减去重复条件），并采用独立样本 *t* 检验比较两组的脑区功能激活差异。再者，选取功能激活存在显著组间差异的脑区，以其最大激活坐标为球心、6mm 为半径的球形范围作为种子点，采用心理生理交互作用(PPI)考察转换任务中被试的全脑功能连接模式，并采用独立样本 *t* 检验比较两组的功能连接差异。最后，基于 PPI 的结果，聚焦于额顶网络中存在异常连接的脑区，将其作为感兴趣区，构建动态因果模型(DCM)以考察异常功能连接的方向性。**结果：**(1) 在执行任务转换范式时，抑郁症组与健康对照组在正确率(MDD<HC, p<0.05)和反应时(MDD>HC, p<0.001)上均存在显著差异。(2) 全脑功能激活结果显示，抑郁症组右侧额下回、右侧顶下小叶和左侧中扣带回的激活水平均显著低于健康对照组(p_{FWE}<0.05, 团块水平校正)。(3) PPI 结果显示，抑郁症组右侧额下回与左侧顶下小叶及左侧颞极的功能连接值均显著低于健康对照组(p_{uncorr}<0.001)，右侧顶下小叶与左侧额上回的功能连接值则显著高于健康对照组(p_{uncorr}<0.001)。(4) DCM 结果显示，抑郁症组从左侧顶下小叶至右侧顶下小叶的有效连接、从右侧顶下小叶至右侧额上回的有效连接均显著弱于健康对照组（后验概率大于 0.95），而从左侧额上回至右侧顶下小叶的有效连接则显著强于健康对照组（后验概率大于 0.95）。**结论：**抑郁症患者转换功能受损，在行为学上表现为速度慢、正确率低，在脑影像学上表现为额顶网络的脑区激活异常、自下而上和自上而下的有效连接失衡。在转换任务中，抑郁症患者对任务无关刺激的抑制不足及注意转移能力降低，这可能是其转

换功能受损的病理机制之一。

***Abstract*：** **Objective:** This study aims to analyze the behavioral and neuroimaging characteristics of the switching function in patients with Major Depressive Disorder (MDD) by using switching tasks and functional magnetic resonance imaging (fMRI), and to explore the underlying neurological mechanism of the impaired switching function in patients with MDD. **Method:** A total of 37 MDD patients and 37 healthy controls (HC) completed the task switching paradigm. The task-related functional magnetic resonance imaging data were collected when subjects were performing the task switching paradigm. Firstly, repeated measures analysis of variance was performed to compare the group differences in the Task Switching Paradigm. Secondly, a one-sample *t*-test was used to analyze the brain activation induced by switching task, and an independent-sample *t*-test was used to compare the group differences in brain activation. Thirdly, seeds were selected based on brain regions with significant group differences in functional activation, and psychophysiological interaction (PPI) analysis was then used to investigate the functional connectivity patterns of the whole brain during subjects performing task. Independent-sample *t*-tests were used to compare the group differences in brain functional connectivity in PPI. Finally, in the frontoparietal network, those brain regions with abnormal connectivity in PPI were selected as the region of interest, and a dynamic causal modeling (DCM) was constructed to explore the directionality of the abnormal functional connectivity. **Results:** (1) When completing the task-switching paradigm, the two groups had significant differences in the accuracy (MDD<HC, $p<0.05$) and reaction time (MDD>HC, $p<0.001$). (2) For the whole-brain functional activation, compared with the HC group, the MDD group had significantly lower activation levels in right inferior frontal gyrus, right inferior parietal lobule, and left middle cingulate gyrus ($p_{FWE}<0.05$, cluster-level correction). (3) For the PPI results, compared with the HC group, the MDD group had significantly decreased functional connectivities between right inferior frontal gyrus and left inferior parietal lobule and left temporal pole ($p_{uncorr}<0.001$), while significantly increased functional connectivity between right inferior parietal lobule and left superior frontal gyrus ($p_{uncorr}<0.001$). (4) For the DCM results, compared with the HC group, the MDD group had significantly decreased effective connectivities from left inferior parietal lobule to right inferior parietal lobule, and from right inferior parietal lobule to right inferior frontal gyrus (posterior probability>0.95), while had increased effective connectivity from left superior frontal gyrus to right inferior parietal lobule (posterior probability>0.95). **Conclusions:** The impaired switching function of patients with MDD shows slow speed and low accuracy, and abnormal activation of some brain regions and the imbalance of bottom-up and top-down effective connectivities in frontalparietal network. Patients with MDD have insufficient inhibition of task-irrelevant stimuli and decreased ability to shift attention when performing switching tasks, which might be the underlying mechanism of the impaired switching function in MDD.

Highlights

- Prenatal immune activation disrupts offspring's nest building and prepulse inhibition.
- Maternal separation disrupts nest building and fear-potentiated startle response.
- Combined immune activation and maternal separation resolved nest building deficits.

Abstract： Early life adversities are known to exert long-term negative impacts on the psychological and brain functions of individuals. The present work examined how a prenatal and a postnatal stressor independently or concurrently influence various maternal responses (e.g., pup retrieval, licking, nest building, etc.) of postpartum female rats and their cognitive and emotional processing, as a way to identify the potential risk factors for postpartum mental disorders. Sprague-Dawley female offspring born from rat mothers exposed to polycytidilic:polyinosinic acid (PolyI:C, 4.0 mg/kg) or saline during pregnancy were subject to a repeated maternal separation stress (3 h/day) for 9 days in the first two weeks of postpartum or no separation (a 2 × 2 design). After they became mothers, their attentional filtering ability (as measured in the prepulse inhibition of acoustic startle response), positive hedonic response (as measured in the sucrose preference test), and negative emotional response (as measured in the fear-potentiated startle) were examined, along with their home-cage maternal behavior. Virgin littermates served as controls in all the behavioral tests except in the maternal behavior. Results showed that mother rats who had experienced a prenatal immune activation (a risk factor for autism and schizophrenia) exhibited a deficit in nest building and sensorimotor gating. Prenatal immune activation also impaired fear-potentiated startle in virgin controls. Mother rats who experienced repeated maternal separation also had fewer nest building activity, but higher basal startle reactivity, and an increased fear-potentiated startle. Interestingly, mother rats who experienced both exhibited normal nest building and fear-potentiated startle, no different from that of virgin controls. Other maternal responses, including pup retrieval, pup licking and hovering over pups, and the positive hedonic response (e.g., sucrose preference) were not affected by either stressor. These results indicate that early life stress can selectively impact maternal related behaviors, mainly nest building, attention and negative emotion response, which could negatively impacts the wellbeing of offspring.

摘 要 **导言：**吸烟是威胁全世界公众健康的重要因素之一，头发中尼古丁和可替宁的定量分析可以为体内的尼古丁和可替宁含量提供可回溯性指证，以评估长期吸烟或者被动吸烟的暴露量。另外，由于吸烟与下丘脑-垂体-肾上腺（HPA）轴之间的关系牵涉到应激反应和尼古丁成瘾，因此更好地了解头发尼古丁、可替宁水平与头发皮质醇、可的松水平之间的关系是吸烟和应激相关研究的重要前提。

方法：本研究致力于开发一种结合在线固相萃取技术和高效液相色谱-串联质谱技术（LC-MS/MS）的定量检测方法，用于分析头发中尼古丁和可替宁含量，同时评估萃取头发中尼古丁和可替宁的孵育溶液以及孵育容器的材料。在验证研究中，该方法被用于分析 20 名吸烟者（Mean ± SD 年龄：44.55 ± 13.33 岁；50% 为男性）和 20 名不吸烟者（Mean ± SD 年龄：47.95 ± 10.39 岁；30% 为男性）的头发尼古丁和可替宁含量，并探索它们与头发皮质醇和可的松含量之间的关系。

结果：研究发现最优的提取方法确定为使用甲醇和玻璃管提取头发中的尼古丁和可替宁，孵育时间为 18 小时。该检测方法的尼古丁和可替宁定量限分别为 1 pg/mg 和 0.1 pg/mg，日间和日内变异系数均低于 15%，

方法回收率在 90% 至 104% 之间。验证研究中，吸烟者头发中尼古丁和可替宁水平显著高于不吸烟者（尼古丁：$Z = 342.5$，$p < 0.001$；可替宁：$Z = 381.0$，$p < 0.001$）。同时，吸烟者头发中的尼古丁和可替宁水平与头发中的皮质醇和可的松水平呈显著正相关（尼古丁和皮质醇： Spearman's $\rho = 0.619$，$p = 0.005$；可替宁和皮质醇： Spearman's $\rho = 0.468$，$p = 0.043$；尼古丁和可的松：Spearman's $\rho = 0.773$，$p = 0.000$；可替宁和可的松：Spearman's $\rho = 0.531$，$p = 0.016$），而在非吸烟者的头发中却没有发现任何相关性。

结论：该研究开发并验证了一种全新的结合甲醇萃取和在线固相萃取的 LC-MS/MS 检测方法，用于定量分析人体头发中尼古丁和可替宁的含量。相关研究结果表明，在未来与应激有关的研究中，应用头发糖皮质类固醇作为慢性应激的生物标志物时，必须考虑到吸烟状况。该研究同时也为其他揭示吸烟与应激之间关系的研究提供了一种新颖有效的方法。

***Abstract*：** **Introduction:** Tobacco smoking is one of the critical public health threats all over the world. Since nicotine and its metabolite cotinine have been routinely used as the biomarkers to estimate the exposure to tobacco smoking, hair nicotine and cotinine analyses can provide of a retrospective index of nicotine and cotinine integrated over extended periods of several months prior to hair sampling to estimate the long-term exposure to tobacco smoking. In addition, hair sample collection is able to offer a simple, non-invasive sampling process. Since the relationship between tobacco smoking and hypothalamic-pituitary-adrenal (HPA) axis is implicated in both stress response and nicotine addiction, better understanding of the association between hair nicotine, cotinine levels and hair cortisol, cortisone levels are an essential prerequisite toward adequate use of this method in future research.

Methods: We here presented an online solid phase extraction (SPE) coupled with liquid chromatography- tandem mass spectrometry (LC-MS/MS) method for quantification of long-term integrated nicotine and cotinine in human hair. Different incubation solvents were evaluated for hair nicotine and cotinine extraction, including methanol, acetonitrile, 1 M sodium hydroxide, 1 M hydrochloric acid, and water. Polypropylene and glass vial were compared under the condition of the current hair preparation protocol. In the proof-of-concept study, this method was applied to the analysis of hair nicotine and cotinine in 20 smokers (mean ± SD age: 44.55 ± 13.33 years; 50% male) as well as 20 nonsmokers (mean ± SD age: 47.95 ± 10.39 years; 30% male), and the investigation of their association with hair cortisol and cortisone. 3 cm hair segment was cut as close as possible to the scalp from a

posterior vertex position of each participant using surgical clippers, and then were wrapped in aluminum foil and kept at room temperature until they were prepared.

Results: Methanol together with glass tube was used for hair nicotine and cotinine extraction during the incubation time of 18-hour. The limits of quantification were 1 pg/mg for nicotine as well as 0.1 pg/mg for cotinine. The inter- and intra-day coefficients of variation were below 15%. The method recovery ranged between 90% and 104%. Group-level analyses revealed that smokers exhibited higher hair nicotine and cotinine levels compared to nonsmokers (Nicotine: Z = 342.5, p < 0.001; Cotinine: Z = 381.0, p < 0.001). Hair nicotine and cotinine levels showed significant positive associations with hair cortisol and cortisone levels in smokers (nicotine and cortisol: Spearman's ρ = 0.619, p = 0.005; cotinine and cortisol: Spearman's ρ = 0.468, p = 0.043; nicotine and cortisone: Spearman's ρ = 0.773, p = 0.000; cotinine and cortisone: Spearman's ρ = 0.531, p = 0.016), but not in nonsmokers.

Conclusions: A novel online SPE LC–MS/MS method coupled with methanol extraction was developed and validated for the measurement of nicotine and cotinine in human hair. The application of online SPE together with methanol extraction led to a considerable automated, simple and fast pretreatment to increase throughput of this method. The smokers exhibited higher hair nicotine and cotinine levels compared to the nonsmokers. Furthermore, hair nicotine, cotinine levels correlated with hair cortisol, cortisone levels in smokers other than nonsmokers. Our findings document that smoking status must be taken into consideration in future stress-related studies with the application of hair steroids as the biomarker of chronic stress. Our results may spark the interest of basic researchers and clinicians alike to unfold the mechanism underlying the association between tobacco smoking and stress.

高原世居者的工作记忆：现象、机制与氧干预

德吉央珍[1]　王美懿[1]　李昊[2]

1 西藏大学高原脑科学研究中心,拉萨，850000

2　西藏大学教育学院，拉萨，850000，futanghu888@126.com

摘 要　工作记忆负责暂时存储和处理信息，虽然高原世居者存在某种程度的适应机制，但有证据显示他们的脑认知功能也受缺氧暴露的影响。本文目的在于探索世居者的工作记忆受高原缺氧暴露影响和生理机制，以及不同氧干预的改善作用。以纵向干预对照设计进行研究。

研究方法：被试（世居者 N=74, M=24.2, SD=1.77），研究分为三个部分，第一部分对所有被试进行了血液、问卷和认知任务测试，对以上指标进行 K-means 聚类分析，将所有被试以缺氧适应程度分组，比较不同组的工作记忆能力，考察缺氧适应能力对工作记忆的影响。第二部分为干预对照研究，将被试分为对照、高压氧与常压氧三组，其中高压氧与常压氧又分干预 30 分钟、60 分钟和 90 分钟三种时间，每两周 5 次共 10 次。考察氧干预对被试工作记忆的影响。第三部分，在控制了睡眠质量和心理健康状况等干扰因素前提下，考察总胆汁酸对氧干预和工作记忆的调节作用，建立解释机制模型。

研究结果：（1）第一部分研究在 1-back 反应时上各组差异显著，优适应组好于低适应组(p=0.051)，说明缺氧适应能力越好的人在 1-back 反应时上表现得越好；（2）第二部分研究中高压氧 30 分钟组(p=0.022, η^2=0.076)和常压氧 30 分钟组(p=0.010，η^2=0.094)在氧干预前后的 1-back 任务正确条件下的反应时差异显著，对照组(p=0.004, η^2=0.118)和高压氧 30 分钟组(p=0.000, η^2=0.252)在氧干预前后的 2-back 任务正确条件下的反应时差异显著，高压氧 30 分钟组(p=0.023，η^2=0.074)和常压氧 30 分钟组(p=0.011, η^2=0.094)在氧干预前后的 1-back 任务反应时差异显著，高压氧 30 分钟组(p=0.006, η^2=0.108)在氧干预前后的 1-back 任务反应时差异显著；（3）第三部分研究结果显示，对于低总胆汁酸的人来说，随着氧干预时间的增加，其工作记忆能力有显著下降的趋势(simple slope=0.908, t=2.703, p=0.012)；对于高总胆汁酸的被试来说，氧干预时间不

显著预测工作记忆能力。

通过本研究首次证实了高原缺氧暴露条件下世居者的工作记忆功能也会受到消极影响，并给出了氧干预能改善这一情况的相应证据。进一步丰富了高原脑科学领域理论基础，对我国世居高原人民的脑健康保护具有应用价值。

Working memory in high-altitude sedentary people: phenomena, mechanisms and oxygen intervention

Yangzhen DeJi[1], Meiyi Wang[1], Hao Li[2]

[1]Plateau Brain Science Research Center, Tibet University, Lhasa, China

[2] Tibet University's School of Education, Lhasa, 850000,futanghu888@126.com

Abstract： Objective**:** Working memory, which is responsible for the temporary storage and processing of information, has been found to be severely affected by hypoxia exposure in highland migrant populations. Although some degree of adaptation mechanisms exists in plateau settlers, there is evidence that their brain cognitive functions are also affected by hypoxia exposure. This paper, therefore, explores the physiological mechanisms by which working memory (WM) in sedentary individuals is affected by hypoxia exposure in the highlands, and the effect of different oxygen supplementation interventions to improve it. The paper was conducted in a longitudinal intervention control design.

Methods: Subjects (selected descent dwellers N=74, M=24.2, SD=1.77), the study was divided into three parts, the first part of the study measured all subjects with blood, questionnaires, and cognitive task tests, and all subjects were grouped by the degree of hypoxia adaptation by performing K-means cluster analysis on the above indicators, comparing the working memory ability of different groups, and examining the effect of hypoxia adaptation ability on The second part was a controlled study. In the second part of the study, participants were divided into three groups: control, hyperbaric and normobaric oxygen, with hyperbaric and normobaric oxygen being divided into three different intervention time levels of 30 minutes, 60 minutes, and 90 minutes, for a total of 10 sessions every two weeks. The effect of the oxygen intervention on the working memory of the highland sedentary was investigated. In the third part, at the end of the intervention, after controlling for confounding factors such as sleep quality and mental health status, the moderating effect of total bile acids on the oxygen intervention and working memory was examined.

Results: (1) In the first part of the study, the groups differed significantly on the 1back reaction time, with subjects in the superior adaptation group were better than those in the low adaptation group (p=0.051), indicating that those with better adaptation to hypoxia also performed better in the 1back reaction time in the N-back task; (2) in the second part of the study, the hyperbaric oxygen 30-minute group (p =0.022, η^2=0.076) and the normobaric oxygen 30-minute group (p =0.010, η^2=0.094),in the oxygen Significant differences in reaction times before and after the intervention with the correct 1-back task were found in the control group (p =0.004, η^2=0.118) and the hyperbaric 30-minute group (p =0.000, η^2=0.252), and in reaction times before and after the oxygen intervention with the correct 2-back task were found in the hyperbaric 30-minute group (p =0.023, η^2= 0.074) and the normobaric oxygen 30-minute group (p =0.011, η^2=0.094) differed significantly in response time to the 1-back task before and after the oxygen intervention, and the hyperbaric oxygen 30-minute group (p =0.006, η^2=0.108) differed significantly in response time to the 1-back task before and after the oxygen intervention. (3) The results of the third part of the study showed that for those with low total bile acids, subjects showed a significant

downward trend in working memory capacity as the duration of the oxygen intervention increased (simple slope=0.908, t=2.703, p =0.012); for subjects with high total bile acids, the duration of the oxygen intervention did not significantly predict working memory capacity.

Conclusion：(1) Hypoxia adaptation affected the working memory capacity of plateau sedentary; (2) 10 sessions of hyperbaric oxygen for 30 minutes, normobaric oxygen for 60 minutes, and normobaric oxygen for 30 minutes interventions all contributed to the functional memory capacity of plateau sedentary; (3) 20 sessions of oxygen interventions of different durations had significant differences in the effects on subjects with different liver functions, and subjects with low total bilirubin had better working memory changes with the 30-minute hyperbaric oxygen intervention.

Through this study, it was confirmed for the first time that working memory function was also negatively affected by indigenous residents under hypoxic exposure conditions in the plateau, and the corresponding evidence that oxygen intervention can improve this situation was given. It further enriches the theoretical basis in the field of plateau brain science and has application value for the protection of brain health of the world-dwelling plateau people in China.

Keywords: oxygen intervention, indigenous residents, working memory, liver function

高原缺氧与吸烟对认知的影响及氧干预的改善作用

习明莉[3] 张玉明[1] 李昊[2]

1 高原脑科学研究中心,拉萨,850000

2 西藏大学教育学院,拉萨,850000，futanghu888@126.com

摘 要 高海拔缺氧环境暴露和严重烟碱依赖都对认知功能有负向影响，但高海拔缺氧环境暴露合并烟碱依赖对基本认知功能影响的叠加效应及机制尚不清楚。本研究目的在于厘清高海拔缺氧与烟碱因素对个体认知的影响及可能的生理机制，并尝试通过氧干预改善缺氧合并烟碱依赖带来的不良影响。

方法：本研究招募在海拔 3650m 生活一年时间的 148 名青年采集血液生理、行为实验方面的数据，通过四项研究进行问题探索。研究 1：探究高海拔环境烟碱依赖者一般生理特征和认知功能差异，根据烟碱依赖水平将被试分为重度、轻度和无依赖三组，采集血液、烟碱依赖程度量表和认知行为数据，比较各组差异。研究 2：加入缺氧适应性到实验中以证实缺氧会使吸烟群体的认知损伤加重，在研究一被试中筛选出轻、重度烟碱依赖者 99 名，探究不同缺氧适应性对烟碱依赖被试的认知功能差异。研究 3：在研究一、二基础上分析原样本 XX 人探究缺氧与烟碱影响认知功能的内在机制并建立模型。研究 4：探究氧干预是否能改善高海拔环境中烟碱依赖者认知损伤及改善效果大小，招募一批轻度烟碱依赖以上男性被试 140 名，分为实验和对照组，实验组氧干预二十天，测量比较两组干预前后的认知功能。

结果：研究一发现高烟碱依赖者 flanker 不一致任务反应时长于不吸烟者。研究二发现烟碱依赖人群 flanker 任务反应时与缺氧适应性呈负相关，在 franker 不一致和不一致任务的反应时间上，缺氧适应性差的重度烟碱依赖者同时高于适应良好的重度烟碱依赖者、缺氧适应性差的轻度烟碱依赖者。研究三发现红细胞压积在缺氧适应性和认知任务的关系中起完全中介作用，受烟碱水平调节。研究四发现氧干预通过改善缺氧水平能改善轻度及以上烟碱依赖者的认知功能。

研究意义：这是首次用氧干预的方式改善高海拔环境下烟碱依赖者的认知功能，为提供个体缺氧适应性方案、改善烟碱对人体的损伤提供了新思路。可进一步通过氧剂量效应实验来探索更适合烟碱人群的临床方案，帮助高原上的吸烟者养成良好生活习惯，增强适应能力。

The effects of altitude hypoxia and smoking on cognition and the improvement effect of oxygen intervention

Mingli Xi[1],Yuming Zhang[1],Hao Li[2]

1 Plateau Brain Science Research Center, Tibet University, Lhasa, China

2 Tibet University's School of Education,Lhasa,850000,futanghu888@126.com

Abstract：Previous studies have found that both high altitude hypoxia and nicotine dependence affect cognitive functions such as attention, memory, and executive control, for example, severe nicotine dependence can lead to cognitive dysfunction and affect daily life. However, the superimposed effect of nicotine dependence on cognitive

function at high altitude and the underlying mechanisms are not clear. Therefore, the purpose of this study is to clarify the effects of hypoxia and nicotine on human physiology and cognition, to help smokers living at high altitude to develop good living habits, to improve the adverse effects of hypoxia and nicotine, and to ensure that individuals can better adapt to the high-altitude environment. On this basis, 148 Tibetan and Chinese youths living at 3650m above sea level were recruited to conduct blood physiological and behavioral experiments to investigate the effects of high-altitude environment on the cognitive function of people with different levels of nicotine dependence. Therefore, four experiments were designed to explore the above problems. Study 1:148 men (M±SD=23±2.01 years old) at high altitude (3650m) were recruited. The participants were divided into three groups according to their nicotine dependence level. Blood indicators, Fagerström Test for Nicotine Dependence and behavioral data were collected to explore the differences in cognitive function between smokers and nonsmokers at high altitude. Study 2: 99 participants (M±SD=20±1.21 years old) with mild level of nicotine dependence or higher were screened on the basis of study 1 participants to explore the performance of cognitive function of participants with different levels of hypoxia state and nicotine dependence in a plateau environment. Study 3: 140 male participants (M±SD=22±2.41 years old) with mild level of nicotine dependence or higher were recruited and divided into experimental and control groups. The experimental group received 20 days of oxygen intervention, and cognitive function was measured before and after the intervention in both groups to investigate the impact of oxygen intervention on cognitive function in nicotine dependent people with hypoxia; Study 4: To explore the mechanism underlying the effect of hypoxia and nicotine on cognitive function.

Study 1 showed that the flanker inconsistent task response time of high nicotine dependence was longer than that of non-smokers (F (1,97) =2.853, p=0.025); and in Study 2 there was a positive correlation between flanker task response time and hypoxia state in the nicotine dependent population (r =.181, p<.001). In terms of the response time of flanker inconsistent and inconsistent tasks, severe nicotine dependent patients with severe hypoxia state were higher than those with mild hypoxia state (p=0.039), and higher than those with severe hypoxia state but mild nicotine dependence (p=0.038); In the Study 3 , we found that oxygen intervention improved the cognitive function of people with mild level of nicotine dependent or higher by improving the hypoxia state, especially in flanker consistency (F(2,138)=6.669, p=0.042, p-η^2=0.065) and inconsistent tasks (F(2,138)=6.669, p=0.037, p-η^2=0.100), the accuracy of hyperbaric oxygen group was higher than that of non-oxygen group; Study 4 developed a moderated mediation model indicating that hematocrit played a full mediation effect in the relationship between hypoxia state and cognitive tasks ($effect$= -0.149, SE = 0.0815, 95% CI =[-0.3233 , -0.0008]), and nicotine levels moderated this relationship. Nicotine dependence in an alpine environment affects individual cognitive function task performance, and oxygen intervention can ameliorate this cognitive impairment, and hematocrit can mediate the relationship between the hypoxic state and flanker task response time and this relationship is modulated by the level of nicotine dependence.

基于机器学习的认知能力预测电竞专长的分类模型比较

苗浩飞[1] Daphné Bavelie[2] C. Shawn Green[2] 迟立忠[1]（通讯作者）
1 北京体育大学心理学院，北京，100091，chilizh3804@163.com
2 日内瓦大学心理与教育科学学院，日内瓦，1211

摘 要 **目的**：探索运动员的核心竞技能力对选材和训练具有重要意义。电子竞技不同于传统的竞技项目，对体能要求相对较低但需要广泛的认知参与、精细的动作控制能力。这些特征决定了认知能力是电竞玩家的核心能力之一。因此采用认知能力预测电竞专长具有理论可行性。然而过去认知预测电竞表现的模型多采用传统的线性回归模型。实际上能力和专长往往并非简单的线性相关。因此基于机器学习的非线性模型可能具有更好的拟合效果。本研究将采用 7 种认知能力，以玩家所处百分位对应的分数(matchmaking rating, MMR)作为专长指标建立分类模型。

方法：共招募年龄在 18-35 岁之间的英雄联盟端游玩家，共 539 人，MMR 在 285-1912 分之间，选取 MMR≥1400 分作为高水平组(标签)，共 152 人；余下的纳入低水平组。预测变量(特征)包括 7 项认知能力：信息处理速度、持续注意、数字广度、多目标追踪、视觉搜索、视觉推理、强化学习。预处理采用 Box Cox 法将数据转换为正态值，采用平均值法处理少量缺失值。采用支持向量机(Suppert Vector Machine, SVM)、最近邻(K-Nearest Neighbor,KNN)、决策树(Decision Tree,DT)、随机森林(Rondom Forest,RF)、多层感知机(Multilayer Perceptron,MLP)共 5 个模型。采用贝叶斯法优化参数,迭代次数设置为 5。采用 10 折交叉验证。训练集、验证集、测试集的比例为 8:1:1。

结果：KNN 模型的拟合效果最好，10 折交叉验证的准确率为 74.7%；其次是 DT 模型，为 73.4%；RF 模型和 MLP 模型的准确率为 72.5%和 72.3%。SVM 的结果最低，为 71.2%。在 KNN 模型的特征权重方面，从高到低依此是信息处理速度、视觉搜索、强化学习、视觉推理、持续注意、多目标追踪、数字广度，其中信息处理速度的权重明显高于其他认知能力。

结论：总体上各个模型的预测准确度较好且结果较为接近。使用机器学习方法建立基于认知能力预测电竞水平的模型具有可行性。未来可尝试新的标签分类方法，检验分类模型在其他电竞项目中的适用性，并适当补充电竞相关的认知能力和精细动作控制能力。

Abstract：Exploring the importance of core athletic abilities of athletes in talent selection and training. Esports differs from traditional sports in that it requires relatively low physical demands but extensive cognitive engagement and fine motor control. These characteristics determine that cognitive ability is one of the core competencies of esports players. Therefore, using cognitive ability to predict esports expertise is theoretically

feasible. However, past models that predict esports performance using cognitive ability have mostly used traditional linear regression models. In reality, ability and expertise are often not simply linearly correlated. Therefore, machine learning-based nonlinear models may have better fitting effects. This study will use seven cognitive abilities and the player's matchmaking rating (MMR) as the expertise indicator to establish a classification model.

Methods: A total of 539 League of Legends players aged between 18 and 35 were recruited, with MMR ranging from 285 to 1912 points. MMR≥1400 points were selected as the high-level group (label), with a total of 152 people; the remaining players were included in the low-level group. The predictive variables (features) include seven cognitive abilities: information processing speed, sustained attention, numerical breadth, multitasking, visual search, visual reasoning, and reinforcement learning. Preprocessing used the Box Cox method to transform the data into normal values, and the mean method was used to process a small amount of missing data. Five models were used: Support Vector Machine (SVM), K-Nearest Neighbor (KNN), Decision Tree (DT), Random Forest (RF), and Multilayer Perceptron (MLP). The Bayesian method was used to optimize parameters, with the number of iterations set to 5. Ten-fold cross-validation was used, with a ratio of 8:1:1 for the training, validation, and test sets.

Results: The KNN model had the best fitting effect, with an accuracy of 74.7% in 10-fold cross-validation; followed by the DT model, with an accuracy of 73.4%; the accuracy of the RF model and MLP model was 72.5% and 72.3%, respectively. The result of the SVM was the lowest, at 71.2%. In terms of feature weights in the KNN model, from high to low, they were information processing speed, visual search, reinforcement learning, visual reasoning, sustained attention, multitasking, and numerical breadth. The weight of information processing speed was significantly higher than that of other cognitive abilities.

Conclusion: Overall, the prediction accuracy of each model is good and the results are relatively close. Using machine learning methods to establish a model based on cognitive ability to predict esports performance is feasible. In the future, new label classification methods can be tried to test the applicability of classification models in other esports projects, and esports-related cognitive abilities and fine motor control abilities can be supplemented appropriately.

视听信息整合促进羽毛球运动预判的 ERP 研究

王晓婷[1,4]　任鹏飞[2]　张鑫[3]　迟立忠[4]（通讯作者）

1 陕西师范大学体育学院，西安，710119

2 延安大学体育学院，延安，716000

3 沈阳体育学院运动训练学院，沈阳，110006

4 北京体育大学心理学院，北京，100101，chilizh3804@163.com

摘 要　在羽毛球等击打类项目以及棒球等团体球类项目中，快速准确地预判对手和队友的下一步动作或动作结果至关重要。高质量的运动预判不仅源于有效获取与整合情景信息和运动学信息(视觉信息)，利用听觉信息预判击球速度与击球力度时，其效果优于视觉信息。以往研究分别探讨了视觉(如运动学信息)与听觉信息(如击球声音)对运动预判的影响，但对视听信息整合是否比仅视觉信息更能促进运动预判及如何促进运动预判的的探讨尚不充分。多感觉整合模型认为，信息整合可能发生在涉及初级感觉皮质的感知加工阶段，也可能发生在信息加工的认知决策阶段。

本研究利用 ERP 技术，采用 3(信息类型：视听信息一致、视听信息不一致、视觉信息) × 2(运动水平：高、低)混合实验设计，以不同水平羽毛球运动员为研究对象，以信息类型为组内自变量、以运动水平为组

间自变量，以落点预判的准确率、反应时及 N1、P2、P3 波幅、潜伏期为因变量，从多感觉信息整合角度，探讨视听信息整合对羽毛球运动预判的影响及视听信息的整合加工过程。

行为结果发现，视听信息一致条件比视觉信息条件落点预判准确率更高，视听信息不一致条件比视觉信息条件落点预判准确率更低、反应时更长。脑电结果发现，与视听信息不一致条件比，视听信息一致条件下的 P2(200-270 ms)波幅更高，P3(370-470 ms)潜伏期更短。结果表明视听信息整合(一致)促进运动预判，P2 代表的语义整合、客体识别等高阶认知在视听信息整合中发挥关键作用，加快了 P3 代表的预判决策进程。

Abstract：In striking sports such as badminton and team ball sports such as baseball, it is very important to quickly and accurately anticipate the next action or result of the opponent and teammates. High-quality sports anticipation not only comes from the effective acquisition and integration of contextual information and kinematic information (visual information), but also uses auditory information to anticipate the speed and strength of the ball, and its effect is better than that of visual information. Previous studies have separately explored the impact of visual (such as kinematic information) and auditory information (such as the sound of hitting) on sports anticipation, but whether the integration of audio-visual information can promote anticipation and how to promote anticipation is more important than visual information has not been fully discussed. The multi-sensory integration suggests that information integration may occur during the perceptual processing phase involving the primary sensory cortex, or during the cognitive decision-making phase of information processing.

This study uses ERP technology, adopts 3 (information type: consistent audio-visual information, inconsistent audio-visual information, visual information) × 2 (sports level: high, low) mixed experimental design, takes badminton players of different levels as the research object, and takes information type as the independent variable within the group, the sports level as the independent variable between groups, and the accuracy and the reaction time of landing point anticipation, the amplitude and latency of N1, P2, P3 components as dependent variables. From the perspective of multi-sensory information integration, this study explores the impact of audio-visual information integration on sports anticipation in badminton and the process of audio-visual information integration.

The behavioral results found that the accuracy of the landing position anticipation was higher under the condition of consistent audio-visual information than that of the visual information condition, and the accuracy of landing position anticipation was lower and the reaction time was longer under the condition of inconsistent audio-visual information than the visual information condition. The results of EEG showed that compared with the condition of inconsistent audiovisual information, the amplitude of P2 (200-270 ms) was higher and the latency of P3 (370-470 ms) was shorter under the condition of consistent audiovisual information. The results show that audiovisual information integration (consistent) promotes sports anticipation, and higher-order cognition, such as

semantic integration and object recognition represented by P2, plays a key role in the integration of audio-visual information, which accelerates the decision-making process of P3 representatives.

工作记忆“执行”容量对篮球运动员冲突决策的影响

苗秀影[1]　迟立忠[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，通讯作者 chilizh3804@163.com

摘 要　进行篮球传球决策时，运动员通常会事先形成传球给谁的意图，当此时传球情景符合运动员已形成的决策时，决策效果最佳，若此时传球情景不符合已有决策，则会出现适合当下传球情景的适应性决策与已有决策的冲突。如何解决冲突避免出现决策偏差成为本文关注的焦点。基于工作记忆的注意控制理论，工作记忆中的“执行”功能不仅能够排除无关因素的干扰、抑制冲动错误，同时可以解决反应冲突，其执行容量越大，解决反应冲突的能力越强。可见，高执行容量能够在一定程度上提高冲突决策质量。本文基于篮球传球决策的真实特点，通过创设冲突情景与常规情景，通过极端被试法区分出高执行容量 21 名和低执行容量 21 名的篮球运动员，分别比较完成冲突情景和常规情景的决策质量差异考察工作记忆的注意控制理论在运动决策中的应用。冲突情景的设置：在篮球传球视频呈现前会出现标有数字的图片，告知被试这是给你提供的推荐选项，比如，呈现数字“3”代表推荐你传给 3 号队友，但你需要根据实际比赛情景进行最佳选择。为保障冲突设置成功，推荐选项图片和最终传球决策结果不一致占比 33%。结果：(1)对工作记忆容量得分进行工作记忆容量(高、低)的方差分析，结果表明，高工作记忆容量组的得分(54.29±2.39)显著高于低工作记忆容量组(34.43±3.82) ($F(1,40)=408.48$, $p<0.001$, $\eta_p^2=0.91$)。(2)对正确率进行运动情景(常规、冲突) × 工作记忆容量(高、低)的重复测量方差分析，最重要的结果表明，运动情景(常规、冲突) ×工作记忆容量(高、低)的交互作用显著($F(1, 40)=4.59$, $p<0.05$, $\eta_p^2=0.10$)，进一步简单效应分析发现，常规情景下，高工作记忆容量的决策正确率(0.76±0.14)与低工作记忆容量的决策正确率(0.71±0.12)无显著性差异($p=0.230$)；冲突情景下，高工作记忆容量的决策正确率(0.68±0.15)显著高于低工作记忆容量的决策正确率(0.54±0.13, $p<0.01$, $d=1.00$)。结论：工作记忆容量在解决竞争反应时发挥重要作用，能够在一定程度上提高冲突决策的质量，支持了工作记忆的注意控制理论在运动决策中的应用。

The Effect of working memory "execution" capacity on basketball players' conflicting decisions

Miao xiuying Chilizhong
Beijing Sport University, Beijing, 100084

Abstract: When making basketball passing decisions, players typically form an intention to pass the ball to whom in advance, or the coach provides tactical guidance. The best decision-making results occur when the passing scenario at this time is consistent with the player's formed decision; however, when the passing scenario does not conform to the existing decision, a conflict will arise between the adaptive decision suitable for the current passing scenario and the existing decision. This paper focuses on how to resolve conflicts and prevent decision-making bias. According to the attention control hypothesis of working memory, the "executive" function of working memory has the ability to not only block impulsive errors and remove interference from irrelevant components, but also to resolve competing responses, the larger the execution capacity, the stronger the ability to solve the

competitive response. At present, there are few studies on the causal relationship between conflict decision in sport situations and executive capacity in working memory. Based on the real characteristics of basketball passing decision-making, this paper distinguishes basketball players with high execution capacity and low execution capacity by creating conflict situation and regular situation, and compares the difference in decision-making quality between completed conflict scenarios and regular scenarios to investigate the application of attentional control theory of working memory in sports decision. Setting the conflict scenario: Before the basketball pass video is presented, a picture marked with a number will appear, telling the participant that this is the recommended option provided to you, for example, presenting the number "3" means recommending you to pass to teammate No. 3, but you need to make the best choice according to the actual game scenario. In order to ensure the success of the conflict setting, the recommendation option picture and the final pass decision result are 33% inconsistent. Results: (1) ANOVA analysis of working memory capacity (high and low) was performed on the working memory capacity score, and the results showed that the score of the high working memory capacity group (54.29±2.39) was significantly higher than that of the low working memory capacity group (34.43±3.82) ($F(1,40)=408.48$, $p. <0.001$, $\eta_p^2=0.91$). (2) Repeated ANOVA of sport situation (regular, conflict) × working memory capacity (high, low) for the correct rate showed that the interaction between sport situation (regular, conflict) × working memory capacity (high, low) was significant ($F(1, 40)=4.59$, $p<0.05$, $\eta_p^2=0.10$), further simple effect analysis showed that there was no significant difference between the decision accuracy rate (0.76±0.14) of high working memory capacity and the decision correction rate (0.71±0.12) of low working memory capacity ($p=0.230$) under the regular situation. Under the conflict situation, the decision accuracy rate of high working memory capacity (0.68±0.15) was significantly higher than that of low working memory capacity (0.54±0.13, $p<0.01$, $d=1.00$). Conclusion: working memory capacity plays an important role in solving competitive responses, which can improve the quality of conflict decision-making to a certain extent, and support the application of attentional control theory of working memory in sport decision.

无用之用，方为大用:仪式化行为提升竞赛压力下的自我控制

员东婷[1,2]　张力为[2]（通讯作者）　仇悦[2]　Robert Schinke[2,3]　刘娇[2]

1 西南财经大学体育学院，成都，611130

2 北京体育大学心理学院，北京，100084, E-mail: liweizhang@hotmail.com

3 Laurentian University, Canada

摘 要　背景：运动员竞赛压力下的竞技表现常成为运动心理学关注的重要课题，既有超常发挥的“Clutch”现象，也有失常失准的“Choking”现象，无论何者都与自我控制有密切关联(e.g., 王进 等, 2018; 张力为, 2013; Beilock et al., 2002)。针对仪式化行为与自我控制关系的研究中，出现了正性影响(e.g., Koole et al., 2010; Tian et al., 2018; Yun et al., 2023)、负性影响(e.g., Hobson et al., 2017; Vohs et al., 2013)及无影响(Hobson et al., 2016)等相矛盾的结果。根据控制论(Rappaport, 1971)，导致以往研究结果不一致的原因是：仪式化行为是一种针对个人和群体行为的控制论系统，如同恒温器的反馈系统(Carver et al., 1982; Friston, 2002)。当不稳定的社会心理状态首先被监测到，然后与理想中的目标状态进行比较，如果发现存在差异，仪式化行为才会被触发，通过不断地监控和校正心理和行为从而缩小与目标间的差异。目的：本文从压力诱发的赤字角度出发，来深入探讨仪式化行为对运动员压力下自我控制的影响及其心理机制，以弥补该方向研究的缺陷。方法：随机选取 146 名大学生运动员，采用 3（行为类型:仪式化行为组 vs.随机行为组 vs.控制组）*2（压力类型：

无压力 vs.有压力）的组间实验设计，因变量为 VR 下信号射击任务的平均环数及错误率。结果：仪式化行为可以提升平均环数[$F(1, 140) = 5.13$, $p = .007$, $\eta_p^2 = 0.068$]并降低错误率[$F(2, 140) = 11.29$, $p < .001$, $\eta_p^2 = 0.139$]，且竞赛压力下仪式化行为的提升效益更大[$F(2, 140) = 3.18$, $p = .045$, $\eta_p^2 = 0.043$]，自上而下机制的自我效能感和自主动机在仪式化行为提升自我控制中起中介作用。结论：仪式化行为可提升运动员在竞赛压力下的自我控制，自上而下的心理属性可作为其提升自我控制的关键成分。未来可基于具身认知设计专门化的仪式化行为，以帮助不同项群的运动员。

The Usefulness of the Useless: How Ritualized Behavior Improves Self-control Under Competition Pressure

Dongting Yun[1,2] Liwei Zhang[2] Yue Qiu[2] Robert Schinke[2,3] Jiao Liu[2]
Southwestern University of Finance and Economics, China
Beijing Sport University, China
Laurentian University, Canada

Abstract：Athletic performance under competition pressure is often an important subject of sports psychology. There is both Clutch and Choking phenomenon, which is closely related to self-control (e.g., Wang et al., 2018; Zhang, 2013; Beilock et al., 2002). Studies on the relationship between ritualized behavior and self-control have shown positive effect (e.g., Koole et al., 2010; Tian et al., 2018), negative effect (e.g., Hobson, Bonk, et al., 2017; Hobson & Inzlicht, 2016; Vohs et al., 2013) or no effect (Hobson et al., 2016). According to the cybernetics (see Friston, 2002), the consequence has been, leading to inconsistent evidence of about the influence of ritualized behavior on self-control. Ritualized behavior is a cybernetic system for individual and group behavior, analogous to the feedback system of a thermostat (Friston, 2002). Unstable psychosocial states are first monitored and then compared to the desired goal state. Ritualized behavior is triggered if discrepancy and deficit are found, and the discrepancy with the goal is reduced by continuously monitoring and correcting psychology and behavior (Rappaport, 1971). A deficit context of competition anxiety was constructed in the present study to investigate in depth the enhancement of self-control by ritualized behavior and the corresponding psychological mechanisms from the perspective of competition pressure. The aim of this study was to explore the effect of athletes' ritualized behavior on self-control under competition pressure. One hundred and forty-six college athletes were recruited. This study used a two-factor between design 2 (competition pressure: low vs. high) × 3 (behavior type: ritualized behavior vs. random behavior vs. control group). Based on the Shooter-type Go/No-go task, the dependent variable was the average number of loops and the error rates of 10-meter air pistol task in virtual reality. We found that ritualized behavior had a moderate impact on the average number of loops [$F(1, 140) = 5.13$, $p = .007$, $\eta_p^2 = 0.068$] and error rates [$F(2, 140) = 11.29$, $p < .001$, $\eta_p^2 = 0.139$], and it was more beneficial for error rate under competition pressure [$F(2, 140) = 3.18$, $p = .045$, $\eta_p^2 = 0.043$], while the symbolic meaning of ritualized behavior promotes self-control by improving self-efficacy and autonomous motivation via a top-down processing system. The psychological feature of ritualized behavior may serve as an important explanatory mechanism for its enhancing effect on self-control under competition pressure. This study supports and integrates the Precaution Theory and Self-determination Theory. In the future, researchers can design unique ritualized behaviors based on embodied cognition to help athletes in different sports groups.

信息量对不同水平排球运动员发球落点预判的影响

徐杨[1] 王文增[2]（通讯作者）
沈阳体育学院研究生部，沈阳，110102
沈阳体育学院运动人体科学学院，沈阳，110102，wangwz993@163.com

摘 要 目的：采用眼动记录技术与事件相关电位技术相结合的手段，通过比较信息量对不同水平排球运动员发球落点预判的行为指标、眼动指标及其脑神经活动水平的差异，探究高水平排球运动员预判的优势特征及其可能的神经机制，为今后专项知觉训练的参数设置提供理论依据。

方法：本文采用“专家—新手”范式，选取体育学院 12 名具有国家二级运动员水平及以上证书的排球运动员为专家组；12 名排球专修班且无运动等级的学生为新手组。采用 2（运动水平）×3（信息量）混合实验设计。运动水平为组间变量，包括专家组和新手组；信息量为组内变量，分为三个水平：T1 为击球前 120ms；T2 为击球前 80ms；T3 为击球前 40ms。运用时间阻断技术截取近几年世界顶级排球比赛中技术分析这一视角的发球视频，要求被试对发球落点做出即快又准的判断，同步采集其行为指标（反应时、准确率）、眼动指标（注视时间、注视次数、眼跳距离）和脑电指标（ERPs 的峰潜伏期、峰波幅）。

结果：（1）行为结果显示，反应时与准确率的组别主效应显著（P＜0.01；P＜0.05），信息量主效应显著（P＜0.05；P＜0.05），表现为专家组的反应时短且准确率高于新手组。

（2）眼动结果显示，注视时间、注视次数、眼跳距离的组别主效应显著（P＜0.05；P＜0.01；P＜0.05），注视时间、注视次数的信息量主效应显著（P＜0.05；P＜0.05），表现为专家组注视时间长、注视次数少、眼跳距离小于新手组。

（3））脑电结果显示，N1、P2、P300 峰波幅的组别主效应显著（*P*＜0.05；*P*＜0.05；*P*＜0.05），信息量主效应显著（*P*＜0.05；*P*＜0.05；*P*＜0.05），表现为专家组诱发出的 N1、P3 峰波幅低于新手组，P2 峰波幅高于新手组。P300 峰潜伏期的组别与信息量主效应均显著（P＜0.05；P＜0.05），专家组 P300 潜伏期短于新手组。

结论：（1）信息量与运动水平对预判发球落点有显著影响。随着信息量的不断增加，专家组显现出既快又准的行为优势。

（2）不同水平的排球运动员运用不同的视觉搜索策略。专家采用集中、简洁、高效的视觉搜索模式，具备搜索关键信息速度快，信息加工能力强的优势特征。

（3）高水平运动员有着高效预判行为的神经机制。专家在预判前期高度集中注意力，搜索关键信息，心理资源消耗较多，并与大脑中记忆系统迅速进行应答，预判后期出现资源“节省化”现象。

Influence of information content on the prediction of serving point of volleyball players at different levels

Yang Xu[1] Wenzeng Wang[2]
1.Graduate Department, Shenyang Institute of Physical Education, Shenyang 110102, China
2.School of Exercise and Human Science, Shenyang Institute of Physical Education, Shenyang 110102, China，wangwz993@163.com

***Abstract*:** Objective :Combining eye movement recording technology with event related potential technology, this paper compares the difference of the information content in predicting the serve point of volleyball players at different levels of behavior index, eye movement index and cranial nerve activity level, explores the advantages and possible neural mechanism of high-level volleyball players' prediction, and provides theoretical basis for the

parameter setting of special perceptual training in the future.
Methods: This paper adopted the "expert-novice" paradigm, and selected 12 volleyball players with national second-level athletes and above certificate from physical Education Institute as the expert group; 12 volleyball students with no sports level are beginners. A mixed experimental design of 2 (exercise level) ×3 (information content) was adopted. Exercise level was an intergroup variable, including expert group and novice group. The amount of information was an intra-group variable and was divided into three levels: T1 was 120ms before the shot; T2 is 80ms before hitting the ball; T3 is 40ms before the shot. The time blocking technique was used to intercept the serving video from the perspective of technical analysis in the world's top volleyball matches in recent years. The subjects were asked to make quick and accurate judgments on the serving point, and the behavioral indicators (reaction time and accuracy rate), eye movement indicators (fixation time, fixation number, sapping distance) and EEG indicators (peak latency and peak amplitude of ERPs) were collected simultaneously.
Results: (1) Behavioral results showed that the group main effect of response and accuracy was significant ($P < 0.01$; $P < 0.05$), the main effect of information volume was significant ($P < 0.05$; $P < 0.05$) showed that the response time of the expert group was shorter and the accuracy was higher than that of the novice group.
(2) Eye movement results showed that the main effects of fixation time, fixation number and saccadic distance were significant ($P < 0.05$; $P < 0.01$; $P < 0.05$), the main information effect of fixation time and fixation number was significant ($P < 0.05$; $P < 0.05$) showed that the expert group had longer fixation time, less fixation times and less saccade distance than the novice group.
(3) EEG results showed that the main effect of peak amplitude of N1, P2 and P300 was significant ($P < 0.05$; $P < 0.05$; $P < 0.05$), the main effect of information volume was significant ($P < 0.05$; $P < 0.05$; $P < 0.05$), the peak amplitude of N1 and P3 induced by the expert group was lower than that of the novice group, and the peak amplitude of P2 was higher than that of the novice group. The group of peak latency of P300 and the main effect of information volume were significant ($P < 0.05$; $P < 0.05$), the incubation period of P300 in expert group was shorter than that in novice group.
Conclusion: (1) The amount of information and movement level have significant influence on the prediction of serve landing. With the increasing amount of information, the expert group showed the advantage of fast and accurate behavior.
(2) Volleyball players at different levels use different visual search strategies. Experts adopt a focused, concise and efficient visual search mode, with the advantages of fast search for key information and strong information processing ability.
(3) High-level athletes have efficient neural mechanisms for predicting behavior. Experts are highly focused in the early stage of prediction, search for key information, consume more psychological resources, and respond quickly with the memory system in the brain, and there is a phenomenon of resource "saving" in the late stage of prediction.

认知与运动任务的自我损耗对运动表现的影响

张晨晖[1]　邵韵如[1]　张力为[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，liweizhang@hotmail.com

摘 要　在竞技运动领域，自我控制是运动员发挥最佳运动表现的关键因素(Englert, 2017; 张力为, 2013)。自我控制的力量模型提出(Baumeister et al., 1994)，所有的自我控制行为都基于一种有限的共用能量。在完

成一项自我控制任务后，如果消耗的能量未得到及时补充，个体就会出现自控能力下降的现象，即“自我损耗”效应(Baumeister et al., 2007; 高科 等, 2012)。然而，以往研究通常仅将自我损耗效应归因于认知任务引起的能量消耗，忽略了运动任务也可能会产生自我损耗效应 (Brown et al., 2020; Hunte et al., 2022)。此外，自我控制力量模型并未涉及不同类型任务引发的自我消耗效应是否存在差异，以及这种差异是否会对自我控制能力产生不同的影响(Baumeister et al., 2007; Forestier et al., 2022)。

基于上述观点，本研究采用“双任务”范式探讨认知与运动任务的自我损耗对运动表现的影响是否不同。本研究分为两个实验，分别探讨不同类型的自我损耗对技能性和体能性运动表现的影响。实验均采用 3(自我损耗类型：认知任务的自我损耗，运动任务的自我损耗，控制组)×2(测量顺序：前测，后侧)混合实验设计。认知任务为不一致的 stroop 任务，运动任务为功率自行车任务，控制组观看中性纪录片，时间均为 15 分钟。

实验一选取 48 名大学生运动员(国家二级及以上)，自我损耗的检测任务为技能性运动任务，指标为 12 次飞镖投掷任务的平均成绩。实验二选取 48 名大学生运动员(国家二级及以上)，自我损耗的检测任务为体能性运动任务，指标为测量参与者持续 50%最大握力的坚持时长。实验一、二的结果解释基本一致。操纵检查结果表明，认知组和运动组在完成自我损耗诱发任务后，报告的主观用力感(RPE)和难度明显高于控制组，而认知组和运动组之间没有显著差异。结果表明，认知组和运动组产生了自我损耗效应，但认知组和运动组的运动表现并没有显著差异。

综上所述，自我损耗效应可能与诱发任务类型无关，在控制任务难度和 RPE 相同的情况下，自我损耗效应对运动表现的影响也相同。

The Effect of Cognitive and Physical Self-Control Exertion on Sport Performance

Chenhui Zhang, Liwei Zhang
School of Psychology, Beijing Sport University, Beijing 100084

***Abstract*：** In the field of competitive sports, self-control is a key factor for athletes to achieve their best performance (Englert, 2017; Zhang, 2013). The strength model of self-control proposed by Baumeister et al. (1994) suggests that all self-control behaviors are based on a limited shared resource. After completing a self-control task, if the expended energy is not promptly replenished, individuals may experience a decrease in self-control ability, known as the "ego depletion" effect (Baumeister et al., 2007; Gao et al., 2012). However, previous research has often attributed the ego depletion effect solely to the energy consumption caused by cognitive tasks, neglecting the possibility that physical tasks may also lead to ego depletion (Brown et al., 2020; Hunte et al., 2022). Furthermore, the strength model of self-control has not addressed whether there are differences in ego depletion effects between different types of tasks and whether such differences may have varying impacts on self-control ability (Baumeister et al., 2007; Forestier et al., 2022).

Based on the above perspectives, this study adopted a "dual-task" paradigm to investigate whether the impact of ego depletion from cognitive and physical tasks differs on sports performance. The study consisted of two experiments, exploring the effects of different types of ego depletion on skill-based and endurance-based sports performance. Both experiments used a 3 (task of ego depletion types: cognitive task, physical task, control group) × 2 (measurement order: pre-test, post-test) mixed experimental design. The cognitive task involved an incongruent Stroop task, the physical task involved a power-based stationary cycling task, and the control group watched a neutral documentary, with each task lasting for 15 minutes.

In Experiment 1, 48 university-level athletes (national second-level and above) participated, and the detection task for ego depletion was a skill-based sports task, with the average score of 12 darts throwing tasks as the indicator. In Experiment 2, 48 university-level athletes (national second-level and above) were selected, and the detection task for ego depletion was an endurance-based sports task, with the duration of maintaining 50% of maximum grip strength as the indicator. The results of Experiments 1 and 2 were essentially consistent.

Manipulation check results indicated that both the cognitive group and the physical group reported significantly higher levels of subjective effort (RPE) and difficulty after completing the ego depletion-inducing tasks compared to the control group, with no significant difference between the cognitive group and the physical group. The results suggest that both the cognitive group and the physical group experienced ego depletion effects, but there was no significant difference in sports performance between them.

In conclusion, the ego depletion effect may not be dependent on the type of inducing task, and under conditions where task difficulty and RPE are the same, the impact of ego depletion on sports performance is also similar for cognitive and physical tasks.

Changes in Leisure Physical Exercise and Smartphone Bending Behavior among College Students: Based on Latent Growth and Cross-Lagged Models

Jingtao Wu,Jinglan Ji, Xiaodan Ch,Jun Hu

***Abstract*: Objective:** This study aims to comprehensively examine the dynamic development relationship, trajectory characteristics, and interaction mechanisms between leisure physical exercise and smartphone bending behavior among college students through cross-lagged regression analysis and parallel latent growth models.**Methods:** A simple sampling method was used. The main tools used were a physical exercise grading scale and a questionnaire on smartphone bending behavior. A total of 585 college students were tracked and surveyed three times over a period of one year.**Results:** (1) Leisure physical exercise levels were significantly negatively correlated with college students' smartphone bending behavior at all three stages, with the correlation coefficients for corresponding stages being relatively stable (r values between -0.24 and -0.28) and showing a decrease at other stages (r values between -0.12 and -0.17); (2) The cross-lagged effect of leisure physical exercise and smartphone bending behavior among college students showed good overall model fit indices: x2/df=2.07, p=0.04, CFI=0.93, TLI=0.95, RMSEA=0.02, SRMR=0.05; (3) Observing the parallel development trend of latent variables of leisure physical exercise and smartphone bending behavior among college students, with gender controlled as a covariate, the overall model fit indices met the standard: x2/df=1.72, p=0.02, CFI=0.93, TLI=0.91, RMSEA=0.04, SRMR=0.03. The higher the initial level of leisure physical exercise, the less smartphone bending behavior was observed. The initial level of leisure physical exercise significantly negatively predicted the growth rate of leisure physical exercise (β=-0.10, P＜0.001), indicating a compensatory effect: individuals with a high initial level of physical exercise had a slower growth rate later. The initial level of smartphone bending behavior significantly positively affected the growth rate of smartphone bending behavior (β=-0.18, P＜0.001). Individuals with more severe smartphone bending behavior had a faster development speed later, playing a protective role.
Conclusion: Higher levels of smartphone bending behavior might inhibit the subsequent increase in physical exercise levels, providing new empirical references for the study of smartphone bending behavior among college students.

Keywords: Leisure Physical Exercise; Smartphone Bending Behavior; Cross-Lagged Model; Latent Growth Model

运动干预对携带、未携带 APOE ε4 基因大学生有氧运动能力和执行功能的影响

朱丽娜[1]　殷恒婵[2]　陈爱国[1]（通讯作者）
1 扬州大学体育学院，江苏扬州，225127，通讯作者 agchen@yzu.edu.cn
2 北京师范大学体育与运动学院，北京，100875

摘 要　探究9周运动干预对携带、未携带APOEε4大学生有氧运动能力和执行功能各子功能的影响，为采用运动手段降低携带APOEε4基因成年早期人群执行功能受损提供理论基础和实践依据。方法：以84名在校大学生为研究对象，采用2（组别：运动组、对照组）×2（APOEε4基因：携带、未携带）×2（时间：干预

前、干预后）混合实验设计，采用三因素重复测量方差分析比较运动干预前后各组有氧运动能力和执行功能各子功能（反应时、正确率）的变化及差异，结果：（1）在有氧运动能力上，干预前携带APOEε4运动组的有氧运动能力显著低于未携带APOEε4运动组，干预后携带、未携带APOEε4运动组大学生的有氧运动能力均显著提高，且组间无显著差异，表明运动干预能够提升携带、未携带APOEε4大学生有氧运动能力，且携带APOEε4运动组效果更好。（2）在执行功能各子功能上，干预前携带APOEε4运动组的抑制、转换功能反应时显著大于未携带APOEε4运动组，干预后携带、未携带APOEε4运动组大学生抑制、刷新、转换功能反应时显著缩短，且干预后携带APOEε4运动组大学生抑制、转换功能与未携带APOEε4运动组无显著性差异，但携带APOEε4对照组大学生抑制、转换反应时显著增加；运动干预后携带、未携带APOEε4运动组大学生执行功能各子功能正确率均无显著性变化。表明运动干预能够促进携带、未携带APOEε4大学生抑制、刷新、转换功能，且携带APOEε4大学生在抑制、转换功能上干预效果更好，携带APOEε4对照组大学生抑制和转换功能随时间变差。结论：运动干预能够提升携带、未携带APOEε4基因大学生有氧运动能力和执行功能各子功能，且对携带APOEε4大学生有氧运动能力和抑制、转换功能的提升效果更好；运动干预能够降低APOEε4基因对大学生抑制、转换功能的负面影响。

Effects of Exercise Intervention on Aerobic Fitness and Executive Function of College Students With and Without APOE ε4 Gene

Zhu Lina[1]　Yin Hengchan[2]　Chen Aiguo[1]
1 College of Physical Education, Yangzhou University, Yangzhou 225127, China
2 College of P.E. and Sports, Beijing Normal University, Beijing, China

***Abstract*：** Objective: This study is to examine the impact of a 9-week exercise intervention on the aerobic exercise ability and executive function of college students, taking into consideration the presence or absence of the APOE ε 4 gene. The findings of this study aim to contribute to the development of both theoretical and practical strategies for mitigating executive function impairment in young adults with the APOE ε 4 gene through exercise. Methods: A total of 84 college students were selected as participants for this study. The research design employed a mixed experimental approach, utilizing a 2 (group: exercise group, control group) × 2 (APOE ε 4 gene: carriers, non-carriers) × 2 (time: pre-intervention and post-intervention) framework. The study employed a three-factor repeated measurement analysis of variance to compare the variations and disparities in aerobic exercise capacity and executive function sub-functions (specifically, reaction time and accuracy) prior to and following an exercise intervention. Results: (1) The pre-intervention aerobic fitness levels of the group with APOE ε 4 were found to be significantly lower compared to the group without APOE ε 4. However, following the intervention, both groups experienced significant improvements in their aerobic fitness levels. Furthermore, there was no significant difference observed between the two groups post-intervention, suggesting that exercise intervention can effectively enhance the aerobic fitness of college students, regardless of their APOE ε 4 status. (2) Before intervention, the exercise group with APOE ε 4 exhibited a significantly longer reaction time for inhibition and shifting function compared to the exercise group without APOE ε 4. However, after intervention, both the exercise group with and without APOE ε 4 experienced a significant reduction in reaction time for inhibition, updating, and shifting function among college students. Following the intervention, there was no notable disparity observed in the

inhibition and shifting capabilities between college students in the exercise group with APOE ε 4 and those in the exercise group without APOE ε 4. However, the reaction time associated with inhibition and shifting exhibited a significant increase among college students in the control group with APOE ε 4. Furthermore, subsequent to the exercise intervention, the accuracy pertaining to each sub-function of executive function among college students in both the exercise group with and without APOE ε 4 did not undergo any significant alterations. The findings of the study indicate that exercise intervention has the potential to enhance the inhibition, updating, and shifting abilities in both college students with and without APOE ε 4. Moreover, the intervention appears to have a more pronounced positive impact on the inhibition and shifting abilities of college students with APOE ε 4. However, it is worth noting that over time, the inhibition and shifting function of college students with APOE ε 4 tended to deteriorate. Conclusion: The implementation of exercise intervention has been found to enhance the aerobic fitness and executive function among college students, regardless of their possession of the APOE ε 4 gene. Moreover, it has been observed that exercise intervention yields superior outcomes in terms of improving aerobic fitness, inhibition, and shifting function specifically among college students with the APOE ε 4 gene. Additionally, exercise intervention has been shown to mitigate the detrimental effects of the APOE ε 4 gene on the inhibition and shifting function of college students.

3. 杭州师范大学附属医院认知与脑疾病研究中心，浙江 杭州 311121

摘 要 目的 系统评价认知参与型身体活动（cognitively engaging physical activity, CEPA）影响儿童青少年执行功能（executive function, EF）的干预效果，探究 CEPA 干预与 EF 变化之间的量效关系，为后续制定更为有效的干预方案提供参考。

方法 检索 Web of Science、PubMed、Medline、EBSCO 和中国知网等数据库，根据纳入排除标准筛选文献，并对文献进行质量评价与数据提取，对提取的数据经过编码后，采用 Comprehensive Meta-Analysis V3.0 进行 Meta 分析。

结果 共纳入 21 篇文献，653 个样本。元分析发现：单次（*SMD*=0.255，95% CI 0.11～0.40，$p<0.001$）和长期 CEPA（*SMD*=0.67，95% CI 0.34～1.00，$p<0.001$）均比不进行额外身体活动对儿童青少年的 EF 影响积极；单次（*SMD*=0.22，95% CI 0.05～0.40，$p=0.013$）和长期 CEPA（*SMD*=0.44，95% CI 0.32～0.56，$p<0.001$）均比低认知需求身体活动对儿童青少年 EF 影响积极。亚组分析发现：长期 CEPA 每次干预的持续时间在 30～45min 对 EF 的影响效果最佳，超过 45min 后，影响效果逐渐降低；每周干预频率在 3 次及以下时的效果略微优于 3 次以上时；持续 8 周以上的干预效果约是 8 周以下的两倍；体感游戏和自编运动方案对儿童青少年的 EF 均具有积极影响，且后者的效果略优于前者；长期 CEPA 对健康和非健康儿童青少年的 EF 均有积极影响，且对健康儿童青少年的干预效果更优。

结论 认知参与型身体活动比低认知需求的身体活动对儿童青少年执行功能的积极影响更大，其中含有的认知需求对儿童青少年执行功能具有额外增益。每次持续时间在 30min～45min、每周 3 次及以下、共计 8 周以上的中高强度自编认知参与型身体活动方案更有可能取得最大执行功能收益。

Meta-analysis of the Effect of Cognitively Engaging Physical Activity on Executive Function in Children and Adolescents

Jianing Wen[1], Qiuyan Jin[1], Qi Zhang[2], Jie Li[3], Qi Si[1](corresponding author)

1. Dept. of Sport and Exercise Science, Zhejiang University, Hangzhou 310028, China;
2. School of Psychology, Beijing Sport University, Beijing 10084, China
3. Center for Cognition and Brain Disorders, the Affiliated Hospital, Hangzhou Normal University, Hangzhou 311121, China;

Abstract:Objective The purpose of this study was to systematically evaluate the intervention effect of cognitively engaging physical activity (CEPA) on children and adolescents' executive function (EF), and explore the dose-effect relationship between intervention and changes in children and adolescents' executive function, to provide a reference for formulating intervention program in future research.

Methods Searched Web of Science, PubMed, Medline, and CNKI database data. The literature was screened according to the inclusion and exclusion criteria, and quality evaluation and data extraction were conducted. After coding the extracted data, Comprehensive Meta-Analysis V3.0 was adopted for Meta-analysis.

Results A total of 21 pieces of literature with 653 sample sizes were included. Compared with no additional exercise, single cognitively engaging physical activity (*SMD*=0.255, 95%CI 0.11-0.40, p=0.001) and longitudinal cognitively engaging physical activity (*SMD*=0.67, 95%CI 0.34-1.00, p<0.001) had positive effects on the executive function of children and adolescents. Compared to physical activity with low cognitive need, single cognitively engaging physical activity (*SMD*=0.22, 95%CI 0.05-0.40, p=0.013) and longitudinal cognitively engaging physical activity (*SMD*=0.44, 95%CI 0.32-0.56, p<0.001) had a greater positive effect on executive function in children and adolescents. Subgroup analysis showed that the effect of CEPA on EF was the best when the duration of each intervention was 30-45 min, and the effect gradually decreased after 45 min. When the frequency of intervention was less than 3 times per week, the effect was slightly better than that when the frequency was more than 3 times per week. Interventions lasting more than 8 weeks were about twice as effective as those lasting less than 8 weeks. Both exergaming and self-designed CEPA programs had positive effects on EF of children and adolescents, and the latter was slightly better than the former. Long-term CEPA had positive effects on EF in both healthy and unhealthy children and adolescents, and the intervention effect on healthy children and adolescents was better.

Conclusions Cognitively engaging physical activity has a greater positive impact on children and adolescents' executive function than physical activity with low cognitive needs. The cognitive need implied in the process of cognitive participation physical activity has an additional gain on children and adolescents' executive function. The moderate-to-vigorous intensity cognitively engaging physical activity intervention with a duration of 30 min to 45 min, three times a week or less, for a total of more than 8 weeks is more likely to achieve the maximum executive function benefits.

不同程度认知参与的身体活动对学龄儿童抑制控制干预效果的元分析

张晨[1]　郑玮琦[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，通讯作者 weiqi71@126.com

摘 要　对于青少年儿童，抑制控制作为过滤无关信息、抑制自身习惯性反应的能力，在学业表现等方面具有重要意义。而小学阶段是身体、认知和运动发育快速发展的关键时期，身体活动因其对认知参与、运动技能学习和复杂动作协调中固有认知的需要，有利于儿童认知功能的发展。以往使用了不同运动方式的研究初步表明身体活动对抑制控制具有促进作用，但不同认知参与程度的运动干预效果差异尚不明确，超重儿童身体活动干预的量效关系也还有待进一步检验。因此，本项元分析研究从认知参与程度的不同这一角度系统评价身体活动对学龄儿童抑制控制的干预效果，对中国知网、万方数据、PubMed、Web of Science、ScienceDirect 等数据库中的相关文献进行检索，检索期限为 2013 年至今，纳入标准为针对学龄儿童高认知参与或低认知参与身体活动的随机对照干预试验相关文献。共纳入 10 篇文献，包含 2635 名参与者，17 个效应量，涉及 1 个结局指标。分别采用 Rev Man 5.4 和 CMA V3 软件进行文献质量评价和元分析，并进行亚组分析进一步探究认知参与程度和体重指数对抑制控制的影响。结果显示，身体活动对学龄儿童的抑制控制具有显著促进作用(SMD = -0.74, 95%CI [-1.17, -0.30])。认知参与程度存在调节作用，高认知参与身体活动对学龄儿童抑制控制存在显著改善和提高 (SMD = -1.04, 95% CI [-1.78, -0.30])，而低认知参与身体活动对抑制控制作用不显著(SMD = -0.42, 95% CI [-0.85, 0.02]), 体重和年龄对于身体活动对抑制控制的回归系数不显著(b = 0.11, 95% CI [-0.04, 0.27], p = 0.16；b = 0.45，95%CI [-0.29，1.18]，p = 0.23)。经偏倚性分析，存在发表偏倚的可能性较小。本研究首次使用元分析的方法，比较了不同程度认知参与的身体活动在改善学龄儿童抑制控制上的效应，并进一步得出该效应在正常体重和超重肥胖儿童之间一致，且在不同年龄之间一致，启示学校体育教学及相关工作者可以在体育课中设计如定向运动、篮球等高认知参与程度的身体活动。未来研究应探讨不同认知参与程度身体活动干预对抑制控制的更长期影响，找出最有效的身体活动处方，从而提高学龄儿童的抑制控制能力。

Effects of different cognitive engaging physical activities on inhibitory control of school-age children: A Meta-analysis

Zhang Chen[1]　Zheng Weiqi[1]

1 School of Psychology, Beijing Sport University, Beijing100084, China

***Abstract*：** For adolescents and children, inhibitory control, as the ability to filter irrelevant information and inhibit their habitual reactions, is of great importance in academic performance. Primary school is a critical period for the rapid development of physical, cognitive and motor skills. Physical activity is conducive to the development of children's cognitive functions because of its inherent cognitive needs in cognitive engagement, motor skill learning and complex motor coordination. Previous studies using different exercise modes have preliminarily shown that physical activity can promote inhibitory control, but the difference in the effect of exercise intervention with different levels of cognitive engagement is not clear, and the dose-effect relationship of

physical activity intervention for overweight children needs to be further tested. Therefore, this meta-analysis systematically evaluated the intervention effect of physical activity on inhibitory control of school-age children from the perspective of different levels of cognitive engagement and searched relevant literature in CNKI, Wanfang Data, PubMed, Web of Science, ScienceDirect and other databases. The search period was from 2013 to the present, and the inclusion criteria were randomized controlled intervention trials with high cognitive engagement or low cognitive engagement in physical activity for school-age children. A total of 10 articles were included, including 2635 participants, 17 effect sizes, and 1 outcome measure. The Rev Man 5.4 and CMA V3 were used for literature quality evaluation and meta-analysis, and subgroup analysis was conducted to further explore the effects of cognitive engagement and body mass index on inhibitory control. The results showed that physical activity significantly promoted inhibitory control in school-age children (SMD = -0.74, 95%CI [-1.17, -0.30]). Cognitive engagement has a moderating effect and high cognitive engagement in physical activity significantly improves inhibitory control in school-age children (SMD = -1.04, 95% CI [-1.78, -0.30]). However, low cognitive engagement in physical activity had no significant effect on inhibitory control (SMD = -0.42, 95%CI [-0.85, 0.02]), and weight and age had no significant regression coefficients for physical activity on inhibitory control (b = 0.11, 95%CI [-0.04, 0.27]. p = 0.16; b = 0.45, 95%CI [-0.29, 1.18], p = 0.23). According to the bias analysis, the possibility of publication bias is small. This study is the first to use a meta-analysis to compare the effects of different levels of cognitive engagement in physical activity on improving inhibitory control in school-age children, and further show that the effect is consistent between normal weight and overweight and obese children, and across ages. It is suggested that physical education teachers and related workers in schools can design physical activities with high cognitive engagement such as orienteering and basketball in physical education. Future studies should explore the longer-term effects of physical activity interventions at different levels of cognitive engagement on inhibitory control and identify the most effective physical activity prescriptions to improve inhibitory control in school-age children.

急性应激损害乒乓球运动员主动性控制：来自 ERP 的证据

徐琳[1]　邵永聪[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，budeshao@bsu.edu.cn

摘 要　在乒乓球运动中，由于隔网对抗、技术打法多变等运动特点，要求运动员必须在有限时间内根据不同的线索信息对来球的动作、方向、旋转、落点等信息进行快速准确的观察和预判，这都依赖于良好的认知控制能力。而对运动员来说，赛前的巨大压力等情况都会引发比赛过程中不同程度的应激，对运动员的认知控制和运动表现产生不良影响。本研究以双重认知控制理论为依据，探讨了急性应激对乒乓球运动员主动性控制和反应性控制的影响，以期帮助运动员更好地认识急性应激对认知控制的影响。研究使用马斯特里赫特急性应激任务诱发乒乓球运动员急性应激，以 AX-CPT 范式为测验任务，共有 25 名男性乒乓球运动员(年龄：20.240±1.943 岁)参加实验。实验为二因素被试内设计，自变量为心理状态(控制/急性应激)和刺激类型(AX/AY/BX/BY)；因变量为完成 AX-CPT 任务的反应时、正确率，以及脑电 ERP 成分波幅，选取 P3b 和 CNV 成分为主动性控制指标，N2 和 P3a 成分为反应性控制指标。研究结果发现，乒乓球运动员在急性应激状态下和控制条件下的反应速度相似，但在急性应激状态下 AY 试次的正确率显著高于控制条件；急性应激状态下比控制条件诱发出了更小的 CNV 波幅和更大的 N2 波幅，但 P3b 和 P3a 成分在两个条件间没有发现显著差异。研究结果表明，急性应激对乒乓球运动员认知控制的两种方式产生了不同影响，急性应激状态下乒乓球运动员更倾向于采用反应性控制而非主动性控制。急性应激对主动性控制的削弱更

多地表现在对反应准备的影响而非前期对刺激的注意和加工，对反应性控制的增强则更多地体现在对冲突信息的检测与监控。

关键词　乒乓球运动员，急性应激，主动性控制，反应性控制，事件相关电位

Acute stress impairs proactive control in table tennis athletes: Evidence from ERPs

Lin Xu[1]　Yongcong Shao[1]

1 School of Psychology, Beijing Sport University, Beijing 100048, China

***Abstract*:** In table tennis, due to the versatility of technical play, athletes are required to make quick and accurate observations and prejudgments of the incoming ball's movement, direction, rotation, and landing point based on different cue information within a limited time, which relies on excellent cognitive control. As for athletes, situations such as intense pre-competition stress can trigger varying degrees of stress during competition, adversely affecting cognitive control and athletic performance. Based on the Dual Cognitive Control Theory, this study investigated the effects of acute stress on proactive and reactive control in table tennis athletes, with the aim of helping athletes better recognize the influence of acute stress on cognitive control. The study used Maastricht Acute Stress Test to induce acute stress in table tennis athletes, with the AX-CPT paradigm as a cognitive testing task, and a total of 25 male table tennis players (age: 20.240 ± 1.943 years) participated in the experiment. The study design was a two-factor within-subjects design, with the independent variables being mental state (control/acute stress) and stimulus type (AX/AY/BX/BY); the dependent variables being reaction time and accuracy in completing the AX-CPT task, and the amplitude of the four ERP components P3b, CNV, N2, and P3a. The behavioral results showed that table tennis players had similar response times in the acute stress condition and the control condition, but the accuracy of AY trials was significantly higher in the acute stress condition than in the control condition. The ERP results showed that the CNV component of the proactive control indicator induced smaller CNV amplitudes in the acute stress condition and the N2 component of the reactive control indicator induced larger N2 amplitudes in the acute stress condition than in the control condition in table tennis players. In contrast, no significant differences were detected between the P3b and P3a components under acute stress and control conditions. The results of the study show that acute stress had different effects on the two modes of cognitive control in table tennis athletes, with table tennis players preferring reactive control to proactive control under acute stress conditions. The weakening of proactive control by acute stress was more evident in the effect on response preparation rather than attentiveness and processing of stimuli, and the enhancement of reactive control was more evident in the detection and monitoring of conflict information.

***Keywords*:** Table tennis athletes, acute stress, proactive control, reactive control, ERP

体感游戏对健康儿童青少年执行功能的影响：一项三水平元分析

张美玥[1]　郭璐[2]（通讯作者）

1 北京体育大学心理学院，北京，100084

2 北京体育大学心理学院，北京，100084，guol@bsu.edu.cn

摘 要　目的：体感游戏是一种将身体活动和视频游戏结合起来的运动形式。与常规身体活动相比，体感游戏结合了更多来自环境的认知刺激。执行功能是一种高级认知过程，包含抑制控制，工作记忆和认知灵

活性三种核心成分。近年来，体感游戏对执行功能的影响受到越来越多研究者的关注。本研究旨在采用元分析技术考察体感游戏对健康儿童青少年执行功能的影响以及潜在的调节变量。方法：在 Web of Science, PubMed, EBSCO 和中国知网四个数据库中检索于 2008 年 1 月至 2023 年 6 月发表的文献。由于多数研究中包含多个效应量，为了处理来自同一研究的效应量之间的依赖性问题，最大化保留信息的完整性，本研究采用三水平元分析的方法检验主效应和调节效应。结果：通过系统检索和筛选文献，共纳入 9 篇研究，被试量为 537 人，包含 52 个效应量。主效应检验的结果表明，与对照组相比，体感游戏显著提高了健康儿童青少年的执行功能，具有小效应量(Hedge's g = 0.454, 95%CI = [0.204, 0.703])。亚组分析结果表明，(1) 体感游戏的认知需求程度有显著的调节作用(F(1, 50) = 15.526, p < .001)，认知需求高的体感游戏对健康儿童青少年执行功能有显著影响且达到中等效应量(Hedge's g = 0.548, 95%CI = [0.282, 0.815])，认知需求低的体感游戏对健康儿童青少年执行功能的影响不显著；(2) 对照组的类型有显著的调节作用(F(3, 48) = 3.908, p = .014)，体感游戏对健康儿童青少年执行功能的影响显著好于常规身体活动(小效应量：Hedge's g = 0.380, 95%CI = [0.109, 0.652])和日常活动(中等效应量：Hedge's g = 0.714, 95%CI = [0.395, 1.032])，但与认知训练和静坐相比未见显著差异；(3) 执行功能子成分、年龄阶段、体感游戏干预时间(一次性 vs 长期)、一次性体感游戏时长、长期体感游戏干预的频率、干预时长、持续时间的调节作用均不显著。结论：体感游戏能够有效改善健康儿童青少年的执行功能，未来研究要进一步检验体感游戏改善执行功能的机制以及其他变量的调节作用。

Effects of Exergame on Executive Function in Healthy Children and Adolescents: A Three-Level Meta-Analysis

Zhang Meiyue, Guo Lu
School of Psychology, Beijing Sport University, Beijing, 100084

Abstract: Objectives: Exergame is one type of physical activity which combines physical activity with video games. Compared with traditional physical activity, people receive more cognitive stimuli from environments while experiencing exergame. Executive function is a high-level cognitive process, which is composed of inhibitory control, working memory and cognitive flexibility as three core components. In recent years, the effects of exergame on executive function are attracting more and more attention. This study aims to examine the effects of exergame on executive function in healthy children and adolescents and some potential moderators with meta-analysis. Methods: Literature published between January 2008 and June 2023 was searched in Web of Science, PubMed, EBSCO and CNKI. Since most studies contain several effect sizes, in order to deal with the dependency among effect sizes from the same study and to maximize the integrity of information, a three-level meta-analysis was used in this study to examine the main effect and the moderating effect. Results: After systematically searching and screening, 9 studies and 537 participants were included, containing 52 effect sizes. The results of main effect showed that compared with control groups, exergame significantly improved executive function in healthy children and adolescents with a small effect size (Hedge's g = 0.454, 95%CI = [0.204, 0.703]). Subgroup analysis showed that (1) the moderating effect of the cognitive demand of exergame was significant (F(1, 50) = 15.526, p < .001), exergame with high cognitive demand had significant effect on executive function in healthy children and adolescents with a medium effect size (Hedge's g = 0.548, 95%CI = [0.282, 0.815]), while exergame with low cognitive demand did not show significant effect; (2) the moderating effect of the type of control group was significant (F(3, 48) = 3.908, p = .014), the effect of exergame was significantly better than that of physical activity with a small effect size (Hedge's g = 0.380, 95%CI = [0.109, 0.652]) and regular activity with

a medium effect size (Hedge's g = 0.714, 95%CI = [0.395, 1.032]), but no significant difference was found when comparing exergame with cognitive training or sitting. (3) core components of executive function, stage of age, type of exergame (acute vs chronic), time of acute exergame as well as frequency, time per session and duration of chronic exergame intervention did not show significant moderating effect. Conclusions: Exergame can effectively improve executive function in healthy children and adolescents. Future studies are supposed to further investigate the mechanisms by which exergame improves executive function and examine more moderators.
Keywords：executive function, exergame, children, adolescents, three-level meta-analysis

轴向旋转经验影响运动员空间能力的脑认知特征——来自行为和fNIRS的证据

冯甜[1]（通讯作者）刘锦钊[2]　张富春[2]　梁曼琪[2]　刘李艳[2]
1 郑州大学体育学院，郑州，450044，maefeng@vip.126.com
2 郑州大学体育学院（校本部），郑州，450001

摘 要　空间能力是指生成、保留、提取和转换视觉图像的能力。心理旋转作为空间能力的重要组成部分，对运动员专项水平提升具有不可忽视的作用。经研究发现轴向旋转经验影响运动员的心理旋转能力，根据前人研究证据，对于不同轴向的练习量的差异或能引起运动员专家优势特征的轴向特征。研究目的：用空间能力测试和 fNIRS 技术对不同轴向旋转经验运动员的进行测试，并分析其行为数据和 fNIRS 数据以期解释不同轴向旋转经验运动员空间能力的认知机制。方法：本研究选择 15 名冰雪运动员年龄为（年龄：14.60±1.02，训练时间：2.13±0.34 年）、15 名径赛运动员（年龄：14.60±1.78 岁，训练时间：1.27±0.44 年）以及 16 名球类运动员（年龄：13.31±0.79 年，训练时间：2.23±1.43 年）进行心理旋转测试，采用 3(运动类型：封闭多轴、封闭单轴、开放单轴)×2(旋转角度：45°、90°)×3（旋转轴向：横轴、竖轴、纵轴）的三因素混合实验设计。对其行为数据和 fNIRS 数据进行重复测量方差分析。行为数据结果发现冰雪运动员心理旋转能力在横轴大角度和竖轴大角度的任务中的反应时和横轴大角度的准确率优于径赛运动员。在 fNIRS 结果中发现冰雪运动员相对于径赛运动员在左侧背外侧额上回、两侧中央前回、两侧中央后回、两侧顶上回、左侧角回、左侧楔前叶和两侧枕上回产生较高脑区激活。结论：通过对不同项目类型、不同旋转角度和不同旋转轴向的青少年运动员进行研究，来对青少年运动员的认知特征进行探索，以期加大对各个运动的了解，从而使运动员的成绩有所提高。研究结果为我们在探究身体旋转经验影响运动者空间认知的脑机制研究提供了实证支撑，有利于今后对不同运动项目的进一步研究。

Axial rotation experience influences brain cognitive characteristics of spatial ability in athletes - evidence from behavioural and fNIRS

Tian Feng[1]　Jinzhao Liu[2]　Fuchun Zhang[2]　Manqi Liang[2]　Liyan Liu[2]
1.Physical Education College of Zhengzhou University, Zhengzhou, China, 450044
2.School of Physical Education, Zhengzhou University, Zhengzhou, China, 450001

Abstract：Spatial ability refers to the ability to generate, retain, extract and transform visual images. Mental rotation, as an important component of spatial ability, has a significant role to play in improving athletes' specialist

performance. It has been found that axial rotation experience affects athletes' mental rotation ability, and based on evidence from previous studies, differences in the amount of practice for different axes may elicit axial characteristics of athletes' expert dominance traits. Aims: To test the spatial ability of athletes with different axial spin experience using the spatial ability test and fNIRS technique, and to analyse their behavioural data and fNIRS data in order to explain the cognitive mechanisms of spatial ability in athletes with different axial spin experience. METHODS: In this study, 15 ice athletes aged (age: 14.60 ± 1.02, training years: 2.13 ± 0.34), 15 track athletes (age: 14.60 ± 1.78 , training years: 1.27 ± 0.44) and 16 ball athletes (age: 13.31 ± 0.79 , training years: 2.23 ± 1.43) underwent a mental rotation test using a three-factor mixed experimental design of 3 (type of movement: closed multi-axis, closed single-axial, open single-axial) × 2 (rotation angle: 45°, 90°) × 3 (rotation axis direction: horizontal, vertical, longitudinal). Repeated measures ANOVAs were conducted on their behavioural data and fNIRS data. The behavioural data results found that the ice athletes' mental rotation ability was better than that of the track athletes in terms of reaction time and accuracy in the task with large angles on the horizontal axis and large angles on the vertical axis. In the fNIRS results it was found that snow and ice athletes produced higher brain area activation in the left dorsolateral superior frontal gyrus, both precentral gyri, both postcentral gyri, both superior parietal gyri, left angular gyrus, left precuneus and both superior occipital gyri relative to track athletes. CONCLUSION: The study of young athletes with different sport types, different rotation angles and different rotation axes was conducted to explore the cognitive characteristics of young athletes with the aim of increasing the understanding of each sport and thus the performance of the athletes. The findings provide empirical support for our research in exploring the brain mechanisms by which body rotation experience affects spatial cognition in athletes, and facilitate further research in different sports in the future.

高强度间歇运动对大学生负性情绪信息有意遗忘的影响：来自 fNIRS 的证据

孙潇　金雨薇 刘荣 宋耀武（通讯作者）

河北大学教育学院，保定，071002，hbusyw@163.com

摘 要　有意遗忘是指由主试的“忘记”指令引起被试记忆内容受损的现象。负性情绪信息的有意遗忘有助于个体减少负性情绪，保持心理健康。来自 fNIRS 研究表明，高强度间歇运动通过调节前额叶皮层氧合血红蛋白浓度（HbO）对抑制控制和积极情绪调节有促进作用。为了解高强度间歇运动对负性情绪信息有意遗忘的影响及其脑机制，本研究招募 52 名大学本科生被试，随机分为运动组和无运动组。运动组在进行有意遗忘学习任务前进行 10 分钟高强度间歇跑步机运动，并通过心率监测和速度控制运动的强度（高强度达到 80-90%最大心率值，速度 9km/h），无运动组则静坐观看中性视频。记忆材料选自汉语情感词系统（CAWS）,包括负性和中性词。有意遗忘范式的学习阶段采用组块设计，以七个同类别词为一组，共 16 组，每组词呈现后进行“记忆”或“忘记”的指令。结果比较不同组别被试自由回忆的正确回忆数量及指令呈现后前额叶皮层 HbO 的变化。结果显示：（1）在正确回忆数量上，指令的主效应显著 $F(1, 50)=43.56$, $p=.000$, $\eta^2=.47$，记忆指令下的正确回忆数量显著高于忘记指令（$p=.000$）；情绪和组别的交互作用显著 $F(1, 50)=4.15$, $p=.047$, $\eta^2=.08$，简单效应分析发现，运动组负性词的正确回忆数量显著低于中性词（$p=.01$），而无运动组对于负性词和中性词的正确回忆数量则没有差异（$p=.85$）。（2）近红外数据以指令呈现前 5s 的 HbO 平均值为基线，比较指令呈现后 5-20s 的 HbO 平均值的变化。采用重复测量方差分析发现，运动组比无运动组在眶额叶皮层有更高水平的激活，忘记指令比记忆指令在左侧腹外侧前额叶、左侧背外侧前额叶和额极区有更强的负激活，负性词比中性词有在右侧腹外侧前额叶有更强的负激活。结果表明，高强度间歇运动通

过激活眶额叶皮层，减少了个体对负性信息的记忆加工；有意遗忘加工过程中的抑制主要来源于左侧腹外侧前额叶、左侧背外侧前额叶和额极区的负激活；情绪词的编码加工主要与右侧腹外侧前额叶有关。综上，高强度间歇运动可在一定程度上减少个体对负性信息的编码加工，但并没有对有意遗忘中的抑制控制产生影响。

Effect of high-intensity interval exercise on the directed forgetting of negative emotional information among college students: A fNIRS study

Xiao Sun, Yuwei Jin, Rong Liu, Yaowu Song
School of Education, Hebei University, Baoding, 071002

Abstract: Directed forgetting refers to the phenomenon that the subject's memory content is damaged caused by the "forgetting" instruction. The directed forgetting of negative emotional information helps individuals to reduce negative emotions and maintain mental health. Studies from the fNIRS showed that high-intensity intermittent exercise promotes inhibitory control and positive emotion regulation by regulating the oxyhemoglobin (HbO) concentration in the prefrontal cortex. To explore the effects of high-intensity interval exercise on the intentional forgetting of negative emotional information and its brain mechanisms, 52 college undergraduate students were randomly assigned to exercise or no-exercise groups. The exercise group performed 10 minutes of high-intensity intermittent treadmill exercise before the learning task of directed forgetting , and the intensity of the exercise was controlled by heart rate monitoring and speed, while the no-exercise group sat quietly and watched the neutral video. The memory material includes negative and neutral words, selected from the Chinese affective word system (CAWS). The directed forgetting paradigm adopts blocks design, with seven words of the same category, and each block of words is followed by "remember" or "forget" instructions. Results compare the number of correct recall and the change in HbO in the prefrontal cortex after the instruction was rendered (5-20s) in different groups. The results are as follows. (1) In the number of correct recall, the main effect of the instruction is significant, $F(1,50) =43.56$, $p=.000$, $\eta 2=.47$, and the number of correct recall under the memory instruction was significantly higher than the forgetting instruction ($p=.000$).The interaction of emotion and group was significant $F(1,50) =4.15$, $p=.047$, $\eta 2=.08$, and the simple effect analysis found that the number of correct recall of negative words in the exersice group was significantly lower than that of neutral words ($p=.01$), and there was no difference in no-exersice group ($p=.85$). (2) Data of fNIRS mainly observed the changes of the prefrontal cortex HbO. The results found that exercise group has a higher level of activation in the orbitofrontal cortex than no-exercise group. Forget instruction have stronger negative activation in the left ventrolateral prefrontal lobe, left dorsolateral frontal and frontal polar region than memory instruction. Negative words have stronger negative activation in the right ventral lateral prefrontal lobe than neutral words. The results show that high-intensity intermittent exersice reduces the processing of negative information by activating the orofrontal cortex, inhibition during directed forgetting processing is mainly derived from negative activation in the left ventrolateral prefrontal lobe, left dorsolateral prefrontal lobe and frontal polar region, and the processing of emotional words is mainly related to the right ventrolateral prefrontal lobe. In conclusion, high-intensity intermittent exercise can reduce the encoding processing of negative information to some extent, but it has no impact on the inhibitory control in directed forgetting.

乒乓球运动员的知觉信息加工：基于自上而下的层级预测编码

彭子伊[1]　邵永聪[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，budeshao@bsu.edu.cn

摘 要　经过过度学习以后的知觉加工更偏向于自上而下的加工，感知过程更像一个预测-匹配的过程。只有当向下的预测与向上传入的感觉信号相匹配时，感知才会在多个处理层次上形成。乒乓球运动要求运动员在短暂的时间内对复杂信息进行认知加工，长期训练诱发了运动员视觉认知加工皮层的神经可塑性，乒乓球运动员在进行运动项目相关的认知加工时以一种资源节约化的方式进行。但目前对于乒乓球运动员的空间加工优势究竟是体现在认知加工的早期的感觉输入、信息整合阶段还是晚期的注意部署、认知控制阶段，还需要进一步讨论。本研究主要通过事件相关电位技术，探讨乒乓球运动员在非运动领域的知觉信息加工特点，厘清乒乓球运动员认知加工的神经特点，为全面理解高水平运动员加工专项相关信息过程中的脑机制提供依据。研究共有 48 名被试（普通大学生 28 人，二级乒乓球运动员 20 人）参与实验，所有受试者均需完成结合乒乓球专项特色的空间认知任务，同时记录事件相关电位。结果显示：乒乓球组的任务表现优于普通组，反应时更短，正确率更高；乒乓球组 N1 成分的波幅显著低于普通组；乒乓球组 P2、P3 波幅大于普通组，P3 潜伏期短于普通组。研究结果表明与普通大学生相比，乒乓球运动员对专项相关信息的具有加工优势，表现为更好的注意资源部署和认知控制能力。乒乓球运动员进行空间知觉信息加工时更多地以自上而下的方式进行，大脑利用已经储存的运动经验，以一种层级的更精细的方式预测当前感官刺激所引发的多层神经元反应模式，以层级预测编码的方式进行加工。

Perceptual information processing in table tennis players: based on top-down hierarchical predictive coding

Peng Ziyi Shao Yongcong
School of Psychology, Beijing Sport University, Beijing, China

Abstract **：** Perceptual processing after overlearning is more biased toward top-down processing, and the perceptual process is more like a prediction-matching process. Percepts here take shape only when downward predictions match the incoming sensory signal, at multiple levels of processing. Table tennis requires athletes to cognitively process complex information in a short period of time, and long-term training induces neural plasticity in the visual cognitive processing cortex of athletes, who perform sport-related cognitive processing in a resource-conserving manner. However, further discussion is needed as to whether the spatial processing advantage of table tennis players is manifested in the early stage of sensory input, or in the late stage of attention deployment and cognitive control. In the present study, we utilized event-related potentials (ERPs) to investigate the perceptual information processing characteristics of table tennis players in non-motor domains, to elucidate the neural characteristics of cognitive processing in table tennis players, to provide evidence for a comprehensive understanding of the brain mechanisms during the processing of specialization-related information in high-level athletes. A total of 48 participants (28 college students and 20 second-level table tennis players) participated in the experiment, all subjects were required to complete spatial cognitive tasks combined with table tennis-specific features. Electroencephalography (EEG) data were recorded during the task. The results showed that: the table

tennis group performed better on the task than the normal group, with shorter response times and higher correct rates; the amplitude of the N1 components of the table tennis group was significantly lower than those of the normal group; the amplitudes of the P2 and P3 in the table tennis group were greater than that of the normal group, and the P3 latency was shorter than that of the normal group. The results of the study suggest that table tennis players have a processing advantage over general college students for specialized relevant information, as evidenced by better deployment of attentional resources and cognitive control. Table tennis players process spatial perceptual information in a more top-down manner. The brain uses stored motor experience to predict, in a progressively more refined manner, the patterns of multilayer neuronal response elicited by the current sensory stimulation, processing in a hierarchical predictive coding manner.

睡眠剥夺对乒乓球运动员和非运动员海马功能连接影响的差异

代慈敏[1]　邵永聪[1]（通讯作者）

1 北京体育大学心理学院，北京，100084

通讯作者 E-mail: budeshao@aliyun.com

摘 要　目的：海马既是认知地图的核心脑区，又是记忆的重要脑区。因此海马在涉及运动经验和空间位置信息的乒乓球落点预判任务中可能具有重要作用。睡眠是一种重要的恢复手段，睡眠不足会导致运动认知损伤，这种损伤可能与海马有关。本研究旨在通过静息态 fMRI，探讨睡眠剥夺对运动预判的影响，及其与海马功能连接的关系。

方法：本研究纳入 28 名非运动员（男，年龄：22.71 ± 2.21）和 20 名二级乒乓球运动员被试（男，年龄：20.55 ± 1.36）。被试在基线和 36 小时睡眠剥夺后各进行一次静息态 fMRI 扫描和乒乓球预判任务。以海马为兴趣区，计算海马和全脑体素的功能连接。采用重复测量方差分析对海马功能连接、预判任务的正确率和反应时进行分析，并计算行为和海马功能连接之间的皮尔逊相关。

结果：（1）乒乓球运动员的预判正确率比非运动员高 (F (1, 43) = 6.62, p < 0.05,)，基线预判正确率比睡眠剥夺后高 (F (1, 43) = 10.35, p < 0.01), 且基线反应时比睡眠剥夺后的反应时更短 (F (1, 43) = 4.17, p < 0.05)。

（2）睡眠剥夺对两组被试双侧海马功能连接的影响存在差异 ($p_{\text{uncorrected}}$ < 0.001, cluster size > 30)。在乒乓球运动员中，右侧海马与双侧壳核、右侧丘脑的功能连接以及左侧海马与右侧苍白球的功能连接在睡眠剥夺后增强，右侧海马与右侧颞中回、右侧枕外侧皮层、右侧角回和左侧颞上回的功能连接在睡眠剥夺后减弱。在非运动员中，睡眠剥夺后双侧海马的功能连接变化与乒乓球运动员相反。

（3）在皮尔逊相关分析中发现乒乓球运动员睡眠剥夺后正确率的变化与海马和右侧丘脑功能连接的增加正相关 (r = 0.49, p < 0.05)，非运动员睡眠剥夺后反应时的变化与右侧海马和右侧颞中回功能连接的增加正相关（r = 0.57, p < 0.01）、左侧海马和右侧苍白球功能连接的下降负相关 (r= -0.46, p < 0.05)。

结论：（1）乒乓球运动员睡眠剥夺后海马与苍白球、壳核等躯体运动有关的脑区的功能连接增强，而非运动员减弱。

（2）睡眠剥夺会损伤运动预判任务表现，且这种影响可能与海马的功能连接有关。

Differences in the effects of sleep deprivation on the functional connectivity of hippocampus between table tennis players and non-athletes

Dai Cimin[1], Shao Yongcong[1]
School of Psychology, Beijing Sport University, 100084

***Abstract*:** Objectives: The hippocampus is not only the core region of cognitive map, but also an important brain area of memory. Therefore, the hippocampus may play an important role in predicting the landing point of table tennis involving exercise experience and spatial information. Sleep is an important means of recovery, and insufficient sleep can lead to motor cognitive impairment, which may be related to the hippocampus. The purpose of this study was to explore the effect of sleep deprivation (SD) on sport-related anticipation and its relationship with functional connectivity (FC) of hippocampus through resting-state fMRI.

Methods: twenty-eight non-athletes (male, age: 22.71 ± 2.21) and twenty National Level II table tennis players (male, age: 20.55 ± 1.36) were included in this study. Participants were given a resting state fMRI scan and a table tennis anticipation task at baseline and after 36 hours of SD, respectively. FC between the hippocampus and the whole brain was calculated. Repeated measures analysis of variance was used to analyze FC of hippocampus and the accuracy and reaction time of anticipation task. And Pearson correlation between behavior and FC of hippocampus was made.

Results: (1) Table tennis players had a higher accuracy than non-athletes (F (1, 43) = 6.62, p < 0.05). Accuracy at baseline was higher than that after SD (F (1, 43) = 10.35, p < 0.01). And reaction time at baseline was shorter than that after SD (F (1, 43) = 4.17, p < 0.05).

(2) There were differences in the effect of SD on bilateral FC of hippocampus between the two groups of participants ($p_{\text{uncorrected}}$ < 0.001, cluster size > 30). In table tennis players, the FC $_{\text{the right hippocampus - the right putamen}}$, FC $_{\text{the right hippocampus - the left putamen}}$, FC $_{\text{the right hippocampus - the right thalamus}}$, and FC $_{\text{the left hippocampus - the right pallidum}}$ increased after SD, while the FC $_{\text{the right hippocampus - the right middle temporal gyrus}}$, FC $_{\text{the right hippocampus - the right lateral occipital cortex}}$, FC $_{\text{the right hippocampus - the right angular gyrus}}$, and FC $_{\text{the right hippocampus - the left superior temporal gyrus}}$ decreased after SD. In non-athletes, the FC changes in the bilateral hippocampus after SD were opposite to those in table tennis players.

(3) Pearson correlation analysis found that the change of accuracy of table tennis players after SD was positively correlated with the increasement of FC $_{\text{the right hippocampus - the right thalamus}}$ (r = 0.49, p < 0.05), while the change of reaction time of non-athletes after SD was positively correlated with the increasement of FC $_{\text{the right hippocampus - the right middle temporal gyrus}}$ (r = 0.57, p < 0.01), and negatively correlated with the decline of FC $_{\text{the left hippocampus - the right pallidum}}$ (r = -0.46, p < 0.05).

Conclusion: (1) After SD, the FC between the hippocampus and pallidum, putamen increased in table tennis players, rather than in non-athletes. The pallidum and putamen are brain regions related to physical movement.

(2) SD might impair the performance of sport-related anticipation task, and this impact may be related to FC of the hippocampus.

定向运动员心理旋转的空间认知优势及脑加工特征研究

肖涵[1]，刘阳[2]（通讯作者）

1.陕西师范大学体育学院，陕西 西安 710119

2.陕西师范大学运动学习科学实验室，陕西 西安 710119，Liuyang0330@snnu.edu.cn

摘 要：目的：定向运动（orienteering）被称为是一项具有高认知成分的有氧运动项目，是指利用地图和指北针进行导航，按规定完成比赛任务的运动项目。在定向运动比赛过程中，运动员得到的地图往往与实际方向有所差异。因此，面对不断变化的方向，参赛选手需不断调节地图和自身方位，通过心理旋转革新与参照物的位置关系，完成自我定位任务。心理旋转是辅助定向运动员进行空间定位的关键，其能力直接影响定向运动员的成绩。因此，关注定向运动员的心理旋转能力对提升专项竞技能力有着重要意义。方法：采用单因素实验设计，选取 21 名一级及以上高水平定向运动员（平均年龄 20.10±1.41，训练年限 4.048±0.86）作为专家组和 21 名定向运动社团的体教专业大学生，均为定向运动业余爱好者，无运动员等级（平均年龄 20.10±1.26，训练年限 0.76±0.25）作为新手组，比较两组在心理旋转任务中的行为绩效及大脑激活的差异性，并评估脑区间的功能连接。研究结果：（1）在心理旋转任务中，专家组的正确率显著高于新手组，反应时显著短于新手组；（2）专家组的正确率与脑血氧激活呈显著相关，专家组在右侧背外侧前额叶（R-DLPFC）、左侧背外侧前额叶（L-DLPFC）、右侧额极区（R-FOA）、左侧额极区（L-FOA）、右侧腹外侧前额叶（R-VLPFC）、左侧腹外侧前额叶（L-VLPFC）的脑血氧激活显著低于新手组，脑间功能连接协同更强。结论：专家组定向运动员在心理旋转任务中表现出行为绩效和脑活动的双重认知优势，背外侧前额叶、额极区、腹外侧前额叶在心理旋转任务中起到重要作用，这种优势可能是长期定向运动训练改变了练习者的心理旋转认知加工模式，从而促进了相关脑自发神经活动的优化。

A study of spatial cognitive dominance and brain processing characteristics of mental rotation in orienteering athletes

XIAO Han[1]， LIU Yang[2]

1. College of Physical Education, Shaanxi Normal University, Xi 'an, Shaanxi, China
2. Laboratory of Sports Learning Science, Shaanxi Normal University, Xi 'an, Shaanxi, China

***Abstract*:** Objective: orienteering is known as an aerobic exercise project with high cognitive components, which refers to the use of maps and north pins to navigate and complete the task of the game according to the regulations. In the course of orienteering competition, the map obtained by the athletes is often different from the actual direction. Therefore, in the face of changing directions, contestants need to constantly adjust the map and their own orientation, and complete the self-positioning task by innovating the position relationship between the mental rotation and the reference object. Mental rotation is the key to assist orienteers in spatial positioning, and its ability directly affects the performance of orienteers. Therefore, it is of great significance to pay attention to orienteers' mental rotation ability to improve their special competitive ability. How: A single-factor experimental design was used to select 21 first-class and above high-level orienteers (average age 20.10±1.41, training years 4.048±0.86) as the expert group and 21 college students majoring in sports education of orienteering associations, all of whom were amateurs of orienteering and had no athlete grade (average age 20.10±1.26, training years 4.048±0.86).

Training years 0.76±0.25) As a novice group, the behavioral performance and brain activation of the two groups in the mental rotation task were compared, and the functional connectivity of brain regions was assessed. Results: (1) In the mental rotation task, the expert group's correct rate was significantly higher than that of the novice group, and the reaction time was significantly shorter than that of the novice group; (2) The correct rate of the expert group was significantly correlated with cerebral blood oxygen activation. Cerebral blood oxygen activation in the right dorsolateral prefrontal lobe (R-DLPFC), left dorsolateral prefrontal lobe (L-DLPFC), right frontal polar region (R-FOA), left frontal polar region (L-FOA), right ventrolateral prefrontal lobe (R-VLPFC), and left ventrolateral prefrontal lobe (L-VLPFC) was significantly lower in the expert group than in the beginner group. The functional connections between the brain are more synergistic. Conclusion: In the expert group, orienteering athletes showed dual cognitive advantages of behavioral performance and brain activity in mental rotation tasks, and the dorsolateral prefrontal lobe, the frontal pole area and the ventrolateral prefrontal lobe played an important role in mental rotation tasks. This advantage may be due to the fact that long-term orienteering training changed the participants' mental rotation cognitive processing mode, thus promoting the optimization of related brain spontaneous neural activities.

运动员心理旋转与姿势控制的认知-动作耦合机制

冯甜[1]（通讯作者） 张富春[2] 刘锦钊[2] 梁曼琪[2] 刘李艳[2]

1 郑州大学体育学院（校本部），郑州，450001，maefeng@vip.126.com

2 郑州大学体育学院，郑州，450044

摘 要 姿势控制是保持身体重心在一定支撑面内的活动。姿势控制是神经系统和肌肉协调配合的产物，增加认知任务的难度姿势控制能力将会受到影响。本研究旨在揭示心理旋转任务影响运动员动作控制执行的生物力学及认知神经机制。方法：招募 17 名武术运动员（平均年龄为 21±0.77 岁），训练年限为 6.81±4.49 年；17 名非运动员（平均年龄为 21±1 岁）。采用双任务研究范式测试专家和新手在主体和客体心理旋转任务时动作平衡的变化情况，记录被试在心理旋转任务下的准确率和反应时、身体重心变化（COP）动摇情况（球长度 mm、椭圆面积 mm2、平均 X mm 和平均 Y mm）和氧血红蛋白浓度变化情况。结果：（1）专家组准确率显著高于新手组。（2）在单脚支撑状态，专家组身体重心变化的球长度变化幅度显著低于新手组；专家组身体重心变化的椭圆面积变化幅度显著低于新手组；在单脚支撑状态下，专家组身体重心变化的平均 Y 变化幅度显著低于新手组；在双脚支撑状态下，专家组身体重心变化的平均 Y 变化幅度显著低于新手组。（3）在单脚和双脚支撑状态下，专家组在左侧前额叶的脑区激活程度显著高于新手组；专家组在左运动区的脑区激活显著高于新手组；在单脚和双脚支撑状态下，专家组在右运动区的脑区激活程度显著高于新手组。结论：（1）在心理旋转任务当中专家组更具优势。（2）在心理旋转任务的刺激下，专家组在单脚和双脚支撑状态下比新手组展现出更好的动作控制能力。（3）在左侧前额叶和左、右运动区专家组大脑的激活程度高于显著新手组，专家组展现出认知-动作耦合机制。

Cognitive-motor coupling mechanisms of mental rotation and postural control in athletes

Tian Feng[1] Fuchun Zhang[2] Jinzhao Liu[2] Manqi Liang[2] Liyan Liu[2]

1.School of Physical Education, Zhengzhou University, Zhengzhou, China, 450001
2.Physical Education College of Zhengzhou University, Zhengzhou, China, 450044

***Abstract*:** Postural control is the activity of keeping the center of gravity of the body within a certain support surface. Postural control is a product of coordination between the nervous system and muscles, and increasing the difficulty of cognitive tasks postural control will be affected. The aim of this study was to reveal the biomechanical and cognitive-neurological mechanisms by which a mental rotation task affects the execution of movement control in athletes. METHODS: Seventeen wushu athletes (mean age 21 ± 0.77 years) with 6.81 ± 4.49 years of training and 17 non-athletes (mean age 21 ± 1 years) were recruited. A dual-task research paradigm was used to test the changes in motor balance of experts and novices during a egocentric and object mental rotation task, and to record the subjects' accuracy and reaction time, change in center of gravity (COP) sway (ball length mm, ellipse area mm2, mean X mm, and mean Y mm), and changes in oxyhaemoglobin concentration under the mental rotation task. RESULTS: (1) Expert group accuracy was significantly higher than the novice group. (2) In the single-legged support condition, the magnitude of ball length changes in body center of gravity (COP) of the expert group was significantly lower than that of the novice group; the magnitude of ellipse area changes in body center of gravity (COP) of the expert group was significantly lower than that of the novice group; the magnitude of mean Y changes in body center of gravity (COP) of the expert group was significantly lower than that of the novice group; and the magnitude of mean Y changes in body center of gravity (COP) of the expert group was significantly lower than that of the novice group in the two-legged support condition. (3) In the single- and double-footed support condition, the expert group's brain area activation in the left prefrontal lobe was significantly higher than that of the novice group; the expert group's brain area activation in the left motor area was significantly higher than that of the novice group; and the expert group's brain area activation in the right motor area was significantly higher than that of the novice group in the single- and double-footed support condition. CONCLUSIONS: (1) The expert group was more dominant in the mental rotation task. (2) Under the stimulation of the mental rotation task, the expert group showed better motor control than the novice group in the one-legged and two-legged support condition. (3) The brain activation level of the expert group was higher than that of the novice group in the left prefrontal and left and right motor areas, and the expert group demonstrated cognitive-motor coupling mechanisms.

公开标记安慰剂干预对锻炼情感反应的影响

仇悦[1] 毛志雄[1]（通讯作者） 员东婷[2] 刘娇[1]
1 北京体育大学心理学院，北京，100084, E-mail: zhxmao@bsu.edu.cn
2 西南财经大学体育学院，成都，611130

摘 要 **目的**：安慰剂效应指排除锻炼本身带来的情感效益后，由实验者诱发的积极预期而引起的额外的情感效益。现有研究均采用传统安慰剂的研究范式，即个体参与锻炼前，告知其“锻炼十分有效”的安慰剂信息，然而这种设计近乎“完美”的运动方案实则并无确凿和统一的科学证据，虽然锻炼具有身心效益已成为大众共识，但其有效程度确是因人而异。相关研究发现，故意夸大运动的益处，会增加个体的心理抗拒感，带来负面影响。鉴于此，本研究引入公开标记安慰剂干预，将干预信息的重点放在阐述安慰剂效应的科学原理和背后机制上，探讨安慰剂效应是否能在不欺骗的条件下产生，及其中的心理机制和边界条件，采用一项基于 fNIRS 的随机对照实验回答上述科学问题。**方法**：随机选取 89 名大学生，采用 3(安慰剂类型：传统安慰剂 vs. 公开安慰剂 vs.控制组) × 3(测量次序：前测 vs.中测 vs.后测)的混合实验设计，其中安慰剂类

型为组间变量。因变量为运动中和运动后的情感反应，运动后前额叶的静息态功能连接(RSFC)。**结果**：在一次短时 20 分钟中等强度的跑步运动中，传统安慰剂和公开安慰剂干预均能有效改善锻炼中和锻炼后情感反应，公开安慰剂干预的效果量更大；预期是有效的中介变量，即安慰剂干预通过增加正向的预期带来积极的锻炼情感反应；锻炼强度容忍度是有效的调节变量，低锻炼强度容忍度的个体更能从安慰剂效应中获益；fNIRS 结果显示，与控制组相比，传统安慰剂组和公开安慰剂组右侧前额叶局部脑区 RSFC 更低，锻炼后愉悦感更高。**结论**：本研究是结合公开安慰剂干预和近红外技术的首次尝试，研究发现揭示了公开标记的安慰剂干预对锻炼参与者的心理和生理具有正向影响，还为其在锻炼指导中的应用价值提供了证据支持。

Effects of Open-Label Placebo Interventions on Exercise Affective Responses

Yue Qiu[1] Zhi-xiong Mao[1] Dong-ting Yun[2] Jiao Liu[1]
1 Beijing Sport University, China
2 Southwestern University of Finance and Economics, China

Abstract：This current study operationally defined the placebo effect as additional affect benefit caused by the experimenter's induced positive expectations after excluding the affect benefit of exercise itself. Studies of the "placebo effect" have generally focused on experimentally manipulating expectations and adopting a traditional paradigm of verbal instructions to convey a positive message, such as "the exercise you will perform often results in a good affect". However, there is no conclusive scientific evidence for this almost "perfect" exercise program, and although there is a public consensus that exercise has physical and mental benefits, the degree of effectiveness varies from person to person. Related studies have found that intentionally exaggerating the benefits of exercise can increase psychological resistance and have negative consequences. Accordingly, this study introduces an open-label placebo intervention, focuses the intervention message on articulating the scientific rationale and mechanisms, and explores whether the placebo effect can be produced under conditions of non-deception, and the psychological mechanisms and boundary conditions therein. A randomized controlled experiment based on fNIRS was used to answer the above scientific questions. Methods: eighty-nine undergraduates were recruited. This study used a three-factor mixed design 2 (placebo types: low vs. high) × 3 (measurement order: pre vs. during vs. post). Placebo type was the between-group variable. Predictor variables were affective responses during and after exercise, and resting-state functional connectivity (RSFC) in the prefrontal lobe after exercise. Results: Both open-label placebo and traditional placebo significantly improved affective responses during and after exercise, with open-label placebo having a larger effect. Expectancy was a significant mediating variable. In particular, deceptive and non-deceptive placebo interventions led to positive affective responses during exercise by increasing participants' positive expectations. Exercise tolerance was an effective moderating variable. Especially, individuals with low exercise tolerance benefited more from the placebo effect. At the neural level, resting functional connectivity in the right prefrontal region was weaker in the deceptive placebo and non-deceptive placebo groups than in the control group. In addition, resting functional connectivity was associated with pleasure after exercise. Conclusion: The present study combines open-label placebo intervention and near-infrared technology in a first attempt, and the findings reveal that open-label placebo interventions have a positive effect on exercise affect, and also provide evidence to support their application value.

无意识成就目标启动对自我控制的影响

吕承颖[1]　张力为[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，liweizhang@hotmail.com

摘 要　已有研究表明无意识目标对人心理和行为的影响十分广泛，根据其作用原理，有意地施加积极刺激以启动相应目标，就能够在潜移默化中影响人在学习和工作中的表现。在竞技运动领域，运动员在单调重复的训练环境中始终坚持训练需要良好的自我控制，因此如何帮助运动员提高自我控制能力是该领域的核心问题之一。依据心理控制点理论，正确的心理定向原则强调对过程的关注，但在运动情境下个体对结果的关注不可避免，因此本研究拟采用图片材料无意识启动大学生运动员的过程目标与结果目标以探究其对自我控制任务表现的影响。实验采用 3（启动内容：过程目标/结果目标/中性启动）×2（测试次序：前测/后测）两因素混合设计，其中测量次序为组内变量，每组各有 12 名运动等级为国家二级及以上的大学生运动员，自变量的启动通过以不同类型图片为背景的视觉搜索任务实现，不同组完成该任务时的背景图片分别体现过程、结果与中性目标，因变量为状态自我控制量表得分与握力任务坚持时长，实验任务完成后进行操控检查以保证后续纳入分析的被试均为未意识到真正实验目的的个体。重复测量方差分析发现，在状态自我控制量表得分和握力任务坚持时长上，三组在无意识启动前后无显著差异(ps>0.163)。本研究结果提示，未来研究需要选取启动效果更佳的启动任务，并进一步控制实验参与人群特点（如仅为某一专项的运动员），以探究无意识目标启动对自我控制的影响。

The influence of unconscious achievement goal priming on self-control

Chengying Lyu[1], liwei Zhang[1]
1 School of Psychology, Beijing Sport University, Beijing 100084, liweizhang@hotmail.com

***Abstract*：** Previous studies have shown that unconscious goals have a wide range of effects on people's psychology and behavior. According to the principle of its action, intentionally applying positive stimuli to activate corresponding goals can subtly affect people's performance in study and work. In competitive sports, the athletes in the repetitive training environment always adhere to the training and need good self-control, so how to help athletes improve their self-control ability is one of the core problems in this field. According to the locus of control theory, the correct principle of psychological orientation emphasizes the attention to the process, but the individual's attention to the result is inevitable in the sports situation. Therefore, this study intends to use picture materials to unconsciously activate the process goal and outcome goal of college athletes to explore their influence on the performance of self-control tasks. The experiment adopts a 3 (starting content: process goal/result goal/neutral start) ×2 (test order: Pre-test/post-test) two-factor mixed design, in which the measurement order is the intra-group variable, and each group has 12 college athletes with national level 2 and above. Independent variables are activated by visual search tasks with different types of pictures as the background. When completing the task, the background pictures of different groups reflect the process, result, and neutral goal respectively. The dependent variables were the State self-control scale score and the grip task's persistence time. The control check was carried out after the completion of the experimental task to ensure that the subjects included in the subsequent analysis

were individuals who did not realize the real purpose of the experiment. Repeated measures analysis of variance found that there were no significant differences between the three groups in the score of state self-control scale and the duration of grip task persistence before and after unconscious initiation (*p*s>0.163). The results of this study suggest that future studies need to select priming tasks with better effects, and further control the characteristics of the participants in the experiment (such as only athletes of a certain specialty) to explore the influence of unconscious goal priming on self-control.

* 通讯作者 E-mail：liyoufa@bnu.edu.cn

摘 要 **重要性：**正念运动（Mindfulness-based movement, MBM）能够同时锻炼个体的身体和心理，具有低受伤风险、促进身心合一、对运动环境要求小等诸多优点。越来越多的证据显示，正念运动有潜在的抗焦虑效应。然而，目前仍缺少检验长期正念运动训练对焦虑影响的相关综合量化研究。**目标：**本研究旨在评估正念运动的抗焦虑效果，并试图识别可能因研究区域、实验参与者特征和干预的剂量效应而产生的效应差异。**方法：**本研究基于 PRISMA 指南进行了系统综述和元分析，系统性地搜索和评估了在 2023 年 2 月 30 日之前发布在 Web of Science, PsycINFO, PubMed, 和 Google Scholar 四个网络数据库中的随机对照试验（Randomized controlled trials, RCTs）。利用 CMA 3.0 软件进行了效应量 SMD 的计算和调节因素分析。**结果：**元分析最终纳入 66 项研究，82 项效应。与对照组（n = 3,695）相比，正念运动干预组（n = 3,692）显著减轻了焦虑，有较小的效应量（SMD = 0.440，95% CI：0.345 - 0.535，p < 0.001，I^2 = 72.48%）。正念运动类型，研究区域，参与者的性别，年龄，健康状况，干预的时长，频率和总项目长度等都是影响抗焦虑效果的调节因素。持续时间超过 8 周，每周至少两次，每次超过 60 分钟的干预措施在缓解焦虑症状方面最为有效。研究设计的整体质量（PEDro 分数）也对效应大小产生重要影响。**结论：**正念运动已显示出作为单独或辅助干预手段管理焦虑症状的潜力，其效益在不同参与者特征和研究区域中均有体现。未来的研究需要提高研究方法质量和设计，并比较不同类型正念运动以及正念运动与其他干预方式的抗焦虑效果，进一步探索正念运动干预的剂量-效应关系。

***Abstract*: Importance:** Mindfulness-based movement (MBM) has emerged as a significant therapeutic approach, amalgamating physical and mental training that carries a low risk of injury, promotes holistic well-being, and necessitates minimal environmental constraints. An increasing body of evidence has highlighted the potential of MBM in exerting anxiolytic effects. However, comprehensive evaluation of the long-term impact of MBM training on anxiety has remained elusive. **Objective:** To assess the anxiolytic effects of MBM, whilst considering potential variation introduced by study area, participant attributes, and intervention factors. **Methods**: This study was designed according to the Systematic Review and Meta-Analysis (PRISMA) guidelines. Randomized controlled trials (RCTs) published from online databases (Web of Science, PsycINFO, PubMed, and Google Scholar) before 30 February 2023 were systematically searched and assessed. Comprehensive Meta-Analysis Version(CMA) 3.0 was utilized for the computation of pooled standardized mean differences and the execution of moderator analyses. **Results**: 66 studies (k = 82) were included in the meta-analysis. Compared with control groups(n = 3,695), MBM intervention groups(n = 3,692) significantly reduced anxiety with a small effect (SMD = 0.440, 95% CI: 0.345 to 0.535, $p < 0.001$, $I^2 = 72.48\%$). Moderator analysis showed that MBM type, research area, sex, age, health, session, frequency and program length played moderating roles. Interventions with more than 8 weeks of length, 2 times a week, and over 60 minutes each session, were most effective in reducing anxiety symptoms. The overall quality of the research design (PEDro score) also plays an important role of the effect size. **Conclusion**: MBM is an effective alternative or adjuvant intervention for anxiety symptoms across different participant characteristics and research area. Future research should improve quality and design, as well as compare the anxiolytic effects between different types of MBM and between MBM and other types of interventions. It is also necessary to delve into the dose effects of MBM interventions.

正念训练对运动员运动倦怠的干预作用

王润泽[1,2] 陈润木[1] 张倩怡[1] 曾永竣[3] 杨寅[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，yangyin@bsu.edu.cn
2 曲阜师范大学心理学院，曲阜，273100
3 北京体育大学体能学院，北京，100084

摘 要　运动倦怠是指一种综合征，泛指情绪和体力耗竭、成就感的降低和运动被贬值的综合表现。研究发现，对于专业运动员而言运动倦怠与正念水平有关，而正念水平能够通过正念训练得到提升。因此，本研究采用五因素正念问卷(FFMQ)、运动员倦怠量表(ABQ)，对 258 名中国专业运动员（男性为 168 名，女性为 87 名，年龄范围在 18~36 岁）进行施测。筛选出 60 名轻度倦怠以上的被试进行实验。实验采用 2x3 混合设计，分别对实验组以及对照组进行前测（t0）正念训练八周后的后测（t1）以及干预结束后八周的追踪测量（t2）。结果发现：(1)观察维度与组别的交互作用显著，$F_{(2, 49)} = 3.489$, $p = 0.034$, $\eta_p^2 = 0.065$ 简单效应分析显示：观察维度在 t1 时，实验组（28.083±1.062）边缘显著高于对照组（25.607±0.984），$F_{(1, 50)} = 2.925$, $p = 0.093$；观察维度在 t2 时实验组（28.708±1.015）显著高于对照组（25.571±0.940），$F_{(1, 50)} = 5.145$, $p = 0.028$, $\eta_p^2 = 0.093$；(2)运动倦怠与组别的交互作用边缘显著，$F_{(2, 49)} = 3.077$, $p = 0.0504$, $\eta_p^2 = 0.058$。简单效应分析

显示：运动倦怠总分在 t2 时，实验组（35.917±1.627）显著低于对照组（41.679±1.548），$F_{(1, 50)} = 2.591$, $p = 0.114$, $\eta_p^2 = 0.049$。(3)将后测正念五因素中描述、有觉知的行动作为自变量，后测运动倦怠总分作为因变量进行回归分析，模型中 $F_{(4, 47)} = 23.468$ ($p < 0.001$), 调整 $R^2 = 0.638$。其中后测描述标准化β=-0.186，t=-2.119 ($p = 0.039$) 能够显著预测后测运动倦怠的得分。结论：正念训练能够提升运动员的正念水平并改善他们的运动倦怠，同时正念中的“描述”维度能够正向预测运动员的运动倦怠。研究结果有助于理解正念在运动倦怠上的作用及其机制，同时也为开发针对运动员运动倦怠的正念训练提供一定的启发与实证支持。

The effect of mindfulness training on athletes’ burnout

Runze Wang, Qianyi Zhang, Runmu Chen, Yongjun Zeng, Yin Yang
School of Psychology, Qufu Normal University, Jingxuan West Road 57, Qufu 273100, China

Abstract： Athletes’ burnout is a syndrome that generally refers to the combination of emotional and physical exhaustion, reduced sense of accomplishment and devalued sports. Research has found that for professional athletes, burnout is associated with levels of mindfulness, which can be improved by mindfulness training. Therefore, the five-factor Mindfulness Questionnaire (FFMQ) and Athlete Burnout Inventory (ABQ) were used in this study to measure 258 Chinese professional athletes (168 male and 87 female, aged 18-36). 60 subjects with mild burnout or above were selected for the experiment. A 2x3 hybrid design was used in the experiment. The experimental group and control group were respectively subjected to pre-test (t0) mindfulness training for eight weeks after the post-test (t1) and follow-up measurement for eight weeks after the intervention (t2). The results showed that: (1) the interaction between observing dimension and group was significant, F (2, 49) = 3.489, p = 0.034, η_p^2= 0.065. At t1, the experimental group (28.083±1.062) had a significantly higher margin than the control group (25.607±0.984), F (1, 50) =2.925, p = 0.093. At t2, the experimental group (28.708±1.015) was significantly higher than the control group (25.571±0.940), F (1, 50) = 5.145, p = 0.028, η_p^2 = 0.093. (2) The interaction margin between athletes' burnout and group was significant, F (2, 49) = 3.077, p = 0.0504, η_p^2 = 0.058. Simple effect analysis showed that the total score of athletes' burnout in the experimental group (35.917±1.627) was significantly lower than that in the control group (41.679±1.548) at t2, F (1, 50) = 2.591, p = 0.114, η_p^2 = 0.049. (3) The .describing and acting with awareness among the five factors of posttest mindfulness was taken as the independent variable, and the total score of posttest athletes' burnout was taken as the dependent variable for regression analysis. In the model, F (4, 47) = 23.468 ($p < 0.001$), and $R^2 = 0.638$ was adjusted. The standardized β=-0.186, t=-2.119 (p = 0.039) could significantly predict the score of posttest athlete burnout. Conclusion: Mindfulness training can improve the level of athletes' mindfulness and improve their athlete burnout. Meanwhile, the "describing" dimension of mindfulness can positively predict athletes' burnout. The results are helpful to understand the role of mindfulness in athletes' burnout and its mechanism, and also provide some inspiration and empirical support for the development of mindfulness training for athletes' burnout.

协同思维训练对足球专修大学生点球表现影响的实验研究

程新月[1]　杨阿丽[2]（通讯作者）
1 沈阳体育学院研究生部，沈阳，11010
2 沈阳体育学院运动健康学院，沈阳，110102，1019923564@qq.com

摘 要　目的：协同思维是指整合了成长型思维和压力可以有益思维的思维模式，它的中心思想是压力事件和压力反应是可控和有帮助的。已有研究表明约 30 分钟的协同思维干预可以有效缓解青少年压力，改善青少年面对压力时产生的不良身心反应。这对长期处于繁重的学业以及紧张的训练和比赛中，时常需要承受多重压力的体育专业大学生而言极为重要。但这种短时高效的干预方法在运动领域的应用还较少，协同思维对体育专业大学生的影响也还不明确。故本研究从足球项目的专项特点出发，旨在探究协同思维训练对足球专修大学生点球表现的影响，为足球训练的发展提供新的实践方法。方法：选取沈阳体育学院足球专修大学生 60 名，采用 2 组别（实验组、对照组）×3 时间（前测/后测/追踪）混合实验设计。对实验组进行 30 分钟左右的协同思维训练，对照组进行 30 分钟左右的大脑知识培训。实验任务为三次模拟足球点球，要求正面距离练习墙约 11 米处，听到哨声响起后 10s 内完成踢点球任务。球击中不同区域得分不同，三次分数相加作为点球表现指标，同时使用《协同思维量表》测量个体协同思维水平。结果：（1）前测中实验组对照组各指标差异不显著；（2）协同思维训练组，点球表现前后测差异显著，后测成绩高于前测($p<0.001$)，协同思维水平也显著提升，大脑知识培训组的点球表现和协同思维水平前后测无显著差异，后测得分都显著低于实验组($p<0.001$)；（3）协同思维训练组，点球表现前测和追踪测试差异显著，追踪成绩高于前测($p<0.001$)，协同思维水平高于前测($p<0.001$)，大脑知识培训组的点球表现和协同思维水平前测和追踪测试无显著差异，追踪测试得分显著低于实验组($p<0.001$)。结论：协同思维训练可以有效提高足球专修大学生的协同思维水平，对其压力下的运动表现具有即时效果和一定的延时效果。这启示足球专修大学生课程中可引入协同思维训练，辅助技能教学，培养其转变思维，正确认识和运用压力，从而提高运动表现。

An Experimental Study on the Influence of Synergistic Mindsets Intervention on the Performance of Penalty Kick of College Students Majoring in Football

Cheng Xinyue, Yang Ali

Shenyang Sport University, No.36 jinqiansong east road, sujiatun district, Shenyang

Abstract：Purpose: Synergistic mindsets refers to a thinking mode that integrates growth mindsets and stress-can-be-enhancing mindsets. Its central idea is that stress events and stress responses are controllable and helpful. Previous studies have shown that about 30 minutes of synergistic mindsets intervention can effectively alleviate adolescent stress and improve the adverse physical and mental reactions that adolescents experience when facing stress. This is extremely important for sports major college students who are often under multiple pressures due to long-term heavy academic workload and intense training and competition. However, the application of this short-term and efficient intervention method in the field of sports is still limited, and the impact of synergistic mindsets on sports major college students is also unclear. Therefore, starting from the specific characteristics of football projects, this study aims to explore the impact of synergistic mindsets intervention on the performance of penalty kick of college students majoring in football, and provide new practical methods for the development of football training. Methods: 60 football majors from Shenyang Sport University were selected. Using 2 groups (experimental group and control group) × 3 time (pre test/post test/tracking) mixed experimental design. Give the experimental group about 30 minutes of synergistic mindsets intervention, and the control group about 30 minutes of brain knowledge training. The experimental task consists of three simulated football penalty kicks, which are required to be completed within 10 seconds after hearing the whistle at a distance of approximately 11 meters from

the practice wall. The score varies when the ball hits different areas, and the sum of the three scores is used as the performance indicator of penalty kicks. At the same time, the synergistic mindsets scale is used to measure the individual's level of synergistic mindsets. Result: (1) In the pre test, there was no significant difference in various indicators between the experimental group and the control group; (2) In the synergistic mindsets intervention group, there was a significant difference in penalty performance between the pre and post tests, and the post test score was higher than the pre test ($p<0.001$). The level of synergistic mindsets also significantly improved. The brain knowledge training group had no significant difference in penalty performance and synergistic mindsets level between the pre and post tests, and the post test scores were significantly lower than those of the experimental group ($p<0.001$); (3) In the synergistic mindsets intervention group, there was a significant difference in penalty performance between the pre test and the tracking test, with tracking scores higher than the pre test ($p<0.001$) and synergistic mindsets levels higher than the pre test ($p<0.001$). The brain knowledge training group had no significant difference in penalty performance and synergistic mindsets levels between the pre test and tracking test, and the tracking test score was significantly lower than the experimental group ($p<0.001$). Conclusion: Synergistic mindsets intervention can effectively improve the Synergistic mindsets level of football majors, and has immediate effect and certain delay effect on their sports performance under pressure. This enlightens that synergistic mindsets intervention can be introduced into football majors' courses to assist skill teaching, cultivate their thinking transformation, correctly understand and apply pressure, and thus improve their sports performance.

神经反馈训练对 MCI 老年人认知神经功能的影响

蒋长好[1]（通讯作者） 黄辰[2]

1 首都体育学院运动脑成像研究中心，北京，100191，jiangchanghao@cupes.edu.cn

2 首都体育学院运动科学与健康学院，北京，100191

摘 要 神经反馈(neurofeedback, NF)是一种无创性的神经调控的技术，被试通过学习和控制仪器所提供的反馈信号，学会自我调节内部心理生理变化，从而达到康复治疗特定疾病或改善生理状态的目的。轻度认知功能障碍(Mild Cognitive Impairment, MCI)是介于正常老化和痴呆之间的一种临床状态。主要表现为记忆损害和执行功能下降，向老年痴呆转化的风险较高且缺乏有效的药物治疗手段。尽管 MCI 人群的认知功能衰退更为严重，但是大脑可塑性依然存在。

已有研究表明，NF 训练可改善 MCI 老年人的认知功能。而且较之于普通的老年人，NF 训练对 MCI 老年人的认知表现的促进效果更好，表现出干预效益的选择性。NF 训练改善 MCI 老年人的认知功能还存在“剂量效应”，表现出剂量依赖性。将锻炼和 NF 训练结合起来使用，还发现联合干预效果优于单一训练效果。脑影像研究表明，NF 训练不仅可以调控 MCI 老年人大脑的激活程度，还可增强不同脑区的功能连通性，提高大脑的整体协调能力。追踪研究还发现，NF 训练增加 MCI 老年人海马等相关脑区的体积，对大脑结构有着可塑性影响。

然而已有研究也存在缺乏对老年 MCI 老年人认知效益的系统分析、NF 训练的剂量效应关系不明确、训练后会让被试产生非训练目标之外的改变即训练效果非特异性、以及 NF 训练改善 MCI 老年人认知效益的机制尚未厘清等问题。进一步的研究，首先要采用多种认知任务，系统考察 NF 训练对 MCI 老年人的认知功能的影响，并揭示 NF 剂量效应关系特征及时间累积效应。其次，通过改进实验设计，扩大研究样本，控制无关因素等，提高研究的生态效度及训练效果的针对性。第三，应结合行为实验和多模态脑影像技术，

并整合运动生理学的相关指标（如皮质醇、儿茶酚胺、血液乳酸、耗氧量等），系统探讨 NF 训练改善 MCI 老年人脑认知功能的机制。

Physical and mental exercise improves cognition and brain function in older adults with mild cognitive impairment

Changhao Jiang[1]　Chen Huang[2]

1 The Center of Neuroscience and Sports, Capital University of Physical Education and Sports, Beijing

2 School of Kinesiology and Health, Capital University of Physical Education and Sports, Beijing

Abstract：Neurofeedback (NF) is a non-invasive technique of neural regulation, in which participants learn to self-regulate internal psycho-physiological changes by receiving feedback signals from the instrument. This aims to achieve the rehabilitation of specific disorders or improve physiological states. Mild Cognitive Impairment (MCI) is a clinical condition that lies between normal aging and dementia. It is characterized by memory impairment and decline in executive function, with a higher risk of progressing to dementia and a lack of effective pharmacological treatment. Despite the cognitive decline in MCI individuals, brain plasticity remains intact.

Existing studies have shown that NF training can improve cognitive function in elderly individuals with MCI. Moreover, compared to regular elderly individuals, NF training has a greater promoting effect on cognitive performance in MCI elderly individuals, displaying selective intervention benefits. The improvement in cognitive function in MCI elderly individuals through NF training also exhibits a "dose-response effect," indicating a dose-dependency. Combining exercise with NF training has been found to result in better combined intervention effects than single training. Brain imaging studies have shown that NF training not only modulates the activation level of the brain in MCI elderly individuals but also enhances functional connectivity between different brain regions, thus improving overall brain coordination. Longitudinal studies have also discovered that NF training increases the volume of brain regions such as the hippocampus in MCI elderly individuals, demonstrating structural plasticity effects on the brain.

However, existing research still lacks a systematic analysis of cognitive benefits in elderly MCI individuals, and the dose-response relationship of NF training is not yet clear. Training effects beyond the training goals, i.e., nonspecific training effects, are also observed. Moreover, the mechanisms underlying the cognitive benefits of NF training in MCI elderly individuals remain unclear. Further research should employ a variety of cognitive tasks to systematically investigate the impact of NF training on cognitive function in MCI elderly individuals and reveal the characteristics of the dose-response relationship and time-accumulation effects of NF training. Improving experimental design, expanding the study sample, and controlling confounding factors are necessary to enhance the ecological validity of the research and the specificity of training effects. Additionally, integrating behavioral experiments and multimodal brain imaging techniques, along with relevant measures from exercise physiology (such as cortisol, catecholamines, blood lactate, oxygen consumption, etc.), can systematically explore the mechanisms underlying the improvement of cognitive function in MCI elderly individuals through NF training.

MICE 和 HIIE 对不同心肺适能

肥胖青少年工作记忆和 HRV 的时程效应

冯展涛 1,2　张月艳 3　毛志雄 1（通讯作者）
1 北京体育大学心理学院，北京，100101，通讯作者 zhxmao@bsu.edu.cn

3 曲阜师范大学附属实验学校，山东日照，276826

摘 要　研究目的：青少年肥胖可能会影响工作记忆，急性锻炼可以改善认知控制，但急性效应可能受不同强度的锻炼方式、认知测试时间以及心肺适能等因素的影响。因此，本研究通过实验 1 探究肥胖青少年工作记忆特点。实验 2 探究中等强度持续锻炼(MICE)和高强度间歇锻炼(HIIE)对不同心肺适能肥胖青少年工作记忆和心率变异性(HRV)的时程效应。

研究方法：实验 1 选取 12-14 岁青少年 80 人(正常体重 40 人，肥胖 40 人)，使用 1-back、2-back 实验范式评估工作记忆。实验 2 选取 12-14 岁肥胖青少年 120 人，采用 2 心肺适能水平(高心肺适能组，HCF、低心肺适能组，LCF)×3 锻炼方式(MICE、HIIE、CON)×3 测试时间(锻炼前、锻炼后即刻、锻炼后 20min)混合实验设计，在锻炼前、锻炼后即刻和锻炼后 20min 分别进行 HRV(RMSSD、LF/HF)和 2-back 任务测试。

研究结果：实验 1：肥胖组 1-back、2-back 的反应时都显著高于正常体重组，两组在 1-back 正确率上无显著差，但在 2-back 正确率上正常体重组显著高于肥胖组。实验 2：1)HCF 的 2-back 任务表现显著优于 LCF。2)对于 LCF，2-back 任务反应时在 MICE 后即刻和锻炼后 20min 都显著降低，且锻炼后 20min 时正确率显著提高；2-back 任务反应时在锻炼后即刻无显著变化，但在 HIIE 后 20min 显著降低。对于 HCF，2-back 任务反应时 MICE 和 HIIE 后即刻及 20min 时都显著降低，尤其在 HIIE 后 20min 时。3)与干预前相比，MICE 和 HIIE 后即刻和延迟 20min，HRV 的时域指标(RMSSD)显著降低，频域指标(LF/HF)显著提高，且 HIIE 对 RMSSD 和 LF/HF 的影响显著大于 MICE。

研究结论：1)肥胖影响青少年的工作记忆；2)急性 MICE 和 HIIE 可以改善不同心肺适能肥胖青少年的工作记忆，但 MICE 对 LCF 的益处更大，HIIE 对 HCF 的益处更大，尤其在锻炼后延迟阶段；3）急性运动后从平衡的 HRV 到交感神经活动占优势的转变反映了唤醒水平的提高，这可能是急性运动对工作记忆有益效应的潜在机制之一。

3 Experimental School affiliated to Qufu Normal University, Rizhao, Shandong Province, China

Abstract：Objective: Adolescent obesity may affect working memory. Acute exercise can improve cognitive control, but the acute effect may be affected by different intensity of exercise, cognitive test time, and

cardiorespiratory fitness. Therefore, this study explored the working memory characteristics of obese adolescents through experiment 1. Experiment 2 investigated the temporal effects of moderate-intensity sustained exercise (MICE) and high-intensity interval exercise (HIIE) on working memory and heart rate variability (HRV) in obese adolescents with different cardiopulmonary fitness.

Methods: In experiment 1, 80 adolescents aged 12-14 (40 normal weight and 40 obese) were selected to assess working memory using 1-back and 2-back experimental paradigms. In experiment 2, 120 obese adolescents aged 12-14 were selected, and a mixed experimental design of 2 cardiopulmonary fitness levels (high cardiopulmonary fitness group, HCF, low cardiopulmonary fitness group, LCF)×3 exercise methods (MICE, HIIE, CON)×3 test time (before exercise, immediately after exercise, 20min after exercise) was adopted. HRV(RMSSD, LF/HF) and 2-back tasks were tested before, immediately after, and 20 minutes after exercise.

Results: Experiment 1: The 1-back and 2-back responses of the obese group were significantly higher than those of the normal weight group, and there was no significant difference in the 1-back accuracy between the two groups, but the 2-back accuracy of the normal weight group was significantly higher than that of the obese group. Experiment 2:1)HCF performed significantly better than LCF in the 2-back task. 2) For LCF, the response time of the 2-back task was significantly decreased immediately after MICE and 20min after exercise, and the accuracy was significantly increased at 20min after exercise; The 2-back task response time had no significant change immediately after exercise, but significantly decreased 20 minutes after HIIE. For HCF, the 2-back task response was significantly reduced both immediately after MICE and at 20min after HIIE, especially at 20min after HIIE. 3) Compared with before intervention, the time domain index (RMSSD) of HRV was significantly decreased and the frequency domain index (LF/HF) was significantly increased immediately after MICE and HIIE and after a delay of 20min, and the effect of HIIE on RMSSD and LF/HF was significantly greater than that of MICE.

Conclusions: 1) Obesity affects adolescents' working memory; 2) Acute MICE and HIIE can improve the working memory of obese adolescents with different cardiopulmonary fitness, but MICE has greater benefits on LCF, HIIE has greater benefits on HCF, especially in the delayed stage after exercise; 3) The shift from balanced HRV to the predominance of sympathetic activity after acute exercise reflects increased arousal levels, which may be one of the underlying mechanisms for the beneficial effects of acute exercise on working memory.

不同时间压力下射击运动员情绪调节策略的选择和使用

刘慧敏 周路路 王欢 姜媛（通讯作者）

北京体育大学心理学院，北京，100084，jiangyuan97@sina.cn

摘 要 运动情境下的时间特征明显。根据情绪调节时间影响模型和情绪调节选择、优化和补偿理论，策略的选择和使用依赖于个人内部可用资源，有时间压力的运动员内部可用资源匮乏，进行判断的时间大幅度减少，进而影响其策略选择和使用。因此，研究旨在探讨不同时间压力下，射击运动员在不同负性情绪强度影响下，对认知重评和分心这两种策略的选择和使用效果的差异。预实验采用“情绪调节策略选择”范式，取策略选择时间的正负 1 个标准差的临界值作为时间压力设定依据。正式实验以 30 名射击运动员为研究对象，采用 2 时间压力（有、无）x 2 负性情绪强度（高、低）x 2 策略（认知重评、分心）三因素被试内设计，因变量为策略选择（策略选择百分比）和策略使用效果（负性情绪评分）。结果发现，以策略选择为因变量，时间压力、情绪强度和策略的交互作用显著($F(1, 29) = 4.74$, $p = .038$, $\eta^2 = .14$)。简单效应分析发现，有时间压力条件下，高、低情绪强度下选择分心策略的比例均大于认知重评策略($F(1, 29) = 3.86$, $p = .059$,Cohen's $d = .72$; $F(1, 29) = 4.19$, $p = .05$, Cohen's $d = .75$)；无时间压力条件下，高情绪强度下选择分心

策略的比例显著大于认知重评策略($F(1, 29) = 5.29$, $p = .029$, Cohen's $d = .83$)。以负性情绪感受评分为因变量，时间压力的主效应显著，相比较于有时间压力，无时间压力时的负性情绪评分显著高($F(1, 29) = 7.17$, $p = .012$, $\eta^2 = .19$)；情绪强度的主效应显著，相比较于低情绪强度，高情绪强度下的负性情绪评分显著高 ($F(1, 29) = 5.94$ $p = .021$, $\eta^2 = .17$)；策略的主效应不显著($F(1, 29) = .19$, $p = .664$)。交互作用均不显著。结果表明，有时间压力时，射击运动员不受负性情绪强度变化的影响，均更多地选择分心策略；无时间压力时，高负性情绪强度导致射击运动员更多地选择分心策略。同时，相较于无时间压力，射击运动员在有时间压力时的策略使用效果更好。

Time Pressures Influence the Emotion Regulation Choice and Effectiveness in Shooting Athletes

LIU Huimin, ZHOU Lulu, WANG Huan, JIANG Yuan (Corresponding author)
School of Psychology, Beijing Sport University, Beijing, 100084

Abstract：The sport context's temporal qualities are clear to see. According to the Temporal Influence Model of Emotion Regulation (TIMER) and Selection, Optimization, and Compensation with Emotion Regulation (SOC-ER) framework, the choice and effectiveness of emotion regulation strategies are dependent on the internal resources available to the individual. When athletes are under time pressure, they have a scarcity of internal resources, leading to a reduction in the time available to make judgments, which in turn affects their choice and effectiveness of strategies. This study aimed to investigate the differences in cognitive reappraisal and distraction strategies' selection and effectiveness by shooting athletes under different time pressures and negative emotion intensities. The pre-experiment involved the "emotion regulation choice" paradigm, and the critical value of plus or minus one standard deviation of strategy selection time was used to set the time pressure. The formal experiment included 30 shooting athletes, using a 3-factor within-subjects design of 2 time pressures (yes vs no) x 2 negative emotion intensities (high vs low) x 2 strategies (cognitive reappraisal vs distraction), with the dependent variables being strategy choice (percentage of strategy choice) and strategy effectiveness (negative emotion score). Results showed a significant interaction of time pressure, emotional intensity, and strategy with strategy choice as the dependent variable($F(1, 29) = 4.74$, $p = .038$, $\eta^2 = .14$). Simple effect analysis revealed that the proportion of distraction chosen at both high and low emotional intensity was greater than cognitive reappraisal in the time pressure condition ($F(1, 29) = 3.86$, $p = .059$,Cohen's $d = .72$; $F(1, 29) = 4.19$, $p = .05$, Cohen's $d = .75$), and that the proportion of distraction strategies chosen at high emotional intensity was significantly greater than cognitive reappraisal in the no time pressure condition($F(1, 29) = 5.29$, $p = .029$, Cohen's $d = .83$). Using negative affective feeling scores as the dependent variable, there was a significant main effect of time pressure, with negative affect scores being significantly higher in the absence of time pressure compared to the presence of time pressure($F(1, 29) = 7.17$, $p = .012$, $\eta^2 = .19$); and there was a significant main effect of emotional intensity, with negative affect scores being significantly higher in the presence of high emotional intensity compared to low emotional intensity($F(1, 29) = 5.94$ $p = .021$, $\eta^2 = .17$); the main effect of strategy was not significant($F(1, 29) = .19$, $p = .664$). None of the interactions were significant. The results indicated that with time pressure, under time pressure, shooters are more likely to choose distraction regardless of negative affective intensity. Without time pressure, high negative affective intensity leads shooters to choose the distraction more often. Moreover, the shooters' effect of strategy is better when there is time pressure compared to no time pressure.

短时有氧运动对社会排斥后情绪及攻击倾向的改善

张跃菲　张国礼（通讯作者）
北京体育大学心理学院，北京，100084，guoli_zhang@126.com

摘 要　背景：社会排斥对情绪造成消极影响，增加个体攻击倾向，而短时有氧运动作为积极的行为策略，具备丰富的身心效益，因此，本研究拟探究短时有氧运动对社会排斥后情绪及攻击倾向的改善作用。方法：实验 1 旨在验证社会排斥对个体情绪及攻击倾向的影响，采用单因素组间设计，自变量为社会排斥（排斥组 vs.控制组），因变量为消极情绪（愤怒、悲伤、受伤感）、积极情绪及攻击倾向，使用 Cyberball 范式操纵社会排斥，攻击倾向采用 Buss-Warren 攻击问卷中文修订版测量，招募 75 名研究对象（排斥组 35 人，控制组 40 人）。实验 2 旨在探究社会排斥情境下，不同强度短时有氧运动对情绪及攻击倾向的改善作用，采用单因素组间设计，自变量为运动类型（低强度 vs.中强度 vs.静坐组），招募 83 名研究对象（低强度 29 人、中强度 27 人、静坐组 27 人），被试在 Cyberball 游戏后，对情绪及攻击倾向进行第 1 次测量，在干预后进行第 2 次测量，对两次测量分数的差值进行分析。结果：实验 1 验证先前研究结论，社会排斥组的消极情绪各维度（愤怒、悲伤、受伤感）均高于控制组，$p< 0.001$，积极情绪低于控制组，$p< 0.001$，攻击倾向高于控制组，$p< 0.05$。实验 2 发现，消极情绪方面，愤怒情绪差值的运动类型组间效应显著，$F(2,80)=4.691$，$p< 0.05$，悲伤情绪差值及受伤感差值的运动类型组间效应均不显著，$p>0.05$，积极情绪差值的运动类型组间效应显著，$F(2,80)=16.254$，$p< 0.001$，攻击倾向差值的运动类型组间效应显著，$F(2,80)=3.554$，$p< 0.05$；事后检验的多重比较显示，在愤怒情绪差值方面，中强度运动组与静坐组之间差异显著，$p< 0.01$，在积极情绪差值方面，低强度运动组与静坐组、中强度运动组与静坐组之间差异显著，$p< 0.001$，在攻击倾向差值方面，低强度运动组与静坐组、中强度运动组与静坐组之间差异显著，$p< 0.05$。结论：社会排斥增加个体的消极情绪、减少积极情绪，并提高攻击倾向，而短时有氧运动对社会排斥后的情绪和攻击倾向具有改善作用，具体表现为中强度有氧运动减少愤怒情绪，中强度及低强度有氧运动均能增加积极情绪并降低攻击倾向。

The Improvement of Short-term Aerobic Exercise on Emotion and Aggression Tendency after Social Exclusion

Yuefei Zhang, Guoli Zhang*
School of Psychology, Beijing Sport University, Beijing 100084, guoli_zhang@126.com

***Abstract*：** Background: Social exclusion has a negative impact on individual emotions and increases their tendency to attack. As a positive behavioral strategy, short-term aerobic exercise has rich physical and mental benefits. Therefore, this study aims to explore the improvement effect of short-term aerobic exercise on emotions and aggression after social exclusion. Method: Experiment 1 aims to verify the impact of social exclusion on individual emotions and aggression tendencies. A univariate inter group design was used, with the independent variable being social exclusion (exclusion group vs. control group) and the dependent variable being negative emotions (anger, sadness, sadness), positive emotions, and aggression tendencies. Cyberball paradigm was used to manipulate social exclusion, and aggression tendencies were measured using the Chinese revised version of the Buss-Warren aggression questionnaire, Recruit 75 research subjects (35 in the exclusion group and 40 in the

control group). Experiment 2 aims to explore the improvement effect of short-term aerobic exercise of different intensities on emotions and aggression tendencies in social exclusion situations. A univariate inter group design was used, with the independent variable being the type of exercise (low intensity vs. medium intensity vs. sedentary group). 83 study subjects (29 low intensity, 27 medium intensity, and 27 sedentary group) were recruited. After playing Cyberball, the participants measured their emotions and aggression tendencies for the first time, and the second time after the intervention, Analyze the difference between two measurement scores. Result: Experiment 1 confirmed the previous research conclusion that the negative emotions (anger, sadness, and sadness) of the social exclusion group were higher than those of the control group in all dimensions, $p<0.001$, and the positive emotions were lower than those of the control group, $p<0.001$. The aggression tendency was higher than that of the control group, $p<0.05$. Experiment 2 found that in terms of negative emotions, the inter group effect of the exercise type with a difference in anger was significant, with $F(2,80)=4.691$, $p<0.05$. The inter group effect of the exercise type with a difference in sadness and sadness was not significant, $p>0.05$. The inter group effect of the exercise type with a difference in positive emotions was significant, with $F(2,80)=16.254$, $p<0.001$. The inter group effect of the exercise type with a difference in attack tendency was significant, with $F(2,80)=3.554$, $p<0.05$; Multiple comparisons of post hoc tests showed that there was a significant difference in anger difference between the moderate intensity exercise group and the sedentary group, $p<0.01$. In terms of positive emotion difference, there was a significant difference between the low intensity exercise group and the sedentary group, and between the moderate intensity exercise group and the sedentary group, $p<0.001$. In terms of aggression tendency difference, there was a significant difference between the low intensity exercise group and the sedentary group, and between the moderate intensity exercise group and the sedentary group, $p<0.05$. Conclusion: Social exclusion increases individuals' negative emotions, reduces positive emotions, and increases their tendency to attack. Short term aerobic exercise has an improvement effect on the emotions and tendency to attack after social exclusion, specifically manifested as moderate intensity aerobic exercise reducing anger emotions. Both moderate intensity and low intensity aerobic exercise can increase positive emotions and reduce their tendency to attack.

积极情绪状态与运动经验影响不同站立方式姿势控制的认知机制

冯甜[1]（通讯作者） 梁曼琪[2] 刘锦钊[2] 张富春[2] 刘李艳[2]

1 郑州大学体育学院（校本部），郑州，450001，maefeng@vip.126.com

2 郑州大学体育学院，郑州，450044

摘 要 积极情绪是指指个体由于体内外刺激、事件满足个体需要而产生的伴有愉悦感受的情绪，积极情绪状态会直接影响运动员运动水平的发挥。研究目的：采用专家-新手范式，探讨积极情绪状态与运动经验影响不同站立方式姿势控制的认知机制。方法：本研究从郑州大学体育学院选取 34 名本科生被试。专家组为武术套路大学生[n=17,平均年龄为（21.02±0.78）岁]，新手组为普通大学生[n=17，平均年龄为（21.36±1.10岁）]。采用 2（运动等级：专家组和新手组）×2（不同站立支撑方式：单脚支撑和双脚支撑）×4（积极情绪等级：1 级、2 级、3 级、4 级）三因素混合设计。对其足底压力变化（COP）数据，分别是球长度、外周面积、 Delta X 以及 Delta Y 数据进行重复测量方差分析。结果：COP 结果发现专家组（1414.70±136.58）的球长度小于新手组（1799.69±114.70）；单脚（1358.74±75.81）的球长度小于双脚（1854.65±147.39）；单脚(16.51±1.1.28)的 X 轴摆动幅度明显小于双脚(64.81±8.00)摆动幅度；新手组在积极情绪等级 4 时，单脚（20.33±2.77）的 X 轴摆动幅度小于双脚（33.16±17.31）；专家组在积极情绪等级 3 时，单脚（14.56±2.52）的 X 轴摆动幅度小于双脚（28.16±15.80）X 轴。结论：1）专家组的姿势控制能力优于新手组。2）专家组在较低的积极情绪等级下，即可保持姿势稳定；新手组则需要在较高的积极情绪等级下保持姿势稳定。3）在积极情绪状态下，专家组和新手组在双脚支撑中的姿势控制均好于单脚支撑。

Cognitive mechanisms by which positive emotional states and motor experience influence postural control across standing styles

Tian Feng[1]　Manqi Liang[2]　Jinzhao Liu[2]　Fuchun Zhang[2] Liyan Liu[2]
1.School of Physical Education, Zhengzhou University, Zhengzhou, China, 450001
2.Physical Education College of Zhengzhou University, Zhengzhou, China, 450044

***Abstract*:** Positive emotion refers to the emotion accompanied by pleasurable feelings produced by an individual as a result of internal and external stimuli and events that satisfy the individual's needs. Positive emotional state will directly affect the athletes' performance of their sport level. Aims: To explore the cognitive mechanisms by which positive emotional state and sports experience affect postural control in different standing styles using the expert-neophyte paradigm. Methods: Thirty-four （undergraduate subjects were selected from the School of Physical Education of Zhengzhou University for this study. The expert group consisted of college students in martial arts routines [n=17, age: (21.02±0.78)], and the novice group consisted of general college students [n=17, age:(21.36±1.10)]. A three-factor mixed design of 2 (exercise level: expert group and novice group) × 2 (different standing support modes: single-footed support and double-footed support) × 4 (positive mood level: level 1, level 2, level 3, level 4) was used. Repeated-measures ANOVA was performed on their plantar pressure change (COP) data, ball length, peripheral area, Delta X, and Delta Y data, respectively. Results: The COP results found that the ball length of the expert group (1414.70±136.58) was smaller than that of the novice group (1799.69±114.70); the ball length of the single foot (1358.74±75.81) was smaller than that of the bipedal foot (1854.65±147.39); and the amplitude of X-axis oscillations of the single foot (16.51±1.1.28) was significantly smaller than that of the bipedal foot (64.81±8.00) swing amplitude; the novice group's X-axis swing amplitude of single foot (20.33±2.77) was smaller than that of double foot (33.16±17.31) at positive mood level 4; the expert group's X-axis swing amplitude of single foot (14.56±2.52) was smaller than that of double foot (28.16±15.80) X-axis at positive mood level 3. Conclusions: 1) The expert group had better postural control than the novice group. 2) The expert group could maintain postural stability at lower positive mood levels; the novice group needed to maintain postural stability at higher positive mood levels. 3) Both the expert group and the novice group had better postural control in two-legged bracing than in one-legged bracing in the positive mood state.

虚拟现实体感运动的锻炼体验与情感反应

李春铖[1]　杨寅[1]（通讯作者）
1 北京体育大学心理学院，北京，100084，yangyin@bsu.edu.cn

摘 要　随着科学技术和电子设备的不断发展，一种新兴的运动方式——体感运动——正在步入人们的视野，其中虚拟现实技术因其极高的沉浸性和娱乐性受到越来越多年轻人的追捧。探讨虚拟现实体感运动（Virtual Reality Exercise）这一运动形式对个体的身心影响具有重要意义。目的：本研究旨在考察大学生在进行虚拟现实体感运动时的身体活动量，以及相同运动强度下虚拟现实体感运动与传统单车运动在运动体验和情感反应上的差异。方法：在 PICO 游戏上商城中根据运动类型和方式选取两款运动类游戏作为实验材料，分两批随机招募 38 名被试。实验一被试佩戴 POLAR 表和 ActiGraph GT3X 三轴加速度计进行两款

游戏的测试，所有被试接受两款运动游戏的顺序随机，运动结束后记录心率和活动量。实验二被试进行单次的 VR 体感运动和单车运动，接受两种运动的顺序随机，运动中佩戴 POLAR 表，运动前后填写正负性情绪量表、运动后填写沉浸感量表和身体活动愉快感量表并询问被试后续参与同类型运动的意愿。结果：在实验一发现两款游戏在平均心率和代谢当量上无显著差异，且运动强度能够达到中等强度下限。实验二未发现 VR 和单车在运动强度上存在显著差异；发现时间和运动类型在消极情绪上存在显著交互作用,参与者在两类运动前消极情绪得分上没有差别，但 VR 运动后消极情绪得分显著低于单车，提示被试在 VR 运动后消极情绪的改善效果比单车运动更好。此外，被试在 VR 运动条件后的身体活动愉快感、沉浸感、后续锻炼意愿分数都显著高于单车运动条件。结论：VR 运动强度能够达到中等强度，并且相较传统单车运动能够获得更高的愉快感、沉浸感，提升后续锻炼意愿并且改善负性情绪。本研究结果提示，VR 运动可以作为日常身体活动量不足的一种补充，且可能带来更积极的运动情感体验，进而提升个体的锻炼意愿，促进锻炼行为。

Exercise Experience and Emotional Response to Virtual Reality Exercise

LI Chuncheng[1],YAN Yin[1]
1 Beijing Sport University, Beijing, 100084, yangyin@bsu.edu.cn

Abstract：With the continuous development of science and technology and electronic devices, an emerging form of exercise, exergaming, is coming into the limelight, and virtual reality technology is increasingly sought after by young people for its high immersion and entertainment. It is important to understand the physical and psychological effects of Virtual Reality Exercise on people. OBJECTIVE: This study aims to explore the physical activity of general students when playing virtual reality exergames and to compare the similarities and differences between virtual reality exercise and traditional cycling sports in terms of exercise experience and emotional response under the same exercise intensity. METHODS: Two exergames were selected as experimental materials according to the type and mode of exercise in the PICO Game Mall, and 38 subjects were randomly recruited in two batches. Experiment 1 subjects wore a POLAR and ActiGraph GT3X tri-axial accelerometer for the two games, all subjects performed the two games in random order, and heart rate and activity data were recorded after the exercise. Experiment 2 subjects performed a single session of VR exergame and cycling exercise, received sequential randomization of the two exercises wearing a POLAR, filled out the Positive and Negative Affect Scale before and after exercise, the Igroup Presence Questionnaire, and the Physical Activity Enjoyment Scale after exercise and asked about the intention to subsequently participate in the same type of exercise. RESULTS: In experiment 1 no significant differences were found between the two exergames in mean heart rate and metabolic equivalents, and the exercise intensity was able to reach the lower limit of moderate intensity. Experiment 2 did not find a significant difference between VR and cycling in terms of exercise intensity; however, a significant interaction between time and exercise type was found in negative mood scores, participants did not differ in negative mood scores before the two types of exercise, but negative mood scores were significantly lower than cycling, suggesting that subjects showed better improvement in negative emotions after VR exercise than cycling exercise. In addition, subjects' scores of physical activity enjoyment, immersion, and intention to exercise after the VR exercise condition were significantly higher than those of the cycling condition. CONCLUSION: VR exercise can reach moderate intensity and be more enjoyable and immersive than traditional cycling, enhancing the willingness to follow up exercise and improving the bad mood. This makes VR exercise can be used as a

supplement to the lack of daily physical activity and may improve people's awareness of exercise through positive emotional feedback and exercise experience, and develop the habit of regular exercise.

Longitudinal Equivalence of the Simplified Chinese Version of the Physical Activity Dependence Scale in a University Student Population

Jingtao Wu，XiaoLin Zhang,Jun Hu

Physical Health Promotion Research Center for Tibetan, Qiang, and Yi Corridors, Leshan Normal University, Leshan, Sichuan, 614000; School of Physical Education, Sichuan Normal University, Chengdu, Sichuan, 610066

***Abstract*: Objective:** To verify the cross-temporal measurement equivalence of the Simplified Chinese version of the Physical Activity Dependence Scale (PADS) in the Chinese university student population. **Methods:** A survey was conducted among 2225 university students in Leshan and Chengdu, Sichuan Province, with an interval of six

months, using the PADS for two follow-up surveys on the same cohort. **Results:** (1) The factor loadings for each dimension in the T1 period ranged from 0.674 to 0.930, and from 0.706 to 0.971 in the T2 period. The Comparative Fit Index (CFI) and Tucker-Lewis Index (TLI) for the PADS were all above 0.9 in both T1 and T2 observation periods, with the Root Mean Square Error of Approximation (RMSEA) below 0.08; (2) In the configural invariance test, all model fit indices were satisfactory: CFI = 0.915, TLI = 0.915, Bayesian Information Criterion (BIC) = 2400.258, Standardized Root Mean Square Residual (SRMR) = 0.048, RMSEA = 0.061, thus establishing configural invariance; (3) The weak invariance results showed that both ΔCFI and ΔTLI were -0.002, far less than the defined range of 0.01, with BIC and RMSEA being 2432.910 and 0.059, respectively, both of which had decreased by 32.652 and 0.002 respectively, indicating that all decay indices were within the model equivalence range; (4) The strict invariance of the scalar model showed that ΔCFI and ΔTLI were both -0.003, with BIC and RMSEA being 2424.652 and 0.058 respectively, a decrease of 2.486 and 0.000 respectively compared to the strong invariance model; (5) The cross-time invariance of the latent variable variance showed that both ΔCFI and ΔTLI were 0.000, with BIC and RMSEA being 2404.356 and 0.058 respectively, a decrease of 20.296 and 0.000 respectively compared to the strict invariance model; (6) The cross-time stability of the model showed that both ΔCFI and ΔTLI were -0.007, with BIC and RMSEA being 2315.566 and 0.058 respectively, a decrease of 88.79 and 0.000 respectively compared to the model of factor variance invariance; (7) The cross-time invariance of the latent variable mean showed that ΔCFI and ΔTLI were 0.009 and 0.036 respectively, with BIC and RMSEA being 131.382 and 0.052 respectively, a decrease of 31.382 and 0.006 respectively compared to the model of factor covariance invariance. **Conclusion:** The five-factor model of the Simplified Chinese version of the PADS demonstrates cross-temporal measurement equivalence.

不同配对方式的评价性条件反射对大学生内隐锻炼态度的影响

张琪 张国礼（通讯作者）

北京体育大学心理学院，北京，100084，guoli_zhang@126.com

摘 要 目的 评价性条件反射（EC）是指将条件刺激（CS）与非条件刺激（US）反复进行配对，使 CS 获得 US 的效价。本研究探究不同配对方式的 EC 对大学生内隐锻炼态度改变的差异，为提升内隐锻炼态度提供更有效的实验范式。方法 52 名（$M_{年龄}$=20.210 ± 1.293 岁）大学生参与实验，采用 3（配对方式）× 2（测量次序）的混合实验设计，配对方式为组间变量，分为积极配对（锻炼词语+积极图片：配对 200 次）、消极配对（非锻炼词语+消极图片：配对 200 次）和混合配对（锻炼词语+积极图片：配对 100 次，非锻炼词语+消极图片：配对 100 次），测量次序为组内变量，分为前测和后测。使用内隐联想测验测量个体的内隐锻炼态度。结果（1）重复测量的方差分析结果显示，测量次序的主效应显著（$F_{(1, 49)}$ =12.929，p = 0.001< .05，partial η^2 = 0.209），参与者后测的内隐态度态度显著优于前测。配对方式与测量次序的交互作用显著（$F_{(1, 49)}$ = 3.347，p = 0.043<.05，partial η^2 = 0.120）。简单效应分析发现，积极配对和消极配对的内隐锻炼态度后测显著优于前测，混合配对后的内隐锻炼态度无显著性变化。（2）以每组参与者内隐锻炼态度后测与前测的差值为因变量，进行单因素方差分析，结果显示不同配对方式的 EC 对大学生内隐锻炼态度的提升效果有显著性差异（$F_{(2, 49)}$ = 3.347， p = 0.043<.05）。多重比较结果显示，积极配对显著优于混合配对，而混合配对与消极配对没有显著性差异。 结论 （1）评价性条件反射能使大学生的内隐锻炼态度发生显著改善。（2）积极配对的评价性条件反射能够更有效的改善大学生的内隐锻炼态度，以期提高大学生的锻炼行为，促进个体的身心健康。后续研究者可以在本研究的基础上，采用积极配对的评价性条件反射，探究个体内隐锻炼态度与身体活动之间的变化关系。

The effect of evaluative conditioning on implicit attitude toward exercise of college students in different matching modes

Qi Zhang, Guoli Zhang (Corresponding author)
School of Psychology, Beijing Sport University, Beijing, 100084, guoli_zhang@126.com

Abstract: Objective Evaluative conditioning (EC) refers to the repeated pairing of a conditioned stimulus (CS) with an unconditioned stimulus (US), so that CS obtains the valence of US. This study explores the difference of EC with different matching modes on the change of implicit attitude toward exercise of college students, provides a more effective experimental paradigm for improving implicit attitude toward exercise. Methods Fifty-two college students (M_{age}= 20.210 ± 1.293 years old) participated in the study. A mixed experimental design of 3 (matching modes) × 2 (measurement order) was adopted. The matching modes was the between-group variable, which was divided into positive matching (exercise words + positive pictures: pairing 200 times) and negative matching (non-exercise words + negative pictures: pairing 200 times) and mixed matching (exercise words + positive pictures: paired 100 times, non-exercise words + negative pictures: paired 100 times), the measurement order was within-group variable, which was divided into pre-test and post-test. The implicit association test was used to measure the individual's implicit attitude toward exercise. Results 1) The repeated-measurements ANOVA results showed that the main effect of measurement order was significant ($F_{(1, 49)}$ =12.929，p = 0.001< .05，partial η^2 = 0.209), and participants' implicit attitude toward exercise was significantly better in the post-test than in the pre-test. The interaction between matching modes and measurement order is significant ($F_{(1, 49)}$ = 3.347，p = 0.043<.05，partial η^2 = 0.120). Simple effect analysis found that the implicit attitude toward exercise of positive and negative matching was significantly better than that of pre-test, and there was no significant change in implicit attitude toward exercise after mixed matching. 2) Using the difference between the post-test and pre-test of implicit attitude toward exercise as the dependent variable, univariate analysis of variance was performed. The results showed that EC with different matching modes had significant difference on the improvement effect of implicit attitude toward exercise of college students ($F_{(2, 49)}$ = 3.347，p = 0.043<.05). The results of multiple comparisons showed that positive matching was significantly better than mixed matching, while mixed matching had no significant difference from negative matching. Conclusion 1) Evaluative conditioning can significantly improve the implicit attitude toward exercise of college students. 2) The evaluative conditioning of positive matching can improve implicit attitude toward exercise of college students more effectively, so as to improve their exercise behavior and promote their physical and mental health. On the basis of this study, subsequent researchers can use positive matching evaluative conditioning to explore the changing relationship between individuals' implicit attitude toward exercise and physical activity.

身体活动中“习惯性启动”与“习惯性执行”的历史溯源、现实审视和未来展望

朱良昊　侯君利　王井强（通讯作者）
湖北商贸学院体育学院，武汉 430079，E-mail：zlhzhupipi@163.com

摘 要　习惯被视为一种过程或心理结构的当代观点盛行，致使身体活动习惯的概念化和运行机制不断接受挑战。特别是身体活动中习惯的两种表现形式：习惯性启动、习惯性执行，引发 Hagger、Phillips、Gardner 等学者于 2019 年在《运动与锻炼心理学》杂志上批判性地讨论这种区分的基本原理及证据，试图更准确地描述个体产生习惯性行为的过程。本文采用叙述性综述，对身体活动中习惯性启动与习惯性执行的历史溯源进行回顾，系统梳理该领域最新理论和实证资料，审视现有研究的成就与不足，并面向未来提出基于习惯的行为改变干预措施的相关建议。首先，文献资料呼吁我们重新认识习惯，完成三重转向：1）由过去行为频率的同义词转向重复响应形成的自动性；2）由脱离认知机制的行为形式转向产生行为冲动的总体过程；3）由目标追求的对立竞争者转向特定行为的默认合作者。将习惯理论应用于复杂行为（身体活动）需要对行为进行解构，研究认为：身体活动是由多个简单子动作依次串联且有意识参与调节的行为序列，习惯性行为是由习惯性启动与习惯性执行独立控制的行为或行为反应。其次，习惯性启动描述了从一系列替代方案中自动选择且承诺实施某项行动的习惯，习惯性执行描述了完成高阶行动所涉及至少一个低阶步骤序列的自动进展，是一种促进流畅表现的习惯。然而，以层次结构为基础的二维分析视角存在逻辑缺陷，需要围绕研究背景和目的，借助相对不适宜分析水平产生的直觉判断，确定一个最适当分析水平理解身体活动的启动点。值得注意的是，这种区分与习惯准备和习惯表现的二分法相似但不等同，分离后的习惯性执行与行为一致性、模式化行动在程序上出现重合，尽管习惯性启动与执行在测量方法上具有独特性。传统观点认为习惯的决定因素与线索、行为、行动者相关，先前的诸多论断都无保留地指向习惯性启动，而忽视这些决定因素与习惯性执行的可能解释。在行为预测方面，习惯对行为的两种典型影响机制都归结于习惯性执行，“固定的习惯性启动”和“多变的习惯性执行”的结合体是预测行为最理想的状态。最后，我们建议：1）应使用传感器数据（例如，GPS）或密集的自我报告数据（例如，日记法、生态瞬时评估）捕捉习惯性启动与习惯性执行，以获取更高的测量精确度；2）如果出于促进参与者形成有益的身体活动习惯，应强调干预对习惯性启动的效果提升；3）针对习惯强度已经趋于稳定的参与者，如果目的是消退有害的身体活动习惯，应优先考虑从结构上打破原有行动序列的自动关联。

The history, practice, and future of “habitual instigation” and “habitual execution” in physical activity

ZHU Lianghao, HOU Junli, WANG Jingqiang
School of Physical Education, Hubei Business College, Wuhan 430074

***Abstract*:** The prevalence of contemporary perspectives on habit as a process or psychological structure has led to a continuous challenge to the conceptualization of physical activity habits and the mechanisms by which they operate. In particular, the two manifestations of habit in physical activity: habitual instigation, and habitual execution, prompted the critically discussed rationale and evidence for this distinction in the Psychology of Sport and Exercise in 2019 by scholars such as Hagger, Phillips, Gardner, and others, in an attempt to more accurately characterise the processes by which individuals produce habitual behaviors. Using a narrative review, this paper

reviews the historical origins of habitual instigation and execution in physical activity, systematically compiles the latest theoretical and empirical information in the field, further examines the achievements and shortcomings of the existing research, and makes recommendations related to habit-based behavior change interventions for the future. First, the literature calls on us to reconceptualise habits and accomplish a triple shift: 1) from synonyms of past behavioral frequencies to automaticity formed by repetitive responses; 2) from forms of behavior divorced from cognitive mechanisms to overarching processes generating behavioral impulses; and 3) from antagonistic competitors in the pursuit of a goal to default co-operators in specific behaviors. Applying habit theory to complex behavior (physical activity) requires a deconstruction of behavior, with research suggesting that physical activity is a sequence of behaviors consisting of a number of simple sub-movements sequentially linked and consciously regulated, and that habitual behaviors are behaviors or behavioral responses that are independently controlled by habitual instigation and execution. Second, habitual instigation describes the habit of automatically selecting and committing to an action from a range of alternatives, and habitual execution describes the automatic progression through a sequence of at least one lower-order step involved in completing a higher-order action, and is a habit that promotes fluent performance. However, a two-dimensional analytical perspective based on a hierarchical structure suffers from logical deficiencies and requires the identification of a point of initiation for understanding physical activity at the most appropriate level of analysis by drawing on intuitive judgements generated by the relatively inappropriate level of analysis around the context and purpose of the study. It is worth noting that this distinction is similar but not equivalent to the dichotomy of habitual preparation and habitual performance, and that separated habitual performance overlaps procedurally with behavioral consistency and patterned action, despite the uniqueness of habitual initiation and performance in terms of measurement methods. The traditional view of the determinants of habits as related to cues, behaviors, and actors, with many previous assertions pointing unreservedly to habitual instigation, ignores possible explanations of these determinants in relation to habitual execution. In terms of behavioral prediction, the two typical mechanisms of habitual influence on behavior are attributed to habitual execution, and the combination of "fixed habitual instigation" and "variable habitual execution" is the most desirable state for predicting behavior. Finally, we suggest that: 1) using sensor data (e.g., GPS) and dense self-reported data (e.g., diary methods, ecological instantaneous assessments) to capture habitual initiation and execution can achieve higher accuracy; 2) If it is to promote the formation of beneficial physical activity habits among participants, emphasis should be placed on enhancing the effectiveness of intervention in habitual initiation; 3) For participants whose habit intensity has stabilized, if the goal is to eliminate harmful physical activity habits, priority should be given to breaking the automatic connection of the original action sequence structurally.

体育锻炼与大学生主观幸福感的关系：有调节的中介模型

王迎晨[1]、邹容[1]（通讯作者）

武汉体育学院运动医学院，武汉，43000，通讯作者 E-mail:zourong4035@qq.com

摘 要 以往研究表明经常性的体育锻炼行为可以改善个体的精神健康，使其可能采用更多的适应性的情绪调节策略，从而有利于提高主观幸福感，然而性别角色规范限制了个体在特定情景下选择合适的情绪调节策略，因此，需要对体育锻炼与主观幸福感之间的关系及作用机制进行探究。

目的：本研究通过检验一个有调节的中介模型，探讨在体育锻炼与主观幸福感之间的关系，情绪调节策略的中介作用以及性别角色的调节作用。

方法：采用问卷法对 896 名大学生进行调查研究，使用体力活动评定量表(PARS-3)、性别角色(PARS-3)、情绪调节问卷（ERQ）并以抑郁、人际关系质量和生活满意度量表的分值作为主观幸福感指标的问卷，采用 SPSS 26.0 软件及 PROCESS 宏程序对数据进行中介和调节效应分析。

结果:（1）体育锻炼显著预测大学生的主观幸福感；（2）控制额外变量后，认知重评和表达抑制在体育锻炼对主观幸福感维度上的抑郁、人际关系质量以及生活满意度起部分中介作用;（3）体育锻炼和主观幸福感各维度上的间接效应前半段受到性别角色的调节；（4）性别角色类型在体育锻炼预测认知重评和表达抑制中其调节作用，具体而言，性别角色类型中男性化和女性化的大学生参与体育锻炼对认知重评的影响作用加强，对表达抑制的影响作用减弱；然而性别角色类型中双性化和未分化的大学生参与体育锻炼对认知重评和表达抑制的产生影响作用不显著。

结论：情绪调节策略在体育锻炼对主观幸福感的影响中起部分中介作用，且这一中介作用的前半段受到性别角色类型的调节。

The relationship between physical exercise and subjective well-being of college students: a moderated mediation model

WANG Yingchen[1] ,ZOU Rong[1] (corresponding author)

College of Sports Medicine, Wuhan University of Physical Education, Wuhan 430000, China.

Corresponding author E-mail:zourong4035@qq.com

Abstract：Previous studies have shown that regular physical exercise can improve the mental health of individuals and enable them to adopt more adaptive emotion regulation strategies, thus helping to improve subjective well-being. However, gender role norms limit the selection of appropriate emotion regulation strategies in specific situations. Therefore, It is necessary to explore the relationship and mechanism between physical exercise and subjective well-being.

Objective: This study examined a moderated mediation model to explore the relationship between physical exercise and subjective well-being, the mediating role of emotion regulation strategies, and the moderating role of gender roles.

Methods: A questionnaire was used to investigate 896 college students. Physical Activity Rating Scale (PARS-3), gender Role Scale (PARS-3), emotional regulation questionnaire (ERQ) and depression, interpersonal relationship quality and life satisfaction scale were used as indicators of subjective well-being. SPSS 26.0 software and PROCESS macros were used to analyze the mediating and moderating effects of the data.

Results: (1) Physical exercise significantly predicted the subjective well-being of college students; (2) After controlling for additional variables, cognitive reappraisal and expression inhibition partially mediated the effects of physical exercise on depression, interpersonal relationship quality and life satisfaction in the subjective well-being dimension; (3) The indirect effects of physical exercise and subjective well-being were regulated by gender roles in the first half; (4) Gender role type has a moderating effect on the prediction of cognitive reappraisal and expression inhibition by physical exercise. Specifically, male and female college students with gender role type participate in physical exercise has a stronger effect on cognitive reappraisal, but a weaker effect on expression inhibition; However, the effects of intersex and undifferentiated college students participating in physical exercise on cognitive reappraisal and expression inhibition were not significant.

Conclusion: Emotion regulation strategy plays a partial mediating role in the influence of physical exercise on subjective well-being, and the first half of this mediating role is regulated by gender role type.

Keywords: physical exercise; Gender roles; Emotion regulation strategies; Subjective well-being

抑制控制对假动作情景下预判表现的影响

刘艳艳[1] 杨楠[2] 王晓婷[1] 高娅卓[2] 周辰[1] 迟立忠[1]（通讯作者）

1 北京体育大学心理学院，北京，100084，chilizh3804@163.com

2 北京体育大学足球学院，北京，100084

摘 要 假动作是运动员寻找时机、创造合适的传球机会的一个必要措施。与非假动作相比，假动作通常诱导运动员利用错误的线索，做出错误的动作反应。如果运动员能够对错误的诱导信息进行抑制，是否可以较少受假动作的影响，从而提高预判表现。研究采用 2(运动情景：假动作、非假动作) × 2 (抑制控制：高、低) × 3(动作序列：t0、t1、t2)混合实验设计。通过 Stroop 任务将 84 名足球运 动员的抑制控制得分进行高、低分组，抑制控制得分在前 27%的运动员为高抑制控制组，后 27%的运动员为低抑制控制组，每组运动员各 22 名。正确率的结果发现，运动情景和抑制控制的主效应显著 (F (1, 42) = 241.058, p < .001, η^2_p = .852；F (1, 42) = 7.631, p = .008, η^2_p = .154)，动作序列与抑制控制的交互作用显著，F (1, 42) = 6.049, p = .004, η^2_p = .126，在 t1(0.71vs. 0.58, p <. 001)和 t2 (0.82 vs. 0.75, p =. 046)动作序列上，高抑制控制组的正确率高于低抑制控制组。动作类型与抑制控制的交互作用显著，F (1, 42) = 11.916, p = .001, η^2_p = .221，在假动作上，高抑制组的正确率高于低抑制组 (0.55 vs. 0.37, p =. 002)；非假动作下无显著差异。动作序列与运动情景的交互作用显著，F (1, 42) = 12.620, p < .001, η^2_p = .231，三个动作序列上假动作的正确率低于非假动作 (0.38 vs.0.86, p <. 001; 0.38 vs. 0.92, p <. 001; 0.62 vs. 0.95, p <. 001)。反应时结果发现，动作序列的主效应显著，F (1, 42) = 58.284, p < .001, η^2_p = .581。运动情景的主效应显著，F (1, 42) = 157.943, p < .001, η^2_p = .790：假动作的反应时 (567.71±27.48) 大于非假动作 (354.62±17.01)。动作序列与运动情景的交互作用显著，F (1, 42) = 4.750, p = .011, η^2_p = .102，三个动作序列的假动作反应时显著大于非假动作。结果表明，抑制控制影响假动作情景下的预判表现，随着动作序列的延申，可用信息变多，促进运动员在假动作情景下的预判表现。

The Effect of Inhibitory Control on the Performance of Anticipation in Deception

Liu yanyan[1] Yang nan[2] Wang xiaoting[1] Gao yazhuo[2] Zhouchen[1] Chi lizhong[1](corresponding author)

1 School of Psychology, Beijing Sprot University, Beijing, 100084, chilizh3804@163.com

2 School of Soccer, Beijing Sprot University, Beijing, 100084

Abstract ：Deceptions are a necessary technical for athletes to find the right moment and create the right passing opportunity. In contrast to geniune movements, deception usually induce athletes to utilize false cues and make incorrect movement responses. If athletes are able to inhibit error-inducing information, could they be less affected by deception and thus improve anticipation performance. The study utilized a 2 (motion scenarios: deception, non-deception) × 2 (inhibition control: high, low) × 3 (action sequences: t0, t1, t2) mixed experimental design. The 84 soccer athletes were grouped into high and low groups by the Stroop task according to the inhibitory control scores. Athletes with inhibitory control scores in the top 27% were in the high inhibitory control group, and athletes in the bottom 27% were in the low inhibitory control group, with 22 athletes in each group. Results for correctness found a significant main effect of movement scenario and inhibition control (F (1, 42) = 241.058, p

< .001, η^2_p = .852; *F* (1, 42) = 7.631, *p* = .008, η^2_p = .154). A significant interaction between movement sequence and inhibition control, *F* (1, 42) = 6.049, *p* = .004, η^2_p = .126 was significant at t1 (0.71 vs. 0.58, *p* < . 001) and t2 (0.82 vs. 0.75, *p* =. 046) action sequences. The high inhibition control group was more correct than the low inhibition control group in deception. The interaction between action type and inhibition control was significant, *F* (1, 42) = 11.916, *p* = .001, η^2_p = .221, with the high inhibition control group having a higher rate of correctness than the low inhibition control group on deception (0.55 vs. 0.37, *p* =. 002). there were no significant differences under non-deception. The interaction between action sequences and motor scenarios was significant, *F* (1, 42) = 12.620, *p* < .001, η^2_p = .231, with lower correct rates than non-deception on the three action sequences (0.38 vs. 0.86, *p* <. 001; 0.38 vs. 0.92, *p* <. 001; 0.62 vs. 0.95, *p* <. 001). Reaction time results found a significant main effect of action sequence, *F* (1, 42) = 58.284, *p* < .001, η^2_p = .581. A significant main effect of movement scenario, *F* (1, 42) = 157.943, *p* < .001, η^2_p = .790. The reaction time to the non-deception (567.71 ± 27.48) was greater than the deception (354.62 ± 17.01). The interaction between action sequences and motor scenarios was significant, *F* (1, 42) = 4.750, *p* = .011, η^2_p = .102, with response times significantly longer for deception than non-deception for all three action sequences. The results suggest that inhibitory control influences anticipatory performance in the deception scenario. As the movement sequences are extended, more information becomes available to facilitate athletes' anticipatory performance in the deception.

强迫运动量表在大学生群体中的性别和纵向等值性

吴静涛[6] 胡军 [1]

（乐山师范学院藏羌彝走廊体质健康促进研究中心，四川乐山 614000 ）

摘 要 **目的：**验证强迫运动量表在大学生群体中的性别和纵向等值性。**方法：**借助强迫运动量表（CET）对乐山市和成都市 8 所在校的 1431 名大学生进行两次纵向调查，间隔时间为 6 个月。**结果：**（1）比以第 1 次观测数据，总分和控制体重的运动维度上男生和女生没有显著性差异（P＞0.05），情绪改善、缺乏运动乐趣、回避和规则驱动等 3 个维度上男女生表现出显著的差异（P＜0.01），且女生得分高于男生，情绪改善维度男生高于女生且表现显著（P＜0.01）。第 2 次观测的各项数值均大于第 1 次，且数据的独立样本检验显著（P＜0.01）；（2）跨性别间的模型拟合度对比，CET 量表在总分、男女生模型的 TLI、CFI 指数均达到大于 0.90 的标准，RMSEA 位于置信区间内（90%）且都小于 0.08 规定数值；（3）模型拟合度的跨性别间比较，对比四个模型校验的拟合度指数，发现 TLI、CFI 指数均大于 0.90，RMSEA 数值落在置信区间内（90%）且均小于 0.08，△CFI 的指数均小于 0.01 界定范围；（4）纵向组别间模型等值性检验，发现△CFI 的指数均小于 0.01，其他观测指标均达标（TLI、CFI、RMSEA），达到了观测模型的要求。**结论：**强迫运动量表（CET）的五因子结构在大学生男女群体、不同观测时段中测量等值性成立。

(Center for physical health promotion in Leshan Normal University Tibetan, Qiang and Yi Corridor, Leshan 614000）

Abstract： **Objective:** To verify the gender and longitudinal equivalence of the Compulsive Exercise Test (CET) in a university student population. **Methods:** The CET was used to conduct two longitudinal surveys among 1431 university students from eight schools in Leshan and Chengdu cities, with an interval of six months. **Results:** (1) Compared with the first observation data, there were no significant differences in the total score and the dimension of exercise for weight control between males and females (P＞0.05), but there were significant differences in the dimensions of mood improvement, lack of exercise enjoyment, avoidance and rule-driven exercise (P＜0.01), with females scoring higher than males in the former three, but males scoring significantly higher in mood improvement (P＜0.01). The values of all items in the second observation were higher than in the first, and the independent sample test was significant (P＜0.01); (2) Comparing the model fit across genders, the CET showed that the Tucker-Lewis Index (TLI) and Comparative Fit Index (CFI) of the total score and gender models all met the standard of >0.90, and the Root Mean Square Error of Approximation (RMSEA) fell within the confidence interval (90%) and were all below the set value of 0.08; (3) Comparing the model fit across genders, the fit indices of the four models' validation showed that TLI, CFI were all above 0.90, RMSEA fell within the confidence interval (90%) and were all below 0.08, and the ΔCFI were all within the defined range of 0.01; (4) In the test of model equivalence across longitudinal groups, all ΔCFI were below 0.01, and other observed indices (TLI, CFI, RMSEA) all met the standard, fulfilling the requirements of the observation model. **Conclusion:** The five-factor structure of the CET demonstrated measurement equivalence in both male and female university students, and across different observation periods.

强制隔离戒毒人员复吸风险性问题分析与矫治对策

王春光[1,2]，陈天宇[4],李勇辉[2,3]

（[1]中央司法警官学院，河北省保定市，071000;2.中国科学院心理健康重点实验室，中国科学院心理研究所，北京 100101；3.中国科学院大学心理系，北京 100049;[4]西交利物浦大学，江苏省苏州市，215100.通讯作者 E-mail: liyonghui@pscy.ac.cn.）

摘 要 **目的：**预防复吸行为仍是强制隔离戒毒工作的关键性问题。本研究旨在分析传统型与新型戒毒人员的复吸风险性存在的问题，并有针对性地提出矫治对策，从而降低强制隔离戒毒人员的复吸风险性。**方法：**研究采用《戒毒人员复吸倾向性量表》对 186 名戒毒人员进行评估测试，对测试数据进行独立样本 t 检验和线性回归分析，比较新型毒品人员与传统型毒品人员在复吸风险因素上的异同。**结果：**戒毒人员的生理唤醒问题最为明显，90%以上的戒毒人员存在此方面的问题。在戒毒效能感方面，传统型的得分高于新型

毒品，达到了显著性差异（t=2.11，P<0.05）。在生理唤醒方面，传统型的得分高于新型毒品，且达到了极其显著性差异（t=2.84，P<0.01）。戒毒效能感（β=0.832，p<0.001）成为预测传统型毒品人员复吸风险的首要因素，戒毒行动（β=0.909，p<0.001）成为预测新型毒品人员复吸风险的首要因素。**结论：**根据两种类型戒毒人员复吸倾向性的问题表现，本研究提出了四个方面的矫治对策，即防复吸心理训练应加强对测试未通过戒毒人员诚信教育、防复吸心理训练应共性和区别对待相结合、防复吸心理训练应分阶段开展、防复吸心理训练应形成“模块化”，通过团体干预与个体干预相结合的方式，降低影响不同类型戒毒人员复吸的主要风险性因素，以促进戒毒人员防复吸矫治工作的科学化发展。

Analyzing Relapse Risk Question and Intervention Strategies for Compulsory Isolated Drug Rehabilitation Participants.

Wang Chunguang[1,2],Chen Tianyu[4],Li Yonghui[2,3]

(1.The National Police University for Criminal Justice, Hebei, 071000, China;2.Key Laboratory of Mental Health,Institute of Psychology,CAS,Beijing 100101,China;3.Department of Psychology,University of Chinese Academy of Sciences,Beijing 100049,China;4.Xi'an Jiaotong-Liverpool University, Jiangsu, 215100, China)

Abstract **：** **Objective:** Preventing relapse remains a key issue in compulsory isolation and drug rehabilitation The aim of this study is to analyze the problems in the risk of relapse among traditional and new types of drug addicts, and to propose targeted corrective measures to reduce the risk of relapse among compulsory isolation drug addicts.**Methods:** The study used the "relapse tendency scale for drug addicts" to evaluate and test 186 drug addicts, and conducted independent sample t-tests and linear regression analysis on the test data to compare the similarities and differences in relapse risk factors between new drug addicts and traditional drug addicts.**Results:** Physiological arousal was found to be the most significant problem for drug addicts, with over 90% of drug addicts experiencing this problem. In terms of drug abstinence self-efficacy, traditional drug addicts scored higher than new drug addicts, with a significant difference (t=2.11, P<0.05). In terms of physiological arousal, the score of traditional drugs was higher than that of new drugs, and reached an extremely significant difference (t=2.84, P<0.01). Drug abstinence self-efficacy (β=0.832, p<0.001) was found to be the primary factor in predicting the risk of relapse for traditional drug addicts, while drug abstinence behavior (β=0.909, p<0.001) was the primary factor in predicting the risk of relapse for new drug addicts.**Conclusion:** Based on the symptoms of relapse tendency in two types of drug rehabilitation personnel, this study proposes four corrective measures: strengthening integrity education for drug rehabilitation personnel who had not passed the test, combining common and differential treatment in anti relapse psychological training, conducting staged anti relapse psychological training, and forming a "modular" anti relapse psychological training.By combining group intervention with individual intervention, the main risk factors affecting relapse among different types of drug addicts can be reduced, in order to promote the scientific development of the prevention and treatment of relapse among drug addicts.

亲密伴侣暴力风险评估工具研究

张佳佳[1 2]

1. 四川警察学院 警察管理系 四川泸州 646000

2.中国人民公安大学 犯罪学学院 北京 100038

摘 要：[研究背景]亲密伴侣暴力(Intimate Partner Violence，以下简称 IPV)是指当前或曾经的亲密伴侣所实施的躯体、性、或情感上的伤害或虐待，通过威胁或强迫的手段来获取权力和对受暴者的控制。IPV 风险评估工具已被引入到多个国家监管和防治家庭暴力实践中，多项研究证明 IPV 风险评估工具可准确识别暴力者及受害者所处的风险等级及确定适当的响应措施，以减少暴力行为的发生。我国 IPV 事件普遍发生且后果严重，但有关部门对 IPV 案件的处置和防治仍处于被动响应状态，缺少客观有效的风险评估、监控、回访和受害者后续安全管理等跟进措施，不利于家庭暴力防治与社会安全治理。[研究目的]旨在为我国选择 IPV 风险评估工具或构建本土化家庭暴力风险评估工具提供参考和借鉴，通过构建或选择符合中国式家庭暴力特点的风险评估工具应用于研究及警务司法实践，为反家庭暴力工作中合理分配资源、受害者保护、司法量刑及开展精准有效的预防干预提供依据。[研究内容及方法]首先介绍了目前 IPV 风险评估的三种方法，包括非结构化临床评估、精算风险评估和结构化专业评估；其次详细阐述了广泛应用于多个国家公安、司法、保护机构实践活动中且预测效度良好的 IPV 风险评估工具及其开发背景、评估方法、评估内容、预测准确性及应用情况等特点，包括危险评估量表(DA)、配偶攻击风险评估指南(SARA)、安大略省家庭暴力风险评估(ODARA)、家庭暴力筛查工具(DVSI)、配偶暴力风险评估清单(SVRA-I)以及家庭虐待、跟踪及基于荣耀的暴力风险评估模型(DASH)和警方风险评估(VPR)、警方风险演变评估(VPER)等，并对这些工具评估的内容和风险因素进行了分析、比较和讨论；最后展望了亲密伴侣暴力风险评估工具的未来研究与发展趋势，包括将继续整合尖端技术以提升风险评估的准确性和高效性，将充分考虑文化多样性以提升工具的适用性和可行性，将进一步完善风险管理策略以产生更有效的风险评估与管理效果，以及重视评估人员专业性培训以提升评估工具的预测效能和可靠性。

Research on Intimate Partner Violence Assessment Tools

ZHANG Jia-jia[1 2]

1. Department of Police Management, Sichuan Police College, Sichuan, Luzhou 646000, China

2. School of Criminology, People's Public Security University of China, Beijing 10038, China

Abstract: [Research Background] Intimate partner violence (IPV) includes physical violence, sexual violence, stalking and psychological aggression (including coercive tactics) by a current or former intimate partner (i.e., spouse, boyfriend/girlfriend, dating partner, or ongoing sexual partner). IPV risk assessment tools have been introduced into regulatory and prevention practices of domestic violence in multiple countries. Through IPV risk assessment, it is possible to accurately identify the risk level of the violent person and the victim and determine the appropriate response measures to reduce the occurrence of violence. In China, IPV incidents are widespread and have serious consequences, but the handling and prevention of IPV cases by relevant departments were still in a passive responsive state. There was a lack of objective and effective risk assessment, monitoring, follow-up visits, and subsequent safety management for victims, which hinders domestic violence prevention and social security governance. [Research Objective] The objective of this study was to provide references and guidance for the

selection of IPV risk assessment tools in China or the development of localized domestic violence risk assessment tools. By constructing or selecting risk assessment tools that align with the characteristics of Chinese-style domestic violence, they can be applied in research and law enforcement practices. This will facilitate the rational allocation of resources in combating domestic violence, protection of victims, judicial sentencing, and the implementation of precise and effective preventive interventions. [Research Content and Methods] Firstly, this study introduced three methods of IPV risk assessment, including unstructured clinical judgment, actuarial risk assessment, and structured professional judgment. Furthermore, a detailed explanation was provided on IPV risk assessment tools that have been widely applied in the practices of law enforcement, judiciary, and protection agencies in multiple countries, and have shown good predictive validity. The characteristics of these tools were discussed, including their development background, assessment methods, assessment content, predictive accuracy, and application status. These tools included the Danger Assessment Scale (DA), Spousal Assault Risk Assessment Guide (SARA), The Ontario Domestic Assault Risk Assessment (ODARA), Domestic Violence Screening Instrument (DVSI), The Spousal Violence Risk Assessment Inventory (SVRA-I), Domestic Abuse, Stalking, and Honor-Based Violence Risk Identification and Management Model (DASH), Police Risk Assessment (VPR), and Police Assessment of the Evolution of Risk (VPER). The content and risk factors assessed by these tools were analyzed, compared, and discussed. Lastly, future research and development trends for IPV risk assessment tools were discussed. Firstly, the cutting-edge technologies will be integrated to improve the accuracy and efficiency of risk assessment. Secondly, the cultural diversity will be fully considered to improve the applicability and feasibility of the tools. Thirdly, it will further improve the risk management strategies to yield more effective risk assessment and management outcomes, and emphasize on professional training for assessors to enhance the predictive efficacy and reliability of assessment tools.

脑发育视角下罪错未成年人分级处遇机制构建研究

谷超[1]（通讯作者）朱丽娜[2]

1 扬州大学法学院，江苏扬州，225127，通讯作者 guchao@yzu.edu.cn

2 扬州大学体育学院，江苏扬州，225127，

摘 要 《中华人民共和国预防未成年人犯罪法》对未成年人不良行为和严重不良行为的内涵和外延作出相应调整，但是当下对未成年人罪错行为的基本内涵、分级标准、分级体系以及处遇措施等还存在较大争议，针对上述问题，需要回归分级的客观标准——未成年人大脑发育情状构建相应的客观标准。未成年阶段，个体大脑发育的三个重要维度——灰质结构、白质结构、人脑自发神经活动在不断变化：灰质中前额叶皮层的不成熟使得青少年比成年人更容易受到冲动行为和风险决策的影响，也更容易受到情绪和社会唤醒对认知功能的影响。白质作为连接脑区的粗大纤维束，是神经元信号传递的载体，青春期期间微观结构通路发育不完善，导致大脑解剖结构临近或相距较远的脑区之间未能形成有效且精确的信息交换，使得未成年人自我控制、决策、执行功能这些高级且复杂的功能也未能发育完善。未成年人大脑中与扣带回相关的5个功能不同的内在连接网络 (涉及运动控制、注意力/认知控制、冲突监控和错误处理、心理化和社会处理以及情绪调节的5个自我控制网络区域)表现为在儿童期和青春期观察到弥散的局部功能连接模式。因此，未成年人脑结构和功能发育的矛盾特征，造就了未成年人出现了高冲动、情绪波动、自我控制能力较低和寻求奖励行为的“风暴时期”。基于前述客观存在，构建罪错未成年人分级处遇机制需初步构建未成年人脑

质发育数据库，为个案中评估未成年人大脑发育水平以及大脑中相应部位的发育状态以服务个别化的人身危险性判断提供样本基础，进而针对未成年人不良行为（不良行为、严重不良行为、犯罪行为）提出针对性的处遇方法：针对不良行为和严重不良行为，以前述个别化的人身危险性判定结果为前提，结合未成年人大脑发育不全的区域可能造成的结果，进行针对性教育；针对犯罪行为，需坚持教育和改造相结合，包括依据大脑发育状况而提出的针对性课程。

An Examination of the Establishment of a Mechanism for Assessing and Addressing Juvenile Offenders through the Lens of Brain Development

Gu Chao[1] Zhu Lina[2]
1 Law School, Yangzhou University, Yangzhou 225127, China
2 College of Physical Education, Yangzhou University, Yangzhou 225127, China

Abstract：The Law of China on the Prevention of Juvenile Delinquency has made revisions to the definition and scope of juvenile misbehavior and serious misbehavior. Nevertheless, significant controversies persist regarding the fundamental definition, criteria for classification, grading system, and intervention strategies for juvenile misbehavior. Given these aforementioned issues, it is imperative to establish objective standards based on the developmental status of juveniles' brains in order to address these concerns effectively. During the juvenile stage, the dynamic nature of individual brain development encompasses three crucial dimensions, namely gray matter structure, white matter structure, and spontaneous neural activity within the human brain. Notably, the immaturity of the prefrontal cortex in gray matter renders adolescents more vulnerable to impulsive behavior and risky decision-making compared to adults. Additionally, emotional and social arousal significantly influences cognitive function in this population. White matter, serving as a substantial fiber bundle facilitating interconnectivity among brain regions, plays a crucial role in the transmission of neuronal signals. In the period of adolescence, the maturation of microstructural pathways remains unfinished, resulting in the inability to establish efficient and precise information exchange between anatomically proximate or distant brain regions. Consequently, this incomplete development hampers the acquisition of sophisticated and intricate cognitive abilities, including self-regulation, decision-making, and task execution, among minors. The cingulate gyrus in the brains of minors is associated with five functional internal connectivity networks, which encompass regions involved in motor control, attention/cognitive control, conflict monitoring and error handling, psychological and social processing, and emotional regulation. These networks demonstrate diffuse local functional connectivity patterns that are observed throughout childhood and adolescence. Hence, the incongruous attributes pertaining to the brain's structure and functional maturation in individuals under the age of majority have given rise to a phase known as the "storm period," characterized by heightened impulsivity, emotional volatility, diminished self-regulation, and a propensity for seeking rewards. In light of the aforementioned objective reality, the establishment of a framework for the categorization and intervention of juvenile offenders necessitates the preliminary construction of a database encompassing the neurological development of minors. This database will serve as a foundational resource for assessing the level of brain development in minors and the corresponding developmental state of specific brain regions in individual cases, thereby facilitating personalized risk assessment. Moreover, this study suggests

specific intervention strategies for addressing minors' negative conduct, encompassing general misbehavior, severe misbehavior, and criminal acts. Specifically, tailored educational interventions are recommended for addressing general misbehavior and severe misbehavior, taking into account the results of individualized risk assessments and considering the potential impact of underdeveloped brain regions in minors. Additionally, a comprehensive approach involving both education and rehabilitation is deemed essential for addressing criminal behavior, which includes targeted interventions aligned with brain development.

摘 要： 自杀一直是全球大学生群体中一个重要的公共卫生问题，已成为大学生非正常死亡的重要原因。探查自杀意念向自杀行为转变过程中的风险因素和保护因素，对降低大学生自杀风险具有重要现实意义。自杀的动机意志模型认为，自杀意念和自杀行为隶属两个不同的认知加工过程，自杀意念的形成更容易受到上行冲动系统的影响，自杀行为的发生更容易受到下行控制系统的影响。感恩的拓展建构理论认为，感恩的人社会适应能力更强，遇到逆境悲观绝望时，低感恩的人可能更容易出现自杀意念和行为。为此，本研究运用分类决策树模型，对 11288 名职校大学生施测感恩问卷、自我控制双系统量表、自杀问卷及人口学信息，分析过去一年内自杀意念及感恩、自控等变量对近半年内自杀行为的预测效应。结果显示：大学生近一年内自杀意念发生率 17.1%，近半年内自杀行为发生率 3.8%。分类决策树分析发现，自杀意念为根节点，感恩、冲动、控制、家庭阶层、是否独生均为重要的子节点(AUC=0.959)。得出如下结论：自杀意念是大学生自杀行为最重要的近端风险因素，年内单次和多次自杀意念学生的自杀行为发生率分别为 14.1%和 30.6%。对年多次自杀意念学生而言：冲动为重要风险因素，高冲动学生自杀行为发生率（40.2%）是中低冲动者（17.8%）的 2.26 倍。在中低冲动的多次自杀意念学生中，感恩特质是自杀行为的远端保护因素，低感恩者的自杀行为发生率（27.7%）是中高感恩者（9.7%）的 2.86 倍。而在高冲动的多次自杀意念学生中，适度控制是自杀行为的远端保护因素（27.2%），过高或过低控制均增加自杀行为风险（44.6%）。而对单次自杀意念学生而言，经济社会地位下层家庭的自杀行为发生率（18.0%）明显高于中上家庭（11.9%）。中上阶层家庭中，非独生子女大学生的自杀行为发生率（15.7%）高于独生子女（7.7%）。

The Classification Decision Tree Model on College Students' Suicide Behavior

XUE Zhaoxia[1] REN Ziyuan[1] JING Lei[1] LI Hui[2]

1. *School of Humanities and Social Sciences*, *Shanxi Medical University*, *Taiyuan* 030001;

2. *Shanxi Vocational and Technical College of Finance and Trade*, *Taiyuan* 030602

***Abstract*:** Suicide is a pressing public health issue among college students worldwide. Understanding the risk and

protective factors associated with the transition from suicidal ideation to suicidal behavior is crucial for prevention efforts. This study used a classification decision tree model to investigate the impact of gratitude, self-control, and demographic factors on suicidal behavior among 11,288 vocational colleges. The results indicated that 17.1% of students reported suicidal ideation in the past year, and 3.8% engaged in suicidal behavior in the past six months. Suicidal ideation emerged as the most important proximal risk factor for suicidal behavior. Gratitude, impulse, control, family class, and whether the student was an only child were identified as important factors in the classification decision tree analysis (AUC=0.959).Among students with single or multiple instances of suicidal ideation during the year, the incidence of suicidal behavior was 14.1% and 30.6%, respectively. For students with multiple instances of suicidal ideation, impulsivity was a significant risk factor. The incidence of suicidal behavior among students with high impulsivity (40.2%) was 2.26 times higher than that among students with medium and low impulsivity (17.8%). Gratitude trait acted as a distal protective factor for students with multiple instances of suicidal ideation and low or moderate levels of gratitude. The incidence of suicidal behavior among students with low gratitude (27.7%) was 2.86 times higher than that among students with medium or high gratitude (9.7%). Among students with high impulsiveness and multiple instances of suicidal ideation, moderate control was a distal protective factor for suicidal behavior (27.2%), while both excessively high and low control increased the risk of suicidal behavior (44.6%).For students with single instances of suicidal ideation, the incidence of suicidal behavior was significantly higher among those from families with lower socioeconomic status (18.0%) compared to those from families with upper or middle socioeconomic status (11.9%). Among college students from upper-middle class families, the incidence of suicidal behaviors was higher among students with siblings (15.7%) compared to those from only child families (7.7%).

In conclusion, this study emphasizes the importance of addressing suicidal ideation as a significant risk factor for suicidal behavior among college students. It highlights the role of impulsivity, gratitude, self-control, and family background in influencing the likelihood of engaging in suicidal behavior. These findings provide valuable insights for suicide prevention strategies targeting college students.

大学生孤独感与智能手机问题性使用间关系的网络分析

任垒[1,2]　陈晨[3]　周喻[1,2]　刘旭峰[4]（通讯作者）

1 武警后勤学院军事心理学教研室，天津，300309

2 军队心理健康服务与研究中心，天津，300309

3 中国人民解放军 95455 部队，遵义，563000

4 空军军医大学军事医学心理学系，西安，710032，lxf_fmmu@163.com

摘 要　孤独感（Loneliness）被认为是智能手机问题性使用（Problematic smartphone use ，PSU）的重要风险因素之一。目前研究大多使用自我报告量表总分来探究孤独感与 PSU 之间的关系。然而，现有研究表明 PSU 可能反映了一种由异质性症状组成的综合症，且每种 PSU 症状可能与其风险因素存在不同的关联模式。另外，孤独感是由不同成分所组成的心理学构念。到目前为止，还没有研究检验大学生孤独感不同成分与 PSU 不同症状间的关联模式。本研究使用网络分析，旨在探究：1）大学生孤独感的内部网络结构及其核心成分；2）大学生 PSU 的内部网络结构及其核心症状；3）大学生孤独感不同成分与 PSU 不同症状间的关联模式及关联两者的桥变量。以陕西省五所大学 1849 名大学生为研究对象。孤独感采用简版 UCLA 孤独感量表（ULS-6）进行评估。PSU 采用中文版九项网络游戏障碍量表简表（CIGD-SSF-9）进行评估。使用软件 R 中 qgraph 包的 EBICglasso 方法构建三个正则化偏相关网络（Regularized partial correlation network），

即孤独感网络、PSU 网络以及孤独感-PSU 网络。使用预期影响（Expected influence）量化孤独感网络和 PSU 网络中每个变量的中心性。使用桥预期影响（Bridge expected influence）量化孤独感-PSU 网络中每个变量的桥中心性。在孤独感网络中，所有关联均为正性。成分“我感到被人冷落”具有最大的预期影响值，意味着其是孤独感网络中的核心成分。在 PSU 网络中，所有关联均为正性，症状“尽管你因为过度使用手机遭遇心理与社会问题，却仍然过度使用”具有最大的预期影响值，意味着其是 PSU 网络中的核心症状。在孤独感-PSU 网络中，所有关联均为正性，孤独感成分“我对自己如此地不善交际感到不快”和 PSU 症状“你使用手机来逃避或缓解负面心境”具有最大的桥预期影响值，意味着其是连接孤独感和 PSU 的桥变量。本研究揭示了大学生孤独感和 PSU 各自内部网络结构和核心变量以及孤独感-PSU 的网络结构和桥变量。这些结果可能会为大学生相关的预防和干预提供了潜在的靶点，如针对过度使用智能手机来降低整体 PSU 的严重程度以及针对不善交际而感到不快来防止从孤独感引发 PSU。

lxf_fmmu@163.com

***Abstract*:** Loneliness is considered as an important risk factor for Problematic smartphone use (PSU). Researches have investigated the relations between loneliness and PSU using total scores on self-report measures. However, existing research has demonstrated that PSU may reflect a composition of heterogeneous symptoms, with individual PSU symptoms uniquely related to risk factors. Moreover, loneliness is a psychological construct, consisting of different components. Yet, no studies to date have examined the association between the different components of loneliness and symptoms of PSU. Using a network analysis approach, we aimed to explore: 1) the internal network structure and core components of loneliness in college students; 2) the internal network structure and core symptoms of PSU in college students; and 3) the association between different components of loneliness and symptoms of PSU, and bridge variables bridging them in college students. We estimated three regularized partial correlation networks (i.e., loneliness network, PSU network, and Loneliness-PSU network) among 1,849 college students from five universities in Shaanxi Province via Package qgraph (EBICglasso) in software R. Loneliness was assessed via the short-form UCLA Loneliness Scale (ULS-6). PSU was assessed via the modified Chinese translated nine-item Internet Gaming Disorder Scale-Short Form. Expected influence was used to quantify the centrality of each variable in the loneliness and PSU network. Bridge expected influence was used to quantify the bridge centrality of each variable in the Loneliness-PSU network. Within the loneliness network, all associations are positive. The component “I feel left out” has the highest expected influence, indicating this component is the core component of the loneliness network. Within the PSU network, all associations are positive. The symptom “Continuing smartphone use despite knowing it was causing problems between you and other people” has the highest expected influence, indicating this symptom is the core symptom of the PSU network. Within the Loneliness-PSU network, all associations are positive. The component “I am unhappy being so withdrawn” of loneliness and the symptom “Using smartphone in order to temporarily escape or relieve a negative

mood" of PSU have the highest bridge expected influence, indicating these two variables are bridge variables bridging loneliness and PSU. This study reveals internal network structure and core variables of loneliness and PSU, and structure and bridge variables of loneliness-PSU network in college students. These results may provide potential targets for related prevention and intervention of college students, such as focusing on "Continuing smartphone use despite knowing it was causing problems between you and other people" to reduce the severity of PSU and targeting "I am unhappy being so withdrawn" to prevent the PSU from being caused by loneliness.

主动性人格与网络自我调节学习：领悟社会支持和适应能力的链式中介效应

陈丹[1]，孙红梅[1]（通讯作者）

1 天津中医药大学管理学院，天津，301617，shm1029@126.com

摘 要 目的：为探讨主动性人格对网络自我调节学习的影响及领悟社会支持、适应能力在其中的作用。方法：采用主动性人格量表、适应能力量表、领悟社会支持量表和网络自我调节学习量表对 511 名在校大学生进行调查。结果：①主动性人格与领悟社会支持、适应能力呈显著正相关（r=0.55, 0.62; P＜0.001），与网络自我调节学习呈正相关（r=0.48, P＜0.001）；领悟社会支持与适应能力呈显著正相关（r=0.49, P＜0.001），与网络自我调节学习显著正相关（r=0.38, P＜0.001）；适应能力与调节学习显著正相关（r=0.44, P＜0.001）；②领悟社会支持和适应能力在主动性人格和网络自我调节学习之间具有显著部分中介作用，总中介效应量为 36.80%。领悟社会支持起单独部分中介作用，相对中介效应量 15.40%；适应能力起单独部分中介作用，相对中介效应量 15.40%；领悟社会支持和适应能力也起到链式中介作用，相对中介效应量 6.00%。结论：网络主动性人格不仅能够正向预测网络自我调节学习，而且还能通过领悟社会支持、适应能力的单独中介作用及领悟社会支持-适应能力的链式中介作用预测网络自我调节学习。

Proactive Personality and Online Self-Regulated Learning: The Chain Mediation Effect of Perceived Social Support and Adaptability

CHEN Dan[1], SUN Hong-mei[1]

1 School of Management, Tianjin University of Traditional Chinese Medicine, Tianjin 301617, China

Abstract: **Objective:** To explore the relationship of proactive personality, perceived social support, adaptability, online self-regulated learning and its mechanism. **Methods:** A total of 511 college students were tested by using Proactive Personality Scale, Adaptability Scale, Perceived Social Support Scale and Online Self-Regulated Learning Scale. **Results:** ①The proactive personality was positively correlated with perceived social support and adaptability (r=0.55, 0.62; P < 0.001), positively correlated with Online self-regulated learning (r=0.48, P< 0.001), and perceived social support was positively correlated with adaptability and online self-regulated learning(r=0.49, 0.38; P< 0.001), and adaptability was positively correlated with online self-regulated learning (r=0.44, P< 0.001). ②Perceived social support had a significant mediating effect between proactive personality and online self-regulated learning, and the total mediating effect size was 36.80%. Perceived social support plays a partial mediating role, with the relative mediating effect size of 15.40%; Adaptability played a partial mediating role, with

the relative mediating effect size of 15.40%. Perceptive social support and adaptability also play a chain mediating role, with the relative mediating effect size of 6.00%. **Conclusion:** Proactive personality can not only directly affect Online self-regulated learning, but also indirectly affect it by the individual mediating effect of perceptive social support or adaptability and the chain mediating effect of perceptive social support and adaptability.

童年期虐待、网络成瘾与大学生社会退缩的关系：同伴依恋的调节作用

钟沛枝　陈佳榕　萧慧仪　聂衍刚（通讯作者）

1 广州大学教育学院青少年心理与行为研究中心，广州，510006，nie-yangang@gzhu.edu.cn

摘 要 社会退缩（social withdrawal）是个体因为其潜在的社交恐惧和焦虑从而抑制其社交动机，使得个体长期避免于同伴互动并在同伴面前表现出孤独行为的一种现象，对大学生的学业发展、身心健康发展、及其毕业后的社会适应具有明显的不利影响。童年期虐待（child maltreatment）是指父母或其它有监管权和法定监护、抚养义务的人，由于一定的行为或疏忽，导致有意或无意地对儿童造成潜在伤害、潜在威胁或实质性伤害的行为。童年期虐待作为一种早期生活不良事件，与个体社会退缩的形成与发展密切相关。然而，当前童年期虐待对大学生社会退缩的研究仍有不足。因此，基于生态系统理论，本研究构建了一个有调节的中介模型，旨在探讨网络成瘾在大学生童年期虐待与其社会退缩关系间的中介作用，以及同伴依恋在这一中介的路径中的调节作用。本研究选取了广东省 449 名大学生（$Mean_{age}$ = 20.20 岁，SD = 1.42）作为研究对象，所有被试匿名完成了童年期虐待量表、网络成瘾量表、社会退缩量表和同伴依恋量表。研究结果发现：（1）童年期虐待、大学生网络成瘾、社会退缩、同伴依恋两两之间显著关联；（2）网络成瘾显著中介童年期虐待与社会退缩的关系（*indirect effect* = 0.07, SE = 0.02, 95%CI = [0.03, 0.11]）；（3）同伴依恋可显著调节中介路径“童年期虐待→网络成瘾→社会退缩”的前半段（β = 0.09, SE = 0.04, p < 0.05）。本研究将有助于我们了解新成人大学生社会退缩的形成机制、减少新成人大学生出现网络成瘾问题及为帮助新成人大学生解决社会退缩问题提供实证支持与理论指导。

The Relationship Between Child Maltreatment, Social Withdrawal and Internet Addiction among College Students: The Moderating Role of Peer Attachment

Peizhi Zhong, Jiarong Chen, Huiyi Xiao, Yangang Nie*

Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou 510006

***Abstract*:** Social withdrawal is a phenomenon in which individuals suppress their social motivation due to their potential social fear and anxiety, leading to long-term avoidance of peer interaction and solitary behavior in front of peers. It has a significant adverse impact on the academic development, physical and mental health development, and social adaptation of college students after graduation. Childhood maltreatment refers to the behavior of parents

or other individuals with regulatory power and legal guardianship and upbringing obligations, intentionally or unintentionally causing potential harm, threat, or substantial harm to children due to certain behaviors or omissions. Childhood maltreatment, as an early life adverse event, is closely related to the formation and development of individual social withdrawal. However, there is still insufficient research on the impact of childhood maltreatment on social withdrawal among college students. Therefore, based on the ecological systems theory, this study examined the mediating role of Internet addiction in the relationship between childhood maltreatment and social withdrawal of college students, and the moderating role of peer attachment in this mediation path. This study selected 449 college students ($Mean_{age}$=20.20 years old, *SD*=1.42) from Guangdong Province as the research subjects. All participants anonymously completed the Childhood Maltreatment Scale, Internet Addiction Scale, Social Withdrawal Scale, and Peer Attachment Scale. The research results found that: (1) there is a significant correlation between childhood maltreatment, college students' internet addiction, social withdrawal, and peer attachment; (2) Internet addiction significantly mediates the relationship between childhood abuse and social withdrawal (*indirect effect t*= 0.07, *SE* = 0.02, 95% CI = [0.03, 0.11]); (3) Peer attachment can significantly regulate the first half of the mediating pathway "childhood abuse → internet addiction → social withdrawal" (β = 0.09, *SE* = 0.04, $p < 0.05$). This study will help us understand the formation mechanism of social withdrawal among new adult college students, reduce the problem of internet addiction among new adult college students, and provide empirical support and theoretical guidance for helping new adult college students solve social withdrawal problems.

Key words：college student, child maltreatment, social withdrawal, Internet addiction, peer attachment

家庭功能对大学生职业决策困难的影响——核心自我评价与职业探索的链式中介作用

王芬芬[1]　李芃森[1]　孙翠翠[2]（通讯作者）王霞[3]

3 成都体育学院，成都，610041

摘 要　近年来，在全球新冠疫情反复爆发的背景下，国内就业环境的不稳定性和不确定性显著增加，大量的高校毕业生出现了“慢就业”的心理状态，这种现象与学生自身的职业决策困难有关。本研究重点关注家庭功能这一微观环境因素对大学生职业决策困难的影响，并揭示这一影响的内在机制。研究采用方便取样的方式，采用家庭功能评定量表、核心自我评价量表、职业探索量表和职业决策困难问卷分别对 680 名大学生施测了。结果显示：（1）大学生职业决策困难分别与家庭功能（$r = –.28$, p=.000）、核心自我评价（$r = –.44$, p=.000）和职业探索（$r = –.29$, p=.000）存在显著负相关；家庭功能分别与核心自我评价（$r = –.51$, p=.000）、职业探索（$r = –.30$, p=.000）呈显著负相关；核心自我评价与职业探索呈显著正相关（$r = –.28$, p=.000）（2）家庭功能对大学生的职业决策困难有显著的负向预测作用（β= –.28,　p=.000）；（3）家庭功能对核心自我评价（β = .17, p = .000）与职业探索（β=.07, p=.007）具有显著的正向预测作用，而对职业决策困难（β=–.14, p=.134）不具有直接的预测作用；核心自我评价对职业探索（β=.47, p=.000）具有显著正向预测作用，对职业决策困难（β=–2.51, p=.000）具有显著的负向预测作用；职业探索对职业决策困难（β=–.58, p=.000）也具有显著的负向预测作用。结论：核心自我评价和职业探索在家庭功能与职业决策困难之间起链式完全中介作用。本研究从外在的家庭因素及内在核心自我评价的认知角度为职业决策困难的形成机制提供了理论参考。

3 Chengdu Sport University, Chengdu 610041, China

Abstract：In recent years, in the context of the repeated outbreak of the global novel COVID-19 epidemic, the instability and uncertainty of the domestic employment environment has increased significantly, and a large number of college graduates have a psychological state of "slow employment", which is related to the difficulties of students' career decision-making. This study focuses on the influence of family function on career decision-making difficulties of college students, and reveals the internal mechanism of this influence. In this study, 680 college students were tested by family function rating scale, core self-assessment scale, career exploration Scale and career decision Difficulty questionnaire. The results show that: (1) Career decision difficulty was negatively correlated with family function (r = -.28, p=.000), core self-evaluation (r = -.44, p=.000) and career exploration (r = -.29, p=.000). Family function was negatively correlated with core self-evaluation (r = -.51, p=.000) and career exploration (r = -.30, p=.000), respectively. There was a significant positive correlation between core self-evaluation and career exploration (r = -.28, p=.000) (2) Family function had a significant negative predictive effect on career decision difficulty of college students (β= -.28, p=.000). (3) Family function positively predicted core self-evaluation (β=.17, p=.000) and career exploration (β=.07, p=.007), but did not directly predict career decision difficulty (β= -.14, p=.134). Core self-evaluation had a significant positive predictive effect on career exploration (β=.47, p=.000), and a significant negative predictive effect on career decision difficulty (β= -2.51, p=.000). Career exploration also had a significant negative predictive effect on career decision difficulty (β= -.58, p=.000). Conclusion: Core self-evaluation and career exploration play a complete intermediary role in the chain between family function and career decision difficulty. This study provides a theoretical reference for the formation mechanism of career decision-making difficulties from the perspective of external family factors and internal core self-evaluation.

大学生对就业环境的认知和不确定条件下的职业决策

高山川　李晓婧

复旦大学心理学系，上海，200433，tracygao@fudan.edu.cn

摘 要　解决大学生就业困难需了解其对环境的认知和风险评估是否合理。根据竞争性生态理论，选项的回报及其获得概率（风险）存在负相关。大学生对工作机会的认知是否符合这一规律？能否根据回报大小推测风险？个人就业胜任力与不同城市环境如何共同影响风险评估与求职？聚焦工作的薪酬回报，进行了两个子研究：研究一考察大学生对各级城市中不同月薪的工作选项之机会多少与竞争程度的认知；研究二设置了 4 种选择情境，各包括两个月薪有高有低的工作选项（差距为 2000~10000 元），考察不同就业胜任力的学生在不确定工作的录取概率时是否愿意申请更高月薪的工作，又如何估计录取概率。

通过预研究编制了不同城市的介绍材料。研究一为 4（工作地点：一线、新一线、二线、三线城市）× 5（月薪：3000、5000、8000、10000、15000 元）的混合设计，因变量为对工作选项的机会多少和竞争程度的主观估计，被试为 124 名大学生。研究二为 2（就业胜任力：强、弱）× 4（工作选择情境：5000 vs. 3000 元、8000 vs. 5000 元、10000 vs. 5000、15000 vs. 5000 元）× 4（工作地点：一线、新一线、二线、三线城市）的混合设计，因变量为申请更高月薪工作的意愿，被试为 87 名大学生。结果发现：

(1)工作地点和月薪对工作机会多少的估计有显著影响，对处于更发达城市或月薪更低的工作，估计有更多机会；二者还有交互作用，学生们认为不同月薪的工作在不同城市的机会不等；(2)工作地点和月薪对工作选项的竞争程度估计有交互作用，学生们认为不同月薪的工作在不同城市的竞争程度有别；(3)就业胜任力和工作选择情境对申请意愿有显著影响，胜任力强的人更愿申请更高月薪工作，随着工作的月薪差距加大，申请更高月薪工作的意愿降低；二者还有交互作用，随着工作的月薪差距加大，比起胜任力强的人，胜任力弱的人申请更高月薪工作的意愿降幅更大；(4)工作的月薪能负向预测主观估计的录取概率。

总之，大学生对就业环境的认知能反映风险与回报的负相关，但对不同城市有高估或低估之处，胜任力弱的人在风险评估方面有待提升。

College Students' Perception of Employment Environment and Career Decision-making under Uncertainty

Gao Shanchuan, Li Xiaojing

Department of Psychology, Fudan University, Shanghai 200433

Abstract：To facilitate college students' job search, it is of great importance investigating how they perceive the world of work and evaluate the risk. According to the Competitive risk–reward Ecology Theory (CET), the payoff of an option often relates inversely to the probability of obtaining it (i.e., risk). Have college students acquired such regularity in the employment environment? If so, do they exploit this association to infer the chance of getting a job by how well it's paid? Will individuals with different competency make different inferences and decisions under uncertainty? To address these questions, two studies were conducted. Study 1 aimed to investigate how college students would estimate the opportunities and competition of job options with different pay and located in various cities. Study 2 further explored the difference between students with high or low competency when they chose between four pairs of potential job options, with the pay gap ranging between 2000-10000 yuan, and the success probabilities had to be estimated.

Prior to Study 1, paragraphs describing four kinds of cities were prepared and validated. A sample of 124

college students participated in Study 1, utilizing a 4 (location: first-tier city, emerging first-tier city, second-tier city, third-tier city) × 5 (monthly pay: 3000, 5000, 8000, 10000, 15000 yuan) mixed design. Participants were asked to estimate both the opportunity and the competition of each job option. Another sample of 87 college students participated in Study 2, utilizing a 2 (competency: high vs. low) × 4 (choice situation: 5000 vs. 3000 yuan, 8000 vs. 5000 yuan, 10000 vs. 5000 yuan, 15000 vs. 5000 yuan) × 4 (location: first-tier city, emerging first-tier city, second-tier city, third-tier city) mixed design. Participants were asked to choose between each of the four pairs of job options and rate their willingness to apply. Then they estimated the chance of getting an offer for each option.

The results showed that, first, both the location and monthly pay had significant main effect on the estimated job opportunities. Specifically, the lower the pay or the more developed the city, the more the subjective opportunities. There was also significant interaction between them, suggesting that participants learned the distribution of jobs with different pay varied across cities. Second, the location and monthly pay had significant interaction effect on the estimated competition of job options, suggesting that participants learned the competition for jobs with different pay also varied across cities. Third, both the competency and choice situation had significant main effect on participants' willingness to apply for the jobs with higher pay. Specifically, competent participants were more willing to apply for the jobs with higher pay than the incompetent. And the willingness would decrease as the pay gap grew larger. There was also significant interaction between the two factors, indicating that, compared with competent participants, the incompetent ones were much less willing to apply for the jobs with higher pay as the pay gap grew larger. Last, it was found that the monthly pay of job options predicted the probability estimates negatively.

In sum, the studies showed that college students may have learned that the inverse relationship between risk and reward also prevails in the employment environment. However, they may not have unbiased perception about how the jobs and competitors are distributed across cities. Additionally, individuals with lower competency may need more career guidance on risk evaluation.

中学生亲社会行为与童年创伤经历、心理资本、社会支持的关系及其干预研究

梁筱宇[1]　姚本先[1,2]（通讯作者）

1 合肥师范学院教师教育学院，合肥，230061，通讯作者 E-mail:ybx7756@126.com

2 安徽省学生心理健康教育指导中心

摘 要 亲社会行为是个体发自内心愿意给予他人需要的、符合社会期望的行为。缺乏亲社会行为不仅会影响个人的心理健康，而且还会导致他们无法适应社会环境。中学阶段是个体亲社会行为形成的关键期，拥有较高水平的亲社会行为是个体迈向成熟及适应社会的关键因素。童年创伤经历是导致各种负面心理和行为的重要风险因素，其势必会对中学生的亲社会行为产生影响，而关于童年创伤经历对亲社会行为影响的研究仍处于起步阶段，因此本研究拟考察中学生亲社会行为的现状，以及童年创伤经历如何对其产生影响，并在此基础上进行团体辅导活动，提高中学生的亲社会行为水平。 本研究包括两部分，研究一采用问卷研究，对安徽省、山东省共 1544 名中学生进行调查，探讨中学生亲社会行为与童年创伤经历、心理资本、社会支持的关系。研究二采用团体辅导活动，依据研究一的调查数据，筛选 40 名亲社会行为水平和心理资本

水平较低的高一年级学生作为研究对象，随机分为实验组和对照组，实验组 20 人进行心理资本团体辅导，对照组 20 人不进行任何干预。研究结果如下：（1）中学生亲社会行为、心理资本、社会支持均处于中等偏上水平，童年创伤经历处于中等偏下水平。（2）童年创伤经历与中学生亲社会行为、心理资本、社会支持之间存在显著负相关。（3）心理资本在童年创伤经历与亲社会行为的关系之间起中介作用，即中学生遭受童年创伤经历会影响其心理资本水平进而导致亲社会行为的缺失。（4）社会支持在童年创伤经历与亲社会行为的关系之间起中介作用，即中学生遭受童年创伤经历会通过影响其社会支持水平而导致亲社会行为的缺失。（5）心理资本和社会支持在童年创伤经历与亲社会行为的关系之间起链式中介作用，即中学生遭受童年创伤经历会通过影响其心理资本和社会支持水平而导致亲社会行为的缺失。（6）中学生的亲社会行为和心理资本水平通过心理资本团体辅导均有显著改善。
关键词 亲社会行为，童年创伤经历，心理资本，社会支持，团体辅导

A study of the relationship between pro-social behavior and childhood traumatic experiences, psychological capital, and social support among middle school students and its intervention

Liang XiaoYu[1] Yao BenXian[1,2] (Corresponding author)
1 Hefei Normal University,HeFei AnHui 230061,China
2 Anhui Mental Health Education and Guidance Center for Student

Abstract： Pro-social behavior is the willingness of individuals to give to others what they need from the bottom of their hearts and in line with social expectations. Lack of pro-social behavior not only affects an individual's mental health, but also leads to their inability to adapt to the social environment. Secondary school is a critical period for the formation of pro-social behavior, and having a high level of pro-social behavior is a key factor for individuals to mature and adapt to society. Childhood traumatic experience is an important risk factor leading to various negative psychological and behavioral factors, which will inevitably have an impact on the pro-social behavior of secondary school students, while the research on the impact of childhood traumatic experience on pro-social behavior is still in its infancy, so the present study intends to examine the current situation of pro-social behavior of secondary school students and how childhood traumatic experience affects it, and on the basis of which we will carry out group counseling activities to improve the level of pro-social behavior of secondary school students. level of pro-social behavior. The study consisted of two parts. Study 1 used a questionnaire to investigate the relationship between pro-social behavior and traumatic childhood experiences, psychological capital, and social support among 1,544 middle school students in Anhui Province and Shandong Province. Study two used group counseling activities, based on the survey data of study one, 40 senior high school students with low levels of pro-social behavior and psychological capital were screened as the research subjects, and randomly divided into experimental and control groups, 20 people in the experimental group underwent group counseling on psychological capital, and 20 people in the control group did not undergo any intervention. The results of the study are as follows: (1) The pro-social behavior, psychological capital, and social support of middle school students are at the medium-high level, and the childhood trauma experience is at the medium-low level. (2) There was a significant negative correlation between childhood trauma experience and middle school students' pro-social behavior, psychological capital, and social support. (3) Psychological capital mediates the relationship between childhood trauma experiences and pro-social behaviors, i.e., the childhood trauma experiences of middle school students will affect their psychological capital level and thus lead to the lack of pro-social behaviors. (4) Social

support mediates the relationship between childhood trauma and pro-social behavior, i.e., exposure to childhood trauma affects secondary school students' level of social support and leads to deficits in pro-social behavior. (5) Psychological capital and social support play a chain mediating role in the relationship between childhood traumatic experiences and pro-social behavior, i.e., secondary school students' exposure to childhood traumatic experiences can lead to deficits in pro-social behavior by affecting their levels of psychological capital and social support. (6) Secondary school students' pro-social behavior and psychological capital levels were significantly improved through psychological capital group counseling.
Keywords：pro-social behaviour,traumatic childhood experiences,psychological capital,social support,group counselling

高中生公正世界信念与问题行为的关系：一项纵向数据的研究

郁嘉铭[1] 高美慧[1] 甄瑞[1,2]（通讯作者）

1 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com

2 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘　要　公正世界信念理论认为当人们认为他们所处的世界是公正有序的时候，为了维护世界的规范运行、减少不公正感，人们会自发地减少问题行为的产生。不过，在世界观验证理论看来，当经验和信念之间出现不一致时，可能会导致消极的行为出现。例如，当拥有高水平公正世界信念地个体遭遇不公待遇时，可能会出现更多的问题行为。为此，以往的研究开始关注公正世界信念对问题行为的影响。不过，以往的研究主要采用横断研究设计，难以明晰两者之间的因果关系；研究对象也主要集中在成年人群体。相对成年人，青少年由于认知和情绪管理能力相对不成熟，更可能表现出较多的问题行为。因此，本研究拟以青少年为研究对象，考察公正世界信念与问题行为之间的关系。研究采用自陈式问卷对 789 高中学生进行调查（T1），并于一年后进行追踪（T2）。为确保研究的可靠性，最后保留同时参加两次调查的 684 名学生的数据并进行交叉滞后模型分析。结果发现：公正世界信念与问题行为的纵向不变性测量皆达到了结构不变性的要求；T1 公正世界信念不能显著预测 T2 问题行为，T1 问题行为可以显著负向预测 T2 公正世界信念。上述结果说明了，问题行为是公正世界信念的危险因素，问题行为水平越高，其公正世界信念水平越低。

Relations between senior high school students’ belief in a just world and problem behavior: A longitudinal study

Jiaming Yu[1] Meihui Gao[1] Rui Zhen[12]

1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China

2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract：The belief theory of just world holds that when people think that the world they live in is just and orderly, in order to maintain the normal operation of the world and reduce the sense of injustice, people will spontaneously reduce the occurrence of problem behaviors. However, according to the world view verification theory, when there is inconsistency between experience and belief, it may lead to negative behavior. For example, when individuals with high-level belief in a just world encounter unfair treatment, more problem behaviors may occur. Therefore, previous studies began to pay attention to the influence of the belief in a just world on problem behavior. However, previous studies mainly used cross-sectional research design, and it was difficult to clarify the

causal relationship between them. The research objects are mainly concentrated in the adult population. Compared with adults, teenagers are more likely to show more problem behaviors because their cognitive and emotional management skills are relatively immature. Therefore, this study intends to take teenagers as the research object to investigate the relationship between belief in a just world and problem behavior. The self-administered questionnaire was used to investigate 789 senior high school students (T1) and followed up one year later (T2). In order to ensure the reliability of the study, the data of 684 students who participated in two surveys at the same time were retained and analyzed by Cross-Lagged Panel Model. The results show that the vertical invariance measurement of just world belief and problem behavior meets the requirements of structural invariance; T1 just world belief can not significantly predict T2 problem behavior, but T1 problem behavior can significantly negatively predict T2 just world belief. The above results show that problem behavior is a risk factor of belief in a just world, and the higher the level of problem behavior, the lower the level of belief in a just world.
Keywords：senior high school students, belief in a just world, problem behavior, Cross-Lagged Panel Model

唉，老师刚刚又批评我了：教师负面反馈和压力如何影响学生任务表现

王泽燊[1]　钟建安[1]（通讯作者）

1 浙江大学心理与行为科学系，杭州，310027，jiananzhong@zju.edu.cn

摘 要　教师负面反馈对学生任务表现的影响在学界一直没有统一的定论。一方面，社会学习理论认为教师负面反馈会加强学生任务解决能力，提升任务表现；另一方面，期望效价理论认为，教师负面反馈会使学生进行自我怀疑并放弃努力，降低任务表现。本文将矛盾的理论组织在一个全面的理论框架下，探讨教师负面反馈对学生任务表现的影响以及成就动机的中介作用和压力的调节作用。根据权变理论，教师的教学风格需随个体变化才能提升教学有效性；反馈干预理论提出，只有被个体意识到的反馈干预结果与标准之间的差异才会对个体行为产生调节。学生压力的大小分别通过两种不同的机制决定了教师负反馈和学生任务表现之间关系：追求成功的动机和避免失败的动机。在学生低压力状态下，教师负面反馈提升了学生的任务表现，因为激发了学生追求成功的成就动机，从而使学生专注于生成更好的任务策略以缩小自己表现与标准的差距。相反，在学生高压力状态下，教师负面反馈使得学生产生避免失败的成就动机，从而阻碍了学生的任务表现。研究一采用 PISA 全球学生的调研数据进行大数据分析，探索教师负反馈对学生任务表现的影响，发现在不同国家结果都显著。在研究二中，我们使用压力检测设备来捕捉学生日常压力情况，采用 30 名学生连续一周（7 天）的每日日记法进行研究，研究结果支持我们的中介调节模型。研究三在一所大型高校招募 30 名研究生，采用 2（教师反馈：负反馈、中性反馈）× 2（压力：高、低）的被试间设计操纵变量，再次支持了研究假设。研究四采用准现场实验，通过两个学期 350 名学生和导师的数据验证结果。本研究具有一定的理论和实践意义，为教师负面反馈对学生任务表现的不同影响结果给出解释框架，提示教师要根据不同学生的情况因材施教，调整教学策略。

关键词　教师负面反馈，压力，成就动机，学生任务表现

Alas, the teacher just criticized me again: How teacher's negative feedback and pressure shape students' task performance

Wang Zeshen[1]　Zhong jianan[1]（Corresponding author）

1 Department of Psychology and Behavior Sciences, Zhejiang University, Hangzhou，310027，
jiananzhong@zju.edu.cn

***Abstract*:** The influence of teachers' negative feedback on students' task performance has not been uniformly concluded in academic circles. On the one hand, social learning theory holds that teachers' negative feedback will strengthen students' task solving ability and improve their task performance. On the other hand, expected valence theory holds that negative teacher feedback will make students self-doubt and give up efforts, which will reduce task performance. In this paper, contradictory theories are organized under a comprehensive theoretical framework to explore the influence of negative feedback on students' task performance, the mediating role of achievement motivation and the moderating role of stress. According to contingency theory, teachers' teaching style should change with individual to improve teaching effectiveness. Feedback intervention theory proposes that only the difference between the feedback intervention result and the standard that the individual is aware of can regulate the individual behavior. The level of student pressure determines the relationship between teachers' negative feedback and students' task performance through two different mechanisms: the motivation to pursue success and the motivation to avoid failure. In the state of low pressure, teachers' negative feedback can improve students' task performance, because it stimulates students' achievement motivation to pursue success, so that students can focus on generating better task strategies to narrow the gap between their performance and the standard. On the contrary, when students are under high pressure, teachers' negative feedback makes students produce achievement motivation to avoid failure, thus hindering students' task performance. In the first study, big data analysis was conducted using the survey data of global PISA students to explore the impact of teachers' negative feedback on students' task performance, and it was found that the results were significant in different countries. In study 2, we used a stress detection device to capture students' daily stress, and daily diaries were kept by 30 students for one week (7 days). The results supported our mediation model. In study 3, 30 graduate students were recruited from a large university, and the inter-subject design of 2 (teacher feedback: negative feedback, neutral feedback) × 2 (pressure: high, low) was used to manipulate variables, which again supported the research hypothesis. Study 4 used a quasi-field experiment to validate the results with data from 350 students and supervisors over two semesters. This study has certain theoretical and practical significance. It provides an explanation framework for the different effects of teachers' negative feedback on students' task performance, and suggests that teachers should adjust teaching strategies according to different students' aptitude.

中学生粉丝的群体自恋与饭圈暴力：

群际威胁敏感性和道德推脱的中介作用

徐泽静[1]　　何宁[2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西师范大学心理学院，西安，710062，通讯作者 E-mail：hening@snnu.edu.cn

摘 要　饭圈文化是近年来兴起的基于新媒体的一种以追星为核心特征文化现象。饭圈有着惊人的舆论动员、集体行动和战斗能力，其群体极化特征极易使粉丝通过编造谣言、歪曲真相、人肉搜索产生人身攻击、丑化他人形象等网络霸凌行为，即饭圈暴力行为。在我国追星的人群大多为青少年，饭圈暴力行为不仅能引发攻击行为，且严重影响青少年的身心健康。群体自恋是一种对于“自身所属群体是卓越的并值得优待，却未充分被他者承认的信念”，或者一种展现了自大(grandiose)、夸大(inflated)的内群体形象的态度取向，而这种形象的维护极大依赖于外界对内群体价值的认可。由此，群体自恋者可能通过敌视与攻击外群体来维护内群体的形象，从而表现出典型的饭圈粉丝行为。但目前对饭圈群体自恋与饭圈暴力行为之关系的研究尚不多见。

本研究旨在探讨青少年的群体自恋与饭圈暴力行为的关系，以及群际威胁敏感性和道德推脱的中介作用。采用问卷法对陕西省西安市和四川省成都市 6 所中学共 600 名中学生进行调查，使用 SPSS 26.0 和 Mplus 8.3 进行数据分析和结构方程建模。结果显示:（1）青少年群体自恋、群际威胁敏感性和饭圈暴力存在性别差异，男性在群体自恋、群际威胁敏感性和饭圈暴力行为上高于女性；（2）青少年群体自恋、群际威胁敏感性和道德推脱均显著正向预测饭圈暴力行为；（3）群际威胁敏感性和道德推脱均在群体自恋和饭圈暴力之间起部分中介作用，且道德推脱和群际威胁敏感性在群体自恋和饭圈暴力之间起并行中介作用。研究揭示了青少年群体自恋对饭圈暴力的影响及其内在心理机制，为青少年饭圈暴力行为的干预提供了实证支持。

关键词　群体自恋，饭圈暴力，群际威胁敏感性，道德推脱

Group narcissism and violence of fan’s group: The mediating role of inter group threat sensitivity and moral disengagement

XuZejing　HeNing

Department of Psychology, Shaanxi Normal University, Xi’an

Abstract: The fan’s group culture is a cultural phenomenon based on new media that has emerged in recent years with celebrity-chasing as its core feature. The majority of fans in China are teenagers. fan’s group has astonishing public opinion mobilization, collective action, and combat capabilities, and its Group polarization feature is very easy for fans to create personal attack, vilify the image of others and other online bullying behaviors through fabricating rumors, distorting the truth, and cyber manhunt, that is, violence of fan’s group. The majority of fans in China are teenagers, and violent behavior can not only trigger aggressive behavior, but also seriously affect the physical and mental health of teenagers. Group narcissism is a belief that one's own group is outstanding and deserving of treatment, but not fully recognized by others, or an attitude that displays an arrogant and inflated image of the inner group, and the maintenance of this image greatly relies on external recognition of the value of the inner group. As a result, group narcissists may maintain the image of the inner group through hostility and attacks on the outer group, thereby exhibiting typical violence of fan’s group. However, there is currently limited research on the relationship between narcissism and violence of fan’s group

The aim of this study is to explore the relationship between group narcissism and violence of fan's group , as well as the mediating role of intergroup threat sensitivity and moral disengagement. A questionnaire survey was conducted on 600 middle school students from 6 high schools in Xi'an, Shaanxi Province and Chengdu, Sichuan Province. SPSS 26.0 and Mplus 8.3 were used for data analysis and structural equation modeling. The results show that: (1) there are gender differences in group narcissism, intergroup threat sensitivity, and moral disengagement among adolescents. Males are higher in group narcissism, intergroup threat sensitivity, and moral disengagement behavior than females; (2)group narcissism, intergroup threat sensitivity, and moral disengagement of teenager all significantly positively predict the violence of fan's group; (3) Both intergroup threat sensitivity and moral disengagement play a partial mediating role between group narcissism and violence of fan's group, and moral disengagement and intergroup threat sensitivity play a parallel mediating role between group narcissism and the violence of fan's group. The study reveals the impact of group narcissism among adolescent on the violence of fan's group and its internal psychological mechanisms, providing empirical support for intervention in adolescent violence of fan's group.

Keywords：group narcissism, violence of fan's group, Intergroup threat sensitivity, moral disengagement

疫情前后初中生网络社交时长的变化对其网络受害及家庭学习适应的影响——一项短期追踪研究

林彤[1]　刘雨婷[1]　高婷[2] 李蓓蕾[1]（通讯作者）

1 北京师范大学教育学部，北京，100875

2 中国人民大学教育学院，北京，100872，通讯作者 beileili@bnu.edu.cn

摘 要　目的：考察疫情前后初中生网络社交时长的变化和网络受害的关系及对其家庭学习适应的影响。方法：采用整群取样法，使用网络受害量表、网络使用行为调查问卷、病人健康问卷抑郁量表、家庭学习适应量表对北京市两所中学 651 名初一至初三学生分别于 2019 年 11 月和 2020 年 3 月进行前后两次相隔 4 个月的（T1、T2）问卷调查。结果：（1）37.2%以及 34.6%的学生分别在 T1 和 T2 阶段有过网络受害经验；T1 和 T2 的网络受害与 T2 的家庭学习适应及抑郁等各变量之间均显著相关；（2）疫情期间初中生的网络社交时长相较于疫情前显著增加，但是网络受害水平显著降低，疫情前后网络社交时长减少、不变和增加的学生分别为 7%、28%、65%，其中时间减少组学生的网络受害显著下降；（3）在控制性别和年级后，T1 和 T2 的网络受害均显著负向预测 T2 家庭学习适应，T2 抑郁在 T1 及 T2 网络受害和 T2 家庭学习适应之间分别具完全中介和链式中介作用；（4）T2 网络社交时长过度组学生的网络受害显著高于适度组学生，网络社交时长与网络受害在过度组学生中边缘显著正相关而在适度组学生中不相关，且网络社交时长对抑郁的中介作用具调节效应，过度组初中生的 T1 网络受害会显著提高 T2 抑郁进而影响疫情期间的家庭学习适应。结论：疫情期间，学生的网络社交时长显著增加，但网络受害反而显著降低。疫情前的网络受害会增加疫情期间的网络受害水平，且疫情前后的初中生网络受害均间接通过提升疫情期间的抑郁情绪进而损害其家庭学习适应。疫情期间日均网络社交时长过度的初中生（超过 1 小时）的网络受害水平显著高于适度组的学生（1 小时以内），网络社交时长对提升网络受害的风险作用仅在过度组学生中存在，且适度组学生的疫情前网络受害对疫情期间的抑郁不具有显著提升作用，从而不会对疫情期间的家庭学习适应产生消极影响。

关键词　新冠疫情，网络社交时长，网络受害，抑郁，家庭学习适应

Social Media Use, Cyber Victimization, and Adjustment during COVID-19 Virtual Learning: A Short-Term Longitudinal Study among Chinese Middle School Students

LIN Tong[1] LIU Yuting[1] GAO Ting[2] LI Beilei[1]

1. Faculty of Education, Beijing Normal University, Beijing 100875
2. School of Education, Renmin University of China, Beijing 100872

Abstract：This study investigated the changes in social media use and cyber victimization before (November 2019) and during the COVID-19 pandemic (March 2020) among Chinese middle school students. It also examined the relation between cyber victimization and school adjustment overtime, and whether depressive symptoms mediated this relation and whether the social media use moderated this relation. We collected two waves of survey data from 651 7th to 9th grade students (M_{age} = 13.93, SD_{age} = 1.17, 50.5% male) from two middle schools in Beijing, China over four months. Results indicated that middle school students spent more time on social media during the pandemic than before COVID-19 (d = 0.55). Cyber victimization was prevalent among Chinese middle school students at both time points (37.2% of students at T1 and 34.6% of students at T2 experienced some cyberbullying). Among the students, 7% reported a decrease, 28% reported no change, and 65% reported an increase in their social media use. Notably, students who reported a decrease in time also experienced a significant decrease in cyber victimization. The relationships between cyber victimization at T1 and T2 and school adjustment at T2 were fully mediated by depressive symptoms at T2. The indirect effects were -.06 (T1, 95% CI [-0.12, -0.01], p < .05) and -.07 (T2, 95% CI [-0.11, -0.04], p < .001). Students' social media use also moderated this mediation. Specifically, for students who used social media excessively (more than one hour per day), cyber victimization at T1 directly predicted depressive symptoms at T2. However, this relation was not significant among students who used social media moderately (one hour or less per day). These results highlight the importance of collaboration between educators and parents to monitor students' social media use, cyber victimization, and depressive symptoms in order to promote adjustment during COVID-19 virtual learning.

Keywords：COVID-19, social media use, cyber victimization, depressive symptoms, adjustment during virtual learning

学校归属感对初中生网络使用问题的影响：自尊与应对方式的链式中介作用

刘子怡[1] 姚宇[1] 李梦茹[1] 苏艳青[2]（通讯作者）

1 山东中医药大学健康学院应用心理学，山东，250000

2 山东中医药大学健康学院，山东，250000，yanqingsu@126.com

摘 要 随着数字时代互联网的日渐普及，初中生对网络的依赖性也越来越高，甚至产生了一系列问题性网络使用问题。因此在此数字化时代下，心理健康服务方面的创新和发展显得尤为重要。初中生作为我国心理健康教育较为薄弱的群体，关注他们在这个时代下所受的影响以及由此引发的一系列数字化问题仍然是

一个很新且具有重要研究意义的课题。学校作为社会环境中的一部分，是对青少年发展影响最大的微观系统，既往研究已经表明，初中生学校归属感与问题性网络使用存在显著的相关性，自尊作为其中的中介变量，其中介作用也已经被国内外研究人员证实。本研究采用学校归属感量表、应对方式量表、Rosenberg 自尊量表和初中生问题性网络使用量表对 750 名初中生进行调查，探讨初中生学校归属感、自尊、应对方式和生活满意度之间的关系。结果发现：学校归属感、自尊、应对方式两两之间呈显著正相关；学校归属感、自尊、应对方式均与初中生问题性网络使用存在显著负相关；自尊、应对方式在学校归属感对初中生问题性网络使用的影响中均起部分中介作用；自尊和应对方式在学校归属感对问题性网络使用的影响中起链式中介作用。这表明学校归属感既可以直接影响初中生的问题性网络使用，也通过自尊的中介作用、应对方式的中介作用、自尊和应对方式的链式中介作用等间接影响初中生的问题性网络使用。
关键词　学校归属感，自尊，应对方式，初中生，问题性网络使用

The impact of school belonging on junior high school students' internet usage issues:The chain mediating effect of self-esteem and coping styles

Liu Ziyi　Yao Yu　Li Mengru　Su Yanqing
Applied psychology, School of Health, Shandong University of Traditional Chinese Medicine, Shandong, 250000
School of Health, Shandong University of Traditional Chinese Medicine, Shandong, 250000,yanqingsu@126.com

Abstract: With the growing popularity of the Internet in the digital era, junior high school students are increasingly dependent on the network, and even a series of problems have arisen, such as the use of Sexual network. Therefore, in this digital era, innovation and development in mental health services are particularly important. As a relatively weak group in China's mental health education, it is still a new and significant research topic to pay attention to the impact and a series of digital issues that junior high school students are facing in this era. As a part of the social environment, school is the micro system that has the greatest impact on the development of young people. Previous studies have shown a significant correlation between junior high school students' sense of belonging to school and problematic network use, with self-esteem as a mediating variable and its mediating role confirmed by domestic and foreign researchers. In this study, 750 junior high school students were investigated with the School Belonging Scale, Coping Style Scale, Rosenberg Self esteem Scale and Problem Sexual network Use Scale for Junior High School Students, to explore the relationship among junior high school students' sense of school belonging, self-esteem, coping style and life satisfaction. The results showed that there was a significant positive correlation between school belonging, self-esteem, and coping styles; School sense of belonging, self-esteem and coping style are significantly negatively correlated with junior high school students' problem Sexual network use; Self esteem and coping style play a partial mediating role in the impact of school belonging on junior high school students' problem Sexual network use; Self esteem and coping style play a chain mediating role in the impact of school belonging on the use of problematic Sexual network. This shows that the sense of school belonging can not only directly affect junior high school students' problem Sexual network use, but also indirectly affect junior high school students' problem Sexual network use through the mediating role of self-esteem, the mediating role of coping styles, self-esteem and the chain mediating role of coping styles.

Keywords: School sense of belonging, Self esteem, Response methods, Junior high school students, Problem Sexual network use

青少年欺凌受害与自我伤害:情绪调节与欺凌班级规范的作用

陈嘉慧[1]　任萍[1]（通讯作者）
1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875
通讯作者 E-mail：renping@bnu.edu.cn

摘 要　**背景：**校园欺凌在学校、文化和国家中无处不在。因此，校园欺凌常常是研究儿童青少年同伴关系的研究者首先关注的问题行为、是国家教育部等重点关注的热点问题。欺凌受害会引发较高程度的心理健康问题，如故意自我伤害。过往研究表明，欺凌受害是故意自我伤害的一个风险因素，但尚不清楚可能中介或者调节二者关系的潜在过程。本研究考察了情绪调节（包括认知重评和表达抑制）在欺凌受害与自我伤害之间的中介作用，以及欺凌描述规范和欺凌受欢迎规范在欺凌受害与自我伤害之间的调节作用。**方法：**本研究以陕西省 3,545 七年级学生（52.4%男生；Mage=12.36；SD=0.50）为研究对象,采用同伴提名和自我报告问卷进行为期半年的 2 次追踪调查。**结果：**多层线性模型分析发现，欺凌受害直接或间接地通过表达抑制增加了半年后故意自我伤害的风险。此外，欺凌描述性规范和欺凌受欢迎规范以不同的方式调节欺凌受害对情绪调节和故意自我伤害的影响。具体表现为，当班级的欺凌描述性规范较低时，高欺凌受害会增加个体使用表达抑制的可能性，进而增加半年后故意自我伤害的风险，反之中介不成立；当班级的欺凌受欢迎规范较高时，高欺凌受害会增加个体使用表达抑制的可能性，进而增加半年后故意自我伤害的风险，反之不成立。这些发现揭示了欺凌班级规范为何以及如何对受害青少年的情绪调节和故意自我伤害产生负面影响，为改进现有的反欺凌干预措施提供了信息，从而防止欺凌受害者产生心理健康问题。

Bullying victimization and deliberate self-harm in adolescents: The roles of emotion regulation and bullying peer norms

Jiahui Chen[1]　Ping Ren[1] *
1 Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University, 100875

***Abstract*：** **Background:** School bullying is ubiquitous in schools, cultures, and nations. As a result, school bullying is often the first problematic behavior of concern for researchers studying the peer relationships of adolescents, and a topical issue of concern for state ministries of education and others. The experience of bullying victimization during childhood or adolescence has long-lasting deleterious effects on psychological and social adjustment. Deliberate self-harm is a complex and important psychological and social maladjustment related to bullying victimization. Although previous literature has indicated that bullying victimization is a risk factor for deliberate self-harm, it is unclear about the underlying processes that may mediate or moderate this association. This study examined the mediating effects of cognitive reappraisal and expressive suppression and the moderating effect of bullying descriptive and popularity norms on the association between bullying victimization and deliberate self-harm. **Methods:** Using a short-term longitudinal design, two-wave data were obtained from 3,545 Chinese adolescents (52.4% boys at Time 1 (T1); Mage = 12.36; SD = 0.50) from 76 classes over 6 months. Participants were asked to completed peer nomination and self-report questionnaires. **Results:** Results indicated

that bullying victimization directly or indirectly increased later deliberate self-harm through expressive suppression. Furthermore, both bullying descriptive and popularity norms matter in diverging ways. The mediating effects of expressive suppression were exacerbated in classrooms with low bullying descriptive norms or high bullying popularity norms. **Conclusions:** These findings shed light on why and how bullying peer norms negatively impact victimized adolescents' emotion regulation and deliberate self-harm, demonstrating the importance of both bullying descriptive and popularity norms on victims' psychosocial adjustment.

新冠疫情下青少年焦虑和手机依赖的纵向关系与作用机制

李天昶[1],孙月仙[1],甄瑞[1,2]（通讯作者）

1. 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com

2. 浙江省哲学社会科学培育实验室"杭州师范大学婴幼儿发展与托育实验室"

摘 要 2019 年底，新冠疫情爆发和蔓延，我国及时采取长期居家等方式进行防控，有效控制住了疫情蔓延，但在这个背景下青少年群体的焦虑和手机依赖问题凸显。焦虑是个体对即将到来的或正在进行的伴随有一定压力、威胁的任务所产生的紧张、不安、忧虑、烦恼等不愉快的复杂情绪状态。手机依赖是指个体过度沉迷于以手机为媒介的各种活动，对手机产生强烈且持续的依赖和渴求，并导致其出现明显的社会和心理功能损害。回顾以往研究和相关理论，发现二者的关系方向不一致，一方面，根据补偿性网络使用模型（Compensatory Internet Use Model），个体的焦虑可能通过网络使用行为缓解，从而促成网络使用相关的成瘾行为；另一方面，根据资源保存理论（conservation of resources theory, COR），长时间使用手机会消耗个体的时间资源可能导致没有充足的资源处理学习和生活中的任务和困难，带来焦虑。同时疫情背景下焦虑和手机依赖问题都处于加剧状态，可能表现出新的特点。基于此，研究一采用手机依赖量表和焦虑量表对嘉兴市的 594 名中小学生进行两次追踪问卷调查，利用交叉滞后模型，探究焦虑和手机依赖的预测关系。结果发现，T1 时间点的手机依赖可以显著正向预测 T2 时间点的焦虑($\beta = 0.17$，$p < 0.001$)，而 T1 时间点的焦虑不能预测 T2 时间点的手机依赖($\beta = 0.034$，$p = 0.425$)。这个结果说明，在新冠疫情流行背景下，手机依赖问题可能预测个体的焦虑。进一步，我们基于研究一加入表达抑制、学业拖延建立结构方程模型，以探究手机依赖预测焦虑的纵向机制。结果发现，T1 时间点的手机依赖可以通过增加 T2 时间点的表达抑制进而正向预测 T2 时间点焦虑($\beta = 0.043$，$p < 0.05$); T1 时间点的手机依赖可以通过增加 T2 时间点的学业拖延进而正向预测 T2 焦虑($\beta = 0.042$，$p < 0.05$); T1 时间点的手机依赖可以通过 T2 表达抑制到 T2 学业拖延的两步路径正向预测 T2 焦虑($\beta = 0.043$，$p < 0.001$)。这些结果说明了，手机依赖不仅可以直接预测焦虑，且手机依赖也会通过表达抑制、学业拖延进一步预测焦虑。

关键词: 焦虑，手机依赖，交叉滞后，表达抑制，学业拖延

Longitudinal association between adolescents' anxiety and mobile phone dependence and influencing mechanisms in the context of COVID-19 pandemic

Tianchang Li[1], Yuexian Sun[1], Rui Zhen[1,2*]（Corresponding Author）

1Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China

2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and

Childcare, Hangzhou Normal University

***Abstract*:** At the end of 2019, COVID-19 's epidemic broke out and spread. China timely adopted long-term home prevention and control, which effectively controlled the epidemic, but in this context, the anxiety and mobile phone dependence of young people are very serious. Anxiety is an unpleasant complex emotional state, such as tension, uneasiness, anxiety, and trouble, caused by an individual's upcoming or ongoing task accompanied by a certain stress and threat. Mobile phone dependence refers to individuals addicted to various activities using mobile phones as media, resulting in strong and continuous dependence and desire for mobile phones, which leading to obvious social and psychological function damage. Reviewing previous studies and related theories, it is found that the relationship between them is inconsistent. On the one hand, according to the Compensatory Internet Use Model, individual anxiety may be alleviated through Internet use behavior, thus contributing to Internet use related addictive behavior; On the other hand, according to the conservation of resources theory (COR), using mobile phones for a long time will consume individual time resources, which may predict insufficient resources to deal with tasks and difficulties in study and life, and increase anxiety. At the same time, under the background of the Covid-2019 pandemic, anxiety and mobile phone dependence are both in an exacerbated state, which may show new characteristics. Based on this, we used study 1 to conduct two follow-up questionnaires on 594 primary and secondary school students in Jiaxing, and used the cross-lagged analysis to explore the predictive relationship between anxiety and mobile phone dependence. We found Time 1 mobile phone dependence could significantly and positively predict Time 2 anxiety(β = 0.17， p < 0.001), while anxiety at Time 1 could not predict Time 2 mobile phone dependence(β = 0.034， p = 0.425). This result shows that mobile phones dependence on one-way prediction of anxiety. Based on Study 1 and in order to further explore the mechanism of the relationship between mobile phone dependence and anxiety, study 2 added expression inhibition and academic procrastination to establish a structural equation model to further explore the longitudinal mechanism of mobile phone dependence in predicting anxiety. We found that the Time 1 mobile phone dependence could positively predict Time 2 anxiety by increasing the Time 2 expression inhibition(β = 0.043，p < 0.05); Time 1 mobile phone dependence can positively predict T2 anxiety by increasing Time 2 academic procrastination(β = 0.042， p < 0.05); Time 1 mobile phone dependence can positively predict T2 anxiety through a two-step path from T2 expression inhibition to T2 academic procrastination(β = 0.043， p < 0.001). These results showed that mobile phone dependence one-way predicts anxiety, and mobile phone dependence can further predict anxiety through expression inhibition and academic procrastination.

通过干预身体意象改善青少年人际关系困扰的实践研究

顾心语[1]（通讯作者） 陈雅菁[1] 李宁静[1]

1 复旦大学社会发展与公共政策学院，上海，200433 guxy21@m.fudan.edu.cn

摘 要 人际关系困扰是青少年时期的重要心理问题。身体意象是青少年对身体的自我态度，在青春期随身体外貌变化发生波动，会对其人际交往产生重要影响，引发人际关系困扰。本研究根据认知行为理论，将外国身体意象著名学者 Cash 的身体意象个体自助手册改编为适合中学生群体的团体干预方案，并通过随机对照研究探讨了通过干预身体意象减少初中生人际关系困扰的效果。

目的：改编国外身体意象的个体自助干预手册，并将其运用于国内青少年身体意象干预的团体活动，探讨

其对改善中学生人际关系困扰的效果。**方法：**研究为干预研究，首先依据认知行为理论改编完成身体意象团体活动方案，使其切合青少年认知水平。随后，上海市某中学 6、7 年级自愿报名的 22 名同学进入实验组，参与为期 6 周的身体意象团体活动；随机抽选 24 名同学进入对照组，不接受相关干预。在实验前后对身体意象、人际关系困扰等指标进行测量，以验证和比较干预效果。**结果：**(1)将 Cash 的身体意象个体自主手册进行改编，得到为期 6 周的切合国内青少年认知水平的团体干预方案；(2)通过该身体意象团体干预方案进行活动，显著改善了实验组青少年的身体意象、降低了人际关系困扰，并在一定程度上提升了自我接纳，对照组各项指标均无显著变化。

结论：本研究完成了对青少年身体意象团体干预方案的初步编制和实践，成果对帮助青少年降低人际关系困扰，丰富中学心理健康教育课程等方面有积极实践意义，并拓展了认知行为理论的应用。

Research on the practice of improving adolescent interpersonal disturbance by intervening body image

Gu Xinyu[1] Chen Yajing[1] Li Ningjing[1]

1 School of Social Development and Public Policy, Fudan University ,Shanghai,200433

***Abstract*：** Interpersonal disturbance is an important psychological problem in teenagers. Body image is the self-attitude towards the body of adolescents, which fluctuates with the change of physical appearance during adolescence, which will have an important impact on their interpersonal communication and cause interpersonal relationship troubles. Based on the cognitive behavior theory, this study adapted the body image individual self-help manual of foreign famous body image scholar Cash into a group intervention program suitable for middle school students, and explored the effect of body image intervention on reducing the interpersonal disturbance of middle school students through a randomized controlled study.

Objective: To adapt the foreign body image self-help intervention manual, and apply it to the domestic adolescent body image intervention group activities, to explore its effect on improving the interpersonal disturbance of middle school students. **Methods:** This study is an intervention study. Firstly, the body image group activity program is adapted according to the cognitive behavior theory to make it fit the cognitive level of adolescents. Subsequently, 22 students in grade 6 and 7 of a middle school in Shanghai voluntarily enrolled in the experimental group and participated in the body image group activity for 6 weeks; 24 students were randomly selected to enter the control group and did not receive relevant intervention. Indicators such as body image and interpersonal disturbance were measured before and after the experiment to verify and compare the intervention effect. **Results :** (1) The body image manual of Cash was adapted to obtain a 6-week group intervention program suitable for the cognitive level of domestic adolescents; (2) The body image group intervention program significantly improved the body image of adolescents in the experimental group, reduced interpersonal distress, and improved self-acceptance to a certain extent, while there were no significant changes in the indicators of the control group.

Conclusion: This study completed the preliminary preparation and practice of adolescent body image group intervention program, and the results have positive practical significance in helping adolescents reduce interpersonal disturbance, enriching middle school mental health education curriculum, and expanding the application of cognitive behavioral theory.

***Keywords*:** adolescents, cognitive-behavioral theory, body image, interpersonal disturbance

青少年问题行为的类别特征及其影响因素

王靖茜[1]　陈展洁[1]　高美慧[1]　甄瑞[1,2]（通讯作者）

1. 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com

2. 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘　要　青少年期是个体的心理和生理趋向成熟、个性趋于稳定、人生观和世界观形成的关键时期，这一时期的青少年也容易受到外在环境的影响，出现各种问题行为。研究发现，问题行为不仅会对青少年的学业成绩、人际关系等方面产生严重的负面影响，而且会影响青少年的身心健康发展，如果不加以引导和干预，可能会出现违法犯罪行为，给其心理健康与社会发展带来巨大的影响。对于青少年而言，常见的问题行为主要表现在向外暴力行为和向内自杀行为两个方面。尽管以往的研究对这两种行为进行了大量的研究，不过研究主要采用了变量为中心的方法，难以有效地考察这两种行为在不同青少年身上的具体表现。为此，本研究将采用以个体为中心的方法，利用潜在剖面分析来探讨问题行为在青少年群体中的类型特征，进一步分析家庭、学校和个体因素对不同类型问题行为的影响。研究采用自陈式问卷，对 2173 名青少年的问题行为、暴力媒体接触程度、社会支持、抑郁、受欺凌情况、孤独感进行调查。潜在剖面分析结果显示，青少年的问题行为可以分为问题行为组（2.9%）自杀倾向组（5.8%）和健康组（91.3%）。多元 logistic 回归结果显示，相对于问题行为组，抑郁水平高、暴力媒体接触程度高的青少年更可能属于自杀倾向组；社会支持水平较高的个体更可能属于健康组。相对于自杀倾向组，孤独感水平高的青少年更可能属于问题行为组。相对于健康组，受欺凌程度高的青少年更可能属于问题行为组。这些结果说明了青少年的问题行为存在异质性特征，抑郁、暴力媒体接触、受欺凌程度、社会支持和孤独感可以显著地区分不同的问题行为类型。

Category characteristics and influencing factors of adolescents' problem behaviors

Jingxi Wang[1]　Zhanjie Chen[1]　Meihui Gao[1]　Rui Zhen[1,2]

1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China

2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract: Adolescence is a critical period in which the individual's psychology and physiology tend to mature. During this period, adolescents' personality tends to be stable, their outlook on life and world start forming. In this time, they are also susceptible to the influence of external environment and appear various problem behaviors. Studies have found that problem behaviors will not only have a serious negative correlation with adolescents' academic performance, interpersonal relationships and other aspects, but also influence their physical and mental health development. If there is no guidance and intervention, adolescents may engage in illegal and criminal behavior, which will have a huge impact on their mental health and social development. For adolescents, the common problem behaviors are mainly manifested in two aspects: violent behavior and suicide. Previous studies

have mainly used a variable-centered approach to conduct extensive research on these two behaviors, but it is difficult to effectively investigate the specific performance of these two behaviors among different adolescents. To this end, an person-centered approach will be adopted in this study. Latent profile analysis is used to explore the category characteristics of problem behaviors in adolescents. The influences of family, school and individual factors on different categories of problem behaviors were further analyzed. Self-report questionnaires were used to survey 2173 adolescents on problem behaviors, exposure to violent media, social support, depression, bullying, and loneliness. The results of the latent profile analysis showed that the problem behavior of adolescents could be divided into the problem behavior group (2.9%), the suicidal tendency group (5.8%) and the health group (91.3%). Multiple logistic regression results showed that compared with the problem behavior group, adolescents with high depression level and high exposure to violent media were more likely to belong to the suicidal tendency group. Individuals with high levels of social support were more likely to belong to the health group. Compared with the suicidal tendency group, adolescents with high levels of loneliness were more likely to belong to the problem behavior group. Compared with the health group, adolescents with high bullying levels were more likely to belong to the problem behavior group. These results indicate the heterogeneity of problem behaviors among adolescents. Besides, the depression, violent media exposure, bullying, social support and loneliness could significantly differentiating different categories of problem behaviors.

Keywords：adolescent, problem behaviors, bullying, latent profile analysis

人际支持网络和青少年内外化问题：基于潜在剖面分析

[1]广州大学教育学院，青少年心理与行为研究中心，广州，510006

[2]华东师范大学心理与认知科学学院，上海市心理健康与危机干预重点实验室，上海，200062

[*]通讯作者：nie-yangang@gzhu.edu.cn

摘 要 作为青少年互动的主要环境，家庭和学校系统共同影响青少年的心理和行为健康发展。来自父母、教师和同伴的人际支持资源是青少年抵御内外化问题的保护因素，而不同来源的人际支持可以相互补偿、相互作用，共同构成青少年个体抵御内外化问题的人际支持网络。本研究采用潜在剖面分析，对青少年个体的人际支持网络水平进行分类，探讨人际支持网络水平与青少年内外化问题的关系。研究采用问卷调查的方法，使用父母教养量表中父母情感温暖分量表、学校氛围量表中师生关系、学生关系分量表，长处与困难量表对 1049 名青少年(M_{age} = 13.86, SD = 1.52)进行测查。结果显示：（1）青少年的人际支持网络水平存在三个潜在剖面(AIC = 4606.08, BIC = 4675.44, aBIC = 4630.98, Entropy = 0.93, LMR(p) < 0.05, BLRT(p) < 0.001)：低人际支持组(6.49%)、中人际支持组(57.92%)和高人际支持组(35.59%)。（2）性别、年龄以及学段对青少年人际支持网络潜在分组无显著影响。（3）不同类型的人际支持网络剖面在内外化问题总得分(χ^2 = 97.49, p＜0.001)、内化问题得分(χ^2 = 93.59, p < 0.001)、外化问题得分(χ^2 = 49.62, p < 0.001)均存在显著差异，高人际支持组的内外化问题显著低于中人际支持组和低人际支持组。中人际支持组的内外化问题显著低于低人际支持组。研究结果有助于深化理解人际支持对青少年心理和行为健康发展的影响，并为启示构建父母、教师、同伴全方位人际支持网络提供理论证据。

关键词 人际支持网络，内外化问题，青少年，潜在剖面分析

The protective role of interpersonal support network in internalizing and externalizing problems among adolescents: A latent profile

analysis

***Abstract*:** As main environment which adolescents interact with, family and school systems jointly influence the psychological and behavioral development of adolescents. Interpersonal support from parents, teachers and peers are important protective factors for adolescents to resist internalizing and externalizing problems. Meanwhile, these interpersonal supports from different significant others can compensate and influence each other, and together constitute the interpersonal support network for adolescents to defend against internalizing and externalizing problems. The current study classified the level of interpersonal support networks among adolescents using latent profile analysis (LPA) and explored the relationship between the level of interpersonal support networks and internalizing and externalizing problems. In this study, we conducted a questionnaire survey among 1049 adolescents (M_{age} = 13.86, *SD* = 1.52) on their parent warmth, teacher-student relationship and peer relationship. The results indicated that (1) There are three latent profiles of interpersonal support network level (AIC = 4606.08, BIC = 4675.44, aBIC = 4630.98, Entropy = 0.93, LMR(*p*) < 0.05, BLRT(*p*) < 0.001): low interpersonal support group (6.49%), medium interpersonal support group (57.92%), and high interpersonal support group (35.59%). (2) Gender, age, and education level have no significant impact on the classification of interpersonal support level. (3) The profiles of interpersonal support level have significant effects on adolescents' internalizing and externalizing problems (*ps*＜0.001). Specifically, the internalizing and externalizing scores of the high interpersonal support group were significantly lower than medium and low groups. The internalizing and externalizing scores of the medium group was significantly lower than low interpersonal support group. These findings contribute to deepen the understanding of the impact of interpersonal support on psychological and behavioral development of adolescents, and provide theoretical evidence for inspiring the construction of a comprehensive interpersonal support network.

父母教育焦虑的测量、类型及其与中小学生学业倦怠的关系

赵晖　贾绪计(通讯作者)
天津师范大学心理学部，天津，300387

摘 要　随着 2021 年“双减”政策的实施和推进，学生的学业负担有所减轻，父母的教育焦虑有所缓解，但父母的教育焦虑总体还比较严重，甚至衍生出新的教育焦虑内容。父母的教育焦虑不仅损害父母的身心健康，而且这种消极影响会产生“代际效应”，影响孩子的学习、人际关系以及情绪等，危及孩子身心健康发展。本研究目的有三个：（1）“双减”背景下，父母可能衍生出新的教育焦虑内容，因此第一个目的是编制高信效度的父母教育焦虑问卷，为更加科学、全面地评估新形势下父母的教育焦虑提供测量工具。（2）“双减”背景下，父母教育焦虑水平有很大的异质性，因此第二个目的是采用个体为中心的方法探索“双减”背景下父母教育焦虑的特点和群体类型，为父母教育焦虑干预的精准性和实效性提供实证支持。（3）中小学生学业倦怠现象普遍，那么学生学业倦怠与父母的教育焦虑是否有关？第三个目的旨在探讨父母教育焦虑的“代际效应”，即父母的教育焦虑是否影响孩子的学业倦怠，以及学业情绪在其中的作用。

研究一：分为初测和正式施测，初测对象是 454 名中小学生父母、正式施测对象是 474 名中小学父母。结果表明：父母教育焦虑分为机会和竞争焦虑、学习焦虑、健康安全焦虑、网络接触焦虑和教养效能焦虑五个维度；区分度分析中所有项目均显著；信度分析中，总量表及其分量表的克隆巴赫 a 系数在 0.807 到 0.953 之间；结构效度分析中，量表五因素模型的验证性因素分析结果为 c^2 / df=2.88，RMSEA=0.064，CFI=0.941，TLI=0.933，SRMR=0.043；量表与校标的关联效度均在 0.210-0.544 之间；测量等值性检验结果表明父母教育焦虑量表在不同的性别、户籍地中有较好的跨群体稳定性。

研究二：采用潜在剖面分析（Latent profile anlaysis）对 474 名中小学生父母的教育焦虑状况进行分析。结果表明：根据父母教育焦虑状况，可以将父母分为五种不同潜在群体类型：整体高焦虑组（13.5%）、整体中-高焦虑组（26.7%）、整体中焦虑组（31.8%）、低网络焦虑组（11.3%）和低学习焦虑组（16.7%）；多项 logistic 回归分析表明，父母教育焦虑群体分布类型受性别影响显著，母亲的教育焦虑较高。

研究三：采用亲子配对的方法，调查了 680 对中小学生与其父母的配对组，其中调查了学生的学业倦怠和学业情绪和父母的教育焦虑。结果表明：父母的教育焦虑显著正向预测学生的学业倦怠；学生学业情绪（积极、消极）做为中介变量，在父母教育焦虑与学生学业倦怠的关系中起中介作用；中介模型的跨群组检验表明，中介模型的性别差异不显著，学段（小学 VS 初中）差异显著，小学生组的中介效应显著高于初中生组。

综合以上研究，主要结论如下：

（1）编制的《父母教育焦虑问卷》具有较高的信度和效度，可以作为测量工具调查“双减”背景下父母的教育焦虑状况。

（2）父母教育焦虑有较高的异质性，可以将父母分为整体高焦虑组、整体中-高焦虑组、整体中焦虑组、低网络焦虑组、低学习焦虑组五种群体类型，其中整体中焦虑组的父母占比最高。

（3）父母教育焦虑有代际传递效应，父母教育焦虑会影响学生的学业倦怠，学业情绪（积极学业情绪、消极学业情绪）在父母教育焦虑与学生学业倦怠的关系中起中介作用。

The assessment and type of parental educational anxiety and its relations with academic burnout

Zhao Hui Jia Xu-ji (corresponding author)
Tianjin Normal University Faculty of Psychology, Tianjin, 3003.87

***Abstract*:** With the implementation of the "double reduction" policy in 2021, students' academic burden has been reduced, and parents' education anxiety has been alleviated, but parents' education anxiety is still relatively serious overall, and even new education anxiety content has been derived. Parents' educational anxiety not only affects their selves, but also produces "intergenerational effects", affecting children's learning, interpersonal relationships and emotions, etc., endangering children's physical and mental health development. Therefore, the purpose of this study is threefold: (1) Under the background of "double reduction", parents may derive new educational anxiety content, so the first purpose is to compile a high-reliability and validity parent education anxiety questionnaire to provide measurement tools for a more scientific and comprehensive assessment of parents' educational anxiety in the new situation. (2) Under the context of "double reduction", parental education anxiety is very heterogeneous, so the second purpose is to explore the characteristics and group types of parental education anxiety in the context of "double reduction" by using an individual-centered approach, and provide empirical support for the accuracy and effectiveness of parental education anxiety intervention. (3) Primary and secondary school students have serious burnout, so is students' academic burnout related to parents' educational anxiety? The third objective aims to explore the "intergenerational effect" of parents' educational anxiety, that is, whether parents' educational anxiety affects children's academic burnout, and the role of academic emotions in it.

In the first study, 454 parents of primary and middle school students were initially tested, and 474 parents of primary and middle schools were officially tested. The results showed that parents' education anxiety was divided into five dimensions: opportunity and competition anxiety, learning anxiety, health and safety anxiety, online contact anxiety and parenting effectiveness anxiety. degree of differentiation; In the reliability analysis, the cronbach's alpha of the aggregate scale and its subscale was between 0.807 and 0.953; the confirmatory factor analysis results of the model werec²/df=2.88, RMSEA=0.064, CFI=0.941, TLI=0.933, SRMR=0.043; the correlation validity between the scale and the calibration standard was between 0.210-0.544; the measurement equivalence test showed that the parental education anxiety scale was of different genders There is good cross-group stability in the household registration area.

In the second study，Latent profile analysis was used to analyze the educational anxiety of 474 parents. The results showed that parents could be divided into five different potential groups according to their educational anxiety: overall high anxiety group (13.5%), overall medium-high anxiety group (26.7%), overall medium anxiety group (31.8%), low Internet anxiety group (11.3%) and low learning anxiety group (16.7%). A number of logistic regression analyses showed that the distribution type of parents' education anxiety group was significantly affected by gender, and mothers' education anxiety was higher than father.

In the third study， using the parent-child matching method, 680 pairs of primary and secondary school students and their parents' pairing groups were investigated, in which students' academic burnout and academic emotions were investigated, and parents' educational anxiety was investigated. The results showed that parents' educational anxiety significantly positively predicted students' academic burnout. Students' positive academic emotions and negative academic emotions play a mediating role in the relationship between parents' educational anxiety and students' academic burnout. The cross-group test of the mediation model showed that the gender difference of the mediation model was not significant, the difference in school segment was significant, and the mediation effect of the primary school student group was significantly higher than that of the junior middle school student group.

Based on the above research, the main conclusions are as follows:

(1) The "Questionnaire on Parents' Education Anxiety " has high reliability and validity, and can be used as a

tool to investigate the educational anxiety of parents under the background of "double reduction".

(2) Parental education anxiety has high heterogeneity, and parents can be divided into five groups: overall high anxiety group, overall medium-high anxiety group, medium anxiety group, low Internet anxiety group, and low learning anxiety group, among which the parents in the overall anxiety group account for the highest proportion.

(3) Parental education anxiety has intergenerational transmission effects, parental education anxiety will affect students' academic burnout, and academic emotions play a mediating role in the relationship between parental education anxiety and students' academic burnout.

童年情感忽视对社交焦虑的影响：一个有调节的中介模型

万玥[1]　罗品超[1]（通讯作者）
华南师范大学心理学院，广州，510631

摘 要　童年情感忽视是指监护人缺失对孩子的爱、养育和支持，令其缺少归属感，未能满足孩子基本情感和心理需求的现象，已有研究结果显示，童年情绪忽视对包括共情发展、社交焦虑形成在内的社会问题产生了深远的影响。然而，其潜在的机制在很大程度上仍不清楚。因此，本研究基于生态系统理论和依恋理论，采用问卷法对 1198 名大学生进行研究，运用儿童期创伤问卷、人际反应指针量表、共情理论量表、交往焦虑量表对童年情感忽视、共情、共情思维、社交焦虑进行测评，构建出一个有调节的中介模型，分析童年情感忽视对社交焦虑的影响路径。结果显示：（1）童年情感忽视能够正向预测大学生的社交焦虑水平，童年情感忽视程度越严重，社交焦虑水平越高。（2）情感共情、认知共情在童年情感忽视与社交焦虑之间起部分中介作用，但作用机制不一样。童年情感忽视程度越严重，情感共情水平更高，认知共情水平更低，社交焦虑更严重。（3）共情思维仅调节认知共情中介模型的后半段，对情感共情中介模型没有调节作用。具体表现为共情思维越符合成长型，童年情感忽视造成的低认知共情导致的社交焦虑程度越弱。研究揭示了共情和共情思维的中介和调节作用，为社交焦虑的发展机制、共情的工作机制提供更多解释路径。
关键词　社交焦虑，童年情感忽视，认知共情，情感共情，共情思维

Relationship between Childhood Emotional Neglect and Social Anxiety: A Moderated Mediation Model

Yue Wan1, Pinchao Luo1*
South China Normal University, China

Abstract：Childhood emotional neglect refers to a lack of availability and responsiveness from parents, leaving the child without a sense of belonging and failing to meet their basic emotional needs. Prior studies have found that childhood emotional neglect exert a far-reaching influence on social problems, including social anxiety and the development of empathy. However, the underlying mechanisms remains largely unknown. Thus, Based on ecosystem theory and attachment theory, the current study built a moderated mediation model exploring the combined effects of the childhood affective neglect on social anxiety, and a total of 1198 college students (480 boys, 718 girls; average age = 21.33 ± 1.87 years) participated in this investigation, assessing in terms of childhood emotional neglect, empathy, empathy mind-set, social anxiety using Childhood Trauma Questionnaire,

Interpersonal Reactivity Index, Theories of Empathy Scale, and Interaction Anxiousness Scale. The results indicated that: (1) Childhood affective neglect can positively predict the level of social anxiety of college students. Compared to individuals with a low childhood affective neglect, students with a high childhood affective neglect had higher levels of social anxiety. (2) Affective empathy and cognitive empathy partially mediate the relationship between childhood affective neglect and social anxiety, but their mechanisms are different. Higher levels of childhood affective neglect were associated with higher levels of emotional empathy but lower levels of cognitive empathy, and they led to higher levels of social anxiety. (3) Empathy mind-set only moderates the latter half of the cognitive model. Specifically, the more malleable view of empathy that someone has, the lower level of social anxiety will be affected by low cognitive empathy which caused by childhood affective neglect.This study reveals the mediating and moderating effects of empathy and empathy mind-set, providing more explanations for the development and working mechanism of social anxiety and empathy.
Keywords: social anxiety, childhood affective neglect, cognitive empathy, affective empathy, empathy mind-set

基于多维项目反应理论的幼儿绘画潜能家长评定量表开发

马骏驰[1] 邢秋连[1] 郑方晓[1] 耿绯[1] 郑元欣[1] 张明珠[1] 王鹏[2]

1 山东师范大学心理学院，济南，250399

2 山东师范大学心理学院，济南，250399，pengsdnu@163.com

摘 要 目的：利用多维项目反应理论编制适合我国幼儿的绘画潜能家长评定量表，并检验其信效度。方法：在文献分析的基础上参考教育部下发的《3-6 岁儿童学习与发展指南》，进一步通过与幼儿家长和教师的访谈以及专家评定，形成具有 20 个题项的初始量表。通过问卷星对幼儿家长进行施测，最终回收并经过数据清洗后获得有效样本 819 份，将有效样本随机分为数据集 A（n=409）和数据集 B（n=410）。对数据集 A 进行项目分析、探索性因素分析和构建多维等级反应（MGR）模型进行参数估计；利用数据集 B 对数据集 A 的模型参数估计结果进行验证分析，并对被试能力参数进行估计，改编了幼儿绘画过程行为观察表作为效标测量工具并利用数据集 B 进行了效标关联效度的分析。结果：经过项目分析和探索性因子分析，形成具有 18 个题项的最终量表，包括绘画技能、绘画见识、绘画思维三个因子。数据集 A 的 MGR 模型参数估计良好，所有项目难度参数均在[-3.2276，2.4878]之间，区分度参数的估计结果均在[0.7747，3.0218]之间，因此不需要删除任何题项；数据集 B 的验证分析结果显示项目的难度参数在[-3.8488，2.9892]之间，项目的区分度参数在[0.6877，2.3604]之间，也均在可接受的的范围之内。由此可知，数据集 a 所得出的模型具有较高的可靠性。量表总分与效标问卷总分之间呈显著正相关（r=0.524，p<0.01），且量表各维度与效标问卷也呈正相关（r=0.250～0.554，p<0.01）,说明编制的幼儿绘画潜能家长评定量表具有良好的效标关联效度。量表总分及三个因子的内部一致性系数分别为 0.934、0.918、0.848 和 0.742，表明问卷具有良好的同质性信度。此外，基于多维项目反应理论构建的 MGR 模型可以获得被试在各个维度上的能力信息，可以更全面的进行认知诊断。结论：本研究编制的幼儿绘画潜能家长评定量表具有良好的信效度，符合心理测量学的特性，可以用来评估幼儿绘画潜能。

Development of the Parent Rating Scale for Young Children's Drawing Potential Based on Multidimensional Item Response Theory

Junchi Ma，Qiulian Xing，Fangxiao Zheng ，Fei Geng，Yuanxin Zheng，Mingzhu Zhang，Peng Wang

School of Psychology, Shandong Normal University, jinan, 250399，
Email：pengsdnu@163.com

Abstract： Objective： This paper aimed to develop a drawing potential parent rating scale suitable for young children in China using multidimensional item response theory and to test its reliability and validity. Methods: On the basis of literature analysis, the initial questionnaire with 20 items was designed with reference to the Learning and Development Guidelines for Children Aged 3-6 issued by the Ministry of Education, and further through interviews with parents and teachers of young children as well as expert evaluation. The questionnaire was administered to parents of young children through the Wenjuanxing, and finally 819 valid samples were recovered and obtained after data cleaning. The valid samples were randomly divided into dataset A (n=409) and dataset B (n=410). Item analysis, exploratory factor analysis and the construction of Multidimensional Graded Response (MGR) model for parameter estimation were performed on dataset A. The results of the model parameter estimation of dataset a were validated using dataset B. The parameters of the subjects' abilities were estimated, and the Behavioral Observation Scale of Young Children's Drawing Process was adapted as a validity scale measurement tool and dataset B was used to measurement calibration validity. Results: After item analysis and exploratory factor analysis, a final scale with 18 items was formed, including the three factors ： drawing skills, drawing insight, and drawing mindset. The parameters of the MGR model for dataset A were well estimated, with all the item difficulty parameters between [-3.2276, 2.4878] and the estimation results of the differentiation parameter between [0.7747, 3.0218], so there was no need to delete any question items; the results of the validation analysis for dataset B showed that the item difficulty parameter was between [-3.8488, 2.9892] and the item differentiation parameter is between [0.6877, 2.3604], which are also within the acceptable range. It can be seen that the model derived from dataset a has high reliability. There was a significant positive correlation between the total score of the scale and the total score of the validity questionnaire ($r=0.524$, $p<0.01$), and the dimensions of the scale were also positively correlated with the validity questionnaire ($r=0.250\sim0.554$, $p<0.01$), indicating the Drawing Potential Parent Rating Scale of young children had good calibration validity. The internal consistency coefficients of the total score of the questionnaire and the three factors were 0.934, 0.918, 0.848 and 0.742 respectively, indicating the scale had good homogeneity reliability. In addition, the MGR model constructed on the basis of multidimensional item response theory can obtain information about the subjects' abilities in various dimensions, which make cognitive diagnosis more comprehensive. Conclusion: The Young Childhood Drawing Potential Parent Rating Scale developed in this study has good reliability and validity , and can be utilized as an effective tool for drawing potential of young children.

Keywords： Drawing potential of young children ， Multidimensional Item Response Theory ， Scale development ，Reliability ，Validity

女生不容易学工科？--基于专业认同感调节的教育增值性评价研究

左利华[12] 聂衍刚[2]（通讯作者）
1 广东海洋大学心理健康与咨询中心，广东 湛江，524088
2 广州大学教育学院青少年心理与行为研究中心，广东 广州，510006，nie-yangang@gzhu.edu.cn

摘 要 高等教育中的专业性别隔离问题一直以来都是教育心理学研究的重点，中国的女大学生较少报考及录取到工科专业。大学生对所学专业的认同程度决定了是否主动学习的态度，是大学生教育增值的重要影响因素。以大学生教育增值性评价中最为重要的两个要素——个人素质和专业能力的提升情况为因变量，探讨性别隔离是如何通过专业认同感影响大学生教育增值的，实证检验男女生就读工科专业的异质性。个人素质主要包括法

治道德、创新思维、责任素养等要素，专业能力主要包括专业思维、解决问题、职业规划等要素。本研究对广东省某高校的 35550 名大学生开展问卷调查，同时收集了被试的学业成绩。自编专业认同感问卷、个人素质发展情况问卷、专业能力发展情况问卷，问卷信度较高（Cronbach's α≥0.842）。问卷检出男生 20350 人、女生 15200 人，其中工科男生 10953 人、工科女生 6132 人。研究结果表明：（1）女生的学业成绩高于男生的（F=645.43, p<0.001）,工科生的学业成绩低于非工科生的（F=189.22, p<0.001）,两者交互作用显著（F=13.81, p<0.001）。（2）工科生有较低的专业认同感（F=13.08, p<0.001），女生的专业认同感、个人素质和专业能力均高于男生（F≥22.48, p<0.001），两者交互作用不显著。（3）专业认同感、个人素质和专业能力相互呈显著正相关（r≥0.196, p<0.001），以上三个变量与学业成绩呈显著正相关（r≥0.104, p<0.001）。（4）将专业认同感作为中介调节变量，探讨两因素（性别、是否就读工科专业）对个人素质、专业能力的影响，分析发现专业认同感对个人素质没有调节作用，个人素质受性别因素影响（R^2=0.13, F=155.15, p<0.001），专业认同感显著调节了性别因素对专业能力的影响（R^2=0.259, F=3111.41, p<0.001），是否就读工科专业对个人素质、专业能力的影响不显著。女生就读工科专业与男生的困难程度无差异，专业认同感主要影响大学生的专业能力发展，学业成绩可以较好的预测大学生教育增值性评价。

Girls Are Not Easy to Learn Engineering?

--Research on the Evaluation of Educational Value-added Based on the Regulation of Professional Identity

Lihua Zuo[1,2]　Yangang Nie [2]

1 Mental Health and Counseling Center, Guangdong Ocean University, Zhanjiang 524088

2 Department of Psychology/Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou 510006

Abstract*:** The issue of professional sex segregation in higher education has always been the focus of Educational psychology research, and female college students in China rarely apply for exams and enroll in engineering majors. The degree of professional identity determines their attitude towards active learning, which is an important influencing factor for the value-added of college education. There are two most important elements in the value-added evaluation of college education: personal qualities and professional abilities. Personal qualities mainly include elements such as legal ethics, innovative thinking, and responsibility literacy. Professional abilities mainly include elements such as professional thinking, problem-solving, and career planning. We need to explore how sex segregation affects the education value-added of college students' through professional identity, and empirically test the differences between male and female students in engineering majors. ***Method: We have developed our own professional identity questionnaire, personal quality development questionnaire, and professional ability development questionnaire, which have high reliability (Cronbach's α≥0.842). The questionnaire survey on 35550 college students from a university in Guangdong Province, and collected their academic performance. The questionnaire detected 20350 male students and 15200 female students, including 10953 engineering male students and 6132 engineering female students. ***Result***: (1) The academic performance of female students is higher than that of male students (F=645.43, p<0.001), while the academic performance of engineering students is lower than that of non engineering students (F=189.22, p<0.001). The interaction between the two is significant (F=13.81,

p<0.001). (2) Engineering students have a lower sense of professional identity (F=13.08, p<0.001), while female students have a higher sense of professional identity, personal qualities, and professional abilities than male students (F≥22.48, p<0.001), and the interaction between the two independent variable is not significant. (3) Professional identity, personal qualities, and professional abilities are significantly positively correlated with each other (r≥0.196, p<0.001), and the above three variables are significantly positively correlated with academic performance (r≥0.104, p<0.001). (4) Using professional identity as a mediating variable, we explores the effects of two factors (gender and whether engineering major students) on personal quality and professional ability. We found that professional identity has no moderating effect on personal quality, and personal quality is mainly influenced by gender factors (R^2=0.13, F=155.15, p<0.001). Professional identity significantly moderates the impact of gender factors on professional ability (R^2=0.259, F=3111.41, p<0.001). The impact of studying engineering majors on personal quality and professional abilities is not significant. **Conclusion:** There is no difference in the difficulty level between girls studying engineering majors and boys. Professional identity mainly affects the development of college students' professional abilities, and academic performance can better predict the value-added evaluation of college education.

校园氛围与网络欺凌实施的元分析

林一瑾[1]　巩宁宁[1]　张佳静[1]　尤若男[1]　李森[1]（通讯作者）

1 河北大学教育学院，保定，071000，1447123652@qq.com

摘 要　网络欺凌逐渐成为公共社会中严重的人际交往问题。而在以往的相关研究中，校园氛围与网络欺凌实施的关系并不一致。本研究旨在通过元分析方法，进一步澄清校园氛围与网络欺凌实施之间的关系，并探讨性别与文化在二者关系中的调节作用。经过对文献的检索与筛选，本研究共纳入 28 篇包含校园氛围与网络欺凌实施相关关系的量化文章，共 33 个效应值，总样本量为 82,580。使用 Comprehensive Meta-Analysis (CMA 3.0)软件，基于随机效应模型对数据进行分析。结果表明：校园氛围与网络欺凌实施行为存在显著的负相关（r = -0.20，p < 0.001）；亚组分析表明，校园氛围与网络欺凌实施间的关系受到文化的调节作用（Q = 6.49，p < 0.05），即个人主义文化中的学生（r = -0.26, 95% CI = [-0.32，-0.19]）比集体主义文化中的学生（r = -0.13, 95% CI = [-0.20，-0.06]）更易受到学校氛围的影响实施网络欺凌行为；元回归分析表明，校园氛围与网络欺凌实施间的关系并不受性别的调节作用（b = 0.022, p = 0.534）。本研究澄清了校园氛围与网络欺凌实施间相关性大小的分歧，揭示了学校氛围与网络欺凌实施间存在的显著性负相关，并且阐明了二者之间的关系受到文化的调节作用。这些发现为网络欺凌行为的预防和干预工作提供了新的科学依据。

Abstract: Cyberbullying perpetration has become a severe interpersonal issue in public society. Since the association between school climate and cyberbullying perpetration remains inconsistent in previous studies. This article aimed to report a meta-analysis of the relationship between school climate and cyberbullying perpetration, and explore the moderating effects of gender and culture. Examination of the literature containing quantitative measurements of both school climate and cyberbullying perpetration produced a sample of 33 effect sizes (N = 82,580) for review. Results based on random-effects model indicated a significant negative relation between school climate and cyberbullying perpetration (r = -0.20, p < .001). Moreover, the moderation analyses revealed that the association between school climate and cyberbullying perpetration was stronger for students in individualistic culture than those in collectivist culture (Q = 6.49, p < .05). However, this relation was not moderated by gender (b = 0.022, p = .534). In conclusion, there is an significant association between school climate and cyberbullying perpetration, and it is moderated by culture.

Keywords: School climate, Cyberbullying perpetration, Culture, Gender

童年中晚期父亲与母亲教养的联合发展轨迹与儿童学校适应的关系

王芳[1]　洪松岳[2]　王美芳[2]（通讯作者）

2 首都师范大学心理学院，北京，100048，meifangw@hotmail.com

摘 要　儿童的学校适应是国内外教育学与心理学研究者关注的重要课题。其中，父母教养是儿童学校适应的重要影响因素。然而，现有研究较少从系统的视角考察父亲和母亲教养的联合发展轨迹对儿童学校适应的影响。本研究以 362 名四年级小学生及其父母为被试，进行为期三年的追踪测查，并采用以个体为中心的方法，分别考察了儿童报告和父母报告的父亲与母亲教养的联合发展轨迹亚组与童年中晚期儿童学校适应（包括学习成绩、师生关系、同伴关系、内外化问题行为以及学校满意度）间的关系。平行过程潜在类别增长模型的结果发现，儿童报告与父母报告的父母教养均存在三组联合发展轨迹。具体而言，儿童报告的父亲与母亲教养存在“慈爱父慈爱母”、“焦虑父焦虑母”与“严厉父严厉母”三个轨迹亚组，父母报告的父亲与母亲教养存在“慈爱父慈爱母”、“严慈父严慈母”与“严厉父严厉母”三个轨迹亚组。除了学习成绩在各个父亲与母亲教养的联合发展轨迹间的差异不显著外，儿童学校适应的其它方面与父亲和母亲教养的联合发展轨迹均存在显著关联。基于儿童报告与父母报告的父母教养识别出的相似的轨迹亚组与儿童学校适应间的关系相同。其中，儿童报告与父母报告识别出的“慈爱父慈爱母”轨迹亚组的儿童学校适应均最好，具体表现为最高水平的师生关系、同伴关系、学校满意度，以及最少的内外化问题行为；而儿童报告与父母报告识别出的“严厉父严厉母”轨迹亚组的儿童学校适应均最差。此外，儿童报告识别出的“焦虑父焦虑母”轨迹亚组中儿童的学校适应较好；父母报告识别出的“严慈父严慈母”轨迹亚组中的儿童学校适应较差。研究结果揭示了父母教养组合对儿童学校适应的影响，并为通过改善父母教养进而提升儿童学校适应的实践干预提供了实证依据。

The Relationship between Co-developmental Trajectories of Paternal and Maternal Parenting and Children's School Adjustment in Middle to Late Childhood

Fang Wang[1], Songyue Hong[2], Meifang Wang[2]

[1] Department of Psychology, Capital Normal University, Beijing, 100048
[2]College of Elementary Education, Capital Normal University, Beijing, 100048

***Abstract*:** Children's school adjustment is a crucial area of interest for educational and psychological researchers worldwide. Parenting plays a significant role in influencing children's school adjustment; however, existing research has limitedly explored the impact of co-developmental trajectories of paternal and maternal parenting on children's school adjustment from a systemic perspective. This study aimed to explore this issue by conducting a three-year longitudinal study on 362 fourth-grade primary school students and their parents. Using an person-centered approach, the study examined the joint developmental trajectories of paternal and maternal parenting as reported by children and parents, respectively. Furthermore, the study investigated the relationship between these developmental trajectories and various aspects of children's school adjustment during middle to late childhood, including academic performance, teacher-student relationships, peer relationships, internalizing and externalizing behavior problems, and school satisfaction. The results, obtained through parallel process latent class growth modeling, revealed three groups of co-developmental trajectories for both child-reported and parent-reported parenting. Specifically, for child-reported paternal and maternal parenting, the trajectory subgroups of "kind father, kind mother", "anxiety father, anxiety mother", and "strict father, strict mother" were identified. For parent-reported paternal and maternal parenting, the trajectory subgroups of "kind father, kind mother", "kind-strict father, kind-strict mother", and "strict father, strict mother" were identified. Apart from the insignificant differences in academic performance among the co-developmental trajectories of paternal and maternal parenting, the other aspects of children's school adjustment are closely related to co-developmental trajectories of paternal and maternal parenting. For the subgroups of trajectory similar to those identified by child and parent reports, the same relationship was found with children's school adjustment. Children in the "kind father, kind mother" trajectory identified for child- and parent-reported paternal and maternal parenting exhibited the most positive school adjustment outcomes, including the best teacher-student relationship, peer relationship, and school satisfaction, and the least internalizing and externalizing behaviors. Conversely, children in the "strict father, strict mother" trajectory experienced the most challenging school adjustment. Additionally, children in the "anxiety father, anxiety mother" trajectory, as identified by children report, demonstrated better school adjustment, whereas children in the "kind-strict father, kind-strict mother" trajectory, as identified by parents report, reported worse school adjustment. These findings contribute to our understanding of the relationship between co-developmental trajectories of parenting and children's school adjustment. They also provide empirical evidence supporting the implementation of interventions aimed at improving parental caregiving to enhance children's school adjustment.

教师心理健康素养干预效果的元分析

梁春雨 胡国鹏 陈宇轩 苏怡西 张信勇（通讯作者）
广东外语外贸大学社会与公共管理学院，广州，510006，zhangxinyong@gdufs.edu.cn

摘 要　近年来，鉴于教育工作者的心理健康素养在促进学生的心理健康和福祉方面发挥着关键作用，关于教师和准教师群体的心理健康素养的干预研究日益增多。本研究运用元分析的方法来考察现有针对教师（包括准教师）的心理健康素养的干预措施在改善心理健康知识、污名化态度、求助、助人上的有效性，

并进一步探讨影响其干预效果的因素。2022 年 11 月在 PubMed、PsycINFO、 ERIC、Web of Science 和 Cochrane Controlled Trials Register 5 个数据库上进行检索。本研究共检索到 6186 篇文献，共纳入 18 项研究。结果发现：（1）干预对知识、污名态度和助人的即时效果量达到显著的效果(知识：g = 1.08, 污名态度：g = -0.33，助人：g = 0.48)。（2）在 3 个月内的追踪效果上，仅对知识和助人的干预效果显著，达到中到大的效果（知识：g = 0.73，助人：g = 0.52）。（3）在 3 个月后的干预效果上，知识和助人的干预效果依然显著(知识：g = 0.53，助人：g = 0.55)。（4）在求助这一结果变量并未观察到显著差异。（5）亚组分析结果表明：在知识的干预上，地域、被干预者类型、试验类型、干预者与被干预者之间的互动形式的亚组分析均不显著。在污名态度的干预上，地域、干预者类型、试验类型均显著影响污名态度的即时效果量。具体为：对欠发达国家教师的干预效果显著优于对发达国家教师的干预效果(g :- 0.-79>-0.24 ,p < 0.001); 对职前教师的干预效果显著优于在职教师的干预效果(g :- 0.-95>-0.27, p < 0.01); 非 RCT 研究的干预效果显著优于 RCT 研究(g :- 0.42>-0.04, p < 0.05) 。在助人的干预上，仅有试验类型的亚组结果显著。研究结论和启示：目前教师心理健康素养的干预措施在短期能有效提升其心理健康素养的知识、污名态度、助人 3 个结果变量。但在长期效果上，只有知识的长期效果是有效的。未来的研究应延长随访时间以确定长期的干预效果，并且进一步探索心理健康素养干预的影响因素。

Meta-analysis of the effect of mental health literacy intervention on teachers: knowledge, stigma, help-seeking,helping

LIANG Chun-yu, HU Guo-peng, CHEN Yu-xuan, Su Yi-xi, ZHANG Xin-yong

School of Public Administration,Guangdong University of Foreign Studies,Guangdong 510006，China

Abstract： In recent years, given the critical role educators' mental health literacy plays in promoting students' mental health and well-being, there has been an increase in studies on mental health literacy among teachers and pre-servive teachers. A systematic review and meta-analysis regarding the effectiveness of mental health literacy interventions aimed at teachers' (including pre-servive teachers') in improving mental health knowledge, stigmatized, help-seeking, and helping, and further explores the impact of these interventions. Studies were identified by searching five databases (Pub Med, Psyc ARTICLES, ERIC, Web of Science and Cochrane Controlled Trials Register).Of the 6186 identified references, 18 studies were included in the meta-analysis.The results were as the following. (1) The immediate effect of the intervention on knowledge, stigma and helping was significant (knowledge: g = 1.08, stigma : g = -0.33, helping others: g = 0.48). (2) At a 3- month follow-up, only the effect of intervention on knowledge and helping were significant and medium to large (knowledge: g = 0.73, helping: g = 0.52). (3) At longer follow-ups (> 3 month), the effect of intervention on knowledge and helping were still significant (knowledge: g = 0.53, helping: g = 0.55). (4) No significant difference was observed in help-seeking. (5) The results of the subgroup analysis were as the following. In terms of knowledge , the subgroup analysis indicated the types of the region, the types of the participants, the types of experiment, and the types of interaction and contact in intervention were not significant. With respect to stigma, the types of the region, the types of the participants, the types of experiment were significant. In terms of helping, only the types of experiment was significant. The conclusions and implications are as following. The mental health literacy among teachers are effective in augmenting knowledge, stigma, and helping in the short term, but not in improving help-seeking.Intervention effects on knowledge are stable in time, while the intervention effects on stigma, helping

are unstable.Future research should extend the follow-up time to determine the long-term intervention effect, and further explore the influencing factors of mental health literacy intervention.

二阶段多分属性估计方法：

突破大规模标准化考试中多分属性认知诊断的计算挑战

韩雨婷[1]　江哲涵[2,3]（通讯作者）

1 北京语言大学心理学院，北京，100083

2 北京大学医学教育研究所，北京，100191

3 北京大学全国医学教育发展中心，北京，100191，通讯作者 E-mail：jiangzhehan@gmail.com

摘 要　鉴于知识和技能的多层次性，学界已提出多分属性的认知诊断模型（polytomous Cognitive Diagnosis Model，pCDM），以更细致地评估考生对各项属性的掌握程度。这种多层次的评估方式与布卢姆等人将教育目标中的认知领域划分为记忆、理解、应用等多个层次的观念相契合，进一步提升了诊断反馈的个性化和精细化水平。然而，由于 pCDM 估计参数数量的增加，其在处理大样本、大题量、多认知层次的全国性大规模标准化考试数据时面临计算困难的技术约束。此外，传统考试命题过程中，常在题目水平上对认知层次进行标定，而非对各个属性单独标定。在此种题目水平标定认知层次的情况下，对考生多分属性掌握模式估计结果的准确性尚需进一步审查。

本研究通过创新研发并实证验证了一种二阶段多分属性估计方法，作为面对大样本高题量场景下 pCDM 的有效替代方案，实现了对考生多分属性掌握模式的精准估计。二阶段多分属性估计方法的基本框架是：先将题目根据认知水平分组，并估计考生二分属性掌握模式，然后将多组二分属性掌握模式整合成多分属性掌握模式。通过 Monte Carlo 模拟研究，我们详细探究了在不同属性数量、题目数量以及样本量条件下，采用题目水平认知层次标定的多分 Q 矩阵时，pG-DINA 模型与新方法对考生多分属性掌握模式和题目参数估计的准确性，以及 pG-DINA 和新方法之间估计结果的一致性。结果表明，在题目层面标定认知层次时，pG-DINA 和新方法都能得到准确的参数估计，且两种方法之间估计结果的一致性极高。此外，我们还利用某大规模卫生类考试数据进行了实证研究，以“考核要点”为认知属性，并在题目层面标定了认知层级。实证研究的结果进一步印证了新方法在处理大规模数据时的有效性和实用性。

总结来说，本研究通过开发二阶段多分属性估计方法，克服了在处理全国大规模标准化考试的海量数据时，采用 pCDM 所面临的计算量瓶颈问题。同时，为实际考试应用中在不同属性数量、试题数量以及样本量条件下选择最优方法和策略提供了重要参考，为进一步推动认知诊断更好地服务于实践提供了方法学支持。

Two-Stage Polytomous Attribute Estimation: Overcoming Computational Challenges in Large-Scale Standardized Testing with Polytomous Cognitive Diagnostic Models

Yuting Han[1] Zhehan Jiang[2,3] (corresponding author)
1 School of Psychology, Beijing Language and Culture University, Beijing, 100083
2 Institute of Medical Education, Peking University, Beijing, 100191
3 National Center for Health Professions Education Development, Peking University, Beijing, 100191, E-mail: jiangzhehan@gmail.com

Abstract: Given the multilevel nature of knowledge and skills, the academic community has proposed the polytomous Cognitive Diagnosis Model (pCDM) to assess students' mastery of various attributes in a more detailed manner. This multilevel assessment aligns with the concept of dividing the cognitive domain of educational objectives into multiple levels such as memory, understanding, and application, as proposed by Bloom et al., thereby enhancing the individualization and refinement of diagnostic feedback. However, due to the increase in the number of parameters to be estimated in pCDM, it faces technical constraints in processing large-scale, large-item, and multi-cognitive level national standardized examination data. Moreover, in traditional exam setting, cognitive levels are usually calibrated at the item level rather than individually calibrating each attribute. Further examination is needed for the accuracy of the estimation results of students' polytomous attribute mastery patterns under this item-level cognitive level calibration.

In this study, a two-stage polytomous attribute estimation method is innovatively developed and empirically validated as an effective alternative to pCDM in scenarios with large samples and a high volume of items, achieving precise estimation of students' polytomous attribute mastery patterns. The basic framework of the two-stage polytomous attribute estimation method is to first group items according to cognitive levels and estimate students' dichotomous attribute mastery patterns, and then integrate multiple groups of dichotomous attribute mastery patterns into polytomous attribute mastery patterns. Through a Monte Carlo simulation study, we thoroughly investigate the accuracy of the pG-DINA model and the new method in estimating the polytomous attribute mastery patterns and item parameters under different attribute quantities, item numbers, and sample sizes, as well as the consistency between the pG-DINA and the new method when using the polytomous Q-matrix calibrated at the item-level cognitive level. The results show that both the pG-DINA and the new method can obtain accurate parameter estimates when calibrating cognitive levels at the item level, and the consistency between the two methods is extremely high. In addition, we conducted an empirical study using large-scale health examination data, using "main points" as cognitive attributes and calibrating cognitive levels at the item level. The results of the empirical study further confirm the effectiveness and practicality of the two-stage polytomous attribute estimation method in handling large-scale data.

In summary, this study develops a two-stage polytomous attribute estimation method to overcome the computational bottleneck faced by pCDM when dealing with the massive data of national large-scale standardized examinations. At the same time, it provides important references for selecting the optimal method and strategy in actual exam applications under different attribute quantities, item numbers, and sample sizes, providing methodological support to further promote cognitive diagnosis to better serve practice.

参数估计误差对多级评分题型测验等值的影响：问题与思考

王少杰[1]（通讯作者） 张敏强[2]
1 广东第二师范学院教育学院，广州，510303，wang021112@126.com
2 华南师范大学心理学院，广州，510631

摘 要 参数估计误差是项目反应理论中重要的概念之一。在测验等值领域常用的 IRT 特征曲线方法并未考虑该误差对测验等值的影响，可能会影响后续结论与决策准确性。为此，Wang 等人（2022）将参数估计误差（信息量）作为权重系数，提出两种项目与测验信息量加权特征曲线方法。经证明，这两种方法在二级评分题型测验等值中具有良好表现。但该类方法在其他测验等值情境中的表现未知，且未有研究探讨参数估计误差在测验等值中的作用。

因此，本文将信息量加权特征曲线方法扩展到多级评分题型测验等值情境。首先，仿照二级评分题型测验等值原理，提出三种新的测验等值方法，分别为等级信息量加权特征曲线方法（CWCC）、项目信息量加权特征曲线方法（IWCC）与测验信息量加权特征曲线方法（TWCC）；并推导出其损失函数的表达式与求解方法。然后，通过蒙特卡洛模拟研究，探究新提出的信息量加权特征曲线方法的表现，以及参数估计误差等因素在此过程中作用的机制。其中，自变量为参数估计误差、考生能力差异、题目数量。在模拟研究中，采用特征曲线类（相对测验特征曲线平方差）与误差类（包括偏差、标准误与均方根误差）两类指标评估等值表现。这两类指标均为绝对值越小，代表测验等值表现越优。整个模拟研究流程重复 1000 次，采用 R 软件自编程序完成。最后，通过实证研究，采用真实考试数据，验证模拟研究结果与结论。

结果发现，在多级评分题型的测验等值情境中新提出的三种方法整体表现较优，均具有较高的准确性与稳定性。同时，三种传统特征曲线方法的测验等值表现亦较为优异。其中，TWCC 方法略优于相应传统方法，CWCC、IWCC 方法与相应传统方法表现相当。参数估计误差与考生能力差异越小，题目数量越大，测验等值的表现越优。同时，在测验等值中，相比于系统误差，随机误差占比更大。本文还发现，上述两类测验等值误差，存在偏差与方差的权衡现象。文中针对测验等值表现、影响因素、两类测验等值误差间的关系展开详细探讨，可为测验等值提供新方向。

The Impact of Parameter Estimation Error on IRT Linking Methods with Polytomous Items: Issues and Considerations

Wang Shao-jie[1], Zhang Min-qiang[2]
1 College of Education, Guangdong University of Education, Guangzhou, 510303
2 School of Psychology, South China Normal University, Guangzhou, 510631

Abstract： This paper focuses on the impact of parameter estimation error on linking methods in item response theory (IRT). The commonly used IRT characteristic curve linking methods do not consider this error. This can affect the accuracy of conclusions and decisions based on it. To address this problem, Wang et al. (2022) proposed two information-weighted characteristic curve methods. These two methods use parameter estimation error (information) as a weighting coefficient, which are named as the item information-weighted characteristic

curve method and the test information-weighted characteristic curve method. Research showed that these newly proposed methods performed well in the IRT linking with dichotomous items. However, the performance of these IRT linking methods in other contexts is unknown. There is no research exploring the role of parameter estimation error in IRT linking methods.

Therefore, this paper extends these two information-weighted characteristic curve methods to the IRT linking with polytomous items. Firstly, based on the rule of IRT linking methods with dichotomous items, three new IRT linking methods with polytomous items are proposed. These are the category information-weighted characteristic curve method, the item information-weighted characteristic curve method, and the test information-weighted characteristic curve method. The expressions and solving methods of the loss function for IRT linking with polytomous items are derived. Furthermore, this paper explores the performance of the three newly proposed information-weighted characteristic curve methods and the role of the factors such as parameter estimation error in the IRT linking with polytomous items through Monte Carlo simulation research. The independent variables include parameter estimation error, student ability differences, and the number of items in a test. Two types of evaluation criteria are used to evaluate the performance of IRT linking methods. These are the evaluation criterion based on characteristic curve and the evaluation criteria based on error. The former criterion is relative squared test characteristic curve difference (RSTD). The evaluation criteria based on error include bias, standard error (SE), and root mean square error (RMSE). Both types of evaluation criteria represent better IRT linking performance with smaller absolute values. The entire simulation research process was repeated 1000 times and completed using the R software with self-written program and mirt package (Chalmers, 2012). Finally, empirical research was conducted using real test data to verify the results and conclusions of the simulation studies.

The results show that the three newly proposed methods have a better overall performance in the IRT linking with polytomous items. These three IRT linking methods have high accuracy and stability (i.e., small absolute values of bias and SE). Moreover, the performance of the three traditional characteristic curve linking methods is also excellent. Among them, the test information-weighted characteristic curve method is slightly better than the traditional test characteristic curve method. The category information-weighted characteristic curve method, the item information-weighted characteristic curve method, and traditional characteristic curve methods perform equally well. The smaller the parameter estimation error and student ability differences, and the larger the number of test items, the better the performance of IRT linking. In IRT linking, random error has a greater proportion than systematic error. This paper also found a trade-off phenomenon between bias and variance in the two types of IRT linking errors.

In summary, this paper provides new insights into the IRT linking methods with polytomous items by extending the information-weighted characteristic curve methods with dichotomous items. The results of this study can contribute to the development of IRT linking and test equating and improve its accuracy and stability. Additionally, this study found that there is a trade-off between bias and variance in IRT linking errors, and that random error has a greater impact on IRT linking than systematic error. This study fills a gap in the research on the role of parameter estimation error in IRT linking and test equating and provides practical implications for researchers and practitioners in the field of educational measurement.

摘 要 领悟社会支持被定义为对个人与他人建立可靠关系能力的认知评估。其中，最常用的测量工具是 Zimet 等人（1988 年）创建的多维领悟社会支持量表（Multidimensional Scale of Perceived Social Support, MSPSS）。该量表已被广泛应用于国外，在不同群体中应用和验证，并逐步扩展到中国的不同年龄组和人群。该量表虽然只有 12 个条目，但大规模的横断面调查往往包含多种类型的量表，使用较短的量表可以更快、更方便地应用于研究和临床工作。因此，本研究计划在中国居民中对领悟社会支持量表进行简化，并对其心理测量学特性进行检验。本研究采用多阶段分层整群抽样法，收集了全国 120 个城市 10914 名居民的数据。将数据随机分为两部分后，分别进行了探索性分析和验证性分析。在对数据集 1 进行探索性分析时，分别使用经典测量理论（Classical Test Theory, CTT）和项目反应理论（Item Response Theory, IRT）中的 Mokken 模型对量表进行了简化，各得到一个简表。同时，引入其它研究中通过多维项目反应理论得到的领悟社会支持量表简表，共得到三个简版量表。并对三个简版量表的实证效度和效标效度进行测试。随后，使用数据集 2 对领悟社会支持量表两个简版的信度、维度、效度和 Mokken 模型假设进行检验。根据数据分析结果，在所有简表中，基于 Mokken 模型假设编制的 7 条目简表具有最佳的心理测量特性。此外，由各维度因子载荷最高的项目组成的 3 条目简表也表现出良好的心理测量特性。因此，本研究认为，在将来的研究中，如果需要使用领悟社会支持量表的简表进行测量，3 条目简版适用于临床环境、大规模横断面研究或纵向研究，而 7 条目简版则适用于更精确的测量。

关键词 领悟社会支持，量表简化，Mokken 模型

Development of a Short Version of the Perceived Social Support Scale: Based on Classical Test Theory and Item Response Theory

6 School of Public Health, Peking University, Beijing, 100191,China

***Abstract*：** Perceived social support is defined as the cognitive assessment of an individual's ability to establish reliable relationships with others in society. The most commonly used measurement tool for this construct is the Multidimensional Scale of Perceived Social Support (MSPSS) created by Zimet et al. (1988). This scale has been widely used in foreign countries, applied and validated in different populations, and gradually extended to different age groups and populations in China. Although the MSPSS scale consists of only 12 items, large cross-sectional surveys often include multiple scales of different types. Using shorter scales can make it quicker and more convenient to apply them in research and clinical work. Therefore, this study aims to simplify the MSPSS scale for Chinese residents and examine its psychometric properties. A multi-stage stratified cluster sampling method was employed to collect data from 10,914 residents in 120 cities across the country. After randomly dividing the data into two parts, exploratory analysis and confirmatory analysis were conducted separately. During the exploratory analysis of Dataset 1, the scale was simplified using both Classical Test Theory (CTT) and the Mokken model in Item Response Theory (IRT), resulting in one short form for each approach. Additionally, three short forms were obtained by introducing other short forms of the MSPSS scale derived from multidimensional item response theory in previous studies. The empirical validity and criterion-related validity of the three short forms were tested. Subsequently, the reliability, dimensionality, validity, and assumption of the Mokken model for the two short forms of the MSPSS scale were examined using Dataset 2. Based on the data analysis results, the 7-item short form developed based on the Mokken model assumption exhibited the best psychometric properties among all the short forms. Moreover, the 3-item short form composed of items with the highest factor loadings in each dimension also demonstrated good psychometric properties. Therefore, this study suggests that in future research, if a short form of the MSPSS scale is needed for measurement purposes, the 3-item short form is suitable for clinical settings, large-scale cross-sectional studies, or longitudinal studies, while the 7-item short form is more appropriate for more precise measurements.

探究小学生器乐艺术潜能家长评定量表的编制：基于多维项目反应理论

郑元欣[1] 程新宇[1] 张明珠[1] 耿绯[1] 马骏驰[1] 郑方晓[1] 王鹏[2]（通讯作者）
1 山东师范大学，济南，250399
2 山东师范大学心理学院，济南，250399，pengsdnu@163.com

摘 要 目的：基于多维项目反应理论（MIRT）编制小学生器乐艺术潜能家长评定量表，对其进行项目分析和信效度检验，探索其适用性，形成正式量表，考察当前小学生器乐艺术潜能的现状与水平。

方法：采用理论探讨与实践调查分析相结合的方法构建初始量表；一半数据（开发集）用于构建 MIRT 模型，进行对比选择最优模型筛选题目；另一半数据（验证集）用于再次构建模型，进行验证，形成正式量表。采用整体抽样法在山东省内某小学进行抽样，共涉及 36 个班级，共计 1067 位家长参与了本研究。199 名参与者因作答无效（99%的题目都选同一选项的问卷）被剔除，剩余有效参与者为 868 人，其中男性为 470 人，女性 398 人，一至六年级分别为 157、147、133、125、158、148 人。

结果：1.开发集区分度参数位于[1.39，3.05]之间，难度参数位于[-3.03，2.17]之间，此步骤未删除项目，项目 18 提供最大信息函数值 2.40，5 个最大信息函数峰值最低的项目（1，2，3，8，14）在验证集中被删除；验证集区分度参数位于[2.08,2.78]之间，难度参数位于[-2.31，1.52]之间，此步骤未删除项目，项目 18 提供最大信息函数值 3.29，没有项目所提供的最大信息量明显低于其他项目，此步骤未删除项目。2.小学生器乐艺术潜能量表由两个分量表 16 个项目构成。3.CFA 验证性结果显示量表结构较好（$\chi^2/df = 8.84$，$RMSEA = 0.095$，$TLI = 0.908$，$CFI = 0.921$，$SRMR = 0.044$）。

结论：经实验证明，使用 MIRT 模型编制小学生器乐艺术潜能家长评定量表是可行的。并且量表各项测量学指标均符合心理测量学的要求。最后，该量表可以有效地测量小学生器乐艺术潜能。

Exploring the development of instrumental art potential parents assessment scale for elementary school students: a data analysis based on multidimensional item response theory

Yuanxin Zheng[1] Xinyu Cheng[1] Mingzhu Zhang[1] Fei Geng[1] Junchi Ma[1] Fangxiao Zheng[1] Peng Wang[2] (Corresponding author)
1Shandong Normal University, Jinan, 250399
2 School of Psychology, Shandong Normal University, Jinan, 250399, pengsdnu.com

***Abstract*:** Objective: The purpose of this study is to develop an instrumental art potential parents assessment scale for elementary school students based on Multidimensional Item Response Theory (MIRT), conduct item analysis and reliability and validity test, explore its applicability, and finally form a formal scale to examine the current status and level of elementary school students' instrumental art potential.

Methods: The initial scale was constructed using a combination of theoretical exploration and practical survey analysis; half of the data (development set) was used to construct the MIRT model for comparison to select the optimal model for screening questions; the other half of the data (validation set) was used to construct the model again for validation to form the official scale. The cluster sampling method was used to sample an elementary

school in Shandong province, involving 36 classes and a total of 1067 parents participated in this study. 199 participants were excluded due to invalid responses (99% of the questions selected the same option in the questionnaire), leaving 868 valid participants, including 470 males and 398 females, with 157, 147, 133, 125, 158, and 148 participants from Grade 1 to Grade 6, respectively.

Results: 1. The development set differentiation parameter was between [1.39, 3.05], the difficulty parameter was between [-3.03, 2.17], no items were deleted at this step, item 18 provided the maximum information function value of 2.40, and the five items with the lowest maximum information function peak (1, 2, 3, 8, 14) were deleted in the validation set; the validation set differentiation parameter was between [2.08, 2.78] and the difficulty parameter was between [-2.31, 1.52], no items were deleted in this step, item 18 provided the maximum information function value of 3.29, no items provided significantly less maximum information than other items, no items were deleted in this step. 2. The Instrumental Art Potential Scale for elementary school students consists of 16 items on two subscales. 3. The CFA validation results showed that the scale structure was better(χ^2/df = 8.84, *RMSEA* = 0.095, *TLI* = 0.908, *CFI* = 0.921, *SRMR* = 0.044).

Conclusion: Firstly, it is feasible to use the MIRT model to develop an instrumental art potential parents assessment scale for elementary school students. Secondly, each of the scale's measurement indicators meets the requirements of psychometrics. Finally, it is possible to measure the instrumental art potential of elementary school students effectively.

基于机器学习开发短式 Buss-Warren 攻击问卷

姜修　杨依天　李俊一（通讯作者）
四川师范大学心理学院，成都，610066
四川师范大学心理学院，成都，610066，junyili@sicnu.edu.cn

摘 要　背景：Buss-Warren 攻击问卷（Buss-Warren Aggression Questionnaire，BWAQ）是应用最为广泛的攻击性测量和评定的工具之一。虽然 BWAQ 具有良好的心理测量特性，但该问卷包含 34 个项目，使其在施测过程中存在一些局限。例如，长问卷会产生更多的不认真作答，降低测量结果的可靠性；长问卷的施测需要更多的时间和精力，会增加研究成本。目标：本研究旨在使用机器学习（Machine Learning，ML）算法，在保证问卷性能的同时，开发更为简短的 BWAQ，以降低施测成本和减少不认真作答，并为大规模普查提供便利工具。方法：样本为 796 名中学生，高攻击性学生占 51.5%。在简化阶段，使用逐步回归（Stepwise Regression）和 ANOVA F-test 确定了 16 个初始版本短式问卷，然后根据机器学习建模结果确定了短式 BWAQ 的最佳版本 —— BWAQ-ML，简化版本仅包含 4 个 BWAQ 题目，临界值为 11。BWAQ-ML 的 AUC、准确率、召回率、精确率和 F1 分数分别为 0.85、0.85、0.89、0.83 和 0.86，说明简化后的问卷性能较好。在验证阶段，BWAQ-ML 的 Cronbach's Alpha 为 0.84，使用反应性-主动性攻击问卷（Reactive-Proactive Aggression Questionnaire，RPQ）和亲社会倾向问卷（Prosocial Tendencies Measure，PTM）检验了 BWAQ-ML 的效度。BWAQ-ML 与 RPQ 分类结果的重合度为 71%，与 RPQ 和 PTM 的皮尔逊相关系数分别为 0.514（$p < 0.001$）和 -0.042（$p = 0.375$），表明短式问卷具有较好的心理测量学特性。结论：过往的机器学习简化问卷的相关研究多采用 R^2作为性能指标，未创建短式问卷的临界值。本研究使用机器学习分类算法简化问卷，根据 AUC、准确率、召回率、精准率和 F1 分数来评估模型，并据此创建了短式问卷的临界值，使问卷的施测更为便利。BWAQ-ML 比 BWAQ 减少了 88%的项目，信效度较好，能够有效测量个体的攻击性，可以作为 BWAQ 的精简版本使用。

Developing a short-form Buss-Warren Aggression Questionnaire based on Machine Learning

JIANG Xiuyu, YANG Yitian, LI Junyi
School of Psychology, Sichuan Normal University, Chengdu(610066), China

***Abstract*:** Background: The Buss-Warren Aggression Questionnaire (BWAQ) is one of the most widely used tools for assessing and measuring aggression. Despite its robust psychometric properties, the questionnaire's 34-item length presents certain limitations during deployment. For instance, longer questionnaires tend to elicit higher rates of insufficient effort survey responding, thereby diminishing the reliability of measurement outcomes. Additionally, the lengthier deployment of the questionnaire necessitates more time and effort, consequently escalating research costs. Objective: The purpose of this study is to apply Machine Learning (ML) algorithms to develop a more concise version of BWAQ while ensuring its performance. This initiative aims to reduce administration costs, mitigate insufficient effort in survey responding, and facilitate large-scale surveys. It can effectively reduce testing costs and reduce insufficient effort in survey responding, making it a convenient instrument for large-scale surveys. Methods: The sample was 796 middle school students, and 51.5% were highly aggressive. In the simplification phase, 16 initial versions of the short-form questionnaire were identified using Stepwise Regression and ANOVA F-test. Then the optimal version of the short-form BWAQ was identified based on the results of the machine learning modeling, named BWAQ-ML, which contains only 4 BWAQ items with a cutoff of 11. The AUC, accuracy, recall, precision, and F1 score of BWAQ-ML were 0.85, 0.85, 0.89, 0.83, and 0.86, respectively, indicating that the simplified questionnaire performed well. In the validation phase, the Cronbach's alpha of the BWAQ-ML was 0.84, and the validity of the BWAQ-ML was tested using the Reactive-Proactive Aggression Questionnaire (RPQ) and the Prosocial Tendencies Measure (PTM). The overlap between the BWAQ-ML and the RPQ categorization results was 71%, and the Pearson correlation coefficients with the RPQ and PTM were 0.514 ($p < 0.001$) and -0.042 ($p = 0.375$), respectively, which suggests that the simplified questionnaire has good validity. Conclusion: Past studies on simplified questionnaires for machine learning have mainly used R^2 as a performance metric and have not created a cutoff for short-form questionnaires. This study simplified the questionnaire using a machine learning classification algorithm to evaluate the model based on AUC, accuracy, recall, precision, and F1 scores. Accordingly, the cutoff of the short-form questionnaire was created to make the deployment of the questionnaire more convenient.The BWAQ-ML has 88% fewer items than the BWAQ, has good reliability and validity, can effectively measure individual aggression, and can be used as a short-form version of the BWAQ.

摘 要 睡眠质量与个体的身心健康状况密不可分，广泛存在的睡眠问题给年轻人带来严重困扰，降低其生活质量。测量睡眠障碍的传统方法是使用问卷进行施测，而随着信息技术的发展，可以获取到个体大量的相关文本，文本中蕴含着大量信息，通过文本分析方法可以直接根据文本信息预测个体的睡眠障碍，使测量更加便捷，并且也可以排除问卷施测中个体易受社会期望效应等影响。本研究的目的在于通过文本分析方法分析出对睡眠障碍具有预测效果的词语。本研究采用匹兹堡睡眠质量指数量表(PSQI)对 1101 名本科生及研究生进行施测，并要求他们用文字描述最近的情绪如何。首先，根据 PSQI 得分将被试分为睡眠障碍组和非睡眠障碍组，之后主要有两个步骤。第一步，旨在验证两类人在正向情绪词和负向情绪词的使用情况上存在差异，具体做法为将被试的文本回答用 Python 进行分词，分词后的文本输入到 LIWC 词频统计软件，得到被试分别使用正向情绪词和负向情绪词的语言特征值，之后采用 t 检验进行验证。第二步，旨在分别选出对睡眠障碍具有预测作用的正向和负向情绪词语，具体做法为将具体的情绪词如“开心”、“低落”等按词频计分当作自变量，睡眠障碍为因变量，采用多重线性回归探索预测睡眠障碍的关键词语。结果：独立样本 t 检验显示，睡眠障碍组和非睡眠障碍组在使用正向情绪词上存在显著差异($t=7.061$, $p<0.001$)，在使用负向情绪词上也存在显著差异($t=-8.903$, $p<0.001$)。具体而言，睡眠障碍组使用的正向情绪词较少，而使用的负向情绪词较多，非睡眠障碍组与此相反。多重线性回归结果显示，对睡眠障碍具有预测效果的词语有“不错”($\beta=0.245$, $t=5.163$, $p<0.001$)、“愉悦”($\beta=0.186$, $t=2.410$, $p<0.05$)等 8 个正向情绪词，以及“悲伤”($\beta=-0.312$, $t=-2.369$, $p<0.05$)、“困倦”($\beta=-0.332$, $t=-2.185$, $p<0.05$)等 5 个负向情绪词。结论：有睡眠障碍的个体倾向于使用更少的正向情绪词和更多的负向情绪词，此外，根据个体在某些特定词语上的使用情况，可以预测出个体的睡眠障碍。未来的研究可进一步探究睡眠障碍与词语使用之间的关系，最终实现通过文本识别和预测个体的睡眠障碍。

Abstract: The quality of sleep is closely related to the physical and mental health of individuals. The widespread problem of sleep quality has brought serious troubles to the young people and reduced their quality of life. The traditional method for measuring sleep disorders is to use questionnaires. However, with the development of

information technology, a large number of relevant texts of individuals can be obtained, which contain a large amount of information. The text-mining method can directly predict the sleep disorders of individuals according to the text information, which makes the measurement more convenient, and can also exclude the influence of individuals' social expectation effect in questionnaire measurement. The purpose of this study was to analyze the predictive words of sleep disorders through text-mining. In this study, 1,101 undergraduate and graduate students were measured using the Pittsburgh Sleep Quality Index (PSQI) and asked to write about their recent mood. First, the subjects were divided into sleep disorder group and non-sleep disorder group according to PSQI score, after which there were two main steps. The first step aims to verify the differences between the two types of people in the use of positive emotional words and negative emotional words. The specific approach is to divide the text answers of the subjects into words using Python, input the text after word segmentation into the word frequency statistics software of LIWC, and obtain the linguistic feature values of the subjects' use of positive emotional words and negative emotional words respectively, and then use the T-test for verification. The second step is to select the positive and negative emotion words that have predictive effects on sleep disorders respectively. The specific approach is to take specific emotional words such as "happy" and "low" as independent variables according to word frequency scores, and sleep disorders as dependent variables. Multiple linear regression is used to explore the key words predicting sleep disorders. It was found that: Independent sample T-test showed that there were significant differences in the use of positive emotion words between the sleep disorder group and the non-sleep disorder group ($t=7.061$, $p<0.001$), and there were also significant differences in the use of negative emotion words ($t=-8.903$, $p<0.001$). Specifically, the sleep disorder group used fewer positive emotion words and more negative emotion words, while the non-sleep disorder group used the opposite. The results of multiple linear regression showed that there were 8 positive emotion words, including "good" ($\beta= 0.245$, $t=5.163$, $p<0.001$) and "happy" ($\beta=0.186$, $t=2.410$, $p<0.05$), and there were 5 negative emotion words, such as "sad" ($\beta = 0.312$, $t = 2.369$, $p < 0.05$) and "sleepy" ($\beta = 0.332$, $t = 2.185$, $p < 0.05$), which had predictive effect on sleep disorders. Conclusion: Individuals with sleep disorders tend to use fewer positive emotion words and more negative emotion words, and an individual's sleep disorder can be predicted based on the individual's use of certain words. Future research could further explore the relationship between sleep disorders and word use, with the goal of identifying and predicting individual sleep disorders through text.

多维 logistic 题组反应模型

徐玲玲[1] 张敏强[2]（通讯作者）
1 北京大学全国医学教育发展中心，北京，100191
2 华南师范大学心理学院，广州，510631，zhangmq1117@qq.com

摘 要 目前，心理与教育测验出现了由采用独立多项选择题向题组过渡的形式。当测验存在共用同一个背景材料的题组时，这时题组内的项目反应间存在一定的相依性，即违反项目反应理论 (item response theory, IRT)中的局部独立性假设，这种现象称为局部项目依赖性。局部项目依赖性会对参数估计造成影响，忽略题组内的局部项目依赖性会导致参数的不准确估计，因此，由其引发的对测验的可靠性影响值得被关注。此外，在实际测验中，既包含多个目标能力，又包含项目内多维题组的测验也真实存在。目前存在的多维题组反应模型基于 Rasch 模型提出，该类模型仅包含难度参数。在实际研究和应用中，项目参数除考虑难度参数外，也常考虑区分度参数或猜测参数。基于此，本研究在多维 logistic 模型的基础上拓展了多维 logistic 题组反应模型。本文以多维两参数 logistic 题组反应模型 (multidimensional two-parameter logistic testlet response model, M2PL-TRM)为例，通过 Monto Carlo 模拟研究探究 M2PL-TRM 的参数估计精度，考察局部项目依赖性和测验长度对参数估计精度的影响，并与忽略题组效应的多维两参数 logistic 模型 (multidimensional two-parameter logistic model, M2PLM)的参数估计结果进行比较。结果表明：(1) 使用 M2PL-TRM 对项目和能力参数所获得的估计精度明显高于 M2PLM；(2) 随着题组内局部项目依赖性的增大，项目和能力参数的估计精度不断降低；(3) 随着测验长度增大，项目和能力参数的估计精度不断提高。总体来说，M2PL-TRM 在考虑目标能力与题组效应多维情况下参数估计精度高于 M2PLM，为测验分析提供了更广泛的模型结构选择, 具有显著的应用价值。

Multidimensional Logistic Testlet Response Model

Xu Lingling [1], Zhang Minqiang [2] (Corresponding Author)
1 National Center for Health Professions Education Development, Peking University, Beijing, 100191
2 School of Psychology, South China Normal University, Guangzhou, 510631, zhangmq1117@qq.com

Abstract: Testlet design has been widely adopted in psychological and educational assessment. Testlets are sets of items sharing the same stimulus such as a graph, a picture, a reading passage, or other contextual elements. The use of testlet violates local independence, which is one of the fundamental assumptions of item response theory (IRT). Violation of local independence is prone to inaccurate estimation of item and person parameters, and the resulting hazards thus deserve attention. Additionally, in actual testing, there are tests that include multiple target abilities and multidimensional testlets within items. Existing multidimensional testlet response models are based on the Rasch model, which only includes difficulty parameters. In practical research and applications, besides considering difficulty parameters, item parameters often include discrimination parameters or guessing parameters. Based on this, this study extends the multidimensional logistic model to multidimensional testlet response models. Taking the multidimensional two-parameter logistic testlet response model (M2PL-TRM) as an example, this study investigates the parameter estimation accuracy of M2PL-TRM through Monte Carlo simulation, examines the impact of local item dependence (LID) and test length on parameter estimation accuracy, and compares the parameter estimation results with the

multidimensional two-parameter logistic model (M2PLM) that ignores testlet effects. The results show that: (1) the estimation accuracy of item and ability parameters obtained using M2PL-TRM is significantly higher than that of M2PLM; (2) as the degree of LID increases, the estimation accuracy of item and ability parameters decreases; (3) as the test length increases, the estimation accuracy of item and ability parameters improves. Overall, in the context of considering multidimensional abilities and testlet effects, M2PL-TRM exhibits higher parameter estimation accuracy compared to M2PLM. This provides a broader range of model structure choices for test analysis and holds significant practical value.

双维心境量表在中国成年人群体中的修订

邵韵如[1]　孟瑞静[1]　赵舒菁[1]　郭璐[2]（通讯作者）
1 北京体育大学心理学院，北京，100084
2 北京体育大学心理学院，北京，100084，guol@bsu.edu.cn

摘 要　背景：心境状态通常是动态变化的，已有研究常存在将持续性心境状态和瞬时心境状态混淆的问题。简式心境状态量表(Profile of Mood States - short form, POMS-SF)是测量心境状态最常用的工具，它基于情绪的维度理论而编制，且条目较多，不适用于测量瞬时的心境状态。双维心境量表(Two-Dimensional Mood Scale, TDMS)基于心理状态的二维模型而编制，包括 8 个条目和 4 个分量表，是一种有效的自我监测心境状态的测量工具。本研究旨在修订适用于中国成年的双维心境量表，检验其信效度及跨性别、跨年龄的测量稳定性。方法：492 名中国成年人在线上完成了双维心境量表和简式心境状态量表(Profile of Mood States - short form, POMS-SF)。由 10 名心理学专业的学生和老师对项目内容和与量表的相关进行四级评定。对数据进行项目分析和信、效度检验。结果：1) 双维心境量表的 8 个条目均具有较好的区分度，各项目的题总相关显著($r = 0.881 \sim 0.968$, $p < .001$)。2) 量表的 4 个分维度(高唤醒高愉悦、低唤醒高愉悦、高唤醒低愉悦、低唤醒低愉悦)的信度良好($\alpha = 0.728 \sim 0.933$)。3) 量表内容效度(scale-level content validity index, S-CVI)为 0.938，单个项目最低项目内容效度(item-level content validity index, I-CVI)为 0.8，表明量表具有良好的内容效度。4) 验证性因素分析显示，一阶相关模型拟合良好($\chi2/df = 3.224$, RMSEA = 0.069, CFI = 0.958, TLI = 0.939, SRMR = 0.041)，因子载荷为 0.751~0.952，表明高唤醒高愉悦、低唤醒高愉悦、高唤醒低愉悦、低唤醒低愉悦四个维度的一阶相关结构清晰。4) 相关分析表明，双维心境量表测量的的愉悦度与 POMS 测量的精力呈正相关，而与紧张、愤怒、疲劳、抑郁、慌乱和自我相关的情绪呈负相关；唤醒度与紧张、精力和自我相关的情绪呈正相关，而与疲劳呈负相关；活力和稳定性均与精力、自我相关的情绪呈正相关，而与紧张、愤怒、疲劳、抑郁和慌乱呈负相关，表明双维心境量表具有较好的区分效度。5) 多组验证性因素分析发现，该量表具有跨性别和跨年龄的完全等值性。结论：中文版双维心境量表具有良好的心理测量学特征，且与 POMS 测量的概念相关但并不完全等价，可作为捕捉中国成年人瞬时心境状态的有效测量工具。

Chinese Version of the Two-Dimensional Mood Scale (TDMS) for Adults

SHAO YunRu, MENG RuiJing, ZHAO ShuJing, GUO Lu
School of Psychology, Beijing Sport University, Beijing 100084, China

Abstract：Background: Negative mood states may lead to a series of serious consequences (for example, reduced self-efficacy, increased loneliness), and effective self-regulation of negative mood states depends on continuous and accurate monitoring of mood states. Mood states are considered to be dynamic, so it is important to capture the momentary mood states. The Two-Dimensional Mood Scale (TDMS) was developed based on the two-dimensional model of psychological states, and was an effective measurement for self-monitoring of momentary mood states. The purpose of the current study was to revise the two-dimensional mood scale in Chinese adults to test its reliability and validity and its stability across gender and age. Methods: 492 Chinese adults completed the two-dimensional mood scale and the profile of mood states - short form (POMS-SF) online. Furthermore, ten psychology students and teachers evaluated the contents of the items and the relevance of the

scale. Results: 1) 8 items of the two-dimensional mood scale showed good discrimination, and the item-total correlations were significant (r = 0.881 ~ 0.968, p < .001). Internal consistency of each dimension was acceptable (α = 0.728 ~0.933). 2) The scale-level content validity index (S-CVI) was 0.938, and the lowest item-level content validity index (I-CVI) of a single item was 0.8, indicating that the current scale has good content validity. 3) Confirmatory factor analysis showed that the model fit was good (χ^2/df = 3.224, *RMSEA* = 0.069, *CFI* = 0.958, *TLI* = 0.939, *SRMR* = 0.041), and the factor loads ranged from 0.751 to 0.952, which showed that the four-dimension structure of the scale was clear. 4) The correlation analysis showed that the pleasure measured by the two-dimensional mood scale was positively correlated with the energy measured by POMS, but negatively correlated with tension, anger, fatigue, depression, panic and self-related emotions. Arousal was positively correlated with tension, energy and self-related emotions, but negatively correlated with fatigue. Vitality and stability were positively correlated with energy and self-related emotions, but negatively correlated with tension, anger, fatigue, depression and panic. These results revealed that the two-dimensional mood scale had good discriminant validity. 5) Multigroup confirmatory factor analysis confirmed the measurement invariance across gender and age. Conclusion: The Chinese version of the two-dimensional mood scale has good psychometric characteristics, and is related to but not completely equivalent to the concept measured by POMS. To conclude, the two-dimensional mood scale can be used as an effective measurement tool to capture the momentary mood states of Chinese adults.

生涯适应力量表：信度概化分析

徐可晴[1]　张春雨[1]（通讯作者）

1 陕西师范大学心理学院，西安，710062，通讯作者 E-mail（chunyu.zhang@snnu.edu.cn）

摘 要　在迅速变化的全球背景下，人们比以往任何时候都更频繁地面临工作、组织和职业之间的转换，生涯适应力作为一种自我调节的优势或能力可以帮助个体应对职业生涯中当前或预期的变化，因此对其进行测量和研究很有必要。生涯适应力量表-国际版本 2.0（CAAS 2.0）是最常用的测量生涯适应力的量表，然而其内部一致性信度估计在某些研究中偏低，在某些研究中则良好，造成这种差异的来源尚不清楚，并且比单一研究更广泛的不同文化背景下的总体信度情况也尚不清楚。本研究对 CAAS 2.0 进行了信度概化分析，该元分析包括了 441 项来自 39 个国家（代表六大洲）的研究，总样本量为 227923。旨在估计 CAAS 2.0 及其四个分量表（关注、控制、好奇和自信）的平均克隆巴赫α系数。其次，探索哪些研究特征可能影响α系数的变异性。最后，估计 CAAS 2.0 的信度引入率。结果显示：（1）CAAS 2.0 总分和分量表的平均α系数值是良好的，范围从.83（控制分量表）到.93（总分）；（2）年龄和样本类型对四个分量表α系数有显著影响。α系数随着年龄的增加而增大；企业员工得分的α系数最高，大学生次之，中学生最低；职业群体得分的α系数高于非职业群体；（3）总分标准差和国家对总量表α系数有显著影响。总分标准差和总量表得分的α系数之间存在显著正相关；在列入分析的 14 个国家中，中国总量表得分α系数最高（.94），荷兰最低（.88）；（4）在使用了完整版的 CAAS 2.0 的研究中，存在 9.64%的信度引入率。本研究表明，CAAS 2.0 是评估不同文化背景下不同群体的生涯适应力的可靠工具，在年龄较低的非职业群体进行施测可能会出现偏低的信度系数，并且信度系数还会部分地受到文化的影响，这提醒研究者们有必要对量表进行跨文化验证。最后，虽然该量表使用的信度引入率较低，但信度引入作为一种错误的做法必须避免，研究者们应该注意报告自己当前样本测验分数的信度，并且根据研究的特点报告其他类型的信度。

Career Adapt-Abilities Scale: A Reliability Generalization Meta-Analysis

Keqing Xu[1], Chunyu Zhang[1*]

1 School of Psychology, Shaanxi Normal University, Xi an, 710062

Abstract **：** In a rapidly changing global context, people are increasingly facing transitions between jobs, organizations, and careers more frequently than ever before. It is necessary to understand and measure career adaptability which refers to a self-regulatory strength or ability that can help individuals cope with current or expected changes in their careers. The Career Adapt-Abilities Scale-International Version 2.0 (CAAS 2.0) is the most commonly used scale to measure career adaptability. However, its internal consistency reliability estimates have been found to be low in some studies but good in others. The reasons which lead to this discrepancy are unclear. Moreover, it is also unclear that how are its overall reliabilities across a wider range of different cultural contexts. The present study conducted a reliability generalization of the CAAS 2.0, a meta-analysis that included 441 studies from 39 countries (representing six continents) with a total sample size of 227923. The aim of this

study was to estimate the average Cronbach's alpha coefficients of the CAAS 2.0 and its four subscales (Concern, Control, Curiosity, and Confidence). Second, we aim to explore which study characteristics may affect the variability of alpha coefficients. Finally, the reliability induction of the CAAS 2.0 was estimated. The results showed that (1) the average alpha coefficients of the CAAS 2.0 total score and subscales were good, ranging from .83 (control subscale) to .93 (total score). (2) age and sample type had a significant effect on the alpha coefficients of the four subscales. That is, alpha coefficients increased with age. Employed adults scored the highest alpha coefficients, university students scored the second highest, and middle school students scored the lowest. The alpha coefficients of scores in working adults were higher than those in non-working groups. (3) the standard deviation of the total score and country have a significant effect on the alpha coefficient of the total scale. There was a significant positive correlation between the standard deviation of the total score and the alpha coefficient of the total score. Of the 14 countries included in the analysis, China had the highest alpha coefficient of the total scale score (.94), and Netherlands had the lowest (.88). (4) in the studies that used the complete version of the CAAS 2.0, there was a 9.64% of reliability induction rate. Our study suggests that the CAAS 2.0 is a reliable instrument for assessing career adaptability in different groups across cultures. However, applying the scale to younger non-working groups may result in relatively lower reliability coefficients. In addition, its reliability coefficients are partially influenced by culture, reminding researchers to examine the cross-cultural validation of the scale. Finally, although the rate of reliability induction in the use of the scale is low, reliability induction as a wrong practice must be avoided Thus, researchers should be careful to report the reliability of the test scores and should report other types of reliability depending on the characteristics of their studies.

摘 要 教师心理健康是指教师个体能够在工作中正确认识自己、保持较高的教学效能感及职业认同感、具有良好的职业品质、职业适应性及情绪调节能力、不断实现自我价值的一种良好状态，是提升教师工作幸福感及工作效率的重要基础。现有研究对中小学教师心理健康的维多集中于对认知和情绪的测量，教师心理健康核心要素测量的关注方向和适用性有待加强。为探究适合我国新教育背景下中小学教师心理健康的结构维度，通过访谈、专家评定并对相关研究进行文献分析，初步确定中小学心理健康的五大维度，分别为教学效能、职业认同、职业品质、职业情绪调节与职业适应 5 个维度，编写了与之对应的 107 个项目。对 504 名来自北京、广东、河南等地的中小学教师发放问卷，进行探索性因素分析，形成 80 个项目组成的正式量表。并采用该量表对 742 名教师进行调查，回收数据并分析其信效度。经过数据分析和处理，最终量表包含 5 个维度 80 道题目，总量表的 Cronbach's α系数为 0.991，各分量表的 Cronbach's α系数在 0.945-0.987 之间，总量表重测信度为 0.985，累计方差解释率为 73.77%。验证性因素分析表明模型拟合良好，χ^2/df =2.927，RMSEA=0.052，RMR =0.012， IFI=0.919，TLI=0.916，CFI=0.919。各个维度之间的相关系数在 0.661-0.827 之间，以《SCL-90 症状自评量表》作为校标，校标关效度为 0.701，效度良好。综上，中小学教师心理健康量表具有良好的信度和效度，符合心理测量学标准要求，可作为测量中小学教师心理健康的有效施测工具。

Abstract： Teachers' mental health refers to a good state in which individual teachers can correctly understand themselves in their work, maintain a high sense of teaching efficacy and professional identity, have good professional quality, professional adaptability and emotional regulation ability, and constantly realize their self-worth. It is an important basis for improving teachers' work happiness and work efficiency. The existing research on the mental health of primary and secondary school teachers mainly focuses on the measurement of

cognition and emotion, and the direction and applicability of the measurement of the core elements of teachers' mental health need to be strengthened. In order to explore the structural dimensions of primary and secondary school teachers' mental health suitable for the new educational background in China, through interviews, expert evaluation and literature analysis of relevant studies, the five dimensions of primary and secondary school mental health were preliminarily identified, namely teaching effectiveness, professional identity, professional quality, occupational emotional regulation and vocational adaptation, and 107 corresponding projects were compiled. 504 primary and secondary school teachers from Beijing, Guangdong, Henan and other places were given questionnaires, and exploratory factor analysis was conducted to form a formal scale consisting of 80 items. This scale was used to investigate 742 teachers, recover the data and analyze its reliability and validity. After data analysis and processing, the final scale contains 80 questions in 5 dimensions. The Cronbach's α coefficient of the total scale is 0.991, the Cronbach's α coefficient of each subscale is between 0.945 and 0.987, the retest reliability of the total scale is 0.985, and the cumulative variance interpretation rate is 73.77%. Confirmatory factor analysis showed that the model fit well, χ^2/df =2.93, RMSEA=0.052, RMR =0.012, IFI=0.919, TLI=0.916, CFI=0.919. The correlation coefficient of each dimension was between 0.661 and 0.827. SCL-90 Symptom Self-Rating Scale was used as calibration criterion, and the criterion validity was 0.701, indicating good validity. To sum up, the mental health scale for primary and secondary school teachers has good reliability and validity, meets the requirements of psychometrics standards, and can be used as an effective measuring tool for primary and secondary school teachers' mental health.

自我客体化对女性自我认知的影响：能力还是热情？

周苇欣　曲琛（通讯作者）

华南师范大学心理学院，广州，510631，fondest@163.com

摘 要　自我客体化是指个体内化观察者视角，忽略自身的内部需求和感受，把自己当作客体来定义和评价。现有研究主要关注自我客体化对女性心理健康的负面影响，但对于这种独特的自我意识对自我认知的影响方向和方式尚不清楚。基于社会认知的双视角模型，本研究设计了三个子研究来探讨自我客体化对女性自我认知维度优势的影响。研究一采用身体监控量表、热情和能力特质重要性评定问卷对 218 名成年女性被试进行了测量，结果显示相较于低自我客体化个体，高自我客体化个体认为热情维度比能力维度更重要。研究二采用 2（自我客体化启动：实验组，控制组）×2（维度：热情，能力）的混合实验设计。将 68 名成年女性被试随机分配到实验组和控制组，然后让被试分别对自我的热情和能力特质以及状态自尊进行自我评估。结果显示自我客体化在热情评分与状态自尊的关系中起到调节作用，即相较于控制组，实验组被试的热情评分显著预测自尊。研究三采用强化学习模型描述个体如何通过外界反馈来更新对不同维度的自我认知，并使用学习率衡量个体通过外界反馈更新自我认识的程度。采用 2（自我客体化启动：实验组，控制组）×2（评价维度：热情，能力）×2（评价情境：积极，消极）的混合实验设计，将 102 名成年女性被试随机分配到实验组和控制组中。结果显示三因素交互效应显著，在控制组中评价维度和评价情境的交互效应不显著。在实验组中，被试在热情积极条件下的学习率显著大于热情消极下的，而在能力维度上没有评价情境的差异。即自我客体化改变了个体对热情维度的信息更新，实验组的被试会根据不同情境调整对热情维度认知的学习率。综上，本研究初步探讨了自我客体化对女性自我认知的影响，有助于进一步理解自我客体化对个体的影响，并进一步拓宽对自我认知维度优势不确定性的理解。

The effects of self-objectification on women's self-cognition: competence or warmth?

Weixin Zhou　Chen Qu
School of Psychology, South China Normal University, Guangzhou 510631

Abstract：Self-objectification refers to the internalization of an observer's perspective, disregarding one's own internal needs and feelings, and defining and evaluating oneself as an object. Existing research has primarily focused on the negative impact of self-objectification on women's psychological well-being, but very little is known about the effect of this form of self-consciousness on self-cognition. Based on the dual perspective model, this study designed three sub-studies to explore the effects of self-objectification on women's self-cognition. In study 1, 218 adult female were surveyed using the Body Surveillance sub-scale of the Objectified Body Consciousness and the Importance of Warmth and Competence Traits Questionnaire. The results showed that, compared with individuals with lower self-objectification, those with higher self-objectification considered warmth as more important than competence. Study 2 employed a 2 (priming of self-objectification: experimental group, control group) ×2 (dimension: warmth, competence) mixed experimental design. Sixty-eight adult female participants were randomly assigned to the experimental and control groups, and they evaluated their own warmth and competence traits as well as state self-esteem. The results indicated that self-objectification moderate the relationship between warmth ratings and state self-esteem, with the experimental group participants' warmth ratings significantly predicting self-esteem compared to those in the control group. In study 3, we develop a reinforcement learning model to describe how individuals update their self-cognition regarding different dimensions through external feedback, using the learning rate as a measure of the extent to which individuals update their self-perception based on external feedback. And this study used a mixed experimental design of 2 (self-objectification priming: experimental group, control group)×2 (evaluation dimension: warmth, competence) ×2 (evaluation situation: positive, negative). One hundred and two adult female participants were randomly assigned to the experimental group and control group. The results showed a significant three-way interaction effect, where the interaction effect between evaluation dimension and evaluation situation was not significant in the control group. In the experimental group, participants had a significantly higher learning rate for the self-view of warmth under positive conditions compared to negative conditions, while there were no significant differences in the competence dimension. This indicated that self-objectification alters the self-view updating of warmth, and participants in the experimental group adjust their learning rate of warmth cognition according to different situations. In conclusion, this study provides a preliminary exploration of the effects of self-objectification on women's self-cognition, contributing to a better understanding of the impact of self-objectification on individuals and further expanding the understanding of uncertainty in self-cognition dimensions.

女权 vs 女拳：女权主义内隐污名效应

章溢 丁凤琴（通讯作者）王丹 张誉瀚
宁夏大学教师教育学院，银川，750021，dingfqin@nxu.edu.cn

摘 要 “女权主义”（feminism），作为一种社会理论和政治运动，旨在改善基于性别的不公平待遇或不利地位，包括结束性别主义、性剥削、性歧视和性压迫。而女权主义污名（feminist stigma）则是对女权主义运动的负面标签，如女拳主义、田园女权主义等，这会对个人造成无法忽略的消极影响。但在本土化的过程中，相关研究更多的集中在法律、政治、社会学和传播学领域，鲜有基于心理学视角对女权主义群体的实证研究。本文通过两个研究探讨个体对女权主义的情感评价特征和内隐污名效应。研究 1 采用网络大数据爬虫技术抓取 174054 条留言，进行文本情感分析并获取关键词词频中消极情绪词和积极情绪词，为研究 2 的内隐污名效应提供词汇材料支撑；研究 2 使用单类内隐联想测验计算女权主义内隐污名的 D 值，并进行性别差异检验。结果发现，在社会网络媒体中的女权主义相关话题在 2017-2018 年产生近 20 倍的增幅；对女权主义的情感评价包含积极、消极和中性三类，其中积极态度占比超 50%，情感倾向偏积极性；进一步研究发现，个体的女权主义内隐污名的 D 值大于 0，即个体对女权主义的内隐态度更为积极。以上研究结果表明，无论是网络媒体平台和实验室实验均倾向于女权主义的积极情感特征评价，并且女权主义的内隐污名效应并不存在。这一研究结果对于了解我国女权主义污名现状具有重要意义，同时拓展研究女权主义的新视角。

Feminism vs Femi-fist: feminist implicit stigma effect

Zhang Yi, Ding Fengqin, Wang Dan, Zhang Yuhan
College of teacher education, Ningxia University, Yinchuan, 750021, dingfqin@nxu.edu.cn

Abstract: Feminism, as a social theory and political movement, aims to improve gender-based unfair treatment or disadvantage, including ending sexism, sexual exploitation, sex, and sexual oppression. Feminist stigma, on the other hand, is a negative label for the feminist movement, such as Femi-fist, pastoral feminism, etc., which can have a negative impact on individuals that cannot be ignored. However, in the process of localization, relevant research has focused more on the fields of law, politics, sociology and communication, and there are few empirical studies on feminist groups based on psychological perspectives. This paper explores the characteristics of individual emotional evaluation and the implicit stigma effect of feminism through two studies. Study 1 uses network big data crawler technology to capture 174054 messages, conduct text sentiment analysis and obtain negative emotional words and positive emotional words in keyword word frequency, which provides vocabulary material support for the study of implicit stigma effect in Research 2. Study 2 used a single-class implicit association test to calculate the D score of feminist implicit stigma and performed a sex difference test. The results show that feminism-related topics in social network media increased by nearly 20 times in 2017-2018. The emotional evaluation of feminism includes three categories: positive, negative and neutral, of which positive attitude accounts for more than 50%, and the emotional tendency is more positive; Further research found that the D value of the individual's feminist implicit stigma is greater than 0, that is, the individual's implicit attitude towards feminism is more positive. The above results show that both online media platforms and laboratory experiments tend to evaluate feminist positive emotional characteristics, and the implicit stigma effect of feminism

does not exist. The results of this study are of great significance for understanding the current situation of feminist stigma in China, and at the same time expand the new perspective of feminism.

性客体化对女大学生情绪的影响：性别偏见的中介作用

曾榆苏[1]　廖宗卿[2]（通讯作者）

1 同济大学人文学院心理学系，上海，200092

2 四川师范大学心理学院，成都，610068，E-mail：zongqing.liao@sicnu.edu.cn

摘 要　随着女性主义思想的传播，越来越多人开始关注女性的身心健康。长久以来，女性一直在经历性客体化，这一现象对女性造成显性或隐性的影响。以往研究表明，性客体化会影响女性的情绪，同时情绪又与性化享受、性别偏见具有显著相关。因此，本研究从客体化效价和客体化来源入手，探究在不同性客体化条件下对女性的情绪产生的影响，并引入性化享受和性别偏见，深入探讨其影响机制。本研究招募了 96 名女大学生作为被试参加实验，采用性化享受量表、正性负性情绪量表和性别偏见量表来考察其经历性客体化后的情绪体验以及可能的潜在影响因素。结果发现：（1）客体化效价主效应显著，女性在被性客体化时，积极性客体化条件下比消极性客体化条件下有更多的积极情绪。（2）客体化来源主效应显著，相较于客体化来源男性，当客体化行为发出者为女性时，女性有更多的积极情绪。（3）在积极性客体化条件下，敌意性别偏见在性化享受和消极情绪中起到完全中介作用。（4）无论在客体化来源女性还是男性，敌意性别偏见都在性化享受和消极情绪间起到完全中介作用。这说明了相比于性客体化行为来源于女性，女性更容易识别出男性的性客体化行为，这与传统性别刻板印象息息相关。同时，积极性客体化以潜在或更为隐蔽的方式影响女性的身心健康，并且通过性别偏见的中介作用表现出来。

The effect of sexual objectification on female college students' emotions: The mediating role of gender bias

Yusu Zeng[1], Zongqing Liao[2] (corresponding author)

1 Department of Psychology, School of Humanities Tongji University, Shanghai

2 College of Psychology, Sichuan Normal University, Chengdu

***Abstract*:** With the spread of feminism, more and more people begin to pay attention to women's physical and mental health. For a long time, women have been experiencing sexual objectification, which has an explicit or implicit impact on women. Previous studies have shown that sexual objectification affects women's emotions, and emotions are significantly related to the enjoyment of sexualization and gender bias. Therefore, this study explores the influence of different objectification conditions on women's emotions from the perspective of objectification titer and objectification source. At the same time, enjoyment of sexualization and gender bias are introduced, and the influencing mechanism is deeply discussed. In this study, female college students are used as subjects in the imagination experiment (N = 96), and the enjoyment of sexualization scale, positive and negative emotion scale, and gender bias scale are used to test their emotional experiences after experiencing sexual objectification and the potential factors that might potentially influence it. The results showed that: (1) the main effect of objectified titer was significant. Women had more positive emotions under positive objectified conditions than under negative objectified conditions. (2) The main effect of the objectification source was significant. Compared with the

objectification source, when the objectification source was female, women had more positive emotions. (3) Under the positive objectification condition, hostile gender bias played a completely mediating role between the enjoyment of sexualization and negative emotion. (4) Regardless of whether the objectified source was female or male, hostile gender bias played a completely mediating role between the enjoyment of sexualization and negative emotions. The results suggest that women are more likely to recognize male's sexual objectification behavior than female's sexual objectification behavior, which is closely related to traditional gender stereotypes. At the same time, positive objectification affects women's physical and mental health in potential or more hidden ways, and it is manifested through the mediation of gender bias.

***Keywords*:** sexual objectification, emotion, enjoyment of sexualization, gender bias

原生家庭结构和跨期决策偏好对生育意愿和生育结果的影响：一项基于生命史理论的研究

孙榕蔓　王晓田

香港中文大学（深圳）应用心理学系，深圳，518000

摘 要　以往的研究显示，原生家庭的社会经济环境和童年经历可以预测一个人的生育意愿和生育结果。相比于注重现在的快生命史策略，童年时家庭的社会经济地位更高的个体更倾向于形成未来导向的慢生命史策略 (Griskevicius et al., 2011)。然而，人们对这种关系的中介和调节机制知之甚少。基于生命史理论，本研究检验了生命史策略在童年社会经济地位和个体生育意愿之间的中介作用，并探讨了出生顺序和兄弟姐妹的数量是否调节了这一中介过程。此外，还从跨期选择的角度研究了原生家庭社会经济地位（SES）对成人后的子女的生育意愿和行为的影响。405 名已婚并有子女的中国父母参与了研究（平均年龄 33.73 岁，女性 272 人）。其中 214 位参与者是独生子女（自己的原生家庭只有一个孩子）。200 名被试现育有一个孩子，205 名被试现育有两个孩子。参与者在中国在线问卷调研平台 Credamo 上完成了匿名的问卷调查。结果显示，较好的童年 SES 促进个体形成以未来为导向的慢策略，并进而促成个体较高的生育意愿。童年 SES 通过生命史策略的形成的形成影响生育意愿。生命史策略的这一中介效应受到独生子女变量的调节，来自多子女家庭的被试的生育意愿受到这一变量的调节。来自独生子女家庭的父母参与者更有可能形成慢生活策略，并且倾向只生育有一个孩子。另外，个体的延迟折扣率对其生育意愿和实际的子代数量具有显著的预测作用。低延迟折扣率（如对较大和较晚的收益的偏好高于较小和较快的收益）增加了个体的生育意愿和实际子女的数量。除此之外，主观预期寿命也调节了童年家庭 SES 和生育意愿之间的关系。主观预期寿命愈长生育意愿愈高。这些发现有助于我们了解生命史变量对生育意愿和生育行为的影响。这一研究对于当下国家生育政策的调整、宣传和贯彻具有一定的借鉴意义，人们的生育目标和结果不仅和生命史策略相关，还受到主观寿命预期和延迟折扣率等因素的调节。

关键词　童年社会经济地位，生育意向，生命史策略，独生子女，延迟折扣率

支持女性主义可能是男性的求偶策略：基于代价信号理论的视角

王霜[1]　刘姗[1]　贡喆[1]（通讯作者）

1 四川师范大学心理学院，成都，610066，通讯作者 E-mail zhegong@sicnu.edu.cn

摘　要　男性为何会支持女性主义？本研究基于进化心理学代价信号理论(Costly Signaling Theory, CST)认为，男性支持女性主义可能是一种求偶策略。CST 认为，雄性为了提高求偶成功几率可能会尝试表现出被异性所青睐的某种品质并甘愿承担一定风险。据此，本文推测男性支持女性主义(被女性广泛认同)可能是在承担一定代价(被其他男性排斥)的基础上展示出的求偶信号和求偶策略，具体可能表现为男性在择偶情境中更倾向于认同女性主义(假设 1)或更愿意构建起自己作为“女性主义者”的形象(假设 2)。本文通过两个实验验证以上假设，实验一在问卷星平台招募 80 名被试，考察男性求偶动机激发(实验组 vs 控制组)对女性主义/动物保护主义(被试间变量)言论的认同程度以检验假设 1。结果表明主效应及交互作用均不显著($p > 0.05$)，求偶动机并不会提升男性女性主义认同水平。实验二在问卷星平台招募 126 名被试，要求被试在不同网站(婚恋网站 vs 知识问答网站 vs 体育交流网站)中花费固定数额的虚拟货币(100 元虚拟币)建立虚拟形象，该形象包括价值取向、外在特点、内在特点三个方面。其中价值取向包括女性主义类别，被试在该类别中赋予越高虚拟币，意味着被试越倾向于构建自己的女性主义者形象(假设 2)。结果表明网站类型的主效应显著，$F(3, 80)=6.898$，$p<0.05$，$\eta_p^2=0.104$，与知识问答网站($M = 0.201$, $SD = 0.098$)和体育交流网站($M = 0.211$, $SD = 0.087$)相比，被试更倾向于在婚恋网站中($M = 0.272$, $SD = 0.094$)给予女性主义在价值取向分数中更高的权重(权重得分=女性主义得分/价值取向总分)，这意味着男性在择偶情境中倾向于创设自身作为女性主义者的虚拟形象。综上，本研究发现，男性在择偶情境中更愿意营造“女权男”的形象而非实际提升对女性主义观念的认同，这可能是男性传递出的某种代价信号以吸引潜在异性对象的择偶策略。未来研究可进一步借助更具生态效度的实验手段考察该效应的内部机制与边界效应。

Supporting Feminism as a Courtship Strategy: A Perspective Based on Costly Signaling Theory

Shuang Wang[1], Shan Liu[1], Zhe Gong[1] *

1 College of Psychology, Sichuan Normal University, E-mail zhegong@sicnu.edu.cn

Abstract:Why do men support feminism? This study, based on the evolutionary psychology Costly Signaling Theory (CST), proposes that male support for feminism may be a courtship strategy. CST suggests that men may attempt to demonstrate certain qualities favored by women and be willing to take on certain risks to increase their opportunities of successful courtship. Accordingly, this study speculates that male support for feminism (widely acknowledged by women) may be a courtship signal and strategy exhibited at the cost of potential exclusion by other men. Specifically, this behavior may manifest as a higher tendency for men to endorse feminism in mate selection scenarios (Hypothesis 1) or a greater willingness to present themselves as "feminists" (Hypothesis 2). Two experiments were conducted to test these hypotheses. Experiment 1 recruited 80 participants through an online crowdsourcing platform to examine the influence of male courtship motivation (experimental group vs. control group) on their endorsement of feminist/animal protectionist statements (inter-subject variable). The results indicated that there were no significant main effects or interactions ($p > 0.05$), and courtship motivation

did not increase male endorsement of feminism. Experiment 2 recruited 126 participants online and asked them to spend a fixed amount of virtual currency (100 virtual coins) to create virtual identities on different websites (matrimonial website vs. knowledge Q&A website vs. sports exchange website). The virtual identity included three aspects: value orientation, external characteristics, and internal characteristics. The value orientation included a feminist category, and the higher the virtual coins assigned to this category, the more participants were inclined to construct their feminist identity. The results showed a significant main effect of website type, $F(3, 80) = 6.898$, $p < 0.05$, $\eta p2 = 0.104$. Compared to the knowledge Q&A website ($M = 0.201$, $SD = 0.098$) and sports exchange website ($M = 0.211$, $SD = 0.087$), participants were more inclined to assign higher weights to feminism in the value orientation score on matrimonial websites ($M = 0.272$, $SD = 0.094$), indicating that men tend to create a virtual identity as feminists in mate selection scenarios. In conclusion, this study found that men are more willing to construct an image of "feminist men" rather than genuinely increasing their endorsement of feminist beliefs in mate selection scenarios. This behavior may represent a certain costly signaling strategy employed by men to attract potential mates. Future research can further explore the internal mechanisms and boundary effects of this effect using more ecologically valid experimental methods.

“渔与鱼”——赋权帮助对女性自我能力评价的提升及其促进机制

杨千一　董超武　晏碧华　（通讯作者）
陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室
西安，710062，E-mail：yanbihua@snnu.edu.cn

摘 要　帮助是社会生活的基本组成部分，分为赋权帮助和非赋权帮助。前者表明受助者在指导下主动学习解决问题；后者表明受助者通过被动学习接受解决方案。优于平均水平效应指人倾向于认为自己的能力、属性比一般同龄人优越。内隐能力可塑观能有效引导个体对自我能力产生积极的倾向。已有研究用自陈式问卷发现，女性受助者在非赋权帮助后对自我能力的评分偏低，而男性没有出现这一现象。由此，女性自我能力评价及其改变的研究还缺乏社会生活背景下的系统实验研究。

本研究通过三项实验考察了不同受助类型对男性和女性自我能力评价的影响。实验一让被试分别回忆三周内接受过赋权或非赋权帮助的经历，回忆前后进行能力认知的内隐联想测验（IAT），并用能力特征评价法测量优于平均效应。实验二是在真实的赋权和非赋权帮助情景中，使用 IAT 和能力特征评价考察前后内隐能力认知和优于平均效应。实验三针对女性能力认知过低，在实验二基础上加入内隐能力可塑观操纵手段，探索维护女性自我积极评价的有效途径。

结果：（1）无论在回忆还是真实情景下，男性在赋权和在非赋权帮助下内隐能力认知均无显著变化，且存在外显的优于平均效应；而女性在非赋权帮助下内隐能力认知显著下降，且优于平均效应消失，在赋权帮助下则与男性一致；（2）在内隐能力可塑观操纵干预后，接受非赋权帮助的女性内隐能力认知无显著差异，且存在优于平均效应，在赋权帮助下其内隐与外显能力评价进一步得以提升。

结论：接受赋权帮助使女性受助者维持内隐能力认知，存在优于平均效应。接受非赋权帮助会使女性受助者内隐和外显自我能力评价降低，但内隐能力可塑观能缓解非赋权帮助的消极影响并提升赋权帮助的积极影响。

"Fishing and Fish" - Enhancement of women's self-assessment of competence by empowering help and its facilitating mechanism

YANG Qianyi, DONG Chaowu, YAN Bihua
(School of Psychology, Shaanxi Normal University, Xi´an 710062, China)

Abstract: Help is a fundamental part of social life and is categorized into empowering and non-empowering help. The former suggests that recipients actively learn to solve problems with guidance; the latter suggests that recipients receive solutions through passive learning. The better-than-average effect (BAE) refers to a person's tendency to perceive his or her abilities and attributes as superior to those of his or her average peers. Implicit incremental theory is effective in guiding individuals to develop positive dispositions toward their own abilities. It has been found using self-stated questionnaires that female recipients rated their self-competence low after non-empowering help, whereas this phenomenon did not occur in males. As a result, there is a lack of systematic experimental research on female self-efficacy ratings and their change in the context of social life.

The present study examined the effects of different types of assistance on men's and women's self-efficacy ratings in three experiments. Experiment I had subjects separately recall their experiences of receiving empowering or non-empowering help over a three-week period, take the Implicit Association Test (IAT) of competence perceptions before and after the recall, and measure better-than-average effect with the Competence Characteristics Rating Method. Experiment two examined pre- and post-implicit competence perceptions and better-than-average effects using the IAT and ability trait ratings in real empowering and non-empowering help scenarios. Experiment III addressed women's low competence perceptions and added the implicit incremental theory manipulation to Experiment II to explore effective ways to maintain women's positive self-evaluations.

Results: (1) In both recall and real situations, there was no significant change in implicit competence perceptions of males with empowering and non-empowering help, and there was an exogenous better-than-average effect; Whereas, implicit competence perceptions of females declined significantly and the better-than-average effect disappeared with non-empowering help, and were consistent with those of males with empowering help; (2) After the manipulation intervention of implicit incremental theory, women who received non-empowering help had no significant difference in implicit competence perception, and there was a better-than-average effect, and their implicit competence evaluations were further improved under empowering help.

Conclusion: Receipt of empowering help resulted in a better-than-average effect on female recipients' maintenance of implicit competence perceptions. Receiving non-empowering help reduced female recipients' implicit and explicit self-competence ratings, but Implicit incremental theory mitigated the negative effects of non-empowering help and enhanced the positive effects of empowering help.

Keywords: empowering help, self-competence, implicit competence, better-than-average effect

社会不平等引起算法决策偏好？

归因调节和系统合理信念的中介作用*

吴旭瑶[1,2] 李晔[1,2**] 宫剑[1,2] 海曼[1,2] 李现菊[1,2]

2 华中师范大学心理学院暨青少年网络心理与行为教育部重点实验室，武汉 430079

摘 要 近年来，在接连不断的突发公共卫生事件的影响下，社会不平等的现象进一步加剧，表现为收入不平等、机会不平等、教育不平等、健康不平等等多种形式的社会不平等现象。人工智能（AI）算法有望减少社会阶层间的不平等现象，因为算法能够忽略个体特征做出无偏的决定。然而，人们宁愿选择容忍不平等，也不愿使用 AI 算法进行人生决策，这阻碍了人工智能在医疗、教育、企业组织等领域的应用。了解人们对社会不平等的认知或许能够推进 AI 算法在社会中的推行应用。本研究在归因理论和系统合理性理论下，构建了一个理解不平等情境下人们对算法决策态度的框架。值得注意的是，本研究试图从人类群体的内部关系出发，而不是探讨算法的特点或情景的特点如何影响人们对算法决策的偏好，强调只有当人们对人类自己构建的社会系统失去信心时，人们才会期望算法这一新的外部技术工具重新建立公平的运行机制。

本研究通过六个实验，探讨了归因在社会不平等与算法决策偏好之间的调节作用和系统合理化信念的中介作用。研究 1 在医疗领域（子研究 1）、组织招聘（子研究 2）和入学考试（子研究 3）三个情境中，验证了只有对不平等的外部归因（而不是内部归因）解释才会引发不平等对算法决策偏好。研究 2 通过采用两点式迫选法和多种因变量指标，再次验证了研究 1 的结果。研究 3 考察了系统合理信念在不平等与算法决策偏好之间的中介作用，以及归因调节不平等与系统合理信念之间的关系。研究 4 通过阻断中介设计，进一步检验系统合理信念和算法决策之间的因果关系，再次验证系统合理信念的中介作用。所有的参与者阅读到来自不同社会阶层的甲型 H1N1 流感患者人数大致相同的新闻后，发现减少系统合理化信念增加了人们对算法决策的偏好，进一步证实了系统合理化信念的中介作用。当社会各界试图借助 AI 算法制定决策，以寻求多方最大化平等时，有必要注意个人认知在其中发挥的重要作用，否则会适得其反。

The impact of inequality on algorithm decision-making: Moderation by attribution and mediation by system-justifying belief *

Xuyao Wu[1], Ye Li [1**], Jian Gong[1], Man Hai[1], Xianju Li[1]

[1] School of Psychology, Central China Normal University; Key Laboratory of Cyberpsychology and Behavior, Ministry of Education, Wuhan 430079, China.

***Abstract*:** With the succession of public health emergencies in recent years, social inequalities which mainly dominated by economic inequalities, are also manifesting increasing in health care, opportunity, and education. Artificial intelligence (AI) algorithm hold promises to reduce inequalities across socioeconomic. Algorithms ignore individual characteristics to make unbiased decisions. Unfortunately, people generally tolerate inequality and are averse to algorithm making important decision, which hinders the adoption of AI in healthcare, education, and organization. Therefore, it is particularly important to understand people's cognitive explanations for inequality. This study draws on the attribution theory and system justification theory to construct a framework for understanding people's attitude towards to algorithm decision-making in inequality situation. Notably, this study focuses on intra-human relations, emphasizing that people expect algorithms, a novel external technological tool, to re-establish a fair operating mechanism only when they have lost confidence in the social system constructed by human beings themselves. Six studies were conducted to examine the moderating role of attribution and the mediating role of system-justifying belief in the relationship between social inequalities and preferences for algorithm decision-making. Study 1, through three experiments in healthcare (Study 1a), organizational recruitment (Study 1b), and entrance exams (Study 1c), verified that an external attributional explanation for inequality drives inequality to increase preferences for algorithm decision-making, whereas internal attribution did not. Study 2 replicated the results of Study 1 by adopting various measurements of algorithm preferences. Study 3 not only re-validated the results of Study 1, but also investigated the mediating role of system-justifying belief between inequality and preferences for algorithm decision-making, as well as attributions moderating the relationship between inequality and system-justifying belief. Specifically, when people make external attributions about inequality, inequality reduces the system-justifying beliefs and thus increases preferences for algorithm decision making. However, when people make internal attributions about inequality, inequality increase the system-justifying beliefs and thus reduces preferences for algorithm decision making. In study 4, all participants read the news with an approximately equal number of people suffering from influenza A (H1N1) across socioeconomic, and the results showed that reducing system-justifying belief increased the preference for algorithm decision-making, further confirming the mediating role of system-justifying belief. Overall, these findings indicated that when inequality is externally attributed, inequality increases a preference for algorithm decision-making, however, not when it is caused by internal factors. Importantly, we also find that the mediating role of system justifying-belief in the relationship between inequality and preference for algorithm decision-making. Instead of focusing on how the characteristics of the algorithm or situation change people's attitudes towards algorithm decision-making, we infer algorithm aversion from the perspective of intra-human relations. These studies suggest that it's necessary to recognize the significant role of individual cognition when promoting AI to reduce inequality in healthcare, education, and organizations, so that AI is not implemented in a counterproductive way.

死亡提醒对消费者怀旧消费偏好的影响及其作用机制

崔锦圣[1] 陈皓云[1] 钟建安[2]（通讯作者）

1 浙江大学心理与行为科学系，杭州，310063

2 浙江大学心理与行为科学系，杭州，310063，jiananzhong@zju.edu.cn

摘 要 在当下社会背景中，随着信息媒体的普及，消费者越来越频繁地接触到与死亡相关的信息，唤醒对死亡的思考，即产生了死亡提醒。死亡提醒会导致消费者进行心理防御，如文化世界观防御、自尊寻求、亲密关系寻求和怀旧。怀旧消费作为怀旧的一种消费行为表现，可以提供怀旧的心理价值。本研究基于恐惧管理理论和意义维持模型展开了 3 项研究，探究死亡提醒对怀旧消费偏好的影响及其机制。研究一招募了 209 名被试，采用单因素被试间（死亡提醒组，对照组）实验设计，运用协方差分析和中介模型分析，结果：(1)经历死亡提醒的消费者对怀旧消费的偏好更强；(2)死亡提醒通过提升意义寻求增强对怀旧消费的偏好。研究二招募了 215 名被试，采用 2（死亡提醒组，对照组）×2（过去积极，过去消极）被试间实验设计，运用协方差分析和调节中介模型分析，结果：(1)时间取向在意义寻求和怀旧消费偏好之间起调节作用，对于过去积极取向的消费者，死亡提醒导致的高意义寻求令消费者更偏好怀旧消费。研究三招募了 220 名被试，采用 2（死亡提醒组，对照组）×2（高社会支持，低社会支持）被试间实验设计，运用协方差分析和调节中介模型分析，结果：(1)社会支持在死亡提醒和意义寻求之间起调节作用，死亡提醒只会令低社会支持的个体提高意义寻求。研究结果初步揭示了意义寻求是死亡提醒增加怀旧消费的潜在机制，并为死亡提醒下的消费者决策行为干预提供了一定参考。

2 Department of Psychology and Behavioral Science, Zhejiang University; 866 Yuhangtang Rd., Hangzhou, 310058, China. E-mail：jiananzhong@zju.edu.cn

Abstract： Study 1 investigated the effects of mortality salience on consumers' preference for nostalgic consumption and the underlying mechanism. A total of 209 participants were recruited and a single-factor between-subjects experimental design (mortality salience vs. control) was used. Data were analysed using analyses of covariance and mediation models. The results showed that consumers exposed to a death reminder showed a stronger preference for nostalgic consumption. Furthermore, the death reminder was found to enhance the preference for nostalgic consumption by increasing the sense of meaning. In Study 2, we extended the findings of Study 1 by examining the moderating role of time orientation (past positive vs. past negative) on the relationship between meaning seeking and nostalgic consumption preferences. A total of 215 participants were recruited using a 2 (mortality salience vs. control) × 2 (past positive vs. past negative) between-subjects experimental design. Data were analysed using analysis of covariance (ANCOVA) and moderated mediation models. The results indicated that temporal orientation moderated the relationship between meaning-seeking and nostalgia consumption preferences. Specifically, for consumers with a positive orientation towards the past, the increased level of meaning-seeking resulting from the death reminder led to a stronger preference for nostalgia consumption. Study 3 aimed to investigate the moderating role of social support (high vs. low) on the relationship between death reminders and meaning-seeking. A total of 220 participants were recruited, and a 2 (death reminder vs. control) × 2 (high social support vs. low social support) between-subjects experimental design was used. Data were analysed using analysis of covariance and moderated mediation models. Results indicated that social support moderated the relationship between death reminders and meaning seeking. Specifically, death reminders led to increased meaning-seeking only among individuals with low social support. Overall, the results of these studies provide preliminary evidence that meaning-seeking serves as a potential mechanism through which death reminders increase nostalgia consumption. These findings provide valuable insights for interventions targeting consumer decision-making behaviour in the context of death reminders.

经济水平差异对社会困境中合作行为的影响

凌晓丽[1] 吴相珍[1] 林之斌[1] 孙鹏[2]（通讯作者）

1 山东师范大学心理学院，济南，250358

2 山东财经大学心理健康教育与研究中心，济南，250014，sunpengsdufe@yeah.net

摘 要 合作是个体或群体之间为了共同的目标而协同活动，促使结果得以实现的社会性行为或意向，是人类社会生存发展的基石。然而，由于合作双方或多方存在着的诸多差异以及信任问题，合作共赢局面的达成并非易事。近年来，经济发展所引发的贫富差距在日益增大，合作领域的研究者也将目光聚焦在了经济水平的差异对合作行为的影响上，但目前的研究结果存有争议。在社会困境中，富裕群体表现出较高的合作倾向，贫穷群体则较低。但也有研究发现了相反的结果。目前对该问题的研究主要分别采用了“双人困境”或“多人困境”，但现实中两种困境可能同时嵌套出现，尚不明确在该情况下被试会如何选择。因此本研究结合两种困境，通过给予不同的初始被试费用设置有贫富差距的贫富两组（每组 4 人）、无贫富差距的中等组，且组间存在利益冲突，探讨多人在混合困境的合作行为。本研究共设置两个实验，实验一以公共物品博弈为基础，通过不同的初始被试费来操纵经济水平，分设贫穷、富有、中等组，并单设损益账户（损人利己），被试可以将初始资金中的部分或全部投放到公共账户中获得更多利益，从而探讨贫富群体合作水平的差异。结果发现，贫穷组较富有组、中等组投入更多的资金到损益账户中，中等组与富有组则没有显著差异。然而，贫穷群体高合作动机，是单纯地为了集体收益还是产生了仇富心理而抱团合作尚不清楚。因此，实验二在实验一基础上增设收益账户（利己不损人），采用迫选法。结果发现，贫穷组选择投入损益账户的人数显著多于中等组，而中等组与富有组则无显著差异。综上，这一定程度上表明贫穷组会表现出损人利己的行为，产生了仇富心理。本研究为贫富差距对合作的影响提供了新证据，当存在贫富差距时，这种经济不平等可能使个体具有竞争性，进而产生损人利己的行为。

The effect of economic level differences on cooperative behavior in social dilemmas

Xiaoli Ling[1] Xiangzhen Wu[1] Zhibin Lin[1] Peng Sun[2]
1 School of Psychology, Shandong Normal University, Jinan, 250358
2 Center for Mental Health Education and Research, Shandong University of Finance and Economics, Jinan, 250014

Abstract: Cooperation is a social behavior between individuals or groups to cooperate for a common goal and to promote the result to be realized, which is the cornerstone of the survival and development of human society. However, it is not easy to achieve win-win cooperation because of individual differences and mutual distrust between two or more parties. The wealth heterogeneity caused by economic growth has been increasing in recent years, and researchers in cooperation have begun to pay attention to its impact on cooperative behavior. Nevertheless, the existing research results were controversial. Some studies have shown that rich groups tend to contribute more than poor groups in social dilemmas, but other studies have found opposite results. These studies mainly explored this issue by adopting the "two-person dilemma" or the "multiple-person dilemma." However, the two dilemmas may coincide in reality, and it needs to be clarified how participants will choose. Therefore, the current study combined the two dilemmas and explored the effect of wealth heterogeneity on the cooperation of multiple people in mixed dilemmas by setting up two kinds of matching groups (rich group vs. poor group; middle group vs. middle group), which were conflicts of interest between groups. The wealth heterogeneity was manipulated through the different initial payments, where each member in the rich groups received ¥15, those in the medium groups received ¥10, and those in the poor groups received ¥5. Two experiments were executed in the present study. In experiment 1, the members of each group received an endowment of 30 tokens. They could decide how many tokens to contribute to the Between pool, increasing the payoff for in-group members but decreasing the out-group. The results found that the poor group contributed more to the Between pool than the medium group, with no significant difference between the middle and rich groups. However, it was unclear whether poor groups' high levels of cooperation were motivated by the collective interest or hatred for the rich group. Therefore, experiment 2 added a Within pool (increases the payoff for in-group members without decreasing the out-group), and contributions can be made to one of the two pools. More people in the poor group chose to invest in the Between pool than the middle group, while there was no significant difference between the middle and rich groups. In summary, these results indicated that the poor group competed against the out-group to a considerable extent. This study provides new evidence of the effect of wealth heterogeneity on cooperation that may drive poor individuals to be competitive and lead to selfish behavior at the expense of others.

摘 要 日常生活中，个体时常遇到自己难以解决的问题，并需要权衡利弊、决定是否主动发起人际请求以获得他人帮助，即求助决策。虽然求助可以带来获益，但也伴随着潜在帮助者的社会拒绝和无法回馈帮助者的焦虑等诸多社会成本。因此，求助者往往需要根据以往求助所带来的实际结果，更新对于潜在社会拒绝和回馈焦虑成本的预期，进而动态调整后续求助决策。这一社会学习过程背后的认知计算机制仍有待考察。本研究自主开发人际互动范式，在实验室真实、重复地诱发个体对于过往求助结果的社会学习，测量其求助决策的动态调整过程，并结合计算建模手段揭示背后的认知计算机制。人际互动范式中，被试每一轮会因前期任务失败而损失代币；同时，被试与一名匿名对家配对，并决定是否向该对家求助以减免一半的损失。被试被告知，系统根据对家的历史拒绝率和系统决定的、被试可以对对家进行回馈的概率，将所有对家分成了四组：高拒绝率（70%）-高可回馈率（70%）组、低拒绝率（30%）-高可回馈率（70%）组、高拒绝率（70%）-低可回馈率（30%）组、低拒绝率（30%）-低可回馈率（30%）组。被试需要在实验中进行试次接试次的是否求助决策，得到实际的求助结果反馈（即实际体验的社会拒绝和回馈焦虑），以学习不同组对家的拒绝概率和可回馈概率，据此不断调整是否求助决策。对被拒绝概率和可回馈概率的强化学习计算建模分析结果发现，被试对拒绝概率的学习率总体显著高于对可回馈概率的学习率；在拒绝概率学习方面，相比于面对两个低拒绝率组时，被试面对两个高拒绝率组时的学习率更高；在可回馈概率学习方面，相比于面对两个高可回馈率组时，被试面对两个低可回馈率组时的学习率更高。对求助决策的计算建模分析发现，求助决策中被试对拒绝概率的考虑权重总是高于其对可回馈概率的考虑权重，说明个体在求助决策中对拒绝概率加工的优先级相对较高。本研究从社会学习的角度揭示了求助决策动态调整的认知计算机制，为相关障碍的循证矫正提供了理论基础。

Abstract: In daily life, individuals often encounter problems that are difficult to solve on their own and need to weigh the pros and cons, and decide whether to initiate an interpersonal request for help, i.e., the help-seeking decision. Although asking for help can be beneficial, it also comes with many social costs, such as social rejection by potential helpers and anxiety about not being able to reciprocate. As a result, help-seekers often need to update their expectations of potential social rejection and repayment anxiety costs based on actual outcomes resulting from previous help-seeking, and thus dynamically adjust subsequent help-seeking decisions. The cognitive computational mechanism behind this social learning process remains unknown. In this study, we developed an interpersonal interaction paradigm to realistically and repetitively induce individuals' social learning of past help-seeking outcomes in the laboratory, to measure the dynamic adjustment process when people make their help-seeking decisions, and to combine it with computational modeling tools to reveal the underlying cognitive computational mechanisms. In the paradigm, subjects lose tokens each trial for failing the pre-task; at the same time, subjects are paired with an anonymous helper and decide whether ask for help from that helper in order to mitigate half of the loss. Subjects were told that the system divided all helpers into four groups based on the historical rejection probability of the helpers and the system-determined probability that the subject could reciprocate to the helpers: high rejection probability (70%)-high repayment probability (70%) group, low rejection probability (30%)-high repayment probability (70%) group, high rejection probability (70%)-low repayment probability (30%) group, and low rejection probability (30%)-low repayment probability (30%) group. Subjects need to make trial-by-trial decisions on whether to seek help in the experiment, get feedback on actual help-seeking outcomes (i.e., actually experienced social rejection and repayment anxiety) in order to learn the probability of rejection and the probability of repayment of different group helpers, and continually adjust the decision on whether to seek help accordingly. The results of the computational modeling analysis of reinforcement learning for rejection probability and repayment probability found that the overall learning rate of subjects for rejection probability was significantly higher than that for repayment probability; in terms of rejection probability learning, the learning rate was higher when subjects faced two groups with high rejection probability compared to when they faced two groups with low rejection probability; and in terms of repayment probability learning, the learning rate was higher when subjects faced two groups with low repayment probability compared to when they faced two groups with high repayment probability. The computational modeling analysis of the help-seeking

decision reveals that the subjects' consideration weight of the rejection probability in the help-seeking decision is always higher than their consideration weight of the repayment probability, indicating that individuals process the rejection probability with relatively high priority in the help-seeking decision. This study reveals the cognitive computational mechanism of the dynamic adjustment of help-seeking decision-making from the perspective of social learning, and provides a theoretical basis for the evidence-based correction of related disorders.

#贡献均等 *通讯作者， yanghu@psy.ecnu.edu.cn

摘 要 **背景：**合作是建立良好人际关系的关键基础，对促进个体形成健康稳定的社会生活模式具有重要意义。根据合作结果，通常可将合作分为正性合作（如警方合作缉拿要犯）与负性合作（如犯罪分子合伙诈骗）。以往研究多考察正性合作对个体间人际关系的影响，目前尚不清楚负性合作如何影响人际关系。本研究通过三项在线行为研究（N = 535），考察含有不同道德成本的负性合作行为对合作双方人际关系的影响。

方法：三项研究分别操纵了负性合作中的不同道德成本。其中，研究一操纵了情境中的欺骗成本（无欺骗成本、有欺骗成本；其中对后者进一步区分了欺骗者的身份：对家、自我或双方，共 4 个水平）。研究二操纵了伤害道德成本的大小（包含无伤害成本，低成本，高成本 3 个水平）。 研究三操纵了两种道德成本（包括无道德成本，欺骗-无伤害成本，欺骗-低伤害成本，欺骗-高伤害成本 4 个水平）。三项研究中，被试均需要两次评价双方人际关系，一次在对家合作前（前测）；一次在对家决策后，基于自己可能的不同决策（合作/不合作）评价双方的人际关系（后测）。三项研究聚焦双方决策后达成合作的情境，以合作前后，个体对合作者信任度（研究一、二：投资行为；研究三：主观报告）与亲近感（主观报告）的变化（后测-前测）作为因变量。研究均采用被试内设计，数据分析均采用单因素方差分析。

结果与讨论：研究一发现：合作达成后亲近感显著增加（变化量>0）。相比于无成本条件，欺骗成本使其变化量降低，而信任度无显著变化；其中，相较双方共同欺骗，自我参与欺骗的条件下亲近感的变化量更低。研究二发现：合作达成后亲近感和信任度显著增加（变化量>0）。同研究一，伤害成本（vs.无成本）显著降低了亲近感和信任度的变化量。研究三发现：道德成本使得合作后双方信任度下降（变化量<0）。而亲近感的变化则呈现出整体上升的趋势（变化量>0），但道德成本（特别是欺骗-高伤害成本条件）使得亲近感的变化量显著降低。

综上，尽管负性合作能够促进合作者间的信任度与亲近感，但不同的道德成本对于信任度和亲近感有着不同的影响，在一定程度上反应出负性合作对人际关系影响的复杂性。

Abstract: **Background**: Cooperation is the key foundation for establishing good interpersonal relationships and plays an important role in promoting the formation of a healthy and stable social life for individuals. Based on the morality of cooperation, cooperation can usually be divided into positive cooperation (such as police cooperation in capturing criminals) and negative cooperation (such as criminals collaborating in fraud). Previous studies have mostly examined the impact of positive cooperation on interpersonal relationships between individuals, and it is unclear how negative cooperation affects interpersonal relationships. This study conducted three online behavioral studies (N = 535) to examine the impact of negative cooperation behaviors with different moral costs on the interpersonal relationships of the cooperating parties.

Method: Three studies manipulated different moral costs in negative cooperation. Study 1 manipulated the cost of deception (with or without cost of deception) and we further distinguished the identity of the deceiver in the former case: partner deceive, self-deceive, or both deceive, resulting a total of 4 moral cost conditions. Study 2 manipulated the magnitude of the cost of harm (including no cost of harm, low cost, and high cost, 3 conditions). Study 3 manipulated two types of fore-mentioned moral costs in four conditions (no moral cost, deception but no harm, deception with low harm cost, and deception with high harm cost). In all three studies, participants were required to evaluate the interpersonal relationships between them and their partner twice: once before cooperation (pretest), and once after the cooperative decision-making (posttest), based on their possible different decisions (cooperating /not cooperating). The three studies focused on the situation where cooperation was achieved between the two parties. The changes in interpersonal trust (Study 1 and 2: investment behavior; Study 3: subjective reports) and closeness (subjective reports) towards the partner were taken as dependent variables by comparing the change from pretest to posttest. All studies adopted a within-subject design, and data analysis was conducted using one-way analysis of variance.

Results and discussion: Study 1 found that interpersonal closeness significantly increased after cooperation was achieved (change of closeness > 0). Compared to the no cost condition, the cost of deception decreased the change in interpersonal closeness, while trust did not show a significant change. Specifically, under the condition of self-deceiving, the change in interpersonal closeness was lower compared to both deceiving. Study 2 found that both interpersonal closeness and trust significantly increased after cooperation was achieved (change of closeness and trust > 0). Similar to Study 1, the cost of harm (vs. no cost) significantly decreased the change in interpersonal closeness and trust. Study 3 found that moral costs led to a decrease in interpersonal trust after cooperation (change of trust < 0). However, the change in interpersonal closeness showed an overall upward trend (change of

closeness> 0), but moral costs (especially the deception-high harm cost condition) significantly decreased the change in interpersonal closeness.

In summary, although negative cooperation can promote interpersonal trust and closeness between collaborators, different moral costs have different impacts on interpersonal trust and closeness, reflecting the complexity of the influence of negative cooperation on interpersonal relationships.

跨越群体边界？他人声誉对个体合作行为的影响

孔繁聪 王晓明（通讯作者） 朱泓锦 陈银燕
曲阜师范大学心理学院，山东曲阜，273165，xmwang2019@qfnu.edu.cn

摘 要 有界广义互惠理论(BGR)预测人们合作是基于群体内成员而非群体外成员的良好声誉，即声誉的作用机制存在群体边界。然而，无界间接互惠理论(UIR)认为，声誉是一种更普适的力量，声誉所带来的影响不受群体边界的限制，即人们同样会基于外群体成员的良好声誉选择与其合作。因此，研究从两大理论的争议点出发，采用嵌套社会困境博弈范式构建群际互动情境以探究他人声誉对个体合作行为的影响是否受群体约束。研究包含三个实验，实验 1 和实验 2 分别采用嵌套社会困境范式(NSD)和普遍与偏狭隘合作游戏范式(IPUC)考察他人声誉对合作行为的影响，实验 3 在此基础上调整了声誉的操纵方式并进一步探讨他人声誉对合作行为的影响机制。结果发现：(1)在嵌套社会困境(NSD)中个体与高声誉的外群体成员会有更多的合作(实验 1)；(2)在普遍与偏狭隘合作游戏(IPUC)中内外群体的声誉皆促进了个体的普遍合作，且由合作预期完全中介(实验 2)；(3)声誉关注在他人声誉对合作行为的影响中具有调节作用，在高声誉关注条件下，内群体的声誉越高普遍合作水平越高；在低声誉关注条件下，外群体的声誉越高普遍合作水平越高(实验 3)；(4)内群体的声誉会抑制强狭隘合作，即牺牲外群体利益只维护内群体利益。但在高群际威胁感知条件下，内群体的声誉会促进个体强狭隘合作(实验 2 和实验 3)。研究结果一方面再次验证了有界广义互惠与无界间接互惠的观点，即群体边界存在但并非不可以跨越；另一方面对声誉如何跨越群体边界的条件进行了探索，并发现了声誉关注与威胁感知的调节作用。研究从群际视角刻画了声誉与合作行为的关系，详细描绘了群际环境中的声誉机制，支持和补充了有界广义互惠和无界间接互惠，这一定程度上可以为理解人们在集体环境中的合作行为提供参考。

Crossing group boundaries? The Effect of Others' Reputation on Individuals' Cooperative Behavior

Kong Fancong, Wang Xiaoming (Correspondence), Zhu Hongjin, Chen Yinyan
Qufu Normal University, Shandong Qufu, 273165, xmwang2019@qfnu.edu.cn

Abstract: Bounded generalized reciprocity (BGR) predicts that people's cooperation is based on a positive reputation of ingroup members rather than outgroup members, i.e., there are group boundaries for the mechanism of action of reputation. However, Unbounded indirect reciprocity (UIR) argues that reputation is a more pervasive force, and that the influence exerted by reputation is not constrained by group boundaries, i.e., people will similarly choose to cooperate with outgroup members based on his or her positive reputation. Therefore, starting from the point of contention between the above theories, the study adopted a nested social dilemma game paradigm to construct an inter-group interaction situation in order to investigate whether the influence of others' reputations on an individual's cooperative behavior is bounded by group boundaries. The study consisted of three experiments, experiments 1 and 2 used the Nested Social Dilemma paradigm (NSD) and the Intergroup Parochial and Universal Cooperation (IPUC) game to examine the effect of others' reputation on cooperative behavior, respectively, while experiment 3 adapted the manipulation of reputation and further explored the mechanism of the effect of others' reputation on cooperative behavior on this basis. The results found that (1) individuals in nested social dilemmas (NSD) cooperate more with outgroup members with high reputations (Experiment 1); (2) both ingroup and outgrou

p reputations in Intergroup Parochial and Universal Cooperation (IPUC) game promote generalized cooperation among individuals and fully intermediated by cooperation expectations (Experiment 2); (3) reputational concern has a moderating role in the effect of others' reputations on cooperative behaviors. In the high reputational concern condition, the higher the reputation of the ingroup the higher the level of generalized cooperation; in the low reputation concern condition, the higher the reputation of the outgroup the higher the level of generalized cooperation (Experiment 3); (4) the reputation of the ingroup inhibits strong narrow cooperation, i.e., sacrificing the interests of the outgroup only to safeguard the interests of the ingroup. However, under high intergroup threat perception conditions, the reputation of the ingroup promotes individual strong narrow cooperation (Experiments 2 and 3). The results, on the one hand, revalidated the idea of bounded generalized reciprocity versus unbounded indirect reciprocity, i.e., group boundaries exist but are not uncrossable; on the other hand, explored the conditions of how reputation crosses group boundaries, and found a moderating effect of reputational concern and threat perception. The study portrays the relationship between reputation and cooperative behavior from an intergroup perspective, detailing the mechanisms of reputation in intergroup settings, supporting and complementing bounded generalized reciprocity and unbounded indirect reciprocity, which can to some extent inform the understanding of people's cooperative behavior in collective settings.

Keywords: other people's reputations, nested social dilemmas, cooperation, reputational concerns, intergroup threat perception

网名性别化感知对人际信任的影响：个体评价的中介作用

宋婉煜[1] 李静玟[1] 尹述飞[1](通讯作者)
1 湖北大学心理学系，武汉，430000，yinshufei121@163.com

摘 要 第 51 次《中国互联网发展统计报告》显示截止 2022 年 12 月，我国网民规模达到 10.67 亿。网络交友已成为当今人际交往的重要形式，高效地利用网名等简单线索进行信任判断是人们进行网络交往时的普遍方式。在现实交往中，名字中的性别化信息会影响对名字主人的特质评价，男性化名字的个体被评价为更有能力，而女性化名字的个体被评价为更具热情，这种评价也会进一步影响人际信任。为探究性别化网名在网络人际交往和印象形成中是否具有同样的效应，本研究通过两个实验考察了网名性别化感知对人际信任和评价的影响。研究一采用信任博弈范式，考察网名性别化感知（网名性别与个体性别一致和不一致）对人际信任水平的影响。结果表明，男性个体在网络中使用女性化网名将减少其得到人际信任，女性个体使用不同性别化的网名均不影响其得到的人际信任。研究二结合刻板印象内容模型，进一步探究网名性别化感知对人际信任水平影响及个体评价（热情和能力）的中介作用。结果表明，男性个体使用女性化网名后得到更低的热情、能力评价，进而导致更低的人际信任水平。总体结果表明，网名性别化感知会对个体评价以及人际信任产生影响。本研究为网名性别化感知与印象评价和人际信任提供了新的实证支持，对今后网名性别化感知的研究具有重要意义。
关键词 性别化网名，人际信任，个体评价

The Effect of Perceived Screen Name Genderization on Interpersonal Trust: the Mediating Role of Individual Evaluation

Wanyu Song[1], Jingwen Li[1], Shufei Yin[1*]
1 Department of Psychology, Faculty of Education, Hubei University
368 Youyi Road, Wuchang, Wuhan, China

Abstract: According to the 51st Statistical Report on China's Internet Development, the number of Internet users in China reached 1.067 billion by December 2022. Making friends online has become an important form of interpersonal communication. It is a common way for people to make trust judgments by using simple clues such as screen names efficiently. In real interactions, the gendered information in the name will affect the evaluation of the owner of the name. Individuals with masculine names are evaluated as more competent, while individuals with feminine names are evaluated as more enthusiastic, which will further affect interpersonal trust. To explore whether gendered screen names have the same effect in online interpersonal communication and impression formation, this study examined the effect of perceived gendered screen names on interpersonal trust and evaluation through two experiments. In the first study, the trust game paradigm was adopted to investigate the influence of the perception of screen name gender (whether the screen name gender is consistent with the individual gender or not) on the interpersonal trust level. The results show that male individuals using feminine screen names will reduce their interpersonal trust, while female individuals using different gendered screen names will not affect their interpersonal trust. In the second study, combined with the stereotype content model, we further explored the effect of perceived screen name gender on interpersonal trust level and the mediating effect of individual evaluation (enthusiasm and competence). It is shown that male individuals get lower enthusiasm and ability evaluation after using feminized net names, which leads to lower interpersonal trust level. The overall results show that the

perception of gender of screen names will have an impact on individual evaluation and interpersonal trust. The research provides new empirical support for the perception and impression evaluation and interpersonal trust of the gender of internet names, which is of great significance to the future research on the perception of gender of screen names.

Keywords：Gendered screen name, interpersonal trust, individual evaluation

社会排斥对大学生人际信任的影响：基于情景观和特质观的双重分析视角

代晨辉[1] 石常秀[1] 李明臻[2] 赵尧瑶[3] 赵小军[1]（通讯作者）
1 河北大学教育学院，河北保定，071002，psy790821@aliyun.com
2 淄博职业学院，山东淄博，255314
3 商丘学院应用科技学院，河南开封，475000

摘 要 以往对于人际信任的研究主要分为两个方面，一种是基于情景状态视角下的人际信任反应，即个体在合作任务中对他人的信任行为，通常采用信任博弈任务等实验范式来测量；另一种则是基于人格特质视角下的人际信任倾向，即个体在人际互动中所形成的对他人或团体可信性的稳定的心理倾向，通常采用信任问卷来测量。人际信任作为人际互动的产物，能够衡量人际关系的质量，研究表明具有良好同伴关系的大学生一定程度上会表现出更多的人际信任。然而并不是所有的大学生都拥有良好的人际关系，部分个体可能会感知到自己被他人所排斥，也就是所谓的社会排斥。本研究旨在从情景状态和人格特质两种视角分析社会排斥对人际信任的影响及其心理机制。研究 1 采用社会排斥范式（想象范式、孤独终老范式）和信任博弈任务对 94 名大学生展开研究，以探讨短期激活的被排斥体验对人际信任反应的影响，结果发现被排斥体验能够负向预测个体的人际信任反应，且即时控制感起完全中介作用，此外研究还发现想象范式组下的人际信任反应显著低于无排斥组，而孤独终老范式组与无排斥组却无显著差异。个体在日常生活中遭遇的往往并不是单一的被排斥事件，而是在很长的一段时间内反复被他人所排斥或忽视，这种长期且频繁的被排斥经历可能会影响个体稳定的认知方式和行为模式，研究 2 通过采用大学生社会排斥问卷、控制感量表、人际信任量表和网络空间人际信任量表对 610 名大学生进行问卷施测以探讨被排斥经历对于大学生现实人际信任倾向和网络人际信任倾向的影响，结果发现，被排斥经历能够负向预测现实人际倾向，但却能正向预测网络人际信任倾向，且特质控制感的中介作用均显著。本研究通过两种研究视角，进一步明确了社会排斥与人际信任之间的关系，社会排斥和人际信任都是影响大学生心理健康和社会适应的重要因素，了解它们之间的关系和作用机制，可以为制定有效的干预措施以改善大学生的人际信任水平提供理论依据。

The influence of social exclusion on interpersonal trust among college students: a dual analytical view based on scenario perspective and trait perspective

Dai Chenhui[1], Shi ChangXiu[1], Li Mingzhen[2], Zhao Yaoyao[3], Zhao Xiaojun[1]
1 School of Education, Hebei University, Baoding 071002
2 Zibo Vocational Institute, Zibo 255314
3 Shangqiu University Applied Science and Technology College, Kaifeng 475000

Abstract： In previous studies, research on interpersonal trust has primarily focused on two aspects. Firstly, it examines interpersonal trust reactions from the perspective of situational states, which refers to individuals' trusting behavior towards others in cooperative tasks. This aspect is commonly measured using experimental paradigms such as trust game tasks. Secondly, research has explored interpersonal trust tendencies from the perspective of personality traits, which refers to individuals' stable psychological inclination towards perceiving others or groups as trustworthy in interpersonal interactions. This aspect is typically assessed through trust

questionnaires. Interpersonal trust, as an outcome of interpersonal interaction, can measure the quality of interpersonal relationships. Research indicates that college students who have good peer relationships tend to exhibit more interpersonal trust to some extent. However, not all college students have good interpersonal relationships. Some individuals may perceive that they are rejected by others, which is called social exclusion. This study aims to analyze the impact of social exclusion on interpersonal trust and its psychological mechanisms from two perspectives: situational state and personality trait. Study 1 employed social exclusion paradigms (imagination paradigm, lonely forever paradigm) and a trust game task to investigate the influence of short-term activated exclusion experience on interpersonal trust response among 94 college students. The results revealed that exclusion experience could negatively predict individuals' interpersonal trust response, and immediate control sense played a full mediating role. Moreover, the study also found that the interpersonal trust response under the imagination paradigm group was significantly lower than that of the no-exclusion group, while there was no significant difference between the lonely forever paradigm group and the no-exclusion group. Individuals often encounter not single instances of exclusion in their daily lives, but rather repeated exclusion or neglect by others over a long period of time. This chronic and frequent experience of exclusion may affect individuals' stable cognitive styles and behavioral patterns. Study 2 surveyed 610 college students using the College Student Social Rejection Questionnaire, the Sense of Control Scale, the Interpersonal Trust Scale and the Online Interpersonal Trust Scale to explore the effects of exclusion experience on college students' real-life interpersonal trust tendency and online interpersonal trust tendency. The results showed that exclusion experience negatively predicted real-life interpersonal trust tendency, but positively predicted online interpersonal trust tendency, and the mediating role of trait sense of control was significant. This study further clarified the relationship between social exclusion and interpersonal trust through two research perspectives. Social exclusion and interpersonal trust are both important factors affecting college students' mental health and social adaptation. Understanding their relationship and mechanism of action can provide theoretical basis for developing effective interventions to improve college students' level of interpersonal trust.

Keywords： social exclusion, sense of control, interpersonal trust response, interpersonal trust tendency

社会拒绝内容对亲和性及自我关注的分离效应

陈菲菲[1]　郭铁元[2]（通讯作者）
1 湖北师范大学心理学系，湖北，435002
2 澳门大学心理学系，澳门，999078，tguo@um.edu.mo

摘 要　社会拒绝在日常生活中广泛存在，对个体的认知、情感以及行为产生重要影响，相关的学术研究中最值得关注的问题之一是人们如何应对社会拒绝。本研究从社会拒绝内容即热情和能力两个方面出发，考察基于热情的社会拒绝或基于能力的社会拒绝对个体的亲和性反应及自我关注的差异影响。根据需求-威胁模型，本研究假设热情拒绝比能力拒绝更加威胁关系需求，能力拒绝比热情拒绝更加威胁效能需求；为了修复受到威胁的关系需求，热情拒绝（相比能力拒绝）会促进个体表现出更多的亲和性反应，为了修复受到威胁的效能需求，能力拒绝（相比热情拒绝）会促进个体表现出更多的自我关注。本研究进行了 4 个实验，结果发现相比能力拒绝，热情拒绝增加了被试对结交新朋友的兴趣(研究 1)，对陌生人的评价更为积极(研究 2、3、4)。相比热情拒绝，能力拒绝增加了被试关注自我的程度(研究 3、4)。此外，当关系需求被启动时，热情拒绝对个体亲和性反应的作用消除；当效能需求被启动时，能力拒绝对个体自我关注的作用消除(研究 4)。研究结果表明，受到威胁的关系需求使热情拒绝增加了个体的亲和性反应，受到威胁的效能需求使能力拒绝增加了个体关注自我，社会拒绝如何影响个体后续的拒绝反应取决于个体对社会拒绝内容的认知。

关键词　社会拒绝，热情，能力，亲和性，自我关注

Divergent effects of warmth and competence social rejections on affiliation and self-focus

Feifei Chen[1]　Tieyuan Guo[2]
1 Department of Psychology, Hubei Normal University, Hubei
2 Department of Psychology, University of Macau, Macao SAR

***Abstract*：** Social rejection has been shown to produce a number of different responses. The present study investigated the divergent effects of warmth and competence social rejections on people's subsequent affiliative responses and self-focus. Based on the need-threat model, the present study hypothesized that because warmth rejection threatens relational needs whereas competence rejection threatens efficacy needs, warmth rejection motivates people to restore their relational needs by affiliating with others more than competence rejection does, whereas competence rejection motivates people to restore their efficacy needs by focusing on the self more than warmth rejection does. Four studies found that warmth rejection motivated participants to be more interested in making new friends (Study 1), and perceive other people as being more sociable than competence rejection did (Studies 2, 3, and 4). Competence rejection made participants be more self-focused than warmth rejection did (Studies 3 and 4). Furthermore, when relational needs were boosted, the effect of warmth rejection on affiliation was eliminated, and when efficacy needs were boosted, the effect of competence rejection on self-focus was eliminated (Study 4). The present results indicated that it was the threatened relational needs that made warmth

rejection increase the affiliative responses, and that the threatened efficacy needs were responsible for the effect of competence rejection on self-focus. This study provided converging evidence that the effects of social rejection depend on the perception of why rejection occurs.

Keywords：Social rejection, Warmth, Competence, Affiliation, Self-focus

人工智能情感特质对人工智能威胁感知的影响机制研究

王紫祎[1] 何宁[1]（通讯作者）
1 陕西师范大学心理学院，西安，710062，通讯作者 E-mail： hening@snnu.edu.cn

摘 要 目的：立足于社会认同理论(social identity theory)与群际威胁理论（intergroup threat theory），本研究将人工智能作为与人类对应的外群体，探讨青年群体人工智能威胁感知的现状与影响机制，为解读当下人工智能类人恐惧现象提供实证研究依据。 方法：研究一提出人工智能威胁（AI Threats）的概念，并使用改编的人工智能消极态度量表（Negative Attitudes Toward AI Scale）对随机抽取 249 位 18-35 岁青年被试进行问卷调查，考察当前青年群体的人工智能威胁感知现状及人工智能接触(AI Exposure)与人工智能经验(AI Experience)对人工智能威胁感知的影响；研究二招募 115 位 18-35 岁被试，使用文字阅读材料分别启动个体对人工智能能力特质(Competence)与情感特质(Emotion)的认知，在控制个体人工智能接触与人工智能经验的条件下，验证人工智能情感特质引发更高人工智能威胁感知的假设；在此基础上，研究三引入感知相似性作为中介变量，探讨人工智能情感特质对人工智能威胁感知的影响路径。 结果：当前青年群体人工智能威胁感知水平偏低，人工智能接触、人工智能经验水平与人工智能威胁感知皆为显著正相关；在控制个体人工智能经验与人工智能接触的条件下，人工智能情感特质引发的人工智能威胁感知显著高于人工智能能力特质引发的人工智能威胁感知；感知相似性在人工智能情感特质对人工智能威胁感知的影响中起到完全中介作用。 结论：当前青年群体存在人工智能威胁感知，但整体水平偏低，并且个体越是熟悉人工智能，越不将其视为外群体威胁；相比人工智能超凡的思维与海量的知识，人工智能具有情感更令青年群体感到恐惧与威胁；当人工智能表现出较高的情感互动能力时，个体感到人工智能更加“类人化”，进而产生更强的群际威胁感知。

Research on the Influence Mechanism of AI Emotional Traits on AI Threat Perception

Wang Ziyi, He Ning
(School of Psychology, Shaanxi Normal University, Xi’an, 710062)

Abstract： Object:Based on Social Identity Theory and Intergroup Threat Theory , this study takes artificial intelligence (AI) as an outgroup corresponding to human beings, and explores the current situation and influence mechanism of AI threat perception in youth groups, so as to provide empirical research for interpreting the phenomenon of AI humanoid fear at present. basis. Methods: Study 1 proposes the concept of AI Threats, and uses the adapted Negative Attitudes Toward AI Scale to conduct a questionnaire survey on 249 randomly selected young subjects aged 18-35 years old, to investigate the current status of AI Threats perception in the current youth group, and the relationship between AI Exposure and AI Experience on AI threat perception; Study 2 recruited 115 subjects aged 18-35 and used textual reading materials to activate individuals' perceptions of AI Competence and Emotion, respectively, to test the hypothesis that AI Emotion triggers higher AI threat perceptions, controlling for individual AI Exposure and AI Experience. Based on the results of Study 2, Study 3 introduces perceived similarity as a mediating variable to explore the influence path of AI emotional traits on AI threat perception. Results: The current young generation has a lower level of AI danger perception. AI exposure, AI experience level, and AI threat perception are all highly positively connected. Controlling for individual AI experience and AI exposure, Study 2 found that AI threat perceptions induced by emotional AI traits were much higher than AI threat

perceptions triggered by ability AI traits. Study3 obtains that perceived similarity plays a fully mediating role in the influence of AI emotional traits on AI threat perception. plays a fully mediating role. Conclusion: Although there is some AI threat perception among today's adolescent groups, it is generally low, and the more familiar they are with AI, the less they see it as a threat to other groups. For youth organizations, the existence of AI's emotions is more terrifying and dangerous than its incredible intelligence. People perceive an AI to be more "humanized" and more of an intergroup threat when it demonstrates higher emotional connection skills.

Keywords：AI Threats, Emotion trait, perceived similarity, intergroup threat

大学生人际不信任与关系攻击的纵向关系：从个体间差异中分离出个体内过程

杨玉川[1]　赵敏翔[1]　陈燕铃[1]　董妍[2]（通讯作者 1）夏凌翔[3]（通讯作者 2）

1 中国人民大学心理学系，北京，100872

2 中国人民大学心理学系，北京，100872，dong8958@126.com

3 心理与社会发展研究中心，西南大学，重庆，400715，xialx@swu.edu.cn

摘 要　近年来，校园欺凌事件频发，大学生的攻击行为已经成为社会关注的一个主要问题。中国文化强调维护社会和谐和积极的人际关系，直接的身体冲突是不被社会所接受的。因此，大学生可能采用隐蔽的，攻击他人人际关系的方式达到伤害他人的目的(即关系攻击)。此外，集体主义强调人际依赖的重要性。因此，关系攻击行为可能对受害者的伤害和影响更大。鉴于中国文化背景下关系攻击的有害性，探究大学生关系攻击的影响因素及其作用机制具有重要意义。根据一般攻击模型和有限的间接实证研究，人际不信任可能会对关系攻击产生影响。然而，目前并未有研究深入探讨人际不信任对关系攻击的影响及其内在机制。本研究基于 5 波纵向数据来探究人际不信任和社会攻击的纵向关系以及敌意归因偏向在这一关系中的中介作用。此外，分析方法上，本研究使用随机截距交叉滞后分析将个体内过程与稳定的个体间差异区分开来，其中个体内过程更能够说明变量间的因果关系。本研究从中国六个省的五所高校招募被试，最终有效被试为 1053 名本科生(女生占比为 64.3%；M_{age} = 19.45)，被试分别在 5 个时间点(间隔 6 个月)完成人际不信任、敌意归因偏向和关系攻击问卷。结果表明，在个体内水平上，大学生人际不信任能够显著正向预测关系攻击，而敌意归因偏向则中介了两者间的关系。本研究在个体内水平上揭示了人际不信任对关系攻击的影响，对制定科学干预措施以减少大学生关系攻击行为具有重要的实际意义。

Longitudinal Associations between Interpersonal Distrust and Social Aggression during College: Disentangling the Within-person Process from Stable Between-person Differences

Yu-Chuan Yang[1], Min-Xiang Zhao[1], Yan-Ling Chen[1], Yan Dong[2], Ling-Xiang Xia[3]

[1] Department of Psychology, Renmin University of China, Beijing, 100872

[2] Department of Psychology, Renmin University of China, Beijing, 100872, dong8958@126.com

[3] Research Center of Psychology and Social Development, Southwest University, Chongqing, 400715, xialx@swu.edu.cn

***Abstract*：** In recent years, there have been frequent incidents of bullying in schools, and aggressive behavior among college students has become a major social concern. Chinese culture emphasizes the maintenance of social harmony and positive interpersonal relationships, and direct physical conflict is not socially acceptable. As a result, college students may use covert, attacks on others' interpersonal relationships for the purpose of harming others (i.e., relational aggression). In addition, collectivism emphasizes the importance of interpersonal

dependence. As a result, relational aggression may be more harmful and influential to the victims. Given the harmful nature of relational aggression in the Chinese cultural context, it is important to explore the influencing factors of social aggression among college students and its mechanism of action. Based on *the General Aggression Model* and limited indirect empirical studies, interpersonal distrust may have an effect on social aggression. However, there is no study examining the directionality of the relationship between interpersonal distrust and social aggression as well as its underlying mechanisms. The present study was based on 5 waves of longitudinal data to investigate the longitudinal relationship between interpersonal distrust and social aggression and the mediating role of hostile attributional bias in this relationship. In addition, analytically, this study used the random intercept cross-lagged panel model to disentangle within-person processes from stable between-person differences, where within-person processes are more indicative of causal relationships between variables. Participants were recruited from five universities in six provinces in China. Valid participants included 1053 undergraduate students (64.3% female; Mage = 19.45) who completed assessments of interpersonal distrust, hostile attribution bias, and social aggression at 5-time points, with 6-month intervals. Results indicated that at the intra-individual level, college students' interpersonal distrust significantly and positively predicted relational aggression, while hostile attribution bias mediated the relationship. The present study revealed the effects of interpersonal distrust on relational aggression at the within-person level, which has important practical implications for the development of scientific interventions to reduce relational aggression in college students.

Keywords：interpersonal distrust, relational aggression, hostile attribution bias, longitudinal data

突发灾厄下的黑白几枰

——心理距离对情感极化产生的链式中介效应

白麒钰[1]（通讯作者） 满运玖[1]

1 北京大学新媒体研究院，北京，100871，通讯作者 E-mail：baiqiyu_pku@163.com

摘 要 随着社交媒体所带来的自我隔离环境和“二极管效应”被越来越多地学者关注，社交媒体成为情感极化发生平台和重要的研究场域，社交媒体的使用与情感极化的发生息息相关。基于群际威胁理论和解释水平理论，群体暴露于突发危机事件中并感知到威胁距离的缩短会诱发情感极化等极端情境的发生。本研究选择 2022 年 12 月北京地区新冠肺炎疫情传播突然严重爆发、并且公众关于防疫政策产生大量意见争鸣的时间窗口，在这一研究语境下试图探寻：在非常规突发事件的背景下，民众的心理距离与其在群体行为中发生的情感极化之间的影响机制是怎样的？民众对于危机事件的风险感知和严重性预期如何影响心理距离与情感极化之间的关系？本研究收集有效问卷 1019 份（男性占比 41.6%，女性占比 58.4，平均年龄 32 岁）。研究发现：心理距离与情感极化负相关，心理距离越近则越容易产生情感极化；严重性预期与风险感知在心理距离与情感极化中起到链式中介作用，心理距离的缩小会增加个体对风险的严重性预期，进而增加个体感知到的风险，从而产生情感极化。时至今日，现代社会的复杂性在诸如风险社会的理论建构中再一次被凸显和放大，风险社会已经不再是社会学家认知现代性危机时所建构出来的后工业时代图景，而成为告别全球性猛进高歌时代后日常基本生活中的切实表征。对于非常规或不确定性因素，足以带来个体的意见表达差异与集体性的舆论争鸣，这与当今互联网社交媒体环境中的复杂社会意见生态存在着无比紧密的联系。这一研究为了解现代社会风险社会构建提供了实证支持，突显了社交媒体在塑造集体舆论争鸣中的重要作用，为理解社交媒体环境下复杂社会意见生态提供了新视角。这些发现有助于深化对群体心理动态和信息传播的理论认知，对于应对非常规事件时群体行为的预测与干预也具有重要参考价值。

关键词 心理距离，严重性预期，风险感知，情感极化，链式反应中介

Catastrophic Events and Emotional Polarization: The Chain Mediating Mechanism of Psychological Distance on Emotional Polarization

Qiyu Bai, Yunjiu Man
School of New Media, Peking University of China

Abstract：With the increasing attention of scholars to the self-isolating environment and "echo chamber effect" brought about by social media, it has become a critical platform and research field for emotional polarization. The use of social media is closely related to the occurrence of emotional polarization. Drawing on the Intergroup Threat Theory and Explanatory Level Theory, exposure of groups to sudden crisis events and the perceived shortening of threat distance can trigger extreme situations such as emotional polarization. In this study, we selected the sudden and severe outbreak of COVID-19 in Beijing in December 2022, during a time when there was a significant public debate on epidemic prevention policies, aiming to explore the impact mechanism between individuals' psychological distance and emotional polarization in group behavior during unconventional crisis events. Additionally, we investigated how individuals' risk perception and severity expectation of the crisis event influence the relationship between psychological distance and emotional polarization. We collected 1019 valid questionnaires for the study (41.6% male, 58.4% female, average age of 32 years). Our findings revealed a negative correlation between psychological distance and emotional polarization, with closer psychological distance associated with a higher likelihood of emotional polarization. Furthermore, we found that severity expectation and risk perception act as chain mediators in the relationship between psychological distance and emotional polarization. The reduction of psychological distance increases individuals' severity expectation of risk, thereby intensifying their perception of risk and leading to emotional polarization. In today's complex modern society, the theory of risk society has been highlighted and amplified, with risk society no longer confined to a post-industrial era construct by sociologists during the era of global advancement. Instead, it has become a tangible manifestation in daily life after bidding farewell to the age of rapid global progress. Unconventional or uncertain factors are sufficient to bring about differences in individual expressions of opinions and collective public debates. This is closely related to the complex social opinion ecology in today's internet and social media environment. Our study provides empirical support for understanding the construction of modern risk society, emphasizing the significant role of social media in shaping collective public debates, and offering new perspectives on comprehending the complex social opinion ecology in the context of social media. These findings contribute to a deeper understanding of group psychological dynamics and information dissemination, and have important reference value for predicting and intervening in group behavior during unconventional events.

Keywords：Unconventional crisis events, psychological distance, emotional polarization, chain mediation

道德认同与幽默感的关系：笑话中道德违背成分与社会心理距离的作用

范丽婷　孙炳海（通讯作者）
浙江师范大学心理学院，浙江金华，321004，jky18@zjnu.cn

摘 要　作为人际交往的润滑剂，幽默感在促进人际和谐方面起着重要作用。一般情况下，幽默感需要打破常规思维，而道德认同则强调对道德规范的维护。鉴于二者在规则的遵守方面存在一定差异，有研究者提出观点，即高道德认同会抑制个体表现出的幽默感，并得到实证研究的支持，但也有研究并未支持这一结果。良性冲突理论指出，如果将幽默刺激视为良性的，那么个体将会表现出较高水平的幽默感。结合已有研究，本研究认为道德违背成分和社会心理距离会影响个体对幽默刺激的良性判断，可能在道德认同影响幽默感的过程中起到调节作用。研究 1 采用问卷调查初步探究道德认同与幽默感之间的关系；研究 2 以笑话作为幽默刺激，采用 2（道德认同：激活、控制）×2（笑话类型：道德违背、非道德违背）混合实验设计，探究不同笑话类型下，道德认同对幽默感的影响；研究 3 聚焦于道德违背笑话，采用 2（道德认同：激活、控制）×2（社会心理距离：远、近）被试间实验设计，探究不同社会心理距离条件下，道德认同对幽默感的影响及其良性判断的中介作用。综合研究 1-3 的结果，本研究主要得出以下结论：（1）高道德认同者的总体幽默感较高，尤其是对积极、非道德违背的笑话。（2）高道德认同者对包含道德违背成分且对象为近社会心理距离的笑话会表现出较低的幽默感。（3）高道德认同降低幽默感成立时，是通过降低良性判断进而降低幽默感的。本研究明确提出高道德认同降低幽默感的条件以及心理机制，丰富了相关领域的现有研究，并为人际交往提供了一定的指导。

关键词　幽默感，道德认同，道德违背，社会心理距离，良性冲突理论

Moral identity and sense of humor: The role of moral violation component and social psychosocial distance in jokes

Liting Fan, Binghai Sun
School of Psychology, Zhejiang Normal University, Jinhua, 321004, Zhejiang, China

Abstract： As a lubricant for interpersonal communication, a sense of humor plays an important role in promoting human-human harmony. In general, a sense of humor requires a break from conventional thinking, while individuals with high levels of moral identity tend to behave in a conservative manner in order to maintain moral norms. Given the differences between the two in terms of rule adherence, some researchers have made the argument that high moral identity inhibits individuals from displaying a sense of humor, and this argument has been supported by empirical studies, but others have not supported this result. The benign violations theory states that if humorous stimuli are viewed as benign, individuals will exhibit higher levels of sense of humor. Based on previous research, this study argues that the moral violation component and social psychological distance affect individuals' benign judgment of humorous stimuli and play a moderating role in the process of moral identity affecting sense of humor. In study 1, questionnaire survey was used to explore the relationship between moral

identity and sense of humor. In study 2, a hybrid design of 2 (moral identity: activation and control) ×2 (joke type: moral violation and nonmoral violation) was adopted, in which moral identity was the inter-subject variable and sense of humor was the dependent variable. Study 3 only jokes containing moral violations were selected as humorous stimuli to explore the impact of moral identity on the sense of humor and its potential psychological mechanisms under different conditions of social psychological distance. In study 3, 2 (moral identity: activation and control) ×2 (social psychosocial distance: distance and proximity) was used as an inter-subject design, with sense of humor as the dependent variable and the cavalier humor beliefs as the mediating variable. Based on the guidance of the benign violations theory and the result of empirical test, this study mainly draws the following conclusions：(1) Individuals with high levels of moral identity have higher levels of sense of humor in general, especially for positive and nonmoral violation jokes. (2) If the joke contains a moral violation, and the target of the joke is proximity, the individuals with high levels of moral identity will show lower levels of sense of humor. (3) Individuals with high levels of moral identity will lower their sense of humor by lowering their benign judgment. This study clearly puts forward the conditions and psychological mechanisms of a level of high moral identity to reduce the level of sense of humor, which encircles the existing research in related fields and provides some guidance for interpersonal communication.

Keywords：sense of humor, moral identity, moral violation, social psychological distance, benign violations theory

字如其人：笔迹美感对书写者道德感知的影响

段妍[1]　　何先友[1]（通讯作者）

[1]华南师范大学心理应用研究中心，华南师范大学脑与认知教育科学重点实验室，华南师范大学心理学院，华南师范大学广东省心理健康与认知科学重点实验室，广州，510631，xianyouhe@163.com

摘 要　书法是中国传统文化的瑰宝，不仅是一种艺术表现形式，更是修身养性的重要载体。虽然从古至今，中国人经常将笔迹与人的品德修养联系在一起，强调在书法中体悟道德美，但是这个观念尚未得到实证研究的支持。因此，本研究旨在探索笔迹美与书写者道德感知之间的关系，以及这种关系背后的内在机制。

首先，实验 1 招募了 200 名被试，让他们评价 17 幅笔迹的美观程度和书写者的道德水平。结果显示，笔迹的美观程度可以显著正向预测书写者的道德评分。这表明人们会从他人的笔迹美感中进行道德推断。

为了进一步了解人们做出这种推断的最小时间条件。实验 2 操纵了不同美感笔迹的暴露时间。结果验证了实验 1 的发现，即人们会主观认为书写美的人更值得信赖。同时，在 100ms 后做出的道德判断与无时间限制的判断高度相关。这表明 100ms 的暴露时间足以形成对笔迹美的道德印象，后续暴露时间的延长提高了人们对道德判断的信心。

实验 3 和实验 4 旨在从内隐的角度考察人们对书法者的道德评价。实验 3 采用了经典的内隐联想范式（IAT）。结果发现，被试更多地将美的笔迹与高道德词汇联系，而将丑的笔迹与低道德词汇相联系。实验 4 为了排除 IAT 固有的方法局限性和书写者面孔的影响，采用了一种创新变体的反应启动范式，。实验 4 的结果显示，相比于中性条件，美笔迹图片启动高道德词的反应时更快。这进一步证明了在内隐条件下，人们会将笔迹美与道德高联系在一起。

最后，实验 5 考察了笔迹美与道德之间联结的内在机制。实验给被试呈现不同美感程度的笔迹，并让被试对书写者的道德和能力进行评分。结果发现，当美的笔迹与中性面孔配对时，道德和能力得分更高。此外，人们感知的能力在笔迹美感和道德感知之间起了中介作用。

综上，本研究为“字如其人”的中国传统书法理论提供了实证依据，验证了笔迹美感与道德之间密不可分的关系。这些发现进一步丰富和拓展了印象形成领域的研究，也为书法美育提供了相应的理论基础。

The style is the man: The impact of Penmanship Aesthetics on Perceptions of the Writer's Morality

Yan Duan [a]　　Xianyou He [a]

a Center for Studies of Psychological Application, South China Normal University, Key Laboratory of Brain, Cognition and Education Sciences, Ministry of Education, South China Normal University, Guangzhou, People’s Republic of China; School of Psychology, South China Normal University, Guangzhou, People’s Republic of China; Guangdong Key Laboratory of Mental Health and Cognitive Science, South China Normal University, Guangzhou, 510631，xianyouhe@163.com

Abstract: Calligraphy, an esteemed facet of traditional Chinese culture, serves not only as an artistic expression

but also as a crucial medium for self-cultivation and moral refinement. Despite the longstanding association between handwriting and moral character in Chinese culture, this belief has yet to be validated through empirical inquiry. Therefore, this study aims to investigate the relationship between penmanship aesthetics and the perception of moral character in writers, along with the underlying mechanisms driving this association.

Experiment 1 involved 200 participants who evaluated the aesthetic appeal of 17 handwriting samples and the perceived moral character of the writers. Results revealed a significant positive correlation between handwriting aesthetics and ratings of moral character, suggesting that individuals tend to infer moral attributes from the aesthetic quality of others' handwriting.

To examine the minimum time required for making such inferences, Experiment 2 manipulated the exposure time of handwriting samples with varying aesthetic qualities. The findings replicated those of Experiment 1, with participants subjectively perceiving writers with beautiful handwriting as more trustworthy. Moreover, moral judgments made at 100ms after exposure significantly correlated with unrestricted judgments, indicating that a brief 100ms exposure time suffices to form moral impressions based on penmanship aesthetics, with prolonged exposure only increasing confidence in moral judgments.

Experiment 3 and Experiment 4 aimed to explore people's implicit moral evaluations of calligraphers. Experiment 3 employed a classic Implicit Association Test (IAT), revealing that participants associated beautiful handwriting with positive moral words and ugly handwriting with negative moral words. In Experiment 4, an innovative variant of the Response Priming paradigm was utilized to eliminate inherent IAT limitations and the influence of calligraphers' facial characteristics. Results indicated that under implicit conditions, participants associated beautiful handwriting with higher moral attributes through faster response times than in the neutral condition. It thereby confirms the link between penmanship aesthetics and moral character.

Finally, Experiment 5 delved into the underlying mechanisms connecting penmanship aesthetics and moral perception. Participants were presented with handwriting samples displaying varying degrees of aesthetics and asked to rate the moral character and competence of the writers. Findings revealed that when beautiful handwriting was paired with neutral faces, both moral and competence ratings were higher. Furthermore, the perception of competence acted as a mediator between penmanship aesthetics and moral perception.

In conclusion, this study provides empirical evidence supporting the traditional Chinese belief that "The style is the man." It validates the inseparable relationship between penmanship aesthetics and moral character, enriching and expanding research in the domain of impression formation, and offering a theoretical foundation for calligraphy education.

摘 要 我们在生活中更愿意向熟人或朋友而非陌生人吐露心声、咨询建议或寻求帮助。尽管如此，对于获得的帮助我们有时候会感激陌生人甚于朋友，我们可能认为帮助我们是朋友应尽的义务，或为无需急于回报朋友的帮助。那么，人际关系是否影响着人们对他人帮助我们过程中付出的感知？为此，本研究探讨了人们对朋友和陌生人在帮助自己过程中付出感知的差异及其机制。共开展了三项研究：

研究一探讨了人们对陌生人和朋友帮助过程中的付出感知。结果发现，对于相同的帮助行为，与获得陌生人的帮助相比，人们对朋友在帮助过程中付出的感知较低；

研究二探讨了帮助类型对付出感知差异的影响。结果发现，人们在主动寻求帮助的情况下会感知到朋友的付出低于陌生人，但这一倾向在被动获得帮助的情况下并不存在；

研究三探讨了人们对付出感知差异的作用机制。结果发现，获益不适感在人际关系与付出感知中发挥着中介作用，与获得陌生人的帮助相比，人们对于朋友的付出体验到较低的获益不适感，由此导致较低的付出感知。此外，获益不适感在人际关系与付出感知关系中的中介作用受到道德义务感的调节，获益不适感的中介作用主要体现在那些认为朋友对于帮助自己有着较高道德义务感的个体身上，而在认为朋友对于帮助自己有着较低道德义务感的个体身上则不存在。

综上所述，本研究揭示了人们低估朋友付出这一现象，即当向他人寻求帮助时，人们对朋友在帮助过程中付出的感知低于陌生人。此外，在低估朋友付出感知这一现象中获益不适感发挥着中介作用，道德义务感发挥着调节作用。

Abstract: We prefer to express our feelings, seek advice or seek help from acquaintances or friends rather than strangers in our daily lives. However, we are sometimes more grateful for the help we receive from strangers than from friends, perhaps because we feel it is our friend's duty to help us, or because we are not eager to return the favour. Thus, do interpersonal relationships affect people's perceptions of what others give in the process of helping us? In response, the present study explores the differences in people's perceptions of giving in the process of helping themselves from friends and strangers and the underlying mechanisms. A total of three studies are

examined in the present study.

Study 1 investigates people's perceptions of giving in the process of helping from strangers and friends. The result reveals that people perceive less giving during helping from friends compared to getting help from strangers for the same helping behavior.

Study 2 examines the impact of different type of help in perceptions of giving. Results found that people perceive friends to be less giving than strangers in the context of proactively seeking for help, but this tendency does not exist in the context of receiving help passively.

Study 3 explores the mechanisms underlying the effect of differences in people's perceptions of giving. It is found that discomfort of benefit mediates the interpersonal relationship and perceptions of giving, which people experience lower discomfort of benefit for friends' giving compared to strangers', and results in lower perceptions of friends' giving. Furthermore, the mediating role of discomfort of benefit in the relationship between interpersonal relationships and perceptions of giving is moderated by the perception of moral obligation, with the mediating role of discomfort of benefit mainly found in individuals who perceive friends as having a higher moral obligation to help themselves, but not in individuals who perceive friends as having a lower moral obligation to help themselves.

In conclusion, the current study reveals that people underestimate the perception of giving from friends. For instance, when seeking help from others, people perceive friends as giving less than strangers in the process of helping. In addition, discomfort of benefits plays a mediating role and the perception of moral obligation plays a moderating role in the perception of underestimating friends' giving.

摘 要　恶意创造力(malevolent creativity, MC)的发生机制问题是该领域研究的关键。本研究基于一般攻击模型(General Aggression Model, GAM)认为愤怒反刍(anger rumination)可能是恶意创造力的核心前因变量。愤怒反刍即个体沉浸于愤怒情绪与愤怒经历，反复思考负性事件起因及后果的 “负性反思”状态。依据 GAM，有计划的攻击行为(如 MC)的产出有赖于个体对当前负性事件进行反复思考与加工，该过程与愤怒反刍近似。据此本研究试图验证愤怒反刍对恶意创造力的激发作用(假设 1)，并关注该激发作用是否借助创造力四阶段中的酝酿期生效(假设 2)。在此基础之上进一步检验不同类型愤怒反刍的作用(问题 1)及主要情绪调节手段抑制恶意创造力的有效性(问题 2)。本研究通过四个实验共招募 781 名被试检验以上假设与问题。实验一为单因素两水平(愤怒反刍组/控制组)被试间设计以检验假设 1，结果表明愤怒反刍可以显著促进恶意创造力。实验二为单因素五水平(愤怒反刍组/分心组/心智游移组/愤怒情绪组/控制组)被试间设计以检验假设 2，采用延时酝酿范式令被试在创造力酝酿期接受不同任务，结果表明与其余各组相比，愤怒反刍可以在酝酿期显著促进恶意创造力。实验三为 2(愤怒反刍特质：高/低)×3(愤怒反刍类型：体验性愤怒反刍/分析性愤怒反刍/控制组)被试间设计以检验问题 1，结果表明高愤怒反刍特质者恶意创造力水平更高；体验性愤怒反刍和分析性愤怒反刍均显著促进恶意创造力，不过二者激发恶意创造力的维度存在差异。实验四为单因素五水平(情绪调节方式：认知重评/表达抑制/宣泄/宽恕/愤怒反刍)被试间实验设计以检验问题 2，结果表明认知重评、表达抑制、宣泄和宽恕均显著降低恶意创造力，但抑制恶意创造力的维度与效果存在差异。综上，本研究发现愤怒反刍对恶意创造力具备重要的激发作用且该过程与创造力酝酿期有关，不同类别愤怒反刍的激发作用及主要情绪调节策略的抑制效果得以验证但功效存在差异。本研究结果有助于厘清恶意创造力的发生机制和干预手段问题，具备重要的理论和实践价值。

The More "Reflection" the More "Evil": The Stimulating Effect of Anger Rumination on Malevolent Creativity

Hu Qing Zeng Zeyu Du Ruichen Xiong Leyi Jiang Yuke Liu Hailong Jing Lingzhu Liu Zhaoyang Gong Zhe
School of Psychology, Sichuan Normal University, Chengdu, zhegong@sicnu.edu.cn
School of International Education, Sichuan Normal University, Chengdu,

Abstract: The mechanism of malevolent creativity (MC) is the key to the research in this field. Based on the General Aggression Model, GAM), this study holds that anger rumination may be the core antecedent of malevolent creativity. Anger rumination is a state of "negative reflection" in which individuals are immersed in anger and anger experiences and repeatedly think about the causes and consequences of negative events. According to GAM, the output of planned aggression (such as MC) depends on the individual's repeated thinking and processing of current negative events, which is similar to anger rumination. Based on this, this study attempts to verify the stimulating effect of anger rumination on malevolent creativity (hypothesis 1), and pay attention to whether this stimulating effect takes effect with the help of the incubation period in the four stages of creativity (hypothesis 2). On this basis, we further test the effects of different types of anger rumination (question 1) and the effectiveness of the main emotional regulation means to inhibit malevolent creativity (question 2). In this study, 781 subjects were recruited through four experiments to test the above assumptions and problems. Experiment 1 was designed between subjects with one factor and two levels (anger rumination group/control group) to test hypothesis 1. The results showed that anger rumination could significantly promote malevolent creativity. In experiment 2, a single factor and five levels (anger rumination group/distraction group/mind wandering group/anger emotion group/control group) were designed between subjects to test hypothesis 2. The delayed incubation paradigm was used to make subjects accept different tasks during the incubation period of creativity. The results showed that anger rumination could significantly promote malevolent creativity during the incubation period compared with the other groups. Experiment 3 is a design of 2 (anger rumination trait: high/low) ×3 (anger rumination type: experiential anger rumination/analytical anger rumination/control group) between subjects to test question 1. The results show that people with high anger rumination trait have higher level of malevolent creativity; Both experiential anger rumination and analytical anger rumination significantly promote malevolent creativity, but there are differences in the dimensions of stimulating malevolent creativity. Experiment 4 is a single factor and five levels (approach of emotion regulation: cognitive reappraisal/expression inhibition/catharsis/forgiveness/anger rumination) experimental design between subjects to test question 2. The results show that cognitive reappraisal, expression inhibition, catharsis and forgiveness all significantly reduce malevolent creativity, but there are differences in the dimensions and effects of inhibiting malevolent creativity. To sum up, this study found that anger rumination has an important stimulating effect on malevolent creativity, and the process is related to the incubation period of creativity. The stimulating effect of different types of anger rumination and the inhibitory effect of main emotional regulation strategies have been verified, but the effects are different. The results of this study are helpful to clarify the mechanism and intervention means of malevolent creativity, and have important theoretical and practical value.

谁是害群之马？社会困境情境下，群体成员身份对联想记忆的影响

张右[1]　王乔[1]　孙朔[1]　聂爱青[1]（通讯作者）
1 山西师范大学教育科学学院，太原，030000，nieaiq@126.com

摘 要　人们对来自同一群体的面孔有记忆优势。(a)以往文献关注到了群体成员身份对面孔项目记忆的影响，但鲜有文献关注到群体成员身份对面孔联想记忆的作用。(b)此外，有文献关注到不同互动身份可以与群体成员身份共同影响项目记忆，相比外群体，个体更容易记住群体内合作者（内群体偏好效应）；相比外群体，人们更容易记住群体内欺骗者（黑羊效应），但还没有文献考虑到不同互动身份和群体成员身份对联想记忆的影响(c) 先前的研究表明，刺激情绪可以影响联想记忆，但其模式是多种多样的:负性可以损害或改善联想记忆，而正性通常会促进联想记忆。本研究想探究面孔情绪是否调节不同互动身份和群体成员身份对联想记忆的影响。综上所述，本研究通过实验，探究在社会困境实验下，群体成员身份对个体联想记忆的影响。实验采用 2（群体成员身份：内群体，外群体）×3（互动身份：合作者、中立者、欺骗者）×3（面孔情绪：正性、中性、负性）×3（联想记忆：完整配对、重组配对、新面孔）的四因素被试内实验设计。因变量为联想任务的正确率和反应时。我们对实验进行如下预测：（a）群体成员身份主效应显著，内群体面孔正确率好于外群体面孔，支持社会分类理论(b)互动身份主效应显著，合作者和欺骗者面孔正确率好于中立者。支持社会契约理论。（c）情绪面孔主效应显著，正性和负性面孔正确率要好于中性（d）个体对内外群体中的不同身份（合作者、欺骗者和中立者） 的联想记忆是不一致的。相比外群体，对内群体的合作者，会产生内群体偏好效应。相比外群体，对内群体的欺骗者，会产生黑羊效应。（e）情绪能调节不同互动身份和群体成员身份对联想记忆的影响，对内群体的正性和负性面孔正确率更好。研究结果支持了社会分类和社会契约理论，为身份信息对联想记忆的研究提供了进一步的证据。

Who is the Black Sheep? The Effect of Ingroup Membership on Associative Memory in a Social Dilemma

You Zhang1, Qiao Wang1, Shuo Sun1, Aiqing Nie1
1Faculty of Education, Shanxi Normal University, Taiyuan, 030000, China nieaiq@126.com

Abstract：People have a memory advantage for faces from their own group. (a) Previous literature has focused on the effect of ingroup membership on memory for faces, but little research has examined the role of ingroup membership on associative memory for faces. (b) Furthermore, some studies have looked at how different interactant behaviors can jointly influence item memory along with ingroup membership – individuals show better memory for ingroup members who were cooperators (ingroup bias) and ingroup members who cheated (black sheep effect) compared to outgroup members. However, no study has considered how different interactant behaviors and ingroup membership might affect associative memory. (c) Prior work shows that emotional stimuli can influence associative memory, but the patterns are mixed – negative emotions can impair or enhance associative memory while positive emotions tend to improve it. The present study seeks to investigate whether facial emotion modulates the effects of different interactant behaviors and ingroup membership on associative

memory.

In summary, this experiment examines the effect of ingroup membership on individuals' associative memory in a social dilemma game, using a 2 (group membership: ingroup, outgroup) × 3 (interactant behavior: cooperator, neutral, cheater) × 3 (facial emotion: positive, neutral, negative) × 3 (associative memory: intact pairs, rearranged pairs, new) mixed factorial design. The dependent variables were accuracy and reaction time on an associative memory task. We hypothesize that: (a) a main effect of group membership will emerge, with better accuracy for ingroup faces, supporting social categorization theory; (b) a main effect of interactant behavior, with better accuracy for cooperators and cheaters versus neutrals, supporting social contract theory; (c) a main effect of emotion, with better accuracy for positive and negative versus neutral faces; (d) individuals will show differential associative memory for different identities (cooperators, cheaters, neutrals) depending on ingroup vs outgroup status, with an ingroup bias for ingroup cooperators, and a black sheep effect for ingroup cheaters compared to outgroup members; (e) emotion will moderate effects of interactant behavior and group membership on associative memory, with even better accuracy for positive and negative ingroup faces. The results will provide further evidence for the effects of identity on associative memory, supporting social categorization and social contract theory.

Keywords：ingroup, social dilemma, associative memory, facial emotion, black sheep effect

社会阶层，幸灾乐祸与道德情境下儿童的亲社会行为

摘 要：亲社会行为是儿童社会化和适应性的重要表现，良好的亲社会行为有利于儿童建立积极的社会关系，对儿童的健康发展具有重要作用。以往研究发现，社会阶层和儿童的亲社会行为之间的关系非常复杂，会受到多种因素的影响。本研究在不同的道德情境之下，通过探讨社会阶层和儿童的亲社会行为之间的关系，促进了对儿童道德发展的理解。研究一（N = 833）发现，当目标儿童追求消极的道德目标效价，然后遭遇不幸时，与低阶层儿童相比，高阶层儿童会产生更多的幸灾乐祸情绪，表现出更少的亲社会行为；当目标儿童追求积极的道德目标效价，然后遭遇不幸时，不同阶层的儿童所表现出来的亲社会行为并未产生显著差异。目标儿童的道德目标效价在这一过程当中起调节作用。研究二（N = 389）的目的是探索幸灾乐祸情绪的前置因素，即高阶层儿童所表现出来的高水平幸灾乐祸是否是由对目标儿童遭遇不幸的更低的共情反应或更高的应得性感知所驱动的。结果显示，社会阶层通过应得性感知和幸灾乐祸情绪对亲社会行为产生了影响，但是社会阶层无法通过影响被试的共情，进而对幸灾乐祸情绪以及被试的亲社会行为产生影响。这些结果共同揭示了社会阶层这一宏观的社会情境因素对儿童道德判断、道德情感和道德行为发展的影响。

Abstract: Past research has found a mixed relation between social class and children's prosocial behavior. The current research advances the understanding of these findings by examining the relation between social class and children's prosocial behavior in moral context. Study 1 (N = 833) found that when a target child pursued a morally negative goal and then suffered misfortune, higher class children, compared to lower class children, experienced higher schadenfreude and acted less prosocially, and the relation is mediated by schadenfreude. Study 2 (N = 389) examined whether the higher schadenfreude of high class children was driven by weaker empathic response to the misfortune or a higher sense of deservingness. The results showed a sequential mediation effect of social class on

prosocial behavior through deservingness and schadenfreude. The findings shed light on the effect of social class on the development of children's moral judgment, emotion, and behavior.
Keywords：social class, schadenfreude, empathy, deservingness, prosocial behavior

性别偏格影响同伴评价的动态演化机制

温芳芳[1] 赵峰[1] 方泽鸣[2] 柯文琳[1] 佐斌[3]（通讯作者）

1 华中师范大学心理学院暨社会心理研究中心，武汉，430079

3 中山大学心理学系，广州，510006，通讯作者 Email: zuobin@mail.sysu.edu.cn

摘要 性别偏格的同伴评价是个体对社会认知对象进行心理决策的连续过程。对于人们头脑中的性别一致（包括性别偏格）的内容，可以通过建立规范化的特征判别的数学表征来实现对刻板印象内容的“逼近”。通常采用一个或一组词来代表某种性别规范一致或不一致。从性别一致的内容看，出生时人们对某个特质词描述对象是男性或女性一无所知，随着在社会生活中经历描述男性和女性特质词语情况的增加，人们就形成了某个特征词与某个性别联系程度的模板，这就是性别相符的学习过程，这一学习过程能够采用基于模型的强化学习范式进行模拟。本研究通过系列实验基于强化学习框架的社会学习理论是否能够解释性别偏格对同伴评价的影响。结果发现，随着无意义符号与性别的关联频率增加，人们对具有该特质的男性或女性的接受度也逐渐增加；人们的接受程度也随着关联频率的反转迅速反转，表明无意义符号与性别的关联频率变化的确会显著影响接受度；利用有意义的真词反转频率后，接受度也出现了与频率相一致的变化，但其变化幅度明显小于无意义符号；男女基本属性特质词起到了关键作用，随着特质关联频率的反转，接受度也会随之发生变化。这些发现对于使用基于模型的强化学习模拟对性别偏格同伴评价的原型形成的揭示具有重要意义。

The dynamic evolutionary mechanism of gender nonconformity affecting peer evaluation

Wen Fangfang[1] Zhao Feng[1] Fang Zeming[2] Ke Wenlin[1] Zuo Bin[3] (corresponding author)

1 School of Psychology and Center for Studies of Social Psychology, Central China Normal University, Wuhan 430079, China

3 Corresponding author: zuobin@mail.sysu.edu.cn, Department of Psychology, Sun Yat-sen University, Guangzhou 510006, China

Abstract **：** Gender nonconformity on peer evaluation is a continuous process in which individuals make psychological decisions about social cognitive objects. For the content of gender consistency (including gender nonconformity) in people's minds, we can achieve the "approximation" of stereotype content by establishing standardized mathematical representation of feature discrimination. A word or group of words is usually adopted to represent a certain gender norm agreement or inconsistency. In terms of the content of gender conformity, people at birth have no idea whether a trait word describes male or female. With the increase in the number of words describing male and female traits in social life, people form a template for the degree of association between a trait word and a certain gender. This is the learning process of gender conformity. This learning process can be simulated using a model-based reinforcement learning paradigm. This study conducted a series of experiments on whether social learning theory based on reinforcement learning framework can explain the influence of gender bias on peer evaluation. The results show that as the frequency of gender association increases, people's acceptance of male or female with this trait also increases. People's acceptance also rapidly reversed with the reversal of

association frequency, indicating that the change of association frequency between meaningless symbols and gender will significantly affect the acceptance; After using meaningful true words to reverse the frequency, the acceptability also changed in accordance with the frequency, but the range of change was significantly smaller than that of meaningless symbols; The basic attribute trait words of men and women played a key role, and with the reversal of trait association frequency, the acceptability would also change. These findings have important implications for uncovering the archetypal formation of gender nonconformity peer evaluations using model-based reinforcement learning simulations.

风度翩翩与朴实无华：科学领域中的外貌刻板印象及其可变性的心理机制

朱小燕[1] 刘雯萱[1] 于钊[1] 康艺馨[1] 张维[1]（通讯作者）
华南师范大学心理学院，广州，510631，psycheungwai@163.com

摘 要 面孔吸引力具有分类线索的功能并能产生相应的刻板印象，已有研究发现，人们会对那些看起来有能力、有道德且有吸引力的科学家的研究内容更加感兴趣。前人研究虽然探讨了面孔信息与科学传播的关系，但是没有解决面孔吸引力如何塑造大众对不同领域科学家的刻板印象的问题。基于此，本研究将通过6个行为实验，从面孔吸引力的角度对科学领域中存在的面孔刻板印象以及这一刻板印象背后的心理机制进行探究。研究一分别采用自由联想（实验1a）和主观猜测范式（实验1b）初步探讨人们对不同科学领域的科学家是否存在不同的外貌–科学刻板印象。结果发现，自由联想任务下，人们对社会科学家外貌特征的描述词偏向于高吸引力的外貌描述词,但这一效应在主观猜测任务中被削弱，结果提示外貌–科学刻板印象更可能存在于内隐层面。研究二采用经典内隐联想测验（IAT,实验2a）和单类内隐联想测验（SC-IAT，实验2b）检验上述效应，结果发现人们更自动化地将高吸引力面孔与社会科学家联结，将中等吸引力面孔与自然科学家联结。研究三进一步探讨外貌–科学刻板印象的心理机制。在句子迫选任务（实验3a）中，人们倾向于将中等吸引力面孔和与“人”相关程度较低的标题相配对、将高吸引力面孔和与“人”相关程度较高的标题配对，但是这种倾向只存在于自然科学领域中。但在更为内隐的句子生成任务（实验3b和3c）中，无论是在社会科学领域还是自然科学领域，更高吸引力的特征词和与“人”相关程度更高的研究内容，更容易出现在同一个句子中，即科学家研究内容的与“人”相关程度的高低能在内隐层面影响人们对科学家外貌的刻板印象。上述结果表明，人们对科学家存在一种自动化的外貌–科学刻板印象，这一刻板印象产生的心理机制与不同学科领域研究内容有关，且这一刻板印象具有可变性，会随着研究内容的变化而发生改变。
关键词 面孔吸引力，外貌–科学刻板印象，刻板印象可变性

Elegant and unpretentious: The psychological mechanisms of appearance stereotype and its changeability in science

Xiaoyan Zhu[1] Wenxuan Liu[1] Zhao Yu[1] Yixin Kang[1] WeiZhang[1]
School of Psychology, South China Normal University, Guangzhou, 510631,
psycheungwai@163.com

Abstract: Facial attractiveness has the function to trigger categorical cues and generate stereotypical impressions. Previous studies have found that people are more interested in the research of scientists who appear competent, ethical and attractive. However, there still remains an open issue that how facial attractiveness shapes the stereotypical impressions of scientists in different fields. This present study aims to investigate the face stereotype in different fields of science and the underlying psychological mechanisms through 6 experiments. Study 1 used free association (Experiment 1a) and subjective guessing paradigms (Experiment 1b) to explore whether people hold different appearance-scientific stereotype in different scientific domains. The results revealed that in the free association task, people tended to use attractiveness-related terms to describe social scientists, but this effect was weakened in the subjective guessing task, suggesting that the appearance-scientific stereotype might be more implicit. Study 2 employed the Implicit Association Test (IAT, Experiment 2a) and Single-Category Implicit Association Test (SC-IAT, Experiment 2b) to examine this stereotype. The results showed that participants

associated highly attractive faces with social scientists, and associated moderately attractive faces with natural scientists more easily. Study 3 further explored the psychological mechanisms underlying the appearance-scientific stereotype. In the sentence completion task (Experiment 3a), participants tended to combine highly attractive faces with titles were highly relevant to human only in the natural sciences. In the more implicit sentence generation tasks (Experiments 3b and 3c), we found high-attractive traits and research content with stronger "human" relevance were more likely to appear in the same sentence in both social and natural science domains. The results indicate that people have an implicit appearance-scientific stereotype of scientists, and the underlying mechanisms of this stereotype are related to specific disciplinary research content.

Keywords: facial attractiveness, appearance-scientific stereotype, the changeability of stereotype

环保宣传主体与时间维度

对亲环境态度和行为意愿的影响

吉楠楠[1]　曾好豪[1]　李尚仪[1]　刘佩佩[1]　张维[1]（通讯作者）

华南师范大学心理学院，广州，510631，psycheungwai@163.com

摘 要　生态问题的日益严重使得亲环境行为成为环境心理学的研究热点，已有研究发现，以图片海报的形式将生态环境问题进行可视化对个体的亲环境行为产生的影响存在不同的结果，这可能与不同人群的亲环境行为与环保动机不同、个体的自我参照类型不同、宣传内容及其形式等因素密切相关。基于此，本研究将通过 4 个实验探讨中国人的亲环境动机偏好及其在不同的环保宣传主体和时间维度上对人们亲环境态度和行为意愿的影响。实验 1 通过动机启动范式探讨中国人的亲环境动机类型。结果发现，在“以人为中心”的环保宣传组中，被试的亲环境态度和行为意愿显著高于“以生态为中心”的环保宣传组，说明中国人持有的亲环境动机主要是“以人为中心”的。实验 2 基于“以人为中心”的环保宣传海报，考察宣传海报对不同类型被试（有子女与无子女）的亲环境意识的影响。结果发现，已婚有子女被试在环保宣传海报强调对后代的负面影响时产生了明显的子女参照效应，从而引发了更为强烈的亲环境动机与行为意愿。实验 3 通过在传达不环保的负面影响（损失框架，实验 3a）和强调环保的积极影响（获益框架，实验 3b）的环保宣传文字材料中强调不同主语和环保问题出现的未来时间点，考察其是否会影响未婚无子女人群的亲环境意识。结果发现，对于未婚无子女人群，通过强调距离未来时间点远的环境问题与对自身的危害，或强调距离未来时间点近的环境问题与对后代的危害可以明显引发未婚无子女人群的亲环境动机与意愿，且这种效应在强调损失的框架下更为明显。基于研究结果，本研究提出在进行环保宣传和环境教育时，可以注意面对不同人群选取相应的环保宣传内容；此外，通过重点展示环境问题对人类社会的消极影响有助于提升人们的环保意识。

The impact of subject and time dimension on pro-environmental attitudes and behavioral willingness in environmental publicity

Nannan Ji, Haohao Zeng, Shangyi Li, Peipei Liu, Wei Zhang

School of Psychology, South China Normal University, Guangzhou, 510631

Abstract：　The increasingly serious ecological problems have made pro-environmental behavior a hot topic in environmental psychology researches. Previous studies have shown that visualizing environmental issues has different effects on the pro-environmental behavior, which may be closely related to a series of factors such as the pro-environmental behavior and environmental motivation of different population groups, different types of individual self-reference, and the content and form of publicity. Therefore, this present study aims to investigate the pro-environmental motivation of Chinese people, and the corresponding impact of different types of subject and temporal dimensions in the publicity for environmental protection on the attitudes and behavioral intentions

towards environment. Experiment 1 used the motivational priming paradigm to explore the types of pro-environmental motivation among Chinese people. The results found that the scores of pro-environmental attitudes and behavioral intentions were significantly higher in the “human centered” environmental publicity group than those in the “ecological centered” environmental publicity group. These results indicated that the pro-environmental motivation held by Chinese people is mainly based on “human centered”. Experiment 2 investigate whether different kinds of “human centered” environmental publicity poster can elicit different kinds of reference effects and affect the pro-environmental awareness of people with or without children. The results revealed that people with children showed a significant child-referencing effect when the environmental posters emphasized the negative impacts on future generations and led to stronger pro-environmental motivation and behavioral intention. Experiment 3 aimed to examine whether emphasizing different affected populations in different future time points in the environmental publicity texts conveying negative impacts of non-environmental protection (loss frame, Experiment 3a) and positive impacts of environmental protection (gain frame, Experiment 3b) would affect the pro-environmental awareness of people without children. The results revealed that for unmarried childless people, emphasizing environmental issues and their personal harm occurring at a distant future time point or the harm to future generations occurring at a near future time point significantly triggered pro-environmental motivation and intentions. Furthermore, this effect was more obvious in the loss frame. Taken together, this study proposes that we can select corresponding environmental promotion content for different groups of people. Additionally, highlighting the negative impacts of environmental issues on human society can help enhance people's environmental awareness.

Keywords **:** environmental publicity, publicity subject, time dimension, pro-environmental attitude, pro-environmental behavioral willingness

性别刻板印象提升人们对人工智能机器人的接受度

朱澄铨[1] 王琛瑀[1] 佐斌[1]（通讯作者）

1 中山大学心理学系，广州，510006，通讯作者 E-mail：zuobin@mail.sysu.edu.cn

摘 要 人工智能机器人正在融入人类社会，深入理解人们对人工智能机器人的看法有利于指导人工智能机器人的开发和利用。通常认为人工智能机器人具有一定的能动性，缺乏体验性。感知体验性的缺乏在一定程度上导致了人们对机器人的消极态度。本研究旨在探索性别刻板印象在其中的作用。研究一采取被试间设计，向参与者分别呈现男性、女性、无性别人工智能机器人，结果显示相比无性别人工智能机器人，男性人工智能机器人被评估为更有能力，女性人工智能机器人被评估为更热情，感知到的能力正向预测了人们对人工智能机器人的消极态度，而感知到的热情负向预测了人们对人工智能机器人的消极态度。研究二采取被试间设计，分别向参与者呈现承担与性别刻板印象一致和不一致工作的人工智能机器人（例，一致：客服女性机器人；不一致：程序员女性机器人），在刻板一致的条件下参与者更喜欢该类型的人工智能机器人，认为其更可靠并且表达了更高的使用意愿，在不一致的条件下参与者的消极态度更明显，使用意愿也较低。总体上，研究结果表明性别刻板印象适用于人机交互领域之中，人们以推定人类类似的方式对机器人做出推定，合适的性别角色设计有助于增加人们对于人工智能机器人的接受度。但是需要注意的是，这种类推有可能进一步加强人们的性别刻板印象。

Gender Stereotypes Promote Acceptance of Artificial Intelligence Robots

ZHU Chengquan, WANG Chenyu, ZUO Bin

Department of Psychology, Sun Yat-sen University, Guangzhou.

***Abstract*：** Artificially intelligent (AI) robots are increasingly integrating into human society, and understanding people's perceptions of AI robots is essential for guiding AI robots' development and utilization. People often perceive AI robots as lacking experientiality, despite having a certain degree of mobility. This perceived lack of experientiality contributes to negative attitudes toward robots. This study aimed to explore the role of gender stereotypes in shaping these perceptions. In Study 1, a between-subjects design was used, presenting participants with male, female, and genderless AI robots. The results showed that compared to genderless AI robots, male AI robots were assessed as more competent, while female AI robots were assessed as warmer. Perceived competence positively predicted negative attitudes toward AI robots, whereas perceived warmth negatively predicted negative attitudes toward AI robots. In Study 2, a between-subjects design was employed, presenting participants with AI robots assigned jobs that were either consistent or inconsistent with gender stereotypes (e.g., consistent: a female customer service robot; inconsistent: a female programmer robot). In the stereotype-consistent condition, participants preferred the AI robot, perceived it as more reliable, and expressed a higher willingness to use it. Conversely, in the inconsistent condition, participants' negative attitudes were more pronounced, and willingness to use was lower. In summary, the results suggest that gender stereotypes are applicable in the field of human-robot interaction, where people make assumptions about robots similar to those of

humans. Designing AI robots with appropriate gender roles can increase people's acceptance of them. However, it is crucial to acknowledge that this approach may further reinforce gender stereotypes in daily life.

Keywords: Gender Stereotype, Artificially Intelligence Robots, Competence, Warmth, Negative Attitudes

社会经济地位与经济不平等对自恋的双重作用

李橦 1 杜洪飞 2（通讯作者）
1 北京师范大学文理学院，珠海，519000
2 北京师范大学人文和社会科学高等研究院，珠海，519000，hongfeidu@bnu.edu.cn

摘要 等级计量理论(the hierometer theory)认为，自恋的功能是反映个体的社会地位。人们的社会地位越高，就越自恋。这一理论强调了个体的社会地位对自恋的影响，但是，忽略了环境因素对自恋的影响。本研究认为，自恋不仅仅由个体的社会经济地位所决定，并且受环境的经济不平等程度所决定。同时，基于能动型-共生型自恋模型，人们受不同动机驱动来满足自我提升需要，因而，自恋可区分为能动型自恋（通过提高自身竞争力）和共生型自恋（通过增强利他性）。本研究分别检验了社会经济地位和经济不平等对能动型自恋和共生型自恋的双重预测作用。为了回答这一问题，本研究使用美国的大样本居民数据,考察社会经济地位和经济不平等对自恋的双重预测作用。被试是来自美国 51 个州（包括华盛顿特区）的 46,745 名居民，报告了他们的能动型自恋和共生型自恋的水平。我们使用多层线性模型进行数据分析，探究个体层面变量——社会经济地位、州层面变量——经济不平等对两种自恋的双重预测作用。结果发现：针对能动型自恋而言：（1）社会经济地位越高，人们的自恋水平越高；（2）经济不平等程度越高，人们的自恋水平越高；（3）经济不平等与社会经济地位的交互效应不显著。针对共生型自恋而言：（1）社会经济地位越高，人们的共生型自恋水平更高；（2）经济不平等的主效应不显著；（3）经济不平等与社会经济地位的交互效应不显著。本研究部分支持了我们的假设，即对于能动型自恋而言，社会经济地位和经济不平等对自恋有双重预测作用。但是，我们没有发现经济不平等对共生型自恋的预测作用。未来研究可以采用实验方法，进一步探究社会经济地位和经济不平等对自恋的因果效应。

关键词 经济不平等，社会经济地位，能动型自恋，共生型自恋

Both High Inequality and High SES boost narcissism?

Tong Li[1], Du Hongfei[2]
1 Faculty of Arts and Sciences, Beijing Normal University, Zhuhai, China, 519000
2 Institute of Advanced Studies in Humanities and Social Sciences, Beijing Normal University, No.18 Jinfeng Road, Xiangzhou District, Zhuhai, China, 519000

Abstract: According to the hierometer theory, the function of narcissism is to reflect one's social status. People from higher social status are more narcissistic. This theory emphasizes the effect of social status at the individual-level on narcissism, but ignores the effect of social environmental variables on narcissism. This study suggests that narcissism is not only determined by an individual's socioeconomic status, but also by economic inequality in the social environment. Meanwhile, agentic-communal narcissism model suggests that narcissism can be separated into two subtypes: agentic narcissism (self-enhance in the agentic domain) and communal narcissism (self-enhance in the communal domain). This study examined the predictive effects of socioeconomic status and economic inequality on agentic and communal narcissism respectively, utilizing a large samples of residents in the United States. The participants, 46,745 residents from 51 U.S. states (including Washington, D.C.), have reported their agentic and communal narcissism. We used a hierarchical linear model to explore the dual predictive effect of socioeconomic status at individual-level and economic inequality at state-level on the two subtypes of narcissism. The results showed that, in terms of agentic narcissism: (1) high SES people showed more agentic narcissistic tendency; (2) high economic inequality enhances agentic narcissism; (3) the interaction effect of economic inequality and socioeconomic status is not significant. And in terms of communal narcissism: (1) high SES people

showed more communal narcissism; (2) the main effect of economic inequality is not significant; (3) the interaction effect of economic inequality and socioeconomic status is not significant. This study partially supports our hypothesis that for the agentic aspect, both socioeconomic status and economic inequality are predictors of narcissism. However, we found no effect of economic inequality on communal narcissism. Future studies are expected to use experimental methods to further explore the causal effects of socioeconomic status and economic inequality on narcissism.

Keywords: economic inequality, socioeconomic status, agentic narcissism, communal narcissism

帮助者对受助意愿的预测偏差及其机制研究

谈欣[1] 赵佳慧[1] 陈迪[1] 王璇[1] 刘玉昕[1] 王士祺[1] 赵珂冰[1] 陈文惠[1] 周洁仪[1] 许筑媛[1] 吴明证[1]（通讯作者）

通讯作者 E-mail：psywu@zju.edu.cn

摘 要 在帮助行为中，帮助者会对受助者寻求帮助的意图、动机，以及受助者获得帮助后对其感激程度等出现预测偏差(prediction bias)。出现这一偏差的可能原因在于帮助者的自我中心思维，以及帮助者和受助者在信息可及性方面的差异。本研究聚焦于受助者接受主动帮助的意愿（即“受助意愿”），探讨帮助者认为受助者愿意接受自己主动帮助的程度，与受助者实际感知到的意愿程度是否相符，即帮助者对受助意愿的预测是否出现偏差，并根据我国文化背景下的人情与面子模型，对帮助者预测偏差的限定条件及作用机制进行探讨。为此，本研究共开展了四项研究：

研究一以受助者接受主动帮助的意愿，主动帮助对帮助者的印象评价以及对双方人际关系的影响为出发点，探究帮助者是否存在对受助者接受主动帮助意愿的预测偏差。结果发现，相比受助者，帮助者会低估受助者接受主动帮助的意愿，低估主动帮助对自己的印象评价以及双方人际关系的积极影响。

研究二在研究一发现的基础上探讨旁观者作为潜在帮助者是否存在对受助意愿的预测偏差。结果发现，旁观者同样会低估受助者接受主动帮助的意愿,验证了研究一的发现。

研究三包含 2 项研究，探讨关系类型对帮助者预测偏差的影响。结果发现，帮助者的预测偏差主要存在于双方关系一般的条件下，当帮助者和受助者双方关系一般时，帮助者会低估受助者接受主动帮助的意愿，以及受助者对于接受主动帮助的积极情绪反应。

研究四进一步探究帮助者对受助意愿的预测偏差背后的作用机制。研究发现，面子顾虑-受助不适感在其中起到链式中介作用，帮助者会高估主动帮助对于受助者的面子影响，高估由此给受助者带来的不适感，进而低估受助者接受主动帮助的意愿。

综上所述，本研究验证并探究了帮助者存在对受助意愿的预测偏差，这一预测偏差存在跨情境和跨角色的稳定性，且通常发生于双方彼此不熟悉，关系一般的情况下，面子顾虑-受助不适感在这一现象中起到链式中介作用。

Helper’s prediction bias on recipient’s willingness to accept proactive helping and its mechanism

Xin Tan[1] Jiahui Zhao[1] Di Chen[1] Xuan Wang[1] Yuxin Liu[1] Shiqi Wang[1] Kebing Zhao[1] Wenhui Chen[1] Jieyi Zhou[1] Zhuyuan Xu[1] Mingzheng Wu[1]

1 Department of psychology and behavioural sciences, Zhejiang University

***Abstract*：** In helping behavior, the helper may have a prediction bias about the recipient's intention and motivation to seek help, and the recipient's appreciation for the help. The possible reasons for this bias are the egocentric thinking of the helper and the difference in information accessibility between the helper and the

recipient. This study focuses on recipients' willingness to accept unsolicited help, and examines whether the extent to which helpers perceive recipients to be willing to accept their unsolicited help matches the extent to which recipients actually perceive their own willingness, which means whether there exists helper's prediction bias on recipient's willingness to accept proactive helping. The study also explored the constraints and mechanisms underlying the bias by using the Favor and Face model in Chinese culture. To this end, four studies were conducted in this study:

Study 1 explored whether this phenomenon exists that helper have prediction bias about recipients' willingness to accept proactive help. The recipient's willingness to accept proactive help, the impression evaluation of the helper and the effect on the interpersonal relationship between the two parties were used as dependent variables. The results found that helpers underestimated recipients' willingness to accept proactive help, the positive impact of proactive help on their impression, and the positive impact on their interpersonal relationship.

Study 2 used school contexts to test the stability of the phenomenon across contexts, and potential helpers (bystanders) to test the stability of the phenomenon across roles. The dependent variable was the same as in Study 1. The results validated the findings of Study 1 that bystanders similarly underestimate recipients' willingness to accept proactive help. The findings of Study 1 were validated.

Study 3 consisted of two studies that explored the variation in the findings of Study 1 and Study 2 across relationship types, using recipients' willingness to help and recipients' emotion to help as dependent variables, respectively. Result shows that the helper's prediction bias was mainly found in the condition of acquaintance relationship. That means, the helper underestimated the recipient's willingness to accept proactive help and the recipient's positive emotional response to accepting proactive help when the relationship between the helper and the recipient was acquaintance.

Study 4 further investigated the underlying mechanisms behind the bias in helpers' predictions of willingness to help. It was found that the face concern and recipient discomfort mediate this, with helpers overestimating the face impact of proactive help on recipients, overestimating the resulting discomfort, and thus underestimating recipients' willingness to accept proactive help.

In summary, this study verified and explored the existence of a prediction bias in helper predict the recipient's willingness to help, which is stable across contexts and roles and usually occurs when the parties are unfamiliar with each other and the relationship is acquaintance, with the face concern and recipient discomfort acting as a mediator in this chain.

对话中的回忆视角对集体记忆的作用

郭倩琳[1]　管健[2]

1 广东警官学院公共管理系, 广州 510230

2 南开大学周恩来政府管理学院社会心理学系, 天津 300350

摘 要　通过记忆对话恢复集体记忆信息，是人们试图复刻事件最初画面的重要方式之一。记忆对话过程又总是伴随着不同的回忆视角，人们对集体记忆信息的恢复是否受到不同记忆视角的作用？本研究设计 3 个实验考察这一问题，其中实验 1 采用 2(激活视角: 第一人称视角 vs 第三人称视角)×2(时间: 前测 vs 后测)两因素混合实验设计，探讨在记忆对话中激活视角互斥框架对集体记忆的作用；实验 2 采用 2(激活视角占比: 第一人称视角 vs 第三人称视角 = 1/3 vs 2/3)×2(时间: 前测 vs 后测)两因素混合实验设计，探讨视角互补框架对集体记忆的作用；实验 3 采用 2(激活视角顺序: 先一后三 vs 先三后一)×2(时间: 前测 vs 后测)两因素混合实验设计，探讨视角转换顺序对集体记忆的作用。结果显示：视角互斥框架下，第一人称视角回忆会减少参与者之间集体记忆的共同记住项目，第三人称视角回忆会增加参与者之间集体记忆的共同记住项目数；视角互补框架下，第一人称视角占比较多会减少参与者之间集体记忆共同记住的项目；且先采用第一人称视角可使参与者之间集体记忆共同记住项目数减少，但首先激活第三人称视角不会产生这一现象。鼓励个体在记忆对话中采用相应的回忆视角框架，有助于恢复记忆对话中更多的集体记忆信息。

Effects of memory perspective in memory conversation on collective memory

GUO Qianlin[1], GUAN Jian[2]

1 Department of Public Administration, Guangdong Police College, Guangzhou 510230, China

2 Zhou Enlai School of Government, Nankai University, Tianjin 300350, China

Abstract：The reconstruction of collective memory information through memory conversation is one of the important ways that people try to recreate the original picture of an event. The process of memory conversation is always accompanied by different memory perspectives. Is the recovery of collective memory information influenced by different memory perspectives? This study examined the effect of memory perspective on collective memory in memory conversations, including three experiments. In Experiment 1, the effect of perspective mutual exclusion framework activation in memory conversations on collective memory was discussed. Experiment 2 investigated the effect of complementary framing on collective memory in memory conversations. Finally, Experiment 3 explored the effect of perspective switching sequence of collective memory in memory conversations. Combining with the results of three experiments, the conclusion was made as follows: (1) When the mutual exclusion frame of perspective was activated, the first-person perspective would reduce the number of items remembered in common between participants, while the third-person perspective would increase the number of items remembered in common between the participant. (2) When the complementary frame of perspectives was activated, A higher proportion of the first-person perspective would reduce the number of items remembered in common by participants. In addition, using the first-person perspective first can make the number of items remembered in common by participants be reduced. Encouraging individuals to adopt the corresponding memory perspective frame in the memory conversation is helpful to recover more collective memory information.

如何维护好人与公序良俗？

——5-6 岁幼儿灵活调整对失范受助者的宽恕与情感

莫秀锋（通讯作者）

广西师范大学教育学部，桂林，541004，E-mail:moxiufeng76@126.com

摘 要　公正与友善是社会主义核心价值观的重要组成部分，乐于助人与知恩图报是中华民族的传统美德，也分别是传递友善和维护社会公序良俗、引人向善的道德规范。学前期是幼儿道德感发展、积极人格特质养成和亲社会行为培养的重要阶段。不过，当受助者有违知恩图报这一道德规范时，幼儿会如何维护好人与公序良俗，尚未可知。实验一考察 5-6 岁幼儿如何对待失范的受助者。采用单因素设计，自变量为特定助人情境故事，因变量为幼儿的宽恕、人际喜爱及信任，共 44 位幼儿参与研究。结果表明：绝大多数 5-6 岁幼儿不原谅、不喜欢、不信任失范的受助者。实验二考察 5-6 岁幼儿是否会基于失范受助者后续的态度，来调整自己对其的态度。采用单因素六水平被试间设计，包括失范受助者道歉并补偿故事、默默补偿故事、道歉故事、沉默无为故事、不知道自己做错故事、知错未改正故事六个水平，因变量为幼儿的宽恕、人际喜爱及信任，共 180 位幼儿参与研究，每组各 30 人。先叙述六种故事之一，然后测查幼儿对故事人物角色的宽恕、人际喜爱及信任。结果表明：听了失范受助者道歉并补偿故事或者默默补偿故事、道歉故事之后，大多数幼儿不仅宽恕而且喜欢、信任故事中先前失范、随后知错就改的受助者，与此形成鲜明对比的是，其他三个故事组的绝大多数幼儿不原谅、不喜爱、不信任相应故事中的这些失范受助者。两个实验综合表明：5-6 岁幼儿能够灵活调整对失范受助者的宽恕与情感，以维护好人与公序良俗。

How to maintain good people and public order and good morals?

—5-6 year olds flexibly adjust their forgiveness and emotions toward the misbehaving recipients

Mo Xiufeng

Faculty of Education, Guangxi Normal University, Guilin 541004, China

Abstract：Justice and friendliness are important components of the socialist core values. Being ready to help others and showing gratitude are the traditional virtues of the Chinese nation. They are also the moral norms of transmitting kindness, maintaining social public order with good customs, and attracting kindness. Preschool is an important stage in the development of children's sense of morality, positive personality traits, and prosocial behaviors. However, it is not yet known how preschool children will defend good people and public order and good morals when the recipients violate gratitude and morals. Experiment 1 examined how 5- to 6-year-old children treat recipients who misbehave. A one-way design was adopted, with the independent variable being a specific helping situation story and the dependent variables being children's forgiveness, interpersonal preference,

and trust, and a total of 44 children participated in the study. The results indicated that most 5-6 year olds did not forgive, like, or trust recipients who misbehaved. Experiment 2 examined whether 5-6-year-olds would adjust their attitudes toward the misbehaving recipients based on their subsequent attitudes. A one-factor, six-level between-subjects design was adopted, including six stories such as misbehaving recipients apology with compensation, apology, silent compensation, silence with inaction, unawareness of the misbehavior, awareness of the misbehavior but unwillingness to correct. The dependent variables were children's forgiveness, interpersonal preference and trust about the misbehaving recipients. Children listened to one of six stories and then were measured on forgiveness, interpersonal preference and trust about the characters in the corresponding story. The two experiments combined showed that 5-6-year-olds are able to flexibly adjust their forgiveness and emotions toward the misbehaving recipients in order to preserve good people and public order and good morals.

***Keywords*:** public order and good morals, the misbehaving recipients, forgiveness, interpersonal preference, interpersonal trust

与个人目标冲突的内群体规范对亲群体倾向的影响

王阳[1] 李凌智[1] 温芳芳[1] 佐斌[2]（通讯作者）
1 华中师范大学心理学院，武汉，430079
2 中山大学心理学系，广州，510006，zuobin@mail.sysu.edu.cn

摘 要 自我和群体的关系是社会生活中经久不衰的主题。一方面，人们存在着归属的本质需要，受群体规范影响；另一方面，人们又存在着自主需要。然而，以往群体规范领域的研究更关注群体属性对个体行为的直接影响，较少讨论在个体存在个人目标的前提下群体规范的作用及其在行为决策之外的影响。为了解决上述问题，本研究综合考虑了群体规范与个人目标两方面因素，构建了二者冲突或一致的情境，以探究自主与合群二者重要性的问题，同时也关注了自我概念清晰性的调节以及认知（群体认同）和情绪（焦虑）因素的中介作用。预实验针对当前实验内容改编了以往研究的实验情境，发现在内群规范与个人目标冲突条件下，人们会受到群体规范影响而做出目标冲突行为。正式实验在预实验基础上将实验情境限定在饮食健康方面，实验 1 共招募 128 名有效被试，随机分入群体规范与个人目标冲突组或一致组，关注两组被试及其自我概念清晰性对行为决策及亲群体行为的影响。结果发现，在行为决策上冲突组相比一致组做出目标冲突行为的比例更高，此外，冲突组中被试的自我概念清晰性越高越倾向于做出目标一致行为。在亲群体倾向上，实验发现一致组被试的亲群体倾向显著高于冲突组，同时自我概念清晰性正向预测了被试的亲群体倾向。实验 2(n = 127)则在实验 1 基础上加入了焦虑情绪和群体认同的中介因素的测量。实验结果在印证实验 1 的基础上发现了焦虑情绪而非群体认同的部分中介作用，同时，自我概念清晰性调节了实验条件对焦虑情绪的影响，对于自我概念清晰性更低的被试，冲突情境引发了更高水平的焦虑，进而降低了被试的亲群体倾向。本研究验证了即使当存在个人目标的前提下，群体规范也会影响到成员行为，这种影响尽管会让被试服从于群体规范，但却会对群体内关系带来消极影响。未来研究有必要进一步探索该情境下个体在面临自主与合群冲突下的内部心理加工机制，以更好地深化对人的社会本质的理解。

关键词 个人目标，群体规范，亲社会倾向，焦虑，群体认同

The impact of in-group norms that conflict with personal goals on pro-group tendencies

WANG Yang[1] LI Lingzhi[1] WEN Fangfang[1] ZUO Bin[2]
1 Central China Normal University, School of Psychology, Wuhan, 430079
2 Department of Psychology, Sun Yat-sen University, 510006, zuobin@mail.sysu.edu.cn

Abstract: The interplay between self and group is an enduring topic in social life. On the one hand, people have a natural need for belonging and are influenced by group norms; on the other hand, people also have a need for autonomy. However, previous research on group norms has focused more on the direct impact of group attributes on individual behavior, and less on the role of group norms when individuals have personal goals, and their impact beyond decision-making. To address these issues, this study integrated both group norms and personal goals, and constructed scenarios where they conflicted or consistent, to explore the importance of autonomy versus conformity, as well as the moderation of self-concept clarity and the mediation of cognitive (group identification) and emotional (anxiety) factors. The pilot experiment adapted the scenarios from previous studies, and found that under the condition of in-group norm and personal goal conflict, people would be influenced by group norms and make goal-conflicting behaviors. The formal experiment limited the experimental scenarios to dietary health based

on the pilot experiment. Experiment 1 recruited 128 participants, randomly assigned to the group norm and personal goal conflict group or consistent group, and focused on the impact of the two groups of participants and their self-concept clarity on decision-making and pro-group behavior. The results showed that in decision-making, the conflict group presented a higher proportion of goal-conflicting behaviors than the consistent group. In addition, the higher the self-concept clarity of the participants in the conflict group, the more likely they were to make goal-consistent behaviors. In terms of pro-group tendencies, the experiment found that the pro-group tendencies of the participants in the consistent group were significantly higher than those in the conflict group, and self-concept clarity positively predicted the participants' pro-group tendencies. Experiment 2 (n = 127) added the measurement of anxiety emotion and group identification as mediating factors based on Experiment 1. The results confirmed the results of Experiment 1 and found a partial mediation effect of anxiety rather than group identification. At the same time, self-concept clarity moderated the effect of experimental condition on anxiety. For participants with lower self-concept clarity, conflict situation triggered a higher level of anxiety, which in turn reduced their pro-group tendencies. This study verified that even when there are personal goals, group norms still affect member behavior. This influence, although it makes participants conform to group norms, has a negative impact on intra-group relations. Future research needs to further explore the internal psychological processing mechanism of individuals facing autonomy versus conformity conflicts in this situation, in order to deepen the understanding of human social nature.

Keywords：personal goal, group norm, pro-group tendencies, anxiety, group identification

紧密=机器，松散=动物:文化的紧密-松散对非人性化的影响

摘 要 人们如何看待来自不同文化背景的其他人?为探究这一问题，我们考察了个体如何感知来自松紧文化的目标。松紧文化是指一个国家或者地区的文化中，强(与弱)的社会规范和对偏差行为的低(高)容忍度。三项研究(N = 614)，分别来自中国(研究 1)和美国(研究 2-3)的不同样本，证实了我们的假设，即生活在紧密文化中的人被认为像机器一样，而生活在松散文化中的人被认为像动物一样。更重要的是，被试感知到目标的自我控制中介了文化松紧度对不同形式的非人性化感知的影响(研究 3)。我们的研究结果表明，人们的文化背景会影响我们对他们的感知。我们还讨论了理论贡献和局限性。

***Abstract*:** How do people perceive others from different cultures? We addressed this question by testing people's perception of the targets living in a tight (vs. loose) culture, which refers to strong (vs. weak) social norms and a low (high) tolerance of deviant behavior. In three studies (N = 614), with different samples from China (Study 1) and the U.S. (Studies 2-3), we confirmed our hypotheses that people living in a tight culture are perceived as machine-like, whereas people living in a loose culture are perceived as animal-like. More importantly, the perceived self-control of the targets mediated the effect of cultural tightness-looseness on different forms of dehumanized perception (Study 3). Our findings suggest that people's cultural backgrounds can influence our perception of them. We also discussed theoretical contributions and limitations.

收入不平等的主观感知与睡眠的关系及其心理机制

刘雯萱[1]　杜洪飞[2]（通讯作者）
1 北京师范大学心理学系，珠海，519000
2 北京师范大学人文和社会科学高等研究院，珠海，519000，hongfeidu@bnu.edu.cn

摘 要　收入不平等与个体的心理与生理健康密切相关。我们认为，收入不平等较高的条件下，个体的心理健康可能受到消极影响，进而对睡眠产生负面效应。通过两项研究，本文探讨人们对收入不平等的主观感知是否影响睡眠，及其社会比较和压力作为这一关系中的内在心理机制。

研究 1 探究个体对收入不平等的主观感知，是否预测他们六年后的睡眠时间。研究 1 使用来自中国 25 个省份的纵向调查数据，研究对象是各省代表性居民样本（$N = 28590$）。结果发现，感知收入不平等显著地负向预测了个体六年后的睡眠时长。即使在控制了个体六年前的睡眠时长以及其他人口学变量，这一纵向效应仍然显著。也就是说，人们在日常生活中感知到较高的收入差距，他们的睡眠时间将无法得到保障。

研究 2 旨在进一步探究收入不平等感知和睡眠两者之间的内在心理机制。研究 2 使用了中国某市的横向调查数据，研究对象是本市社区居民（$N = 1009$）。该研究选取了三个睡眠指标：睡眠质量、睡眠满意度和睡眠功效，并分别检验了社会比较和压力在感知收入不平等与睡眠关系中的中介作用。结果发现，与研究 1 结果一致，感知收入不平等显著地负向预测了睡眠质量、睡眠满意度和睡眠功效。同时，在加入中介变量社会比较后，感知收入不平等对睡眠质量和睡眠功效的负向预测作用降低；而在加入中介变量压力后，感知收入不平等对睡眠三个指标的负向预测作用均降低。研究 2 的结果说明，感知收入不平等会影响对个体的睡眠，这重复验证了研究 1 的结果。此外，研究 2 揭示了社会比较与压力作为感知收入不平等预测睡眠的内在心理机制。

综上所述，本研究表明，人们对收入不平等的主观感知，对睡眠产生持久的不利影响。社会比较和压力解释了不平等感知对睡眠的负向效应。我们认为，推动共同富裕的政策，将有利于消除人们的不平等感知，进而能够提升人们的心理与生理健康水平，为健康中国战略奠定坚实的基础。

Subjective Income Inequality and Sleep: An Examination of Psychological Mechanisms

Wenxuan Liu, Hongfei Du (corresponding author)
Beijing Normal University at ZhuHai, No.18 Jinfeng Road, Tangjiawan, Xiangzhou District, Zhuhai City, Guangdong Province, P.R.China

Abstract: Income inequality is closely related to individuals' psychological and physical health. We argue that higher income inequality can negatively affect individuals' psychological health, which in turn has a negative effect on sleep. Through two studies, the present study explores whether individuals' subjective income inequality affect sleep, and whether social comparison and stress mediate this relationship.

Study 1 used longitudinal survey data from 25 Chinese provinces with a representative sample of residents from each province (N = 28,590) to explore whether individuals' subjective perception of income inequality predicted their sleep duration six years later. Study 1 found that subjective income inequality was associated with

less individuals' sleep duration six years later, even after controlling for individuals' sleep duration six years earlier and other demographic variables.

Study 2 used cross-sectional survey data from a Chinese city with community residents (N = 1,009) to further explore the psychological mechanisms underlying the relationship between subjective economic inequality and sleep. The study selected three sleep indicators: sleep quality, sleep satisfaction, and sleep efficacy, and examined the mediating roles of social comparison and stress in the relationship between subjective economic inequality and sleep. In line with the findings of Study 1, Study 2 found that subjective income inequality was associated withe less all three indicators of sleep. Additionally, social comparison and stress were identified as intrinsic psychological mechanisms that mediate the negative effect of perceived income inequality on sleep. Specifically, social comparison mediated the negative effect of subjective income inequality on sleep quality and sleep efficacy, while stress mediated the negative effect on all three indicators of sleep.

In summary, our findings suggest that individuals' subjective income inequality have a lasting adverse effect on sleep, and that social comparison and stress explain this negative effect. The findings highlight the importance of promoting common prosperity as a policy to eliminate individuals' perception of inequality, which can enhance individuals' psychological and physiological health and lay a solid foundation for the Healthy China strategy.

不同风险情境下社会规范对陌生人信任的影响:基于规范焦点理论的视角

郭新生[1]　张佳静[2]　赵小军[1]（通讯作者）

1 河北大学教育学院，保定，071000　2 河北大学教育学院，保定，071000

3 河北大学教育学院，保定，071000，psy790821@aliyun.com

摘 要　陌生人信任不但有助于人际交往，而且能够为发展长期的信任关系奠定基础，但是陌生人互动面临更多的未知性、不确定性等风险因素，导致陌生人信任很难产生，因此关于陌生人初始信任的研究具有重要意义。规范焦点理论将社会规范影响个体行为的方式分为两类：描述性与命令性社会规范，不同社会规范对陌生人信任的影响可能存在差异。本研究采用两个实验深入探讨社会规范与风险因素共同影响陌生人信任的方式及内部机制。实验一招募 76 名大学生采用 2（描述性规范：高、低）×2（命令性规范：高、低）被试间实验设计，探讨不同社会规范对陌生人信任的作用，结果显示社会规范可以显著影响陌生人信任，当两种规范导向一致时对陌生人信任的影响最大，当两种规范发生冲突时，命令性社会规范对陌生人信任的影响作用更大，但是实验结果未发现两种社会规范对陌生人信任的交互作用；实验二招募 84 名大学生采用 3（社会规范：命令性规范、无规范、描述性规范）×2（风险情境：高、低）混合实验设计，探讨风险因素在社会规范影响陌生人信任中的作用，结果显示即使在高风险情境下、命令性社会规范仍可以显著影响陌生人间的信任决策，其中命令性社会规范通过风险感知的间接作用影响陌生人信任，命令性社会引发个体更强的人际导向的社会目标，减少个人利益目标的考虑，从而忽略情境中的风险，做出群体期望的信任行为，即当得知信任行为是值得鼓励和提倡的时候，人们会为赢得社会的赞赏而忽略情境中的风险，采取更多的信任行为。本研究在社会规范与风险因素双重系统下探讨陌生人初始信任，为进一步揭示陌生人信任的影响因素，提升陌生人际信任水平提供一定的理论启示与实证证据。

The Impact of Social Norms on Stranger Trust in Different Risk Situations: From the Perspective of Normative Focus Theory

Guo Xinsheng[1] Zhang Jiajing[2] Zhao Xiaojun[1]
School of Education HeBei University，BaoDing

***Abstract*：** Stranger trust not only helps interpersonal interactions, but also can provide a foundation for developing long-term trusting relationships. However, interactions with strangers face more risk factors such as unknowns and uncertainties, making it difficult to trust strangers. Therefore, it is significant to study initial stranger trust. The Focus Theory of Normative Conduct classifies the ways in which social norms influence individual behavior into injunctive norms and descriptive norms. The impact of the two different social norms on stranger trust may differ. The present research adopts two experiments to explore the ways in which norms and risk factors jointly influence stranger trust and the internal mechanisms in depth. Experiment 1 recruited 76 college students using a 2 (descriptive norms: high, low) × 2 (injunctive norms: high, low) between-subjects experimental design to explore the role of different social norms on stranger trust. The results showed that social norms can significantly influence stranger trust . The greatest effect on stranger trust was found when the two normative orientations were aligned . And the effect of imperative social norms on stranger trust was greater when the two norms were in conflict. However, the experimental results did not find an interactive effect of the two social norms on stranger trust. Experiment 2 recruited 84 college students using a 3 (social norms: imperative norms, no norms, descriptive social norms) × 2 (risky situations: high, low) mixed experimental design to explore the role of risk factors in the influence of social norms on stranger trust. The results showed that social norms can significantly influence trust decisions between strangers even in high-risk situations . In particular, imperative social norms influence stranger trust through the partial mediation of risk perception . The injunctive society may trigger stronger inter-personally oriented social goals in individuals and reduce the consideration of personal interest goals, thus allowing them to ignore the risks in the situation and engage in the trusting behavior expected by the group. When people learn that trust behavior is worth encouraging and promoting, we will ignore the risks in the situation and adopt more trust behaviors in order to win the appreciation of society. Based on a dual system of social conduct norms and risk factors, the present research provides some theoretical insights and empirical evidence for enhancing individual interpersonal stranger trust by exploring the factors influencing stranger initial trust.

社会规范与 COVID-19 健康行为:群体因素的纵向调查

周昊辰[1]（通讯作者） Diana Cárdenas[2] Katherine J. Reynolds[1,3]
1 澳大利亚国立大学，心理学研究院，堪培拉，澳大利亚，E-mail: haochen.zhou@anu.edu.au
2 蒙特利尔大学，心理学系，蒙特利尔，加拿大
3 墨尔本大学，教育研究生院，墨尔本，澳大利亚

摘 要 大多数关于社会规范和 COVID-19 的研究都忽视了社会规范的群体性和动态性，其中自我相关的显著群体会在不同的情况下出现和变化，从而导致它们对健康行为的影响也会随之变化。许多关于社会规范的文献综述强调，规范的来源(即，许多可能产生规范的群体)决定了它们的影响。内群体规范(相对于一般的“社会”规范)与自我更相关且对其群体成员更加重要(Reynolds et al., 2015)。因此，规范的来源对规范的影响是否成功至关重要。此外，规范在历史上被描绘成在社交环境或社会中相对固定；共同的历史和经历造就了“我们”。同样，对个人重要的“他人”也被认为是一个相当静态的社会网络的一部分。最近，有一些新兴的讨论认为，基于人们对他人的某些行为的参与，他们对规范的感知会不断更新(Prentice & Paluck, 2020)。也就是说，规范对行为的影响是动态的，可以随时间而变化(Prentice & Paluck, 2020)。这意味着，要理解规范性的影响，就必须理解这种可能的流动性(以及可能的稳定性)，并采用更多的纵向研究方法。

当前的研究试图通过三个时间点的纵向实验设计来探索这些问题。我们采用了一个澳大利亚代表性样本(N wave 1 = 3024)，分别在 2020 年 5 月、6 月/ 7 月和 9 月/ 10 月针对两个群体(社区和国家群体)调查了规范对两种 COVID-19 健康行为(保持身体距离和手卫生)的潜在影响。结果表明，在控制人口学变量和个体水平的健康变量的情况下，社区描述性规范(而不是国家或禁令性规范)对健康行为的影响最大，特别是从第一波时间点到第二波时间点。这表明影响行为的群体和相关规范随着时间的推移而变化。由此得出结论，对于社会规范的研究需要去探索哪些群体在何时会起到影响。

Norms and COVID-19 Health Behaviours: A Longitudinal Investigation of Group Factors

Haochen Zhou[1](corresponding author) Diana Cárdenas[2] Katherine J. Reynolds[1,3]
1 Research School of Psychology, Australian National University, Canberra, Australia
2 Department of Psychology, University of Montreal, Montreal, Canada

Abstract： Most studies on norms and COVID-19 have ignored the group-based and dynamic nature of normative influence where self-relevant and salient groups might emerge and change along with their impact on health behaviours. Many reviews of social norm literature highlight that the source of the norm (i.e., from which of many possible groups the norms emerge) determines their influence. An ingroup norm (versus a generic ‘social’ norm) is tied to a group that is self-relevant and salient for its constituents (Reynolds et al., 2015). The source of

the norm, then, is critical to the success of normative influence. Moreover, norms have been historically portrayed as being relatively fixed in the social milieu or society; a product of shared history and experiences that shapes who 'we' are. Likewise, the 'others' that are important to the individual have been assumed to be part of a reasonably static social network. More recently, there are emerging discussions that norm perception is constantly being updated based on people engaging in certain behaviours over others (Prentice & Paluck, 2020). That is, normative influence on behaviours is dynamic and can change in time (Prentice & Paluck, 2020). This means that to understand normative influence it is essential to understand this possible fluidity (as well as possible stability) and to enlist more longitudinal methods.

The current research seeks to explore these issues using a three-wave longitudinal design with a representative sample of Australians (N wave 1 = 3024) where two group sources of potential normative influence (neighbourhood and national groups) and two COVID-19 health behaviours (physical distancing and hand hygiene) were investigated in May, June/July and September/October 2020. Results indicated that especially from Wave 1 to Wave 2 neighbourhood descriptive norms (rather than national or injunctive norms) had the most impact on health behaviours while controlling for demographic and individual-level health variables. This demonstrates that groups and associated norms that influence behaviours vary across time. It is concluded that research on norms needs to study which groups matter and when.

人工(不)智能：创造力低估是导致 AI 绘画审美偏见的主要因素

李婉悦[1]　何先友[1]（通讯作者）

[1]华南师范大学心理学院，广州，510631

摘 要　算法的革新使 AI 生成器能够大量创作音乐、绘画和诗歌等各种各样的艺术产品，但是公众对于 AI 艺术品仍然心怀疑虑。近年来研究显示，被宣称为 AI 创作者的艺术品会诱发偏负性的态度，例如更低的审美愉悦和购买意愿。然而，AI 和人类创作的艺术品是否真的存在差异，以及个体在审美评价中对 AI 创作者身份偏见的成因及其心理机制目前仍不清楚。本研究通过三个实验探讨了个体对于 AI 绘画、电子绘画和手工绘画审美评价的差异，以及创造力和努力评价在其中的影响。实验一在创作者身份已知和未知条件下测量了个体对 AI 绘画、电子绘画和手工绘画的美感、创造力和努力程度评分，发现创作者身份信息显著改变了个体对绘画作品的评价。在身份信息未知的条件下， AI 绘画的审美评价显著高于手工绘画。而在身份信息已知的条件下，AI 绘画的创造力和努力评分显著降低，其中创造力评分是影响审美评价的主要因素。实验二采用了迫选任务，要求被试首先对画作进行创作者身份的选择，然后进行一系列审美评价。实验二进一步验证了 AI 创作者偏见的心理机制，发现 AI 画作的创造力低估导致了个体对 AI 绘画作品的审美偏见。实验三探讨了 AI 创作经验在其中的影响，发现参与 AI 绘画的创作体验并不能缓解这种偏见，反而改变了个体的评价策略，使其更加在意创作者身份，更倾向于将人类创作的画作判断为由 AI 创作。总之，本研究探讨了个体在审美评价中对 AI 创作者的身份偏见及其内在机制，发现创造力低估是影响 AI 绘画审美评价的主要因素。这有利于阐明当人机交互被应用于艺术创作领域所导致的算法厌恶的成因，也为未来 AI 艺术的规范化发展提供了建议。

Artificial (non)intelligence: The main factor of aesthetic bias in AI painting hides in the undervaluation of its creativity

Wanyue Li[a]　Xianyou He[a]

[a] School of Psychology, South China Normal University, Guangzhou, People's Republic of China

Abstract： The innovation of algorithms has enabled AI generators to create a wide variety of artistic products such as music, paintings, and poetry in large quantities, but people are still skeptical about AI artwork. Recent studies have found that people tend to under evaluate the artworks labeled as created by AI, but what causes this bias is still unclear. Through three experiments, we investigated the creator identity bias in the aesthetic evaluation of AI, digital, and handmade paintings, and the role of creativity and effort ratings in the influence of creator identity on the beauty ratings. Experiment 1 compared aesthetic evaluations of different painting types in conditions of with and without identity priming, and found that creator identity information significantly changed individuals' evaluations of paintings, with creativity ratings being the main factor contributing to the change in beauty ratings. Experiment 2 used the forced choice paradigm to further validate the results of Experiment 1 and found that individuals exhibited a negative bias towards AI painting due to their undervaluation of AI's creativity. Experiment 3 required participants to experience the AI painting creation and found that this experience could not

alleviate this bias, but rather made participants more concerned about the creator identity. These findings contribute to the understanding of the internal causes of creator identity bias in AI artworks and provide suggestions for the future normative development of AI art.

浪漫关系减弱了恋人竞争：来自人际关系神经同步的证据

贾淑钰 [1]　孟雨佳 [1]　刘映杰 [1]

1 华北理工大学，河北，唐山，063210

华北理工大学，河北，唐山，063210，psyliuyingjie@163.com

摘 要　以往的研究表明，当恋人之间进行合作互动时，他们的脑间活动会更加同步。类似地，竞争也是社会交互中不可或缺的一部分，在人类生活中扮演着重要的角色。然而，关于浪漫关系与竞争之间的关系，以及对女性个体竞争互动的影响，仍值得进一步探讨。本研究以女性个体为主要研究对象，通过脑电超扫描技术，选取同步锁向值(PLV)作为脑间同步的衡量指标，探究浪漫恋人脑间活动与竞争的关系。本研究使用了单因素两水平的实验设计，共招募了 104 名大学生参与研究。其中包括 26 对恋人和 26 对陌生异性。参与者在计算机上完成了一个视觉提示-目标竞争任务，并记录其行为和脑电信号。研究结果显示，当女性个体与恋人竞争时，其胜率更高。个体之间的 alpha 频段 PLV 受到浪漫关系的影响。在竞争互动目标刺激出现的早期阶段，女性个体与陌生异性竞争时的 PLV 显著更高，而在竞争后期，女性个体与恋人竞争时候的 alpha 频段 PLV 更高。此外，女性个体的胜率与 alpha 频段脑间 PLV 之间存在显著相关，女性对竞争对手的主观印象与 alpha 频段脑间 PLV 之间也存在显著相关。研究结果表明，在竞争互动时，脑间同步情况受到浪漫关系的调控作用。男性在浪漫关系中更倾向于选择配偶保留策略，以维持浪漫关系的和谐稳定。对女性来说，浪漫关系还会影响女性个体的警觉性和注意力状态，从而对竞争结果产生影响。本研究基于达尔文的性选择理论，证明了浪漫关系对竞争的影响，完善了浪漫关系及竞争互动的理论解释。

Romantic Relationship Attenuated Dyadic Competition: Evidence from Interpersonal Neural Synchronizatio

Shuyu Jia[1], Yujia Meng[1], Yingjie Liu[1]

1 North China University of Science and Technology, Hebei, Tangshan

Abstract：Previous studies have shown that when couples engage in collaborative interactions, their brain activity becomes more synchronized. Similarly, competition is also an indispensable part of social interaction and plays an important role in human life. However, the relationship between romantic relationships and competition, as well as the impact on individual female competitive interactions, still deserves further exploration. This study mainly focuses on female individuals and uses electroencephalography (EEG) hyperscanning technology to select the synchronized locked value (PLV) as a measure of brain synchronization, exploring the relationship between brain activity and competition in romantic couples. This study used a single-factor two-level experimental design and recruited a total of 104 college students to participate in the study. This includes 26 pairs of lovers and 26 pairs of strangers of the opposite sex. Participants completed a visual cue-target competition task on a computer and recorded their behavior and EEG signals. The research results show that when female individuals compete with their partners, their winning rate is higher. The alpha frequency band PLV between individuals is influenced by romantic relationships. In the early stage of the emergence of competitive interaction target stimuli, female individuals have significantly higher PLV when competing with strangers of the opposite sex, while in the later stage of competition, female individuals have higher alpha frequency PLV when competing with their partners. In

addition, there is a significant correlation between the success rate of female individuals and the alpha frequency band brain PLV, and there is also a significant correlation between women's subjective impressions of competitors and the alpha frequency band brain PLV. The research results indicate that during competitive interactions, brain synchronization is regulated by romantic relationships. Men tend to choose spouse retention strategies in romantic relationships to maintain harmony and stability. For women, romantic relationships can also affect their individual alertness and attention state, thereby affecting the outcome of the competition. Based on Darwin's Sexual selection theory, this study proves the impact of romantic relationships on competition, and improves the theoretical explanation of romantic relationships and competitive interactions.

目标推断中承诺预期对注意的引导：来自眼动的证据

段愚凡[1] 徐昊骅[1] 徐健哲[1] 程少哲[1] 周吉帆[1]（通讯作者）

[1]浙江大学心理与行为科学系，杭州，310058

通讯作者 E-mail：jifanzhou@zju.edu.cn

摘 要 目标推断是指通过观察他人外显行为与状态来推断他人内在目标。准确高效的目标推断有助于理解他人意图、预测他人行为、改善沟通和互动，是人类顺利开展社会交互的重要基础。传统理论认为，观察者总是假设行动者遵循理性原则规划行为，因而在根据行为推断目标时遵循同样的理性原则。然而，行动者在规划行为时往往表现出“非理性”，完全基于理性原则的目标推断有时无益于社会交互的顺利进行。因此，一种潜在的假设是，观察者预期行动者并非绝对理性，并据此推断行动者目标。目标承诺是一类普遍存在的非理性行为，表现为当场景中存在多个潜在目标时，行动者优先选择旧目标（而非最优目标）。据此，本研究假设，观察者在目标推断时预期行动者存在目标承诺，其注意将优先被引导至旧目标，且对目标的推断偏向于旧目标。

研究共包含两个实验（各 24 名被试），每个实验中均要求被试观看行动者的行为轨迹，并推断其目标：实验一采用“连续吃豆人”场景，场景中始终包含两个潜在目标。存在目标冲突条件下，行动者每到达一个目标后，场景中将出现一个新目标；无目标冲突条件下，行动者每到达一个目标，场景中所有原目标均消失，并出现两个新目标。实验二采用“噪声吃豆人”场景，在行动者移动的过程中，可能出现噪声使其向意图的反方向移动。存在目标冲突条件下，噪声将行动者拉偏至距离新目标更近或与两个目标等距；不存在目标冲突条件下，噪声后行动者仍然距离旧目标更近。

两个实验的结果一致：存在目标冲突条件下，在观察到后续行为前，被试注视旧目标的时间占比显著高于注视新目标，即注意优先被引导至旧目标，且被试更倾向于推断行动者会选择旧目标；而在无目标冲突条件下，被试的注意选择和目标推断结果仅依赖于目标与行动者的距离。以上结果表明，人类的目标推断并非基于完全理性原则，而是预期他人存在目标承诺，据此引导注意选择并推断潜在目标。

关键词 目标推断，目标承诺，注意选择，预期

Expectations of Commitment Guide Attention in Goal Inference: Evidence from Eye Movements

Yufan Duan[1], Haokui Xu[1], Jianzhe Xu[1], Shaozhe Cheng[1], Jifan Zhou[1] (Corresponding Author)
[1]Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310058

Abstract：Goal inference refers to inferring the potential goal of others from their explicit behaviors and states. Efficient goal inference helps on intention understanding, behavior prediction, further communication and interaction, and thus plays an important role in human social interaction. Traditional opnion holds that observers always assume that actors plan their actions according to the rational principle, and thus follow the same rational principle in goal inference. However, actors often show "irrationality" when planning behaviors, and goal inference based entirely on rational principle may bring disadvantages for social interactions. Therefore, it is reasonable to assume that the observer holds expectation that the actor is not absolutely rational, and infers from this the underlying goal behind the observed behavior. Goal commitment is a kind of ubiquitous irrational behavior, which is manifested in that when there are multiple potential goals in the scene, the actor prefers the old goal (rather than the rational optimal goal). Based on this, the current study hypothesizes that observers expect the actor to have goal commitment during goal inference, and their attention will be preferentially directed to the old goal, and the inference of the goal is biased towards the old goal.

Our study consisted of two experiments (24 subjects respectively), each of which required subjects to watch the behavioral trajectories of actors and infer their goals: Experiment 1 used a "Sequential Pac-Man" scenario, which always contained two potential goals. Under the conflict condition, every time the actor reaches a goal, a new goal will appear in the scene; under the inconflict condition, every time the actor reaches a goal, all the original goals in the scene will disappear, and two new goals will appear in the scene. Experiment 2 uses the "Noise Pac-Man" scene. During the moving process, noise may appear to make the actor move in the opposite direction of the intention. Under the conflict condition, the noise will pull the actor closer or equidistant to the new goal; under the inconflict condition, the actor is still closer to the old goal after the noise.

The results of the two experiments are consistent: in the conflict condition, before observing the follow-up behavior, the proportion of fixation duration on the old goal was significantly higher than that on the new goal, which meant attention was preferentially directed to the old goal. Participants were also more likely to infer that the actor would choose the old goal. In the inconflict condition, participants' attention selection and goal inference depend only on the distance between the goal and the actor. The above results reveal that human goal inference is not entirely based on rational principles, but also based on the expectation of other people's goal commitment, which guides attention to select and infer potential goal.

摘 要　社会等级作为社会组织的基本原则，广泛存在于社会物种当中，对个体与社会的发展至关重要。在对社会等级信息的习得、影响等方面进行了逐步深入的研究过程中，还有一个重要且亟待探讨的问题是：社会等级是如何产生的？作为一种人际互动的基本模式，社会等级在人际交往中逐步产生，并在双方的相互影响下逐步稳固。基于此，本研究关注社会等级产生与发展变化的动态互动过程。为了探究该问题，研究通过斗鸡博弈构建了具有支配行为表达的社会环境和社会规则，并在双人真实互动中追踪人际关系的变化轨迹。具体来说，通过基于近红外脑成像（fNIRS）的超扫描技术，以小波相干为指标，本研究考察了支配行为表达过程中的脑间神经同步性。进一步，根据双人互动模式进行划分，比较了等级分化模式和制约平衡模式的社会互动脑机制，以探究社会等级关系产生的特异性脑间神经同步性特征。结果发现：（1）支配表达过程中，互动双方在内侧前额叶（mPFC）以及右侧颞顶联合区（rTPJ）的神经同步性增高；（2）支配等级关系的形成会伴随着互动双方在 mPFC 处的神经同步性降低，这一特征可能是支配等级关系形成的社会互动神经机制的特征。该研究从人际互动和脑间神经同步性的视角探究了支配行为表达的过程，其发现为理解等级关系的形成提供了双脑信号的证据。

Abstract: Social hierarchy, as a basic principle of social organization, exists widely among social species and is essential to the development of individuals and societies. In the course of the gradual and in-depth research on the acquisition and influence of social hierarchical information, there is an important question to be explored: how does the social hierarchy emerge? As a basic pattern of interpersonal relationships, social hierarchy gradually arises in interpersonal interactions and gradually solidifies under the mutual influence of both parties. The present study focuses on the dynamic and interactive process of the emergence and development of social hierarchies. To investigate this issue, we constructed social contexts and rules with dominant behavioral expressions through the Chicken game and traced the trajectory of interpersonal relationships in two-person real interactions. Specifically, employing functional near-infrared spectroscopy (fNIRS)-based hyperscanning technique and using wavelet coherence as the index, this study examined interpersonal neural synchronization during dominance expression. Further, to explore the specific characteristics arising from social hierarchical relationships, the interpersonal neural synchronization of the hierarchy mode and the balance mode were compared by dividing dyadic interaction characteristics. The results revealed that (1) neural synchronizations between the interacting parties at the medial prefrontal cortex (mPFC) and the right temporoparietal joint region (rTPJ) were increased during dominance expression, and (2) the formation of dominance hierarchical relationships is accompanied by a decrease in neural synchronization between the interacting parties at the mPFC, a feature that may characterize the neural mechanism of the social interactions in which dominance hierarchical relationships are formed. This study explored the processes of dominance behaviors from the perspectives of interpersonal interactions and interpersonal neural synchronization, and the findings provide evidence of the formation of hierarchical relationships.

摘 要　前人的脑电与近红外联合测谎研究(Lin et al., 2018)发现在隐藏信息测谎范式(concealed information test，CIT)中联合脑电 P300 波幅和近红外氧合血红蛋白浓度变化（HbO）能有效提高测谎鉴别率，但关于脑电与近红外联合测谎背后的机理目前仍不清楚。以往的CIT测谎原理的研究表明基于中枢神经系统的CIT的测谎机理主要与定向反应或反应抑制有关，其中定向反应与刺激的新异性和意义性有关，而反应抑制与欺骗紧密相关，所以本研究试图通过对比有无欺骗对测谎的影响来探索其测谎机理。实验中，脑电和近红外数据通过自建的系统同步收集。所有被试均为犯罪者，并随机分为欺骗组与无欺骗组。实验采用隐藏信息测谎范式，测谎时会给被试呈现一系列名字刺激作为靶子刺激、无关刺激或探测刺激。所有被试的探测刺激都是自己的名字，任务是判断呈现的刺激是否是靶子刺激，如果是靶子刺激就按键反应。测谎中，欺骗组被试需要隐藏认识自己名字的事实，即看到自己的名字时说谎，而无欺骗组则诚实反应。结果表明，对欺骗组和无欺骗组而言，探测刺激与无关刺激诱发的 P300 波幅差异和 HbO 浓度变化差异均显著，而且探测刺激诱发的 P300 和 HbO 浓度变化没有显著差异。这说明欺骗并不影响脑电与近红外联合测谎，因此实验证明脑电与近红外联合测谎的机理是定向反应。

The neural mechanism of deception detection with combined EEG and fNIRS

Xingyu Yi, Hongrui Li, Xiaohong Lin*
Department of Psychology, Hangzhou Normal University, Hangzhou, China

Abstract：Previous studies (Lin et al., 2018) have revealed that combining P300 amplitude and changes in oxygenated hemoglobin concentration (HbO) in the concealed information test (CIT) significantly enhances the discrimination rate of deception detection. However, the underlying mechanism of this combination remains unclear. Researches have demonstrated that the deception detection mechanism based on the central nervous system was primarily associated with the orienting response and response inhibition. The orienting response was associated with to the novelty and significance of stimuli, while response inhibition was closely tied to deception. Consequently, the present study's primary objective is to investigate the deception detection mechanism by manipulating deception. EEG and fNIRS data were simultaneously collected using a home-made system. All participants were randomly divided into the deception group and the non-deception group. In the CIT, participants were presented with a series of name stimuli, including target stimuli, irrelevant stimuli, and probe stimuli during deception detection. Participants were presented with their own names as probe stimuli and tasked with discriminating whether the presented stimulus was a target stimulus. They responded by pressing a button if it was indeed a target stimulus. The deception group was required to conceal the truth that they recognized their names, i.e., they had to lie when they saw their names, whereas the non-deception group responded truthfully. The results demonstrated significant differences in P300 amplitude

and HbO concentration changes between probe stimuli and irrelevant stimuli for both the deception group and the non-deception group. However, there was no significant difference in P300 and HbO concentration changes induced by probe stimuli. These findings suggest that deception had no effect on the deception detection, indicating that the neural mechanism underlying EEG and fNIRS deception detection was associated with the orienting response.

身高很重要：相对身高劣势促进第三方惩罚的的脑电研究

孟雨佳[1]　贾淑钰[1]　刘映杰[1]（通讯作者）

华北理工大学心理与精神卫生学院，唐山，063000，psyliuyingjie@163.com

摘 要

第三方惩罚是发生在人际互动中的亲社会行为，互动对象的特征将对第三方惩罚产生重要影响。作为直立行走的人类，身高是最显著的外在特征。拿破仑情结是身高影响心理的重要表现，是指矮个子男性将产生自卑心理并采取其他方式来弥补身高差距。本研究采用基于独裁者博弈的第三方惩罚任务，应用事件相关电位（ERP）、时频分析和功能连接技术，全面探讨男性相对身高差异（拿破仑情结）对第三方惩罚影响及其认知神经机制。结果发现，与第三方的身高高于不公平分配方案的接受者相比，当第三方的身高矮于接受者时，第三方惩罚率和惩罚分数都显著更大。当第三方的身高矮于接受者时，由身高劣势引起的愤怒会引起显著更大的 P300 波幅和 theta 能量。此外，受到愤怒情绪的影响，个体对分配方案的注意力被分散，引起的 N1 波幅将减小。功能连接结果显示，当第三方低于接受者时，rTPJ 与顶叶区、DLPFC 与顶叶区之间的功能连接值(wPLI)显著更大。研究结果表明，个子较矮的男性为了追求声誉利益而进行第三方惩罚，所以他们更关心他人对自己的评价，并有更多的心理化过程。综上所述，拿破仑情结将促进第三方惩罚。相对较矮的男性会受到相对身高劣势引起的负面情绪的影响，并追求声誉利益来弥补身高劣势。

Height matters: An EEG study of the relative height disadvantage promoting third-party punishment

Yujia Meng　Shuyu Jia　Yingjie Liu

School of Psychology and Mental Health, North China University of Science and Technology

21 Bohai avenue, Caofeidian district, Tangshan, Hebei province, China

Abstract: Third-party punishment is essential for maintaining social norms. However, third-party punishment is usually influenced by personal characteristic factors. In this study, we applied event-related potential (ERP), time-frequency analysis, and functional connectivity to comprehensively explore the influence of a typical personal characteristic-male relative height difference (Napoleon complex) on the third-party punishment and neural mechanism. The results found that shorter men show a higher punishment rate and more transfer amount. When the third party is shorter than the recipient, anger caused by the height disadvantage evoked greater P300 amplitude and more theta power. Affected by anger, attention to the offering is dispersed, evoking a smaller N1. When a third party is shorter than the recipient, alpha band power was less, and wPLI was significantly stronger between rTPJ and the posterior parietal region and DLPFC and the posterior parietal region. The results suggest that shorter men engage in third-party punishment to pursue reputation benefits, so they care more about the perceptions of others and have more mentalizing processes. The Napoleon complex promotes third-party

punishment. Relative shorter men are influenced by negative emotions resulting from relative height disadvantage and pursue reputation interests to make up for height disadvantage.

通讯作者 dingfqin@nxu.edu.cn

摘 要 新冠肺炎流行期间，抑郁焦虑共病人群数量激增。与单一抑郁或焦虑相比。合并症造成了更严重的功能损伤、更差的治疗效果和预后以及更低的患者满意度。与主流的共同病因模型相比，网络分析是研究合并症的一个新视角，可以从症状水平上更好地识别合并症的典型症状以及两种障碍间的合并机制，揭示传统评估工具无法捕捉到的病情变化。本研究在 2019 年 11 月至 2022 年 11 月期间，收集了 787 名临床合并症患者（平均年龄：31.8 岁，67.1%为女性）治疗前后（T1→T2）的 Zung 氏抑郁自评（SDS）和焦虑自评（SAS）量表数据，计算了节点强度中心性和桥梁强度，评估了网络的稳健性，并利用网络比较测试（NCT）来探索治疗前后和不同性别群体的网络差异。研究结果表明，获得的网络模型是高度稳定和准确的。“空虚感”在合并症状中表现出最高的强度中心性，尤其在青少年群体中最为明显；网络中最强的边缘出现在两个障碍的重叠症状之间（心动过速-心悸，疲劳-易疲劳，睡眠困难-失眠）；大多数桥梁节点与 SDS 的情绪、生理和心理症状有关，失眠与 SAS 的躯体症状相关。尽管治疗过程中评估工具的总分降低，但 NCT 证实网络的整体强度显著增加（$p = .03$）。此外，在男性的网络分析中“精神解体”显示出更高的强度中心性。以上结果说明：（1）确定了合并症中最核心症状—空虚感，支持了“空心病”的理论，为进一步治疗合并症提供准确的干预靶点；（2）揭示了两种障碍之间的起到合并作用的桥症状以及合并的路径，重叠症状和两种障碍各自独立症状簇的发现再次验证了两种疾病有共同的结构又表现出独特的特征；（3）证实了当前评估工具对症状的变化的掩盖，以及合并症网络的性别差异。因此，将网络分析整合到诊断、治疗和随访过程中有助于制定个性化干预措施并加速合并症人群的康复。

Network analysis of comorbid depression and anxiety disorders in a large clinical sample: a pre- and post-treatment comparison

Ning Li[1, 2], Fengqin Ding[1*], Sensen Zhang[1] , Zhi Jing[1, 3], and Yumeng Zhao[1]
[1] Department of Psychology, Institute of Teacher Education, Ningxia University, Yinchuan, China
[2] Ningxia Provincial Mental Health Center, Ningan Hospital,Yinchuan, China
[3] Mental Health Counseling Center of Erdos College of Applied Technology, Ordos, China

Abstract: During the COVID-19 pandemic, there has been a significant increase in the number of individuals with comorbid depression and anxiety. Compared to singular depression or anxiety, comorbidity leads to more severe functional impairment, poorer treatment outcomes and prognosis, and lower patient satisfaction. Network analysis, as a new perspective in studying comorbidity, allows for a better identification of typical symptoms and the underlying mechanisms between the two disorders at the symptom level. It reveals changes in illness that traditional assessment tools fail to capture. In this study, data from the Zung Self-Rating Depression Scale (SDS) and Zung Self-Rating Anxiety Scale (SAS) were collected from 787 clinical comorbid patients (mean age: 31.8 years, 67.1% female) before and after treatment (T1→T2) between November 2019 and November 2022. Node strength centrality and bridge strength were calculated, network robustness was evaluated, and Network Comparison Tests (NCT) were conducted to explore the differences in networks before and after treatment and among different gender groups. The results indicate that the obtained network model is highly stable and accurate. *Emptiness* exhibited the highest strength centrality among comorbid symptoms, particularly in the adolescent group. The strongest edges in the network occurred between overlapping symptoms of the two disorders (rapid heartbeat-palpitations, fatigue-easily fatigued, sleep difficulties-insomnia). Most bridge nodes were related to emotional, physiological, and psychological symptoms of SDS, while insomnia was associated with physical symptoms of SAS. Despite a decrease in overall scores of the assessment tools during the treatment process, NCT confirmed a significant increase in the overall strength of the network (p = .03). Furthermore, *Mental disintegration* showed higher strength centrality in the network analysis of males. The results suggest that: (1) the core symptom of comorbidity, *Emptiness,* supports the theory of *Hollow mind disorder* and provides accurate intervention targets for further treatment of comorbidity; (2) the bridging symptoms and pathways that contribute to comorbidity between the two disorders are revealed, and the discovery of overlapping symptoms and distinct symptom clusters of each disorder reaffirms the common underlying structure and unique features of the two diseases; (3) it confirms the masking effect of current assessment tools on symptom changes and the gender differences in comorbidity networks. Therefore, integrating network analysis into the diagnostic, treatment, and follow-up processes helps in developing personalized interventions and expediting the recovery of comorbid populations.

中国癌症患者抑郁症状亚型的分类与转变：一项纵向研究

邵宇飞[1]　朱蕾[1]（通讯作者）

1 陕西师范大学心理学院，西安，710062，lei.zhu@snnu.edu.cn

摘 要　随着死亡率和发病率的上升，癌症已成为世界范围内死亡的主要原因之一。癌症患者总是比健康人群报告更多严重的心理问题，而抑郁是这些问题中最为常见的心理症状之一。然而，不同患者的抑郁症状不尽相同，因此应针对不同的抑郁亚型精准实施不同的干预措施来减轻其症状。目前该方面的研究多为横断研究，纵向研究较少，且基本以西方为背景进行，缺少针对于中国癌症患者的研究。本纵向研究聚焦于中国癌症患者的抑郁症状，目的：(1)确定癌症患者抑郁症状的不同亚型；(2)研究抑郁症亚型在不同癌症阶段的稳定性和转变率。方法：对陕西省肿瘤医院的 153 名癌症患者进行三个时间点的追踪研究，分别于首次确诊后一周内(T1)、开始就医后一周内(T2)、就医结束后一周内(T3)进行数据收集，包括人口学数据、医学特征，以及采用 9 条目病人健康问卷(PHQ-9) 测量的抑郁情况。通过潜在剖面分析（LPA）和潜在转换分析（LTA）对数据进行建模和验证。结果：本研究确定了四种潜在的抑郁症亚型:“无抑郁”、“轻度抑郁”、“中度抑郁”和“重度抑郁”。“无抑郁”亚型的大多数患者从 T1 到 T3 时期均保持稳定。大约一半的“轻度抑郁”患者从 T1 到 T2 保持稳定，但从 T2 到 T3 过渡到“无抑郁”亚型。“重度抑郁”的患病率从 T1 到 T2 保持稳定，但从 T2 到 T3 显著下降。结论：本研究证实了我国癌症患者存在四种不同的抑郁症状亚型。四种亚型的大多数患者从首次诊断到开始治疗保持稳定，而后症状有所缓解至治疗结束。同时，仍需要对“重度抑郁”患者进行专门的心理干预。

Classification and transition in subtypes of depressive symptoms in Chinese cancer patients: A longitudinal study

Shao Yufei, Zhu Lei

School of Psychology, Shaanxi Normal University, Xi'an, 710062

Abstract：With the rise in mortality and morbidity, cancer has become one of the leading causes of death worldwide. Cancer patients always are more likely to report serious psychological problems than the healthy people, while depression is one of the most common psychological symptoms among these problems suffered by cancer patients. However, the depressive symptoms in different patients are not the same, different interventions should therefore be precisely implemented for different subtypes to relieve their symptoms. At present, most of the studies in this aera are cross-sectional studies, and few longitudinal studies basically conducted in the Western background, while there is a lack of research on Chinese cancer patients. This longitudinal study focused on depressive symptoms in cancer patients in China, the purpose of this longitudinal study is to (1) identify the different subtypes of depressive symptoms; (2) investigate the stability and transition of depression subtypes over different stages of cancer. Methods: The study was conducted on 152 cancer patients in Shaanxi Cancer Hospital at three time points. Data, including demographic data, medical characteristics, and depressive symptoms measured by the 9-item Patient Health Questionnaire (PHQ-9), were collected within 1 week after the first diagnosis (T1), 1

week after the start of medical treatment (T2), and 1 week after the end of medical treatment (T3), modeled and validated by Latent profile analysis (LPA) and Latent transition analysis (LTA). Results: Four latent subtypes of depression were identified: “no depression”, “mild depression”, “moderate depression” and “elevated depression”. Most patients in the “no depression” profile remained stable from T1 to T3. About half of patients in “mild depression” profile remained stable from T1 to T2 but moved into “no depression” profile from T2 to T3. The prevalence of “elevated depression” remained stable from T1 to T2 but significantly declined from T2 to T3. Conclusions: Four different subtypes of depressive symptoms were confirmed in Chinese cancer patients in this study. Most patients of the four subtypes remained stable from the first diagnosis to the beginning of medical treatment, while relieved till the end of medical treatment. Meanwhile, specialized psychological intervention is still needed to offer to patients in “elevated depression” profile.

重度抑郁症患者白质微结构的内在破坏:基于体素的弥散张量成像元分析

郭云霄[1] 刘奕浓[1] 刘威[1] 任志洪[1]（通讯作者）

[1]青少年网络心理与行为教育部重点实验室，华中师范大学心理学院，湖北省人的发展与心理健康重点实验室，武汉，430079，ren@ccnu.edu.cn

摘 要 近年来大脑白质与精神疾病的关系得到广泛重视。重度抑郁症(Major depressive disorder, MDD)是一种常见的致残性情绪障碍，很多研究发现重度抑郁症与大脑白质(white matter, WM)微结构异常有关，判断白质微结构异常的核心指标是分数各向异性(Fractional anisotropy ,FA)。然而当前使用弥散张量成像技术(diffusion tensor imaging, DTI)研究报告重度抑郁症患者的 FA 异常脑区不一致，且有研究发现重度抑郁症患者相较于健康对照组(Healthy control, HC)其大脑白质 FA 值并无显著异常。为解决当前研究困惑，本研究根据 PRISMA 指南采用关键词在 Embase、Web of Science、PubMed、PsycINFO、Cochrane Library 和 Scopus 数据库进行文献搜索，检索时间截至 2023 年 5 月 30 日，纳入已发表和未发表的文献进入统计分析。使用基于全脑的分析方法对 MDD 相对于健康对照组的分数各向异性(FA)进行了荟萃分析，利用基于种子的主题图像排列映射(Seed-based d mapping via permutation of subject images, SDM-PSI)来识别与 MDD 发病机制相关的 WM 异常。分析方法分别为基于体素的全脑分析（Voxel-based analysis ,VBA）和基于神经纤维束的空间分析（tract-based spatial statistics ,TBSS）。为了对 VBA 研究和 TBSS 研究共同进行荟萃分析，在生成效应大小统计的差异图时采用了基于 FMRIB58 FA 骨架的 TBSS 模板，将 TBSS 骨架掩膜应用于每个效应大小统计的差异图，确保 TBSS 和 VBA 研究都受到相同的分析覆盖。经过筛选本研究最终将 35 项研究，包括 3064 名被试（MDD=1755，HC=1309）纳入基于全脑的荟萃分析。结果显示，与健康对照相比，重度抑郁症患者的胼胝体(Corpus callosum , CC)和丘脑前投射(anterior thalamic projections , ATP) FA 较低。元回归分析显示，MDD 患者的胼胝体(CC)FA 值减少与症状严重程度和抑郁持续时间呈负相关。亚组分析显示，单独 17 项 VBA 分析结果更为显著，MDD 患者的胼胝体(CC)相对于健康对照组有更低的 FA 值。单独 18 项 TBSS 分析在统计矫正后无结果。 本研究结果为 MDD 的临床诊断和治疗提供了强有力的证据，表明大脑半球间连接和丘脑-皮层前回路的 WM 损伤可能在 MDD 的发病机制中起重要作用，它可能是重度抑郁症的潜在生物标志物。除此之外，本研究发现对于 MDD 的白质 FA 值分析，VBA 相对于 TBSS 可能更具有敏感性。

Intrinsic disruption of white matter microarchitecture in major depressive disorder: A voxel-based meta analysis of difusion tensor imaging

Yunxiao Guo[1] Yinong Liu[1], Wei Liu[1] , Zhihong Ren[1]

[1] Key Laboratory of Adolescent Cyberpsychology And Behavior (CCNU), Ministry Of Education; School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health Of Hubei Province, Wuhan, China

Abstract： In recent years, the relationship between brain white matter and mental illness has received extensive attention. Major depressive disorder (MDD) is a common disabling mood disorder, and many studies have found

that major depressive disorder is associated with abnormal white matter (WM) in the brain. Fractional anisotropy (FA) is the core index for determining white matter abnormalities. However, current studies using diffusion tensor imaging (DTI) have reported that the FA abnormal brain regions in patients with major depression are inconsistent, and some studies have found that compared with the control group, the FA values of the brain white matter in patients with major depression are not significantly abnormal. In order to solve the current research confusion, this study conducted a literature search based on PRISMA guidelines using keywords in Embase, Web of Science, PubMed, PsycINFO, Cochrane Library and Scopus databases. The search time was up to May 30, 2023. Published and unpublished literature was included in the statistical analysis. A meta-analysis of the fractional anisotropy (FA) of MDD relative to healthy controls was performed using a whole-brain-based analysis method. A Seed-based d mapping via permutation of subject images (SDM-PSI) was used to identify WM abnormalities associated with the pathogenesis of MDD. The analysis methods were Voxel-based analysis (VBA) and tract based spatial statistics (TBSS). To allow for meta-analyzing both VBA studies and TBSS studies, we adopted the TBSS template when generating the effect size-signed differential maps. This template is based on the FMRIB58 FA skeleton(http://www.fmrib.ox.ac.uk/fsl). Applying the TBSS skeleton mask to each effect size-signed differential map ensures that both TBSS and VBA studies are subjected to identical analysis coverage. After screening, 35 studies including 3064 participants (MDD=1755, HC=1309) were included in a brain-based meta-analysis. Results showed that patients with major depression had lower Corpus callosum (CC) and anterior thalamic projections (ATP) FA compared to healthy controls. Meta-regression analysis showed that reduced corpus callosum (CC)FA values in MDD patients were inversely associated with symptom severity and duration of depression. Subgroup analysis showed that the results of 17 VBA analyses alone were more significant, with MDD patients having lower FA values in the corpus callosum (CC) compared to healthy controls. The 18 TBSS analyses alone had no results after statistical correction. Our findings provide strong evidence for clinical diagnosis and treatment that WM impairment of the brain's interhemispheric connections and thalamic-cortical precircuits may play an important role in the pathogenesis of MDD and that it may be a potential biomarker of major depressive disorder. In addition, this study found that VBA may be more sensitive than TBSS for white matter FA value analysis of MDD.

短视频成瘾与抑郁症状的纵向发展：一项交叉滞后网络分析

刘博文 陈润森（通讯作者）
清华大学万科公共卫生与健康学院，北京，100101
通讯作者 E-mail：runsenchen@tsinghua.edu.cn

摘 要

背景：短视频成瘾作为一种新兴的网络成瘾类型，在当今青少年中已成为一个重要问题。短视频成瘾可能会与抑郁症状存在共病，但这些具体症状之间相互作用、以及进一步维持症状的机制仍未清晰。近年来，网络分析模型成为揭示这个复杂难题的一种有效方法。这种模型突破了潜变量模型的局限，将精神障碍区分为具体症状本身之间的相互作用。交叉滞后面板网络模型则可以进一步精神症状随着时间发展而变化的纵向过程。因此，本研究采用交叉滞后面板网络模型，旨在揭示短视频成瘾和抑郁症状纵向发展的网络结构。

方法：采用整群抽样法在北京一所大学进行了问卷调查，分别在 2021 年和 2022 年进行了两次数据收集，数据收集间隔为 12 个月。最终样本包括 1163 名参与者（Mage=19.46，SD=1.04, 77.6%为女性）。抑郁症状使用患者健康问卷-9（PHQ-9）进行测量，短视频成瘾使用修改版的 Facebook 成瘾量表进行测量。所有统计分析均基于 R 软件。使用 glmnet 包分析网络回归，使用 qgraph 包绘制所有图形，使用 R 中的 bootnet 包估计网络稳定性和准确性。计算预期内影响（IEI，指某症状被其他症状所影响的效力）和预期外影响（OEI，指某症状对其他症状的影响效力）来明确症状之间的方向性。计算桥接预期影响（BEI）以确定桥接节点。

结果：短视频成瘾症状中最强的预期外影响节点是 A2（“越来越想使用短视频软件”，OEI = 1.93），抑郁症状中最强的预期外影响节点是 D1（快感缺失，OEI = 0.57），这意味着它们对其他症状有更强的预测能力。短视频成瘾症状中最强的预期内影响节点是 A1（“花费大量时间思考短视频软件或计划使用它”，IEI = 2.06），抑郁症状中最强的预期内影响节点是 D3（睡眠问题，IEI = 1.05），这意味着它们受其他症状的强烈预测。A6（“刷短视频影响了学习”，BEI = 1.70）和 D2（情绪低落，BEI = 0.80）被发现作为桥接症状连接了两种心理健康问题。值得注意的是，在抑郁症状中存在两个较强的负向边：D9：自杀意念→D1：快感缺失（OR = 0.89），以及 D9：自杀意念→D2：情绪低落（OR = 0.90）。

结论：研究结果明确了特定成瘾症状如“越来越想使用短视频软件”（A2）和抑郁症状如“快感缺失”（D1）可以预测网络中其他症状的发展。此外，成瘾症状“冲突”（A6）和抑郁症状“情绪低落”（D2）可能作为桥接症状说明了两个症状群之间的共病机制。此外，本研究发现“自杀意念”症状的存在负向预测了随后的抑郁症状中‘快感缺失’（D1）和‘情绪低落’（D2）的发生。这提示自杀意念可能作为一种情绪调节策略，为个体提供了缓解情绪的突破口。从理论角度来看，本研究结果揭示了短视频成瘾症状和抑郁症状之间纵向发展的关键症状。在实际应用中，识别这些关键的靶点症状有助于为相关的预防和治疗策略提供指导。

The longitudinal relationships between short video addiction and depressive symptoms: A cross-lagged panel network analysis

Bowen Liu, Runsen Chen (Corresponding author)
Vanke School of Public Health, Tsinghua University, Beijing, China.
E-mail：runsenchen@tsinghua.edu.cn

***Abstract*：**

Background: Short video addiction, a specific type of internet addiction, has emerged as a significant problem among youth today. The high prevalence of co-occurring mood problems, such as depressive symptoms, in individuals with short video addiction poses additional challenges for treatment. However, the extent to which these symptoms interact, predict each other, and further maintain the problems remains unclear. In recent years, the rapid development of the network approach has emerged as a promising avenue for unraveling this complex puzzle. Instead of perceiving these disorders as latent entities, this approach conceptualizes mental disorders as emerging from causal interactions among various symptoms. The cross-lagged panel network model (CLPN) can unveil the longitudinal dynamics occurring within and between mental disorders over time. Therefore, this study employed CLPN to reveal the directional network structure between the co-occurrence of short video addiction and depressive symptoms.

Methods: A cluster sampling method was used to conduct questionnaire surveys in a university located in Beijing in both 2021 and 2022, with a 12-month interval between the two data collection waves. The final sample consisted of 1163 participants (Mage = 19.46, SD = 1.04), including 903 (77.6%) females. Depressive symptoms were measured by the Patient Health Questionnaire-9 (PHQ-9) and short video addiction was measured by the modified version of the Facebook Addiction Scale. All statistical analyses were performed using R (Version 4.2). The glmnet package was used to calculate regressions and the qgraph package was used to plot all graphs. The bootnet package in R was used to estimate the network stability and accuracy. In-expected influence (IEI) and out-expected influence (OEI) were estimated to parse the directionality between items. The bridge expected influence (BEI) were estimated to identify the bridge items.

Results: There were 112 non-zero cross-lagged edges after regularization convergence and omission of autoregressive paths in the network, and the mean of cross-lagged edges was 1.02. The strongest out-EI nodes were A2 (Tolerance, ‘felt an urge to use ticktock more and more’, OEI = 1.93) in short video addiction symptoms and D1 (Anhedonia, OEI = 0.57) in depressive symptoms, meaning they had stronger predictive power for other symptoms. The strongest in-EI nodes were A1 (Salience, ‘spending a significant amount of time thinking about TikTok or planning its use’, IEI = 2.06) in short video addiction symptoms and D3 (sleep, IEI = 1.05) in depressive symptoms, meaning they were strongly prospectively predicted by other symptoms. Both A6 (Conflict, ‘used ticktock so much that it has had a negative impact on your studies’, BEI = 1.70) and D2 (Sad mood, BEI = 0.80) were found to act as bridging symptoms, connecting two mental health issues. The noteworthy point is that there were two strong negative edges within depression symptoms: D9: suicide ideation → D1: anhedonia (OR = 0.89), and D9: suicide ideation → D2: sad mood (OR = 0.90).

Conclusion: The study findings highlight that specific addiction symptoms like ‘Tolerance’ (A2) and depressive symptoms such as ‘Anhedonia’ (D1) can predict the development of mental health issues over time. Additionally, addiction problem ‘Conflict’ (A6) and emotional states like ‘Sad mood’ (D2) may act as bridge symptoms linking the co-occurrence of these conditions. Identifying these key and bridge symptoms can guide prevention and treatment strategies for short video addiction in this population. Moreover, it was observed that the presence of ‘suicidal ideation’ symptoms negatively predicted the occurrence of subsequent depressive symptoms over time, including ‘Anhedonia’ (D1) and ‘Sad mood’ (D2). Suicidal ideation may serve as an emotional regulation strategy, offering individuals immediate tension reduction and a perceived sense of control over their emotions. Our research not only expands the theoretical value of the problematic internet use model but also underscores the practical value of considering bridge symptoms in the exploration of addiction problems. From a

theoretical perspective, it highlights the growing comorbidity phenomenon between symptoms of short video addiction and depressive symptoms. In practical application, it is imperative to disrupt the link between bridge symptoms to prevent the exacerbation of dense connectivity among comorbid mental health problems.

摘要　COVID-19 的流行及其广泛影响，导致创伤后应激障碍(posttraumatic stress disorder，PTSD)症状的发病率大幅度上升。移动网络化接纳承诺疗法(Acceptance and Commitment Therapy, ACT)被证明能有效干预 PTSD，但导致其有效的心理机制还有待探索。本研究以再分析一项以 221 名符合 PTSD 临时诊断以及亚临床症状者为被试的随机对照试验的数据来探索移动网络化 ACT 干预 PTSD 的心理机制。该随机对照试验设置 ACT 干预组（*n*=78），正念干预组（Mindfulness Intervention，MI 组，*n*=76）以及等待组（Waitlist，WL 组，*n*=67）。假设的心理机制是心理灵活性的六个成分，即，接纳、此时此刻、以己为景、认知解离、价值和承诺行动。假设的心理机制用多维心理灵活性清单-24 (multidimensional psychological flexibility inventory, MPFI-24)评估。结果变量为 PTSD 症状的严重性，以创伤后应激障碍检查表第五版（Posttraumatic Stress Disorder Checklist-5，PCL-5)评估。本研究共 7 个测量时间点，数据分析采用潜变量增长曲线模型（latent growth curve modeling，LGCM）。结果表明，除了此时此刻没有在 ACT 干预中得到显著改善，认知解离、承诺行动、价值、接纳和以己为景均在 ACT 干预 PTSD 中起到完全的中介作用。因此，提升接纳、以己为景、认知解离、厘清价值观和增强承诺行动有助于提升 ACT 干预 PTSD 的有效性。

***Abstract*:** The COVID-19 epidemic and its widespread impact have led to a significant increase in the incidence of posttraumatic stress disorder (PTSD) symptoms. Internet-based Acceptance and Commitment Therapy (ACT) has been shown to be an effective intervention for PTSD, but the psychological mechanisms leading to its effectiveness remain to be explored. This study analyzed data from a randomized controlled trial of 221 participants who met the provisional diagnosis and subclinical symptoms of PTSD to explore the psychological mechanism of Internet-based ACT intervention in PTSD. The participants were assigned to ACT Intervention group (*n*=78), Mindfulness Intervention group (MI group, *n*=76) and waiting group (WL group, n=67). The

putative mediators were the six components of psychological flexibility, namely, acceptance, present moment awareness, self as context, cognitive defusion, values, and committed action. putative mediators were evaluated using multidimensional psychological flexibility inventory (MPFI-24). The outcome was the severity of PTSD symptoms, as assessed by the Posttraumatic Stress Disorder Checklist 5 (PCL-5). There were 7 measurement time points in this study, and the data were analyzed using latent growth curve modeling (LGCM). The results showed that cognitive defusion, committed action, value, acceptance, and self as context were mediators in the ACT intervention for PTSD. Therefore, promoting acceptance, self as context, cognitive defusion, clarifying values, and enhancing commitment actions can improve the effectiveness of ACT intervention for PTSD.

摘 要 创伤后应激障碍（Posttraumatic stress disorder, PTSD）是一种以直接或间接方式接触实际的或被威胁的死亡、严重创伤或性暴力事件后所发展出的心理障碍。新冠肺炎疫情爆发后，PTSD 在世界范围内的检出率显著提升，其所造成的健康风险、经济负担、财政压力为个人、家庭和社会带来巨大挑战，也为针对 PTSD 的有效干预提出了更高的要求。以认知行为疗法、延长暴露疗法、眼动脱敏疗法等为代表的心理干预是治疗 PTSD 的重要手段，然而，仅有不到 50%的患者能从干预中获益，其余患者则可能经历延长症状、甚至出现症状的恶化。考虑到无效或不充分干预对患者可能造成的二次伤害，有必要探究能有效预测 PTSD 心理干预效果的基线变量，进而为干预方案的选择及干预-患者的精准匹配提供指导。基于此，本研究在 Web of science，Embase，PubMed/Medline, PsycINFO 和 Cochrane 进行文献检索，共纳入 123 项研究，25284 名被试，系统综述对 PTSD 心理治疗效果具有预测意义的基线变量，并在此基础上计算各类变量对治疗效果的标准化预测效应量。结果显示，（1）现有受到较多关注的基线预测变量主要来自临床症状、创伤特征、心理及社会特征、认知加工特征、认知神经及生物特征、人口学特征六个领域。（2）性别（r = 0.09）、基线愤怒（r = -0.19）、基线抑郁（r = -0.09），创伤后负性认知（r = -0.17），社会支持（r = 0.27）对干预效果的预测作用显著。具体来说，相比较男性，女性更容易在 PTSD 的心理干预中获益；具有较低基线愤怒、抑郁、创伤后负性认知，较高社会支持水平的个体更有可能在干预后获得症状改善。PTSD 心理干预效果的预测变量正变得越来越具有多样性，但研究结果间的异质性和不稳定性也较为突出，未来需要更多高质量、具有针对性的预测因素研究，进而为优化干预方案，推进个性化干预提供指导。

Predictors of psychotherapy outcomes for posttraumatic stress disorder: a systematic review and meta-analysis

Ziyi Zhao, Rui Li, Yunxiao Guo, Yi Lu, Jun Ruan, Ying Li, Zihan Guo, Xinyi Liu, Zhihong Ren
Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Key Laboratory of Human Development and Mental Health of Hubei Province, School of Psychology, Central China Normal University, Wuhan; China

Abstract：Posttraumatic stress disorder (PTSD) is a psychological disorder which develops after the exposure to actual or threatened death, serious injury, or sexual violence in direct or indirect ways. The COVID-19 pandemic has increased mental health problems in the global public, especially posttraumatic stress disorder (PTSD) symptoms, putting individuals at risk of health problems, and placing a heavy financial burden on families and societies. Psychological interventions, including cognitive behavioral therapy (CBT), prolonged exposure therapy (PE) and eye movement desensitization and reprocessing therapy (EMDR), are important treatment for PTSD. However, less than 50% of PTSD patients benefit from the psychological intervention, and symptoms may be prolonged or even worsened in the rest. Considering the potential harm caused by ineffective or inadequate interventions, the present systematic review and meta-analysis aims to explore the predictors of psychotherapy

outcomes for PTSD and compute comparable effect sizes at marker level, which could further provide guidance for the selection of intervention and the precise matching of interventions-patients. Web of science, Embase, PubMed/Medline, PsycINFO, and Cochrane were systematically searched. One hundred twenty-three studies, totaling 25,284 individuals, met inclusion criteria. Results showed that (1) the predictors of psychotherapy outcomes for PTSD mainly came from six domains: clinical symptoms, trauma characteristics, psychological and social, cognition, cognitive neurological and biological, and demographic characteristics. (2) Gender (r = 0.09), baseline anger (r = -0.19), baseline depression (r = -0.09), post-traumatic cognitions (r = -0.17), and social support (r = 0.27) were significant predictors of intervention effects. Specifically, women were more likely to benefit from psychological interventions for PTSD compared to men; individuals with lower baseline anger, depression, negative posttraumatic cognitions, and higher levels of social support were more likely to experience symptomatic improvement after the intervention. Identifying and understanding the pre-treatment markers that predict treatment response may offer insight into the mechanisms of psychological treatment, provide a foundation for improving the efficacy of treatment, and inform treatment matching. Further high-quality research with more transparent and standardized reporting is needed.

基于网络分析的心理痛苦三因素模型对老年人自杀意念的预测效能

陈钰莹[1]　李欢欢[1]（通讯作者）
1 中国人民大学心理学系，北京，100872
通讯作者 E-mail: psylihh@ruc.edu.cn

摘 要　老年人是自杀高危人群，该人群自杀既有相对特有的风险因素如躯体因素，也有与其他人群共有的风险因素如自杀理论下的心理因素。以往多识别单一风险因素，对它们之间如何相互作用从而增加老年人自杀风险知之甚少，因此本研究基于心理痛苦三因素模型，结合网络分析方法，考察该模型对老年人自杀意念的解释力以及风险因素之间的关系模式。采用分层按比例抽样法，从北京市海淀区六所社区招募 505 名 60 周岁及以上的老年人，其要完成贝克自杀意念量表、心理痛苦量表、三维心理痛苦量表、贝克抑郁量表第 2 版、贝克无望感量表、巴瑞特冲动性量表、人际需求量表、习得自杀能力-无畏死亡量表、世界卫生组织生存质量测定量表简表、疾病家庭负担量表和整体疼痛量表。结果发现：（1）在老年人自杀意念网络中，从直接关系看，当前痛苦逃避、习得自杀能力、无望感、单维心理痛苦、生理疼痛、家庭疾病负担和社会领域生存质量与当前自杀意念直接正向关联，最严重时痛苦逃避、最严重时痛苦体验、受挫的归属感、习得自杀能力和无望感与最严重时自杀意念直接正向关联，其中单维心理痛苦与当前自杀意念的连线权重最大（r_p=0.18），最严重时痛苦逃避与最严重时自杀意念的连线权重最大（r_p=0.48）。从间接关系看，抑郁、受挫的归属感以及心理领域生存质量通过单维心理痛苦间接与当前自杀意念相连，抑郁、知觉到的累赘感以及环境领域生存质量通过当前痛苦逃避间接与当前自杀意念相连；（2）当前痛苦体验预期影响最大，单维心理痛苦中介中心性最强；（3）在对当前和最严重时自杀意念可预测性的相对重要性排序中，当前（7.94%, 95% CI 0.51-26.17）和最严重时痛苦逃避（29.00%, 95% CI 19.59-37.20）分别是位于首位的风险因素。结果表明相较于心理因素、躯体因素和综合因素，痛苦逃避对老年人自杀意念的解释力更优。痛苦体验可能是老年人自杀意念维持的重要因素。对不同远端因素，心理痛苦都是老年人自杀意念稳定的近端风险因素。提示在老年人心理危机干预策略中，心理痛苦可作为有效干预靶点。

Association between Three-Dimensional Psychological Pain and Suicidal Ideation in Older Adults: A Network Analysis

Yuying Chen[1], Huanhuan Li[1] (corresponding author)
Department of Psychology, Renmin University of China, Beijing 100872, China
E-mail: psylihh@ruc.edu.cn

Abstract: Older adults are at high risk of suicide, and this population has both unique risk factors such as physical factors and common risk factors such as psychological factors. Previous studies have mostly identified single risk factor. Little is known about how these factors interact to increase the risk of suicide in older adults. The present study aimed to identify the role of three-dimensional psychological pain model in interpreting suicidal ideation among the older population and the associations of different risk factors using the statistical method of network analysis. Five hundred and five older adults over sixty years old were recruited from six different

communities in Haidian District of Beijing. All the participants completed Beck Scale for Suicide Ideation (BSI), the Psychache Scale (PAS), Three-Dimensional Psychological Pain Scale (TDPPS), Beck Depression Inventory-II (BDI-II), Beck Hopelessness Scale (BHS), the Barratt Impulsivity Scale (BIS), Interpersonal Needs Questionnaire (INQ), Acquired Capability for Suicide Scale-Fearlessness About Death (ACSS-FAD), WHO Quality of Life Scale-Brief (WHOQOL-BREF), Family Burden Scale of Disease (FBS) and Global Pain Scale (GPS). The results showed that: (1) In the cross-sectional network about the suicidal ideation, current pain avoidance, acquired capability for suicide, hopelessness, psychache, global pain, family burden of disease and quality of life about social relationship had direct and positive associations with current suicidal ideation. While worst pain avoidance, worst painful feelings, thwarted belongingness, acquired capability for suicide and hopelessness had direct and positive associations with worst suicidal ideation. The edge weight between worst pain avoidance and worst suicidal ideation (r_p=0.48) was largest compared to factors which directly and positively associated to worst suicidal ideation while the edge weight between psychache and current suicidal ideation (r_p=0.18) was largest compared to factors which directly and positively related to current suicidal ideation. Moreover, some factors such as depression, thwarted belongingness and quality of life about psychology were indirectly linked to current suicidal ideation through psychache, and depression, perceived burdensomeness and quality of life about environment were indirectly linked to current suicidal ideation through current pain avoidance. (2) Current pain avoidance had the highest expected influence centrality while psychache had the highest betweenness centrality. (3) Current pain avoidance (7.94%, 95% CI 0.51-26.17) and worst pain avoidance (29.00%, 95% CI 19.59-37.20) had the biggest value of relative importance (19.78%, 95% CI 9.26-31.53) in the predictivity of current suicidal ideation and worst suicidal ideation, respectively. Pain avoidance is a stable behavioral variable that can effectively predict suicidal ideation among older population compared to physical factors, psychological variables and other relevant factors. Painful feelings play an important role in the maintenance of suicidal ideation network. Psychological pain is a stable proximal risk factor for suicidal ideation in older adults. These findings highlight that psychological pain may be an effective target in the process of suicide intervention among older population.

大众与专家的知识鸿沟：香港民众哀伤素养的代表性电话调查

张心兰[1]　唐苏勤[1]（通讯作者）　庄晓宇[2]

1 深圳大学心理学院，深圳，618060，jasminetsq@hotmail.com

2 香港浸会大学社会工作系，香港

摘 要　世界卫生组织于 2018 年正式将延长哀伤障碍（prolonged grief disorder, PGD）列入《国际疾病分类第十一次修订本（ICD-11）》中，但公众对这一精神障碍的关注远不如对其他精神障碍（如重性抑郁症）的认识与讨论。罹患延长哀伤障碍会严重影响丧亲者的身心健康，提升公众关于丧亲反应及延长哀伤障碍的心理健康素养，有助于在公共卫生层面促进丧亲适应。目前，很少研究关注公众的哀伤素养，学界对中国民众哀伤素养更是知之甚少。本研究以香港为例，旨在考察公众（1）对丧亲反应及其持续时间的看法，和（2）对哀伤可否被诊断为精神疾病的态度及其原因。本研究采用随机抽样电话调查，在全港随机抽取了 1011 名 18 岁及以上的香港居民，询问其对丧亲反应及其持续时间的看法、哀伤可否诊断为精神疾病的态度及原因、人口学信息和丧亲经历。结果发现：（1）被调查者提及最多的丧亲反应是悲伤（n = 722，76.4%）和思念（n=275，27.2%）；哀伤持续时间集中在六个月（n = 216，22.8%）和十二个月（n = 206，21.7%）。（2）近七成被调查者认为哀伤在某些情况下可能是一种精神疾病（n = 699，69.1%），而反对者（n = 311，30.8%）则认为哀伤是正常的现象或只是一种情绪而非精神疾病。（3）将支持诊断的被调查者提到的原因与 ICD-11 延长哀伤障碍的诊断标准进行比较，部分被调查者提到了核心症状（过度思念或持久的有关逝者的先占观念；n = 200，28.6%））、病程标准（哀伤持续时间过长；n = 142，20.3%）和功能标准（影响社会功能；n=81，11.6%）。（4）支持诊断的被调查者更年轻、受教育程度更高、没有丧亲经历或丧亲经历对其产生了重要影响，而更多人提及难以继续生活、出现生理反应和感觉生活失去意义这三个 ICD-11 延长哀伤障碍的症状。女性、有丧亲经历的被调查者中，更多人提及思念这一核心症状，而更少人提及出现生理反应这一症状。本研究启示，大部分香港民众能意识到哀伤可能会发展为精神疾病，但诊断标准和公众认识之间存在一定差异，未来研究及实践应关注提升公众哀伤素养的路径。

Knowledge gap between the public and professionals: a representative telephone survey on grief literacy in Hong Kong

Xinlan Zhang[1], Suqin Tang[1], Xiaoyu zhuang[2]

1 School of Psychology, Shenzhen University, Shenzhen 518060, China

2 Department of Social Work, Hong Kong Baptist University, Hong Kong 999077, China

Abstract：The International Statistical Classification of Diseases 11th Revision (ICD-11) first included Prolonged grief disorder (PGD) as an official diagnosis in 2018, yet public attention to this mental disorder is much less than other mental disorders such as major depressive disorder. The physical and psychological health of the bereaved would be severely challenged once they developed PGD. Improving mental health literacy about bereavement reactions and PGD of the public could contribute to the adjustment to loss at a public health level. Few studies have focused on grief literacy of the public, particularly grief literacy of Chinese people. Taking Hong

Kong as an example, this study aimed to investigate: (1) public opinion about bereavement reactions and the duration of these reactions, and (2) public attitude toward whether grief could be considered a mental disorder and the reasons for their choices. We conducted a telephone survey with a randomized sampling strategy. A total of 1011 Hong Kong residents aged 18 and/or above were recruited and asked about their opinions about bereavement reactions and the duration of these reactions, attitudes to and reasons for diagnosing or not diagnosing grief, demographic information, and bereavement experience. We found that sadness (n = 722, 76.4%) and longing (n=275, 27.2%) were the two most frequently mentioned bereavement reactions, and the most commonly nominated durations of bereavement reactions were 6 months (n = 216, 22.8%) and 12 months (n = 206，21.7%). About seven-tenth of the participants (n=699, 69.2%) agreed that grief could be a mental disorder under certain circumstances, whereas the remainder disagreed (n= 311, 30.8%) as they believed that grief was normal or just an emotion instead of a mental disorder. When comparing the reasons participants agreed with diagnosing grief to the ICD-11 PGD criteria, a small part of the supporters mentioned the core symptoms (i.e., longing for the deceased or persistent preoccupation with the deceased; n=200, 28.6%), the durations criterion (i.e., grief lasts too long; n=142, 20.3%), and the functioning criterion (i.e., impaired social functioning; n=81, 11.6%). Younger and higher educated participants, as well as participants who had no bereavement experienced or were greatly influenced by their bereavement experiences, tended to agree with diagnosing grief. The proportion of mentioning ICD-11 PGD symptoms including difficulty in reintegration, strong physical problems, and a sense of meaninglessness of life was higher among supporters than opposers. Female and bereaved participants tended to mention the reaction of longing and tended not to mention strong physical problems. This study revealed that most Hong Kong residents were able to realize that grief could develop into a mental disorder, but there is a knowledge gap between the public and professionals regarding the diagnostic criteria. Future research and practice should focus on how to improve grief literacy in public.

4 华南师范大学心理学院，广州，510631，lihong_psych@m.scnu.edu.cn

摘 要 广泛性焦虑障碍（Generalized anxiety disorder，GAD）是最普遍的、也是最难成功治疗的焦虑症。越来越多的证据表明自悯在焦虑症治疗中有重要作用，但是目前研究没有将自悯训练用于治疗 GAD。本研究旨在考察两周八次的自悯训练对 GAD 的疗效，并与经典的正念治疗进行直接比较。75 名 GAD 患者被分配到自悯训练组（n = 25）、正念训练组（n = 25）、常规治疗组（n = 25）（ClinicalTrials 注册 ID: ChiCTR2100053374），其中自悯训练组和正念训练组除了接受包含药物使用的常规治疗之外，还分别接受自悯或正念训练。主要结果变量包括汉密尔顿焦虑量表和宾州担忧问卷，并在干预前、干预后和干预后三个月分别施测。次要结果包括汉密尔顿抑郁量表、匹兹堡睡眠质量指数、自悯量表和多伦多正念量表。根据意向性分析原则（Intention-to-treat Analysis，ITT）对改变量进行了方差分析，并基于此建立了中介模型。结果显示，自悯训练组和正念训练组都能有效降低 GAD 患者的焦虑和抑郁，并且比常规治疗组起效更快。三组的担忧变化无差异。中介分析显示，自悯通过降低焦虑来改善睡眠质量。我们结果表明自悯训练组和正念训练组都能有效降低 GAD 患者的临床症状，但自悯训练的愉悦体验和接受程度更高，而且自悯训练通过降低焦虑间接地改善 GAD 患者的睡眠质量。研究结果表明自悯训练对 GAD 临床治疗具有巨大的潜力，有望成为新的辅助心理治疗工具。

4 School of Psychology, South China Normal University, Guangzhou 510631, lihong_psych@m.scnu.edu.cn

Abstract： Generalized anxiety disorder (GAD) is the most common anxiety disorder and very difficult to treat successfully. Many studies have shown the potential of self-compassion in reducing anxiety symptoms, but no studies have applied self-compassion training to the treatment of GAD. The aim of this study was to examine the effect of a two-week self-compassion training including eight sessions for GAD, in direct comparison with classic mindfulness-based treatment. 75 GAD patients were assigned to self-compassion training group (n = 25), mindfulness training group (n = 25), treat-as-usal group (n = 25) (ClinicalTrials registration ID: ChiCTR2100053374), in which self-compassion training group and mindfulness training groups received either self-compassion or mindfulness training respectively, in addition to treat-as-usal i.e., medication use. Primary outcomes included the Hamilton Anxiety Rating Scale and the Penn State Worry Questionnaire, which were administered at pre-intervention, post-intervention, and three months after the intervention. Secondary outcomes included the Hamilton Depression Rating Scale, the Pittsburgh Sleep Quality Index, the Self-Compassion Scale, and the Toronto Mindfulness Scale. According to the principle of intention analysis (Intention-to-treat Analysis, ITT), analysis was carried out on the variables of change, and a mediation model was established based on this. Results showed that both the self-compassion training and mindfulness training group effectively reduced anxiety and depression in patients with GAD, and the effect came faster than the treat-as-usal group. There was no difference in change in worry among the three groups. Mediation analysis revealed that self-compassion improves sleep quality by reducing anxiety. Our results show that both the self-compassion training group and the mindfulness training group can reduce the clinical symptoms of patients with GAD, but the pleasure and acceptability of self-compassion training are higher, and self-compassion training can improve the sleep quality of GAD patients by reducing anxiety. These findings suggest that self-compassion training has great potential for the treatment of GAD and is expected to be a promising psychotherapy tool.

父母低头行为对青少年问题行为的影响：亲子联结感的中介作用与正念教养的调节作用

朱晓晴[1]　程红[2]　王雨吟[1]（通讯作者）

[1]中山大学心理学系，广州，510000，wangyuy2@mail.sysu.edu.cn

[2]北京大学心理与认知科学学院，北京，100000

摘　要：青春期是问题行为的高发期，而家庭作为青少年最重要的生活环境和社会关系，家庭因素对青少年问题行为的影响值得重视。父母低头行为是现代社会催生的一种消极养育方式，指的是亲子互动中父母因使用手机而忽视孩子的现象。已有研究表明，父母低头行为与青少年内外化问题行为（如手机成瘾、抑郁等）存在关联。但目前尚无研究直接探讨父母低头行为与反映青少年整体心理健康状况的一般性行为和情绪问题的联系。此外，现有研究大多基于横断面数据，难以考察家庭系统中两者的动态关系，也限制了对其潜在机制的探讨。

本研究结合横断面和密集追踪数据，旨在探讨中国家庭背景下父母低头行为与青少年问题行为之间的关系，以及亲子联结感的中介作用和正念教养的调节作用。研究一共招募 164 对亲子被试参与横断面问卷调查，其中父母低头行为由父母和青少年双方报告，亲子联结感和青少年问题行为由青少年单方报告。结果表明，父母自评的低头行为与青少年感知的父母低头行为呈显著正相关；青少年感知的父母低头行为与青少年问题行为呈显著正相关，亲子联结感在其中起中介作用。

研究二共招募 110 对亲子被试，首先由父母报告正念教养水平，随后通过密集追踪方法连续采集 10 天数据，由青少年报告其感知的父母低头行为、亲子联结感和问题行为。数据分析采用多水平结构方程模型，在个体内和个体间水平进一步探索父母低头行为、青少年问题行为与亲子联结感之间的关系。结果表明，每日父母低头行为可以正向预测每日青少年问题行为，每日亲子联结感在其中起中介作用。此外，正念教养可以调节父母低头行为对青少年问题行为的影响，当父母的正念教养水平较高时，低头行为所带来的负面影响将被削弱。

本研究表明，父母低头行为会损害亲子联结感，进而使得青少年问题行为增加。这一发现无疑为中国父母敲响了警钟，在亲子互动中不应让手机分走了对孩子的关注。此外，本研究也揭示了正念教养在亲子关系中的保护作用，提示父母采取积极教养方式的重要性。

关键词：父母低头行为，青少年问题行为，亲子联结感，正念教养

Parental Phubbing and Problem Behaviors in Chinese Adolescents: The Role of Parent-Child Connectedness and Mindful Parenting

Xiaoqing Zhu[1], Hong Cheng[2], Yuyin Wang[1]
[1]Department of Psychology, Sun Yat-sen University, Guangzhou, China
[2]School of Psychological and Cognitive Sciences, Peking University, Beijing, China

Abstract: Adolescents' psychosocial problems are a major public health concern worldwide. Although children's social worlds undergo a significant transformation with increased salience of peer relationships across adolescence, parents continue to serve as a source of nurturance at this age period. With the growing popularity of smartphone use in everyday family life, there has been a growing scholarly interest in understanding the negative effects of parental phubbing on adolescents' development in recent years. Parental pubbing is a new concept in the research area of parenting. It refers to parents using or being distracted by smartphones when interacting with their children.

In general, parental pubbing has been identified as negative parenting that can interfere with the quality of parent-child interactions and associate with children's increased maladaptive outcomes. However, as a new research construct, the current understanding of parental pubbing's potential effects on adolescent outcomes remains limited. First, extant research has primarily focused on the relationship between parental pubbing and adolescent problematic smartphone use, leaving its roles in adolescents' general psychosocial development understudied. Second, the reliance on cross-sectional designs in extant research precludes understanding the dynamic relationship between parental phubbing and adolescent outcomes within family systems over time. Third, the underlying mechanism through which parental pubbing relates to adolescent psychosocial outcomes and whether there are possible buffers in their relations remains unclear.

To address the abovementioned limitations, we conducted two studies with parent-adolescent dyads living in a metropolitan city in China. Study 1 is a cross-sectional design, and Study 2 is a 10-day intensive longitudinal design. The two studies explored the relationship between parental pubbing and adolescents' psychosocial problems, as well as the possible mediation of parent-child connectedness and moderation of mindful parenting. We focused on these two factors because past literature has consistently shown that technology interference likely decreases relationship quality between the parent and child. Parent-child connectedness reflects parent-child relationship quality. Mindful parenting, which refers to applying mindfulness skills to parent-child interactions, has been demonstrated to be beneficial for parent-child relationship and adolescent development.

A sample of 164 pairs of Chinese adolescents (52.4% male; mean age = 12.72 years, *SD* = 2.95) and their parents (17.1% male; mean age = 39.80 years, *SD* = 5.71) participated in Study 1. Both parents' and adolescents' perceived parental phubbing were collected. Adolescents also completed questionnaires regarding perceived parent-child connectedness and self-report problem behaviors. The results indicated that parents' self-reported phubbing behavior was positively correlated with adolescents' perceived parental phubbing. Besides, adolescents' perceived parental phubbing was positively correlated with adolescent problem behavior and parent-child connectedness partially mediated this relationship. However, parents' self-reported phubbing behavior was not significantly related to adolescents' perceived parent-child connectedness and adolescent problem behavior, and therefore it was excluded from subsequent analyses and research.

Study 2 further employed a 10-day intensive longitudinal design to validate the results of Study 1 at both within- and between-person levels. A sample of 110 pairs of Chinese adolescents (57.3% male; mean age = 13.15 years, *SD* = 0.76) and their parents (7.3% male; mean age = 41.97 years, *SD* = 4.24) was recruited. In step 1, parents were invited to report their mindful parenting levels. In step 2, adolescents reported their daily perceived

parental phubbing, parent-child connectedness, and problem behaviors during the next ten consecutive days. The multilevel structure equation model (MSEM) analysis in Mplus 8.0 was executed to test the moderated mediation model. The results indicated that adolescents' daily perceived parental phubbing positively predicted their daily problem behaviors and the daily parent-child connectedness played a mediating role in it. Moreover, mindful parenting moderated the impact of parental phubbing on adolescent problem behavior, the negative effect was weakened when parents with a high level of mindful parenting.

This research proves that parental phubbing can significantly increase adolescent problem behavior by damaging parent-child connectedness. Additionally, it demonstrates that mindful parenting can buffer the negative effect of parental phubbing on adolescents' psychosocial problems, which aligns with previous literature highlighting the benefits of mindful parenting on child development. These findings serve as a wake-up call for Chinese parents, suggesting that they should consider to put down smartphones when getting along with adolescents.

Keywords: parental phubbing behavior, adolescent problem behavior, parent-child connectedness, mindful parenting

父母与儿童抗逆力对突发公共卫生事件不同时期焦虑的影响：纵向主客体互倚分析

方婧欣[1]　赵轶[2]　安媛媛[1]（通讯作者）
1 南京师范大学心理学院，南京，210097，anran220@163.com
2 北京师范大学心理学部，北京，100875

摘 要　新冠肺炎疫情作为一场典型的重大突发公共卫生事件，引发了广泛而持续的恐慌和焦虑。长期的居家隔离往往被视为家庭资源和功能的重大威胁，然而，根据家庭系统理论，极长时间的封闭相处也增加了家庭成员之间的互倚性，某一家庭成员在事件中所表现出的抗逆力很可能帮助整个家庭维持日常生活秩序，缓解其他家庭成员的焦虑等心理症状。有研究发现，疫情下父母的抗逆力能够负向预测儿童的焦虑水平。然而，目前尚未有研究从互倚的角度，探究家庭中父母与儿童抗逆力水平对焦虑的相互作用。本研究旨在采用主客体互倚中介模型，探究重大突发公共卫生事件下父母与儿童的抗逆力对双方焦虑的保护作用，并探讨其在疫情高峰期与稳定期的差异。研究选取 315 户家庭的父母与儿童作为被试，分别于 2020 年 2 月（T1，疫情爆发期）采用抗逆力量表（CD-RISC），于 2020 年 3 月（T2，疫情高峰期）和 10 月（T3，疫情稳定期）采用焦虑自评量表（SAS）进行施测，并搭建了 T1 抗逆力对 T2 和 T3 焦虑影响的纵向主客体互倚中介模型。结果发现：（1）儿童/父母 T1 的抗逆力水平对其疫情高峰期（T2）焦虑水平的主体效应显著，并能进一步预测其自身在疫情稳定期（T3）的焦虑水平；（2）父母 T1 的抗逆力水平对疫情高峰期（T2）儿童焦虑水平的客体效应显著；（3）儿童 T1 的抗逆力水平对疫情稳定期（T3）父母焦虑水平的客体效应显著。结果表明，重大突发公共卫生事件下父母的抗逆力可以在短期内迅速缓解儿童的焦虑，孩子的抗逆力能够在更长期的稳定期对父母的焦虑水平起到反向的保护作用。这揭示了父母与儿童的抗逆力在家庭适应危机的不同阶段可能表现出不同的作用机制，并提示在重大突发公共卫生事件中，应注重家庭整体的适应过程与家庭成员间的相互影响，发掘部分家庭成员的心理资源与优势以缓解其他成员的焦虑等心理症状。

The effect of parents' and children's resilience on anxiety in different periods of public health emergencies: a longitudinal actor-partner interdependence analysis

Jingxin Fang[1], Yi Zhao[2], Yuanyuan An[1](Corresponding author)
1 School of Psychology, Nanjing Normal University, Nanjing, 210097
2 Faculty of Psychology, Beijing Normal University, Beijing, 100875

Abstract：As a typical major public health emergency, the novel coronavirus (COVID-19) pandemic has triggered widespread and sustained panic and anxiety. Long-term isolation at home is often seen as a major threat to family resources and functions. However, according to the family system theory, prolonged isolation also increases the interdependence of family members, and the resilience shown by a family member during an event is likely to help the whole family maintain the order of daily life and alleviate psychological symptoms such as

anxiety of other family members. Some studies have found that parents' resilience can negatively predict children's anxiety symptoms during the pandemic. However, there are no studies to explore the interaction of resilience between parents and children on anxiety in the family members from the perspective of interdependence. The aim of this study was to explore the protective effect of resilience of parents and children on anxiety in major public health emergencies, and to explore the difference between the peak and stable period of the COVID-19. The study selected 315 families of parents and children as subjects, using the Connor-Davidson Resilience Scale (CD-RISC) in February 2020 (T1, the outbreak period of COVID-19), using the Self-Rating Anxiety Scale (SAS) in March 2020 (T2, the peak period of COVID-19) and in October 2020 (T3, the stable period of COVID-19). A longitudinal actor-partner interdependence mediation model of the effects of T1 resilience on T2 and T3 anxiety was established. The results showed that: (1) the resilience of children and parents at T1 had a significant actor effect on their anxiety symptoms at the peak of the COVID-19 (T2), and could further predict their anxiety symptoms at the stable period of the COVID-19 (T3); (2) The partner effect of parents' resilience at T1 on the anxiety symptoms of children at the peak of the COVID-19 (T2) was significant; (3) The partner effect of children's resilience at T1 on the anxiety symptoms of parents in the stable period of the COVID-19 was significant. The results show that parents' resilience can rapidly relieve children's anxiety in the short term, and children's resilience can inversely protect parents' anxiety during the longer stable period. These findings reveal that the resilience of parents and children may show different mechanisms in different stages of family's adaptation crisis, and suggest that in major public health emergencies, we should pay attention to the adaptation process of whole family and the interaction between family members, and explore the psychological resources and advantages of some family members to alleviate the anxiety and other psychological symptoms of other members.

他们在害怕什么？社交焦虑自动思维的质性探索

崔洌川[1] 皮雨虹[1] 邓嘉琪[1] 唐信峰[1]（通讯作者）
1 中国人民大学理学院心理学系，北京，100872 （xtang@ruc.edu.cn）

摘要

目的：根据社交焦虑的认知模型（例如，Clark & Wells, 1995; Hofmann, 2007），负面认知（自动思维和信念）是社交焦虑的主要成因。本研究旨在深入探索社交焦虑者在社交情境下的自动思维种类，从而开发更有效、更个性化的干预手段提供可能。

方法：采用目的取样法，对 34 名有社交焦虑的大学生进行了半结构化访谈，纳入标准为社交恐怖症量表（Social Phobia Inventory, SPIN）＞19 分。我们使用 MAXQDA 软件对访谈内容进行主题分析。

结果：根据对访谈结果的内容分析，我们提炼出了 7 个主题，包括负面评价、表现过程不好、表现结果不好、严苛的社交规范、可见和隐匿的身体表现、不良的情绪控制以及社交的挑战性。具体来说，我们发现在对待自己的想法上，社交焦虑者均有对自己包括外在及内在特质的负面评价，并担忧来自他人对自己各项能力表现及性格特点的负面评价。面对社交过程，他们中的大部分会担心自己在社交过程中的表现及结果不好，例如发言过程不流畅、面试得低分等。这令他们在社交时持续处于紧张状态。而对社交本身，他们中的大多数人也会有所顾虑，这些人可能会有一套或真实或想象的社交规范来约束自己的言行，避免犯错或违反他人的规范，同时也有许多受访者觉得社交本身就是一件具有挑战性的难题，例如人们之间总是因为各方面差异而产生隔阂，甚至还可能充满隐私受到侵犯等危险，这阻碍了他们进入社交。最后，也会有受访者担忧情绪和身体方面的表现，包括社交过程会产生的尴尬、焦虑等负面情绪，以及心跳加速、脸红出汗等身体反应，并且他们会觉得这种反应是不可控的，从而更加焦虑。上述这些担忧和顾虑的想法可能是个体社交焦虑产生的直接原因和维持因素。

讨论：本研究深入探索了中国高社交焦虑学生群体的自动思维和信念类型，明确地阐述了社交焦虑个体所恐惧的核心内容。此研究为社交焦虑预防及干预策略的制定提供了重要的指导方向。

关键词　社交焦虑，自动思维，质性研究

What Are They Afraid Of? A Qualitative Exploration of Automatic Thoughts in Socially Anxious College Students

Liechuan Cui, Yuhong Pi, Jiaqi Deng, Xinfeng Tang
Department of Psychology, Renmin University of China, Beijing, China
Corresponding author: xtang@ruc.edu.cn (X. Tang)

Abstract

Aim: Based on the cognitive model of social anxiety (e.g., Clark & Wells, 1995; Hofmann, 2007), negative cognitions (automatic thoughts and beliefs) are considered significant factors contributing to social anxiety. The present study aims to delve into the types of automatic thoughts experienced by individuals with social anxiety in social situations, with the ultimate goal of developing more effective and personalized intervention strategies.

Methods: Using purposive sampling, semi-structured interviews were conducted with 34 college students who met the criteria for social anxiety, as indicated by a Social Phobia Inventory (SPIN) score > 19. The data collected from the interviews were analyzed using thematic analysis in MAXQDA software.

Results: Content analysis of the interview results yielded seven themes, including negative evaluation, poor performance process, poor performance outcomes, rigid social norms, visible and invisible physical symptoms, poor emotional control, and the challenges of social interaction. Specifically, it was found that individuals with social anxiety exhibit negative self-evaluations concerning both their external and internal traits, as well as concerns about negative evaluations of their abilities and personality traits by others. In social interactions, the majority of them worry about their performance process and outcomes, such as speaking fluency or receiving low scores in interviews, leading to a continued state of anxiety during social interactions. Furthermore, many interviewees have concerns about social interactions themselves, often adhering to a set of real or imagined social norms to regulate their behavior, avoid making mistakes, or violating others' norms. Some also perceive social interactions as challenging due to differences among individuals, potential privacy infringements, and other risks, hindering their engagement in social situations. Lastly, interviewees express concerns about emotional and physical manifestations, including embarrassment, anxiety, and uncontrollable physiological responses such as increased heart rate, blushing, and sweating during social interactions, which exacerbate their anxiety. These worries and concerns may serve as direct causes and maintenance factors of individual social anxiety.

Discussion: This study provides an in-depth exploration of the types of automatic thoughts and beliefs among Chinese college students with high social anxiety, elucidating the core content of their fears. This research offers crucial guidance for the development of social anxiety prevention and intervention strategies.

心理健康促进 4P 模型：过程与应用

唐信峰[1]（通讯作者） 贾思茗[2] 任志洪[3]

[1]中国人民大学心理学系，北京，100872， xtang@ruc.edu.cn

[2] 中国人民大学社会工作与社会政策系，北京，100872

[3] 华中师范大学心理学院，武汉，430079

摘 要

心理健康促进在全球范围内已成为一项重要议题，并广泛应用于学校、社区、政府和企业等各个领域，旨在促进各年龄段的个体心理健康，涵盖情绪困扰（如抑郁、焦虑）和行为问题（如欺凌、拒学）等多个方面。

在现有的心理健康促进模型中，Gordon（1983）提出的三级预防（普遍性预防、选择性预防和指向性预防）产生了深远影响。普遍性预防（universal prevention）针对整个人群提供预防策略，以使所有个体受益。选择性预防（selective prevention）则专门针对被确认处于较高疾病风险的亚群体，提供相应的预防措施。指向性预防（indicated prevention）则针对那些表现出初步症状但尚未达到诊断标准的个体，以提供相应干预措施。然而，该模型存在一定局限，其仅仅划分了干预的人群，对于干预的具体内容和目标缺乏明确说明。此外，该模型是从研究者和实践者的角度开发的，未考虑来访者/病人的视角和需求，因而在来访者/病人的求助过程中并未提供充分的支持。

为此，我们提出了一个新的心理健康促进模型——4P 模型（Four-Phase Model of Mental Health Promotion），包含以下 4 个阶段：科普（popularization）、教育（psychoeducation）、咨询（psychotherapy）和治疗（psychiatric treatment）。第一阶段（科普阶段）旨在提升个体对自己和他人心理健康困扰的心理健康素养：增加疾病知识，减少疾病污名化，并促进求助意愿和行为。第二阶段（教育阶段），又称心理教育阶段，旨在提升个体对疾病干预的理论和技术的了解，帮助他们掌握有效的自助干预技巧。第三阶段（咨询阶段），主要采取心理咨询的方式，通过更为深度的咨询互动、体验和练习，帮助个体改善问题。第四阶段（治疗阶段），针对诊断为心理障碍的个体，在医疗环境中进行药物或心理干预，协助其改善心理困扰。这四个阶段根据干预目标（增加知识或改善症状）、目标人群（普通人群或临床人群）、干预递送人员（专业人员或非专业人员）以及干预形式（团体或个体、高强度或低强度、线上或线下、自助或专业人士带领）进行了差异化设置。

心理健康促进的 4P 模型具有以下优点：首先，它纳入了心理健康素养的提升，这在发展中国家尤为重要。其次，它将以自助为主的教育阶段（第二阶段）和以专业人士带领的咨询阶段（第三阶段）分开，更加清晰地区分这两种干预方式的差异。最后，该模型不仅为研究者和实践者提供了指南，还能为普通公众/来访者/病人提供求助指引。

Four-phase Model of Mental Health Promotion: Process and Applications

Xinfeng Tang[1], Siming Jia[2], Zhihong Ren[3]

[1]Department of Psychology, Renmin University of China, Beijing, China

[2]Department of Social Work and Social Policy, Renmin University of China, Beijing, China

Corresponding author: xtang@ruc.edu.cn (X. Tang)

***Abstract*:**

Mental health promotion has become a significant global issue and is widely applied across various domains, including schools, communities, governments, and corporations. The primary objective is to foster psychological well-being among individuals of all age groups, encompassing multiple aspects such as emotional distress (e.g., depression, anxiety) and behavioral issues (e.g., bullying, school refusal).

Among the existing mental health promotion models, Gordon's (1983) three-tiered prevention model (universal prevention, selective prevention, and indicated prevention) has had a profound impact. *Universal prevention* targets the entire population with preventive strategies, benefiting all individuals. *Selective prevention* focuses on subgroups identified as having a higher risk of developing certain disorders and offers tailored preventive measures. *Indicated prevention* targets individuals exhibiting initial symptoms that have not yet met diagnostic criteria, providing effective intervention strategies. However, this model has certain limitations as it only categorizes intervention target populations, lacking explicit specifications of intervention content and objectives. Moreover, its development has been researcher- and practitioner-centric, neglecting the perspectives and needs of clients/patients, thereby not providing adequate support during their help-seeking process.

Therefore, we propose a novel model for mental health promotion, the Four-Phase Model of Mental Health Promotion (4P Model), comprising four distinct phases: *Popularization*, *Psychoeducation*, *Psychotherapy*, and *Psychiatric Treatment*. The first phase (Popularization) aims to enhance individuals' mental health literacy towards themselves and others: increase disease knowledge, reduce stigma, and promote help-seeking intentions and behaviors of themselves and others. The second phase (Psychoeducation) focuses on enhancing individuals' understanding of disease interventions, providing them with effective self-help intervention skills. The third phase (Psychotherapy) primarily involves psychological counseling, employing more in-depth counseling interactions, experiential learning, and practice to help individuals improve their issues. The fourth phase (Psychiatric Treatment) addresses individuals diagnosed with mental health disorders, offering psychiatric or psychological interventions within a medical setting to assist in alleviating their psychological distress. The four phases are differentially tailored based on intervention objectives (knowledge enhancement versus symptom improvement), target population (general population versus clinical population), service providers (professionals versus non-professionals), and delivery formats (group versus individual; high intensity versus low intensity; online versus face-to-face; self-help versus professionally-led).

The 4P Model possesses several advantages: Firstly, it incorporates the improvement of mental health literacy, which is particularly crucial in developing countries. Secondly, it distinctly separates the psychoeducation (Phase 2) focused on self-help interventions from the psychotherapy (Phase 3) led by professionals, providing clarity on the differences between these two approaches. Lastly, this model not only offers guidance for researchers and practitioners but also provides a roadmap for the general public/clients/patients seeking assistance.

功能分析心理疗法及其临床应用进展

王礼军[1]（通讯作者） 向苇秦[1]
1 安徽师范大学教育科学学院，芜湖，241000，nnuwlj8421@163.com

摘 要 “第三浪潮”认知行为疗法强调正念、情感、接纳、关系、价值观念、目标和元认知等方面，旨在帮助来访者澄清自己的价值观，鼓励来访者采取积极灵活的行动以改变生活，且已在医院、学校、社区或通过在线平台被广泛应用，在预防和治疗各类疾病方面取得明显成效。功能分析心理疗法（functional analytic psychotherapy, FAP）是“第三浪潮”认知行为疗法中聚焦人际关系问题的一种新型疗法，其主要特点是强调治疗情境与日常环境的功能等同性，通过分析来访者在治疗过程中的问题行为，积极创设能促进来访者改变的情境，强化来访者的行为改变并泛化至日常生活，以恢复来访者的人际关系等功能。FAP 主张在 ACL 模型的指导下，基于 5 项治疗准则开展治疗，并采用功能分析心理疗法评定量表、功能分析心理疗法能力量表、功能分析心理疗法亲密量表、自我体验量表等工具以检验 FAP 的治疗效果、评估治疗师的能力以及了解来访者的心理特征以及治疗过程中的变化。FAP 既可以单独用于治疗各类心理问题，也可与其它治疗方法联合使用以增强治疗效果，其在改善人际关系障碍中的临床应用得到团体和个案研究的有效证明，在改善抑郁症、精神分裂症、边缘型人格障碍、反社会型人格障碍等临床应用方面也取得重要进展。但关于 FAP 的研究仍存在研究设计缺陷、内在机制和治疗规则探讨不足、评价工具不完善等问题，且 FAP 作为一种新型的治疗手段尚未引起国内学者的充分关注和应用。后续研究应完善 FAP 的研究方法和工具、探讨 FAP 的治疗规则及患者的神经机制变化、推进 FAP 中国化和数字化治疗服务应用进程。

Functional Analytic Psychotherapy and Its Clinical Application

WANG Lijun, XIANG Weiqin
School of Educational Science, Anhui Normal University, Wuhu 241000

Abstract: The “third wave” cognitive behavioral therapy places emphasis on mindfulness, emotion, acceptance, relationship, values, goals and meta-cognition. It aims to facilitate clients in clarifying their values and motivating them to take active and flexible actions to change their lives. It has been extensively utilized in hospitals, schools, communities and online platforms with remarkable effect in the prevention and treatment of various diseases. Functional analytic psychotherapy(FAP) is a new therapy that focuses on interpersonal issues in the “third wave” cognitive behavioral therapy. Its main characteristic is to emphasize the functional equivalence between treatment conditions and daily environments, create situations that can promote clients’ change by analyzing their problematic behaviors during the treatment, reinforce their change, and generalize it to daily life. FAP’s purpose is to restore clients’ interpersonal relationship and other functions. FAP carries out treatment guided by ACL model and based on five treatment guidelines. It utilizes tools such as Functional Analytic Psychotherapy Rating Scale, Functional Analytic Psychotherapy Competency Scale, Functional Analytic Psychotherapy Intimacy Scale, Experiencing of Self Scale to assess FAP’s treatment effectiveness, therapist competency, and client psychological characteristics and changes throughout the treatment process. FAP can be used to treat various psychological problems alone, or in conjunction with other therapies to augment the therapeutic outcome. Its clinical efficacy has been effectively demonstrated in ameliorating interpersonal relationship disorders through groups and case studies, as well as making significant strides in the treatment of depression, mental disorders, borderline personality disorders, and antisocial personality disorders. However, there are still some issues in FAP research, such as

deficiencies in research design, inadequate discussion of internal mechanisms and treatment rules, and imperfect evaluation tools. Additionally, as a new psychotherapy approach, FAP has not received sufficient attention or application from domestic scholars. Subsequent studies ought to improve the research methods and tools of FAP, explore the treatment rules for FAP and the neurological changes in clients, as well as promote the application of FAP in China and digital treatment services.

反刻板印象想象对心理咨询师关于来访者内隐性别刻板印象的影响研究

李渠渠[1] 林靖凯[2] 张军[2]（通讯作者）
1 北京师范大学，北京，100101
2 华南理工大学，广州，510000
2 北京师范大学珠海校区，广东省珠海市，519000，zjpsy@bnu.edu.cn

摘 要 心理咨询师关于来访者的性别刻板印象会影响咨询过程和咨询效果。本研究分为两个部分，探讨了心理咨询师关于来访者内隐性别刻板印象的具体内容和强度，并通过反刻板印象想象对心理咨询师关于来访者刻内隐性别刻板印象进行干预，通过 excel 计算每个被试的内隐 D 值作为被试内隐性别刻板印象的程度指标，利用 SPSS 27.0 进行数据分析。

研究一使用自由联想法探讨心理咨询师关于来访者性别刻板印象的具体内容并将其作为材料制作内隐联想测验程序，招募 132 名心理咨询师完成内隐联想测验，发现心理咨询师对来访者内隐性别刻板印象较强（Mean D =0.84），对女性来访者的刻板印象为情感丰富、倾诉欲、敏感、细腻、纠结、关注关系，对男性来访者的刻板印象为情感隔离、压抑、理性、回避、易怒、控制。

研究二考察反刻板印象想象对心理咨询师内隐性别刻板印象的干预效果。研究 2a 招募 94 名心理咨询师作为被试，选取对男性和女性来访者内隐刻板印象程度最高的词语作为干预目标，让被试想象符合刻板印象、反刻板印象的来访者或风景，进行 5 分钟想象后记录想象内容。发现反刻板印象想象对心理咨询师关于男性来访者内隐性别刻板印象干预效果显著(t =-2.89, p =0.009)，对关于女性来访者内隐性别刻板印象干预效果不显著；进一步地，研究 2b 招募 53 名心理咨询师作为被试，选取符合男性来访者程度最低的词语作为干预目标，发现反刻板印象想象对心理咨询师关于男性来访者较弱的性别刻板印象仍能起到显著干预作用（t =-2.66, p =0.015）。研究还发现，心理咨询师的性别、年龄、咨询小时数与心理咨询师内隐性别刻板印象强度和反刻板印象想象的干预效果无显著相关性。

关键词 性别刻板印象，心理咨询，反刻板印象

A STUDY ON THE EFFECT OF ANTI-STEREOTYPE IMAGINATION ON COUNSELORS' IMPLICITSTEREOTYPES OF CLIENTS

Liququ[1] Linjingkai[2] Zhangjun[2] (Corresponding author)
1 Beijing Normal University, Beijing,100101
2 South China University of Technology, Guangzhou, 510000
2 Beijing Normal University Zhuhai Campus, Zhuhai City, Guangdong Province, 519000,
zjpsy@bnu.edu.cn

Abstract

Counselors' gender stereotypes about clients can affect counseling process and counseling effectiveness.This study is divided into two parts,exploring the specific content of counselors' gender stereotypes about clients, the

strength of counselors' implicit gender stereotypes and the influence of anti-stereotype imagination on them.The implicit D value of each participant is calculated using Excel as an indicator of the degree of implicit stereotype among participants, and data analysis is conducted using SPSS27.0.

In study 1, the free association method was used to explor the specific content of counselors' gender stereotypes about clients and used it as a material to create the Implicit Association Test procedure. 132 counselors were recruited to complete the Implicit Association Test. It was found that counselors have strong implicit gender stereotypes about clients (Mean D =0.84), the stereotypes of female clients are emotionally rich, talkative, sensitive, delicate, entangled, and focused on relationships, while the stereotypes of male clients are eemotional isolation, suppression, rationality, avoidance, irritability, and control

Study 2 examines the influence of anti-stereotype imagination on implicit gender stereotypes in counselors. In Study 2a, 94 counselors were recruited as participants, and the words that met the highest degree of male and female clients were selected as the intervention objects. The participants were asked to imagine the client who met or anti-stereotype or stereotype or scenery, and the imagination content was recorded after 5 minutes of imagination. It was found that anti-stereotype imagination had a significant intervention effect on male clients' stereotypes by counselors (t =-2.89, p =0.009), but had no significant intervention effect on female clients' stereotypes by counselors; Furthermore, in Study 2b, 53 counselors were recruited as participants, and the words with the lowest degree of compliance with male clients were selected as intervention subjects. It was found that anti-stereotype imagination still had a significant intervention effect on counselors' weaker gender stereotypes of male clients (t =-2.66, p =0.015). The study also found that there is no significant correlation between the gender, age, and consultation hours of a counselor and the intervention effect of the counselor on the implicit gender stereotype intensity and anti-stereotype imagination of clients.

完美主义团体干预方案对青少年社交焦虑的干预效果研究

孟佳策[1]　余萌[1,2]

[1] 中山大学心理学系，广州，510006

[2*]南方医科大学公共卫生学院心理学系，广州，510510，Email：yumengbnu@163.com

摘　要：完美主义是一个跨诊断因素，对于诸多心理问题（包括社交焦虑）都有影响。干预青少年的完美主义将有利于降低其社交焦虑水平，从而促进其心理发展。以往研究主要集中于消极完美主义对社交焦虑的影响上，关于积极完美主义对社交焦虑的影响的研究相对较少。而本研究将同时从积极和消极两个角度对完美主义进行探讨，从干预的角度研究其与青少年社交焦虑之间存在的关系。

本研究基于文献和相关书籍研发了一套适合青少年的干预完美主义的方案，以认知行为治疗的框架为主，融合了积极心理治疗和正念的技术，旨在降低成员的消极完美主义，提升积极完美主义。为了探讨这一干预手段是否可以有效干预社交焦虑水平，本研究共招募 71 名高社交焦虑青少年（$M_{年龄}$=16.282,$SD_{年龄}$=0.865），并将其随机分配到干预组（n=34）和对照组（n=31）。干预组被试参加为期 6 周，每周 1 次，每次约 1.5 个小时的团体心理干预。在干预前（T1）、 干预两周后（T2)、干预四周后(T3)、干预六周后(T4)，测量两组被试的积极和消极完美主义以及社交焦虑水平。

基线测量显示，两组被试同质。重复测量方差分析表明，各变量都出现了显著的组别（$F_{社交焦虑}$=64.627，p<0.001; $F_{积极完美主义}$=12.077，p=0.001; $F_{消极完美主义}$=16.067，p<0.001)和干预时间点（$F_{社交焦虑}$=32.250，p<0.001; $F_{积极完美主义}$=17.471，p<0.001; $F_{消极完美主义}$=23.887，p<0.001)的主效应。同时，各个变量组别和干预时间点的交互作用显著。对照组的各个维度均没有显著变化。而干预组被试的积极完美主义显著增加（T4-T1=22.235,t=7.704），消极完美主义显著减少（T4-T1=-19.147,t=-6.994），社交焦虑水平较干预前有显著降低（T4-T1=-13.882，t=-11.385）。进一步的简单效应表明，相较于对照组，在第二周后，干预组和对照组的社交焦虑水平(p<0.001)、消极完美主义（p=0.005）出现了显著减少。在第四周后，干预组和对照组的积极完美主义出现了显著增加(p<0.001)。

结果显示这一干预方案能够有效干预青少年的社交焦虑水平，给其心理健康发展带来裨益，以期对中学心理健康老师从事青少年的工作带来一定的实用价值和借鉴意义。

Study on the Effect of Perfectionism Group Intervention Program on Social Anxiety of Adolescents

Meng Jiace [1], Yu Meng[1,2]
1 Department of Psychology, Sun Yat-sen University, Guangzhou, 510006
2 * Department of Psychology, School of Public Health, Southern Medical University, Guangzhou, 510510, Email: yumengbnu@163.com

Abstract: Perfectionism is a cross diagnostic factor, which has an impact on many psychological problems (including Social anxiety). Intervention of adolescents' perfectionism will help to reduce their Social anxiety level, thus promoting their psychological development. Previous studies mainly focused on the impact of negative perfectionism on Social anxiety, while there were relatively few studies on the impact of positive perfectionism on Social anxiety. This study will explore perfectionism from both positive and negative perspectives, and study the relationship between perfectionism and adolescent Social anxiety from the perspective of intervention.

Based on the literature and related books, this research developed a set of intervention perfectionism programs suitable for adolescents, focusing on the framework of cognitive Behaviour therapy, integrating positive psychotherapy and mindfulness technology, aiming to reduce the negative perfectionism of members and improve the positive perfectionism. In order to explore whether this intervention can effectively intervene the level of Social anxiety, 71 adolescents with high Social anxiety (M_{age}=16.282, SD_{age}=0.865) were recruited and randomly assigned to the intervention group (n=34) and the control group (n=31). The intervention group participants participated in a group psychological intervention for 6 weeks, once a week, for approximately 1.5 hours each time. The levels of positive and negative perfectionism and Social anxiety of the two groups were measured before the intervention (T1), two weeks after the intervention (T2), four weeks after the intervention (T3), and six weeks after the intervention (T4).

Baseline measurements showed that both groups of participants were homogeneous. Analysis of variance of repeated measurements showed that each variable had significant main effects in groups ($F_{scial\ anxiety}$=64.627, p<0.001; $F_{positive\ perfectionism}$=12.077, p=0.001; $F_{negative\ perfectionism}$=16.067, p<0.001) and intervention time points ($F_{social\ anxiety}$=32.250, p<0.001; $F_{positive\ perfectionism}$=17.471, p<0.001; $F_{negative\ perfectionism}$=23.887, p<0.001). At the same time, the interaction between various variable groups and intervention time points is significant. There were no significant changes in all dimensions of the control group. In the intervention group, positive perfectionism was significantly increased (T4-T1=22.235,t=7.704), negative perfectionism was significantly reduced (T4-T1=-19.147, t=-6.994), and Social anxiety level was significantly reduced (T4-T1=-13.882, t=-11.385). Further simple effects showed that compared with the control group, the level of Social anxiety (p<0.001) and negative perfectionism (p=0.005) in the intervention group and the control group significantly decreased after the second week. After the fourth week, there was a significant increase in positive perfectionism in the intervention group and the control group (p<0.001).

The results show that this intervention program can effectively intervene the level of Social anxiety of adolescents, bring benefits to their mental health development, and bring certain practical value and reference significance to middle school mental health teachers engaged in the work of adolescents.

摘 要：个性化心理治疗的实现一致是一个难点。近年来，复杂系统科学的思想在精神病学领域得到了长足发展，心理健康被认为是由多种心理症状表现相互作用形成的复杂网络。不少研究使用复杂网络的分析方法，通过计算网络的核心节点确定关键症状表现，以期为干预或治疗提供明确的“靶点”。但是，由于聚焦关键症状节点的靶向治疗是否优于无针对性的治疗尚缺乏实证支持，此类研究的临床价值受到了较大质疑。鉴于实际治疗投入较大，本研究使用仿真的方法，从理论层面探索针对关键节点和无针对性的治疗对心理健康症状网络的影响，为心理治疗提供新思路。在仿真中，分别用蓄意攻击和随机攻击代表针对性治疗和无针对性治疗方法，以症状网络的自然连通度表示网络的抗毁性。基于青少年健康主题数据库中 2020 年的横断调查数据，将 SCL-90 总分超过 200 或任一因子分超过 3 的被试作为研究对象。首先，基于 R 语言的 bootnet 包构建以 SCL-90 条目为节点的症状网络，计算网络中不同症状节点中心性，根据预期影响值（EI）的大小确定症状重要程度。其次，进行抗毁性测试，采用随机攻击与针对重要节点的蓄意攻击的方式分别对症状网络进行攻击，并计算网络遭受攻击时的自然连通度。结果表明，症状网络在遭受随机攻击与蓄意攻击时网络连通度变化明显不同。在随机攻击中，网络的连通度变化缓慢，节点移除个数从 1-75 渐增时，自然联通度变化的拟合曲线始终在 10-15 区间内波动，节点移除个数与整体连通度无明显线性关系；在蓄意攻击中，随着节点移除个数的增加，网络连通度呈线性递减，节点移除个数从 1-75 渐增时，自然联通度变化的拟合曲线在 0-25 区间内波动。研究结果说明，对存在明显心理问题的青少年而言，普适性的治疗方法（随机攻击）不能很好地破坏症状网络之间的联系，治疗效果欠佳，对核心症状进行有针对性的治疗（蓄意 攻击）能更快、更彻底地破坏症状之间的联系，治疗效果较好。
关键词：青少年，心理健康，症状网络，针对性治疗，抗毁性测试

Simulation Study on the Impact of Different Treatment Methods on Adolescent Mental Health

Kechuang Zhang[1]　Mengbi Yang[1]　Shubin Si[1]　Weixia Zhang[2](corresponding author)

Abstract: Personalized psychological treatment is challenging. In recent years, the principles of complex systems science have made significant advancements in the field of psychiatry, in which mental health was treated as a complex network formed by the interaction of various psychological symptoms. Many studies have employed analytical methods from complex network to identify key symptoms by computing the core nodes of the network. The aim is to provide clear "targets" for intervention or treatment. The clinical significance of these studies have been disputed, however, as there is a lack of empirical support for whether targeted treatment focused on key nodes is superior to non-targeted treatment. Given the substantial investment required for actual treatments, this study utilizes simulation methods to explore, from the theoretical perspective, the effects of targeted and non-targeted treatments on the symptom network of mental health. The study aims to provide new insights for the

treatment of depression. In the simulation, deliberate attacks and random attacks are used to represent targeted and non-targeted treatment methods, respectively, with the network's natural connectivity representing its invulnerability. The data source for the study is the cross-sectional survey results from the Adolescent Health Theme Database in 2020, where participants with a total SCL-90 score exceeding 200 or any factor score exceeding 3 were selected. First, using the bootnet package in R, a symptom network is constructed with SCL-90 items as nodes. The centrality of different symptom nodes in the network is calculated, and symptom importance is determined based on the magnitude of the Expected Influence (EI). Next, invulnerability testing is conducted by attacking the symptom network using both random attacks and deliberate attacks targeting important nodes. The network's natural connectivity is computed when subjected to attacks. The results show that the changes in network connectivity are significantly different when the symptom network undergoes random attacks compared to deliberate attacks. During random attacks, the network's connectivity changes gradually, with no apparent linear relationship between the number of removed nodes and overall connectivity. As the number of removing nodes increased from 1-74, the trend of connectivity fluctuate between 10 and 15. However, during deliberate attacks, as the number of removed nodes increases, the network's connectivity changes linearly. As the number of removing nodes increased from 1-74, the trend of connectivity change in 0-75. Our findings indicate that for adolescents with significant psychological problems, non-targeted treatment methods (random attacks) fail to effectively disrupt the connections between symptom networks, resulting in poor treatment outcomes. Targeted treatment focusing on core symptoms (deliberate attacks) can more quickly and thoroughly disrupt the connections between symptoms, leading to better treatment effects.

言为心声：基于 LDA 挖掘心理咨询语料库中的心理和生涯主题

王笑　袁熙庆 程新宇　邢秋连 明玉 王鹏（通讯作者）
山东师范大学心理学院，济南，250000，pengsdnu@163.com

摘 要 背景和目的：基于对话机器人进行的心理咨询对话为文本分析研究提供了丰富的数据资源。本研究拟挖掘首个开放的中文心理咨询对话语料库，探索心理烦恼、心理异常和心理危机个体的生涯主题模型。方法：使用 Pycharm2021.3.2 语言编辑器，基于词频统计和 LDA 主题模型，提取不同程度心理问题个体的文本特征。结果：（1）个体的心理烦恼及伴随的生涯事件主要有：烦躁、很迷茫、没有安全感、有外遇、高三升学、找工作、厌学、毕业等；心理异常及伴随的生涯事件有：忧郁症、焦虑症、偏执、离过婚、离职、工作压力、传销、车祸、学习成绩等；心理危机及伴随的生涯事件有：不想活了、轻生、工作压力、家暴、传销等。（2）经过 LDA 主题模型训练后，语料库中个体的心理烦恼和生涯事件可归为 4 个主题：以“迷茫”、“厌学”等为关键词的大学生心理烦恼和生涯主题模型，以“心理压力”、“长大”、“毕业”等为关键词的毕业生心理烦恼和生涯主题模型，以“没兴趣”、“财务”等为关键词的上班族的心理烦恼和生涯主题模型，以“焦虑”、“早恋”、“技校”等为关键词的高中生心理烦恼和生涯主题模型。个体的心理异常和生涯事件可归为 3 个主题：以“家暴”、“家庭烦恼”为关键词的心理和生涯主题模型，以“产后抑郁”、“男同性恋”等为关键词的心理和生涯主题模型，以“单亲”、“暴食”等为关键词的心理和生涯主题模型。个体的心理危机和生涯事件可以归为 3 个主题：以“家庭暴力”、“男同性恋”、“长相”等为关键词的心理和生涯主题模型，以“残疾”、“单亲”、“校园暴力”等为关键词的心理和生涯主题模型，以“产后抑郁症”、“压力过大”、“怎么死”等为关键词的心理和生涯主题模型。结论：LDA 模型是便利实用的文本分析工具，在挖掘识别个体的非正常心理状态及关联的生涯事件方面表现优异。
关键词 LDA 主题模型，心理咨询语料库，生涯

Words are for the heart: mining psychological and career themes in the counseling corpus based on LDA

Xiao Wang　Xiqing Yuan　Xinyu Cheng　Qiulian Xing　Yu Ming　Peng Wang
School of Psychology, Shandong Normal University, Jinan

Abstract： Background and Purpose: Counseling conversations based on conversational robots provide a rich data resource for text analysis research. This study intended to mine the first open Chinese corpus of counseling conversations to explore the career topic models of individuals with psychological concerns, psychological abnormalities, and psychological crises. Methods: Using Pycharm2021.3.2 language editor, textual features of individuals with different degrees of psychological problems were extracted based on word frequency statistics and Latent Dirichlet Allocation(LDA) topic modeling. Results: (1) Individuals' psychological concerns and accompanying career events mainly include: irritability, being confused, insecurity, having an affair, advancing to senior high school, looking for a job, being bored with school, and graduation. Psychological abnormalities and accompanying career events include depression, anxiety, paranoia, divorce, separation, work pressure, pyramid selling, car accidents, academic performance, etc. Psychological crises and accompanying career events include: not wanting to live, making light of one's life, work pressure, domestic violence, pyramid scheme, etc. (2) After the training of LDA topic model, the psychological concerns and career events of individuals in the corpus can be categorized into four topics: college students' psychological concerns and career topic model with the keywords of

"confusion" and "boredom of studying". Graduate's psychological concerns and career topic model with keywords such as "psychological pressure", "growing up", "graduation", and so on. Working people's psychological concerns and career topic models with keywords such as "uninterested", "finance", and so on. High school students' psychological concerns and career theme models with keywords such as "anxiety", "calf love" and "technical school". Individual psychological abnormality and career events can be categorized into three topics: psychological and career topic models with keywords such as "domestic violence" and "family troubles". A model of psychological and career topics with keywords such as "postpartum depression" and "male homosexuality". Psychological and career topic models with keywords such as "single parent" and "overeating". Individual psychological crises and career events can be categorized into three topics: psychological and career topic models with keywords such as "domestic violence", "male homosexuality" and "looks". Psychological and career thematic models with keywords such as "disability", "single parent", "school violence", etc. Modeling of psychological and career topics with keywords such as "postpartum depression", "stress", "how to die", etc. Conclusion: the LDA model is a convenient and practical tool for text analysis, and it is excellent at mining to identify individuals' abnormal mental states and associated career events.

军事场景风险决策中任务紧迫性对人机组队后悔情绪的影响

杨千一　董超武　晏碧华　（通讯作者）
陕西师范大学心理学院暨陕西省行为与认知神经科学重点实验室
西安，710062，E-mail：yanbihua@snnu.edu.cn

摘 要　军事决策指经过判断推理而选择军事行动方案，定下决心并付诸实施的过程。战场形势瞬息万变，决策者不仅需要承受任务紧迫性及其引发的时间压力感对认知加工的影响，还需要根据有限的信息尽可能地对当前形势做出正确决策。不仅如此，由于人类决策者的有限理性限制，不可避免地会导致决策风险性上升，影响后续任务的绩效。因此，决策者需要在复杂条件下不断平衡利弊进行连续风险决策。连续风险决策是模拟风险逐步累积过程的决策方式（如快速救援任务）。此外，当前军事决策场景多由自动化辅助系统和人类合作者共同完成，人机组队中的风险决策问题尤为重要。基于此，本研究从时间压力出发，探讨人机组队和人人组队在军事场景决策中的后悔体验及表现。

本研究基于军事场景下的风险决策设置了四项实验，以任务紧迫性水平（时间压力：高、中、低、无）为被试间变量进行分组，实验采用 2（组队方式：人机组队、人人组队）×2（选择方式：相容选择、不相容选择）×2（结果：成功、失败）的被试内设计，考察不同任务紧迫性条件下不同组队方式、选择方式对决策主体后悔情绪以及决策任务绩效的影响。

结果：（1）任务紧迫性显著影响被试在失败条件下的后悔情绪体验，表现为时间压力越大，个体后悔情绪越强；（2）无论选择方式如何，人机组队中的被试在高任务紧迫性中的后悔体验显著低于人人组队，任务绩效则显著高于人人组队；（3）相容选择条件下，人机组队中的被试在低、无任务紧迫性中的后悔情绪与人人组队中的后悔情绪无显著差异，绩效无显著差异。

结论：军事场景下，任务紧迫性影响风险决策后悔情绪及绩效；相较于人人组队，人机组队更能够缓解紧迫任务的后悔情绪及提高任务绩效，但要求人机间保持选择相容。

The effect of mission urgency on Human-automation teaming regret in risky decision-making in military scenarios

YANG Qianyi, DONG Chaowu, YAN Bihua
(School of Psychology, Shaanxi Normal University, Xi´an 710062, China)

Abstract: Military decision-making refers to the process of choosing a military course of action, making up one's mind, and putting it into practice after judgment and reasoning. As the situation on the battlefield is rapidly changing, decision-makers not only need to bear the impact of task urgency and the time pressure it induces on cognitive processing but also need to make the best possible decision on the current situation based on limited information. In addition, the limited rationality of human decision- makers inevitably leads to an increase in the riskiness of decision-making, which affects the performance of subsequent tasks. Therefore, decision-makers need to continuously balance the pros and cons of continuous risk decision-making under complex conditions. Continuous risk decision-making is a decision-making approach that simulates the gradual accumulation of risk (e.g., rapid rescue missions). In addition, current military decision-making scenarios are mostly performed by automated assistive systems and human collaborators, and the problem of risky decision-making in human crews is particularly important. Based on this, this study explores the performance and regret experience of Human-automation teams and Human-Human teams in decision-making in military scenarios from the perspective of time pressure.

This study set up four experiments based on risky decision-making in military scenarios, grouped by task urgency level (time pressure: high, medium, low, and none) as a between-subjects variable, and the experiments used a 2 (teaming style: Human-automation teaming, Human-Human teaming) × 2 (choice style: compatible choice, incompatible choice) × 2 (outcome: success, failure) within-subjects design to examine the effects of different task urgency conditions on decision-making in different The effects of teaming and choice modes on decision subjects' regret emotions and decision task performance were investigated under different conditions of task urgency.

Results: (1) Task urgency significantly affected subjects' experience of regret in the failure condition, which was manifested in the fact that the higher the time pressure, the stronger the individual's regret; (2) Regardless of the choice mode, subjects in the Human-automation team had a significantly lower experience of regret in high task urgency than in the Human-Human team, while task performance was significantly higher than in the Human-Human team; (3) when the condition was a compatible choice, the regret experience of the Human-automation team was significantly higher than in the low and no task urgency were not significantly different from those in the Human-Human team, and performance was not significantly different.

Conclusion: In military scenarios, task urgency affects risky decision regret and task performance; compared with Human-Human teaming, Human-automation teaming is more capable of mitigating urgency and improving task performance, but requires that the choices between humans and machines be kept compatible.

无人机打击场景中的道德决策与自动化信任研究

董超武　杨千一　晏碧华（通讯作者）
陕西师范大学心理学院，西安，710062，E-mail：yanbihua@snnu.edu.cn

摘 要　技术的成熟与发展促使自动化系统逐渐迈向自主化，人工智能的应用推动了人机关系的变革，也在军事领域推动着战场形态的质变。在新式人机关系中，人不再扮演操作角色，而是作为系统的监控者与机器协作，这种关系需建立在稳固的信任之上。信任缺乏普遍接受的定义，但可解释为“一方对另一方的行为具有脆弱性的意愿，其基础是预期对方将执行对委托人重要的特定行动，而不论对方是否有能力监督或控制该方”。当前，以无人机自动化打击为代表的作战方式将建立新的作战体系，人机组队中的道德决策问题亟待解决。人类会由于机器的可靠性而信任机器，也会由于机器缺乏完整的高级思维模式而厌恶机器做出到的决策。

本研究分三部分对被试在无人机打击场景中的道德抉择问题进行探索。具体而言，研究一将被试被随机分配到两种结果（成功打击、失败打击）中的一种，并对不同决策主体（机器、人）做出的决定进行容忍度评级和结果感知评级；研究二在决策“黑箱”规模（低、中、高）三种条件下测量“人-机思维距离”，探索无人机打击场景下的机器道德决策厌恶机制；研究三通过三种手段（提升情绪体验、决策角色替换、增加专业知识表达）试图减轻被试对机器道德决策厌恶的途径。此外，研究 1 和研究 2 会在实验前测量被试的自动化信任水平并在任务结束后进行后测。

结果：（1）无论结果好坏，被试对人类做出道德决策的容忍程度都显著高于机器，失败的结果还会显著削弱个体的自动化信任水平；（2）机器做出道德决策的思维可见性（“黑箱”规模）显著影响了被试对其道德决策的态度和信任程度；（3）在无人机打击背景下，被试对机器道德决策的厌恶难以消除。

结论：在无人机打击背景下，个体厌恶机器做出道德选择，其原因之一在于个体感知到的机器决策过程与自身思维过程相去甚远，相关改进只能部分减弱这种厌恶感。

关键词　无人机，自动化信任，道德困境，人机关系

Research on moral decision making and trust in automation in UAV strike scenarios

Dong Chaowu Yang Qianyi Yan Bihua(corresponding author)
Shaanxi Normal University, Xi'an

***Abstract*:** The maturity and development of technology promote the automatic system gradually towards autonomy, the application of artificial intelligence promotes the change of human-machine relationship, and also promotes the qualitative change of battlefield form in the military field. The new human-machine relationship, in which humans no longer play an operational role but collaborate with machines as system monitors, needs to be based on solid trust. However, there is no specific definition of trust, but it can be interpreted as "the willingness of one party to be vulnerable to the actions of another based on the expectation that the other party will perform a particular action that is important to the principal, regardless of the other party's ability to supervise or control that party" (Mayer et al., 1995). At present, the combat mode represented by unmanned aerial vehicle(UAV) automatic strike will establish a new combat system, and the decision-making problem of moral dilemma in man-machine team is urgent to be solved. Humans will trust machines because of their reliability, and they will loathe the decisions made by machines because they lack a complete higher level of thought.

This study is divided into three parts to explore the moral choice of the subjects in the drone strike scenario. Specifically, in study 1, the subjects were randomly assigned to one of two outcomes (successful attack or fail attack), and the decisions made by different decision-making agents (machines and people) were rated for tolerance and outcome perception. In the second study, the "man-machine thinking distance" was measured under three conditions of the "black box" scale (low, medium and high), and the mechanism of machine moral decision aversion under the UAV attack scenario was explored. Study 3 attempts to reduce the aversion of subjects to machine moral decision making through three means (improving emotional experience, replacing decision-making roles, and increasing the expression of professional knowledge). In addition, Study 1 and Study 2 measured the level of automated trust before the experiment and after the task.

Results: (1) Whether the result is good or bad, the tolerance of human moral decision is significantly higher than that of machine, and the result of failure will significantly weaken the level of individual trust in automation; (2) The mental visibility of the machine to make moral decisions (the "black box" scale) significantly affected the subjects' attitude towards and trust in their moral decisions; (3) In the context of drone strikes, subjects' aversion to machine moral decision-making is difficult to eliminate.

Conclusion: In the context of UAV strikes, one of the reasons for individuals' aversion to machine making moral choices is that the decision-making process perceived by individuals is far from their own thinking process, and relevant improvements can only partially reduce this aversion.

***Keywords*:** UAV, trust in automation, moral dilemma, human machine relationship

特质正念对语段阅读注意特征的影响：来自动态眼动的证据

邢辰[1]，朱霞[1]，何玮[3]，叶盛东[3]，苗丹民[2*]（通讯作者）
第四军医大学军事医学心理学系：[1]军事心理学教研室，[2]航空航天心理学教研室；
[3]第四军医大学基础医学院，
陕西 西安 710032

摘 要 **目的** 采用眼动技术分析特质正念在语段阅读过程中表现的动态眼动特征。**方法** 以标准化语段为阅读素材，以内导向认知范式为框架设计基于眼动追踪的语段阅读及自我参照任务。招募大学本科生 124 人，以特质正念量表得分划分高低组后纳入实验。采用动态数据处理方法对相应眼动数据进行分析。**结果** 0-10 s 阅读期间的数据显示，特质正念和认知导向显著影响了对不同区域注视比例的变化趋势。具体而言，低正念组表现出 0-2.5 s 期间显著的对于文本区域和背景区域注视比例的波动，而高正念组则在 0-10 s 期间内保持稳定。在内外不同认知导向条件下，正念水平显著影响了注视特征的差异。**结论** 本研究揭示了在阅读早期由特质正念引起的显著的眼动特征，提示了正念可能的与注意分心的关系。研究同时发现了正念与内导向认知的关系，提示了正念与内省思维的密切联系。这些结果均说明正念中注意监控成分可以很好的通过眼动特征进行表达。

Exploring the Impact of Trait Mindfulness on Attentional Characteristics of Passage Reading: Insights from Dynamic Eye Movements

Chen Xing[1], Xia Zhu[1], Wei He[3], Shengdong Ye[3], Danmin Miao[2*] (Corresponding author)
Military Medical Psychology School, Fourth Military Medical University: [1]Department of Military Psychology, [2]Department of Aerospace Psychology;
[3]Basic Medical Science Academy, Fourth Military Medical University

***Abstract*：** **Objective:** This study aims to examine the attentional characteristics of individuals with trait mindfulness during passage reading using eye-tracking technology. **Methods:** A standardized passage was utilized as the reading material, and a task combining eye-tracking technology and introspective thinking was designed within the internal directed cognitive paradigm. The participants consisted of 124 undergraduate students who were divided into high and low trait mindfulness groups based on their trait mindfulness scale scores. Dynamic data processing methods were employed to analyze the corresponding eye movement data. **Results:** The analysis of data from the initial 0-10 second reading period revealed that trait mindfulness and cognitive direction significantly influenced the proportion of gaze directed towards different areas of interest. Specifically, the low trait mindfulness group exhibited significant fluctuations in the proportion of gaze between verbal and nonverbal areas within the first 2.5 seconds, whereas the high trait mindfulness group maintained stability throughout the entire 10 seconds. Furthermore, the level of trait mindfulness had a significant impact on gaze characteristics under

different cognitive directions. **Conclusions:** This study unveils distinctive eye-movement patterns associated with trait mindfulness during early reading, suggesting a potential association between mindfulness and attentional distraction. Moreover, a relationship was identified between mindfulness and internally directed cognition, indicating a close connection between mindfulness and introspective thinking. Overall, these findings suggest that the attentional monitoring aspect of mindfulness can be manifested through eye movement features.

消防救援队员领悟社会支持与积极应对方式的关系：积极情绪和生命意义感的中介作用

张誉瀚[1]，欧阳丽萍[2]，陈思瑜[1]，王丹[1]，章溢[1]，靖治[1]，张森森[1]，丁凤琴[1]（通讯作者）
1 宁夏大学教师教育学院，银川，750021，通讯作者 E-mail（dingfqin@nxu.edu.cn）
2 桂林市消防救援支队，桂林，541001

摘要：消防救援队员肩负着抗震救灾和抢险救援的重要任务，是保障人民群众生命财产安全的中坚力量。然而，难以预测险情与灾情，经常使消防救援队员处于可能引起受伤甚至牺牲的应激情境之中，从而承受较大的心理压力。显然，消防救援队员的心理问题已经成为制约消防部队稳定和救援能力的一大障碍。因此，考察消防队员心理健康的影响因素、为维护消防队员心理健康提供科学依据，是当前急需加强研究的重要课题。以往研究表明：积极应对方式不仅是影响消防救援队员心理健康的重要因素之一，还与消防救援队员工作状态密切相关。然而，却鲜有研究探讨消防救援队员积极应对方式及其背后的心理机制，这也正是本研究是意义所在。本研究探讨消防救援队员的领悟社会支持与积极应对方式的关系以及积极情绪和生命意义感的链式中介作用，采用领悟社会支持量表(PSSS)、正性负性情绪量表(PANNS)、生命意义感量表(MLQ)、简易应对方式问卷(SCSQ)对某市消防救援支队共 354 名消防救援队员进行问卷调查。结果表明：(1)消防救援队员的领悟社会支持能正向预测其积极应对方式；(2)消防救援队员的积极情绪在其领悟社会支持和积极应对方式间起独立中介作用；(3)消防救援队员的生命意义感在其领悟社会支持和积极应对方式间起独立中介作用；(4)消防救援队员的积极情绪和生命意义感在领悟社会支持和积极应对方式中起双重中介作用。以上研究说明：消防救援队员的领悟社会支持分别通过积极情绪和生命意义感进而正向预测其积极应对方式。该结果揭示了消防救援队员领悟社会支持与积极应对方式的内在作用机制，旨在为提高消防救援队员的心理健康和救援能力提供理论依据和实践指导。

关键词：消防救援人员，领悟社会支持，积极应对方式，积极情绪，生命意义感

The relationship between perceived social support and positive coping styles in the fire rescue personnel: the mediating effect of positive emotion and sense of meaning in life

Zhang Yuhan[1], OuYang Liping [2], Chen Siyu[1], Wang Dan[1], Zhang Yi[1], Jing Zhi[1], Zhang Sensen[1], Ding Fengqin[1]
1.NingXia University, No.489 Helan Mountain West Road, Yinchuan City,
2.Guilin Fire and Rescue Detachment, No.119 Zhongyin Road, Guilin City.

Abstract: The fire rescue personnels shoulder the important task of earthquake relief and rescue, and is the backbone of ensuring the safety of people's lives and property. However, it is difficult to predict the danger and disaster, which often makes the fire rescue personnels in the stress situation that may cause injury or even sacrifice, thus bearing greater psychological pressure. Obviously, the psychological problems of fire rescue personnels have become a major obstacle restricting the stability and rescue ability of fire forces. Therefore, investigating the influencing factors of mental health of fire rescue personnels and providing scientific basis for maintaining mental health of fire rescue personnels is an important topic that needs to be strengthened at present. Previous studies have shown that the positive coping style is not only one of the important factors affecting the mental health of fire

rescue personnels, but also closely related to the working status of fire rescue personnels. However, few studies have explored the active coping styles of fire rescue personnels and the psychological mechanisms behind them, which is why this study is significant. This study explores the relationship between perceived social support and positive coping styles, as well as the chain mediating effect of positive emotion and sense of life meaning among fire rescue personnels. A total of 354 fire rescue members of a fire rescue detachment in a city were investigated by Perceived Social Support Scale (PSSS), positive and negative Emotion Scale (PANNS), meaning of Life Scale (MLQ) and Simple Coping Style Questionnaire (SCSQ). The results show that: (1) the comprehending social support can positively predict the positive coping style of fire rescue personnels; (2) The positive emotions of fire rescue personnels play an independent mediating role between their understanding of social support and their positive coping styles; (3) The meaning of life of fire rescue personnels play an independent mediating role between their understanding of social support and positive coping styles; (4) Fire rescue personnels' positive emotions and sense of life meaning play a double mediating role in perceived social support and positive coping styles. The above research shows that the perceived social support of fire rescue personnel positively predicts their positive coping style through positive emotion and sense of life meaning respectively. The results reveal the internal mechanism of perceived social support and positive coping style of fire rescue personnels, aiming to provide theoretical basis and practical guidance for improving the mental health and rescue ability of fire rescue personnels.

Key words: fire rescue personnel，perceived social support，positive coping style，positive emotion，meaning of life

散偏远官兵抑郁和焦虑的流行率、相关因素和网络分析研究

通讯作者 E-mail：wushj@fmmu.edu.cn

摘 要 抑郁和焦虑是军队官兵中最常见的心理健康问题，对军队的日常管理和训练有着重要影响。本研究旨在评估抑郁和焦虑在散偏远地区军人中的流行程度、相关因素和网络结构。研究从2022年7月至2023年1月在符合散偏远地区操作性定义的地区进行数据收集，共获得有效问卷831份。本研究采用PHQ-9（Patient Health questionnaire-9）和GAD-7（Generalized anxiety disorder 7-item）量表来评估抑郁和焦虑症状。进一步进行单因素分析、多因素回归分析和网络分析。在散偏远官兵中抑郁发生率为23.10%，焦虑的发生率为10.83%。协方差分析表明有抑郁或焦虑症状的官兵孤独感、感知压力显著高于健康官兵，而社会支持水平显著低于健康官兵。多元回归结果显示具有更高压力和孤独感的官兵更有可能出现抑郁或焦虑问题，而社会支持、对未来发展充满希望和对环境感到满意则是保护性因素。此外，担忧身体健康是焦虑症状的危险因素，抑郁症状随着年龄的增加而减轻。网络分析结果显示，"不能控制地担心"是抑郁焦虑共病网络中的核心症状和桥梁症状。我们发现，散偏远地区官兵中年轻和有身体疾病的应得到更多关注；过高的压力和孤独感会对心理健康产生负面影响，而社会支持是重要的保护因素。此外，针对关键节点的心理认知训练对于改善散偏远官兵的抑郁和焦虑症状可能具有现实意义。

关键词 抑郁，焦虑，网络分析，散偏远，官兵

Prevalence, correlates, and network analysis of depression and anxiety among military personnel in dispersed remote areas

Mengyuan Yang[1], Yuanbei Zhang[1], Zhaojun Pu[1], Yijun Li[1], Lei Ren[2], Shengjun Wu[1,*]

[1] Department of Military Medical Psychology, Air Force Medical University, 169 West Changle Road, Xi'an, Shaanxi 710032, China

[2] Department of Military Psychology, Armed Police Logistics College, Tianjin 300309, China

***Abstract*:**

Background: Depression and anxiety as the most common mental health problems among army officers and soldiers, have significant influence on the daily management and training of the army. The purpose of this study aimed to assess the prevalence, correlates, and network structure of depression and anxiety among military personnel in dispersed remote areas.

Method: The study was conducted from July 2022 to January 2023 for data collection in areas that met the operational definition of dispersed remote areas, and a total of 831 valid questionnaires were obtained. PHQ-9 (Patient Health questionnaire-9) and GAD-7 (Generalized anxiety disorder 7-item) scales were used in this study to assess the symptoms of depression and anxiety. Further univariate analysis, multivariate regression analysis and network analysis were performed.

Results: The prevalence of depression was 23.10% and anxiety was 10.83% among the dispersed remote officers and soldiers. Analysis of covariance showed that officers and soldiers with symptoms of depression or anxiety had significantly higher loneliness and perceived stress and significantly lower levels of social support than healthy

officers and soldiers. Multiple regression results showed that officers and soldiers with higher levels of stress and loneliness were more likely to have depression or anxiety problems, while social support, hope for future development and satisfaction with the environment were protective factors. In addition, Worrying about physical health is a risk factor for anxiety, and depressive symptoms decrease with increasing age. The results of the network analysis showed that "uncontrollable worry" was the core and bridge symptom in the depression-anxiety co-morbidity network.

Conclusion: We found that young and physically ill soldiers in remote areas should be given more attention; excessive stress and loneliness can negatively affect mental health, and social support is an important protective factor. In addition, psycho-cognitive training targeting key points may be practical for improving depression and anxiety symptoms in dispersed and remote officers and soldiers.

“舰机融合”视阈下舰载战斗机飞行人员身心抗逆力模型构建研究

邹骐阳　应鹏飞　吴昊

海军大连舰艇学院基础部，辽宁大连，116000

摘 要　抗逆力即人的心理弹性、韧性。拥有强大的身心抗逆力是舰载战斗机飞行人员完成超负荷、超难度舰载飞行任务的身心基础。伴随海军航空兵不断发展装大，未来海军舰载战斗机飞行人员需求与日俱增，对于该群体的抗逆力研究较少且有意义。

方法：研究主要采用文献资料法、Delphi 专家调查法，利用担任海军飞行人才心理选拔任务契机，整理与资深飞行专家的访谈记录，通过 Nvivo 11.0 质性分析软件，围绕舰载战斗机飞行学员的身心抗逆力模型构建展开研究。

结果：1.身心抗逆力模型构建依据：研究在前人文献基础上，从未来舰机融合作战的角度出发，以航空特种医学、心理学、运动训练学等学科知识为理论依据，尝试构建该群体身心抗逆力模型。

2.心理抗逆模型的构成：舰载战斗机飞行人员的抗逆模型共包含 7 个一级指标，26 个二级指标，分别是：（1）坚韧血性（5 项：身心抗逆、行为控制、勇敢冒险、生理力量、血性应激）；（2）理性从容（5 项：遇事冷静、分析详尽、预知结果、预设预案、坦然应对）；（3）自我效能（4 项：正视成败、定位准确、信念坚定、自信乐观）；（4）柔性应对（4 项：灵活变通、活跃思维、觉察当下、澄清价值）；（5）责任安全（5 项：责任意识、遵章守法、备飞认真、准确决断、团队和谐）；（6）服从执行（3 项：集体荣誉、服从意识、敢于牺牲）。

结论：结合测试数据,本研究所构建出的舰载战斗机飞行人员身心抗逆力模型，突出了舰机融合特点，可为海军舰载战斗机飞行人员的招飞选拔、培训使用提供有效支撑。

Research on the Construction of Physical and Psychological Resilience Model of Carrier-based Fighter Pilots under the Perspective of "Carrier-fighter Integration"

ZOU Qiyang,YING Pengfei,WU Hao

Institute of military sport, Dalian Naval Academy , Dalian,LiaoNing 116000

Abstract：Resilience refers to people's psychological flexibility and toughness. Possessing strong physical and psychological resilience is the physical and psychological foundation for carrier-based fighter pilots to complete overloaded and extremely difficult carrier-based flight missions. With the constant development of naval aviation, the demand for naval carrier-based fighter pilots will increase day by day, but there are few and meaningful research on the resilience of this group.

Methods: The research mainly adopts the document literature and Delphi methods and takes advantage of the opportunity of serving as the psychological selection task of naval pilot personnel to sort out the interview records with senior flight experts and conduct research around the construction of the physical and psychological resilience model of carrier-based fighter pilots through Nvivo 11.0 qualitative analysis software.

Results: 1. Basis for the construction of the physical and psychological resilience model: based on previous literature, from the perspective of future carrier-fighter integrated operations, and based on the theoretical basis of special aviation medicine, psychology, sports training, and other disciplines, an attempt was made to construct the physical and psychological resilience model of this group.

2. Composition of the psychological resilience model: The resilience model of carrier-based fighter pilots contains 7 first-level indicators and 26 second-level indicators, which are: (1) tenacity and boldness (5 items: physical and psychological resistance, behavior control, dare to adventure, physical strength, and bold stress); (2) rationality and calmness (5 items: calmness in situations, detailed analysis, predict the result, preset plans, and cope calmly); (3) self-efficacy (4 items: face up to success or failure, accurate positioning, firm belief, and self-confidence and optimistic); (4) flexible response (4 items: flexible adaptation, active thinking, think about the present, and clarify the value); (5) Responsibility and safety (5 items: awareness of responsibility, compliance with laws and regulations, serious preparation for flight, accurate decision-making, and team harmony); (6) Obedience and execution (3 items: collective honor, awareness of obedience, and dare to sacrifice).

Conclusion: Combined with the test data, the physical and psychological resilience model of carrier-based fighter pilots constructed by this research highlights the characteristics of carrier-fighter integration, and is able to provide effective support for the recruitment, selection, training, and use of naval carrier-based fighter pilots.

飞行事故场景记忆的边界扩展

杨静怡[1]　晏碧华[1]（通讯作者）
陕西师范大学心理学院，西安，710062，E-mail：yanbihua@snnu.edu.cn

摘 要　视觉场景感知和记忆是人类适应环境的重要过程，但是人的感知和记忆在很多时候会被扭曲。除了场景内容本身，视觉记忆还会受到其形成时的时空环境影响。边界扩展（boundary extension）和边界压缩（boundary contraction）就是场景记忆扭曲的例子。边界扩展指对视觉场景的记忆包含了实际看到的边界之外的信息，也就是对场景边界进行了扩展；而边界压缩是指视觉场景的记忆对场景边界处的信息进行了缩减。边界扩展与边界压缩被统称为边界转换。现有研究围绕常规自然场景记忆的边界转换，对场景深度、场景比例、场景倒置及个体经验等影响因素进行了考察，本研究将对飞行事故场景记忆的边界转换特性展开探索。

通过图库和模拟飞行软件收集飞行场景图片，分为事故与非事故图片，事故图片具有飞机破损、着火、浓烟等特征，建立飞行场景图集。研究一探索了不同场景（事故、非事故）的编码特征（集中编码、分散编码）对图片记忆边界转换的影响。研究二检验了飞行事故场景常见视角（空中垂直俯视，即无人机视角、陆地山坡斜视视角）下事故与非事故图片记忆的边界转换特征，研究三考察了极值边的设置（有无极值边）的影响。三个研究均为 2×2 被试内设计，采用快速场景识别任务和判断信心评级收集反应数据。

结果发现：（1）包含飞机客体的静态场景与事故场景均出现场景记忆的边界扩展现象，事故场景尤其是集中编码的事故场景，其边界扩展量更大；（2）俯视视角下的飞行事故场景扩展量更大；（3）极值边的设置可以降低非事故场景的边界扩展，然而，即使设置了极值边，仍不能减缓或消除飞行事故场景的边界扩展。

结论：飞行事故场景记忆会出现场景边界扩展，且和普通飞行场景比有极化现象，其原因可能和事故飞机作为特殊客体的焦点记忆有关，也有可能是由于飞机特定朝向引起的表征动量与边界扩展叠加而产生极化效应。本研究对航空飞行事故分析有较为重要的意义。

Boundary extension of flight accident scene memory

YANG Jingyi, YAN Bihua (corresponding author)
(School of Psychology, Shaanxi Normal University, Xi’ an 710062, China)

Abstract: Visual scene perception and memory is an important process for human to adapt to the environment, but human perception and memory are often distorted. In addition to the content of the scene itself, visual memory is also affected by the space-time environment in which it was formed. Boundary extension and boundary contraction are examples of distortion of scene memory. Boundary extension means that memories of visual scenes include information beyond the boundaries actually observed, that is, the boundary of the scene is extended. Boundary contraction means that memories of visual scenes contracted the information at the scene boundaries. Boundary extension and boundary contraction are referred to as boundary transformation. The existing researches focus on the boundary transformation of natural scene memory, and investigate the influence factors such as scene depth, scene proportion, scene inversion and individual experience. This study will explore the boundary transformation characteristics of flight accident scene memory.

The images of flight scene are collected through the gallery and the flight simulation software, which are divided into accident and non-accident pictures. The accident pictures have the characteristics of aircraft damage, fire, smoke and so on, build a flight scene atlas. Study 1 explores the influence of different scenes (accident,

non-accident) and coding features (centralized coding, scattered coding) on the boundary transformation of scene memory. Study 2 examines the boundary transformation characteristics of the accident and non-accident pictures under the common perspective of flight accident scene (vertical overlooking of aerial view, namely the perspective of unmanned aerial vehicle and oblique perspective of land slope). Study 3 examines the influence of the setting of extremal edges (with and without extremal edge). All three studies had a 2×2 within-subject design and collected response data by rapid scene-recognition task and judgment confidence ratings.

The results show that: (1) Boundary extension occurs in both static scenes and accident scenes, especially accident scenes with centralized coding. (2) The extension of the flight accident scene in the overlooking perspective is larger. (3) The setting of extremal edge can reduce the boundary extension of non-accident scenes, but cannot decrease or eliminate the boundary extension of flight accident scene.

Conclusion: The scene boundary extension occurs in the memory of flight accident scenes, and the polarization phenomenon is more than that of ordinary flight scenes. The reason may be related to the focus memory of the accident aircraft as a special object, or the polarization effect may be caused by the superposition of the representational momentum and boundary extension caused by the specific orientation of the aircraft. This research is significant to the analysis of aviation accident.

军人抑郁和焦虑症状的关系探索：基于网络分析

吴忠英 马竹静 冯钰婷 刘斌 金银川 李逢战 杨群（通讯作者）
空军军医大学军事医学心理学系，西安，710032，yangqun@fmmu.edu.cn

摘 要 研究发现心理问题会对工作表现产生不良影响。焦虑和抑郁作为最常见的心理问题，常常以共病形式存在。心理病理学网络理论认为，心理问题的产生源于症状之间的相互作用。本研究对军人的抑郁和焦虑共病网络进行了分析，探索了抑郁和焦虑共病网络的核心症状及桥接症状，以期为缓解军人的抑郁和焦虑状况提供预防和干预建议。采用网络分析方法对 656 名军人抑郁症筛查量表（PHQ-9）和广泛性焦虑量表（GAD-7）得分进行研究，基于软件 R 构建和评估抑郁和焦虑共病网络，并对网络拓扑结构、中心性指标、桥中心性指标以及网络性能进行分析。结果表明，抑郁和焦虑网络中最强的连边分别存在于抑郁网络内部或焦虑网络内部。在抑郁网络中，“快感缺失—疲倦”以及“快感缺失—情绪低落”连接强度最高，在焦虑网络中，“坐立不安—害怕有不好的事情发生”, 以及 “感觉紧张或焦虑—无法控制担忧”连接强度最高。“坐立不安”、“疲劳”以及“无法控制担忧”具有最强中心性，而 “精神动力学激越或迟滞”和 “害怕有不好的事情发生”为桥症状。本研究首次使用网络分析方法探究军人抑郁和焦虑症状之间的复杂关系特征。结果表明“坐立不安”、“疲劳”、“无法控制担忧”、“精神动力学激越或迟滞”以及“害怕有不好的事情发生” 为抑郁和焦虑共病网络的关键症状，提示优先针对这 5 个症状进行干预，可能会取得更大的干预效益。

Understanding the association between depression and anxiety of soldiers: A network analysis

Wu Zhongying, Ma Zhujing, Feng Yuting, Liu Bin, Jin Yinchuan, Li Fengzhan, Yang Qun*
Department of Military Medical Psychology, Air Force Medical University, Xi’an, 710032, China

Abstract：Mental health issues have been found to negatively affect work performance. Depression and anxiety are common psychological disorders and often comorbid. From the network model perspective, psychological disorders arise from direct interactions between symptoms. The current study investigates the network structure of depression and anxiety symptoms of Soldiers and identifies the central symptoms, bridge symptoms, in order to provide suggestions for the prevention of and intervention for depression-anxiety comorbidity in soldiers. We recruited 656 soldiers with symptoms of depression and anxiety, severity spanning from minimal to severe. Patient Health Questionnaire-9 (PHQ-9) and Generalized Anxiety Disorder 7-Item Questionnaire (GAD-7) were utilized to measure depression and anxiety symptoms. The network of depression and anxiety symptoms was constructed and estimated in the statistical programming environment R. Finally, the features of our network including topology, network centrality, bridge centrality, and stability were investigated. Four strongest edges existed in the network were from the same disorder. Two were between depression symptoms, including links between “Anhedonia” and “Fatigue”, as well as “Anhedonia” and “Depressed or sad mood”. The others were between anxiety symptoms, containing links between “Restlessness” and “Afraid something will happen”, as well as “Nervousness or anxiety” and “Uncontrollable worry”. The symptoms “Restlessness”, “Fatigue” and “Uncontrollable worry” had the highest expected influences. Results also revealed two bridge symptoms: “Psychomotor agitation/retardation” and “Afraid something will happen”. The current study not only stressed critical central symptoms “Restlessness”, “Fatigue” and “Uncontrollable worry”, but also highlighted

critical bridge symptoms “Psychomotor agitation/retardation” and “Afraid something will happen”. This study is the first to use network analysis method to explore the complex relationships among the depression symptoms and generalized anxiety symptoms in soldiers. It is found that symptoms “Restlessness”, “Fatigue”, “Uncontrollable worry”, “Psychomotor agitation/retardation” and “Afraid something will happen” are the key symptoms of soldiers’ depression and anxiety. Giving priority to the intervention according to these symptoms may achieve greater therapeutic effects.

Keywords：Depression; Anxiety; Network analysis; Soldiers

大学生自我建构与孤独感：特质错失恐惧与人际关系满意度的作用

毛建[1] 陈沛[1] 何嘉杰[1] 聂衍刚[1]（通讯作者） 韦俊峰[1] 萧慧仪[1]

1 广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006

nie-yangang@gzhu.edu.cn

摘 要　自我一直是心理学领域的重要研究课题。自我建构作为该领域的一个分支，指的是个体对自我认识时更强调自己还是与他人的关系，分别对应独立型与依存型自我建构。两种自我建构类型可以并存于同一个体中，只是以某种突出的建构倾向占主导地位。作为现代社会下的一个公共健康问题，孤独感是与社交相关的消极情感体验，由个体期望的社会关系质量与现状之间的差异导致。依存型建构与东方集体主义的文化价值观相吻合，生活在该文化背景下具有依存型建构倾向的个体容易获得社会支持以及感受积极情绪，体验更少的孤独感。然而，持不同观点的研究者认为依存型建构比独立型建构的个体对和谐人际关系的需求更高，可能更容易产生现实人际关系与期待水平之间的差距, 从而感到孤独。在实证研究中，两者的关系也没有得到一致验证。鉴于此，本研究将关注依存型自我建构可能增加孤独感的风险因素（特质错失恐惧的中介作用），以及人际关系满意度的调节作用。采用自我建构量表、孤独感量表、特质错失恐惧量表以及一项人际关系满意度题项对 384 位大学生进行施测，删除答题时间短、反应一致等无效问卷后，得到有效问卷 323 份。结果发现：（1）依存型自我建构与孤独感相关不显著(r=0.07, p>0.05)，与特质错失恐惧显著正相关(r=0.19, p<0.001)，特质错失恐惧与孤独感显著正相关(r=0.34, p<0.001)；（2）特质错失恐惧在依存型自我建构与孤独感关系间起中介作用；（3）人际满意度调节了依存型自我建构与孤独感的关系，低人际关系满意度水平下，依存型自我建构显著正向预测孤独感(β=0.14, p<0.05)，反之，则负向预测孤独感(β=-0.16, p<0.05)。结果表明依存型自我建构倾向的大学生可能通过特质错失恐惧经历更多的孤独感，依存型自我建构对大学生孤独感的影响取决于其人际关系满意度的水平。本研究为理解自我建构与孤独感的关系提供了新的视角，拓展了自我建构倾向的认知和情绪效应的相关研究，有助于减少和改善大学生的孤独感。

Self-construal and Loneliness among Chinese College Students: the Roles of trait-Fear of Missing Out and Interpersonal Relationship Satisfaction

Jian Mao[1], Pei Chen[1], Jiajie He[1], Yangang Nie[1], Junfeng Wei[1], Huiyi Xiao[1]

1 Department of Psychology/Center for studies of Adolescent Psychological and Behaviors, Guangzhou University, Guangzhou, 510006

Abstract：The self has been an important topic of study in the field of psychology. Self-construal, as a branch of the field, refers to whether individuals recognize the self with more emphasis on themselves or in relation to others, corresponding to independent and dependent self-construals, respectively. The two types of self-construal can coexist in the one individual, dominated by one prominent constructive tendency. Loneliness is considered a global public health issue. Loneliness describes a subjective negative emotional experience related to social communication. The discrepancy between individuals' desired and existing social relationships causes feelings of loneliness. The interdependent construct coincides with the cultural values of Eastern collectivism, individuals living in this culture with a tendency towards the interdependent construct are more likely to access social support and experience positive emotions, and feel less loneliness.However, dissenting researchers have argued that individuals with interdependent constructs have a higher need for harmonious interpersonal relationships than those with independent constructs, and may be more likely to experience a gap between the reality of interpersonal relationships and the level of expectations, and thus to feel lonely. This relationship has also not been consistently verified in empirical studies. Given this, the present study will focus on the risk factors for which interdependent self-construals may increase loneliness (the mediating role of trait-Fear of Missing Out(trait-FoMO)), as well as the moderating role of interpersonal relationship satisfaction. The self-construal scale, loneliness scale, trait

-FoMO scale, and an interpersonal relationship satisfaction question were tested on 384 college students, and 323 valid questionnaires were obtained after deleting invalid questionnaires such as short response time and response consistency. The results found that (1) the interdependent self-construal was not significantly correlated with loneliness (r=0.07, p>0.05), was significantly positively correlated with trait-FoMO (r=0.19, p<0.001), and trait misplaced fear was significantly positively correlated with loneliness (r=0.34, p<0.001); (2) trait-FoMO mediated the relationship between the interdependent self-construal and loneliness ; (3) Interpersonal relationship satisfaction moderated the relationship between interdependent self-construals and loneliness, with interdependent self-construals significantly and positively predicting loneliness at low levels of relationship satisfaction (β=0.14, p<0.05), and negatively predicting loneliness at the opposite level (β=-0.16, p<0.05). The results indicated that college students with interdependent self-constructing tendencies may experience more loneliness through trait-FoMO, and the effect of interdependent self-constructing on college students' loneliness depends on the level of their interpersonal satisfaction. This study provides new perspectives for understanding the relationship between self-construal and loneliness, expands research related to the cognitive and emotional effects of self-construal tendencies, and contributes to the reduction and improvement of college students' loneliness.
Keywords: self-construal, loneliness, trait-fear of missing out, interpersonal relationship satisfacton

成年期人格剖面与身体锻炼

王金凯　邵韵如　郭璐（通讯作者）　毛志雄（通讯作者）
北京体育大学心理学院，北京，100048
guolu2000@163.com
zhxmao@bsu.edu.cn

摘　要　长久以来，人格被视作预测身体锻炼的重要心理因素。目前的研究集中于探讨人格的各项特质（维度）与身体锻炼的关系，累积证据支持外向性和尽责性正向预测身体锻炼。然而，此类已有研究尚存在许多不一致的结果，主要体现在宜人性和开放性与身体锻炼的关系上。在实践方面，研究单一特质所

获的结论也难以有效应用于锻炼促进的指导，因为每个人都具有不同水平的多种人格特质，这些特质相互作用产生人格。相比之下，关注人格特质的组合更具理论和实践指导价值。因此本研究旨在采用以个体为中心的研究路径，考察成年期的“大五”人格剖面及其与身体锻炼行为之间的关系。为支持人格剖面的稳定性和剖面预测身体锻炼的可重复性，研究问题分别在成年早期、成年中期和成年晚期人群中分析。数据来自中国家庭追踪调查（China Family Panel Studies），28304 名成年人报告了“大五”人格（Big Five Inventory）和身体锻炼行为。潜在剖面分析在成年早期、成年中期和成年晚期人群中均识别出 5 种人格剖面——普通、保守、自信、坚韧和脆弱。基于所得剖面进一步发现了不同剖面的个体在身体锻炼上存在显著差异，坚韧和自信剖面的个体往往有更多的身体锻炼行为，而脆弱剖面的个体较少参与锻炼。研究结果揭示了人格特质的不同组合可以预测个体的身体锻炼，既有助于更深入地理解身体锻炼和人格之间的联系，也有助于识别存在缺乏锻炼风险的成年人，并制定针对性的运动干预策略。

Personality Profiles and Exercise Behaviour across Adulthood

Jin-Kai Wang　Yun-Ru Shao　Lu Guo*　Zhi-Xiong Mao*
School of Psychology, Beijing Sport University, Beijing, China
guolu2000@163.com
zhxmao@bsu.edu.cn

Abstract：Personality has long been considered a significant psychological component predicting exercise behaviour. Prior research has mostly focused on how personality traits (dimensions) were associated with exercise behavior, with the cumulative evidence supporting extraversion and conscientiousness are associated with exercise. However, findings linking the five personality dimensions to exercise behaviour are mixed or even contradictory, agreeableness and openness were the focuses. On the other side of the coin, most research paid attention to relationships with single personality dimensions; it would not be practical to institute measures to promote exercise according to single personality dimension. Because people normally possess many personality characteristics with varying levels, these subcomponents interact with each other to produce personality. Hence, focusing more closely on combinations of personality traits might prove valuable in the future. The present study aimed to bridge this gap by identifying the personality profiles and investigating the associations between Big Five personality profiles and exercise behaviour based on a person-centred approach in adults. And it is worth noting that these questions were addressed in young adulthood, middle adulthood and later adulthood individuals separately to demonstrate the stability of personality profiles and the replicability of the predictive power of exercise behaviour. Data from the China Family Panel Studies (CFPS) were used (N＝28,304 adults), in which participants reported their Big Five personality and exercise behaviour. Latent profile analyses, grounded in young adulthood, middle adulthood, and later adulthood sub-samples, revealed five personality profiles: moderate, reserved, confident, resilient, and vulnerable. Employing profiles identified, significant differences between the five personality profiles in relation to exercise behaviour were revealed. Specifically, people with the resilient or confident profiles generally have longer exercise duration while people with vulnerable profiles tend to exercise less. Our findings give greater insight into the link between exercise and personality, suggesting that different combinations of personality traits may determine individuals' exercise behaviour. It opens promising avenues for identification of adults at risk of lacking exercise, and for personality-targeted exercise interventions as well.

父母支持充分性对青少年一般性应激反应症状的影响：一个有调节的中介模型

杨雨濛 刘倩文* 王振宏*

陕西师范大学心理学院，陕西（高校）儿童青少年心理与行为健康哲学社会科学重点研究基地,西安，710062,

liuqw24@126.com; wangzhenhong@snnu.edu.cn

摘 要 一般性应激反应症状(Symptoms of General Stress Response)是指由广泛的应激源引起的持续性身心应激反应症状，包括焦虑与抑郁等心理应激反应以及躯体化反应症状，是个体身心健康的风险预测指标。个体的一般性应激反应症状可能会受到环境因素和个体因素的共同影响。父母支持充分性即个体期望的父母支持水平与实际感受到的父母支持水平的匹配程度，作为一种家庭环境资源是否影响青少年的一般性应激反应症状，目前没有研究予以探讨。已有研究表明，压力感知水平的高低影响个体应激反应的大小，因此，父母支持充分性可能会通过影响压力感知进而影响一般性应激反应症状。性格优势是个体的积极心理资源，也可能会与父母支持充分性交互作用于青少年的压力感知水平和应激反应症状，但已有研究对这些问题都缺乏探讨。因此，本研究考察了父母支持充分性对青少年的一般性应激反应症状的影响以及压力感知在其中的中介作用和性格优势的调节作用。运用《儿童及青少年社会支持量表》、《简版中学生品格问卷》、《压力知觉量表》、《广泛性焦虑量表》、《流调中心抑郁量表》、《症状自评量表》中的躯体化维度和《匹兹堡睡眠质量指数量表》，对 631 名青少年($M_{年龄}$=13.88 岁，SD=0.61)进行间隔半年的两次数据采集。研究结果发现：(1)父母支持充分性负向预测青少年一般性应激反应症状，且压力感知在父母支持充分性和一般性应激反应症状之间起纵向中介作用；(2)性格优势不仅能够在父母支持充分性与青少年压力感知之间起调节作用，而且能够调节父母支持充分性对一般性应激反应症状的影响。具体而言，与性格优势水平高的青少年相比，性格优势水平低的青少年更容易受到父母支持充分性的影响，进而作用于其压力感知水平和一般性应激反应症状。研究结果表明，压力感知在父母支持充分性与青少年一般性应激反应症状关系中起到中介作用，而性格优势在父母支持充分性与青少年一般性应激反应症状关系中起到调节作用。

The effect of parental support adequacy on symptoms of general stress response in adolescents : A moderated mediation model

Yumeng Yang, Qianwen Liu*, Zhenhong Wang*

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062

Corresponding authors：Qianwen Liu, liuqw24@126.com; Zhenhong Wang, wangzhenhong@snnu.edu.cn

Abstract：Symptoms of general stress response refer to psychosomatic stress symptoms caused by a wide range of stressors, including psychological stress symptoms (i.e., anxiety, depression) and accompanying somatization symptoms, which are risk predictors of individuals' physical and mental health. Symptoms of general stress response may be influenced by a variety of environmental and individual factors. Whether the parental support adequacy, that is, the degree to which the individual's desired level of parental support matches the actual level of parental support actually felt, as a family environmental resource, affects adolescents' symptoms of general stress response, has not been explored. Existing empirical evidence indicated that the level of perceived stress affects the size of symptoms of stress response, which may play a mediating role in the relationship between parental support adequacy and adolescents' symptoms of general stress responses. Character strengths is a positive psychological resource and may also interact with parental support adequacy to influence adolescents' perceived stress and symptoms of general stress responses, but these issues have not been discussed in the existing studies. Therefore, the present study sought to investigate the mediating role of perceived stress in the relationship between parental support adequacy and adolescents' symptoms of general stress responses, and the moderating role of recent character strengths. A total of 631 adolescents (M_{age} =13.88 years, *SD* =0.61) were tested by Child and Adolescent Social Support Scale, the Simplified Chinese version of the Character Scale for Adolescents, the Chinese version of the Perceived Stress Scale, Generalized Anxiety Disorder-7, Center for Epidemiological Survey-Depression Scale, the somatization subscale of Symptom Checklist 90, and Pittsburgh Sleep Quality Index at an interval of half a year. After controlling for gender, age, family socioeconomic status, perceived stress of the first measurement, and symptoms of general stress response of the first measurement, the results showed that: (1) parental support adequacy has a significant negative effect on adolescents' symptoms of general stress responses, and perceived stress can mediate the relationship between parental support adequacy and adolescents' symptoms of general stress responses, that is, parental support adequacy can not only directly affect adolescents' symptoms of general stress responses, but also affect adolescents' symptoms of general stress responses via influencing adolescents' perceived stress. (2) character strengths not only moderated the relationship between parental support adequacy and adolescents' symptoms of general stress responses but moderated the influence of parental support adequacy on adolescent perceived stress. Specifically, compared with adolescents with more character strengths, adolescents with fewer character strengths were more likely to be affected by parental support adequacy and perform a low perceived stress and symptoms of general stress response. In conclusion, the results show that perceived stress plays a mediating role in the relationship between parental support adequacy and adolescents' symptoms of general stress response, while character strengths plays a moderating role in the relationship between parental support adequacy and adolescents' symptoms of general stress response.

Keywords：adolescents, parental support adequacy, perceived stress, character strengths, symptoms of general stress response

亲子关系与小学高年级儿童认知评价恐惧的关系：感觉加工敏感性的中介作用

卢禹名 刘倩文* 王振宏*

陕西师范大学心理学院，陕西（高校）儿童青少年心理与行为健康哲学社会科学重点研究基地,西安，710062

liuqw24@126.com; wangzhenhong@snnu.edu.cn

摘 要 社交焦虑认知行为模型提出，负性评价恐惧和正性评价恐惧是社交焦虑的核心特征。其中负性评价恐惧是指对他人的负面评价感到压力；正性评价恐惧则强调为他人正面的评价而苦恼和担忧。研究表明，儿童的认知评价恐惧会受到家庭环境因素和个体因素的共同作用。感觉加工敏感性(Sensory Processing Sensitivity, SPS)反映了儿童对外部刺激的敏锐性、认知加工深度及复杂程度、以及产生的情绪与生理反应，包括审美敏感性、低感觉阈限和易受过度刺激三个维度。研究发现，SPS 在个体评价恐惧和社交焦虑的形成中起着重要作用。此外，儿童 SPS 也会受到家庭环境的影响，且不同的 SPS 维度在影响儿童社会适应时可能起着不同的作用。但亲子关系作为家庭心理社会环境的核心因素，是否会通过影响 SPS 进而作用于儿童认知评价恐惧，目前还没有研究予以探讨。因此，本研究运用《亲子亲密度量表》、《亲子冲突问卷》、《自我报告高敏感儿童量表》、《正性评价恐惧量表》和《简版负面恐惧量表》对 611 名小学高年级儿童（$M_{年龄}$ =11.1 岁，*SD* =1.05）的亲子关系、SPS 和评价恐惧进行测量，考察了 SPS 不同维度在亲子亲密和亲子冲突影响儿童认知评价恐惧中的中介作用。结果发现:（1）亲子亲密和亲子冲突对小学高年级儿童的正性和负性评价恐惧主效应均显著；（2）低感觉阈限在亲子亲密影响正性评价恐惧间起中介作用，易受过度刺激分别在亲子冲突影响正性和负性评价恐惧中起中介作用；（3）亲子亲密和亲子冲突均不会通过儿童的审美敏感性来影响其对正性和负性评价的恐惧；（4）不同 SPS 维度在亲子关系影响评价恐惧中的作用不存在显著的性别差异。研究结果表明，亲子关系会通过影响小学高年级儿童的感觉加工敏感性中的低感觉阈限与易受过度刺激维度而间接影响其认知评价恐惧，研究也提示感觉加工敏感性的三个维度即审美敏感性、低感觉阈限和易受过度刺激在儿童社会适应性发展中的作用机制是不同的。

The relationship between parent-child relationship and cognitive fear of evaluation in high-grade primary school students: The mediating role of sensory processing sensitivity

Yuming Lu, Qianwen Liu*, Zhenhong Wang*

School of Psychology, Shaanxi Normal University, Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an 710062

Corresponding authors：Qianwen Liu, liuqw24@126.com; Zhenhong Wang,wangzhenhong@snnu.edu.cn

Abstract： The cognitive-behavioral model of social anxiety proposes that fear of negative evaluation and fear of positive evaluation are core characteristics of social anxiety. The fear of negative evaluation refers to the stress of negative evaluation of others, while the fear of positive evaluation refers to the distress and worry about the positive evaluation of others. Research has shown that cognitive fear of evaluation in children is influenced by family environment factors and individual factors. Sensory processing sensitivity (SPS) is characterized by

enhanced awareness, depth of processing, and emotional reactivity to external stimuli, including three dimensions, i.e., aesthetic sensitivity, low sensory threshold, and ease of excitation. Prior studies have shown that SPS exerts an essential impact on the formation of individual evaluation fear and social anxiety. In addition, children's SPS is considered to be affected by the family environment, and different SPS dimensions may play different roles in influencing children's social adaptation. However, whether the parent-child relationship, as a key factor of family psychosocial environments, will affect children's cognitive fear of evaluation by influencing SPS has not been explored. Thus, the purpose of the present study was to investigate the mediating roles of different dimensions of SPS in the effects of parent-child intimacy and parent-child conflict on children's cognitive fear of evaluation. A total of 611 high-grade primary school students (M_{age} =11.10 years, SD =1.05) were recruited to complete the Parent-Child Close Scale, Parent-Child Conflict Questionnaire, Highly Sensitive Child Scale, Fear of Positive Evaluation Scale, and Brief Fear of Negative Evaluation Scale to assess their parent-child relationship, SPS, and cognitive fear of evaluation. The results found that: (1) Parent-child intimacy and parent-child conflict had significantly main effect on fear of the positive and negative evaluation. (2) Low sensory threshold played a mediating role in the relationship between parent-child intimacy and fear of positive evaluation, while ease of excitation played a mediating role in the relationship between parent-child conflict and fear of the positive and negative evaluation; (3) Neither parent-child intimacy nor parent-child conflict could affect significantly children's fear of positive and negative evaluation via their aesthetic sensitivity; (4) There was no significant gender difference in associations among parent-child relationship, SPS, and cognitive fear of evaluation. The current study results indicated that the parent-child relationship indirectly affects the cognitive fear of evaluation by influencing the low sensory threshold and ease of excitation of sensory processing sensitivity in high-grade primary school students. Meanwhile, the three dimensions of sensory processing sensitivity, aesthetic sensitivity, low sensory threshold, and ease of excitation, have different mechanisms in children's social adaptive development.

中国人幽默人格和幽默感本质主义信念对心理健康的影响机制

曹毅 余慧慧 侯玉波（通讯作者）
北京大学心理与认知科学学院，北京，100010
通讯作者 houyubo@pku.edu.cn

摘 要 中西方的文化差异影响着人们对幽默的认识与理解，同时也塑造了幽默人格在不同文化中的表现形式。本研究以中国传统文化中的幽默思想为依据，通过 5 个系列研究，首先开发了中国人幽默人格量表，接着在此基础上结合本质主义信念理论，探索了中国人幽默人格和幽默感本质主义信念对人们心理健康的影响与机制。具体而言，研究 1 根据人格词汇学假设，分别通过探索性(研究 1A, N = 397)和验证性因素分析(研究 1B, N = 289)，开发了中国人幽默人格工具。研究 2(N 中 = 400; N 西 = 381)运用测量不变性和描述性统计方法，证明中国人幽默人格的 5 因子结构具有文化特异性。研究 3(N = 290)考察了中国人幽默人格影响心理健康的中介机制，发现认知评价与压力知觉在其中起链式中介作用。研究 4(N = 346)启动被试的幽默感本质主义信念，探索它在幽默人格影响认知评价中的调节作用，结果显示幽默感本质主义信念可以调节幽默人格对认知评价的影响，并进一步调节了幽默人格通过认知评价来影响压力知觉的间接效应。研究 5 (N = 357)采用多时点问卷收集方式进一步发现幽默感本质主义信念可以调节认知评价和压力知觉的链式中介作用。这些研究结果丰富了跨文化心理学、幽默心理学及本质主义信念领域的相关文献，并且为更好地促进民众的心理健康提供了理论与实践上的启示。

The Impact Mechanism of Chinese Humor Personality and Essentialism about Sense of Humor on Mental Health

Yi Cao Huihui Yu Yubo Hou
School of Psychological and Cognitive Sciences, Peking University, Beijing, China

Abstract: Cultural differences between China and the West influence people's perception and understanding of humor, and also shape the different expressions of humor personality. The present research through 5 studies, firstly construct the structure of humor personality in Chinese culture derived from traditional Chinese thinking in humor, then combine the theory of essentialist beliefs to explore the impact mechanism of Chinese humor personality and people's beliefs in essentialism about sense of humor (BESH) on mental health. Specifically, Study 1 used exploratory factor analysis (Study 1A, $N = 397$) and confirmatory factor analysis (Study 1B, $N = 289$) to construct and confirm the five factors of Chinese humorous personality structure. Study 2 ($N_{Chinese} = 400$; $N_{West} = 381$) utilized measurement invariance and descriptive statistics to demonstrate that the 5-factor structure of Chinese humorous personality was not valid in Western participants, indicating its cultural specificity. Study 3 ($N = 290$) collected questionnaires at two different time points to investigate the impact mechanism of Chinese humor personality on mental health. The results indicated that cognitive appraisal and stress perception

played a chain mediating role in the relation of Chinese humor personality on mental health. Study 4 (N = 346) used an experimental paradigm to explore the moderating role of BESH. The results revealed that participants' BESH moderated the effect of their humor personality on cognitive appraisal and further moderated the indirect effect of humor personality on stress perception. Study 5 (N = 357) used a longitudinal design to further validate the moderating effect of BESH on the chain mediating effect of Chinese humor personality on mental health. The findings enrich the literature in the fields of cross-cultural psychology, humor psychology, and essentialism, and provide theoretical and practical insights to promote public mental health in a better phase.

Keywords：culture, humor personality, mental health, essentialist beliefs

面孔运动促进独立型自我建构个体的面孔整体加工*

连玉净 王安清 张琪 杨学贤 汪海玲(通讯作者)
山东师范大学心理学院，济南，250358，hailingwang@sdnu.edu.cn

摘 要 面孔整体加工受到跨文化因素影响，已有研究表明东亚个体整体加工能力强于高加索个体。这一现象可能由于东亚个体依赖型自我建构重视自我和社会关系的整体联系，而高加索个体独立型自我建构强调自我的独特性。前人研究基于静态面孔材料探讨了自我建构对面孔整体加工的影响，发现独立型自我建构个体整体加工水平低于依赖型个体，但是面孔运动对不同类型自我建构个体的面孔加工方式的影响及其机制尚未明确。本研究通过改变面孔空间频率(spatial frequency, SF)操纵面孔加工方式，其中低 SF(LSF) 信息被认为主要涉及面孔整体加工，而高 SF(HSF) 信息涉及特征加工。研究采用 2(自我建构类型：依赖型；独立型) × 2(学习面孔：动态；静态) × 2(测验面孔：LSF；HSF)被试内实验设计，首先向被试呈现学习面孔 1350ms，随机间隔 300-500ms 后呈现测验面孔 1500ms，被试需要对学习面孔和测验面孔进行匹配。实验过程中多次使用圈读法启动被试的自我建构类型，并通过问卷测量启动效果。ERP 结果发现：(1) P1 成分上 LSF 面孔诱发波幅大于 HSF 面孔，同时二者差异在动态条件下更大；相反，N170 成分上 HSF 面孔诱发波幅大于 LSF 面孔，但是该差异在动静态之间保持一致；随后的 P2 成分上发现 LSF 面孔诱发波幅大于 HSF 面孔，该差异在动静态之间同样保持一致。(2)对依赖型自我建构个体而言，静态条件下，LSF 面孔诱发的 P2 大于 HSF 面孔；但是，对独立型自我建构个体而言，动态条件下，LSF 面孔诱发的 P2 大于 HSF 面孔。综上所述，本研究发现面孔运动对整体加工的促进作用表现在视觉加工的较早阶段；在面孔的深度加工阶段更依赖于整体加工，而在此之前，面孔加工遵循由粗到细(coarse-to-fine)的加工机制。与前人研究一致，静态学习面孔促进依赖型个体的面孔整体加工；本研究则进一步发现，动态学习面孔对整体加工的促进作用体现在独立型自我个体上。

Facial motion facilitates the holistic face processing with independent self-construal individual*

Yujing Lian, Anqing Wang, Qi Zhang, Xuexian Yang, Hailing Wang (Corresponding Author)
School of Psychology, Shandong Normal University, Jinan, 250358, hailingwang@sdnu.edu.cn

Abstract: Cross-culture factors have been shown to influence holistic face processing, as previous studies have demonstrated that East Asians possess a higher degree of holistic face processing compared to Caucasian. This finding might be attributed to the fact that East Asians are likely to have a dependent self-construal that focuses on the relationship between themselves and their social relationships, while Caucasians tend to prioritize individual uniqueness through their independent self-construal. Previous studies have investigated the effect of self-construal on holistic face processing using static facial stimuli, revealing that individuals with an independent self-construal exhibit lower degree of holistic processing compared to those with a dependent self-construal. However, it is remains unclear whether facial motion has diverse effects on the neural mechanisms underlying holistic face processing depending on the type of self-construal. The current study manipulated face processing by altering the

spatial frequency (SF) of face, with low spatial frequency (LSF) information being associated with holistic face processing and high spatial frequency (HSF) information being related to feature-based processing. A 2 (self-construal type: dependent, independent) × 2 (study face: dynamic, static) × 2 (test face: LSF, HSF) within-subject design was employed. Participants were initially presented with a study face for 1350ms followed by a random interval of 300-500ms, after which the test face was presented for 1500ms. Subsequently, they were instructed to match the identity of the study face and the test face. By employing the pronoun-circling task, self-construal types were primed repeatedly to evaluate the efficacy of priming, which was then assessed immediately through questionnaires. ERP results were as follows. (1) P1 response to the LSF face was larger than the HSF face, and the facilitative effect of LSF face was more pronounced in the dynamic condition than in the static condition. Conversely, the N170 response was consistently larger for HSF face than for LSF faces in both static and dynamic conditions. LSF face elicited a greater P2 than HSF faces in both static and dynamic conditions, with consistent differences between the two. (2) After studying static faces, the dependent self-construal condition elicited a greater P2 response to LSF than HSF faces. For independent self-construal condition, LSF face elicited a greater P2 than HSF face after studying dynamic face. In conclusion, the current study found that facial motion facilitates holistic processing during the earliest visual stages. Holistic face processing is more prominent during the depth stage of face processing, whereas prior to this stage, face processing follows a coarse-to-fine sequence. The current study found that static study face promotes holistic face processing in individuals with interdependent self-construal, a result that is consistent with previous research. Furthermore, the findings revealed that dynamic study face facilitates holistic face processing in those with independent self-construal.

人格与无手机恐惧的关系：基于潜在类别分析方法的探索

季顺鑫[2]　周嬰[2]　刘拓[1,2,3]（通讯作者）

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387

2 天津师范大学心理学部，天津，300387

3 学生心理发展与学习天津市高校社会科学实验室，天津，300387，liutuo@tjnu.edu.cn

摘 要　手机功能的不断更新为使用者们带来了更多的便利，但同时也对人们产生一些消极影响，无手机恐惧(Nomophobia)正是由于问题性手机使用引起的。手机使用被认为是一种行为结果，那么了解行为背后的心理因素才是解决问题的关键。人格作为稳定的心理特征，经常被用于研究个体的行为表现，研究者们也发现了不同的人格特质对无手机恐惧有着不同的预测作用。前人研究往往聚焦于大五人格的维度差异，本研究为了将研究对象的五种人格特质同时考虑进去，使用潜在类别分析方法探讨大学生的人格类型。在此基础上，使用单因素方差分析探究人格类型与无手机恐惧之间的关系。本研究采用中国大五人格问卷简式版和中文版本的无手机恐惧量对1906名大学生进行问卷调查，利用Mplus 8.0和SPSS19.0对数据进行分析。研究结果表明: (1)潜在类别分析的结果显示4个类别的模型拟合良好，分别将其命名为低弹性型(17%)、高弹性型(22%)、低脆弱性(36%)和高脆弱型(25%)。低弹性型与高弹性型在神经质维度上作答概率最低，在剩余4个维度方面作答概率均较高，且高弹性型得分高于低弹性型。低脆弱型与高脆弱型在外向性和神经质维度的作答概率均处于中间状态，在剩余3个维度方面作答概率较高，但低脆弱型得分高于高脆弱型。(2)单因素方差结果显示，4个人格类型与无手机恐惧总分及其分维度均有显著差异(ps<0.001)。事后检验表明，除“害怕失去联系”维度以外，高低脆弱型的被试无手机恐惧程度更强(ps<0.01)。相比于高弹性型的被试，低弹性型更加害怕失去手机带来的便利(p<0.05)。在“害怕失去联系”上，低弹性型的被试显著低于其它的类型(ps<0.01)，且高脆弱型显著低于低脆弱型(p<0.05)。本研究的结果证明了不仅限于独立人格特质与无手机恐惧的具有关系，人格的潜在类别也与无手机恐惧有一定的联系，为未来关于人格与手机使用的研究提供一定的启示。

The Relationship between Personality and Nomophobia: An Exploration Based on Latent Class Analysis

Shunxin Ji [2] Zhao Zhou [2] Tuo Liu[1,2,3] (Corresponding author)

1 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China;

2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China;

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China, liutuo@tjnu.edu.cn

Abstract：The continuous advancement of mobile phones functions has brought more convenience to users, but it has also had a negative impact on people. Nomophobia is caused by problematic mobile phone use. Mobile phone use is considered a behavioral outcome, so understanding the psychological factors behind mobile phone use is crucial for addressing this issue. Personality, as a stable psychological trait, is often used to study the individual's behavioral performance, and researchers have found that different personality traits are differently predicated on nomophobia. Previous studies have tended to focus on the differences in the dimensions of the big five personality, and the present study used latent class analysis(LCA) to explore the personality types of university students in order to take the five personality traits of the subjects together into consideration. Based on this, one-way analysis of variance (ANOVA) was used to explore the relationship between personality types and nomophobia.In this study, questionnaires were administered to 1,906 college students using the Chinese brief version of the Big Five Personality Inventory and the Chinese version of Nomophobia Scale, and the data were analyzed using Mplus 8.0 and SPSS 19.0. The results showed that: (1) The results of the LCA showed a best model fit for the four classes, which were named weakly resilient(17%), strongly resilient(22%), weakly vulnerable(36%), and strongly vulnerable(25%) respectively. Weakly resilient and strongly resilient had the lowest response probability in the neuroticism dimension, higher response probability in the remaining four dimensions, with strongly resilient scoring higher than weakly resilient. Both weakly and strongly vulnerable had medium response probabilities in the extraversion and neuroticism dimensions and higher response probabilities in the remaining three dimensions, but weakly vulnerable scored higher than strongly vulnerable. (2) One-way ANOVA results showed that the four personality types were significantly different from the total score of nomophobia and its sub-dimensions(ps<0.001). Post hoc tests showed that weakly and strongly vulnerable subjects were more afraid of nomophobia(ps<0.01), except for the fear of losing contact dimension. Weakly resilient subjects were more scared of losing the convenience of mobile phone than strongly resilient subjects(p<0.05). Fear of losing contact dimension was significantly lower for weakly resilient than other types(ps<0.01), and strongly vulnerable was significantly lower than weakly vulnerability(p<0.05). The findings of this study demonstrated that not only independent personality traits had a relationship with nomophobia, but that latent classes of personality were also associated with nomophobia, providing some insights for future research on personality and mobile phone use.

社交媒体中隐性社会规范对自动化信任传递的影响

董超武　杨千一　晏碧华（通讯作者）
陕西师范大学心理学院，西安，710062，E-mail：yanbihua@snnu.edu.cn

摘 要　我国社交媒体用户已达 10.15 亿，庞大的用户规模使社交媒体成为了群体信念传递的主要途径。近来，Chatgpt 等自然语言处理工具引发了公众对自动化信任的讨论，社交媒体中的自动化信任被视为社会信任的一部分。社会规范是指社会中多数个体做什么或赞成做什么的信念。其中，描述性规范指某一场景中的普遍适应性行为方式，禁令性规范是针对他人是否赞同以及他人行为可能得到的奖惩的暗示。

本研究聚焦社交媒体平台中的规范信息（如标题内容），通过三项实验探索了描述性规范和禁令性规范对自动化信任传递的影响。实验一通过操纵自动化宣传材料的传播指标，对比了描述性规范和禁令性规范对社交媒体用户自动化信任水平以及传播意愿的影响；实验二进一步探索了不同水平的描述性规范（低、中、高）的对社交媒体用户自身信念和对他人信念评价的影响；实验三通过加入社会比较信息场景，尝试揭示个体自动化信任水平受不同规范影响的部分原因。此外，本研究设计了符合我国社交媒体平台的实验材料，加入了针对自动化信任内隐态度测验，尽可能避免主观问卷测量带来的偏差。

结果：（1）描述性规范显著影响了社交媒体用户的自动化信任水平和传播意愿，禁令性规范的效果则不显著，甚至削弱了部分被试的传播意愿；（2）描述性规范的强度越大，被试的自动化信任水平和传播意愿的提升就越明显；（3）社会比较信息关注水平中介了描述性规范对个体自动化信任和传播意愿的影响。

结论：社交媒体中的隐性社会规范信息显著影响了自动化信任的水平和传递，描述性规范是有效的干预方式，可减少外显信任和内隐态度间的误差。

The impact of implicit social norms on trust in automation transmission in social media

Dong Chaowu　Yang Qianyi　Yan Bihua(corresponding author)
Shaanxi Normal University, Xi'an

***Abstract*:** The number of social media users in China has reached 1.015 billion, and the huge scale of users makes social media become the main way of group belief transmission. Recently, natural language processing tools such as Chatgpt have sparked public discussion about trust in automation (TiA), which is seen as part of social trust in social media. Social norms are beliefs about what the majority of individuals in a society do or approve of. The descriptive norm refers to the general adaptive behavior pattern in a certain scene, while the injunctive norm is the suggestion of whether others agree with it and the possible rewards and punishments for others' behavior.

Through three experiments, our study explored the effects of descriptive norms and injunctive norms on transmission of TiA based on normative messages (such as headline content) in social media platforms. Experiment 1 compared the effects of descriptive norms and injunctive norms on the TiA level and communication intention of social media users by manipulating the communication indicators of automation propaganda materials. Experiment 2 further explored the effects of different levels of descriptive norms (low, medium and high) on social media users' beliefs towards themselves and others. Experiment 3 added social comparison information scene, to

partly revealed the reason why individuals' TiA level was affected by different norm. Notably, redesigned experimental materials that fit the Chinese social media platform, and added the implicit attitude test for TiA trust, so as to avoid the bias caused by subjective questionnaire measurement as much as possible.

Results: (1) Descriptive norms significantly affected the level of trust in automation and communication intention of social media users, while injunctive norms had no significant effect, and even weakened the communication intention of some subjects; (2) The stronger the extent of descriptive norms, the more obvious the improvement of subjects' TiA and transmission intention; (3) The level of social comparative information concern mediates the influence of descriptive norms on individuals' TiA and transmission intention.

Conclusion: The implicit social norm information in social media significantly affects the level and transmission of TiA. Descriptive norm is an effective intervention method, which can reduce the error between explicit trust and implicit attitude.

2 华东师范大学计算机科学与技术学院，上海智能教育研究院，上海，200062

摘 要 虚拟人技术作为一种创新的人机交互方式，正逐渐应用到越来越多的领域，比如入职面试和情感陪伴等。随着技术的持续进步和人工智能的不断发展，虚拟人技术在语音识别、自然语言处理和情感表达等方面取得了显著进展。通过复杂的算法和模型，虚拟人可以实时感知用户的语言和情感，并以自然流畅的方式进行回应和互动。那么，虚拟人与真人之间的交流效果是否能够与真人相媲美，以及人类在多大程度上能够与虚拟人建立有效的交流，是一个备受关注的重要问题。本研究旨在比较真人访谈和虚拟人访谈对被试的影响，以探究虚拟人技术在人机交互体验中的潜在优势和局限性。我们招募了 158 名在校大学生参与实验，其中 77 人（17 男，60 女）接受真人结构化访谈，81 人（20 男，61 女）接受虚拟人结构化访谈，访谈过程中我们记录了被试的言语和非言语行为。访谈结束后，被试填写大五人格量表和访谈体验问卷。研究结果显示，尽管在某些主观感受上与真人访谈相比有所欠缺，虚拟人访谈能够成功地激发受访者的言语交流行为。为更好地提升交互体验，未来的研究可以进一步优化虚拟人的外貌和语言表现，提升交互的逼真度和互动体验。此外，不断改进虚拟人系统的智能化程度和个性化服务，将是推动虚拟人技术更广泛应用的关键。

Virtual humans enable verbal interaction with humans during interviews

Ning Zhou [a], Chen-Lu Lin [a], Ke-Qi Pan [a], Miao Zheng [a], Jia-Lu Sui [a], Bin Tang [b], Cheng-Long Deng [a], Shu-Guang Kuai [a,*]

[a] Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China
[b] Shanghai Institute of AI for Education, School of Computer Science and Technology, East China Normal University, Shanghai, 200062, China

Abstract: Virtual human technology, as an innovative form of human-computer interaction, is progressively being applied in various domains such as job interviews and emotional companionship. With continuous advancements in technology and the ongoing development of artificial intelligence, virtual human technology has made remarkable progress in areas like speech recognition, natural language processing, and emotional expression. Leveraging sophisticated algorithms and models, virtual humans can dynamically perceive users' language and emotions, responding and interacting in a natural and seamless manner. A crucial and highly scrutinized question remains unclear, however, can virtual human interactions match the effectiveness of human-to-human interactions, and to what extent can humans establish meaningful communication with virtual counterparts? This study aims to compare real human interviews with virtual human interviews to explore the potential advantages and limitations of virtual human technology in human-computer interaction experiences. We recruited 158 university students, with 77 individuals (17 male, 60 female) participating in real human interviews and 81 individuals (20 male, 61 female) participating in virtual human interviews. During the interviews, we recorded participants' verbal and non-verbal behaviours. After the interviews, participants completed the NEO Five Factor Inventory and an interview experience questionnaire. The results showed that, although virtual human interviews may lack certain subjective perceptions compared to real human interviews, they strongly stimulate verbal communication behaviour between the interviewers and respondents. To further enhance the interactive experience, future research can focus on optimizing the appearance and language performance of virtual humans, elevating the realism and interactivity of the interactions. Additionally, continuously improving the level of intelligence and personalized services of the virtual human system will be the key to promoting the widespread application of virtual human technology.

多任务环境中人机协同绩效的提升：基于信任的视角

朱思雨[1]　宋晓蕾[1]（通讯作者）
1 陕西师范大学心理学院，西安，710062，songxiaolei@snnu.edu.cn

摘 要　针对现代复杂人机系统中经常涉及到的多任务导致的用户认知负荷过高问题，人们开发了诊断性自动化辅助工具来降低多任务环境中急剧增加的认知负荷，进而提高任务绩效。以往研究证明了任务负荷与警报的错误偏差对任务绩效的影响，但其中并未涉及到系统可靠性的问题。而系统可靠性会直接影响到人对系统的信任，进而影响绩效。因此，本研究旨在从多维度（主观任务负荷、系统可靠性、自动化信任）评估系统因素对人机协同绩效以及自动化信任的影响，并尝试从信息透明度视角改善系统因素对人机协同绩效的负面影响。实验要求被试在一个飞行模拟程序（MATB-II）中同时执行两种不同类型的任务：一个由不完美的自动化报警系统辅助的监控任务和一个手动跟踪任务。实验一探究在不同任务负荷下，系统可靠性和警报错误偏差如何影响操作者的任务绩效及其对自动化报警系统的信任。实验二在此基础上进一步探究是否能通过给被试提供更高水平的可靠性信息来增加信息透明度，进而改善系统因素对人机协同绩效的消极影响和自动化信任。结果表明，低可靠性时，错误警报（Fa）在高任务负荷条件下对任务绩效的负面影响急剧增加。而当透明度更高时，被试的监控任务绩效更好。在自动化信任方面，低任务负荷下操作

者更加信任自动化。并且，被试感知到的自动化可靠性与其对自动化的信任呈正相关。本研究为人机系统中人机协同监控的自动化报警系统设计提供了科学依据。

Human-Machine Collaborative Performance Improvement in Multitasking Environments：A Trust-Based Perspective

Zhu Siyu, Song Xiaolei
School of Psychology, Shaanxi Normal University, 710062
songxiaolei@snnu.edu.cn

Abstract：In response to the problem of high user cognitive load due to multitasking often involved in modern complex human-machine systems, diagnostic automation aids have been developed to reduce the drastically increased cognitive load in multitasking environments and thus improve task performance. Previous studies have demonstrated the impact of task load and error bias on task performance, but they have not addressed the issue of system reliability. System reliability can directly affect operators' trust in automation, which in turn affects performance. Therefore, this study aims to assess the effects of system factors on human-machine collaboration performance as well as automation trust from a multidimensional perspective (subjective task load, system reliability, and trust in automation), and attempts to ameliorate the negative effects of system factors on human-machine collaboration performance from an information transparency perspective. Experiments required subjects to perform two different types of tasks simultaneously in a flight simulation programme (MATB-II): a monitoring task assisted by an imperfect automated alarm system and a manual tracking task. Experiment 1 explored how system reliability and alarm error bias affected operators' task performance and their trust in the automated alarm system under different task loads. Experiment 2 builds on this by further exploring whether the negative influence of system factors on human-machine collaborative performance and automation trust can be improved by providing subjects with higher levels of reliability information to increase information transparency. The results showed that at low reliability, the negative effect of false alarms (Fa) on task performance increased dramatically in the high task load condition. In contrast, when transparency was higher, subjects' monitoring task performance was better. In terms of automation trust, operators trusted automation more under low task load. Moreover, subjects' perceived automation reliability was positively correlated with their trust in automation. This study provides a scientific basis for the design of automated alarm systems for collaborative human-machine monitoring in human-machine systems.

对话响应时间及反馈方式对老年人语音交互满意度的影响

崔晨虹[1]　周博霖[2]　张浩[1]　曹贤才[1,2,3]（通讯作者）
1 天津师范大学心理学部,天津，300387
2 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院,天津，300387
3 学生心理发展与学习天津市高校社会科学实验室,天津，300387，通讯作者 caoxiancai@tjnu.edu.cn

摘 要 随着数字化科技的成熟与发展，语音交互方式被广泛运用于手机、智能音箱、家居、车载等不同设备或使用场景中。同时，语音交互方式因其自然性可以较好适用于老年群体或特定障碍人群执行相对复杂任务的人机交互。然而目前对语音交互产品的设计与研究主要针对年轻人，相关研究指出老年人在使用语音交互过程中存在满意度不高、接受度较低等问题。因此，亟待有研究关注老年群体的语音交互，以提高老年人对语音交互的满意度。本研究聚焦于语音交互中相对重要的对话环节，考察对话响应时间及反馈方式对老年人语音交互满意度的影响。研究共招募 60 岁以上老年人 31 名，平均年龄为 70.2±4.8 岁，采用小度智能音箱作为模拟实验对象，使用人工断点的形式记录对话响应时间，在不同的对话响应时间与反馈方式的结合下，老年人对满意度、舒适度、拟人性、速度快慢进行评分。本实验为 10（对话响应时间：0ms,300ms,600ms,900ms,1200ms,1500ms,2000ms,2500ms，3000ms,3500ms)×3(对话反馈方式：任务导向型、社交导向型）被试内实验设计。研究结果发现：（1）二次曲线模拟的结果显示，随着唤醒响应时间的延长，老年人对智能音箱的满意度、舒适度、拟人性下降，但在拟人性评分上，任务导向型下降速率先慢后快、社交导向型下降速率先快后慢。（2）老年人接受的舒适响应时间段为[300-1500ms]。（3）老年人在满意度评分上，响应时间与反馈方式主效应显著，二者交互作用不显著。在反馈方式上，社交导向型的评分显著大于任务导向型；在响应时间上，3000ms 以上的评分显著低于 2000ms 内的时间段。在拟人性评分上，仅存在响应时间主效应边缘显著， [2500-3000ms]评分显著低于[1200-1500ms]。在舒适度评分上，仅发现响应时间主效应显著，3000ms 以上的评分显著低于 2500ms 内的时间段。本实验结果表明对话响应时间和反馈方式会影响老年人语音交互的满意度，得到了老年人在不同主观评价指标下的语音交互的差异，以及最佳的响应时间段和反馈方式。研究结果表明与年轻群体研究结果存在差异，能够为语音交互适老化设计提供建议，提高老年人在使用语音交互技术或产品时的用户体验。

The Impact of Dialogue Response Time and Feedback Style on the Satisfaction of Older Adults with Voice Interaction

Chenhong CUI[1] Bolin ZHOU[2] Hao ZHANG[3] Xiancai CAO[1,2,3]

1 Faculty of Psychology, Tianjin Normal University, Tianjin, China

2 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin, China

3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin, China

Abstract：With the maturity and development of digital technology, voice interaction has been widely used in different devices or scenarios such as smartphones, smart speakers, smart homes, and cars. At the same time, voice interaction is well-suited for older adults or individuals with disabilities to perform relatively complex tasks due to its naturalness. However, current design and research on voice interaction products mainly focus on young people, and studies have pointed out that older adults have low satisfaction and acceptance levels when using voice interaction. Therefore, there is an urgent need for research on voice interaction for the elderly to improve their

satisfaction with it. This study focuses on the relatively important dialogue phase in voice interaction and examines the impact of dialogue response time and feedback styles on the satisfaction of older adults with voice interaction.

The study recruited 31 participants aged 60 and above, with an average age of 70.2±4.8 years. A XiaoDu smart speaker was used as the experimental device, and the dialogue response time was recorded using artificial breakpoints. Under different combinations of dialogue response time and feedback styles, older adults rated their satisfaction, comfort, anthropomorphism, and perceived speed level. The experiment followed a 10 (dialogue response time: 0ms, 300ms, 600ms, 900ms, 1200ms, 1500ms, 2000ms, 2500ms, 3000ms, 3500ms) × 3 (dialogue feedback style: task-oriented, social-oriented) within-subject design. The results of the study showed that: (1) The results of quadratic curve simulation showed that as the wake-up response time increased, the satisfaction, comfort, and anthropomorphism of older adults towards the smart speaker decreased. However, in terms of anthropomorphism rating, the task-oriented feedback style had a slower initial decrease rate and a faster later decrease rate, while the social-oriented feedback style had a faster initial decrease rate and a slower later decrease rate. (2) The comfortable response time range accepted by older adults was [300-1500ms]. (3) In terms of satisfaction rating, both dialogue response time and feedback style had significant main effects, while their interaction effect was not significant. Post hoc comparisons indicated that the social-oriented method had significantly higher ratings than the task-oriented method and ratings above 3000ms were significantly lower than those within the 2000ms range. In terms of anthropomorphism rating, only the main effect of response time was marginally significant, with ratings in the [2500-3000ms] range significantly lower than those in the [1200-1500ms] range. In terms of comfort rating, only the main effect of response time was significant, with ratings above 3000ms significantly lower than those within the 2500ms range.

The results of this experiment indicate that dialogue response time and feedback style can affect the satisfaction of older adults with voice interaction. The study identified differences in subjective evaluation indicators of voice interaction among older adults and identified optimal response time ranges and feedback styles. The results of the study indicate differences from research results on younger populations and can provide suggestions for age-friendly design of voice interaction, thereby improving the user experience of older adults when using voice interaction technology or products.

描述信息的来源可信度及其偏差对基于经验的风险决策的影响

高山川　吴彦佑

复旦大学心理学系，上海，200433，tracygao@fudan.edu.cn

摘 要　在基于经验的决策中，个人通过反复抽样和反馈来把握不同结果的概率分布，当事先获知有关收益、损失及其概率的概括性描述后，其选择会同时受到描述信息和经验的影响。外部信息来源有不同的可信度，对选项的描述也可能偏离个人经验，如夸大收益率、隐瞒潜在损失。人们利用描述信息时会考虑来源可信度吗？越是夸张的描述是否越有迷惑性？经验的积累能否消除描述信息的误导并让人发现真相？通过模拟投资决策情境进行了两个实验，分别对风险选项的收益率进行不同程度夸大或对可能的亏损进行隐瞒，以考察描述信息的来源可信度及其与经验的偏差将如何共同影响风险选择。

通过预实验编制了不同投资咨询机构的介绍材料，被试阅读后感知到不同的可信度。实验一采用 2（描述信息来源可信度：高、低）×2（夸大收益率：10%、20%）的被试间设计，要求在确定选项与风险选项

之间做 100 轮选择，后者的真实收益率为 50%，但被夸大描述。实验二为 2（描述信息来源可信度：高、低）×2（隐瞒亏损：500 元、1000 元）的被试间设计，如实描述 50%收益率但隐瞒 10%的可能产生或大或小亏损。被试各 80 人，因变量均为选择风险选项的比例。结果发现：

(1)描述信息来源可信度对风险选项选择有显著影响，夸大收益率情境下，可信度高时被试不仅比可信度低时更多地选择风险选项，选择比例还明显超过真实的 50%收益率；隐瞒亏损情境下，可信度低时被试不仅比可信度高时更少地选择风险选项，选择比例还低于真实的收益率；(2)更大程度偏离经验的描述信息并未产生更大的影响，夸大 20%不比 10%吸引人更多地选择风险选项，亏小钱也不比亏大钱时让人更少地回避风险选项；(3)经历 100 轮选择后各组被试都发现先前的描述不太可信，夸大收益率情境下，能准确估计风险选项的真实收益率约 50%，隐瞒亏损情境下，却会高估亏损率、低估收益率。

总之，当原本可靠的信息来源夸大宣传时，人会更冒险，面对不可信的来源，则可能过于谨慎。即使开始时人可能受描述影响，随着经验积累，终将接近真相。

The Influences of Source Credibility of Descriptive Information and its Deviation from Experience on Risky Choices

Gao Shanchuan, Wu Yanyou
Department of Psychology, Fudan University, Shanghai 200433

***Abstract*:** When making decisions based on experience, individuals learn about the potential outcomes of their choices and associated probabilities by observing samples of outcomes over time. Previous research showed that participants tended to combine the available abstract descriptions about the underlying distribution of outcomes with their own experience in decision-making. However, little attention was paid to impact of the source credibility of descriptive information and the extent of its deviation from experience, which could be either overstating the chance of gain or no warning against the possible loss. Will the credibility of external source be taken into consideration when people incorporate the descriptive information? Is it that the more the descriptions deviate from experience, the more people are to be misled? Can they finally get to know the true distribution as they accumulate enough experience? To address these questions, we conducted two studies using the scenarios of investment decision-making and investigated the influences of source credibility of the descriptive information and its deviation from experience on risky choices.

Prior to Study 1, paragraphs describing two agencies for investment consulting were prepared and validated, which were to be presented to participants to manipulate their perception about the credibility of each source. A sample of 80 college students participated in Study 1, utilizing a 2 (source credibility: high vs. low) × 2 (overstatement of the chance of gain: 10% vs. 20%) between-subjects design. Participants were asked to make 100 choices between two investment options with the same expected value, yet one yielding sure smaller gain and the other actually yielding larger gain 50% of the time otherwise nothing, which was described as 10% or 20% more. Another sample of 80 college students participated in Study 2, utilizing a 2 (source credibility: high vs. low) × 2 (concealed loss: 500 yuan vs.1000 yuan) between-subjects design. Similar to Study 1, participants also made 100 choices between sure and risky options with the exception that there was 10% chance to lose some money besides the 50% chance of larger gain. The dependent variable of the studies was the rate of selecting the risky options (R-rate).

The results showed that, first, the main effect of source credibility on the R-rates was significant. Specifically, when they were presented the overstatement from the source perceived as highly credible, participants chose the risky options more frequently than those seeing the overstatement from the unreliable source, with the R-rate even higher than the experienced probability level. Meanwhile, when they were presented the descriptions without warning against the possible loss from the unreliable source, participants chose the risky options less often than those seeing the descriptions from the credible source, with the R-rate even lower than the experienced probability of gain. Additionally, the descriptions deviating more from participants' experience didn't show significantly greater influence on their choices, indicating that the overstatement of 20% greater chance didn't make the risky option more attractive than that of 10% greater chance, while concealing smaller loss didn't make participants choose the risky options less often than concealing bigger loss. Last, after making 100 choices, all groups of participants gave low ratings for the credibility of the prior descriptions of risky options. Their estimation of the probability of gain in Study 1 was close to the experienced level (i.e., 50%), whereas in Study 2 the estimated probability of loss was higher than the experience (i.e., 10%) and the estimated probability of gain was lower than the experience.

In sum, the studies showed that descriptive information from the source perceived as highly credible may mislead people into risk seeking and the unreliable source may make them risk averse. Although descriptions may have initial influence on decision making, people could learn the real distribution in the environment through experiential exploration.

急性压力对青少年冒险的影响：来自动态瞬时评估和 fNIRS 的证据

刘子豪[1,2]　毕晓燕[2]　窦凯[1,2]（通讯作者）

1 广州大学教育学院青少年心理与行为研究中心，广州，510006，psydk@qq.com

2 广州大学教育学院，广州，510006

摘 要　青少年冒险行为指青少年忽略潜在风险、执着于有利回报的行为。对青少年而言，青春期是充斥着来自人际、家庭、学业等多种压力的特殊时期，也是其冒险高发的危险时期。基于压力情境-行为回应模型和自我控制的资源模型，本研究提出了急性压力影响青少年冲动冒险的双路径模型，通过动态瞬时评估技术探究了日常生活情境中急性压力对青少年冲动冒险的动态影响(研究 1)，并在此基础上进一步采用功能性近红外光谱技术(functional Near-Infrared Spectroscopy, fNIRS)探究了青少年冒险背后的认知神经机制(研究 2)。

研究 1 在线招募了 120 名(其中女性 82 名, *M*age=20.9 岁, *SD*=1.63)青少年被试，采用瞬时评估技术和移动版赌博任务范式对他们进行了 7 天的短期追踪，以构建多水平模型探究自我控制和奖赏敏感在急性压力和青少年冒险间潜在的中介作用。研究结果发现：1) 在日常情境中，青少年个体遭受的急性压力能负向预测其在移动版赌博任务中的冒险表现，且急性压力能通过削弱个体的自我控制能力增加个体在移动版赌博任务中的冒险表现(奖赏敏感不存在中介作用); 2) 个体水平的因素中，仅有性别存在跨水平的交互作用，表现为：相比于男性个体，女性青少年更容易因遭遇急性压力而削弱她们的自我控制能力最终导致其在移动版赌博任务中选择冒险；研究 2 招募了 35 名女性(*M*age=20.26 岁 *SD*=1.54)被试，通过对比急性压力组和控制组被试在实验室中完成 BART 任务的行为绩效和脑区激活情况进一步揭示冲动冒险背后的认知神经机制。

结果发现：1) 行为方面：急性压力组被试在多项 BART 绩效上的表现均显著高于控制组，其表现更加冒险。2) fNIRS 方面：相比于控制组，急性压力组的背外侧前额叶皮层的相关通道(CH04、CH14)的激活水平更低，且 CH04 通道在急性压力和冲动冒险之间的存在显著中介作用。

概言之，本研究发现急性压力主要通过削弱自我控制来促使青少年个体冒险，且相比于男生，女性的自我控制在遭遇急性压力时会受到更严重的影响。这一发现丰富了青少年冲动冒险的动态追踪研究与认知神经研究，为保护青少年的健康发展提供了理论参考和应用指导。

The impact of acute stress on adolescent's risk-taking behavior: Evidence from Ecological Momentary Assessment and fNIRS

Zi-hao Liu [1, 2] Xiao-yan Bi [2] Kai Dou [1, 2] (corresponding author)
1 Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, psydk@qq.com
2 School of Education, Guangzhou University, Guangzhou

Abstract：Adolescent risk-taking behavior is defined as a kind of action taken by teenagers where they ignore potential risks and solely concentrate on beneficial rewards. Adolescence is a unique time for teens which is full of pressure from relationships, families, schools, etc. It is also a perilous time with a high incidence of risk-taking. Based on the strength model of self-control and the general strain theory, this study developed a dual-path model to investigate how acute stress affects propensity for impulsive risk-taking in real-world scenarios using Ecological Momentary Assessment method (Study 1). Study2 investigated the cognitive brain mechanisms behind teenagers' risk-taking through functional Near-Infrared Spectroscopy (fNIRS).

Study 1 recruited 120 adolescent subjects (including 82 females, *M*age=20.9 years old, *SD*=1.63) online, then conducted short-term follow-up research for 7 days by using Ecological Momentary Assessment method and Mobile Gambling Task. The results of the study found that: 1) In daily situations, adolescents' acute stress level can negatively predict their risk-taking performance in Mobile Gambling Task and can increase the individual's risk-taking by weakening the individual's self-control ability.2) For the Between-level factors, only gender has a cross-level interaction, which shows that compared with male individuals, female adolescents' self-control is more likely to be weakened by acute stress which will eventually lead them to take risks in Mobile Gambling Task. Study 2 aiming to Uncover the cognitive neural mechanisms behind their risk-taking behavior recruited 35 female subjects (*M*age=20.26 years old, *SD*=1.54), and compared the behavioral performance and brain area activation of subjects in the acute stress group and the control group when they completed the Balloon Analogue Risk Task in a laboratory setting. The results showed that: 1) For behavioral-results: the participants in the acute stress group's BART performances was more risk-taking than control group.2) For fNIRS-results: Compared with the control group, the activation levels of related channels (CH04, CH14) in the dorsolateral prefrontal cortex (dlPFC) of the acute stress group were lower, and there was a significant mediation between the acute stress and risk-taking (CH04 channel).

In summary, this study found that: acute stress primarily impacts people's risk-taking by weakening their self-control. And compared to male, female adolescents' self-control will be more seriously weakened under the influence of acute stress. This finding enriches the Ecological Momentary Assessment research and offers theoretical support and practical application advice for safeguarding the healthy development of adolescents.

摘 要　确证性偏差指个体偏向于关注和支持与其原始观点一致信息的现象，它在建议采纳、信息搜索和决策选择等领域普遍存在。为了探索信息特点对确证性偏差的影响，本研究通过一系列实验考察了结论性信息（有/无）和信息来源（人类/智能系统）对确证性偏差的影响。实验一在店铺地址选择（S1a）、治疗方案选择（S1b）和理财产品选择（S1c）三重情境下考察了相关信息属性对个体在信息判断中呈现出的确证性偏差强度的影响。结果一致发现，相比于包含结论性信息，当个体评估的信息中不包含结论性信息时，其表现出的确证性偏差程度显著减弱。然而，无论信息来源于人类还是智能系统，确证性偏差程度没有显著差异。为了排除实验一材料中可能引发信息来源歧义的无关效应，实验二进一步调整了实验 S1a 的相关材料，仍然重复了实验一的结果。实验三采用了 Fischer 等人 (2011)提出的续签场景，实验四则采用了信息选择任务，均重复了实验一的结果。本研究结果提示人们，在为他人提供建议或信息时，应尽可能避免提供过多的结论性信息，以减少由确证性偏差带来的潜在负面影响。

Effect of Concluding Information and Information Sources on Confirmation Bias

Hongzhou Xuan, Chenchen Zhu, Guibing He*, Zhiqin Chen*
Department of Psychology and Behavioral Sciences, Zhejiang University, 310028

Abstract：Confirmation bias, characterized by individuals' inclination to selectively attend to and support information that aligns with their preexisting beliefs, manifests widely across decision making, information search, and recommendation acceptance. This study aimed to investigate the influence of information characteristics on confirmation bias through a series of experiments exploring the effects of concluding information (with vs. without) and information source (human vs. AI). Experiment 1 examined the impact of relevant information attributes on the degree of confirmation bias in three scenarios: selecting a location to open a café (S1a), choosing a treatment for lower back pain (S1b), and selecting an investment product (S1c). The results consistently demonstrated that people experienced less confirmation bias when the information in the information evaluation task did not contain concluding information compared to when it did. However, we did not find a significant difference in the degree of confirmation bias between information sourced from humans and AI. To eliminate potential confounds arising from information source ambiguities in Experiment 1's materials, Experiment 2 adjusted the relevant materials of S1a, and its results still replicated the findings of Experiment 1. In Experiment 3, we adopted a scenario from Fischer et al. (2011) involving the decision to extend an employee's contract, and in Experiment 4, we employed an information selection task. Both experiments also replicated the outcomes of Experiment 1. The findings of this study suggest that minimizing the inclusion of concluding information when providing advice or information to others can help mitigate potential negative impacts caused by confirmation bias.

摘 要　随着互联网的快速发展，人们逐渐依赖网络的帮助以快速获取信息。网络已经渗透到人们的日常学习、工作和生活中，改变着人们的学习方式、生活方式和思维方式。研究发现，人们接受网络帮助会影响个体对自身能力的自我评估，产生过分自信。在现实生活中，人们遇到问题之后，不仅会接受网络的帮助,也会选择求助于人类同伴。本研究以已有研究为基础，通过实验探讨网络帮助与人类同伴帮助对个体过分自信水平的影响差异，并进一步探讨其原因。

实验一证明不同帮助方式对过分自信的影响存在差异。网络帮助组的过分自信水平显著高于人类同伴帮助组与无帮助组，而人类同伴帮助组与无帮助组的过分自信水平差异不显著。在此基础上，实验二加入“思考条件”因素，通过 2（帮助方式：网络帮助、人类同伴帮助）×2（思考状况：有思考、无思考）的被试间设计，发现在控制了首次作答正确率后，思考状况的主效应显著，思考条件下被试的过分自信水平显著低于无思考条件下的被试；帮助方式主效应也显著，网络帮助条件下被试的过分自信水平高于人类同伴帮助条件下的被试；思考状况与帮助方式的交互效应不显著。

根据以上实验可得出结论：（1）接受网络帮助会促使人们更加高估自己的能力，产生更高程度的过分自信水平。（2）人们在接受人类同伴帮助时，不会像接受网络帮助一样产生更高的过分自信水平，而是像没有接受帮助的个体一样可以相对准确地评估自己的能力。（3）网络帮助与人类同伴帮助对过分自信的影响存在差异的原因是接受网络帮助的个体缺乏对问题的思考，难以意识到自身认知的局限性。迫使人们在接受帮助前先“思考”，可以有效地缓解其过分自信，从而更好地校准其对自身能力的评估。

Comparison of the effects of online assistance and human peer assistance on overconfidence

Jimen Li[1] Yumei Lu[1] Yanling Bi[1]
School of Psychology, Shaanxi Normal University,710062, biyanling@snnu.edu.cn

Abstract：With the rapid development of the internet, people gradually rely on the help of the internet to quickly obtain information. The internet has penetrated people's daily learning, work, and life, changing their way of learning, life, and thinking. Research has found that people's acceptance of online help can affect individuals' self-evaluation of their own abilities, leading to overconfidence. In real life, when people encounter problems, they not only accept the help of the internet, but also choose to seek help from their human companions. This study is based on existing research and explores the differences in the impact of online assistance and human peer assistance on individual overconfidence levels through experiments, and further explores the reasons for these differences.

Experiment 1 demonstrates that different ways of helping have different effects on overconfidence. The overconfidence level of the online help group is significantly higher than that of the human peer help group and the helpless group, while the difference in overconfidence level between the human peer help group and the helpless group is not significant. On this basis, Experiment 2 added the factor of "thinking conditions" and used the inter subject design of 2 (help methods: online help, human peer help) ×2 (thinking state: thinking, no thinking), finding that after controlling for the accuracy of the first answer, the main effect of thinking state was significant, and the overconfidence level of participants under thinking conditions was significantly lower than that under no thinking conditions. The main effect of help methods is also significant, with participants having a higher level of overconfidence under online help compared to those under human peer help. The interaction effect between thinking status and help methods is not significant.

Based on the above experiments, it can be concluded that (1) accepting online assistance can lead people to overestimate their abilities and generate a higher level of overconfidence. (2) When people receive help from human peers, they do not develop a higher level of overconfidence like when receiving online help, but rather can relatively accurately evaluate their abilities like individuals who have not received help. (3) The reason for the difference in the impact of online help and human peer help on overconfidence is that individuals who receive online help lack thinking about problems and are unable to recognize their cognitive limitations. Forcing people to "think before receiving help" can effectively alleviate their overconfidence and better calibrate their assessment of their abilities.

经历未来：动态未来情景思维对跨期决策的影响

齐怀远[1]　毕翠华[2]（通讯作者）　罗扬眉[1]
1 陕西师范大学心理学院，西安，710062
2 四川师范大学心理学院，成都，610011，通讯作者 E-mail: cuihuabi@sicnu.edu.cn

摘 要　人类是天生短视的动物，在面对眼前的小收益和未来的大收益时人们更容易选择前者(如吸烟、储蓄、消费乃至医疗决策)。而未来情景思维(episodic future thinking, EFT)能引发对未来的感知、目标追求、行为动机、对未来可能性的探索，从而引发人们对未来收益的关注，缓解人们的短视。但传统 EFT 操作过于强调对未来某些时间点或片段进行片面思考，这种思维模式容易受到许多条件限制，所以对决策的积极作用常常大打折扣。庆幸的是，人类也是天生会讲故事的动物，人们可以将自身过去的生活经历随时间不断叙述出来。根据已有理论观点，个体具有依据头脑中的主客观规律，随时间动态建构未来情景的思维能力，即动态叙事。通过动态叙事，设想未来事件一系列的发生发展过程，人们可以体验到未来预期事件在时间上的关联性和新颖性，更深入地影响人们对跨期决策时间和收益的认知加工，从而弥补以往 EFT 作用的局限。因此，本研究基于理论和研究基础上提出构建了“动态未来情景思维(dynamic episodic future thinking, DEFT)”的概念、操作与检验方式。将传统对未来短暂的想象操作，拓展为对未来进行动态叙事的想象操作。通过 1 项预实验和 3 项实验研究来探索 DEFT 对跨期决策的影响效果和内在机制：

（1）预实验编制了 DEFT 的唤醒程序，发现通过任务程序能够有效地唤醒个体的 DEFT 的思维模式，并体验到想象事件的关联性、时间顺序等特点。而进行 EFT 唤醒的被试则缺少类似的体验，证明了 DEFT 在操作上的有效性。

（2）基于预实验，研究一采用 2(唤醒类型： EFT，DEFT)×2(测验顺序：前测 AUC 值，后测 AUC 值)两因素混合设计。结果显示，唤醒 DEFT 比唤醒 EFT 对个体跨期决策的延迟偏好有更强的促进作用。

（3）基于研究一，研究二使用未来时间感知任务，以探索时间感知在唤醒类型(EFT，DEFT)对跨期决策的作用机制。结果显示 DEFT 可能会调用更多的认知资源，使被试对时间感知进一步主观收缩，这种促使人们主观放大了延迟收益价值，更偏好选择延迟收益。

（4）基于研究二，研究三采用 2(唤醒类型：DEFT、EFT)×2(注意偏向：左侧，右侧)两因素混合设计，通过操作被试对跨期决策即时和延迟奖励的注意偏向（左侧偏向更关注隐喻时间起点的即时选项；右侧偏向更关注隐喻时间终点的延迟选项），比较 EFT 和 DEFT 的时间感知与决策的差异，来进一步探索 DEFT 在心理表征上的的特点。结果支持了 DEFT 可能唤醒被试对未来事件的动态叙事的心理表征，这种表征包括对事件起点、过程和终点的关注，区别于传统 EFT。

综合而言，本研究提出了一种新的未来情景思维模式，并通过行为实验从认知资源和心理表征角度给出了其影响跨期决策的理论解释，在拓展未来情景思维与跨期决策领域的研究有重要的理论贡献，也为进一步改善人们的跨期决策行为提供了理论上的指导。

Experience the future: The impact of dynamic episodic future thinking on intertemporal decision-making

Huaiyuan Qi　Cuihua Bi　Yangmei Luo

School of Psychology, Shaanxi Normal University, Xi'an
School of Psychology, Sichuan Normal University, Chengdu

***Abstract*:** Humans are naturally short-sighted, and when faced with small immediate gains versus large future gains, they are more likely to choose the former (e.g., smoking, saving, spending, and even medical decisions). Episodic future thinking (EFT) can arouse the perception of the future, goal pursuit, behavior motivation, and exploration of future possibilities, thereby arousing people's interest in future benefits and reducing their myopia. However, traditional EFT operations overemphasize one-sided thinking about certain points or segments of the future, and because this mode of thinking is easily constrained by numerous conditions, its positive effect on decision-making is frequently diminished. Thankfully, humans are also natural storytellers, and they can recall their past life experiences over time. Individuals can construct future scenarios based on subjective and objective laws in their minds in a dynamic manner over time, i.e., dynamic narratives, according to existing theories. Through dynamic storytelling, envisioning the sequential development of future events, people can experience the temporal relevance and novelty of anticipated future events. This process deeply influences individuals' cognitive processing of intertemporal decision-making and benefits, thereby addressing the limitations of previous Episodic Future Thinking (EFT). Therefore, the purpose of this study is to develop the concept, operation, and evaluation of "dynamic episodic future thinking (DEFT)" based on theory and previous research. This study extends the conventional practice of imagining the future for a brief period of time into the practice of imagining a dynamic narrative of the future. Explore the effect and internal mechanism of DEFT on intertemporal decision-making through one pre-experiment and three experimental studies:

(1) The pre-experiment prepared an arousal program for DEFT, and it was discovered that the task program was effective at arousing individuals' thinking patterns of DEFT and allowing them to experience the correlation and chronological order of imagined events, among other characteristics. In contrast, the subjects who underwent EFT arousal lacked similar experiences, demonstrating the operational efficacy of DEFT.

(2) Study 1 utilized a 2 (type of arousal: EFT, DEFT) x 2 (order of testing: pre-test AUC value, post-test AUC value) two-factor mixed design based on the pre-experiment. Results indicated that arousal to DEFT had a greater facilitative effect than arousal to EFT on the delayed preference of individuals for intertemporal decision making.

(3) Based on the findings of Study 1, Study 2 employed a future time perception task to investigate the mechanism of time perception in the role of arousal type (EFT, DEFT) on intertemporal decision making. The results demonstrated that DEFT may mobilize additional cognitive resources to further subjectively contract subjects' time perception, resulting in a subjective enhancement of the value of delayed gains and a greater preference for delayed gains.

(4) Based on the findings of Study 2, Study 3 used a 2 (arousal type: DEFT, EFT) 2 (attentional bias: left-side, right-side) two-factor mixed design to compare the time perceptions of EFT and DEFT by manipulating subjects' attentional biases toward immediate and delayed rewards for intertemporal decision making (left-side bias focuses more on the immediate option with a metaphorical temporal origin; right-side bias focuses more on the delayed option The results support the notion that DEFT may elicit a mental representation of subjects' dynamic narratives of future events that includes attention to event beginnings, processes, and endings, differentiating it from conventional EFT.

In conclusion, the current study proposes a new model of future scenario thinking and provides theoretical explanations from the perspectives of cognitive resources and mental representations through behavioral experiments, which makes an important theoretical contribution to expanding the research in the field of future scenario thinking and intertemporal decision-making, and also provides theoretical guidance to further improve individuals' intertemporal decision-making behavior.

摘要 即使面对同等概率分布的收益或损失，人们也会因为对与之关联的来源熟悉度不同，而产生不同的价值估计，从而给予更熟悉来源更强的决策偏好。Fox 和 Tversky 在对于 Ellsberg 双瓮问题和模糊厌恶的相关研究中，发现了正是由于对不确定情境下风险来源的偏好，导致了熟悉性偏差（Fox & Tversky, 1995）。以往关于来源偏好的研究中，更多聚焦在其公理化（Chew & Sagi, 2008）、实证检验（Chew, Ebstein & Zhong, 2012；Chew, Li & Sagi, 2021）和生物行为基础（Chark et al, 2022）等, 而对于其认知过程的计算建模则较少涉及。本研究中，采用北京-东京城市最高温度尾数的奇偶性作为彩票来源的依据（Chew, 2022）。通过设定彩票来源的熟悉程度（北京/东京/电脑）和收益规模，最终构建一系列二元化来源偏好决策任务，在 100 名大学生被试中进行行为实验收集数据。行为研究结果显示，在熟悉程度更高的决策来源中，个体更倾向于不确定的收益和确定的损失。进一步基于决策反应时和决策结果，利用漂移扩散模型进行计算建模，使用贝叶斯分层估计分解出刻画决策过程的四个基本参数：决策阈限(a)、非决策时间（t）、漂移率（v）和 决策起点（z）。建模结果发现，在收益情境下，北京的 a、t 和 z 都显著低于东京低于电脑，只有 v 高于电脑高于东京。在损失情境下，北京的 a、t 和 z 都显著高于东京高于电脑，只有 v 低于东京低于电脑。这意味着对于，面临收益时，被试对更熟悉来源的决策，谨慎程度有所下降，但对决策任务的理解更加迅速，价值累积的速度也更快，同时具有对彩票更强的先验偏好。而面临损失时，被试对更熟悉来源的决策，谨慎程度提高，任务理解速度减缓，价值累积速度变慢，但对固定损失的先验偏好更强。在来源偏好决策中，熟悉性偏差意味着对于收益的确定性，和对于损失的不确定性的感知提升，从而放大个体的损失厌恶倾向，使个体更加偏好不确定的收益和确定的损失。同时，相比高熟悉性来源，低熟悉性来源关联的决策出现更加不一致的行为倾向。这些发现有助于加深对来源偏好决策过程的理解，也为后续更深入的神经经济方法提供参照。

Abstract: Familiarity bias in source preference is observed using the parity of the trailing digits of city temperatures and computer-generated random numbers. Employing a drift-diffusion model (DDM) and Bayesian hierarchical estimation, four basic parameters are estimated: decision caution level (a), speed of task comprehension (t), speed of value information accumulation (v), and latent initial preference (z).* For subjects in Chengdu, the estimated a, t, and z are significantly lower (higher) for Beijing than for Tokyo except for v which is higher under the gain condition. This pattern is reversed for estimates of a, t, z, and v under the loss condition. Notably, for the computer-generated random numbers, the estimated parameters are more extreme than the corresponding estimates for both city temperatures under the gain as well as the loss condition.

Key words*:* Source preference, familiarity bias, drift diffusion model, latent preference

*In the original DDM (Ratcliff, 1978), these parameters are defined in terms of decision threshold (a), non-decision time (t), drift rate (v), and decision starting point (z).

如何使 1 度电更有价值？机会成本凸显对环保节电行为的助推研究

沈丝楚[1]（通讯作者） 王耀民[1]
1 福建师范大学心理学院，福州，350117，shensc@fjnu.edu.cn

摘 要 气候变化严重威胁地球环境，亟需推动“双碳”目标的实现，减少能源使用量，共同推动绿色发展。我国居民用电量近几年居高不下，如何促进居民节省用电，达到节能减排的目的？行为决策领域已有研究尝试用助推的方式推动人们在经济、健康等领域做出更具有适应性的决策，而在环保领域此类策略是否能起作用所知甚少。为了推动人们做出环保节电行为，我们通过 3 个研究考察了机会成本凸显这一效应对环保行为的影响及其边界条件，即凸显了用电所消耗能源的机会成本这一信息后能否助推人们做出更加环保的节电行为。研究 1 通过对比不同凸显方式，探讨机会成本凸显对环保意愿的影响。研究 2 通过对比不同的信息表征方式，探讨机会成本凸显起作用的边界条件，并探究不同环保意识水平个体的适用程度。研究 3 通过启动机会成本凸显的程度，进一步揭示了机会成本凸显对真实，而非自我报告的环保行为的影响。研究结果发现，机会成本凸显能够提高人们的环保意愿（研究 1），也能够增加真实的环保行为（研究 3），而在机会成本凸显的表征形式上，使用图文混合表征的效果更好，在受众群体上对高环保意识个体更有效（研究 2）。以上研究结果揭示了机会成本凸显对环保行为的积极助推作用，为节省电力的宣传及降低成本提供了证据支撑和参考价值。

How to enhance the value of 1 kilowatt-hour? The nudging effect of opportunity cost salience on electricity saving behavior

Shen Si-Chu[1*], Wang Yao-Ming[1]
1. Department of Psychology, Fujian Normal University

Abstract: Climate change poses a significant threat to the global environment, demanding urgent action to promote the realization of the "dual carbon" goal, reduce energy use, and jointly promote green development. However, electricity usage among residential consumers has remained persistently high in recent years. How to promote the residents to save electricity and achieve the purpose of energy saving and emission reduction? There are studies in the field of behavioral decision making that try to nudge people to make more adaptive decisions in areas such as economics and health, but little is known about whether such strategies work in the field of environmental protection. To address this issue, this research examines the effectiveness of opportunity cost salience in encouraging electricity conservation behavior, exploring its impact on environmental intentions as well as its boundary conditions through three distinct studies. Study 1 investigates the influence of different approaches to opportunity cost salience on individuals' environmental intentions. Study 2 explores the boundary conditions of opportunity cost salience by comparing various representation formats and target demographics. Study 3 examines opportunity cost salience effects on actual environmental behavior by priming opportunity cost. The findings reveal that opportunity cost salience leads to an increase in individuals' environmental intentions (Study 1) and fosters actual electricity conservation behavior (Study 3). Moreover, the combination of textual and visual representation proves to be the most effective format, while the efficacy of opportunity cost salience varies among individuals with a stronger environmental consciousness (Study 2). These results highlight the positive impact of opportunity cost salience on environmental behavior and provide valuable evidence and guidance for electricity saving campaigns and cost reduction initiatives.

Keywords: nudge, opportunity cost, pro-environmental behavior

伴侣选择中的价值导向信息搜索

王弘毅[1, 2]　马佳欣[2]　何黎胜[3]（通讯作者）

摘 要　找到合适的伴侣是绝大多数人的重大人生决策之一。主流择偶理论认为，由于需要考虑的因素和可供考虑的选择过多，人们依靠并不充足的信息来寻找伴侣，从而会使用非补偿性的启发式策略（non-compensatory choice heuristics）。然而，近期的实验研究通常发现，人们在选择伴侣时似乎会考虑所有的相关信息，其策略结果也更加符合补偿性的选择策略（compensatory choice strategies）。为了解决这一理论与实证结果不一致的问题，本研究将伴侣选择中的信息搜索过程与评估过程区分开来，并对两个认知过程分别进行建模分析。

通过两个过程追踪实验（眼动实验和 MouseLab 在线鼠标追踪实验），本研究发现，人们对所有类型的线索（外貌、月收入以及创造力）都表现出强烈的价值导向搜索启发式策略（value-directed search heuristics）：高价值的线索（例如，外表吸引力高）能增加人们后续对于同一对象的信息获取；低价值的线索则会降低后续对于同一对象的信息获取。并且价值导向搜索的规模随着线索首要性的增加而增加。例如，男性对于外表吸引力这一线索比女性表现出更强的价值导向的信息搜索；而女性对于资源或智力相关的线索比男性表现出更强的价值导向的信息搜索。线索首要性还解释了线索类型和参与者性别对价值导向搜索程度的交互作用:男性比女性进行更多的“面孔→其它”价值导向互动搜索；女性相比男性进行更多的“收入→其它”和“创造力→其它”的价值导向互动搜索。

本研究通过区分决策过程中的信息搜索和评估过程，弥合了理论和实验证据之间的鸿沟。与主流的理论观点一致，我们发现伴侣选择过程中采用了价值导向的搜索启发式。我们进一步论证了价值导向搜索不一定导致非补偿性选择，但可能为补偿性决策策略服务。本研究结果表明，人们在选择伴侣时会采用启发式搜索，从而更有效地找到理想的伴侣。

Value-directed information search in partner choice

Abstract：Finding the right person as a relationship partner is one of the most important decisions grown-ups make in life. Mainstream theories of partner selection suggest that, considering the vast number of potential candidates and cues, people search for and choose romantic partners efficiently by using non-compensatory choice heuristics, relying on incomplete information. However, recent experimental work typically finds that partner choice follows compensatory choice strategies which take all relevant information into consideration. To bridge this gap between theory and experimental evidence, we distinguished the information search process from the evaluation process in the mate choice problem and, critically, modeled the two cognitive processes separately, drawing upon research on the cognitive processes of human decision-making.

In two process-tracing experiments (an eye-tracking experiment and a MouseLab experiment), we show that people display strong value-directed search heuristics in response to all types of cues(facial attractiveness, monthly income, and creativity): High cue values increased subsequent information acquisition within profiles, and low cue values decreased subsequent information acquisition within profiles. The magnitude of value-directed searches increases with cue primacy. For example, men displayed a stronger value-directed search in response to attractiveness cues than women did and women displayed a stronger value-directed search in response to resource- or intelligence-related cues than men did. Cue primacy also explains the interaction effect of cue type and participant sex on the extent of valued-directed search: men made more attractiveness directed interactive search than women did, while women made more income- and creativity-directed interactive search.

By distinguishing the information search process from the evaluation process in the decision process, our work bridged this gap between theory and experimental evidence. In line with the celebrated theoretical claims, we find that preferential partner choice involves strong value-directed search heuristics. However, such value-directed search heuristics do not necessarily lead to non-compensatory choices but rather serves compensatory decision-making. Our results demonstrate that people adopt remarkably smart search heuristics to find an ideal partner efficiently.

高自尊者的双面性：“投”“取”困境中的合作行为差异

孙庆洲（通讯作者） 黄靖茹 郭浩智

浙江工业大学 管理学院，杭州 310023，通许作者 sunqingzhou2008@163.com

摘 要　在个人利益和集体利益冲突的两难困境中，高自尊者更合作还是低自尊者更合作？过往研究并未得到一致结论，一个潜在原因是并未区分“投入”型困境和“索取”型困境。通过三项研究，我们探究了投取困境下不同自尊者的合作行为差异：发现高自尊者具有双面性，低自尊者相对稳定。研究一通过设置对等的“投入”型困境（公共物品博弈）和“索取”型困境（公共资源博弈），发现相对于低自尊者，高自尊者在“投入”型困境中更加合作，而在“索取”型困境中更不合作。我们推测这可能是投取困境诱发的账户指向性差异所致（投入框架指向个人账户，索取框架指向公共账户），为此，研究二改变了投取困境中的账户指向性，发现无论在“投入”型困境还是“索取”型困境中，当指向公共账户时高（vs.低）自尊者更合作，而当指向个人账户时高（vs.低）自尊者更不合作。投取困境的账户指向性为何影响高、低自尊者的合作行为？研究三通过投射法对此进一步探究，测量了四种困境下（指向个人账户的投入困境、指向公共账户的投入困境、指向个人账户的索取困境、指向公共账户的索取困境）投取行为与自我利益关注、社会声望关注及个人能力的关联性，发现指向个人账户激活了自我利益关注，（个人）账户数额越多体现了能力越强；指向公共账户激活了社会声誉关注，（公共）账户数额越多体现了能力越强。这些发现表明，投取困境诱发的账户指向性影响了认知关注和知觉关联，进而影响了不同自尊者的合作表现，这为现实投取困境下的合作行为助推提供了决策参考。

Duplex of high self-esteem individuals: differences in cooperative behavior under the giving vs. taking dilemma

SUN Qingzhou（corresponding author）, HUANG Jingru, GUO Haozhi
School of Management, *Zhejiang University of Technology*, *Hangzhou* 310023

Abstract：In dilemmas of interest conflicts between individual and collective, are high or low self-esteem individuals more cooperative? One potential reason for the lack of consistent findings in previous studies is that they did not distinguish giving and taking dilemmas. Through three studies, we explored differences of cooperative behavior among self-esteem individuals under giving and taking dilemmas: high self-esteem individuals have duplex and low self-esteem individuals are relatively stable. By setting up reciprocal giving dilemma (public goods dilemma) and taking dilemma (public resources dilemma), Study 1 found that high(vs. low) self-esteem individuals were more cooperative in the giving dilemma and less cooperative in the taking dilemma. We hypothesized that this might be due to the difference in account direction induced by different dilemma (the giving frame points to the public account and the taking frame points to the personal account), thus, Study 2 changed the account direction in two dilemmas and found that both in the giving dilemma and the taking dilemma, high (vs. low) self-esteem individuals were less cooperative when directed to the personal account, and more cooperative when directed to the public account. Why does account directions of dilemmas affect the cooperative behavior of high and low self-esteem individuals? Study 3 further explored this by projection, measured the association between the withdrawal behavior and self-interest concern, social prestige concern, as well as personal competence under four dilemmas (giving dilemma pointing to personal account, giving dilemma pointing to public account, taking dilemma pointing to personal account, and taking dilemma pointing to public account). The study found that personal account direction activated self-interest concern, more amount in (personal) accounts reflect greater capacity, and public account direction activated social reputation concerns, more amount in(public) accounts reflect greater capacity. These findings suggest that account direction induced by two dilemmas influences

cognitive concerns and perceptual associations, which in turn affects the cooperative performance of different self-esteem individuals, and this provides decision references for cooperative behavior facilitation under realistic dilemmas.

感知经济流动性正向影响利他惩罚

杨莎莎[1]　杜婧依[1]　李莹[1]　陈思静[2]　刘永芳[1]（通讯作者）

1 华东师范大学心理与认知科学学院，上海市心理健康与危机干预重点实验室，上海 200062

2 浙江科技学院经济与管理学院，杭州 310023

（通讯作者 E-mail：yfliu@psy.ecnu.edu.cn）

摘要 感知经济流动性是个体对于自身或他人的社会经济地位在不同社会层级之间上下流动可能性的评估。先前研究表明，感知经济流动性能够正向预测个体的亲社会行为，但局限于参加慈善组织、志愿活动、公益项目及慈善捐赠等典型的亲社会行为，较少关注到利他惩罚——惩罚者承担成本去惩罚那些违反社会规范的个体——这种特殊的亲社会行为。而此种亲社会行为又是一种强合作行为，对于维系社会稳定具有重要作用。那么，感知经济流动性是否及如何影响利他惩罚呢？本文通过 4 项研究较为完整地考察了这一问题。

研究 1 利用 2013 年中国综合社会调查数据发现感知经济流动性正向影响利他惩罚，其中包含牺牲自身利益举报环境污染项目和反抗上司不端行为。研究 2 让被试回忆过去 1 个月内目睹真实违规事件时的反应，结果发现：感知经济流动性正向影响直接惩罚，但对间接惩罚的影响不显著；此外，公正世界信念是“感知经济流动性-直接惩罚”这一路径中的潜在中介变量。研究 3 通过直接操纵感知经济流动性，为研究 2 的中介模型提供了因果证据。研究 4 同时操纵感知经济流动性和结果效能，并发现：感知经济流动性对利他惩罚的正向影响仅在结果效能较高时（即惩罚能够有效地维护社会规范）成立。

本文的发现有助于将感知经济流动性对个体行为的影响扩展至社会层面。具体而言，经济流动性的下降会在一定程度上减少个体在违规情境中的惩罚行为，从而降低社会规范对个体行为的约束力并带来更低的合作水平和更高的违规行为发生率，最终对社会福利水平、危机应对能力等产生深远的负面影响。

Perceived economic mobility positively affects altruistic punishment

Shasha Yang[1], Jingyi Du[1], Ying Li[1], Sijing Chen[2], Yongfang Liu[1] (corresponding author)

1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

2 School of Economics and Management, Zhejiang University of Science and Technology, Hangzhou 310023, China

(Corresponding author Email: yfliu@psy.ecnu.edu.cn)

***Abstract*:** Perceived economic mobility can be defined as an individual's assessment of the likelihood that their own or another person's socioeconomic status would move up or down between hierarchical levels of society. Previous research suggests that perceived economic mobility has a positive correlation with individual pro-social behavior. However, existing studies have primarily focused on conventional pro-social behaviors, such as participation in charitable organizations, volunteering, philanthropic projects, and charitable donations. The specific pro-social behavior of altruistic punishment, wherein the punisher incurs costs to enforce social norms, has not received sufficient attention. This particular manifestation of prosocial behavior represents a strong and pivotal form of cooperation crucial for maintaining social stability. It becomes imperative to explore the influence of perceiving economic mobility on altruistic punishment. This paper comprehensively investigates the above influence through four studies and presents a preliminary answer.

Study 1 examined the relationship between perceived economic mobility and altruistic punishment using the *Chinese General Social Survey (2013)* obtained from the National Survey Research Center at Renmin University of China. The results indicated a positive influence of perceived economic mobility on altruistic punishment. Specifically, participants demonstrated altruistic punishment by voluntarily reporting environmental pollution at personal cost and retaliating against a foreign boss who insulted China. Expanding on these findings, Study 2 involved participants recalling their reactions when they witnessed an actual violation. The results indicated that perceived economic mobility positively affects direct punishment, but not indirect punishment. Additionally, beliefs in a just world were identified as a potential mediator in the pathway between perceived economic mobility and direct punishment. To provide causal evidence for the mediation model proposed in Study 2, Study 3 manipulated perceived economic mobility and established a mediation framework. Lastly, Study 4 manipulated both perceived economic mobility and outcome efficacy. The results indicated that the positive effect of perceived economic mobility on altruistic punishment only holds when outcome efficacy is high.

The findings of this paper have the potential to extend the understanding of the effects of perceived economic mobility on individual behavior to the societal level. Specifically, reduced economic mobility may result in a decrease in individuals' punishment for violations, consequently leading to less stringent social norms and diminished levels of cooperation. These outcomes can contribute to higher rates of violations and have far-reaching negative consequences on social welfare and the ability to address crises.

***Keywords*:** perceived economic mobility, altruistic punishment, belief in a just world, outcome efficacy

减轻痛苦还是节省金钱?医生偏好低疼痛超过低价格时的人际与行为成本

朱冬青[1]（通讯作者） 郑金孟[1] 赵睿雯[1]

1 北京学习与认知重点实验室，首都师范大学心理学院，北京，100037，zdq@cnu.edu.cn

摘 要 疼痛与金钱的权衡是医疗决策领域特有的典型问题，不同倾向方案的推荐可能会对医生产生不同的人际和行为反应。以往的研究往往围绕疼痛与金钱的关系，而缺少了对人们在这两者之间做权衡后的人际影响的探究。本文关注当医疗方案的疼痛与价格不可兼顾时，医生的偏好将在何时、以及如何影响

患者对医生的人际反应和行为反应。基于社会评价两维度模型和双避冲突的属性权衡等动机归因领域的研究，本文预测，当医生偏好减轻痛苦优先的高价格方案时（相较于低价格高疼痛方案），患者会对医生产生更负面的人际与行为反应，这一过程是由患者对医生的动机归因所中介的。本文通过 4 项研究对上述假设进行验证。研究 1 为田野研究，通过患者对真实就诊经历的记忆回溯，初步发现了医生推荐高价格低疼痛方案会带来的相应的人际与行为成本的趋势，患者倾向以价格（而不是疼痛）线索作为指导他们对医生反应的信号；研究 2 通过实验操纵医生推荐，验证了患者对推荐高价格低疼痛方案的医生的负性人际与行为反应之间的因果关系（在第三方视角和医生同行视角下依然成立）；研究 3 旨在探究上述关系的心理机制，通过实验验证了患者对医生利他、利己动机的归因对人际反应的平行中介作用，利他动机中介了患者对医生的行为反应。同时，排除了医患决策差异与感知匹配两种替代性解释；研究 4 再次检验了中介模型，并加入家属建议作为对照，结果发现与医生推荐时完全相反的影响。这说明推荐高价格低疼痛方案之所以会带来人际和行为成本，其根源是医患关系的特殊性，而不是方案本身的疼痛价格属性。本文揭示了在疼痛价格权衡的医疗决策中，患者的动机归因对医生人际反应的心理机制，强调了医疗实践中的认知偏差和感知动机管理等方面的必要性，并提供了启示。

To Reduce Pain or to Save Money? The Interpersonal and Behavioral Costs of Physicians' Preference for Low Pain over Low Price

Dongqing Zhu[1](Corresponding author), Jinmeng Zheng[1], Ruiwen Zhao[1]
1 Beijing key lab of Learning and Cognition, Department of Psychology, Capital Normal University, Beijing, 100037, zdq@cnu.edu.cn

Abstract: The trade-off between pain and money is a typical problem specific to the field of medical decision making, and the recommendation of different preferred options may produce different interpersonal and behavioral responses for physicians. Previous research has tended to focus on the relationship between pain and money, and has lacked an exploration of the interpersonal effects of people making trade-offs between the two. This paper focuses on when and how physician preferences will influence patients' interpersonal and behavioral responses to physicians when pain and price of medical options are not traded off. Based on research in the area of motivational attributions such as the two-dimensional model of social evaluation and attribute trade-offs for dual conflict avoidance, this paper predicts that patients will have more negative interpersonal and behavioral reactions toward their physicians when physicians prefer a high-price option that prioritizes pain reduction (compared to a low-price, high-pain option), a process mediated by patients' motivational attributions toward their physicians. In this paper, the above hypothesis is tested by four studies. Study 1 was a field study that initially identified a trend toward corresponding interpersonal and behavioral costs associated with physician recommendations of high-price, low-pain options through patients' memory recall of real visit experiences, and patients tended to use price (rather than pain) cues as a signal to guide their reactions to physicians; Study 2 validated patients' negative interpersonal and behavioral responses to physicians who recommended high-price, low-pain options by experimentally manipulating physician recommendations causal relationship with behavioral responses (which still holds under the third-party perspective and physician peer perspective); Study 3 aimed to explore the psychological mechanisms of the above relationship and experimentally verified the parallel mediating role of patients' attributions of altruistic and self-interested motives to physicians on interpersonal responses, with altruistic

motives mediating patients' behavioral responses to physicians. Also, two alternative explanations, doctor-patient decision differences and perceived matching, were excluded; Study 4 tested the mediation model again and added family recommendations as a control, and found exactly the opposite effect as when physician recommendations were made. This suggests that the interpersonal and behavioral costs associated with recommending high-price, low-pain options are rooted in the specificity of the doctor-patient relationship rather than in the pain-price properties of the options themselves. This paper reveals the psychological mechanisms underlying patients' motivational attributions to physicians' interpersonal responses in medical decision making in pain price trade-offs, highlighting the need for and providing insights into aspects of cognitive bias and perceived motivational management in medical practice.

追随群体还是坚守道义？

嵌套社会困境下道德认同和群体认同对合作的影响

朱泓锦 孔繁聪 陈银燕 王晓明（通讯作者）

曲阜师范大学心理学院，山东曲阜，273165，xmwang2019@qfnu.edu.cn

摘 要 在嵌套社会困境中，人们既可以为所属的群体做出贡献（狭隘合作），也可以为更大的集体（群体所隶属的集体）做出贡献（普遍合作）。社会认同理论(SIT)指出，基于群体身份的认同会驱使人们与内群体合作。道德即合作理论(MAC)与行为调节模型(BRM)则认为，道德是指导人类合作行为的关键，人们出于对自身道德品质的认同会做出合作行为。尽管群体认同与道德认同都能促进合作行为，但群体认同的核心驱力是使群体利益最大化，道德认同则是彰显道德品质或形象。也就是说，群体认同促进狭隘合作，而道德认同促进普遍合作。研究期望探索两种认同对合作行为产生的影响，尝试通过嵌套社会困境博弈范式区分合作行为并挖掘深层动机。研究设计了三个实验，采用嵌套社会困境，考察道德认同对合作行为的影响(实验 1)及道德认同与群体认同的共同作用(实验 2 和 3)。结果发现：(1)道德认同启动组的普遍合作水平显著高于控制组（实验 1）；(2)道德认同启动组和群体认同启动组的普遍合作水平均显著高于控制组（实验 2）；(3)在群体认同控制条件下，道德认同启动组的普遍合作水平显著高于控制组。而在道德认同控制条件下，群体认同启动组的普遍合作水平显著高于控制组（实验 2 和 3）；(4)两者共同作用时普遍合作行为水平与单一认同作用时无显著差异（实验 2 和 3）。据此，研究结果反映了道德认同和群体认同对合作行为的影响，但在实验 2 和 3 均未发现两者对合作行为的共同促进作用。由此推测，道德认同和群体认同会使人们基于不同动机做出合作行为。研究对探索自身道德与群体身份的双重认同及其与合作行为的关系具备一定的价值，为理解嵌套社会困境中合作行为的类型与动机提供一定参考。

Follow your group or your morality?

The influence of moral identity and group identity on cooperation under nested social dilemmas

Zhu Hongjin, Kong Fancong, Chen Yinyan, Wang Xiaoming (Correspondence)
Qufu Normal University, Shandong Qufu, 273165, xmwang2019@qfnu.edu.cn

Abstract: In nested social dilemmas, people can either contribute to their own group (parochial cooperation) or to a larger collective (universal cooperation). Social Identity Theory (SIT) suggested that identity based on group membership drives people to cooperate with ingroup members. Morality as Cooperation (MAC) and Behavioral Regulation Model (BRM) proposed that morality is a key to guide human cooperative behavior, and people cooperate out of identification with their own moral quality. Although both group identity and moral identity can promote cooperative behavior, the core motivation of group identity was to maximize group interests, moral identity was to manifest moral quality or image. That is, group identity promoted parochial cooperation, while moral identity promoted universal cooperation. The study aimed to explore the effects of the two identities on cooperative behavior, and attempted to distinguish cooperative behavior and uncovered the underlying motives by using nested social dilemma game paradigms. The study designed three experiments, using nested social dilemmas, to examine the effect of moral identity on cooperative behavior (Experiment 1) and the joint effect of moral identity and group identity (Experiment 2 and 3). The results showed that: (1) The universal cooperation level of the moral identity priming group was significantly higher than that of the control group (Experiment 1); (2) The universal cooperation level of both the moral identity priming group and the group identity priming group was significantly higher than that of the control group (Experiment 2); (3) Under the control condition of group identity, the universal cooperation level of the moral identity priming group was significantly higher than that of the control group. Under the control condition of moral identity, the universal cooperation level of the group identity priming group was significantly higher than that of the control group (Experiments 2 and 3); (4) There was no significant difference in the level of universal cooperation behavior between the joint effect and the single effect of the two identities (Experiments 2 and 3). Based on this, the results reflected the effects of moral identity and group identity on cooperative behavior, but no joint promotion effect of the two identities on cooperative behavior was found in Experiment 2 and 3. It is speculated that moral identity and group identity may make people cooperate based on different motives. The research has certain value for exploring the dual identification of self-morality and group identity and their relationship with cooperative behavior, and provides some reference for understanding the types and motives of cooperative behavior in nested social dilemmas.

Keywords: nested social dilemmas, moral identity, group identity, cooperative behavior

求助者低估不耻下问后他人对自己的好感

邱天[1]　陆静怡[1]（通讯作者）
1 华东师范大学心理与认知科学学院，上海，200062，jylu@psy.ecnu.edu.cn

摘 要　对于需要求助的人来说，选择向谁求助至关重要，因为求助对象的选择既影响问题解决，也影响他人对求助者的社会评价。在可选求助对象中，即使是专业胜任力不如求助者的下级也常常能为求助者提供帮助，向他们不耻下问可灵活高效解决问题。然而，求助者往往耻于下问，不能充分发挥下级的帮助功能。我们认为，求助者之所以耻于下问，是因为他们低估了他人在评价自己时更关注灵活性而非胜任力的程度，进而低估求助下级带来的社会评价。

我们通过四项研究考察了求助者对不耻下问后所得社会评价的预测偏差。研究将被试随机分配至求助者或旁观者组。情境中求助者遭遇无法自己解决的困难，而下级能够为求助者提供有效帮助。求助者预测自己若求助下级能否获得旁观者好感，旁观者评价对不耻下问的求助者的好感。研究 1 表明，求助者低估了旁观者对自己的好感，并且该低估在求助下级时（相比求助与求助者专业水平相当的同级时）被放大，从而揭示求助下级导致独特的错误预测。研究 2 对比了旁观者评价求助者时对胜任力和灵活性的关注程度以及求助者的预测，发现求助者以为旁观者关注灵活性和胜任力的程度相当，而实际上旁观者关注灵活性远超胜任力，从而揭示了预测偏差的机制。研究 3 通过操纵旁观者和求助下级者对胜任力和灵活性的关注程度，进一步检验了错判关注点的机制。研究 4 揭示了效应的后果，发现即使求助下级伴随代价，求助者仍然耻于下问，进而遭受损失。

理论方面，本研究通过考察求助者的错误预测，在帮助研究领域推进了对求助对象选择的深入认识，亦揭示回避求助下级并不能达到求助者预期的印象管理效果，从而拓展了印象管理研究。实践方面，本研究结果有助于鼓励人们不耻下问。

Not bowing down thine ear: Underestimating the liking by observers after seeking inferiors' help

Tian QIU[1]　Jingyi LU[1]

1 School of Psychology and Cognitive Science, East China Normal University, Shanghai, China

Abstract：For help-seekers, the choice of whom to ask for help is crucial as it may affect whether they can resolve the problem as well as how they are perceived by others. The inferiors who have lower expertise than help-seekers can also help the them solve the problem efficiently. However, help-seekers rarely ask help from inferiors. We propose that help seekers avoid seeking inferiors' help because they underestimate observers' liking of them when they ask for help from inferiors. The mechanism underlying this misprediction is that help-seekers underestimate the extent to which observers weighed flexibility over competence in their evaluations.

Four studies examined the proposed misprediction. In our studies, we randomly assigned participants as help-seekers or observers. Help-seekers encountered difficulties that cannot be solved by themselves but can be solved by inferiors. Observers rated their liking of help-seekers if they asked help from inferiors, while help-seekers predicted observers liking of them. Study 1 showed that help-seekers underestimated the observers' liking when seeking help from inferiors. This underestimation was reinforced when compared with asking for help from peers. Study 2 revealed that observers focused more on flexibility than on incompetence compared to help-seekers' predictions. As a result, help-seekers underestimated observers liking of them. Study 3 further test the focus account by manipulating the observers' and help-seekers' focus on flexibility and competence. Study 4 showed that help-seekers avoided seeking help from inferiors, even when doing so was costly.

Theoretically, our research contributes to the help-seeking literature by examining how help-seekers' miscalibration of social evaluations when seeking help from inferiors guides their choice of helpers. We also contributed to research on impression management by revealing that people misjudged the effectiveness of avoiding seeking help from inferiors as an impression-management strategy. Practically, our research encourages help-seekers to "bow down their ears."

中国成年人的未来时间知觉与繁衍感的发展特征

吴婧轩　彭华茂（通讯作者）
北京师范大学发展心理研究院，北京，100875，penghuamao@bnu.edu.cn

摘 要　**背景：**繁衍感是个体在关心培育后代方面的动机及行为表现。繁衍感既包括生理层面的繁殖(生儿育女延续下一代)也涉及精神层面的创造(利用自己的经验财富对家庭外的晚辈予以关爱和引导)。繁衍感对个体自身身心健康、家庭家族福祉以及社会可持续进步有重要作用。未来时间知觉是指个体对自己人生中未来时间的感知和评价，且未来时间知觉会影响个体的动机、目标和行为计划。社会情绪选择理论提出，在人的一生中，未来时间知觉的变化会导致繁衍感水平的变动。**目的：**现有实证研究发现繁衍感毕生发展趋势存在一定跨文化差异。繁衍感通常与人际活动、非利己的社会性贡献等息息相关，这与集体主义文化所强调的群体归属及为集体付出的观念存在一定相容性。因此，本研究旨在阐明中国成年人繁衍感的随龄衍变特征及未来时间知觉在其中发挥的作用。**方法：**利用洛约拉繁衍感量表和未来时间知觉量表对 691 名 18 岁到 76 岁的中国成年人进行测查。分别检验全部样本及分年龄段的子样本(青年人、中年人和老年人)中成年人的繁衍感和未来时间知觉发展特征以及未来时间知觉与繁衍感之间的关系。**结果：**中国成年人的繁衍感从青年到老年期一直保持恒定。无论对于全样本还是子样本而言，中国成年人都表现出未来时间知觉越充裕则繁衍感越高的模式。未来时间知觉在年龄影响成年人繁衍感中发挥遮掩作用。**讨论：**中国成年人的未来时间知觉与繁衍感之间的关系模式虽然从结果上看不支持社会情绪选择理论，但其产生的潜在原因与原理论的观点有共通之处。因为在集体主义文化下中国人更重视重视人情关系，参与亲社会活动、培育晚辈、获得积极的声誉都会被融入进个人发展目标，这些高繁衍行为还会是一种促进个人达成发展目标的重要途径。其次，虽然个体随着年龄的增长，各种机能有所衰退，感知未来时间和机会渺茫，客观条件不足会阻碍个体生成繁衍感。但实际上，他们依然有借助其他社会载体繁衍精神财富的需求和能力。所以两条路径共同促成中国成年人繁衍感的维持。

关键词　繁衍感，未来时间知觉，遮掩效应

The Developmental Characteristics of Adults' Future Time Perspective and Generativity in China

Jingxuan Wu; Huamao Peng*
Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875,
penghuamao@bnu.edu.cn

***Abstract*：Background:** Generativity refers to an individual's concern and actions regarding the cultivation of offspring. Generativity encompasses both the physiological aspect of reproduction (having children to continue the next generation) and the psychological aspect of creation (using one's experiential wealth to care for and guide younger generations outside the family). Generativity plays an important role in an individual's physical and

mental well-being, family welfare, and societal progress. Future time perspective (FTP) refers to an individual's perception and evaluation of future time in their life. FTP could influence an individual's motivation, goals, and behavioral plans. The Socioemotional Selectivity Theory (SST) proposes that changes in FTP throughout a person's life can lead to variations in the level of generativity. **Objective:** Existing empirical research has found certain cross-cultural differences in the lifelong developmental trends of generativity. Generativity is often closely related to interpersonal activities and selfless social contributions, which are compatible with the concept of collective belonging and collective sacrifice emphasized in collectivist cultures. Therefore, this study aims to elucidate the age-related developmental characteristics of generativity in Chinese adults and the role of FTP in this process. **Methods:** The Loyola Generativity Scale (LGS) and the Future Time Perspective Scale were used to assess 691 Chinese adults aged 18 to 76 years. The developmental characteristics of Chinese adults' generativity and FTP in the entire sample and in sub-samples divided by age groups (young adults, middle-aged adults, and older adults) were examined, as well as the relationship between FTP and generativity. **Results:** Chinese adults' generativity remained constant from young adulthood to late age. Both the entire sample and sub-samples showed a pattern where higher levels of FTP were associated with higher levels of generativity among Chinese adults. FTP played a suppressor role in the age-related impact on adults' generativity. **Discussion:** Although the pattern of the relationship between FTP and generativity among Chinese adults does not directly support SST, underlying reasons align with the theory's viewpoint. In collectivist cultures, such as China, individuals place greater emphasis on interpersonal relationships, participating in prosocial activities, nurturing younger generations, and gaining a positive reputation, all of which are integrated into personal developmental goals. These higher generative behaviors also serve as important pathways to achieving personal developmental goals. Furthermore, despite the decline in various functions, and limited FTP and opportunities that come with aging, individuals still have the desire and ability to generate generative wealth through other social means. Therefore, these two pathways collectively contribute to the maintenance of generativity among Chinese adults.

维度水平改变对老年刻板印象内化的影响及其中介机制

林瑶[1]　张宝山[2]（通讯作者）

1 西安体育学院运动与健康科学学院，西安，710065

2 陕西师范大学心理学院，西安，710062，zhangbs@snnu.edu.cn

摘 要　消极刻板印象内化是老年期个体容易面临的困境，会对老年人身心健康、认知及行为等多方面产生不良影响。一般来讲，老年刻板印象在效价和内容上都被认为是多维和复杂的。而当前研究尚难以全面回答老年刻板印象不同维度的内化特征，更缺乏对内化机制的探讨。于是本研究着眼于老年刻板印象的内化，进一步考察维度之间的相互作用对老年刻板印象内化的影响及其机制。研究一从内隐测量和外显测量两个层面展开，探讨了刻板印象单一维度的改变对老年刻板印象内化的影响及机制。研究一 a 通过单一操纵温暖维度，检验能力维度是否会发生变动趋向，从而影响老年刻板印象的内化。内隐层面和外显层面的研究结果一致地发现低温暖操纵降低了老年刻板印象内化水平。并且研究发现自我归类在温暖操纵和能力维度内化之间起中介作用。研究一 b 通过单一操纵能力维度，检验温暖维度是否会发生变动趋向，从

而影响老年刻板印象的内化。内隐测量的结果分析表明，低能力启动组被试的内化水平更低，能力维度与自我联系更紧密。外显测量的结果中并未发现两组被试内化程度上的差异。此外，自我归类与能力内化水平显著相关，但并未在能力操纵和能力刻板印象的内化之间起中介作用。根据研究一中的结果，研究二旨在通过对自我归类进行干预，进一步验证自我归类在老年刻板印象内化中的作用。外显测量和内隐测量的结果均一致地验证了自我归类影响老年刻板印象能力维度的内化。研究结果丰富和补充了老年刻板印象内化的理论体系，为现实生活中干预消极老年刻板印象内化提供了借鉴和启示。

The Influence of Changes in Dimension Levels on the Aging Stereotype Internalization and the Underlying Mediating Mechanisms

Yao Lin[1]　Baoshan Zhang[2*]

1 Xi'an Physical Education University, Xi'an, China

2 School of Psychology, Shaanxi Normal University, Xi'an, China

Abstract：The internalization of negative stereotypes poses a challenge for individuals in old age and has adverse effects on various aspects of older adults' well-being, cognition, and behavior. Generally, stereotypes about older adults are considered to be multidimensional and complex in terms of valence and content. However, previous research has not comprehensively addressed the internalization characteristics of different dimensions of stereotypes in old age, and there is a lack of exploration of the underlying mechanisms of internalization. Therefore, this research focuses on the internalization of stereotypes in old age and further investigates the influence of interactions between dimensions on stereotype internalization, as well as the underlying mechanisms.

Study 1 investigated the impact and mechanism of manipulating a single dimension on the aging stereotype internalization, using both implicit and explicit measures. Study 1a manipulated the warmth dimension to test whether changes in the competence dimension occurred, affecting the internalization of aging stereotypes. The results did not reveal compensatory effects of the warmth dimension on the competence dimension but showed that lower warmth reduced the level of internalization of aging stereotypes. Self-categorization plays a mediating role between warmth manipulation and the internalization of competence. Study 1b manipulated the competence dimension to test whether changes in the warmth dimension occurred, affecting the internalization of aging stereotypes. Similarly, no compensatory effects of the competence dimension on the warmth dimension were found. The analysis of implicit measures revealed that the internalization level of the low competence group was lower. There was no significant difference between the low competence group and the high competence group in terms of the level of internalization in the explicit measures. In addition, self-categorization was significantly correlated with competence internalization but did not mediate the relationship between competence manipulation and stereotype internalization. Study 2 aimed to further verify the role of self-categorization in the aging stereotypes internalization. Both the implicit and explicit measures confirmed that self-categorization affects the aging stereotypes internalization of the competence dimension, rather than the warmth dimension.

The findings of this study enrich and supplement the theoretical framework of stereotype internalization in old age and provide insights and guidance for interventions targeting the negative internalization of stereotypes among older adults.

通讯作者：李娟 ijuan@psych.ac.cn

摘 要 背景：社会网络是影响老年人心理健康的关键因素，且随着年龄增长有削减的趋势。研究显示，相较于城市老年人，我国农村老年人的社会网络各项指标均较弱，因此，增强农村老年人的社会网络具有实践意义。基于心理理论的可塑性及老年人的心理特点，我们编制出一套老年人社会网络增强干预训练方案，本研究验证了该方案的有效性。**方法：**在北京市门头沟区和通州区分别选取两个农村社区，招募社区中全部符合入组标准的 60 岁以上老年人作为干预组（n=82）和对照组（n=81）。干预组接受为期 12 周，每周 1 次，每次约 60 分钟的社会网络增强干预课程，且课后完成家庭作业；对照组保持日常生活，不接受任何干预。干预前后考察心理理论水平，个体网络指标及整体网络指标。**结果：**与对照组相比，干预后干预组被试的心理理论水平（包括眼区情绪识别得分及失言任务得分）得到了显著提升（*Ps*<0.001），个体网络指标（包括规模及异质性）及整体网络指标（包括点入中心度和互惠性）也得到了显著提升（*Ps*<0.01）。干预后干预组的整体网络密度相较干预前有显著增强（*P*<0.001）；与对照组相比，干预组后测时的整体网络密度也显著更强（*P*<0.001）。结论： 本研究验证了在我国农村老年人中 12 周的社会网络增强干预训练的有效性，为后续大规模的实践工作提供了有效理论支撑。

3 School of Teacher Education, Ningbo University, Ningbo 315211, China
Corresponding author: Juan Li, lijuan@psych.ac.cn

Abstract: Background: Social networks are a critical factor influencing the mental health of older adults and tend to decrease with age. Studies have shown that compared with urban older adults, the social networks of

rural older adults in China are weaker in all indicators. Therefore, it is of practical significance to strengthen the social network of rural older adults. Based on the plasticity of the Theory of Mind and the psychological characteristics of older adults, we developed a training program for social network enhancement intervention for older adults, and this study verified the effectiveness of the program. Methods: Two rural communities in Mentougou district and Tongzhou District of Beijing were selected, and all the older adults over 60 who met the inclusion criteria were recruited as the intervention group (n=82) and the control group (n=81). The intervention group received a 12-week, 60-minute weekly social network enhancement intervention session with homework. The control group maintained daily life and did not receive any intervention. The level of Theory of Mind, ego network index, and whole network index were compared before and after intervention. Results: After the intervention, the level of Theory of Mind (including the eye emotion recognition scores and faux pas task scores) was significantly improved in the intervention group compared with the control group (*Ps*<0.001), ego network metrics (including size and heterogeneity) and whole network metrics (including in-degree centrality and reciprocity) were also significantly improved (*P*s<0.01). After the intervention, the whole network density of the intervention group was significantly stronger than that before the intervention (*P*s<0.001).The whole network density at the posttest was also significantly stronger in the intervention group than in the control group (*P*s<0.001). Conclusions: This study verified the effectiveness of the 12-week social network enhancement intervention in rural older adults in Chinese rural areas and provided effective theoretical support for subsequent large-scale practical work.

新冠疫情下中国老年人的死亡焦虑及其与应对方式和人格特质的关系

杨登乐

广东外语外贸大学，广州，510420

Email：yangdengle@foxmail.com

摘 要

目的：本研究探究了新冠疫情下中国老年人的死亡焦虑状况及其与应对方式和人格特质的关系。

方法: 本研究运用了死亡焦虑量表（DAS）、大五人格量表（NEOFFI）和简明应对方式量表（BCOPE）对中国大陆 4 个城市的 264 名老年人进行了一对一的面谈。

结果: 1) 疫情期间是否经历隔离对老年人的死亡焦虑没有显著影响（t=-0.847,P＞0.05）；2) 对高低死亡焦虑组的老年人的人格特质和应对方式进行了比较，发现在尽责性,外倾性, 宜人性和神经质四个人格特质上均存在显出差异，在积极应对, 正性重构, 自我分散, 行为脱缰, 计划, 幽默和工具性支持七个应对方式上差异显著; 3) 多元线性回归分析发现神经质、开放性以及新冠影响对死亡焦虑分数起到 44.6%的预测作用（F=45.845，p<0.001）。

结论: 结果支持压力易感模型以及恐惧管理理论，在后疫情时代，建议关注具有人格易感性的老年人心理健康状况，结合中国文化帮助老年人建立积极的应对方式。

Death anxiety during COVID-19 and its relationship with coping strategies and personality traits among Chinese elderly people

Yang Dengle
Guangdong University of foreign Studie,
2 Baiyun Avenue, Baiyun District, Guangzhou 510420, China

***Abstract*:**

Objectivity：This study aimed at investigating the death anxiety and its relationship with coping method and personality traits of the Chinese elderly during COVID-19.

Methods: This study totally interviewed 264 participates from 4 regions, Death anxiety scale (DAS), NEO-Five-Factor Inventory and Brief COPE were utilized, One-on-one interviews with the elderly were conducted by interviewers.

Results: 1) Quarantine experience didn't make significant difference in death anxiety among the elderly（t=-0.847,P＞0.05）; 2) The personality traits and coping styles of elderly people with high and low death anxiety groups were compared，it has significant difference in four personality traits: Conscientiousness, Extraversion, Agreeableness and Neuroticism，and seven coping strategies: Active copping, Positive Reframe, Self-distraction, Behavior Disengagement, Plan, Humor and Instrumental support; 3) Multiple linear regression analysis showed that neuroticism, openness and COVID impact predicted 44.6% of the variance in the death anxiety among elderly people（F=45.845，p<0.001）。

Conclusions: Results support theories of vulnerability-stress model and terror management theory, In the post-epidemic era, what the author found suggests that it is important to pay attention to the mental health status of elderly people with personality susceptibility to handling the stress of infection badly. The authors recommend helping the elderly establishing positive coping strategies in combination with Chinese cultural supports.

年轻人与老年人的认知-情绪双任务协调差异

何娟[1] 陈睿[2*]（通讯作者） 何晓英[3]
1 雅安职业技术学院，雅安，625107
2 云南师范大学教育学部，昆明，650500，13759599505@163.com
3 四川商务职业学院，成都，611131

摘 要：双任务协调是指当需要同时完成两项任务时，注意力在两者之间进行分配的能力。随着年龄的增长，老年人在感知觉、认知、思维、情绪等心理功能方面都会发生变化。以往研究从认知-运动双任务的角度，对年轻人和老年人双任务协调能力差异进行探讨并得出了不同的结论，但对于认知-情绪双任务上的表现却很少关注。本研究旨在探讨年轻人与老年人认知-情绪双任务的年龄差异，并对双任务协调理论模型

和双任务协调的年龄差异假说进行验证。为此共选取了 32 名年轻人(平均年龄 19.59±1.13 岁)和 30 名老年人(平均年龄 64.19±4.9 岁)参与本研究的认知任务、情绪任务、认知-情绪任务三个实验任务。

实验结果显示：（1）年轻人在简单/困难认知任务中的表现均优于老年人，且在困难认知任务中，这种年龄差异更明显；（2）年轻人在情绪任务上的表现优于老年人；（3）在同时执行两项任务时，老年人仅在认知任务的双任务亏损上与年轻人差异显著。在情绪任务的双任务亏损上，老年人与年轻人无显著差异。同时，当认知任务为困难水平，老年人情绪任务的正确率显著低于当认知任务为简单水平时，而年轻人的情绪任务正确率却不受认知任务难度的影响。

研究结果表明：(1)无论是年轻人还是老年人，其在竞争共同资源的认知-情绪双任务中所表现出的任务干扰均符合资源模型假设。与年轻人相比，老年人在认知-情绪双任务中表现较差，可能是其资源容量不足造成的。(2)考虑了单任务基线中与年龄相关的差异之后，老年人双任务亏损符合双任务缺陷假说。表明双任务协调是一项独特的能力，可以将其作为老年人认知衰退的可靠标记物。(3)老年人的认知任务与情绪任务在双任务亏损上表现出不同的趋势，随年龄的增长，认知任务成绩下降趋势更明显。

关键词 ：双任务协调，年龄差异，认知老化，双任务亏损

The Difference in Cognitive-emotional Dual-task Coordination Between Younger and Older Adults

He Juan[1] Chen Rui[2*] He Xiaoying[3]

1 Ya'an Polytechnic College,Ya'an,625107

2 Faculty Of Education, Yunnan Normal University,Kunming,650500,13759599505@163.com

3 Sichuan Business Vocational College,Chengdu,611131

Abstract：Dual-task coordination is one of the sub-components of executive function, which refers to the ability to allocate attention between two tasks when they need to be completed at the same time.With the increase in age, there will be changes in the psychological functions of the elderly, such as sensory perception, cognition, thinking, emotion and so on. From the perspective of cognitive-motor dual-task, previous studies have discussed the differences in coordination ability between the young and the elderly and drawn different conclusions. However, little attention has been paid to the performance of cognitive-emotional dual-tasks.The aim at this study is to explore the age differences in cognitive-emotional dual-tasks between young and elderly people, and to validate the theoretical models of dual-task coordination and the age difference hypotheses of dual-task coordination.For this reason, 32 younger adults (average age 19.59 ±1.13) and 30 elderly people (average age 64.19 ±4.9) were selected to participate in the three experimental tasks of this study.

The experimental results show that: (1) young people perform better than elderly people in simple/difficult cognitive tasks.The age differences are more pronounced in difficult cognitive tasks;(2) Young people perform better in emotional tasks than older people;(3) When performing two tasks at the same time, the elderly only showed significant differences compared to young people in the dual-task costs of cognitive tasks.There is no significant difference between elderly and young people in the dual-task costs of emotional tasks.Meanwhile, when the cognitive task is at a difficult level, the accuracy of emotional tasks in elderly people is significantly lower than when the cognitive task is at a simple level, while the accuracy of emotional tasks in young people is not affected

by the difficulty of cognitive tasks.

The research results indicate that:(1) Whether young or old, the task interference in cognitive-emotional dual-tasks competing for the same resources is consistent with the resource model hypothesis. Compared with younger adults, older adults perform poorly in cognitive-emotional dual-tasks, which may be due to their insufficient resource capacity.(2) After considering the age-related differences in the single-task baseline, the dual-task costs of the elderly conform to the dual-task deficit hypothesis. It shows that dual-task coordination is a unique ability and can be used as a reliable marker of cognitive decline in the elderly.(3) The cognitive task and emotional task of the elderly show different trends in dual-task costs, and the cognitive task performance decreases more obviously with age.

Keywords：dual-task coordination,age difference, cognitive aging, dual-task cost

非痴呆进行性核上性麻痹患者序列工作记忆的损伤

张冠宇[1]（通讯作者） 马敬红[2] 陈彪[2] 叶铮[3]（通讯作者）

1 国家体育总局体育科学研究所，北京，100061，1601466858@qq.com

3 中国科学院脑科学与智能技术卓越中心神经科学研究所，上海，200031，yez@ion.ac.cn

摘 要 序列工作记忆是指在短时间内保持和操作序列信息的能力。进行性核上性麻痹（PSP）患者在需要排列思想或行动的任务中表现不佳。本研究评估了 36 名非痴呆 PSP 患者、36 名非痴呆帕金森病（PD）患者和 36 名健康对照者(HC)的序列工作记忆情况。所有参与者完成了数字顺背测验（DST-F）、数字倒背测验（DST-B）和改良版数字序背测验（DOT-A）三项神经心理测试。每项测验主试均以每秒一个数字的速度朗读一串数字，要求被试立即以原来顺序（DST-F）、完全倒序（DST-B）、从小到大顺序（DOT-A）说出主试念的数字。也就是说，DST-F 仅需要保持序列，而 DST-B 和 DOT-A 则需要操作序列。PSP 组在 DST-B 和 DOT-A 上的得分低于 PD 组和 HC 组，但在 DST-F 上的得分与 PD 组和 HC 组无显著差异。这表明 PSP 患者损伤的是对序列的操作能力，而非序列保持能力。此外，在 PSP 患者和 PD 患者中，DOT-A 得分和 DST-B 得分分别与非运动症状和运动症状的严重程度相关。多巴胺 D2/3 受体激动剂剂量与 DST-B 得分、DOT-A 得分呈正相关，说明服用大剂量多巴胺 D2/3 受体激动剂的患者在 DST-B 和 DOT-A 中的表现更好。左旋多巴实际剂量与 DST-B 得分和 DOT-A 得分呈负相关，说明服用大剂量左旋多巴的患者在 DST-B 和 DOT-A 中的表现更差。多巴胺 D2/3 受体激动剂剂量与倒背代价（DST-F 与 DST-B 的得分差值）和序背代价（DST-F 与 DOT-A 的得分差值）呈负相关，说明服用大剂量多巴胺 D2/3 受体激动剂的患者在 DST-B 和 DOT-A 中付出了较小的代价。左旋多巴实际剂量与序背代价呈正相关，说明服用大剂量左旋多巴的患者在 DOT-A 中付出了较大的代价。这些结果表明刺激多巴胺 D2/3 受体可以改善 PSP 患者和 PD 患者的序列操作能力。

[3]Department of Neurobiology, Neurology and Geriatrics, Xuanwu Hospital of Capital Medical University, Beijing Institute of Geriatrics, Beijing 100053
[4]Institute of Neuroscience, Center for Excellence in Brain Science and Intelligence Technology, Chinese Academy of Sciences, Shanghai 200031, E-mail: yez@ion.ac.cn

Abstract: Sequential working memory is the ability to maintain and manipulate sequential information in a short period of time. Patients with progressive supranuclear palsy (PSP) perform poorly in tasks which need to arrange thoughts or actions. We assessed the sequential working memory in non-demented patients with PSP (N=36), non-demented patients with Parkinson's disease (PD, N=36), and healthy controls (HC, N=36). All participants completed three neuropsychological tests, including digit span forward (DST-F), digit span backward (DST-B), and adaptive digit ordering tests (DOT-A). Participants heard a sequential of random digits at speed of one digit per second in each trial and immediately recall the digits in original order in DST-F, in reversed order in DST-B, and in ascending order in DOT-A. Namely, the DST-F needs to maintain sequences, and the DST-B and DOT-A need to manipulate sequences. The PSP group scored lower than both PD and HC groups in DST-B and DOT-A but not in DST-F, indicating that the ability to manipulate sequences was impaired in PSP patients regardless of the ordering rule but maintenance was preserved. Moreover, in PSP and PD, the DOT-A score and DST-B score correlated with the severity of non-motor symptoms and motor symptoms, respectively. The levodopa equivalent dose of D2/3 receptor agonists was positively correlated with the DST-B score and DOT-A score. The patients who took a greater dose of D2/3 receptor agonists tended to perform better in the DST-B and DOT-A. The actual levodopa dose was negatively correlated with the DST-B score and DOT-A score. The patients who took a greater dose of levodopa tended to perform worse in the DST-B and DOT-A. The levodopa equivalent dose of D2/3 receptor agonists was marginally negatively correlated with the DST-B ordering cost (DST-F score vs DST-B score) and DOT-A ordering cost (DST-F score vs DOT-A score). The patients who took a greater dose of D2/3 receptor agonists tended to have smaller ordering cost in the DST-B and DOT-A. The actual levodopa dose was marginally positively correlated with the DOT-A ordering cost. The patients who took a greater dose of levodopa tended to have larger ordering cost in the DOT-A. Stimulating D2/3 receptors might improve the manipulation of sequences in PSP and PD.

老年群体提取遗忘的独特性——更持久的记忆损伤

刘绍航[1] 杨春亮[1]（通讯作者）

1 北京师范大学心理学部，北京，100875，通讯作者邮箱：chunliang.yang@bnu.edu.cn

摘 要 提取练习（retrieval practice）可以增强对提取目标的记忆，但同时也会损伤对非提取相关信息的记忆，该现象被称为提取遗忘（retrieval-induced forgetting）。提取遗忘被认为是对干扰信息的适应性抑制控制，因此，研究发现，提取遗忘往往会在 24 小时后消失，并不会造成长期的记忆损伤。然而，对老年人而言，其睡眠期的记忆巩固（sleep-dependent memory consolidation）和编码阶段的记忆整合（integration）能力相比年轻人均有显著降低。因此，老年人的选择性提取的持续时间可能相对较长，即选择性提取可能会给老年人造成长期甚至是永久的记忆损伤。

本研究通过两个实验对此假设进行了验证。实验一（45 名 65-75 岁老年人，M = 69.8 岁，44 名 18-25 岁年轻人，M = 21.1 岁）采用经典的提取遗忘材料。年轻人和老年人在实验的第 1 天学习分属于不同类别的词汇（如：水果-猕猴桃），在第 3、5、7 天进行选择性的提取练习（提取一半类别的一半词汇，每次提取内容相同），并在第 8 天进行总测试。结果发现：总测试中，年轻人并未表现出提取遗忘，但老年人的提取遗忘显著（与提取词同类别词的成绩显著低于不同类别的词）。实验二（47 名 65-75 岁老年人，M = 70.4，45 名 18-25 岁年轻人，M = 22.5）与实验一流程相同，但采用了两篇科学短文作为学习材料，以增加被试对相关信息的整合进而促进记忆。结果发现，年轻人不仅没有出现提取遗忘，选择性提取反而增加了与提取目标相关的未提取内容的记忆；而老年人提取遗忘仍然显著。不仅如此，实验后的问卷显示，老年人能够意识到整合是一种有效的记忆策略，且在编码过程中主动使用该策略。然而，年轻人所报告的使用整合的程度显著预测了选择性提取对非提取内容的记忆促进，但该预测关系对老年人并不显著。可见，并非是老年人的策略失当，而是其整合能力的下降导致了选择性提取产生了长期的提取遗忘。

选择性提取在日常生活中时常发生。虽然对于年轻而言，其只产生了短期的消极影响，但对于老年人而言，选择性提取所导致的长期，甚至是永久记忆损伤应当引起重视。

关键词 提取遗忘，选择性提取，认知老化

Retrieval-induced Forgetting Causes Long-term Memory Impairment of Old Adults

Shaohang Liu[1]，Chunliang Yang (corresponding author)
Faculty of Psychology, Beijing Normal University, Beijing, China, Email: chunliang.yang@bnu.edu.cn

Abstract: Retrieval practice enhances memory but is at a price of impairing memory of unretrieved information, a phenomenon known as retrieval-induced forgetting (RIF). RIF was considered as an adaptive inhibitory control of interfering competitors. Previous studies have demonstrated that RIF disappeared 24 hours after learning phase and will not cause long-term memory impairment. However, due to old adult's deficits in sleep-dependent memory consolidation and integration, RIF may lead to long-term or even permanent memory impairments of older adults.

We conducted two experiments to test this possibility. Experiment 1 (45 older adults from 65 to 75 years, M = 69.8; 44 younger adults from 18 to 25 years, M = 21.1) used typical category-exemplar as materials (e.g., *fruit-kiwi*). Both old and young adults learned all exemplars on day 1, and three retrieval practice sessions respectively on day 3, 5 and 7. In the retrieval practice session, only half of exemplars of half of the categories were retrieved. On day 8, all participants had a final recall covering all the exemplars. The results showed insignificant RIF of young adults in the final recall but significant RIF of old adults. Experiment 2 (47 older adults

from 65 to 75 years, *M* = 70.4; 45 younger adults from 18 to 25 years, *M* = 22.5) employed identical procedure to Experiment 1 but with different materials. Participants learned scientific proses so that they could more actively integrate related information to promote memory. The result showed that young adult group showed significant retrieval-induced facilitation, i.e., memory of unretrieved but related items were boosted. However, RIF was still significant for the olds. Additionally, both age groups reported well-matched level of integration usage and perceived utility of integration, while the level of integration usage only significantly predicted the size of retrieval-induced facilitation for the young adults but not the olds.

Selective retrievals are ubiquitous in daily life. Although it only generates transient negative effect on young adult's memory, it is worth-noting that it can cause long-term even permanent memory impairment of older adults.

Keywords: retrieval-induced forgetting, selective retrieval, cognitive aging

认知与情绪功能对老年人饮食模式转变的调节作用

牛程程[1] 姜海鑫[1] 喻婧[1]（通讯作者）

[1]西南大学心理学部，重庆，400715，yujingpku@gmail.com

摘 要 背景：常言道病从口入，长期饮食模式潜移默化的影响着老年人的身心健康，研究不同饮食模式老年人的心理特点以及影响老年人饮食模式转变的心理因素对于促进老年人的身心健康具有重要意义。方法：采用中国老年健康影响因素跟踪调查（Chinese Longitudinal Healthy Longevity Survey，CLHLS），使用潜类别分析（LCA）和潜在转换分析（LTA）对 3441 名年龄为 52~116 岁的老年人在 T1（2014）和 T2（2018）的数据进行分析。确定中国老年人饮食模式的亚组，探究这些潜在饮食模式类别在时间上的转换关系以及有助于调节老年人饮食模式的心理因素。结果：潜类别分析确定了中国老年人饮食模式的 4 类亚组：第一类为"单一饮食"，第二类为"偏素食主义饮食"，第三类为"高蛋白饮食"，第四类为"多样化饮食"。四类饮食模式的老年群体在认知功能，焦虑，抑郁和生活满意度及自评健康上均具有显著差异，具体表现为，多样化饮食特点的老年人具有更好的认知功能和生活满意度及自评健康，和更低的焦虑、抑郁水平，因此，多样化饮食被认为是更健康的饮食模式。高蛋白饮食模式和多样化饮食模式的老年群体具有较高的稳定性，四年间分别有 0.59 和 0.50 的概率仍然停留在相同的饮食模式下。T1 为单一饮食、偏素食主义饮食和高蛋白饮食老年群体在 T2 转变为多样化饮食模式的概率分别为 0.01、0.17 和 0.20. 我们的研究结果还发现认知功能，焦虑和生活满意度及自评健康等心理因素在调节老年人饮食模式的转变方面发挥着重要作用，心理因素的有益方面能够显著促进老年人的健康饮食。结论：本研究采用以人为本的研究方法（LCA 和 LTA）确定了中国老年人饮食模式的潜在亚组特征，探究了认知与情绪功能对改善老年人饮食模式的作用。表明可通过认知和情绪功能来对老年人的饮食模式进行干预，从而促进老年人的身心健康。

The moderating effect of cognitive and emotional functions on dietary transition in older adults

Cheng-Cheng Niu[1], Hai-Xin Jiang[1], Jing Yu[1*]

[1] Faculty of Psychology, Southwest University, Chongqing, China

Abstract： Background: It is often said that disease enters through the mouth, and long-term dietary patterns

implicitly affect the physical and mental health of older adults. In order to promote the health of older adults, it is important to study the associations between psychological characteristics and different dietary patterns and the psychological factors that influence transitions in their dietary patterns. Methods: Longitudinal data from the Chinese Longitudinal Healthy Longevity Survey (CLHLS) were used. A total of 3441 older adults aged 52-116 years were recruited in T1 (2014) and T2 (2018). Latent class analysis (LCA) and latent transition analysis (LTA) were used to identify meaningful subgroups of Chinese older adults' dietary patterns, the transformation relationships of these latent dietary pattern classes, and the effect of psychological factors on moderating older adults' dietary patterns. Results: Four subgroups of dietary patterns were identified by latent class analyses. The first class was " *Mono-diet* ", the second was " *Vegetarian diet* ", the third was " *High protein diet* ", and the fourth was " *Diversified diet* ". The results showed that there were significant differences in cognitive function, anxiety, depression, and life satisfaction and self-rated health among the four dietary patterns. Specifically, older adults in *Diversified diet* had better cognitive function, life satisfaction and self-rated health, and lower levels of anxiety and depression, suggesting that the *Diversified diet* was a healthier dietary pattern. Older adults in the *High protein diet* and *Diversified diet* had higher stability, with 0.59 and 0.50 odds of remaining on the same dietary patterns over the four years, respectively. However, some individuals also showed changes to the *Diversified diet* status over the two time points. The probabilities of moving to the *Diversified diet* for older adults in the *Mono-diet, Vegetarian diet* and *High protein diet* status at T1 were 0.01, 0.17 and 0.20, respectively. Our results also showed that psychological factors such as cognitive function, anxiety, and life satisfaction and self-rated health played an important role in moderating changes in older adults' dietary patterns. The positive aspects of psychological factors may significantly contribute to healthy dietary patterns in older adults. Conclusion: This study used person-centered approaches (LCA and LTA) to identify potential subgroup characteristics of Chinese older adults' dietary patterns, and explored the role of cognitive and emotional functions in improving older adults' dietary patterns. It suggests that the dietary habits of older adults can be influenced by cognitive and emotional functions of older adults, thereby promoting their physical and mental health.

中华民族共同体意识的隐喻表征建构

吴佳臻 丁凤琴（通讯作者）孙逸舒

宁夏大学教师教育学院，银川，750021，dingfqin@nxu.edu.cn

摘 要:中华民族共同体意识是一个复杂抽象的概念，在认知维度上，表现为个体对中华民族身份及共同价值理念等方面的积极认知；在情感维度上，体现为个体对中华民族共同体的亲近感、自豪感等正向积极情绪；在意志维度上，呈现为怀抱实现中华民族伟大复兴的共同目标，并愿为之付出自觉性行为的态度倾向。概念隐喻理论指利用熟悉、具体概念去理解和构建陌生、抽象概念，几乎所有概念都可成为隐喻研究的主题。探究中华民族共同体意识概念背后的隐喻架构，需要结合文化本土性进行拓展阐释与延伸建构。

受儒家、道家等传统文化影响，国人的家国情怀、人格内涵中包含了深刻地隐喻思维。“天”作为一种超验存在的，具有“包罗万象”“容纳万物”的容器属性；同时，古人“天人合一”思想将“天”赋予了“德配天地”价值属性；红色是五千年传统文化精髓嬗变而来的文化底色,也是中华民族最具代表性的情感符号；“大我”和“小我”是中国人独特的自我结构，“大我”“小我”需要同时得到均衡适度满足，能够推动个体自我实现与共同体发展互促共融。

基于中华民族文化心理特征，中华民族共同体意识的隐喻建构与解读，可以从容器隐喻、垂直空间隐喻、颜色隐喻、大小隐喻四个维度切入。（1）共融于器：“中华民族共同体”认知存在容器隐喻表征，共同的血缘纽带和地缘关联，使 56 个民族产生像石榴籽一样紧紧抱在一起的家庭归属感。（2）道不离器：“价值理念”认同存在垂直空间隐喻表征，国家至上、民族至上是中华儿女不变的信仰。（3）知情合一：“中华民族情感”存在红色隐喻表征，中国红承载着深厚的爱国主义情感。（4）立身行道：“共同意志”存在大小隐喻表征，将“小我”融入“大我”，才能担当民族复兴时代大任。未来可采用实验方法进一步验证多种维度隐喻的心理现实性。

关键词： 中华民族共同体意识，空间隐喻，颜色隐喻，隐喻表征

The Construction of Metaphorical Representation in the Sense of Community for the Chinese Nation

WU Jia-zhen　DING Feng-qin　Sun Yi-shu
School of Teacher Education，Ningxia University，Yinchuan，750021

Abstract： The sense of community for the Chinese nation is an abstract mental concept.In terms of the cognitive dimension, it is manifested as the positive cognition of community for the Chinese nation and common values.In terms of the emotional dimension,it is manifested as the positive emotion of closeness to and pride in the community for the Chinese nation. In the dimension of will, it is represented as having a common goal of achieving the great rejuvenation of the Chinese nation and the willingness to engage in conscious behaviour towards it.Conceptual metaphor theory refers to the use of familiar and specific concepts to understand and construct unfamiliar and abstract concepts. Almost all concepts can become the subject of metaphor research.In order to explore the metaphorical structure behind the concept of the sense of community for the Chinese nation, we need to expand the interpretation and extension construction in combination with cultural localization.

Influenced by traditional cultures such as Confucianism and Taoism, the Chinese people's national sentiment and personality connotation contain profound metaphorical thinking.Firstly, as a transcendental existence, the 'heaven' has container properties of 'encompassing everything' and 'accommodating all things';the ancients' thought of "Unity of Heaven and humanity" endows "heaven" with the value attribute;red is the cultural background that evolved from the essence of 5000 years of traditional culture, and it is also the most representative emotional symbol of the Chinese nation; the ego structure of the Chinese can be divided into "big ego" and "small ego",the "big ego" and "small ego" need to be satisfied in a balanced and moderate way, which can promote the mutual promotion and integration of individual self-realisation and community development.

Based on the cultural psychological characteristics of the Chinese nation, the metaphor construction and interpretation of the sense of community for the Chinese nation can be started from four dimensions: container metaphor, vertical space metaphor, color metaphor, and size metaphor.(1)The "community for the Chinese nation" is represented by the container metaphor, the common blood ties and geographical connections make the 56 ethnic groups have a sense of family belonging like pomegranate seeds;(2)the "common values" are represented by the vertical space metaphor,the supremacy of the country and the nation is the unshakable belief of the Chinese people;(3)the "Chinese national emotion" is represented by the red metaphor,China red carries a deep patriotic sentiment;(4)the "common will" is represented by the size metaphor,the integration of the material self into the larger self,we can assume the great responsibility of realising the Chinese dream of national rejuvenation.In the

future,experimental methods can be used to further verify the psychological realism of the multiple dimensions of the metaphor.

3 北京师范大学中国基础教育质量监测协同创新中心，北京，100875

摘 要　近年来，在铸牢中华民族共同体意识成为新时代党的民族工作主线的时代背景下，党和政府对少数民族教育的关注与支持不断提升，越来越多的少数民族青少年进入高等院校深造。然而，由于语言文字、风俗习惯等方面的不同，使得他们面临着更多的心理压力与挑战。因此，加强少数民族大学生心理健康研究至关重要，而良好的心理素质又是青少年心理健康维持和发展的关键。为此，本研究旨在调查我国少数民族大学生心理素质的发展现状，并建立全国常模，以期为后续少数民族大学生心理素质相关研究提供参考借鉴。研究一采用整群随机抽样抽取 9 所高校的 1249 名汉族学生和 756 名少数民族学生作为调查对象，使用大学生心理素质问卷（简化版）（College Student Psychological Suzhi Questionnaire-Simplified version，CSPS-SV）进行测试。对调查数据进行验证性因素分析多组比较，结果显示 CSPS-SV 在汉族和少数民族大学生样本间的形态等值、单位等值、截距等值和误差方差等值模型均可被接受。即 CSPS-SV 的双因子模型结构在汉族和少数民族大学生之间具有测量等值性，该问卷可以作为良好的心理素质测评工具应用于全国大样本施测中。研究二采用 CSPS-SV，在全国范围内整群抽取 6689 名少数民族大学生作为调查对象。研究对象来自 47 个少数民族，具有较强的代表性。调查结果表明，少数民族大学生心理素质整体得分较高，且呈现负偏态分布，表明绝大部分学生的心理素质得分向高分趋近；个性品质得分显著较高，认知品质和适应能力得分处于中等水平。性别层面，男生认知品质得分显著高于女生，而个性品质和适应能力的性别差异不显著。年级层面，心理素质总分以及各维度得分随年级的升高均呈现出先降低再升高的趋势；其中，在认知品质上，大四学生得分显著高于其它三个年级的学生；在个性品质上、适应能力和心理素质总分上，呈现出大一和大四学生得分差异不显著，但均显著高于大二和大三学生的得分。家庭居住地层面，认知品质和心理素质总分呈现三级阶梯式递减态势。同时，本研究据此制定了相应的全国常模。

The Characteristics and National Norm of Psychological Suzhi for Minority College Students

Zhu Zhengguang[1]　Zhang Dajun[1]*　Liu Guangzeng[2]　Zhang Libin[3]

1. Faculty of Psychology, Research Center of Mental Health Education, Southwest University, Chongqing 400715, China

2. School of Education and Psychology, Southwest Minzu University, Chengdu 610225, China

3. Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal

University, Beijing 100875, China

Abstract：Under the background of the Party's ethnic work in the new era, the Party and the government have paid increasing attention to and supported the education of ethnic minorities, and more and more ethnic minority teenagers have entered colleges and universities for further study. However, due to the differences in language, customs and other aspects, they are facing more psychological pressure and challenges. It is very important to strengthen the mental health research of minority college students, and good psychological suzhi is the key to the maintenance and development of adolescent mental health. Therefore, the purpose of this study is to investigate the development status of psychological suzhi of ethnic minority college students in China, and establish a national norm, in order to provide reference for subsequent research on psychological suzhi of ethnic minority college students. In the first study, 1249 Han students and 756 minority students from 9 universities were selected by cluster random sampling. College Student Psychological Suzhi Questionnaire-Simplified version (CSPS-SV) was used for the test. Multi-group confirmatory factor analysis was conducted to test the survey data. The results showed that configural, weak, strong and strict invariance of the CSPS-SV across nation were all acceptable. In the second study, a total of 6689 minority college students from 47 ethnic groups were selected as the survey objects by using CSPS-SV. The results show that the psychological suzhi of minority college students develops well. Among them, the scores of personality quality were significantly higher, and the scores of cognitive quality and adaptive ability were at a medium level. At the gender level, the cognitive quality score of male students was significantly higher than that of female students, but the gender differences in personality quality and adaptability were not significant. At grade level, the total score of psychological quality and scores of all dimensions showed a trend of first decreasing and then increasing with the increase of grade level. At the level of family residence, the total score of cognitive quality and psychological quality showed a three-step decline trend. At the same time, this study has formulated the corresponding national norm.

学校氛围与少数民族大学生中华民族认同的关系：文化心理适应和群际接触的作用

朱政光[1]　张大均[1]（通讯作者）　刘广增[2]

1 西南大学心理学部/心理健康教育研究中心，重庆，400715，通讯作者 E-mail：zhangdj@swu.edu.cn

2 西南民族大学教育学与心理学学院，成都，610225

摘 要　中华民族认同体现着对中华民族的情感归属与认可，是中华民族共同体意识的基底与主干，铸牢中华民族共同体意识的重要途径之一就是提升中华民族认同。校园是学生学习生活最主要的场所，学校的氛围环境对学生的影响是深远持久的，提升学生中华民族认同离不开良好的校园氛围环境。为此，基于生态系统理论，本研究采用横断研究设计，探讨学校氛围对少数民族大学生中华民族认同的影响，并考察文化心理适应和群际接触（积极接触和消极接触）在其中的中介和调节作用。参与者包括来自新疆两所高校的 305 名少数民族大学生，其中男生 127 人，女生 178 人；平均年龄 19.8 岁。研究结果表明：（1）学校氛围显著正向预测少数民族大学生的中华民族认同；（2）文化心理适应在学校氛围与中华民族认同的

关系中起部分中介作用；（3）群际接触对于学校氛围到大学生中华民族认同的直接路径的调节效应不显著，而学校氛围经由文化心理适应的中介效应受到了群际接触的调节。具体来看，积极接触增强了文化心理适应对中华民族认同的积极影响，消极接触则阻碍了文化心理适应对中华民族的积极影响。同时，消极接触带来的消极影响要略高于积极接触带来的积极影响，进一步证实了群际接触存在积极-消极不对称效应。研究结果为提升少数民族大学生的中华民族认同提供了启示，即应给予少数民族大学生更多的积极社会支持，同时促进良好的学校氛围的形成。未来研究可进一步比较汉族大学生与少数民族大学生在不同群际接触上的差异特点，并进一步考察其中的内在作用机制。

The Relationship between School Atmosphere and Minority College Students' Chinese National Identity: The Role of Cultural-psychological Adaptation and Intergroup Contact

Zhu Zhengguang[1]　Zhang Dajun[1]*　Liu Guangzeng[2]

1. Faculty of Psychology, Research Center of Mental Health Education, Southwest University, Chongqing 400715, China

2. School of Education and Psychology, Southwest Minzu University, Chengdu 610225, China

Abstract: The Chinese national identity embodies the emotional belonging and recognition of the Chinese nation, and is the base and backbone of the Chinese national community consciousness. One of the important ways to forge the Chinese national community consciousness is to enhance the Chinese national identity. The campus is the most important place for students to study and live, and the atmosphere of the school has a far-reaching and lasting impact on students. The enhancement of students' Chinese national identity is inseparable from a good campus atmosphere. Therefore, based on the ecosystem theory, this study adopts a cross-sectional research design to explore the influence of school atmosphere on ethnic minority college students' Chinese national identity, and examines the mediating and moderating effects of cultural psychological adaptation and intergroup contact (include positive contact and negative contact). The participants included 305 ethnic minority students from two universities in Xinjiang, 127 male and 178 female. The mean age was 19.8 years. The results show that: (1) School atmosphere positively predicts minority college students' Chinese national identity; (2) Cultural psychological adaptation plays a partial mediating role in the relationship between school atmosphere and Chinese national identity; (3) School atmosphere is regulated by intergroup contact through the mediating effect of cultural-psychological adaptation. Specifically, positive contact enhances the positive impact of cultural psychological adaptation on Chinese national identity, while negative contact hinders the positive impact of cultural psychological adaptation on Chinese national identity. At the same time, the negative impact of negative contact is slightly higher than that of positive contact, which further confirms the existence of positive-negative asymmetric effect in intergroup contact. The results of the study provide enlightenment for the promotion of ethnic minority college students' Chinese national identity, that is, more positive social support should be given to ethnic minority college students, while promoting the formation of a good school atmosphere.

基于 PERMA 心盛模型的血液透析患者益处发现现状及方案构建的研究

杨婕　吴菁　燕宏丽　储静（通讯作者）
海军军医大学，上海，200433
通讯作者 E-mail：chujing1999@smmu.edu.cn

摘 要

目的：本研究拟从“积极心理学”的视角出发，通过横断面调查析出血液透析患者益处发现现状并分析其核心影响因素，在此基础上，通过文献回顾初步制定基于 PERMA 心盛模型的血透患者益处发现促进方案并通过专家会议法论证修订，以期为改善患者心理健康，提高生命质量提供参考。

方法：本研究基于量性研究、范围综述、专家会议等方法，初步构建了基于 PERMA 心盛模型的血液透析患者益处发现促进方案。

结果：本研究共调查了 396 名血透患者，平均年龄为 57.91±13.54 岁，男性 235 人（59.3%），女性 161 人（40.7%），平均透析龄为 6.89±6.73 年。经 K-S 检验，本研究的连续型变量均不满足正态性，因此采用中位数与四分位数进行描述。患者益处发现得分为 77（64,87），得分较低，其中年龄、PERMA 心盛、积极应对、领悟家庭支持、血透对生活影响程度与益处发现呈正相关，血透的知识了解程度与益处发现呈负相关，以上共同解释益处发现 45.6%的总变异，F=56.079，P＜0.001。通过范围综述分别归纳整理国内外有关基于 PERMA 心盛模型的心理干预和益处发现促进方案的相关研究，共纳入 65 篇文献，初步构建了基于 PERMA 心盛模型的血液透析患者益处发现促进方案，邀请 8 名资深专家参加专家小组会议修订方案，共进行 2 抡，修订后的干预方案的具体内容为：干预形式为线上线下联合团体辅导；干预实施者为课题组成员和接受干预培训后的血透护士；干预持续 8 周，每周 1 次，每次 60~90 分钟；分别在干预前、第 5 次干预后、第 8 次干预后、干预结束后 1 个月、3 个月进行生理和心理的结果评价。每周的干预主题依次为：（1）走进积极心理；（2）发现积极情绪；（3）感受沉浸体验；（4）建立积极关系；（5）引导增强信心；（6）寻求生命意义；（7）体验成就感觉；（8）提升心理健康。

结论：血透患者益处发现有待提升，其核心影响因素包括年龄、PERMA 心盛、积极应对、领悟家庭支持、血透对生活影响程度和知识了解程度。基于量性调查、范围综述、专家会议等研究方法初步构建了基于 PERMA 心盛模型的血液透析患者益处发现促进方案。

Research on the status of benefit finding of HD patients and Promote program construction based on PERMA flourish model

Yang Jie　Wu Jing　Yan Hongli　Chu Jing (Corresponding author)
Naval Medical University, Shanghai 200433, China
Corresponding author, E-mail: chujing1999@smmu.edu.cn

***Abstract*：**

Objectives From the perspective of "positive psychology", this study intends to extract the current status of benefit finding (BF) in hemodialysis (HD) patients through cross-sectional investigation and analyze its core influencing factors. On this basis, through literature review, a promotion plan for BF in HD patients based on PERMA model is initially formulated and revised through expert meeting method, with a view to improving the mental health of patients. Improve the quality of life to provide reference.

Methods Based on quantitative research, scope review, expert meeting and other methods, this study initially constructed a BF promotion scheme for HD patients based on PERMA Flourish model.

Results A total of 396 HD patients were investigated in this study, with an average age of 57.91±13.54 years, including 235 males (59.3%) and 161 females (40.7%). The average dialysis age was 6.89±6.73 years. According to K-S test, none of the continuous variables in this study could satisfy normality, so median and quartile were used to describe them. The BF score of patients was 77 (64,87), which was low. Age, PERMA flourish, positive coping, perceived of family support, and degree of influence of HD on life were positively correlated with BF, while knowledge understanding of HD was negatively correlated with BF. The above combined explanations accounted for 45.6% of the total variation in BF, F=56.079. P < 0.001. Through a scope review, relevant domestic and foreign studies on psychological intervention and BF promotion program based on PERMA heart flow model were summarized, and a total of 65 literatures were included. A BF promotion program for HD patients based on PERMA heart flow model was initially constructed, and 8 senior experts were invited to attend an expert group meeting to revise the plan. The specific contents of the revised intervention plan are as follows: the intervention form is online and offline joint group counseling; The implementers of the intervention were members of the research group and HD nurses who received intervention training. The intervention lasted for 8 weeks, once a week for 60 to 90 minutes each time. The physiological and psychological results were evaluated before the intervention, after the fifth intervention, after the eighth intervention, 1 month after the intervention, and 3 months after the intervention. The themes of each week's intervention were: (1) Entering positive psychology; (2) Finding positive emotions; (3) Experience immersion; (4) Establish positive relationships; (5) Guide and enhance confidence; (6) Seeking the meaning of life; (7) Experience the feeling of achievement; (8) Improve mental health.

Conclusion The benefit of HD patients needs to be improved. The core influencing factors include age, PERMA, positive coping, perceived of family support, degree of influence of HD on life and degree of knowledge understanding. Based on quantitative investigation, scope review, expert meeting and other research methods, a beneficial discovery and promotion scheme for HD patients based on PERMA flourish model was initially constructed.

摘 要 **背景：**乳腺癌是女性中最常见的癌症之一，尽管随着癌症筛查的普及和诊疗技术的进步，乳腺癌患者的生存率有所提高，但由于癌症本身的难以治愈性和复发的不确定性，复发恐惧成为患者及其家庭普遍存在的问题。互倚理论指出，亲密关系中的二元个体间存在较强的相互作用，并且个体的认知、情感或行为等易在两者间转移，也会影响对方的健康结局。基于此，本研究旨在从二元视角探讨乳腺癌患者及其配偶的正念与癌症复发恐惧之间的关系，并分析家庭回避癌症沟通在其中的中介作用，为减轻该群体癌症复发恐惧提供实证支持。 **方法：**采用方便抽样法，于 2021 年 6 月~11 月，在山东省某三级甲等肿瘤专科医院招募 249 对乳腺癌患者及配偶为研究对象，采用一般资料调查表、正念注意觉知量表、家庭回避癌症沟通量表和恐惧疾病进展简化量表进行调查。 **结果：**（1）乳腺癌患者及配偶正念对癌症复发恐惧的主体效应均显著（β = -0.044, P = 0.019, 95%CI = -0.125 ~ -0.007; β = -0.046, P = 0.007, 95%CI = -0.130 ~ -0.009），双方的正念均可通过自身的家庭回避癌症沟通从而作用于自身的癌症复发恐惧；（2）配偶正念对癌症复发恐惧的客体效应显著（β = -0.031, P = 0.019, 95%CI = -0.098 ~ -0.002），即配偶的正念可通过自身的家庭回避癌症沟通作用于乳腺癌患者的癌症复发恐惧。 **结论：**乳腺癌患者及其配偶的正念水平对于缓解癌症复发恐惧具有重要作用，并且家庭回避癌症沟通在其中发挥了中介作用，未来的临床干预应侧重于培养正念技能，同时促进家庭成员之间的沟通，以促进患者及配偶的身心健康。

Abstract*: *Background Breast cancer is one of the most prevalent malignancies among women. In recent years, with the widespread dissemination of cancer screening and the advancement in diagnostic and therapeutic technologies, the survival rate of breast cancer patients has gradually increased. However, due to the uncertainty of cure and recurrence, the fear of cancer recurrence (FCR) has become a universal concern for both patients and their families. According to the theory of interdependence, binary persons have strong mutual influences within intimate relationships, where cognition, emotions, or behaviors easily pass between one another, influencing each other's health outcomes. Grounded in this perspective, this study aims to explore the actor and partner effects of mindfulness on FCR, and to examine the mediating role of family avoidance of communication about cancer based on the actor-partner interdependence mediation models, which could provide empirical evidence for improving FCR in this population. ***Methods*** A convenience sampling of 249 dyads of breast cancer patients and their spouses were recruited from June to November 2021 in a tertiary cancer hospital in Shandong Province. The survey tools included general information questionnaire, Mindful Attention Awareness Scale-5, Family Avoidance of Communication about Cancer Scale and Fear of Progress Questionnaire-Short Form. ***Results*** (1) Both the actor effects of mindfulness on FCR were significant in breast cancer patients and their spouses (β = -0.044, P = 0.019, 95%CI = -0.125 ~ -0.007; β = -0.046, P = 0.007, 95%CI = -0.130 ~ -0.009). The mindfulness of both parties can influence their own FCR through the practice of family avoidance of communication. (2) The partner effects of

spouses' mindfulness on FCR were significant (β = -0.031, P = 0.019, 95%CI = -0.098 ~ -0.002), that is to say, the mindfulness of spouses can influence FCR in breast cancer patients through family avoidance of communication. ***Conclusion*** Both breast cancer patients' and spouses' mindfulness had actor effects on FCR by the mediating role of their family avoidance of communication about cancer. Future clinical interventions should focus on cultivating mindfulness skills while promoting communication among family members, thereby fostering the physical and mental well-being of both patients and their spouses.

Keywords: breast cancer, mindfulness, fear of cancer recurrence, family avoidance of communication, actor-partner interdependence mediation model

病耻感和结直肠癌肠造口患者社会隔离的关系：造口接纳和价值行动的链式中介作用

李国鹏　覃瑞　赵迪　厉萍（通讯作者）

山东大学护理与康复学院，济南，250012，pingli12@sdu.edu.cn

摘 要 目的：结直肠癌肠造口患者普遍具有较高的病耻感和社会隔离，然而，病耻感和社会隔离的内在关联却不清楚。基于此，本研究拟探讨病耻感和结直肠癌肠造口患者社会隔离的关系，并基于接纳承诺疗法理论，进一步验证造口接纳和价值行动在上述关系间的中介作用。

方法：采用便利抽样法，选取山东省肿瘤医院造口门诊的 306 例结直肠癌肠造口患者为被试，研究工具包括病耻感量表、造口接纳和价值行动量表、社会隔离量表以及自行设计的一般资料调查表。通过 SPSS26.0 和 PROCESS4.0 插件进行数据分析。

结果：结直肠癌肠造口患者社会隔离、病耻感、造口接纳和价值行动评分分别为：（16.51 ± 2.58）、（7.39 ± 2.07）、（29.27 ± 6.84）、（34.89 ± 4.90）分。社会隔离与病耻感呈显著正相关（r = 0.207, P < 0.001），与造口接纳（r = -0.350, P < 0.001）和价值行动（r = -0.488 P < 0.001）呈显著负相关；病耻感与造口接纳（r = -0.316, P < 0.001）和价值行动（r = -0.113, P < 0.05）呈显著负相关；造口接纳和价值行动呈显著正相关（r = 0.406, P < 0.001）。病耻感不仅能直接正向预测社会隔离（直接效应 = 0.112，P < 0.001），还可以通过以下 3 个途径间接预测社会隔离（总间接效应 = 0.132，95%CI = 0.058 - 0.211，总效应量 = 53.9%）：病耻感→造口接纳→社会隔离（间接效应 = 0.052，95%CI = 0.002 - 0.107，效应量 = 21.2%）、病耻感→价值行动→社会隔离（间接效应 = 0.056，95%CI = 0.015 - 0.110，效应量 = 22.9%）、病耻感→造口接纳→价值行动→社会隔离（间接效应 = 0.024，95%CI = 0.006 - 0.048，效应量 = 9.8%）。表明造口接纳和价值行动在病耻感和社会隔离间起链式中介作用。

结论：病耻感、造口接纳和价值行动是结直肠癌肠造口患者社会隔离的重要预测因素。病耻感不仅能直接正向预测社会隔离，还可以通过造口接纳和价值行动的链式中介作用间接预测社会隔离。该结果为开展接纳承诺疗法改善结直肠癌肠造口患者的社会隔离提供理论依据。

Relationship between stigma and social isolation among colorectal cancer patients with stomas: A chained mediation model of stoma acceptance and valued action

Li Guopeng, Qin Rui, Zhao Di, Li Ping (Corresponding author)
School of Nursing and Rehabilitation, Shandong University, Jinan 250012,
pingli12@sdu.edu.cn

Abstract **Objective:** Colorectal cancer patients with stomas typically experience a high level of stigma and social isolation. However, the underlying relationship between stigma and social isolation is still unclear. Hence, based on the theory of acceptance and commitment therapy, this study aimed to investigate the link between stigma and social isolation among colorectal cancer patients with stomas and to further verify the mediating role of stoma acceptance and valued action in this relationship.

Methods: A convenient sample of 306 colorectal cancer patients with stomas was selected from the Ostomy clinic of Shandong Cancer Hospital. The assessments included stigma scale, stoma acceptance and value action scale, social isolation scale and self-designed socio-demographic questionnaire. Data was processed and analyzed through SPSS 26.0 and PROCESS 4.0 plug-ins.

Results: The scores of social isolation, stigma, stoma acceptance, and valued action of participants were (16.51 ± 2.58), (7.39 ± 2.07), (29.27 ± 6.84) and (34.89 ± 4.90), respectively. Social isolation was positively correlated with stigma ($r = 0.207$, $P < 0.001$), and negatively correlated with ostomy acceptance ($r = -0.350$, $P < 0.001$) and valued action ($r = -0.488$, $P < 0.001$); stigma was negatively correlated with stoma acceptance ($r = -0.316$, $P < 0.001$) and valued action ($r = -0.113$, $P < 0.05$); in addition, stoma acceptance was positively correlated with valued action ($r = 0.406$, $P < 0.001$). Stigma could not only positively and directly predict social isolation (direct effect = 0.112, $P < 0.001$) but also indirectly through the following three pathways (total indirect effect = 0.132, 95%CI = 0.058 - 0.211, total effect size = 53.9%) : Stigma → stoma acceptance → social isolation (indirect effect = 0.052, 95%CI = 0.002 - 0.107, effect size = 21.2%), stigma → valued action → social isolation (indirect effect = 0.056, 95%CI = 0.015 - 0.110, Effect size = 22.9%), stigma → stoma acceptance → valued action → social isolation (indirect effect = 0.024, 95%CI = 0.006 - 0.048, effect size = 9.8%). These results indicated a chained mediating role of stoma acceptance and valued action between stigma and social isolation.

Conclusion: Stigma, stoma acceptance, and valued action are important predictors of social isolation in colorectal cancer patients with stoma. Stigma not only positively and directly predicts social isolation, but also indirectly through the chained mediation of stoma acceptance and valued action. These results could provide a theoretical basis for improving social isolation in colorectal cancer patients with acceptance commitment therapy.

Keywords*:* Social isolation, stigma, stoma acceptance, valued action, colorectal cancer

老年慢性病患者照顾者对“网约护士”服务的接受度：基于技术接受模型的调查研究

单瑞洁[1]　王贞慧[2,3]　崔乃雪[1]（通讯作者）
1 山东大学护理与康复学院，济南，250012，cnx@sdu.edu.cn
2 北京医院医疗保险管理处，国家老年医学中心，北京，100730
3 中国医学科学院老年医学研究院，北京，100730

摘 要　**背景与目的:** “网约护士”是数字信息时代下诞生的一种为个体和家庭提供可及的卫生保健服务的新型服务模式，其有望改善医疗资源的分配和利用，减轻特殊群体家庭照顾者的压力。老年慢性病患者的

照顾者是其主要服务对象之一，然而尚不清楚其对“网约护士”的接受度及相关因素。本研究根据修订的技术接受模型 (modified Technology Acceptance Model, mTAM)，旨在分析老年慢性病患者照顾者对“网约护士”的接受度及其相关因素。**方法:** 2023 年 2 月至 3 月，采用方便抽样法从北京市三家三级甲等医院共招募了 299 名住院老年慢性病患者的照顾者。使用问卷星网络研究平台向参与者发放电子问卷，采用自我报告的网约护士服务接受度问卷评估其对“网约护士”服务的感知有用性、感知易用性、感知安全、使用态度以及使用意向。基于 mTAM 建立研究假设，使用结构方程模型分析数据，通过模型拟合指数和变量之间的回归系数判断研究假设是否成立。**结果:** 63.9%的照顾者对使用网约护士有中等到弱积极的使用意向。经过模型修正后的结构方程模型拟合达标 (χ^2/df=2.833, RMSEA=0.078, TLI=0.946, CFI=0.961)，感知易用性与感知有用性显著正相关 (β=.943, t=24.882, P<.001)，感知有用性和感知安全与使用态度显著正相关 (β=.253, t=4.512, P<.001; β=.723, t=12.797, P<.001)，使用态度和使用意向显著正相关 (β=.800, t=15.514, P<.001)。此外，感知有用性与使用意向之间存在直接的正向关联 (β=.184, t=3.586, P<.001)。**结论:** 改善“网约护士”服务的易用性、安全性和实用性可能有助于提高老年慢性病患者照顾者对“网约护士”服务的积极态度，从而增加使用该服务的意向。

Investigating the Acceptance of the Internet-Based Sharing Nursing Service among Chinese caregivers of elderly patients with chronic diseases based on the Technology Acceptance Model

Shan Ruijie[1]　Wang Zhenhui[2,3]　Cui Naixue[1]

1 School of Nursing and Rehabilitation, Shandong University, Jinan, 250012, cnx@sdu.edu.cn

2 Social Medical Scheme Management Office, Beijing Hospital, National Center of Gerontology, Beijing, 100730

3 Institute of Geriatric Medicine, Chinese Academy of Medical Sciences, Beijing, 100730

***Abstract*:** **Background and objective:** Internet-based sharing nursing service (IBSNS) is a new model of nursing services for providing accessible health care services to individuals and families, born in the digital information age. IBSNS is expected to improve allocation and utilization of health care resources and ease family caregivers' pressure to care for special groups. However, the acceptance and associated factors of IBSNS among caregivers of elderly with chronic diseases who are the major clients of the service are unclear. The aim of this study is to analyze the acceptance of IBSNS and its associated factors based on a modified Technology Acceptance Model (mTAM) among a sample of Chinese caregivers towards elderly patient with chronic diseases. **Methods:** A total of 299 caregivers of hospitalized elderly with chronic diseases were recruited from three tertiary hospitals in Beijing, China, using the convenient sampling method from February to March 2023. Distributing electronic questionnaires to them through Wenjuanxing, an online survey platform. Self-administrated survey using the IBSNS acceptance questionnaire that assessed perceived usefulness, perceived ease of use, and perceived security of IBSNS, attitude towards IBSNS, and behavioral intention to use IBSNS was conducted. Structural equation modeling was used to analyze the data. **Results:** A total of 63.9% of the caregivers had neutral to weakly positive behavioral intention of using IBSNS. The revised structural equation modeling showed satisfactory fit indices (χ^2/df=2.833, RMSEA=0.078, TLI=0.946, CFI=0.961). Structural equation modeling showed that

perceived ease of use was positively associated with perceived usefulness (*β*=.943, *t*=24.882, *P*<.001). Both perceived usefulness and perceived security were positively associated with attitude towards IBSNS (*β*=.253, *t*=4.512, *P*<.001; *β*=.723, *t*=12.797, *P*<.001) and attitude linked to high level of behavioral intention (*β*=.800, *t*=15.514, *P*<.001). In addition, perceived usefulness was associated with behavioral intention directly (*β*=.184, *t*=3.586, *P*<.001). **Conclusion:** Improving the ease of use, security, and usefulness of the Internet sharing nurse service may be helpful to increase the positive attitude towards IBSNS, which may increase behavioral intention of using the service.

炎症性肠病患者病耻感的潜在剖面分析

唐李晨[1]，雷阳[1]，李莎[1]，顾珺怡[1]，朱展慧[1]，王清玉[1]，陈佳丽[1]，程涵天[1]，林征[1,2]

1. 南京医科大学护理学院，江苏省南京市，211166

2. 南京医科大学第一附属医院护理部，江苏省南京市，210029，E-mail：linzheng100@163.com

摘 要 **背景** 炎症性肠病患者因疾病症状反复且迁延不愈易导致其身体意象改变、躯体功能下降及劳动力受损等，均会扰乱患者正常生活，使其承受诸多心理压力，极易产生病耻感。 **目的** 探究炎症性肠病患者病耻感的潜在类别，并分析炎症性肠病患者病耻感的的影响因素。 **方法** 采用便利抽样法，选取 2023 年 3 月-7 月在南京市某三级甲等医院的 322 例炎症性肠病患者作为调查对象，选用一般资料调查表、慢性病病耻感量表、中文版疾病认同问卷、炎症性肠病心理韧性量表对其进行调查。并通过单因素分析、Logistic 回归分析探讨炎症性肠病病耻感不同潜在剖面的影响因素。 **结果** 炎症性肠病患者病耻感可分为 2 个潜在类别，分别命名为低病耻感-感受负担组（70.2%）和高病耻感-消极应对组（29.8%）。二元 Logistic 回归分析显示，家庭年收入（*OR*=0.328，*P*=0.014）、吞没感（*OR*=1.196，*P*<0.001）、心理韧性（*OR*=0.960，*P*=0.001）是炎症性肠病患者病耻感的影响因素。 **结论** 炎症性肠病患者病耻感存在明显分类特征，医护人员应重点关注高病耻感-消极应对组的患者，及时纠正其错误认知及消极、回避等不当应对方式，注重患者自我调试和心理干预，不断提升其疾病适应能力和韧性，以降低患者的病耻感水平。

Latent profile analysis of stigma in patients with inflammatory bowel disease

TANG Lichen[1], LEI Yang[1]，LI Sha[1], GU Junyi[1] , ZHU Zhanhui[1], WANG Qingyu[1] , CHEN Jiali[1], CHENG Hantian[1]，LIN Zheng[1,2]

School of Nursing，Nanjing Medical University，Nanjing 211166，China

Nursing Department，the First Affiliated Hospital with Nanjing Medical University，Nanjing 210029，China

[Abstract] **Background** Patients with inflammatory bowel disease are vulnerable to changes in body image, decreased physical function and labor impairment due to repeated and prolonged symptoms of the disease, which will disrupt the normal life of patients, make them bear a lot of psychological pressure, and are prone to stigma. **Objective** To explore the potential categories and influencing factors of stigma in patients with inflammatory bowel disease. **Methods** A total of 322 patients with inflammatory bowel disease from a tertiary first-class hospital

in Nanjing city were enrolled as investigation subjects via convenience sampling methodology. General information questionnaire, Stigma Scale for Chronic Illness (SSCI), Illness Identity Questionnaire (IIQ), and Resilience Scale for Inflammatory Bowel Disease (RS-IBD) were utilized as the investigating tools. At the same time, the influencing factors of stigma in inflammatory bowel disease were explored by univariate analysis and Binary logistic regression analysis. **Results** The characteristics of stigma among patients with inflammatory bowel disease were sub-grouped to 2 potential categories，namely low stigma-perceived burden group(70.2%), and high stigma-negative coping group (29.8%). Binary logistic regression analysis shows, annual household income (*OR*=0.328，*P*=0.014), engulfing (*OR*=1.196，*P*<0.001), psychological resilience (*OR*=0.960，*P*=0.001) were the influencing factors of stigma in patients with inflammatory bowel disease. **Conclusion** There are obvious classification characteristics of stigma in patients with inflammatory bowel disease. Medical staff should focus on patients in the high stigma-negative coping group, correct their misperceptions and improper coping methods such as negativity and avoidance in a timely manner, pay attention to patients' self-debugging and psychological intervention, and continuously improve their disease adaptability and resilience to reduce the level of stigma in patients.

实习护生品格优势与职业认同的关系研究：以领悟社会支持为中介变量

李晨[1,2]　王蕾[1] 李雁飞[1*]（通讯作者）

（1. 南京医科大学第一附属医院老年消化科，江苏 南京 210029；2.南京医科大学护理学院，江苏 南京 210029；通讯作者 E-mail:448178728@qq.com）

（2.

摘 要 **目的** 基于人环境匹配理论及特质激发理论探讨领悟社会支持在实习护生品格优势与职业认同关系间的中介作用。**方法** 采用便利抽样法，选取 2021 年 10 月至 12 月在江苏省 4 家三甲医院实习的 511 名护生作为调查对象。采用一般资料调查表、三维性格优势问卷、领悟社会支持量表、职业认同量表进行调查。对数据采用 SPSS 24.0 进行描述性统计、Pearson 相关分析，采用 PROCESS 3.5 检验中介作用。**结果** 本组实习护生品格优势、领悟社会支持、职业认同总体得分分别为（3.75±0.57）分、（5.35±0.93）分、（3.76±0.69）分。相关性分析表明，品格优势与职业认同总分及各维度均呈显著正相关(r=0.133~ 0.293,P＜0.01)。品格优势与领悟社会支持总分及各维度均呈显著正相关(r=0.197~ 0.321,P＜0.01)。领悟社会支持与职业认同总分及各维度均呈显著正相关(r=0.259~0.658,P＜0.01)。中介效应检验表明，在控制最高学历、专业选择及未来就业意向的影响后，实习生品格优势对职业认同的直接预测作用显著（β=0.120，P＜0.001）；领悟社会支持在实习生品格优势和职业认同的关系中起部分中介作用（效应值=0.147，Boot95%CI 0.101～0.198），中介效应占总效应的 55%。**结论** 本研究实习护生的职业认同得分处于中等偏上水平，实习生品格优势不仅可以直接影响职业认同，也可以通过领悟社会支持的中介作用间接影响职业认同。帮助护理实习生识别和运用品格优势，使用各种设计提升实习护生对社会支持的感知，通过内外激励或可提高护生对护理专业的职业认同，以稳定护理队伍。

Abstract **Objective:** To explore the mediating effect of perceived social support on the relationship between character strengths and professional identity among nursing interns based on Person-Environment Fit theory and Trait Activation Theory.**Methods:** A total of 511 nursing interns from 4 tertiary A-level hospitals in Jiangsu province were recruited into this study by convenient sampling method and were surveyed by using general data questionnaire, Three-Dimensional Inventory of Character Strengths, Perceived Social Support Scale,Professional Identity Scale for nurse students. SPSS24.0 was used for descriptive statistics of test indexes and Pearson correlation analysis.PROCESS 3.5 was used to test the mediating effect of the data.**Results:** The overall scores of character strengths , social support and professional identity were (3.75±0.57) points, (5.35±0.93) points and (3.76±0.69)points, respectively.Correlation analysis showed that character strengths was positively correlated with the total score of professional identity and all dimensions (r=0.133~ 0.293,P < 0.01). There was a significant positive correlation between character strengths and perceived social support scores (r=0.197~ 0.321,P < 0.01). There was a significant positive correlation between social support and professional identity (r=0.259~0.658,P < 0.01).The mediating effect test showed that, after controlling the influence of final education level, major decision and employment intention, the interns' character strengths had a significant direct prediction effect on professional identity (β=0.120, P＜0.001). Perceived social support played a partial mediating role in the relationship between character strengths and professional identity (effect value =0.147, Boot95%CI 0.101-0.198), and the mediating effect accounted for 55.06% of the total effect. **Conclusions:** The professional identity score of nursing interns was above the average level.The character strengths can not only directly affect the professional identity, but also indirectly affect the professional identity by the mediating role of perceived social support. To help nursing interns recognize and utilize character strengths, apply various designs to improve the perception of social support for nursing interns, and improve the professional identity through internal and external motivation, so as to stabilize the nursing team.

Construction of a digital competency evaluation index system for clinical nurses

Zhang Zeyu[1], Yang Xiumu[1,2], Zhao Shuang[1], Shao Yujiao[1], Duan Xiaocui[1]

***Abstract*: Objective** To construct a digital competency evaluation index system for clinical nurses based on competency theory and the EU digital competency framework. **Methods** Using DigComp 2.2 as the main structural framework, the first draft of the clinical nurse digital competency evaluation index system was formulated by literature analysis method and Delphi method, and the first and second level index weights were determined by using hierarchical analysis method with the help of MATLAB mathematical modeling software. **Results** The effective recall rates of the questionnaires of the 2 rounds of expert consultation were 94.44% and 88.89%, the authority coefficients of experts were 0.83 and 0.86, and the Kendall coordination coefficients of the primary and secondary indicators in the 2nd round of expert consultation were 0.32 and 0.26, (p<0.001). The final evaluation index system of digital competence of clinical nurses contained 5 primary indicators and 15 secondary indicators. The first-level indicators were digital cognition and skills (0.2776), information and digital literacy (0.2439), digital communication and innovation (0.1913), digital values and pursuit (0.1680), and basic personality traits (0.1190) in order of weighting. The top 3 weightings of the secondary indicator combination were, digital skills (0.1851), digital security awareness (0.1000), and digital cognition (0.0925). **Conclusion** The constructed index system for evaluating the digital competence of clinical nurses is scientific and reasonable, which meets the actual work needs and provides certain criteria for the digital competence training of clinical nurses.

组织公平感对新入职护士工作偏差行为的影响及中介机制

姜哲[1]

1.河南大学护理与健康学院，开封，475004，hljjz1225@126.com

摘 要 目的：本研究的目的是探讨情绪劳动和心理资本对新入职护士组织公平感和工作偏差行为的影响。

方法：本研究采用了横断面调查的方法去收集数据。我们于 2023 年 1 月至 2 月在中国河南省 5 家医院对新入职的护士进行调查，一共回收了 546 份完整并有效的问卷。问卷的内容包括参与者的一般人口统计学量表、组织公平感量表、情绪劳动量表、心理资本量表和工作偏差行为量表。本研究采用了 SPSS 26.0 软件和 PROCESS Macro 软件对收集到的数据进行分析。数据分析应用描述性统计去表示频率、均值和标准差；采用皮尔逊相关分析来探讨情绪劳动，心理资本，组织公平感和工作偏差行为这四个变量之间的相关性，并用 PROCESS 模型 4 和模型 14 来验证假设模型。结果：新入职护士的组织公平感与情绪劳动呈负相关（r=-0.461, $P<0.01$），组织公平感和工作偏差行为呈负相关（r=-0.403, $P<0.01$），情绪劳动与工作偏差行为呈正相关（r=0.400, $P<0.01$）。同时，情绪劳动在组织公平感与工作场所偏差行为之间起部分中介作用，占总效应的 32.44%。此外，情绪劳动对工作偏差行为的直接路径受心理资本的调节。结论：护理管理者应建立公平的管理体系，提高新入职护士的组织公平感，同时关注其情绪劳动，提高心理资本水平，从而减少新入职护士的工作偏差行为。这有利于稳定护士队伍和改善医疗环境，并促进医院的长远发展。

The influence of organizational justice on the workplace deviance behavior of new nurses and the mediating mechanism

Zhe Jiang[1]

1.School of Nursing and Health, Henan University, Kaifeng

***Abstract*：** Objective: The purpose of this study was to investigate the influence of emotional labor and psychological capital on the organizational justice and workplace deviance behavior of new entry nurses. Methods: This study used a cross-sectional survey to collect the data. We conducted a survey of new nurses in five hospitals in Henan Province, China from January to February 2023, and collected a total of 546 complete and valid questionnaires. The contents of the questionnaire included the participants' general demographic scale, organizational justice scale, emotional labor scale, psychological capital scale, and workplace deviance behavior scale. In this study, the SPSS 26.0 software and the PROCESS Macro software were used to analyze the collected data. Descriptive statistics were applied to represent frequency, mean and standard deviation; Pearson's correlation analysis was used to explore the relationship between emotional labor, psychological capital, organizational justice and workplace deviance behavior, using PROCESS model 4 and model 14. Results: New nurses' organizational justice was negatively correlated with emotional labor (r= -0.461, P <0.01), organizational justice and workplace deviance behavior was negatively correlated (r= -0.403, P <0.01), and emotional labor was positively correlated with workplace deviance behavior (r=0.400, P <0.01). At the same time, emotional labor plays a partial mediating role between the organizational justice and the workplace deviance behavior, accounting for 32.44% of the total effect. Moreover, the direct path of emotional labor to workplace deviance behavior is modulated by psychological capital. Conclusion: Nursing managers should establish a fair management system, improve the organizational justice of new nurses, pay attention to their emotional labor, improve the level of psychological capital, so as to reduce the workplace deviance behavior of new nurses. This is conducive to stabilizing the nurse team, improving the medical environment, and promoting the long-term development of the hospital.

***Keywords*：** Organizational justice, emotional labor, psychological capital, workplace deviance behavior, new nurse

更年期护士绝经症状与主观认知下降的独立与累积效应

何旭东[1] 申晓娜[1] 赵迪[1] 厉萍[1]（通讯作者）

1 山东大学护理与康复学院健康心理研究所,济南,250012,pingli12@sdu.edu.cn

摘 要 **目的** 绝经症状和主观认知能力下降都是中年女护士更年期较为常见的主诉。然而，绝经症状的严重程度和数量与主观认知能力下降之间的关系尚未明确。因此，本研究的目的是探讨更年期护士绝经症状和主观认知能力下降的个体效应和累积效应。 **方法** 采用方便抽样法对 2019 年 2 月至 9 月 1335 名中国更年期护士进行调查。所有参与者均完成一般信息调查问卷、更年期评定量表和主观认知下降量表。根据主观认知下降量表的截断值将参与者分为主观认知下降组和无主观认知下降组。倾向性评分匹配用于平衡两组之间的协变量。使用逐步二元 logistic 回归和 Cochran-Armitage 线性趋势检验分析绝经症状和主观认知能力下降的个体和累积效应。 **结果** 倾向性评分匹配后，无主观认知下降组与主观认知下降组差异无统计学意义（P>0.05）。 Logistic 回归分析显示，有四种绝经症状（“血管舒缩症状”、“身体/精神疲惫”、“性问题”和“肌肉和关节不适”）与主观认知能力下降密切相关。 Cochran-Armitage 线性趋势检验结果显示，这四种绝经症状的数量与主观认知能力下降之间的比值比呈上升趋势，绝经期护士在同时经历两个以上绝经症状时，患 SCD 的可能性增加四倍。 **结论** 更年期经历单个绝经症状和同时经历多个绝经症状均对主观认知能力下降有显着影响。这可能有助于医疗保健提供者制定指导方针，以改善护士在更年期的认知功能。

关键词 累积效应，护士，绝经症状，主观认知下降

Individual and additive-effect relationships of menopausal symptoms and subjective cognitive decline among nurses during the menopausal transition

Xudong He[1] Xiaona Shen[1] Ping Li[1]

1. Department of Health Psychology, School of Nursing and Rehabilitation, Shandong University, Jinan, 250012, pingli12@sdu.edu.cn

Abstract

Objective: Menopausal symptoms and subjective cognitive decline are relatively common complaints among middle-aged female nurses. However, the association between the severity and number of menopausal symptoms and subjective cognitive decline has not been well established. Therefore, the aim of this study was to examine the individual and additive-effect of menopausal symptoms and subjective cognitive decline among nurses during the menopausal transition.

Methods: A convenience sampling method was used to survey 1335 Chinese menopausal transition nurses from February to September 2019. All participants completed a general information questionnaire, the Menopause Rating Scale, and the Subjective Cognitive Decline Scale. Participants were divided into the subjective cognitive decline group and the non-subjective cognitive decline group according to the cut-off value of the Subjective

Cognitive Decline Scale. Propensity score matching was used to balance covariates between the two groups. The individual and cumulative effects of menopausal symptoms and subjective cognitive decline were analyzed using stepwise binary logistic regression and Cochran-Armitage trend test.

Results: After propensity score matching, no significant difference was observed between the non-subjective cognitive decline group and subjective cognitive decline group (*Ps* > 0.05). Logistic regression analysis showed that four menopausal symptoms. ("vasomotor symptoms", "physical/mental exhaustion", "sexual problems", and "muscle and joint discomfort") were closely associated with subjective cognitive decline. The Cochran-Armitage trend test showed an upward trend in odds ratios between the number of these four menopausal problems and subjective cognitive decline, and menopausal transition nurse were more than four times more likely to have SCD when they experienced more than two of these individual menopausal symptoms occurred simultaneously.

Conclusion: Both the individual and additive numbers of menopausal symptoms had a significant effect on subjective cognitive decline. This may help healthcare providers develop guidelines to improve cognitive function among nurses during the menopausal transition.

Key Words: Additive effect, Menopausal symptoms, Nurse, Subjective cognitive decline

组织支持对规培期新护士工作投入的影响：自我调节疲劳与个人-工作匹配的链式中介作用

温高芹[1]　高敏[1]　徐明雨[1]　严伟[1]　孙国珍[1,2]（通讯作者）

1 南京医科大学第一附属医院心血管内科，南京，210029

2 南京医科大学护理学院，南京，210000，通讯作者：孙国珍，Email：gzsun100@126.com

摘 要　**目的**　了解江苏省规培期新护士工作投入的现况，并探讨其自我调节疲劳及个人-工作匹配在组织支持与工作投入之间的路径关系。**方法**　采用便利抽样法，使用一般资料调查表、组织支持量表、自我调节疲劳量表、个人-工作匹配量表、工作投入量表于 2022 年 8 月至 9 月对江苏省 12 所三级医院（苏北、苏中、苏南各 4 所）的规培期新护士进行横断面调查。**结果**　共回收有效问卷 440 份，其组织支持得分为（56.75±11.38）分，个人-工作匹配得分为（3.45±0.53）分，自我调节疲劳得分为（43.82±8.59）分，工作投入得分为（37.95±7.59）分。Pearson 相关分析结果表明，规培期新护士的工作投入与组织支持和个人-工作匹配呈正相关（r=0.682，0.647，均 P<0.01），与自我调节疲劳呈负相关（r=-0.381，P<0.01）；自我调节疲劳与个人-工作匹配、组织支持呈负相关（r=-0.565，-0.414，均 P<0.01）；个人-工作匹配与组织支持呈正相关（r=0.787，P<0.01）。Bootstrap 分析显示，组织支持可正向预测工作投入，直接效应值为 0.304（95%CI= 0.232～0.376），占总效应的 66.81%；个人-工作匹配在组织支持与工作投入间的中介效应显著，效应值为 0.118（95%CI= 0.095～0.259），占总效应的 25.93%；此外，自我调节疲劳和个人-工作匹配在组织支持与工作投入间的链式中介效应显著，效应值为 0.021（95%CI= 0.015～0.054），占总中介效应的 13.91%。**结论**　规培期新护士工作投入程度尚待进一步提高，护理管理者应尽可能给规培期新护士提供资源与组织支持，帮助新护士在规培期找到工作契合点，提高其个人-工作匹配程度，激发工作热情；同时应充分重视该群体的自我调节疲劳，应采取多种方法延缓其自我控制资源的进一步消耗并探索此种心理资源补给的途径与形式，以改善自我损耗，促进工作投入，提高护理质量。

关键词　规培期新护士，组织支持，个人-工作匹配，自我调节疲劳，工作投入

Effects of organizational support on work engagement of new nurses during standardized training period: the chain mediating effect of self-regulated fatigue and individual-work matching

Wen Gaoqin[1] Gao Min [1] Xu Mingyu[1] Yan Wei[1] Sun Guozhen[1,2](corresponding author)
1 The Department of Cardiovascular Medicine, the First Affiliated Hospital of Nanjing Medical University, Nanjing, 210029
2 School of Nursing, Nanjing Medical University, Nanjing, 210000, corresponding author: Sun Guozhen, Email: gzsun100@126.com

***Abstract*：** **Objective** To understand the status of new nurses in standardized training period in Jiangsu Province, and to explore the relationship between self-regulating fatigue and individual-work matching in organizational support and work engagement. **Methods** From August to September 2022, convenience sampling was used to conduct a cross-sectional survey of new nurses during the standardized training period in 12 tertiary hospitals in Jiangsu Province (4 in northern, central and southern Jiangsu respectively) using the general information questionnaire, Organizational Support Scale, Self-regulatory Fatigue Scale, Areas of Worklife Scale and Work Engagement Scale. **Results** A total of 440 valid questionnaires were collected, with organizational support score (56.75 ± 11.38), individual-work matching score (3.45 ± 0.53), self-regulation fatigue score (43.82 ± 8.59), and work engagement score (37.95 ± 7.59). Pearson Correlation analysis results showed that the work engagement of new nurses was positively correlated with organizational support and individual-work matching (r=0.682,0.647, all P <0.01) and negatively correlated with self-regulating fatigue (r= -0.381, P <0.01); self-regulating fatigue was negatively correlated with individual-work matching and organizational support (r= -0.565, -0.414, all P <0.01); individual-work matching was positively correlated with organizational support (r=0.787, P <0.01). The Bootstrap analysis revealed that, organizational support for positive predictive work engagement, the direct effect value was 0.304 (95% CI = 0.232 to 0.376), 66.81% of the total effect; significant mediation effect of individual-work matching between organizational support and work engagement, the effect value was 0.118 (95% CI = 0.095 to 0.259), for 25.93% of the total effect; besides, the chain mediation effect of self-regulating fatigue and individual-work matching between organizational support and work engagement is significant, the effect value was 0.021 (95% CI = 0.015 to 0.054), accounting for 13.91% of the total mediation effect. **Conclusions** The work engagement of new nurses in the standardized training period needs to be further improved. Nursing managers should provide resources and organizational support to new nurses in the standardized training period as much as possible, help them find a job fit during the period, improve their individual-work matching degree, and stimulate their work enthusiasm. At the same time, managers should pay attention to the ego depletion of the group, take a variety of methods to delay the further consumption of self-control resources and explore the ways and forms of replenishable such psychological resources, so as to improve the ego depletion, promote work engagement and improve the quality of nursing.

面向大学生心理健康的微博文本语言表达特征分析

柴昭甲[1]（通讯作者）王萌[1] 王天[1] 柴昭元[2]
1 江南大学教育技术系，无锡，214122，chaizhaojia0905@163.com
2 江西省分宜县第三中学，新余，336600

摘 要 Web2.0 的发展促进了以用户交互为主的在线社交媒体的产生，如微博、博客等。《微博 2020 用户发展报告》显示 90 后和 00 后两个年龄段使用微博的人数占比接近 80%，用户群体明显呈年轻化趋势。以微博为主流的短文本社交平台中富含了大量情绪信息，用户通过发表观点、转发博文、评论内容等方式进行信息交互。由于字数的限制，社交文本的情感内容更加集中，其个体使用语言的表达方式在一定程度上可以反映用户的性格与情绪特点。通过分析大学生用户的微博文本语言表达特点，可以为后续的智能化心理健康评估提供支持。因此，本研究爬取了患有抑郁症的心理异常学生用户与心理健康学生用户的微博文本数据，经过人工筛选和数据清洗后得到 12758 条数据，分别使用不同的方法从文字语言特征和非文字语言特征两个方面进行了分析。文字语言文字特征分为词汇层级和句子层级，非语言文字特征包含表情符号、标点符号和数字语言三个方面。研究发现：在词汇层级，对词性进行分析，我们可以看出在微博平台中使用名词频率最高，占一半以上，其次是动词的使用频率，占四分之一，形容词和代词的使用频率最少。在词频方面，心理异常的人群会在微博中发表包含大量的消极情绪词，如“哭”“累”“死”等，反映出用户内心的低落与绝望；而正常用户则更多地使用了积极情感词和中性情感词。在词类方面，可以发现心理异常用户的第一人称单数、否定词、消极词使用频率相比心理正常用户高出很多，在文本表达中多是陈述性和感觉性的自我描述信息。在句子层级中，心理异常的学生用户在平均句长和句子总数两方面的数值均高于心理正常的用户。通过 LDA 对句子主题进行分析，可以发现两类人群的关键词聚类主题区分度明显，心理异常用户的主题基本聚焦于人生思考、生活状态和抑郁症治疗等方面，心理正常用户的话题多集中于人际关系、学习生活、情感表达等。最后，在非文字语言特征方面，心理异常用户与心理正常用户相比较少使用表情符号、标点符号和数字语言。

Analysis of Language Characters of Weibo Text for Psychological Health of College Students

CHAI Zhao-jia[1] (Correspondence), WANG Meng[1], WANG Tian[1], CHAI Zhao-yuan[2]
1 Department of Educational Technology, Jiangnan University, Wuxi 214122, China
2 No. 3 Middle School of Fenyi County, Jiangxi Province, Xinyu 336600, China

***Abstract*：** The development of Web 2.0 has promoted the emergence of online social media primarily focused on user interaction, such as Weibo and blogs. The Weibo 2020 User Development Report shows that the proportion of people born in the 1990s and 2000s who use Weibo is close to 80%, and the user group is clearly showing a younger trend. Short-text social media platforms dominated by Weibo are rich in a large amount of emotional information, and users interact with each other through methods such as expressing opinions, forwarding blog posts, and commenting on content. Due to the limitation of word count, the emotional content of

social texts is more concentrated, and the way individuals express themselves in language can to some extent reflect the user's personality and emotional characteristics. By analyzing the language expression characteristics of college student users' Weibo texts, it can provide support for subsequent intelligent mental health assessments. Therefore, this study crawled the microblog text data of students with mental disorders and students with mental health who suffered from depression. After manual screening and Data cleansing, 12758 pieces of data were obtained. Different methods were used to analyze the text language characteristics and non-text language characteristics. The features of text language can be divided into lexical level and sentence level. The features of non-text language include emoticons, Punctuation, and digital language. Research has found that, at the lexical level, analyzing part of speech, we can see that nouns are used the most frequently on Weibo platforms, accounting for more than half, followed by verbs, accounting for a quarter, and adjectives and pronouns are used the least frequently. In terms of word frequency, people with psychological abnormalities will post a large number of negative emotional words on Weibo, such as "crying", "tired", "dead", etc., reflecting users' inner depression and despair; normal users use more positive and neutral emotional words. In terms of parts of speech, it can be found that the frequency of first-person singular, negative, and negative words used by users with psychological abnormalities is much higher than that of users with normal psychology. In text expression, there is mostly declarative and sensory self-description information. At the sentence level, students with psychological abnormalities have higher values in terms of average sentence length and total number of sentences compared to users with normal psychology. Through LDA analysis of sentence themes, it can be found that there is a clear distinction between the keyword clustering themes of the two groups of people. The themes of users with psychological abnormalities mainly focus on life thinking, life status, and depression treatment. The topics of users with normal psychology are mostly focused on interpersonal relationships, learning and life, emotional expression, and so on. Finally, in terms of non-text language features, users with mental disorders use fewer emoticons, punctuation, and digital language than users with mental health.

Keywords：college students, mental health, text analysis, microblog text, language character

中央凹负荷对副中央凹词汇加工的影响

李芳 [1,2] 张慢慢 [2,3,4] 李馨 [2,3,4] 白学军 [2,3,4]（通讯作者）

1 天津中医药大学管理学院，天津，301617

2 天津师范大学心理学部，天津，300387

3 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387

4 学生心理发展与学习天津市高校社会科学实验室，天津，300387

摘 要　在自然阅读过程中，读者的每次注视既能加工中央凹视觉区的当前注视信息，也能预先加工右侧副中央凹视觉区的信息。中央凹负荷假说认为副中央凹词汇加工受中央凹词汇识别负荷调节。当前的眼动控制模型基于该假说提出不同的理论观点，但是仅有少量基于拼音文字的研究提供实验证据，该假说仍然有待验证。基于汉语的研究发现中央凹词汇识别负荷不调节一致预视效应，但是尚不清楚其是否调节副中央凹词汇加工的形、音、义提取阶段。汉语形、音、义信息的激活时间和激活必要性存在差异，如果中央凹词汇识别负荷导致副中央凹注意资源或者预视时间有限，那么读者可能选择性地提取副中央凹词的词形、

语音、或者语义信息。本实验采用2（中央凹负荷：低、高）×5（预视类型：一致、形近、音近、义近、无关）的被试内设计。以双字词为前目标词，基于该词的词频操纵中央凹负荷：高频前目标词的中央凹负荷低；低频前目标词的中央凹负荷高。以单字词为目标词，采用边界范式，基于预视词与目标词关系操纵预视类型：。使用Eyelink 1000 plus眼动仪记录130名大学生阅读汉语句子（170个实验句）的眼动数据。结果发现：（1）与无关预视条件相比，一致预视条件下读者对目标词的跳读率更低、第一遍注视时间更短；与无关预视条件相比，形近/音近/义近预视条件与无关预视条件下读者对目标词的跳读率、第一遍阅读时间均没有显著差异；（2）中央凹负荷与一致/形近/音近/义近预视效应的交互作用在各眼动指标均不显著，即没有发现中央凹负荷对副中央凹词汇加工的调节作用。

4 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin, 300387

Abstract：Readers can not only process the currently fixated word in foveal vision, but also preprocess the upcoming word in parafoveal vision during natural reading. Foveal Load Hypothesis is a central feature of current major models of eye movement control, such as E-Z Reader model and SWIFT model. However, whether increased foveal lexical processing load induces a reduction of parafoveal processing remains uncertain. We sought to establish whether observing a foveal load effect depends on the types of parafoveal lexical information, because necessity of the activation of orthographic, phonological and semantic information differs in Chinese when limited attention or time is distributed to parafoveal processing. Participants'eye movements were recorded in this experiment as they read Chinese sentences in which foveal load was manipulated by word frequency of pretarget words, with a low-frequency word n causing high foveal load and a high-frequency one causing low foveal load. The boundary paradigm was used to present parafoveal previews of single-character target words, in which identical, phonologically-related, orthographically-related, and semantically-related preview words were compared with unrelated ones. Results showed readers benefited from a preview of an identical word, but no such benefits were found from all non-identical preview conditions on target skipping and first-pass measures of target fixation duration. In addition, no modulation of foveal load on each type of parafoveal processing was found in Chinese reading.

Keywords：foveal load, parafoveal processing, eye-tracking

40Hz 经颅交流电刺激对汉语阅读障碍个体语音加工技能的干预效果研究

李森 [1,2]　贾尧 [1,2]　赵晶晶 [1,2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

摘 要　汉语阅读障碍个体存在语音加工缺陷，并且在听觉皮层表现出异常的神经振荡。经颅交流电刺激(tACS)是一种重要的非侵入性脑刺激(NIBS)技术，通过向大脑皮层输送特定频率电流，诱发相应脑区脑电频率的相位同步，具有改善个体认知功能的效果。本研究旨在通过结合神经调控、脑电与认知测验技术，探究阅读障碍个体是否存在左侧听觉皮层低频 Gamma（40Hz）振荡缺陷，以及经颅交流电刺激能否通过改善障碍患者对应皮层振荡幅值进而促进语音加工技能的改善。研究前期通过阅读历史问卷（Adult Reading History Questionnaire, ARHQ）筛选出 20 名阅读障碍风险组大学生（10 男：10 女），并匹配 20 名对照组大学生（8 男：12 女），分为 4 组：阅读障碍真刺激组、阅读障碍伪刺激组，对照组真刺激组与对照组伪刺激组，每组各 10 名。研究采用双盲随机对照组前后测组间实验设计。在听觉皮层区域进行 20 分钟 1mA 40Hz 经颅交流电或假刺激前后，分别使用脑电采集、音位删除测验、语音编码测验和快速阅读测验测查被试左侧听觉皮层的 40Hz 频率幅值、音位意识、语音编码和阅读流畅性。结果发现，干预前，阅读障碍风险组的音位意识和左侧听觉皮层 25Hz、40Hz、50Hz 振荡能量值均显著弱于对照组；40Hz 经颅交流电刺激干预后，阅读障碍风险组与对照组的音位意识与阅读流畅性显著提高；与伪刺激相比，两组在语音加工技能、阅读流畅性以及左侧听觉皮层不同频率幅值的改善不显著。

***Abstract*:** Individuals with Chinese reading difficulties have been found to exhibit deficits in phonological processing and abnormal neural oscillations in the auditory cortex. Transcranial Alternating Current Stimulation (tACS) is a significant non-invasive brain stimulation technique that delivers specific frequency currents to the cerebral cortex, inducing phase synchronization of corresponding brain regions' electroencephalogram frequencies, thus improving individual cognitive functions. This study aims to explore whether individuals with reading difficulties exhibit deficits in low-frequency gamma (40Hz) oscillations in the left auditory cortex and whether transcranial alternating current stimulation can enhance phonological processing skills by improving cortical oscillation amplitudes. In the initial phase of the research, 20 university students at risk of reading difficulties (10 male: 10 female) and 20 matched control group students (8 male: 12 female) were selected using the Adult Reading History Questionnaire (ARHQ). They were divided into four groups: reading difficulties real stimulation group, reading difficulties sham stimulation group, control group real stimulation group, and control group sham stimulation group, each containing 10 participants. The study adopted a double-blind randomized controlled pre-test and post-test experimental design. Before and after receiving 20 minutes of 1mA 40Hz transcranial alternating current or sham stimulation in the auditory cortex region, the participants underwent electroencephalogram recordings, phoneme deletion tests, speech coding tests, and rapid reading tests to assess the 40Hz frequency amplitude, phonemic awareness, speech coding, and reading fluency in the left auditory cortex. The results showed that before the intervention, the phonemic awareness and left auditory cortex oscillation energy at 25Hz, 40Hz, and 50Hz in the reading difficulty risk group were significantly weaker than those in the control group. After 40Hz transcranial alternating current stimulation, the phonemic awareness and reading fluency in the reading difficulty risk group significantly improved to levels comparable to those in the control group. Compared to a pseudo-stimulus, there was no significant improvement in speech processing skills, reading fluency, or left auditory cortex oscillation amplitudes at different frequencies between the two groups.

通讯作者：jingjing.zhao@snnu.edu.cn, 029-85303395

摘要 阅读障碍个体通常表现出听觉加工损伤，即在听觉皮层表现出异常的偏侧化神经振荡代偿，但汉语阅读障碍是否存在偏侧化神经振荡缺陷有待研究。本研究旨在考察具有阅读障碍风险的个体在听觉加工过程中的大脑颞叶区域神经振荡偏侧化的表现。研究招募了 500 名在校大学生，通过汉语成人阅读历史问卷（Chinese-Adult Reading History Questionnaire, C-ARHQ）筛选出具有阅读障碍风险的 32 名大学生，并选取 44 名年龄、性别、非言语智力、利手与阅读障碍风险组匹配的大学生作为无阅读障碍风险控制组。研究进一步对两组被试进行汉语阅读准确性和流畅性、语音意识、语音工作记忆、快速自动化命名任务测量，并对两组被试采用时长 8 分钟的调制白噪音来诱发脑电听觉稳态反应（Auditory Steady State Responses, ASSR）。研究发现：1）阅读障碍风险组的识字量和语音意识均显著低于控制组，但语音工作记忆和快速自动化命名与控制组没有显著差异；2）调制白噪音在颞叶区域所诱发的低 gamma 频段脑电波组间差异显著：阅读障碍风险组在左侧颞叶区域的激活值低于控制组，而在右侧颞叶区域的激活值高于控制组；3）阅

读障碍风险组存在听觉采样神经振荡的右偏侧化代偿，即阅读障碍风险组比控制组更加偏右侧化。研究结果表明，通过汉语阅读历史问卷筛查出的存在汉语阅读障碍风险的成人存在阅读能力和语音加工缺陷，并在听觉加工中表现出右偏侧化代偿。研究为深入理解阅读障碍听觉加工机制提供了实证证据。

***Abstract*:** Developmental dyslexia (DD) typically exhibit auditory processing impairments. Individuals with DD always show abnormal lateralized neural oscillations compensations in the auditory cortex. However, the lateralization of neural oscillations deficits in Chinese DD has been not systematically investigated. The aim of the present study was to examine the lateralization in the temporal lobe during auditory processing in individuals at risk of DD. A total of 500 university students were recruited. From them, 32 students at risk of DD were screened by the Chinese-Adult Reading History Questionnaire (C-ARHQ), and 44 students matched for age, gender, non-verbal intelligence, and handedness with the DD risk group were selected as controls without DD risk. The study further measured Chinese reading accuracy and fluency, phonological awareness, phonological working memory, and rapid automatic naming. An eight-minute modulated white noise was adopted to evoke auditory

steady state responses (ASSR) presented for both groups. The results of the present study showed that: (1) The DD risk group showed significantly lower reading ability and phonological awareness than the control group. But the difference of phonological working memory and rapid automatic naming were not significant between DD and control group. (2) Activation in the low gamma band induced by modulated white noise in the left temporal lobe in the DD risk group were lower than those in the control group, while activation in the right temporal lobe in the DD risk group were higher than those in the control group. (3) There was a right lateralization compensation of auditory sampling neural oscillations in the dyslexia risk group. Specifically, the DD group was more right lateralization than the control group. The results of the present study suggest that adults at risk of Chinese DD screened by C-ARHQ showed deficits in reading ability and phonological processing. They also showed atypical right lateralization compensation in auditory processing. The study provides empirical evidence for a deeper understanding of the mechanisms of auditory processing in DD.

摘 要 阅读障碍和计算障碍是两种常见的学习障碍，其共病普遍存在。已有研究表明拼音文字阅读障碍核心缺陷为语音缺陷，计算障碍也存在语音缺陷，具体表现为语音意识、快速自动化命名和言语短时记忆缺陷，两种学习障碍语音缺陷共病的认知机制有待深入探究。本研究旨在考察汉语环境中，成人阅读障碍与计算障碍的语音加工缺陷共病特征。通过成人阅读历史问卷和成人数学历史问卷对 3300 多名中国大学生进行筛查，问卷得分高于 10%的成人分别被认定为阅读障碍风险和计算障碍风险，筛选出纯阅读障碍风险组成人 52 人、纯计算障碍风险组成人 49 人、共病风险组成人 49 人、控制组成人 55 人。研究进一步从语音意识、快速自动化命名和语音短时记忆三方面对他们的语音加工能力进行评估，结果发现：三个障碍风险组共同的认知缺陷是语音意识，共病风险组语音意识缺陷几乎等于阅读障碍风险组和计算障碍风险组相加；共病风险组和阅读障碍风险组共同认知缺陷是语音短时记忆，共病风险组缺陷几乎等于阅读障碍组。逻辑回归分析发现，仅能通过语音意识区分共病风险组与阅读障碍风险、计算障碍风险组。结果表明：成人汉语阅读障碍和计算障碍语音意识缺陷和语音短时记忆缺陷的共病机制存在差异，语音意识缺陷符合双分离模型，而语音短时记忆缺陷符合共同病因模型。为语音意识可能是阅读障碍、计算障碍、共病的共同风险因素提供进一步证据，可基于语音意识发展针对不同障碍的有效筛查和干预手段。

Abstract：Learning disabilities (i.e., dyslexia and dyscalculia) are common, as is their comorbidity. It has been suggested that phonological processing deficits are considered to be the core cognitive deficit in alphabetic dyslexia，besides, there are phonological processing deficits in dyscalculia，which are manifested as phonological awareness(PA), rapid automatized naming(RAN), and verbal short-term memory(v-STM). However, the mechanism of cognitive deficits underlying the comorbidity of phonological deficits in the two learning disabilities needs to be further explored. The current study aimed at investigating the comorbidity of phonological processing between adult dyslexia and dyscalculia in Chinese context. Over 3,300 Chinese university students were screened by the Adult Reading History Questionnaire (ARHQ) and the Adult Math History Questionnaire（AMHD）. Adults who scored consistently above the 10th percentile in ARHQ and/or AMHD were identified as dyslexia risk and/ or dyscalculia risk respectively and 52 adults were screened out in pure dyscalculia risk group, 49 adults were screened out in pure dyslexia risk group, 49 adults were screened out in comorbidity risk group, and 55 adults were screened out in control group. We further assessed three sub components of phonological processing (PA, RAN and v-STM). Results suggested that the common cognitive deficit of adults from the three disability risk groups was in PA，and the PA deficit in the comorbid risk group was almost the addition of that in the dyscalculia risk group and dyslexia risk group. The common cognitive deficit of adults from comorbidity risk group and dyslexia risk group was in v-STM, and the v-STM deficit in the comorbid risk group almost equaled the dyslexia risk group. Multinomial logistic regression analysis revealed that the comorbid risk group could only be distinguished from the dyscalculia/dyslexia risk group by PA. The findings suggest that comorbidity of Chinese dyscalculia and dyslexia fits into double dissociation model in PA deficit and common etiology model in v-STM deficit. This study provides further evidence that language PA appears to be a common cognitive risk factor for dyslexia, dyscalculia and dyslexia & dyscalculia. Effective screening and intervention can be developed based on PA in different disability groups.

口语词汇识别中说话者身份信息和语言信息的表征关系

殷舒琦# 穆凯代斯·艾尔肯# 余可可（通讯作者） 王瑞明（通讯作者）
广东省心理健康与认知科学重点实验室/教育部脑认知与教育科学重点实验室、华南师范大学心理学院/心理应用研究中心，广州，510631，通讯作者 E-mail：kkyu@m.scnu.edu.cn；wangrm@scnu.edu.cn

摘 要 口语词汇识别是言语理解的基础。过去研究主要探讨了口语词汇语言信息的表征，对说话者身份信息的关注不足。近来有研究表明，听者会将说话者的身份信息作为词汇表征的一部分进行编码。然而，身份信息和语言信息在词汇层和概念层的表征关系是分离的还是共享的，这一问题还有待解决。本研究采用长时重复启动范式，通过两个实验，分别从词汇层和概念层考察身份信息和语言信息的表征关系。两个

实验均分为学习阶段和测验阶段。具体而言，实验 1 采用词汇决定任务。学习阶段给两组被试（身份一致组、身份不一致组）呈现一个说话者的语音材料（如，说话者 A-学校），要求被试判断听到的词语是汉语的真词还是假词。测验阶段，一组被试（身份一致组）呈现与学习阶段相同说话者的语音材料（如，说话者 A-学校（学习过），说话者 A-汽车（未学习过））；另一组被试（身份不一致组）呈现另一名说话者的语音材料（如，说话者 B-学校（学习过），说话者 B-汽车（未学习过））。测试阶段的任务与学习阶段相同。实验 1 结果显示：在身份不一致条件下，学习过的词和未学习过的词的正确率不存在显著差异，即被试未出现显著的重复启动效应，表明身份信息和语言信息在词汇层的表征是分离的。实验 2 采用概念决定任务，被试需要判断听到的词语是生物词还是非生物词，其余实验流程均与实验 1 相同。实验 2 结果显示：在身份不一致条件下，学习过的词的正确率显著大于未学习过的词，即被试出现了显著的重复启动效应，表明身份信息和语言信息在概念层的表征是共享的。综上所述，总的实验结果表明，在口语词汇识别中，口语词汇所蕴含的说话者身份信息与语言信息在词汇层分离表征，而在概念层共享表征。本研究结果有助于进一步完善口语词汇识别的理论模型。

Abstract: Spoken word recognition is the foundation of speech comprehension. Previous studies mainly focused on the representation of linguistic information in spoken words, while insufficient attention was paid to the speaker's identity information. Recent studies have shown that listeners could encode speaker's identity information as part of word representations. However, whether the representative relationship between identity and linguistic information at the lexical and conceptual levels is separated or shared remains to be resolved. The present study adopted the long-term repetition priming paradigm, and through two experiments, examined the representational relationship between identity and linguistic information in spoken word recognition from the lexical level and the conceptual level respectively. Specifically, Experiment 1 employed a lexical decision task. The experiment was divided into learning block and testing block. In the learning block, two groups of participants (identity-identical vs. identity-inconsistent) were presented with a speaker's auditory stimuli (for example, speaker A-school), and participants were asked to judge whether the word is a real word or a pseudo word in Mandarin (Experiment 1), In the test block, identity-consistent group was presented with the same speaker's auditory stimuli as in the learning block (e.g., speaker A-school (studied), speaker A-car (unstudied)). Another identity-inconsistent group was presented with another speaker's auditory stimuli (e.g., speaker B-school (studied), speaker B-car (unstudied)), and the task was the same as learning block. The results of Experiment 1 showed that in identity-inconsistent condition, there was no significant differences between the accuracy of studied and unstudied

words, that is, there is no significant repetition priming effect for participants, indicating that identity and linguistic information were separately represented at the lexical level. Experiment 2 employed a concept decision task, participants need to judge whether it is a biological word or a non-biological word, the experimental procedure was the same as Experiment 1. The results of Experiment 2 showed that in identity-inconsistent condition, the accuracy of studied words was significantly larger than that of unstudied words, that is, participants showed a significant repetition priming effect, indicating that the representation of identity and linguistic information at the conceptual level was shared. In conclusion, the overall experimental results showed that in spoken word recognition, speaker's identity and linguistic information contained in spoken words are represented separately at the lexical level, while shared representations at the conceptual level. Our findings can further improve the theoretical model of spoken word recognition.

Keywords：spoken word recognition, speaker's identity information, linguistic information, representation relationship, long-term repetition priming

语言越相似双语冲突越小：来自中国七大方言区的证据

摘 要　语言相似程度被认为是影响双语冲突的重要因素。前人研究通常比较掌握两种高相似度语言的双语者（如西班牙语-加泰罗尼亚语）与掌握两种低相似度语言的双语者（如西班牙语-巴斯克语）在双语切换任务中的表现，得到了不一致的结果。这可能是因为被试群体数量太少，语言相似度以外的因素（如文化差异和语言使用经历）带来了混淆。本研究以文化背景和语言使用经历等方面有较高同质性的 170 名中国七大方言区的双言者（如：闽方言-普通话使用者[相似度低]、北方方言-普通话使用者[相似度高]）作为研究对象，让他们在单言情境和双言情境下根据颜色提示使用普通话或者方言来产出数字的名称（如：红色-方言、蓝色-普通话）。结果发现：（1）被试呈现出显著的切换代价（即，从另一种语言切换而来比重复使用同一种语言有更长的反应时或者更高的错误率）和混合代价（即，在双言情境下重复使用同一种语言比在单言情境有更长的反应时或者更高的错误率），分别反映了局部语言控制和全局语言控制，重复了前人双语切换的结果；（2）在语言相似度越高的被试群体中，错误率的切换代价越小，反应时的混合代价越小，混合代价的不对称性（即，普通话的混合代价大于方言的混合代价）越小。这些结果表明，语言越相似，语言产出所需要的局部控制和全局控制都越少，双语冲突越小，这可能是因为越相似的语言越少存在有差异的语言加工环节，从而更少地需要双语者使用语言控制功能来防止和解决两种语言在这些环节的冲突。本研究首次招募中国七大方言区的被试，将语言相似程度作为连续变量，更加系统地考察语言相似度与双语冲突的关系，推进了对双语者词汇通达机制的认识。

Abstract **:** The degree of linguistic similarity is essential to bilingual conflict. Previous studies have usually compared the performance of bilinguals with mastery of two languages of high similarity (e.g., Spanish-Catalan) with that of bilinguals with mastery of two languages of low similarity (e.g., Spanish-Basque) in bilingual switching tasks, obtaining inconsistent results. It may be due to only two groups of bilinguals, leading to confounds of factors other than linguistic similarity (e.g., cultural differences and language-use experiences). In this study, 170 bidialectals (e.g., Min dialect-Mandarin bidialectal speakers [low similarity], Northern dialect-Mandarin bidialectals [high similarity]) from the seven Chinese dialect regions were used as the subjects of this study, who had a high degree of homogeneity in terms of their cultural backgrounds and language-use experiences. We asked them to produce the name of the numbers in monodialectal contexts and bidialectal contexts using either Mandarin or dialect based on color cues (e.g., red-Dialect, blue-Mandarin). We found that : (1) participants showed high switching costs (i.e., prolonged response latencies or higher error rates when switching from another language than when repeating the same language) and mixed costs (i.e., prolonged response latencies or higher error rates when repeating the same language in bidialectal contexts than in monodialectal context), replicating results in previous studies on local language control and global language control. (2) Bidialectals of higher linguistic similarity between their dialects and Mandarin showed smaller switching cost of error rates, mixing cost of response latencies, and asymmetry of mixing cost (i.e., the higher mixing cost of Mandarin than that of dialect). These results suggest that the more similar the languages are, the less local and global control is required for linguistic output and the less bilingual conflict there is. We propose that the less distinct language processes in the two languages of higher similarity demand less language control to prevent and resolve the conflict of different processes. This study is the first to examine the relationship between language similarity and bilingual conflict by recruiting participants from seven Chinese dialect regions and taking language similarity as a continuous variable, which advances our understanding of bilinguals' lexical access mechanisms.

Keywords **:** language control, bilingual switching, bilingual conflict, linguistic similarity, dialect

摘要 网络学习是当学习材料以组块形式组织呈现时，其学习效率比完全随机呈现时更高。现有语言材料的网络学习研究都集中于探讨网络组块的学习效应，很少有研究将组块与材料本身的内在属性相结合，例如词汇的形-音对应家族本身就是自然词汇学习的组块方式。本研究将网络学习的组块与词汇内在的形-音家族相结合，考察网络组块应用于自然词汇学习的内在机制。具体通过考察汉语母语者学习 15 个维吾尔语四音节词，一组材料由 3 个形-音家族组成，每个家族的 5 个词共享了一个音节的形-音对应；另一组的 15 个词不具有共享的形-音家族属性。根据网络学习的组块方式，5 个词汇构成一个网络学习组块，从而构建了三种实验条件：无形-音家族（条件一）和有形-音家族材料（条件二）的随机组块网络学习、以及按形-音家族组块的网络学习（条件三）。结果发现三种条件下均表现出网络学习的组块效应，即网络组块内试次的反应时要快于组块间试次的反应时。而且，条件一的组块效应在词汇学习的后期更加明显；条件二的组块效应明显受到了形-音家族的抑制作用，后期的组块效应相对第一个条件更弱；而条件三从词汇学习的早期就表现出组块效应，形-音家族组块明显促进了词汇学习。研究结果表明，当刺激呈现的网络组块与词汇原有内在属性网络相符时，能达到更好的学习效果，从而丰富和扩展了网络学习的内在机制探讨，为词汇学习实践应用提供了指导。

Grapheme-phoneme correspondence neighborhood influences network learning

Lirou Tan, Jianfeng Yang, Xiaojuan Wang
School of Psychology, Shaanxi Normal University, Xi’an, China

Abstract：Network learning refers to the phenomenon that presenting learning materials in a modular manner results in higher learning efficiency compared to completely random presentation. Current research on network learning with linguistic materials primarily focuses on investigating the learning effects of module. However, there is limited research that combines modular network with the intrinsic properties of the materials themselves, such as the grapheme-phoneme correspondence neighborhood, which is, in itself, a form of module in natural word learning. This study integrates modular network with the inherent grapheme-phoneme correspondence neighborhood in word and investigates the internal mechanisms of applying module to natural word learning. Specifically, this study examined the learning process of 15 four-syllable Uighur words by native Mandarin speakers. One set of materials consists of three grapheme-phoneme correspondence neighborhoods, where each neighborhood group shares a common syllable among five words. The other set of 15 words lacks shared neighborhood attributes. According to the network learning method, five words form a module, resulted in three experimental conditions: random module with no neighbor and random module with neighbors, as well as module based on the grapheme-phoneme correspondence neighborhood. The results showed that all three conditions demonstrated cross cluster effects, meaning that reaction times within module were faster than between modules. Moreover, the cross cluster effects in the first condition became more pronounced in the later stages of learning. The second condition's cross-cluster effects was noticeably suppressed by the neighborhood effects, resulting in a relatively weaker effect in the later stages compared to the first condition. But the third condition exhibited cross-cluster effects from the early stages of learning, indicating that the neighborhood-based module significantly promoted word learning.The research findings indicate that when the presented module align with the inherent attributes of word, better learning outcomes can be achieved. This study enriches and expands the exploration of

the internal mechanisms of network learning, providing guidance for practical applications in word learning.

摘 要　作为元语言意识的一种，语音意识是早期阅读能力发展的一个重要组成部分，之前的研究表明，英语和汉语中不同的语音意识成分在预测早期阅读习得上发挥着不同的作用。目的：本研究以 67 名 6-8 岁的汉语儿童（英语二语初学者）为研究对象，同时采用横断研究和纵向追踪研究，考察其汉语语音意识与英语阅读之间的关系，以及不同水平的汉语语音意识对英语真假词阅读的跨语言迁移作用。方法：研究测试了这些儿童在 T1 水平上的汉语声母意识、韵母意识和音位意识以及 T1 水平和 T2 水平（三个月后）上的英语真词阅读和假词阅读能力。通过建立两个结构方程模型，我们发现汉语音位意识和英语解码能力在汉-英双语学习中的重要作用，并提出了英语二语习得的汉语语音意识-英语解码路径模型（CPA-ED 模型）。研究结果表明：汉语语语音意识中的较小单元——音位意识可以直接预测 T1 水平的英语假词阅读，并且可以通过 T1 假词阅读的完全中介作用预测 T1 真词阅读。而语音意识中的较大单元——汉语声-韵母意识对英语假词阅读的影响则完全通过音位意识进行中介。另外，在英语学习过程的纵向研究中存在一个语音解码和阅读的双向作用机制。最后，我们发现 T1 时间点的汉语音位意识还可以通过当前的英语假词阅读间接预测 T2 时间点的英语假词阅读。结论：研究结果强调了汉语语音意识在英语阅读中的跨语言迁移作用，并证明了语音意识的大单元成分通过小单元成分对阅读起作用。研究结果同样提供了母语能力能够影响二语习得和表现的证据。

From Chinese phonological awareness to second language English reading: Cross-language mediation by Chinese phoneme awareness and English decoding

CHEN Xi[1, 2], LI Jiamei[3], SONG Zujun[1, 4], FAN Tengwen[1, 5], LI Sen[1], ZHAO Jingjing[1*]

[1] Shaanxi Normal University, Xi'an, China; [2] Chengdu University, Chengdu, China; [3] Xi'an Vocational and Technical College, Xi'an, China; [4] Ankang University, Ankang, 725000; [5] Louisiana State University, Baton Rouge, USA

***Abstract*:** As a category of metalinguistic awareness, phonological awareness (PA) is an important component of early reading abilities. Previous studies have demonstrated that different phonological awareness components in English and Chinese play diverse roles in predicting early reading acquisition. **Purpose:** This study explored the cross-sectional and longitudinal relationships between Chinese phonological awareness and English reading, and the cross-language transfer of different levels of PA to the English word and pseudoword reading among Chinese primary school children aged 6 to 8, who were beginners in English. **Method:** A sample of 67 Chinese children was tested on concurrent Chinese onset-rime awareness, Chinese phoneme awareness and concurrent and subsequent English word and pseudoword reading. By modeling two structural equations, we found the crucial roles of Chinese phoneme awareness and English decoding ability in Chinese-English bilingual learning. In addition, our study demonstrates the existence of a Chinese PA-English decoding pathway model (CPA-ED model) in ESL acquisition. **Results:** The results showed that children's Chinese phoneme awareness directly contributed to English pseudoword reading and predicted English word reading entirely through pseudoword reading. While the influence of Chinese onset-rime awareness on English decoding is mediated exclusively through Chinese phoneme awareness. Additionally, a bidirectional relationship between phonetic decoding and reading was found in the longitudinal English learning process. On the other hand, concurrent Chinese phoneme awareness could indirectly predict subsequent English pseudoword reading through concurrent pseudoword reading. **Conclusion:** The findings underscore the significant role of the cross-language transfer of Chinese PA in English reading and provided evidence that the coarse-grained representational unit of PA acts on reading through the fine-grained unit. This also shed light on the evidence that native language proficiency directly affects second language acquisition and performance.

Keywords: Chinese phonological awareness, English reading ability, English phonemic decoding, cross-language transfer.

重温旧事：怀旧的适应性作用及其解释

张杉 [1,2,3] 吕厚超 [1,2,3]（通讯作者）

1 西南大学心理学部，重庆，400700

2 西南大学心理学部时间心理学研究中心，重庆，400700

3 西南大学中国社区心理服务与研究中心，重庆，400700，houchao928@163.com

摘 要 近年来，已有大量研究表明怀旧对个体心理和行为有着积极作用，如身心健康（提高自尊、增强社会联系、增加生活意义感、缓冲死亡带来的不利影响、对抗歧视、镇痛）、行为（增加慈善行为、促进求助行为、影响消费行为）和认知（影响时间自我评价和内群体偏好）等。怀旧的适应性作用影响十分广泛，所以关于怀旧的研究领域众多且发散。目前还尚未有综述统合有关怀旧适应性的相关研究。因此，本文旨在系统梳理已有关于怀旧适应性的文献，并尝试基于社会认知基本维度视角（能动性和社群性）解释其心理机制。一方面，当唤起与自我相关的怀旧事件时，可以通过真实性、自尊等能动性内容促进心理健康。与自我相关的怀旧事件可以给个体带来控制感和安全感，抵消当下意义或者其他方面的缺失。另一方面，当怀旧事件涉及和他人关系时，可通过社会联系等社群性内容发挥其适应性作用。当个体回忆过往的亲密关系或有他人在场的事件时，可以感受到温暖、友好的人际关系，带来归属感和社会支持，从而起到适应

性作用。虽然本文从社会认知基本维度的视角来理解怀旧及其适应性功能的关系，但是现有研究还未对此直接进行验证。未来研究将从社会认知的角度探索怀旧及其作用，试图纳入相关变量来探索其中的作用机制。

3 China Community Psychology Service and Research Center, Southwest University, Chongqing, China
Corresponding author at: Faculty of Psychology, Southwest University, No. 2, Tiansheng Road, Beibei District of Chongqing, Chongqing, China

***Abstract*:** In recent years, a large number of studies have shown that nostalgia has positive effects on individual psychology and behavior, such as physical and mental health (improves self-esteem, enhances social connections, increases the sense of meaning in life, buffers the adverse effects of death, combat discrimination, analgesia), behavioral (Increasing charitable behavior, promoting help-seeking behavior, influencing consumer behavior) and cognition (affecting time self-evaluation and in-group preference), etc. The adaptive effect of nostalgia has a wide range of influences, so the research fields on nostalgia are numerous and divergent. At present, there is no review and integration of relevant research on the adaptation of nostalgia. Therefore, this article aims to systematically sort out the existing literature on nostalgia adaptability, and try to explain its psychological mechanism from the perspective of the basic dimensions of social cognition (agency and communion). On the one hand, when nostalgic events related to the self are evoked, mental health can be promoted through authenticity, self-esteem, etc. Nostalgic events associated with the self can bring a sense of control and security to the individual, offsetting a lack of present meaning or otherwise. On the other hand, when nostalgic events involve relationships with others, social connections can play an adaptive role. When individuals recall past close relationships or events in which others were present, they can experience warm, friendly relationships that bring a sense of belonging and social support, thereby playing an adaptive role. Although this paper attempts to understand the relationship between nostalgia and its adaptive functions from the perspective of basic dimensions of social cognition, existing studies have not directly verified this. Our future research will explore nostalgia and its role from the perspective of social cognition, and try to incorporate relevant variables to explore the mechanism of action.
***Keywords*:** nostalgia, emotion, mental health, fundamental dimensions of content in social cognition

上行社会比较对自我损耗的影响：相对剥夺感的中介效应和防御性悲观的调节效应

夏乐怡　吕一麟　郑钰苗　邱梦思　方杰　李美华（通讯作者）
广东财经大学人力资源学院应用心理学系，广州，510320，may_33333@126.com

摘 要： 近年来，“内卷”与“躺平”突然成为了青年群体口中的热词，反对“内卷”，走向“躺平”已成为新的潮流。这种社会心态转变的背后，正是青年群体面对个体“收益努力比”普遍下降的无奈自嘲。根据公平理论，上行社会比较会使青年产生更多“内卷”行为和不公平感，“内卷”行为和不公平感的出现会促使相对剥夺感产生，其带来如愤怒、不满等负面情感体验会增大个体对情绪调控资源的投入，进而加重自我损耗，更容易导致青年选择“躺平”。因此，本研究假设上行社会比较通过相对剥夺感间接影响自我损耗。之后，本研究进一步检验了防御性悲观在上行社会比较与相对剥夺感之间的调节作用。拟采用上行社会比较量表、相对剥夺感问卷、简版自我损耗量表、社会版防御性悲观问卷对 335 名 18-28 岁青年人进行问卷调查并使用 SPSS 和 Process Macro 对本研究所提出的有调节的中介模型进行检验。结果发现：（1）上行社会比较显著正向预测青年的自我损耗；（2）相对剥夺感在上行社会比较与自我损耗之间起部分中介作用，中介效应占总效应的 48%；（3）防御性悲观显著调节了上行社会比较与相对剥夺感之间的关系。具体地，在低防御性悲观条件下，上行社会比较可显著正向预测相对剥夺感（β_{simple}=0.07，*SE*=0.03，*p*<0.001）；在高防御性悲观条件下，上行社会比较对相对剥夺感的正向预测作用更大（β_{simple}=0.14，*SE*=0.04，*p*<0.001）。

The effect of upward social comparison on Ego-depletion: The Mediating Effect of Relative Deprivation and the Moderating Effect of Defensive Pessimism

XIA Leyi, LV Yilin, ZHENG Yumiao, QIU Mengsi, FANG Jie, LI Meihua
Department of Applied Psychology, School of Human Resources, Guangdong University of Finance and Economics, Guangzhou, 510320，may_33333@126.com

Abstract: In recent years, "involution" and "lying flat" have suddenly become popular among young people, with opposing "involution" and moving toward "lying flat" has become a new trend nowadays. Behind this change in social mentality is the helplessness of the young in the face of the general decline in the individual "income effort ratio". According to Equity Theory, upward social comparison will make young people have more " involution " behavior and sense of injustice, and the appearance of " involution " behavior and sense of injustice will promote the emergence of relative deprivation, which will bring about negative emotional experiences such as anger and dissatisfaction, increase individuals' investment in emotional regulation resources, further increase ego-depletion, and more easily lead young people to choose "lying flat". Therefore, this study hypothesizes that upward social comparison indirectly influences ego-depletion through relative deprivation. This study then further examined the moderating effect of defensive pessimism between upward social comparison and relative deprivation. A total of 335 young people aged 18-28 were surveyed using Iowa-Netherlands Comparison Orientation Measure (INCOM), the Relative Deprivation Sense Scale，A short version of the Ego-depletion Scale and Defensive Pessimism Questionnaire[DPQ(Social)]. SPSS and Process Macro were used to test the moderated mediation model proposed in this study. Conclusions: (1) Upward social comparison is a significant positive predictor of youth ego-depletion; (2) Relative deprivation plays a partial mediating role between upward social comparison and ego-depletion, and the mediating effect accounts for 48% of the total effect; (3) Defensive pessimism significantly moderates the relationship between upward social comparison and feelings of relative deprivation. Specifically, under low

defensive pessimism conditions, upward social comparison could significantly positively predict relative deprivation (βsimple=0.07, SE=0.03, p<0.001). In the highly defensive pessimistic condition, upward social comparison had a greater positive predictive effect on relative deprivation (βsimple=0.14, SE=0.04, p<0.001).

Keywords: Upward Social Comparison, Ego-depletion, Relative Deprivation, Defensive pessimism, Moderated mediation model

时间比较在自我体验与提升中的优势效应研究

王宇阳　张锋（通讯作者）
河南大学教育学部，开封，475004

摘 要　随着“鸡娃”“内卷”等现象的火热化，义务教育阶段的儿童越来越多地接收到来自“比较”的信息，左右着儿童对自身的态度和情感体验。社会比较的信息在影响个体自我体验的同时，也促使儿童产生 “优于他人”的竞争性目标取向；而时间比较更关注自我随时间的内部变化，可能促进“自我提升”良好目标的形成。本研究选择中小学生为研究对象，采用故事书写法分别启动学生不同方向的社会比较、时间比较、无比较状态，随后要求其完成相关量表，探讨不同的比较方式对中小学生自我体验的影响及其跨学段的发展；同时，测量被试在启动不同比较类型后自我提升的目标倾向。结果显示：（1）在自我体验上，小学生和中学生表现一致，具体表现为：比较方式的主效应显著，与更差的过去自己比较组、与更好的未来自我比较组、与更差的他人比较组的自我体验得分显著高于无比较组，与更好的他人比较组的自我体验得分显著低于无比较组，与更好的过去自我比较组、与更差的未来自我比较组与无比较组无显著差异；（2）在自我提升倾向上，小学生和中学生的表现一致，具体表现为：比较类型的主效应显著，进行时间比较的个体自我提升倾向得分显著高于社会比较组和无比较组。结论：1. 在社会比较中，与更差的他人相比提升中小学生的积极自我体验，与更好的他人相比降低中小学生的积极自我体验; 2. 在时间比较中，与更差的过去自我相比、与更好的未来自我相比提升中小学生的积极自我体验，而相反方向的时间比较并不会降低积极自我体验; 3. 与社会比较相比，时间比较促进中小学生自我提升目标的形成。本研究证明了与社会比较相比，时间比较在中小学生良好自我体验及健康目标取向塑造中的优势作用及其跨学段的稳定性。

The Advantage of Temporal Comparison in Self-Experience and Self-Improvement Orientation

WANG Yuyang　ZHANG Feng
School of Psychology, Henan University, Kaifeng 475004

***Abstract*:** Primary and secondary school students are frequently exposed to the information of comparison, which determines their emotional experience and attitude towards themselves. Social comparison affects children’s self-experience, while inadvertently trigger a desire to be superior to others, which demonstrate competitiveness. Temporal comparison focuses on the internal changes of the self over time, which may grow the desire of

self-improvement. So, we randomly chose 421 primary and 503 secondary school students to engage in temporal comparison (compare to worse past, better past, better future, worse future self), social comparison (compare to better or worse others) and no comparison, to explore the impact of different comparison states on the self-experience and self-improvement orientation of primary and secondary school students and their development across two stages. The results showed that: (1) The self-experience of children who compared to worse past, better future self and worse others were significantly higher than those who engaged no comparison; The self-experience of children who compared to better others was significantly lower than those engaged no comparison; No significant difference was found between the children who compared to worse future and no comparison or better past self and no comparison. (2) Compared to social comparison and no comparison, engaged in temporal comparison could significantly grow children's self-improvement orientation. (3) The impact of different comparison states on the self-experience and self-improvement orientation were consistent across primary and secondary stages. Collectively, our findings suggest that compared to social comparison, temporal comparison maintain a good self-experience and contribute a self-improvement orientation, which is similar across primary and secondary stages.

Keywords **：** Temporal comparison, Primary and secondary school students, Self-experience, Self-improvement orientation

中小学家长的家校教育责任认知及其与儿童成长满意度的关系

施静[1]　鄂蓉蓉[1]　邓铸[2]（通讯作者）

1 南京师范大学心理学院，南京，210024

2 南京师范大学大学心理学系，南京，210024，E-mail:zdeng_psy@163.com

摘 要: 自《家庭教育促进法》实施以来，由家校教育责任边界不清带来的家校协同问题引发社会关注。已有研究发现，家长的家校教育责任认知存在模糊。知是行的基础，家长的责任认知与儿童的成长发展有什么关系呢？

为调查家长的家校教育责任认知，本研究在访谈的基础上，对前期编制的《家校教育责任认知调查表》进行修订。其内容包括五个维度，共 43 个题项，其中自尊自信和伙伴交往、劳动素养和健康审美、品德教育和社会规则更多由家庭教育落实，课程学习和团队精神更多由学校教育落实，自我管理和健康生活则是不明显偏向于家或校的教育责任。该问卷题项采用 5 级计分，计分越高，反映该项责任更应属于学校教育；反之，该项责任则更应属于家庭教育。此外，以家长对儿童的成长满意度来侧面反映其孩子的发展状况。在访谈的基础上，编制了信效度较高的《子女成长满意度调查表》，其内容包括五个维度：认知思维与情绪健康、道德品质与社会交往、团队合作与社会认知、运动技能与身体状态、生活习惯与身体发育。该问卷共 40 个题项，采用 5 级计分，计分越高，反映家长对儿童该项能力发展越满意。使用这两个调查表对中小学生家长进行施测，得到 4753 个有效样本。结果显示：（1）除品德教育和社会规则维度外，男性家长相较于女性家长更多地将其他维度的责任归属于学校教育；（2）在课程学习和团队精神维度上，家长存在学历和职业的显著交互作用，全职高学历家长相较于全职低学历家长更多地将该责任归属于家庭教育；（3）家长对自尊自信和伙伴交往的责任认知与其对儿童道德品质和社会交往的满意度呈显著负相关；对课程学习和团队精神的责任认知与其对儿童团队合作与社会认知的满意度呈显著正相关。结论：（1）进一步验证了

家长的家校教育责任认知边界存在模糊，表现为对家庭教育责任认知不足，对学校教育责任过度干预；（2）家长正确的家校教育责任认知与其对儿童积极的成长评价相关联，因此，在家庭教育指导工作中应使家长明确家校教育责任。

关键词:中小学生家长，家庭教育，家校教育责任认知，儿童成长满意度

The Cognition of Family School Education Responsibility of Primary and Secondary School Parents and Its Relationship with Children's Growth Satisfaction

Shi Jing[1] E Rongrong[1] Deng Zhu[2]
1 Psychology, Nanjing Normal University, Nanjing, 210024
2 Psychology, Nanjing Normal University, Nanjing, 210024, E-mail:zdeng_psy@163.com

Abstract：Since the implementation of the "Family Education Promotion Law," the lack of clarity in the boundary between family and school responsibilities has sparked widespread concern about the issue of collaboration between parents and schools. Existing research has revealed that parents' understanding of their educational responsibilities is somewhat ambiguous. Recognizing the fundamental link between knowledge and action, the way parents perceive their responsibilities plays a crucial role in children's developmental growth.

To investigate parents' perception of family-school educational responsibilities, this study built upon previous interviews and refined the "Family-School Educational Responsibility Perception Questionnaire." The questionnaire comprises five dimensions with a total of 43 items. Among these dimensions, aspects related to self-esteem and interpersonal communication, work ethics and aesthetic health, as well as moral education and social rules, are seen as primarily the responsibility of family education. Conversely, curriculum learning and team spirit are viewed as predominantly the responsibility of school education. Self-management and healthy living, however, are perceived as areas where the educational responsibilities are less distinct between family and school. The questionnaire employs a 5-point scoring system, where higher scores indicate a stronger association with school education, and lower scores imply a stronger link with family education. Additionally, the study indirectly assessed children's developmental status by measuring parents' satisfaction with their children's growth. In addition to the "Family-School Educational Responsibility Perception Questionnaire," the study developed the "Child Growth Satisfaction Survey," which demonstrated high reliability and validity. This survey comprises five dimensions: cognitive thinking and emotional health, moral qualities and social interactions, team cooperation and social cognition, physical skills and health status, as well as daily habits and physical development. The 40 items in this questionnaire are also scored using a 5-point scale, where higher scores indicate greater satisfaction with the child's development in the respective area. By administering these two surveys to parents of primary and secondary school students, the study collected 4753 valid samples. The results revealed the following: (1) Except for the dimension of moral education and social rules, male parents tend to attribute responsibilities in other dimensions more to school education compared to female parents. (2) In the dimension of curriculum learning and team spirit, there is a significant interaction effect between parents' education level and occupation. Full-time parents with higher education tend to assign more responsibility to family education compared to full-time parents with lower education levels. (3) Parents' responsibility perception towards self-esteem and interpersonal communication negatively correlates with their satisfaction with children's moral qualities and social interactions. On the other

hand, parents' responsibility perception towards curriculum learning and team spirit positively correlates with their satisfaction with children's team cooperation and social cognition. Based on these findings, the study draws the following conclusions: (1) It further confirms the existence of blurred boundaries in parents' perception of family-school educational responsibilities, manifested by insufficient awareness of family education responsibilities and excessive intervention in school education responsibilities. (2) Parents' accurate understanding of family-school educational responsibilities is positively associated with positive evaluations of their children's growth. Therefore, in the guidance of family education, it is crucial to help parents clarify their family-school educational responsibilities.

Keywords：primary and secondary school parents, family education, cognition of family school education responsibility, satisfaction with children's growth

养育需要社区吗？——一项关于养育社区感的质性研究

侯力琪[1]　马凤芝[1*]

1 北京大学社会学系，北京，100091

*通讯作者（Email: mafzhi@163.com）

摘 要　社区感（Sense of Community）是社区心理学中的一个重要概念，与居民的身心健康、生活满意度与社区参与行为都有着密切的关联。在城镇化快速发展的背景下，城市父母在 0-3 岁儿童的养育过程中的社区感是值得探索的主题。因此，本研究提出了“养育社区感”（Sense of Community for Parenting, SOCP）这一概念，希望探索其内涵、影响因素以及可能的培育路径。

通过文献整理和针对城市社区 0-3 岁儿童的父母的质性访谈，本研究发现，对于许多成长于传统农村社区或单位制社区的研究对象而言，他们对养育社区感有着丰富的回忆和渴望。然而在目前的居住环境中，他们的养育社区感较为薄弱。

诸多因素阻碍了养育社区感的形成，包括城市社区高楼的封闭式居住模式、社区组织活动的欠缺、社区育儿环境的不完善以及可能存在的安全隐患。同时，年轻父母们普遍感到在“内卷”的社会环境中缺乏时间精力开展社交，并在有限的互动中感知到阶层的差异、育儿理念的冲突和已经构成了某种社交规范的边界感。

鉴于养育社区感的重要性，社区社会工作者可以围绕养育这一共同主题，通过科普讲座、亲子工作坊等丰富的活动，打破多重因素带来的藩篱，促进养育者之间的联结，从而使社区成为更有凝聚力的生活共同体。

Does parenting need a community? A qualitative study on the sense of community for parenting

Liqi Hou; Fengzhi Ma
Department of Sociology, Peking University
Corresponding Author Email: mafzhi@163.com

Abstract：Sense of Community (SOC) is an important concept in community psychology, closely linked to residents' physical and mental well-being, life satisfaction, and community engagement. Against the backdrop of rapid urbanization, the sense of community among urban parents with children aged 0-3 years is a topic worth exploring. Thus, this study introduces the concept of "Sense of Community for Parenting" (SOCP) with the aim to investigate its dimensions, influencing factors, and potential cultivation pathways.

Through literature review and qualitative interviews with parents of 0-3-year-old children in urban communities, this research reveals that for many participants who grew up in traditional rural or institution-based communities, they possess rich memories and yearnings for a sense of parenting community. However, in their current residential environments, their SOCP tends to be relatively weak.

A handful of factors hinder the formation of a sense of parenting community, including the enclosed residential mode of high-rise urban communities, lack of community organizational activities, inadequate parenting environments within the community, and potential safety hazards. Simultaneously, young parents commonly feel a shortage of time and energy for social interactions in the context of a burnout social environment. In their limited interactions, they perceive social class differences, conflicts in parenting philosophies, and new social norms in modern society.

Given the significance of fostering SOCP, community workers can center their efforts around parenting as a common theme. Through informative lectures and various activities, such as parent-child workshops, they can break down barriers resulting from multiple factors and facilitate connections among caregivers. By doing so, the community can transform into a more cohesive space.

拟态环境中的意见"变色龙"：
社交媒体情感极化对个体意见立场影响的双刃剑路径

白麒钰[1]（通讯作者） 陈沛[1]
1 北京大学新媒体研究院，北京，100871，通讯作者 E-mail：baiqiyu_pku@163.com

摘 要　极化的表现形式是界定群体分化和对立的重要依据，通常表现为情感、态度、意见、立场等。西方计划以党派差异为主要标签，然而在我国的语境中极化往往表现为思想立场的冲突。通过对新冠疫情时期"动态清零"管控放开的舆论分析，研究发现在国家安全议题牵涉到个体生命健康议题时存在两种意见的分化进路。一种是基于个人健康的以保证社会整体健康稳定、自身不受感染为核心诉求，指责那些建议放开疫情管控使其常态化的行为，称之为"个人健康立场"；另一种是坚持应该放开管控，以维护自身出行，反思批判公权力运作和管理中出现的诸多问题，可以称之为"自由自决立场"。

本研究通过收集中国网民在 2022 年 11 月-12 月期间关于自身健康和心理调节策略的网络问卷（N=1019），进一步研究了这种意见进路分化的影响因素。研究发现，不同个体对社交媒体舆论环境中情感极化不同的感知是影响他们采取不同意见立场的重要因素，并基于群际威胁和社会认同理论建立了情感极化-个体意见表达立场的双刃剑模型。模型说明，当个体因网络情感极化感受到更高的本体安全感威胁时，更倾向于采取“个人健康立场”的意见表达立场；当个体因网络情感极化而唤起更高的社会公正信念时，更倾向于采取“自由自决”的意见表达立场。

本研究将情感极化在中国公共健康领域意见语境下进行了个体微观层次的探讨，进一步延展了情感极化的研究视野与应用外延。选取本体安全感而非传统意义上的心理安全感作为中介变量，并验证了其在危机情境下对个体意见表达产生的作用。这一发现弥补了心理安全感在个体发展和环境连续、稳定性维度的缺失，为后续研究提供了一个可行性的思路。同时研究检验了双路径下系统性式维和启发式思维方式的调节作用。面对当下极易被操纵的网络情绪，本研究提出了侦测情绪“二极管”效应的一种路径，有助于澄清互联网中的虚假共识，真正引导政策和公共安全理论朝着理性和有利于社会建设的方向发展。

“Hello Chameleon”: The double-edged effects of social media affective polarization on self-regard viewpoints

Qiyu Bai*, Pei Chen
School of New Media, Peking University of China

Abstract：Polarization manifests as a significant basis for defining group differentiation and opposition, often seen in emotions, attitudes, opinions, and positions. In Western contexts, polarization is primarily labeled by party differences, while in China, it often involves conflicts in ideological stances. Through analyzing public opinions during the lifting of "zero-COVID" control measures amid the COVID-19 pandemic, this study identifies two divergent opinion pathways related to national security issues and individual health concerns. One pathway emphasizes safeguarding overall social health stability and individual well-being, criticizing suggestions to normalize epidemic control measures, termed "personal health stance." The other pathway advocates for lifting control measures to safeguard personal freedoms and criticize issues within government operations and management, termed "freedom of choice stance."

Collecting web-based questionnaires from Chinese netizens during November to December 2022 (N=1019) on personal health and psychological coping strategies, this research investigates factors influencing the divergent opinion pathways. Findings reveal that different perceptions of affective polarization in social media discourse environments significantly impact individuals' adoption of distinct opinion stances. Building on intergroup threat and social identity theories, a dual-edge model of affective polarization-individual opinion expression stance is established. The model illustrates that when individuals feel higher ontological security threats due to online affective polarization, they tend to adopt the "personal health stance." Conversely, when online affective polarization triggers stronger beliefs in social justice, individuals lean towards the "freedom of choice stance."

This study provides a micro-level exploration of affective polarization within the context of public health opinions in China, expanding the research scope and application of affective polarization. Choosing ontological security instead of traditional psychological security as a mediating variable validates its role in individual opinion expression during crisis situations. This finding fills the gap in the dimension of individual development and

environmental continuity, offering a feasible approach for future research. Moreover, the study examines the regulatory effect of systemic versus heuristic thinking under the dual pathways. In the face of easily manipulated online emotions, this research proposes a pathway for detecting the "diode effect" of emotions, aiding in clarifying false consensus on the internet, and guiding policies and public safety theories towards rational and socially beneficial directions.

Keywords：Affective polarization, ontological safety, belief in social justice, social media, false consensus

在线合作学习中的情绪对合作学习效果与认知投入的影响及合作脚本干预的作用

聂昕晓　赵明珠　刘忠健　刘海诺　房敏　田媛（通讯作者）

华中师范大学心理学院暨青少年网络心理与行为教育部重点实验室，武汉，430079，tiany@ccnu.edu.cn

摘 要　关于失败的消极反馈是较为常见的教学组成部分，对学习者的情绪、动机等均存在显著影响。在涉及消极反馈的在线合作学习情境中，情绪对合作学习效果的影响如何，目前尚未有实证研究进行考察。此外，学习者情感投入不足是目前在线合作学习面临的挑战之一，考虑到当前计算机支持的合作学习中情感设计的缺陷，亟需采取恰当设计以促进成员间情感联结、提高学生快乐感与愉悦感，实现学习者认知投入与情感投入的提升，进而改善合作学习效果。针对以上局限，本研究聚焦关于成就结果的消极反馈背景，开展了两项实验。具体来讲，实验一对在线合作中的情绪与合作学习效果、认知投入的关系进行了深入研究，即从个人角度，通过回归、相关分析等探究在线合作学习中的情绪对合作学习效果、个人认知投入的影响；从小组交互的角度，通过社会网络分析考察情绪交互对小组认知投入的影响。实验二，基于消极反馈背景，探究合作脚本干预对个人及小组层面的情绪和认知是否有积极影响，采用了单因素 (有干预、无干预) 被试间实验设计。结果表明：(1) 任务前的消极高唤醒情绪能够显著负向预测合作学习效果，任务中的积极和消极情绪与合作学习效果显著相关。此外，任务中的个人消极情绪能显著负向预测其认知贡献度，小组的情绪交互密度显著正向预测小组认知投入。(2) 消极反馈背景下，合作脚本能够显著增加任务中的积极情绪以及任务后的积极高唤醒情绪，并且能够促进合作学习效果、小组情绪交互和小组认知投入。综上，在线同步合作中，学习者的情绪及小组的情绪交互对合作学习、认知投入均具有重要作用，且合作脚本干预能够有效促进互动合作的积极情绪、合作学习与认知投入。

The effect of emotion on the effectiveness of cooperative learning and cognitive engagement in online cooperative learning and the role of cooperative script intervention

NIE Xinxiao, ZHAO Mingzhu, LIU Zhongjian, LIU Hainuo, FANG Min, TIAN Yuan
School of Psychology, Central China Normal University, Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan, 430079,
tiany@ccnu.edu.cn

Abstract: Negative feedback about failure is a common component of teaching, which has a significant impact on learners' emotions and motivation. No empirical study has examined how emotions affect the effectiveness of cooperative learning in online cooperative learning involving negative feedback. In addition, the lack of learners' emotional engagement is one of the challenges of online cooperative learning. Considering the defects of emotional design in current computer-supported cooperative learning, it is urgent to adopt appropriate design to promote the emotional connection between members, improve students' happiness and pleasure, and realize the improvement of learners' cognitive and emotional engagement, so as to improve the effectiveness of cooperative learning. To address these limitations, two experiments were conducted, focusing on the context of negative feedback about achievement outcomes. Specifically, in Experiment 1, we explored the relationship between emotions and cooperative learning effectiveness, as well as cognitive engagement in online cooperation. That is, from the perspective of individuals, regression and correlation analysis were used to explore the effect of emotion on cooperative learning effectiveness and personal cognitive engagement in online cooperative learning. From the perspective of group interaction, social network analysis was used to examine the effect of emotional interaction on group cognitive engagement. In Experiment 2, based on the background of negative feedback, we explored whether the cooperative script intervention had positive effects on emotion and cognition at the individual and group levels, using a between-subject design with a single factor (intervention vs. without intervention). The results showed that: (1) the negative high-arousal emotion before the task could significantly negatively predict the cooperative learning effectiveness, and the positive and negative emotions during the task were significantly correlated with the cooperative learning effectiveness. In addition, individual negative emotions during the task significantly negatively predicted their cognitive contribution, and the emotional interaction density of the group significantly positively predicted group cognitive engagement. (2) Under the background of negative feedback, cooperative scripts could significantly increase the positive emotion during the task and the positive high-arousal emotion after the task, and promote the cooperative learning effectiveness, group emotional interaction and group cognitive engagement. In conclusion, in online synchronous cooperation, the emotion of learners and the emotional interaction of the group play an important role in cooperative learning and cognitive engagement, and the cooperation script intervention can effectively promote the positive emotion, cooperative learning effectiveness and cognitive engagement of interactive cooperation.

Keywords: Online cooperative learning, emotion, cooperative learning effectiveness, cognitive engagement, cooperative script intervention

媒体多任务对工作记忆表现的影响：来自行为与脑电的证据

孟素洁[1,2,3]　王伟军[1,2,3]　孔繁昌[1,2,3]（通讯作者）

1 青少年网络心理与行为教育部重点实验室

2 华中师范大学心理学院

3 湖北省人的发展与心理健康重点实验室，武汉，430079

kfcpsy@ccnu.edu.cn

摘 要　随着信息技术的快速发展，个体使用及参与媒体的方式逐渐发生改变。与以往人们通常只处理单一的媒体相比，越来越多的人倾向于进行媒体多任务。工作记忆作为人类认知活动的核心，主要负责对信息进行暂时存储和加工。在日常生活中，媒体多任务这一新兴媒体使用方式的流行可能会影响个体的工作记忆。然而，目前关于媒体多任务和工作记忆关系的研究仍存在一些局限。首先，以往研究大多没有对媒体多任务进行实验操纵；其次，目前关于考察二者关系的认知神经机制方面的研究还相对缺乏。为了弥补前人研究的不足，本研究将结合行为和认知神经证据，系统全面地探究媒体多任务类型对工作记忆的影响，主要开展以下两个研究：

研究一通过启动范式操纵媒体多任务，采用 N-back 任务检验工作记忆，考察了同时（26 名）和顺序媒体多任务组（24 名）在不同认知负荷下的工作记忆差异。研究结果发现，在正确率和辨别力指数 d’指标上，当认知负荷处于 1-back 水平时，同时组在工作记忆上的表现显著差于顺序组；处于 2-back 水平时，同时组的表现显著差于顺序组只体现在正确率指标上，d’无显著差异；而处于 3-back 水平时，两组表现无显著差异。这表明媒体多任务类型损害工作记忆，且受到认知负荷的调节。

研究二重复研究一的实验范式，招募被试 48 名并随机分配至同时、顺序媒体多任务组，考察他们在工作记忆任务上的行为以及事件相关电位和神经振荡指标。结果发现，在行为指标正确率、反应时和 d’上，同时组的工作记忆均显著差于顺序组。在 ERPs 指标方面，同时媒体多任务组在额区 P2 成分上的潜伏期显著长于顺序组，波幅显著小于顺序组；在 EEG 神经振荡方面，同时组和顺序组在额区 theta 振荡上差异显著，在顶区 theta 振荡上差异边缘显著，均为同时组的 theta 振荡能量小于顺序组；两组在顶区 alpha 振荡上无显著差异。

研究结果验证了媒体多任务对认知的损害效应，在行为和认知神经层面全面揭示了媒体多任务对工作记忆的影响及作用机制，为引导正确地使用媒体任务并进行干预具有一定的借鉴意义。

The Effect of Media Multitasking on Working Memory Performance: Behavioral and EEG Evidences

Meng Sujie[abc], Wang Weijun[abc], Kong Fanchang[abc]

[a]Key Laboratory of Adolescent Cyberpsychology and Behavior(CCNU), Ministry of Education, Wuhan 430079, China;

[b] School of Psychology, Central China Normal University;

[c] Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079, China

***Abstract*:** With the rapid development of information technology, the way individuals use media and engage with them is gradually changing. Compared to the past when people usually only deal with one single media, more and more people tend to engage in media multitasking. Working memory, as the core of human cognitive activities, is primarily responsible for the temporary storage and processing of information. The popularity of media multitasking, an emerging media use in daily life, may affect individuals' working memory. However, there are still some limitations in current research on the relationship between media multitasking and working memory. First, most previous studies have not experimentally manipulated media multitasking; second, there is a relative lack of research on cognitive neural mechanisms underlying the relationship between the two. In order to make up for the shortcomings of previous studies, this present study will combine behavioral and cognitive neural evidence to systematically and comprehensively explore the impact of media multitasking types on working memory by conducting the following two main studies.

Study 1 examined the differences in working memory between the simultaneous (n=26) and sequential media multitasking groups (n=24) at different cognitive loads by using a priming paradigm to manipulate media multitasking and using an N-back task to examine working memory. The results found that the simultaneous group performed significantly worse than the sequential group on working memory when the cognitive load was at the 1-back level on the accuracy and the sensitivity (d'), and the simultaneous group performed significantly worse than the sequential group on working memory when the cognitive load was at the 2-back level only on the accuracy, while there was no significant difference in the working memory performance of the two groups at the 3-back level on the accuracy and the sensitivity (d'). This suggests that media multitasking negatively affects working memory and is moderated by cognitive load.

Study 2 repeated the experimental paradigm of Study 1, recruited 48 participants and randomly assigned them to the simultaneous and the sequential media multitasking groups, and examined their behavioral differences in working memory performance as well as event-related potentials and neural oscillations. It was found that the simultaneous group all performed significantly worse than the sequential group in terms of the behavioral indicators (accuracy, reaction time and d'). In terms of ERPs metrics, the simultaneous media multitasking group had significantly greater latencies and significantly smaller wave amplitudes than the sequential group on the P2 component of the frontal area. In terms of EEG neural oscillations, the differences between the simultaneous and sequential groups were significant in frontal theta oscillations and marginally significant in parietal theta oscillations, both of which were less energetic in the simultaneous group than in the sequential group; there was no significant difference in parietal alpha oscillations.

The results verify the cognitive impairment effect of media multitasking and comprehensively reveal the effect and mechanism of media multitasking on working memory at both the behavioral and cognitive neural levels. Our research has implications for guiding correct media tasks and conducting interventions.

大学生网络视频成瘾倾向与孤独感、弹幕偏好的关系：一项混合方法研究

严志豪[1,2] 杨泽旸[1]（通讯作者）
1 苏州大学教育学院心理系，苏州，215123
2 安徽师范大学教育科学学院，芜湖，241000
通讯作者 E-mail：zyyang@suda.edu.cn

摘 要

背景：网络视频因其高沉浸感、高社交属性、不断刷新等特点，易导致成瘾问题，引起孤独感等心理健康问题。弹幕是观看网络视频时弹出的匿名评论性字幕，能够满足观看视频者“社会互动”的需求，创造出一种许多人陪着你一起看视频的“错觉”。

方法：研究一以处于教育过渡期的大一新生为样本（N=685），进行三次纵向追踪施测（每次间隔四个月），并通过交叉滞后分析探究个体网络视频成瘾倾向与孤独感之间相互影响的关系。研究二调查自我报告的“弹幕偏好”与孤独感、网络视频成瘾倾向之间的关系（N=316）。研究三在实验室中模拟人们观看网络视频的真实情境，并通过眼动追踪仪器（Eyelink 1000 Plus）记录被试观看网络视频时对弹幕区域的注视情况，进一步探究上述研究变量之间的关系（N=204）。

结果：

（1）大一新生网络视频成瘾倾向与孤独感之间存在较为稳定的中等正相关关系，三次施测相关系数分别为 0.24、0.31、0.30，$p < .001$。且交叉滞后分析表明两者之间存在纵向的双向预测关系。

（2）大一新生入学以后，网络视频成瘾倾向得分呈逐步上升趋势。且网络视频成瘾人数有所增加，三次施测成瘾检出率分别为 1.2%、3.7%、4.2%。而大一新生孤独感的平均水平整体较为稳定。

（3）大学生自我报告的弹幕偏好程度整体较高，且在观看网络视频时对弹幕区域注视较多，对弹幕区域的平均注视时间、次数百分比分别为 15%、19%。

（4）孤独的人自我报告的弹幕偏好水平不一定更高，但在观看网络视频时却对弹幕注视更多。网络视频成瘾者自我报告的弹幕偏好水平更高，且在观看网络视频时对弹幕注视也更多。

讨论：基于以上结果，为有效预防和减少大学生网络视频成瘾提出以下两点对策，首先，学校及家庭应加强教育、鼓励大学生养成良好的网络（视频）使用习惯，同时对易感人群（高孤独感、适应不良）保持重点关注和及时干预。其次，网络视频平台应受到更严格的监管，在防止用户“成瘾”方面做出更多的改变，如在视频中加入更多善意的防沉迷弹幕提醒。

The relationship between university students' online video addiction tendency, loneliness and danmu preference: a mixed methods study

Zhihao Yan[1,2], Zeyang Yang[1*] (corresponding author)
[1]Department of Psychology, School of Education, Soochow University, Suzhou, 215123

***Abstract*：**

Background： Online videos, due to their high level of immersion, social attributes, and constant refreshing, can easily lead to addiction problems and cause psychological health issues such as loneliness. Danmu is the anonymous comment subtitles that pop up when watching online videos, which can satisfy the viewers' need for "social interaction" and create an illusion of many people watching the video together with you.

Methods： In study 1, we recruited first-year undergraduates who were in the transitional period of education (N=685). A three-wave longitudinal study (with four-month intervals) was conducted to explore the bidirectional relationship between online video addiction tendency and loneliness through cross-lagged analysis. Study 2 investigated the relationship between self-reported "Danmu preference" loneliness and online video addiction tendency (N=316). Study 3 simulated the real situation of people watching online videos in the laboratory, and recorded the participants' fixation on the Danmu area when watching online videos through eye-tracking equipment (Eyelink 1000 Plus), and further explored the relationship between the above research variables (N=204).

Results:

(1) There was a relatively stable moderate positive correlation between online video addiction tendency and loneliness among freshmen ($r = .24, .31, 30$, $p < .001$). The cross-lagged model analysis showed that there was a longitudinal bidirectional relationship between the two variables.

(2) After freshmen entered university, the score of online video addiction tendencies gradually increased. The number of online video addicts increased, and the rates of addiction in the three tests were 1.2%, 3.7%, and 4.2%, respectively. The average level of loneliness among freshmen is relatively stable overall.

(3) College students' self-reported preference for danmu comments was generally high, and they gazed at danmu areas frequently when watching online videos. The average percentages of fixation duration time and counts of danmu areas were 15% and 19%, respectively.

(4) The self-reported danmu preference level of lonely people was not necessarily higher, but they gazed more at Danmu when watching online videos. Online video addicts reported a higher level of danmu preference, and they also gazed more at Danmu when watching online videos.

Discussion： Based on the above results, the following two suggestions are put forward in order to effectively prevent and reduce university students' online video addiction. First, schools and families should strengthen education and encourage students to develop good habits of using the internet (online video). Meanwhile, it is necessary to maintain focused attention and timely intervention on vulnerable individuals (high loneliness, maladjustment). Secondly, online video platforms should be more strictly regulated, and more changes should be made to prevent users from "addiction", such as adding more well-intentioned anti-addiction Danmu comments.

***Keywords*：** online video addiction tendency; loneliness; Danmu preference

教师生成性绘画对学习者视频学习效果的影响研究

刘忠健[1] 聂昕晓[1] 刘海诺[1] 房敏[1] 田媛[1]（通讯作者）

1 华中师范大学心理学院暨青少年网络心理与行为教育部重点实验室，武汉，430079

通讯作者 Email: tiany@ccnu.edu.cn

摘　要 随着在线视频学习的广泛使用，越来越多优质的教学视频被设计出来，而教师生成性绘画作为一种

新颖的视频内容呈现方式，其有效性的相关研究较为缺乏。同时，学习者作为学习的主体，先验知识水平的不同是否均能从教师生成性绘画中受益，以及学习者采用怎样的学习策略更好地发挥其效用等问题尚没有统一结论。基于以上问题，本研究通过两个实验室实验探讨在线视频学习中采用教师生成性绘画的呈现方式对学习者的学习体验和学习结果的影响。实验一通过选择不同先验知识（高 vs 低）的学习者，探讨视频学习环境中教师生成性绘画的呈现方式对不同类型学习者的影响差异。实验二进一步聚焦于低先验知识学习者，考察生成性学习策略（自我解释 vs 重复观看）在教师生成性绘画的呈现方式下，对学习者学习效果的促进作用。结果发现：（1）相比于动画和图片呈现，教师生成性绘画可以提高低先验知识学习者的学习效果，但并不影响高先验知识学习者。（2）对于低先验知识学习者，在生成性绘画条件下，自我解释策略对学习的促进作用显著低于重复观看策略，而在动画条件下，自我解释策略的作用则显著高于重复观看策略。其中教师生成性绘画与重复观看策略的组合对学习效果的促进作用最佳，而动画呈现与重复观看策略组合效果最差。（3）学习者生成自我解释的质量能够显著预测其保持测验和迁移测验成绩。综上，视频学习中，教师生成性绘画对于低先验知识学习者的学习效果具有十分明显的促进作用，并且其与重复观看策略的组合能够取得最佳的效果。

Research on the Influence of Instructor-Generated Drawings on Learners' Video Learning Performance

LIU Zhongjian[1], NIE Xinxiao[1], LIU Hainuo[1], FANG Min[1], TIAN Yuan[1]

1 School of Psychology, Central China Normal University, Key Laboratory of Adolescent Cyberpsychology and Behavior (CCNU), Ministry of Education, Wuhan 430079, China

Email: tiany@ccnu.edu.cn

Abstract：With the widespread use of online video learning, more and more high-quality teaching videos have been designed. As a novel content presentation mode, instructor-generated drawings lack relevant research on their effectiveness. At the same time, as the main body of learning, whether learners with different levels of prior knowledge can benefit from instructor-generated drawings, and what learning strategies should be adopted to maximize the role of instructor-generated drawings, there is no unified conclusion. Based on the above questions, this study explored the influence of instructor-generated drawings on learning experience and results in video learning through two laboratory experiments. In Experiment 1, learners with different prior knowledge (high vs low) were selected to explore the differences in the influence of instructor-generated drawings in video learning. Experiment 2 focused on learners with low prior knowledge and examined the promotion of generative learning strategies (self-explanation vs repeated watching) on learning performance under the instructor-generated drawings. The research shows that: (1) Compared with animation and pictures, instructor-generated drawings can improve the learning performance of learners with low prior knowledge, but it does not affect learners with high prior knowledge. (2) For learners with low prior knowledge, under the condition of instructor-generated drawings, the effect of self-explanation strategy on learning is significantly lower than that of repeated watching. In contrast, under the condition of animation, the effect of self-explanation strategy is significantly higher than that of repeated watching. Among them, the combination of instructor-generated drawings and repeated watching has the best effect on learning performance. (3) Learners' self-explanation quality can significantly predict their retention and transfer test scores. In summary, in video learning, instructor-generated drawings have apparent improvement on the learning performance of learners with low prior knowledge, and its combination with repeated watching strategies can achieve the best results.

Keywords：video learning, instructor-generated drawings, learners' prior knowledge, self-explanation strategies, learning performance

网络受排斥对青少年人际交往意愿的影响：社交焦虑的中介作用

许春艳　谢笑春（通讯作者）

东北师范大学心理学院，长春，130024，psyxiexc@163.com

摘 要　在线社交媒体正在日益渗透我们的生活，一方面促进了人际互动，但另一方面也增加了问题网络行为的风险，例如网络成瘾和网络受排斥。网络受排斥，是指在网络社会交往过程中，个体对归属和关系的需求因社交关系的中断而受到阻碍的现象和过程。与儿童期和成年期相比，青春期的个体在网络社交过程中情绪更敏感，更容易经历网络排斥。以往研究表明，遭受网络排斥的青少年会表现出更多的攻击行为、精神健康受损等，但较少关注网络受排斥对青少年人际交往方面的影响。基于威胁——需要的时间模型，长期遭受网络排斥的个体会进入退避阶段，不愿进行人际交往。因此，本研究旨在探究网络受排斥对青少年人际交往意愿的影响，并揭示社交焦虑的中介作用。本研究采用问卷法对西南地区 2 所中学 716 名学生（平均年龄 16.46 ± 0.98 岁，其中男生占比为 58.10%）的网络受排斥、人际交往意愿和社交焦虑进行间隔 3 个月的 3 次追踪调查,通过 Mplus 8.3 构建结构方程模型考察网络受排斥对青少年人际交往意愿的预测作用以及社交焦虑的中介作用。结果显示：在控制年龄和性别后，（1）T1 网络受排斥负向预测青少年的 T3 人际交往意愿；（2）T2 社交焦虑在 T1 网络受排斥和 T3 人际交往意愿间起到中介作用。上述分

析本研究得到如下结论：青少年在受到网络排斥一段时间后，会产生更高水平的社交焦虑，进而降低人际交往意愿。本研究一方面丰富了网络受排斥领域以及威胁——需要的时间模型的实证研究；另一方面，为青少年人际交往的干预提出了新的科学依据。

The Effect of Cyber-ostracism on Adolescents' Interpersonal Willingness: The Mediating Role of Social Anxiety

Chunyan Xu, Xiaochun Xie
School of Psychology, Northeast Normal University, Changchun, 130024

Abstract： Online social media are increasingly permeating our lives. It facilitates interpersonal interactions, but increases the risk of problematic online behaviors, such as Internet addiction and cyber-ostracism. Cyber-ostracism, as a form of cyberbullying, refers to the phenomenon and process by which an individual's need for belonging and relationships during online social interactions is hampered by the disruption of social relationships. Compared to childhood and adulthood, adolescents are more emotionally sensitive during online socialization and more likely to experience cyber-ostracism. Previous research has shown that adolescents who experience cyber-ostracism exhibit more aggressive behaviors, impaired mental health, etc. However, less attention has been paid to the effects of cyber-ostracism on the interpersonal aspects of adolescent socialization. Based on the threat-need temporal model, individuals who suffer from cyber-ostracism for a long period of time enter a withdrawal phase and are reluctant to engage in interpersonal interactions. Therefore, this study aimed to investigate the effects of cyber-ostracism on adolescents' willingness to engage in interpersonal interactions and to reveal the mediating role of social anxiety. The present study used the questionnaire method to conduct three follow-up surveys at 3-month intervals on cyber-ostracism, interpersonal willingness, and social anxiety among 716 students (M_{age} = 16.46 ± 0.98, 58.10% boys) in two middle schools in Southwest China. Structural equation modeling with Mplus 8.3 was used to examine the predictive role of cyber-ostracism on adolescents' willingness to engage in interpersonal interactions and the mediating role of social anxiety. The results showed that, after controlling for age and gender, (1) T1 cyber-ostracism negatively predicted adolescents' T3 interpersonal willingness, and (2) T2 social anxiety mediated the relationship between T1 cyber-ostracism and T3 interpersonal willingness. We conclude that adolescents who have been cyber-ostracized for a period of time develop higher levels of social anxiety, which in turn reduces the willingness of interpersonal interaction. On the one hand, this study enriches the empirical research in the field of cyber-ostracism and the temporal threat-need model. On the other hand, the results suggest a new scientific basis for interventions in adolescents' interpersonal interactions.

Keywords： cyber-ostracism, adolescents, interpersonal willingness, social anxiety

大学生社交焦虑与社交媒体使用的纵向关系：一项交叉滞后分析

尹学琴[1,2]，王金良[2]（通讯作者）
1 重庆工商大学文学与新闻学院，重庆，400067
2 西南大学心理学部心理健康教育研究中心，重庆，400715，
通讯作者 E-mail: wangjinliang09@gmail.com

摘 要 社交焦虑是指一种逃避社交互动抑或在与他人互动的过程中表现得压抑的状态。以往研究已经证实，社交焦虑与社交媒体使用之间存在正向关系，社交焦虑程度越高的个体越倾向于使用数字技术来逃避面对面交往。然而，目前关于社交焦虑个体在社交媒体上的具体行为偏好和使用效果仍不清楚。鉴于社交媒体的社交互动功能和潜在网络威胁，本研究拟从寻求社交与寻求安全的角度来探讨社交焦虑与社交媒体两种具体使用行为之间的关系，具体是探讨社交焦虑与主动性使用和网络安全寻求行为之间的关系，并探讨其中潜在的性别差异。通过对 523 名 18 至 26 岁的大学生（$M_{年龄}$ = 19.78, SD = 1.26）开展为期半年的纵向追踪，进行交叉滞后模型分析，结果发现，社交焦虑与社交媒体使用存在交叉滞后关系，但这种关系通过不同的使用行为来实现。具体而言，T1 社交焦虑显著正向预测 T2 社交媒体安全寻求行为；T1 主动性使用负向预测 T2 社交焦虑。此外，多群组分析结果表明，对男生而言，T1 社交媒体主动性使用负向预测 T2 社交焦虑；但对女生而言，T1 社交焦虑正向预测 T2 社交媒体安全寻求行为。上述研究结果表明，就行为偏好而言，社交焦虑与个体在社交媒体上寻求安全（而非寻求联系）的行为倾向有关；但从使用效果层面来看，只有寻求联系（而非寻求安全）的使用倾向有助于降低社交焦虑水平。总之，本研究为理解社交焦虑个体为何无法通过使用社交媒体实现“弱者变强”提供了见解，也为基于性别差异的在线行为干预提供了方向与指导。

The longitudinal relationship between social anxiety and social media use among undergraduate students: A cross-lagged analysis

Xue-Qin Yin [1, 2], Jin-Liang Wang [2*]
[1] School of Literature and Journalism, Chongqing Technology and Business University, Chongqing, Chongqing, China.

Abstract: Social anxiety refers to one’s state of avoiding social interactions and appearing inhibited in such interactions with other people. Previous studies have demonstrated a positive association between social anxiety and social media use, and individuals with higher levels of social anxiety are more inclined to use digital technologies to avoid face-to-face communication. Nevertheless, how these individuals would use social media or what media effect they would receive from that use is unknown. Considering the social function and the potential risks of social media, this study aims to investigate the relationships between social anxiety and two kinds of social media use (i.e., active usage behaviors and online safety-seeking behaviors) and also explore the potential gender difference. Using a longitudinal data of 523 emerging adults aging from 18 to 26 years old (M_{age} = 19.78, SD =

1.26), results of cross-lagged analyses revealed a reciprocal relationship between social anxiety and social media use, while this relation varied across different usage behaviors. Specifically, social anxiety was positively associated with online safety-seeking behaviors over time, while active social media use would decrease the level of social anxiety over time. Moreover, the multi-group analysis indicated that for boys, T1 active use could negatively predict the level of social anxiety at T2, while for girls, T1 social anxiety could positively predict T2 safety-seeking behaviors. These findings suggest that social anxiety was related to the behavioral preference for seeking safety over seeking connection on social media, while one's tendency of seeking connection rather than seeking safety could decrease the level of social anxiety. overall, this study provides insights for understanding why socially anxious individuals cannot get socially richer from using social media, and also provides direction and guidance for online behavioral interventions based on gender differences.

特质愤怒与青少年网络欺负的关系:友谊嫉妒的中介作用与感知学校消极氛围的调节作用

张甜[12]　石慧芬[12]　范翠英[12]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079

2 华中师范大学心理学院，武汉，430079，fancy@ccnu.edu.cn

摘 要　网络欺负是随着电子信息技术的发展而出现的新的欺负形式，它是青少年群体中一种高发的行为问题。特质愤怒是青少年网络欺负的风险因素，然而特质愤怒与网络欺负之间的内在机制还需要进一步探索。本研究综合个体因素（人格特质和情绪）以及学校因素对青少年网络欺负行为的发展进行探究，建立了一个有调节的中介模型，探讨了友谊嫉妒在特质愤怒与网络欺负之间的中介作用，以及感知学校消极氛围的调节作用。本研究以 1699 名青少年为研究对象，采用特质愤怒量表、友谊嫉妒问卷、学校氛围量表和网络欺负量表进行问卷调查。结果表明：（1）在控制了性别、年龄、传统欺负后，特质愤怒显著正向预测青少年网络欺负。（2）友谊嫉妒在特质愤怒与网络欺负的关系中起部分中介作用。（3）感知学校消极氛围在特质愤怒与网络欺负之间的直接路径以及友谊嫉妒中介效应的后半段路径起调节作用。具体来说，特质愤怒与青少年网络欺负之间的正向关系以及友谊嫉妒与青少年网络欺负之间的正向关系都仅在高感知学校消极氛围水平下显著。本研究丰富了网络欺负领域的相关研究，揭示了特质愤怒怎样影响青少年网络欺负以及在何种条件下对青少年网络欺负的影响更强或者更弱，对预防青少年网络欺负具有一定的指导意义。首先，家长与老师需要帮助青少年正确表达愤怒，学会接受友谊的变化，减少友谊嫉妒的情绪。其次，学校要塑造积极的学校环境。通过这两方面以降低青少年出现网络欺负行为的风险。

Trait anger and adolescent cyberbullying: The mediating role of friendship jealousy and the moderating role of negatively perceived school climate

Tian Zhang[12], Huifen Shi[12], Cuiying Fan[12]
1 Key Laboratory of Adolescent Cyberpsychology and Behavior, Wuhan, 430079
2 School of Psychology, Central China Normal University, Wuhan, 430070

Abstract：Cyberbullying is a new form of bullying that has emerged with the development of electronic information technology, and it is a highly prevalent behavioral problem among adolescents. Trait anger has been shown to serve as an adolescent cyberbullying risk factor. However, the mechanisms underlying this relationship need further exploration. The present study explored the development of adolescent cyberbullying by integrating individual factors (personality trait and emotion) as well as school factor, and developed a moderated mediation model to explore the the mediating role of friendship jealousy and the moderating role of negatively perceived school climate in the association between trait anger and cyberbullying. Questionnaires were completed by 1699 Chinese adolescents regarding demographics, traditional bullying, trait anger, friendship jealousy, negatively perceived school climate, and cyberbullying. The study results revealed that trait anger was positively related to cyberbullying and that friendship jealousy partially mediated this relationship. Negatively perceived school climate moderated the direct and indirect effects of trait anger and cyberbullying, and that these effects were significant only for adolescents with a high level of negatively perceived school climate. This study enriches related research in the field of cyberbullying by revealing how trait anger affects adolescent cyberbullying and under what conditions it is stronger or weaker, which is instructive for the prevention of adolescent cyberbullying. First, parents and teachers need to help adolescents express anger properly, learn to accept changes in friendships, and alleviate friendship jealousy. Second, schools need to shape a positive school environment. Through these two aspects in order to reduce the risk of adolescents' cyberbullying.

Keywords：Trait anger, Cyberbullying, Friendship jealousy, Negatively perceived school climate

“越害怕错过越冲动？”

错失恐惧和对社交媒体线索的自发接近反应的实验研究

钟丹[12] 许放[12] 郭嘉程[12] 周宗奎[12]（通讯作者）

1 青少年网络心理与行为教育部重点实验室，武汉，430079
2 华中师范大学心理学院暨湖北省人的发展与心理健康重点实验室，武汉，400379，zhouzk@ccnu.edu.cn

摘 要 现如今，随着社交媒体的发展，人们的生活变得更加便利。但是与此同时，错失恐惧现象变得更加普遍且严重。以往研究发现，错失恐惧对社交媒体成瘾有重要预测作用。然而，关于错失恐惧与社交媒体成瘾的内部作用机制的实证研究还不够丰富，且极少从认知的角度探讨作用机制。因此，本研究拟通

过实验法探讨错失恐惧与对社交媒体线索的自发接近反应之间的因果关系，从而从认知的角度丰富对错失恐惧与社交媒体成瘾的作用机制的认识。此外，由于关于错失恐惧诱发方法的研究相当匮乏，本研究拟通过实验法探讨三种自主设计的诱发方法是否能有效诱发被试产生错失恐惧。围绕以上两个研究目的，本研究进行了两个实验：实验一旨在探究有效的错失恐惧诱发方法。该实验以 112 名在校大学生为有效被试，通过对不同实验组（自己手机振动组、实验室手机振动组、想象任务组）使用不同错失恐惧诱发方法（“让被试在等待时间听到自己手机振动声但不能查看手机”、“让被试在等待时间听到实验室手机振动声但不能查看手机”、“想象范式”），并将实验组被试的焦虑水平与错失恐惧程度与空白对照组进行比较，从而探讨有效诱发方法。研究结果表明，三组实验组中仅有想象任务组被试的焦虑水平与错失恐惧程度显著高于空白对照组的。实验二，基于实验一的结果，探究了错失恐惧与对社交媒体线索的自发接近反应的因果关系。该实验以 64 名在校大学生为有效被试，对实验组进行错失恐惧诱发操作，而不对空白控制组进行任何诱发操作，然后让两组被试完成刺激-反应兼容范式来测量其对社交媒体线索的自发接近反应强度。结果表明，在对社交媒体线索的自发接近反应上，实验组和空白对照组并不存在显著差异。

“More fear of missing out, more impulsive?” An experimental study of fear of missing out and spontaneous approach reactions toward social media cues

Zhong Dan[a b]　Xu Fang[a b]　Guo Jiacheng[a b]　Zhou Zongkui[a b]

a Key Laboratory of Adolescent Cyberpsychology and Behavior(CCNU), Ministry of Education, Wuhan 430079

b School of Psychology, Central China Normal University; Key Laboratory of Human Development and Mental Health of Hubei Province, Wuhan 430079

Abstract：Nowadays, with the development of social media, people's life has become more convenient, but at the same time, the fear of missing out (FoMO) has become more common and serious. Previous studies have found that FoMO is an important predictor of social media addiction. However, empirical studies on the internal mechanism of FoMO and social media addiction are not rich enough, and the mechanism is rarely discussed from the perspective of cognition. Therefore, this study intended to explore the causal relationship between FoMO and spontaneous approach reactions toward social media cues through experimental methods, so as to enrich the understanding of the mechanism of FoMO and social media addiction from the cognitive perspective. In addition, due to the lack of research on FoMO inducing methods, this study intended to explore whether three self-designed FoMO inducing methods can effectively induce participants’ FoMO through experimental methods. Based on these two research purposes, we conducted two studies:Study 1 was to explore the effective FoMO inducing methods. In this study, 112 college students were selected as valid participants. By using different FoMO inducing methods ("let the participants hear the vibration sound of their own mobile phone but not check it during the waiting time", "let the participants hear the vibration sound of the lab’s mobile phone but not check it during the waiting time", "imagination paradigm") on the different experimental groups (own phone vibration group, lab’s phone vibration group, imagination task group) and comparing anxiety level and the degree of the FoMO of experimental groups and blank control group, we thus discussed the efficient inducing methods.The results showed

that among the three experimental groups, the level of anxiety and FoMO in the imagination task group were significantly higher than those in the blank control group.Study 2, based on the results of Study 1, explored the causal relationship between FoMO and spontaneous approach reactions toward social media cues. In this study, 64 college students were selected as valid participants. And this study conducted FoMO inducing operation in the experimental group, but not in the blank control group.And then let two groups' participants complete the Stimulus-Response Compatibility task. The results showed that there was no significant difference in spontaneous approach reactions toward social media cues between the experimental group and the blank control group.

Keywords：fear of missing out, spontaneous approach reactions, social media addiction, impulsive system

自我肯定缓冲在线沉默对被排斥感的影响：基于亲密关系中即时通讯的研究

刘瑶瑶 谢笑春（通讯作者）

东北师范大学心理学院，长春，130024，xiexc713@nenu.edu.cn

摘　要 信息化时代下即时通讯成为维系亲密关系的重要工具，人们会时常查看手机并保持“永远在线”的状态。不过在人们发出消息后迟迟收不到消息的现象也随处可见。当人们发出求助消息后，很可能面临对方迟迟没有回应的社交情境，这种现象就是在线沉默。在线沉默是一种模糊的社交情境，它会降低亲密关系满意度并威胁个体的基本心理需要满足。但在线沉默与被排斥感之间的关系尚不明确。本研究采用两个研究探讨了处于亲密关系中的个体遭遇在线沉默是否会产生被排斥感，以及这种效应是否能被自我肯定缓冲。研究 1 采用问卷法探究了在线沉默与被排斥感之间的关系。研究 1a 采用自编问卷对 452 名大学生进行调查，结果发现，大多数人经历过使用即时通讯软件紧急求助但遭遇在线沉默，并且大多数人表示在经历在线沉默时会产生被忽视、被排斥的感觉。研究 1b 采用自编问卷探究在线沉默时长与被排斥感的关系(n=427)，结果发现，在线沉默时长与被排斥感之间呈线性关系，在线沉默时间越长个体的被排斥感越高。研究 2 采用 3（情境：立即回复 /短时在线沉默 5-10 分钟/长时在线沉默 120-180 分钟）×3（自我肯定：内部自我肯定/外部自我肯定/无自我肯定）被试间设计进一步探究在线沉默和自我肯定对个体被排斥感的影响（n=151）。结果发现：（1）相比于立即回复组，在线沉默组的被排斥感更高。长时在线沉默组的被排斥感高于短时在线沉默组。（2）相比于无自我肯定组，自我肯定组的被排斥感降低更多。内部自我肯定组的被排斥感降低多于外部自我肯定组。（3）在立即回复条件下，三组的被排斥感无差异；在在线沉默条件下，内部自我肯定组的被排斥感降低多于外部自我肯定组和无肯定组，外部自我肯定组的被排斥感降低多于无肯定组。结果表明：亲密关系一方的在线沉默会使得消息发出者产生被忽视、被排斥的消极体验，而自我肯定能够缓冲在线沉默对被排斥感的这一消极作用。本研究结果有助于理解即时通讯背景下网络社会排斥的内在机制及其与在线沉默的关系。

The effect of self-affirmation buffering online silence on feelings of exclusion: based on instant messaging in intimate relationships

Yaoyao Liu, Xiaochun Xie
School of Psychology, Northeast Normal University, Changchun

Abstract : In the information rea, instant messaging has become an important tool to maintain intimate relationships, and people will often check their mobile phones and stay "always on". However, delays in receiving messages after they are sent out are also common. When people send a message for help, they are likely to face a social situation where the other party has not responded, which is a phenomenon called online silence. Online silence is an ambiguous social situation that reduces intimate relationship satisfaction and threatens individuals' basic psychological needs. But the relationship between online silence and feelings of exclusion is less clear.Two studies were used to investigate whether individuals in intimate relationships who experience online silence experience feelings of exclusion, and whether this effect can be buffered by self-affirmation. Study 1 used a questionnaire to explore the relationship between online silence and feelings of rejection. In study 1a, a self-designed questionnaire was used to survey 452 college students, and the results found that most of them had experienced online silence while using instant messaging for emergency help, and most of them said that they would feel ignored and excluded when experiencing online silence. In study 1b, a self-designed questionnaire was used to explore the relationship between online silence duration and feelings of exclusion (n=427). The results showed that there was a linear relationship between online silence duration and feelings of exclusion, and the longer the online silence duration, the higher the feelings of exclusion. In study 2, a 3 (scenario: immediate response/short online silence 5-10 minutes/long online silence 120-180 minutes) ×3 (self-affirmation: internal self-affirmation/external self-affirmation/non-self-affirmation) intersubject design was used to further explore the effects of online silence and self-affirmation on individuals' feelings of exclusion (n=151). The results showed that: (1) Compared with the immediate response group, the online silence group had a higher sense of rejection. The feelings of rejection in the long online silence group were higher than those in the short online silence group. (2) Compared with no self-affirmation,self-affirmation group feelings of exclusion to reduce more. The internal self-affirmation group had a lower feelings of exclusion than the external self-affirmation group. (3) Under the

immediate response condition, there was no difference in the feelings of exclusion among the three groups;In the online silence condition, the internal self-affirmation group had a greater reduction in the feelings of exclusion than the external self-affirmation group and the non-self-affirmation group, and the external self-affirmation group had a greater reduction in the feelings of exclusion than the non-affirmation group. The results show that the online silence of an intimate relationship can make the message sender have a negative experience of being ignored and excluded, and self-affirmation can buffer the negative effect of online silence on the feeling of exclusion. The results of this study help to understand the internal mechanism of online social exclusion in the context of instant messaging and its relationship with online silence.

摘 要 媒体作为“风险放大站”，对气候变化的报道会增加人们对生态环境的关注和环保行为。虽然已有较多证据表明，媒体报道是生态焦虑和亲环境行为的重要预测因素，但是很少有研究探讨它们之间的因果关系。此外，弹性悖论指出，个体在面对实际发生的自然灾害时，高心理弹性个体在出现较少的负性情绪的同时也会减少应对行为。然而，弹性悖论是否适用于媒体对气候危机的报道，有待探究。为此，本研究通过线上实验（研究 1，N=284）和问卷调查（研究 2，N=507），分别对气候变化报道与生态焦虑和亲环境行为之间的因果关系，以及生态焦虑的中介作用和心理弹性的调节作用进行检验。结果发现，研究 1 中实验组被试阅读关于全球气候变暖的新闻后，其生态焦虑水平和对环保组织的捐款数额均高于对照组；但生态焦虑与亲环境行为之间的关系不显著。研究 2 发现，日常生活中对气候变化报道的关注与生态焦虑和亲环境行为呈正相关，生态焦虑在其中起中介作用。此外，弹性悖论可以解释个体面对媒体报道时的情绪和行为。高心理弹性者的生态焦虑程度较低，但其亲环境行为也较少。研究结果表明，在利用媒体报道提高人们的环保行为参与度时，应考虑其可能引发的生态焦虑的水平以及个体特征的影响。未来研究应关注个人福祉与环境可持续性之间的平衡发展。

关键词 媒体报道，生态焦虑，亲环境行为，心理弹性

Media coverage of climate change, eco-anxiety and pro-environmental behavior: Experimental evidence and the resilience paradox

Shao Lei[1], Yu Guoliang[2] (Corresponding author)

1 School of Education, Renmin University of China, No.59, Zhongguancun Street, Haidian District, Beijing 100872, China

2 Institute of Psychology, Renmin University of China, No.59, Zhongguancun Street, Haidian District, Beijing 100872, China, yugllxl@sina.com

Abstract：As a risk amplification station, media coverage of climate change affects people's concerns about ecological environment and pro-environmental behaviors. Substantial evidence has revealed that media coverage is a crucial predictor of eco-anxiety and pro-environmental behaviors. However, few studies have explored the causal relationship between them. In addition, the resilience paradox states that individuals who are highly psychologically resilient experience fewer negative emotions along with reduced coping behaviors when faced with an actual natural disaster. However, whether the resilience paradox applies to exposure to media coverage of the climate crisis remains to be explored. To examine these questions, we conducted an experiment (Study 1, N = 284) and a cross-sectional survey (Study 2, N = 507) online. The results found that participants in the experimental group in Study 1 had higher levels of eco-anxiety and more donations to environmental organizations after reading news about global warming than the control group. But there was no significant link between eco-anxiety and pro-environmental behavior. Study 2 found that attention to climate change coverage in daily life was positively correlated with eco-anxiety and pro-environmental behavior, and eco-anxiety played a mediating role. Additionally, the resilience paradox could explain individual emotion and behavior in the face of media coverage. Individuals with high resilience felt less eco-anxious but also engaged in fewer pro-environmental behaviors. Findings suggest that we should consider the degree of eco-anxiety and individual differences when using media coverage to increase people's behavioral engagement. Future research should focus on the balance between individual well-being and environmental sustainability.

Keywords：media coverage; eco-anxiety; pro-environmental behavior; resilience

网络新闻的真实性知觉：共情的作用

俞怡帆[1]　严世振[2]　许祯臻[1]　周广方[1]　张琪涵[1]　金花[1]（通讯作者）

1 天津师范大学心理学部，天津，300387

2 福建医科大学健康学院，福州，350122，jinhua@tjnu.edu.cn

摘 要　目的：虚假新闻一直是互联网治理的难点，已有文献缺少对共情与网络新闻真实性知觉的关系的探讨。本研究以网络新闻为材料，探究了受众特质共情、状态共情与网络新闻真实性知觉之间的关系以及新闻类型在其中的调节作用。旨在揭示影响网络虚假新闻真实性知觉的认知机制，及为遏制虚假新闻的传播提供科学治理的线索。方法：72 名大学生(32 男)志愿参与了本研究。实验材料为真实、虚假新闻各 80 条。虚假新闻取自国内知名的事实核查网站，真实新闻选自央视网等主流媒体。材料经 Photoshop 处理后以一般网络新闻的形式（附有新闻标题、图片且配有描述文字的格式）由 E-prime 软件编程呈现。新闻以伪随机方式逐条呈现在电脑屏幕中间，被试被要求认真阅读每条新闻，并在阅读结束后对新闻进行可信度、状态共情度、效价、唤醒度、熟悉度的 1-7 点李克特评分。可信度为真实性知觉的指标，虚假新闻的评分越高说明其真实性知觉能力越差。特质共情数据通过中文版人际反应指数量表（IRI—C）收集。结果：1 独立样本 t 检验发现，真假新闻的唤醒度、熟悉度无显著差异，但虚假新闻的效价显著低于真实新闻的；2 相关分析发现特质共情与状态共情显著正相关,状态共情和特质共情与对新闻的可信度均呈显著正相关；3. 采用 SPSS26.0 的 PROCESS 插件和 Bootstrap 分析方法进行有调节的中介模型检验发现，状态共情在特质共情对可信度影响中的中介作用显著，控制了中介变量后, 特质共情对可信度的直接效应依然显著。新闻类型在共情度影响可信度中具有显著的调节作用：当新闻类型为真时，中介效应占直接效应的 23.57%，当新闻类型为假时,中介效应占直接效应的 60.67%。结论：受众的特质共情能力既可直接预测其对新闻的真实

性知觉能力，还可通过状态共情间接预测其真实性知觉；且状态共情的中介效应量受新闻类型的调节，虚假新闻的中介效应量更大。结果提示高特质共情的受众可能更容易受到虚假新闻的侵扰，在面对高状态共情的新闻时尤其要注意分辨新闻的真实性。

The perceived accuracy of Online News： a role of Empathy

YU Yifan[1]　YAN Shizhen[2]　XU Zhenzhen[1]　ZHOU Guangfang[1]　ZhangQihan[1]　JIN Hua[1]
1 Department of Psychology, Tianjin Normal University, Tianjin, 300387, China
2 School of Health, Fujian Medical University, Fuzhou, China, jinhua@tjnu.edu.cn

Abstract： Objective: Fake news has always been a difficult point in internet governance, and little literature has explored the relationship between empathy and the perceived accuracy of online news. Taking online headlines as materials, this study investigated the relationship among the trait empathy, state empathy, and perceived accuracy of online news, and the regulatory role of news types in it. The aim was to reveal the cognitive mechanism of susceptibility to online disinforming news and further provide clues for scientific governance to curb the spread of false news. Method: 72 college students (32 males) volunteered to participate in this study. The experimental materials were 80 true and 80 fake news. The fake news was chosen from well-known fact-checking websites in China, and the true news was from official medias such as CCTV. After being processed by Photoshop and programmed by E-prime, each piece of news was presented in the way online news is presented in the real-world situation (with news headlines, pictures, and descriptive text format). The news was presented in the center of the computer screen one by one in a pseudo-random way, and the participants were instructed to read each piece of news carefully and scored the credibility, state empathy, emotion valence, arousal, and familiarity of news with a Richter scale of 1-7 points after reading. Credibility was an indicator of the perceived accuracy, and the higher the score of false news, the lower its perceived accuracy. Trait empathy data were collected by the Chinese version of the Interpersonal Response Index Scale (IRI-C). Result: 1. T-test of independent samples showed that there was no significant difference in arousal and familiarity between true and fake news, but the emotion valence of fake news was significantly lower than that of true news; 2. Correlation analysis showed that trait empathy was positively correlated with state empathy, and both state empathy and trait empathy were positively correlated with the credibility of the news; 3. The PROCESS plug-in of SPSS26.0 and the Bootstrap analysis method were used to test the regulated mediation model. It was found that state empathy played a significant mediating role in the influence of trait empathy on credibility, and the direct effect of trait empathy on credibility was still significant after controlling the mediation variable. News types had a significant regulatory role in the influence of state empathy on credibility: the intermediary effect accounts for 23.57% of the direct effect when news types were true, and it accounts for 60.67% of the direct effect when news types are fake. Conclusion: The audience's trait empathy can not only directly predict their perceived accuracy of online news, but also indirectly predict their perceived accuracy through state empathy. Moreover, the mediating effect of state empathy may be regulated by news types. The mediating effect of fake news may be greater than that of true news. The results suggest that the individual with high trait empathy may be more vulnerable to fake news, and should pay special attention to distinguish the credibility of online news when facing the news evoking high state empathy.
Keywords： state empathy, trait empathy, online fake news, the perceived accuracy

质疑评论对新闻可信度的影响：感知群体态度的中介

刘颖哲[1]　朱敏帆[1]　谢晓非[1]（通讯作者）
1 北京大学心理与认知科学学院，北京，100871，xiaofei@pku.edu.cn

摘 要　评论是社交媒体中网民参与度最高的交互行为之一，在网民理解和评价新闻内容中扮演着重要的角色。一方面，评论可以作为辟谣信号帮助用户鉴别虚假新闻，另一方面，有害或虚假的评论也可能干扰网民对重要信息的理解与评价，目前针对评论与新闻可信度间关系的研究仍有待深入。本研究通过微博数据分析与线上实验，旨在探讨质疑性评论对新闻可信度的影响，并进一步讨论解释机制和边界条件。在研究一中，爬取部分微博新闻与评论内容，通过中文情感词典对 72084 条评论进行分析，检验评论质疑强度对新闻可信度的影响。在研究二中，操纵质疑评论所占比例，在被试阅读评论前后测量对新闻可信度的评价，并进一步测量其转发和评论意愿，共收集了来自 890 名被试的数据。结果发现，（1）质疑性评论会显著降低新闻可信度，并进一步降低个体进行点赞、转发和评论的意愿；（2）这一效应在不同评论构成组中表现不同，当质疑性评论占多数时，效应显著，而认可性评论占多数时，效应不显著；（3）这一效应由感知到的群体态度中介，只有在感知到群体认为新闻为假时，个体才会改变态度，即表现出了从众。本研究探讨了评论与新闻可信度之间的关系，发现其受到评论构成的调节，而感知群体态度在其中起中介作用。研究结果为进一步理解社交媒体中用户生成内容与新闻的关系提供了重要线索，对于帮助用户识别虚假新闻，管理跟帖评论行为，塑造健康积极的网络信息环境有重要的理论和实践意义。

The effect of doubting comments on news credibility:

The mediating role of perceived group attitude

Yingzhe-Liu[1], Minfan-Zhu[1], Xiaofei-Xie[1]
1 School of Psychological and Cognitive Sciences, Peking University, Beijing 100871,
xiaofei@pku.edu.cn

Abstract：Comments, as the highly engaged form of user-generated content, have a significant impact on users' perception of news content. On one hand, comments can serve as social correction cues, aiding individuals in discerning fake news. Conversely, negative and uncivil comments may dampen users' understanding of news content. Currently, there is insufficient research investigating the relationship between comments and news credibility. Hence, this research aims to investigate the influence of doubting comments on news credibility through the analysis of Weibo posts and online experiments, and examine whether this effect will be moderated by the distribution of doubting and affirmative comments. In study 1, we collected news posts and their corresponding comments from Weibo, employing the Chinese emotion dictionary to examine whether doubting comments diminish users' intention to like, share, and comment on the posts. In study 2, we conducted two online

experiments, manipulating the distribution of comments to measure participants' perception of news credibility prior to and after their exposure to the comments. Additionally, we assessed people's intention to share and comment on the news post. Our findings reveal that doubting comments decrease individual's perception of news credibility, consequently reducing their intention to like, share and comment. This effect is moderated by the distribution of comments. When doubting comments constitute the majority (i.e., surpassing 50% of the total comments), the perception of news credibility declines as the proportion of doubting comments increases. In contrast, when affirmative comments prevail, the association between doubting comments and news credibility is not significant. In addition, this effect is mediated by the perceived opinion of the majority. Individuals only alter their perception of news accuracy when they perceive a collective doubt regarding news credibility. In summary, this research demonstrates that doubting comments can have a negative impact on news credibility, especially when they are dominant in the comment section. The research findings yield valuable insights contributing to a deeper comprehension of the relationship between user-generated content and news. Findings of these studies have great implications on how to support users identify fake news, regulate commenting behavior, and foster a healthy and constructive online information ecosystem.

"社恐"的避风港还是新囚笼：线上社交双刃剑效应的质性研究

刘佳琦[1]　唐信峰[1]（通讯作者）

1 中国人民大学心理学系，北京，100872，　xtang@ruc.edu.cn

摘 要

目的：计算机中介交流（CMC, Computer Mediated Communication）对于社交焦虑者而言可以避免面对面的直接接触，减少社交情境中的威胁线索，从而规避焦虑和尴尬情况。然而，随着社交媒体的流行和普及，线上社交弊端逐渐暴露出来。因此，本研究旨在探索社交焦虑者在线互动的优势及弊端。

方法：采用质性研究方法，对 31 名存在社交焦虑症状（社交恐怖症量表 SPIN＞19 分）的大学生（18-25 岁）进行半结构式访谈。访谈内容社交媒体特点、社交焦虑者的线上社交体验、线上社交的优点及弊端等方面展开。采用主题分析法对资料进行分析。

结果：质性分析的结果显示，相比面对面社交，社交媒体的可操控性、匿名性、去线索化、多样性和时空压缩为社交焦虑者带来更好的互动体验。然而社交媒体的单调性、模糊性、异步性、数字留痕和信息超载等特点又会引发社交焦虑问题。此外，研究还发现，技术的可供性致使社交焦虑者在线互动时可能会采取一系列安全行为以避免社交焦虑，具体包括：限制社交动态的发布、检查言语措辞、隐匿身份、设置权限、形象整饬、延迟回复等。然而，安全行为并不能真正帮助社交焦虑者逃避社交情境中的尴尬和不适，反而可能会进一步加重社交焦虑体验。

结论：研究结果表明线上社交对社交焦虑存在双刃剑效应，网络的媒介特点在一定程度上缓解了社交焦虑，为社交焦虑者带来更为轻松的互动体验。另一方面，社交焦虑者在网络社交情境中同样存在社交焦虑问题，甚至出现了技术引发的新社交困境。

The Safe Haven or the New Cage of Social Anxiously Individuals: A Qualitative Study of the Double-Edged Sword Effect of Online Social Interaction

Jiaqi Liu Xinfeng Tang
Department of Psychology, Renmin University of China, Beijing, China
Corresponding author: xtang@ruc.edu.cn (X. Tang)

***Abstract*:**

Objective: The present study aims to explore the advantages and disadvantages of Computer-Mediated Communication (CMC) for individuals experiencing social anxiety. CMC offers an opportunity for socially anxious individuals to avoid direct face-to-face interactions, thereby reducing perceived threat cues and mitigating feelings of anxiety and embarrassment. However, as social media become increasingly popular and prevalent, the drawbacks associated with online social interaction have begun to surface.

Methods: To investigate this phenomenon, a qualitative research approach was employed, involving semi-structured interviews with 31 college students aged 18 to 25 who exhibited symptoms of social anxiety (as indicated by a Social Phobia Inventory score greater than 19). The interviews focused on various aspects of online social interactions, including the characteristics of social media, the experiences of socially anxious individuals in online social contexts, as well as the strengths and limitations of online social interactions. Thematic analysis was used to analyze the collected data.

Results: The results of qualitative analyses show that the manipulability, anonymity, de-cueing, diversity and spatio-temporal compression of social media provide a better interactive experience for socially anxious people compared to face-to-face socialising. However, the monotony, ambiguity, asynchrony, digital traceability and information overload of social media can trigger social anxiety problems. Furthermore, the study discovered that the availability of technology leads socially anxious individuals to adopt a range of safety behaviors during online interactions to avoid anxiety. These safety behaviors include limiting the release of social updates, monitoring speech and language, concealing identity, setting privacy controls, curating one's image, and delaying responses. However, it is important to note that these safety behaviors may not effectively help socially anxious individuals escape awkwardness and discomfort in social situations. On the contrary, they may exacerbate the overall experience of social anxiety.

Conclusion: The results indicate that online social interaction has a double-edged sword effect on social anxiety, where the distinctive characteristics of social media partially alleviate social anxiety, providing socially anxious individuals with a more relaxed interactive experience. On the other hand, within the context of online social interactions, socially anxious individuals still encounter social anxiety issues, and there may even arise new social dilemmas triggered by technology.

谁更可能减少社交媒体成瘾行为？性别和主动性人格的差异

毛建[1] 陈沛[1] 何嘉杰[1] 聂衍刚[1]（通讯作者） 钟沛枝[1]

1 广州大学教育学院心理学系/青少年心理与行为研究中心，广州，510006

nie-yangang@gzhu.edu.cn

摘 要 近年来，社交媒体的使用规模呈指数增长。社交媒体为使用者提供了诸多便利，但频繁的使用也可能会导致社交媒体成瘾行为。以往学者们围绕社交媒体成瘾的成因开展了大量的研究，为社交媒体成瘾的干预提供了理论指导。然而，个体减少社交媒体成瘾行为的意向对他们是否接受干预技术起着重要作用。最近的研究发现并非所有人都愿意主动减少社交媒体成瘾行为，换句话说，尽管随着社交媒体成瘾倾向越高，个体的社交媒体减少使用意向越大，但两者的关系因人而异。因此，为了提高个体主动减少社交媒体成瘾行为的动机，有必要深入探讨社交媒体成瘾与个体社交媒体减少使用意向之间的关系。本研究将从性别和主动性人格的视角探讨社交媒体成瘾与社交媒体减少使用意向关系间的个体差异。365 位大学生社交媒体用户分别在两个时间段（间隔两周）完成了社交媒体成瘾问卷、社交媒体减少使用问卷、主动性人格问卷的调查。结果表明：(1)社交媒体成瘾显著正向预测社交媒体减少使用意向(β=0.29, 95% CI [0.192,0.389], p<0.001)；(2)社交媒体成瘾对减少使用意向的预测效应存在性别差异，即相较于女生(β=0.13, 95% CI[-0.0002, 0.258], p=0.05)，预测效应在男生中更大(β=0.49, 95% CI [0.353,0.646], p<0.001)；(3)社交媒体成瘾对减少使用意向的正向预测效应受到了主动性人格的调节作用，该预测效应在主动性人格水平高的个体中显著(β=0.43, 95% CI[0.313, 0.548], p<0.001)，在主动性人格水平低的个体中不显著(β=0.10, 95% CI[-0.034, 0.248], p>0.05)。结果有利于提高大学生减少社交媒体成瘾倾向行为的动机，进一步地促进社交媒体成瘾行为的改善。

Who is More Likely to Reduce Social Media Addictive Behavior? Differences in Gender and Proactive Personality

Jian Mao[1], Pei Chen[1], Jiajie He[1], Yangang Nie[1], Peizhi, Zhong[1]

1 Department of Psychology/Center for studies of Adolescent Psychological and Behaviors, Guangzhou University, Guangzhou, 510006

Abstract：The usage of social media has grown exponentially on a large scale in recent years. Social media offers many conveniences to users, but frequent use can also lead to social media addictive behaviors. Previous scholars have conducted numerous studies around the causes of social media addiction, providing theoretical guidance for social media addiction interventions.However, individuals' intentions to reduce social media addictive behaviors play an important role in whether they accept interventional techniques.Recent studies have found that the willingness to actively reduce social media addictive behaviors is not shared by all; in other words, while social media addiction increases, the greater the individual's intention to reduce social media use， but this relationship varies from person to person. Therefore, in order to increase the motivation of individuals to actively reduce their social media addictive behaviors, it is necessary to explore in depth the relationship between social media addiction and the intention to reduce social media use. This study will explore individual differences between the relationship between social media addiction and the intention to reduce social media use from the perspectives of gender and proactive personality.365 college social media users completed the Social Media Addiction Questionnaire, the Social Media Reduced Use Questionnaire, and the Proactive Personality

Questionnaire at two separate time periods (two weeks apart). The results showed that (1) social media addiction significantly and positively predicted social media use reduction intention (β=0.29, 95% CI [0.192,0.389], p<0.001); and (2) there was a gender difference in the predictive effect of social media addiction on use reduction intention, such that compared to girls (β=0.13, 95% CI [-0.0002, 0.258], p = 0.05), the predictive effect was greater among boys (β=0.49, 95% CI [0.353,0.646], p<0.001); (3) the positive predictive effect of social media addiction on intention to reduce use was moderated by proactive personality, and this predictive effect was significant among individuals with high levels of proactive personality (β=0.43, 95% CI [0.313, 0.548], p<0.001) and not significant in individuals with low levels of proactive personality (β=0.10, 95% CI [-0.034, 0.248], p>0.05).The results are conducive to increasing college students' motivation to reduce social media addictive tendency behaviors, further contributing to the reduction of social media addictive behaviors.
Keywords: social media addiction, intention to reduce social media use, gender, proactive personality

被动性社交网站使用对自尊的影响：基于潜在剖面分析

方俊燕[1]（通讯作者） 黄熙彤[2]

1 广州体育学院休闲与数字体育学院，广州，510500，fangjy12@126.com

2 华南师范大学心理学院，广州，510631

摘 要 **目的**：识别大学生被动性社交网站使用的潜在类别，并分析其与自尊之间的关系。**方法**：采用被动性社交网站使用问卷、错失焦虑问卷和自尊量表对 436 名大学生进行调查，运用潜在剖面分析探讨被动性社交网站使用的潜在类别及特征，并通过稳健三步法和 BCH 法进行后续分析。**结果**：①大学生被动性社交网站使用可以分为三个潜在类别：深度沉迷组（n =134，30.7%），适度使用组（n =159，36.5%）和低度使用组（n =143，32.8%）。②性别和错失焦虑是大学生被动性社交网站使用的危险性因素，性别为女和错失焦虑水平高的大学生更容易沉迷于被动性社交网站使用。具体而言，相比于“深度沉迷组”，女生属于“适度使用组”的发生比要低 49%（OR =0.51, p<0.01）,属于“低度使用组”的发生比要低 61%（OR =0.39, p<0.001）；相比于“深度沉迷组”，个体的错失焦虑每升高一个单位，其属于“低度使用组”的发生比会降低 46%（OR =0.54, p<0.01）。③被动性社交网站使用的各潜在类别在自尊上的差异具有统计学意义（χ^2=7.38，p<0.05），“深度沉迷组”的大学生自尊得分最低，“低度使用组”的大学生自尊得分最高。**结论**：大学生的被动性社交网站使用存在显著的群体异质性，未来可根据人群分类特点制定针对性的干预措施，应重点关注女生群体，可以通过降低错失焦虑来减少被动性社交网站使用，进而避免自尊受损。

关键词 被动性社交网站使用，错失焦虑，自尊，潜在剖面分析

Effects of Passive Social Network Site Use on Self-esteem: A Latent Profile Analysis

Fang Junyan[1] Huang xitong[2]

1 School of Leisure Sports and E-sports, Guangzhou Sport University, Guangzhou 510500, China
2 School of Psychology, South China Normal University, Guangzhou 510631, China

Abstract: **Objective:** To identify potential categories of passive social network site use among college students and further analyze the association of different categories with self-esteem. **Methods:** A total of 436 college students by convenient sampling method were taken as the object of the research. Students completed the Passive Social Network Site Use Questionnaire, Fear of Missing Out Scale, and Rosenberg Self-Esteem Scale. The latent profile analysis was used to explore the potential categories of passive social network site use, and the R3step method and the BCH method were used for further analyses. **Results:** ①College students' passive social network site use can be divided into three potential categories: high addiction group (n=134, 30.7%), moderate use group (n=159, 36.5%), and minor use group (n=143, 32.8%). ②Gender and the fear of missing out were risk factors of passive social network site use. Compared with the high addiction group, the girl's incidence rate of moderate use group decreased by 49% (OR=0.51, p<0.01), and the girl's incidence rate of minor use group decreased by 61% (OR=0.39, p<0.001). Compared with the high addiction group, when the fear of missing out increased by one unit, the incidence rate of minor use group would decrease by 46% (OR=0.54, p<0.01). ③There were significant differences in self-esteem among different potential categories of passive social network site use (χ^2=7.38，p<0.05). The high addiction group scored lowest on self-esteem and the minor use group scored highest. **Conclusion:** There is significant group heterogeneity in passive social network site use among college students, and there are differences in self-esteem among different groups. Targeted prevention and intervention measures can be carried out according to the characteristics of population classification. Passive social network site use can be reduced by alleviating the fear of missing out, so as to avoid low self-esteem.

Keywords: Passive social network site use, fear of missing out, self-esteem, latent profile analysis

网络游戏与独处行为的关系：基于交叉滞后分析的探讨

刘歆阳[2] 万富裕[2] 刘拓[1,2,3]（通讯作者）
1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387
2 天津师范大学心理学部，天津，300387
3 学生心理发展与学习天津市高校社会科学实验室，天津，300387，liutuo@tjnu.edu.cn

摘 要 在信息时代的背景下，网络游戏已经从一个新兴的娱乐活动逐渐转变为全球最大的产业之一。据调查，我国网络游戏用户规模已达 5.22 亿，占网民整体的 48.9%，是非常普遍的娱乐方式。适度地使用网络游戏能降低压力和焦虑，过量的网络游戏不仅会对个体的生理产生负面影响，还可能导致一系列严重的心理健康问题，例如社交的减少、成瘾行为的增加、情绪控制的降低，以及工作和学业受到干扰，并且这些负面影响可能会在较长时间内持续存在，因此网络游戏对于个体的影响备受心理学界的关注。近些年的研究发现独处行为与网络游戏有着密切的联系。独处行为指个体独自一人、没有与他人进行交流的状态，可以划分为积极独处、孤僻、社交回避和孤独。根据自我决定理论，个体健康的发展依赖于自主需要、胜任需要和关系需要，三种基本需要的满足。当个体在不同独处状态时，存在不同程度的关系需求，可能通过网络游戏来满足这种需求，并进一步影响个体的独处行为。本研究运用交叉滞后分析探讨网络游戏与独处行为的相互作用关系，采用简版独处行为量表（Short Form of Solitude Behavior Scale）和改编自前人研究的媒体使用问卷（Media Use Questionnaire）对 417 名大学生进行间隔两周的三次追踪测量，数据分析分别在 SPSS 26.0 和 Mplus 8.3 中进行。交叉滞后分析的结果表明，（1）积极独处、孤僻、社交回避、孤独和网络

游戏使用具有一定程度的稳定性。（2）积极独处与网络游戏使用具有双向预测关系，积极独处显著负向预测后一时间点的网络游戏使用，网络游戏使用也显著负向预测后一时间点的积极独处。孤独对随后的网络游戏使用具有显著的正向预测作用，但孤僻和社交回避无法预测随后的网络游戏使用。研究的模型均为饱和模型，故没有再报告模型拟合指标。本研究揭示了网络游戏与独处行为相互影响与预测的联系，特别是积极独处和孤独影响个体随后的网络游戏使用的研究结果，提示应对非适应性独处行为及早发现并进行干预，以减少对心理健康影响。

The relationship of video game and solitude behavior: A Cross-Lagged Panel Analysis

Xinyang Liu [2] Fuyu Wan [2] Tour Liu [1,2,3](Corresponding Author)
1 Key Research Base of Humanities and Social Sciences of the Ministry of Education, Academy of Psychology and Behavior, Tianjin Normal University, Tianjin 300387, China
2 Faculty of Psychology, Tianjin Normal University, Tianjin 300387, China
3 Tianjin Social Science Laboratory of Students' Mental Development and Learning, Tianjin 300387, China, liutuo@tjnu.edu.cn

***Abstract*:** Video games have gradually transformed from an emerging entertainment activity to one of the largest industries in the world. According to the survey, the number of video game users in China reached 522 million, accounting for 48.9% of the overall Internet users. Moderate use of video games can reduce stress and anxiety. Excessive use of video games not only negatively affected an individual's physiology, but may also lead to a series of serious mental health problems, such as reduced socialization, increased addictive behaviors, reduced emotional control, and interference with work and schooling, and these negative effects may persist over a long period of time, so the effect of video games on individuals have received a great deal of attention from the psychological community. Studies have found a close relationship between solitude behaviors and video games in recent years. Solitude behavior refers to a state in which an individual is alone and does not interact with others, and can be classified as positive solitude, eccentricity, social avoidance, and loneliness. According to Self-Determination Theory, the healthy development of an individual is dependent on the fulfillment of three basic needs, autonomy needs, competence needs, and relationship needs. When individuals are in different states of solitude, there are different levels of relational needs, which may be satisfied through video games and further influence the individual's solitude behavior. In this study, cross-lagged analysis was used to explore the relationship between video games and solitude behavior, and the Short Form of Solitude Behavior Scale and the Media Use Questionnaire were used to measure video game and solitude behavior among 417 college students three times at two-week intervals. Data analysis was performed in Mplus 8.3 and IBM SPSS 26.0. The results showed: (1) Positive solitude, eccentricity, social avoidance, loneliness, and video game use had stability. (2) Positive solitude negatively predicted video game use at a later time point, and video game use also negatively predicted positive solitude at a later time point. Loneliness was a significant positive predictor of subsequent video game use. Eccentricity and social avoidance did not predict video game use. The present study revealed the link between video games and solitude behavior, particularly the findings that positive solitude and loneliness influence individuals' subsequent video game use, suggesting that non-adaptive solitude behavior should be detected and intervened with early to reduce the impact on mental health.

摘 要

背景：儿童青少年在日常生活中正逐渐使用人工智能（Artificial intelligence, AI），同时他们也是技术依赖的风险人群，探讨儿童青少年 AI 使用现状及其与技术依赖的关系具有重要意义。为此，借助层级 CMC 分类框架，本研究从 AI 使用数量、使用时间、使用类型和使用内容四个水平调查儿童青少年 AI 使用现状，并探讨 AI 使用与儿童青少年 AI 依赖的关系。

方法：研究 1 分析了 5015 名青少年（男=2498，年龄 = 13.47±2.46）的 AI 使用数量和 AI 使用时间及其对 AI 依赖的影响。研究 2 分析了 3021 名四/八年级学生（四年级=1610，男=793；八年级$_{男}$=730）的 AI 使用类型和使用内容的现状及其对 AI 依赖的影响。测查工具包括 AI 使用数量（1 题）、使用时间（2 题）、使用类型（4 题）、使用内容（13 题）和 AI 依赖问卷（5 题）。

结果：研究 1 中，青少年使用 AI 数量占比为：从未使用过(11.4%)、1-5 种(70.7%)、5 种以上(18%)。上学日使用 AI 情况为：不使用 AI(56.2%)、2 小时及以上(3.4%)；休息日 AI 使用情况：不使用(21.7%)、2 小时及以上(18.9%)。回归分析表明 AI 使用时间正向预测 AI 依赖，AI 使用数量负向预测 AI 依赖。研究 2 中，四年级学生在虚拟助手、AI 小程序或 APP、类人化 AI 机器、非类人化 AI 机器等四种使用类型上的“未使用”的比例分别是 13%、48.8%、63.3%、53.7%；八年级学生该比例依次是 10.7%、41.4%、77.7%、62.0%。AI 使用类型最多的是移动设备及对应的虚拟助手，其次是智能音箱、扫地机器人等。回归分析表明，四年级中，仅使用虚拟助手正向预测 AI 依赖；八年级中，使用虚拟助手和使用 AI 小程序均正向预测 AI 依赖。此外，13 种 AI 使用内容中（如使用 AI 辅助学习、绘画、创作等），四年级仅使用 AI 辅助游戏和使用 AI 辅助康复正向预测 AI 依赖；八年级中使用 AI 日常聊天、辅助游戏、音乐创作、辅助学习正向预测 AI 依赖。

结论：大部分儿童青少年有 AI 使用的经历，且集中在周末，基于移动设备的虚拟 AI 是其主要的使用类型。使用 AI 数量越多更不容易依赖 AI，而使用 AI 时间越长则越容易依赖 AI。不同的 AI 类型和 AI 使用内容对四/八年级学生 AI 依赖影响不一致。

关键词 人工智能使用，人工智能依赖，儿童青少年

Status of artificial intelligence use among children and adolescents and its relationship with artificial intelligence dependence

***Abstract*:**

BACKGROUND: Children and adolescents are gradually using artificial intelligence (AI) in their daily lives, and at the same time, they are also at risk for technology dependence, so it is important to explore the current status of AI use among children and adolescents and its relationship with technology dependence. To this end, based on hierarchical CMC taxonomy framework, this study investigated the current status of AI use among children and adolescents in terms of the number of AI use, AI use duration, AI use types, and AI use content, and explored the relationship between AI use and children's and adolescents' dependence on AI.

METHODS: Study 1 analyzed the amount of AI use and time spent on AI use and its effect on AI dependence in 5015 adolescents (male = 2498, age = 13.47 ± 2.46). Study 2 analyzed the current status of type of AI use and content of use and its effect on AI dependence in 3021 fourth/eighth graders (fourth grade = 1610, male = 793; eighth grade male = 730). Measurement instruments included AI use quantity (1 item), AI use time (2 items), AI use types (4 items), AI use content (13 items), and the AI dependency questionnaire (5 items).

RESULTS: In Study 1, the percentage of the number of AI use was: never used (11.4%), 1~5 products (70.7%), and more than 5 products (18%). AI use on school days was: no AI use (56.2%), 2 hours or more (3.4%), and AI use on weekends: no use (21.7%), 2 hours or more (18.9%). Regression analysis showed that AI use time positively predicted AI dependence and AI use quantity negatively predicted AI dependence. In Study 2, the proportions of fourth-grade students who “did not use” virtual assistants, AI mini program or APPs, human-like AI machines, and non-human-like AI machines were 13%, 48.8%, 63.3%, and 53.7%, respectively; and the proportions of eighth-grade students were 10.7%, 41.4%, 77.7%, and 62.0%, respectively. The most popular AI use types were mobile devices and the corresponding virtual assistants, followed by intelligent speakers, sweeping robots, and so on. Regression analysis showed that in grade 4, only the use of virtual assistants positively predicted AI dependence; in grade 8, both the use of virtual assistants and the use of AI Mini Program/Apps positively predicted AI dependence. In addition, of the 13 AI use contents (e.g., use AI for assisted learning, drawing, and creating, etc.), only the use of AI-assisted gaming and the use of AI-assisted rehabilitation positively predicted AI dependence in grade 4; in grade 8, the use of AI for daily chatting, assisted gaming, music creation, and assisted studying positively predicted AI dependence.

CONCLUSION: The majority of children and adolescents experienced AI use and their usage were mainly on weekends, with virtual AI on mobile devices being the main AI use type. More number of AI use was less likely to be AI dependent, while longer AI use time was more likely to be AI dependent. Different AI use types and AI use content had inconsistent effects on AI dependence among 4th/8th graders.

摘 要 【背景】包括 ChatGPT 在内的人工智能工具对人们生活产生了革命性影响，例如可能影响个体的创造性思维。然而，个体使用 ChatGPT 可能会受到人工智能焦虑的影响。因此，本研究旨在探讨认知思维类型与 ChatGPT 使用之间的关系。【方法】本研究招募 454 名中国人（平均年龄 22.7±3.6 岁），基于问卷法和在线实验法，分别使用人工智能焦虑量表、自编 ChatGPT 使用问卷、多用途任务范式和远距离联想范式，分别用于测量人工智能焦虑、ChatGPT 使用时间、ChatGPT 使用频率、发散思维和聚合思维。【结果】结果显示，AI 焦虑与 ChatGPT 使用时间（r=-0.176，p＜0.001）、ChatGPT 依赖（r=-0.097，p＜0.05）和聚合思维呈负相关（r=-0.134，p＜0.01）。ChatGPT 使用时间与发散思维呈正相关（r=0.116，p＜0.05）。在中介分析中，AI 焦虑通过直接路径显著预测聚合思维（Estimate=-0.173，p=0.003）。AI 焦虑可以通过 ChatGPT 使用时间显著预测个体的发散思维（Estimate=-0.087，p=0.013），但不能预测个体的聚合思维（Estimate=0.005，p=0.69）。也就是说，当个体的 AI 焦虑水平较低且 ChatGPT 使用时间较长时，其发散思维较高，但聚合思维并不增加。ChatGPT 依赖不能作为 AI 焦虑与创造性思维之间因果关系的中介。随着 AI 焦虑水平的降低，个体可能变得依赖于 ChatGPT，但这种依赖并不能帮助提高他们的发散或聚合思维。【结论】本研究结果表明 AI 焦虑对个体的发散思维有一定影响，ChatGPT 使用时间作为 AI 焦虑与发散思维之间的中介，这对于理解人们在使用人工智能技术时的心理状态和思维方式具有重要意义。

***Abstract*：** The advent of artificial intelligence (AI) tools, such as ChatGPT, has revolutionized various

aspects of human life, including potentially influencing individual creative thinking. However, the use of ChatGPT may also be associated with AI anxiety. This study aims to explore the relationship between cognitive thinking styles and the utilization of ChatGPT, while considering the influence of AI anxiety. A total of 454 Chinese participants (mean age 22.7±3.6 years) were recruited for this research. Data was collected through questionnaires and online experiments, including the Artificial Intelligence Anxiety Scale, a self-developed ChatGPT usage questionnaire, a multitasking paradigm, and a remote association paradigm. These measures were utilized to assess AI anxiety, ChatGPT usage time and frequency, divergent thinking, and convergent thinking.The results revealed significant negative correlations between AI anxiety and both ChatGPT usage time ($r=-0.176$, $p<0.001$) and ChatGPT dependency ($r=-0.097$, $p<0.05$), as well as a negative correlation with convergent thinking ($r=-0.134$, $p<0.01$). Moreover, a positive correlation was found between ChatGPT usage time and divergent thinking ($r=0.116$, $p<0.05$). Mediation analyses indicated that AI anxiety significantly predicted convergent thinking directly (Estimate=-0.173, $p=0.003$), while it indirectly influenced divergent thinking through ChatGPT usage time (Estimate=-0.087, $p=0.013$). However, AI anxiety did not predict individual convergent thinking (Estimate=0.005, $p=0.69$), suggesting that longer ChatGPT usage time and lower AI anxiety levels were associated with increased divergent thinking, but not with enhanced convergent thinking. Furthermore, ChatGPT dependency was not found to mediate the relationship between AI anxiety and creative thinking.These findings highlight the impact of AI anxiety on individual divergent thinking and indicate that ChatGPT usage time acts as a mediator between AI anxiety and divergent thinking. Understanding the psychological state and thinking patterns of individuals when utilizing AI technology is crucial in the context of the increasing prevalence of artificial intelligence in society.

在线风险暴露的基本状况与潜在类别：变量与个体中心双视角

靳康悦　张亚利

河北师范大学教育学院，石家庄，050024，33342052352@qq.com

目的：近年来，大量研究关注了网络过度使用现象，对该现象的发生率以及在人口学变量上的表现特点进行了探讨。然而，关于网络使用中可能存在的风险暴露问题却未充分关注，对不同人群中表现出的差异未做详实的分析，同时，关于在线风险暴露的研究大都基于变量中心视角，尚未有研究基于个体中心的视角对该现象的特点和影响因素加以分析。因此本研究拟从变量与个体中心双视角下探究在线风险暴露的基本状况与潜在类别，弥补国内该领域研究资料不足的现状，为相关领域的研究人员和决策者提供一手资料。方法：本研究使用在线风险暴露量表对我国 11 个省份的 14 所高校共 2538 名大学生进行施测。结果：(1)大学生在线风险暴露的发生率为 70.9%，其中不良内容接触的发生率为 54.8%占比最高。此外，性别、独生与否、生源地和恋爱状态是影响在线风险暴露程度的重要因素。(2)大学生在线风险暴露的潜在类别可分为安全组(67.8%)、内容暴露组(24.4%)和风险组(7.8%)。此外，性别、生源地、恋爱状态和每日上网时长是影响在线风险暴露潜在类别划分的重要因素。结论：大学生在线风险暴露较为普遍且存在异质性，应从变量和个体中心双视角分析在线风险暴露的基本情况和潜在类别，从而有针对性的对大学生在线风险暴露问题加以预防和控制。

The Basic Situation and Potential Categories of Online Risk Exposure: A Dual Perspective of Variables and Person -Centered

JIN Kang-yue ZHANG Ya-li
Hebei Normal University , Shijiazhuang, 050024

Abstract Objective: In recent years, a large number of studies have focused on the phenomenon of Internet overuse, and discussed the incidence of this phenomenon and its characteristics in Demography variables. However, insufficient attention has been paid to the potential risk exposure issues in online use, and detailed analysis has not been conducted on the differences exhibited by different populations, At the same time, research on online risk exposure is mostly based on a variable centered perspective, and there is no research that analyzes the characteristics and influencing factors of this phenomenon from an individual centered perspective. Therefore, this study aims to explore the basic situation and potential categories of online risk exposure from a dual perspective of variables and individual centers, to make up for the lack of research data in this field in China, and to provide first-hand information for researchers and decision-makers in related fields. Method: This study used the online risk exposure scale to test a total of 2538 college students from 14 universities in 11 provinces of China.Result: (a) The incidence of online risk exposure among college students is 70.9%, with the highest incidence of adverse content exposure being 54.8%. In addition, gender, only child status, place of origin, and romantic status are important factors that affect the level of online risk exposure. (b) The potential categories of online risk exposure for college students can be divided into security group (67.8%), content exposure group (24.4%), and risk group (7.8%). In addition, gender, place of origin, romantic status, and daily online duration are important factors that affect the classification of potential categories of online risk exposure. Conclusion: College students' online risk exposure is common and heterogeneous. The basic situation and potential categories of online risk exposure should be analyzed from the perspectives of variables and individual centeredness, in order to prevent and control the problem of college students' online risk exposure in a targeted manner.

Keyword: College students, online risk exposure, incidence, potential profile analysis

父母干预与青少年手机成瘾的关系：心理阻抗和获益解释的作用

张永欣[1] 陈冰然[1] 彭欠欠[2]（通讯作者）孙会杰[1] 黄辉洋[1]
1 信阳师范大学教育科学学院，信阳，464000
2 商丘工学院教育与现代艺术学院，商丘，476000，shangpqq@163.com

摘 要 随着网络不断发展和手机日益普及，电子游戏、短视频、电子小说等数字化内容日益渗透儿童青少年的日常生活，父母因此不得不对儿童青少年的手机使用进行监控、管理，以帮助其合理正确使用尤其是避免手机成瘾，父母的这些行为被研究者称为父母干预 (parental mediation)。但以往研究发现父母干

预对青少年手机成瘾的影响不一致，本研究将父母干预分为积极型干预（如共同使用、主动干预）和限制型干预（如约束、监控、技术限定），基于心理阻抗理论考察两类干预与青少年手机成瘾的关系及其心理机制。采取方便抽样，对河南省三所中小学六至九年级学生共计 822 人（被试平均年龄为 13.38 岁，标准差为 1.35 岁）进行问卷调查，采用青少年手机成瘾量表、父母干预问卷、状态心理阻抗量表、父母干预的获益解释问卷，以班级为单位进行团体施测，结果表明：（1）本研究中 172 名中小学生可诊断为手机成瘾，检出率为 20.9%；（2）限制型父母干预和积极型父母干预均与青少年获益解释、手机成瘾呈显著正相关；限制型父母干预与青少年状态心理阻抗呈显著正相关，但积极型父母干预与青少年状态心理阻抗相关不显著；（3）限制型父母干预显著正向预测青少年手机成瘾，但积极型父母干预对青少年手机成瘾预测作用不显著；（4）状态心理阻抗在限制型父母干预和青少年手机成瘾之间起中介作用，获益解释调节该中介路径前半段，具体表现为：当青少年的获益解释较高时，限制型父母干预对青少年状态心理阻抗的影响被减弱。该研究结果表明，不同类型的父母干预策略对青少年手机成瘾的作用不同，相较于积极型干预，限制型父母干预是青少年手机成瘾的风险因素，主要通过激发青少年的心理阻抗起作用，而青少年对父母干预的主观认知（获益解释）会影响干预的效果。

关键词　父母干预，手机成瘾，状态心理阻抗，获益解释。

The relationship between parental mediation and adolescent mobile phone addiction: The role of psychological resistance and benefit explanation

Zhang Yongxin[1], Chen Bingran[1], Peng Qianqian[2*], Sun Huijie[1], Huang Huiyang[1]
1 School of Education Science, Xinyang Normal University, Xinyang 464000;
2 School of Education and Modern Art, Shangqiu Institute of Technology, Shangqiu, 476000

Abstract：With the continuous development of the Internet and the increasing popularity of mobile phones, digital content such as electronic games, short videos and electronic novels are increasingly penetrating into the daily lives of children and teenagers. Therefore, parents have to monitor and manage the use of mobile phones by children and teenagers to help them use mobile phones reasonably and correctly, especially to avoid mobile phone addiction. These behaviors of parents are called parental mediation by researchers. However, previous studies have found that parental mediation has inconsistent effects on adolescent mobile phone addiction. In this study, parental mediation is divided into active mediation (such as co-use and active mediation) and restrictive intervention (such as restraint, monitoring and technical restriction). Based on the psychological resistance theory, the relationship between these two types of parental mediation and adolescent mobile phone addiction and its psychological mechanism are investigated. A total of 822 students (M_{age} = 13.38, *SD* = 1.35) from grades 6 to 9 in three primary and secondary schools in Henan Province were investigated by means of convenient sampling. Adolescent mobile phone addiction scale, parental mediation questionnaire, state psychological resistance scale, and benefit explanation questionnaire of parental mediation were used as a group test unit. The results showed as follows: (1) In this study, 172 primary and secondary school students could be diagnosed as mobile phone addiction, with a detection rate of 20.9%. (2) Both restrictive parental mediation and active parental mediation were significantly positively correlated with adolescents' benefit explanation and mobile phone addiction; there was a significant

positive correlation between restrictive parental mediation and adolescent state psychological resistance, but there was no significant correlation between active parental mediation and adolescent state psychological resistance. (3) Restrictive parental mediation is a significant positive predictor of adolescent mobile phone addiction, but active parental mediation is not a significant predictor of adolescent mobile phone addiction. (4) State psychological resistance played a mediating role between restrictive parental mediation and adolescents' mobile phone addiction, and benefit explanation moderated the first half of this mediating pathway. Specifically, when adolescents' benefit explanation was high, the influence of restrictive parental mediation on adolescents' state psychological resistance was weakened. The results of this study showed that different types of parental mediation strategies have different effects on adolescents' mobile phone addiction. Compared with active parental mediation, restrictive parental mediation is a risk factor for adolescents' mobile phone addiction, mainly through stimulating adolescents' psychological resistance, and adolescents' subjective cognition of parental mediation (such as benefit explanation) will affect the effect of the intervention.

Keywords：parental mediation, mobile phone addiction, state psychological resistance, benefit explanation

情绪状态与求助者类型对网络利他行为的影响

鲁婷（通讯作者） 刘珂菁 高香莉

湖北大学心理学系，武汉，430062，tinglu@hubu.edu.cn

摘 要 随着互联网的发展，网络利他行为已成为了新的利他行为模式。感恩、负债感等情绪状态与大学生现实中的利他行为的关系已被许多研究所证实。另有研究表明求助者类型与利他行为有密切关联，具体表现为相较于陌生人，人们更倾向于对施助者表现出利他行为。但以往研究多是探讨现实中利他行为的影响因素，且较多从单一角度探讨利他行为的影响因素。本研究通过实验选取湖北省某高校 120 名大学生，采用施助者和陌生人两种刺激情境以及改编的感恩和负债感两种剧本，通过微信聊天软件创造真实的网络情境，采用人性的哲学量表(PHN)利他主义分量表、自编的情绪状态和网络利他行为测评工具测量大学生的利他观念、情绪状态、利他行为以及再利他行为。实验采用 2(情绪状态：感恩、负债感)*2(求助者类型：施助者、陌生人)被试间实验设计。最终回收有效数据 118 份，其中男生、女生均 58 人，平均年龄 20.38±1.29 岁，通过构建结构方程模型分析，考察情绪状态(感恩、负债感)与求助者类型(陌生人、施助者)对大学生网络利他行为的作用及差异。结果显示：(1)在利他行为上，求助者类型主效应显著，情绪状态与求助者类型的交互作用显著；在再利他行为上，情绪状态与求助者类型的交互作用显著；(2)在感恩情绪状态下，相较于陌生人，施助者更能获得网络利他行为；在负债感情绪状态下，相较于施助者，陌生人更能获得网络再利他行为。(3)在施助者背景下，感恩情绪能够显著正向预测网络利他和再利他行为；在陌生人背景下，负债感能够正向预测网络利他行为，并且利他行为能够正向预测再利他行为。研究结果表明不同情绪状态对于施助者/陌生人的网络利他及再利他行为存在不同的影响，研究结果有助于了解网络利他行为的作用机制，同时对于维护网络环境的安定和谐具有一定的参考价值。

The effect of emotional state and help-seeker type on online altruism

LuTing Liu Kejing Gao Xiangli
Department of Psychology, Hubei University, Wuhan, 430062, tinglu@hubu.edu.cn

Abstract: With the development of the Internet, outline altruism has become a new model of altruism. The relationship between emotional states such as gratitude and sense of debt and college students' altruistic behavior in reality has been confirmed by many studies. Other studies have shown that the type of help seekers is closely related to altruistic behavior, specifically, compared with strangers, people are more inclined to show altruistic behavior toward the help giver. However, most of the previous studies focused on the influencing factors of altruistic behavior in reality, and most of them discussed the influencing factors of altruistic behavior from a single perspective. In this study, 120 college students in a university in Hubei Province were selected through the experiment, and the real outline situation was created through wechat chat software by using two stimulus situations of helper and stranger and two adapted scripts of gratitude and debt. The altruistic concept, emotional state, altruistic behavior and re-altruistic behavior of college students were measured by the Philosophical Scale of Human Nature (PHN) altruism subscale, self-designed emotional state and online altruistic behavior assessment tools. The experiment was designed among 2 subjects (emotional state: gratitude, sense of debt)*2(type of help-seeker: donor, stranger). Finally, 118 valid data were collected, including 58 males and 58 females, with an average age of 20.38±1.29 years old. Through structural equation model analysis, the effects and differences of emotional state (gratitude, debt) and types of help seekers (strangers, helpers) on online altruism of college students were investigated. The results showed that: (1) In altruistic behavior, the main effect of help-seeking type was significant, and the interaction between emotional state and help-seeking type was significant; In the re-altruism behavior, the interaction between emotional state and help-seeking type is significant; (2) In the state of gratitude, compared with strangers, donors are more likely to obtain online altruistic behavior; In the indebted emotional state, strangers are more likely to obtain realtruistic behavior online than helpers. (3) In the context of helpers, gratitude can significantly positively predict outline altruism and re-altruism behavior; In the context of strangers, the sense of debt can positively predict the outline altruistic behavior, and the altruistic behavior can positively predict the re-altruistic behavior. The results show that different emotional states have different effects on the outline altruism and re-altruism behavior of helpers/strangers. The study results are helpful to understand the mechanism of outline altruism behavior, and have certain reference value for maintaining the stability and harmony of outline environment.

手机自我扩展对大学生手机拍照中“谷歌效应”的影响

车天可[1]　谢笑春[1]（通讯作者）
1 东北师范大学心理学院，长春，130024，xiexc713@nenu.edu.cn

摘 要　随着科技的发展，手机等移动设备、电脑以及互联网逐渐成为人们存储和提取信息的主要资源。手机拍照功能的广泛使用使得拍摄、存储和分享照片变得更加便利，也使得人们存储一些信息变得更加容易。以往研究发现，互联网的使用可能会对个体的记忆和认知自尊造成损伤，研究者们将这种消极影响称为“谷歌效应”。然而，相关研究集中在互联网使用行为中检验这一结果，较少研究关注智能手机等移动设备使用的影响，也未探讨手机自我扩展对这种“谷歌效应”的作用。本研究以前人研究为基础，通过两个实验，探究手机拍照对个体记忆和认知自尊的影响，检验互联网的“谷歌效应”是否可以推广到智能手机使用中，并探讨手机自我扩展水平对该效应的影响。实验一通过单因素被试间设计考察了手机拍照对个体文本信息记忆效果和认知自尊的影响。结果显示，相比于不使用手机拍照的个体，使用手机拍照的个体对于文本信息的记忆效果更差，拥有的认知自尊更高。实验二在实验一的基础上，通过单因素被试间设计探讨手机自我扩展水平在手机拍照影响个体记忆和认知自尊中的作用。结果显示，相比于不使用手机拍照的个体，无论是使用自己手机（高自我扩展）还是他人手机（低自我扩展）拍照的个体，对于文本信息的记忆效果都更差；相比于使用他人手机拍照的个体，不拍照和使用自己手机拍照的个体拥有的认知自尊都更低。本研究将互联网中的“谷歌效应”推广到智能手机使用当中，丰富了该领域的研究结果，对该方面的探讨有利于青少年生活、学习方式的改善与优化。

关键词　手机自我扩展，交互记忆，认知自尊，谷歌效应，大学生

The effect of self-expansion via smartphone on the Google effect in photo-taking of college students

Tianke Che, Xiaochun Xie
School of Psychology, Northeast Normal University, Changchun

Abstract：With the advancement of technology, mobile devices such as smartphones, computers, and the internet have gradually become the primary resources for people to store and retrieve information. The widespread use of camera phones has made it easier than ever to capture, store, and share photographs. Previous studies have found that internet use may have detrimental effects on individuals' memory and cognitive self-esteem, which researchers refer to as the “Google effect”. However, these studies have mainly focused on the internet use behavior and have paid less attention to the effects of using mobile devices like smartphones, as well as the role of self-extension via smartphone in this “Google effect”. Based on previous studies, the present study investigates the effects of photo-taking on individuals' memory and cognitive self-esteem in two experiments, examines whether the "Google effect" can be generalized to smartphone use, and explores the influence of the self-expansion via smartphone on this effect. Experiment 1 examined the effects of taking photos on smartphones on individuals' memory effects for textual information and cognitive self-esteem through a one-factor between subject design. The results showed that individuals who used smartphones to take photos had poorer memory for text information and higher cognitive self-esteem than those who did not take photos. Experiment 1 examined the effects of taking photos on smartphones on college students' memory effects for textual information and cognitive self-esteem

through a one-factor between subject design. The results showed that participants who used smartphones to take photos had poorer memory for text information and higher cognitive self-esteem than those who did not take photos. Building upon Experiment 1, Experiment 2 explored the role of self-expansion via smartphone in the effect of photo-taking on college students' memory and cognitive self-esteem through a one-factor between subject design. The results showed that participants who took photos with their own smartphones (high self-expansion level) or control smartphones (low self-expansion level) remembered the text information more poorly than those who did not take photos, and that participants who did not take photos and those who took photos with their own smartphones had lower cognitive self-esteem than those who took photos with control smartphones. This study extends the "Google effect" observed on the internet to smartphone usage, enriches the research findings in this field, and contributes to the improvement and optimization of the lifestyles and learning styles of young people.

Keywords：self-expansion via smartphone，transactive memory，cognitive self-esteem，Google effect, college students

心理忽视对大学生网络引战的影响：孤独感和反刍思维的中介作用以及网络去抑制的调节作用

摘 要 网络引战是一种新兴网络攻击行为，其通过传播具有挑衅性、攻击性和恶意的信息来故意制造冲突，引发网络骂战。与网络欺负相比，网络引战的攻击对象更广泛，对网络环境和社会的影响也更严重。其容易导致受害者出现负面心理、自杀行为和社会舆论极化，严重扰乱社会秩序。研究显示，高达 71.2%的大学生每周至少参与一次网络引战。因此，网络引战已经成为一个严重的社会问题。目前研究主要集中于负性心理特征，而较少考虑家庭因素。本研究从心理发展和家庭教养方式的角度，以心理忽视作为自变量探究其与网络引战的关系。心理忽视指监护人长期忽视儿童在情感、教育、身体健康等方面的基本需求，其破坏了儿童与依赖者的安全依恋，严重危害儿童的心理健康成长，阻碍情绪调节、共情、认知归因和应激反应正常发展，使个体在人际交往中容易表现出敌意和攻击行为。以往研究表明，大学生儿童期心理忽视与网络欺凌行为呈正相关。因此，研究根据依恋理论和风险增强效应选择心理忽视作为自变量，孤独感和反刍思维作为中介变量，网络去抑制作为调节变量，构建有调节的链式中介模型，探究四者与网络引战的关系。研究使用心理忽视量表、孤独感量表、反刍思维量表、网络引战量表、网络去抑制量表对 1014 名大学生进行施测，使用 SPSS26.0 对数据进行统计分析。结果表明：（1）大学生童年期受到的心理忽视越多，网络引战行为越多。（2）反刍思维在心理忽视对网络引战的影响中的中介作用显著，且反刍思维和孤独感的链式中介作用显著。（3）网络去抑制增加反刍思维对大学生网络引战行为的预测作用。本研究以网络使用主体青年群体为研究对象，关注了网络中普遍存在的引战行为，首次探索了童年心理忽视与成年大学生网络引战之间的关系和作用机制。同时，研究综合考虑了个人特质、家庭教养方式和网络环境三个方面的变量，为中小学家庭教育和学校教育提供思路，旨在寻找改善恶劣引战的解决方案，以建立更文明的网络环境并促进青少年的健康成长。

关键词 心理忽视，网络引战，孤独感，反刍思维，网络去抑制

The Relationship between Psychological Neglect and College Students' Online Trolling: Mediating Effect of Loneliness and Rumination and Moderating Effect of Online Disinhibition

Yiping Zhou, Jingjing Liang, Wuzuo Yang, Jing Liu, Hongyu Liu, Li Fang
School of Psychology, Sichuan Normal University, Chengdu, China

Abstract ： Online trolling is a new type of cyberattack, which intentionally creates conflicts and triggers users by disseminating provocative, offensive and malicious information. Compared to cyberbullying, online trolling has wider targets and more serious impacts on online environment and society. It often leads to negative psychology, suicide among victims and polarization of public opinion, thus seriously disrupting the social order. Research shown that up to 71.2% college students engage in online trolling at least once a week, highlighting the severity of this social problem. Previous studies mainly focus on negative psychological traits associated with online trolling. Present study, with psychological neglect as the independent variable, explores the relationship between psychological neglect and online trolling from psychological development and family upbringing. Psychological neglect refers to when children's basic needs for emotional support, education, and physical health are ignored by their guardians for a prolonged period. This neglect destroys the secure attachment between children and caregivers, putting their psychological well-being at risk. Furthermore, it hinders the development of crucial skills such as emotion regulation, empathy, cognitive attribution, and stress response. As a result, individuals are more likely to exhibit hostile and aggressive behaviors in their relationships with others. Previous studies have shown that college students' childhood psychological neglect is positively associated with cyberbullying. The study chose psychological neglect as the independent variable, loneliness and rumination thinking as the mediating variables, and online disinhibition as the moderating variables based on attachment theory and risk enhancement effect, constructing a moderated chain mediation model to explore its' relationship with online trolling. To explore the relationship between psychological neglect and college students' online trolling and the mediating mechanisms between them, a total of 1014 college students completed the Child Psychological Neglect Scale, the Loneliness Scale, the Ruminative Responses Scale, the Online Disinhibition Scale, the Global Assessment of Internet Trolling. The data were statistically analyzed by using SPSS 26.0. The results showed that psychological neglect was positively related to college students' online trolling. Rumination played a mediating role between psychological neglect and online trolling. Loneliness and rumination played a chain mediating role between psychological neglect and online trolling. Online Disinhibition moderated the relationship between rumination and online trolling. With the youth group as the primary of internet users and concerned about the prevalence of online trolling, this study is the first to explore the relationship and mediating mechanism between childhood psychological neglect and college students' online trolling. Additionally, this study takes personal traits, family upbringing, and online environment as important variables. It aims at offering insights for primary and secondary school education, as well as cultivating the awareness to foster a more civil online environment. Ultimately, the study is beneficial for the healthy development of young individuals.

Key words**:** psychological neglect, rumination, loneliness, online trolling, online disinhibition

基于网络分析的听障青少年心理健康问题研究

张思羽[1] 翟梦晓[1] 吴瑞强[1] 徐夫真[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，徐夫真，xufuzhen@sdnu.edu.cn

摘 要 听障青少年由于先天或后天原因导致了不同程度的听力损失，这种生理缺陷可能会引发心理健康问题。已有研究发现，总体上听障青少年的焦虑、抑郁水平高于听健青少年。先前研究更多采用心理健康问题相关问卷得分来测查其心理健康问题，难以识别症状之间的联系。精神疾病网络理论指出，干预心理健康问题的核心是改变网络核心症状的状态，促使网络分布结构发生变化，从而达到治疗效果。而使用网络分析方法能够可视化听障青少年心理健康问题之间具体症状的关联，识别网络核心症状，提供更有针对性的听障青少年心理健康服务。本研究旨在关注听障青少年心理健康问题的网络结构，选取山东省特殊教育学校中 829 名听障青少年为研究对象，采用听障青少年自我报告的中文健康问卷，使用 R 语言进行网络模型的建构与估计。结果表明，“失去信心了吗”是心理健康问题网络的中心节点，其预期影响值为 2.21，表明其在网络中发挥重要作用。其中，节点“感到痛苦和忧虑吗”和节点“失去信心了吗”联系最为紧密，表明两者具有很强的关联性。项目相关稳定性系数为 0.52，表明该网络结构具有较好的稳定性。因此，失去信心是本研究听障青少年心理健康问题网络的核心症状，在针对听障青少年心理健康的干预措施中注重增强听障青少年的自信心可能会提升干预效果，有助于缓解听障青少年的心理健康问题。

关键词 听障青少年，心理健康问题，网络分析

Network analysis for mental health problems in hearing-impaired adolescents

Siyu Zhang[1], Mengxiao Zhai[1], Ruiqiang Wu[1], Fuzhen Xu[1](Corresponding Author)

1 School of Psychology, Shandong Normal University, Jinan, 250014, Fuzhen Xu, xufuzhen@sdnu.edu.cn

Abstract: Hearing-impaired adolescents may experience varying degrees of hearing loss due to congenital or acquired reasons, which may lead to mental health problems. Existing research has indicated that hearing-impaired adolescents have higher levels of anxiety and depression compared to their hearing peers. However, most prior studies have relied on scores from questionnaires assessing mental health problems, making it difficult to identify the interconnections among symptoms. The network theory of mental disorder suggests that the core of intervening in mental health problems lies in altering the state of core symptoms in the network, inducing changes in the distribution structure, and thus achieving therapeutic effects. Therefore, using network analysis methods can visualize the specific associations among mental health problems in hearing-impaired adolescents, identify core symptoms in the network, and provide more targeted mental health services for this population. The aim of this study is to examine the network structure of mental health problems among hearing-impaired adolescents. A sample of 829 hearing-impaired adolescents from special schools in Shandong Province was recruited, and a self-reported Chinese health questionnaire was employed. Network models were constructed and estimated using the R programs. The results indicate that “Have you lost confidence?” is the central node in the network of mental health problems, with an expected influence value of 2.21, highlighting its critical role in the network. Specifically, the node “Do you feel pain and anxiety?” has the strongest association with the node “Have you lost confidence?”, indicating a robust linkage between the two. The item-related stability coefficient is 0.52, suggesting good stability of the network structure. Therefore, loss of confidence emerges as the core symptom in the network of mental health problems among hearing-impaired adolescents in this study. Emphasizing the enhancement of

self-confidence among hearing-impaired adolescents in interventions targeting their mental health may improve intervention effectiveness and contribute to alleviating their mental health problems.

“人比人，气死人”？游戏玩家群体内与群体外社会比较的神经机制：一项 fMRI 研究

方子杰[1] 文宏伟[1] 周玉红[1] 高雪梅[1]（通讯作者）

1 西南大学心理学部，重庆，400715，通讯作者 zhenggao@swu.edu.cn

摘 要 社会比较是个人定义其社会特征的重要方式，而拥有大量社交信息的在线游戏为玩家之间的社交比较提供了一个方便的平台。然而，很少有研究关注电子游戏背景下玩家之间的社会比较机制。本研究试图通过功能磁共振成像（fMRI）和点估计范式探讨玩家在群体间和群体内情境下社会比较的神经机制。

实验纳入了 26 名被试（17 名男性，9 名女性，平均年龄 21.62 岁）。社会比较的维度（同化/对比）和方向（向上/向下）被同时纳入实验变量，经由最小群体范式操控维度，而使用点估计范式操控方向。通过 2×2 的实验设计，详细分析了大脑区域在不同社会比较情境下的激活情况。研究结果发现，与向上比较相比，向下比较导致的大脑激活显著不同。当比较对象的群体身份与玩家的群体身份相同时，引起同化效应，向下比较显著激活了梭状回、壳核、豆状核、楔前回和中央前回。当比较对象的群体身份与玩家的群体身份不同时，引起对比效应，向下比较显著激活了角回、额中回和额上回。一方面，无论是群体内还是群体间比较，向下的社会比较都激活了奖赏相关的脑区。另一方面，不同群体比较情境下，脑区激活存在差异，群体内的向下比较会引发自我参照与负面情绪，群体外则会因为激发积极情绪和目标导向动机。这表明，社会比较方向和维度的认知过程相对独立却又存在交互效应。

研究结果发现，群体认同对玩家社会比较的认知过程具有调节作用，并从神经机制的角度为游戏成瘾的原因提供了一种新的可能性。

关键词 社会比较，群体认同，社会神经科学，游戏成瘾

Comparisons are Odious? The Neural Mechanism of Intergroup and Intragroup Social Comparison among Game Players : An fMRI Study

Zijie Fang [1], Hongwei Wen [1], Yuhong Zhou [1], Xuemei Gao[1]

[1] Faculty of Psychology, Southwest University, Chongqing, China

Abstract：Social comparison is an important way for individuals to define their social characteristics, and online games with a large amount of social information provide a convenient platform for social comparison between players. However, few studies have focused on the social comparison mechanisms between players in the context of electronic games. This study tried to explored the neural mechanism of intergroup and intragroup social comparison among players through fMRI and dot estimation paradigm.
26 participants participated in our experiment. We considered the dimensions (assimilation/contrast) and directions (up/down) of social comparison simultaneously, manipulated the dimensions through the minimum group paradigm, and used dot estimation paradigm to manipulate the direction. Through a 2×2 experimental design, we set a detailed analysis of the activation of brain regions in different social comparison contexts. The results showed that compared to upward comparison, downward comparison resulted in significantly different brain activation. When the group identity of the comparison object is as same as that of the player, it causes assimilation effect, and downward comparison significantly activates the fusiform gyrus, putamen, lentiform nucleus, precuneus and precentral gyrus. When the group identity of the comparison object is different from that of the player, the contrast effect is caused, and downward comparison significantly activates the angular gyrus, middle frontal gyrus and superior frontal gyrus. On the one hand, whether it's intergroup or intragroup, downward social comparisons activate reward related brain regions. On the other hand, there are differences in brain activation between intergroup and intragroup comparison. Intragroup downward comparison within the group can trigger self-reference and negative emotions, while Intergroup downward comparison can trigger positive emotions and goal oriented motivation. This indicates that the cognitive process of social comparison direction and dimension is relatively independent but has interactive effects.
Our research proves that group identity can moderate the cognitive process of players' social comparison and provides a new possibility for the causes of gaming addiction from the perspective of neural mechanisms.

对自然界积极情绪性声音线索的注意偏向及认知神经机制

王艳梅[1,2]，汤镇委[1]，王麟子

（1 华东师范大学心理与认知科学学院，上海市心理健康与危机干预重点实验室，上海， 200062）

（2 上海市长宁区精神卫生中心，上海，200335）

摘要 自然界声音可以携带情绪性信息，近年来研究已经发现人类健康个体对积极视觉情绪刺激存在优先加工的注意偏向，但对积极情绪性声音刺激是否存在注意偏向尚不清楚。本研究以自然界情绪性声音作为线索刺激（正性、负性、中性），采用经典的考察空间注意分配任务的线索-提示任务范式，结合事件相关电位技术（ERP）和经颅电刺激技术（tDCS），在四个实验中，考察了对自然界的情绪性声音刺激的听觉注意偏向及听-视跨通道注意偏向，以及对自然界积极情绪性声音引发的注意资源分配在大脑时间变化上的进程，并进一步通过脑调控技术，考察了增强左背外侧前额皮层（lDLPFC）是否能够影响人类健康个体对自然界

积极情绪性声音的注意偏向。结果发现，人类健康个体对自然界消极情绪性声音（如警笛声）和积极情绪性声音（如鸟鸣声）均存在听觉注意偏向及听-视跨通道注意偏向，具体表现为在有效提示条件下，对自然界情绪性声音（积极和消极）线索的反应时显著快于中性声音线索时的反应时。且相比于中性听觉线索，自然界积极情绪性线索刺激引发了更大的 N1 平均波幅，说明对积极情绪性声音的注意偏向为一种自下而上的、自动化的注意朝向。另外，自然界积极情绪性声音线索引发的 P300 平均波幅比中性声音线索引发的 P300 波幅更大，说明自然界积极情绪性声音线索也增强了注意的保持。对健康个体的左背外侧前额皮层的进行 tDCS 阳极刺激，相比于伪刺激，减弱了对自然界情绪性声音（积极情绪声音和消极情绪声音）的注意偏向。本研究为人类健康个体对自然界积极听觉刺激存在早期自动化的注意朝向提供了行为学和神经学层面的证据，这种积极听觉注意偏向对人类寻求奖赏、保持稳定的积极心境可能有进化上的适应意义。

关键词：注意偏向，自然界积极情绪性声音，线索-提示任务，事件相关电位，左背外侧前额皮层

The Neural correlates of auditory and cross-modal attentional bias toward positive natural sounds

Yanmei Wang[1,2 *], Zhenwei Tang[1], Linzi Wang[1]

(1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science, East China Normal University, Shanghai, China, 200062)

(2 Shanghai Changning Mental Health Center, Shanghai, China, 200335)

***Abstract*：** Recently, researchers have expanded the investigation into attentional biases toward positive stimuli; however, few studies have examined attentional biases toward positive auditory information. In three experiments, the present study employed an emotional spatial cueing task using emotional sounds as cues and auditory stimuli (Experiment 1) or visual stimuli (Experiment 2 and Experiment 3) as targets to explore whether auditory or visual spatial attention could be modulated by positive auditory cues. Experiment 3 also examined the temporal dynamics of cross-modal auditory bias toward positive natural sounds using event-related potentials (ERPs). The behavioral results of the three experiments consistently demonstrated that response times to targets were faster after positive auditory cues than they were after neutral auditory cues in the valid condition, indicating that healthy participants showed a selective auditory attentional bias (Experiment 1) and cross-modal attentional bias (Experiment 2 and Experiment 3) toward positive natural sounds. The results of Experiment 3 showed that N1 amplitudes were more negative after positive sounds than they were after neutral sounds, which further provided electrophysiological evidence that positive auditory information enhances attention engagement at early stages in healthy adults. In addition, positive natural sounds evoked higher amplitude of P300 relative to neutral natural sounds, indicating that positive natural sounds information also facilitated attention maintenance. In experiment 4, we adopted used an emotional spatial cueing paradigm combined with a high-definition transcranial direct current stimulation (HD-tDCS) to explore the role of the left dlPFC in attention bias towards positive natural sounds. The results showed that enhancing the activation of the left dlPFC reduced attentional bias towards emotional natural sounds. These findings indicated that humans exhibited an attentional bias toward positive natural sounds, and enhancing the activation of the left dlPFC, which is closely correlated with attention control, reduced positive attentional bias towards natural sounds.

歧视知觉和同伴关系对乡村儿童孤独感的影响：基于潜在剖面分析

王慧[1] 华筝[1] 王彩妹[1] 谢敏玉[1] 温义媛[2]（通讯作者）
1 赣南师范大学教育科学学院，赣州，341000
2 赣南师范大学心理咨询与健康教育中心，赣州，341000，wenyiyuan81@126.com

摘 要： 儿童青少年的情绪适应是发展心理学研究的重要课题之一，良好的情绪适应是个体身心健康及社会发展的重要保证。有研究表明，乡村地区经济欠发达，文化氛围不够，家长大多受文化水平限制，教育方法一般比较简单或粗暴，心理健康教育方面更是一片盲区，因而增加了乡村儿童经历孤独、抑郁和焦虑等消极情绪困扰的可能性。发展情境论指出：影响个体发展的情境因素包括环境和个体因素；个体的发展是它们相互作用的结果；同伴关系是儿童在日常互动中形成的人际关系，是影响儿童发展的重要情境因素；歧视知觉是个体的主观体验，属个体因素。现有研究大多依据量表总分对被试的孤独感进行简单划分，而忽略了被试在各题目上的表现差异。基于此，本研究采用以人为中心的方法，探讨乡村儿童孤独感的潜在类别，并检验同伴关系和歧视知觉与乡村儿童孤独感的关系。采用同伴关系量表、歧视知觉量表以及孤独感量表对 486 名乡村儿童进行测量。结果表明，乡村儿童孤独感存在 3 个潜在类别：低孤独感组（33.2%）、中等孤独感组（41.5%）和高孤独感组（25.3%）。多项 Logistic 回归分析结果表明，歧视知觉对不同孤独感类别乡村儿童的影响不同，与低孤独感组相比，歧视知觉得分越高，被试越可能出现在高孤独感组；同伴关系对不同孤独感类别乡村儿童的影响不同,与高孤独感组相比，同伴关系得分越高，被试越可能出现在低孤独感组。该研究反映了个体和情境因素对不同类别孤独感的影响，对农村留守儿童孤独感的预防有重要意义，同时强调了同伴关系对孤独感的缓冲作用，能有效促进农村留守儿童的身心健康发展。

关键词 歧视知觉，同伴关系，孤独感，乡村儿童

Effects of discrimination perception and peer relationships on loneliness in rural children: Based on potential profile analysis

Wang Hui[1] Hua Zheng[1] Wang Cai mei[1] Xie Min yu[1] Wen Yi yuan[2]
College of Educational Sciences, Gannan Normal University, Ganzhou,341000
Psychological Counseling and Health Education Center of Gannan Normal University,GanZhou,341000, wenyiyuan81@126.com

Abstract: The emotional adaptation of children and adolescents is one of the important topics in developmental psychology research, and good emotional adaptation is an important guarantee for the physical and mental health and social development of individuals. Studies have shown that rural areas are economically underdeveloped, the cultural atmosphere is not enough, parents are mostly limited by the level of education, education methods are generally relatively simple or crude, and mental health education is a blind area, thus increasing the possibility of rural children experiencing negative emotional distress such as loneliness, depression and anxiety. Developmental situational theory points out that the situational factors affecting individual development include environmental

and individual factors; The development of individuals is the result of their interactions; Peer relationship is an interpersonal relationship formed by children in daily interaction, which is an important situational factor affecting children's development; The perception of discrimination is an individual's subjective experience and is an individual factor. Most of the existing studies simply divide participants' loneliness according to the total score of the scale, and ignore the differences in participants' performance on each topic. Based on this, this study uses a human-centered approach to explore the potential categories of loneliness in rural children, and examines the relationship between peer relationships and discrimination perceptions and loneliness in rural children. A total of 486 rural children were measured using the Peer Relationship Scale, the Discrimination Perception Scale and the Loneliness Scale. The results showed that there were three potential categories of loneliness among rural children: low loneliness group (33.2%), moderate loneliness group (41.5%), and high loneliness group (25.3%). The results of multiple logistic regression analyses showed that discrimination perception had different effects on rural children in different loneliness categories, and compared with the low loneliness group, the higher the discrimination perception score, the more likely the participants were in the high loneliness group. Peer relationships had different effects on rural children in different loneliness categories, and the higher the peer relationship score compared to the high loneliness group, the more likely participants were in the low loneliness group. This study reflects the influence of individual and situational factors on different types of loneliness, which is of great significance for the prevention of loneliness among rural left-behind children, and emphasizes the buffering effect of peer relationship on loneliness, which can effectively promote the physical and mental health development of rural left-behind children.

Keywords: Perceived discrimination，peer relationship，loneliness，rural children

疫情政策开放下特质敬畏对心理健康的影响及解释偏向的中介作用：一项纵向研究

罗利[1]　王潇寒[2]　焦立名[3]　袁加锦[2*]

(1.内江师范学院 教育科学学院 四川内江 641112；

2. 四川师范大学 脑与心理科学研究院 四川成都 610066；

3. 内江师范学院 经济与管理学院 四川内江 641112)

摘 要：疫情政策开放后，新冠病毒在短时间内大规模传播。面对突如其来的病毒传播，以及其导致的不确定性，这必然对个体心理健康产生负面影响。为了减轻这一负面影响，本研究从认知-感情相符理论和积极情绪的拓展-建构理论角度，考察了特质敬畏对心理健康的保护作用，以及解释偏向在这一关系间的中介作用。本研究在疫情政策开放的两个月内收集了 527 名被试的数据(年龄：21.18 ± 3.39，16-78 岁之间)。被试共完成了三次在线测试，每次间隔一个月。完成的量表包括特质敬畏量表(DPES-awe)、解释偏向问卷(IQ)、积极消极情绪量表(PANAS)、生活满意度量表(SWLS)、简明抑郁-幸福感量表(SDHS-C)和症状自评检查表 90 (SCl-90)。结果：(1) 相比于 T2 和 T3，疫情政策开放一个月内个体的心理健康(包括负性情绪和自评症状报告)水平最差，负性解释偏向最高。随时间推移，积极和中性解释逐渐提升，心理健康水平也逐渐恢复。(2) 研究以特质敬畏为自变量，正性心理功能(包括幸福感、正性情绪和生活满意度)和负性心理功能(包括 SCL-90)为因变量，解释偏向为中介变量，并控制性别、年龄、感染新冠病毒的次数、感染新冠病毒的严重性、学历、以及来自的区域(农村或城镇)等变量，建立了变量间的交叉滞后模型。结果发现 T1 的特质敬畏

能显著提升 T2 积极解释偏向、减弱 T2 消极解释偏向，从而提升 T3 正性心理功能；同时，T1 特质敬畏能显著地减弱 T2 消极解释偏向，进而降低 T3 负性心理功能。综上，敬畏通过塑造个体的解释偏向，减弱了疫情政策开放后因病毒大规模传染而给心理健康带来的负面影响。这一结果增强了我们对敬畏与心理健康之间关系的认识，也为提升特殊时期个体的心理健康的维护提供了新的思路。

Interpretation bias mediates the protective role of dispositional awe for mental health after loosened COVID-19 policies in China: A longitudinal study

Li Luo[1] Xiaohan Wang[2] Liming Jiao[3] Jiajin Yuan[2*]

[1]The Department of Education Science, Neijiang Normal University, Neijiang, China 641112;

[2]The Affect Cognition and Regulation Laboratory (ACRLab), Institute of Brain and Psychological Sciences, Sichuan Normal University, Chengdu, China 610066;

[3]The Department of College of Economics and Management, Neijiang Normal University, Neijiang, China 641112

Abstract: The loosened COVID-19 policies would lead to the large-scale transmission of the virus in a short period, which will inevitably influence individuals' mental health. To explore ways of alleviating this impact, the current study examined the potential protective effect of awe (as a self-transcendent emotion) on people's mental health and its cognitive pathway during this public health condition. We collected three-time longitudinal data from 527 participants (aged between 16 to 72; M = 21.18, SD = 3.39; Nmale = 368) in China within the first two months after the implementation of loosened COVID-19 policies. Results showed that individuals' negative interpretation bias was the highest and their mental health (including negative affect and SCL-90) was the poorest in Time 1, which was then gradually improved in Time 2 and Time 3. Cross-lagged analysis shows that dispositional awe in Time 1 significantly predicted improved positive interpretation bias and weakened negative interpretation bias in Time 2, and then predicted positive mental health (including happiness, positive affect, and life satisfaction) in Time 3. Meantime, negative interpretation bias in Time 2 mediated the predictive role of dispositional awe in Time 1 for reduced psychological symptoms assessed by SCL90 in Time 3. These results suggest that the inspiration of a trait-like awe feelings may serve as a buffer for people's mental health through shaping interpretation bias during public health conditions.

Key words: dispositional awe, mental health, interpretive bias, mediation effect, longitudinal study

父母情绪教养模式与儿童情绪适应性：基于潜在剖面分析与多角度测量

车俐颖 宋漫漫 徐健捷 安也 朱晨曦 韩卓（通讯作者）
北京师范大学心理学部，北京，100875，rachhan@bnu.edu.cn

摘 要　家庭是儿童发展的重要场所。其中，父母情绪教养对儿童的情绪发展具有重要作用。父母情绪教养包含多种行为，如情绪教导、谈论情绪、情绪表达、情绪回应等。其中，父母对儿童情绪的回应在日常亲子情绪互动中频繁出现，是影响儿童情绪发展非常直接、典型的途径。已有研究多以变量为中心，从群体层面单独考察对儿童不同的消极情绪回应方式对儿童情绪适应性的作用，却忽视了不同家庭可能存在回应方式的异质性与独特性，无法揭示异质性亚群体的差异。因此本研究以个体为中心的视角，采用潜在剖面分析方法，生态揭示中国文化背景下父母情绪教养的多种模式，并异质性地探讨不同情绪教养模式对儿童情绪适应性的影响。研究选取了 150 名儿童（平均年龄为 8.64 岁，标准差为 1.67 岁）及其家长为研究对象，采用多角度测量，儿童自我报告抑郁、自尊，父母问卷报告对儿童消极情绪的回应方式、儿童情绪调节和问题行为，同时通过冲突讨论任务采用观察编码方式更为客观地测量儿童的情绪调节能力。采用基于 BCH 方法的潜在剖面分析方法进行统计推断。结果发现：(1)中国父母的情绪回应方式存在三种潜在类别：支持型 (高支持性回应-低非支持性回应，38.67%)、严苛型 (低支持性回应-高非支持性回应，27.33%)、高投入型 (高支持性回应-高非支持性回应，32.67%)；(2)父母为支持型情绪教养家庭中的儿童在情绪适应的各方面均优于严苛型和高投入型家庭中的儿童；(3)父母情绪教养为严苛型的儿童情绪适应能力最低；(4)父母高投入家庭的儿童与支持型家庭的儿童相比，有更低的自尊水平和更差的情绪调节能力，但与严苛型家庭中的儿童相比，有更少的内化问题和更好的情绪调节能力。本研究启示父母在面对儿童的消极情绪时应有意识觉察自身的情绪反应，进而科学改进情绪回应模式，多采取支持型的情绪教养方式，同时避免采用惩罚等非支持型情绪教养方式，以实现儿童情绪健康的最优发展。

Patterns of Emotion-Related Parenting and Children's Emotional Adjustment: A Latent Profile Analysis with Multi-Methods

CHE Liying, SONG Manman, XU Jianjie, AN Ye, ZHU Chenxi, HAN Zhuo
Faculty of Psychology, Beijing Normal University, Beijing 100875, China

Abstract：Family is an important context for child development, in which emotion-related parenting plays a critical role in children's emotional adjustment. Emotion-related parenting has various components, such as emotion coaching, emotion discussion, emotion expression, and responses to emotion. Among them, responses to child's emotion emerge frequently in the daily parent-child emotional interactions, which is one of the most direct and typical ways to influence children's emotional adjustment. Previous studies have predominantly been based on variable-centered approaches, whereas overlooking the potential heterogeneity and uniqueness of emotion-related parenting among different families. Therefore, this study adopted a person-centered perspective and utilized latent profile analysis to reveal multiple patterns of emotion-related parenting, aiming to heterogeneously explore the impact of different emotion parenting patterns on children's emotional adjustment. Our sample included 150 children (M_{age} = 8.64 years, *SD* = 1.67) and their parents. Using multi-methods, the current study assessed children's depression and self-esteem through self-report measures; parents' responses to children's negative emotions and children's problem behaviors were measured using questionnaires completed by parents; children's emotional regulation abilities were measured through both parents' report and behavior observation. We conducted

latent profile analysis with BCH approach. As the results indicated, there were three subtypes of Chinese emotion-related parenting patterns: “supportive” (high supportive and low unsupportive responses to negative emotions, 38.67%), “harsh” (low supportive and high unsupportive responses to negative emotions, 27.33%) and “over-engaged” (both high supportive and unsupportive responses to negative emotions, 32.67%). Children with supportive parents exhibited the highest emotional adjustment, whereas children of harsh parents exhibited the lowest adjustment. In addition, children with over-engaged parents showed lower levels of self-esteem and higher levels of emotional dysregulation than those with supportive parents, but showed lower levels of internalizing problems and lower levels of emotional dysregulation than those with harsh parents. This study suggests that parents should be aware of their own emotional responses when facing children’s negative emotions. Parents should also adjust their emotional responses to be supportive instead of being unsupportive in order to meet their children’s emotional needs, which helps achieve the optimal development of child adjustment.

摘 要 充足的睡眠对个体的身心健康十分必要，而失眠作为最常见的睡眠障碍已经成为一个广泛的社会公共健康问题，睡眠缺失会导致个体生理和心理功能严重受损。当前已有不少研究探讨了急性睡眠剥夺对情绪加工的影响,然而，这些研究结果并不一致。失眠所导致的慢性睡眠缺失是否同样也会干扰个体情绪加工以及这种影响是否具有情绪效价或强度的依赖性尚未可知。此外， 慢性失眠影响情绪加工的时域和频域振荡与行为改变间的关联性如何有待探究。

本研究通过记录脑电图(EEG)信号，探究 25 例非临床失眠个体(失眠组)和 22 例健康人(控制组)分别进行内隐情绪加工 oddball 任务，以及外显情绪加工情绪面孔探测任务的行为差异及脑电活动特征。行为结果显示，在情绪 oddball 任务上，失眠障碍个体的反应时间明显慢于健康人。而情绪面孔探测任务中失眠个体仅对强度为 20%的面孔反应明显慢于健康人。ERPs 结果显示，失眠组诱发比健康组更大的 N2 波幅，且被负性图片诱发比正性图片更大的 N2、P2 波幅，而健康组被正性图片诱发比失眠组被试更大的 EPN 波幅。频域指标上，在后部脑区，失眠组的 delta、alpha、theta 能量显著大于健康对照组。结论: 失眠会干扰情绪加工，表现为低频振荡（theta 和 alpha）和高频振荡（beta）的增加，以及情绪效价依赖的行为与 ERP 时频活动改变，即负性情绪刺激的效价强度变化尤为敏感，失眠障碍个体会对负性情绪投入的更多的注意。

***Abstract*:** Sufficient sleep is essential for individuals' physical and mental well-being. Insomnia, as the most common sleep disorder, has become a widespread public health issue, as sleep deprivation can severely impair physiological and psychological functioning. Previous research has explored the effects of acute sleep deprivation on emotion processing; however, the findings have been inconsistent. It remains unclear whether chronic sleep loss caused by insomnia also disrupts individuals' emotion processing and whether this effect is dependent on emotional valence or intensity. Furthermore, the relationship between the time-domain and frequency-domain oscillations of emotion processing and behavioral changes in chronic insomnia remains to be investigated.

In this study, we recorded electroencephalogram (EEG) signals to examine behavioral differences and neuroelectric activity patterns during implicit emotion processing (oddball task) and explicit emotion processing (facial detection task) in 25 individuals with non-clinical insomnia (insomnia group) and 22 healthy individuals (control group). The results showed that individuals with insomnia exhibited significantly slower response times in the emotion oddball task compared to healthy individuals. In the facial detection task, individuals with insomnia responded significantly slower to 20% intensity faces compared to healthy individuals. The event-related potentials (ERPs) results indicated that the insomnia group elicited larger N2 amplitudes compared to the control group, and the insomnia group showed greater N2 and P2 amplitudes in response to negative pictures compared to positive pictures, while the control group exhibited larger EPN amplitudes in response to positive pictures compared to the insomnia group. In terms of the frequency domain, the insomnia group exhibited significantly higher delta, alpha, and theta power in the posterior brain regions compared to the control group. In conclusion, insomnia disrupts emotion processing, characterized by an increase in low-frequency oscillations (theta and alpha) and high-frequency oscillations (beta), as well as valence-dependent behavioral and ERP/time-frequency activity changes, with a heightened sensitivity to intensity changes in negative emotional stimuli. Individuals with insomnia exhibit increased attention towards negative emotions.

摘要：本研究旨在确定 COVID-19 大流行期间中国青少年抑郁症状的不同剖面特征及预测因素，并采用一年纵向追踪，进一步探索导致居家隔离期间和疫情后不同抑郁症状剖面转变的风险因素（家庭/学校/社区）。**方法**：采用纵向追踪，对 COVID-19 大流行期间 694 名长期居家隔离的青少年进行调查（男孩：48.6%；M_{age} = 12.65; SD = 1.49）。所有被试在居家隔离期间（Time 1）和一年后（Time 2）需报告个人信息，社区感染病例，儿童版流调中心抑郁量表（CES-DC），父母环境问卷—亲子冲突子量表（PEQ）和学业压力等。**结果**：潜在剖面分析(Latent Profile Analysis; LPA)结果表明青少年可能存在三个抑郁亚组：低抑郁组 (74.9% at T1/68.3% at T2); 阈下抑郁组 (20.6% at T1/24.5% at T2)和可能的临床抑郁组(4.9% at T1/7.2% at T2)。个体的年龄，学业压力、亲子冲突和 T1 时间点的社区感染病例可以显著两个时间点抑郁剖面的形成。潜在转化分析(Latent Transition Analysis；LTA)结果表明，低抑郁组别(77.8%)相较于可能的临床抑郁组(36.6%)具有更高的稳定性。学业压力和亲子冲突是导致青少年在一年时间内不同抑郁组之间转换的主要因素，而非社区感染病例（感染风险）。**结论**：本研究提供了 COVID-19 大流行期间中国青少年抑郁模式变化的纵向证据。较高的亲子冲突更有可能导致青少年抑郁症状从较低程度向较高程度的转换，而更高的学业压力则使隔离期间的临床抑郁症组青少年在一年后有更高的概率维持在临床抑郁症组。

Abstract Background: The primary goals of this longitudinal study were to identify subgroups of Chinese adolescents with different profiles of depressive symptoms and to explore predictors of the transitions between profiles. Method: Participants were 694 adolescents (48.6% boys; Mage = 12.65 years; SD = 1.49) recruited in 2020 during an extended period of home quarantine. At baseline (T1) and then again one year later (T2), participants completed a series of self-reports (i.e., demographic characteristics, depressive symptoms, academic pressure, parent-children conflict). Results: Results from latent profile analysis (LPA) yielded a three-depression subgroups solution: low depression (74.9% at T1/68.3% at T2); subthreshold depression (20.6%/24.5%), and probable clinical depression (4.9%/7.2%). Membership in the probable clinical depression group was predicted by academic pressure and parent-child conflict at both time points, and infected cases in the community at T1. Results from latent transition analysis (LTA) indicated greater stability in the low depression group (77.8%) than the probable clinical depression group (36.6%) from T1 to T2. Transitions between groups were predicted by academic pressure and parent-child conflict rather than infection risk. Limitations: Our assessments were all obtained from the self-report. Conclusions: This study presents initial longitudinal evidence of changes in depression patterns among Chinese adolescents during the COVID-19 pandemic. Parent-child conflict is more likely to cause a transfer from lower to higher levels of depression, while academic pressure leads to more severe depression among those already experiencing clinical depression.

Keywords: depression; latent transition analysis; academic pressure; parent-child conflict; COVID-19 pandemic

抑郁谱系障碍期待性快感缺失的潜在认知机制：来自奖赏表征加工的初步证据

夏峥[1]　杨静雯[1]　陈思路[2]　易正辉[3]　严超[4]（通讯作者）

摘 要 快感缺失，指对以往的愉快经历失去兴趣，是抑郁症的核心症状之一。该症状包含两个维度：即时性快感缺失与期待性快感缺失。以往大量研究主要探讨即时性快感缺失的病理心理机制，而对期待性快感缺失潜在机制的了解十分有限。根据奖赏多维加工模型，奖赏表征的激活与维持是产生期待性快感体验的关键过程，因此本研究探究临床抑郁症患者的奖赏表征激活与维持功能与其期待性快感体验之间的关系，并试图厘清不同抑郁状态对奖赏表征加工的影响。本研究招募了 12-30 岁的临床抑郁组（n=59）、亚临床抑郁风险组（n=40）及健康对照组（n=55）完成奖赏表征维持任务。结果表明：在表征激活与维持阶段，临床抑郁组在无需维持表征时的表征错误率显著高于亚临床抑郁风险组和健康对照组，并且临床抑郁组在需要维持时的表征错误率显著高于无需维持条件，同时，临床抑郁组患者的抑郁水平越高，其对高金额奖赏表征的激活与维持错误率越高，这表明抑郁症患者的奖赏表征激活与维持均存在损伤。亚临床抑郁风险组在需要维持时，其表征错误率显著低于健康对照组。在期待按键反应阶段，临床抑郁组被试对低金额（1 元）的期待反应程度显著高于亚临床抑郁风险组和健康对照组，而对高金额（10 元）的反应程度显著低于亚临床抑郁风险组和健康对照组，表明临床抑郁症患者对不同奖赏水平的区分度减退，以致对未来的潜在奖赏存在不合理的预期。另一方面，亚临床抑郁风险组在高金额条件下的期待反应程度却显著高于健康对照组。综上所述，本研究发现临床抑郁症以及亚临床抑郁风险群体的奖赏表征激活与维持功能相对于健康人群表现出独特分离的异常加工模式。其中临床抑郁症患者的奖赏表征激活与维持功能均受到损伤，而亚临床抑郁症风险群体的奖赏表征激活与维持功能可能起着“代偿”作用，以弥补抑郁状态对奖赏期待的影响。本研究通过探究抑郁谱系障碍奖赏表征加工能力与期待性快感体验之间的关系，增进了对抑郁症病理发展机制的理解。

Exploring the Cognitive Mechanism of Anticipatory Anhedonia in the Depressive Disorder Spectrum: Preliminary Insights from Reward Representation

Zheng Xia[1] Jingwen Yang[1] Silu Chen[2] Zhenghui Yi[3] Chao Yan[4]
Affective Neuroscience & Developmental Psychopathology Laboratory,
East China Normal University, Shanghai

Abstract： Anhedonia, a loss of interest in past pleasurable experiences, is one of the core symptoms of depression with two dimensions: consummatory anhedonia and anticipatory anhedonia. A large number of previous studies have mainly discussed the psychopathological mechanism of consummatory anhedonia, but the understanding of the underlying mechanism of anticipatory anhedonia is limited. According to the multi-dimensional reward processing model, the activation and maintenance of reward representation is the key process to generate anticipatory pleasure. Therefore, this study explored the relationship between the activation and maintenance of reward representation and anticipatory pleasure in patients with major depressive disorder, and attempted to clarify the influence of different depressive states on the processing of reward representation. In this study, 12-to-30-years- old clinical depression group (n=59), subclinical depression risk group (n=40) and healthy control group (n=55) were recruited to complete the reward representation maintenance task. The results showed that: in the stage of representation activation and maintenance, the rate of representation error of the clinical depression group was significantly higher than that in the subclinical group and the healthy control group. The rate of representation error of clinical depression group was significantly higher when maintenance was required than that in the non-maintenance condition. In addition, the higher level of depression of clinical depression group was associated with the higher the error rate of activation and maintenance of high-amount reward representation, indicating that both the activation and maintenance of reward representations were impaired in patients with depression. The rate of representation error of subclinical depression risk group was significantly lower than that of healthy control group when the reward representation needed to be maintained, suggesting that subclinical depression risk group had over-excellent performance in reward representation processing. During the reward anticipation stage, the anticipatory response of clinical depression group to low-amount reward(1 yuan) was significantly stronger than that of subclinical depression risk group and healthy control group, while the anticipatory degree of high-amount reward(10 yuan) was significantly lower than that of subclinical depression risk group and healthy control group, indicating that patients with depression had decreased distinction of different reward levels, resulting in unreasonable anticipation of future reward. On the other side, the anticipatory response of subclinical depression risk group to high-amount reward was significantly higher than that of healthy control group. In conclusion, this study found that reward representation activation and maintenance function in clinical depression group and subclinical depression risk group showed a unique and separate abnormal processing pattern compared with healthy population. The activation and maintenance of reward representation of patients with depression are both impaired while the reward representation function of subclinical depression risk groups may play a "compensatory" role to compensate for the effect of depressive state on reward anticipation. By exploring the relationship between reward representation processing function and anticipatory pleasure of depressive spectrum disorder, this study has enhanced the understanding of the pathological development mechanism of depression.

摘 要　研究生群体面临着科研压力，生活压力及就业压力，个体负性情绪较为普遍。本研究拟使用治疗性隐喻材料作为认知干预材料，观察治疗性隐喻缓解负性情绪的独特性及有效性。本研究拟在实验室条件下，对被试使用“文本微咨询任务”进行单次认知重构干预并同时记录事件相关 fMRI 活动，并在干预前、干预后及干预一周后，对个体积极与消极情绪水平进行重复测量，用以探讨治疗性隐喻诱发认知重构对个体负性情绪的干预效果及神经机制。本研究选取 62 名轻度焦虑的研究生，随机分成两组，一组为隐喻组（n=31）；另一组为非隐喻组（n=31）。要求被试在 fMRI 扫描过程中完成认知重构干预，隐喻组在心理痛苦问题情境下阅读隐喻解答，非隐喻组阅读非隐喻解答。研究结果发现：1)在干预过程中，相较于非隐喻解答，隐喻组阅读隐喻解答诱发了更强的顿悟体验。2）隐喻解答诱发了双侧海马、左侧额下回、左侧颞极的活动；3）与非隐喻组相比，干预后隐喻组被试的积极情绪显著提高，个体心理痛苦水平在干预后和一周追踪显著下降；4）隐喻任务激活的左侧海马和额下回活动性可以分别预测干预后心理痛苦的缓解程度。本研究揭示了隐喻这一语音表达方式可运用于临床干预的潜力，也为未来进行更为广泛的心理干预提供了理论基础。

Intervention and prediction of negative emotions in graduate students based on therapeutic metaphor

Zhang Xiaoyu [1, 2, *] Zhang Wencai [2]

[1] School of Psychology, Beijing Sport University, Beijing, China

[2] Institute of Psychology, Chinese Academy of Sciences, Beijing, China

Abstract：The graduate student population faces research pressure, life pressure, and employment pressure, leading to a prevalent presence of negative emotions. This study aims to use therapeutic metaphorical materials as cognitive intervention tools to observe the uniqueness and effectiveness of therapeutic metaphor in alleviating negative emotions. The study plans to conduct a laboratory-based experiment, using a "text-based micro-counseling task" for a single cognitive reconstruction intervention on participants while simultaneously recording event-related fMRI activity. Positive and negative emotional levels of individuals will be measured before intervention, immediately after intervention, and one week after intervention to explore the intervention effects and neural mechanisms of therapeutic metaphor-induced cognitive reconstruction on negative emotions. A total of 62 mildly anxious graduate students will be randomly assigned to two groups: the metaphor group (n=31) and the non-metaphor group (n=31). Participants will be required to complete the cognitive reconstruction intervention during fMRI scanning. The metaphor group will read metaphorical answers in the context of psychological distress, while the non-metaphor group will read non-metaphorical answers. The study results revealed the following: 1) During the intervention, compared to non-metaphorical answers, the metaphor group experienced stronger moments of insight when reading answers. 2) Metaphorical answers induced activity in the bilateral hippocampus, left inferior frontal gyrus, and left temporal pole. 3) Compared to the non-metaphor group, the metaphor group showed significant improvements in positive emotions after the intervention, and their levels of psychological distress significantly decreased immediately after the intervention and during the one-week follow-up. 4) The activity in the left hippocampus and inferior frontal gyrus, as induced by the metaphor task,

respectively predicted the degree of relief in psychological distress after the intervention. This study reveals the potential of utilizing metaphor as a linguistic expression for clinical interventions and provides a theoretical foundation for future extensive psychological interventions.

共同反刍与大学生日常情绪的关系：依恋风格与心理困扰的调节作用

彭闻捷[1,2]　唐苏勤[2]（通讯作者）

1 华南师范大学心理学院，广州，510631

2 深圳大学心理学院，深圳，518060，通讯作者 E-mail:sqtang@szu.edu.cn

摘 要　共同反刍是常见的人际互动模式，以过度讨论负性事件和消极情绪为特征，对大学生心理健康产生重要影响。然而，目前关于共同反刍的研究较少关注大学生日常互动，对大学生共同反刍及其日常情绪后果缺乏了解，也很少探讨个体间差异是否调节日常共同反刍与日常情绪的关系。因此，这项研究的目的在于进一步探索共同反刍及其与大学生日常情绪的关系。具体而言，采用日记法对 98 名大学生的情绪和共同反刍状况进行为期 14 天的追踪研究，通过基线问卷和每日问卷收集个体间和个体内水平的数据。然后，构建两水平回归模型探究每日共同反刍的预测因素，考察共同反刍与日常情绪的关系并检验依恋风格和心理困扰在每日共同反刍与每日情绪关系中的跨水平调节作用。结果发现，当个体特质共同反刍程度越高、遭遇更多负性事件、与讨论对象更亲密或倾向于讨论双方问题时，每日共同反刍的程度都会越强。每日共同反刍会正向预测每日消极情绪，但前一日的共同反刍会与当日更少的消极情绪相关。此外，特质共同反刍程度更高，个体的平均积极情绪更多。进一步的调节效应检验发现，个体间水平的依恋回避、抑郁、焦虑和压力都会显著调节每日共同反刍对每日积极情绪的预测作用。结果表明，虽然在短期内共同反刍会增加大学生的日常消极情绪，但更长期来看，共同反刍可能表现出效益。不同依恋回避程度和不同心理困扰水平的大学生需要根据自身情况选择是否采用共同反刍这一方式进行情绪调节，优化自身的情绪调节策略。

The relationship between co-rumination and daily affects in college students: The moderating roles of attachment style and psychological distress

Wenjie Peng[1,2]　Suqin Tang[2*]

1 School of Psychology, South China Normal University, Guangzhou 510631, China

2 School of Psychology, Shenzhen University, Shenzhen 518060, China

* Correspondence to School of Psychology, Shenzhen University, 3688 Nanhai Avenue, Nanshan District, Shenzhen 518060, China, Email: sqtang@szu.edu.cn (S. Tang).

***Abstract*：** Co-rumination is a common form of interpersonal emotion regulation, characterized by excessively discussing problems and focusing on negative feelings, which has an important impact on the mental health of college students. However, because previous studies on co-rumination seldom considered the daily interactions of college students, little is known regarding co-rumination and its daily emotional consequences in college students. Besides, it is rarely discussed whether between-person differences moderate the relationship between daily co-rumination and daily affects. Therefore, this study aimed to further explore the predictors of co-rumination and its relationship to the daily affects of college students.

Specifically, 98 college students, recruited by convenience sampling, completed baseline assessments including the Chinese versions of the co-rumination questionnaire (CRQ), general attachment subscale of experiences in close relationships-relationship structures scale (ECR-RS), and depression-anxiety-stress scale (DASS-21). Then, participants were asked to complete a 14-day daily diary assessing daily affects, daily co-ruminations, negative events, and behaviors. The total number of daily questionnaires completed was 1269. Through the above process, between- and within-person information was collected. Next, multilevel modeling (MLM) was used to analyze the two-level dataset. Two-level regression models were constructed to explore the predictors of daily co-rumination, test the relationship between co-ruminations and daily affects, and finally examine the cross-level moderating roles of attachment style and psychological distress on the relationship between daily co-rumination and daily affects.

The results showed that higher trait co-rumination, a larger number of negative events, closer relationships, and discussing each other's problems predicted higher daily co-rumination. Daily co-rumination positively predicted daily negative affects, but higher co-rumination the day before was associated with a lower frequency of negative affects that day. In addition, trait co-rumination positively predicted the average frequency of daily positive affects. Further examination of the moderating effects found that attachment avoidance, depression, anxiety, and stress significantly moderated the relationship between daily co-rumination and daily positive affects. Daily co-rumination positively predicted daily positive affects for individuals with high attachment avoidance, but daily co-rumination negatively predicted daily positive affects for individuals with low attachment avoidance. Similarly, higher daily co-rumination was associated with a higher frequency of daily positive affects for individuals with high depression, anxiety, or stress, but higher daily co-rumination was associated with a lower frequency of daily positive affects for individuals with low depression, anxiety, or stress.

The present study uses the daily diary method to explore the predictors of daily co-rumination and how co-rumination relates to daily affects. The results suggested that although co-rumination was associated with a higher frequency of daily negative affects of college students in the short term, it was possible to bring benefits in the longer term. College students should consider whether to use co-rumination as an emotional regulation strategy according to their levels of attachment avoidance and psychological distress. This study is the first one to explore daily co-rumination among Chinese college students. It helps college students reduce negative experiences caused by daily negative events, enabling them to learn what is a more adaptive emotional regulation strategy for themselves, and preventing them from developing mental health problems.

***Keywords*：** co-rumination, attachment style, psychological distress, daily diary study

面孔运动影响情绪面孔整体加工的神经机制*

方海情 连玉净 汪海玲（通讯作者）
山东师范大学心理学院，济南，250358，hailingwang@sdnu.edu.cn

摘 要 先前研究表明，面孔情绪信息的识别既依赖整体加工也依赖特征加工。然而以往的研究主要关注静态情绪面孔的加工机制，而对动态情绪面孔整体和特征加工的神经机制则知之甚少。本研究采用 2 (情绪类型：快乐 vs.愤怒) × 2 (情绪呈现方式：动态 vs.静态）× 3 (面孔区域：眼睛区域 vs.嘴巴区域 vs.完整面孔) 的被试内实验设计，借助整体-部分范式，探究面孔非刚性运动对情绪面孔加工方式的影响。本研究使用延迟匹配任务, 先向被试呈现动态和静态情绪面孔，然后向被试呈现眼睛、嘴巴或完整面孔的情绪刺激，要求被试判断测试面孔和学习面孔所呈现的情绪是否相同，并记录测试刺激诱发的 ERP 成分。行为结果显示，眼睛区域促进愤怒情绪的识别，嘴巴区域促进快乐情绪的识别。ERP 结果主要分析了 N170 (150-200ms)、P2 (200-250ms)以及 EPN (250-320ms)成分所在时间窗口的平均波幅，结果如下。在 N170、P2 和 EPN 成分上发现情绪类型与面孔区域显著的交互作用，进一步分析发现：对于 N170，完整面孔存在愤怒优势；对于 P2，完整面孔和眼睛区域存在快乐优势；对于 EPN，完整面孔和眼睛区域存在愤怒优势。这表明，愤怒和快乐情绪的加工优势不仅受面孔整体和特征信息的影响，而且随时间进程发生变化。对于 EPN 成分，显著性结果集中表现在左半球，即动态条件下，无论是愤怒还是快乐情绪，完整面孔比眼睛区域的平均波幅更大；静态条件下，只有面孔呈现快乐情绪时，完整面孔和嘴巴区域比眼睛区域的平均波幅更大。这表明，面孔运动促进愤怒情绪的整体加工，而对快乐情绪的整体加工影响较小。

Facial movement affects the neural mechanism of holistic processing of emotional faces*

Haiqing Fang, Yujing Lian, Hailing Wang (Corresponding Author)
School of Psychology, Shandong Normal University, Jinan, 250358, hailingwang@sdnu.edu.cn

Abstract: Previous studies have shown that the recognition of emotional faces depends on both holistic and featural processing. However, previous studies mainly focused on the processing mechanism of static emotional faces, little was known about the neural mechanism of holistic and featural processing of dynamic emotional faces. In this study, a 2 (emotion: happy vs. angry) × 2 (face format: dynamic vs. static) × 3 (face region: eye vs. mouth vs. whole face) within-subject design was adopted to explore the influence of non-rigid facial motion on emotional face processing with the whole-part paradigm. Participants were initially presented with a dynamic or static emotional face (study face), after which the test face with the eyes, mouth or whole face was presented. Subsequently, they were instructed to match the emotion of the study face and the test face., and the ERP components induced by the test stimuli were recorded. The behavioral results showed that the eyes promoted the recognition of angry emotion and the mouth promoted the recognition of happy emotion. We analyzed the mean amplitude of N170 (150-200ms), P2 (200-250ms) and EPN (250-320ms) with the interested time window, and the results were as follows. There was a significant interaction between emotion and face region in N170, P2 and EPN. Further analysis showed that the N170 response was larger for angry faces in the whole face condition; P2 had a happy advantage for both the whole face and the eye region; and EPN had an anger advantage for both the whole

face and the eye region. This demonstrates that the processing advantages of angry and happy expressions are not only determined by holistic and featural information, but also change over time. For EPN, the significant results were found in the left hemisphere, which indicated that when dynamic conditions were presented, the average amplitude of the whole face was greater than that of the eye region, regardless of whether the face emotion was one of anger or happiness. In static conditions, when only happy expressions were presented, the whole face and mouth region had greater amplitude than the eye region, suggesting that facial movement promoted the holistic processing of angry faces, but had little effect on the holistic processing of happy faces.

第二语言影响情绪面部表情识别：掩蔽和非掩蔽情绪启动范式的证据

吴成刚[1]　张娟[2]　（通讯作者）

1 上海外国语大学国际教育学院，上海，201620

2 澳门大学教育学院，澳门，通讯作者 E-mail：juanzhang@um.edu.cn

摘 要　已有大量研究表明语言可以显著影响情绪识别，但是现有研究大多关注于第一语言，而对第二语言（L2）如何影响情绪认知尚不明确。本研究结合掩蔽和非掩蔽情绪启动范式通过六个实验研究第二语言情绪词对情绪面部表情识别的影响。因为在掩蔽启动范式中，有证据表明 L2 不能产生语义启动，而情绪启动一般为自动化的。那么如果 L2 情绪词的情绪激活是情绪性激活，L2 情绪词继而能够在掩蔽启动范式中对情绪面部表情产生启动效应。而如果 L2 情绪词情绪激活是基于语义激活的，那在掩蔽启动范式中则不存在情绪启动效应。本研究分别研究 L2 情绪标签词（比如悲伤、开心）和情绪负载词（比如死亡、金婚）在掩蔽（实验 1a,2a,1b,2b）和非掩蔽启动范式（实验 3,4）中对情绪面部表情识别的影响，任务为要求被试判断面部表情的效价（积极还是消极）。结果发现在掩蔽启动范式中，L2 情绪标签词（实验 1a,2a）和负载词（实验 1b,2b）都没有对面部表情识别产生启动效应。此外，提升 L2 熟练度（实验 2a,2b）依旧没有产生启动效应。而在非掩蔽启动范式中，L2 情绪标签词（实验 3）和负载词（实验 4）都对情绪面部表情识别产生启动效应，即当启动词和面部表情的效价一致时，面部表情的效价判断反应时比不一致条件更短，正确率更高。这些发现证实 L2 情绪词表征是非具身的，即 L2 情绪词的情绪表征是基于语义而非情绪性的，L2 情绪词产生情绪效应需要借由语义激活实现。

Second language shapes emotional facial expression perception: evidence from masked and unmasked affective priming paradigms

Chenggang Wu[1], Juan Zhang[2]

[1] School of Education, Shanghai International Studies University

[2] Faculty of Education, University of Macau

Abstract： Numerous studies have shown that language can significantly influence emotion recognition. However, existing research has mostly focused on the first language (L1), and the effects of the second language (L2) on emotion cognition remain unclear. This study combines masked and unmasked affective priming paradigms in six experiments to investigate the impact of L2 emotion words on facial expression recognition. In the masked priming paradigm, evidence suggests that L2 does not produce semantic priming, while emotion priming generally occurs automatically. Therefore, if the emotional activation of L2 emotion words is affective in nature, they should be able to elicit a priming effect on facial expressions in the masked priming paradigm. On the other hand, if the emotional activation of L2 emotion words is based on semantic activation, no emotion priming effect would be observed in the masked priming paradigm. This study examines the effects of L2 emotion-label words (e.g., sad, happy) and emotion-laden words (e.g., death, golden wedding) on facial expression recognition in both masked (Experiment 1a, 2a, 1b, 2b) and unmasked priming paradigms (Experiment 3, 4). Participants were required to judge the valence of facial expressions (positive or negative). The results revealed that neither L2 emotion-label words (Experiment 1a, 2a) nor emotion-laden words (Experiment 1b, 2b) had a priming effect on facial expression recognition in the masked priming paradigm. Furthermore, increasing L2 proficiency (Experiment 2a, 2b) did not lead to a priming effect. However, in the unmasked priming paradigm, both L2 emotion label words (Experiment 3) and emotion-laden words (Experiment 4) had a priming effect on facial expression recognition. In other words, when the priming word and the valence of the facial expression were congruent, participants showed shorter response times and higher accuracy in valence judgments compared to incongruent conditions. These findings confirm that L2 emotion word representation is dis-embodied, meaning that the emotional representation of L2 emotion words is based on semantics rather than affectivity. The production of emotional effects by L2 emotion words requires semantic activation.

Keywords： emotion-label word, emotion-laden word, second language, masked affective priming

疫情封控期间中国社交媒体用户负面情绪研究：基于情感分析和动态主题模型

张梦楠[1] 朱干成[2] 张红[3] 王鹏[1]（通讯作者）

通讯作者 E-mail pengsdnu@163.com

摘 要 疫情对人们的生活、工作和学习方式产生了深远影响，显著影响了全球公众的心理健康，导致负面情绪增加。世界范围内实施了各种控制措施，包括限制社会活动的封控政策。虽然很多研究指出未来的公共卫生政策需要解决封控对公众情绪的潜在负面影响，但这方面的研究仍然存在很大空缺。

现有研究主要通过问卷调查和访谈来识别消极情绪的类型及其潜在的影响因素。然而，自我报告方法存在被试效应、生态效度较低等局限性，阻碍了对潜在负面影响的深入探索。此外，很少有研究关注封控期间的情绪分析，且现有研究主要利用机器学习来提取信息，与基于词典或基于机器学习的模型相比，深度学习方法在情感分析中表现出更高的准确率和更好的预测性能。

为了弥补现有研究的不足，进一步理解消极情绪及其影响机制，本研究利用情感分析和文本挖掘技术，利用社交媒体数据考察不同时期消极情绪的变化。2022 年 3 月 15 日至 2022 年 5 月 15 日期间，共收集了 58606 条原始微博，其中包含关键词“上海”“封控”。这些微博经过了严格的爬虫、收集和处理过程。随后，采用基于 Transformer 的情感分析技术对微博文本中表达的 6 种情感（快乐、惊讶、悲伤、恐惧、愤怒、厌恶）进行识别和分类。此外，为了更深入地了解话题的演变发展，研究使用动态主题模型（Dynamic Topic Modeling，DTM）来分析收集到的微博中与负面情绪有关的变化趋势、潜在影响因素和应对策略。结果表明，在封控期间，尽管负性情绪占主导地位，但总体情绪趋向积极发展，愤怒、厌恶和悲伤的变化显著。这些情绪的变化和调整可以通过马斯洛的需求层次理论来解释。首先，满足公众在封控期应对负性情绪时的生理需求和安全需求。第二，关注公众的归属和爱的需求。尤其是带着厌恶和悲伤的情绪，很多人觉得得不到他人的尊重。第三，可以通过强调追求尊重需要，甚至是自我实现来调动积极情绪。

本研究通过创造性地结合定量和定性方法，并利用大数据分析，提供了对情绪的洞察，为通过社交媒体动态检测和干预公众心理健康提供了一种新的方法。从纵向角度理解情绪变化有助于缓解重大突发公共卫生事件或风险对个体的负面影响。这种心理学和计算机科学的跨学科研究为公众心理健康的改善提供了有价值的应用，并为未来该领域的研究提供了参考。

***Abstract*:**

The COVID-19 pandemic has had a profound impact on people's way of life, work, and study, and has significantly affected global public mental health, leading to an increase in negative emotions. Various control measures, including lockdown policies restricting social activities, have been implemented in response to the

infectious nature of the virus. However, these measures have inadvertently caused a surge in negative emotions, leading to emotional overeating, emotional dysregulation among children, and burnout among local social workers. While studies have acknowledged the need for future public health policies to address the unexpected negative impact of lockdowns on public sentiment, this aspect remains underexplored.

Current research primarily relies on questionnaires and interviews to identify types of negative emotions and their potential influencing factors. However, these self-reported methods have limitations, such as researcher-driven content, low ecological validity, and biased self-reporting, hindering in-depth exploration of potential negative effects. Moreover, few studies have focused on analyzing emotions during the lockdown period, with existing research mainly utilizing machine learning analysis to extract information. Deep learning methods have demonstrated higher accuracy and better prediction performance in sentiment analysis compared to lexicon-based or machine learning-based models.

To bridge the gap in existing research and further understand negative emotions and their effects, this study leverages sentiment analysis and text mining technology to examine changes in negative emotions during different periods using social media data. In present study, a total of 58,606 original microblogs were collected, which contain the keywords "Shanghai" and "lockdown" from the period between March 15, 2022, and May 15, 2022. These microblogs were subjected to a rigorous scraping, gathering, and filtering process. Subsequently, a Transformer-based sentiment analysis technique was employed to discern and categorize six emotions (happiness, surprise, sadness, fear, anger, and disgust) expressed in the microblog posts, thereby adopting a longitudinal perspective. Moreover, to gain deeper insights into the evolving discourse, Dynamic Topic Modeling (DTM) was utilized to explore and analyze the changing trends, potential influencing factors, and coping strategies pertaining to negative emotions within the collected microblogs. The results indicate that during the lockdown period, overall emotions tended to become more positive, though negative emotions still dominated, with significant variations observed in anger, disgust, and sadness. These changes and adjustments in emotions are interpreted through Maslow's hierarchy of needs theory. The first is to meet the physiological needs and safety needs of the public when coping with negative emotions during the lockdown period. In this study, each kind of emotional public mentioned the most, is the lack of living supplies, epidemic prevention work is not in place easy to increase the risk of infection, and medical treatment difficulties. Second, pay attention to the public's need for belonging & love. Especially with disgust and sadness emotion, many people feel not respected by them. Third, we can mobilize positive emotions by emphasizing the pursuit of self-esteem needs, even self-realization.

By creatively combining quantitative and qualitative methods and utilizing big data analysis, this study provides insights into emotions, offering a novel approach for dynamically detecting and intervening in public mental health through social media. Understanding emotional changes from a longitudinal perspective can help mitigate the negative impact of major public health emergencies or risks on individuals. This interdisciplinary research in psychology and computer science offers valuable applications for the betterment of public mental health and provides a reference for future studies in this field.

睡眠问题与青少年抑郁的关系：一项交叉滞后分析

高美慧[1] 郁嘉铭[1] 陈博[1] 甄瑞[1,2]（通讯作者）

1. 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com
2. 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘 要 青春期是抑郁情绪频发时期，抑郁情绪不仅直接影响青少年的身心健康，还会影响其学业发展和社会适应，因此青少年抑郁及其诱发因素受到社会和学界的广泛关注。近期，被广泛探讨的一个诱发因素是个体的睡眠问题。有研究发现，睡眠质量差可能会给个体带来抑郁风险，但也有研究显示抑郁情绪会引发睡眠问题，这种不一致的研究结果可能是由横断研究的局限性带来的。为此，本研究基于纵向研究设计，对浙江省 1632 名中小学生进行了间隔一年的两次问卷调查，以考察睡眠问题与抑郁情绪的相互作用关系。结果显示，控制性别和年龄后，在两个时间点上，睡眠问题与抑郁呈显著正相关（r_{T1}=0.41，p=0.000；r_{T2}=0.33 ，p=0.000）。T1 睡眠问题能够显著正向预测 T2 抑郁（β=0.20，$p\leq0.05$）和 T2 睡眠问题（β=0.52，$p\leq0.05$）；T1 抑郁能够显著正向预测 T2 睡眠问题（β=0.045 ，$p\leq0.05$）和 T2 抑郁（β=0.39，$p\leq0.05$）。这说明睡眠问题和抑郁存在双向预测作用，但 T1 睡眠问题对 T2 抑郁的预测力要高于 T1 抑郁对 T2 睡眠问题的预测力，即前期由睡眠问题后续引发抑郁的可能性更强。本研究丰富了睡眠问题与抑郁关系的研究，结果提示我们应该对青少年的睡眠问题进行有效的筛查和干预，对青少年的睡眠健康给予更多的关心，帮助青少年形成正确的睡眠习惯，提高睡眠质量，以降低抑郁风险。

Longitudinal Relations between Sleep Problems and Depression among Adolescents: A Cross-Lagged Analysis

Meihui Gao[1], Jiaming Yu[1] , Bo Chen[1], Rui Zhen[12]

1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China
2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Keywords **:** Adolescence is a period of frequent depression, which not only directly affects adolescents' physical and mental health, but also affects their academic development and social adaptation. Therefore, adolescents' depression and its inducing factors have been widely concerned by society and academic circles. Recently, a widely discussed inducing factor is the individual's sleep problem. Some studies have found that poor sleep quality may bring depression risk to individuals, but other studies have shown that depression can cause sleep problems. This inconsistent research result may be caused by the limitations of cross-sectional studies. Therefore, based on the longitudinal study design, this study conducted two questionnaires to 1632 primary and middle school students in Zhejiang Province at intervals of one year to investigate the interaction between sleep problems and depression. The results showed that after controlling sex and age, there was a significant positive correlation between sleep problems and depression at two time points (rT1=0.41, P = 0.000; rT2=0.33 ，p=0.000）。T1 sleep problems can significantly positively predict T2 depression (β=0.20, p≤0.05) and T2 sleep problems (β=0.52, P ≤ 0.05). T1 depression can significantly positively predict T2 sleep problems (β=0.045, p≤0.05) and T2 depression (β=0.39, p≤0.05). This shows that there is a two-way predictive effect between sleep problems and depression, but the predictive power of T1 sleep problems on T2 depression is higher than that of T1 depression on T2 sleep problems, that is, it is more likely to be triggered by sleep problems in the early stage. This study enriches the research on the relationship between sleep problems and depression. The results suggest that we should effectively screen and intervene the sleep problems of teenagers, pay more attention to their sleep health, help

them form correct sleep habits, improve their sleep quality and reduce the risk of depression.

青少年自杀意念的相关因素：一项元分析研究

张璐[1,2] 康仪婷[1] 李佳慧[1,2] 马雪儿[1,2] 赵晶晶[1,2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西省行为与认知神经科学重点实验室，西安，710062

通讯作者 E-mail（jingjing.zhao@snnu.edu.cn）

摘 要 青少年自杀已成为世界各国广泛关注的问题，而自杀意念是预测个体自杀行为发生与否的有效信号因子。已有大量国内外研究报告了不同地区、不同青少年群体自杀意念的相关和影响因素，这些因素涉及范围广，研究间存在较大差异；且已有元分析研究只纳入国内文献，所得结果并不全面，因此本研究采用元分析的方法整合国内外青少年产生自杀意念的相关因素，并探究文化（亚洲、欧美）、自杀意念测量工具（自编、非自编）、自杀意念发生率对自杀意念和相关因素关系中的调节作用，最终纳入符合标准的文献 92 篇(英文 55 篇，中文 37 篇)，包括 173 个效应量，总样本量 520816 人。结果发现：(1)自杀意念的相关因素包括消极情绪（抑郁、焦虑、悲观绝望）、家庭因素（特殊家庭结构、负性家庭关系）、卷入欺凌行为（受欺凌、暴力）和社会支持四类因素。其中，消极情绪与自杀意念呈显著正相关($r = 0.39, p < 0.0001$)；家庭因素与自杀意念呈显著正相关($r = 0.18, p < 0.0001$)；卷入欺凌行为与自杀意念呈显著正相关($r = 0.23$,p< 0.0001)；社会支持与自杀意念呈显著负相关($r = -0.26, p < 0.0001$)；(2)文化差异可以显著调节社会支持与自杀意念的关系($p < 0.01$)；自杀意念的测量工具可以显著调节抑郁、焦虑、特殊家庭结构、受欺凌和社会支持与自杀意念的关系($p < 0.05$)；而自杀意念发生率则对悲观绝望、社会支持与自杀意念的关系起调节作用($p < 0.001$)。上述结果表明，消极情绪、家庭因素、卷入欺凌行为和社会支持和自杀意念显著相关，调节青少年消极情绪、改善家庭结构与家庭关系、减少欺凌和暴力行为的发生，给予青少年关怀以及社会支持能够显著降低自杀意念，基于此开展针对性的干预措施有益于防控青少年自杀行为。

The relevant factors of suicidal ideation: A Meta-analysis

Lu Zhang[1,2] Yiting Kang[1] Jiahui Li[1,2] Xue'er Ma[1,2] and Jingjing Zhao[1,2]

1 School of Psychology, Shaanxi Normal University,710062

2 Shaanxi Provincial Key Laboratory of Behavior and Cognitive Neuroscience, Xi'an, China, 710062, corresponding author E-mail (jingjing.zhao@snnu.edu.cn)

Abstract：Adolescent suicide has become a widespread concern around the world, and suicidal ideation is an effective signaling factor in predicting whether an individual's suicidal behavior will occur or not. A large number of domestic and foreign studies have reported the relevant and influencing factors of suicidal ideation in different regions and groups of adolescents, which cover a wide range of factors, with considerable variation among the studies. Moreover, existing meta-analysis studies have only included domestic articles, and the results

obtained were not comprehensive. Therefore, this study adopts a meta-analysis method to integrate the relevant factors of suicidal ideation among domestic and foreign adolescents, and explores the moderating effects of culture (Asia, Europe and America), suicidal ideation measurement tools (self-administered, non-self-administered), and suicidal ideation prevalence on the relationship between suicidal ideation and related factors. Finally, 92 articles (55 in English and 37 in Chinese) were included, including 173 effect sizes, with a total of 520816 participants. The results showed that:(1)The related factors of suicidal ideation include four categories: negative emotions (depression, anxiety, pessimism and despair), family factors (special family structure, negative family relationships), involvement in bullying behavior (being bullied, violent), and social support. Among them, negative emotions are significantly positively correlated with suicidal ideation($r = 0.39, p < 0.0001$); family factors are significantly positively correlated with suicidal ideation($r = 0.18, p < 0.0001$); involvement in bullying behavior is significantly positively correlated with suicidal ideation($r = 0.23, p < 0.0001$);there is a significant negative correlation between social support and suicidal ideation($r = -0.26, p < 0.0001$);(2)Cultural differences can significantly moderate the relationship between social support and suicidal ideation ($p < 0.01$);the measurement tool for suicidal ideation can significantly moderate the relationship between depression, anxiety, special family structure, bullying, and social support with suicidal ideation ($p < 0.05$);and suicidal ideation prevalence moderated the relationship between pessimism and despair, and social support and suicidal ideation ($p < 0.001$). The above results indicate that negative emotions, family factors, involvement in bullying behavior, and social support are significantly correlated with suicidal ideation. Regulating adolescents' negative emotions, improving family structure and family relationships, reducing bullying and violence, and providing adolescents with care and social support can significantly reduce suicidal ideation, and that targeted interventions based on these results are beneficial to the prevention and control of adolescent suicidal behavior.

近期负性生活事件和童年负性生活事件对大学生抑郁影响的独立、交互和累积效应模型验证：HPA 轴基因的调节作用

杨阳[1] 刘春雨[1] 黄奥迪[1] 张红梅[1] 王美萍[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，wangmeiping@sdnu.edu.cn

摘 要 抑郁是大学生群体中最为常见的心理健康问题之一，根据《中国国民心理健康发展报告(2021～2022)》，21.48%的中国大学生存在抑郁风险。已有研究发现近期压力与早期压力是抑郁的重要预测因素，但关于二者联合作用的方式尚缺乏系统深入研究，且已有研究结果存在分歧。基于此，本研究采用多基因-环境设计，基于独立效应、累积效应、交互效应框架，以 560 名大学生为被试（$M = 19.74 \pm 0.85$ 岁，女生占 75.5%），探讨近期负性生活事件与童年负性生活事件对抑郁的影响模式以及何种效应模型解释率最高。同时，考察 HPA 轴基因是否调节了不同的效应模型以及是否存在性别差异。研究采用自我报告测评近期负性生活事件、童年负性生活事件和抑郁，采用 *FKBP5* 基因 rs1360780 多态性和 *NR3C1* 基因 rs41423247 多态性两个基因位点计算 HPA 轴多基因累加得分。经过性别不平衡校正和 FDR 校正后，结果发现：（1）近期负性生活事件和童年负性生活事件对不同性别大学生抑郁的独立效应和累积效应显著，但交互效应不显著。（2）独立效应模型和累积效应模型在不同性别中解释率差异均不显著。（3）HPA 轴基因只调节了独立效应模型。近期负性生活事件与多基因累加得分的交互作用对女大学生抑郁的预测作用显著，具体来说，与低多基因累加得分组相比，高多基因累加得分组的女大学生对近期负性生活事件更敏感进而表现出更高的抑郁水平。研究结果强调了从多种环境和多基因视角去探究抑郁的影响因素的重要性，同时，对干预实践也有重要意义。结果提示，应基于不同的环境因素与遗传因素选择最有效的效应模型，以提高抑郁症状预测的准确性，从而提供更精确的治疗方案。

关键词 近期负性生活事件，童年负性生活事件，HPA 轴，抑郁，多基因×环境

Independent, Multiplicative, and Cumulative Effects of Recent Stressful Life Events and Adverse Childhood Events on Depressive Symptoms among Undergraduates: Moderation by the Hypothalamic-pituitary-adrenal (HPA) Axis-related Genetic Variants

YANG Yang, LIU Chunyu, HUANG Aodi, ZHANG Hongmei, WANG Meiping
School of Psychology, Shandong Normal University, Jinan 250014

Abstract：Depression is a prevalent mental health problem among undergraduates. According to the "Report on national mental health development in China (2021-2022)", 21.48% of Chinese undergraduate students are at risk of depression. Previous studies have found that recent stressful and early stress are crucial predictors of depressive symptoms. However, there is a lack of comprehensive and in-depth investigation into the combined effects of these factors, and existing research results are inconsistent. Therefore, the present study adopted a genes-environment design, utilizing the frameworks of independent, cumulative, and multiplicative effects, with 560 undergraduate students (M = 19.74 ± 0.85 years, 75.5% females) to explore the impact modes of recent stressful life events and adverse childhood events on depressive symptoms, identify the effect model with the highest explained variance, investigate moderating effects of HPA-axis related genes, and examine gender differences. The study employed self-report measures to assess recent stressful life events, adverse childhood events, and depressive symptoms. The cumulative genetic score (CGS) of the *FKBP5* rs1360780 and *NR3C1* rs41423247 were used to assess the depressive sensitivity of the HPA-axis related genes. After gender imbalance correction and FDR correction, the results showed that the independent and cumulative effects of recent stressful life events and adverse childhood events were significant, but the multiplicative effects were not significant. There was no significant difference in explained variance between the independent and cumulative effect in either gender. HPA-axis related genes only modulated the independent effect model. The interaction between recent stressful life events and CGS significantly predicted depressive symptoms in female students. Specifically, compared to the group with low CGS, females with high CGS were more susceptible to recent stressful life events and exhibited higher depressive symptoms. The study underscores the importance of considering multiple environmental and genetic perspectives in understanding depressive symptoms and has significant implications for intervention practices. Our findings suggest that selecting the most effective effect model based on different environmental and genetic factors is essential to improve the accuracy of depression prediction and provide more precise treatment strategies.

1 中南大学湘雅二医院医学心理中心，长沙，410011

2 国家精神心理疾病临床医学研究中心，长沙，410011，xiongzhaozhu@csu.edu.cn

3 广州医科大学附属脑科医院，广州，510370

摘 要 强迫症患者已被发现存在快感缺失，然而快感缺失是一个多维度的症状，存在不同类型或子成分，强迫症具体的快感缺失特征及其神经机制尚不明确。279 名强迫症患者和 136 名健康个体完成了行为学研究。采用一系列快感缺失量表全面评估被试各类型快感缺失水平，包括躯体、社会、期待、完成及状态性快感缺失，并采用协方差分析（ANCOVAs）比较两组被试各类型快感缺失水平的差异；在功能性磁共振成像扫描中，40 名强迫症患者和 39 名健康被试完成了货币奖赏延迟任务（Monetary Incentive Delay Task, MID），38 名强迫症患者和 39 名健康被试完成了社会奖赏延迟任务（Social Incentive Delay Task, SID）。采用独立样本 t 检验比较两组被试在各条件下脑激活的差异。提取强迫症患者在上述有差异脑区的平均激活水平（beta 值），采用相关分析探讨强迫症患者在奖赏延迟任务下的脑激活水平与快感缺失及临床变量之间的关系。结果显示强迫症患者所有类型快感缺失水平均高于健康对照组（$ps < 0.01$），在控制抑郁水平后，躯体性、社会性和完成性快感缺失水平仍显著高于健康对照组（$ps < 0.05$），而期待性和状态性快感缺失水平无显著差异；在 SID 任务中，相比于健康对照组，强迫症患者在惩罚预期阶段表现出右侧楔前叶、左侧梭状回、左侧前扣带回和右侧眶额叶脑激活水平的升高，而在受到社会奖赏时右侧纹状体的激活减少；在 MID 任务中的脑激活未发现显著组间差异；以抑郁水平为协变量的偏相关分析结果显示，惩罚预期阶段，强迫症患者右侧眶额叶的激活水平与人际愉悦体验呈显著负相关关系（$r = -0.35$，$p = 0.039$），左侧前扣带回的激活水平与特质焦虑水平呈显著负相关关系（$r = -0.33$，$p = 0.046$）。奖赏结果阶段，纹状体的激活水平与强迫总严重程度（$r = -0.37$，$p = 0.025$）和强迫思维得分（$r = -0.34$，$p = 0.045$）呈显著负相关关系。以上结果表明，强迫症患者存在快感缺失，表现为躯体性、社会性和完成性快感缺失水平升高，这些快感体验受损独立于抑郁水平而存在；强迫症患者在预期社会性惩罚时楔前叶、梭状回、前扣带回和眶额叶的过度激活，以及在接受社会性奖赏时纹状体的激活不足可能是强迫症患者社会性快感缺失的神经基础。

Characteristics of Anhedonia in Patients with Obsessive-Compulsive Disorder and its Neural Mechanism

Jingjie Lu[1,2,3] Xiang Wang[1,2] Qian Liu[1,2] Quanhao Yu[1,2] Jie Fan[1,2] Xiongzhao Zhu[1,2]

[1] Medical Psychological Center, the Second Xiangya Hospital, Central South University, Changsha, Hunan, China

[2] National Clinical Research Center for Mental Disorders, Changsha, Hunan, China

[3] The Affiliated Brain Hospital of Guangzhou Medical University, Guangzhou, China

Abstract：Anhedonia has been observed in patients with obsessive-compulsive disorder (OCD). Anhedonia can be classified into different types or subcomponents; however, the specific characteristics of anhedonia in OCD and the underlying neural mechanisms remain unclear. Therefore, this study aims to identify the specific characteristics of anhedonia in OCD patients, and investigate the neural mechanisms of anhedonia in patients with OCD. A behavioral study was conducted in 279 OCD patients and 136 healthy individuals (HCs), with a comprehensive assessment for various types of anhedonia, including physical, social, anticipatory, consummatory, and state anhedonia. ANCOVAs were used to explore the differences in anhedonia levels between OCD patients and HCs, controlling for depression leve. During functional magnetic resonance imaging (fMRI) scans, 40 OCD patients and 39 healthy subjects completed the Monetary Incentive Delay Task (MID), and 38 OCD patients and 39 HCs completed the Social Incentive Delay Task (SID). A two-sample t-test was used to compare brain activation differences between OCD patients and HCs under each condition. For all brain regions that showed significant differences between OCD and healthy individuals, mean activation signals were extracted to investigate the relationship between brain activation and anhedonia, as well as clinical variables in OCD patients by using Pearson correlations analyses. All types of anhedonia were found to be higher in OCD patients than in healthy controls (*ps* < 0.01). However, after controlling for depression levels, physical, social, and consummatory anhedonia remained significantly higher in OCD patients compared to HCs (*ps* < 0.05), while anticipatory and state anhedonia showed no significant differences between two groups. In the SID task, compared to HCs, OCD patients demonstrated increased brain activation in the right precuneus, left fusiform gyrus, left anterior cingulate cortex, and right orbitofrontal cortex during the punishment anticipation phase, and reduced activation in the right striatum (particularly in the caudate nucleus) when receiving social rewards. No significant group differences in activation were observed in the MID task. Pearson correlation analyses revealed that the activation level in the right orbitofrontal cortex during the social punishment anticipation phase was significantly negatively correlated with interpersonal pleasure anhedonia in OCD patients (r = -0.38, p = 0.019). After controlling for depression level, the activation level in the right orbitofrontal cortex during the social punishment anticipation phase was still significantly negatively correlated with interpersonal pleasure (r = -0.35， p = 0.039), and the activation level of right anterior cingulate cortex during the social punishment anticipation phase was significantly negatively correlated with trait anxiety level (r = -0.34， p = 0.046). Meanwhile, right striatum activation during the reward outcome phase was significantly negatively correlated with the overall severity of OC symptoms (r = -0.37, p = 0.025) and obsessive thoughts (r = -0.34, p = 0.045). Physical anhedonia, social anhedonia, and consummatory anhedonia are independent clinical features in patients with OCD, which are not contingent upon the level of depression. Excessive activation of the precuneus, fusiform gyrus, anterior cingulate cortex, and orbitofrontal cortex during anticipated social punishment, along with inadequate activation of the striatum during receipt of social rewards, may constitute the neurobiological basis of anhedonia in individuals with obsessive-compulsive disorder.

摘 要 本研究从积极情绪的动机性维度出发，考察其对认知控制影响的神经机制。实验招募四十名参与者，采用近红外成像技术(fNIRS)探测被试在实验过程中的氧合血红蛋白浓度变化，透过近红外采集数据揭示趋近动机积极情绪诱发与执行认知控制过程中脑区激活状况，并探究在不同趋近动机水平上的积极情绪对认知控制影响的神经机制。研究结果表明高、低趋近动机积极情绪的刺激下，大脑前额皮层区域激活模式存在显著差异。在高趋近动机积极情绪诱发下的前额皮层区域激活范围更为广泛，包括右中央前回、右内侧额上回、左中央后回、左额中回；而在低趋近动机积极情绪条件下，只有右内侧额上回与左背外侧额上回出现显著激活。两种条件下的右中央前回与左背外侧额上回区域激活存在边缘显著的差异。在不同趋近动机积极情绪条件下，被试完成认知控制任务的脑区激活模式存在显著差异。在高趋近动机情绪条件下被试完成认知控制任务中，没有通道被显著激活($p>0.05$)；而在低趋近动机积极情绪条件下，CH03、CH04、CH07、CH17 等多个通道所探测的多个脑区被显著激活($p<0.05$)，其中包括左背外侧额上回、左额中回、左中央前回、右额中回、右内侧额上回等。这些证据表明，低趋近动机积极情绪组被试在执行认知控制能力时，前额叶脑区存在显著的血氧变化，这与前人研究得出额叶联合区负责计划、调节和控制行为的结论相吻合。此外基于每组趋近动机积极情绪与认知控制的数据分析发现，低趋近动机积极情绪组被试在情绪诱发任务与认知控制任务中，右内侧额上回区域均存在显著激活，且前后的情绪诱发任务与认知控制任务在该区域通道上的 beta 值存在边缘显著的正相关($p=0.055$)，表明右内侧额上回区域可能时低趋近动机积极情绪影响个体认知控制的潜在脑区。

fNIRS study on the influence of positive emotions with different approach motivations on cognitive control.

Zhenfeng Chen[1], Renhao Zhao[1], Junfeng Wei, Yangang Nie[1]
1 Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou 510006, China

Abstract: This study examines the neural mechanisms underlying the influence of positive emotions on cognitive control from the motivational dimension of positive emotions. The experiment used functional near-infrared spectroscopy (fNIRS) to detect changes in oxygenated hemoglobin concentration in subjects during the experiment, revealing brain activation patterns during the process of approaching motivation-induced positive emotions and cognitive control through near-infrared data collection, and exploring the neural mechanisms underlying the influence of positive emotions on cognitive control at different levels of approach motivation. The results showed significant differences in the activation patterns of the prefrontal cortex under high and low approach motivation positive emotion stimuli. Under high approach motivation positive emotion induction, the activation range of the prefrontal cortex was more extensive, including the right middle frontal gyrus, right medial superior frontal gyrus, left middle posterior gyrus, and left middle frontal gyrus; under low approach motivation positive emotion conditions, only the right medial superior frontal gyrus and left dorsolateral superior frontal gyrus showed significant activation.

There were marginally significant differences in the activation of the right middle frontal gyrus and left dorsolateral superior frontal gyrus under the two conditions. There were significant differences in brain activation patterns when subjects completed cognitive control tasks under different approach motivation positive emotion conditions. In the high approach motivation emotion condition, no channels were significantly activated ($p > 0.05$) when subjects completed cognitive control tasks; under low approach motivation positive emotion conditions, multiple channels including CH03, CH04, CH07, CH17 detected significant activation ($p < 0.05$) in multiple brain regions including left dorsolateral superior frontal gyrus, left middle frontal gyrus, left middle frontal gyrus, right middle frontal gyrus, right medial superior frontal gyrus. These findings suggest that there is significant blood oxygen change in the prefrontal cortex when subjects in the low approach motivation positive emotion group perform cognitive control abilities, which is consistent with previous research that the prefrontal association area is responsible for planning, regulating and controlling behavior. In addition, based on data analysis of each group's approach motivation positive emotions and cognitive control, it was found that in both emotion induction tasks and cognitive control tasks in the low approach motivation positive emotion group, there was significant activation in the right medial superior frontal gyrus region, and there was a marginally significant positive correlation ($p = 0.055$) between beta values on this region's channel in previous emotion induction tasks and subsequent cognitive control tasks, indicating that the right medial superior frontal gyrus may be a potential brain region for low approach motivation positive emotions to influence individual cognitive control.

童年期情感忽视经历对大学生脑白质结构的影响

金晓康[1]，徐滨[1]，金花[1]（通讯作者）
1 天津师范大学心理学部，天津 300387
jinhua@tjnu.edu.cn

摘 要 背景：童年期情感忽视指看护者未能满足未成年个体基本的情感需求，具有相当高的发生率并且可能独立于其它亚型发生。大量研究发现，即使在成年人中，童年期情感忽视经历也会对心理健康和社会功能产生长期影响。然而，单一性的童年期情感忽视经历对脑白质结构的潜在影响尚未可知。本研究通过比较仅有童年期情感忽视经历的大学生群体和无任何创伤经历的大学生群体的脑白质结构差异，旨在探究童年期情感忽视经历对脑白质结构的影响。**方法**：经过在线问卷调查、访谈以及专业医生的诊断，本研究获得了 20 名有童年期情感忽视经历的大学生(情感忽视组)和 20 名没有童年期情感忽视经历的大学生(对照组)，所有参与者均没有任何精神疾病。应用纤维束自动定量分析(AFQ)，追踪了主要的 20 条纤维束，并将每一条纤维束等分为 100 个节点，考察每条纤维各个节点位置的各向异系数值（FA）的组间差异。**结果**：AFQ 分析发现，情感忽视组在右侧丘脑辐射束的 1-35 节点的各向异系数值(FA)连续低于对照组。**结论**：前人研究表明，丘脑辐射束及其相关白质通路不仅将感觉和运动信息传递到中央前皮质和中央后皮质，丘脑辐射束还在情绪表达、情绪调节中起到重要的作用。而童年期情感忽视经历对个体情绪调节相关的损害已被很好的证明。因此，童年期情感忽视经历可能改变了右侧丘脑辐射束的发育，进而影响情绪调节功能。本研

究有望揭示童年期情感忽视经历增加心理健康风险的机制，为预防和干预童年期情感忽视经历继发的心理、行为问题提供更有针对性的建议和参考；也为早期情感环境对情感/社会功能发展的影响提供了新的视角。

The Influence of Childhood Emotional Neglect Experience on the Brain White Matter Structure of College Students

JIN Xiaokang[1], XU Bin[1], JIN Hua[1]

[1] Department of Psychology, Tianjin Normal University, Tianjin 300387, China

jinhua@tjnu.edu.cn

***Abstract*：Background**: Childhood emotional neglect, which refers to a failure to provide for the child's basic emotional needs, is highly prevalent and may occur independently of other subtypes. Numerous studies have found that even among adults, childhood emotional neglect experience can have long-term effects on mental health and social functioning. However, the potential impact of a single childhood emotional neglect experience on brain white matter structure is not yet known. By comparing the differences in brain white matter integrity between early adulthood with childhood emotional neglect experience and those without any childhood traumatic experience, our study aimed to investigate the effects of childhood emotional neglect experiences on brain white matter structure. **Method**: After online questionnaires, interviews, and diagnosis by a specialized physician, 20 college students with childhood emotional neglect experiences (emotional neglect group) and 20 college students without childhood trauma were obtained for this study, and all participants did not have any psychiatric disorders. Applying Automating Fiber-Tract Quantification (AFQ), the main 20 fibers were traced and each fiber was equally divided into 100 nodes. The group differences in Fractional Anisotropy (FA) at each node position of each fiber were examined. **Result**: AFQ analysis revealed that the Fractional Anisotropy (FA) at nodes 1-35 of the right thalamic radiation were consecutively lower in the emotional neglect group than in the control group. **Conclusion**: Previous studies have shown that the thalamic radiation tract and its associated white matter pathways not only transmit sensory and motor information to the precentral and postcentral cortices, but the thalamic radiation tract also plays an important role in emotion expression and emotion regulation. Furthermore, the impairment associated with childhood emotional neglect experiences on individual emotion regulation has been well established. Therefore, childhood emotional neglect experience may alter the development of the right thalamic radiation tract, affecting emotion regulation functions. This study expects to reveal the mechanism that childhood emotional neglect experience increases the risk of mental health and provide more targeted suggestions and references for the prevention and intervention of psychological and behavioral problems secondary to childhood emotional neglect experience. It also provides a new perspective on the influence of early emotional environment on the development of emotional/social function.

浙江大学动态面部表情数据库的建立和验证

潘之禾，陈惠敏，刘思琦，方霞 (通讯作者：x.fang@zju.edu.cn)
浙江大学心理与行为科学系，杭州，310058

摘 要 面部表情的动态特性传递了丰富而复杂的运动模式，使面孔成为人们情绪交流的重要媒介。然而，以往研究主要集中在对静态、基本情绪种类的考察，并且聚焦于西方文化。近年来，越来越多的研究表明情绪表达具有文化特异性。本研究旨在探究在中国文化背景下，可由动/静态面部表情传递的情绪类别以及是否存在动态识别优势效应，包括两个实验。实验 1 建立了常见情绪词汇库。通过回顾整理以往东西方情绪研究中的情绪词汇，并依据专家和参与者(N = 61)的评价，筛选常见性高且相似性低的情绪词汇纳入情绪词汇库。招募另一批参与者(N = 105)对筛选后的情绪词汇进行情绪表达方式评价(包括面部表情、声音、肢体动作等)。最终，选取面部表情表情选择比例大于 85%的情绪，连同基本情绪，共 28 种情绪(包括害羞，悲伤，开心，胜利等)。实验 2 采集并验证了面部表情。在第一阶段中，招募 64 名参与者表演 28 种情绪的面部表情并进行录制。全部表演完毕后，参与者回看自己的录像并指出最能代表每种情绪的画面，依此得到每种情绪相应的动/静态面部表情。在第二阶段中，招募另一批参与者对所有动态(N = 386)和静态面部表情(N = 415)进行情绪识别和维度评价。结果显示，参与者可以从静态表情中识别 13 种情绪，但能从动态表情中识别 23 种情绪。此外，18 种情绪显示了动态识别优势，其余 10 种情绪则未显示动静态表情识别的显著差异。本动态情绪面孔数据库丰富了国内现有的情绪面孔研究材料，并为面部表情情绪识别、动态面孔识别优势提供了证据。

Establishment and Validation of the Zhejiang University Dynamic Facial Expression Database

Zhihe Pan, Huimin Chen, Siqi Liu, Xia Fang (x.fang@zju.edu.cn)
Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, 310058

Abstract: The dynamic characteristics of facial expressions convey rich and complex patterns of movements, making the face a vital medium for emotion communication among individuals. However, previous research has mainly focused on static, basic emotions and has primarily been centered on Western cultures. In recent years, research has highlighted the cultural specificity of emotion expression. The present research aims to explore the emotions that can be conveyed through dynamic/static facial expressions as well as whether there exists dynamic advantage effect in emotion recognition in the Chinese culture. The study consists of two experiments. Experiment 1 established the emotion word set. By reviewing emotion words involved in Eastern and Western emotion researches, and based on evaluations from experts and participants (N = 61), emotion words with high commonality and low similarity were selected and included in the emotion word set. Another group of participants

(*N* = 105) self-reported their expression modes for selected emotion words (including facial expressions, vocalizations, and body movements, etc.). Twenty-eight emotions (including shyness, sadness, happiness, triumph, etc.) with facial expression selection rate of over 85% along with basic emotions were ultimately chosen. In Experiment 2, facial expressions were collected and validated. In phase 1, 64 participants posed and recorded facial expressions of 28 emotions. After posing all the expressions, they reviewed their recordings and indicated the images that best represented each emotion, resulting in the corresponding dynamic and static facial expressions. In phase 2, another group of participants performed emotion recognition and dimensional evaluation on all dynamic facial expressions (*N* = 386) and static facial expressions (*N* = 415). The results showed that participants could recognize 13 emotions from static expressions, but 23 emotions from dynamic ones. Additionally, 18 emotions exhibited dynamic advantage, while the remaining 10 emotions did not show significant differences in recognition between dynamic and static expressions. The current dynamic facial expression database enriches the existing materials for facial expression research in Chinese culture as well as provides evidence for the facial expression recognition and its dynamic advantage.

4 天津师范大学教育学院，天津，300074

摘 要 睡眠质量是影响大学生身心健康发展的重要因素。截面研究中发现睡眠质量和积极、消极注意偏向有密切的关系，但关于睡眠质量和积极、消极注意偏向之间的动态机制研究相对较少。本研究基于经验取样法探讨大学生睡眠质量、积极注意偏向和消极注意偏向的作用机制，有利于厘清睡眠质量和注意偏向之间的因果关系。来自中国公立大学的 240 名大学生连续完成 14 天睡眠质量，积极、消极注意偏向的每日问卷调查，每天早晨七点测量睡眠质量，晚上九点测量积极、消极注意偏向，并使用动态结构方程模型分析睡眠质量与积极、消极注意偏向之间的纵向关系。结果显示:(1)大学生睡眠质量、积极注意偏向和消极注意偏向自回归效应显著；(2)睡眠质量和积极注意偏向间呈双向预测效应，即前一天的睡眠质量能够显著正向预测当天的积极注意偏向(β = 0.188, 95% CI [0.148, 0.225])，前一天的积极注意偏向也能够显著正向预测当天的睡眠质量 (β = 0.052, 95% CI [0.014, 0.089])；(3)睡眠质量和消极注意偏向之间具有单向预测效应，即前一天的睡眠质量显著负向预测当天的消极注意偏向 (β = -0.051, 95% CI [-0.089, -0.008])，但前一天的消极注意偏向对当天的睡眠质量没有显著预测作用(β = -0.008, 95% CI [-0.049, 0.027])。本研究揭示了睡眠质量、积极注意偏向和消极注意偏向的动态机制，并发现相对于降低消极注意偏向，提高积极注意偏向是改善睡眠质量的可行路径，该结论对设计改善睡眠质量的相应干预方案有一定的参考价值。

***Abstract*：** **Objectives** Emotional attentional bias are the cognitive tendencies that people have when processing information, and they may affect the emotional and psychological state of individuals.The association between emotional attentional bias and sleep quality in cross-section study has been well documented. However, at the level of short-term dynamics, the extent to which emotional attention bias or sleep quality persists in daily life is under-explored. This experience sampling study aimed to explore the temporal relationship between emotional attention bias and sleep quality. **Methods** There are two sub-studies in this study, 14 consecutive daily diaries (twice daily, 6438 observations) on sleep quality and positive and negative information attention bias completed by 240 subjects from public universities in China, respectively. We combined the two interrelated time series into one model using dynamic structural equation modeling. **Results** The results of the study found different reciprocal effects between sleep quality and positive and negative information attention bias, with both processes showing significant autoregressive. In Study 1, the autoregression of sleep quality (β = 0.203, 95% CI [0.160, 0.244]) and positive information attention bias (β = 0.183, 95% CI [0.143, 0.221]) showed significant stability. Positive emotional attention bias was a significant predictor of subsequent sleep quality (β = 0.052, 95% CI [0.014, 0.089]), while sleep quality was also a significant predictor of subsequent positive emotional attention bias (β = 0.188, 95% CI [0.148, 0.225]). In Study 2, the autoregression of sleep quality (β = 0.235, 95% CI [0.196, 0.281]) and negative information attention bias (β = 0.121, 95% CI [0.076, 0.166]) was significant. Negative information attention bias was not a significant predictor of subsequent sleep quality (β = -0.008, 95% CI [-0.049, 0.027]), but sleep quality was a significant predictor of negative information attention bias (β = -0.051, 95% CI [-0.089, -0.008]). **Conclusions** In summary, at the level of short-term dynamics, we found that sleep quality can be viewed as both an antecedent and an outcome of positive information attention bias. However, sleep quality can only be viewed as an antecedent of negative information attention bias.

父母教养剖面对于青少年脑结构以及内化症状的影响

丁晴雯[1, 2]　李新影[1, 2]（通讯作者）

1 中国科学院心理研究所，北京，100101

2 中国科学院大学心理学系，北京，100101，通讯作者 E-mail：lixy@psych.ac.cn

摘 要　教养方式影响青少年的情感和认知功能，大脑发育被认为是这一过程的神经基础。然而，母亲和父亲教养如何共同影响青少年的大脑结构以及内化症状尚未得到研究。本研究使用纵向双胞胎脑成像数据来确定在不同养育组合中青少年的大脑结构差异以及与抑郁和焦虑的关系，并探索结构差异的遗传基础。招募来自于北京双生子平台的 216 名双胞胎在青春期早期（平均 [SD] = 12.59 [0.94] 岁）完成教养方式量表，在青春期中期（平均年龄 [SD] = 15.76 [0.94] 岁）完成结构脑成像扫描以及焦虑和抑郁症状量表。利用潜在剖面分析在青春早期确定了四种养育方式剖面，分别为“好父母”、“虎爸”、“虎妈”和“虎爸虎妈”家庭。研究发现父母教养剖面对于脑结构的影响显著：与“好父母”家庭抚养的青少年相比，“虎妈”家庭抚养的青少年在青春中期左侧伏隔核体积较小，“虎爸虎妈”家庭抚养的青少年前胼胝体体积较小，“虎爸”家庭抚养的青少年左侧丘脑体积较大。遗传分析表明与教养相关的大脑结构差异也归因于大量的遗传影响。遗憾的是，本研究没有发现父母教养剖面对三年后青少年抑郁和焦虑症状的影响。此外，与教养相关的神经差异与内化症状无关。研究表明，不同养育组合下的青少年会表现出明显不同的大脑结构特征。脑结构的差异主要集中在皮层下区域。我们的研究进一步强调了母亲和父亲教养环境对于青春期神经发育中的重要性。

The influence of parenting profiles on adolescent brain structure and internalizing symptoms

Qingwen Ding[1,2], Xinying Li[1,2]*

[1] CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing, China

[2] Department of Psychology, University of Chinese Academy of Sciences, Beijing, China

Abstract：Parenting influences adolescent affective and cognitive function, and the neurodevelopment is widely proposed to underlie the process. Nevertheless, how the combination of maternal and paternal parenting influence adolescent brain structure and internalizing problems has not been investigated. This study used a longitudinal twin neuroimaging study to determine the brain structural heterogeneity in adolescents that raised in different parenting profiles (father and mother) and examine its association with depression and anxiety, and address its genetic basis. A total of 216 twins completed parenting measures in early adolescence (mean [SD] = 12.59 [0.94] years) and MRI scanning in middle adolescence (mean age [SD] = 15.76 [0.94] years). We found four parenting profiles in early adolescence, including the “kindparents,” “tigerdad,” “tigermom,” and “tigerparents” families. Compared to adolescents raised in the “kindparents” families, those raised in “tigermom” families showed smaller volumes in the left nucleus accumbens, those raised in “tigerparents” families showed smaller volumes in the middle anterior corpus callosum, and those raised in “tigerdad” families showed larger volume in

left thalamus in middle adolescence. The structural heterogeneity in these brain regions was also attributed to considerable genetic factors. Unfortunately, there were no effects of parenting profiles on adolescent depression and anxiety symptoms three years later. Furthermore, these structural differences were not associated with internalizing symptoms. Findings suggest that adolescents raised in different parenting combinations exhibited distinct brain structural features. These brain changes converge on subcortical regions. Our study highlights the significance of both maternal and paternal parenting in adolescent neurodevelopment.

3 广州医科大学附属脑科医院，广东，广州，510370

摘要 急性社会心理应激如何影响不公平决策一直未有定论，因为决策过程中的心理过程相对复杂，且受到个体差异影响。为进一步探究此问题，我们设计了竞争性群体特里尔社会应激任务（C-TSST-G），让两名被试同时进行应激诱导并评估双方表现，但宣布表现较差一方获胜，以制造真实的不公平经历。获胜者进行独裁者游戏（DG），落败者进行最后通牒任务（UG），双方都以为在和对方进行金钱分配。控制组被试则经历了无应激双人 TSST，先后完成和匿名对手的 DG 和 UG。人际反应指标（IRI）被用来测量被试的共情程度是否影响应激下的决策行为。

78 名健康年轻男性参与实验，应激组 42 名，控制组 36 名。皮质醇和三维情绪问卷的结果显示应激诱导成功，且 TSST 后应激 DG 组的心情更差，更紧张，而应激 UG 组的清醒程度更高。应激 DG 组的自我评价相比应激 UG 组更低。和控制组相比，应激对 DG 任务中的分配额度和反应时均无影响，对 UG 任务中不同条件的接受率和反应时也没有影响。基于不公平厌恶模型进行计算建模，生成劣势不公平敏感性(α)、行为随机性(τ)、公平适应性(ε)三个行为学指标，也不受到应激影响。在 DG 任务中，被试认为自己相比于对手表现的越差，越倾向于把金钱都留给自己；而表现评分对 UG 无影响。IRI 对 DG 的分配率无影响，但在无应激时，同情关心越高的被试给出分配方案的速度越快；而应激条件下，想象得分越高的被试给出分配方案速度越快。在 UG 任务中，只有在应激条件下，同情关心程度越高，对公平分配方案的反应速度越长；感受到他人的个人痛苦程度越高，个体受到内在公平感的影响也更强。在所有被试中，想象得分越高，劣势不公平敏感性越高，对于不公平分配的接受率越低。

本研究首次使用 TSST 范式同时诱导急性竞争性应激和不公平经历，操纵被试在真实的不公平感受下进行不公平决策任务，发现急性应激放大了共情相关的指标对不公平决策心理过程的影响，为应激的“照料与结盟”亲社会模型提供了证据。

Perform better but being rejected? The interpersonal reactivity influences the fairness-related decision-making under acute competitive psychosocial stress

Siyu Yu[1], Siyu Yu[3], Shijia Li[1, 2]*

Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), Institute of Brain and Education Innovation, School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China, E-mail: sjli@psy.ecnu.edu.cn

Shanghai Changning Mental Health Center, Shanghai, 200335, China

The Affiliated Brain Hospital of Guangzhou Medical University, Guangzhou, 510370, China

Abstract

How acute psychosocial stress affects unfair decision making has been inconclusive because the psychological processes involved in decision making are relatively complex and are influenced by individual differences. To further explore this issue, we introduced a Competitive Trier Social Stress Task for group (C-TSST-G) by having two subjects simultaneously perform a stress induction and assess the performance of both, but declaring the lesser performer the winner in order to create a realistic experience of inequity. The winner performed the Dictator Game (DG) and the loser performed the Ultimatum Game (UG), with each side thinking they were engaging in a monetary distribution with the other. The control group experienced a stress-free version of TSST-G, and finished both DG and UG tasks with anonymous opponent. The Interpersonal Reactivity Index (IRI) were used to measure whether subjects' level of empathy influenced decision-making behavior under stress.

Seventy-eight healthy young men participated in the experiment, 42 in the stress group and 36 in the control group. The results of the cortisol and Mood Questionnaire showed successful stress induction and a worse and more nervousness mood in the stress DG group after TSST, while the stress UG group had a higher level of alertness. Self-evaluation was lower in the stress DG group compared to the stress UG group. Compared to the control group, stress had no effect on both the amount allocated and the reaction time in the DG task, nor did it have an effect on the acceptance rate and reaction time for the different conditions in the UG task. Computational modelling based on the Rescorla-Wagner Model generated three behavioral indicators of disadvantageous aversion (α), decision noise (τ) and norm adaptation rate (ε), which were also not affected by stress. In the DG task, the worse the participants regarded themselves performed compared to their opponents, the more inclined they were to keep most of the money for themselves; and performance ratings had no effect on UG. IRI had no effect on the average money allocation of the DG, but subjects with higher empathetic concern gave the decisions faster in the absence of stress, whereas subjects with higher fantasy scores gave the decisions faster in the stress condition. In the UG task, only in the stress condition, participants with higher empathetic concern scores spent longer time in responding to a fair offer, and participants with higher personal distress scores showed stronger influence by an internal sense of fairness. Among all subjects, the higher the fantasy scores, the higher the unfairness sensitivity and the lower the acceptance rate for unfair offers.

This study is the first to use the TSST-G paradigm to simultaneously induce acute competitive stress and

unfair experiences, and manipulate subjects to perform an unfair decision-making task under actual unfair experience. We found that acute stress amplifies the effects of empathy-related indicators on the psychological process of unfair decision-making, providing evidence for a “Tend-and-Befriend” pro-social model of stress.

感恩与抑郁症状的关系：来自日记法研究的证据

孔凤[1]（通讯作者） 张琳婷[2] 许沛鸿[2] 蒋达[3]

1 陕西师范大学心理学院，西安，710062，kongfeng87@126.com

2 香港理工大学应用社会科学系，香港

3 香港教育大学特殊教育与辅导学系，香港

摘 要 感恩是个体意识到施恩者给予的恩惠或帮助后产生的一种情感体验，可以促进个体身心健康发展，降低罹患心理问题的风险。而抑郁是最普遍的心理问题之一，表现为兴趣减退和情绪低落等，是影响个人身心健康的重要危险因素。以往研究通过横向或纵向设计揭示了感恩与抑郁症状的负相关关系，但这些研究多采用整体追溯法，存在较大的回忆偏差，并且无法测查自然状态下感恩与抑郁症状的日常波动。因此，本研究基于感恩的放大理论，采用连续 14 天的日记法设计，调查了 243 名大学生的每日感恩（感恩形容词评定量表）和每日抑郁症状（简明心境量表抑郁子量表），探讨感恩与抑郁症状在每日水平上的关系以及特质感恩对每日感恩和每日抑郁症状之间的滞后关系的调节作用。结果显示：（1）在同一天，感恩与抑郁症状呈负相关（b = -0.229, p < .001）；（2）交叉滞后分析的结果表明，前一天的感恩负向预测当天的抑郁症状（b = -0.056, p = .009）；（3）特质感恩对前一天感恩与当天抑郁症状之间的关系的调节作用不显著（b = -0.002, p = .697）；（4）在控制积极情绪、消极情绪和心理幸福感后，交叉滞后分析以及调节效应分析的结果保持稳定。以上研究结果表明，当某一天的感恩水平较高时，个体在同一天以及第二天的抑郁症状会得到减轻，并且特质感恩不能调节每日感恩和每日抑郁症状之间的滞后关系。本研究将感恩与抑郁症状之间的关系拓展到了每日水平上，支持了感恩的放大理论，也为抑郁的预防和干预提供依据。

关键词 感恩，抑郁症状，日记法

The association between gratitude and depressive symptoms: evidence from a daily diary study

Feng Kong[1](corresponding author) Linting Zhang[2] Bryant Pui Hung Hui[2] Da Jiang[3]

1 School of Psychology, Shaanxi Normal University, Xian, 710062，kongfeng87@126.com

2 Department of Applied Social Science, Hong Kong Polytechnic University, Hong Kong

3 Department of Special Education and Counselling, Education University of Hong Kong, Hong Kong

Abstract: Gratitude is an emotion that occurs when an individual realizes that a benefactor has given him or her a favor or help, and it can contribute to physical and psychological health and reduce the risk of developing mental problems. Depression is one of the most prevalent mental problems, which is characterized by loss of interest and depressed mood, and is an important risk factor for an individual's physical and mental health. Previous studies have revealed the negative correlation between gratitude and depressive symptoms through cross-sectional or longitudinal designs, but most of these studies have used global reports, which cause a number of recall biases. Previous studies also failed to measure the daily fluctuations of gratitude and depressive symptoms in the natural context. Therefore, based on the amplification theory of gratitude, the present study utilized a daily diary design for 14 consecutive days and measured daily gratitude (Gratitude Adjective Checklist) and daily depressive symptoms (Depression Subscale of the Profile of Mood States) in 243 college students to explore the relationship between gratitude and depressive symptoms at the daily level and the moderating effect of trait gratitude on the lagged link between daily gratitude and daily depressive symptoms. Results showed that (1) gratitude was negatively related to depressive symptoms on the same day (b = -0.229, p < .001); (2) the cross-lagged analyses indicated that the previous day's gratitude negatively predicted depressive symptoms on the current day (b = -0.056, p = .009); (3) the moderating effect of trait gratitude on the relationship between the previous day's gratitude and the present day's depressive symptoms was not significant (b = -0.002, p = .697); and (4) the results of cross-lagged analyses as well as moderating effect analyses remained stable after controlling for positive affect, negative affect, and psychological well-being. The above findings suggest that when individuals' gratitude levels are higher on a given day, they would experience a reduction in depressive symptoms on the same day as well as the next day, and that trait gratitude does not moderate the lagged link between daily gratitude and daily depressive symptoms. The present study extends the association between gratitude and depressive symptoms to the daily level, supporting the amplification theory of gratitude and providing a basis for prevention and intervention on depression.

Keywords: gratitude, depressive symptoms, daily diary study

孤独感与抑郁、焦虑间关系的网络分析

任垒[1,2]　梁淑怡[3]　刘旭峰[3]　周喻[1,2]（通讯作者）

1 武警后勤学院军事心理学教研室，天津，300309，273325838@qq.com

摘 要　孤独感是抑郁和焦虑的重要风险因素之一。以往研究大多采用自我报告量表总分（障碍/潜变量水平）来探索孤独感与抑郁、焦虑之间的关联。最近研究表明，症状水平而不是障碍水平的分析可能会对理解精神病理方面提供更精细的视角。到目前为止，极少有研究检验孤独感不同成分与抑郁和焦虑不同症状间的关联模式。本研究旨在：1）孤独感不同成分与抑郁不同症状间的关联模式及关联两者的桥变量；2）孤独感不同成分与焦虑不同症状间的关联模式及关联两者的桥变量。以陕西省五所大学 1849 名大学生为研究对象。孤独感采用简版 UCLA 孤独感量表（ULS-6）进行评估，抑郁症状采用抑郁症筛查量表（PHQ-9）进行评估，焦虑症状采用广泛性焦虑量表（GAD-7）进行评估。通过软件 R 中 qgraph 包的 EBICglasso 方

法构建两个正则化偏相关网络（Regularized partial correlation network），即孤独感-抑郁网络和孤独感-焦虑网络。同时，计算两个网络中每个变量的桥预期影响（Bridge expected influence）。在孤独感-抑郁网络中，所有关联均为正性，孤独感成分“感觉自己与别人隔离了起来”与抑郁症状“自杀意念”有较强的跨社团正性关联。孤独感成分“感觉自己与别人隔离了起来”和抑郁症状“觉得自己很糟或觉得自己很失败，或让自己或家人失望”在各自社团中具有最大的桥预期影响值，意味着其是连接孤独感和抑郁的桥变量。在孤独感-焦虑网络中，所有关联均为正性，孤独感成分“感觉自己与别人隔离了起来”和焦虑症状“对各种各样的事情担忧过多”在各自社团中具有最大的桥预期影响值，意味着其是连接孤独感和焦虑的桥变量。因此，孤独感成分“感觉自己与别人隔离了起来”对抑郁（包括自杀意念）和焦虑具有重要的跨诊断风险性作用。我们讨论了研究结果对临床预防和干预的意义，例如通过增加社交活动和减少社交隔离来缓解抑郁（包括自杀意念）和焦虑症状。

Abstract：Loneliness is one of the important risk factors for depression and anxiety. Previous studies have investigated the relations between loneliness, depression and anxiety using total scores on self-report measures (disorder/latent variable level). Existing research proposed that moving from a disorder-level analysis to a symptom-level analysis may provide a more fine-grained understanding of psychopathology. So far, there have been few studies examining the association patterns between different components of loneliness and different symptoms of depression and anxiety. This study aimed to explore: 1) the relations between different components of loneliness and symptoms of depression, and bridge variables bridging them; and 2) the relations between different components of loneliness and symptoms of anxiety, and bridge variables bridging them. We estimated two regularized partial correlation networks (i.e., loneliness-depression network and loneliness-anxiety network) among 1,849 college students from five universities in Shaanxi Province via Package qgraph (EBICglasso) in software R. Loneliness was assessed via the short-form UCLA Loneliness Scale (ULS-6). Depression symptoms were measured by Patient Health Questionnaire-9 (PHQ-9) while anxiety symptoms were measured by Generalized Anxiety Disorder 7-Item Questionnaire (GAD-7). Bridge expected influence was used to quantify the bridge centrality of each variable in these two networks. Within the loneliness-depression network, all associations are positive. There is a strong cross community positive correlation between the component “I feel isolated from others” of loneliness and the symptom “suicidal thoughts” of depression. The component “I feel isolated from others” of loneliness and the symptom “Feeling bad about yourself, or that you are a failure or have let yourself or your family down” of depression have the highest bridge expected influence, indicating these two variables are bridge variables bridging loneliness and depression. Within the loneliness-anxiety network, all associations are positive. The component “I feel isolated from others” of loneliness and the symptom “Worrying too much about different things” of anxiety have the highest bridge expected influence, indicating these two variables are bridge variables bridging loneliness and anxiety. Therefore, the component “I feel isolated from others” of loneliness has an important transdiagnostic risk effect on depression (including suicidal thought) and anxiety. Implications for

clinical preventions and interventions are discussed, such as we could alleviate both depression (including suicidal thought) and anxiety symptoms by increasing social activity and reducing social isolation.

高低数学焦虑在数列推理上的差异——电生理学证据

冯瑾[1]　秦焕超[1]　陈庆飞[2]（通讯作者）

1 深圳大学心理学院，深圳，518060

2 深圳大学心理学院，深圳，518060，myth3233@126.com

摘 要　数学焦虑(Math anxiety)分为了特质数学焦虑(Trait MA)和状态数学焦虑(State MA)，前者将对数学相关场景的消极反应作为一种持久的人格特质，后者指发生在数学活动期间的一种暂时性的、与情境相关的反应。本研究借助事件相关电位技术在电生理学水平上考察高低数学焦虑特质人群在数列推理过程中的差异。研究选取 40 名(20 名高数学焦虑，20 名低数学焦虑)非数学非心理学专业大学生被试进行数学能力测验和数字序列任务(The number series task)，数字序列任务要求被试寻找数字序列中的隐藏规则，并预测一个序列中下一个可能出现的数字，需要寻找的规则分为两种：简单规则和复杂规则。在简单规则中，数字和数字之间的规则是一元的，例如+1,+1,+1...或-2,-2,-2...；在复杂规则中数字之间的规则是二元的，例如+2,+4,+6...-12,-10,-8...。任务将推理过程分为规则搜索、规则发现和规则追随。结果发现：(1)在行为上，高数学焦虑人群和低数学焦虑人群在数字运算能力上没有显著差异，但是在数字序列任务上有差异：不管是简答规则还是复杂规则，高数学焦虑寻找到的数目均低于低数学焦虑；(2)在脑电指标上，在所有正确试次中，不管是简单规则还是复杂规则，相比低数学焦虑，高数学焦虑被试表现出更大的 N400。在规则跟随阶段，复杂规则比简单规则诱发了更大的 P300，在规则发现阶段上无显著差异。上述结果表明，虽然在基础的数学运算上高低数学焦虑个体没有显著差异，但是在数列推理上高数学焦虑个体的表现差于低数学焦虑个体，这说明高数学焦虑个体需要用额外的注意去处理负面情绪，从而影响认知活动上的表现，特别是数学相关的复杂任务。

Differences between high and low math anxiety in number series - Electrophysiological evidence

Jin Feng, Huanchao Qin, Qinfei Chen(Corresponding Author)）

Shenzhen University, Shenzhen, 518060, myth3233@126.com

Abstract：Math anxiety has been divided into Trait Math Anxiety (Trait MA), which refers to negative reactions to math-related scenarios as an enduring personality trait, and State Math Anxiety (State MA), which refers to a temporary, contextually relevant reaction that occurs during math activities. The present study examined the differences between people with high and low math anxiety traits during number sequence reasoning at the

electrophysiological level with the help of event-related potentials technique. Forty (20 high math anxiety, 20 low math anxiety) non-math and non-psychology college students were selected to take the Mathematics Aptitude Test and The number series task. The number series task requires subjects to look for hidden rules in a sequence of numbers and to predict the next possible number in a sequence, and there are two types of rules to look for: simple rules and complex rules. The rules to be found are of two kinds: simple rules and complex rules. In simple rules, the numbers and the rules between the numbers are one-dimensional, e.g. +1,+1,+1... or -2,-2,-2... ; in complex rules the rule between numbers is binary, e.g. +2,+4,+6... -12,-10,-8.... The task divides the reasoning process into rule search, rule discovery and rule following. It was found that (1) behaviorally, there was no significant difference between the high and low math anxiety population in number arithmetic ability, but there was a difference in the number sequence task: the number of rules found was lower in high math anxiety than in low math anxiety, regardless of whether the rules were simple or complex; and (2) in terms of electroencephalographic metrics, in all the correct trials, regardless of whether the rules were simple or complex, compared to the low math anxiety, high math anxiety subjects showed greater N400. complex rules induced greater P300 than simple rules in the rule-following phase, and there was no significant difference on the rule-finding phase. The above results indicate that although there is no significant difference between high and low math anxious individuals in basic math operations, high math anxious individuals perform worse than low math anxious individuals in number series reasoning, which suggests that high math anxious individuals need to pay extra attention to deal with negative emotions, which affects the performance on cognitive activities, especially complex tasks related to math.

儿童焦虑的发展轨迹：

父母挑战性教养和害羞气质的作用

菅景康[1]　耿喆[2]　封亚飞[1]　吴艳丽[1]　徐夫真[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，xufuzhen@sdnu.edu.cn

2 山东英才学院，济南，250014

摘要　焦虑是儿童群体中最为常见的心理健康问题之一，童年期持续的焦虑可能会扩展到青春期甚至是成年期，增加个体后来罹患焦虑障碍的风险。发展情境理论认为，个体发展是个体与其所处情境交互作用的结果。儿童焦虑的发展也是个体因素与早期教养等环境因素相互作用的结果。本研究基于变量中心和个体中心的视角考察了儿童焦虑的发展特点以及父母挑战性教养和害羞气质对儿童焦虑发展轨迹的预测作用。本研究对山东省 7 所小学的 558 名三、四年级的学生（$M = 10.98 \pm 0.77$ 岁, 46.80%为女生）及其父母进行了三次问卷调查，每两次调查间隔一年，使用潜增长曲线模型、潜类别增长模型和多元 Logistic 回归进行统计分析。结果发现：（1）儿童焦虑整体上呈线性增长趋势，初始水平和发展速度负相关，即儿童焦虑初始发展水平越高，增长速度越慢；儿童焦虑的发展存在三条异质性发展轨迹，分别是：低水平稳定组（81.18%）、高水平缓慢降低组（9.86%）和中水平快速增长组（8.96%）。（2）父母挑战性教养显著正向预测儿童焦虑的初始水平，而害羞气质显著负向预测儿童焦虑的初始水平和发展速度。（3）害羞气质在父母挑战性教养与儿童焦虑初始水平和发展速度之间起调节作用，即父母挑战性教养可以显著负向预测高害羞气质儿童焦虑的初始水平和发展速度，对低害羞气质儿童焦虑的初始水平和发展速度的预测作用不显著。

（4）害羞气质、父母挑战性教养与儿童焦虑的异质性发展轨迹存在显著关联，以低水平稳定组为参照组，高害羞气质的儿童相较于低害羞气质的儿童更可能属于中水平快速上升组，而父母挑战性教养水平越高，个体属于中水平快速上升组的可能性就越小。上述结果表明儿童焦虑的发展轨迹具有群体异质性，存在不同类别的发展趋势，父母挑战性教养和害羞气质对儿童焦虑的发展轨迹存在显著预测效应。其中，父母挑战性教养对高害羞气质儿童的保护性作用支持了差别易感性模型，综上所述，父母应针对儿童的气质特点采用适宜的教养行为，从而促进儿童情绪健康发展。

The Development Trajectory of Children's Anxiety: The Roles of Challenging Parenting Behaviour and Shyness Temperament

Jingkang Jian[1], Zhe Geng[1], Yafei Feng[1], Yanli Wu[1], Fuzhen Xu[1] (Corresponding Author)
1 School of Psychology, Shandong Normal University, Jinan, 250014, xufuzhen@sdnu.edu.cn

***Abstract*:** Anxiety is one of the most common mental health problems that affect children and persistent anxiety in childhood may extend into adolescence and even adulthood, increasing an individual's risk of developing an anxiety disorder later in life. From the perspectives of developmental contextualism, individual development is the result of interaction between individuals and their situations. The development of anxiety in children is also the result of the interaction between individual factors and environmental factors such as early parenting. Therefore, the present study examined the developmental characteristics of children's anxiety and the predictive role of parental challenging parenting and shyness temperament on children's anxiety developmental trajectories based on variable-centered and individual-centered analytic orientations. In present study, a total of 558 students (M_{age} = 10.98 ± 0.77, 46.80% girls) and their parents were surveyed from 7 elementary schools in Shandong province were surveyed three times with a gap of one year, and statistically analyzed using latent growth curve modeling, latent category growth modeling, and multivariate logistic regression. Results were as follows: (1) The children's anxiety showed an overall linear growth trend, with initial level and developmental rate negatively correlated, specifically, the higher the initial development level of children's anxiety, the slower the growth rate; There were three heterogeneous developmental trajectories of children's anxiety, namely: low-level stable group (81.18%), high-level slow decrease group (9.86%), and medium-level rapid growth group (8.96%). (2) Parental challenging parenting significantly positively predicted initial level of children's anxiety, whereas shyness temperament significantly negatively predicted initial level and developmental rate of children's anxiety. (3) Shyness temperament moderated the relationship between parental challenging parenting and the initial level and developmental rate of children's anxiety. Specifically, parental challenging parenting significantly negatively predicted the initial level and developmental rate of anxiety in children with high shyness temperament, and did not significantly predict the initial level and developmental rate of anxiety in children with low shyness temperament. (4) Challenging parenting behaviour and shyness temperament were significantly associated with the heterogeneity of children's anxiety trajectories. Taking the low-level stable group as the reference group, children with high shyness temperament are more likely to belong to the medium-level rapid growth group compared to those with low shyness temperament, whereas the higher the level of parental challenging parenting, the less likely the individual is to belong to the medium-level rapid growth group. The above results indicate that the developmental trajectory of children's anxiety is group heterogeneous, with different categories of developmental

trends, and that there is a significant predictive effect of parental challenging parenting and shyness temperament on the developmental trajectory of children's anxiety. Among them, the protective effect of parental challenging parenting on children with high shyness temperament supports the differential susceptibility model. In summary, parents should adopt appropriate parenting behaviors according to children's temperament characteristics, so as to promote children's emotionally healthy development.

摘 要

社交焦虑是一种普遍的焦虑障碍，对患者的生活和工作产生严重影响，亟需研究验证其背后的机制。对于机制的验证，一套标准化图片库将有效作为实验材料，推动通过实验室研究得到社交焦虑相关的客观行为和生理指标。然而，在社交焦虑领域中暂时没有标准化的社交焦虑图片数据库，带来以下局限。首先，实验刺激缺乏针对性，过往研究选取情绪图片作为实验刺激，对社交焦虑的针对性不足。其次，同类研究可比性不足，即不同图片材料的选择对结果的潜在影响难以排除。最后，已有研究缺乏对图片客观属性和主观情绪诱发程度的定量描述，如图片中的人物数量、特征和社交交互特征等，以及参与者观看图片后诱发的情绪感受等。上述原因使得研究者在使用图片刺激时，难以选取社交焦虑针对性刺激，也难以定量控制图片的各类属性，或排除图片本身的属性差异对结果的潜在影响。

为解决上述局限，本研究旨在基于 AI 作图，开发标准社交焦虑图片数据库。本研究基于 Dalle-2、Stable diffusion XL 等深度学习文生图大模型，以较低的成本和高仿真度，基于社交焦虑理论维度、场景和描述，生成多种族、多场景、多样化的图片材料。本研究基于社交焦虑量表的 5 个维度，根据以下三个维度生成图片：1）场景：在公共场所，2）人物：与有压力的人交流，3）动作：负性情绪的表达和接受，生成共 120 张社交焦虑图片和 120 张控制图片。图片包含了多种触发社交焦虑的活动，如公众演讲、小组讨论、社交聚会等。本研究通过线上实验测量图片的主观评价得分，包括社交焦虑感受程度、效价和唤醒度等。同时研究也详细记录了图片的客观属性，包括图片中的人物特征（如人数、种族等）和社交交互特征（如，是否存在社交交互行为）等。

在知识共享许可下，本研究将开放社交焦虑图片数据库，旨在通过提供多维社交焦虑图片信息，为定量化、可重复、可比较的社交焦虑研究提供支持，以促进建立客观评价和诊断体系。

The Development of Social Anxiety Picture System (SAPS): Based on AI Art Generation Model

Qianqian Ju[1], Zile Chen[2], Zhijian Xu[1], Han Zhang[3], Yujia Peng[1, 4, 5]

5 National Key Laboratory of General Artificial Intelligence, BIGAI, Beijing, China, 100871

Abstract:

Social anxiety stands out as one of the most prevalent anxiety disorders, significantly impacting the lives and functioning of affected individuals. Consequently, there is an urgent need for research that delves into the mechanisms underlying this social anxiety. To understand the underlying mechanisms of social anxiety, a standardized dataset of pictures would serve as valuable experimental materials to reveal associated behavioral and physiological indicators in laboratory studies. However, there is currently a lack of database containing specific social anxiety pictures, and several limitations need to be addressed. First, traditional experimental stimuli lack specificity, as prior studies mostly employed emotional pictures as experimental materials, which do not specifically target social anxiety, making it difficult to directly compare results across studies. Moreover, existing database lacks quantitative descriptions of objective attributes of the pictures (e.g., the number of characters, their characteristics, and the presence of social interaction features) , or the degree of evoked emotions after viewing the pictures. Consequently, the aforementioned limitations make it challenging for researchers to select visual stimuli targeting social anxiety studies that can control for various picture attributes, and account for potential influences of the pictures on the results.

To address these limitations, the current study aims to develop a standardized Social Anxiety Picture System (SAPS) based on AI art generation models. Employing deep learning AI models of Dalle-2 and Stable diffusion XL, we generate pictures with diverse ethnicity and scenarios, based on theories of social anxiety. This approach is cost-effective and ensures high vividness in the generated pictures. The SAPS consists of 120 social anxiety pictures and 120 control pictures, which were developed based on the five dimensions of the Social Anxiety Questionnaire. The pictures encompass three main dimensions: 1) Scene: being in a public place, 2) Characters: interacting with people under pressure, and 3) Actions: expression and reception of negative emotions. They portray various activities that trigger social anxiety, such as public speaking, group discussions, and social gatherings. To examine the associated attributes of the generated pictures, we collected subjective evaluation scores for the pictures through an online experiment, including measures of evoked social anxiety, valence, and arousal. The dataset also provides detailed information of the objective attributes of the pictures, including characteristics of the depicted individuals (e.g., number of people, ethnicity, etc.) and features of social interactions (e.g., presence or absence of social interaction behaviors).

In line with ethical principles, the Social Anxiety Picture System will be shared under a creative commons license, aiming to promote quantitative, reproducible, and comparable social anxiety research. By providing a comprehensive and standardized dataset, this initiative aims to promote quantitative, reproducible, and comparable social anxiety research studies, and facilitate the establishment of an objective evaluation and diagnostic system

for social anxiety.

追踪焦虑情绪的动态变化：

注意偏向与情绪调节的作用

周钰程, 张萌（通讯作者）
浙江大学心理与行为科学系，杭州，310030，mz3822@zju.edu.cn

摘　要　焦虑的认知模型指出焦虑易感性与个体多种功能障碍有关，包括自下而上的自动威胁评估和自动威胁定向（例如，威胁性信息注意偏向），以及自上而下认知过程的干扰（例如，情绪调节）。然而，先前的研究还没有阐明注意偏向的不同成分以及情绪调节是否对焦虑情绪的动态变化具有不同的影响。本研究的目的是在日常生活情境下，考察注意偏向的两个成分(即注意脱离困难和注意增强)和情绪调节困难与焦虑情绪动态变化的关系。被试由 86 名在校大学生构成。所有的被试首先在实验室完成了注意偏向评估任务与情绪调节困难量表，随后，从第二天开始完成持续 7 天的生态瞬时评估任务（每天在 10 个固定时间点报告当下的焦虑状态以及是否遭遇负性应激事件）。结果发现，注意偏向中的注意脱离困难(而非注意增强)成分和情绪调节困难都与个体遭遇负性应激事件后立即出现的焦虑情绪的反应性增加有关。具体而言，在遭遇负性应激事件后：1.高注意脱离困难的个体（相较于低注意脱离困难）焦虑情绪的上升程度显著更大；2.高情绪调节困难的个体（相较于低情绪调节困难）焦虑情绪的上升程度显著更大。本研究结果强调了焦虑情绪动态变化中的风险因素与保护因素，对于高焦虑特质人群的认知干预措施提供了新的见解。

***Abstract*:** Cognitive models suggest that vulnerability to anxiety relates to dysfunction in several mechanisms, including bottom-up automatic threat assessment and orientation, and as well as the top-down cognitive interference. Nevertheless, whether different components of attentional biases and emotion regulation play separate roles on anxiety has not been fully elucidated. We aimed to examine the associations between two facets of attentional biases (namely engagement biases and disengagement biases), emotion regulation difficulties, and anxious mood dynamics under a daily life setting. Participants (86 college students) accomplished the modified attentional assessment task and the questionnaires in the laboratory, after which they entered a 7-day ecological momentary assessment (EMA) to collect data on their momentary anxious mood and occurrence of negative events at 10 different time points per day. Then we estimated multilevel models to explore how different components of attentional bias and emotion regulation difficulty affect the dynamic changes of anxiety. We found that Both attentional disengagement bias (not engagement bias) and impaired emotion regulation were associated with a more significant increase in anxious mood immediately after encountering a negative event, but not associated with anxious mood maintenance after a relatively long period. The present study highlights the specific risk and protective factors involved in anxiety dynamics, which could be crucial for designing interventions for populations with high level of trait anxiety.

自我同情、尾状核功能联结与青少年自杀意念的关系

刘冠民[1]　Karina Quevedo[2]（通讯作者）

1 天津大学应用心理研究所，天津，300350

2 明尼苏达大学精神医学系，明尼阿波利斯，MN 55454，通讯作者 E-mail：queve001@umn.edu

摘 要　自杀是青少年的第二大死因，而抑郁症是青少年自杀的强烈预测因子，找出能够降低抑郁症青少年自杀意念的心理因素非常关键。自我同情可能就是这样一个变量。众多研究证据表明自我同情和自杀意念呈负相关关系，但是这种关系背后的神经机制仍然不清楚。因为自杀意念与自我参照加工时异常的尾状核活动有关，该区域与其他脑区的神经功能联结可能是自杀意念的一个生物标记物。在本研究中，我们以抑郁症和健康的青少年作为被试，考察了他们的自我同情水平与其在进行自我评价任务（考察自我参照加工的典型研究范式）时尾状核的功能联结之间的关系以及两者与自杀意念水平之间的关系。在核磁扫描仪中，79 个抑郁症青少年和 36 个健康青少年听到一系列句子，他们需要判断这些句子是否能从不同的角度描述他们。结果发现，自我同情水平越高，被试在进行积极（相对于消极）自我评价时左侧尾状核跟以下脑区之间的功能联结越强：双侧后测颞上沟/颞顶联合区、左侧颞中回中部以及左侧枕中回。而左侧尾状核与左侧颞中回中部之间的功能联结强度则进一步解释了自我同情和自杀意念之间的负相关关系，这种关系在控制了抑郁程度、焦虑程度和非自杀性自伤行为之后仍然显著。未来的研究可以通过神经反馈等技术增强积极（相对于消极）自我参照加工时左侧尾状核与左侧颞中回中部之间的功能联结，并与自我同情干预相结合，考察其降低青少年自杀意念的效果。

Self-compassion, caudate functional connectivity and suicide ideation in youth

Guanmin Liu[1]　Karina Quevedo[2,*]

1 Institute of Applied Psychology, Tianjin University, Tianjin, 300350

2 Department of Psychiatry, University of Minnesota, Minneapolis, MN 55454

*Correspondence: queve001@umn.edu

Abstract：Suicide is the second leading cause of death, and depression is a strong proximal predictor of suicidality in youth. It is vital to identify psychological factors that may reduce suicide ideation in depressed adolescents. Self-compassion may be such a factor. Converging evidence indicates the inverse association between self-compassion and suicide ideation, but the neural mechanisms underlying their link remained unknown. Because suicide ideation is associated with distorted self-referential caudate activity, its connectivity may be a biomarker of suicide ideation. In this study we examined the relationship between self-compassion and caudate functional connectivity during self-appraisals, a typical self-referential paradigm, and their associations with suicide ideation in depressed and healthy youth. In the scanner, 79 depressed youth and 36 healthy controls evaluated, from various perspectives, whether phrases heard described them. The results showed that self-compassion was associated with stronger left caudate functional connectivity with bilateral posterior superior temporal sulcus/temporoparietal junction, the left middle middle temporal gyrus (mMTG) and the left middle occipital gyrus during positive versus negative self-appraisals across subjects. Stronger left caudate connectivity with the left mMTG further explained the association between higher self-compassion and lower suicide ideation,

even controlling for non-suicide ideation depression severity, anxiety severity and non-suicidal self-injurious behavior. Functional connectivity between the left caudate and the left mMTG during positive versus negative self-referential processing could be a biomarker to be targeted by neurofeedback interventions for reducing suicide ideation in youth, combined with self-compassion interventions.

Keywords： suicide ideation, depressed adolescents, self-compassion, self-referential processing, caudate functional connectivity

父母元情绪理念与幼儿问题行为的关系:电子媒体使用的中介作用

高千航[1] 赵妍岑[2] 田静[3] 车翰博[4]

（[1]辽宁师范大学教育学部，大连，116021）

（[3]山西师范大学教育科学学院，太原，030000）

通讯作者 E-mail：chbdhr@163.com

摘要：父母元情绪理念对自身情绪健康、幼儿的情绪发展、身心健康和社会适应等方面有着重要影响，本研究在电子媒体时代背景下，考察父母元情绪理念这一重要心理变量和幼儿电子媒体使用情况对幼儿问题行为的影响机制。

本研究以 D 市和 Y 市 436 名幼儿及其父母为调查对象，采用父母元情绪理念问卷、幼儿长处困难问卷、学前儿童电子媒体使用问卷，考察父母元情绪理念对幼儿问题行为的影响，并分析幼儿电子媒体使用在两者间的中介作用。研究内容主要分为现状研究与关系研究两个部分，现状部分主要研究父母元情绪理念、幼儿问题行为、幼儿电子媒体使用的现状与影响因素，关系研究部分以父母元情绪理念各维度为因变量，构建以幼儿电子媒体使用情况在父母元情绪理念与幼儿问题行为间为中介的结构方程模型。研究结果发现：

（1）父母元情绪理念在父母自身性别和受教育程度上存在显著差异，幼儿问题行为在性别、年级和独生情况上存在显著差异，幼儿电子媒体使用在独生情况与父母受教育程度上存在显著差异；

（2）父母元情绪理念、幼儿电子媒体使用与幼儿问题行为之间呈显著相关关系，父母元情绪理念直接影响幼儿问题行为，也可以通过幼儿电子媒体使用间接预测幼儿问题行为；

（3）积极电子媒体使用在父母情绪教导理念、情绪紊乱理念与幼儿问题行为之间起中介作用（中介占比占总效应的 9.46%），消极电子媒体使用在父母元情绪理念各维度与幼儿问题行为之间起中介作用（中介占比占总效应的 52.89%）。

最后，针对研究结果从家庭、幼儿园与社会三方面提出建议，期望家校社共同合作，促进儿童健康成长。父母要重视自身元情绪理念和幼儿问题行为，改善自身媒介养育行为，为幼儿成长营造良好的家庭环境；幼儿园要重视幼儿问题行为，帮助家长正确引导孩子使用电子媒体；社会方面应尽快落实家庭教育促进法，更好为家庭教育赋能，同时强化法治保障，提升幼儿网络环境安全和健康。

关键词：父母元情绪理念，幼儿，电子媒体使用，问题行为

The Relationship Between Parents' Meta-emotional Concept and Children's Problem Behavior: The Intermediary Role of Electronic Media Use

Gao Qianhang[1] Zhao Yancen[2] Tian Jing[3] Che Hanbo[4]
（[1]Education Department of Liaoning Normal University，Da Lian，116021）

Abstract：Parental meta-emotional concept has important influence on their own emotional health, emotional development, physical and mental health and social adaptation. In the background
of electronic media era, the influence mechanism of parental meta-emotional concept on children's behavior is investigated.

In this thesis, parents and children of 436 children in city D and city Y were used to investigate the influence of parents' meta-emotional concept questionnaire, children's strengths and difficulties questionnaire, and electronic media use questionnaire in preschool children to analyze the mediating effect of electronic media use in children. The content of the study is divided into two parts: the present situation research and the relationship research, the present situation research mainly studies the parent meta-emotional concept, the child's problem behavior, the child electronic media use situation and the influence factor, the relationship research part takes the parent meta-emotional concept each dimension as the variable, constructs the structure equation model which mediates the child electronic media use between the parent meta-emotional concept and the child's problem behavior. The study found:

(1) There are significant differences in parents' own gender and educational attainment, in children's problematic behaviour in terms of gender, grade and only child, and in children's use of electronic media in relation to only child and parental education;

(2) There is a significant correlation between parental meta-emotional concept, use of electronic media in young children and children's problem behaviors. Parental meta-emotional concept can predict children's problem behaviors directly or indirectly by using electronic media in young children;

(3) The use of active electronic media mediates between parenting concepts, emotional disorder concepts and problematic behaviors in young children(Mediating effect value=9.46%), and the use of passive electronic media mediates between dimensions of parental meta-emotional concepts and problematic behaviors in young children(Mediating effect value=52.89%).

Finally, according to the research results, some suggestions are put forward from three aspects: family, kindergarten and society, hoping that the family, school and society can cooperate together to promote the healthy growth of children. Parents should attach importance to their own meta-emotional ideas and children's problem behaviors, improve their own media parenting behaviors, and create a good family environment for children's growth; Kindergartens should pay attention to children's problem behaviors and help parents correctly guide their children to use electronic media; The society should implement the family education promotion law as soon as possible to better empower family education, and at the same time strengthen the protection of the rule of law to improve the safety and health of children's online environment.

Key Words: Parents' Meta-emotional Concept, Young Children, Use Of Electronic Media, Problem Behavior

基于微博文本情感分析的大学生心理健康模型构建研究

柴昭甲[1] 王萌[1]（通讯作者）王天[1] 柴昭元[2]

摘 要　随着生活节奏的加快，学习压力的陡增，大学生心理健康问题日渐突出，给学生的学习和生活带来巨大负担。大学生的情绪特点变化迅速、强度剧烈、起伏明显，而传统心理健康评估方法的被动性、样本规模的有限性、获取数据的回溯性在一定程度上不利于大学生心理健康的监测。相关医学研究表明，心理健康和情绪有着密切的联系。在社交媒体的广泛普及的时代下，越来越多的学生通过社交媒体分享观点，表达情绪，从而在网络空间中留下大量个人数据。这些数据蕴含了丰富且有价值的情绪信息，为建立心理健康文本情感语料库提供了数据支持。文本情感分析是自然语言处理领域中的热点研究问题，具体是指用计算机技术对文本中所带有的主客观属性和所表达的观点、情绪等进行挖掘，从而判断文本具有的情感倾向性。情感分类是文本情感分析中的核心任务之一，心理学中常用的情感分类是根据“效价-唤醒度”来进行的，在自然语言处理中可以表示为情感极性和情感强度。在此背景下，本研究将面向大学生的微博文本数据，构建基于微博文本情感分析的大学生心理健康模型，分别从情感极性分类和情感强度计算两个方面对其进行分析，以期为大学生的心理健康状态识别和动态监测提供参考。本研究采集了华东某高校 100 位学生的微博社交文本数据，经过数据清洗后得到 10694 条数据。在情感极性分类中，分别使用了深度学习中的 Bert、TextCNN 与 Fasttext 模型进行模型训练，最终选择结果最优的 Bert 模型。在情感强度计算方面，根据自建的情感强度词典从词汇层级和句子层级两方面，对文本进行情感强度计算，并将结果归一化处理。最后，根据情感极性和情感强度的结果，绘制面向心理健康的情感状态走势图。在后续的实际应用中，可以从时间维度、情感强度值变化幅度与频率等方面进行心理健康状态的评估。

Abstract： With the acceleration of the pace of life and the sharp increase in learning pressure, the mental health problems of college students are becoming increasingly prominent, bringing a huge burden to their learning and life. The sentimental characteristics of college students change rapidly, with intense intensity and significant fluctuations. However, the passivity of traditional mental health assessment methods, the limited sample size, and the retrospective nature of data acquisition are to some extent detrimental to the monitoring of college students' mental health. Medical research has shown that there is a close connection between mental health and emotions. In the era of the widespread popularity of social media, more and more students are sharing opinions and expressing sentiments through social media, thus leaving a large amount of personal data in the online space. These data contain rich and valuable emotional information, providing data support for establishing a mental health text sentimental corpus. Sentiment analysis is a hot research issue in the field of natural language processing, specifically referring to the use of computer technology to mine subjective and objective attributes and expressed views, sentiments, etc. so as to judge the sentimental orientation of the text. Sentiment classification is one of the core tasks in Sentiment analysis. Sentiment classification commonly used in psychology is based on "valence arousal", which can be expressed as sentiment polarity and intensity in Natural language processing. In this context, our research will build a college students' mental health model based on the sentiment analysis of microblog text data, and analyze it from two aspects: sentiment polarity classification and sentiment intensity calculation, with a view to providing a reference for college students' mental health status recognition and dynamic monitoring. We collected the social text data of microblogs of 100 students in a university in the east of China and obtained 10694 pieces of data after data cleaning. In sentiment polarity classification, Bert, TextCNN, and Fasttext models from deep learning were used for model training, and the optimal Bert model was ultimately selected. In terms of sentiment intensity calculation, based on the self-built sentiment intensity dictionary, it is performed on the text from both vocabulary and sentence levels, and the results are normalized. Finally, based on the results of sentiment polarity and intensity, we draw a sentiment state trend chart for mental health. In subsequent practical applications, psychological health status can be evaluated from aspects such as time dimension, amplitude, and frequency of sentimental intensity changes.

摘 要

中枢神经系统由大脑和脊髓组成，能够自上而下支配个体的全部感觉、运动和自主功能，对人类生存和发展具有重要作用。皮层-脊髓同步功能成像是近十年来新兴的成像方法，它使我们能够无创性、无侵入性且高空间分辨率地探究人类中枢神经系统功能。然而，相较于成熟的脑磁共振成像而言，皮层-脊髓同步功能成像面临方法和技术挑战。例如，大脑和脊髓在神经血管系统方面存在显著差异，对 BOLD 的敏感性不同；头颈信号采集线圈的设计使其对大脑和脊髓的覆盖效率和穿透深度有差异，这影响了图像的信噪比；脊髓区域的 B0 场比大脑更为不均匀，且当前的 fMRI 数据处理软件大多针对大脑设计，缺乏针对皮层-脊

髓同步成像的标准化处理流程等。

我们通过改进现有的西门子 SMS-EPI 成像序列，开发优化了一种新的脑与脊髓同步功能成像方案，并提出了相应的任务态功能像数据分析框架。与前人研究相比，这种功能成像序列采用了扩大的视场，能够一次性获取整个皮层、脑干和颈髓的信号；通过在脑干和脊髓添加局部匀场框，获取稳定高质量的图像；采用了并行多层采集技术，缩短成像时间（TR = 2.68 s），易于临床多站点推广。相匹配的数据分析框架整合了针对脑脊同步结构像的场偏校正、脑与脊髓结构分割和配准等步骤，功能像则包括生理噪声去除、形变失真矫正、运动矫正、空间平滑、时间滤波和配准，以及统计分析等。为了验证这一成像和图像后处理方案的效果，我们在两个数据采集站点（N1=39；N2=23）开展了经典的疼痛、触觉和运动诱发激活任务，证明了这种新的成像方法获取功能像的时间信噪比在常规良好范围内（脊髓 11.39±2.26，大脑 33.38±4.85，mean ± SD），图像预处理步骤对信号质量有显著提升，并且能够捕捉经典的伤害性热痛刺激、非伤害性触觉刺激以及主动运动任务诱发的脑脊激活。本研究将对脑与脊髓同步成像技术在基础科研和临床应用中的推广具有重要意义。

Abstract:

The central nervous system (CNS), comprised of the brain and spinal cord, plays a fundamental role in human survival and development, acting as a central hub for receiving and integrating external information. It maintains top-down control over all the organism's sensory, motor, and autonomic functionalities. Over the past decade, simultaneous cortico-spinal functional imaging has emerged as a revolutionary tool, providing a high-resolution, non-invasive insight into the functionality of the human CNS. However, this innovation has challenges, particularly when juxtaposed with the brain fMRI technique. Critical differences in neurovascular systems between the brain and spinal cord lead to varying sensitivities to BOLD signals. The design of the head-neck coil, another contributing factor, produces inconsistencies in coverage efficiency and penetration depth across the brain and spinal cord, which in turn impacts the signal-to-noise ratio of the resultant images. Further complicating matters is the inhomogeneous B0 field within the spinal cord region compared to the brain, coupled with the current fMRI data processing software primarily focusing on brain imaging, leaving a gap in the standardization of the processing pipeline for simultaneous cortico-spinal imaging.

We improved the Siemens SMS-EPI sequence and developed a new simultaneous cortico-spinal fMRI protocol. We also proposed a corresponding task-state fMRI data analysis pipeline. Compared to previous methods, this protocol features an expanded field of view that allows us to simultaneously acquire BOLD signals from the entire cortex, brainstem, and cervical spinal cord. Adding 3D shimming volume to the brainstem and spinal cord achieves

relatively high signal quality. We implemented a multiband combined GRAPPA parallel imaging method to shorten the imaging time (TR = 2.68 s), making it suitable for adaptability across multiple imaging sites. The accompanying data analysis framework integrates steps such as field bias correction, segmentation and registration for the structural image. FMRI analysis pipeline includes physiological noise regression, distortion correction, motion correction, spatial smoothing, temporal filtering, registration, statistic, etc. To validate the performance of this protocol, we conducted classical pain, tactile, and motor-induced activation tasks at two data sites (N1=39; N2=23). This novel imaging method achieved a time signal-to-noise ratio (TSNR) within a conventional range for fMRI (spinal cord section: 11.39±2.26; brain section: 33.38±4.85, mean ± SD), and image preprocessing steps could significantly enhance signal quality. This protocol could effectively capture brain-spinal activations induced by classical noxious thermal pain stimulation, non-noxious tactile stimulation, and voluntary motor tasks. This research holds significant implications for promoting simultaneous cortico-spinal imaging technology in basic research and clinical applications.

经颅磁刺激对抑制控制脑区活动的调节作用：效应可能在脑连接而不必然在脑激活

程琦文[1,2]　蒲鑫萍[1,2]　计艳楠[1,2]　柯玉茗[1,2]　闫国利[1,2]　吴俊杰[1,2]（通讯作者）

摘 要　当人们面对复杂多变的环境时，认知控制能力能够协调知觉、记忆、语言等认知过程，以使得行为与当前的情境和目标保持一致。前人研究表明，右侧额下回是抑制控制的重要脑区，而且对该脑区施加经颅磁刺激（transcranial magnetic stimulation，TMS）可以显著提高被试在抑制控制任务下的行为表现。然而前人研究主要聚焦在该脑区接受 TMS 后的行为改变，尚不清楚相应神经活动的变化。因此，本研究招募了 25 名大学生被试，让他们分三周完成不同 TMS 序列刺激后的功能性核磁共振（Functional magnetic resonance imaging，fMRI）扫描下的西蒙任务。具体来说，这些 TMS 序列都作用在右侧额下回（靶点坐标为 x = 51，y = 19，z = 17；选取自 de Bruin, A., Roelofs, A., Dijkstra, T., & Fitzpatrick, I. (2014). Domain-general inhibition areas of the brain are involved in language switching: fMRI evidence from trilingual speakers. *NeuroImage*, *90*, 348-359.），分别是连续θ爆发式刺激（continuous theta burst stimulation，cTBS，降低皮层兴奋性）、间歇θ爆发式刺激（intermittent theta burst stimulation，iTBS，增加皮层兴奋性）、假打序列（线圈翻转，用作安慰剂），序列顺序在被试间平衡。其中西蒙任务为区组设计：一致区组内全都为一致试次；混合区组有一半为一致试次，另一半为冲突试次，以更强地调用被试的抑制控制功能。结果发现：（1）混合区组比一致区组有更长的反应时和更多的错误率，并且更强地激活了右侧额下回/脑岛前部（峰值坐标为 x = 39，y = 15，z = 0），即在行为和脑激活上都表现出西蒙代价；（2）靶点坐标与峰值坐标相距 2.1 cm，且两者存在紧密的功能连接（$r = 0.775$，$p < 0.001$），提示 TMS 有很大可能作用到了目标脑区；（3）行为和脑激活上的西蒙代价在三种 TMS 序列下没有显著的差异；（4）相比于假打序列，只有抑制序列下右侧额下回与左侧颞上回的功能连接强度减弱。这些结果表明，对右侧额下回施加 TMS 不必然提高或者降低该脑区的激活强度，但抑制序列可能降低该脑区与其他脑区的连接强度。本研究首次考察经颅磁刺激对于

高级的抑制控制相关脑活动的调节作用，提示未来的研究可能要更多关注经颅磁刺激对于脑功能连接的调节作用。

***Abstract*:** Cognitive control ability enables us to coordinate our behaviors with the goals in the complex and ever-changing environment by regulating cognitive processes such as perception, memory, and language. Previous studies have shown that the right inferior frontal gyrus (rIFG) is a critical brain region for inhibitory control, and stimulating this region using transcranial magnetic stimulation (TMS) can significantly improve performance in inhibitory control tasks. However, previous studies have mainly focused on the behavioral changes in this brain region after receiving TMS, leaving corresponding neural activity changes still need to be better understood. Therefore, this study recruited 25 college students to complete the Simon task during functional magnetic resonance imaging (fMRI) scanning after three different TMS sessions stimulation over three weeks. Specifically, these TMS sessions were continuous theta burst stimulation (cTBS, a neuroexcitatory protocol), intermittent theta burst stimulation (iTBS, a neuroinhibitory protocol), sham stimulation (coil flipping, a placebo protocol), which were applied on rIFG (the target coordinates: x = 51, y = 19, z = 17; selected from de Bruin, A., Roelofs, A., Dijkstra, T.,& Fitzpatrick, I. (2014) Domain general inhibition areas of the brain are involved in language switching: fMRI evidence from trilingual speakers. *NeuroImage, 90*, 348-359.). The sequence of the TMS sessions was counterbalanced across participants. We adopted the block design in the Simon task to obtain more robust signals of brain activity for inhibitory control. Specifically, all trials in the congruent block were congruent trials; half of the trials in the mixed block were congruent trials, and the other half were incongruent trials. The results showed that: (1) compared with the congruent block, the mixed block showed longer reaction times, larger error rates, and greater activation in rIFG /anterior insula(AI) (the peak coordinates: x = 39, y = 15, z = 0), that is, there was the Simon cost in both behavior and brain activation; (2) The distance between the target coordinates and the peak coordinates was 2.1 cm, and there was a close functional connection between these two loci (r = 0.7752, p < 0.001), indicating that TMS probably affected the target brain area; (3) There was no significant difference in Simon cost of behavior and brain activation among the three TMS sessions; (4) Compared with the sham TMS, only the neuroinhibitory TMS showed weaker functional connectivity between rIFG and the left superior temporal gyrus (lSTG). These results indicated that TMS applied to rIFG does not necessarily increase or decrease brain activation but may impact brain connectivity. This study is the first to investigate the effect of TMS on brain activities involving high-level cognitive processing (i.e., inhibitory control), suggesting that future research may pay more attention to the TMS effect on brain connectivity.

摘 要

背景：心理治疗是治疗精神障碍的重要方法，心理治疗如何调节自发的大脑活动并最终产生效果仍存在困惑。局部一致性（Regional Homogeneity, ReHo）、低频振幅（Amplitude of Low Frequency Fluctuation, ALFF）、度中心性（Degree Centrality, DC）和百分率振幅（Percent amplitude of fluctuation, PerAF）是常用的基于静息态功能磁共振成像全脑体素水平评估自发大脑活动的指标。为了揭示心理疗法治疗精神障碍患者自发大脑活动的潜在神经机制，我们基于涉及全脑体素水平指标的静息态功能磁共振成像研究进行了系统回顾和荟萃分析。

方法：按照 PRISMA 指南（注册编号 CRD42023432388），在 PubMed、PsycINFO 和 Web of Science 进行了系统文献检索。此研究对比了心理治疗前后精神障碍患者自发大脑活动的改变。同时，我们对不同测量方法（ReHo, ALFF），特定心理治疗方法（认知行为疗法）或特定患者群体的自发大脑活动变化是否有所不同进行了亚组分析。

结果和讨论：本研究纳入了 9 项研究，共包括 192 名患者。在经过心理治疗后，右侧前岛叶（anterior insular）活动水平显著降低。前岛叶在个体的认知、情绪和社会功能中起着重要的调控作用，它与其他脑区的连接密切，形成复杂的网络，共同支持着人类的心理过程。这一结果表明心理治疗可以调节患者的认知、情绪与社会功能，从而起到治疗效果。亚组分析显示，在强迫症患者中，心理治疗后左侧壳核（putamen）的 ALFF 值显著降低。壳核在运动控制、认知功能和情绪调节等方面起着重要的作用，心理治疗可能通过调节壳核的功能来改善强迫症患者的强迫思维和强迫行为等核心症状。

结论：此研究表明心理治疗可能通过调节岛叶前侧从而调节精神障碍患者的认知、情绪和社会功能，不同类型的患者对于心理疗法的关键响应区域可能不同。这为我们理解心理治疗的脑影像学机制做出了贡献，并为改进对精神障碍患者，进行精准靶点干预提供了重要价值。

***Abstract*:**

Background: Psychotherapy is a crucial approach in the treatment of mental disorders, and how psychotherapy modulate spontaneous brain activity and finally take effects remain confusion. Regional Homogeneity (ReHo), Amplitude of Low Frequency Fluctuation (ALFF), Degree Centrality (DC) and Percent amplitude of fluctuation (PerAF) are commonly used voxel-wise whole-brain (VWWB) measures based on resting-state functional magnetic resonance imaging (rs-fMRI) to assess spontaneous brain activity. In order to reveal the underlying neural mechanisms of psychotherapy in spontaneous brain activity in patients with mental disorders induced by psychotherapy, we conducted a systematic review and meta-analysis based on rs-fMRI studies involving VWWB measures.

Methods: A systematic literature search was conducted in PubMed, PsycINFO and Web of Science following PRISMA criteria (registration number CRD42023432388) to investigate the differences between pre- and post-psychotherapy. To investigate whether changes in spontaneous brain activity differ across different measures (ReHo, ALFF), specific psychotherapy approaches (Cognitive Behavioral Therapy, CBT) or specific patient populations, subgroup analyses were performed.

Results and Discussion: Nine studies involving a total of 192 patients were included. We observed a significant decrease in activation within the right anterior insular after treatment with psychotherapy. The anterior insula has been shown to play a crucial regulatory role in individual's cognition, emotion, and social functioning. It is closely connected with other brain regions, forming a complex network that collectively supports human psychological processes. This finding suggests that psychotherapy can regulate cognitive, emotional and social functioning of patients, and thus play therapeutic effects. The subgroup analysis revealed significantly decreased ALFF in the left putamen after psychotherapy treatment among OCD patients. The putamen plays an important role in motor control, cognitive functions, and emotional regulation. Psychotherapy may potentially improve the core symptoms of obsessive-compulsive disorder, such as obsessions and compulsions, by modulating the function of the putamen.

Conclusions: The current study indicate that the clinical efficacy of psychotherapy may be modulated by anterior

insular and the key response brain nodes of psychotherapy may vary across different mental disorders. This contributes to our understanding of the neurobiological mechanisms of psychotherapy and provides valuable insights into improving precise targeting interventions for individuals with mental disorders.

摘 要 自我参照加工指的是人们在加工与自己相关的信息时与加工他人相关信息时不同的认知过程。先前研究表明，受到精神疾病困扰的群体在自我参照加工上与健康人群可能存在差异，且这种差异具有跨疾病诊断的特点。但是目前没有研究对不同精神疾病患者与健康人群体在自我参照加工上的差异进行系统地分析。为探索这一问题，本研究通过激活似然估计（ALE）元分析的方法，对基于自我参照加工范式的脑成像研究进行元分析。通过对 PubMed 和 Web of Science 数据库的检索，得到 675 篇文献，筛选后得到 48 篇符合纳入标准的文献，其中健康个体组 24 个（463 名被试，174 个激活坐标点），精神疾病研究 24 个（430 名被试，189 个激活坐标点）。为了得到跨疾病的自我参照加工的差异，未对精神疾病文献进行进一步分类。元分析的结果表明，健康被试在自我参照加工中激活了后扣带回皮层（Posterior Cingulate Cortex, PCC）、前扣带回皮层（Anterior Cingulate Cortex, ACC）、额内侧回（Medial Frontal Gyrus）、额上回（Superior Frontal Gyrus），而精神疾病组则不仅激活了后扣带回皮层（Posterior Cingulate Cortex, PCC）、前扣带回皮层（Anterior Cingulate Cortex, ACC）、额内侧回（Medial Frontal Gyrus）、额上回（Superior Frontal Gyrus），还激活了额下回（Inferior Frontal Gyrus）以及皮层下结构。对报告疾病组与健康组在自我参照加工上差异的文献（31 篇）也进行 ALE 元分析，未发现显著的脑区激活。对健康组和精神疾病组的 ALE 元分析结构进行对比分析，发现精神疾病组在额下回、眶额叶皮层（Frontal Orbital Cortex）和额叶盖（Frontal Operculum Cortex）三个脑区中比健康组表现出更强的激活，健康组在前副扣带皮层（Paracingulate Gyrus）、内侧额叶皮质（Frontal Medial Cortex）、额极（Frontal Pole）、扣带回后部（Cingulate Gyrus, posterior division）比精神疾病组激活更强。这些结果表明，精神疾病患者在自我参照加工中激活的大脑网络与健康个体相比存在明显的差异性，为先前关于精神疾病患者在自我参照加工中功能异常的结果提供了可能的解释。这些发现可能有助于进一步理解精神疾病患者的自我概念及其与精神疾病之间的关系。

Abstract：Self-referential processing refers to the cognitive processes by which people process information relevant to themselves differently than they process information relevant to others. Previous research suggests that patients who suffered from mental illness may differ in self-referential processing from healthy populations, and that such differences are transdiagnostic distortions. However, there are not systematically examination of differences of the brain mechanism in self-referential processing between different groups of patients with mental disorders and healthy population. To fill the gap, this study synthesized brain imaging studies based on the self-referential processing paradigm by using activation likelihood estimation (ALE) algorithm. A search of PubMed and Web of Science databases yielded 675 publications, 48 publications were included in the meta-analysis after screening, including 24 in the healthy individual (463 subjects, 174 activation coordinate points) and 24 studies with mental disorders (430 subjects, 189 activation coordinate points). We did not distinguish different mental disorder to obtain transdiagnostic pattern during the self-referential processing. The results of the meta-analyses indicated that self-referential processing activated the posterior cingulate cortex (PCC), anterior cingulate cortex (ACC), medial frontal gyrus (MFG), superior frontal gyrus for healthy controls. For mental disorder group, not only the posterior cingulate cortex (PCC), anterior cingulate cortex (ACC), medial frontal gyrus (MFG), superior frontal gyrus (SFG), and superior frontal gyrus (SFG), and the superior frontal gyrus were activated, the inferior frontal gyrus and subcortical structures were also activated during the self-referential processing. ALE meta-analysis was also performed based for coordinates (from 31 articles) that are significantly different during self-referential processing between the mental disorder group and healthy groups, but no significant brain region survived. Contrast analysis of ALE meta-analytical results from the healthy controls and mental disorder groups revealed that the mental disorder groups showed stronger activation than the healthy group in three brain regions: the inferior frontal gyrus, frontal orbital cortex, and frontal operculum cortex, and that the healthy group showed stronger activation in the paracingulate gyrus, frontal medial cortex, frontal pole, and posterior division of the cingulate gyrus, posterior division. These results suggest that there is a significant difference in the brain regions activated in self-referential processing in individuals with mental illness compared with healthy individuals, providing a possible explanation for the transdiagnostic abnormalities in self-referential processing mental disorders. These findings may contribute to our understanding of the self-concept of individuals with mental disorders.

4 复旦大学老龄研究院，上海，200433，zheng_l@fudan.edu.cn

摘 要　大量研究表明，人类语言的获得是一个内隐学习的过程，在该过程中掌握远距离语法（尤其是多重映射远距离语法）是学习和加工语言的重要基础。当多重映射远距离语法规则与序列组块知识同时存在时，该语法规则在内隐习得中是否更具优先性还尚待进一步探讨。本研究借助功能磁共振成像技术（fMRI），采用人工语法学习范式，将多重映射远距离语法规则与表面的序列组块知识（即相邻的 2 个或 3 个元素构成的组合）设置在同一维度（即均以声调为载体），进一步考察了该语法规则是否具有内隐学习优势性的问题，并探索与该语法规则内隐学习相关的脑机制。实验包括学习和测验两个阶段，均在磁共振扫描仪内进行。学习阶段先给被试呈现一系列符合多重映射远距离语法规则的 10 音节声音串，并要求被试进行复述。测验阶段则要求被试对呈现的新声音串进行语法判断任务。结果发现，被试能内隐习得多重映射远距离语法规则，但无法习得组块知识，表明多重映射远距离语法规则的内隐学习具有优势效应。脑数据表明，在测验阶段，低组块合法串相对于低组块非法串引发了布洛卡区（Broca’s area）更强的激活。同时，布洛卡区在低组块合法条件下与左侧颞上回（Superior Temporal Gyrus, STG）的功能连接强度显著高于低组块非法条件下的功能连接强度，在学习阶段，该功能连接的强度随着学习进程的增加而逐渐增强。综上，当多重映射远距离语法规则与组块知识处于同一维度时，被试仍可优先内隐习得该语法规则，且学习阶段和测验阶段的脑研究结果一致表明，布洛卡区以及与左侧颞上回的功能连接参与了该语法规则的内隐学习过程。

Abstract：A large body of research indicated that acquiring human language is an implicit learning process, in which mastering nonadjacent dependencies (especially multiple nonadjacent dependencies) forms an essential foundation for language learning and processing. The prioritization of these nonadjacent grammar rules during implicit acquisition, when juxtaposed with surface-level sequential chunking knowledge (i.e., combinations of adjacent 2 or 3 elements), remains further investigated. In this fMRI study, the nonadjacent grammar rule and chunk knowledge were placed both on the carrier of Chinese tones to examine whether there is an implicit learning advantage for the knowledge of grammar rules with nonadjacent dependencies and to explore the neural basis of implicit learning of the grammar by the artificial Chinese poetry paradigm. Participants were asked to listen to and repeat back a number of strings of 10 syllables generated from nonadjacent artificial grammar; after the training phase, they were required to judge whether new strings were legal. Results showed that participants implicitly acquired grammar knowledge but not the chunks, showing a grammar-learning advantage. At the neural level, Broca's area was engaged during the low chunk strength grammatical string relative to the low chunk strength nongrammatical strings in the test phase. Furthermore, this region showed significantly higher functional connectivity with the left superior temporal gyrus (STG) in the low chunk strength grammatical string compared with nongrammatical strings, and this strength of functional connectivity increased with the training time. Our results showed that participants prioritized the implicit learning of the nonadjacent grammar rules, even when the grammar and chunks were placed on the same dimension. Broca's area and its functional connectivity with the left STG were engaged in the implicit learning of the nonadjacent dependency rule.

不同社会情境下道德判断的认知及神经机制研究

靖淑针[1] 范宁[1]（通讯作者）
1 河北大学教育学院，保定，071002，ningfan@hbu.edu.cn

摘 要　以往关于道德两难问题的研究大多基于个人视角，缺乏对公开情境或多人存在的社会情境下道德判断的心理机制的探究。而基于双加工理论的传统道德困境范式受到了许多质疑，如缺乏生态效度，对于功利主义和道义主义的划分过于绝对等。CNI 模型则对道德判断的认知加工过程进行了细致区分，能明确道德决策的变化是由结果敏感性、道德规范敏感性或一般性的行动/不行动倾向引起的。本研究对不同社会情境下道德判断的认知及神经机制进行了探究。实验一采用社会观察范式，考察个体的道德判断是否会受到单纯的决策暴露的影响。结果发现，被试的道德决策不受观察者存在与否的影响。实验二采用平行判断范式，考察社会信息反馈对个体道德判断的影响，同时测量社会性指标。结果发现，被试较低的决策接受性是由于其存在明显的不行动倾向，同时个体的判断信心受到社会压力和潜在的社会评价的影响。实验三采用双人共同判断范式，考察需要达成一致时双方的决策变化。结果发现，被试仍有较低的决策接受性，且一方面是由于道德规范敏感性的提升，另一方面则是由于更明显的不行动倾向，而且被试有着更小的压力知觉和更高的社会赞许性水平。实验四采用 fNIRS 的超扫描技术综合考察平行判断情境和共同判断情境下被试不同脑区的激活程度变化和脑间同步性的表现。结果发现，共同判断相比于单独判断，在左侧前额叶（PFC）引起更高的血氧激活，在左侧颞顶联合区（TPJ）引起较弱的血氧激活，同时在右侧前额叶和左侧颞顶联合区存在更强的脑间同步。本研究表明，在有他人在场的社会情境下，个体更倾向于做出不接受的道德决策，而这种看起来更道义的决策，一方面源于想获得社会赞许而导致的道德规范敏感性的提升，另一方面则是由于责任分散产生的不行动倾向，而且即便没有言语交流，个体之间也会存在相互的脑间同步作用。

Cognitive and Neural Mechanisms of Moral Judgment in Different Social Contexts

Shuzhen Jing　Ning Fan
College of Education Hebei University, Baoding

***Abstract*：** Previous studies on moral dilemmas were mostly based on individual perspectives, lacking exploration of the psychological mechanisms of moral judgment in public or social contexts where multiple individuals exist. The traditional paradigm of moral dilemma based on the dual-process theory has been questioned in many ways, such as the lack of ecological validity and the absolute division between utilitarianism and deontology. The CNI model provides a detailed distinction of the cognitive processing involved in moral judgment, clarifying whether changes in moral decision-making are caused by sensitivity to consequences, sensitivity to norms, or general action/inaction. This study investigates the cognitive and neural mechanisms of moral judgment in different social contexts. Experiment 1 adopts the social observation paradigm to examine whether an individual's moral judgment will be affected by simple decision-making exposure. The results showed that the participants' moral decisions were not influenced by the presence of observers. Experiment 2 adopts the parallel judgment paradigm to investigate the impact of social information feedback on individual moral judgment, and measured social indicators. It was found that the participants' lower acceptance of decision-making was due to their obvious tendency to inaction, and the individual's confidence in judgment was affected by social pressure and underlying social evaluation. Experiment 3 adopts the two-person co-judgment paradigm to examine the decision-making changes of both parties when consensus is required. It was found that the participants still had low acceptance of decision-making, and on the one hand, due to the increased sensitivity of moral norms, on the other hand, due to more obvious inaction tendencies, and the participants had a smaller sense of stress and a higher level of social approval. In Experiment 4, the hyper-scan technology of fNIRS was used to comprehensively

investigate the changes of activation degree of different brain regions and the performance of brain synchronization under the parallel judgment situation and the joint judgment situation. The results showed that compared with individual judgment, joint judgment caused higher activation of blood oxygen in the left prefrontal cortex（PFC） and weaker activation in the left temporoparietal joint area（TPJ）. At the same time, there was stronger inter-brain synchronization in the right prefrontal cortex and the left temporoparietal joint area. This study shows that individuals are more inclined to make unacceptable moral decisions in the presence of others, and this seemingly more moral decision stems from the increased sensitivity of moral norms caused by wanting to obtain social approval on the one hand, and the tendency to inaction due to the decentralization of responsibilities on the other hand, and even if there is no verbal communication, there will be mutual brain synchronization between individuals.

Keywords：Moral judgment, CNI model, Social contexts, Inter-brain synchronization

成年人诗词学习的神经机制：与角回区域建立多样的有效连接

周柳芳[1] 朱芳炜[2] 柳淑滢[2] 江镕[2] 孟明[2]（通讯作者）

1 上海外国语大学大学国际工商管理学院，上海，201620

2 华南师范大学心理学院，广州，510631，mingmeng@m.scnu.edu.cn

摘 要 诗词是人类文明中的语言艺术瑰宝。成年人的诗词学习与大脑终身的功能可塑性密切相关，能有效帮助我们理解人类如何学习这一重要科学命题。近年来对复杂自然语言的加工机制已成为新的前沿热点，但对诗词加工的机制理解仍很不足。此外，诗词学习研究将对语文学科教育等应用领域提供理论和实践指引。

本研究招募了 38 名大学生参加一项连续 13 天的诗经学习项目。通过前后测设计，在学习前和学习后各接受一次功能磁共振扫描。通过实验材料对照设计，在每次功能磁共振扫描中随机呈现学习材料和控制材料。本研究也探索了不同的学习方式如何影响诗词学习：其中一半的被试被伪随机分配至重复学习组（通过反复抄写来学习诗词），另一半被试分配至探索学习组（通过主动搜索信息、理解和反思来学习诗词）。两组被试除了学习方式不同，所接受的其他实验处理和测试材料均一样。

我们进行了两种基于任务的广义心理生理相互作用分析：跨时间对比，即对比学习材料的学前和学后条件；跨材料对比，即对比在学后扫描中学习材料和控制材料条件。令人激动的是，这两种对比分析结果共同指向了以左侧角回为中心的网络内功能连接的变化。在两组被试中，跨时间对比下均呈现角回与中央前回的功能连接增强，跨材料对比下均呈现角回和视觉词形区之间的功能连接增强。无论通过跨时间对比还是跨材料对比，探索学习组的角回和额下回之间的功能连接增强，而重复学习组无显著改变。最后，进一步的相关分析显示，在跨材料对比下的角回与视觉词形区的功能连接变化越大，被试对学习材料的记忆相关测验成绩越好于对照材料（$r = 0.502$，$p = 0.012$）。相比之下，跨材料对比下的角回与额下回的功能连接变化越小，被试对学习材料的理解相关测验成绩越好于对照材料（$r = -0.509$，$p = 0.011$）。

综上，本研究揭示了成年人诗词学习的神经机制，关键在于与角回区域建立有效连接；不同的学习方式下，大脑各功能区与角回建立的多样有效连接网络，可能是学习效果多样性的神经基础。

The neural mechanisms of poem learning in adults:

Building various effective connectivity with angular gyrus

Liu-Fang Zhou[1] Fangwei Zhu[2] Shuying Liu[2] Rong Jiang[2] Ming Meng[2]

1 School of Business and Management, Shanghai International Studies University, Shanghai, China, 201620

2 School of Psychology, South China Normal University, Guangzhou, China, 510631

***Abstract*:** Poetry is a language art treasure in human civilization. Poetry learning in adults is closely related to the lifelong functional plasticity of the brain, which can greatly help to understand the scientific quest of how humans learn. In recent years, the processing mechanism of complex natural language has become a new frontier focus, but the understanding of poetry processing is still insufficient. In addition, the research on poetry learning will provide theoretical and practical guidance for application fields such as language and literature education.

In this study, 38 college students were recruited to participate in a 13-day learning program of the Book of Songs. Through a pre-posttest design, each subject received a fMRI scan before and after the program. Through a material contrasting design, the study material and the control material were presented at each fMRI scan. This study also explored how different learning approaches affect poetry learning: half of the participants were assigned to the learn-by-repetition group, where they memorized and repeated the poems by hand-copying. The remaining half were encouraged to seek information for meaningful comprehension and to reflect upon the poems (learn-by-exploration group). Except for the different learning methods, the two groups received the same experimental treatment and test materials.

Two different task-based gPPI analyses have been conducted: 1) session contrast for the learnt poems; 2) material contrast in the post-learning scan. Surprisingly, these two approaches convergingly pointed to changes of functional connectivity (FC) with the left angular gyrus (AG). Higher FC between AG and Visual Word Form Area (VWFA) was observed in learnt poems than controls in both groups (uncorrected pvoxel < 0.001, FDR-corrected pcluster < 0.05, same below). Interestingly, only in the learn-by-exploration group, there was an increase of the FC between AG and inferior frontal gyrus (IFG) in both cross-session and between-material contrast. Further correlation analysis revealed significant positive relationship between AG~VWFA connectivity and verse memorization in the learn-by-repetition group ($r = 0.669$, $p = 0.003$, $N = 17$) and overall participants (partial correlation with group controlled, $r = 0.502$, $p = 0.012$, $N = 34$). In contrast, there were significant negative correlations between AG~IFG connectivity and lexical comprehension in the learn-by-exploration group ($r = -0.703$, $p = 0.005$, $N = 14$) and overall participants (partial correlation with group controlled, $r = -0.509$, $p = 0.011$, $N = 28$).

In summary, this study reveals that the neural mechanism of adult poetry learning lies in the establishment of effective connections with AG; the variety of effective connection established with AG may explain the diverse learning outcomes with different learning approaches.

耳听为虚：语音虚假信息对目击者记忆的影响及其脑机制

朱丽[1,2]（通讯作者）　李傲[1]

1 北京师范大学认知神经科学与学习国家重点实验室，北京，100875，通讯作者 E-mail: zhubi@bnu.edu.cn

2 北京师范大学发展心理研究院，北京，100875

摘 要　随着数字化时代的发展，人工合成的语音虚假信息迅速传播，对个体心理行为起到日益重要的影响。虚假信息效应是指：目击者对原始事件记忆因接触到事后虚假信息而发生变化的心理现象。研究分三个阶段：目击者先看到原始事件，随后看到或听到他人对于该事件的叙述（含部分虚假信息），最后根据看到的原始事件进行记忆测验。若目击者在针对原始事件的记忆测验中报告了虚假信息并坚信在原始事件中看到，则被称为虚假信息效应引发的错误记忆。以往研究考察了视觉呈现的文字虚假信息对原始事件记忆的影响，及其跨阶段神经模式相似性。但目前尚不清楚人脑在听语音虚假信息时如何对原始事件进行再现。该研究采用功能磁共振脑成像技术和神经模式相似性分析方法，考察目击者在观看原始事件与倾听语音虚假信息时的跨阶段神经模式相似性，比较真实和错误记忆在神经表征上的异同。30 名健康成年被试在磁共振扫描仪中观看 300 张原始事件图片（如，看到图片显示男子拿起蓝色糖盒）并在随后倾听 300 句事后陈述（如，听到人工合成的语音虚假信息“男子拿起红色糖盒”），最后完成针对原始事件的 156 道记忆测验题（如，在原始事件中，男子拿起什么颜色的糖盒？）。真实记忆、错误记忆、无关记忆分别指选择原始信息（蓝色）、虚假信息（红色）、无关信息（白色）的试次。结果发现：错误记忆选择率高于无关记忆，说明虚假信息效应显著。只有针对真实记忆，在看原始事件和听虚假信息之间的项目特异性神经表征相似性上，左外侧额下回和左侧顶下小叶高于基线，而外侧枕叶皮层低于基线；而对于错误记忆没有这种差异。这说明个体在听事后虚假信息时，如果对原始事件进行模糊神经表征再现（即模糊语义匹配：听到男子拿起糖盒而提取相应语义表征）且进行细节神经表征再现（细节视觉不匹配：听到红色而提取蓝色视觉表征），那么更有可能成功抵御虚假信息效应。该研究支持并拓展了感知觉再激活和模糊痕迹理论，对理解人脑记忆重构本质和司法实践具有应用价值。

关键词　记忆，虚假信息效应，视觉，听觉，功能磁共振脑成像

Hearing is vague: The effect of auditory misinformation on eyewitness memory and its neural basis

Bi Zhu[1, 2] (corresponding author) Ao Li[1]
1 State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing, 100875, corresponding author E-mail: zhubi@bnu.edu.cn
2 Institute of Developmental Psychology, Beijing Normal University, Beijing, 100875

***Abstract*:** With the development of the digital age, the rapid spread of AI-generated voice containing misinformation is having an increasingly significant impact on individual psychological behavior. The misinformation effect refers to changes in an eyewitness' memory of an original event due to exposure to post-event misinformation. It involves three stages. A witness first saw an event, then read or heard narratives about that event containing misinformation, and finally took a memory test based on what he or she saw in the original event. False memory from misinformation refers to the reporting of misinformation during the memory test of the original event. Previous research has investigated the effect of visually presented text-based misinformation on eyewitness memory of the original event and its cross-stage neural pattern similarity. However, it is unclear about the neural representations of the original event when hearing misinformation. Using functional magnetic resonance imaging and neural pattern similarity analysis, this study investigates the cross-stage neural pattern similarity between the original-event image and the post-event auditory misinformation, and then compares the neural representations between true and false memories. Thirty healthy adults viewed 300 original-event images (e.g., an image depicting a man taking a blue candy box) and then listened to 300 post-event narratives (e.g., an AI-generated auditory misinformation "the man took a red candy box") in the scanner. Finally, they completed the memory test for the original event containing 156 questions (e.g., "What color of candy box did the man take in the original event?"). True memory, false memory, and foil memory refer to trials in which participants selected the original information (blue), misinformation (red), and unpresented information (white), respectively. The results showed that the false memory rate was higher than the foil memory rate, indicating a significant misinformation effect. Item-specific neural pattern similarity between the original-event image and the post-event misinformation was higher than baseline in the left inferior frontal gyrus and left inferior parietal lobe, whereas it was lower than baseline in bilateral occipital cortex only for true memory. No such differences were found for false memory. When a person hears misinformation, if he or she can reinstate the original event with gist representations (i.e., a semantic match: "the man took a candy box") and verbatim representations (i.e., a visual mismatch: hearing "a red candy box" and reactivating an image of “a blue candy box”), then he or she will be more

likely to resist the misinformation. This study supports and extends the sensory reactivation and fuzzy-trace theories. It may contribute to the understanding of the reconstructive nature of human memory and its application in the legal system.

Keywords：memory, misinformation effect, visual, auditory, functional Magnetic Resonance Imaging

Cognitive and Neural Mechanisms of Moral Judgment in Different Social Contexts

Shuzhen Jing Ning Fan
College of Education Hebei University, Baoding

***Abstract*：** Previous studies on moral dilemmas were mostly based on individual perspectives, lacking exploration of the psychological mechanisms of moral judgment in public or social contexts where multiple individuals exist. The traditional paradigm of moral dilemma based on the dual-process theory has been questioned in many ways, such as the lack of ecological validity and the absolute division between utilitarianism and deontology. The CNI model provides a detailed distinction of the cognitive processing involved in moral judgment, clarifying whether changes in moral decision-making are caused by sensitivity to consequences, sensitivity to norms, or general action/inaction. This study investigates the cognitive and neural mechanisms of moral judgment in different social contexts. Experiment 1 adopts the social observation paradigm to examine whether an individual's moral judgment will be affected by simple decision-making exposure. The results showed that the participants' moral decisions were not influenced by the presence of observers. Experiment 2 adopts the parallel judgment paradigm to investigate the impact of social information feedback on individual moral judgment, and measured social indicators. It was found that the participants' lower acceptance of decision-making was due to their obvious tendency to inaction, and the individual's confidence in judgment was affected by social pressure and underlying social evaluation. Experiment 3 adopts the two-person co-judgment paradigm to examine the decision-making changes of both parties when consensus is required. It was found that the participants still had low acceptance of decision-making, and on the one hand, due to the increased sensitivity of moral norms, on the other hand, due to more obvious inaction tendencies, and the participants had a smaller sense of stress and a higher level of social approval. In Experiment 4, the hyper-scan technology of fNIRS was used to comprehensively investigate the changes of activation degree of different brain regions and the performance of brain synchronization under the parallel judgment situation and the joint judgment situation. The results showed that compared with individual judgment, joint judgment caused higher activation of blood oxygen in the left prefrontal cortex（PFC） and weaker activation in the left temporoparietal joint area（TPJ）. At the same time, there was stronger inter-brain synchronization in the right prefrontal cortex and the left temporoparietal joint area. This study shows that individuals are more inclined to make unacceptable moral decisions in the presence of others, and this seemingly more moral decision stems from the increased sensitivity of moral norms caused by wanting to obtain social approval on the one hand, and the tendency to inaction due to the decentralization of responsibilities on the other hand, and even if there is no verbal communication, there will be mutual brain synchronization between individuals.

机器人还是人类：演奏形式对音乐影响食物选择的调控作用

邱林波　宛小昂（通讯作者）
清华大学心理学系，北京，100084，wanxa@mail.tsinghua.edu.cn

摘 要　音乐机器人作为一种融合了人工智能和音乐艺术的创新技术，近年来在科学、艺术和技术领域引起了广泛的关注。在本研究中我们探究了与人类演奏的音乐相比，音乐机器人演奏的音乐对于个体的认知过程是否会产生不同的影响。在消费情境中，音乐可能会通过诱发心理意象这一认知过程从而影响个体的消费选择。例如，相比于诱发城市意象的音乐，诱发自然意象的音乐会让个体做出更多以素菜为主的食物选择。我们将被试随机分为两组，其中一组被试会观看机器人乐队演奏音乐的视频并被告知在本实验中听到的音乐均为机器人乐队演奏的音乐，而另一组被试会观看真人乐队演奏的音乐并被告知在本实验中听到的音乐均为真人乐队演奏的音乐。接着，所有被试都要在在虚拟现实中边听背景音乐边完成食物选择的任务。我们选取了能够诱发城市意象和自然意象的两类音乐片段来作为实验材料。被试需要在两道荤菜和两道素菜中选择三道自己想吃的菜式，因此被试会做出以素菜为主的食物选择和以荤菜为主的食物选择。结果发现，当被试被告知所听到的音乐为真人乐队演奏的音乐后，他们在诱发自然意象的音乐下会比在诱发城市意象的音乐下做出更多的以素菜为主的食物选择；而当被试被告知所听到的音乐为机器人乐队演奏的音乐后，他们在诱发自然意象的音乐下以素菜为主的食物选择比例和在诱发城市意象的音乐下的以素菜为主的食物选择也有显著差异，但是这种差异相比于真人乐队组的被试的差异要小。本研究的结果表明音乐的演奏形式对音乐影响食物选择的认知过程存在影响，相比于真人乐队演奏的音乐，机器人乐队演奏的音乐削弱了音乐对于食物选择的影响。以往的研究主要关注于音乐机器人演奏的音乐对于个体情绪感受的影响，而忽视了音乐机器人演奏的音乐对于个体认知过程的影响。本研究的结论不仅丰富了音乐影响个体认知过程这一领域的研究结果，而且对于人机交互特别是人类感知机器人演奏的音乐具有一定的理论贡献。

Robots or Humans: the role of performance form in moderating musical influences on food choices

Linbo Qiu & Xiaoang Wan
Department of Psychology, Tsinghua University, Beijing

Abstract：Music robots, as an innovative technology that combines artificial intelligence and the art of music, have gained a lot of attention across the domains of science, art, and technology in recent years. We examined whether music played by music robots has a different effect on individuals' cognitive processes compared to music played by human beings. In the context of consumption, music might influence individuals' consumption choices by impacting cognitive processes, such as inducing mental imagery. For example, music inducing nature imagery leads individuals to make more vegetable-forward food choices compared to music inducing urban imagery. All the participants were assigned into two groups randomly, one group of participants

watched a video in which music robots were playing the music and were told that all music pieces in this study were played by music robots. Another group of participants watched a video in which human beings were playing the same music and were told that all music pieces in this study were played by human beings. Subsequently, all participants were required to complete a food choice task while listening to background music in virtual reality. We selected two types of music that induce urban and natural imagery as music stimuli. The participants were required to choose three dishes out of a set comprising two meat dishes and two vegetable dishes, so they made a meat-heavy food choice or a vegetable-forward food choice in each trial. The results revealed that for the participants who were informed that music was played by human beings, they made more vegetable-forward food choices while listening to music inducing natural imagery compared to urban imagery. Participants who believed the music was performed by music robots also displayed a disparity in vegetable-forward food choices between the natural and urban imagery conditions, albeit to a lesser extent than the human-performed music group. The results suggested that the performance form of music played a role in the cognitive process underlying the influence of music on food choices. The music played by music robots weakened the effect of music on food choices compared to music played by human beings. While several researchers investigated the influence of music played by robots on individuals' emotions, few studies have investigated the influence of robot-performed music on individuals' cognitive processes. The findings of this study not only enrich the findings in the area of music influencing individual cognitive processes, but also make a theoretical contribution to human-robot interaction, particularly on how humans perceive music played by music robots.

Keywords：music robots, virtual reality, mental imagery, human-robot interaction

器乐训练可能增强汉语情绪韵律识别

刘梦婷[1] 江俊[2]（通讯作者）

1 哈尔滨音乐学院艺术学系，哈尔滨，150500

2 上海师范大学音乐学院，上海，200234，jjxytc@163.com

摘 要 Patel (2014)的扩展性 OPERA 假说提出，器乐训练可以提高言语加工能力。这是因为，音乐与言语共享感觉或认知加工机制，而且音乐对这些机制的要求更高。在言语加工中，言语情绪识别能力对社交具有重要的作用。已有研究发现，器乐训练可以增强非声调语言言语情绪识别能力。但是，与非声调语言不同，声调语言言语情绪识别任务相对更难。那么，器乐训练对非声调语言产生的这种促进效应是否会拓展到声调语言？目前，尚未有研究考察器乐训练是否与声调语言言语情绪识别能力相关。为了探究该问题，本研究招募了 36 名从小接受器乐训练的音乐专业大学生和 36 名未接受过任何专业音乐训练的大学生作为被试。两组被试在年龄、性别、受教育年限、非言语 IQ 和偏手性方面进行了匹配，但是音乐大学生自我报告的音乐能力和音乐活动水平高于非音乐大学生。被试在线聆听随机呈现的 210 个表现快乐、悲伤、愤怒、恐惧和中性情绪的汉语伪句子（符合主谓宾结构，但句意无意义）。在听完每个句子后，被试需要尽可能又快又准确地识别句子表达的情绪，并对其情绪强度进行评定。以组别（音乐组、非音乐组）为被试间变量、情绪（快乐、悲伤、愤怒、恐惧、中性）为被试内变量分别对正确率、反应时和情绪强度进行的混合方差分析（基于效应量估计和贝叶斯因子）结果显示，有极强的证据表明存在一个大的组别主效应，

即音乐组在所有情绪识别的正确率、反应时和情绪强度评定方面均高于非音乐组。这些结果表明，器乐训练可能增强听者对汉语情绪韵律的感知，在一定程度上支持了 OPERA 假说。

Instrumental music training may enhance the recognition of emotional prosody in Mandarin

Mengting Liu[1]　Jun Jiang[2]*

1 Department of Art, Harbin Conservatory of Music, Harbin, 150500
2 Music College, Shanghai Normal University, Shanghai, 200234

Abstract：The expanded OPERA hypothesis by Patel (2014) proposes that instrumental music training can enhance speech processing, as music shares sensory or cognitive processing mechanisms with speech, and music makes higher demands on these mechanisms. In speech processing, the ability to recognize vocal emotion plays an important role in social interaction. Studies have demonstrated that instrumental music training can improve vocal emotion recognition in nontonal languages. However, recognizing vocal emotions in tonal languages is more difficult than in nontonal languages. It remains to be seen if the same facilitating effect of instrumental training on nontonal languages extends to tonal languages, as there is no research that has investigated this. To investigate whether instrumental music training is associated with greater sensitivity to emotional prosody in tonal languages, 36 music students who had received instrumental music training since childhood and 36 students who had received no professional music training were recruited. The two groups were matched for age, gender, years of education, nonverbal IQ and handedness, but the music students reported higher levels of musical ability and activity than the non-music students. The subjects listened online to 210 Chinese pseudo-utterances expressing happy, sad, fearful, angry, and neutral emotions, and were asked to quickly and accurately identify the emotion and rate its intensity. Results from a 2 × 5 mixed ANOVA (based on effect size estimate and Bayes factors) with group (musical, nonmusical) as the between-subjects variable and emotion (happy, sad, fearful, angry, neutral) as the within-subjects variable on accuracy, reaction time and emotional intensity provided extreme evidence for a large main effect of group; that is, the musical group was more accurate, took longer to respond, and gave higher emotional intensity ratings for all emotions than the nonmusical group. These results suggest that instrumental music training may enhance listeners' perception of Chinese emotional prosody and provide some support for the OPERA hypothesis.

汉语校对阅读与自然阅读的加工差异：来自词频效应的证据

赖馨　江新（通讯作者）

北京语言大学心理学院，北京，100083，jiangxin@blcu.edu.cn

摘 要 校对阅读是指在阅读过程中检查文本中的错误的阅读。关于拼音文字阅读的研究发现，校对阅读的词汇加工过程与自然阅读是存在差异的，体现在校对阅读的词频效应大于自然阅读的词频效应。但是对汉语校对阅读的词汇加工过程仍缺乏认识。另外，词频和熟悉度关系密切，熟悉度可能会对词频的作用产生影响，但较少研究对两者进行区分。因此，本研究考察以下问题：汉语校对阅读和自然阅读的词频效应大小是否存在差异？汉语校对阅读和自然阅读的词频效应大小是否受到熟悉度的影响而发生变化？实验采用2（阅读任务：自然阅读/校对阅读）*2（目标词的词频：高频/低频）*2（目标词的熟悉度：高熟悉/低熟悉）三因素被试内设计，请汉语母语者在两种指导语的条件下阅读包含高频–高熟悉词、高频–低熟悉词、低频–高熟悉词、低频–低熟悉词的句子，一种是要求检测句子中的错误（校对阅读），一种是要求理解句子（自然阅读）。结果显示：（1）在句子的阅读速度以及目标词的总注视时间和跳读率上，校对阅读的词频效应大于自然阅读的词频效应。（2）在目标词的凝视时间上，熟悉度对校对阅读和自然阅读的词频效应大小产生影响，对于高熟悉度的目标词，自然阅读下没有词频效应，校对阅读有词频效应；对于低熟悉度的目标词，自然阅读和校对阅读都出现词频效应，且校对阅读的词频效应大于自然阅读的词频效应。研究结果表明，汉语校对阅读和自然阅读的词频效应大小存在差异，校对阅读的词汇加工深度可能比自然阅读的更深，它不是一个浅层的加工；在早期的词汇识别中，汉语校对阅读和自然阅读的词频效应大小会受到熟悉度的影响，但始终表现为校对阅读的词频效应大于自然阅读的词频效应。

关键词 校对阅读，词频效应，熟悉度，眼动，汉语

Processing differences between proofreading and reading in Chinese: Evidence from word frequency effect

Lai Xin Jiang Xin

School of Psychology, Beijing Language and Culture University, Beijing, 100083

***Abstract*:** Proofreading means detecting errors in the text during reading. Previous studies have found that word processing of proofreading is different from that of reading, which is reflected in the fact that word frequency effect during proofreading is greater than that during reading. However, we still know little about word processing of proofreading in Chinese. In addition, frequency and familiarity are closely related, and familiarity may have an impact on the effect of frequency, but few studies have distinguished them. Therefore, the present study examined the following questions: Is there a difference in the sizes of word frequency effect between Chinese proofreading and reading? Are the sizes of word frequency effect during Chinese proofreading and reading changed by familiarity? The three-factor within-subject design was used, which was 2(task: reading/proofreading)*2(word frequency of target words: high frequency/low frequency)*2(familiarity of target words: high familiarity/low familiarity). Chinese native speakers were asked to read sentences containing high frequency-high familiarity words, high frequency-low familiarity words, low frequency-high familiarity words and low frequency-low familiarity words under two instructions: One was required to detect errors in sentences(proofreading), the other was required to read for comprehension(reading). The results showed that: (1)word frequency effects during proofreading were greater than those during reading in reading rate of sentences, total fixation duration and skipping rate of target words. (2)Word frequency effects during proofreading and reading were affected by familiarity in gaze duration on target words. On high familiarity target words, word frequency effect was not found

during reading but was found during proofreading. On low familiarity target words, word frequency effects were found during reading and proofreading, and word frequency effect during proofreading was greater than that during reading. These results suggest that there is a difference in word frequency effects between Chinese proofreading and reading, indicating that the word processing depth of proofreading may be deeper than that of reading. Proofreading is not a shallow processing. What's more, in early stage of word recognition, word frequency effects during Chinese proofreading and reading were influenced by familiarity, but it always shows that word frequency effect during proofreading is greater than that during reading.
Keywords**:** proofreading, word frequency effect, familiarity, eye movement, Chinese

中文阅读中词切分的老化效应：来自眼动研究的证据

李琳（通讯作者）[1]　鲍凌珊[1]　李卓尔[1]　李莎[2]　Kevin B. Paterson[3]

[1] 心理与行为研究院，天津师范大学心理学部，天津，300387，linpsy@outlook.com

摘要　在中文文本中，没有空格对词边界信息进行标记。因此，读者必须通过词切分来进行词汇的识别和整合。尽管熟练的读者使用的认知策略目前存在争议，但词切分对他们来说是非常容易的(Li & Pollatsek, 2020; Yu et al., 2021)。随着年龄的增长，老年人在阅读方面存在明显的困难，然而，对中文文本进行高效词切分的能力是得到了保留还是已经丧失，目前还没有研究进行深入探讨(Zhang et al., 2022)。

因此，当前研究在 Zhou 和 Li(2021)研究的基础上，通过两个实验来比较青年人(18-30 岁)和老年人(65 岁以上)的词切分。采用三字增量词作为目标词(如“幼儿园”)，前两个字可以组成一个两字词作为嵌入词(如“幼儿”)，读者在阅读句子过程中，这种增量词会产生暂时性的词切分歧义。实验设置四种条件：两字嵌入词单独与句子上文构成合理或不合理条件；三字增量词作为目标词总是合理的，但其中嵌入的两字词与句子的上文构成合理或不合理的条件(见附件：实验 1 材料举例)。当前实验检验了读者是否会对词汇进行增量地切分，从而对两字嵌入词和目标词产生类似的合理性效应。结果发现，两个年龄组都在仅有两字嵌入词的句子条件下产生了合理性效应；在三字增量词合理的句子条件下，两个年龄组都没有表现出两字嵌入词的合理性效应。结果支持了 Zhou 和 Li(2021)的发现，他们发现青年人不会对文本进行增量式的切分，当前研究进一步表明，老年读者使用了与青年人相同的词切分策略(Zhou & Li, 2021)。

实验 2 将合理与不合理的三字增量词和两字嵌入词交叉嵌入到语境中(见附件：实验 2 材料举例)。结果发现，不论增量词是否是合理的，在首次通过类指标上都没有出现嵌入词的合理性效应，证明了读者不会增量切分文本。与 Zhou 和 Li(2021)的结果不一致的是，当前研究发现嵌入词的合理性在两个实验中均带来了副中央凹-中央凹效应，这表明嵌入词是可以通过副中央凹进行加工的。当前研究表明，老年人依然保留了非增量式的词切分能力，结果支持了 CRM 模型(Li & Pollatsek, 2020)。

Lin Li linpsy@outlook.com

Abstract: Chinese does not use spaces to mark word boundaries. Consequently, readers must segment text to support word recognition and integration. This appears remarkably easy for skilled young adult readers, although the nature of the cognitive strategies they employ is disputed (Li & Pollatsek, 2020; Yu et al., 2021). However, whether this capability is preserved or changes in older adulthood has not been investigated, despite older adults having poorer reading capabilities (Zhang et al., 2022).

Accordingly, we conducted two experiments comparing word segmentation by young (18-30 years) and older (65+ years) adults, based on Zhou and Li (2021). In Experiment 1, participants read sentences that included a three-character target (e.g., 幼儿园) whose first two characters could form a two-character word (e.g., 幼儿) which was plausible or implausible in the sentence context; with performance for these sentences compared with sentences where this two-character word was the target (see Figure). This tested whether, by incrementally segmenting text, readers would produce two-character word plausibility effects for both embedded and target two-character words. However, both age groups produced a plausibility effect for two-character targets only, without an effect for two-character embedded words. This replicated Zhou and Li's finding that young adult readers do not segment text incrementally, while suggesting that older readers employ the same word-segmentation strategy.

Experiment 2 further investigated this issue, employing contexts in which target and embedded word plausibility was crossed. The absence of an embedded word plausibility effect in first-pass measures, regardless of target word plausibility, affirmed that readers do not segment text incrementally. Interesting, however, and contrary to Zhou and Li's findings, we observed parafoveal-on-foveal effects of embedded word plausibility in both experiments, suggesting that the embedded words were processed parafoveally. We take our findings to show that word segmentation is preserved in older readers.

Keywords: cognitive aging, eye movements during reading, Chinese word segmentation, incremental words

中文阅读中语义透明度对词素位置概率词切分作用的影响

曹海波[1,2] 王敬欣[2]（通讯作者）

1 河北大学教育学院，保定，071002

2 天津师范大学心理学部，天津，300387，通讯作者 wjxpsy@126.com

摘 要 中文词切分的认知机制是心理语言学领域关注的焦点问题之一。中文无词间空格标识词边界，但研究发现读者可运用隐藏的词素位置概率线索帮助词切分，词素位置概率是指汉字出现在词首或词尾时双字词的次数占该汉字组成的所有双字词个数的比重。例如，语料库中“精”可组成 51 个双字词，其在词首可组成 44 个词，如“精神”“精彩”等，其词首词素位置概率为 0.87。可见“精”常居于词首，这为读者提供了较为清晰的词边界信息，同时也表明在复合词加工过程中发生了词素分解。然而，中文复合词是以词素、整词亦或混合方式进行表征尚未形成一致观点，语义透明度的研究中发现不透明词识别时词素与整词的连接较弱、词素发挥的作用较小，研究者认为透明词倾向词素存储，不透明词倾向整词存储。词素位置概率研究揭示出词素在词汇识别中的作用，那么倾向于整体存储的不透明词中是否也存在词素位置概率效应，即词素位置概率在不透明词识别中还能否发挥作用？本研究采用词汇判断和眼动记录法，操控词素位置概率和语义透明度变量，探究词素位置概率在不透明词加工中的作用，以考查语言学统计特征与语义信息联结对中文复合词表征方式的影响。实验 1 采用词汇判断任务，采用 2（词首词素位置概率：高、低）×2（语义透明度：高、低）的两因素被试内实验设计。结果发现，在正确率和反应时指标上，词首的词素位置概率和语义透明度的主效应显著。实验 2 采用句子阅读任务，考察在自然阅读情境中语义透明度对词素位置概率的影响。结果发现，词首词素位置概率在凝视时间、回视路径时间、总注视时间上的主效应显著；语义透明度在首次注视时间、凝视时间、回视路径时间上的主效应显著。结果表明，词素位置概率信息是中文读者重要的语言词切分线索，且可能不受语义透明度的限制。中文复合词的识别受语义透明度和词素位置概率影响，研究结果倾向支持词汇识别的混合通达表征模型。

The Role of Character Positional Frequency and Semantic Transparency on Chinese Reading: Lexical Decision and Eye Movements Studies

Cao Haibo[1,2], Wang Jingxin[2]

1 College of Education, Hebei University, Baoding, 071002

2 Faculty of Psychology, Tianjin Normal University, Tianjin, 300387

***Abstract*:** Understanding the cognitive mechanisms of polymorphemic word representation has been an important focus for research on Chinese reading. Considerable research addressed the issue mainly by comparing the processing of morpheme and whole word representation. The importance of character positional frequency and

semantic transparency in processing polymorphemic word representation has been further underlined. Previous research shows that Chinese readers can make use of their knowledge of the positional frequency of characters (i.e., how often they are used as the first or second character in words) to facilitate word segmentation and recognition, as providing compelling evidence for morphological decomposition during the recognition of compound words. Nevertheless, there is some controversy as to exactly how polymorphemic words are represented in the mental lexicon. Accordingly, with the present research we conducted two experiments, using the lexical decision task and eye movements during reading to investigate the use of positional frequency information and semantic transparency in both visual word recognition and reading.

The design of the experiment was 2 × 2 (character positional frequency [high, low] × semantic transparency [high, low]), within participants and items. In Experiment 1, we manipulated both initial character positional frequency and semantic transparency for target words. There were significant effects of initial character positional frequency and semantic transparency in the latency of lexical decisions. In Experiment 2, we used measures of eye movements to investigate the use of character positional frequency and semantic transparency in natural sentence reading. The results showed a clear effect of character position frequency and semantic transparency on reading times. Participants made shorter fixation duration on transparent words than on opaque words and shorter fixation duration in high character positional frequency conditions than in low character positional frequency conditions.

In sum, findings from both the lexical decision task and measures of eye movements in reading reveal a vital role for initial character positional frequency as a cue to word segmentation and recognition. Furthermore, the initial character positional frequency and semantic transparency play a more important role during Chinese word recognition. These results suggest that a morphological decomposition process co-occurs with whole-word processing. We argue that these findings support the augmented addressed morphology model theory of Chinese word recognition and can help inform the development of a model of character positional processing model in Chinese reading.

文本与 emoji 情绪一致性对个体情绪感知的影响

王惠珍[1] 李莹莹[1] 尹述飞[1](通讯作者)

1 湖北大学心理学系，武汉，430000，yinshufei121@163.com

摘 要：现实生活中的非语言信息在网络文字交流中难以实现，表情符号便出现在线上辅助表达了非语言信息在交流中表达的信息。其中 emoji 在网络交流中的应用广泛，在 emoji 与其文本配对的使用中，emoji 情绪与文本情绪经常不一致。为探究文本情绪与 emoji 情绪一致性对发送者情绪感知的影响，以及情境情绪的调节作用，本研究设计了 2（背景效价：积极、消极）*3（句子类型：纯文本句、emoji 和文本一致句和 emoji 和文本不一致句）的被试内实验，以情绪感知时反应时、愉悦度和唤醒度为因变量指标。共招募 30 名被试参与研究。结果发现，（1）句子类型主效应显著，emoji 与文本一致句的愉悦度、唤醒度显著高于纯文本句和 emoji 与文本不一致句，纯文本句的愉悦度低于 emoji 与文本不一致句，纯文本句的唤醒度高于 emoji 与文本不一致句；emoji 与文本不一致句的反应时高于 emoji 与文本一致句高于纯文本句。（2）背景效价调节表情在句子中的情感作用。积极情境下 emoji 与文本不一致句的愉悦度和 emoji 与文本一致句的差异大于消极情境下 emoji 与文本不一致句的愉悦度和 emoji 与文本一致句的差异；积极情境下 emoji 与文本一致句的唤醒度大于 emoji 与文本不一致句，消极情境下 emoji 与文本一致句的唤醒度和 emoji 与文本不

一致句无显著差异；积极情境下 emoji 与文本一致句的反应时小于 emoji 与文本不一致句，消极情境下 emoji 与文本一致句的反应时大于 emoji 与文本不一致句。

The Impact of Emotional Consistency between Text and Emoji on Personal Emotional Perception

Wang Huizhen[1] Li Yingying[1] Yin Shufei[1](通讯作者)

1 Department of Psychology, Hubei University，Wuhan，430000，yinshufei121@163.com

Abstract： Non-verbal information in real life is difficult to achieve in network text communication, so emojis appear online to help express the information expressed by non-verbal information in communication.The application of emoji in online communication is widespread, and in the use of pairing emoji with their text, emoji emotions and text emotions are often inconsistent. To investigate the impact of consistency between text and emoji emotions on the emotional perception, as well as the moderating effect of situational emotions, this study designed an mixed experiment of 2 (background valence: positive, negative) * 3 (sentence types: pure text sentences, emoji and text consistent sentences, and emoji and text inconsistent sentences), with response time, pleasure, and arousal as dependent variables during emotional perception. A total of 30 participants were recruited to participate in the study. The results showed that (1) the main effect of sentence type was significant. The pleasure and arousal of emoji and text consistent sentences were significantly higher than those of text sentences and emoji and text inconsistent sentences. The pleasure of text sentences was lower than emoji and text inconsistent sentences, and the arousal of text sentences was higher than emoji and text inconsistent sentences; The reaction time between emoji and text inconsistent sentences is higher than that between emoji and text consistent sentences and pure text sentences. (2) Background valence regulates the emotional role of expressions in sentences. The pleasure level of emoji and text inconsistent sentences in positive situations and the difference between emoji and text consistent sentences were greater than those in negative situations; The arousal of emoji and text consistent sentences in positive situations was greater than that of emoji and text inconsistent sentences, while there was no significant difference in arousal of emoji and text consistent sentences and emoji and text inconsistent sentences in negative situations; The reaction time between emoji and text consistent sentences in a positive context was less than that between emoji and text inconsistent sentences, while in a negative context, the reaction time between emoji and text consistent sentences was greater than that between emoji and text inconsistent sentences.

Key words： Emoji emotion，Text emotion，Inconsistency，Emotional perception

理想美、身体积极性、社交媒体：社交媒体内容对女性身体意象的影响

郎敏[1]　叶一舵[2]（通讯作者）

1 成都师范学院教育与心理学院，成都，611130
2 福建师范大学大学心理学院，福州，邮编 350117，通讯作者 yeyiduo@163.com

摘 要　近年来随着网络技术的发展，社交媒体在人们日常生活中的应用越来越普遍。已有研究发现社交媒体中蕴含着大量美化的、不现实的女性身体形象，而这些美化的外貌理想美严重影响女性的身体意象。为抵抗这一负面影响，一场全球化的名为“身体积极性”的运动在社交媒体中流行。在这场活动中女性通过展示自己真实的、不同于理想美的身材和相貌来表达女性身体的多样性，同时也鼓励女性不论自己的身材和相貌如何都要接纳和欣赏自己的身体。基于国外社交媒体特别是 Instagram 的研究初步表明，社交媒体中的身体积极性内容对女性身体意象具有积极作用，有望作为干预女性不良身体意象的新途径。然而，尽管国内社交媒体中已经出现了大量类似身体积极性主题的网络内容，如“反容貌焦虑”、“拒绝身材焦虑”等，但这些内容是否被年轻女性所接触和认可尚不清楚。基于此，本研究就社交媒体对女性身体意象的影响，特别是女性对身体积极性社交媒体内容的接触和认知情况，以及身体积极性社交媒体内容对女性身体意象的影响等问题进行探讨。本研究采用自编访谈提纲对 24 名活跃的年轻社交媒体女性用户进行一对一访谈。通过主题分析提取出 4 个主要的主题：（1）社交媒体中的理想美压力：传统、西方、多元审美融合；（2）社交媒体中的身体积极性内容；（3）年轻女性对中国社交媒体中身体积极性内容的接触情况及认知；（4）身体积极性身体媒体内容改善女性身体意象的潜力及存在的问题。研究发现：（1）社交媒体中的理想美压力来自中国文化和西方文化中理想美的传播，同时也出现少量健康和多元的理想美概念。（2）年轻女性已经开始接触社交媒体中身体积极性内容，并认为其有潜力改善女性的身体意象，但对于社交媒体中某些身体积极性内容的专业性有所担忧，且认为在个体身体意象问题较为严重时，身体积极性内容的积极作用可能较小。

Beauty ideals, social media, and body positivity：The influence of social media content to female body image

Lang Min[1]　Ye Yiduo[2]（Corresponding author）
1 School of Education and Psychology, Chengdu Normal University, Chengdu, 611130
2 School of Psychology, Fujian Normal University, Fuzhou, 350117, E-mail address: yeyiduo@163.com

Abstract：In recent years, with the development of network technology, the application of social media in people's daily life is more and more common. It has been found that social media contains a large number of beautified and unrealistic female body images, and these beautified beauty ideal seriously affect women's body image. To challenge this negative impact, a global momentum called "body positivity" has been trending on social media. In this movement, women show the diversity of women's bodies by showing their real bodies and looks, and encourage women to accept and appreciate their bodies regardless of how their body size and appearance. Studies based on foreign social media, especially Instagram, preliminary showed that body positive social media has a positive effect on female body image, which is expected to be a new way to intervene women’s body image. However, although there has been a large amount of body positive content on domestic social media similar to that on foreign social media, such as "Refusing appearance anxiety" and "Resisting facial anxiety", it is not clear whether these contents have been contacted and recognized by young women. Based on this, this study discusses

the impact of social media on female body image, especially women's exposure to and cognition of body positive social media content, and the impact of body positive social media content on female body image. Active young female social media users (n = 29) participated in individual interviews. Thematic analysis revealed four primary themes: (1) media appearance pressures: the fusion of traditional, Western and multiple aesthetics, (2) presence of body positivity on domestic social media, (3) young women's exposure to and cognition of body positive social media content ; (4) the potential and existing problems of using body positive social media content to improve women's body image. The findings are as follows: (1) The pressure of beauty ideals in social media comes from the spread of beauty ideals in Chinese culture and Western culture, and there are also a few healthy and diversified beauty ideals concepts. (2) Young women have been exposed to body positive social media content and believe that it has the potential to improve women's body image, but they are concerned about the professionalism of some body positive social media content and believe that the positive effect of body positive social media content may be weakened when the individual's body image problems are more serious.

粤港澳大湾区大学生国家认同的三维模型构建

——基于个体生活历史记忆视角

张玲燕[1]　林晓琪

1 广东技术师范大学应用心理学系，广州，510665

通讯作者 E-mail（290900363@qq.com）

摘 要　国家认同是一个国家社会成员凝聚力和向心力的集中体现，粤港澳大湾区大学生作为大湾区未来建设的主力军，其国家认同对粤港澳大湾区各领域的发展与合作具有重大影响。本研究从个体生活历史记忆的角度出发，采用深度访谈的方式，运用扎根理论编码，挖掘大湾区大学生的国家认同的内部心理机制。基于 35 位粤港澳大学生的个体生活历史记忆调查，获得大约 40 万字的文本数据，采用 NVivo 编码分析提取出国家认同内涵的内部三维构成和四个国家认同的外部因素，分别为对己对国的辩证认知、对国家的依恋（情感）、利己利国的行为倾向，国家综合实力、教育系统、国家对国民的保障和社会环境氛围，最终构建出粤港澳大学生国家认同的内涵理论模型。本研究厘清了国家认同的内涵、结构及其影响因素，为开展大学生爱国主义教育提供了理论依据。

Three dimensional model construction of national identity of college students in Greater Bay Area -- based on the perspective of life history memory

Zhang Lingyan, Lin Xiaoqi
Guangdong Polytechnic Normal University, Guangzhou, Guangdong

Abstract：National identity is a concentrated embodiment of the cohesion and centripetal force of a country's social members. As the main force in the future construction of the Greater Bay Area, college students in the Greater Bay Area have a significant impact on the development and cooperation in various fields of the area.

From the perspective of living history memories, this study adopts the method of in-depth interview and the application of grounded theory coding to explore the internal psychological mechanism of national identity of college students in the Greater Bay Area. Based on the individual life history memory survey of 35 college students in Guangdong, Hong Kong and Macao, about 400,000 words of text data were obtained. The internal three-dimensional composition of the connotation of national identity and four external factors of national identity were extracted by NVivo coding analysis, which were dialectical cognition of oneself to the country, attachment (emotion) to the country, and behavioral tendency of self-interest and benefit to the country, national comprehensive strength, education system, national protection for citizens and social environment. Finally construct the connotation theoretical model of national identity of Guangdong, Hong Kong and Macao college students.

The significance of this study is to build a bridge between individual psychology and national identity, which is conducive to enhancing the national consciousness and national concept of college students in the Greater Bay Area, stimulating rational patriotic feelings, and then generating voluntary patriotic actions, so as to contribute to the economic construction and long-term social stability of the Greater Bay Area.

新冠期间中国农村留守儿童心理健康的质性研究：一项基于留守儿童的访谈

刘宁宁[1] 张敏[1] 高淳海[2]（通讯作者）
1 辽宁师范大学脑与认知神经科学研究中心，大连，116029
2 深圳大学教育学部，深圳，518000，gaochunhai@szu.edu.cn

摘 要 目的：通过质性研究方法，探究新冠疫情期间中国农村留守儿童的心理健康水平，以及学业适应能力和亲子关系对其的潜在影响。方法：以中国西南某省份为例，采用访谈法，对 22 名年龄在 10 至 15 岁之间的农村留守儿童进行深度访谈。结果：研究结果显示，新冠疫情造成留守儿童生活方式的彻底改变，严重影响了农村留守儿童的健康状况：（1）留守儿童在情绪和心理状态调整方面表现出相当大的困难，出现孤独、抑郁、焦虑和悲伤等消极的情绪和心理问题；（2）由于照顾者教育背景有限、学习方式改变以及家务繁重等原因，留守儿童的学习时间减少，学习积极性明显受损；（3）亲子之间长期社会隔离导致沟通减少，对亲子关系和依恋质量产生了负面影响。而亲子关系的变化又进一步影响留守儿童的心理健康和

学业成绩。结论：本研究关注农村留守儿童的心理健康，对新冠疫情期间的农村留守儿童进行了面对面的深度访谈。新冠疫情是全球性问题，由于留守儿童的学业需求、心理需求和社交需求受到的关注和解决较少，新冠疫情对农村留守儿童的影响尤为严重，尤其是中国隔代监护对孩子的发展存在诸多弊端。因此，后疫情时代政府应加强与关注弱势儿童群体的非政府组织的合作，完善识别和监测体系，从而为农村留守儿童提供必要的帮助和支持。

A Qualitative Study on the Psychological Well-being of Left-behind Children in Rural China During COVID-19

Abstract：This study sought to explore the psychological well-being of left-behind children (LBC) in rural China during COVID-19, and to assess the potential influence of academic adjustment and quality of parental attachment on these children. To this end, we adopted a qualitative research method consisting of interviews with 22 LBCs (face-to-face) aged 10-15 in an anonymous rural province of southwestern China. The study results reveal that COVID-19 has caused a complete change in the lifestyle of LBCs, significantly impacting LBC well-being: (1) the children exhibited considerable difficulty adjusting their emotional and psychological state owing to the radical lifestyle changes caused by COVID-19; (2) LBC academic engagement and motivation were notably jeopardized during COVID-19; (3) a long parental absence from a rural household negatively influences the relationships between the parent and child, and the changes in parent-child relationships further impact the psychological well-being and academic performance of LBC. This study focuses on the psychological well-being of LBC in rural China and conducted in-depth face-to-face interviews with them during COVID-19. COVID-19 is a global problem that has severe impact on rural LBCs due to the limited attention and addressing of the academic, psychological, and social needs of them, especially when it comes to understanding the negative impacts of inter-generational care in China on LBCs' development. Therefore, this study suggests that in the post-pandemic era, the Chinese government should seek to identify and monitor these children by working with non-governmental organizations that target such children.

他们为什么不寻求专业帮助？社交焦虑求助行为影响因素的质性探索

邓嘉琪[1]　宋亦江[1]　唐信峰[1]（通讯作者）

1 中国人民大学心理学系，北京，100872，xtang@ruc.edu.cn

摘 要

背景与目的：青年人群是社交焦虑高发群体，但该群体的求助行为却不高。个体因心理健康问题寻求帮助存在许多促进和阻碍因素。关于社交焦虑的求助行为的促进和阻碍因素研究比较少。本研究旨在基于健康信念模型（The Health Belief Model），探索影响大学生社交焦虑求助行为的影响因素。

方法：我们对 21 名非心理学专业大学生进行了半结构化访谈，受访者在《Social Phobia Inventory》测量得分在 43 分以上。我们询问了大学生对社交焦虑概念、原因、治疗方式等问题的知识和态度。采用质性分析软件 MAXQDA 对文本进行主题分析。

结果：我们发现，大部分同学对社交焦虑（社恐）感知易感性（Perceived Susceptibility）较高，他们认为自己有一定程度的社交焦虑。对社交焦虑严重性（Perceived Severity）的认识则不一致，尽管大部分受访者认为社交焦虑会影响到他们将来的职业选择，但是对他们当前生活而言影响似乎不大。大部分同学也能认为改善社交焦虑有好处（Perceived Benefits），包括得到更多的机会、有更好的人际交往体验等。但是，在求助行为过程中，受访者们感知到了诸多障碍（Perceived Barriers），包括对科学有效的干预方式缺乏知识，对心理咨询的效果缺乏足够的信心，对心理咨询具体干预的方式和内容缺乏了解。因此，即使在社交焦虑易感性、严重性和治疗益处已经有较多的认识，但是诸多阻碍使得人们向专业人士求助的比例较低。

结论：综合来看，目前大学生关于社交焦虑的专业求助行为不理想，将来需要开发课程、工作坊等各种形式，提升他们对社交焦虑各方面的认识，去除各方面的阻碍。

Why Don't They Seek Professional Help? A Qualitative Exploration of Factors Influencing Help-Seeking Behavior for Social Anxiety

Jiaqi Deng, Yijiang Song, Xinfeng Tang
Department of Psychology, Renmin University of China, Beijing, China
Corresponding author: xtang@ruc.edu.cn (X. Tang)

***Abstract*:**

Background: Young adults represent a high-risk group for social anxiety, yet their help-seeking behavior remains relatively low. Help-seeking for psychological health issues is influenced by numerous facilitating and inhibiting factors. However, there is limited research specifically focused on the facilitators and barriers of help-seeking behavior for social anxiety. This study aims to explore the factors of help-seeking behavior for social anxiety among college students, based on the Health Belief Model.

Methods: A semi-structured interview was conducted with 21 non-psychology major college students who scored 43 or higher on the Social Phobia Inventory (SPIN). Participants were asked about their knowledge and attitudes towards social anxiety, including its definition, causes, and treatment. Qualitative analysis software MAXQDA was utilized for thematic analysis of the interview transcripts.

Results: We found that most students had a high level of *perceived susceptibility* to social anxiety, indicating that they believed they experienced a certain degree of social anxiety themselves. However, their perceptions of the severity of social anxiety (*perceived severity*) were inconsistent. While the majority of respondents believed that social anxiety would impact their future career choices, many perceived its current impact on their daily lives to be relatively minor. Additionally, most students recognized the potential benefits of improving social anxiety (*perceived benefits*), such as accessing more opportunities, and enhancing their interpersonal experiences. Nevertheless, students encountered many *perceived barriers* during the help-seeking process , including a lack of

knowledge about effective interventions, insufficient confidence in the effectiveness of counseling, and a lack of understanding of specific contents in counseling. Consequently, despite having relatively good awareness of the susceptibility, severity, and benefits of reducing social anxiety, these barriers led to a lower proportion of individuals seeking assistance from mental health professionals.

Conclusion: Overall, the professional help-seeking behavior for social anxiety among college students is unsatisfactory. Future efforts should focus on developing various forms of courses, workshops, and interventions to enhance their understanding of social anxiety and address the barriers that hinder help-seeking behavior.

鲁迅自我同一性的心理传记学研究

刘学斌[1] 舒跃育[2]

1 西北师范大学心理学院，兰州，730000

2 西北师范大学心理学院，兰州，730000, shuyueyu@nwnu.edu.cn

摘要：本研究采用心理传记学的方法，以鲁迅本人留下的著作以及记录他生平经历的知名传记作为研究资料，运用新精神分析的相关理论对他少年至成年的成长经历进行了分析，试图揭示其自我同一性的发展过程，并探讨他形成“善感多思，犹豫多疑”个性的缘由。

研究发现：（1）少年时期，书香门第的家族文化与具有父权文化氛围的家庭环境对鲁迅的自我同一性发展具有塑造作用。（2）青年时期，理想实践的一一失败和包办婚姻解决亲密-孤独的矛盾的无效，使他在这一阶段遭遇了同一性发展危机，为了解决这一危机，鲁迅回归大家庭建立消极同一性以对抗危机。（3）成年时期，鲁迅与兄弟周作人失和，在大家庭中建立的消极同一性也随之破灭，鲁迅不得不去寻找新的亲密关系以对抗孤独。46 岁的鲁迅与许广平的结合，以及儿子海婴的出生，让鲁迅发展出关心的品质，至此，鲁迅的自我整合完成。鲁迅的生命成长经验并不是所谓的顺风顺水，可是他依然能从环境中发展出健康的自我同一性，这值得让我们在数字化时代的背景下重新思考鲁迅的意义。

通过探讨鲁迅自我同一性的发展历程，有助于理解家庭环境、社会环境以及亲密关系对个体的自我同一性的影响，启示我们应从多个方面关注自我的成长，从真实自我出发接受全面完整的自我，从而实现融洽的心理健康。

非预期躯体情绪较面孔情绪的神经表征优势

刘建邑 赵晶晶(通讯作者)

陕西师范大学心理学院，西安，710062，赵晶晶 jingjing.zhao@snnu.edu.cn

摘要 面孔和躯体是视觉通道上情绪信息的主要载体，人们所处的社会环境里充斥着由他人面孔、躯体携带的复杂情绪信号。现有研究通常关注单独的面孔或者躯体情绪，这些研究通过视觉失匹配负波(vMMN)揭示了非预期的面孔或躯体表情的自动化加工机制。然而，现实生活中面孔和躯体总是作为整体出现的，这意味着单独呈现某一刺激缺乏生态效度。本研究拟通过呈现完整面孔躯体图片的方式，分别操纵面孔、躯体及二者间一致性，考察面孔和躯体情绪信息的神经表征。研究设计包含四个 block：三个 oddball block 和一个等概率 block。在所有的 oddball block 中，标准刺激均为中性面孔结合中性躯体的图片（呈现概率为 0.8），偏差刺激则分为三组：1)恐惧面孔结合恐惧躯体和快乐面孔结合快乐躯体图片；2)恐惧面孔结合快乐躯体和快乐面孔结合恐惧躯体图片：3)恐惧面孔结合中性躯体和快乐面孔结合中性躯体图片。等概率 block 则以相同的概率呈现六种偏差刺激。被试在整个实验过程中记录脑电信号，并被要求完成无关任务（判断中心十字是否消失）。实验数据分析包括传统的单变量分析（获得不同类型刺激的 vMMN 波幅均值，并执行方差分析）和多变量表征相似性分析。在表征相似性分析中，神经不相似矩阵(neural RDM)通过以 SVM 为分类算法的 10 折交叉验证获得（以两两刺激间的解码正确率作为不相似度），模型不相似矩阵(model RDM)基于两种情绪理论构建（基本情绪理论及维度理论）。结果发现，躯体情绪以及面孔躯体情绪一致性能够在 oddball 和等概率序列中得到显著的神经表征，两个序列中两类信息神经表征的强度差异与单变量分析的结果有很好的对应关系。具体表现为 170-230 毫秒内 vMMN 波幅表现出躯体情绪类型的主效应，这个时间段内刚好仅被检测到躯体情绪神经表征的序列间差异；而在 230-330 毫秒内 vMMN 波幅表现出面孔情绪和躯体情绪的交互作用，在这段时间内检测到了躯体情绪和一致性神经表征的序列间差异。这些结果揭示了复杂环境中大脑快速处理非预期情绪信号时可能更加依赖于躯体表情而非面部表情。

The neural representation advantage of unexpected body expression over facial expression

Jianyi Liu, Jingjing Zhao
School of Psychology, Shaanxi Normal University, 199 South Chang'an Road, Xi'an 710062, China. Email: jingjing.zhao@snnu.edu.cn

Abstract: Faces and bodies are the main carriers of emotional information in the visual channel. The social environment people live in is full of complex emotional signals carried by other people's faces and bodies. Existing studies usually focus on individual faces or body emotions, and these studies reveal the automatic processing mechanism of unexpected face or body expressions through visual mismatch negativity (vMMN). However, in real life, faces and bodies always appear as a whole, which means that presenting a stimulus in isolation lacks ecological validity. Therefore, this study intends to investigate the neural representation of the corresponding information presenting the picture of the complete face-body, and we manipulated the emotion type of face, body and the consistency between them. Specifically, we designed four blocks, including three oddball blocks and one equally probability block. In all oddball blocks, the standard stimulus was a picture of a neutral face combined with a neutral body (presentation probability 0.8), and the deviant stimulus was divided into three groups: 1. Fear face combined with fear body and happy face combined with happy body pictures 2. Fear face combined with happy body and happy face combined with fear body pictures 3. Fearful face with neutral body and happy face with neutral body. Equal probability block present six deviant stimuli with the same presentation probability. EEG

signals were recorded while the subjects performed an unrelated task (determining whether the central cross had disappeared). We performed traditional univariate analysis (obtaining vMMN amplitude averages for different types of stimuli and performing ANOVA) and multivariate representational similarity analysis (RSA) on the experimental data. In the representational similarity analysis, the neural dissimilarity matrix (neural RDM) was obtained by 10-fold cross-validation using SVM classification algorithm (with the decoding accuracy rate between the two stimuli as the dissimilarity), and the model dissimilarity matrix (model RDM) was constructed based on two emotion theories (basic emotion theory and dimension theory). The results showed that body emotion and consistency between face and body emotions could be significantly represented in oddball and equal probability sequences. The difference in the intensity of neural representations of the two types of information in these two sequences corresponded well with the results of univariate analysis. Specifically, the vMMN amplitude in 170-230 milliseconds showed the main effect of body-emotional type, and only the sequence-to-sequence differences in body-emotional neural representations were detected during this time period. The vMMN amplitude showed the interaction between facial emotion and body emotion within 230-330 milliseconds, and the sequence-to-sequence differences between body-emotional and consistency neural representation were detected during this time. These results suggest that the brain may rely more on body expressions than facial expressions to rapidly process unexpected emotional signals in complex social environments.

提取干扰对知觉识别内隐记忆的影响：一项 ERP 研究

黄发杰[12]　孟迎芳[2]（通讯作者）　黄思捷[2]　董月晴[3]

1 福建医科大学健康学院，福州，350122

2 福建师范大学心理学院，福州，350117，mengyf1978@126.com

3 内蒙古师范大学心理学院，呼和浩特，010020

摘 要　记忆传统观点认为“无意识的内隐记忆是自动化加工”，因为其启动效应免受提取干扰的破坏。内隐记忆主要反应了提取加工，我们近期的系列实验却发现，启动效应会受到提取干扰的破坏，但在不同类型上存在差异，即产生式启动相比识别式启动受到的破坏更小，这对传统观点提出了异议，支持内隐记忆并非完全自动化加工。有意思的是，有一项行为研究发现，知觉识别属于一种识别式启动，竟然与产生式启动一样免受提取干扰的破坏(Lizito & Mulligan, 2010)。对此，我们推测，知觉识别虽然属于识别式启动，但因为刺激呈现短暂，被试需要根据知觉到的部分刺激进行“产生式”提取，由此具备了产生式启动特征，进而具有与产生式启动类似的“抗干扰性”。但目前，知觉识别内隐记忆的“抗干扰性”及其成因的认知神经特征都还不清楚？

为此，本研究延续前期的实验范式(黄发杰, 孟迎芳, 严颖, 2020)，采用事件相关电位技术(ERP)考察提取干扰对知觉识别内隐记忆影响。结果发现：(1)在行为上，在有、无干扰条件下，知觉识别均有显著的新旧效应；(2)在 ERPs 上，注意资源相关的 P3a 成分中，在有、无干扰条件下，知觉识别的 P3a 均有显著的新旧差异；内隐记忆相关的 N400 和 P600 成分中，在无干扰条件下，知觉识别的 N400 和 P600 新旧差异既分布在与识别式启动关联的中央区、顶区，又分布在与产生式启动关联的前额区、额区；在提取干扰条件下，知觉识别在额区的 N400 新旧效应受到了破坏，但随着与“产生式启动”相关的前额区的参与，额区的 P600 新旧效应不会受到破坏，这一趋势在 700~900ms 时间窗继续延伸。

综上所述，本研究认为，知觉识别内隐记忆兼具识别式启动和产生式启动的测验特征，这是首次获得ERP证据的支持；重要的是，知觉识别内隐记忆在额区的N400新旧效应会受到提取干扰的破坏，进一步支持了内隐记忆并非完全自动化加工，此外，该测验具有与“产生式启动”类似的抗干扰性，成因可能与“产生式”关联的前额区参与有关。

The effects of retrieval interference on perceptual identification implicit memory:An ERP Study

Fajie Huang[12]　Yingfang Meng[2]　Sijie Huang[2]　Yueqing Dong[3]

1 School of health，Fujian normal university, Fuzhou，350122

2 School of psychology，Fujian normal university, Fuzhou，350117

3School of psychology，Inner Mongolia Normal University，010020

Abstract：The traditional view of memory holds that "unconscious implicit memory is an automatic process", because its priming effect is protected from the interference of retrieval. Implicit memory mainly reflects retrieval processing, but our recent series of experiments have found that priming effect can be damaged by retrieval interference, but there are differences in different types, that is, production priming is less damaged than identification priming, which contradicts the traditional view and supports that implicit memory is not completely automatic processing. Interestingly, a behavioral study has found that perceptual identification is a kind of identification priming, which is as immune to retrieval interference as production priming (Lizito & Mulligan, 2010). In this regard, we speculate that although perceptual identification belongs to identification priming, because the stimulus is short, the subjects need to extract "production" according to the perceived part of the stimulus, which has the characteristics of production priming, and then has the "anti-interference" similar to production priming. However, at present, the "anti-interference" of perceptual identification implicit memory and the cognitive neural characteristics of its causes are still unclear?

In order to solve the above problems, this study used the previous experimental paradigm (Huang Fajie, Meng Yingfang, Yan Ying, 2020), and used event-related potential (ERP) technology to investigate the effect of retrieval interference on implicit memory of perceptual identification. The results showed that: (1) in behavior, there was a significant new-old effect in perceptual identification with and without interference; (2) in ERPs, there was a significant new-old difference in P3a of perceptual identification with and without interference in the component of P3a related to attention resources; In the N400 and P600 components related to implicit memory, in the condition of no interference, the differences between old and new N400 and P600 of perceptual identification were not only distributed in the central and parietal areas related to identification priming, but also in the prefrontal and frontal areas related to production priming; In the retrieval interference condition, the N400 new-old effect of perceptual identification in the frontal region was destroyed, but with the participation of the prefrontal region related to "production priming", the P600 new-old effect in the frontal region was not destroyed, and this trend continued to extend in the 700-900 ms time window.

In summary, this study suggests that perceptual identification implicit memory has the test characteristics of both identification priming and production priming, which is the first time to be supported by ERP evidence; Importantly, the N400 new-old effect of perceptual identification implicit memory in the frontal area is destroyed by retrieval interference, which supports that implicit memory is not completely automatic processing. In addition,

the test has a similar interference resistance to "production priming", which may be related to the participation of the prefrontal area associated with "production".

即时奖赏预期和延迟奖赏预期影响抑郁个体认知冲突的神经机制

张妍[1]　荣亚朝[1]　魏萍[1*]（通讯作者）

1 首都师范大学心理学院，北京市“学习与认知”重点实验室，北京，100048

*通讯作者：weiping@cnu.edu.cn

摘 要　延迟折扣现象表明，与即时奖赏相比，人们倾向于赋予延迟奖赏更小的价值。然而，即时或延迟获得的奖赏如何影响抑郁倾向个体在认知冲突任务中的注意分配及其神经机制尚不清楚。本研究共招募37名健康被试和31名抑郁倾向被试，采用金钱激励延迟范式(Monetary Incentive Delay, MID)和脑电技术，结合线性混合模型(Linear-mixed Effect Model, LMM)和表征相似性(Representational Similarity Analysis, RSA)分析方法，探究即时奖赏和延迟奖赏预期对个体认知冲突控制的影响机制。在不同的线索提示后（即时奖赏、延迟奖赏、无奖赏），要求被试进行 Stroop 任务，反应越快越好则会获得相应的奖赏。被试获得的即时奖赏在实验结束后立即支付，延迟奖赏在三个月后支付。行为结果显示，即时奖赏条件下的反应时最快，其次是延迟奖赏，无奖赏条件反应最慢。Stroop 干扰效应显著，且抑郁组的 Stroop 干扰效应大于正常组。脑电结果显示，在奖赏预期阶段，正常组 Cue-P3 显著正于抑郁组，且正常组和抑郁组在即时奖赏条件的组间差异显著大于延迟奖赏和无奖赏条件。在目标阶段，正常组比抑郁组诱发了更正的 Target-P3 波幅，并且正常组即时奖赏和延迟奖赏的差异显著大于抑郁组。在晚期 LPP 成分上，正常组的 Stroop 干扰效应显著大于抑郁组。RSA 结果显示，抑郁组与正常组被试相比，延迟奖赏和无奖赏条件的线索表征时间短于即时奖赏。在目标阶段，两组被试在即时奖赏条件下 Stroop 任务中的神经表征都可以预测被试行为表现，但是只有抑郁组被试的在延迟奖赏条件下的神经表征可以预测行为表现。当前研究结果表明，奖赏预期阶段和目标阶段都表现出即时奖赏编码表征优势，并且正常组的表征优势强于抑郁组，目标阶段的表征决定了认知冲突任务的行为表现。表征相似性分析的结果为进一步理解即时奖赏和延迟奖赏预期对抑郁个体认知控制的神经表征差异提供了证据。

Neural mechanisms underlying the influence of immediate reward expectancy and delayed reward expectancy on the cognitive conflict in depression

Yan Zhang[1] Yachao Rong[1] Ping Wei[1*]（Corresponding Author）
1 Beijing Key Laboratory of Learning and Cognition, and School of Psychology, Capital Normal University, Beijing, China, 100048
*Correspondence: weiping@cnu.edu.cn

***Abstract*:** Previous studies have consistently found that individuals have the tendency to prefer an immediate and smaller reward over a larger but delayed reward. The tendency to devaluate rewards over time is referred to as delay discounting. So far, it is unclear whether immediate and delayed rewards expectation influences cognitive control in depression. In the current study, a total of 37 healthy controls (HC) and 31 depressed participants completed the Monetary Incentive Delay (MID) task with event-related potential (ERP) recording. The Linear-mixed Effect Model (LMM) and Representational Similarity Analysis (RSA) were combined to explore the impact of immediate reward and delayed reward expectation on the mechanisms underlying cognitive conflict control.

A pre-cue indicates the potential of gaining a monetary reward including an immediate reward (indicating that participants could receive the reward immediately after the experiment), a delayed reward (indicating that participants could receive the reward three months later), and a no reward baseline condition. The target (Stroop word) was presented requiring a fast and accurate response regarding the color of the stimuli. Then, response-contingent feedback was presented indicating whether the participant would receive the corresponding reward. Behavioral results revealed that reaction times were significantly shorter in the immediate reward as compared with delay reward and no-reward conditions (IR < DR < NR). The Stroop interference effect was significant, and the depression group exhibited a greater Stroop interference effect compared to the HC group. The EEG results revealed that during the reward anticipation phase, the HC group elicited more positive-going Cue-P3 amplitude compared to the depressed group, and the difference between immediate reward versus delay reward conditions or no rewards conditions was significantly higher in the HC group than the depressed group. Moreover, during the target phase, the HC group elicited more positive-going target-P3 amplitudes than the depressed group, and the difference in P3 amplitudes between immediate and delayed reward conditions was significantly greater in the HC group than in the depressed group. For the late LPP component, the HC group showed a larger Stroop interference effect compared to the depressed group. Furthermore, the RSA results indicated that in comparison to the HC group, the depressed group had shorter reward cue representation times for delayed reward and no reward conditions than for immediate reward conditions. During the target phase, the neural representation in the Stroop task can predict performance in the immediate reward in both groups, but only the neural representation in the depressed group predicted behavior performance in the delayed reward condition.

The current study revealed an advantage in encoding representations for immediate rewards than for delayed

rewards in both the reward anticipation phase and the target phase, with the advantage being stronger in the HC group compared with the depressed group. Critically, reward boosted neural coding in both groups, and the extent of this increase was associated with improvements in task performance. These findings help to inform how immediate reward expectancy and delayed reward expectancy shapes neural processing in the depressed human brain.

色味一致性和关联强度对视觉搜索的影响：来自行为和电生理的证据

张乐　房欣　蔡思思　全紫涵　林其玉　蔡晨（通讯作者）

青岛大学师范学院心理系，青岛，266071

通讯作者 E-mail：caichen@qdu.edu.cn

摘要：个体倾向于将事物的各种特征通过不同的感官体验联系起来。已有大量研究探讨了视觉和味觉信息的跨通道联结（crossmodal correspondences）对视觉加工的影响机制，但仍缺乏对相关机制的深入解释。因此，本研究通过行为和电生理技术探究多感官注意下视觉搜索过程的深层认知加工机制。初步研究通过一项包含两份问卷的在线调查（$N1 = 219$，$N2 = 269$）来筛选实验材料以确定用于实验的颜色-味道组合，最终筛选出五种组合。正式实验采用 2（色味一致性：一致，不一致）×2（色味关联强度：强关联，弱关联）被试内实验设计，共有 44 名被试（平均年龄 19.34 ± 1.63 岁，19 名男生）参与该实验。在实验流程中，首先提示一个风味标签词，要求被试在随后呈现的四个饮料瓶图片中选择含有该标签词的目标图片。与前人研究不同，考虑到许多水果有多种不同关联强度的常见色（如，柠檬的强关联色为黄色，绿色的柠檬较为少见），本研究通过操控饮料图片中标签词的色味一致性和关联强度，进一步探讨视觉搜索过程中的认知加工机制。行为结果表明，在色味一致条件下搜索弱关联色的标签词要显著慢于搜索强关联色的标签词，不一致条件下则相反。ERP 成分分析发现，色味不一致条件比色味一致条件诱发了显著更小的 N2 波幅以及更大的 P3 和 LPC 波幅。进一步时频分析结果表明，色味一致和强关联目标分别比色味不一致和弱关联目标诱发了更小的顶区 theta 波（200–800 ms，4–8 Hz）。综上所述，本研究表明：（1）色味一致性和关联强度交互影响视觉搜索效率；（2）注意由外部刺激转向内部记忆的过程对于有效的视觉搜索十分必要；（3）顶区在注意加工和记忆提取过程中发挥着关键作用。本研究将注意转向记忆(attentional switch to memory)模型由情景记忆扩展至语义记忆提取过程，揭示了视觉搜索中涉及的复杂认知过程和深层神经认知动态。

The effect of color-flavor congruency and association strength on visual search: Evidence from behavior and electrophysiology

Le Zhang　Xin Fang　Sisi Cai　Zihan Quan　Qiyu Lin　Chen Cai*

Department of Psychology, Normal College, Qingdao University, Qingdao, 266071
*E-mail: caichen@qdu.edu.cn

***Abstract*:** Individuals are apt to link various characteristics of an object or event through different sensory experiences. Numerous studies have explored the impact mechanism of crossmodal correspondences between vision and taste perception on visual processing, but a deeper explanation is still lacking. Consequently, we used behavioral and electrophysiological technology to examine the in-depth cognitive processing mechanisms underlying the visual search process in multisensory attention. A pilot study with two questionnaires ($N1 = 219$, $N2 = 269$) was conducted to screen experimental materials and establish the color-flavor combinations used in the experimental study, and five combinations were finally selected. A 2 (color-flavor congruency: congruent, incongruent) × 2 (color-flavor association: strong, weak) within-subject design was implemented in the experimental study, 44 students (mean age = 19.34 ± 1.63 years; 19 males) were recruited in this study, they were prompted with a flavor label and asked to choose the one with it from the following four beverage bottle images during the experimental procedure. Divergent from previous studies, taking into account the fact that many fruits have various typical colors of different associated degrees (e.g., lemons are strongly associated with yellow, and green lemons are relatively rare), the present study attempts to manipulate the color-flavor congruency and association strength of flavor labels in beverage packaging pictures, and further explore the cognitive processing mechanism during the visual search process. The behavioral results showed that searching for a color-flavor weak association target was slower than for a strong association one in the color-flavor congruent condition, opposite to the incongruent condition. The ERP component analysis detected smaller N2 and larger P3 and LPC amplitudes for the color-flavor incongruent targets than for the congruent targets. A further time-frequency analysis elicited that the color-flavor congruent and strong association targets evoked lower parietal theta power (200–800 ms, 4–8 Hz) than the incongruent and weak association targets, respectively. Overall, our research indicated that (1) the color-flavor congruency and association strength interactively impacted the visual search efficiency, (2) the attentional switch from external stimuli to internal memory is necessary for efficient visual search, and (3) the parietal region plays a critical role in attentional processing and memory retrieval. These findings extended the *attentional switch to memory* model from episodic memory to semantic memory retrieval and shed light on the intricate cognitive processes involved in visual search and the underlying neurocognitive dynamics.

注意模板的边界及其作用机制

付纤[1]　郑田田[1]　王小桃[1]（通讯作者）
1 江西师范大学心理学院，南昌，330022，wangxt@jxnu.edu.cn

摘要 由于视觉系统加工能力的限制，我们只能选择一部分信息进行更深层次的加工，这体现了注意的选择性。而注意模板又在注意选择过程中起着重要作用，注意模板是指在工作记忆中存储的关于目标（目标模板）或非目标（拒绝模板）的特征，可以自上而下地引导注意选择过程，从而促进对目标特征的选择或干扰特征的抑制。注意选择过程还受到特征相似性的影响。特征相似性是指目标颜色和干扰颜色之间的颜色距离，颜色距离越相近，干扰颜色对目标颜色的干扰作用就越大。但是干扰颜色的干扰作用不是随颜色距离增加而线性递减，而是先快速下降然后再渐渐变慢，有研究者认为这个干扰作用由大变小的拐点，即注意模板的边界。我们先前的研究证实，拐点确实与注意模板相关，只有建立注意模板才会产生拐点。但是

现在尚不清楚，拐点的产生是注意模板增强了目标的加工，还是抑制了干扰物的加工，亦或是两者共同作用导致的？本研究采用工作记忆-视觉搜索范式，操纵目标与干扰物之间的颜色距离（分别为 20°、40°、60°、80°、100°、180°），采用事件相关电位技术（ERP），考察目标诱发的 N2PC 和干扰物诱发的 PD 是否会与颜色距离存在线性关系，并且存在明显的拐点。实验 1 的研究结果发现，目标诱发的 N2PC 受颜色距离影响不明显，不存在拐点；但干扰物诱发的 PD 与颜色距离成线性关系，并且存在拐点，拐点出现在颜色距离 80°左右。实验 2 在排除了一些视觉干扰后试图重复实验 1 的结果。结果与实验 1 基本相同，只是干扰物诱发的 PD 的拐点出现在颜色距离 100°左右。本研究的两个实验结果一致表明注意模板的边界取决于对干扰物的抑制而不是对目标的增强。

The boundary of attention template and its action mechanism

Fu Xian[1]　Zheng Tiantian[1]　Wang Xiaotao[1]
School of Psychology, Jiangxi Normal University, Nanchang, 330022, wangxt@jxnu.edu.cn

Abstract：　Due to the limitation of visual system processing ability, we can only select part of information for further processing, which reflects the selectivity of attention. Attention template plays an important role in the process of attention selection. Attention template refers to the features stored in working memory about the target (target template) or non-target (rejection template), which can guide the attention selection process from top to bottom, thus promoting the selection of target features or the suppression of disturbing features. Note that the selection process is also affected by feature similarity. Feature similarity refers to the color distance between the target color and the interference color. The closer the color distance is, the greater the interference effect of the interference color on the target color is. However, the interfering effect of interfering colors does not decrease linearly with increasing color distance, but rather decreases rapidly and then tapers off, and some researchers have suggested that the inflection point at which this interfering effect changes from large to small, i.e., the boundary of the attentional template. Our previous research confirms that inflection points are indeed related to attentional templates, and that inflection points only arise when attentional templates are established. But it is not clear whether the inflection point results from the attentional template enhancing the processing of the target, or inhibiting the processing of the interferer, or a combination of both? In this study, we used a working memory-visual search paradigm and manipulated the color distances between the target and the distractor (20°, 40°, 60°, 80°, 100°, and 180°), and examined whether the target-induced N2PC and distractor-induced PD would be linearly related to the color distances with significant inflection points using an event-related potential (ERP) technique. The results of Experiment 1 found that the target-evoked N2PC was not significantly affected by the color distance and did not have an inflection point; however, the interferent-evoked PD was linearly related to the color distance and had an inflection point, which appeared at a color distance of about 80°. Experiment 2 attempted to repeat the results of Experiment 1 after eliminating some visual distractors. The results were essentially the same as in Experiment 1, except that the inflection point of the interference-induced PD appeared at a color distance of about 100°. The results of the two experiments consistently show that the boundary of the attentional template depends on the inhibition of the distractor rather than on the enhancement of the target.

Keywords：　Selective attention, Attention template, N2pc, Pd

负性模板的时间进程：一项 ERP 研究

罗文宇[1]　张瑾[1]　王小桃[1]（通讯作者）

1 江西师范大学心理学院，南昌，330022，wangxt@jxnu.edu.cn

摘要　存储在记忆系统里的目标表征被称为注意控制定势或正性模板。正性模板能引导注意，只有与正性模板相匹配的信息才能被选择，并得到进一步的加工。最近有研究者提出表征在记忆系统里的干扰物特征（拒绝模板或负性模板）是否也能引导注意？关于这个问题现在还存在争论：一部分研究者认为记忆中被表征的干扰物特征能被预先主动抑制，因此建立负性模板能促进对目标的选择；另一部分研究者认为与负性模板相匹配的特征会先吸引注意然后再抑制。本研究使用 go/no-go 空间线索范式结合事件相关电位技术（ERP）来探讨该问题。在正性模板条件下，go 刺激只有一种颜色，而 no-go 刺激有 4 种颜色，以促进被试只记住 go 颜色；在负性模板条件下，目标有四种颜色，而干扰物只有一种颜色，以促进被试只记住 no-go 颜色。行为结果发现，在正性模板条件下，只有 go 颜色线索捕获了注意，中性和 no-go 线索都不捕获注意，说明被试只记住了 go 颜色建立了正性模板；而在负性模板条件下，只有 no-go 颜色线索没有捕获注意，中性和 go 线索都捕获了注意，说明了被试只记住了 no-go 颜色建立了负性模板。脑电结果发现，在正性模板条件下，只有 go 线索在 180ms-290ms 的时窗内诱发了 N2pc 成分，而中性线索和 no-go 线索均没有诱发 N2pc 成分；而在线索呈现后的 300ms-350ms 的时窗中，go 线索和 no-go 线索诱发了 Pd 成分。在负性模板条件下，三种线索都在线索呈现后的 180ms-290ms 的时窗内诱发了 N2pc 成分，而在线索呈现后的 300ms-400ms 的时间窗，只有 no-go 线索诱发了 Pd 成分。这些结果说明，与负性模板相匹配的刺激会先捕获注意，并没有被预先抑制。

Time course of negative templates: an ERP study

Luo Wenyu[1]　Zhang Jin[1]　Wang Xiaotao[1]

School of Psychology, Jiangxi Normal University, Nanchang, 330022, wangxt@jxnu.edu.cn

Abstract: The representation of the target stored in the memory system is known as the attentional control setting (ACS) or positivity template. Positive templates guide attention, and only information that matches a positive template can be selected and further processed. Recently, some researchers have asked whether distractor features stored in the memory system (rejection templates or negative templates) can also guide attention? There is still a debate about this question: some researchers believe that the features of the represented distractor in the memory system can be actively suppressed in advance, thereby facilitating the selection of a target; others believe that features matching negative templates first attract attention and then are suppressed. The present study used the go/no-go spatial cueing paradigm in association with the event-related potential (ERP) technique to explore this issue. In the positive template condition, the go stimulus had only one color, whereas the no-go stimulus had four colors to promote subjects to remember only the go color; in the negative template condition, the target had four colors, whereas the distractor had only one color to promote subjects to remember only the no-go color. Behavioral results revealed that in the positive template condition, only the go color cue captured attention, and neither the neutral nor the no-go cue captured attention, suggesting that subjects remembered only the go color to establish a positive template; whereas, in the negative template condition, only the no-go color cue did not capture attention, and the neutral and go cues both captured attention, suggesting that subjects remembered only the no-go color to establish a negative template. The EEG results revealed that in the positive template condition, only the go cue evoked the N2pc component in the 180-ms-290-ms time window, whereas neither the neutral cue nor the no-go cue evoked the N2pc component; whereas the go cue and the no-go cue evoked the Pd component in the

300-ms-350-ms time window after cue presentation. In the negative template condition, all three cues evoked the N2pc component in the 180ms-290ms time window after cue presentation, whereas only the no-go cue evoked the Pd component in the 300ms-400ms time window after cue presentation. These results suggest that stimuli matching negative templates capture attention first and are not pre-suppressed.

基于机器学习的创造性思维脑电信号分类

高慧[1]，刘春雷[1]（通讯作者）

[1]曲阜师范大学心理学院，曲阜 273165

通讯作者：刘春雷 liuchunlei@qfnu.edu.cn

摘要：随着人工智能技术的不断提升，机器学习技术在脑电信号领域中的应用快速增长。脑电图（electroencephalogram, EEG）作为一种低成本、高时间分辨率的神经成像技术，有助于研究者对创造性思维的深入了解。在脑电信号分析中，机器学习通过利用其能够自适应地对数据进行模式识别和分类的特点，实现对脑电信号的分类、识别和分析。大量研究证实，额叶皮层 alpha 功率与个体的创造性表现相关。因此，为考察机器学习技术在创造性思维领域对脑电信号进行分类的有效性。本研究对被试在进行替代用途任务（Alternative Uses Task, AUT）中的脑电信号进行机器学习分析。选取刺激出现后 1-22s 的时间窗口，使用功率谱密度(power spectral density, PSD)技术进行α频段的频域特征提取，分别采用支持向量机（support vector machine, SVM）、二次判别分析（Quadratic Discriminant Analysis, QDA）、逻辑回归（Logistic Regression, LogR）、决策树（Decision Tree）、梯度提升决策树（Xtreme Gradient Boosting, XGBoost）、轻量梯度提升机（Light Gradient Boosting Machine, LightGBM）的方法进行分类。结果发现对创造力高、低试次的分类准确率依次达到 76.50%、75.24%、74.37%、66.77%、72.34%、72.73%，对高创造力试次的分类准确性达到 83.40%、85.20%、86.54%、76.68%、80.71%、81.61%。这些结果表明，机器学习在创造力研究中不可忽视的潜力和巨大的发展空间。

Classification of EEG signals related to creative thinking based on machine learning

Hui Gao[1], Chunlei Liu[1] (corresponding author)
[1] School of Psychology, Qufu Normal University, Qufu 273165, China
Correspondence: liuchunlei@qfnu.edu.cn

Abstract: With the continuous improvement of artificial intelligence technology, the application of machine learning technology in the field of EEG signal is growing rapidly. electroencephalogram (EEG) is a low-cost, high-time-resolution neuroimaging technique that helps researchers gain insight into creative thinking. In the analysis of EEG signals, machine learning realizes the classification, recognition and analysis of EEG signals by making use of its characteristics of pattern recognition and classification of data. A large number of studies have confirmed that frontal cortex alpha power is related to individual creative performance. Therefore, in order to investigate the effectiveness of machine learning technology in classifying EEG signals in the field of creative thinking. In this study, the EEG electrical signals were analyzed by machine learning when the subjects were performing Alternative Uses Task (AUT). The time window of 1-22s after the occurrence of the stimulus was selected, and the frequency domain features of the α band were extracted using power spectral density (PSD) technology. support vector machine (SVM), Quadratic Discriminant Analysis (QDA) and Logistic Regression were used respectively. LogR), Decision Tree, Xtreme Gradient Boosting (XGBoost), Light Gradient Boosting Machine, LightGBM) method for classification. The results showed that the classification accuracy of high creativity and low creativity was 76.50%, 75.24%, 74.37%, 66.77%, 72.34%, 72.73%, respectively. The classification accuracy of high creativity tests reached 83.40%, 85.20%, 86.54%, 76.68%, 80.71%, 81.61%. These results show that machine learning has great potential and great room for development in creativity research.

人亦有言，进退维谷：基层干部的公共服务动机与两难困境研究

贺晓玲　刘海丽　周莹

南昌大学公共政策与管理学院心理学系 江西南昌 330031

摘 要 公共服务动机是指个人在内外部因素的影响下逐渐形成、长期存在的一种以公共利益为导向的服务他人和社会的思想和行为。本研究旨在深入研究基层干部在公共服务过程中所面临的两难困境，特别关注公共服务动机与亲社会性违规行为之间的关系，并探究道德辩护、组织容错和权力距离的影响机制。通过向广大基层干部发放调查问卷，共收集 427 份有效问卷数据，结果显示：公共服务动机不仅直接正向影响亲社会性违规行为，道德辩护和组织容错在公共服务动机与亲社会性违规行为之间起部分中介作用；通过 Process 宏程序的调节效应检验和简单斜率检验结果显示，随着权力距离的增大，公共服务动机对亲社会性违规行为的预测作用减弱，说明权力距离在公共服务动机与亲社会性违规行为之间起负向调节作用。本研究深入理解了基层干部在公共服务领域的难题,通过明确影响因素和作用机制，政府和相关部门可以采取措施，优化基层干部的工作环境和条件，提高他们的公共服务动机和行为质量，从而更好地满足人民群众日益增长的美好生活需要。

People also have words, Dilemma: Research on Public service motivation and dilemma of grassroots cadres

He Xiaoling　Liu Haili　Zhou Ying

School of Public Policy and Administration, Nanchang University, Nanchang, 330031

Abstract：Public Service Motive refers to a kind of thought and behavior of serving others and society with the public interest as the orientation, which gradually forms and exists for a long time under the influence of internal and external factors. This study aims to deeply study the dilemmas faced by grassroots cadres in the process of public service, paying special attention to the relationship between public service motivation and pro-social violations, and exploring the influence mechanism of moral defense, organizational fault tolerance, and power distance. A total of 427 valid questionnaires were collected from grassroots cadres. The results showed that public service motivation not only directly and positively affected prosocial transgressions, but also moral justification and organizational fault tolerance played a partial mediating role between public service motivation and prosocial transgressions. The results of Process Macro's moderating effect test and simple slope test show that with the increase of power distance, the predictive effect of public service motivation on prosocial transgression weakens, indicating that power distance has a negative moderating effect between public service motivation and prosocial transgression. This study has an in-depth understanding of the difficulties of grass-roots cadres in the field of public service. By clarifying the influencing factors and mechanism, the government and relevant departments can take measures to optimize the working environment and conditions of grass-roots cadres, improve their motivation and quality of public service, and better meet the growing needs of the people for a better life.

Keyword: Grassroots cadres; Public service motivation; Pro social violations; Moral defense; Organizational fault tolerance; Power distance

中国女大学生童年环境类型与放纵性态度及生育意愿的关系：基于生命史理论与潜在剖面分析的探索研究

陈羽[1]　徐华春[1]（通讯作者）

1 四川师范大学心理学院，成都，610066，Seanxu1981@163.com

摘 要　进化心理学的生命史理论认为童年环境在个体成长早期提供了一个未来可能环境的参照，使得个体发展出与之相适应的生命史策略。童年不良生活环境容易使个体形成以性成熟更早、对子女投入更少

为特点的快生命史策略。为进一步挖掘中国文化背景下童年环境的内涵，并探究其对“交配-养育”这一生殖策略的具体影响；本研究以 913 名中国女大学生为样本，采用以“个体为中心”的研究策略，利用潜在剖面分析（Latent Profile Analysis, LPA）的方法，首次尝试对童年生活环境的整体状态进行描述和比较，探测个体在童年环境压力、留守经历、养育方式的维度上，是否存在复杂的组合关系，形成不同的童年环境亚型。以及不同亚型对女性成年后具体生殖策略的影响。结果发现：（1）以童年环境不可预测性、童年环境严峻性、留守时长、开始留守的年龄、父亲参与教养和童年父母自主支持 6 个维度，可将女大学生的童年环境分为四种潜在类型：“良好陪伴型”、“晚留守型”、“典型留守型”和“短留守时长型”；（2）“短留守时长型”女大学生放纵性态度显著高于“典型留守型”女大学生；（3）“晚留守型”女大学生生育意愿及理想孩子个数显著高于其他三组。本研究首次将女性童年环境进行分类，并发现不同类别童年环境对个体生殖策略的影响，结合进化心理学生命史策略与中国传统文化观念进行相关讨论,为当代中国青年女性复杂矛盾的生殖行为模式提供阐释。

The relationship between childhood environment profiles and permissive sexual attitudes and fertility intentions among Chinese female college students: An exploratory study based on Life history theory and Latent Profile Analysis

CHEN Yu[1]　XU Hua-chun[1]

1. College of Psychology, Sichuan Normal University, Chengdu 610066, China

***Abstract*:** Life history theory based on evolutionary psychology suggests that individual differences in Reproductive Trade-offs are partially rooted in environmental conditions experienced early in life. Unfavorable childhood environments tend to predispose individuals to develop fast life history strategies characterized by more mating effort and less parenting effort. Based on a sample of 913 Chinese female university students, the present study adopted a “person-centered approach” by utilizing Latent Profile Analysis (LPA) to explore the different childhood environment subtypes of individuals in terms of the dimensions of childhood environmental stress, left-behind experiences, and parenting styles. We further explored the connotations of childhood environment in the Chinese cultural context, and explored its influence on the reproductive trade-off of "mating and parenting". Results: (1) According to the six dimensions of Childhood unpredictability, Childhood harshness, Time to start staying, Length of staying, father's involvement in parenting, and parental autonomy support in childhood, female college students can be categorized into four potential profiles: " Highly companionable childhood ", " Late start to stay ", " Typical left-behind type " and " Shorter length of stay ". (2) The permissive sexual attitudes of the " Shorter length of stay " female university students were significantly higher than those of the " Typical left-behind type ";(3) The fertility intentions and the Ideal number of children by the "late-staying-type" female university students are significantly higher than those of the other three profiles. This study is the first to categorize women's childhood environments and to find out the effects of different types of childhood environments on individual reproductive strategies. This study combines life-history theory with traditional Chinese cultural concepts to explain the complex and contradictory reproductive trade-offs among young women in contemporary China.

Keywords： Female college students, Life history theory, Childhood environments, Permissive sexual attitudes, Fertility Intention

情境线索对生育意愿的影响：共情情绪的作用

韦晓[1]（通讯作者） 王萍[1] 兰楠[1]

1 六盘水师范学院教育科学学院，六盘水市，553000，weixiao@snnu.edu.cn

摘 要 生育意愿通常被认为是一种深刻的、由生物学驱动的愿望，或者是基于权衡成本和收益的理性决定。基于这些概念，许多人认为生育意愿是稳定不变的。随着当今社会的发展，生育越来越成为个人决定，了解预测生育意愿的心理因素，以及这种意愿的可塑程度是当今社会的一个重要话题。鉴于有证据表明生育意愿可以预测随后的育儿结果，了解情境因素是否以及在多大程度上可能会改变生育意愿，将有助于揭示当前生育状况。为了确定情境线索（即观看积极或消极的亲子时刻）是否会唤起共情情绪和更大的生育意愿。本研究通过问卷+实验的方式测量了 488 名年轻人（18-40 岁）观看积极亲子时刻的描述（相对于成人独处的时刻）是否会通过增加共情情绪来增加他们的生育意愿。其次，研究还比较了积极亲子时刻和消极的亲子时刻的影响。结果发现，（1）生育意愿很容易被情境线索所改变，例如描绘父母和孩子的积极形象的句子、图片或视频；（2）积极的亲子形象会增强个体共情情绪，从而导致年轻人更渴望生孩子；（3）消极的亲子形象也会减少想要孩子的愿望。研究结果表明，父母和孩子的亲子形象可能会影响年轻人生孩子的愿望。当年轻人看到父母和可爱孩子的亲子时刻时，他们会更渴望拥有自己的孩子，部分原因是这些图像让他们产生共情、富有同情心和关怀。

关键词 生育意愿，共情情绪，情境线索

The Impact of Contextual Clues on Fertility Intention: The Role of Empathy

Wei Xiao[1] (corresponding author) Wang Ping[1] Lan Nan[1]

[1] School of Education Science, Liupanshui Normal University, 553000, weixiao@snnu.edu.cn

Abstract: Fertility intention is often considered a profound, biologically driven desire, or a rational decision based on weighing costs and benefits. Based on these concepts, many people believe that fertility intention is stable and unchanging. With the development of today's society, childbirth has increasingly become an individual decision. Understanding the psychological factors that predict fertility intentions and the degree of plasticity of such intentions is an important topic in today's society. Given the evidence that fertility intention can predict subsequent parenting outcomes, understanding whether and to what extent situational factors may alter fertility intention will help reveal the current fertility status. To determine whether situational cues (i.e., viewing positive or negative parent-child moments) will evoke empathy and greater willingness to conceive. This study measured

whether 488 young people (18-40 years old) who watched descriptions of positive parent-child moments (compared to when adults were alone) would increase their willingness to conceive by increasing empathy through a questionnaire and experiment. Secondly, the study also compared the impact of positive parent-child moments with negative parent-child moments. The results showed that (1) fertility intention is easily altered by contextual cues, such as sentences, pictures, or videos depicting positive images of parents and children; (2) A positive parent-child image can enhance individual empathy, leading to younger people being more eager to have children; (3) Negative parent-child images can also reduce the desire to have children. The research results indicate that the parent-child image of parents and children may affect the wishes of young children in life. When young people see the parent-child moments of their parents and lovely children, they are more eager to have their own children, partly because these images create empathy, empathy, and care.

Keywords：fertility intention, empathy, contextual cues

心理调节对社区多元化调解的影响：一个有调节的中介模型

丁宁[1] 李常旭[2] 刘雨桐[3]

1 吉林师范大学教育科学学院心理学系，吉林四平，136000

2 长春康林心理医院，吉林长春，130000

3 哈尔滨师范大学教育科学学院心理系，黑龙江哈尔滨，150000，liuyutong1214@163.com

摘要：社区多元化调解不仅是国家治理体系和治理能力现代化的重要内容，也是“平安中国”建设的重要方面。作为化解社区冲突和维护社会稳定的一种新型调解思路，多元化调解在国内许多社区的民众调解实践中已经产生了积极的成效。在众多社区多元化调解案例中，心理调节被尝试使用。为探索心理调节对社区多元化调解的影响机制，本研究选择 5 个社区的 43 件调节案例进行研究，其中采用心理调节的案件共有 18 件。采用问卷法，邀请居民对工作人员态度、调解方法的接纳程度、调解难度、调解结果满意度以及调解过程满意度进行打分；邀请社区工作人员对案件调节难度进行打分。采用 PROCESS 4.2 宏程序进行了有调节的中介模型检验（Model 12），结果如下：1.被调解者在有心理调节参与时对工作人员的态度、接纳调解方法的程度、对调解结果和调解过程的满意度都相对较高，同时调解次数和调解难度也都更高（$t= 8.52, p < .001$；$t= 1.69, p < .05$；$t = 2.93, p < .001$；$t= 2.67, p < .001$；$t= 2.12, p < .05$；$t= 2.09, p < .05$）。2.当引入心理调节参与和调解难度后，工作人员态度与心理调节参与的交互效应对调解方法接纳程度产生显著影响（$b = 1.31, p < .001$）。工作人员态度与调解难度的交互效应对被调解人整体满意度的影响显著（$b = 1.31, p < .001$）。3.在调解难度为中等水平时，心理调节参与显著调解了对调解方法接纳程度在工作人员态度与调解结果满意度之间的间接影响（Index= -1.92，95%CI=[-5.07, -.11]）。4.在有心理调节参与时，只有在难度适中时，工作人员态度才显著影响调解整体满意度（effect = 2.14, 95%CI = [.66, 3.63]）。本研究发现，心理调节能够有效提升中等调节难度的社区矛盾事件，但社区多元化调解过程更倾向于将难度较高或陈年旧案交由心理调节参与的社区多元化调解的案例中。心理调节能够有效提升工作人员的工作态度进而更好的为居民排忧解难，也能够提升居民对于调节方案的认可程度。本研究为有心理调节参与的社区多元化调解提供了一定的使用参考。为有效化解社区居民矛盾提供了一定的方法借鉴。

The effect of psychological adjustment on community pluralistic mediation: a moderated mediation model

Ding Ning1 LiChangxu2
1 Jilin Normal University
2 Changchun Kanglin Mental Health Hospital
3 Harbin Normal University

Abstract：Community pluralistic mediation is not only an important part of the modernization of the national governance system and governance capacity, but also an important aspect of the construction of "Peaceful China". As a new mediation idea to resolve community conflicts and maintain social stability, pluralistic mediation has produced positive results in the practice of civil mediation in many communities. Psychological adjustment has been tried in many community pluralistic mediation cases. In order to explore the influence mechanism of psychological adjustment on community pluralistic mediation, this study selected 43 mediation cases from 5 communities to study, of which 18 cases used psychological adjustment. By using questionnaire, residents were invited to rate the attitude of the staff, the acceptance of the mediation method, the difficulty of mediation, the satisfaction of the mediation result and the satisfaction of the mediation process. Community staff were invited to rate the difficulty of case adjustment.The mediated Model test (Model 12) was conducted using PROCESS 4.2, and the results are as follows:1. The mediatee's attitude towards the staff, the degree of acceptance of the mediation method, the satisfaction with the mediation result and the mediation process are relatively high when they are involved in psychological adjustment, and the frequency and difficulty of mediation are also higher (t= 8.52, p < .001； t= 1.69, p < .05； t = 2.93, p < .001； t= 2.67, p < .001； t= 2.12, p < .05； t= 2.09, p < .05). 2. When psychological adjustment participation and mediation difficulty are introduced, the interaction effect of staff attitude and psychological adjustment participation has a significant impact on the acceptance degree of mediation methods (b = 1.31, p < .001). The interaction effect of staff attitude and mediation difficulty has significant influence on the overall satisfaction of the mediates (b = 1.31, p < .001). 3. When the mediation difficulty was moderate, psychological adjustment participation significantly mediated the indirect impact of acceptance of mediation methods on staff's attitude and satisfaction with mediation results (Index= -1.92，95%CI=[-5.07, -.11]). 4. When psychological adjustment was involved, staff attitude significantly affected the overall satisfaction of mediation only when the difficulty was moderate (effect = 2.14, 95%CI = [.66, 3.63]). This study found that psychological adjustment can effectively improve community conflict events with moderate adjustment difficulty, but the community pluralistic mediation process is more inclined to assign difficult or old cases to the community pluralistic mediation cases involving psychological adjustment. Psychological adjustment can effectively improve the working attitude of the staff to better solve the problems for the residents, and also improve the recognition of the residents for the adjustment plan. This study provides some reference for community pluralistic mediation involving psychological adjustment. It provides some methods for reference to effectively resolve the contradictions of community residents.

Key words: community pluralistic mediation, psychological adjustment, mediation satisfaction, mediation model, mediator model

认知接种对网络错误信息相信度的影响：

自信心、策略习得能力的作用

王碧涵[1] 陆辰[1] 张梦蕾[2] 王俭勤[1]（通讯作者）

1 复旦大学社会发展与公共政策学院，上海，200433，通讯作者 wjq@fudan.edu.cn

2 东北师范大学心理学院，长春，130000

摘 要 新媒体时代，人们日常会接触到大量错误信息，媒体上的大量虚假夸大、渲染情绪的错误信息往往拥有更高的曝光量，干扰了个人对真相和事实的判断，扰乱了社会秩序。错误信息难以更正很大程度上是因为无法对更正信息进行有效加工。因此，提升个人识别错误信息的能力，可以从源头最大可能地减少错误信息的扩散，降低错误信息带来的不良影响。认知接种(Inoculation)是近年来兴起的一种针对错误信息的广谱性认知干预手段，被试通过接触关于编造错误信息的常用策略，减少其对一般性错误信息的相信度，从而提高对错误信息的辨别能力。

本研究基于接种理论，在梳理和分析关于错误信息影响因素的基础上，开展了一项预实验和两个正式实验。预实验基于国外已有范式并结合中国社会中的主要谣言类型和谣言编造策略，设计开发了本土化的认知接种程序，并通过可用性测试提高了程序的易用性。实验一采用 2（认知接种：有，无）×2（测量时间：前测，后测）的混合实验探索认知接种抵抗错误信息的有效性。结果发现，基于本土化的认知接种程序能够有效降低大学生对错误信息的相信度。

实验二在实验一的基础上进一步考察认知接种降低错误信息相信度的机制。结果显示，接种可以降低被试对错误信息的相信度，且不会降低被试对正确信息的相信度；相比对照组，接种组的威胁感知更高。此外，被试对错误信息的判断信心、对错误信息编造策略的习得能力可以预测接种游戏抵御错误信息的效果。最后，结果发现控制组被试的判断信心低于实验组，可能表明他们在一定程度上意识到他们使用的信息是模棱两可的。

综上，本研究基于接种理论，开发了本土化的降低错误信息相信度的认知接种程序，并探究了自信心、策略习得能力在认知接种中的作用。该研究发现拓展了认知接种抵抗错误错误信息的解释范围，深化了对认知接种机制的认识，丰富了错误信息防治策略。

Using Inoculation Technology against Online Misinformation:

The Role of Confidence and Learning Strategy

Bihan Wang，Chen Lu，Menglei Zhang，Jianqin Wang*

Department of Psychology，Fudan University, 220 Handan Road, 200433, Shanghai

Northeast Normal University school of psychology, 5268 Renmin Road, 130024, Changchun

Abstract：In our digital age, misinformation is pervasive and disruptive. Addressing this, our study, based on inoculation theory, explored cognitive strategies to mitigate the impact of misinformation. We conducted a pre-experiment and two main experiments. The pre-experiment developed a localized cognitive inoculation program, tailored to Chinese society's misinformation types and fabrication strategies.

Our first experiment revealed that this program significantly reduced university students' belief in misinformation. The second experiment further elucidated the mechanism behind this reduction. The results indicated that inoculation lessens belief in misinformation without affecting belief in accurate information. Subjects' confidence in judging misinformation and their strategy acquisition ability were key predictors of the inoculation's effectiveness.

Overall, this research deepened understanding of the mechanisms behind cognitive inoculation against misinformation and provided new insights for misinformation prevention strategies.

为何要“德才兼备”？

--以说谎行为为例

潘雅洁[1,2]　夏丽帕·艾尔肯[1,2]　刘毅[1,2]（通讯作者）

1 新疆心智发展与学习科学重点实验室，乌鲁木齐，830017

2 新疆师范大学心理学院，乌鲁木齐，830017，nyliuyi@sina.com

摘　要　创造力是学校教育的重要目标，具备高创造力是个体和社会的普遍愿景。通常情况下，创造力与积极的形象和价值相联系，也有研究者关注到创造力的“阴暗面”，如创造力对说谎行为有正向预测作用，然而创造力对说谎行为的影响机制目前还并不清楚。本研究以高中生为研究对象，通过两个研究，尝试回答两个问题：（1）高创造力者为何有更多说谎行为？（2）高创造力者是否必然有更多说谎行为？

实验 1 共招募 114 名高中生被试，通过远距离联想测验以测量个体的创造力、帮助编造圆谎理由测量个体的说谎能力、说谎量表测量个体的说谎行为。结果显示，创造力对说谎行为具有显著的正向预测作用，说谎能力在创造力与说谎行为的关系中起显著的中介作用。实验 2 采用 2（创造力：高创造力组 / 低创造力组）× 2（道德推脱：高道德推脱组 / 低道德推脱组）被试间设计，共招募 124 名高中生参与实验，通过自我损耗任务操纵个体的创造力，通过道德推脱量表对个体的道德推脱动机进行分组，说谎行为通过经典数字矩阵任务进行测量。结果显示，对低道德推脱组，高、低创造力组的说谎行为无显著差异，而对高道德推脱组，高创造力组的说谎行为显著高于低创造力组。

本研究的结果表明，高创造力者有更强的说谎能力（如：编造更令人信服的理由）可能是其有更多说谎行为的重要原因，然而创造力对说谎行为的影响还受到道德推脱的调节，即创造力显著增加了高道德推脱组的说谎行为，但并不会提高低道德推脱组的说谎行为，验证了影响个体行为的“能力+动机”假设。另一方面，本研究的结果对在人才培养中必须重视“德才兼备”提供了理论和实证支持。

关键词　创造力，说谎行为，说谎能力，道德推脱

Why should we “have both moral integrity and talent”?

--Taking lying behavior as an example

Yajie Pan
The Key Laboratory of Mental Development and Learning Science of Xinjiang, Urumqi

Abstract： Creativity is an important goal of school education, and having high creativity is a universal vision for individuals and society. Usually, creativity is associated with positive images and values, and some researchers have focused on the "dark side" of creativity. For example, creativity has a positive predictive effect on lying behavior. However, the mechanism by which creativity affects lying behavior is currently unclear. This study focuses on high school students and attempts to answer two questions through two studies: (1) Why do highly creative individuals exhibit more lying behavior? (2) Are highly creative individuals bound to have more lying behaviors?

In Experiment 1, a total of 114 high school students were recruited to measure their creativity through Remote Association Tests(RAT), assist in fabricating false excuses to measure their lying ability, and measure their lying behavior using a Lie Scale. The results show that creativity has a significant positive predictive effect on lying behavior, and lying ability plays a significant mediating role in the relationship between creativity and lying behavior. Experiment 2 adopts 2 (creativity: high creativity group/low creativity group) × 2 (moral disengagement: high moral disengagement Group/low moral disengagement Group) between-subjects design, a total of 124 high school students were recruited to participate in the experiment. Individual creativity was manipulated through ego depletion tasks, and individual moral disengagement motivations were grouped using the Moral Disengagement Scale. Lying behavior was measured using classical number matrix tasks. The results showed that there was no significant difference in lying behavior between the low moral disengagement group and the high and low creativity groups, while for the high moral evasion group, the lying behavior of the high creativity group was significantly higher than that of the low creativity group.

The results of this study indicate that the stronger lying ability of highly creative individuals (such as fabricating more convincing reasons) may be an important reason for their more lying behavior. However, the impact of creativity on lying behavior is also moderated by moral disengagement, that is, creativity significantly increases the lying behavior of the high moral disengagement group, but does not increase the lying behavior of the low moral disengagement group, Verified the hypothesis of "ability and motivation" that affects individual behavior. On the other hand, the results of this study provide theoretical and empirical support for the importance of "possessing both moral integrity and talent" in talent cultivation.

童年与家养犬关系对生育意愿的影响:亲代养育倾向的中介作用与人际信任的调节作用

邱兰钧[1] 葛佳洋[1] 徐华春[1]（通讯作者）
1 四川师范大学心理学院，四川 成都，610068，Seanxu1981@163.com

摘 要 生育问题一直是社会关注的热点，其中生育意愿是人们对于生育活动的一种愿望表达形式，与生育结果有着紧密联系。生态环境理论认为，个体童年时期的成长环境及经历会对其生育意愿现状产生影响，并且这种影响是长期存在的。在个体童年时期的家庭中拥有家养犬的现象普遍，人犬关系为个体身心健康带来的积极影响众多，养育情感的提升是其带来的益处之一。而生育和养育是密切相关的，与家养犬的有效互动及对其的照料行为会促进个体亲代养育倾向的提升。进化心理学的理论观点认为，亲代养育倾向是人类为促进后代传递而出现的养育系统，对个体的生育意愿有积极作用。此外，人际信任是个体的一种心理品质或者是对他人的一种期待，在个体人际交往中所形成的人际信任水平高低会影响个体采取风险性行为水平的高低，进而会对其生育态度带来一定影响。因此，本研究基于个体童年时期饲养经历的视角，探讨个体童年时期与家养犬关系质量与其生育意愿现状之间的联系，以及人际信任在这当中产生的作用机制。采用莫纳什狗-主人关系问卷、生育意愿题项、广义人际信任问卷及亲代养育与柔情问卷，对童年时期有且仅饲养过犬类动物经历的大学生群体发放问卷 540 份，最后回收有效问卷 483 份。结果显示：（1）童年与家养犬关系和个体的生子欲望、理想子女数显著正相关，和个体理想生育年龄显著负相关；（2）亲代养育倾向在童年与家养犬关系和生子欲望、理想子女数及理想生育年龄间起部分中介作用；（3）人际信任调节童年与家养犬关系对理想子女数及理想生育年龄影响的后半段路径。具体而言，当人际信任水平相对较高时，亲代养育倾向对理想子女数与理想生育年龄的预测作用更强。可见，研究从童年与家养犬关系进一步验证对生育意愿的影响，揭示了亲代养育倾向的中介作用和人际信任的调节作用，对个体产生积极的生育态度带来启示。

The effect of childhood relationship with the domestic dog on fertility intentions: The mediating role of parental care motivation and the moderating role of interpersonal trust

Qiu Lanjun [1]Ge Jiayang[1] Xu Huachun[1](Corresponding author)
[1] College of Psychology, Sichuan Normal University, Chengdu, China

Abstract： Fertility has always been a major social concern, and fertility intentions are a form of expression of people's desire to have children and are closely linked to fertility outcomes. Ecological theory suggests that the environment and experiences of an individual's childhood have an impact on his or her current fertility intentions and that this impact is long-lasting. It is common for individuals to have a domestic dog in their childhood home and the relationship between dog and human has many positive effects on an individual's physical and mental health, with the enhancement of nurturing emotions being one of the benefits. As fertility and nurturing are closely linked, effective interactions with and care for domestic dogs promote an individual's propensity for parenting. Evolutionary psychology theory that parenting is a nurturing system that emerges in humans to facilitate the transmission of offspring, contributing to an individual's willingness to have children. In addition, interpersonal trust is a psychological quality or an expectation of others, and the level of interpersonal trust developed during an individual's interpersonal interactions affects the level of risky behaviors adopted by the individual, which in turn has an impact on the individual's attitude toward reproduction. This study therefore examined the relationship between the quality of one's childhood relationship with a domestic dog and one's current fertility intentions and the mechanisms by which interpersonal trust was involved, based on one's childhood ownership experiences. The

Monash Dog Owner Relationship Questionnaire, the Fertility Intentions Questionnaire, the Generalised Interpersonal Trust Questionnaire, and the Parenting and Tenderness Questionnaire were used for 540 questionnaires distributed to a group of college students who had and had only had the experience of owning canine animals during their childhood, and 483 valid questionnaires were collected at the end of the study. The results showed that: (1) Childhood relationships with domesticated dogs positively predicted individuals' desire to have children, the ideal number of children and negatively predicted ideal age of childbearing; (2) Intergenerational parenting tendencies partially mediated the relationship between childhood domestic dog relationships and desire to have children, ideal number of children and ideal age of childbearing; (3) Interpersonal trust moderates the second half of the pathway between childhood and domestic dog relationships on ideal number of children and ideal age at childbearing. Specifically, when the level of interpersonal trust was relatively high, parenting tendencies were stronger predictors of the ideal number of children and the ideal age of childbearing. As can be seen, the study further validated the effects on fertility intentions from childhood relationships with domestic dogs, revealing the mediating role of parental care motivation and the moderating role of interpersonal trust, which shed light on the development of positive fertility attitudes in individuals.

本体安全感威胁对文化混搭产品评价的影响：一个有调节的中介模型

王单[1]（通讯作者）

成都理工大学产业技术学院，宜宾，645151，1059162998@qq.com

摘要　各国经济的发展和全球化进程的加快，社会制度、物质环境发生一系列变化，打破了人们以往的生活节奏，恐慌的人们常常会陷入一种本体不安全的状态，感受到来自本体安全感的威胁。本研究以本体安全感理论和恐惧管理理论为基础，探讨本体安全感威胁、感知文化入侵、人格开放性与文化混搭产品评价之间的关联，揭示影响文化混搭产品评价的内在心理机制。

预实验 a，为检验文字启动材料的有效性，将 76 名被试分为本体安全感威胁实验组和对照组，完成一项相应的阅读任务。结果表明：实验组被试的本体安全感威胁得分显著高于对照组，这意味着文字材料启动有效。预实验 b，考察文化混搭产品图片材料的有效性。共招募了 70 名被试，分别对图片的神圣性、产品喜爱度、是否为文化混搭三个方面进行评分。最终，成功地筛选出了 2 张非神圣性的中性文化混搭产品图片，作为后续研究的材料。

研究一 a，使用本体安全感威胁量表、感知文化入侵量表和语义差异量表对 590 名被试进行问卷调查；结果表明：特质性本体安全感威胁可以负向预测文化混搭产品评价，感知文化入侵在两者间起部分中介作用。研究一 b：为增强研究结果的稳健性，采用单因素被试间实验设计，将 240 名被试随机分为本体安全感威胁的实验组和控制组，完成特定的阅读任务后，呈现 2 张文化混搭产品的图片，并对其进行打分；结果显示：状态性本体安全感威胁也可以负向预测文化混搭产品评价，感知文化入侵在两者间起部分中介作用。

研究二，为了探析本体安全感威胁与感知文化入侵、文化混搭产品评价间关系的边界条件，探讨了人格开放性在中介模型中的调节作用；选取 268 名被试，采用 2（本体安全感威胁：实验组 vs 控制组）x2（人格开放性：高 vs 低）的被试间实验设计；结果表明，高人格开放性缓冲了本体安全感威胁对感知文化入侵和文化混搭产品评价的负面影响。

结论：感知文化入侵在本体安全感威胁与文化混搭产品评价中起部分中介作用，并且人格开放性在中介模型前半段路径与直接路径中起调节作用。

关键词：本体安全感威胁，感知文化入侵，文化混搭，产品评价，人格开放性

同伴群体地位等级性对青少年孤独感的影响：文化的调节作用和同伴支持的中介作用

摘 要 同伴群体地位等级性反映了同伴群体中个体权利和地位的分布，是同伴群体中的一种自然且普遍的现象。以往研究发现，地位等级性能够影响青少年的心理与行为适应，然而研究结果并不一致。一方面，从功能主义的视角来看，清晰的地位等级性可以提高群体内关系的稳定性，进而促进青少年之间的支持和帮助，提高个体的心理适应水平；另一方面，“权力平衡”视角提出，地位的不平等会导致群体内的冲突增加，欺负和受欺负现象频频发生。同伴群体作为一个微观系统嵌套在宏观系统文化中，其功能和作用机制很有可能存在文化差异。集体主义强调服从地位等级和维护集体利益，而个人主义重视地位平等和个人利益。基于此，本研究旨在同伴群体地位等级性对青少年孤独感的影响是否会受到文化背景的影响，以及青少年感知到的同伴支持是否会在同伴群体地位等级性和孤独感之间起中介作用。研究采用两个时间点的纵向研究设计，选取 787 名中国学生（M_{age} = 12.55 years, SD = 1.59）和 1033 名加拿大学生（M_{age} = 11.81 years, SD = 1.53）为研究对象，采用自我报告方式测量青少年感知到的同伴群体地位等级性、同伴支持以及孤独感。研究发现：（1）在控制了 T1 孤独感、青少年的性别和年龄后，T1 同伴群体地位等级性对 T2 孤独感的预测受到文化背景的调节；（2）文化的调节作用可以被青少年感知到的同伴支持所解释。具体来说，对于中国青少年，同伴群体中清晰的地位等级性能够增加群体内同伴支持，进而减少孤独感；对于加拿大青少年，同伴群体中地位等级性越清晰，反而会减少群体内同伴支持，进而影响其孤独感。本研究结果表明，在不同文化背景下地位等级性对青少年适应的影响是不同的，这提示我们在探讨儿童青少年同伴环境对其适应的影响时应关注社会和文化背景的重要性。

4 Graduate School of Education, University of Pennsylvania, Philadelphia, Pennsylvania, USA

Abstract: Peer group hierarchy represents the distribution of power and dominance in the adolescents' peer group. The emergence of status hierarchies within human peer groups is considered a natural and pervasive phenomenon, but its effect on individuals behavioral and psychological adjustment is controversial. On the one hand, from the functionalist perspective, studies have underlined the virtues of status hierarchies; they appear to promote intra-group support and decrease the psychological maladjustment by enhancing the predictability and stability of social relationships. On the other hand, a growing body of research supports the "balance-of-power" view by showing status inequality within peer group, is associated with victimization, bullying, and other violent behaviors. From the bio-ecological theory, adolescents are embedded within multi-layered ecological systems that encompasses both the immediate micro-level peer group environment (e.g., group status hierarchy) and the larger, macro-level societal and cultural contexts. In societies with vertical-collectivism, such as China, puts great emphasis on obedience to group norms and status hierarchy as well as sacrifices their own interests for the collective well-being, whereas in societies with egalitarian-individualism, such as Canada, focus on equality of status and self-benefits. Therefore, the present studies aimed to explore whether the direct effect of group status hierarchy on loneliness and the mediating process may be moderated by the culture by using longitudinal design. At wave 1, a total 1,820 children in Grades 4 to 8 from Shanghai, P.R. China (n = 787, 343 girls; M_{age} = 12.55 years, *SD* = 1.59) and Ontario, Canada (n = 1,033, 589 girls; M_{age} = 11.81 years, *SD* = 1.53) were recruited in 2009-2010. Adolescents reported on their perceived group status hierarchy, peer support and loneliness. The results indicated that: (1) After controlled T1 loneliness, gender and age, the culture moderated the effect of T1 group status hierarchy on T2 loneliness; (2) The moderator effects of culture partial through the mediating effect of peer support. Specifically, for Chinese adolescents, higher group status hierarchy can promote peer support, and further decreased their loneliness, whereas for Canadian adolescents, higher group status hierarchy can reduce peer support, which in turn fosters strong feelings of loneliness. These findings highlight the importance of considering social and cultural contexts when examining the implications of children's peer group structure.

中华优秀传统文化融入现代心理治疗的理论与实践研究

王壮生

山东省滨州医学院大学生心理健康中心，烟台，264000，邮箱：514441609@qq.com

摘 要 在中华优秀传统文化和临床心理实践基础上，采用从具体现象中提炼出认识现象的概念，然后不断地在具体事物里去核实的方法，定性研究与定量研究相结合，借鉴西方人格特质理论的模式,中国本土人格五分法总结出三个人格维度,五种典型人格类型，（见图1）。

图1：中国本土人格五分法维度类型

五种人格类型与中华优秀传统文化有着密切的关系，一型人格个体利用儒家思想,“儒表法内”,二型人格个体践行儒家思想，三型人格类型个体没有真正理解不会灵活运用儒家思想，四型人格类型个体不肯遵守甚至践踏儒家思想，五型人格类型个体信奉无为的道家思想,（见图2）。

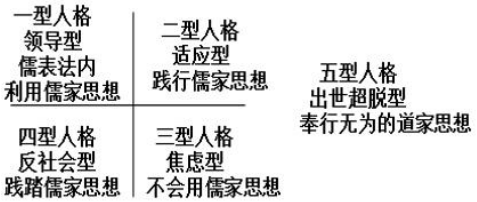

图2：五种人格类型与传统文化的关系

一型、二型人格行为既符合社会要求同时又满足主体需要，是健康人格。四型人格行为在满足主体需要的同时与社会规范背道而驰是反社会人格，三型人格行为符合社会规范与个体主观需要相违背，是焦虑型人格。中国本土人格五分法能够解释某些异常人格的发病机制，利用五分法的转化性特征运用一定技术可以将三型、四型人格分别向二型、一型人格转化，中国本土人格五分法可以为中华优秀传统文化融入现代心理治疗提供理论基础。

以中国本土人格五分法为理论依据，借鉴西方认知行为理论的技术创立的儒家认知行为疗法，三型人格个体压抑、敏感、完美、退缩、缺乏主见，情绪不稳定，是本疗法的主要适应症。儒家认知行为疗法运用访谈、观察、自编量表对来访者进行定性、定量评估，结合具体事情就事论事，发掘不良认知，给予实时分析辨别。通过行为技能训练和模仿训练引导三型人格个体合理拒绝，自主不臆断，不怕误会，以直报怨，正确对待失误，培养兴趣爱好等。在儒家优秀传统文化氛围下引导三型人格个体构建相对正确的认知行为方式，培养良好的行为，“不忧不惧，知天知命”，提高社会适应能力，促进心身健康。

当代中国人君子人格：理论构成和心理学测量

郑尧[1]　侯玉波[2]（通讯作者）

1 北京大学 心理与认知科学学院，北京，100871

2 北京大学 心理与认知科学学院，北京，100871，通讯作者 E-mail（houyubo@pku.edu.cn）

摘 要　君子人格自古便是儒家思想中的理想人格典范，是中华优秀传统文化的一部分。然而，随着时代的变迁和历史文化的演进，当代中国人的君子人格在继承古代思想传统的基础上，同时受到来自现代西方人格理论和研究范式的影响，表现出明显的人格特质类型。因此，本研究试图从中国社会变迁的视角，运用扎根理论中的文本分析和深度访谈等质性研究方法，探索当代中国人君子人格的现实内涵和理论构成(研究 1; *N*=30); 并结合现代心理学实证科学的方法对当代君子人格的结构要素进行了探索性和验证性的因素分析，最终编制了信效度良好的当代君子人格测量工具(研究 2; *N*=1316)。研究发现数据分析与理论模型结果基本一致, 当代君子人格主要由精神、道德、行为、情绪和认知这五个维度构成，分别命名为“精神追求”、“道德修养”、“处世智慧”、“积极情绪”和“理性思维”；且各维度间不是完全独立而是相互依存的关系，即两两之间均存在显著的正相关关系。此外, 校标关联效度分析结果显示：当代君子人格中除认知维度外，其余各维度均与孔子思想中的君子人格及其维度(智仁勇、恭而有礼、喻意怀德、有所不为、持己无争)存在显著正相关；当代君子人格及其维度与西方大五人格中除神经质以外的其余各维度(外向性、宜人性、尽

责性和开放性)均存在中等程度的正相关；与主观幸福感指标(如生活满意度、积极和消极情感、自尊等)也存在相关关系。

The Contemporary Chinese Junzi Personality: Theoretical Construct and Psychological Measurement

Yao Zheng[1]，Yubo Hou[2] (Corresponding Author)
School of Psychological and Cognitive Sciences and Beijing Key Laboratory of Behavior and Mental Health, Peking University, No.5 Yiheyuan Road, Haidian District, Beijing, 100871

Abstract: Junzi personality has been the ideal personality model of Confucianism since ancient times and is a part of the excellent Chinese traditional culture. However, with the change of eras and the evolution of history and culture, junzi personality for contemporary Chinese people shows obvious personality trait types on the basis of inheriting the ancient ideological tradition and being influenced by the modern Western personality theory and research paradigm. Therefore, this study attempts to explore the current connotation and composition of the contemporary Chinese junzi personality from the perspective of China's social changes, by using the qualitative methods of text analysis and in-depth interviews according to the Grounded Theory (Study 1; *N*=30); Combined with the empirical-based method of modern psychology, this study makes the exploratory and confirmatory factor analysis on the inner structure of the contemporary junzi personality, and finally develops a measurement tool of the contemporary junzi personality with good reliability and validity (Study 2; *N*=1316). The results from the data analysis are basically consistent with the theoretical model, and it is believed that the contemporary junzi personality is mainly composed of five dimensions, which are named the "Spiritual Pursuit" (spiritual dimension), "Moral Cultivation" (moral dimension), "Interpersonal Intelligence" (behavioral dimension), "Positive Emotion"(emotional dimension) and "Rational Cognition" (cognitive dimension) respectively; and each dimension is not purely independent but interdependent from one another, which means there is a significant positive correlation between every two factors of junzi personality. In addition, results from the criterion-related validity analysis demonstrate that dimensions of the contemporary junzi personality, except for the cognitive dimension, were significantly positively correlated with the dimensions of junzi personality from Confucius' thoughts ("wisdom, benevolence, and courage", "respectfulness and propriety", "conversancy with righteousness and cherishment of benign rule", "refraining from what should not be done", and "self-cultivation rather than contentions with others"). The contemporary junzi personality are also positively correlated with the Big-Five personality model and its dimensions (Extraversion, Agreeableness, Conscientiousness, and Openness) at a moderate level except for its negative link with Neuroticism. Last, junzi personality also has a correlation with the subjective well-being indicators (e.g., life satisfaction, positive and negative emotions, and self-esteem, etc.).

Keywords: the connotation and structure of junzi personality, Chinese traditional culture, indigenous psychology, personality measurement

道德概念中的水平空间隐喻效应探究：来自行为与 ERP 的证据

赵欣璐[2]　许苏薇[2]　刘拓[1,2,3]（通讯作者）

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387
2 天津师范大学心理学部，天津，300387

通讯作者: liutuo@tjnu.edu.cn

摘 要 道德的空间隐喻是以空间位置概念为始源域向以抽象道德概念为代表的目标域映射的过程。以往研究已经分别从垂直和水平两个空间维度对道德概念空间隐喻进行了探究，并在垂直维度上得到了较为一致的结论。在水平维度，前人研究普遍认为道德概念与右侧空间，不道德概念与左侧空间存在隐喻联结，但从文化视角来看，虽然西方国家因宗教等原因普遍贬“左”崇“右”，但在中国文化中，“左”和“右”并无褒贬之分而是更多应用在中性语境中。因此，少数学者认为汉语中的左右空间与道德效价之间可能并不具有相应的联结。那么，在汉语语境下，道德概念中是否存在水平空间隐喻效应呢？为回答以上问题，本研究设置两个实验分别从行为和认知神经层面对道德概念的水平空间的隐喻效应进行探究。实验一采用空间 Stroop 范式，招募 31 名大学生，采用 2(词汇类型：道德词汇、不道德词汇)×2(水平位置：左、右)的两因素被试内设计，探讨道德概念与水平方位之间是否具有隐喻联结。结果发现：词汇类型与词汇呈现方位之间的交互作用不显著($p > 0.05$)，即被试对左侧或右侧呈现的道德词或不道德词的反应时没有显著差异，结果未验证水平隐喻现象的存在。实验二以 36 名在校学生为被试，同样采用空间 Stroop 范式，并进一步结合事件相关电位技术(Event Related Potential, ERP)考察被试在词汇加工过程中的大脑电位活动的变化。结果发现：一致条件（道德词出现在屏幕右侧或不道德词出现在左侧）和不一致条件（道德词出现在屏幕左侧或不道德词出现在右侧）下，P300，N200 和 N400 的激活程度均无显著差异($ps > 0.05$)，脑电结果未能验证水平隐喻效应的存在。综合两个实验结果表明，汉语道德概念词中不存在水平空间隐喻效应($BF_{01}s > 54.48$)，个体不会以左右位置为参照来表征道德概念。本研究首次将 ERP 技术应用于道德的水平空间隐喻研究，在一定程度上为已有的道德概念隐喻和具身道德认知研究提供了新的实证参考。

Horizontal Spatial Metaphor Effects in Moral Concepts: Evidence from Behavior and ERPs

Xinlu Zhao[2] Suwei Xu[2] Tuo Liu [1,2,3] (Corresponding author)

***Abstract*:** The spatial metaphor of morality is a process of mapping the spatial location concept as the origin domain to the abstract moral concept as the target domain. Previous studies have explored the spatial metaphor of moral concepts from both vertical and horizontal dimensions, and have reached relatively consistent conclusions on the vertical dimension. In the horizontal dimension, it is generally concluded that moral concepts are metaphorically linked to the right space and immoral concepts to the left space, However, from a cultural perspective, although Western countries generally belittle "left" and favor "right" due to religious reasons, in Chinese culture, "left" and "right" are not either positive or negative, but are more commonly used in neutral

contexts. Therefore, a few scholars have suggested that there may not be a corresponding link between left-right space and moral valence in Chinese. Then, does the horizontal space metaphorical effect of moral concepts exist in the Chinese context? To answer the above questions, the present study conducted two experiments to explore the metaphorical effects of the horizontal space of moral concepts from the behavioral and cognitive neural levels. Experiment 1 utilized a spatial Stroop paradigm and recruited 31 college students to explore whether there is a metaphorical link between moral concepts and horizontal orientation using a two-factor within-subjects design of 2 (vocabulary type: moral vocabulary, immoral vocabulary) × 2 (horizontal location: left, right). It was found that the interaction between vocabulary type and vocabulary presentation orientation was not significant ($p > 0.05$), i.e., there was no significant difference when subjects responded to moral or immoral words presented on the left or the right, and the results did not validate the existence of the horizontal metaphor phenomenon. Experiment 2 used 36 school students as subjects, also using the spatial Stroop paradigm, and further combined with the Event Related Potential (ERP) technique to examine the changes in the subjects' brain potential activity during lexical processing. The results revealed that there was no significant difference ($ps > 0.05$) in the activation levels of P300, N200, and N400 between the congruent condition (moral words appeared on the right side of the screen or immoral words appeared on the left side) and the incongruent condition (moral words appeared on the left side of the screen or immoral words appeared on the right side of the screen), and the EEG results failed to validate the existence of the horizontal metaphor effect. The comprehensive results of two experiments indicate that there is no horizontal spatial metaphorical effect (BF_{01}s > 54.48) in Chinese moral concept words, and individuals do not use left and right positions as references to represent moral concepts. This study is the first to apply ERP technology to the study of moral horizontal spatial metaphors, providing new empirical references for existing research on moral conceptual metaphors and embodied moral cognition.

敬畏与智慧：多种时间取向的中介效应

王笑笑　王伊萌　汪凤炎（通讯作者）

南京师范大学心理学院，南京，210097，通讯作者 fywangjx8069@163.com

摘 要　敬畏是人类因自身生存基础的有限性而产生的对神圣性对象既敬且畏的复合型情感。当人们产生敬畏的情绪体验时，更有可能反思自己的过去，观察当下的直接经验及考虑当前行为的未来后果。因此，本研究旨在探讨敬畏对智慧的直接影响，并确定时间取向是否介导了这种影响。为探究这一机制，本文提出敬畏可通过未来时间取向和平衡时间取向对智慧产生正向效应，通过两个研究分别从特质和状态两个层面进行验证：研究 1 运用问卷横断自评，对个体的特质敬畏、时间取向以及智慧进行调查，发现敬畏、多种时间取向与智慧推理的正向关系，并初步验证敬畏可通过提升未来时间取向和平衡时间取向增进个体对冲突事件的智慧推理水平；研究 2 对敬畏进行启动，发现对敬畏的启动使个体更倾向于采用平衡时间取向与未来时间取向，也同时引发了智慧推理相关特征。中介分析进一步表明敬畏对智慧的影响可以通过平衡时间取向、未来时间取向来解释。这些发现表明，敬畏可能有助于个体积极反思过去、觉察当下与展望未来，增进个体对冲突事件的智慧推理水平，从而获得智慧发展。因此，个体可适当创造接触崇高事物的机会，培育其对自然、真理、良法和良知的敬畏感，同时积极反思过去、觉察当下与展望未来，促进智慧发展。

关键词　敬畏，时间取向，智慧推理

Awe and Wisdom: The Mediating Effect of Multiple Time Orientations

Xiaoxiao Wang, Yimeng Wang,Fengyan Wang
(1 School of Psychology, Nanjing Normal University, Nanjing 210097, China)

Abstract：Awe is a compound emotion of both respect and fear for sacred objects, which is generated by the limited existence of human beings. When people experience awe, they are more likely to reflect on their past, observe immediate experiences in the present, and consider the future consequences of their actions. Therefore, this study aimed to explore the direct effect of awe on wisdom and determine whether temporal orientation mediates this effect. In order to explore this mechanism, this paper proposes that awe can have a positive effect on wisdom through future time orientation and balanced time orientation, which are verified from the trait and state levels respectively through two studies: In study 1, a cross-cutting self-assessment questionnaire was used to investigate individuals' trait awe, time orientation and wisdom, and found the positive relationship between awe, multiple time orientation and intelligent reasoning, and preliminarily verified that awe can improve individuals' intelligent reasoning level for conflict events by improving future time orientation and balancing time orientation. Study 2 priming awe found that priming awe made individuals more inclined to adopt balanced time orientation and future time orientation, and also triggered the characteristics related to intelligent reasoning. Mediation analysis further suggests that the effect of awe on wisdom can be explained by balancing time orientation and future time orientation. These findings suggest that awe may help individuals actively reflect on the past, perceive the present and look forward to the future, and enhance their intellectual reasoning level for conflict events, thus achieving intellectual development. Thus, individuals can appropriately create opportunities to contact the sublime, cultivate their sense of reverence for nature, truth, good law and conscience, and actively reflect on the past, perceive the present and look forward to the future, promoting the development of wisdom.

感知财务约束对从众消费的影响及其内在机制

郑智行[1]　崔力元[1]　钟建安[1]（通讯作者）
1 浙江大学心理与行为科学系，杭州，310058，jiananzhong@zju.edu.cn

摘 要　近年来，受疫情的影响，全球经济下行，裁员和降薪使得越来越多的人们处于财务约束的状态。感知财务约束作为一个主观心理变量，与客观财富之间只有中等大小的相关，它反映的是个体对自身财务状况限制了其预期消费水平的感知程度。感知财务约束可能会引发个体的不确定性和不安全感，进而导致个体风险规避倾向增加，并对个体的消费行为产生影响。而从众消费作为一种常见的降低决策风险的手段，很可能在风险规避中被采纳，以用于缓解感知财务约束所带来的不确定性和不安全感。本文基于资源稀缺的自我调节模型开展了 3 项研究，旨在探究感知财务约束对从众消费的影响及其内在的心理机制。结果显示：(1)感知财务约束会增加个体的从众消费倾向；(2)感知财务约束通过提高个体的风险规避倾向来增加个体的从众消费倾向；(3)消费者知识在感知财务约束和从众消费之间起调节作用，当消费者知识水平较高时，感知财务约束对个体从众消费的影响有所减弱；(4)决策者角色在感知财务约束和从众消费之间起调节作用，为他人决策时，感知财务约束对个体从众消费的影响有所减弱。研究结果初步揭示了风险规避倾向是感知财务约束增加从众消费的潜在机制，并为商家制定策略和消费者避免盲目从众提供了一定的思考和建议。

The Effect of Perceived Financial Constrains on Conformity Consumption and Its Internal Mechanism

Zheng Zhixing[1]　Cui Liyuan[1]　Zhong Jianan[1] (Corresponding author)
1 Department of Psychology and Behavioral Sciences, Zhejiang University; 866 Yuhangtang Rd., Hangzhou 310058, China, jiananzhong@zju.edu.cn

***Abstract*：** In recent years, the global economic downturn due to the COVID-19 pandemic, along with layoffs and salary reductions, has placed more and more people in a state of financial constraints. As a subjective psychological variable, perceived financial constraints which are only modestly correlated with objective wealth, reflect the extent to which people believe that their financial situation restricts desired consumption. It may trigger individual uncertainty and insecurity, leading to an increase of the tendency of risk aversion and affecting consumer behavior. As a common means of reducing decision-making risks, conformity consumption is likely to be adopted in risk aversion to alleviate the uncertainty and insecurity caused by perceived financial constraints. This research conducted three studies based on the self-regulation model of resource scarcity to explore the impact of perceived financial constraints on conformity consumption and the underlying psychological mechanisms. The results showed that: (1) Perceived financial constraints would increase the tendency of conformity consumption; (2) Perceived financial constraints increase the tendency of conformity consumption by increasing the tendency of risk aversion; (3) Consumer knowledge plays a moderating role between perceived financial constraints and conformity consumption. When the level of consumer knowledge is high, the effect of perceived financial constraints on individual conformity consumption is weakened. (4) The role of decision maker plays a moderating role between perceived financial constraints and conformity consumption. When making decisions for others, the effect of perceived financial constraints on individual conformity consumption is weakened. The results reveal that risk aversion tendency is a potential mechanism for perceived financial constraints to increase conformity consumption, and provide certain thoughts and suggestions for merchants to develop strategies and consumers to avoid blind conformity.

越贫困越冒险？经济贫困影响青少年冒险行为的 ERPs 研究

梁惟旋[1]　窦凯[1]（通讯作者）　冯雪珂[1]
1 广州大学教育学院青少年心理与行为研究中心，广州，510006，psydk@gzhu.edu.cn

摘 要 经济贫困是青少年冒险行为的风险因素，过往研究指出处于经济贫困的青少年更有可能参与冒险行为（如打架、吸烟和酗酒等），但目前鲜有研究探讨经济贫困影响青少年冒险行为的神经机制，其电生理证据更缺乏探索。基于此，采用 2（经济贫困类型：经济贫困、经济富裕）×2（反应类型：go、no-go）×2（反馈类型：收益、损失）的混合实验设计，招募 36 名大学生被试，随机分成经济贫困组 17 人(M_{age} = 20.35, SD = 1.84)与经济富裕组 19 人(M_{age} = 19.84, SD = 1.77)，并采用阶段任务(The Stage Game)来操纵经济贫困状态，借助事件相关电位技术记录被试完成 Go/no-go 任务、简单赌博任务时的电生理信号，进而检验经济

贫困影响青少年青少年冒险行为的神经机制。结果：（1）脑电结果显示，Go/no-go 任务中，经济富裕组的 N2 差异波比经济贫困组更大；（2）在简单赌博任务中，经济贫困组在收益以及损失反馈中都诱发比经济富裕组更负的 FRN。据此推测，经济贫困主要导致青少年对于金钱奖赏的敏感性增强，降低青少年的抑制控制能力来间接加剧青少年的冒险行为。上述发现有助于理解经济贫困影响青少年冲动冒险的深层原因，并为此提供了其电生理的证据，为降低和预防经济贫困个体的风险寻求和冲动决策提供理论参考。

The poorer you are, the more adventurous you are? Economic poverty affects adolescents' risk-taking behaviors: Evidence from an ERP

Weixuan Liang [1] Kai Dou[1] Xueke Feng [1]

1 Research Center of Adolescent Psychology and Behavior, School of Education, Guangzhou University, Guangzhou, 510006

Abstract: Economic poverty is a risk factor for risk-taking behaviors in adolescents, and previous studies have pointed out that adolescents in economic poverty are more likely to engage in risk-taking behaviors (e.g., fighting, smoking, and drinking), but few studies have explored the neural mechanisms by which economic poverty affects adolescents' risk-taking behaviors, and the neural evidence for it is even more unexplored. Based on this, a mixed experimental design of 2 (economic poverty type: economic poverty, economic affluent) × 2 (response type: go, no-go) × 2 (feedback type: gain, loss) was used to recruit 36 university student subjects, who were randomly divided into 17 economic poverty group (M_{age} = 20.35, *SD* = 1.84) and 19 economic affluent group (M_{age} = 19.84, *SD* = 1.77), and were manipulated into economic poverty by using The Stage Game. The Stage Game was used to manipulate the state of economic poverty, and the neural signals of the Go/no-go task and the simple gambling task were recorded with the help of the event-related potentials technique to examine the neural mechanisms of economic poverty affecting the risk-taking behaviors of adolescents. Results: (1) EEG results showed that the N2 difference wave was larger in the economic affluent group than in the economic poverty group in the Go/no-go task; (2) the economic poverty group induced a more negative FRN than the economic affluent group in the gain and loss feedbacks in the simple gambling task. it was hypothesized that economic poverty mainly leads to an increased susceptibility of adolescents to monetary rewards, which reduces the self-control of adolescents and indirectly exacerbates their risk-taking behaviors. Indirectly exacerbate adolescents' risk-taking behaviors. The above findings contribute to the understanding of the underlying reasons why economic poverty affects impulsive risk-taking in adolescents and provide neural evidence for it, providing theoretical references for reducing and preventing risk-seeking and impulsive decision-making in individuals' economic poverty.

Keywords: economic poverty, risk-taking behaviors, adolescents, ERP

具象程度不同的食物名称对食物评价与消费意愿的影响

于钊 [1]　吉楠楠 [1]　曾好豪 [1]　李尚仪 [1]　张维 [1]（通讯作者）

华南师范大学心理学院，广州，510631，psycheungwai@163.com

摘 要　近年来，许多餐饮从业者开始使用模糊而抽象的名称对食物进行命名，这种命名方式比描述性名称和常规名称都更不具象和不典型。然而，不同具象程度的中式食物名称如何影响消费者对食物的评价以

及消费意愿尚不明确。基于此，本研究拟通过两个实验探究人们对不同具象程度的食物名称的感知及其对食物相关属性（美味、消费意愿等）评价。实验 1 采用主观猜测范式探究不同具象程度的名称被认为是一道食物或菜式的可能性，结果发现，与心理图像一致性假设的预期相一致，对比低具象程度名称，人们在面对容易构建心理图像的高具象程度的名称时，更倾向于将其判断为是一道食物或菜式。实验 2 进一步探究了具象程度不同的食物名称对消费者感知食物相关属性的影响。结果显示，具象程度高的食物名称在美味程度、消费意愿和高品质维度上均显著高于具象程度低的食物名称，而在健康维度上则显著低于具象程度低的食物名称，但两者在昂贵维度上没有显著差异。上述结果表明，具象程度高的名称更有可能被判断为一道食物或菜式，同时在食物的评价（美味、高品质）与消费意愿上也更有优势，但在健康评价上却被认为是更不健康的。研究结果与结论能为有关食物名称命名和食品相关属性的研究提供新的证据，也能为餐饮行业对食物与菜品的命名提供建议与策略。

The influence of food names with different level of concreteness on food evaluation and consumption intention

Zhao Yu, Nannan Ji, Haohao Zeng, Shangyi Li, Wei Zhang

School of Psychology, South China Normal University, Guangzhou, 510631

Abstract： In recent years, many restaurateurs in the food and beverage industry have started using vague and abstract names to label their dishes. However, the influence of food names with different level of concreteness on consumers' evaluations of the food and their purchase intention remains unclear. Based on this, the present study aimed to investigate people's perceptions of food names with different levels of concreteness and their evaluation of food-related attributes (e.g., deliciousness and purchase intention) through two experiments. Experiment 1 investigated the likelihood of different levels of concreteness in names being perceived as food or dish through subjective guessing tasks. In line with the hypothesis of mental imagery consistency, the results revealed that individuals were more inclined to perceive high-concrete names as actual food or dishes than low-concrete names. Experiment 2 further examined the impact of food names with different levels of concreteness on consumers' perception of food-related attributes. The results showed that high-concrete food names were significantly higher than low-concrete food names in terms of perceived deliciousness, purchase intention, and high quality of food. However, the ratings of perceived healthiness of high-concrete food names were significantly lower than those of low-concrete food names. No significant differences were found between the two groups in the ratings of perceived expense. These results indicated that a high-concreteness name is more likely to be perceived as food or dish. Moreover, they also had advantages in terms of food evaluations in terms of deliciousness, high quality and purchase intention. The present findings provide new evidence for studies related to food naming and food-related attributes, and offer suggestions and strategies for the food and beverage industry in terms of naming their food and dishes.

Keywords： food names, different levels of concreteness, food evaluation, purchase intention

疼痛对延迟折扣的影响：内外向人格的调节作用

刘 阳[1]　孙玲超[1]　王大伟[1]（通讯作者）

1 山东师范大学心理学院，山东济南，250358，wdw112@163.com

摘 要　以往有关疼痛与延迟折扣关系的研究发现，高强度疼痛会增加个体延迟折扣，低强度疼痛对个体延迟折扣没有影响，究其原因可能是疼痛强度导致研究结果存在差异性。这表明，疼痛和延迟折扣的关系可能会随着疼痛强度的变化而改变，这促使研究者想要更加深入地探究两者的关系。相比于高、低强度疼痛，人类在日常生活中更多承受中等强度的疼痛。那么，中等强度的疼痛对延迟折扣的影响又当如何？因此，本研究基于疼痛重叠理论和决策双系统理论，开展两项平行实验，分别通过辣椒素刺激和自传体回忆任务诱发被试中等强度的生理疼痛或心理疼痛，使用延迟折扣任务作为实验材料，旨在检验中等强度的疼痛对内外向个体延迟折扣的影响。结果表明：(1) 无论是经历生理疼痛还是心理疼痛，决策者在中等强度的疼痛条件下比控制组更少地选择即时较小的选项，目光更为长远。(2) 内外向人格在心理疼痛对延迟折扣的影响中起调节作用，心理疼痛显著降低了外向型个体的延迟折扣。本研究不仅在实验室环境中检验了中等强度生理和心理疼痛对延迟折扣的影响，拓展了对于疼痛和延迟折扣的关系的认识，为疼痛重叠理论和决策双系统理论提供了进一步的证据支持。而且，为降低个体延迟折扣，使其目光更加长远提供了新的干预方式。

The influence of pain on delay discounting: the moderating role of extraversion

Yang Liu[1], Lingchao Sun[1], Dawei Wang[1]

1 School of psychology, Shandong Normal University, 250358, wdw112@163.com

Abstract：In recent years, the influence of pain on delay discounting has begun to attract researchers' attention. Some studies found that pain made people shortsighted, and others found that pain conditions had no effect on delay discounting. The difference in results may be attributed to the intensity of pain. This suggests that the relationship between pain and delay discounting may vary depending on the intensity of pain, prompting the researchers to further investigate this relationship. In daily life, individuals typically experience moderate intensity pain more frequently than high or low intensity pain. What about the influence of moderate intensity pain on delay discounting? Therefore, based on the pain overlap theory and the dual system theory, two parallel experiments were conducted to manipulate the influence of moderate intensity pain on delay discounting of introvert and extravert individuals, in which participants were induced with moderate intensity physical pain or psychological pain by capsaicin stimulation or an autobiographical recall task, respectively, as well as a delay discounting task was used as experimental material. The results showed that : (1) regardless of they experienced physical pain or psychological pain, decision-makers were less inclined to choose the small-sooner option than the control group and had a longer vision under moderate intensity pain condition; (2) extraversion moderated the relationship between psychological pain and delay discounting. For extraverts, the proportion of choosing the small-sooner option in the psychological pain group exhibited a significant reduction compared to that in the control group. The current study investigated the influence of moderate intensity physical or psychological pain on delay discounting in a laboratory, enhanced our comprehension of the relationship between pain and delay discounting, and provided further evidence to support both the pain overlap theory and dual system theory. Additionally, the results presents a novel intervention method for reducing individuals' delay discounting and promoting their long-term perspective.

Keywords：moderate intensity pain, delay discounting, extraversion, pain overlap theory, dual system theory

如何缓解低不确定性容忍度个体的冲动性？奖赏框架和积极预期想象的作用

王蝶[1]　宗天琦[1]　聂昕晓[1]　王大伟[1]（通讯作者）

1 山东师范大学心理学院，济南，250300，wdw112@163.com

摘 要　不确定性容忍度(UT) 在焦虑症的形成和发展中起核心作用，焦虑症患者普遍具有低不确定性容忍度，倾向于将不确定性感知为威胁且更容易产生负面情绪。因而，焦虑症患者会冲动的选择当前确定选项以回避令人痛苦的未来不确定性事件，这进一步加剧了焦虑症状。因此，有必要考察如何缓解低不确定性容忍度个体的冲动性，为今后焦虑症的干预提供理论基础。本研究基于不确定性容忍度整合模型的视角，从降低不确定性和提高容忍度两个方面，通过两个实验分别探究了奖赏框架和积极预期想象对不确定性容忍度与冲动性之间关系的调节作用。实验 1 采用 2(不确定性容忍度：高、低)×2 (奖赏框架：藏零、显零)×5 (延迟时间：7 天、15 天、30 天、60 天、120 天)的混合实验设计。实验 2 采用 2(不确定性容忍度：高、低)×2(条件：无线索、有线索)×5(延迟时间：7 天、15 天、30 天、60 天、120 天) 的混合实验设计。结果表明：(1)低不确定性容忍度个体比高不确定性容忍度个体更加偏好即时选项。(2)显零框架能够降低两类个体的跨期决策即时选项选择比例，在藏零框架下，低不确定性容忍度个体较高不确定性容忍度个体更加偏好即时选项，在显零框架下，两类个体的跨期决策偏好不存在显著差异。(3)积极预期想象能够降低两类个体的跨期决策即时选项选择比例，在无线索条件下，低不确定性容忍度个体较高不确定性容忍度个体更加偏好即时选项，在有线索条件下，两类个体的跨期决策偏好不存在显著差异。这些研究结果丰富了不确定性容忍度整合模型，并提供了展开积极情景想象和关注机会成本这两个降低焦虑症患者冲动性的干预新方向。

How to alleviate the impulsivity of individuals with low uncertainty tolerance? The role of reward framing and positive episodic future thinking

Die Wang[1], Tianqi Zong[1], Xinxiao Nie[1], Dawei Wang[1*]

School of Psychology, Shandong Normal University, Jinan, 250300，wdw112@163.com

Abstract：　Uncertainty tolerance (UT) plays a central role in the formation and development of anxiety disorders. Patients with anxiety disorders generally have low uncertainty tolerance, tend to perceive uncertainty as threatening, and are more prone to negative emotions. Thus, people with anxiety disorders impulsively choose the current certainty option in order to avoid distressing future uncertain events, which further exacerbates anxiety symptoms. Therefore, it is necessary to investigate how to alleviate impulsivity in individuals with low uncertainty tolerance to provide a theoretical basis for future interventions for anxiety disorders. Based on the perspective of the integrative model of uncertainty tolerance, in terms of reducing uncertainty and increasing tolerance, respectively, the two current studies explored the moderating effects of reward framing and positive episodic future thinking on the relationship between uncertainty tolerance and impulsivity. In Experiment 1, a mixed experimental design of 2 (Group: high UT, low UT) × 2 (Reward framing: hidden-zero, explicit-zero) × 5 (Delay time: 7, 15, 30, 60, 120 days) was used. In Experiment 2, a mixed experimental design of 2 (Group: high UT, low UT) × 2 (Cue: cued, uncued) × 5 (Delay time: 7, 15, 30, 60, 120 days) was used. Results showed that: (1) Individuals with low uncertainty tolerance prefer immediate options more than those with high uncertainty tolerance. (2) Explicit zero framing can reduce the proportion of immediate choice of the two groups in

intertemporal decision making. Under the hidden zero framing, participants with low uncertainty tolerance preferred more immediate choices than participants with high uncertainty tolerance. While there was no significant difference in intertemporal decision preference between the two groups under the explicit zero framing. (3) Episodic future thinking can reduce the proportion of immediate choice of the two groups in intertemporal decision making. Under the uncued condition, participants with low uncertainty tolerance preferred more immediate choices than participants with high uncertainty tolerance. While there was no significant difference in intertemporal decision preference between the two groups under the cued condition. In conclusion, these findings extend the integrative model of uncertainty tolerance and provide two new directions for impulsive decision-making interventions for patients with anxiety disorders: thinking of future imagery and focusing on opportunity costs.

Keywords: uncertainty tolerance, integrative model of uncertainty tolerance, impulsivity, reward framing, episodic future thinking

特质敬畏对中学生道德推脱的影响：一个有调节的中介模型

蔺哲子[1]　布雅静[1]　张潮[2]（通讯作者）

1 山西师范大学教育科学学院，太原，030031

2 山西师范大学教育科学学院，太原，030031，zhangchao951217@163.com

摘 要　道德推脱会降低个体的道德标准，使得个体做出不道德行为。道德推脱作为影响校园欺凌的重要因素之一，找到如何降低学生的道德推脱水平是解决校园欺凌现象的一个关键点。已有研究表明敬畏可以通过小我促进个体的道德扩张，增加个体对广泛目标的道德关注。而且学校道德氛围作为调控校园环境的人际关系、影响青少年学生道德发展的规范与价值观系统，能够影响中学生的道德推脱；特质共情作为一种能使个体会在不同环境下感受和体验他人情绪情感和心理状态的能力可以调节环境对行为的作用。由于敬畏和道德推脱之间的关系尚不明确，目前还未有实证研究探讨敬畏是否能通过学校道德氛围的中介预测中学生的道德推脱，以及验证共情的调节作用。为检验这一假设，本研究试图探讨特质敬畏和道德推脱之间的关系，以及学校道德氛围的中介作用与共情的调节作用。方法：采取整群抽样法抽取山西 537 名中学生填写特质积极情绪中的敬畏分量表(DPES)、青少年道德推脱问卷、学校道德氛围知觉问卷和基本共情量表(Basic Empathy Scale, BES)。预期结果：（1）特质敬畏负向预测道德推脱行为；（2）学校道德氛围感知在特质敬畏与道德推脱之间起部分中介作用；（3）共情对学校道德氛围感知与道德推脱之间的关系存在调节作用。相较于低共情水平的中学生，学校道德氛围感知对高共情水平中学生道德推脱行为的预测作用显著增强。

关键词　敬畏，道德推脱，学校道德氛围，共情

The influence of trait awe on middle school students' moral disengagement: a moderated mediation model

Lin Zhezi, Bu Yajing, Zhang Chao(Corresponding author)

School of Education Science , Shanxi Normal University , Taiyuan , 030031

Abstract: Moral disengagement will lower the moral standards of individuals and make individuals behave immorally. As one of the important factors affecting campus bullying, finding out how to reduce students' moral

disengagement level is a key point to solve the problem of campus bullying. Research has shown that awe can promote the moral expansiveness of the individual through the small-self and increase the moral concern of the individual for a broad range of targets. Moreover, school moral atmosphere, as a standard and value system that regulates the interpersonal relationship of campus environment and influences the moral development of young students, can affect the moral disengagement behavior of middle school students. Trait empathy, as the ability to feel and experience the emotions and mental states of others under different circumstances, can regulate the effect of environment on behavior. Because the relationship between awe and moral disengagement is not clear, there is no empirical study to investigate whether awe can predict middle school students' moral disengagement through the mediation of school moral atmosphere, and to verify the moderating effect of empathy. To test this hypothesis, this study attempts to explore the relationship between trait awe and moral disengagement, as well as the mediating role of school moral atmosphere and the moderating role of empathy. Methods: Cluster sampling method was used to select 537 middle school students from Shanxi Province to fill in the awe subscale of Dispositional Positive Emotion Scale(DPES), the Adolescent Moral Disengagement Questionnaire, the School Moral Atmosphere Questionnaire and the Basic Empathy Scale (BES). Expected results: (1) Trait awe negatively predicted moral disengagement behavior; (2) The perception of school moral atmosphere plays a partial mediating role between trait awe and moral disengagement; (3) Empathy has a moderating effect on the relationship between school moral atmosphere perception and moral disengagement. Compared with middle school students with low empathy level, school moral atmosphere perception has a significantly stronger predictive effect on high empathy middle school students' moral disengagement behavior.

未来自我连续性与生命意义存在：自我概念清晰性的中介作用及领悟社会支持的调节作用

薛璐璐 范航 闫芸 张利平 姜艳娜 陈立鹏（通讯作者）

中国人民大学心理学系，北京，100872，chenlipeng2019@126.com

摘 要 人们感知到未来自己与当下自己关系的紧密程度是否会影响生命意义存在，我们还知之甚少。为了解决这个问题，我们在两项研究（$N = 788$）中探讨了未来自我连续性对生命意义存在的影响及其内在机制。研究 1 包括 2 个单因素被试间实验。研究 1a 的参与者（n = 167）被随机分配到“启动未来自我连续性组”和“未启动未来自我连续性组”。结果表明：相比于未启动未来自我连续性的参与者而言，启动未来自我连续性的参与者生命意义存在的水平更高（$p < 0.001$）。研究 1b 的参与者（n = 162）被随机分配到“启动高未来自我连续性组”和“启动低未来自我连续性组”，结果表明：相比于启动低未来自我连续性的参与者而言，启动高未来自我连续性的参与者生命意义存在的水平更高（$p < 0.001$）。研究 2 的参与者（n = 459）分别完成了未来自我连续性问卷、自我概念清晰性量表、生命意义分量表、领悟社会支持量表。在控制了性别后，结果表明：（1）未来自我连续性、自我概念清晰性、生命意义存在、领悟社会支持彼此间呈显著正相关（$rs = 0.24 - 0.38, p < 0.01$）；（2）未来自我连续性正向影响生命意义存在（$\beta = 0.25, p < 0.001$）；（3）自我概念清晰性在未来自我连续性与生命意义存在间起中介作用（$\beta = 0.20, p < 0.001$）；（4）领悟社会支持在“未来自我连续性→自我概念清晰性→生命意义存在”这一中介路径的前半段起调节作用（$\beta = -0.12, p < 0.001$）。具体而言，相比于领悟社会支持高的参与者而言，未来自我连续性对自我概念清晰性的影响在领悟社会支持低的时候更大。总的来说，本研究具有一定的理论和实践意义。一方面，本研究首次证实了未来自我连续性对生命意义存在的影响及其内在机制，丰富了生命意义存在的理论研究。另一方面，研究结

果表明，通过教育和培训增强人们的未来自我连续性是提升生命意义存在的有效手段。同时，呼吁人们重视自我概念清晰性的发展，并积极获取更多的社会支持，以便拥有更有意义的生活。
关键词 未来自我连续性，自我概念清晰性，生命意义存在，领悟社会支持

Future self-continuity and the Presence of meaning: The mediating role of Self-concept clarity and the moderating role of Perceived social support

XUE Lulu FAN Hang YAN Yun ZHANG Liping JIANG Yanna CHEN Lipeng
Department of Psychology, Renmin University of China, Beijing 100872

Abstract: There is little research on whether the closeness of people's perceived present selves to their future selves affects the presence of meaning. To address this question, we explored the effects of future self-continuity on the presence of meaning and its underlying mechanisms in two studies (N = 788). Study 1 consisted of two single-factor between-subjects experiments. Participants in study 1a (n = 167) were randomly assigned to an "initiated future self-continuity group" or a "non-initiated future self-continuity group." The results showed that participants who initiated future self-continuity had a higher level of presence of meaning than those who did not initiate future self-continuity (p < 0.001). Participants in study 1b (n = 162) were randomly assigned to the "high future self-continuity priming group" and the "low future self-continuity priming group", and the results showed that participants with high future self-continuity priming had a higher level of presence of meaning than participants with low future self-continuity priming group (p < 0.001). Participants in study 2 (n = 459) completed the Future self-continuity questionnaire (FSCQ), Self-concept clarity scale (SCCS), Meaning in Life subscale (MLQ-P), and Perceived social support scale (PSSS), respectively. After controlling for gender, the results indicated that (1) future self-continuity, self-concept clarity, presence of meaning, and perceived social support were significantly and positively correlated with each other (rs = 0.24 - 0.38, p < 0.01); (2) future self-continuity positively influenced presence of meaning (β = 0.25, p < 0.001); (3) self-concept clarity mediates the relationship between future self-continuity and presence of meaning (β = 0.20, p < 0.001); (4) perceived social support moderates the first half of the mediation pathway "future self-continuity → self-concept clarity → presence of meaning" (β = -0.12, p < 0.001). Specifically, the effect of future self-continuity on self-concept clarity was greater in participants with low perceived social support than in those with high perceived social support. In general, this study has certain theoretical and practical significance. On the one hand, this study confirms for the first time the impact of future self-continuity on the presence of meaning and its internal mechanism, which enriches the theoretical research on the presence of meaning. On the other hand, the findings suggest that enhancing people's future self-continuity through education and training is an effective way to enhance the presence of meaning. At the same time, it calls on people to pay attention to the development of self-concept clarity and actively obtain more social support to have a more meaningful life.

摘 要 抑郁的无望理论模型指出无望感是导致抑郁的充分条件，由无望感导致的低自尊是抑郁的核心症状之一。意义感危机则是导致抑郁症的助力条件，而人生目的驱使个体完成既对自我又对超越自我以外世界有意义的事，带给人们希望感并负向预测无望感与抑郁水平。尽管先前研究发现人生目的感可以负向预测抑郁症状，但关于人生目的追寻的具体内容与抑郁症状的联系尚缺乏进一步考察。为了比较抑郁症患者与普通人群对各人生目的类型重视程度的差异，以及各人生目的类型对抑郁核心症状之一——自尊的预测作用，本研究采用《人生目的类型自评量表》、《人生目的类型迫选量表》和《罗森伯格自尊量表》对 73 名抑郁症患者和 146 名与其人口统计学信息相匹配的普通人群进行了测查。结果发现：1）抑郁症患者与普通人群对各人生目的类型的排序相同：同样更重视家庭福祉和个人成长，较少重视个人福祉和社会促进；然而，抑郁症患者对各类型的人生目的重视程度均低于普通人群；2）在普通人群中，只有个人福祉目标重视程度与自尊水平存在显著的正向关联；然而在抑郁症患者中，所有四种人生目标重视程度均与自尊水平存在显著的正向关联，3）家庭福祉和社会促进在抑郁与否对自尊水平的预测作用中起调节作用，即对于超越自我的人生目标重视程度可以减缓抑郁症对自尊的不良影响。上述结果的启示是，可以通过帮助抑郁症患者建立人生目标追寻（尤其是超越自我的人生目标）来实现症状改善。

Differences in Purpose Orientations between Depressed Patients and the Healthy Population

Xiaosong Gai[1, 2] Dannuo Lyu[1]
1 School of Psychology, Northeast Normal University, Changchun, Jilin Province, China
2 Research Center of Mental Health Education in Northeast Normal University, Key Research Institute of Humanities and Social Science in Universities in Jilin Province, Changchun, Jilin Province, China

Abstract: The hopelessness theory model of depression suggests that hopelessness is a sufficient condition for depression, and that low self-esteem caused by hopelessness is one of the core symptoms of depression. Lack of meaning contributes to depression, and purpose in life drives individuals to achieve things that are meaningful both to the self and to the world beyond the self, resulting in a sense of hope and negatively predicting levels of hopelessness and depression. Although purpose may negatively predict depressive symptoms, the relationship between the specific content of purpose and depressive symptoms has not been further examined. To compare differences in purpose orientations between depressed patients and the healthy population and the predictive effect of purpose orientations on one of the core symptoms of depression, self-esteem, the Purpose Orientation Scale-Self Rating, the Purpose Orientation Scale-Forced Rating, and the Rosenberg Self-Esteem Scale were administered to 73 depressed patients and 146 healthy people matched on demographics to the depressed patients. The results showed that: 1) Both depressed patients and healthy people valued family well-being and personal growth more, and valued personal well-being and social promotion less; however, the level of depressed patients valued all purpose orientations less than the level of healthy population; 2) Healthy people's personal well-being was significantly and positively associated with self-esteem, while depressed patients' all four purpose orientations were significantly and positively associated with self-esteem; 3) Family well-being and social promotion moderated the predictive effect of depression on self-esteem, i.e., prosocial purpose orientations may moderate the

negative effects of depression on self-esteem. The implication of the above results is that intervention can be conducted by helping depressed patients to establish life goals (especially prosocial purpose orientations).

Keywords： Purpose Orientation, Purpose in Life, Depression, Self Esteem

“向死而生”电影疗法应用于生命教育的探索

——一个基于量性和质性的混合研究

闻佳[1] 谭潇[2] （张颖）

1 湖北第二师范学院，武汉，430000

2 湖北第二师范学院，武汉，430000,2503221083@qq.com

摘要：电影疗法又称为电影治疗，是一种以电影为治疗媒介的新型艺术心理疗法。近年来“生命”题材影视作品喷涌而出，为电影疗法在中国的发展提供了坚实的基础。与此同时，00 后大学生因疫情封闭在校进行常态化管理期间，犯罪、自杀等漠视生命现象频现，“躺平”“佛系”等极端态度成为他们生活的代名词。基于以上问题导向，本研究在借鉴国外电影疗法的基础上进行本土化改良，对 108 名大学生进行了为期两个个月的积极干预，并采用混合方法研究范式予以分析。首先通过预研究，随机选取 700 名大学生填写 Steger 等编制的《生命意义感量表（MLQ）中文修订版》量表，初步了解他们的生命意义感现状。在量性研究方面，通过独立样本 t 检验对比干预前后效果。在质性研究方面，运用扎根理论分析访谈内容。结果显示：以“生命”题材的电影疗法对大学生的生命意义感存在正面且较为显著的影响。基于此，我们从高校和影视两个方面提出提高大学生生命意义感的相关建议。本研究是对电影疗法的一次循证实践，把握疫情这一突发公共事件引发人们强烈的生命危机意识，以危机为契机，在后疫情时代促进高校“立德树人”工作的落实，积极探索电影疗法的本土化发展，助力国家“健康中国”战略的推进，进而带动我国心理健康事业乃至整个经济的健康持续发展。

Exploring the Application of Movie Therapy in Life Education:

Being-towards-death

——A Mixed Study Based on Quantity and Quality

WenJia[1] TanXiao[2] （ZhangYin）

Hubei University Of Education,Hubei Wuhan

***Abstract*:** Movie therapy, also known as film therapy, is a new type of art psychotherapy using film as the therapeutic medium. In recent years, the gush of life themed movies has provided a solid foundation for the development of movie therapy in China. At the same time, the generation born in the 00s closed their campuses for normal management due to the epidemic, and ignored life phenomena such as crime and suicide occurred frequently, and extreme attitudes such as "couch potato" and "Buddhas" became synonymous with their lives. Based on the above problem orientation, this study made local improvement on the basis of learning from movie therapy, and carried out active intervention on 108 college students for three months, and analyzed it with mixed method research paradigm. Firstly, through a pre-experiment, 700 college students were randomly selected to fill in the "Meaning in Life Questionnaire(MLQ) Chinese Revised version" compiled by Steger et al., and a preliminary understanding of their sense of life meaning was conducted. In the quantitative study, independent-samples T test was used to compare the effects before and after intervention. In the aspect of qualitative study, grounded theory is used to analyze the interview content. The results show that movie therapy has a positive and significant impact on college students' sense of life meaning. Based on this, we put forward some suggestions to improve students' sense of life meaning from the aspects of universities and films. This study is an evidence-based practice of film therapy, which takes the epidemic as a public emergency to arouse people's strong awareness of life crisis, and promotes the implementation of comprehensive talent cultivation in universities in the post epidemic era, actively explore the localization development of movie therapy in China, and promote the development of mental health in China and even the world.

忆往昔，觅意义：怀旧对生命意义词汇判断的影响

王丹 丁凤琴（通讯作者） 章溢 张誉瀚

宁夏大学教师教育学院，银川，750021，dingfqin@nxu.edu.cn

摘 要 数字经济迅速发展，人们的精神却愈发贫瘠，有人患上“空心病”，开始“躺平”甚至“摆烂 ”，究其本质在于生命意义的缺乏。怀旧是为个体提供生命意义的心理资源之一，是指回忆往昔时产生的与自我相关的一种社会性情绪体验(Sedikides et al., 2015)。梳理过往文献发现，怀旧可以直接或间接提升个体的生命意义(Layous et al., 2021; Routledge et al., 2011)。但目前鲜有研究探讨怀旧对生命意义不同维度的影响及其神经机制的差异。鉴于此，本研究采用图片与认知加工相结合的方式诱发怀旧情绪，探究其对生命意义不同维度的影响及神经机制差异。行为结果表明：对于生命意义追寻维度，怀旧组对生命意义积极词的反应时显著短于生命意义消极词，控制组对生命意义积极词和消极词的反应时无显著差异；对于生命意义存在维度，无论是怀旧组还是控制组，对生命意义积极词的反应时都显著短于生命意义消极词。脑电结果表明：与控制组相比，怀旧组在额区及中央区诱发更大的 N400 波幅和更小的 P600 波幅。这表明怀旧组与控制组进行生命意义词汇判断时调用的认知资源存在差异，与控制组相比，怀旧组对生命意义词汇的加工所需的控制

性加工资源更少。研究结果不仅对理解怀旧对生命意义影响的内在机制具有理论意义，也对生命意义的教育与干预具有现实启示意义。

关键词 怀旧，生命意义，词汇判断，神经机制

Remembering the past, searching for meaning: the influence of nostalgia on lexical decision of the meaning of life

Wang Dan, Ding Fengqin, Zhang Yi, Zhang Yuhan

College of teacher education, Ningxia University, Yinchuan, 750021, dingfqin@nxu.edu.cn

Abstract: While the digital economy is developing rapidly, people's spirits are becoming more and more barren. Some people suffer from "hollow heart disease" and begin to "lie flat" or even "lay down". Nostalgia is one of the psychological resources that provide meaning to an individual's life, and it refers to a social emotional experience associated with the self when recalling the past(Sedikides et al., 2015). A review of the literature reveals that nostalgia can directly or indirectly enhance the meaning of life(Layous et al., 2021; Routledge et al., 2011), but few studies have examined the differences in the effects of nostalgia on different dimensions of the meaning of life and its neural mechanisms. In view of this, the present study used a combination of pictures and cognitive processing to induce nostalgia and to investigate it. Behavioural results showed that for the meaning-search dimension, the nostalgia group had a significantly shorter response time to positive words than to negative words, and there was no significant difference between the control group's response time to positive and negative words; for the meaning-presence presence dimension, both the nostalgia and control groups had a significantly shorter response time to positive words than to negative words. The EEG results showed that compared to the control group, the nostalgic group evoked greater N400 wave amplitude and smaller P600 wave amplitude in the frontal and central regions. This suggests a difference in the cognitive resources called upon to make lexical decision of the meaning of life between the nostalgic and control groups, with the nostalgic group requiring fewer controlled processing resources for the processing of meaning-of-life words compared to the control group. The findings have theoretical implications for understanding the mechanisms underlying the influence of nostalgia on meaning of life, and practical implications for education and interventions for meaning of life.

Keywords: nostalgia, meaning of life, lexical decision, neural mechanisms

亲职压力与农村留守幼儿亲社会行为的关系：远程亲子沟通与亲子关系的链式中介作用

赵晓琪[1] 李春怡[2] 汪双存[3] 刘文[4] 车翰博[1*]（通讯作者）

[1]辽宁师范大学教育学部，大连，116029，[*]通讯作者 E-mail:chbdhr@163.com

[3]曲靖市沾益区第一幼儿园，曲靖，655331

[4]辽宁师范大学心理学院，大连，116029

摘 要 **目的：**亲职压力是父母在履行养育子女的职责时感受到的压力，农村留守幼儿父母亲职压力较高，更容易导致低频率和低质量的亲子沟通、不良的家庭关系等，进而影响幼儿亲社会行为的发展。因此

本研究将探讨亲职压力与农村留守幼儿亲社会行为的关系，以及远程亲子沟通与亲子关系在二者关系中的作用。**方法：**本研究采用分层整群抽样法选取 318 名农村留守幼儿父母进行问卷调查，使用亲职压力量表、自编远程亲子沟通问卷（χ^2/df=1.76，CFI = 0.911, TLI = 0.903, RMSEA = 0.053, SRMR = 0.056）、亲子关系量表和长处与困难问卷中的亲社会维度进行调查，并对数据进行分析。**结果：**亲职压力总分的得分为（95.61±33.40）分，各维度中亲职愁苦得分最高。本研究调查的农村留守父母中，以亲职压力总分得分 90 分为临界，高亲职压力有 171 人，发生率为 53.77%。各变量之间存在相关，基于此建立结构方程模型，远程亲子沟通问卷中的有效沟通维度（β=0.33,P＜0.001）在亲职压力与农村留守幼儿亲社会行为之间存在中介作用；亲子亲密（β=0.02,P＜0.001）在亲职压力与农村留守幼儿亲社会行为之间存在中介作用；远程亲子沟通问卷中的有效沟通维度与亲子亲密（β=0.03,P＜0.01）在亲职压力与农村留守幼儿亲社会行为之间存在链式中介作用。亲子冲突（β=-0.031,P＜0.001）在亲职压力与农村留守幼儿亲社会行为之间存在中介作用；远程亲子沟通问卷中的消极沟通维度与亲子冲突（β=-0.02,P＜0.001）在亲职压力与农村留守幼儿亲社会行为之间存在链式中介作用。**建议：**为提高农村留守幼儿亲社会行为，应增加社会支持，积极提供远程亲子沟通条件，提供远程亲子互动指导，减少亲职压力，增进亲子关系，让幼儿形成安全型依恋，促进幼儿的健康发展。

[4]College of Psychology, Liaoning Normal University, Dalian, 116029

***Abstract*：** Objective: Parenting stress is the pressure that parents feel when they perform their duties of raising their children. Parents of left-behind children in rural areas have higher parental stress, which is more likely to lead to low-frequency and low-quality parent-child communication and bad family relations, thus affecting the development of children's prosocial behavior. Therefore, this study will explore the relationship between parental stress and prosocial behavior of left-behind children in rural areas, and the role of long-distance parent-child communication and parent-child relationship in the relationship between them. Methods: In this study, 318 parents of left-behind children in rural areas were selected by stratified cluster sampling method, and the parental stress scale, self-made long-distance parent-child communication questionnaire (χ^2/df=1.76, CFI = 0.911, TLI = 0.903, RMSEA = 0.053, SRMR = 0.056), parent-child relationship scale and prosocial dimension in the strengths and difficulties questionnaire were used to investigate. Results: The total score of parental stress was (95.61 33.40), and the score of parental distress was the highest in all dimensions. Among the left-behind parents in rural areas investigated in this study, the total score of parental stress is 90, which is critical, and there are 171 people with high parental stress, with an incidence rate of 53.77%. There is a correlation among the variables. Based on this, the structural equation model is established. The effective communication dimension (β=0.33,P<0.001) in the

long-distance parent-child communication questionnaire has an intermediary role between parental stress and prosocial behavior of left-behind children in rural areas. Parent-child intimacy (β=0.02,P<0.001) mediates the relationship between parental stress and prosocial behavior of left-behind children in rural areas. The effective communication dimension and parent-child intimacy in the long-distance parent-child communication questionnaire have a chain intermediary role between parental pressure and prosocial behavior of left-behind children in rural areas. Parent-child conflict (β=-0.031,P<0.001) mediates the relationship between parental stress and prosocial behavior of left-behind children in rural areas. The negative communication dimension and parent-child conflict in the long-distance parent-child communication questionnaire have a chain intermediary role between parental pressure and prosocial behavior of left-behind children in rural areas. Suggestions: In order to improve the prosocial behavior of left-behind children in rural areas, we should increase social support, actively provide long-distance parent-child communication conditions, provide long-distance parent-child interaction guidance, reduce parental pressure, enhance parent-child relationship, make children form safe attachment and promote their healthy development.

Keywords **：** Parenting pressure, Prosocial behavior, Left-behind children in rural areas, Long-distance parent-child communication, Parent-child relationship

积极心理干预提升高校网络思想政治教育实效性的实践探索

摘要

根据《关于新时代加强和改进思想政治工作的意见》，教育部明确提出推动新时代思想政治工作创新发展和加强互联网思想政治工作建设是当今高校教育的重点，自此网络思政教育成为思想政治教育的热潮。加强高校网络思政教育，大力提升网络思想政治教育实效性是高校育人工作的重中之重，提高大学生思想政治素质，促进大学生全面发展迫在眉睫。

研究表明，大学生积极心理品质培育能够提升高校网络思想政治教育实效性，对学生积极参与高校网络思想政治教育的态度转变具有促进作用。多位学者提出，积极心理学“培育个体积极品质和营造社会积极氛围，进而提升个体幸福感”的教育理论，与网络思想政治教育“促进人自由而全面的发展”的教育宗旨内在契合。将积极心理学引入高校网络思想政治教育，进一步增强高校网络思政教育的感染力和吸引力，通过正确的引导与实践干预挖掘学生内在力量，让学生获得成长、快乐和成就感等积极情绪体验，促进积极学习网络思政教育内容的态度转变，从而实现网络思想政治教育实效性的提升。

在积极心理学视域下，当代高校学生普遍存在希望、乐观、自我效能、韧性水平不足等问题，使得高校网络思想政治教育存在学生学习主动性不高、实际参与度较低等现实困境。为探索解决高校网络思想政治教育现实困境的有效方案，本研究采用随机干预实验进行积极实践与验证，首先对西安某高校 4374 名学生的网络思想政治教育现状进行了调查，随后采用随机干预实验的方法对 480 名学生进行了积极心理干预。实验结果表明，通过积极心理干预，高校学生积极心理水平和思想政治水平均有提升。在此基础上，梳理了积极心理干预提升网络思想政治教育实效性的模型，为高校网络思政教育模式的改革和创新提供了新思路。

Abstract

According to the Opinions on Strengthening and Improving Ideological and Political Work in the New Era, the Ministry of Education has clearly put forward the promotion of the innovative development of ideological and political work in the new era and the strengthening of the construction of ideological and political work on the Internet as a key point of education in colleges and universities nowadays, and since then, cyber ideological education has become a hot trend of ideological and political education. Strengthening network ideological and political education in colleges and universities, and vigorously improving the effectiveness of network ideological and political education is the most important task of college and university education, and it is urgent to improve the ideological and political quality of college students and promote the overall development of college students.

Research has shown that the cultivation of positive psychological qualities of college students can enhance the effectiveness of network ideological and political education in colleges and universities, and has a facilitating effect on the attitude change of students' active participation in network ideological and political education in colleges and universities. Many scholars have suggested that the educational theory of positive psychology, which "fosters individual positive qualities and creates a positive social atmosphere to enhance individual happiness", is inherently compatible with the educational purpose of cyber ideological and political education, which is "to promote the free and comprehensive development of human beings". Introducing positive psychology into network ideological and political education in colleges and universities further enhances the infectious force and attraction of network ideological and political education in colleges and universities, taps the inner strength of students through correct guidance and practical interventions, and allows students to gain positive emotional experiences such as growth, happiness, and a sense of achievement, and promotes a change in the attitude of actively learning the contents of network ideological and political education, thus realising the enhancement of the effectiveness of network ideological and political education.

Under the perspective of positive psychology, contemporary college students generally have the problems of hope, optimism, self-efficacy, and insufficient level of toughness, which makes the network ideological and political education in colleges and universities have the realistic dilemmas of low students' learning initiative and low actual participation. In order to explore effective solutions to the real dilemma of network ideological and political education in colleges and universities, this study adopts randomised intervention experiments for positive

practice and validation, firstly investigating the current situation of network ideological and political education of 4374 students in a college in Xi'an, followed by positive psychological interventions for 480 students using the method of randomised intervention experiments. The experimental results show that the positive psychological level and ideological and political level of the college students are improved through positive psychological intervention. On this basis, the model of positive psychological intervention to enhance the effectiveness of network ideological and political education is sorted out, which provides new ideas for the reform and innovation of the network ideological and political education model in colleges and universities.

不同真诚度道歉对受害者和第三方决定性宽恕及情感性宽恕的影响

马茹雪[1]　梁三才[2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西师范大学心理学院，西安，710062，liangsancai@snnu.edu.cn

摘 要　宽恕是指个体受到冒犯后的一系列亲社会动机的转变过程，包括决定性宽恕和情感性宽恕。研究表明，冒犯者的道歉是促进宽恕的有效策略，但不是所有道歉都会促进受害者宽恕：冒犯者不同真诚度的道歉对受害者做出宽恕行为的意愿有不同影响。以往研究发现，第三方会比受害者(第一方)更不容易原谅冒犯者，即第三方宽恕效应。为了考察无关第三方和受害者在面对冒犯者不同真诚度道歉时对决定性宽恕和情感性宽恕产生的不同影响，本研究设计了以下两个实验：实验一以 114 名大学生为被试，运用改编的包含冒犯与道歉的情景测验范式，并采用 3（不同真诚度道歉：强迫道歉，自愿道歉，不道歉）×2（角色：受害者，无关第三方）被试间设计对这一问题加以探讨。结果发现，对于情感性宽恕而言，不同真诚度道歉和不同角色的交互作用显著，简单效应分析结果显示，在强迫道歉条件下，受害者相比无关第三方更容易产生情感性宽恕，这一效应在自愿道歉和不道歉条件下均未出现；对于决定性宽恕而言，不存在上述交互作用。实验二以 105 名大学生为被试，运用生态效度更好的冒犯与道歉的自传体回忆范式，并采用与实验一相同的实验设计对同一研究主题进一步加以探究。结果发现，对于决定性宽恕而言，不同真诚度道歉和不同角色的交互作用显著，简单效应分析结果显示，在强迫道歉条件下，受害者相比无关第三方更容易产生决定性宽恕，但这一效应在自愿道歉和不道歉条件下均未出现；对于情感性宽恕而言，不同真诚度道歉和不同角色的交互作用显著，简单效应分析结果显示此交互作用与在决定性宽恕结果中表现出不同模式：在强迫道歉和不道歉条件下，受害者相比无关第三方均更容易产生情感性宽恕，但这一效应在自愿道歉条件下未出现。这些研究结果表明，强迫道歉和自愿道歉对于受害者和无关第三方的决定性宽恕和情感性宽恕具有不同的影响模式。这些研究结果不但加深了对于道歉与宽恕关系的理解，而且丰富了有关第三方宽恕效应的研究。

The impact of apology with different sincerity on victims and third parties' decisional and emotional forgiveness

Ma ru xue [1], Liang san cai [2],
1.School of Psychology,Shanxi Normal University,Xian 710062,China

Abstract：Forgiveness refers to a series of prosocial motivation changes after an individual is offended, including decisional and emotional forgiveness. Studies have shown that the offender's apology is an effective strategy to promote forgiveness, but not all apologies promote victim forgiveness: different sincerity of the offender's apology have different effects on the victim's willingness to forgive. Previous studies have found that the third party is less likely to forgive the offender than the victim (the first party), that is, the third-party forgiveness effect. In order to investigate the different influences of unrelated third parties and victims on decisional and emotional forgiveness when faced with different sincerity of the offender's apology, the following two experiments were designed: In experiment 1, 114 college students were used as subjects, and the adapted situational test paradigm involving offense and apology was adopted,the 3 (apology with different sincerity: coerced apology, voluntary apology, non-apology) ×2 (role: victim, the third party) design was adopted to explore this issue. The results show that, for emotional forgiveness, the interaction between different sincerity of apology and different roles is significant. The simple effect analysis results show that under the condition of coerced apology, victims are more likely to generate emotional forgiveness than unrelated third parties, and this effect does not appear in the condition of voluntary apology and non-apology. For decisional forgiveness, none of these interactions exist. In experiment 2, 105 college students were taken as subjects, and the autobiographical recall paradigm of offense and apology with better ecological validity was used to further explore the same research topic with the same experimental design as experiment 1. The results show that, for decisional forgiveness, the interaction between different sincerity of apology and different roles is significant. The simple effect analysis results show that under the condition of coerced apology, victims are more likely to generate decisional forgiveness than unrelated third parties, but this effect does not appear in the condition of voluntary apology and non-apology. For emotional forgiveness, the interaction between different sincerity levels of apology and different roles is significant, and the simple effect analysis results show that this interaction is different from that in the decisional forgiveness: under the condition of coerced apology and non-apology, victims are more likely to have emotional forgiveness than unrelated third parties, but this effect does not appear under the condition of voluntary apology. These findings suggest that coerced and voluntary apologies have different patterns of influence on decisional and emotional forgiveness of victims and unrelated third parties. These findings not only deepen the understanding of the relationship between apology and forgiveness, but also enrich the research on the effects of third-party forgiveness.

摘要　目的：探讨正念训练对特质焦虑个体心流体验的影响。方法：采用 2×3 混合实验设计，把 67 名特质焦虑个体随机分为实验组和对照组，实验组接受 8 周正念训练，在同一时间段对照组阅读心理学书籍。训练结束后进行后测，三个月后进行追踪测试，比较两组被试的注意集中水平和心流体验的变化情况。结果：正念训练结束时，实验组后测的心流体验（学习心流和游戏心流）显著高于前测，追踪测试时心流体验仍显著高于前测，追踪测试与后测的心流体验差异不显著。对照组三次测试的心流体验彼此间均差异不

显著。前测时实验组和对照组的心流体验差异不显著，后测和追踪测试时实验组的心流体验均显著高于对照组。经过 8 周正念训练，实验组被试的注意集中水平也显著提升，对照组被试三次测试的注意集中水平不存在显著差异。后测和追踪测试时实验组的注意集中水平均显著高于对照组。结论：正念训练能显著提升特质焦虑个体的心流体验和注意集中水平，且干预效果持续。

Influence of mindfulness training on flow experience in trait anxiety individuals

SUN Junfang[①②], BAO Hugejiletu[③]
①School of Psychology, Inner Mongolia Normal University, Hohhot 011517; ②School of Educational Science, Jining Normal University, Ulanqab 012000; ③School of Physical Education, Inner Mongolia Normal University, Hohhot 010022

Abstract ： **Objective**: To explore the influence of mindfulness training on flow experience of trait anxiety individuals. **Methods**: Using a 2×3 mixed experimental design, 67 trait anxiety individuals were randomly divided into experimental group and control group. The experimental group received mindfulness training for 8 weeks, and the control group read psychological books at the same time. A post-test was conducted after the training, and a follow-up test was conducted three months later， to compare the changes in attention concentration and flow experience between the two groups. **Results**: The flow experience (learning flow and game flow) of the experimental group after mindfulness training was significantly higher than that of the pre-test, while the flow experience of the follow-up test was still significantly higher than that of the pre-test, and there was no significant difference of flow experience between the follow-up test and the post-test. There was no significant difference of flow experience between the three tests in the control group. There was no significant difference of flow experience between the experimental group and the control group in the pre-test, but the flow experience of the experimental group was significantly higher than that of the control group in post-test and follow-up test. After 8 weeks of mindfulness training, the attention concentration level of the experimental group participants also significantly improved, while there was no significant difference in the attention concentration level of the control group participants in the three tests. The concentration level of attention in the experimental group was significantly higher than that in the control group during post testing and follow-up testing.**Conclusion**: Mindfulness training can significantly improve the flow experience and concentration level of attention of trait anxiety individuals, and the intervention effect is sustained.

亲社会视频游戏对运动员积极共情和亲社会行为的影响

甘友腾　王若航　范虹颖（通讯作者）
北京体育大学心理学院，北京，100084，通讯作者 E-mail：fanhy@bsu.edu.cn

摘　要　目的：运动员在日常生活和比赛训练中的共情能力和亲社会行为不仅能够帮助他们建立良好人际关系和促进积极体验，而且也会直接或间接影响其运动表现。亲社会视频游戏所营造的积极情境有利于提升玩家的积极认知和情感，从而引导亲社会行为产生。因此本研究皆在探讨亲社会视频游戏对运动员积

极共情和亲社会行为的影响，并纳入非运动员群体对干预效果进行对比。 方法：采用 2(运动员/非运动员) × 2(亲社会/中性视频游戏) ×2(前/后测)的混合实验设计，其中组间变量为不同群体和游戏干预方式，组内变量为测量时间。共有 118 名被试参与本研究(平均 20.55 ± 1.41 岁)，各组参与者在性别和年龄等人口学特征方面均无统计学差异，并需要进行每天 30 分钟、为期 14 天的游戏干预。根据研究计划，在游戏干预前后采用积极消极共情量表(PaNES)、亲社会倾向量表(PTM)和运动亲、反社会行为量表(PABSS)对参与者的共情、亲社会倾向和运动亲、反社会行为进行测量。 结果：（1）在前测阶段，运动员组的积极共情、消极共情和共情总分以及 PTM 量表中“匿名的”维度得分显著低于非运动员组；（2）经过视频游戏干预后，亲社会运动员组的积极共情水平提升，反社会行为(队友)水平降低；亲社会非运动员组的积极共情和共情总分提升，亲社会行为(队友和对手)水平提升；（3）中性视频游戏组参与者的各个量表得分在前后测阶段均无统计学差异。 结论：亲社会视频游戏对运动员的积极共情和在运动情境下的亲社会行为具有一定改善效果，这一结果也适用于非运动员群体。本研究提示，运动工作者在今后心理服务过程中可以通过采取适时、适当的视频游戏训练手段，以促进运动员的亲社会行为并帮助其构建良好人格品质。

Effects of prosocial video games on positive empathy and prosocial behavior in athletes

Youteng Gan, Ruohang Wang, Hongying Fan
School of Psychology, Beijing Sport University, Beijing, 100084

Abstract：Objective: The empathic ability and prosocial behavior of athletes in daily life and competition training can not only help them establish good interpersonal relationships and promote positive experiences, but also directly or indirectly affect their sports performance. The positive situations created by prosocial video games were conducive to enhancing players’ positive cognition and emotion, thus guiding the generation of prosocial behaviors. This study aimed to explore the effects of prosocial video games on positive empathy and prosocial behaviors of athletes, and to include non-athletes to compare the intervention effects. Methods: A mixed experimental design of 2(athlete/non-athlete) ×2(prosocial/neutral video game) ×2(pre-/posttest) was adopted, in which the inter-group variables were different groups and game intervention methods, and the intra-group variable was measurement time. A total of 118 participants (Mage = 20.55 years old, SD = 1.41) participated in this study, and there were no statistical differences in demographic characteristics such as sex and age among the groups, and they were required to perform a 30-minute daily play intervention for 14 days. Positive and Negative Empathy Scale (PaNES), Prosocial Tendencies Measure (PTM) and Prosaically and Antisocial Behavior in Sport Scale (PABSS) were used to measure the participants’ empathy, prosocial tendency, and sports prosocial and antisocial behavior before and after the game intervention Results: (1) In the pretest stage, the scores of positive empathy, negative empathy, total empathy and the "anonymous" dimension of PTM scale in the athletes group were significantly lower than those in the non-athletes group; (2) After the intervention of video games, the level of positive empathy of prosocial athletes group increased, the level of antisocial behavior (teammates) decreased, the total scores of positive empathy and empathy of prosocial non-athletes group increased, and the level of prosocial behavior (teammates and opponents) improved; (3) There was no significant difference in the scores of each scale between the pre-and post-test periods for the neutral video game groups. Conclusions: Prosocial video games have a certain improvement effect on positive empathy and prosocial behavior in sports situations, and this result also applies to non-athletes. This study suggests that sports workers in the future psychological service process can take

timely and appropriate video game training means to promote athletes' prosocial behavior and help them build good personality quality.

青少年心理时间之旅对其生命意义感的预测：自我连续性的中介作用

袁木子[1] 殷悦[1] 刘俊升[1] 桑标[1 2]（通讯作者）

[1]华东师范大学心理与认知科学学院，上海，200062

[2]上海市教育科学研究院，上海，200032，bsang@psy.ecnu.edu.cn

摘 要　青春期是心理健康问题的高发期，而生命意义感作为保护性因素，对于青少年的心理健康与社会适应有着积极的影响；生命意义感水平高的个体，往往也展现出更高水平的生活满意度、自尊以及更好的人际关系等等。已有研究指出，心理时间之旅，即个体主观地将自我定位到曾经历过的事件或未来的事件中的能力，能够促进其生命意义感。当个体回溯过去或者想象未来时，能够增强当下自我与过去以及未来自我的联系，提高个体所感知到的自我连续性和一致性，从而提高其生命意义感。然而，面向过去与未来的心理时间之旅是否都能够提高青少年的自我连续性和生命意义感，两种时间导向的影响是否有所不同，这些问题仍然有待探索。因此，本研究采用追踪设计，探究青少年心理时间之旅对其生命意义感的影响以及自我连续性的中介作用。研究被试为 1543 名初高中生（48%男生，M_{age}=15.02, SD_{age}=1.58），采用自我报告的形式，在 2022 年 10 月以及 2023 年 4 月分别进行了间隔约半年的两次问卷追踪。被试在 T1 时间点报告了怀旧、未来预期、生命意义感水平，并在 T2 时间点报告了自我连续性以及生命意义感水平。潜变量中介模型拟合良好，χ^2 = 1443.44, df = 308, p < .001, CFI = .96, TLI = .95, RMSEA = .05, SRMR = .06。具体来说：1）在控制了 T1 的生命意义感后，T1 的怀旧能够通过提高 T2 的自我连续性从而提高 T2 的生命意义感，同时 T1 的怀旧水平也可以直接负向预测 T2 的生命意义感；2）在控制了 T1 的生命意义感后，T1 的未来预期能够通过提高 T2 的自我连续性来提高 T2 的生命意义感，且自我连续性起到了完全中介的作用。结果说明，心理时间之旅能够通过提升青少年的自我连续性进而促进其生命意义感，但过去和未来的不同时间导向影响并不相同；尽管怀念过去或想象未来都可以让个体感受到自我的连续性和生命的意义感，但单纯的怀旧则可能对个体有着负面的影响。本研究对心理时间之旅促进青少年生命意义感的作用机制进行了探索，为提高青少年生命意义感提供了实证依据。

Adolescent Mental Time Travel Predicting Meaning in Life: The Mediating Role of Self-Continuity

Muzi YUAN[1], Yue YIN[1], Junsheng LIU[1], Biao SANG[1 2]

[1]School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China

[2]Shanghai Academy of Educational Science, Shanghai, China, 200032, bsang@psy.ecnu.edu.cn

Abstract: Adolescence is a critical developmental period with high risk of occurrence of mental health problems. As a protective factor, meaning in life has a positive impact on adolescent psychosocial adjustment. Individuals with a higher level of meaning of life tend to show a higher level of life satisfaction, self-esteem and could maintain more positive interpersonal relationships. Studies have shown that mental time travel, the ability of individuals to subjectively locate themselves to past or future events, contributes to their sense of meaning in life. When individuals look back to the past or imagine the future, the connection between the present self and the past

and future self is strengthened, which helps to improve the continuity and consistency of the individual's perceived self and subsequently enhance their meaning in life. However, it remains to be explored whether both past- and future-oriented mental time travel can improve adolescents' sense of self-continuity and meaning in life, and whether the effects of the two orientations differ from each other. Therefore, the current study utilized a longitudinal design to explore the influence of mental time travel on adolescents' meaning in life as well as the mediating role of self-continuity. A total of 1543 middle and high school students (48% male, M_{age}=15.02, SD_{age}=1.58) participated in the study. Two waves of data collection using self-report questionnaires were conducted in October 2022 and April 2023 with an interval of roughly half a year. Participants reported their levels of nostalgia, future prospection and meaning in life at T1, and self-continuity and meaning in life again at T2. The latent variable mediation model was constructed, and the results showed that the model fit data well, χ^2 = 1443.44, *df* = 308, p < .001, CFI = .96, TLI = .95, RMSEA = .05, SRMR = .06. Specifically, 1) After controlling meaning in life at T1, nostalgia at T1 could improve meaning in life at T2 by improving self-continuity at T2, and nostalgia at T1 could also directly and negatively predict meaning in life at T2; 2) After controlling meaning in life at T1, future prospection at T1 could improve meaning in life at T2 by improving self-continuity at T2, and self-continuity could fully mediate the relation between future prospection and meaning in life. The results indicate that mental time travel can promote adolescent meaning in life by enhancing their self-continuity, but the effects differ for past and future time orientations. While reminiscing about the past or imagining the future can give individuals a sense of continuity and meaning in their lives, mere nostalgia may have a negative impact on individuals. This study explores the mechanism of mental time travel in promoting adolescents' sense of meaning in life, and provides empirical evidence for improving adolescent meaning in life.

大学生特质宽恕、情感平衡与人际宽恕的关系:反刍的纵向调节作用

万 烬[1] 梁三才[2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西师范大学心理学院，西安，710062，liangsancai@snnu.cn

摘要 人际宽恕是化解人际冲突的有效途径之一，人际宽恕与幸福感和身心健康密切相关。特质宽恕作为促使个体社会适应的积极品质，对个体人际宽恕水平具有显著预测作用。同时，有研究显示个体的情感与人际宽恕密切相关，并考察了反刍思维在其中的调节作用，但较少有研究考察它们之间的纵向关系。本研究采用特质宽恕量表、积极情绪与消极情绪量表、人际侵犯动机量表和反刍思维问卷分别在 2022 年 9 月（T1）和 2022 年 12 月（T2）对 441 名大学生进行两次追踪调查，采用 Mplus8.3 软件构建纵向调节模型，旨在检验特质宽恕、情感平衡与人际宽恕的交叉滞后关系，并揭示反刍在其中的纵向调节作用。结果显示：（1）两次测试的特质宽恕、情感平衡、人际宽恕以及反刍的自回归路径均显著，显示这些变量具有跨时间稳定性。（2）T1 特质宽恕能够显著正向预测 T2 人际宽恕（β=0.145，p<0.01），T1 情感平衡能够显著负向预测 T2 人际宽恕（β=-0.113，p<0.05），T1 人际宽恕显著正向预测 T2 特质宽恕（β=0.270，p<0.001）。（3）控制性别、年龄和 T1 人际宽恕等变量后，反刍显著调节了 T1 特质宽恕到 T2 人际宽恕之间的交叉滞后路径（β=0.154，p<0.01）。简单斜率检验显示，高反刍条件下，T1 特质宽恕对 T2 人际宽恕的预测作用更大。这些结果说明，大学生特质宽恕、情感平衡与人际宽恕之间存在纵向关系，并且反刍缓冲了特质宽恕对人际宽恕的纵向影响。

Undergraduates' Trait Forgiveness, Affect Balance, and Interpersonal

Forgiveness: Longitudinal Moderating Role of Rumination

Wan Jin[1] Liang Sancai[2]

School of psychology, Shaanxi Normal University, Xi'an, 710062, China

***Abstract*:** Interpersonal forgiveness is one of the effective ways to resolve interpersonal conflicts, and interpersonal forgiveness is closely related to well-being and physical and mental health. Trait forgiveness, as a positive quality that contributes to an individual's social adaptation, is a significant predictor of an individual's level of interpersonal forgiveness. Meanwhile, some studies have shown that individuals' emotions are closely related to interpersonal forgiveness and examined the moderating role of rumination, but fewer studies have examined the longitudinal relationship between them. In this study, the Trait Forgiveness Scale, Positive and Negative Emotions Scale, Interpersonal Aggression Motivation Scale, and Rumination Thinking Questionnaire were used to conduct two follow-up surveys on 423 undergraduate students in September 2022 (T1) and December 2022 (T2), respectively, and the longitudinal moderation model was constructed by using the Mplus 8.3 software with the aim of examining cross-lagged relationships among trait forgiveness, affect balance, and interpersonal forgiveness. and to reveal the longitudinal moderate role of rumination in it. The results showed that (1) the autoregressive paths of trait forgiveness, affect balance, interpersonal forgiveness, and rumination were significant for both tests, indicating that these variables were stable across time. (2) T1 trait forgiveness significantly positively predicted T2 interpersonal forgiveness (β=0.164, $p<0.01$), T1 affect balance significantly negatively predicted T2 interpersonal forgiveness (β=-0.118, $p<0.05$), and T1 interpersonal forgiveness significantly positively predicted T2 trait forgiveness (β=0.492, $p<0.01$). (3) Controlling for variables such as gender, age, and T1 interpersonal forgiveness, rumination significantly moderated the cross-lagged path from T1 trait forgiveness to T2 interpersonal forgiveness (β=0.164, $p<0.01$). A simple slope test showed that T1 trait forgiveness was a greater predictor of T2 interpersonal forgiveness in the high rumination condition. These results suggest that there is a longitudinal relationship between trait forgiveness, affect balance, and interpersonal forgiveness among undergraduates and that rumination buffers the longitudinal effects of trait forgiveness on interpersonal forgiveness.

生命意义内隐认知的情境依赖性—自我与他人视角

李宁[1,2] 丁凤琴[1]（通讯作者） 宋秀萍[1]

1 宁夏大学教师教育学院心理学系，银川，750000

2 宁夏精神卫生中心，宁安医院，银川，750000

通讯作者 dingfqin@nxu.edu.cn

摘 要 生命意义包括认知、动机和情感三个维度。以往研究大多采用外显的方法探究其认知与动机维度，缺乏对生命意义情感维度和内隐认知的研究。另外生命意义会随着情境和自我—他人视角的不同而发生动态改变和调整，但尚不知生命意义的内隐认知是否会因情境中自我—他人视角不同而产生不同结果。本研究利用 ERP 技术，通过 3 个递进实验，从生命意义的三个维度探讨生命意义的内隐认知效应。方法：实验 1 利用情感错误归因范式(AMP)，探讨生命意义的内隐认知及其神经机制；实验 2 在实验 1 的基础上，采用评价启动范式(EPT)，加入自我—他人视角差异的研究；实验 3 在实验 2 的基础上，采用句子启动范式(SPP)，探讨不同情境下个体的自我—他人生命意义的内隐认知。结果：(1)当生命意义词词性为积极词汇时，被试对追寻维度愉悦度的反应概率大于存在维度；当生命意义词词性为消极词汇时，被试对追寻维度愉悦度的反应概率与存在维度无显著差异。相比于存在维度，追寻维度在脑区诱发的 P100、N170、P300、

N400 成分的脑电波波幅更正；相比于消极词汇，积极词汇在脑区诱发的 P100、N170、P300、N400 成分的脑电波波幅更正；(2)启动自我词汇后，被试对生命意义追寻维度的积极词汇联结更快。自我启动条件下，生命意义追寻维度积极词汇产生的 P100 波幅显著正于消极词汇，他人启动条件下，生命意义追寻维度的积极与消极词汇产生的 P100 波幅无差异；(3)自我奉献情境启动条件下，个体对生命意义追寻维度的积极词汇联结更快；自我损害情境启动条件下，个体对生命意义追寻维度的消极词汇联结更快；而无论是他人奉献情境还是他人损害情境，个体对生命意义追寻维度的积极词汇以及消极词汇的判断均无显著差异。结论：生命意义的内隐认知效应存在，并且生命意义追寻维度的内隐认知随着不同主体(自我—他人)和不同情境(奉献—损害)的变化而变化。这为后续开展生命意义教育，提高个体生命意义认知提供了实践指导。

关键词：生命意义，内隐认知，自我—他人视角，情境依赖性

Situational Dependence of Implicit Cognition of the Meaning in Life -- Self and other Perspectives

Ning Li[1, 2], Fengqin Ding[1*], and Xiuping Song[1]

[1] Department of Psychology, Institute of Teacher Education, Ningxia University, Yinchuan, China

[2] Ningxia Provincial Mental Health Center, Ningan Hospital,Yinchuan, China

Abstract: Meaning in life encompasses cognitive, motivational, and emotional dimensions. Previous research has mostly focused on the explicit exploration of cognitive and motivational dimensions, lacking investigation into the emotional dimension and implicit cognition of meaning in life. Furthermore, meaning in life dynamically changes and adjusts with different contexts and self-other perspectives, but it remains unknown whether situational differences in self-other perspectives yield different results in implicit cognitive processes of meaning in life. In this study, utilizing ERP (event-related potentials) technology, we examined the implicit cognitive effects of meaning in life from its three dimensions through three progressive experiments. Method: Experiment 1 employed the Affective Misattribution Paradigm (AMP) to investigate the implicit cognition and neural mechanisms of meaning in life. Building upon Experiment 1, Experiment 2 employed the Evaluative Priming Paradigm (EPT) to study the self-other perspective differences. Experiment 3, based on Experiment 2, employed the Sentence Priming Paradigm (SPP) to explore the implicit cognitive processes of self-other meaning in life in different contexts. Results: (1) When the valence of the meaning in life words was positive, participants showed a higher probability of responding with pleasantness for the pursuit dimension compared to the existence dimension. When the valence of the meaning in life words was negative, there was no significant difference in the probability of responding with pleasantness between the pursuit and existence dimensions. Compared to the existence dimension, the amplitude of P100, N170, P300, and N400 components of brainwaves induced in the pursuit dimension was more positive. Compared to negative words, positive words induced more positive amplitudes of P100, N170, P300, and N400 components of brainwaves. (2) After self-priming, participants demonstrated faster associations between positive words and the pursuit dimension of meaning in life. Under self-priming conditions, the P100 amplitude of brainwaves induced by positive words in the pursuit dimension was significantly more positive than that of negative words. Under other-priming conditions, there was no significant difference in the P100 amplitude of brainwaves induced by positive and negative words in the pursuit dimension. (3) Under self-devotion context priming conditions, individuals formed faster associations between positive words and the pursuit dimension of meaning in life. Under self-harm context priming conditions, individuals formed faster associations between negative words and the pursuit dimension of meaning in life. However, whether it was under other-devotion or other-harm context priming conditions, there were no significant differences in the judgment of positive and

negative words regarding the pursuit dimension of meaning in life. Conclusion: Implicit cognitive effects of meaning in life exist, and the implicit cognition of the pursuit dimension of meaning in life varies with different subjects (self-other) and contexts (devotion-harm). This provides practical guidance for future meaning in life education and improving individual meaning in life cognition.

Keywords: Meaning in life, implicit cognition, self-other perspective, situational dependence

乐观偏差的影响因素与作用：基于 COVID-19 背景的研究

吕丹诺[1] 盖笑松[1, 2]（通讯作者）

1 东北师范大学心理学院，长春，130024

2 吉林省普通高等学校人文社会科学重点研究基地东北师范大学心理健康教育研究中心，长春，130024，

通讯作者 E-mail：gaixs669@nenu.edu.cn

摘 要 乐观偏差是指人们普遍相信自己会比其他人经历更多的积极事件、更少的消极事件。以往关于乐观偏差的研究多依赖于假设的事件或情景，这些事件与场景可能与研究的参与者没有任何直接联系。本研究拟以中国 COVID-19（Corona Virus Disease 2019）疫情发展的两个关键时间点为背景，考察乐观偏差的影响因素及结果。研究 1 于 2020 年 2 月疫情突发阶段对全国范围内 4313 名被试施测，使用直接比较法和间接比较法测量被试对 COVID-19 的乐观偏差，使用《生活取向量表》测量被试的气质性乐观，并收集了施测时间范围内媒体报道的全国每日新增确诊、疑似及死亡病例数量。结果表明人们对 COVID-19 存在普遍的乐观偏差，且气质性乐观的乐观维度正向预测乐观偏差。此外，媒体报道的每日新增确诊病例及疑似病例对乐观偏差有正向的预测作用。研究 2 于 2022 年 12 月感染普及化阶段对全国范围内 1767 名被试施测，使用直接比较法和间接比较法测量被试对 COVID-19 的乐观偏差，使用自编的《COVID-19 疫情时期行为改变量表》测量被试在疫情时期采取的防护行为水平、《COVID-19 感知严重性量表》测量被试对疫情感知到的主观严重性、《COVID-19 焦虑量表》测量疫情引发的焦虑感，并收集了被试社会关系成员中已感染的人数。结果发现在感染普及化阶段人们依然存在乐观偏差，但相较于疫情突发阶段乐观偏差的程度显著降低。被试社会关系中的感染人数负向预测被试的乐观偏差，而人们感知到的 COVID-19 严重性正向预测人们的乐观偏差。乐观偏差不仅在 COVID-19 感知严重性与 COVID-19 焦虑感之间发挥调节作用，降低了感知严重性对焦虑感的正向预测；乐观偏差还在 COVID-19 感知严重性与新冠疫情时期防护行为间发挥部分中介作用，感知严重性可以通过提高乐观偏差正向预测防护行为。该研究表明，在公共卫生事件中乐观偏差在生理和心理上具有保护作用。

关键词 乐观偏差，COVID-19，气质性乐观

Determinants and effects of optimism bias: A study in the context of COVID-19

Dannuo Lyu[1] Xiaosong Gai[1, 2]

1 School of Psychology, Northeast Normal University, Changchun, Jilin Province, China

2 Research Center of Mental Health Education in Northeast Normal University, Key Research Institute of Humanities and Social Science in Universities in Jilin Province, Changchun, Jilin Province, China

Abstract： Optimism bias is the general belief that people will experience more positive events and fewer negative events than other people. Previous studies of optimism bias have relied on hypothetical events or scenarios that may not be directly relevant to the participants in the study. This study aimed to investigate the determinants and outcomes of optimism bias at two critical points during the COVID-19 epidemic in China. The researchers conducted Study 1 (N=4313) during the initial outbreak in February 2020. The direct and indirect comparison methods were used to measure participants' optimism bias towards COVID-19. The Life Orientation Scale was used to measure participants' dispositional optimism during the outbreak. The number of daily confirmed cases, daily suspected cases and daily deaths in China were also collected during the first test period. The results showed that people had an optimism bias for COVID-19. The optimism dimension of dispositional optimism positively predicted the optimism bias. In addition, media reports of new confirmed and suspected cases positively predicted optimism bias. Study 2 (N=1767) was conducted during the Omicron outbreak in December 2022. The direct and indirect comparison methods were used to measure participants' optimism bias towards COVID-19. The self-designed Behaviour Change Scale during COVID-19 was used to measure participants' level of protective behaviour, the Perceived Severity Scale of COVID-19 was used to measure participants' perceived severity of the consequences of COVID-19, and the Anxiety Scale of COVID-19 was used to measure anxiety caused by COVID-19. The results showed that there was still an optimism bias compared to the initial outbreak, but to a lesser extent. The number of infections in participants' social relations negatively predicted optimism bias, while the perceived severity of COVID-19 consequences positively predicted optimism bias. Optimism bias may decrease the positive prediction of anxiety by perceived severity, and perceived severity may positively predict protective behaviour by increasing optimism bias. The study demonstrates that optimism bias is physically and psychologically protective during public health events.

身心锻炼改善轻度认知功能障碍老年人的认知和脑功能

蒋长好[1]（通讯作者） 戴元富[2]

1 首都体育学院运动脑成像研究中心，北京，100191，jiangchanghao@cupes.edu.cn

2 首都体育学院运动科学与健康学院，北京，100191

摘 要 轻度认知功能障碍(Mild Cognitive Impairment, MCI)是介于正常老化和痴呆之间的一种临床状态。中国 60 岁及以上人群中，MCI 患病率估计为 15.5%，即中国有 3,877 万人患有轻度认知障碍。MCI 主要表现为认知功能下降，向老年痴呆转化的风险高且缺乏有效的药物治疗手段。通过早期干预治疗 MCI 可以恢复至正常认知状态，其恢复率可以到达 25～30%。

已有研究显示，身心锻炼有助于改善 MCI 老年人认知，而且身心锻炼对 MCI 老年人认知影响还有选择性，身心锻炼可显著改善注意、记忆以及执行功能。但对认知加工速度的影响不明显。身心锻炼改善 MCI 老年人认知功能还存在剂量效应关系，中等强度锻炼对 MCI 老年人的认知改善效果更好，至少 4 周、每周

3-4 次的中等频率干预比每周 1-2 次的低频率的干预效果更大。而且身心锻炼对认知的影响是动态变化的，锻炼认知效益依赖于干预时间。脑影像研究发现，身心锻炼有助于提高 MCI 老年人的脑功能激活、改善脑网络活动模式，提高认知功能，逆转老化的不良影响。身心锻炼还可改变大脑结构，提高额区容量和白质完整性，并能改变海马形态学特征。

总体而言，已有研究尚存在以下需要进一步解决的问题。一是样本量小、结果测量的异质性和缺少对 MCI 老年人认知功能的锻炼效益的系统分析等问题。因此，进一步的研究应扩大样本量并分离认知功能的主要成分，深入探讨身心锻炼对 MCI 老年人认知功能不同子成分的影响。二是当前关于干预强度、频率、干预周期及认知效应的延续效果的研究仍然偏少，一些研究采用横断研究，难以做出因果推断，因此需要更多的干预研究进一步揭示身心锻炼改善 MCI 老年人认知功能的量效关系。三是已有研究大多聚焦于身心锻炼影响 MCI 老年人认知功能的脑神经机制，而关于身心锻炼影响认知功能和脑可塑性的时间进程特征和累积效应的研究相对更少，一些研究结论也不尽一致，相关研究还需要进一步加强。

Physical and mental exercise improves cognition and brain function in older adults with mild cognitive impairment

Changhao JIANG[1]　Yuanfu DAI[2]

1 The Center of Neuroscience and Sports, Capital University of Physical Education and Sports, Beijing

2 School of Kinesiology and Health, Capital University of Physical Education and Sports, Beijing

Abstract：Mild Cognitive Impairment (MCI) is a clinical state between normal aging and dementia. The prevalence of MCI is estimated to be 15.5% among people aged 60 years and above in China, which means that 38.77 million people in China suffer from mild cognitive impairment.MCI is mainly manifested by cognitive decline, with a high risk of transitioning to dementia and a lack of effective pharmacological treatments. Through early intervention, MCI can be restored to a normal cognitive state, with a recovery rate of 25-30%.

Many studies have shown that physical and mental exercise can help improve cognition in older adults with MCI, and the effects of physical and mental exercise on cognition in older adults with MCI are also selective, as physical and mental exercise can significantly improve attention, memory, and executive function. However, the effect on cognitive processing speed was not significant. There was also a dose-effect relationship between physical and mental exercise on improving cognitive function in older adults with MCI. Moderate-intensity exercise had a better effect on cognitive improvement in older adults with MCI, and moderate-frequency interventions of at least 4 weeks, 3-4 times per week, had a greater effect than interventions with a lower frequency of 1-2 times per week. Moreover, the effects of physical and mental exercise on cognition were dynamic, with exercise cognitive benefits dependent on the duration of the intervention. Brain imaging studies have found that physical and mental exercise helps to increase functional brain activation, improve brain network activity patterns, improve cognitive function, and reverse the adverse effects of aging in older adults with MCI. Physical and mental exercise also altered brain structure, improved frontal area volume and white matter integrity, and altered hippocampal morphological features.

Overall, the following issues exist in the existing studies that need to be further addressed. One is the small sample size, heterogeneity of outcome measures, and lack of systematic analyses of the benefits of exercise on cognitive function in older adults with MCI. Therefore, further studies should expand the sample size and isolate the major components of cognitive functioning to explore in depth the effects of physical and mental exercise on different

subcomponents of cognitive functioning in older adults with MCI. Secondly, current studies on the intensity, frequency, period of intervention and the continuation effect of cognitive effects are still scarce, and some studies have used cross-sectional studies, which makes it difficult to make causal inferences; therefore, more intervention studies are needed to further reveal the quantitative-effective relationship between physical and mental exercise to improve cognitive function in older adults with MCI. Thirdly, most of the existing studies focus on the brain-neural mechanism of physical and mental exercise affecting cognitive function in older adults with MCI, while there are relatively few studies on the time course characteristics and cumulative effects of physical and mental exercise affecting cognitive function and brain plasticity, and the conclusions of some studies are inconsistent, so the relevant studies need to be further strengthened.

摘 要：近年来，音乐治疗在我国戒毒工作中居于重要地位，国内文献关于音乐教育治疗对戒毒影响涉及音乐对心理健康、康复、症状缓解等心理效用的研究。研究音乐戒毒心理效果主要有三种研究路径：与常模对照；同组干预前后对照；实验组和干预组对照。音乐治疗心理效果评定量表主要包括 SCL-90,SAS,SDS 等，采用的统计技术主要为 t 分数显著性检验方法，现有研究均未涉及音乐治疗对戒毒人员心理影响的效应值评价。由于音乐治疗对戒毒心理影响的效应值评价目前存在缺失，研究者筛选出 16 篇关于音乐戒毒效果的实证研究，对效应值进行分析，研究发现：（1）6 篇涉及音乐治疗对戒毒人员焦虑影响的 SAS 研究中，cohen'd 的效应值 2 篇为高效应值，效应值分别为 0.88、0.899；2 篇为中效应值，效应值分别为 0.655、0.770；2 篇为低效应值。（2）7 篇涉及音乐治疗对戒毒人员抑郁影响的 SDS 研究中,cohen'd 的效应值 4 篇为中效应值，效应值分别为 0.797、0.69、0.645、0.588；三篇为低效应值。（3）2 篇音乐治疗对戒毒人员 SCL-90 影响中,样本大于 50 的 cohen'd 的效应值检验，音乐治疗只对抑郁分量表产生效应值为 0.5 的中等影响；在小样本研究中，采用 Hedges' g 效应值检验，发现音乐治疗只对敌对、恐怖、精神病性三个维度产生中等效应值的影响，值分别为 0.74,0.52,0.66。本研究揭示，音乐教育对戒毒人员心理健康影响，治疗焦虑的效果最优；治疗抑郁取得效果中等，心理评定量表 SCL-90 的治疗主要对抑郁、敌对、恐怖、精神病性产生作用。效应值研究与原作者的 t 检验方法表现出不同的结果，揭示效应值对深入研究音乐治疗效果的重要意义，未来需要作进一步整合 cohen'd 的研究。

童年中期欺凌行为对同伴接纳、同伴拒绝的影响：班级地位等级性的作用

张洁　张梦园　潘斌　李腾飞　纪林芹　张文新（通讯作者）
山东师范大学心理学院，　济南，　250014，zhangwenxin@sdnu.edu.cn

摘 要　通常而言，欺凌行为与较低同伴接纳、较高同伴拒绝相关联。班级地位等级性反映了个体在班级中地位和权力的分布情况，并可能调节欺凌行为与同伴地位之间的关系。机能主义的观点认为，在高地位等级性的班级中，欺凌行为会破坏班级中的等级、秩序，不被同伴接纳且遭受更多同伴拒绝；权力均衡的观点则认为，在高地位等级性的班级中，欺凌行为是一种获取和维持地位的合理手段，会被同伴接纳且较少受到同伴拒绝。本研究旨在进一步检验关于班级地位等级性调节欺凌行为与同伴地位关系的两种竞争性假说。本研究以班级为单位抽取 4 所小学 29 个班级的 1174 名 3 年级（n = 615, 46.5%女生, 平均年龄 9.29 ± 0.40 岁）和 4 年级儿童（n = 559, 44.9%女生, 平均年龄 10.31 ± 0.40 岁）进行为期一年两时间点的追踪，考察欺凌行为与同伴接纳、同伴拒绝的纵向关系以及班级地位等级性的调节作用。结果发现：（1）欺凌行为会导致一年后同伴接纳的降低和同伴拒绝的增加；（2）班级地位等级性调节欺凌行为与随后同伴拒绝的关系，在地位等级性较低的班级中，欺凌行为会预测同伴拒绝的增加，在地位等级性较高的班级中，欺凌行为与同伴拒绝无显著关联。这一结果揭示了中国文化背景下欺凌行为与同伴接纳、同伴拒绝的关系，支持了权力均衡的假说，表明较高地位等级性会降低欺凌行为的代价。

The Effect of Bullying Behavior on Peer acceptance and Peer Rejection: The Role of Classroom Status Hierarchy

Jie Zhang, Mengyuan Zhang, Bin Pan, Tengfei Li, Linqin Ji, Wenxin Zhang
School of Psychology, Shandong Normal University, Jinan, 250014

Abstract：Children who bully others are often less accepted and more rejected by peers. The power and status distribution in the classroom (i.e., classroom status hierarchy) might moderate the association between bullying and peer acceptance/rejection. From a functionalist perspective, in the hierarchical environment, bullying is recognized as a behavior that damage the social order, thereby leading to less acceptance and more rejection. On the contrary, the balance of power perspective argues that the hierarchical context may evoke competition for power and status. In such a context, bullying behavior could be seen as a legitimate means to maintain and reinforce one's status within the group, resulting in less rejection. To clarify these two contrasting views, the current study was to examine the moderating role of classroom status hierarchy in the longitudinal association between bullying and peer acceptance and rejection. The sample of this study was 1,174 children attending grade 3 (n = 615, 46.5% girls, M_{age} = 9.29 years, SD = 0.40) and grade 4 (n = 559, 44.9% girls, M_{age} = 10.31 years, SD = 0.40) from 29 classes in 4 primary schools. Two waves of data were collected in the spring semester of 2018 and 2019. The results revealed that (1) bullying behavior led to decreases in peer acceptance and increases in peer rejection over one year; and (2) classroom status hierarchy moderated the longitudinal association between bullying behavior and peer rejection — bullying behavior was associated with the increases in peer rejection only in the classrooms with a low level of the status hierarchy, but not in the classrooms with a high level of status hierarchy. The results in current study provide a support for the balance of power perspective, indicating that hierarchical structure within classrooms might reduce the costs of bullying.

摘 要 中学阶段是青少年的关键过渡期，也是各种适应挑战的高发期。青少年受欺凌和抑郁症状因其发生率高而成为全世界现阶段青少年健康发展的主要威胁。青少年受欺凌指的是反复发生的故意伤害和无法保护自己的事件，与抑郁症状的相关性比许多其他社会心理适应问题更大。已有大量的研究发现青少年受欺凌和抑郁往往同时发生。尽管探究受欺凌和抑郁关系的研究很多，但尚未有研究从症状层面探究青少年受欺凌和抑郁之间的相互关系，去揭示受欺凌和抑郁的纵向症状关联模式。因此，本研究借助交叉滞后网络的分析方法，探讨青少年受欺凌类型与不同抑郁症状之间的因果关系。

本研究采用 Olweus 受欺凌量表和儿童抑郁指数量表对 1130 名中学生进行四次追踪调查，首先应用最小绝对收缩和选择算子(LASSO)构建 T1 到 T2，T2 到 T3，T3 到 T4 三个交叉滞后网络，然后进行中心性估计，计算网络的出度预期影响指数(out ExpectedInfluence, outEI)和入度预期影响指数(in ExpectedInfluence, inEI)，最后，采用 bootstrap 进行边线准确性估计以及采用构建子集(subsetting bootstrap)的方法对中心性进行检验，以评估网络的稳定性。研究结果显示：（1）在受欺凌和抑郁的交叉滞后网络中，在受欺凌症状簇内不同类型受欺凌间和抑郁症状簇内不同抑郁症状间在时间历程中存在相互预测、互为因果的关系；在受欺凌和抑郁症状簇间更多的体现为抑郁症状激发个体受欺凌，支持了症状驱动模型理论；（2）在三个交叉滞后网络中，快感缺失的出度预期影响最高，言语受欺凌和关系受欺凌的是受到其他节点影响最多，入度预期影响最高；（3）中心性指标的稳定性系数均大于 0.25，表明网络具有较好的稳定性。研究结果表明快感缺少对青少年受欺凌的独特作用，揭示了青少年受欺凌和抑郁之间的复杂与深层次关系，为未来实现“精准干预”提供可能。

A Cross-lagged Panel Network of the Peer Victimization and Depression in Adolescents

Zhang Libin, Wang Chenxu, Yang yang, Liang Wenyu, Zhou Yukai, Yang Yanan，Zhang Yunyun
Beijing Normal University
Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing, 100875

Abstract：Secondary school is a critical transition period for adolescents and a time of high incidence of various adjustment challenges. Peer victimization and depressive symptoms are major threats to the healthy development of adolescents at this stage of life worldwide due to their high prevalence. Peer victimization, which refers to repeated incidents of intentional victimization and inability to protect oneself, is more associated with depressive symptoms than many other psychosocial adjustment problems. Numerous studies have been conducted to find that peer victimization and depression often co-occur in adolescents. Although there are many studies exploring the relationship between peer victimization and depression, no study has yet explored their longitudinal interrelationships at the symptom level. Therefore, the present study examined the causal relationship between peer victimization and different depressive symptoms in adolescents by using cross-lagged network analysis.

In this study, 1130 secondary school students were followed up four times using the Olweus Bullying Scale and the Childhood Depression Index Scale. Firstly, the least absolute shrinkage and selection operator (LASSO) was applied to construct three cross-lagged networks from T1 to T2, T2 to T3, and T3 to T4. Then centrality estimation was performed to compute the network's out-ExpectedInfluence (outEI), and in-ExpectedInfluence (inEI). Finally, a bootstrap is used for edge accuracy estimation as well as a centrality test using a subsetting bootstrap to assess the stability of the network. The results showed that: (1) In the cross-lagged network analysis of peer victimization and depression, a bidirectional predictive and causal relationship was observed among different subtypes of victimization within the bullying victimization cluster, as well as among various depressive symptoms within the depression clusters. Between the different clusters of peer victimization and depression, more depressive symptoms leads to individuals being bullied, which supports the symptom-driven model theory; (2) In the three cross-lagged networks, Anhedonia had the highest out-expected influence centrality, verbal victimization and relational victimization were the most affected by other nodes, and the in- expected influence centrality was the highest; (3) the stability coefficients of the centrality indexes were all greater than 0.25, which indicated that the networks had good stability. The research findings indicate that Anhedonia have a unique effect on bullying victimization among adolescents, revealing the complex and underlying relationship between peer victimization and depression, providing possibilities for targeted peer victimization intervention.

2 浙江省哲学社会科学培育实验室“杭州师范大学婴幼儿发展与托育实验室”

摘 要 校园欺凌作为一种创伤事件，会导致中学生出现诸多消极心理反应，如孤独感。孤独感是指当个体知觉到自己的社交关系并非自己所期待的，无法从社会交往中获得满足感，从而产生的不愉快的情绪体验，是导致个体出现手机依赖、网络成瘾等诸多消极后果的风险因素。因此，为探究受欺凌中学生孤独感的发展轨迹及其影响因素，提供针对性的干预措施，提升其心理健康水平，本研究采用追踪研究设计，分别在 2019 年 11 月，2020 年 11 月，2021 年 11 月三个时间点，采用中文版特拉华受欺负量表（学生版）、孤独感量表、中文版多伦多述情障碍量表、领悟社会支持量表和师生关系量表对 2173 名中学生进行调查，并根据问卷应答结果筛选出 725 名有受欺凌经历的中学生进行混合增长模型和多元 logistic 回归分析。结果发现，受欺凌中学生存在 4 种异质性的发展轨迹，分别是高水平组、高-缓慢下降组、中等-稳定组和低水平组。以中等-稳定组作为参照组进行分析，结果显示，女生、社会支持水平较高、师生关系水平较高的中学生更可能有低水平的孤独感发展轨迹；年龄越小的中学生属于低水平组的概率越小；述情障碍水平越高的中学生越有可能属于高水平组或高-缓慢下降组。这些结果说明，中学生受到欺凌后，孤独感存在异质性的发展轨迹，人口学变量、述情障碍、社会支持、师生关系是重要的影响因素。

2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract: Middle school students who experienced school bullying, a traumatic event, were more likely to show psychological problems, such as loneliness. It refers to the perception of deficiency when one feels that interpersonal relationship networks are smaller or less satisfying than those that are desired. Previous studies have shown that loneliness was the risk factor for many problems like mobile phone dependence and internet addiction. In order to investigate the developmental trajectory of loneliness and its relevant factors among middle school students who were bullied, develop targeted interventions improving their well-being, the present study adopted a longitudinal design in November 2019, November 2020, and November 2021. A total of 2173 middle school students were administered five scales: the Delaware Bullying Victimization Scale, loneliness scale, Toronto Alexithymia Scale, Received Social Support Questionnaire, and Student-Teacher Relationship Scale. Then 725 middle school students who had been bullied were screen out through the questionnaire results to analysis, with growth mixture model and multiple logistic regression. We found four heterogeneous developmental trajectory of loneliness among middle school students who were bullied, including High, High-Decreasing slowly, Medium-Stable, and Low group. The Medium-Stable group was taken as the reference group. Students who were female, or had higher level of social support and student-teacher relationship were more likely to have low level of developmental trajectory of loneliness. Students who were younger were less likely to belong in the Low group. Students with high level of alexithymia were more likely to belong in the High and High-Decreasing slowly group. These findings indicated that the developmental trajectory of loneliness among students who were bullied were heterogeneous, demographic factors, alexithymia, social support, and student-teacher relationship were important factors.

班级友谊网络中社会距离与个体受欺凌的关系：基于社会网络分析的研究

刘海东[1]　张其文[1]　张云运[1]（通讯作者）
1 北京师范大学中国基础教育质量监测协同创新中心，北京，100875，yyzhangff@126.com

摘 要　欺凌不仅是单纯的攻击行为，而且是具有社会意义的权力地位竞争行为，与其所在的同伴生态密切关联。根据社会网络的强弱联结理论，对青少年同伴生态的考察不仅要考虑强联结（如：朋友），也应该关注弱联结（如：与网络中其他人的联系），两种关系都可能会对青少年的行为产生重要影响。但已有研究主要聚焦于朋友关系（强联结）对个体受欺凌的保护作用，忽略了对弱联结保护作用的探讨。关注友谊网络中弱联结对受欺凌的影响，能找到班级中保护受欺凌者的社会因素，更加有效地防止个体受欺凌，改变欺凌发生的生态土壤。社会网络分析能够同时关注到个体特征和其所处的网络结构位置，能够更好地探究青少年友谊网络的弱联结对受欺凌的影响。本研究采用社会网络视角，基于对 1362 名七年级学生为期两年四个时间点的班级友谊网络进行追踪，考察班级友谊网络中个体与同班三种最高社会地位的同伴之间的社会距离，与其自身受欺凌的关系。结果发现：（1）个体与中介中心度最高的同伴的社会距离与个体受欺凌相互正向预测，表现为七年级下学期的社会距离正向预测八年级上学期的个体受欺凌，八年级上

学期的个体受欺凌正向预测八年级下学期的社会距离；（2）个体与接近中心度最高的同伴的社会距离与个体受欺凌相互正向预测，表现为七年级上学期的社会距离正向预测七年级下学期的个体受欺凌，七年级下学期的社会距离正向预测八年级上学期的个体受欺凌；（3）个体与度中心度最高的同伴的社会距离，对个体受欺凌没有影响。以上结果表明，与不同高社会地位同伴的社会距离对个体受欺凌的作用不同，个体与中介中心度最高、接近中心度最高的同伴在友谊网络中的社会距离越短，越不容易受欺凌；但与度中心度最高的同伴的社会距离对个体受欺凌没有影响。该研究发现了友谊网络中弱联结对于个体受欺凌的重要作用，揭示了与不同高社会地位同伴的社会距离对个体受欺凌的保护作用存在差异，为青少年同伴群体中的欺凌预防提供了启示。

The relationship between social distance and individual bullying in the classroom friendship networks: A social network-based study

Haidong Liu, Qiwen Zhang, Yunyun Zhang
China basic education quality monitoring Collaborative Innovation Center, Beijing Normal University

***Abstract*：** Bullying is a social process based on peer relationships that occurs not as a mere act of aggression, but as a socially significant struggle for a position of power. The examination of bullying should be placed in the context of the entire peer ecology. The strong and weak tie theory of social networks suggests that not only strong ties (e.g., friends) but also weak ties (e.g., connections to others in the network) should be considered in the examination of adolescents' network relationships, and that both types of relationships may have a significant impact on adolescents' behavior. However, existing studies have mainly focused on the protective effects of friendships (strong tie) on individuals being bullied, neglecting to explore the protective effects of weak ties. Focusing on the effects of weak tie in friendship networks on bullying can identify social factors that protect bullied individuals in the classroom, more effectively prevent individuals from being bullied, and change the ecology in which bullying occurs. Social network analysis, which can focus on both the attribute characteristics of individuals and the network structure in which they are embedded, is better able to explore the impact of weak ties in adolescents' friendship networks on bullying. Using social network analysis, we used a sample of 1362 seventh-grade students who were followed over two years at four time points to examine the association between the social distance and bullying. The findings as follow: (1) the social distance between individuals and peer of the highest betweenness-centrality degree and individual bullying were positively predicted by each other, as evidenced by social distance in the second semester of seventh grade positively predicting individual bullying in the first semester of eighth grade, and individual bullying in the first semester of eighth grade positively predicting social distance in the second semester of eighth grade; (2) the social distance between individuals and peer of the highest closeness-centrality degree and individual bullying were positively predicted by each other, as evidenced by social distance in the first semester of seventh grade positively predicting individual bullying in the second semester of seventh grade, and social distance in the second semester of seventh grade positively predicting individual bullying in the first semester of eighth grade; (3) the social distance between the individual and the peer with the highest degree centrality has no effect on the individual being bullied. This This study identified the important role of weak tie in classroom friendship networks for individual bullying, revealed differences in the protective effect of distance from peers of different high social status on individual bullying, and provided insights into bullying prevention in adolescent peer groups.

儿童青少年的攻击与同伴侵害：共同发展及对内化问题、执行功能的影响

翟欣　马建平　袁媛　纪林芹（通讯作者）

山东师范大学心理学院，济南，250014，sdjlq@126.com

摘 要 本研究采用平行过程的潜类别增长分析，探究攻击与同伴侵害的联合发展轨迹，及其对内化问题和执行功能发展的影响，以及潜在的中介效应。通过对 646 名 5 年级儿童（平均年龄 10.53 ± 0.59 岁，男生占比 57.1%）历时 2 年的 4 次追踪测量，结果发现：（1）攻击与同伴侵害的联合发展轨迹包括攻击-受侵害上升组、攻击-受侵害组、攻击组、受侵害组和未参与组 5 类；（2）对于内化问题，攻击-受侵害上升组的初始水平显著高于未参与组，但低于攻击-受侵害组、攻击组和受侵害组，增长速率均显著高于其他各组；攻击-受侵害组的初始水平显著高于未参与组、攻击组和受侵害组；攻击组的初始水平显著高于未参与组和受侵害组，且与未参与组相比下降速率显著；受侵害组的初始水平显著高于未参与组；（3）对于抑制控制，攻击-受侵害上升组的初始水平显著低于未参与组；攻击-受侵害组的初始水平显著低于未参与组、攻击-受侵害上升组、攻击组和受侵害组；攻击组的初始水平显著低于未参与组；（4）内化问题对随后的抑制控制具有显著的预测作用，T2 内化问题显著负向预测 T3 的抑制控制，T3 内化问题显著负向预测 T4 的抑制控制；以未参与组为参照组，T3 内化问题在攻击-受侵害上升组和 T4 抑制控制间起中介作用，T3 内化问题在攻击-受侵害组和 T4 抑制控制间起中介作用。本研究结果表明存在持续经历攻击行为和同伴侵害的“攻击-受侵害”亚群体，其伴随着最严重的内化问题和抑制控制缺陷，同时发展结果间的作用机制也为攻击事件的防治提供了潜在思路。

Joint Developmental Trajectories of Aggression and Victimization from Late Childhood to Early Adolescence and Associations with Internalizing Problems and Executive Functions

ZHAI Xin, MA Jianping, YUAN Yuan, JI Linqin

School of Psychology, Shandong Normal University, Jinan 250014, China

Abstract: Aggressive behavior among children and adolescents is a prevalent and pervasive public health concern across the globe. Whether as aggressor or victim, involvement in aggression is associated with negative consequences for youths' psychosocial adjustment. However, only a smaller body of work has demonstrated that relations between aggression perpetration and victimization are far more heterogenous. Some youths are both perpetrators and victims of peer aggression, which are conceptualized as aggressive victims. Compared to "pure" victims and aggressors, aggressive victims have the highest risk of health problems. Therefore, the present study

aimed to identify and characterize the joint developmental trajectories of aggression and victimization, and examine the adjustment outcomes for different subgroups. Additionally, the potential mechanism of group membership on adjustment outcomes was also considered.

The joint development of trajectories of aggression and peer victimization from Grade 5 to Grade 6 and predictive associations with child- and parent-reported adjustment outcomes (internalizing problems and inhibitory control as key component of executive functions) were examined in a large sample (N = 646) of Chinese children. Using parallel-process latent class growth analysis for longitudinal data, five distinct joint developmental trajectories of aggression and peer victimization were found: an increasing aggressive-victim group (n = 62, 9.60%), an aggressive-victim group with high chronic aggression and victimization (n = 20, 3.10%), an aggressor-only group (n = 86, 13.31%), a victim-only group (n = 42, 6.50%) and an uninvolved group (n = 436, 67.49%).

As for internalizing problems, the increasing aggressive-victim group showed higher initial levels than the uninvolved group, but lower initial levels than the aggressive-victim, aggressor-only and victim-only groups. This group also showed a significant increase compared with all the other groups. The aggressive-victim group showed higher initial levels than the uninvolved group, aggressor-only and victim-only groups. The aggressor-only group showed higher initial levels than the uninvolved and the victim-only groups, and a significant decrease than the uninvolved group. The victim-only group showed higher initial levels than the uninvolved group.

As for inhibitory control, the increasing aggressive-victim group showed lower initial levels than the uninvolved group. The aggressive-victim group showed lower initial levels than the uninvolved group, the increasing aggressive-victim group, aggressor-only and victim-only groups. The aggressor-only group showed lower initial levels than the uninvolved group.

Cross-lagged analysis showed that internalizing problems predicted lower subsequent inhibitory control significantly. Specifically, the internalizing problems at Time 2 predicted decrease in inhibitory control at Time 3. The internalizing problems at Time 3 also predicted decrease in inhibitory control at Time 4.

The mediating role of internalizing problems was identified between group membership and inhibitory control. Compared with the uninvolved group, the increasing aggressive-victim group membership promoted higher levels of internalizing problems at Time 3, which in turn was associated with lower inhibitory control at Time 4. Similarly, the mediating role of internalizing problems at Time 3 was also distinguished between the aggressive-victim group and inhibitory control at Time 4 compared with the uninvolved group.

These results evidenced the continuous existence of aggressive-victim subgroup and depicted the developmental characteristics. The worst adjustment outcomes of these subgroups suggested the specific measurements. Furthermore, the identification of potential mediating mechanism may help to clarify the processes by which group membership eventuate inhibitory control.

校园欺凌中旁观行为的内群体偏爱机制

陈光辉（通讯作者）　丁雯　刘春艳　张文新

山东师范大学心理学院，济南，250014，chengh2100@126.com

摘 要　内群体偏爱是指个体在群际互动中表现出的更偏向内群体的态度和行为。研究表明，相比于外群体成员，个体对内群体成员表现出更多的亲社会行为，也会更加偏袒或包庇内群体成员的不当行为。然而，目前尚未有研究考察校园欺凌情景中的内群体偏爱效应在不同旁观行为上的体现以及背后的机制。

因此，本研究设计了三个子研究，以 884 名初一、初二学生作为研究对象，采用虚拟故事范式，探究校园欺凌不同旁观行为上是否存在内群体偏爱效应(子研究一)及其影响因素(子研究二和三)。

子研究一使用实验任务区分内、外群体，采用 2(情景: 实施欺凌、遭受欺凌) × 2 (群体身份: 内群体成员、外群体成员) 被试内实验设计，确证了校园欺凌中的旁观行为存在内群体偏爱效应，即比起外群体成员遭受欺凌，当内群体成员遭受欺凌时旁观者会做出更多的反欺凌行为、更少的亲欺凌行为和置身事外行为。子研究二立足群体层面，采用 2 (情景: 实施欺凌、遭受欺凌) × 2(群体身份: 内群体成员、外群体成员) × 2 (内群体认同: 高、低)混合实验设计，发现内群体认同水平高低不会对旁观行为内群体偏爱效应产生显著影响。子研究三则从个体层面入手，通过 3 个混合实验设计分别检验内群体成员的社会认知信息（道德、能力、社交）特征对校园欺凌中旁观行为内群体偏爱效应的影响作用。结果发现，只有当内群体成员具备高道德水平时才会获得偏爱，具体体现为旁观者会对内群体欺凌者做出更少的反欺凌行为、对内群体受欺凌者实施更多的反欺凌行为和更少的亲欺凌行为；只有当受欺凌者具备高社交水平时，其内群体成员才会愿意做出保护行为，即实施更少的亲欺凌行为和置身事外行为；而内群体成员的能力信息不会对校园欺凌旁观行为的内群体偏爱效应产生影响。研究结果有助于揭示校园欺凌中不同旁观行为产生的社会心理机制，也为校园欺凌的科学防治提供了新视角。

The In-group Favoritism Mechanism of Bystander Behavior in School Bullying

CHEN Guanghui (corresponding author), DING Wen, LIU Chunyan, ZHANG Wenxin
School of Psychology, Shandong Normal University, Jinan, 250014, chengh2100@126.com

***Abstract*：** In-group favoritism refers to attitudes and behaviors that individuals exhibit in intergroup interactions that are more biased toward the in-group. Researches have shown that individuals show more pro-social behaviors toward in-group members than out-group members, and also show more favoritism or shielding of in-group members' misbehavior. However, no research has examined the in-group favoritism effect in school bullying scenarios in terms of different bystander behaviors and the mechanisms behind them. Therefore, this study designed three sub-studies with 884 first grade and second grade of junior high school students as particpants, using the hypothetical vignette paradigm to investigate whether the in-group favoritism effect exists on different bystander behaviors in school bullying (Sub-study 1) and its influencing factors (Sub-studies 2 and 3).

Sub-study 1 used the color discrimination task to differentiate between in-groups and out-groups, and a 2 (scenario: bullying situation, victimization situation) × 2 (group identity: in-group member, out-group member) within-subjects experimental design to confirm the existence of an in-group favoritism effect on bystander behaviors in school bullying, results showed that bystanders engage in more anti-bullying behaviors, less pro-bullying behaviors, and less outsider behaviors when in-group members were bullied than when out-group members were bullied. Sub-study 2 was based on the group level and used a mixed experimental design of 2 (scenario: bullying situation, victimization situation) × 2 (group identity: in-group member, out-group member) × 2 (in-group identity: high, low), and found that high or low levels of in-group identity did not have a significant effect on the in-group favoritism effect of bystander behaviors. Sub-study 3, on the other hand, started from the individual level and tested the role of in-group memberss social cognitive information (morality, competence, and sociability) traits on the in-group favoritism effect of bystander behavior in school bullying through three mixed experimental designs, respectively. The results revealed that information about morality and sociability can provide important references for bystanders to choose different bystander behaviors, but competence does not

affect in-group favoritism. Only when the bully has a high moral level, his/her in-group members are more willing to favor and cover up his/her bullying behavior, that is, to do less anti-bullying behavior; Only when the victim has a high moral level, the in-group members are willing to take protective behaviors, that is, to carry out more anti-bullying behaviors and less pro-bullying behaviors. Only when the victim has a high level of social interaction do in-group members become willing to engage in protective behavior, i.e. less pro-bullying behavior and less outsider behavior. The results of this study help to reveal the psychosocial mechanisms underlying different bystander behaviors in school bullying and provide new perspectives for the scientific prevention and treatment of school bullying.

摘 要　欺凌和保护是欺凌事件中两种常见的行为，与基本的社会动机中的受欢迎和情感动机相关。许多研究使用自我报告的方式询问个体的行为动机，这有其局限性。自动化的认知加工过程可能会阻碍个体正确认识自身行为动机。并且，个体可能在实施特定行为时具有多重动机，这进一步增加了识别个体行为的主要目标的复杂性。考察欺凌和保护行为动机的另一种方法是关注与该动机相关的其他行为，例如友谊选择。受欢迎目标和情感目标会影响欺凌或保护水平较高的儿童的友谊偏好。个体可能出于受欢迎动机，通过欺凌或保护他人获得地位；个体也可能出于情感动机，通过保护他人获得亲密关系。根据目标框架理论，个人会对有助于目标实现的信息特别敏感。对于拥有受欢迎目标的欺凌或保护水平较高的儿童，受欢迎的同龄人可能更有吸引力。如果欺凌或保护水平高的人认识到结交高人气的朋友可以实现受欢迎目标，他们会追求与受欢迎的同龄人交朋友。此外，拥有高知名度朋友的人，个体能够欺凌或保护他人而不必担心受到公开挑衅或报复。与性格相似的人结交有利于实现情感目标，因此通过保护他人来追求情感目标人也可能会偏好相似的同伴。保护水平有差异的朋友可能会因为行为和价值观不合而产生冲突；而水平相似的朋友更了解彼此，往往拥有更稳定的友谊。本研究利用社交网络分析，旨在澄清欺凌和保护行为背后的主要目标，调查欺凌或保护水平高的人更喜欢行为水平相似的朋友还是更受欢迎的朋友。研究被试为中国三四年级学生（T1: $N = 453$, 54.79%男生; T2: $N = 454$, 54.35%男生; T3: $N = 453$, 54.05%男生）。结果显示，欺凌水平较高的儿童更有可能选择受欢迎的同龄人作为朋友，而保护水平高的孩子则倾向于选择保护水平相似的朋友。这表明欺凌行为主要由受欢迎目标驱动，而保护则由情感目标驱动。这项研究首次提供了中国文化中欺凌、保护和受欢迎的动态友谊关系的证据，并强调了欺凌事件中动机的重要性。

Are similar or popular children coveted friends?

Friendship dynamics of bullying, defending and popularity

LIU Xiaowei, ZHANG Mengyuan, ZHANG Wenxin

Research Institute of Child and Adolescent Development, School of Psychology,

Shandong Normal University, Jinan 250014, China

Abstract： Bullying and defending are two common behaviors in the bullying process, associated with the fundamental social motives of popularity and affection. The self-report method used in many studies may pose limitations in comprehending the underlying motivation of such behavior. The automatic cognitive processing in human behaviors may hinder the accurate reporting of corresponding goals, and multiple behavioral goals further complicate the identification of predominant goals that influence individuals' behavior. An alternative approach to discerning motivations of bullying and defending involves examining related behaviors for the same motivations, such as friendship selection. In the case of children engaging in bullying or defending behaviors, it is conceivable that status and affection goals affect their friendship preferences. For the sake of popularity goal, individuals may bully or defend others and then gain popularity; for affection goals, individuals may defend others then catch intimate relationships. According to goal-framing theory, individuals are particularly sensitive to information that is useful for goal realization. Popular peers may emerge as desired friends, particularly for individuals who possess status goal, such as children with high levels of bullying or defending behaviors. If people with high level of bullying or defending recognize that making friends with high level of popular can realize popularity goals, they will catch this opportunity and try to befriend popular peers. Another advantage is that people with friends with high level of popularity might be better able to bully others without the fear of public challenge or revenge. Establishing friendships with people sharing similar characters proves advantageous in fulfilling affection goals, thus people who defend others for the sake of pursuing affective goals may tend to select similar peers as friends.. Defending behaviors are widely driven by affective empathy and morally obligation. And they benefit those who do so by gaining peer acceptance. Therefore, people with high levels of defending may also have affection goals and prefer friends who are similar to themselves. Friends with different levels of defending may encounter a lot of conflicts due to their mismatched behaviors and values, while friends shared similar level of defending tend to have more stable friendships because they have a better understanding of each other. Using social network analysis, this study aimed to clarify the major goal underlying bullying and defending behaviors and investigate whether people with bullying or defending behaviors preferred friends with similar level of behaviors or those who have high level of popularity. Participants were third- and fourth grades students in China (N = 453, 54.79% boys at wave1; N = 454, 54.35% boys at wave2; N = 453, 54.05% boys at wave3). Results revealed that children with a tendency towards bullying were more likely to choose popular peers as friends, while those with high level of defending tended to select friends shared similar level of defending. The findings indicated that bullying is primarily driven by status goals, while defending is motivated by affection goals. This study provided first evidence on the friendship dynamics of bullying, defending and popularity in Chinese culture, and highlighted motivations in intervening in school bullying.

青少年欺凌保护行为的类别特征与转变模式：适应功能及影响因素

金国敏[1], 魏鲁昊[2], 王梓璇[1], 刘俊升[1] (通讯作者)

1 华东师范大学心理与认知科学学院, 上海, 200062, 通讯作者 E-mail: jsliu@psy.ecnu.edu.cn

摘 要 保护者是校园欺凌参与角色中唯一的积极角色, 对制止校园欺负、缓解受欺凌者适应问题具有重要的作用。越来越多的研究表明, 青少年会采取多种策略保护受欺凌同伴, 包括直接果断型保护、攻击型保护、安慰受欺凌者、报告权威以及计谋型保护。以往研究大多采用以变量为中心的视角探究不同保护策略

的前因后果，忽略了个体可能会同时采取多种策略抑或仅仅依赖某一策略保护受欺凌同伴的可能性。基于此，本研究采用潜在剖面分析和潜在转变分析考察青少年保护行为的亚组分类与转变情况及其对青少年心理社会适应的影响，以及攻击行为的道德判断在保护行为亚组分类与转变中的作用。对 1282 名 4-6 年级学生(平均年龄 10.90 岁，女生占比 42.6%)进行为期 1 年的 3 个时间点的追踪调查，结果发现: (1)在 3 个时间点上，青少年均可被区分为四个不同类型的亚组: a)高保护行为参与组(在 5 种保护策略上得分均较高), b)中等保护行为参与组(在 5 种保护策略上得分均处于平均水平), c)低保护行为参与组(在 5 种保护策略上得分均较低), d)非攻击型保护行为组(在攻击型保护上得分较低，但在其他 4 种保护策略上得分较高); (2)随时间的推移，非攻击型保护行为组和中等保护行为参与组的青少年表现出较高的稳定性，高保护行为参与组和低保护行为参与组的青少年向上述两组转变的概率较高; (3)保护行为的亚组分类及转变模式与青少年心理社会适应状况有关。其中，处于或转变到非攻击型保护行为组的青少年表现出最佳的适应状况，包括更低的受欺负和抑郁水平以及更高的同伴接纳水平。处于或转变到高保护行为参与组则与心理社会适应不良有关; (4)青少年对攻击行为的道德判断水平对保护行为亚组归属有显著的预测作用。具体表现为高道德判断者更可能处于非攻击型保护行为组。此外，研究并未发现道德判断水平的变化对亚组转换概率的预测作用。研究结果有助于深化对青少年欺凌保护行为发展模式多样性的理解，为基于保护者角度的欺凌干预项目的开展提供重要参考。

Different ways to defending victims of bullying: Understanding the antecedents and implications of defending profiles and their transitions in Chinese adolescents

Guomin Jin[1], Luhao Wei[2], Zixuan Wang[1], Junsheng Liu[1]

1 School of Psychology and Cognitive Science, East China Normal University, Shanghai, China
2 Department of Human Development and Family Studies, Purdue University, West Lafayette, IN, US

***Abstract*:** Adolescents might use various strategies to help their victimized peers during bullying episodes. The current study adopted person-centered approaches to gain a better understanding of how the five types of defending strategies (i.e., assertive defending, aggressive defending, comforting victims, reporting to authority, and tactical defending) combine within adolescents to form different defending profiles. Additionally, we investigated changes of these profiles over time and examined how profile membership and transition patterns related to theoretically relevant predictors (moral reasoning about aggression, MRA) and outcomes (peer victimization, depressive symptoms, and peer preference). Data were gathered at three time points, 6 months apart, from a sample of 1282 Chinese early adolescents in Grades 4 to 6 (initial M_{age} = 10.90, *SD* = 0.96, 42.6% females). Latent profile analysis revealed four distinct defending profiles, which were similar across measurement points. The profiles were labelled *active defenders* (high engagement in all five types of defending strategies), *occasional defenders* (moderate engagement in all strategies), *infrequent defenders* (low engagement in all strategies), and *nonaggressive defenders* (low engagement in aggressive defending but high in other strategies). Latent transition analysis showed the *nonaggressive defenders* and the *occasional defenders* profiles was relatively stable and that

the *active defenders* and the *infrequent defenders* profiles related to more transitions across time. Importantly, profile membership and their change patterns were differentially associated with adolescents' psychosocial adjustment. The stable membership in or transition into the *nonaggressive defenders* profile was associated with optimal adjustment (e.g., lower peer victimization and depressive symptoms, and higher peer preference), whereas membership in or shift to the *active defenders* profile was associated with some negative outcomes. With regard to the antecedents, our results demonstrated that adolescents with well-developed MRA were more likely to belong to the *nonaggressive defenders* profile compared to other profiles. However, change in MRA did not predict the likelihood of transitioning across profiles. Overall, our findings provide new knowledge on how adolescents change their strategies to defend victimized peers and the antecedents and implications of this, which may have implication for anti-bullying programs that encourage adolescents to defend.

***Keywords*:** defending, moral reasoning about aggression, psychosocial adjustment, latent profile analysis, latent transition analysis

校园欺凌旁观者助人意愿与助人规范的共存模式

陈展洁[1]　王靖茜[1]　郁嘉铭[1]　甄瑞[1,2]（通讯作者）

1. 杭州师范大学经亨颐教育学院，杭州，311121，zhenrui1206@126.com

2. 浙江省哲学社会科学培育实验室"杭州师范大学婴幼儿发展与托育实验室"

摘要　高发于中小学阶段的校园欺凌现象是一个全球性的问题，它往往给受欺凌者带来严重的身心伤害。在校园欺凌事件发生时，除了欺凌者和受欺凌者，还可能存在大量旁观者。旁观者的表现影响着欺凌事件发生的时间、频率，甚至可以影响欺凌事件结果的严重程度，因此激发旁观者主动、安全助人是防治校园欺凌的一个重要方向。周围的人如何反应（描述性规范），教师和父母等重要成人要求如何（命令性规范）等社会规范都可能会影响校园欺凌旁观者的助人意愿，但以往研究均以变量为中心来考察某个被试群体平均化了的社会规范的影响，并未将个体差异性考虑在内。为进一步了解助人意愿与助人规范的相互关联，本研究将以个体为中心法来探究旁观者助人意愿与助人的社会规范（同伴规范、教师规范和父母规范）的共存模式。采用自评的校园欺凌助人意愿和助人规范问卷，对浙江省某中学的 1384 名初中生开展调查，并使用潜在剖面分析法考察初中生助人意愿与助人规范的共存模式。结果显示初中生在目睹有人受欺凌时其助人意愿和助人规范有 5 种共存模式：无助人-无规范组（4.8%；被试无助人意愿，同学无助人行为，老师和父母不要求助人）、无助人-父母规范组（3.6%；被试无助人意愿，同学无助人行为，老师无助人要求，父母有高助人要求）、低助人-低规范组（24.3%；被试有较低助人意愿，同学有较低助人水平，教师和父母有较低助人要求）、中等助人-师生规范组（40.6%；被试有中等助人意愿，同学有中等助人水平，老师有中等助人要求，父母不要求助人）、高助人-师生规范组（26.7%；被试有高助人意愿，同学有高助人水平，老师有高助人要求，父母不要求助人）。结果表明，当周围的同学不去或很少去帮助受欺凌同学、教师和父母都要求不要去或少去帮助受欺凌同学时，被试的确会出现不助人或少助人的倾向。在所有 5 种模式中，被试的助人意愿与周围同学的助人行为倾向呈现高度一致性，与老师的要求也呈现较高一致性，即初中生的助人意愿最可能受到同学助人行为的影响，其次会受到教师要求的影响。值得关注的是，在 4 种模式中，初中生的助人意愿均与父母的助人要求相悖。这说明对于初中生来说，师生规范对其助人意愿有很大影响，但父母规范却难以发挥作用，这些结果对未来校园欺凌防治工作提供了重要启示。

Co-existence patterns of bystanders' helping willingness and helping norms in school bullying

Zhanjie Chen[1] Jingxi Wang [1] JiaMing Yu[1] Rui Zhen[1, 2]
1 Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou, 311121, China
2 Zhejiang Philosophy and Social Science Laboratory for Research in Early Development and Childcare, Hangzhou Normal University

Abstract: School bullying occurs frequently in primary and secondary schools, which is a global problem and it often brings serious physical and mental harm to the victims of bullying. When school bullying occurs, there may be a large number of bystanders in addition to the bullies and victims. The performance of bystanders may affect the time and frequency of bullying events, and even the severity of the results of bullying events. Therefore, inspiring bystanders to help others actively and safely is an important direction to prevent school bullying. Social norms such as how people around us react (descriptive norms), and how important adults such as teachers and parents demand (injunctive norms) may affect the helping willingness of bystanders in school bullying events. However, previous studies have adopted a variable-centered approach to examine the impact of homogenized social norms of a certain group of participants, without taking individual differences into account. To further analyse the correlation between helping willingness and helping norms, this study will adopt person-centered approach to explore the co-existence patterns of bystanders' helping willingness and helping norms (peer norms, teacher norms, and parents norms). This study investigated 1384 students from a secondary school in Zhejiang Province by using the self-assessed questionnaire of helping willingness and helping norms in school bullying. And we used latent profile analysis to investigate the co-existence patterns of secondary school students' helping willingness and helping norms. The results showed that there were five co-existence patterns of helping willingness and helping norms among secondary school students when witnessing someone being bullied: no helpfulness - without norms group (4.8%; participants without helping willingness, classmates without helping behaviors, teachers and parents without demanding helpfulness), no helpfulness - parent norms group (3.6%; participants without helping willingness, classmates without helping behaviors, teachers without demanding helpfulness, parents with high demanding helpfulness), low helping willingness - low norms group (24.3%; participants with low helping willingness, classmates with low level of helping willingness, teachers and parents with low demanding helpfulness), medium helping willingness - teacher-student norms group (40.6%; participants with medium helping willingness, classmates with medium level of helping willingness, teachers with medium demanding helpfulness, parents without demanding helpfulness), high helping willingness - teacher-student norms group (26.7%; participants with high helping willingness, classmates with high level of helping willingness, teachers with high demanding helpfulness, parents without demanding helpfulness). The results indicated that when classmates around them did not help or rarely helped bullied classmates, teachers and parents demanded not to help or less to help bullied classmates, it showed a tendency that participants chose not to help or to help less. In all five patterns, the helping willingness of the participants showed high consistency with the tendency of their classmates to help others, and also showed high consistency with the demand of teachers. That is, the helping willingness of secondary school students was most likely influenced by the behavior of their classmates, followed by the demand of teachers. It was worth noting that in the four patterns, the helping willingness of secondary school students contradicted the demand of their parents. This showed that for secondary school students, teacher-student norms may have a great impact on their helping willingness, but parents norms may be difficult to play a role. These results provided important enlightenment for the prevention and control of school bullying in the

future.

同伴排斥对青少年学习投入的影响：未来取向和教育价值观的作用

戚心洁[1, 2] 肖茜丹[1] 连榕[1]

1 福建师范大学心理学院，福州，350117

2 福建船政交通职业学院，福州，350007，lianrong1122@126.com

摘 要 为探究同伴排斥对青少年学习投入的影响机制及其边界条件。方法：研究 1 以 132 名中学生为研究对象，通过回忆范式操纵同伴排斥，采用延迟折扣任务和情景投射范式分别对未来取向和学习投入意愿进行测量，以考察同伴排斥、未来取向和学习投入三者间的关系；研究 2 以 138 名中学生为被试，采用 Cyberball 范式操纵同伴排斥，以未来取向作品分析法对未来取向进行测量，学习投入意愿的测量与研究 1 相同，并通过问卷形式测量教育价值观。进一步探究教育价值观在同伴排斥和学习投入之间的调节作用和未来取向的中介作用。研究结果表明：同伴排斥能显著负向预测青少年学习投入水平；当教育价值观没有纳入考察时，未来取向的中介作用显著；但当纳入教育价值观考察时，未来取向的中介作用不显著，教育价值观调节作用显著。具体表现为在任何程度的同伴排斥情境下，持有积极教育价值观的青少年的学习投入均无显著差别，但持有消极教育价值观的青少年在高水平同伴排斥情境下的学习投入水平显著低于低水平同伴排斥情景。研究结论揭示了同伴排斥对青少年学习投入产生负面影响的内部机制；以及体现了教育价值观在消极情景下对青少年学习行为的保护作用。这提示教育者应重视对青少年教育价值观的培养和提高，这有利于其更好地应对生活中的压力事件。

The Impact of Peer Exclusion on Adolescent Learning Engagement: The Role of Future Orientation and Educational Values

Qi Xinjie[1,2] Xiao Xidan[1] Lian Rong[1]

1. School of Psychology, Fujian Normal University , Fuzhou, 350117

2.Fujian Chuanzheng Communications College, Fuzhou, 350007, lianrong1122@126.com

Abstract :To explore the mechanism and boundary conditions of peer exclusion on adolescents' learning engagement, two studies were conducted. In Study 1, 132 middle school students participated in a recall paradigm to manipulate peer rejection. The relationships among peer rejection, future orientation, and learning engagement were investigated using a delay discounting task to measure future orientation and a scenario projection paradigm to measure learning engagement.Study 2 involved 138 middle school students and used the Cyberball paradigm to manipulate peer exclusion. Future orientation was measured using future-oriented work analysis, while willingness

to learn was measured as in Study 1. Additionally, educational values were assessed through a questionnaire. The study aimed to further explore the moderating effect of educational values on peer exclusion and learning engagement, as well as the mediating effect of future orientation.The results indicate that peer exclusion significantly negatively predicts adolescents' level of learning engagement. When educational values are not considered, future orientation mediates this relationship significantly. However, when educational values are included, the mediating effect of future orientation becomes non-significant while the moderating effect of educational values remains significant.Specifically, regardless of the level of peer rejection experienced, adolescents with positive educational values exhibit similar levels of learning engagement. On the other hand, adolescents with negative educational values show significantly lower levels of learning engagement in high-level peer rejection situations compared to low-level peer rejection situations.This study sheds light on the internal mechanism behind the negative impact of peer exclusion on adolescents' learning engagement. It also highlights the protective role of educational values in influencing adolescents' learning behavior under adverse circumstances. This suggests that education plays an important role in buffering the negative effects caused by peer exclusion on adolescents' academic involvement.
Keywords: teenagers, peer exclusion, learning engagement, future orientation, Educational values

对受欺凌者的共情与青少年反欺凌行为的关系：班级特征的调节作用

王丰玲　汪雨　邓会成　陈光辉（通讯作者）
山东师范大学心理学院，济南，250014，chengh2100@126.com

摘 要　校园欺凌产生于同伴互动之中，是影响青少年身心健康发展的重要危险因素。旁观者的反欺凌行为能够有效阻止校园欺凌事件的发生和发展。旁观者在面对欺凌事件时是否选择做出反欺凌行为，不仅受旁观者自身相关的个人特征或认知情感等因素的影响，还可能受到同伴群体或班级特征层面的影响，如班级反欺凌态度。本研究采用整群抽样方式，抽取山东省济南市 3 所中学 44 个班级 1783 名七八年级学生（51.8%男生，平均年龄 12.94 ± 0.72 岁）为被试，自我报告法测量对受欺凌者的共情、反欺凌行为、班级反欺凌态度，同伴提名法测量班级人际联结紧密程度和班级受欢迎规范。多层线性模型分析显示：（1）对受欺凌者的共情正向预测青少年反欺凌行为，对受欺凌者的共情越高，青少年做出的反欺凌行为越多；（2）班级反欺凌态度和班级人际联结紧密程度均在对受欺凌者的共情与青少年反欺凌行为的关系中发挥调节作用，但二者调节方向不同，高水平的班级反欺凌态度和人际联结紧密程度分别在对受欺凌者的共情与青少年反欺凌行为的关系中发挥抑制和强化作用；（3）班级受欢迎规范正向预测青少年反欺凌行为，但在对受欺凌者的共情与青少年反欺凌行为关系间的调节作用不显著。本研究从生态系统理论与目标框架理论的角度针对个体和班级特征对校园欺凌干预实践的影响进行了讨论。

关键词　反欺凌行为，共情，班级反欺凌态度，班级人际联结紧密程度，班级受欢迎规范

The Relationship Between Empathy Toward Victims and Adolescents' Anti-Bullying Behavior: The Moderating Role of Classroom Characteristics

Fengling Wang, Yu Wang, Huicheng Deng, Guanghui Chen*
School of Psychology, Shandong Normal University, Jinan 250014

Abstract：School bullying, arising from peer interactions, poses a significant risk to the healthy physical and mental development of young people. Bystanders' anti-bullying behaviors can effectively prevent the occurrence and development of school bullying. The decision of bystanders to engage in anti-bullying behaviors is not only affected by their personal characteristics or cognitive emotions, but also by peer group or classroom characteristics, such as classroom anti-bullying attitudes. In this study, 1,783 seventh and eighth grade students (51.8% boys, M_{age}= 12.94 ± 0.72 years) from 44 classes in three middle schools in Jinan City, Shandong Province, were recruited as participants by cluster sampling. Self-reporting was used to measure empathy toward victims, anti-bullying behaviors, and classroom anti-bullying attitudes, while peer nomination was used to measure classroom interpersonal density and popularity norms. Multilevel linear model analysis showed that: (1) Empathy toward victims positively predicted adolescents' anti-bullying behaviors. As empathy levels toward victims increased, adolescents exhibited more anti-bullying actions. (2) Both classroom anti-bullying attitudes and classroom interpersonal density played a moderating role in the relationship between empathy toward victims and adolescents' anti-bullying behaviors, but the moderating direction was different. A higher level of classroom anti-bullying attitudes inhibited the relationship, while greater classroom interpersonal density strengthened it. (3) Classroom popularity norms positively predicted adolescents' anti-bullying behaviors, but had no significant moderating effect on the relationship between empathy toward victims and adolescents' anti-bullying behaviors. This study discusses the impact of individual and classroom characteristics on school bullying intervention practices from the perspective of ecological systems theory and goal framing theory.

Keywords：anti-bullying behavior, empathy, classroom anti-bullying attitudes, classroom interpersonal density, classroom popularity norms

大学生网络休闲效应的测量及其影响因素研究

徐荣华[1,2]　　席居哲[1]（通讯作者）

[1]华东师范大学心理与认知科学学院，华东师范大学附属精神卫生中心，上海市心理健康与危机干预重点实验室，上海, 200062 ; [2]深圳市第七高级中学，深圳, 518100　通讯作者 Email: jzxi@psy.ecnu.edu.cn

基金项目：上海高校思想政治工作专项建设; 上海市家庭文明建设立项课题(2023 年)

摘 要　积极心理学视角下休闲是个体追求积极体验、 提升幸福感的重要途径。随着技术发展，休闲的方式变得多种多样，尤其是网络休闲成为人们的新趋势。信息时代中，大学生是网络休闲的主要群体之一。而网络休闲给人们带来放松愉悦的体验时， 逐渐出现了异化问题。 因此本文拟通过两个研究， 首先考察网络休闲效应的评估， 然后探索大学生网络休闲效应的影响因素及机制。

研究一基于休闲和主观幸福感的核心要素模型(DRAMMA)， 编制网络休闲效应问卷。 模型包括解离-恢复、自主、掌握、意义和联结 5 个维度，并依据维度释义编写初测问卷的条目。 问卷初次施测时， 178 名参与者的作答数据有效。随后通过项目分析和因素分析， 对条目进行删减和修正， 22 个条目保留下来。因网络休闲存在负面影响，依据开放式问题作答文本的词频分析，额外编制了消极效应维度的 6 个条目。

问卷第二次施测时， 586 名参与者填写的作答数据有效。 通过问卷的信度和效度分析， 形成了正式版网络休闲效应问卷。问卷包含 6 个维度 27 个条目，且整体和各维度的内在一致性信度、效标关联效度和结构效度在接受范围内。

研究二采用横断调查的问卷法， 探索网络休闲情况对网络休闲效应的影响，以及时间碎片化和感知信息过载在其中的作用。在自编网络休闲效应问卷的施测基础上， 还测量了大学生的网络休闲情况、 时间碎片化和感知信息过载程度等。586 名大学生参与者的作答数据有效。随后对数据分析得出的主要结果如下： 大学生的网络休闲参与显著正向预测休闲积极效应； 而时间碎片化在其中起调节作用。 同时其网络休闲时长显著正向预测休闲消极效应， 感知信息过载在其中起部分中介作用。因此高水平的休闲时间碎片化会削弱网络休闲参与带来的积极效应；过长的网络休闲时间会增加感知信息过载水平，从而增加网络休闲消极效应。

The measurement and influencing factors of internet leisure effect in college students

Ronghua Xu[1,2], Juzhe Xi[1] (Corresponding author)

1 Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, Affiliated Mental Health Center (ECNU), School of Psychology and Cognitive Science, East China Normal University, Shanghai, 200062, China; [2] Shenzhen NO.7 Senior High School, Shenzhen, 518100, China　Correspondence: jzxi@psy.ecnu.edu.cn

***Abstract*:** From the perspective of positive psychology, leisure is an important way for individuals to pursue positive experience and well-being. With the development of technology, various ways of leisure have emerged. Especially internet leisure has become a new trend. In the information age, college students are one of the main groups of internet leisure. While internet leisure brings people a relaxing and pleasant experience, some problems gradually appear. Therefore, this paper intends to conduct two studies, firstly to develop the measurement tool of internet leisure effect, and to explore the influencing factors and mechanisms of the effect of college students' internet leisure.

In study 1, a questionnaire about internet leisure effect was developed based on the core element model of leisure and subjective well-being (DRAMMA). The model includes five dimensions: detachment-recovery, autonomy, mastery, meaning and affiliation. And the items of the preliminary questionnaire were written according to the definitions of these dimensions. In the first survey, the data of 178 participants were valid. Through item analysis and factor analysis, there were 22 items left after deletion and modification. Because of the negative effect of internet leisure, six additional items of negative effect dimension were compiled according to the word frequency analysis about the answers of open-ended question. In the second survey, the valid data of 586participants were collected. Then through the reliability and validity analysis, there vised questionnaire was

formed. The questionnaire contained 27 items from 6dimensions. And the overall and each dimension have good internal consistency reliability, criterion-related validity and construct validity.

In study 2, a cross-sectional questionnaire was used to explore the influence of internet leisure situations on internet leisure effect, and the role of time fragmentation, and perceptual information overload. Based on the self-designed questionnaire of internet leisure effect, the internet leisure situations, time fragmentation and perceived information overload of college students were also measured. Data from 586participants were valid. Through analysis, the main results are as follows: College students' participation in internet leisure significantly positively predicts the positive effect of leisure and time fragmentation plays a moderating role. At the same time, college students' internet leisure time significantly positively predicts the negative effects of leisure, and perceived information overload plays a partial mediating role. Therefore, the conclusions are as follows: high level of leisure time fragmentation will weaken the positive effect of internet leisure participation. Too long leisure time will increase the level of perceived information overload, thus increasing the leisure negative effect.

Keywords：internet leisure, DRAMMA model, time fragmentation, perceived information overload

预期想象和消极重复性思维对延迟折扣的影响及干预

武晓[1]　刘霈瑶[1]　胡艺馨[1]（通讯作者）

1 山东师范大学心理学院，济南，250358，huyixin2005@163.com

摘 要　延迟折扣是指对发生在不同时间点上事件或者结果的价值进行权衡，并做出最终选择的过程。较高的延迟折扣率指更多的即时奖励偏好，反映着个体更强的冲动性，且在临床上与多种不良行为问题高度相关。因此，帮助个体提高抵制眼前诱惑而发展长远目光的能力，有助于个体在现实生活中做出更多的适应性决策，减少潜在不良行为的发生风险。基于情绪连锁反应理论，消极重复性思维(repetitive negative thinking, RNT) 会导致负面情绪的加剧，进而产生个体行为失调的连锁反应。与此相对，作为一种基于具体形象和细节的情景思维，预期想象(episodic future thinking, EFT) 则是降低延迟折扣率的有效策略。利用具体生动的预期想象可以避免个体陷入非适应性的思维，降低消极重复性思维对冲动性决策带来的负面影响。因此，本研究从不同效价的预期想象可激活相应情绪环路的角度出发，设计了两项研究。研究 1 以 44 名大学生为被试，探索了消极重复性思维和预期想象对延迟折扣的影响。结果发现：(1) 消极重复性思维对个体的延迟折扣具有重要影响，相较于低消极重复性思维个体，高消极重复性思维个体更倾向于选择小而即时的选项；(2) 积极预期想象可有效调控高消极重复性思维个体的冲动性决策偏好，在积极的预期想象条件下，高、低消极重复性思维个体的延迟折扣表现无明显差异。基于此，研究 2 提出了预期想象干预(Episodic Future Thinking Intervention, EFTI) 训练，在为期八周的干预后，结果发现，相较于对照干预组与等待组，EFTI 组被试报告了更多的消极重复性思维的减少和心理幸福感的增加，在延迟折扣任务中选择即时选项的比例也显著降低。由此证明了积极预期想象对改善高消极重复性思维个体延迟折扣偏好的有效性。

关键词　消极重复性思维, 预期想象, 延迟折扣, 干预

The effect of episodic future thinking and negative repetitive thinking on delay discounting and its intervention

***Abstract*:** Delay discounting is the process of weighing up the value of events or outcomes that occur at different points in time and making a final choice. Several studies have shown that an excessive preference for sooner and smaller (SS) options than later and larger options (LL) exhibited in delay discounting reflect higher impulsivity, and the preferences that enjoy the present and ignore delayed gratification have a high clinical correlation with a variety of maladaptive behaviors. Therefore, improving the ability of resisting immediate temptations and developing a long-term perspective can help individuals make more adaptive decisions in real life and reduce the risk of potentially undesirable behaviors. According to the emotional cascades model, repetitive negative thinking (RNT) exacerbates negative emotions, and could lead to a chain reaction of behavioral dysregulation. In contrast, episodic future thinking (EFT), as a form of situational thinking based on concrete images and details, is an effective strategy to improve delay discounting. Utilizing concrete and vivid EFT could prevent individuals from falling into non-adaptive thinking and reduces the negative impact of RNT on impulsive decision making. Therefore, this study further explores the issue through two studies. Study 1 explored the effects of RNT and EFT on delay discounting using 44 college students, and the results showed that: (1) RNT has an important influence on delay discounting, and individuals with high RNT prefer more small and immediate options compared with individuals with low RNT; (2) positive EFT can effectively regulate the impulsive decision-making preferences of individuals with high RNT, and there is no significant difference in the performance of individuals with high and low RNT in delay discounting under the condition of positive EFT. Based on this, study 2 proposed the Episodic Future Thinking Intervention (EFTI) training. After the eight-week intervention, it was found that compared with the control intervention group and waitlist, participants in the EFTI group reported more reductions in RNT and increases in psychological well-being, as well as significantly lower proportions choosing the SS options in the delay discounting task. The results demonstrated that the EFTI project successfully reduced RNT, enhanced emotion management skills, and improved decision-making preferences in individuals with high RNT.

Keywords: Repetitive negative thinking, episodic future thinking, delay discounting, intervention

个体内和人际情绪调节大学生有价值生活的共同影响

段耀琨[1]　朱蕾[1]（通讯作者）

1 陕西师范大学心理学院，西安，710062，lei.zhu@snnu.edu.cn

摘 要　引言：情绪调节指的是利用各种策略调节自己或他人情绪的过程，对大学生心理健康有重要影响。当前研究大多集中在个体内情绪调节，对人际情绪调节关注较少，且尚未有研究探讨个体内和人际情绪调节对大学生心理健康状态的共同影响。因此，本研究针对大学生群体，探讨大学生个体内和人际情绪调节对心理健康（以有价值生活为指标）的影响。方法：采用横断面研究设计，通过人际情绪调节问卷（包含增强积极情绪、观点采择、寻求安抚、社交建模）、情绪调节问卷（包含认知重评与表达抑制）、有价值生活量表对 433 名大学生进行问卷调查。首先应用潜在剖面分析(Latent Profile Analysis)探索大学生在个体和人际两个层面的不同情绪调节模式，其次采用回归混合模型(Regression Mixture Model)考察不同的情绪调节模式对有价值生活的影响作用。结果：（1）根据个体内情绪调节策略与人际情绪调节策略，可以将大学生划分为五个类别，分别是，剖面 1“个体内和人际情绪调节双低组”组、剖面 2“个体内和人际情绪调节中等组”、剖面 3“高表达抑制和低人际情绪调节组”、剖面 4“高表达抑制和高人际情绪调节组”、剖面 5“低表达抑制和高人际情绪调节组”；（2）与其他四组相比，剖面 1 具有较低的价值进程水平；剖面 2、3 分别

与剖面 4 和 5 相比，具有较低的价值进程水平；剖面 1 与剖面 2 和 4 相比，具有较低的价值阻碍水平；剖面 5 与剖面 2、3 和 4 相比，具有显著更低的价值阻碍水平。结论：中国大学生个体中存在五种不同的情绪调节模式，情绪调节的不同模式对有价值生活有显著预测作用。本研究能够帮助我们从更个人化的角度理解处于社会关系中的个体心理健康。

The Joint Influence of Intrapersonal and Interpersonal Emotional Regulation on Valued Living of College Students

Duan Yaokun[1], Zhu Lei[1](Corresponding author)
1 School of Psychology, Shaanxi Normal University, Xi'an, 710062, lei.zhu@snnu.edu.cn

Abstract：Objective: Emotion regulation refers to the process of using various strategies to regulate one's own or others' emotions, which has a significant impact on the mental health of college students. Current research has predominantly focused on intrapersonal process, with limited attention given to interpersonal emotion regulation. Furthermore, there is a lack of studies investigating the combined effects of intrapersonal and interpersonal emotion regulation on the mental health of college students. Therefore, this study aims to examine the influence of intrapersonal and interpersonal emotion regulation on mental health (measured by valued living) among college students. Method: A cross-sectional study design was employed, and a total of 433 college students were assessed with the Interpersonal Emotion Regulation Questionnaire (including enhancing positive emotions, perspective taking, soothing, and social modeling), the Emotion Regulation Questionnaire (including cognitive reappraisal and express suppression), and the Valued Living Questionnaire. Latent profile analysis was initially utilized to explore distinct emotion regulation profiles at the intrapersonal and interpersonal levels among college students. Subsequently, regression mixture modeling was employed to examine the effect of different emotion regulation profiles on valued living. Result: (1) Based on intrapersonal and interpersonal emotion regulation strategies, college students were classified into five profiles: Profile 1 "Low intrapersonal and interpersonal emotion regulation", Profile 2 "Average intrapersonal and interpersonal emotion regulation", Profile 3 "High express suppression and low interpersonal emotion regulation", Profile 4 "High express suppression and high interpersonal emotion regulation", and Profile 5 "Low express suppression and high interpersonal emotion regulation". (2) Profile 1 reported lower levels of value process compared to the other four profiles. Profiles 2 and 3 respectively had lower levels of value process compared to Profiles 4 and 5. Profile 1 showed lower levels of value obstacle compared to Profiles 2 and 4. Profile 5 indicated significantly lower levels of value obstacle compared to Profiles 2, 3, and 4. Conclusion: There are five distinct emotion regulation profiles among Chinese college students, significantly predicting valued living. The study contributes to a more personalized understanding of individuals' mental health within social relationships.

Self-Control Belief and Gaming Disorder: A Reciprocal Model and Gender Differences

Shimin ZHU, Ph.D.[a,b*] & Di QI, Ph.D.[a]

Authors' affiliations:
[a] Department of Applied Social Sciences, The Hong Kong Polytechnic University, Hong Kong SAR, China
[b] Mental Health Research Centre, The Hong Kong Polytechnic University, Hong Kong SAR, China

Abstract： Gaming is a popular leisure activity worldwide, but excessive gaming can lead to gaming disorder, especially among children and adolescents. There is an urgent need to identify the associated factors to prevent gaming disorder among youths. We employed cross-lagged panel models to examine the directional links between self-control mindset and the severity of gaming disorder symptoms with a one-year, two-wave, school-based longitudinal study. A total of 3,264 students (338 in Grades 4-5 and 2,926 in Grades 7-10) from 15 schools in Hong Kong participated in the classroom surveys. A bidirectional relationship was found between self-control mindset and gaming disorder symptom severity. Subgroup analyses of male and female respondents revealed that growth mindsets regarding self-control predicted less severe gaming disorder symptoms in girls but not in boys, while the prediction path of gaming disorder symptoms to self-control mindsets was significant in both boys and girls. Our findings implied that promoting growth mindset regarding self-control is a promising preventive strategy for gaming disorder prevention and early intervention.

Keywords: growth mindset regarding self-control, gaming disorder, cross-lagged panel model, children and adolescents

中国学校心理健康研究现状概述

陈凌隽[1]（通讯作者） 宫瑞[1] 施乐[1]
1 上海交通大学教育学院，上海，200240，通讯作者邮箱：lingjunchen@sjtu.edu.cn

摘 要 背景：心理健康对学生的成长至关重要，我国在改善学生心理健康方面一直在努力。这一趋势在国内学术界的反映如何，研究与实践是否一致都值得探讨。因此，本研究将概括 6 本高水平 C 刊上发表的与学校心理健康相关的最新研究，以揭示当前国内学者的研究重点和兴趣，并将类似主题的论文与英文学术期刊上的文章进行比较。方法：搜索 6 本高水平中文期刊（《心理学报》、《心理科学进展》、《心理科学》、《中国临床心理学杂志》、《心理发展与教育》和《中国心理卫生杂志》）在 2021 年上的发文，找出有关师生幸福感或心理健康的文章，提炼关键词和信息并进行汇总。同时，对 4 本英文高水平心理学期刊和 3 本学校心理学期刊行审阅，以确定外刊研究中的重要主题和热点话题。结果：共在 6 本杂志中找到 351 篇中文文章。样本上，纯关注教师的只有 12 篇文章，其余大部分关注学生。23 篇文章关注社会弱势群体。引起学者关注的心理问题具有典型性，包括抑郁（53 篇）、焦虑（38 篇）、外化问题（21 篇）、孤独（11 篇）、自闭症（9 篇）。约有 1/4 的文章研究了与现代技术相关的心理问题，包括网络成瘾、手机成瘾、网络欺凌以及作为风险因素的社交媒体。同时，也有一些文章以中立的态度研究了在线行为或在线心理干预。此外，还有很多文章研究了与学生心理健康相关的人际关系，其中家庭因素最受关注，有 68 个关键词涉及教养方式或家庭因素，但关于同伴或同学和教师的关键词分别仅有 32 和 14 个。在研究方法上，62%的文章采用横断设计并仅收集问卷数据。最后，通过查阅英文期刊中的摘要，发现中外研究

的大主题类同，如成瘾行为、校园安全和社会公正问题等。然而，由于社会现状差异，同一大类主题的文章在不同国家会有不同的分主题。结论：我国学者在更好地理解学生心理健康问题和提出解决方案上所做的努力与现代科技发展和促进类实践较为一致。此外，本研究还就样本和视角的涵盖性以及方法的多样性提出了未来的发展方向。

An Overview of Current Research Focus in School Mental Health in China

Lingjun Chen[1], Rui Gong[1], Le Shi[1]
1 School of Education, Shanghai Jiao Tong University, Shanghai 200240, China

***Abstract*：** **Background:** School mental health is vital to the growth of students and there have been continuous efforts made in improving student mental health in China. How this trend reflects in Chinese academia and what might be potential gaps between research and practice is worth exploring. Therefore, this study aims to review the latest research relevant to school mental health published in six high-level Chinese academic journals to reveal the current research focus and interests among Chinese scholars, and also to compare papers under similar topics with academic journals in English. **Methods:** Six high-level Chinese journals whose publication scope is partially or entirely on student well-being and school mental health are selected, that is, *Acta Psycho-logical Sinica (Xinli Xuebao), Advances in Psychological Science (Xinli Kexue Jinzhan), Psychological Science (Xinli Kexue), Chinese Journal of Clinical Psy-chology (Zhongguo Linchuang Xinlixue Zazhi), Psychological Development and Education (Xinli Fazhan yu Jiaoyu), and Chinese Mental Health Journal (Zhongguo Xinli Weisheng Zazhi)*. Articles on the well-being or mental health of students, teachers, school-age children, and adolescents are identified from these six journals in 2021, followed by keywords and key information subtraction from the abstracts. Finally, all the articles on school mental health published in four high-level psychology journals and three important school psychology journals are reviewed to identify central themes and hot topics in the world, especially Western countries. **Results:** A total of 351 Chinese articles were identified. Regarding the samples in these articles, 12 articles focus solely on teachers, whereas the remaining majority focus on students (44 on elementary school students, 154 on secondary school students, 139 articles on college students, and six articles on postgraduate students). 23 articles focus on socially disadvantaged populations. Some typical psychological problems have attracted the research attention, including depression or depressive symptoms (53 articles), anxiety (38), aggression and externalizing problems (21), loneliness (11), autisms (9). There are about a quarter of articles that study psychological problems related to modern technology, including internet addiction, mobile phone addiction, cyberbullying, and media exposure as a risk factor. Simultaneously, the internet plays a key role in people's daily life, not necessarily a negative factor. There are more than 10 articles studying social media use, online interactions, online reading, and online gaming in a neutral manner, as well as articles conducting online psychological interventions to improve student mental health. Additionally, there are many articles study key interpersonal relationships that are related to students' well-being and mental health, and family factors received the most attention. Reflected from keywords, there are 68 keywords either on parenting or on family factors. Comparatively, only 32 keywords focus on peers and classmates, and 14 keywords on teachers. Regarding the method of reviewed studies, 62% of articles only use cross-sectional designs and collect data coming from questionnaire. Lastly, after reviewing article abstract in journals in English, it is evident that the research shares similar major themes, such as addictive behaviors, campus safety, and social justice issues. However, articles on

the same theme usually cover different topics across countries due to societal conditions. **Conclusions:** Chinese scholars' efforts in better understanding student mental health issues and solutions are in line with both the modern technology development and the mental health promotion practices. Future directions regarding the sample and perspective inclusiveness and method variety are also suggested.

Keywords： hot topics, comparisons across countries, high-level Chinese journals, school mental health, modern technology

身心互益：正念-有氧运动联合干预改善高校学生网络成瘾症状的效果及其机制探索

魏小淇[1, 2] 赵越[1, 2] 何韵涵[1, 2] 迟新丽[1, 2]（通讯作者）

1 深圳大学心理学院，深圳，518060

2 深圳大学心理健康中心，深圳，518060，xinlichi@126.com

摘 要 网络成瘾症状近年来已经被视为一个公共健康问题,并且在高校学生群体中十分高发。由于网络成瘾症状复杂的生理与心理机制，关于如何有效干预高校学生的网络成瘾症状仍在探索中。根据具身认知理论，结合正念与有氧运动的团体联合干预对降低高校学生网瘾症状风险能起到身心兼具的作用。然而，当前少有研究考察该联合干预方式的效果与机制。为此，本研究旨在通过一项试验性的正念-有氧运动联合干预方案，检验该方案对高校学生网瘾症状的改善效果并探索潜在作用机制。研究采用随机对照试验，72 名参与者被随机分配到干预组（*N*=36）和对照组（*N*=36）。干预组被试将接受为期 8 周，每周一次的正念-有氧运动联合训练，对照组则不接受任何干预。网络成瘾测验用于评估参与者的网络成瘾症状。重复测量方差分析和网络干预分析分别用于检验干预效果和机制。最终共有 29 名干预组被试和 29 名对照组被试有效填写了前后测问卷。重复测量方差结果显示，时间*组别的交互作用显著（F=19.5，p<0.001，偏η^2=0.27），干预组网络成瘾症状水平在接受干预后显著降低（干预前 vs 干预后：54.4 vs 41.4），而对照组网络成瘾症状无显著变化（干预前 vs 干预后：51.1 vs 54.8）。网络干预分析结果表明，协同训练对网络成瘾症状“渴望下一次上网”、“因别人打搅上网而发脾气”和“无法控制上网时间”有直接作用。本研究结果初步证明了正念协同有氧运动的身心联合干预方式对改善高校学生网络成瘾症状的有效性，并拓展了具身认知理论在促进身心健康领域研究的应用。

关键词 协同干预，正念，有氧运动运动，网络成瘾症状，随机对照试验，高校学生

Mutual benefit for Physical-and-Mental Health: the Effect and Mechanism of Mindfulness and Aerobic Exercise Combined Intervention on Internet Addiction Symptoms among college students

Xiaoqi Wei[1,2], Yue Zhao[1,2], Yunhan He[1,2], Xinli Chi[1,2,*]

1 School of Psychology, Shenzhen University, 518060

2 Center for Mental Health, Shenzhen University, Shenzhen, 518060

Abstract：Internet addiction (IA) symptoms have been recognized as a public health concern in recent years and have been highly prevalent among college students. Due to IA symptoms' complex physical and mental mechanisms, interventions on how to protect college students from such deleterious outcomes are still under exploration. According to embodied cognition theory, group-based combining aerobic exercise and mindfulness training may confer benefits in reducing the risk of IA symptoms. However, little is known about the effect of the combined intervention among college students. To address this issue, this pilot study aimed to examine the feasibility and effectiveness of the combined intervention on IA symptoms and to investigate the underlying mechanisms. A two-arm pilot study of a randomized controlled trial was taken. Seventy-two participants were randomly allocated to the intervention group (N = 36) or the control group (N = 36). Participants in the intervention group received 8 weeks of weekly mindfulness plus aerobic exercise training, while the control group received no intervention. The Internet Addiction Test (IAT) was used to assess IA symptoms. The effectiveness and mechanism of the intervention were tested using the repeated measurement ANOVA and the network intervention analysis (NIA). The findings included 29 participants in the intervention group and 29 participants in the control group, all of whom completed pre-test and post-test questionnaires. The results of the repeated measurement ANOVA showed that the time*group interaction effect was significant (F=19.5, p<0.001, partial η^2=0.27). Compared to the control group (51.1 vs. 54.8), there was a significant decrease in the level of IA symptoms in the intervention group (54.4 vs. 41.4). NIA results indicated that the combined intervention had direct impacts on IA symptoms "anticipation for future online activities", "annoyed if bothered while being online", and "failure to cut down the time spent online". The findings in this study empirically suggested the effectiveness of the mindfulness and aerobic exercise combined intervention on IA symptoms and expanded the application of embodied cognition theory in promoting physical and mental health among Chinese college students.

Keywords： Combined intervention, Mindfulness, Aerobic exercise, Internet addiction symptoms, Random controlled trail, College students

一起吃会更不健康？共食对高热量食物选择的影响

王楚珺　宛小昂（通讯作者）

清华大学心理学系，北京，100084，通讯作者 E-mail（wanxa@mail.tsinghua.edu.cn）

摘 要　人们在生活中会经常与他人一同用餐，这种行为被称为共食。共食已被证实会提升人们的进食量，但是共食对于=食物选择的影响仍需进一步的探究。本研究探究了个体为不同进食情境做出的食物选择间的差异，并从奖赏性加工的角度验证了该效应的稳健性，在此基础上提出了社会性因素可能存在的影响。我们在实验 1 中要求被试想象自己单独进食或与他人共食，接着在一个高热量食物和一个低热量食物间进行选择。结果表明，相比单独进食，共食会让个体更偏好高热量食物。实验 2 则通过操纵食物的易得性来探究当个体对于高热量食物的奖赏性感知被改变时，这种选择上的差异是否还存在。该实验的结果表明，当高热量食物的奖赏性感知较低时，个体依然会为共食（相比单独进食）选择更多的高热量食物。但是当个体对高热量食物的奖赏性感知被提升，这种效应就不会发生。实验 3 通过操纵食物推荐度来进一步探讨了该问题，并将共食分为了分餐和合餐。实验 3 的结果表明，当个体对高热量食物的奖赏性感知被提升时，分餐对于高热量食物的选择效应会受到限制，但合餐依然会比单独进食选择更多的高热量食物。此外，考虑到共食是一种社会性进食，对高热量食物的选择也可能受社会性因素驱动。实验 4 将共食的互动分为讨论个人或工作相关的情境，结果表明，当讨论个人相关的内容时，两种共食与单独进食在对高热量

食物的选择上不存在差异。但是当互动内容与工作相关时，相比单独进食以及分餐，被试在合餐时会选择更多的高热量食物，这可能是因为此时双方的亲密度较低，人们会为了和谐与面子而选择美味的高热量食物。总的来说，本研究通过 4 个实验验证了共食相比于单独进食会使个体选择更多的高热量食物，并且揭示了这其中可能的机制以及边界条件。本研究的结论为社会性进食情境影响个体的食物消费研究提供了更进一步的实证依据，丰富与拓展了人们对社会性情境影响食物消费的作用机制的理解，也能够为人们的健康饮食行为提供重要的思路与建议。

Eating together makes you less healthy? The influence of commensality on high-calorie food choices

Chujun Wang & Xiaoang Wan*
Department of Psychology, Tsinghua University, Beijing, China

Abstract：People often eat with others, a behavior known as commensality. It has been shown that eating with others can influence individuals' food intake, prompting the question of how commensality affects food choice? Here we report four experiments designed to investigate the differences in food choices for high-calorie foods between commensality and solitary eating. Additionally, we examined the robustness of this effect from the perspective of reward processing, and proposed potential influences of social factors. In Experiment 1, we asked participants to imagine themselves eating alone or eating with others, and then choose between a high-calorie food and a low-calorie food. The results revealed that people chose more high-calorie foods when eating with others than when eating alone. We manipulated food availability in Experiment 2 to examine whether the observed difference in food choice between commensality and solitary eating persists when individuals' perception of the rewarding value of high-calorie foods is altered. The results of this experiment showed that even when the perceived rewarding value of high-calorie foods was low, individuals still exhibited a preference for choosing more high-calorie foods during commensality compared to solitary eating. However, when the perceived rewarding value of high-calorie foods increased, this effect was no longer observed. In Experiment 3, we further investigated this issue by manipulating food recommendation, and categorized commensality into separate commensality and shared commensality. The results revealed that the effect of commensality on food choice was constrained when individuals' perceptions of the rewarding value of high-calorie foods increased. However, this constraint was only observed in the separate commensality condition. In the shared commensality condition, individuals chose more high-calorie foods compared to solitary eating, provided that the level of food recommendation was not low. Moreover, considering that commensality is a form of social eating, the choice of high-calorie foods may also be driven by social factors. In Experiment 4, we asked participants to imagine engaging in interactions during commensality, focusing either on personal-related content or work-related content. The results revealed that when discussing personal-related content, there were no differences in the choice of high-calorie foods between the two types of commensality and solitary eating. However, when discussing work-related content, participants tended to choose more high-calorie foods when imagining engaging in shared commensality compared to engaging in solitary eating or separate commensality. This could be attributed to a lower level of intimacy between diners and a greater motivation to choose tasty high-calorie foods in order to maintain harmony and preserve social face. In summary, this study contributes further empirical evidence regarding the influence of social eating on individuals' food consumption, enhancing our understanding of the underlying mechanisms involved. Furthermore, it offers important insights for promoting healthy eating behaviors

among individuals.

Keywords：solitary eating, separate commensality, shared commensality, food choice, reward processing

活动与饮食行为的行为网络：一项日记法研究

张春青[1] 黄嘉笙[1]（通讯作者）

1 中山大学心理学系，广州，510006

通讯作者 E-mail：huangjsh39@mail.sysu.edu.cn

摘 要 背景：活动与饮食包含了多种健康行为（如锻炼行为、久坐行为、零食摄入等），这些行为之间具有紧密的相互联系，并共同影响着人们的健康状况；许多疾病的预防与管理都需要人们同时坚持进行多种健康的活动与饮食行为。因此，探讨活动与饮食行为之间的相互联系模式将有助于助推多行为改变、促进整体的健康生活方式建立。本研究试图通过一项日记法研究建立日常活动与饮食行为的行为网络，揭示此健康行为群组内的相互联系模式。**方法：**本研究招募了 146 名大学生在下午三点及晚上十点完成问卷，持续 28 天，共 101 名被试填写率达到 70%被纳入分析。问卷测量了被试在对应时间段内的活动行为（久坐时间和锻炼行为）与饮食行为（过度进食行为、含糖饮料摄入和零食摄入行为）。研究使用多层向量自回归模型(mlVAR)估计日常活动与饮食行为的时序网络（个体内的交叉滞后预测性网络关系）、同时网络（个体在同一时间点内所展现的变量网络关系）和个体间网络(整个测量时间段的变量均值在个体间的网络相关关系)；并分别计算不同水平网络中行为节点的期望影响力(Expected Influence, EI)、识别网络内最具影响力的中心行为。**结果：**活动与饮食行为在不同水平上的行为网络具有明显差异。在时序网络中，仅零食摄入行为显著预测更短的久坐时间。在同时网络中，饮食行为之间存在正向联系，锻炼与久坐行为之间存在负向联系，饮食行为中的含糖饮料摄入与过度进食行为均与活动行为存在联系。个体间网络中活动与饮食行为的相互联系更为密集，多数健康行为间都存在显著联结。不同水平的行为网络内的中心行为也有一定差异，其中同时网络中锻炼行为和久坐行为的预期影响力最高，个体间网络中的久坐行为与含糖饮料摄入行为的预期影响力最高。**结论：**活动与饮食行为的相互联结模式在个体内的交叉滞后关系、个体内的共时相关关系和个体间相关关系这三个不同水平上具有明显差异，提示着多行为干预需要更精细地考虑活动与饮食行为在不同时间尺度上的相互影响关系。在不同水平上，对于行为扩散和整体生活方式转变最有影响力的中心行为也有所不同，但整体而言活动行为（久坐与锻炼行为）具有更高影响力；这提示着针对活动与饮食的生活方式干预可考虑以活动行为作为干预靶点，从而更高效地促进整体生活方式的改善。

Examining the Network Dynamics of Daily Movement and Dietary Behaviors: A Diary Study

Chunqing Zhang[1] Jiasheng Huang[1]

1 Department of Psychology, Sun Yat-Sen University, Guangzhou, China

Abstract： **Background:** Movement behaviors and dietary behaviors are lifestyle clusters that consist of multiple health behaviors (e.g., exercise behaviors, sedentary behaviors, snack intake, etc.). These behaviors have inherent connections with each other and jointly influenced health outcomes. Therefore, it is important to investigate how to effectively promote multiple behavior change within the lifestyle cluster of physical activity and eating. This diary study aimed to investigate the behavior network of daily movement and dietary behaviors and

reveal the pattern of interconnections within this lifestyle cluster. **Method:** A total of 146 college students to take part in the daily survey, which required them to complete behavior questionnaires at 3 pm and 10 pm for 28 consecutive days. Out of these, 101 participants who completed more than 70% of the daily surveys were included in the analyses. The behaviors assessed in this study were sedentary behavior, exercise behavior, overeating behavior, sugar-sweetened beverage intake, and snack intake. The multi-level vector autoregressive model (mlVAR) was used to estimate the temporal network (i.e., depicting the cross-lagged predictive effects between variables) the contemporaneous network (i.e., depicting the associations between variables within the same measurement occasion), and the between-subject network (i.e., depicting the associations between person-means of the variables during the whole measurement period) of these behaviors. The expected influences (EIs) of each behavior node in different networks were also calculated to identify the central behavior within each network. **Results:** The analyses revealed distinct network dynamics of movement and dietary behaviors at different levels. In the temporal network, only snack intake significantly predicted shorter sedentary time. In the contemporaneous network, positive interconnections between dietary behaviors and a negative connection between exercise and sedentary behaviors were observed. The between-person network was denser, with most behaviors being significantly connected. Central behaviors also varied between different levels of networks, with the role of movement behaviors being particularly highlighted. **Conclusions:** The interconnections between movement and dietary behaviors demonstrated different patterns at the within- (including temporal and contemporaneous) and between-person levels. This suggests that multi-behavior interventions should take into account the varying interactions between movement and dietary behaviors at different time scales. Moreover, movement behaviors (including sedentary and exercise behaviors) appear to be more influential in behavior spread, indiacting that lifestyle interventions can target in movement behaviors in order to effectively facilitate comprehensive lifestyle transformation.

Keywords：health behavior, movement behavior, dietary behavior, network analysis, diary study

伴侣发出的社会阻抑对员工安全行为的影响：认知和情感的双路径模型

毛文勖[1]　王大伟[1]（通讯作者）

1 山东师范大学心理学院,山东济南,250358,wdw112@163.com

摘 要　员工安全行为是组织安全事故和伤害发生的重要影响因素。以往研究对安全行为前因的探索多关注工作场所相关变量(如领导风格、团队氛围和文化等)，而忽视了家庭领域中具体经历的影响。社会阻抑行为是一种负性、非支持性的人际互动，当这种行为由本应该提供社会支持的伴侣发出时，其破坏性影响会更凸显。本研究基于工作家庭机制、资源保存理论和认知—情感系统理论，考察伴侣发出的社会阻抑行为对员工安全行为的影响及其内在机制。

本文包括三个研究，研究一对状态反刍问卷进行修订，采用整群随机抽样从某国有企业中共计选取 664 名企业员工，经过翻译-回译程序形成量表中文版，并对其进行探索性因素分析、验证性因素分析、信度分析、相容效度分析、效标关联效度检验等分析步骤，最终得到了信效度良好、适用于中国样本的状态反刍问卷。研究二从某国有石油公司通过整群随机抽样后筛选出 145 名有伴侣的有效被试，通过基于线索回忆的单因素被试间实验探究伴侣发出的社会阻抑对员工安全行为的影响，以及状态性反刍思维和消极工作情绪的中介作用。研究三为两阶段(间隔两周)的问卷调查研究，采用整群随机抽样从两家大型石油行业和水泥制造业公司中选取 361 名员工为被试，以社会阻抑量表、反刍思维量表、消极情绪量表、安全行为量表为测量工具，在组织的真实情境下再次检验伴侣发出的社会阻抑和员工安全行为的关系及机制，并将研究二的结果从状态性反刍拓展到了稳定的反刍思维中，提升结论的敏健性和推广性。使用 SPSS 25.0 及 Process

3.5 宏程序以及 Mplus 7.0 软件对数据进行管理与分析。结果发现：(1)修订后的状态反刍量表信效度达到测量学要求；(2)问卷研究表明，伴侣发出的社会阻抑负向预测员工安全遵守和安全参与；(3)实验研究和问卷研究共同表明，消极工作情绪在伴侣发出的社会阻抑和员工安全遵守、安全参与间起中介作用；(4)问卷研究表明，反刍思维和消极工作情绪在伴侣发出的社会阻抑和员工安全遵守、安全参与间起着链式中介作用。

The effect of partner-instigated social undermining on employees' safety behavior:

a dual path model of cognition and emotion

Wenxu Mao[1], Dawei Wang[1]

1 School of psychology, Shandong Normal University, 250358, wdw112@163.com

***Abstract*：** Employee's safety behavior is an important factor affecting the occurrence of organizational safety accidents and injuries. Previous studies on the antecedents of safety behaviors mainly focused on factors in the work domain (such as leaderships, team climate and culture, and relationships between leaders and members, etc.), ignoring the impact of specific experiences purely in the family domain. Social undermining is a negative, unsupportive interpersonal interaction behavior, and its damaging effect on employees' job performance will be accentuated when it is perpetrated by a partner who is supposed to provide social support. Therefore, based on the work-family mechanism, conservation of resource theory and cognitive-affective processing system (CAPS) theory, this study examines the influence of partner-instigated social undermining on employees' safety behavior and its internal mechanism.

This study includes three studies. The state rumination questionnaire was revised in study 1, and 664 employees were selected from two state-owned enterprises by cluster random sampling. The Chinese version of the scale was formed after a complete translation-back translation procedure, and exploratory factor analysis, confirmatory factor analysis, reliability analysis, compatible validity analysis, criterion-related validity analysis were carried out to obtain the status rumination questionnaire with good reliability and validity, which is suitable for Chinese samples. In study 2, 145 effective participants who have partners were selected from a state-owned oil company by cluster random sampling, to examine a causal relationship between partner-instigated social undermining and employees' safety behavior and the mediating effect of state rumination and negative work emotion, using the between-subjects design to perform a cued recall experiment. Study 3 was a two-stage (two weeks apart) questionnaire study, using cluster random sampling, 361 enterprise employees from two large oil and cement manufacturing companies were selected as participants, and the social undermining scale, ruminative responses scale, negative emotion scale and safety behavior scale were used as measuring tools. Hence, in the real situation of the organization, the relationship and mechanisms between social undermining issued by partners and employees' safety behavior were again examined, so as to improve the sensitivity and generalization of the conclusion. SPSS 25.0 and Process 3.5 macro as well as Mplus 7.0 software were used to manage and analyze the data. The main findings are as follows: (1) the reliability and validity of the revised state rumination scale meets the measurement requirements; (2) the questionnaire study show that partner-instigated social undermining negatively predicts employees' safety compliance and safety participation behaviors; (3) both the experimental study and the questionnaire study show that negative work emotion mediates the relationship between partner-instigated social undermining and the safety compliance and safety participation of employees; (4) the

questionnaire study show that rumination and negative work emotion play a serial mediating role between partner-instigated social undermining and employee's safety behavior.

Keywords：safety behavior, social undermining, rumination, negative work emotion, work-family mechanism

无意识健康目标启动对自我损耗下食物选择决策的影响

罗雨晨[1] 赵国军[1]（通讯作者）

1 西北师范大学心理学院，兰州，730070，zhaogj@nwnu.edu.cn

摘 要 2020 年世界卫生组织表明：超重和肥胖已达到了流行范围。面对这一问题，食物选择决策成为了一个重要的研究领域。资源有限理论认为，食物选择决策往往涉及到有意识的抑制对高热量美味食物的渴望，这个过程会损耗自我控制的能量，从而降低自我控制水平。自我损耗已经被证明与暴食、饮食节制等饮食失调行为有关。越来越多的研究者也开始着手探索能够有效改善人们饮食失调行为的干预方法。以往研究通过图片启动个体的健康目标，结果发现个体选择高热量食物的比例显著降低。然而研究并没有进一步探讨在自我损耗下启动个体的健康目标是否仍然可以促进个体更加合理健康的进行食物选择行为。出于以上考虑，本研究从以下两个实验出发，考察无意识健康目标启动对自我损耗下食物选择决策的影响。其中实验一采用色彩 Stroop 任务和食物选择任务，检验自我损耗对食物选择决策的影响，结果显示，相比于非损耗组，损耗组在高热量食物选择比例上更高，表现出自我损耗条件下个体会更多的选择高热量食物。实验二先后采用色彩 Stroop 任务、句子整理任务和食物选择任务及相，探讨了在自我损耗条件下无意识健康目标启动是否可以改善个体食物选择决策，结果显示，目标启动组的被试选择高热量食物会更少，但目标启动的效果只在非损耗条件下有显著作用，此外，无论是在目标启动组还是在目标控制组，损耗条件都会造成个体更多选择高热量食物。研究结果提示自我损耗会造成个体更多选择高热量食物，无意识健康目标启动可以降低个体的高热量食物选择比例，但无意识健康目标启动不能弥补自我损耗对食物决策的消极影响，因此，未来研究需要进一步关注健康目标对自我控制和食物选择关系的影响，探讨能够预防自我损耗对食物选择决策消极影响的有效途径。

Unconscious self-control goal initiation improves of inhibitory control in mobile phone dependents

Zhao Guojun[1] Lu Yuchen[1]

1 school of Psychology, Northwest Normal University,Lanzhou, 730070,

zhaogj@nwnu.edu.cn

Abstract: In 2020, the World Health Organization showed that overweight and obesity have reached epidemic range. Faced with this problem, food choice decision-making has become an important area of research. The finite resource theory suggests that food choice decisions often involve consciously suppressing cravings for high-calorie, delicious foods, a process that depletes energy for self-control and thus reduces the level of self-control. Self-depletion has been shown to be associated with eating disorders such as binge eating and dietary abstinence. More and more researchers are also beginning to explore interventions that can effectively improve people's eating disorder behavior. Previous studies that used pictures to initiate individual health goals found that the proportion of individuals choosing high-calorie foods was significantly reduced. However, the study did not further explore whether initiating an individual's health goals under self-depletion can still promote a more rational and healthy food choice behavior in the individual. Based on the above considerations, this study starts from the following two experiments to investigate the influence of unconscious health goal activation on food choice decisions under self-depletion. Among them, the first experiment used the color Stroop task and the food selection task to test the influence of self-loss on food choice decision-making, and the results showed that compared with the non-loss group, the loss group had a higher proportion of high-calorie food selection, indicating that individuals would choose more high-calorie foods under self-depletion conditions. The results showed that the participants in the target initiation group would choose fewer high-calorie foods, but the effect of target initiation only had a significant effect under non-loss conditions, in addition, whether in the target initiation group or in the target control group, the loss conditions would cause individuals to choose more high-calorie foods. The results suggest that self-depletion will cause individuals to choose more high-calorie foods, and unconscious health goal activation can reduce the proportion of high-calorie food choices in individuals, but unconscious health goal activation can not compensate for the negative impact of self-depletion on food decision-making, so future research needs to pay more attention to the impact of health goals on the relationship between self-control and food choice, and explore effective ways to prevent the negative impact of self-depletion on food choice decisions.

背景颜色和健康目标启动对食物偏好的影响：基于健康目标启动范式

邓芝彤[1]　闻涛[1]　罗晶晶[1]　田汶冉[1]　冯果[1,2]（通讯作者）

1 西南交通大学心理研究与咨询中心，成都，611756

2 西南交通大学应用心理学研究院，成都，611756，fengguo@swjtu.edu.cn

摘 要　**背景：**健康是一切生命活动的基石。探讨食物偏好的影响因素和干预办法，有利于不良饮食者和减重需求者采取有效的策略减轻或改善这些不良饮食行为，对促进健康饮食具有重要的现实意义。食物偏好受到许多因素的影响，包括个体因素和环境因素。其中，情境线索这一环境因素在食物偏好中起着至关重要的作用。研究发现，只要注意到与饮食健康相关的线索，个体对体重的意识就会被激活，进而倾向于选择健康的食物。健康目标启动是一种很受关注的情境因素。因此，本研究通过操纵被试的健康目标启动，探究其在不同背景颜色下对高低热量食物的食欲评分是否存在差异，来明确背景颜色和健康目标启动对食物偏好的影响，并进一步验证视觉和味觉的跨通道整合效应。**方法：**通过健康目标启动范式，采用2(背景颜色：红色、绿色)×2(热量：高、低)×2(健康目标启动：健康目标启动组、控制组)的混合设计，招募60名大学生被试，随机分为健康目标启动组和控制组（每组30人），要求被试对不同背景颜色下的高低热量食物图片进行0—100的食欲评分。**结果：**(1)背景颜色与健康目标启动有显著的交互作用($F(1,60)=33.819$，$p<.001$)，启动健康目标显著增加了被试对绿色背景下食物的喜好程度。(2）背景颜色与食物热量也有显著的交互作用（$F(1, 60)=19.716$，$p<.001$），与红色背景相比，绿色背景会显著降低被试对高热量食物的

喜好程度。**结论：**健康目标启动和背景颜色可以共同影响个体的食物偏好，这可为未来视味觉联合通道、健康饮食干预以及食品包装的研究提供新的思路。

The Impact of Background Color and Health Goal Priming on Food Preference: Based on the Health Goal Priming Paradigm

Zhitong Deng[1]，Tao Wen[1]，Jingjing Luo[1]，Wenran Tian[1]，Guo Feng[1,2]

1 Psychological Research and Counseling Center, Southwest Jiaotong University, Chengdu 611756, China

2 Institute of Applied Psychology, Southwest Jiaotong University, Chengdu 611756, China

***Abstract*：** **Background:** Health is the cornerstone of life activities. To explore the influencing factors and intervention methods of food preference, it is of great practical significance for people with bad diet habits and those who need to lose weight to adopt effective strategies to reduce or improve these bad eating behaviors. Food preference are influenced by many factors, both individual and environmental. Among them, situational cues, an environmental factor, plays a crucial role in food preference. Previous studies have found that simply by paying attention to cues related to diet health, an individual's awareness of body weight is activated, and in turn tends to choose health foods. Health goal priming is one of the highly concerned situational factor. Therefore, by manipulating the health goal priming of participants, this study explored whether there were differences in their appetite scores for high and low calorie foods under different background colors, so as to clarify the influence of background color and health goal priming on food preference, and further verify the cross-modal integration effect of vision and taste. **Methods:** Through the health goal priming paradigm, we designed a 2 (background colors: red and green) ×2 (calorie type: high and low) ×2 (health goal priming: priming group and control group) mixed-subject experiment. We recruited 60 college students and divided them into health priming and control groups randomly. The participants completed the task of rating appetite on a scale of 0 to 100 for high and low-calorie food images with different color backgrounds. **Results:**（1）There was a significant interaction between background color and the health goal priming（$F(1, 60)=33.819$，$p<.001$）, which increase participants' preference for food under a green background. (2) There is also a significant interaction between background color and food calories（$F(1, 60)=19.716$，$p<.001$）. Compared to a red background, a green background significantly reduces participants' preference for high calories foods. **Conclusion:** The priming of health goals and background color can jointly affect food preferences of individuals, providing new ideas for the cross-modal integration of vision and taste，healthy dietary interventions and food packaging research.

父母控制的亲子感知差异与儿童焦虑的纵向关系：亲子亲密的调节作用

翟梦晓[1]　张思羽[1]　董悦[1]　徐夫真[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，通讯作者 E-mail: xufuzhen@sdnu.edu.cn

摘要 父母和儿童在感知父母教养行为方面往往存在稳定的、有现实意义的感知差异。与父母相比，儿童在父母积极教养行为上感知水平更低，而在消极教养行为上感知水平更高，这种感知差异能够稳定地预测儿童的发展结果。父母控制是典型的教养行为之一，其中心理控制被认为是消极的教养行为，可能会导致儿童产生焦虑情绪；行为控制在某些情况下具有积极作用，能够减少儿童焦虑情绪。同时，与父母的亲密关系是儿童重要的情感资源，能够调节父母教养行为与儿童焦虑的关系，是减少儿童焦虑的保护性因素。然而，以往研究较少关注到父母控制的亲子感知差异对儿童焦虑的影响，以及亲子亲密在其中的作用。此外，以往研究多使用差异分数法来评估感知差异，在某种程度上过度简化了预测变量与结果变量的关系，而多项式回归与响应面分析法通过使用三维曲面同时呈现感知一致性与差异性对儿童发展的线性和曲线性影响，目前被认为是评估感知差异更好的方法。因此，本研究采用间隔一年的纵向研究设计，以 1168 名儿童及其父母为研究对象，采用儿童焦虑量表、父母控制量表和亲子亲密度量表，通过多项式回归与响应面分析法探讨亲子在心理/行为控制上的感知差异及其对儿童焦虑的影响，以及亲子亲密在其中的调节作用。结果发现，（1）与父母相比，儿童感知到的父母心理控制水平更高、行为控制水平更低；（2）当亲子在心理/行为控制上感知一致时，双方对心理控制感知水平越高、行为控制感知水平越低，儿童一年后的焦虑水平越高；（3）当亲子在心理/行为控制上感知不一致时，双方感知差异越大（儿童对心理控制感知越高、行为控制感知越低），儿童一年后的焦虑水平越高；（4）母子亲密在母子心理/行为控制感知差异性与儿童焦虑之间起调节作用。这一研究强调多主体评估及评估差异的重要性和必要性，同时也提示父母在教养过程中要考虑儿童的真实感受，并与儿童建立良好的亲子关系。

The longitudinal relations of parent-child perceived discrepancies of parental control and children's anxiety: Moderating effect of parent-child closeness

Mengxiao Zhai[1], Siyu Zhang, Yue Dong, Fuzhen Xu[1] (Corresponding Author)
1 School of Psychology, Shandong Normal University, Jinan, 250014

Abstract: There are stable and meaningful perception discrepancies between parents and children regarding their perceptions of parenting behaviors. Specifically, compared with parents, children have lower perceptions of positive parenting behaviors and higher perceptions of negative parenting behaviors, and these discrepancies in perception can reliably predict children's developmental outcomes. Parental control is a typical parenting behavior, in which psychological control is considered a negative parenting behavior, which may lead to children's anxiety, and behavioral control plays a positive role in reducing children's anxiety in some cases. At the same time, the closeness between children and their parents is an important emotional resource for children, which can modulate the relationship between parenting behavior and children's anxiety, and is a protective factor to reduce children's anxiety. However, previous studies have paid less attention to the impact of parent-child perception discrepancies regarding parental control on children's anxiety, and the role of parent-child closeness in it. In addition, there are some limitations in the previous methods of studying perceptual discrepancies. For

example, the difference score method oversimplifies the relationship between predictive variables and outcome variables, while polynomial regression and response surface analysis use three-dimensional surfaces to present the linear and curvilinear effects of perceptual congruence and incongruence on children's development, which is a relatively new method in the field of psychology. Therefore, this study used a longitudinal study design with an interval of one year, taking 1168 children and their parents as the research object, using the Spence Children's Anxiety Scale, the Parental Control Scale and the Parent-Child Closeness Scale, through polynomial regression and response surface analysis to explore the impact of parent-child perception discrepancies in psychological/behavioral control on children's anxiety, and the moderating role of parent-child closeness. The main results were as follows: (1)Children perceived higher levels of psychological control and lower levels of behavioral control compared to their parents; (2)When there was perception consistency between parents and children regarding psychological/behavioral control, higher levels of perceived psychological control and lower levels of perceived behavioral control were associated with higher levels of child anxiety one year later; (3)When there was perception inconsistency between parents and children regarding psychological/behavioral control, greater differences in perception (with children perceiving higher psychological control and lower behavioral control) were associated with higher levels of child anxiety one year later; (4)Mother-child closeness moderated the negative impact of maternal-child perception inconsistency on children's anxiety. The above results highlight the significance of considering parent-child discrepancies when examining the role of parental control in children's anxiety. This also suggests that parents need to consider the true feelings of children in the process of parenting and establish a good parent-child relationship with children.

自我同情对癌症患者心理治疗感知障碍的预测作用：一项纵向研究

孙莎莎[1]　朱蕾[1](通讯作者)

1 陕西师范大学心理学院，西安，710062，lei.zhu@snnu.edu.cn

摘　要　心理治疗感知障碍是指阻碍癌症患者接受心理治疗的情境因素和信念。以往研究发现癌症患者普遍存在心理治疗感知障碍，并且心理困扰严重的患者寻求心理治疗帮助的意愿也较低。然而较少有研究探讨心理治疗感知障碍的保护性心理因素。因此，本研究聚焦于自我同情，拟探讨自我同情对于癌症患者心理治疗感知障碍的保护性作用。本研究采用纵向设计，考察了患者在初次癌症诊断时期的自我同情对患者在接受治疗过程中心理治疗感知障碍的预测作用。本研究在陕西省肿瘤医院招募了 153 名患者，并在确诊后一周内（T1），开始治疗一周内（T2）和治疗结束一周内（T3）对其进行问卷调查。采用层次线性回归分析进行数据分析。横向回归分析显示，自我同情总分和消极自我同情与羞耻感显著相关。纵向回归分析显示，患者在 T1 的自我同情总分和消极自我同情可以显著预测患者在 T2 和 T3 的对心理治疗的负面评价。此外，患者在 T1 的自我同情总分可以显著预测患者在 T3 的羞耻感，治疗与需求的不匹配和参与限制。患者在 T1 的消极自我同情可以显著预测患者在 T3 的参与限制。研究结果表明自我同情是心理治疗感知障碍的一个保护性心理因素。未来干预研究应聚焦于提高癌症患者的自我同情，从而降低患者的心理治疗感知障碍。

The predictive role of self-compassion in perceived barriers to psychological treatment in cancer patients: A longitudinal study

Sun Shasha, Zhu Lei
School of Psychology, Shaanxi Normal University, Xi'an 710062, China

***Abstract*:** Perceived barriers to psychological treatment refer to situational factors and beliefs that may prevent people from accessing treatment. Previous studies have found that perceived barriers to psychological treatment were common among cancer patients, and people with serious psychological distress are less likely to seek psychological treatment. However, little is known about the protective psychological factors for perceived barriers of psychological treatment. Therefore, this study focuses on self-compassion and intends to investigate the predictive role of self-compassion in perceived barriers to psychological treatment in cancer patients. This current study adopts a longitudinal study design and examines the predictive role of patients' self-compassion at the first diagnosis in their perceived barriers to psychological treatment during the course of treatment. A total of 153 heterogeneous cancer patients were recruited from Shaanxi Provincial Tumor Hospital in Xi'an, China. Participants were assessed after the first diagnosis (T1), at the beginning (T2), and the end (T3) of medical treatment. Hierarchical linear regression analyses were used to examine the research questions. Cross-sectional regression analysis showed that at T1 a self-compassion total score and negative self-compassion were significantly related to stigma. The longitudinal regression analysis showed that self-compassion total score and negative self-compassion at T1 could significantly predict patients' negative evaluation of therapy at T2 and T3. Moreover, self-compassion total score at T1 was significantly related to patients' stigma, misfit of therapy to need, and participation restriction at T3. Negative self-compassion at T1 was significantly related to time constraints at T2, and participation restriction at T3. The results suggest the predictive effect of self-compassion on perceived barriers to psychological treatment. Future studies should focus on improving cancer patients' self-compassion to reduce these barriers.

睡眠障碍作为预防药物复吸的干预锚点

李振华，许寿生
北京体育大学，北京，100084

目的：在戒毒干预和治疗中，预防复吸已成为一项重中之重的任务。尽管中国法律规定强制隔离是戒毒和预防复吸的主要手段，但目前的强制隔离中心在减轻对药物的渴望或防止复吸方面尚未取得显著进展。因此，本研究旨在探讨毒品依赖者的睡眠障碍与复吸倾向之间的关系，以及相关的作用机制和干预措施。方法：首先对 400 名男性吸毒者进行一项横向调查，使用相应的问卷评估他们的睡眠障碍、生活质量和复吸倾向。随后从中筛选出 60 名患有睡眠障碍的参与者（睡眠质量得分大于 7 分），并随机将其分配到干预组和对照组。干预组接受了为期 12 周的旨在治疗睡眠障碍的健身气功，而对照组从事常规的生产工作。在设计本研究的健身气功处方时，我们充分考虑了中医的理念。从中医的角度来看，睡眠模式的正常与否是由阴阳平衡决定的，睡眠障碍通常与阳盛阴虚有关。而肾是阴的源头，直接或间接地与身体的所有功能相关联，因此睡眠障碍可能源于肾阴不足。为了滋阴补肾，我们设计了一套有针对性的健身气功动作。结果：睡眠障碍对复吸倾向有正向的预测作用，生活质量在其中起到中介作用。为期 12 周的针对睡眠障碍的健身气功不仅改善了毒品依赖者的睡眠质量，而且提高了他们的整体生活质量，从而减少了复吸倾向。结论：

本研究不仅探索了影响毒品复吸的高危因素，还制定了具有针对性的干预策略，这为未来开展更多针对睡眠障碍的干预研究提供了基础，并为提升戒毒治疗的成功率提供了有益的参考。
关键词：睡眠障碍；生活质量；复吸倾向；健身气功；毒品依赖者

Sleep disorders as a prospective intervention target to prevent drug relapse

Abstract: Preventing relapse has become a crucial task in drug intervention and treatment. Although compulsory isolation is the primary approach for drug detoxification and relapse prevention according to Chinese law, the existing compulsory isolation centers have not made significant progress in reducing drug cravings or preventing relapse. Therefore, this study aims to explore the relationship between sleep disorders in drug dependents and relapse tendencies, as well as the associated mechanisms and intervention measures. Methods: A cross-sectional survey was conducted on 400 male drug users, assessing their sleep disorders, quality of life, and relapse tendencies using relevant questionnaires. Subsequently, 60 participants with sleep disorders (sleep quality score greater than 7) were selected and randomly assigned to an intervention group and a control group. The intervention group underwent a 12-week fitness qigong program aimed at treating sleep disorders, while the control group engaged in regular occupational work. Traditional Chinese medicine concepts were taken into consideration when designing the fitness qigong prescription for this study. From a Traditional Chinese Medicine perspective, the normality of sleep patterns is determined by the balance of yin and yang, and sleep disorders are often related to excessive yang and deficient yin. The kidneys are the source of yin and are directly or indirectly associated with all bodily functions; therefore, sleep disorders may originate from insufficient kidney yin. To nourish yin and tonify the kidneys, a targeted set of fitness qigong exercises was designed. Results: Sleep disorders had a positive predictive effect on relapse tendencies, with quality of life playing a mediating role. The 12-week fitness qigong program targeting sleep disorders not only improved the sleep quality of drug dependents but also enhanced their overall quality of life, thereby reducing relapse tendencies. Conclusion: This study not only explores high-risk factors influencing drug relapse but also formulates targeted intervention strategies, providing a foundation for future research on interventions for sleep disorders. It also offers valuable insights for improving the success rate of drug detoxification treatment.
Keywords: sleep disorders, quality of life, relapse inclination, Health Qigong, substance users

基于 Optuna-Stacking 可解释机器学习模型揭示执行功能在精神分裂症辅助诊断与预后中的价值

张统一[12]　赵鑫[12]（通讯作者）

1 甘肃省行为与心理健康重点实验室,甘肃 兰州，730070

2 西北师范大学心理学院，甘肃 兰州 730070，psyzhaoxin@nwnu.edu.cn

摘 要　执行功能已被广泛视为解码精神分裂症病理机制的关键途径，在精神分裂症的发病机制和病程中起重要作用。然而，由于受传统统计方法的限制，目前对执行功能与精神分裂症之间复杂关系的理解仍十分有限。传统统计方法并不能充分捕捉到执行功能特征与精神分裂症之间的隐含联系与内在规律。本研究首次尝试使用可解释性机器学习算法，以揭示执行功能在精神分裂症诊断和预后中的潜在价值。

实验一基于 195 名精神分裂症患者和 169 名健康对照组的执行功能行为数据和社会人口学资料，使用 Stacking 方法融合三种基学习器 (SVM、Adboost 以及 ANN 模型)建模，并采用 Optuna 算法参数调优，之后利用 SHAP 值进行模型解释。实验二构建纳入与不纳入执行功能行为数据的两组模型 (两组模型均整合临床易获取的数据，如临床量表、病历、血常规等)，比较模型在预测 86 名患者住院治疗 4 至 6 周后临床症状缓解效果的性能。结果显示，OP-Stacking (Optuna-Stacking)模型在分类诊断任务中表现最佳 (准确率=0.8783；精确度=0.8710；召回率=0.8896；F1 值=0.8774；AUC=0.9359)。流体智力、失业、独生子女以及执行功能被确认为模型最重要的预测因素。在基于执行功能特征预测个体是否为精神分裂症患者时，模型表现出一定的差异性。在预后分类任务中，纳入执行功能行为数据的模型在预测精神分裂症治疗效果方面的性能更优。

结果发现，执行功能可作为一种可靠的生物标志物，用于精神分裂症的辅助诊断和预后评估。基于执行功能行为数据和易获取的社会人口学信息所构建的分类模型具有较好分类性能，能有效识别出精神分裂症患者。尽管执行功能损伤是精神分裂症群体的典型表现，但可能并非所有亚型的患者都在同等程度上受到影响。临床诊断时应关注那些执行功能损伤的独生子女以及大龄失业青年。执行功能在预测精神分裂症临床干预效果方面也起到了关键作用。未来研究应进一步探索执行功能在诊断和预后评估共病或类似精神疾病患者中的作用，尤其是关注执行功能三个子成分 (转换、抑制与刷新)同一性和独特性的潜在价值。

Developing an Optuna-Stacking Interpretative Machine Learning Model Leveraging Executive Functions for Auxiliary Diagnosis and Prognosis of Schizophrenia

ZHANG TongYi[12]　ZHAO Xin[12]

1Key Laboratory of Behavioral and Mental Health of Gansu province, Lanzhou Gansu, 730070

2 School of Psychology, Northwest Normal University, Lanzhou Gansu, 730070

***Abstract*：** Executive functions have been widely recognized as pivotal pathways for decoding the pathological mechanism of schizophrenia, playing an important role in the disease's onset and progression. However, due to the constraints of traditional statistical methods, our current understanding of the intricate relationship between executive functions and schizophrenia remains limited. Traditional statistical methods fail to fully capture the implicit connections and intrinsic patterns between the characteristics of executive functions and schizophrenia. This study is the first to attempt to leverage interpretable machine learning algorithms to reveal the potential of executive functions in diagnosing and predicting schizophrenia.

In Experiment 1, we utilized behavioral data related to executive functions and sociodemographic information from 195 schizophrenia patients and 169 healthy controls. We used a Stacking methodology to combine three base learners (Support Vector Machine, Adaboost, and Artificial Neural Network), and the Optuna algorithm was employed for parameter tuning. Subsequently, we used SHAP values for model interpretation. In Experiment 2, we constructed two groups of models, one incorporating executive function behavioral data and the other excluding it (both sets of models integrated readily obtainable clinical data, such as clinical scales, medical records, and routine blood tests), and compared their performance in predicting the remission of clinical symptoms in 86 patients after 4 to 6 weeks of hospital treatment. The results revealed that the Optuna-Stacking (OP-Stacking) model performed best in the diagnostic classification task (accuracy = 0.8783; precision = 0.8710; recall = 0.8896; F1 score = 0.8774; AUC = 0.9359). Fluid intelligence, unemployment, being an only child, and executive functions were confirmed as

the model's most important prediction factors. The model showed some variability when predicting whether an individual is a schizophrenia patient based on the characteristics of executive functions. In prognosis classification tasks, the model that incorporated executive function behavioral data demonstrated superior performance in predicting the treatment outcomes of schizophrenia.

These results indicate that executive functions can serve as reliable biomarkers for assisting in the diagnosis and prognostic assessment of schizophrenia. The classification model, built on the basis of executive function behavioral data and easily obtainable sociodemographic information, demonstrated great classification performance and could effectively identify schizophrenia patients. Although impairment in executive functions is a typical manifestation in the schizophrenia population, it may not affect all subtypes of patients to the same extent. Clinical diagnoses should pay attention to single children and older unemployed individuals with impairments in executive functions. Executive functions also played a crucial role in predicting the effectiveness of clinical interventions for schizophrenia. Future research should further explore the role of executive functions in the diagnosis and prognostic evaluation of patients with comorbidity or similar mental disorders, especially focusing on the potential of the unity and diversity of the three subcomponents of executive functions (shifting, inhibition, and updating).

家庭功能如何影响青少年的积极或消极应对方式？

核心自我评价和优势知识的作用

温岚　黄伟伟　张姝玥（通讯作者）

广西师范大学教育学部，桂林，541100,627610275@qq.com

摘 要　**设计** 本研究主要探讨核心自我评价（CSE）和优势知识在家庭功能与积极应对方式（PCS）之间的连锁中介作用，以及优势知识在家庭功能与消极应对方式（NCS）之间的调节作用。**方法** 共有 2746 名（560 名男生，2186 名女生）中国青少年参与了本研究。这些参与者填写了家庭功能评估量表、CSE 量表、优势知识量表和简单应对量表。在 SPSS 25 中使用过程模型 1 和模型 6 研究调节和中介作用。**结果** 根据研究结果，在积极维度上，CSE 与优势知识形成了链式中介，家庭功能对积极应对方式形成正向预测作用，CSE 和优势知识是部分中介。在消极维度上，家庭功能对消极应对方式的直接效应不显著，是通过 CSE 和优势知识的链式中介产生间接影响的，所以 CSE 和优势知识是完全中介。而且优势知识在家庭功能和消极应对方式的关系中存在调节作用，随着优势知识水平的提高，家庭功能有效地减少了青少年对 NCS 的使用。另外，排除家庭功能变量，构建一个新的模型，发现优势知识在 CSE 和消极应对方式的中介作用中呈现了“遮掩效应”。**结论** 家庭功能和 CSE 以及优势知识是青少年应对方式的保护因素。家庭是青少年重要的支持来源。家庭成员，尤其是父母，必须成为孩子合适的力量教练。基于内在愿望，良好的依恋关系可以促进个人的 CSE 和优势知识。但注意“物极必反”的现象，优势知识并非越高越好，在较高的核心自我评价上，过高的优势知识反而增加了消极应对方式的应用。因此，通过家庭成员优化家庭的生态系统和功能，青少年可以优化他们的应对方式。

关键词　家庭功能，积极应对方式，消极应对方式，核心自我评价，优势知识，青少年

How does family functioning contribute to adolescents' positive or negative coping styles?

The roles of core self-evaluations and strengths knowledge

Lan Wen, Weiwei Huang, Shuyue Zhang
Faculty of Education, Guangxi Normal University, Guilin, China

***Abstract*：** **Design** The current study focuses on the chain mediating roles of core self-evaluations (CSE) and strengths knowledge in the relationship between family functioning and positive coping styles (PCS) and the moderating role of strengths knowledge in the relationship between family functioning and negative coping styles (NCS). **Methods** A total of 2746 (560 boys, 2186 girls) Chinese adolescents participated in this research. These participants completed the Family Functioning Assessment Scale, CSE scale, Strengths knowledge Scale and Simple Coping Scale. Models 1 and 6 of Process were used in SPSS 25 to investigate moderation and mediation roles. **Results** According to the results of the study, on the positive dimension, family functioning positively predicted PCS, with CSE and strengths knowledge formed a chain mediation. CSE and strengths knowledge were partial mediators. On the negative dimension, the direct effect of family functioning on NCS was not significant, but it was indirectly influenced through chain mediation of CSE and strengths knowledge. So CSE and strengths knowledge were full mediators. Moreover, there was a moderating role of strengths knowledge between family functioning and NCS. Simply put: family functioning effectively reduced application of NCS as increase of strengths knowledge. In addition, a new model was constructed, excluding family functioning, and it was found that strengths knowledge had a "masking effect" in mediating between CSE and NCS. **Conclusions** Family functioning and CSE as well as strengths knowledge are protective factors for adolescents' coping styles. Family is an important source of support for adolescents. Family members, especially parents, must be suitable strength coaches for children. Based on intrinsic aspirations, a good attachment relationship can promote individuals' CSE and strengths knowledge. But we should pay attention to "Things will develop in the opposite direction when they become extreme." Strengths knowledge is not the higher the better, too much strengths knowledge can lead to too much NCS. By family members optimizing the ecological system and functioning of family, adolescents can optimize their coping styles.

AR 卡通面孔加工在调节孤独症儿童目光接触障碍中的作用

赵恬[1]　刘睿东[1]　李雨玲[1]　丁妮[2]（通讯作者）
1 北京师范大学，北京，100875
2 北京师范大学，北京，100875，dingni@bnu.edu.cn

摘 要　增强现实（Augmented Reality，AR）是一种将虚拟信息与真实世界相结合的技术，它可以在真实环境中实时叠加虚拟的三维图像、视频、音频等多媒体信息，从而增强用户对真实环境的感知和理解。近年来，随着 AR 技术的推广，更多的创新性研究聚焦于如何运用 AR 技术对孤独症儿童典型障碍进行有效干预和症状改善。由于 AR 技术能够有效提升现实情境的清晰直观性和感知冲击力，使得情景式的学习

方式更具亲和性、动态性和自然性，在一定程度上能弥补孤独症儿童对现实世界信息和刺激接收迟缓的弱势，以及社交沟通上动机明显不足的劣势。

据最新的流行病学调查数据结果显示，全世界孤独症谱系障碍的患病率已达到 0.6%，并呈现逐年递增的趋势，我国 0-18 岁孤独症儿童数量已高达 300 万。目光接触障碍作为孤独症儿童最显著症状之一，是孤独症儿童社会交往能力中一个不可忽视的因素。已有研究表明，孤独症儿童对卡通面孔的注意觉察和维持更优，且可能采用整体加工的方式加工卡通面孔，这使其卡通面孔的情绪识别正确率更高，反应时更短。孤独症人群在真人和卡通的脸部处理差异可能反映了与某些类型的眼睛接触的动机的差异。在区分真人表情时，未患有孤独症的儿童的表现要比孤独症儿童更好，而他们在区分卡通表情时，并无显著的差异。干预研究也表明，在对孤独症患者的情绪识别进行干预时，使用卡通面孔比使用真人面孔效果更好。但是现有应用研究中很少有结合这一加工特性对孤独症儿童目光接触障碍改善进行实践和应用。

基于以上分析，本研究基于孤独症儿童在卡通形象的加工优势，设计出素描写实风、三维动画风、二次元卡通风等三种典型卡通风格的面孔特效，采用交互式 AR 技术与现实场景真人面孔进行结合，在不同训练阶段对虚拟卡通面孔特效进行调整，使得孤独症儿童从卡通面孔交互到真实面孔交互的逐步过渡和适应，达到改善孤独症儿童目光接触障碍的目的。实证研究进一步对比分析了三种 AR 卡通面孔在调节孤独症儿童目光接触障碍中的效果。

关键词　增强现实，孤独症，卡通面孔，目光接触障碍

The Role of AR Cartoon Face Processing in Regulating Eye Contact Disorder in Autistic Children

Tian Zhao[1]　Ruidong Liu[1]　Yuling Li[1]　Ni Ding[2]（Corresponding author）
Beijing Normal University, 100875

***Abstract*:** Augmented Reality (AR) is a technology that combines virtual information with the real world. It can superimpose virtual three-dimensional images, video, audio and other multimedia information in the real environment in real time, so as to enhance users' perception and understanding of the real environment. In recent years, with the promotion of AR technology, more innovative research has focused on how to use AR technology to effectively intervene and improve symptoms of typical disorders in autistic children. Since AR technology can effectively enhance the clear intuitiveness and perceptual impact of the real situation, it makes the situational learning style more friendly, dynamic and natural. To a certain extent, it can make up for the weakness of autistic children who are slow to receive information and stimulation in the real world, as well as the obvious lack of motivation in social communication.

According to the latest epidemiological survey data, the prevalence of autism spectrum disorders in the world has reached 0.6%, and the trend is increasing year by year, and the number of children aged 0-18 with autism in China has reached 3 million. Eye contact disorder, as one of the most significant symptoms of autistic children, is a factor that cannot be ignored in their social communication ability. Previous studies have shown that children with autism have better attention awareness and maintenance of cartoon faces, and may process cartoon faces in a holistic way, which makes their emotional recognition accuracy of cartoon faces higher and reaction time shorter. The differences in face processing between real and cartoon people with autism may reflect differences in motivation for certain types of eye contact. The non-autistic children were better than the autistic children at distinguishing real expressions, while there was no significant difference in their ability to distinguish cartoon expressions. Intervention studies have also shown that the use of cartoon faces is better than the use of real faces when it comes to emotion recognition in autistic people. However, few of the existing applied studies have

combined this processing property to improve the eye contact disorder in children with autism.

Based on the above analysis, based on the processing advantages of autistic children in cartoon images, this study designed three typical cartoon style face effects, namely sketch realism style, three-dimensional animation style and two-dimensional cartoon style. Interactive AR technology was used to combine with real faces in real scenes, and the virtual cartoon face effects were adjusted in different training stages. It makes the children with autism gradually transition and adapt from cartoon face interaction to real face interaction, and achieves the purpose of improving the eye contact disorder of autistic children. The empirical study further compared and analyzed the effect of three kinds of AR cartoon faces in adjusting the eye contact disorder of autistic children.

费希纳定律的基础：工作记忆表征更新解码对数量值的意识知觉

陈有国[1]（通讯作者）

1 西南大学心理学部，重庆，400715

摘 要　韦伯-费希纳定律是心理物理学中最具影响力的定律之一。韦伯定律的神经基础可以用调谐曲线得到很好的解释，而费希纳定律的神经基础还不清楚。为了探明费希纳定律的神经基础，我们将 Kappa 效应任务与脑电技术进行结合。以前的研究已经提出三阶段贝叶斯模型对 Kappa 效应任务进行了很好地描述。在该任务中，相继呈现两个实心圆，操纵小圆之间的时间间隔与空间距离，要求参与者复制两个圆圈之间的时间间隔，而忽略它们之间的空间距离。采用线性与对数的贝叶斯模型对数据进行拟合，发现对数模型对复制时间的拟合度优于线性模型。脑电数据分析发现，时间间隔的结束诱发了的明显的 P2 和 P3b 成分，其波幅随时空信息的对数转化值的增加而线性增加。结果提示，工作记忆的表征更新在意识知觉水平上解码了对数量值信息。

关键词　费希纳定律，工作记忆，表征更新，对数量值，意识知觉

The foundation of Fechner’s law: representation updating in working memory decodes the conscious perception of logarithmic magnitudes

Youguo Chen

Faculty of Psychology, Southwest University, Chongqing 400715, China

Abstract：Weber-Fechner law is one of the most influential laws in psychophysics. Neural basis of Weber’s law was well explained by tuning curves, however that of the Fechner’s law is still unclear. To identify the neural basis of Fechner’s law, we used a Kappa effect task that was well characterized by three-stage Bayesian models. In the task, two solid circles were presented successively, and the time interval and spatial distance between the

circles were manipulated. Participants were required to reproduce time intervals between two circles and ignore their space distances with synchronous electroencephalogram recordings. Linear and logarithmic Bayesian models were used to fit the data, the Bayesian model on the logarithmic scale was superior to the linear model in predicting production times. EEG data analysis showed that P2 and P3b components were elicited by offset of the time intervals, and their amplitudes increased linearly with logarithmic spatiotemporal information. The results suggest that representation updating in working memory decodes the conscious perception of logarithmic magnitudes.

Keywords： Fechner's law, working memory, representation updating, logarithmic magnitude, conscious perception

时间领导的研究综述

刘翠银

河南大学教育学部，河南 开封，475004

时间领导（Temporal Leadership）作为领导力和时间视角结合的新兴概念，自提出以来就备受关注。首先，研究者对时间领导的概念界定涉及组织、团队和个体三体层面，其中具有代表性的是团队层面：为帮助组织、协调和管理团队任务完成速度的一系列领导行为。其次，关于时间领导结构与测量主要有三种观点。第一是单一任务维度，并有相应 7 个项目团队时间领导量表，该量表目前应用最为广泛；第二是在任务维度的基础上发展关系维度，开发了 10 项目的时间领导量表；第三是时间领导包含自我参照时间领导和变换参照时间领导，其中变换参照时间维度又分为 5 个维度，即时间自主性、时间规划、时间提醒、时间压力以及时间复杂性意识，并开发了个体层面的时间领导量表。再次，目前关于时间领导的影响结果和作用机制研究发现，时间领导能力强的领导者可以帮助减少团队时间冲突、提高团队工作效率和团队绩效以及增加员工的助人行为和幸福感，时间领导对创造力、工作繁荣、员工助人行为、主观幸福感、团队学习的积极影响，时间领导与团队创造力存在倒 U 型关系，以及时间领导还具有显著的调节效应。最后，时间领导研究有待进一步加强，即概念定义有待明确；结构和测量工具有待开发和验证；需要完善理论框架以开展实证研究，尤其是时间领导在不同情境下的调节作用以及不同的情境对时间领导机制的影响；时间领导的跨文化差异有待探索。

A Review of Temporal Leadership Research

Cuiyin Liu

Faculty of Education, Henan University, Henan Province, Kaifeng 475004, China

Temporal leadership, as an emerging concept that combines leadership and a temporal perspective, has received extensive attention since its inception. Firstly, researchers have defined temporal leadership at the organizational, team, and individual levels, with a representative example being at the team level, which involves a series of leadership behaviors to help organizations coordinate and manage team task completion speed. Secondly, there are three main perspectives on the structure and measurement of temporal leadership. The first is a single-task dimension, and a widely used scale is the seven-item Team Temporal Leadership Scale. The second

perspective adds a relationship dimension based on the task dimension, and a 10-item scale has been developed. The third perspective includes ego referenced temporal leadership and alter referenced temporal leadership, with the latter consisting of five dimensions: time autonomy, time planning, time reminders, time pressure, and time complexity awareness. An individual level scale of temporal leadership has been developed using this perspective. Thirdly, research findings on the effects and mechanisms of temporal leadership show that leaders with strong temporal leadership abilities can help reduce team time conflicts, improve team work efficiency and performance, and increase employees' prosocial behavior and happiness. Temporal leadership has a positive impact on creativity, work prosperity, employee prosocial behavior, subjective well-being, team learning, and has a inverted-U relationship with team creativity. Temporal leadership also has a significant moderating effect. Finally, future research on temporal leadership needs to clarify the concept definition, develop and validate the structure and measurement tools, improve the theoretical framework to conduct empirical research, especially the moderating effect of temporal leadership in different contexts and the impact of different contexts on temporal leadership mechanisms, and the cross-cultural differences of temporal leadership need to be explored.

Keywords: leadership, temporal leadership, temporal perspective

事件边界和一体化水平影响时间顺序记忆的实证研究

刘凯歌[1]　叶群[1]（通讯作者）
1 浙江师范大学心理学院，金华，321004，qun.ye@zjnu.edu.cn

摘　要:时间顺序记忆是指对已经经历的事件时间发生顺序的记忆。本研究旨在探究事件边界和一体化水平对时间顺序记忆的影响，并研究一体化水平是否能够调节事件边界对时序记忆的影响。在学习阶段，被试需要依次编码多组图片，每组图片包括一张背景图片和一张物体图片。被试需要将物体想象到背景中，通过操纵物体和背景之间的语义合理程度使得物体与背景之间形成高、中、低三种一体化水平。此外，我们通过改变背景图片来形成事件边界。在测试阶段，被试需要依据学习顺序对两张物体图片进行时序判断。一组被试在进行时序判断时同时呈现物体与背景图片（呈现背景组），另一组仅仅呈现物体图片（不呈现背景组）。对于不呈现背景组，被试在时序判断后还需要进行来源记忆测试，即判断此物体在学习阶段与哪一背景图片进行关联。

实验结果发现，1）一体化水平对来源记忆具有显著影响。随着一体化水平的提高，来源记忆正确率也显著提高，表明一体化水平操纵的有效性；2）事件边界与是否呈现背景存在显著的交互作用。在不呈现背景的条件下，边界内的时序记忆正确率显著高于跨边界的时序记忆，但在呈现背景的条件下两者之间没有差异；3）未发现一体化水平对事件边界影响时序记忆的调节作用，只有一体化水平的主效应。具体而言，相比于一体化水平处于高和低条件下，中等水平条件下被试时序记忆正确率显著更高。综上所述，我们的研究结果揭示了事件边界、一体化水平和背景呈现对时间顺序记忆的影响。这些发现对于理解时间顺序记忆的认知机制具有重要意义，并为进一步研究时序记忆的调节机制提供了启示。

Effects of Event Boundary and Unitization on Temporal Order Memory: An Empirical Study

Kaige Liu[1] Qun Ye[1]

(School of Psychology, Zhejiang Normal University, Jinhua, 321004, Email: qun.ye@zjnu.edu.cn)
Abstract：Temporal order memory refers to the memory of the sequential occurrence of events that have already been experienced. This study aims to explore the impact of event boundaries and unitization levels on temporal order memory, as well as investigate whether unitization levels can modulate the effects of event boundaries on temporal order memory. During the learning phase, participants are required to sequentially encode multiple sets of pictures, each set consisting of a context image and an object image. Participants were required to mentally integrate the object within the context and manipulate the semantic coherence between the object and the context to create high, medium, and low levels of unitization. Additionally, we created event boundaries by altering the context images. In the testing phase, participants are asked to make temporal order judgments on two object images based on the learning sequence. One group of participants was presented with both the object and context images during temporal order judgments (context-present group), while the other group was only shown the object images (context-absent group). For the context-absent group, participants also underwent a source memory test after the temporal order judgments, where they had to determine which context image was associated with the object during the learning phase.

The experimental results revealed the following: 1) The unitization level significantly influences source memory. As the levels of unitization increase, the accuracy of source memory also significantly improves, indicating the effectiveness of manipulating the level of unitization 2) There is a significant interaction between event boundaries and context. The interaction was driven by the fact that the context-absent group showed better temporal order memory for within-event pairs compared to cross-boundary pairs, whereas the context-present group did not show any significant difference in performance between within-event and cross-boundary pairs. 3) No moderating effect of unitization levels on the influence of event boundaries on temporal memory was found, only a main effect of unitization levels. Specifically, compared to the high and low unitization level conditions, participants in the medium unitization level condition showed significantly higher temporal order memory accuracy. In summary, our research findings reveal the influence of event boundaries, unitization levels, and context on temporal order memory. These findings carry important implications for understanding the cognitive mechanisms of temporal order memory and provide valuable insights for further exploring the modulating mechanisms of temporal order memory.

时距加法运算的顺序效应

王小静[1] 李宝林[2]（通讯作者）

1 陕西师范大学心理学院，西安，710062

2 陕西师范大学心理学院，西安，710062，lblpsy@snnu.edu.cn

摘 要 时距知觉是指对两个连续事件之间的间隔，或一个事件的持续时间的知觉，是时间知觉的一部分。现有研究表明，感知的持续时间会被许多因素扭曲，如注意力、情绪、大小和感知历史。通常，我们倾向于在心理求和中高估时距长度，且心理运算可能受到操作数顺序的影响，从而导致顺序效应。有关时距加法运算的顺序效应是如何产生的知之甚少。为了回答这个问题，本研究考察了三元素时距加法运算中的顺序效应及其产生的原因。

本研究设计了两个实验。实验 1 检验了声音刺激呈现顺序和声音刺激持续总时间对加法运算效应量的影响；实验 2 进一步检验了刺激呈现的规律性和最后位置刺激时长对加法运算效应量的影响。在正式任务中，参与者被要求通过按下和释放按钮来再现第一、第二和第三个听觉刺激持续时间的总和。

结果表明，三元素时距加法存在显著的运算动量效应。即三个持续时间的总和在所有情况下都被高估

了。并且，在三元素时距加法运算中加法元素的顺序对加法运算有显著影响。相比运算序列中元素的位置随机呈现，递增条件下个体时距加法运算的总时长较长，而递减条件下则较短。此外，特定位置量值而非总体趋势决定了顺序效应，即时距加法运算的顺序效应取决于运算序列中最后一个位置的量值大小，最后一个位置量值越大，个体加法运算的高估效应量越大。

综上，研究揭示了时距加法运算中的顺序效应及其产生的内在机制。证实了三元素时距加法运算的高估效应，并系统地验证了时距加法运算中的顺序效应，且发现加法运算的顺序效应并不依赖于运算元素变化的总体趋势，而是依赖于最后一个运算元素的量值大小。这表明这种效应的产生更多源于记忆的近因效应。

The Order Effect of Mental Summation of Temporal Duration

Xiaojing Wang[1]，Baolin Li[2] (corresponding author)
1 School of Psychology, Shaanxi Normal University,710062
2 School of Psychology, Shaanxi Normal University, 710062,lblpsy@snnu.edu.cn

Abstract　Time perception refers to the perception of the interval between two consecutive events, or the duration of an event, and is a part of time perception. Existing research shows that the duration of perception will be distorted by many factors, such as attention, emotion, size and perception history. Usually, we tend to overestimate the length of time interval in psychological summation, and psychological operation may be affected by the order of operands, thus leading to the order effect. Little is known about how the sequential effect of time-interval addition is produced. In order to answer this question, this study investigates the sequence effect in the three-element time-interval addition operation and its causes.

Two experiments were designed in this study. In experiment 1, the effects of the presentation order of sound stimuli and the total duration of sound stimuli on the effect of addition operation were examined. Experiment 2 further examined the influence of the regularity of stimulus presentation and the last position stimulus duration on the effect of addition operation. In a formal task, participants are required to reproduce the sum of the first, second and third auditory stimulus durations by pressing and releasing buttons.

The results show that the three-element time-interval addition has significant operational momentum effect. That is, the sum of the three durations is overestimated in all cases. Moreover, in the three-element time-interval addition operation, the order of addition elements has a significant influence on the addition operation. Compared with the random presentation of the positions of elements in the operation sequence, the total duration of the individual time interval addition operation is longer under the increasing condition, but shorter under the decreasing condition. In addition, the order effect is determined by the magnitude of specific position rather than the overall trend. The order effect of instant distance addition operation depends on the magnitude of the last position in the operation sequence. The greater the magnitude of the last position, the greater the overestimation

effect of individual addition operation.

To sum up, the study reveals the order effect in time-interval addition and its internal mechanism. The overestimation effect of three-element time-interval addition operation is confirmed, and the order effect in time-interval addition operation is systematically verified. It is found that the order effect of addition operation does not depend on the overall trend of the change of operational elements, but on the magnitude of the last operational element. This shows that this effect is more due to the recency effect of memory.

Key words duration perception, mental summation, order effect, operational momentum effect, recency effect

亲子亲密度与儿童焦虑的动态关系：

基于交叉滞后模型和随机截距交叉滞后模型的分析

菅景康[1] 陈晓旭[1] 封亚飞[1] 李宏敏[1] 徐夫真[1]（通讯作者）

1 山东师范大学心理学院，济南，250014，xufuzhen@sdnu.edu.cn

摘要 焦虑是儿童群体中最常见和最持久的心理健康问题之一，其发生发展多与家庭情境有关。其中，亲子关系是影响儿童发展的重要家庭因素之一，亲子亲密度反映了亲子关系的亲密程度，是衡量亲子关系质量的重要指标。根据动态相互作用模型的观点，个体发展是自身与其所处情境之间持续的、动态的、相互作用的结果。已有研究发现亲子亲密度和儿童焦虑之间存在负向关系，但针对此问题的追踪研究较少且往往基于交叉滞后模型（CLPM）等传统分析方法，该方法不能区分个体间和个体内关系。需要指出的是，虽然二者均属“纵向关系”，但前者无动态性、后者有动态性，对个体内关系的分析更有利于变量之间因果关系的构建。对此，随机截距交叉滞后模型（RI-CLPM）在 CLPM 的基础上进一步发展，通过引入随机截距，能够分别考察个体间和个体内关系，更加真实地反映变量间的因果关联。鉴于此，本研究采用亲子亲密度量表和 Spence 儿童焦虑量表对山东省 7 所小学 548 名三、四年级的学生（$M = 9.59 \pm 0.61$ 岁, 43.61% 为女生）进行了为期两年（共 3 个时间点）的追踪测查，除了通过 CLPM 分析与先前的研究结果进行比较外，还通过 RI-CLPM 分析更加全面地考察了亲子亲密度与儿童焦虑在个体间水平和个体内水平的关联。结果：CLPM 的结果发现，T1-T3 时间段内，亲子亲密度与儿童焦虑存在相互的负向预测作用。RI-CLPM 的结果发现，在个体间水平上，亲子亲密度与儿童焦虑呈显著负相关；在个体内水平上，亲子亲密度的变化对儿童焦虑变化的纵向预测不显著，但儿童焦虑的增加能够显著预测后一时间点亲子亲密度的下降。多群组分析未发现亲子亲密度与儿童焦虑的动态关系中存在性别差异。结论：综合 CLPM 和 RI-CLPM 的结果发现，亲子亲密度对儿童焦虑的预测作用更多源于稳定的个体间差异，而儿童焦虑对亲子亲密度的预测作用则源于个体内的动态变化。本研究结果强调了区分个体间差异和个体内动态变化的重要性，也揭示了要高度关注亲子亲密度较低的家庭以及通过降低儿童焦虑水平来改善亲子亲密度的必要性和重要性。

关键词 亲子亲密度，儿童焦虑，交叉滞后模型，随机截距交叉滞后模型

The Dynamic Associations between Parent-child Closeness and

Children's Anxiety: Based on the Cross-Lagged Panel Model and the Random Intercept Cross-Lagged Panel Model Analysis

Jingkang Jian[1], Xiaoxu Chen[1], Yafei Feng[1], Hongmin Li[1], Fuzhen Xu[1] (Corresponding Author)
1 School of Psychology, Shandong Normal University, Jinan, 250014, xufuzhen@sdnu.edu.cn

***Abstract*:** Anxiety is one of the most common and persistent mental health problems that affect children, and its development is mostly related to family context. Among them, parent-child relationship, as an important part of children's social relationship, is one of the important family factors affecting children's development, and parent-child closeness reflects the closeness of parent-child relationship, which is an important indicator of the quality of parent-child relationship. According to the dynamic interaction model, individual development is the result of continuous, dynamic and interactive interaction between oneself and the situation in which they live. Despite existing evidence on negative associations between parent-child relationship and children's anxiety, research focusing on the potential bidirectional associations between the two is limited and also is largely based on traditional analyses such as cross-lagged panel model (CLPM), which does not distinguish between- and within-person associations. It should be noted that although both between- and within-person associations are "longitudinal", the former is not dynamic and the latter is dynamic, and the analysis of within-person associations is more conducive to the construction of causal associations between variables. In this regard, the random intercept cross-lagged panel model (RI-CLPM) is improved on the basis of the CLPM, and by including random intercept factors that enable the model to examine between-and within-person effects separately, and results from RI-CLPM could better reflect the nature of the temporal dynamics of the parent-child relationship and children's anxiety. In view of this, the present study used the Parent-Child Closeness Scale and the Spence Children Anxiety Scale to track 548 third- and fourth-grade students (M_{age} = 9.59 ± 0.61, 43.61% girls) in seven primary schools in Shandong province over a period of two years (total of three time points). In addition to comparing the CLPM analysis with the previous research results, the RI-CLPM analysis was also used to more comprehensively examined the associations between parent-child closeness and children's anxiety at the between-person level and the within-person level. Results were as follows: The results of the CLPM revealed that parent-child closeness and children's anxiety were negatively predictive of each other during the T1-T3 time period. The RI-CLPM analyses indicated at the between-person level, parent-child closeness was negatively associated with children's anxiety. At within-person level, changes in parent-child closeness had no effect on changes in children's anxiety, but increases in children's anxiety predicted subsequent decreases in parent-child closeness. To sum up, combining the results of CLPM and RI-CLPM, the predictive effect of parent-child closeness and children's anxiety stems more from stable between-person differences, whereas the predictive effect of children's anxiety on parent-child closeness stems from within-person dynamics. These results shed light on the importance of distinguishing between- and within-person associations and the necessity and importance of focusing on families with lower parent-child closeness and improving parent-child closeness by reducing children's anxiety.

***Keywords*:** parent-child closeness, children's anxiety, cross-lagged panel model, random intercept cross-lagged panel model

基于脑科学的线上线下融合模式家庭教育指导课程开发

王天爱[1]　周甜[1]　骆宏[2]

1 杭州师范大学，杭州，311000
2 杭州师范大学临床医学院，杭州，311000，luohong@hznu.edu.cn

摘 要 家庭作为儿童和青少年发展过程中最重要的环境之一，其教育对于儿童的全面发展起着至关重要的作用。开发和实施更加符合家长需求的家庭教育指导课程也成为当下家庭教育指导服务工作的重要内容。近年来，随着脑科学的不断发展，大量神经科学研究证据为家庭教育实践提供了重要启示，从脑科学相关内容出发的家庭教育课程能更好地满足家长对于家庭教育指导的需求。随着以互联网、人工智能和大数据等为代表的信息技术的日趋成熟，其广泛的教育应用为线上线下融合(Online Merge Offline，OMO) 教学的形成与发展提供了坚实的技术基础，该模式近年来在不同领域中得到广泛应用。因此，本研究旨在基于脑科学的知识和理论，在建构主义教育理论框架内，采用线上线下融合教学模式开发和实施家庭教育课程，采用问卷和访谈方法对其进行初步评价。杭州某试点依托高校和医疗系统心理专家团队的技术督导，借助相关部门专业资源，为家长提供该家庭教育系列课程，通过问卷和访谈调查，取得如下结果。第一，加强了家长对于家庭教育的意识和观念。第二，结果显示课程前后参与家长的心理资本存在显著差异。第三，家长形成了共同成长的互助团体，并在线上持续获得家庭教育指导内容。最后，密切了学校、医疗、家庭和社会各方面的合作，给儿童提供了系统性心理健康支持。作为初步实践，本文所开发的家庭教育课程，迎合了当前家庭教育指导课程的巨大社会需求，规范了当前家庭教育课程开发的路径，并结合线上线下融合的数字化教学技术，为促进数字化家庭教育和保护青少年心理健康提供了良好试点和探索。

Online Merge Offline Family education guidance course development based on brain science

Wang Tianai[1] Zhou Tian[1] Luo Hong[2]
1 Hangzhou Normal University, Hangzhou, 311000
2 The Clinical Medical College of Hangzhou Normal University, Hangzhou, 311000，
luohong@hznu.edu.cn

Abstract： As one of the most important environments in the development of children and adolescents, family education plays a vital role in the comprehensive development of children. Development and implementation of family education guidance courses that meet the needs of parents have also become an important part of the current family education guidance service. In recent years, with the continuous development of brain science, a large number of neurological research evidence has provided an important inspiration for family education practice. Family education courses starting from brain science related content can better meet parents' needs. With the increasingly mature information technology represented by the Internet, artificial intelligence, and big data, its extensive educational application provides a solid technical foundation for the formation and development of the teaching of Online Merge Offline integration. The model has been widely used in different fields in recent years. Therefore, this study aims to use the knowledge and theory of brain science, in the framework of constructivism theory of education, use online and offline integration teaching models to develop and implement family education courses, and use questionnaires and interview methods to get preliminary evaluations. A pilot in Hangzhou relies on the technical supervision of a team of psychological experts in colleges and medical systems. With the help of professional resources of relevant departments, it provides parents with a series of courses for the family education. The following results are obtained through questionnaires and interviews. First, we strengthened parents' consciousness and concepts of family education. Second, the results

showed that there were significant differences in the psychological capital of parents before and after the course. Third, parents have formed a common -growth mutual aid group, and continue to obtain family education guidance content online. Finally, the cooperation of schools, medical care, family and society closely supported children's systematic psychological health. As a preliminary practice, the family education course developed in this article caters to the huge social needs of the current family education guidance courses, standardizes the current path of the development of family education courses, and combines digital teaching technologies with online and offline integration to promote digital family education. It also protects children's psychological health and provides good pilots and explorations.

摘 要　择偶复制(mate choice copying)是指在择偶过程中个体受到其他同性别个体（榜样）对目标对象评价的影响，从而做出相似的择偶决策的一种择偶策略。本研究以 60 名大学生为被试，通过系列实验探讨吸引力匹配、榜样评价类型、榜样人数、择偶策略对择偶复制的影响，并分析其中的性别差异。实验一：采用择偶复制的经典范式，探讨吸引力匹配与对短期交往意愿和长期交往意愿的影响。实验二：在多人评价情境中，将评价分为积极评价和消极评价两组，探讨评价类型对择偶复制的影响。实验三：在单人评价情境中，探讨评价类型对择偶复制的影响。结果发现：（1）男性对异性吸引力评价更低，男性的吸引力影响女性短期择偶意愿。（2）对男性的积极评价能够显著提高女性的短期交往意愿和长期交往意愿，对女性的消极评价能显著降低男性的短期交往意愿和长期交往意愿。（3）对男性的积极评价人数越多，女性的短期交往意愿和长期交往意愿越高；对女性的积极评价人数越多，男性的长期交往意愿越高。据此得出结论，择偶过程中，男性对女性的外貌要求更高，择偶时更关注对女性的负面评价；相反女性择偶时更关注对男性的正面评价，且评价的人越多越会强化积极的择偶复制。这可能反映出，男性在选择伴侣，尤其是选择长期伴侣时，会通过强调女性的缺点来提高自己的标准，进而提高择偶的准确性和对未来长期关系的满意度。与此相反，女性在选择伴侣时更强调男性的优势，从而导致在长期关系中的负面体验。未来的研究可以进一步探讨择偶复制与婚姻满意度和主观幸福感之间的关系，为年轻人树立正确的婚姻观和择偶观提供理论和现实依据。

关键词　择偶复制，榜样评价，性别差异，吸引力匹配，择偶策略

Positive vs. Negative Evaluations: Gender Differences Under the Influence of Role Models in Mate Choice Copying

Yiwen Huang[1]，Yuzhong Wang[2]

[1]Department of Applied Psychology，Guangdong Peizheng College，Guangzhou

[2]Applied Psychology Research Center，Guangdong Peizheng College，Guangzhou

Abstract: Mate choice copying (MCC) is a mate choice strategy in which individuals are influenced by the evaluations of other individuals of the same sex (role models) on the target object during the mate choice process, so as to make similar mate choice decisions. In this study, 60 college students were used as subjects, and a series of experiments were conducted to explore the effects of attractiveness matching, the type of role model evaluation, the number of role models, and the choice copying strategy on choice copying, and to analyze the gender differences. Experiment 1: The classical paradigm of mate choice replication was used to explore the effects of attractiveness matching and on short-term willingness to interact and long-term willingness to interact. Experiment 2: In a multi-person evaluation situation, evaluations were categorized into two groups, positive and negative, to explore the effect of evaluation type on mate choice replication. Experiment 3: The effect of evaluation type on mate choice replication was explored in a single-person evaluation situation. The results found that (1) males rated heterosexual attractiveness lower, and male attractiveness influenced females' short-term mate choice intentions. (2) Positive evaluations of men significantly increased women's short-term and long-term relationship intentions, and negative evaluations of women significantly decreased men's short-term and long-term relationship intentions. (3) The greater the number of positive evaluations of men, the greater the willingness of women to engage in short-term and long-term relationships; the greater the number of positive evaluations of women, the greater the willingness of men to engage in long-term relationships. Accordingly, it is concluded that in the process of choosing a mate, men are more demanding of women's appearance and pay more attention to negative evaluations of women when choosing a mate; on the contrary, women pay more attention to positive evaluations of men when choosing a mate, and the more people evaluating them reinforces the positive mate-choice replication. This may reflect that men, when choosing a partner, especially a long-term partner, raise their standards by emphasizing women's shortcomings, which in turn increases the accuracy of their mate choice and their satisfaction with their future long-term relationship. In contrast, women emphasize men's strengths more when choosing a partner, leading to negative experiences in long-term relationships. Future research can further explore the relationship between mate choice replication and marital satisfaction and subjective well-being, providing a theoretical and practical basis for young people to establish a correct view of marriage and mate choice.

青少年正念与孤独感的关系：一项交叉滞后研究

张桥（通讯作者） 梁三才

陕西师范大学心理学院，西安，710062，bridgy0907@163.com

摘 要 孤独感是个体的社会关系在数量或质量无法满足个人需求时产生的消极情感体验。青少年时期是发展同伴关系的关键期，此阶段的青少年缺乏应对孤独感的经验。因此，对青少年孤独感进行干预显得尤为重要。研究发现，基于正念的干预可以有效降低孤独感水平，因而基于正念的干预在教育和临床领域得到了广泛应用。正念是个体有意识且不加评判地对当前经验保持觉察和接纳的状态。然而，鲜有研究探讨正念与孤独感的相互预测关系。一方面，根据自我决定理论，当自主、胜任和关系三种基本心理需求未得到满足时，个体会产生孤独感等痛苦的心理体验。研究发现，正念有利于提升个体的自我决定水平，

从而降低个体的孤独感。另一方面，孤独感的进化理论认为，孤独感会激活个体的“自我保护”模式，具体表现为冗思、过度警觉、对拒绝信息高度敏感等，这些都不利于正念功能的发挥。在前人研究的基础上，本研究旨在探讨青少年正念与孤独感之间的相互预测关系。本研究采用了儿童青少年正念量表和 ULS-6 孤独感量表对 633 名初中生（299 名男生）进行三次的纵向追踪调查。研究结果发现：（1）青少年正念与孤独感均具有相对稳定性，也存在一定的差异：正念的觉察与不评判维度呈现先下降后维持稳定的趋势；孤独感水平呈现先下降后上升的趋势。（2）正念的觉察与不评判和接纳维度与孤独感呈显著负相关。（3）正念与青少年孤独感呈现交叉滞后关系，即前测的正念能显著预测后测的孤独感，且前测的孤独感能显著预测后测的正念。本研究表明青少年正念与孤独感之间存在一定程度的发展变化，且存在相互预测关系。这启示我们，应该采用基于正念干预方式来减少孤独感的危害，阻断“正念降低—孤独感提升—正念降低”这一恶性循环，进而提升个体心理健康水平。

Mindfulness and Adolescents' Loneliness: A Three-wave Cross-Lagged Analysis

Zhang Qiao*　Liang Sancai
College of Psychology, Shaanxi Normal University, Xi'an, 710062, China

***Abstract*：** Loneliness is a negative emotional experience that arises when an individual' s social relationships are insufficient in quantity or quality to meet their needs. Adolescence is a critical period for developing peer relationships, during which adolescents lack experience in coping with feelings of loneliness. Therefore, intervening in adolescent loneliness is particularly important. Research has found that mindfulness-based interventions can effectively alleviate loneliness, making them widely applied in the fields of education and clinical practice. Mindfulness is a state in which individuals consciously and non-judgmentally maintain awareness and acceptance of their present experiences. However, there is limited research exploring the mutual relationship between mindfulness and loneliness. On the one hand, according to Self-determination Theory, individuals experience psychological distress such as loneliness when their basic psychological needs for autonomy, competence, and relatedness are not met. Research has found that mindfulness can enhance individuals' levels of self-determination and thereby alleviate loneliness. On the other hand, the Evolutionary Theory of loneliness holds that loneliness activates a "self-protection" mode, expressed through rumination, hypervigilance, and rejection sensitivity, which are not conducive to the functioning of mindfulness. The present study used a cross-lagged analysis to explore the relationship between teenagers' mindfulness and loneliness. The scale used in the present study was the Child and Adolescent Mindfulness Measure (CAMM) and the 6-item form of the University of California Los Angeles Loneliness Scale (ULS-6). The participants came from a junior high school in Shaanxi province. After measuring three times, 633 valid participants were obtained after removing the extreme and invalid values. The results indicate that: (1) The level of awareness and non-judgment decreased and then remained stable; the level of loneliness increased and then decreased significantly at three-time points. (2) Mindfulness and loneliness are negatively correlated. (3) There is a cross-lagged relationship between mindfulness and loneliness, in which mindfulness in the first test can significantly predict loneliness in the second test, and loneliness in the first test can significantly predict mindfulness in the second test. This study indicates that there is a certain degree of developmental change between adolescent mindfulness and loneliness, and there is a mutual predictive relationship. This suggests that we should adopt mindfulness-based interventions to alleviate loneliness, block the vicious cycle of "low mindfulness - high loneliness - low mindfulness," and improve individuals'

psychological health.

通讯作者 E-mail：chenfumei@bnu.edu.cn

摘 要 青春期是抑郁高发期，父母积极教养是重要保护因素 (Thapar et al., 2012; Walter et al., 2023)。但是，青少年自主意识地觉醒、对自主权地争夺和频繁的亲子冲突都很容易让父母在教养上感到力不从心(Coleman, 2011)。随着正念在改善个体心理健康上的有效性得到广泛认可，研究者将正念和教养结合，提出了正念教养的概念，旨在通过这种亲子互动中的正念帮助父母更好地教养青少年(Duncan et al., 2009; Kabat-Zinn & Kabat-Zinn, 1997)。相较与一般教养，正念教养的独特性体现在父母对自身情绪的调节，而父母情绪健康是正念教养对青少年影响的重要中介变量(Duncan et al., 2009)。相关研究也发现正念教养与父母和青少年抑郁均存在密切相关(例如，Burgdorf & Szabó, 2021)。本研究在中国文化背景下，探讨父母正念教养对青少年抑郁影响的作用机制。

研究招募了我国东部地区两所学校的七年级和高一年级学生及其家长，进行了三波纵向追踪(每次间隔 7 个月，T1~T3)，以来自父母婚姻完整、父母与孩子共同居住的 1371 个家庭（包括青少年、父亲、母亲）为研究对象，青少年平均年龄 M=13.20±1.31，父亲平均年龄 M=41.72±5.37，母亲平均年龄 M=42.34±5.57。采用自我报告的方式，使用 Pan 等人(2019)修订的父母正念教养量表(IM-P)测量 T1 时父母各自的正念教养状况，PHQ-9 量表(Kroenke & Spitzer, 2002)测量 T2 时父母的抑郁和 T3 时青少年抑郁。在控制了家庭社会经济地位、青少年独生与否、学段以及性别后，采用主客体互倚模型(Actor Partner Interdependence Model, APIM)在父母关系对中进行正念教养对青少年抑郁影响的作用机制分析，随后分青少年性别检验。结果发现：

（1） T1 时父亲和母亲的正念教养对 T3 时青少年抑郁的直接预测作用均不显著。

（2） 父亲正念教养对青少年抑郁间接影响的客体效应显著。具体表现为 T1 父亲正念教养能够通过影响 T2 母亲抑郁间接影响 T3 青少年抑郁，

（3） 母亲正念教养对青少年抑郁间接影响的主体效应显著。具体表现为 T1 母亲正念教养能够通过影响 T2 母亲抑郁间接影响 T3 青少年抑郁。

（4） 父母正念教养通过影响父母抑郁对青少年抑郁的影响不存在青少年性别差异。

关键词 父亲正念教养，母亲正念教养，青少年抑郁，父母抑郁

The Impact of Maternal and Paternal Mindful Parenting on Adolescent Depression: The Mediating Role of Maternal and Paternal Depression

Abstract：Adolescence represents a susceptible phase for experiencing depression, and positive parenting serves as a crucial protective factor against adolescent depression (Thapar et al., 2012; Walter et al., 2023). However, the maturation of adolescents' sense of autonomy, competition for autonomy, and frequent parent-child conflicts can engender a sense of powerlessness in parents regarding their parenting role (Coleman, 2011). With the widely recognized effectiveness of mindfulness in improving individual mental health, researchers have increasingly focused on the concept of mindful parenting, which integrates mindfulness principles into parent-child interactions to enhance parental effectiveness in guiding adolescencts (Duncan et al., 2009; Kabat-Zinn & Kabat-Zinn, 1997). Compared to conventional parenting, the uniqueness of mindful parenting lies in parents' regulation of their own emotions, with parental emotional well-being serving as a crucial mediating variable in the impact of mindful parenting on adolescents (Duncan et al., 2009). Relevant studies have also found a close association between mindful parenting and both parental and adolescent depression (e.g., Burgdorf & Szabó, 2021). This study aims to explore the mechanisms through which mindful parenting by parents influences adolescent depression within the cultural context of China.

To achieve this, seventh-grade and senior-first-grade students, along with their parents, were recruited from two schools in the eastern region of the country. Three waves of longitudinal follow-up assessments were conducted at seven-month intervals (T1-T3), involving a total of 1371 families (including adolescents, fathers, and mothers). The average ages were as follows: adolescents (M=13.20±1.31), fathers (M=41.72±5.37), and mothers (M=42.34±5.57). Self-report measures were used, including the revised Mindful Parenting Inventory (IM-P) by Pan et al. (2019) to assess parents' mindful parenting at T1, the PHQ-9 scale (Kroenke & Spitzer, 2002) to measure parental depression at T2, and adolescent depression at T3. After controlling for family socioeconomic status, whether the adolescent was an only child, school level, and gender, the Actor Partner Interdependence Model (APIM) was used to analyze the mediating effects of mindful parenting on adolescent depression within the context of parental relationships, followed by a test of adolescent gender differences. The results showed:

(1) The mindful parenting of both fathers and mothers at T1 did not exhibit a significant direct effect on adolescent depression at T3.
(2) The indirect effect of partner effect of fathers' mindful parenting on adolescent depression was significant, specifically, fathers' mindful parenting at T1 could indirectly influence adolescent depression at T3 through its impact on mothers' depression at T2.
(3) The indirect effect of actor effect of mothers' mindful parenting on adolescent depression was significant, specifically, mothers' mindful parenting at T1 could indirectly influence adolescent depression at T3 through its impact on mothers' depression at T2.
(4) There were no gender differences in the impact of parental mindful parenting on adolescent depression through parental depression.

融合中国诗词的线上正念干预对参与者依从性的影响

王彪[1]　王珍珍[1]　刘兴华[2]（通讯作者）
1 北京大学心理与认知科学学院，北京，100091
2 北京大学心理与认知科学学院临床与健康心理学系，北京，100091，xinghua_liu@pku.edu.cn

摘 要　近些年，随着互联网的快速发展，在线正念干预也在蓬勃发展，但其参与者的依从性较低是目前面临一个普遍问题。另外，诗歌经常被用来作为其他心理治疗形式的补充，特别是基于正念的方法，而且在已有研究中诗歌已经成为了正念认知疗法和正念减压疗法的一部分。但目前国内将中国诗词和正念干预进行结合的研究还比较少，非常值得进一步探索。针对以上问题，开展了本次研究。

研究一将中国诗词引入正念干预，以北京大学刘兴华研究员主持开发的线上自助情绪困扰的正念干预（Internet self-help Mindfulness Intervention for Emotional Distress, iMIED）为基础，设计了一种融合中国诗词的网络自助正念干预模式。该课程主要基于微信小程序展开，为期 49 天。网络招募参与者 55 名，要求完成前后测，以及干预可行性的问卷。通过 SPSS 27.0 采用配对样本 *t* 检验进行干预前后分析。从项目可接受性、需求性、可执行性、实用性、以及有效性检验等五个维度进行评估，结果显示，本研究设计开发的融合中国诗词的网络自助正念干预模式是可行的。研究二为随机对照实验。网络招募 118 名参与者，随机分为两组，实验组参与融合中国诗词的网络自助正念课程，对照组参与没有诗词的课程。采用卡方检验对干预后数据进行分析。实验结果显示，相比对照组，实验组在保证干预效果相同的前提下能够显著提高了参与者的依从性（χ^2=4.37,p=0.04）。

本研究将中国诗词和正念干预进行融合，开发了一种极富中国特色的正念干预模式，在帮助人们缓解精神健康问题的同时，也起到了推广和传播中国传统文化的作用。本研究采用的是纯网络自助模式，为正念干预的大规模应用推广提供了更多可能性，同时研究结果也显示，诗词元素的加入显著提高了参与者的依从性。未来随着在线正念干预的快速发展，这都具有一定的实践意义和社会价值。

The impact of online mindfulness intervention integrating Chinese classical poetry on participants' adherence

Biao Wang, Zhenzhen Wang, Xinghua Liu
School of Psychology and Cognitive Science, Peking University (No.5 Yiheyuan Road)

Abstract **：** In recent years, with the rapid development of the Internet, online mindfulness-based interventions (MBIs) is booming, but the low participants' adherence is currently a common problem. In addition, poetry is often used as a supplement to other forms of psychotherapy, especially mindfulness intervention, and has become a part of mindfulness-based cognitive therapy (MBCT) and mindfulness-based stress reduction therapy (MBSR). However, there is currently relatively little research in China that combines Chinese classical poetry with mindfulness intervention, and it is worth further exploration. This study was conducted to address the above issues.

In study1, Chinese classical poetry was introduced into mindfulness intervention. Based on Internet self-help mindfulness intervention for emotional distress (iMIED) hosted by Xinghua Liu from the Mindfulness Lab of Peking University, an online self-help mindfulness intervention model integrating Chinese classical poetry was designed. This project is mainly based on the WeChat mini program and lasts for 49 days. A total of 55

participants were recruited online and asked to complete a pre and post-test, as well as a questionnaire on the feasibility of intervention. SPSS 27.0 was used for pre-intervention and post-intervention analysis by paired sample *t*-test. The evaluation was conducted from five dimensions: Acceptability, Demand, Implementation, Practicality and Limited-efficacy testing. The results show that the online self-help mindfulness intervention model integrating Chinese classical poetry is feasible. The study 2 was a randomized controlled trial. 118 participants were recruited online and randomly divided into two groups: the experimental group participated in an online self-help mindfulness course integrating Chinese classical poetry, and the control group participated in a mindfulness course without Chinese classical poetry. SPSS 27.0 was used to analyze the post intervention data by χ^2 test. The experimental results showed that compared with the control group, the experimental group could significantly improve the participants' adherence (χ^2=4.37, p=0.04).

This study integrates Chinese classical poetry and mindfulness, and develops a mindfulness intervention model with Chinese characteristics, which not only helps people to alleviate mental health problems, but also plays a role in promoting and disseminating Chinese traditional culture. This study adopts a pure online self-help model, which provides more possibilities for the large-scale application and promotion of mindfulness intervention. At the same time, the research results also show that the addition of Chinese classical poetry significantly improves participants' adherence. With the rapid development of online MBIs in the future, it has certain practical significance and social value.

每日正念与睡眠拖延之间的关系：自我调节的中介作用

吴沚玲 [1#]　吴朝毅 [2#]　周晖 [1,3] (通讯作者)

1 中山大学心理学系，广州，510006

2 上海交通大学医学院附属精神卫生中心，上海，200030

3 中山大学心理健康教育中心，广州，510275，Email：edszh@mail.sysu.edu.cn

摘 要　随着生活节奏的加快，当代人出现了一种特殊的问题性拖延行为——睡眠拖延。睡眠拖延指的是“在没有外部因素干扰的情况下仍人为地拖延睡眠时间”，会导致睡眠质量、工作学习效率的下降，对身心健康均有负面的影响。自我调节理论认为，睡眠拖延是自我调节失败的一种体现。正念与自我调节能力息息相关，指的是个体在当前情境下能够保持专注、接纳、觉知的状态。本研究从自我调节理论的角度出发，使用日志法探究正念与睡眠拖延之间的关系，以及自我调节在行为层面的表现——自我控制在这一关系中的中介作用。研究招募 113 名被试完成了连续 14 天、每天 2 次的问卷收集。结果表明：(1)在个体间水平，正念负向预测睡眠拖延情况。(2)在个体内、个体间水平，自我控制均显著中介了正念与睡眠拖延之间的关系。(3)每日的自我控制水平能显著负向预测当晚的睡眠拖延情况，而当晚的睡眠拖延也负向预测第二日的自我控制，二者存在一个双向时间滞后效应。总结而言，本研究的结果表明：正念会减少睡眠拖延行为，而这一过程是由行为上的自我调节中介的。此外，自我控制和睡眠拖延存在时间上的双向交叉滞后效应。本研究揭示了正念对睡眠拖延的保护作用，且这种保护作用可能是通过影响行为上的自我调节产生的。本研究的结果为睡眠拖延的干预研究提供了潜在的、具有高生态效度的干预靶点。

The Effect of Daily Mindfulness on Bedtime Procrastination: the Mediating Role of Self-regulation

WU Zhiling [1#] WU Chaoyi [2#] ZHOU Hui [1,3]

1 Department of Psychology, Sun-Yat-Sen University, Guangzhou, 510006, China

2 Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, 200030, China

3 Centre for Mental Health Education, Sun-Yat-Sen University, Guangzhou, 510275, China

Abstract： As life speeds up, people nowadays are facing a specific issue called "bedtime procrastination." Bedtime procrastination refers to the deliberate delay of sleep time despite the absence of external interference. This problematic behavior can lead to a decrease in sleep quality, as well as a decline in work and study efficiency, ultimately resulting in negative impacts on both physical and mental well-being. According to the self-regulation theory, bedtime procrastination is regarded as a manifestation of self-regulatory failure. Mindfulness and self-regulation are closely related. Mindfulness refers to an individual's ability to stay focused, accepting, and aware in the present moment. From the perspective of self-regulation theory, the present study uses diary study to explore the effect of mindfulness on bedtime procrastination and the mediatorial role of self-control, which represent the behavioral part of self-regulation ability. A total of 113 participants were recruited for the study and were asked to complete a series of questionnaires twice daily over a consecutive period of 14 days. Results were as follows: (1) At the individual level, mindfulness negatively predicted the occurrence of bedtime procrastination. (2) At both the within-individual and between-individual levels, self-control significantly mediated the relationship between mindfulness and bedtime procrastination. (3) Daily levels of self-control significantly negatively predicted the occurrence of bedtime procrastination on the same evening. Additionally, bedtime procrastination negatively predicted self-control the following day, indicating a reciprocal time-lagged effect between the two variables. In conclusion, this study found that mindfulness decreases bedtime procrastination, which mediated by behavioral self-control. Meanwhile, self-control and bedtime procrastination have a reciprocal time-lagged effect. This study reveals the protective role of mindfulness against bedtime procrastination, highlighting the possibility that such process may be mediated by its influence on behavioral self-regulation. Additionally, it provides a potential intervention target with high ecological validity for research on addressing bedtime procrastination.

正念联合身体活动干预对抑郁与焦虑症状的影响：随机对照实验的系统综述与元分析

黄菊 [1,2] 魏小淇 [1,2] 姚立晴 [3] 迟新丽 [1,2]（通讯作者）

1 深圳大学心理学院，深圳，518060

2 深圳大学心理健康中心，深圳，518060，xinlichi@126.com

3 澳门科技大学医学部医学院，澳门，999078

摘 要 本研究运用系统综述与元分析技术，以抑郁为主要结果变量、焦虑为第二结果变量，考察了正念联合身体活动训练的干预效果及其影响因素，以期为更高效的改善抑郁症状提供参考。本篇系统综述

与元分析共纳入 18 项随机对照研究，运用 Stata 软件进行数据分析。结果发现：1）在抑郁方面，正念联合身体活动干预组（联合干预组）与普通对照组相比改善效果更好[SMD: -0.94, 95%CI(-1.48, -0.40), $p<0.01$]；联合干预组与单一身体活动组相比改善效果更好[SMD: -0.52, 95%CI(-1.03, -0.02), $p<0.05$]，但联合干预组与单一正念组之间的干预效果无显著差异[SMD: 0.11, 95%CI(-0.17, 0.38), $p>0.05$]；2）在焦虑方面，联合干预组与普通对照组相比改善效果更好[SMD: -1.64, 95%CI(-2.56, 0.71), $p<0.01$]，联合干预组与单一身体活动组相比改善效果更好[SMD: -0.65, 95%CI(-1.29, -0.01), $p<0.05$]，但联合干预组与单一正念组之间的干预效果无显著差异[SMD: 0.01, 95%CI(-0.29, 0.31), $p>0.05$]。亚组分析结果表明：正念联合身体活动的干预效果受到被试年龄、被试类型(病人、健康人群)、国别、干预的持续时间等多个变量的影响。总之，联合干预组相比普通对照组和单一身体活动组，对抑郁与焦虑症状的改善作用更大。未来的研究应该进一步弥补联合干预与单一正念干预效果比较的实证研究不足，关注联合干预在积极的心理健康指标(如幸福感、生活质量等)上的干预效果，并结合中国文化与人群特征，制定针对不同干预对象的个性化干预方案，以提升干预效益。

The effect of mindfulness and physical activity combined intervention on depression and anxiety symptoms: a systematic review and meta-analysis of randomized controlled trials

Ju Huang[1,2]　Xiaoqi Wei[1,2]　Liqing Yao[3]　Xinli Chi[1,2] (Correspondence)

1 School of Psychology, Shenzhen University, Shenzhen, China

2 Center for Mental Health, Shenzhen University, Shenzhen, China

3 Faculty of Medicine, Medical Sciences Division, Macau University of Science and Technology, Macau, China

Abstract: With depression as the primary outcome and anxiety as the secondary outcome, the present study used systematic review and meta-analysis to investigate the intervention effects and influencing factors of mindfulness and physical activity intervention, in order to provide reference for more efficient improvement of depression and anxiety symptoms. The systematic review and meta-analysis included a total of 18 randomized controlled studies. The results showed that: (1) as for depression, the combined intervention group improved better than the control group [SMD: -0.94, 95%CI(-1.48, -0.40), $p<0.01$] and compared with the physical activity group alone [SMD: -0.52, 95%CI(-1.03, -0.02), $p<0.05$], but with a single mindfulness group [SMD: 0.11, 95%CI(-0.17, 0.38), $p>0.05$] no significant differences. (2) As for anxiety, the combined intervention group improved more than the control group [SMD: -1.64, 95%CI(-2.56, 0.71), $p<0.01$] and the physical activity group alone [SMD: -0.65, 95%CI(-1.29, -0.01), $p<0.05$], but with a single mindfulness group [SMD: 0.01, 95%CI(-0.29, 0.31), $p>0.05$] no significant differences. The results of subgroup analysis showed that the effect of mindfulness and physical activity combined intervention was affected by several variables, such as age, subject type (patients, healthy people), country and duration of intervention. In conclusion, the combined intervention group improved symptoms of depression and anxiety more than the control group and the physical activity group alone. In the future, it is necessary to further make up for the lack of comparative studies of combined intervention with mindfulness intervention alone, pay attention to the intervention effect of combined intervention on positive mental health indicators (such as happiness, quality of life, etc.), and develop personalized intervention programs for different intervention objects in combination with Chinese culture and population characteristics to improve the effectiveness of intervention.

正念、孤独感与友谊网络：基于心理测量法和社会测量法

张桥（通讯作者）　梁三才

陕西师范大学心理学院，西安，710062，bridgy0907@163.com

摘 要　孤独感的泛滥对个体和社会产生了巨大危害。研究发现正念干预可以有效降低孤独感并发展社会网络，但正念降低孤独感、发展社会网络的作用机制仍有待探索。因此，本研究采用心理测量法结合社会测量法，探讨正念、孤独感、友谊网络之间的复杂关系。

研究一采用心理测量法，以正念觉知量表、ULS-8 孤独感量表和 Lubben 社会网络量表对陕西省 449 名被试进行问卷调查。结果发现，正念和友谊网络可以显著负向预测孤独感，且友谊网络调节了正念和孤独感之间的关系。当个体有高水平的友谊网络时，正念不能预测孤独感；当个体的友谊网络处于低水平时，正念显著降低了个体孤独感。这为研究二进一步探究三者的动态关系奠定了基础。

研究二采用纵向社会网络分析方法，基于同伴提名法生成友谊网络，结合简版正念觉知量表、ULS-6 孤独感量表，收集了某学院的全体 115 名大学一年级新生的两时间点纵向数据。本研究采用随机指数图模型（Exponential random graph models, ERGM）分别描述正念和孤独感对友谊网络一致性和准确性的影响；采用随机行动者导向模型（Stochastic actor-based models, SABM）探讨正念和孤独感在友谊网络中的跨行为影响。ERGM 结果发现，正念提升了友谊网络之间的一致性；孤独感降低了友谊网络之间的一致性且提升了友谊网络之间的准确性。更进一步，SABM 结果发现，朋友的正念会降低个体的孤独感，即朋友正念的水平越高，该个体的孤独感水平有降低的趋势。

综上，研究一发现了正念可以降低孤独感，研究二发现朋友的正念可以降低个体的孤独感。这些结果表明了正念在促进人际关系发展和降低负性情绪过程中的积极作用，支持并发展了自我决定理论和二元互动过程理论。未来研究应进一步探讨正念、孤独感与友谊网络之间的复杂关系，进而为降低大学生孤独感、拓展他们的友谊网络提供实证依据。

Mindfulness, Loneliness, and Friendship Networks: Combining Psychometric and Sociometric Approaches

Zhang Qiao*　Liang Sancai

College of Psychology, Shaanxi Normal University, Xi'an, 710062, China

Abstract：Developing friendships is one of the main tasks of individual socialization. Studies have investigated that mindfulness intervention can effectively alleviate loneliness and develop friendship networks. It is noted that the mechanism of mindfulness in developing friendships and alleviating loneliness still needs to be explored.

We investigated the complex relationship among mindfulness, loneliness, and friendship through psychometrics and sociometry. The first study aimed to investigate the moderating effect of friend networks on the relationship between mindfulness and loneliness. A sample of 449 participants was recruited. They completed a battery of online questionnaires including measures of mindfulness, loneliness, and friend network. The additive

multiple moderation analysis revealed that friend network moderated the relation between mindfulness and loneliness, with the negative relation between mindfulness and loneliness being stronger when the family network or friend network was at a low level, whereas no significant association between mindfulness and loneliness was found when friend network was at the high level. These findings suggest that mindfulness-based intervention on loneliness is more efficacious for those with low levels of friend networks.

The second study aimed to explore the relationship among mindfulness, loneliness, and friendship networks by longitudinal social network analysis. The subjects were all 115 freshmen from the entire college. Subjects completed a battery of paper-pencil questionnaires including measures of mindfulness, loneliness, and friendship networks at two times points: at the beginning of their first month in college and one semester later. Exponential Random Graph Models (ERGMs) were used to identify the effects of mindfulness and loneliness on structural patterns of friendship networks. The main contribution of ERGMs was to test how mindfulness and loneliness influence the congruence and accuracy of friendship respectfully, shedding light on how personal attributes related to cognitive perceptions of the social environment. Stochastic actor-based models (SABMs) were used to investigate the indirect influences of friends' mindfulness on an individual's loneliness, aiming to shed light on the mechanism of mindfulness of loneliness in friendship. The ERGM test shows that there is a negative entrainment effect of mindfulness, that is, the higher the level of mindfulness of an individual, the higher the level of inconsistency. The ERGM test also showed that there is a positive entrainment effect and a negative exchange effect of loneliness, indicating that the higher level of loneliness, the lower the accuracy of the friendship network, which indicated that loneliness will impair social perception. Furthermore, the SABMs test revealed that friends' mindfulness can alleviate an individual's loneliness.

In summary, the first study revealed that mindfulness can alleviate loneliness; the second study indicated that mindfulness of friends can alleviate an individual's loneliness. These results support the positive role of mindfulness in promoting interpersonal development and reducing negative social emotions, which further support and develop the Self-determination Theory and the Binary Interactive Processes Theory. Future research should further explore the complex interplay between mindfulness, loneliness, and friendship network.

摘 要 《中国未成年人互联网运用报告》(2022)显示，未成年人上网普及率已近饱和，看视频已经超越了打游戏和听音乐，成为了未成年人最主要的网络使用行为。而关于农村留守儿童的最新调研显示，近七成孩子用手机看短视频，过度沉迷于短视频严重影响其学业及身心健康发展。基于此，本研究拟考察短视频使用对农村留守儿童注意稳定性及学业成绩的影响，并探究注意稳定性（狭义注意稳定性与学习注意稳定性）在短视频使用与不同学科学业成绩之间的中介作用机制。方法：2023 年 3 月采用短视频使用量表、学习注意稳定性量表、注意稳定性测验对河南省四所农村小学三到六年级中有浏览短视

频经历的 396 名留守儿童进行测查，选择 2022-2023 学年第一学期的期末成绩（语文及数学）为学业成绩指标，并对其进行标准化处理。结果：（1）男生的短视频使用程度显著高于女生，男生的语文成绩、学习注意稳定性及狭义注意稳定性均显著低于女生；四年级小学生的狭义注意稳定性显著低于五年级、六年级，四年级小学生的语文成绩显著高于三年级、六年级。（2）短视频使用与注意稳定性、语文成绩、数学成绩均呈显著负相关，注意稳定性与语文成绩、数学成绩均呈显著正相关。（3）短视频使用主要是通过狭义注意稳定性和学习注意稳定性间接负向预测留守儿童的语文成绩。（4）短视频使用既可以直接负向预测数学成绩，也可以通过狭义注意稳定性来间接负向预测数学成绩。结论：（1）短视频使用可以负向预测农村留守儿童的注意稳定性及学业成绩。（2）狭义注意稳定性和学习注意稳定性在短视频使用与语文成绩的关系中起完全并行中介作用，狭义注意稳定性在短视频使用与数学成绩的关系中起部分中介作用。研究结果可为农村留守儿童科学合理使用短视频，提升其学业及身心健康水平提供理论依据。

A study on the influence of short video use on rural left-behind children's attention stability and academic performance

Qingchun Wang [1] (Corresponding Author), Suhui Wang[1], Mengxin Kong[1], Lingyao Song[1], Wei Wu[2]

1 School of Psychology, Faculty of Education, Henan Normal University, Xinxiang 453007, 111101@htu.edu.cn

2 The Third Affiliated Hospital of Xinxiang Medical College, Xinxiang 453003, China

Abstract：According to the Report on Internet Use of Chinese Minors in 2022, the Internet penetration rate of minors has reached saturation. Watching videos has become the most important behavior of minors using the Internet, which has surpassed playing games and listening to music. The latest research on rural left-behind children shows that nearly 70% of children watch short videos on mobile phones, and their addiction to short videos seriously affects their academic, physical and mental health development. Based on this, this study intends to investigate the effects of short video use on attention stability and academic performance of rural left-behind children, and explore the mediating mechanism of attention stability (narrow attention stability and learning attention stability) between short video use and academic performance of different disciplines. Methods: In March 2023, 396 left-behind children from grades three to six in four rural primary schools in Henan Province who had experience of viewing short videos were investigated by using the Short Video Usage Scale, the Learning Attention Stability Scale and the Attention Stability Test. At the same time, the final scores of Chinese and mathematics in the first semester of the 2022-2023 academic year are selected as the indicators of academic performance, and the scores were standardized. Results: (1) The degree of short video use of male students was significantly higher than that of female students, and Chinese scores, learning attention stability and narrow attention stability of male students were significantly lower than those of female students; The narrow attention stability of fourth grade students is significantly lower than that of fifth grade and sixth grade, and the Chinese scores of fourth grade students is significantly higher than that of third grade and sixth grade. (2) Short video use was significantly negatively correlated with the attention stability, Chinese and math scores, while the attention stability was significantly positively correlated with Chinese and math scores. (3) Short video use mainly indirectly and negatively predicts left-behind children's Chinese scores through narrow attention stability and learning attention stability. (4) Short video use can not only directly predict math scores negatively, but also

indirectly predict math scores negatively through narrow attention stability. Conclusion: (1) Short video use can negatively predict the attention stability and academic performance of rural left-behind children. (2) Narrow attention stability and learning attention stability play a completely parallel mediating role in the relationship between short video use and Chinese scores, while narrow attention stability plays a partial mediating role in the relationship between short video use and math scores. The research results can provide theoretical basis for the scientific and rational use of short videos for rural left-behind children to improve their academic, physical and mental health.

提取难度对困难材料提取练习效应的促进作用：来自行为和 fNIRS 的证据

张俐娟　江妍雪　张锦坤(通讯作者)
福建师范大学心理学院，福州，350117
jinkunzhang@126.com

摘 要　提取练习效应(Retrieval Practice Effect, RPE)是指在相同时间内，对学习材料进行提取比重复学习能更有效地提高学习和记忆水平。除了提取练习本身促进记忆保持(直接效应)以外，提取练习还能提高元认知监测的准确性，从而促进随后学习并提升学习效果(间接效应)。研究表明，编码难度和提取难度是影响 RPE 的重要因素。本研究旨在通过操纵材料难度和提取支持探究编码和提取难度对提取练习的直接和间接效应的影响。实验 1 为行为实验，采用 2(词对难度：简单，困难)×2(提取支持：无，有)的两因素混合实验设计，考察延迟测试(2 天后最终测试)下提取练习的直接效应。实验 2 结合行为和 fNIRS 脑成像技术，进一步区分词对难度与提取支持对提取练习的直接和间接效应的影响，采用 2(提取支持：无，有)×2(词对难度：简单，困难)×2(提取后重学：无，有)的三因素混合实验设计。结果发现，在直接效应上，实验 1 和实验 2 的行为结果一致：简单词对的记忆成绩显著高于困难词对；提取支持能够提高初始提取记忆成绩，但延迟测试下，无提取支持组的记忆成绩显著高于有提取支持组。fNIRS 脑成像结果发现，学习者在无提取支持条件下的颞上回区域(与提取难度关联)激活水平显著高于有提取支持条件；与提取简单词对相比，学习者提取困难词对时背外侧前额叶显示更广泛的激活(与认知负荷关联)。在间接效应上，实验 2 行为结果发现，简单词对的记忆成绩显著高于困难词对；无提取支持最大程度地促进了困难词对(初始提取成绩较低)提取后的重学效果(延迟测试记忆成绩显著提高)。fNIRS 脑成像结果发现，与初始学习相比，提取后重学简单词对时引起的前额皮层相关脑区(与加工深度关联)激活减弱；但在重学困难词对时，无提取支持组表现出明显的激活增强。研究结果表明，困难材料的提取练习效应弱于简单材料；降低提取支持最大程度地增加了困难材料的提取难度和再编码时的加工深度，从而有效促进困难材料提取练习的直接和间接效应。

The Facilitating Effect of Retrieval Difficulty on the Retrieval Practice Effect for Difficult Materials: Evidence from Behavior and fNIRS.

Zhang Lijuan　Jiang Yanxue　Zhang Jinkun*
School of Psychology, Fujian Normal University, 350117
jinkunzhang@126.com

***Abstract*:** The Retrieval Practice Effect (RPE) refers to the phenomenon in which retrieving learning materials is more effective than repeated learning in improving learning and memory at the same time. In addition to the retrieval practice itself facilitating memory retention (direct effect), retrieval practice also improves the accuracy of metacognitive monitoring, thus facilitating subsequent learning and enhancing the learning effect (indirect effect). This study aims to investigate the effects of encoding and retrieval difficulty on the direct and indirect effects of retrieval practice by manipulating material difficulty and retrieval support. Experiment 1 was a behavioral experiment. A two-factor mixed experimental design of 2 (word pair difficulty: easy, difficult) × 2 (retrieval support: none, yes) was adopted to investigate the direct retrieval practice effects under a delayed test (final test after 2 days). Experiment 2 combined behavioral and fNIRS brain imaging techniques to further differentiate the direct and indirect effects of retrieval practice. Experiment 2 adopted a three-factor mixed experimental design of 2 (extraction support: none, yes) × 2 (word pair difficulty: easy, difficult) × 2 (relearning after extraction: none, yes). The results showed that in terms of direct effect, the behavioral results of experiments 1 and 2 were consistent: memory performance for easy word pairs was significantly higher than for difficult word pairs, and retrieval support enhanced initial retrieval performance. However, during delayed testing, the memory performance of the no-retrieval support group was significantly higher than that of the retrieval support group. The fNIRS brain imaging results showed that the activation level of the superior temporal gyrus region (associated with retrieval difficulty) was significantly higher in the no-retrieval support condition than in the retrieval support condition. Additionally, learners showed more extensive activation in the dorsolateral prefrontal cortex (associated with cognitive load) when retrieving difficult word pairs compared to retrieving easy word pairs. Regarding the indirect effect, the behavioral results of experiment 2 found that the memory performance for easy word pairs was significantly higher than for difficult word pairs. The absence of retrieval support maximally facilitated the relearning effect for difficult word pairs (with initially lower retrieval performance), leading to significantly improved memory performance during delayed testing. The fNIRS brain imaging results showed that the activation of prefrontal cortex-related brain areas (associated with processing depth) was weakened when easy word pairs were relearned after retrieval compared to initial learning. However, during the relearning of difficult word pairs, the no-retrieval support group exhibited significant activation enhancement. The findings of this study show that the retrieval practice effect is weaker for difficult materials than for easy materials. Reducing retrieval support maximizes the difficulty of retrieving difficult materials and the processing depth during re-encoding, thus effectively facilitating both the direct and indirect effects of retrieval practice on difficult learning materials.

学业压力影响高中生学业成绩的纵向研究：内化问题和共同冗思的作用

王稳　王云强（通讯作者）

南京师范大学心理学院，南京，210097

通讯作者 E-mail：　wangyunqiang@njnu.edu.cn

摘 要　学业压力对高中生学业成绩具有重要影响，但其影响机制和条件需要进一步探明。内化问题是指向个体内部心理的，主要表现为焦虑、抑郁、恐惧、敏感和社交回避等表现的一种问题心理，对青少年的发展起着不良作用。青少年与母亲共同冗思是指双方对自身或者对方的问题进行过度的讨论，具体表现是频繁讨论问题、重复讨论相同问题、揣摩推测问题因果、彼此强化讨论行为以及过多关注负性情绪。本研究采用问卷法，以 330 名高中生为被试，进行两次数据收集，考察内化问题、青少年与母亲共同冗思在学业压力影响高中生学业成绩中的作用。结果发现：（1）学业压力与高中生学业成绩呈显著负相关，学

业压力与内化问题呈显著正相关，内化问题与学业成绩呈显著负相关，青少年与母亲共同冗思和学业成绩呈显著负相关。（2）内化问题在学业压力和学业成绩之间起到部分中介作用，学业压力通过直接和间接两条路径影响高中生学业成绩。（3）青少年与母亲共同冗思在学业压力-内化问题-高中生学业成绩之间的中介模型中，调节了模型的后半路径，即青少年与母亲共同冗思能调节内化问题对高中生学业成绩的影响。进一步分析发现，高青少年与母亲共同冗思会增强内化问题对学业成绩的负面影响，低青少年与母亲共同冗思会减弱内化问题对学业成绩的负面影响。由此可见，高中生学业压力影响其学业成绩，能够以内化问题为中介，并受到青少年与母亲间共同冗思的影响。

A Longitudinal study on the Impact of Academic Stress on High School Students' Academic Achievements: The Role of Internalization and Mother-adolescent Co-rumination

Wang Wen　Wang Yunqiang
School of Psychology, Nanjing Normal University, Nanjing, 210097

Abstract：Academic stress has a significant impact on the academic achievement of high school students, but its mechanism and conditions need to be further explored. Internalization problems refer to the internal psychology of individuals, mainly manifested as anxiety, depression, fear, sensitivity, and social avoidance, which play a negative role in the development of adolescents. Mother-adolescent co-rumination refers to excessive discussions about their own or each other's problems, which can manifest as frequent discussions, repeated discussions of the same problem, speculation about the cause and effect of the problem, reinforcement of discussion behavior, and excessive attention to negative emotions. This study used 330 high school students as subjects and conducted two longitudinal questionnaire measurements to investigate the role of internalization and mother-adolescent co-rumination in the impact of academic stress on high school students' academic achievement. The results showed that: (1) there was a significant negative correlation between academic stress and high school students' academic achievement, a significant positive correlation between academic stress and internalization, a significant negative correlation between internalization and academic achievement, and a significant negative correlation between mother-adolescent co-rumination and academic achievement. (2) Internalization play a partial mediating role between academic stress and academic achievement, and academic stress affects high school students' academic achievement through both direct and indirect pathways. (3) In the mediating model between academic stress, internalization and high school students' academic achievements, the mother-adolescent co-rumination can adjust the latter half of the model, that is, the mother-adolescent co-rumination can adjust the impact of internalization on high school students' academic achievements. Further analysis found that high mother-adolescent co-rumination can enhance the negative impact of internalization on academic achievement, while low mother-adolescent co-rumination can weaken the negative impact of internalization on academic achievement. From this, it can be seen that high school students' academic stress affects their academic achievements, which can be mediated by internalization and influenced by the mother-adolescent co-rumination.

Keywords：academic stress, internalization, academic achievement, mother-adolescent co-rumination

听众面孔对学习者自我生成教学的影响：一项眼动研究

成美霞　王福兴（通讯作者）
华中师范大学心理学院，武汉，430079，通讯作者 E-mail：fxwang@ccnu.edu.cn

摘 要 学习者自我生成教学（Learning by non-interactive teaching）是一种生成性学习策略，指学习者在知识学习过程中转换角色，将自己所学知识以知识传授者角色讲解给其他人听，即学习者借助非互动性教学进行学习。研究发现，学习者以线上的方式向远程的听众教学比以录像的方式向假想的听众教学学习表现更差。然而，其中原因尚需要进一步探讨，学习者进行线上教学时可以通过网络摄像头看到听众，听众面孔的呈现是否分散了学习者自我生成教学时有限的注意力资源，进而损害了生成性学习呢？在本研究中，大学生($N = 108$)观看人类免疫系统的多媒体课程，随后，他们被要求分别以录像的方式向脑海中假想的听众(无面孔录像组)、以线上的方式向屏幕上关闭摄像头的远程听众(无面孔在线组)或以线上的方式向屏幕上打开摄像头的远程听众(有面孔在线组)讲解学习材料。结果发现，无面孔录像组($d = 0.63$)和无面孔在线组($d = 0.60$)在迁移测验上显著优于有面孔在线组，而且，无面孔录像组($d_{临场感} = –1.66$, $d_{认知负荷} = –0.75$)和无面孔在线组($d_{临场感} = –1.61$, $d_{认知负荷} = –0.60$)教学时感知到的社会临场感和认知负荷均显著低于有面孔在线组。此外，有面孔在线组比无面孔在线组的学习者在教学时对屏幕上听众的关注更多，具体而言，有面孔在线组比无面孔在线组对电脑屏幕上的听众区注视次数更多($d = 1.48$)、注视时长更长($d = 1.48$)。结论认为，遮挡听众面孔可以减少学习者自我生成教学时的注意分散，使他们有限的认知资源更多地专注于对核心材料的理解和阐述上，有利于提高自我生成教学的有效性。

The Effect of Audience Face on Learning by Non-Interactive Teaching: An Eye Movement Study

Meixia Cheng, Fuxing Wang
School of Psychology, Central China Normal University, Wuhan 430079, Hubei, China.
Corresponding author e-mail: fxwang@ccnu.edu.cn

Abstract: Learning by non-interactive teaching is a generative learning strategy in which students are asked to teach what they are learning to others. Previous studies have found that learners exhibited lower levels of learning when learning by non-interactive teaching involved lecturing to a remote person they could see via a webcam than lecturing to a camera for a fictitious person they could not see. However, it is unclear whether the underlying process is due to the faces of the audience distracting the limited attentional resources of the learners and thus detrimental to learning. In this study, college students watched a multimedia lesson on the human immune system with instructions that afterwards they would explain the materials by making a lecture video (no audience face video group), explain to an online student who turned off the webcam (no audience face online group), or explain to an online student who turned on the webcam (see audience face online group). The no audience face video group ($d = 0.63$) and the no audience face online group ($d = 0.60$) significantly outperformed the see audience face online group on transfer test; the two groups with no audience face also reported significantly lower social presence ($d_{video} = 1.66$, $d_{online} = 1.61$) and cognitive load ($d_{video} = 0.75$, $d_{online} = 0.60$) during teaching than the see audience face online group. Moreover, learners in the no audience face online group paid less attention to the on-screen audience area (i.e., gazing at the audience less often ($d = 1.48$) and for less time ($d = 1.48$)) than learners in the see audience face online group. Masking the faces of the audience may reduce distractions of the learners during teaching and somewhat mitigate the negative effects of learning by non-interactive teaching at a distance online.

Key words: learning by non-interactive teaching, generative learning, audience face, distraction, multimedia learning

数学焦虑≠一般焦虑：基于网络分析与潜剖面分析的证据

雒瑞帆[1]　禚新峰[1]　刘畅[1]　司继伟[1]（通讯作者）
1 山东师范大学心理学院，济南，250358，sijiwei1974@126.com

摘 要　数学焦虑是指在面对数学问题时产生的恐惧、紧张和担忧等负面情绪。根据精神障碍诊断与统计手册和国际疾病分类标准，数学焦虑并非一个单独的诊断类别，而通常被认为是属于广泛性焦虑症或社交焦虑症的范畴。但数学焦虑究竟是一种特殊的焦虑类型，还是一般焦虑的表现方式之一，学界对此尚无定论。根据情绪和焦虑障碍的情绪失调模型，情绪失调可能是导致焦虑症持续存在的核心因素。本研究采用网络分析和潜在剖面分析的方法，在 2073 名三、四年级学生（50.1%男性，M_{age}=9.83±0.67 岁）中初步探讨了数学焦虑、一般焦虑和情绪调节之间的关系。主要发现如下：（1）网络分析结果显示，数学焦虑、一般焦虑和情绪调节是不同的概念，并可以划分为四个社区，分别对应数学焦虑，一般焦虑以及情绪调节的两个维度（认知重评、表达抑制）。在这些社区中，数学焦虑与认知重评的联系较为密切，而一般焦虑与表达抑制的联系较为密切；（2）桥梁预期影响最大的节点是一般焦虑量表项目：“我每天花大部分时间担心各种各样的事”，它起到了连接不同社区的主要作用；（3）潜剖面分析揭示小学生中存在着三种类别：健康组（59%；情绪调节水平高，数学焦虑、一般焦虑低）、平均组（28%；情绪调节水平、数学焦虑、一般焦虑中等）和焦虑组（13%；情绪调节水平低，数学焦虑、一般焦虑高）。本研究揭示了数学焦虑与一般焦虑的结构特征，深化了对数学焦虑和一般焦虑的差异与联系的科学理解，为进一步关注和及时防范小学阶段的数学焦虑情绪提供了初步证据支持。

Math Anxiety ≠ General Anxiety: Evidence from Network Analysis and Latent Profile Analysis

Ruifan Luo[1], Xinfeng Zhuo[1], Chang Liu[1], Jiwei Si[1](Corresponding author)
1 School of Psychology, Shandong Normal University, Jinan, 250358

Abstract：Math anxiety refers to the negative emotion of fear, nervousness, and worry that emerges when confronted with mathematical problems. According to the Diagnostic and Statistical Manual of Mental Disorders and the International Classification of Diseases, math anxiety is not a separate diagnostic category, but is usually regarded as a subtype of generalized anxiety disorder or social anxiety disorder. However, the academic community has not reached a consensus on whether math anxiety is a specific form of anxiety or one of the manifestations of general anxiety. Based on the emotional dysregulation model of emotional and anxiety disorders, emotional dysregulation may be the core factor that leads to the persistence of anxiety disorders. This study employed network analysis and latent profile analysis methods to investigate the relationship between math anxiety, general anxiety, and emotion regulation among 2073 third- and fourth-grade students (50.1% male, M_{age}=9.83±0.67 years old). The main results are as follows: (1) The network analysis results indicated that math anxiety, general anxiety, and emotion regulation were distinct concepts and were partitioned into four communities, corresponding to math anxiety, general anxiety, and two dimensions of emotion regulation (cognitive reappraisal,

expressive suppression). Among these communities, math anxiety was more strongly associated with cognitive reappraisal, while general anxiety was more strongly associated with expressive suppression; (2) The node with the largest bridge expected influence was the general anxiety scale item: “I spend most of my time worrying about all kinds of things every day”, which played a vital role in connecting different communities; (3) Latent profile analysis revealed that there are three categories among elementary school students: healthy group (59%; high level of emotion regulation, low math anxiety, low general anxiety), average group (28%; moderate level of emotion regulation, math anxiety, general anxiety), and anxious group (13%; low level of emotion regulation, high math anxiety, high general anxiety). This study demonstrates the structural features of math anxiety and general anxiety, enhances the scientific knowledge of the differences and connections between math anxiety and general anxiety, and provides preliminary evidence support for further attention and effective prevention of math anxiety emotions in elementary school stage.

Keywords：math anxiety, general anxiety, emotion regulation, network analysis, latent profile analysis

非符号近似数量表征中的连结点效应：试次间的序数性分析

刘晓宇[1] 刘畅[1] 朱红祥[1] 禚新峰[1] 司继伟[1]（通讯作者）

1 山东师范大学心理学院，济南 250358，sijiwei1974@126.com

摘 要 非符号近似数量表征能力允许个体直接从非符号表征中提取粗略的数量。主流观点支持近似数量系统(Approximate number system, 简称 ANS)的存在，即数值被作为独立维度认知，个体能够从直觉上感知总数值，不受物理线索的干扰。然而，近年来不少学者认为数值维度之外的像素感觉(诸如面积、凸包等)才是影响数值估计的主要因素。因此，有必要辨明个体究竟是通过数值维度还是更局部的感官元素产生数量信息。连结点效应(dumbbell effect/ connectedness effect)是指当用直线连接两个点时，个体对点的数量出现明显低估的现象。稳定的连结点效应为 ANS 的观点提供了支持，在一定程度上有助于解决上述争议。本研究在验证连结点效应的基础上，纳入了试次间的序数性分析，即考察 ANS 中感知的近似数量与符号化数字表征顺序是否保持同向。采用点阵数量（2：多、少）×连线（3：无连结、连结、断线）被试内实验设计，通过控制点阵的半径和凸包等感官线索，以数量估计值为因变量，考察 41 名大学生（20.6±1.2 岁）非符号数量估计的连结点效应。对原始估值进行的重复测量方差分析结果表明：点阵数量少时，连结、断线条件下的数量估计显著低于无连结条件；点阵数量多时，连结条件下的数量估计显著低于无连结条件。进一步以相邻两个试次间的数量估计差为因变量，进行连线变化（3：无线→连线、连线情况不变、连线→无线）×点阵数量（2：多、少）的完全随机设计方差分析。结果发现当两试次之间客观数值相同时，在“无线→连线”条件下观察到显著的数值低估现象，这表明在序数性上同样存在连结点效应。这意味着无论是在显性行为还是在更加接近无意识的认知方式中，个体更可能是在数值维度上感知数量，而非从较低层次的物理特征中提取数量信息。上述发现有助于丰富人们对连结点效应的认识，深化了对近似数量加工机制的理解。

Connectedness Effects in Non-symbolic Approximate Quantitative Representation: Ordinal Analysis between Trials

Xiaoyu Liu, Chang Liu, Hongxiang Zhu, Xinfeng Zhou, Jiwei Si

School of Psychology, Shandong Normal University, Jinan 250358

***Abstract*:** Plenty of evidence shows that the ability of non-symbolic approximate quantity representation are able to extract an approximate number of items from non-symbolic representations. The mainstream view supports the existence of Approximate number systems (ANS), in which enables individuals to perceive numerosity intuitively, and number is recognized as an independent dimension out of all kinds of other visual cues. However, in recent years, many researchers believe that the visual cues (such as area, convex hull, etc.) outside the numerical dimension is the primary factor affecting the numerical estimation. Therefore, it is necessary to distinguish whether the individual perceives quantity through discrete individual intuitions or visual elements. Connectedness effect refers to the phenomenon of significantly underestimating the number of points when two points are connected by a straight line. The existence of a stable connectedness effect can support the existence of the individuation in numerical processing and the ANS view. Based on the repeated verification of the connectedness effect, the current study includes the ordinal analysis between trials, that is, to investigate whether the approximate number perceived in ANS and the order of symbolic number representation maintain the same direction. In this experiment, the original estimation was taken as dependent variables, the number of dot array (more or less) and the case of connection (isolate, connective, disconnective) were taken as independent variables. We tested the connectedness effect of 41 subjects by non-symbolic quantity estimation and found: When the number of dot array is small, estimation in the connective and disconnective conditions were significantly lower than those in the isolate condition. When the number of dot array is more, estimation in the connective condition was significantly lower than those in the isolate condition. In addition, the variance analysis of a completely random design with case of connection changes (3: isolate→ connective, unchanged, connective → isolate) × number of dots (2: more, less) is further performed with the change of inter-trial estimation as the dependent variable. The results show that when the objective values are the same between the two trials, a significant underestimation is occurred from isolate to connective, which indicates that there is also a connectedness effect on ordinality.. This study uses inter-trial analysis to confirm the existence of the connectedness effect from an ordinal point of view, which means that individuals are more likely to perceive quantities intuitively rather than extract quantitative information from

lower-level physical features, both in explicit behavior and in cognitively closer to the unconscious. These findings serve to enrich the understandings of the connectedness effect and approximate quantity.

Keywords: Non-symbolic approximate quantitative representation, Connectedness effect, Inter-trial analysis, Ordinality

孤独症谱系障碍大脑连接组动力学的性别差异：来自动态功能连接的证据

马雪儿[1,2] 赵跃野[1,2] 赵晶晶[1,2](通讯作者)

1 陕西师范大学心理学院，西安，710062

2 陕西省儿童青少年心理与行为健康研究中心，西安，710062，jingjing.zhao@snnu.edu.cn

摘 要 孤独症谱系障碍（autism spectrum disorder, ASD）群体的大脑存在性别差异已被广泛认可。目前主要有两种理论解释 ASD 大脑的性别差异：极端男性脑理论和性别不一致模型。极端男性脑理论强调 ASD 群体的大脑普遍具有男性化趋势，但 ASD 群体内的性别差异模式与典型发育（typically developing, TD）群体较为一致；性别不一致模型则认为 ASD 群体内部的性别差异弱于 TD 群体，甚至与 TD 群体相反。遗憾的是，鲜有脑影像研究探讨 ASD 的性别差异，并为上述模型提供直接的证据支持。本研究借助孤独症脑影像数据交换平台，从节点、连边、大脑状态三个层面，系统探究了 ASD 大脑连接组动力学的性别差异。经过严格的数据筛选以及对性别、年龄、智商总分进行匹配，研究最终纳入 ASD 女性（$M_{年龄（岁）}$ = 13.46）、ASD 男性（$M_{年龄（岁）}$ = 13.27）、TD 女性（$M_{年龄（岁）}$ = 12.90）、TD 男性（$M_{年龄（岁）}$ = 13.55）各 49 人。借助滑动时间窗技术构建大脑连接组的动态功能连接，分别考察了 ASD 大脑的模块变异性、连边变异性以及状态变异性的性别差异。结果发现：1）ASD 男性和女性在左侧额中回均表现出较低的模块变异性，这可能与 ASD 的社交情感缺陷有关；2）ASD 男性和女性在右侧嗅皮质和右侧中央旁小叶的功能连接上均表现出较低的连边变异性，而在左侧杏仁核和右侧前扣带和旁扣带回功能连接的连边变异性上表现出与 TD 组相反的性别差异模式；3）ASD 男性和女性在大脑低功能连接状态（State 4）向高功能连接状态（State 3）的转移上均表现出较低的状态变异性，而在大脑高功能连接状态（State 3）的维持上表现出与 TD 不一致的性别差异模式（大脑状态见图 1）。上述结果表明，ASD 非典型的模块变异性为极端男性脑理论提供了大脑连接组动力学的证据，而 ASD 非典型的连边变异性和状态变异性均分别为极端男性脑理论和性别不一致模型提供了大脑连接组动力学的证据。这些结果也为 ASD 男性和女性的临床诊断和干预，提供了来自大脑连接组动力学视角的新见解。

Sex Differences in Brain Connectome Dynamics in Autism Spectrum Disorders: Evidence from Dynamic Functional Connectivity

Xue'er Ma[1, 2] Yueye Zhao[1, 2] Jingjing Zhao[1, 2] (corresponding author)
1 School of Psychology, Shaanxi Normal University,710062
2 Shaanxi Provincial Key Research Center of Child Mental and Behavioral Health, Xi'an, China, 710062, jingjing.zhao@snnu.edu.cn

***Abstract*:** It is widely recognized that there are sex differences in the brain of the individuals with autism spectrum disorder (ASD). The extreme male brain theory and the gender incoherence model are the main theories to explain sex differences in autistic brain. The former emphasizes that the autistic brains present more male-typical features, yet the sex difference modes within the individuals with ASD are still consistent with the typically developing (TD) individuals. However, the latter suggests that the sex differences in ASD are weaker than TD, and even opposite to TD. Nevertheless, few brain imaging studies have investigated sex differences in ASD and provided direct evidence to support the two theories. The current study systematically investigated sex differences in autistic brain connectome dynamics from three levels: node, edge, and brain state. The data were selected from the Autism Brain Imaging Data Exchange (ABIDE) dataset. Forty-nine subjects in each group (age of ASD (years): M_{female} = 13.46, M_{male} = 13.27; age of TD (years): M_{female} = 12.90, M_{male} = 13.55) were included through strict inclusion criteria and matching strategy (i.e., sex, age, and full IQ were matched among the four groups). Using sliding window approach to build the dynamic functional connectivity, the current study respectively explored the sex differences in modular variability (node level), edge variability (edge level), and state variability (brain state level) in autistic brain connectome. The results showed that (i) both autistic males and females presented lower modular variability than TD peers in the left middle frontal gyrus, this atypical pattern in modular variability may be related to autistic social affective deficits; (ii) both autistic males and females showed lower edge variability in the functional connectivity between the right olfactory cortex and the right paracentral lobule than that in TD; however, for the functional connectivity between the left amygdala and the right anterior cingulate and paracingulate gyri, the contrary sex pattern was observed in ASD compared with TD; (iii) both autistic males and females presented lower state variability in the transition from low (State 4) to high (State 3) brain functional connectivity state; in comparison, ASD showed an incoherent sex difference in the maintenance of high brain functional connectivity state (State 3) compared with TD. These results indicated that the extreme male brain theory was supported by autistic atypical modular variability, edge variability, and brain state variability; the gender incoherence model was supported by edge and brain state variability. The current study also provided new insights for clinical diagnosis and intervention in autistic males and females from the perspective of brain connectome dynamics.

摘 要　A 型人格(Type A Personality, TAP)的主要特征包括强烈的竞争驱力，长期的时间紧迫感和无端敌意。TAP 被证明是健康的风险因素，与较高的工作压力，更多的吸烟，危险驾驶和吸毒行为有关。从对单个、独立脑区的关注转向对整体、全局脑网络的考察将致力于深入理解 TAP 如何与脑功能关联。然而，TAP 的神经影像学研究仍然鲜少，目前仅有的几项研究仅关注了 TAP 与局部脑区结构或功能特征的关系，如与运动有关的辅助运动区和中央前回，与抑制控制有关的额中回以及与情绪调节有关的膝下前扣带回。因此，探究 TAP 与大尺度脑网络特征的关系具有重要的科学价值。为了进一步推进对 TAP 神经基础的认识，本研究使用静息态功能磁共振成像方法，基于预先定义的脑网络模板，对 1614 名被试(平均年龄 18.83 岁，女性占 67.47%)进行功能网络连接(FNC)分析。在控制年龄，性别和头动后，进行回归分析考察 TAP 与脑网络功能连接的关系。随后，使用平衡十折交叉验证的机器学习方法，以检验 FNC 结果的稳定性。结果显示，TAP 得分较高个体的高级认知加工网络(即默认网络[DMN]和额顶网络[FPN])和初级感觉信息加工网络(即感觉运动网络[SMN]和视觉网络[VN])之间具有更强的连通性。十折交叉验证分析结果显示，DMN-SMN, DMN-VN, FPN-SMN 和 FPN-VN 连接能够稳定地预测 TAP。我们进一步检验了组间差异，比较 TAP 高分组(A 型人格得分大于 M+1*SD*, n = 244)和低分组(A 型人格得分小于 M-1*SD*, n = 278)在 FNC 分析得到的四个网络连接上的差异。结果显示，这 4 个网络之间的连接模式依然存在(即 DMN-SMN, DMN-VN, FPN-SMN 和 FPN-VN 连接)。另外， TAP 高分组在 VN 之内，VN 和 SMN 之间的功能连接显著弱于低分组。本研究表明，静息态功能网络连接能够稳定地解释 TAP 的个体差异, 这为 TAP 的神经基础研究提供了新见解；DMN, FPN, SMN 和 VN 之间的相互作用模式可能是 TAP 关键的神经标记物，这些发现有助于识别对个体的身心健康有保护作用或潜在威胁的人格特征。

3 Research Center of Psychology and Social Development, Chongqing, 400715

Abstract： Type A Personality (TAP) is characterized by excessive competitive drive, chronic sense of time emergency, and free-floating hostility. TAP has been linked with an increased risk of poor health, such as more work stress, smoking, risky driving behaviors, and drug consumption. Prior research has suggested that the network-level perspective is likely critical in understanding the neural bases of a complex psychological factor like TAP. However, the neuroimaging studies to date have largely focused on regional brain features related to TAP, such as areas involved in motor (e.g., the supplementary motor area and precentral gyrus), inhibition control (e.g., the middle frontal gyrus), and emotion regulation (e.g., the subgenual anterior cingulate cortex). Thus, there is a need to explore large-scale brain networks underlying TAP to obtain a fuller characterization of TAP-brain. To address this limitation, resting-state functional magnetic resonance imaging was applied to uncover the association between TAP and functional network connectivity (FNC) states based on predefined networks in a large general population sample (N = 1614, M_{age} = 18.83, 67.47% female). Regression analysis was conducted to investigate TAP-connectivity associations, controlling for differences in age, sex, and head motion. To validate the robustness of the FNC results, prediction analyses based on machine learning using ten-fold balanced cross-validation were performed. We observed significant positive correlations between TAP and inter-network functional synchrony.

That is, individuals with higher TAP scores showed increased connectivity between higher-order cognitive processing networks (e.g., the default mode network [DMN] and fronto-parietal task control network [FPN]) and primary sensory processing networks (e.g., the sensory/somatomotor network [SMN] and visual network [VN]). Prediction analysis suggested that the DMN-SMN, DMN-VN, FPN-SMN, and FPN-VN connectivity reliably predicted TAP scores. These connectivity patterns identified in FNC analysis (i.e., DMN-SMN, DMN-VN, FPN-SMN, and FPN-VN connectivity) remained significant when further comparing the high-score group (scored higher than M+1*SD* on TAP scale, n = 244) to the low-score group (scored lower than M-1*SD* on TAP scale, n = 278) on intra- and inter-network connectivity of the 4 identified network. Additionally, the high-score group demonstrated weaker intra-network functional synchrony in the VN and inter-network functional synchrony between the VN and SMN. Our findings confirm that resting-state FNC of young adults robustly accounts for individual differences in TAP in a large sample, providing new insights into TAP. The interplay patterns between the DMN, FPN, SMN, and VN may be crucial neural markers that underlie TAP, which may contribute to identifying personality profiles that play a role in protection against or risk for physical and mental health problems.

摘 要

目的 重复经颅磁刺激（rTMS）是近年来被广泛应用于神经康复领域的一种无创、无痛、无依赖性新技术。低频 rTMS 在失眠患者中的疗效得到多项研究肯定，但目前鲜有研究探讨高频 rTMS 对失眠患者睡眠及情绪的治疗效果。本研究旨在比较低频与高频 rTMS 治疗失眠症的疗效及对患者情绪改善的差异，为失眠患者探索更佳的治疗方案。

方法 选取 2021 年 1 月～2022 年 4 月佛山市第一人民医院神经内科收治的 60 例失眠症患者，根据其近红外脑功能成像(fNIRS)前额叶激活程度分为低频 rTMS 组（携氧血红蛋白浓度均值>0.10(mmol/L)*mm）与高频 rTMS 组（携氧血红蛋白浓度均值<0.10(mmol/L)*mm）各 30 例。低频 rTMS 组以 1 Hz 刺激右侧前额叶背外侧（R-DLPFC），高频 rTMS 组以 10Hz 刺激左侧前额叶背外侧（L-DLPFC），每周 5 次，共治疗 2 周。治疗前后评估匹兹堡睡眠质量指数（PSQI）、Zung 氏抑郁自评量表（SDS）、Zung 氏焦虑自评量表（SAS），比较两组疗效。

结果 低频 rTMS 组及高频 rTMS 组治疗前后 PSQI、 SDS、 SAS 评分均明显下降，差异有统计学意义（P<0.001）；低频 rTMS 组 PSQI 减分率略高于高频 rTMS 组，高频 rTMS 组 SDS 和 SAS 减分率略高于低频 rTMS 组，但差异均无统计学意义（P>0.05）。

结论 低频 rTMS 刺激右侧前额叶背外侧和高频 rTMS 刺激左侧前额叶背外侧均能明显改善患者的失眠症状与伴随的焦虑和/或抑郁症状。低频 rTMS 可能更适合大脑皮层过度兴奋导致的失眠患者，而高频 rTMS 可能更适用于大脑功能下降伴随抑郁症状的失眠患者。

A comparative study on the efficacy and emotion improvement of

different frequency repetitive transcranial magnetic stimulation in insomnia

Jiali Luo[1,2], Yukai Wang[1], Pan Shang[1], Shuyun Huang[1], Yajing Liu[1], Haiqun Xie[1*], Qi Chen[2*]

***Abstract*:**

Objective: Repetitive transcranial magnetic stimulation (rTMS) is a new non-invasive, painless and independent technique that has been widely used in the field of neurological rehabilitation in recent years. The efficacy of low-frequency rTMS in patients with insomnia has been confirmed by many studies, but few studies have investigated the effect of high-frequency rTMS on sleep and emotion in patients with insomnia. The purpose of this study is to compare the efficacy of low frequency rTMS and high frequency rTMS in the treatment of insomnia and the difference of emotion improvement in patients, so as to explore a better treatment plan for insomnia patients.

Methods: A total of 60 patients with insomnia admitted to the Department of Neurology of Foshan Hospital Affiliated to Sun Yat-sen University from January 2021 to April 2022 were selected. According to the activation degree of prefrontal cortex in functional near-infrared spectroscopy (fNIRS), the subjects were divided into low frequency rTMS group (oxygenated hemoglobin concentration mean>0.10(mmol/L)*mm) and high frequency rTMS group (oxygenated hemoglobin concentration mean<0.10(mmol/L)*mm), with 30 cases in each group. Patients in the low-frequency rTMS group received 1 Hz stimulation of the right dorsolateral prefrontal cortex (R-DLPFC), and the high-frequency rTMS group received 10Hz stimulation of the left dorsolateral prefrontal cortex (L-DLPFC), 5 times a week for 2 weeks. The Pittsburgh Sleep Quality Index (PSQI), Zung Self-rating Depression Scale (SDS) and Zung self-rating Anxiety Scale (SAS) were evaluated at baseline and after treatment, the curative effect was compared between the two groups.

Results: The PSQI, SDS and SAS scores of the low frequency rTMS group and the high frequency rTMS group decreased significantly after treatment (P<0.001). The reduction rate of PSQI in the low frequency rTMS group was slightly higher than that in the high frequency rTMS group, and the reduction rate of SDS and SAS in the high frequency rTMS group was slightly higher than that in the low frequency rTMS group, but the differences were not statistically significant (P>0.05).

Conclusion: Both low frequency rTMS stimulation of the right dorsolateral prefrontal cortex and high frequency rTMS stimulation of the left dorsolateral prefrontal cortex can significantly improve the symptoms of insomnia and accompanying anxiety and/or depression. Low frequency rTMS may be more suitable for insomnia patients caused by excessive cortical excitation, while high frequency rTMS may be more suitable for insomnia patients with decreased brain function and depressive symptoms.

目睹家庭暴力与非自杀性自伤的关系：一个多重序列中介模型

王泓懿 张珊珊（通讯作者） 崔爱琳
沈阳师范大学教育科学学院，沈阳，110034，E-mail:zhangxiaobai2@163.com

摘 要 非自杀性自伤是指在无自杀意图下，个体故意地、重复地对自己身体实施直接伤害的行为，且不

被社会接纳与认可的行为。目前，非自杀性自伤已成为威胁青少年身心健康的重要公共卫生问题，引发了社会各界的广泛关注。家庭是青少年成长的重要环境，父母关系质量可以直接影响青少年身心发展，相比于直接作用于青少年发展的家庭因素，间接作用在青少年成长中的家庭变量对其伤害性可能更大。从累积风险角度看，目睹家庭暴力可能会加大个体罹患抑郁的风险，个体对目睹家庭暴力的认知评价对其发展具有重要影响。因此，本研究拟探究目睹家庭暴力对青少年非自杀性自伤的影响，同时引入累赘感知、归属受挫和抑郁三个重要的心理变量，进一步探讨目睹家庭暴力对非自杀性自伤的作用机制，以期为青少年非自杀性自伤的防范与干预工作提供实践性指导。为考察归属受挫、累赘感知和抑郁在目睹家庭暴力与非自杀性自伤关系间的多重序列中介效应。采用儿童暴露家庭暴力量表、青少年自我伤害问卷、人际需求问卷、流调中心抑郁量表对 583 名高中生进行调查。结果显示：（1）高中生非自杀性自伤行为检出率为 32.4%；（2）目睹家庭暴力分别与归属受挫、累赘感知、抑郁和非自杀性自伤呈显著正相关；（3）目睹家庭暴力显著正向预测非自杀性自伤；（4）归属受挫、累赘感知和抑郁在目睹家庭暴力对非自杀性自伤的作用中起多重序列中介效应，即目睹家庭暴力分别通过累赘感知、抑郁、累赘感知→抑郁和归属受挫→抑郁对非自杀性自伤起到显著间接作用（中介效应值分别为 0.045，0.018，0.018，0.015；*Ps*<0.001）。因此，归属受挫、累赘感知和抑郁在目睹家庭暴力与非自杀性自伤关系间起多重序列中介作用。
关键词　目睹家庭暴力，非自杀性自伤，归属受挫，累赘感知，抑郁

The relationship between witnessing domestic violence and non-suicidal self-injury: A multiple serial mediation model

Hongyi Wang, Shanshan Zhang, Ailin Cui
College of Education Science, Shenyang Normal University, Shenyang

Abstract：Non-suicidal self-injury refers to the behavior that an individual intentionally and repeatedly inflicts direct harm on his own body without suicidal intention, which is not accepted and approved by the society. At present, non-suicidal self-injury has become an important public health problem threatening the physical and mental health of adolescents, which has aroused widespread concern in the community. Family is an important environment for the growth of adolescents, and the quality of parent relationship can directly affect the physical and mental development of adolescents, as compared with the family factors that directly affect the development of adolescents, the indirect effect of family variables on the growth of adolescents may be more harmful. From the perspective of cumulative risk, witnessing domestic violence may increase an individual's risk of depression, and an individual's cognitive evaluation of witnessing domestic violence has an important impact on their development. Therefore, this study aims to explore the impact of witnessing domestic violence on adolescents'; non-suicidal self-injury, and to introduce three important psychological variables: perceived redundancy, attribution frustration and depression, to further explore the mechanism of witnessing domestic violence on non-suicidal self-injury, in order to provide practical guidance for the prevention and intervention of non-suicidal self-injury in adolescents. To examine the multiple serial mediating effects of thwarted belongingness, perceived burdensomeness, and depression between witnessing domestic violence and non-suicidal self-injury. A total of 583 senior high school students completed four questionnaire surveys. The results showed: (1) The rate of occurrence in non-suicidal self-injury was 32.4% among senior high school students. (2) Witnessing domestic violence was positively associated with thwarted belongingness, perceived burdensomeness, depression and non-suicidal self-injury respectively. (3) Witnessing domestic violence positively predicted non-suicidal self-injury (β=0.17, P<0.001). (4) Thwarted belongingness, perceived burdensomeness and depression played multiple serial mediating effects in the influence of witnessing domestic violence on non-suicidal self-injury. For instance, witnessing domestic violence

played indirect effects on non-suicidal self-injury through the paths of perceived burdensomeness, depression, perceived burdensomeness→depression, and thwarted belongingness→depression, respectively (mediation effect value=0.045, 0.018, 0.018, 0.015; *Ps*<0.001). Therefore, thwartedbelongingness, perceived burdensomeness and depression play multiple sequential mediatingroles in the relationship between witnessing domestic violence and non-suicidal self-injury.

Keywords ： witnessing domestic violence, non-suicidal self-injury, thwarted belongingness, perceived burdensomeness, depression

孤独症谱系障碍与正常发展个体的反语理解差异：一项三水平元分析

庞志强　郑婉瑜　肖泽宇　马伟娜（通讯作者）

杭州师范大学经亨颐教育学院心理学系，杭州，311121，通讯作者 E-mail：mwn505@hznu.edu.cn

摘 要　反语是社会交际中普遍存在的一部分，在这种语言表达中，讲话者的言辞表达与其潜在意图相反。尽管有大量研究报告了孤独症谱系障碍(Autism Spectrum Disorder, ASD)个体在理解反语方面存在严重困难，但也有研究者表示 ASD 个体与正常发展(Typically Developing, TD)个体在理解反语的准确性方面没有显著差异。本研究首次采用三水平元分析技术整合相关实证研究，检验 ASD 与 TD 个体的反语理解能力差异以及影响研究间结果的潜在调节变量。通过文献检索和筛选，纳入 29 篇文献，57 个效应量，共计 845 名 ASD 参与者与 876 名 TD 参与者。主效应检验发现，ASD 个体对反语的理解能力落后于 TD 个体(Hedge's g = -0.55)。元回归分析表明，文化背景和匹配策略的调节效应显著，而年龄、语言类型、任务属性(例如，呈现形式、反语线索、问题类型、回答形式)等变量的调节效应不显著。本研究使用三水平元分析方法提升了纳入文献信息的完整性，从而就 ASD 与 TD 个体的反语理解能力差异及调节变量的作用得出更为全面可靠的结论。然而，由于纳入研究数量的限制，调节变量各亚组的效应量数量不平衡，也无法对一些重要的认知因素(如心理理论、执行功能)进行分析。这提示需要更多的实证研究深入探讨跨文化差异、匹配策略、任务属性以及认知因素对于 ASD 个体反语理解的影响。

Differences in Irony Comprehension between Individuals with Autism Spectrum Disorder and Typically Developing Individuals: A Three-Level Meta-Analysis

PANG Zhiqiang, ZHENG Wanyu, XIAO Zeyu, MA Weina

Department of Psychology, Jing Hengyi School of Education, Hangzhou Normal University, Hangzhou 311121, China

Abstract：Irony is a common component of social interaction, where the speaker's verbal expression in this form of language contradicts their underlying intent. Despite numerous studies reporting significant difficulties in understanding irony in individuals with autism spectrum disorder (ASD), some researchers have suggested that individuals with ASD do not show significant differences in accuracy in understanding irony compared to typically developing (TD) individuals. This study, for the first time, employs a three-level meta-analysis method to integrate relevant empirical research, examining differences in irony comprehension between individuals with ASD and TD

individuals, as well as potential moderating variables influencing the results across studies. Through literature search and screening, 29 articles with a total of 57 effect sizes were included, comprising 845 participants with ASD and 876 TD participants. The main effect analysis revealed that individuals with ASD lag behind TD individuals in their ability to comprehend irony (Hedge's g = -0.55). Meta-regression analysis indicated significant moderating effects of cultural background and matching strategy, while the moderating effects of variables such as age, language type, and task properties (e.g., presentation format, irony cues, question type, response format) were not significant. This study enhances the comprehensiveness of the included literature by employing a three-level meta-analysis approach, leading to more reliable conclusions regarding the differences in irony comprehension between individuals with ASD and TD individuals, as well as the role of moderating variables. However, due to the limitation in the number of included studies, there is an imbalance in the number of effect sizes across subgroups of moderating variables. Additionally, it was not possible to analyze important cognitive factors such as theory of mind and executive functions. These findings highlight the need for further empirical research to delve into the impact of cross-cultural differences, matching strategies, task properties, and cognitive factors on irony comprehension in individuals with ASD.

摘 要 学生学习投入是促进学业成就的重要影响指标，高投入水平的学生通常会表现出种种有利于学习的特征，并取得更好的学业成绩。成就动机是影响学习投入的重要近端因素，能直接预测学生学习投入水平。动机与投入之轮(Motivation and Engagement Wheel) 是学习投入运用最广泛的理论模型之一。基于该理论和 Dweck 成就目标定向理论，本研究探究学业倦怠在不同目标定向和学习投入之间的作用，以明确不同学成就目标定向对学习投入的影响。采用成就目标定向量表、学业倦怠量表、学习投入量表，随机抽取 401 名在校大学生进行施测，使用 Mplus 8.0 进行数据分析。结果显示：①大学生学习投入、学业倦怠、目标定向均不存在性别、年级的显著差异（ps<0.01）。②表现目标、掌握目标均可显著正向预测学习投入（β=0.111、0.313，ps<0.05），显著负向预测学业倦怠（β=-0.162、-0.382，ps<0.01），学业倦怠显著负向预测学习投入（β=-0.637、-0.607，ps<0.001）。③加入学业倦怠这一中介变量后，表现目标对学习投入的直接正向预测作用不显著（β=0.008，p>0.05），中介效应为 0.103，Bootstrap95%置信区间为[0.040,0.172]，不包括 0，中介效应占比为(0.103/0.111)*100%=92.90%；掌握目标对学习投入直接正向预测作用不显著（β=0.081，p>0.05），中介效应为 0.232，Bootstrap95%置信区间为 [0.170,0.303]，不包括 0，中介效应占比为（0.232/0.313）*100%=74.10%。说明学业倦怠在表现目标、掌握目标与学习投入的关系中均发挥中介作用。基于结果可知，相比于掌握目标与学习投入，学业倦怠在表现目标与学习投入之间发挥的中介作用更强。说明持表现目标学习动机的大学生的学习投入更容易受到学业倦怠的影响。本研究引入学业倦怠这一中介变量，揭示了其在不同目标定向和学习投入之间的不同影响效果，一方面启提示教育者不仅要重视大学生掌握目标的培养，同时也不应忽视表现目标对学习投入的促进作用。另一方面也从掌握目标培养的角度，为减弱学业倦怠对大学生学习投入的影响提供了新的思路和方法。

The Effect of Goal Orientation on College Students' Academic Engagement: the Mediating Role of Academic Burnout

Liu Yiwen Sun Wenmei (Corresponding author)
School of Psychology, Department of Education, Henan Normal University, Xinxiang, Henan, 453007, China E-mail:sunwenmei328@163.com

Abstract: Student engagement in learning is an important influential indicator for academic achievement, and students with high levels of engagement typically exhibit a variety of characteristics that are conducive to learning and achieve better academic performance. Motivation for achievement is an important proximal factor influencing engagement in learning and is a direct predictor of student engagement levels. The Motivation and Engagement Wheel is one of the most widely used theoretical models of learning engagement. Based on this theory and Dweck's achievement goal orientation theory, this study investigated the role of academic burnout in the relationship between different goal orientations and learning engagement to clarify the effects of different student achievement goal orientations on learning engagement. The Achievement Goal Orientation Scale, Academic Burnout Scale, and Learning Engagement Scale were administered to a random sample of 401 college students, and data were analyzed using Mplus 8.0. The results showed that (1) there were no significant differences between gender and grade (ps<0.01) in academic engagement, academic burnout, and goal orientation among college students. (ii) Performance goals and mastery goals were significant positive predictors of academic engagement (β=0.111, 0.313, ps<0.05), significant negative predictors of academic burnout (β=-0.162, -0.382, ps<0.01), and academic burnout was a significant negative predictor of academic engagement (β=-0.637, -0.607, ps<0.001). (iii) After adding academic burnout as a mediating variable, the direct positive predictive effect of performance goal on learning engagement was not significant (β=0.008, p>0.05), the mediating effect was 0.103, Bootstrap 95% confidence interval was [0.040,0.172], excluding 0, and the mediating effect accounted for (0.103/0.111)*100%= 92.90%; the direct positive predictive effect of mastery goal on learning engagement was not significant (β=0.081, p>0.05), the mediating effect was 0.232, Bootstrap 95% confidence interval was [0.170,0.303], excluding 0, and the mediating effect share was (0.232/0.313)*100%=74.10%. This indicates that academic burnout plays a mediating role in the relationship between performance goals, mastery goals, and learning engagement. Based on the results, it is clear that academic burnout plays a stronger mediating role between performance goals and learning engagement than mastery goals and learning engagement. This indicates that the learning engagement of college students who are motivated by performance goals is more likely to be influenced by academic burnout. On the one hand, this study introduces the mediating variable of academic burnout to reveal its different effects between different goal orientations and learning engagement, and on the other hand, it suggests that educators should not only pay attention to the cultivation of mastery goals, but also should not neglect the role of performance goals in promoting learning engagement. On the other hand, it also provides new ideas and methods to reduce the influence of academic burnout on college students' learning engagement from the perspective of mastery goal cultivation.

Keywords: performance goals, mastery goals, academic burnout, learning engagement

3-6 岁农村幼儿动作发展与情绪识别的关系：工作记忆的中介作用

李玲源，姚雪，王明辉

摘 要　习近平总书记在二十大报告中提出，增进民生福祉，提高人民生活品质。要推进健康中国建设，把保障人民健康放在优先发展的战略位置，完善人民健康促进政策。随着乡村振兴战略的实施，在建设健康中国的过程中，尤其是农村幼儿的健康是不可忽视的，他们的健康成长是健康中国的重要部分。目的：探讨 3-6 岁农村幼儿动作发展与情绪识别的关系，以及工作记忆的中介作用。方法：采用方便取样，选取

河南省某乡村幼儿园 3～6 岁幼儿 187 名（男 109 名，女 78 名），采用大肌肉动作发展测试第二版（TGMD-2）、Beads 任务、情绪识别测验（TER）来测试动作发展、工作记忆和情绪识别。结果：幼儿各变量发展在年龄上均存在显著差异，年龄越大，各方面发展越好(P 均 < 0.001)；动作发展与工作记忆和情绪识别两两之间均呈显著正相关（r =0.35～0.42，均 $P < 0.01$）；动作发展显著正向预测工作记忆(β=0.42，$P < 0.001$)，工作记忆显著正向预测情绪识别（β=0.29，$P < 0.001$）。动作发展对情绪识别直接正向预测作用依然显著（β=0.22，$P < 0.01$）。直接效应（0.22）和中介效应（0.12）分别占总效应（0.34）的比例为 64.71%和 35.29%。结论：农村幼儿动作发展不仅能够直接促进情绪识别，也能够通过工作记忆的中介作用间接促进情绪识别。

The relationship between motor development and emotion recognition of 3-6 year rural children: the mediating role of working memory

Abstract: President Xi Jinping put forward in the Report to the 20th CPC National Congress that improving people's livelihood and improving people's quality of life. It is necessary to promote the construction of a healthy China, give priority to the protection of people's health, and improve people's health promotion policies. With the implementation of rural revitalization strategy, in the process of building a healthy China, especially the health of rural children can not be ignored, and their healthy growth is an important part of a healthy China. Objective: To explore the relationship between motor development and emotion recognition of rural children aged 3-6, and the mediating role of working memory. Methods: Adopt convenient sampling, 187 children (109 boys and 78 girls) aged 3-6 years in a rural kindergarten in Henan Province were selected, and the motor development, working memory and emotion recognition were tested by the second version of the big muscle motor development test (TGMD-2), Beads task and emotion recognition test (TER). Results: There were significant differences in the development of children's variables in age, and the older they were, the better they developed in all aspects ($P < 0.001$). There was a significant positive correlation between motor development and working memory and emotion recognition (r =0.35～0.42, all $P < 0.01$). Motor development significantly positively predicted working memory (β=0.42, $P < 0.001$), and working memory significantly positively predicted emotion recognition (β=0.29, $P < 0.001$). The direct and positive predictive effect of motor development on emotion recognition is still significant (β=0.22, $P < 0.01$). The direct effect (0.22) and the mediating effect (0.12) account for 64.71% and 35.29% of the total effect (0.34) respectively. Conclusion: Rural children's motor development can not only directly promote emotional recognition, but also indirectly promote emotional recognition through the mediating role of working memory.

***Abstract*:** Parental care including offspring feeding and care is essential for survival and mental and physical development. Direct paternal care is central to most human societies with varying degrees of engagement in affiliative behaviors exhibited by fathers (i.e. carrying or grooming) which are partly distinct from those of mothers. Moreover, mothers and fathers have evolved differential roles with for example the majority of communicative interactions between infants and mothers tending to lower arousal activity including mutual gazing, co-vocalizations and affectionate touch while interactions between fathers and infants, such as play, tend to increase arousal. Meanwhile, neural synchronicity occurs between mothers and fathers and their children during these social interactions but it is unclear whether they differ in this respect.

In the current study, we used data from a publically available fNIRS-based hyperscanning dataset with 33 mother-child and 29 father-child dyads to examine the inter-subject synchronization (ISS) differences in mothers and fathers and their children during passive co-viewing of 3-min children's program videos and 10-min free-play activities. Both the video complexity of the videos and the behavioral and emotional interactions of the dyads during free-play were micro-coded. In addition, all parents were administered the Parenting Stress Index-Short Form to assess the parents' perceived parenting stress. We employed a phase-locked values and K-means algorithm respectively to evaluate the dynamic synchronization strength and identify specific patterns of ISS across different regions during passive or active interaction tasks. Changes specific to parent-child dyads were established by contrasting them with randomized pairs of parents and children using a K-space-based permutation test that relies on the K-means and K-Nearest Neighbor algorithm.

We found that, during passive viewing of videos, mothers showed greater synchrony with their children than fathers in an ISS pattern involving the aPFC and IFG and synchronization was positively associated with video complexity and negatively associated with parental stress. During play interactions, mothers showed more controlling behaviors over their child and greater evidence for joint gaze and joint imitation play with their children whereas fathers were less controlling and more sensitive but spent more time gazing at other things. While no parental gender differences were observed in the strength of synchronization patterns during the free-play sessions, the proportion of one involving the left SFG, MFG and IFG was only positively correlated in mothers with their level of child involvement. Interestingly, patterns of neural synchrony showed a high degree of overlap between passive and active interaction contexts. Furthermore, while mother-child dyads showed greater synchronization in an ISS pattern mainly involving the SFG when the child smiled, in father-child dyads it did so in another pattern involving the SFG and right MFG and IFG when the child verbalized. Notably, the synchronization strength in an ISS pattern associated with the child smiling was negatively associated with the level of how difficult the child was perceived to be.

Together, these findings provide evidence for greater neural synchrony between young children and their

mothers, relative to random mother-child pairings, during shared passive activities in some regions of the frontal cortex and greater joint attention during play interactions, although strength of synchrony was weakened by levels of parental distress and perceived child difficulty. Additionally, different aspects of child communication may promote neural synchrony between mothers and fathers and their children during active play interactions.

中小学生亲社会行为与心理适应问题的关系：同伴偏好与社交自我知觉的链式中介作用

李明欣[1]　金国敏[2]　任童颜[1]　阿尔升·海达别克[1]　陈凌隽[3]　丁雪辰[1]（通讯作者）
1 上海师范大学心理学系，上海，200234，通讯作者邮箱：dingxuechen_psy@163.com

3 上海交通大学教育学院，上海，200240

摘 要　亲社会行为是个体在社会交往中有利于他人和社会的自愿行为或倾向，虽然已有大量研究发现亲社会行为与个体心理适应问题之间呈负相关，但其中的潜在中间过程机制尚不明确。社交自我知觉是个体对自己社交状况的主观评价，同伴偏好是个体被同伴群体喜欢的程度，在以往研究中都是作为测量同伴地位的重要指标，本研究旨在探讨其在亲社会行为与心理适应问题中的中介作用。本研究对上海市某小学和中学的 951 名 3~7 年级的学生（*M*age =11 岁）采用同伴提名的方法收集了其亲社会行为和同伴偏好水平，运用自我报告方法收集了社交自我知觉以及心理适应问题指标（即孤独感和抑郁感）的水平。结果表明：（1）在中小学生群体中，亲社会行为与同伴偏好和社交自我知觉呈正相关，但与孤独感和抑郁感负相关；同伴偏好和社交自我知觉也与孤独感和抑郁感呈负相关；（2）在控制了性别和年龄后，同伴偏好和社交自我知觉在中小学生的亲社会行为和心理适应问题之间构成链式中介作用，即中小学生所表现出的亲社会行为使他们更受欢迎，拥有更高水平的同伴偏好，而这种高同伴偏好又能提高中小学生的社交自我知觉，进而减少他们的抑郁感和孤独感。因此，本研究揭示了中国文化背景下亲社会行为与中小学生心理适应问题之间的潜在中间机制，为理解中小学生群体的亲社会行为的适应功能提供了新的思考，并为预防和干预中小学生的心理适应问题提供了相应的理论参考。

Relations between Prosociality and Psychological Maladjustment in Chinese Elementary and Secondary School Students: Mediating Roles of Peer Preference and Self-PerceivedSocial Competence

3 School of Education, Shanghai Jiao Tong University, Shanghai 200240, China

Abstract： Prosociality refers to one's tendency to act in a manner that benefits others, and it manifests in many ways, such as caring, sharing, and helping, which have been proven to be negatively linked with psychological maladjustment. However, the mechanisms that might help to explain the association between prosociality and psychological maladjustment are not well understood. Peer preference means being well-liked and preferred by peers; Self-perceived social competence refers to one's subjective perceptions of competence or adequacy in the social domain of functioning. Previous findings have proved that both of peer preference and self-perceived social competence are relevant with students' prosociality and psychological maladjustment. Therefore, the goal of the present study was to examine the mediating effects of peer preference and self-perceived social competence on the associations between prosociality and psychological maladjustment (i.e., depressive symptoms and loneliness). Participants were 951 students (Mage = 11 years, 442 girls) in Grades 3~7 from Shanghai, China. They completed peer nominations of prosociality and peer preference and self-report measures of self-perceived social competence, depressive symptoms, and loneliness. Multiple mediation analyses revealed that: (1) prosociality is directly and negatively related to loneliness and depressive symptoms but positively related to peer preference and self-perceived social competence, while peer preference and self-perceived social competence related to loneliness and depressive symptoms negatively; (2) Prosociality is linked with psychological maladjustment through its negative associations with peer preference and self-perceived social competence in a serial way. That is, prosociality may be related to greater levels of peer preference, which in turn may be associated with higher levels of self-perceived social competence. Higher self-perceived social competence would then be related to decreased psychological maladjustment (i.e., depressive symptoms and loneliness) among students of elementary and secondary school in Chinese culture. The findings of this study point to potential targets in the prevention and intervention of Chinese students' internalization of problems.

4 至 10 岁儿童对学业进步和退步的理解与评价

胡颖[1] 舒宇航[2] 赵欣[1]（通讯作者）

1 华东师范大学教育心理学系，上海，200062，xzhao@dep.ecnu.edu.cn

2 弗吉尼亚大学心理学院,美国弗吉尼亚州夏洛茨维尔，22903

摘 要 当评价他人的学业表现时，我们不只关注某一次的表现，也会关注一段时间内表现的变化，比如进步或退步。以往研究发现，儿童会对他人的学业成就进行评价，但尚未有研究探究儿童如何看待一段时间内的表现的变化，因而本研究探究儿童对一段时间内学业表现变化的理解、推测和评价。在研究一中（102 名 4~10 岁儿童和 92 名成人），我们给被试呈现两位故事人物在一学期内的两次考试的表现，其中一位故事人物在两次考试中均获得 4 张贴纸（即，不变者），另一位故事人物则在第一次考试获得 3 张贴纸，第二次考试获得 4 张贴纸（即，进步者）。接着，我们让被试推测两位故事人物谁更聪明，谁更努力，并且进行评价（如，奖励给谁？你更喜欢谁？谁以后会更成功？）。结果发现，4~9 岁的儿童均推测不变者更加聪明（$t(100) = -7.578$, $p < 0.001$），但年龄较小的儿童认为不变者也更加努力，而年龄更大的儿童及成人则认为进步者更努力（$r = 0.397, p < 0.001$）。此外，儿童的评价也随年龄变化，年龄更大的儿童对进步者评价更高（$r = 0.635, p < 0.001$）。研究二（103 名 4~9 岁儿童和 106 名成人）采用与研究一基本一致的方法，并探究变化方向（即，进步或退步，被试内变量）的影响。结果发现，儿童和成人对成绩变化者的偏好均受变化方向的影响。具体表现为，当比较成绩进步者与不变者时，年龄较小的儿童更加偏好不变者，年龄更大的儿童及成人则更加偏好进步者（$r = 0.470, p < 0.001$）；当比较成绩退步者与不变者时，年龄较小的儿童更加偏好退步者，年龄更大的儿童及成人则更偏好不变者（$r = -0.387, p < 0.001$）。研究三（51

名 4~6 岁儿童）进一步探究，最后一次考试中，进步者成绩与不变者成绩的比较情况是否会影响学龄前儿童的评价。结果发现，当进步者最后一次考试的表现与不变者相同时，4~6 岁儿童的评价稍微倾向于不变者（$t(49) = -1.801$, $p = 0.078$）；但当进步者最后表现超过不变者时，4~6 岁儿童则明显对进步者评价更高（$t(48) = 2.830$, $p = 0.007$）。综上所述，随着年龄的增长，儿童对进步和退步的理解越来越成熟，并且他们对于学业变化的理解和评价会灵活考虑到变化方向及最终表现等因素。本研究对了解儿童是如何理解学业变化，从而引导儿童理性对待进步或者退步有重要意义。

***Abstract*:** When evaluating others' academic performance, we not only focus on how one performs at one time, we also consider changes in performance over time (e.g., increase or decrease in performance). Previous studies have found that children can reason about evaluate about others' academic achievements, but there has been no investigation on how children reason and evaluate changes in academic performance over a period of time. In the current study, we investigated children's inferences and evaluations of changes in academic performance over time. In Study 1, 102 children aged 4-10 and 92 adults were presented with two story characters and their performances in two exams over one semester. One of the characters got 3 stickers in the first exam and 4 stickers in the second exam (i.e.,the increasing character). The other character got 4 stickers in both exams (i.e., the constant character). Participants were then asked about their inferences of the two characters (i.e., "Who is smarter?", "Who is more hardworking?"), and the comparative evaluations of the two characters (i.e.,"Who would you award a prize to ?", "Who do you prefer?", "Who will be more successful in the future?"). The results showed that children aged 4 to 9 all inferred the constant character as smarter ($t(100) = -7.578$, $p < 0.001$). Younger children also inferred the constant character as more hardworking, while older children and adults inferred the increasing character as more hardworking ($r = 0.397$, $p < 0.001$). In addition, with age, children tended to evaluate the increasing character more favorably than the constant character ($r = 0.635$, $p < 0.001$). Study 2 (103 children aged 4 to 9 years and 106 adults) employed similar method as Study 1, and further examined the effect of direction of change (i.e., increasing or decreasing, within-subject). The results showed that children's and adults' preference for the changed character was influenced by the direction of change. Specifically, when comparing the increasing character with the constant one, with age, children tended to favor the increasing character ($r = 0.470$, $p < 0.001$). However, when comparing the decreasing character with the constant one, with age, children tended to favor the constant character ($r = -0.387$, $p < 0.001$). Study 3 (51 children aged 4-6 years) further investigated whether the comparative performance in the last exam influenced preschoolers' evaluations. The results showed that when the increasing character's performance on the last exam was the same as that of the constant character, children aged 4 to 6 evaluated the constant character more favorably ($t(49) = -1.801$, $p = 0.078$). However, when the increasing character outperformed the constant in the last exam, children aged 4 to 6 instead evaluated the improved character more favorably ($t(48) = 2.830$, $p = 0.007$). In summary, with age, children's understanding and evaluation of changes in performance over time gradually develop, and they gradually flexibly take into account factors such as the

direction of change and comparative final performance. This research is of great significance to our knowledge of how children understand changes in performance and guide children to rationally evaluate these changes.

1 南通大学教育科学学院，江苏南通， 226001

2 南通大学教育科学学院；江苏南通， 226001，E-mail:444617269@qq.com

摘 要　现教育过程中学业拖延越来越广泛流行，其普遍存在于个体或群体的学生之间。学业拖延是指在既定学习任务的基础上，按照要求完成所需要的学业任务过程中，出现的学业拖延现象，且伴随着不愉快的主观体验。对于广大学生来说，学业拖延情况的改善有助于其学业成就的提高，促进学生个体心理健康的发展。此外，学业拖延情况的改善有助于教师管理和提高教育水平，对于教育事业的长期发展有着不可忽视的作用。学业拖延受多种因素的影响，是个体主观的选择，一般有内心冲突的表现，往往会导致不良的结果。现有国内外研究提出了许多关于学习拖延概念的解释，同时制定了多种度量学习拖延的工具，提出了多种解释学习拖延原因的理论。文章对于现有研究对学业拖延含义的界定进行了简单的归纳；从一个新的视角去讨论分析了学业拖延的产生原因以及各因素对学业拖延的影响。从人格特质理论、本能论或自我防御理论、强化说、时间折扣与期望价值理论来分析学业拖延的产生原因。任务性质、人格特质、完美主义与自我阻碍、动机都会在一定程度上对学业拖延造成影响。内部因素和外部环境，都会导致学业拖延的产生，同时不同的内部和外部环境对学业拖延的影响不同。最后，本文提出了现有研究中的一些不足之处，并基于这些不足之处，对未来的研究方向进行了展望。

Research progress of the cause and factors of academic delays

WenCheng[1]　　ZhangPengchneg[2]（Communication Author）

1 School of Education and Science, Nantong University, Nantong, Jiangsu, 226001

2 School of Education and Science, Nantong University; Nantong, Jiangsu, 226001, e-mail: 444617269@qq.com

Abstract：The current education process is becoming more and more widely popular, and it is generally existing between individual or group students. Academic delay refers to the academic delay phenomenon that appears in the process of completing the academic tasks required in accordance with the required academic task, accompanied by unpleasant subjective experience. For the majority of students, the improvement of academic delay will help improve their academic achievements and promote the development of individual mental health of students. In addition, the improvement of academic delays can help teachers' management and improve education level, which has a role in the long -term development of education. Academic delays are affected by various factors. They are individual subjective choices. Generally, they have inner conflict and often lead to bad results. There are many explanations on learning delayed concepts, at the same time, it has developed a variety of measures for learning delay, and a variety of interpretation of the theory of learning delay is proposed. The article simply summarizes the definition of academic delay in the existing research; discussed and analyzed the cause of academic delay from a new perspective and the impact of various factors on academic delay. The cause of

academic delay is analyzed from personality theory, instinctive theory or self -defense theory, strengthening theory, time discounts and expectations of value. Mission nature, personality characteristics, perfectionism and self -obstruction, and motivation will affect academic delay to a certain extent. Internal factors and external environments will lead to the emergence of academic delays. At the same time, different internal and external environments have different impact on academic delay. Finally, this article proposes some of the shortcomings in the existing research, and based on these shortcomings, the future research direction is outlook.

后新冠疫情时代大学生大五人格与焦虑情绪的关系研究

温丞[1]　　张鹏程[2]（通讯作者）
1 南通大学教育科学学院，江苏南通，　226001
2 南通大学教育科学学院；江苏南通，　226001，E-mail:444617269@qq.com

摘 要　2020 年初，新冠病毒肺炎疫情在全球爆发,疫情防控常态化措施在 2022 年被执行，新冠疫情给全球各地人民的生活带来了不同程度的影响，其中个体的心理健康受到的危害尤其严重。其主要外显的表现为焦虑、抑郁等情绪的增加。个体身心健康是人民全面发展的目标，面对这种个体身心健康危机，在后新冠疫情时代，为揭示后新冠疫情时代大学生大五人格与焦虑情绪的关系，通过有效的利用人格去预测被试的焦虑情绪，在这项研究的基础上从而为后续更深入的大学生身心健康研究做铺垫。研究对高校大学生使用大五人格量表 BFI 与新冠肺炎相关焦虑量表进行网络线上问卷调查，使用 SPSS 对影响因子进行独立性 t 检验、相关性检验以及线性回归分析，探讨二者之间的相关关系。在大背景后新冠疫情时代，本研究中大学生经历新冠肺炎后相关焦虑处于轻度焦虑，在人口学特征中，女性大学生在经历新冠疫情后焦虑情绪高于男性大学生，较男性大学生受到更多影响。人格特质对焦虑情绪具有直接的预测作用，大五人格五个维度与后新冠疫情焦虑情绪呈现相关关系且相关性不同，神经质与后新冠疫情焦虑情绪呈现显著正向相关，宜人性、责任心与后新冠疫情焦虑情绪呈现显著负相关。经历新型冠状肺炎疫情后，高校应在现阶段新冠疫情防控工作中，对女性大学生、神经质的大学生给予更多关注。
关键词　神经质,新冠疫情,大五人格,焦虑情绪

Research on the relationship between the five personality and anxiety of college students in the era of the Post- COVID-19 epidemic

WenCheng[1]　　ZhangPengchneg[2]（Communication Author）
1 School of Education and Science, Nantong University, Nantong, Jiangsu, 226001
2 School of Education and Science, Nantong University; Nantong, Jiangsu, 226001, e-mail: 444617269@qq.com

Abstract：At the beginning of 2020, the new coronary virus pneumonia epidemic broke out around the world, and the normalization measures for the prevention and control of the epidemic were implemented in 2022. The COVID-19 epidemic has a varying degree of impact on the lives of people around the world. Among them, the harm of individual mental health is particularly serious. The main manifestations are the increase in emotions such as anxiety and depression. Individual physical and mental health is the goal of the people's comprehensive development. Facing this kind of personal and mental health crisis in individuals, in the post -COVID-19 epidemic era, in order to reveal the relationship between the five personality and anxiety emotions of college students in the

Post- COVID-19 epidemic era, it is effectively using personalities to predict the trial. Anxiety, on the basis of this research, pave the way for subsequent deepening college students' physical and mental health research. Study on college students using large five personality tables BFI and new coronary pneumonia related anxiety tables to conduct network online questionnaire surveys, use SPSS to conduct independent T test, related testing, and linear regression analysis of influencing factors, and explore the two between the two relationship. In the era of the COVID-19 epidemic after the big background, the relevant anxiety is in mild anxiety after experiencing the new crown pneumonia in China. In the characteristics of population, female college students are higher than male college students after experiencing the COVID-19 epidemic. Essence Personal traits have a direct predictive effect. The five dimensions of the five -person personality and the post -COVID-19 epidemic are different and the correlation is different. The neurotic and the post -COVID-19 epidemic anxiety emotion is significantly positive. The COVID-19 epidemic anxiety is significantly negative. After experiencing a new type of coronary pneumonia, colleges and universities should pay more attention to female college students and neurotic college students in the current COVID-19 epidemic prevention and control work.

中小学生病理性互联网使用与学业表现的关系随年龄发展显著变弱

李静[1] 吴欢欢[1] 于晓丹[1]（通讯作者）

1 中国海洋大学教育系，青岛，266100，yuxiaodan@ouc.edu.cn

摘 要　随着信息技术的广泛应用，病理性互联网使用成为全球关注的社会问题，研究者将其定义为一种无法控制互联网使用而导致不良后果的成瘾行为。青少年是受病理性互联网使用影响最大的群体，由于自我控制和自我管理能力尚未成熟，他们更容易被互联网分散时间和精力从而导致较差的学业表现。虽然有研究关注病理性互联网使用与学生学业成绩之间的关系，但很少有研究深入探讨问题性互联网使用与学业成绩之间的关系如何随年龄变化。本研究采用整群随机抽样方法对我国 17208 名四年级学生（M_{age}=9.79±0.44；男生 8898 名）和 11127 名八年级学生（M_{age}=13.65±0.54；男生 5477 名）进行病理性互联网使用和数学成绩的数据收集，以探析病理性互联网使用发生率的年级差异以及病理性互联网使用与学业表现相关性的随龄变化规律。结果表明：（1）四年级病理性互联网使用发生率为 9.50%，其中男生 1359 名，女生 605 名；八年级发生率 6.60%，其中男生 482 名，女生 247 名。小学成瘾比例高于初中，男生比例高于女生。（2）病理性互联网使用与数学成绩之间存在显著的负相关关系，其中强迫性冲浪和负面后果维度与四年级、八年级学生的数学成绩呈显著负相关。（3）年级上，八年级学生病理性互联网使用与数学成绩的相关性在两个维度上都明显低于四年级；性别上，八年级女生的相关性明显低于男生。（4）多因素方差分析结果显示，年级和性别对强迫性冲浪维度具有显著的交互效应，但对负面后果维度没有影响；年级和性别对强迫性冲浪与数学表现之间的关系以及负面后果与数学表现之间的关系存在显著的交互效应。本研究对不同年龄病理性互联网使用的发生率进行比较，进一步探析病理性互联网使用与数学成绩之间负相关的随龄变化情况，可从教育环境变化角度为提高病理性互联网使用学生的学习成绩提供思路。

The Relationship between Pathological Internet Use and Academic Performance in Primary and Secondary Schools Weakens Significantly with Age

Li Jing[1], Wu Huanhuan[1], Yu Xiaodan[1] (Corresponding Author)
1 Department of Education, Ocean University of China, Qingdao 266100,
yuxiaodan@ouc.edu.cn

Abstract： With the wide application of information technology, pathological Internet use has become a social problem of global concern. Researchers define pathological Internet use as an addictive behavior that can not control Internet use and lead to adverse consequences. Teenagers are the group most affected by pathological Internet use. As their self-control and self-management abilities are not yet mature, they are more likely to be distracted by the Internet, which will lead to poor academic performance. While research has focused on the relationship between pathological Internet use and student academic achievement, few studies have delved into how the relationship between problematic Internet use and academic achievement changes with age. In this study, cluster random sampling was applied to 17208 fourth grade students in China (Mage=9.79±0.44; 8898 boys) and 11127 eighth graders (Mage=13.65±0.54; 5477 boys) collected the data of pathological Internet use and math performance to explore the grade differences in the incidence of pathological Internet use and the age-related changes of the correlation between pathological Internet use and academic performance. The results showed that: (1) The incidence of pathological Internet use was 9.50% in the fourth grade, including 1359 boys and 605 girls; In grade 8, the incidence was 6.60%, with 482 boys and 247 girls. The proportion of addiction in primary school is higher than that in junior middle school, and the proportion of boys is higher than that of girls. (2) There was a significant negative correlation between pathological Internet use and math achievement, in which compulsive surfing and negative consequences were significantly negatively correlated with fourth and eighth grade students' math achievement. (3) In grade, the correlation between pathological Internet use and math achievement of eighth graders was significantly lower than that of fourth graders in both dimensions; In terms of gender, the correlation was significantly lower for eighth grade girls than for boys. (4) The results of multivariate analysis of variance showed that grade and gender had significant interaction effects on the compulsive surfing dimension, but had no effect on the negative consequences dimension; Grade and gender had significant interactive effects on the relationship between compulsive surfing and math performance, and on the relationship between negative consequences and math performance. This study compared the incidence of pathological Internet use at different ages, and further explored the age-related negative correlation between pathological Internet use and math performance, which could provide ideas for improving the academic performance of students with pathological Internet use from the perspective of changes in educational environment.

摘 要　**目的：**“善意的谎言”即白色谎言是儿童、青少年社会交往与个人发展过程中的一个重要内容。本文从整合的视角出发，探讨青春期学生在真实的学业水平的“基准”之上，在施予和接受学业评价反馈的过程中产生了多大程度的偏差(即白色谎言)，并进一步分析在白色谎言的交流与反馈中，是否会因年龄和性别的不同产生差异。**方法：**研究 1 通过模拟学生相互评价场景，从施予角度验证白色谎言的存在与年级差

异。研究 2 通过模拟教师作文批阅任务，从接受角度验证白色谎言的存在与性别差异。研究 3 则探讨了自然条件下学生互评中的白色谎言，从施予和接受两个角度再次印证了研究 1 和研究 2 的结论。**结果：**（1）在各研究条件下平均评分均高于真实情况（t=20.59、t=14.13，P＜0.001）；（2）研究 1、研究 3 显示白色谎言在年级上存在显著差异（F=5.96，p=0.001, η_p^2 = 0.11；F=3.59，P=0.02, η_p^2 = 0.13）；（3）研究 2、研究 3 显示白色谎言在性别上存在一定的显著性（t(61)=-1.77，P=0.08；χ^2 (1, N = 77) = 5.096, P = 0.02, ϕ(Phi) = 0.26）。**结论：**三项研究的结果表明：(1)白色谎言在学业评价反馈中普遍存在；(2)从施予视角看，白色谎言的程度存在年级差异，在五年级即 11 岁左右达到最高；(3)从接受视角看，白色谎言的程度存在着性别差异，女性可能会接受更高程度的白色谎言反馈，而男性接受的反馈则相对更接近真实水平。

***Abstract*：** **Objective:** kind lies, or white lies, are an important part of the social interaction and personal development of children and adolescents. From the perspective of integration, this paper explores to what extent adolescent students have deviations in terms of white lies in the process of giving and receiving academic evaluation feedback based on the "benchmark" of real academic level, and further analyzes whether there are differences in the communication and feedback of white lies due to age and gender**. Methods:** Study 1 verified the existence and grade differences of white lies from the giving perspective by simulating peer evaluation scenarios. Study 2 verified the existence and gender differences of white lies from the receiving perspective by simulating teacher essay grading tasks. Study 3 explored white lies in student peer evaluation under natural conditions, and confirmed the conclusions of Studies 1 and 2 from both giving and receiving perspectives. **Results:** (1) The average scores in all study conditions were higher than the actual situation (t=20.59, t=14.13, P<0.001); (2) Studies 1 and 3 showed significant grade differences in white lies (F=5.96, p=0.001, η_p^2 = 0.11; F=3.59, P=0.02, η_p^2 = 0.13); (3) Studies 2 and 3 showed some significance in gender differences in white lies (t(61)=-1.77，P=0.08；χ^2 (1, N = 77) = 5.096，P = 0．02，ϕ(Phi) = 0．26). **Conclusion:** The results of three studies indicate that: (1) White lies are common in academic evaluation feedback; (2) From the giving perspective, there are grade differences in the degree of white lies, reaching a peak at grade five or around age eleven; (3) From the receiving perspective, there are gender differences in the degree of white lies; females may receive higher levels of white lie feedback while males receive feedback that is closer to reality.

数学知识类型与学生数学焦虑的关系—

—基于结构方程模型的实证研究

吴欢欢[1]　李静[1]　于晓丹[1]（通讯作者）
1 中国海洋大学教育系，青岛，266100，yuxiaodan@ouc.edu.cn

摘 要　数学焦虑是在完成与数学相关任务时紧张焦虑的情绪反应。大量研究表明数学焦虑与数学成绩之间存在显著负相关，个体的数学焦虑水平越高，在不同类型数学任务中的表现就越差。但数学知识的不同类型与学生数学焦虑的关系如何尚未得到证实。数学知识类型包含情境数学、符号数学和言语数学三部分，其中的情境数学指包含数学原理的情境，符号数学是采用特定的数学符号（数字和字母）等对数学原理加以表示，言语数学主要指用自然语言对数学原理进行描述。本研究旨在探讨数学知识的不同类型（三元数学）与学生数学焦虑的关系。研究招募 4496 名四年级学生（男生 2144 名，女生 2352 名）和 4018 名八年级学生（男生 1898 名，女生 2120 名），共 8514 名学生。所有学生均参加了数学焦虑问卷调查和数学成就测验，其中数学成就测验的试题内容划分为言语类、符号类、情境类的问题解决任务。结果发现：（1）四年级数学焦虑高于八年级；四年级女生数学焦虑高于男生，八年级男生数学焦虑高于女生，随年级增长，数学焦虑出现性别转移。（2）数学焦虑与数学成就之间存在显著的负相关，八年级学生数学焦虑与数学成就的负相关关系低于四年级。（3）利用结构方程模型定量分析了符号类、情境类、言语类数学问题解决任务对数学焦虑的影响程度，结果表明，符号类数学问题解决任务与学生数学焦虑的关系相较于言语类和情境类数学问题解决任务更为密切；符号类数学问题解决任务比言语类和情境类数学问题解决任务更容易引发数学焦虑。数学焦虑主要通过符号类数学问题解决任务影响学生数学学业成就，在数学教学过程中，应重视数学内容的呈现形式、教学方法等，尤其是符号类数学问题解决任务，尽量降低数学焦虑的负面影响，帮助其提高学业成就。

The relationship between types of mathematical knowledge and students' mathematical anxiety--An empirical study based on structural equation modelling

Wu Huanhuan [1], Li Jing[1], YU Xiaodan[1] (Corresponding Author)
1 Department of Education, Ocean University of China, Qingdao 266100,
yuxiaodan@ouc.edu.cn

Abstract: Mathematical anxiety is the emotional response of nervousness and anxiety when completing tasks related to mathematics. Numerous studies have shown that there is a significant negative correlation between maths anxiety and maths performance, and that the higher an individual's level of maths anxiety, the worse he or she performs in different types of maths tasks. However, how different types of mathematical knowledge relate to students' mathematical anxiety has not been proven. The types of mathematical knowledge contain three parts: situational mathematics, symbolic mathematics and verbal mathematics, where situational mathematics refers to situations containing mathematical principles, symbolic mathematics is the representation of mathematical principles using specific mathematical symbols (numbers and letters), etc., and verbal mathematics mainly refers to the description of mathematical principles in natural language. The aim of this study was to investigate the relationship between different types of mathematical knowledge (ternary mathematics) and students' mathematical anxiety. The study recruited 4496 fourth grade students (2144 males and 2352 females) and 4018 eighth grade students (1898 males and 2120 females), totalling 8514 students. All students took the Maths Anxiety Questionnaire and the Maths Achievement Test, in which the content of the Maths Achievement Test was divided

into verbal, symbolic, and situational problem-solving tasks. The results found that (1) maths anxiety was higher in grade 4 than in grade 8; girls' maths anxiety was higher than boys' in grade 4, and boys' maths anxiety was higher than girls' in grade 8, and there was a gender shift in maths anxiety as the grades increased. (2) There was a significant negative correlation between maths anxiety and maths achievement, and the negative correlation between maths anxiety and maths achievement was lower for eighth graders than for fourth graders. (3) Structural equation modelling was used to quantitatively analyse the degree of influence of symbolic, contextual and verbal mathematical problem solving tasks on mathematical anxiety, and the results showed that the relationship between symbolic mathematical problem solving tasks and students' mathematical anxiety is closer than that between verbal and contextual mathematical problem solving tasks, and that symbolic mathematical problem solving tasks are more likely to trigger mathematical anxiety than verbal and contextual mathematical problem solving tasks. Anxiety. Mathematics anxiety mainly affects students' academic achievement in mathematics through symbolic mathematical problem solving tasks. In the process of teaching mathematics, attention should be paid to the presentation of mathematical content and teaching methods, especially symbolic mathematical problem solving tasks, to minimise the negative effects of mathematics anxiety and help students improve their academic achievement.

认知技能对学龄期儿童家庭读写环境与阅读能力的中介作用

刘泽琪[1] 刘佳欣[1] 凌嘉[2] 王伊[2] 李京晓[2] 苏萌萌[1]（通讯作者）

1 首都师范大学初等教育学院，北京，100048，sumengmeng@cnu.edu.cn

2 首都师范大学心理学院，北京，100048

摘 要 早期家庭读写环境对儿童阅读能力的发展起着重要作用。家庭读写模型认为，儿童在家庭中接触到的读写活动大致可以分为两类：正式读写活动和非正式读写活动。有学者基于该模型，以拼音文字为母语的学前期儿童为研究对象，发现正式读写活动通过促进儿童的字词解码技能，进而提升儿童的阅读能力；非正式读写活动通过促进儿童的口语理解技能，进而提升儿童的阅读能力。然而，目前尚不清楚以汉语为母语的学龄期儿童家庭读写环境与阅读能力的关系，以及字词解码等认知技能在此之间的中介作用。因此，本研究基于家庭读写模型，以 226 名北京市 1-6 年级儿童 (M 年龄 ＝9.35，SD 年龄 ＝1.73) 为研究对象，探究其家庭读写环境与阅读能力的关系。研究结果表明：(1)字词解码技能 (字词阅读准确性) 在正式读写活动与阅读理解能力之间起完全中介作用 ($p < 0.001$, 95%CI[-33.10, -15.23])。(2)字词解码技能 (字词阅读流畅性) 在正式读写活动与阅读理解能力之间起完全中介作用 ($p < 0.001$, 95%CI[-39.43, -19.34])。(3)口语理解技能 (语素产生) 在非正式读写活动与阅读理解能力之间起完全中介作用 ($p < 0.001$, 95%CI[-26.16, -6.64])。上述家庭读写活动与阅读理解能力之间呈显著负相关。综上，本研究考察了家庭读写模型在汉语学龄期儿童中的适应性，发现读写活动通过作用于认知技能，间接影响儿童的阅读能力。该研究结果为家庭读写模型在中国学龄期儿童中的应用提供了部分支持。

The mediation of cognitive skills in the relationship between home literacy environment and reading skills in Chinese school-age children

Liu Zeqi[1] Liu Jiaxin[1] Lin Jia[2] Wang Yi[2] Li Jingxiao[2] Su Mengmeng[1] (corresponding author)
1 College of Elementary Educaiton, Capital Normal University, Beijing, 100048,
sumengmeng@cnu.edu.cn
2 College of Psychology, Capital Normal University, Beijing, 100048

Abstract: Early home literacy environment plays an important role in the development of children's reading skills. The home literacy model argued that children are exposed to two types of literacy experiences at home; namely, formal and informal literacy activities. Based on this model, researchers had studied the home literacy environment of preschool children in alphabetic languages, and found that formal literacy activities are associated with later reading skills through decoding skills. Informal literacy activities are associated with later reading skills through oral language skills. However, it is still unclear the relationship between home literacy environment and reading skills in Chinese school-age children, and the mediation of cognitive skills (decoding skills and oral language skills) in this relationship. Therefore, the present study aimed to explore the relationship between the home literacy environment of Chinese school-age children and reading skills based on the home literacy model. The present study involved 226 children in grades 1-6 (M_{age} = 9.35, SD = 1.73) from Beijing. The results of the study indicated that: (1) Decoding skills (word reading accuracy) fully mediated the relationship between formal literacy activities and reading comprehension (p < 0.001, 95%CI [-33.10, -15.23]). (2) Decoding skills (word reading fluency) fully mediated the relationship between formal literacy activities and reading comprehension (p < 0.001, 95%CI [-39.43, -19.34]). (3) Oral language skills (word product) fully mediated the relationship between informal literacy activities and reading comprehension (p < 0.001, 95%CI [-26.16, -6.64]). All the home literacy activities showed significant negative correlations with reading comprehension. In conclusion, this study examined the adaptability of the home literacy model in Chinese school-age children, and found that literacy activities indirectly influenced children's reading skills through cognitive skills. Our findings provided partial support for the home literacy model in Chinese school-age children.

3 北京师范大学(珠海校区)应用心理学院，广东 珠海，519087

摘 要 阅读流畅性和阅读理解是阅读的重要方面。阅读流畅性指快速进行字词解码，包括出声的朗读流畅性和不出声的默读流畅性；阅读理解指在无时间限制的情况下对文本内容的理解和掌握程度。研究表明不论是母语还是二语学习，词汇均影响书面阅读。词汇两维度理论(Ouellette, 2006)提出词汇包括词汇广度和词汇深度。词汇广度指掌握的词汇数量及对词汇主要信息的把握，体现语音表征。词汇深度指词汇知识的质量与词汇在心理词典中的组织，体现语义表征。词汇质量假说理论(Perfetti, 2007)认为对词汇意义理解越深，越有益于阅读。为探讨词汇对阅读流畅性和阅读理解的影响作用，采用追踪设计，对 127 名一年级学生进行为期一年的跟踪调查，包括词汇广度、词汇深度、朗读流畅性、默读流畅性、阅读理解和 IQ，运用结构方程模型对数据进行分析，结果显示：（1）词汇广度和深度与一年后的阅读流畅性、阅读理解的相关均达到统计性显著；（2）在控制 IQ 后，一年级时的词汇广度对一年后二年级的朗读流畅性、默读流畅性和阅读理解的路径系数分别为 0.30、0.37 和 0.16；（3）一年级的词汇深度对二年级的默读流畅性和阅读理解的路径系数分别为 0.22 和 0.24，但对朗读流畅性的预测作用不显著。结果表明词汇广度是阅读流畅性和

阅读理解的重要预测因素，对阅读流畅性的作用更大；词汇深度促进默读流畅性和阅读理解的发展，但对朗读流畅性作用不明显。

3 School of Applied Psychology, Beijing Normal University at Zhuhai, Zhuhai 519087

***Abstract*:** Reading fluency and reading comprehension are important aspects of reading performance. Reading fluency refers to the rapid decoding of words, it includes both reading aloud fluency and silent reading fluency; reading comprehension refers to the degree of understanding and mastery of text content without time constraints. Research has shown that vocabulary affects written reading in both native and second language learning. The two-dimensional theory of vocabulary (Ouellette, 2006) proposes that the vocabulary includes vocabulary breadth and vocabulary depth. Vocabulary breadth refers to the number of words mastered and the grasp of the main message of the words, reflecting phonological representation. While vocabulary depth refers to the quality of vocabulary knowledge and the organization of vocabulary in the mental lexicon, reflecting semantic representation. The theory of vocabulary quality hypothesis (Perfetti, 2007) suggests that the deeper the understanding of the meaning of vocabulary, the more beneficial it is to reading. To explore the role of vocabulary on reading fluency and reading comprehension, a tracking design was used to follow 127 first graders for one year, including vocabulary breadth, vocabulary depth, reading aloud fluency, silent reading fluency, reading comprehension, and IQ, the data were analyzed using structural equation modeling. The results showed that: (1) the correlations of vocabulary breadth and depth with reading fluency and reading comprehension one year later all reached statistical significance; (2) after controlling for IQ, the path coefficients of vocabulary breadth in first grade on reading aloud fluency, silent reading fluency, and reading comprehension in second grade one year later were 0.30, 0.37, and 0.16, respectively; (3) The path coefficients of vocabulary depth in first grade on silent reading fluency and reading comprehension in second grade were 0.22 and 0.24, respectively, but the predictive effect on reading aloud fluency was not significant. These findings demonstrates that vocabulary breadth is a significant predictor of reading fluency and reading comprehension, especially favoring reading fluency; vocabulary depth promotes silent reading fluency and reading comprehension, but had an insignificant effect on reading aloud fluency.

语素意识对默读流畅性的影响:词汇广度和词汇深度的作用

侯峥榕[1]　辛紫菡[1]　程冬阳[1]　伍新春[2,3]　李利平[1]（通讯作者）

1 山西师范大学教育科学学院，太原，030031，liliping2092@163.com

2 北京师范大学心理学部，应用实验心理北京市重点实验室，儿童阅读与学习研究院，北京，100875

3 北京师范大学(珠海校区)应用心理学院，广东 珠海，519087

摘 要 快速进行默读即默读流畅性是阅读教学的任务之一。语素意识是默读流畅性的重要影响因素，同时词汇也影响着儿童默读的顺利进行。语素意识是个体对语言中最小语义单元的感知和操纵能力，儿童对语素的加工越熟练，越能够进行快速阅读。词汇质量假说(Perfetti，2007)认为词汇表征的质量越高，越能够促进儿童阅读的顺利进行。词汇包含词汇广度和词汇深度两个维度，较多研究探讨了词汇的深度，对词汇广度的研究涉及较少。随着儿童阅读发展阶段的不同，底层的认知技能对高层的阅读行为的影响作用可能有所不同。因此本研究欲探讨：（1）语素意识对默读流畅性的直接影响作用；（2）词汇广度和词汇深度的中介作用以及年级效应。选取两所小学一年级和三年级共 291 名儿童，分别对儿童语音意识、语素意识、词汇广度、词汇深度、默读流畅性等语言技能进行测查，运用结构方程模型对数据进行分析，由同音语素意识、同形语素意识和复合语素意识三者抽取潜变量语素意识，并把语音意识作为控制变量，建立一、三年级的直接作用模型和中介作用模型，并且通过模型比较考察不同年级之间加工模式的差异。结果显示：（1）在一、三年级的直接模型中，语素意识对默读流畅性的直接效应值分别为 0.33 和 0.49，均达到统计显著；（2）在一年级的中介模型中，词汇广度和词汇深度在语素意识和默读流畅性之间的间接效应不显著，但在三年级的中介模型中，词汇广度和词汇深度在语素意识和默读流畅性之间起着完全中介的作用，词汇广度和词汇深度的间接效应值分别为 0.31 和 0.23，均达到统计显著，但二者的中介作用差异不显著，即语素意识通过词汇广度和词汇深度对默读流畅性的影响作用相同；（3）通过多群组模型比较，一、三年级的中介模型无显著差异(χ^2=4.674，*df*=2，*p*=0.0966)，具有相同的影响机制。研究表明语素意识是默读流畅性的重要影响因素，并且词汇广度和词汇深度在语素意识和默读流畅性之间的作用随着年级的发展而变化。

The Influence of Morphological Awareness on Silent Reading Fluency: The Role of Vocabulary Breadth and Depth

Zhengrong Hou[1] Zihan Xin[1] Dongyang Cheng[1] Xinchun Wu[2,3] Liping Li[1] (Corresponding author)

1 School of Education Science, Shanxi Normal University, Taiyuan 030031

2 Institute of Children's Reading and Learning, Beijing Key Laboratory of Applied Experimental Psychology, Faculty of Psychology, Beijing Normal University, Beijing 100875

3 School of Applied Psychology, Beijing Normal University at Zhuhai, Zhuhai 519087

Abstract: Silent reading fluency is one of the tasks of reading teaching. Morphological awareness is an important factor affecting silent reading fluency, and vocabulary also affects the smooth progress of children's silent reading. Morphological awareness is an individual's ability to perceive and manipulate the smallest semantic unit in a language. The more proficient children are in morpheme processing, the more fluent they are in fast reading. The lexical quality hypothesis (Perfetti, 2007) holds that the higher the quality of lexical representation, the more able it is to promote children's reading. Vocabulary includes two dimensions: vocabulary breadth and vocabulary depth. Many studies have discussed the vocabulary depth, but the research on vocabulary breadth is less involved. With the different stages of children's reading development, the influence of the underlying cognitive skills on the high-level reading behavior may be different. Therefore, this study intended to explore: (1) The direct effect of morphological awareness on silent reading fluency; (2) The mediating effect of vocabulary breadth and vocabulary depth and grade effects. A total of 291 children from grade 1 and grade 3 of two primary schools were selected to test their language skills such as phonological awareness, morphological awareness, vocabulary breadth,

vocabulary depth, and silent reading fluency. Structural equation model was used to analyze data. The latent variable morphological awareness was extracted from homophone awareness, homograph awareness, and compounding awareness at the word level, and the phonological awareness was used as the control variable, the direct effect model and the mediation effect model of grade 1 and grade 3 were established. The differences of processing modes between different grades were investigated through model comparison. The results demonstrated: (1) In the direct effect model of grade 1 and grade 3, the direct effect of morphological awareness on silent reading fluency was 0.33 and 0.49, respectively, which were statistically significant. (2) In the mediation effect model of grade 1, the indirect effects of vocabulary breadth and vocabulary depth on morphological awareness and silent fluency were not significant. However, in the mediation effect model of grade 3, vocabulary breadth and vocabulary depth played a full mediator role between morphological awareness and silent reading fluency. The indirect effects of vocabulary breadth and vocabulary depth were 0.31 and 0.23 respectively, which were statistically significant, but there was no significant difference between the two mediations, morphological awareness has the same effect on silent reading fluency through vocabulary breadth and vocabulary depth. (3) Through the comparison of multi-group models, there was no significant difference between the mediation models of grade 1 and grade 3(χ^2=4.674, *df*=2, *p*=0.0966), and they have the same influence mechanism. The research showed that morphological awareness is an important influencing factor of silent reading fluency, and the role of vocabulary breadth and vocabulary depth between morpheme awareness and silent reading fluency changes with the development of grade.

摘 要　随着网络技术的发展，电子媒介成为现代青少年的必备物品。电子媒介使用增加了青少年网络游戏的频率，导致不同的攻击主题偏好，产生更多的网络欺凌，需要关注攻击主题偏好与网络欺凌的内在关联。为了减少网络欺凌发生，探究其影响因素，我们研究了攻击主题偏好，道德推脱，应对方式和网络欺凌之间的关系。选取湖北省恩施州某中学 558 名初中生，采用网络欺凌，攻击主题偏好，道德推脱和应对方式量表收集数据，利用 SPSS 和 Mplus 分析数据。结果：（1）攻击主题偏好和网络欺凌显著正相关(r=0.26,p<0.01)，和道德推脱正相关（r=0.23,P<0.01),应对方式显著正相关(r=0.15,p<0.01)；道德推脱和网络欺凌正相关（r=0.27,P<0.01)；应对方式和网络欺凌显著正相关(r=0.14,p<0.01)；（2）道德推脱和应对方式在攻击主题偏好影响中学生网络欺凌之间起并行中介作用。攻击主题偏好影响中学生网络欺凌，在这一过程中，需要关注个体道德推脱和应对方式的重要影响。

关键词 中学生，网络欺凌，攻击主题偏好，应对方式

Sensational Interests and Cyberbullying：Parallel Mediating Roles of moral disengagement and coping

Qianqian Chen , Lei Wang

Wuhan Sports University,Wuhan,430079

***Abstract*：Background:** The rapid development of the network has made electronic media usage an essential part of adolescent daily life. The utilisation of electronic media has improved the lifestyle of young individuals, however, it has also resulted in a social issue known as cyberbullying, which is affecting numerous families. **Objective:** The purpose of this study is to examine the correlation between sensational interests, coping mechanisms, and cyberbullying. Our aim is to identify the factors that influence cyberbullying and provide recommendations for mitigating such behaviours. We will present empirical evidence to support our findings. Methods: In this study, a questionnaire was utilised to survey 558 students from the first to the third grade of Gaoping Experimental Middle School in Hubei Province. The data was analysed using SPSS and Mplus.**Results:** (1) The findings of the research indicate a positive correlation between sensational interests and cyberbullying($r = 0.26$, $p < 0.01$), as well as between cyberbullying and moral disengagement ($r = 0.27$, $p < 0.01$) and coping($r = 0.15$, $p < 0.01$). Additionally, there was a positive correlation between sensational interests and moral disengagement ($r = 0.23$, $p < 0.01$) and coping ($r = 0.15$, $p < 0.01$). The results suggest that moral disengagement and coping partially mediate the relationship between sensational interests and cyberbullying. **Conclusion:** The impact of sensational interests on cyberbullying should be addressed by prioritising moral disengagement and coping strategies.

童年创伤与中学生网络攻击行为之间的关系：特质愤怒和道德推脱的作用

李燕筠[1] 杨玲[1] 曹华[2]（通讯作者）

1 西北师范大学心理学院，兰州，730070

2 西北师范大学心理学院，兰州，730070，caohua360083915@163.com

摘 要 近年来，随着互联网的高速发展与普及，网络攻击行为作为导致中学生出现一系列生理、心理甚至行为问题的重要预测因素，受到研究者的广泛关注。以往研究发现，中学生群体中网络攻击行为的检出率较高。本研究基于社会学习理论与社会信息加工理论构建了一个链式中介模型，以探讨童年创伤与中学生网络攻击行为的关系，并进一步探讨童年创伤、特质愤怒与道德推脱对网络攻击行为的影响机制。采用儿童期创伤问卷、少年网络攻击行为量表、特质愤怒量表和道德推脱问卷对 1089 名在校中学生进行问卷调查。结果发现：(1)童年创伤、特质愤怒、道德推脱和网络攻击行为两两之间呈显著正相关；(2)童年创伤既可以直接预测网络攻击行为,还可以通过特质愤怒经道德推脱的链式中介作用来正向预测网络攻击行为。具体来说，童年创伤不仅直接影响中学生的网络攻击行为，还可能通过特质愤怒和道德推脱对网络攻击行为产生影响。本研究不仅解释了导致网络攻击行产生的影响因素，以及在何种条件下的影响作用更大；也启示我们关注对特质愤怒和道德推脱两个方面的干预，这可能是阻止或减少中学生网络攻击行为产生的一种有效方法。童年创伤和网络攻击行为都是中学生面临的重要问题，中学生正处于人生发展历程中一个非常重要的阶段，而童年创伤对中学生的影响是深远的，并可能影响到个体成年后网络攻击行为的产生。基于此，对于有网络攻击行为的中学生需要关注他们的早期创伤经历，以及童年创伤经历对特质愤怒、道德推脱的影响。

关键词 网络攻击行为，童年创伤，特质愤怒，道德推脱

Childhood Trauma and Cyber-aggression in Middle School Students: Mediating Role of Trait Anger and Moral Disengagement

Li Yanjun[1] Yang Ling[1] Cao Hua[2]
1 school of Psychology, Northwest Normal University,Lanzhou, 730070
2 school of Psychology, Northwest Normal University,Lanzhou, 730070,
caohua360083915@163.com

Abstract: In recent years, with the rapid development and popularization of the Internet, cyber-aggression, as an important predictor of a series of physical, mental and even behavioral problems among middle school students, has been widely concerned by researchers. Previous studies have found that there is a high detection rate of cyber-aggression among middle school students. This study constructs a chain mediating model based on social learning theory and social information processing theory to explore the relationship between childhood trauma and middle school students' cyber-aggression. and further explore the underlying mechanism of childhood trauma, trait anger and moral disengagement on cyber-aggression. 1089 middle school students were investigated with the Childhood Trauma Questionnaire, the Juvenile Cyber-aggression Scale, the Trait Anger Scale and the Moral Disengagement Questionnaire. The results showed that: (1) There was a significant positive correlation among childhood trauma, trait anger, moral disengagement and cyber-aggression; (2) Childhood trauma can directly predict cyber-aggression, it can also positively predict cyber-aggression through the chain mediating role of trait anger through moral disengagement. Specifically, childhood trauma not only directly affects the cyber-aggression of middle school students, but may also have an impact on cyber-aggression through trait anger and moral disengagement. This study not only explains the factors that lead to cyber-aggression, but also under what conditions the impact is greater; It also sheds light on our concern that intervention in trait anger and moral disengagement may be an effective way to stop or reduce the occurrence of cyber-aggression by middle school students. Childhood trauma and cyber-aggression are important issues faced by middle school students, and the middle semester is a very important stage in the development of an individual's life, and the impact of childhood trauma on secondary school students is far-reaching and may affect the occurrence of cyber-aggression in adulthood. Based on this, middle school students with cyber-aggression need to pay attention to their early experiences, as well as the impact of childhood traumatic experiences on trait anger and moral disengagement.

语言认知技能对学龄前儿童口语叙事能力的预测作用

凌嘉[1] 李京晓[1] 王伊[1] 刘佳欣[2] 刘泽琪[2] 周蔚[1] 苏萌萌[2]（通讯作者）
1 首都师范大学心理学院，北京，100048
2 首都师范大学初等教育学院，北京，100048，sumengmeng@cnu.edu.cn

摘 要 学龄前儿童处于读写萌发阶段，其口语叙事能力对后续读写能力的发展至关重要。口语叙事能力是书面叙事（写作）的基础，有研究者指出儿童的口语叙事能力会随着年龄、语言水平以及认知水平的发展而发展。幼小衔接阶段（大班）是儿童语言发展的关键时期，培养叙事能力有助于幼儿做好入学准备，更好适应小学生活。以往研究发现了学龄前儿童的相关语言认知技能与口语叙事能力的相互关系，但对于幼小衔接阶段这一特殊发展阶段的探讨还较少。本研究通过构建分层回归模型，探讨了幼儿园大班儿童的

口语叙事能力特点及其与语言认知技能的相互关系。来自北京市某城区的 152 名儿童（72 名男孩，80 名女孩，M = 5.80 岁，SD = 0.40）参与本研究，我们对其进行了口语词汇、听力理解、语音意识等认知技能的测量；观察收集了这 152 名儿童的口语叙事内容并进行转录，从宏规结构（语篇质量评分）和微观结构（实际词汇量、非重复词汇量等）两个维度进行研究。结果发现，在控制了总字数、性别以及智力后，儿童的口语词汇能够显著预测口语叙事的微观结构维度（非重复词汇量，β= 0.215，p = 0.004）以及宏观结构维度（语篇质量，β= 0.295，p < 0.001）得分，而听力理解则显著预测了儿童口语叙事的微观结构维度（实际词汇量，β= 0.183，p = 0.042）得分。这表明儿童的口语词汇得分越高，口语叙事时词汇运用越丰富，叙事语篇质量越高；听力理解得分越高，儿童对故事内容的理解越全面，从而有助于儿童在叙事时有更多的词汇产出。我们的发现为探索提高儿童口语叙事能力的方法提供了实证依据，帮助幼小衔接阶段儿童更好进行入学准备。

2 College of Elementary Education, Capital Normal University, Beijing, 100048, China

Abstract：Oral narrative skill of preschoolers in the stage of emergent literacy plays a crucial role in the subsequent development of literacy skills. Oral narrative skill serves as the foundation for written narrative (writing), and researchers have noted that children's oral narrative skill develops alongside their age, language proficiency, and cognitive abilities. The process of kindergarten and primary school connection (Kindergarten Senior Class) is a critical period for children's language development, and cultivating narrative skill can help young children prepare for school and adapt better to primary school life. Previous research has found the relationship between preschool children's relevant language cognitive skills and oral narrative ability, but there is little discussion on the special development stage of young children's cohesion. By constructing a hierarchical regression model, this study discusses the characteristics of oral narrative ability of kindergarten children in large classes and its relationship with language cognitive skills. One hundred fifty-two Chinese children (72 boys and 80 girls, M = 5.80 *years, SD* = 0.40) from a district in Beijing in this study. All children were attending Kindergarten Senior Class. We assessed their cognitive skills, including vocabulary, listening comprehension, and phonological awareness. Next we observed and transcribed their narratives and estimated it from two perspectives: macrostructure (text quality) and microstructure (actual vocabulary size, non-repetitive vocabulary size, etc.). Results showed that, after controlling for total word count, gender, and intelligence, children's vocabulary significantly predicted the scores of microstructure (non-repetitive vocabulary size, β=0.215, p=0.004) dimension and macrostructure (text quality, β=0.295, p<0.001) dimension of their oral narratives. Additionally, listening comprehension score significantly predicted the microstructure (actual vocabulary size, β=0.183, p=0.042) score of children's oral narratives. Results suggests that children with higher vocabulary scores exhibit richer vocabulary usage and higher text quality during oral narrative. And higher listening comprehension score helps children better understand the story content, leading to a greater vocabulary output during narrative. Our findings provide empirical evidence for exploring methods to improve children's oral narrative skill and help children in the process of kindergarten and primary school connection have better school readiness.

数字游戏化学习中听觉情绪设计对学习效果的影响

詹杰妮[1] 王智铿[1] 桂阳[1] 蔡志慧[1]（通讯作者）
1 华中师范大学心理学院，武汉，430079，caizhihui922@mail.ccnu.edu.cn

摘 要 在游戏化学习中，关于情绪设计的研究尚处于起步阶段，情绪设计对于学习效果的影响仍然存在争议。情绪设计假设认为在学习过程中，有吸引力的设计元素，如有趣的上下文声音，能够促进学习者的认知加工过程。然而，无关的听觉辅助可能会加重认知负荷，对学习效果无益反损。因此，本文采用单因素被试间实验设计，选取 162 名大学生（45 名男生），将其随机分配到积极、中性和无背景音乐 3 种条件下，以探讨数字游戏化学习中听觉情绪设计的作用。结果表明，积极的听觉情绪设计能够显著地提升学习者的积极情绪，且无论是积极还是中性的背景音乐，都要比无背景音乐更能促进学习者的参与度、心流体验和学习保持成绩。进一步的中介效应分析证明了参与度和心流体验在背景音乐和学习保持成绩之间起链式中介作用。此外，通过行为日志分析，发现有背景音乐条件下的学习者更能够获取核心学习信息，活动过程更流畅，从而表现出更多与学习相关的行为。对表情识别分析的数据进行卡方检验，结果显示，积极背景音乐组的学习者表现出更多的积极情绪和更少的消极情绪，中性背景音乐组的学习者表现出更多的积极情绪、中性情绪和更少的消极情绪。因此，与游戏内容契合的音乐并不会阻碍学习者的学习，反而能够起到促进的作用。综合主观报告与客观的行为分析、表情分析的结果，本研究发现在游戏化学习中，背景音乐可以显著提高数字游戏化学习中的学习效果。本研究证明了听觉情绪设计在数字游戏化学习中的重要作用，为如何设计更有效的教育游戏提供了实证证据。

The effect of auditory emotional design on learning outcomes in digital game-based learning

ZHAN Jieni[1]; WANG Zhikeng[1]; GUI Yang[1]; CAI Zhihui[1]
2 School of Psychology, Central China Normal University, Wuhan 430079,
caizhihui922@mail.ccnu.edu.cn

Abstract: Research on emotional design in digital game-based learning is still in its infancy, and the impact of emotional design on learning outcomes remains controversial. The emotional design hypothesis suggests that attractive design elements, such as interesting contextual sounds, can facilitate learners' cognitive processing during the learning process. However, irrelevant auditory aids may add to the cognitive load, which is not beneficial but detrimental to learning outcomes. Therefore, in this paper, a one-way between-subjects experimental design was conducted to select 162 college students (45 males), who were randomly assigned to three conditions: positive, neutral, and no contextual music, in order to explore the role of auditory emotional design in digital game-based learning. Results indicated that a positive auditory emotional design significantly boosted learners' positive mood and that both positive and neutral background music promoted learners' engagement, flow, and learning retention scores more than no background music. Further mediation effect analyses demonstrated that engagement and flow acted as chain mediators between background music and learning retention scores. In addition, behavioral log analysis revealed that learners in the condition with background music are more able to access core learning information and have a more fluid activity process, thus exhibiting more learning-related

behaviors. A chi-square test on the data analyzed for expression recognition showed that learners in the positive background music group showed more positive emotions and fewer negative emotions, and learners in the neutral background music group showed more positive emotions, neutral emotions, and fewer negative emotions. Thus, music that fits with the game content does not hinder learners' learning, but rather can be a facilitator. Combining the results of subjective reports with objective behavioral and expression analyses, this study found that background music in digital game-based learning can significantly enhance learning outcomes. This study demonstrates the important role of auditory emotional design in digital game-based learning and provides empirical evidence on how to design more effective educational games.

自发性动作同步——合作学习中脑间同步的外源性因素

李媛媛[1#] 苏畅[1#] 潘亚峰[*]
浙江大学心理与行为科学系，杭州，310058
yafeng.pan@zju.edu.cn

摘 要 合作学习是人类社会文化演化和生存的关键。通过与同伴合作学习，个体能够不断进步和发展。最近的研究表明，个体之间的脑间同步（Interbrain Synchronization,个体间大脑活动在时间上的耦合）与有效合作学习密切相关。然而，对于互动学习过程中脑间同步的源头，我们仍不清楚。为了填补这方面的研究空白，我们从具身的角度出发，检验了动作同步是否是驱动脑间同步的外源性因素。我们根据被试先验知识水平的高低来配对个体，形成了高-高、高-低、低-低三种学习小组，并要求他们合作分析一首中国古诗。在学习小组进行合作学习任务的过程中，我们使用功能性近红外光谱成像技术(functional Near-Infrared Spectroscopy, fNIRS)同时记录了他们的脑活动，并通过基于计算机视觉的运动能量分析（Motion Energy Analysis，MEA）对人际运动同步进行了解析。结果显示，低-低组的学习结果表现最好，高-高组次之，高-低组最差。相比异质学习小组（即高-低组），同质学习小组（高-高或低-低组）表现出更强的动作同步和脑间同步。进一步的中介分析显示，个体之间自发的同步性身体动作有助于建立脑间同步，从而促进学习。这一发现填补了我们对理解个体之间信息传递的空白：个体间的动作同步是合作学习中脑间信息传递的外源性因素，最终作用于社会学习。这项研究提供了新的视角来理解人类社会学习的本质和机制，同时也为教育领域提供了新的思路和方法。

Spontaneous movement synchrony as an exogenous source for interbrain synchronization in cooperative learning

Yuanyuan Li[1#], Chang Su[1#], Yafeng Pan[*]
Department of Psychology and Behavioral Sciences, Zhejiang University, Hangzhou, China

Abstract： Learning through cooperation with conspecifics – “cooperative learning” – is critical to cultural evolution and survival. Recent progress has established that interbrain synchronization (IBS) between individuals predicts success in cooperative learning. However, the likely sources of IBS during learning interactions remain poorly understood. To address this dearth of knowledge, we tested whether movement synchrony serves as an exogenous factor that drives IBS, taking an embodiment perspective. We formed dyads of individuals with varying

levels of prior knowledge (high-high [HH], high-low [HL], low-low [LL] dyads) and instructed them to collaboratively analyze an ancient Chinese poem. During the task, we simultaneously recorded their brain activity using functional near-infrared spectroscopy and filmed the entire experiment to parse interpersonal movement synchrony using the computer-vision Motion Energy Analysis. The results showed that the LL dyads achieved the highest learning outcomes, followed by the HH dyads, and the HL dyads performed the worst. Interestingly, the homogeneous groups (HH and/or LL) exhibited stronger movement synchrony and IBS compared to the heterogeneous group. Importantly, a mediation analysis revealed that spontaneous and synchronized body movements between individuals contribute to IBS, hence facilitating learning. This study therefore fills a critical gap in our understanding of how interpersonal transmission of information between individual brains, contributed to by behavioral entrainment, shapes social learning.

Keywords： spontaneous body movement, interbrain synchronization, cooperative learning, group composition, fNIRS hyperscanning

课程学习与青少年社会参与素养的关系：一项潜在转变分析

王雨 [1] 陈宁 [1]（通讯作者）唐甜 [2]

1 上海师范大学，上海，200233

2 上海师范大学心理学系，上海，200233，chenning@shnu.edu.cn

摘 要 以上海市某中学 297 名高中生为被试进行 2 年，间隔三次的追踪研究，采用潜在剖面分析与潜在转变分析考察了青少年社会参与素养的亚组分化与转变情况，以及课程学习在青少年社会参与发展中的作用。结果发现：（1）青少年的社会参与素养在三个时间点分化成 3 个亚组：发展良好组、分化加剧组、整体弱化组；（2）从 T1 到 T2，分化加剧组的青少年呈现出了高稳定性，整体弱化组的青少年则具有较高的转变性，从 T2 到 T3，发展良好组的青少年呈现出了高稳定性，分化加剧组的青少年则具有较高的转变性；（3）学习社会参与素养特色课程数量越多，青少年更可能处于或保留在发展良好组，更低概率地进入整体弱化组，但从 T2 到 T3，随着课程学习数量的增加，T2 时处于整体弱化组和分化加剧组的青少年转变到 T3 发展良好组的概率并没有显著升高。

The Relationship Between Curriculum Learning and Adolescent Social Participation Competencies: A Latent Transition Analysis

Wang Yu,Cheng Ning,tang tian

Shanghai Normal University，Shanghai

Abstract: A total of 297 high school students in a middle school in Shanghai were selected as subjects for a two-year, three-time follow-up study. Latent profile analysis and latent transformation analysis were used to investigate the subgroup differentiation and transformation of adolescents ' social participation competencies, and the role of curriculum learning in the development of adolescents ' social participation. The results showed that : (1) Adolescents ' social participation competencies was divided into three subgroups at three time points : good development group, intensified differentiation group, and overall weakening group ; (2) From T1 to T2, the adolescents in the intensified differentiation group showed high stability, while the adolescents in the overall

weakening group showed high transformation. From T2 to T3, the adolescents in the well-developed group showed high stability, while the adolescents in the intensified differentiation group showed high transformation. However, from T2 to T3, with the increase of the number of curriculum learning, the probability of adolescents in the overall weakening group and the differentiation group at T2 to the well-developed group at T3 did not increase significantly.

The Effect of Death Anxiety on Older Adults' Vulnerability to Fraud: The Moderating Role of Mental Simulation

Zhihu Chen[1], Jing Wen[1], Jingjin Shao[1,2], Chun Gou[1]

1 Centre for Mental Health Education, Southwest University, Chongqing, 400715

2 Faculty of Psychology, Southwest University, Chongqing, 400715, jingjinshao@126.com

Abstract: Fraud in older adult has become a serious public social problem that is currently of widespread concern in countries around the world. However, most of the fraud victims are unwilling to actively report their fraud experiences, and fraud vulnerability can help to predict the likelihood that an individual will be easily defrauded in some real fraud situation in the future. Death anxiety arousal is one of the most common fraud tactics used in the older adults, considering that death anxiety is more likely to be felt when in older age than younger. However, the relationship between death anxiety and the vulnerability to fraud in old age still lacks empirical support. Due to the weakened emotional regulation and cognitive processing ability, older adults are hardly able to make a comprehensive and rational understanding of the fraud, and death anxiety may further increase the vulnerability to fraud. Secondly, older adults are not passively submissive to the scammer, but affected by their self-control, which ultimately determines whether they will fall into the scam. It was found that mental simulation, as an effective self-regulation mechanism, can effectively reduce consumers' irrational consumption behaviors. Accordingly, it may play an important role in reducing the vulnerability of the older adults to fraud. This study used two experiments to examine the effects of death anxiety on older adults' vulnerability to fraud, as well as the moderating role of mental simulation. Study 1 used a mortality salience paradigm to examine whether mortality salience could significantly increase older adults' vulnerability to fraud (i.e., advertisement credibility scores and purchase intention scores). Study 2 further manipulated the moderating variable of mental simulation, which was divided into process simulation (i.e., imagining the detailed process of purchasing goods), upward outcome simulation (i.e., imagining possible positive outcomes after purchasing), and downward outcome simulation (i.e., imagining possible negative outcomes after purchasing). That is, the study employed a 2 (Death anxiety: high, low) * 3 (Mental simulation: process simulation, upward outcome simulation, and downward outcome simulation) mixed design. It was found that: (1) the mortality salience group had significantly higher advertisement credibility scores and purchase intention scores than those in the control group; (2) mental simulation could significantly affect the relationship between death anxiety and older adults' vulnerability to fraud. Specifically, in the process simulation condition, the high death anxiety group rated advertisement credibility significantly higher than the low death anxiety group, while the purchase intention of advertised goods was rated significantly lower than the low death anxiety group. In the downward outcome simulation condition, the high death anxiety group had significantly lower advertisement credibility and purchase intention than the low death anxiety group. In the upward outcome simulation condition, the high death anxiety group had significantly higher advertisement

credibility and purchase intention than the low death anxiety group. These findings contribute to understanding the role of death anxiety in older adults' fraud, suggest that mental simulation can increase or decrease vulnerability to fraud, provide empirical evidence for the role of mental simulation in fraud prevention and intervention for older adults.

Key words: older adults; vulnerability to fraud; death anxiety; mental simulation

儿童观点采择、共情关心与父母过度保护的交叉滞后分析

莫然[1] 高聃[2] 刘俊升[3] 刘阳阳[1] 熊明慧[1] 成丹丹[1]（通讯作者）

1 山东中医药大学健康学院，济南，250399

2 莱顿大学教育与儿童研究所，荷兰莱顿，2333AK

3 华东师范大学心理与认知科学学院，上海，200062

通讯作者 E-mail 512671170@qq.com

摘 要 **目的** 本文主要探讨 7-11 岁中国儿童在共情不同维度上的发展，以及与父亲和母亲过度保护教养方式之间的双向关系。儿童共情包含观点采择(perspective taking)和共情关心(empathic concern)两个维度。通过区分共情的具体维度，可以更好了解儿童共情与父母过度保护之间的纵向关系，为儿童的社会情绪发展提供更好的教养理念。 **方法** 选取 288 名小学生(44.1%女孩, M_{age} = 9.75, *SD* = 1.17)及其父母，进行为期两年的纵向研究。选用人际反应指数量表(Davis Interpersonal Reactivity Index)测量儿童共情的不同维度，以及儿童抚养行为问卷(Child-Rearing Practices Report)测量父亲和母亲过度保护。使用 Mplus 8 进行验证性因素分析，并建立交叉滞后模型，通过对比多组模型分别得出父亲和母亲与儿童共情的纵向关系。**结果** 父亲和儿童共情纵向关系的模型拟合指数为：CFI = .83, TLI = .80, RMSEA = .04, SRMR = .08； 母亲和儿童共情纵向关系的模型拟合指数为：CFI = .82, TLI = .80, RMSEA = .04, SRMR = .08。模型结果显示，儿童在第一年的观点采择能力，显著正向预测第二年父亲(*b*=.46, *SE*=.08, *p*<.001)和母亲(*b*=.47, *SE*=.07, *p*<.001)的过度保护水平。儿童第一年的共情关心水平对父母第二年的过度保护预测不显著。母亲在第一年的过度保护水平，显著正向预测第二年儿童的观点采择能力(*b*=.18, *SE*=.09, *p*<.05)，对儿童共情关心水平的预测没有显著预测作用。父亲在第一年的过度保护对儿童在第二年的观点采择和共情关心预测都不显著。**结论** 父母过度保护对儿童共情发展的不同维度起到了不同的作用，并且父亲和母亲在儿童共情发展中的作用也有显著不同。本研究揭示了父母教养需要关注和区分儿童共情能力的不同方面，从而促进儿童共情能力的整体发展。并且儿童可以通过学习如何进行适当共情，以调节其父母过度保护的教养行为。

Cross-lagged panel analyses of young adolescents'perspective taking and empathic concern and parental overprotection

Ran Mo[1] Dan Gao[2] Junsheng Liu[3] Yangyang Liu[1] Minghui Xiong[1] Dandan Cheng[1]

1 College of Health Sciences, Shandong University of Traditional Chinese Medicine, Jinan, China, 250399

2 Institute of Education and Child Studies, Leiden University, Leiden, the Netherlands, 2333AK

3 College of Psychological and Cognitive Science, East China Normal University, Shanghai, China, 200234

***Abstract*： Objective** This study aimed to examine the development of different dimensions of empathy in

Chinese children aged 7-11 years, and the bidirectional relation between children's empathy and overprotective parenting practices of fathers and mothers. Children's empathy includes two dimensions: perspective taking and empathic concern. By distinguishing the specific dimensions of empathy, we can gain a better understanding of the longitudinally bidirectional relation between children's empathy and parental overprotection, as well as provide improved parenting concepts for children's social-emotional development. **Methods** A sample of 288 primary school students (44.1% girls, M_{age} = 9.75, *SD* = 1.17) and their parents participated in a two-year longitudinal study. The Davis Interpersonal Reactivity Index was used to measure the different dimensions of children's empathy, and the Child-Rearing Practices Report was used to assess paternal and maternal overprotection. Confirmatory factor analysis and cross-lagged panel models were conducted using Mplus 8. **Results** The cross-lagged panel model of paternal overprotection and child empathy showed acceptable fitting indexes: CFI =.83, TLI =.80, RMSEA =.04, SRMR =.08; The fitting indexes of the model of maternal protection and child empathy were CFI =.82, TLI =.80, RMSEA =.04, SRMR =.08. The results revealed that children's perspective-taking ability in the first year positively predicted the level of fathers' overprotection (*b*=.46, *SE*=.08, *p*<.001) and mothers' overprotection (*b*=.47, *SE*=.07, *p*<.001) in the second year. However, children's empathic concern in the first year did not predict parents' overprotection in the second year. Additionally, Mothers' overprotection level in the first year positively predicted children's perspective taking in the second year (*b*=.18, *SE*=.09, *p*<.05), but did not predict children's empathic concern. Paternal overprotection in the first year did not predict children's perspective taking and empathic concern in the second year. **Conclusion** Parental overprotection has different effects on the distinguished dimensions of children's empathy development. Fathers and mothers play different roles in children's empathy development. Therefore, to promote the overall development of the children's empathy, it is recommended to focus on and distinguish different aspects of children's empathy in relation to parenting practices. Furthermore, children have the ability to shape their parents' overprotective parenting behaviors by learning how to develop their empathy.

Keywords：Children's empathy, Perspective taking, Empathic concern, Overprotection, Father and mother

摘 要 物质主义是指物质财富对于个人生活重要性的价值观念，将物质的获取和占有当作生活的中心、幸福的根本和成功的标准。该价值观随着国内消费主义文化的兴起，通过网络媒体大范围的传播开来。该观念对社会普遍道德发起否定，对中国传统价值观念造成冲击，并带来消极影响，如降低主观幸福感，诱发强迫性购买，减少亲社会行为等。亲社会行为是指对他人有益的行为，对个体主观幸福感，生活满意度，生命意义感等有积极影响，也与我国的德育教育和核心价值观建设密切相关。虽然研究表明高水平物质主义会降低个体亲社会行为，但其影响机制仍然缺乏探索。因此本研究基于道德认同视角构建了一个有调节的中介模型，采用物质主义价值观量表，青少年道德认同量表，自我意识量表，亲社会行为倾向量表对 1708 名本科生(男生 693 名，年龄 19.73±4.17)进行施测，得到如下结果：①相关分析表明，物质主义与亲社会行为(*r*=-0.31，*p*<0.01)，道德认同(*r*=-0.17，*p*<0.01)显著负相关，而物质主义与公我意识(*r*=0.32，*p*<0.01)显著正相关；②中介分析表明，物质主义可以通过道德认同预测大学生亲社会行为(B=-0.16，95%CI=[-0.21,-0.11])，中介效应占比 27.12%；③公我意识在道德认同符号化与亲社会行为之间起调节作用。具体而言,公我意识在物质主义通过道德认同符号化负向影响亲社会行为的后半段路径中起着调节作用。当公我意识较强时，物质主义通过道德认同符号化作用于亲社会行为的间接效应较弱(B=-0.11，95%CI=[-0.15，-0.07])；当公我意

识较弱时，该间接效应较强(B=-0.14，95%CI=[-0.18，-0.09])。可以推测，高物质主义者拥有更低的道德认同水平是减少亲社会行为的重要原因，而提高公我意识有助于抑制这一效应。基于上述发现，教育工作者需要重视在校大学生的德育教育工作，这对帮助大学生提高道德修养，树立正确的价值观念，促进亲社会行有一定的教育意义。
关键词　物质主义，道德认同，亲社会行为，道德认同符号化，公我意识

Materialism and Prosocial Behavior: The Mediating Role of Moral Identity and the Moderating Role of Public Self-consciousness

Wang Yan[1] Xiao Haiyan[1,2] Zhang Yu[2] Yang Lili[2]
1 School of Education Science, Shanxi Normal University, Taiyuan
2 Metal Health Education and Counseling center, Shanxi Datong University, Datong

Abstract: Materialism refers to the value concept of the importance of material wealth to personal life, which regards the acquisition and possession of material as the center of life, the foundation of happiness and the standard of success. With the rise of consumerism culture, materialism has been widely disseminated through Internet media. This concept negates the general morality of society, impacts traditional Chinese values, and brings negative impacts, such as reducing subjective well-being, inducing compulsive purchases, and declining pro-social behaviors. Prosocial behavior refers to the behavior that is beneficial to others, which have a positive impact on individual subjective well-being, life satisfaction, meaning in life. It is also closely related to China's moral education and core values construction . Although some studies have pointed out that high levels of materialism can weaken individual prosocial behavior, the mechanism of its effects are still unexplored. In this study ,a moderated mediation model constructed based on the perspective of moral identity, using the materialistic values scale, adolescent moral identity scale, self-consciousness scale, prosocial behavior tendency scale to measure 1708 undergraduates(693 males, age 19.73±4.17) .The following results were obtained:①Correlation analysis showed that materialism was significantly negatively correlated with prosocial behavior (r=-0.31, p<0.01), moral identity(r=-0.17, p<0.01) ; there was positive correlation between materialism and public self-consciousness(r=0.32, p<0.01);②Mediation analysis showed that materialism could significantly predict college students prosocial behavior through moral identity(B=-0.16, 95%CI=[-0.21,-0.11]), and the mediation effect accounted for 27.12%;③Public self-consciousness modulates the relationship between moral identity symbolization and prosocial behavior. The mediating effect of moral identity symbolization between materialism and prosocial behavior was moderated by public self-consciousness. When public self-consciousness was strong, the indirect effect of materialism on prosocial behavior through the moral identity symbolization was weaker (B=-0.11, 95%CI=[-0.15, -0.07]);when public self-consciousness was low, this indirect effect was stronger (B=-0.14, 95%CI=[-0.18, -0.09]). It can be speculated that high materialists have a lower level of moral identity is an important reason for reducing prosocial behavior, while increasing public self-consciousness helps to suppress negative effect. Based on above findings, educators need to pay attention to moral education of college students, which has certain educational implications for helping college students improve their moral cultivation, establish correct values, and promote pro-social behavior.

Keywords: Materialism, moral identity, prosocial behavior, moral identity symbolization, public self-consciousness

摘 要 学业倦怠（academic burnout）不仅会带来心理健康方面的问题，而且容易引起物质滥用甚至自杀等不良的行为后果。弹性(resilience)作为一种保护机制可以减弱学业倦怠的不良影响。尽管学业倦怠与弹性之间存在明确的关联，对于个体学业倦怠的不同症状与弹性各个维度之间的关系研究较少。因此，本研究使用网络分析方法，将学业倦怠与弹性作为具有互动节点的体系来探索它们之间的关系。在本研究中，我们在大学生群体样本（N=1236）中评估学业倦怠的不同症状与弹性各个维度之间的结构关系。首先，我们在各自网络中计算了预期影响(expected influence, EI)值来揭示学业倦怠和弹性内部的内在关联。在联合网络中，我们进一步计算了桥预期影响(bridge expected influence, BEI)值来确定连接学业倦怠不同症状与弹性各个维度之间最具影响力的节点。结果揭示了学业倦怠症状与弹性各个维度之间的潜在关联。学业倦怠网络中的“学习兴趣减退”和弹性网络中的“克服困难达到目标”和“认为自己是强大的人”具有最高的预期影响值。此外，通过桥预期影响值的计算确定“战胜压力可以让我更强大”和“自我效能感下降”作为维持整个学业倦怠和弹性网络最重要的桥梁节点。本研究结果与应激相关成长理论（stress-related growth）相一致，并且强调了压力事件后的自我成长对于预防学业倦怠的重要作用。最后，目前的研究强调了针对弹性的干预来改善大学生学业倦怠的潜在价值。

[3] Department of Military Psychology, Armed Police Logistics College, Tianjin 300309, China

***Abstract*:**
Background: Academic burnout not only brings about mental health problems, but also can lead to adverse behavioural consequences such as substance abuse and even suicide. Resilience as a protective mechanism can attenuate the adverse effects of academic burnout. Despite the clearly established link between academic burnout and resilience, little is known about how individual symptoms of academic burnout and aspects of resilience interrelate.
Method: The study used network analysis to explore the association between academic burnout and resilience as a system of interacting nodes. In this study, we assessed the structural relationships between the different symptoms of academic burnout and the aspects of resilience in a population sample of university students (N = 1236). First,

we computed expected influence (EI) values to reveal differential associations among academic burnout symptoms and aspects of resilience in their respective networks. Further, in the joint network we calculated bridge expected influence (BEI) values to identify the most influential nodes connecting the different symptoms of academic burnout to the aspects of resilience.

Results: The results revealed potential associations between symptoms of academic burnout and aspects of resilience. "Decreased interest in learning" in the academic burnout network and " Can achieve goals despite obstacles " and "Thinks of self as strong person" in the resilience network had the highest EI values. In addition, the calculation of the BEI value identified "Coping with stress can strengthen me" and "Decreased self-efficacy" as the most important bridge nodes to maintain the entire academic burnout and resilience network.

Conclusion: The findings are consistent with stress-related growth theory and highlight the importance of self-growth after stressful events in preventing academic burnout. Ultimately, the current study highlights the potential value of resilience-targeted interventions to alleviate academic burnout among college students.

父母低头行为与学前儿童问题行为的关系：一个双路径模型

周姝颖[1]（通讯作者） 马颖[1]

1 陕西师范大学教育学部，西安，710062，shuyingzhou01@163.com

摘 要 低头行为是一种与使用手机相关的社会排斥行为，在人际交往中，低头症会损害人际关系，造成低质量的沟通。已有研究证明家庭中伴侣低头会降低配偶的心理健康，关系质量和满意度。然而，作为家庭系统中的重要一环，少有研究关注父母低头症对学前儿童行为发展的影响及作用机制。学龄前期是儿童心理行为发展的关键时期，也是最容易产生问题的时期，父母低头行为会让幼儿感受到忽视和排斥，增加幼儿产生问题行为的风险。根据情境-过程-结果模型，父母低头行为作为远端情境，不一定能直接作用于幼儿行为，需要借助近端情境发挥作用。亲子关系，如亲子间的亲密与冲突，可能是重要的近端情境。父母低头行为会打断亲子互动，降低亲密度，增加亲子间的冲突，使儿童产生不良行为。同时，不良的亲子关系容易使父母在养育中感到疲惫，养育效能感降低，形成养育倦怠，进一步增加对孩子的忽视或暴力，影响儿童行为发展。因此，本研究拟探讨父母低头行为对学前儿童问题行为的预测作用及亲子亲密、亲子冲突与养育倦怠在其中的作用机制。研究采用父母低头行为量表、亲子关系量表、养育倦怠量表、儿童行为评定-长处和困难量表，对西安市 1594 名父母进行问卷调查，结果发现：（1）父母低头行为、亲子关系、养育倦怠、学前儿童问题行为之间两两相关显著；（2）父母低头行为正向预测学前儿童问题行为；（3）亲子亲密、养育倦怠在父母低头行为与学前儿童问题行为的关系中起序列中介作用（保护减少效应）；亲子冲突、养育倦怠在父母低头行为与学前儿童问题行为的关系中起序列中介作用（风险增加效应），其中风险增加效应更加突出。具体而言，父母低头行为通过亲子亲密、亲子冲突、养育倦怠的单独中介作用及亲子亲密、养育倦怠和亲子冲突、养育倦怠的序列中介作用影响学前儿童问题行为。本研究揭示了父母低头行为与儿童发展的关系，加深了人们对父母低头行为消极影响及内在机制的认识，启示父母规范使用手机，减少低头行为。

The Relationship Between Parental Phubbing and Preschool Children's Behavior Problems: A Two-Path Model

Zhou Shuying[1] Ma Ying[1]
1 Shaanxi Normal University, Xian, 710062, shuyingzhou01@163.com

***Abstract*：** Phubbing is a form of social exclusion behavior associated with mobile phone use. In interpersonal interactions, phubbing has been demonstrated to damage relationships and hinder effective communication. Previous research has indicated that phubbing in the family can reduce spouses' mental health, relationship quality and satisfaction. However, as an important part of the family system, few studies have focused on the effect and mechanism of parental phubbing on the behavioral development of preschool children. The preschool period is a critical stage for children's psychological and behavioral development, and it is during this time that issues are most likely to emerge. Parental phubbing will make children feel neglected and rejected, increasing the risk of children's behavior problems. According to the context-process-outcomes model, parental phubbing, as a distal context, may not directly affect children's behavior, but needs to through the proximal context to play a role. Parent-child relationships, such as parent-child intimacy and conflict, may be important proximal context. Parental phubbing may interrupt parent-child interaction, reduce intimacy, increase parent-child conflict, and lead to problem behaviors in children. At the same time, poor parent-child relationship is easy to make parents feel tired, reduce parenting efficacy, form parenting burnout, further increase the neglect or violence to children, and affect children's behavior development. Therefore, this study aims to explore the predictive effect of parental phubbing on the behavior problems of preschool children and the mechanism of parent-child intimacy, parent-child conflict, and parenting burnout. A total of 1594 parents in Xi 'an were investigated by using the Parental Phubbing Scale, Child-Parent Relationship Scale, The Parental Burnout Assessment and the Strengths and Difficulties Questionnaire. The results showed that: (1) Parental phubbing, parent-child relationship, parenting burnout and preschool children’s behavior problems were significantly correlated; (2) Parental phubbing positively predicted the preschool children’s behavior problems; (3) Parent-child intimacy and parenting burnout play a sequential mediating role in the relationship between parental phubbing and preschool children’s behavior problems (protection-reduced effect); Parent-child conflict and parenting burnout played a sequential mediating role in the relationship between parental phubbing and preschool children’s behavior problems (risk-increased effect), and the risk-increased effect was more prominent. Specifically, parental phubbing affected preschool children’s behavior problems through the separate mediating effects of parent-child intimacy, parent-child conflict, and parenting burnout and the sequential mediating effects of parent-child intimacy, parenting burnout and parent-child conflict, and parenting burnout. This study revealed the relationship between parental phubbing and children's development, deepened people's understanding of the negative impact and internal mechanism of parental phubbing, and inspired parents to regulate the use of mobile phones and reduce parental phubbing.

父母心理控制对本科护生社交媒体成瘾的影响:错失焦虑的中介作用

吕童玉[1] 张雪雁[1]（通讯作者）
1 滨州医学院，山东 烟台，264003

摘 要 目的 本研究以护理专业大学生为研究对象，考察错失焦虑在父母心理控制与社交媒体成瘾间的中介效应。方法 采用便利抽样法选取山东省某所医学院校 425 名护生，采用自制的一般资料调查表、父母心理控制量表、错失焦虑量表、社交媒体成瘾量表对其进行调查，运用 SPSS 26.0 软件对数据进行共同

方法偏差检验、描述性统计、相关分析、中介效应分析。结果　本研究护生父母心理控制与错失焦虑、社交媒体成瘾得分分别为（41.73±12.23）、（23.93±6.27）、（89.94±19.48）。护生父母心理控制与错失焦虑、社交媒体成瘾均呈显著正相关（$P<0.001$）；Bootstrap 检验结果显示，错失焦虑在护生父母心理控制和社交媒体成瘾间的中介效应为-0.25（95%CI：-0.05~0.15），占总效应的 46.94%。结论　父母心理控制既可以直接影响社交媒体成瘾，也可以通过错失焦虑间接影响社交媒体成瘾。

The Relationship between Parental Psychological Control and Nursing Undergraduates' Social Media Addiction: The Mediating Effect of Fear of Missing Out

Lv Tongyu[1], Zhang Xueyan[1]
1School of nursing, Binzhou medical university, Yantai (264003), Shandong Province, China

Abstract：Objective This study was conducted to examine the mediating effect of fear of missing out between parental psychological control and social media addiction among nursing undergraduates. Methods Totally 425 nursing students from five universities in Shandong Province were recruited by using convenience sampling, then they were investigated utilizing a general information questionnaire, the Parental Psychological Control Scale (PCS), the Fear of Missing Out Scale (FOMOS), and the Social Media Addiction Scale (SMAS)，and SPSS 26.0 software was used to conduct common method bias testing， descriptive statistics， correlation analysis， mediation effect analysis. Results The scores of psychological control and fear of missing out and social media addiction of nursing students' parents in this study were (41.73±12.23), (23.93±6.27), and (89.94±19.48), respectively. Parental psychological control of nursing undergraduates was significantly and positively correlated with fear of missing out and social media addiction (P<0.001). The results of Bootstrap test showed that the mediating effect of fear of missing out on the relationship between parental psychological control and social media addiction was 0.25 (95% CI： 0.05 ~0.15)， accounting for 46.94% of the total effect. Conclusion Parental psychological control can influence social media addiction both directly and indirectly through fear of missing out.
Keywords：nursing undergraduates, parental psychological control, fear of missing out, social media addiction, mediating role

小学生语素意识与字词识别的关系：来自追踪的证据

程冬阳[1]　侯峥榕[1]　辛紫菡[1]　伍新春[2,3]　李利平[1]（通讯作者）
1 山西师范大学教育科学学院，太原，030031，liliping2092@163.com
2 北京师范大学心理学部，应用实验心理北京市重点实验室，儿童阅读与学习研究院，北京，100875
3 北京师范大学（珠海校区）应用心理学院，珠海，519087

摘 要　小学阶段字词识别不仅是课文阅读的重要前提，还是教学的主要任务之一。根据简单阅读观(Gough & Tunmer, 1990)，字词识别作为解码能力是一种自下而上的加工，指根据字形提取语音和语义的过程(Ehri, 2000)。汉语作为一种表意文字，识别时需要通过字形来通达语义。语素作为语言中的最小语义单位，不仅是个体的底层语言技能的展示，更是个体对字词内部语素结构感知及操作能力的体现，这也就决定了语素意识在字词识别中的作用。语素意识也有助于儿童对字词进行准确的识别和理解(周怡彤 等,2023)。同时，

交互激活模型(Reilly & Radach, 2006)提出，高水平的字词识别会促进低水平认知技能的发展。而以往研究也发现字词识别可能会经由字形知识、语音意识、词汇知识贡献于语素意识的发展。儿童从“学习阅读”转向“从阅读中学习”的过程中，语素意识与字词识别之间的关系可能也存在动态变化。据此，为探明(1)小学生语素意识与字词识别的因果关系；(2)小学生语素意识与字词识别的关系是否存在年级差异？本研究选取了 124 名小学一年级学生(低年级)和 123 名小学三年级学生(高年级)进行了为期三年的语素意识(同音字意识、同形词意识、复合词意识)和字词识别的追踪测试，并运用交叉滞后模型分析。结果显示：(1)一年级的交叉滞后模型拟合较好(χ^2=72.14、*df*=46、RMSEA=0.06、CFI=0.96、TLI=0.95、SRMR=0.04)。一年级字词识别对二年级语素意识有单向预测，路径系数为 0.2；二年级字词识别与三年级语素意识有双向预测，路径系数分别为 0.19 和 0.21。(2)三年级的交叉滞后模型拟合指数较好(χ^2=82.59、*df*=45、RMSEA=0.08、CFI=0.04)。三年级语素意识对四年级字词识别的单向预测显著，路径系数为 0.28；四年级时的语素意识对五年级字词识别的单向预测在边际水平上显著，路径系数为 0.19，*P*=0.06。研究表明，语素意识与字词识别的因果关系随着儿童阅读阶段的发展而变化，字词识别的作用在低年级时更大，而语素意识的作用在高年级时更大。

The Relationship between Morpheme Awareness and Word Recognition in Primary School Students: Evidence from Tracking

Dongyang Cheng[1]　Zhengrong Hou[1]　Zihan Xin[1]　Xinchun Wu[2,3]　Liping LI[1](Corresponding author)

1 School of Education Science, Shanxi Normal University, Taiyuan, 030031

2 Faculty of Psychology, Beijing Key Laboratory of Applied Experimental Psychology, Research Center of Children’s Reading and Learning, Beijing Normal University, Beijing, 100875

3 School of Applied Psychology, Beijing Normal University At Zhuhai, Zhuhai, 519087

Abstract: Word recognition in primary school is not only an important prerequisite for text reading, but also one of the main tasks of teaching. According to the simple reading view (Gough & Tunmer, 1990), word recognition as a decoding capability is a bottom-up process that refers to the process of extracting speech and semantics from glyph (Ehri, 2000). As an ideogram, Chinese needs to understand the semantics through glyph when identifying. As the smallest semantic unit in language, morphemes are not only the display of an individual's underlying language skills, but also the embodiment of an individual's ability to perceive and operate the internal morpheme structure of words, which also determines the role of morpheme awareness in word recognition. Morpheme awareness also helps children to accurately identify and understand words (Zhou et al., 2023). At the same time, the interaction activation model (Reilly & Radach, 2006) proposes that high levels of word recognition promote the development of low-level cognitive skills. Previous studies have also found that word recognition may contribute to the development of morpheme awareness through glyph knowledge, phonological awareness, and vocabulary knowledge. As children shift from "learning to read" to "learning from reading", there may also be dynamic changes in the relationship between morpheme awareness and word recognition. Accordingly, in order to explore the causal relationship between (1) primary school students' morpheme awareness and word recognition; (2) Is there a grade difference in the relationship between morpheme awareness and word recognition among primary school students? In this study, 124 primary 1 students (lower grades) and 123 primary 3 students (upper grades) were selected to conduct three-year tracking tests of morpheme awareness (homophone awareness, homograph awareness, compound word awareness) and word recognition, and cross-lag model analysis was used.

The results showed that: (1) The cross-hysteresis model fit well in the first grade (χ^2=72.14, *df*=46, RMSEA=0.06, CFI=0.96, TLI=0.95, SRMR=0.04). First-grade word recognition had a one-way prediction of second-grade morpheme awareness with a path coefficient of 0.2, while second-grade word recognition and third-grade morpheme awareness had two-way prediction, with path coefficients of 0.19 and 0.21, respectively. (2) The fitting index of the cross-hysteresis model in the third grade was good (χ^2=82.59, *df*=45, RMSEA=0.08, CFI=0.04). The one-way prediction of word recognition in grade 4 was significant, with a path coefficient of 0.28, and the one-way prediction of morpheme awareness on word recognition in grade 5 was significant at the marginal level, with a path coefficient of 0.19 and *P*=0.06. Studies have shown that the causal relationship between morpheme awareness and word recognition changes with the development of children's reading stage, and the role of word recognition is greater in the lower grades, while the role of morpheme awareness is greater in the upper grades.

跨文化视角下童年期创伤和成人期自杀意念的关系：一项元分析

陶芽[123] 吴俊杰[123]（通讯作者）

1 教育部人文社会科学重点研究基地天津师范大学心理与行为研究院，天津，300387

2 天津师范大学心理学部，天津，300387

3 学生心理发展与学习天津市高校社会科学实验室，天津，300387，通讯作者 E-mail:psywujunjie@tjnu.edu.cn

摘 要 自杀是一个严重的全球卫生问题,童年期创伤被认为是成人期自杀意念的重要影响因素。尽管诸多研究探讨了这种关系，但是研究结果却存在很大差异，并且也不清楚该现象是否存在文化差异。本研究采用传统元分析的方法来明确不同类型的童年期创伤（情感虐待、情感忽视、身体虐待、身体忽视和性虐待）和成人期自杀意念之间的关系，并探讨了影响两者关系的调节变量。共检索了 Medline,Embase,Web of Science,CINAHL,WangFang Data,CNKI 和 CQVIP 数据库，检索时限截止至 2022 年 12 月 30 日，共获取 45 项研究，含 180 个效应量，涉及被试 147310 名，其中东方被试 28455 名，西方被试 118855 名。结果发现，童年期创伤越严重，成人期自杀意念越强烈（r = 0.19[0.17,0.21]）；该现象在整体上具有文化普遍性（东方 r = 0.18[0.16,0.18]，西方 r = 0.21[0.19,0.24]),但是性虐待与成人期自杀意念的关系紧密程度在东方文化下可能弱于西方文化（东方 r = 0.11[0.07,0.16],西方 r = 0.17[0.13,0.21]）；该现象在不同类型的创伤中存在差异，其中情感虐待最高（r = 0.25[0.19,0.30]),性虐待最低（r = 0.14[0.11,0.18]），情感忽视（r = 0.25[0.19,0.29]）、身体忽视（r = 0.19[0.14,0.24]）和身体虐待（r = 0.17[0.13,0.22]）居中；此外，调节效应检验发现五种童年创伤和成人期自杀意念之间的正相关关系不受被试年龄、男性比例、是否为临床样本、测量工具的影响。这些结果表明，在不同文化氛围下，童年期创伤都是成人期自杀意念的风险因子。本研究启示未来研究可以更多地关注童年期创伤经历者自杀的潜在机制，进一步探索两者关系的调节变量，寻找影响童年期创伤经历者自杀意念的保护因素，从而指导制定更有效的干预措施。
